RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK

BRANCH OFFICES AT 375 OLD COLONY BUILDING CHICAGO, AND QUEEN ANNE'S CHAMBERS WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. *We give in our editorial columns* OUR OWN *opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.*

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS:

W. H. BOARDMAN, *Prest. and Editor.*
E. A. SIMMONS, *Vice-President.*
RAY MORRIS, *Secretary*
R. S. CHISOLM, *Treas.*
I. B. RINES, *Cashier*
L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Managing Editor*
BRAMAN B. ADAMS
CHARLES H. FRY
FRANK W. KRAEGER
GEORGE L. FOWLER
HUGH RANKIN
BRADFORD BOARDMAN

CONTENTS

VOL. XLIV., No. 1. FRIDAY, JANUARY 3, 1908.

CHANGES IN RAILROAD OWNERSHIP AND CONTROL.

The principal changes in railroad ownership or control during the year 1907 are listed briefly in another column. The list includes purchases of street railways for steam railroad lines and the steamship purchases of the year of the New York, New Haven & Hartford. The expansion of the New Haven's influence is, on the whole, the year's most striking development, particularly taken in connection with the purchases of the Connecticut Railway & Lighting Company and the Rhode Island trolleys, which took place late in December, 1906. The final outcome of the Boston & Maine purchase is still unsettled, but it is likely that Massachusetts, after having safeguarded her interests by certain legislative restrictions, will sanction the merger, which is a natural development and in the direction of the best tendencies of railroad consolidation. An entirely unique piece of financing by the New Haven was the increase and exchange of stock of the Consolidated Railway, which controlled most of the New Haven's electric lines, for stock of the New England Navigation Company which owned the Sound steamboat lines. The stock of the Consolidated Railway, tripled so as to cover the Navigation securities, was then exchanged share for share for stock of the New York, New Haven & Hartford Railroad itself, the stock of the Consolidated Railway and of the Navigation company remaining in the treasury of the merged company as free assets. At the same time a new company, the New England Steamship Company, was organized to operate the Sound lines. The purchase by the New Haven of a projected high-speed electric road in the suburban territory north of New York and of one of the few remaining small independent lines in its territory—the Poughkeepsie & Eastern—were further evidences of the unification of the system, while the purchases of steamship lines running from its territory to Philadelphia, Baltimore, Newport News, Norfolk and Savannah marked a new and bold extension of the New Haven's influence. The purchase of the Chicago & Alton by the Toledo, St. Louis & Western was another important development of the year. The Alton after having been controlled first by the Union Pacific and most recently by the Rock Island Company now goes to a road smaller and much less important than itself but with which it is to work closely in future.

The acquisition of control of the Mexican Central by the government of Mexico placed most of the railroad mileage of that country in the hands of the Federal authorities and definitely committed the government to the policy of consolidation of competing lines. A plan had been worked out and was about to be declared effective for the consolidation of the Mexican Central, the National of Mexico, the Mexican International and the Interoceanic of Mexico in one great holding corporation to be known as the National Railways of Mexico, when the financial storm broke and postponed its completion. Judging by the announced terms of this plan, the new company will have an exceeding amount of water in its stock. But apparently consolidation of competing lines and stock watering are desirable when they are carried out by a government. The Baltimore & Ohio by paying off the bonds of the Chicago Terminal Transfer gained a share in the control of this important Chicago belt line from which it leases its Chicago freight and passenger terminals. It is probable that the Baltimore & Ohio and the Burlington will control it jointly. Early in January the Northwestern Pacific was incorporated to take over various small railroads north of San Francisco and east of the Southern Pacific's San Francisco-Portland line, some of which were owned by the Southern Pacific and the rest by the Santa Fe. These two groups of these are to be connected by a through line and operated by the new company which is controlled by the two large railroads jointly.

Early in the year the Seaboard Air Line bought almost all of the stock of the Macon, Dublin & Savannah, by which it gets a better line between Atlanta, Ga., and Savannah. A 95-mile line of the Santa Fe, which will eventually probably form part of a new trans-continental cut-off for both roads, was transferred during the year to the Southern Pacific. The Central of Georgia, whose status during the last 11 years had never been made quite clear, was sold and proved to have been held since 1896 by the reorganization committee of the Richmond Terminal Railroad & Warehouse Company for the benefit of the Southern Railway. The Burlington, which has much mileage in Nebraska, took over a Great Northern line in that state, thus placing all the Hill road in Nebraska under one management. The lease of the Pere Marquette to the Cincinnati, Hamilton & Dayton was abrogated and the Pere Marquette is now in process of reorganization as a solvent independent company. The Boston & Maine, the Delaware & Hudson and the New York, New Haven & Hartford all extended their ownership of electric lines by purchase of small companies. The two Hill transcontinentals bought the Astoria & Columbia River which runs west along the south bank of the Columbia river below Portland, thus preventing it from falling in the hands of the Harriman companies and keeping for themselves the rich timber resources of its territory. The belt line of the New York Central at Chicago bought the outer mileage of the Chicago Junction Railway, thus strengthening its influence in the Chicago terminal territory. The Maine Central, by buying three small railroads in Maine, increased its territorial monopoly in that state. Most of the other purchases were unimportant, representing the taking over of small branch lines by strong companies.

THE CINCINNATI, HAMILTON & DAYTON AND THE NEW "CLOVER LEAF" SYSTEM.

There have recently been reports that the Cincinnati, Hamilton & Dayton, now in a receiver's hands, will soon become part of the new system made up of the Toledo, St. Louis & Western and the Chicago & Alton. It is interesting to observe the reasons which might bring about such a consolidation and its possible advantages.

The Alton and the Clover Leaf now connect with each other only at St. Louis. Not only is this a roundabout route for through business between Kansas City and Toledo, for which it is to be assumed they expect to compete, and also a route which involves the delays due to the frequent congestion of the St. Louis terminals and bridges, but for 117 miles westward out of St. Louis the Alton, having no line of its own, uses the Burlington tracks. Therefore a connection between the Alton and the Clover Leaf north of St. Louis is needed. The Cincinnati, Hamilton & Dayton would supply this. Its line from Hamilton, Ohio, west to Springfield, Ill., 296 miles, intersects the Clover Leaf at Metcalfe, Ill., 105 miles east of Springfield, which is on the Chicago & Alton's line to Kansas City over its own rails all the way.

It has been pointed out by the Clover Leaf interests that by building a seven-mile connecting line from Panama, Ill., on the Toledo, St. Louis & Western 50 miles northeast of St. Louis, west to the eastern end of a Chicago & Alton branch at Litchfield, the two roads could easily be connected. Even this route, however, would be roundabout for through traffic for it would be necessary to haul cars out of their east and west direction south or north either between Roodhouse and Carrollton or between Iles, which is just south of Springfield, and Carlinville. More than this, these southern lines of the Alton are not its most efficient lines, while at Springfield is the eastern end of its recently opened air-line cut-off from Iles to Murrayville on its Kansas City line.

The distance between Kansas City and Toledo by the Alton-C., H. & D.-Clover Leaf route is 686 miles as against 662 miles by the Wabash, 721 miles by the suggested Panama-Litchfield cut-off and 734 miles by the Chicago & Alton and the Clover Leaf via St. Louis. Over the Burlington and the Lake Shore via Chicago the distance between Kansas City and Toledo is 733 miles.

Between Cincinnati territory and Kansas City the advantage in distance is all with the Cincinnati, Hamilton & Dayton-Chicago & Alton route. By it the distance from Cincinnati to Kansas City is 613 miles, while from Cincinnati to Kansas City over the Big Four and the Missouri Pacific is 659 miles, and over the Pennsylvania Lines and the Missouri Pacific 668 miles. Dayton, Ohio, to Kansas City by the Pennsylvania-Missouri Pacific route is 635 miles; by the Hamilton & Dayton-Alton route 620 miles. Hamilton, Ohio, to Kansas City over the Pennsylvania Lines and the Missouri Pacific is 634 miles as against 587 miles by the Cincinnati, Hamilton & Dayton and the Alton. Then, too, the other and longer routes are all through St. Louis. They include the transfer between East St. Louis and St. Louis and handling by two, three or four different carriers.

The advantages of a combination of the Cincinnati, Hamilton & Dayton with the Clover Leaf and the Alton would be, not only the saving in distance, but what is more important to both shippers and passengers, through lines under one management. This, particularly in freight service, means quicker time and simpler methods. In all these ways the Cincinnati, Hamilton & Dayton would well round out the through routes of the present Clover Leaf-Alton system.

From the standpoint of the Cincinnati, Hamilton & Dayton such an arrangement would be important and valuable. The Hamilton-Springfield line does not now amount to much beyond Indianapolis. Such a consolidation would greatly increase the importance of all of this line and particularly of its now little used western end. The lines between Cincinnati and Toledo are and always have been profitable because this is a rich manufacturing territory. A through traffic alliance with the Alton would not only mean a great increase of traffic on the Springfield line from the west to this manufacturing territory, but would result in the routing of much westbound traffic over this line to Springfield for delivery there to the Alton. There would therefore be advantages to both parties if this reported consolidation should take place.

There remain to be considered the owners of the Cincinnati, Hamilton & Dayton, J. P. Morgan & Company who paid a high price for a bankrupt road in order to protect the general trunk line situation. Is it probable that they would be willing to turn over this property to the Clover Leaf-Alton interests? To attempt an answer to this question it is necessary to go back several years and consider the reasons which brought about the purchase of the Cincinnati, Hamilton & Dayton-Pere Marquette aggregation by the guardian spirit of the trunk line railroads. To them the bitter pill of the "Great Central Route" was that the rich traffic originated by the Cincinnati, Hamilton & Dayton in the prosperous manufacturing regions of western Ohio, which previously had been turned over to the various trunk lines at their respective junction points with this north and south line to be carried eastward over their tracks to tidewater, was instead hauled north to Detroit and there turned over to the Pere Marquette to be hauled eastward north of Lake Erie to the Buffalo gateway. The same thing was true of traffic between western Ohio territory and Chicago. In either case the Pere Marquette was a roundabout route for such traffic. As one railroad officer expressed it, it was carrying freight "round Robin Hood's barn." It was primarily to put a stop to this that the "Great Central" roads were taken over.

United with the Toledo, St. Louis & Western and the Chicago & Alton, the Cincinnati, Hamilton & Dayton would have, from the standpoint of the trunk lines, few of the same possibilities for harm that it did when working with the Pere Marquette. Eastbound traffic from Ohio points would not be affected in any way whatever by such a consolidation. It is this which is most important and which in particular made the Cincinnati, Hamilton & Dayton-Pere Marquette merger unendurable to the trunk line community of interest. Furthermore the present arrangements for westbound traffic, so far as the Chicago gateway is concerned, would not be disturbed. It is this gateway in which the trunk lines are directly interested. The Chicago-Atlantic seaboard roads would be affected only by the loss of traffic which they formerly received at Chicago from the Chicago & Alton, but this they are apparently in any case to lose as far as Toledo to the Toledo, St. Louis & Western. Thus, from a traffic standpoint—and it was the potentialities of the "Great Central Route" as a traffic disturber that brought about its purchase—there seems to be no reason of moment why the trunk lines should object to this sale of the Cincinnati, Hamilton & Dayton.

A consolidation of the Cincinnati, Hamilton & Day
Toledo, St. Louis & Western and the Chicago & Alt
advantageous to all three and would not disturb the ex
relations in trunk line territory. Accompanied by ap
prevent "Robin Hood's barn" routings, which do not
belong to the proposed combination, such for example
sible one from Dayton, Ohio, south to Hamilton, west thr
apolis, Ind., to Springfield, Ill., thence north to Chic
Alton, there seems to be no strong reason why the o
Cincinnati, Hamilton & Dayton should object to this .

It should be remembered that this is not a proph
is to come about but an examination of the facts and
of such a merger.

REVIEW OF 1907

From the standpoint of a railroad officer, the most valuable record of the commercial aspects of a year is that comprised in a collection of the annual reports of the railroads themselves and of the great industrial corporations, interpreted with understanding. The *Railroad Gazette* has made a continuous effort to present this record currently in an intelligent manner, and the illustrated round-up of the report reviews in another column will aid in fixing in memory the salient points of the year. But the 1907 covered by the annual reports begins six months earlier and ends six months later than the 1907 of the calendar—a year which is worthy of attention in review—because many important things have happened in it, and certain long-prominent tendencies have been reversed.

In less than three months' elapsed time a severe car shortage of some three years' duration has been turned into a widespread and marked surplusage; gross earnings have dipped down at a pronounced angle from the former curve of increase; expenses, after piling along nearly without interruption for a decade, have begun to waver, and a hostile and dangerous public sentiment has become mild as a dove. In twelve months' elapsed time it has become vira proportionate increase far greater than that of gross to a total of 112 per cent. above 1899, while gross earnings are 104 per cent. greater.

The variation in net earnings has been even more striking. It will be seen that there was a great increase in net between 1902 and 1903, a falling off in net in 1904, a striking gain up to 1906 and a much smaller gain up to 1907.

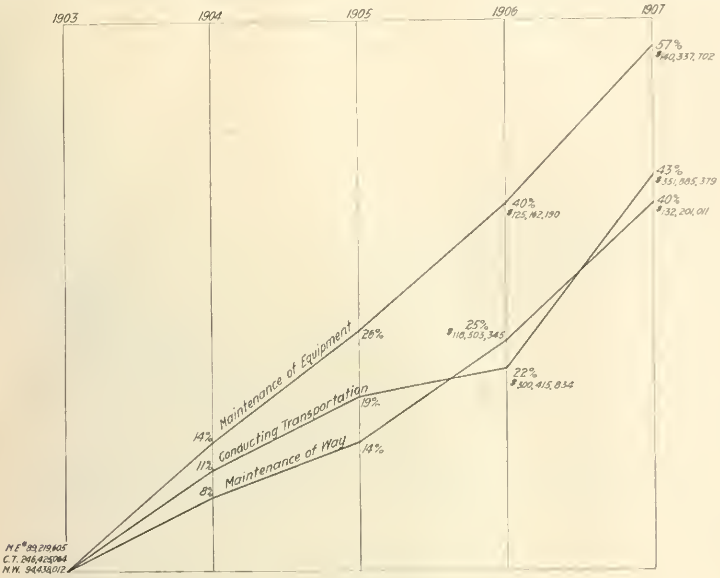

Fig. 2—Increases Per Cent. from 1903 Base. Nineteen Roads.

Figure 2, the diagram showing the per cent. increases in operating costs on the year 1903 as a base, brings out graphically some facts which are pretty well known.† The greatest increase per cent. has been in maintenance of equipment, as is naturally the case in view of the material increases in the size of equipment used. Until last year, the next greatest increase per cent. over the 1899 base was the cost of maintenance of way and structures, and this is also natural because the heavier equipment required a better roadbed. But during this past year traffic has been so enormous and costs have so constantly increased that in spite of the very liberal maintenance expenditures, the cost of conducting transportation has taken a sudden bend upward and has gone to second place on the diagram. From present indications, all three of these curves are likely to bend downward in the 1908 year, although almost five months of this 1908 year passed before traffic began suddenly to drop off. Therefore, the effect will perhaps not be fully represented in next year's figures. The significance in the extraordinary rise in the item of conducting transportation is best understood when it is realized that a large group of roads have been spending over $3,000 per locomotive a year on maintenance and renewals out of income; that several roads have charged an average of over $100 per freight car for the same purpose and that the expenditure for maintenance of way per single-track mile (counting two miles of switches and sidings as equal to one mile of main line) had been well above $1,200 on the Atchison, the Lehigh Valley and a large group of other roads, around $1,500 on the Southern Pacific and the Norfolk & Western, and over $1,000 on the Northern Pacific—to mention only a few characteristic instances of high maintenance expenditure.

Fig. 3, which we show this year for the first time, presents graphically the tendencies of one branch of increased expense. The comparison of the respective increases per cent. of taxes and of net earnings since 1899 shows that between 1899 and 1905 taxes increased each year at a rate never less than 7 per cent., or more than 9 per cent. above the base. In 1906, however, the percentage figure went up 16 per cent., and in 1907 it went up 28 per cent. The diagram shows particularly well how the curve of net earnings slacked off this year in its upward movement, while the tax curve took an incline by far the sharpest of that for any of the years shown. From all present indications, these two curves will intersect and cross each other in the current fiscal year. The upward bend of the tax curve in 1906 and 1907 tells as well as a long chapter of discussion how closely legislative attention has been di-

†The roads from which this second chart is made are as follows: Atchison, Topeka & Santa Fe; Buffalo, Rochester & Pittsburgh; Baltimore & Ohio; Chesapeake & Ohio; Chicago & Alton; Chicago & North-Western; Cleveland, Cincinnati, Chicago & St. Louis (1906 fiscal year); Chicago, Milwaukee & St. Paul; Chicago, Burlington & Quincy; Denver & Rio Grande; Great Northern; Illinois Central; Missouri, Kansas & Texas; New York, New Haven & Hartford; New York Central (year ending Dec. 31, 1906); Norfolk & Western; Chicago, Rock Island & Pacific; Southern Pacific (1906 year); Wabash.

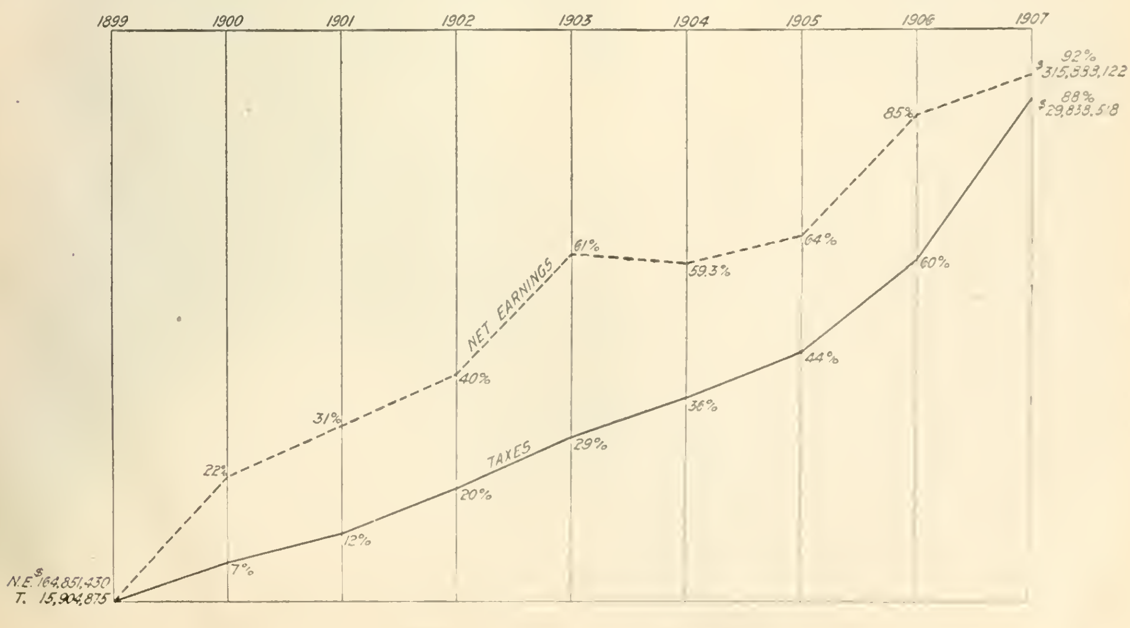

Fig. 3—Increases Per Cent. from 1899 Base. Seventeen Roads.

rected to the exaction of the greatest possible payments from railroads in the last two years. Fig. 3 and Fig. 1 are based on the same group of roads.

Figures 4, 5, 6, 7 and 8 represent graphically an exhibit of earnings compiled by the *Commercial and Financial Chronicle.* We have shown this exhibit for several years in the same form. The period represented in each diagram is the 10 months ended Oct. 31 of the calendar year shown on the right-hand wall of the diagram, and the increases per cent. are the increases over the same 10 months in the calendar year shown on the left-hand wall of each diagram. Thus, in figure 8 it is seen that in the 10 months ended Oct. 31, 1907, the operating expenses of 88 roads were 17.7 per cent. higher than the operating expenses of the same 88 roads were in the 10 months ended Oct. 31, 1906. The gross earnings of this group increased 12.9 per cent. in the same period and net earnings increased only 2.9 per cent. In only one year since 1902, when we began this form of record, has the 10 months' increase in gross earnings exceeded the increase in the operating expenses, and that was in the banner year 1906, when operating expenses increased fast enough in all conscience, but were passed by both gross and net.

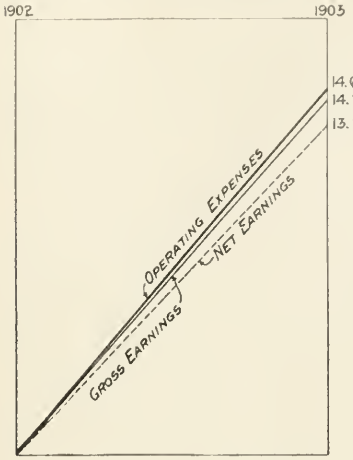

Fig. 4—Increases Per Cent., 10 Months Ending Oct. 31. 101 Roads.

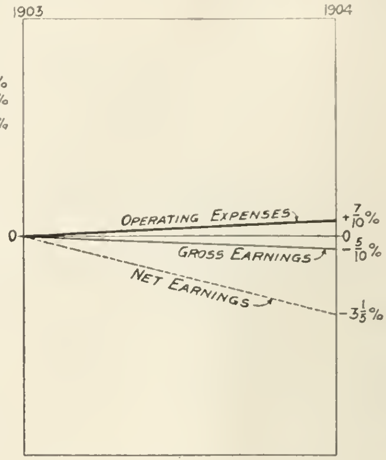

Fig. 5—Increases Per Cent., 10 Months, Ending Oct. 31. 95 Roads.

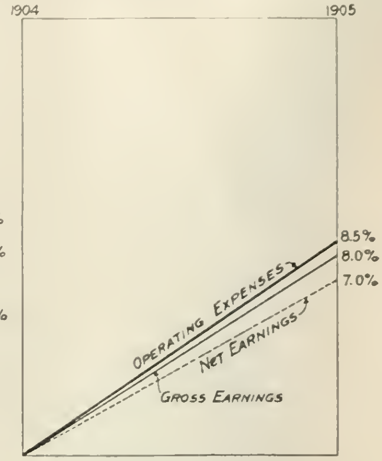

Fig. 6—Increases Per Cent., 10 Months, Ending Oct. 31. 93 Roads.

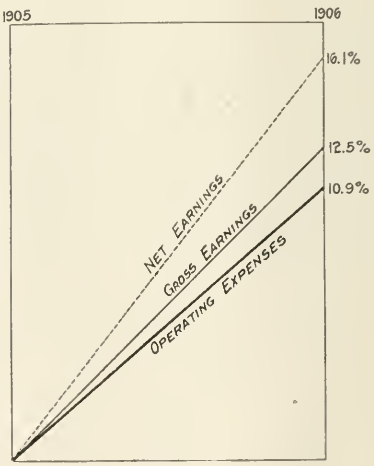

Fig. 7—Increases Per Cent., 10 Months, Ending Oct. 31. 90 Roads.

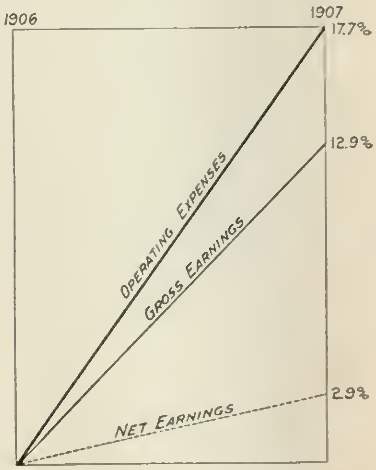

Fig. 8—Increases Per Cent., 10 Months, Ending Oct. 31. 88 Roads.

The next diagram, Fig. 9, we have compiled this year for the first time. The passenger-miles, ton-miles, number of freight cars and single-track miles are the aggregate showing of the Northern Pacific; Chicago, Burlington & Quincy, and Atchison; the car capacity, figure in tons, is that of the Northern Pacific only, since the other two roads do not give this figure. The Northern Pacific car capacity serves sufficiently well, however, to illustrate the tendency. The figure for single-track miles is arrived at by adding all the miles of first track, second track, third track and of switches and sidings operated, the idea being to show how track facilities have increased in proportion to traffic. It will be seen from this diagram that since 1899 the smallest proportionate increase has been in track capacity; the next smallest increase has been in the number of freight cars operated; passenger-miles and ton-miles, which, curiously enough, had the same total of increase, come next, a long way above the number of freight cars, while car capacity shows the highest figure of all and is approximately three times what it was eight years ago.

The curve of passenger-miles and of ton-miles, shown on this diagram, is of considerable interest. It will be seen that in the 1900 year, ton-miles increases the faster; then passenger-miles crossed them and stayed on top until June 30, 1903, when the two curves met. But the increase of passenger-miles was the steadier. Their percentage of increase was 13 points higher than that of the ton-miles in 1905 and then the curve took a slightly sharper upward bend but was, nevertheless, crossed by ton-miles in 1906. Now in 1907 the two are together again at 154 per cent. It will be seen from this chart that the rate of increase of ton-miles fluctuates more widely than does that of the passenger-miles. In the exceptionally good years, such as 1903 and 1906, ton-miles show a rate of increase about the same as that of the passenger-miles, but in the off years like 1904, passenger-miles are much less affected than are ton-miles. If we can draw conclusions for the next year from the results of the eight years past, it may be hazarded that passenger-miles will be on top (proportionate rate of increase).

Two points of interest are shown very graphically on this diagram; the conservative increase in single-track miles in proportion to traffic gains, and the great increase in the average size of the car equipment used, as indicated by the wide divergence in the curve showing car capacity and actual number of cars in service. It is also noteworthy that the curves of car capacity, of freight cars owned and of single-track miles bent upward with much greater rapidity in the 1907 year than in any other year on the chart. This is one minor point which differentiates 1907 panic conditions from those of almost all the other panics which we have had. Where there has been overproduction, in previous panic times, it has occurred in its most flagrant form a year to two years before the panic. Here we can see from the comparison of traffic increase to increase of facilities that there has been no over-production at all, and that the largest gain has occurred in the same year in which panic conditions came about, representing rather a scramble to catch up with the great ton-mile increase of 1906 than a speculative bid for the future.

Figures 10, 11, 12 and 13 are also introduced for the first time this year and are a study of individual roads rather than a compilation of general tendencies. Yet the tendencies which they show are extremely characteristic. The purpose of these diagrams is to show how general tonnage, particularly that made up of manufactures and merchandise, has increased in the last 10 or 12 years compared with the tonnage of the commodity which constitutes the road's specialty. Each one of the four roads chosen is a specialty road. The Missouri, Kansas & Texas used to depend primarily on its lumber and its grain; the Cotton Belt on cotton and lumber; the Norfolk & Western on bituminous coal; the Atchison on grain. But in the chain of golden years which received a check in 1907, the most characteristic thing about all the roads in this country has been the noteworthy increases in general, unclassified business, tending to wipe out the importance of their specialties, or at least to reduce it materially.

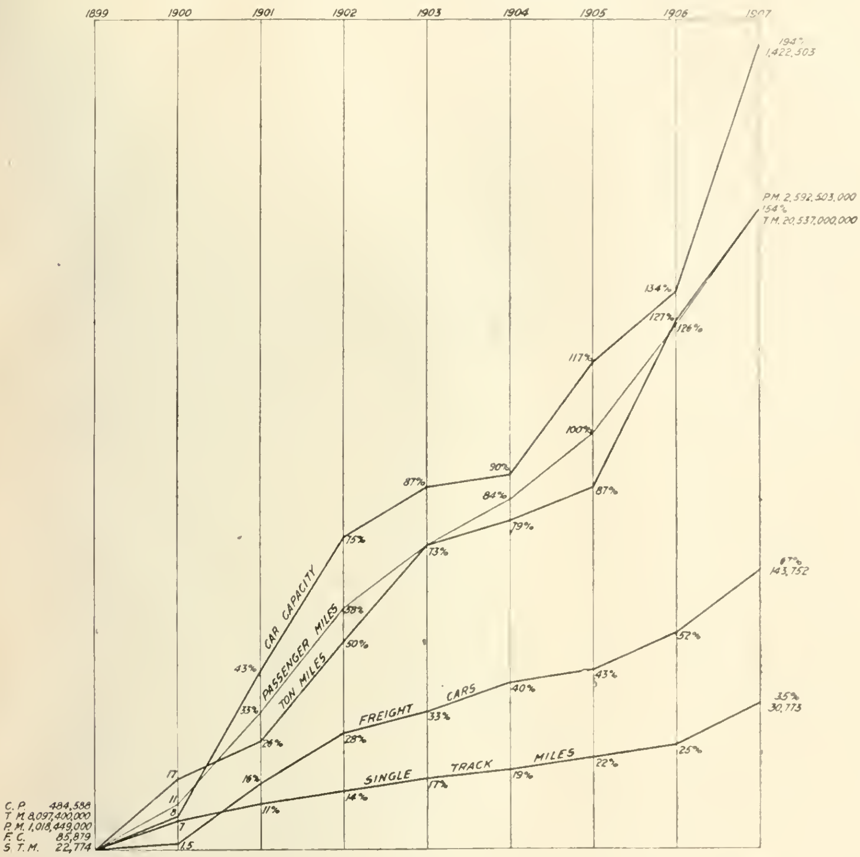

Fig. 9—Increases Per Cent. from 1899 Base. A. T. & S. F., C. B. & Q., Nor. Pac.

Note, therefore, that on the Missouri, Kansas & Texas in the 11 years ending December 30, 1907, the tonnage of manufactures and merchandise increased 268 per cent., while the tonnage of lumber increased 160 per cent., and the tonnage of grain increased only 80 per cent. The road carried some 10,000 more tons of grain in 1896 than it did of manufactures and merchandise; it carried twice as great a tonnage of manufactures and merchandise in 1907 as it did of grain—and, of course, it got a much higher proportionate ton-mile rate for it.

On the Cotton Belt, the total tonnage of the road increased 107 per cent. in 11 years, the tonnage of lumber increased 53 per cent., and the tonnage of cotton and cotton products, 105 per cent., while merchandise and miscellaneous increased 229 per cent. On the Norfolk & Western, in spite of the enormous increases in bituminous coal traffic since 1897, manufactures and merchandise went 29 points better; on the Atchison, the grain tonnage that used to determine the prosperity of the season, increased 13 per cent. between 1898 and 1907 and was not as high in 1907 as it was in 1903, the great crops of 1902 appearing, of course, as the grain tonnage for the year ended June 30, 1903. But the tonnage of merchandise, manufactures and miscellaneous articles increased 98 per cent. in the nine years.

There is one curious and rather sinister comment to be made on the showing as presented. The diagrams show conclusively that the roads in question will no longer be affected the way they used to be by a failure or a reduction in the output of their commodity, such as would be caused by a bad grain or cotton crop. But it is also apparently true that a wide and general reduction in the tonnage of manufactures and miscellaneous articles will affect these roads proportionately more than it would 10 or 15 years ago. For example, the grain roads are going to make a good showing in the current fiscal year, although not quite the highest on record. The interesting present question is, Will this showing be entirely offset by a bad record in manufactured articles? One thing is certain, that in the long run of years there will be a good many more bad crop years in this country than there will be years of general commercial depression, and the commodity diagrams show pretty clearly that the effect of these bad crop years will be greatly mitigated by the preponderance of general traffic.

One more general tendency should be presented, and it can be shown rather better by a table than by a percentage curve—the average revenue trainload. We have for similar years presented the composite of 17 roads selected as characteristic, and it will be seen that the average of these roads rose 11 tons in the last fiscal year, from a total of 399 to a total of 410. Between 1901 and 1902 the revenue trainload average increased 16 tons; between 1902 and 1903, 15 tons; in 1904 it was the same that it was in 1903. In 1905 it increased 20 tons, and in 1906, 23 tons. The increase of 11 tons this year is significant for two diametrically opposite reasons: First, because it brings the total figure so high; second, because the increase was not greater. The reason that it was not greater is because railroad managers and railroad superintendents have had so great a volume of traffic to move and have been so harassed with conditions of car shortage that they have been constrained to get their trains out as best they could and have had very little time to study out the most efficient loading of their trains, especially when this loading would necessitate any delay in train movement. Therefore, it may be said, generally speaking, that the 11-ton increase in trainload this year indicates rather an increased capacity of the motive power than general attention to the possibilities of economical operation. In a year of reduced traffic we may naturally expect this average to increase materially.

Turning from the general tendencies which have been presented to some of the specific things brought out in the reports of American railroads in 1907, some facts and figures can be produced which are highly significant of the period. The Atchison, after liberal maintenance in a year of splendid traffic, spent $9,791,226 out of income as a special appropriation for betterments. On the other hand, the Chicago & North Western, which for the last seven years has averaged over $4,000,000 a year as its appropriation out of income for betterments, and which in 1906 set $6,000,000 aside for this purpose, made no appropriation at all in 1907. These facts are both interesting. The Atchison was greatly desirous of carrying on some very important improvement work in the Southwest and, new funds were, to all intents and purposes, out of reach. It therefore made a notable appropriation which it was very well able to make, thereby strengthened its assets against securities already outstanding, instead of increasing obligations against assets. The Chicago and North-Western found itself in a condition of having completed the most urgent betterment work which had been on hand; also of requiring to create a large depreciation fund in accordance with the new accounting rules of the Interstate Commerce Commission.

The Buffalo, Rochester & Pittsburgh divested itself of its Rochester & Pittsburgh Coal & Iron Company holdings during the year by incorporating the Mahoning Investment Company in the state of Maine and selling to it the Coal & Iron Company's stock. Buffalo, Rochester & Pittsburgh stockholders received all but a small fraction of the Mahoning Investment stock, and the railroad profit and loss account was thus debited with about $1,000,000 in extra dividends. This transaction is interesting because it is the first instance where a railroad with a strong interest in the coal business has gotten rid of its coal holdings under the new law. The action of the Baltimore & Ohio in regard to the Consolidation Coal Company antedated the law.

The Central of Georgia has been twice sold during the year. The Southern Railway interests first of all disposed of the property to a shareholders' committee presumably in fear of the operations of the Anti-Trust law or of local hostility. Then the shareholders who bought it became involved in difficulties in the trust company failures and the property is understood to have passed to Mr. Harriman.

The Chicago, Milwaukee & St. Paul has apparently spent about 32½ million dollars on its Pacific coast extension and expects the work to be done in 1909. This is substantially all that can be learned about this project from the company's report.

The Missouri, Kansas & Texas and the Kansas City Southern made noteworthy records this year, handling not only the greatest business in their history, but a business so much greater than it ever was before that fresh attention has been directed to the future traffic possibilities of the north and south trunk lines. The Missouri, Kansas & Texas surplus in 1907 was nearly four times the surplus in 1906 and over ten times the surplus in 1905. The Kansas City Southern's gross earnings increased 20 per cent. in the 1907 year; its operating expenses decreased 3 per cent., and its net earnings increased 83 per cent., furnishing one of the very few instances in the entire country where a road was able to substantially increase net and at the same time decrease operating expenses last year. Both these roads have been rehabilitated, and the part they are to play in the future in the railroad strategy of the country is interesting and suggestive.

In the extreme Northwest an interesting situation was created this year by the new competition of the Grand Trunk, the Canadian Northern and Hill's Winnipeg-Vancouver line with the Canadian Pacific. The Canadian Pacific retaliated sharply by making traffic arrangements with the Harriman interests over the Oregon Railroad & Navigation into Portland, Ore., with the result that the great Canadian company now has a through route from Minneapolis to Portland, running most of the way on Canadian soil.

The Clover Leaf this year bought the Alton from the Rock Island, but the most sensational news and rumor of impending change has come from New England, where the New Haven road acquired a potential control of the Boston & Maine, but aroused such local hostility that it did not attempt to use it. The New England situation is now much confused, since the New Haven has the Boston & Maine to dispose of as a very important balance of power and is also in open revolt against the 50-cent per diem rate.

Space forbids a more extended review of the events of the year. The diagrams show the tendencies well; to go beyond these, except for the very high places in the curve of events, the reader must consult the detailed reviews of reports covering all the principal companies. These have been printed in the *Railroad Gazette* as fast as the reports appeared.

Dividend Changes and New Railroad Capital in 1907.

The first of the following tables sums up the principal changes in the rate of railroad dividends paid during the calendar year 1907 or declared during the year for payment in 1908. The month given opposite each new dividend is usually that in which the dividend was announced or declared. The present annual rate as shown in the table is based on the latest payment or declaration in the calendar year 1907. In some cases the rate was changed by a semi-annual dividend declared early in the year and since maintained. The column showing the former rate shows either the amount paid in the calendar year 1906 or the amount paid in the previous year in which the last dividend was paid.

The record of dividend changes shows out strikingly the contually impossible to raise new railroad capital, whether by issues of bonds, stock or notes; therefore, a slackening of traffic to within limits that can be handled by existing facilities has its compensations.

When the winter of 1907 was well under way, last February, North Dakota reported such extreme scarcity of fuel, and of fodder as well, that at one time the lights were extinguished in more than 100 villages, and farmers were killing their live stock. The temperature was 48 deg. below zero at McHenry, February 5, and the town had not seen a freight train since December 18. A 300-mile branch on the Minneapolis, St. Paul & Sault Ste. Marie was closed for six weeks by snow, and all through the northwestern country genuine hardship abounded, caused by the shortage in local stocks of food and fuel and the inability of the railroads to meet the needs, in the face of the most severe winter of a generation and general car shortage. When spring came the car shortage became even worse, and the track shortage, preventing free movement of loaded trains, was equally apparent, but financial conditions were such that no comprehensive plans for bettering the situation could be put in effect. In view of subsequent events, it is very fortunate that this was the case; if the October panic had followed an abundant money market, so that the railroads most hindered and crowded could have done extensive financing to meet their needs in the spring of 1907, the long drag of recovery would probably be much extended. As it is, the depression reveals very little unsoundness throughout the country in the way of overproduction, and this is particularly true of the railroads.

The car shortage occasioned a number of investigations by commissions and by individuals, but the only useful work to alleviate the situation was done by the car efficiency committee of the American Railway Association, which published Mr. Hale's bulletins, showing graphically where there was inefficiency in shopping cars and wasted money in borrowing cars when it would be cheaper to own them. Through the information thus collected and systematized, the committee was also able to help the situation informally with its suggestions, and its work has been and promises to be of such importance that it deserves well a place in the year's record.

The characteristic of the year in finance—the change of the stock period of 1906 to a note period, because of the demoralization of the bond market, and the terrific effect on stock values occasioned even by rumor that rights to subscribe to new issues were likely to be given—came early. The Erie, in April, had to discount short-term notes like commercial paper and pay around 11 per cent. for its money; the Deepwater and Tidewater Railways had to pay some 7 per cent. for a short-time loan which bore H. H. Rogers' personal indorsement. A great many companies needed money urgently in larger sums than could be procured from earnings; they had the choice of raising it with short-time notes at a fancy rate of interest or doing without it, and even this choice was not long open. By the summer time it may be said that no money was to be had at any price a railroad could pay and preserve its self-respect unless the circumstances were most exceptional, for the outburst of notes served to depress each other's values with astonishing rapidity; most of the underwritings failed miserably, and a number of prominent banking houses are still carrying the loads thus assumed rather than sell in the present market.

Concurrent with this extreme difficulty of providing the new capital so greatly needed to handle enormous traffic, the railroads were being made the target of hostile state legislation in a way never equaled in this country since the Granger agitation in the seventies, and then only felt by a comparatively small group of roads, and there was this difference between the 1907 legislation and the Granger legislation, that in the early seventies the roads deserved, if not all, they got, at least a good part of it. They had been to all intents and purposes lawless for a long period of years and took no pains to placate an enraged public sentiment, whereas during the last few years the railroads have had to be almost as much interested in public sentiment as in gross earnings, and have made extraordinary efforts to have their actions clearly understood, believing that if they were so understood they would not be the victims of unjust legislation.

Mr. Finley, in decrying the attitude of the people traversed by his road in regarding all failures of services as wilful, hit the keynote of the discontent. Mr. Hill in showing that facilities were all inadequate to the traffic they had to carry, and that there was not money enough or labor enough in the country to make conditions right all at once, showed clearly where the principal source of difficulty lay. Yet the craze for 2-cent passenger fares, which reached fruition in Ohio the year before, spread through Arkansas, Georgia, Illinois, Indiana, Michigan, Minnesota, Missouri, Nebraska, Oklahoma, Pennsylvania, Virginia, West Virginia and Wisconsin, while Kansas required 500-mile books to be sold at the 2-cent rate. Governor Hughes was the only governor in the country who had the courage and the honesty to say that he did not propose to sign a 2-cent bill until he was convinced that the people who drew up the bill knew what they were doing. The other states passed the bills on the Widener formula of voting first and discussing afterward.

Freight rates were reduced by legislation in 11 states during the year, and reciprocal demurrage was legislated in 10 states. Hours of labor were limited in 12 states, and 11 states established or renovated their railroad commissions. In the mass of hostile legislation which was enacted it is possible by close scrutiny to discern a few safety regulations of a wholesome nature and to see where certain wrongs have been adjusted or relieved. But the record of the year is not creditable to the outworkings of democracy when applied to details. At all events, it so fell out that all these legislative enactments coincided with a period of maximum expenses—the roads found themselves obliged to pay much more than ever before for the things they bought (excluding one or two commodities), while at the same time they were required to sell their transportation for less, the reductions being mainly arbitrary ones. It was pointed out on a certain prominent line in the south that the cost of its bridge timber had more than doubled in eight years, and that its labor cost had increased from an average of $1,622 a mile in 1905 to $2,875 at the close of 1906. And it was not possible to get anything like the normal efficiency out of the labor employed. As one railroad president expressed it: "The only way you can maintain discipline is by being able to fire a man who does not do his work, and when he knows he can go across the street and get another job just as good he does not care whether you fire him or not." Estimates of the reduced efficiency varied greatly, but the sum of the matter was that the railroads were paying much more than they used to for the services of men who did much less than they used to.

But a considerable part of the legislation affecting earnings did not apply to the earnings of the June 30 fiscal year; consequently, as may be seen from the graphic diagrams on another page, the general increases in gross earnings were too great to have their benefits entirely obliterated by the high costs and rapidly increasing taxes, and a number of roads paid increased dividends. The Atchison, having raised its annual rate in 1906 from 4 to 5 per cent., put it up to 6 per cent. in 1907; the Delaware & Hudson increased from 7 to 9 per cent.; the Vandalia from 4 to 5 per cent.; the Burlington from 7 to 8 per cent., and the Kansas City Southern put its preferred stock on a 4 per cent. basis. The increase of the Pennsylvania from 6 to 7 per cent. became effective in November, 1906, and was continued throughout 1907, and the New York Central raised its rate from 5 per cent. to 6 per cent. and increased simultaneously the dividends of some of its subsidiary lines. A number of other lines which were well in position either to pay dividends or to increase a low existing rate—notably the Rock Island—preferred to put their properties in shape for more efficient operation out of income, and thus strengthened their assets.

How certain of the dividend increases are going to work out in a year of lessened traffic is still problematical, but it may be said, in general, that if American roads paid their dividends after the British plan of dividing everything above operating cost, allowing only for strict maintenance, these increases could have been made long ago, and they were all based on an abundant safety margin, viewed from the standpoint of prosperous times.

The acute panic conditions beginning in October are a vitally important part of the year's record, but need not be discussed in this review, as full comment was made on them in the *Railroad Gazette* last week. The effect of the panic on railroad business in 1908 is interestingly discussed by 42 railroad officers, whose comments will be found in another column in this week's paper. Nearly all are agreed that traffic is going to be less, but the apparent reduction that can be effected in operating costs, and the greater efficiency that can be had when railroad managers really have a chance to use their splendid transportation machines scientifically, and when employees do what they are told to do—these items have also to be considered, though they cannot well be measured. Apart from all these things, the panic and the depression may be worth what they cost and more, if they change the rule of the demagogue and political agitator for that of the legislator who realizes that the country cannot be prosperous when its railroads and industrial corporations are prohibited from earning a return that will attract capital into them.

We built 5,212 miles of railroad this year, according to a thoroughly careful preliminary estimate; an amount not very far from the average yearly addition of the last eight years, and equal to an increase of some 2⅓ per cent. in the entire mileage of the country. We also built 284,188 freight cars, 5,457 passenger cars, and 7,362 locomotives. The equipment figures include the output of Canadian companies, but not that of railroad shops. If the new mileage cost an average of $30,000 per mile it cost $156,360,000. The equipment costs can be estimated with greater accuracy, and they probably amounted to $476,000,000—three times the cost of the mileage—though in justice we should, of course, include 977 miles more for Canada, to balance its equipment. We believe, however, that the average cost of the Canadian mileage was under $30,000, and that the entire equipment built, including the output of railroad shops, did cost something like three times as much as the entire mileage did. At all events, there has never before been such a golden year for the equipment companies. Full comment on the mileage built and on the equipment ordered was made in the *Railroad Gazette* last week.

To turn from general to specific events of the year, the inauguration of electric suburban service on the New York Central, the New York, New Haven & Hartford, and the West Jersey & Seashore (1906) is worthy of special notice owing to the new conditions presented. The enormous immigration has furnished another event of the highest importance, and in connection with it should be noted that steamers are carrying full steerage loads both ways at the present time, and there is such a demand for accommodations on outbound ships that freight has been refused in many cases to make room for the steerage passengers. This condition is rather unique and not altogether harmful from an economic standpoint. Its direct influence on the steamship business tends, of course, to make operating profits very great, since steerage traffic is far and away the most profitable of all the ocean business at the present day. The influx of immigration was very necessary to the extensive construction work throughout the country during the last five or six years, and now that a very much smaller number of people can find employment it is, on the whole, desirable that they should leave the country, at least temporarily.

The new state laws of the year have already been touched on. Governor Comer, of Alabama, and his injunction-proof harassments that were enjoined before the ink of his signature was dry upon them, furnish the comedy of the situation and perhaps the solution of it as well, through his *reductio ad absurdum* of the functions of an anti-corporation official. In national legislation, the 16-hour law, the reduced telegraphers' hours, and the extension of the principle of employers' liability, furnishes perhaps the most important individual records, although the great Standard Oil Company fine (not yet paid) showed what could be done under a statute which had never before been construed in so ferocious a manner. But there are signs that the amendment of the Sherman Anti-Trust law may not be distant, and that certain forms of agreements between rival carriers are likely to be legalized, in place of the ridiculous outworkings of our national doctrine of enforced competition as now construed. Just as the Sherman law has shown the lengths to which corporation legislation cannot profitably go, in a certain direction, it may well be that the crop of 1907 laws will point out some other legislative fallacies so clearly that we shall be delivered from them for another generation.

Review of 1907 Annual Reports.

The accompanying review is intended to supplement the general statement of the characteristics of the year printed in another column, and to show by means of graphic diagrams some of the tendencies which have been particularly noteworthy.

The diagrams themselves tell the story pretty well. The first one, with 1899 as a base, shows the respective percentages of increase, year by year, of gross earnings, operating expenses and net earnings of 17 railroads.* The roads selected serve quite well as examples of the entire railroad business of the country, and the aggregate sums from which the curves were constructed are so large that the effect of peculiar local conditions is to a great extent eliminated.

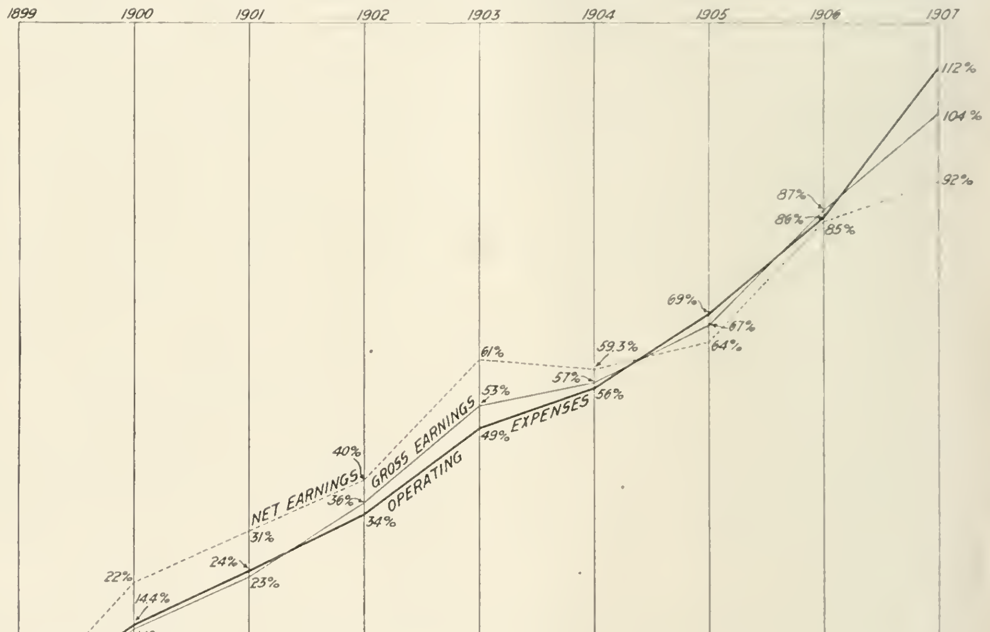

Fig. 1—Increases Per Cent. from 1899 Base. Seventeen Roads.

It will be seen that from 1899 to 1901 operating expenses increased slightly faster than gross earnings, but not very much faster. Then gross earnings received a great impetus and the expense account did not eat up the advantage thus gained until after the temporary depression in 1904. In 1905 operating expenses had increased 69 per cent. above the 1899 base and gross earnings had increased only 67 per cent. In 1906 gross earnings again increased faster than operating expenses but in 1907 operating expenses show

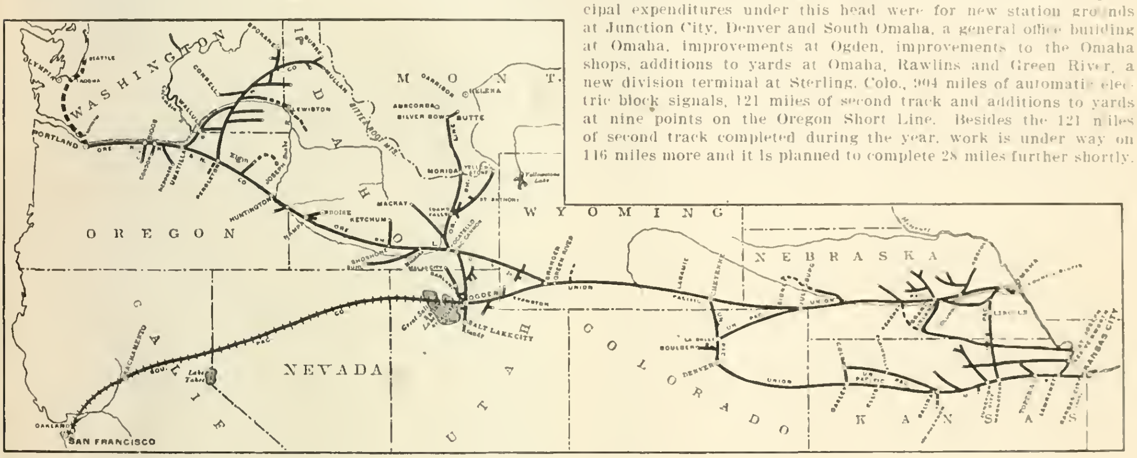
*These roads are as follows: Atchison, Topeka & Santa Fe; Baltimore & Ohio; Chesapeake & Ohio; Chicago, Burlington & Quincy; Chicago & North Western; Chicago, Milwaukee & St. Paul; Cleveland, Cincinnati, Chicago & St. Louis; Erie; Great Northern; Illinois Central; Louisville & Nashville; New York, New Haven & Hartford; Norfolk & Western; Northern Pacific; Philadelphia & Reading; Southern; Wabash.

increase of 7 per cent. in the locomotive mileage. Repairs and renewals of passenger cars cost $1,092 against $1,079 in 1906. There was an increase of 7 per cent. in the mileage of passenger cars. Repairs and renewals of freight cars cost $131 against $123 in 1906. There was an increase of 5 per cent. in the mileage run by cars in freight trains.

Conducting transportation costs increased $4,100,000, or 25 per cent. The increase of $1,171,000, or 29 per cent., in cost of locomotive fuel has already been mentioned. Locomotive service, not including fuel, increased 19 per cent., train service 17 per cent. and station and terminal service $16\frac{1}{2}$ per cent. As a result of the increase of the per diem from 25 cents to 50 cents a day, and of the serious detention of cars caused by traffic congestion during the year "mileage and switching payments" almost doubled. One small contributary to the increase in cost of conducting transportation was a decrease of 7 per cent. in the average train load. The congestion of traffic was responsible for this and the Union Pacific's experience in this particular was the same as that of most other roads during the great floods of traffic throughout most of the last fiscal year. Smaller trains were run in order to relieve the congestion and move the increased traffic as fast as possible. There was a very special reason which reduced the train load of the main line of the Union Pacific east of Cheyenne, Wyo. Instead of using Wyoming coal on this line eastern coal was used so as to send a greater amount of Wyoming coal to the territory west of Cheyenne, where there were serious shortages of fuel in many localities during the winter. As long as Wyoming coal was shipped eastward the fullest loading was secured on eastbound traffic because of the favorable grades. The change in direction of these shipments greatly reduced the traffic for eastbound cars and in consequence the average train load and car load. The loaded car load on the Union Pacific proper decreased 3 per cent., while on the Oregon Short Line and the Oregon Railroad & Navigation in each case it showed a slight increase. The train load on the Union Pacific proper was 456 tons against 494 tons in 1906; on the Oregon Short Line 530 tons against 558 tons in 1906, and on the Oregon Railroad & Navigation 477 tons against 502 tons in 1906. The average for all lines was 475 tons against 510 tons in the earlier year. The greater cost of moving the traffic can be summed up most briefly and concisely when approached from the locomotive mileage. Per locomotive mile, the cost in expense of moving and getting the traffic was 65.6 cents against 57.5 cents in 1906. General expenses increased 22 per cent.

There was a falling off in the freight density. In 1907 there were 1,185,367 tons of freight (including company freight) carried one mile per mile of road, against 1,203,174 tons in 1906. This was doubtless due in part to the increase of 241 miles, or 4 per cent., in average mileage operated. In 1905 the Union Pacific began a new policy of branch line development, whose effects were first noticeably shown last year. These lines, most in unoccupied sections of Oregon and Idaho, naturally had thin traffic compared to the heavy density of the Union Pacific's through main line. The rate received per ton of freight per mile is not given in the report but works out at 9.62 mills. This compares with 7.69 mills on the Great Northern last year. The Great Northern's figure is low because so large a proportion of its tonnage is grain. The Union Pacific's rate is high because it has so large a proportion of high grade tonnage.

During the year there were large improvements to the property. Besides the expenditures included in operating expenses, separate accounts are now kept for betterments and for additions, in order to distinguish between betterments upon the existing roadway, structures, equipment and facilities, and additions to the existing property which do not take the place of anything previously existing. The expenditures for betterments during the year amounted to nearly $2,000,000 and were principally for over two miles of steel bridges and trestles, replacing timber trestling and embankments and lighter steel structures on the Union Pacific proper, betterments to station buildings at six points on the Oregon Short Line and over one mile either of new steel bridges or of pile and timber trestles filled in on the Oregon Railroad & Navigation Company's lines, as well as a new brick car shop 492 ft. long by 342 ft. wide at Omaha. There was $561,000 spent on changes of line and revision of grades, of which four on the Union Pacific proper, one on the Oregon Short Line and five on the Oregon Railroad & Navigation were finished during the year or were still in progress at its close. Two of these, on the Union Pacific, reduced the maximum grade from 95 to 63 ft. per mile and by building 17 miles saved 14 miles in distance and 1,163 deg. of curvature. A line change on the Oregon Railroad & Navigation at Summit, Ore., open for business on May 15, 1907, reduced the maximum grade from 66 ft. to 11 ft. to the mile and another, 17 miles long, will save 1,455 deg. of curvature. The expenditures for additions amounted to over $6,000,000. Against this sum was credited $1,260,000 proceeds from land sales, making a net balance of $4,800,000 to be charged to capital account. The principal expenditures under this head were for new station grounds at Junction City, Denver and South Omaha, a general office building at Omaha, improvements at Ogden, improvements to the Omaha shops, additions to yards at Omaha, Rawlins and Green River, a new division terminal at Sterling, Colo., 904 miles of automatic electric block signals, 121 miles of second track and additions to yards at nine points on the Oregon Short Line. Besides the 121 miles of second track completed during the year, work is under way on 116 miles more and it is planned to complete 28 miles further shortly.



Union Pacific System.

The Southern Pacific connection from Ogden to San Francisco is shown.

All second track is laid with 90-lb. rail. When the mileage on which work is under way is finished, 267 miles of the 817 miles from Council Bluffs to Green River will be double-tracked. It is probable that the construction of second track will be steadily carried on until the whole line is so equipped, making the Union Pacific the first double-track through line west of the Missouri river. The new block signals form another notable improvement. On the Union Pacific automatic block signals have been put in on 803 miles of main track and 224 miles of second track, and their installation is progressing on 150 miles of main and 194 miles of second track. On the Oregon Short Line there are automatic signals on 45 miles of track, and they are being put in on 258 miles more. On the Oregon Railroad & Navigation automatic signals between Durkee and La Grande, 78 miles, and between Troutdale and Pendleton, 160 miles, are approaching completion. Already the Union Pacific is far and away the best protected railroad west of the Missouri river.

Of the lines under construction the most important are the Lane cut-off, from South Omaha west to Lane, 32 miles, a very expensive piece of work undertaken for the purpose of avoiding a loop on the present main line and a new cut-off from Onaga, Kan., northwest to Marysville, on the St. Joseph & Grand Island, which, in connection with a branch to be built by the St. Joseph & Grand Island from Hastings, Neb., west to Kearney, on the main line of the Union Pacific, with trackage rights over the St. Joseph & Grand Island, will shorten the distance for through trains between Kansas City, Mo., and Cheyenne, Wyo., by 98 miles and give a much more favorable line than over the old Kansas Pacific line via Denver. The branch from the main line up the North Platte river to Northport, Neb., 115 miles, is under way, and 54 miles have been finished. The Yellowstone Park Railroad is about finished to the boundary of Yellowstone Park near its northwest corner.

Dating from July 1, 1907, a new issue of $75,000,000 _-year convertible 4 per cent. bonds was sold. The balance sheet shows how important at that time was the need for larger working capital. Cash and demand loans stood at $8,570,000 on June 30, 1907, as against $55,968,000 one year earlier. At the same time there was a current liability of $69,000,000 in loans and bills payable by the Union Pacific, against no corresponding item whatever in the earlier year.

The cash funds which were on hand at the end of the fiscal year in 1906 were used to pay for the investments in stocks of various railroad companies whose purchase was made public in the testimony at the Interstate Commerce Commission investigation in the first week of 1907. "Stocks and bonds owned" stood on the balance sheet at $209,400,000 on June 30, 1907, against $96,800,000 a year earlier. This increase was due both to the investment purchases and to the funding of advances to the San Pedro, Los Angeles & Salt Lake in first mortgage 4 per cent. bonds and stock of that company.

Mr. Harriman treats of the investment operations of the company in considerable detail. Without attempting to follow the intricacies of these various operations, the situation may be summed up as follows: The original investment in Northern Securities stock cost $79,500,000, or, including Great Northern stock later acquired at par under subscription rights, $83,200,000. There have been sold at an average price of $304 for Great Northern, $209 for Northern Pacific, and $77 for Great Northern ore certificates, stocks of these various companies for which $117,900,000 was received. There is here shown a net profit in money of $34,700,000, plus the stocks of these companies on hand June 30, 1907, whose market value on the preceding day was $22,400,000, so that the total profit of these operations was over $50,000,000. There was invested during the last fiscal year $131,700,000 in stocks of various railroad companies not connected with the Union Pacific System, on which an income of 4.46 per cent. is being received, against an income of 2.79 per cent. which was being received on the Hill stocks at the average prices at which they were sold. Since the re-investments were made there has been a shrinkage in their market value as of June 29, 1907, of $23,100,000, but the shrinkage on the market value of the Hill stocks which had been sold on the same date would have been $55,500,000, so that not only was the income return to the Union Pacific largely increased by the reinvestments, but the loss through shrinkage of market values as of June 29, 1907, was $32,400,000 less than it otherwise would have been.

Mr. Harriman also shows a table based on the market prices on December 5, 1907, the date of the report, and also, incidentally, the day on which the stock market was higher than on any day for some weeks before or since, showing the market value of all investment stocks owned on that day as compared with their cost. The market value on that day was $228,400,000 and the cost $227,400,000, so that on this showing the market value was $1,000,000 more than the cost. If some day a week earlier or a week later had been chosen, the market value and the cost would probably have been about even. This calculation, however, takes no account of the $34,700,000 profits from the sale of the Hill stocks in excess of the cost of the same, which must be considered as a profit from the whole transaction. Looking at the whole series of operations together, there is no doubt that the Union Pacific has largely profited from its experiment in banking operations. It is equally evident that under certain market conditions it would have lost equally, and furthermore, that through these large purchases during the last fiscal year its working capital was seriously reduced, while its current obligations were tremendously increased. It must always be remembered, of course, that the original investment was made with the idea of safeguarding its territory, but the lesson of the whole striking series of transactions is plain that a railroad should not engage in speculative investment operations.

The following table, arranged according to our usual method, shows the income results for the last two years ended June 30:

	1907.	1906.
Mileage worked	5,645	5,404
Passenger earnings	$14,912,508	$13,236,055
Freight earnings	54,859,302	48,992,015
Gross earnings	75,651,105	66,879,142
Maint. way and structures	10,066,868	9,900,409*
Maint. of equipment	7,853,933	7,118,940†
Conducting transportation	20,276,530	16,203,783
Operating expenses	40,155,523	34,824,076
Net earnings	35,495,582	32,055,066
Other income	11,587,018‡	10,329,816
Net earnings and other income	47,082,600	42,384,882
Fixed charges and taxes	10,905,679	10,620,207
Net income	36,176,921	31,764,674
Dividends	23,530,036	19,552,424
Improvement appropriations	2,271,011§	4,504,556‖
Year's surplus	10,375,874	7,727,694

*This includes $1,691,610 charged as reserve for future maintenance, renewals, etc. No similar charge in 1907.

†This includes $515,000 charged as reserve for the future maintenance, renewals, etc. No similar charge in 1907.

‡Does not include dividends amounting to $2,015,963 declared since June 30, 1907, for account of the year ended on that date on stock of the Atchison, Topeka & Santa Fe; the Baltimore & Ohio, and the Illinois Central, but does include $1,125,000 paid July 1, 1907, and $1,350,000 paid Oct. 1, 1907, by the Southern Pacific. Similarly "Other Income" for the year ended June 30, 1906, includes $2,250,000 paid by the Southern Pacific on Oct. 1, 1906.

§Includes $312,009 reserved for depreciation of equipment.

‖ Includes $304,556 reserved for depreciation of equipment.

Railroad Officers on the 1908 Outlook.

The following compilation of answers to our circular letter of inquiry is published in the same form as in previous years. We have agreed in each case to protect the identity of the writer, and are therefore obliged to classify answers geographically, and, in some cases, to omit a line or two that would furnish a direct clue. We received 42 detailed answers to our inquiry, covering every part of this country, including Canada and Mexico. Of these letters, 16 are clearly and definitely optimistic, 14 indicate their belief that a more or less protracted period of mild depression is ahead; 12 anticipate severe depression. We will let them speak for themselves.

QUESTION 1.—HOW DOES THE GENERAL RAILROAD OUTLOOK FOR 1908 APPEAR TO YOU COMPARED WITH THE OUTLOOK A YEAR AGO AT THIS TIME? IS BUSINESS GOING TO REMAIN GOOD IN YOUR TERRITORY, OR DO YOU ANTICIPATE A MILD OR A SEVERE PERIOD OF DEPRESSION?

Central West and Trunk Lines.

The general railroad outlook for 1908 does not look favorable to me compared with the outlook a year ago at this time. With quite a number of our steel plants already closed down and with the prospects at the present time of more closing down in the near future, it hardly seems reasonable to expect that the business will remain as good in this territory as it has been during the past few years. Under ordinary circumstances, business suffers more or less depression during the Presidential year, and my notion is that there will be a severe period of depression in 1908, because of the continued agitation against corporate interests that has been manifested by the present administration.

There is such a general lack of confidence among the people of the United States, and I might say abroad, because of the legislative enactments, both national and state, against railroad properties and other corporate interests, and with the fear of more such legislation, which has been planned, that it is impracticable for railroads or other corporate interests to get the use of money for further development of their properties, many of which have been spending money freely during the past few years, with the expectation of continued prosperity, so that to-day many of these properties have assumed fixed charges which they would not have undertaken in the face of a depression which now seems inevitable, but which they would have had no difficulty whatever in carrying if the prosperity of the country had been permitted to continue.

As an offset to this disadvantage might be cited the high value of the grain crop of the country. While not so large in volume as in 1906, yet the market value in dollars and cents exceeds that of any other year in the history of the country, but the same difficulty is met with in marketing the crops as in various railroad improvements—the absolute inability to secure from banks the money with which to move the crops. —*Vice President.*

The outlook is not nearly so good as it was a year ago at this time. There is a much less volume of business offering, and, in my opinion, there will be a very considerable decrease in the gross earnings for several months —*President.*

The railroad outlook does not appear to be any better than a year ago, and I fear a further falling off in business.

—*President.*

The general outlook for 1908 compared with the previous year is bad. Business will not remain good in this territory. The shrinkage will be quite large, I think. I anticipate a severe period of depression. —*President.*

In my opinion, there will be a more or less marked period of depression during the entire calendar year for reasons so obvious as to require no portrayal. —*President.*

Railroad outlook for 1908 in this territory indicates a gradual recession in manufacturing, but gradual resumption in grain movements as the financial situation improves.

—*General Manager.*

The railroad outlook for 1908 is not as good as it was a year ago at this time. I anticipate a period of mild depression.

—*President.*

We anticipate a decrease in volume of traffic, but more economy in handling same with a possible slight reduction in cost of labor, material and supplies, which should show better comparative net results. —*Vice-President.*

In regard to the general railroad outlook for 1908, would say, we believe there will be considerable curtailment along both of our lines, which will cover a period of two years, although it will not begin to show much falling off prior to the end of the fiscal year June 30, 1908. We note that lumber operations along our lines will be curtailed by probably 50 per cent., beginning with this year.

—*President.*

The business on our lines has been somewhat reduced, but in this respect we do not differ from any of our neighbors, so far as I am aware. I am inclined to believe that we have reached the limit of the downward tendency in this direction, and while I do trasts of the year 1907. In the early part of the year there were dividend increases. After the stock market panic in March a few dividends were reduced or paid in some other form than in cash. Toward the end of the year there were some decreased payments. At the same time there were extra dividends on two of the western subsidiaries of the New York Central in order to provide funds for payment of the full dividend on stock of the parent company. Of the roads which paid their dividends in something else than money, the Erie paid in 4 per cent. interest bearing scrip, the Atlantic Coast Line in 4 per cent. certificates of indebtedness and the Missouri Pacific in stock. In this connection the recent action of the Western Union in declaring its regular dividend payable in stock may be mentioned. One class of the dividend increases marked the beginning of payments by roads on stocks which had never before received any return. Such cases were the dividends on the preferred stock of the Kansas City Southern and the Toledo, St. Louis & Western and the dividend on the second preferred stock of the Colorado & Southern.

The second table includes the more important new authorizations, issues, sales or listings of railroad stocks, notes and bonds during the year. An arbitrary minimum of $500,000 has been used in making up the list. A similar list published in the *Railroad Gazette* a year ago, with a $1,000,000 minimum, showed a total authorization of new securities amounting to about $2,600,000,000. The total this year is much smaller; it amounts to only about $1,800,000,000. There have, however, been a great number of issues of securities during the year. The dates shown in the table are, in the case of bonds or notes, usually the day on which they are dated and in the case of other issues, the date or month of issue. New authorizations, no part of which was issued, have the date of authorization. The column showing the amount of refunding covered is necessarily not exactly accurate, but shows in general the proportion of the new authorizations or issues which takes the place of securities previously outstanding. Similarly the amount issued or sold is not always announced by the companies, so that this showing cannot be entirely accurate. This is particularly true of security issues of a controlled or leased company held by the parent corporation.

The striking feature of the year's financing has been the great output of short term notes, which amount, including extensions of bonds, to over $375,000,000. The expansion of the New York, New Haven & Hartford is also clearly reflected in the table. The railroad financing of the year 1906 was done largely by stocks, the proportion of mortgage bonds being very small. The typical development of the year 1907 was the fact that neither stock nor bonds could be sold, and that the railroads had to turn to note issues to finance their absolutely necessary requirements, paying for these funds higher rates than had obtained for many years. Judging by the precedents of the Union Pacific in the case of first mortgage bond issues covering two of its new lines under construction, both of which are to be an important part of its through line, and of the New Haven in making its recent large convertible debenture issue, well secured railroad bonds bearing 6 per cent. interest will for some time be common.

[4]Extension of old notes.
[5]Deposited as security for $5,000,000 notes dated July 1.
[6]Owned by United States Steel Corporation.
[7]Extended for one year from July 1, 1907.
[9]Under subscription; $34,616,212 paid up on June 30, 1907.
†About.

[11]Extension of first mortgage 5 per cent. bonds due January 1, 1908.
[12]Notes of the Cherokee Construction Company; new notes of the construction company also given in exchange to the extent of 30 per cent. old notes.
[13]Extension of notes due October 1, 1907.
[14]Guaranteed by the Southern and the St. Louis & San Francisco.

[15]Exchanged for Consolidated Railway stock.
*Exchanged for Boston & Maine stock.
**Held to be exchanged for 6 per cent. convertible bonds.
††Successor of the Mobile, Jackson & Kansas City and the Gulf & Chicago.
[16]Stockholders also voted to issue common and preferred stock and an equipment trust.
[17]Refunded 4½ per cent. notes due November 1.
[18]In exchange for Cumberland Valley common, first and second preferred, at rate of 3 to 1.
[19]In exchange for Philadelphia & Erie stock.
[20]Notes maturing November 1.
[21]In exchange for Bald Eagle Valley stock.
[22]Successor of the P., N. J. & N. Y. and the P., N. Y. & L. I.
[23]Owned by the Pennsylvania Company.
[24]Reorganized company.
[25]Receivers' certificates.
[26]Guaranteed by C. R. I. & P. and the St. L. & S. F.
[27]To comply with Missouri law governing relative proportion of authorized bonds and stock.
[28]Extension of similar bonds due March 1, 1907.
[29]Paid for Chicago & Alton stock.
[30]Guaranteed by the Colorado & Southern and the Chicago, Rock Island & Pacific.
[31]For exchange for new convertible bonds.
[32]Issued by the Tidewater Construction Company, secured on $20,000,000 Tidewater Railway bonds and $10,000,000 stock exchange collateral.
[34]Sold in 1905 to a syndicate. Listed June, 1907.
[35]Collateral for notes.

Union Pacific.

As usual, the Union Pacific report is one of the most striking and important of the railroad statements of the year. This is especially so this year because President Harriman describes at length the financial operations of the company, particularly the investment operations of the past year. The part of the report signed by him covers 20 pages as against 13 pages a year ago. The whole is a story of growth, progress and wealth so remarkable that it cannot be easily understood or realized.

The year ended June 30, 1907, was the tenth since the reorganization of the company. The changes which have come about in the ten years are little short of marvelous. With only about 300 miles more operated than in 1898, gross receipts from all sources have increased from $33,000,000 to $87,000,000, or nearly 164 per cent. Surplus after fixed charges has increased from $9,000,000 to $36,000,000, a gain of 300 per cent. Dividend payments have risen from $1,800,000 to $23,500,000, an increase of 1,205 per cent., while the surplus after dividends is nearly double. One of the most striking features in the development is the decrease in fixed charges. During each of the last three years, which have been the three years of the most remarkable gains in traffic during the decade, the fixed charges decreased, so that instead of being $12,100,000 as in 1901, they amounted to only $8,700,000 last year. Compared with 1898, fixed charges have not quite doubled.

It is no secret how these remarkable results were accomplished. The present management has always devoted great energy to the improvement of the property. If little new mileage has been added, the efficiency of the old lines has been so increased that the result in capacity for handling traffic amounts to the creation of about 7,500 new miles of railroad. The expenditures for changes in line, for grade reductions, for second track, for larger and better shops, terminals, etc., for new lines, and for other betterments and additions have amounted to over $130,000,000, of which $33,500,000 were for grade reductions, second tracks, shops, terminals, etc.; $32,700,000 for new lines, including ownership in the San Pedro, Los Angeles & Salt Lake; $26,100,000 for new equipment; $11,800,000 for changes in line, and $26,200,000 for new lines in course of construction and terminal properties. All of these expenditures (except possibly part of the last item) were made previously to July 1, 1907.

The past year's record has been a very satisfactory one. Gross railroad earnings rose from $66,879,112 in 1906 to $75,651,105 in 1907, an increase of $8,771,963, or 13 per cent. The 1906 earnings were $8,122,216 larger than in 1905, so that the large increase of that year was continued at the same rate in 1907. More satisfactory still, in a year when operating expenses were greatly on the increase, net earnings rose just as fast as in the year 1906. The 1907 net earnings were $35,165,837, or $10\frac{3}{4}$ per cent. larger than in the year before, while in 1906 net earnings were $32,020,372, or $10\frac{1}{2}$ per cent. larger than in 1905. This was accomplished, to be sure, by a reduction of the proportion of operating expenses which were for maintenance, compared with the part used in operation, the latter heading including both conducting transportation and general expenses, but, as examination of the unit maintenance charges later will show, the Union Pacific's expenditures for keeping up its property are still exceedingly liberal. The decrease of $77,000 in fixed charges was canceled by an increase of nearly $300,000 in tax payments, so that net income from transportation operations was $3,155,000 larger than in the previous year. From this net income from transportation operations, amounting to $21,600,000, $15,700,000 was paid out in dividends, or 4 per cent. on the preferred stock and 6 per cent. on the common stock of the Union Pacific, as well as 4 per cent. on the trifling amount of preferred stock of the Oregon Railroad & Navigation Company still remaining in the hands of the public. The surplus from transportation operations after payment of the dividends which are charged to the railroad, as distinguished from the banking side of the Union Pacific, was $8,900,000, an increase of $3,100,000 over 1906.

The remaining 4 per cent. of the 10 per cent. paid on Union Pacific common stock is charged against income other than from transportation operations. The most important source is investments, from which the Union Pacific received $11,563,105 last year. The Southern Pacific contributed $5,985,000, or nearly half of this large total, and the properties listed below contributed the following amounts.

Baltimore & Ohio	$1,111,151
Great Northern	770,718
New York Central	770,113
Illinois Central	661,869
Northern Pacific	625,196
Chicago & Alton	415,774
The Pacific Express Company	381,000
Atchison, Topeka & Santa Fe	240,000
Chicago, Milwaukee & St. Paul	231,150
Chicago & North-Western	202,415

Dividends declared since June 30, 1907, for the year ended on that date, by the Atchison, the Baltimore & Ohio, and the Illinois Central, amounting to $2,015,963, are not included in this total, but there is included $1,125,000 paid July 1, 1907, and $1,350,000 paid October 1, 1907, by the Southern Pacific. The total income from stocks, $11,563,105, compares with $7,237,917 received in the same way in 1906. The item, "Balance of rentals from steamships and property and other income," under this head is less than half as much as in 1906, principally because of disasters in the summer of 1906 to both of the ocean steamships owned by the Union Pacific and rented to the Pacific Mail Steamship Company. The "Manchuria" went aground on the Hawaiian Islands and was so damaged that she was unable to resume service until August 8, 1907. The "Mongolia" went aground on Midway Island, but was temporarily repaired and continued in service. On completion of repairs to the "Manchuria" the "Mongolia" was put in dry-dock for permanent repairs, and resumed service again Nov. 12, 1907. Under the terms of the marine insurance, only a small part of the cost of repairs will be borne by the owners. The loss in earning power, however, is a final one. The total income other than from transportation operations was $12,000,000, but there was deducted from this nearly $500,000 for interest, so that the net income from these sources amounted to $11,600,000. Out of this there was paid $7,800,000, being 4 per cent. on the outstanding Union Pacific common stock, leaving a surplus after dividends from investments of $3,800,000, against $6,400,000 in 1906. This decrease was due to the fact that only one semi-annual dividend of 2 per cent. was paid in the previous year.

Adding $8,900,000, the surplus after railroad dividends, and $3,800,000, the surplus after investment dividends, the total surplus after dividends from both transportation operations and other operations, is found to be $12,646,885, which is about the same figure as in the previous year. From this, about $2,000,000 was appropriated for betterments, against $2,700,000 for betterments and $500,000 for betterments and additions of branch lines, and $1,000,000 for new equipment appropriated in 1906. There was, therefore, less than half as much appropriated for this purpose last year as in 1906. If the same amounts had been spent in these ways the year's surplus from all operations would have been the same as in the earlier year. As it was, the year's surplus was $2,700,000 larger than in 1906.

There were important increases in every department of earnings. Passenger earnings increased 13 per cent., mail and express earnings 27 per cent., and freight earnings 12 per cent., while the number of revenue passengers carried one mile and the ton mileage of revenue freight was 7 per cent. larger. No total of commodities carried is included in the report so that it is not possible to trace the growth and fluctuations of the different classes of traffic, but it is fair to assume that the increased earnings came from larger tonnage of almost every important commodity. As the most direct line between the Missouri river and San Francisco, the Union Pacific secures a great amount of high grade traffic, the movement of which was undoubtedly exceptionally heavy during most of the year.

As against the increase of 13 per cent. in gross earnings, operating expenses as shown increased 15 per cent. The increase in the normal cost of operation was, however, really nearly 23 per cent., for the 1906 expenses were charged with over $2,200,000 which was credited to a reserve fund for future maintenance and renewals "for which there was no necessity this year." There were a large number of unfavorable causes which account for this increase of nearly one-fourth in the normal cost of operation. Most of the wage schedules were higher and the greater part of these increases went in effect in the fall of 1906. Material cost more, particularly fuel, whose cost increased from $4,000,000 to $5,200,000 in 1907, an increase of 30 per cent. The movement of traffic was exceptionally heavy during a large part of the year so that it exceeded the limit of economical handling. During the summer of 1906 operations were embarrassed by the accumulation of cars and of traffic following the San Francisco fire. Later there occurred in the Pacific coast states unusually heavy rains, followed by disastrous floods, heavy snowstorms and extremely cold weather. Many miles of track and a number of bridges were washed away, the movement of traffic was seriously interrupted for over four months and as a result there was a traffic congestion over a large part of the system.

There were 129 less miles of new rails laid than in 1906 and 60,000 fewer cross ties, equal to 31 miles of continuous track; 52 miles less of tie plates and 195 less of continuous rail joints put in track. On the other hand 8 per cent. of the mileage of first and second track was on June 30, 1907, laid with 90-lb. rail, against 4 per cent. a year earlier. Maintenance of way cost $1,782 per mile, against $1,832 in 1906, including the reserve for future maintenance, etc. Not including this, the 1906 figure for straight maintenance per mile of road was $1,519.

Maintenance of equipment expenses increased $1,250,000, or 18 per cent. over the straight maintenance of equipment expense of the previous year. The 1906 maintenance of equipment account, however, was charged with $515,000 as a reserve for future maintenance, renewals, etc., so that the 1907 total was an increase of 11 per cent. over the total shown in 1906. Repairs and renewals of locomotives cost $2,933 against $3,068 in 1906. There was an not expect any rapid recovery, I believe the business of the country will slowly improve from now on. We have been for some time past engaged in adjusting our expenses to meet the changed conditions of business, and have been reducing our forces and hours of labor to correspond as nearly as may be to the reduced amount of business done. We have practically finished all of the work which we had under way, and it is not likely that we will engage in any further construction or purchase any new equipment until business conditions generally improve. As we have practically sufficient facilities for handling the business we are now doing very comfortably.

The fact that the wage schedules are, as a rule, a subject of contract with our employees does not permit a general reduction along that line until the expiration of the present agreements. There will probably be some shrinkage in gross earnings during the coming year, and in view of the wage agreements referred to, it is not likely that the operating expenses can be reduced in the same proportion as the gross earnings are likely to decline.

On the other hand, the business that is done will probably be done with greater ease, with less straining of facilities and little congestion, and consequently with less expense, as such conditions as have prevailed for the last two or three years always make rail road operations unduly expensive. —*President.*

East.

The general railroad outlook for 1908 appears to be quite unsatisfactory as compared with the indications a year ago at this time. The present financial stringency has spread itself over the whole country and is not, as many people suppose, simply a Wall street panic. The first effect of this stringency is a reduction in the output of nearly all the large manufacturing industries in this section, and there is consequently a proportionate decrease in the traffic offered for transportation by the railroads. It may therefore be expected that, for a time at least, railroad earnings will show considerable decreases as compared with last year.

—*President.*

In our territory we anticipate a mild period of depression.
—*Vice-President.*

The outlook for 1908, in general, is very gloomy, but is not seriously bad in our territory. This railroad depends upon the increase in population, and as this is the natural channel for the overflow from New York City, we expect our business for 1908 will be better than for 1907. —*President*

We anticipate the general business will be the same as during 1907. —*General Manager.*

My road serves a territory of large resources in timber, water powers, storage basins and soil. The kinds of timber peculiar to the section have been pretty heavily broken into elsewhere until, probably, no other such area of them exists in the country, so near to the Atlantic seaboard. Most of the log floating streams, rivers and lakes, with which northern Maine abounds, are used to float lumber tonnage to the railroad.

The soil of populated A. county is of a character which produces an exceptionally fine quality of potatoes. Not alone is their reputation high for table use, but they are understood to be [illegible]r than any others obtainable for seed, especially in the southern [illegible]s, the West Indies, Bermuda, etc. Since 1870, when about 40,000 [illegible]shels were shipped out of the country, the acreage has been steadily increased until, from the crop of 1906, the company has moved something over 13,000,000 bushels. Probably over 16,000,000 bushels were moved by all routes, and several million bushels used in starch manufacture.

The acreage in 1907 was larger than in 1906. An unprecedentedly cold and wet year and heavy October frosts prevented a successful outcome. The quantity of potatoes to be shipped is variously estimated at 50 to 75 per cent. only of the quantity from crop of 1906. The large shipments will be delayed until seed demand comes on because prices are expected to favor. The large shipments from crop of 1906 were from the field. Our September to November, inclusive, earnings have been seriously affected by the conditions as stated.

Not much can be done toward moving forest products to the railroad, after the time for rivers and streams to be closed with ice, until they are frozen solidly enough for teams, and until also there is depth of snow enough for woods roads. Last year extreme cold and plenty of snow came early, not far from the middle of November. At this writing heavy ice has not made. There is no snow.

The company's prospects cannot fairly be considered along with those of railroads in general. The resources, and the request for all that can be supplied from them, would appear to insure the same steady gains in traffic offerings, by years, now and in the future, as in the past. It is a question whether seasons of depression do not encourage extra exertion with the hoe and the axe in a territory where the population understands the use of both, and where opportunity to profitably use them is at its door. —*President.*

South.

I anticipate severe depression until after the Presidential election. —*President.*

All improvements absolutely stopped; confidence shattered by national and state legislation; tonnage growing lighter every week Look for hard times in 1908 —*President.*

The general railroad outlook at the moment is very bad our earnings held up fairly well until 10 days ago, but during the last 10 days have fallen off to an alarming extent The car movement shows a decrease in pay loads the last week in November of something over five thousand. Unless this crisis proves an exception to former ones through which I have passed, we have entered upon a long period of depression —*President.*

In this section the outlook for 1908 is very discouraging. The adverse legislation in some of the southern states, and the great drop in the price of pig iron and the closing of a number of iron furnaces has depleted the railroad tonnage to a very large extent The money matters are being handled in an excellent manner. Pig iron is a great barometer in this country and the products of the forest sympathize with the prices of iron. I do not look for better times here for a year —*General Manager*

I do not believe that we have yet passed through the full period of depression, which seems to be the inevitable result of general antagonistic legislation against railroad property.

—*General Manager.*

I anticipate a mild period of depression
—*General Manager.*

Twenty per cent below normal. —*General Manager*

Mild state of depression for some months.
—*Chairman of Board*

The outlook for 1908 is not materially worse than a year ago for the conditions at that time were not encouraging owing to the fact that the previous boom in the lumber business upon which we largely depend for our earnings, collapsed prior to January 1, 1907. —*General Manager*

I consider business will remain good in this territory
—*General Manager.*

The territory of our lines is peculiar, much of the area being water The products are of food, agriculture and the forest The first two classes being in unlimited demand are nearly stable, the third, together with other industrial and commercial articles, fluctuates.

Subject to the next crop conditions, there is no present reason why the regular annual increase of food and agricultural shipments should not continue in 1908. There may be some decrease of manufacturing output, but altogether we expect increase of gross earnings per mile of road, resulting in some measure, from our new lines and a more compact system

Our earnings for 1907 were increased by the Jamestown Exposition, and it is difficult to say to what extent, if at all they were affected by rate legislation. In Virginia, the Railroad Commission did not apply to us the rulings imposed on other companies because of our physical situation. In North Carolina much of our mileage was exempted from the reduced passenger rate because of existing or recent construction. We do not expect further hostile legislation. The local popular feeling in our territory is not now and never has been generally antagonistic; our relations with the public have been reciprocal, fostered possibly, by the feeling of security by the public in the abundance of competition by water and other lines. —*Vice-President*

Southwest

The general railroad outlook is bad compared with the outlook a year ago; business is not going to remain as good in our territory, and I anticipate a period of depression, perhaps not severe
—*Vice-President.*

The general railroad outlook for 1908 is not at all favorable. Business in the territory served by our rails will undoubtedly show a severe period of depreciation Just at present our traffic has fallen off very materially, and with the present financial stringency I look for a greater falling off We are moving some lumber and other forest products, but very little cotton.

—*Vice-President.*

We do not think that the railroad outlook for 1908 compares at all favorably with the outlook a year ago. From the standpoint of to-day, we look for a material decrease in business in 1908 as compared with 1907, although we do not think the depression will be so severely felt in our territory—Texas and Louisiana—as in mining and manufacturing districts of the North and East, our line depending more largely upon agricultural results. Our lines are located in a growing and developing territory. Increased acreage will be brought into cultivation, and if we are favored with good crops, especially with a good cotton crop, our earnings may not be materially affected. —*Vice-President.*

The railroad outlook at present in this section seems to be about 50 per cent of what it was last year. We are anticipating a mild period of depression. —President.

I do not anticipate general business will be as good for 1908 as for the past year. In the southwestern states, Oklahoma and Texas especially, we expect a moderate depression.
—Vice-President.

West.

The general railroad outlook for the year 1908 compared with the outlook a year ago is distinctly depressing, business will not be good and I anticipate a severe period of depression. After the crops of next season there will be the usual amount of transportation of food products as well as supplies for the use of those who produce them, but no new enterprises of any kind are likely to be started during the year 1908, or at least until the Presidential question is settled, and I shall be happy if our gross receipts for the calendar year 1908 do not decrease by 20 per cent.
—President.

I do not think the railroad outlook is as favorable as it was a year ago at this time. The crops are good, the farmers are prosperous, so that there cannot be what may be termed "hard times," but I think there will unquestionably be a serious reduction in volume of freight carried by the railroads, as the general cessation of construction work and curtailment of orders for equipment, made necessary by the damage done to their credit by political agitation, has already forced them—and will continue to force them—to adopt vigorous policies of retrenchment. We must not forget that the material required for construction of motive power, rolling stock and new lines was a very potent factor in the general tonnage movement of the early part of the year 1907. —Vice-President.

The general railroad outlook for the coming year is not as good as it was a year ago. Farmers in our territory have harvested fair crops the past season which, in connection with the high prices obtained therefor, barring the present period of financial uncertainty, will result in a fair local business. We do not anticipate a severe period of depression, although the present financial situation and the uncertainty always attending a Presidential election year will put a stop to a large extent to enterprises which, under normal conditions, would bring a considerable tonnage to our line.
—President.

Pacific.

General outlook for business for 1908 at the present time is not very favorable. Believe present depression and tightness in money market is going to result in quite a decrease in our business.
—General Manager.

We do not look for any serious reduction of business on our lines. —Vice-President.

The general railroad outlook for 1908 as compared with a year ago is bright so far as the general conditions and crops are concerned. I anticipate, however, a mild depression due entirely to the money stringency, which I do not think will extend very far into 1908. —Vice-President.

Canada.

While the crops this year have not been as large as the years immediately preceding, they are still above the average, and the demand from foreign countries and high prices existing will net the farmers quite as much money as their larger output of preceding years, although there will not be as much grain for the railroads to haul. While, therefore, there will be some decrease in earnings in this direction and some general falling off as the result of the financial situation, I look for a fair business for the year 1908.
—Vice-President.

The traffic in 1908 will be just about the same as it was last year. —General Manager.

Mexico.

General railroading outlook good for 1908.
—Superintendent.

Outlook for 1908 same as for 1907. No changes to report.
—General Manager.

QUESTION 2.—RETRENCHMENT. ARE YOU PLANNING TO RETRENCH EXTENSIVELY, OR ARE YOU ALREADY DOING SO? IF SO, HAVE YOU BEEN ABLE TO REDUCE ANY WAGE SCALES RECENTLY ADVANCED, OR DOES THE RETRENCHMENT LIE IN SHORTENING FORCES, IN STOPPING NEW CONSTRUCTION WORK AND IN REDUCING EQUIPMENT ORDERS?

Central West and Trunk Lines.

We have reduced our expenses to the minimum in all departments, but owing to the fact that our wages are pretty generally controlled through agreements with labor organizations, we have been unable to return to the old scale of wages. We have reduced the number of working hours at our shops, have stopped all new construction work, and have placed no orders for equipment for next year. —Vice-President.

We are reducing the force wherever possible. Have not been able to make any reduction in wages. —President.

We are retrenching in every direction. We do not expect to be able to reduce wages at the present time, but have reduced the working hours of the men and have made material reductions in the number of men employed. Our new construction work has practically all been stopped, and we have no equipment orders on the market. —President.

We are already doing as much as we can in the way of retrenchment. We have not been able to reduce any wages.
—President.

With the first of the year we shall retrench in every possible direction. Some reductions have been made in certain classes of employees, but no general reduction in the wage scale has been attempted, the retrenchment consisting principally of reducing forces, stopping new work and a general lessening of the stroke in construction. —President.

We have already commenced radical retrenchment, consisting of reducing forces and stopping new work. We have made no attempt to reduce wages, increase in which has more than equalled our increase in earnings for the past six months, and with falling off of earnings to less than a year ago this very appreciably affects our net earnings. —General Manager.

We are already making such retrenchment as possible. We have not reduced any wage scale as yet, our retrenchment lies in shortening hours of labor and in reducing forces, stopping new construction work and in reducing equipment orders.
—President.

No attempt at general retrenchment but an especial effort towards more economical service in all departments. We are taking advantage of the labor supply to increase construction forces on the 210 miles we have under contract with the hope of completing same during 1908. —Vice-President.

We have already stopped all new construction work and are curtailing very materially on what we have under way, and are placing no orders for equipment for the coming season. Our wage scale has not been reduced since advanced in November, 1906.
—President.

East.

The roadway is in good condition throughout. It is usual at this season to reduce track, masonry, fence, etc., forces. We are now able to reduce, and are reducing them more than ever. Considerable passenger train mileage is to be canceled, and some minor stations will be temporarily closed. Upon conferences with leading patrons, to be affected, they have approved. We will have no incomplete construction 10 days hence. Wage scale has not been reduced. —President.

We, in common with other railroads, are endeavoring to retrench so as to bring operating expenses into a right relation with operating income, but up to the present time we have not attempted to consider the rearrangement of wage schedules. Thus far our efforts are being directed to a reduction in train service corresponding with reductions in income, and in discontinuing all kinds of construction work, including equipment orders, that can be postponed. —President.

We are retrenching and expect to further retrench in shortening hours of work, and in abandoning new construction work. At this time we do not see our way clear to reduce wage scales recently advanced. —Vice-President.

The general situation has made it necessary for us to retrench in all improvement work. We do not believe it will be necessary to reduce wage schedules recently advanced, but we are retrenching in every direction possible. —President.

We are not planning to retrench extensively, neither have we already done so. —General Manager.

South.

We have not been able to reduce wage schedules yet on account of the strength of the unions, but believe that the next three months will see a change in this. —President.

Retrenching in all ways possible. —President.

We have endeavored to retrench in every way possible for many months past. We have not reduced wages, but have reduced force; however, it seems to me that a reduction in wages is inevitable unless business largely improves very soon. We are endeavoring to keep our roadway and equipment in good order, but have suspended all work that can be dispensed with. We do not anticipate purchasing any new equipment during the present fiscal year.
—President.

Owing to the falling off in tonnage we are already retrenching, taking off trains and reducing the number of men in the shops and on the track. We tried retrenching by reducing hours to keep as many men as possible and give them some kind of a living.
—General Manager.

We are retrenching extensively. All new construction has been stopped, and no new equipment is likely to be ordered in the near future. —General Manager.

We are going ahead, but with not quite as much vigor as formerly. It has been found possible to reduce track labor from $1.50 to $1.25 per day. —*General Manager.*

We are retrenching by stopping new work and by shortening forces, but have not reduced any wage scale. —*General Manager.*

All works of improvement not imperatively necessary have been suspended. Orders for supplies, etc., have been curtailed. There has been no reduction in wages. —*Chairman of Board.*

We found it advisable to make retrenchment in expenses before the end of the last fiscal year, and have made still further retrenchment since the recent financial troubles, but it has not yet been practicable to make any material reduction in wages. We are not doing any construction work, nor have we made any additions to our equipment since June last. —*General Manager.*

Not retrenching. Are reinforcing the old lines and preparing to construct the new lines. —*General Manager.*

Some construction work is suspended, and operating expenditures will be governed by considerations of safety and prudent economy. The property has been well kept up, and could very well live on its own fat for a considerable period, but it is not intended to deprive it of adequate repair. Beyond retrenchment in reducing forces and purchases, there is no road open to us toward lower operating cost. Wage scales have not been cut, and they are about 5 per cent. higher now than a year ago. —*Vice-President.*

Southwest.

We are planning to retrench wherever possible. Have not been able to reduce any wage schedules. We are following a general plan for revision of alignment and grades with permanent construction and relaying heavy steel from Texico to Woodward, Oklahoma, in my territory, but have cut out some extensive improvements, such as the completion of lap sidings, with an interlocking tower at the lap, and have stopped the construction of all new lines. We had no intention of buying new equipment; however, the Texas Railroad Commission has issued orders for the heavy purchases of cars and engines. —*Vice-President.*

We have already made extensive retrenchments. Wage scales remain about the same. We have no new construction work or equipment orders outstanding. —*President.*

We are gradually retrenching as far as we can consistently without crippling our service. We have no new construction to speak of under way, and are not arranging for any new construction for the coming year, as we have recently largely increased our equipment, and will not place orders for any new equipment for 1908. We have made no reduction in wage scales recently advanced, but we believe that it will be necessary for all lines and industries in our territory to make material reductions in the near future. —*Vice-President.*

We are retrenching where possible, but have been unable to reduce wage schedules. Have laid off surplus force where practicable, and have stopped all new construction work, and are withholding orders for additional equipment. At this writing we have a surplus of equipment on our rails, and are turning back to connecting lines a considerable number of empty cars. —*Vice-President.*

We have already begun to retrench in our expenses, by stopping improvements and reducing forces in the shops. —*Vice-President.*

West.

We have pursued the customary policy of retrenchment to meet existing conditions as far as possible. We have not as yet reduced any wage scales recently advanced, but decrease in business has enabled us to reduce train mileage and make considerable saving in other directions. Our plans for construction work next year were not very extensive, and, based on the present outlook, they will be to a considerable extent carried out. We added quite largely to our equipment, both cars and power, during the past year, and it may not be necessary to make further additions to take care of the business of 1908. —*President.*

Our lines are retrenching and are deferring all construction work and improvements of every description that can be deferred without injury to the property. There has been some fall in the scale of wages of laborers, but in no other classes, and retrenchment simply lies in shortening hours and in reducing forces. —*Vice-President.*

We are retrenching in every possible way by stopping new construction and improvements—in fact, spending no money whatever which we can avoid without deterioration in that which we now have, and except where work previously commenced is so far advanced as to make its completion essential. There will be no equipment orders whatever during the year 1908. It will probably not be possible to reduce the wage scales for skilled labor. —*President.*

Pacific.

We are not planning any extensive retrenchment. Owing to common labor being very plentiful we have reduced the wages of some of our section men. We have stopped some unimportant new construction work, but are continuing all construction and maintenance work necessary to keep the property up to its standard. —*Vice-President.*

We have made no retrenchments any more than usual at this time of year. We are, however, intending to reduce wages in certain lines of labor about January 1. —*Vice-President.*

All construction work has been discontinued and we do not think it will be resumed until early spring, when, in all probability, work already started will be pushed to completion. We have only ordered a part of the equipment which we had figured on buying for 1908. —*General Manager.*

In the matter of retrenchment, we shall probably limit our new works to the completion of those begun the previous year, and not undertake anything further until times are better. What retrenchments are made in our labor force will be rather in the direction of reduced force or shortening of hours than any change in the wage scale. As to new equipment, we have ordered about the same average amount as preceding years. —*Vice-President.*

Mexico.

Retrenchment, such as good business principles demand during the present financial condition, any excess in operating expenses will be reduced according to present conditions only. —*Superintendent.*

Question 3.—Are you making any other efforts to check the prevalent large increases in operating expenses?

Central West.

We have been doing everything possible to check the large increase in operating expenses, but with the increased prices for both labor and materials of all kinds, the only way that reductions can be made is by entirely cutting out all work that can possibly be dispensed with. —*Vice-President.*

There are no efforts we can make to check the increase in operating expenses, except as above specified, and in reducing our train service wherever practicable. —*President.*

Every effort possible. —*President.*

Every possible effort is being made to prevent an undue ratio of operating expenses to earnings. —*President.*

Until the earnings very materially fall off, will not put in force economies that will affect the efficiency of our service. —*General Manager.*

We are reducing our forces in every department to check a probable large increase in expenses, so far as we can without affecting the safety of our patrons and without permitting the property to deteriorate, either as to its physical condition or its equipment. —*President.*

Only by an effort to a better education of our men as to cost of service, and their mutual interest with the company in the general operating results. —*Vice-President.*

It is possible we might take measures to reduce our operating expenses by 5 per cent. to 10 per cent. the coming year. —*President.*

General economies are being studied and applied as fast and as fast as is deemed wise. —*President.*

We are endeavoring to check the increase in operating expenses that have prevailed during the last two years. —*President.*

No. —*Vice-President.*

We are making every effort to check the large increase in operating expenses by reducing train service and in other ways cutting out all luxuries and extraordinary expenditures. —*President.*

We are not making any special effort to check the increases in operating expenses. —*General Manager.*

South.

We are making every possible effort to check the prevalent large increases in operating expenses, and with a good deal of success for many months past, in the items of car loading, engine loading and per diem as affected by the movement of foreign cars on our line. —*President.*

We are making every effort to check increases in the operating expenses, but the new legislation, particularly in Georgia and Alabama, makes it difficult to reduce. —*General Manager.*

We are making every effort possible to check the large increase

in operating expenses. This is a difficult matter to accomplish on account of the labor situation and increased cost of all material entering into the maintenance and operation of railroads.
General Manager.

We are making every effort to prevent any further increase in operating expenses consistent with the requirements of our State Corporation Commission, which does not permit us to decrease train service, which is the most effectual way to economize.
—General Manager.

Am making every effort to keep operating expenses down, and am watching car movements very closely, for, in this section, the handling of foreign cars is the weakest point.
General Manager.

Southwest

We are making strong effort to check increases in operating expenses by not increasing the salary of any man, and buying only such new material as is imperative. *Vice-President.*

There is very little opportunity to reduce operating expenses except by a decrease in rates of pay and in cost of all supplies and material used. *—Vice President*

We are making an effort to check the increase in operating expenses by a reduction in force. It is our intention to maintain cars, engines, etc., at least equal to their present standard. This will result in our maintenance expense showing some increases, as a great number of our cars are now coming home to us.
—Vice-President.

We are making efforts in every direction to check prevalent large increases in operating expenses. *Vice-President.*

West.

To check the large increases in operating expenses, renewed effort has been made to increase car and train loading by reducing in many cases the speed of trains to promote it.
Vice President

We feel that the high water mark has been reached and passed in the matter of large increases in operating expenses, and, except as accompanied by adverse legislation, look for reductions rather than increases. *President.*

Pacific.

We have in a few cases curtailed expenses in our stations by slightly reducing the help. *—Vice-President.*

We are reducing operating expenses as much as is consistent with efficient operation. We expect to cut down wages, which have been abnormally high, in some departments about January 1.
—Vice-President.

We are making a special effort to keep operating expenses down to the very lowest possible point. *—General Manager.*

QUESTION 4.—DO YOU ANTICIPATE ANY SHRINKAGE IN GROSS EARNINGS FOR 1908?

Central West.

With many industries shut down and the remainder working with reduced forces, it could hardly be expected that the gross earnings for 1908 will equal those of 1907.
—Vice-President.

I anticipate a shrinkage in gross earnings for 1908.
—President.

Yes. *—President.*

A considerable shrinkage in gross earnings is inevitable. The grain crop is below the average, the demand for building materials is less, and the combined effect will prevent an increase in gross earnings. *President.*

We anticipate material shrinkage in gross earnings for 1908.
General Manager.

I anticipate a shrinkage in gross earnings for 1908.
President

No. *Vice President.*

The A. B. gross receipts will probably not be decreased by the year ending June 30, 1908, but will be considerably less the following year. The C. D. gross earnings are likely to be increased in 1908 over 1907, due to new traffic arrangements made by which we secure additional tonnage from other sources than heretofore.
President

East.

We are hopeful for increased gross earnings in 1908. Everything now points to a handsome increase. *President*

We do anticipate a considerable shrinkage in gross earnings, for the present at least, but whether that will continue through the year 1908 will depend wholly upon whether the business of the country revives. A railroad is not a producer. It is simply a carrier of what other people produce, and therefore its income is wholly dependent upon the prosperity of its customers.
President

We anticipate some shrinkage in gross earnings.
—Vice-President.

We do not anticipate any shrinkage in gross earnings for 1908 compared with 1907, but we do not anticipate that the earnings will be as great as they would be if the financial depression had not appeared. *—President.*

We do not anticipate any shrinkage in gross earnings for 1908.
—General Manager.

South.

Fifteen to 20 per cent. reduction. *—President.*

I fear that shrinkage in gross earnings for 1908 is inevitable.
—President

We anticipate great shrinkage in gross earnings for 1908 for all the railroads in the South. *—General Manager.*

Shrinkage in gross earnings for the year 1908 seems inevitable.
—General Manager

Twenty per cent. reduction. *—General Manager.*

We hope to earn something more than this year.
—Chairman of Board.

We have reasonable ground to hope that the shrinkage in gross earnings, which the larger roads in this section seem to anticipate, will miss us, or touch us lightly. *—General Manager*

No. *—General Manager.*

Southwest.

I anticipate a considerable shrinkage in gross earnings for 1908, possibly 10 per cent. *—Vice-President.*

We anticipate about 50 per cent. shrinkage in gross earnings for 1908. *—President.*

In our territory, where our gross earnings are so largely affected by the result of our crops, we would not feel justified in making an estimate on gross earnings for the year 1908 as compared with the year 1907. *—Vice President.*

Gross earnings for 1908 will undoubtedly show a considerable decrease over 1907. *—Vice President.*

I anticipate a very considerable shrinkage in gross earnings in 1908 compared with 1907. *—Vice President.*

West.

As we think the tonnage carried by the roads will be reduced in 1908, there must necessarily be a shrinkage in gross earnings.
—Vice-President

It seems reasonable to anticipate a reduction of from 10 to 15 per cent. in the gross earnings for the ensuing year.
—President

Pacific.

I do not anticipate any shrinkage in the gross earnings for 1908.
—Vice-President.

We do not anticipate any large shrinkage in gross earnings. Up to the present they are considerably in excess of last year.
—Vice-President.

Expect quite a decrease in gross earnings for 1908, the extent of which, however, will depend entirely on 1908 grain and fruit crops. *—General Manager.*

QUESTION 5.—IF GROSS EARNINGS ARE LESS, DO YOU THINK OPERATING EXPENSES ON YOUR ROAD CAN BE SO REDUCED THAT THERE WILL BE LITTLE, IF ANY, LOSS IN NET?

Central West.

With the increase in wages in all lines of service and the increased prices of all materials, it would be impracticable to show the same net, even if the gross earnings were equal.
—Vice-President

I do not see how operating expenses can be reduced so as to meet this condition; the net must suffer a loss. *—President.*

Expenses cannot be reduced to an extent that will enable us not to show quite a loss in net. *—President.*

I do not think it possible to maintain the present ratio of net earnings for the ensuing year. *—President.*

With present rate of wages operating expenses cannot be so reduced that there will be little if any loss in net.
—General Manager.

I do not think the operating expenses can be so reduced so there will be little or no loss in net; on the contrary I anticipate a loss in net. *—President.*

Do not think any material reduction in operating expenses likely. *—Vice-President.*

We expect our net earnings for 1908 will be about equal to 1907.
—President.

East.

We believe there will be a good gain in net.
—President.

It is impossible to determine now whether the reductions in operating expenses can be made large enough to meet the losses in net for the reason that we cannot yet approximate what those losses will be. —*President.*

We think operating expenses can be reduced to very nearly offset shrinkage in gross earnings. —*Vice-President.*

Under the present plans, the operating expenses of this road will be reduced so that there will be no loss in net earnings. —*President.*

South.

We think loss in net is inevitable. —*President.*

We cannot keep off shrinkage of net revenue. —*President.*

I do not believe that operating expenses can be reduced so as to cover the loss in gross earnings without a sharp cut in wages. —*President.*

Cannot reduce operating expenses to make up for the loss in tonnage. —*General Manager.*

I do not believe that operating expenses can be reduced proportionately to reduction in gross earnings. —*General Manager.*

No. —*General Manager.*

With a shrinkage in gross earnings, it is hardly to be expected that our net earnings from operation could be maintained. —*General Manager.*

I expect to increase net earnings. —*General Manager.*

We cannot now forecast the maintenance of net earnings for the calendar year 1908. Were there no other factors—and the others are plainly indicated above—the unknown crop of the year—vegetables, cotton, corn and peanuts—forestalls any estimate of value. —*Vice-President.*

Southwest.

It will be impossible to reduce operating expenses to prevent considerable loss in net. —*Vice-President.*

We will try to hold our own in regard to operating expenses. —*President.*

With a heavy reduction in gross earnings, under present cost of labor, supplies and material, it is doubtful that there would not be some reduction in net earnings, even under the most watchful care and supervision. —*Vice-President.*

Under the present high wage schedules it will be impossible to reduce operating expenses to a point that will permit the net to remain stationary, and I look for a considerable decrease in the net. —*Vice-President.*

I don't think operating expenses are going to be so reduced that there will be little loss in net earnings, unless the trunk lines that fix the very large compensation paid to enginemen, trainmen, machinists and other shop men by contract, revise their contracts and make lower schedule of wages to apply during the depression. —*Vice-President.*

West.

It will probably be impossible to offset this entire shrinkage by a reduction in operating expenses, but probably two-thirds of the decrease can be so offset. —*President.*

I do not think operating expenses can be so reduced that there will be anything but a serious loss in net. By serious I mean that while we will in all probability earn a safe margin above our dividend payments we shall make a very unfavorable showing as compared with last year. —*President.*

It is difficult to forecast the effect on net earnings. There have been no material increases in rates, while state commission. have been reducing them quite generally. The 16-hour law affecting train service and the eight-hour law affecting telegraph operators the effect of both of which will mean large increases in operating expenses, have yet to be felt, as they take effect in March, 1908. The problem before operating officers of maintaining net earnings at the same figure as last year is, therefore, one presenting many difficulties. —*Vice-President.*

Pacific.

In case of a slight decrease in gross earnings I think operating expenses can be correspondingly decreased so as to leave no loss in net earnings. —*Vice-President.*

Do not think that operating expenses can be reduced except that wages of labor will probably be more reasonable. —*Vice-President.*

We expect to keep operating expenses down to a point which will avoid showing decrease in net earnings. —*General Manager.*

Canada.

I think that a lesser volume of traffic with the labor situation more amenable to control than has been the case in late years, should enable us to prevent much of a loss in net. —*Vice-President.*

Mexico.

Expect increase in tonnage during 1908 over 1907, with increased net earnings. —*Superintendent.*

QUESTION 6.—HAVE YOUR EXPENDITURES FOR MAINTENANCE AND BETTERMENTS BEEN ON SO LIBERAL A SCALE DURING THE PAST FEW YEARS THAT THE PROPERTY CAN GET ALONG FOR A YEAR OR SO WITH LESS EXPENDITURE, IF NECESSARY? HOW MUCH DO YOU EXPECT TO SPEND ON EXTRAORDINARY BETTERMENTS IN 1908, AS COMPARED WITH 1907?

Central West and Trunk Lines.

Our expenditures for maintenance and betterments have been fairly liberal during the past two or three years and can be reduced during the next year without injury to the property. Labor cost is about 15 per cent. more than it was a year ago. —*President.*

The property can get along for a year or more with less expenditure on maintenance of way owing to the present condition of the property. I do not expect that we will make any extraordinary betterments in 1908 beyond those compelled by law or ordinances, such as our work on track elevation at Joliet and the completion of some track elevation work in Chicago. —*President.*

Yes. I do not anticipate spending very much for extraordinary betterments. —*President.*

No expenditures for extraordinary improvements are to be made in 1908 beyond keeping the roadway and equipment in proper shape. —*President.*

Expenditures for maintenance and betterments during past few years have not been on so liberal scale that the property can get along for a year or more with any less. We will not spend as much on "extraordinary" betterments the coming year we did the past year. —*General Manager.*

Our expenditures for maintenance and betterments have been on such a scale during the past few years that we probably can yet along for a year or so with less expenditures, if necessary. I am not prepared at this writing to state what our expenditures on extraordinary betterments in 1908 will be, as compared with 1907. —*President.*

Yes, if absolutely necessary, but doubt the wisdom of the policy except under compulsion. —*Vice-President.*

Our expenditures for maintenance and betterments will be very much less in 1908 as compared with 1907, due to the extraordinary expenditures made during the past 18 months. —*President.*

The general physical condition of the property is such that we could probably get along for a year, if necessary, with very small maintenance expenses, but I do not think it will be necessary to allow it to depreciate in any way from its present good condition. Probably expenditures for extraordinary betterments will be less than during the year just passed. —*President.*

East.

Expenditures for maintenance, betterments and equipment have been very liberal since the company began to operate the railroad. The necessity for coming expenditure on those lines is to be insignificant, for some years, save to meet increasing traffic demands upon the property. Not 10 per cent. of the outgo in 1907, against the items named, need be expended in 1908. —*President.*

Our expenditures for maintenance and betterments have been so large during the past three years that the property will not suffer from retrenchment in these matters during the coming year. —*President.*

Expenditures for maintenance and betterments have been so liberal that this road can get along for some years with less expenditure. During the year ended June 30, 1907, the company spent $933,898 for additions and betterments. Since June 30, and to December 31, 1907, we will have spent about $400,000 more. Jan. 1, 1908, to June 30, 1908, we do not expect to spend anything; in other words our expenditures for extraordinary betterments will be practically nothing. —*Vice-President.*

Our expenditures for maintenance and betterments have been on a very liberal scale during the past few years, and the property is in very good condition, and we will get along for a year or two with less expenditures. —*President.*

This property can be maintained without any excessive expenditures for maintenance and betterments for a year or two. We expect to spend a similar amount on extraordinary betterments in 1908 as we did in 1907. —*General Manager.*

South.

We will not spend any more than enough to keep the property in safe condition. —*President.*

Our expenditures for maintenance and betterments have been on a liberal scale during the past few years and the property can get along for a year or so with reduced expenditures if necessary. I am having the data compiled, with reference to the extraordinary betterments in 1908 as compared with 1907 [illegible] information is not yet in hand. There will be a sharp reduction.

—President.

Our expenditures and improvements for betterments have been considerable and the property is in good condition and can be run with a considerably less force. Cannot advise you what we will spend for betterments in 1908.

—General Manager.

Our expenditures for maintenance and betterments have been on so liberal a scale for the last two years that we can get along for the next two years with small expenditure without serious deterioration to the property. The amount to be spent on extraordinary betterments for the year 1908 will not amount to more than 25 per cent. of the amount expended during the year 1907.

—General Manager.

No.

—General Manager.

Cannot give figures; will spend as little as possible.

—Chairman of the Board.

If necessary we can get along with less expenditure for maintenance and betterments than heretofore. We have expended little for betterments in 1907, and will expend little or nothing in that direction for 1908.

—General Manager.

It is expected that this year's expenditures will be larger than those of last year to bring condition of property to normal.

—General Manager.

Southwest.

Expenditures for maintenance and betterments have been immense, but the work is now only about 60 per cent. complete, so that we will not get much benefit from it in 1908. We expect to complete the betterment work between Texico and Woodward, Okla., 265 miles, in 1908, with possibly the exception of the ballast. The work consists in reduction of grade from 1 per cent. to six-tenths, of alinements of 6 deg. curves to two; permanent bridge work, and replacing 52-lb. and 56-lb. rail with 75-lb.

—Vice-President.

We shall keep expenditures for betterment and maintenance at a minimum.

—President.

Our property has been well maintained, from the standpoint of maintenance and betterments, and our expenses in this direction, if conditions required, could be reduced next year as compared with the current year.

—Vice-President.

Expenditures for betterments, maintenance, etc., have been on a liberal scale for some years past, and we are in shape to get along for a year or so with less expenditure for maintenance of track and equipment, if necessary, although our entire efforts will be directed toward keeping up our present standard as regards maintenance. Expenditures for extraordinary betterments during 1908 will be nil.

—Vice-President.

Our expenditures in betterments has been liberal during the past few years, and the property can get along for a year or more with less expenditure in that direction, except that before the panic struck us I contracted a $10,000 expenditure in the direction of strengthening several metal bridges that were erected when the railroad was built in 1880 and 1881. Our expenditures for equipment and betterments in 1907 aggregated $232,520; 1908 expenditures will be limited to the $10,000 above referred to.

—Vice-President.

West.

The condition of the property is such that, if necessary, it could be maintained satisfactorily for a year or more with less expenditure than in the past, but we do not anticipate a situation which will make this necessary.

—President.

Our expenditures for maintenance and betterments have been on an extremely liberal scale during the past few years, so that we think our property can get along with less expenditures for maintenance than have heretofore been made. The amount to be spent on betterments in 1908 will depend largely on financial conditions.

—Vice-President.

Our expenditures for maintenance and betterments during the last 10 years have been such that the property can be maintained at a minimum of expense. There will be no expenditures for extraordinary betterments.

—President.

Pacific.

Our property being comparatively new, we could very easily get along for a year or so with less expenditure for maintenance if necessary, but we do not anticipate that this will be necessary. I have no doubt we will spend on extraordinary betterments in 1908 as much as we did in 1907.

—Vice-President.

We have kept our track and equipment in first class condition and could, if necessary, considerably reduce maintenance expenses for a year or two. We do not expect to make any extraordinary betterments during 1908.

—Vice-President.

As for the last two or three years our expenditures for improvements and betterments have been on such a liberal scale we can get along for some time without any extraordinary expenses, if necessary to do so.

—General Manager.

Canada.

We do not expect to curtail any of our regular expenditures for maintenance of the property.

—Vice-President.

Mexico.

Expenditures for maintenance for 1907 have been in view of putting road in first class condition for anticipated increase of business.

—Superintendent.

QUESTION 7.—HOW DO YOUR LABOR COSTS COMPARE WITH THOSE OF LAST DECEMBER? HOW DO COSTS OF MATERIALS COMPARE?

Central West and Trunk Lines.

The increase in wage schedules plus the increase fc. overtime rules that have had to be conceded will run from 10 per cent. to 15 per cent. more than for the same period of last year, and the cost of material will run from 10 per cent. to 25 per cent. more.

—Vice-President.

Labor costs are considerably higher than last December, and also material.

—President.

An increase of about 7 per cent. in labor. Material about the same as last year.

—President.

There is as yet no decrease in current costs as compared with those of one year ago.

—President.

Labor and material costs, as compared to a year ago, equal about 10 per cent. increase.

—General Manager.

There is no material change in the cost of labor or material as compared with a year ago December.

—President.

Labor increased approximately 15 per cent., materials from 10 per cent. to 25 per cent.

—Vice-President.

Our labor costs are about the same as a year ago—December, 1906. The cost of material would average a trifle less than last December.

—President.

In a general way I should say that our labor costs are perhaps 10 to 12 per cent. higher than they were a year ago, but in the materials which enter most prominently into railroad operations the increase has been little, if any, during the past year.

—President.

East.

Moderate concessions have been made to labor within the year, but not to the extent where less numbers of employees cannot receive present wage and, on account of the betterments, perform December, 1906, work.

—President.

Labor with us is from 5 to 10 per cent. higher during December, 1907, as compared with December, 1906. With the exception of lumber and coal prices show a decided tendency towards a decrease over December, 1906.

—Vice-President.

Our labor costs, compared with last year, show an increase of 10 per cent.; costs of materials show an increase of 15 per cent.

—President.

There has been an increase of 10 per cent. in the cost of labor and 10 to 15 per cent. in the cost of materials.

—General Manager.

South.

In material about 10 per cent. and labor not over 5 per cent.; so far about 5 per cent. reduction in force.

—President.

Our labor cost compared with last December is probably 10 per cent. higher.

—President.

We have reduced price of labor, particularly on track. Have not noticed any less prices on metal materials yet, but they will come down soon.

—General Manager.

The rate paid our labor is about 7 per cent. greater than last December. Cost of material about 12 per cent. more.

—General Manager.

Considerably greater.

—President.

Both are larger.

—Chairman of Board.

The cost of both labor and materials is higher than in December, 1906.

—General Manager.

Labor about the same. Material is a little higher, but we purchase little.

—General Manager.

Southwest.

Cost of labor and material about [illegible] per cent. higher than last year.

—Vice-President.

Cost of labor is the same. Cost of materials about 10 per cent. less.

—President.

The cost of labor as compared with last December shows an increase of from 5 to 15 per cent.; the increased cost of material is even greater.

—Vice-President.

Labor costs as compared with December, 1906, show an increase of approximately 10 per cent. Costs of material show about the

same ratio of advance, although I look for a reduction in the cost of materials and supplies, commencing the first of the year.
—*Vice-President.*

Labor and materials have advanced greatly since last December. I haven't the figures at hand to give the per cent. of increase, but it is quite large. —*Vice-President.*

West.

There has been an increase of about 5 per cent. in the average wages of skilled labor since December, 1906. —*President.*

Labor costs in all departments, except track labor—which is about the same as last December; are very much higher. Costs of materials generally are higher, except lumber which has recently been somewhat reduced. Rail and track trimmings unchanged.

It is difficult to say what our labor costs are compared with those of last December, but there will be an increase of not less than 12 per cent. for the same amount of work. The cost of material has undergone a slight decline, but only in unimportant items. Steel and ties remain at the maximum prices. —*President.*

Pacific.

We are paying our skilled labor more this year than a year ago, but our unskilled labor a trifle less. Material, principally lumber, is less than last year. —*Vice-President.*

Labor and material are as yet about the same as last year.
—*Vice-President.*

We cut the rate for ordinary labor used in track work in the middle of November about 25 per cent. Rates for other labor practically the same as in December, 1906.

Cost of material is a little in excess of what it was this time last year. —*General Manager.*

Canada.

Labor is 10 per cent. or 15 per cent. higher than last December. Material about the same. —*Vice-President.*

Mexico.

Labor is cheaper and more plentiful at present time.
—*Superintendent.*

QUESTION 8.—HAVE YOUR EARNINGS, FREIGHT OR PASSENGER, BEEN MATERIALLY REDUCED BY STATE LEGISLATION THIS YEAR, AND DO YOU EXPECT A REDUCTION IN 1908 ON THIS ACCOUNT?

Central West and Trunk Lines.

The only reduction that we have suffered by legislative enactment is the 2-cent passenger fare law in Ohio and Pennsylvania, and as our passenger traffic was extremely thin, there was really no net money in the 3 cent fare which formerly prevailed. This enactment simply increased our burden just this much, as it is absolutely impracticable for us to haul passengers at a profit over our lines under a rate of 2 cents per mile. —*Vice-President.*

Our passenger earnings have been very much reduced on account of the 2-cent per mile passenger fare, which became effective Sept. 28. As a large portion of our mileage runs through a sparsely settled district of Michigan, reduced rates will not increase the travel.
—*President.*

Earnings, both freight and passenger, have been materially reduced by state legislation, and this undoubtedly will be reflected in the returns for 1908. —*President.*

Yes. —*President.*

There is a marked increase, over half a million, in taxes, and a consequent material reduction in net earnings. —*President.*

Passenger and freight earnings have not been materially reduced by state legislation, except that we believe the 2-cent law in Ohio, Indiana and Illinois has resulted in reducing our earnings, but with material growth in passenger business the loss has been largely overcome—this, we believe, not entirely due to cheaper fares.
—*General Manager.*

Our earnings on freight and passengers have been materially reduced by state legislation, and I anticipate a reduction in 1908 on this account. —*President.*

Slightly. Anticipate further reduction in 1908.
—*Vice-President.*

We do not expect that our earnings will be materially affected the coming year by any state legislation —*President.*

There is no question that our earnings have been reduced to some extent by state legislation during the year, but not to any such extent, proportionately, as our compensation for carrying the mails. In connection with the action of Congress, which resulted in decreasing our earnings by about 10 per cent., the Postmaster-General, on the day of adjournment of Congress, made a further reduction of about 15 per cent., so that the compensation for the carriage of mails within the last year has been cut about 25 per cent.
—*President.*

East.

Earnings have not been affected by state legislation.
—*President.*

There has been no legislation in the states within which we operate that will affect our rates, and we have no [illegible] that any legislation will be made during the coming year that will change present conditions. —*President.*

Earnings have not been materially reduced by legislation [illegible] we do not anticipate any change in this respect.
—*Vice-President.*

Our passenger earnings have not been materially reduced by direct legislation, but indirectly we made some concessions which stopped some direct legislation which would have seriously affected us. We do not expect a reduction in 1908 on this account.
—*President.*

Earnings, freight or passenger, have not been reduced by state legislation during 1907. —*General Manager.*

South.

Greatly hurt. —*President.*

By being a small line no direct reductions, only loss by indirect competition with large line reductions. —*President.*

Our passenger earnings have been irregular in Georgia since the $2\frac{1}{2}$-cent rate was put into effect, but there is no doubt, as shown by analysis, that we shall show not only reduced earnings compared with last year, to say nothing of the normal increase which we have shown from year to year. —*President.*

Our earnings of both passenger and freight have been materially reduced by state legislation this year, and there will be the same conditions in 1908, as the new laws of Alabama and Georgia reduce freight rates. —*General Manager.*

Our earnings have been materially reduced by state legislation this year. We do not expect a reduction in 1908 on this account; at least we hope that such will not be the case.
—*General Manager.*

Yes. —*President.*

Too soon to tell. State legislation has only affected passenger rates. —*Chairman of Board.*

We are operating 85 miles of road in West Virginia through the mountains in a district where a traveler would formerly gladly pay from 25 to 50 cents per mile if he could escape going that way. Our railroad, built at an average cost of $100,000 per mile and dependent entirely upon a sparse local business is only allowed to charge [illegible] cents per mile. —*General Manager.*

There has been no legislation to reduce either passenger or freight rates during 1907, but our passenger fares have been reduced one-eighth by the State Corporation Commission, which is much less than the general reduction in this state.
—*General Manager.*

The Georgia Railroad Commission has treated these small roads very leniently. Earnings have not suffered therefrom, and it is not thought they will in 1908. —*General Manager.*

Southwest.

There has been reduction in passenger earnings from 3 to 2 cents in Oklahoma and some slight reduction in Texas, due to Railroad Commission order, and considerable reduction in New Mexico due to interstate rulings. —*Vice-President.*

Freight and passenger earnings have been materially reduced this year, but I cannot say that it was wholly due to legislation. We hope for better things in 1908. —*President.*

Our freight and passenger earnings have not been materially affected by state legislation this year. The 2-cent passenger rate bill before the last Texas legislature was defeated and our legislature only convenes biennially. Therefore, we are not looking for any material change, brought about by state legislation or by further reduction in freight rates by the Railroad Commission, during the year 1908. —*Vice-President.*

Earnings, both freight and passenger, have been materially reduced by state legislation, and the year 1908 will undoubtedly show still further reductions, although it is only fair to say that many of the reductions made during 1907 did not become effective until the year was half gone. —*Vice-President.*

Our gross earnings have not been reduced by state legislation during this year, nor do I expect a reduction from that cause during 1908, but our expenses are being largely increased by acts of the thirtieth Texas legislature. —*Vice-President.*

West.

Earnings, both freight and passenger, have been materially reduced by state legislation, and a similar reduction will continue in the future. This reduction has been offset to a large extent the past year by exceedingly favorable business conditions generally, hence the reduction will be relatively of more moment in 1908 than in 1907. —*President.*

Earnings, both freight and passenger, have been materially reduced by the action of state legislatures and commissions, and as these laws will be operative through 1908 the reduction for that year will be greater than in 1907, as they were operative only a part of the year. —*Vice-President.*

Our passenger earnings have undergone a serious reduction by state legislation, and efforts are being made by several state commissions to make reductions in freight rates. —*President*

Pacific.

I do not believe our earnings, either freight or passenger, have been materially reduced by state legislation this year, nor do I anticipate any reduction from that cause the coming year. —*Vice-President*

Our freight and passenger earnings have not been reduced by state legislation. —*Vice-President.*

Do not think freight or passenger earnings will be affected to any great extent by state legislation this year. —*General Manager*

No material reduction that we can point to as the result of state legislation. —*Vice-President.*

QUESTION 9.—HOW MUCH HIGHER WILL YOUR TAXES BE IN 1908 THAN THEY WERE IN 1907?

Central West and Trunk Lines.

We could only approximate what the increase in taxes might be. There is a movement on foot, however, to force the railroads of this section to pay considerably higher taxes, but just what it will amount to we cannot foretell. —*Vice-President*

Do not anticipate any increase in taxes. —*President*

In hope there will be no material increase. —*President.*

Our taxes will be about the same as 1907. Our valuation for taxation purposes was increased during the years 1905 and 1906 39 per cent. —*President.*

It is impossible to forecast what the legislatures now convening in the several states may do in the way of further unfavorable corporate legislation. The impression is gaining ground that they will do less in the way of further oppression of railroad corporations this session than last. —*President.*

Taxes have increased about $3\frac{1}{2}$ per cent. on our gross earnings the past year. —*General Manager.*

Our taxes will be, approximately, $80,000 higher in 1908 than they were in 1907. —*President.*

Uncertain. —*Vice-President.*

About the same. —*President.*

East.

This year's taxes will not appreciably differ from those of last year. —*President.*

Railroad taxes in the states in which we operate are levied under laws which have not been changed, and I do not, therefore, anticipate any material increase in the total of our taxes during the coming year. —*President.*

Our taxes were increased during the year ended June 30, 1907, and show an increase of 92.25 per cent. over year ended June 30, 1906. We expect a slight increase for year ending June 30, 1908. —*Vice-President*

Our taxes in 1908 will be 15 per cent. higher than they were in 1907. —*President.*

Taxes in 1908 will be the same as they were in 1907. —*General Manager.*

South.

Do not look for any change. Increase of 1907 over 1906 about 20 per cent. —*President*

Our taxes in 1908 will probably be $125,000 in excess of 1907. —*President*

We have not yet had any intimation regarding taxes that will be in 1908, but suppose that they will be again raised. —*General Manager.*

Our taxes will be about 10 per cent. higher for 1908 than they were in 1907. —*General Manager*

Ten per cent. higher. —*President*

A little higher, not a great deal. —*Chairman of the Board.*

Taxes for 1908 will depend upon the assessments to be made by the State Corporation Commission on the first of September next and the county and municipal rates of taxation for 1908, but we do not anticipate any material increase in the taxes over those just paid for 1907. —*General Manager*

There are no new bases of assessment in either of our states that will increase our taxes in 1908. Our gross taxes will be materially increased in that year by the creation of additional property in the new lines. —*Vice-President*

About the same. —*General Manager*

Southwest.

It is impossible to estimate the taxes exactly in 1908, but we expect them to be about 5 to 8 per cent. higher than in 1907. —*Vice-President*

Should be about the same. —*President*

The new tax bills passed by the last Texas legislature increased our taxes about $150,000 for the year 1907. We do not expect an increase in the year 1908. —*Vice-President.*

I look for an increase in taxes. The tendency for some years past has been toward a gradual increase, both in the assessed valuation and the rate of taxation. —*Vice-President.*

Our taxes in 1908 will be nearly double the amount paid in 1907. —*Vice-President.*

West.

Taxes in 1908 will probably be higher than in 1907. The tendency is universal to increase taxes, and every month of the present fiscal year is showing a large increase over the corresponding month of last year, the average being about 10 per cent.

In some states we are still being taxed on the basis of gross earnings, and as it is impossible to state to what extent our gross earnings will be reduced we cannot give an intelligent estimate of the total of the taxes for 1908 as compared with 1907. —*President*

Pacific.

Somewhat higher. —*Vice-President*

About double what they were in 1907. —*Vice-President*

We estimate that our taxes for 1908 will exceed those for 1907 to the extent of about $50,000. —*General Manager*

Canada.

Taxes about the same as last year. —*Vice-President.*

QUESTION 10.—IS LOCAL POPULAR FEELING IN YOUR TERRITORY AS MUCH OR MORE ANTI-RAILROAD AND ANTI-CORPORATION THAN IT WAS LAST DECEMBER? DO YOU SEE ANY SIGNS OF REACTION TOWARD A KINDLIER FEELING?

Central West and Trunk Lines.

Local popular feeling seems to be undergoing a change in our territory, as the inability of the railroads to go ahead with their improvements, because of lack of money, has had a reflex action upon the industries served by these roads, many of which have been compelled to close down, forcing large numbers of workmen out of employment, and the people are beginning to ask themselves whether the railroads and other large corporations really deserve the extreme punishment that has been inflicted upon them during recent years. —*Vice-President.*

I believe it is the consensus of opinion locally that anti-railroad legislation has probably gone a little too far. We have no session of the legislature this coming winter. —*President.*

I do not think the local popular feeling against the railroads is as great now as it was last December. —*President.*

No let up as yet. —*President.*

Local popular feeling on line of road seems less antagonistic than a year ago, but railroad commissioners in all states are exercising very inquisitive jurisdiction over the railroads, making it more expensive on that account to operate. —*General Manager.*

The local popular feeling in this territory is not as much anti-railroad or anti-corporation as it was last December. I see decided signs of reaction toward kinder feeling. —*President.*

Can see but little change. —*Vice-President.*

The local popular feeling in this territory does not seem to be as strongly anti-railroad or anti-corporation as it has been previously. —*President*

I am somewhat inclined to believe that there is a more kindly popular feeling manifesting itself in our territory, or perhaps it would be better to say a less bitter feeling, than existed a year ago, and this is evidenced to a large extent by the tendency on the part of the local press to give the railroads an opportunity to be heard in various questions that arise. I believe this feeling will continue to grow, but its growth must depend very largely upon the different railroad managements and the attitude which they assume in meeting and conferring more than they have heretofore done with the leaders of public opinion in the various communities. —*President*

East.

Popular feeling in our territory never was so cordially kind toward us. —*President*

There has not been in this section as much local popular feeling against railroads and other corporations as in other parts of the country, although there has been more of this feeling than was pleasant to encounter. I think, however, there is a slight improvement in this particular. —*President.*

Local popular feeling in our territory seems to be more kindly than in the past. —*Vice-President.*

We think the local popular feeling in our territory is more kindly than it was a year ago, taking all things into consideration. —*President.*

The anti-railroad and anti-corporation feeling in this territory is about the same as it was last December Do not see any signs of reaction toward a kindlier feeling. —*General Manager.*

South.

Prejudice subsiding to some extent. —*President.*

There is every indication of a large change in public sentiment with reference to the railroad question in this territory. The general impression seems to be that measures against railroads have been too drastic and have been pushed too far. —*President.*

The local popular feeling here is not as much averse to railroads and corporations as it was a year ago. I believe the people see that mistakes have been made by the legislatures and that it will have the effect of lessening this prejudice in another year. —*General Manager.*

The local feeling in our territory is much less of an anti-railroad and anti-corporation character than it was last December. There are also signs of a reaction. —*General Manager.*

Feeling is more kindly. —*President.*

The feeling is better. —*President.*

Popular feeling has become more anti-railroad during the past year, and there are no material signs of a reaction as yet. —*General Manager.*

The pendency of litigation in the rate cases in North Carolina must necessarily curb any immediate further radical tendency. —*Vice-President.*

The feeling, never very bad in this section, is now better. —*General Manager.*

Southwest.

We think we can see a revulsion of feeling in our territory and a kindlier feeling toward railroads and corporations than last year, at least among business men. A great many business men are beginning to see that their interests are very closely linked with the prosperity of railroads. In evidence of this is the action of the lumber men and grain men in Texas, in making an effort to reduce the severity of reciprocal demurrage rules proposed by legislation and the Texas Commission. There is not much of a change in Oklahoma, although political conditions there have absolutely tied up further construction, and it is expected the feeling will change there. —*Vice-President.*

We feel that there has been a slight reaction in regard to the kindlier feeling. —*President.*

We feel that the popular feeling in our territory is gradually becoming more conservative toward railroad and other corporations, and that the bitter feeling that has been worked up against all corporations has now passed the "high-water mark," and we can see signs of reaction. In our opinion, the kindlier feeling is gradually developing. —*Vice-President.*

There is a tendency toward a kindlier feeling on the part of the public in regard to corporations, largely due to the present financial conditions. The fact that the government, national and state, have been making war on corporations, has caused a general fear of panic, and thinking people to stop and reason. If the practically universal onslaught by the various state legislatures and candidates for office continues against railroad corporations, it will undoubtedly eventually apply to all property interests. The heavy fine against the Standard Oil Company, and the various suits brought by the attorneys-general of the many states against the different corporations, under the various anti-trust laws, has caused some reaction in feeling, and the people to see the effects of political agitation. —*Vice-President.*

I think popular feeling in our territory is not quite so radical against corporations as it was a year ago, and I think I see decided signs of reaction; in other words, we are not "held up" quite so often as we were a year ago, except by men who handle live stock, who continue to handle the railroads through the courts in such a way as to make the business unremunerative regardless of the market. In former years shippers of live stock were apparently satisfied if they secured from the railroads, in the way of claims, an amount to cover the freight charges, but at the present time they are exacting not only a rebate of the charges, but in a good many instances demand payment to almost the full value of the animals being handled. —*Vice-President.*

West.

There has been a marked recession of the anti-railroad disposition in the territory served by this company. While it still exists in many quarters, we believe the majority of the communities served by our lines believe that anti-railroad legislation has gone too far already, and no encouragement will be given a continuance of the legislative policy which has been so marked the past two years. —*President.*

I think I see some signs on the part of thinking men in some of the states through which we pass of a kindlier feeling toward the corporations, and a query as to whether persecution has not been carried to excess—but it has not reached the state officials. They still seem to feel that their political future depends on harassing the railroads in every possible way. —*President.*

We think local popular feeling in our territory is decidedly less hostile than it was last December. We believe the people generally, and the press in some cases, are realizing that the railroad corporations have been seriously crippled by the action of the politicians during the past year. The people are beginning to realize that the coal famines, congestion of freight and impossibility to provide empties, questions that were so acute last winter, were not due to the "pure cussedness" of railroad officers but largely to conditions over which they had no control; in other words, they are being educated and are beginning to understand the situation. —*Vice-President.*

Pacific.

I do not believe that the popular feeling in our territory against railroads and other corporations is as strong this year as a year ago. I believe the tendency is toward a kindlier feeling on the part of the public. —*Vice-President.*

Local popular feeling toward corporations about the same as heretofore. The only agitation against railroads in this section of the country is on the part of lumber shippers, whose rates to the east have recently been increased. —*Vice-President.*

There is quite a strong anti-railroad feeling in this section at the present time, but I do not think it is as strong as it was a year ago, for the reason that this feeling culminated to a certain extent in the appointment of railroad commissions in both Oregon and Washington at the last legislatures. —*General Manager.*

Canada.

Have not noted any particular change. —*Vice-President.*

QUESTION 11.—IF THERE ARE NEW STATE ELECTIONS IN YOUR TERRITORY THIS YEAR, DO YOU ANTICIPATE THAT THE SUCCESSFUL CANDIDATES WILL BE MORE OR LESS RADICAL THAN THE LAST CROP?

Central West and Trunk Lines.

In the present state of the public mind, it is difficult to anticipate whether successful candidates will be more radical than formerly, as it will depend entirely on whether the people wish to continue the present agitation against corporate interests. —*Vice-President.*

I do not think in the case of new elections that the successful candidates will be as radical as they have been in the past. —*President.*

Nothing apparent to hope for. —*Vice-President.*

There were no new state officers of any prominence elected in this state this year. We expect, in the coming election, candidates of less radical nature will be more successful. —*President.*

East.

The railroads have not been made, to any great extent, a political issue in this section, and I therefore anticipate no troubles from that source. —*President.*

In New York, state elections, we think, have resulted in a less radical crop of office holders than last year. In New Jersey, possibly more radical, however, than a year ago. —*Vice-President.*

While there are no new state elections in our territory this year, we are of the opinion that if there were the successful candidates would not be as radical as the last ones elected. —*President.*

South.

New candidates will be more conservative. —*President.*

I believe the people in the southern states in which we are interested, will be glad to put into office within another year men who are less radical about corporations, for a large portion of the public see now that the stringent laws recently enacted are injuring the development of these states. —*General Manager.*

Less radical. —*President.*

About the same. —*Chairman of Board.*

So long as the popular sentiment is against railroads and other corporations, there is little doubt that the successful candidates will be those that avail of it to the best advantage. —*General Manager.*

It is considered that the anti-railroad feeling has run its course in this section. —*General Manager.*

Southwest.

Candidates for election are apparently of the radical sort, but while apparently none of them has abandoned the motto of "[illegible] to Corporations," some of them have received pretty strong hints that may cause them to mollify their propositions; even the Farmers' Union has refused to accept the dictates of several prominent candidates. —*Vice-President.*

Our next state election will be held in November, 1908, and there will be no change in our state officials until January, 1909. It is probable that the present state officials will be re-elected.
—Vice-President.

All the states touched by our rails will have elections during 1908. It is rather difficult to say what the successful candidates will stand for, although we look for no improvement in the aspect of the state legislature, for the reason that the political situation in most of the states is controlled by the demagogue politician.
—Vice-President.

Texas elects a Governor next year and it goes without saying that it will re-elect the same malignant demagogue that now fills that position. No crime could be committed by a Governor in Texas that would prevent his re-election to a second term, unless he should turn his coat entirely wrong side out and make a display of decency and business ability in handling the legislature in matters where corporations are concerned.
—Vice-President.

West.

I do not think new state elections would be effective or that there will be any radical changes in the attitude of the successful candidates unless and until a reaction more apparent takes place among the voters.
—President.

We hope the successful candidates will be fairly representative of popular feeling, which is distinctly less hostile than a year ago.
—Vice-President.

QUESTION 12.—WHAT IS YOUR ESTIMATE OF THE FIRST YEAR'S WORK OF THE INTERSTATE COMMERCE COMMISSION UNDER THE NEW LAWS?

Central West and Trunk Lines.

Most of the work performed by the Interstate Commerce Commission since the new law went into effect would be unobjectionable to the railroads of the country, as the roads generally have been honestly and squarely conducted, and have nothing to conceal. Some burdens have been added in the methods of accounting, which do not seem to me to be justified, but these matters will all be threshed out and the roads will adjust themselves to the new conditions in due time. No doubt much good will result from the work of this commission. The work of the Interstate Commerce Commission can hardly be attributed as the cause of the lack of confidence on the part of the people in this country and abroad in the stability of the railroads and other large corporations, because the railroads can unquestionably adjust themselves to the rules and regulations laid down by the Commission, the members of which and their assistants seem to be thoroughly fair men, but the continued agitation reflected from the National Capitol back to the state and municipal corporations has prompted the enactment of very stringent and arbitrary local laws that have injuriously affected the earning capacity of the roads. It could hardly be fairly said that any action on the part of the Interstate Commerce Commission has caused the lack of confidence in the stability of the railroads of the country which has prompted the monied people to tighten up on their "purse strings," thereby retarding the development of the railroad facilities. It would probably be more nearly correct to assume that the holding up to public odium of the prominent railroad men of the country and generally advertising all over the world some of their shortcomings, ignoring entirely any of the good things which they have accomplished, has made the people of this country and abroad believe that our railroad system is all wrong and that we are, as a class, a lot of highwaymen, when as a matter of fact there is less return on capital invested in railroads in this country to-day than in any other industry, and it is also probably fair to assume that an examination of the history of the railroad men in this country will compare favorably from the standpoint of honor, integrity and stability with any other class of business men.
—Vice-President.

It would take too much time to answer intelligently this question. Generally speaking, the Commission has not been able to do much during the past year. Of course, whatever has been done is in the direction of reducing our rates, but it is safe to say that it has been conservative so far.
—President.

I think the Commission's work has been good.
—President.

Our estimate of the first year's work of the Interstate Commerce Commission, under the new laws, is that the Commission is getting experience and knowledge, and until it gets down to a working basis we cannot tell to what extent it may affect us. We look for some relief from Congress in the enactment of a pooling law, under supervision of the Interstate Commerce Commission, which will help earnings in competitive territory.
—General Manager.

We feel the Commission's work in the main has an educational result that will work to the ultimate advantage of both the public and the railroads, bringing more conservative legislation, more liberal consideration by the public and a more strict regard by the railroads of their public duties.
—Vice-President.

We do not feel competent to answer this question at the present time with the information we have before us.
—President.

The work of the Interstate Commerce Commission during the past year under the new laws has, I think, been about what might have reasonably been expected. The system of accounting which they have prescribed is, in the main, excellent and in most respects a very able [illegible]. Unfortunately, it was adopted without consultation with or consideration by the actual executive and responsible officers of the railroads. It should be noted, I think, in this connection, that it is the determination on the part of the Federal Government to enforce the law rather than the actual law itself, which has brought about the principal improvement in the situation. Every indictment so far found against a railroad company or a corporation has been under the old Interstate Commerce Act and the Elkins amendment. One important feature of the new law has been the operation of the thirty-day clause. This, in connection with the great cost of the tariffs, has made changes in the tariff much less frequent, and it is evident that tariffs are, as a rule, becoming more and more inflexible. In connection with this feature there are some advantages, but at the same time there are also some marked disadvantages. In other words there is a good deal to be said on both sides of the question.
—President.

East.

We are not able to pass judgment upon the year's general work of the Interstate Commerce Commission under the new laws. In such matters as we must study and as are brought to our notice differences of interpretation arise and are confusing. Arbitrary decrees, even if strained, are sometimes better than doubt. The public has, notoriously, been unreasonable in clamor against the physical operation of railroads. It has not been allowed to, even if it would, regard that as distinct from manipulation. The physical operation of railroads is a serious problem. For the best results to the people it requires toleration and consideration by the people. It has been of little use for those wrestling with the railroad side of the problem to so state. There has appeared to be no one representing all the people to state it. The present demonstration may, in the big plan, have its uses.
—President.

We are hardly in position to give you any intelligent expressions of the first year's work of the Interstate Commerce Commission under the new laws. From our standpoint it is too soon to judge.
—Vice-President.

I think we are in the same position as other railroads in that we have been so busy compiling reports and giving information to the Interstate Commerce Commission and the state commissions that we have not had time to conclude whether the first year's work is beneficial or otherwise. So far we might say that we have not been affected.
—President.

Have not as yet formed an opinion in regard to work of Interstate Commerce Commission under new laws.
—General Manager.

The first year's time of the Interstate Commerce Commission has been so largely devoted to determining its forms of procedure, and in interpreting the new provisions of the Interstate Commerce law, that nothing seems yet to have been done disastrously affecting any of the interests involved.
—President.

South.

You can judge the effect in reductions and value of stocks and bonds, which shows the effect of the rate making power. The states, however, do more harm than the National body, but the inspiration was given them by Roosevelt and Congress.
—President.

Without attempting to say anything in detail with reference to the first year's work of the Interstate Commerce Commission, I have been impressed with the conservatism of this Commission, and of all the powers designated to deal with the railroads, the Interstate Commerce Commission seems to have manifested a more just and liberal spirit than any of the others.
—President.

The Interstate Commerce Commission has performed a good work but makes the mistake of condemning all railroads by the acts of a few of them.
—General Manager.

The first year's work of the Interstate Commerce Commission seems to have been fairly good.
—General Manager.

It is preliminary to finally reaching good results.
—General Manager.

The new Interstate Commerce law mainly affected us in the curtailment of passes, greater stability of rates, increased clerical cost and impairment of net earnings to extent of the charges for depreciation of equipment.
—Vice-President.

Decidedly good as seen from the purview of these small roads.
—General Manager.

Southwest.

I have not been able to decide whether the first year's work of the Interstate Commerce Commission has resulted in benefit or injury. I feel they have reduced some rates too low, but from their own viewpoint I believe they have intended to be absolutely fair, but some of their rulings appear to be ill-advised, from a railroad point of view. —*Vice-President.*

It will be some time before an intelligent reply can be made to this question. —*President.*

As far as this company is concerned, we believe, as a whole, the new law has been beneficial to this company. —*Vice-President.*

The work of the Interstate Commerce Commission this year would indicate a disposition on their part to treat fairly with the railroads, and we have no criticism to make. —*Vice-President.*

West.

We have faith in the integrity and intelligence of the Interstate Commerce Commission, and believe that its work the past year has been very beneficial in preventing destructive forces achieving the results which might otherwise have been accomplished. Constructive action on the part of the Commission will doubtless follow in due course, and from such action we believe the railroads will derive a fair portion of benefit as compared with the public. —*President.*

We think the railroads have very little to complain of from the first year's work of the Interstate Commerce Commission under the new laws. The Commissioners have shown a spirit of fairness that has been very encouraging and reassuring, and we think through their instrumentality and decisions of controversies the public will be educated and harmonious relations will be promoted. —*Vice-President.*

In general I think the Interstate Commerce Commission is to be congratulated upon the way it has started out. I believe it is making a sincere effort to divest itself of prejudice and to be a judicial body as it always should have been. —*President.*

Pacific.

I am not prepared to give an estimate of the first year's work of the Interstate Commerce Commission under the new laws. I believe it is an intelligent body of men and aims to do right by both corporations and the public. But at the same time it has an enormous task before it and I do not believe any estimate could be made on its work at this time. —*Vice-President.*

Important Changes in Railroad Officers in 1907.

The following list of official changes during the past year while not complete is intended to show the more important executive appointments by the larger railroads. Some appointments which reflect changes of ownership are also included. Similar lists were published in the *Railroad Gazette* of December 29, 1905, and December 28, 1906.

Astoria & Columbia River.

April—C. M. Levey, Third Vice-President of the Northern Pacific and President of the Portland & Seattle elected President.

Atlantic, Birmingham & Atlantic.

April—J. R. Rowland, Traffic Manager of the Brunswick Steamship Co., appointed Traffic Manager.

October—H. M. Atkinson, President, appointed also General Manager, succeeding to some of the duties of G. D. Wadley, Second Vice-President in charge of construction.

Baltimore & Ohio Southwestern.

January—C. C. F. Bent, General Superintendent of the Baltimore & Ohio, appointed General Manager of the Baltimore & Ohio Southwestern.

Bangor & Aroostook.

October—O. Stewart, Superintendent of Motive Power and Equipment, retired after 60 years of railroad service.

Boston & Albany.

October—A. H. Smith, Vice-President and General Manager of the New York Central & Hudson River appointed also Vice-President and General Manager of the Boston & Albany.

—J. H. Bustis, General Superintendent of the Western division of the New York Central & Hudson River, appointed Assistant General Manager.

—R. D. Smith, Mechanical Expert of the Lake Shore & Michigan Southern, appointed Assistant Superintendent of Motive Power in special charge of the Boston & Albany.

Boston & Maine.

January—Henry Bartlett, Superintendent of Motive Power, appointed General Superintendent of the Mechanical Department.

Buffalo & Susquehanna.

May—Charles W. Goodyear, First Vice-President, elected President, succeeding F. H. Goodyear, deceased.

—A. C. Goodyear elected First Vice-President.

Buffalo, Rochester & Pittsburgh.

July—R. W. Davis, General Freight Agent, appointed Freight Traffic Manager.

November—E. F. Robinson, Assistant Engineer of Tests, appointed Chief Engineer.

Canadian Northern.

July—M. H. McLeod, Chief Engineer, appointed General Manager.

Canada.

March—H. R. Emmerson, Minister of Railways and Canals, resigned.

September—George P. Graham appointed Minister of Railways and Canals.

Canadian Pacific.

February—G. J. Bury, General Superintendent, appointed Assistant General Manager of Western Lines in charge of maintenance and operation.

March—J. E. Schwitzer, Principal Assistant Engineer, appointed Assistant Chief Engineer, with headquarters at Winnipeg.

Chicago & Alton.

October—Edwin Hawley, President of the Minneapolis & St. Louis and the Iowa Central, elected Vice-President of the Chicago & Alton.

—T. H. Hubbard, Vice-President of the Toledo, St. Louis & Western, elected Chairman of the Board of the Chicago & Alton. The various departments of the Toledo, St. Louis & Western and the Chicago & Alton combined in this and succeeding months.

December—Theodore P. Shonts, President of the Toledo, St. Louis & Western, elected also President of the Chicago & Alton.

—George H. Ross, Second Vice-President and General Traffic Manager of the Toledo, St. Louis & Western elected also Vice-President of the Chicago & Alton.

—W. L. Ross, General Freight and Passenger Agent of the T. St. L. & W., appointed General Traffic Manager of the Toledo, St. Louis & Western and the Chicago & Alton.

Central Vermont.

November—William Kennedy, Master Mechanic of the Grand Trunk at Toronto, appointed Superintendent of Motive Power of the Central Vermont, succeeding Archibald Buchanan, Jr., now Chief of the Bureau of Inspection of the New York Public Service Commission, Second district.

Chesapeake & Ohio.

May—H. T. Wickham, General Solicitor, appointed General Counsel.

—H. W. Fuller, General Passenger Agent, appointed Passenger Traffic Manager.

Chicago & North-Western.

January—S. M. Braden, Superintendent at Chicago, appointed General Superintendent of the Lines West of the Missouri river.

Chicago, Burlington & Quincy.

October—Frank E. Ward, General Manager of the Great Northern, appointed General Manager of the Burlington Lines East of the Missouri river, succeeding J. M. Gruber, appointed General Manager of the Great Northern.

Chicago Great Western.

December—Otto Cornelisen, Superintendent of Transportation, appointed General Superintendent.

Chicago, Milwaukee & St. Paul.

January—E. S. Keeley, General Freight Agent, appointed Freight Traffic Manager.

June—H. R. Earling, Assistant General Superintendent, appointed General Superintendent of Western lines, including the Pacific extension, with headquarters at Butte, Mont.

Chicago, Rock Island & Pacific.

March—W. S. Tinsman, General Superintendent of the Southwestern district, appointed Assistant General Manager.

—W. J. Tollerton, Superintendent of Motive Power at Topeka, appointed Assistant General Superintendent of Motive Power.

May—E. L. Pollock, Purchasing Agent of the New York, New Haven & Hartford, elected Vice-President in charge of purchases of the Chicago, Rock Island & Pacific, the St. Louis & San Francisco, the Chicago & Eastern Illinois and the Evansville & Terre Haute.

Chicago, St. Paul, Minneapolis & Omaha.

October—W. A. Gardner, Vice-President of the Chicago & North-

Western, elected President, succeeding Marvin Hughitt, now Chairman of the Executive Committee.

Cincinnati, New Orleans & Texas Pacific.

January—G. P. Biles, General Freight Agent, appointed Freight Traffic Manager of the Cincinnati, New Orleans & Texas Pacific and the Alabama Great Southern.

August—T. C. Powell, Vice-President of the Southern Railway, elected also Vice-President of the Cincinnati, New Orleans & Texas Pacific and the Alabama Great Southern, in charge of the operating and purchasing departments.

October—W. S. Andrews, Assistant to the General Manager, appointed General Superintendent of Transportation of the Cincinnati, New Orleans & Texas Pacific.

Colorado & Southern.

April—J. D. Welsh, Superintendent, appointed General Superintendent in charge of transportation, motive power and maintenance of way, succeeding J. H. Young, General Manager, resigned.

Colorado Southern, New Orleans & Pacific.

February—A. J. Davidson, President of the St. Louis & San Francisco, elected also President of the Colorado Southern, New Orleans & Pacific.

September—J. H. Elliott, General Superintendent of the Third district of the St. Louis & San Francisco, elected Vice-President and General Manager of the Colorado Southern, New Orleans & Pacific.

Corvallis & Eastern.

January—J. P. O'Brien, Vice-President and General Manager of the Oregon Railroad & Navigation, elected also President of the Corvallis & Eastern.

Delaware & Hudson.

February—W. J. Mullen, Assistant to the Second Vice-President, appointed General Traffic Manager.

April—L. F. Loree, Chairman of the Executive Committee of the Kansas City Southern, elected also President of the Delaware & Hudson, succeeding David Willcox, deceased.

May—C. S. Sims, Assistant to the President of the Erie, appointed General Manager.

June—C. S. Sims, General Manager, elected Second Vice-President and General Manager, succeeding Abel I. Culver, resigned.

October—W. H. Williams, Assistant to the President, elected Third Vice-President.

Denver & Rio Grande.

May—W. S. Martin, General Manager of the Mexican International, appointed Assistant General Manager of the Denver & Rio Grande.

Detroit River Tunnel.

November—W. J. Wilgus, who resigned in October as Vice-President in Charge of Engineering of the New York Central & Hudson River, appointed Consulting Engineer of the Detroit River Tunnel Company.

Detroit, Toledo & Ironton.

November—George K. Lowell, General Manager, elected Vice-President of the Ann Arbor and the Detroit, Toledo & Ironton.

El Paso & Southwestern.

April—George F. Hawks, General Superintendent of the Houston & Texas Central, the Houston East & West Texas and the Houston & Shreveport, appointed General Superintendent of the El Paso & Southwestern.

Erie.

January—D. W. Cooke, Assistant General Traffic Manager, with headquarters at New York, appointed General Traffic Manager, with headquarters at Chicago.

February—T. Rumney, Assistant Mechanical Superintendent, appointed Mechanical Superintendent, succeeding George W. Wildin, who went to the Lehigh Valley as Assistant Superintendent of Motive Power.

June—W. J. Harahan, Vice-President of the Illinois Central, appointed Assistant to the President of the Erie, succeeding C. S. Sims, now Second Vice-President of the Delaware & Hudson.

October—T. Rumney, Mechanical Superintendent, appointed General Mechanical Superintendent, succeeding E. A. Williams, resigned several months previous.

Grand Rapids & Indiana.

January—Joseph Wood, First Vice-President of the Pennsylvania Lines West, elected President, succeeding James McCrea.

Grand Trunk.

April—W. G. Brownlee, Superintendent of the Middle division, appointed General Transportation Manager, succeeding to some of the duties of F. H. McGuigan, resigned to go to the Great Northern as First Vice-President.

July—William Wainwright, General Assistant and Comptroller, elected Fourth Vice-President, succeeding F. H. McGuigan.

—Joseph Hobson, Chief Engineer, appointed Consulting Engineer.

—Howard G. Kelly, Chief Engineer of the Iowa Central and the Minneapolis & St. Louis, appointed Chief Engineer.

October—D. Crombie, Master of Transportation, appointed Assistant to the General Transportation Manager.

Grand Trunk Pacific.

April—O. O. Winter, Superintendent of Terminals of the Canadian Pacific at Fort William, appointed General Superintendent of the Grand Trunk Pacific.

October—John W. Loud, Freight Traffic Manager of the Grand Trunk, appointed also Freight Traffic Manager of the Grand Trunk Pacific.

Great Northern.

March—H. A. Kennedy, Assistant General Superintendent at Spokane, appointed Assistant General Manager, in charge of Western lines.

—F. H. McGuigan, Fourth Vice-President of the Grand Trunk, elected to the new office of First Vice-President of the Great Northern.

April—J. J. Hill, President, elected Chairman of the Board.

—L. W. Hill, Vice-President, elected President.

May—Benjamin Campbell, Fourth Vice-President, in charge of traffic, resigned to go to the New York, New Haven & Hartford as Vice-President in charge of traffic.

—W. W. Broughton, Freight Traffic Manager, appointed General Traffic Manager.

August—F. H. McGuigan, First Vice-President, resigned.

October—J. M. Gruber, General Manager of the Burlington Lines East of the Missouri river, appointed General Manager of the Great Northern in charge of maintenance and operation, succeeding F. E. Ward, who took Mr. Gruber's place on the Burlington.

Hocking Valley.

February—S. S. Stiffey, Superintendent of Motive Power, appointed General Superintendent of Motive Power of the Hocking Valley and its controlled lines.

Houston & Texas Central.

March—G. Radetzki, Superintendent of the G., H. & S. A., appointed General Superintendent of the Houston & Texas Central, the Houston East & West Texas and the Houston & Shreveport, succeeding G. F. Hawks, who went to the El Paso & Southwestern as General Superintendent.

Illinois Central.

January—I. G. Rawn, General Manager, elected Vice-President, in charge of operation. Frank B. Harriman, General Superintendent of Northern and Eastern lines, appointed General Manager.

February—C. L. Ewing, Superintendent at Carbondale, Ill., appointed General Superintendent of Northern and Western lines, succeeding F. B. Harriman.

June—W. J. Harrihan, Vice-President in charge of traffic and construction, resigned to go to the Erie as Assistant to the President.

July—Authority of I. G. Rawn, Vice-President in charge of operation, and F. B. Harriman, General Manager, extended over the Yazoo & Mississippi Valley.

Interborough Metropolitan Company.

January—Theodore P. Shonts, Chairman of the Isthmian Canal Commission, elected President, succeeding August Belmont.

April—Theodore P. Shonts, President, elected also Chairman of the Executive Committee composed of the operating heads of the Interborough Rapid Transit, the Manhattan Elevated and the New York City Railway.

International & Great Northern.

December—H. M. Clarke, Superintendent of Transportation of the Mobile & Ohio, elected Second Vice-President and General Manager of the International & Great Northern. Effective January 1, 1908.

Isthmian Canal Commission.

January—T. P. Shonts, Chairman, resigned.

March—John F. Stevens, Chief Engineer, resigned.

—Major G. W. Goethals appointed Chairman, succeeding Mr. Shonts, and also Chief Engineer, succeeding Mr. Stevens.

—Major D. D. Gaillard, Major W. L. Sibert, Senator J. C. S. Blackburn and R. R. Rodgers, General Counsel, appointed Commissioners.

Kansas City, Mexico & Orient.

June—Frederick Mertsheimer, formerly Superintendent of Machinery of the Kansas City Southern, appointed Superintendent of Motive Power and Rolling Stock of the Kansas City, Mexico & Orient.

Kansas City Southern.

January—R. J. McCarty, Assistant Secretary and Auditor, appointed Vice-President and Auditor.

February—R. M. Galbraith appointed Superintendent of Machinery, succeeding F. Mertsheimer, resigned to go to the Kansas City, Mexico & Orient as Superintendent of Motive Power and Rolling Stock.

Lake Shore & Michigan Southern.

December—D. C. Moon, Assistant General Manager, appointed General Manager, succeeding E. A. Handy, deceased.

Macon, Dublin & Savannah.

February—Alfred Walter, President of the Seaboard Air Line, elected also President of the Macon, Dublin & Savannah.

Mexican Central.

February—E. E. Styner, General Manager, resigned.

May—H. R. Nickerson, Vice-President, resigned to go to the Rio Grande, Sierra Madre & Pacific as President.

November—S. M. Felton, President of the Chicago & Alton, elected President of the Mexican Central.

—E. Richards, Acting President, re-elected Vice-President and General Counsel.

—J. N. Galbraith, formerly General Manager of the Tehuantepec National, appointed General Manager of the Mexican Central.

Mexican International.

May—W. S. Martin, General Manager, resigned to go to the Denver & Rio Grande as Assistant General Manager. See National Lines of Mexico.

Mexican Southern.

July—W. L. Morkill, General Manager, resigned to go to Peru.

December—J. H. Chisholm appointed General Manager.

Michigan Central.

May—S. W. Brown, Assistant General Superintendent of the Lake Shore & Michigan Southern, appointed General Superintendent of the Michigan Central, succeeding H. S. Nutt, General Superintendent, resigned to go to the Northern Pacific.

Minneapolis & St. Louis.

July—W. D. Wheeler, Division Engineer of the Iowa Central, appointed Chief Engineer of the Iowa Central and the Minneapolis & St. Louis, succeeding H. G. Kelley, now Chief Engineer of the Grand Trunk.

Missouri, Kansas & Texas.

February—C. Haile, Traffic Manager, elected Vice-President in charge of traffic.

Missouri Pacific.

July—Charles L. Stone, General Passenger Agent of the Louisville & Nashville, appointed Passenger Traffic Manager of the Missouri Pacific.

October—A. C. Bird, Vice-President in charge of traffic of this road and other Gould lines, resigned.

November—J. M. Johnson, Assistant to the Vice-President, elected Vice-President in charge of traffic.

—B. M. Flippin, Assistant Freight Traffic Manager, appointed Freight Traffic Manager.

Mobile, Jackson & Kansas City.

March—T. F. Whittelsey, Second Vice-President and General Manager, resigned to go to the Seaboard Air Line as General Manager.

—H. S. Jones, Chief Engineer, appointed General Superintendent, succeeding to Mr. Whittelsey's duties.

May—W. D. Stratton, Chairman of the Board, elected also First Vice-President.

July—L. S. Berg elected President, succeeding B. M. Robinson, resigned.

—W. F. Owen appointed General Manager.

August—H. S. Jones reappointed Chief Engineer and office of General Superintendent abolished.

National Lines of Mexico.

May—Authority of A. Clark, General Manager of the National Railroad of Mexico, extended over other National lines.

June—J. M. Reed, Chief Engineer of the National Railroad of Mexico, appointed Chief Engineer of Construction of the National Lines of Mexico.

New Orleans & North-eastern.

June—D. E. Curran, Vice-President and General Manager, elected President of this road and allied lines, and in September made also General Manager.

New Orleans Great Northern.

June—C. W. Goodyear, Vice-President, elected President, succeeding F. H. Goodyear, deceased.

September—E. A. Niel, Traffic Manager of the Buffalo & Susquehanna, appointed also Traffic Manager of the New Orleans Great Northern.

New York Central & Hudson River.

March—P. E. Crowley, General Superintendent Western district, appointed Assistant General Manager.

May—George H. Daniels, Manager General Advertising Department, retired.

October—W. J. Wilgus, Vice-President in charge of construction, resigned.

New York Central Lines.

May—B. B. Mitchell, Freight Traffic Manager of the Lines East of Buffalo, appointed General Freight Traffic Manager of all New York Central lines.

—Francis LaBau, Assistant Freight Traffic Manager of the Lines East, appointed Traffic Manager of the Lines East.

New York, New Haven & Hartford.

January—E. J. Buckland, Counsel, elected Vice-President.

June—Benjamin Campbell, Fourth Vice-President of the Great Northern, elected Vice-President in charge of traffic of the New York, New Haven & Hartford.

—A. E. Mitchell, Expert and Engineer of Tests, appointed also Manager of Purchases and Supplies.

August—John F. Stevens elected Vice-President in charge of operation.

Norfolk & Western.

July—W. G. MacDowell, Vice-President, elected First Vice-President.

—N. D. Maher, General Manager, elected also Vice-President.

—T. S. Davant, Freight Traffic Manager, elected Vice-President and Traffic Manager.

Northern Pacific.

May—C. M. Levey, Third Vice-President, given charge of maintenance and operation.

—H. J. Horn, General Manager, appointed General Manager of the Eastern lines.

—H. S. Nutt, General Superintendent of the Michigan Central, appointed General Manager of the Western Lines of the Northern Pacific.

October—H. J. Horn resigned and succeeded by George F. Slade, formerly General Superintendent of the Great Northern.

Northwestern Pacific.

January—E. E. Calvin, Vice-President and General Manager of the Southern Pacific, elected President.

—A. H. Payson, Assistant to the President of the Santa Fe, elected Vice-President.

September—W. S. Palmer, General Superintendent of the Northern district of the Southern Pacific Pacific system, appointed General Manager.

Panama Railroad.

April—Major G. W. Goethals, Chairman of the Isthmian Canal Commission, elected President of the Panama Railroad, succeeding T. P. Shonts, now President of the Interborough-Metropolitan Company. E. E. Drake, Secretary, Treasurer and Assistant to the President of the Panama Railroad, elected Vice-President, succeeding John F. Stevens, resigned to go to the New York, New Haven & Hartford as Vice-President in charge of operation.

September—J. A. Smith appointed General Manager, succeeding W. G. Bierd, now General Superintendent of the New York, New Haven & Hartford.

Pennsylvania.

January—James McCrea, First Vice-President of the Lines West, elected President of the Pennsylvania Railroad, succeeding A. J. Cassatt, deceased.

September—George D. Dixon, Freight Traffic Manager, appointed General Traffic Manager.

Pennsylvania Lines West.

January—Joseph Wood, Second Vice-President in charge of traffic, elected First Vice-President, succeeding James McCrea.

—J. J. Turner, Third Vice-President in charge of transportation, elected Second Vice-President.

—E. B. Taylor, Fourth Vice-President in charge of treasury and accounting, elected Third Vice-President.

—D. T. McCabe, Freight Traffic Manager, elected Fourth Vice-President in charge of traffic.

—William Hodgdon, Freight Traffic Manager of the Vandalia, appointed Freight Traffic Manager, succeeding Mr. McCabe.

Pere Marquette.

December—William Cotter, General Attorney, elected President.

Phoenix & Eastern.

May—Epes Randolph, President of various Southern Pacific lines in Arizona, elected also President of the Phoenix & Eastern.

Rio Grande, Sierra Madre & Pacific.

April—L. D. Baldwin, elected Vice-President.

May—H. R. Nickerson, Vice-President of the Mexican Central, elected President of the Rio Grande, Sierra Madre & Pacific.

St. Louis, Brownsville & Mexico.

October—William Doherty, General Passenger Agent, appointed Traffic Manager.

Seaboard Air Line.

February—W. A. Garrett, First Vice-President and General Manager, elected President, succeeding Alfred Walter, deceased.

—T. F. Whittelsey, Second Vice-President of the Missouri, Jackson & Kansas City, appointed General Manager of the Seaboard Air Line.

September—A. J. Poole appointed General Master Mechanic, succeeding R. P. C. Sanderson, Superintendent of Motive Power, resigned to go to the Virginian Railway.

Sonora Railway.

January—Epes Randolph, President of Southern Pacific lines in Arizona, appointed also General Manager of the Sonora Railway.

March—A. R. Oster appointed Assistant General Manager, succeeding J. A. Naugle, resigned.

Southern.

January—R. A. Dugan, Assistant General Manager, resigned and office abolished.

March—M. M. Ritchie, General Superintendent of the Middle district, appointed Manager of the Middle and Western districts.

—J. N. Seale, Manager of Transportation, appointed Manager of the Northern and Eastern districts.

September—C. P. Cooper, General Superintendent of the St. Louis-Louisville lines, appointed Manager of those lines.

November—E. H. Coapman, General Superintendent of the Northern district, appointed Manager of the Northern and Eastern districts, succeeding J. N. Seale, deceased.

Southern Pacific.

November—W. R. Scott, General Superintendent of the Northern district of the Pacific system, appointed General Manager of the Pacific system.

Tehuantepec National.

June—W. B. Ryan, Vice-President, appointed also General Manager.

Toledo, St. Louis & Western.

December—W. L. Ross, General Freight and Passenger Agent, appointed General Traffic Manager of the Toledo, St. Louis & Western and the Chicago & Alton.

Trinity & Brazos Valley.

March—W. E. Greene elected Vice-President and General Manager.

Union Pacific.

November—W. A. Worthington appointed Assistant to the Director of Maintenance and Operation of this system and of the Southern Pacific.

Virginian Railway.

August—R. P. C. Sanderson, Superintendent of Motive Power of the Seaboard Air Line, appointed Superintendent of Motive Power of the Virginian Railway.

Wabash.

May—Henry Miller, General Manager, elected also Vice-President.

Washington & Columbia River.

July—Authority of Northern Pacific officers extended over the Washington & Columbia River.

Western Maryland.

March—B. F. Bush elected President, succeeding W. S. Pierce.

—Alexander Robertson, General Manager, elected also Vice-President.

October—R. C. Evans appointed Superintendent of Motive Power, succeeding William Miller, resigned.

Western Pacific.

December—W. J. Barnett, Vice-President and General Attorney, resigned.

Wheeling & Lake Erie.

January—Robert Blickensderfer, Consulting Engineer, retired.

A New Switch Indicator.

The drawings and photographs shown herewith illustrate a new switch indicator for use in connection with automatic block signals, which is held "clear" with one-third the current used to energize the coils in the first place. It is made by the General Electric Company. It possesses several novel features suggested by the experience of signal engineers.

Fig. 1 is a front and Fig. 2 a back view. As shown by Fig. 3, with the indicator "clear" a resistance, equal to double that of the operating coils, is connected in series with them, thus reducing the current consumption to one-third. With the indicator at danger, the effect of this resistance is nullified, as the armature when down closes a back contact, causing two-thirds of the current to flow through the coils of the magnet. Thus, the magnets being de-energized and the miniature semaphore showing danger, the closing of the circuit by the clearing of the block section track circuit which controls the instrument sends through the magnet coils of the indicator a current of, say, 45 milamperes, but immediately the armature is lifted the resistance is thrown into the circuit and the current is reduced to 15 milamperes; and this is all that is ever required except at the moment of closing.

Fig. 1

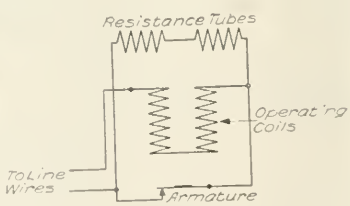

Fig. 3

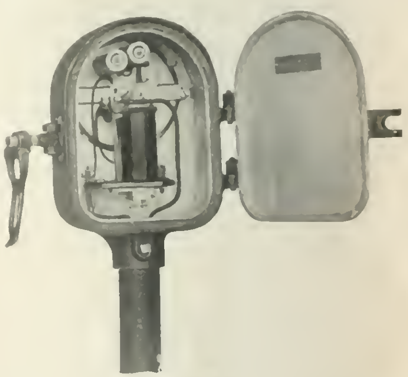

Fig. 2

Switch Indicator, Made by the General Electric Company, Schenectady, N. Y.

The case of this indicator is made weather proof by a door gasket of elastic felt, which has been found more satisfactory than the tubular rubber gaskets usually used. The connecting wire enters the bottom of the case through an insect barrier of felt, like that used around the door. The case is so designed that it is impossible for spiders or other insects to get at the blade.

The terminals are mounted on non-warping moulded insulation, which is the same as that used in General Electric signal relays. The magnets are wound with enameled waterproof magnet wire. The armature and shaft bearings are cylindrical, the journal being made of hard drawn German silver. A General Electric lightning arrester is furnished when required.

The indicators are made with four different resistances, as follows:

Resistance of operating coils.	Total resistance.
250 ohms.	750 ohms.
500 "	1,500 "
750 "	2,250 "
1,000 "	3,000 "

Changes of Railroad Ownership or Control in 1907.

The following list summarizes briefly the principal changes in ownership or control of railroads during the past year. Purchases of electric roads which have been made by or in the interest of steam railroad companies are included, as well as the steamship lines bought by the New York, New Haven & Hartford during the year. A related event too indefinite to be included in the list but deserving mention was the option which the New Haven gave to the New York Central to buy the New York, Ontario & Western. This is still in effect.

The record of these changes, listed under the name of the purchasing or selling railroad, follows:

Baltimore & Ohio.—May 3 paid par and accrued interest for two years for $15,140,000 bonds of the Chicago Terminal Transfer, which owns 82 miles of belt railroad in Chicago. Later offered $25 a share for minority preferred stock, about 65 per cent. of the issue being controlled by the Burlington.

Boston & Maine.—The Fitchburg Railroad was on May 16 authorized by the Massachusetts legislature to buy the Conway Electric Street Railway operating six miles of electric line at Conway, Mass.; stock $100,000; bonds $35,000.

Chicago, Burlington & Quincy.—On November 1, took over the Sioux City & Western, Sioux City, Neb., to O'Neill, 129 miles, from the Great Northern, which now has no mileage in Nebraska.

Cincinnati, Hamilton & Dayton.—Lease of Pere Marquette abrogated by C., H. & D. stockholders on October 8; by P. M. stockholders December 9.

Delaware & Hudson.—Acquired control in July of Troy & New England, an electric line from Troy, N. Y., to Averill Park, nine miles; stock $180,000; bonds $160,000.

Denver & Rio Grande.—Rio Grande Western in October bought the San Pete Valley Railway, Nephi, Utah, to Morrison, 51 miles; stock $510,000; bonds $815,000.

Fort Dodge, Des Moines & Southern.—Electric interurban line. Announced in July that control of the Newton & Northwestern, a steam road, Newton, Iowa, to Rockwell City, 102 miles, had been acquired; 40 miles of N. & N. equipped for electric operation in January; stock $2,500,000; bonds $3,060,000.

Great Northern.—With Northern Pacific bought in April for price said to be $3,500,000 the Astoria & Columbia River, Goble, Ore., to Seaside, and a branch, 83 miles; stock $1,619,000; bonds $555,000. Valuable for the lumber resources of its territory.

Gulf Line Railway.—New company. In May bought Flint River & Gulf, Ashburn, Ga., to Bridgeboro, 32 miles, and leased Hawkinsville & Florida Southern, Worth, Ga., to Hawkinsville, 44 miles; stock $100,000; bonds $325,000. The Georgia Southern & Florida holds an interest in the H. & F. S. and guarantees the bonds.

Kalamazoo, Lake Shore & Chicago.—On April 15 leased for 25 years South Haven & Eastern branch of Pere Marquette, Lawton, Mich., to South Haven, 34 miles.

Lake Shore & Michigan Southern.—The Indiana Harbor Belt Railroad, owned jointly with Michigan Central, in June leased and on November 4 bought about 46 miles of track of the Chicago Junction Railway, a belt road at Chicago; stock $2,200,000; bonds $2,500,000.

In July arranged to acquire Chicago & Wabash Valley; Dinwiddle, Ind., to McCoysburg and branch, 26 miles; stock $300,000; no bonds.

Lorain & Ashland.—Under construction by interests headed by Joseph Ramsey. In December bought Ashland & Western, Ashland, Ohio, to Custeloga, 23 miles; stock $200,000; no bonds.

Maine Central.—In March bought large majority of stock of Somerset Railway, Oakland, Me., to Moosehead Lake, 91 miles; stock $736,649; bonds $1,761,500, which includes $1,500,000 notes.

May 1 leased for 999 years at rental of $328,000 a year Portland & Rumford Falls and its controlled property, the Rumford Falls & Rangeley Lakes, Rumford Junction, near Auburn, Me., to Rumford Falls and Livermore, 100 miles; stock of both $2,300,000, bonds $2,520,000.

Maritime Coal, Railway & Power Company.—In May bought Canada Coal & Railway Company, owning 12 miles of road in Nova Scotia.

Michigan Central.—In July bought Detroit & Charlevoix, Frederic, Mich., to South Arm and branch, 52 miles, stock $520,300, no bonds.

National Lines of Mexico.—In December, 1906, it was announced that the Mexican government had bought control of the Mexican Central, 3,195 miles. The various lines controlled by the government are to be merged in a new company, the National Railways of Mexico, as soon as the financial situation is favorable.

New York, New Haven & Hartford.—In January acquired control of the Maine Steamship Company, running from New York to Portland, Me.

In February acquired control of the Boston & Philadelphia Steamship Company, running between Boston, Fall River, Providence and Philadelphia.

In March bought one-half the stock of the Merchants & Miners' Transportation Company, owning steamship lines from Boston and Providence to Baltimore and Norfolk, from Philadelphia to Savannah, and from Baltimore to Newport News, Norfolk and Savannah. This company took over the Boston & Philadelphia Steamship Company.

In April, bought for price said to be $400,000, Poughkeepsie & Eastern, Poughkeepsie to Boston Corners, and branch, 39 miles; stock $500,000; bonds $500,000.

May 31 exchanged its own stock share for share for the $30,000,000 stock of the Consolidated Railway owning or leasing, with small exceptions, all trolley lines in Connecticut and Rhode Island and the Sound steamboat lines directly controlled by the New York, New Haven & Hartford.

In May bought about $11,000,000 of the $28,291,790 common stock of the Boston & Maine, 2,228 miles directly operated.

In October announced that New Haven had bought control of the New York, Westchester & Boston and the New York & Portchester, two companies which have franchises to build a high-speed electric road from the northern part of New York City through Mt. Vernon to New Rochelle, on which considerable construction work has been done.

In December bought the Joy Line, running from Providence to New York.

Northern Pacific.—See Great Northern.

Northwestern Pacific.—New company controlled jointly by the Atchison, Topeka & Santa Fe and the Southern Pacific. On January 1 took over North Shore; California Northwestern, San Francisco & Northern Pacific; Eureka & Klamath River, Fort Bragg & Southeastern, and San Francisco & Northwestern, roads in California north of San Francisco previously controlled by the Southern Pacific or the Santa Fe.

Pennsylvania Company.—In May took over Chicago, Indiana & Eastern, Converse, Ind., to Munsey, 43 miles; stock $1,000,000, bonds $500,000. Now part of Logansport division of the P., C., C. & St. L. Pennsylvania Company bought all securities and settled all other debts.

Reading Company.—In April bought control of Williams Valley Railroad, Brookside, Pa., to Lykens, 12 miles; stock $120,000, bonds $120,000.

Seaboard Air Line.—In January bought nearly all stock of Macon, Dublin & Savannah, Vidalia, Ga., to Macon 92 miles; stock $2,040,000; bonds $1,880,000.

Southern Pacific.—In April bought, from the Santa Fe, the Phoenix & Eastern, Phoenix, Ariz., to Winkleman, 96 miles; stock $1,275,000.

In June bought control of Corvallis & Eastern, Yaquina, Ore., to Idanah, 141 miles; stock $1,410,000; bonds $1,110,000.

Southern Railway.—In June sold the $5,000,000 Central of Georgia stock which had been held since 1896 by the Richmond Terminal reorganization committee, to Oakleigh Thorne and Marsden J. Perry, 1,899 miles operated. In October control of Central of Georgia reported sold to E. H. Harriman.

Toledo, St. Louis & Western.—In August bought from the Rock Island Company $11,420,000 of the $19,512,800 common and $6,380,000 of the $19,544,000 preferred stock of the Chicago & Alton, 970 miles.

Virginian Railway.—New company. In May took over Tidewater Railway and Deepwater Railroad, Norfolk, Va., to Deepwater, W. Va., 443 miles, of which about 300 are built.

Western Maryland.—January 17 bought the $1,000,000 stock of Georges Creek & Cumberland, Cumberland, W. Va., north to Pennsylvania state line and west to coal workings, 33 miles, bonds $601,000. Owns only available outlet to the west from Cumberland.

Pensions on the Grand Trunk.

The Grand Trunk has announced the details of its pension system for employees which goes into effect January 1. It includes employees of all grades and departments. Every employee must retire at the age of 65. If he has served 15 years or more he will be entitled to annuity of 1 per cent. of the highest average annual pay received for 10 consecutive years. Thus if a man had served 30 years receiving an average of $1,000 per year for any 10 consecutive years of that period he would be entitled to 30 per cent of $1,000, making a pension of $300 a year. The minimum is fixed at $200, irrespective of the rate of pay or length of service. The shareholders have set aside $200,000 as a nucleus for the fund, but it is thought that at least $75,000 additional will have to be provided each year. Provision is also made for men incapacitated by accident. The pension fund will be administered by a board of trustees and will be wholly maintained by the company without contributions from its employees. The number affected is about 35,000.

For officers, station men and clerical employees the Grand Trunk has had a pension fund for over 30 years but the employees themselves contributed half of the money for it

Comparative Physical Tests of Car Wheels and Tires.*

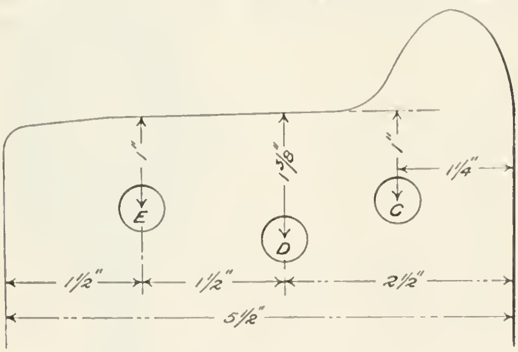
BY GEO. L. FOWLER.

(Reprinted from a volume of reports made to the Schoen Steel Wheel Co.)

All the tires and wheels referred to in this work were bought in the open market, chosen at random, and tested under identical conditions in comparison with each other. They represent the principal brands in use, giving satisfactory service, and the results stand on the basis of each sample representing the average of its class and brand. They will be designated as tires A, B, C and D, wheels E and F and Schoen steel wheel.

Tests were made of the tensile strength, including the limit of elasticity, per cent. of elongation and the reduction of area at the point of fracture. The steels were tested for hardness by a drop of the Martel scale. Abrasion tests were made in order to find the resistance of the several materials to grinding at various points below the tread. Specimens were also cut for the determination of the specific gravity of the metals at different points below the tread. Chemical analyses were made from samples of each tire and wheel taken from a point below the center of the tread. Finally, a series of microphotographs were taken of etched specimens of the metals in order to show their structure and the relation of that structure to the physical and chemical properties, previously determined independently.

The chemical analyses for carbon were all made by the combustion process and the tensile tests were made in the usual manner, using test pieces 2 in. long between marks. The reason for choosing this length was that the curvature of the treads of the wheels and tires made it impossible to cut longer ones. These specimens were cut from the points, C, D and E, as indicated on the diagram showing the location of tensile test specimens. These test



Location of Tensile Test Specimens.

pieces were cut on a chord of the tire and gave an available length of 2 in. on the reduced area ½ in. in diameter, the center of which was carefully located at the point indicated on the drawing. The tensile tests were made in an Olsen testing machine of 100,000 lbs. capacity, and the results obtained are given in detail in the following table marked "Comparative Tests of Steel Wheels and Tires"

Comparative Tests of Steel Wheels and Tires.

Test piece.	Tire or wheel	Per cent Elongation in 2 in.	Per cent Reduction of area.	Max. load, pr sq. in., lbs.	Lbs., per sq. in. of section Breaking load.	Lbs., per sq. in. of section Approximate limit of elasticity.	Pr ct of limit of elasticity to total load.	Hardness on the Martel scale.

E	" "	11.00	20.80	124,129	118,340	110,142	88.75	1,149

The averages of these are collected and presented in a condensed form in the table marked "Average of Comparative Tests of Steel Wheels and Tires"

Average of Comparative Tests of Steel Wheels and Tires.

Tire or wheel	Per cent Elongation in 2 in.	Per cent Reduction of area	Max. load, pr sq. in. lbs.	Lbs., per sq. in. of section Breaking load	Lbs., per sq. in. of section Approximate limit of elasticity	Pr ct of limit of elasticity to total load	Hardness on the Martel scale
C tire	13.50	15.89	116,761	113,352	77,133	66.66	818
A "	11.35	11.45	124,018	121,951	91,646	73.89	817
D "	20.90	29.50	115,963	104,095	95,008	81.92	783
B "	15.10	19.33	114,519	107,989	95,232	83.18	799
E wheel	7.40	6.87	113,610	111,184	82,388	72.63	872
F "	11.90	17.13	114,477	110,857	95,589	83.50	875
Schoen wheel	8.66	12.32	124,386	121,523	104,124	86.45	1,125

From this table it will be seen that, in the wheels examined, the average maximum tensile strength varied from 113,610 lbs. to 124,386 lbs. per square inch of section, that the elongation in 2 in. varied from 7.40 per cent. to 20.90 per cent., the limit of elasticity from 66.66 per cent. to 86.45 per cent. of the maximum tensile strength, and the hardness from 783 to 1,125 points on the Martel scale.

In reviewing these results it is necessary to consider the relative influence of the chemical composition on them. This is given in the table marked "Chemical Composition of Steel Wheels and Tires."

Chemical Composition of Steel Wheels and Tires.

Wheel	Carbon	Phosphorus.	Sulphur	Manganese	Silicon
C tire	0.616	0.048	0.011	0.698	0.305
A "	0.716	0.065	0.023	0.753	0.263
D "	0.573	0.075	0.038	0.763	0.309
B "	0.676	0.061	0.035	0.833	0.254
E wheel	0.646	0.071	0.029	0.978	0.219
F "	0.671	0.081	0.042	0.775	0.241
Schoen wheel	0.690	0.012	0.008	0.870	0.094

As would be expected the low carbon content of the D tire is accompanied by comparatively low tensile strength, high ductility and low hardness.

At the same time it is evident that the work put on the wheel is an influential factor in all of these results, and there is a variation of tensile strength and ductility that is not fully accounted for by the variation of carbon content. Take as an extreme example the E wheel and the Schoen wheel. There is a variation of but .044 per cent. in carbon and yet the maximum tensile strength of this E wheel was but 113,610 lbs. per square inch, while that of the Schoen wheel was 124,386 lbs. with a corresponding elongation in 2 in. of 7.40 per cent. and 8.66 per cent., respectively, while the limit of elasticity was 72.63 per cent. and 86.45 per cent. of the tensile strength, respectively. The actual variation in limit of elasticity was much greater, because of the higher base of comparison with the Schoen wheel, the limit of elasticity of the E wheel being but 79.12 per cent. of that of the Schoen wheel. In making these tensile tests great care was exercised not only in the preparation of the specimens, but in making the tests themselves. The machine was run slowly after a stress of 50,000 lbs. had been reached, so that the limit of elasticity could be very accurately determined.

A comparison of the results obtained with all wheels and tires with those obtained with the Schoen steel wheel are given in the table marked "Comparative Results of Physical Tests of Schoen Steel Wheels with Other Wheels and Tires," in which the results obtained with the Schoen wheel are taken as a base, and the results obtained with the other wheels and tires are given in percentages of that base. From this table it appears that the Schoen wheel leads all of the others in the items of tensile strength, limit of elasticity, per cent. of limit of elasticity to ultimate strength and in hardness.

Comparative Results of Physical Tests of Schoen Steel Wheels with Other Wheels and Tires.

Tire or wheel.	Maximum load per sq. in. lbs.	Per cent Elongation in 2 in.	Per cent Reduction of area.	Lbs. per sq. in. of section Breaking load.	Lbs. per sq. in. of section Approx limit of elasticity.	Per ct. of limit of elasticity to total load.	Hardness on the Martel scale
Schoen wheel	100.00	100.00	100.00	100.00	100.00	100.00	100.00
A tire	99.70	131.06	92.94	100.35	88.02	85.47	72.62
C "	93.87	155.89	128.98	93.28	74.08	76.41	72.71
D "	93.23	241.34	239.45	85.66	91.25	94.76	69.60
B "	92.07	177.84	156.90	88.86	91.47	96.22	71.02
F wheel	92.05	172.05	139.04	91.22	91.79	96.59	77.78

The tests for hardness were made with a drop arranged with a pyramidal punch. The principle on which this work was done was to measure the force of a blow delivered by the punch on the smooth face of the metal to be tested, as well as the amount of metal displaced by the blow. This method of testing was devised by Col. J. T. Rodman, of the United States Army. It was afterward developed and formulated by Lieut.-Col. Martel, of the French army, and was then adopted as a standard test by the French government. The results obtained are known as the degrees of hardness by the Martel scale. By his investigations Colonel Martel showed that the amount of metal displaced by the punch varied inversely as the hardness and directly as the weight of the drop and the height of the fall.

In this investigation the Rodman pyramidal punch was used. It was fastened to a drop, weighing, together with the punch, 2.2616 kilograms and the height of fall was 600 millimeters. The punch was of hardened tool steel, carefully ground to form, and it withstood the work without deformation.

The specimens for the test were cut from the tires and wheels

*Copyrighted by the Schoen Steel Wheel Co., and published by special permission.

at the same points as the tensile test pieces, as indicated at C, D and E, and the results obtained are given with the other physical properties in the several tables.

These tests show the Schoen wheel to have been the hardest of the seven specimens tested, and that the D tire was the softest. This was to be expected, judging from the carbon content; but we note that while the A tire has a higher percentage of carbon than the Schoen wheel for some reason the latter is the harder of the two.

For the abrasion tests a cylinder ½ in. in diameter was cut from a point near the center of the tread of each wheel, extending vertically down into the body of the metal. This was placed in a frame, with the end that was at the tread resting on an emery wheel. A load of 2 lbs. 11½ ozs. was put on the upper end of the cylinder to hold it down on the wheel. This weight was selected after some preliminary trials made to ascertain the pressure that could be used without heating the material or grinding it away too rapidly so as to make the count smaller than would be convenient for making comparisons. To this weight must be added the weight of the cylinders themselves, which varied about 0.54 oz., a variation which was duly considered and the proper allowance made therefore, although it is practically a negligible quantity.

The wheel used was made by the Carborundum Co., and was $10\frac{9}{64}$ in. in diameter and ¾ in. thick when new. At the conclusion of the tests the wheel was worn to a diameter of $10\frac{7}{64}$ in. It was known on the maker's schedule as Grit 120, Grade H., Bond G 9. It was run at a speed of about 2,500 revolutions per minute.

While grinding a constant and uniform stream of water was kept running on the wheel and specimen, and at the conclusion of the test the specimens were invariably cool and showed no signs of heating whatever.

The counting of the revolutions was done by means of a special counter coupled to the shaft and having a worm meshing with a gear of 25 teeth mounted on a shaft to which a revolution counter was attached. The reading of the counter was, therefore, multiplied by 25 to obtain the number of revolutions of the wheel.

In addition to the regular tests, a cylinder was cut from the same position in a chilled cast iron wheel, and the results of its abrasion test, as well as those of the wheels and tires, have been plotted and shown in the illustration "Diagram of Abrasion Tests of Steel Tires and Wheels." The abscissas indicate the location of the metal below the tread, and the ordinates the number of revolutions of the wheel required to grind off ⅛ in. from a cylinder ½ in. in diameter.

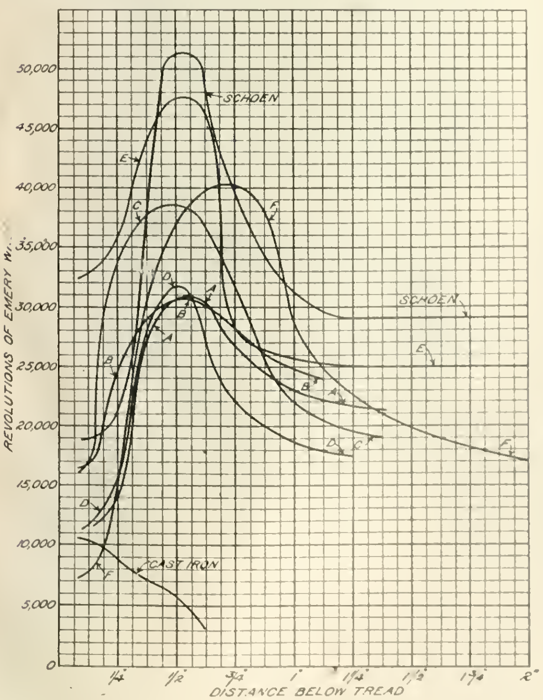

Diagram of Abrasion Tests of Steel Ties and Wheels, Showing Relation of Rate of Wear at Various Depths Below Tread, and Revolutions of Every Wheel.

It will be noted that in every test there is a rise in the number of revolutions at a point about ½ in. below the surface of the tread, or for the space between ¼ in. and ¾ in. Had the work been done in rotation this peculiarity might have been attributed to a change in the texture of the wheel, glazing, heating the material or a similar cause. The tests were started, however, before all of the cylinders had been finished, and those from the A, B, C and D tires were well along when a start was made with the cylinder cut from the Schoen wheel. This was worked down in rotation with those from the tires, when that from the E wheel was introduced, and this was followed in the same way by that of the F wheel, so that the wheel structure itself is responsible for the diagram. By reducing these diagrams to an average the results are as follows

Average Abrasion Per ⅛ Inch of Tires and Wheels.

Tire or wheel.	Revolutions.	Linear feet.
Schoen wheel	32,635	86.483
E wheel	30,660	81.249
C tire	28,205	74.743
B tire	26,320	69.748
F wheel	25,540	67.681
A tire	23,270	61.666
D tire	21,445	56.729
Cast iron wheel	5,485	14.535

Reducing these to percentages on the basis of the Schoen wheel we have:

Tire or wheel	Per cent
Schoen wheel	100.00
E wheel	93.95
C tire	86.43
B tire	80.65
F wheel	78.26
A tire	71.30
D tire	65.71
Cast iron wheel	16.81

From this it appears that the resistance of the Schoen wheel to abrasion was greater than that of any of the other wheels and tires with which it was compared. The cast iron wheel gave the lowest resistance of any cylinder tested. The wheel was of good material, with a depth of chill of about ⅝ in.

An explanation of the peculiar rise in the number of revolutions required to grind these tires between ¼ in. and ¾ in. will be brought out in the discussion of the microphotographs. The examination made of the specific gravities of the metal of the tires and wheels at different points below the surface of the tread, also tends to show a reason for the peculiar rise in the rate of abrasion by the emery wheel. From this examination it appears that with slight local aberrations the density of the material increases from the tread down to a depth of about 1 in. and then decreases down to 2 in. A few observations made below these depths show that there is again a tendency to increase in density as the inner edge of the tire is approached. There was, however, a variation of this condition found in the rim of the Schoen wheel. Although there was a tendency to follow the general behavior of the other specimens, it was along a wavy line, corresponding, but not in exact location, with the variation in the texture of the grain which will be brought out in the microphotographs to be discussed later.

Another peculiarity that was developed is the relation of hardness, resistance to abrasion and tensile strength to the specific gravity of the material.

It will be noted that the rate of wear of the cast iron wheel as shown on the diagram, was much greater than that of any of the steel tires or wheels. The rapid fall in the number of revolutions per ⅛ in. of metal removed as the chill was worn away is easily accounted for, but it was not expected that the variations from the results obtained with the steel tires would be so great as they were. In the laboratory the metal and wheel were kept cool, so that at no time did the temperature rise, even on the face of the specimen, above that of the hand. As these abrasive tests have been checked in other ways, as will be shown later, it appears that the avoidance of heat is the explanation of the great difference.

It must be borne in mind that the primary object of these investigations was to ascertain to what extent the metal entering into the construction of the Schoen wheel fulfilled the requirements of actual service as determined by comparison with other wheels already upon the market and doing satisfactory work.

The conclusions to be drawn from a general review of the results obtained in this investigation are as follows:

From the physical tests of the metal of the Schoen solid forged and rolled steel wheel, it appears that it is the strongest of any of the tires and wheels examined. This strength appears in the maximum stress to which the metal was subjected, the point at which rupture took place and the limit of elasticity, all of which were higher than in any other wheel or tire, with the single exception of that of the A tire. This tire had a breaking load exceeding that of the Schoen wheel by but 428 lbs. per square inch of section, an amount that is unimportant.

The limit of elasticity, as expressed both in actual figures and in the percentage of the total load, was far higher in the Schoen wheel than in any of the others.

The ductility of the metal of the Schoen wheel, as indicated by the elongation of the tensile test pieces, is less than that of any of the other specimens with the exception of the E wheel. Here there is a difference of nearly 15 per cent. in favor of the Schoen wheel, despite the fact that the E wheel contains nearly .05 per cent. less carbon. This is probably due to the difference in the amount of work put on the two wheels.

In hardness the Schoen wheel stands the highest on the scale. This is shown in another way by the abrasion tests, which show the Schoen wheel to be the slowest of any to grind away.

In specific gravity the Schoen wheel is the highest.

The chemical composition is, of course, a matter that is regulated by specifications, and a review of these since the introduction of steel-tired wheels has shown a steady advance in the carbon content. The makers of the Schoen wheel have placed their wheel next to the highest in carbon content. This explains, in part, the high ultimate tensile strength, although it cannot account for it, altogether because the Schoen wheel leads the A tire, which has a higher carbon content, in elasticity and maximum load, and in ductility is above the E wheel, having a lower carbon content. In this analysis special attention is directed to the sulphur, not a trace of which could be found in the Schoen wheel specimens under examination.

Some Chicago Manufacturers on the 1908 Outlook.

J. M. Hopkins, Vice-President and General Manager, Camel Co., Chicago.—There is no business at present, and I do not believe that it will be at its best again until the early fall of next year.

E. F. Carry, First Vice-President and General Manager, American Car & Foundry Co., Chicago.—At present, of course, there are no car orders. Before April next business will begin again.

M. A. Garrett, Vice-President, Farlow Draft Gear Co., Chicago.—I think there will be a slight increase in business after January 1, but I do not look for anything big until after the Presidential nomination.

Chas. Riddell, Western Representative, Baldwin Locomotive Works, Chicago.—We are hopeful of a gradual increase after the first of January, but next year, being a Presidential year, will tend to keep business down somewhat.

Percy Manchester, Secretary, Quincy, Manchester, Sargent Co., Chicago.—We look for a decided improvement after February, 1908, which we believe will be the beginning of a healthy but gradual growth; in fact, this is indicated by the business of the past two weeks.

J. R. Cardwell, President, Cardwell Manufacturing Co., Chicago.—We positively believe that money will be easier after the first of the year and securities higher, which is sure to benefit business in all channels. We, therefore, are expecting larger orders.

A. C. McCord, President, McCord & Co., Chicago.—There are just two disturbing possibilities in making up our outlook: Some new political heresies and the extent of the commercial failures that inevitably follow a panic. If these failures are not too extensive we shall begin recovery in the spring and progress rapidly.

L. M. Viles, Secretary, Buda Foundry & Manufacturing Co., Chicago.—I believe that it will be some time before business will resume on the old basis, probably three or four months; but after that time I think there will be a gradual increase, because the lack of confidence, which is the predominating cause in this depression, will have disappeared.

W. H. Rooper, General Agent, Safety Car Heating & Lighting Co., Chicago.—There is no doubt in my mind as to the outcome of this situation, providing there is no possibility of a change of administration; but, on the other hand, if there is a possibility, I greatly fear that the so-called hard times will continue until such time as the people will again have sufficient confidence to invest their money.

G. E. Pratt, General Sales Manager, Hicks Locomotive & Car Works, Chicago.—We are not doing much business at present; we are doing some, however. I do not believe that orders will be lacking after the first of the year. Of course, it cannot be expected that business will resume on the same basis as it has been heretofore, but I do firmly believe the growth will be a gradual, consistent and a healthy one. I also believe that the firms with the cars and locomotives ready for immediate delivery will be the ones who will get the bulk of the business.

M. E. Ward, General Sales Agent, Chicago-Cleveland Car Roofing Co., Chicago.—When a patient drops into coma, you can fear a funeral, but when finance, commerce and trade fall into a dead stupor, as typified in the present situation, the patient is only taking a needed rest, and always arises reinvigorated. If it were not that everybody is possessed of a sort of nightmare feeling the situation could be readily righted, for the fundamentals of prosperity are scarcely ruffled by this disturbance. It is the most superficial of panics and, though its shadows may lengthen out to the fall months of 1908, I look for a marked, but not normal, revival of equipment orders in the first quarter of the new year.

G. C. Marsh, Manager, Contractors' Supply & Equipment Co., Chicago.—As we see it, the situation has changed greatly for the better within the last few days. We have had more inquiries for concrete mixers and hoisting engines and other machines used in railroad and other construction work in the past week than we have had in six weeks before. We look for a very decided change for the better after January 1st. With the cost of labor less and the efficiency of labor greater, it should be quite an incentive to new construction. Bond houses which finance railroads should recognize the fact that railroads built when labor and material are cheap are better security than when built with high prices for these articles. We are feeling quite optimistic.

W. E. Symons, President Pioneer Cast Steel Truck Co., Chicago.—While there is evidence of a partial restoration of confidence and resumption of business activities in all directions, particularly in the railroad line, yet it would seem unsafe to attempt to predict, with any degree of accuracy, what may occur in a very short period of time. This condition has been especially emphasized by our recent experience in which we have learned that, while in the midst of the most prosperous epoch in American history, it is possible for a few persons to so completely destroy confidence in all financial, industrial and business concerns, and to so question the honesty of their fellow men and neighbors, that about 40,000,000 people have withdrawn and hoarded sums ranging from millions down to a few dollars with the result that in the midst of prosperity many of the most influential and well-managed business institutions are on the verge of bankruptcy.

The Mississippi Valley will, not many years hence, be the abiding place and furnish sustenance for a population equal to that of the United States at present, and in order to provide transportation facilities, both rail and water, additions on as broad or broader scale than any yet predicted by Mr. Hill or Mr. Harriman will be necessary, but with the public confidence shaken, as it is, it would seem that the problem of financing such additions as are at present badly needed is one very difficult of solution, and the future is decidedly problematical.

H. C. Dolph, President, The Ostermann Manufacturing Co., Chicago.—With adjustment of money conditions and movement of crops, a gradual improvement in business should follow.

The following expressions are from important officers or representatives of railroad supply and car building concerns, who desired their names withheld:

"If times were normal the railroads would need more cars, but as the case is now, the foreign cars are being returned to their home roads, which gives the railroads sufficient cars for handling the crops, consequently there is no market for new cars."

"Wall street had its own way for a long time, but Theodore Roosevelt has shaken matters up, causing a slow money market. This has reacted upon the railroads and they, in turn, are curtailing expenses."

"The present turn of affairs is for the good of all and will help to weed out the businesses established on illegal foundations. Last year's market was far above normal and it will be a long time before such a market is reached again."

"The labor situation of the past has been a fruitful cause in bringing about the present condition of the market and I would consider it one of the reasons for the railroads postponing the purchase of new equipment. A recovery in the market can hardly be looked for before six months. Crops are plentiful this year and the railroads seem to have sufficient cars to handle them."

"The inevitable dullness that always follows a panic is sure to return this year, as in former years, therefore I would say that we expect no business until after the Presidential election. There is a slow movement in handling the crops, consequently railroads are not in need of new equipment. The present uncertainty of the money market, and adverse state legislation, have caused the railroads to defer action until a decision has been reached."

Foreign Railroad Notes.

The Italian State Railroads report that they are now running $17\frac{1}{2}$ per cent. more trains than when they took over the management from the companies July 1, 1905; that the speed of many trains has been increased, and in many cases freight separated from passenger traffic, while since Nov. 15 last third class cars are attached to all so-called "fast" trains, while it contemplates attaching them to some "express" trains.

There is a conflict between the general government of China and the province of Che-kiang over the building of a railroad from Soo-chow, a city 50 miles west of Shanghai and connected with it by rail, extending south by west 65 miles to Hang-chow, and thence east 65 miles along a bay to Ning-po. The province claims that two years ago it was given the right to build the line, and the Pekin government says that it is going to contract with an English-Chinese company to build. Shanghai merchants are said to be ready to subscribe $15,000,000 to the provincial enterprise, and they threaten to boycott English goods and to refuse to pay taxes if the English are let into the enterprise.

GENERAL NEWS SECTION

NOTES.

It is reported in Iowa that the Chicago, Burlington & Quincy will hereafter sell no liquors on dining cars in that state.

The Maine Central, controlled by the Boston & Maine, has followed the B. & M. in withdrawing from the per diem agreement.

The Pennsylvania and the Philadelphia & Reading have decided not to grant reduced passenger rates to clergymen. Certificates now held by clergymen, and expiring December 31, are not being renewed.

The Union & Southern Pacific announce that they now have 4,593 miles of line protected by the "Most Modern Safety Block Signal System." This means, apparently, the mileage of automatic signals.

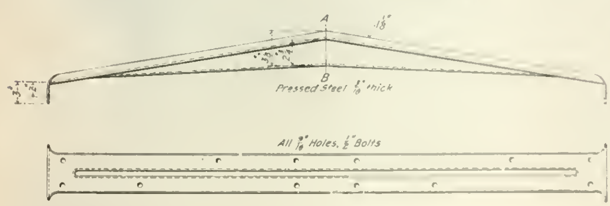
The Erie Railroad has made reductions of 2 to 10 per cent. in the salaries of officers and clerical employees. The reduction, it is said, applies to all of the classes named who receive more than $50 per month, and it affects 1,700 persons.

On the Saturday before Christmas, December 21, the lines of the Interborough Rapid Transit Company, New York City, carried 1,649,752 passengers. Of these 961,114 were carried on the Elevated lines and 688,638 on the Subway division.

The Boston Elevated Railway has distributed to its employees $60,000 in the shape of rewards of $15 each to those employees who during the past year have not been reported for delinquency or misconduct. It is said that this year 85 per cent. of the men received the rewards. This is the fifth time the company has made New Year gifts of this kind.

The Chicago, Burlington & Quincy has established a Bureau of Employment, which will supervise, over the whole of the company's lines, all applications for employment, except in unskilled labor; also the records of all employees in the service. The Superintendent of the bureau is J. N. Redfern, who is also Superintendent of the Relief department.

The Pittsburgh Railways Company, operating the street car lines in Pittsburgh, Pa., has adopted a rule that passengers must pay fare on entering the cars. This action is taken without waiting to provide special large-platform cars, as in Montreal. The main object, it is said, is to keep the conductor always at the rear platform, where he can have control of the brakes while descending hills.



Pressed Steel Carline.

The Central of New Jersey, which has been notified by the New York, New Haven & Hartford that through freight traffic between the two lines by way of New York harbor will no longer be encouraged by the New Haven, has filed with the Interstate Commerce Commission a formal petition asking the Commission to order the New Haven to pay the regular rate (50 cents a day) on freight cars sent by the Central to the New Haven; or, if the Commission does not approve the rate, that a fair per diem rate be prescribed. The other roads terminating in New Jersey have joined the Central of New Jersey in the petition—namely, the Pennsylvania, the New York Central (West Shore), the Erie, the Baltimore & Ohio, the Lehigh Valley, the Delaware, Lackawanna & Western, the Philadelphia & Reading, the Delaware & Hudson and the Lehigh & Hudson River. From this action it would seem that the New Haven has not settled its car service balances for the months of October and November. The complainants declare that 50 cents a day is below a reasonable rate.

Improved Service on the New York Subway Lines.

By shortening and more strictly regulating the stops at stations, the officers of the New York City Subway have succeeded in running express trains in the busy hours at the rate of 30 trains an hour and in exceptional cases a little better than this. This is a considerable improvement over the best previous practice. These trains stop at intervals of about $1\frac{1}{2}$ to two miles and are run under the block system, with overlaps, so that except at stations trains when running at full speed have to be kept something more than a half mile apart. Under the new arrangement there is at a busy station like that in Forty-second street, a man with a stop watch, situated where he can have an unobstructed view of the whole length of the platform, who by a bell signal orders the trains started after they have been stopped 45 seconds, except in cases where (a) the passengers desiring to alight have not all got out or (b) the station platform is so crowded that it is necessary to send away some of the waiting passengers. It is said that but comparatively few passengers have had to wait for a later train by reason of the shortening of stops. The policemen now on duty at the express stations have succeeded in making passengers distribute themselves along the platform better than formerly, thus relieving the congestion at the entrances of the cars at the middle of the train.

New Signal Orders.

The Union Switch & Signal Company's orders booked during December last total a larger sum than in any month since August. They are larger, too, than for the corresponding month in 1906. It is also significant and worthy of note that no overwhelmingly large order, during this past month, swells the total. It consists of a great many orders from many railroads. The block signalling orders are comparatively slight; the bulk of the business now is in supplies and orders for minor installations of interlocking plants. Colonel Prout has for the past six months considered the outlook serious, and, in mentioning the above facts, says that they do not at all coincide with his somewhat pessimistic theories of the to be expected results of the financial disturbance.

New Pattern of Pressed Steel Carline.

The pressed steel carline made by the Cleveland Car Specialty Co., Cleveland, Ohio, was described in the *Railroad Gazette*, April 29, 1904. A new pattern is now being made, a drawing of which is shown herewith. It combines a channel and I section to give a maximum of strength and lightness. The channel also provides room for a 5-in. nailing strip, which is bolted to it, giving a wide support for the longitudinal course of boards.

SECTION A-B.

Because of their lightness and strength, fewer pressed steel carlines are required per car than wooden ones and an appreciable reduction in weight is gained. Also, in most cases, greater inside clearance is obtained. These pressed steel carlines are made in several patterns, for different types of cars. The one shown here is for an outside metal roof.

State Regulation of Railroad Details.

The New York State Public Service Commission, First District, on Dec. 27 issued orders to railroads on a great variety of subjects. Two orders applying to the Staten Island Rapid Transit Railway and the Staten Island Railway Company provide that the companies shall install warning bells at all crossings, signs requiring the engineers to ring their bells at certain specified places, gates at specified crossings of especial danger, all stations to be adequately lighted, as well as trains, all trains to be run to connect with incoming and departing boats at the municipal ferry at St. George. The Staten Island Rapid Transit is ordered to abate smoke and noise nuisances at the freight yards on the west side of the island. Unnecessary labor on Sundays is prohibited.

The Staten Island Railway is commanded to place a flagman at a specified crossing in Tottenville, to lay planking where its tracks cross certain streets to make a level crossing and to run three additional trains daily on Sundays and holidays. The number of cars and the times are specified. The Brooklyn Union Elevated is ordered to repair its waiting rooms at the 36th street station, which now are used chiefly as storerooms for working materials, and to erect windbreaks there to shelter passengers. This work must be completed by January 25. The Interborough (New York) is directed to resume a discontinued service along Amsterdam avenue, from Kingsbridge road to the 155th street terminus. The Commission also adopted a resolution providing for the widening of the subway stairway leading from Vanderbilt avenue at the Grand Central Station.

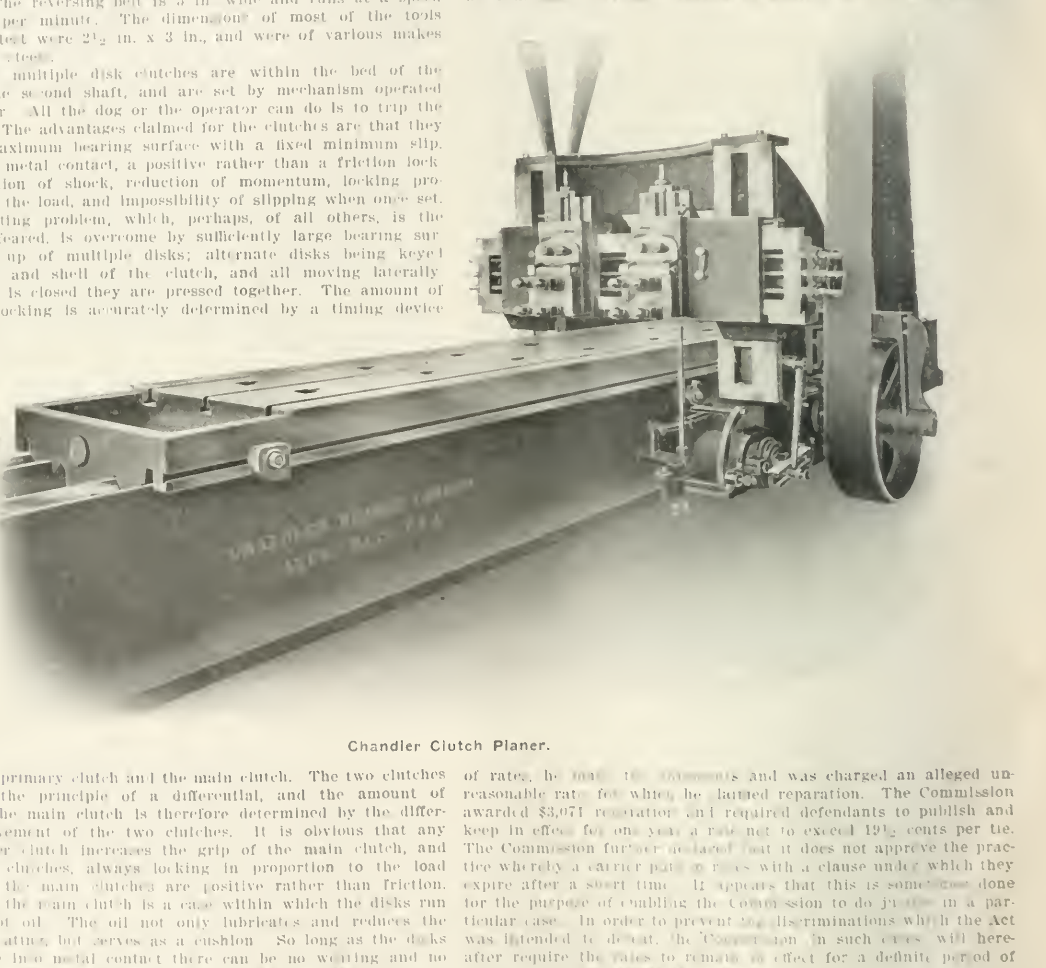
Chandler Clutch Planer.

The Chandler Planer Co. has been testing at its shop at Ayer, Mass., a clutch-driven planer shown in the accompanying illustration. The planer removes the side of the head up to the web, on a pair of extra hard 75-lb. easy switch points, cutting back 9 ft. in less than 6 minutes. The company expects to reduce that time about 20 per cent. At a cutting speed of 20 ft., it removed from a 10-point carbon steel forging a chip ¾ in. deep with ¾ in. feed. It runs for hours on a 14 in. stroke without any indication of injurious heating or wearing.

It is 42 in. x 20 in. x 20 ft., and weighs about 30 tons. In order to subject the clutches to the severest class of work, the planer is of the frog and switch type. Its cutting speed is 20 ft., with a return of 4 1. The cutting belt is 10 in. double and runs at a speed of 1,860 ft. per minute with ratio of 93 ft. of belt to 1 ft. of platen. The reversing belt is 5 in. wide and runs at a speed of 3,900 ft. per minute. The dimensions of most of the tools used in the test were $2\frac{1}{2}$ in. x 3 in., and were of various makes of high speed steel.

The two multiple disk clutches are within the bed of the planer on the second shaft, and are set by mechanism operated by the planer. All the dog or the operator can do is to trip the mechanism. The advantages claimed for the clutches are that they provide a maximum bearing surface with a fixed minimum slip, avoidance of metal contact, a positive rather than a friction locking, elimination of shock, reduction of momentum, locking proportionate to the load, and impossibility of slipping when once set.

The heating problem, which, perhaps, of all others, is the most to be feared, is overcome by sufficiently large bearing surfaces, made up of multiple disks; alternate disks being keyed to the shaft and shell of the clutch, and all moving laterally. When clutch is closed they are pressed together. The amount of slip before locking is accurately determined by a timing device



Chandler Clutch Planer.

between the primary clutch and the main clutch. The two clutches operate on the principle of a differential, and the amount of locking of the main clutch is therefore determined by the difference in movement of the two clutches. It is obvious that any slip of either clutch increases the grip of the main clutch, and insures the clutches always locking in proportion to the load. In a sense, the main clutches are positive rather than friction. The shell of the main clutch is a case within which the disks run in a bath of oil. The oil not only lubricates and reduces the chance of heating, but serves as a cushion. So long as the disks do not come into metal contact there can be no wearing and no heating. One clutch engages with the cutting belt shaft and one with the reversing belt shaft. Consequently, one clutch is idle while the other is in operation. This gives the idle clutch a chance to rest and become thoroughly lubricated before engaging. When engaged, both the primary and main clutch revolve as one clutch.

As momentum is the product of weight multiplied by velocity, every material reduction of either greatly reduces the difficulty of reversing. The clutches are on the second shaft, and the only parts of the clutch that reverse are the disks that are keyed to the shaft. The clutch case and all the other operating mechanism moves constantly in one direction. Supplementing the primary and main clutches is a mechanically operated device which insures a proper and positive engagement of the primary clutch and leaves nothing to the mischance of dogging, and provides a proper margin of safety to meet all the conditions of varying platen load. To run the planer light at a cutting speed of 20 ft., with return speed of 4:1, requires 6 to 7 h.p. on either stroke. To reverse requires about 29 h.p. On severe cutting loads the clutches hold without slipping under a load of over 50 h.p.

INTERSTATE COMMERCE COMMISSION RULINGS.

Reduced Rates Ordered for a Fixed Period of Time.

In an opinion rendered by Commissioner Harlan the Commission has announced its decision in the case of the Holcomb-Hayes Company against the Illinois Central and the Southern. These companies in December, 1905, leased the Tennessee Central and a few days later canceled the through tariffs formerly in effect over that road. When this occurred complainant was engaged in filling a contract for delivering a large number of ties at Pawnee Junction, Bloomington and Baxter, Illinois, from various shipping points on the Tennessee Railroad. Instead of waiting for the readjustment of rates, he made the shipments and was charged an alleged unreasonable rate for which he claimed reparation. The Commission awarded $3,071 reparation and required defendants to publish and keep in effect for one year a rate not to exceed $19\frac{1}{2}$ cents per tie. The Commission further declared that it does not approve the practice whereby a carrier puts in rates with a clause under which they expire after a short time. It appears that this is sometimes done for the purpose of enabling the Commission to do justice in a particular case. In order to prevent the discriminations which the Act was intended to defeat, the Commission in such cases will hereafter require the rates to remain in effect for a definite period of time, to be designated in the order.

New Road Not Encouraged to "Divide the Traffic" With Old.

In an opinion by Commissioner Harlan the Commission has announced its decision in the case of the Chicago & Milwaukee Electric Railroad against the Illinois Central and others. The Commission holds that the act makes no distinction between railroads that are operated by electricity and those that use steam locomotives. The complainant made application for the establishment of through routes and joint rates on freight in both directions between points on its own line and points on the lines of the defendants, but it appeared that the shipping community was already supplied with a reasonable or satisfactory through route, and the Commission decided that the complaint should be dismissed.

The Commission further declared that the proviso in section 15 of the amended law limiting the power of the Commission to establish through routes and joint rates to cases where "No reasonable or satisfactory through route exists" is to be interpreted as meaning that the law is not intended to afford a means by which new lines, with the aid of the Commission, may profitably force their way into shipping districts built up and already well served by older lines, and thus seize and divide with the latter such traffic as may be offered. The purpose of the clause was to afford relief to shipping communities and not to aid carriers to acquire strategic advantages in their contests with one another.

Miscellaneous Rulings.

A number of administrative rulings, involving questions of importance affecting the operation of the interstate commerce law, have been issued by the Interstate Commerce Commission.

It is held that employees of produce companies must pay full fare in traveling to points on the carriers' lines where they expect to obtain consignments and become caretakers.

It is also held that the limitation of rates to shipments handled by steam power as against those handled by electric power is unlawful and must be eliminated from the tariff.

The Commission adheres to its previous ruling that carriers must exhaust their legal remedies to collect undercharges from consignees before filing their petitions for redress.

A tariff containing a new reconsignment privilege cannot be applied retroactively for a previous reconsigned shipment, and cannot be accepted for the basis of a refund.

The granting by carriers of commissions to persons acting as consignees on import merchandise, it is decreed, is a practice that cannot be sanctioned.

The Commission holds it has no power to relieve carriers from the obligations of tariffs providing for demurrage charges on the ground that such charges have been occasioned by a strike.

Where stock in one railroad company is owned by another railroad company, but both maintain separate organizations and report separately to the Commission, it is decided that they may not lawfully carry freight free for each other.

When, after complaint is made and before a hearing, a rate is reduced to the sum demanded by the complainant, the order disposing of the proceedings will be made to require the maintenance of that rate as a maximum for not less than two years.

A tariff filed without naming a date on which it was to take effect was held unlawful and as never having taken effect.

OBITUARY NOTICES.

Edward Payson Rogers, formerly Assistant General Freight and Passenger Agent of the Southern Pacific lines in Oregon, died at his home in Portland, December 21, at the age of 77. Mr. Rogers was one of the pioneers of the northwest, having gone from Iowa to Oregon in 1877. He was born in Vermont and before going to the Pacific Coast was General Freight and Passenger Agent of the Burlington, Cedar Rapids & Northern. His entire railroad career of 30 years in Oregon was passed on lines which finally were all merged into the Southern Pacific. He retired from active service in 1903.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Beaumont & Great Northern.—Leroy Trice, formerly Vice-President of the International & Great Northern, has been elected a Director and Vice-President of the Beaumont & Great Southern, with headquarters at Palestine, Tex.

Canadian Pacific.—Grant Hall, Assistant Superintendent of Motive Power, will also assume the duties of Assistant to the Second Vice-President, succeeding William Cross, whose office has been abolished.

St. Louis & San Francisco.—W. F. Evans, General Attorney, has been appointed General Solicitor, succeeding L. F. Parker, deceased.

Operating Officers.

Chesapeake & Ohio.—This road will hereafter be operated in three general divisions, as follows: The Virginia General division will consist of the Richmond division and Clifton Forge division; the West Virginia General division will consist of the Hinton division, Huntington division and Greenbrier division, and the Kentucky General division will consist of the Ashland division (formerly Kentucky division) and Cincinnati division. The following Superintendents have been appointed: J. W. Knapp, Division Superintendent, has been appointed General Superintendent of the Virginia General division, with office at Richmond, Va. E. J. King, Trainmaster, has been appointed Superintendent of the Richmond division with office at Richmond, Va. E. P. Goodwin, Division Superintendent, has been appointed General Superintendent of the Kentucky General division, with office at Covington, Ky. J. A. Fox, Assistant Division Superintendent, has been appointed Superintendent of the Ashland (formerly Kentucky) division, with office at Ashland, Ky. J. P. Stevens, Assistant Division Superintendent, has been appointed Superintendent of the Cincinnati division, with office at Covington, Ky. The office of Assistant Superintendent of the Kentucky division and the office of Assistant Superintendent of the Cincinnati division have been abolished.

Ohio River & Columbus.—E. H. Blair, Vice-President, has been appointed General Manager, with office at Ripley, Ohio, and the position of Superintendent is abolished.

Oregon Short Line.—J. M. Davis, Assistant General Superintendent, has been appointed Acting General Superintendent of the Oregon Short Line and the Southern Pacific lines east of Sparks, with headquarters at Salt Lake City, Utah, succeeding E. Buckingham, resigned.

Seaboard Air Line.—R. E. Boswell, Superintendent of the Alabama Great Southern at Birmingham, Ala., has been appointed Superintendent of Transportation of the Seaboard Air Line, succeeding H. W. Standley.

Traffic Officers.

Chicago & Alton.—E. A. Keane, Assistant General Freight Agent of the Toledo, St. Louis & Western at St. Louis, has been appointed to the same office on the C. & A. and will have charge of the freight business of both roads at St. Louis.

C. J. Chisam, Assistant General Freight Agent of the C. & A. at St. Louis, has been transferred to Chicago, where he will have supervision, with the same title, of the coal and lumber traffic of the C. & A. and the Toledo, St. Louis & Western.

B. C. Stevenson, Assistant General Freight Agent of the Toledo, St. Louis & Western at Toledo, has been transferred to Chicago. He will hold the same title on the Toledo, St. Louis & Western and the C. & A.

E. M. Davis, Traveling Freight Agent of the Toledo, St. Louis & Western, has been appointed Division Freight Agent at Toledo.

The authority of George B. Simpson, Assistant General Freight Agent of the C. & A. at Kansas City, is extended over the Toledo, St. Louis & Western.

D. Bowes, Assistant General Passenger Agent of the C. & A. at St. Louis, has been appointed Chief Assistant General Passenger Agent of both the C. & A. and the T., St. L. & W.

R. J. McKay, Assistant General Passenger Agent of the T., St. L. & W. at St. Louis, has had his jurisdiction extended over the C. & A., and will move his headquarters to Chicago.

T. J. Burns, of the T., St. L. & W. at Kansas City, becomes Assistant General Passenger Agent of both roads.

C. R. Davidson has been appointed Assistant General Passenger Agent of the C. & A. at Chicago.

Chicago, Rock Island & Pacific.—The headquarters of G. B. Albright, Assistant General Freight Agent, have been transferred from St. Louis, Mo., to Kansas City, Mo., succeeding K. M. Wharry, resigned.

International & Great Northern.—R. E. Lee, chief clerk in the general passenger department, has been appointed Assistant General Passenger Agent, with office at Palestine, Tex., succeeding G. D. Hunter, promoted.

Kansas City Southern.—H. A. Graber, commercial agent, has been appointed General Agent, with office at St. Louis, Mo., succeeding C. H. Ivers.

Missouri, Kansas & Texas.—J. E. Arnold has been appointed Traveling Manager of dining car service between St. Louis and New Orleans.

Toledo, St. Louis & Western.—See Chicago & Alton.

Wabash.—R. W. Owens, heretofore commercial agent at Denver, Colo., has been appointed General Agent of the passenger department, succeeding P. P. Hitchcock, resigned to go into other business.

Engineering and Rolling Stock Officers.

Chicago & Alton.—Charles E. Fuller, Superintendent of Motive Power, has resigned, effective January 1. Peter Maher, Superintendent of Motive Power of the Toledo, St. Louis & Western, will now hold that office for both the T., St. L. & W. and the C. & A.

Chicago, Cincinnati & Louisville.—K. L. Dresser has been appointed Master Mechanic, with headquarters at Peru, Ind., succeeding G. W. Dickson, resigned.

Grand Trunk.—G. W. Dickson, Master Mechanic of the Monon at Peru, Ind., has been appointed Master Mechanic of the Grand Trunk in Canada. K. L. Drexler succeeds Mr. Dickson.

LOCOMOTIVE BUILDING.

The United States Government Engineer Corps, War Department, Portland, Ore., has ordered three Forney locomotives weighing 17 tons, with 9 [illegible] x [illegible]-in. cylinders, from the Davenport Locomotive Works.

CAR BUILDING.

The Grand Trunk is said to be figuring on six or eight cars.

The Waterloo, Cedar Falls & Northern has ordered two interurban electric cars and five 10-bench open cars from McGuire-Cummings Company for April delivery.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

ARKANSAS, OKLAHOMA & WESTERN.—Surveys are being made for an extension of this road from Rogers, Ark., northeast to Eureka Springs, and from Siloam Springs, Ark., west to Pryor Creek, Okla., a total of 10 miles. Contract let for some of the work to the W. R. Felker Construction Company, of Rogers, Ark.

BESSEMER & LAKE ERIE.—The extension of the Western Allegheny to West Pittsburgh, where a connection is to be made with the Pittsburgh & Lake Erie and with the Baltimore & Ohio, will be finished and put in operation early in 1908. The new line is two miles long. It runs from the present terminal of the Western Allegheny near Cascade Park, Pa., through Shenango township to West Pittsburgh.

BLAIR LUMBER COMPANY'S ROAD.—Contract has been given to Vito Greco, of Ligonier, Pa., for building a line for this company from Laurel Summit, Pa., to Indian Creek, four miles. Address J. W. Baker, Ligonier.

BUFFALO CREEK & GAULEY.—Surveys are made by this company for an extension from Cresmont, W. Va., to Camden-on-Gauley, 40 miles. Wm. D. Janney, Chief Engineer, Clay, W. Va.

CAROLINA VALLEY.—This company is building an extension from Thomasville, N. C., to High Point, six miles, and from High Point to Greensboro, 16 miles; also from High Point to Winston-Salem, 21 miles.

CHICAGO & WABASH VALLEY.—This company is building an extension from Dinwiddie, Ind., north to Gary, 20 miles.

DULUTH & NORTHERN MINNESOTA.—This company, which last year extended its line north in Minnesota five miles to mile 50, is making surveys from that point north to mile 170.

FLORIDA CENTRAL.—An officer writes that this company, which last year built 28 miles of line in Georgia and Florida, is building with its own men an extension from Maysville, Fla., north to Roddenbury, Ga., 22 miles. J. L. Philips, President, Thomasville, Ga.

GRAND RAPIDS & INDIANA.—See Pennsylvania Lines West.

KENTUCKY MIDLAND.—Contract has been given to A. B. Wood, of Cottage Grove, Ore., for building an extension from Cypress Creek, Ky., to Midland, ten miles. Surveys under way for an extension from Midland to Madisonville, 13 miles. M. M. Wheeler, Chief Engineer, Central City.

LITTLE RIVER.—Contract let to J. W. Anderson & Co., of Townsend, Tenn., for an extension from Forks, Tenn., to Trenthams, four miles.

LOUISIANA & FORT BOYD.—Contracts have been given to S. R. Neel, of Hunter, Ark., for building an extension from Dollar Junction, Ark., to New London, 15 miles. An extension is projected from New London to Wilmington, 17 miles further.

MINIDOKA & SOUTHWESTERN.—See Union Pacific.

MORGANTOWN & NORTH FORK.—This company is building with its own men an extension from Paragon, Ky., southeast to Redwine, ten miles.

MOUNTAIN CENTRAL.—This company has projected a 12-ft. line from Campton, Ky., northeast to Hazel Green, ten miles. J. C. M. Day, General Manager, Clay City, Ky.

NORTHWESTERN RAILROAD.—See Union Pacific.

OREGON RAILROAD & NAVIGATION.—See Union Pacific.

OREGON SHORT LINE.—See Union Pacific.

OREGON, WASHINGTON & IDAHO.—See Union Pacific.

PENINSULA RAILWAY.—An officer writes that this company, which has projected a line from Bartow, Fla., west to Tampa, 50 miles, also from Bartow southwest to St. Lucie, on the Atlantic coast, has four miles graded and track laid on about one mile. Work has been stopped on account of the financial stringency. E. C. Stuart, President, Bartow, Fla.

PENNSYLVANIA & MARYLAND STREET (ELECTRIC).—It is reported that this company, which is building a line to connect Salisbury, Pa., Meyersdale, Berlin and Somerset, now nearly finished, will build a line through Somerset county to Johnstown, where a connection is to be made with the South Cambria.

PENNSYLVANIA LINES WEST.—The Grand Rapids & Indiana has given contracts to the McDonald-O'Connor Company, of Grand Rapids, Mich., for building a 10-mile extension from Ardis, Mich. Surveys are being made from Harbor Springs northwest 12 miles.

SOUTH OMAHA & WESTERN.—See Union Pacific.

TOLEDO, ST. LOUIS & NEW ORLEANS.—Negotiations are under way between this company and residents of Paducah, Ky., to secure an entrance to that place. The company, several years ago, asked for a bonus of several thousand dollars, agreeing to make this point a terminal and to spend $500,000 on improvements.

TOPEKA & NORTHWESTERN.—See Union Pacific.

UMATILLA CENTRAL.—See Union Pacific.

UNION PACIFIC.—The report of this company for the year ended June 30, 1907, shows work done as follows by the following companies:

Work on the projected line from Hershey, Neb., to Northport, about 115 miles, has been finished for 51 miles and work is progressing on the remaining 61 miles.

South Omaha & Western.—Grading on this double-track line from South Omaha, Neb., to Lyman, about 11.60 miles, is nearing completion.

Topeka & Northwestern.—Grading on the extension from Onaga, Kan., to Marysville, 32.1 miles, is progressing and it is expected to finish the line by May 1, 1908. This line, in connection with the trackage arrangements over the St. Joseph & Grand Island Railway, will effect a saving of about 98 miles between Kansas City, Mo., and Cheyenne, Wyo., as against the Denver line, and will also [illegible] between these points of much more favorable gradients and curvatures than via Denver.

Oregon Short Line.—An extension of the North Kemmerer branch, in Wyoming, along Willow creek, about eight miles, is nearing completion.

Minidoka & Southwestern.—On the extension from Twin Falls, Idaho, to Buhl, 15.22 miles, work has been finished.

Northwestern Railroad.—This company was organized to build a line from Blake's Spur, Ore., northward along the west side of the Snake river to Homestead, Ore., 58 miles. Grading is under way along the entire line.

Yellowstone Park.—Of the remaining 53.97 miles of this line, 21.15 miles are finished. Grading under way on the remaining 32.82 miles.

Oregon Railroad & Navigation.—On the extension of the Elgin branch from Elgin, Ore., to Joseph, about 40 miles are graded ready for track, and grading is progressing on the remaining 14 miles.

Oregon, Washington & Idaho.—Track has been laid from Texas City, Wash., to Vaola, 37 miles, and grading on the remaining 25 miles has been finished.

Umatilla Central.—This company, which was organized to build a line from a point near Pendleton, Ore., to Pilot Rock, 14.29 miles, has finished the line.

UNITED TRACTION COMPANY.—Contract has been let to A. W. Sykes, of Sykesville, Pa., for building seven miles of electric line from Sykesville, Pa., to Big Run. E. W. Hess, Chief Engineer, Du Bois, Pa.

WESTERN ALLEGHENY.—See Bessemer & Lake Erie.

WESTERN PACIFIC.—This company is pushing work in the foothills of the Sierra Nevada mountains. George J. Gould, in speaking of the work carried on during the year, states that with 8,000 men at work more earth and rock has been moved than 20,000 men have moved on the Panama canal. During the first eleven months of 1907, 11,171,300 cu. yds. were moved, more than half of which was rock, as compared with 8,171,000 cu. yds. moved on the Panama canal. In addition, the Western Pacific during the same period has driven more than three miles of tunnels, most of which are lined, has built a large amount of masonry, and erected numerous steel bridges. Nearly 200 miles of detached main line steel track was laid and ballasted and a number of stations have been put up; also water tanks, coal chutes and telegraph lines. The Utah Construction Co., of Ogden, Utah, and the E. B. & A. L. Stone Co., of Oakland, Cal., are at work on the remaining 577 miles to finish the line from Salt Lake City, Utah, west to Oakland, Cal., a total of 929 miles.

YELLOWSTONE PARK.—See Union Pacific.

UNION PACIFIC RAILROAD COMPANY—TENTH ANNUAL REPORT.

INCOME FOR THE YEAR.

The gross receipts and disbursements of the Union Pacific Railroad and auxiliary companies, after excluding all offsetting accounts between them, were as follows:

	1907	1906.
Average miles of rail lines operated during year	5,644.55	5,403.55
Transportation Operations.		
Gross transportation receipts	$76,040,726.65	$67,281,542.60
Operating expenses	$40,574,889.10	$35,261,170.84
Taxes	2,069,734.46	1,702,602.32
Total operating expenses and taxes	$42,644,623.56	$36,963,773.16
Receipts over operating expenses and taxes	$33,396,103.09	$30,317,769.44
Fixed Charges.		
Interest on funded debt outstanding	$8,640,608.34	$8,870,898.05
Sinking fund, Utah & Nor. Ry. Co. cons. mtg.	12,013.33	12,013.33
Rentals to Un. Pac. Equip. Ass'n., for equipment	153,578.76	....
	$8,806,200.43	$8,882,911.38
Surplus after payment of fixed charges	$24,589,902.66	$21,434,858.06
Application of Surplus.		
Dividends on stocks of Union Pacific R.R. Co.:		
2 per cent. on preferred, paid Apr. 1, 1907	$1,990,882.00	$1,990,882.00
2 per cent., on preferred, payable Oct. 1, 1907	1,990,882.00	1,990,882.00
3 per cent. on common, paid April 1, 1907	5,864,337.00	5,776,497.00
1½ per cent. on common, payable Jul. 1, 1907	2,932,168.50 }	5,864,337.00
1½ per cent. on common, payable Oct. 1, 1907	2,932,318.50 }	
On stocks of Ore. R. & Nav. Co. outstanding:		
2 per cent. on prfd., paid Jan. 1, 1907	134.00	134.00
2 per cent. on prfd, payable July 1, 1907	98.00	134.00
	$15,710,820.00	$15,622,866.00
Surplus after payment of dividends	$8,879,082.66	$5,811,992.06
Income Other Than from Transportation Operations.		
Interest on bonds owned other than Ore. Sh. L. and Ore. R.R. & Nav. Companies	$258,841.28	$297,910.67
Dividends on stock owned other than Ore. Sh. L. and Ore. R.R. & Nav. Companies	*11,563,105.25	7,237,916.67
Bal. rentals from steamships, other property, etc	242,458.14	506,179.24
Bal. int. on loans and open accounts other than with auxiliary companies	....	2,287,809.02
Total	$12,064,407.67	$10,329,815.60
Less—balance of interest on loans and on open accounts other than auxiliary companies.	477,389.45	....
Balance	$11,587,018.22	$10,329,815.60
Deductions—Dividends on Union Pacific stock:		
2 per cent. on common, paid Apr. 1, 1907	$3,909,558.00	....
1 per cent. on common, payable July 1, 1907	1,954,779.00 }	$3,909,558.00
1 per cent. on common, payable Oct. 1, 1907.	1,954,879.00 }	
Total deductions	$7,819,216.00	$3,909,558.00
Surplus.	$3,767,802.22	$6,420,257.60
Total surplus from transportation and other income after payment of dividends.	$12,646,884.88	$12,232,249.66
Applied as follows:		
For betterments made during the year	$1,959,002.03	$2,700,000.00
For betterments and additions of branch lines	.....	500,000.00
For new equipment.	....	1,000,000.00
Total	$1,959,002.03	$4,200,000.00
Net surplus	$10,687,882.85	$8,032,249.66
Increase in net surplus,* 1907 over 1906	2,655,633.19	..

*Does not include dividends of $2,015,962.50, declared since July 1, 1907, for year ended June 30, 1907, on shares of Atchison, Topeka & Santa Fe, Baltimore & Ohio, and the Illinois Central railroads.

ASSETS AND LIABILITIES

The assets and liabilities of the Union Pacific Railroad and Auxiliary Companies are shown in detail in Table No. 5. The securities of the Auxiliary Companies owned by the Union Pacific Railroad Co. and of the proprietary railroads which are operated as an integral part of the system and are owned by the Union Pacific Railroad and auxiliary companies, as well as all offsetting accounts between the companies, are eliminated, thus dealing only with the securities in the hands of the public and the assets due from and liabilities due to the public.

The increase or decrease in assets and in liabilities since the last report, briefly stated, is as follows:

Increase in Assets		
Cost of railways, equipment and appurtenances as shown in detail under "Capital Expenditures"		$21,073,150.32
Stocks and bonds, including $18,000,000 San Pedro, Los Angeles & Salt Lake R.R. Co. 4 per cent. bonds taken over in settlement for advances		113,175,005.75
Material, fuel and supplies		2,051,621.24
Current cash accounts		1,041,225.22
Expenditures for construction of new lines, for terminal properties and for rolling stock	$14,468,083.22	
Less: Expenditures for construction of new lines in preceding years, dealt with as deferred assets in last year's report, transferred this year to cost of railroads, equipment and appurtenances	6,040,260.03	
		8,427,823.19
Total increase in assets		$145,768,825.72
Deduction—Received from San Pedro, Los Angeles & Salt Lake R. R. Co.	$17,300,000.00	
Decrease in cash and demand loans	45,398,034.05	
Decrease in unadjusted accounts	68,276.16	
		62,766,310.21
Net increase in assets		$83,002,515.51
Increase in Liabilities		
Capital stock	$29,130.00	
Current cash accounts	2,185,834.56	
Loans and bills payable	69,050,220.00	
Reserve depreciation and replacement of equipmt	420,688.56	
Due to proprietary companies	1,503,623.16	
Insurance, trust and hospital funds.	97,724.01	
	$73,287,220.29	
Deduct—Decrease in funded debt	466,500.00	
		72,820,720.29
Net increase of assets (gain in profit and loss)		$10,181,795.22

Since the close of the year the company has sold $75,000,000, face value "20-Year 4 Per Cent. Convertible Gold Bonds," hereinafter referred to, and the proceeds have been applied to the discharge of current liabilities.

There were sold during the year:

64,000 shares	Great Northern Railway Co.	$19,220,000.00
92,000 "	Northern Pacific Railway Co.	18,954,055.56
13,200 "	Great Northern Railway Ore Ctfs	1,021,789.63
Total		$39,195,845.19

which was credited against the cost of stocks owned. The proceeds from the sale of above stocks, together with the sales reported in the annual reports for the years 1905 and 1906, amounted to $117,869,799.66.

The state of the account in respect of the cost of the stock of the Northern Securities Company and of the preferred stock of the Great Northern Railway Company acquired under subscription rights, and the amount realized from the sale of stocks received in the distribution of the stocks of the Northern Securities Company, is as follows:

Cost of 824,918.71 shares Northern Securities Company stock.		$79,459,691.36
" 37,444.0 " Great Northern Railway Co. stock, acquired under subscription rights		3,744,400.00
Total cost		$83,204,091.36
The amounts realized from the stocks sold were:		
For 100,000.00 shares Nor. Securities Co. stock*	$16,880,019.46	
" 163,600.89 " Gt. Nor. Ry. Co. stock	49,801,576.47	
" 240,300.82 " Nor. Pac. Ry. Co. stock.	50,166,357.97	
" 18 " Nor. Securities Co. stubs	56.13	
	$116,848,010.03	
" 13,200.00 " Gt. Nor. Ry. Co. ore ctfs.	1,021,789.63	
		117,869,799.66
Amount realized from sales in excess of total cost of stocks†		$34,665,708.30

*Sold prior to distribution of Gt. Nor. Ry. Co. and Nor. Pac. Ry. Co. stocks.

†Besides 90,364 shares Great Northern Ry., 77,164 shares Great Northern Ry. Ore certificates, 41,528 shares Northern Pacific Ry. and 7,249 shares Northern Securities stubs still on hand unsold.

The annual dividends on the stocks amounted to $3,290,512.01. The average price realized per share was $168.80 for Northern Securities Company, $304.41 for Great Northern Railway Company, $208.76 for Northern Pacific Railway Company, and $77.41 for Great Northern Railway Company ore certificates. At these prices the dividends averaged per annum 2.67 per cent. on Northern Securities Company stock, 2.30 per cent. on Great Northern Railway Company stock, and 3.35 per cent. on Northern Pacific Railway Company stock, or an average of 2.79 per cent. for all. It was therefore decided to dispose of these holdings and to reinvest the proceeds in securities yielding a greater return.

Accordingly, there were purchased stocks costing $83,415,732.48, and, subsequently stocks of the Baltimore & Ohio Railroad Company costing $45,466,960. The deferred payment on the latter purchase amounted to $36,29[illegible] 432, against which the company had on hand, unsold, 100,364 shares of Great Northern Railway Company and 79,528 shares Northern Pacific Railway Company stocks, worth, at the then prevailing prices, about $47,000,000.

The state of the account in respect of these reinvestments, the value of Great Northern and Northern Pacific stocks unsold, and the annual dividends or interest are as follows:

	Shares	Cost	Annual Dividends or Interest: Rate	Annual Dividends or Interest: Amount
A., T. & S. F. Ry. Co., pf.	100,000	$10,395,000.00	5	$500,000.00
C., M. & St. P. Ry. Co., com.	36,900	5,997,750.24	7	258,300.00
C. & N. W. Ry. Co., com.	32,150	5,946,673.94	7	225,050.00

Total		$128,882,692.48		$5,721,585.00
Twenty-five per cent. paid on C., M. & St. P. Ry. Co. pf.	18,450	461,250.00	5	23,062.50
Twenty-five per cent. paid on C., M. & St. P. Ry. Co., com.	9,225	230,625.00	5	11,531.25
Fifty per cent. paid on subscription to Gt. Nor. Ry. Co. stk.	36,145.60	1,807,280.00	5	90,364.00
Twelve and one-half per cent. paid on subscription to Northern Pacific Ry. Co. stk.	24,916	311,424.00	7	21,799.68
Total		$131,693,271.48		$5,868,342.43

Value of unsold stocks on hand (market value June 29, 1907):			
90,364 shares Great Northern Ry. Co. @ 131..	$11,837,684 00		
77,164 shares Great Northern Ry. ore certificates @ 58..	4 475,512 00		
41,528 shares Northern Pacific Ry. Co @ 129	5,357,112 00		
7,219 shares Northern Securities Stubs @ 100 ..	724,900 00		
		$22,395,208 00	1,036,653 00
Proceeds from sale of Northern Securities, Great Northern and Northern Pacific stocks (from which the annual dividends amounted to $3,290,512.01) ..		117 869,799 66	
Total—Value of unsold stocks and proceeds from sales ..		$140,265 007 66	
Cost of Northern Securities and of Great Northern stocks		83,204 091 36	
Surplus		$57,060,916 30	
Annual income from reinvestment stocks, Great Northern Railway, and Northern Pacific Railway stocks on hand, unsold			$6,901,995 43

The income from the reinvestments yields an average of 4.46 per cent. against 2.79 per cent. on the original investment. This amounts to an annual gain of $1,968,424.72.

The market value of Northern Securities, Great Northern, and Northern Pacific stocks which were sold for $117,869,799.66, would, if still on hand, have been, at the prices of June 29, 1907, $62,342,263.04, a shrinkage of $55,527,536.12

The market value of the reinvestments made, at the prices of June 29, 1907, was $108,543,376.55, a shrinkage of...... 23,149,894.93

Increase in value by reinvestments..... $32,377,641.19

The stocks and bonds owned, other than stocks and bonds of the Union Pacific Railroad and auxiliary companies, stand charged at the close of the year with $209,406,811 81, an increase during the year of $112,625,005.75. This increase was mainly in the aforementioned reinvestments, the purchase of $20,000,000 San Pedro, Los Angeles & Salt Lake Railroad Company 4 per cent. bonds, the payment of $1,050,000, subscription of 25 per cent. to preferred stock of the Southern Pacific Company, and $2,022,540 paid for 50,822 shares of the preferred and common stocks of the St. Joseph & Grand Island Railway Company. The details of the stocks and bonds owned, pledged and unpledged, and the increase or the decrease during the year, are shown in tables Nos. 9, 10 and 11.

The details of the stocks and bonds of the Union Pacific Railroad and auxiliary companies are shown in tables Nos. 7 and 8. From table No. 8 it will be seen that the companies own bonds, unpledged, to the amount of $83,432,500 face value.

Including the miles of railroad released by the satisfaction of the Union Pacific Railroad Company first lien convertible 4 per cent. mortgage, the companies own, free of mortgage debt, the following miles of railroad and the entire outstanding stocks and bonds of the following railroads built in their interest:

Malheur Valley Railway Company	14.24
Minidoka & Southwestern Railroad Company	59.09
St. Anthony Railroad Company	37.46
Salmon River Railroad Company	85.99
Snake River Valley Railroad Company	65.85
Topeka & Northwestern Railroad Company	37.50
Wyoming Western Railroad Company	19.02
Yellowstone Park Railroad Company	16.40
Total miles	1,649.90

The profit and loss surplus at the close of the year amounted to $52,977,821 61. However, the actual annual surpluses since the company's reorganization aggregated a much larger amount. The above profit and loss surplus of $52,977,821 61 is the sum that remained after applying against this account profits applied in diminution of the cost of stocks and bonds, appropriations from income applied in writing down the cost of railroads, equipment and appurtenances, and, also, liabilities created by appropriations from income and by charges to expenses. The items thus applied have been reported in detail in the several annual reports and were as follows:

Profits from sale of Northern Securities, Great Northern and Northern Pacific stocks in excess of their cost ($31,665,708.30), credited against the aggregate cost of stocks and bonds (less $1,955,479.30 credited to profit and loss in the year 1905)	$29,710,229.00
Appropriations from income for betterments and additions applied in writing down cost of railroads, equipment and appurtenances	16 959,816.24
Received from improvement and equipment fund applied in writing down cost of changes in line	7,252,036.56
Appropriations from income for a reserve fund for future betterments, additions and new equipment	4,678,350 93
Charged to expenses for a reserve fund for maintenance renewals, etc	4,774,610.39
Total of items not included in the above profit and loss surplus	$63,375,043 12

CAPITAL EXPENDITURES.

The charges to capital account, other than for stocks and bonds in companies other than the Union Pacific Railroad and auxiliary companies, were as follows:

Expenditures for account of new railroad construction			$10,763,831.69
Expenditures for account of extensions			704 871.10
Stocks and bonds of following companies pledged under Oregon R.R. & Navigation Co. 4 per cent consolidated mortgage as muniments of title to railroads which form part of its main line. These stocks and bonds were in former reports included in stocks and bonds owned			
Cascades R. R. Co., capital (par, $300,000)		$150,000 00	
Columbia & Palouse R.R. Co.:			
Capital stock, par value		1,000,000 00	
First mortgage 6 per cent bonds, face value		2,829,000 00

Per cent	3.35	1.64	1.37	1.76

*Ton-miles per revenue freight train and all mixed train miles.

The decrease in tons per train resulted from the sm[illegible]r tr[illegible]ns run in order to relieve the congestion of traffic and to move the increased traffic with all possible despatch. The decrease in tons per train on the Union Pacific Railroad was augmented by using eastern coal on its line between Council Bluffs and Cheyenne so as to send a greater amount of Wyoming coal to the Inter mountain territory. This greatly reduced the traffic for eastbound cars, and as the fullest loading had been heretofore secured with eastbound traffic on account of the favorable grade, the change materially reduced both train and carload.

GENERAL

To provide funds for paying off current liabilities, for equipment to be delivered, for improvements and construction under way, and for other corporate purposes, the Board of Directors of the Union Pacific Railroad Co. on May 9, 1907, authorized the issue of "Twenty Year Four Per Cent. Convertible Gold Bonds" not exceeding $75,000,000 and recommended to the stockholders an increase of $100,000,000 in the common capital stock of the company.

At a special meeting of the stockholders of the Union Pacific Railroad Company held at Salt Lake City, Utah, on June 15, 1907, resolutions were adopted amending the Articles of Association of the company for the purpose of increasing its common capital stock by the amount of $100,000,000 and authorizing the issue of such additional common capital stock from time to time for such lawful corporate purposes and upon such lawful terms as should be determined by the Board of Directors of the company. These resolutions further provided that the said stock or so much thereof as the Board of Directors should set aside or reserve for that purpose might be issued from time to time in exchange for the "Twenty Year Four Per Cent. Convertible Gold Bonds" of this company authorized to be issued. At a special meeting of the Board of Directors of the Union Pacific Railroad Company held on July 8, 1907, $42,857,200 par value of the additional common capital stock authorized was set apart and reserved to be issued in exchange for the "Twenty Year Four Per Cent. Convertible Gold Bonds. The stock so set apart is not to be issued or used prior to the first day of July, 1917, except to such extent as such bonds should, in the meantime, have been redeemed or paid off.

The convertible bonds issued under this authority were offered to the holders of the preferred stock and common stock of the Union Pacific Railroad Company in amount equal to 25 per cent. of their respective holdings of such stocks at 90 per cent. of the face value of the new bonds. Subscriptions were payable 25 per cent. thereof on, or before July 10th, 25 per cent. August 9th, and 50 per cent. September 10th. The bonds bear interest from July 1, 1907, payable January 1 and July 1. They will be convertible at the option of the holder at any time after issue and prior to July 1, 1917, into paid-up shares of the common stock of the railroad company at $175 per share. The bonds may be called for redemption by the company on July 1, 1912, or on any semi-annual interest day thereafter or on 90 days notice, at a premium of 2½ per cent.

Under provisions of the Interstate Commerce Commission Act as amended, the railroads are required to provide refrigerator cars, to show the charges for such cars and for the service of the refrigeration, ventilation, etc., in their tariffs, and to include such charges in their freight bills. In order to furnish these cars and service, it was deemed advisable for the Union Pacific Railroad Company and the Southern Pacific Company to arrange for the incorporation of a company whose stock should be taken by said companies and who should acquire and furnish them and their allied lines the necessary cars and service. In pursuance of this plan there was organized under the laws of the state of Utah the "Pacific Fruit Express Company" with an authorized capital of $12,000,000. Six thousand six hundred refrigerator cars were ordered, costing about $10,180,800. There have already been delivered 3,600 cars, and the delivery of the remaining 3,000 cars will be completed during December, 1907.

For the purpose of purchasing equipment for the use of the Union Pacific Railroad and auxiliary companies, there was also incorporated under the laws of the state of Utah a corporation known as the "Union Pacific Equipment Association. The equipment company either holds title to the equipment and leases it to the several companies, or holds title thereto until such equipment is distributed among the companies. The association received during the year 109 locomotives, 14 passenger train cars, 2,460 freight train cars, and 150 road service cars, costing $4,730,949.48. There remained to be delivered on outstanding contracts 15 locomotives, 44 passenger train cars and 1,340 freight train cars which will cost about $2,150,000.

As this fiscal year completes a decade of the company's operations since its reorganization, the following statement showing the receipts, disbursements and surplus, by years, will, it is believed, be of interest to the owners of these properties:

Years.	Miles of Road Operated.	Gross Receipts and Income	Surplus after Payment of Operating Expenses and Taxes.	Fixed Charges	Surplus after Payment of Fixed Charges.	Dividends	Surplus after Payment of Dividends
1907	5,644.55	$87,474,766.11	$44,829,542.55	$8,652,621.67	$36,176,920.88	$23,530,036.00	$12,646,884.88

1902	5,710.91	50,554,202.49	21,994,976.13	10,491,727.36	14,503,248.77	8,187,288.00	6,[illegible]15,960.[illegible]
1901	5,543.44	44,514,812.04	19,957,666.97	7,422,609.37	12,535,057.60	7,980,970.00	4,554,087.60
1900	5,427.89	40,396,973.52	18,969,428.29	6,732,037.91	12,237,290.58	7,393,429.50	4,843,861.08
1899	5,357.73	36,425,820.13	17,357,633.03	7,399,620.35	9,958,012.68	3,020,582.90	6,9[illegible]7,4[illegible]9.78
1898	5,325.68	33,281,125.78	13,700,834.89	4,188,260.06	9,212,574.83	1,781,130.95	7,431,44[illegible].88

In the year just closed, the revenue of the companies and the traffic moved were the largest since their reorganization in 1898. They carried over their rails an average of 1,010,547 tons one mile per mile of road against 410,758 tons in 1898, a ratio of 2.46 to 1, and 120,520 passengers one mile per mile of road against 42,854 passengers in 1898, a ratio of 2.81 to 1.

These results were made possible by the expenditures in past years for changes in line, for reducing grades, for second track, for enlargement to and addition of shops, terminals, etc., and for betterments and additions in all directions by which the service to the public was increased, and also by the building of new lines and payments for account of new lines from which additional traffic was secured. These expenditures to June 30, 1907, amounted to $104,127,986.85, and were principally for:

Changes in line	$11,802,289.51
Reducing grades, second tracks, passing tracks, shops, buildings, terminals and other betterments and additions	33,519,565.93
New equipment	26,382,588.37
Construction of new lines and payments for account of San Pedro, Los Angeles & Salt Lake R. R. Co.	32,723,543.04
Total	$104,127,986.85

In addition to the above expenditures the companies have also expended for account of new lines in course of construction and for terminal properties, $26,212,601.19.

The details of the investment stocks are shown in table No. 10. Since the close of the year, the remaining payments on the subscription to the preferred stock of the Southern Pacific Company and payments on account of subscriptions to other stocks have been made. Excluding the hereinbefore mentioned amount realized from the sale of Northern Securities, Great Northern and Northern Pacific stocks in excess of their cost (which stands as a credit against the aggregate cost of stocks and bonds), the investment stocks owned December 5, 1907, cost $227,346,292.36. The market value of these stocks on that day was as follows:

Shares.		Market Value. Last Sale or Bid.	Value.	Annual Dividends or Interest. Rate.	Amount.
87,864	Gt. Nor. Ry. Co. pf.	120	$10,543,680	7	$615,048.00

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK
BRANCH OFFICES AT 375 OLD COLONY BUILDING CHICAGO, AND QUEEN ANNE'S CHAMBERS WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. *We give in our editorial columns* OUR OWN *opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.*

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS

W. H. BOARDMAN, *Prest. and Editor.*
E. A. SIMMONS, *Vice-President.*
RAY MORRIS, *Secretary*
R. S. CHISOLM, *Treas.*
I. B. RINES, *Cashier*
L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Managing Editor*
BRAMAN B. ADAMS
CHARLES H. FRY
FRANK W. KRAEGER
GEORGE L. FOWLER
HUGH RANKIN
BRADFORD BOARDMAN

CONTENTS

VOL. XLIV., No. 2. FRIDAY, JANUARY 10, 1908.

By a divided bench, the United States Supreme Court has overthrown the Employers' Liability Act of June 11, 1906. Four justices—Harlan, McKenna, Holmes and Moody—held that the law was valid in whole or in part; a fifth—Justice White—believes that it can be so redrawn as to be valid. Chief Justice Fuller and Justices Peckham and Brewer believe that Congress has attempted regulation repugnant to the Constitution. Thus the application of the law is stopped, the majority opinion being that it was so drawn that the unconstitutional parts were inseparable from the constitutional; but application of the underlying principle is, apparently, only postponed. Two interesting comments suggest themselves—first, that many of the extremely important, radical corporation cases now pending before that august body are pretty likely to terminate in the same way; second, that there are two distinct parties in the court, one of which is willing to see Congress do a great deal more regulating than the other is, and that between these parties the balance of power is quite uncertain, depending on the vote of several justices to whom each case is a new case.

We begin this week the publication in serial form of a paper by Dr. Smith, of the University of Pennsylvania, on the Ocean Carrier. Many historians have described the upbuilding of the merchant marine in this country and foreign countries, and excellent literature on marine architecture has always been available, but Dr. Smith, so far as we know, is the only writer who has studied the development of the ocean carrier from the direct standpoint of the world commerce that the carrier exists to move. In his previous monograph on the Organization of Ocean Commerce, he discussed charter traffic and line traffic and the reasons why line vessels and charter, or tramp, vessels afford respectively the natural and efficient methods of serving different kinds of traffic. Where the freight is, where it is going, how it can best be gotten there, and how much it costs to do it—these are the kinds of topics that Dr. Smith treats of, showing, by the way, how certain types of carriers have been developed while other types have been discarded, and discussing the competitive conditions that have had so strong an effect on modern ocean business. Most traffic men come into contact with a greater or less number of these problems, at one time or another; the history and discussion of them ought to interest them all, and the bearing of water transportation upon rail transportation is so great and is constantly becoming so much greater, owing to the world-wide competition of commodities in search of a market, that the fundamental principles involved ought to be known a great deal more widely than they are. In England, where the over-sea dairy products of Denmark compete actively with those of Devonshire, and nearly every important rail route has a competing water route, the nearby conditions are well appreciated. We have continuous water competition on the Atlantic, Pacific and Gulf coasts and an open-season competition along the Great Lakes and in many other localities, the conditions of which are fully understood, but we also figure in a series of world traffic routes that are not understood so well, and that are yearly becoming more important as commerce expands and the marine engine becomes more efficient. The purpose of the present series of articles is to put some of these matters on record in a form as definite as that of the mere physical history of the steamships in the Atlantic trade.

THE 1908 RAIL ORDERS SITUATION.

The present rail situation is without precedent, and this is meant to include the acceptance of the new specifications, which seems to be quite general; the differing methods now being undertaken to the end of securing safer rails and more economical rails; the prices for better quality; and, lastly, the fact that but few large orders for 1908 delivery have thus far been placed with the mills. We are told by the officers of the steel companies that their December correspondence with the railroads with reference to new orders has been extraordinarily large but, owing to the unsettled conditions above referred to, the holding back of orders was what might have been reasonably expected.

Probably every railroad officer in the United States has been stirred by the development of the extent to which rails break. He has also been moved by the knowledge that rails are so soft as to make a large percentage of increase in the cost of rail maintenance. Undoubtedly also the financial situation is in many cases causing delay in giving orders, first, because it is harder to provide the money to pay the bill, and, second, because in many cases thorough investigations have been made and are still being made to see to what extent the quantities ordered for 1908 can safely be reduced below the average amount required for maintenance. For example, the average amount needed for maintenance on the Pennsylvania Lines West may be said to be about 60,000 tons a year, and for the

Pennsylvania lines east of Pittsburg more than 100,000 tons. The New York Central Lines east of Buffalo need something like an average of 50,000 tons a year. But never before in the history of these two roads has the track been of such a high standard as it is now. It is highly probable that no danger would be involved and no considerable loss caused by reducing the amount of new rails used this year to one-half or possibly one-third of the average amount. This statement is generally true of the railroads throughout the country so that nearly all of them, under financial stress, can make a quick temporary economy by reducing rail orders, and this fact is a considerable factor in the present situation.

The most important item in the new specifications left undecided was the percentage of discard from the top of the ingot to be agreed on by all railroads and to be in force at all mills. We are told that when prices have been asked for rails with a specified discard, those prices have been figured on the basis of $28 a ton for rails made from ingots with a 9 per cent. discard, with an additional cost of 5 per cent. for each additional 5 per cent. of discard. This would make $30.80 a ton for 19 per cent. discard and $32.20 for 24 per cent. discard. This cost would not seem to be unreasonable if the rails were made hard enough so as to effect economy in use in addition to the presumed avoidance of the cost of broken rails. In the matter of price the effect of concentration of ownership of mills has thus far been good. Judge Gary has expressed the sum of opinion, after consultation with many railroad presidents and with his own officers, that $28 a ton is, for all concerned, a good price to adhere to. The mills gave us all a good lesson when they maintained the $28 price for rails during a period when billets were selling for $32.

The failure to agree upon a fixed discard from the ingot by the committee last October was a disappointment to many others as well as to us. Nevertheless, disappointment should never mean discouragement. There is an old song with a line: "The best cure for misfortune is to marry again." The study and the work on this subject has not halted. It has not been confined to the members of the American Railway Association rail committee. Experiments have been made at three different mills to learn if physical defects can always be detected by breaking up crop ends from rails made from that part of the ingot where such defects commonly occur. If this proves practicable, and if the whole heat is rejected when a physical defect is so found, it may be a more scientific method than saying arbitrarily that in every case either a quarter or a fifth of the ingot must not be used. Involved also in this undertaking is a legible numbering of each rail, locating its position in the ingot, so that the record of breakages may indicate something more than it now does; and also so that users may, if they choose, select for the severer services rails with the higher numbers—made from the lower end of the ingot.

There is now intelligent co-operation between the manufacturers and the railroad officers to the end of finding whether the arbitrary discard, which may be presumed to be effective, but which is certainly wasteful, is the only way out. The object of the present study and experiments is, if possible, to devise a specification which will avoid that waste, secure sound rails and furnish to the mills the greatest possible incentive to the improvement of the ingot.

THE VALUE OF TIE PRESERVATION.

The timber preserving plant which the Burlington has built at Galesburg, Ill., described in another column, is the seventeenth treating plant to be built by a railroad in this country, if the record before us is correct. This includes three portable plants of the Union Pacific, Oregon Short Line and the Southern Pacific respectively, and a plant of the Denver & Rio Grande which, though nearly completed for some time, has not yet been put in operation. But, on the other hand, it does not include the large number of privately-owned plants, a part or all of whose product is taken by the railroads on which they are situated, nor two plants of Mexican roads. The estimated capacity of the 17 railroad plants is around 16,500,000 ties a year. The Government report on the consumption of ties for 1906 recently issued (*Railroad Gazette*, Dec. 20) gives the number of ties treated by the roads at their own plants in that year as 6,365,523, and the number of treated ties bought as 4,773,116, or a total of about 11,000,000 treated ties used by the steam roads. On the basis of the estimate given above the number of ties treated by the roads in 1906 was about 40 per cent. of their present estimated plant capacity. All of these plants, with two exceptions, are west of the Mississippi river. This is due to the greater scarcity in this region of suitable tie timber and the need therefore of using the inferior soft woods. But some of the eastern roads have been giving serious consideration to the matter for a year or two past and one of them had practically decided to build one or more plants when the unfavorable monetary conditions caused a postponement; another is proceeding with preparatory work, and others have been making investigations that doubtless will bear fruit in the near future.

A report to one such road on methods and costs of treatment and the saving to be realized, which would be the justification for the installation of a preserving plant, figures conservatively as follows: Untreated white oak ties cost this road 85c. A treated red oak tie would cost the same, at 15c. for treating. Cost of putting in track is 15c., making the total cost of either in track $1. The life of the untreated tie is taken at eight years, and of the treated tie at 12 years. Interest is taken at 4 per cent. Neglecting interest, the yearly saving for each treated tie would be $0.0417, which can be considered the dividend paid to the plant by each treated tie during its life.

On the basis of the annual charge, at 4 per cent. interest, to be made for each kind the figures would be:

Untreated.		*Treated.*	
Interest	.04	Interest	.04
Sinking fund $\left[\frac{.04}{(1+.04)^8-1}\right] =$	.1085	Sinking fund $\left[\frac{.04}{(1+.04)^{12}-1}\right] =$	.0667
Total	.1485	Total	.1067

The difference, or saving, is $0.0418, nearly the same as given above.

The annual charge for the untreated tie, $0.1485, is the interest at 4 per cent. on $3.71; or, in other words, if the expenditure be capitalized, this is the sum which, at the given rate of interest, would furnish a new tie in track at the expiration of the eight-year period. How much can be paid for a tie having this same capital, which would last 12 years?

$$x + \frac{x}{(1+.04)^{12}-1} = \$3.71$$
$$x = \$1.39$$

Therefore a treated tie lasting 12 years would be worth 39 cents more than the untreated eight-year tie. If the treated tie would last 15 years it would be worth $1.65. Therefore, a treating plant having a yearly capacity of 1,000,000 ties would create a value of $390,000 if producing 12-year ties, due to the longer life. Since a well equipped two-retort treating plant with wooden buildings is estimated to cost $60,000 to $70,000, depending on the process, though not including cost of land and tracks, the expenditure for such a plant would appear to be a highly profitable investment according to the computation given.

THE RAILROAD SITUATION IN THE SOUTH.

The appointment of receivers for the Seaboard Air Line with its nearly 3,000 miles of road calls sharp attention again to the situation of the railroads in the South. A brief review of the events leading up to the present crisis in that territory will make the present situation easily understood. The recently issued annual report of the Seaboard Air Line is reviewed in another column.

From the time of the war until a few years ago, the southern railroads had a hard time to get along. There were certain short lines between important points, particularly in Virginia, North Carolina and Georgia, which were very profitable and correspondingly strong financially. But the bulk of the lines either were not specially profitable or were run at a loss. Many railroads were most of the time in receivers' hands. The process of consolidation which has resulted in putting most of the important railroad mileage in the South in the control of three dominating groups—the Atlantic Coast Line-Louisville & Nashville, the Southern Railway and the Seaboard Air Line—began by the extension of the ownership and influence of some of the smaller and very profitable roads. A connecting line would first be taken over, then a line connecting with that and so on until the present systems were formed, stretching from Virginia and Kentucky on the north, to the gulf states. In this process a good many lines locally unprofitable, but necessary as part of a through connection or as a protection against competition, were acquired or built, so that the large systems were usually made up of strong roads, roads which were little more than solvent, and weak or bankrupt roads. For instance, in the case of the Seaboard Air Line, the Seaboard & Roanoke Railroad running from Portsmouth, Va., to Weldon, N. C., the original nucleus of the system, was one of the richest roads in the South.

It was inevitable that systems made up of such different kinds of railroads, many of them running through a territory which had for years produced little traffic, should be found wanting when there was suddenly developed a tremendous increase in industrial activity. These roads had not been built to be low-grade through lines and they had not had funds even if they had had faith to undertake, previous to the need for them, large improvements which would amount in many cases to reconstruction. As a result, when the rush of traffic of the past three years came, the railroads of the South were unable to satisfactorily carry it. It was large enough to require much new double track, many grade reductions and a large amount of new equipment, and these, particularly the first two, cannot be provided in a day. Not only were the weak lines of light traffic overtaxed, but all these pouring their freight together at the various throats of the different systems made still greater congestion on these connecting routes which had previously been the most efficient parts of the roads. The new high traffic level went far beyond the increase in railroad facilities.

The resulting unsatisfactory service, both freight and passenger, gave an opportunity to that class of politician, even more abundant in the South than elsewhere, who appeals for success to public prejudice and passion. Anti-railroad political campaigns were waged in most of the southern states and were generally successful. One great reason why the railroads were unable to make effective opposition to these attacks was that their influence had in the past been strong in the state legislatures and that they therefore could not come forward with clean hands to oppose the unjust proposals of the demagogues. Another was that the South had suffered some of the most flagrant cases of railroad financial jugglery ever carried out in this country, and these more recently than the similar instances in other sections, so that the sincerity of railroad managers was under suspicion. Not only were anti-railroad governors elected, but legislatures also, and the laws passed during last winter's sessions were peculiarly severe.

The rest of the story is only too familiar—decreased net earnings, the impossibility of selling securities to pay for new improvements which were under way and the consequent stopping of these improvements, the conflicts of jurisdiction between State and Federal courts, the extra session of last fall in Alabama called for the sole purpose of bringing the railroads to terms, and finally an industrial reaction in the South, followed by decreases in gross and net earnings and the receivership of the Seaboard Air Line.

Already, however, there have been certain encouraging changes. Public sentiment toward the railroads is showing a decided change. The business men of Alabama as well as the organizations of railroad employees have sent delegations to the Governor protesting against the attacks on the railroads. All kinds of business have already felt, and felt severely, the effects of the reaction, and the farmer, whose railroad ties are no longer as good as currency at his local store, feels the change also. In the case of at least one of the important systems in the South the tactics of the railroad officers have also undergone a change. There is to be no more hurrying to Raleigh or to Columbia or to Montgomery to try to head off hostile legislation. The president, the vice-presidents and the general manager intend in future to devote their time to the business of railroad operation. If the people of the various states through which the road runs insist on ruining it—as there is no doubt they can do—they are to be allowed to bear the whole responsibility for so doing. Most important, of all, as this last statement implies, this railroad is no longer in politics.

This is a strong and sensible stand for the railroads to take. Had it been taken in the past, it is probable that much harm could have been avoided. Whether this is true or not, it is certain that the system of political influence failed utterly to protect the railroads in their hour of greatest need. There is no doubt that the present situation in the South, with its rapidly decreasing traffic, its locomotives newly received from the builders but lying in the shops without the packings taken off, its idle freight cars and its decrease in earnings is a discouraging one; but there is already a promise of a fairer and more honorable relation between railroads and people which should result both in shortening the depression and in uniting both elements, lately so hostile, in the task of developing the South. Specifically, the bare fact that one of the great systems is now so situated that the tactics of state legislators will be met in the open by federal receivers instead of by corporation officers, is of great interest and importance, not only to the Seaboard itself, but to all other southern railroads.

GOOD AND BAD WORK UNDER THE RATE LAW.

The report of the Interstate Commerce Commission is an interesting document and in many ways a conservative one. Yet the point of view which runs through it from beginning to end and appears in one form or another in every recommendation which the Commission makes, is wrong-headed. The Commission assumes, as if there could be no debate on this point, that all citizens desire to see governmental regulation of the railroads made as tight and as complete as possible. Thus—"one is forced to conclude that an authoritative valuation of railway property is the next important step in the development of governmental supervision over railway administration." From the sentence quoted, one is also forced to conclude that the idea of the Commission is to increase and expand governmental control stone by stone and brick by brick until some sort of structure is arrived at the dimensions of which are not clear in the commissioners' own minds as yet.

This point of view illustrates a very serious deficiency and a potential source of much harm in the scope of the Commission's work. We maintain that proper regulation of public service companies is good, provided that this regulation consists of such police powers as may be necessary to protect the lives of travelers and the property of shippers, and the freedom of every man to do business on equal terms with his neighbor. These things can be accomplished under very simple legislation, and, in the main, were fully provided for before the Rate Law of 1906 was enacted, although in some respects justice was facilitated by this law, and the small shipper was given a practical instead of a theoretic basis of equality with his more powerful neighbor before the law. The reason that the work of the Commission has on the whole been good and helpful during 1907 under the new law, has been that this work has proceeded along elemental lines of ordinary fairness. The Commission has attempted nothing radical; it has simply heard the respective cases of the railroads and of their customers, and has found the customers wrong just as often as it has found the railroads wrong. But, as the Commissioners themselves intimate in their report, the chief reason why there has been greater harmony this year between shipper and carrier than has generally prevailed, has been the fact that a tribunal existed. It may be said, somewhat paradoxically, that the efficiency of a city police force is measured not by the arrests which are made, but by the arrests which do not have to be made, and the same thing is true of the year's work of the Interstate Commerce Commission.

In only one important instance has the Commission attempted to make a radical branching out from the precepts of simple justice, and in that instance it has done harm already and has paved the way for much subsequent trouble. We refer to the arbitrary accounting requirements. No careful student of the subject will be disposed to deny that the railroads ought to keep their accounts honestly and in such form as to be intelligible to those who are entitled to see them. But an inflexible system of required depreciation charges is a thoroughly bad thing when applied to American railroads, and the proposal that all betterment charges from income should be clearly ticketed, is not as equitable as it looks. The American railroad system is not old enough or stable enough to provide annually a fixed sum or a fixed proportion for the upkeep of its property. In time it will be, so far as the important lines are concerned. But neither this generation nor the next is likely to see a succession of years with changes in traffic so slight that income and expenditure may be measured year after year with the same rule. It is characteristic of an old country that its commercial business is stable; it is characteristic of a young country that its commercial business fluctuates widely, and so long as America is a young country and has nowhere nearly grown to fill its shell, its railroad traffic is going to have fat years and lean ones. The custom long established of spending great sums on a property in years of abnormal prosperity and economizing strictly in years when prosperity is below the average has given good results in the past, and attempts to arbitrarily change this practice are not going to do any [illegible].

An average of expenditure can be struck which, when spread over a dozen years, is about right, but the money is not spent in equal sums. In a certain year a railroad knows that it is earning materially more than it has ever earned before and more than it can reasonably hope to continue earning season after season without relapses. It seems to the manager wiser to put some of this money back into the property than to declare an extra dividend—and the Commission has no quarrel with him here. What the Commission does want is to have that extra betterment disbursement separated from the regular maintenance charges so that [illegible] can see it. Surely no proposition could sound more equitable than this; but unfortunately, it omits consideration of one very important thing—human nature. When the shipper who thinks he pays too high a rate or the tax assessor who wants to increase state revenues sees this free sum ready to be put back into the property, he proposes to get some of it for himself first, and laws are forthwith passed reducing rates and increasing taxes to absorb this obvious operating surplus. But if business slackens and there is threat of hard times, rates do not get put up again and taxes put down. The railroad manager has been in the business some time and knows that great prosperity does not continue forever; the legislator is interested only in the year's earnings. What this all comes to is that substantial betterment work has got to be done out of earnings, in good times, if it is done at all, and the Commission's theoretic rulings on this subject have greatly increased the difficulties of doing this work.

From these concrete illustrations of the efficiency of the Commission when it devotes its attention to its police functions and to the inefficiency of the Commission when it attempts to proceed along new and radical lines, one ought to be able to judge whether or not it should be given the new powers for which it earnestly asks. We are not disposed to criticize the suggestion that an arbitrary advance in interstate rates should be restrainable until the case can be adjudicated, provided that the Commission does not become so blocked with its duties that, as sometimes happens in a federal court, the delays in making a ruling amount to a denial of justice. But we are wholly opposed to a general valuation, so called, of all the railroads in the United States, with a view to fixing the amount and kind of securities which they can issue—to determining their rates, their payments to shareholders, and what not. We have always maintained the plain fact that a railroad valuation does not mean anything whatever, but that, once made, it will be used by demagogues and politicians just as if it did mean something. The value of a railroad is not what it costs to build it, nor what it would cost to replace it; and if we skip all this, and take a valuation based on the selling price of securities, we become at once entangled in the fact that the price of securities depends upon the earning power of the road, so that if we use our valuation to reduce rates we are going to depreciate the security, which will require us to make a new valuation, which will in turn effect a further change in the value of the security, and so on. The same objection holds true of a valuation made by capitalizing net earnings, although this valuation is the fairest kind which can be made. We do not believe that there are now any serious thinkers and economic students left who hold that the rate which a railroad charges under competitive conditions has any relation to its capitalization or to its valuation. Yet, just as surely as a governmental valuation is established, on whatever basis you please, it will be used in legislation, direct or indirect, affecting rates, which will concern not only the carrier which is subject to the order, but all other carriers feeling its competition, however remote that competition may be.

The whole thing reverts to this: that governmental regulation of common carriers is thoroughly good so far as it is confined to police work performed in a careful and conservative manner, but that it is thoroughly bad when it attempts to do the impossible thing of attending equitably to the details of finance and management which now occupy the entire attention of an enormous corps of highly trained specialists. We should much rather see the Commission work as an efficient than as an inefficient body, because we believe that it can be very useful in righting old wrongs and preventing new ones. Hence we should be extremely sorry to see it become an arbitrary, autocratic bureau charged with duties which it never could perform.

Seaboard Air Line.

"The traffic on your company's lines during the period under review shows a gratifying improvement as compared with that of the previous year. Prosperous conditions prevail in the territory through which your road operates, and with the development now in progress generally throughout the Southern States, it is believed that these conditions, favorable to your company's continued increase in business, will be maintained."

This is the comment of the Seaboard Air Line's president in the annual report for the year ended June 30, 1907, dated October 23, 1907, but not issued until the end of December. Carefully analyzed, it is no doubt literally true, but, as a description of the progress of the Seaboard Air Line during the year and of the outlook for its future, the event has proved that it is strikingly misleading. Mr. Garrett was much franker last February, some three weeks after his election as president of the Seaboard, when in an interview published in an Atlanta paper, he said that unless conditions then existing changed for the better there would be a receivership of the property.

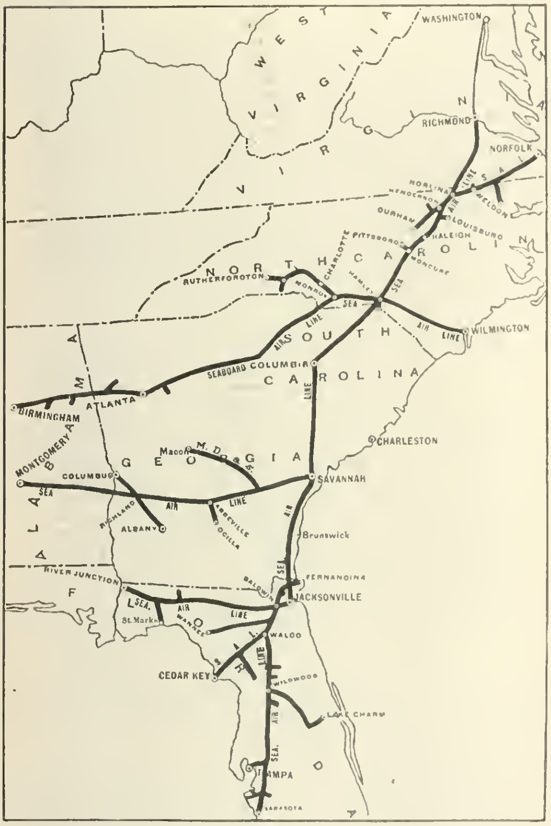
They grew worse instead of better and at the opening of the new year two receivers were appointed for the Seaboard Air Line, the largest railroad company in point of mileage which has suffered receivership since 1893, when a larger mileage of railroads went into receiverships than in any year before or since. The road has not had a fortunate history. Starting under the guidance of John M. Robinson as the Seaboard & Roanoke Railroad, running from Portsmouth, Va., to Weldon, N. C., 79 miles, a short and very profitable line in North Carolina, the system has been steadily expanding until it now comprises altogether 2,975 miles of line. In the effort to get through lines much mileage of thin traffic has from time to time been built or acquired. Instead of leasing the Atlanta & Charlotte Air Line, which would have brought the Seaboard from Charlotte, N. C., to Atlanta, Ga., this road was allowed to go to the Richmond Terminal company, and now is one of the best main lines of the Southern Railway. In order, however, to reach Atlanta, the Georgia, Carolina & Northern, from Monroe, N. C., east to Atlanta was built. This line when built lay between two old-established competitors for through traffic and traversed a country which then produced almost no local traffic. In consequence it was for some time decidedly unprofitable. In 1905 the Birmingham extension from Atlanta east to Birmingham was built, and this has been even more unprofitable, so much so that it has never yet been taken into the operating accounts of the Seaboard Air Line. It cost about $10,000,000, or $45,500 a mile, instead of $6,000,000, or $27,000 a mile, as had been estimated. Last year it had gross earnings of nearly $1,000,000, but its operating expenses were almost as large, the operating ratio being about 92½ per cent. As a result net earnings fell short by $512,000 of meeting fixed charges. The amount due to the parent company by the Atlanta & Birmingham Air Line increased $884,000 during the year. Yet the gross earnings of the Seaboard Air Line itself during the year on business received from this extension were only $545,000. It is evident that instead of being a help to the rest of the system, the Birmingham line has been a great drain on the finances of the parent road. Also, like all the other railroads in the South, the Seaboard has suffered during the last two years from an increase of traffic which greatly exceeded its facilities, higher wages, increased cost of materials and public hostility crystallized in legislation. These difficulties have all been made much worse by the changes and disorganization in the management, which date from January 1, 1895, when Major John C. Winder was succeeded as Vice-President by Everitte St. John.

In 1904 interests headed by Thomas F. Ryan gained control of the property, which they have since held, though under the constant bitter criticism of John Skelton Williams, formerly President and Chairman of the Board, and still largely interested in the road's securities. The Ryan party in 1905 formed the Seaboard Company to hold control of the property. Whatever else has been accomplished by it, this supernumerary holding company has failed to protect the road in time of difficulty, which was the announced reason for its creation. In 1906 Alfred Walter succeeded James M. Barr as President, and would perhaps have succeeded in bringing about the regeneration of the property as he had earlier with brilliant success of the Lehigh Valley, but before his first year of service was over his health failed rapidly, and he died on February 27, 1907. He was succeeded by William A. Garrett, who had been General Manager of the Cincinnati, New Orleans & Texas Pacific, an able and experienced railroad officer. Mr. Garrett has worked with great energy, and if it had not been for the financial crisis and resulting business depression it is possible that he would have succeeded within two or three years in putting the Seaboard property on its feet, but there were too many adverse influences, and they came too suddenly to be overcome. At a time when even the strongest railroad companies had grave difficulties in securing funds, it was impossible for the Seaboard to raise sufficient new capital, for its net earnings were decreasing, the weak points of the property had been carefully disclosed by the attacks of Mr. Williams, and the formation of the holding company and the lack of information in regard to its operations caused distrust.

Operating difficulties fell more severely on the Seaboard than on the other southern roads, because of the demoralization of its organization. The constant changes which had taken place in both the executive and operating departments, including both the highest and the lowest officers in the operating forces, had so unsettled and demoralized the organization that there was lack of co-operation, and, as the inevitable consequence, bad service to the public and expensive service to the company. The lack of confidence of the employees in the management and of the management in the men appears to have been one immediate and direct cause of the great decrease in net earnings. During the early part of 1907, when traffic was heavy, the road was very short in both power and equipment, and a great many of its locomotives were in bad condition. Shop facilities, side tracks and terminals were altogether inadequate to meet the demands of traffic. These physical handicaps taken together with the lack of efficient organization, resulted in an operating ratio, not including the Birmingham extension, which is said to have risen last March as high as 90 per cent.—a figure which leaves little or nothing with which to meet fixed charges.

The results of operation for the fiscal year ended June 30, 1907, show all this. Gross earnings increased $1,300,000, or 9 per cent., but operating expenses rose $2,400,000, or 23 per cent., the result being a decrease of $1,100,000, or 24 per cent., in net earnings. The operating ratio increased from 70 per cent. to 79 per cent.—a very sharp rise. Worst of all, the increase in operating expenses came largely in conducting transportation, which account was $1,700,000, or 27 per cent. larger than in 1906, and rose from 40.7 to 47.7 per cent. of the gross earnings. No further proof is needed of the disorganization of the operating forces than the fact that the Seaboard Air Line had to use nearly 50 per cent. of its gross earnings for paying the direct costs of getting and moving the traffic. The Southern Railway with all the great difficulties which it had to face used only 42.2 per cent. of gross earnings last year for this purpose.

At the same time that there was a decrease of $1,100,000 in net earnings there was an increase of over $300,000 in fixed charges. The two unfavorable influences together were large enough to change a net income of a little less than $1,000,000 in 1906 to a deficit of



Seaboard Air Line.

Including Atlanta & Birmingham Air Line and other subsidiary roads.

nearly $500,000 last year. These are the results from the operation of the rail lines. The water lines, made up of the Baltimore Steam Packet Company, showed a net income of $154,110 last year, so that the total deficit was reduced to a little more than $300,000, this figure however not including the deficit on the Birmingham line.

The largest proportionate increase in net earnings during the year was in passenger earnings, which were 15 per cent. larger than in 1906. The passenger density increased from 52,000 passengers one mile per mile of road to 61,400. The average distance carried rose from 45 miles to 48 miles, probably reflecting the development of the through Florida traffic, for which last winter was a profitable one. The legislative rate reductions of the various southern states began to show their effect in a slight reduction of the passenger-mile rate.

Freight earnings increased 6 per cent., and the freight density from 368,000 tons one mile per mile of road to 392,000. There was a slight reduction in the ton-mile rate. The trainload (whether including company freight or not is not indicated) rose from 194 tons to 208 tons. Gross earnings per mile of road were $6,292, against $5,790 in 1906, but net earnings per mile of [illegible] were only $1,333, against $1,763 in the previous year. Per train mile [illegible] earnings decreased from 52 cents in 1906 to 38 cents last year, a [illegible] off of 27 per cent—a result which eloquently bespeaks [illegible] zation.

The cost of maintaining the way and structures increased 18 per cent. Per mile of road, maintenance of way cost $840, against $715 in 1906. However, although only 163 miles of the line are laid with heavier than 75-lb. rail, and 1,757 out of the 2,548 miles owned are laid with rail weighing 70 lbs. or less, there was a decrease in rail renewals. Maintenance of equipment as a whole increased 19 per cent. Repairs and renewals cost $2,113 per locomotive against $2,061 in 1906; $829 per passenger car against $705 in 1906, and $57 per freight car, against $55 in 1906. This is a case where increased unit maintenance of equipment charges do not represent any concealed equity, for although the average charges during the past year reach a fair average as compared with other roads, the Seaboard Air Line's equipment during the last two years has been in bad condition and larger expenditures are therefore necessary to accomplish the same results as can be obtained on other roads at smaller cost.

Under the head of conducting transportation there was a particularly large increase in the cost of fuel for locomotives, which cost 31 per cent. more than in 1906 and 59 per cent more than in 1905. One of the disadvantages under which the Seaboard Air Line necessarily labors is that except on its Birmingham extension it reaches no coal mining regions, and therefore most of its fuel has to be carried considerable distances. All the items which are made up largely of wage payments also show large increases. Per diem payments were 97 per cent. larger than in 1906. Payments for freight lost and damaged increased 47 per cent., and for injuries to persons 79 per cent. The swift increase of the conducting transportation costs during the last winter is shown by the fact that with 91,000,000 tons carried one mile in November, 1906, the cost of conducting transportation was only $636,000, whereas in April, with only 89,000,000 tons carried one mile, the conducting transportation expense was $731,000.

A new general mortgage and collateral trust 30-year 5 per cent. bond issue amounting to $18,000,000 was authorized exactly a year ago. Of this issue $6,345,000 was sold. If it had been possible to sell the rest the company would probably have come safely through without a receivership, but sales later in the year were out of the question. An issue of $1,655,000 mortgage and collateral trust three-year 5 per cent. notes which matured on March 1, 1907, was extended to May 1, 1911. Three new car trust agreements were made September 26, 1906; May 16, 1907, and July 2, 1907. The total car trust payments during the fiscal year amounted to over $2,000,000.

The balance sheet shows the condition which forced the receivership of the company. On June 30 last, current assets, including over $2,000,000 material and supplies, amounted to $5,100,000, while current liabilities, including $3,900,000 in notes payable, amounted to $9,100,000. Since that time conditions have [illegible] been getting worse, for it has not been possible to issue any new securities, and earnings have been decreasing. According to the bill filed in application for the appointment of receivers there was due on January 1, 1908, on bonds and equipment notes, $7[illegible], and for taxes, traffic balances, pay-rolls, supplies and other claims, $[illegible], much of it overdue, besides floating indebtedness said to amount to about $3,000,000. To take care of the [illegible] indebtedness is the first problem which must be solved in the reorganization. The receivers have been ordered to issue receivers' certificates with which to pay the amount due on bonds and equipment notes.

The best chance for the ultimate success of the property is a drastic reorganization which shall reduce the amount of the road's capital and simplify and unify its securities and its railroads. Then with an able and continuous management it should before many years come into its own. The interests represented by John Skelton Williams are actively co-operating in the receivership proceedings with the Ryan-Blair party who have controlled the road, and with this unity among the stockholders it should be possible to bring about this result.

The following table shows the results of operation for the last two years ended June 30 of the Seaboard Air Line Railway, not including the Atlanta & Birmingham Air Line, 227 miles; the Florida West Shore, 70 miles, the Tallahassee, Perry & Southeastern, 39 miles, and the Plant City, Arcadia & Gulf, 18 miles.

	1907	1906
Mileage worked	2,611	2,611
Passenger earnings	$[illegible]	$[illegible]
Freight earnings	[illegible]	[illegible]
Gross earnings	16,427,91[illegible]	[illegible]
Maint. way and structures	2,2[illegible]	[illegible]
Maint. of equipment	2,[illegible]1,915	[illegible]
Conducting transportation	7,[illegible]13	[illegible]
Operating expenses	12,948,012	[illegible]
Net earnings	[illegible],479,901	[illegible]
Net income	458,[illegible]1*	[illegible]
Net income including Baltimore Steam Packet Co.	304,190*	1,17[illegible]

*Deficit.

CONTRIBUTIONS

Final S in Walschaerts.

London, Dec. 18, 1907.

TO THE EDITOR OF THE RAILROAD GAZETTE:

I notice in your issue of Nov. 29 a letter from Mr. F. W. Dean, of Boston, suggesting that the name of the inventor of the Walschaerts valve gear should be spelled without a final "s." Mr. Dean does not give any reason for the spelling he proposes, and the position he takes is quite untenable. If he will refer to your issue of December 8, 1905, page 493, he will find a translation of a short biography of E. Walschaerts, the inventor of the valve motion, written by Prof. M. J. Boulvin, of the University of Ghent. Prof. Boulvin, being a fellow countryman of Walschaerts, should certainly be an authority on the proper spelling of his name. Further, I have before me a quotation from the report of the Belgian members of the jury of the Paris Exhibition of 1878 which refers to the valve gear invented by Walschaerts and patented in 1844.

I think this is conclusive evidence as to the propriety of spelling Walschaerts with a final s. LAWFORD H. FRY.

Discipline Versus Accidents.

Omaha, Neb., Jan. 2, 1908.

TO THE EDITOR OF THE RAILROAD GAZETTE:

Can the strong (?) arm of the law prevent railroad accidents?

The recent discussion of this subject in your magazine, ranging from conservative editorials to radical viewpoints of correspondents, is interesting to the students of the art of discipline. This is certainly one of the most important subjects connected with modern railroading, seemingly not confined to the United States, as our cousins on the north (the cold, deliberate Anglo-Saxon) are wrestling with it seriously, while the hot blooded sons of the Latin races on our southern border are frequently accused of chasing the erring engineer or conductor through the cactus and confining him in the old Spanish dungeons or burying him in the Government salt mines, for complicity in some accident which has resulted in loss of life.

Can we not profit by the history of human experience to evolve something that will really accomplish what we desire? Our railroad experience covers only a little over three-quarters of a century, while our general experience goes back into the Dark Ages of centuries past. The Chinese, for instance, have had a longer continuity of civilization than any other nation. The great struggle for existence makes the people of this great empire value human life less and to take a more serious view of business transactions than any other. They ought to be able to view a matter of this kind free from sentiment or prejudice. What would the Chinamen do under similar circumstances? These people are well behaved, law-abiding, economical, modest, industrious and studious as a whole. Incompetency or dishonesty is not tolerated in responsible positions. They are impatient of mistakes as being too serious a burden upon the public at large.

There is a story of a bank failure in China 300 years ago, the investigation of which resulted in the decapitation of every one connected with the institution from the porter up to the president; and no failure since.

We are inclined to the opinion that the Chinese will operate their railroads much the same, viz., exact from employees that for which they are paid—perfect service—and as a natural sequence they will not need to exact it—such service will come spontaneously out of the long heredity of that people; their very habits and characteristics must operate as a compelling force along the lines desired. This we have all witnessed or heard of in the admirable service rendered in menial capacity by the few Chinamen with whom we are acquainted, mostly Canton coolies, the descendants of the lowest classes, even criminals, sent over to this country during our pioneer railroad building to get rid of them. The more intelligent classes have an even better reputation for the higher sense of duty.

Coming back to our own country, take 2,000 young men out of any American rural district, divide them indiscriminately into two military regiments of 1,000 each, put in charge of one an officer who is a disciplinarian, who looks out for the comfort and interests of his men (perhaps it may be for a selfish motive entirely), but who exacts obedience until he is finally able to move this force as one unit at his will. At the head of the other regiment put an indifferent, lax commanding officer, who is kind to himself, cares but little what his men are doing in the idle moments, having as his motto, "Sufficient unto the day is the trouble thereof." Which of the two regiments would you choose to go up against in battle if you were on the other side?

We think it has been made plain that if you have a high sense of moral responsibility in your personnel you have the best material with which to operate, lacking in this, the next essential is to take what you can get and mold it into the best possible substitute. That is what must be done on the railroads in this country—drill, discipline, drill—until the forces at your command cannot exert an adverse force sufficient to prevent obtaining what is desired—good service. Moral suasion will not do it. Your force is not sufficiently pliable. The majesty of the law will not do it, because your subject is a "sovereign." The law cannot prevent serious crimes that are undoubtedly on the increase under our criminal code. Then how can it compel service?

To err is human. There was only one perfect man. Mistakes will be made (regrettable as it may be) until the end of time. If hundreds of train crews and despatchers create hazards of accidents yearly, as they do, with the law taking cognizance of only those in which loss of life occur, where is the consistency? One must be as much of a crime as the other, the only difference being perhaps in the physical conditions or unfortunate adverse circumstances which bring about the fatality and for which the unlucky subject of legal investigation may not be in any way responsible. To punish an individual for destruction of property would lead to imprisonment for debt, petty persecutions and injustice. Who will draw the line, and where? To invite a higher degree of honor, of duty and loyalty will lead to a public sentiment that is stronger than the law in compelling that sense of personal responsibility requisite to perfect service. There should be certain infractions of the rules that require immediate and irrevocable dismissal, the most important of which are insubordination, disloyalty and dishonesty; with a distinct understanding that such offense cannot be discussed by grievance committees, further than, if necessary, to submit to them the proof.

The working forces should be well cared for and closely looked after. Reasonable recreation should be afforded them, and the temptation of the drinking places overcome by others equally attractive; then enforce rules against the use of intoxicants strictly. Place before employees in the train service information relative to their duties in such a way that they may be induced to enter into the operation of the road with a spirit of voluntary loyalty that is genuine.

Give some of your most efficient men, who have absolutely clear records, who are not agitators and who have by meritorious conduct shown that they are willing to render more service than they are paid for, a premium in the way of stock in the property. A few shares scattered here and there would have a wonderful effect in making watch dogs of the treasury. They should be held in escrow during the service of the employee, paid to his family immediately upon demise, or to himself on permanent retirement from the service; the profit sharing to be for exceptional service and at the discretion of the management. Leave something in the hands of the responsible operating official with which he can work to bring about results to his liking. Formerly he had the promotions or preferred runs to work on. This has been taken away by the schedules until now all stand on an equality, and there is nothing looked for or expected but punishment, with a well organized, paid force to contend against, prevent or undo discipline by coercion, argument or pleas for leniency. The monitors of the service are not now in evidence; their efforts to correct among themselves lax duty at present are made odious; to report an infraction of the rules is considered an offense on a par with treason, and one who practices it is liable to social ostracism, if not in danger of physical violence. The trainmaster cannot know all that he should unless information is obtained in this way—he finds it more difficult each day so to obtain it.

Last and most important of all and again is the drill. Anticipate accidents; prevent them by exacting the performances of duty with a military precision. All the indiscriminate forces on the railroad will contend against this—the public, traffic, the operating officials themselves and the employees. Delays will occur, trains will lose time while the drill is going on, but after the battle is won most of the difficulties will vanish and something will be gained. Surprise tests will accomplish wonders in this direction, and are the only things that will. Perhaps the selection of this term is unfortunate, as it gives the men an opportunity to allege the dangerous conditions under which they work and the possibility of personal injury from being "surprised." "Efficiency tests" would be the better expression, and all the term implies could be exacted to any extent desired.

Do not neglect those things which are beyond the control of the men; otherwise they will accuse you of insincerity. Throw every safeguard consistent with existing conditions around them and encourage suggestions from the men themselves along these lines. Too many officials do not know, and not knowing, fear discovery. To ward off such incompetency they assume that high and mighty bearing that chills those who do know, at least that which they do successfully each day, and from experience can possibly offer valuable suggestions.

With the installation of block signals and the operation of railroads along the above lines there will not be much left for the public to criticize—our methods will bear prospective governmental investigation. While accidents will continue to occur, they will be classed as "accidents," and be accepted by the public as unavoidable risks of travel. At present they do not feel this way, and it is up to the railroad men of this country to correct it; the Law cannot do it—the railroad men can.

W. L. PARK,
General Superintendent, Union Pacific Railroad.

Rail Sections and Specifications.

Detroit, Mich., Dec. 31, 1907.

To the Editor of the Railroad Gazette:

I agree with the article of E. W. Heinle of November 27. I wonder why the American Railway Association found it necessary to suggest experimental sections for rails lighter than, say, 80 lbs. per yard?

Perhaps it would be well for some road to try the new sections and see how they roll and how they wear before committing the railroads generally to a section which none of them know anything about.

J. D. HAWKS,
President and General Manager, Detroit & Mackinac.

Pittsburgh, Pa., Dec. 31, 1907.

To the Editor of the Railroad Gazette:

Quoting from Robert Job's article read before the New York Railroad Club: "Twenty or thirty years ago steel rails did not cause the difficulty which is found with the present product. This is due to a number of causes. A vastly greater tonnage is handled to-day by the mills, and the same care is not used in the preparation and cropping of the ingots, while in rolling a much higher finishing temperature is maintained, resulting in a coarser structure with relatively rapid wear. In many cases the composition is better to-day than formerly, yet in spite of what, under present practice, would be considered dangerous composition, it is a well-known fact that the old rails gave generally excellent service, this being due largely to the thorough working of the steel down to a low finishing temperature. Some old 67 John Brown rails, rolled and laid in 1864, have been in track for 34 years. The composition was as follows: Carbon, .330 per cent.; phosphorus, .039 per cent.; manganese, .390 per cent.; sulphur, .030 per cent.; silicon, .070 per cent."

"An 80-lb. rail of somewhat the same composition, namely: Carbon, .396 per cent.; phosphorus, .072 per cent.; manganese, .660 per cent.; sulphur, .033 per cent.; silicon, .286 per cent., and rolled a few years ago, has a far greater coarseness of structure. Under the same traffic the one has given long service, while the other would cut out rapidly."

Mr. Job gives an exceedingly strong argument in favor of a greater number of passes in rolling rail section, if we expect to secure a good rail, in fact, the strongest that has yet been advanced; although he does not say that a greater number of passes will accomplish this result, but if anyone will take the trouble to look up the record of the John Brown mill, they will find that there was used in rolling the No. 67 rail not less than the 25 passes advocated by me; more likely a greater number of passes than these were used.

Mr. Job also corroborates an assertion made by me—although he does not seem to realize that a greater number of passes will do this—that if a greater number of passes were used the carbon content could be reduced. He shows that the John Brown rail was but .330 carbon, and yet the rails were better than the ones rolled to-day with over .50 carbon. What stronger argument does one need than this? Here is one of the foremost metallurgists of the age coming forward and saying that rails rolled 40 years ago with chemical conditions, that to-day would be considered dangerous, are better than rails rolled at the present time, with the best metallurgical conditions that can be secured, and he is right. The answer to it all is, better mechanical treatment of the steel in the earlier days than prevails under present mill practice.

The only way to get rails finished at a low temperature without excessive strain and great disturbance of the molecular structure is to use more roll passes and less reduction per pass. This is a mechanical condition, and metallurgy cannot control it.

If it takes an average of 8 or 9 minutes to roll a finished rail from the ingot with 15 passes, as claimed by F. E. Abbott, of the Lackawanna Steel Co., how are we to get rails finished at a lower temperature than at present, if no more passes are used? Mills cannot give us any lower temperature at the initial pass, and roll the rails with the present reduction; their machinery is not strong enough. Nearly every break of machinery that occurs in rolling mills to-day comes from a delayed piece of steel that has become so cold that the reduction cannot be given without breakage of rolls or other mill parts.

Now what is to be done? Build a mill strong enough to crush the life out of the steel in a few passes at a low temperature, or put in more sets of rolls, thereby getting more passes, allowing the rolling to be done at a minimum reduction per pass, and get a rail approaching the condition so much desired by everybody? That is, a close-fibered, tough, homogeneous body of steel as nearly approaching the condition of cold rolled shafting as is practicable.

S. T. FIERO,
Inspecting Engineer.

The Influence of Heat Value and Distribution on Railroad Fuel Cost.*

The cost of locomotive fuel is about 12 per cent. of the total operating expenses of a railroad, consequently the subject of fuel economy is of the utmost importance. It is not the purpose of this paper to discuss the economical use of coal on locomotives, but to deal with the economical purchase and supply of coal before it reaches the locomotives. In order that coal may be economically purchased and distributed the heat value and cost must be considered. The heat value of coal may be determined by laboratory calorimeter tests or by evaporation tests made on locomotives. The latter method is preferable, as the coal is tested in actual service.

Locomotive Coal Tests.—The heat values of the coals found on or near the railroad system which are being or are likely to be used, should be determined by locomotive evaporation tests. The coals should be tested in groups, and in order that different groups of coals may be compared, even though the tests are made 1,500 miles apart, each group of tests as well as the individual tests should be carried on under similar conditions.

The unit of comparison for coals is the number of pounds of equivalent water evaporated per pound of coal. It is evident that the following items will affect this ratio or unit of comparison: Kind of coal; class of engine; condition of engine; engine crew, especially the fireman; class of service. Since the object of coal tests is to determine the comparative value of various coals, all others of the above conditions should be kept as uniform as possible.

Coals should be tested on a division where they are being used, as the firemen are already accustomed to them. When coals which differ materially from those habitually used are to be tested, a number of trial runs must be made until the firemen can fire the coal properly.

If possible, all the tests made on one railroad system should be made on one class of engine. This is advisable in order that the coals tested at one end of the system can be compared with those tested at the other end without having to correct for the difference in evaporative efficiencies of the engines.

The engines should always be in good condition; this applies especially to condition of flues and firebox. Whether a brick arch is used or not, the conditions in this particular should be the same in all tests.

During a series of tests the same firemen should be used throughout, thus avoiding any difference on this account. It is not so important that the same engineers be used, for while one engineer may use more steam than another, the ratio of the coal to the water used will not change materially.

Passenger service is preferable to freight on account of the more uniform conditions. It is desirable that the time between terminals, the time using steam and the weight of the trains shall be nearly uniform from day to day, and that the average of these values for all tests made with each kind of coal shall be nearly the same. When tests are conducted in freight service, at least twice the length of time will be required to test one kind of coal, and the expense will be more than doubled on account of additional coal weighers being required.

At each terminal a fuel tester is located to take charge of the supply and weighing of the test coal and to see that none of the weighed coal on the engine is used during its stay at the terminal. The coal weigher is relieved by an engine observer before the engine leaves the roundhouse, and he stays with the engine until relieved by the coal weigher at the other terminal. The engine observer keeps record of coal, water, steam pressures, stops, shut-offs, etc., in a printed thumb-indexed note book made up of seven printed forms and three blank pages. From four to eight men are required to make the tests properly, according to whether one or two engines are used and whether they are single or double crewed.

Exclusive of that used for firing up, about 150 tons of each kind of coal should be used on the tests. From six to eight round trips are made with each coal, and where two firemen are used, half the tests are made with each fireman. This is necessary, as one fireman might be slightly better than another. Tests in one direction on account of grades, speed or number of cars may be more favorable than in the other, hence the same number of trips in each direction is necessary.

The data taken for each test are recorded on the blanks already mentioned, and the more important totals and averages are recorded on a "final result" sheet. The data and computations of each test are recorded in a column and the average for all tests in an "average" column. In a series of tests which have all been conducted under similar conditions, the heat value of each coal is pro-

*A paper presented at the November meeting of the Western Railway Club by J. G. Crawford, Fuel Engineer of the C., B. & Q. Ry.

portional to the average of the items showing the equivalent number of pounds of water evaporated from and at 212 deg. per pound of coal.

The results covering the A. B. C. Railroad will be expressed as follows:

Name of coal.	Equiv. evap. per lb. coal, actual.	Rank per cent.	Price, per ton.	Name of coal.	Equiv. evap. per lb. coal, actual.	Rank per cent.	Price, per ton.
A	5.60	80	$1.50	F	7.00	100	$1.10
B	5.60	80	1.30	G	7.70	110	1.40
C	6.30	90	1.30	H	7.70	110	1.20
D	6.30	90	1.60	I	8.40	120	2.10
E	7.00	100	1.30	J	8.40	120	2.50

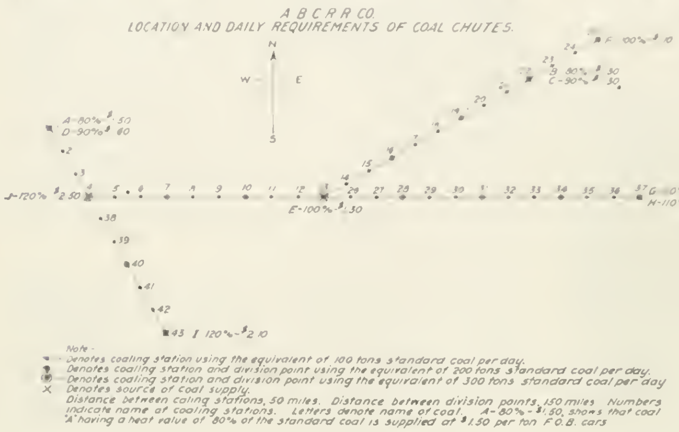


Fig. 1.

The above coals do not necessarily represent individual companies or mines, but coals of equal heat value and price from the same point of distribution are included under one name. For convenience the coals have been assumed to be poorer and better than the standard coal by multiples of 10 per cent. The prices selected in most cases bear little or no relation to the heat value, which is true under actual conditions.

For convenience the A. B. C. Railroad, as shown in Fig. 1, has been assumed as having the following requirements and conditions.

(1) Coaling stations require respectively the equivalent of 100, 200 and 300 tons of standard (100 per cent.) coal per day.

(2) The railroad can get as much coal as it desires from all the sources of supply.

(3) All these coals will mix with each other without additional trouble from clinkering.

(4) Cost of handling at chutes, 10 cents per ton.

(5) Cost of haulage from source of supply to chute, 2 mills per ton-mile. (Under the accounting system put in force by the Interstate Commerce Commission on July 1 no charge is made against the fuel account for the haulage of coal on a company's own line. This has been the practice, at least on the more important lines, for a number of years past; although about 1901 at least two of the important systems charged their fuel account with the haulage of company coal at the rates of 3 and 5 mills per ton mile, respectively. Whether or not the haulage of company coal on a company's own line is, or is not, charged to the fuel account, is a matter of no importance, as the cost remains the same in either case, but in order to work out the best coal distribution it is a

Fig. 4.

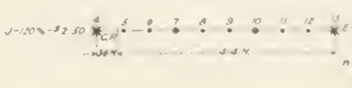

Fig. 5.

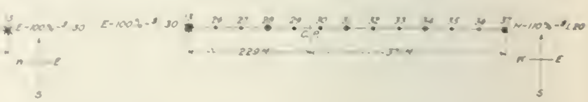

Fig. 6.

matter of the utmost importance to accurately know this cost of haulage. The above rate of 2 mills per ton mile is probably too low in most cases, but is selected at this figure to simplify the computations to follow.)

Competitive Points.—The prices and heat values of the coals have been so selected that they illustrate a number of combinations that arise in practice which will be taken up under the following headings:

Equal Heat Value, Unequal Price and Same Source of Supply.—Coals G and H having the same heat value, and being supplied from the same point should cost the same. As $1.40 per ton is asked for G and $1.20 for H, G should not be used, and thus is eliminated from consideration.

Equal Heat Values, Unequal Price and Different Sources of Supply.—Coals J and I, Fig. 2, have the same heat value, and J is supplied at $2.50 per ton from station No. 4, [illegible] miles from station No. 43, where I is supplied at $2.10 per ton.

The dividing line between coals J and I, which is called the competitive point, is found from the following equation in which x is the distance from station No. 4 to the competitive point.

$$\frac{\$2.50 + \$0.10 + x\,(\$0.002)}{120\ \text{per cent}} = \frac{\$2.10 + \$0.10 + ([illegible] - x)\,\$0.002}{120\ \text{per cent}}$$

x = [illegible] miles.

This shows that at all points north of station No. 38 J coal should be used, south of station No. 38 I coal should be used, and

Fig. 2.

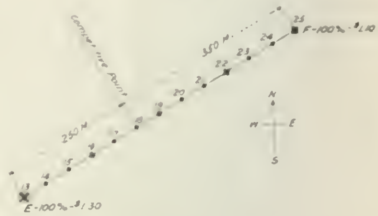

Fig. 3.

at station No. 38 either I or J coal can be used, as both will cost $2.70 on the engine at that point, made up as follows.

	Coal J	Coal I.
F. o. b. station	No. 4	No. 43
First Cost	$2.50	$2.10
Haulage	.10	.50
Handling at chute	.10	.10
Cost on engine per ton	$2.70	$2.70
Cost on engine of amount equivalent to 1 ton standard coal	2.25	2.25

Coals E and F, Fig. 3, have also the same heat value and are from different sources of supply.

The equation for finding the competitive point of these coals is as follows:

$$\frac{\$1.30 + \$0.10 + x\,(\$0.002)}{100\ \text{per cent.}} = \frac{\$1.10 + \$0.10 + (600 - x)\,\$0.002}{100\ \text{per cent.}}$$

x = 250 miles.

This shows that at station No. 18 both coals cost the same, made up as follows:

	Coal E.	Coal F.
F. o. b. station	No. 13	No. 25
First cost	$1.30	$1.10
Haulage	.50	.70
Handling at chute	.10	.10
Cost on engine	$1.90	$1.90

Unequal Heat Values, Equal Price, Same Source of Supply.—Coals B and C, costing the same, are supplied from the same source, but B is an 80 per cent. and C a 90 per cent. coal. As C is 12½ per cent. better than B, C should be used and B excluded.

Unequal Heat Values, Unequal Prices, Same Source of Supply.—Coals A and D are supplied from the same source, but are different in both heat value and price, A being an 80 per cent. coal costing $1.50 per ton, and D being a 90 per cent. coal costing $1.60 per ton. D being 12½ per cent. better than A, and costing only 6⅔ per cent. more, should be used to the exclusion of A.

Unequal Heat Values, Unequal Prices and Different Sources of Supply.—Coals D and J, Fig. 4, are unequal in heat value and price and are supplied from different points. Their competitive point would be found as follows.

$$\frac{\$2.50 + \$0.10 + x\,(\$0.002)}{120\ \text{per cent}} = \frac{\$1.60 + \$0.10 + (150 - x)\,\$0.002}{90\ \text{per cent}}$$

x = 14.3 miles.

The competitive point of coals D and J is 14 miles north of J, therefore stations No. 1, No. 2 and No. 3 should be supplied with

D, and station No. 4 with J. At the competitive point coal on the engine would cost as follows:

	Coal D.	Coal J.
F. o. b. station	No. 1	No. 4
First cost	$1.60	$2.50
Haulage	.27	.03
Handling at chute	.10	.10
Cost on engine, per ton	$1.97	$2.63
Cost on engine of amount equal to 1 ton standard coal. .	2.19	2.19

The competitive point of coals J and E, Fig. 5, is found from the following equations:

$$\frac{\$2.50 + \$0.10 + x\ (\$0.002)}{120 \text{ per cent.}} = \frac{\$1.30 + \$0.10 + (450 - x)\ \$0.002}{100 \text{ per cent.}}$$

$$x = 36.4 \text{ miles.}$$

This shows that J coal cannot be used east of station No. 4 and that E coal should be used at stations No. 5 to No. 13 inclusive. At the competitive point coal on the engine would cost as follows:

	Coal J.	Coal E.
F. o. b. station	No. 4.	No. 13
First cost	$2.50	$1.30
Haulage	.07	.83
Handling at chute	.10	.10
Cost on engine, per ton	$2.67	$2.23
Cost on engine of amount equal to 1 ton standard coal. .	2.23	2.23

The competitive point of coals E and H is determined by the following equation, as shown in Fig. 6:

$$\frac{\$1.30 + \$0.10 + x\ (\$0.002)}{100 \text{ per cent.}} = \frac{\$1.20 + \$0.10 + (600 - x)\ \$0.002}{110 \text{ per cent.}}$$

$$x = 229 \text{ miles.}$$

E coal is thus limited to station No. 29 and west thereof and H coal from stations No. 30 to No. 37 inclusive. At the competitive point the following would be the cost of coal on the engine:

	Coal E.	Coal H.
F. o. b. station	No. 13	No. 37
First cost	$1.30	$1.20
Haulage	.46	.74
Handling at chute	.10	.10
Cost on engine, per ton.	$1.86	$2.04
Cost on engine of amt. equal to 1 ton standard coal....	1.86	1.86

The competitive point of coals C and F, Fig. 7, is found from the following equation:

$$\frac{\$1.30 + \$0.10 + x\ (\$0.002)}{90 \text{ per cent.}} = \frac{\$1.10 + \$0.10 + (150 - x)\ \$0.002}{100 \text{ per cent.}}$$

$$x = -13.2 \text{ miles.}$$

Note that x is a negative quantity which shows that F can be hauled 26.4 miles more than the above 150 miles and then cost the same on the engine at station No. 22, the point of distribution of C, as the amount of C coal equivalent to one ton of standard coal. This is proven by the following table:

	Coal C.	Coal F.
F. o. b. station	No. 22	No. 25
First cost	$1.30	$1.10
Haulage	.00	.30
Handling at chute	.10	.10
Cost on engine, per ton	$1.40	$1.50
Cost on engine of amount equal to 1 ton standard coal. .	1.55	1.50

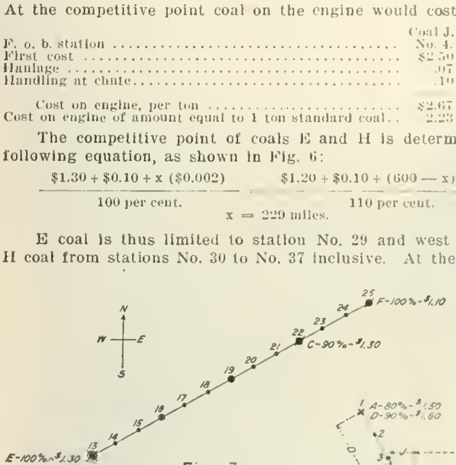

Fig. 7.

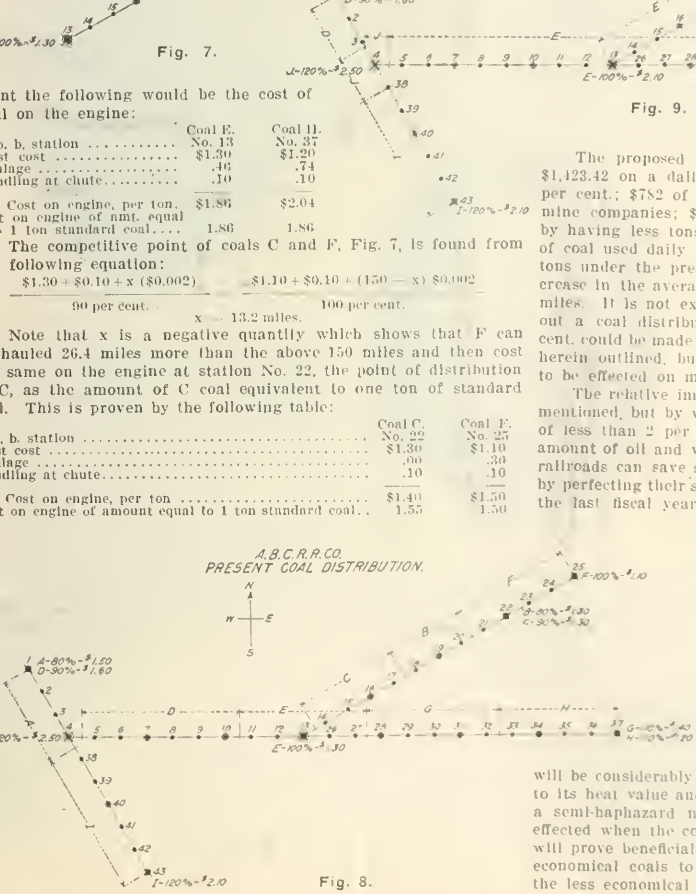

Fig. 8.

Present vs. Proposed Coal Distribution A. B. C. R. R.—The present coal distribution on the A. B. C. Railroad is shown by Fig. 8 and the proposed distribution by Fig. 9. Some objection may be offered to the distribution shown in Fig. 8, but when it is considered that the relative heat values are not known before tests have been made the distribution is not an improbable one.

The cost of fuel per day under the present system of coal distribution, and that of the proposed distribution, are shown in two large tables not reproduced here. The following totals, made up from these tables, show the amount of each kind of coal used under the present and proposed distributions:

Kind of coal	Present distribution: Tons used.	Present distribution: Equivalent to following tons of standard coal.	Proposed distribution: Tons used.	Proposed distribution: Equivalent to following tons of standard coal.
A	875.0	700	. . .	. . .
B	500.0	400	. . . .	. . . .
C	555.5	500	. . . .	. . .
D	888.8	800	444.4	400
E	700.0	700	2,300.0	2,300
F	700.0	700	1,100.0	1,100
G	636.3	700	. . .	.
H	636.3	700	999.9	1,100
I	666.4	800	583.1	700
J	. . .	. .	333.3	400
Total	6,158.3	6,000	5,760.7	6,000

Below are given the averages and totals of these tables, and the savings to be made by adopting the proposed distribution:

Distribution.	Coal Tons.	Average Haulage.	Average Tn miles.	Cost of coal: First cost.	Haulage	Handling.	Total.
Present	6,158.3	176	1,084,035	$8,840.55	$2,168.07	$615.83	$11,624.45
Proposed	5,760.7	136	783,140	8,058.68	1,566.28	576.07	10,201.03
Difference	397.6	40	300,895	$781.87	$601.99	$39.76	$1,423.42

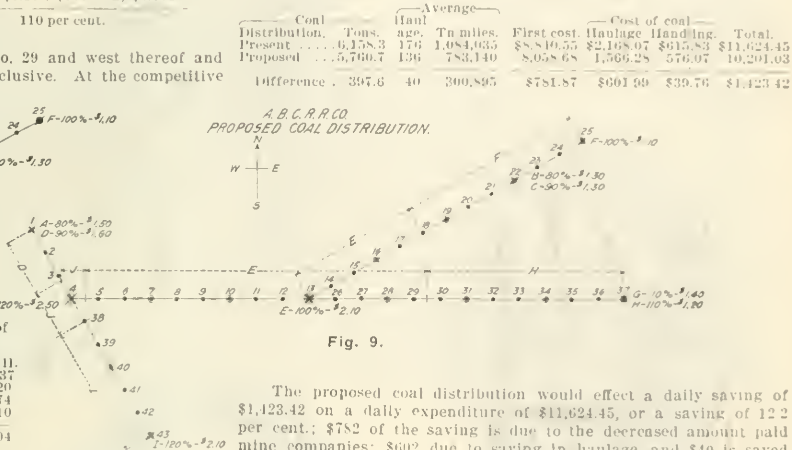

Fig. 9.

The proposed coal distribution would effect a daily saving of $1,423.42 on a daily expenditure of $11,624.45, or a saving of 12.2 per cent.; $782 of the saving is due to the decreased amount paid mine companies; $602 due to saving in haulage, and $40 is saved by having less tons of coal to handle, there being only 5,761 tons of coal used daily under the proposed distribution as against 6,158 tons under the present distribution. The table also shows the decrease in the average length of haul and the decrease in total tonmiles. It is not expected that every railroad company in working out a coal distribution would find that a saving of over 12 per cent. could be made by distributing the coal according to the methods herein outlined, but there is no doubt that considerable saving is to be effected on most systems.

The relative importance of fuel and oil economy has often been mentioned, but by way of comparison it may be said that a saving of less than 2 per cent. in the fuel bill would pay for the entire amount of oil and waste used for locomotive lubrication, and many railroads can save several times the amount of the lubrication bill by perfecting their system of coal purchase and distribution. During the last fiscal year the average cost of fuel for locomotives and lubrication for locomotives on five leading western roads was as follows:

		Per cent.
Fuel for locomotives	$6,042,266	13.2
Lubrication for locomotives	148,160	0.3
Total operating expenses	45,604,82[illegible]	. .

This shows that the cost of lubrication of locomotives amounts to only 2.5 per cent of the cost of fuel for locomotives and that at least 40 times the energy that is now spent in reducing the cost of lubrication should be expended on the fuel item.

It is not expected that any railroad can at all times distribute coal according to some predetermined plan, but the cost of fuel will be considerably less, when purchased and distributed according to its heat value and cost, than when purchased and distributed in a semi-haphazard manner. The greatest saving can probably be effected when the commercial demand is not at a maximum, which will prove beneficial to purchase and distribution by allowing more economical coals to be used and correspondingly less amounts of the less economical coals.

The Block Signal and Train Control Board.

The portraits shown on this page are those of the members of the "Block Signal and Train Control Board" which, acting under the authority of the Interstate Commerce Commission, is charged with the duty of investigating the subject of automatic train stops and other block signaling questions. The appointment of this board, under authority of a Congressional resolution, was noticed in the *Railroad Gazette* of July 19, last, page 58. The Chairman of the board is Professor Cooley, Dean of the Engineering School of the University of Michigan. He has been connected with that institution since 1885, previous to which time he was in the United States Navy. Professor Cooley has done expert engineering work in connection with railroads for the state of Michigan and for the city of Chicago.

Captain Ames is Signal Engineer of the Electric Zone of the New York Central & Hudson River, and has served on the Lake Shore & Michigan Southern and Boston & Albany, as well as on different divisions of the New York Central. His title as Captain comes from his service in the Engineering Corps of the United States Army during the war with Spain in 1898.

Mr. Ewald is Consulting Engineer of the Illinois Railroad and Warehouse Commission, and was formerly in the Engineering Department of the Atchison, Topeka & Santa Fe.

Mr. Adams is associate editor of the *Railroad Gazette*.

Concerning the work of this Board, the Commission, in its annual report, says that

M. E. Cooley.

Azel Ames, Jr.

F. G. Ewald.

H. H. Adams.

its attention has thus far been directed to an examination of inventions that have been presented in response to a circular letter issued by the Commission. Continuing, the Commission says: "As the block system proper is now in general use and information concerning it can be obtained with comparative ease the board has devoted its attention mainly to the question of automatic stops. In considering the desirability of such devices on railroads generally one of the first problems to be solved is the reliability of the apparatus when its operation is interfered with by snow, ice or accidental disturbances or obstructions. Another problem is the arrangement and regulation of the apparatus so as to provide against failure or inconvenience and delay caused by such irregularities as unusually long or short trains, varying rates of speed, train movements in the reverse direction, and the unexpected stoppage of trains.

"The questions to be determined by test are, first, the merit when used in general service of those devices which are already in use in exceptional situations, and, second, what merit there may be in the large number of inventions and alleged inventions which have not yet been developed and installed. Concerning the first class a number of concerns are now proposing to make experimental installations, and these, if ready, will be inspected by the board during the coming winter. As to the second class, all but a few of the devices that have been presented for consideration are from inventors who have little knowledge of the present state of the art of signaling and who appear to have taken little pains to secure the counsel of men experienced in railroad operation.

"The use of automatic stops necessitates special equipment on each engine traversing the line where the stops are installed. This is a radical innovation and involves questions which must be considered with great care. There are two principal methods of communication with the engine, namely, by mechanical trips and by electrical contacts. The relative desirability and reliability of these methods is one of the first questions to be settled. Under this head it will be desirable to investigate certain cab signal installations in Europe, some of which are of ten years' standing. Cab signals are not automatic train stops, but they use either the mechanical trip or electrical contact in the same way that an automatic stop would use it, hence the need of learning the lesson of this European experience through a visit by a member of the board or some other competent person to England and France.

"Up to date the board has examined descriptions of 495 devices or systems; 245 of this number have been laid aside as not coming within the terms of the joint resolution. They deal with devices intended to improve the condition of tracks, automatic car couplers, automatic steam and air hose couplers, safety cars, etc. Of the remaining inventions the board has been furnished with descriptions of 175 which relate directly to block signals, cab signals, or automatic train stops; 55 of this number have already been disposed of and 120 are now in the course of examination. In nearly all of the 55 cases which have been passed upon the board has unanimously decided that the alleged inventions have not sufficient merit to warrant further attention. In most of these cases the plans and specifications that have been furnished indicate that the inventors are manifestly unacquainted with the requirements of railroad service, their devices being merely repetitions of what has been previously invented."

Mallet Compound Locomotive for the Central of Brazil.

The American Locomotive Co. has recently built three Mallet articulated compound locomotives for the Central Railroad of Brazil, which, while not ranking in size and capacity with those built by the same company for the Baltimore & Ohio and Erie, are still of goodly proportions and have a capacity on a par with the heaviest consolidation locomotives in use on American roads. In general design the type built resembles the Erie engine, except that it is fitted with three pairs of driving wheels in each truck instead of four pairs. The boiler is rigidly attached to the rear frame and the flexible connections to the front cylinder and the exhaust are the same as those shown in the *Railroad Gazette* Oct. 4, 1907.

As in the case of the other locomotives the Walschaerts valve gear is used. There is one detail to which attention may be called, and that is the comparatively low position of the injector check. It will be seen to be just above the top of the main air reservoir and well down below the center line of the boiler, showing that despite all of the discussion on the subject that has appeared during the last year or so, the position of the part has not yet been definitely settled.

The following are some of the principal dimensions of these engines:

Cylinders, diameter, h. p.	$17\frac{1}{2}$ in.
Cylinders, diameter, l. p.	28 "
Piston stroke	26 "
Track gage	5 ft. 3 "
Wheel base, rigid	9 " 0 "

The Galesburg Timber Preserving Plant of the Burlington.

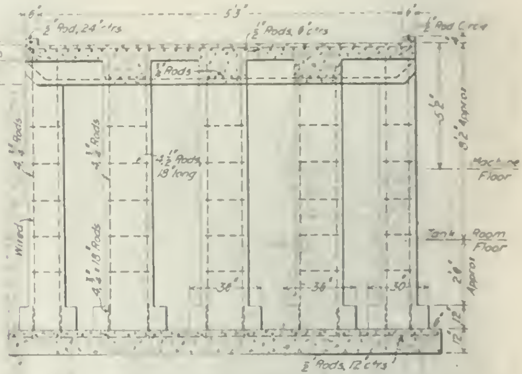
The Chicago, Burlington & Quincy built its first timber preserving plant in 1900. It was located at Edgemont, S. Dak., for treatment of Oregon fir and mountain pine cut in the vicinity. This plant, which was described in the *Railroad Gazette* of April 6, 1900, used the Burnettizing and Wellhouse processes. The following year it was moved to Sheridan, Wyo., to be nearer the sources of timber supply. There it has been in operation ever since. Its capacity is only 350,000 ties a year. The Burlington lately determined to build another and much larger plant embodying the most recent ideas in timber preservation. As the timber to be treated was the inferior oak, maple, gum, pine and other soft woods, coming principally from the southern states, the logical place for the location of the plant was some point in Illinois reached by the lines extending southward in that state. The plant was put at Galesburg where all of the lines in Illinois center.

A large new freight yard, described in the *Railroad Gazette* of Sept. 8, 1905, was built at Galesburg about a year ago. The timber preserving plant is located southwest of this yard on a cut-off built from its south end, which is adjacent to the Kansas City line, across to the Omaha line. The plant is about four miles from the city, on an 80-acre tract. There is storage space for 1,500,000 ties, which is the yearly capacity of the plant. There is also space for a considerable amount of piling and bridge timber. The tract is rectangular in shape and the storage yard is laid out with nine parallel sets of tracks, the three northerly of which will not be built at present. Four of the tracks are laid with three rails for narrow and standard gage cars.

The main building, which is 152 ft. x 115 ft. and has retort, engine, boiler and tank rooms, is built of reinforced concrete. The beams, roof and floor are crushed stone concrete of a 1:2:4 mixture, and the walls and foundations are gravel concrete of an equivalent 1:2:6 mixture. The side walls are 5 in. thick and reinforced with ½ in. corrugated steel bars, spaced 18 in. centers both ways. The floors, where reinforced, are in 15-ft. x 30-ft. panels with ½-in. corrugated bars spaced 3 in. by 8 in. on centers, every other bar being arched over the beam. The roof has ½ in. bars spaced 6 in. by 12 in. It was mopped with pitch and covered with a four-ply composition roofing. The retort room is ventilated with two monitors each 10 ft. wide and 30 ft. long made entirely of concrete. Their windows and all others in the building have steel sash and wire glass lights.

In excavating for the building water was encountered at a depth of 5 ft. This modified the method of erection somewhat. After putting in the foundation walls, the pilasters were built first and the intervening wall panels put in afterward suitably keyed to the pilasters. This was because of the possibility of unequal settlement between the loaded pilasters and the unloaded wall panels and was done to avoid cracking.

The retort room is 152 ft. long and 38 ft. wide. There are three retorts 132 ft. long and 6 ft. in diameter, made of ⅞-in. steel, with a capacity of 100 ties to the charge. The plant capacity per 24-hour day is 5,000 ties. The plant is equipped for either the Card, Rueping or Burnettizing process. The second and third of these have been fully described heretofore. The Card process is the zinc-creosote (Rutger) process adapted for use in this country at reasonable cost by an efficient and inexpensive method of agitating the mixture under pressure. Unless this is done, the use of a special imported oil is necessary to get a mixture that will not separate under pressure. In the Card process a centrifugal pump is used, with suction and discharge connected respectively to the top and bottom of the treating cylinder. The discharge pressure is distributed uniformly throughout the length of the cylinder by means of a perforated pipe. The pressures on the two sides of the pump are equalized, being the same as the cylinder pressure, and little power is needed to handle large quantities of the mixture. Thorough agitation is obtained and enables the use of any good grade of oil with the zinc chloride regardless of their respective specific gravities. Impregnation is effected at a pressure of 180 lbs.



Reinforced Concrete Foundation for Tank.

The boiler room, which is 46 ft. square, has three 150-h.p. boilers, one of which is extra for emergency use. The boilers are equipped with an induced draft system. The engine room, 30 ft. x 115 ft., contains an air compressor, fire pump, electric generator, three pressure pumps and an oil pump, with ample room for additional machinery. The valves for controlling the fluid in the headers in the basement also are worked from this room and all gages are under the eye of the engineer.

In the tank room, 39 ft. x 56 ft., is a 50,000-gal. steel working

New Timber Preserving Plant at Galesburg, Ill.; Chicago, Burlington & Quincy.

tank and a 100,000-gal. steel storage tank for creosote. This room was specially designed for these tanks, arched ceiling beams being used to permit the convex tank roofs to come close to the ceiling and thus avoid waste of space. Outside, close to the building, are the storage and measuring tanks. There is one 500,000-gal. steel tank for creosote storage and two 5,000-gal. steel creosote measuring

Reinforced Concrete Foundation for Tank; Galesburg Timber Preserving Plant.
Table for second foundation in form in foreground.

tanks; also two 50,000-gal. wooden tank for zinc chloride. The outside creosote tanks have steam heating coils.

All tanks are set on reinforced concrete foundations. These are of two types, one of which is shown herewith by a photograph and the other by a drawing. The foundation shown in the photograph is for one of the 50,000-gal. zinc chloride tanks. The concrete columns, which are 22 in. in diameter, rest on piers and are joined at the top by 12-in. x 16-in. beams. Columns and beams are reinforced and tied together by four ¾-in. corrugated bars near the bottom of the beams. The two inner bars are made continuous through all the beams, while the two outside bars in each beam are bent downward and run to the foot of the column. The table is 6 in. thick and is reinforced with ½-in. bars spaced 6 in. on centers. At first it was intended to make the tank foundations of plain concrete. But there is considerable vibration of the tank when the liquid is being forced in it: in fact, if care is not used when first opening the valves the sudden rush of the liquid will cause heavy shocks within and to the tank. For this reason reinforcing was put in the foundations.

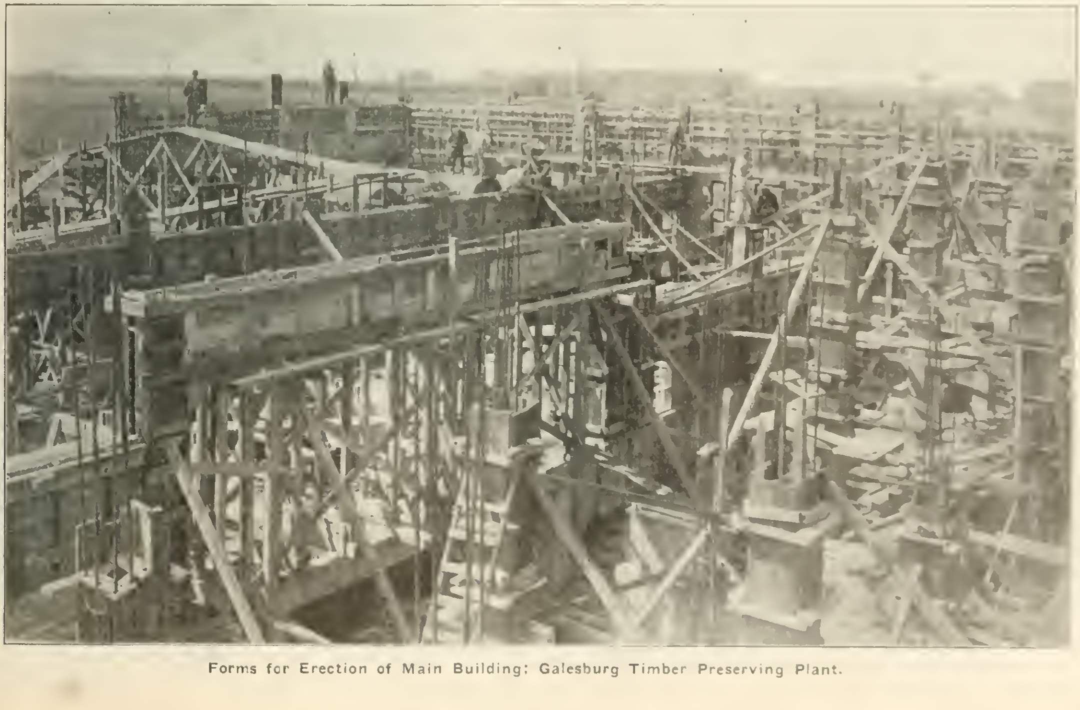
The drawing shows the foundation for the 15-ft. steel tank in the tank room. The columns are rectangular in section, those at the periphery being 18 in. x 24 in. and the others 21 in. square. All details are shown by the drawing.

There is a concrete loading platform 480 ft. long and 25 ft. wide in the yard. Narrow-gage tracks from the retort room run on top of it and there is a standard-gage track each side. The yard is piped for fire protection, with hydrants well distributed. The water for this and for the boilers is obtained from a well 1,200 ft. deep, yielding 6,000 gals. an hour. There is a steel storage tank of 100,000 gals. capacity.

Besides the four large rooms in the main building already mentioned, there is an experiment room, 16 ft. x 39 ft., fitted with a miniature tie treating plant, whose retort will hold two ties.

The preparation of the plans of the plant and its construction were in charge of W. J. Frein, Architect of the Burlington, under the supervision of T. E. Calvert, Chief Engineer. The buildings were erected by the Knickerbocker Roofing & Paving Co., Chicago. F. J. Angier, superintendent of the plant at Sheridan, has been put in charge of the new plant. The Sheridan plant is being renewed and modified to administer the Rueping process in addition to those previously used.

The English have built a railroad 36 miles long on the Island of Cyprus, which is large enough, populous enough and fertile enough to support much more than this; but this it supports ill. In the first eight months of its last fiscal year its gross earnings were $12,186 and its working expenses $31,179.



Forms for Erection of Main Building; Galesburg Timber Preserving Plant.

Interstate Commerce Report.

The following extracts are taken from the twenty-first annual report of the Interstate Commerce Commission, issued Jan. 6, which is of special interest because it covers the first year's work under the 1906 Rate Law.

Little more is attempted in this report than a general statement of the work performed by the Commission during the last year in the discharge of its official duties. A considerable part of the time has been occupied in giving administrative construction to various provisions of the law for the guidance of both shippers and carriers. To secure the best results of legislation with the least possible delay there was obvious need of a correct and uniform interpretation of the statute. Therefore, without reference to questions arising in particular cases, and to avoid unnecessary controversy, it has seemed our duty to construe the law in advance wherever it appeared obscure or ambiguous, so that the obligations of the railroads and the rights of the public might be promptly understood. This has resulted in numerous rulings explaining our view of the meaning and application of various provisions of the statute. These rulings have in practically every instance been accepted by the carriers, even in cases where their legal advisers were not entirely in accord with the opinion of the Commission.

The benefits of this course are beyond question. The Commission has endeavored to adopt a workable construction of the law in all cases, and has as a rule announced its conclusions in matters of importance only after conference and discussion with representative shippers and traffic officials. This is especially true with reference to tariff regulations. This matter is fundamental in any scheme of public regulation. There is scarcely a complaint or controversy which is not based upon the schedules of rates and charges established by the carriers. If those schedules are clear and definite in their statements, there is no excuse for disregarding them. If the rates and regulations are reasonable and plainly announced, the shipper knows his rights and the railroad official knows the obligations of his company. If the charges are claimed to be excessive or discriminatory, the question can be intelligently determined after the full hearing which the statute provides. It is believed that the efforts of the Commission in this direction have already been fruitful of good results and that they will prove of increasing value in the future.

The amended law has now been in force for upwards of 15 months, and some opinion may be expressed as to its operation and effects. The substantive provisions of the original act, forbidding the exaction of unreasonable charges and prohibiting discriminations between persons and places, were unchanged by the legislation of 1906. The main purpose of that legislation was to provide more adequate means for the enforcement of rights and duties already declared to exist. The vital principle of a right is found in the obligation to respect it. Without remedial procedure the declaratory portion of any law is little more than the statutory expression of a sentiment, but when efficient machinery for securing observance is provided the performance of definite duties and the recognition of definite rights may be expected to follow in ordinary conduct without resort to litigation. That this is true in regard to the amended act, and to an extent not generally appreciated, is confidently asserted. Just as the value of criminal laws is measured by the peace and security of society rather than the occasional conviction of offenders, so the salutary effects of the present statute are shown in the more general enjoyment of previously existing rights rather than by the number of cases in which the authority of the Commission has been invoked or the list of decisions and prosecutions which makes up the record of administration.

It is likewise true that the substantial and permanent benefits of this law are indirect and frequently unperceived, even by those who in fact profit by its observance. It means much for the present and more for the future than the principles of this law have gained greatly in general understanding and acceptance. The injustice of many practices which were once almost characteristic of railroad operations is now clearly apprehended, and an insistent public sentiment supports every effort for their suppression. By railroad managers almost without exception the amended law has been accepted in good faith, and they exhibit for the most part a sincere and earnest disposition to conform their methods to its requirements. It was not to be expected that needed reforms could be brought about with more or less difficulty and delay, but it is unquestionably the fact that great progress has been made and that further improvement is clearly assured. To a gratifying extent there has been readjustment of rates and correction of abuses by the carriers themselves. Methods and usages of one sort and another which operated to individual advantage have been voluntarily changed, and it is not too much to say that there is now a freedom from forbidden discriminations which is actual and general to a degree never before approached. As this process goes on, as special privileges disappear and favoritism ceases to be even suspected the indirect but not less certain benefits of the law will become more and more apparent.

An incidental respect in which equality of treatment has been greatly promoted is in such matters as switching, terminal, demurrage, reconsignment, elevation and other charges making up the aggregate cost of transportation. In the past it was often within the power of a carrier to waive charges of this nature in favor of particular shippers while collecting them from business rivals. Now the law and the rules of the Commission require all charges of this description to be plainly stated in the tariffs and to be applied with the same exactness and uniformity as the transportation rate itself. This is only one of the ways in which distinct advance has been made toward placing competing shippers in each locality upon a basis of equality in the enjoyment of a public service.

It is this general and marked improvement in transportation conditions that the Commission observes with special gratification. The amended law, with its enforceable remedies, the wider recognition of its fundamental justice, the quickened sense of public obligation on the part of railroad managers, the clearer perception by shippers of all classes that any individual advantage is morally as well as legally indefensible, and the augmented influence of the Commission resulting from its increased authority have all combined materially to diminish offensive practices of every sort and to signally promote the purposes for which the law was enacted.

Under the operation of the interstate commerce act the right to initiate interstate rates rests entirely with the railroad, which may, by giving 30 days' notice, put into effect any rate or any regulation or practice affecting a rate which it sees fit. The Commission is not required to approve these rates and has no authority whatever to condemn them. It can only act upon a rate so established by the railroad in case a formal complaint is filed attacking that rate and after a full hearing. This is the express provision of the statute.

In the majority of instances, perhaps, advances may properly be made before the reasonableness of the advanced rate has been finally passed upon by this Commission; but there are also many instances where great injustice must result unless matters can be kept in statu quo while proceedings are pending to test the reasonableness of the advance. Where a rate has been maintained for a considerable time and where business interests will be seriously affected by its change it is no undue hardship to require the carrier to continue that rate in effect until the propriety of the advance can be passed upon, and to finally make the advance itself at such time as will work no unnecessary injury. Certainly there ought to be some tribunal to which shippers can appeal, with authority, if such a course seems just, to prohibit the advance or the change until the general question can be considered.

At the present time it is not very clear whether such authority anywhere exists. Certainly the Commission does not possess it. It cannot itself by any order restrain the advance, nor can it, apparently, apply to the courts for such a restraining order unless the advance works such a discrimination as is forbidden by the so-called Elkins bill, and this is not usually true of a mere increase in the rate. In several instances courts of equity have interfered to prohibit advances pending proceedings before the Commission. In these cases an injunction has been issued in favor of the complainants alone, so that at the present time the general public is paying the advanced rate, while the complainants are being charged the old rate. These injunctions were granted upon the filing of a bond—$10,000 in one case and $250,000 in the other. It is evident that the application of any such practice must result in discrimination and hardship to the general public.

We suggest that when an advance in rates or a change in any regulation or practice is attacked by complaint to this Commission, the Commission shall have the power, in its discretion, after notice to and hearing of the parties, to prohibit the taking effect of the advance or change until the matter has been finally heard and determined.

At all events Congress should definitely understand that we, under the present law, are powerless to act in reference to these advances except upon the filing of a formal complaint and after a full hearing of the case.

RAILROAD INVESTMENTS.

The joint control of the Alton Railway by the Union Pacific and the Chicago, Rock Island & Pacific Railway Company has undoubtedly eliminated competition between the Alton and the Rock Island between Chicago, St. Louis and Kansas City.

These are conspicuous illustrations of the development of the theory of "community of interest" and "harmony of management" which Mr. Harriman suggested when he demanded representation upon the Santa Fe board.

If the policy of purchasing and controlling stocks in competing lines is permitted to continue, it must mean suppression of competition.

The function of a railroad corporation should be confined to the furnishing of transportation. Railroads should not be permitted to invest generally in the stocks, bonds and securities of other railroad and steamship companies, except connecting lines, for the purpose of forming through routes of transportation, including branches and feeders. It is in the interest of the public to facilitate the consolidation of connecting lines. The credit of a railroad company is founded upon the resources and prosperity of the country through which it runs. Its surplus funds and credit should be used for the betterment of its lines and in extensions and branches to develop the country contiguous to it. The testimony taken upon this hearing shows that about 50,000 square miles of territory in the state of Oregon surrounded by the lines of the Oregon Short Line Railroad Company, the Oregon Railroad & Navigation Company and the Southern Pacific Company are not developed, while the funds of those companies which could be used for that purpose are being invested in stocks like the New York Central and other lines having only a remote relation to the territory in which the Union Pacific system is located.

Railroad securities should be safe and conservative investments for the people. To this end the risks of the railroad should be reduced to a minimum. Every one knows that railroad securities fluctuate more or less, according to the prosperity of the times, and also by reason of the wide speculation in such securities. It therefore adds an element of hazard to a railroad's capital and credit to have its funds invested in the stocks or other companies, thereby endangering its solvency and its ability to pay reasonable dividends upon its own capital stock. It is a serious menace to the financial condition of the country to have large railroad systems fail to meet their obligations or go into the hands of receivers, and the object of legislation and administration should be to lessen the risks of railroad investments.

It is contrary to public policy as well as unlawful for railroads to acquire control of parallel and competing lines. This policy is expressed in the federal laws and in the constitutions and laws of nearly every state in the Union. We have examined the constitutions and laws of all the states, and find in about 40 of them prohibitions against consolidations of capital stock or franchises of competing railroads, or the purchase and acquisition by a railroad of competing lines. Competition between railroads as well as between other industries is the established policy of the nation. And while the acquisition of a small minority of the stock of a competing line might not decrease the competition, yet the acquisition of any considerable amount of stock, with representation on the board of directors of such railroad, unquestionably has the effect of diminishing competition and lessening to that extent its effectiveness. So long as it is the policy of the general government and of the states to maintain competition between naturally competing lines, the ownership of any stock by one railroad in a competing railroad should not be permitted, and such lines of railroad should be prohibited from having any common directors or officers.

The time has come when some reasonable regulation should be imposed upon the issuance of securities by railroads engaged in interstate commerce. We are aware that in the construction of new lines of railroad, developing new territory, it has been necessary in many instances to sell railroad securities at large discount, and to sell bonds with stock bonuses, and even in such cases it has many times been difficult to raise the necessary capital. Men will not invest their money and take the risk for small rates of interest.

But this principle does not apply to old fashioned railroad systems having good credit. Such railroads should be prevented from inflating their securities for merely speculative purposes. Railroads should be encouraged to extend their systems and develop the country. It is of the utmost importance, also, that railroad securities should be safe and conservative investments for the public and should yield good and ample return for the money invested. Reasonable regulation will tend to make them safer and more secure investments, and thereby benefit not only the railroad companies but the public.

VALUATION OF RAILROAD PROPERTY.

Reference has been made in previous reports to the importance of a physical valuation of railroad properties. The considerations submitted in favor of such a valuation need not be repeated at this time. It may, however, be proper to call attention to the fact that the introduction into operating expenses of a set of depreciation accounts brings prominently into view an added necessity for an inventory of railroad property. The chief purpose of the depreciation accounts is to protect the investor against the depletion of his property by an understatement of the cost of maintenance, and to protect the public against the maintenance of unduly high rates by charging improvements to cost of transportation. These accounts, which serve so important a purpose, require for their proper and safe administration complete and accurate information relative to the value of the property to which they apply, and this information can only be secured by a formal appraisal embracing all classes of railroad property.

Yet another reason may be submitted. Before the close of the present fiscal year the Commission will be in a position to prescribe a standard form of balance sheet. The purpose of a balance sheet is to disclose the financial standing of a corporation, and this it does by placing in parallel columns a statement of assets and of liabilities. But in the case of railroad companies the Commission is unable to test the accuracy of the assets reported, and there is no feasible means of providing such a test other than by a detailed inventory of the property which the assets represent. If Congress designed, by the provision which it made for a prescribed system of accounts, that the Commission should do what lies in its power to guarantee the sound financing of railroads, the necessity for making an inventory appraisal of railroad property cannot longer be delayed.

From whatever point of view this question of valuation be regarded, whether of reasonable capitalization, of a reasonable schedule of rates, of effective administration of the depreciation accounts or of the correct interpretation of the balance sheet, one is forced to conclude that an authoritative valuation of railroad property is the next important step in the development of governmental supervision over railroad administration.

The Commission cannot emphasize too strongly the significance of the supervisory work which, upon the authority conferred by the twelfth section of the act to regulate commerce as amended, has assumed such large proportions; and believing as it does that a comprehensive, systematic and authoritative valuation of railroad property is essential for the successful development of this work, as well as for other purposes named, it does not hesitate to submit to Congress a formal recommendation for the enactment of a law under which such a valuation can be made.

HOLDING COMPANIES.

The compilation of reports has been greatly embarrassed by the fact that certain "holding companies" have questioned the authority of the Commission to require the information sought.

Two illustrations, showing the character and effect of holding companies, may be noted.

The Rock Island Company was organized apparently for the purpose of securing a centralized control over operating properties. Its interest is confined to the Rock Island system of railroads. It has, so far as its reports to stockholders reveal the facts, no equities in any other industries nor in any other railroad systems than those generally regarded as a part of the Rock Island railroad system.

The Rock Island Company was chartered in New Jersey in 1902 as a holding company. It had outstanding, outside of the treasury, on June 30, 1907, \$49,047,390 of preferred stock and \$89,602,402 of common stock, a total of \$138,649,792. It has no debt.

The Chicago, Rock Island & Pacific Railroad Company, chartered in Iowa in 1902, is in fact a holding company intermediary between the operating companies and the Rock Island Company. Its entire outstanding stock, amounting to \$115,000,000, is owned by the Rock Island Company, which the latter corporation secured in exchange for its own stock. The Chicago, Rock Island & Pacific Railroad Company, using this Rock Island Company stock in combination with two issues of collateral trust bonds, has purchased more than 93 per cent. of the stock of the Chicago, Rock Island & Pacific Railway Company, and nearly 60 per cent. (practically the entire common stock issue) of the St. Louis & San Francisco Railroad Company stock, the stocks of these two latter corporations being deposited as security for the collateral trust bonds.

It should be noted further that the Chicago, Rock Island & Pacific Railway Company owned on June 30, 1907, 48 per cent. of the stock of the Chicago & Alton Railway, which amounts to virtual control; that the St. Louis & San Francisco Railroad Company owned 82½ per cent. of the stock (excluding treasury holdings) of the Chicago & Eastern Illinois Railroad Company, and that this latter corporation owns 60 per cent. of the stock of the Evansville & Terre Haute Railroad Company.

The voting right of securities is also pertinent. Holders of the preferred stock of the Rock Island Company have the right, to the exclusion of holders of the common stock, to choose the directors of the first class, such right to be surrendered only with the consent of two-thirds of the preferred stockholders. Furthermore, the amount of preferred stock cannot be increased, except upon affirmative vote of the holders of two-thirds of the entire preferred and two-thirds of the entire common stock. It therefore appears that a majority of the preferred stock of the Rock Island Company, or say, \$25,000,000 out of a total of \$49,000,000 of preferred stock of that corporation, dominates the situation and controls the vast network of railroad lines comprised in the Rock Island system.

Another striking instance of consolidated control through the medium of a holding company is that of the Atlantic Coast Line Company, of Connecticut, organized in 1889 for the purpose of consolidating under one ownership a series of Southern roads along the Atlantic coast. This corporation, with a capitalization on June 30, 1906, of only \$10,500,000 of stock and \$13,000,000 of certificates of indebtedness, owned more than 53 per cent. of the stock of the Atlantic Coast Line Railroad Company. The significance of this holding becomes clearer when it is observed that on June 30, 1907, the Atlantic Coast Line Railroad Company owned $39,600,000 out of $60,000,000, or 51 per cent., of the stock of the Louisville & Nashville Railroad Company, and that the latter corporation, jointly with the Southern Railway Company, owned 88 per cent. of the stock of the Chicago, Indianapolis & Louisville Railroad Company, and leased jointly with the Atlantic Coast Line Railroad Company the railroad properties of the Georgia Railroad and Banking Company. This holding company, with a comparatively small capitalization, which represents still less of actual investment, probably not more than $5,000,000, is in control of a railroad system more than 5,000 miles long, and with capital stock aggregating considerably more than $100,000,000.

It is not intended to discuss the economic justification of such holding companies, if, indeed, they can be justified from that point of view. The significant fact for the consideration of Congress is that companies of this class deny the jurisdiction of Federal supervision under the law, a contention which, if admitted and carried to its logical result, would exclude many important financial questions which affect public interests from the supervisory control of the Commission. It is the purpose of the Commission to bring this question to judicial determination, but in order to arrive speedily at some practical conclusion, to the end that the work undertaken be not further embarrassed, it is respectfully submitted that the act to regulate commerce be amended so as to make clear the responsibilities and the rights of the Commission as regards holding companies.

Massachusetts Railroad Commissioners' Report.

The state railroad commissioners of Massachusetts, W. P. Hall, G. W. Bishop and Clinton White, have issued the thirty-ninth annual report of the Board. The first part of the report is taken up with the usual statistics and with the report of the Bridge Engineer. Acting under the law passed in 1906 dividing railroads into three classes; "railroad corporations," "street railway companies" and "electric railroads," the board has issued one certificate of public convenience and necessity to an electric (interurban) railroad, has rejected two and has two others under consideration. The board has again investigated the locomotive smoke nuisance but finds nothing new to say. The principal difficulty is in unskilful firing. The board believes that before long electric motive power will have to be used in order properly to abate the smoke nuisance, and recommends that the whole question of electric propulsion be studied.

Eleven grade crossings have been done away with during the past year. Since 1890, when the state began to aid the towns in this work, over $29,000,000 has been expended; nearly 18 millions by the railroads, nearly eight millions by the state and the rest by the cities and towns.

Two years ago the board recommended a law providing for compulsory block signaling and the report gives a brief statement of the number of miles of track on each road now worked under the block system, but it does not appear that any mandatory orders have been issued. The board has formally approved the use of automatic block signals of different types now in operation on the three principal roads of the state, but does not appear to have approved manual signals anywhere except on the New York, New Haven & Hartford. The Boston & Maine intends to expend $370,000 on automatic signals in 1908 finishing the equipment of all its double-track lines in Massachusetts. The Boston & Albany proposes to equip 23 miles of track this year. The New York, New Haven & Hartford has no new work laid out for this year on its lines in Massachusetts. Speaking of block signaling generally, the board expresses satisfaction with the progress of the work and with the attitude of the officers of the railroads.

Over 25 pages of the report are devoted to the Boston & Albany, the legislature having directed the board to make a special investigation of that road on account of the poor service afforded. The improvements made during the past year are set forth in considerable detail and the commissioners seem to think that the managing officers are now doing their best to put the road in condition to give good service.

Concerning the ventilation of street cars, which was discussed in the last preceding report, the commission says:

The Board has recently changed its requirement with reference to the point of outside temperature at and below which companies are called upon to heat street cars, making that point 40 instead of 50 degrees above zero, the temperature to be then maintained to have a range that shall not be lower than 40 nor higher than 60 degrees. In making this radical change and certain other changes, the Board has had in view a rule that companies will find it possible to obey, and that the district police can enforce under the statute which makes them responsible for its enforcement.

It is a common thing that opinions differ as to what the temperature of a room in a private house ought to be, and that the same person entertains different opinions at different times according to condition of health or circulation of blood. Obviously, then, an attempt to always satisfy every occupant of a street car with the atmospheric conditions must be futile. Even if passengers were of the same mind, it is impracticable to constantly maintain air of a given quality and the temperature at a specific point in a car that is one moment really empty and the next crowded to the limit, now stationary, then in motion, with doors continually opening and shutting, and with an outside temperature varying between zero and 40 degrees above.

Companies are not, however, relieved from the obligation to keep the air in such reasonably warm and pure condition on account of the difficulties in the way of doing this to the satisfaction of every traveler. In fulfilling their obligations both management and employees must expect to deal with the old and young, with the robust and feeble, with those who thrive on draughts of cold air and with those to whom such draughts are fatal, with those who are dyspeptic and nervous, unsound as well as with the sane and cheerful.

The days of horse cars, with straw on the floor to keep the feet warm, and with no ventilation except that afforded through the doors, are within easy recollection. While to-day the electric heater exemplifies radical progress in heating, the ventilator commonly in use is about as crude as any device could be. Present discomfort is due fully as much to the failure to properly use means at hand for keeping the air pure and warm as to imperfection in apparatus. There is no reason why, for example, a movable ventilating window should be kept entirely open or entirely shut, or in any one position throughout a long journey in total disregard of the temperature outside and of the changing conditions inside the car.

It should be a part of the regular duty of those in charge of cars to regulate both heating and ventilating apparatus from time to time to meet varying needs. Admirable work of this kind is now done by individual conductors and there is no reason why their success in caring for the public should not become a general feature of the service. Co-operation, too, between passengers and employees is of great benefit to both, and the privilege of making suggestions ought not to be monopolized by the chronic complainant.

The Board must ask that companies adopt prompt measures for a larger experimental use of the more improved methods of ventilation and meanwhile enforce rules for adjusting all devices in use to existing conditions.

Possible Peace in Passenger Fares.

In South Carolina, which state has not followed its neighbors in taking radical action concerning railroad rates, the Southern Railway has announced a voluntary reduction in passenger fares. President W. W. Finley, in announcing the new rates, proposes that they shall be kept in effect for one year so as to give the scheme a fair trial. In detail the proposition, as sent by Mr. Finley to the Governor of the state, is as follows:

First—A flat rate of $2\frac{1}{2}$ cents a mile for interstate passenger travel, with an extra charge of 15 cents against persons boarding a train without a ticket except at stations where there are no agents, provided that no charge shall be less than 10 cents, and in the event that a charge at the said rate of $2\frac{1}{2}$ cents a mile shall aggregate a sum between two multiples of five, such charge may be made that multiple of five to which it is nearest.

Second—Two thousand mile books, intrastate, interchangeable with such of the solvent roads of the state as will consent, at 2 cents a mile, good for heads of firms and employees not exceeding a total number of five, the names to be furnished at the time of the purchase of mileage book and entered thereon.

Third—One thousand mile books, intrastate and interchangeable with such of the solvent roads of the state as will consent, limited to one individual at 2 cents a mile and good only in the hands of the purchaser, the name of the purchaser to be furnished at the time of the sale of the book and entered thereon.

Fourth—Five hundred mile books at $2\frac{1}{4}$ cents a mile, good for heads of families and dependent members thereof, intrastate and non-interchangeable, the names of the families to be furnished at the time of purchase and entered thereon.

All of such mileage books to be limited to one year from date of purchase and redeemable, charging for the part used at $2\frac{1}{2}$ cents a mile.

It is reported in Atlanta that the State Railroad Commission of Georgia, acting in line with the recent propositions made by the Southern Railway, will soon order the establishment of a uniform rate of $2\frac{1}{2}$ cents a mile for passenger fares throughout the state of Georgia, the change to go into effect April 1. If this should be done there are a few lines on which the present rates would be increased. On the Atlanta & West Point and the Western & Atlantic the present rate is 2 cents.

It is reported that the Virginia Commission also will issue an order in consonance with President Finley's offer.

Opening of New York Subways.

The subway under the East river from the Battery, in Manhattan, New York City, to the Borough Hall, in Brooklyn, was put in use for regular traffic on Thursday morning, January 9. This subway is operated by the Interborough Rapid Transit Company, the same as the Manhattan subways, and trains are run through from the northern termini in the borough of the Bronx to the Brooklyn Borough Hall.

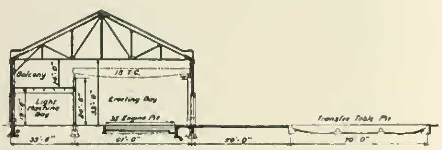
The tunnel of the Hudson & Manhattan Railroad, beneath the Hudson river, from Hoboken, N. J., to Christopher street, New York City, which will be open for business within a few weeks, has been so far completed that a special train, carrying officers and guests, was run through on January 4. The trip was made in about seven minutes.

Arrangement of Railroad Shops.*

Railroad repair shops cost money, both to build and to operate. Just at this time it may be of interest to approach the subject of their design, arrangement and equipment from a financial standpoint. There is hardly a better field for demonstrating that "engineering is the science of making a dollar go the farthest" than the art of designing and building railroad repair shops, and, as nearly all work of this character must start with an "authority for expenditure," or perhaps an "appropriation," it will be instructive to inquire just how great an investment in repair shops will ordinarily be justified.

The original cost of an average modern locomotive may vary from $14,000 to $17,000. The actual expense for labor and material to maintain this locomotive in first class condition will range from $1,500 to $3,000 per year, each road, of course, having its own individual conditions that influence this cost, and which make it impossible to establish an absolutely definite figure. For our present purposes, however, it may be said that a locomotive costing $15,000 will involve a maintenance cost of about $2,250 per annum, and this expenditure should go far toward overcoming the natural depreciation of and wear on the equipment, and thus keep the locomotive in first class running order.

The original investment in a complete new locomotive repair shop, fully equipped to efficiently make these repairs, will depend on the location, the size, the design, the selection of the equipment and the cost of labor and material entering into the buildings. These factors are so variable that it is impossible to determine an average that can be regarded as an exact standard. Even an approximate estimate for any given case can only be obtained after a detailed study has been made of the conditions surrounding the particular problem in hand. The following figures must, therefore, be used with judgment, or they may be misleading. These figures have been taken from the records of the actual cost of a number of repair shops with the design and construction of which the writer has been connected. The fact that there is such a wide variation emphasizes the danger of deriving a general law from any particular experience, or even of drawing a conclusion for a particular case from a general experience.



Cross Section of Oelwein Main Shop—Chicago Great Western.

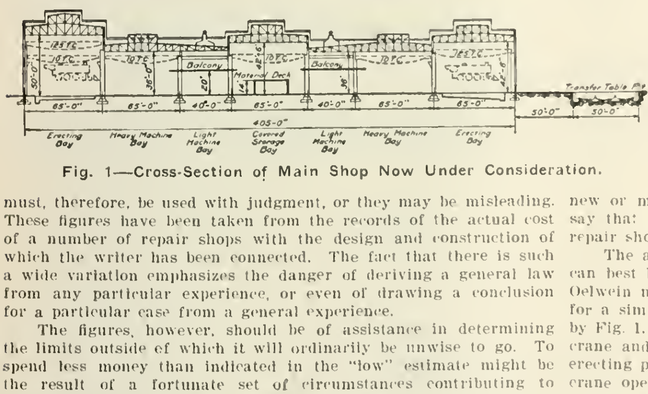


Fig. 1—Cross-Section of Main Shop Now Under Consideration.

The figures, however, should be of assistance in determining the limits outside of which it will ordinarily be unwise to go. To spend less money than indicated in the "low" estimate might be the result of a fortunate set of circumstances contributing to economy, but every precaution should be taken to insure that the saving accomplished is not at the expense of a false economy. To spend more money than indicated by the "high" estimate may be desirable, or even necessary in certain cases, but ordinarily the higher figures are sufficient to cover all repair shop needs, unless it is the intention of those in charge of the work to erect a monument.

The writer has purposely approached this subject of cost with considerable caution, and it is only because the literature of shop building is so meagre of actual cost data that the risk has been taken of having the figures misunderstood, and therefore the information misapplied.

Our records show that locomotive repair shops which are laid out on a basis of the number of pits required equal to 6 per cent. of the number of locomotives served can be built and equipped complete for an expenditure ranging between $50,000 and $65,000 per pit. If one pit will serve $16\frac{2}{3}$ engines per year, the cost of repair facilities will fall some place between the limits of from $3,000 to $4,000 per locomotive. An investment amounting to the lower limit is absolutely necessary if the engines are to be kept on the road. Just how much more than the lower limit should be spent in order to secure the minimum cost of locomotive maintenance, including all the items of not only actual repair expenses, labor and material, but also interest, depreciation, insurance and taxes upon the plant provided, is a question that should have the most careful consideration.

The following analysis of the total cost will serve to indicate the relative importance of the decisions that must be reached in order to give each dollar expended a maximum earning capacity. The sum total of the "low" and of the "high" figures shown will result in grand totals which will show a wider range than the $33\frac{1}{3}$ per cent. variation indicated by the unit figures of $3,000 to $4,000 per locomotive but as it is improbable that any shop would be built using either the lowest or the highest estimate for every one of its parts it will be found that only in exceptional cases will the actual total cost fall outside of the limits first given.

Table of Cost Limits for Locomotive Repair Shops.
On the Basis of 25 Erecting Pits.

Divisions. Shop Yards.	Limits of cost per pit — Low.	Limits of cost per pit — High.	Approx Proportion of total cost per cent
Tracks, crane runways, transfer or turntables	$1,400	$3,000	4
Water and sewer system	1,000	1,800	2
Piping and wiring tunnels and tunnel piping	500	1,000	1
Buildings.			
Machine and erecting shop	8,000	12,000	17
Boiler and tank shop	3,000	5,000	7
Forge shop	1,500	2,400	4
Storehouse and offices	1,000	2,500	3
Locomotive carpenter shop	500	1,000	1
Power house	1,200	2,100	3
Oil house and equipment	400	600	1
Misc. bldgs.: scrap bins, material sheds, &c.	500	1,000	1
General Equipment for all Departments.			
Power-house equipment	5,000	8,000	11
Traveling cranes	1,500	3,000	4
Tool equipment	10,000	15,000	22
Heating system	1,200	2,500	3
Power and lighting systems*	1,500	4,500	5
Plumbing and lockers	300	1,000	1
Air, water, steam and oil piping in buildings	600	1,200	2
Incidentals, organization and engineering	2,000	7,000	8
			100

*Including yard wiring and lighting

Note.—These figures do not include items for real estate and preparation of the shop site, which cost necessarily varies between wide limits. The foundry building and equipment are not included in these figures.

The history of "modern" locomotive repair shops may be considered as beginning with the use of what has been called "the electric drive." The use of the electric motor makes possible (a) the arrangement of departments independent of the line shaft requirements; (b) the use of electric cranes, and (c) the construction of all power producing equipment in one central power plant from which may be distributed heat, water, compressed air, light and power. One of the first shops to make use of the electric motor for both individual machines and groups of tools, as well as the electric crane and the central power plant, was the Oelwein, Iowa, shops of the Chicago Great Western, which were put in commission in 1900. Since that date there have been over 70 shops either built entirely new or modernized from previously existing plants. It is safe to say that more than $80,000,000 has been expended upon railroad repair shops and their equipment within the last 10 years.

The advance that has been made in the art during this period can best be illustrated by a comparison of the cross-section of the Oelwein machine and erecting shop and the cross-section of a shop for a similar purpose which is now under consideration, as shown by Fig. 1. The Oelwein erecting shop was equipped with one 80-ton crane and one 15-ton crane, both upon the same runway over the erecting pits. The second and more recent example has one 120-ton crane operating over the erecting pits on a runway above the two 10-ton messenger cranes, while the machine shop is supplied with two 10-ton cranes over the heavy tools, and an additional crane is provided over the covered yard.

It is needless to say that the more elaborate equipment of the latest development in repair shops cost more than the more modest shops which first adopted the electric system, but at the same time locomotive equipment has been gradually increasing in size and cost in such a way as to make these more extensive repair shop facilities an absolute necessity. Care must be exercised, however, to insure that the repair facilities provided are not greater than the needs of the equipment to be served, which brings us at once to the question of the size of the shops.

Some of the first shops designed to use a central electric power plant were handicapped by the use of the 220-volt direct current electric system, which made it desirable to limit the radius of distribution to about 1,000 ft. from the generating plant. The development of the induction motor and the alternating current system soon removed this limitation, but as it was still necessary to use the direct-current motor to obtain satisfactory electric speed control on many of the independently motor-driven tools, a mixed electric system was adopted by many shops. It is still the practice in a number of recent installations to provide both direct and alternating current throughout the shop—using direct current for the

*A paper presented at the January meeting of the Canadian Railway Club by Geo. A. Damon, Managing Engineer, The Arnold Co., Chicago.

cranes, variable speed motors and perhaps the mercury vapor lamps and alternating current for the constant speed motors, incandescent lights, and the yard lighting system. The recent improvements in mechanical speed-changing devices, the development of the alternating current crane, and the reduction in cost of the induction motor are creating a decided tendency toward the elimination of the direct current system. By these improvements it is possible to distribute power from a central plant over a larger area and also remove the old limitations of the amount of ground covered by the shop plant.

The size of a locomotive repair shop will depend primarily upon the number of locomotives to be repaired each year, and the number of days each locomotive under repair must occupy an erecting shop pit. To the pits required for "heavy" repairs must be added a number of pits for "light" repairs, for emergency work and for future growth. The ratio of the number of pits to the number of locomotives will vary with the assumptions as follows:

Pits Required in Erecting Shop.

Let A = number of locomotives served by shop.
B = Percentage of locomotives to undergo "heavy" repairs each year.
C = average number days each locomotive occupies an erecting shop pit.
D = Number of working days each year.
P′ = number of pits required for "heavy" repairs.
P″ = number of pits required for "light" repairs.
P‴ = Total number of pits required.

Then

$$P' = \frac{A \times B \times C}{D}, \text{ and}$$

$$P''' = P'' + P'$$

The effect of the different assumptions as to the percentage of the total number of locomotives to be repaired each year and the length of time on a pit are shown by the following table, which was prepared for a shop serving 400 locomotives at present, with a probable increase to 500 within the next five years.

No. of locos. A	Per cent. repaired. B	Days in shop. C	Working days in year. D	Pits: Heavy repairs. P′	Pits: Light repairs. P″	Pits: Total. P‴	Per cent. P″/P′	Per cent. P‴/A
500	80	20	288	28	7	35	25	7
500	70	17	288	21	9	30	43	6
500	60	11	288	15	10	25	66	5

From this table it will be seen that the number of pits may vary from 5 per cent. to 7 per cent. of the total number of locomotives, which variation corresponds with actual practice. Individual conditions will govern the assumptions for each road, and there are, fortunately, a number of other methods of checking these calculations.

The size of the machine shop space per pit depends largely upon the methods adopted for operating the shop. The work on the pit can be crowded, and the erecting output under normal conditions can be doubled during rush periods, but the output of the machine tools cannot be increased in the same ratio. The tendency at present is to favor the amount of floor space allowed for machine tools. On the other hand, the use of high-speed tools is rapidly increasing the output of each machine, and this development is contributing to the output efficiency of each foot of machine tool space. The space per pit for machine tools varies from 1,500 to 2,500 sq. ft. This result is often largely influenced by the demands made upon this space for manufacturing new work, or for supplying repair parts to other shops.

An average rule for the size of the boiler shop is to allow one-third as much space for this department as is allotted to the machine and erecting shop, but this rule is affected by the character of boiler repairs to be made. The kind of coal, the conditions of the water supply, and whether or not new boilers are to be constructed must be known before a final decision can be reached.

The blacksmith shop is ordinarily one-third the size of the machine and erecting shop, but local conditions must again be carefully considered before reaching conclusions. The safest way for all shops is to canvass the requirements for output and the capacity and floor space required of each machine, and then design the shop to fit the machines, rather than crowd or spread out the machines into a space the size of which has been too hurriedly determined.

The preliminary considerations which must have attention before the problems of relative arrangement of the buildings can be approached involve so much of the personal equation that only tendencies of recent practice can be noted, and no hard and fast rules can be established. It is not the province of this paper to discuss the advantages and disadvantages of the various points which must be thoroughly canvassed in order to reach consistent preliminary conclusions, as these subjects have been already covered by special books and technical papers which are available to those who are interested enough in these subjects to study them in detail. To indicate briefly the problems which must be considered and decided upon by the shop designer early in his work on any particular layout will, however, be of value.

For instance the question of "transverse shop versus longitudinal shop" for the erecting bay must be settled before much progress can be made. The tendency appears to be in favor of the transverse shop, but the writer must admit that his own personal equation enters into this conclusion.

Whether or not the boiler shop shall be under the same roof with the machine and erecting shop is a question that is usually settled by the experience and preferences of those who are to operate the shop.

The use of a transfer table or a turntable as a means of getting locomotives into the shop is a subject upon which volumes have been and can be written, but this question is usually decided in favor of the desires of the operating official who is to have charge of the shop after it is completed.

The use of yard cranes, telphers or locomotive cranes for handling materials outside of the buildings is being given more careful attention than formerly, with the result that these auxiliary transportation systems are having a marked influence upon the arrangement of shops. There is a tendency to cover a portion of the yard with a crane, and locate the lye vats and tire furnaces in this covered yard.

The location of the storehouse and the oil house will depend upon their individual use, whether it is the intention for them to serve the entire system or not.

Fireproof concrete construction is having an effect upon bringing the storehouse closer to the various departments to be supplied, the tendency apparently being to locate the storehouse contiguous to the machine and erecting shop, as was originally done at Oelwein.

Whether to locate the car repair department contiguous to the locomotive repair department is a question of policy for the management to decide, and the answer depends largely upon local conditions of operation and organization. The location of the car repair tracks, the desirability of having the common power house near the planing mill to burn refuse, and the location of the forge shop convenient to both departments has a marked influence on the general arrangement of the shops.

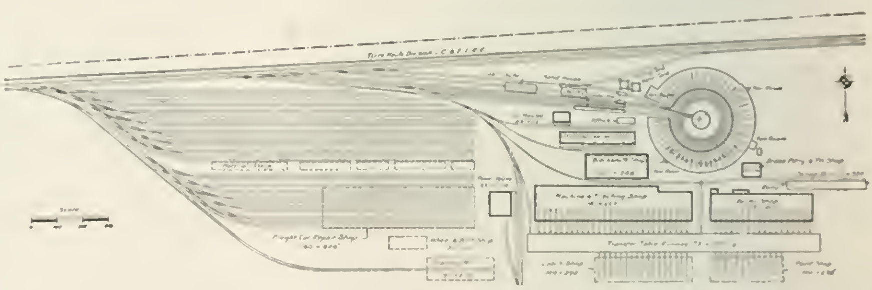

Fig. 2—Oaklawn, Ill., Shops, C. & E. I. Ry. Plan No. 2.

The location of the shop itself, as influenced by traffic conditions of the system, and the selection of the shop site after the general location has been decided, are questions in the solution of which serious mistakes have been made. Recent decisions seem to indicate a tendency to locate shops as near as possible to favorable labor markets, instead of in smaller towns, or at some inconvenient distance from the larger cities.

Certain fundamental principles should be recognized before attempting a railroad shop arrangement, and as far as possible the arrangement should be worked over until it satisfies these requirements, always recognizing exceptions due to individual conditions.

(1) Liberal space (say 100 per cent.) should be allowed for the extension of each department.

(2) The storehouse (with administrative offices in one of the upper floors) should be central, convenient to all departments and easy of access on two tracks from the main line service track.

(3) The forge shop should be convenient to both the locomotive and car repair departments.

(4) The power house should be central and near the planing mill and repair tracks in order to burn refuse.

(5) Yard cranes should be arranged to serve between the storehouse platforms and all departments.

(6) The roundhouse should be very near the shop, or located

far enough away to justify a separate machine shop for light repairs.

(7) Tracks, cranes, telphers and storage spaces should be arranged to insure the movement of materials with the greatest economy of time and labor.

(8) Some consideration should be given to the appearance of the shops and accessory storage facilities, lumber yards, etc., from the main line.

(9) The advantages of a short tunnel of ample cross-section for the use of the various steam, air and water piping systems should not be forgotten.

(10) The possibilities of the adoption of longer and heavier engines should be considered, and some provision made for present or future repair facilities for these larger engines.

(11) The cost of the shops should be consistent with not only the actual necessities, but in proportion to the refinements which the road can afford. All expenditures over and above those required for actual needs should be capitalized and made to show a satisfactory return on the investment.

Actual examples of shop arrangements can be studied to advantage; in fact, a designer of a new shop should make himself conversant with existing plants, and thus make every effort to improve present practice. Advances in any art are usually made step

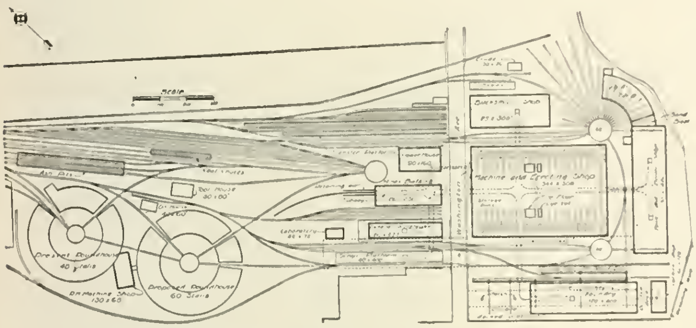

Fig. 3—Proposed Arrangement, Superseded by Layout in Fig. 4.

In this arrangement the boiler and tank shop are separated from the machine and erecting shop, and two turntables have been located to facilitate the transfer of boilers and other material from one department to another. The disadvantage of the open pits will be overcome by extending the decking of the turntable over the entire pit.

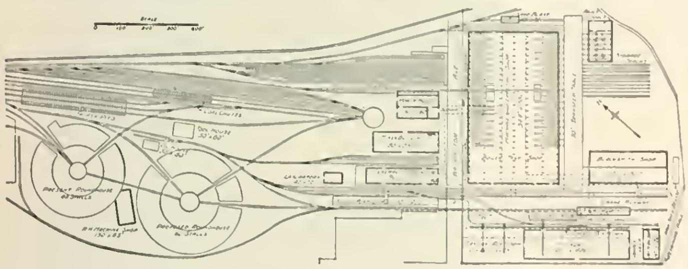

Fig. 4—General Arrangement of New Plant Now Under Construction.

In this arrangement the machine and erecting shop is served by means of a transfer table extending along one side of the shop. The boiler and tank shop is located in the extension of the main shop, it being the intention to maintain the same sections of the building throughout.

by step, and progress in the right direction can be made with much more certainty if there is a familiarity with the ground already covered by others.

The shop arrangements described in this paper are examples taken from recent practice. None of the plans are advanced as ideal, but each one is the result of at least 20 preliminary studies, and the reasons for their selection may be of interest. In two cases the shops are not yet built, and therefore, their location cannot be disclosed.

The Ivorydale Shops of the Cincinnati, Hamilton & Dayton (*Railroad Gazette*, Sept. 21, 1906).—These shops were designed to provide facilities for the storage and care of locomotives lying over at Cincinnati between trips, and also for the necessary light running repairs upon engines running in and out of this division point. This shop is, therefore, an example of a terminal locomotive repair plant to take care of light repairs only as an auxiliary to the main repairs shop where all heavy repairs are made. The unique feature of this arrangement is the longitudinal engine house, sometimes called a "square roundhouse." This engine house is served by the same transfer table that serves the erecting shop, the two buildings being directly opposite one another across the transfer table pit. The yard tracks form a "Y," thus obviating the necessity of a turntable. Incoming engines pass onto the transfer table over one of two ash pits. There is one outgoing track. Engines can take coal and water either on the way in or out. The engine house is built of reinforced concrete, and is designed for simply the care and storage of locomotives, no drop pit being provided on the engine house side of the transfer table. The machine and erecting shop has two drop pits in a separate section devoted to light repairs, while the erecting shop proper has a drop table to unwheel engines undergoing more extensive overhauling. One track without a pit is reserved for boiler repairs, which has sufficient space to work on two boilers at one time. This arrangement makes the most economical use of the space available. It would have been impossible to have introduced the usual turntable plan with a round engine house on the property.

The Oaklawn Shops of the Chicago & Eastern Illinois (*Fig. 2*).—The remarkable thing about this plan is that in 1901 the first machine and erecting shop was built with 11 pits, and the provision made for doubling the shop was considered to be ample for years to come. In 1907, however, the shop was doubled, a fact which emphasizes the necessity of allowing ample room for growth.

In this plant the locomotive department may be said to have been grouped around the engine house from which a shop track running between the machine shop and the boiler shop leads directly onto the transfer table, thus providing a convenient means of transportation to and from all departments. The coach shop and the paint shop have not yet been constructed, but eventually the transfer table will also serve these two buildings of the car department. The boiler shop is separate from the machine and erecting shop, and is served by the same transfer table. The blacksmith shop is convenient to the car repair tracks, as well as to the roundhouse and machine shop. The storehouse is central and handy to the main line. The power house is located between the two departments, and serves the locomotive shop through a pipe tunnel that connects all departments.

Too little space was originally allowed in the machine shop for machine tools, but this defect has been remedied to a certain extent in the recent additions. The general layout has proven so satisfactory in actual use that recently the management has had under consideration the reproduction of the entire plant at another point on the system.

In the main shop of this plant the larger individual motor-driven tools are located in the erecting bay, that is made extra wide for this purpose. The disadvantage of this arrangement is the necessity of increasing the span of the traveling cranes and thereby adding to their cost.

The Battle Creek Shops of the Grand Trunk.—The distinguishing feature of this arrangement is the efficient use of the yard crane idea, extending over the storehouse tracks and part of the storehouse platforms. This crane serves all of the ends of the bays of the machine and erecting shop; the foundry, forge shop and frog shop, and eventually can be extended over the car repair tracks. The "midway" space under the crane, which will be used partly for storage of materials, is provided with a system of industrial tracks which are a part of a network extending throughout the entire plant. The boiler and tank shop in this arrangement are located at one end of the machine and erecting shop, but these departments are at right-angles to one another, so as not to interfere with the entire plant being doubled at some future date. Ample openings are left in the wall between the boiler and the erecting shops, so that a boiler can be conveniently passed from one department to another.

The 100 per cent. extension to the main shop will be accomplished by practically duplicating the present shop, leaving a common machine shop twice the size of the existing one between two parallel erecting shops. This arrangement will eventually provide for 50 erecting pits, and all departments can be extended to meet this maximum requirement. For the present the locomotive shop will be served by two tracks, but when extensions are made two turntables can be installed.

The Beech Grove Shops of the Big Four (*Railroad Gazette*, Nov. 29, 1907).—In this layout even more extensive use has been made of the idea of a storage yard served by a high-speed overhead crane. The midway may be said to be the main avenue of travel between all departments, and the space between the buildings may be compared to side or cross streets. This crane serves practically every building except the tank shop, the wheel shop and the freight car repair shop, but all of these shops can be reached easily by industrial tracks.

The second feature of importance in this arrangement is the turntable serving the boiler shop, the tank shop and the main shop of the locomotive department. Tracks have been provided into each of these buildings independent of this turntable, but for intercommunication or the transfer of parts from one department to another this turntable will be in constant demand. This turntable arrangement was adopted after the most careful consideration of an alternative plan having a transfer table along each side of the main shop, with the boiler shop on the opposite side of one transfer table and the tank shop on the opposite side of the other table.

On one side of the yard crane nearly all the buildings extend away from the runway, thus allowing for future extension, while on the other side of the crane the buildings are arranged with their greater length parallel to the main line of travel. The freight car repair department is located along the main line tracks and convenient to the classification yards.

The Springfield (Mo.) Shops of the Frisco System.—In this arrangement the yard crane is a prominent feature, and the midway and cross street idea has been developed still further, as all buildings are at right angles to this main avenue of interdepartment travel.

The striking feature of the Frisco shop arrangement, however, is the use of the transfer table serving one side of the erecting shop only. The erecting bay next to the transfer table is single decked, i.e., the heavy crane used for unwheeling locomotives is not placed on an upper runway, so that it will be impossible to lift one locomotive over another in this shop, and reliance must be placed in the transfer table to put the locomotives on their pits. Eventually, however, when the shop is doubled, the future erecting bay on the other side of the shop will be double-decked, and the locomotives will be delivered to their respective pits on this side of the shop by an overhead 120-ton crane, instead of by a transfer table. When the shop is extended to its full capacity, no doubt the transfer table side of the shop will be devoted largely to light repairs and the double-decked crane-served side will take care of the heavier repairs.

The storehouse is at one end of the transfer table and near the center of the yard crane runway, so that material can be conveniently collected from or delivered to any building on the ground. The power house is located exactly in the center of the site. Every department can be increased at least 100 per cent. without unduly extending the lines of travel for men and material.

Shops Under Construction.—The arrangements indicated in Figs. 3 and 4 are good examples of shops located on a congested site, which makes it impossible to secure an efficient layout of buildings, or make any liberal allowances for future extension. The advantage of locating the shop plant near the center of the city, however, is thought to offset the disadvantage of having the shop site cut in two by a city street. Fortunately the ground is high, and the drainage is good, making possible a subway under the street, and connecting all departments. This feature adds much to the convenient handling of materials.

The yard crane is again the determining feature of the arrangement, serving nearly all departments, and arranged to take or deliver material from and to the subway and also the street, which fortunately is on a grade, so that it can be bridged.

The location of the foundry was determined by the fact that this department was the only one which could be placed along the retaining wall which in lower part of the site. The heavy cranes in the erecting shop and the steam hammers in the forge shop make it desirable to locate these latter departments on solid ground.

The transfer platform, one roundhouse and the accessory ash pits and coal chutes were in place at the time the new shop arrangement was taken up, but even with these handicaps a fairly satisfactory arrangement of buildings has been worked out.

Shops Under Consideration.—The layout of shops in Fig. 5 is now under consideration and provides for a complete locomotive repair shop combined with a proposed terminal car repair plant. The main car department is located elsewhere.

This plan shows a crane-served covered yard extending through the center of the main shop. This yard is not to be heated, and besides furnishing storage facilities for material, it will provide a convenient location for fan rooms, toilet rooms, locker and wash rooms, which often occupy valuable room inside the shop.

The outside storage yard is served by a locomotive crane instead of an overhead crane, and this same locomotive crane can be used at all other points in the yard where it can be worked to advantage.

The transfer table serves one side of the machine and erecting shop, as in several of the other plans, two cross tracks being provided to transfer engines into and out of the erecting bay on the further side.

As the main shop becomes crowded, it is possible to erect a separate boiler and tank shop along the transfer table as shown, but for the present all locomotive repair departments will be under one roof.

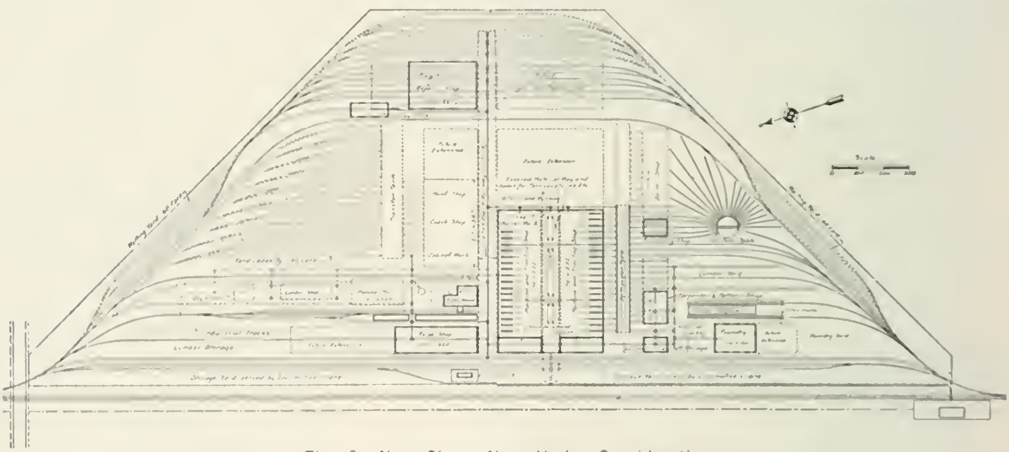

Fig. 5—New Shops Now Under Consideration.

The usual precautions have been taken to locate the blacksmith shop and the power house convenient to all departments.

The cross-section of the main shop (see Fig. 1) shows the covered yard between the two shops as well as the transfer table serving one side of the building.

Will the results to be expected with new shops justify the investment? This is a question very often asked, particularly in view of the fact that apparently some of the new shops are not showing any better economy as far as actual cost of locomotive maintenance is concerned than is obtained with comparatively older and poorly equipped shops. As a matter of fact, there is no reason why a new shop handicapped with an undeveloped organization and a lack of an efficient system, should do any better work, or even as good, as an old shop with a harmonious corps of workers equipped with a full complement of jigs, templets and methods of operation.

The logical developments in cutting down the cost of engine repairs upon any road would appear to be (a) make the best use of the repair equipment at hand by perfecting shop kinks and systems for handling the work adapted to the outfit available; (b) to wear out the old tool equipment in the old shop as far as possible, so that when the building of the new shop cannot be postponed longer there will be little, if any temptation to economize by using the old tools; and (c) with the coming of the new shop, old methods of operation should be improved to fit the changed conditions and new systems developed and adopted. A new shop should not be considered complete until every man, tool, accessory and system is doing its most effective work. Under these conditions the new shops will show ample results to justify the investment.

opment of the induction motor and the alternating current system

W. A. Gardner to the Traveling Engineers.*

Having accepted office, you have doubled your responsibilities. Heretofore, you have served two interests—your family and your master mechanic; now you have four interests to consider—your family, the public, your subordinates and the shareholders that own your company. * * * A higher standard of zeal and accuracy maintains in railroad service than elsewhere. In all ordinary business, an error or over-sight is speedily corrected, generally without personal injury or financial loss, but in engine or train service an error or over-sight is quite likely to result in fatalities, and there is no business on earth where the opportunities for mistakes are so numerous. Happily, the employees are so instinctively alert and have been so trained and drilled until it is a part of their every day life to be ready for emergencies all the time, that comparatively few mishaps occur. So while we read of medals being awarded to people for devotion to duty in their particular line, we must be content with the approval of our immediate associates and our own conscience until such time as some impartial historian analyzes railroad service without prejudice and records the fact that railroad employees, as a class, embrace a very large number of the highest types of manhood, conspicuous equally for efficiency and modesty.

* * * Very few men are fit to govern unless they have been governed, and it is very easy on a railroad to detect those who are trying to boss without ever having been bossed themselves. * * * I take it for granted that a traveling engineer, before he accepts promotion, has agreed with himself that he has come to a parting of the ways—a peaceable and self-respecting parting, however. Of course, the old man you fired for will look askance at your suggestions as to how he might do better work. Those who fired when you did will possibly wonder what the company saw in you that they thought could be made over into a general manager, and the young fire eaters may wait for a chance to test your nerve, but not a one of them that does not really wish you well at heart and not a difficulty that you cannot overcome by exercising tact. I do not believe it is possible for any man, however honest and square he may be, to do justice to himself or anybody else if he tries to look with one eye at the Brotherhood of Firemen or the Brotherhood of Engineers, and with the other eye at the superintendent or master mechanic. Either one or other of the optics will be pretty badly strained in the course of time, and eventually, both would become entirely useless.

I would not have you misconstrue my position as to labor organizations on railroads. I believe the particular orders which you are naturally affiliated with, are composed of honest men; that they are honestly conducted. I do not think they are a menace to the railroads; on the contrary, they are of assistance in asserting the sacredness of contract, in raising the standard of service, and in many other ways.

Now all this is commendable, I grant you, and it is not because I mistrust the motives of organization that I suggest you should withdraw from them, but otherwise you will be misjudged, and forced eventually to pay more attention to politics than to your legitimate duty, and I believe that once a traveling engineer, your next aim should be master mechanic, or superintendent, and one way to insure going ahead is to cut off all the avenues for going in any other direction. Some way should be provided for organizations to perpetuate your insurance; possibly, that is already done, and mark you this, more men would be promoted from organized labor, if organized labor offered more encouragement and support to their members who have ability and ambition. You are one of the first lieutenants of the army, if you please. You are expected to understand the rules and regulations and to exact obedience thereto—not with an ax—because it is one of your duties to educate before you admonish and admonish before you resort to harsher measures. Give confidence; trust the men and they will trust you; be square.

A great many changes have taken place in the manner of conducting negotiations between officers and men on a railroad. Individuality seems to be at a discount. About the only things our men ask for, personally, are passes or to be placed on the pension rolls, or to see that the payroll equals the record of their time slips. Everything else is done through a committee, and of late, the committee gets as far away as it can by delegating its desires to a general conference. One month we meet a federated body, and the next month the two parts of that same body notify us that they have hands and feet of their own and are liable to grow horns. Then, on the other side of the house, the officers associate, confer, look as wise as their salaries will justify, talk about the Declaration of Independence and the Battle of Bunker Hill, but in the end, I notice that human nature has endowed us all with a good many things in common. So over in the particular household that I hail from, we still cling to the belief that the personal factor never dies, although it seems to go to sleep and require a little shaking to wake up. I can recall the day when the general superintendent of the North-Western knew, personally, four-fifths of the employees; that is no longer possible, and the relations that were established directly, now have to be carried on through traveling engineers, trainmasters, superintendents, etc., and whatever may be the policies of your respective companies—and I will wager that they are alike humane, pacific and solicitous of the welfare of their employees—it is no small part of your duty to impress this policy upon those with whom you come in contact. I see men here to-day with whom I have been associated all my life, they have seen my hair grow gray, and I have seen theirs grow gray. Perhaps at odd times we have both done things that added to the other fellow's gray hair; but I would rather have their good will and confidence than the greatest office in the gift of any railroad, and I flatter myself they feel the same way toward me—or would if I did not make an occasional speech—and that is a condition, gentlemen, that I recommend you to nourish and cultivate on behalf of yourself as well as your company. * * *

Do not let your job overtake your education. You have read about great public men who obtained a start by teaching school, and they always had to study at night to keep ahead of their classes. Perhaps, some of you have had occasion to look up a few things in advance so as not to appear in an unfavorable light before your children. The art of anticipation is a great thing. If you keep one day in advance of the class, you can really make them believe you are a very wise man. I have tried that and recommend it highly. The company cannot afford to educate you as an officer only to go part way on the journey; they want and are entitled to the maturity of your judgment. You cannot afford to go through hardships of a subordinate officer's life only to fail by lack of education when you have nearly in your grasp that which always comes to him who toils and labors hard. Keep up your study, associate with those who know more than you do; do not confine yourself to technical things; inform yourself on business methods in general; be an all-around fellow, have visions of what you will be when you are general manager; prepare yourself to perform the duties of that office, and after awhile you will do some of those very things you dreamed about. Regard the company's material as if it were your own, your coal, your oil; see that they are used economically. Don't be afraid to be called a company man, nor a family man; there is no stigma about either one of them. People generally think well of a man who thinks well of his family, and they likewise respect a man who realizes his responsibility as trustee for the owners of a railroad, or anything else.

I have not pictured an ideal. A great many people fulfill all that I have said, and more too, and positions of great trust and adequate compensation will always be at the command of him who is honest, faithful and zealous.

*From an address by W. A. Gardner, Vice-President of the Chicago & North-Western before the National Association of Traveling Engineers, at its annual convention in Chicago.

The Ocean Carrier.

BY J. RUSSELL SMITH, PH.D.

In the space of a century and a decade from the time of our first census, 1790, to the last in 1900, the United States rose from a string of feeble commonwealths with a population of 3,929,214 to a world power of nearly 80 million people. That amazing 20 fold growth of the nation may serve as a parallel by which we can get some concept of the development that has taken place in the ship that served us at the two periods, but there is this difference, the ship has advanced faster than the nation; the present ship is 60 times bigger and several times faster than the prototype of George Washington's day. Taken on the even basis of ton for ton, the shipping of the present is five or six times as efficient as that at the beginning of the period under review.

This remarkable improvement is the result of a rapid evolution produced by the competition of sail and steam for motive power, and wood, iron and steel for material of construction. This double competition has made a rather complex result as an improvement in one of these fields often reacted in the other, and both have conduced to improvements in design that cannot be easily classified under either heading. One peculiarity of the century of progress is the fact that we have had revolutions without the destruction of the old type. As material for great vessels iron has replaced wood and steel has replaced iron, but wood continues to be used. Steam may be said to have vanquished sail but sailing vessels are still being built. The steps in the progress of this competition merit attention.

The rivalry between steam and sail is distinctly a rivalry between the modern and the old. For a thousand years man has hoisted a sail to be filled by the winds of nature which took him across the sea with all the fickleness and uncertainty for which the wind is famed. This motive power is cheap but it is variable, uncertain, may be adverse if there are zones of calms. The sailing vessel may make a short journey between Saturday and Monday, and on repeating the trip she may not reach port until Monday week. The fact that Providence furnishes the power gives the sailer cheaper costs of construction than the steamer and more space to stow freight The space taken by equipment is but one twentieth in comparison to the steamer's one third The building of engines gives greater initial cost, their repair requires greater maintenance cost, their operation gives a fuel bill unknown to the sailer, and the operation of the mechanical ship requires a crew at least three-eighths larger than that of the sailer, and examples of best modern types would show crew rolls with variation of 100 per cent. between the two types But the steamer has speed and a regularity that gives small heed to the ordinary whims of wind

The object of the ship is transportation and the users of transportation usually want to be able to know in advance the date of its performance By this standard the slow and irregular sailer is found wanting for all exacting service A few years ago it was declared that "the ratio of four to one" is "the present measure of the efficiency of steam tonnage compared with sail tonnage."* In this contest low cost and low efficiency is giving way to high cost and high efficiency.

A century ago the steam vessel was a dream of ridiculed enthusiasts and the world's commerce was using blocky old tubs with blunt ends and a width sometimes one-third as great as their length. Some of them had high bows and sterns, relics of the mediaeval fighting towers, and the average vessel was probably below 200 tons register. A few vessels were much larger than this; for example the "Grand Turk," 1791, with 561 tons, was a record breaker for American builders

The rapid increase in our commerce during the period of the Napoleonic wars led to great increase in American shipbuilding, and Yankee ingenuity made great improvements in design. The decks were flattened and the vessel narrowed.

The period of the war of 1812 saw two suggestive changes in shipping technique. The almost constant danger of capture at sea by either French or British vessels made speed an essential for the American merchantman that was eventually to market its cargo. The war made privateering profitable and if the small privateer could catch a big merchantman or elude a big man-of-war, the returns of the business were likely to be good. Spurred by this impetus the American shipbuilder made astonishing improvements in speed. Baltimore seems to have been the leader in this and was long famed for her fast clippers. Two hundred and nine of these vessels went to sea as privateers during the war of 1812 and not one was captured.

Parallel with this came the general adoption of the steamboat to river use. Fulton's "Clermont" began on the Hudson 1807, the Delaware was shortly provided with a similar service; in 1812 the great Father of Waters was redeemed from its one-sided commerce that could only go downstream with the flat boat and the raft; and in 1814 there were five steamers on the Thames. The general adoption of steamers on rivers was almost immediate. During the 25 years 1815-1840 the steamer, feeling her way behind the protection of the shore, was gaining the necessary experience and receiving the needed perfection to sally forth upon the high seas and challenge the sail to the final contest for maritime supremacy. In 1809 the American flag was the first to be steam bourne upon the high seas, flying at the masthead of the "Comet" as she journeyed from New York to Philadelphia In 1816 there was a line established from New York to New London, Conn., and one across the English channel from Brighton to Havre. The mail route from Ireland to Wales was a very important one, and the distance between Holyhead and Dublin is only 65 miles, but the sailing vessel service there often took three or four days and sometimes seven or nine days. In 1821 steamers were tried with such signal success that they were promptly used in various services to the continent and in British coasting trade. A Parliamentary report of 1822 showed that upon 30 coasting routes the average speed by steam was eight or nine knots per hour, and the voyage was completed in one-half to one-sixteenth the time required by sailing vessels

It is interesting to note that at this time the steamers sailing upon the ocean were using the same side-wheel propellers that were in use on river boats, and they had the hulls of sailing vessels. The adaptation of the steam engine to marine use and its improvement in efficiency were slow The "Savannah," a sailing vessel with auxiliary engines, crossed the Atlantic in 1819 using her engines a part of the time. This mixed effort is commonly hailed as the beginning of ocean steam navigation, but the practical difficulties with such weak and heavy engines as then existed were such that it was 1838 before transatlantic steam navigation in a commercial sense may be said to have had its beginning in the repeated and successful voyages of the "Sirius" and "Great Western," which vessels, both British, one from Bristol, the other from Liverpool, practically had a race to New York and arrived within a few hours of each other.

In the meantime the sailing vessel had experienced great technical progress The American shipbuilders had been stimulated to produce a fast boat by the dangerous commercial conditions existing between 1790-1815 and upon the return of peace and the increase of trade and travel after 1815 they began to study ship design in a scientific manner As a result of experiment and copying the lines of fast swimming fish we soon evolved the packet ship, which was the finest seagoing vessel in the world Until the middle of the century the maximum size of these vessels was about 1,000 tons register and they could carry from 600 to 1,000 persons. The time to Europe was 15-20 days which was two or three days better than the English vessels did, and there were records of crossing the Atlantic in 12 or 13 days. This superiority of the American packet over its rivals from other countries was so marked and so well recognized that it had a practical monopoly of the passenger, mail and express traffic This superiority of the American sailor and his vessel is yet held in speed contests as witnessed by all the international yacht races of a half century.

The supremacy of the American and his sailing vessel was challenged by the British steamer Nature made England maritime Being set down in the sea within sight of the continent and of Ireland she had had excellent opportunity to practice in the steamer business in short journeys to neighboring lands. Twenty two years of this, from 1816, when the first English channel line was established, to 1838 served for the accumulation of enough experience for the successful mastery of the problem of crossing the Atlantic in a real steamer. The Atlantic race of the "Sirius" and the "Great Western" mentioned above was the real beginning of transatlantic steam traffic which has, with very short breaks during the first winters, been continuous from that time. The "Great Western" kept right on, and while the "Sirius" returned to her old work in British coasting trade other vessels were quickly built to get a share in the novelty traffic for the rates on the new steamers to New York were high. The British Government became convinced of the feasibility of the Atlantic steamers for the mail service, and having been long in the habit of advertising for private offers for the mail service, a mail subsidy was offered by the government and taken by Samuel Cunard, the founder of the Cunard line. Steam vessels and lines rapidly multiplied, but mechanical and architectural improvements had to come first.

The paddle wheel is admirable for river traffic but it is ill adapted to the ocean, where the rolling vessel often has one wheel clear of the water and the other deeply buried There was at the same time dissatisfaction with wood as a material for the larger vessels that were desired in the transatlantic trade There had been some occasional experiments with iron vessels from 1777, but they had their practical beginning about 1830, and one of 600 tons was built in 1837. These experimental vessels easily overcame the idea that an iron boat being of heavy material must sink. Iron boats not only float but are actually lighter than wooden vessels of same size, and therefore have more buoyancy. The iron vessel can be strengthened at the desired point easier than the wooden one, and the comparison of a few wrecks soon proved that the iron vessel could stand more pounding and had a stronger hull than a wooden vessel. The fact that the iron of the hull disarranged the compass was an effective barrier to an open sea journey until 1839, when an improvement in the compass made that invaluable instrument workable on iron ships. The way was now open for the use of iron on any vessels, and in 1840 the famous engineer, Brunel, designed the "Great Britain," an iron giant of that day, built for the New York trade. This vessel of 2,984 tons was an innovator in size, in material and in mechanical equipment, for she was driven by the screw propeller a device that had been proved efficient in 1836 by John Ericsson. The "Great Britain" was a success, but Brunel was rather ahead of his time. He had seized upon new processes that had, like most improvements, to make their way gradually As late as 1859 the same Brunel built the "Great Eastern," which had both screw and paddle wheels The slow adoption of iron was due in part to the conservative influence of the Cunards, the leading line of Britain, and the one enjoying the government subsidy This company built wooden paddle-wheelers while Brunel built the "Great Britain" and the Cunards only adopted iron hulls in 1856 The screw came into general use about 1850. In 1853 iron was the material used in building one quarter or more of the vessels built in Great Britain and one-quarter were propelled by steam.

The American Civil War developed the ironclad and introduced iron to the war fleets of the world. The economic situation in Great Britain made that country the leader in iron merchant vessels. She was devoid of forests and supplies of timber, but was the world's leader in the manufacture of iron Consequently the transfer to iron ships was rapid and in less than half a century the disappearance of wooden ships in British yards had become complete. A similar period served for the disappearance of iron as building material, for in 1875 experiments showed the suitability of steel, which is merely a better form of iron In four years the new material was used in one-tenth of the new vessels built on the Clyde, and in 10 more years its virtue was so widely recognized that its use in new vessels was well nigh universal, amounting to 97 per cent.

*Report of U. S. Commissioner of Navigation, 1903, p 181.

The change from wood to iron did not come so rapidly in the United States as in Great Britain. We were exporters of wood and importers of iron; we had the equipment for building the wooden ship, and our wooden ship was the best in the world. During the civil war the industry of the country was paralyzed, and since that period our merchant marine has been in a state of low development when it was limited largely to the coasting and sailing vessel trades. Here wood had its stronghold, and when Great Britain had entirely ceased to build wooden vessels they still outnumbered iron in this country $1\frac{1}{2}$ to 1.

The accompanying table of materials shows the progress of the different materials in the world's needs since 1890. That is a period during which new building has been predominantly of steel, as is shown by the 560 per cent. increase in tonnage. Wood and iron have decreased respectively 52 and 40 per cent. These are not exact measures of the virtue of the two materials, for wood has been used as material of construction much more than iron, so that vessels of wood have been replenished while those of iron have not been affected much by any factor except the natural reduction of tonnage existing in 1890. The life of a wooden ship is short in comparison to iron. There are some cases of wonderful longevity of wooden ships, the century mark even having been reached, but the East India Company had a general rule that the life of the ship in their business was eight years, and that she was then sometimes worth repairing for four more years of service. The life of an iron ship has scarcely been determined on the basis of life of material,* but they are steadily being broken up because they are obsolete and incapable of competing with the newest types embodying the results of a half century of progress in motive power and design. These improvements in power and design have been made in both steam and sail.

Materials of World's Merchant Marine.

(From annual report Commissioner of Navigation, 1904, p. 253.)

Year.	Power.	Wood. No.	Wood. Tons.	Iron. No.	Iron. Tons.	Steel No.	Steel Tons.
1890.	Steam	902	360,147	7,719	8,495,920	2,343	4,086,555
	Sail	18,924	6,693,738	1,879	2,021,593	248	348,653

		9,490	3,455,610	6,879	6,347,318	12,651	24,865,850
Per ct., 1904 to 1890			48	.....	60	......	560

The marine engine has been improved more than the hull since the first vessel steamed across the Atlantic. In 1899 an old steamer was torn up and her engine weighed 17 times as much per horsepower as the then best type. The Atlantic racers of 1840 had a boiler pressure of 13 lbs. per sq. in., and passed the steam from the cylinder where it did the work directly to the condensers. The compound engine passes the steam from the first cylinder, where it has great pressure, to a second cylinder with greater size and less pressure per unit of area. The pistons from both cylinders drive a common shaft, but the connecting rods exert their pressure upon it at different angles and there is an interval of time between the strokes of the two pistons. The available power from a given amount of steam is not doubled but it is considerably increased. The compound engine was applied in Glasgow in 1856, was put into vessels in China trade in 1865, and was generally adopted about 1870. Boiler pressures were raised until 200 lbs. per sq. in. became common in the last decade of the nineteenth century; the compound or double-expansion engine was followed by the triple-expansion, and it in turn by the quadruple-expansion engine. In the 65 years from 1840-1905 the improvements just mentioned, along with better combustion by forced draught, the return of heated water to boilers and many minor improvements have reduced the coal required for the horse-power hour from $5\frac{1}{2}$ lbs. to about 1 lb., and the end is not yet. Theoretically the best engines are yet getting but one-fifth of the power from coal.

The turbine is apparently opening a new epoch in steam navigation. With the new Cunarders it leads the world in size and speed of vessels. It makes no great saving in coal but it uses its power advantageously. It is smaller and takes up much less space. It is simpler, occasions less friction, less wear and repair. Its operation is quiet. Like an electric motor, the parts are balanced.

Another improvement of great value has been the division of the ship into water-tight compartments, of which one could be filled with water and the ship, buoyed by the remaining seven-eighths or eleven-twelfths of her hull, still float in safety. This also enables the ship to have separate engines and engine rooms, so that one of these may be flooded and the other run steadily onward. Double engines mean twin screws, which under all circumstances are great guardians of the ship's safety. The modern steamer dependent upon one screw is helpless with a broken shaft. With twin screws she proceeds at something more than half speed and a calamity is turned into a mishap. The twin screw is therefore the usual thing on passenger ships; the new turbine Cunarders have four screws.

*The career of the "Great Britain," the first iron Atlantic steamer is interesting proof of this fact. She was launched in 1843, spent the winter of 1846-7 ashore on the rocks of the Irish coast, was re-engined, spent 22 years in the Melbourne trade, and was converted into a sailing vessel in 1882, and in 1895 she was reported as doing service as a coal hulk at Falkland Islands.—See Henry Fry's "History of North Atlantic Steam Navigation," p. 43.

During the two-thirds of a century that have elapsed since the "Sirius" and "Great Western" raced to New York in 1838 the designers of sailing vessels have not by any means been idle. The sailing vessel is still with us and during the first 50 years of the oceanic competition she held her own numerically at least, and it is only in the last 15 years that she has had to go down ingloriously before her steaming sister.

The steamer with hull and machinery has a greater field in which to perfect improvements, and it is really remarkable how much the sailing vessel has been improved under the goading competition of advancing steam. Iron and steel were found to be quite as usable in the construction of sailing vessels as in steamers, and these materials have been adopted, although it did not come as promptly as was the case with steam vessels. The spreading of sails to the wind seems to be a simple process, but it has been improved almost as fast as the devices for harnessing steam. The typical sailing vessel of 1850 was a square rigged ship—a vessel with several spars at right angles to each of several masts and many square sails high aloft. Much rigging held this complex harness together, and the numerous sails were set and reefed by many men far aloft at the risk of their lives. The thousand-ton "East Indiaman" of 1850 had a crew of 80 hands, a 2,500 four-masted barque of 1900 had 33 hands. Taking the figures for the British merchant marine for 21 years it appears that the sailing vessel has actually reduced her crew faster than the steamer. For British vessels engaged in the foreign trade the number of crew per 100 tons net register has been as follows:

	1880.	1890.	1898.	1901.	Per cent reduction.
Sailing vessel	2.32	1.96	1.65	1.61	31
Steamer	2.95	2.73	2.32	2.22	25

These figures from the British marine are but averages of many vessels of all ages and do not cover the case as accurately as would figures which described only the most modern types.

The British figures refer too much to the fast disappearing square rigged ship which promises to disappear from the competition of the typical American sailing vessel, the schooner. The advantage of this rig* lies in the absence of the yards and spars. The sail being fastened on one side of the mast only and supported by booms and gaffs that swing upon the mast as a pivot. Each mast has a small top sail and one great sail which can be hoisted by a rope from the deck. This is a safe process and one in which men can work to good advantage. This vessel was evolved by the Gloucester fishermen about 1745. In 1800 these fishing schooners were of from 20 to 40 tons, and soon after they began to be used in the American coasting trade. By 1860 the typical coasting schooner had two masts and was of about 250 tons burden. If she were made larger the raising of anchor and sails required more men than were needed at any other time.

A three-masted schooner had been built in 1831. By 1850 they had passed the experimental stage, and by 1870 they were the prevalent type, ranging from an average size of 300 tons to 700 for the largest. Then followed one of the most striking of modern ship developments. The masts began to be multiplied. In 1880 a four-masted schooner was built; in 1888 came the five-master. A representative of this pattern, built in 1899, carries 4,000 tons of cargo. In 1900 came a six-master carrying 5,500 tons. All these were of wood and the center of construction was the coast of Maine. In 1902 the present climax was reached in the launching of the "Thomas W. Lawson," a seven-masted schooner built of steel and carrying 7,500 tons of cargo with the amazingly small crew of 19 men. Of this vessel, recently wrecked, three decks were of steel, 135 ft. of the 193 ft. of mast was of steel; the standing rigging was of steel, and the sails were hoisted by steam. The steering gear was steam-driven. In this steam crew lies the secret of the small force of men aboard, and the ultimate value of the American schooner, if she is to have any ultimate value, lies in the fact that she is of such a design that she can use auxiliary steam to harness the wind as she spreads her acre of sails. The net result of the working of all these factors in the competition for the motive power is shown in the accompanying statistics of the world's merchant marine for a period of 32 years.

Table I. shows that since 1873 the steam tonnage of the world

*Any good unabridged dictionary gives cuts of the various and numerous varieties of sailing vessels which are named in accordance with the method of sail arrangement, i. e., the rig.

and of all countries has increased enormously and steadily. The average for the world being 336 per cent. for a quarter of a century, average of over 100 per cent. for each of the three decades. During the time of this great absolute increase in steam tonnage, the sail tonnage as shown in total in table II, or in detail in table III., declined absolutely. This decline of 40 per cent. in the world's total was not relieved by a gain in any single country, nor did any country hold its own. Norway having her forests and her lumber trade held out the longest, but with the new century her sail total fell. Table IV shows that most of the relative and absolute decline of the sailer has come since 1890. Before that time the efficiency of sailing vessels as cheap freight carriers enabled them to outrank steamers in total tonnage, but the latter half of the decade, 1880-90, was the period of the general adoption of steel hulls and triple-expansion engines. With these improvements in the steamer the sailing vessel could not compete and building fell off in favor of the improved steamer. The relative proportions of steam and sail at different periods show the newness of steam predominance. In 1871 sailing vessels were to steamers as 1.7 to 1, in 1890 1.2 to 1, in 1901 .34 to 1. Expressing it in percentages, it appears that 18 per cent. of the world's shipping was propelled by sail. From the standpoint of work done, the application of the old rule of efficiency of 4 to 1 in favor of sail, shows that sailing vessels are now doing but 5.3 per cent. of the world's ocean carrying.

In 1901, 1902 and 1903 steamers carried many cargoes of Pacific coast grain to Europe. It was, it is true, done at a loss, but such periods come rather frequently in the shipping industry. It is not being claimed here that the steamer promises immediately to replace the sailer in this trade, but it has already competed for full cargoes. Much more significant is the consolidation of all sailing lines between the two coasts of America and the sale of these vessels and their replacement by high type steamers. Freight carrying perfection is illustrated in the new American steamers that have been built to replace the sailing vessel line from New York to San Francisco. Some of these vessels can carry 10,000 tons dead weight of freight and 2,500 tons of coal. If the Panama canal were open it is expected that they would make the 5,000-mile voyage from New York to San Francisco at nine knots per hour with 1,000 tons of coal, or one ton of coal for 10 tons of freight. With coal at $3 per ton, the coal cost of a ton of freight carried 5,000 miles would be 30 cents. Small wonder that a man interested in these steamers exclaimed when comparing them with sailers, "Oh, the coal is a bagatelle." Upon the opening of the Panama canal the sailer will probably be entirely displaced in the Atlantic-Pacific trade by the apparently impossible task of competing around Cape Horn with a steamer passing through the canal, and saving more than half of the distance.

The route from New York to Australia was claimed by Lieutenant Maury, the great ocean expert of 40 years ago, as the perpetual home and exclusive possession of the sailer. The route is long, the winds are fair and coaling stations for the rival steamers are scarce and expensive. But when the trade turned against the sailers this stronghold was also invaded. In the year 1896 several lines added steamers to their service, and have maintained them for 11 years and are shipping a large part, indeed the greater part of the freight by them.

TABLE IV. *The World's Merchant Marine.*
[Recorded in Lloyd's, 100 tons or over.]

Year	Steam No.	Steam Net tons.	Sail No.	Sail Net tons.
1890	11,108	8,295,514	21,190	9,166,279
1893	12,588	9,622,610	19,452	8,983,957
1894	12,907	10,111,769	17,814	8,503,294
1895	13,256	10,573,642	17,112	8,219,661
1896	13,652	11,027,603	16,228	7,876,264
1897	14,183	11,531,829	14,168	7,300,839
1898	14,701	12,073,074	13,351	7,019,958
1899	15,324	12,935,994	12,866	6,795,782
1900	15,898	13,856,513	12,524	6,674,370
1901	16,528	14,874,253	12,563	6,591,627
1902	17,156	16,026,372	12,472	6,577,776
1903	17,761	16,822,466	12,182	6,459,766
1904	18,467	17,682,141	10,823	6,156,505

This decline has been general, not local; it has affected the shipping of all countries, the trade of all oceans and of almost all commodities.

The claim is often made that there are special commodities and particular routes that belong exclusively to the traffic of the sailing vessel. Conspicuous among commodities supposed to belong to the sailer are nitrate of soda from Chile, lumber in the American coasting trade and elsewhere, and wheat from San Francisco. Within the past decade the shipment of full cargoes of nitrate by steam has become common, and several lines of steamers regularly carry it as a large part of their return cargo. Special steamers have been built to carry Carolina pine to New York and New England, and the shipments* of pine lumber and ties from the port of Savannah, Ga., for seven months, April 1-Nov. 7, 1905, show the following results:

	Steam Million ft., B. M.	Sail Million ft., B. M.
Foreign	4.74	0.6
Baltimore	10.13	1.93
Philadelphia	5.26	1.95
New York	23.82	15.91
Boston	3.16	1.81
Other ports		7.40
Total	47.11	40.66

*N. Y. *Lumber Trade Journal*, Nov. 15, 1905, p. 22.

It appears from the statistics of 1904-5 that there has been a pause in the downward course of sail tonnage. During the five years, 1899 to 1903, the total decline was not much greater than the annual decline from 1890 to 1899. This halt was due largely to the great boom of 1898 and 1899, which made every kind of vessel profitable in the extreme, and produced the greatest increase of steam shipping ever known. Steam and sail alike were profitable, and were built wherever the equipment was available, and the decline of the sailer was stayed, but the figures for 1904 show that the boom influence is over and that the upward march of steam and the downward march of sail tonnage has begun again.

The multimasted schooner with minimum crew and steam, sail and steering gear is spectacular, and has been heralded as the beginning of a renascence of the sailer. These vessels are not being built very rapidly, and in the steamers there is the counterbalancing improvement of oil-burning engines which require less space and less crew. There is also a mechanical stoker in use and the turbine is apparently coming. There does not appear to be any contrivance in sight to increase the force of sail competition with steam, and increasing disadvantage appears likely.

The extinction of the commercial sailer is not predicted here. For a long period to come there will be some distinctly sailing vessel work, but further decline of tonnage seems evident. She cannot hold her paltry twelfth part. In 1902 the British steam tonnage increased 708,000 tons and the sail tonnage declined 65,000 tons. The traffic upon which the sailing vessel has the strongest hold is some irregular and spasmodic trade, both coasting and foreign, which cannot be organized and handled as line traffic. The beginning of a new trade may be the occasional departure of a sailing vessel. Such a trade is now arising between the Gulf ports of the United States and the La Plata ports. If it grows, a line of steamers will take it over and most of the sailers will be displaced, giving another reduction to sailing tonnage.

There are times when the sailing vessel is desired because the low speed and consequent long voyage enable the shipper to save storage expenses at one of the termini, but the competition of a seaworthy ship as a mere storage warehouse is not a strong foundation for continued prosperity.

(*To be continued.*)

GENERAL NEWS SECTION

NOTES.

The New York, New Haven & Hartford is now running stateroom sleeping cars between New York and Boston.

At Jersey City, N. J., last week a street railroad company was fined $50 for violating the city ordinance requiring that every passenger be furnished with a seat. The case will be appealed to the Supreme Court.

The application of the railroads of Mexico for permission to increase their rates on ores is to be granted but, according to reports, the government will not permit the higher rates to go into effect until April 1.

The Pennsylvania Railroad has discontinued sending through freight trains over its Portage line, and, according to press despatches, the result will be the dismissal of several hundred men at East Hollidaysburg.

The Cincinnati, Hamilton & Dayton last week ran an "Agricultural special" over its line, making a three days' journey and stopping at the principal towns where farmers could be gathered. Lectures were given on the best corn to plant in Ohio and on the value of alfalfa.

The Long Island Railroad Co. has notified the New York State Public Service Commission that demurrage charges on cars at Long Island City and at certain other stations would be at once abolished. There is now no serious congestion of freight and consignees will be allowed to take their time in unloading their goods.

The New Jersey State Railroad Commission in its first annual report recommends the granting of increased power to the commission in certain directions, but does not favor granting to a commission the power to regulate rates. On this last point Commissioner Whiting dissented and made a minority report advocating the passage in New Jersey of a law similar to that now in effect in New York.

By lengthening 21 passing tracks between Roseville, Cal., and Truckee, the Southern Pacific has increased the capacity of its main line eastward from Sacramento almost 50 per cent., these passing tracks, now 2,600 ft. long, being able to accommodate 45-car trains, whereas before trains were limited to 30 cars each. The company has during the past year increased its freight car capacity 20 per cent. and its locomotive power capacity about the same.

The attempt which was made at Pittsburgh last week to require street car passengers to pay their fare on entering, broke down before the end of the second day. Many passengers offered $1 and $2 bills and insisted on stopping for their change, and the tracks were blocked with cars for long distances. One conductor, who encountered a woman holding a nickel between her teeth, is said to have succeeded in pushing the coin down her throat; and several conductors threw up their jobs.

The Committee on Car Efficiency of the American Railway Association, Arthur Hale, Chairman, has issued a statement of car surpluses and shortages on December 11, showing an aggregate surplus of cars amounting to 119,339 and an aggregate shortage of only 4,520. As there is now a surplus of cars everywhere the committee will discontinue detail bulletins, but will issue, fortnightly, condensed bulletins; and the Chairman will, on request, furnish details for particular roads, where desired.

According to a press despatch from Chicago the Atchison, Topeka & Santa Fe has changed 200 oil-burning locomotives into coal burners because the Interstate Commerce Commission rules that one railroad must not carry fuel for another without compensation. This apparently is meant to be taken as indicating that some other company (the Southern Pacific?) has such a warm interest in the prosperity of the Atchison that it is willing to carry fuel for it without charge. Thus the Government at Washington by its cold and unfeeling decision, chilling the milk of human kindness in the breast of a corporation, dries up the springs of the oil traffic in southeastern Texas.

President Roosevelt has awarded a railroad life saving medal to Edward A. McGrath, of Milwaukee, station agent of the Chicago, Milwaukee & St. Paul at Beecher street, in that city. He is a cripple, his left leg being about 8 in. shorter than the right one, making it necessary for him to wear a piece of wood on the bottom of his shoe to make his legs of even length. On the 26th of August while he and others were standing on the platform, the crossing gates being closed for the passage of a train, a six-year old girl attempted to cross the track in front of the approaching train. McGrath shouted to her to stay back, but she did not heed his warning. McGrath at great risk to himself ran to her aid and succeeded in lifting her from in front of the approaching train just as it rushed by. McGrath was struck by the pilot beam of the engine, but escaped serious injury. The child was entirely uninjured.

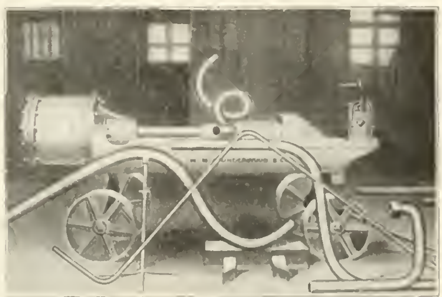
Southern Pacific Orange Traffic.

Besides buying this year 6,600 of the best refrigerator cars for its California fruit traffic, the Southern Pacific has taken up the problem of cooling the fruit before it is loaded. The company has begun building pre-cooling plants, and also ice-making plants to supply its cars. When pre-cooling comes to be general a large amount of fruit will be saved that now becomes spoiled, and fruit can remain on the trees longer. It is expected that pre-cooling will add from 10 to 20 per cent. to the value of California's citrus fruit production, which, in the season just closed, brought $34,000,000, and made the total fruit crop of the state worth twice as much as her gold production.

All-the-year-round demand for oranges has increased to such an extent that California growers have found it necessary to propagate more very early and very late varieties, until now there is hardly a day in the year in which citrus fruit shipments are not made from this state. The bulk of the crop, however, is handled between January 1 and July 1. For the fruit season ending Nov. 30, the total number of cars of oranges shipped was 23,981, and the increase for all citrus fruits was 2,000 cars for the year.

Pneumatic Pipe Bending Machine.

The accompanying illustration shows a portable pneumatic pipe bending machine made by H. B. Underwood & Co., Philadelphia, Pa. It has been in use for some months in a large railroad repair shop, where it does all the pipe bending required in equipping



Pneumatic Pipe Bending Machine.

locomotives, including the air-brake piping. It makes a right angle bend in a 2-in. pipe in two minutes and does not flatten or injure the pipe in any way. Dies of standard radius for locomotive work are furnished for pipe from ½ in. to 2 in. diameter, while special dies of any required radius or shape can be made to order.

New York City Slow.

Three thousand suburban travelers living along the line of the Western Railroad of France, exasperated by continued delays in transit through which, they allege, they lose hours in pay daily and sometimes even are dismissed by their employers, wrecked the offices at the St. Lazare terminus of the railroad Jan. 3, and for an hour held the police at bay. They were finally dislodged by the Fire Department, which played on them streams from two lines of hose.

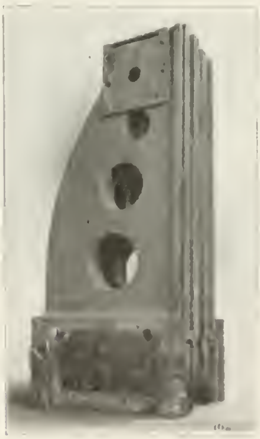
Supply and Demand in the Labor Market.

Mr. Gompers is reckoning without his host when he says that the wages of organized labor will not have to come down along with the prices of raw materials in the present general business and financial depression. The inexorable law of supply and demand will make itself felt in the case of organized labor, as well as in all other branches of business, Mr. Gompers notwithstanding. Labor has been at a premium for the last four years, and it has also been less efficient that ever before. All classes of employees have pointed to the heavy earnings and, in consequence, have received their share in the shape of higher wages. Mr. Gompers overlooks the axiom that when labor is at a premium the employee is in a position to make terms with the employer, but when labor is at a discount, as it is now, the employer is the dictator. In the immediate future employers will have more to say about the scale of wages than for several years, provided the present business recession obtains, as now. The price of unskilled labor has already declined.—*Interview with F. D. Underwood.*

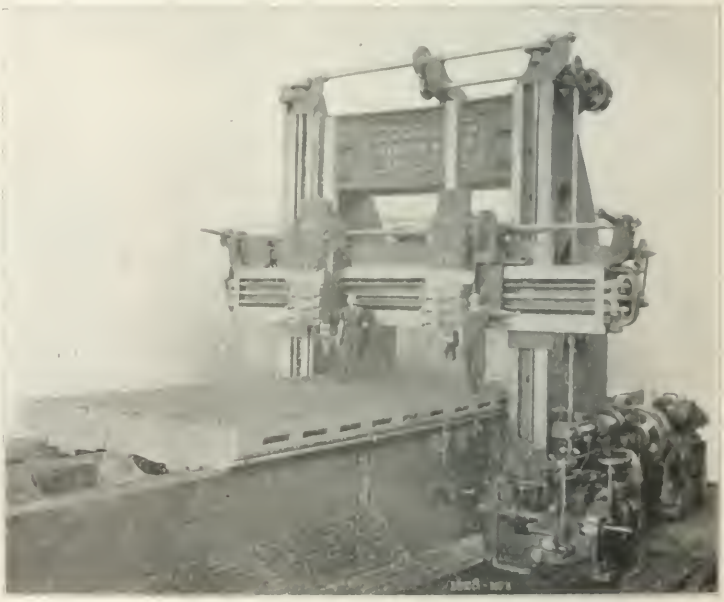
An Enormous Planer.

The planer shown in the accompanying illustrations was recently built at the Bement Works of the Niles-Bement-Pond Co., New York, for the Mackintosh-Hemphill Co., of Pittsburgh, Pa. It weighs 815,000 lbs., and the motors used to drive it aggregate 207½ h.p. It is 14 ft. 4 in. wide between uprights, and the distance from the top of table to the under side of the cross rail is 12 ft. 2 in. The stroke of the table is 30 ft. The main drive is by a 100-h.p. motor attached to the base of the right hand housing. It has a slight variation in speed and further changes can be made by the gears. Power is transmitted by gearing from the motor to reversing multiple disc pneumatic clutches. A small valve controls the starting, stopping and reversing, the valve being tripped by table-dogs for automatic reverse. Inside of the bed is a part of the driving mechanism, consisting of two large steel bull wheels, which engage with two racks on the table. The pinions driving the bull wheels are cut directly on the forged shaft with teeth spaced half pitch apart. Faces of pinions, bull wheels and racks are 15 in. wide.

In general the machine is of the usual type, but has several unusual features, in addition to the reciprocating table motion. Slotter bars, with 8-ft. stroke, are carried in the rail heads. One of the heads also has a power reversing cross motion for transverse planing, while both have quick power traverse on the rail, as well as tool slides in heads for quickly bringing them to approximate positions. When slotting certain classes of work the table has to be intermittently fed as on a regular slotting machine. The motor for the slotting and cross planing motion is 50 h.p. It has a slight speed variation, and there are change gears to further alter cutting speed the same as for the table driving motor. This smaller motor is near the base of the left hand housing, and drives pneumatic clutches of smaller size, but similar to those on the driving side. Power is transmitted through bevel gearing to a vertical shaft, which is made square to eliminate the use of sliding keys under great torsional strain. Above the motor is a disc driven from the main train of slotter gearing. It has adjustable stops on its circumference which are set to control the length of stroke just as dogs on a planer table.



The Two Uprights of Niles Planer.



Planer; Niles-Bement-Pond Co.

The short vertical column attached to the right hand side of the bed consists of an inner shaft and a sleeve. On the upper end are two sockets, in one of which is a handle. The upper socket is attached to the inner shaft, which connects with the rod for controlling valve and pneumatic clutches for slotter bars. The lower socket is attached to the sleeve, which controls the movement of table for regular planing, and is connected by lever and rods to the automatic reversing dogs on both sides of the bed. This control is duplicated on the other side of the planer. Only one handle is provided for each side, and thus mistakes arising from operating the wrong lever are avoided.

The uprights are massive castings 25 ft. high, 12 ft. deep, where bolted to bed, and with vertical faces 30 in. wide. Mounted on the uprights is a cross rail 5 ft. high and long enough to allow full traverse of either head between uprights. On this rail are heads with counterweighted tool slides 7 ft. 8 in. long having a vertical traverse of 4 ft. The tool aprons are of steel 28 in. wide, with three slots for clamp bolts and are arranged to swivel in the usual manner. Horizontal quick power traverse of heads on rail or vertical traverse of tool slides is operated by a 7½-h.p. motor, placed on the right hand end of the cross rail. A 20 h.p. motor for raising and lowering the cross rail is at the top of the right hand upright.

Pneumatic feed was adopted because of the great weight of the work and the table which must be fed across the bed when slotting or cross planing. On the side of the right hand upright is a cylinder, whose piston rod connects with a rack which meshes with a gear near the bottom of the vertical feed shaft. The feed shaft has on its lower end a bevel gear meshing with another bevel gear on a horizontal shaft which transmits motion to the vertical feed shaft on the left-hand upright. The movement of these feed shafts is constant at all times, and amount and direction of head feeds is controlled by adjusting the connecting rod in the slotted cranks on the ends of the cross slide. Feed cranks are graduated, so that definite cross and vertical feeds can be obtained and by using the cranks on both sides at the same time an angular feed can be given to the tool, which is at times desirable, as the complete heads were not designed to swivel. The feed mechanism for table necessary when slotting or transverse planing is directly in front of and at the base of the right hand upright. This feed works much the same as the feed for the cross head, except that variation in stroke or amount of feed is obtained by an adjustable stop, which regulates the movement of the piston. The machine has its own air compressor, driven by a 30 h.p. motor.

The table is 32 ft. long, 11 ft. wide and slides on three ways each 15 in. wide, the center way being V-shaped and outside ways flat. The bed is 60 ft. long, 13 ft. wide and 73 in. deep at center. Because of the great weight and large dimensions, it was impracticable to make the bed or table in one piece. The central section of the bed is divided longitudinally into three parts, and the two end sections into two parts each. The weight of the bed is about 275,000 lbs. The table is made in two sections, divided longitudinally in the center, and weighs about 110,000 lbs.

INTERSTATE COMMERCE COMMISSION RULINGS.

Beer and Water Not to be Mixed.

In an opinion rendered by Chairman Knapp the Commission has announced its decision in the case of the Milwaukee-Waukesha Brewing Company against the Chicago, Milwaukee & St. Paul and others. Defendants refused to apply carload rates on carloads made up of less than carload lots of mineral water and beer. Upon the facts disclosed, and principles announced in the recent case of Paper Mills v. Pennsylvania Railroad, the Commission decided that the refusal of defendants has not been shown to be unlawful. The complaint was dismissed.

Railroad Papers to be Preserved.

An order has been issued by the Commission to the effect that until further notice all records, documents and papers bearing on the statistics and accounts of railroads, with certain exceptions, shall be kept as a permanent file and in such manner as to make them easily accessible at all times for inspection by a properly accredited examiner of the Commission.

Certain papers that may be destroyed are indicated in the order. Among these are tissue copies of statements, waybills or reports, duplicate detached reports, used or canceled tickets, waybills dated before January 1, 1889, and conductors' and waiters' checks. Among the papers that may be destroyed after having been retained in the files for three years are train conductors' reports of train and car movements, detached papers relating to labor and material and papers subordinate to payrolls, including time checks and excepting time books.

Dining conductors' trip reports, daily reports of service of mechanical department employees and daily reports of service of transportation department employees may be destroyed at the expiration of six months after a carrier which has given previous notice of such purpose in writing to the Commission shall have received formal acknowledgment of such notice.

TRADE CATALOGUES.

Engineers' Hand Book on Rolling Doors.—This is catalogue No. 34 of the James G. Wilson Manufacturing Company, No. 3 West 29th street, New York, and it can be obtained free; nevertheless the title given it is a correct one. It contains 31 large pages of detail drawings which the engineer can ill-afford to do without in planning locomotive roundhouses, sheds and shops, car barns, freight houses, pier sheds and the like—wherever openings are to be covered and uncovered by fireproof or other construction efficiently and without waste of space. There are also about 60 good photographs, valuable in showing the varied applications in many kinds of building construction. Rolling doors are made of wood, bronze, iron or steel, and are flexible, so as to easily lift and coil in a roll over the opening. The engineer is more directly interested in two forms: The corrugated steel, a solid sheet, but flexible enough to roll up, and with malleable-iron clips which prevent wear in the guides; and the interlocking slat doors, with the same malleable-iron protection, more flexible and easier worked. It is out of place here to attempt giving more than a notion of the variations in details in making these applications to meet differing conditions. For example the Northern Pacific shed, at Seattle, has bays with shutter-covered openings 19 ft. wide; one at Baltimore 24 ft. wide; a car barn at Mt. Washington, Pa., with an opening 30 ft. wide. These involve considerable weights in the broad steel shutters to be lifted and lowered. They are counter-weighted or spring balanced. They are commonly operated by a winch, conveniently located, but small electric motors are frequently used. The methods of automatic closing of fireproof doors, when unusual heat comes from an accidental fire, are interesting. Indeed the whole catalogue is interesting.

The Union Pacific passenger department has made up a brief statement regarding the irrigation projects on and tributary to that road and its related lines under consideration and construction by the U. S. Reclamation Service; also concerning irrigable lands in public and private ownership which will eventually be reclaimed by means of proposed systems. It is printed in circular form for general distribution. A handbook relating to the operation of the Reclamation Act, prepared in the form of questions and answers, has also been issued by the Union Pacific for the information of the public generally.

Small Electric Motors.—Bulletin No. 4545, of the General Electric Company, Schenectady, N. Y., describes single-phase motors, type I. S., form K. G., ranging in size from ¼ h.p. to 15 h.p. The usual full dimensions and other information are given.

MANUFACTURING AND BUSINESS.

The plant which the Chicago Railway Equipment Co., Chicago, has been building at Grand Rapids, Mich., is nearly completed.

The name of the India Rubber & Gutta-Percha Insulating Co. has been changed to the Habirshaw Wire Co., 253 Broadway, New York.

L. W. Barber, Secretary of the Standard Car Truck Co., Chicago, was killed on the South Side Elevated Railroad in that city on January 5.

The Anderson-Lacy Electric Headlight Co., Houston, Tex., has shipped four locomotive headlight equipments to the Union Pacific for experimental use.

Charles F. Pierce has been appointed Manager of the railroad department of the New York & New Jersey Lubricant Co., New York, maker of non-fluid oils.

E. S. Nethercut, Chief Engineer of the Buda Foundry & Manufacturing Co., Chicago, has resigned. Mr. Nethercut will be in California for several months and expects to form no business connection until his return east.

E. M. Hedley, who has been in the experimental railroad department of the General Electric Co., Schenectady, N. Y., has been appointed General Superintendent of the Hudson & Manhattan, which is soon to start operation through its tunnels under the Hudson river.

C. W. Martin, Assistant General Manager of Jenkins Brothers, New York, died on December 31 of pneumonia. Mr. Martin was 37 years old. He had been with Jenkins Brothers for a number of years and in 1905 was Chairman of the Executive Committee of the Railway Supply Men's Association.

Robert W. Hunt & Co., inspecting and consulting engineers, Chicago, New York and Pittsburgh, have established a branch office and chemical laboratory at St. Louis, Mo., under the charge of Charles W. Gennett, Jr., M.E., formerly with the Baldwin Locomotive Works and the Southern Railway and lately Western Sales Agent of the Atha Steel Casting Company at Chicago.

A plan has been made public looking to the termination of the receivership of the Westinghouse Machine Co., Pittsburgh, Pa. It includes the issue of $7,200,000 three-year 6 per cent. notes secured by about $8,500,000 in bonds of the company. Claims of less than $1,000 are to be paid in cash and the others in notes. No dividends are to be paid until provision has been made for retiring the outstanding notes.

F. J. Cole, Mechanical Engineer of the American Locomotive Co., New York, has been appointed Consulting Engineer, with headquarters at Schenectady, N. Y. The office of Mechanical Engineer has been abolished and its duties will be included in those of William Dalton, Chief Engineer, whose headquarters are at Schenectady. Carl J. Mellin, Designing Engineer, has also been appointed a Consulting Engineer, with headquarters at Schenectady.

The E. H. Mumford Co., Philadelphia, Pa., has acquired all the patent rights, molding machines and equipment of Ph. Bonvillain and E. Ronceray in the United States and has added these machines and pattern processes to its molding machine line. The offices of the company will be moved from 17th and Callowhill streets, the present location, to 1315 Race street, where the French machines have been installed as a working exhibit for some months.

OBITUARY NOTICES.

John F. Fanning, a pioneer railroad builder of the Northwest, died in Chicago January 5, age 81 years. Mr. Fanning built parts of the Chicago, Rock Island & Pacific, the Northern Pacific and the Union Pacific lines.

Samuel Carpenter, formerly General Eastern Passenger Agent of the Pennsylvania, died at his home in New York on January 7. When he retired, a year ago, Mr. Carpenter had served on the Pennsylvania for 49 years.

Albert A. Folsom, Treasurer of the Eastern Railroad Association, died at his home in Brookline, Mass., December 24, at the age of 73. Mr. Folsom was for many years Superintendent of the Boston & Providence before it was merged in the Old Colony, having entered the service of that road in 1854.

Arthur G. Stanwood, Assistant Treasurer of the Chicago, Burlington & Quincy, died at his home in Boston, Mass., December 31, at the age of 58. Mr. Stanwood had spent the whole of his business life in the service of the Burlington road, having begun as a clerk in the Boston office. From that position he was rapidly promoted until he became Auditor. He had been Assistant Treasurer seven years.

Enos H. Tucker, who was a prominent figure in railroad life in Massachusetts for over 40 years, died at Needham, Mass., December 30, at the age of 93. Mr. Tucker began his railroad service on the Norfolk County Railroad in 1849 and had served on the Boston & Providence and on the New York & New England under its various names. He was for many years Superintendent of the Woonsocket division, retiring about 10 years ago.

Elmer E. Hill, Commissioner of the Colorado Car Service Bureau, died at his home in Denver last week Wednesday after a brief illness. He is survived by a widow and three children. Mr. Hill was born at Pleasant View, Ohio. He had been demurrage commissioner at Denver about ten years. Before that he was at Omaha. The Omaha demurrage bureau, established in 1888, was the first important institution of the kind in the country, so that Mr. Hill was the pioneer manager in this important reform.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

American Society of Civil Engineers.

At the meeting of this society, January 8, the subject for discussion was the Use of Reinforced Concrete in Engineering Structures.

Canadian Society of Civil Engineers.

At the meeting of this society January 9, there was a discussion on Water Wheels in continuation of the discussion on the paper by W. Kennedy, Jr., which was read November 14.

International Master Boiler Makers' Association.

The Secretary wishes us to announce that the International Railway and Master Steam Boiler Makers' Association having consolidated, there is now only one association, the International Master Boiler Makers' Association, which will hold its next convention in Detroit, Mich., May 26-28, 1908. The officers are: George Wagstaff, President (N. Y. C.), Buffalo, N. Y.; E. S. Fitzsimmons, First Vice-President (Erie), Galion, Ohio; E. J. Hennessy, Second Vice-President (N. Y. C.), Depew, N. Y.; W. M. Wilson, Third Vice-President, Chicago, Ill.; E. W. Rogers, Fourth Vice-President (Am. Loco. Co.), Paterson, N. J., and Peter F. Flavin, Fifth Vice-President (Standard Ry. Co.), St. Louis, Mo. The Executive Committee is composed of: G. W. Bennett (N. Y. C.), West Albany, N. Y., D. G. Foley, Green Island, N. Y.; P. J. Conrath, St. Louis, Mo., A. N. Lucas, Milwaukee, Wis., and James J. Fletcher, Toronto, Ont. Harry D. Vought, Secretary, 62 Liberty street, New York, and Frank Gray, Treasurer, Bloomington, Ill.

Railway Signal Association.

The next meeting of this association will be held in lecture room No. 6, Engineering Societies building, 29 West 39th street, New York City, on Tuesday, January 14. At the morning session, 10 a.m., the subject to be discussed is the report of Committee No. 4, Automatic Block Signals, as presented at the annual meeting, at Milwaukee, and there accepted as a progress report without discussion. At the afternoon session, at 2 p.m., there will be a paper by F. R. Cook on Economical Operation of Electric Signals and Care and Maintenance of Storage Batteries; also the report of Committee No. 3, Electric Interlocking, beginning at No. 60, page 23, Advance Notice No. 5, 1907.

At the Executive Committee meeting on December 2, 1907, it was voted that dues for representative members for 1908 should be $1 per vote per annum. Instructions to committees are to be published in the annual proceedings. Proceedings for 1908 are to be published as follows: Subjects for March meeting to be mailed February 25; subjects for May meeting to be mailed May 1; subjects for September meeting to be mailed August 15. Advance notice of annual meeting to be mailed two weeks in advance of date of meeting; discussion at annual meeting to be mailed December 20. The September meeting is to be devoted to reading of papers presented and accepted by the Executive Committee; no reports of committees for annual meeting to be discussed.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Astoria & Columbia River.—F. B. Clarke has been chosen President in place of C. M. Levey.

Boston & Albany.—See New York Central & Hudson River.

Cincinnati, Hamilton & Dayton.—A. J. Anderson has been appointed Comptroller, with office at Cincinnati.

Cuba Eastern.—Edgar VanEtten, who has resigned his position on the New York Central, has been appointed President of the Cuba Eastern. The chief operating office of this road is at Guantanamo, Cuba.

Georgia & Florida.—F. Q. Brown has been elected First Vice-President; office at New York City. E. L. Bemiss has been elected Second Vice-President; office at Richmond, Va. W. H. Alexander is Auditor; office at Augusta, Ga.

Grand Trunk.—N. J. Power, Assistant Auditor, with office at Montreal, Que., has been appointed General Auditor, in place of H. W. Walker, who has been retired on pension after over 50 years in the company's service.

New York Central & Hudson River.—Edgar VanEtten, Vice-President in charge of operation of the Boston & Albany, has resigned. See Cuba Eastern.

New York Central Lines.—Alexander S. Lyman has been appointed General Attorney of the New York Central & Hudson River and of its leased and operated lines east of Buffalo, except the Boston & Albany. Clyde Brown has been appointed General Solicitor of this company and of its leased and operated lines east of Buffalo, and also of the Lake Shore & Michigan Southern, the Michigan Central, the Cleveland, Cincinnati, Chicago & St. Louis, the Chicago, Indiana & Southern, the Indiana Harbor Belt and the Lake Erie & Western. He will have charge of legal matters relating to interstate commerce and traffic. Charles C. Paulding has been appointed Solicitor of the N. Y. C. & H. R. and of its leased and operated lines east of Buffalo, except the Boston & Albany. He will have charge of legislative matters. Messrs. Glennon, Cary, Walker & Howe have been appointed General Attorneys of the Lake Shore & Michigan Southern and the C. C. C. & St. L., with office at LaSalle street station, Chicago. They will have charge of legal matters at Chicago and in its vicinity. Leonard J. Hackney has been appointed General Counsel of the Cleveland, Cincinnati, Chicago & St. Louis, with office at Cincinnati. Henry Russell has been appointed General Counsel of the Michigan Central, with office at Detroit.

New York Public Service Commission, First District.—George S. Coleman has been appointed Counsel to the Commission, in place of A. E. Blackmar. Office at New York City.

New York State Public Service Commission, Second District.—William A. Sutherland, of Rochester, has been appointed Counsel, with office at Albany, N. Y.

Pere Marquette.—J. L. Cramer has been appointed Vice-President and Comptroller, with office at Detroit, Mich. J. E. Howard has been appointed Secretary and Treasurer. While the P. M. and the Cincinnati, Hamilton & Dayton were operated jointly these men held similar positions at Cincinnati.

Portland & Seattle.—F. B. Clarke has been elected President, instead of Assistant to the President, as previously reported.

Seaboard.—S. L. Kamps was on December 27 appointed Assistant to the President, with office at Norfolk, Va.

Seaboard Air Line.—S. Davies Warfield and R. Lancaster Williams, appointed last week Receivers of this road, have designated President W. A. Garrett as Chief Executive Officer for the Receivers.

South Side Elevated (Chicago).—C. V. Weston, Chief Engineer, has been elected President and General Manager, succeeding M. Hopkins, deceased.

Toledo Terminal Railroad.—This company, successor of the Toledo Railway & Terminal Co., was organized at Toledo December 31. The President is H. B. Ledyard, of the Michigan Central. General Manager, Thomas B. Fogg, is reappointed.

Operating Officers.

Ann Arbor.—See Detroit, Toledo & Ironton.

Atchison, Topeka & Santa Fe.—W. F. Buck, Mechanical Superintendent, at Topeka, has been promoted to the position of Superintendent of Motive Power, with office at Chicago, succeeding Alfred Lovell, resigned.

Atchison, Topeka & Santa Fe Coast Lines.—J. Kinnucan has been appointed Superintendent of Terminals at San Francisco, Cal.

Baltimore & Ohio.—Thomas Fitzgerald, General Manager, has resigned, but reports are uncertain as to whether he is to retire from the service of the company or is to be appointed to some other position.

Brookhaven & Pearl River.—W. H. Sullivan has been appointed General Manager, with office at Brookhaven, Miss., succeeding E. C. Enochs.

K. A. Smith has been appointed Assistant General Manager, with office at Bogalusa, La. F. L. Curtis is Superintendent; office at Brookhaven.

Canadian Northern Ontario.—C. W. Spencer, General Manager of this road and of the Canadian Northern Quebec and other Mackenzie & Mann lines east of Fort William, has resigned. See Halifax & Southwestern.

Canadian Northern Quebec.—See Canadian Northern Ontario.

Canadian Pacific.—R. R. Jamieson, who was recently appointed General Superintendent of the Central division of the Canadian Pacific, with office at Winnipeg, Man., was promoted to that office from the General Superintendency of the Western division, which he had held since 1903. Mr. Jamieson was born in Wentworth county, Ont., and began his railroad service on the Great Western of Canada as telegraph operator in 1873. He subsequently went to the Grand Trunk and afterward for two years was engaged in the construction of telegraph lines in Indiana. After that he returned to Canada as agent and subsequently as despatcher on the Credit Valley road.

R. R. Jamieson.

That road was absorbed by the Canadian Pacific and from 1890 to 1896, Mr. Jamieson was Assistant Superintendent on the C. P. He was successively promoted to the positions of Superintendent of the Eastern division and of the Crow's Nest branch, and in 1903, as before stated, to the General Superintendency at Calgary.

Chicago & Alton.—C. A. Goodnow, General Manager, has resigned and the position has been abolished. The authority of P. Houlahan, General Superintendent of the Toledo, St. Louis & Western, has been extended over the Alton, and his office will be at Chicago.

E. V. Dexter, General Inspector of Fuel, Equipment and Material, has resigned.

Detroit, Toledo & Ironton.—J. H. Fraser, heretofore Superintendent at Springfield, Ohio, has been appointed General Superintendent of this road and of the Ann Arbor Railroad and Steamship Lines, with office at Toledo, Ohio.

Grand Trunk.—James McCowan has been appointed General Car Accountant, with office at Montreal, Que., in place of W. H. Rosevear, retired on pension after 53 years in the service of the company.

W. H. Farrell has been appointed Superintendent of Terminals at Toronto, Ont.

Halifax & Southwestern.—W. B. Barclay has been appointed General Manager, with authority over the Mackenzie & Mann lines in the Maritime Provinces, including the Inverness Railway & Coal Company's line.

Houston Belt & Terminal.—J. R. Dillon has been appointed Superintendent.

Hudson & Manhattan.—Edward M. Hedley, heretofore with the General Electric Company, has been appointed General Superintendent of the Hudson & Manhattan. This company will soon open a line beneath the Hudson river between Hoboken and New York.

Mexican Central.—J. S. Reddoch has been appointed Superintendent at Aguascalientes, in place of J. H. Clegg. R. M. Elliott has been appointed Superintendent at Gomez Palacio. J. J. Lewis has been appointed Superintendent of Terminals at Tampico.

Northern Pacific.—G. A. Goodell has been appointed General Superintendent of the lines between Mandan, N. Dak., and Trout Creek, Mont., with office at Livingston, Mont.

Peoria & Eastern.—Thomas Hayes has been appointed Trainmaster at Bloomington, Ill., in place of W. F. Schaff.

Toledo, St. Louis & Western.—J. F. Clement, heretofore Superintendent of Telegraph, has been appointed Superintendent, with office at Frankfort, Ind. P. H. Houlahan, General Superintendent, who now has charge of the Chicago & Alton also, has moved to Chicago.

Tonopah & Tidewater.—W. W. Cahill, Assistant Superintendent, has been appointed Superintendent; office at Ludlow, Cal.

Washington, Idaho & Montana.—J. D. Morrissey has been appointed Superintendent, in place of J. D. Sullivan, office at Potlatch, Idaho.

Traffic Officers.

Brookhaven & Pearl River.—H. C. Homeyer has been appointed General Freight and Passenger Agent, with office at Brookhaven, Miss., in place of W. J. Helmick, resigned.

Chicago, Peoria & St. Louis.—C. W. Galligan has been appointed General Freight Agent. Office at St. Louis, Mo.

Chicago, Rock Island & Pacific.—A. D. Murray has been appointed General Agent at St. Louis, Mo.

Evansville & Terre Haute.—D. H. Hillman, General Freight and Passenger Agent, has resigned.

Gulf, Colorado & Santa Fe.—J. R. Dillon, Assistant General Freight Agent, has resigned. See Houston Belt & Terminal.

Mississippi Central.—R. D. Reeves has been appointed General Freight Agent, with office at Hattiesburg, Miss., in place of W. P. Emerson, resigned to become Secretary of the New Orleans Traffic Association.

Missouri, Kansas & Texas.—J. L. West, Assistant General Freight Agent, with office at St. Louis, Mo., has been promoted to the place of F. A. Leland, with the same title, Mr. Leland having resigned to become Chairman of the Southwestern Tariff Committee. W. W. Miller, Assistant General Freight Agent at Kansas City, succeeds Mr. West at St. Louis, and R. F. Campbell, heretofore commercial agent at Joplin, takes the place of Mr. Miller at Kansas City.

R. W. Hockaday has been appointed General Freight and Ticket Agent in Kansas, with office at Parsons.

Missouri Pacific.—B. Howard Payne has been appointed General Passenger and Ticket Agent, with office at St. Louis, Mo., in place of H. C. Townsend, resigned. W. H. Blssland has been appointed Assistant General Passenger and Ticket Agent, with office at St. Louis, succeeding Mr. Payne.

Southern.—L. A. Emerson, Assistant General Freight Agent at Charleston, S. C., has resigned and the office is abolished.

Engineering and Rolling Stock Officers.

Arkansas, Louisiana & Gulf.—E. G. Courtney has been appointed Master Mechanic of this new road, which has been built from Monroe, La., to Wardville, 30 miles.

Canadian Pacific.—Grant Hall has been appointed Superintendent of Motive Power of Western Lines, with office at Winnipeg, Man.

Chicago, Burlington & Quincy.—Joseph W. Cyr has been appointed Master Mechanic at Hannibal, Mo., in place of Isaac N. Wilber, resigned.

Chicago Great Western.—W. P. Chrysler, Master Mechanic at Oelwein, Iowa, has been appointed to the new office of Superintendent of Motive Power, with office at Oelwein, Iowa, succeeding to the duties of J. E. Chisholm, General Master Mechanic, resigned.

Grand Trunk.—James Coleman has been appointed Superintendent of the Car Department, with office at Montreal, Que., in place of William McWood, retired on pension after 52 years in the service of the company.

Illinois, Iowa & Minnesota.—H. S. Rogers, Engineer of Maintenance of Way, has resigned to go to another road, and the office has been abolished.

International & Great Northern.—O. H. Crittenden, Resident Engineer at Palestine, Tex., has been made Consulting Engineer.

Lake Shore & Michigan Southern.—O. M. Foster has been appointed Master Mechanic of the Michigan Southern division, with office at Elkhart, Ind., in place of M. J. McCarthy, resigned to go to the C., C., C. & St. L. as Superintendent of Shops at Beech Grove. John T. Carroll has been appointed Assistant Master Mechanic at Elkhart, succeeding Mr. Foster.

Mexican Central.—W. J. Dempster has been appointed Master Mechanic of the Monterey division, in place of J. A. Lewis, transferred. R. N. Millice has been appointed Master Mechanic of the Aguascalientes division in place of R. D. Gibbons, transferred. L. G. Wallace has been appointed Acting Master Mechanic at Guadalajara in place of R. N. Millice, promoted.

New York Central & Hudson River.—George H. Haselton, heretofore Division Superintendent of Motive Power at West Albany, has been appointed Assistant Superintendent of Motive Power, with office at New York City. Eben A. Walton, hitherto Division Superintendent of Motive Power at Oswego, succeeds Mr. Haselton at West Albany.

Rio Grande, Sierra Madre & Pacific.—J. M. Barnes has been appointed Master Mechanic, office at Ciudad Juarez, Mex.

Texas Midland.—N. L. Smitham, formerly Master Mechanic of the

Texas Central has been appointed Master Mechanic of the Texas Midland, with office at Terrell, Tex., in place of O. W. Lewis, resigned.

Purchasing Agents.

Buffalo & Susquehanna.—B. D. Falsett has been appointed Purchasing Agent, with office at Buffalo, N. Y.

Chicago, Peoria & St. Louis.—E. A. Williams, General Passenger Agent, will henceforth have charge of purchases also, C. H. Besler, Purchasing Agent, having resigned.

Waterloo, Cedar Falls & Northern.—A. I. Breckenridge has been appointed Purchasing Agent, with headquarters at Waterloo, Iowa.

LOCOMOTIVE BUILDING.

The Delaware, Lackawanna & Western was recently in the market for 52 locomotives, but has postponed the order.

CAR BUILDING.

The Chicago Consolidated Traction is in the market for 500 or more cars.

The Little Rock & Pine Bluff has ordered 15 closed electric cars from the Jewett Car Co.

The Lehigh & New England is asking bids on 1,000 thirty-ton box cars and 250 forty-ton gondolas.

The Colorado & Southern is figuring on 12 interurban combination baggage and passenger cars for the Denver & Interurban.

The Chicago-New York Electric Air Line has ordered two electric cars from the Danville Car Co. for March delivery. These cars will measure 40 ft. 6 in. long and 8 ft. 5 in. wide.

The Waterloo, Cedar Falls & Northern, as reported in the *Railroad Gazette* of January 3, has ordered two interurban and ten 10-bench open cars from the McGuire-Cummings Co. for January and May delivery. The interurban cars will weigh 46,000 lbs. and will measure 52 ft. long and 8 ft. wide, inside measurements. The open cars will weigh 30,000 lbs. and will measure 31 ft. long, inside measurement. The special equipment for all cars includes:

Heating system, for interurban	Baker
Paint	Sherwin-Williams
Trucks, for interurban	McGuire-Cummings
Trucks, for open cars	Taylor
Wheels	Griffin

The New York, New Haven & Hartford, as reported in the *Railroad Gazette* of December 27, has ordered 10 blind end baggage cars, 10 unvestibuled baggage and smoking cars, five vestibuled smoking cars, three unvestibuled smoking cars, 27 unvestibuled passenger cars and one mail and letter car from Osgood Bradley & Sons for 1908 delivery. The blind end baggage cars will measure 60 ft. long, 8 ft. $11\frac{3}{8}$ in. wide and 9 ft. high, inside measurements, and 63 ft. $3\frac{1}{2}$ in. long, 10 ft. $\frac{1}{4}$ in. wide and 14 ft. high, over all. The unvestibuled baggage and smoking cars will weigh 78,000 lbs. and will measure 60 ft. 2 in. long, 8 ft. $11\frac{1}{2}$ in. wide and 9 ft. high, inside measurements, and 68 ft. 8 in. long, 10 ft. $\frac{1}{4}$ in. wide and 14 ft. high, over all. The vestibuled smoking cars will weigh 83,500 lbs.; the unvestibuled passenger cars, 77,700 lbs.; and the unvestibuled smoking cars, 78,000 lbs. All these cars have the same measurements as the unvestibuled baggage and smoking cars. The mail and letter car will measure 61 ft. $10\frac{3}{8}$ in. long, 9 ft. $\frac{5}{8}$ in. wide and 9 ft. high, inside measurements, and 64 ft. 10 in. long, 10 ft. $\frac{1}{4}$ in. wide and 14 ft. high, over all. Bodies and underframes of all cars will be of wood. The special equipment for all cars includes:

Bolsters	Commonwealth
Brake-beams	Diamond special
Brake-shoes	Diamond S steel back, flanged
Brakes	Westinghouse
Brasses	Magnus metal
Couplers	Buhoup 3-stem
Curtain fixtures	Forsyth
Curtain material	Pantasote
For unvestibuled baggage and smoking cars, vestibuled smoking cars, unvestibuled passenger and unvestibuled smoking cars.	
Draft rigging	Sessions Standard, friction
Dust guards	Harrison
Heating system	Gold direct steam
Light	Commercial Acetylene
Platforms	Standard Coupler Co.
Roofs	Canvas
Trucks	Four-wheel
Vestibules	Buhoup blind end (for blind end baggage cars and mail and letter cars), Buhoup wide (for vestibuled smoking cars)
Wheels	Paige plate, steel tires

The New York, Chicago & St. Louis, as reported in the *Railroad Gazette* of December 27, has ordered 1,000 box cars of 80,000 lbs. capacity from Haskell & Barker, for February delivery. These cars will weigh 35,500 lbs., and will measure 36 ft. long, 8 ft. 6 in. wide and 8 ft. high, inside measurements. The special equipment includes Janney couplers and Haskell & Barker bolsters, brake-beams, brake-shoes, brasses, door fastenings, doors, draft rigging and dust guards.

RAILROAD STRUCTURES.

BEAVER, PA.—Plans have been made by the Pittsburgh & Lake Erie for building a steel bridge over the Beaver river.

BIRMINGHAM, ALA.—The Southern Railway, it is said, is double-tracking from Decatur Junction, for three miles and will build two new steel bridges over the Tennessee river. The Louisville & Nashville has the joint use of this track. The cost of the improvement is about $500,000.

DENVER, COLO.—Action will soon be taken by the city authorities towards building the 19th street viaduct.

EDMONTON, ALB.—It is estimated that the cost of a proposed steel bridge for the Grand Trunk Pacific over the Pembina river west of this place will be about $250,000.

ELKHART, IND.—The Lake Shore & Michigan Southern, it is said, has bought about 25 acres of land as a site for new shops here.

FORT WILLIAM, ONT.—Contract is reported let to Barnett & McQueen at about $600,000 for rebuilding the Canadian Pacific elevator here.

KAYLOR, PA.—New car shops, it is said, are to be built by the Western Allegheny Railroad.

MINNEAPOLIS, MINN.—The Chicago, Milwaukee & St. Paul will put up a 16-stall steel addition to its engine house here.

NEW WESTMINSTER, B. C.—The plans for the steel bridge to be built over the north arm of Fraser river provide for a combined highway and street railway bridge.

OWENS, WIS.—The Fairchild & North-Eastern has given a contract to the Hennepen Bridge Company for putting up a steel bridge here.

PITTSBURGH, PA.—The Pittsburgh & Lake Erie is planning to put up a new freight station here.

ROCHESTER, N. Y.—Announcement is made by Mayor Cutler that the New York Central has appropriated $1,500,000 for a new passenger station here. About seven acres and a half of land adjoining the present station in Central avenue have been bought, so that the entire site will comprise $11\frac{1}{2}$ acres. The plans provide for a building to cost $1,100,000 east of Clinton avenue. The present station is west of Clinton avenue.

TOPOLOBAMPO, MEX.—It is stated that the Mexican government will join the Kansas City, Mexico & Orient in converting Topolobampo into a first-class port. It is estimated that more than $15,000,000 gold will be spent in making the improvements planned, of which the K. C., M. & O., under the terms of the concession for which it has made application, agrees to furnish two-thirds. The railroad has bought Momocahui Island, at the entrance of the port, on which great terminal yards will be situated. Six steel piers will be constructed and the road will fill in the low places on the northern side of the harbor for about three miles.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

BALTIMORE & OHIO.—This company recently began operating a new track known as the Alberton cut-off on the old main line, from Davis, Md., east to Hollofields, four miles, completing the rebuilding of the old main line and making it a low grade line from Relay, Md., to Washington Junction. About three-quarters of a mile was saved and about 542 deg. of curvature eliminated. The maximum curve between these two places was reduced from 12 deg. to 7 deg., and westbound grade was reduced from .9 to .5 per cent., the eastbound to .3 per cent. The work, which took about two years to finish, cost about $750,000, and included a tunnel at Dorsey's, 1,025 ft. long, double-tracked and lined with brick, with stone portals; also a tunnel at Davis 498 ft. long, also double-tracked and lined with brick, with stone portals. Two deck girder bridges were also built on stone piers and abutments. The bridge at Davis has two spans, one of 90 ft. and one of 98 ft., and the bridge at Alberton three 90-ft. spans, one 100-ft. and one 26-ft. span. T. A. Shoemaker & Co., Philadelphia, were the contractors.

All trains will soon be operated over the new double-track line now building between Sterling, Ohio, and Nova, on the New Castle division, 15 miles. Over 2,000,000 yards of grading has been done in constructing this new line, and some 10,000 yards of stone arch and bridge masonry erected. All the bridges and viaducts are arched and have ballasted tops. Double-track passing sidings are located just east of Lodi and at Homer. The new double-track between Nova and Sullivan and between the point of divergence east of Lodi and Sterling has been in operation for some time.

Brooklyn Rapid Transit.—During the year 1907 this company added 4,150 ft. of double track as follows: From Livingston and Court streets, in the Borough of Brooklyn, to Flatbush avenue, 3,400 ft., and on Lafayette avenue from Flatbush to Fulton street, 750 ft. On the Brighton Beach line the company has laid third and fourth tracks from Church avenue to Neptune avenue, 24,215 ft.

Cairo & Kanawha.—An extension of this road is projected from MacFarlan, W. Va., to Smithville, eight miles.

Canada West Coal Companies Railroad.—Announcement is made that this company, the head office of which is at St. Paul, Minn., will build a line to haul coke from Butte, Mont., north to the smelters at Calgary, Alb.

Central Ontario.—Contracts have been given by this company to build an extension from Maynooth, Ont., to Lake St. Peter, eight miles; also from Lake St. Peter to Whitney, 19½ miles.

Grand Trunk Pacific.—This company, which has given contracts for building its entire line from Winnipeg, Man., west to Edmonton, Alb., 789 miles, and which finished track laying on 325 miles of main line and 28 miles of sidings on this section in 1907, is pushing the work. Much delay was experienced last fall on account of bad weather and scarcity of ties. Near Drumague, Sask., 160 men are at work. Mild weather permits good progress to be made. It is hoped to have this section finished by spring.

Great Northern.—Contract is reported let to F. P. Howard, of Maroon Valley, B. C., for work on the Vancouver, Victoria & Eastern, near Hedley, B. C.

Greenville & Knoxville.—This company is building an extension from Marietta, S. C., to River Falls, 11 miles, and has projected a further extension from River Falls to the North Carolina state line, 22 miles.

Ilwaco Railroad.—See Oregon Railroad & Navigation.

Kingsport & Bristol.—Surveys are reported made and contracts are shortly to be let for building this proposed line from Kingsport, Tenn., east about 30 miles to Bristol. F. A. Cothran is Chief Engineer.

Little Rock, Maumelle & Western.—This company, which built 16 miles of road last year in Arkansas, is making surveys for a 12-mile extension from Douglas.

Louisville & Atlantic.—Contracts have been given to Mason, Hanger & Coleman, of Richmond, Ky., and to the Canton Bridge Company, of Canton, Ohio, for building three miles of line for this company from Heidelberg, Ky., to Elk City. C. W. Moorman, Engineer Maintenance of Way, Richmond, Ky.

Louisville & Nashville.—The work on the Cumberland division reducing grades between Barbourville and Flat Lick, 3.10 miles, in Knoxville county, Ky., is about finished.

On the Kentucky division grading has been finished and second-track laid from Livingston to Berth, 2.60 miles; from East Bernstadt to Pittsburgh, 2.70 miles; from Little Laurel River to Frantz, 3.10 miles, and also from Lynn Camp Creek to mile post 172, one mile all in Kentucky.

During 1908 grading work and second track is to be laid on the Kentucky division from Perth to East Bernstadt, nine miles, and a new double-track line is to be built between Pittsburgh and Little Laurel River, 6.80 miles. A new double-track line is also to be built between Frantz and Lynn Camp Creek, 6.50 miles.

On the South & North Alabama between Graces, Ala., and Hardy, 17 miles, work is under way reducing grades and revising the line. A second track is also to be added, which will probably be finished early this year.

On the Pine Mountain Railroad between Clear Fork River, Ky., and Gatliff coal mines, 17 miles, it is expected to have grading work and track laid this year; also a branch diverging from this line at Yost to Mahan, 2.30 miles.

The Swan Creek Railway has laid track from Mount Pleasant, Tenn., for about four miles, leaving 13½ miles yet to be built to complete the line to Flanagan. It is expected to have the work finished early this year.

Nevada-California-Oregon.—This company is building with its own men an extension from Likely, Cal., to Alturos, 20 miles. A further extension is projected from Alturos to Lakeville, 60 miles.

New York, Auburn & Lansing (Electric).—This company, which is building an electric line from Auburn, N. Y., to Ithaca, 39 miles, has track laid from Auburn to Genoa, 19 miles, and during 1907 finished the section from Myers to South Lansing, 10.9 miles, and from Ithaca to McKinneys, 1.1 mile. Work is under way by the Auburn Construction Company from South Lansing to McKinneys, 4.1 miles. (July 26, p. 111.)

New York Subways.—The New York State Public Service Commission, First district, has approved the building of a subway from the south end of Manhattan Island northward, most of the way through Broadway as far as Eleventh street then under private property to Lexington avenue and thence northward to the Harlem river; beyond which the line branches; the western arm going to Woodlawn by way of Jerome avenue, and the eastern to Pelham Bay Park. The Commission has ordered plans and estimates prepared, but has taken no further definite action.

Oregon Railroad & Navigation.—Work is under way by this company finishing extension as follows: Between Elgin, Ore., and Joseph, on the remaining 56½ miles, and between St. John and Woodlawn on 1.80 miles;

On the Oregon, Washington & Idaho, between Riparia, Wash., and Lewiston, Idaho, 37 miles.

On the Ilwaco Railroad, between Ilwaco, Wash. and Knappton, 9.10 miles.

Oregon, Washington & Idaho.—See Oregon Railroad & Navigation.

Osceola, Little River & Western.—An extension has been projected by this company from Youngs, Ark., to Little River, seven miles.

Pine Mountain Railroad.—See Louisville & Nashville.

Pittsburgh, Shawmut & Northern.—This company has finished relocating its line from Paine, Pa., to Detsch, five miles. On this section the ruling grades have been reduced and 1,000 deg. of curvature have been eliminated.

Salt Lake & Ogden.—This company is building an extension from Ogden (Utah) city limits to Canyon, 5.60 miles.

South & North Alabama.—See Louisville & Nashville.

South & Western.—This company, which last year added 22 miles to the line it is building from Elkhorn, Ky., south to Bostick, N. C., expects to finish all the work from Dante in Russell county, Va., south to Bostick, during 1908. On this section grading is 70 per cent. finished, also the tunnel and masonry work.

Swan Creek Railway.—See Louisville & Nashville.

Vancouver, Victoria & Eastern.—See Great Northern.

Versailles & Sedalia.—This company has projected an extension from Ouachita, Mo., to Sedalia, 24 miles.

Virginia Air Line.—This company, which last year built 17 miles of railroad between Lindsay, Va., and Palmyra, has work under way on 13 miles. J. N. H. Cornell & Co., Gordonville, Va., are the contractors. W. Washabaugh, Chief Engineer, Charlotteville, Va.

Washington, Westminster & Gettysburg.—This company, which built 25 miles of its line between Washington, D. C., and Laytonsville, Md., last year, is making surveys to build three miles additional in the District of Columbia, with a terminus at 15th and H streets, N. E. The line will probably be operated by gasolene motor cars. J. B. Colegrove, President, Washington, D. C.

Wisconsin & Northern.—An extension is being built from Crandon, Wis., south three miles. Surveys made to extend the line from Van Ostrand, Wis., north to a point south of Crandon, 28 miles.

Woodville Railroad.—This company, which last year built four miles in Florida, has projected an extension from Lavender to Crawfordville, 10 miles.

RAILROAD CORPORATION NEWS.

Atchison, Topeka & Santa Fe.—Gross earnings of the system increased slightly in November. Operating expenses were $1,250,000 larger, leaving a decrease of $1,180,000, or 37 per cent in net earnings; this with an increase of 151 miles in mileage operated. This decrease in net earnings followed a decrease of $1,210,000 in the month of October. For the five months ended November 30, gross earnings increased $2,800,000 and net earnings decreased $3,260,000.

Baltimore & Ohio.—See Chicago Terminal Transfer.

Boston & Maine.—This company has $1,000,000 5 per cent one-year notes outstanding which mature on January 15. Through R. L. Day & Co. these have been renewed at 6 per cent until January 6, 1909. Another $1,000,000 notes mature on February 15 and a third block of the same size on March 15.

Canadian Pacific.—An issue of $24,826,000 additional common (ordinary) stock is to be offered at par to stockholders of record January 14 on the basis of one share of new stock for each five shares held. Payments of 20 per cent each are to be made on or before February 19, April 21, June 19, August 19 and October 19. This issue was approved by the shareholders in special meeting on December 30.

Chicago & Illinois Western.—This road which has 17 miles of line in operation in the outskirts of Chicago and 37 miles under construction has made a mortgage covering $1,000,000 40-year 6 per cent. bonds. The proceeds are to be used for new construction.

Chicago Great Western.—A. B. Stickney, President of this company, and Charles H. F. Smith, of St. Paul, were on January 8 appointed receivers. This action was taken as a direct result of Mr. Stickney's failure to make arrangements in London to fund about $1,400,000 five-year sterling 5 per cent. notes which fall due this month. There are also about $2,000,000 more of these notes maturing this year and $1,000,000 notes maturing in 1909. Frank B. Kellogg, of St. Paul, who asked for the appointment of the receivers, said that notes to the amount of $515,000 had already gone to protest. There are no mortgage bonds issued on the 818 miles of the Chicago Great Western proper. It is the intention to create a $20,000,000 first mortgage bond issue on these main lines with which to fund the notes and other obligations outstanding and to double-track and improve the road, whose facilities have been insufficient for its traffic. Including the Mason City & Fort Dodge and the Wisconsin, Minnesota & Pacific component parts of the system, the Chicago Great Western operates 1,176 miles of road.

Chicago Terminal Transfer. The stockholders' protective committee has announced that the Baltimore & Ohio has not yet ratified the arrangement by which the committee was to sell not less than $1,500,000 of the $17,000,000 preferred stock of the Chicago Terminal Transfer at $25 a share. The committee, which represents upwards of $6,500,000 of the preferred stock, believes that the Burlington owns or controls about $7,500,000 of it. The offer of the Baltimore & Ohio has not been rescinded.

Cincinnati & Muskingum Valley.—See Pennsylvania Company.

Cincinnati, Hamilton & Dayton. A special meeting of the stockholders is to be held on February 7 to authorize an issue of $11,286,000 five-year 4 per cent. purchase money notes, whose proceeds are to be used for retiring the refunding mortgage 50-year 4 per cent. bonds of 1954, of which $11,557,000 are outstanding. The maturity of these bonds is to be changed from 1954 to 1913. Interest on them is not in default. This is a step toward the termination of the receivership.

Cleveland & Marietta.—See Pennsylvania Company.

Colorado & Southern.—With an increase of 178 miles, gross earnings for the month of November, 1907, were $1,422,241, an increase of $272,526; net earnings $546,139, an increase of $169,685. Gross earnings for the five months ended November 30 were $6,152,976, an increase of $898,204; net earnings $2,311,218, an increase of $386,538.

Gulf & Chicago.—See New Orleans, Mobile & Chicago.

Louisville & Nashville. Net earnings for the month of November decreased 45 per cent. from the net earnings for November, 1906. Gross earnings for November, 1907, were $3,900,000, a decrease of $171,000; operating expenses increased $450,000, leaving net earnings of $753,000, a decrease of $624,000. The operating ratio was 80.75 per cent., against 66.3 per cent. in 1906. For the five months from July 1 to November 30, 1907, the loss in net earnings was $735,500, only a little more than the decrease for the month of November alone.

Mobile, Jackson & Kansas City.—See New Orleans, Mobile & Chicago.

New Orleans, Mobile & Chicago. This is the name of a company which is to take over the Mobile, Jackson & Kansas City and the Gulf & Chicago, probably some time during the present month. Most of the bondholders of the two companies which are to be taken over have agreed to this action under a plan of reorganization by which securities of the old roads will be exchanged for those of the new company. The interest payments due January 1 on the bonds of the Mobile, Jackson & Kansas City and the Gulf & Chicago were not paid, but are to be funded with securities of the new company.

New York Central Lines. Gross earnings for the month of November were as follows:

	1907	Change	
New York Central & Hudson River	$7,876,736	Dec.	[illegible]
Lake Shore & Michigan Southern	3,717,084	Inc.	281,[illegible]
Lake Erie & Western	391,671	Dec.	[illegible]
Chicago, Indiana & Southern	[illegible]	Inc.	[illegible]
New York, Chicago & St. Louis	866,891		[illegible],787
Michigan Central	2,[illegible],998	Dec.	[illegible]
Cleveland, Cincinnati, Chicago & St. Louis	[illegible],068,060	Inc.	[illegible]
Peoria & Eastern	[illegible],718	Dec.	18,[illegible]
Cincinnati Northern	79,687		2,[illegible]
Pittsburgh & Lake Erie	1,277,367	Inc.	[illegible]
Rutland	260,277		[illegible]

New York City Railway. Frederick W. Whitridge was on January 6 appointed Receiver of the Third Avenue Railroad. In March, 1900, the Metropolitan Street Railway acquired control of the Third Avenue, then in the hands of a receiver, and shortly afterward leased it for 999 years, at the same time agreeing to pay, beginning in 1901, annual dividends of from 5 to 7 per cent. on its stock. In the course of the present receiverships of the New York City Railway and its leased company, the Metropolitan Street Railway, this guaranteed dividend has been defaulted. In December the receivers of the two controlling companies made a report on the condition of the Third Avenue Railroad, which showed that no charge had been made for depreciation of the property and that in consequence it was in bad condition.

New York, New Haven & Hartford.—The steamer lines running on Long Island Sound in which the New York, New Haven & Hartford is interested are now operated by two companies. The New England Steamship Company operates the lines which are directly owned and the United States Transportation Company operates the lines of which the New Haven's control is not so definite. The New England Steamship Company on January 1 opened an all-water freight line between New York and Boston. There are to be three sailings a week from each city, and the trip is to be made in 20 hours. The steamers "Bunker Hill," "Old Colony" and "Massachusetts" are to be used on this route.

Ohio Connecting.—See Pennsylvania Company.

Pennsylvania Company.—In the table published in the *Railroad Gazette* of January 3, 1908, page 11, showing new railroad capital authorized or issued during the calendar year 1907, through a mistake, the Pennsylvania Company was shown to have issued $50,000,000 three-year 5 per cent. collateral improvement notes, which refunded a like amount of 4½ per cent. notes due November 1. The Pennsylvania Company, however, did not issue any obligations during the year 1907, and the $50,000,000 collateral improvement notes which matured November 1 of that year were paid off and canceled. The $50,000,000 notes maturing November 1, shown to have been refunded by the issue of $60,000,000 notes by the Pennsylvania Railroad, were the Pennsylvania Company's notes already referred to, which matured November 1.

Increased annual dividends on stocks of subsidiary companies were declared at the end of 1907 as follows: Cincinnati & Muskingum Valley, 4 per cent., the rate having been 2 per cent. since 1900; Ohio Connecting Railway, 7 per cent., rate in 1906 being 5 per cent.; Cleveland & Marietta, 4 per cent., rate in 1906 3 per cent.; Toledo, Walhonding Valley & Ohio, 2 per cent., none paid in 1906.

Seaboard Air Line. On application of the attorneys of this company in a bill stating that there was due on January 1, 1908, on bonds and equipment notes $765,000, and for taxes, traffic balances, pay-rolls, supplies and other claims, many of them overdue, more than $2,000,000, besides a floating indebtedness of about $3,000,000, all of which the company was without funds to meet, the United States Circuit Court for the Eastern district of Virginia on January 2 appointed S. Davies Warfield and R. Lancaster Williams, receivers of the Seaboard Air Line Railway. Mr. Warfield is President of the Continental Trust Company of Baltimore, which is trustee under the first mortgage, and probably represents the Ryan-Blair interests, which have controlled the company. Mr. Williams is a brother of John Skelton Williams, formerly president, and for the past three years a bitter critic of the company's policies. The receivers have been given authority to borrow money to pay the bond interest and the amount due on equipment notes. The object of the receivership was to maintain the system intact pending reorganization. The company had no funds nor credit on which to borrow, and therefore a receivership was necessary in order to protect it from disintegration.

Southern.—Gross earnings for November decreased slightly and net earnings showed a decrease of 9 per cent. The December results are understood to have been still more unfavorable, but the current month shows better results both in gross and net earnings.

Tallulah Falls.—W. S. Irwin, General Manager, and J. R. Adams were on January 7 appointed temporary receivers of the Tallulah Falls Railway, on application of H. H. Dean, of Gainesville, Ga., in a bill alleging that there are current floating debts amounting to over $10,000. The road runs from Cornelia, Ga., on the Southern Railway, north to Franklin, N. C., 57 miles.

Third Avenue Railroad.—See New York City Railway.

Toledo & Indiana (Electric). This company has postponed payment of the semi-annual interest due January 1 on its $1,650,000 first mortgage 5 per cent. bonds. Many of the bonds are held by the directors of the company and it is therefore believed that a receivership will be avoided.

Toledo, Walhonding Valley & Ohio.—See Pennsylvania Company.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK

BRANCH OFFICES AT 375 OLD COLONY BUILDING CHICAGO, AND QUEEN ANNE'S CHAMBERS WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. *We give in our editorial columns* OUR OWN *opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.*

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS:

W. H. BOARDMAN, *Prest. and Editor.*
E. A. SIMMONS, *Vice-President.*
RAY MORRIS, *Secretary*
R. S. CHISOLM, *Treas.*
I. B. RINES, *Cashier*
L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Managing Editor.*
BRAMAN B. ADAMS
CHARLES H. FRY
FRANK W. KRAEGER
GEORGE L. FOWLER
HUGH RANKIN
BRADFORD BOARDMAN

CONTENTS

VOL. XLIV., No. 3. FRIDAY, JANUARY 17, 1908.

The most striking feature in the railroad situation of the country, viewed on its financial side, is its reversion, during the last few weeks of stress in the money market, from abnormal to normal symptoms with the inexorable laws of political economy now asserting themselves. Men were wondering a few months ago at steadily falling prices of railroad securities in the face of a great volume of business and increased railroad earnings, both gross and net, coupled with a general condition of prosperity throughout the country, and actual failures few and insignificant. Corporation "baiting" but partly explained the anomaly. It was an element, but an insufficient cause. But a brief period of semi-panic has brought us back to the natural and logical sequels of such a period. Prosperity has somewhat receded. Railroad earnings have dropped in gross, and roads not returning a positive decrease have failed to maintain a normal gain; and net earnings, owing to rise of operating expense, have decidedly fallen. The two things that differentiate the situation from earlier epochs of sudden depression are, first, its impact at a time of high expense and large loans for improvements, and, secondly, its recovering just after a general increase of railroad wages. The problems ahead are: how can improvements be held up or curtailed? how can imperative improvements be financed? and how can fixed charges and dividend requirements be met without the risk of labor troubles by reducing wages at a time when labor is highly organized and assertive. But the gloom is far from encircling, and rational optimism has also its kindly lights. It can point to financial conditions at the New York center oscillating upward where they were lately downward; to the few defaults in interest and dividends and only a small proportion of those defaults in railroads; to the fact that past prosperity has also made operating economy more feasible in such matters, for example, as more concentrated train service; to the facts that, even if later the question of reduced wages must be faced, it will be after labor has had its warnings and may be amenable to a situation, if not to reason, while the halting of improvements is far easier when the traffic that calls for them is ebbing than when traffic is "balled up" for lack of rolling stock or a second track. Finally, in the list of benign forecasts, is the chastened spirit to be observed at one end of Pennsylvania avenue.

A letter from a subscriber who is a car foreman on one of the large roads says the majority of passenger car repair shops are not up to the times for handling work. This was after a trip, taken something more than a year ago, in which the shops of a number of roads and manufacturing concerns were visited. No one will be inclined to dispute this assertion with regard to any but the newer shops, which doubtless constitute the minority that by inference our correspondent considers up-to-date. In this connection a glance at the latest practice, which is probably best exemplified in the Union Pacific car department at Omaha, now being rebuilt, will be of interest. Its arrangement and equipment were planned to minimize waste of time and labor, and to establish a system of routing work to avoid unnecessary handling and have a continuous forward movement. The department will have the sub-store feature to facilitate delivery of material. The coach shop has a 60-ton overhead traveling crane for removing and replacing trucks beneath cars. The wheel and truck shop has overhead traveling cranes for handling trucks and heavy material. There are electric trolleys and electric derrick cars for moving wheels and axles to and from the storage platforms and in the shops. A 10-ton electric crane spanning three tracks will be used for unloading wreckage and handling heavy material. The transfer table has the unusual length of 90 ft., which is 15 ft. greater than present general practice. The shop equipment will include the latest machinery to effect all possible saving in the cost of producing finished material and turning out work. As compared with the locomotive department, the car department problem is a simple one. Paramount considerations are: rapid and efficient distribution of material, and a continuous forward movement of the work. Yard cranes, telphers and overhead shop cranes are effective agents in the accomplishment of these objects, and have been employed in the Union Pacific plant more fully than in any previous instance. This does not, however, imply the neglect of industrial tracks for the movement of material. With these features well worked out, and suitable planing mill, forge shop and storage facilities, the rest is largely a matter of organization and methods.

The Great Central and the Great Northern are two English railroads which serve almost exactly the same territory and for the past 14 years have been strong competitors. They are now to be united under a working agreement which, according to the English custom of great publicity in such matters, is to be submitted to the shareholders of each company and after being there approved, to the Railway and Canal Commission. This consolidation—for apparently it amounts to nothing less—is brought about by the simple device of appointing the boards of directors of the two companies as a joint committee to manage the two properties. A working arrangement has been in force since the beginning of 1905 between the London & North Western and the Lancashire & Yorkshire which has resulted in greater efficiency and economy of operation to the railroads and better service to the public. Judging from similarity of their territories, a like arrangement between the Great Central and the Great Northern should also be effective in producing these same results. Both roads run from London north to York, each with a network of branch lines reaching very much the same points, including Sheffield Manchester, Liverpool, Leeds, Lincoln and the port of Grimsby on the east coast. There are in fact only four important towns on each system which the other does not reach either directly or by trackage rights. The Great Central has 1,072 miles of line and the Great Northern 1,257. The Great Central has gross earnings of \$10,700,000 and net earnings of \$3,600,000, against gross earnings of \$11,800,000 and net earnings of \$5,000,000 for the Great Northern. The history of the two companies is strikingly different. The Great Central was built about 1846 and was originally an east and west line running from Liverpool on the west coast across the country to Grimsby. The Great Northern was built from London north to Doncaster, which is on this cross-country line of the Great Central, in 1850. As long as the two lines were thus distinctive in their functions—one an east and west, the other a north and south railroad—they were close allies, but in 1891 the Great Central, under its then name of the Manchester, Sheffield & Lincolnshire, began to promote an extension to London, which was opened for passenger traffic in 1899. As a result of this move in 1893 the close alliance between the two companies was broken and the Great Central and the Great Northern became sharp competitors. The Great Central, however, under its old charter granted in 1858 when it was an east and west line only, was specifically authorized to unite with the Great Northern. Meanwhile the recent competition of the two roads resulted in duplication of facilities, particularly freight facilities, in a number of important towns. Recently, however, the Great Central has built a short line connecting with the Great Northern at a point not far north of London over which through trains are now being run between the southwest and the northeast of England. This evidence of co-operation has been followed by the announcement of the proposed consolidation of the two companies.

Statistics of the freight carried on the German railroads give striking evidence of the growth of productive industries in the Empire; a growth which has been surpassed probably only in this country. We discussed the growth of freight traffic in the United States in the *Railroad Gazette* of Sept. 27 last, when it appeared that the number of ton-miles increased from 173,221 millions in 1903 to 215,878 millions in 1906—24.6 per cent.—within three years. The German statistics give tons shipped and not ton-miles, which are sufficient as statistics of production, and in that country, where the average distance carried does not vary much from year to year, is sufficiently accurate as statistics of transportation. This increase in tons was from 315 millions in 1903 to 379 millions in 1906—64 millions, or 20 per cent., in the same three years. That this increase should be so near ours may seem surprising. It has not, however, been nearly so difficult for the railroads to handle as the growth here, for the reason that it has been much more regular. The increase here was less than 1 per cent. from 1903 to 1904; in Germany it was full 4 per cent. The next year freight traffic grew 7.4 per cent. here and 6 per cent. there; while from 1905 to 1906 we had to provide for an increase of 15.9 per cent.; the German railroads for one of 8.9 per cent. In the two years since 1904, the German railroads had an increase of 15.5 per cent., and ours an increase of 23.7 per cent., the growth here being greater in the later year than in Germany for the two years. Of course the absolute quantities carried are enormously greater in this country than in Germany, and if we go back to 1902, we find that the *increase* in four years in tons (not ton miles) shipped by rail in the United States (431 millions) exceeded the *total* carried in Germany in 1906 (379 millions). This little problem, to provide in four years for a new freight traffic greater than that of the whole German Empire, is what our railroad managers have had to worry over. Doubtless they would have solved it much more satisfactorily if the growth had been at a somewhat regular rate, instead of 1 per cent in one year and 16 per cent. in another The average haul being longer here, a given amount of production causes an amount of transportation larger in proportion than in Germany But compared with population, the number of tons shipped is astonishingly large here, where about 86 millions of people shipped 1,631 million tons of freight in 1906, which in Germany 60 millions shipped 379 million tons—19 tons per inhabitant here against 6.3 tons there. In both countries, the same ton is doubtless often counted twice A through shipment over several connecting railroads is now counted but once here as well as there; but there is a large amount of freight which is shipped to a distributing point, there held in store, and later re-shipped to the consumer. A vast amount of grain in this country is so marketed Iron ore shipped from the mines to the lakes, forwarded by lake, and then forwarded by rail to the blast furnace counts twice. Altogether it is probable that there is more of such traffic here than in Germany, and that we do not actually produce three times as much weight per individual as the Germans do. In both countries an enormous proportion of the whole tonnage is furnished by mines, furnaces and manufactures of metal—in Germany just about two-thirds of the whole tonnage

MATTHIAS NACE FORNEY

Mr Forney became attached to the *Railroad Gazette* during the first year of its existence as a serious newspaper He had been for some time in the service of the Hinckley Locomotive Works, of Boston, but was then endeavoring to introduce an invention of his own, the "Forney locomotive," which had its chief career many years later on the elevated railroads of New York The *Railroad Gazette* at the time was desperately in need of an editor with practical technical training, but, though the young man from the first made the impression of integrity, earnestness and highmindedness, no one guessed then that here was a man whose character outweighed the highest technical accomplishments His career had been a struggle upward from modest beginnings. From his father's tanyard, after some schooling, he had gone into a Baltimore machine shop as an apprentice. He took drawing lessons, attended debating societies, read and studied, became an expert draftsman, and through this door entered the engineering profession His tastes were as refined as if he had sprung from a long line of aristocrats. His senses were painfully acute, and his conscience was as acute as his senses

During the first year of his connection with the *Railroad Gazette* Mr. Forney continued his professional work as consulting engineer, and thereafter gave the whole of his time to the paper The great Chicago fire drove the *Railroad Gazette* to New York, which was the occasion of Mr. Forney's becoming one of its proprietors and directing its policy on the technical side for more than twelve years, until 1884, when he retired.

It is hard for railroad men of this day to appreciate what a task this was. There was then scarcely any literature on railroad mechanical engineering in America, and little other railroad literature. There were good engineers, and some of extraordinary ability, but few of them could write, and most of those who could write thought they couldn't; and moreover, there seemed to be a general feeling that a railroad man ought not to write for publication. The technical societies were unborn or in their swaddling clothes. Both the Master Mechanics' and the Master Car Builders' associations are younger than the *Railroad Gazette*. The technical editor to a very great extent was compelled to extract the results of experience and the opinions drawn therefrom by personal intercourse with the practical men; to obtain by pressure, as it were, the data which now comes in floods in the form of papers for technical societies and journals.

Mr. Forney will doubtless never get full credit for what he did to change this condition of things His influence on the two societies named was very great, and otherwise he did much to favor the method of collecting data of experience, complete so far as possible, as a basis for conclusions and a guide for practice.

To us who knew Mr Forney intimately, however, the character of the man overshadows all accomplishments and performances. He not only did justly, but he was willing to spend and be spent that justice might be done He loved mercy, and he labored that the weak and helpless should be mercifully dealt with. In the later years of his life he gave a great deal of work and was at considerable expense to secure better treatment of horses—creatures with which personally he had little more to do than with elephants. Believing that material political progress is to be hoped for from minority representation, he published at his own expense a book on the subject, containing, with much else, the substance of other works then out of print. In many similar ways he demonstrated his public spirit, his humanity and his unselfishness No one could more truly say

"Write me as one who loves his fellow-men " S. W D.

Forney was a dreamer and saw visions, but his dreams and visions were not unreal except as to time. For practical purposes he was apt to look too far in the future. His highly successful invention of a tank locomotive was probably fully ten years in advance of the need for it, although he did not think so. Its chief value proved to be for suburban services, not then highly developed. He was among the early observers of the evil results of the foolish practice of high-checking horses and did much earnest work as a reformer, with the usual early disappointments. He sustained the same relation and like early disappointments in his advocacy of cumulative voting and minority representation. It was long years before he could get attention to his powerful and valid arguments, which resulted in the standardization of screw threads in this country, a reform whose beneficial results are incalculable. He was among the early engineers who recognized not only the value, but the absolute necessity of standardization in locomotive and car work. This was his central idea in joining in the reorganization of the Master Car Builders' Association on a basis which secured for it official recognition and caused the adopted standards to be generally accepted by the railroads in this country. His professional work is outlined in his own biographical notes, but little reference is made to his other activities, which were many. For example, his too long foresight is illustrated by his study, many years ago, of the real estate possibilities in a portion of the city of New York. To some extent he profited by this study in an important real estate investment. His undertaking to produce a commercially successful balanced engine occupied intervals of time through many years, but latterly his drawings and studies for a solution of the problem seemed to be a form of recreation. Nevertheless, he was always hopeful.

No one of Forney's friends will ever recall his personality without a quick thought of his peculiar sense of humor and his use of it. He was never a funny man and he abhorred such men. He had what might be defined a useful sense of humor and in the use of ridicule as an argument he was highly successful without being disagreeable. Whenever he spoke—and he spoke often at conventions of railroad associations and railroad clubs—he was always expected to be amusing as well as instructive, and he seemed never to disappoint either of these expectations, although it was plain that he was in thorough control of his power to amuse and he was using it for a specific purpose. In the use of ridicule for the purpose of argument in the discussion of mechanical problems he was masterful. For example, two locomotives designed by Eugene Fontaine were built at Paterson, N. J., and put at work. Before building these locomotives Mr. Fontaine naturally consulted Forney, then the highest authority, who gave him an adverse report on his design for superimposing the two forward driving wheels over the two rear driving wheels, so as to have a friction drive and be capable of adjustment for a high rate of speed with a slow piston motion and dispense with side rods. The machines were unsuccessful, but before this was discovered in practice Forney ended the discussion which the invention involved by an absurd drawing of a man driving a bicycle under somewhat like circumstances.

During the period 1870 to 1885 it was often said of Forney that he had a wider acquaintance and more friendships among railroad officers than anyone else, and this was perhaps true if we assume that friendship means respect. He was a man of many fads, none of them objectionable. He was well known for his condemnation of smoking. He maintained over his office desk a modestly printed card reading as follows: "Is smoking offensive? Yes, always," and yet frequently in his own office he would insist on a friend smoking when he noticed that the temporary abstinence was producing unrest.

Forney remained a bachelor until he was 72 years old and then married a friend of his youth, a lovable and helpful companion, and it is unquestionably true that his last year in this world was his happiest year. W. H. B.

THE RECESSION OF A GOVERNOR.

Some six months ago, near the close of its long session, the Massachusetts legislature passed a bill, necessarily general in terms, but aimed actually at the New Haven-Boston & Maine merger. It was a veritable curio in railroad law-making, all the more grotesque as emanating from a commonwealth in which mind is inferred by tradition and habitude to dominate matter. It prohibited any railroad corporation of that state from acquiring or attempting to acquire, any shares of a Massachusetts railroad corporation; gave enlarged powers to the State Railroad Commission; and, until July of 1908, set the veto of the state on the voting power of stock held by a railroad company in another railroad company. The measure even went further and into the limbo of corporate psychology by prohibiting "any control, direction, supervision or influence whatsoever," directly or indirectly, by one railroad corporation over the other in which it had an interest. Apparently President Mellen was denied even telepathic communication with President Tuttle, and all train currents from the New Haven directorate flowing toward Boston & Maine territory were dammed up at the Massachusetts border. And this state embargo on influences concrete and mental was enforced by mighty penalties rising to $10,000 and a year's imprisonment for each offense.

All this was "before election" in Massachusetts. Politics were hot, personal ambitions vaulting high, candidates timid on the subject of popular sentiment, and Governor Guild, who signed the drastic measure afore-cited, himself seeking another term since obtained. It is "after election" now. There has been financial panic, contraction, industrial retreat. President Mellen has reduced train and trolley service, the looms of Massachusetts are humming much less than they did, and the verities of an industrial "drag," longer or shorter, rest upon the Bay state as upon other commonwealths of the land. In this sharp light of the luminous after event it is interesting to read the text of Governor Guild's message just sent in to the Massachusetts law-makers.

The Governor, last spring assertive, now becomes suggestive and interrogative. The public service corporations must still be made aware that the dignity and inviolability of Massachusetts statutes will be maintained. But "legislation that is merely destructive should be avoided. No policy which has not been thoroughly and carefully followed to its conclusion should be adopted. The burden of proof in any proposed change of management emphatically is on those seeking the change. He who asserts must prove. * * * Detailed and exact knowledge of actual existing conditions should precede any action in any case in question." Right here, by the way, one might criticize the Governor's own "exact knowledge" when later in his message he refers to one of the three steam railroad systems of Massachusetts as "dominated by an express company with headquarters in New York." Were not the American Express Company's holdings, direct and indirect, of about one-tenth of the outstanding Boston & Maine shares transferred some seven months ago to the New Haven by exchange of stock? The former one-tenth interest in the Boston & Maine has become an interest of about one-thirty-third in New Haven control now, and without a single New Haven director to represent it. Does it still "dominate" the Boston & Maine.

Mildly and in an interrogative form the Governor treats matters which a few months ago were expressed by the foes of the merger in Massachusetts as radical dogmatisms. He criticizes steam railroad service in the state and still favors the severance of railroads from the trolleys and from express corporations. But he holds it wise and beneficent that the railroad corporations should control steamship lines, this idea obviously carrying with it the wisdom of control of the Sound boat lines—a subject which has been "under investigation" at Washington and raised against the New Haven by some of its foes in Massachusetts. But it is upon the more relevant and imperative question, "Should one steam railroad be allowed to control another?" that the Governor's recession becomes most evident. He believes that "on certain terms permission for some union of interests not in violation of any national statute should be granted." This under larger powers of the railroad commission, with community of interest between the combined systems, under Massachusetts charters, with headquarters at Boston and the controlling system owning no Atlantic terminal for eastbound freight outside of New England. These conditions hit the New York Central. They obviously do not hit hard the New Haven-Boston & Maine merger proposition which has been the focal point of the recent acrimonious controversy.

After the bitter asperities of the Massachusetts anti-merger conflict, the recession of the Governor is suggestive even though one allows for the elimination of pre-election politics. In that state, as elsewhere, the pocket nerve of communities has begun to quiver and not without pain. Depressed industry and trade have struck home and, as usual in manufacturing regions, struck home quickly. The large ratio of the railroad in the sum total of commercial welfare and touching that welfare not merely as a carrier and as an employer of labor, but through the fiscal weal of thousands of shareholders, becomes more luminous in the gloom of industrial depression. Corporation backing recedes when the public finds that it is baited too. Governor Guild is but one of many advance agents to proclaim these economic truisms, nor does judgment go far astray when it infers that the Massachusetts legislature will be but one of a good many lawmaking bodies to follow his example.

Atlantic Coast Line.

The Atlantic Coast Line-Louisville & Nashville system is the largest, richest and most important of the three large railroad systems in the South. The Atlantic Coast Line itself without the Louisville & Nashville is stronger than either the Seaboard Air Line or the Southern Railway. As its name implies, its territory is the strip of country south of Chesapeake bay nearest the Atlantic coast. This coast strip, as the map shows, it occupies very completely. Generally speaking, the Seaboard Air Line occupies the north and south strip next inland, and the Southern Railway the territory further inland still.

The Richmond & Petersburg, a 25-mile road chartered by act of the legislature of Virginia in 1836 and opened for traffic between Richmond and Petersburg on September 17, 1838, was the beginning and nucleus of the Atlantic Coast Line. Various other railroads reaching southward along the coast as far as Charleston, S. C., and inland from the coast, were bought by the owners of the Richmond & Petersburg and were operated together as "The Atlantic Coast Line of Railways to the South." Control of these allied roads was transferred in 1889 to the Atlantic Coast Line Company which was organized in that year under the laws of Connecticut. In 1900, by amendment of the original Virginia legislative act, the name of the Richmond & Petersburg was changed to the Atlantic Coast Line Railroad. With this were merged a few months later the other railroads controlled by the Atlantic Coast Line Company. The fact that the Atlantic Coast Line Railroad is the successor of the Richmond & Petersburg explains the fact that its report for the year ended June 30, 1907, is the "seventy-third annual report."

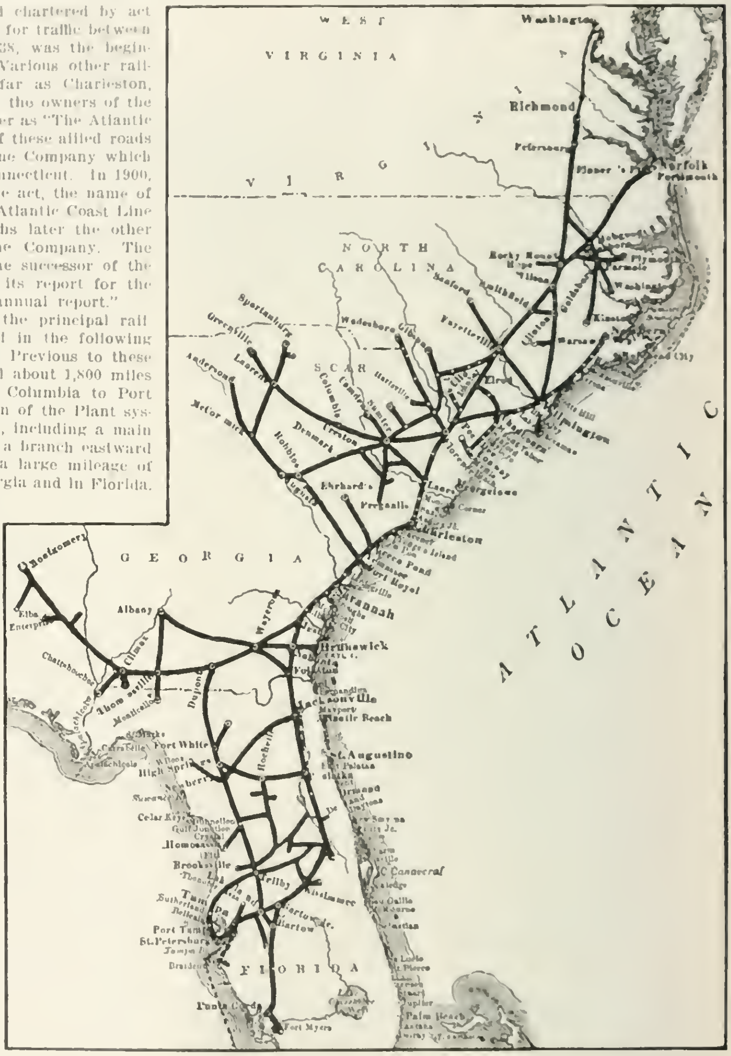
In 1901 the Savannah, Florida & Western, the principal railroad of the Plant system, was taken over, and in the following year the rest of the Plant system of railroads. Previous to these acquisitions the Atlantic Coast Line had operated about 1,800 miles of line, all, with the exception of a line from Columbia to Port Royal, north of Charleston, S. C. The acquisition of the Plant system added about 2,200 miles south of Charleston, including a main line through Savannah, Ga., to Jacksonville, Fla., a branch eastward from this main line to Montgomery, Ala., and a large mileage of branches and connecting lines in southeastern Georgia and in Florida. These additions brought up the Atlantic Coast Line mileage to over 4,000 miles.

In October, 1902, as a result of the sale by the Louisville & Nashville of new stock previous to its issue and listing on the New York Stock Exchange and the Gates corner which followed, it was arranged that the Atlantic Coast Line should buy a majority of the stock of the Louisville & Nashville. Control of this road has since been held, but the two companies are operated separately. Ownership of the Louisville & Nashville, which lies to the westward of both the Seaboard Air Line and the Southern, has been valuable among other reasons because the Atlantic Coast Line has received from it, either directly or through controlled roads, considerable high grade and other traffic.

With the taking over of the Plant system and the Louisville & Nashville purchase, the power and importance of the Atlantic Coast Line Company were greatly increased, so that now, according to the annual report of the Interstate Commerce Commission issued last week, this holding company, with a capitalization which probably represents not more than $5,000,000 of actual investment, is in virtual control of a railroad system more than 11,000 miles long.

For many years the Atlantic Coast Line was the aristocrat of the southern railroads. It had money to spend and it bought the best. As recently as 1906 its stock sold as high as 167. But it could not escape the consequences of the various adverse factors which have developed in the South during the last two years. Along with its poorer neighbors, it suffered severely. Net earnings for the last fiscal year were the smallest earned in any year since the Plant system was taken over. The net earnings in 1903 were $7,800,000, while last year's net amounted to only $7,200,000; all this while gross earnings were increasing, so that from $19,700,000 in 1903 they rose to $26,800,000 last year. In four years, therefore, there was an increase of 36 per cent. in gross earnings and a decrease of 8 per cent. in net earnings. Even with its better equipment, larger yards and terminals and greater *esprit de corps*, the Atlantic Coast Line was not able to handle the sudden rush of traffic in the South. In a speech on March 7, 1907, at the annual banquet of the Wilmington Chamber of Commerce, President Emerson showed that for the 19 months from June, 1905, to February, 1907, "prosperity" brought in nearly $4,000,000 additional revenue but the same "prosperity" took away in the way of increased wages, increased cost of material, etc., nearly $5,000,000, so that for this period the Atlantic Coast Line's share in the prosperity of the South was represented by about $900,000 less than nothing.

Meanwhile the public was demanding increased facilities, more and better equipment, improved stations and more of them, and faster freight movement. Mr. Emerson showed that in order to meet these demands the Atlantic Coast Line during the 5½ years



Atlantic Coast Line.

preceding March 1, 1907, had bought new equipment costing $15,800,000, and had spent for yards, terminals, new stations, heavier rail, signal towers and interlocking plants, double tracking, etc., $6,200,000, which latter amount did not include $2,000,000 more authorized but not then spent owing to scarcity of material and efficient labor. On July 1, 1902, the road owned 13,157 freight cars. On January 1, 1908, if delivery of new cars ordered was made promptly, it owned about 26,000 freight cars, or nearly 100 per cent. increase in 5½ years. These large expenditures, too, were made at a time when prices were high. For instance, box cars which in 1904 would have cost from $500 to $550, in 1907 cost $900 to $1,000.

Early in the year these expenditures for new improvements came to a sudden stop. In February the Atlantic Coast Line sold $5,000,000 5 per cent. 3-year gold notes at 95½ net, but since then it has been able to get no new funds. Its working capital, in fact, fell so low that the semi-annual dividend of 3 per cent., declared in December, was made payable in 4 per cent. certificates of indebtedness instead of in cash. On Wednesday the closing market price for Atlantic Coast Line stock was 72.

President Emerson speaks as follows in regard to the rate reductions of the year. His brief comment should be pondered by every citizen who favors reductions of railroad rates by act of legislature without investigation:

"Since our last report the following named states, either through their legislatures or corporation commissions, have taken such action as will greatly reduce your passenger rates:

Virginia.

By corporation commission: Reducing passenger rates from 3 cents a mile to 2 cents a mile, effective Oct. 1, 1907.

North Carolina.

By act of legislature: Reducing passenger rates from 3¼ cents a mile for first-class, and 2¾ cents a mile for second class, to 2¼ cents a mile for both classes; effective Aug. 8, 1907.

Georgia.

By railroad commission: Reducing passenger rates from 3 cents a mile to 2½ cents a mile, effective Sept. 1, 1907.

Alabama.

By act of legislature: Reducing passenger rates from 3 cents a mile to 2½ cents a mile, and also a material reduction in freight rates, effective Oct. 1, 1907.

"We are now operating these reduced rates, although we believe them to be confiscatory, and their legality is being tested in the courts; in the meantime the company is suffering irreparable loss pending final decision."

Gross earnings for the year increased $1,900,000, or 8 per cent. over 1906. Freight earnings increased 6 per cent. and passenger earnings 12 per cent. Operating expenses were larger by $3,500,000, or 22 per cent. As a result there was a decrease of $1,600,000, or 18 per cent. in net earnings. Net income was $3,100,000, against $4,800,000 in 1906, a decrease of 40 per cent. The operating ratio was 73.2 per cent., against 64.7 per cent. in 1906. After payment of the regular dividends, there was a surplus for the year of $126,000, against $2,100,000 in 1906, a decrease of 94 per cent.

The income results of particular interest are in the operating expenses. Maintenance of way and structures (not including $249,000 charged in this account for additions and betterments) increased 18 per cent. and cost $842 per mile of line, against $719 in 1906. Large improvements were made to the roadbed. There were 352 miles of new 85-lb. rails and over 2,000,000 new cross ties laid in track. Nearly 14,000,000 board feet of lumber, not including piling, were used in new work and repairs. Work was begun in February on 22 miles of new second track in North Carolina. With completion of this, the road will have 86 miles of second track on its 4,347 miles operated. There were many general improvements, including new bridges, changes of line, new freight yards at South Rocky Mount, and Wilmington, N. C., and at Southover Junction, near Savannah, Ga.; new freight and shop yards and new shops at Waycross, Ga., and coal storage plants of 40,000 tons capacity, at South Rocky Mount and at Waycross. All these were to have been finished by the beginning of 1908.

Maintenance of equipment (not including $9,000 charged for additions and betterments) increased 28 per cent. Repairs and renewals of locomotives cost $2,108, against $1,948 in 1906. The 1907 figure included $94,000 charged to replace missing numbers. Repairs and renewals of passenger cars cost $838 per passenger car, against $754 in 1906. The 1907 figure included $41,000 charged to replace missing numbers. Repairs and renewals of freight cars cost $78 per car, against $73 in 1906. This item for 1907 included $258,000 charged to replace missing numbers. New equipment costing over $5,000,000 was contracted for on equipment trusts for delivery between March and November, 1907. The apportioning between capital and operating accounts of the expenditures for new equipment, are given clearly and fully, an example which ought to be followed by all railroads.

Conducting transportation, the cost of getting and moving the traffic, increased from $9,000,000 to $11,000,000, a rise of 23 per cent. Part of this was due to the greater traffic, for there was an increase of 11 per cent. in revenue ton-miles and of 12 per cent. in revenue passenger-miles. Engine miles (coal burning)—perhaps the most accurate test of the amount of work done—increased 16 per cent. Mr. Emerson analyzes certain increases in expenses aggregating $2,700,000, or 78 per cent. of the total rise in operating expenses. Most, though not all, of these fall under the head of conducting transportation. The analysis of these increases follows:

	Increase.
Changes in method of accounting	$44,089
Replacement charges, equipment and structures	124,871
Materials and supplies	615,561
Overtime	84,189
Paid foreign roads for car repairs	69,957
Fuel, increased consumption	248,985
Car mileage balance	266,899
Loss and damage	221,371
Roadway pay roll	245,461
Shop force pay roll	272,389
Other additional forces	76,702
Pay roll of train crews	163,877
Other pay rolls	296,888
Total	$2,731,239

With this may be compared another table published in the annual report for 1906 analyzing certain increases in expenses for the last six months of that fiscal year, which amounted to $1,845,876, or 70 per cent. of the increases in operating expenses for the whole fiscal year ended June 30, 1906. This table follows:

	Increase.
Additions and betterments	$227,975
Real estate purchased	6,553
Changes in method of accounting	26,375
Additions to force	454,435
Wages	41,700
Various small items	42,276
Replacement charges, equipment and structures	225,918
Material and supplies	158,029
Overtime	65,503
Paid foreign roads for car repairs	44,044
Fuel, increased cost per ton	85,602
Fuel, increased consumption	160,976
Car mileage balance	144,287
Loss and damage	139,814
Rentals	2,589
Totals	$1,845,876

These statements suggest the difficulties with which the management has had to contend in the last two years.

No classification of tonnage by commodities is given in the report. The Atlantic Coast Line's traffic is quite different from that of any other road. Probably the two most important items are fruit and vegetables, and lumber—two widely different classes of traffic. The perishable fast freight traffic of the road is large and varied. From its southern lines it carries Florida oranges, lemons and grapefruit to the northern markets; Georgia sends peaches; South Carolina and North Carolina, small fruits and vegetables. The Atlantic Coast Line has been known to haul in one day off its main line between Florence, S. C., and Weldon, N. C., 210 miles, as many as 700 cars of strawberries. Last year there was a shortage of the strawberry and vegetable crops which resulted in a decrease of $239,000 in gross earnings from these sources, but other traffic more than made up for this loss. The extent of the refrigerator traffic is reflected in the trainload, which is 179 tons. The next two most important items of traffic are probably naval stores and phosphate. The road has an agricultural and immigration department through whose efforts 578 heads of families, in addition to a large number of settlers placed by other agencies, last year located on the lines to engage in agriculture. There were 127 new industries started.

Since November the traffic of the road has shown a great falling off. The lumber industry was one of the first to be hard hit by the panic owing to the general suspension of building and construction operations. There has also been a large decrease in general traffic. These are the most unfavorable features of the present situation. On the other hand, public opinion is changing. The people of the South are beginning to realize that railroad officers were sincere when they prophesied that the legislative attacks on the railroads would hurt the people of the South. The receivership of the Seaboard Air Line has had some effect in bringing about this change, but even before that happened, the effects of the industrial depression were being sharply felt in the South and it was obvious that the attacks on the railroads had been one of its principal causes. The future of the Atlantic Coast Line rests largely with the people of its territory. The officers of the road are doing their best, as they have been, to be fair in their treatment of the public. They ask in return justice; no special favors, but an understanding by the public of the facts and difficulties of railroad operation, and the passage of laws based in fairness on these facts. The most encouraging sign of the present railroad situation in the South, amid all its discouraging features, is the tendency toward a fair and reasonable co-operation between the railroads and the public.

The following table, rearranged according to our usual method, shows the income results of the Atlantic Coast Line Railroad for the past two years ended June 30:

	1907.	1906.
Mileage worked	4,347	4,327
Passenger earnings	$6,083,991	$5,4[illegible]6,174
Freight earnings	18,113,695	17,374,526
Gross earnings	26,771,529	24,868,448
Maint. way and structures	3,660,312	3,112,368
Maint. of equipment	3,936,686	3,071,036
Conducting transportation	11,088,157	8,904,691
Operating expenses	19,328,625	15,746,097
Net earnings	7,442,904	9,122,351
Net income	3,370,708	5,153,175
Dividends	2,992,086	2,718,830
Improvement appropriations	258,753	[illegible]36,233
Year's surplus	125,869	2,098,312

NEW PUBLICATIONS.

How to Burn Illinois Coal Without Smoke.—Bulletin No. 15 of the Engineering Experiment Station of the University of Illinois, on the above subject, by L. P. Breckenridge, Director of the Station, has been issued. A few pages are devoted to the principles of combustion and the losses due to smoking chimneys, but the larger part of the bulletin relates to the constructive features of those boiler settings and furnaces that have been found practically smokeless in operation at the power plant and in the experiment station at the University of Illinois. The leading dimensions of the settings and furnaces are given, and sectioned cuts show the general character of the settings. With each cut is given a statement as to the range of capacity of each setting for smokeless operation. Especial emphasis is given to the importance of knowing the rate at which the coal is to be burned on each square foot of grate surface, together with the percentage of volatile combustible which the coal contains, and for which a suitable combustion space or chamber must be provided. Some interesting illustrations show clearly the significance of the numbers used in describing smoke densities, and there is also a chart devised for making graphic records of smoke observations. Five tables of tests are given showing the conditions of operation of a smokeless furnace under changes of boiler capacity varying from 50 to 150 per cent. There are no illustrations showing approved settings for the horizontal fire-tube boiler, but suggestions are given as to methods of hand firing which will tend to reduce smoke production.

While this bulletin discusses the smokeless burning of Illinois coals, the principles and methods explained apply equally well to the burning of all kinds of soft coal. Copies of this bulletin may be had free by writing to the Director, Engineering Experiment Station, Urbana, Ill.

Tests of Reinforced Concrete Beams.—Bulletin No. 14, Tests of Reinforced Concrete Beams, Series of 1906, has been issued by the University of Illinois Engineering Experiment Station. The tests described are a continuation of the tests discussed in Bulletin No. 4. The topics investigated include the effect of quality of concrete upon the strength of beams, the effect of repetitive loading upon the action of beams, and the resistance of beams to diagonal tension failures. The results of the investigation of diagonal tension failures throw light upon the amount of the vertical shearing stress which may be allowed in reinforced concrete beams not having metallic web reinforcement. The resistance of beams to diagonal tension may be the controlling feature of relatively short beams, and as such failures occur suddenly and without much warning, a knowledge of the resistance of the concrete is essential. Some beams gave surprisingly low values and it seems evident that the values allowed by many city building ordinances are higher than should be recommended. The tests of plain and reinforced concrete columns and of reinforced concrete T-beams for 1906 have already been published.

Manual of Recommended Practice of Railway Engineering and Maintenance of Way. 1907 edition. Published by the American Railway Engineering and Maintenance of Way Association, Chicago. Cloth, 291 pages; 6 in. x 9 in. Price, $3.

The first edition of the Manual was published in 1905 and covered the work of the first six conventions of the Association. Last year a supplement was published containing the amendments and addenda to the Manual adopted by the Association at its 1906 convention. This bore the title, "Supplement of 1906, Addenda to Edition of 1905," and was contained in Bulletin 79 of the Association. The present edition contains all matter in its final and duly authorized form as adopted by all conventions to 1907 inclusive. The volume has almost twice the number of pages of the first edition. The style of printing and the arrangement is similar to that of the annual Proceedings, the marginal topic headings being a great help to quick finding of any point sought. The Manual of this Association has been in demand by railroads in all parts of the world, and its value and usefulness increase each year.

CONTRIBUTIONS

The Service of the Railroads.

Albany, N. Y., Jan. 9, 1908.

TO THE EDITOR OF THE RAILROAD GAZETTE:

In the *North American Review* of November, 1907, Logan G. McPherson brings out some interesting comparisons under the heading, "The Farmer, the Manufacturer and the Railroad." Mr. McPherson's figures are taken from the reports of the Interstate Commerce Commission, the United States census and the Year Book of the Department of Agriculture, and show

	1905.	1900.
Gross returns per $1,000 of capital:		
Manufacturers	$1,216	$1,321
Railroads	150	128
Agriculture	191	187
Net returns per each $1,000 of capital		
Manufacturers	151	191
Railroads	44	41
Agriculture	98	92
Average salary—wage per worker:		
Manufacturers	539	477
Railroads	607	567
Total salary—wage per each $1,000 of expenditure		
Manufacturers	245	245
Railroads	572	568
Total salary—wage per each $1,000 net returns		
Manufacturers	1,730	1,430
Railroads	1,362	1,223

These figures bring out clearly the following points:

1. That the gross returns or receipts per dollar of investment in the railroads of the United States are less than the receipts either from manufacturing or from money invested in agriculture.

2. That the interest, reward or profit on each dollar invested in the railroads is 4.4 per cent., while that of the money invested in agriculture is 9.8 per cent., and in manufacturing 15.1 per cent.

3. That the average salary paid by the railroads of the country is 12.6 per cent. greater than the average paid by the manufactures and, if the figures were known, is wonderfully greater than the average pay of those engaged in agriculture.

Mr. McPherson also states: "The outcry has been taken up by politicians—who do not ship freight or pay freight bills—and their utterances have impressed the great body of the people who likewise do not to any appreciable extent ship freight or directly pay freight bills. These people have been ignorant of the fact that the freight charges have been in constantly decreasing ratio to the cost of production and the cost of marketing the great commodities of daily need. The freight charge is so low that it is seldom a factor in the retail prices of these commodities. That is, the retail prices of the commodities of daily use, with but few exceptions, are determined without reference to the rate of freight; they would be neither higher nor lower if the commodities were transported by the railroads gratis."

That the American railroad has done this much and even more for the United States is in a measure brought out by the following statements.

The developing of the manufacturer and of the agriculture of the country can be said almost to depend upon its transportation—its railroad building, which has pushed forward to such a point that in 1905 there was one mile of railroad for each 381 people.

Year.	Population U. S. census.	Miles of railroad.	Population to each mile of railroad
1820	9,633,822	.	9,633,822
1830	12,866,822	23	559,392
1840	17,069,453	2,818	6,057
1850	23,191,876	9,021	2,571
1860	31,443,321	30,626	1,026
1870	38,558,371	52,922	728
1880	50,155,783	93,262	537
1890	62,622,250	166,703	375
1900	76,303,387	194,262	392
1905	83,143,000	218,101	381

Thoroughly to appreciate what this enormous growth of railroad mileage means, it should be compared with the railroad mileage in some of the principal countries of the world.

Country	Miles of railroad.	People to each mile of railroad	Square miles to one mile of railroad
France	24,500	1,590	8.46
Brazil	12,370	1,558	260.16
Austria Hungary	26,901	1,789	9.76
Belgium	4,337	1,631	2.62
China	3,500	119,714	1,443.00
German Empire	33,423	1,813	6.25
Italy	9,943	3,286	11.12
Japan	4,496	9,844	36.17
Russian Empire	38,045	3,548	220.24
Spain	8,206	2,267	23.90
United Kingdom	22,847	1,821	5.29
United States	218,101	381	13.61

Regardless of the fact that these statements show that there is almost five times as much railroad mileage per capita, or, in other words, only one-fifth the number of people to support each mile of railroad—the charges for transportation of freight in this country are lower than in any country probably in the world.

That the charge for passenger transportation is wonderfully low, considering the fact that there is only one-fifth the population per mile, is shown by the following figures obtained from the Department of Commerce and Labor, Bureau of Statistics, and from the British Statistical Abstract of Foreign Countries, published by the Board of Trade, London; from the Interstate Commerce Commission and the London *Statist*:

FREIGHT

Country	Year	Rate per ton per mile in Cents
United States	1905	0.766
Germany	1904	1.552
France	1904	1.428
Austria	1904	1.503
Russia, European	1903	1.018
Russia, Asiatic	1903	1.157
England (United Kingdom)	1903	2.160

PASSENGER

Country	Year	Rate per passenger per mile in cents
United States	1905	1.962
Germany	1904	0.992
France	1904	1.133
Russia, European	1903	0.722
Russia, Asiatic	1903	0.458

But it is said that the American railroad is overcapitalized, regardless of the fact that the income earned on a dollar invested in American railroads is less than that of a dollar invested in almost any other line; that the average wage paid by the railroad is greater than that paid in almost any other form of business; that their charge for freight transportation is less than in any other nation in the world; and that their passenger charge, when considering the character of the equipment, the speed of the trains, the excellence of the service and the limited number of people to be transported compared with those of other countries, is wonderfully low. The ground is not well taken, as clearly shown by the following figures which are copied from a report on the transportation routes and systems of the world, issued by the Bureau of Statistics of the Department of Commerce and Labor.

Country.	Year.	Capital or cost per mile of railroad.
United States	1904	$55,261
Canada	1904	60,504
Uruguay	1899	52,758
Venezuela	1904	70,972
Germany	1903	98,443
Austria	1903	128,334
Hungary	1903	74,056
Belgium (State railroads only)	1903	160,893
France	1902	137,691
Switzerland	1903	104,969
United Kingdom	1904	272,737
Russia	1902	78,553
Finland	1902	32,189
Norway	1904	38,371
Sweden (State railroads)	1904	14,669
Sweden (private railroads)	1902	22,006
Italy	1902	108,212

As a matter of fact, the capitalization of the American railroad is vastly less than the actual value of the properties to-day. It is very much to be doubted whether one railroad in 20 could be replaced for its existing capitalization. The roads have forged ahead so rapidly that seldom, if ever, could their bonds be sold for par; in some cases they were sold at a discount as great as 40 per cent., and in many cases, in addition to a discount on the bonds, stock bonuses had to be given. This was necessary in order that the country could have this vast railroad growth and that the country could be built up to its present greatness.

Each year vast sums out of earnings are put into bettering the properties, in the form of heavier bridges and rail, better stations and grade and line changes; and these sums have not been capitalized and are of such magnitude that they would equal dividends of from 2 to 3 per cent. yearly on the entire stock capitalization. Again, the land and property increment in value is not capitalized and it is increasing at a rate of 4 or 5 per cent. a year, and in the case of railroad terminal property has reached vast proportions. An illustration: one of the important trunk lines paid a few hundred dollars for its terminal when entering the city of Chicago. Recently, under oath, a number of railroad presidents testified that the value of this property was from 12 to 15 million dollars.

As pointed out by Mr. McPherson, the people of the United States do not realize what has been done for the country by its railroads, or the present hostile conditions would not exist. Apparently every one of the 46 states in the United States is passing hostile railroad legislation. Some of it is confiscatory in its results. Much of it is unnecessary, ill-advised and harmful, and a little of it is proper and will have a healthful effect. All of it, however, has had the effect of undermining the credit of the railroads, and already one great line has gone into the hands of a receiver; and the monthly returns of the railroads unfortunate enough to be located in the states where legislation has been most drastic show that they are being sadly hampered; that their earnings are being depleted; that for lack of money, necessary railroad work is being stopped or slowed up all over the country; that they have had to borrow money on short-time notes at high rates of interest; and that the additional moneys which unreasonable legislation has deprived their making would have been put to very much better advantage were it used in the building of additional second-track, of block signaling and bettering the physical conditions of the properties.

Over 90 per cent. of the American railroad system is still single track, while in the United Kingdom there is only a little over 40 per cent. of single track. The further growth of the American manufacturer and of the agricultural interests of the country depends absolutely upon the prosperity of the American railroad.

That, in some few cases, there has been rebating and undue favoritism, is admitted, but the enforcement of the Elkins law absolutely stopped these practices. It is most unfortunate that through lack of exact information the American public should have any other than the kindest feeling toward its transportation properties; and as the people of this country have righted every wrong just as quickly as it is demonstrated, so will they correct the present situation when its vast importance and the injustice done is clearly brought to their attention. C. S. SIMS.

Second Vice-Pres. and Gen. Mgr. Delaware & Hudson Co.

Analogy of Conditions in 1884 and in 1907.

New York, Jan. 13, 1908.

TO THE EDITOR OF THE RAILROAD GAZETTE:

Your editorial entitled Five Panics (Dec. 27, 1907) says that the 1907 panic was more akin to that of 1884, in many important respects, than it was to any other of our serious commercial setbacks in this country, and because of this you conclude that the after-drag is going to be short and the recovery comparatively rapid. The Annual Review of the Foreign Commerce of the United States, recently published by the Department of Commerce and Labor, puts in evidence a rather striking confirmation of one phase of the resemblance between 1884 and 1907—the trade balance The following table (specie not included) illustrates this point:

	Excess			Excess	
	Of imports.	Of exports.		Of imports.	Of exports.
1837	$19,029,676	......	1884	......	$72,815,916
1857	54,604,582	......	1895	$18,735,728	......
1873	119,656,288	......	1907	.....	446,429,653

I realize that this showing was affected by local conditions in each of the above years, and that it is to a certain extent superficial. Nevertheless it certainly indicates an interesting tendency which bears out your analysis—and we should all like to believe that your prophecy of a short drag is correct. HISTORIAN.

The London Underground Troubles.

The Lot's Road, Chelsea, power house which is furnishing electrical energy to the district, several tube lines, and to a portion of the system of the London United Tramways, is supplying an average output of about 100,000,000 units per annum, which are sold at a price which while reasonable from the point of view of the different interests mentioned, is also yielding a satisfactory profit on the power house expenditure. In mentioning this fact in the annual report recently issued, the directors of the Underground Electric Railways Company of London show how far their different tube lines have been advanced structurally during the year, and they add some notes concerning the progress that each has been making from the traffic standpoint. The following references are made to the appointment of Mr. Stanley and to the troubles of financial and competitive kinds that the concern has been and is still passing through:

In April of this year the directors secured the services of Mr. Albert H. Stanley, who was up to that time general manager of the New Jersey Public Service Corporation. He is now the general manager of the Underground Electric Railways Company, as well as of the District and the three tube companies above mentioned, by which means co-ordination and uniformity of operation are secured. The very unsettled state of the money markets of the world has seriously hampered the development and operations of the company, and this unrest still continues. Stocks all over the world have depreciated in price, and those dependent on London traffic have, owing to severe competition and excessive reduction in fares, fallen lower than many securities of intrinsically less value. The competitors for London passenger traffic include the London County Council, on whose growing network of tramways passengers are carried at fares which it is believed are in many cases unremunerative, and the motor omnibus companies, who have come into the field since the incorporation of the company, but who can probably not operate profitably on the basis of their existing fares. It seems at last, however, to have been universally recognized that for a large number of companies to carry passengers at a loss is not sound business. The responsible heads of the principal London passenger traffic companies have, therefore, recently constituted a Traffic Conference under the chairmanship of the company's managing director, Sir George Gibb, for the purpose of discussing the best means by which injurious competition can be, as far as possible, avoided. The Board has been for some time considering (in conjunction with Messrs. Speyer) a plan for dealing with the £7,000,000 notes which will become due on June 1, 1908. It is hoped that within a short time, probably early in 1908, the plan will be published and submitted to the shareholders and noteholders for their approval. In the meantime, Messrs. Speyer offered to purchase at their face value the coupons on the notes due December 1, 1907.

Immigration in 1907.

The total number of cabin and steerage passengers landed at the port of New York during 1907 by all the transatlantic steamship lines was 1,287,617. In 1906, the number was 1,159,551; in 1905, 992,065. The largest number of passengers was carried on the ships of the North German Lloyd Line from Bremen and from Mediterranean ports. In 151 trips, 222,121 passengers were landed by the steamers of this line, and of these 17,051 were first cabin voyagers. The Hamburg-American Line, with 131 steamers arriving, brought 200,909 passengers, of which number 16,991 were first cabin. The White Star Line, from Liverpool, Southampton and the Mediterranean, landed 16,748 first cabin passengers, and the total number brought by this line was 115,859. The trips numbered 98

The Cunard steamers, from Liverpool and the Mediterranean, brought 147,766 passengers of all classes, and of these 12,086 were first cabin. Sailings to the number of 100 were made. The Red Star Line, from Antwerp, brought 81,642; the French Line from Havre, 83,882, and the Holland-American Line, from Rotterdam, brought 62,056 passengers of all classes. Composed of four lines and six services the International Mercantile Marine Company's ships made 196 trips from foreign ports, and brought a grand total of 237,906 passengers of all classes.

Autobiographical Notes by Matthias Nace Forney.

News of the death of Mr. Forney after a first attack of paralysis Jan. 14, came as an entire surprise to almost all his friends. We are glad to have the opportunity to print the following notes, which he gathered together in 1903.

If tradition and the record of the family Bible can be relied on, I was born in the old house on Chestnut street, in Hanover, York County, Pennsylvania, on March 28, 1835. My father, after whom I was named, died on March 25, 1837, leaving our good mother, Amanda Forney, to take care of three sons and three daughters.

The school education which was administered to us in Hanover in those early days was of a somewhat irregular kind, and depended upon the ministrations of teachers of a more or less itinerate habit. They were good, bad and indifferent—chiefly the latter—so that our book knowledge had to be assimilated from much indigestible food.

Very early in life mechanism and science interested me very much. It gave me great pleasure to decorate the top of our old woodshed with miniature windmills, to construct water-wheels which were driven by the stream from a spring near the house, and to make toy cannons out of anything which would hold a charge of powder. My great ambition was to build a small steam-engine, but for that my mechanical resources were not adequate, although I made a number of attempts in that direction. Tools and machinery were my delight then, and have been ever since. I then always had a workshop which was very poorly equipped with carpenters tools, but it was a source of endless pleasure to me. My first ambition was to be a ship-builder, then steam-engines took hold of my imagination and finally locomotives got possession of me and have absorbed much of my time and thoughts ever since.

Matthias Nace Forney.

When fourteen years of age I was sent to a school in Baltimore, with my brother George, who had already been there two years before me, where he had attended the "Collegiate Department of the University of Maryland," under which high sounding title Mr. Horace Morison—an uncle of the engineer, the late George S. Morison—conducted a school of from thirty to forty boys. Three winters were spent there, which ended my school education.

In April, 1852, I entered the shop of Ross Winans as an apprentice. He was then engaged in building locomotives in Baltimore, chiefly for the Baltimore & Ohio Railroad. Three years were spent in the shop, and after that one was spent in the drawing office. I then secured a position as draftsman in the shops of the Baltimore & Ohio Railroad, in Baltimore, then under the charge of Mr. Henry Tyson, who was Master of Machinery of the road, and continued in that position altogether about three years. As the prospect of advancement there seemed very poor, in 1857 or 1858 I was led to go into mercantile business in Baltimore, and continued in such occupation for about three years more. This brought me to 1861, the period of the outbreak of the War of Secession.

My business ventures up to this time had not been successful. All business in Baltimore was much disturbed, and after trying a number of different occupations I accepted a position as draftsman in the Machinery Department of the Illinois Central Railroad in Chicago, then under the charge of Mr. Samuel J. Hayes, who was Superintendent of Machinery of that road.

While employed there I designed an "improved tank locomotive," which afterwards became known as the "Forney engine." A patent was applied for, but there was considerable difficulty and delay in the Patent Office before the patent was allowed, so that it was not issued until 1866. Although every effort was made to introduce it into use, my efforts had little success until it was adopted for the New York Elevated Railroads nearly ten years after the patent was allowed. No other kind of locomotive was ever used on those roads thereafter, and it was also exclusively adopted in the Brooklyn and Chicago Elevated lines, and many were also built for other roads. Now, 1903, these engines have been superseded in the elevated roads by electric power, but it is still a popular form of locomotive for suburban and some other kinds of traffic. After the patent expired it was very generally adopted. It was a source of some profit to me during the latter part of the existence of the patent, but never paid as much as it would if the merits of the invention had been recognized earlier.

My engagement on the Illinois Central Railroad also continued for about three years. After this a brief engagement as draftsman with the Detroit Bridge & Iron Works followed, which was succeeded in the spring of 1865 by an appointment by the President of the Illinois Central Railroad Company, to superintend the building of some locomotives for that line, for the construction of which a contract had been made with the Hinckley & Williams Works in Boston. This was in the spring of 1865, and occupied me for about six months. When the engines were completed Mr. Williams made an arrangement with me to remain in their employ. My duties were partly those of a draftsman and partly of a traveling agent. My services there also lasted about three years.

During the last year of that term, my office and headquarters were in New York, and when my engagement with that company was ended, and after a year or more spent in futile attempts to make a living by office and other work, in the fall of 1870 I accepted the position of Associate Editor of the *Railroad Gazette*, which was offered to me by Mr. A. N. Kellogg, who then published that paper in Chicago. In 1871 the great fire occurred there and the publication office of the paper was temporarily—as it was then thought—removed to New York. Soon thereafter Mr. S. W. Dunning, who was Editor-in-Chief, and myself, each bought an interest in the paper, and a year or two thereafter bought the whole of it, each of us owning a half. In editing the paper, my department was that of engineering and mechanical matters, while Mr. Dunning had charge of the transportation and traffic department and general railroad news.

In 1873 we obtained a copy of Georg Kosak's excellent little book on the locomotive, written in German. Mr. Dunning, who reads that language, agreed to translate the book and proposed that I should revise and adapt it to American practice, and that the translation should then be published serially in the *Railroad Gazette* and in book form thereafter. The translation was made and submitted to me for revision and adaptation according to the original intention. Before that I had planned and had commenced writing an elementary treatise on the locomotive. In revising the first chapter of the translation of Mr. Kosak's book, it was found that it occupied only, to a very limited extent, the ground which in my incomplete plan I hoped to cover. Therefore the original intention of "adapting" Mr. Kosak's work was abandoned, and the whole book was rewritten and published in book form thereafter. In writing it, the aim was to explain the principles, construction and operation of locomotives in the simplest and clearest language possible so as to be easily comprehended by engineers, mechanics, firemen and apprentices who have had few educational advantages. The only mathematics employed, excepting simple arithmetic, was one algebraic formula, and that might have been omitted.

The book seemed to supply a need, and at once had a large sale, which has continued ever since. It was rewritten and enlarged in 1889, and the demand for the revised edition still continues.

In 1872 I became an associate member of the American Railway Master Mechanics' Association, and in 1873 of the Master Car Builders' Association. About the same time—or perhaps earlier—I was elected a member of the American Society of Civil Engineers, but resigned a few years ago. I was one of the organizers, and am still (1903) a member of the American Society of Mechanical Engineers.

The work of these associations, especially the two devoted exclusively to railroad engineering, was of great interest to me, and for years I took an active part in their proceedings, as is shown in their early annual reports.

By way of explanation, it may be said that away back in the seventies before any system of transit, more rapid than horse cars, existed in New York, that its population and daily papers, every winter, were thrown into paroxysms by each severe snowstorm which obstructed traffic in the streets and made it very difficult for people to be transported up and down town mornings and evenings. During such periods all kinds of wild projects were proposed for systems of rapid transit above, below, and in the streets of the city. In September, 1874, during such a period of exacerbation, at my suggestion, Mr. Octave Chanute, then Chief Engineer of the Erie Railroad, introduced a resolution at one of the meetings of the American Society of Civil Engineers, "that a committee of five members of the society be appointed by the president to investigate the necessary conditions of success, and to recommend plans for:

"First—The best means of rapid transit for passengers, and

"Second—The best and cheapest methods of delivering, storing and distributing goods and freight in and about the city of New York . . . and to report thereon."

The resolution was adopted, and a committee consisting of Mr. Chanute, Ashbel Welch, Gen. Charles K. Graham, Francis Collingwood and myself were appointed.

Although there were three other members of the committee, Mr. Chanute and myself did most of the work of preparing the report. We each of us devoted a great deal of time to collecting and tabulating data relating to the subjects submitted to the committee for investigation, concerning which there had then been very litle reliable information published. The old Greenwich street elevated railroad had been built from the Battery up to Thirtieth street, on Ninth avenue, and had then abandoned the use of a cable, which was first used by Mr. C. T. Harvey for transmitting the motive power to the cars, and a small four-wheeled locomotive had been substituted for the cable. This was then the only thing approximating to "rapid transit" in the city of New York. The only data obtainable concerning the probable traffic and expenses of a real "rapid transit" road was from this line, and those operated on the surface of the streets; the motive power of all of the latter was then horses.

In the report made it was said: "The committee deemed it necessary, as a preliminary basis, to ascertain what would be the probable earnings and expenses of rapid transit roads, and in what amount of capital the net revenue thus estimated would pay a fair rate of interest. The usual methods of assuming the operating expenses to be a certain percentage of the earnings seemed to us quite worthless when applied to roads possessing so many features of novelty. During the progress of this inquiry, therefore, two of the members of the committee made careful estimates, from the best data they could obtain, of the possible revenues, and of the cost of running trains furnishing the required accommodations. These computations were entirely independent of each other. . . . The result was gratifying. Although carried by somewhat different processes, the final computations agreed so closely as to give the committee confidence in the approximate correctness of their estimates."

The conclusion which was reached was: "That the traffic on rapid transit roads would in a few years be equal to 35,000,000 passengers per annum, on each side of the island, and that it would warrant an expenditure of about $935,000 per mile of road."

The last (1902) annual report of the Manhattan Elevated and the Interborough lines shows that 246,587,022 passengers were carried in the year covered by the report. When our committee in 1875 ventured to estimate that "the traffic on rapid transit roads would, in a few years, be equal to 35,000,000 passengers per annum, on each side of the island," or a total of 70,000,000, this "estimate" of the committee was regarded as wild and visionary.

The report was completed and read at a meeting of the Society held on February 3, 1875. It was received with a perfect storm of opposition and denunciation by members, some of whom had for years been recommending and lending their names and influence to different schemes for rapid transit railroads. The report was, however, printed by the Society. Legislation was then pending in Albany, which led to the appointment of what was known as the "Tilden committee," whose investigations and report was followed by the enactment of a Rapid Transit Act under which the existing Elevated roads were built. The report was placed in the hands of that committee and had much influence in shaping legislation and guiding those who directed it. The value of the work which the committee did, however, was never recognized, although it served to shape legislation and guide those who afterward built the elevated roads, and resulted in great advantage to their projectors and the public generally.

The appendix which I wrote for the report contained the recommendation, "that no authority should be granted to any company to build a rapid transit railroad without the express stipulation *that not more than half-fare should be collected unless the passenger is provided with a seat on demand.*" My recollection is that such a just and salutary provision was inserted in the original bill, but was eliminated before it finally passed the legislature.

After being a member of the Master Car Builders' Association for a number of years and taking an active part in its work, it became apparent to me that there was a great deal of work which such an association ought to do, but which could not be done unless some direct relations existed between it and the railroad companies whose interest it should represent. At the same time, it was evident that any important change in the existing conditions of membership would be defeated if proposed to the Association. In this dilemma, to quote from a report made in 1889, "the idea was conceived of leaving the conditions of membership the same as theretofore, but of creating a new class of members to be appointed by the Presidents, General Managers or General Superintendents, to represent the railroad companies in the Association, such members to have a vote proportionate to the number of cars owned by the companies they represented. This measure was proposed to some of the older members, including Leander Garey, F. D. Adams, and others, and approved by them.

After much negotiating, many reports and a great deal of discussion, such a measure was finally carried and ultimately resulted in all the principal railroad companies in this country and Canada appointing what were called representative members.

It was carried, however, in the face of very strong opposition, but its salutary effect upon the Association and its effectiveness at once became apparent, and the beneficial results have increased every year since.

A full account of the reorganization of the Association was given in my final report to the Association as Secretary in 1889. In that it was said: "The influence of the Association has been very much widened and strengthened by the reorganization, which has given to railroad companies a representation in its deliberations."

After the reorganization in 1882, I was appointed Secretary of the Association and held that position until 1889. The work interested me very much, and perhaps by aiding in the adoption of standard forms and methods of construction of cars, and the introduction of safety appliances, some good may have been accomplished. At any rate, the work which was commenced then has been followed up by other people and other agencies—notably the Interstate Commerce Commission—so that there is the satisfaction of having helped in a movement which has greatly lessened the loss of life and limb in railroads.

Early in the history of the Master Car Builders' Association the confusion of names used to designate the different parts of cars attracted attention, and in 1871 a committee was appointed to prepare a "Dictionary of Terms used in Car Building."

In the preface of the "Dictionary" which was subsequently published, it is said:

"This committee originally consisted of eight or ten members, who held a number of meetings without accomplishing much, and it soon became apparent that it was too unwieldy to do the work which had been undertaken." It was finally narrowed down to Leander Garey, Calvin Smith and myself. I did the writing and the other members acted as consulting members of the committee. We held many meetings, and the preparation of the first edition of that book was a long and tedious work. The book was, however, finally completed, and published by the *Railroad Gazette*. Several new editions have been issued since.

Mr. Dunning and myself continued to publish the *Railroad Gazette* until the end of 1883. I then sold my interest to W. H. Boardman, who had been business manager of the paper for a number of years. In a valedictory editorial, with the title "Some Last Words," published in the *Railroad Gazette* of Dec. 28, 1883, it was said:

"The work of editing a journal like the *Railroad Gazette* is not only severe, but unremitting. Every week brings its tasks, and there is no opportunity for recuperating exhausted energies, however serious the need may be. * * * When it became apparent that the editorial steam gage could no longer be kept up to working pressure, the question had to be decided whether it would be wisest under the circumstances to diminish the loads and continue at work until the mechanism was fit only for the scrap heap, or whether it would be best to uncouple from the train entirely and lay up for thorough repairs. The latter plan is the wisest course to pursue with locomotives, and is the one which the master mechanic who superintends the repairs to the writer insisted must be adopted in his case, or the machine would soon be too dilapidated for any further service.

"And thus a career commenced with much hope, pursued with more than a little toil, is ended with some disappointed anticipations, but with many pleasant and some tender recollections."

For three years thereafter, my life seems to have been divided into cycles of three years. I was not engaged in any regular business. Doing nothing soon grew wearisome, and in the latter part of 1886, for the sake of having regular occupation I bought the *American Railroad Journal* and Van Nostrand's *Engineering Magazine*, and on the first of January consolidated the two publications under the name of *The Railroad and Engineering Journal*. That paper I published and edited until the end of 1895, but changed its name at the beginning of the year 1893 to the *American Engineer and Railroad Journal*. The enterprise however, never was financially successful, and on Jan. 1, 1896, my interest in it was sold to R. M. Van Arsdale, the proprietor of *The National Car and Locomotive Builder*, who then consolidated the two publications. Part of the agreement in making the sale was that I should edit the new paper for one year.

Since that time I have not been in any regular business, although much occupied in different ways and on a variety of matters.

Invention has always had a great fascination to me as it has many others. It is akin to the passion which the fortuity of gambling has to a gamester, and once having developed the taste for invention its allurements have led me on, as will be shown by the following list of patents which have been granted to me, and which will indicate the subjects in which my efforts to improve things have been exercised:

List of Patents to M. N. Forney.

No.	Date.	Title.
52,406	Feb. 6, 1866	Locomotives
247,031	Sept 13, 1881.	Interlocking switch and signal apparatus
250,517	Dec. 6, 1881	Railroad signalling apparatus.
266,802	Oct. 31, 1882	Railway tell tale
266,685	Oct. 31, 1882	Locomotive engine
17,949	Oct. 24, 1883.	Improvement on locomotive engine (Canadian)
324,825	Aug. 25, 1885.	Car seat
354,631	Dec. 21, 1886.	Furnace doors.
360,148	Mar. 29, 1887.	Car seat.
408,004	July 30, 1889.	Locomotive engines.

Of the patents on tank locomotives, mention has already been made. Thus far the only other of these patents which have been profitable to me are some of those on car-seats. These for a time yielded me considerable income. Some of the rest, I feel sure, would have done so if sufficient effort had been made to introduce them, or, in other words, if they had been properly "pushed" commercially. Of the ultimate success of those, which still have any considerable term of existence, it is, of course, impossible to predict. It may, however, be well to make a confession here of a consciousness of a deficiency of the kind of capacity needed in selling things, and a constitutional abhorrence of anything relating to what is called the "solicitation of business." Probably if as much effort had been exerted, to the introduction of some of my inventions as was exercised in devising and perfecting their mechanical features, they would have been more or less successful and perhaps profitable. The mechanical development of my various schemes has been intensely interesting to me, whereas the effort required to introduce them has always been more or less obnoxious.

Besides a disposition to improve mechanism of various kinds, I have also had an inclination to improve social and political affairs, and to that end, have been a member of the American Free Trade League and American Peace Society in Boston, the Citizens' Union and Anti-Imperialist League of New York, and have been a member of the Executive Committee of the latter. I am also a member of the Union League, the Century, the Engineers' and the New York Railroad Clubs. In 1898, the American Railway Master Mechanics' Association did me the honor to elect me an "honorary member." My associate membership dated back to 1872, and that in the Master Car Builders' Association to 1873. The latter elected me a life member in 1890.

Besides the two mechanical books already referred to, in 1894 when the Constitutional Convention of the State of New York was in session, I wrote a book with the title "Political Reform by the Representation of Minorities," with the purpose of influencing that convention to make some form of Proportional Representation possible in this state. It failed to accomplish that purpose, and apparently has had little or no other influence. Later I wrote and published two pamphlets, one with the title "Proportional Representation; A Means for the Improvement of Municipal Government," and the other, "Minority Representation in Municipal Government." If any of these ever produced any effect it has not yet been made apparent to me. Writing them however gave me some diversion, and it of course may be that it is a case of "bread cast upon the waters." I have had and still have a strong conviction that the most effective means of improving national, state and municipal government would be some form of proportional or minority representation, which would place it in the power of portions of people less than a majority to represent their views and interests. The justice of such a measure does not seem to be suited to the apprehension of popular intelligence or perhaps it should be said popular ignorance.

During the most active part of my life I often made the mistake of undertaking too much, and now the consciousness is distinctly felt of having had too much work and not enough play during many of the past years.

Perhaps some men and all women who see these notes, will be curious to know why no woman was ever asked to share my joys and sorrows. It would not be difficult to give an answer, which would be somewhat like this: during the impressionable period of my life I could not afford to assume such a partnership; when things went better with me my time was too much occupied to give the matter the required attention, and later, by reason of age, attractive women would not smile on me. It would do no good to admit now that it was a mistake to live alone, but it is also true that celibacy has its compensations.

This brings the summary of life up to the present time, August, 1903. Someone else must add the date when it will be ended.

Electric Locomotive for Passenger and Freight Service; Metropolitan Railway, of London.

Of the ten electric locomotives for passenger and freight service which are being supplied by the British Thomson-Houston Co., Ltd., of Rugby, to the Metropolitan Railway Company, of London, three have been delivered.

These locomotives are of the double bogie type with box wagon

Front View of Electric Locomotive; Metropolitan Railway.

shaped cab, and weigh, in running order, 47 tons. The motors with which they are equipped are of the GE 69 type with one-turn armatures, the gear ratio being $\frac{}{}$ = 3.36. One motor is mounted on each of the four axles. They are of 200 h.p. each, and weigh, complete with gearing and gear case, approximately, 6,100 lbs. They are of the box frame type with nose suspension. The internal construction is of B. T. H. standard practice.

The control is the Sprague-Thomson-Houston multiple unit system, and is similar to that used on the passenger trains equipped for the Metropolitan Railway by the B. T. H. Co.

The collector gear consists of twelve shoes arranged as follows: Two positive shoes in parallel on each side of each truck which are supported by oak beams bolted to the axle boxes. There are four

Side View of Electric Locomotive; Metropolitan Railway.

negative shoes, one being attached by a suitable insulated bracket to each motor.

The following are the leading dimensions:

Gage	4 ft. 8½ in.
Length over cab and headstocks	30 " 0 "
Length over buffers	33 " 6 "
Centers of bogies	17 " 0 "
Wheel base of each bogie	7 " 6 "
Width over cab	8 " 0¼ "
Width over side sills	8 " 0 "
Width over all	8 " 7 "
Height from rails to top of cab	12 " 3⅞ "
Height from rails to top of floor	4 " 7½ "
Diameter of wheels	3 " 2 "
Diameter of axles:	
At center and in motor suspension bearings	6½ "
At gear wheel seat	7½ "
At wheel seats	7 1/16 "
At truck journals	5½ "
Length of journals	9 "

Trucks.—These are of the pressed steel type strengthened with reinforcing plates, steel angles and gussets; they are fitted with a swinging bolster, built up with steel sections and steel castings. The bolster is supported on two nests of coil springs of circular section, each nest consisting of three springs. The bolster is also provided with cast steel wearing plates, center and side bearing plates. The side frames are supported on the axle boxes by laminated springs of heavy design. The axle boxes are of steel castings, machined to work in the horn plates, which are also of steel castings and machined, being riveted to the side frames which are cut out to receive them. The side frames are further strengthened at this point by a doubling plate. The axle boxes are provided with removable fronts, each front of which is fitted with an inspection door. The bearings are of anti-friction metal. The axle boxes are provided with lugs at the bottom to which the collector shoe beams are attached. Ample provision is made for lubrication and the exclusion of dust. The brake gear is of the inside type, one block per wheel being provided, the whole being of specially heavy design so as to stand operation by both power brakes simultaneously. The wheels have centers of wrought iron with nine open spokes forged into them, and are fitted with rolled steel tires 5 in. wide by 3¼ in. deep, held in place by retaining rings, and also by four set screws. The motors are carried on the transoms by means of cast steel brackets riveted thereto, in which the nose on the motor rests, being held there by a forged strap. Collector shoe beams are of oak and bolted to the axle boxes on each side of each truck, the collector shoes being hung inside the wheel base.

Underframe.—This is constructed of steel members of sufficiently heavy section to bring up the locomotives to the weight desired. Each side sill is formed by a channel 12 in. x 3 in. x ½ in. section connected together at the ends by head stock channels of the same section. The underframe bolster is formed by two channels 10 in. x 3½ in. x ½ in. section, and between the two bolsters there are two crossbars of channel section 10 in. x 3 in. x ⅜ in. Between headstocks, bolsters and crossbars there are two longitudinal channels parallel to one another of 10 in. x 3 in. x ⅜ in. section. To further strengthen the ends of the frame against buffing strains there are two struts, diagonally placed, of channels of 10 in. x 3 in. x ⅜ in. section. The whole frame is firmly riveted together with steel angles and gussets. The top of this main underframe is covered with steel plate ¼ in. thick. Above this is a sub-floor 6 in. deep, formed by channels, in which is laid the whole of the piping containing the wiring, besides the piping for the brakes. On the top of this sub-floor is a floor of steel plates ¼ in. thick made in removable sections. At each end of the driving positions and down the center of the locomotive this floor is covered with wooden walking grids ⅞ in. thick. At each end of the underframe are

Control Apparatus in Cab of Electric Locomotive.

Interior Arrangement of Electrical Apparatus.

placed buffers and draw hooks with screw coupling, of standard English pattern, besides a central automatic coupler, so that the locomotives can be used for hauling either standard coaches or electric stock.

Cab.—The cab, of the box wagon shape with curved roof, is constructed of steel plates ⅛ in. thick riveted to supporting vertical and longitudinal angles, which are in turn riveted to the underframe. The upper portion of the cabs on each side between the doorways are fitted with louvres of pressed steel for ventilation. All lines of rivets are covered with neat metal mouldings so as to improve the appearance of the outside of the cab. At each end of the cab there are four movable windows, three being dropping lights, and one hinging inwards. There is also one dropping light at each side, in the corners.

Hinged doors are fitted at each side of the locomotive at the ends, there being two single doors and two double doors, the double doors for use whenever it is necessary to remove the exhausters, compressors, etc., from inside the cab. All windows are glazed with $^5/_{16}$ in. glass, the doors being fitted at the bottom with steel frames.

The locomotive is fitted at each end with complete driving equipment consisting of master controller, provided with "deadman's" handle, air and vacuum brake, driver's valves, starting switches for exhauster motors, valves for air operated whistle and sanding gear, air and vacuum gages and ammeter, also at each end of the cab to the right of the driving equipment is fitted a column to carry the hand brake gear.

The control and brake equipment is as far as possible divided into two sets and placed on either side of the locomotive, leaving a gangway down the center. The control itself is entirely divided into two sets, one set for each two motor equipments.

Taking each side of the locomotive, the arrangement is as follows:

On one side, switchboard containing the necessary main, control and cut-out switches, compressor motor switch and main lighting switch, control gear consisting of contactors, resistances and circuit breaker, all mounted on a strong steel frame rigidly connected to the cab sides and underframe. Underneath this is fixed the reverser. The air compressor, main air and vacuum reservoirs are placed in line with the supporting frame.

On the opposite side of the locomotive, looking from the same end, are arranged two motor-driven vacuum exhausters, and control gear on framework, arranged as above, together with switchboard containing the necessary control switches, etc., with the addition of the main switches for the vacuum exhausters. The auxiliary reservoir for the air brake is fixed in the cab over the exhausters.

The air brake is of the quick-acting pattern, air being supplied by a B. T. H. electrically-driven compressor of the C. P. 23 type. diameter. Immediately under the above are two transverse rocking shafts to which the pistons of the cylinders are connected, viz.: one air and one vacuum to each shaft, each set in turn being connected to the rigging for one truck. It should be noted, however, that the hand brake wheel at either end of the cab operates the brake rigging on both trucks.

Trip cocks, one for air and one for vacuum, are fitted on each truck.

Power sanding gear is provided, a sand hopper being fitted at each end of the locomotive in the cab, under which is fixed a combined air and sand valve, the sand and air being carried by a flexible pipe to the fixed delivery pipes on the leading end of each bogie.

Lighting.—Four lighting circuits are provided: one of five lamps placed in the roof down each side of the locomotive and one of five lamps at each end of the locomotive, the distribution of the light in the latter being four lights in the destination indicator and one in the headlight. All the lamps are of 16 c. p. and are arranged for working five in series on a 600 volt circuit. Provision is also made at each end of the locomotive for the reception of the necessary oil signal lamps to suit the traffic requirements.

Wiring.—All cables are asbestos covered, and are run in drawn steel tubing fitted in the sub-floor wherever possible. The connection between contactors and rheostats are of copper rod. The necessary connection boxes are fitted in the sub-floor and underframe for connecting to the motors and collector shoes.

Capacity.—Each locomotive when operating on a 600 volt circuit is capable of hauling a 120-ton passenger train on the level at a speed of 35 miles per hour, and of starting with the same load on a grade of 1 in 44, also of hauling a 250-ton goods train up a grade of 1 in 41 and starting with the same load on a grade of 1 in 90.

New Freight Car Repair Shops of the Santa Fe.

The great growth of freight traffic on the Atchison, Topeka & Santa Fe has made it necessary to provide facilities for repairing a greater number of freight cars with a shorter average detention than heretofore. For the past 10 years repairs to freight cars at Topeka, the largest shops on the system, have been made in a large shed run in conjunction with the passenger car repair shops. One planing mill and one wheel shop served both. But the need for larger and more modern facilities was so great that a new group of buildings has been provided for repairing freight cars only, and this work now is separated entirely from the passenger car work. Each of the departments is in charge of a general foreman who reports directly to the superintendent of shops.

The new buildings are, freight car repair shop, 208.5 ft. x

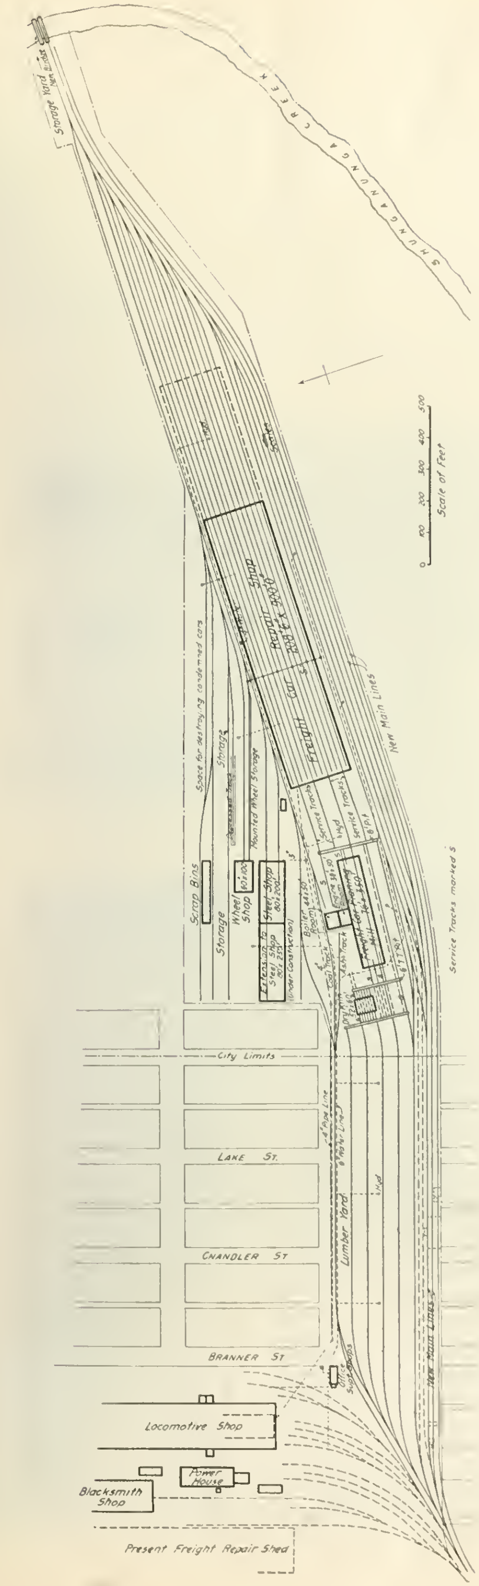
Planing Mill, Structural Street Shop and Power House on Left; Freight Car Shop Beyond on Right.

This set will operate against a pressure of 90 lbs. per sq. in., and has a cylinder displacement of 50 cu. ft. per minute.

In connection with the vacuum brake, there are provided two exhausters each electrically driven by a B. T. H. type D A motor. One of these exhausters is used for creating the vacuum when starting the train, the other (continuously in operation at half speed) for maintaining the vacuum whilst running.

In the underframe there are fixed two air brake cylinders of the vertical type, 13 in. diameter, and two vacuum cylinders, 22 in.

900 ft.; planing mill, 76 ft. x 350 ft.; power house, 50 ft. x 80 ft.; steel car repair shop, 80 ft. x 450 ft.; wheel shop, 60 ft. x 100 ft.; lavatory, 16 ft. x 36 ft.; dry kiln, 52 ft. x 60 ft. These buildings are located along the north side of the main line tracks just east of the older plant. Considerable land had to be bought to provide room for them, some of it improved residence property. Not all of this has yet been vacated, as the accompanying plan of the new group shows. The main line of the road also had to be moved southward. It formerly ran through the site of the freight car



Atchison Topeka & Santa Fe: Freight Car Repair Shops and Yards at Topeka, Kansas.

repair shop. The new buildings are brick with wooden roof framing and tar and gravel roofing.

The freight car repair shop, with roof of the familiar train-shed type, is plentifully supplied with windows, there being 40,000 sq. ft. of glass in the roof and walls, giving ample light. The roof is supported by wooden posts. The brackets for the scaffolding are attached directly to these posts and are so made that the lower or supporting member can be unfastened and the bracket swung down at the side of the posts out of the way. This leaves more room for handling heavy material to and from the cars.

There are 12 tracks running lengthwise through the building. Eight are repair tracks and four are material tracks, one of the latter supplying two repair tracks. There is a total of nearly two miles of tracks in the shop, with room for 140 cars, allowing 50 ft. of repair track to a car. On each side of the material tracks are bins and racks for bolts, nuts and other small material, so placed that the workman will always be within easy reach of whatever small supplies he needs. The material tracks are planked for convenience in handling small hand trucks, but the rest of the floor is surfaced with finely crushed stone. This is wet down about once a week, which keeps it hard and smooth and in good condition.

Outside of the shop, along the south side of the building, are well-arranged racks and bins for such large forgings and castings as cannot be accommodated inside. Material which is liable to damage by the weather is stored at the west end of the shop, between it and the planing mill. The distance between these buildings is 250 ft. and a large part of this is to be roofed over for the protection of this material. Repaired cars are painted outside of the shop on the first two tracks south, compressed air being used where possible.

Practically all of the car repairers work by the piece. The only exceptions to this are the "students," who are paid by the hour until they have become proficient enough in the use of their tools to warrant their being changed to piecework. The car repairers are worked in gangs of four, a leader being in charge of each gang. The work which each gang reports completed is checked by a timekeeper, who also figures the earnings of each gang. The earnings are divided equally among the members of the gang. Each leader has the privilege of choosing his own co-workers. This method has proven very satisfactory as it combines the good men into gangs by themselves and puts the poorer ones into less efficient and lower-paid groups.

It is the intention to make only heavy repairs in this building. The working force is to be increased in the near future to 400 men, including laborers, and the output will be between 50 and 60 extra heavy repairs a day.

Just west of and in direct line with the freight car shop is the planing mill. This is a modern building equipped with new machinery throughout and has capacity to prepare daily, without over-crowding, between 40,000 and 50,000 ft. of finished lumber for repairing freight cars. The shavings exhaust system is worked by 60-in. single exhaust fans, feeding to the fireboxes of three 150-h.p. return tubular boilers. No other fuel is necessary. Power for driving the mill is supplied by a simple Corliss engine built at the shops from designs furnished by the Allis-Chalmers Company.

North of the planing mill is the structural steel car shop. It has a capacity of eight cars and is supplied with all the necessary forges, etc., for handling the work. A traveling crane of 2,000 lbs. capacity supports a portable pneumatic riveter. There is also space in this building for making heavy repairs to car trucks for the freight car shop.

The wheel shop is north of the structural steel shop. It does all of the freight wheel and axle work for the Topeka plant and also for many outside points. There are two wheel presses, one each for pressing wheels on and off the axles, and three axles lathes. The capacity of the shop is between 130 and 140 pairs of wheels a day. The depressed track for unloading wheels and axles and loading scrap and mounted wheels accommodates four cars. Mounted wheels are stored on a spur leading from the wheel shop along the north side of the main shop; trucks from the structural steel shop are handled in the same way, and both are run into the main shop on a crossover track.

The structural steel and wheel shops are run by a small Corliss engine in the former, steam being obtained from the planing mill power house near by. The main shaft extends through the wall to the wheel shop. A rope drive is used.

The drying kiln is west of the planing mill and at the head of the lumber yard. It is large enough to accommodate sills and all other lumber that must be seasoned under cover. The steam coils are supplied by heavily lagged overhead pipes from the power house. The doors are canvas. The lumber yard has five tracks, each about 1,000 ft. long, with spaces 50 ft. wide between them, giving room for the storage of a considerable supply of green lumber. At the extreme east end of the shop grounds are tracks for the storage of bad order cars, with room for 1,000 cars.

The shops were planned for the economical handling of material. The lumber yard, drying kiln, planing mill and freight car shop lie practically in a line, and there is no reverse movement of material. The repaired cars are drawn from the east end of the shop. For such lumber as does not go through the dry kiln or planing mill, tracks pass outside of these buildings directly from the lumber yard into the freight car shop. All of the tracks from the lumber yard to the freight car shop, both outside and inside of the intermediate buildings, are connected transversely by three push car transfer tables, one placed respectively between the lumber yard and the dry kiln, the dry kiln and the planing mill, and planing mill and freight car shop.

The building of this freight car repair plant at Topeka is in line with the policy of the Santa Fe to centralize, as much as possible, repairs to cars and locomotives. The addition of these shops gives the Santa Fe the largest railroad shop plant west of Chicago.

List of Tools in Planing Mill

1 12 in. x 30 in. double surfacer (Berlin)
1 10 in. x 26 in. double surfacer (Preble)
1 16 in. x 24 in. (No. 8) planer and matcher (S. A. Woods & Co.)
1 12 in. x 20 in. sill planer (J. A. Fay & Egan Co.).
1 12 in. x 26 in. surfacer (J. A. Fay & Egan Co.).
1 18 in. x 20 in. four-spindle boring machine (Greenlee).
1 10 in. x 20 in. single spindle boring machine (J. A. Fay & Egan Co.)
1 14 in. x 16 in. three-spindle boring machine (J. A. Fay & Egan Co.)
1 36 in. automatic knife grinder (Berlin)
1 36 in. automatic cut-off saw (J. A. Fay & Egan Co.)
1 36 in. railway cut-off saw (J. A. Fay & Egan Co.)
1 30 in. rip saw (Greenlee)
2 24 in. rip saws (Atch., Top. & S. Fe)
1 Band saw for 18 in. stock (Bentel & Margedant)
1 36 in. resawing machine (J. A. Fay & Egan Co.)
2 No. 3 automatic cut-off saws, 24 in. (J. A. Fay & Egan Co.)
1 9 in. x 9 in. universal woodworker, jointer and sticker (J. A. Fay & Egan Co.)
2 14 in. x 16 in. reciprocal mortisers with boring attachment (J. A. Fay & Egan Co.)
1 14 in. x 16 in. hollow mortiser (Greenlee)
1 16 in. x 18 in. rotary mortiser with boring attachment (J. A. Fay & Egan Co.)
1 6 in. x 15 in. large matcher (J. A. Fay & Egan Co.)
1 6 in. x 15 in. small matcher (J. A. Fay & Egan Co.)
1 6 in. x 15 in. matcher (Berlin)
1 10 in. x 16 in. large tenoning machine (J. A. Fay & Egan Co.)
1 10 in. x 16 in. combination tenoning and gaining machine (J. A. Fay & Egan Co.)
1 14 in. x 14 in. sill tenoning machine (J. A. Fay & Egan Co.)
1 18 in. x 20 in. automatic gaining machine (J. A. Fay & Egan Co.)
1 Shaper, handles stock 3 in. thick (Atch., Top. & S. Fe)
1 Band saw filing machine for saws up to 2 in. wide (Hetrick & Harvey)
1 10 in. double emery wheel

New Freight Car Repair Shop at Topeka; Atchison, Topeka & Santa Fe.

Interior of Freight Car Repair Shop at Topeka; Atchison, Topeka & Santa Fe.

Coleman Sellers.

Dr. Coleman Sellers, one of the most distinguished mechanical engineers of the nineteenth century, both a scientist and an inventor, died at his home in Philadelphia, Pennsylvania, December 28, 1907, at the age of 81.

Dr. Sellers was born in Philadelphia, and in boyhood worked on a farm. His parents intended to have him live a farmer's life, but his mechanical bent was irresistible and during the two years that he worked on a farm he gave his time largely to improving farm implements. At the age of 19 he left the farm and went to work for his elder brothers in the Globe Rolling Mill at Cincinnati as draftsman, and from this time on the story of his achievements is a continuous record of important inventions rapidly succeeding one another. The story of his life, printed below, from the pen of the late president of Stevens Institute of Technology, gives the impressions of an associate and friend. Supplementing President Morton's narrative it should be noted that Stevens Institute conferred on Mr. Sellers the degree of Doctor of Engineering; and that the University of Pennsylvania made him Doctor of Science.

BY THE LATE DR. HENRY MORTON.

Coleman Sellers.

Coleman Sellers was born January 28, 1827. His father's family were among the earliest Quaker settlers of Pennsylvania, and his immediate ancestors were men of mechanical pursuits and respected and influential citizens. His mother was a daughter of Charles Wilson Peale, best known for his portraits of Washington and other officers of the Revolution, but also remarkable for the versatility of his talents, his mechanical skill, and his ingenuity. Dr. Sellers began his education in private schools in Philadelphia, and in 1838 entered the academy of Anthony Bolmar at West Chester, Pa., where he remained until his seventeenth year, distinguishing himself for his scholarship, especially in mathematics and the natural sciences, which had for him a marked attraction. * * * In his nineteenth year an opportunity was offered him in the Globe Rolling Mill in Cincinnati, then operated by his elder brothers, Charles and Escol. It was arranged that he should be the draftsman for the rolling mill, and his first work was in that line. He found his new business congenial, and he applied himself with ardor to mastering its details and with such success that we find him, before his twenty-first birthday, acting as superintendent of the plant, with entire control of its operation. The mills made wire bars, merchant bar and flat rails such as were then in use, and also drew iron telegraph wire. His brothers sold out their interests in the business, and in 1850 he was persuaded to join his brother Escol in building his patent hill-climbing locomotives and his "orograph," a mechanical surveying-machine for plotting contours; it was also a part of the scheme that they should instruct the young men in the mechanic arts. Three locomotives were built for the Panama Railroad and did good service there, although the third-rail grip—the hill-climbing feature—was not used. A few other locomotives were constructed, but the enterprise failed, and Coleman Sellers accepted a position in the Niles Locomotive Works in Cincinnati and soon became foreman. He reorganized the shop, subdivided the work, introduced an effective piece-work system, and radically changed the methods of manufacture, purchased and installed new machinery, and recorded in his diary that he was prepared to complete two engines a week.

These strenuous years of his young manhood were formative in a great degree in determining the bent of his mind and in giving him a fund of experience and a diversified practice which was of great value to him in his subsequent career. They were years of hard mental and manual work, often with primitive and inefficient appliances; but they developed his ingenuity and resourcefulness.

He read with interest the published accounts of electrical discoveries as they were from time to time announced by Faraday and others, and made for his own use the apparatus necessary to repeat many of the experiments for the benefit of his friends. Much of this apparatus is still in existence, and its marked excellence speaks well for his neatness and skill. He botanized, collected fossils and fresh-water shells, and in the latter pursuit his zeal and success were recognized by the distinguished conchologist, Mr. Isaac Lea, who named a new species from his cabinet *Melania Sellersiana* in his honor.

In 1850 he married the daughter of Horace Wells, of Cincinnati, a man of advanced mechanical ideas, who was first attracted to his future son-in-law by a lecture he delivered on "Scientific Fallacies," in which he demonstrated the conservation of energy and assailed, among others, a perpetual-motion scheme then very alluring to many otherwise sane persons.

In 1856 he removed to Philadelphia and entered the establishment of his kinsmen, William Sellers & Company, as chief draftsman and engineer. He applied himself with zeal to the duties of his new position, which afforded him ample scope for his marked inventive ability. His thoroughness, his originality and sound mechanical ideas, as illustrated in the productions of his firm and demonstrated in his published writings and his lectures, soon earned for him a distinguished position in the engineering world. As in Cincinnati he had identified himself with the Ohio Mechanics' Institute, so in Philadelphia he soon applied himself to the work of the Franklin Institute, and in a great measure helped, by his papers, lectures and committee work, to instil a new measure of vitality into that venerable society.

Dr. Sellers early took up photography, first as an adjunct to his business—to advertise machines—then as a pastime, and found in it a new outlet for his vigorous mental activity. He attained considerable proficiency and contributed many useful papers to the photographic press. He was for several years the American correspondent of the "British Journal of Photography," then the leading exponent of the art.

Dr. Sellers was admitted to partnership in the firm of William Sellers & Company about 1870, and upon its incorporation in 1885 was elected to the office of engineer. He remained with the house for over 30 years, retiring in 1887 to take up an independent practice as a consulting engineer. He has been granted more than 30 patents of utility and value, and the science of engineering is largely indebted to him for the great progress it has made during the last half century in the direction of increase of efficiency of machinery and mechanical appliances.

The versatility of Dr. Sellers has already been referred to. As additional evidence of this, and also the practicality which marked his original work in whatever line, may be mentioned the use of absorbent cotton for surgical operations, which was first thought of and recommended by him in his contributions to scientific journals as early as 1861. He also proposed the employment of glycerine for the purpose of keeping photographic plates moist, and it is interesting to note, in connection with the experiments in the early days of photography, that in the year 1861 Dr. Sellers invented and patented an apparatus in which figures in stereoscopic photographs could be seen as if in motion. Dr. Sellers' uncle, the late Franklin Peale, suggested the name "kinomatoscope" for this apparatus, which therefore, both in name and purpose, may be truly accepted as the parent of the "kinetoscope" of to-day, which has been made possible by instantaneous photography and subsequent improvements in electrical appliances. He had many avocations. Needing a microscope to study boiler scale he mastered microscopy and invented many improvements in that field. He used the telegraph to connect the different departments of the factory at Philadelphia and himself became a capable operator. He was also expert at shorthand. At the Centennial Exposition in 1876 he was one of the special judges for final settlement of disputed awards.

When Dr. Sellers retired from his position as chief engineer with William Sellers & Company in 1887, he became a non-resident member of the Faculty of the Stevens Institute as Professor of Engineering practice, giving such time as he could spare from his practice as consulting engineer to deliver lectures on the actual practice of engineering.

In 1889 Dr. Sellers was called upon by capitalists to consider the practicability of the development and utilization of the hydraulic power of Niagara Falls. He was subsequently appointed to represent America in the International Niagara Commission of five members, with Lord Kelvin as chairman, which in 1890 was established in London to consider various methods of utilizing the power of the falls, and he became the active engineering head of the work, both as consulting engineer of the Cataract Construction Company, and president and chief engineer of the Niagara Falls Power Company. The important mechanical design of the large dynamos for the plant was the invention of Dr. Sellers, and they were built under his patents by the Westinghouse Electric & Manufacturing Company. Under his advice and directions important improvements have been made in the hydraulic machinery, and to his mechanical ability, sound judgment, and experience is largely due the success of the entire equipment and its freedom from costly methods so often met with in undertakings of this magnitude. In 1881 Dr. Sellers was appointed to the honorary Chair of Professor of Mechanics in the Franklin Institute of the state of Pennsylvania.

He is a member of the American Society of Naval Architects and Marine Engineers; member and past president of the Franklin Institute of the state of Pennsylvania; member and past president of the American Society of Mechanical Engineers; member of the American Society of Civil Engineers and of the American Philosophical Society; also of the Institution of Civil Engineers and the Institution of Mechanical Engineers, both of Great Britain; and corresponding member of the Society of Arts of Geneva, Switzerland.

In 1887 the Royal Norwegian Order of St. Olaf was conferred upon him by the King of Sweden in recognition of his valued services in his profession. He was one of the founders and for a time president of the Photographic Society of Philadelphia, and also of the Pennsylvania Museum and School of Industrial Art of Philadelphia. He was a member of the Seybert Commission of the University of Pennsylvania for the investigation of the claims of spiritualism, being chosen in consequence of his active and clear perception of the laws governing cause and effect, and his knowledge of sleight-of-hand in which art, as a pastime, he had been an expert since boyhood.

Railway Signal Association.

The regular meeting of this association was held at the United Engineering Societies Building, New York City, on Tuesday last, President A. H. Rudd in the chair. About 150 members were present, which is the largest attendance ever reported at other than an annual meeting.

The executive committee announced that under the revised constitution 22 railroads had appointed representative members of the association, the representative member in nearly every case being the signal engineer of the road. These roads are the Atchison, Topeka & Santa Fe; Baltimore & Ohio; Baltimore & Ohio Southwestern; Boston & Maine; Chicago, Rock Island & Pacific; Chicago, Indiana & Southern; Chicago & North-Western; Chicago, Milwaukee & St. Paul; Cincinnati, Hamilton & Dayton; Canadian Pacific; Delaware & Hudson; Delaware, Lackawanna & Western; Lehigh Valley; Maine Central; New York Central & Hudson River; Norfolk & Western; Pennsylvania; Pennsylvania Lines West of Pittsburgh; Philadelphia & Reading; Pittsburgh & Lake Erie; Seaboard Air Line, and the Staten Island Rapid Transit.

The first discussion was that on specifications for the installation of automatic block signals, taking up the report which was presented at the Milwaukee meeting last October, but which was not then discussed. Mr. Denny, Chairman of the committee, read the specifications paragraph by paragraph, and the meeting, resolving itself into a committee of the whole, discussed and criticised every word. As in former discussions of this kind, the differences of opinion which developed were legion, and the subject occupied the attention of the meeting until luncheon time. Votes were taken on a number of questions, but the conclusions reached have the effect only of suggestions to the committee—to guide it in making revisions for the next annual meeting.

In the afternoon the association listened to a paper by T. R. Cook, an electrical expert of the Pennsylvania Lines West of Pittsburgh, on Economy in the Use of Storage Batteries in Operating Signals and on the Details of Caring for Such Batteries. Mr. Cook is not a member of the association, but the paper was prepared at the request of a member. Statistics of service and of experiment were presented, showing the cost of operating signal motors by power derived from a power house conveyed by a line wire, and by primary batteries situated at the signals; and the principal conclusion was that for the average double-track road the cost by the power line will be 30 per cent. less than with the use of gravity batteries.

In the discussion Mr. W. H. Elliott thought that Mr. Cook had figured the cost of using gravity cells too high, and that the saving by using the power line would be greater than he had shown. Besides this there is a marked advantage in using a power line with storage batteries, because of the greater freedom from failures. On a four-track line the saving in cost in using the power line is still greater. Mr. Cozzens told of the satisfactory service of a power line on the New York Central, where power is bought from the Niagara Falls plant. Mr. Gilmor told of the successful use of power lines on the Pennsylvania. Asked as to the greatest difficulty encountered in the use of storage batteries, he said that it was the need of better informed repair men. These men should be able to discover trouble in storage batteries by ocular inspection. They can see the batteries every day, whereas the battery expert cannot make inspections so often. Mr. Rudd said that in one case the charging line on the Pennsylvania had been out of service for a week, yet the storage batteries kept the automatic signals working satisfactorily. This, however, was with electro-pneumatic signals, requiring but little current. The Pennsylvania now uses cells of the 5E type, fixed at each signal bridge—a cell working a track circuit and a signal circuit. A four-track bridge requires eight cells, one for each track and four in reserve. Formerly "9-E" cells were used, each cell feeding two-track circuits; but this was not entirely satisfactory. On a busy four-track line cells are charged every night, and on lighter divisions three times a week.

On the Lake Shore & Michigan Southern, as reported by Mr. Denny, power plants, consisting of a 15-h.p. gasolene engine and a 10-kw. generator, are situated at intervals of about 15 miles, and each is used to charge two loops, one east and one west. This is a convenient length of line for a maintainer. Mr. Denny could give no complete statistics, but said that for the first 11 months the cost was about 20 per cent. less than it would have been with primary batteries.

The meeting passed a vote of thanks to Mr. Cook, the author of the paper, and referred it to the committee on storage batteries. The specifications for automatic block signals were then again taken up for discussion. The only radical difference of opinion developed was on the question whether an automatic semaphore should be so designed as to lock when in the stop position. One member had had a distant signal (standing in a horizontal position) pulled down by a painter and tied there for convenience in painting and then forgotten and left so as to send a train over a misplaced switch. The majority of the speakers, however, believed the lock undesirable.

In discussing the question of what metals should be used for bearings attention was called to the fact that new non-corrosive metals were now appearing on the market, so that a specification requiring the use of bronze for one of the two metals for bearings may be behind the times.

An informal discussion followed concerning the difficulty in arranging mechanical connections between cabins and signals, so that all switches can be bolt-locked by the signal connection. In large plants it is often necessary to run a circuitous line of pipe to comply with this requirement of the specification. Many members agreed that electric locking was the only practicable remedy.

Foreign Railroad Notes.

The Swiss union of railroad employees asks the state to raise the pay of the lowest grade of employee to $291 per year.

The Hungarian State Railroads purpose to buy three coal mines in different parts of the country to secure a better supply of fuel.

Trial trips have been made on a new railroad up the Wetterhorn, which is so steep it is called an "elevator," rising 450 meters in a length of 600, which is a "grade" of 3,960 ft. per mile, or 75 per cent.

Hungary is rejoicing over its first self-unloading car. It is for coal, built in Budapest, and apparently substantially after an American design, with trucks, but carrying only 44,000 lbs. It is for a 38-in. gage road, however.

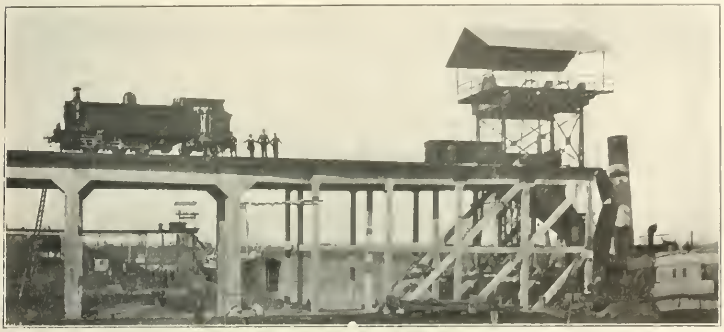
The project for pooling the rolling stock of the state railroads of the several German states, which was seriously discussed a year or two ago, has come up again, and is said to be likely to succeed, but limited to the freight car equipment.

The train-robber turns up in Germany adapted to the environment. He put on a conductor's cap, sidled along the foot-board until he came to a compartment where there was but one man, opened the door and asked to see the passenger's ticket; when the passenger pulled out his pocket-book with the ticket he knocked him senseless with a revolver and seized the pocket-book (which contained $8.33), and when next the train slowed down lighted out, and at last accounts had not been traced.

Reinforced Concrete Railroad Viaducts at Seville, Spain.

BY E. OMMELANOE.

The Spanish Cala Iron Company recently built a private railroad about 60 miles long from its mines in the interior to the port of Seville, where it ships ore by vessel. Its original plan for terminal docks in Seville included two timber loading wharves along the river, approached by timber trestles and earth embankments over the low ground between the river bank and the high ground further inland. Work had already been begun on this plan and some of the approach embankment made when the company decided to build the loading wharves of reinforced concrete instead of timber and instead of timber trestle and embankment approaches to use reinforced concrete viaducts. The change in plan was decided on because of the height of the approach viaducts necessary to carry the line from the high ground back from the river to the docks, the treacherous nature of the intermediate low ground and the necessity of making as small obstruction as possible to the flow of water across the flats during floods.



Reinforced Concrete Wharf With Car Dumper at Seville, Spain.
Second wharf and viaduct in left background.

The two wharves are about 600 ft. apart. The completed part of the embankment was made use of in building the approach viaduct to one of the docks. Nine spans of concrete viaduct were built between the end of the embankment and the wharf. The other viaduct approaching the second wharf is built entirely of reinforced concrete girder spans.

In general the concrete spans of both viaducts are similar. Each is double-tracked and is built in two levels. The upper level gives a slight down grade to the dock from the high ground back of the river. The track on the lower level slopes back from the dock and is used for returning empty cars by gravity to a storage yard at the inner end of the viaduct. The reinforced concrete girders are 4 ft. deep by 9 in. wide with a span of 29 ft. 2 in. between centers of supporting columns. There are two such girders under each track supporting a concrete slab floor 11 ft. 8 in. wide, on which a track of 3 ft. 4 in. gage is laid with 65-lb. rails on longitudinal stringers secured by bolts passing through the concrete floor. The girders and the supporting columns were built in the form of a monolithic structure.

The columns are rectangular, 23½ in. x 9 in. They are braced laterally at two levels, one 26 ft. 3 in., and the other 35 ft. above high water. Additional lateral bracing is provided for the high columns at about 42 ft. 7 in. above high water. Each lateral row of four columns supporting the two tracks rests on a reinforced concrete slab 22 ft. 2 in. x 5 ft. 9 in. x 8 in. deep, stiffened with ribs. This slab is in turn carried on a foundation block of ordinary concrete, 22 ft. 11 in. x 6 ft. 6 in. x 12 in. deep, giving a uniform bearing pressure on the ground of 1,000 lbs. per sq. in. under normal load and which may be increased to 2,200 lbs. per sq. in. if both tracks are supporting the weight of two loaded trains complete with their locomotives. The first six spans of one of the viaducts inland from the wharf are built in the form of a curve of 622 ft radius which was made necessary in order to join the line to the other line back on the high ground.

The two wharves or docks were the most difficult part of the work. They consist of reinforced concrete columns, the highest of which are 89 ft. high, braced together by longitudinal and lateral girders and by diagonals in the three outer panels. One of the illustrations shows one of the docks in the foreground and the other dock in the background. The docks have two levels, one 17 ft 6 in. above low water and the other 49 ft. 6 in above low water. The upper platform is about 25 ft. wide and 75 ft. long. The floor is 8 in thick and is designed to have a carrying capacity of 736 lbs. per sq. ft., or to support at any point a movable 10-ton crane. The lower platform is 5 in thick and is designed to carry a load of only 184 lbs. per sq. ft. It is used for loading ore from light dump cars. The upper platform supports the large cars used in through transportation of ore and if necessary the locomotives, as shown in the illustration. The vertical posts and all of the diagonal and horizontal braces are 12½ in. sq. On the upper level of the dock is mounted a car dumping apparatus for unloading the cars direct into a spout leading to the hold of the vessel loading alongside.

The columns in the docks are supported on reinforced concrete piles 12½ in. sq. These piles were moulded and allowed to set two months before being driven. In building the first dock a pile driver with a tup weighing 2,500 lbs. was used and the piles sunk with the aid of a water jet. In driving the piles for the second wharf however, no water jet was used, but the weight of the tup of the pile driver was increased to 6,000 lbs.

In the construction of the first viaduct and wharf the concrete moulds were made of timber and the scaffolding was erected and taken down as each panel was finished. It was found, however, that the tamping of the concrete into the moulds together with the caustic action of the cement and the changes from wet to dry and vice versa made the boards warp. Therefore, and because the spans were similar so that the same moulds could be used for the same parts on each, the moulds used on the second viaduct were made of sheet iron ⅛ in thick stiffened with ribs of angle iron placed 1 ft. 8 in. apart. In this way the erection and dismounting of the moulds was hastened, the concrete ran better and the finish was smoother and finer. In a few instances this method could not be used and at such times specially stout timbers were selected. The moulds for the girders and the cantilever extensions were made in the same way.

Section of Two Reinforced Concrete Viaducts Leading to Wharf of the Spanish Cala Iron Company at Seville.

Before use, the whole structure was carefully tested. One of the spans of the first viaduct was loaded with rails placed so as to correspond to the weight of a 18-ton locomotive. The deflection under this load was only [illegible] in. after 72 hours. Another span was loaded with 72 tons, which is more than half again as much as the weight of the locomotive which is used on the viaduct. The greatest deflection under this load was [illegible] in. In another test a moving train of 20 cars weighing 20 tons each hauled by a locomotive weighing 18 tons was suddenly stopped by emergency application of the brakes. This was done repeatedly, the wheels being skidded on some of the stops. The greatest deflections recorded were $^{1}/_{10}$ in. under the locomotive and [illegible] in. under the cars. No oscillation was observed even in the curved part of the viaduct where the columns are highest.

The one of the two viaducts which was built first took about eight months. It cost about $34,500. Its loading pier, not including the tipping apparatus, cost about $12,000, making a total of $46,500.

The Ocean Carrier.

BY J. RUSSELL SMITH, PH.D.

II.

*The Epoch of the Merchant Carrier on the Sea.**

The common carrier performs the most conspicuous transportation service upon the ocean, but the private sea carrier continues to perform a surprisingly large amount of work. The wagon, the typical private land conveyance, is relegated to a purely local work, but on sea the independent vessel is yet a good ship still maintaining a position of independence, equality and rivalry in certain phases of the work.

The development of the common carrier upon the ocean giving regular service is more recent than it is upon the land. Its beginning in American foreign commerce dates practically from the close of the war of 1812. Before that date, with certain small exceptions, the unit was the single private vessel belonging to and used by a merchant or a roving captain. Since that date the independent ship has been of steadily declining importance in comparison to the line of vessels running at regular intervals and carrying for all shippers. The causes of the late continuance of the merchant epoch and the slow emergence of the common carrier may be considered under three heads: (1) The lack of facilities for carrying on commerce, (2) the character of the commerce, including the great lack of travel and exchange of mail, and (3) the disturbed, warlike and semi-piratical conditions of the times.

(1) At the beginning of the last century and during all the preceding colonial epoch, a long period was required to deliver produce in a foreign country and get the returns from its sale. There was not, as now, prompt departure and quick voyages, not to mention selling by telegraph, and if need be, paying by telegraph. It is now easy to follow prices and, if need be, to send produce to a European commission merchant and get quick returns. By the actual commercial practice of to-day the world has ceased to have dimensions, so far as they affect international sales and payments. For practical purposes the telephones bring the merchants of a great city as near to each other as though they were in one building, and the ocean cable, with its codes of pregnant words, brings the man of all cities side by side. Their knowledge of prices, their quotations and their bargains are almost as prompt as the telephone. The financial partners of the wire-flashed knowledge are the bill of exchange, and the international banking system which can transmit credits and payments to the seller as quickly as quotations can be passed to prospective purchasers. From bargaining and from payment the time element has been eliminated, and the improvement of shipping shows that in a century about three-fourths of the time element has been cut out of the actual moving of commodities.

A comparison of the modern speedy methods with the possibilities that faced the 18th century merchant shows why there was so little organization in those days. A single exchange of letters in any bargaining operation took an amount of time. If a man made a quotation by mail greater than the long round voyage. It might be three months before his transatlantic correspondent could accept or decline. Plainly, business by correspondence was well-nigh impossible—a paralyzing example of the drawbacks that came from slow communication. It is true that the bankers had long used bills of exchange in place of bullion and cash, but the bills had to be presented. In the year 1837 there were some heavy failures of American merchants in London, due to the non-arrival of large remittances which they expected to come by the New York packets. They were hourly expected, but were so greatly delayed "during the prevalence of extraordinary east winds which blew for two months" that the merchants with wealth locked in the Atlantic winds failed wretchedly in London for the want of it. This, too, occurred in the days of the famous American packet ships. The present cable would have shortened the anxiety [illegible] The sailing vessels of these [illegible] so slow that months elapsed before American goods [illegible] European [illegible] could be heard from.

It was therefore difficult to organize regular ocean carriers in the face of such difficulty of communication, and the natural response to the conditions of the time was that each vessel usually became a commercial unit—a trading [illegible], her commercial operations being managed in some one small world in nearly the same way that a cart peddler or a trader among the Indians seeks his market. The management of the ship [illegible] and the goods concerned had to be in the same place. The possibility of detached control of moving merchandise had not arisen. Under such conditions regularity of exchange of goods is difficult to arrange, and it is upon regularity that lines of vessels depend. Satisfactory development of lines demands such organization of commercial operations that the supercargo or the bargaining captain can be done away with so that the merchants may stay at home and send their goods by the dependable carrier. This was almost impossible in the slow-going and disturbed century preceding the peace of 1815.

The continuance of the period of private ocean carrying enterprise was made easier by the small tonnage of the ordinary vessel of that day. It was by its size fitted for a private conveyance. Three or four modern freight cars would hold as much as a good-sized vessel and more than most of them. The Maryland or Virginia planter living upon the tidewater estuaries connecting with the Chesapeake often had his own sailing vessel by which he could send his tobacco or grain to Europe. If he had room he might carry some of his neighbors'. The merchants of our seaports who handled the export commodities of the small producers placed this freight in their own ships, sent it across the sea to market to be sold upon their own account by their own representatives and loaded the ships with goods to be distributed from their own warehouses on this side. Almost the whole of ocean transportation of this period was upon the basis of the individual ship carrying the private cargo of her merchant owner.

(2) The character of the commerce was such that no steady flow of goods took place between Europe and America or any other two continents of the world. America was in the homespun stage and every household was nearly independent of every other one and of the rest of the world. Foreign trade depended largely upon luxuries and exotics. The import of manufactures from abroad was small and the family supply for many months could easily be laid in at one time. The export of our raw colonial produce was not a trade requiring shipments at all seasons of the year. It was shipped then, as are such goods now, shortly after harvest. Hence there was no great need for lines of vessels to carry freight either to or from this country at all seasons. The commerce of that day was sufficiently served by the irregular voyages of independent ships, of which there were many.

Nor were lines necessary to accommodate the travel of that period. The number of travelers was so small that it would not have paid ship owners to establish passenger lines. People did not go to sea for pleasure in those days. They went when they were compelled to, and their departure was a matter of tears, prayers and the making of wills. Those few persons who were thus compelled to make sea journeys hunted up any vessel that happened to be going their way and made their bargains with the captain.[1] The passenger was a corollary, a by-product gladly taken and even advertised for[2] when opportunity offered and the vessel came to a promising port; but the passenger traffic was never sufficient for a regular business. It is surprising to note the small provision for passengers and the consequent small passenger traffic at the time of the introduction of steam navigation on the North Atlantic. The famous packet ships of 1840 usually had provision for ten first cabin passengers and twenty second cabin passengers. In the steerage they could carry hundreds of emigrants to a new home across the Atlantic, but the emigrant business was small in the half century between the Stamp Act and the exile of Napoleon. The satisfactory unit for all kinds of ocean carrying was, therefore, primarily and naturally the freight vessel sent across the sea upon the private enterprise of her owner.

After the Revolution various changes in national life, commercial conditions and the technique of ship building were paving the way for a rapid rise of common carriers when the world settled down to order after the commercial chaos of the epoch of dynastic, colonial and imperial wars that ended in 1815.

It is not the intention of the writer to give the impression that the period prior to 1815 was one of meager commercial connections. It was, on the contrary, a period of very wide shipping connections. American ships were everywhere; our fishermen, our traders and our merchants carried the flag upon their small sailing craft to places where it has since been unseen for decades at a time, but

*The author wishes to state that in the collection of data for part of this chapter he received valuable assistance from Mr. A. R. [illegible], of Philadelphia.

[1] *Quarterly Review*, Vol. 62, p. 207.

[1] In "Views Afoot," p. [illegible], Bayard Taylor gives a graphic account of his journey across the Atlantic with a captain whom he had sought out. This was near the middle of the nineteenth century, in the day of the regular packets, but the packets were costly, and Taylor, to spare expense, went in the style of 1800 and hunted up a captain who was quite as willing to fill his space with human beings as with cotton if they paid as well.

[2] [illegible] Gazette, September, 17[illegible].

they were bound on individual enterprises, not as common carriers, and they went once where they might never go again.

Referring to the eastern trade of Boston and Salem, Lindsay says: "In the late 18th and the early part of the 19th century the merchants of Massachusetts supplied not merely their own people with the bulk of the teas, spices, silks, sugar and coffee from the East, as well as with nankeens and other cotton clothes, but re-shipped them from Boston to Hamburg and the northern ports of Europe in their own vessels." Owing to the monopoly of the British East India Company they were enabled to derive large profits from trade with British colonies from which British subjects were excluded.

In the same period Philadelphia boasted that her ships went to Calcutta, Madras and Canton and Sumatra; to Leghorn Messina, Hamburg; the ports of Spain, Portugal and France, and, as of old, greatly to the West Indies.‡

This is almost as good a list of connections as that same port can boast to-day, when it is the metropolis of a state twice as populous as the nation of 1790. Many a little port like Salem, Nantucket, Richmond, Bridgeton, N. J., which sent ships the world over a century ago, is now but the harbor of fishing boats and paddle-wheelers.

The method of carrying foreign mail during the colonial period is indicative of our transportation methods until after the war of 1812. We are told in the early history of New York that the keeper of a tavern hung up a coffee bag in his place for the receipt of letters. Before setting sail the masters of vessels called for any accumulated mail and delivered the letters through some tavern at the port of destination for a penny a piece. This method the British conquerors of New York found in vogue in 1665, and continued throughout most of the colonial period. It was only in 1816 that the mail was taken permanently by regular lines of packets.

As late as 1851 an American publicist in setting forth the reasons why the United States should have a steamship line to the Mediterranean advanced as one of his arguments the fact that it was a shame for the American people and the American nation to be any longer dependent upon the chance sailing ship for the transport of mails to that part of the world. "At the present time it (the Government at Washington) is compelled to rely even for the carrying of its despatches to naval commanders on that station and the coast of Africa upon transient vessels or the ordinary routes over the continent of Europe. We have known of a case of a vessel in the Mediterranean and others on the coast of Africa required in our home service and ordered home immediately when the despatch did not reach the commander for fourteen weeks after it was sent*— time enough for the battleship "Oregon" to sail around two continents and have a month to spare.

The same writer who in 1850 was arguing for a steam line to Italy from New York estimated that since travel to Italy had so greatly increased, there must then have been 700 Americans going to Italy each year. As mail and travel go hand in hand, it is plain to be seen why there was no regular connection or regular mail to the Mediterranean from this country even in 1850, for these conditions were like those prevailing between America and the other countries of Europe at earlier dates.

(3) The effect of unsettled conditions. The period from the Revolution to the war of 1812 was one of great commercial activity, but one ill-suited to the establishment of regular connections. The European trade reprisals which accompanied the wars, beginning with the French Revolution and extending through the Napoleonic upheaval, rendered the American ship often the prey of the naval vessels of both England and France. She suffered from the navies and the privateers of both these countries from Mediterranean pirates, and it is even asserted[2] that under the cover of the general disturbances American privateers took American vessels. Under such risks the maintenance of regular service was impossible. But the profits of the commerce of this period were so large as greatly to tempt individual enterprise, and this indeed seems to have been the period of its greatest development in ocean transportation. Lindsay in his "History of Merchant Shipping" says (Vol. 2, p. 363) of this time that American "merchants and shipowners increased in numbers to an extent out of all proportion to the general state of the population. Many persons who had realized moderate capitals from mercantile and other pursuits now became daring adventurers as carriers by sea." Plain commerce was "daring adventure."

The establishment of lines which might have come then was unquestionably delayed by the uncertainties and disturbances of the time. Periods of peace, then as during the preceding century were of short duration—too short for the growth of well-established lines, which at best are the result of years of development.

The great shipping lines of the present have nearly all had small beginnings, with slow growth at first and have attained their great size in from 30 to 60 years. Their ripening into greatness is usually the result of some one man's business genius, and his career normally reaches over several decades—sometimes half a century. Many of the great ocean lines show, by an examination of their history, that they have been started and built up by the life-work of some one man. This slow growth, too, has occurred when the merchant and the carrier have had at their command all the speedy tools of to-day—of steamships, railways, telegraphs and the security of large populations and nearly continuous naval peace. During the 18th century England, France, Spain or Holland were engaged in naval wars nearly half of the time. Two decades of continuous peace were almost if not quite unknown, and the intervals were usually much shorter than this. And pirates almost as bad as war were ever on the sea and were never out of the merchant captain's mind.

The New York and Philadelphia journals of the first part of the 18th century contain a wonderful collection of reports of the encounters and experiences with the pirates who sailed the shores of the North Atlantic. This is the reason for the 18th century resemblance in build that existed between a merchantman and a war vessel. To make matters still worse, war in that day meant privateers who multiplied many fold the number and commercial destructiveness of navies. It is hard to draw any economic distinction between privateers and protected pirates. Both forbid line traffic. No vessel was so surely theirs as the vessel of known and regular movements.

There was thus a premium on disorganization and a premium on increased trade in the first quarter of a century of our national existence. The merchant trader loaded his vessel with a cargo and sailed away. If he escaped capture he could sell his cargo in the West Indies or Europe at rates which were extremely profitable. But he took in his own hands not only his property, but his life. Here, therefore, was the most commanding motives for the building of fast ships. If you could outsail your rivals and the pirates you got rich quickly; if they outsailed you there was a fight, and perchance your ship went off under some other captain flying a foreign flag, and you might return a man before the mast or you might end your days a slave in Barbary. The result was that the American vessel became the fastest in the world.

The trade method of the period is well established by the case of one Abraham Pesch, a prominent shipping merchant of Philadelphia. He decided to risk the danger of trading with the blacks of San Domingo, who were then in insurrection and bitter with hatred toward the whole white race. Pesch's schooner was forthwith "invitingly" laden and cruised about at a safe distance, but near enough to tempt the natives. Thomas Thuit, the single white man whom the natives had saved, that he might serve their commercial interests, communicated with the schooner, assured her of safety if she moored, unloaded and sold her cargo. "Impromptu coffee at 5 cents a pound was poured like sand into the hold of the craft until water washed her gunwales." The cargo was sold at a great profit on the vessel's return. Such vessels might be owned by a merchant who would send his vessel after cargo, or they might be owned by a roving trading captain, who would get a cargo in the manner indicated above and sell it to some merchant upon his arrival in port.

The career of Stephen Girard is typical of the commercial methods of the period. He was a merchant and shipowner who sent his ships for foreign goods, and he also bought cargoes that were brought to the port by such rovers as Pesch. Girard's greatest prosperity came during the period 1793-1812. He seems to have been one of the pioneers in a quickly copied policy of sending a vessel out to make repeated exchanges of cargo before returning with the accumulated profits. His vessel went to the West Indies, where cargo was exchanged for coffee and sugar, then proceeding to Hamburg or Amsterdam, the coffee would be sold for Spanish dollars or exchanged for cargo which would secure him at the Spice Islands, Calcutta or Canton the products of those climes. We probably owe the possession of Oregon to voyages of this character by which Astor and others of New York traded for furs on the Pacific coast that they might exchange them for tea in China.

Men did not usually embark on these enterprises, more dangerous than present service in the navy or standing army for mere pay. Then, too, the owner wanted the greatest possible interest of the crew in the success of the voyage. Derby, the great merchant of Salem, gave each of his common sailors the privilege of taking 800 lbs. of freight for private trafficking and personal profit. The officers had a proportionately larger share. In 1819 an English publicist bewailed the fact that his nation must soon disappear from the China trade because there was nothing to send out but bullion and coin, while the prosperous traders of the United States had the coveted ginseng and possessed a monopoly of trading on the north Pacific coast of America, where for a few trinkets and old clothes the Indians would surrender the choicest furs to be exchanged for China cargoes on so profitable a basis that even the common seaman's share of the gain was sometimes several thousand dollars.

During the merchant carrier period of the beginning of the 19th century the captain of the ship naturally filled a much more important place than he now does. At present he is chief navigator,

subject to steamship agents, who load and unload his vessel and to pilots who keep him in leading strings until he is safely down to sea. A hundred years ago he was usually his own pilot, and he was often, in addition, the owner or the business representative of the owner, if perchance the owner was not also on board. The captain sold and bought cargo like a merchant. If he lacked the qualities for such service the ship carried a business manager called the supercargo, a man who has now long been unnecessary because of the commission merchant, the ship broker, the freight broker, the ocean cable and the wide mercantile organization that has resulted from instantaneous communication, changes which have reduced the captain to the position of conductor on a freight train and made the supercargo, like the pirate, an ornament of history.

The close of the war of 1812 has been mentioned as the most important date marking the transition from the merchant carrier to the common carrier. It is almost needless to point out that the merchant continued a carrier after this date, and that, on the other hand, there had been many previous signs of the coming change. Some of the preliminary steps in this change are worthy of notice here. First among these signs of change is the increase in the practice of chartering ships—*i. e.*, hiring out; second, is the growth of the practice of having an agent transact the port business of the ship; third, the increase of joint ownership of shipping enterprises; fourth, attempts at founding lines.

1. The practice of chartering vessels is almost as old as history. It was practiced on the Nile in Roman times, with a good bill of lading. The Venetians carried it to a fine point to the heyday of their prosperity, but the practice did not begin to affect relations in the western world until about the close of the 18th century.

It was the most natural thing conceivable for a merchant knowing the lines of trade to find that he could use more ships than he had and hire one. That it had not come into prominence much sooner must be due to the fact that wars, disturbances and governmental restrictions in America and the greater chartered companies in Europe kept mercantile firms at a small size in colonial times. But in the prosperity that came from supplying Napoleon's armies during the last decade of the 18th century ships were chartered.[1]

Closely akin to chartering was the offer of merchants of Havre to the rover Cleveland, when he was in that port empty-handed and with full pocket from profitable sale of both ship and cargo. Several firms offered to fit up a ship for him, load it with a rich cargo and let him start out to make traffic with it.[2]

In Boston[3] two vessels were advertised in 1789 as about to sail for the isles of France and India, and "any person wishing to adventure to that part of the world may have an opportunity of sending goods on freight." The use of the word "adventure" there is also extremely suggestive of the attitude of the day toward maritime operations—you sailed over unchartered and piratic seas to unknown lands, strange peoples and markets of which you had only last year's reports. This practice of carrying for others evidently advanced rather more rapidly in Great Britain than in America, as witnessed by the following passage from the introduction to the volume published in 1807 by the Society of Shipowners of Great Britain:[4]

> The Society of Shipowners think it important to state that the numerous body of men whose capitals are embarked at this time in British shipping are not engaged in other mercantile pursuits, but depend wholly on the returns they expect to receive from their property so employed. This observation is considered the more necessary from recent inquiries which have been made to ascertain who the Shipowners were, they never having been before considered distinct from the Merchants, and that the property in shipping generally belonged to that very respectable and intelligent class of his Majesty's subjects.

2. *The Rise of the Agent.*—Toward the end of the 18th century there appear evidences of a change in the function of the captain. His old position is well shown by this advertisement from the New York *Gazette* of 1736:

> "For Philadelphia, the Schooner Judith and Rebecah, John Clark, Master. Well accommodated for Passengers, will sail in about ten days. For Freight or Passage agree with said master at his house near the Custom House."

This announcement, full of the atmosphere of a village on the river's bank, was replaced in 1783 by another announcing that in addition to the captain (who might not always be available to landsmen) persons desiring freight or passage could confer either with the captain or some merchant who was an important user of the vessel[5] and was taking orders for her and for the time at least acting as the merchant captain's assistant. We have here the germ of the present institution of ship agents—a world-scattered fraternity—who now arrange such a large share of the world's ocean transportation.

An advertisement of the year 1800 (Philadelphia *General Advertiser*, April) shows that the ship's agent was fast developing:

> "SAMUEL EMERY, Ship Broker.—Buys and sells vessels, procures freight or charters, transacts all kinds of business at the custom house for entering and clearing [illegible] of goods [illegible] bottomry, etc. Secures [illegible]"

3. *Joint Enterprise.*—The close of the Revolutionary war made it possible for Americans to engage in the China tea trade—a trade requiring such a long voyage and so much capital that the individual owner was often unable to finance the venture. The first American ship that went out from New York to China was the joint enterprise of merchants in Philadelphia, New York and Boston. Joint stock companies were formed to build and despatch these ships. It also became common for partnerships[7] to be formed, in which each holder had a share corresponding to the present method of divided ownership in American coasting vessels, various persons owning halves, fourths, sixteenths, thirty-seconds or sixty-fourths. The captains of these vessels usually had a small share, each sailor also often had a share, in that he was allowed a certain amount of space or a certain weight of cargo to use for any merchandise he might take for private trading on the voyage. The partnership vessel was operated as a unit—a private unit—the partnership having merely split the ownership without changing management or service. The time for lines had not yet come.

4. *Early Attempts at Lines.*—There were some early attempts at the establishments of lines, but a diligent search of the literature of the period reveals but little concerning them. There were vessels to charter, and there were roving sea captains engaged in all grades of occupations, from the "honest" buccaneer to the legitimate merchant. But none of these approach line traffic, and the very existence of most of these navigators and the accounts of their activity add weight to the belief that the scanty annals of the 18th century line traffic are scant because of the paucity of such activity. What we know of the history of the period and of the requirements of line traffic show that it was plainly impossible for any such service to have been long-lived. The following incidents appear to be natural and descriptive of the period:

Before the Revolutionary war there were five packet boats plying between New York and the port of Falmouth, England, known as the Falmouth Line.[8] They sailed occasionally during the Revolutionary war, and some of them resumed service after 1783, but the accounts of their operations are extremely meager, and a dozen chroniclers aver that the first line from America was in 1816.

The signing of the Treaty of Peace of 1783 was the signal for a pretentious French venture at opening up connections with the new republic. In November, 1783, before the evacuation of New York, the "Courier de l'Europe" arrived in port from l'Orient, France, and heralded herself as the first of a line of first-class packet ships which advertised to make monthly sailings between New York and France and to carry passengers, mail and freight.[9] But the depressed condition of American commerce seems to have been very discouraging for this new venture which did not long survive. Then came the French wars, and regular service was impossible.

Mention is made in Colonial Office Records (London), Board of Trade papers, Vol. XVI, Trade Papers, of the establishment of regular sailings of packet boats between New York and England, 1703. There are also post-office record references to the New York packet service.

An examination of the documents of Colonial History of New York shows plainly (Vol. V, p. 811) that packet service could refer to a single ship, 1726, and further accounts of the traffic show that if lines existed they must have been very nearly imaginary lines. For three years, 1715-18 (Vol. V, p. 618) the average number of ships sloops and the like from New York to Great Britain was 21, of 1,461 tons and 226 men. This entire flotilla is only one-tenth the size of some steamers now plying on that route. The correspondence of the colonial governors with the Board of Trade shows frequently that there was no regular service, and that many weeks, and even months, elapsed between opportunities to send a letter.

This rather brief statement of the conditions under which early ocean carrying existed has, it is hoped, made clear the reason for calling this long period of the American colonial epoch and the establishment of the republic the epoch of the merchant carrier. There was, practically speaking, no other carrier than the merchant carrying his own goods—other service was incidental—a by-product. The common carrier, the specialist, had to have the better conditions of the 19th century, and of all of these beneficial conditions the most important were peace and security from the ravaging hand of man. The resulting traffic transformation has been remarkable.

In the merchant carrier days of the late 18th century a small city like Salem sent ships to a wide list of countries, such as we now only find trading with a few of our ports, each of which is ten to twenty times as large as was the now decadent Salem in her prime. Her merchants sailed from place to place and traded with the merchants in the ports where they stopped. To-day the merchant ships his consignments by some line of steamers from New York, Boston, San Francisco, Philadelphia, and if need be he

will have them transshipped at Liverpool, London, Hamburg, Antwerp or Genoa, but it goes by the lines.

We still have a long list of countries on the custom house books for ship entry and clearance, but instead of being roving merchant ships, with valuable cargoes, they are tramps carrying a full load of some bulky produce—logs for cabinet, dye or tanning stuffs, ores or copper, nickel silver, iron or manganese, flint or clay for the potter, pebbles for cement grinding, guano bones or fossils for fertilizer, coal, petroleum, lumber, sugar or wheat. Most of this is new commerce—commerce of the steam engine and steamship era, and it has arisen beside the old which yet flourished, but in a different way. The tea, silk, spices and trinkets of the 18th century now ride in state and haste in some snug, secure and peaceful steamer fully insured and following a prosaic schedule along a firm, fixed, well-lighted, safe and unromantic route. Together the merchant carrier and his counterpart in independence of the pirate, ceased to be the conspicuous figures of the sea.

(*To be continued.*)

Immigrant Laborers in the United States.

Italy, Austria-Hungary and the Slavic countries of eastern Europe are at present the principal sources of the unskilled labor supply of the United States. They contribute more than two-thirds of all the immigrants now entering the country, about one-fourth of the total coming from Italy. The Slavic group includes the Jews from eastern Europe, who, while not Slavs, economically and industrially represent practically the same classes. The distribution, employment and manner of living of these immigrants, with special reference to their assimilation into American industrial life, is the subject of a study by Frank J. Sheridan in Bulletin 72 of the Bureau of Labor.

Although about half of them had previously been at work as farmers or farm laborers, they do not seek a similar employment here, mainly because of the higher rates of wages in transportation, manufacturing, mining and in building, where the demand for common labor has been very great. The Italian immigrant shows a marked preference for railroad construction, tunnel building, grading, ditching, building excavation, and work in factory industries, while the Slav and the Hungarian turn to those industries where the pay is somewhat higher and the work somewhat heavier—as in blast furnaces, iron and steel works, iron-ore handling, and coal mining.

Large numbers of the immigrants seek and find work through employment agencies, but the great mass, through acting on the advice of relatives and friends, go directly to the states where wages are highest and their services are in greatest demand. In 1906, 78.82 per cent. of all immigrants and 86.55 per cent. of the Italian, Slavic and Hungarian immigrants went to seven states—New York, Pennsylvania, Illinois, New Jersey, Massachusetts, Ohio and Connecticut—the states where the demands of industry were expressed in terms of the highest wages. Objection to paying long-distance railroad fares, the great demand for labor in the north, and a seeming disinclination to work in the south, except in some cases where northern contractors are building railroads in the south, kept the majority of the Italian laborers in the north. To these reasons may be added the desire of the Italian padrone agency to keep the men where it can again distribute them to its own advantage and furnish the commissary after the temporary employments cease.

Of the 36,176 unskilled laborers distributed by New York City agencies, the average rate of wages per day for the Italians was $1.46, for the Slavs and Hungarians $1.46, and for the other nationalities $1.41. Of the Italians, one-third received less than $1.50 a day, 60 per cent. $1.50 a day, and 7 per cent. over $1.50. Of the Slavs and Hungarians, 38 per cent. received less than $1.50 a day, 41 per cent. $1.50, and 21 per cent. over $1.50. These rates are for 1905 and the first seven months of 1906. The records of a large contracting company engaged on railroad construction and employing many laborers of various nationalities as well as Italians shows that the actual cost to the company of groceries, provisions and payment for cooks, waiters, fuel, light, etc., at its boarding camps for a given period was 19 cents a meal, or $3.99 a week for each man. The men were charged $18 a month for board and lodging. The records of three railroads in New York, Pennsylvania and New Jersey for 1905 and 1905 give accurately the earnings and the total cost of living of large numbers of Italian laborers employed on these railroads and living under the usual commissary system. The average earnings per man for a representative month in 1906 for 89 gangs, numbering 1,530 men, were $37.07. The cost of all food was $5.30, and of rent of shanty and sundries $1.49, or a total of $6.79, leaving a surplus of $30.28.

The Italian laborers are said to save more money at the same wage rate than any other class of European laborers in the United States. The amount is indicated to some extent by the money orders sent from this country to Italy. The total amount of money orders sent in 1906 to all countries was $62,435,343, and of this $36,798,562, or 58.9 per cent., went to Italy and the Slavic countries. The total amount of these money orders sent to Italy was $16,239,134, while the amount sent to Austria-Hungary and Russia was $20,559,428, the number of natives of those countries in the United States being about double those from Italy. These sums, great as they are, represent but a part of the total savings of these laborers sent abroad. Large amounts, of which there are no records, are sent over through Italian bankers. Immense sums in the aggregate are carried over in person by immigrants who return to Italy late in the fall of each year. At least 100,000 Italians return to Italy each year for the winter months because they find it cheaper, healthier, and more satisfactory to return to Italy and spend the winter months with their families.

Alternating Current Automatic Block Signals on the Highland Division of the New York, New Haven & Hartford.

Signal engineers who have been perplexed to decide the question whether semaphore arms should be inclined upward or downward, and whether they should project from the right or from the left of the post, may find all their difficulties settled in an actual installation which has lately been finished on the Highland division of the New York, New Haven & Hartford, near Hartford. Here the arms point both ways at once and all theories ought to be satisfied. These block signals have been installed on this section, which is eight miles long, East Hartford to Vernon, because of the introduction of electric propulsion and of a consequent large increase in the number of daily trains. The two main tracks of the steam railroad have been equipped for the use of the cars of the Connecticut Company, running between Hartford and Rockville. The signal installation is A. C. stepping down from a 10,000-volt power transmission line to a 2,200-volt transmission line for signal purposes. The signals are operated (and also lighted) directly by a 110-volt 60-cycle alternating current, so that no batterymen or lamp men are required.

Signal arms similar to those here used, pivoted near the center, have been in use for several months on the electrified section of the New Haven road, west of Stamford, where all the signals are suspended from the under side of the bridges which support the power lines for conveying current to the motors. Those here used (Fig. 1) are of the same design, except as to minor details of the casting. In the horizontal position these arms extend equal distances to the right and to the left of the bearing, but when in the proceed position much more than half of the arm is at the left of the post.

This section of the line is now used both by the New Haven road for passenger and freight service, using steam locomotives, and by the Connecticut Company, for passenger service, using electrically propelled cars. The Signal Engineer was required not only to install a signal system to work with the present direct-current 550-volt equipment of the street railway company, but also to provide for working equally well, and without any change, with an alternating single-phase propulsion current of 25-cycle frequency, in case that should be adopted.

At each of the junctions, East Hartford and Vernon, there has been installed a manual interlocking station for the operation of the switches and signals, and the automatic semaphore signals between the stations named are set at intervals of from 3,700 to 5,200 feet. The entire electrical equipment is operated by alternating current.

Source of Energy.—Through the entire length of the signaled section there is a 10,000-volt, three-phase, 60-cycle commercial line giving a reliable 24-hour service. From this supply current is procured for the signal system, the connection being made through step-down transformers. The transformers are connected to one phase of the high potential line, stepping the current down from 10,000-volt to 2,200-volt and connecting through oil switches to the signal transmission lines which extend the entire length of the signal system. From this 2,200-volt, 60-cycle line, current is obtained through transformers for the various signal requirements.

Interlocking Plants.—The interlocking towers are built on concrete foundations. In the front opening in the foundation for the lead-out the building is supported by cast-iron pillars set 24 in. apart between centers. In these cabins special attention was given to the design of the roof and the windows. The roof is carried out four feet from the side of the building to shade the windows, and it is slightly curved upward so that the lower edge does not reach below the top of the window and there is no limitation of the signalman's outlook. The lower window sash is much longer than the upper so that the frame at its upper end is above the range of the eye, and the building is so framed that the sash when raised passes up to the plate, bringing its lower edge up to the top sash.

The machine is a Saxby & Farmer and the frame rests on concrete foundations. All home and dwarf signals are pipe connected and stand upon concrete foundations. All cranks and compensators are mounted on iron piers imbedded in concrete. The distant signals are of the electric motor type the same as the automatic signals hereinafter described. These signals are controlled from the tower and also through circuit controllers attached to the arms of the home signal to which they govern the approach. All home signals are equipped with electric motors, which are controlled by an indicator in the tower, the indicators being controlled by the track circuit so that the operator has constantly before him an indicator which shows the presence of any train on any section of track to which his signals give admission. All levers which operate home signals controlling distant signals are equipped with an indication lock which prevents the latching of the home signal lever in the stop position until the distant signal is in the caution position. The electric motors, indicators and locks are supplied with current by a duplicate set of 21 ampere-hour storage batteries. The batteries are charged by a single-phase mercury arc rectifier, taking current from the 2,200-volt signal transmission line through a transformer stepping down to 110 volts.

Automatic Signals.—The automatic equipment consists of home and distant signals mounted upon the same post. The eastbound and the westbound signals are placed nearly opposite each other but are staggered sufficiently to avoid putting a signal where a trolley pole will hide it from the engineman. The blade grip castings are designed to permit the arm to extend to the left of the post for the reason that the trolley poles would obstruct the view of the signal if it extended only to the right.

The motor signals have double-case bases and rest on concrete

Fig. 1—Special Semaphore for East Hartford-Vernon Line.

foundations. The upper case contains the signal mechanism which is operated by a 110-volt single-phase induction motor. The motor has sufficient torque at starting to start under load from any point in the arc through which the signal travels. The time required to clear both the home and the distant arms is five seconds. The lower case contains the track relays, the line relays, the controlling switches, the fuses and the lightning arresters. All signals have the same apparatus in the same relative position and are wired alike, so that the maintainer finds a uniform arrangement in all the cases. Duplicate two-candle power incandescent electric lights are used in the lanterns. Oil founts are also provided.

At each signal there is a transformer transforming the current from the 2,200-volt line to 110 volts to supply current for the local signals and the control circuits for the next signals in the rear. All wire connections between transformers, signals, tracks and the signal control circuits are in wood boxing placed upon stakes four feet apart. The signal control line extends the entire length of the block section, taking energy at the outgoing end and looping through the track relays and switch instruments.

The track circuit equipment installed is designed to be used with a propulsion current either direct or alternating, either 550-volt direct or 11,000-volt 25-cycle single-phase alternating. The electric railway company required that the tracks be cross bonded at least every 3,000 ft., thus making necessary a "cut section" in each block. Energy is supplied to the tracks by a transformer situated in the middle of a track circuit section. The track circuit has a relay at each end. These are "frequency" relays, that is to say,

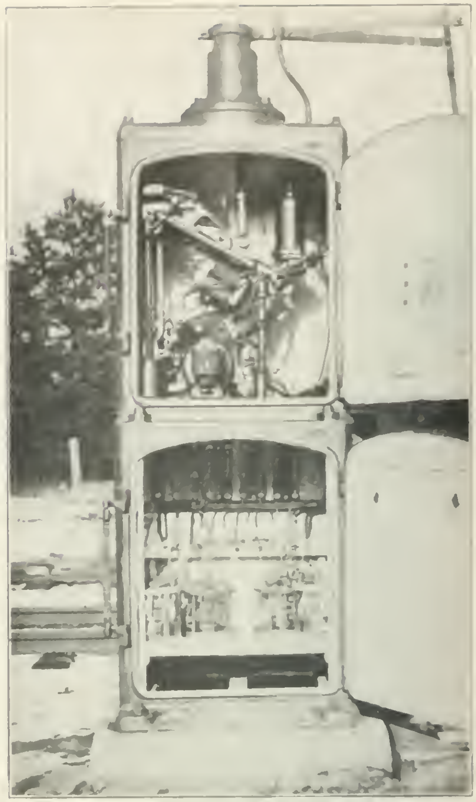

Fig. 2—Signal Motor and Relays.

relays which respond only to alternating currents of a given frequency. These control the signal circuits. At each end of the track circuit there is also an inductance bond the terminals of which are connected to the rails and the center of which is connected to the center of the bond of the next track circuit, thus forming a metallic connection around the insulated rail joints for the return propulsion current. This center connection may also be used for cross bond taps.

The inductance bonds were designed to carry the heavy current necessary with direct-current propulsion and also were perfectly balanced to offer the least possible impedance to an alternating propulsion current. In fact, if the external track return is perfectly balanced the only impedance of the bonds may be said to be ohmic. The frequency relays are absolutely immune

Fig. 3—Signal Cabin, Vernon, Conn.

to a direct current or to alternating current of 25 cycles, having been designed to operate at 60 cycles. The unbalancing of the track therefore, even if sufficient to throw a heavy current through the frequency relays, would not result in a false clear signal indication. This system will, of course, be not in the least affected by any foreign trolley current. In connecting the inductance bonds to the rails use is made of an old rail about 15 ft. long. To connect up an inductance bond to a track with broken or staggered joints, it is necessary either to cut one rail of the track so as to have the

In Fig. 1 the 2,200-volt signal wire may be seen on the pole which stands close to the signal. The 110-volt signal wires are on the lower arm of the Western Union poles, situated at the extreme right of the photograph. The three-phase, 10,000-volt, 60 cycle, and the three-phase, 11,000-volt, 25-cycle power lines are on the upper arms of the poles at the left of the track, while the short lower arm on these poles carries the 550-volt feeders for the trolley wires. Fig. 2 shows the motor signal case with the relays in the lower part. Fig. 3 shows one of the standard interlocking cabins.

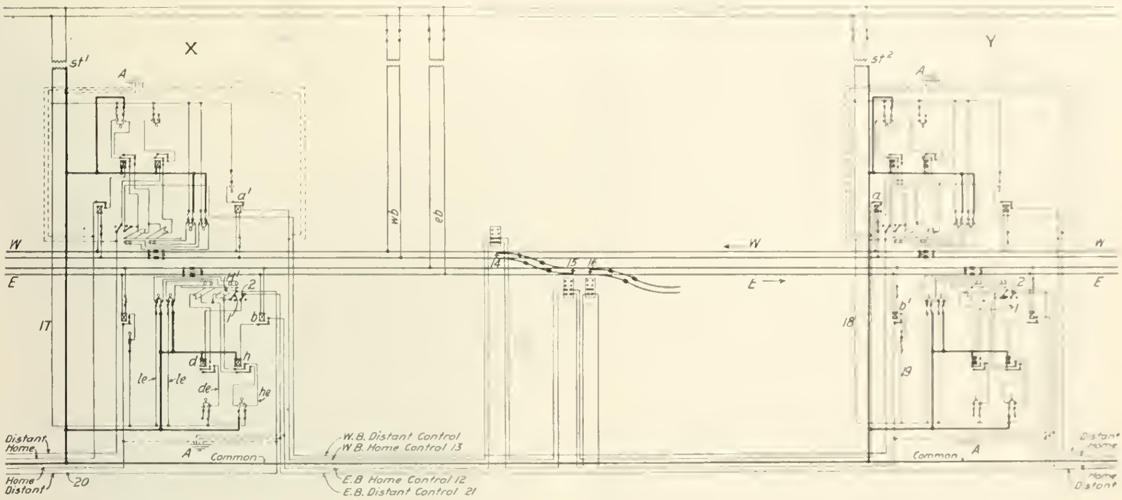

Fig. 4—Signal Circuits for Electrified Line; Highland Division, New York, New Haven & Hartford.

insulated joint near the bond, or to provide a conductor from the bond to connect with the track beyond the insulated joint, which may be some 15 ft. The piece of steel rail is better than copper because it costs less and is not liable to be stolen; and besides this if alternating current is used for propulsion, the iron serves to restore the balance of the inductance of the two lines of rails, which with one side 15 ft. shorter than the other, would be unbalanced.

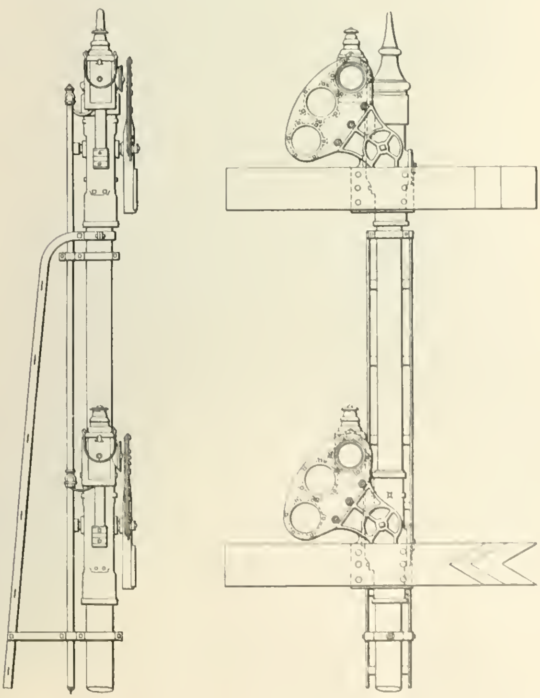

Fig. 5—Details of Signal, Showing Electric Light Connection.

The arrangement of the track and signal circuits is shown in Fig. 4, in which W is the westbound and E the eastbound track. Taking, for example, the eastbound track, the current is fed to the rails at *e b* near the middle of the section, and this circuit controls the signals through relays *b* and *b*'. These two track relays, when closed, close signal relay *h*, at station X, which receives energy through home control wire 12 from transformer *s t 2* at station Y, through wires 18 and 19. Signal relay *h* closes the motor circuit to home signal H', admitting trains to block section X Y. Power for this motor comes from transformer *s t 1* at station X through wires 17, *h*, *e*, etc.

Home signal H being cleared, is clears the corresponding distant signal in the rear by means of the circuit closer 1, and distant

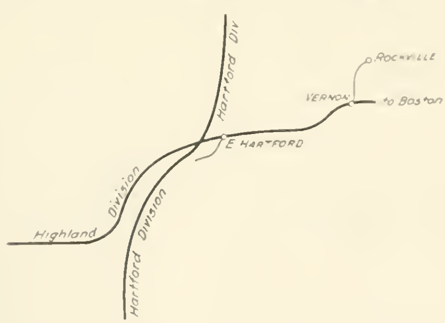

Fig. 6—Electrified Line—East Hartford to Vernon.

control wire 20. The distant signal at station X is controlled in the same way through relay *d*, which receives energy through circuit breaker 2 on signal H' and distant control wire 21, which may be traced to circuit breaker 2 at station Y. Signal H', when put to the stop position, causes the distant signal on the same post to also go to the horizontal position by opening circuit breaker 2.

The control wires not numbered are for the westbound track. The common wire is shown by a heavy line throughout the drawing.

The control wires are run through the switch instruments in the usual manner, and opening either switch 14 or switch 15 puts in the stop position the signals on both main tracks. The locations of the lightning arresters at each signal are shown by broken-line connections to the ground, A.

The arrangement of the electric lights on the signals is self-explanatory. These lights derive their power from the mains, as may be seen by following wires 17 *l e* at station X.

The apparatus for the entire installation was designed and installed by the Union Switch & Signal Company of Swissvale, Pa.

The Best Design of Car for Suburban Traffic at Melbourne.*

BY THOMAS TAIT,
Chairman of the Victorian Railways Commission

The type of car best suited for the passenger traffic on the Melbourne suburban lines is a subject which has been receiving the consideration of the Commissioners for some time past, and I lost no opportunity of acquiring information which would be of help in determining this important question, visiting Hamburg and Chicago mainly for that purpose.

The latest standard car in use on the Melbourne lines for suburban traffic is of the cross compartment type, with two side doors for each compartment, and no corridor. The body of this car is 50 ft. long, and 8 ft. 6 in. wide, and will seat about 80 passengers. The principal advantages of such a car are maximum seating capacity for its length and width, as no space is taken up for corridors, and the celerity with which passengers can enter and leave the car owing to there being side doors for each compartment.

One of the disadvantages of such a car is that there is no means of getting from one compartment to another, which results frequently in some overcrowding with passengers standing in some compartments, while, at the same time, there is seating accommodation to spare in other compartments on the same train. Passengers from a way station boarding a fairly well filled train (that is, a train in which a number of the compartments are already fully occupied), have not much time to select a compartment in which there is unoccupied seating accommodation, and are apt to enter compartments which are already fully occupied, in which event, owing to the absence of any means of access to other parts of the car or train, such passengers must either stand or overcrowd the seating capacity of such compartments, and this, although there may be seating accommodation to spare elsewhere on the train. The provision of corridors in the cars and of vestibule connections between the cars would overcome this and permit of a better distribution of passengers throughout the trains, and the use of the seating accommodation to the fullest extent. Investigation of some of the complaints received as to overcrowding on our suburban trains shows that while some of the compartments had more passengers in them than there were seats, there was seating accommodation on the train as a whole for all the passengers on it.

Another disadvantage of the existing type of car is the swinging side door.

Although the gage of the Victorian lines is 5 ft. 3 in. (with the exception of three short narrow-gage lines), we do not derive as great an advantage as we should from this wide gage in the direction of being able to run wide carriages, etc., as contrasted with a 4-ft. 8½-in. gage, owing to the fact that the tracks on double-track lines and elsewhere have been built so close together, viz., 11 ft. 8 in. center to center, whereas in America the 4-ft. 8½-in. double tracks are built from 12 ft. to 13 ft. center to center.

It has not been considered advisable to use so wide a side-door car that the side door, if open, would strike the head or arm of a person projecting from a car on a contiguous track, and this has limited the width of the body of the cars for use on our suburban lines to 8 ft. 6 in. The use of sliding, instead of swinging side-doors would, I think, permit of the width of these cars being increased to about 9 ft. 6 in., with a considerable increase in the floor area available for seating accommodation and corridors.

Another disadvantage of the swinging side-door is the fact that it requires, in the interest of the safety of the passengers in the compartment, as well as those on trains running on contiguous tracks and of persons standing on station platforms, to be closed and fastened, and that this requires the services of the guards and platform staff, as well as involves some delay at stations, and the closing of these doors is accompanied by objectionable noise, which cannot be entirely avoided. Moreover, a swinging side door closed but not fastened is an element of danger, especially in the case of children riding in the compartment, as it may swing open if leaned against.

The closing and fastening of side-doors will become a very important matter if electric traction is adopted, for with the increase in acceleration on electric trains (that is, the increase in speed when starting from stations) it will not be possible for the present staff to close and fasten such doors, and to restrict the acceleration on electric trains would be to abandon to some extent one of the chief advantages of electrification.

The adoption of a sliding side door on the cars employed, at least for the suburban traffic, would enable us to safely widen those cars sufficiently to provide a corridor without diminishing their seating capacity, thus with vestibule connections, between the cars enabling the passengers to distribute themselves throughout the train, and utilize the seating accommodation to its fullest extent.

Sliding side doors could not, however, be closed and fastened by the guards and platform staff, but I see no reason why such doors could not only be opened, as the swinging doors are at present, by the passengers themselves, but the closing and fastening of them be left, with safety, to the passengers, as in the case of the electric cars on the Southport line of the Lancashire & Yorkshire. Thus, not only would some time at stations and labor of staff be saved, but the noise accompanying the closing of swinging doors be got rid of. Less danger would be attached to failure to fasten a sliding door than in the case of a swinging door, for, in the event of a child or other person leaning against it, it would not swing outwards and would not slide. The liability to catch and seriously injure fingers would be less with the sliding than the swinging doors, as also the liability to injure persons standing on station platforms. I may add that sliding doors at the ends and the center of cars have been lately adopted on the underground railways in London, and opposite each pair of seats on the Illinois Central for its suburban traffic at Chicago.

As I have mentioned, the adoption of sliding doors would enable us to safely use wider suburban cars and provide a corridor without much, if any, reduction in the seating capacity. On the underground railways in London the cars with sliding doors have a central corridor, or, more properly speaking, a central aisle, while in the Illinois Central company's new type of suburban car there is an aisle on each side. This latter is, no doubt, the best arrangement to facilitate the movement and distribution of passengers throughout the car and the celerity of ingress and egress, but two aisles occupy too much space, and the advantages gained as contrasted with one aisle do not justify the sacrifice of so much seating accommodation. The extra space gained by the use of sliding instead of swinging doors for suburban cars will not be sufficient to provide more than one aisle without a serious diminution in seating capacity, which we cannot afford, but a corridor or an aisle along one side only would appear to have an advantage over a center aisle in that passengers entering the car on the aisle side could, in the event of there being no vacant seat in the compartment immediately opposite the door by which they entered, pass along the side aisle to a compartment with vacant seating accommodation without in any way disturbing the passengers in the compartment immediately opposite the door by which they entered the car as they would with a center aisle.

It would be possible, as a rule, to so run cars with one side aisle that the aisle would be next the station platforms on the trains bringing passengers into the city, especially during the busy hours of the morning, the seating capacity of which trains is fully taxed, and for which passengers have little time to select a compartment with vacant seating room. The aisle being on the side of the car away from the platform at the central terminal stations on departing trains would be no disadvantage, as passengers taking such trains at those stations have, as a rule, ample time to select a compartment which is not fully occupied. Nor would the aisle being on the side away from the platform be of any disadvantage in the case of passengers disembarking at any station, as it would not be necessary for them to use the aisle to reach the door of their compartment. The Prussian State Railways have adopted an aisle on one side for their suburban cars in Berlin and Hamburg.

The accommodation for passengers in a number of our suburban cars is somewhat too luxurious and too liberal as to space, and consequently too costly, having regard to the comparatively short time suburban passengers occupy such accommodation. The average length of all journeys on our suburban trains during the year ended June 30, 1907, was only 4.76 miles, and the average time occupied per journey about 17 minutes—the average fare being 4.82 cents,* which is equivalent to 1 cent* per passenger mile. Not only do partitions and high seat backs and luxuriously leather upholstered seats and backs with upholstered arm rests add appreciably to the cost of suburban cars, but they add materially to their weight, a very important factor in view of the numerous starts which the suburban trains make, and the heavy gradients on some of our lines. We can undoubtedly save considerable expenditure in the construction and maintenance of our suburban cars by the adoption of comfortable low-backed seats upholstered in leather or other suitable material without arm-rests, and the elimination of all partitions except between smoking and non-smoking compartments, in combination smoking and non-smoking cars. The abolition of partitions and high-backed seats will not only increase the air space and improve the ventilation and light, but allow passengers to see at a glance where there are vacant seats, and reach them by way of the proposed aisle.

The seating and other accommodations provided for suburban travelers at the various places visited by me fully confirm me in the views I have just expressed.

*This statement is from the report of Mr. Tait on electrification of steam railroads, most of which was published in the *Railroad Gazette* of Dec. 13, 1907, on page 709.

*Pence transferred to cents by multiplying by 2.

GENERAL NEWS SECTION

NOTES.

The New York, New Haven & Hartford has established a school of telegraphy at Boston.

The Swiss Federal Railroads have opened a handsome passenger office in New York City, at 241 Fifth avenue.

The amount of anthracite coal mined in the year 1907 was 67,109,393 tons, by far the largest production on record, and about 11½ millions more than in 1906.

The State Railroad Commission of Georgia is to issue an order revising passenger rates in the state in accordance with the proposition lately made by the Southern Railway.

The legal department of the state of Wisconsin is to sue the Chicago, Milwaukee & St. Paul for violation of the law limiting to eight hours the working time of certain employees.

President Finley announces that, in view of the falling off in business, the Southern Railway has determined to reduce by 10 per cent. the pay of the President, Vice-Presidents and the other general officers, and their office forces.

The Chicago subway now moves 2,000 cars daily, of which 1,200 carry United States mails. The lines now connect with 11 railroads and 14 large mercantile houses. Negotiations are under way for many other connections.

The Attorney-General of Texas has filed suit against the Missouri, Kansas & Texas, the Texas & New Orleans and the Galveston, Harrisburg & San Antonio for heavy penalties for alleged violations of orders of the Railroad Commission, requiring them to run their passenger trains on time.

Under a decision by a board of arbitration telegraph operators on the Grand Trunk are to receive an increase of salary of about 10 per cent. and aggregating $27,000 yearly. This refers to ordinary operators; about $10,000 will also be added to the pay of telegraphers in the higher grades.

Senator Crane of Massachusetts has introduced in Congress a resolution instructing the Interstate Commerce Commission to enlarge the field of its investigation of safety appliances by including facing point switches, the necessity for protecting them, and also the question of the automatic control of such switches.

The Department of Justice at Washington announces that the Chicago, Burlington & Quincy and the Chicago & Eastern Illinois are to be at once prosecuted on indictments for giving secret rates similar to those on which the Chicago & Alton was tried (but let off) and on which the Standard Oil Company was fined $29,400,000.

The Georgia State Railroad Commission has issued a rule requiring railroads to receive and check baggage for prospective passengers, in advance of the passenger's departure. The checks given may be made exchangeable for a regular check at the time of departure, and if baggage is brought more than 12 hours in advance a storage charge may be imposed.

The Long Island Railroad advises that there has been no thought of abolishing demurrage charges at Long Island City or other stations. The note in our issue of January 10 proves to have been based on a proposition to discontinue track storage charges, which, however, has not yet been carried out. It appears that on certain team tracks special "track charges" are made.

At Mineola, N. Y., January 8, a conductor on an electric railroad was sentenced to three months' imprisonment for manslaughter in the second degree. He was held responsible for leaving a meeting point before the opposite car had arrived, his action being in direct disobedience of an order. In the resulting collision the motorman of the other car was killed. The case has been appealed to a higher court.

A number of roads have reduced wages in freight houses and in forces of laborers, on track work and elsewhere; and reductions still more expensive appear to have been decided on in many cases, but not formally announced. Reductions of working hours in shops and on track work are numerous. On many roads payrolls have been much reduced within the past two weeks, without changes in rates, by the falling off in freight traffic, trainmen being paid by the trip.

The Farmers' Special, which was run by the Cincinnati, Hamilton & Dayton the first week in January, and heretofore referred to, stopped at 26 places and over 6,000 farmers were addressed by the speakers. Division Freight Agent Law says that the enterprise was a great success, outdoor meetings having to be held to accommodate the large numbers attending. State Grain Inspector Culver accompanied the party and gave useful statistics concerning the profits which have been made on different kinds of grain.

The Interstate Commerce Commission has issued a circular calling the attention of railroads to the necessity of changes in many features of many freight tariffs to make them conform to the law and to the rules which have been promulgated by the Commission, and stating that all tariffs hereafter issued must conform strictly to the regulations. Tariffs now in use, however, may be continued in force until July 15, 1908, notwithstanding their irregularities, provided the railroads show good faith in their endeavors to eliminate all features which are not approved by the Commission.

Prosecutions for Imperfect Car Couplers, Etc.

The Government is going to prosecute the Illinois Central in Kentucky for 22 violations of the Safety Appliance Act. A prior decision in that district on similar cases was unsatisfactory, but the circumstances were such that the United States could not take an appeal. The suits now about to be brought will be so framed as to cure this difficulty.

Attorney-General Bonaparte last week directed the various United States Attorneys to institute suits against 43 other roads, 312 violations in all. The roads are:

	No. of violations.

Helping to Restore Confidence.

The Sherwin-Williams Co., Cleveland, Ohio, is trying to help re-establish normal business conditions by increasing the enthusiasm of the members of its force. The following extract from a bulletin issued by General Manager W. H. Cothingham to representatives of the company is a good example of the encouraging literature it is distributing.

"America is a great and an extraordinary country. Whatever she does, she does in a big way. No other country has ever done as many big and extraordinary things as she has. When she goes in for a panic it's a good one; not a little flurry, not a little storm, but a good, stiff hurricane; one worthy of her vastness and her gigantic force. Big storms, while extremely severe at the time don't last long. They usually leave some wreckage behind, it's true, but the worst is soon over. The clouds quickly pass and the sun shines for all once more, and we feel better for it and appreciate more fully the daily blessings we enjoy. The great financial hurricane that has swept across the land is over. It will take a little time to clear away the debris, but not long, for the wreckage has not been great, and the warm sun of prosperity will soon repair what damage has been done. Let me repeat, America is a great country, and always does big and extraordinary things—this is the proof of her genius; and, just as the panic stunned us all with its fearful suddenness and frightful severity, I believe, now that it has passed, we will have an exhibition of the country's great stability and recuperative powers that will astonish the world as much as the panic did.

Overhead Carrier Between Warehouse and Dock.

All steamboat cargoes discharged or awaiting shipment at the Virginia street dock in Seattle, Wash., are stored in a warehouse on the opposite side of Railway avenue, about 250 ft. from the dock. A large volume of miscellaneous freight is handled daily between the dock and warehouse. To transfer this economically and at the necessary speed, without obstructing traffic in the street, there was recently installed an overhead carrier which does the work at low cost and which can handle the freight more rapidly than it is possible to load or dispose of it at the terminal points. The equipment is simple and can be modified to suit almost any industrial condition which involves moving packages or miscellaneous articles in large numbers between fixed points.

As shown by the accompanying illustrations, the dock and warehouse are connected by a light elevated structure which supports an endless-chain carrier, with terminals on the dock level at one end and on the second floor of the warehouse at the other. The carrier consists of a series of wooden flights, 9 in. wide by 1 in. thick and 30 in. long, made of Puget Sound fir. These are secured every 12 in. to two strands of No. 180 Jeffrey steel-thimble roller chain, forming an almost continuous apron on which the freight is carried. Wedge-shaped blocks attached to every third flight catch anything that might roll down the incline at the dock end. The conveyor is driven by a 10-h.p. electric motor at the upper, or warehouse, end.

Overhead Carrier Between Warehouse and Dock.

Dock End of Overhead Carrier.

Being reversible, it carries freight to equal advantage in either direction. It is designed to handle packages not more than 3 ft. wide and 4 ft. high. They are usually cases of salmon, sacks of salt and sugar, barrels of cement and miscellaneous articles weighing as much as 1,000 lbs. each. It travels at a speed of 70 f.p.m. and consumes about 6 h.p. when delivering 1,000 packages weighing 100 lbs. each per hour. As already mentioned, this rate of delivery represents the limit of speed with which packages can be loaded and cared for at the dock and the warehouse; it is much below the actual capacity of the machine.

The plant was designed and installed by the Pacific Engineering Co., Seattle, the conveying machinery being furnished by the Jeffrey Manufacturing Co., Columbus, Ohio. The latter company has installed several machines of this general character for handling freight to and from ships direct; for such work the outer end is adjusted to the rise and fall of the tide and the height of freeboard of vessels.

Storage Battery Motor Truck for Industrial Railways.

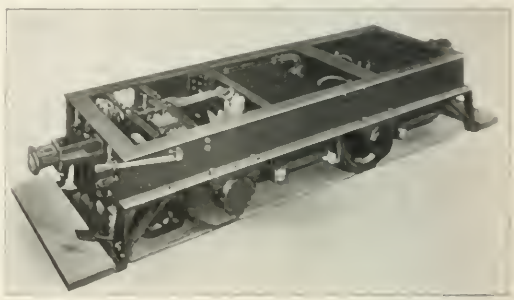
The Westinghouse Machine Co., Pittsburgh, Pa., is now making and selling storage battery motor-trucks of from 10 to 10 tons capacity for use on industrial railways. The company used to use at its own works small cast iron 3-ft. gage trucks, of small capacity and moved by hand. Heavy castings were carried on 50-ton trucks, which were usually moved by a rope passing under a snatch block and attached to a crane hook. When the storage battery trucks were installed there was a marked improvement in crane service, since they relieved the crane of the work of transporting many of the heavier castings from one end of the long shops to the other.

The accompanying photograph shows a 10-ton truck. A steel frame, thoroughly braced, is carried on four wheels, the journals of which run in roller bearings. The driving axle or axles, as the case may be, carry the motor, or motors, as in street railway practice. The motor is spring suspended from the frame at one end, and connected to driving axle by suitable reducing gearing. A spring suspended cradle of angle irons carries the battery trays. At the operating end of the truck are mounted the controller, brake, charging receptacle, cut-out switch and volt-ammeter. A convenient step and drawbar head are provided at each end. All the machinery is below the top of the frame and is covered by a heavy wooden deck for carrying the load. This deck, which is not shown in the illustration, is made in sections so that any part of the mechanism is readily accessible.

The motor is of the Westinghouse vehicle type, designed for heavy overloads and being dustproof and self-oiling. The controller is of the same type, and gives four speeds in either direction. It is provided with operating and reverse levers, which are interlocking to prevent premature reversal.

The battery is in two or more trays of cells and is built to operate at high rates of charge and discharge, so as to stand short periods of heavy duty usually requiring a battery of four or five times the capacity. Another reason for adopting a battery of smaller ampere hour capacity than is customary in similar work is that the time available for charging during the working hours is usually three times the period of time that the truck is actually running.

During a six months' test of the 10-ton truck the power required to charge the battery in regular and heavy shop service averaged 63 k.w. hours a month. The work done was recorded and averaged about 700 ton miles a month, the loads ranging from a few hundred pounds to 15 tons. These trucks used as locomotives on a level track and without any weight to secure adhesion can haul on suitable cars, from one-half to their full rated capacity as a truck, depending on the condition of the track and kind of bearings on the cars hauled. By placing sufficient weight over the drivers to secure adhesion, they can handle from one to two times their capacity as a truck for a continuous period of not more than five minutes.



Westinghouse 10-Ton Storage Battery Motor Truck.

Standard trucks are made for six different gages: 18, $21\frac{1}{2}$, 24, 30 and 36 in., and 4 ft. $8\frac{1}{2}$ in. For track systems provided with turn-tables they are made with rigid trucks. Where tracks are installed with curves, the trucks for all gages, up to 36 in., have swivelled front axles, allowing free operation on curves of 12 ft. radius.

Long-Time Burner Without a Chimney.

Peter Gray & Sons, 82 Union street, Boston, Mass., makers of switch and signal lamps and lanterns, use a chimney-less long-time burner for such lamps. They report the results of a long-time service test as giving a high candle power after burning 100 hours. The

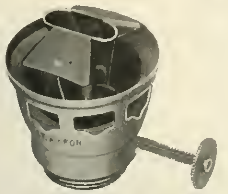


Fig. 1—Chimney-less Long-Time Burner.

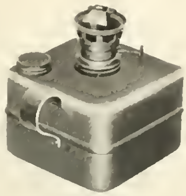

Fig. 3—Oil Fount.

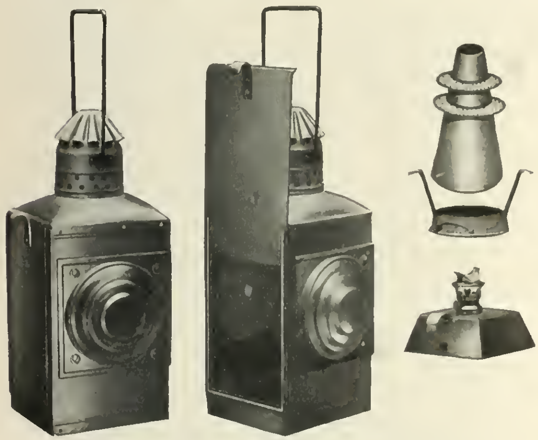

Fig. 2—Peter Gray & Sons' Semaphore Lamp.

shape and style of the burner are shown in the accompanying engravings. By doing without the chimney it is expected to save about one-half the cost of this part of the lamp, besides doing away with the risk of failures of lights from accumulations of smoke on chimneys and from breakages. Because of the peculiar design of the burner, the flame issues in a wide and uniform body. It is a robust and steady flame. Messrs. Gray & Sons have also designed a new fount, as shown in the engraving, Fig. 3. Both fount and burner are so designed that the position of the flame in relation to the lens is the same as in former styles.

Machinery Club of New York.

The Machinery Club of the City of New York is being organized to provide a convenient meeting place for persons interested in the machinery and metal trades. It is to be, primarily, a lunch club. The rooms are to be on the 21st, 20th and possibly the 19th floors of the Fulton Terminal building, which is under construction by the Hudson & Manhattan as the Manhattan terminal of its tunnels under the Hudson river. The club's quarters include a roof garden, lunch and grill rooms, assembly rooms, library and perhaps a few bedrooms for out-of-town members. It expects to occupy this space by May 1, 1908. The membership is limited as follows: Resident, 750; suburban, 500; non-resident, 1,000. The temporary address is 26 Cortlandt street. The officers are: President, F. H. Stillman, President of the Watson-Stillman Co., New York; Vice-President, R. C. McKinney, President of the Niles-Bement-Pond Co., New York; Treasurer, Walter L. Pierce, Secretary of the Lidgerwood Manufacturing Co., New York; Secretary, Theodore Waters.

Meeting of the Society for Promoting Industrial Education.

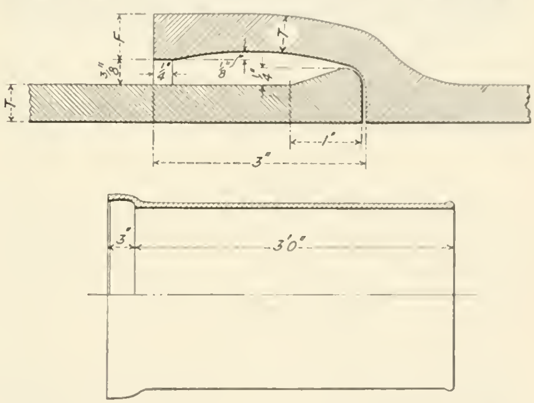
The annual meeting of the National Society for the Promotion of Industrial Education is to be held at Chicago on Thursday, Friday and Saturday, January 23, 24 and 25. It will begin with a public dinner at 6.30 p.m. on January 23 at the Auditorium Hotel, where the speakers will discuss the aims of the society and industrial education as an essential factor in national prosperity. The next day there will be public meetings at the Art Institute. The subjects of addresses and discussions include: The Apprenticeship Systems as a Means of Promoting Industrial Efficiency; The Place of a Trade School in Industrial Education and the Wage Earners' Benefit from Industrial Education. On Saturday morning the subject before the public meeting will be, A True Ideal of the Public School System that Aims to Benefit All. The afternoon will be taken up with business meetings of the society. C. R. Richards, Columbia University, New York, is Secretary, his address after January 20 will be the Auditorium Hotel, Chicago.

Cast Iron Culvert Pipe in 3-ft. Lengths.

The American Casting Co., Birmingham, Ala., is putting on the market a new design of cast-iron pipe for culverts. The cast iron pipes usually used for this purpose are the ordinary water main sections which are of unwieldy lengths and unnecessarily heavy for culverts, the internal pressure in a culvert being so much less than that in a water main. The pipe made by the above company is furnished in 3-ft. lengths, with dimensions and weights as follows:

	Thickness of pipe, T.	Face of hub, F.	Weight, per ft.
Diameter of pipe, 12-inch	[illegible]/16 in.	[illegible]/16 in.	60 lbs.
" " " 14-inch	[illegible]/16 in.	[illegible]/16 in.	70 "
" " " 16-inch	1/2 in.	5/8 in.	90 "
" " " 18-inch	1/2 in.	5/8 in.	105 "
" " " 20-inch	1/2 in.	5/8 in.	120 "
" " " 24-inch	[illegible]/16 in.	[illegible]/16 in.	160
" " " 30-inch	5/8 in.	3/4 in.	220
" " " 36-inch	11/16 in.	[illegible]/16 in.	300
" " " 42-inch	3/4 in.	7/8 in.	380
" " " 48-inch	[illegible]/16 in.	[illegible]/16 in.	[illegible]

The accompanying drawings show longitudinal sections of the whole pipe and of the joint. The bell is 3 in. deep and the inside diameter at the face of the hub is 1/4 in. larger than the outside diameter at the thickest part of the spigot. The short 3-ft. lengths of pipe, besides being easily handled, render the culvert quite flexible and by the enlargement of the inside diameter of the middle of the bell still further flexibility is secured. This design gives enough clearance for assembling, yet requires but a small amount of lead or cement



Cast-Iron Culvert Pipe, Showing Detail of Bell and Spigot.

for calking and frequently makes any calking unnecessary. In connection with culverts, the following table of estimated areas which certain sizes of pipe with given fall will drain of storm water is of interest:

Diameter of pipe.		Fall per 100 feet							
		1 in.	2 in.	3 in.	6 in.	9 in.	12 in.	24 in.	[illegible]
12 in.	Acres	1	2	3	4	5	6	8	10
14 "		2	3	4	6	8	10	13	16
16 "		3	4	5	7	9	12	16	[illegible]
18 "		4	5	6	8	10	13	20	[illegible]
20 "		6	8	10	12	16	20	[illegible]	[illegible]
24 "		10	12	15	20	25	30	[illegible]	[illegible]
30 "		20	25	30	45	60	75	100	[illegible]
36 "		40	50	60	75	100	130	200	[illegible]
42 "		60	80	100	125	150	200	300	[illegible]
48 "		80	100	120	150	200	260	400	[illegible]

Abolition of Grade Crossings on the Pennsylvania.

While invariably avoiding grade crossings on new work, the Pennsylvania has in the last five years been eliminating crossings at grade at many other places. On Jan. 1, 1902, there were 994 grade crossings on the lines of heaviest traffic between New York and Washington, and Philadelphia and Pittsburgh; but in the six years since then 568 of these—or more than half—have been abolished. The completion of the new Washington terminal marks the consummation of the plan of the late President Cassatt to eliminate all grade crossings in the important cities between New York and Washington. This has involved the elevation or depression of tracks in Jersey City, Newark, Elizabeth, New Brunswick, Trenton, Philadelphia, Chester, Wilmington, Baltimore and Washington. Out of 101 grade crossings between Altoona and Harrisburg on Jan. 1, 1902, only 51 remained on the first day of this year. These figures take no account of the extensive and costly revision of grades so conspicuous in Philadelphia—whereby tracks for trains in different directions have been either elevated or depressed, thereby eliminating the necessity for trains to cross tracks at grade. This has been an important factor of safety at places where traffic is dense.

A Forty-Yard Blue Print.

The accompanying photograph shows a blue print 51 in. wide and 120 ft. long recently made on an Everett-McAdam continuous

Blue Print 120 Feet Long.

electric blue printing machine manufactured by the Revolute Machine Company, New York. This print was made on a single sheet of paper.

In Reduced Circumstances.

The Nantucket Central, the smallest railroad in New England, has installed gasolene motor cars, and will send back to the Boston, Revere Beach & Lynn the little narrow gage locomotive that has been its motive power for many years. The line is 8.50 miles in length, and its yearly mileage has been 6,500 miles. Now there will be that boon that Nantucket Island people never enjoyed before—winter service between Nantucket and Siasconset.

The first of the new cars arrived the other day. It is a small affair, capable of carrying nine persons. Two larger cars will be constructed for summer use to carry 35 persons each. It is planned to construct a turnout at the four-mile marker so that trains may leave Nantucket and Siasconset simultaneously and pass each other. The trains will stop wherever signaled to allow passengers to board. Hereafter the force will probably consist of one baggage master, in charge of the baggage car, two or three motormen (as traffic requires), and a master mechanic. Hitherto there has been a coal bill of $500 annually. This will be materially reduced. Another plan is the extension of the track down Steamboat wharf as far as the freight house. This will bring close connection with the steamboat trade.—*Boston Herald.*

TRADE CATALOGUES.

A California Hydro-Electric Plant.—Bulletin No. 2,027 of the Allis-Chalmers Co., Milwaukee, Wis., entitled "The Hydro-Electric Plant at Trinity River, California," gives information on an interesting power transmission system. This plant has been built with an eye to future, rather than present, needs of the communities which it serves. It is in the central part of Trinity county, California, two miles below Junction City, where Canon creek, which supplies the water power, flows into Trinity river. The drainage area is 52 square miles. The dam, which is small, serves only to divert the water. In the system are 5,250 ft. of ditches and open flumes and a 1,821-ft. tunnel. An effective head of 600 ft., or a working pressure of 260 lbs. per sq. in., is obtained from two penstocks each 1,165 ft. long. The power house is equipped with Allis-Chalmers electrical machinery consisting of two three-phase, 25-cycle, 750-k.w., 500-r.p.m., 2,200-volt generators, seven step-up transformers, and auxiliary apparatus. The description of the plant is quite complete and will be of interest to engineers and students.

Band Saw Tools and Sharpeners.—The Rotary File & Machine Company, Brooklyn, N. Y., has issued a booklet describing band saw filing, setting, brazing and sharpening machines. The Ideal band saw sharpener is a new machine just being put on the market. It is similar to the New Reliable power machine, but is worked by hand and is designed for filing small band-saws up to 1½ in. wide with teeth spaced ½ in. apart. The saw is gripped by a vise firmly enough to hold it while each tooth is being filed, yet allowing it afterward to slip along into position for filing the next tooth. At each revolution of the file shaft the file is automatically withdrawn from the tooth, the saw is moved along and the file engages the next tooth. It is easily adjusted to take different sizes and the cutting depth is controlled by cams.

Speed Indicator.—Harry Vissering, Chicago, has published a pamphlet describing the Hausshalter speed, time and distance indicator and recorder for locomotives and cars. This apparatus has been used in Europe for the last eight years. It indicates and records speed at all times up to 100 miles an hour and also records the time of stops and time between stops, the total time that the train stands still between terminals, the time of delays and distance from the terminal where the delay occurred, the time of acceleration from stop to any speed and vice versa, distance between stations or stops and the total length of run. Line drawings show the construction of the device and its application to cars and locomotives.

Suction Gas Plants.—A pamphlet issued by R. D. Wood & Co., Philadelphia, Pa., is devoted to suction gas power plants. This system is designed particularly for prime movers from 40 to 300 h.p. The pamphlet gives tables comparing the relative net efficiency of steam engine and gas engine based on the original heating power per pound of coal. Other tables show the comparative consumption and fuel costs of different types of reciprocating and turbine steam engines, of gasolene, oil and gas engines and of the gas engine with suction producer. There are also some interesting results of tests. The illustrations consist of line drawings and half-tones of suction producer plants.

Small D. C. Generators.—Bulletin No. 93 of the Crocker-Wheeler Co., Ampere, N. J., is devoted to small engine type d.c. generators. These range in size from 25 k.w. to 150 k.w. The bulletin is illustrated with half-tones showing the motor and certain parts; rating and speeds of the different sizes are given in a table. Bulletins Nos. 91, 92 and 94 take up, respectively, induction motor panels; combined generator and feeder panels for direct current of from 125 to 250 volts, and switchboard panels.

Boilers.—A pamphlet of the Rust Boiler Co., Pittsburgh, Pa., is mostly taken up with full reports of two evaporation tests made by William Kent, Mem. A. S. M. E., of a 335-h.p. Rust boiler. The tests show between 10.8 and 12.2 lbs. equivalent evaporation per pound of combustible and from 69.2 to 75.9 per cent. efficiency of boiler based on combustible. The fuel used was Pittsburgh bituminous coal. The rest of the pamphlet illustrates and describes the Rust boiler.

Fans.—The Massachusetts Fan Co., Watertown, Mass., has just issued an additional section of its perpetual catalogue. This section is 16 pages and is entitled "Vertical and Horizontal Engines for Fan Driving." It is illustrated and gives descriptions, dimensions and horse-power tables. Previous sections of the catalogue relate to blowers and exhausters, heating, ventilating, drying and mechanical draft apparatus, etc.

Paint.—A recent issue of *Co-operation and Expansion*, published in the interests of the Heath & Milligan Co., Chicago, contains two interesting addresses on paint legislation, suggestions to sales agents, figures showing the growth in the number of establishments, capital invested and value of product of the paint manufacturers in the country, and news notes of interest to agents.

Reinforced Concrete.—The Atlas Portland Cement Co., New York, has published a 249-page pamphlet entitled "Reinforced Concrete in Factory Construction." It gives general data on factory construction and design, with one chapter on concrete aggregates, and then goes into more detail in descriptions of 10 individual buildings. It is profusely illustrated with photographs.

Portable Industrial Railways.—The Arthur Koppel Co., Pittsburgh, Pa., is distributing a pamphlet devoted to portable industrial railways. It gives dimensions, weights, etc., of types of dump and platform cars of various gages, and the weight of 15-ft. sections of track with different gages and rail sections. There are numerous photographs of installations.

Oil Storage.—Bulletin No. 4,002 of S. F. Bowser & Co., Fort Wayne, Ind., describes the Bowser system of oil storage as adapted to railroad storehouses and signal towers. It describes in detail the construction of the tanks, dumps and accessories, and is illustrated with half-tones showing parts and complete installations on several roads.

Catenary Line Material.—Bulletin No. 4,538 of the General Electric Co., Schenectady, N. Y., describes the catenary system of line conductors for high tension a.c. electric traction. The bulletin also describes designs of frogs, crossings, hangers, etc., and separate parts. It is illustrated with numerous half-tones of installations and auxiliary devices.

Thermit.—A folder issued by the Goldschmidt Thermit Co., New York, briefly describes the process of welding broken motor cases with thermit. A matrix of yellow wax is shaped about the fracture and the sand mold built about this as a pattern. The wax is then burnt out with a gasolene torch and the weld made as usual.

Storage Batteries.—Bulletin No. 8 of the Gould Storage Battery Co., New York, describes the two storage battery plants on the Dayton & Western, an interurban line. Bulletin No. 9 is devoted to storage batteries on alternating current systems and describes the plant on the Rutland Railway, Light & Power Co.

"Off for California."—One of the most attractive publications for the California season yet received is that of the Chicago, Milwaukee & St. Paul, with the above title. It is printed in colors, with artistic half-tone illustrations. There is a map of the system and a schedule of the "Overland Limited."

The Valve World.—The December issue of this organ of the Crane Company, Chicago, gives in full a paper on Education for Mechanics, read by President R. T. Crane at a recent meeting of the Western Railway Club. Correspondence between Mr. Crane and Andrew Carnegie on this subject is included.

United of Havana.—A recent folder entitled "Cuba: Its Battlements and Bowers," maintains the standard set by the passenger department in previous publications. Nearly all the photographs reproduced are new and well adapted to attract the attention of prospective tourists.

Belts and Ropes.—The Cling Surface Co., Buffalo, N. Y., has issued a pamphlet entitled "The Treatment of Belts and Ropes for Service and Profit." It goes at length into methods of using Cling surface on many different types of belts and ropes under various conditions.

Illinois Central.—A recent folder issued by the passenger department is designed to point out the interest and comfort of the trip to Cuba via New Orleans. It describes, with attractive illustrations, the sea voyage and Havana and other Cuban cities.

Rail Chairs.—T. H. Symington, Baltimore Md., is distributing a circular showing a drawing and perspective view of Gilchrist rail chairs of two types: one for light work on electric lines and the other for heavy work on both electric and steam lines.

Frogs, Switches and Crossings.—The Indianapolis Switch & Frog Co., Springfield, Ohio, is distributing a portfolio consisting of perspective views and drawings of many styles of switches, frogs and crossings, including parts and accessories.

Tie Plates.—The Spencer Otis Co., Chicago, has issued a pamphlet illustrating the Economy rolled steel flange tie plate. Several types of this and other plates are shown.

MANUFACTURING AND BUSINESS.

Fritz von Hiller has been appointed representative at Mexico City of the Pressed Steel Car Co., Pittsburgh, Pa., succeeding D. G. Farragut, resigned.

An organization in western Europe wants to get in touch with makers of pressed steel fire bars. For address, apply to the Bureau of Manufactures, Washington, D. C., mentioning file number 1,829.

A. E. Robbins has resigned from the Gold Car Heating & Lighting Co., New York, to go to the Ward Equipment Co., 141 Broadway, New York. His position in the latter company will be prominent; the title is as yet undecided, as the details of organization are not fully worked out.

The Erie has arranged to have some locomotives repaired by the American Locomotive Co., New York, but has not made any definite contract as to the number of engines. The Baldwin Locomotive Works, Philadelphia, Pa., has been for some time repairing about one locomotive a day for the Erie.

During 1907 the Baldwin Locomotive Works, Philadelphia, Pa., built 2,663 locomotives, of which 363 were for export. The total output includes 2,371 steam locomotives and 292 electric locomotives. Of the steam locomotives, 40 were Mallet compounds. The average weekly payroll amounted to 18,665 men.

F. K. Rhines has been made Assistant to the Treasurer and General Manager of the General Fireproofing Co., Youngstown, Ohio. Mr. Rhines was formerly Engineer with the East Iron & Machine Co., bridge builders, at Lima, Ohio, and more recently has been Chief Engineer and General Manager of the Dixon Engineering & Construction Co., Toledo, Ohio.

The new factory of the Glidden Varnish Co., Cleveland, Ohio, is completed and in full operation, and the old factory, the home of the company since 1874, is idle for the first time in its history. The new plant has been a year and a half in building and cost over $500,000. It covers 17 acres and the buildings are of brick, concrete and steel. It is said to be the largest and most perfectly appointed exclusive varnish factory in the world both in manufacturing and storage facilities. There also is a large grinding department.

Beginning Jan. 1, 1908, the sales departments of the Western Tube Co., Kewanee, Ill., and the Shelby Steel Tube Co., Pittsburgh, Pa., will be consolidated with the sales department of the National Tube Co., Pittsburgh, Pa. The new sales organization will be as follows. Edward Worcester, First Vice-President and General Manager of Sales; James W. Downer, John Duncan and H. S. White, Assistant General Managers of Sales, all with offices at Pittsburgh Instead of five local sales offices, there will be nine, as follows: New York, Battery Park building, Clifton Wharton, Jr., Manager of Sales, with sub-office in the Pennsylvania building, Philadelphia, Pa.; Pittsburgh, Pa., Frick building, A. M. Lally, Manager of Sales; Chicago, Commercial Bank building, H. S. Raymond, Manager of Sales; St. Louis, Mo., Chemical building, E. A. Downey, Manager of Sales; San Francisco, Cal., Crocker building, George S. Garritt, Manager of Sales, Thos. W. Brooks, Assistant Manager of Sales; Portland, Ore., R. R. Hoge, Manager of Sales, with sub-office at Seattle, Wash.; Denver, Colo., Majestic building, Edwin H. Fowle, Manager of Sales; New Orleans, La., Hugo Weidmann, Manager of Sales, and Atlanta, Ga., Candler building, Edward Worcester, Jr., Manager of Sales.

Iron and Steel.

The Chicago, Milwaukee & St. Paul has bought 2,200 tons of bridge steel.

The Pittsburgh & Lake Erie is reported to be in the market for 16,000 tons of bridge steel for a bridge at Beaver, Pa.

OBITUARY NOTICES.

Frank L. Palmer, formerly and for about 30 years connected with the passenger department of the Wabash, died suddenly at his home in Chicago, January 11, at the age of 65. Mr. Palmer resigned the office of Assistant General Passenger Agent about three years ago.

Henry F. Kenney, formerly and for many years Superintendent of the Philadelphia, Wilmington & Baltimore, died on January 10 at his home in Ridley Park, near Philadelphia, at the age of 73. Mr. Kenney continued in charge of the P., W. & B., and also of the Baltimore & Potomac after they came under control of the Pennsylvania, and he retired from active service only a few years ago. He remained President of the Delaware Railroad, a part of the system, up to the time of his death.

George F. Evans, Vice-President and General Manager of the Maine Central, died suddenly at Vanceboro, Me., January 10, while on a tour of inspection. Mr. Evans was about 60 years old. He was born at Concord, N. H. His first railroad service was on the Louisville, Evansville & St. Louis, where he began in 1881 as Secretary and Treasurer and rose to be General Manager. In 1892 he left that company to go to the Boston & Maine, where he was for three years Superintendent of the Southern division. Then for a year he was Assistant General Manager, and on December 1, 1896 was appointed to the position on the Maine Central (controlled by the Boston & Maine), which he held at his death. He was also Vice-President of the Washington County Railway.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

New York Railroad Club.

At the meeting of this club to be held in the building of the United Engineering Societies, No. 29 West 39th street, on Friday, January 17, a paper on "The Era of Steel and the Passing of Wood in Car Construction," by Arthur M. Waitt, will be read. W. R. McKeen (Union Pacific), and G. R. Henderson, of New York, will participate in the discussion.

Western Railway Club.

At the January meeting, to be held in the Auditorium Hotel, Chicago, on Tuesday, the 21st inst., at 8 o'clock p.m., the paper on "Ventilation and Heating of Coaches and Sleeping Cars," by S. G. Thompson, Assistant Engineer of Motive Power, Pennsylvania Railroad, postponed from the December meeting, will be presented; also a paper on "The Car Wheel and Its Relation to the Rail and Car," by S. P. Bush, Vice-President and General Manager of the Buckeye Steel Castings Co., Columbus, Ohio.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Chicago River & Indiana.—The President of this company is H. T. Gilbert; Vice-President and Treasurer, Frank Donnelly, office of both at Chicago.

Pennsylvania State Railroad Commission.—Governor Stuart on January 13 announced the appointment of the three members of the new State Railroad Commission, authorized under the law which went into effect January 1. The Chairman is Nathaniel Ewing, now Judge of the United States District Court in Western Pennsylvania, and formerly counsel for the Pennsylvania Railroad and other corporations. He is appointed for a term of five years. He is 60 years old. The second member is Charles N. Mann, of Philadelphia, clerk in the office of the prothonotary of Philadelphia county, 70 years old, appointed for four years. The third member is John Y. Boyd, of Harrisburg, retired; 45 years old. Mr. Boyd was formerly connected with anthracite coal companies on the line of the Pennsylvania Railroad.

Seaboard Air Line.—The United States Circuit Court has appointed E. C. Duncan, of Raleigh, N. C., as a third Receiver of this road.

Operating Officers.

Ann Arbor.—Eugene Hertenstein has been appointed Superintendent at Owosso.

Chicago Great Western.—C. S. Weston has been appointed Superintendent of the Southwest division, with office at Des Moines, Iowa, in place of C. L. Nichols, resigned. C. T. Banks has been appointed Superintendent at Red Wing, Minn.

Chicago River & Indiana.—D. L. Phipps is General Superintendent and T. P. Convey, Car Accountant; offices at Chicago.

Cleveland, Cincinnati, Chicago & St. Louis.—A. A. Hyatt has been appointed Trainmaster on the Cairo division, in place of T. J. Hayes.

Coahuila & Zacatecas.—P. E. O. Carr has been appointed General Manager, with office at Saltillo, Mex.

Lake Shore & Michigan Southern.—J. M. Horgan, heretofore Trainmaster, has been appointed Assistant Superintendent of the Franklin division.

Engineering and Rolling Stock Officers.

Atchison, Topeka & Santa Fe.—J. H. McGoff, heretofore Master Mechanic at Fort Madison, Iowa, has been appointed Mechanical Superintendent of the Eastern Grand division, with office at Topeka, Kan.

International & Great Northern.—J. F. Enright has been appointed Superintendent of Motive Power, with office at Palestine, Tex. See Mobile & Ohio.

Mexican.—W. T. Ingram, heretofore Engineer of Maintenance of Way on the Interoceanic, has been appointed Superintendent of Permanent Way, in place of T. A. Corry, office at Mexico, Mex.

Missouri Pacific.—J. L. Butler has been appointed Master Mechanic at Atchison, Kan., in place of L. J. Mills.

Mobile & Ohio.—E. G. Brooks has been appointed Master Mechanic of the Mobile division at Whistler, Ala., in place of J. F. Enright, who has resigned. Mr. Brooks also holds the title of Master Mechanic of the Southern Railway in Mississippi.

Tonopah & Goldfield.—E. S. Van Housen has been appointed Chief Engineer of this road and of the Bullfrog-Goldfield Railroad.

LOCOMOTIVE BUILDING.

The Imperial Copper Co. of Oregon has ordered one locomotive from the Hicks Locomotive & Car Works.

The Smith & Powers Logging Co., of Oregon, has ordered one locomotive from the Hicks Locomotive & Car Works.

CAR BUILDING.

The Stanley, Merrill & Phillips Ry. has ordered 25 flat cars from the Hicks Locomotive & Car Works.

The Canadian Pacific has ordered 400 composite steel and wood freight and ballast cars from the Dominion Car & Foundry Co.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

Arkansas, Louisiana & Gulf.—This company's projected line is from Monroe, La., on the St. Louis, Iron Mountain & Southern and the Vicksburg, Shreveport & Pacific, north across the Louisiana-Arkansas state line to Pine Bluff, Ark., with a seven-mile branch to Crossett, Ark., on the Chicago, Rock Island & Pacific, in all 113 miles. It has made a mortgage, of which the Colorado Title & Trust Company, of Colorado Springs, is trustee, securing $6,000,000 5 per cent. gold bonds. Of these, $2,860,000 are to be issued at the rate of $20,000 a mile on the 143 miles now projected, and the remaining $3,140,000 reserved for future extensions. The road has been built from Monroe, La., north to Bastrop, 28 miles, and grading is finished 28 miles further to Hamburg, Ark., and also on the branch to Crossett. Track-laying is in progress on these lines. The 80-mile further extension from Hamburg to Pine Bluff has been surveyed. The company has already received equipment both for operating the completed lines and for carrying on the construction work. J. M. Parker is General Manager of the Southern Development Company, which is building the road.

Arkansas, Oklahoma & Western.—See this company under Railroad Corporation News.

Atlanta, Birmingham & Atlantic.—Work is now under way on an extension of this company's line from Talladega, Ala., west to Birmingham, 75 miles, and on that from Bessemer, Ala., to Mulgay, 14.5 miles. The contractors are the Lane Bros. Company, Atlanta, Ga., and C. D. Smith & Co., Birmingham, Ala.

The company is making surveys for a line from Atlanta, Ga., southwest to New Orleans, approximately 500 miles.

Atlanta, Norcross & Gainesville.—Incorporated in Georgia to build a line from Atlanta northeast to Gainesville, about 50 miles. The incorporators include: H. D. Jaquish, C. C. Sanders, W. B. Smith, J. H. Hunt, R. Smith, A. J. Mundy, H. B. Smith, M. M. Ham, J. W. Bailey, H. H. Denn and J. L. B. Stevens, all of Hall county.

Canadian Northern Ontario.—Work is now under way on a line to Key Harbor, on Georgian Bay, about six miles, to carry iron ore from the Moose Mountain deposits.

Charlotte Harbor & Northern.—This company, which last year built 37 miles of railroad in Florida, is building with its own men a three-mile line known as the Hull cut-off to Hoist No. 7. The company is planning to build an extension from Arcadia to Plant City, 60 miles.

Chattahoochee Valley.—This company, it is said, has filed plans for an extension from West Point, Ga., north through Troup county, Ga., to Standing Rock, in Chambers county, Ala., thence to a point near Texas in Heard county, Ga.

Chicago & Milwaukee (Electric).—This company last year built 38 miles of electric line as follows: From Racine, Wis., toward Milwaukee, 34 miles, and four miles in Milwaukee. Work is now under way by the MacArthur Bros. Co., on the remaining six miles to Milwaukee; also on $3\frac{1}{2}$ miles additional in Milwaukee.

Chicago, Milwaukee & St. Paul.—It is said that this company expects soon to begin operating its Pacific extension from the Missouri river west to Marmath, Mont., 200 miles. The line is now in operation from the Missouri river west to Bowman, N. Dak., 163 miles. Most of the grading between this point and Butte, Mont., is finished, and it is expected to have the line in operation west to Butte about June 1.

Cumberland River & Nashville.—Contracts have been given to the Monticello Construction Company, of Monticello, Ky., for building this proposed line from Burnside, Ky., southwest to Monticello, 20 miles; graded for 12 miles. The line is projected from Corbin, Ky., west to Burnside, and thence southwest to the Tennessee state line, 100 miles. S. Woodward, President, Carlisle building, Cincinnati, Ohio.

Dansville & Mount Morris.—This company has projected a line to be built under the name of the Hornell & Dansville from Dansville, N. Y., south to Burns, 10 miles.

Denver, North-Western & Pacific.—This road, building from Denver, Colo., west to Salt Lake City, Utah, 500 miles, is now in operation to Yarmony, Colo., 147 miles. Contract has been let to Orman & Crook, of Denver, for the section from Yarmony to Steamboat Springs, 6.8 miles, leaving 310 to be built to finish the line to Salt Lake City. A contract was recently signed by which 2,000 men will be put to work to finish the line to Salt Lake City as rapidly as possible. A company has been formed by D. C. Dodge, Charles Boettcher, Thomas F. Walsh, of Washington; C. Phipps, of Pittsburgh, and H. M. Porter to push the work.

Denver & Transcontinental.—This company, it is said, has stopped making surveys for its proposed line from Denver, Colo., southwest to the Pacific coast.

Florida East Coast.—The extension of this road from Homestead, Fla., southwest along to Florida Keys, Key West, 126 miles, is reported opened for traffic south to Knight's Key, 66 miles. From Key West north track has been laid on about 15 miles.

Fourche River Valley & Indian Territory.—Location surveys have been made by this company from the present end of track to the west line of Perry county, Ark., 38 miles. An officer writes that the company has stopped work until times are easier. (March 15, p. 384.)

Grand Trunk Pacific.—Contract has been let to Foley Bros. & Larsen, of Winnipeg, for building from a point six miles east of Edmonton, Alb., to Wolf Creek, 120 miles west. The section will be the most expensive of any so far under contract, the cost being estimated at between $40,000 and $50,000 per mile. On the Lake Superior branch, which is being built by the same firm, there is some difficult engineering and it is not expected that the road between Winnipeg and Port Arthur can be finished before the latter part of 1910. About 100 miles was built last year on this section. Tenders have been asked for building a 100-mile section in British Columbia from Prince Rupert east.

Gulf, Colorado & Santa Fe.—Contract has been given to John Scott & Sons, of St. Louis, Mo., for building a connecting line from Center, Tex., to Zuber, on the Texas & Gulf, 21 miles.

Hillsboro & Northeastern.—This company has projected an extension from Hillsboro, Wis., south to Richland Center, 28 miles.

Hornell & Dansville.—See Dansville & Mount Morris.

Idaho & Washington Noathern.—This company is building with its own men an extension from Grand Junction, Idaho, to McGuires, 1.3 miles.

Indian Creek Valley.—This company has location surveys made for an extension from Jones Mills, Pa., about 10 miles. C. F. Hood, President, Normalville, Pa.

Lake Superior & Ishpeming.—Surveys are being made for a change of main line through Negaunee, Mich., about three miles; also for reducing the grade on a five-mile mining branch and to extend this branch three miles. The work, which will be heavy, is being done on account of prospective caving ground at the mines. It will necessitate the building of a number of steel bridges.

Laramie, Hahns Peak & Pacific.—This company has location surveys made and is about ready to lay tracks on an extension from Centennial, Wyo., south to Hebron, Colo., 77 miles; 33 miles will be in Wyoming and 44 miles in Colorado. Grading has been finished on about six miles.

Mexican Central.—Grading is reported finished on about 40 miles on the line this company is building from Apulco to Tamos, and track laying on this section is shortly to be started. Work is under way on a bridge over the Panuco river. Connection is to be made at Tamos with the Tampico-Aguascalientes branch, which is 25 miles from Tampico. The line is now in operation from Mexico City to Apulco, and when the entire work is finished will furnish a short and direct route from Mexico City to Tampico.

Mexican Roads.—Plans are being made by Robert S. Towns and associates, who own large smelting interests in Mexico, to build a line from Gutierrez, on the Mexican Central, to the Sombrete mining district in the state of Zacatecas, about 100 miles. Final location surveys for most of the way have been made, and construction work, it is said, will soon be started.

A concession is shortly to be granted by the Mexican Government for a line from Comacho, Zacatecas, where a connection is to be made with the Mexican Central to Bonanza, about 100 miles. The names of the projectors are not given.

Mingo & Monongahela.—Surveys made by this company for a line from the mouth of Mingo creek, Pa., northwest to Thomas on the Wheeling branch of the Baltimore & Ohio, 11 miles. C. McK. Watts, President, Elizabeth, Pa.

Missouri Southern.—Contracts let to the S. H. R. Robinson & Son Contracting Company, of St. Louis, Mo., for an extension from Ohlman, Mo., to Bunker, eight miles. The company has projected a further extension from Bunker to Salem, 20 miles.

Montana Railroad.—Contract has been given to Dittner, Bradbury & Co., of Lombard, Mont., for rebuilding this line from Lombard, Mont., east to Minden, 36 miles. Surveys also made from Minden north to Summit, 11 miles.

Nevada County Narrow Gage.—Contract let to Horan Bros., of Grays Valley, Cal., for building a line from Coleman Station to Long Ravine, 3½ miles.

New York Subways.—The necessary consent of property owners has been obtained by the Interborough Rapid Transit Company for its proposed improvements at Broadway, 96th and 102d streets. Three additional tracks are to be laid to make a more convenient junction. (Aug. 23, p. 215.)

Pacific & Eastern.—Surveys are being made by this company for an extension from Eagle Point, Ore., to Butte Falls, 21 miles.

Pittsburgh, Binghamton & Eastern.—Location surveys have been made for extending this line from Cedar Ledge, Pa., to Clearfield, 141 miles, of which 21 miles from Cedar Ledge to Powell were built last year. The Holbrook, Cabot & Rollins Corporation, Boston, Mass., are the contractors.

Randolph & Cumberland.—An officer writes that this company has temporarily stopped work on its extension from Hallison, N. C., northeast to Tillman, 3½ miles. Grading has been finished

San Francisco, Idaho & Montana.—Contract has been given to the Congon Construction Company, of Caldwell, Idaho, for building this line from Caldwell, Idaho, to Homedale, 16.2 miles, and work is now under way. Surveys made from Homedale to Winnemucca Nev., 275 miles. Address F. H. Richardson, Caldwell.

Stephenville North & South Texas.—This company has projected an extension of its line from Stiegler, Tex., north for 38 miles, and from the southern end of the line at Hamilton, south 60 miles.

Texas State.—This road, in operation from Rusk, Tex., west 10 miles, is owned by the state. It is to be extended west 18 miles to Palestine; also from the eastern terminus at Rusk east to a connection with the Southern Pacific, six miles. Plans, it is said, are being made to extend the road from Palestine northwest to Dallas, Tex., 100 miles, and on the southern end southeast to Sabine Pass, on the Gulf coast, about 160 miles from Rusk. (April 26, p. 600.)

Toronto, Hamilton & Buffalo.—Contract has been given by this company to Anderson & Goodale, of Hamilton, Ont., for building the Westinghouse spur to the city of Hamilton, Ont., 1.26 miles.

Tremont & Gulf.—This company, which now operates a line from Tremont, Tex., south to Winnfield, 50 miles, with a branch from the main line near its southern terminus at Menefee, northwest to Pyburn, 10.5 miles, is building an extension of this branch from the main line at Menefee southeast to Rochelle, 18 miles.

Van's Harbor Land & Lumber Company's Road.—Work is progressing in the clearing of the right-of-way on a proposed logging road to be built from Van's Harbor, Mich., towards Cook's Mill, nine miles, and it is expected to begin grading early this spring. A further four-mile extension is projected to finish the line to Cook's Mill.

Waterloo, Pella & Southwestern.—An officer writes that this company, which was incorporated last year to build a line from Waterloo, Iowa, southwest to Charlton, 120 miles, with about 20 miles of sidings, is making surveys and securing rights-of-way. Contracts will probably be let for building the entire line early this spring. E. A. Harris, Vice-President and General Manager, Pella, Iowa.

Wheeling & Lake Erie.—Referring to recent reports of improvements on this road, an officer writes the company has in contemplation a considerable amount of double tracking and minor grade and curvature reduction work and also the completion of the Sugar Creek & Northern, a new cut-off from Bolivar, Ohio, northwest to Orrville, 22 miles, which is now three-fourths finished. This cut off line will save six miles in distance, and will do away with the only severe grades on the main line, also provide greatly improved yard and terminal facilities. This work, however, as well as all other improvement and betterment work, has been for some time suspended, and there is no early probability of its being resumed until the financial conditions are wholly changed.

Wichita Falls & Northwestern System.—This company is building with its own men an extension from Olney, Tex., south to Belknap, 14 miles.

RAILROAD CORPORATION NEWS.

ARKANSAS, OKLAHOMA & WESTERN.—This company, formerly the Rogers Southwestern, has 30 miles in operation from Rogers, Ark., west to Siloam Springs, on the Kansas City Southern. An extension of 65 miles is projected from its western terminus to Pryor Creek, Okla., and an extension of 30 miles from its eastern terminus to Eureka Springs, Ark. Merriam, Smith & Co., of New York, are offering at par the first mortgage, 10-year 6 per cent. bonds of 1947 of this company. The issue of these bonds is limited to $10,000 a mile.

BALTIMORE & OHIO.—See Chicago Terminal Transfer.

BOSTON & MAINE.—The Fitchburg Railroad has renewed for one year at 6 per cent. $500,000 5 per cent. notes which matured January 15. The new notes have been sold at par through R. L. Day & Company.

CHICAGO, ROCK ISLAND & PACIFIC.—This company has sold to Speyer & Company $3,000,000 first and refunding 4 per cent. 30-year bonds and has given that firm an option on $6,000,000 more of the bonds. The bonds are part of an issue of $55,592,000. It is not announced what use is to be made of the proceeds of this sale, but it is believed that the transaction is part of the plan for redeeming $6,000,000 4½ per cent. notes maturing April 1.

CHICAGO TERMINAL TRANSFER.—The stockholders' protective committee has issued a statement to the effect that it was the "alleged lease dated April 1, 1903, to the Baltimore & Ohio at the ruinously low rental of approximately $160,000 per annum which brought the Terminal Company to foreclosure, the property leased to the Baltimore & Ohio being worthy of a rental of not less than $600,000 per annum. The properties leased to the Baltimore & Ohio are among the most valuable owned by the Terminal Company." It was because of representations to this effect made by the committee at the time the Baltimore & Ohio applied to the Court for permission to pay the first mortgage bonds of the Terminal Company that the Court ordered that this action should be done without prejudice to the rights of the Chicago Terminal Transfer to contest the Baltimore & Ohio lease as fully and freely as if the Baltimore & Ohio had not been allowed to pay the first mortgage bonds.

CRIPPLE CREEK CENTRAL.—The quarterly dividends on the common and preferred stocks have been passed. The annual rates have been 4 per cent. on the preferred and 6 per cent. on the common. This action is taken because of losses which the company sustained in the recent failure of the banking firm of Kessler & Company.

ERIE.—Net earnings for November, after taxes and equipment depreciation charges, decreased 68 per cent. Gross earnings were $4,294,239, a decrease of $341,996. Net earnings $449,644 against $1,418,816 in 1906, a decrease of $969,173. The gross earnings for the five months ended November 30 were $23,855,349, an increase of $1,024,667. Net earnings were $5,096,200, a decrease of $1,947,468.

GULF & SHIP ISLAND.—All the lumber mills on the line of this road, many of which were closed during December, are in operation again. The road runs from Jackson, Miss., south to Gulfport.

MICHIGAN CENTRAL.—The Turbine Steamship Company, of Buffalo, is reported to be negotiating to buy or lease the line of the Michigan Central extending from Fort Erie, along the western bank of the Niagara river, north to Niagara-on-the-Lake, 27 miles, as a connection for a line of turbine steamers from Niagara-on-the-Lake across Lake Ontario to Toronto.

MISSOURI PACIFIC.—This company has made application to the New York Stock Exchange to list $1,935,200 additional stock. This is to pay the regular semi-annual dividend of 2½ per cent. recently declared payable in stock.

MOHAWK VALLEY.—The Rochester Railway & Light Company has declared the first dividend of 5 per cent. on its $6,500,000 common stock. The Syracuse Rapid Transit has declared the first dividend of 3 per cent. on its $2,750,000 common stock. Both companies are controlled by the Mohawk Valley Company, which in turn is controlled by the New York Central & Hudson River.

NEW YORK CENTRAL & HUDSON RIVER.—See Mohawk Valley Company.

NEW YORK CENTRAL LINES.—The expected issue of equipment trust notes has been announced. It consists of $30,000,000 5 per cent. 15-year notes maturing in equal annual instalments, beginning November 1, 1908. They are guaranteed jointly and severally by the New York Central & Hudson River, the Lake Shore & Michigan, the Michigan Central, the Cleveland, Cincinnati, Chicago & St. Louis and the Chicago, Indiana & Southern. J. P. Morgan & Company and Drexel & Company have offered them for sale at prices ranging from 93 for the instalment maturing in 1922 to 98¾ for the first instalment.

NORTHERN SECURITIES.—This company's income for the year ended December 31, 1907, amounted to $359,000, an increase of $94,000 over 1906. Its two principal sources of income are dividends on the stock of the Chicago, Burlington & Quincy Railroad and on the stock of the Crows Nest Pass Coal Company. During the year the company acquired 150 additional shares of Burlington stock and 2,067 additional shares of the Crows Nest Pass stock. The one remaining outstanding share of the company's original capital stock was also surrendered to it, thereby permitting the distribution of its former holdings of Northern Pacific and Great Northern shares to be completed.

PENNSYLVANIA.—During the calendar year ended December 31, 1907, the shipments of coal and coke originating on the Lines East of Pittsburgh and Erie amounted to 58,457,932 tons against 49,711,088 tons in 1906. This is an increase of 8,746,844 tons, or 18 per cent.

ROGERS SOUTHWESTERN.—See Arkansas, Oklahoma & Western.

SEABOARD AIR LINE.—Judge Pritchard, in the United States Circuit Court at Richmond, Va., on January 14, announced that as the two present receivers were representatives of two hostile interests, he would appoint a third receiver of the Seaboard Air Line, representing the United States Court and no other interest. Edward C. Duncan, of Raleigh, N. C., a director of one of the constituent companies of the Norfolk & Southern, was on January 15 named as third receiver.

SOUTHERN PACIFIC.—This company continues to report heavy decreases in net earnings. The average mileage operated in November was 9,483, an increase of 175 miles as compared with November, 1906. Gross earnings were $11,692,722, an increase of $539,430. Net earnings after taxes were $3,524,434, a decrease of $1,381,822. For the five months ended November 30, with 202 more miles operated than in the corresponding period of the previous year, gross earnings were $58,030,955, an increase of $7,492,816. Net earnings for the five months were $16,765,486, a decrease of $3,545,848. In explanation of the showing for November the following official statement is made:

"About $866,000 of the increase in expenses is for maintenance of way, structures and equipment. The continuous rains of the spring of 1907, lasting longer than ever before known since the construction of the lines, softened the roadbed of the entire mileage in the states of California, Nevada and Oregon, so that under the exceptionally heavy traffic the track deteriorated very rapidly, and it was found after temporary repairs necessarily put on the line were made, that practically all of this mileage had to be resurfaced, ballasted and retied, and these causes have affected expenses in every month of the present fiscal year. They have added $494,000 to the expenses, of which $320,000 was for roadbed repairs and $174,000 for renewal of ties. Renewals of equipment increased about $190,000, due to increases in wages and heavier repairs required. Expenses for conducting transportation increased $665,000. Of this increase $295,000 is due to the higher prices of coal and fuel oil and a larger consumption. The remaining expenses resulted mainly from an increase of 78,000,000 ton-miles, or about 11 per cent."

TOLEDO & OHIO CENTRAL.—The Ohio Savings Bank & Trust Company, of Toledo, is offering at a price to yield 6¼ per cent. part of an issue of $500,000 4 per cent. car trust notes maturing up to 1818 of the Zanesville & Western, guaranteed by the Toledo & Ohio Central. These notes were issued for 500 steel underframe drop-bottom gondola cars of 100,000 lbs. capacity. The Toledo & Ohio Central owns the entire capital stock of the Zanesville & Western.

TOLEDO TERMINAL RAILROAD.—The reorganization plan of the Toledo Railway & Terminal Company has been declared operative by the bondholders committee. The new company is the Toledo Terminal Railroad.

UNION PACIFIC.—The average mileage operated in November was 5,713 miles, an increase of 120 miles as compared with the figure for the corresponding period of 1906. The gross earnings for that month were $7,406,655, an increase of $806,132. Net earnings after taxes were $3,371,176, an increase of $64,055. With 93 miles increase in average mileage, gross earnings for the five months ended November 30 were $36,389,214, an increase of $4,111,764. Net earnings for the five months were $15,010,174, a decrease of $1,168,019.

VANDALIA.—The $1,676,000 first mortgage 7 per cent. bonds of the Indianapolis & Vincennes, which mature February 1, 1908, are to be paid.

ZANESVILLE & WESTERN.—See Toledo & Ohio Central.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK
BRANCH OFFICES AT 375 OLD COLONY BUILDING CHICAGO, AND QUEEN ANNE'S CHAMBERS WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. *We give in our editorial columns* OUR OWN *opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.*

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS:

W. H. BOARDMAN, *Prest. and Editor.*
E. A. SIMMONS, *Vice-President.*
RAY MORRIS, *Secretary*
R. S. CHISOLM, *Treas.*
I. B. RINES, *Cashier*
L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Managing Editor.*
BRAMAN B. ADAMS
CHARLES H. FRY
FRANK W. KRAEGER
GEORGE L. FOWLER
HUGH RANKIN
BRADFORD BOARDMAN

CONTENTS

VOL. XLIV., No. 4. FRIDAY, JANUARY 21, 1908.

Modern transportation affords so many luxuries that we carelessly assume that it can give us everything. Having got a car of oranges through from California in ten days we expect the railroads to bring all cars of all freight through in the same time. Why not? We make close connection at a junction every day for two months; why should we miss connection (and waste two hours) three times in the next ten months? The telegraph is infinitely faster than the locomotive, yet it bothers us in the same way. A broker telegraphs from New York to Chicago and gets his answer in five minutes or less; why do ordinary messages sometimes take six hours? These facts of experience are called to mind by a letter in a New York paper from a complaining passenger. He says:

> My wife and two children boarded the Second Empire for Rochester at the Grand Central Station, New York, on Dec. 23. I accompanied them as far as Albany. An hour before arriving there I was informed that the car we were in would be taken off at that station, and that I had better take my family into the crowded car ahead. The train arrived in Albany promptly at 3:57 p. m., and left on time, 4 p. m. In the interim of three minutes I managed with much trouble and inconvenience, to find a place for them in the car ahead. They were hardly seated when we were told to return to the car we had just left, as it had been decided to take off the car we had been sent into. Meanwhile the crowd at the Albany station was permitted to crowd in. My wife and I managed to carry our boy, two and a half years old, and an infant, one year old, together with winter wraps and baggage, back into the original car we had boarded at the Grand Central Station. I had to jump from the car, going at about seven miles an hour, to avoid being carried beyond Albany. The change-car performance was repeated at Utica, where my wife was compelled to make two trips with children and baggage through two parlor cars and a diner.

That passenger, no doubt, is mad enough to blame the company for all his troubles, even if he were to be shown that he himself was partly responsible; yet his case is not so clear as it seems. In the first place he should have inquired as to the best time to change. He would have been told to go forward just before reaching Albany. The party should have gone to the center of the forward car, there to stand until the Albany passengers vacated seats. Then the woman and children would at least have been somewhat calmed and prepared for the return journey. Remaining in the train to assist his wife to settle herself may have seemed to this man reasonable, as it does to some people to throw kisses after a train till sometime after it has vanished from sight; but it is utterly unreasonable, unless one is willing to limit himself not only to the time allowed by the time table, but to a considerably less time. It is a gross imposition on passengers entering a train to be knocked over by men hurrying out at the last moment. It is a pity that there is no way to regulate these people who lack the fortitude to say good-bye at the gate. (This man's estimate of the actual stop in this case appears to be wrong.)

The car inspectors may or may not have been negligent. Taking off the forward car was probably due to some fault which was discovered after the train stopped; and not even a critical passenger will ask that all defects in trucks shall be discovered while trains are in motion. The limiting of the stop to three minutes is also a feature that the passenger will agree is unavoidable, if he belongs to that great majority who demand that every train shall reach its destination in the shortest possible time. As this man gives no particulars, it is to be assumed that the leaving and entering crowds at Albany avoided each other with reasonable decency; but we should not have been surprised if he had found two-thirds of the passengers entering at the wrong door and many persons waiting for others to get out of their way when they might have been moving if properly instructed. By intelligent co-operation between stationmen and trainmen passengers might be saved a great deal of unnecessary annoyance. Why do not stationmen direct passengers, two minutes before the train arrives, to gather at the most favorable point on the platform? Where there are two or three cars in a train, a trainman ought to be watchful and show passengers where seats are most plentiful, possibly remaining on the car platform or inside the car to stir up the car-seat hogs who are intrenching themselves against newcomers. In a dark train-shed the assistance given by brakemen is particularly welcome to passengers. (Why should not cars be lighted well—instead of by a single burner—when in a dark station?) On local trains where people have little hand baggage, these attentions to passengers' wants are less important, but a through train, stopping only three minutes at a big station, presents another problem. Quite likely the best way to cure these difficulties, in many cases, would be to lengthen three-minute stops to six minutes, and put the corresponding additional burden on the engine; but brakemen and platform men ought to be "jacked up" in any event. As to how this road came to be so unfortunate as to have to cut out two cars on a single trip, our complaining friend should go to the Public Service Commission. That body is going to investigate obscure causes of delays.

The courts have succeeded the legislatures. The opinions now being handed down dealing with the state railroad legislation of 1907 are not temporary restraining orders granted for the sake of preserving equitable rights pending judicial determination of the facts, but the formal opinions of judges arrived at after mature consideration. Two decisions were given on Monday which will serve to remind the thoughtless legislator that railroads as a class are still entitled to be treated with the same careful fairness and justice as private citizens. One of these decisions was by Judge Smith McPherson, in the United States District Court at Kansas City, Mo. It dealt with a statute passed by the Missouri legislature in 1907 forbidding foreign corporations from transferring suits brought against them from the courts of the state to federal courts on pain of forfeiture of their charters. Both in Missouri and in Arkansas and Alabama, which also in 1907 passed similar laws, federal judges had straightway issued temporary injunctions prohibiting the states from enforcing any of the penalties laid down in these laws, pending decision as to their constitutionality. The decision of Judge McPherson is, we believe, the first final decision which has been handed down in one of these cases. As long as we have a federal government and a constitution there can be no great doubt as to the fate of such laws as these, but the gist of Judge McPherson's opinion is worth quoting for the brevity and accuracy with which it sums up the absurdity of such laws. He holds as follows:

> "The Missouri statute of 1907 is void because it allows a resident company to sue in the federal courts if there is a federal question and denies that right to a non-resident company, and because it seeks to take from the complainant a right which is given by the Constitution."

The application of various railroads of the state for a permanent injunction to prevent the secretary of state from enforcing the law was therefore granted. The attorney-general of Missouri has announced that the case will be appealed, but we fail to see any reasonable chance that this law will be upheld. The other decision was given by the Supreme Court of Pennsylvania, which, on a close division—4 to 3—in effect overthrew the 2-cent passenger rate law passed by the legislature in 1907. This was an affirmation of a decision made in September, 1907, by the Common Pleas Court for the district of Philadelphia, which declared the 2-cent fare law could not be enforced against the Pennsylvania Railroad because it was confiscatory. From this last decision there is no possible appeal, and the Pennsylvania, which on October 1 reduced its rates to 2 cents a mile, in spite of the favorable decision of the lower court, is now free to make a general increase in passenger rates. The majority opinion of the Supreme Court was given by Justice Mitchell, who took occasion in the course of it to say in substance:

> The point of injustice is reached long before that of confiscation, and in putting the legal estimate of legitimate profit at 6 per cent. there are other elements which would justify much larger earnings. Injustice is done by any failure to consider these.
>
> Passenger and freight traffic should be separately considered, otherwise freight rates would be inequitable, so that passenger travel might be cheap.
>
> While the public has certain rights, which in case of conflict must prevail, yet it must not be forgotten that even so-called public service corporations are private property, organized and conducted for private corporate profit. Assuming that it fulfills its duties to the public, a corporation is entitled to a fair profit on every branch of its business just as a merchant or manufacturer is.

One of the minority opinions declared that the rate of 2 cents a mile is not unreasonable; another that the exact effect of the law cannot be determined on account of the complex nature of the railroad business, and another that the effect of the act on the gross earnings, and not alone on the earnings from passenger traffic, should have been considered. The practical application of the decision is complicated by the fact that directly it applies only to the Pennsylvania, but in effect it apparently applies to all the railroads of Pennsylvania.

COAL ROADS UNDER THE RATE LAW.

The "commodities clause" of the Rate Law makes it unlawful for a common carrier to transport in interstate commerce after May 1, 1908, any commodity except timber, "manufactured, mined or produced by it or under its authority, or which it may own in whole or in part, or in which it may have any interest direct or indirect," except for its own use. This section of the law affects mainly the anthracite coal roads and also some railroads which own bituminous coal companies. Its strict enforcement four months hence could hardly fail to cause great losses to the holders of many kinds of railroad securities, both because many railroad companies would have to sell property at a time when values are low, and because the uncertainty attending the method of separation of railroads and coal properties combined as security under the same mortgage would reduce current prices. Application of this section of the law would also upset the whole anthracite coal trade, by making illegal the present methods of marketing. It is, therefore, with a great deal of relief that the anthracite coal roads have received the following statement made on January 17 by Attorney-General Bonaparte, covering the "commodities clause":

> It is clear that this clause if valid will make it impossible for many railroads which own coal mines to transport the coal to market after the date named and it is understood that some of these railroads have been advised by their respective counsel that the above quoted provision of law is unexceptional. The Department of Justice contemplates the institution of proceedings, as soon as possible after the date named whereby a prompt determination of this question by the Supreme Court of the United States may be obtained. It is expected that the railroads concerned will cooperate with the Government to this end, and if they do so in good faith and if they in good faith and immediately obey the decision of the Supreme Court when rendered it is not the purpose of the Department of Justice to prosecute them for a failure to comply with the terms of the act pending the decision of the Supreme Court.

There are two railroads which had already made clear their position in regard to this section of the Rate Law. The Buffalo, Rochester & Pittsburgh in December, 1906, sold the Rochester & Pittsburg Coal & Iron Company, whose stock is deposited as part of the security for the railroad's general mortgage bonds of 1937, to the Mahoning Investment Company, subject, however, to the lien of this mortgage. For the \$1,000,000 stock of the coal and iron company the railroad received a little more than \$4,000,000 of the stock of the investment company, which it distributed pro rata among its stockholders. Whether or not transferring coal properties to a separate company, presumably controlled in exactly the same interest as the railroad satisfies this law, is a question. It would certainly seem that in this case the railroad still has at least an indirect interest in the company which mines the coal.

The other company which has outlined its position on this section of the law is the Delaware, Lackawanna & Western. In the annual report for the year ended December 31, 1906, President Truesdale speaks as follows in regard to this section of the Rate Law: "The avowed purpose of this law was to compel companies such as this to dispose of their coal properties, thus separating the transportation of coal from the mining and merchandizing thereof. The management is advised by its legal representatives that this company cannot be required to dispossess itself of its coal properties by the action of Congress under the guise of regulating commerce between the states, especially as by the terms of its charter—one of the early ones granted by Pennsylvania—it has the undoubted right to mine, purchase, transport and merchandize coal." This flat denial of the right of Congress to compel the disposal of their coal properties is likely to be the position taken by all those companies which have early charters granted by the state of Pennsylvania specifically giving them the right to engage in the coal business. One of the anthracite roads holds even a stronger position than this. The Delaware & Hudson, though usually spoken of as if it were the Delaware & Hudson Railroad, is the Delaware & Hudson Company, the direct successor of the Delaware & Hudson Canal Company, which was a canal and coal mining company which owned and leased railroads. However, the general question of the constitutionality of this section of the law is settled by the United States Supreme Court, the case of this road will involve special technicalities.

Besides the anthracite roads, other roads which are in one way or another interested in coal properties, are the Buffalo & Susquehanna, Pittsburgh, Shawmut & Northern; New York Central; Pennsylvania; Baltimore & Ohio, Western Maryland; Norfolk & Western; Chesapeake & Ohio; Hocking Valley; Evansville & Terre Haute; Louisville & Nashville; Missouri Pacific; St. Louis, Rocky Mountain & Pacific; Denver & Rio Grande; Union Pacific; Great Northern, and Lake Shore & Michigan Southern. These last two roads are included in the list because they own stock in subsidiary companies, which subsidiary companies own coal mining companies; the Great Northern, the Lake Superior Company; and the Lake Shore & Michigan Southern stock of the Lehigh Valley and of the Reading Company, which controls the Philadelphia & Reading Coal & Iron Company. The ownership of coal properties by the railroads ranges all the way from direct ownership of coal lands by a railroad company to ownership of a railroad company by a coal mining or by a manufacturing company like the Tennessee Coal, Iron & Railroad Company, part of whose business is mining coal. A decision on the part of the United States Supreme Court that this section of the Rate Law is constitutional will necessarily be followed by much litigation, for there are so many forms and degrees of ownership, control or indirect interest in coal properties by railroads, and *vice versa*, that a large number of individual cases will have to be decided to establish enough precedents to cover the whole ground.

RAILROAD BONDS AS FINANCIAL POINTERS.

The place of the railroad bond in this country as an index of financial conditions is becoming more and more definite. In the first place the volume of that class of security has grown to be immense even allowing for the competition of the industrial bond and, in a localized sense, of the street railway bond. The railroad bond has thus the high status derived from its relative magnitude as a vested interest. It also has the dignity of age based upon a form of property and investment which goes back for more than three-quarters of a century and, contrasted with which, almost all other classes of bonds, except public or realty securities, seem of mushroom growth. Finally it has the reputation of conservatism. To be sure it has had its periods of gloom. Railroads, like other properties, have had their receiverships, their bond foreclosures, their reorganizations; and not many years ago came that vicious form of speculative high finance when the capital stock of high class roads was translated into bonded debt and new and relatively valueless stock issued for purposes of control pure and simple. Still, allowing for all its mutations and vicissitudes, the railroad bond has generally asserted its value. The senior bonds of a strong railroad becomes the first and earliest investment of the capitalist, large or small, in his reaction from the terrors of a panic. The long "drag" of five years following our great panic in the autumn of 1873 depressed greatly railroad stocks and kept them down; but during the same time the interest return on high grade railroad bonds fell from 7 to 4 per cent. or a little more. The railroad share, even of a conservative railroad, fell; the conservative railroad bond rose.

In the present stage of recovery from the panic conditions of the closing months of 1907 the same transfer of funds, many of them lately hoarded, into high class railroad bonds is to be observed. But the situation varies much from that in 1873 and the succeeding years. There was then no great mass of "undigested" securities, many of them railroad bonds, waiting to be poured upon the market. There were practically no underwriters holding such securities in stock awaiting liquidation. There were in 1873 a considerable number of railroads caught by the panic in process of construction; but it is doubtful whether, in their total, they were more than a moderate fraction of the various forms of railroad improvements more or less tied up now and awaiting a better market for loans, and those loans, in turn, depending measurably on a recovery in railroad earnings itself based partly upon an uplift of productive industry. Finally, overhanging the situation like a summer cloud, is the coming period of maturity of the so-called "short notes" of the railroads added to the natural maturity of regular funded obligations. In round numbers about $117,000,000 of these short notes of the railroad companies mature this year; about $71,000,000 in 1909; and about $235,000,000 in 1910. To these are to be added about $215,000,000 of regular railroad bond maturities during the three years besides some $65,000,000 of equipment notes or bonds. The impressive total of the maturities of the three years is approximately $703,000,000, of which $179,000,000 mature during the year 1908. It is an imposing sum; and, as it must be liquidated mainly by railroad securities senior to stock, the railroad bond, both as a liquidating force and as an index of the situation, leaps to fresh prominence.

The pessimist, or in the vulgate of the street, the habitual "bear," naturally lays stress upon the bigness of the figures and talks in the language of despondency. But a blow runs through his major premise. He talks as though the whole of these railroad liabilities must be met with *cash*. They are in fact liabilities actually outstanding to be replaced by others without increase of the debt. Of the total maturities only about 25 per cent. fall due in the present year, and of these about 22 per cent. are old long time mortgage bonds easily refunded. It is noteworthy also that of the old railroad bonds falling due during the coming three years, out of 55 issues 32 represent old 6s and 7s sure to be refunded at a lower rate and with a considerable annual saving of interest. The reverse is true, however, of the equipment issues of the three years of which almost the whole of the $65,000,000 were marketed in low rate interest periods, very few of them as high as 5 per cent., and most of them to be refunded probably at a higher rate than they bear now. Some $22,000,000, or about one-third, fall due in the present year. Of the railroad short notes, so copiously marketed during the last year or two, $423,000,000 fall due within the three years. They are, for the most part, 5 per cents. and refunding at that rate or lower ought to be feasible—considerably lower if a mortgage bond is substituted. Of the whole $703,000,000 to be met during the three year period only a very small part is likely to call for cash and the only question in liquidation will be the market value of the refunding bond.

In this vital question of the future, the potency of refunding bonds, the year, especially considering the fact that the market has but just emerged from panic conditions, starts off very encouragingly. In the face of adverse prophecies the New York Central has refunded the $14,000,000 of Canada Southern bonds and has placed its $30,000,000 of new equipment notes. The New York, New Haven & Hartford has negotiated successfully its $39,000,000 of debentures. On the basis of present market values the index rate of the three loans is about 5 per cent., and only in one case is there high mortgage security. Three new railroad loans alone thus, in amount, represent $83,000,000, or about 71 per cent. of the whole of the $117,000,000 of short notes falling due in 1908, or about 60 per cent. if the 1908 equipment notes of the railroads are included. Taking another test one finds, since the recent recovery of the market, the high grade mortgage bond back at the 4 per cent. basis—for example West Shore 4s—total issue $50,000,000—selling at above par, or Union Pacific first mortgage 4s—total issue $100,000,000—a trifle below par. As a pointer to the future the railroad bond of the substantial and dividend paying corporations thus responds cheerfully. There are, of course, adverse contingencies. Nobody knows just what is the volume of undigested securities, some of them underwritten, waiting for a better market. Nobody can measure with exactitude the length and depth of the industrial drag; and, after the chastening experience of the last few months, every motive urges railroad corporations toward economy and conservatism. But, with that motive harvesting results, the railroad bond, so far as it is a solvent of the situation, points toward clearing weather rather than toward cloud and storm.

Train Accidents in December.[1]

Our record of train accidents occurring on the railroads of the United States in December includes 14 collisions and 10 derailments, 24 accidents in all. This record is not published in full except in the cases of the few accidents which are especially prominent—in the present instance four collisions and two derailments. The record of "ordinary" accidents—which term includes, for our present purpose, only those which result in fatal injury to a passenger or an employee or which are of special interest to operating officers—is given at the end in the shape of a one-line item for each accident, showing date, location, class and number of deaths and injuries. The items of which details are given are indicated in the tabular statement by the use of italics. This record is based on accounts published in local daily newspapers, except in the cases of accidents of such magnitude that it seems proper to send a letter of inquiry to the railroad manager.

The rear collision of passenger trains at Hanover, Md., on the 4th, killing five passengers, appears to have been due to the negligence of the engineman of the following train who had passed two automatic block signals set against him (at Sand Pit and Harwood) one and two miles west of Hanover respectively. The leading train was a local passenger just starting away from the station, and the one following was an express. The men killed were passengers. The passengers injured were mostly in the rear car of the standing train, which was wrecked.

The collision near Worcester, Mass., on the 14th, was due to the presence of freight cars on the main track in the face of an express passenger train, the men in charge of switching operations having moved these cars to the main track without proper protection. An eastbound passenger train running at full speed on a descending grade crashed into and wrecked the freight cars and its engine was overturned. This part of the line is equipped with automatic block signals but the switch at which the freight cars

[1]Abbreviations and marks used in Accident List:
rc........Rear collision.
bc........Butting collision.
xc........Other collisions; as at crossings or in yards. Where only one train is mentioned, it is usually a case of a train running into a standing car or cars, or a collision due to a train breaking in two on a descending grade.
b.........Broken.
d.........Defective.
dr........Defect of roadway.
eq........Defect in car or engine.
n.........Negligence.
unf.......Unforeseen obstruction.
unx.......Unexplained.
derail.....Open derailing switch (negligence of engineman or signalman).
ms........Misplaced switch.
acc. obst..Accidental obstruction.
malice....Malicious obstruction of track or misplacement of switch.
boiler.....Explosion of boiler of locomotive on road.
fire.......Cars burned while running.
Pass......Passenger train.
Ft........Freight train (includes empty, engines, work trains, etc.).
*Wreck wholly or partly destroyed by fire.
†One or more passengers killed.

were thrown to the main track has no indicator by which the men in charge of the switching movements could know when a train was approaching the entrance of that block section on the main line. A flagman had been sent out by the switching crew, and, a few minutes before, he had stopped a train and the main track had been cleared for it, but it appears that his signal was not seen by the engineman of the passenger train. There was a blinding snow storm at the time. This engineman at last accounts had made no statement, being confined to the hospital. The engineman was the only person seriously injured.

The collision at Camden, N. J., on the 27th, causing the death of three passengers, occurred on a block signaled line, but appears to have happened close to the terminal, where the space interval was not enforced. A train from Pemberton ran into the rear of one from Atlantic City. The speed was not high but it appears that the tender of the engine of the Pemberton train penetrated the first passenger car behind it and that the fatalities occurred in this car. There was a dense fog at the time of the accident. The newspapers say that since the collision an order has been issued to enforce the block system on this part of the line.

The collision near Lenox, Mich., on the 27th, also occurred in a dense fog. The freight train, with two engines, was standing on a side track and it appears that the switch connecting with the main track had not been set right. The five men killed were all trainmen; two enginemen, two firemen and a brakeman.

The derailment at Shenandoah Junction, W. Va., was caused by a rear collision of freight trains. This collision did not do great damage but the wreck fouled the adjacent track, on which the passenger train was running. The conductor and flagman of the freight train which was run into are held blameworthy for not having properly signaled the following train. Testimony was given before the coroner that the conductor was asleep in his caboose.

The derailment at Marshall, Colo., on the 24th, was of a kind which has been heard of before in Colorado but rarely in other states. Two passenger cars and a baggage car were thrown from the track and lodged some distance away and the express car was overturned. The engine remained on the track. In former years the derailment of trains by high wind was reported nearly or quite every winter in Colorado, but the trains which suffered were made up of narrow-gage cars and engines, which were both light and top heavy; but the accident now reported occurred on a line which is recorded in the *Official Guide* as standard gage.

TRAIN ACCIDENTS IN THE UNITED STATES IN DECEMBER, 1907.

Collisions.

Of the eight street car accidents of greater or less importance reported in the newspapers in December, none is charged with having caused any fatal injury.

CONTRIBUTIONS

The Griffin Double-Tread Car Wheel.

Buffalo, N. Y., Dec. [illegible], 1907.

TO THE EDITOR OF THE RAILROAD GAZETTE:

On account of absence from home I saw only recently the description of the double tread car wheel, published in your issue of November 8. There are some points in the article that should be corrected. The patent was not issued to the New York Car Wheel Company. It is the intention to arrange for the manufacture of this type of wheel, under proper conditions, with any car wheel makers throughout the country who may wish to make such arrangements, in order that the wheels may be obtained at any desired point or in any desired quantity. I would also like to correct the inference, which might be drawn from your description, that the inner tread would not be subject to brake heating. The friction from brakes would heat the inner tread the same as it does the outer one. The important point is that the heating of the inner tread would not set up dangerous conditions, or interfere with the wearing capacity of the wheel in the manner that such conditions now affect the outer tread. In order to have a proper understanding of the whole matter, I beg to give herewith the reasons that lead me to believe that this new type of wheel will remedy the present unsatisfactory conditions of wheel service.

In order to produce a car wheel that will successfully meet

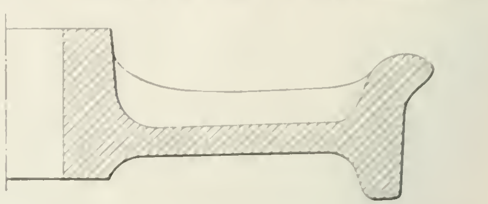

Fig. 1.

the severe requirements of heavy car and locomotive service, there must be some change or improvement in the present type of wheel. Under 50-ton cars and heavy locomotives the wheel load has nearly doubled; in passenger car service, the increased load and speed develop brake service conditions that are proving very disastrous to every type of wheel used, whether steel or iron. At present all of these strains fall on the single outer tread, and it is manifest that if they can be divided so that an outer tread is subjected to rail wear only, while the inner tread takes the strains arising from brake service, the life of wheels will be increased, and the dangers involved in having all strains imposed on the single outer tread will be averted.

During the past 50 years the standard freight car wheel used in America has been the chilled wheel. The manufacture of such wheels began in a limited way in the United States about 60 years ago and the section of wheel first used was known as "single plate" (see Fig. 1). When the weight of cars and locomotives began to increase, in the early sixties, it was found that the single plate wheel would not stand the expansion strains caused by the increased brake friction necessitated by heavier loads and higher speed. Cracks running through the single plate in line with the tread and extending afterwards to the tread became so prevalent,

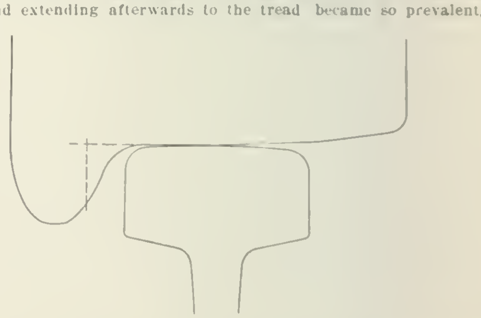

Fig. 2.

and broken wheels became so numerous, that it was necessary to find some means of overcoming the trouble. The double plate wheel was invented to meet the need.

One of the original types of this section, known as the Washburn double plate wheel, soon became the standard section for American railroads. This type of double plate wheel, made heavier from time to time to meet the increasing requirements of service, has remained ever since the standard section. Within the past few years, the rapid introduction of heavy equipment has produced two important results in the life of car wheels: First, more rapid wear on tread and flange; second, disintegration and burning of the metal in the wearing face of tread and flange by reason of increased brake friction.

Fig. 2 shows a section (half size) of the M. C. B. standard tread and flange, and an A. S. C. E. 85-lb. rail section. The vertical dotted line shows the limit of flange wear allowed under M. C. B. rules. When the limit is reached, the wheel must be removed from service. The difference in profile between throat of wheel and corner of rail against which the flange must bear may be noted, and also the actual section of metal that can be worn from the flange at throat of wheel before the latter is condemned as unfit for service. There can be no question but that the factors of wear and strain under 50-ton cars and heavy locomotives have been very heavily increased, and that the life of wheels will be correspondingly shortened.

The causes for which wheels are removed from service under heavy equipment show a marked increase in certain directions, namely: cracks in the face of tread and in the throat of wheel at flange extending through the chilled surface, which arise from the heat caused by heavier braking friction; shelling, or crumbling, out of the metal in the face of tread when the life of the metal has been destroyed by constant heating from increased braking friction; and thin flanges, caused by more rapid wear due to heavier service. It may be seen that these three causes of wheel removals are connected entirely with the tread and flange, and that they arise principally from the results of brake service. It is also evident that proper control of the heavier equipment by means of brakes must produce greater heating on the tread and flange of wheel, and that therefore the life of wheels will be shortened as the use of the heavier equipment becomes more general.

Not only is the question of increased cost of wheel service due to the above conditions a serious matter, involving as it does the removal of the cars from service while wheel repairs are being made, but the factor of increased danger from broken wheels and broken flanges is one that must be provided for in some way. The breakage of wheel flanges due to the formation of cracks as above described is rapidly increasing, and very few wheels removed from heavy equipment fail to show groups of such cracks or long cracks made up of such groups when flanges are broken off with a sledge to determine if such cracks exist. It is not an exaggeration to state that nearly all wheels under heavy equipment will develop such defects sooner or later. Some remedy for these conditions must be found. The use of steel wheels has been proposed, but it remains yet to be seen to what extent steel wheels, or even steel-tired wheels, will be free from like conditions after being subjected for a similar length of time to the heavier car and locomotive service. The burning of the metal due to heavy brake friction produces effects as disastrous on the steel wheel as on the chilled wheel.

The fact that the chilled wheel has been, practically, the standard wheel used under all freight equipment in America during the past 50 years, the low first cost and high scrap value it possesses, and the readiness with which it can be obtained from manufacturers in all parts of the country, certainly make it unique in its position among the important items of railroad equipment. If some way out of the difficulties created by the advent of the 50-ton car and the great increase in weight in all classes of railroad equipment can be found, it will be a very important advance in overcoming one of the great difficulties of present conditions of service. The rail problem is familiar to almost every one; the wheel problem is familiar enough to railroad officials and wheel manufacturers who appreciate its gravity, but it has not yet been publicly discussed as extensively as the rail question.

The standard section of 33-in. chilled wheel weighing 700 lbs., as now used by nearly all railroads under 50-ton cars, seems to possess ample strength in the body for the service required. The entire difficulty seems to lie in the tread and flange. Following the line of development from the single to the double plate wheel, it is now proposed to use a double tread wheel to avoid the increased failures caused by present conditions. Fig. 3 shows the Griffin double tread wheel, developed to this end. The fundamental purpose in the double plate wheel was to replace the straight line and section of the single plate wheel by the curved double plates connected with the hub and the curved single plate connected with the tread, the latter being supported by the curved brackets running from the double plates to the tread. The idea was that when the tread of wheel was heated and expanded by the application of brakes, the curvature of the double and single plates and brackets supporting the tread would permit the expansion of the wheel as a whole without the cracking or fracture which occurred in the single plate wheel. This was exactly what took place, and not only was this valuable object accomplished by the use of the double plate wheel, but the support of the load on wheel tread was distributed over a greater length of wheel seat in a proper manner by means of the double plate wheel section. It may be readily seen that if this type of wheel has carried the load and stood the effects of brake heating all upon the single tread, that by removing the effects of brake heating and wear from brake applications from the outer single tread, the life of the latter and of the wheel as a whole would be very much increased. Efforts have been made to find some means of accomplishing this, and with light equipment braking discs on the wheel, or separate braking discs on the axle have been tried. No satisfactory development along these lines, however, has yet been worked out, and in the case of 50-ton cars and heavy locomotives, the whole effect of brake friction, expansion from brake heating, and all other results of brake service fall upon the single outer tread.

In the case of the double tread wheel, it may be seen that the extra tread can be added to the present section of wheel so that the inner tread can meet all the conditions of brake service precisely as well as the outer tread now meets them, and with the additional advantage that the heating of the inner tread will not lead to the disastrous results now caused by the heating of the outer tread, for the reason that the inner tread never comes in contact with the rail. Brake friction may heat the inner tread, but this will not in any way impair its efficiency for continuous braking service, even if the small cracks referred to heretofore are produced. While it is proposed to add the inner tread to present wheel patterns in order that the manufacture of wheels according to the present standards will not be interfered with, it is also proposed on new or even on present equipment to increase the length of the wheel hub by $1\frac{1}{2}$ or 2 in., in order to obtain an additional length of wheel seat, which experienced railroad officials state is needed under present conditions of service with heavy equipment. The diameter of axle at wheel seat has been increased to 7 in., which is the full length of the wheel hub, and it is manifest that the resistance of the wheel to displacement on the axle is less than it was when the wheel seat was smaller in proportion to its length. The section of proposed double tread wheel with longer hub is the one shown in Fig. 3, and the section of double tread wheel with double tread as adapted to present section and length of hub is shown in Fig. 4. These drawings show a flange on the inner tread to keep the brake shoe from touching the other flange; but if desired the wheel can be used without the second flange.

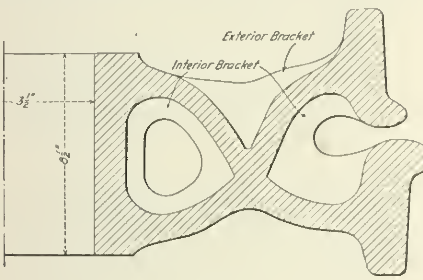

Fig. 3.

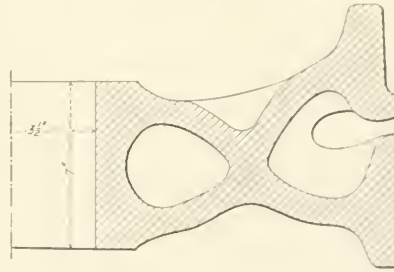

Fig. 4.

It will be necessary to move the brake-head about 5 or 6 in. on each end closer to center, to provide for proper contact with the inner tread. To properly clear all guard rails, switches and special work, the inner tread should be about 3 in. less in diameter than the outer tread, or a diameter of 30 in. as compared with the outer diameter of 33 in. Shortening the distance between points of strain on the brake-beam as stated will decrease the tendency to deflect under heavy pressure, and in case breakage of brake-head or shoe occurs the broken parts will fall between the tracks and not upon them or on the special work.

As a matter of foundry practice the manufacture of the double tread wheel is little more difficult than the manufacture of the present single tread wheel, the division between the outer treads being made with a suitable pan core in the same manner that the division of the double plates in the present type of wheel is now made. It is not necessary to go more fully into this matter at present. It can be explained to any one interested.

The additional weight of the inner tread would depend on the thickness of metal used. In the case of a 700-lb. standard wheel it is probable that the inner tread would add about 200 lbs. to the weight of wheel. As the metal on the inner tread would have the same scrap value as the rest of the wheel, the additional cost on account of extra weight can be determined.

It is proposed to use the double tread wheel for centers for steel-tired wheels as well as for the chilled wheels. As the inner tread will be chilled precisely in the same manner as the outer tread, it will provide the same resistance to wear of brake-shoes as the outer tread now does, and considering the serious damage to steel tires caused by brake application, it is manifest that to move this service to the inner tread would be a very great advantage. As cast-iron centers are now used generally in steel-tired wheels, it is not necessary to dwell further upon their suitability for such use.

If the double tread wheel will prove to be the means of regaining the ground that has been lost in the length of service and other results obtained from the use of the chilled wheel, it can hardly be said that the extra cost of additional metal should prevent its use. The question of safety after all stands pre-eminent. When any important article of railroad equipment becomes unsafe for use through any change in service conditions, it is manifest that the continued use of such material becomes more than a question of economy, it becomes one of responsibility.

The double tread wheel may, or may not, prove a relief from present conditions of wheel service. In the opinion of the writer, based on many years of practical experience and investigation of such questions, it does provide the means of overcoming conditions for which some remedy must be found. This opinion is also strongly expressed by some very competent practical railroad officials to whom the matter has been presented.

F. H. GRIFFIN.

Seaboard Air Line.

Norfolk, Va., Jan. 15, 1908.

TO THE EDITOR OF THE RAILROAD GAZETTE:

Referring to your review of the annual report of the Seaboard Air Line in your issue of January 10, I beg to call your attention to one or two inaccuracies therein.

In the third paragraph you say: "In 1906 Alfred Walter succeeded James M. Barr, and would perhaps have succeeded in bringing about the regeneration of the property as he had earlier with brilliant success of the Lehigh Valley, but before his first year of service was over his health failed rapidly, and he died on February 27 1907." When Mr. Walter assumed the presidency of the Seaboard, May 1, 1906, that property required no "regeneration"—this had already been effected; its operating staff was thoroughly efficient; the relations between the official staff and all employees were most cordial; the *esprit de corps* of the service was high; and the character of service rendered the public was fully equal to that of any road in the South Atlantic states.

When I took the management of this road as Vice-President, May 1, 1901, I found its transportation service inefficient, and its track generally in low physical condition. This was especially true of the lines in Florida, whose condition was the worst I ever saw in an experience of thirty years in railroad work. The transportation service was quickly brought to an efficient condition, and the track was improved gradually until its condition equaled that of any road in the same section. On account of light density of traffic, and meeting the cost of the improvements out of earnings, it was necessary to spread this work over several years; as the business handled increased, the expenditures were increased. The disability of the road was confined to its grade line, its inadequate facilities, and its decrepit freight equipment; and the results secured from its operation were as good as could be obtained thereunder. These things are matters of common knowledge throughout this section.

You will see from the statement enclosed that during the five years I was in charge of the Seaboard, there was no increase in the cost of conducting transportation per unit of service performed, notwithstanding the increased cost of wages and materials used in operation and maintenance, and that the rate received per passenger and per ton mile for the year ended June 30, 1907, was as high as that received therefor during a part of the period named.

When Mr. Walter took hold of the Seaboard he was a sick man, and in consequence did not possess the physical and mental vigor necessary to successfully cope with the conditions confronting him, and the resulting worry unquestionably hastened his death. At the time Mr. Garrett was placed in charge of the operation of the Seaboard by Mr. Walter, as Vice-President, the ratio of expenses to earnings was above 75 per cent.

Since May 1, 1906, the efficiency of the service secured from its employees by the Seaboard has declined, as the enclosed figures show, due in part to the many changes in its official staff, but the primary cause of its inability to earn interest charges was the failure of its owners to provide money to remove its disabilities, and thereby enable it to handle its business economically and efficiently.

I am writing you in this connection because I feel the reference to me, in your comments above quoted, is unfair. I have been a subscriber to and reader of your journal for many years and this is the first time I have seen any attempt made therein to place responsibility where it did not belong.

J. M. BARR.

[The following is the statement enclosed by Mr. Barr.—EDITOR.]

SEVEN YEARS' RESULTS ON THE SEABOARD AIR LINE RAILWAY

	Year ended June 30						
	1901	1902	1903	1904	1905	1906	1907
Average miles operated	2,592	2,601	2,607	2,611	2,611	2,611	2,611
Gross earnings	$10,426,280	$11,068,478	$12,156,928	$12,750,271	$13,619,271	$15,116,948	$16,427,943
Operating expenses	7,401,421	7,329,800	8,441,096	9,113,217	9,092,36.	10,512,461	12,948,042

Operating ratio, excluding taxes, per cent	70.98	66.22	69.43	71.47	66.76	69.55	78.82
Operating ratio, including taxes, per cent	73.88	69.66	73.00	75.66	70.70	72.97	81.97
Surplus	$252,676	$765,832	$750,132	$294,295	$1,084,062	$992,121	*$458,[illegible]
Capital expenditures	.....			650,537	181,784	925,564	1,487,293
Gross earnings per mile of road	$4,022	$4,251	$4,663	4,883	5,216	5,790	6,292
Net earnings per mile of road	1,167	1,436	1,425	1,393	1,734	1,763	1,333
Gross earnings per train mile	1,394	1,430	1,521	1,558	1,640	1,695	1,780
Net earnings per train mile	404	483	465	447	545	516	.379
Cost of maintenance of way, per mile of road	$539	$493	$569	$613	$694	$715	$846
Per cent. cond. transportation expenses to gross earnings	41.87	40.79	41.25	40.31	36.92	40.72	47.65
Rate received per ton per mile in cents	1.188	1.068	1.114	1.177	1.180	1.121	1.118
Rate received per passenger per mile in cents	2.480	2.357	2.286	2.342	2.327	2.382	2.362

*Deficit.

Pennsylvania Two Cent Fare Law Void.

The Supreme Court of Pennsylvania has decided by a vote of 4 to 3 that the two-cent passenger rate law passed by the Legislature of 1907 is invalid so far as the Pennsylvania Railroad is concerned.

The decision applies specifically to the Pennsylvania Railroad because its appeal was the only case before the court. Chief Justice Mitchell wrote the opinion of the majority, Justices Fell, Elkin and Brown concurring. Separate dissenting opinions were written by Justices Mestrezat, Stewart and Potter.

The majority opinion says:

"The exact question to be determined on this appeal is not the general constitutionality of the act of 1907, but the right to enforce it against the appellee. The same clause in the Constitution that authorized its passage provides that such legislation shall do no injustice to the corporators of any company whose charter is thereby altered. Would the provisions of the act of 1907 do injustice to the corporators or the appellee?"

Chief Justice Mitchell finds that it would, and continues:

"Corporations are private property, organized for private profit, and unless necessary for the fulfilment of their corporate duties they should not be required to do any part of their business in an unbusinesslike way with a resulting loss. If part is unprofitable it is neither good business nor justice to make it more so because the loss can be offset by profit on the rest. Freight must not be made dear that travel may be cheap. The corporation is entitled to make a fair profit on every branch of its business, subject to the limitation that its corporate duties must be performed, even though at a loss."

Justice Mestrezat in his dissenting opinion declares that the majority conceded the right of legislative supervision of rates of common carriers, but declined to pass upon the immunity of the plaintiff company from such supervision. The reason given for this neglect, he says, is that counsel did not argue that question. He says that in determining whether a rate for transportation is reasonable or not all the revenues should be considered, including all the revenues from freight, expressage and all other sources. It is impossible to accurately determine what revenue the company receives from each of the several sources. It is clear that under the evidence, considering only the revenue from the passenger traffic, that the rate is not unreasonable, much less confiscatory.

Justice Stewart in the second dissenting opinion declared that the two-cent rate act violated no contract between the state and the railroad, and Justice Potter says that the evidence has not shown that a flat rate of two cents would prevent a fair return upon the capital invested by the railroad. Justice Potter agrees with Justice Mestrezat that the company's revenues from all sources should have been included when considering the question of reasonableness of the rate. (The lower court had decided that the reduced rate would not produce a fair interest on the capital invested by the Pennsylvania in passenger facilities.)

There is a report that the road will put into effect the old rate, but no definite announcement has been given out.

Attorney General Todd, who made the principal argument in support of the act, says that the matter is ended. No appeal can be taken to the United States Supreme Court. Mr. Todd said further: "The court has merely affirmed the judgment of the lower court in granting an injunction against the enforcement of the law against the Pennsylvania Railroad. It refused to pass on the question of the constitutionality of the law. Two points were raised by the railroad: The first that, under its contract rights, the legislature could not compel it to carry passengers for less than 3 and 3½ cents a mile, the amount specified in its charter; the second point was that it could not be compelled to carry passengers for so low a price, which, it contended, would mean a loss. The court refused to decide the question of contract right, but passed upon the other question merely; so that the law remains in force against all other railroads in the state."

The two-cent fare law was enacted by the last legislature, the bill passing both houses by a practically unanimous vote. The railroads fought the bill vigorously, and after it became a law the Pennsylvania Railroad instituted suit in the Common Pleas Court of Philadelphia restraining the County of Philadelphia from enforcing the law. The court sustained the company's contention. The County of Philadelphia then took the case to the State Supreme Court. Other railroads brought similar action in several counties of the State.

The Trials of a Master Mechanic.*

The problem of engine failures to all of us is synonymous with, "please explain," "can you tell us why," etc., and all the attending evils—briefly, the handling of an amount of correspondence which would be staggering to a layman. It requires a cool, well-balanced head, either to interrogate the engineer or to subsequently present the explanation on an acceptable basis to the superintendent of motive power, who as a rule is equally well-versed, if not sharper, than yourself. Some of these things are knotty in the extreme. For instance, two minutes are lost on a certain important run, account of low steam: should we say it is "up to the fireman," they would probably tell us to take him off, or question our judgment in using an incompetent man; if we state "blower-pipe tipped over," or "exhaust base leaking," we are called upon to explain why we despatched the engine in that condition; if we claim that the engineer is incompetent, or did not take proper advantage of his opportunities, and discipline him in accordance with our ideas concerning the gravity of the offense, he will point to his 20 or 25 years' successful record, and no doubt send his committee after us; should we on the other hand fall back on the time-honored and time-worn "bad coal," the superintendent of motive power, if he is on to his job, and he generally is, will likely come back, asking us to state definitely wherein the coal is bad, in other words how much slate, sulphur, bone, ash and other inert substances figure in its composition.

Explanations of engine failures truly place a man between Scylla and Charybdis, because the middle ground is restricted to a degree, and once or twice worked over there is no more to it. Some of the explanations would make a dead man turn over in his grave, to wit: "This failure was due to an old concealed defect, which could not be detected in an ordinary roundhouse inspection"; another, "Owing to a high northwest wind which prevailed while the engine was being sanded some particles were blown into the truck box, resulting in delay of ten minutes from box heating, subject of your letter such a date"; and still another, "Pipe to auxiliary reservoir, engine 2,397, failed, causing delay of 27 minutes. This failure was due to pipe being short-threaded, and was a builder's defect of a concealed nature. This part has never been removed since engine was received here."

A great many of these explanations are soundly based on fact, but many are not so. To handle the matter intelligently an observant man will make each case an object lesson, and will insure, so far as his facilities will permit, against its recurrence. Sometimes letters come from up the line stating that "bad coal" will no longer be accepted as an excuse, but this does not alter the fact that very often the coal is bad, in the broadest acceptance of the term, and the best thing to do then is to read up thoroughly on the subject and try to prove it—if you can.

Having to do with the coal problem, one of a master mechanic's trials, and certainly not the least, is for the rumor to go broadcast over the division that the fuel is not up to the standard; and it requires many days, if not weeks, to swing the firemen back into line. Some of my most exacting days have been spent in missionary work among the latter, preaching always from one text, "Fine coal does not necessarily mean bad coal." Logical and scientific arguments, coupled with practical demonstration, sometimes turn the trick, but a number always remain outside the fold.

Some engineers are prone to resent any questions regarding an engine failure, and patience and tact are both requisites to secure the facts "Why, that was only a minute," some of them will say, and they don't seem to grasp the idea that just as long a letter is required to explain one minute as 20. It is only fair to add, however, that to a man they fight hard to keep a delay off the run slip, and this is all the more commendable in view of the fact that it is exercised irrespective of any feeling which they may have against the master mechanic or the shop. I cannot recall a case in my entire experience where a delay was wilfully brought about.

Under a divisional organization the superintendent is practically general manager in his own territory, and the master mechanic will be sorely tried if he fails to gain his good opinion on the very start. Primarily the superintendent wants his trains to run on time, and, just as important, he wants power to move them when a movement is necessary. Thus is brought about another complex situation with which many of us have contended. A man could never be placed more curiously between two fires than in trying to please both the superintendent and the motive power department, when the freight movement is heavy. The natural inclination of the master mechanic is to keep peace at home, and to this end he turns the power as fast as possible. If it runs down, he will likely fall into disrepute with the general offices; while on the other hand if he holds the engines in and painstakingly and thoroughly does all the reported work, a lament will go up from his own people in regard to slow movements from the roundhouse. This situation requires the middle ground again, and all the common sense, judgment and diplomacy you can ram into it.

Engineers with an imperfect understanding of what is meant by a divisional organization are inclined to criticise the authority of the superintendent to assign the power, claiming that this belongs properly to the master mechanic. They also blame the master mechanic for not taking the business in his own hands. In my own case I was very fortunate in having a superintendent who simply insisted on the best possible train service, and was more interested in the results than in the means employed to reach them. To digress a little, this man truly had the so-called knack of handling men, and certainly understood the true meaning of a divisional organization. We all knew, however, that he meant every word he said, and we were very anxious to please him, as he did not consume time in exploiting trivialities which might be much better employed at something else. I can't exactly say why suiting the superintendent should be thought a trial. I have found that if a man will make the honest effort to do all that his resources will permit, the superintendent will come to his aid more frequently than he will be censured.

The question of providing for material is probably as vexatious, if not more so, than the engine failures. There is certainly no greater trial for any man's patience than to have a bunch of orders returned to you every day, marked "not in stock." Always it is something of which you are in the greatest need. In particular, the locomotive equipment is a serious problem. I venture to say that with possibly two or three exceptions this matter of keeping supplies on locomotives is nothing more than a bluff or a farce.

This situation is extremely embarrassing to a master mechanic, and too often a temporary remedy is sought in robbing one engine for another; and I may as well say now, that this thing once started, it never stops. I have known an engine to be laid in about two weeks waiting for some minor casting, and to be so stripped in that time, owing to storeroom shortage, that scarcely more than the boiler and wheels remained.

The extremes to which a man may be driven would scarcely be credited. I worked for one road some years ago which possessed more than its share of able-bodied requisition slashers. It was not out of the accepted order of affairs to see an engine go out on an important passenger run with a lantern stuck up in the headlight case in lieu of an interior When an engine would come on the ash pit a gang of men would be waiting to remove the grease-cup plugs, coupler knuckles, headlight reflector, and occasionally the air hose, with which to get something else into service. Even the fire hooks and shovels, especially the latter, ran first in, first out, and when they began chain-ganging the tanks and reverse lever latches, I left for a place where the pay was less but things were not quite so strenuous. This was the only instance in my career when I voluntarily threw up the sponge. This same road, by the way, also ran out of nuts. They had plenty, of course, 2½ and 3 in., which would have filled the bill all right in some marine engine works, but none of the common sizes, seven-eighths or inch. In consequence a machinist at 30c. an hour would spend half a day rooting in the scrap pile, and the other half tapping the few nuts he was lucky enough to find. The entire situation was distressing in the extreme.

From my experience all roads are short in locomotive equipment. The majority have a system of tool inspection and accounting beyond criticism, but it is an almost impossible task to live up to the requirements. The situation may be held within reasonable bounds when the engines are assigned to regular crews, but it is practically hopeless in the pool. The engineers do not stop short of the master mechanic in filing complaints along this particular line: "Mr. So-and-so I have a hammer and a broken chisel on my engine, and no monkey wrench. I will go out if you say so, but I will not be responsible if I have to disconnect." What are you going to do in that case? Time may be pressing: perhaps he should then be on his train. You try the storehouse, and they have

*From a paper read before the New England Railroad Club by R. H Rogers.

no monkey wrenches. In this last extremity, and to prevent a terminal delay, you order one off another engine, and away goes your tool system.

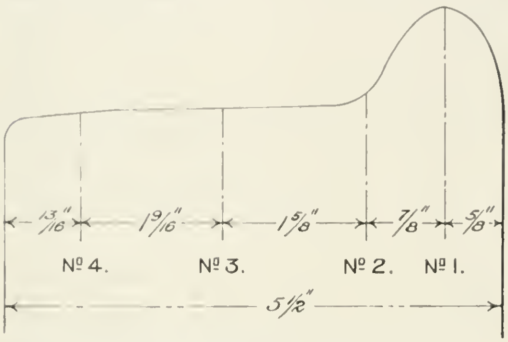
I do not mean to suggest a remedy for this condition, indeed I am not qualified to do so, but take it all in all, it is a menace to the peace of any master mechanic. Although I am naturally of a stoical and rather optimistic temperament, it has cost me many anxious hours.

Microphotographs of Steel Wheels and Tires.*

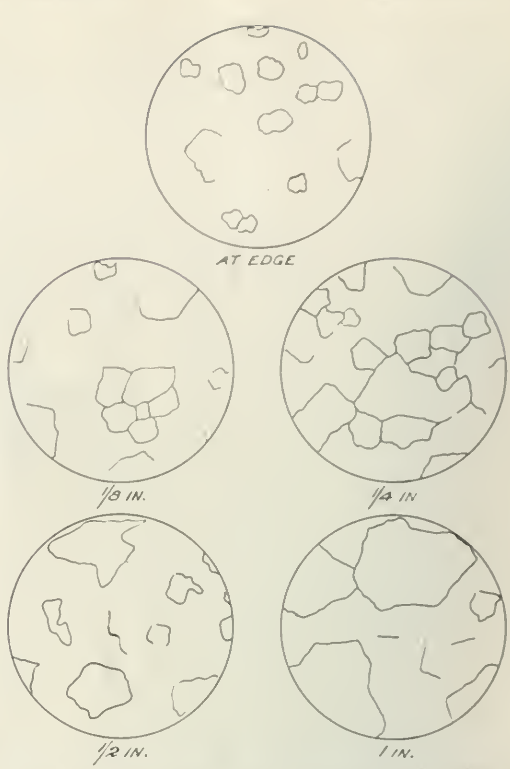
BY GEO. L. FOWLER.

(Reprinted from volume of reports made to the Schoen Steel Wheel Co.)

The physical properties of the steel in these wheels and tires having been determined, an examination with the microscope was made of samples from each. In the preparation of the specimens for this work strips were cut from each wheel and tire in accordance with the lines shown on the diagram. The numbers 1, 2, 3 and 4 are for the identification of the strips and are used in connection with the photographs, all of which were made with a magnification of 88 diameters.



Section of Tire, Showing Location of Microphotographs.



*Interpretation of Grain Structure in Tire A at Varying Distances Below Surface of Tread.

Referring first to the microphotographs of the D tire, Nos. 1 to 6. Nos. 1 to 5 were taken in strip No. 4, at the tread and at 1/8 in., 1/4 in., 1/2 in. and 1 in. below the tread, respectively, and No. 6 at 1 in., below the tread in strip No. 3. These photographs show an exceedingly fine granular structure, indicating careful heat treatment, a low average percentage of carbon and an abundance of ferrite. The structure becomes somewhat coarser as the metal is penetrated and the normal structure is reached at a depth of about 1 in. It will also be seen that there is a slight difference between the structures of the metal as illustrated by the two photographs Nos. 5 and 6 which were taken at a depth of 1 in. below the tread in strips 1 and 3 respectively. No. 5 is the finer, showing that the metal received more work at that point than it did deeper in on strip No. 3. This D tire had the finest grain and the most uniform structure of the samples examined. On the other hand, the photographs corroborate the chemical analysis of low carbon content, possibly down to 0.50 per cent. as indicated by the proportion of ferrite (white) and pearlite (black).

Next in order of fineness of grain comes the C, B and A tires respectively. Here again the relative amounts of ferrite and pearlite give an approximate indication of the amount of contained carbon from which it would appear that the B and C tires would not run over 0.60 to 0.65 per cent. while the A may rise to 0.70 per cent.

The material of the B tire shows a practically uniform texture of grain throughout its whole depth, with no decarbonization at the tread due to heat treatment, although this is undoubtedly due to the tire having been turned before being examined.

In the C tire, which was new, it will be seen that the outer layer of the material next to the tread, as indicated by the photograph No. 7, was decarbonized by the action of the heat treatment to which it was subjected. The presence of ferrite is very marked all the way across the tread, but below the surface, as indicated by the photographs Nos. 8, 9 and 10, which were taken at depths of 1/8 in., 1/2 in. and 1 in. below the tread respectively, the grain assumes the normal condition for the steel at its finishing temperature, although it is somewhat finer at the edge strips Nos. 1 and 4 than in the center strips Nos. 2 and 3, indicating failure of the work to penetrate the center.

The A tire has such a high carbon content that the absence of excess ferrite causes the grain to become obscure. It was possible to bring the formation out in part only by oblique illumination. When viewed under the microscope with the light adjusted to the best advantage a decided coarsening of the grain is noted at suc-

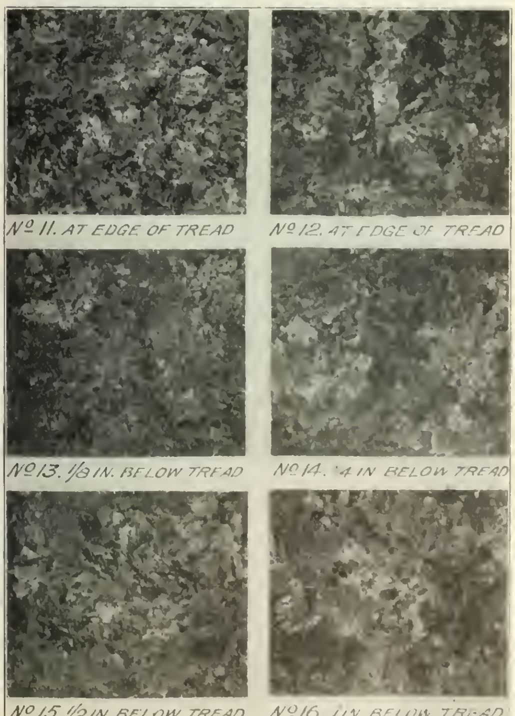
MICRO-PHOTOGRAPHS OF C TIRE

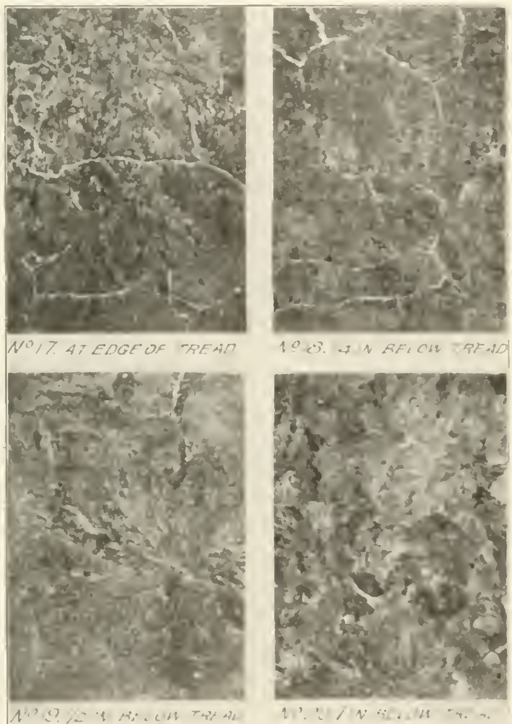


MICRO-PHOTOGRAPHS OF A TIRE

cessive points below the tread. For example, at the surface the grains are apparently about the same size as those immediately below the decarbonized shell of the tread in the C tire, but the grain coarsens rapidly and at a depth of 1 in. it is somewhat coarser than that of the C tire. The structure is interpreted from the microphotographs in the accompanying diagram made at the same magnification.

The E wheel has an exceedingly coarse structure with traces throughout of inequality of carbon content and disappearance of the grain. This is especially noticeable in photographs Nos. 19 and 20 and appears in the others to a greater or less extent, showing an unevenness of structure that is suggestive of cast steel. This is discussed elsewhere in connection with a shelled-out wheel of the same make. The penetration of work was apparently very slight as is shown by the large size of the grains in No. 17, taken at the surface of the tread, and the increasing size of structure as shown in Nos. 18, 19 and 20 taken at depths of 1/4 in., 1/2 in. and 1 in. respectively.

The F wheel has a coarser grain than the A, B or C tire and is slightly coarser than that of the D tire. The carbon content appears to be about the same as that of the C tire or somewhat above

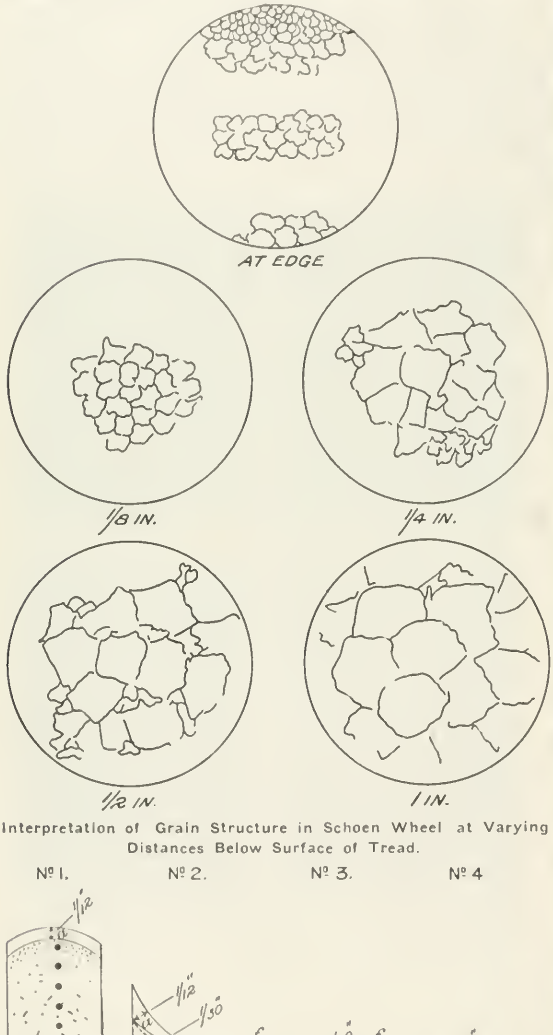


MICRO PHOTOGRAPHS OF E WHEEL

0.60, and this is checked by the chemical analysis. The surface decarbonization which is so marked in the case of the C tire appears in this one also, as indicated by the increase of the amount of ferrite accompanied by softening of the surface. The large size of the grain in this wheel, as illustrated by photographs Nos. 21 to 26, is caused by the peculiar heat treatment to which this wheel was subjected, as there is no work put upon it after the final heating. This also explains why there is comparatively little enlargement of the grain going down from the surface of the tread. The photograph No. 21 was taken at the surface of the tread and the others followed at depths of 1/8 in., 1/2 in., 1 in., 2 1/8 in. and 2 3/8 in. respectively.

The B tire is typical of the others and needs only a word of explanation of the microphotographs Nos. 27 to 30, which were taken at the surface of the tread and at depths of 1/8 in., 1/4 in. and 1/2 in. respectively. From these the gradually increasing size of the grain is apparent, though from its large dimensions, even at the tread, it would appear that this particular tire was finished at a rather high temperature.

The microphotographs of the Schoen steel wheel show that for the first 1/8 in. of depth it has the finest structure of any of the wheels and tires examined, but below this depth its grain increases in size in a comparatively uniform manner though with a variation to be noted later, until, at a depth of 1 in. it is slightly coarser than any of the tires. On the other hand, it contains but a trace of ferrite, indicating that the carbon content is about the same as that in the A tire. Here again owing to the absence of sufficient ferrite to outline the grain clearly, it was necessary to photograph by oblique illumination, and it was under this light that the accompanying sketches to show the grain's size were made. The microphotographs closely check the abrasion tests and the determinations of specific gravity.



Interpretation of Grain Structure in Schoen Wheel at Varying Distances Below Surface of Tread.

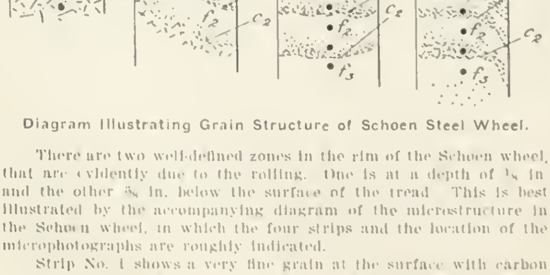


Diagram Illustrating Grain Structure of Schoen Steel Wheel.

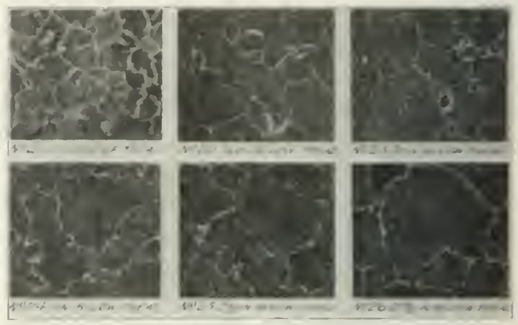
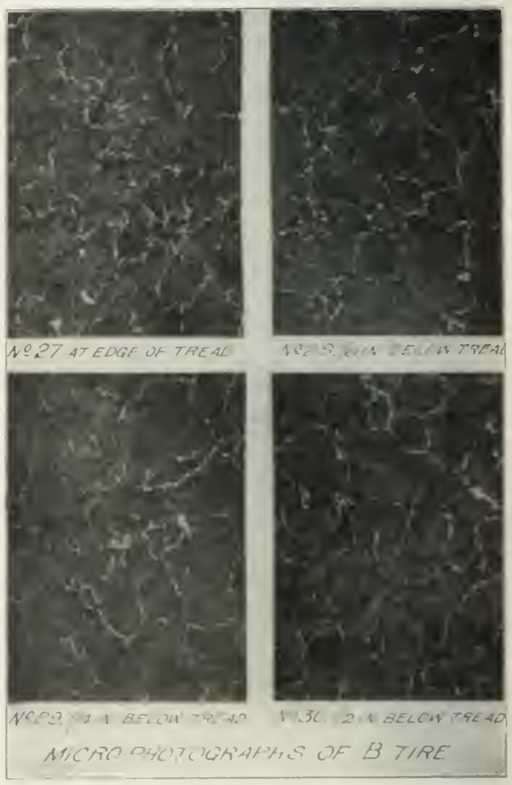
There are two well-defined zones in the rim of the Schoen wheel, that are evidently due to the rolling. One is at a depth of 1/8 in. and the other 3/8 in. below the surface of the tread. This is best illustrated by the accompanying diagram of the microstructure in the Schoen wheel, in which the four strips and the location of the microphotographs are roughly indicated.

Strip No. 1 shows a very fine grain at the surface with carbon well below 0.50 per cent. This structure runs down for about [illegible] in. where there begins a gradual increase of the grain size until the normal dimensions are reached at about [illegible] in. below the top of the flange. The first [illegible] in. is formed of a very fine mixture of about equal proportions of ferrite and pearlite, and below this the ferrite gradually disappears and the grains increase in size. At a depth of [illegible] in. the ferrite appears as a discontinuous band or envelope around the grains of pearlite, indicating that the carbon content is about 0.70 per cent. This increase in the size of the grains continues downward until they reach their maximum at a depth of about 1 in.

In strip No. 2 there is the same fine-grained surface structure



Microphotographs of F Wheel.



(a) corresponding to that of No. 1. The depth of this decreases from one side of the strip to the other and is about [illegible] in. thick at the corner. This structure is shown in the photograph No. 31. On the right hand side, two zones will be seen; one of which, starting at $f1$, is of very fine pearlite. The point of maximum coarseness is at $c1$. This is not really a coarse grain in itself, for it is fine even when compared with that of the D tire. Below $c1$ there is an abrupt change to extreme fineness again at $f2$. This is followed by a gradual increase in the size of the grain down to $c2$, where the normal structure is found at a depth of about 1 in.

In strip No. 3 there is the same fine grain at the surface, as

MICRO-PHOTOGRAPHS OF SCHOEN STEEL WHEEL

shown in the photograph No. 32, which extends down to a depth of about $^1/_{50}$ in. The extreme outside shows almost entire absence of carbon, or nearly pure ferrite. This is followed by a gradual increase in the amount of carbon until, at a depth of about [illegible] in. a fine grain structure almost wholly of pearlite is indicated at *f*1. Next comes a uniform increase in the size of the grains, until they reach their maximum at the point marked *c*1, where there is an abrupt change to a structure of great fineness, which, in turn, increases in size to a maximum at *c*2, when there is a second abrupt change to extreme fineness at *f*3. Below this there is a gradual increase in the grain size until the normal structure is reached at about 1 in.

In strip No. 4 there is the same decarbonized outer layer (*a*) which is about $^1/_{30}$ in. thick at the center, thickening towards the right in the direction of the edge of the wheel rim. This structure differs in appearance from the corresponding area in No. 3 due to the distortion of the grain by mechanical treatment of the metal after ferrite or pure iron became excessive as the result of burning out the carbon on the surface of the steel. The size of the grain increases from fine at *f*1, to a maximum coarseness at *c*1, $^1/_8$ in. below the surface where there is the same abrupt change as before to a fine structure at *f*2. This will be seen by a reference to photograph No. 38. The grain again increases to a maximum coarseness at *c*2, with another change to extreme fineness at *f*3, at a depth of about $^1/_2$ in. Beyond this point the grain increases uniformly until the normal size is reached at a depth of 1 in. as indicated by photograph No. 36, and the diagram of grain sizes.

These changes in grain size are accounted for by the successive heat and mechanical treatments to which the Schoen wheel was subjected.

The conclusions drawn from this work with the microscope are practically the same as those reached by a study of the physical and chemical tests. It is apparent that the Schoen wheel is quite equal to the best tires, as regards depth of finish and the fineness of the grain in the steel.

Influences Affecting Train Resistances.

C. Carns Wilson read a paper before the Institution of Civil Engineers in London on Dec. 10, 1907, in which he discussed the forms of train resistance formula, and concluded with a resumé of the various causes affecting that resistance and the effects which they produce. They were as follows:

(1) *Journal-friction in its relation to train-resistance and its possible reduction by roller-bearings.*—The real value of roller-bearings in railroad traction is shown to lie in the reduction of running resistance and consequent saving of energy, and not in the reduction of starting-effort. The results of tests with roller-bearings on the Eastern Bengal State Railway show a saving actually obtained of 1 per cent. greater than that calculated by the use of the resistance-formulas.

(2) *The influence of the truck on the resistance of bogie-coaches.*—The resistance of a coach is shown to depend largely upon the wheel-base of the truck, and the relation of the weight of the bogie-trucks to that of the whole coach.

(3) *The effect of electrical driving on the resistance of bogie-coaches.*—The weight of the motors and the extra weight of the motor-trucks in electrically-driven coaches increases the flange action and the total resistance of such coaches. The resistance of electrical motor-coaches is in some cases as much as 54 per cent. greater than that of trailing coaches running at the same speed under similar conditions.

(4) *The reduction of the resistance of goods-wagons by the use of bogies.*—The influence of the bogie on train-resistance is shown to be greatest in the case of goods wagons.

(5) *The relation between the tractive efforts required to haul loaded and empty bogie goods-wagons.*—Since flange-action depends upon the ratio of the weight of the bogie to that of the whole wagon it must follow that the resistance per ton of a loaded bogie-wagon must be less than that of the same wagon empty. This is a matter of general experience, and can only be explained on the above hypothesis. The results of tests in which a train of bogie-wagons was hauled over a considerable distance backwards and forwards, first loaded and then empty, show that the ratio of the mean draw-bar-pull in the two cases was 0.56. When the resistances are calculated by the formulas, the ratio is found to be 0.62.

(6) *The incidence of train-resistance on flange and rail-wear.*—The energy expended in overcoming flange-resistance is represented by the wear of tires and rails. This wearing action is much greater in some cases than in others.

(7) *The reduction of flange-action by mechanical contrivance.*—It is shown that by giving the bogie a lead, as is done in Timmis' bogie-lead, the flange-action of the bogie can be reduced, and that the saving depends upon the ratio of the bogie wheel-base to the distance between the bogie centers, and also upon the ratio of the bogie weight to the total weight.

(8) *The effect of side play on train-resistance and its possible*

limitation.—The amount of play between the flanges and the rails is an important factor in train resistance. The want of uniformity in current railroad practice in this matter is illustrated by the amount of side play adopted on different railroads in Great Britain, in the United States, and on the Continent. The increased resistance and wear occasioned by large flange-play suggests the importance of a reduction of the play to a standard ⅜ in. as on the London & South-Western and other railroads.

(9) *The relative importance of air-resistance.*—The resistance of the air with a train of bogie-coaches, running at 60 miles per hour, amounts to about one-half of the total tractive effort required to haul the train. The experiments conducted by the St. Louis Electric Railway Test Commission show that a large reduction can be made in the front and rear air resistance by shaping the ends, and that by this means a saving can be effected of 10 per cent. of the total tractive effort with a long passenger train, and 30 per cent. with a single coach.

The Car Wheel and Its Relation to the Rail and Car.*

In going back to the period of the 24,000-lb. capacity car, and comparing it with the present 100,000-lb. capacity car, the increase in load capacity is 76,000 lbs., increase in tare weight, formerly 18,000 lbs., now 42,000, is 24,000 lbs.; increase in permitted excess load, 10 per cent., formerly 2,400 lbs., now 10,000 lbs., or 7,600 lbs., making a total increase which the eight wheels of the car have to carry, of 107,600 lbs., which is 240 per cent., or 3.3 times as much load.

The wheel used under a 24,000-lb. capacity car weighed 525 lbs. and the wheel used now under a 100,000-lb. capacity car weighs 700 lbs., an increase of 175 lbs., or 33 per cent. The brake pressure applied to the eight wheels of a car was formerly 12,600 lbs. and at the present time is 30,000 lbs., an increase of 138 per cent. In addition to these changes, there have been other changes that have had a material effect upon the service, viz., greater rigidity of car trucks and car bodies, higher speeds, and a general introduction of the air brake, involving a much greater and more general absorption of energy at the periphery of the car wheel. It thus appears that the work generally imposed upon the wheel in service at the present time is very much more severe than formerly, and in this there seems to be little opportunity for disagreement.

I might state here that during this period between the general use of the 24,000-lb. capacity car and the introduction of the 100,000-lb. capacity car, the requirements of the cast iron wheel imposed by railroads upon manufacturers have been made considerably more severe and comprehensive. The time guarantee has been raised from two to four and five and, in some cases, six years. Physical tests of car wheels have been generally imposed, and the thermal test has been added to the drop test. The increased exactions of the railroads in this way have been met by the manufacturers at an actual reduction in price of about 25 per cent.

It has been suggested of late that the cast iron car wheel is no longer equal to the conditions imposed by modern service, unless a very material improvement in quality can be obtained, which no one has thus far been willing to suggest as probable, but it does not follow by any means that such a thing is not possible. While the question of improving the quality to meet these new conditions is under consideration, it occurs to me that possibly other developments might be brought about which would greatly mitigate the difficulties that are being experienced.

The development of the steel car wheel has been taken up actively by several concerns in this country with the idea of providing something to meet the needs of modern service, and there are others who are about to embark in this line of work. They have received a good deal of encouragement, and there are those who believe that the real remedy for the present difficulties lies in the use of steel instead of cast iron. Steel has many qualities that commend it for the purpose, but I do not think it is going too far to state that the use of steel should not be expected to completely eliminate the present troubles, and that whether or not the steel wheel shall be considered essential and come into more general use, it would appear that it, as well as the cast iron wheel, should be protected, as far as possible, from some of the very trying conditions to which all wheels are now subjected.

The particular failure of wheels that is attracting most attention at the present time is that of the breaking off of the flange. This is not so frequent as might be supposed, but its consequences are often most disastrous, the number of removals of wheels whose flanges might easily break is much larger than the number of those that finally fail in service. In addition to this, I find that of all wheels removed from service, not less than 50 per cent. are removed on account of worn flanges, and in this percentage I include those that are worn away from the flange, usually found on the opposite end of the axle and which cannot be remated. Fifty per cent. is the minimum percentage, the maximum that I have found is 85 per cent. My data for this statement is obtained from four heavy service eastern railroads and two typical western railroads. Taking up first the question of broken flanges, I would state that my conclusions are based on personal observation of a large number of wheels examined on several railroads. Comparatively few broken flanges come from the flange being worn thin and broken off laterally through the smallest section at the base of the flange. By far the larger number come as a result of the development of a seam opened on the tread of the wheel and oftentimes beneath the surface close to the base of the flange, and often before the flange is worn to any considerable extent. Sometimes this seam exists and is not apparent at the surface, in fact, I have seen cases where the seam has existed beneath the surface for some time before reaching it, but in the majority of cases the seam extends to the surface at about the same time. In most of the cases examined it has been noted that the fractured metal has a blue discoloration, an indication of oxydization from heat. In thus stating the facts I am confirmed by experienced railroad and mechanical men and wheel makers. Several explanations for this failure have been made to the writer, but the most logical explanation seems to be as follows:

Fig. 1 illustrates the relation between a wheel with a 25 to 1 taper on the tread and the rail head. This shows the wheel and the rail in their normal relation; that is to say, the wheel occupying its proper gaging position with reference to the rail, and it will be seen from this that the contact between the two is reduced to a very small area, in fact, theoretically it is a point. If the wheel occupies a position such that the flange or the throat of the flange is against the rail, the contact will be changed as shown by Fig. 2, so that the contact will be practically on the tread at the base of the flange. Frequently heavy loads are carried for some time on the wheels in this way, so that under this condition there is an extreme concentration of the load at this point, which is, as a rule, the point at which these seams are developed. At the same time severe application of the brake occurs, the brake shoe bearing heavily on the tread at the base of the flange. Such a combination of conditions as this might occur on a down grade and in passing around a curve. In addition to the heat developed by the brake shoe there is a material increment of heat developed as a result of the abrasion between the flange of the wheel or the base of the flange and the rail. Here, then, is a combination of extreme conditions; in other words, concentrated load and concentrated heat, together with considerable lateral pressure against the flange if the car happens to be passing around a curve at considerable speed.

During the period of the lighter capacity car these same conditions prevailed and occasionally the flange of the wheel failed in the same way as it fails at the present time, but such cases were so infrequent and so much less disastrous in their effect than at the present time that little notice was taken of them. It sometimes occurs to-day under 60,000-lb. capacity cars.

In considering greater frequency of flange failures at the present time it must be borne in mind that the number of freight equipment cars in service has increased very greatly during the last few years and the average mileage that these cars make is very much greater than it used to be—as nearly as I can ascertain about 100 per cent.—and the application of air brakes to freight equipment cars is now universal, so that the increased number of flange failures is readily accounted for, allowing the causes to be practically the same as formerly.

As to the manner, in detail, by which this seam is developed, I suggest the following explanation. The sudden application of heat to the tread of the wheel at the base of the flange has the effect primarily of making the metal at the surface expand quickly. The metal below the surface cannot expand so quickly and so resists the expansion of the surface metal. The surface metal is therefore put under compression while below the surface the metal is put under tension. The one is working against the other with the result that the metal will yield at the weakest section, which would be that part that is under tension. Subsequently, if the conditions prevail for a sufficient length of time the surface will crack also and a thrust against the flange, as in passing around a curve, would remove a portion if not the entire flange. The operation of heat in this way may be illustrated in large metal ingots. It is not infrequently the case that when a large body of hot steel is poured into an ingot mold, that that part of the metal which comes in contact with the metal mold cools rapidly while that at a distance from the surface cools very much more gradually, with the result that, as the surface metal tends to contract and is resisted by the body of metal within, the surface metal, which is subjected to a pull or tensile stress, yields, and a crack or check develops.

This operation is the reverse of that which takes place in the wheel, but the forces at work are identical and operate in the same way. To these conditions brought about by the application of heat, add the concentration of load at the same locality with lateral thrust against the flange, and it would seem strange if failures did not occasionally occur.

The writer has seen flanges of steel tired wheels that have failed

*A paper presented at the January meeting of the Western Railway Club by S. P. Bush, Vice-President and General Manager of the Buckeye Steel Castings Co., Columbus, Ohio.

in the same way as cast iron, but it is a question whether the causes were precisely the same, although it would appear the same causes were largely contributory. Where the load is concentrated as here described it would seem that a peening action must take place to some extent, probably more with the steel than with the cast iron, inasmuch as steel is ductile and there is at times what is generally designated as a flow of metal under pressure. This peening action would necessarily seem to have a considerable influence in the case of the steel wheel, but the chill of the cast iron wheel being so hard, the metal cannot flow as in the case of the steel, but may wear or disintegrate very rapidly if the pressure is extreme. But this peening action, in the case of the steel wheel, and the concentration of heat together with considerable and constant lateral pressures, do not appear as unreasonable causes for the failure of the flanges of some steel wheels. It should be borne in mind that on a straight track a wheel is often running to one side constantly and lateral flange pressure is produced.

I might here call attention to the fact that the chills in which car wheels are cast develop such cracks in the surface in time, as a result of sudden heating and cooling. In fact, it is one of the chief reasons for the discarding of chills and the requiring of renewals. It is not at all an unusual thing for heavy castings to crack in a foundry as a result of internal stresses caused by a difference in temperature between the surface of the casting and the metal within. In fact, the process of annealing is for the purpose of preventing very large internal stresses which might cause failure in use, and the practice of soaking wheels or slowly cooling them is provided for the purpose of eliminating internal stresses.

I present some samples of broken flanges which are typical of the failures that I have described. I desire to lay particular stress on the fact that that part of the fracture which exists at the base of the flange extends vertically for a considerable distance into the tread, as shown in Figs. 3 and 3A. If the flange itself were not sufficiently strong to successfully resist the lateral thrust it would seem that the fracture, instead of going vertically down into the tread, would go transversely across the base of the flange. There are comparatively few cases that have come to my notice where the fracture has been transversely across the base of the flange. In nearly all such cases that I have examined the flanges have been worn thin vertically and the wheel should not be held responsible.

One prominent car builder with whom I have talked in connection with this matter expressed a belief that at points where these seams develop there is already an internal stress which might be considered a seam in embryo, and one manufacturer of cast iron wheels suggests that this might occasionally occur, depending upon the conditions of manufacture and particularly depending upon the rapidity of pouring and the temperature of the metal.

The superintendent of motive power of a very prominent railroad that removes from service a large number of seamy wheels states as follows: "The most serious cause for flange failure is the development of seams at the throat of flange and subsequent breakage. We consider that these seams are the result of concentrated load and heat in combination with poor quality of wheels. We believe that the discontinuance of the use of the proper proportion of charcoal pig iron, together with the inauguration of the thermal test and the more liberal use of ferromanganese in connection with the inferior wheel mixture has had more to do with the development of seams at the throat of flanges and the breakage of the latter than any other items."

As has been said, the fracture in the case of flange failure starts in a vertical rather than a horizontal direction, as shown in Fig. 3. The thickening of the flange in a horizontal direction will not therefore materially assist in the elimination of this trouble. In considering this matter I think it is generally felt that the flange of the cast iron wheel is weak, possibly too weak to perform the service required, but in the light of my investigation I cannot see that such a conclusion is fairly reached.

This particular question was of sufficient importance to one railroad to enlist the interest of Purdue University in making some tests for it with a view of determining the pressure required to remove a piece of flange as if it were in contact with the rail. The wheels were mounted on a suitable support under a heavy service press and the ram of the press was brought down on the flange until the latter gave way.* Three of the wheels tested were taken from service under 100,000-lb. capacity cars after having been in service about eight months. A number of others which were tested had not been in service. In all, 23 tests were made, the results of which are shown by the following tabulation:

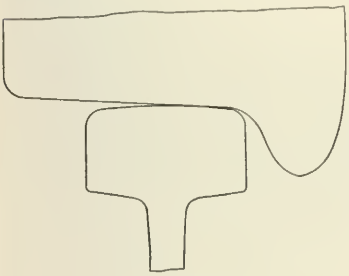

Fig. 1.

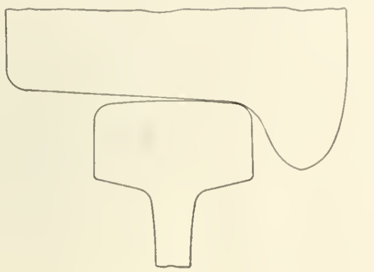

Fig. 2.

17.	79,350	A. C. & F. Co. wheel 650	Opposite bracket	Wheel broke through rim.
18.	52,300	H. 19,558	Between brackets	Broken wheel, one half submit'd for test
19.	111,600	1904 M. C. B. pattern (Tape 1) 700	Opposite bracket	
20.	87,000	1904 M. C. B. pattern (Tape 1) 700	Between brackets	
21.	109,900	1904 M. C. B. pattern (Tape 1) 700	Opposite bracket.	
22.	98,900	A. C. & F. Co. wheel (Tape 2) 700	Opposite bracket	
23.	98,900	A. C. & F. Co. wheel (Tape 2) 700	Between brackets	

From this it will be seen that the minimum load was 47,700 lbs., maximum 111,600, the average about 60,000 lbs. In the case of wheels that have been in service for some time it is probable that the average would be less than this.

The strength of the flange of the steel wheel made by the Schoen Steel Wheel Co., tested at Purdue University with the same apparatus, showed that a pressure of 526,612 lbs. was necessary to remove a piece of the flange. This would indicate that the strength of the steel flange was over eight times that of the cast iron, but as I have stated the flanges of steel wheels sometimes fail, also indicating that lateral thrust is not likely to be the primary cause of such a failure, although it may be the ultimate cause.

Geo. L. Fowler has recently written for the Schoen Steel Wheel Co. a very interesting publication on the subject of the steel wheel and makes comparisons with the cast iron wheel.† His arguments are based on the belief that the failure of flanges

*Railroad Gazette, Sept. 1[illegible], 1907, p. [illegible]

†Railroad Gazette, Dec. 20 and 27, 1907, Jan. 3, 1908.

is primarily and ultimately due to pressure alone, but in this I cannot agree with him. The evidence that I have collected thus far indicates that the number of cases of flanges broken as a result, primarily, of lateral thrust is almost negligible and that the other causes already described are more likely to be the real ones. He points out, however, and very truly, that the lateral thrust between the flange of the wheel and the rail is oftentimes very considerable, and he has taken great pains to determine accurately just what the lateral thrust is. He has made an exhaustive series of experiments on the Pennsylvania Lines West of Pittsburgh with an apparatus designed by himself for carefully measuring the lateral thrust in the case of moving cars or trains passing around curves.‡ His measurements were taken at the outer rail near the end of a 4 deg. 25 min. curve, or a radius of 1,307 ft., the elevation of the outer rail being $3\frac{7}{8}$ in., which, as he states, is correct for a speed of 36.66 m.p.h. Most of his results are obtained from a single car allowed to run alone around these curves at different speeds. At a maximum speed of 30.60 m.p.h. his maximum pressure recorded 12,865 lbs. No doubt the lateral thrusts considerably exceed these figures at times, in fact there can be no doubt about it. I am fully convinced that they do, and have seen evidence within the past 30 days to indicate that such is the case. I have seen a number of arch bars, $1\frac{1}{4}$ in. x 5 in. material, used under 100,000 lb. capacity car trucks bent laterally $\frac{3}{4}$ in., not as a result of wreck or derailment but extreme service conditions. I was told at the time I was shown these bars that similar cases are found from time to time. The cars under which these trucks were used were of very rigid construction, both body and truck, and such evidence as this, together with the information presented by Mr. Fowler from actual measurements, should, I think, confirm anyone in the belief that in the designing of modern cars this item has been greatly neglected.

When the new M. C. B. axles were designed a very important item of allowance was made on account of lateral thrust which reached the axle through the wheel, yet on many railroads, at least, the thought of relieving the wheel has been given little or no consideration. Some railroads have taken this into account and provide in their truck construction for lateral motion or yielding resistance. The old swing motion truck provided this, and it would seem that some provision for yielding resistance would be highly desirable. Here, I think it is fair to state, that some provision of this kind should not be considered as a complete remedy but as a means for alleviating the difficulty somewhat; in fact, it would seem that a satisfactory provision of this kind would be very material in its effect.

In conclusion on this point, I would state that it would seem that if the flanges of cast iron wheels were not sufficiently strong to stand the thrusts of modern service we would have very many more failures than we do. In fact, to my mind we could not have gone as far as we have in the use of the cast iron wheel. The thickness of the flange has been increased and the limit of wear for the flange has been decreased, with the idea that more strength might originally be had and subsequently maintained. Greater coning of the wheel has been recommended and adopted by some, for the purpose of keeping the flange of the wheel away from the rail as much as possible.

With reference to the increased coning, the consensus of opinion seems to be that it has rendered some assistance in the matter of making the wheels under trucks in service track better or maintain a proper alinement on straight or tangent track. I call attention to the fact, by referring to Fig. 1, that the increased coning has also served to concentrate the load on a smaller area and that, too, closer to the flange of the wheel. It would appear that little consideration has been given the matter of dissipating or distributing the load rather than concentrating it, and similarly little attention seems to have been given the matter of the application of brake shoes to the wheels in the way of preventing the concentration of heat at the throat of the flange. When new brake shoes are applied to new wheels it is almost generally the case that the bearing is at the throat alone, and in the case of worn wheels at the throat and the outer portion of the tread. It is often the case also that brakes are so hung that the brake shoes themselves wear into the flange at the throat. I have examined a great many cases of late and find this statement to be entirely correct. When a new wheel is put in service on a new rail or even on old rails, the bearing between the two would be as indicated in Figs. 1 and 2. As wear takes place, which must be very rapid in so small a bearing, the area of contact increases until finally the coning is all worn off except a small portion near the flange, but the tread of the wheel in time increases its bearing so that $1\frac{1}{2}$ or 2 in., sometimes more, of the width of the tread will be found in contact with the rail. Apparently this is a condition to which it is desired the wheel should come and it may be said that if wheels are successful in reaching this condition they are likely to continue in successful service giving a normal life unless for some reason there is an extreme condition brought about at some time whereby the heat is concentrated as indicated heretofore. It would appear then that that portion of the coning which remains is reasonably effective in preventing the wheel from running to the rail. I think it is clearly understood at this time that it is difficult, if not impossible, to mount a large number of wheels on axles and for each two wheels mounted on the same axle to have exactly the same diameter, and the coning, therefore, has for its principal object the equalization of the differences in diameter. The wheel of smaller diameter will have a tendency to run to the flange and the wheel of larger diameter will have a tendency to run away from the flange. In time they seek a level if not prevented from so doing by other causes which will be spoken of later, and accomplish the result desired. I wish here to draw attention to the fact that with such

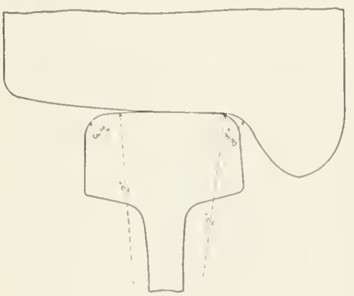

Fig. 4.

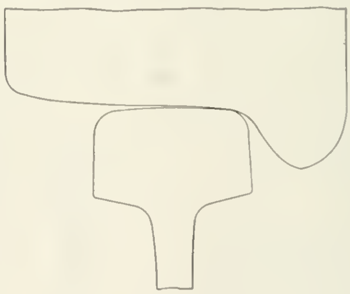

Fig. 5.

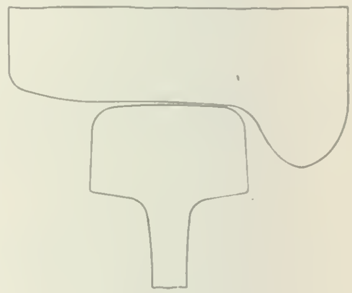

Fig. 6.

a limited bearing between the wheel and the rail as is shown by Fig. 2, the larger diameter on which the wheel rolls could not be expected to last very long, in fact, it would naturally break down very rapidly and therefore the purpose of the increased diameter might be defeated, particularly if the influence of the greater diameter to turning the truck is not at least equal to the resistance. As a matter of fact, the resistance to turning is probably very much greater than this influence, in many cases, and therefore a wheel may run constantly for a limited period on this larger diameter without accomplishing the purpose for which the coning is intended.

In my judgment it would seem that having reached this working basis by wear, the coned wheels are in far better condition to withstand service successfully than they were when first put into service for the reason that gradually the load is changed from a concentrated condition on a small area of tread near the flange to a very much larger area extending outwardly toward the edge of the tread.

So far as I have been able to ascertain from railroad mechanical men this statement of what I have described as a good working basis is regarded by them as correct; at any rate I regard it as correct. If this working basis that I have described is a desirable one to reach, why should it not be brought into play when wheels are first put into service by making the contour accordingly? From an examination of the treads of a large number of wheels I have obtained a composite contour which corresponds very closely to that shown in Figs. 4, 5, 6 and 7, and it will be seen that this contour bears quite a different relation to the rail from that shown by Figs. 1 and 2. In the former case the bearing is of considerably greater extent, going as a rule beyond the crown of the rail from the flange, and instead of the existence of straight coning, as is originally applied, there is the equivalent extending a short distance from the base of the flange outward and having a radius

‡Railroad Gazette, Sept. 13, 1907.

from 1½ in. to 2 in. before meeting the fillet at the base of the flange which is usually worn to 1½ in. or less.

It is my contention that a contour of this kind bears a much better relation to the rail, is quite as effective in equalizing the differences in diameter, has the material advantage of dissipating the load on the rail and wheel tread and makes the wheel more serviceable with less opportunity for failure than would the straight coning of 1 in 20 or 1 in 25 recently recommended and now constituting the practice of the country.

It would appear from the facts as found in service that an increase of the radius of the fillet at the base of the throat beyond ⅝ in. is a positive disadvantage rather than an advantage, inasmuch as in a short time it must be reduced, and provides an opportunity for more extreme concentration of the load on the tread than with the smaller radius. It would appear that a coning beyond this fillet, having some relation to the top edge of the rail so as to avoid extreme concentration of load but which would permit the wheel to roll for a short time on a larger diameter, would be a more effective means of protecting the flange than that at present provided.

In conclusion on this point I do not state that this alone would be a cure for existing difficulties, but I do state that it seems reasonable to me, at least, that it will tend to mitigate the difficulties somewhat if I am right in my premises that it is desirable to dissipate loads on the tread of the wheel rather than concentrate them.

With reference to the matter of improving the quality of the wheel it would seem that after consideration of the conditions under which wheels operate at the present time as compared with formerly, there must have been a considerable improvement in the process of manufacture and in the quality, but it is possible that the larger use of ferro-manganese and the introduction of the

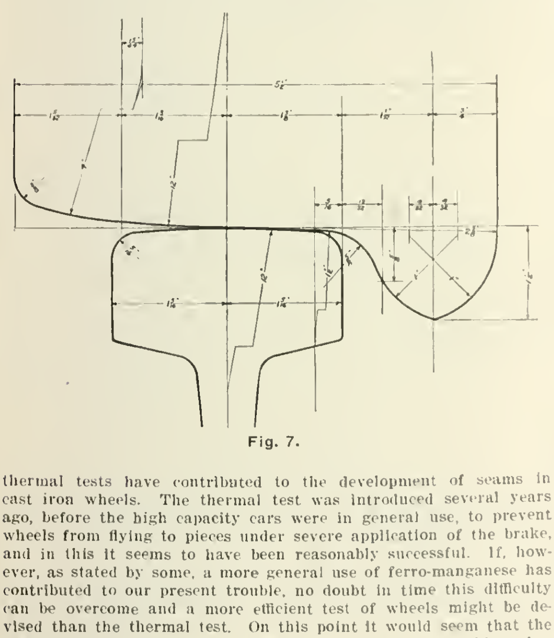

Fig. 7.

thermal tests have contributed to the development of seams in cast iron wheels. The thermal test was introduced several years ago, before the high capacity cars were in general use, to prevent wheels from flying to pieces under severe application of the brake, and in this it seems to have been reasonably successful. If, however, as stated by some, a more general use of ferro-manganese has contributed to our present trouble, no doubt in time this difficulty can be overcome and a more efficient test of wheels might be devised than the thermal test. On this point it would seem that the manufacturers of cast iron wheels might present something that would be helpful.

I have already set forth the greatly increased work required of wheels at the present time. I am of the opinion generally speaking, that unless an improvement is effected in the quality of wheels the failures will be very much more numerous than they are at the present time. If physical tests are of any practical value in determining quality there can be no doubt that the quality is better, although it may be entirely possible that a change in chemical composition such, for instance, as the increased percentage of ferro-manganese used, may have had some effect on the chill whereby it is not so well able to withstand the application of heat.

It is a fact in making slight variations in the chemical makeup of irons and steels that certain relations are oftentimes very radically changed. I can only say that in making my investigations in this direction so little seems to be actually known and so much unknown that this matter must be approached most conservatively. I am prepared to state beyond question, as a result of actual experience in making wheels, that it is entirely possible to produce a cast iron wheel the body of which will be very much tougher and stronger than is the case to-day.

A short time since, wishing to ascertain something about this matter, I made a number of wheels with the idea of eliminating some of the elements that usually make cast iron what it is, viz.: brittle. By greatly reducing the phosphorus and sulphur content I succeeded in making a wheel, the flange and body of which were incomparably stronger than anything that has been commercially produced up to the present time, but I am not at all prepared to state whether the chill of such wheels, if subjected to the conditions of concentrated load and heat at the present time, would withstand existing conditions any better than do the average wheels, although it appears quite probable. It is well known that sulphur is an element that makes for brittleness, yet it also makes for hardness. It is well known that phosphorus makes for brittleness, yet it also makes for red shortness and greatly reduces the strength, but it also increases the fluidity of iron in the melted state and assists in the process of pouring, and it is possible that with a reduction of sulphur and phosphorus content some other element might be substituted which might greatly improve the quality of the chill. There has, however, been little done in the way of investigation along these lines, and I am led to believe that wheel manufacturers have had little inducement to pursue investigations of this kind. I might here state that if an improvement in the quality of the wheels is desired it is absolutely certain that an increase in the cost will be unavoidable. I hope to be able to pursue this phase of the question later, but at the present time it is my desire to point out other possible remedies which may materially alleviate the difficulty of broken and worn flanges, not only in the case of the cast iron wheel but of the steel wheel as well.

While the matter of improving the quality of the wheel must necessarily be a very gradual one and worked out by experiment covering, no doubt, a considerable period of time, the question arises in the meantime what other things suggest themselves as partial remedies. I have already pointed out that the concentration of heat is one of the probable causes of failure at the present time and it has occurred to me that probably something might be done to avoid this. Would it not be possible to so design our brake shoes as to prevent any material bearing or development of friction and heat either at the flange or on the tread of the wheel near the flange where the load is often concentrated? In discussing this matter with one railroad man a short time since, he suggested that he thought the area of brake shoe contact with the wheel was already rather limited, and that if contracted any further it would be a disadvantage rather than an advantage. Since that time I have taken occasion to inspect a large number of brake shoes in service and find that probably not more than one half of those in service have effective use of more than 50 per cent. of their full area. I found also, some years ago, when conducting brake shoe experiments for the Master Car Builders' Association, that when the surface of the shoe in contact with the wheel became hot the metal expanded, changing the shape of the brake shoe so that the bearing was considerably greater at the central part of the shoe and very little at the ends, and that upon cooling, the shape of the shoe was again changed as a result of the wear of the central portion and when thoroughly cooled the brake shoe would take its bearing at the end portions only; so it would appear that little or nothing would be lost by removing almost entirely that part of the shoe which now bears on the tread of the wheel at the throat. This might necessitate some modification of the brake shoe holder and of the point of bearing of the brake-beam, but I am led to the belief that a great deal can be done by changing the shape of the brake shoe alone, that is, by cutting away the bearing near the flange. I wish to point out again that I do not present this as an absolute cure for the difficulties that exist, but as something that would tend in the direction of mitigating the difficulties. In fact, I believe that the means suggested for diffusing the load and preventing the concentration of heat would have a decided influence towards reducing wheel failures.

From one railroad where the service is exceedingly heavy I have obtained the following facts concerning the removal of wheels during the year 1907: Total wheels removed for all causes, 79,000; wheels removed on account of seams at or near throat on tread, without failure of flange, 3,312.

I might say here that this condition is typical of the conditions on a number of other roads with which I am familiar and which I have investigated, and it seems to lend considerable weight to the argument that I have here advanced concerning the concentration of heat and load.

I have already made the statement that of all wheels removed from the service on two typical western roads and four heavy service eastern roads, about 50 per cent. are removed on account of worn flanges, with a maximum of 86 per cent. on one road. The enormous loss of wheel service on this account, to say nothing of the necessity of holding cars out of service for the purpose of renewing wheels and of increased train resistance, seem to be a waste and expense that should be avoided somewhat, at least if possible. Whether the quality of the cast iron wheel is improved or whether the steel wheel is brought into more general use, this item of worn flanges will continue and be more expensive with the increased first cost of wheels. Considerable has already been said by others concerning this matter and also about means for preventing it. A few railroads have taken some active steps towards minimizing this waste but the majority seem to have done little. The difficulty seems to lie in the fact that wheels under cars do not track as intended, that is to say, the alinement of the wheels is not coincident with the alinement of the rails.

It is well understood that this flange wear is not produced as a result of passing around curves; it takes place on straight or tangent track; it is so general and has extended over so long a time that it seems fair to state that the wheels are not permitted to track. I say this for the reason that in some cases where they are permitted to track they do track. It is often the case, as stated previously, that wheels mounted on the same axle are not of exactly the same diameter, and it is the tendency for a wheel of smaller diameter to wear toward the flange. The coning is intended to overcome this difficulty. In some cases it seems to be effective, and in other cases to the extent already noted it does not seem to be effective. There is considerable evidence to show that coning might be made more effective if the resistance of the trucks to pivoting or turning about their pivotal center could be materially reduced.

It has been well established that the resistance of trains has considerably diminished in the case of cars where the body and truck side bearings are free or clear of each other, and where the resistance to pivoting is principally at the center bearing. Numerous papers have been presented and numerous discussions have taken place before this club covering this point, and I think it is safe to say that this principle is so well established that it is regarded as right and necessary to construct cars that shall have the side bearings free and continue so for some time at least. I would call attention, however, to the fact that on some roads, if not on most, where this effort has been made with considerable success to keep side bearings clear, that the percentage of wheels removed on account of worn flanges has, instead of decreasing, actually increased; in fact, on one heavy service railroad, in comparing the service of wheels under 40,000 and 60,000-lb. capacity cars with those under 100,000-lb. capacity cars, I find that the average life of the wheels has been reduced until now it is but 33 per cent. under high capacity cars of that which it was formerly under the lighter capacity cars, and that 75 per cent. of all the wheels removed are on account of worn flanges, which, as I have said, includes those that are worn away from the flange and cannot be remated, but which are not worn through the chill. This would seem to indicate that this condition, while possibly reaching the extreme on this particular railroad, exists to a marked extent on all railroads, or nearly so, and that enough has not yet been done to provide an efficient or partially efficient remedy.

Some years ago one railroad in this country having its interest aroused, determined to pursue this matter with a view of ascertaining what might be done. L. H. Turner, S.M.P. of the Pittsburgh & Lake Erie, has kindly furnished me with a resume of his experiments in this direction. After making preliminary tests about seven years ago and reaching the conclusion that an anti-friction center bearing would relieve the worn flanges, they commenced to equip some of their cars with the ball bearing center and side bearings, so that at the present time they have a total of 8,600 cars so equipped and 6,961 cars without. The latter are older cars of ordinary design, largely coal cars or gondolas. The average life of the ball bearing cars at the present time is between three and four years, quite long enough, it would appear, to ascertain whether the tendency of the ball bearings has operated in the direction of avoiding worn flanges. Covering a period of 36 months, ended May 31, 1907, I find that 19,608, or 86 per cent. of all the wheels removed, both from their own and foreign cars, were removed on account of worn flanges, that 472, or 2.1 per cent., were removed from cars equipped with ball bearings, that 8,926, or 39.2 per cent., were removed from the non-ball-bearing cars of their own equipment and 10,207, or 44.8 per cent., were removed from foreign cars, out of a total of 22,806 wheels removed from all causes.

It is true that these figures may not accurately and comprehensively state the entire situation, but it would seem to be reasonably clear that with 8,600 cars in service an average of over three years that only 2.1 per cent. of the wheels removed in that time were due to worn flanges, is considerable and important evidence to the effect that if wheels have a better opportunity to track they will do so.

It may be true that the particular device which the P. & L. E. used has not been all that might be desired. It is true that balls have broken and that they have become imbedded in the plates, and there is considerable that may be desired before pronouncing this anti-friction center bearing entirely satisfactory, but there is no gainsaying the fact that if the accomplishment in saving wheels were one-half that which he states, the results should be well worthy of serious consideration.

Some shop tests made recently by one railroad with a view to determining the difference in resistance between anti-friction center bearings and plain center bearings show that the resistance to turning of a dry cast steel or malleable iron center bearing as compared with the anti-friction center bearing is as 6 to 1 and in one case over 50 to 1. Mr. Turner, in his shop tests, gives the relation as about 5½ to 1, but there is reason to believe that in service this relation might be somewhat changed and not be quite so great. In case of the bearing used by the P. & L. E.§ the construction is such that in passing around a curve the action of the balls on their seats raises the body of the car slightly and when passing off the curve on to a tangent this elevation of the car body is applied to return the truck to its normal and proper position, with relation to the rail. Other anti-friction center bearings thus far developed do not appear to have included this feature and it is not evident at this time to what extent this is an advantage, for with an efficient anti-friction center bearing without this feature the wheels themselves would be expected to return the truck to the same normal position.

I feel that the Pittsburgh & Lake Erie is entitled to a great deal of credit in carrying this work as far as it has, and am convinced that in these results which Mr. Turner has presented there must be enough reliable substance to warrant the belief that many railroad men have had, that something of the kind would be valuable for the purpose intended. What I desire to point out in this connection is that one railroad has tried and obtained results, and that if attention and effort are concentrated on this subject by other railroads, or by railroads in general, an entirely efficient means will be developed for relieving the car wheel from what appears to be an unnecessary burden. It is usually the case that where there is concentration of effort, results are forthcoming.

The inability of wheels to track, it would seem, has some bearing on the failure of flanges, in that a wheel would be crowded constantly toward the flange and would necessarily have its load concentrated near the flange. In this way I am of the opinion that some additional relief might be given the already over-burdened wheel.

Finally, to summarize the points that I have endeavored to make, and laying aside for the present the matter of improving the quality of the wheel, which is a work that must necessarily go on, I would suggest (1) avoid the concentration of load by the use of a more satisfactory relation between the contour of the wheel and that of the rail; (2) avoid the concentration of heat at or near the flange of the wheel by a modification of the brake practice; (3) relieve the oftentimes existing high pressures against the flange by introducing the feature of lateral motion in truck construction, so that a considerable yielding resistance will be offered instead of an abrupt one; (4) for the purpose of avoiding the excessive wear of wheel flanges of all kinds modify the contour and provide means whereby the resistance to the pivoting of the truck and of the wheels to track may be very materially reduced.

Foreign Railroad Notes.

The Italian State Railroads have been authorized to contract, in Italy and elsewhere, for 330 locomotives, 270 passenger cars, 250 baggage cars and 10,951 freight cars, at an aggregate cost of about $28,000,000.

A world's electrical exhibition is to be held in Marseilles, beginning April 19 next and closing Oct. 31. The French Prime Minister, Clémenceau, is honorary president, and the Minister of Public Works and other high public functionaries are among its officials.

The Executive Council, to which is committed the oversight of the Italian State Railroads, has had its pay fixed at $2,000 a year for each member, and $6 additional for every day it meets. This council is supposed to represent the people whom the railroads serve.

Putting obstructions on a railroad in order to cause a derailment seems to be regarded as a serious matter in Prussia. Two young men, thinking to amuse themselves in this way, first put heavy iron hooks over the rails and hid nearby to see the fun. The engine shoved these hooks several hundred feet before it was stopped, but did not leave the track. Then they put a number of rails across the track in front of another train, and again the engine was stopped after shoving them some distance. The men were caught, brought to a confession, tried and sentenced to six years in prison—and we may be pretty sure that they will not be pardoned within a year or two.

§Railroad Gazette, Jan. 30, 1903, p. 82.

The Railroads of Canada.

BY J. L. PAYNE,
Comptroller of Railway Statistics, Dominion of Canada.

Canadians, with a genuine appreciation of the relationship between transportation facilities and commercial expansion, find satisfaction in watching the growth of their railroad system. In public regard this question is of first importance, as the course of events has demonstrated. To the lavish appropriation of public money, and still more generous gifts of land, in aid of railroad enterprises, no objection has been offered. Federal and Provincial governments alike have opened their treasuries to the owners of charters, while municipalities all over the Dominion have cheerfully assumed heavy debenture liabilities in order to provide the wherewithal for railroad construction. No other people under the sun have done as much to help themselves in this respect as have the sturdy citizens of this northland; and in thus proceeding they have been nudged as much by the stern call of necessity as by the instincts of optimism.

The extent to which our railroads have grown may be gathered from the following statement of mileage in five-year periods:

1863	2,189	1888	12,585
1868	2,270	1893	15,005
1873	3,832	1898	16,870
1878	6,226	1903	18,988
1883	9,577	1907	22,452

For the year ended June 30, 1907, the addition of 1,099 miles must be regarded as satisfactory, in view of prevailing conditions. Scarcity and cost of labor, coupled with swelling prices for supplies, have retarded construction very seriously. For example, the new Grand Trunk Pacific three years ago estimated the cost of their prairie section at $17,500 per mile; it actually cost them during the past year from $22,000 to $23,400 per mile. They were required to pay 50 per cent. more for labor and 100 per cent. more for supplies. The same influences are restraining projectors and contractors generally throughout the Dominion. In this land of forests ties are now costing from 75 to 90 cents each in the West, as compared with 20 to 25 cents when the Canadian Pacific was built in the early eighties.

Over and above the 1,099 miles referred to in the preceding paragraph 324 miles of second track were laid down during 1907. This is practically encouraging. It brings the double track mileage up to 1,067 miles, and completes a total of 27,611 miles of all tracks in Canada. Ontario heads the list with 7,638 miles of line, Quebec has 3,074, and the Western Provinces which were without a single road in 1883, have 8,198 miles. In fact, the Dominion, by one vital test, is the best served country in the world in respect of railroads. With a population of 6,500,000, she has one mile of railroad to every 289 persons, as compared with 381 in the United States, 1,821 in Great Britain, 1,590 in France, 686 in New South Wales, and 10,119 in India. The reverse is true, however, by the territorial measurement, for Canada has but one mile of railroad to every 161.80 square miles of her area, as against 13.61 in the United States, 5.29 in Great Britain, 8.46 in France, 146.09 in New South Wales, and 61.09 in India. These figures will, of course, be materially altered when the 3,500 miles of line now building in Canada are completed.

The 22,452 miles of railroad in Canada represent a capitalization of $1,171,937,808, divided into $588,568,591 of stocks and $583,369,217 of funded debt. This sum is the equivalent of $53,117 per mile, as compared with $65,926 in the United States, and $273,437 in Great Britain. The railroads of Australasia and India are owned by the government, and cannot therefore be compared on the capitalization basis; but the fact that those at the Antipodes cost $63,100 per mile, and those in India, although more than half of narrow gage, $56,800 per mile, would seem to make the Canadian showing relatively satisfactory. Net earnings of $42,989,537 last year yielded 3.67 per cent. on the total capitalization, although the actual results as applied to all the principal railroads were much more favorable. Hundreds of millions included in the statement never have earned, nor never will earn, a penny of dividend. It must also be remembered that Canada has 1,815 miles of line, built, owned and operated by government, the capital cost of which, amounting to $100,958,402, is not included in the figures given above.

In dealing with this question of capitalization, the element of aid assumes an important place. As has been said, no other people in the world have been so generous in this regard. In subventions and land grants the contributions have been as follows:

Dominion Government	$128,827,649
Provincial Governments	35,123,131
Municipalities	17,316,633
Dominion lands	31,762,954 acres
Provincial lands	20,420,109 "

Here is a total of $181,298,412 in money and 52,183,063 acres of land, quite apart from the cost of government-operated railroads. The cash payments alone amounted to $8,074.93 per mile for the total mileage of Canada, and are over and above guarantees of interest on possibly $100,000,000 of bonds. In 1882 the policy of giving a subsidy of $3,200 per mile to railroads was adopted by the Dominion Government, and in 1898, as an encouragement to the construction of high-class lines, this was increased to a maximum of $6,400, on a basis of half the cost over $15,000 per mile up to $21,400. This was not, however, the commencement of the giving of aid. The $3,200 was in 1882 taken to be the cost of steel rails per mile, and was adopted as a general measure of assistance to practically all new roads, but without any definite policy many millions had been appropriated in preceding years. Time will probably demonstrate, however, that the granting of from 7,000 to 10,000 acres per mile to lines in the West was the more valuable subvention. The experience of the Canadian Pacific leads to this conclusion. This line was in 1881 given $25,000,000 in cash, 25,000,000 acres of land, and the mileage which had been built in the West by government at a cost of $62,785,319. In 1886 the bargain was modified by taking back 6,793,014 acres of land and substituting $10,189,521 additional in cash. This left the company with 18,206,986 acres of land, which amount it has added to very largely by the purchase of charters from other companies. The Canadian Pacific commenced by selling land at $1.50 per acre; but as settlement progressed this price was increased year by year, until last year it reached an average of $7.15. The company still has approximately 16,000,000 acres for sale, and, with settlers coming into the West at the rate of 200,000 a year, it will be seen that these land holdings, in a rising market, must eventually yield an enormous sum—probably sufficient to pay their total funded liability.

It cannot be assumed, however, that the policy of granting liberal subsidies toward railroad construction will continue indefinitely. Much as Canadians feel the need of transportation facilities, and freely as they approve what has been done to meet that need, there is a growing conviction that the time must be near at hand when the government should close the till against further payments. This judgment is accentuated by the fact that the railroad bill is only part of the total. Canals have cost $92,000,000, and a proposition is now before Parliament for the construction of a waterway between the Georgian bay and Montreal involving probably $150,000,000 more. The cost of administering the present canal system of the Dominion is $1,000,000 per annum. The government, too, is engaged in building 1,800 miles of the new transcontinental railroad through a different country, and when that work is completed another $100,000,000 will likely be added to the gross capital outlay; so that, resourceful as the country may be, the fixing of limitations for the future will soon be imperative.

The total earnings of Canadian railroads for the year ended June 30 last amounted to $146,738,214, which, after deducting $103,748,672 for operating expenses, left a net balance of $42,989,537. Gross earnings have grown more rapidly than has mileage, as the following statement shows:

1882	$29,027,789	1897	$52,[illegible]278
1887	38,841,609	1902	83,666,503
1892	51,685,768	1907	146,738,214

Thus, while the betterment between 1882 and 1892 was 78.0 per cent., it was equal to 180.3 per cent. for the latter decade. Perhaps no other test of growth could be so comprehensive. Certainly no other country within the same period has done quite as well. To make up that amount $95,738,079 was received from freight service, and $45,730,652 from passenger service. Other sources contributed $5,269,483. The proportion of operating expenses to earnings was 70.70, a relative increase over 1906 of 1.2 per cent. Canadian railroads have not fared differently from American railroads during recent years in realizing a steady encroachment on their net earning power. Higher wages and ever-increasing prices for supplies have been the chief influences in this movement.

A summary of items growing out of the results of operation for the year is as follows:

Tons of freight carried	6[illegible],866,1[illegible]5
Passengers carried	32,137,319
Earnings per ton	$1.472
" " passenger	1.423
" " mile of railroad	6,5[illegible]64
" " train mile	1.953
" " passenger per mile	2.083 cents
" " ton per mile	.702 of 1 cent
" " freight train mile	$2.216
" " passenger train mile	1.513
Passengers carried one mile	2,049,549,813
Tons hauled one mile	11,687,711,8[illegible]
Average journey per passenger miles	64
Average freight haul, miles	18[illegible]
Passenger train mileage	[illegible]0,220,461
Freight train mileage	[illegible]
Total train mileage	75,115,765
Locomotive mileage	100,151,966
Average cost, one mile, all trains	$1.24
Fuel consumed by locomotives, tons	5,6[illegible]8,951

In connection with the rate of .702 cent per ton per mile a word or two of explanation is called for. This was the first year in which specific information was gathered of this nature under the schedules and classifications of the Interstate Commerce Commission adopted by Canada in 1906, and the returns in some instances were obviously too high. There are about 70 strictly commercial operating lines in Canada and some of these in the West, with a low mileage, have exceedingly high rates. The average of these western roads was 12.352 cents per ton. Including these, the average of all lines was 3.655 cents; while 59 roads showed a rate of 2.328. The average, however, for the railroads which hauled 75 per cent. of all the freight was .702 cent. The rate for the Dominion Government railroad system was the lowest returned—.584—on a total of 3,695,611 tons hauled. The average of United States railroads for 1906 was .718.

The operating expenses for the year were, as has been said, $103,718,677, divided as follows:

Maintenance of way and structures	$20,887,092
Maintenance of equipment	21,666,373
Conducting transportation	57,325,543
General expenses	3,869,669

Owing to important changes in classification these figures can not be compared with those of preceding years.

The average operating expenses per train-mile have increased within the decade from .772 to $1.249, but the gross earnings, which had grown from $1.178 to $1.953 within the same period, more than met this advance. In other words, while the operating charges went ahead by 60.5 per cent., the earnings showed a betterment of 65.8 per cent. This result was due almost wholly to higher traction power, heavier units and road improvements. Earnings per mile of line, amounting to $6,536, were considerably below the $10,460 returned for the United States in 1906, while the comparison of operating expenses was as $4,621 is to $6,912. This reveals a difference in favor of American net results as between 51.3 and 41.4 per cent.; but the measure of growth on the Canadian side has been quite as large as on the other.

An agitation has been begun in Canada for the reduction of passenger rates to 2 cents per mile. The question is now before Parliament, although the sentiment behind the movement is not as yet strong. Hitherto the average revenue per passenger per mile has not been available; but, under the new statistical reorganization applied in 1906, the rate is found to be 2.083 cents. This is but a trifle above the rate of 2.002 which obtained in the United States last year. At the present time the standard ticket charge in Canada is 3 cents per mile with a return rate of 5 cents. There are no 2-cent rates on any of the railroads. The fact, however, that the average passenger journey in Canada was 64 miles, as compared with 30 miles in the United States last year, shows a low proportion of suburban traffic. In the Colony of Victoria—which is typical of all British colonies south of the equator—with a population of 1,200,000, the number of passengers carried was 65,000,000, as against 32,000,000 in Canada; but the average journey was slightly over six miles, revealing a very large suburban business. It is this class of travel which also swells the British returns. So that, having regard to the railroad situation in Canada, a 2 cent rate would practically mean a reduction at least of 20 per cent. in the earnings from passenger service, and it is scarcely likely Parliament will be disposed to impose such a heavy tax on the railroads. This agitation, however, demonstrates the hostile feeling which is steadily, although in large measure unreasonably, gaining force against corporate interests.

For several years past complaints with respect to the available car supply of the Dominion have been persistently made. The Railway Commission has been fairly obsessed by the clamor from shippers, Boards of Trade and other bodies. To laymen the matter, of course, has always appeared simple and the remedy easy of application. "The railroads should buy more locomotives and cars," they say. In this situation special inquiries were made under my direction to ascertain what would be the number of cars obtainable if all the car shops in the country were run at their full capacity. The answers were complete. They showed the annual producing capacity of all the plants, whether owned by railroads or private corporations, to be 227 locomotives, 9,994 box cars, 212 stock cars, 2,221 flat cars, 113 vans, 37 refrigerators, 134 first class cars, 14 second class cars, 44 sleepers, 83 combination cars, 756 other cars for freight purposes and 122 other cars for passenger service—a total of 227 locomotives, 14,333 freight and 397 passenger cars. In 1906 there were 99,884 cars of all classes in use on Canadian railroads, of which 96,565 were in the freight service and 3,319 in the passenger service. On June 30, 1907, the account stood: Freight cars 113,418, and passenger cars 3,632—an increase in the former of 16,853, and in the latter of 313. With regard to locomotives, the number had increased from 2,911 to 3,499. In all these classes of equipment it will be observed that the betterment was beyond the actual number turned out of Canadian shops during the year. A bare 41 locomotives and 155 box and flat cars had been imported from the United States, which were probably all that could be had from that source. The explanation probably lies in too low a return in 1906, and a full accounting under the new schedules.

There is, however, another phase to the matter. Just how many cars were put out of commission during the year could not be ascertained. The railroads fought shy of that question. On an equipment of 99,884 cars in 1906 what should have been the normal depreciation? In trying to determine this important point I soon found that there was a wide divergence of opinion. The estimate of the Master Car Builders' Association is alleged to be too low; it probably is. But who can say what is the life of a freight car? Until the principal railroads join in an honest effort to follow the history of a given group of cars on each system, and something like the actuarial work of insurance companies is applied to this problem, the whole question will remain in the field of conjecture. No value can be attached to the displacements which take place year by year, having regard to the changing character of the units.

Be this as it may, it is apparent from the figures given above that our Canadian railroads did all that was possible to meet the demand for more cars. They bought or built every car that could be turned out in Canada, and probably imported as many more as could be had from United States shops already working under pressure. Yet they were short. The total supply for the year was equal to but 5,218 freight cars per 1,000 miles of railroad, as compared with 8,810 on American railroads. By the same test, the number of locomotives on this side of the line was 156, as against 232 on the other. This shortage of equipment arose from a variety of causes. The increase in freight tonnage, the addition to the mileage in operation, plus the rolling stock put out of commission, combined to keep the railroads in despair notwithstanding the fresh supplies brought in during the year. Producing plants are being increased; but with the growth of railroads and traffic it is doubtful if more locomotives and cars will entirely solve the difficulty. To these agencies must be joined more double tracks, more yard room and increased terminal and siding facilities.

The public side, however, cannot be ignored. Shippers have not added to their warehouse accommodation to the extent of trade expansion. Delays are constant from this cause. Last year the average volume carried per freight car was 594 tons, as against 888 in the United States, clearly demonstrating that our railroads have not obtained the maximum of service from their car supply. These hindrances have been aggravated by an element which does not exist in the United States. Just when Canadian railroads were distracted by the appeals for rolling stock the Lord's Day Act came into operation, practically stopping all traffic on Sunday. I shall not guess at its effect in limiting the movements of trains. The Assistant Traffic Officer of the Railway Commission spent months in studying the matter, and he has officially declared that it has reduced the carrying capabilities of the Canadian Pacific by 21 per cent. That estimate no doubt fits to all lines. Then in the West the Manitoba Grain Act has borne very severely on the railroads by its arbitrary provisions with respect to the distribution of cars, and to protect themselves from heavy penalties the C. P. R., in particular, has had to skimp the East. So that, taken altogether, the car supply problem is not likely soon to be solved in Canada.

During 1907 the number of railroad employees in Canada and their rates of remuneration were ascertained. Even the census had systematically disregarded this important matter. The results are most instructive. Altogether 124,012 persons were employed, and the aggregate compensation was $58,719,493. This sum was equal to 58 per cent. of the operating expenses, and a careful estimate of the relationship of employees to population makes it clear that probably one person in six obtains a livelihood, directly or indirectly, out of the transportation interests of the country. In this calculation shipping is, of course, included, together with all collateral industries.

The accident record for the year is both alarming and distressing. Altogether, 587 persons were killed and 1,698 injured, both numbers being the highest in our railroad experience. The division of the total is as follows: Passengers, 70 killed and 352 injured; employees, 249 killed and 1,126 injured; trespassers, 195 killed and 125 injured; non-trespassers, 70 killed and 88 injured; postal clerks, three killed and seven injured. One passenger in every 459,105 carried was killed, and one in every 91,290 injured. Relatively, there have been two worse years by a small percentage; but the tendency has been steadily in the direction of an annually longer casualty list. Trainmen were killed at the rate of one in 137, and injured in the proportion of one in every 26. This is considerably below the United States record for 1906; but measured by train mileage the Canadian showing is the darker. One or two features of the year's returns are surprising. For example, with the universal application of the automatic coupler and the air-brake two or three times as many trainmen were killed while coupling cars, and by falling from trains, as in the days of the link and pin and old hand-brake. The level crossing cost 69 lives, and the broken rail was much in evidence among the causes of accidents. Collisions and derailments involved the sacrifice of 108 persons, and the injuring of 439 others.

The railroad situation in Canada at this juncture is particularly interesting. The Canadian Pacific has spanned the continent, the Canadian Northern has pushed its western terminus to the Rocky Mountains, and the Grand Trunk Pacific is under construction from ocean to ocean. All this outlay and effort has in view the new Canadian commonwealth which is springing up in the far West, and which during the past year has grown in population at the rate of 700 souls per day as the result of a swelling tide of immigration. Nearly 60,000 settlers came over from the United States during the twelve-month. The peopling of the prairies with producers creates almost at once an urgent need for additional transportation facilities. These newcomers must have the manufactures of the East, and they must at the same time have an outlet for their pastoral products. In view of these conditions, the Grand Trunk Pacific has made strenuous efforts to complete its central section from Lake Superior to Edmonton. In October last part of that line was opened for grain traffic, and before another harvest has been reaped it will probably have 800 miles in full operation through the center of the great wheat belt. This will mean practically three trans-continental roads in close competition in the West, and before another five years have passed that section of the Dominion, which until 1882 had not heard the whistle of even a construction locomotive, will have more than half the railroad mileage of the country. Out of this development has come a marvelous stimulation to industrial life in the older provinces, and to it are attached the larger hopes of the Canadian people.

At least one enterprising American has made extensive plans to reach out for a share of this new Canadian traffic. James J. Hill has already pushed eight lines connected with the Great Northern system across the boundary, representing a total of 388 miles within the Dominion. He has done this wholly without aid from the government, and at considerable cost. These encroachments are naturally resented by Canadian railroad interests, and rumors of a retaliatory invasion of Great Northern territory are being given currency. Meanwhile, the people of the West are not saying nasty things to Mr. Hill. But just what may be his ultimate ambition cannot very well be guessed from the somewhat seattered nature of his existing enterprises on Canadian soil. Whatever it may be, he at least has the example before him of many United States lines doing business in eastern Canada. The New York Central, the Michigan Central, the Wabash, the Maine Central, the Boston & Maine, the Vermont Central and the Pere Marquette have lines and connections in Ontario, Quebec and the Maritime Provinces, with a considerable passenger and freight traffic. It is to the future they are shrewdly looking, and in that prospect the citizens of Canada are just beginning to discern the measure of their great heritage.

The Ocean Carrier.

BY J. RUSSELL SMITH, PH.D.

III.

*The Origin of the Common Carrier on the Sea.**

The year 1815 brought peace in Europe and America, and what was of particular importance, peace upon the Atlantic. Commerce, freed from the risks of war and increased to greater dimensions than ever before, was now in every respect ready for organized transportation by lines of vessels performing the service of common carriers. The speedy American vessels, built for privateers and with occupation gone, were well suited for this new service, to which they were now turned. Promptly after the peace of December, 1815, a line was established between New York and Liverpool. Others quickly followed. Boston and Philadelphia were soon included. These new lines of sailing packets carried passengers, the mails and valuable freight, and from that time to the present we have had a steady development in the extent, efficiency, permanency, and regularity of line service across the North Atlantic Ocean.

The first line, the famous Black Ball Line of 1816, was founded by Isaac Wright & Son, Chas. H. Marshall and others. Their vessels, of 400 to 500 tons burden, were considered very large and fine and sailed regularly on the first of each month from New York to Liverpool. For the first nine years the average time to Liverpool was 23 days, with a record of 15 days and 18 hours, and the return voyage against the North Atlantic winds averaged 40 days. A second Liverpool line, the Red Star, was founded in 1821 by Byrnes, Grimble & Co., with a monthly sailing day on the 24th. The now prosperous Black Ball Line met this rivalry with enough new ships to despatch one on the 16th. Promptly thereafter the interval in the weekly calendar was filled by the Swallow Tail Line (Thaddeus Phelps & Co. and Fish, Grennell & Co.), which had its sailing day on the 8th, and for the first time New York had the advantage of a weekly packet to Liverpool.

In 1821 Thomas P. Cope & Son, of Philadelphia, merchants, who had for 14 years been in the Liverpool shipping trade, established a packet line from their city to Liverpool, which was sustained through all circumstances. For nearly half a century this was a famous line, and for many years it was Philadelphia's only line.

In 1823 the proprietors of the Swallow Tail Line from New York to Liverpool established a line of packets from New York to London, which survived until about 1870. The founding of this first line of London packets resulted in a second line being founded about the same time by John Griswold (later E. E. Morgan's line).

"About" 1822 the first line was sent to Havre by Francis Depau, and ten years later William Whitlock started the third, the second having been established somewhere in the interval by Messrs. Boyd & Hincken.

The line traffic of the packet ships, now well established to Great Britain and the continent, went on increasing and prospering, new lines being established, new and better ships added, until past the middle of the century. This is the much-boasted period of American leadership upon the seas. Nearly all of our commerce was carried under our own flag and much of the commerce of other countries. We outsailed the ships of other nations and got the lion's share of the passenger traffic. The packets were the most elegant, comfortable and commodious ships afloat. A packet for London in 1823 was advertised as having a physician and a piano on board, and one enthusiastic American writer, with a mind full of details and performances of ships, declares that "in their presence the English and French trading vessels were absolutely insignificant. Their agents, builders and captains speedily became rich, for all were owners—the agent owning, say, an eighth of the vessel, the builder another eighth, in order that he might secure the job of repairing her, which cost about $500 a round trip; the captain another eighth, that he might have the strongest of all motives to vigilance and prowess, the blockmaker and the sailmaker each a sixteenth, perhaps; and the other persons the remainder, a packet of 500 tons being worth about $40,000."

These sailing ships were steadily improved and enlarged, but it is stated that the Mississippi, of 750 tons, was the largest American merchant ship when she was launched in 1833. In 1843 there was a marked increase in size, and in 1846 the New World held the size record and was regarded as a wonder with her 1,400 tons. In 1854 the two Morgan liners, "Palestine" and "Amazon," reached the highwater mark of 1,800 tons. In that year one of these ships put her passengers in London two days ahead of the Cunard Line steamer, having landed them at Portsmouth on the 14th day out from New York. This 14-day record for the packet ships was an unusual, though repeated, occurrence.

The New York packet service to Europe greatly stimulated the coasting trade. In addition to having the local market, the coasting vessel had the surety of being able to forward goods to Europe by the packets, proceeding at regular intervals. Goods came from New Orleans, Charleston, Baltimore, Philadelphia and Boston to be forwarded. The development of coasting lines was the next natural step. In 1818, two years after the origin of the packet service, there was a line of 180-ton sloops running from Boston to New York. There is mention of a "regular packet" to Charleston in 1825. In 1832, E. K. Collins established a line of full-rigged packets to Vera Cruz. The prompt success of this line caused him to send a schooner line to Tampico, and in 1832 the first regular line of packets to New Orleans.

No one should let this account of the packet lines create the impression that the era of the merchant carrier with his individual ship was at an end. The packet lines were limited to the North Atlantic and to the trade of a few ports in America with a few ports in Europe. The long-distance trade of all the rest of the world went on as of yore, while line traffic grew and improved in the one little corner of the world's ocean that separated the commercial metropoli of Europe and North America.

It is rather remarkable that this period of the origin of line traffic should have been also the period of the greatest brilliance in the whole history of single ship enterprise. Yet such was truly the case, through the fame that attended the clipper ship era from 1840 to 1855. The clipper was among tramps what the packet was among liners. The trade with India and China, and later with California, was over routes so prodigiously long, that line traffic was practically impossible, but speed was none the less desirable. So the clipper, profiting by all the experience of the packets, was built, long, sharp and narrow, with every possible regard for speed, so that she might distance all rivals in the race for the ports of the Antipodes. This speed was particularly valuable, because the English tea purchasers coveted the first new teas, and there was an annual tea ship race to get the new crop to the British market. The captain of the ship carrying the first cargo was in an exceedingly fortunate position, because he could sell it out at a fancy price, yielding an exorbitant profit. The time of tea harvest in South China saw annually a fleet of vessels there waiting for the chance to hasten away with the first cargo. This fleet of clippers was largely American, because in the preceding thirty years it had been so repeatedly demonstrated that no other ships were so fast. In 1853, the little clipper "Architect," built in Baltimore, won distinction by placing her tea in London in 107 days from Canton and getting her whole cargo sold before any of the British fleet arrived. The "Architect" took scrap iron to New York and there loaded flour and cotton goods for China. Her next tea voyage showed the value of a speed record, for she was at once chartered to take tea to London for £8 per ton, while the English vessels were glad to get £3 or £4 per ton.

The first of the clippers to demonstrate the differentially high value of speed was the "Rainbow," 750 tons, of 1843. She was quickly copied by the leading merchants of the day, but they rather

*References: Harper's Magazine, Vol. 68, p. 217; Scharff & Westcott, History of Philadelphia, Vol. 3, p. 2,216; Harper's Magazine, Jan. 1884, Feb. 1892; Quarterly Review, Vol. 62, p. 207; Hunt's Merchants' Magazine, 1840, British Admiralty.

overdid the matter of speed, for many of these vessels were so light that they were easily strained and the repair bill cut into profits. Then came fast clippers of greater strength and size, reaching up to and passing 2,000 tons. One of these larger vessels, the "Comet," made the record voyage from New York to San Francisco in 76 days and the "Flying Cloud" made the San Francisco-New York voyage in the astonishing time of 84 days, breaking all records.

In 1851 the "Dreadnought" reached Sandy Hook from Liverpool the same day that the Cunarder reached Boston, and the Cunarder had started one day earlier than the clipper.

The "Sea Witch" was another of these famous ships, which netted her owners $50,000 above all expenses by the freights earned on the voyage from New York to London via San Francisco and Canton. In 1852, 157 vessels arrived at San Francisco, and of these 70 were clippers.

These clippers were often owned by the leading merchants of the period, and they brought a world renown to the American sailor and the American flag, which the Americans of that day enjoyed to the fullest and which the historians of the present make the most of.

The change in the names of the ships from 1815 to 1850 is suggestive of the changed spirit of the men of the time. At first, as they crept out from under the right of search, their ships were named "Hope," "Endeavor," "Perseverance," "Traveler," etc. Then came a period when the names of merchants and captains were commemorated, and lastly came the confidence of triumph, and the ship was named "Challenge," "Invincible," "Flying Cloud," "Sovereign of the Seas."

Several causes contribute to this double triumph in both branches of ocean carrying. It is all included by saying that it was a superior class of men commanding and manning a superior class of ships. This period was dominated by the men who went to sea or went to the counting room in the period preceding the peace of 1815. Most of these men came from New England, where the opportunities for employment were not numerous. The Great West was a wilderness unapproachable by any except those who chose the emigrant wagon and the life of the frontier farmer, whose opportunities for marketing produce were exceedingly meager. Other than this the young men could go to town or go to sea, and they did both. Young men of parts, of family and of education went to sea in those days and began before the mast. The quarter century preceding the peace of 1815 was a time when the risks and prizes of the sea trade were a particular temptation to a lad of courageous, hardy and venturous equipment. Combining this with stagnation at home, we have a reason why some of the ablest men in America should be found dispatching ships and striding the deck between 1820 and 1860. The New England whaler was a schoolship of the most efficient sort for the graduation of the sons of New England into the sea life which they helped to elevate to its most distinguished epoch.

Harried by privateers, pirates, hostile navies and British captains exercising the right of search, the American ship had come to beat the world at running away, and hence was the fastest thing on the surface of the salt sea. The good American sailor had a good ship. The merchants of the day had also often come to the counting house after having risen to the command of ships. With such men having such experience, the era of packets and clippers was natural. There are occasional records of whole crews on an American ship in which all but two or three of the men could perform feats of navigation only known to the officers of foreign ships.

In 1880, with possibilities of safety considerably advanced, insurance rates on the same kind of vessel had gone down 50 per cent., a direct measure of efficiency of navigation.

The captain of a packet or clipper was a man of more financial and social importance than is now to be found on the ships of peace. He was absolute master of the ship and all on board. The engineer on some great steamer lines is not responsible to the captain. The captain of 1840 was commander, part owner, often attended to the cargo and met merchants on an equality. "His income was often $5,000 a year, consisting of 5 per cent. of all of the freight money, 5 per cent. of all the steerage passage money, 25 per cent. of all the cabin passage money, the entire receipt from the carriage of the mails, two pence a letter from the British Government, and two cents a letter from the American Government and a salary of $360 per annum, and, moreover, he had the privilege of taking his wife and sometimes even her sister, board free."

Forty years later the steamship lines had driven these noble old captains and their ships from the sea, but the steamer captain had not secured his emoluments. The captains of the Hamburg and Bremen liners received $1,200 per year and the Cunard commodore got only $2,500.

The lines, firms and shipping enterprises of the period from 1815 to 1850 grew up naturally and gradually as is the case with nearly all great enterprises. The inception of the famous and record-breaking Collins Line is due to the energy of E. K. Collins, whose career is typical of the period. He was born in 1802, the son of a sea captain. He was reared on Cape Cod, and at 15 was a clerk in a New York store. At 20 he was a supercargo, sharing the profits of voyages to the West Indies and testing his nerves in shipwreck and pirate fray. At 23 he became partner with his father in mercantile business in New York. One day a returning Liverpool packet reported a phenomenal rise in the price of cotton. Straightaway the speculators bought all they could find and engaged passage to Charleston on the packet which departed that afternoon. A rival syndicate was formed to try for this Charleston prize. Their representative was the young Collins, now 23, who much to the merriment of the speculators on the packet crossed the bar beside them in a pilot boat. But he had been down that coast before, and his shallow draught boat followed inshore passages and when the New York packet crossed the Charleston bar young Collins was sailing out, master of all the cotton in Charleston and on adjacent rivers. His fortune was half made and the next year he married an heiress. Four years later he established a line of full rigged packets to Vera Cruz, then a line of schooners to Tampico, and in 1832 he established the first packet service to New Orleans.

He knew enough about ship building to introduce some new designs for the New Orleans packets, and when in 1835 he sent his "Shakespeare" to Liverpool she created so much interest that she had to decline three times as many passengers as she could carry. Mr. Collins took the hint from this profitable and auspicious voyage and founded the Dramatic packet line to Liverpool.

But scarcely had he got his transatlantic line running when in 1838 the British steamers, "Sirius" and "Great Western," successfully and profitably crossed the Atlantic and were followed by others. In 1840 Mr. Collins is reported to have said, "There is no longer chance for enterprise with sails. It is steam that must win the day. I will build steamers that shall make the passage from New York to Europe in 10 days and less." It took him 10 years to keep this promise, but he did it.

These glowing accounts of success and speed of the sailing vessel are not the whole story. The best sailing ships in the world sometimes had their exceedingly great difficulties in the perverse winds of the Atlantic. There is an account of a vessel that made 5,000 miles and crossed the Gulf Stream three times on the 3,050-mile route between Liverpool and New York. The bark "Ellen," 103 days from Leghorn, hoisted her flag at Sandy Hook and was then driven off to sea for another month with her crew subsisting on macaroni and sweet oil. In February, 1837, the British ship "Diamond," 100 days from Liverpool, reached New York with 163 passengers, having lost 17 from plain old starvation. The packet record for tedium from Liverpool to New York was 110 days. Truly the passenger on such voyages needed many resources for entertaining himself.

These extremes of slowness, like the extremes of speed, should be compared with the average performances of the packet ships. New York to Liverpool, Liverpool to New York.

	Days: New York to Liverpool.	Days: Liverpool to New York.

Average of the two new steamship lines, 1838-39	13	

The era of the prosperous and triumphant clipper ships was short-lived; 1855 may be put down as the last year of their heydey. A few years before a Yankee offer of $20,000 on a race from Canton had had no takers, but in 1855 a British clipper won a notable race from the East. In 1856 the Panama Railroad was completed and thereby a great prop was knocked from clipper ship prosperity. California trade had been one of its main standbys. Linked in with the China trade the clipper ship made fine voyages round the world. By our coasting trade reservation the Atlantic coast trade to California was an American monopoly. But here came the Panama Railroad joining its steam wagons with the steamers that came down from San Francisco on one coast and went up from Colon to New York on the other, cutting into the clippers' boom of prosperity with a mercilessly quick and regular connection between New York and San Francisco. Eighteen hundred and fifty-six was a black year in shipping rates and a blacker year in the almost abandoned ship yards. The next year brought the panic of 1857 and four years later came the Civil War and the clipper had descended to the inconspicuous common place.

The downfall of the packets was less sudden in that it was a gradual decline spread over a period of 30 years from 1840 to 1870.

The first successful crossing of the Atlantic by steamer was really the doom but by no means the cause of immediate death of the packet ships, despite the graphic journal entry of a passenger on one of the "Black Ball" packets as the "Great Western" overhauled and passed her on this maiden trip to New York: "Then (the steamer) dashing ahead * * * the brave old 'liner' (packet) is no more seen. Her owners will scarcely know her when she reaches port at last. She brings no news. She will soon bear no letters, no species. Nobody will watch for her, nor speak of her, alas! her day is gone by. Who can think of her suffering without a sigh?"

But the steamer did not do all this suddenly. Her struggle upward was slow and painful. In five years after the "Clermont," the first of the steamboats run on the Hudson, 1807, the steamer had conquered the western rivers by ascending the Mississippi and opening a continent by putting lines of steamers on its rivers; but it took more than five times five years more to develop the ability to compete with packet liners on the Atlantic. In the interval the lines of steamers on short voyages and coasting voyages had far outstripped all rival sailing lines. The sailing vessel is good for the open sea, away from the impediments of coasts where sailing ships so often come to grief. The sailing vessels that carried the mail were, when winds were adverse, sometimes many days in making a hundred miles between some British and some continental port. In 1815 a 63-ft. steamer passed from the Clyde to the Thames—the first to be upon that river. Other voyages were soon made and the fitness for coasting service was observed.

The action of the British government concerning the mail service during the decades 1820-40 throws interesting light upon the efficiency of the new lines of sailing vessels and the limitations of their service in competition with steamers on short voyages. About 1820 it was found that steam vessels could satisfactorily carry the mail from Great Britain to the continent of Europe. But there were no private owners in a position to do this work, and from 1822 to 1851 the British government provided its own steamers, the mails being carried in vessels owned and operated entirely by the British government upon regular service, carrying some freight in addition to the mails.

When the government began this service private enterprise in shipping lines was at a low ebb, but it soon seized the new tool for the development of common carriers and the coasting trade is thus glowingly described by a writer in the *Quarterly Review* of 1838 (Vol. 62, page 188):

"There are at this hour scarcely two ports in the United Kingdom of any consideration between which steamers do not regularly ply. In 1818 the most sanguine never dreamed of their being available for much more than inland navigation, with here and there a little circumspect sallying out and skirmishing along the curves of the coast something after the style of the ancients. * * * Who would have believed that by this medium would be maintained our regular communication with all the neighboring ports of the continent and through them with Europe at large?—that every week at least, in some cases daily, London boats would be visiting Hamburg, Holland, Belgium, the French coast, Lisbon and Cadiz?"

At this time the steam coasting service that had survived upon the American coast was limited to Long Island Sound, although in 1818-20 a steamer had made several trips from New York to New Orleans via Charleston and Havana. There had also been some other isolated voyages, but all were of small significance.

During this 20 years, 1818-1838, when the steamer line had been proving itself in the English coasting, continental trade and upon the American rivers and lakes, there had been various sporadic and unsuccessful attempts at long ocean service. The famous voyage of the "Savannah" to Liverpool was not a commercial success, nor was the ship steam-driven all the way. In 1825 a steamer with auxiliary sails went from England to India, but she stayed in the Indian service. In 1830 one went to Australia, but instead of being the founder of a line, she was a heavy loss to her owners. In the late twenties a steamer made a few trips from Europe to Guiana, but she soon stopped and no others followed.

The occurrences of 1838, however, showed that after all of these experiments the steamer was at last ripe for the Atlantic trade. In that year the transatlantic steamer proved itself to the satisfaction of business men and even of the conservative British government. Since 1833 Junius Smith, an American merchant in London, had been laboring on the scheme and finally his company, the British & American Steam Navigation Company, succeeded in landing a steamer in New York from Portsmouth, England, on April 23, 1838, the same day that the Great Western Steamship Company landed the steamer "Great Western" from Bristol. The people of New York went into transports of joy. Later in the year the Transatlantic Steamship Company of Liverpool also sent a steamer to New York, but despite this auspicious start for the record-making year these new steamship companies were not yet able to give a line service of the regularity afforded by the weekly packets.

During 1838-39 their service was irregular, some of them being taken off entirely during the winter. In the words of a writer in *Chambers Journal* (15, 390): "From the absence of method in the departure of the several steamers arising principally, perhaps from the rivalry and non-accommodating spirit more or less characteristic of all competing companies, there was a wanting that faultless regularity in the despatch or receipt of intelligence, which, whether in matters of politics or commercial information, is of the first importance."

The British government also recognized this along with the fact that the steamer was capable of regular line service, and in October, 1838, six months after the crossing of the "Sirius" and "Great Western," advertised for bids for a fortnightly steam service from Liverpool to the United States via Halifax. The bid of the Cunard Company, of Halifax and Liverpool, at about $15,000 per voyage was accepted, and on the fourth of July, 1840, the "Brittaina," a wooden paddlewheel steamer of eight knots per hour, sailed under this contract from Liverpool for Boston, via Halifax. This is the date of the founding of line traffic by steamer across the Atlantic following a regularly maintained schedule that survived in winter and summer and calm and storm.

It should be noted that the introduction of steam made no revolution in the form of service by ocean carriers. It simply gave a new and improved tool for the old work. The line traffic was already established and the Cunards, with their steamers, merely substituted the new type of vessel in the North Atlantic service. It was merely a better line, that was all. The packet lines had taken the passengers, mail and fast freight from the occasional sailing vessel. Now the steamer, faster than the packet, took from it the mail and the freight and the passengers possessing the highest ability to pay.

From that day to this there has been nothing new in the sea service except continuous and rapid improvement of the then existing services and the substitution of new types of vessels for the obsolete.

(To be continued.)

The Era of Steel and the Passing of Wood in Car Construction.*

BY ARTHUR M. WAITT.

The standards of 10 or 15 years ago are considered entirely insufficient and unsatisfactory to meet the demands of the public and the increased business of the present time, and the track, bridges, stations, terminal and transfer yards, locomotives and cars of many of our progressive trunk lines have been almost entirely replaced. It is the purpose of this paper to consider, somewhat briefly, the progress and changes which we see to-day in car construction, especially in the United States and Canada.

There are those living who have seen the development in car construction from a car which, aside from the wheels, axles, journal box and bearings, center plates and couplers, and the necessary rods and bolts for tieing the structure together, was composed almost exclusively of wood, these cars being built to carry a load of only 10 tons. From this very primitive car to the modern one of almost exclusively metal construction, development has been rapid, and yet only by gradual steps. The modern steel car was not created full-fledged and perfect by the mind of a god as was the goddess Minerva by the power of Jupiter; it has been developed by the plodding, persistent study and work of the human minds and human hands of the master car builders, whose ruling motto was, "To do with their might whatsoever their hands found to do." The substitution of metal for wood came gradually, necessitated by the rapid wear and frequent breakage in service of parts too weak for the duty demanded of them.

John Kirby formerly General Master Car Builder of the Lake Shore & Michigan Southern, who is probably the oldest living representative of American master car builders and who has been largely responsible for the highest development of the American wooden freight car, stated to the writer that his first knowledge of metal car construction in this country was in 1853, when the New York Central had a few hundred box cars made principally of metal, although the body bolsters, inside sheathing, floor and roof boards were of wood. These cars gave fairly good service for a few years, but corrosion took place just above the sill line in the outer metal covering, and considerable patching was required; nevertheless, they continued in use many years. As early as 1860, Mr. Kirby put in passenger car service the cast-iron brake-head and shoe as a substitute for the wooden block and the wooden block with an iron lining, again, in 1868, he designed and put in service the double, metal body bolster as a superior substitute for the old wooden bolster.

So far as the writer can learn, the earliest metal cars used in this country were a large number of four-wheel iron cars built by the Baltimore & Ohio prior to 1853. These were built for carrying coal, and were in constant use for that service up to the time that all four-wheel cars were discarded from service, which was some 20 years ago. In 1861 the Eastern of France began substituting iron sections for wood in car construction. In 1895, 34 years later, this company had over 20,000 cars with metal framing or of all metal construction. The first 50-ton pressed steel hopper bottom car built in America was exhibited at the Master Car Builders' convention at Old Point Comfort, Va., in 1897. This was the first year that modern metal cars were built in any large number in this country. They were designed and built especially for the coal and ore trade, and, though of much lighter design than cars for similar purposes constructed to-day, they have been in continuous service

*Abstract of a paper presented at the January meeting of the New York Railroad Club.

tor 10 years, and on the average show very little deterioration from service or corrosion. Steel cars in service on the Eastern of France since 1869 are said to have shown a loss of only 6 per cent. in corrosion as a result of the first 28 years of service. Only in a very few cases, and those where exceptional and unusual conditions existed, has there been publicly reported any serious deterioration of modern steel cars from excessive corrosion.

M. L. Tolmar, Chief of Shops on the Eastern of France, has, within a few years, published in the *American Engineer* an interesting series of articles in connection with the company's long experience with the metal car. Mr. Tolmar estimated that the life of cars with all metal underframing would be about 50 years, so far as the body frame is concerned. Where the upper frames are of metal, he found that these give out first, while the underframes are still good. In general, his conclusions were that the steel underframe car would have double the life of the car with a wooden underframe. Some of his further conclusions were:

"In the design of the cars the smaller the number of pieces the better. Rivets are better than bolts. Good rivets give no trouble. Cars of all steel construction should, if possible, have the inside at exposed places cleaned and repainted every three years." The use of all steel upper frames for box cars is not encouraged by Mr. Tolmar. He further says: "We have never been able to prove, even in shops where 30,000 cars a year are repaired, that damage to the frames was attributable to disappearance of rivets or the premature weakening of sections by rust." The final conclusions regarding the use of steel cars in preference to wooden ones are as follows: "First—In an enterprise or an undertaking of a transitory nature one can be content with wooden cars, which for 15 years will not involve expense greater than those of mixed or iron frames. Second—The enterprise of long duration should seek permanence in its construction at the risk of diminishing a little the benefits accruing during the earlier years, and to this end must use metal frames."

Shortly after the appearance of the first steel hopper-bottom coal cars in 1897 some very interesting comparisons were made by C. T. Schoen, designer of these original pressed-steel cars, as to the cost, life and maintenance of such cars as compared with wooden ones. Any one interested in learning the basis for the claims made in favor of the steel car at that early date can see them by referring to the *American Engineer* for February 25, 1898.

The early advocates of steel cars made a great deal of the advantage due to the lighter weight as compared with wooden cars of similar capacity. In the early days of steel car construction the additional cost as compared with wood was quite considerable. To find favor in placing the new cars on the market it was necessary to show some material offset for the added cost. In order to accomplish this by reduction in weight the earlier steel cars were made somewhat too light to stand in an entirely satisfactory manner the strains of service. In later designs this fault was gradually rectified so that the cars turned out at present are almost always fully capable of resisting the shocks in the heavy trains in which they are run, and they are standing up quite satisfactorily. With the exception of the results of collisions or accidents the steel car of to-day is for the first few years of its life nearly free from repairs other than the renewal of wearing parts, such as brake-shoes, wheels, axles and journal-bearings. The deterioration from corrosion and other causes is hardly noticeable in cars from eight to ten years old, except in a few cases where they are used under unusual and exceptional conditions. Foreign roads, as well as some American roads who have reported on the subject, have found that there is almost no cost for repairs to steel underframes in the first four years.

According to the *Railroad Gazette*, in the year 1907 there were 289,645 cars built in the United States and Canada by car building companies, and of this number 280,216 were for domestic use. About 72 per cent. of the freight cars built were of steel or steel underframe construction. This is a growth of over 400 per cent. in the proportion of steel cars as compared with the record of 1901. The capacity of the steel car works in the country has been materially increased during the past four years; at present the total available capacity for building steel cars has been increased to about 150,000 cars a year, and the total available capacity for all kinds of freight cars approximates 1,000 cars per day, which would seem to provide amply for the number of cars required yearly for some years to come.

In the statistics of freight cars ordered during 1907, it is interesting to note that, with the exception of a few built for private companies, for small railroads, or for special purposes, the great majority are of 80,000 lbs. and 100,000 lbs. capacity except for roads in the southern states, in New England and in Canada. For roads in the latter groups, many cars of 60,000 lbs. capacity are still being built.

The "passing of wood in car construction" is not only due to the greater economy in maintenance, the greater stability and efficiency and the much greater safety of the steel car, but is being forced by the scarcity of suitable lumber, as well as its rapid increase in cost. In a paper prepared by R. L. McCormick, President of the Mississippi Valley Lumber Men's Association, on "The Exhaustion of the Lumber Supply," he states: "The present stand of yellow pine in the southern states has been stated by R. A. Long in a paper read before the annual meeting of the Southern Lumber Manufacturers Association to be about 137,000,000,000 feet. For the census of 1900 the total cut of yellow pine was given as nearly 10,000,000,000 feet. These figures show that at the present rate of consumption the present stand of longleaf yellow pine will be exhausted long before a second crop could be produced." In a pamphlet published by the United States Department of Agriculture on the "Waning Hardwood Supply," the following statements are made: "The hardwood lumber cut in 1899, according to the census, was 8,634,021 thousand feet, in 1906 it had fallen to 7,315,491 thousand feet, a decrease of 15.3 per cent. That the decrease is due to diminished supply rather than to lessened demand seems to be proved beyond question. During the same period the wholesale price of various classes of hardwood lumber advanced from 25 to 65 per cent. The most notable shrinkage has been in the leading hardwoods to which the public has been long accustomed. Oak, which in 1899 furnished one-half the entire output of hardwood lumber, fell off 36.5 per cent." As to the supply of hardwood lumber in sight for wooden car construction, Mr. Hall says further: "The plain truth is that in the Appalachians, as in the other regions, the hardwood lumbermen are working upon the remnants. The supply is getting short and the end is come into sight. The largest estimate sets the figure for hardwoods at 400,000,000,000 feet. If we are using hardwoods at the rate of 25,000,000,000 feet per year this would mean a 16 years' supply. There is no hardwood supply in the far West. When the supply in the central and eastern states is gone there will be no other source to which to turn." The Norway pine supply in the United States is about exhausted. The most available substitute for yellow or Norway pine for car sills is the Oregon fir, of which there is an ample supply for many years to come; but which must necessarily be high in price as well as less suited in strength for the requirements of service for freight car framing.

There are three distinctly different theories and systems in connection with the design for steel cars, each supported by able advocates. With one system the designers endeavor to carry the load on the side sills, using the center sills for buffing only. Another school of design endeavors to distribute the load nearly equally over all the sills. This design necessitates somewhat heavier construction than the former. The third school, which has the support of several car builders, endeavors to carry the load largely on the center sills, which are made very deep (even up to 30 in.); the center sills thereby not only carry the load but are also exceptionally strong to resist buffing. With the rapid introduction of steel car framing and its permanence in future practice, it seems at this time desirable as far as possible to eliminate the present great diversity of designs; such diversity makes it impossible to keep in stock the necessary parts for interchange repairs in the shops and repair yards of the various roads in the country. Not only is it desirable to simplify and eliminate this great diversity of design, but there are also many strong arguments for working toward a body framing in freight cars, which will permit of an underframing interchangeable for box cars, gondolas and flat cars. The system of body framing which carries the load largely on the center sills seems to have a basis which will make it readily possible to have the body framing interchangeable as above suggested.

Much has been done in past years toward unifying and simplifying the design of wooden cars, and it would seem that sufficient experience has now been had with cars of all metal construction, or at least of all metal underframing, to make it desirable for the Master Car Builders' Association to take similar steps soon in regard to them. It seems perfectly feasible at this time to adopt as recommended practice, and later as standard, some rolled and pressed sections, at least in the main members of the body framing. A move in this direction would before long be felt in increased simplicity and economy in interchange repairs. It would seem even possible at this time to adopt standards in lengths and widths for steel box, gondolas and flat cars, and then as a natural sequence many standard shapes and sizes would follow. It would be also practicable to standardize many of the rolled sections for angles and channels which are used in the superstructure of many styles of cars.

In freight and in passenger car construction during the development period in the past the cars were strengthened where found necessary; there were all sorts of makeshift methods and devices, such as truss rods, flitch plates, etc., and malleable iron was introduced in place of cast-iron. All this was done to make the cars stand up in service, with their increasing size and the increased severity of the work imposed upon them. All proved ineffectual and unsatisfactory, and the needs of our present-day service can be met only by a car with steel body framing.

During the past year one prominent road in the country has designed and constructed box cars with not only a steel underframing, but a steel superstructure. This is a daring attempt to further develop "the era of steel" for car construction, but the practice is one which would seem open to decided doubt as to whether entirely satisfactory results will be obtained in service. On first impression the observer might assume from the description or examination of the all-steel box car that it was in every way a decided advance step. It is to be hoped that railroads will very carefully consider the history of steel box cars both abroad and at home before going heavily into their construction. In a communication which the writer published in the *Railway Age* in reference to this all-steel box car, it was stated: "From a standpoint of structural design and practical construction no serious difficulty may be feared in this departure for American railroad service, but from the standpoint of service conditions, the development should be approached with great care. In America, freight cars go from north to south and from east to west without territorial restrictions. Any satisfactory car adopted in America for general use must be one suited to the hottest as well as to the coldest temperatures, and they must be adapted to the rapidly varying climatic conditions of an enormous area of diversified country.

"If one has spent hours in midsummer in large railroad yards where great numbers of steel gondolas are stored they need not be further enlightened as to the enormous heat in such yards due to the accumulation stored up in the sides of these steel cars. Many times in midsummer the steel sides and ends of the cars are too bad to be grasped with the bare hand. If such cars were covered with a roof of sheet steel on which the direct rays of the sun would fall, and in addition have steel sides and ends, the heat emanating from them would be enormously increased, and the temperature inside such cars would not only be destructive to any forms of life in them, but would be seriously injurious to a large variety of the different classes of freight ordinarily carried in box cars.

"In summer time in a yard where large quantities of all-steel box cars might be stored, the heat would be sufficient to seriously injure, and possibly kill cattle, hogs or sheep that might be in trains which were held any length of time in such yards. With cars carrying grain, the heat in summer-time would be injurious to such grain and would seriously depreciate its value. In winter, with sudden changes of weather from hot to cold, the deposits of moisture from the atmosphere which are so frequently noticed on the sides of locomotive tanks would occur with many classes of lading, on either the inside or outside of such cars.

"It is argued that steel grain elevators have been successful, and that they do not require lining in order to prevent the grain from sweating or becoming dampened as the result of sudden changes of temperature. The writer has been advised, however, that considerable trouble has been experienced with steel storage elevators for grain, and in order for them to be at all satisfactory for general use in climates subject to considerable variations in heat and cold and variations in humidity, it is necessary to have them lined, giving an air space between the inner and outer casings.

"In the design of all-steel box cars which have recently been illustrated in several of the technical papers, there seems to be no provision made for an inside lining either at the ends or the sides. For carrying grain, as well as many other classes of freight, such a lining made of wood would seem absolutely necessary as a protection from heat as well as cold, as a non-conducting air space between the outside sheeting of the car and the inside lining is always necessary to prevent damage to many classes of lading. The addition of such a lining, which in an all-steel car would be necessary for the roof as well as the sides and ends, will so add to the weight of the car as to give the all-steel car no advantage over its wooden superstructure predecessor so far as weight is concerned.

"When one realizes that in box cars heavy machinery and automobiles are often loaded, and when it is remembered that in properly blocking the lading as well as properly stowing it in the car, it is often necessary in some manner to get a good hold on the floor in order to readily move the machinery or other articles to a convenient place, and furthermore, when it is remembered that many classes of freight, such as automobiles, carriages and machinery, it is necessary to fasten blocks on the floor to prevent the lading from shifting, it will be seen that no small amount of difficulty will be experienced with a box car floor composed of steel sheets. It should be remembered that in a large number of cases the load is put in the cars at points where the men doing the loading do not have conveniences for making and adjusting long braces to properly hold the lading in position. In case of renewal, convenience of moving and securing the lading, a floor composed of $1\frac{3}{4}$-in. or 2-in. plank has many advantages over thin steel plates.

"It would seem wise in the development of the steel box car construction that progress should be made slowly and with great care, and to this end it would appear first desirable to design a car with a steel underframing and a steel framing for the superstructure, which is entirely practical, but to protect the car both on the sides, ends, roof and floor by a covering of wood, which, with present experience as a guide, is much more suitable and better adapted to the peculiar and varied climatic service conditions met with in freight traffic on the lines of our American railroads." In the construction of gondolas and flat cars, except where such cars are likely to be used in service for hot cinders, hot billets, or some similar lading, it would seem to the writer the wisest policy to use a wooden flooring rather than steel.

In a paper read before the New England Railroad Club in 1904 by John F. MacEnulty, he said: "It has been determined by two of the largest railroad systems of the country that the drawbar pull required to move a ton of freight in a properly constructed car of 100,000 lbs. capacity is 24 per cent. less than that required to move the same load in an average wooden car of 60,000 lbs. capacity." This is not only a strong argument in favor of steel car construction, but also for the use of large capacity cars.

Ease of renewal of the worn or broken parts in steel car construction is a feature of considerable advantage in favor of such cars as compared with those made of wood. Another great advantage is found when trains are wrecked, for steel cars withstand successfully punishment which would mean the total destruction of wooden cars. It has been found that the parts bent or torn in damaged steel cars can be readily renewed or put back in their original shape at a comparatively reasonable cost. The cost of steel cars per ton of carrying capacity is in general less than that of wooden cars. In large wooden cars it is found that the ratio of light weight to carrying capacity is altogether too high for comparison with steel cars. In cost of maintenance the steel car has a decided advantage.

The life of wooden cars built to-day must necessarily be shorter than those built 15 years ago, for at present it is impossible to get lumber anywhere approaching in quality that which was required in first class freight cars in 1892.

The demand for cars has, during the past few years, been so much in excess of the supply that cars have not been taken out of service for needed repairs so long as they could be kept going and pass inspection for safety. Under such conditions the wooden car has suffered very materially and depreciated rapidly. The increased cost of all kinds of material going to make up the car has so added to the cost price that one of the principal arguments against steel cars has been nullified. Length of train and increased size and weight of the average car, together with the very great increase in size of locomotives, during the past decade, has subjected cars to such increased strains as to make the strength of the wooden car of 10 years ago insufficient for economical service in heavy trains on our trunk lines. The continued construction of the so-called wooden cars for general use and interchange on trunk lines is an uneconomical proposition, and cannot longer be justified except on the narrow policy of a temporary saving of slight amount in first cost, regardless of the following increased cost of maintenance, and increased amount of depreciation, which the officers ordering such cars do not expect to have to justify during their own terms of office.

As showing the conclusions arrived at on one of the prominent railroad systems of the country, the writer has had before him a report recently made to the chief executive officer of the company. The report recommends retiring 4,600 coal and coke cars ranging from nine to 23 years in age, and having from 40,000 to 60,000 lbs. capacity. It was shown that these cars, on the average, cost $95.98 a year for repairs, or 37.8 per cent. of the average value of the cars. It was shown conclusively that the company could buy 3,000 new steel cars having a total capacity 20 per cent. greater than that of the 4,600 wooden cars, and out of the amount that it would cost to maintain the wooden cars for one year they could pay 6 per cent. interest on the cost price of the new steel cars and have remaining over $215,000.

There are, unfortunately, some executive officers whose policy is to make a great financial record for themselves for a few years, regardless of the consequent depreciation of the property entrusted to them, and regardless of the fact that their successors will have to spend much money later to correct the evils resulting from a selfish, shortsighted and necessarily short-lived policy of those who preceded them. On railroads dominated by such a "penny wise and pound foolish" policy (or lack of policy), it may be expected that the "era of steel" for underframing for all freight cars will be deferred as long as possible, even in the face of undoubted evidence that the wooden-framed car is an uneconomical structure.

It is only during the past three years that much has been done in this country to adapt steel construction to the various styles of passenger equipment. During several recent yearly visits to Europe, the writer found that the use of steel underframing for passenger equipment is now quite general both on the Continent and in Great Britain; but the use of practically all-metal construction has been quite limited in the past, abroad as well as in America.

The many serious railroad accidents of the past few years, and the use of electricity as a motive power, both as a substitute for steam in heavy railroad service as well as its use for lighter service in subways and elevated railroad traffic, has given the design of all-metal cars for passenger transportation a rapid impetus. Very satisfactory designs have been developed for baggage and postal cars, as well as for suburban and regular passenger service and within the past year, also for Pullman sleepers. It is too early yet to predict the outcome, but it seems to the writer that in future development of designs for steel passenger equipment a happy medium may be found and generally adopted, where the underframes and the superstructure framing will be of metal, but a reasonable use be made of wood or some fireproof substitute, other than metal, which will permit of a decorative treatment more pleasing to the eye than thin metal, and which will also have all of the reasonable and necessary elements of safety for those who entrust their lives in such cars.

In the early days of steel cars the matter of repairs was looked upon with many misgivings by the average master car builder and car repair foreman. Experience in handling these cars in large numbers has shown that there was no cause for any uneasiness on this score. In the repairs of steel cars it is not necessary to employ specially trained labor, and very few extra tools or facilities are absolutely necessary, though, of course, a few especially adapted tools and appliances will greatly facilitate the work. On roads having large numbers of steel cars in service it has been found that not more than one-half of 1 per cent. of this equipment need be out of service at any one time, needing repairs, while in the case of wooden cars from 2 to 4 per cent. is not unusual.

Relations Between Interurban Railways and Steam Railroads.*

You have a territory that is probably 20 to 30 miles wide, between the main lines of your steam railroads. Apparently all of the business that can be secured in that territory is being well and efficiently handled by the steam railroads. Until five years ago there were no evidences that such conditions were not satisfactory or ideal to the people in between those main lines, simply because these people had no idea of any better or more efficient transportation service. As the country further east became more thickly settled, the merchant, manufacturer and farmer found that a greater degree of prosperity attended the locality where it was easy to get about quickly. The result was that between main lines of steam railroads in territory that was reasonably densely populated, there was usually not sufficient additional business in sight to cause the steam lines to spur out 15, 20 or 30 miles and put on the mechanical appliances necessary to efficiently operate that spur. But the people in between demanded additional service. Your electric railway man in cities then began to reach out his line 15, 20 and 30 miles. As he reached out, it was found not only that he did not impair the freight and passenger business of the steam railroad, but he generated business in between those main lines and brought it into the stopping places of the steam railroads, adding to their receipts. For instance, take as an illustration two railroads 20 to 25 miles apart. A man would have cattle enough on the place for the milk supply of the family and possibly a few gallons over. He would raise vegetables enough in the garden to supply the family, and have a few bushels over. There would be a certain amount of farm produce, for instance hay, that was not consumed. All that was wasted, the steam roads did not come in and take over that sort of business. The electric railway man came into the field, and people found it profitable not only to keep cows enough to supply themselves, but to send off a half dozen cans or a dozen cans of milk to market. They also found, at times when they could not work the large crops in the big fields, that it was possible to attend to smaller products, cabbages, celery, etc., and to take care of the orchard, to plant plum, peach and pear trees, and they found a ready sale for all that sort of stuff whenever they got to a point where they could reach the market. The electric lines developed that business, and where you find electric railways and steam railroads in contact with each other, you will find territories that produce 50 to 60 per cent. more in any line of small produce than they do where there are no electric railways. The electric railway takes up the commodity and delivers it to the next nearest stop for the long distance haul of the steam railroad, and any railroad that has such shortline feeders pays more per mile than the line that does not have them. I do not believe that steam railroad managers have given this subject attention enough to appreciate the ratio of increased business.

The profit from the operation of any railroad depends directly upon the population and productiveness of the territory it reaches. Take the case of the more newly settled parts of the country. We have between the Mississippi basin and the foot hills of the Rocky mountains five or six transcontinental lines that are absolutely losing propositions in the local territory, for the reason that the population is sparse and the productiveness of the country, outside of livestock, is absolutely nil. If there can be any conditions brought about whereby the population of these localities is increased, and whereby the productiveness of these localities is increased, it will add revenue to the long-haul transportation company's treasury. Wherever electric railways have been installed connecting two cities with a country strip of territory intervening they have resulted in an increased population ranging from 10 to 15 per cent. for the first three years after the installation of the electric railway.

Following the electric railway, there is an increase in population and in production, and that increased production gives additional freight traffic and passenger traffic to the road that goes to New York or San Francisco. I have figures here taken from the records of the railroad commissioners at the State House, showing the increase in population in interurban localities in Iowa. The railroad officials in Iowa recently called attention to the increased population that had been brought about by interurban railroads while the population of the state as a whole, decreased 30,000 between 1900 and 1905. Between Waterloo and Waverly, which are connected by electric railway, the population in the townships, exclusive of towns, increased from 3,845 to 4,895. The population in the townships between Iowa City and Cedar Rapids, outside of the towns, increased during the same period from 11,512 to 13,456. The townships between Des Moines and Colfax, exclusive of the towns, increased from 8,633 to 9,178.

At the commencement of interurban development around Indianapolis, the population there ranged from 168,000 to 170,000. At the present time, I am informed by the president of the American Engineering Company of Indianapolis that the population exceeds 250,000. Every steam railroad that runs into or out of Indianapolis gets its proportionate share of the passenger traffic of that 250,000 people and its proportionate share is greater than it would have been had there been no interurbans to add to the population of Indianapolis. In addition to that there is the proportionate share of the freight over their road that is manufactured by the increase in population. The same thing is true of every center in the United States which has fostered the building of systems which reach out over the adjacent localities; the centers have an increased population and that increased population increases every line of business in the territory.

For the last two years I have been driving across this country that we expect to occupy. The people pay no attention except to the farm business. They possibly go either to Creston or Des Moines and they don't think about going back to make the folks down east a visit; they don't think of going to the Exposition, they don't think of going to California or Florida for the winter. Why? Simply because they haven't the vision of a car just passing their door every day. They have got to climb into a lumber wagon or surrey, which is an inconvenient way of riding, and drive six or eight or ten miles to get to the nearest steam railroad station. The result is, they do not think about going back to see the home folks. The same class of people, in those states with the advantages that we have in Iowa, see an interurban car go by their door every day, and the first thing they do is to get on an interurban and go down six or eight miles to see John Smith about a bunch of cattle, and then the good wife gets on a car and goes six miles the other way to see Sarah, and the first thing you know, they get the riding habit and they go to the interurban man and want to know how to get to some point in Indiana or Ohio. The interurban man can only carry them 25 miles, but he is foxy enough to know there is a little bit of commission in selling the ticket, and he goes to the steam line ticket man and gets the price, and the result is that the steam line gets four or five passengers that it would not have got in 20 years unless the electric railway people had started them. The percentage of long distance travel at Jackson, Mich., to New York City, New Orleans and San Francisco has increased some 18 per cent. in six years. That is the effect of the interurban, building the electric railway has opened up new steam railroad business.

So long as any of us are alive, I believe that trains of eight, 10 and 15 cars will always be hauled through the medium of steam, and I sincerely believe that the day will come when the ability of man to build a machine big enough to haul the people who are teased into the desire to travel by the electric railway, will be taxed to the utmost.

*From an address by A. L. Park before the Iowa Railway Club.

The Swiss Diet has declared that the Simplon parallel tunnel shall be enlarged, lined and made ready for a second track immediately. Brand, Brandau & Co., the contractors who built the tunnel now in operation, contracted also to complete the parallel tunnel for a given sum if notified to do so by Feb. 8, 1908. The firm does not wish to undertake it. It made only $210,000 on the work heretofore done, or 2 per cent. on the expenditure. One of them died before the tunnel was completed, a second became an invalid and a third is 70 years old. Moreover, the traffic so far is abundantly accommodated by a single track. But the State Railroad authorities say that the parallel tunnel must be enlarged and lined to preserve it and to prevent the deformation of the other tunnel where the track is. Moreover, if the work is not begun till the second track is needed, it will be much more difficult to do it. While there are few traffic trains on the existing track it can be utilized for the new construction.

GENERAL NEWS SECTION

NOTES.

The conference of railroad commissioners called by the Commission of Oklahoma will meet on January 28 at Oklahoma City. The states to be represented are Missouri, Kansas, Arkansas, Texas and Oklahoma.

The State Railroad Commission of Wisconsin has ordered six of the principal railroads of the state to reduce by $33\frac{1}{3}$ per cent. their rates for carrying pulp wood. The paper makers have been asking for this reduction for over a year.

In the Federal court at Kansas City, January 20, Judge McPherson decided unconstitutional the law of Missouri forbidding railroads to remove to the Federal courts suits begun against them in the State courts to compel compliance with the rate laws of the state.

The State Railroad Commissioners of Montana have issued demurrage regulations to be adopted for freight cars throughout the state on February 8. On coal, lumber and precipitates three days' free time must be allowed. The demurrage charge after five days is increased gradually to a maximum of $2 car per day.

The Supreme Court of New Jersey has decided in favor of the railroad a suit brought four years ago by J. G. Montgomery asking to have condemned as extortionate a charge of 10 cents made by the railroad for the storage of a package in the station at Pemberton, which Montgomery had brought with him from Philadelphia, but which he did not take away for several days.

The Subway lines of Manhattan, New York City, operated by the Interborough Rapid Transit Company, having been extended from the southern terminus beneath the East river to Brooklyn, are carrying more passengers than ever before. On Monday last the total was 704,879. On the same day the Elevated lines, operated by the Interborough, carried 910,215, making a total of 1,625,094 passengers on the Interborough system.

The time of the Twentieth Century Limited Express trains over New York Central lines between New York and Chicago has been shortened. The westbound train is now scheduled to run through in 18 hours 30 minutes, one hour less time than by the schedule abandoned, but still 30 minutes slower than the summer schedule; and the eastbound train runs through in 19 hours, which is a shortening of 30 minutes, but still is one hour longer than the summer schedule.

The Philadelphia & Reading has announced in Philadelphia that at the end of this week 60 local passenger trains will be withdrawn, passenger receipts having fallen off seriously. Nineteen trains will be taken off the Chestnut Hill branch, six from the Norristown division, six from the Frankford division, seven from the Glenside division, three from the New York division and smaller numbers from other divisions. The announcement says that it is believed that the trains will not be seriously missed by the public.

The disagreement between the New York, New Haven & Hartford and its connections appears to be the subject of varied and successive complaints before the Interstate Commerce Commission. The Central of New Jersey and its connections have now filed formal proceedings alleging discrimination on the ground that the New Haven continues with the Pennsylvania and the Lehigh Valley arrangements which it threatens to break with the complainants. There are rumors that a compromise will be reached, but no substantial grounds are given for the rumors.

The Governor of Tennessee has invited the presidents of the principal railroads of the state to meet him January 27 to see what can be done about reducing passenger rates and obviating the necessity of calling a special session of the Legislature for that purpose. In the meantime, the State Railroad Commission, apparently looking upon the action of the Governor as too slow, has issued an order requiring the railroads of the state to reduce their fares to $2\frac{1}{2}$ cents a mile on the first of April. The railroads declare that they will ask the courts to forbid the enforcement of this order.

The Southern Railway has decided to extend voluntarily to all its passenger traffic in Tennessee the same rates which it expects shortly to establish in many of the Southern states as a result of the compromise agreements now being reached between the road and those states in which rate laws were passed last year. No rate laws have been passed in Tennessee. President Finley says that compromises are being reached in most of the states on the basis of $2\frac{1}{2}$ cents a mile for single tickets, $2\frac{1}{4}$ cents a mile for family mileage books, and 2 cents a mile for commercial mileage books. These rates are to be put on trial for a period of 12 months. In North Carolina a special session of the Legislature has been called to pass an act validating the understanding regarding rates which has been reached between the Governor, the Railroad Commission and the Southern Railway. In South Carolina it is expected legislation along the lines of the compromise will be enacted. In Georgia the Railroad Commission is supreme, and an understanding has been reached with the commission. In Alabama the situation is about the same, and in Mississippi it is expected the necessary legislation will be passed.

Government Statement of Monthly Railroad Earnings.

The Interstate Commerce Commission last week made public for the first time as provided by the law passed by the last Congress, figures showing the monthly earnings of the separate railroads. A typical example is given below in order to show the method of reporting railroad income results according to the revised accounting standards now in force. The showing of the Pennsylvania Railroad for November, 1907, is as follows:

Pennsylvania Railroad

Freight revenue	$9,958,743
Passenger revenue	2,606,391
All other revenue from transportation	1,137,551
Revenue from other operation	122,849
Total operating revenue	$13,825,534
Maintenance of way and structures	$1,402,679
Maintenance of equipment	2,688,946
Traffic expenses	172,072
Transportation expenses	5,241,408
General expenses	289,454
Total operating expenses	$9,840,974
Net operating revenue	3,984,560
One twelfth of annual taxes	174,339
Operating income	3,810,220

Opening of the Guatemala Railway.

The Guatemala Railway, which is controlled by the United Fruit Company, has finished its through line from Puerto Barrios, on the Atlantic coast, to Guatemala City, the capital of the republic, about 200 miles, where it will connect with the Guatemala Central, which runs to San Jose, on the Pacific coast, 70 miles. The United Fruit Company has announced a new fortnightly steamship service between New York and Puerto Barrios. The new line is to be put in operation on February 1.

Exports of Grain, Beef and Cotton in 1907.

During the calendar year 1907 the recorded exports of wheat from the United States were 89,897,600 bushels, valued at $84,859,379, an increase of 47 per cent., as compared with 1906, when 61,347,789 bushels, valued at $47,716,891, were exported. There were 15,191,351 barrels of wheat flour exported as compared with 14,259,252 barrels in 1906. Exports of canned beef fell from 35,028,912 lbs. to 21,948,354 lbs., while other cured beef decreased from 73,638,734 lbs. to 50,351,-835 lbs. Exports of fresh beef decreased very slightly. The year's exports of cotton, other than Sea Island, were 4,404,992,246 lbs., valued at 10.7 cents a pound, which compares with 3,471,931,550 lbs. at 11 cents in 1906.

Effect of Eight-Hour Telegraphers' Law in Wisconsin.

The last Wisconsin legislature passed an eight-hour telegraphers' law and a number of complaints have now been filed with the State Railroad Commission to the effect that the railroads, in order to supply the necessary shifts of telegraphers at the large stations, have closed the telegraph offices at the smaller stations. The companies point out that they cannot afford to maintain three shifts at small way stations.

Net Weight Packages for Paints and Colors.

Leading paint, color and white lead manufacturers have changed all packages of their products sold by the pound from gross weight to net weight. This change went into effect January 1. Heretofore it has been the custom of the trade to put up non-liquid goods in gross weight packages, although liquid goods have been sold by all reputable manufacturers for some years full United States standard measure. This is a step in the right direction because it fixes a definite standard regardless of the shape or weight of the package in which the goods are sold, and enables the consumer to know how much material he is buying. A number of paints and colors are already on the market bearing the net weight on the labels. All reputable gums of our character will be affected as soon as the various makers can make the necessary changes.

Annual Report of New York State Public Service Commission for the First District.

The New York State Public Service Commission, First district (New York City), has sent its report to the Senate. It recommends the passage of four amendments to the public service law:

1. A constitutional amendment exempting from the 10 per cent. debt limit bonds for the construction of rapid transit lines when, so far, and so long as such rapid transit lines shall be self-supporting.

2. An amendment to the rapid transit laws providing that leases of extensions of rapid transit lines may be made to terminate at the same time as the original lease, this commission having the power, in conjunction with the Board of Estimate and Apportionment, to fix the terms, conditions and compensation and to readjust the same each twenty or twenty-five years thereafter.

3. An amendment to the rapid transit law which shall give the local authorities and this commission the power to allow the construction and operation of rapid transit lines by private companies upon the payment of part of the earnings to the city or other proper terms and with a reservation to the city of the privilege to purchase at any time after a certain period of not more than twenty or twenty-five years and without any payment for the franchise itself; and

4. An amendment to the rapid transit law authorizing contracts for operation for a longer period than twenty years or else to make the lease terminable at any time after a certain period of not more than twenty years, with a provision that the equipment shall be purchased at a fair price by the city on the termination of the lease.

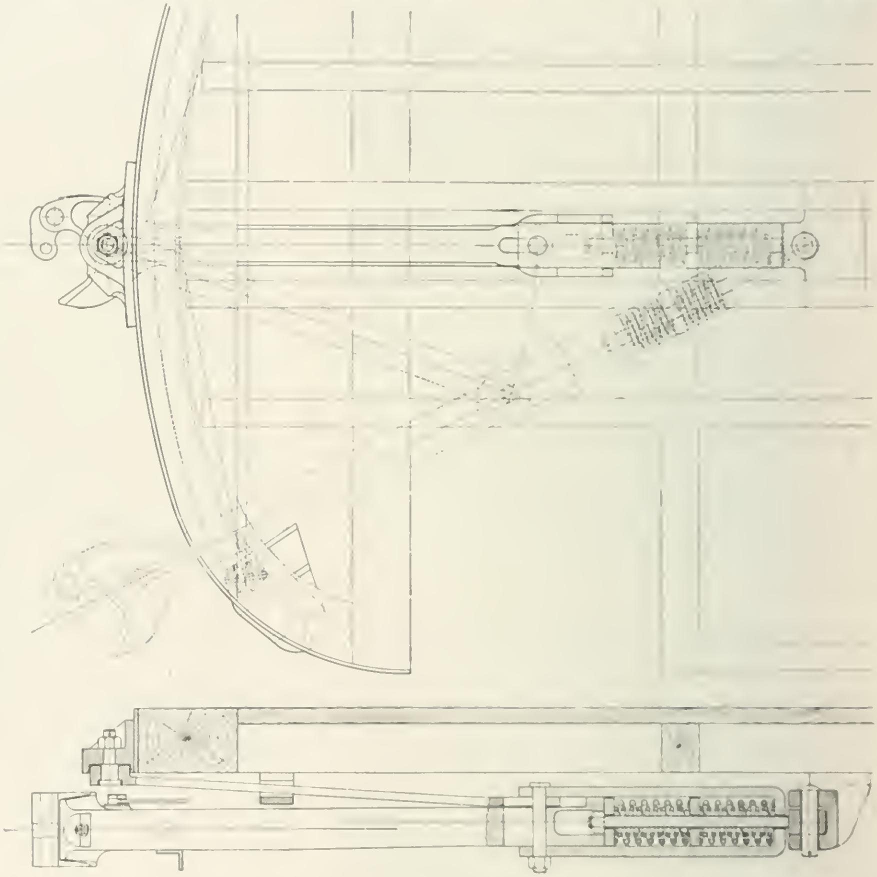
The commissioners have been unable to accomplish anything definite to bring about the removal of surface tracks of the New York Central on Eleventh avenue and West street. For the six months it has been in office the board has held 179 public hearings, and as a result of these hearings the commission has issued 186 orders which have called for increases of from 20 to 25 per cent. in the local railroad services. A conservative estimate of the increases required of all the operating companies indicates that over 15,000,000 additional seats yearly have been added to the service in New York City under orders of the commission. This was accomplished largely through improvements in facilities already at hand. At the same time comprehensive plans for extension of subway construction and important modifications in plans already accepted have been made. Much attention has been given to the extension of subway construction, not only in Manhattan and the Bronx, but in Brooklyn as well. Plans for a Broadway-Lexington avenue subway line, with two branches running into the Bronx, will be submitted to the Board of Estimate this month.

Commenting on the number of accidents in the six months the commission describes the total as "appalling." In the six months ended December 31 last there were 24,209 accidents, the number of deaths being 288. A committee has been directed to make a thorough investigation to ascertain whether it will be possible to adopt any method that will result in fewer persons being killed.

The commissioners report that they have not been able to enforce the present gas order because of the injunctions which have been obtained by the companies, but it is presumed that an appeal will be taken to the United States Supreme Court.

Janney Radial Coupler for Electric Cars.

The accompanying drawing shows a plan and longitudinal section of the Janney coupler with radial movement, designed especially for electric and interurban service, like those shown on model cars at the street railway convention at Atlantic City last fall. It is an adaptation of the Janney M. C. B. type passenger coupler, but has a wide range of lateral movement to accommodate itself to sharp curves. The auxiliary bar connected at its front end to the platform and at its rear end to the coupler yoke and to the stem of the coupler prevents lateral buckling of the stem under the impact shock of coupling. The draft spring, acting through



Janney Radial Coupler.

this bar, returns the coupler to the approximate center line of the car when the side strains are removed. It has been found desirable to have, on the heavier types of electric and interurban cars, a stronger type of coupler than that previously in service on the lighter cars on city streets; it is also desirable that these cars be equipped to couple with cars of steam roads, which are sometimes hauled over interurban lines or interchanged with them. This coupler fulfills these requirements. It is made by the McConway & Torley Co., Pittsburgh, Pa.

Andrew Carnegie Research Scholarship.

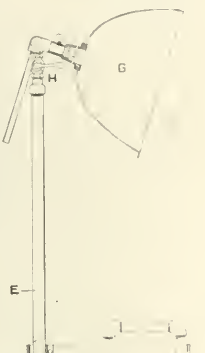
Andrew Carnegie has given the Iron and Steel Institute $89,000 in 5 per cent. debenture bonds. The council of the institute is to use this fund to endow one or more research scholarships annually. Candidates, men or women of any nationality, but under 35 years of age, must apply on a special form before the end of February to the secretary of the institute, 28 Victoria street, London, Eng.

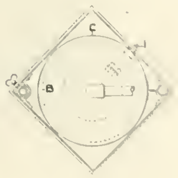
The object of the scholarship is not to facilitate ordinary collegiate studies, but to enable students who have passed through a college curriculum or have been trained in industrial establishments to conduct researches in the metallurgy of iron and steel and allied subjects, with the view to aiding its advance or its application to industry. There is no restriction as to the place of research, provided it be properly equipped for such work. The appointment to a scholarship shall be for one year, but the Council may renew it for a further period instead of appointing a successor. The results of the research shall be reported to the institute in the form of a paper at the annual meeting, and, if of sufficient merit, the Andrew Carnegie gold medal shall be awarded to its author.

The Milburn Acetylene Light.

The Milburn acetylene light for construction and maintenance of way work is shown in the accompanying illustrations. The apparatus consists of an outer tank, generally square, a vertical burner standard, and an interior cylinder. The carbide trays, A, are half filled with carbide and nested in the cylinder, B; the cover, C, telescopes over cylinder B and locks itself. The whole is then put in the tank, which is filled up with water. On turning the cock, as soon as the air is expelled from the pipe, which takes not more than a minute, the gas is ready to use.

The water rises under the cover, C, as the air or gas pressure is relieved, and enters the inner chamber through minute holes at the side, thus reaching the carbide. The reflector and burner is attached by a swing joint, and, since the burner pipe is free to turn around the inner pipe, the light can be turned to any angle required. There is a small double





Parts and Sectional Views of the Milburn Light.

chamber at the base of the tank through which the gas passes before going into the burner standard, so that back firing cannot take place; any condensation is drained into the chamber to prevent the pipes becoming stopped up.

Carbide of calcium generally costs from $3\frac{1}{2}$ cents a pound, by the ton, and $3\frac{3}{4}$ cents a pound, in 100-lb. lots, upwards. Each pound of carbide gives 5 cu. ft. of gas. In the Milburn light burner it is mixed with an unusually large percentage of air, so that the light is inexpensive. The United States Life Saving Service, after tests, reported that with the No. 2 Milburn light fine printed matter could be read at a distance of 360 ft. and objects 600 ft. away were plainly visible.

It can be piped by flexible or permanent tubing to any part of a wrecking car and either a reflector or large open burners can be used. It has been successfully adapted to dredges, cranes and steam shovels. A unique use of the light is for tunnel and sewer work. In one case two lights have been coupled together and a pipe run from these down a 60-ft. shaft and along about 250 ft. of tunneling each way, where a series of burners are used at intervals of about 50 ft. At the ends where the work of excavating is carried on, flexible tubing is used and connected with a tripod bearing several burners; these brightly illuminate the work and can be quickly removed when blasting is necessary.

The No. 3-Z size, giving 5,000 candle power for 16 or 17 hours with an extra cylinder, measures 12 in. square x 36 in. high and weighs only 80 lbs., as outside of the charge of from 12 to 18 lbs. of carbide only water is used, the handling of the light is an easy matter. The Milburn hand lights cost in use less than a cent an hour.

The light is made by the Alexander Milburn Co., 507 W. Lombard street, Baltimore, Md., and among the company's agents are, Manning, Maxwell & Moore, New York, and the Handlan-Buck Manufacturing Co., St. Louis, Mo.

Performance of Large Gas Engines and Electric Generators Under Adverse Conditions.

The Allis-Chalmers Co., Milwaukee, Wis., sends the following: The reliability of large gas engine-driven electrical units under unusual and severe conditions of service was shown during the recent heavy snow and wind storm in the Northwest. Interurban lines centering at Milwaukee, as well as a large part of the street railway system of that city, were completely at a standstill for 24 to 36 hours, with the exception of the Milwaukee-Northern Railway. This line, with power house at Port Washington, on Lake Michigan, 20 miles north of Milwaukee, is supplied with current from one of two Allis-Chalmers alternating current generators direct coupled to four-cycle, double-acting, twin-tandem gas engines made by the same company, each unit being rated at 1,000 k.w. Most of the right-of-way is through a flat, open country, where there was full exposure to the storm. Accordingly precautions had been taken against snow interfering with traffic by putting up snow fences along the worst places, but the storm, very early in the day, destroyed these fences and the tracks were soon covered with snow to the depth of several feet in places.

At this time three large interurban cars, a large snow plow, a large sweeper and four city cars were running. The interurban cars, when going through heavy snow, would take as much as 550 h.p., and the snow plows considerably more. This, together with the city cars, gave the gas engine at Port Washington a swinging load of from 280 to 2,400 h.p. The engine acted extremely well under these trying conditions, picking up the heavy load with apparent ease, and running so quietly that if it had not been for the wattmeter it would have been hard to detect an overload by the action of the engine. Although the cars did not run on schedule time during the day, they were kept going and by nightfall were back to the regular schedule.

Tie and Post Contract

Joseph Meloney, of Bloomer, Wis., and J. H. Meloney, of Williams, Minn., report that they have entered into a contract with the Grand Trunk Pacific for 125,000 ties and 150,000 posts. This material is to be used for the construction work in Canada. The ties and posts are being cut in the state of Wisconsin, north of Chippewa Falls.

Date Growing in California.

Investigations by the Southern Pacific company have gone far enough to show that the date palm can be grown successfully in California soil. At the Government's experimental farm near Mecca, in the California Desert, several acres have been set out and the trees are thriving. They have not reached the full bearing stage, but several branches have produced as high as 20 lbs. each already. Mr. Fee, Passenger Traffic Manager of the Southern Pacific, has received samples of both the soft and dried dates produced at these farms, and pronounces them of excellent quality.

Kansas, Mississippi, New York and Texas.

The legislature of Kansas is now in session. The Governor in his message told the members that they would be expected to pass a two-cent fare law. In the Mississippi legislature, which is now in session, a bill has been introduced making $2\frac{1}{2}$ cents a mile the maximum fare on the railroads of the state and requiring the railroads to sell 1,000-mile tickets at two cents a mile. A press despatch from Austin says that the railroad commission of Texas has abandoned its proposed reduction of passenger fares in that state, this action being taken, it is said, after the receipt from 16 railroads of notice that they would abandon their attempt to secure an injunction against freight rate reductions ordered by the commission. The New York State Public Service Commission, Second District, has issued a decision prepared by Commissioner Decker holding that low rates for the use of children attending school, a long existing custom, is desirable, proper and legal. The practice, confined within reasonable limits, is not discriminatory. The two-cent fare law of Pennsylvania has been declared unconstitutional by the Supreme Court of that state.

Steel Ties.

It was mentioned in these columns, December 27, that L. P. Friestedt, of Chicago, had bought the United States patents for the York cross-rolling process. We are now told: "The negotiations which were supposed to have been closed between Mr. York and Mr. Friestedt have been terminated, owing to present unsettled financial conditions; and, as soon as things appear again to be all right, the original intention may be carried out."

INTERSTATE COMMERCE COMMISSION RULINGS.

Export Rate on Walnut Lumber Reduced.

In the case of the Miller Walnut Co. v. Atchison, Topeka & Santa Fe and Gulf, Colorado & Santa Fe, the Commission (opinion by Commissioner Prouty) has decided that the rate of 26¼ cents per 100 lbs. for transportation of walnut lumber from Oklahoma City, Okla., to Galveston, Tex., for export, is unjust and unreasonable, and should not for the future exceed 21¾ cents per 100 lbs.

Reparation on Two Cars of Snapped Corn.

In the case of the Ocheltree Grain Co. v. St. Louis & San Francisco (opinion by Commissioner Prouty) it appeared that previous to December 12, 1906, the rate on snapped corn from Laverty, Okla., to Millican, Tex., and from Laverty, Okla., to Navasota, Tex., had been for a long time 29 cents per 100 lbs., but by tariff effective on that date the rate was advanced to 36¼ cents per 100 lbs. This advanced rate was continued in effect until February 17, 1907, when it was reduced to the former rate, where it stands to-day. On that statement, the Commission declared that it must hold that the rate charged complainant was excessive. The fact that the defendant had for some time maintained a rate of 29 cents and has since reduced its rate to the same figure is in the nature of an admission on its part that this rate is a fair one. Reparation of $58 was awarded complainant for unreasonable charge for the transportation of two carloads of snapped corn at an excess charge of 7¼ cents per 100 lbs.

Rate Fabric Upheld; Indirect Supervision Over Interstate Rates.

The Commission, in an opinion rendered by Commissioner Prouty, has announced decision in the case of Reliance Textile & Dye Works v. Southern Railway et al. The complainant alleged that rates on cotton piece goods from Cincinnati, Ohio, to Chicago, Ill., are so adjusted as to discriminate against Cincinnati in comparison with certain similar establishments at Clearwater, S. C., and Lanette, Ala. The rate on cotton piece goods from Clearwater and Lanette to nearby dye works and from the dye works to Chicago is less than the combination from the mill to the dye works of the complainant at Cincinnati and thence to Chicago. This is because the rates from Clearwater and from Lanette is competitive with rates from New England. The Commission decided that while the lower combination of rates in favor of the southern dye works may be a discrimination against the works of the complainant, it is not, under all the circumstances, undue and therefore unlawful. The complaint was therefore dismissed.

In connection with this decision, the Commission declared that where a discrimination results from the combination of a state and an interstate rate, both established by the same carrier, the matter is not withdrawn from its jurisdiction by the fact that the discrimination is produced by an improper state rate—certainly not when the state rate is voluntarily made by the carrier.

Grain Rates from Buffalo to New York and to New England Reduced.

The Commission, through Commissioner Prouty, has decided several cases covering grain rates from Buffalo to New York City and to New England points. In the case of the Banner Milling Company v. New York Central & Hudson River it appeared that the complainant is engaged in grinding spring wheat flour at Buffalo in competition with mills at Minneapolis, had its rate on flour from Buffalo to New York advanced on May 1, 1907, from 10 cents to 11 cents per 100 lbs., while no similar advance was made from Minneapolis. The Commission held that the 11-cent rate and the rate of 13 cents to New England points were unjust, and should not exceed 10 cents to New York and 12 cents to New England points. The Commission decided, however, to make no order in the case pending leave granted to the defendant to establish a proportionate rate on ex-lake grain, which would correct the discrimination.

In the case of the Thornton & Chester Milling Co. v. Delaware, Lackawanna & Western et al., the rate of 13 cents per 100 lbs. from Buffalo to Providence was condemned, but no order was made, the action being similar to that in the Banner Milling Company case.

Similar action was taken by the Commission in the case of the Washburn-Crosby Co., of Buffalo, v. the Erie et al. and in the case of the Washburn-Crosby Co. v. the Lehigh Valley, on complaints of excessive and discriminatory charges on wheat products from Buffalo to New England points.

The case of the Washburn-Crosby Co. v. the Pennsylvania Railroad, attacking the rates on grain and grain products from Buffalo to Philadelphia and Baltimore, was dismissed. It was shown that the failure of Buffalo to obtain differentials given to Philadelphia and Baltimore was due to its location, a disadvantage which the railroad never has attempted to equalize and which the Commission does not believe it ought to be required to equalize.

Philosophy of the Long and Short Haul Law.

The Commission, in an opinion by Commissioner Clark, has announced its decision in the case of the Bovaird Supply Company v. Atchison, Topeka & Santa Fe et al. On rope cables from San Francisco to Independence, Kan., complainant is charged 75 cents per 100 lbs., whereas the rate on such rope from San Francisco to Missouri river points, Chicago, etc., is 60 cents; but the Commission decided that the rate is not shown to be unreasonable.

The Commission views with disfavor the maintenance of a lower rate for a longer haul than for a shorter one included within the longer, and the circumstances and conditions obtaining at the more distant point which are relied upon to justify it must not only be clearly shown to be substantially dissimilar from those prevailing at the nearer point, but also to clearly exercise a potent or controlling influence in making the lower rate.

If the influence of competition, between points of production, in commodities, between carriers, and in rates prevailing at the farther distant point but not at the nearer one controls the establishment of a lower rate to the former, it will constitute such dissimilarity of circumstances as will justify the lower rate for the longer haul.

Competition in commodities alone, at the nearer point, will not make the circumstances there substantially similar to those at the farther point where the other competitive influences and conditions also prevail.

Dissimilar circumstances which justify under Section 4 a greater charge for a shorter haul than for a longer haul will also prevent such rate from constituting an illegal preference or advantage under Section 3.

Upon discovery that shipments have through mistake been moved at an unlawful rate the carrier should forthwith demand and the shipper forthwith pay the difference between such unlawful rate and the legal rate applicable thereto.

TRADE CATALOGUES.

Pipe Coverings.—The revised catalogue of the Philip-Carey Company, Cincinnati, Ohio, is devoted to the many types of Carey coverings, including 85 per cent., 50 per cent. and 35 per cent magnesia pipe coverings; asbestos and air cell pipe coverings; Argentum air chamber and cork pipe coverings. Other products include: 85 per cent. magnesia sectional blocks and locomotive lagging; asbestos block covering; air cell fire board; magnesia and asbestos cement, Carey cold water paints, and other magnesia and asbestos specialties. Prices are given.

Machine Tools.—Catalogue No. 45 issued by the Newton Machine Tool Works, Philadelphia, Pa., is a new general catalogue. It is 6½ in. x 9¼ in., has 303 pages and is bound in cloth. The press work throughout is excellent. The tools illustrated and described include boring machines, cold saw cutting-off machines, drilling and milling machines, crank and rotary planers, shapers, etc.

Compressed Air.—The December issue of *Compressed Air* includes "The Caisson Work for the Paris Subway"; "Life and Work of the Sand-hog"; "Compressed Air on the Belmont Tunnel Work"; "Steam Consumption in Air Compressors," and the usual departments.

Traction Draft Rigging.—The Edwin C. Washburn traction couplers and draft rigging are fully illustrated in a pamphlet recently published by the Washburn Steel Castings & Coupler Co., Minneapolis, Minn. These devices are particularly adapted for use on curves as sharp as 45 ft. radius. The illustrations consist of photographs and working drawings. The pamphlet also describes steam freight and passenger couplers, engine couplers and spring buffers and cast-steel bolsters for electric cars.

Roller Bearings.—Bulletin No. 103 of the Hyatt Roller Bearing Co., Newark, N. J., is a circular giving some data showing the friction load of shafting in an electrically-driven machine shop when equipped with roller bearings made by this company. The data is the result of tests made at the Dubois, Pa., shops of the Buffalo, Rochester & Pittsburgh.

MANUFACTURING AND BUSINESS.

J. B. Cox, formerly Chief Engineer of the Chicago Junction Ry., has opened an office as Consulting Engineer at 1741 Railway Exchange building, Chicago.

The Hayes Track Appliance Co., Geneva, N. Y., has made the Railway Specialty & Supply Co., Great Northern building, Chicago, agent for the Hayes derail in the Chicago district.

At the recent annual meeting of the American Civic Association at Providence, R. I., Mrs. A. E. McCrea, Landscape Architect of the Chicago, Milwaukee & St. Paul, was re-elected Vice-President and Chairman of the Railroad Department.

The Pittsburgh Lamp, Brass & Glass Co., Pittsburgh, Pa., has made the Railway Specialty & Supply Co., Great Northern building, Chicago, agent in Chicago for the sale of Kopp signal glass. The latter company is prepared to furnish promptly all styles of lenses, roundels and lantern globes.

The Maryland Railway Supply Co. of Baltimore City, 510 Continental building, Baltimore, Md., has been organized to handle steam railroad, electric railway and automobile supplies, working under exclusive territorial contracts in eastern and southern states. Several agencies have already been secured. A general office for New England is to be established at once; traveling salesmen will for the present cover the southern states and other offices will be opened in the north, east and south as soon as the amount of business justifies them. The officers are: President, Nelson E. Perin; Vice-President and General Manager, Charles Elliott; Secretary and Treasurer, Thomas W. Boykin. As Sales Manager of the West Virginia corporation of similar name and as a former railroad officer, Mr. Elliott already has many friends among railroad officers in the South and the personnel of the new company makes its prospects for success of the brightest.

The following reorganization plan for the Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa., has been approved by the receivers, the directors and the creditors' committee. Its consummation is subject to subscription by stockholders to $7,000,000 new capital, unless otherwise determined by the committee. The plan provides for $35,000,000 first mortgage and collateral trust 5 per cent. 25-year bonds secured by mortgage on the various plants and by pledge of most of the heretofore unpledged securities of subsidiary and other companies. Part of the bonds are convertible into stock after January 1, 1910. The $18,500,000 convertible sinking fund 5 per cent. bonds and the $1,969,000 5 per cent. debenture certificates outstanding, are to be exchanged, dollar for dollar, for these convertible bonds. The remainder of the first mortgage issue is to take care of the $14,531,000 (about) floating debt. The $6,000,000 three-year 6 per cent. collateral notes maturing August 1, 1910, and the 14,000,000 francs ($2,800,000) ten-year 5 per cent. collateral notes maturing October 1, 1917, are to be exchanged (optional in the case of the ten-year notes) for similar notes with modified collateral and rights to participate in case of deficiency *pro rata* with the new bonds. The personnel of the board of directors is to be approved by the committee. Provision for the election of future boards satisfactory to the committee is to be made by voting trust or otherwise.

Iron and Steel.

The new Grey universal structural steel mill of the Bethlehem Steel Co., South Bethlehem, Pa., is now in operation. The company expects to work up by degrees to the mill's capacity; at present only 12-in. 70-lb. girder beams are being made.

OBITUARY NOTICES.

W. E. Estes, General Freight Agent of the Central of Georgia, died at his home in Savannah last week.

T. L. Courtney, formerly and for many years Superintendent of the Richmond, Fredericksburg & Potomac, died at his home in Richmond, Va., on the ninth of this month at the age of 83.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

Franklin Institute.

At the section meeting held January 23 there was an address on Semi-Liquid Steel Ingots by N. Lilienberg.

At the meeting to be held February 28, there will be an address on Electric Power Transmission by Paul A. Spencer.

Western Society of Engineers.

The officers for 1908 are: President, C. F. Loweth (C., M. & St. P. Ry.); First Vice-President, J. W. Alvord (Chicago); Second Vice-President, P. Junkersfeld (Chicago); Third Vice-President, D. W. Mead (Univ. of Wisconsin); Treasurer, A. Reichman (Chicago), re-elected; Trustee for three years, L. E. Ritter (Chicago).

Canadian Society of Civil Engineers.

The twenty-second annual meeting at Montreal will fill three days, Jan. 28, 29 and 30. The first day, Tuesday, will conclude the general business, and there will be an exhibition of lantern views illustrating the Quebec bridge by Henry Holgate. On Wednesday the members will visit the works of the Lakefield Portland Cement Company at Pointe aux Trembles, the new power house of the Montreal Street Railway, and the foundry of Warden King at Maisonneuve, these to be followed by the annual dinner in the Windsor Hotel. The reports will be presented on Thursday.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Acme, Red River & Northern.—T. K. Hawkins has been appointed Secretary, Auditor and Treasurer, with headquarters at Dallas, Texas.

Delaware & Eastern.—Jacob L. Greatsinger has been elected First Vice-President, succeeding E. C. Fairchild.

Maine Central.—Morris McDonald has been elected Vice-President and General Manager in place of George F. Evans, deceased. Mr. McDonald has for 10 years been General Superintendent. George S. Hobbs, Controller, has been elected Second Vice-President.

Susquehanna & New York.—P. M. Newman, hitherto General Manager, has been elected President in place of C. S. Horton, deceased; office at Williamsport, Pa.

Washington County.—Morris McDonald has been elected Vice-President, in place of George F. Evans, deceased.

Operating Officers.

Canadian Northern Ontario.—See Canadian Northern Quebec.

Canadian Northern Quebec.—F. M. Spaidal, hitherto General Superintendent of the Canadian Northern Ontario at Toronto, has been appointed General Superintendent of the C. N. Q., with headquarters at Montreal. A. J. Hill succeeds Mr. Spaidal.

International & Great Northern.—Henry Martin has been appointed Superintendent at Palestine, Texas.

Louisiana Western.—See Southern Pacific.

Missouri, Kansas & Texas of Texas.—W. G. Koch has been appointed Superintendent of the Dallas, the Fort Worth, the Denton and the Henrietta divisions in place of C. H. Scott, resigned.

Morgan's Louisiana & Texas.—See Southern Pacific.

Northern Pacific.—Newman Kline, Assistant General Superintendent, has been transferred to the office of Superintendent at Minneapolis, Minn., in place of M. M. Fowler, who is now Trainmaster.

San Antonio & Aransas Pass.—See Southern Pacific.

Southern.—On account of the resignation of M. M. Richey, E. H. Coapman, Manager, now has authority over the Middle and Western districts, with office at Washington, D. C.

T. C. Laughlin has been appointed Trainmaster at Princeton, Ind., in place of Niles Shaw, who has been appointed Chief Train Despatcher.

Southern Pacific.—William M. Hobbs, hitherto Vice-President and General Manager of the San Antonio & Aransas Pass, has been appointed Manager of the Louisiana Lines of the Southern Pacific, succeeding to the duties of E. B. Cushing, General Superintendent.

H. W. Sheridan, heretofore Trainmaster on the Union Pacific at Green River, has been appointed Assistant Superintendent of the Sacramento division of the S. P.

Traffic Officers.

Chicago, Burlington & Quincy.—H. H. Holcomb has been appointed Assistant General Freight Agent, with office at Chicago.

Engineering and Rolling Stock Officers.

Central Vermont.—W. Kennedy has been appointed Superintendent of Motive Power and Cars, with office at St. Albans, Vt., in place of James Coleman, resigned.

Chicago, Burlington & Quincy.—J. G. Crawford has been appointed Fuel Engineer, with headquarters at Chicago. He will have charge of the inspection of coal.

Great Northern.—M. Flannagan has been appointed Master Mechanic of the Montana division in place of K. M. Froburg.

Kansas City Belt.—W. E. New, heretofore foreman of shops on the A., T. & S. F. at Newton, Kan., has been appointed Superintendent of Motive Power of the K. C. B.; office at Kansas City, Mo.

LOCOMOTIVE BUILDING.

The Orleans Railroad, 8 Rue de Londres, Paris, France, is asking American builders for bids on 10 passenger locomotives.

The New York, Chicago & St. Louis, which was reported as being in the market in the *Railroad Gazette* of December 27, has ordered 10 simple ten-wheel (4-6-0) locomotives, five simple consolidation (2-8-0) locomotives, and five simple six-wheel switching (0-6-0) locomotives from the American Locomotive Co., for February delivery. The specifications are as follows:

General Dimensions.

Types of locomotives	10-wheel.	Consolidation.	Switching
Weight, total	136,500 lbs.	160,000 lbs.	103,450 lbs.
Weight on drivers	105,600 lbs.	142,000 lbs.	103,450 lbs.
Diameter of drivers	62 in.	62 in.	50 in.
Cylinders	19 in. x 24 in.	19 in. x 28 in.	18 in. x 24 in.
Boiler type	Radial stay; ext. w. top.	Radial stay; wagon top.	Radial stay; straight top
" wrkg. steam pressure	180 lbs.	200 lbs.	170 lbs.
" number of tubes	244	306	172
" material of tubes	Iron.	Iron.	Iron
" length of tubes	13 ft. 3/8 in.	14 ft. 10 3/8 in.	11 ft. 1 1/16 in.
Firebox, length	102 3/8 in.	96 in.	96 in.
" width	40 1/4 in.	63 in.	33 in.
" material	......	Otis steel.	Otis steel.
" grate area	28.51 sq. ft.	40.9 sq. ft.	21.31 sq. ft.
Heating surface, total	1,783.0 "	2,532.0 "	1,121.0 "
Tank capacity	5,500 gals.	5,500 gals.	3,000 gals.
Coal capacity	14 tons.	14 tons.	4.4 tons.

Special Equipment.

Air brakes	Westinghouse
Bell ringer	Gollmar
Boiler lagging	Keasbey & Mattison
Brake beams	Waycott
Brake-shoes	American Brake Shoe & Foundry Co.
Couplers	Climax
Headlights	United States
Injector	Monitor
Journal bearings	Magnus
Piston rod packings	United States
Valve rod packings	United States
Safety valve	Coale
Sanding devices	Leach
Sight feed lubricators	Nathan bull's-eye
Springs	Railway Steel Spring Co.
Steam gages	Crosby
Tires, driving wheel	Latrobe

RAILROAD STRUCTURES.

Allentown, Pa.—It is said that the Philadelphia & Reading and the Central of New Jersey are planning a more convenient interchange of traffic from the North Penn division. Plans are under way for putting up a three-track bridge over the Lehigh river at South Bethlehem, and building additional yards and probably new passenger and freight stations in Allentown. The improvements are to cost about $1,000,000. When completed, trains of the North Penn can run through to and from Allentown by using the Central tracks west of Bethlehem.

Beaver, Pa.—Bids, it is said, will soon be asked for by the Pittsburgh & Lake Erie for putting up the proposed steel bridge over the Ohio river, which is to have a total length of 1,787 ft. The cost of the improvement with the necessary changes in tracks and approaches will be about $2,000,000.

Bethlehem, Pa.—Bids are wanted January 25, by Engineer R. E. Neumeyer, for putting up three truss spans and one girder span steel bridge over the Philadelphia & Reading and the Bethlehem Steel Works tracks between William and Anthracite streets, Northampton Heights. The proposed bridge is to be 385 ft. long, and the cost is to be shared by the Philadelphia & Reading, the Bethlehem Steel Company, the Eastern & Pittsburgh Transit Company and the Borough of Northampton Heights.

Brooklyn, N. Y.—The Coney Island & Brooklyn is planning to build six sub-stations this year at a total cost of $250,000.

Fort William, Ont.—This town will raise $50,000 towards building a municipal railway system. Bridges are also to be built over the McKellar, Mission and Kaministiquia rivers.

Fort Worth, Tex.—The Texas & Pacific freight house here which cost $150,000, was recently destroyed by fire. About $100,000 worth of freight was in the station at the time of the fire and it was entirely destroyed.

Hornell, N. Y.—Announcement is made that the Erie is planning to make improvements to its shops here.

New Castle, Pa.—All objections to the Pittsburgh street bridge having been withdrawn, plans will be made at once to carry out the work. The bridge is to be used by the Mahoning & Shenango Valley Railway & Light Company.

Somerset, Ky.—Plans, it is said, are being made to rebuild the high bridge over the Kentucky river.

Superior, Wis.—Plans have been made by the Great Northern to put up a steel elevator to replace the one destroyed by fire. Schmidt Bros. & Hill, Superior, Wis., and the Minneapolis Steel Company, of Minneapolis, Minn., will have charge of the work. The cost of the improvement will be about $1,000,000.

Wilkesbarre, Pa.—The railroads entering this place are planning to abolish a number of grade crossings within the city limits and to put up a union passenger station near Market and Northampton streets.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

Buffalo, Rochester & Pittsburgh.—An officer writes in regard to the reported improvements to be made on this road that the only large improvement under way or contemplated at the present time is on a ten-mile section from Carman, Pa., south to Brockwayville, where the line is to be revised and a double-track tunnel pierced, about 1,000 ft. long. Contracts for grading let to Eyre-Shoemaker & Co., of Philadelphia.

Canadian Northern.—Surveys are reported being made for an extension from Regina, Sask., west toward Lethbridge, Alberta, on about 200 miles. (Dec. 6, p. 701.)

Cincinnati, Bluffton & Chicago.—This company now operates 52 miles of main line, having finished last year the extension from Bluffton, Ind., to Huntington, 15 miles, where the company has shops, roundhouses and terminals. It is expected that contracts for work on the southern extension from Portland south to Versailles, Ohio, 35 miles, will be let shortly.

Danville & Bloomsburg Street Railway.—This company, it is said, is planning to build an extension from Danville, Pa., west to Milton, 16 miles.

Dayton, Lebanon & Cincinnati Railroad & Terminal Co.—This company will begin work early this year on an extension of its Dayton branch from Lambeth, Ohio, west to Union Station in Dayton, 1.9 miles.

Hudson & Manhattan Railroad.—The "uptown" tunnels extending from Hoboken to Sixth avenue, New York, have been finished. Experimental trains are now in operation. Forty all-steel cars have been delivered and equipped and are now in the tunnels for preliminary operation. They will shortly be opened to the public for traffic between the station in Hoboken at the Lackawanna Terminal and the station at Fourteenth street and Sixth avenue, New York. A few weeks later the runs of the trains will be extended to Nineteenth street and shortly after to Twenty-third street and Sixth avenue, New York.

Work on the "downtown" tunnels, terminating between Cortlandt and Fulton streets in Manhattan, has actively progressed, the work being pushed by driving shields both from the New Jersey side and from the New York side.

The terminal station building at Cortlandt, Fulton and Church streets, in which is the loop terminal of the downtown tunnels, is nearing completion. The building is to be ready for tenants by April 15 of this year, and the station will be finished by the time the railroad is ready for operation.

The station at the present western terminus of this tunnel, at the Pennsylvania terminal in Jersey City, is about finished and work is progressing on the approach to the river tunnels on Railroad avenue and on the north and south tunnels along the line of Washington street in Jersey City.

The electrical power house at Washington street, Jersey City, is finished and boilers and machinery are being put in. All work is being done for the Hudson Companies. Charles M. Jacobs, Chief Engineer, and J. Vipond Davies, Deputy Chief Engineer. The electrical installation, power and rolling stock equipment are under the charge of L. B. Stillwell, Consulting Electrical Engineer, and Hugh Hazelton, Electrical Engineer.

Hudson Companies.—See Hudson & Manhattan Railroad.

Kansas City, Mexico & Orient.—On the Kansas-Oklahoma division of this road all the track has been laid and train service is now in operation from Wichita, Kan., south to the Red river, 272 miles. The next section to be finished is from Sweetwater, Tex., north on which track is now laid to a point two miles north of Benjamin, 90 miles, leaving about 69 miles to finish the line to the Oklahoma line at the Red river, where a 3,000-ft. bridge is to be built. On the completion of this work the company will have 431 miles of continuous track laid south of Wichita. Plans are also made to build south from Sweetwater to finish the line to San Angelo, 77 miles. On this section track has been laid for 11 miles from San Angelo north. All the roadbed is graded and all ties and bridge material are on the ground, but the rails are coming slowly.

MASSILLON, WOOSTER & MANSFIELD TRACTION.—An officer writes that this company has given contracts to the Northern Engineering & Construction Company, of Cleveland, Ohio, to build an electric line from Massillon, Ohio, west via Dalton, Orrville, Smithville, Madisonburg, Wooster, Reedsburg, Jeromeville and Hayesville to Mansfield, 50 miles. Grading finished for about four miles between Smithville and Madisonburg. G. A. Bartholomew, Chief Engineer, 1423 Williamson building, Cleveland, Ohio.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—This company, it is said, has plans under consideration for building an extension from Thief River Falls, Minn., northeast to Roosevelt, on the Canadian border, about 82 miles.

NEVADA NORTHERN.—It is reported that this company is planning to build an extension from its southern terminus at Ely, Nev., southwest to Goldfield, about 170 miles.

NEW YORK & NORTH SHORE TRACTION.—A franchise has been granted this company to extend its line from Foleys Corners, Roslyn, Long Island, east via Manhasset, Great Neck and Thomaston, to Little Neck, about five miles.

NEW YORK SUBWAYS.—The New York Public Service Commission, First district, expects to ask for bids early in February to build six sections of the projected subway from the Manhattan bridge, in the Borough of Brooklyn, toward Coney Island as follows:

From the Manhattan bridge to Willoughby street under Flatbush avenue extension.

Willoughby street to the beginning of Ashland place.

Ashland place to Sackett street.

Sackett street to Ninth street.

Ninth street to a point between 26th and 27th streets.

From the point between 26th and 27th streets to 41st street.

When these contracts are let the Commission will immediately take up the other divisions continuing the line to Fort Hamilton and the spur to Coney Island under New Utrecht avenue, 86th street and Stillwell avenue. (Oct. 18, p. 473.)

PAN-AMERICAN.—This company, which is building a line from the National Tehuantepec Railroad at San Geronimo southeast to the Guatemalan border, 250 miles, expects to have the line finished to Tapachula, 10 miles from the Guatemalan border, next month. The company has money on hand to finish the line, which is already in operation for about 200 miles.

PENNSYLVANIA.—Work on the tunnels under way for the past three years, under 32d and 33d streets, New York, from the terminal station at Seventh avenue to the East river, are about finished. The final blast was fired recently 60 ft. under Sixth avenue and 32d street. It cleaned the last obstacle in the 32d street tube. The 33d street tube was entirely blasted through some weeks ago. Much work yet remains to be done in the tunnels under the East river, in the Long Island City yards and approaches, and on the Jersey approaches to the Hudson tubes.

WILMINGTON & WESTCHESTER (ELECTRIC).—T. E. O'Connell, Wilmington, the principal promoter of this company, is quoted as saying that work will soon be begun on an electric line from Wilmington, Del., north to West Chester, Pa., 17 miles. A power-house is to be put up at Brandywine Summit.

RAILROAD CORPORATION NEWS.

BALTIMORE & OHIO.—Gross earnings of this system for December decreased over $1,000,000, or 16 per cent.; operating expenses increased $165,000, leaving a decrease of $1,200,000, or 53 per cent., in net earnings. President Murray is quoted as saying that the increase in expenses was more than accounted for by higher rates of pay and the larger charges for depreciation. Over 85 per cent. of the decrease in gross earnings was in connection with the steel industry, particularly in coke, ore and pig iron traffic. In the McConnellsville region alone all lines together in December moved only 23,000 loads of coke as compared with 61,000 in December, 1906. The movement of bituminous coal, which comprises about 50 per cent. of the company's tonnage, showed an increase of over 100,000 tons. This movement was, however, eastbound and therefore less profitable than the usual ordinary westbound tonnage. For the six months ended December 31 1907, gross earnings were $42,900,000, an increase of $1,100,000, and net earnings $13,000,000, a decrease of $2,000,000.

BOSTON & MAINE.—President Tuttle has filed a petition and bill with the Massachusetts House of Representatives, claiming that the law covering the issue of new railroad stocks and bonds should be changed so that securities may be issued "on such terms and such price as would warrant stockholders in subscribing" for them. The bill submitted with the petition provides that railroad corporations be authorized to issue preferred stock on such terms of preference as the railroad commissioners may approve, and also to issue convertible bonds subject to the same approval.

See New York, New Haven & Hartford.

BUFFALO, ROCHESTER & PITTSBURGH.—Gross earnings for the first two weeks of January, 1908, were 21 per cent. less than for the corresponding period in 1907. In the second week the decrease was 14 per cent.

CHICAGO & ALTON.—A stockholder owning 500 shares of the common stock of the old Chicago & Alton Railroad, which was consolidated in March, 1906, with the Chicago & Alton Railway into the present Chicago & Alton Railroad, has brought suit in the United States Circuit Court at Chicago asking that separate accounts be kept for the old Railroad company and that an accounting of profits wrongfully diverted from it be ordered. The contention is that the old Railroad company was much more prosperous than the Railway company which was consolidated with it in 1906, and that the outstanding stock of the old Railroad company should receive returns in proportion to the profits which are being earned by its individual properties. If the claims of this stockholder are upheld, the economies which were to have been brought about by the consolidation of the two companies in 1906 will be done away with, for it will be necessary to keep separate accounts for the old Railroad company and for the new Railroad (consolidated) company.

CHICAGO GREAT WESTERN.—Since the appointment of receivers the income results for the month of November have been made public. Gross earnings were $715,000, a decrease of 10 per cent.; and net earnings $110,000, a decrease of 50 per cent. For the five months ended November 30, 1907, net earnings were $74,400, a decrease of $592,000, or 44 per cent. Both the showing for November and for the five months are the most unsatisfactory for years.

CHICAGO, ROCK ISLAND & PACIFIC.—The Peoria & Bureau Valley, which is leased to the Chicago, Rock Island & Pacific Railway, has declared a regular semi-annual dividend of 4 per cent. and an extra dividend of 1 per cent. on its $1,500,000 stock.

Speyer & Company are offering $6,000,000 first and refunding mortgage 4 per cent. bonds of 1934 of the Chicago, Rock Island & Pacific Railway at 85½, a yield of 5 per cent. There were already $66,851,000 of these bonds outstanding. The Railway company, which is controlled by the Rock Island Company through the Chicago, Rock Island & Pacific Railroad, has paid dividends of not less than 5 per cent. each year since 1898. These are the first straight long term railroad bonds offered at public sale for some time.

DENVER, NORTH-WESTERN & PACIFIC.—The Denver Steamboat Construction Company was on January 10 incorporated in Colorado with $1,500,000 capital stock to extend the Denver, North-Western & Pacific from its present terminus at Yarmony, Colo., west through the coal fields of the Oak Hills district of Routt county to Steamboat Springs, 68 miles. Contract for this work has already been given by the railroad to the construction company, whose directors are: Col. D. C. Dodge, Henry M. Porter, Lawrence C. Phipps, Thomas F. Walsh, John F. Campion, Charles Boettcher, Charles J. Hughes, Jr., William Byrd Page and Samuel M. Perry, representing mining, cattle, beet-sugar, coal and other interests at Denver and outside interests. Much of the stock of the construction company had been subscribed for before its incorporation.

ERIE TRACTION.—This company, whose road runs from Erie, Pa., to Cambridge Springs, 27 miles, which is on the Erie, is reported to have been bought by the Wells-Fargo Express Company, presumably to prevent the Adams and American Express companies from shipping over it, thus cutting into Wells-Fargo territory. This attempted action of these two companies follows the success of the Wells-Fargo in getting into Pittsburgh over an electric railroad.

GREEN BAY & WESTERN.—Besides the regular annual dividends of 5 per cent. on the A debentures and 5 per cent. on the stock an initial dividend of one-half of 1 per cent has been declared on the B debentures. The A debentures are entitled to 2½ per cent. if earned, then the stock to 2½ per cent.; thereafter the two share equally. The B debentures are entitled to all surplus earnings after 5 per cent. has been paid on the A debentures and on the stock.

INTERNATIONAL & GREAT NORTHERN.—Estimated gross earnings for the week ended January 14, 1908, were $135,000, against $182,000 in the corresponding week of 1907, a decrease of $47,000, or 26 per cent. This sharp falling off in net earnings is typical of the experience of most other railroads in the Southwest during the last six weeks.

INTERNATIONAL TRACTION.—See Mohawk Valley Company.

KANSAS CITY SOUTHERN.—Gross earnings for December decreased $92,000, or 12 per cent.; operating expenses increased $64,000, leaving a decrease of $156,000, or 46 per cent. in net earnings. Net earnings, taxes deducted, were $166,000. After deducting one-twelfth of the other fixed charges for the fiscal year ended June 30, 1907, from this sum, there would be left $67,000 for the preferred stock, which is at the rate of 3.8 per cent. a year. It is, of course, not fair to judge of the year's results by any one month, as the results for the six months ended December 21, 1907, show. In this half year gross earnings were $5,000,000, an increase of $700,000, and net earnings $1,700,000, a small increase. The company intimates, but does not say, that a considerable amount was charged to operating expenses during this period, which ordinarily would be chargeable to betterments.

LOUISVILLE & NASHVILLE.—An extra dividend of 1 per cent., in addition to the regular semi-annual cash dividend of 3 per cent. declared December 19, 1907, was declared after the close of business on January 18, 1908. This extra dividend is payable in stock of the Louisville Property Company, fractional parts of shares to be represented by non-interest bearing scrip. The Louisville Property Company is a holding company which owns various lands in Louisville & Nashville territory, including coal lands. Its capital stock on June 30, 1907, was $50,000, but this has since been increased to at least $600,000, which amount exactly covers the recently declared dividend. Milton H. Smith, President of the Louisville & Nashville, is President of the Louisville Property Company. The regular dividend of the Louisville & Nashville was declared on December 19 in the usual way, but no announcement of the extra dividend was made until after the close of business on Saturday, January 18. On January 20 the books closed for payment of the dividends.

MISSISSIPPI VALLEY.—This company has been incorporated in Arkansas with $100,000 stock to lease the Portland & Southeastern, which operates 14 miles of railroad in Ashley and Chicot counties. The incorporators are: J. H. Bird and M. G. Price, of St. Louis; H. L. Pitman, C. C. Curl and C. Sawyer, of Ashley county.

MISSOURI, KANSAS & TEXAS.—Net earnings for the month of November were $512,000, against $1,007,000 in 1906, a decrease of 52 per cent. Fixed charges were $553,000, leaving a deficit of $41,000 for the month, against a surplus of $666,000 for the month of November, 1906. This decline came after a long period of great prosperity. Gross earnings for the month decreased $449,000, owing to the almost entire lack of cotton shipments, the reduction in traffic in coal and manufactures and legislative rate reductions, while operating expenses increased $139,000, owing to higher cost of materials and labor and legislative restrictions on operations.

MOHAWK VALLEY COMPANY.—It is reported that the International Traction Company, which operates 217 miles of line, including all the street railway mileage of and between Buffalo, Niagara Falls, Lockport, Tonawanda and North Tonawanda, N. Y., is to be acquired by the Mohawk Valley Company. This acquisition would greatly strengthen the Mohawk Valley Company, which already controls the street railway systems of Rochester, Syracuse and Utica and jointly with the Delaware & Hudson, of Schenectady. The D. & H. owns the street railways in Troy and Albany. The Mohawk Valley Company also controls several interurban lines, including a line from Utica to Syracuse. The New York Central owns 60 per cent. of its stock.

NEVADA CENTRAL.—An interest payment of $2\frac{1}{2}$ per cent. is being made on the $750,000 first mortgage 5 per cent. non-cumulative income bonds. The last previous payment on these bonds was 4 per cent. in July, 1906. The road is narrow gage and runs from Battle Mountain, Nev., to Austin, 93 miles.

NEW YORK CENTRAL LINES.—Nearly all of the $30,000,000 5 per cent. equipment trust certificates recently offered have already been sold. Of these, $20,389,000 were issued against the following equipment which has been or is about to be delivered to the following companies:

New York Central & Hudson River—165 locomotives, 76 passenger cars, 1,000 gondola cars, 1,000 flat cars and 2,000 box cars.

Lake Shore & Michigan Southern—125 locomotives, 25 passenger cars, 200 ballast cars, 1,000 hopper cars, and 2,000 gondola cars.

Boston & Albany—79 locomotives, 12 passenger cars.

Michigan Central—[illegible] passenger cars, 200 ballast cars, [illegible] flat cars and 1,000 gondola cars.

Cleveland, Cincinnati, Chicago & St. Louis—107 locomotives, 51 cabooses, 100 ballast cars, 250 flat cars, 250 hopper cars and 500 gondola cars.

Chicago, Indiana & Southern—[illegible] passenger cars, 150 ballast cars, [illegible] flat cars and 100 hopper cars.

Peoria & Eastern—500 gondola cars.

NEW YORK CENTRAL & HUDSON RIVER.—See Mohawk Valley.

NEW YORK, NEW HAVEN & HARTFORD.—Butler Ames, Representative in Congress from Lowell, Mass., has issued a statement favoring the consolidation of the Boston & Maine with the New York, New Haven & Hartford in view of the following advantages to be gained: Better freight and passenger rates; transfer accommodations around Boston between the two roads, electrification of suburban lines about Boston; a large saving in equipment and reduction of about half of the cost of management. Mr. Ames says that control of the Boston & Maine was not sought for by the New Haven, but that a block of stock sufficient to give control of the property was seeking a market, offered to the New Haven and the offer accepted. He regrets that this stock was not bought by citizens of Massachusetts, but believes that since it was not, control by the New Haven is preferable to that of any other railroad in the United States or Canada. He also points out that the interests of New England are a unit as against the interests of the territory west of the Hudson river in the matter of rates and traffic. He also calls attention to the fact that less than carload lots shipped from any point on the Boston & Maine to any point on the New Haven and *vice versa* now are transferred from car to car at junction points. He urges that two members of the board of directors of the consolidated system should be named by the Governor of Massachusetts.

NORTHERN ELECTRIC.—The Northern Electric Railway, incorporated on September 19, 1907, in California, with $10,000,000 5 per cent. non-cumulative preferred stock, of which $5,000,000 is outstanding, and $15,000,000 authorized common stock, has acquired the properties of the Northern Electric Company, which include a line from Chico, via Oroville, Yuba City and Marysville to Sacramento; also the Shasta Southern (Electric) Railway operating between Chico and Hamilton. The Northern Electric Railway has made a first consolidated mortgage securing $25,000,000 5 per cent., 40-year gold bonds dated December 1, 1907, none of which are as yet outstanding. The company is now operating more than 100 miles of track and plans to build over 300 miles more.

PENNSYLVANIA LINES WEST.—The Pittsburgh, Cincinnati, Chicago & St. Louis reports for December, 1907, an estimated decrease of $500,000 in gross earnings and a decrease of $200,000 in operating expenses and taxes, leaving an increase of $300,000 in net earnings after taxes. This would seem to show that this company is able to reduce expenses to meet the decreased earnings.

For the year ended December 31, 1907, gross earnings increased $2,700,000 and operating expenses and taxes $2,500,000, leaving an increase in net earnings after taxes of about $200,000.

PEORIA & BUREAU VALLEY.—See Chicago, Rock Island & Pacific.

PITTSBURGH, SHAWMUT & NORTHERN.—Part of an issue of $592,000 5 per cent. car trust bonds issued by the receiver of this railroad, and of the Shawmut Mining Company and the Kersey Mining Company, dated November 1, 1907, and maturing from 1908 to 1914, have recently offered for sale at a price yielding $6\frac{1}{2}$ per cent. for the 1908 maturity and 7 per cent. for each of the other maturities. These bonds cover three locomotives and 500 steel underframe coal cars of 100,000 lbs. capacity, 10 per cent. of whose cost has been paid. Owing to the fact that they are issued by the receiver, they have, besides the usual advantages of an equipment trust, a lien prior to existing mortgages on the properties of the three companies.

PORTLAND & SOUTHEASTERN.—See Mississippi Valley.

TEXAS & PACIFIC.—Estimated gross earnings for the two weeks ended January 14, 1908, were 24 per cent. less than for the corresponding period in 1907.

THIRD AVENUE RAILROAD.—Former District Attorney J. Addison Young, of Westchester county, has been appointed temporary receiver of the Westchester Electric Railway, which operates the electric lines at Mt. Vernon, N. Y., and of the Tarrytown, White Plains & Mamaroneck, which operates electric lines between these three points. Former County Clerk Leslie Sutherland, of Westchester county, has been appointed receiver of the Yonkers Railroad, which operates electric lines in Yonkers and thereabouts. These companies are all controlled by the Union Railway, which stock is owned by the Third Avenue Railroad, which, previous to the recent appointment of a separate receiver for it, was leased to the Metropolitan Street Railway, which was leased to the New York City Railway.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK

BRANCH OFFICES AT 375 OLD COLONY BUILDING CHICAGO, AND QUEEN ANNE'S CHAMBERS WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. *We give in our editorial columns* OUR OWN *opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.*

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS:

W. H. BOARDMAN, *Prest. and Editor.*
E. A. SIMMONS, *Vice-President.*
RAY MORRIS, *Secretary*
R. S. CHISOLM, *Treas.*
I. B. RINES, *Cashier*
L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Managing Editor.*
BRAMAN B. ADAMS
CHARLES H. FRY
FRANK W. KRAEGER
GEORGE L. FOWLER
HUGH RANKIN
BRADFORD BOARDMAN

CONTENTS

The short term notes issued so freely during the past two years are beginning to mature. But fortunately it is now possible to secure new railroad capital. The Delaware & Hudson, which has $6,000,000 one-year notes of the Quebec, Montreal & Southern falling due in February has borrowed $6,000,000 from the First National Bank and Kuhn, Loeb & Company, of New York, for six months at $4\frac{1}{2}$ per cent. This company evidently believes that by August conditions will be favorable for permanent financing. The rate of $4\frac{1}{2}$ per cent. on this loan is strong evidence of financial clearing. The Missouri Pacific has adopted a new expedient in order to get funds. Certain of its lines, including the connecting line running west to meet the Denver & Rio Grande at Pueblo, Col., which will on completion by 1909 of the Western Pacific, be part of the through line to the Coast, are the property of the Kansas & Colorado Pacific. A new "first refunding" mortgage has been created covering the lines of this company which, including refunding, is limited to $30,000 per mile on 1,450 miles, a total of $43,500,000. The prior liens are at the rate of $15,541 per mile. These bonds are 30-year 6 per cents., dated February 1, 1908, guaranteed by the Missouri Pacific. Of these bonds, $12,000,000 have been deposited as collateral for $6,000,000 Missouri Pacific two-year 6 per cent. notes dated February 10, 1908, convertible at par into the first refunding mortgage 6 per cent. bonds of the Kansas & Colorado Pacific by which they are secured. These notes are to refund a like amount of 5 per cent. notes originally issued in 1904 as two year notes, in 1906 extended for two years and maturing February 10, 1908, and they have been sold to bankers and offered to the public at 99. We are informed by the bankers that these are the first notes convertible into bonds ever issued. At the moment the railroad company could not sell the bonds themselves; it evidently hopes that the notes will all be converted within the next two years into the bonds and thus changed from a short term to a long term issue. Being secured by bonds, they are believed to be a legal investment for insurance companies in New York State.

TO GET TRACK-GANG EFFICIENCY.

There is in use in the track and bridge departments of the Illinois Central, and probably on other roads, a Time Roll and Distribution of Labor book which each foreman is compelled to keep marked up to date and turn over to his supervisor on the 27th of each month. Its effect is to make it easier to detect and generally prevent any attempt to pad the payroll or date back a new laborer or credit any laborer more time than he has made. Indirectly also it has a telling effect in preventing the men from paying the foreman a commission for their employment. The book is $8\frac{1}{2}$ in. wide by 9 in. high, but it folds to $4\frac{1}{2}$ in. by 9 in., and is inserted in an oilcloth cover and carried in the foreman's pocket with little danger of getting soaked and illegible.

Its peculiar feature is that each leaf consists of two pieces of white paper pasted together at the edges, and fastened immovable between those leaves is a carbon paper, so that when a pencil record is once made it cannot be erased because it is duplicated on the other sheet of this compound leaf. When a foreman makes a mistake in entering he cannot rub it out, but on another page provided for the purpose he can write an explanation of his mistake. Opposite each man's name there are two blank squares about a quarter of an inch wide for each day. Opposite each laborer's name the foreman puts a dot in the blank square showing when the man reports for work. At noon he puts the number of hours, 3 or 4 or 5; after dinner when each man begins, he puts a dot in the afternoon square, and in the evening puts in the number of hours, so that when a man works all day there are two dots and two figures entered. At night the foreman turns to another page of the book and enters up the totals for each man and the distribution of hours to the accounts chargeable.

To prevent the foreman dating a man back, and so giving him some extra days' pay in return for a commission or fee, the foreman is required to keep all blank spaces of a previous date cancelled by drawing lines across the spaces. The supervisor looks at the foreman's book frequently, and he must see to it that these cancellations of previous dates are kept up. More than this, the company employs a number of time checkers who have no other duties than the checking of the number of men employed in the gangs with the number of men shown on the time rolls. These checkers are shifted from time to time to various points and they appear on the work and check the time rolls of the foremen at any time. This might be called surprise checking.

The subsequent history of the books is interesting. On the 27th of each month the books are handed to the supervisor who holds them for a day or two for checking and correction and the making up of his own report. The foreman's book of original entry then goes with the supervisor's report to the auditor who compares the payrolls with the work shown in the books, signs each book and returns it to the supervisor. H. R. Safford, Chief Engineer of Maintenance of Way of the Illinois Central, tells us that in the beginning the foremen had to be educated in the use of these time books and although some little trouble was experienced when the book was adopted, it was overcome in a short time and they are now having no trouble in getting the foremen to put up the time in detail four times a day and to keep their books in a neat condition.

The use of the book has effected a reform and in this connection the following comment and reminiscences of an experienced supervisor are interesting: "The dishonesty among track employees is nearly always due to weakness—to a foreman's desire to put off the day of trouble; to be comfortable after finding that it costs something to be known as a good fellow, appertaining to which, as Bill Devery once said, 'A man ought to have I get ready to get it in the neck with an axe as soon as trying.'

"One of my foremen spent his evenings in the saloon to meet his friends and smoke a pipe. He did not drink in excess and went home early. He paid cash for his beer and tobacco at first, but once when he happened to be short, his friend, the proprietor, said 'never mind.' This habit grew and it grew a good deal until the proprietor casually mentioned that he knew a good man who wanted a job. After that Mike paid for no more beer and the proprietor furnished all the men, charging the men for their jobs and keeping them as customers. I soon detected this in the amount of work done and had to let the foreman go. He was a good fellow and a good trackman.

"I had another foreman who was all for the interests of the company. He got good men and he held them. In a broad-minded way he offered premiums for efficiency. If a valuable man was sick for a day or two he credited him full time if necessary, to coax a good man from somewhere else he dated him back a few days on the payroll. He had the best gang I ever saw. But the small irregularities leaked out and the foreman was blackmailed. He is still working, but he was transferred and is living down the past.

"Another valuable foreman was positively afraid to take a pen or pencil in his hand. He was always on his job, loyal and energetic, the first man out at the least sign of a storm. Work exhilarated him, but in making up his time book he would gasp for breath and at just the right time a handy man appeared who offered to keep his book and employ men for him. Of course, this handy man collected from the laborers and credited long hours and extra days and pretty soon I called in the foreman and showed him the results. The results were a reduction of 40 per cent. in efficiency."

TWO CENTS A MILE ON THE NEW HAVEN.

In the annual report of the New York, New Haven & Hartford Railroad Company for the year ending September 30, 1886, President George H. Watrous announced an important reduction of passenger fares by vote of the directors. Beginning with January 1, 1887, he said, the company would reduce to two cents a mile the regular fare on the main line from New York to Springfield, Mass., and at the same time would reduce to 2½ cents a mile the fare on the Shore Line and Air Line divisions of about 50 miles each. The actual reductions in each case appear to have been about half a cent a mile. The reduction was, in the main, voluntary. It was true that to some extent the menace of a "parallel" hung over the New Haven line that later materialized in a bitter and very corrupt battle in the Connecticut legislature when in the metaphor of the time "the ship of state floated in a sea of champagne shored by greenbacks." But at least there was no popular outcry for the reduction and no threat or danger that it would be enforced by legislation. It was a matter of broad rather than specific policy and to that today the New Haven ranks as a pioneer among American railroads. The charter rate of two cents a mile on the main line of the New York Central, it is true, antedates the New Haven's action, but it was the legislative price paid for the consolidation of its lines across New York State.

In his report announcing the reduction, President Watrous forecast, on the basis of existing passenger traffic, a loss for the next fiscal year ending September 30, 1887, of $500,000. The gap between prophecy and the event was striking. The year in question included nine months of the reduction. But instead of a half million decrease passenger receipts rose from $1,225,698 to $1,319,252, or a gain of $93,554. Passengers carried rose from 8,267,310 to 9,361,426, a gain of 1,094,116, or somewhat more than 13 per cent., and passenger mileage rose from 226,162,000 to 249,161,000, a gain of about 10 per cent. [illegible] further on the New Haven in the fiscal year 1888 [illegible] returns [illegible] important additional lines [illegible].

For some twenty years [illegible] no important change was made in the New Haven's regular passenger rate. But in the meantime [illegible] a mile rate for 1,000 miles [illegible] books at the same rate for [illegible] miles in the [illegible] of Massachusetts, Rhode Island and Connecticut [illegible]. Early in the year [illegible], President [illegible] reduction to two cents a mile for regular fares [illegible] to the whole system of 2,000 miles [illegible]. The change was to [illegible] March 1, [illegible] and to be completed November 1 [illegible] It was to begin on certain [illegible] at the [illegible] part of the system and work eastward until on November [illegible] the through New York-Boston rate, thus [illegible] the order of density of passenger traffic. It [illegible] that this reduction was voluntary, that it [illegible] a [illegible] degree on the Boston & Maine [illegible] for [illegible] the part of Boston and Massachusetts, has hardly been vivid. On the basis of existing passenger travel the reduced annual receipts were estimated by the company at $7[illegible]. What actually came to pass is set forth in the table annexed showing regular passenger and commutation earnings by months for three years beginning with the month (November) of the completed reduction.

	1904-1905	1905-1906	1906-1907
November	$1,644,601.77	$1,72[illegible]	$1,76[illegible]
December	1,502,737.2[illegible]	1,6[illegible]	1,74[illegible]
January	1,376,963.65	1,[illegible]	1,[illegible]
February	1,261,977.62	1,378,5[illegible]	1,4[illegible]
March	1,461,601.85	1,51[illegible]	1,6[illegible]
April	1,625,820.82	1,697,67[illegible]	1,782,[illegible]
May	1,690,828.66	1,750,870.10	1,8[illegible]
June	1,775,286.60	1,922,768.26	1,971,7[illegible]
July	1,962,653.30	2,042,011.49	2,16[illegible]
August	2,07[illegible]172.99	2,175,649.18	2,4[illegible]
September	2,07[illegible]676.91	2,181,416.26	2,[illegible]
October	1,8[illegible]	1,9[illegible]31.92	2,04[illegible]
Total	$2[illegible]	$21,560,49[illegible].01	$22,771,87[illegible]

The first column represents the complete year beginning [illegible] November before the reduction, the second column includes [illegible] months under the sliding scale of reduction, and the final column represents the first full year after the reduction went into force on the whole system. The impressive comparison is therefore between the first column and the last. It shows a gain in passenger receipts of $2,487,212.72, or somewhat more than 12 per cent., with no increase of track mileage worth mention, a fact which gives the comparative returns increased value. The great increment is emphasized also by the fact that it appears on a system where the mileage books were already very commonly used and, indeed, privately traded in by temporary transfers. On the other hand, it is to be noted that in the year 1905-1906 the company [illegible] developed its excursion business which, however, in the following year, was reduced by its inability to run its excursion trains to New York City owing to obstruction due to the terminal improvements above the Grand Central Station.

How much of this greatly increased passenger business was due to the two cent rate, how much to national growth of passenger traffic cannot even be guessed at, and obviously there will be no light upon the subject during the year to come with its industrial recession affecting passenger traffic as well as freight. It is manifest also that the New Haven system, with its volume of passenger business not only immense, but dense and producing operating revenue almost equal to that from freight, holds a unique position in the matter of passenger rate reduction. Still, with every allowance on the plus and minus side, the increased revenue from reduced and uniform fares is peculiarly impressive. One cannot reason from the New Haven to other railroad systems great or small with their passenger business, nor to whole states or other geographical divisions that contain varied railroad lines. But the New Haven example has at least two sharp suggestions. First, the occasional value of voluntary as contrasted with compulsory passenger rate reductions, and, secondly, the feasibility and success of the "postage stamp" idea as applied progressively in systems with high passenger density, at first in the form of the mileage book, next to the zone of densest travel and finally to the system as a whole. Along these lines, without the dictate of legislatures or commissions, the future of the American railroad promises some instructive results. Were it not for the fear of public clamor for further and unreasonable reduction the idea would probably be tried out sooner and more often.

GOVERNMENT ACTION AGAINST THE HARRIMAN ROADS.

The current week has brought out two interesting and highly contradictory pieces of news with regard to the attitude of our government towards the railroads. On January 25, Attorney-General Bonaparte directed that a bill in equity be filed to set aside the control by the Union Pacific Railroad Company and its subsidiary corporations of the Southern Pacific and the San Pedro, Los Angeles & Salt Lake; also to have declared illegal the ownership by the Union Pacific or the Oregon Short Line of stock in the Santa Fe, the Great Northern and the Northern Pacific, it being alleged that all these lines are competitors of the Union Pacific and that they have conceived and carried out a conspiracy in restraint of trade. E. H. Harriman, Jacob H. Schiff, Otto H. Kahn, James Stillman, Henry C. Frick, Henry H. Rogers and William A. Clark are cited as individual defendants. Mr. Bonaparte has issued an official statement in which he says that the extended investigation by the Interstate Commerce Commission into the relations existing between the various roads engaged in transcontinental traffic, supplemented by independent investigations by the Department of Justice, has caused the department to arrive at the conclusion that the stockholding of the Union Pacific and its subsidiary companies in the other corporations mentioned above is in direct violation of the Sherman act. The department regards the suit as of great importance, since it seeks by means of it to break up what it refers to as the substantial monopoly of the transportation business of the country between the Missouri river on the East, and the entire Pacific Coast south of Portland on the West.

This news came out on January 25, as stated. On January 27, a conference as requested by the President took place in Washington, and some nine highly experienced railroad men discussed with him the question of modifying the Sherman law so as to minimize the restrictions now placed upon railroad pooling and traffic agreements for securing uniformity of traffic regulations and rates, etc.

It has, of course, for a long time been obvious to all careful economic students in this country that our national law has definitely taken two positions which are absolutely irreconcilable with each other. Through the Sherman law it has required competition; through the rate law of 1906 it has made it impossible. The doctrine of enforced competition is a subject too big to discuss here. It is sufficient to say that it has been the historic theory of most governments which did not own their railroads that competition between the roads should be required by law, although experience has amply shown that the law has never yet been successful in its efforts to sow seeds of dissension that should raise fruit of benefit to the public. On the other hand, evidence has been accumulating year after year which shows with incontrovertible definiteness the fallacy of the whole proposition as outlined by government.

It is now 36 years since the famous committee on railroad amalgamations was appointed in Great Britain. Charles Francis Adams, Jr., told us 21 years ago how this committee had showed with grim precision that in the 40 years during which railroads in Great Britain had been doing business up to the time when the committee made its report, English railroad legislation had never accomplished anything which it sought to bring about nor prevented anything which it sought to hinder. The cost to the companies of the useless mass of enactments (3,300 of them) had amounted to some $400,000,000, yet the committee concluded that competition between railroads existed only to a limited extent and that it could not be maintained by legislation. The committee cited practical examples of the respective workings of amalgamation and of competition, and then stated that in view of such facts as these it was clear that amalgamation had not brought with it the evils that were anticipated, but that in any event long and varied experience had fully demonstrated the fact that while Parliament might hinder and thwart, it could not prevent it, and was powerless to lay down any general rule determining its limits or character.

Having thus quoted the British Parliamentary committee on the futility of attempting to enforce by law competition between railroads, Mr. Adams took occasion to comment that the whole theory under which the American railroad system was left to develop itself was founded on the same theoretical error which had prevailed in Great Britain; the supposition being then universally accepted as an axiom that in all matters of trade, competition, if allowed perfectly free play, could be relied upon to protect the community from abuses. Thus the efficacy of railroad competition, expressing itself in the form of general laws authorizing the freest possible railroad construction everywhere and by anyone, at an early day became almost a cardinal principle of American faith. Yet, said Mr. Adams, "it is found that wherever this characteristic (the natural monopoly of the railroads) exists, the effect of competition is not to regulate cost or to equalize production, but under a greater or less degree of friction to bring about combination and a closer monopoly. The law is invariable."

Well, it was 22 years ago when Mr. Adams wrote his book and it is now 36 years since the British committee reported, and materially longer since George Stephenson observed that where combination is possible competition is impossible. Yet to-day the government is attempting to tear apart a great and enormously useful railroad system because its form of organization is alleged to represent combination just as all great and useful railroad systems must represent combination, instead of competition which, in the days when rivalry had full swing in this country effectually prevented any railroad system from being either great or useful in the fullest sense of both of these words. In the face of this action, however, the government appears to doubt the divine inspiration of the law which requires competition in all things—else why the conference of January 27?

A bystander unlearned in the law cannot help thinking that these two pieces of news in Washington have come out in the wrong order. If the government really thinks that the Sherman law is probably a foolish one, why does it not settle the conference on this point before it undertakes great new prosecutions under that law? While the chemist is still investigating our drinking water to see whether it is going to poison us, is it not better to drink something else for the time being?

What a Technical Journal Ought To Do.

It is a curious and interesting commentary on modern scientific and industrial development that book making cannot keep pace with it. The surgeon can learn the groundwork of his profession from recognized text books, but to keep abreast of the best current practice he must either see that practice, or hear it described, or read of it in the technical publications devoted to that alone. The lawyer can pass his bar examinations on the basis of his theoretic instruction at the law school, but to win cases he must read cases, as fast as decisions are handed down. The same thing has always been true of the work of the civil and the mechanical engineer. Certain standard books on bridge design and on locomotive design have collected together a great group of cardinal principles derived from two generations of practical experience, but no text book has ever yet or will ever be able to contain a full record of progress as it is illustrated by the best current practice—a record corresponding to the cases which the lawyer studies and also to the cases of a different kind which the surgeon studies. As rule-of-thumb methods in engineering work have more and more given way to scientific methods it has been more and more necessary for the engineer to know just what was being done simultaneously in all parts of the world. Within the last decade progress greater than many people realize unless they look back and count the milestones, has been made in the application of [illegible] and well understood methods to the operating, financial and traffic departments of a railroad as well as to the engineering department, and here again the production of text books has utterly failed to meet the demand for information.

To fill this demand is one of the two great purposes for which a technical journal exists. Colonel Proat pointed this out with great clearness in a paper which he wrote for *Transport* (now incorporated in the British edition of the *Railroad Gazette*) in 1902. He cited the case of the costly and elaborate volume [illegible] Modern Locomotives, published at the end of 1900 which, in 1902 was valuable as history, but not as a description of current practice, while the greater branch of service, covering both traffic and transportation, was represented in no book at all that did it even the most meagre justice.

But important as that function of the technical journal is, its other function—the broadening of the individual for his own good and for the good of the whole machine—is far more important. There are many branches of railroad service just as there are many branches of every other kind of service that in their direct tendency are exceedingly narrowing. Thus, a division superintendent may be so anxious to get a record figure for the biggest trainload that he forgets that trainloading, like every other branch of railroad work, exists for the sake of moving traffic. Similarly, a very large and important collection of railroad accountants, last spring, forgot that their accounts were collected for the sake of use and not merely as a hot house collection of beautifully developed statistical plants. Narrowing down our discussion from technical journals in general to a particular class of technical journals, it is undeniably true that the great and fundamental value of a paper which tries earnestly and successively to make a comprehensive study and give a broad view of railroad practice lies in the incentive at once to individual development and to team play.

The *Railroad Gazette* has recently been enabled to support this kind of theorizing in a rather remarkable manner. Some time ago, we addressed to all our readers a circular letter asking them whether or not we were devoting too much space to the reviews which we printed of annual reports. Our own point of view was that a proper and understanding review of an annual report constituted an extremely valuable part of the joint business of furnishing facts and furnishing incentives to usefulness; that an abstract of a report made only with an editor's blue pencil was not useful along either of these lines, because the facts which it presented were only half truths, and the conclusions that could be drawn from these half truths were of no service to anybody. Therefore, we had been making a series of thorough, careful and painstaking reviews, in which the information given in the reports was interpreted, measured by rules and standards applicable to all companies, and expanded with comment based on real information about the physical and financial status of the property, including the efficiency or lack of efficiency of its management. But all this took a great deal of space, and we sent out our circular letter of inquiry to see what the real opinion of our readers was about this matter.

We confidently expected that railroad presidents, financial officers, and banking houses would approve heartily of these reviews, because we knew that the work was done well; but in our weekly audience there are a great many more master mechanics, and chief engineers, and signal engineers, and general superintendents, and engineers of maintenance of way, than there are bankers and railroad presidents; just as in a well constituted regiment there is only one colonel and one lieutenant colonel, but there are two majors, 10 captains, 20 lieutenants and some 60 sergeants.

Our theories about the real use of a technical journal in training men to think and to see their positions as parts of a whole instead of as separate entities, received a most gratifying confirmation in the replies to this letter of inquiry. The total number of replies received was 335; say, in round numbers, one reply for 20 subscribers among officers. Twenty-seven of these 335 were inclined to think that we gave too much space to the publication of annual report reviews, 26 of them cast ballots which may be described as defective because they answered some other question than the question asked, and 282 said very positively that we were not giving too much space to the reviews and that they found them helpful and valuable in their work.

Now let us see who these people were. Comparing for the moment railroad financial officers with officers in charge of the roadway (including chief engineers, maintenance of way engineers and their principal assistants) we found, to our great interest, that three financial officers answered our letter, all of whom spoke enthusiastically about the reports; and that 41 engineers of roadway answered our letter, 39 of whom were heartily in favor of the report reviews. Thus, a financial officer writes:

"I consider this one of the greatest improvements the *Railroad Gazette* has instituted in the seven or eight years I have been a constant reader. I do not think you are giving too much space to the publication of annual reports and I have read every word of them."

This is what we expected and hoped for, although we would never have believed that he had read every word of these reviews unless he himself had told us so. But now observe the following replies:

"The *Railroad Gazette* is our most important source of information in such matters, and we feel that the space which you give to the statement and analyses of railroad reports is of great value." —*Consulting Engineers.*

"You have not given too much space to the review of reports. The comparisons you make, as, for instance, that of the Chesapeake & Ohio and Norfolk & Western, bearing on their class of traffic, difficulties of operation, department expenditures, etc., are all very interesting and valuable to an engineer, and I find them especially so in connection with the theory of railroad economics, as given by Wellington, Webb and others."

—*Consulting Engineer.*

"I take great pleasure in reading these reports."

—*Engineer Maintenance of Way.*

"I read, clip, index and file nearly all of the information in the annual reports as published by you." —*Construction Engineer.*

"I read these reports with a great deal of interest."

—*Chief Engineer, Maintenance of Way.*

"Your articles are so admirably prepared and give the information desired in such convenient and systematic form that they must be extremely valuable to those whose interests lie in the department of operation, traffic and finance." —*Bridge Engineer.*

"I should be very much disappointed if you were to discontinue the report reviews or give them in any more restricted form than at present."

—*Right of Way Inspector.*

"I have had a great deal of pleasure and profit in reading the reviews you refer to. I think them especially valuable to any persons engaged in any way in the [illegible] business of [illegible] lest we forget the ultimate object for which railroads are built and operated."

—*Assistant Engineer of Bridges.*

"I take great interest in these articles. I consider them one of the most valuable features of your paper." —*Engineer of Roadway.*

"An analysis of these reports such as [illegible] is very important to every railroad officer." —*Engineer [illegible] and [illegible].*

"I believe that it is proper that your paper [illegible] a [illegible] such subjects rather than [illegible] along [illegible] technical matters only." —*Civil Engineer.*

This is support from the permanent way department, and besides the 39 permanent way officers who approved, 18 civil engineers, two or three of whose replies were quoted above, expressed their entire approval of the work we had done along lines which apparently lay to a considerable extent outside of things in which they were directly interested.

Now let us see how the mechanical people feel about the reviews. We found one master mechanic, one shop superintendent and three men in the car and locomotive department who thought we gave too much space to report reviews; also an assistant engineer of tests, whose work is doubtless primarily mechanical. But the mechanical people who did read our reviews last year and who approved of them come second on our entire list in order of precedence, to a total number of 28. Here are some of their letters:

"I do read these reviews with great interest. [I] have got much information of value from them." —*Superintendent of Machinery.*

"I consider them extremely valuable and have gone over them with a great deal of interest. They have enabled me to collect figures and data on the cost of operation that otherwise would not have been obtainable."

—*Superintendent of Motive Power.*

"I try to read them all." —*Mechanical Engineer.*

"I have been very much interested in these reports and hope that you will find it convenient to continue them. The treatment accorded has been such that the reader is enabled to get the proper understanding of the subject."

—*Assistant Superintendent of Machinery.*

"We do read these reports. We cannot offer any suggestions that would improve the manner in which the subject has been handled by the *Railroad Gazette*. The fact that these reports are not actuated by the desire of pleasing the companies whose reports are reviewed makes them valuable, and I think your readers are convinced that that is your intention and effort."

—*Superintendent of Motive Power.*

"I read the reviews with considerable interest as they certainly give in a nutshell a pretty complete resume of the items in which all railroad men are interested and enable one to compare the results obtained on his own road with the results obtained on others." —*Mechanical Engineer.*

"I feel that they have given me a better knowledge of the conditions on our road than I could have obtained in any other way."

—*Superintendent of Motive Power.*

Among men engaged specifically in railroad service, we got the largest affirmative vote, next to the permanent way and mechanical departments, from the superintendents, 16 of whom heartily endorsed the work we have been doing while three dissented. For example:

"I read everyone of them. I have been very much interested in the articles." —*Superintendent.*

"I read most of them. I am very much interested in the reports as compiled." —*General Superintendent.*

"I have read many of these with interest. The analyses of the subject have been so well handled that I cannot criticize them or make any suggestions of value." —*Assistant General Superintendent.*

"I have read them carefully." —*General Superintendent.*

Continuing up a step in the same operating line we found that general managers and assistant general managers approved by a unanimous vote of the 15 who replied. One of the especially interesting replies is from the General Manager of a large street railway system in Wisconsin, as follows:

"I have learned more and gotten more valuable information which is useful in the electric railway business from reading these reports than I have from reading all the street railway journals published in the country. These unbiased and critical analyses, absolutely independent of the feeling of the corporation which is being discussed, I have held up to my friends in the street railway publication field as shining examples." —*General Manager.*

From the steam railroad general managers we quote the following:

"I have read all but a few. These reports have always appealed to me as specially interesting as showing railroad people how a report of this kind can be analyzed and what deduction can be properly made from it."

—*Assistant General Manager.*

"I have been very much interested and have read practically all the reports you have made public through your magazine." —*General Manager.*

"I have not read one that I regarded too long." —*General Manager.*

"While I cannot say that I have read everyone of them, I have read the reviews of all the principal lines and I consider them the best that have been made public. I believe the work is the very best there is and that it ought to be continued." —*General Manager.*

The total affirmative vote in addition to the officers already given was made up of the replies from persons whom we have classified as follows: Railroad presidents, 12; vice-presidents in charge of operation, 11; miscellaneous manufacturers, 17; manufacturers of cars and car specialties, 10; manufacturers of locomotives and locomotive specialties, five; signal engineers, seven; librarians, one; bankers, six; lawyers, statisticians, state railroad commissions and trainmasters, each three; bridge engineers, bridge manufacturers, purchasing agents, ticket agents and officers of coal companies, each two; also one favorable reply from each of the following: Traffic man, economist, assistant to president, industrial agent, contractor, locomotive engineer, chemist, superintendent of telegraph, yardmaster, passenger department, car accountant, passenger conductor, architect, timber expert; also 41 favorable replies which we have not attempted to classify by vocations. We will quote only a few of the replies to show the general range of interest and the point of view of people occupying a great many different kinds of official positions.

"I have read many of the reviews with interest as I can gather what I desire to know with less difficulty than by studying the annual reports, and the reviews save me the trouble of calling for such of the reports as I wish to see if they do not otherwise find their way to my hands. Permit me to say in this connection that the practice of the *Railroad Gazette* in regard to these reviews seems to me not only quite in keeping with its character as *the* railway journal of this country, but especially beneficial to the class of railway men who habitually read the *Gazette* in that it leads their minds to an intelligent consideration of the three principal elements of the railway question; namely, operation, traffic and finance. As a rule I think operating men are your best readers, in which I include the engineering department. Traffic men probably come next and those having to do with finance last. The tendency with operating and traffic men is to dwell upon their own particular branch of the service to the exclusion of the other two. Once in a while there is one bright enough to understand relative values and this man moves up, but ten to one of the successful operating men fail of such advancement as their ability in that branch of the service would seem to entitle them to because their minds are not trained to take a larger grasp of things. The articles referred to in the *Railroad Gazette* are calculated to stimulate this lack of interest in and appreciation of elements with which their duties do not ordinarily bring them into immediate contact." —*President.*

"I have been a very great admirer of the manner in which this information has been presented through your paper." —*President.*

"We have looked over these analyses and we find them in every way splendid. We think that your claim that they are better than those published in any other paper is not exaggerated; it is almost impossible to find a brief and fearless analysis of a railroad report setting forth the bad points as well as the good, and we congratulate you upon the straightforward method in which you have done this." —*Bankers.*

"We appreciate very much the critical analyses of railroad reports contained in the *Railroad Gazette*, and the frank and full way in which you deal with the principal topics of such reports. We always read them with much attention." —*Bankers.*

"These reviews are more interesting to the average railroad man, I think, than nearly any other railroad news item which might be published." —*Vice-President and General Manager.*

"We read them every time, and we file them for reference, regarding them as of invaluable use to us." —*Vice-President and General Manager.*

"I have no suggestions to make. I may say, however, that in your treatment of these reports I have found much of interest and value." —*Purchasing Agent.*

"The articles constitute, in my judgment, the clearest and most complete and practical outlining of railroad doings that ever appeared in any railroad paper." —*Sales Department, Manufacturing Company.*

"The writer has made it his practice to read these reports." —*President Bridge Company.*

"The reviews are extremely valuable, and I read them with the greatest interest." —*Secretary, Rolling Stock Company.*

"I think I can say that I read all of them." —*Trainmaster.*

We have devoted a good deal of space to these replies because they show far better than could be shown by theorizing, what the actual helpful work of a carefully edited technical journal is, in broadening the outlook of the individual. We can safely assume that the trainmaster who read every one of these reviews got more out of them which will be of service to him in shaping his future career than any of the railroad presidents did.

The Railroads of India.

The railroads of British East India at the end of the year 1906 had an aggregate length of 29,098 miles, of which 802 miles had been opened in that year. A little more than half the mileage was of the 5-ft. 6-in. gage originally adopted for the Indian standard; but there were 12,254 miles of meter gage, and 1,419 miles of narrower gages (30-in. and 24-in.). The length of the railroads owned by the state was 21,719 miles out of these 15,614 miles were worked by corporations under contract with the state. The capital of these railroads was at the average rate of $42,555 per mile. For the year 1906 their average gross earnings per mile were $4,819, and their net earnings $2,116, the working expenses having been a trifle less than 50 per cent. of the earnings. The gross earnings per mile were nearly 3 per cent. greater than in 1905, the net 1 per cent. less.

The traffic of these railroads in 1906 was at the average rate of 367,948 passenger-miles and 376,807 ton-miles per mile of road, or equal to a daily movement each way over the entire system of 504 passengers and 516 tons of freight. On the railroads of the United States the corresponding figures were 135 passengers and 1,345 tons of freight each way daily. In India the passenger-miles and ton-miles are nearly equal, here the ton movement is nearly nine times as great as the passenger movement. That the passenger traffic per mile of railroad should be 3¾ times as great in India as here is sufficiently explained by the fact that there are more than 10,000 inhabitants per mile of railroad in India, and less than 390 here. The light earnings per mile of the Indian railroads is due to the very low rates on the large passenger traffic and the comparatively small amount of the freight traffic. In 1906 the average rates received were 0.4157 cent per passenger-mile and 0.808 cent per ton-mile. If we charge half of the mixed-train mileage (which is more than 30 per cent. of the whole) to each kind of traffic, the average train loads were 265 passengers and 191 tons of freight. No other country has so large an average passenger train load. The average earnings per train-mile (all kinds) were 124.9 cents gross and 62.5 cents net. There is probably no other country which has so low a cost per train-mile which is very largely due to the very low wages paid to natives of India. These formed 463,108 of the whole number of employees against 6,850 Europeans and 9,326 Eurasians—offspring of white fathers and Hindoo mothers. This is at the rate of 16.5 employees per mile of road.

Of the whole number of passengers 95 per cent. traveled third class, paying an average fare of 0.387 cent per mile. The first class passengers were but as 1 out of 367; but they paid a trifle more than 3 per cent. of the total passenger earnings, with an average rate of 2.224 cents per mile. The largest specified freight was coal—12,580,000 short tons. Next came 11,939,400 tons of grain and beans, 2,565,000 tons of flax seed and other oil seeds, 2,064,000 tons of salt, and not very much less weights of sugar and cotton.

In spite of their low rates, the Indian railroads are prosperous, partly because of their low capital cost, but chiefly because they are worked so cheaply. Their net earnings were 5.83 per cent. of their capital in 1906, and 5.92 in 1905. Additions of considerable extent are made yearly.

NEW PUBLICATIONS.

Economics of Railway Operation. By M. L. Byers, C. E., Chief Engineer Maintenance of Way, Missouri Pacific Railway. New York: *The Engineering News Publishing Co.*; London: Archibald, Constable & Co., Ltd. 1908. 672 pages; 6 x 9; cloth. Price, $5.

Mr. Byers has endeavored to produce a book which will be to the science of railroad operation what Wellington's Economic Theory of Railroad Location has been to railroad construction, and he has probably succeeded. At all events, he has produced a standard reference book entirely different from anything now in print; a book which ought to serve a very useful purpose for a good many years.

The author makes a point which has often been brought out in the *Railroad Gazette*, that with the extremely rapid development of railroad transportation along special lines it has become more and more difficult to obtain a true perspective. The department officer too often works for the advancement of the department alone, losing sight of the broader interest of the stockholder, while the young man entering upon a railroad career finds it difficult, if not impossible, to obtain any very clear view of the relation of his work to that of other departments. Therefore, Mr. Byers has tried to bring into view the general outline of the mechanism of railroad operation as it is carried on to-day and to develop the principles involved.

The first chapter deals with organization and gives some very useful rules. For example Rule 1 reads: "Provide a supreme authority at all points where action must be taken". Rule 2: "Carefully and fully outline the authority and responsibility of each position". Rule 4: "Avoid as far as possible making any person subordinate to two or more others, especially in regard to matters at all closely related." A full quotation showing the disadvantages of extreme centralization in matters of administration is taken from the report of the committee appointed by the British Secretary of State for War to consider the decentralization of the War Office business resulting from the breakdown of that department in the Boer war. In this same chapter on organization, the departmental and divisional types are clearly differentiated and the advantages and disadvantages inherent to each type are shown. A [illegible] set of by-laws giving details of organization for a large railroad is shown.

The employment, education and discipline of force receive full attention, with a good many helpful suggestions about appointment, promotion and education and the relations which brotherhood employees have to the total working force. Thus it is shown that in 1900 the Brotherhood of Locomotive Engineers had 35,910 members among a total of 42,837 engineers, whereas the telegraphers in 1900 enrolled only about a third of the entire force within their union. The third division of the first chapter relates to accounts and accounting and it is perhaps open to criticism on the ground that it is rather more theoretical than the case demands. The function and idea of the accounting system receive wide discussion, but we should suppose that the men directly engaged in this highly specialized branch of the business would want considerably more on the subject, while the men only casually interested would require considerably less.

The same criticism can be made of other parts of the book. Yet on the whole it must be admitted that the selection of concrete material to illuminate theory is quite good. Under the general head of reports, 60 pages are devoted to abstracts such as the following:

"Form M. W. 26 will be used by foreman water service for rendering monthly reports to superintendent of water service on or before the 10th of each month following that covered by the report, of cost of operating and maintaining all water stations in his territory."

The objection which the casual critic might make to the selection of this material is that it would be better either to show all the forms themselves or to refer to them in more general terms. However, we do not doubt that the 60 pages of definite examples like the above will have their use.

Under the general head of economic operation, which constitutes Part 5 of the book, and fills some 360 pages, each detail of the expense account is discussed at length with copious examples from the practice of specific railroads. Specific examples are shown at large of such documents as "Daily report of condition of boilers and fireboxes examined at X Station; Roundhouse No. —." The topic of transportation is then taken up, under 18 specific heads, from the standpoint of the division officer. Topic No. 1 is train rules; No. 4, foreign car-home-routing instructions; No. 15, yard service, etc. The standard code is given in full; specifications are shown for train order forms, etc., illustrated with cuts; preparation of the train schedule or time-table is fully discussed, and each of the detailed 18 topics receives careful and studious treatment. We have only the highest praise for this entire study of economic operation. It is admirably done and is by itself worth the cost of the book many times over.

Part 6 deals with analysis of operation and control of expenses, showing the difference between constant expenditures, which do not fluctuate with any ordinary changes in the amount of traffic; indirect variable expenditures, and direct variable expenditures. This analysis is well made, and is followed by discussion of the general balance sheet and general income account. The book then tells what an inspector of transportation ought to do, and gives a number of specific examples of such an inspector's work and of the kind of report which he ought to make. Control of expenditures is, of course, the underlying theme of this final section of the book, and the topic is handled in a thoroughly competent and satisfactory manner.

We should be very much surprised if there was an operating man to be found in the whole great group of highly trained American railroad officers who would not derive much profit and helpful suggestion from reading Mr. Byers' book, which seems likely to remain a standard work for a long time.

What Are We Going to Do About Railroad Accidents?

New York, Jan. 30, 1908.

AN OPEN LETTER TO NEWSPAPER EDITORS.

The appearance of the yearly accident bulletin is always occasion for expressions of horror in the great dailies, and too often with ill considered demands for drastic legislation. The *Evening Post*, sane and with fine traditions to live up to, asks a proper question which we prefer to think is addressed to the railroads, rather than to legislators. It says:

"If 5,000 persons had been killed and 76,286 injured in battle or in two or three accidents the country would be aflame at the news. Because these casualties occurred on our railroads in the course of 12 months nobody pays much attention to them. The Interstate Commerce Commission gives the ghastly figures in its recent annual report. They bring up the question anew, 'What are you going to do about it?'"

The answer by railroad managers might truthfully be: "We are doing more than ever before; are making progress, but cannot be successful until we are allowed to control our employees." In the employment and discharge of enginemen and train crews the trade unions have rather more authority than the employers and except perhaps on the Reading and the Chicago, Burlington & Quincy, which have paid dearly for the privilege, dangerous men cannot always be weeded out. Nevertheless, many railroad officers do less than their full duty in organization and vigilance, and are legally and morally guilty of criminal negligence. The force of public opinion, which the newspapers aim to express and often to influence, together with the enforcement of the present laws, is practically the only hope for a better condition.

TRAIN ACCIDENT KILLINGS.

While it is true that 5,000 passengers and employees have been killed on the railroads in the last year, nevertheless people generally accept this as meaning train accident killings and assume that all of it or nearly all of it can be stopped. This summary is misleading and does a lot of harm. An "injury" is a variable, from a bruised thumb to a lost leg, and the minuteness of reporting varies on different railroads and in different countries, so that fair comparison can only be had from the more accurate records of those killed. Let us separate the items and try to see how much of the killing is within control of railroad officers or of anyone. Only 1,421 people were killed in train accidents. Of these 776 lost their lives in collisions, and it is quite nearly true to say that every collision is due to disobedience of orders—a lack of discipline—so that at least this much is pure waste and can be stopped. Of the 515 lives lost in derailments this is nearly but not quite so true. A detailed examination shows that at least 22 of these lives could not have been saved by the railroad man's vigilance. Unusual disturbances by the forces of nature and malicious interference are beyond control. Also by no means all these derailments were due to a lack of discipline; a considerable proportion, fully one-fourth, were caused by defects in equipment, preventable, but not by the same methods. Equipment includes the roadway and its structures, as well as all rolling stock. One hundred and thirty lives were lost in unclassified train accidents, and these cannot be analyzed fully, except that we find the same causes, human errors, defects of equipment and uncontrollable elements.

The other killings which go to make up the total of 5,000 are 3,579 lives lost on the right-of-way, and a careful examination of these losses is most instructive. For example: Seven passengers lost their heads by sticking them out of windows and 147 passengers were killed while trying to save time in getting on and off trains. Due to the same foolishness, more than 2,000 passengers were wounded—self-inflicted injuries, beyond the control of others.

THE HUMANE EFFECT OF SAFETY DEVICES.

In coupling and uncoupling cars, 302 employees lost their lives last year. In the year 1890 a greater number, 396, were killed while doing that work, although the number of freight cars in service has considerably more than doubled during the period and the yard and terminal work has increased by a much larger proportion. This subject is worth a little further study. Railroad accident statistics show, uncertainly, that 15 are injured for each one killed; but in car coupling accidents the ratio is about 27 to 1. In 1890, 7,842 were injured while coupling less than half as many cars were coupled as last year, when only 3,948 were injured; that is to say, more than 75 per cent of these injuries have been eliminated. We may assume that this relative reduction in killing and wounding is entirely due to the use of the automatic car coupler.

In tending switches and other similar work about trains 310 were killed this year. This, too, is a proportionate reduction due to the increasing use in busy yards of a power movement of switches in connection with the interlocking machines.

In contacts with overhead bridges and structures 142 lives were lost last year. The method of classifying accidents has been changed so that we cannot in this case make exact comparisons, except that here there has been an enormous reduction, due entirely to the invention of the Westinghouse air brake, with the result that brakemen rarely need to ride on the freight car roofs.

KILLING TRACK LABORERS.

There remains unclassified the large number of 1,873 lives lost on the railroad right-of-way. Perhaps the largest single item is the killing of trackmen. The foreman of a track gang has a heavy responsibility. He knows the time table and watches his timepiece, but he needs to be alert and watchful for extra trains and light engines. Nevertheless, foremen vary in alertness and the killing goes on. These workmen, Italians and the like, are apt to be stupid, but with a low cunning. In night work it is difficult to keep track of them and protect them. They will skulk and be found dead on the track behind a passing train. Material improvements have been made in methods of watching out and warning, but we need not expect much reduction in this kind of killing.

WE CAN SAVE 1,000 LIVES.

It would seem, therefore, that only a small reduction can now be made in the above mentioned total of 3,599 lives lost outside of train accidents. It appears also that nearly all of the 1,421 lives lost in train accidents would be saved if there were strict obedience by employees and if the design and material of rolling stock and permanent way were perfect. Perfection is not attainable in this world, and therefore a somewhat careful examination has been made of the accidents which involved these 1,421 lives.

Without going into detail, it does seem possible to reduce that loss by two-thirds—that is to say, our problem is limited to the saving of 1,000 lives of passengers and employees a year in railroad operation.

THE GENERAL MANAGER'S RESPONSIBILITY.

The newspapers have taken as a text the remarkable exoneration of General Manager Smith from responsibility for the fatal derailment on the electrical division of the New York Central—remarkable because the Court decided, without allowing the jury to consider a verdict, that the evidence showed a full measure of energy and caution in the use of equipment and the choosing of men. This is all that the manager can do, but he will be held to higher standards than we have had heretofore. The stenographer's report of the Smith trial makes a ponderous volume, including most of the material for a text book on train operation, and is inspiring in suggested possibilities of inspection of materials and men. Inasmuch as this railroad has been under severe fire, some details of its methods of improving discipline are worth noting. Some of the same methods are used on other roads.

TRAINMASTERS.

This not quite descriptive title is given to the four or five men employed on each engine division to spend their entire time on the line, riding in freight-train cabooses and on passenger trains and being at signal cabins and stations—wherever train movement can be observed. They are field inspectors of operation, such as enginemen's obedience to the signal indications, and their compliance with the rules for giving whistle signals at crossings and for sending out front and rear flagmen. They watch for infractions of safety rules by conductors, brakemen, towermen and station men. To prevent their being regarded as simply spies or detectives, they are given a measure of authority to deal privately—warn without reporting—with first offenses and make recommendations in favor of efficient men. They make "surprise tests"—for example, go to an automatic signal post and hold the semaphore and light at the caution or stop position and see if the engineman is alert in obedience.

INSPECTION AND PUBLICITY.

The New York Central has also, within the past year, put in effect a plan which seems to be original. An expert investigator, whose ordinary work at headquarters is such that he can leave at a moment's notice, proceeds at once to the scene of an accident that is serious or involves a lesson, and joins the division engineer and superintendent in an investigation and report. Mr. Brown, Senior Vice-President, writes: "The expert investigator's duties are, primarily, to bring out any wrong practice that may exist and which, if it had not already done so, might lead to an accident. I hope that with experience these special investigators, of whom we have two east of Buffalo, will become such authorities that the cause of an accident will be quickly determined and full of accurate information given to the press."

The establishment of an inspection department, thoroughly organized, primarily to insure strict observance of rules, was probably original with Julius Kruttschnitt, now Director of Maintenance and Operation of the Harriman lines. He appointed an Inspector of Train Service, and he and his staff have done great things on the Southern Pacific. The work covers cleanliness, ventilation, heating and lighting of cars and stations; neatness and good manners everywhere; excessive speed, schedule failures, neglect to flag and running past signals. These latter dangerous practices have been nearly eliminated. Mr. Kruttschnitt in his plan recognized the fact that neatness and orderliness are closely allied to uniform obedience to orders. It is surprising that this departmental method of administering discipline has not found favor on more railroads.

On the Chicago & North Western and on the Rock Island—and probably on other roads—there is an interesting undertaking for the triple purpose of promoting discipline, establishing frank relations with the public and getting, or holding, business. There is a fixed, compulsory, monthly meeting of division superintendents, and at this conference all that pertains to these subjects is discussed. Each officer then goes slowly over his division, keeping his eyes open and examining each station agent. He stays long enough in each community to make calls on shippers and others who have complaints or are otherwise critical and disaffected. If a frank exchange of views and facts can accomplish a better understanding, as it generally does, his work is done, for, as President Winchell expresses it, "he has no time to call on our friends, he must see the men who paint us black."

DEFECTIVE EQUIPMENT.

During the present winter a succession of rail breakages prompted a thorough inspection of about 80 miles of track—cleaning the sides of the rails with steel brushes and looking closely for flaws. Twenty-six cracks were found, all ripe for breaking and disaster. And even now, after this inspection, they are breaking on this short piece of railroad an average of one rail a week. It is only by sleepless vigilance that these accidents are prevented. The bad rails forced on the railroads under conditions which have made them helpless for several years make a story too long to be told here. The cause is greed, and it is only because of united action by all the railroads, through the American Railway Association, that there is now hope of reforming this outrageous situation.

The freight car travels from Maine to Texas, and the Lord have mercy on it if the Texas State Commission should not find something assessable in it! They might levy on its grab irons for taxes. The quality of material in its sills, cast iron wheels, brake-beams and brake riggings, draft gear and coupler knuckles, varies with the grades, loads and speeds of the owning railroad, and also with the quality of its officers. Foreign cars form a large proportion and are mixed in long freight trains on any trunk line. On a descending grade the long-applied brake shoes heat a cheap cast iron wheel. It explodes and wrecks the train. Due to poor material, brake-beams fall, knuckles and flanges break and drawbars pull out with like results. There is no known means of preventing, under unfavorable circumstances, a passenger train from derailment by the debris from a wrecked freight train on an adjoining track.

THE 6,330 "OTHER PERSONS" KILLED.

Before studying out the ways in which the railroads can reduce the number (5,000) of passengers and employees killed, it is necessary to look at the much larger number of "other persons" killed by railroad trains and not included in the Interstate Commerce Commission Accident bulletin. In 1906 (these returns for 1907 are not yet available) 6,330 people other than passengers or employees were struck by trains and were killed. Concerning this greater killing we have never seen serious mention and consideration in any daily newspaper. Of those so killed, 5,381 were trespassers, mostly tramps, but including many women, children and other not alert persons walking for short distances on the tracks. The railroads spend large sums and try hard to persuade the community to enforce the laws of trespass and vagrancy—to get rid of tramps who steal and destroy railroad property, cause wrecks and get killed. Under Mr. Loree's administration of the Pennsylvania Lines West an orderly and measurably successful undertaking to this end was made among the communities along the lines. That region is said to be now one of the least infested. Their tramps have simply moved to other fields of harmfulness.

During the year, 926 presumably good citizens were killed at highway crossings of railroads; proportionately as real a loss to the country as the 1,421 lives lost in train accidents. The elimination of a grade crossing usually requires joint action by the community and the railroad. The state of Massachusetts stands alone in cordial co-operation with its railroads for this desirable end. New York and other states have good laws, based on the Massachusetts plan—the state to pay one-fourth, city or town one-fourth and the railroad one-half of the cost of eliminating grade crossings. It is the railroad's interest to effect these changes in order to avoid the cost of slow-downs and killing, but it is only by strenuous effort, pressure, argument and persuasion that some small progress is made in this humane and economic reform.

THE POSSIBLE REMEDIES.

The General Manager is responsible and has the power to stop most of the loss of 1,000 lives in collisions and derailments. It is hard, but he must. Perhaps his most difficult problem is getting obedience and weeding out inefficient men. The trade unions are arrayed against him, but his disciplinary work is essentially military and he cannot succeed until he gets a high quality of military discipline throughout the entire operating force on train and track. We have said that the General Manager will be held to higher standards than heretofore. We need no new statutes. The law of criminal negligence is good; it needs only to be enforced. Judge Kellogg showed plainly in his summing up of the evidence in the Smith trial that if he could find any lack of extreme caution in making an operating organization for the Electric Zone—in delegating authority to anyone without an unassailable record—in making a working schedule without excessive speed, in training and examining motormen—in having a high standard of maintenance of way and rolling stock—for any lack of a full measure of vigilance and caution the General Manager must go to jail. Criminal prosecutions do good, although it is an agonizing experience for a faithful officer.

The present rate of killing nearly 1,000 persons a year at grade crossings has been a necessary incident in our method of developing new country by cheaply built railroads and city and town streets. This pioneering method has made our country rich. But long ago the time came when the elimination of these grade crossings was both humane and profitable, and it is now the communities and not the railroads who are at fault. Right-minded editors of newspapers can do much for this reform.

The killing of 5,381 trespassers on railroad tracks is largely the fault of government whose primary duty is police protection of citizens. The amount of this killing is appalling, but it only touches the edge of the harm done every year by tramps. They ravage the country, wreck trains and get killed. The subject is so big, and its effects so wide, that its concern to the railroads becomes only incidental. Nevertheless, the railroads have a plain duty to spend money and work energetically with any community that tries for improvement.

W. H. BOARDMAN,
Editor of the *Railroad Gazette*.

A Compound Rail Section

[illegible]

To the Editor of the Railroad Gazette:

The general shape of the present American T-rail is not in harmony with the fundamental principles of rolling and prevents a natural conformation of the metal. Two factors are responsible for this condition: first, the established mechanical relations in the roll passes; second, the temperature maintained by certain parts of the rail during conformation. Higher temperature can be held in some parts by simply increasing their thickness, but the proper mechanical roll effects cannot be had without altering the form of the section.

Some parts of a standard rail are formed in a manner which if permitted to continue, would subsequently help improve the internal character of the material, while other parts of the rail are formed in an unnatural way which curtail the process of forming. In other words, if a difference of mechanical effect is present in separate parts of an integral section the final finishing of the whole is governed by the part of the rail which assumes refractory conditions first. This physical condition will prevail in rolling the thick or thin flanges, since no effective change can be made in the mechanical action of the passes. However, within prescribed proportions this physical disparity can be controlled by proper mechanical application of the different diameters, but while it has had the effect of getting out the section, it has never eliminated the use of auxiliary apparatus and artificial requisites.

Small T-rails are rolled and finished without artificial assistance, although, to a degree, they are unbalanced. Middle sized sections require subsidiary apparatus to overcome progressive irregularities in curvature (metal flow) and physical distortion, and large sections invariably require the aid both of artificial and of mechanical means. It can readily be seen that the development of the final form is, and always has been, at the expense of the structure, while independent means, other than the rolls themselves, must be applied to arrest excessive distortion.

With every enlargement of the standard rail section the necessity for independent mechanical assistance during and after the rolling has increased. This proves that the shape of the standard rail does not furnish the proper mechanical conditions in the roll passes and is at variance with the fundamental principles which would benefit the material while rolling. It also indicates that the present method of shaping rails pretends to be nothing more than a means to form them.

Since medium sized standard rails are not in harmony with natural and fundamental principles for conforming the metal, it follows that larger unbalanced sections must have a greater disadvantage in rolling. Experimenting with small thick flanged sections will not guarantee internal improvements in larger sections, because every section has an individual relation with the center line of rolling. If the general shape of a T-rail establishes the center of gravity near the flange in smaller types of rails, and the same shape is preserved in the larger sections, there is no denying that there will be greater curvature and longitudinal tension in the metal while it is being elongated.

Because the head of a standard rail is formed by co-acting vertical pressures, which are positive, progressive, and cause a free flowing of the metal, these pressures disagree with the mechanical conformation at the base of the rail. The flange is formed by lateral pressure of roll surfaces varying widely in diametrical speed from the center line of rolling. They are slow and retarding, and the metal compressed between them is operated upon irregularly and elongated unequally. Even if a higher temperature can be maintained in the flange part of a rail it will not obviate this mechanical condition in the roll passes nor will it remove the cause which sets up longitudinal tensions in the metal at the rail base. The thickening of the whole flange is only a temporary adjustment and will not suffice for the successful rolling of structurally good rail above certain sizes. The many troubles which are associated with the manufacture of the present large standard rail give evidence that the limit of an unnatural mechanical treatment has been reached.

If a change in the design must be made to gain a natural conformation of the metal, it should be one that is capable of fulfilling the mechanical requirements in rolling still larger rails. If the present design will not conform to a natural development of a rail shape, how are the larger sections going to be benefited by the same mechanical treatment?

A suitable metal distribution offering the proper mechanical applications in the roll passes should be made now, for the reason that a natural conformation will contribute to the betterment of the structure. Reliable results cannot be acquired in any other way without working injury to the material. The best internal characteristics are gained by treating the metal decently in the initial stages of rolling, and similarly throughout the whole process of forming, not relying on treatment after the final form of the rail has taken place.

A practical way to gain the mechanical roll effects which would elongate the metal in a natural way at the head and base of a section is to use a section which may be described as being a combination of the double-head and American types. In this form the section assumes a contour susceptible to mechanical influences which have benefited the character of the double-head rail. The good granular condition of the double-head rail is well known, but the principal reason for its superiority has never been thoroughly investigated. The ease with which a double-head rail can be rolled is due to its symmetry about the horizontal and vertical axes, so that an equal amount of reduction can be placed over all. Most of the reduction of metal is thus accomplished in the line of least resistance, which is fundamental.

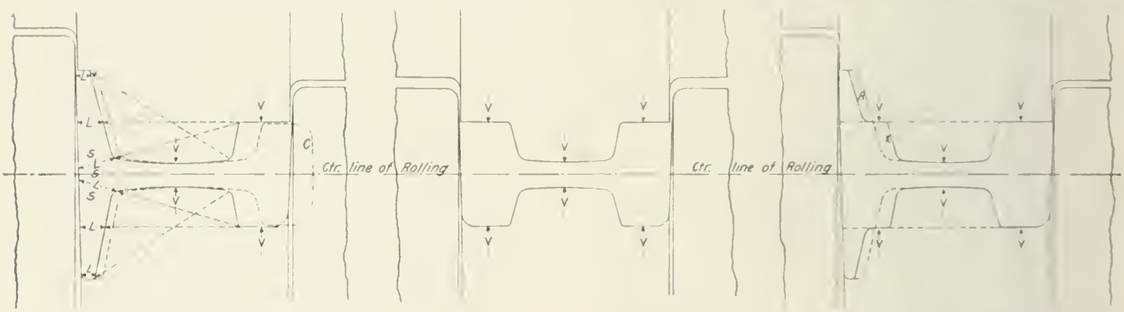

Fig. 1—Roll Groove for Standard Rail.

V—Vertical compression. S—Strained area.
L—Lateral compression. C—Deeper section.

Fig. 2—Roll Groove for Double-Head Rail.

V—Vertical compression.

Fig. 3—Roll Groove for Flat-Bottom Double-Head Rail.

V—Vertical compression.
R—Material removed to V.

An equal diametrical compression of co-acting roll surfaces on the head and base elongates the metal freely on both sides of the section, causing a true rolling motion. The elongation of all parts in line of least resistance eliminates internal straining and prevents any inclination on the part of the metal to flow laterally. In the standard rail the metal to form the flange is greatly reduced over that which is to form the head and naturally minute flaws move more readily toward the rail head. If the metal can be made to flow uniformly in one direction only, a far better opportunity to refine the metal is presented.

During and after the conformation, similar parts of the double-head rail cool evenly and more or less separately; therefore the chill does not travel toward either head, and a coarse crystalline structure is avoided.

As said before, a uniform elongation of material by co-acting roll surfaces equidistant from the center line of rolling eliminates longitudinal tensions, hence internal straining is not set up, and rolling can be continued to lower degrees of temperature without fear of distortion. To finish rolling a rail at the critical point in temperature is desirable and has its benefits, but the character of the material can be enhanced by approaching that degree in heat with a more gradual reducing of the metal. It is not generally known that heavy reduction per pass is out of all proportion to internal concentration and the natural contraction of the crystals. The harder the material, the more destructive is the process, and the greater the necessity for a gradual natural conformation.

If a symmetrical figure is primarily responsible for good structural results, the principal factors involved should be embodied in a flat-bottom, double-head rail. The effective mechanical action in the roll passes which will assist in a natural treatment of the metal can then be gained. A vertical compression of roll surfaces is positively necessary on the base of the rail to advance the metal at an even rate with the head. If applied at the proper place on the flange it will be the means of equalizing the elongation or flow of the metal. The cooling of the separated heads in the double-head section is more or less independent, with an alternating radiation of heat from similar shaped parts through the web, the effect of which subsequently anneals the whole section.

By assuming a similarity of parts, approximately those of the double-head rail, a combination section can be designed in which a uniform heat radiation is possible in all parts of the rail. This factor, together with the proper metal distribution, would undoubtedly extend the workable state of the metal. The continual working of the metal to form the combination section with light reductions per pass, accompanied uniformly with an equal contraction of the metal, will give a dease, homogeneous structure.

The metal in a thicker flange section can be distributed to better advantage by removing it from the flange points and placing it within vertical lines corresponding with the width of the rail head. This transfer of the metal from the flange points to the base of the web is the point where the mechanical influences of the roll passes are gained, and it will make the rolling of extremely large rails possible.

By placing the metal in the base of the rail in a form corresponding to the general shape of the head, a vertical roll pressure is applied midway between the flange points and the foot of the web. By so doing there is gained an active mechanical advantage of 50 per cent. over the established conditions for forming the standard flange. The delivery of the base is then as positive as shorter flanges beginning at the web. If the only true rolling action, which drags the metal through the passes, is exerted at the converging of the flange and web, the presentation of a like influence higher up on the flange will make the forming of still longer flanges possible. The true mechanical advantages the flat-bottom double-head rail will permit of, together with its ability to equally distribute the heat throughout all the parts, and principally the base, enables the whole section to go through any number of roll passes consistent with the workable state of the metal. The number of roll passes to be used would then depend on the comparative reduction per pass and the diminishing of the heat. By this arrangement the speed of the rolls could be increased, reduction per pass reduced, and more roll grooves added, or, less reduction per pass at the present speed of the rolls with enough additional grooves to reach the proper finishing degree in temperature without ceasing to work the metal. Actual practice will prove the usefulness of not less than 28 or 30 passes, according to the size of the section. However, all these advantages will depend on the specific shape of the rail and its successful passage through the rolls. The physical improvement which can be gained in rolling cannot be created in the laboratory as some are prone to believe. Rails cannot be made good regardless of the mechanical treatment, any more than [illegible] without the proper amount of [illegible].

Considering all the conditions in rail making up to the [illegible] there is no factor as important as the mechanical treatment [illegible] what gave enduring quality to the "John Brown" rail. It is what will give character to any piece of metal. It is one of the principal factors which will prolong the use of the Bessemer process, since analytical conditions of the material tending toward [illegible] can be overcome and benefited by a natural conformation, more roll passes, less reduction per pass and a final cooling which is at the same time uniform and more or less self annealing.

Consulting R[illegible]

New Compartment Sleeping Cars for the New York, New Haven & Hartford

The accompanying photographs show interior views of one of the two compartment cars recently built for the New York, New Haven & Hartford by the Barney & Smith Car Co., Dayton, Ohio. They were delivered on December 19 and 20, 1907, and immediately put in service between New York and Boston. They are 71 ft. 6 in. long, over sills, and 78 ft. 5 in., over platforms. Each has 10 staterooms with upper and lower berths and toilet facilities. The passageway runs along the outside of the staterooms. One of the photographs gives the impression that there is a corridor running through the staterooms. This is because the doors between them are all opened. With these doors it is possible to arrange the rooms in suites. The rooms are 6 ft. 3 in. long and 6 ft. 9 in. wide, the passageway taking up 2 ft. of the width of the car. There are lockers at each end of the car and at one end is a general toilet room. The lighting is by both electricity—generated on an axle-light system—and gas, with a combination chandelier in each section and a berth light at each seat. The corridor has deck electric lights and bracket gas fixtures. Each room is fitted with an electric fan. The windows, each 2 ft. 4 in. wide, are in pairs, with upper semi-elliptical panes of art glass. A particularly interesting feature of the interior finish is the variety of woods used.

Interior View; N. Y., N. H. & H. Compartment Car.

Stateroom; N. Y., N. H. & H. Compartment Car.

Stateroom A is finished in [illegible]. The trade name in the United States is Blanchet wood, so called from the name of the importer, who says that this special importation came from the island of Martinique shortly before the last volcanic eruption. The same wood is known in the West Indies as [illegible], in Panama as algarrola, in Brazil as [illegible] and in Guiana as [illegible]. The tree grows to enormous size and [illegible] in most parts of tropical America. Immense buttresses form at the trunk [illegible] a[illegible] to make the diameter 10 f[illegible]

Stateroom B is finished in [illegible] mahogany, so [illegible] by Barney & Smith. It was first introduced into this country [illegible] three years ago. The native name is [illegible]. It is used [illegible]

[illegible] present [illegible] interior finish and [illegible] to foreign.

Stateroom C is finished in [illegible] and is known as true or Spanish mahogany to distinguish it from other varieties. Real Spanish mahogany grows in Cuba and San Domingo but in the latter country it cannot now be obtained in practicable sizes. The wood used in this stateroom is from the mountains directly back of Guantanamo and Santiago, Cuba. It is said that it often takes 12 oxen from three to four weeks to haul a single log from stump to shipping point.

Stateroom D is done in jiqui, the name being native Cuban. It is somewhat like mahogany. This particular variety is seldom imported into this country.

Stateroom E is in tigerwood, so called from its mottled appearance. It comes from Africa and British Guiana, where it is known as itaka or itiki wood.

Stateroom F is finished in East Indian walnut, otherwise called koko, from Rangoon, India.

Stateroom G has the distinction of being finished in a wood of whose origin nothing definite is known. The Bureau of Forestry is investigating. It is called Moro wood and is supposed to be from the East Indies.

Stateroom H is in Circassian walnut, sometimes known as French walnut. This importation is from the Caucasus mountains.

Stateroom I is in padouk, from the Andaman Islands, south of India. It is also known as vermilion, East Indian mahogany and Burmese rosewood.

Stateroom J is in English oak.

The corridor and other public parts of the car are finished in mahogany. The design of the seats is simple and the upholstery is in keeping with the elaborate wood finish.

New Law Affecting Foreign Patents in Great Britain.

BY JOHN P. O'DONNELL.*

The Patents and Designs Act of 1907, which finally came into force on Jan. 1, 1908, in addition to various alterations in the previous acts and in the practice thereunder, introduced some striking innovations. The principal points in the act may be set forth briefly as follows:

Working.—At any time not less than four years from the date of a patent, and not less than one year after the passing of this act (i.e., Aug. 28, 1907), any person may apply to the Comptroller for the revocation of a patent on the ground that the article or process covered by the patent is manufactured or carried on entirely or mainly abroad. This is practically on all fours with the working clauses in the patent laws of most of the European countries, which compel patentees in those countries to actually manufacture the patented articles in the countries within varying periods (generally three years) from the date of the patent.

This working clause practically amounts to a protective clause, which renders a patent liable to be declared void if articles made under the patent are manufactured abroad and imported into this country.

The Comptroller may either order immediate revocation of the patent, if he is satisfied that there are no good grounds for the non-manufacture, or he may allow a reasonable time within which manufacture on a commercial scale sufficient to supply the demand in this country must take place, and if manufacture is not commenced within that time, he may then order the patent to be revoked.

An order of the Comptroller revoking a patent under this section of the act is subject to an appeal to the court.

Patents of Addition.—Patents of addition may be obtained for improvements or modifications of inventions covered by a specification on which an application for a patent has been filed, or on which a patent has been granted. Such patents of addition are limited in duration to that of the original patent and expire therewith. No renewal fees are payable on patents of addition.

Provisional Specifications.—An applicant for a patent having filed two or more provisional specifications for kindred inventions or inventions that are mere improvements on or modifications of those covered by the preceding specification or specifications may file a single complete specification including the subject matter covered by each of the provisional specifications and if the Comptroller is satisfied that the combined subject matter of all the provisional specifications constitute a single invention, he may grant a single patent thereon, and such patent shall be dated as of the date of the first provisional specification. In relation to questions of validity and for the purposes of oppositions to the grant of patents, however, the dates of the respective provisional specifications will be taken into consideration.

Opposition to Patents.—Three important changes have been made in regard to oppositions to the grant of patents, namely, (1) the second ground of opposition under the old act has been amended so as to permit of opposition on the ground of *any* complete specification or an application for a patent of prior date. This will include [illegible] complete specification whether or not such complete specification has been accepted and published before the date of the patent the grant of which is opposed, and also [illegible] specifications filed under the international convention; (2) a further ground of opposition has been added under which the grant of a patent may be opposed on the ground that the invention or the manner in which it is to be carried out is not fairly or fully described in the complete specification, and (3) the Comptroller may award costs in respect of oppositions.

Further, the Comptroller may require oral evidence instead of or in addition to any declarations filed in an opposition.

Revocation of Patents.—The Comptroller may, on an application made within two years of the date of a patent by any person who would have been entitled to oppose the grant of the patent, revoke the patent on the same ground or grounds on which the grant might have been opposed. This practically means that the period of opposition to the grant of a patent is extended to two years.

The Comptroller's decision is subject to appeal to the court.

Search as to Novelty.—In relation to the 50 years search in the records of British patents made by the Patent Office examiners under the Act of 1902, in respect of all complete specifications filed, the Comptroller has, under the new act, the power to refuse the grant of a patent if he considers the invention claimed to have been completely claimed in any prior patent within the 50 years. Under the 1902 act the most the Comptroller could do was to insert a specific reference by number and date to such an anticipating patent.

An appeal may be made to the law officer from the Comptroller's decision refusing the grant of a patent under this section.

Further, the new act provides, by a special section, that the search shall extend to specifications published *after the date* of the application in respect of which the search is made. This brings in specifications on applications filed under the provisions of the International convention and which may be actually deposited or filed at the British patent Office subsequently to, but on which the patent when granted would bear an earlier date than that of the application in respect of which the search is to be made.

Restoration of Patents.—The Comptroller has power to restore any patent which has lapsed owing to the failure of the patentee to pay the renewal fees at the proper time or times. Any application for restoration of a patent is, however, subject to opposition by the public, and the Comptroller's decision is subject to an appeal to the court.

This procedure is much cheaper and simpler than under the old acts, which necessitated all the trouble and heavy cost of obtaining a special act of Parliament to restore a patent.

Compulsory Licenses.—Any interested party may petition the Board of Trade for the grant of a compulsory license under a patent or for the revocation of a patent on the ground that the reasonable requirements of the public in regard to the supply of the patented articles have not been complied with, and if the Board of Trade is satisfied that a case has been made out, the petition shall be referred to the court, the court shall decide either to dismiss the petition, to grant a compulsory license, or to revoke the patent, according to the circumstances of the case.

Contracts for Sale or Licenses of Patented Inventions.—All agreements or contracts for the sale or license of patented inventions containing (a) any condition prohibiting or restricting the purchaser or licensee from using any article supplied or owned by any person other than the seller or licensor, or (b) containing any condition requiring the purchaser, or licensee, to purchase any articles from the seller, or licensor, or his nominees, and not covered by the patent, shall be null and void in respect of such conditions.

Further, any contract containing conditions as above set forth and made before the passing of this Act may be canceled by either party giving three months' notice in writing to the other, the party giving notice, however, being liable to pay compensation either to be agreed upon by the parties or, failing an agreement, to be settled by arbitration, the arbitrator to be appointed by the Board of Trade.

Further, any contracts relating to the leasing or licensing of a patented article or process, whether made before or after the passing of the act, may, providing the patent or patents has or have become void, be canceled by either party by three months' notice in writing, but where such notice is given in respect of a contract made before the passing of the act, the party giving notice is liable to pay compensation to be agreed upon by the parties or to be settled by arbitration.

Marking of Patented Articles.—All patented articles must be marked with the number and year of the patent in addition to the word "patent" or "patented", otherwise a patentee may be unable to recover damages in respect of infringement.

Designs.—The new provisions relating to designs are briefly as follows:

If an application for registration of a design is not completed within 14 days after the expiration of 12 months from the date

*Consulting Engineer and Chartered Patent Expert, Palace Chambers, Westminster, London.

of application, the application will be deemed to be abandoned. The Comptroller may give a further extension of 14 days in exceptional cases.

The duration of a design may be extended under the new act to 10 or 15 years, instead of, as under the old act, being limited to five years.

If a design is worked mainly abroad, the Comptroller may, on an application by an interested party, cancel the registration.

A design registered in one or more classes of goods may be registered by the proprietor of the design in some other class or classes.

Generally speaking, all articles covered by registration must be marked.

I have given above the most important provisions of the Patents and Designs Act, 1907, but there are other modifications of and additions to the old acts, which are, however, mainly in the nature of details relating to procedure. For instance, the act provides that models and samples of inventions may be called for. Further, the Board of Trade has power to increase the amounts of renewal fees payable for the maintenance of patents, but I am glad to say that, according to the new rules of practice recently issued and consequent upon the new act, the renewal fees remain, at all events for the present, the same as before.

Act Retrospective.—The act is retrospective, and will therefore apply to patents and designs granted, and also to those pending, before the commencement of the act.

The Alberton Cut-Off of the Baltimore & Ohio.

The Baltimore & Ohio has recently finished a revision, known as the Alberton cut-off, of its main line between Hollofield, Md., and Davis, on the old main line between Relay, Md., and Washington Junction. This is part of the work which has been going on for the past seven years making a low-grade freight line between these two points. Relay is the junction point for Washington coming from the east, and Washington Junction the junction point coming from the west. The through passenger trains run via Washington. The old main line between these two points is being made into a low-grade freight line.

The eastern part of this line from Relay to Mt. Airy follows the Patapsco river, the valley of which is narrow and crooked, with hills rising from the water's edge and spurs from these hills projecting across the bends of the river. The original main line, which had heavy grades and curves, followed closely the windings of the stream. In the reconstruction the line has been straightened and a number of tunnels and bridges have been built. The accompanying plan and profile of the territory between a point west of Hollofield and Davis shows the old and the new lines.

Work was begun on this section in September, 1905, and completed in October, 1907, during which time 400,000 cu. yds. of material were excavated. Seventy per cent. of this was granite; the rest sand, loam and clay. There were 10,000 cu. yds. of Pennsylvania sand stone bridge masonry built and 5,000 cu. yds. of concrete in foundations. Two tunnels, together 1,523 ft. long, and three undergrade crossings were built. Two changes of the river channel were made and a highway nearly a mile long was reconstructed.

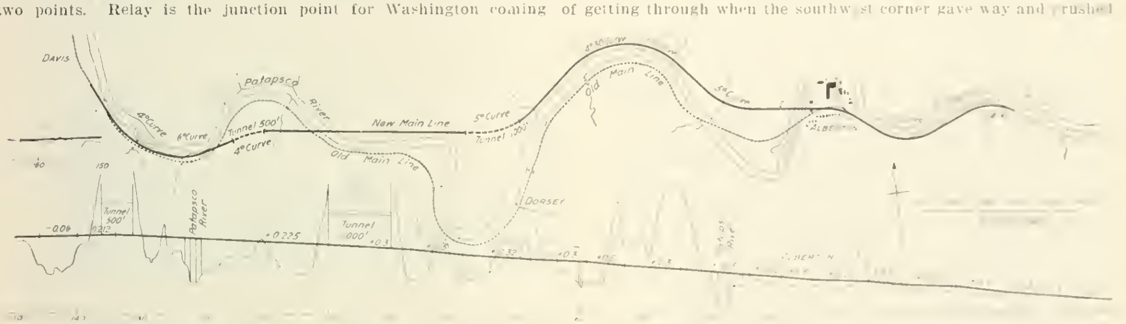
The grading averaged 100,000 cu. yds. to the mile. In the cut west of Alberton, which is 2,000 ft. long and 75 ft. high, there were 187,000 cu. yds. of grading. Nearly all the earth on the entire contract was in this cut between the original surface and a point about 25 ft. above subgrade. All the material in this cut was removed with a 70-ton Bucyrus shovel working in lifts from surface to subgrade, bringing it down full width and wasting the top material on tracks running around the contours of the hill on the same grade as the shovel.

The material in the east end of the south side of this cut was made up of pockets of mica sand, red clay and ledges of limestone alternating. This formation caused the south slope to break and pockets of this material to slide out at the seams. These slips were removed with the shovel. The rest of the excavation was all [illegible] land granite and was removed with steam drills and shovels.

Dorsey tunnel, one mile west of Alberton and on the [illegible] side of the river from the old line, is 1,025 ft. long from face to face of portals. This was bored through solid granite. Only [illegible] ft. of the west end had to be timbered—this on account of seams in the roof. A top heading 7 ft. x 10 ft. was first driven from both ends; the rest of the material was taken out in two benches. The amount of excavation in this tunnel was 36,500 cu. yds.

Davis tunnel is one-half mile east of Davis on the same side of the river as the old line. The material here to be excavated was a mixture of mica sand, soft granite which disintegrated when exposed to the air, and a hard rock which followed the subgrade closely, at times reaching as high as the wall plate grade 14 ft. above subgrade. This tunnel was 498 ft. long and had to be timbered for its whole length. Seven segments 12 x 12 were used for the centers and a plum post 3 ft. center to center. Where hard rock was encountered at wall plate grade, the segments rested on wall plates on the rock bench. This tunnel was driven in a different way from the Dorsey tunnel. The first heading was excavated from the roof to the wall plate grade and was taken out full width, the bottom bench being taken out later. The excavation in the Davis tunnel amounted to 17,000 cu. yds.

On October 22, 1906, while this tunnel was being lined, after 96 ft. of lining had been finished in the east end a fall [illegible] ft. in diameter occurred 140 ft. from the east end, almost on the center line and extending to the original surface of the ground, 92 ft. above subgrade. This fall was almost plumb and looked like a shaft. The north side overhung slightly and had a well defined rock seam. From that point south the material was soft granite and mica sand. The contractor then began to line the tunnel from the west end and finally got to within 104 ft. of the lining from the east end. It was then several times attempted to get under the fall by using crown bars. Four different times the men were within a few feet of getting through when the southwest corner gave way and crushed



Plan and Profile of Main Line Improvement Between Hollofield, Maryland, and Davis; Baltimore & Ohio.

the timber centers. This method was then given up. By June, 1907, the sides of the fall had been increased to 73 ft. at the roof of the tunnel and 140 ft. at the surface of the ground. A model A. Marion shovel was then put on the work and this removed the fall, which contained 36,000 cu. yds. and formed a natural [illegible] the original grade. The Davis tunnel was finished on September 25, 1907.

Both tunnels are standard double track section lined with [illegible] and vitrified brick and have sandstone portals. They were both driven by compressed air, the compressor plant being [illegible] between them and connected with them by 4-in. pipes. Payment for this work was not made per unit of excavation [illegible] a price per lineal foot of finished tunnel.

The bridge crossing the Patapsco river at Alberton has [illegible] spans. One 27½ ft. span, one 2[illegible] ft. 9 in. deck girder [illegible] undergrade crossing, two 90-ft. spans, one 100-ft. [illegible] 70-ft. span. The deck girders are 10½ ft. from base of rail to bridge seat and 32 ft. to the surface of the river. The bridge crossing the river east of Davis has three spans. One [illegible] span and two 90-ft. deck girder spans 12 ft. from base of rail to bridge seat and 36 ft. to the water in the river. The superstructure of these bridges was furnished by the Pennsylvania Steel Company and erected by the Youngstown Construction Company.

Except for one-half mile west of Hollofield, which was raised 5 ft. above the old grade, the old line was abandoned. East of Alberton the new line was built south of the old line through a rock cut. From Alberton to just east of Davis tunnel the new line is on the opposite side of the river from the old line. At the east end of Davis tunnel the new line crosses the river and the old line at a point 12 ft. above the old grade and at the west end of the [illegible] crosses the old line again at a point 8 ft. above the old grade. It continues on the north side of the old line to Davis where it connects with the old line.

The change of line does away with 542 deg. of central angle of [illegible] reduced the [illegible] from [illegible] to 7 deg. [illegible] grade from [illegible] and the [illegible] grade from 0.8 to [illegible] per [illegible]. On [illegible] are spiraled and all grades compensated. The new line is double track [illegible] with stone ballast and [illegible] with a [illegible] cuts and [illegible] on fill.

The cost of this [illegible] was $750,000. [illegible] Company, of Philadelphia, were the contractors and the work was done under the direction of D. D. Carothers, Chief Engineer, A. M. [illegible], Engineer of Construction, and J. [illegible] Wilson, Assistant Engineer of the Baltimore & Ohio.

Car Surpluses and Shortages Jan. 8.

Owing to the general car surplus Mr. Hale's committee feels that it is unnecessary at present to continue issuing bulletins giving the situation in detail, but will supply it for designated roads upon request. The following condensed bulletin is issued, as of January [illegible], with totals compared with Dec. 24, 1907:

[illegible]

The Fort Worth & Denver City is commanded as follows:

[illegible]

To construct adequate and suitable depot facilities at [illegible], Quanah and [illegible] [illegible]

Improvements Ordered by Texas Railroad Commission.

The Railroad Commission of Texas, after inspection of the lines, has issued orders to the Texas & Pacific, the International & Great Northern, the Fort Worth & Denver City, and the Chicago, Rock Island & Gulf to make improvements. The orders to the first three of these roads fix minimum schedules for passenger trains over the lines which are to be improved. These schedules are to remain in effect until the improvements have been made and the schedule time can be shortened, subject to the Commission's approval.

The improvement orders to the Texas & Pacific do not cover the El Paso division, which had not yet been inspected when the orders were issued, but on which improvements are to be ordered later. The improvements required of the Texas & Pacific are as follows:

To relay with rails, not lighter than 75 lbs. per yard, all remaining 56-lb. rails in the Transcontinental division between Bagwells and Sherman, 82 miles. To be completed by December 31, 1908.

To renew all decayed and unserviceable ties now in the track over the entire mileage of the Eastern and Transcontinental division and the joint track between Whitesboro and Fort Worth, with an average equivalent to about 15 per cent. of all ties now in the track, or between 500 and 600 per mile. To begin at once and be completed by June 30, 1908.

To ballast with broken stone, or first-class gravel ballast, averaging from 2,500 to 3,000 cu. yds. per mile, the entire mileage of the Eastern and Transcontinental divisions and the joint track between Whitesboro and Fort Worth except those parts of those divisions which have been ballasted with stone and gravel during the past year. To begin at once and be completed at the rate of not less than 200 miles per year.

To construct new, suitable and adequate passenger depots at Marshall and Honey Grove and to rebuild and improve the present station buildings at Jefferson and Longview Junction. Plans and specifications for the Marshall and Honey Grove depots to be filed with the Commission by January 31, 1908, and the depots to be completed by December 31, 1908.

The following orders to the International & Great Northern do not include the Houston division of that road, which is still to be inspected:

To ballast with broken stone or heavy gravel ballast, using not less than from 2,500 to 3,000 cu. yds. per mile, all the main line from Longview Junction via Palestine to Laredo, except such parts of this line as have been ballasted with an equivalent amount of gravel ballast during the year 1907. To ballast one with sand or gravel the Mineola branch from Troupe to Mineola, the Henderson branch from Overton to Henderson, and the Georgetown branch from Round Rock to Georgetown. The work of ballasting to begin at once and to continue at the rate of not less than 200 miles per year until completed.

To renew ties on the main line and branches as follows: Between Longview Junction and Palestine, from 600 to 700 ties per mile; between Palestine and Valley Junction, from 800 to 900 ties per mile; between Valley and Austin, from 900 to 1,000 ties per mile; between Austin and San Antonio, from 1,000 to 1,200 [illegible]; between San Antonio and Laredo, from 700 to 800 ties per mile; between Overton and Henderson, from 600 to 700 ties per mile; between Troupe and Mineola, from 600 to 700 ties per mile; between Round Rock and Georgetown, from 900 to 1,000 ties per mile. These renewals at the designated rates to be placed in track within six months after the date of the order, and depots to be completed by December 31, 1908.

The Chicago, Rock Island & Gulf is ordered:

To construct adequate and suitable depot buildings at Amarillo. Plans for same to be submitted for approval within 30 days after the date of the order, and building to be completed by December 31, 1908.

To renew the ties in track between Amarillo and the Texas-Oklahoma State line near Texola within the next six months, at an average rate of not less than 700 to 800 per mile. All ties placed in the track since December 1, 1907, may be credited.

New Interlocking at Hoboken.

The Delaware, Lackawanna & Western has put in service at its enlarged passenger terminal at Hoboken, opposite New York City, a new electro-pneumatic interlocking plant, a general plan of which is shown in Figs. 8, 9, 10 and 11 herewith. This is a track circuit plan and it does not show the normal position of the switches. Fig. 1 is a general view of the yard, looking east from bridge No. 5. No detector bars are used in this plant, track circuit detector locking being used. A good view of a slip without detector bars is shown in the foreground at Fig. 1. As will be seen from the plan there are two long signal bridges as well as four short ones. The latter are not new, having been put in with the former plant several years ago.

Fig. 4 shows the cabin, which is of brick to the first story and of reinforced concrete above that. The top floor contains the interlocking machine. This is the standard electro-pneumatic machine made by the Union Switch & Signal Co. There are:

35 levers for 36 single switches.
23 double slip switches with movable point frogs.
1 single slip switch with movable point frog.
44 levers for 110 signals.
39 working levers.
11 spare switch levers.
21 spare signal levers.
131-lever frame.

Fig. 5 shows the machine. In this machine there are light indicators, showing whether or not a track is occupied, one under each switch lever. These consist of ground glass disks about 2 in. in diameter, but they do not show in the illustration. They are fixed in the ledge beneath the levers, each indicator directly under the switch for which it indicates. The number of the indicator is painted on its face. The machine was found to be too narrow to accommodate all the necessary contacts on the usual horizontal rollers. To overcome this difficulty vertical rollers were added at the back side.

The train director has before him a cabinet containing 14 miniature semaphore indicators to indicate whether or not the train shed tracks are occupied (Fig. 7). There is another cabinet containing 14 disk indicators controlled from push buttons fixed in the train shed at the east and the west ends on each track. These buttons are used to announce that the trains are ready to leave. The row of

Note.—[illegible]

push buttons shown in the illustration are for restoring the disk indicators to their normal position.

The middle floor of the cabin contains the relay room, supervisor's office, yardmaster's office and toilet. In the relay room are 122 repeating relays and 70 route-locking relays, making a total of 192 relays. They have six points each and are of 1,000 ohms resistance.

The lower floor is used for a repair shop and a generator and battery room. The generator room contains a G. E. 5 h.p. 110-volt, 3-phase, 60-cycle induction motor direct connected to a G. E. 60-volt, 3 k.w. d.c. generator and G. E. 1 h.p. induction motor, same characteristics as above, direct connected to a G. E. 20-volt, ½ k.w. d.c. generator. The large set is used to charge the storage batteries, and the small one to furnish current to the interlocking machine in case of emergency. The main switchboard is in this room.

In the storage battery room are two sets, eight cells each, 410 amp. hours, chloride accumulator to supply current to the machine, and two sets, two cells each, of same type to furnish current to the 11 track circuits in the train shed.

Fig. 5 shows a battery cupboard fixed in one of the legs of bridge No. 5. The cupboard contains 19 relays and the resistance used in connection with track circuits. The four storage battery cells in the lower cupboard are for track circuits near this bridge. These cells are 111 amp. hours each. They are General Storage Battery Co.'s 7 E type.

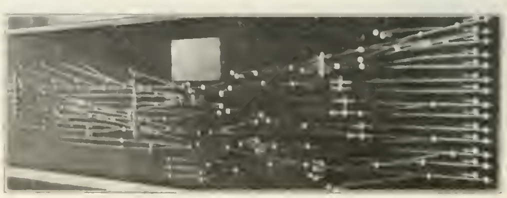

Fig. 6—Track Indicator.

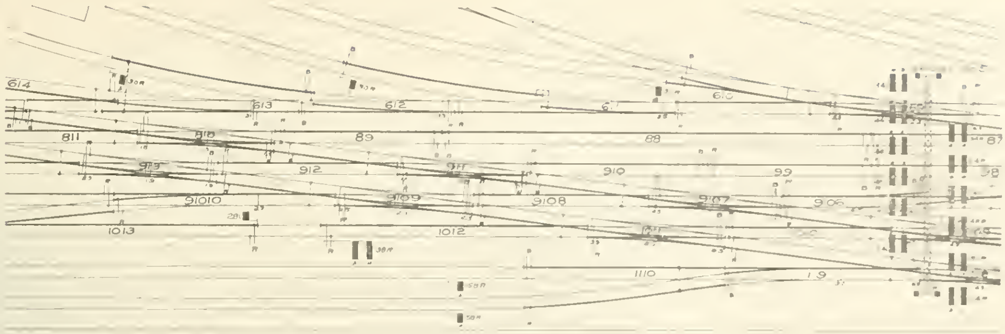

Fig. 9.

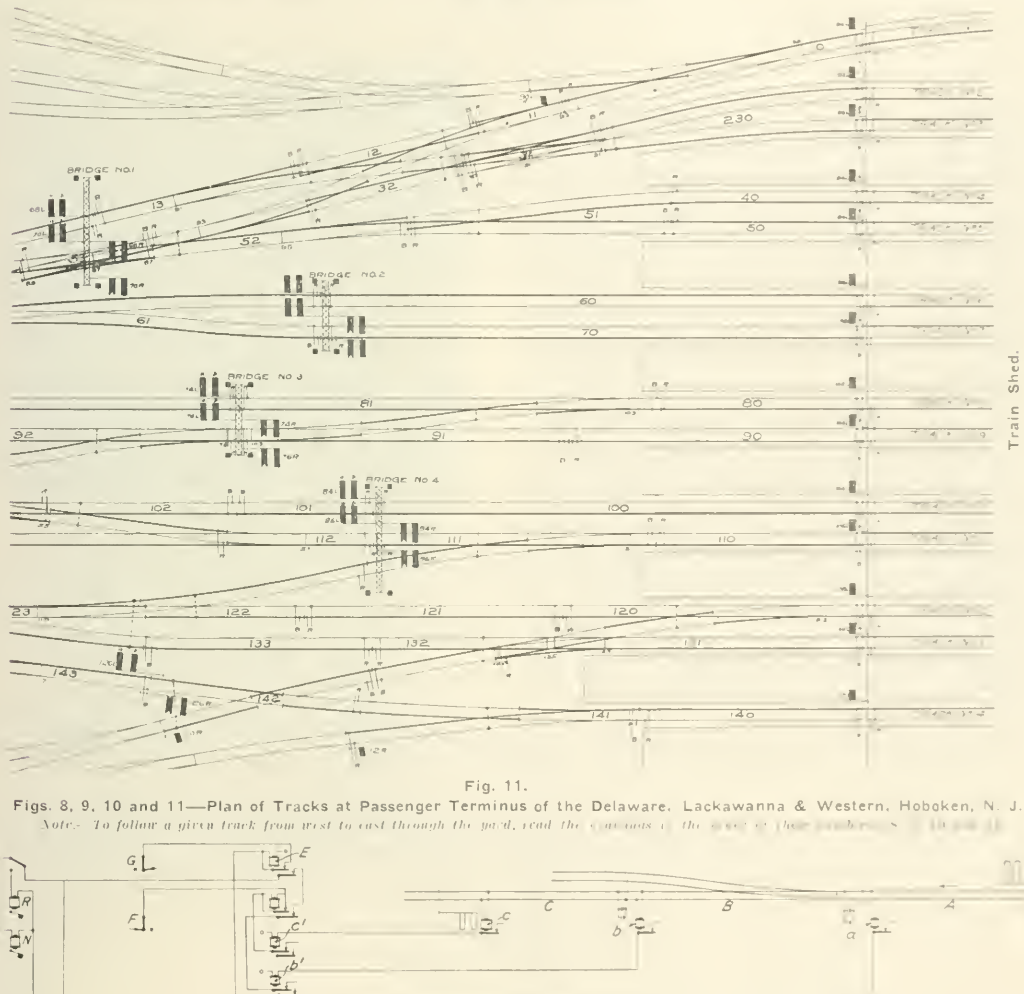

Fig. 11.

Figs. 8, 9, 10 and 11—Plan of Tracks at Passenger Terminus of the Delaware, Lackawanna & Western, Hoboken, N. J.

Note.- To follow a given track from west to east through the yard, read the

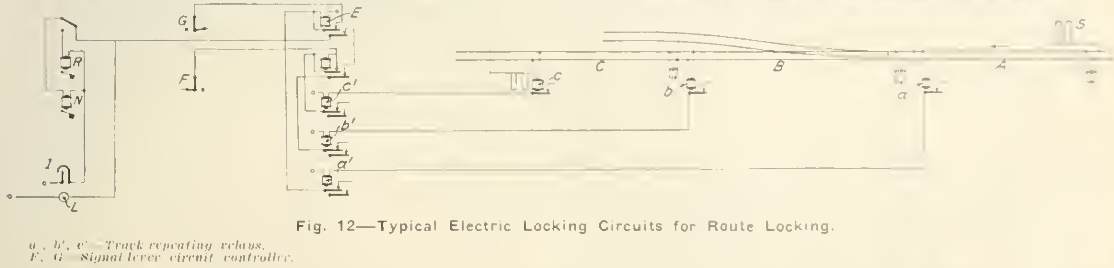

Fig. 12—Typical Electric Locking Circuits for Route Locking.

a′, b′, c′—Track repeating relays.
F, G—Signal lever circuit controller.

One hundred and twenty-two track circuits are fed from storage batteries. The batteries are contained at each signal bridge and in two special boxes opposite the cabin. The track circuits cover all switches, fouling points, and in many cases gaps between a signal and the first switch, and also between switches, to make route locking continuous.

Fig. 12 shows a typical electric locking circuit. The track is divided into convenient sections between signals so as to allow of maximum freedom of lever movement. a, b, c are track relays for circuits A, B, C, respectively. Each of these track relays controls a repeating relay, a′, b′, c′. These merely repeat the action of the track relays. Relays a′ and c′ control advance stick relays. The stick circuit is operative only when signal lever is reversed, so that for reverse train movements the circuit will be an ordinary locking circuit. When once this relay has opened owing to the presence of a train in the section with the signal lever reversed, it cannot pick up again until the train has left the track section, but with the lever normal the relay will be inoperative. This arrangement provides approach locking. Special magnets are provided on the indication quadrants in the machine to prevent the lever from being put full normal or reversed as the case may be when the magnet is deenergized. The circuit for these magnets is selected through a circuit controller on the lever and passes through the stick relays or repeating relays for the routes governed and to the battery, and to common, through a latch circuit controller normally open. In parallel with the circuit for these magnets is an electric light placed just below the lever handle, which burns when the switch is free but is extinguished when the switch is locked by the presence of a train.

Thus circuits are provided to lock all switches in the route when a train passes the governing signal at clear. The switches remain locked until the train has passed over them or has backed off the route. Each switch is released as soon as a train has cleared its points or cleared a fouling point. Thus a route cannot be changed ahead of a train, but may be behind one provided the home signal has been put normal.

All control wires are run in bituminous fiber conduit, made by the American Conduit Co. This conduit is laid in concrete with manholes at distributing or junction points about every 100 ft. Large main conduits run each way from the cabin.

The distant signals governing movements into the train shed are used to indicate whether or not the shed tracks are occupied. If a train is already on the shed track the distant cannot be cleared.

This plant was installed by the railroad company's men under the direction of M. E. Smith, Signal Engineer. The material, except as otherwise noted above, was furnished by the Union Switch & Signal Company. Mr. Smith informs us that the value of the light indicators (beneath the switch levers) as an aid to quick movement in case of dense fog, when the levermen can see but a short distance from the cabin, has already been tested, with highly satisfactory results.

Right to Discharge a Union Man Upheld by the United States Supreme Court.

The United States Supreme Court (opinion by Justice Harlan) on Jan. 27 decided that the most important section (10) of the arbitration act passed in 1898 is unconstitutional. Justice McKenna and Justice Holmes delivered dissenting opinions. The case was that of William Adair v. United States. Mr. Adair, who was and now is Master Mechanic of the Louisville & Nashville, at Covington, Ky., was tried in the United States District Court on the charge of threatening to discharge a locomotive engineer named Coppage, because he was a member of a labor union. Under the act of 1898, which was passed as one of the results of the great Chicago railroad strike, the District Court fined Adair $100. The decision of the Supreme Court overthrows this verdict.

In the course of his opinion Justice Harlan said:

"The right of a person to sell his labor upon such terms as he deems proper is in its essence the same as the right of the purchaser of labor to prescribe the conditions on which he will accept such labor from the persons offering to sell it. So the right of an employee to quit the service of the employer, for whatever reason, is the same as the right of the employer, for whatever reason, to dispense with the services of such employee. It was the legal right of the defendant, Adair, however unwise such a course might have been, to discharge Coppage because of his being a member of a labor organization, as it was the legal right of Coppage, if he saw fit to do so, however unwise such a course on his part might have been, to quit the service in which he was engaged because the defendant employed those who were not members of some labor organization. In all such particulars the employee and the employer have equality of right, and any legislation that disturbs that equality is an arbitrary interference with the liberty of contract which no government can legally justify in a free land."

To Provide for a Uniform Balance Sheet.

The Interstate Commerce Commission has sent out a circular asking the criticisms, suggestions and assistance of railroad officers in drawing up a uniform balance sheet. For purposes of the study the suggestion is made that the assets and liabilities of carriers should be divided into three general or primary accounts: (1) capital, (2) deferred and miscellaneous, (3) current or working. These general or primary accounts it is proposed to subdivide into such detail or subprimary accounts as may be found necessary to reflect sufficient data to enable clear and comprehensive analysis. The Commission asks the following questions and submits the following tentative balance sheet, with the request that replies to the circular should be made in duplicate, one copy to be sent to C. G. Phillips, Secretary Association of American Railway Accounting Officers, 113 Dearborn street, Chicago, and one copy to the Division of Statistics and Accounts, Interstate Commerce Commission, Washington, D. C. Replies should be sent prior to March 1.

1. To produce uniformity in compilations, subprimary accounts should be classified and a prescribed classification thereof agreed upon. You are therefore requested to submit for consideration a classification representing your views as to what items appearing on your general ledger should appear under the three general accounts suggested, and the order in which they should appear.

2. Generally speaking, "Cost of Road," "Cost of Equipment," and "Cost of Property" other than road and equipment, as reflected in the balance sheet, are those costs only which are capitalized, and do not include additions made to either of the classes mentioned from surplus or income, as a result, those accounts do not reflect true costs. If additions are made and charged to income, they disappear through the profit and loss account. To the end that the balance sheet may reflect the true costs of the property of a carrier, should not the costs of additions made and charged to income or to surplus be shown on the balance sheet as separate and distinct items?

3. Should the cost of equipment as stated on the balance sheet be affected by the introduction of the depreciation charge; that is, should that cost be the original cost, or the inventory value at a given date, or should it be the original cost or the inventory value as reduced periodically to the extent of the depreciation charge? You are requested to consider these three methods of procedure, and to state which of them approves itself to your judgment, giving your reasons therefor. In considering this question, due regard should be had to the possibility of introducing depreciation charges for other classes of railroad property than equipment.

4. The disposition through the balance sheet of premiums and discounts on securities sold, when securities are sold for the purpose of recouping a corporation for additions to its property or for the construction or acquisition of new property, should be carefully considered. Should premiums and discounts be disposed of through "income," "profit and loss," or "cost of property," or should they be set up in a permanent capital account on the balance sheet? You are requested to submit definite suggestions relative thereto, and your reasons therefor.

5. In stating capital liabilities, what distinction upon the balance sheet between "authorized issue," "outstanding," and "held in the treasury," should be made, it being understood that these terms are used in connection with an analytical statement of balance sheet liabilities?

6. Should material and supplies on hand be treated as a capital or a current asset and your reasons therefor? Many other questions will present themselves when the balance sheet is taken into final consideration. You are therefore requested to submit whatever observations and statements of facts in your opinion will be of assistance in working out the problem here submitted.

Tentative Balance Sheet.

The Shelling Out of Steel Wheels and Tires.*

BY GEO. L. FOWLER.

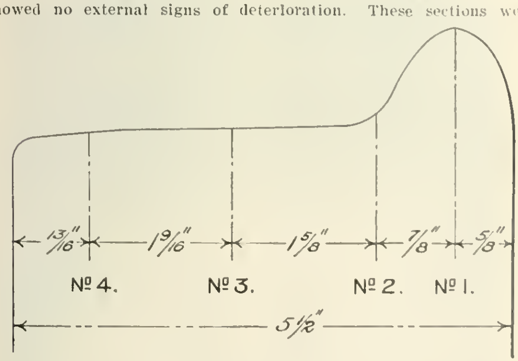
The service that can be expected from any wheel depends on the soundness and homogeneity of the metal of which it is composed. Irregularity of texture must necessarily result in irregular wear, while local defects are apt to result in an immediate failure. Of such failures, one that is the cause of much annoyance and trouble is that known as shelling out. It was for the purpose of ascertaining, if possible, the causes of this shelling out of wheels and tires that an examination with the microscope of a number of defective tires that had failed in service was undertaken.

The Rules of Interchange of the Master Car Builders' Association define a shelled-out wheel as one "with a defective tread on account of pieces shelling out." This is a poor definition; it may be supplemented by saying that the common understanding of a shelled-out wheel is one in which pieces from the tread have flaked off, due to inherent defects in the metal, such as the laminations so frequently found in wrought-iron boiler plates. It will be seen later that the analogy in the case of steel wheels is very close. The cause of shelling out of cast-iron wheels is outside of this investigation and will not be considered.

SHELLED-OUT STEEL TIRE AND WHEEL.

The samples of defective material investigated include one of each brand of wheel and tire previously referred to in these pages, and were obtained from several railroad companies. Each of these wheels and tires had one or more shelled-out spots on the tread, and there were also places on each where no signs of shelling out could be detected. The general appearance of two samples is shown in the accompanying photographs, and these may be considered as characteristic of all.

A section was taken at the spot where the worst shelling was found and another through a place on the tread where the metal showed no external signs of deterioration. These sections were then cut into strips whose centers lay along the lines 1, 2, 3 and 4 respectively. The strips were then polished, etched and photographed. The photographs were taken at the tread, and at intervals approximately 1/8 in., 1/4 in., 3/8 in. and 1/2 in. below. This was not strictly followed in all cases, since the examination was governed, to a certain extent, by the structure of the material examined, as it appeared under the microscope.

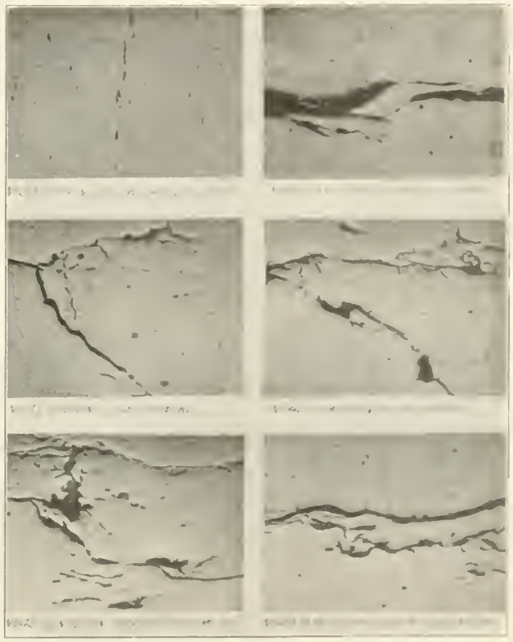


Section of Tire, Showing Location of Microphotographs.

Nos. 39 to 42 show the structure of the C tire at the point where the worst shelling out occurred. In strip No. 1, which ran down into the wheel from the flange, the metal shows a fairly good fine-grained structure at the edge and well down into the rim. In No. 39, which was taken at 1/4 in. below the edge, spots of manganese bisulphide are visible. The metal shows a good structure in all of the strips down to 1/2 in. in depth, wherever the photographs avoid the serious defects. In No. 40, however, which was taken from strip No. 3, there is a distinct flaw due to the presence of slag. The same kind of flaw appears, very pronounced, in the photographs Nos. 41 and 42, which were taken from strips Nos. 2 and 3 respectively, and through which a continuous line of slag extends. At other points adjacent to these defective places normal conditions and structure of metal was found.

Photographs Nos. 43 and 44 were taken from points on strip No. 3 at depths of 1/8 in. and 1/4 in., cut from an apparently solid piece of metal, and yet they show the presence of pronounced slag flaws. These flaws had not developed into shelled-out spots, but it is reasonable to suppose that it was only a matter of time when they would have done so.

Comparing this defective C tire with the sound new tire, the absence of a decarbonized surface on the defective tire is to be noticed, while it was very apparent in the new tire and can be clearly seen in photograph No. 7 (*Railroad Gazette*, Jan. 24). This is accounted for by the fact that the defective tire was in service and this soft outer shell had been worn away.



Microphotographs of Shelled-Out C Tire.

The balance of the material of the defective C tire is normal in structure, except that the manganese sulphide globules are large. Its failure is readily accounted for by the slag flaws found scattered through the whole body of the material as shown in Nos. 40 to 44.

The B tire failed from the same cause as the C tire. The structure of the metal is normal through a large part of the sections, but contains occasional slag cracks, and the characteristic markings of manganese bisulphide, as shown in No. 45. In the other parts of the tire precisely the same conditions exist as in C tire, namely, slag cracks, as shown in Nos. 46, 47 and 48, which were taken at various depths, and where no indication of shelling out had appeared at the time that the tire was removed from service. The presence of such large slag veins as those shown in Nos. 46 and 47 leaves no room for doubt as to the cause of failure. The presence of manganese bisulphide was also indicated in the new Tire B, but no slag veins are revealed.

Nos. 49 and 50 were taken from the defective A tire. If the metal of this tire is compared with that of the sound new tire, it will be seen that there is no variation in the normal structure

*Copyrighted by the Schoen Steel Wheel Co., and published by special permission.

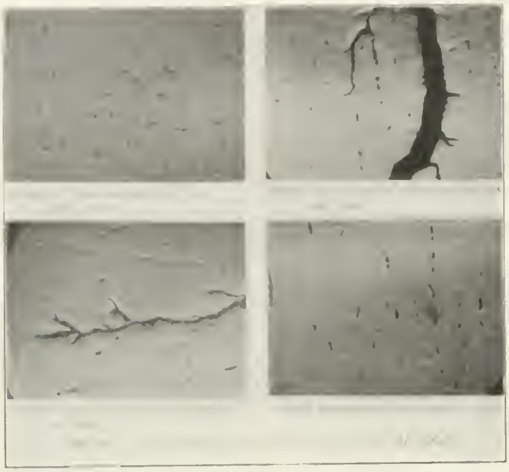
of the material to indicate a difference in the wearing quality, so that the failure of the shelled-out tire is undoubtedly due to the slag flaws clearly shown in the photographs.

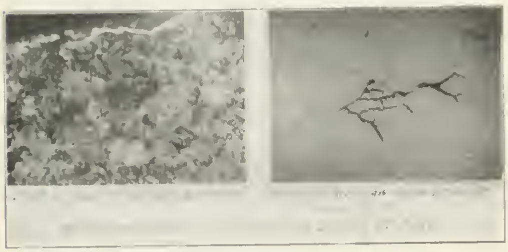
In the shelled-out D tire normal structure was found but interspersed with slag cracks as in the other defective tires. These are shown in Nos. 51 to 54, some of which were taken close to the edge of the tread. In some places there were spots of manganese bisulphide near the edges, but the cause for failure is the presence of the slag flaws that form planes of extreme weakness. In photograph No. 51 such a flaw is shown, which eventually must have caused shelling out. Another example of the same sort is shown in No. 52.

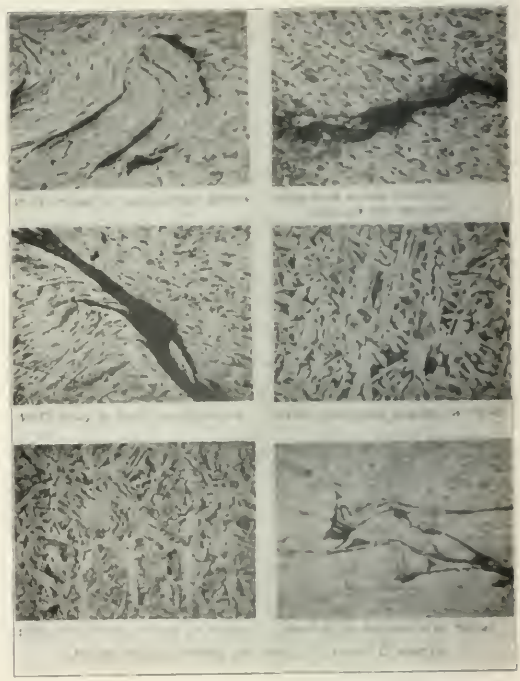
In the E wheel, the slag flaws can be seen in Nos. 55 and 56, which were taken from the shelled-out portion. In No. 55, there is a distortion of the slag defects due to the forging and in No. 57 there can be seen a slag crack which existed in the metal with no visible defect on the surface.

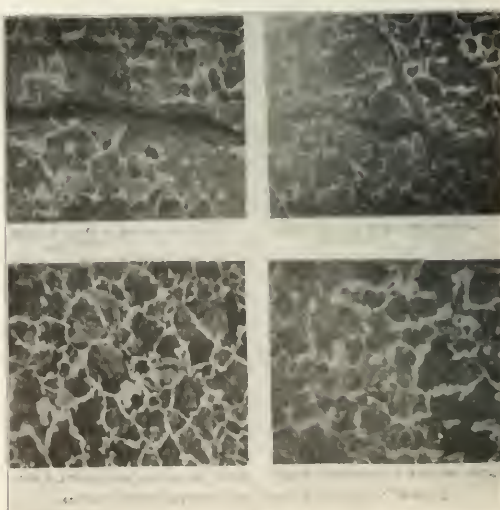
The material in this particular wheel is bad in every particular. The carbon content is low, apparently ranging from 0.35 to 0.40 per cent. The effect of both the work and heat treatment is practically nil and the structure looks like that of untreated cast steel or a metal that has been overheated. The surface shows the effect of cold rolling in the mixture of ferrite and slag, the whole having a schistose appearance. The presence of so much slag, as shown in Nos. 55, 56 and 57, renders the wheel totally unfit for service. The grain is coarse, as is seen in photos Nos. 58 and 59, and resembles that in the new wheel of the same brand that was examined. The carbon content of the new wheel, however, was apparently much higher.

In the shelled-out portion of the F wheel the slag flaws also appear well down in the metal, see Nos. 61 and 62. What was



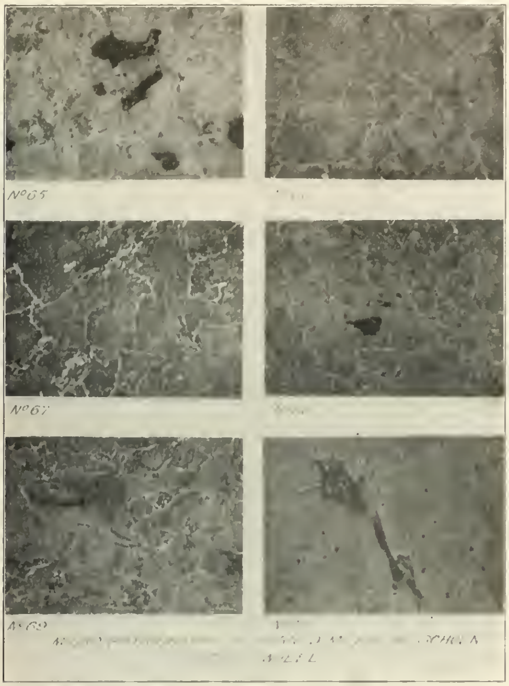






said of the defective E wheel applies to the F wheel. The carbon content seems to be low, while the presence of large quantities of slag, photograph No. 67, caused the many lines of weakness along which rupture occurred.

At the time this examination was being made, three specimens



of the Schoen solid forged and rolled steel wheel were obtained, two from shelled-out wheels and one from a section of a wheel

Burned Metal of Schoen Steel Wheel.

that had been purposely burned in heating during manufacture. An examination of the photographs of the two defective wheels, Nos. 67 to 70, shows that there are defects in the interior of the metal that were undoubtedly the cause of the shelling out but there is no evidence of slag. The same characteristics are to be noted in Nos. 65 and 66 of the specimen that had been purposely burned. The three specimens are examples of burned steel in which there is no evidence of slag.

From these photographs it is evident, therefore, that the cause of the failure of all of the wheels and tires, except the Schoen wheels, was due to the presence of slag flaws occurring near the surface of the tread.

It appears, therefore that there are at least two causes for the shelling out of steel tires and wheels, namely, slag flaws and overheating.

Western Canada and the Canadian Northern Railway.*

The commercial history of Western Canada begins in 1670, with the charter by which Charles the Second constituted Prince Rupert and seventeen of his friends—"The Governor and Company of Adventurers Trading into Hudson's Bay"—and permitted them to trade over an area of 2,500,000 square miles. For these tremendous privileges their only obligation to the monarch was to supply him annually with two elk and two black beaver from the country over which they assumed practically sovereign rights. The difference between the elk and beaver of the Governor and Company of Adventurers and the annual reports of the Canadian Pacific Railway and the Canadian Northern Railway is the difference between Western Canada without transportation and Western Canada with transportation.

One of the most remarkable characteristics of the race to which we belong is the pioneering instinct. It has made us what we are. Why do men carry implements and wives into the far country of the Peace river when a thousand miles nearer the best market for their produce, there are square miles of fertile land to be obtained for the asking? A gentleman, whom I will not name, was asked if he would sell, at a magnificent profit, his interests in a railroad system. His answer was, "No, I like building railroads." Now, the instinct of the Peace river agriculturist is vitally the same as that of the railroad projector. Each is the complement of the other, and each contributes to the newness of life that comes to the migrating millions of the race without which no empire can save itself alive. The impulse that brings my fellow-countrymen to Canada is not always the desire to acquire a little money. It is rather the reassertion of that elemental quality in virile mankind which has founded colonies and transplanted empires across the face of the planet. Abraham trekked out of Ur of the Chaldees under Divine direction. Thousands of settlers in the Canadian west were moved by the same influence, though they didn't recognize it, in the lantern lectures of the agents of the Dominion Government or the advertisements of steamship and railroad companies.

It is a profitable exercise occasionally to dip into the early literature of the prairie provinces of to-day. To glance over the prophecy of a living general in the British army, Sir William Butler, in "The Great Lone Land," written in 1871, as you cross Manitoba, Saskatchewan and Alberta in a luxurious train, is to make one fairly well satisfied with what has been done. Butler trailed from Fort Garry to Edmonton and Macleod, and returned over Saskatchewan ice. Reading his book you breathe an atmosphere of isolation, not to say desolation. But in the middle of it there is the prediction of settlement and abounding grain fields, a prediction fulfilled in his own time. Butler's journey was made just 200 years after the charter of the Company of Adventurers was granted. The intervening years had seen the company's work spread over a vast, immeasurable territory, and had produced Lord Selkirk's heroic efforts to found an agricultural community, imported via Hudson's bay to the Red river. But there was a majestic vacancy about the whole land. Even when a corner of the country had become sufficiently civilized to need an armed force to dissipate political rebellion the white population was pitifully sparse. The advance guard of ploughmen pioneers from the East soon afterward, however, began to break through the woods and waters of the Dawson route. But there could be no real advance so long as the Red river and the Dawson route governed the going out and coming in of the people. Men eagerly looked for railroads. They got the railroads, but they have never had enough of them, and never will have so long as there is a railroad builder in whom the pioneering instinct expresses itself in parallel lines of steel and in reduced passenger and freight rates.

The Canadian Pacific was the forerunner. The early promoters of that great corporation have never, I think, received all the credit due for their marvelous and successful effort to bind the East with the West. Remember the conditions under which that great enterprise was accomplished. Between settled Ontario and the prairies there was a wilderness of poverty. Between the prairies and the Pacific were ranges of mountains which many people thought no combination of engineer and capitalist could penetrate. The end-all of the scheme was foreseen by some excellent men to be unpaid bills for axle grease. Financially the times were unpropitious. In 1879 Sir Sanford Fleming felt compelled, in view of what he considerately called "the necessities of the situation," to advise the Minister of Public Works to "establish a great territorial road on the site of the main line of the Pacific Railway from Lake Nipissing to the north side of Lake Superior."

When, in 1881, the first Canadian Pacific rails were laid west of Winnipeg, the white population between the western boundary of Ontario and the Rocky mountains, and between the United States boundary and the Arctic Circle was 66,161. Manitoba contained 59,187 whites, of whom 8,000 were in Winnipeg, and several thou-

*From an address by D. B. Hanna, Third Vice-President of the Canadian Northern and President of the Canadian Northern Quebec and the Quebec & Lake St. John, before the Empire Club of Toronto.

ands were brought in by the railroad contractor. The true population indicator of that time is the fact that in the Northwest Territories there were only 6,971 whites, practically all living on the fur trade, and 19,500 Indians. It was only in 1876 that civil government was organized in the territories. Governor Laird, who took up his abode at the new founded Battleford and who still lives in Winnipeg, has described the perilous conditions under which he journeyed officially to Fort Macleod, which is now in the fall wheat section of southern Alberta. Eliminating British Columbia then, the Canadian Pacific in 1881 began to open up territory 900 miles long and 300 miles wide—taking the Saskatchewan valley as roughly the northern frontier—with a population of 66,000, or one-fourth of a civilized person to the square mile. But in the territories, or three-fourths of the prairie country, there was only one white person for every 35 square miles of cultivable land. It was not an inviting prospect for men of faint heart and little faith. The Canadian Pacific builders were of another sort. True, the company was given an unprecedented stake in the possibilities of the West, but its early history was one of hard times, and for years was a load of care to those who had riveted to it all of their own fortunes and as much of the fortunes of other people as they could attract to their cause. That it is to-day an enterprise of which all Canadians are proud is gratifying alike to the Dominion and to the company.

Beginning with 1881, the year in which the Canadian Pacific laid the first track west of Winnipeg, the growth of white population in 25 years was as follows:

	1881	1906	
Manitoba	59,187	365,688	
Saskatchewan and Alberta	6,971	257,763	Saskatchewan
	....	185,412	Alberta.
Total	66,161	808,863	

This is an increase of over 1,200 per cent. in 25 years. Quite as illuminating as the growth of population are the immigration returns, which show that during the year ended June, 1896, the total immigration to Canada was 16,835, and in the year ended June, 1907, it was 256,000. Yet the twentieth century had come in before the immigration reached 50,000 in a year. In 1901-2 it was 67,379, and in 1902-3, 128,364.

Equally illuminating is the growth in actual settlers located on free lands granted by the Dominion of Canada. Thirty years ago, or in 1877, 845 homestead entries were made, aggregating 135,200 acres (a homestead is 160 acres), but 54 per cent. of the entries were subsequently canceled, the duties required under the Homestead Act not having been complied with, and the land reverted to the Government. Five years later, in 1882, when the railroad reached Brandon, the homestead entries were 7,483, representing 1,197,280 acres, with cancellations of 47 per cent. Twenty years later, in 1902, the western country had passed the experimental stage, and the larger movement of settlers was in full swing. Then began what has often been called the American invasion, and that year, in addition to hundreds of thousands of acres of land sold by land companies to actual settlers, 22,215 homestead entries, representing 3,554,400 acres, were made. The figures are as follows:

	Homestead entries.	Average acreage.
1903	32,682	5,229,120
1904	26,513	4,242,080
1905	31,645	5,643,200
1906	42,012	6,721,920
1907 (10 months)	25,305	4,018,800

Up to the end of June, 1907, it may be conservatively estimated that over 30,000,000 acres of land have been granted by the Crown to legitimate settlers in Manitoba, Alberta and Saskatchewan. Add to this acreage sales made by railroad companies and land companies of approximately 20,000,000 acres, and it is not difficult to foresee that the Canadian West must soon become the bread basket for the world. The Surveyor-General of Canada estimates that in Saskatchewan and Alberta alone there is a total land area, after deducting 30,080,000 acres for water, of 324,125,140 acres, of which he says 106,240,000 acres are suitable for growing grain, the remainder being suitable for ranches and mixed farming. The influx of people and the occupation of the land have been coincident with railroad expansion.

The great expansion in immigration in 1902-3 was in a most remarkable degree coincident with the extension of the railroad with which I am associated. The Canadian Northern claims no special credit for the phenomenal increase in immigration; but it cannot dispute the fact that the rapid development of the enterprise opened up a wide and fertile territory and made it possible for the great influx of new settlers to locate on free or cheap lands near to markets and general supplies.

Besides enjoying the privilege, as I do, having been the officer in immediate charge of the operations of this company from the first day a wheel was turned, I am able to speak from a personal knowledge of what has been done. I shall refer exclusively to the lines west of Lake Superior. Ten years ago, in 1897, we operated 100 miles of railroad through a then unsettled country. Traffic was light and train service limited. Our equipment consisted of three locomotives and some 80 cars, all told, a working staff of less than 20 men altogether, and a payroll for the year of less than $17,000. The gross revenue for the first year was under $60,000, but it was more than sufficient to pay our debts. During that year we handled 25,700 tons of freight and carried 10,343 passengers. There is nothing particularly impressive in these figures.

To-day, or ten years afterward, we are operating 3,345 miles. We have an equipment of 237 locomotives, 219 passenger cars, including 35 sleeping and dining cars, and about 8,500 freight cars of all kinds. These figures do not include the large number of locomotives and cars ordered and now building. The 20 men of 1897 have become 10,700 in 1907, with a payroll of over $5,000,000 a year. And these figures do not include the large construction forces which at times run into thousands of men. The gross earnings now amount to over $10,000,000 a year; the freight handled for the past fiscal year was 1,822,220 tons, and we carried 703,988 passengers. We are accepting freight and passengers for 411 different points west of Port Arthur. If I were dealing with eastern as well as western lines I could tell you that the Canadian Northern has become the second largest railroad in Canada. Only a chastened humility prevents me from enlarging the fact that with 2,990 miles in the West actually in operation, 150 in Ontario, 531 in Quebec, and 431 in Nova Scotia, we have in all 4,059 miles in Canada, whereas the Grand Trunk Railway has in the Dominion 3,829 miles.

To me, however, the most fascinating result of the past ten years of western development is that the Canadian Northern system is responsible for the creation of over 150 town sites, of which at least 125 have been named by our officers and at least 70,000 persons (exclusive of Winnipeg and other large centers) have found homes tributary to this railroad. I think it is reasonable to estimate that at least one-third of the growth of Winnipeg in this century is directly due to the business opened up by the Canadian Northern. Let me repeat, we claim no special credit for that. But even railroad men are not devoid of the instincts of citizenship and may be allowed to reflect without boasting that they have inaugurated communities wherein the institutions of a free, strong and intelligent people may mature.

The railroads which connect Winnipeg with Eastern Canada are western lines, inasmuch as without them the West could not be served. They bind the East to the West and the West to the East as nothing else could. They are the abiding symbol of Canadian nationality, and, as they increase in number, they make the nationality the more abiding also. The lakes are the friend of the West in summer, but steel is its defense against the rigors of winter. The railroads are more vital to the national prosperity than water, for rails can do without the help of navigation, but navigation, of itself, would be helpless against the forces that tend to an identity of interest between the western United States and the western provinces.

The function of railroad transportation in the West, then, is to keep open communication with the East. On purely commercial grounds it is infinitely more important to the East than to the West that it should be so. May we not say that this is true, also, as a matter of sentiment? It is not necessary to argue that the present prosperity of Eastern Canada is the fruit of transportation in the West. It is conceded, on the one hand, that the rural population of Ontario has declined. On the other hand, the manufacturing population of Ontario has enlarged out of all proportion to the increase of Ontario's demand for Ontario-made goods, while the Winnipeg warehouses of eastern manufacturers tell an eloquent story of the origin of modern Canadian growth and pay tribute in the fullest sense to the wisdom of rail connection with the East. For Canadian solidarity there must be more and still more communication to and from the West.

Foreign Railroad Notes.

The railroad in German East Africa from Dar-es-Salaam westward to Mrogoro, 140 miles, was opened for traffic Dec. 16 last. It was begun Feb. 9, 1905. Dar-es-Salaam is in 7 deg. south latitude and just about 200 miles south of Mombasa, the ocean terminus of the British Uganda Railroad. The new railroad crosses the unhealthy lowlands near the coast and reaches the comparatively healthy high country. It is intended eventually to extend the railroad to the south end of Lake Victoria Nyanza, making a line nearly parallel to, but about 200 miles south of, the Uganda Railroad.

Last summer the Hungarian State Railroads conducted a series of tests of the Westinghouse quick-action brake, the results of which were recently published. The tests were made with a train of 71 covered freight cars, with three passenger cars interspersed among them for purposes of observation, and two testing cars equipped with all manner of recording instruments. Preliminary tests were made in which the brakes were applied 275 times, with no injurious shock and no parting of the train. The main tests were then made in the presence of a committee of the German Railroad Union, and of many other Austrian and German railroad officers. The train was hauled first by one and then by two locomotives, and all the applications of the brake were satisfactory.

sleeping and dining accommodation, or as inspection cars, wrecking cars, baggage cars, etc.

A run was recently made with the car over the tracks of the Delaware & Hudson from Schenectady, N. Y., to the junction with the Susquehanna division, thence to Albany, Cohoes, Mechanicsville and back to Schenectady, about 78 miles in all. The car carried its full complement of passengers and made 23 stops, the engine running continuously. The speed varied from 23 miles an hour on a 1.3 per cent. up grade to 56 miles an hour on a ¼ per cent. down grade, except where traffic conditions and road regulations required lower speeds. Where traffic conditions permitted, a speed of 50 miles an hour was recorded on level track, and from Albany to Mechanicsville 47 miles per hour was sustained on a steadily rising grade. The operation of the equipment was in every way satisfactory, neither vibration nor sound of the engine reaching the passengers. The car heated readily from the exhaust system although the day was cold and the air keen. The gas engine developed at times 150 h.p. and the two motors were under such control that the acceleration was noticeably smooth and free from jerks.

The Ocean Carrier.

BY J. RUSSELL SMITH, PH.D.

IV.

*Line Traffic and Its Extension.**

The British Government, which had been the pioneer founder of steamship lines in 1822, did so because private citizens did not seem to be able to fill the need. By 1838 the government was able to hand some of the work over to private firms and the first regular transatlantic line, the result of the British mail contract, was really a subsidized line. Without such aid a transatlantic line in the period of 1840 to 1860 was in a precarious situation as witnessed by the speedy failure of most of those attempted during the period.

The Cunard, starting with a strong subsidy and backed by the support of the government, kept steadily on, as also did the Inman Line, which started 10 years after the Cunards, and after 1856 shared the mail contracts with them. By 1861 there had been 12 distinct attempts at steam connection between United States and England, and only these two had survived although the second Glasgow line had then been running five years.

Between 1840 and 1850 the old packet lines were as numerous and as fast as ever, and they occasionally beat the Cunard steamers, even when that line had been 15 years running, but these performances were unusual and far from the average. The Cunarders had their own way with mail, with the express freight which paid $36 per ton, and also with those passengers who could afford a costly journey, for the charges were much above the packet fares. During this decade the steamers carried only first and second class passengers, although the third class, then as now, made up the bulk of the travel and was very profitable. All of this class, from necessity, still traveled in the packets which were on the whole well able to compete with the steamer lines and were effectively doing so as was proved by the repeated failure of steamer lines during the period 1840-1860. Up to 1850 the steamer certainly could not have held its own, without the aid of the subsidy. The decade 1850-60 witnessed the real establishment of an economically self-sustaining ocean steamship line traffic on the Atlantic.

The full list of the failures in this transition period need not be enumerated here, but at least four American attempts of the period are worthy of attention.

The success of the Cunard steamers was a great blow to American pride. Our newspapers had for decades been rejoicing in no moderate terms over the triumphs upon the sea that had been won by our world-famed packets and clippers. Then the British line steamers sailed into our ports, and the speed records were held by the other side. In 1847 an attempt to win back these laurels was made by an American corporation, the Ocean Steam Navigation Company, which started the first of its two steamers, "Washington" and "Hermann," to Bremen via Southampton (Cowes) on June first. But it was counted a failure because the Cunard steamers made from two to four days better time. The American Government mail payment was $200,000 per year, but the British authorities discriminated against the American-borne mail. The city of Southampton gave the line no welcome and it was continued only a short time.

While this line was leading its cheerless existence, another of similar performance but longer life began operations. An American company, the New York & Havre Steam Navigation Company, organized in 1848, sent its first steamer, the "Franklin," in 1850; a second steamer was put on the next year and the company with difficulty managed to maintain a two-boat service until the outbreak of the Civil War. The gap was thereafter filled by the French Transatlantic Company, founded in 1860.

But this line to France did not even pretend to be in the Cunard record-breaking class. The failure of the one American attempt in this direction goaded the nation to more determined efforts. The idea of naval dependence was brought before the public mind by the carrying of all steamer mail by the British. The packets were recognized as useless for this race. The nation was stirred and a subsidy was granted to E. K. Collins, owner of a line of packets running from New York to Liverpool. He contracted for 20 voyages a year and was to receive $19,250 per voyage; later it was raised to $33,000, or $858,000 per year. No pains were spared in the effort to beat the British. The national spirit was shown by contractors who assisted in the enterprise by delivering to Mr. Collins at cost.

In 1850 the Americans were ready. Mr. Collins sold his packet ships and launched his fortune on the sea in his great new wooden paddlewheel steamers, having the unheard-of boiler pressure of 13 lbs. per sq. in. This race between Britain and America was a world event and Mr. Collins beat the Cunards. He beat them once and beat them regularly, the average difference in time of voyage for the two lines in 1851 being seven hours going east and 18 hours going west; the annual average time of the Collins steamers for that year being a fraction over 11 days and the Cunard slightly over 12 days. It is interesting to note that in the 96 trips made by these two lines between New York and Liverpool that year they carried only 8,268 passengers, an average of but 86 per trip. They were almost evenly divided, but the smallness of the number will help to explain the lamentable failure of the Collins Line a few years later.

This competition was in more than speed. It was an inroad upon the Cunard's monopoly. Upon the opening of the Collins service the steamship freight rate fell from £7, 10s. to £4—a rate which to-day would seem like the most Heavenly kind of manna to the owners of ocean greyhounds.

In December of 1850, the same year that the Collins Line began, the Inman Line (British) established a fortnightly service between Liverpool and Philadelphia, and made the innovation of giving full and complete competition with the clipper ships by providing for third class passengers. This was a popular move which was copied three years later by the Cunard Line. The Collins Line still represented the strictly express type of service built for speed, at which it succeeded. It thereby added great laurels to the American flag and name, but it netted only losses to the stockholders. In 1854 one of their steamers, the "Arctic," was lost in collision on the Grand Banks. Two years later, the "Pacific" disappeared at sea with Mr. Collins' wife and two children on board. Then, even worse for the fate of the line, the great subsidy upon which it had rested was withdrawn, due, some say, to the jealousies of Boston, Philadelphia and Baltimore, and to the business jealousies of the clipper ship owners who made a combination in Congress which killed the Collins subsidy, and this promptly killed the Collins Line. It made its last voyage in 1858. During the eight years of its brilliant, but unfortunate career, the passenger traffic had increased five fold.

The experience of this line with the subsidy shows how unstable the company is that depends upon the repeated votes of a legislature dominated by party politics. The government support of the Cunard Line was never violently withdrawn.

Upon the failure of the Collins Line, the Inman Line swung its Philadelphia service to New York and took the Collins dates and kept up the bi-monthly service. In 1860 it became weekly, 1863 three in two weeks, and in 1866 bi-weekly in summer.

Another sturdy American, Vanderbilt, tried to follow in the footsteps of Collins and get a subsidy for a route to the continent. He labored hard in this cause and failing to get a subsidy he determined to put on steamers anyhow. In 1855 he began service from New York to Havre and Southampton. The next year he extended it to Bremen and in 1858 he got the contract for carrying the mail and was paid the amount of the actual postage receipts. In 1861 he gave it up and sold most of his steamers to go to the Pacific, and retired from the Atlantic carrying trade.

The year 1856 witnessed the founding of a line, the second attempt, which was probably more nearly a freight line than any other of the period—the Anchor Line from Glasgow to New York. This service, with its greater dependence upon freight, marks another stage in the progress of the development of line traffic and of the replacing of sail by steam lines. From 1850 until 1870 this replacing continued steadily, and with increasing speed. The new lines were usually steam lines, and the old lines gradually changed their vessels from sail to steam. The Hamburg American Packet Company, incorporated in 1847, had sailing vessels only, for nine years, and then in 1856 a screw steamer was added. Others

followed and in 1860 the nine remaining sailing vessels on the line were replaced by four new steamers and fortnightly sailings to New York were inaugurated.

The old Black Ball Line, the pioneer between New York and Liverpool, the pioneer of all the Atlantic lines, had 25 fine sailing ships in 1850. But the competition of the new lines of steamers was such that they had to be merged shortly into the Guion Line, and this company in 1863 made an arrangement with the Cunard Line to carry some of its passengers in the Cunard steamers. In 1866 the Guions added their first steamer and in eight years more they had a steam fleet. The decade 1860-70 marked the practical disappearance of the old transatlantic packet-ship lines and their final replacement by lines of steamers. The last days of the packet lines found them carrying emigrants while the first and second cabin passengers were taken by the steamers. The White Star Line was an example of this transformation of an established line traffic from one type of vessel to another. The present service had its origin in the purchase of a sailing vessel fleet in 1870, their immediate transference to another service and their replacement by steam vessels.

The summer of 1856 saw the establishment of the subsidized Allan Line steamers from Montreal to Liverpool by an old firm of merchants and sailing ship owners who had been running their vessels in the Montreal-Glasgow trade for a quarter of a century. The first ocean steamer to reach Montreal came in 1853, and for two years there was a poor, irregular service, but it was so irregular that the government canceled its mail contract, and the next effort was the more liberally paid Allan Line, which succeeded and maintains itself to the present day.

In 1866, the North German Lloyd Line from New York to Bremen, which had been founded with steamers in 1858, increased its service to once a week. Between 1866-70 it succeeded in beating out three attempts of New York capitalists headed by Henry Ruger, who tried to establish competitive service to Bremen and to Scandinavian ports. In 1869 the Bremen company started a steam service to New Orleans. The next year the New Orleans cotton merchants, who had been depending on sail for their direct shipments to Europe, formed the Mississippi and Dominion Steamship Company, which ran steamers from New Orleans to Liverpool in winter when the cotton season was on and in summer when the St. Lawrence was open they went to Quebec and Montreal. This New Orleans service was not long lived. It was shifted to the New England and Canadian ports and there became known as the Dominion Line.

The period of 1840-60, that of the founding of steam line traffic on the North Atlantic, was also the period of its establishment in nearly all parts of the globe.

It is rather remarkable that the backward, warring and disturbed countries on the west coast of South America should have had upon the Pacific ocean one of the earliest of oceanic steamship lines, but there were peculiar reasons for this. The topography of the coast made land travel to any distance absolutely impracticable. The sea was the only highway and here the peculiarities of the winds were such that sailing vessel communication was exceedingly slow and tedious. William Wheelwright, an enterprising American, who had spent some years on those coasts as consul, appreciated the situation and went to Europe to raise money for a steamship line. His pamphlet stated that "by steam many voyages would be performed in 40 or 50 hours which now occupy 20 or 25 days." The explanation of these disparities he showed to be a combination of southeastern trades and prevailing westerly winds to the south of them which made it necessary for a sailing vessel bound on a mere coasting journey to go far out into the Pacific to get the requisite winds. Mr. Wheelwright secured his financial support and the first two steamers reached their station in 1840. In 1852, there was a bi-monthly service from Valparaiso to Panama, where it connected with the Atlantic navigation. In 1865 the service was extended around the southern end of the continent to the River Plate and the Falkland Islands, and two years later regular steam connection was had with England through the Straits of Magellan.

At first Wheelwright's English line, the Pacific Steam Navigation Company, had great difficulty to secure the necessary fuel which had to be brought around the Horn in sailing vessels. In this respect it was identical with the Pacific Mail Steamship Company, an American company giving service from Panama northward.

The acquisition of California gave the United States an exceedingly remote possession (there is no colony anywhere so really remote to-day). With this territory some kind of connection was imperative and the administration, which was so liberal in helping the Collins Line to beat the British, contracted with the Pacific Mail Steamship Company, formed in 1847, for a service from Panama to Astoria and from New York, Charleston and New Orleans to Havana, from which port the company already had a connecting line to Chagres (Colon), thus completing the connection between the coasts. The first steamer left New York October 6, 1848, and the company soon had six of the finest steamships afloat. The speed from Panama to San Francisco was more than 10 miles per hour. Thus the United States had line traffic of first class character connecting its remote coasts before it had a good American line to Europe. At Panama it connected with the Pacific Steam Navigation Company, giving service to Peru and Chile, so that before the middle of the century the Pacific had at least 5,000 miles continuous steam line traffic. The success of the United States government's line on the Pacific was far more enduring though somewhat less brilliant than that of the Collins Line. Its steamers had not reached the coast before the gold fever set rovers from all over the world flying toward California. Despite the troubles of 'round-the-Horn coal, the company, dropped by chance in the golden stream, reaped a golden harvest, and when railroad competition began shortly after 1870 it was by all means the largest American maritime organization. It had 33 fine steamships capable of holding 74,000 tons of cargo and many passengers. It served 47 Pacific and three Atlantic ports and had 35 agencies in the Orient, United States, Spanish-American and Europe. On January 1, 1867, it had begun a monthly service to the Orient terminating at Hong Kong. This was soon made a fortnightly service and a branch established at Yokohama to skirt the Japanese inland sea and go on to Shanghai. There was an express steamer from San Francisco every two weeks connecting with the New York steamer via the Panama Railway. There was also an accommodation steamer which attended to the local needs of the coasts of Mexico and Central America, and at Panama connection was had, not only with New York, but also with lines to Hamburg, Havre, Southampton and Liverpool.

England pushed out her steamer lines to her colonies about as quickly as she had to America. "In 16 years after the crossing of the North Atlantic, regular lines of steamships traverse both the North and South Atlantic, the Indian ocean, the Arabian sea, the Mediterranean sea," etc.

The same burst of confidence and mechanical enthusiasm that started companies to building steamers in 1836 for the North Atlantic, sent two steamers out to India in 1836 and 1837 to ply between Bombay and Suez. This line soon became a link in one of the largest and certainly the oldest steamship companies in the world. The present Peninsular & Oriental Company started as the London & Dublin Steam Navigation Company, running two steamboats about 1824. This enlarged in 1837 into a line running steamboats to the (Iberian) Peninsula, hence the name Peninsular. Before this innovation, the sailing vessel time from London to Lisbon had been three weeks. As the next step in the development of its service and its name, the Peninsular Company took a subsidy in 1842 to carry the mail in steamers between Alexandria and London. At Alexandria it connected first by camels and then by four-horse vans with the Suez Line to India, a service which has been maintained to the present day and extended to the east and southeast, taking in China and Australia. The Australian Line came in 1873 after the opening of the Suez Canal permitted the abandoning of the bothersome shifting at Suez and substitution for it of a continuous steamer voyage.

Australia appears to have first had line traffic connection with the mother country in 1850 when a lively sailing vessel traffic was deemed of enough importance to be reduced to a schedule. In 1852 the desire for greater regularity of mail brought about a contract for the carrying of the mail in steamers. The first steamer sailed June 5, 1852, and between that and 1854 several others were successfully added.

In the fifties, the South African traffic was carried in sailing vessels with the exception of such service as the first Australian steamers rendered. In 1857, the Union Steamship Company, which after 50 years, still dominates the South African situation, entered into a contract to carry the British mails. In 1872 the Castle Line was founded. In 1873 it participated in the mail contract, and in 1876 it shared equally and helped maintain the schedule.

The pioneer in the service from England to eastern South America was the Royal Mail Steam Packet Company, which started its first steamer from Falmouth in 1842 and has since built up a great service and met the rivalry of many companies.

It appears that the Atlantic ocean can scarcely be called the pioneer in the establishing of ocean steam line traffic although it certainly had been in the sailing traffic. Experiments were being made in all oceans at the same time, and the period 1840-1857 is the epoch of the establishment of steam line traffic to all important quarters of the globe. There were lines on the North Atlantic, fast, fine and competing. These were the backbone of the world's connection. At New York the American Pacific Mail Line gave connection through Panama with the Pacific coasts of both Americas. The Cunard Line had connecting lines here to Bermuda and West Indies.

On the other end of the Atlantic trunk, the English lines gave quick access to the Mediterranean and India, to South Africa and Australia. The world was connected. The rest is a story of improvement.

(To be continued.)

GENERAL NEWS SECTION

NOTES.

The Baltimore & Ohio has issued a notice that employees must abstain from the use of intoxicants both while on and while off duty.

The Baltimore & Ohio has reduced by 10 per cent. the pay of all officers and employees receiving $166 a month or more and reducing to $150 all now receiving between $150 and $166.

At Kansas City, Jan. 21, D. H. Kresky and W. A. McGowan, the former agent for a shipper and the latter for a railroad, were fined $1,000 each for violation of the freight rate law. They were indicted two years ago.

Acting on a complaint concerning the compression of cotton in Oklahoma, the Interstate Commerce Commission has decided to hold a general inquiry into the whole question of compression and the relations of the railroads to compressors, buyers and shippers everywhere.

A press despatch from Pottsville, Pa., says that some of the employees of the Pennsylvania Railroad at that place have been furloughed for nine months. By taking this course, instead of dismissing the men, the company reserves to them their rights and privileges as regards promotion.

At Denver, Colo., the United States District Court has issued a temporary injunction requiring ticket brokers to conform to the recent decision of the United States Supreme Court in the Bitterman case, outlawing all outside dealing in tickets which, according to their terms, are non-transferable.

The Philadelphia, Baltimore & Washington has conveyed to the government by deed the recently abandoned passenger terminal at Sixth and B streets, Washington. The railroad surrenders its right to use any portion of the mall; and the sum of $1,500,000, to be contributed by the government toward the cost of the new union station, now becomes payable.

The State Railroad Commission of Illinois has directed the Cleveland, Cincinnati, Chicago & St. Louis to run one passenger train each way daily over the Kankakee & Seneca branch regardless of the probability that the trains will earn less than it will cost to run them. Hitherto for many years the company has maintained only a freight service on this branch.

Those employees of the United Steel Corporation who subscribed for preferred stock in 1903 under the profit sharing plan and have since held their stock, are to receive an extra dividend of $65.40 in addition to the regular 7 per cent. dividend and the regular bonus of 5 per cent. a year. Next year, stock subscribed for in 1904 will be entitled to a similar extra payment.

The Railroad Commission of Wisconsin, which is investig the action of the railroads under the law of that state limiting telegraphers' work to eight hours a day, finds that the Chicago, Milwaukee & St. Paul has discontinued 63 telegraph offices; the Chicago & North-Western 41, and the Wisconsin Central 36. These all did commercial business, but the roads had to have the operators to put into more important stations to comply with the law. It is probable that the telephone will be extensively used by these railroads.

The Pennsylvania Railroad, in reporting monthly earnings to the Government, declines to make affidavit that the accounting rules issued by the Interstate Commerce Commission have been followed, and the New York Central, it is said, has made no monthly reports whatever. The Government proposes, therefore, to proceed against these roads for not complying with the law. Notice has also been given that henceforth all roads will be required to send their monthly statements within 10 days after the end of the month, as required by the rules issued by the Commission.

The railroads centering in Manhattan, Brooklyn, Long Island City and Jersey City have agreed on "track service charges" in addition to car service (demurrage) charges at congested stations, to be put in effect Feb. 20, amounting to $1 a day (total demurrage and track charge $2) for the third and fourth days; $1 additional for the fifth and sixth days and $1 more for the seventh, making the gross rate after the sixth day $4 per car per day. Coal, coke and hay are excepted from this regulation. It appears that the Long Island Railroad has decided not to abandon this "track charge" as was proposed a few weeks ago.

At Washington last Monday a number of prominent railroad officers called on the President and on the Interstate Commerce Commission to see what could be done towards securing the amendment of the law limiting the hours of telegraphers and signalmen, which comes into force in March, but it does not appear that the conference produced any tangible results, and the Washington reporters seem to think that Congress will be very slow to take action on any modification of the laws affecting railroads. The Chief of the Order of Railway Telegraphers says that there are plenty of competent telegraphers in the country.

At the conference called by Governor Patterson of Tennessee at Nashville last Tuesday to see if the railroads would reduce passenger fares, the Southern repeated its former announcement that rates would be reduced in Tennessee to the basis which is to be adopted in Georgia, and the Mobile & Ohio and the Cincinnati, New Orleans & Texas Pacific announced that they would follow the action of the Southern. The other roads represented said that they could not afford to make the desired reduction. President Smith of the Louisville & Nashville said, however, that if the surrounding states succeeded in securing a reduction of passenger fares on his road the company would adopt the same reduced rates in Tennessee. The Illinois Central made a similar promise. Meanwhile the order issued by the State Railroad Commission requiring all rates to be reduced on April 1 to the basis of 2½ cents a mile still stands.

In an opinion by Justice Peckham the Supreme Court of the United States has decided the case of the Penn Refining Company, of Oil City, against the Western New York & Pennsylvania and the Lehigh Valley in favor of the railroads. The independent refiners of Western Pennsylvania charged that the privilege of shipping in tank cars, permitted to the Standard Oil Company, was denied to the other companies. The Interstate Commerce Commission ordered the railroad companies to pay damages of $13,000, and the United States Circuit Court for the Western District of Pennsylvania upheld the order. That court, however, was reversed by the Circuit Court of Appeals, and the independent refiners took the case to the Supreme Court, which now has affirmed the decision of the Court of Appeals. In his opinion Justice Peckham said:

The whole theory of discrimination rests upon the alleged failure to furnish tank cars to shippers demanding them, while at the same time the defendants (the railroad companies) leased tank cars from their owners and used them to carry the oil of such owners exclusively; and yet in this case there has been no such failure because there has been no demand for such cars by the refiners, who had no use for them. . . . It is therefore apparent that the failure of the plaintiff to use tank cars was not owing to refusal or omission of the defendants to supply them, but because the plaintiffs did not demand and could not use them economically for the transportation of oil.

Detector Bars Abandoned.

The Pennsylvania is making great improvements in its interlocking towers. A new electro-pneumatic machine, with latest improvements in locking up fouling points electrically, has just been installed in the tower at Henderson street, Jersey City. This does away with the old-style detector bars used on switches as, until the route is perfectly clear, the track circuits keep the signal lever locked. The drawbridges across the Hackensack and Passaic rivers have been similarly equipped. (Approach track-circuit locking.) Five towers on the New York division are now equipped in this way and all others will be in due time.—*Newark (N. J.) Call.*

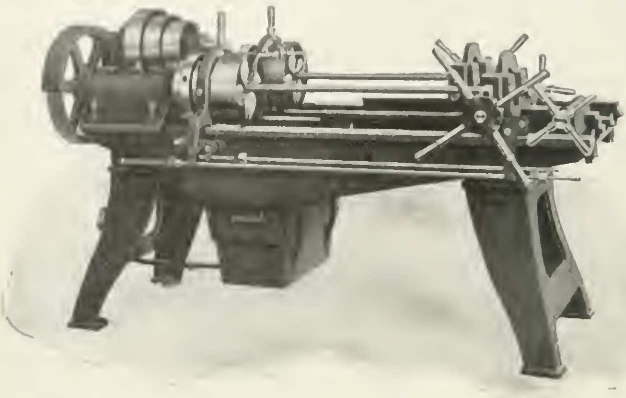
Cement Makers' Association.

The Association of Licensed Cement Manufacturers, 30 Broad street, New York, was organized on January 9 by the North American Portland Cement Co., the Atlas, Alpha, American, Lehigh, Lawrence and Vulcanite Portland cement companies, and various other companies in the East and West, including the Dexter, Edison, Nazareth, Pennsylvania, Penn-Allen and Catskill companies, all of which have secured licenses under the Hurry and Seaman, Edison, Carpenter and other patents controlled by the North American company. The association already represents nearly 70 per cent of this country's Portland cement output, and other applications for membership have been presented and are under consideration. The officers of the association are: President, A. F. Gerstell, Vice-President and General Manager of the Alpha Portland Cement Co.; Vice-President, Conrad Miller, President of the Dexter Portland Cement Co.; Secretary and General Manager, Alfonso De Navarro, Vice-President of the Atlas Portland Cement Co.

The purposes of the association include the betterment of the mechanical and chemical processes used in making cement, the improvement of the quality of cement, matters of traffic and shipment and the establishing of an association laboratory for technical tests and experiment. It is understood that all existing and properly equipped cement plants will be granted licenses and admitted to membership. Infringers of the patents above referred to will be vigorously prosecuted.

Landis Staybolt Cutter.

The illustrations show the new Landis staybolt cutter, recently placed on the market. It is equipped with Landis patent dies. The chasers are each 4 in. long, with threads milled on the flat side and running the full length. These chasers are set tangent to the rod, being threaded to give the right cutting clearance. The rake can be ground to any angle desired to suit the kind of material that is being



Landis Staybolt Cutter.

cut, and a rolling chip is cut just as from a lathe tool, so that the thread can be cut at high speed. All chasers are interchangeable.

The die requires no lead screw to govern the pitch of the thread that is being cut. The chasers are not hobbed but milled, and they are held so that the front or working teeth do the cutting, while the back teeth do no cutting, but extend across the cutting line, so that the four chasers form a lead nut which bears on the threaded rod and draws it into the cutting teeth true to the pitch of the die. This lead is so positive that it is impossible to influence the pitch of the thread by retarding or forcing the rod into the die. Before such action could affect the pitch either the threads would be stripped off the rod or the teeth would be pulled off the die. This leading feature is permanent, as the die never needs to be ground in the throat; the ends only of the chasers are ground, which keeps their shape uniform. In machines using lead screws there are at least two hardenings and one screw, whose inaccuracy must be corrected to get the right pitch. The best lead screw made must be cut with some form of die or on an engine lathe where accuracy cannot be guaranteed. In the Landis die there is but one hardening—the hardening of the die. When lead screws and dies are not of exactly the same pitch a bad and distorted thread will be produced. The lead screw will work against the dies, and the lead screw nut being the most powerful of the two the die is bound to distort the thread, giving it a ragged appearance and frequently pulling off the tops of the threads, as all of the teeth can shave the thread in the hobbed die. The die in the Landis machine never needs to be annealed, hobbed or retempered. Its life is much longer and it has a much wider range on special diameters.

The carriage on the machine can be adjusted upward, downward and sidewise, and the cutting strain is central. The rack has recesses between the teeth, so that when chips or scale drop on the rack they will fall through and not interfere. The machine is built single and double head, in sizes up to $1\frac{1}{2}$ in. Each machine is provided with pump, countershaft, wrenches and automatic throw-out. The main spindles are so arranged that any oil which may be carried into the spindle will feed back into the oil tanks and not be carried out at the rear end of the spindle to run on the floor.

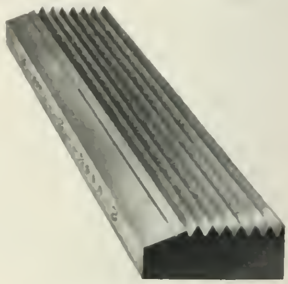
The machine is manufactured and sold by the Landis Machine Co., Inc., Waynesboro, Pa.

Passenger Fares on the Pennsylvania.

The Supreme Court of the state of Pennsylvania having decided that the act of the last Legislature fixing a maximum passenger fare of 2 cents a mile is inapplicable to the Pennsylvania Railroad, its branches and leased lines, the company announces that on Feb. 1 it will restore the schedule of fares which had prevailed from Nov. 1, 1906—when the maximum one-way rate was voluntarily reduced to $2\frac{1}{2}$ cents a mile—until Oct. 1, 1907. On the latter date, when the 2-cent fare act became effective, all one-way rates were reduced to conform to the law as it stood. The system of passenger fares which prevailed prior to Oct. 1 will, after Feb. 1, again apply to all portions of the Pennsylvania Railroad within the State of Pennsylvania, including the Buffalo & Allegheny Valley, the Philadelphia & Erie, and the United Railways of New Jersey grand divisions.

But as the act is held to apply to the Pennsylvania Railroad and its branches only, the 2-cent rate, until cases now pending before the courts are decided, will be retained on such portions of the Philadelphia, Baltimore & Washington and the Northern Central as are within the state of Pennsylvania and on the Bedford division and the Lancaster and Quarryville branch.

The company will also resume the sale of 180-trip three-month tickets, 100-ride tickets (good within a year) and all other commutation privileges which were withdrawn pending the decision of the courts. Although the 2-cent rate will still apply to the Philadelphia, Baltimore and Washington Railroad, the company will, after Feb. 1, restore all commutation privileges which were withdrawn Oct. 1, 1907. Pending the decision of the courts, the Pennsylvania Railroad and its affiliated lines East of Pittsburgh, Buffalo and Erie withdrew the issuance of orders for special rates to clergymen living along these lines. Beginning March 1 clerical orders will again be issued, the amount of work involved in preparing them making this delay unavoidable.



Chaser for Landis Die.

Portable Lathe Driven by Westinghouse Motor.

Electric motor drive has brought into use several convenient and labor-saving portable machines. An example is the portable bolt-turning lathe, for use in locomotive repair shops. The illustration shows a lathe made for this purpose by the Williams & Wilson Co., Montreal, Que., equipped with a Westinghouse motor. They form a compact unit, which is mounted on wheels. It can be

Portable Lathe, Driven by Westinghouse Motor.

lifted by a crane and placed beside an erecting pit and then shifted as desired by hand. When in working position the machine rests on the two rear wheels and the front legs. To move it, the legs are lifted from the floor and the load thrown on the front wheel by simply lowering the handle, which acts as a lever.

The motor is the induction type, 2 h.p., 1,700 r.p.m., connected through a friction clutch, providing for either 200 or 400 r.p.m. of the spindle. Direct current motor applications are equally successful. Current is carried by flexible cable connection to plugs located at convenient intervals. A simple and convenient connecting plug is made for the purpose. The advantages in the use of a machine of this type in work that requires turning each bolt to the proper size is readily apparent. It saves trips to and from the machine shop and enables the mechanic to do his work without interruption.

The Hendershot Shaft Coupling.

A new shaft coupling, to be known as the Hendershot coupling, is being put on the market by Manning, Maxwell & Moore, Inc., New York. The assembled coupling and the parts are shown in the accompanying illustrations. The advantages claimed for it are unusual strength, and quickness and ease of application. The shells A and B are first slipped on the shafting. The short taper compression sleeves, S, S, Fig. 2, are put in place and the shells are drawn over them and bolted together. The shells have cast lugs which engage each other so as to put the torsion strains directly on the shells themselves. This relieves the bolts of all shearing stresses.

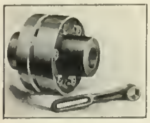


Fig. 1.

The internal surface, 3, on shell B, and the external surface, 4, on shell A, true up the coupling to approximate alinement which is made exact by keeping the faces 1 and 2 parallel while adjusting the coupling. This saves a good deal of time, particularly in a new factory where it is not convenient to start up to see how the line runs. The use of two sleeves makes it possible to put the

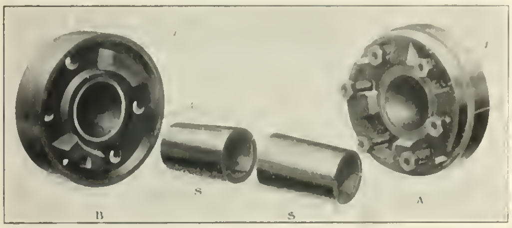

Fig. 2.

two halves of the coupling in place while the shafting is on the floor. It may then be hoisted into position and bolted together as easily as a plain flange coupling. In uncoupling, the shells can be drawn apart by screwing two bolts into holes tapped for this purpose. If the shafts to be coupled are of slightly different sizes or are a little out of line, or both, this coupling adjusts itself and the compression will be the same on the whole length of the sleeves. The strength of the coupling is increased, without increasing its outside diameter, by making the sleeves thinner and the hubs heavier. It is made of gray iron.

Trifles Make Perfection.

T. F. Whittelsey, General Manager of the Seaboard Air Line, has issued a general order, in which he says that "all officials and employees of the Seaboard Air Line Railway when answering telephone calls should do so with a rising inflection of the voice. The telephone is to a large extent the voice of the company, and we should assure our patrons that we are eager to communicate with them and in a cheerful and accommodating manner."

Third Class in China.

An Englishman who ventured his life in a third class car on the Shantung Railroad, where the trainmen are Chinese, found it disagreeable. These cars have three compartments, intended to hold 20 passengers each; but sometimes twice as many squeeze in. The rules say that a passenger may take into the car only so much baggage as he can carry in his hand; but it is common for one to have a pile of boxes, baskets and packages, sometimes making a respectable bale. Often the passenger piles the seat full of baggage and himself sits on the floor. Some bring bedding with them, and if they get into the car while there is room, they spread it on the floor and sleep, remaining undisturbed by the guard, however the car may be crowded afterwards. Meanwhile the air becomes thick with the smoke of Chinese tobacco, Japanese cigarettes and Manila cigars. The floor is littered with egg and peanut shells, sweet potato skins and melon seeds, and slippery with spilt soup and spittle. In the course of a few hours the car looks like a hogpen. The Chinese trainmen are obeyed by the Chinese passengers; but shrink before a European. A German tramp, without ticket, money or baggage, traveled on his face in a third class car nearly the whole length of the road. The trainmen would not venture to put him off.

John R. Walsh.

John R. Walsh, President of the Southern Indiana Railway, and late President of the Chicago National Bank, has been found guilty of violating the national banking laws in making loans irregular in form and without the knowledge and approval of the directors. That the acts were reckless and wrong, the evidence is convincing, but that they were with criminal intent there is no evidence, and, based on this, an appeal has been taken from the verdict. An acquittal was given in all the counts relating to the railroad company. This is a case of a great man and a good man, attaining great power, uniformly acting for the benefit of the community, and in this accomplishing great results and doing good in the world. With nearly uniform success from the time when he began as a Chicago newsboy, it was natural to get a confidence in his own judgment which made him impatient of control and perhaps arrogant in administering the affairs of a bank and the funds of depositors and stockholders. His fellow-directors were at fault and he was at fault, but for the purpose of estimating his character it is a fair plea in abatement to note that he became a banker late in life and in making loans without the knowledge of his directors he followed many precedents, and also that after the failure, by wonderful vigor and with sturdy integrity, he saved his depositors from loss.

Earnings of the United States Steel Corporation.

The United States Steel Corporation on January 28 reported its earnings for the three months ended December 31, 1907, by months. There has been no more striking testimony to the effect of the financial panic on business. The earnings, after deducting all operating expenses, including those for ordinary repairs and maintenance of plants, employees' bonus funds, and also bond interest and other fixed charges of subsidiary companies, were as follows:

October, 1907	$17,052,211
November, 1907	10,167,253
December, 1907	5,034,531

The earnings for October were the largest for any month in the company's history. As against the total of $32,500,000 for the quarter, the corresponding figure for 1906 was $41,700,000. In the quarter ended June 30, 1907, which was the largest on record, earnings were $45,500,000 and for the September, 1907, quarter $43,800,000. Unfilled orders on December 31, 1907, were reported as 4,624,553 tons, against 8,489,718 a year previous, 8,043,858 in March, 1907, 7,603,878 in June, 1907, and 6,425,008 in September, 1907.

Traffic Club of New York.

The January meeting of the Traffic Club of New York was held on January 28. James H. Gannon, Jr., Financial Editor of the New York *Times*, gave a clear review of the causes which brought about the banking panic of October and drew comparisons for the future from the year following the panic of 1893. C. H. Crosby, Vice-President of the United States Express Company, gave a general review of the express business, tracing its history from its beginning in 1839 and describing the various functions of the express companies. The difficulties of compliance on their part with the rules of the Interstate Commerce Commission may be judged from the fact that the filing of the rates to competitive points alone, including points at which there is competition by any possible combination of companies, required 39 volumes, which cost $45,000. It was announced that Governor Charles E. Hughes will attend the annual dinner, which is to be held on March 6.

Referred to the Committee on Standardization of Practice.

There is a station on the Chicago & North-Western Railroad at State Line, Wis., the depot being built on the boundary line between Wisconsin and Michigan, a white strip down the side of the building showing where one state ends and the other begins.

The station stood mostly on Badger soil and the town has been credited to Wisconsin. Since the passage of the Wisconsin eight hour law the company has moved the building into Michigan. The postoffice designated as State Line, Wis., is not in Wisconsin, and the agent-operator-baggageman-express agent-postmaster has to put in more than eight hours service.—*Press Despatch*

Final Decision in Axle-Light Suit.

Notice of the decision in the suit of the Consolidated Railway Electric Lighting & Equipment Co., New York, against the Adams & Westlake Co., Chicago, for infringement of its patent relating to car axle generating electric lighting equipment was given in our issue of March 29, 1907, page 462. That decision, which was rendered in the

Circuit Court of the United States for the Northern district of Illinois, Eastern division, held that with the exception of a single equipment which had been built by the defendant for a customer, the patent had never been infringed. Neither party was fully satisfied with this decision and both appealed, the complainant seeking to have the finding of infringement extended to cover all equipments of the defendant, and the latter asking to be relieved of the finding in the single instance referred to. On January 7, 1908, the United States Circuit Court of Appeals rendered a decision in favor of the defendant and ordered the suit dismissed.

Dinner to Mr. Vreeland.

Responding to numerous suggestions from the membership at large, the executive committee of the New York Railroad Club has arranged a reception and dinner to Herbert H. Vreeland, President of the club, to be given Feb. 7, the hour and place of meeting to be announced later. The announcement says: "Mr. Vreeland has for many years given most generously of his time and effort wherever possible to promote the welfare of the club. In unusual measure he has contributed to its continued success and present high standing. It seems peculiarly fitting that some evidence of our appreciation should be made manifest. Your committee has therefore decided that this testimonial dinner shall be by popular subscription at a cost of $5 per plate, that each member in attendance may feel he is present as a host and to personally attest his esteem for our president and guest." Members are asked to signify their acceptance by Feb. 1. The circular is signed by W. G. Besler, chairman; Frank Hedley, William B. Albright, Richard L. Thomas, Otis H. Cutler and Daniel M. Brady.

INTERSTATE COMMERCE COMMISSION RULINGS.

Coke Oven Basis of Car Supply Condemned.

The Commission, in an opinion rendered by Chairman Knapp, has announced decision in the case of the Powhatan Coal & Coke Co. v. Norfolk & Western and 56 coal operating companies in the Pocahontas district of West Virginia.

The complaint in this proceeding alleged that the method of car distribution known as the "coke-oven basis," enforced by the Norfolk & Western Railway Company in the Pocahontas-Flat Top coal district, unduly discriminates against the complainant, and asked that the so-called "capacity basis" of car distribution be adopted. The theory of the coke oven basis of distribution is that the available supply of coal cars shall be distributed to mine operators in proportion to the number of coke ovens erected by each operator. That is to say, the number of ovens erected by an individual operation divided by the total number of coke ovens in the district will give the percentage of the available car supply to which such operation is at any time entitled.

The Commission decided that the coke oven basis does not fairly measure the relative rights of the various operators, but unduly discriminates against complainant and operates to the unreasonable preference of other mining companies in the same field.

The Commission further declared that while the mine capacity of a given shipper may be greater than his allotment of cars, yet where this is also the case as to other shippers similarly situated in the same coal field, it is the duty of the carrier, when the supply of cars is inadequate, to fairly distribute the available number among all operators.

It requires only ordinary imagination, said the Commission, to see the illogical and artificial character of the coke oven basis. One company, with limited capital, uses its money in building coke ovens instead of extending its underground workings, while another company expends the same sum in enlarging its mining facilities, but without adding to the number of superfluous ovens. The necessary result would be that the former, with its mining capacity unchanged, would secure an increased car supply, while the latter, with largely augmented ability to produce coal, would have fewer cars for its shipment. A system which involves such absurd consequences is open to grave objection.

It appeared in the case that the Norfolk & Western some years ago became and still is the virtual owner of the coal lands on which the operations in question are located, the legal title thereto being in a land company whose stock is owned by the railroad company. The coke oven basis of car distribution seems to have been the outcome of the general policy of the railroad, in accordance with which the land company required each lessee of coal lands to construct a certain number of coke ovens per hundred acres of land leased. This policy was evidently adopted for the purpose of encouraging coke production and the manufacture in that district of articles which could be made by the use of coke. The railroad company preferred to discontinue the coke oven basis and apparently desired an order of the Commission as a justification for taking that course.

While the Commission is convinced by the facts and circumstances disclosed that the present basis is unjust and results in unlawful discriminations, it is not unmindful that the change which will be directed may occasion loss and injury to some of the operators whose expenditures for the construction of coke ovens, as required by their leases, may be materially and perhaps greatly diminished in value. Although not warranted in sanctioning a further continuance of the coke oven basis, which under existing conditions is found to be neither just nor suitable, the Commission does not desire or intend that the report and order herein shall affect the rights, responsibilities or liabilities of any of the interested parties under any contract or agreement which they might otherwise be able to enforce for their benefit. It is assumed that some form of capacity basis suited to the conditions and peculiarities of the district in question will be devised and put into effect, but the railroad should take the responsibility, at least in the first instance, of determining and applying the substituted basis.

The Norfolk & Western was ordered to cease and desist for a period of at least two years from enforcing the coke oven basis in said district. It was further ordered to establish for at least two years a regulation whereby coal cars shall be distributed fairly and equitably among the operators along its line in said district, without undue discrimination against or undue preference in favor of any of said operators.

TRADE CATALOGUES.

Bridges, Buildings and Foundations.—The Condron & Sinks Co., Civil Engineers, Chicago, have prepared a book of views of steel and reinforced concrete structures built after their designs and specifications. These structures include railroad and highway bridges, shops and mercantile buildings, foundations, reservoirs, tanks, roofs, etc. The illustrations, which are half-tone reproductions of photographs, are good and their arrangement is in good taste. Line engravings show two steel truss designs and a reinforced concrete arch. The book is 6 in. x 9 in. and has 31 pages.

Reinforced Concrete Culvert Pipe.—The American Concrete Co., Chicago, a new company, has prepared a pamphlet illustrating and describing its reinforced concrete culvert pipe. The characteristics, construction and advantages of this pipe are described in detail, and its economies compared with cast-iron pipe. The illustrations are full-page half-tones, mostly from photographs. The pipe has been used by the Chicago, Burlington & Quincy for over a year and was described in the *Railroad Gazette* of Oct. 12, 1906. The company also makes reinforced concrete piling and girders.

Testing Alternating Current Generators.—Bulletin No. 1,037 of the Allis-Chalmers Company, Milwaukee, Wis., describes the company's method of testing alternating current generators. It was perfected by B. A. Behrend, Chief Electrical Engineer, who makes it possible to get, comparatively easily, the most important data of the performance of alternating current generators while they are yet in the shop, the machines being subjected to full load conditions without actually putting them under full load.

Valves.—Catalogue No. 10 of the Golden-Anderson Valve Specialty Co., Pittsburgh, Pa., illustrates and describes Anderson cushion non-return valves, emergency stop valves, pressure reducing valves. Clean Seat valves and blow-offs; check valves, balanced plug cocks and blow-offs and Golden steam tilting traps. Other specialties include: Anderson automatic standpipes and counterbalance valves, automatic float valves, controlling altitude valves and strainers and fish traps.

Flexible Conduits and Conductors.—Pamphlet No. 429 of the Sprague Electric Co., New York, describes Greenfield flexible steel conduits and flexible steel armored conductors and cords, together with tools and fittings in connection with them. The conduits are made of rolled concave strips of steel, galvanized inside and out, and rolled spirally on each other so as to interlock. The conductors are armored with sheathing made in a similar way.

Car Couplers and Kindred Devices.—The Washburn Steel Castings & Coupler Co., Minneapolis, Minn., has issued its 1908 catalogue. It illustrates and briefly describes the car couplers and kindred devices made. The latter include a new design of car replacer, shown in this catalogue for the first time. The form and method of working these frogs are fully illustrated. The book is 6 in. x 9 in. and has 94 pages.

Signaling on the Union Pacific.—The passenger department of the Union Pacific has prepared an interesting pamphlet on its interlocking and block signal systems. The principles of both systems are explained briefly, and colored half-tone views illustrate the various indications of the signals. These engravings are made from photographs and give an excellent idea of the character of Union Pacific signal equipment.

London & North-Western.—The passenger department of this road has published a pamphlet describing in full the "American special" train between Liverpool and London. This service began with the first sailing of the "Lusitania" last fall. The train consists of a baggage car, five corridor cars and a dining car. The pamphlet is illustrated with line drawings of each type of car.

Injectors.—A pamphlet issued by William Sellers & Co., Philadelphia, Pa., describes and illustrates with sectional and prospective views the latest types of Sellers' injectors, giving dimensions, capacities and prices. Other specialties of the company are also included, among them being valves, water strainers and boiler washers.

Bolsters.—Bulletin No. 4 of the Atha Steel Casting Co., Newark, N. J., shows a number of types of cast-steel body and truck bolsters used by various steam roads. Driving wheel centers, motor frames, electric railway truck frames and cast-steel gears made by the company are also shown.

Electric Drive in Cement Plants.—Bulletin No. 4,555 of the General Electric Company, Schenectady, N. Y., describes the application of electric drive to cement plants, and gives information regarding different processes and the apparatus used in making cement.

Springs.—A pamphlet issued by the Union Spring & Manufacturing Co., Pittsburgh, Pa., illustrates and describes a number of types of coil and elliptic springs for locomotives and cars. Several styles of pressed steel journal box lids are also shown.

MANUFACTURING AND BUSINESS.

W. P. Cosper, Chicago, dealer in railroad specialties, has been appointed Central Western Agent for the Lord Electric Co., Boston, Mass.

The Detroit Seamless Steel Tubes Co., Detroit, Mich., is installing machinery to make larger sizes of cold-drawn seamless steel tubes. This increases materially the capacity of the plant.

The St. Paul, Minn., office of the Northern Electrical Manufacturing Co., Madison, Wis., has been moved from 21 East Fifth street to 516 Endicott building. T. E. Drohan, formerly Superintendent of the company's shops at Madison, is in charge of the new office.

A meeting of department and district office managers of the Allis-Chalmers Co. was recently held at headquarters in Milwaukee, Wis. The prevailing note during the meeting was one of decided optimism. With the possible exception of a single district, which depends on one particular product for its prosperity, reports indicate that there is a general resumption of business activity, and the outlook for purchases of material of all kinds, particularly power and electrical machinery, is encouraging. Many district managers stated that during the past two weeks inquiries have been many, and customers are only waiting for a little more nearly complete restoration of normal conditions to place large orders for apparatus.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

Engineers' Club of Philadelphia.

At the meeting of this club to be held February 1, there will be a paper on Engineering Problems in Road Construction, by Joseph W. Hunter, illustrated with lantern slides. The Secretary announces the election of the following officers: H. W. Spangler, President, Washington Devereux and William Easby, Jr., Vice-Presidents; Francis Head, Secretary, and George T. Gwilliam, Treasurer.

American Railway Engineering and Maintenance of Way Association.

The nominations for officers for this association to be voted on at the coming convention to be held in Chicago March 17, 18 and 19, are: President, Walter G. Berg (Lehigh Val.); Vice-President, L. C. Fritch (Ill. Cent.); two Directors, C. S. Churchill (Norf. & West.) and E. F. Wendt (P. & L. E.); Treasurer, W. S. Dawley (Mo. & North Ark); Secretary, E. H. Fritch, Chicago.

American Society of Mechanical Engineers.

The first meeting of the gas power section of this society is to be held February 11, in the Engineering Societies building at 29 West 39th street, New York. The subjects for discussion will be "Experimental Gas Turbines in France," illustrated with lantern slides; "A Simple Continuous Gas Calorimeter," "A Gas Engine and Producer Guarantee." Other subjects relating to the question of gas power will also be discussed.

Convention Plans for Supply and Machinery Associations.

A joint meeting of the committees appointed from the American Supply and Machinery Manufacturers' Association, the National Supply and Machinery Dealers' Association, and the Southern Supply and Machinery Dealers' Association, was held at Richmond, Va., last Friday to formulate a programme for the joint annual convention of these three associations to be held at the Jefferson Hotel, Richmond, May 13, 14 and 15, 1908. The complete programme will be ready for publication early in April and will be sent to all members of these associations fully a month before the convention.

The committees who met to arrange the programme were made up as follows:

American Supply and Machinery Manufacturers' Association.—M. W. Mix, Dodge Manufacturing Co., Mishawaka, Ind.; E. H. Hargrave, the Cincinnati Tool Co., Cincinnati, Ohio; C. F. Aaron, New York Leather Belting Co., New York; F. A. Hall, the Yale & Towne Manufacturing Co., New York; D. K. Swartwout, the Ohio Blower Co., Cleveland, Ohio; W. M. Hood, the Lunkenheimer Co., Cincinnati, Ohio; F. D. Mitchell, Secretary-Treasurer, New York.

National Supply and Machinery Dealers' Association.—George Puchta, Queen City Supply Co., Cincinnati, Ohio; A. T. Anderson, Secretary-Treasurer, Cleveland, Ohio.

Southern Supply and Machinery Dealers' Association.—J. C. Miller, Miller Supply Co., Huntington, W. Va.; Alvin M. Smith, Smith-Courtney Co., Richmond, Va.; Hunter B. Frischkorn, Hunter B. Frischkorn, Richmond, Va.; Levin Joynes, Southern Railway Supply Co., Richmond, Va.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Pere Marquette.—Henry B. Ledyard, Chairman of the Board of the Michigan Central, has been elected a Director of the Pere Marquette.

Operating Officers.

Baltimore & Ohio.—John G. Walber, hitherto Assistant General Manager of the Baltimore & Ohio Southwestern at Cincinnati, has been appointed Assistant to the Third Vice-President of the Baltimore & Ohio, with office at Baltimore, Md. Mr. Walber began his railroad career on the Ohio & Mississippi in 1885 and has been Secretary to various Managers and Vice-Presidents. He was made Assistant to the General Manager at Cincinnati four years ago.

Canadian Northern.—J. R. Cameron has been appointed General Superintendent, with office at Winnipeg, Man. A. Wilcox has been appointed Superintendent of the First division, with office at Port Arthur, Ont.

Canadian Pacific.—Grant Hall, who has been appointed Superintendent of Motive Power on the Western Lines of the Canadian Pacific, at Winnipeg, has been Assistant Superintendent of Motive Power for about three years past. Mr. Hall was born in Montreal and was educated at Bishops College School at Lennoxville, P. Q. He entered the service of the Canadian Pacific as a machinist in 1886 and was soon promoted to the position of locomotive foreman. In 1893 he went to the Intercolonial as general locomotive foreman, but in 1898 he returned to the Canadian Pacific and was rapidly promoted through the several grades until he became Assistant Superintendent of Motive Power of the Eastern Lines. In October, 1904, he went to the Western Lines, as before stated.

Grant Hall.

Chicago & Alton.—Patrick Henry Houlahan, who has been appointed General Superintendent of the Chicago & Alton, with office at Chicago, thus becoming the head of that department on both the Alton and the Toledo, St. Louis & Western, has held that office on the T., St. L. & W. for the past three years. Mr. Houlahan was born in 1855 at Ottawa, Ill., and began his railroad service in 1867 as a water boy with a track construction gang. By 1875 he had become a ticket agent and five years later conductor (on the Fox River branch of the Chicago, Burlington & Quincy). From 1881 to 1886 he was on the St. Louis division of the Burlington, rising from train despatcher to Assistant Trainmaster and then to the position of Trainmaster. In 1886 he went to the St. Louis, Arkansas & Texas, where he was Master of Transportation on the Missouri & Kansas division, but he soon returned to the Burlington, where he became Superintendent. From 1892 to 1905 he was Superintendent of the Hannibal & St. Joseph, a part of the Burlington System. From there he went to the Toledo, St. Louis & Western, of which road, as before stated, he has been General Superintendent for three years.

P. H. Houlahan.

Chicago, Burlington & Quincy.—Robert Rice, heretofore Superintendent of the Hannibal division, has been appointed Superintendent of the St. Joseph division, with office at St. Joseph, Mo. E. Welsie succeeds Mr. Rice at Hannibal.

Chicago Great Western.—Charles S. Weston, who has been appointed Division Superintendent of the Southwest division, with office at Des Moines, Iowa, has been for the past five years Superintendent at Red Wing, Minn. Mr. Weston was born in 1858 at Linden, Wis., and began his railroad service on the Burlington, Cedar Rapids & Northern as brakeman in 1879. He was rapidly promoted through the different grades until he became Trainmaster in 1901.

Missouri Pacific.—A. J. Abell has been appointed Superintendent of the Valley division of the St. Louis, Iron Mountain & Southern, with office at Monroe, La., in place of C. H. Bevington, resigned.

Northern Pacific.—George Arthur Goodell, who has been appointed General Superintendent of the Middle district of this road, with headquarters at Livingston, Mont., has for the past five years been General Superintendent of the Chicago Great Western. Mr. Goodell was born at Knoxville, Ill., on August 13, 1855, and began his railroad service on the Chicago, Burlington & Quincy in 1869 as a telegraph operator. He served for a short time on the Toledo, Peoria & Warsaw, and in 1877 went to the Burlington, Cedar Rapids & Northern, where he was promoted successively to the positions of train despatcher, Assistant Superintendent and Superintendent. In 1902 he left that road and went to the Chicago Great Western, as above noted.

G. A. Goodell.

Southern.—J. M. Bennett has been appointed Superintendent of the Winston-Salem division, in place of A. M. Smith; office at Winston-Salem, N. C.

Southern Pacific.—The report of the resignation of E. B. Cushing, General Superintendent at New Orleans, and the appointment of W. M. Hobbs in his place, is denied.

Engineering and Rolling Stock Officers.

Atchison, Topeka & Santa Fe.—A. Dinan, heretofore Master Mechanic of the Middle division, has been appointed Master Mechanic of the Missouri division, with office at Fort Madison, Iowa, in place of J. H. McGoff, promoted. G. W. Taylor, heretofore Master Mechanic of the Oklahoma division, has been appointed Master Mechanic of the Middle division at Newton, Kan., in place of A. Dinan. J. T. Lendrum has been appointed Master Mechanic of the Oklahoma division, with office at Arkansas City, Kan., in place of Mr. Taylor.

Colorado Southern, New Orleans & Pacific.—C. H. Fisk has been appointed Chief Engineer of Maintenance of Way, with office at Beaumont, Tex.

Missouri Pacific.—E. J. Correll has been appointed Division Engineer of the Valley division of the St. Louis, Iron Mountain & Southern at Monroe, La., in place of R. A. Gray, resigned.

Northern Pacific.—C. T. Hessmer has been appointed Master Mechanic of the Minnesota division, with office at Staples, Minn., in place of Williard Lincoln, resigned. Silas Zwight has been appointed Master Mechanic of the St. Paul division, with office at Minneapolis, Minn.

CAR BUILDING.

The Keweenaw Central has ordered 20 flat cars of 60,000 lbs. capacity from the Hicks Locomotive & Car Works.

The Pittsburgh, Canonsburg & Washington, under construction, intends to ask bids on electric cars about April 1. F. Uhlenhaut, Pittsburgh, Pa., is Chief Engineer.

The Duluth & Iron Range, it is reported, is in the market for 200 or more freight cars. Up to the time of going to press we have not been able to confirm this item.

The Woodstock, Marengo, Genoa & Sycamore Electric, which is to build 38 miles of road in Illinois, intends to ask bids on rolling stock in April. Charles A. Spenny, Chicago, is Secretary.

The Brownsville, Masontown & Smithfield Street Railway, under construction from Brownsville, Pa., to Uniontown, 36 miles, will ask bids on rolling stock in March. W. J. Sheldon, McKeesport, Pa., is President.

The Morgantown Interstate Railroad, under construction from Morgantown, W. Va., to Star City, four miles, will ask bids on electric cars about April 1. W. W. Smith, Morgantown, W. Va., is Secretary and Treasurer.

The Northern Pacific, as reported in the *Railroad Gazette* of December 6, will, it is said, be in the market for new passenger equipment within a few days. Up to the time of going to press we have been unable to confirm this item.

The Massillon, Wooster & Mansfield Traction, under construction from Massillon, Ohio, to Mansfield, 50 miles, will ask bids on rolling stock in about three months. G. A. Bartholomew, Williamson building, Cleveland, Ohio, is Chief Engineer.

RAILROAD STRUCTURES.

Austin, Tex.—The State Railroad Commission has made public improvement orders which direct that the following work be carried out by the railroads: The Chicago, Rock Island & Pacific to build new stations at Amarillo or to jointly build with the Fort Worth & Denver City a union station at that place; the Texas & Pacific to build new passenger and freight stations at Longview Junction and at Jefferson; the Fort Worth & Denver City to build new stations at Decatur, Electra, Quanah and at Amarillo; the International & Great Northern is required to replace all wooden culverts and bridges with concrete and steel structures.

Brooklyn, N.Y.—The Delaware, Lackawanna & Western company's freight yard, at Kent avenue and Cross street, is to be enlarged about 17,500 sq. ft., which will permit the handling of 25 more cars. When the yard is enlarged it is understood that the tracks will be rearranged. The improvements will give the yard 175 ft. more frontage on Washington avenue.

St. Louis, Mo.—Bids are to be asked for at once by the Manufacturers' Railway Company, controlled by A. Busch and associates, for putting up a steel and reinforced concrete elevated structure at Second and Dorcas streets, St. Louis, at an estimated cost of about $100,000. The work will call for about 3,000 cubic yards of concrete and 575 tons of steel. Address Edward Flad, Consulting Engineer, Fullerton building.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

Brownsville, Carmichaels & Waynesburg (Electric).—See Brownsville, Masontown & Smithfield.

Brownsville, Masontown & Smithfield (Electric).—Grading work is to be started early in February on this proposed electric line from Brownsville, Pa., south via Masontown to New Geneva, thence northeast via Smithfield to Uniontown, 36 miles. Surveys made for 20 miles and being continued on the rest of the line. The company has already graded about half a mile between Masontown and West Masontown. The work will include several viaducts. Contracts are to be let in February and March. E. C. McCullugh, Chief Engineer, Uniontown.

The Brownsville, Carmichaels & Waynesburg has been granted franchises and is shortly to be incorporated to build about 58 miles of electric lines from Waynesburg east to Carmichaels, thence north via Jefferson and Rice's Landing, in Green county, and Clarksville, Zollarsville and Bentleyville, in Washington county; also a line from a point on the Monongahela river opposite Rice's Landing northeast to Brownsville, in Fayette county. Work is expected to be started this spring from Rice's Landing to Waynesburg, 15 miles. When the organization of the company is finished it may be taken over by the Brownsville, Masontown & Smithfield. W. J. Sheldon, McKeesport, holds the franchises and is organizing the company.

Canadian Pacific.—William Whyte, Second Vice-President, is quoted as saying that in addition to the work already under way, the new work arranged for to be carried out during 1908 includes the completion of the following lines: Between Kirkella and Asquith, Sask., on the Edmonton branch, and a line to Hardisty, Alb.; also a line from Lanigan, Sask., to Sheho, 82 miles; between Woolsey, Sask., and Reston, Man., 23 miles; extension of the Winnipeg Beach line north to Icelandic river; and continuation of the line from Tuxford, Sask., 50 miles west. A large amount of bridge work is also to be carried out; in British Columbia many of the present wooden structures will be replaced by permanent structures.

Centralia Eastern.—Contract has been given by this company to W. F. Nelson, of Seattle, Wash., for building its proposed line from Centralia, Wash., northeast nine miles. Grading is expected to begin early next month. Contracts will probably soon be let for building five miles additional. B. A. Johnson, Chief Engineer, Centralia.

Chicago, Lake Shore & South Bend (Electric).—This company, building an electric line from South Bend, Ind., west to Chicago, Ill., 71 miles, has track laid on 48 miles. Grading will shortly be finished on 13 miles additional. It is expected to have the entire line in operation by July this year. A mortgage for $6,000,000 has been filed, of which $3,500,000 will be used for construction and the remaining $2,500,000 held for future extensions and improvements.

Cumberland Railroad.—Contracts let to S. P. Condon, of Knoxville, Tenn., for extending this road from Artemus, Knox county, Ky., south via Cumberland to Jellico, Tenn., 32½ miles. Track laid from Artemus to Cumberland, 8.2 miles. B. C. Milner, Chief Engineer, Warren, Ky.

East Carolina.—This road, which was recently extended from Farmville, N. C., south to Hookerton, 13 miles, is now open for freight service on this section, and the company expects to start passenger service next month.

Keweenaw Central.—This company is building a branch from Phoenix, Mich., to Eagle River, two miles.

Mexico, Santa Fe & Perry Traction.—An officer writes that this company began grading its proposed line from Mexico, Mo., northeast via Molino and Santa Fe to Perry, 27 miles, last November. J. M. Wolfe, Collinsville, Ill., has contracts for all the work, some of which has been sublet. About three miles of grading is finished and the company expects to have the entire line in operation about September of this year. The work includes a number of bridges for which contracts are soon to be let. An extension from Mexico to Columbia is also projected. S. L. Robison, President and General Manager, and C. O. Thon, Chief Engineer, Belleville, Ill.

Morgantown & Dunkard Valley (Electric).—Under the name of the Morgantown Interstate Railroad grading is now under way for an electric line from Morgantown, W. Va., to Star City, four miles. The work includes a bridge 600 ft. long. W. W. Smith, Secretary and Treasurer, Morgantown.

Morgantown Interstate (Electric).—See Morgantown & Dunkard Valley.

Mountain Central.—An officer writes that the projected extension from Campton, Ky., northeast to Hazel Green, has been abandoned for the present.

Pittsburgh, Binghamton & Eastern.—Building from Binghamton, N. Y., southwest to Clearfield, Pa., 232.5 miles. Grading under way from Renova, Pa., to above Westport. Contract let to the Holbrook, Cabot & Rollins Corporation, Boston, Mass. About 21 miles was built from Cedar Ledge, Pa., to Powell last year. Additional contracts will probably soon be let.

Branch located and most of the rights of way have been secured from Cedar Ledge to Oregon Hill, 32 miles. Work will probably be started this spring.

Red Bud & Belleville Interurban.—Incorporated in Illinois to build an interurban line from Red Bud, Randolph county, Ill., north through Monroe county to Smithton, 15 miles. C. Becker, Red Bud; J. Keller, Hecker, Ill., and B. A. Gundlach, Belleville, incorporators.

St. Louis & Oklahoma Southern.—This company has been incorporated with a capital of $10,000,000 to build a line from Benton County, Ark., southwest to a point near Oberlin, Bryan county, Okla., 260 miles. H. G. Baker and W. R. Eaton, of Muskogee; C. L. Stower, J. B. Christensen and J. H. Elton, of St. Louis, incorporators.

Southern Pacific.—The Cananea, Yaqui River & Pacific, building through western Mexico, it is expected, will be nearing completion by the close of 1908. The government concession requires that 248 miles of track shall be built this year, but the company plans to greatly exceed this mileage. Orders have been given for 30,000 tons of 65-lb. rails for delivery at Guaymas during 1908. Large quantities of construction materials are also arriving at Orendain, where the road will connect with the Mexican Central. The federal inspector of railroads reports that the following track has been finished: Main line from Guaymas southeast, 217.5 miles; from Mazatlan north toward Culiacan, 17.5 miles; Mazatlan south toward Tepic, 22.5 miles; Orendain toward Tepic, 7.5 miles; Nacozari branch, 18 miles; branch between Cananea and Nogales, 12.5 miles; branch between Alamos and Navajo, 47 miles; and on the branch between Corral and Cumaripa, 37 miles.

Susquehanna & New York.—This company, in 1907, finished an extension of its road from Pleasant Stream to Marsh Hill, Pa., from which point trackage arrangements have been made with the Pennsylvania into Williamsport. At Williamsport the company has shops and yards, and connection is made with the Philadelphia & Erie division of the Pennsylvania, with the Pennsylvania division of the New York Central and with the Philadelphia & Reading, giving a good connection from the coal fields of Pennsylvania to New England points. In addition the company has carried out revision work on its main lines from Tonawanda to Ralston, replacing light rails with 80-lb. sections and putting in heavy bridges to replace light structures.

Woodstock, Marengo, Genoa & Sycamore (Electric).—This company, which was incorporated last year to build an electric line from Woodstock, Ill., southwest via Marengo and Genoa to Sycamore, 38 miles, is ready to receive bids for material and for building the line. The company expects to begin grading work in May. Charles A. Spenny, Secretary, Chicago, Ill.

RAILROAD CORPORATION NEWS.

Baltimore & Ohio.—A semi-annual dividend of 2½ per cent. has been declared on the $8,000,000 common stock of the Cleveland, Lorain & Wheeling, which is operated by the Baltimore & Ohio. The Baltimore & Ohio owns about 75 per cent. of its stock. This is the first dividend on the common.

Boston & Maine.—This company has renewed for one year at 6 per cent. $1,000,000 5 per cent. one-year notes maturing on Feb. 15 and $1,000,000 5 per cent. one-year notes maturing on March 15. It has also arranged to sell $1,300,000 Boston & Lowell one-year 6 per cent. notes. This arrangement was in addition to the renewal of $1,000,000 5 per cent. one-year notes which fell due on Jan. 15, and $500,000 Fitchburg Railroad one-year notes which fell due on the same date, both of which were renewed for one year at 6 per cent. All these arrangements were made through R. L. Day & Co., of Boston, and associates.

Boston & Worcester Street.—E. H. Gay & Co., New York, have offered $250,000 4½ per cent. first mortgage bonds of 1923 of this company at 96. The Boston & Worcester has paid 6 per cent. dividends on its stock since completion of the road in 1904.

Chicago, Milwaukee & St. Paul.—On January 1 train service was extended so that the Pacific extension is now in operation from Mobridge, S. Dak., on the Missouri river west to Marmarth, N. Dak., 193 miles. At the same time the train service in Montana was extended. The road is now in operation in that state from Harlowton Junction east to Musselshell, 92 miles. It is expected that the road will be in operation from the Missouri river to Butte in May or June. Rails are being laid on the completed grading at the rate of about four miles a day.

CHICAGO, ROCK ISLAND & PACIFIC.—For the five months ended Nov. 30, 1907, gross earnings were $27,200,000, against $24,700,000 in 1906. Including in the operating expenses for 1907, $498,000 on account of depreciation of equipment, net earnings were $7,900,000, against less than $8,950,000 in 1906. As no similar depreciation charge was made in 1906, the net earnings for 1907 on a straight comparison would be $8,400,000 instead of $8,950,000. The other increase of $556,000 over the 1906 operating expenses was largely due to increased wages and higher cost of materials and labor.

CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—A semi-annual dividend of 1 per cent. was on January 28 declared on the $47,000,000 common stock. Four per cent. has been paid annually since 1901, in which year $3\frac{1}{2}$ per cent. was paid. In 1900 3 per cent. was paid. This was the first distribution since 1893, when also 3 per cent. was paid.

Income results (partly estimated) for the 12 months ended December 31, 1907, were as follows:

		Increase
Earnings	$26,384,300.00	$1,789,400.00
Expenses (76.11 per cent.)	20,081,300.00	1,648,600.00
Net earnings	6,303,000.00	140,800.00
Other income	180,900.00	27,700.00*
Gross income	6,483,900.00	113,100.00
First charges and taxes	4,520,900.00	214,800.00
Available for dividend	1,963,000.00	101,700.00*
Dividends†	1,911,500.00	100,200.00*
Surplus	51,500.00	1,500.00*

*Decrease.

†5 per cent. on preferred, and 3 per cent. on common, in 1907; 5 per cent. on preferred, and 4 per cent. on common, in 1906.

CLEVELAND, LORAIN & WHEELING.—See Baltimore & Ohio.

CONNECTICUT RAILWAY & LIGHTING.—See New York, New Haven & Hartford.

DELAWARE & HUDSON.—This company has borrowed $6,000,000 for six months at $4\frac{1}{2}$ per cent. from the First National Bank and Kuhn, Loeb & Co., of New York City. The proceeds will be used to pay off $6,000,000 one-year notes of the Quebec, Montreal & Southern, which mature early in February.

FLORIDA EAST COAST.—Harvey Fisk & Sons, New York, have offered at 98 to yield about 7 per cent. $750,000 3-year 6 per cent. notes due Aug. 15, 1910. These are part of a total issue of $5,080,000 which were issued in two series, $3,500,000 dated Aug. 1, and $1,580,000 dated Aug. 15, 1907. These notes are secured by $7,258,000 first mortgage 5 per cent. bonds of the Florida East Coast, which is at the rate of 70 per cent. of the par value of the bonds. The notes are further secured by the personal endorsement of Henry M. Flagler, of the Standard Oil Company. The first mortgage bonds which are deposited as collateral are all the first mortgage bonds outstanding, and are a first lien at the rate of $18,000 a mile on the main line from Jacksonville to Miami, 366 miles, 37 miles of branches and all the rolling stock and other property of the company. The proceeds of these notes were used in the extension which is being built south along the Florida Keys to Key West, which was recently opened as far as Knight's Key, 47 miles from Key West.

HUDSON & MANHATTAN.—The Hudson Companies, through Harvey Fisk & Sons, New York, are offering to preferred stockholders at $98\frac{1}{2}$, $50,000,000 6 per cent. 2-year collateral notes secured by $22,500,000 $4\frac{1}{2}$ per cent. convertible bonds of the Hudson & Manhattan Railroad. This company's line is soon to be in operation from the Susquehanna station to Hoboken to Sixth avenue and 11th street, New York.

ILLINOIS CENTRAL.—New financing is being considered. On June 30, 1907, bills payable outstanding amounted to $10,300,000 against $1,400,000 a year earlier. These represented principally construction expenditures on the lines to Indianapolis and Birmingham.

MISSOURI PACIFIC.—This company has $6,000,000 two-year 5 per cent. notes outstanding which mature on February 10. In order to refund them it has sold $6,000,000 two-year collateral 6 per cent. convertible gold notes dated February 10, 1908, which are secured by $12,000,000 Kansas & Colorado Pacific first refunding mortgage 30-year 6 per cent. bonds dated February 1, 1908, guaranteed by the Missouri Pacific. These notes have been offered by Taller & Company of New York at 99, yielding 6 per cent. income. The Kansas & Colorado Pacific owns 1,450 miles of the Missouri Pacific lines, including the Colorado through line. This new mortgage is subject to prior liens, at the rate of $15,541 per mile. The authorized issue of the new bonds, including refunding of the prior liens, is limited to $30,000 a mile, or $43,500,000. These notes, being secured by bonds, are believed to be a legal investment for insurance companies in the state of New York. They are the first convertible notes ever issued by any company.

The Attorney-General of New York has rendered an opinion that in order to have their bonds qualify as legal investments railroad companies must pay dividends in cash. The bonds of the Missouri Pacific, heretofore legal savings bank investments, will therefore cease to be such on expiration of a year within which the company has not paid cash dividends equal to at least 4 per cent. on stock. The January dividend of $2\frac{1}{2}$ per cent. was paid in stock. If, however, the Missouri Pacific should before the end of 1908 declare a total dividend of 4 per cent. in cash the bonds of the company would still remain legal savings bank investments.

NATIONAL RAILWAYS OF MEXICO.—It is probable that the financial plan for the merger of the Mexican Central, the National of Mexico, the Mexican International and the Interoceanic will be announced shortly. Its general terms were announced in 1907, but it was postponed because of the financial situation.

NEW YORK CENTRAL & HUDSON RIVER.—The option given by the New York, New Haven & Hartford to the New York Central to buy a controlling interest in the $29,160,000 New York, Ontario & Western stock held by the New Haven at the price paid for it by the New Haven, $45 a share, has been again extended; this time indefinitely. The original option expired on April 1, 1907, and the second on January 1, 1908.

NEW YORK, CHICAGO & ST. LOUIS.—An annual dividend of 5 per cent. was on January 28 declared on the $11,000,000 second preferred stock. In 1907, 4 per cent. was paid, from 1902 to 1906 inclusive, 3 per cent., and in 1901, 2 per cent., the first payment on this issue.

NEW YORK CITY RAILWAY.—The receivers of this company have brought suit in the United States Circuit Court at New York against the Metropolitan Securities Company and its directors, alleging that these directors, most of whom were also directors of the New York City Railway, entered into a conspiracy whereby the notes of the New York City Railway were sold to the Securities company at a discount of 30 per cent. It is claimed that the Securities company derived a profit of $2,797,200. The New York City Railway asks for an accounting. The Metropolitan Securities Company is the owner of all the stock of the New York City Railway.

NEW YORK, NEW HAVEN & HARTFORD.—At a recent meeting of the stockholders of the Connecticut Railway & Lighting Company the Chairman said that the company is earning about 4 per cent. on its $8,100,000 4 per cent. cumulative preferred stock and 2 per cent. on its $9,000,000 common stock. The road is leased to the New York, New Haven & Hartford. It has 193 miles of track in trolley lines.

The $39,029,600 convertible 6 per cent. debentures offered in December at par to holders of stock and debenture bonds have been fully subscribed. Between $20,000,000 and $25,000,000 has already been paid in.

NEW YORK, ONTARIO & WESTERN.—See New York Central & Hudson River.

NEW YORK-PHILADELPHIA COMPANY (ELECTRIC).—This company operates trolley cars between Philadelphia and Jersey City. It owns about two-thirds of the stock of the Camden & Trenton Railway and all the stock of the Trenton & New Brunswick. These companies are now in default in interest payments on their bonded debts.

PITTSBURGH & LAKE ERIE.—Gross earnings for the year ended Dec. 31, 1907, were $14,900,000, against $14,500,000 in 1906, and net earnings $3,384,000, against $3,288,000 in 1906. Of the gross earnings, $13,300,000 were from freight, against $13,000,000 in 1906, and $1,400,000 from passenger, against $1,300,000 in 1906.

QUEBEC, MONTREAL & SOUTHERN.—See Delaware & Hudson.

ST. LOUIS & SAN FRANCISCO.—Kleybolte & Co., of New York, have offered at prices yielding $6\frac{1}{4}$ per cent., $669,000 6 per cent. equipment trust certificates maturing semi-annually from 1908 to 1918, inclusive. These cover 45 locomotives bought from the Baldwin Works for $743,690.

UNION PACIFIC.—The Attorney-General of the United States has directed that a bill in equity be filed in the United States Circuit Court at Salt Lake City, Utah, to set aside the control by the Union Pacific of the Southern Pacific and the San Pedro, Los Angeles & Salt Lake, and to have declared illegal its ownership of stock in the Atchison, Topeka & Santa Fe, the Great Northern and the Northern Pacific, on the ground that all these lines are its competitors. F. B. Kellogg and C. A. Severance, of St. Paul, who were the counsel for the Interstate Commerce Commission in the Harriman investigation of 1907, have been engaged as special assistants to the Government. See editorial columns.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK

BRANCH OFFICES AT 375 OLD COLONY BUILDING CHICAGO, AND QUEEN ANNE'S CHAMBERS WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. *We give in our editorial columns* OUR OWN *opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.*

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS

W. H. BOARDMAN, *Prest. and Editor.*
E. A. SIMMONS, *Vice-President.*
RAY MORRIS, *Secretary*
R. S. CHISOLM, *Treas.*
I. B. RINES, *Cashier*
L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Managing Editor*
BRAMAN B. ADAMS
CHARLES H. FRY
FRANK W. KRAEGER
GEORGE L. FOWLER
HUGH RANKIN
BRADFORD BOARDMAN

CONTENTS

VOL. XLIV., No. 6. FRIDAY, FEBRUARY 7, 1908.

Engineers and contractors who have occasion to use concrete piles would do well to read C. R. Gow's article in the October number of the *Journal of the Association of Engineering Societies.* He believes that the concrete pile has come to stay and must be accepted by the engineering fraternity as a permanent addition to the list of foundation expedients, but like all innovations it can be overdone through excessive enthusiasm and the desire to try something new. "Economic considerations usually demand that a concrete pile shall be capable of replacing at least three or four wooden piles. To do this it must carry safely a load of approximately 30 tons. But it must be borne in mind that the ground under and around the pile must ultimately carry this load, and since there is a limit to the carrying capacity of any soil, there must also be a limit to the load we can concentrate on one pile of ordinary section." This imposes severe demands on a small section of concrete, requiring particular excellence of construction. Few, if any, of the present methods of making and driving concrete piles are free from objectionable features; they also involve an element of risk. Concrete pile construction falls into two general classes—those built in place and those cast and driven. The former leaves some doubt as to the final sufficiency of the pile because of the inaccessibility of the space in which the concrete is placed and the uncertainty as to what takes place during and after placing the concrete. The second, while of assured quality of construction, involves a factor of considerable uncertainty in the driving. Different conditions require different methods, and careful study by the engineer is recommended before making a choice. The author of the article describes several methods used in special cases, explaining the reason for their adoption. In connection with one of these, where it was necessary to use cast piles, he records an interesting fact. Construction of the piles was begun late in the fall and an unexpected freeze caught a large number, some before initial set and all before final set. These lay exposed throughout the winter, alternately freezing and thawing. It was decided to make a test to determine the actual condition of the piles after such an experience. After thawing one and testing it immediately thereafter for crushing strength, with results that were not very satisfactory, another was thawed and then allowed to remain in a warm room for four weeks before testing. It made practically as good a showing as an unfrozen pile tested at the same time, indicating that it had recovered practically full strength as soon as the freezing action was permanently removed. All the frozen piles were subsequently used.

"Thermostat," whose letter we print, makes a complaint which will fit a good many railroads, though he does not name a single one. As he speaks of the third rail his first incident must have occurred on the Long Island or the New York Central; and as his second happened at the Grand Central station, New York, it seems likely that he means the N. Y. C. But his grievance cannot be against that road, for it has a specific rule which forbids such neglect of passengers;* therefore by a "process of exclusion" the guilt is fastened on the New Haven road, which runs trains over the New York Central tracks. But, as we have said, the New Haven is not guilty above others; and, to be sober about it, we cannot swear that all N. Y. C. conductors fully and intelligently carry out Rule X. Like the Bible and the standard code, that rule lays down principles, but does not fit all cases with specific instructions. To do this it would need to be greatly amplified. On most roads another amplification would be necessary—that of the force of trainmasters. To educate conductors so that they will carry out with thoroughness the spirit of this rule, high grade trainmasters who know how to improve petty practices without being petty-minded, should ride on trains very frequently, getting into real touch with the men. The trainmaster who has to supervise 500 trainmen has far too heavy a task. Taking Rule X as it stands, the trouble is that in practice it does not come into action until passengers have already done a considerable amount of worrying. Telling passengers, after an hour, that they will be detained two hours longer, is all right, if that is the best that can be done; but the passenger demands, and often justly, that he shall be informed in 10 minutes of a delay of, say, 10 minutes, or be advised that conditions are uncertain. Possibly some reader will say that we are going pretty well into small details; but no New York Central officer can complain at this, for the "general notice" in the N. Y. C. rule book says that "the

*RULE X, N. Y. C. & H. R. R.R.—Whenever the passenger service is [illegible] arranged the public shall be informed of the probable length of time of the interruption, and, when ascertained, the time the service will be restored. Advices from the superintendent received by station masters and station agents must be posted in a conspicuous place at the station. Announcement must also be made in waiting rooms and on platforms, and to passengers when purchasing tickets. Conductors of delayed trains must also inform passengers.

strongest recommendation any employee can have is the fact that by . . kindly accommodation of patrons he has secured the good will of the community." To do this, an employee must devote his days and nights to perfecting himself in what seem to be petty details.

TWO ANOMALIES OF A RAILROAD SITUATION.

At a time like the present when the country is in the penumbra of recent panic and when business is recessive the noun "contraction" becomes a kind of all round watchword. Limiting the term to our railroads there is still for the word scope enough and to spare. There is contraction of train service, contraction of shopwork, contraction of improvements and contraction of credit measured by the high interest rate on the new railroad loan unless it happens to be very highly secured. The railroad manager is asking not as much what he can do as what he can do without—where he can economize most and where he can expand least, if at all. Such a situation always flings to the surface certain anomalies which just now, owing to somewhat exceptional causes, are peculiarly conspicuous.

The present stress in American railroading has followed close on two uncommon conditions, which to some extent have denoted cause and effect. One of them has been the era of corporation baiting shared by both federal and state authority and the first in a great degree an irritant and promotor of the last. In the states the anti railroad hostility has in a measure calmed down. At Washington it would calm down but for the assertiveness and persistency of the executive, to use the mildest words of description. But public sentiment toward the railroad still remains sub-acute and exacting and pushes some anomalous and unjust demands. The railroad, hard pressed to pay moderate dividends, perhaps even to pay fixed charges, tries to retrench. But public sentiment resists the privilege which it concedes to the private corporation. The big factory may close and discharge its thousand hands and there is no public note save one of passing regret. But let the railroad take off a single unprofitable train and public outcry rises. Certain fundamental rights of private capital are denied to the quasi-public capital invested in the railroad. True, the railroad corporation has derived from the community, crystallized into the state, a charter that conveyed a franchise and certain privileges including that of eminent domain. But the railroad has shared with the public the task of making the franchise valuable; it has been attended with greater or less risk to the invested private dollar; and public necessity and convenience have been served by utilizing the franchise. Who will say that, under such conditions the private dollar publicly invested has not served a community better than the private dollar privately invested? Yet hard times and forced retrenchment give us the paradox of public pity for the one, public censure for the other, and that whether the company is poor or prospered, diluted by water or solidified by past reorganization and loss.

Another anomaly or at least novelty, in the railroad situation bears upon the attitude of the railroad corporations toward labor in the existing period of stress and strain. Prosperity, reaching over several years previous to the present recession, had produced the usual result of higher wages and more thorough organization as well as enlargement of the unions. Some of the railroad companies not only had raised wages a number of times but raised them last year not long before the financial flurry and its aftermath. The railroad corporations, therefore, face the dilemma of risking a strike by a general reduction of wages on the one hand, or, on the other hand, of reducing the hours or the number of hands or both. Ordinarily the first alternative would have been adopted. Under the peculiar conditions the railroads are now almost universally adopting the second, although they may be forced to general wage reductions later when the number of unemployed makes a strike more improbable or its effects, should it come, less serious. The results in the ranks of "highly organized" railroad labor are anomalous and impressive. Instead of the usual and orthodox scaling down of wages evenly distributed with the minimum of suffering there is now an uneven distribution. A certain number of hands retain their old hours and pay; others, not a few, retain the old *rate* but, with lessened hours, diminished absolute pay; and a large number are discharged and get no pay at all. Organization of labor on the railroads and the consequential dread on the part of railroad managers of an organized and costly strike has thus forced privation and hardship on the man out of work instead of dividing them in a much lesser degree in reduced wages with the man who holds his job. One union man must starve that another union man may have the union wage.

The outcome of such an anomalous result of the theory of unionizing the railroad wage earners will be watched with interest as the enforced railroad economies proceed. As a disorganizing and weakening force on the unions its influence is manifest but that is only one branch of the general truism, that unions are strong during business prosperity and the reverse during adversity. The normal striker doesn't strike when another man is waiting for his job. But apart from that it will be instructive to see how far shorter hours, less absolute pay and imperilled work and wages brace up to greater efficiency the train man, shop man and track man. The head of a great railroad system not long ago called to his office the presidents of the unions, gave them some of the figures of reduced earnings, told them that many men must be discharged and that only greater efficiency of the men who remained would avert a sweeping reduction of the wage scale. That, in substance, represents the position of a good many heads of railroad corporations who front, not without grave solicitude, earnings that have run down while fixed charges, including wages, have run up. But anxiety has just now its place in the councils of organized labor as well as in the offices of railroad presidents.

SOME CAUSES OF WHEEL SLIDING.

The development of the high-speed brake, using increased brake pipe pressure and greater leverage in the foundation brake gear, has caused a gradual increase in initial brake shoe pressure up to more than 100 per cent. of the light weight of cars. Theoretically this high initial braking pressure should not cause flat wheels during ordinary stops from speeds above 40 miles an hour even under unfavorable conditions of wet rail, because the time required to bleed off the pressure in the brake cylinders through the high-speed reducing valve is less than the time required to reduce the speed to the point where the coefficient of brake-shoe friction begins to rise rapidly. Nevertheless flat wheels do develop, and frequently the size of the flat spots is such as to indicate that the wheel has skidded almost from the beginning of the stop. The not uncommon sliding for a car length at the end of the stop is not sufficient to produce a spot from 2 in. to 4 in. long, even with a sanded rail.

There are a number of causes of wheel sliding with these high braking pressures, which may occur singly or in combination. Some of them have not developed heretofore because the margin of safety between the braking pressure and the braking weight was great enough to take care of slight variations from the theoretical calculations of leverage and friction. They are nearly all due to defects in the design of the foundation brake gear, which is an equalized unit, while the wheels to which the brakes are applied are separate units.

In the usual arrangement of foundation brake gear the rod connecting the floating lever and the truck live lever pulls in a line from 14 in. to 17 in. to one side of the center of rotation of the truck. If both trucks rotate simultaneously and equally, the combined effect is neutralized, but if for any reason one truck turns more than the other when the brakes are set up hard there is an instantaneous increase in the brake-shoe pressures on the rotating truck which may be just enough to cause the shoes to lock on the wheels.

Every one who has watched the action of a truck when the brakes are applied has noticed the tilting which occurs, forward with outside hung brakes and backward with inside hung brakes. This results in a change in the static wheel loads, relieving the wheels under the high end of the truck of an appreciable part of their normal load. The brake-shoe pressure, however, is equalized and is the same for the lightly loaded wheels as for the heavily loaded wheels. This is perhaps the most common cause of flat wheels.

If the brake-shoe pressure is constant and at a maximum any instantaneous decrease in the pressure between the wheel and the rail may cause the wheel to lock. A bad joint in the track will cause the wheel to leave the rail altogether for an instant of time and give the brake-shoe a chance to take hold even though the opposite wheel on the axle is still carrying its normal load.

The method of hanging the brake-shoes below the center of the axle gives in effect a powerful wedging action to the shoe, which tends to drag under the wheel. There is no logical reason for this long continued practice except perhaps the limited clearance between wheels for inside hung brakes. Some experiments on street car trucks made a few years ago proved that brake-shoes hung opposite the center of the wheel were very effective in preventing flat wheels, even though a more powerful brake was used.

Sticking triple valves, giving undesired quick action applications at slow speed, are also a source of some trouble. The remedy is more frequent cleaning and oiling than was formerly required. With an increase in brake-pipe pressure from 70 lbs. to 110 lbs. there is a much greater pressure on the triple valve slide valve and this causes the oil to be forced out from between the valve and its seat in a short time. The valve sticks and does not respond to a light service application, but if this is followed by another application the valve jumps into quick action and is followed by all the other valves in the train.

CAUSES OF THE TERRA COTTA COLLISION.

The Interstate Commerce Commission gives in its annual report (see page 177 of this issue) what seems to be intended for its final conclusion on the Terra Cotta collision (Dec. 30, 1906); but as a résumé of the facts this statement is brief and incomplete, and as a decision it is still less complete. As this collision is one of the most notable of recent years and as it occurred on a block signaled line (the telegraph block system) it seems desirable that the facts and circumstances should be fully summarized.

The essential facts of the collision itself were given in the *Railroad Gazette* of January 11 and 18, 1907. These may be summarized as follows: Eastbound passenger train No. 66 of the Baltimore & Ohio was making its regular trip, on Sunday night, December 30, 1906, and had just made its stop at Terra Cotta station, about three miles west of the terminus at Washington, D. C. The time was between 6 and 7 p. m. and there was a dense fog. This train was run into at the rear by a following train of empty passenger cars, headed by engine No. 2120. Neither the engineman nor the fireman of No. 2120 saw the tail lights of No. 66, and the passenger train was pushed forward several hundred feet and its three cars wrecked. Forty-three passengers were killed and 67 injured. The stations involved, beginning at the west, are:

Silver Spring, day and night block office.
Takoma, 1.2 miles, day block office.
Terra Cotta, 3.2 miles.
University, 4.3 miles.
Q N, 5.3 miles, day and night block office.

The grade is descending from Silver Spring to Terra Cotta at about 1 per cent., with some irregularity. At Takoma the block signal usually is not operated at night after 6:30 p. m., the signal being at that hour (or soon after) put clear and the light extinguished. At Silver Spring the block signal is on the left of an engineman approaching from the west. At Terra Cotta there is a crossover, and at night, when Takoma is closed, it was the custom to give to all eastbound trains at Silver Spring, a permissive block signal indicating that the block through to Q N must be traversed under control and that a train may be switching at the crossover. The ordinary permissive signal is a green light, but in cases like this, where it is desired to give a special caution concerning a crossover, two green lights are displayed, the second being a lantern hanging on the signal post about 10 ft. above the ground. The signalman at Silver Spring gave to No. 2120 (as he had also given to No. 66) a white (clear) signal at 6:28 p. m. At 6:31 this train passed Takoma, the signal there being at red, but evidently not seen by either the engineman or the fireman; and the train passed that station at high speed and evidently continued at unchecked speed (though not using steam) until the collision occurred.

These are the facts as shown by the testimony of the signalmen, which was not shaken, and they indicate that the engineman of No. 2120 was not keeping a good lookout. This engineman had been on duty 48 hours with the exception of two periods of four hours each. During these two periods he had opportunity to sleep. During one or two other short periods he had been waiting, with no duties to perform, but had not slept. The statement of the signalman at Takoma, that his signal showed red and that the train passed his station at 6:31 at high speed was well corroborated by other testimony. The General Manager of the road in testifying before the Commission, accepted as correct the statements of the signalman at Silver Spring.

The enginemen tell a different story. Engineman Hildebrand, of No. 2120, claimed that the signal at Silver Spring was "double green"; that the time was past 6:30; and that, therefore, he was not bound to look for a signal at Takoma. All he would say concerning the indication of the Takoma signal was that he saw nothing as he passed there. But, on his own testimony, he was negligent in not approaching Terra Cotta with speed under control, there being a crossover there. Engineman Vermilion of No. 66 also testified that he had received a "double green" signal at Silver Spring, and that, therefore, he had concluded that Takoma had been closed for the night. But he acknowledged finding a white (clear) signal at Takoma, which, he said, surprised him. In view of the unshaken testimony of the signalmen, the most plausible explanation of the testimony of Engineman Vermilion and of the two firemen, who corroborated the testimony of their respective enginemen, is that they desired to support the theory which Hildebrand depended on to clear himself.

Engineman Hildebrand and also the conductor, the fireman and one brakeman of his train were indicted in the District of Columbia and tried for manslaughter, but, on December 23, 1907, were acquitted, after a trial lasting three weeks.

We make this summary at this time because, on account of the incompleteness of the Interstate Commerce Commission's report, and the unsatisfactory result of the criminal trial, railroad officers who are interested will, presumably, desire to form conclusions of their own. By reading again the testimony which we published a year ago, they can readily do this. The unreliable character of the trial before the court and jury is perhaps sufficiently indicated by the fact that, notwithstanding the clear indications of the preliminary inquiries, all the members of the crew of train 2120 were tried.

It is scarcely necessary to point out that the overwhelming preponderance of the support given to the signalmen's testimony goes to show that the opposing testimony was false. This conclusion is reinforced by the statement of the engineman's hours, raising a presumption that while running down grade he would easily fall asleep; and by the fact that, on his own testimony, he was running at dangerous speed. The Interstate Commerce Commission rightly calls attention to the employment of inexperienced block signal men, and to other collateral facts, but does not cite all of these facts, nor does it give sufficient emphasis to those that are cited. It is proper to recall these, for the testimony as a whole revealed loose or improper practices which go far to explain how such gross disregard of rules could come about. For example the omission to call to account enginemen who overran block signals appeared to have been common. An engineman who was willing to work excessive hours, at the risk of becoming too tired to attend to his duties, seems to have found it easy to do so, no vigilant officer being on watch to prevent such a dangerous practice. The practice of giving permissive signals constantly, even when clear signals could have been given, evidently tended to relax respect for the block signal rules, as one would naturally expect. Finally, the rule to regularly extinguish the Takoma signal light at 6:30 p. m., though not contributing to this collision, is shown to be one which ought to be changed. The worst result from it in this case was that it gave an opportunity to juggle with the facts as to the exact time that the trains passed different points. It is fundamentally unsound in that it permits an engineman to treat the absence of a signal as indicating "all right." This condition may seem to be provided for, when the order tells enginemen to treat such a block signal as though it were non-existent, but this is of questionable propriety, for whenever, by the light of the moon, or otherwise, the semaphore arm can be seen, the arm and the lamp seem to convey conflicting requirements. Even if the whole signal, post and all, were to be taken down and laid in the ditch it would still be desirable to have at that point some visible thing which the engineman could be required to see and to take note of. Again, the safety of the rule permitting enginemen to ignore a signal depends, in part, as was shown in this case, on their having accurate timepieces; whereas the block system should be safe regardless of inaccuracies in enginemen's watches.

The rule requiring passengers to show their tickets on entering the cars, which was adopted in the state of Missouri by the Chicago & Alton Railroad, December 1, has now been in force two months, and an officer of the road informs us that it has worked successfully. There is no friction or trouble and the people comply willingly. The circular which was issued announcing the change gave instructions that for the first week conductors might hold trains if necessary to allow passengers to go back to the ticket office to buy tickets, but it does not appear that serious delays were caused in this way. The reason why this new rule is necessary is that the law of Missouri, limiting passenger fares, forbids the railroads to charge an excess fare to passengers paying cash on the trains. Not being able to employ this inducement to buy tickets the company found itself confronted, on the advent of the 2-cent law, by a tremendous increase in the amount of cash fares, making it impossible in some cases for the conductors to make their collections. A number of local stations furnished an average of 30 cash fare passengers a day to certain trains. While, as in this case, the cash-fare evil is aggravated to some extent by the laws of the states, it is troublesome even where the railroads are free to adopt their own corrective measures, and it is much to be desired that such a rule should be adopted in a great many other places; that is to say, everywhere that it is possible to require such practice without causing serious delays to trains. The Alton tried a scheme of this kind ten or a dozen years ago, and, if we remember correctly, had it in force for a number of months on nearly or quite the whole of its lines, but there was considerable objection and we believe trains were delayed somewhat; and after a short time the old practice was resumed. It looked as though a good deal of the objection was based on other than sound and honorable reasons, and it can hardly be said that the experiment was continued long enough to warrant the acceptance of the apparently unfavorable results as conclusive.

Paul Kelly, the motorman of the elevated train of the Interborough Rapid Transit Company, New York City, which was wrecked at 53d street and Ninth avenue on September 11, 1905, has been tried, convicted and sentenced to state's prison for not more than two years and six months and not less than one year and six months. Kelly absconded immediately after the accident, but was persistently followed through many distant cities, and at last was captured. This accident, in which a dozen or more passengers were killed, one car falling into the street, was due to excessive speed on a sharp curve, the curve which leads from the Ninth avenue to the Sixth avenue line. Kelly's train was bound south on the Ninth avenue line, which is straight; but the switch was set for Sixth avenue, and Kelly passed around the curve without slackening speed. Home and distant signals were set against him. These signals consisted of lamps turning on vertical spindles. The side of the case of the lamp (the distant signal painted yellow and the home signal red) constituted the daylight indication. Kelly had been in the service of the road six months, running only on the Ninth avenue line. His previous experience had been on electric cars in St. Louis.

NEW PUBLICATIONS.

Course d'Economie Politique (Course in Political Economy). By C. Colson, Engineer in Chief of Highways and Bridges, State Councilor, Paris. Gauthier-Villars; 6th vol., 527 p., 6½ in. x 10 in.; paper cover. Price, 6 francs.

This volume is one of a number of books, forming together an encyclopedia of public works in which such questions as water supply, railroads, physics, steam engines and locomotives, bridges and masonry and the like are discussed. This sixth volume of the course on political economy deals with public works and methods of transportation, and by public works are meant all those that are executed for the purpose of general utility, by the organizations of collective interest. The book opens with an explanation of its scope and plan, and shows the distinction that should be borne in mind between works that are executed solely by the public through its own servants and by its own means, for its own use and behoof, and those works which are of a *quasi* public character but are executed by private enterprise, by virtue of a formal delegation of the public power, as in the case of England and the United States where the situation is quite different from that in France. In these English-speaking countries the companies have no contract with the state, they are proprietors in perpetuity of the works which they build, they usually fix their own charges and subsidies and a division of profits is rare. But any public service, howsoever it may be organized, can be viewed as coming within the domain of political economy, because it is always possible to calculate its money value, at least approximately, as well as its usefulness to the community or nation. Questions of this character are treated in the first seven chapters in so far as they relate to methods of communication. In this there is an attempt to determine the cost of transportation theoretically, and there is a discussion upon the influence of tolls on services rendered, and an inquiry into the principle of making those who profit by the facilities pay the cost in contradistinction to taxing the public for the maintenance. There then follows a general resume of the situation in the matter of highways of communication in France, and in some foreign countries, with especial reference to the standpoint of traffic, expense and receipts. This is done from both a practical and theoretical point of view. The discussion of this question is at first limited to an investigation of the utilitarian value of a proposed work, and an inquiry into the elements which enter into the cost of transportation, the lowering of which represents the sole direct benefit accruing from the creation of or an improvement in the means of communication, and to which the indirect benefits must be added.

This is followed by an expose of the methods to be pursued in order to keep the receipts as high as possible in comparison with the taxes, without impeding traffic, and without falling into an arbitrary method of handling it in the establishment of the rates. An examination is also made into the effect of a multiplicity of enterprises that are intended to serve the same needs, and the agreements that may be made between them. The question of the extent to which private enterprise may be associated with public service is handled in a way to show the advantages and disadvantages that may be presented by exploitation by the state or by corporations, as well as the object and character of the control that should be held in the hands of the public. This portion of the subject is concluded by a study of the various methods that have been attempted for the exercise of this control and association of the two interests from a financial viewpoint, such as subsidies, guarantee of interest and a division of profits. Finally in the last chapter there is a summary of the principles that have been set forth relative to means of communication, showing how they may be applied to the distribution of water, gas, compressed air or the electric current. It is also shown at the same time, how these same principles extend to such enterprises as the establishment of sewers, the draining of swamps, the construction of levees to prevent inundation and the regulation of streams where the direct benefit accrues to a certain locality, but which differ in the fact that those who participate in them do not necessarily do so voluntarily, as may be said of travelers, and the consumers of water and gas, but, because they are located in a certain locality, must share in the results perforce, so that, in order that all interested may share in the expense, it becomes necessary that their contribution shall be a forced one, and shall not partake of the nature of a payment for services rendered, and yet it must be a direct rather than an indirect tax.

Naturally the book is based upon the conditions of affairs as they exist in France, in comparison with conditions in foreign countries, and in the use of such comparisons a warning is issued against drawing conclusions too quickly, because it is always necessary to consider the differences of national customs, temperament, legislative tendencies and the general organization existing. The work concludes with a plea that the principles of political economy should always be considered, in order that the future of liberalism and civilization may be insured.

Einfluss der Armatur und der Risse im Beton auf die Tragsicherheit. Mitteilungen aus dem Koeniglichen Material-Prufungsamt zu Gross-Lichterfelde, West, bearbeitet und besprochen von E. Probst, Zivil-Ingenieur. 77 illustrations, 9 plates. Berlin: Julius Springer, 1907.

The use of reinforced concrete is recent and as compared with the use of masonry and of iron in structures there are many points that require exact determination. Reinforced concrete is not a homogeneous material, its value for structural purposes depending on its composition, the manner of making the concrete and on the character and position of the reinforcing iron. It was for the purpose of obtaining precise data for deductions as to some of the important points on which the use of concrete and of iron in conjunction depends that the tests detailed in this monograph were made. They were carried out at the Royal Testing Station at Gross-Lichterfelde West, their scope and character were planned jointly by the author and Mr. A. L. Johnson, of St. Louis, Mo. The results of the testing station are given in tabulated detail, the mathematical deductions are those of E. Probst. The engineer and the investigator in the field of structural materials will find both worthy of study.

It will be of interest and may be an inducement to consult the original to give a short sketch of the ground covered. A detailed description of the materials used in the concrete, the proportions of these materials, the character and dimensions of the reinforcing iron and the manner of preparing and the dimensions of the test pieces is given. Preliminary tests were made on a large number of prisms and cylinders to determine the tensile, compressive and transverse strength, together with the modulus of elasticity of the concrete. Four different kinds of iron bars were used: plain round, square twisted (Ransome), bulbous (Thatcher), corrugated (Johnson), each kind being tested to determine its modulus of elasticity, its elongation and its tensile strength. The main tests consisted in determining the transverse strength of reinforced beams, experiments as to the liability to corrosion in the iron after fissures had been developed, bending tests to determine the capacity of adhesion between concrete and the different styles of bars.

The graphic and mathematical interpretations and analyses of the results are the work of E. Probst and the testing station is in no way responsible for them. They are given in extended detail and are clear and comprehensive. His discussion ends with a calculation based on his deductions of the factors of safety secured by following the official formulae governing reinforced concrete work in Germany, Switzerland and France. The nine plates give autotype reproductions of photographs showing the condition of the test pieces after the test in about one-eighth to one-quarter natural size, and the illustrations and diagrams throughout the work are ample and clear. E. F. E.

Proceedings of the Society for the Promotion of Engineering Education. Vol. XV.; 690 pages; 6x9; cloth. Edited by Charles S. Howe, Arthur L. Williston and William T. Magruder.

This volume consists of the proceedings of the fifteenth annual meeting, held in Cleveland, Ohio, last July. There are the usual lists of officers, committees and members, followed by about 50 papers and the discussions. Most of the papers deal with methods of teaching, but some of them go into wider fields. The authors, with a few exceptions, are members of the faculties of technical schools and colleges.

CONTRIBUTIONS

Wilson's Curve and Switch Tables.

Chicago, Jan. 29, 1908.

To the Editor of the Railroad Gazette:

Referring to a letter from Mr. S. S. Roberts, printed in your issue of December 27, 1907, in which he calls attention to errors in the explanation of the Curve and Switch Tables published in your issue of November 8, 1907, I wish to state that the line under the expression "CC-2G" was intended to act as a vinculum or the equivalent of a parenthesis, making the formula the same as the one given by Mr. Roberts, namely, N (CC-2G).

The explanation of the combined uses of tables I. and II. is for a turnout from the outside of the curve and not from the inside, the mistake being a stenographic one in the copy furnished you.

In the sixth line from the bottom of the second column, page 552 (issue of Nov. 8, 1907), the term "straight jacket" appears. Of course this is a misprint of "straight track." E. B. WILSON.

To Eliminate Petty Grievances.

New York, Jan. 28, 1908.

To the Editor of the Railroad Gazette:

Noting your comment in last issue relative to inconvenience of a passenger on a New York Central train, would say that while the second section of your comment is somewhat of an improvement upon the first section, I think that, on the whole, you do not attach enough importance to the general theme of the weight of minor complaints of this sort in their effect upon public sentiment and influence. I think that such complaints as are referred to have had a very important influence in shaping adverse public sentiment concerning railroad matters—more so than some larger features, such as mergers, etc., that have attracted much more public attention. It seems to me, further, that the railroad papers, by advocating the elimination of these minor causes of complaint, might have put their patrons, the companies, in a much stronger position before the public.

I feel very sure that such minor difficulties as the unnamed correspondent refers to have had more influence in shaping public opinion than $100,000 arguments by Joseph Choate on the sacredness of contracts, the right of corporations to a square deal and all other matters of that sort. In one case there is something definite before the private individual, a grievance that he communicates to his father-in-law, his mother-in-law and all his friends and relatives; in the other a mere generalization on an abstract subject which the average citizen only hears of through newspaper headlines.

I submit that you and other journalistic representatives of railroad interests can do good work for your patrons by urging the cutting out of petty annoyances. F. W. SAWARD,

General Manager, *Coal Trade Journal*.

Keeping Passengers in Suspense.

New York, Jan. 20, 1908.

To the Editor of the Railroad Gazette:

Men that go down to the sea in ships seem to be in a perilous and lonesome situation, and people take great pains to be considerate of their wishes. They are accorded special notice in holy writ, and the prayer book recognizes all kinds of people—good and bad—when they are in such a situation. In modern times, since we have come to rely more on our own ingenuity and less on prayers, the wireless telegraph has been invented for the benefit of men thus isolated, and unable to communicate with the rest of the world. A passenger on a suburban railroad train, however, is as bad off as he has ever been at any time since the world began; and his condition seems to be growing worse. On a train running out of New York not long ago a half dozen cars filled with passengers were kept standing for an hour at a point not far from a station, while the men got rid of some obstruction on the track; and the only way that any person on the train could find out whether the detention was to be 30 minutes or 30 hours was to go out in the dark and, braving the dangers of the third rail and of being struck by lightning express trains on adjacent tracks, search for some unofficial and reckless employee who would take the risk of answering a civil question.

Of course, many ladies and other persons would prefer to remain in suspense rather than go in search of information under such conditions. One would naturally expect that after, say, 20 to 40 minutes, some brave spirit among the railroad men would find out what was the matter and spread the information in the cars. In this case, however, no such relief expedition came to us, and so the scores of passengers continued to sit decorously in their places, contented and ignorant. I was one of those who had an interesting story to read and, being in no particular hurry, have only a mild grievance. I am writing to you on behalf of those who had a more serious grievance but who did not know how to prosecute it. Why did not the telegraph and telephone stations within 500 to 1,000 ft. of that train impart some information to the passengers? Of course, they knew what the trouble was. They may have been utterly unable to predict the length of the delay, but, in such a case, passengers are glad to know that they are unable; to know that someone at least desires to measure the length of time which is going to be lost, even if he can't do it. Or, supposing the stationman or signalman is not fully informed, why should not the superintendent advise him at once? If the superintendent is not on duty (this was about 7 p.m.) why should not the train despatcher on duty be a man as big as a superintendent?

It would do no good for a state railroad commission to issue an order to regulate a matter like this, for improvement, if there is to be any, must depend on the railroad superintendent himself. A commission could say that passengers must be promptly informed, but the real issue hinges on what interpretation is put upon the word "prompt." Judging by the way relief trains are made up and sent to wrecks, it may often happen that to act in one hour is prompt. Surely a state commission, prescribing general rules, could not try to figure closer than one hour, but the railroad superintendent can do much better than this. On a road with block-signal stations every two or three miles communication ought to be had with headquarters from a delayed train usually in 20 minutes or even less.

A smaller but equally exasperating delay happened to me only last week. I boarded a train at the Grand Central Station, New York City, at 6.30 p.m. It started out on time and progressed beautifully for about one-eighth of a mile—that is to say, one-quarter of the distance through the yard; and then stopped. We were backed down into the station and stood there 30 minutes while the engine was repaired or changed. During that half hour we saw no relief expedition whatever; though the candy peddler, who had "worked" the train before it started, came back and renewed the attack. As in the former case, I had a book and so did not much care. I am writing now simply to let you know my poor opinion of the railroad. Here, again, although we were in a station, we were worse off, as before suggested, than if we had been 1,000 miles east of Nantucket lightship; for there Marconi would have helped us. THERMOSTAT.

Chilled Iron Versus Steel Wheels.

107 Fenchurch St., London, E. C., Jan. 25, 1908.

To the Editor of the Railroad Gazette:

The article entitled "Comparative Physical Tests of Car Wheels and Tires," running through the present volume of your paper, has proved very interesting reading, but to my mind it seems that the chilled cast-iron wheel does not come in for its fair share of commendation; in fact, it appears to be brought in for adverse criticism only, whereas by noting the results carefully, and endeavoring to bring them in line with actual running conditions, the chilled iron wheel apparently shows itself for all practical purposes equal to the steel wheel for ordinary freight rolling stock as in use in this country and the Colonies, and especially for narrow-gage light stock of all type, and therefore to be recommended to all who are aiming at obtaining the best results at the least cost, owing to the great economy effected in the first cost of the cast-iron wheel against that of the steel wheel, provided, of course, that the chilled wheels are purchased from a manufacturer of reputed standing.

The cast iron wheel tested on the short length of track, as mentioned in Chapter 2, is stated as having a depth of chill of about ⅝ in., whereas a fracture of a 28-in. diameter wheel of Messrs. Miller & Co.'s (a Scotch firm) make now before me shows a chill extending over [illegible] in. deep, which should therefore give even better results than the one tested.

Now, in the first chapter it is stated that "In the tests for both cast-iron wheel and steel wheel the permanent set was all in the rail. The rail * * * showed signs of a permanent set under a load of 20,000 lbs.," this seemingly applying both to the cast-iron and the steel wheel. Taking, for example, an ordinary 12-ton wagon, and assuming a tare of eight tons, this gives when fully loaded a wheel load of 11,200 lbs., therefore with regard to the question of giving a permanent set to the rail no notice need be taken.

Again, on referring to the diagram on page 10, it is shown that the area of contact is practically the same for both cast-iron and steel wheels up to 22,500 lbs., although owing to the co-efficients of slipping and skidding being slightly more for the steel wheel, a small advantage is on the side of the steel wheel, but hardly worth considering. Further, it is shown that the chilled iron wheel does not break or show signs of yielding until a load of 27,000 lbs. is applied, therefore this point need not be brought into very serious consideration, as the maximum weight per wheel would not approach within 50 per cent. of this under ordinary conditions.

In the test for wear, on a length of track it was shown that at three miles an hour the chilled iron wheel wore away at about $5\frac{3}{4}$ times faster than the steel wheel, while at 12 miles an hour the positions were practically reversed, owing, it is assumed, to the tires becoming heated. Granted this, the balance is all in favor of the chilled wheel, because the brake would ordinarily be applied when the speed of the truck averaged 10 or 12 miles an hour, and cause, according to the figures given, the steel wheel to wear at 4.6 times the rate of the chilled wheel, and this state of things should, without doubt, continue until the train was brought to rest, as when the speed had been reduced to three miles per hour, surely the tire would not get cooler?

The laboratory tests for abrasion are valuable so far as demonstrating the points of greatest density and hardness of the metals, but owing to the tests being made in a manner far from approaching ordinary running conditions, do not seem to be of much service in comparing chilled iron wheels against steel wheels. It would, however, be very interesting to know the result of the test for hardness on the Martel scale of the cast-iron wheel; surely one was made? But possibly this was suppressed owing to showing a superiority over the Schoen wheel.

In conclusion, may I be permitted to give a couple of extracts from a paper by Mr. W. E. Fowler, Master Car Builder, Canadian Pacific Railway, on the Chilled Iron Wheel? "The importance and value of the cast-iron wheel in railroad service lies unquestionably in the wearing qualities of its tread or tire, the more than steely hardness of which gives more mileage for the same amount of wear (or metal removed), than any other wheel in existence. And not only does it stand up well under its present service conditions—that of carrying heavy loads over steel rails made as hard as they can be without danger of breaking, it also withstands with comparative freedom from failure the tremendous friction of the brake-shoes when making stops from a high speed, or when descending long heavy grades.

It is not uncommon in mountain districts to see the grease on the face of the wheels smoking from this cause, the wheels themselves being too hot to touch, and the brake-shoes red-hot, and it will be, I think, very difficult to produce materials of any other kind, which will give us wheels so serviceable, so economically manufactured, and so valuable when worn out, as the chilled cast iron wheel."

And again: "The 600-lb. wheel costs about $10.80 new, and after giving a mileage of 40,000 to 70,000, it is turned back to the foundry at a scrap value of about $7.80, giving a cost per 1,000 miles of about 5 cents.

Can it be possible that this showing can ever be beaten with any other kind of wheel?

A. T. PERRIN,
Of Alexander Penney & Co.

The Bay Shore Cut-Off of the Southern Pacific.

The Bay Shore cut-off of the Southern Pacific out of San Francisco was opened December 8, notice of it being given in our issue of December 14. The construction work, which was very heavy, was described in the *Railroad Gazette* of March 15, 1907. This line forms a direct and easy entrance into the city for the Coast Line of the road, saving over $2\frac{1}{2}$ miles in distance, and as much as 30 minutes in time for some trains, as compared with the Ocean View line, which it supersedes. The latter climbs through the high ranges of hills on the south of the city and, in order to find workable grades, makes a considerable detour to westward. But even with this it has heavy helper grades of 158 ft. to the mile southbound and

Tunnel 2; Bay Shore Cut-Off.

Track from Tunnel 4; Bay Shore Cut-Off.

Tunnel 5; Bay Shore Cut-Off.

a maximum elevation of 292 ft. above city base. The new line pierces the hills avoided by the other. Although only about 10 miles long it has almost two miles of tunnels, cuts with a maximum depth of 96 ft., and over 3,600 ft. of permanent creosoted timber trestle and steel bridges carrying the road over city streets. The maximum grade of the line is 15.84 ft. to the mile, and it is only 20.3 ft. above city base at its highest point.

We show herewith some interesting views of the finished line. The right-of-way and general design are for a four-track road, but only two tracks have been built.

Tunnel Under St. Joseph's Orphan Asylum.

Annual Report of the Interstate Commerce Commission.

The first part of the twenty-first annual report of the Interstate Commerce Commission, sent to Congress recently, was given in the *Railroad Gazette* of January 10. The present article deals with other portions for which there was not room in that issue.

Decisions of the Supreme Court.—Of the whole report, which fills 157 pages, about 25 pages are filled with court decisions relating to enforcement of the commission's orders, to injunctions to restrain proposed changes in rates, demurrage charges, free passes, the Schlemmer and other safety appliance cases, and many other subjects, all carefully classified and digested. On three decisions by the Supreme Court of the United States special comment is made, these decisions being regarded as peculiarly important in their bearing on the work of the Commission. The first is that in the Texas & Pacific cotton seed case (204 U. S. 426), in which the court held that the only remedy against the payment of an unreasonable interstate rate was to apply to the Interstate Commerce Commission. No suit at law can be brought in the courts until the Commission has acted. This seems to mean that any claim for damages based on alleged unjust rates must be taken before the Interstate Commerce Commission. In the Illinois Central case (206 U. S. 441) the court held that as a general proposition the reasonableness of rates was largely a question of fact which must be passed upon in the first instance by the Commission, whose findings of fact would not be lightly disturbed; for the Commission will have studied the conditions and have seen the witnesses. In the Atlantic Coast Line case (206 U. S. 1) a jury in North Carolina found that the public interest required the running of an additional train at a loss to the road of $15 a day. The Supreme Court held that it was lawful for the state commission to compel such service. The court distinguished between a single rate and a schedule of rates; between a single train and an entire passenger service. The state must allow the road a reasonable return for its entire service, but still it may be justified in requiring a single train to be run at less than cost.

In the Illinois Central case referred to the court held that a railroad has no right to put its earnings into betterments and at the same time pay dividends, if the two appropriations together

Trestle Between Tunnels 3 and 4; Bay Shore Cut-Off.

Tracks and Tunnel 6; Bay Shore Cut-Off.

exceed a reasonable return on the value of the property. Improvements which are to increase the value of the property for many years must be paid for out of net income and not out of earnings.

Insufficient Railroad Facilities. The report, written probably two months ago, speaks of the shortage of freight cars and the lack of track capacity and other things which have blocked freight traffic during the past year, but the only recommendation is that "all who believe in the full development of the country should give earnest thought" to the problem.

Tariffs. An immense amount of work has been done in systematizing freight and passenger tariffs and condemning irregular and unlawful issues. Much is being done, but much remains to be done. In the year ending November 30, the Commission received 220,982 tariffs and about 100,000 notices of concurrence in tariffs. The task is declared to be by no means hopeless. The Commission believes that it is empowered by the law to modify the requirement that tariffs shall be posted in every station and proposes to issue an order allowing tariffs to be kept in the agent's office. He must keep those applicable at his station, and at one station on the road there must be a complete file of rates applicable from all stations. Every agent must have an index of this complete file. Agents must aid inquirers to interpret the tariffs, without asking them to give a reason for their inquiry.

Bills of Lading. The Commission expects soon to prescribe a uniform bill of lading which will be acceptable to all the railroads.

Uniform Classification of Freight. This is again mentioned and the Commission feels much satisfaction that the railroads are trying to carry out its wishes.

Opinions. The principal decisions made by the Commission during the past year are given in an appendix, and the more important ones are summarized in the report itself. These deal with free transportation, party-rate tickets, violations of the anti-trust act, unreasonable rates, estimated weights, elevator charges, compression of cotton in transit, undue discrimination in rates and in facilities, and through routes and joint rates. The number of contested cases decided from the time the revised law took effect to November 11, 1907, was 107. In 46 cases orders were made against the defendants; in 46 the complaints were dismissed, and in 15 no orders were issued.

Rebating. The Commission now has a "Division of Prosecutions" which has in charge investigations into criminal violations of the act to regulate commerce. This division prepares cases to be sent to the Department of Justice. Investigations made during the year show that rebating by payment of money or by billing at secret rates is now "far less" common than ever before, but preferences of a less tangible kind are still enjoyed by some shippers. These present practices are briefly described, including cases where a railroad buys property from a shipper at an exorbitant price, and even in some cases stipulating that the price of the property shall be determined by the number of shipments made.

Court Decisions.—A detailed résumé is given of court decisions since December 1, 1906, which have sustained the Interstate Commerce Commission law, such, for example, as that decision in the Standard Oil prosecution where a fine of $29,240,000 was imposed.

Work Done. During the past year the Commission has received 5,156 complaints, formal and informal, and has begun 415 formal investigations. The number of hearings held has been 276; more than three times as many as in former years. All departments of the work of the Commission in this direction show large increases. The aggregate amount of reparation awarded was $104,700, and about 200 reparation claims were denied. These claims are so numerous that the work has been made a special department of the Division of Statistics and Accounts.

Block Signal and Train Control Board.—The work of this board was noticed in the *Railroad Gazette* of January 10. In connection with the work of this board, the Commission suggests that Congressmen who want to have the board take up and consider all sorts of so called safety devices should have the scope of the law enlarged to provide for this.*

Block System.—A chapter is given, as in former years, briefly summarizing the accident reports as published in the monthly bulletins for the periods up to June 30, 1907. The number of passengers killed in train accidents for the last four years has averaged 303 a year. As in former years, the board recommends a law to compel the establishment of the block system and to empower the Commission to investigate train accidents. This subject and the necessity of suspending proposed increases in railroad rates until their justice can be investigated are emphasized by the Commission as the two specially important matters of the report. On the block system bill the Commission says, in part:

The collision horror continues to be a crying evil. There has, indeed, been a steady increase in the use of the block system on the railroads of the country, but in the great activity in passenger travel of the past few years, which has been rapidly growing year by year, the passenger business of non block signaled lines has increased, with that of others, and many passengers have been killed in collisions. In the few serious collisions that have occurred on block signaled lines the management and discipline in every case with possibly one exception have been shown to be glaringly faulty, demanding government investigation. This demand is urgent, as has been set forth in our previous reports.

So far as the Commission is aware the only objections to this proposal are: (1) That the accident record and its death list grow because traffic is growing, there being apparently no new causes, nor any reason existing now which has not existed for many years, which would warrant legislative action; (2) that the principal railroads are gradually extending the use of the block system without compulsion, and that therefore a law would be an unnecessary governmental interference with private enterprise; (3) that governmental action is liable to be harmful because of the difficulty of dealing by statute with such a subject as block signaling, embracing, as it does, complicated and delicate machines, a variety of details in operation and difficult scientific questions.

These arguments are adequately answered by obvious facts.

1. As percentages and averages in this matter contain very little instructive information, the first argument, as an argument, may be admitted. But it should have no weight unless we are ready to admit also that the evil referred to is incurable. Collisions continue to occur from the same causes that figured in the records forty years ago. Some of our railroads have taken successful measures to remove those causes; others have not. The principal remedial action has been the introduction of the block system.

2. The principal railroads have the block system in use and are extending it. But this extension is irregular and is subject to hindrances, and some prominent roads are extending it too slowly or not at all. A regulative and compulsory law is necessary to insure regular and uninterrupted progress. Errors of judgment on the part of railroad managers and engineers, or disagreements between such officers and their superiors, who, not well informed, refuse appropriations for signal improvements, have in well known instances proved decided obstacles to progress, and disastrous collisions have followed such procrastination.

3. The measure recommended by the Commission would not deal with the details of block signaling. As in the case of the safety appliance laws, it would simply require, in substance, that the railroads as a whole shall make progress in a direction in which the most intelligently managed roads are already making progress. The Congress would do a great service if it were only to compel the laggards to keep abreast of the standards of progress set by the best managed lines. The principal thing proposed, aside from the main requirement, is the provision for governmental supervision. Again making comparison with the safety appliance law, the situation as regards block signals is like that which the law of 1893 encountered in the case of automatic car couplers—a fair degree of uniformity (on the best roads) in the fundamental feature, but great diversity in details.

These details are not unimportant, however. Probably it is not a proper function of the Government to rigidly regulate or prescribe them, but it is important that they be given more publicity, and the Federal Government is the only authority which can bring about such publicity. In its two main provisions—(1) for a very liberal and unconditional requirement that the block system be used, and (2) for investigation, inspection, and supervision of block signal practice—the proposed measure is the same as that which was passed in Great Britain over seventeen years ago and which has produced such highly satisfactory results in that country. In a sense, supervision of block signaling has greater possibilities for good, as a governmental function, than has investigation of accidents, for it looks toward prevention of a certain class of accidents without waiting for the object lesson of an actual disaster.

It will perhaps be fair and just to require the railroads to adopt the block system in a shorter period of time than has been heretofore suggested. Some roads have made nearly or quite as rapid progress in the introduction of block signals as would probably have been required by law. It is believed, therefore, that no injustice will be done if railroads, or parts of railroads, having passenger receipts of $1,500 per mile per annum, are required to be brought under the block system in two years. Railroads having total receipts from all traffic of $3,000 per mile per annum should be subject to the same requirement.

Laws looking to the compulsory establishment of the block system are now in force in Massachusetts, Minnesota and Indiana, and the revised public service law of New York gives plenary powers in this matter to the public service commission of that State. There is as yet no indication that there will be any conflict between State and Federal laws on this subject, but as any law which the Congress, pursuant to the constitutional provision, may pass concerning interstate railroads will, without doubt, prevail as against any conflicting State statute, it is desirable that action be taken by the Congress without delay and before the state legislatures shall go further.

Investigation of Accidents. The investigation of collisions, derailments, and other serious accidents on railroads by competent experts is a matter deserving the careful attention of the congress. A recommendation to authorize such investigation has been made in previous reports, and the same recommendation is now again made. The daily and technical press have both endorsed the recommendations which have been made by this Commission. The causes of railroad accidents are often complicated and obscure and a cross examination and sifting of evidence is necessary in nearly every important case in order to bring out the truth and to rightly apportion the blame. Unlike some of the questions connected with the subject of rates, or other matters not affecting the safety of lives or the security of property, this subject of accident investigation (as well as that of block signaling) is one on which there is no doubt as to public policy. All persons are agreed that the lives of passengers on railroads should be better safeguarded, and there is little, if any, dispute as to the direction which any government activity should take.

As has been pointed out in previous reports, all railroad accidents should be reported to the Commission monthly, relieving the railroads' annual reports of this feature. To provide for this and as a definite embodiment of the recommendation for investigation a tentative draft of a bill is given in the Appendix.

Terra Cotta Collision.—In this chapter the Commission makes its first report on the collision at Terra Cotta, D. C., December 30,

*Senator Crane, of Massachusetts, on Jan. 9, introduced a resolution looking to the enlargement of the functions of the board.

1906, when 43 persons were killed. Acting under the Congressional resolution authorizing the Commission to investigate the subject of block signaling, a special inquiry was made into this accident. The report now embodied in the annual report is brief and apparently not intended as an exhaustive study or a formal decision. It says:

An extra train of empty passenger cars struck a regular train heavily loaded with passengers upon a division of road which was equipped with block-signal system, of manual control. Several intelligent and credible eye-witnesses testified that red signal was displayed against this extra train at a block-signal station passed by it shortly before the collision occurred; that the signal was disregarded, and that train proceeded at a high rate of speed. This was corroborated by telegraph operators who heard the operator in charge of that signal immediately report by wire the fact that this train had run by his red signal. The men who were employed on this train testified that if a red signal was there they did not see it. The testimony was conflicting and contradictory between the men on the train and those at the station as to the character of the signal displayed when this extra train passed the block signal station next preceding the one at which it was alleged the danger signal was disregarded.

Inquiry was made as to the care with which employees in charge of trains and engines and of block signal stations were selected, and as to the thoroughness with which their fitness for the positions was tested and determined. Many young and rather inexperienced men are employed as block-signal operators, but it was not shown that neglect or lack of experience on their part contributed to this disaster.

If the preponderance of evidence as to the condition of the signal at the last signal station passed by this train before the wreck occurred is accepted, the men in charge of that extra train are thereby convicted of having run by a danger and positive stop signal. On the other hand, if their own testimony as to the condition of the signal at the last signal station but one which they passed before the wreck occurred is accepted, they are thereby convicted of having entered the block under a caution signal, which, under the rules of the company, required that they run through the block with extreme care and with train under full control, and of having run through that block at a high and dangerous rate of speed, especially in view of the fact that at the time a dense fog prevailed; which fact, under the rules, would require extraordinary care and caution. Many references were made to incidents or instances of more or less important infractions of rules by employees and of absence of rigorous discipline by the company. This wreck was caused by disregard of rules and signals upon part of the men in charge of the extra train. Inquiry did not disclose act or omission on part of other employees or defect in the operating rules of the company which contributed to this awful occurrence. These men took charge of this train at noon and the collision occurred about 7 o'clock in the evening.

Concerning the collision at Lawyer, Va., where President Spencer was killed, the Commission made no investigation, but embodies in the report the conclusions published by the Virginia State Corporation Commission. These were given in the *Railroad Gazette* of May 24, 1907.

Safety Appliances.—From reports made to the Commission by its inspectors of safety appliances, the general condition of cars appears to be much better than it was a year ago. Somewhat fewer cars were inspected during the last year, the number being 271,617 for 1906, and 242,881 for 1907. Calls upon inspectors to investigate complaints of violation of the law were more numerous and they were also engaged more frequently as witnesses in court. For each 1,000 cars inspected in 1906 there were 139.34 defects; in 1907 there were but 94.14.

By an act of the last Congress the Commission's inspectors are required to examine mail cars and to report upon their construction, adaptability, design and condition. Since July 1, 1907, 70 postal cars have been inspected. Copies of reports of these inspections have been transmitted to the Postmaster-General, in compliance with the terms of the law.

Rigid enforcement of the interchange agreement, adopted as a result of conference between the Commission and the railroads, is largely responsible for the improved condition of equipment. The fact that cars cannot be delivered to nor received from connecting lines with defective safety appliances has practically resulted in double inspection. Cars are inspected upon arrival at a terminal or interchange point and again before delivery to a connecting line. This system works admirably and gives satisfaction wherever it is enforced. The roads most rigid in observing the interchange agreement are the ones upon which cars are found in the best condition.

Considerable increase in the number of men employed by railroads in repair work has been made at some points, but there are still places where more men could be employed to advantage. Difficulty in securing competent men has caused disabled cars to accumulate, and bad-order cars have been moved long distances to points where repairs could be conveniently made. As a result many complaints have been made concerning the movement of cars without drawbars and attached to one another by means of chains. This practice is extremely dangerous and the Commission has made every effort to put a stop to it.

The courts have decided that carriers must have men and material necessary to make safety-appliance repairs wherever there is likelihood of defects occurring, and to haul a disabled car past a repair point because it is more convenient to have repairs made at some point farther on is a violation of the law. A decision to this effect was made by Judge McPherson in a case against the Chicago, Milwaukee & St. Paul, November 27, 1906 (149 Fed. Rep., 486). This case has been taken to the Circuit Court of Appeals by the railroad company; argument has been had and the case submitted. A decision holding the movement of chained up cars unlawful was also made by Judge McCall on June 11, 1907 (154 Fed. Rep., 516).

In nearly all train yards of importance men are now specially employed for the purpose of looking after the condition of safety appliances. These men have become trained in their work and more readily detect defects than the ordinary inspectors who have other duties to attend to. The employment of traveling inspectors by railroads has also done much to improve conditions. These inspectors educate repairmen.

The number of cars equipped with air-brakes has greatly increased, due largely to the order of the Commission increasing the percentage of air brakes to be used in trains on and after August 1, 1906, and also to a rule of the Master Car Builders' Association requiring all cars delivered in interchange to be equipped with air-brakes. This rule went into effect September 1, 1907, but it was anticipated for some months previous to that date by practically all the large roads in the country, which refused to receive cars from their connections unless they were equipped with air-brakes. While this increase in the number of air-brakes used is gratifying, it must be noted that the maintenance of air-brake equipment has not been up to the standard. Insufficient attention is paid to the matter of piston travel, train pipe leakage, and the proper cleaning and oiling of triples.

Comparatively few train yards are equipped with testing plants, and cars are often permitted to leave terminals without a proper brake test. This results in many defective cars being hauled in trains and a consequent decrease in braking power. * * * Complaints are numerous concerning the bad condition of hand brakes. * * * Many employees have suffered serious injury in gravity yards because of defective hand-brakes, and to this cause may be attributed much of the damage to cars and their contents which is commonly laid to rough usage or carelessness in switching.

The safety-appliance law should be amended so as to cover all appliances included in the Master Car Builders' standards for the protection of trainmen; sill steps, ladders, roof hand holds and running boards. These appliances are necessary for the safety of employees, and it is important that they be kept in first class condition. There should also be an amendment to the law requiring the use of automatic air and steam hose couplers. Men are subjected to danger by going between the cars to couple and uncouple hose. Many casualties are due to this cause and as automatic appliances for the connection of steam and air hose are no longer an experiment, it is believed that their use may properly be enforced by law.

In general, carriers have shown a disposition to comply with the law and have co-operated with the Commission to secure its proper enforcement. The Commission has endeavored to secure the ends of the statute without prosecution wherever possible. Since our last report 171 cases, involving 716 separate violations of the statute, have been filed in court. In 29 cases, involving 117 violations, verdicts have been rendered for the Government; in four cases, involving 28 violations, there have been verdicts for the defendant. Two cases have been dismissed by the Government on account of technical error in complaint. The four cases in which verdicts in favor of defendant were rendered have been appealed.

Since the last report of the Commission, the important case of Schlemmer v. Buffalo, Rochester & Pittsburg Railroad Company (205 U. S., 1) has been decided by the Supreme Court of the United States [*Railroad Gazette*, March 15, 1907]. * * * In one count of a case against the Missouri Pacific, decided by Judge Munger, Nebraska, October 5, 1907, involving the height of drawbars, a verdict was rendered for the road, the court holding that the language of the regulation is indefinite in that the 3 in. variation from the standard height of 34½ in. might apply either way. * * * Up to date judgments to the amount of $45,000 have been had against carriers for violation of the statute. In a total of 282 violations involving fines amounting to $28,200, the repairs necessary would have cost but $68.03.

The question of the safe handling of trains on heavy grades has been brought to the attention of the Commission, it being contended that a literal interpretation of the law requires that trains shall be handled exclusively by means of air-brakes under all circumstances and conditions of train operation. The object and intent of the law is to save life. If trains cannot be handled upon these heavy grades without the use of hand-brakes it is certainly not the intent of the law to require that they be controlled by air alone. The Commission has examined the practices in handling trains on heavy grades in all parts of the country. A report concerning this matter is now being prepared and will be published later.

Medals of Honor.—By an act of Congress of February 23, 1905, the President of the United States is authorized to bestow bronze medals of honor on persons who by extreme daring, endanger their own lives in saving, or endeavoring to save, lives from any wreck, disaster, or grave accident upon railroads engaged in interstate commerce. Up to date 17 applications for medals under this law have been received by the Commission. Seven of these applications were not supported by sufficient evidence and could not be acted upon. In the 10 other cases, eight applications have been approved and medals awarded, two applications have been rejected. The names of persons to whom medals have been awarded will appear in an appendix to this report.

Uniform Railroad Accounts.—The report summarizes what has been done during the past year in prescribing methods of railroad bookkeeping. Before the beginning of the next fiscal year, July 1, 1908, rules will be prescribed for the financial accounts of railroads. Congress is again asked to authorize an official valuation of the property of all the railroads of the country, and the reasons for recommending this are given. The government is going to require the railroads to keep depreciation accounts, as being an essential feature of any system which is to show the true cost of maintenance, and a valuation is declared to be necessary as preliminary to this. Fifteen states have already provided for a more or less complete valuation of railroad properties.

Having prescribed bookkeeping rules for the railroads, the Commission now requires the person at the head of the accounting department to take the responsibility of seeing that the law is obeyed—that is, to see that the accounts are kept according to the prescribed rules.

State railroad commissions are uniformly in favor of doing everything possible to make their accounting forms uniform with those of the Federal Commission. This is especially desirable in connection with electric roads, for not more than one-fifth of such lines come within the jurisdiction of the Federal Commission. The National Association of Railway Commissioners has requested the Interstate Commerce Commission to establish a bureau of correspondence for the purpose of unifying statistical practice throughout all the Commissions, and this will be done.

The Commission proposes to establish a large board of special examiners to keep track of the accounts of all the railroads throughout the country.

Preliminary Statistics to June 30, 1907.—For the last fiscal year ending June 30, 1907, returns have been received for 894 railroad companies, representing an operated mileage of 225,584.30 miles, or, presumably, more than 99 per cent. of the mileage that will be covered by the final report.

This advanced report shows that the gross earnings of the roads it covers for the year 1907 were $2,585,913,002; passenger service, $683,980,921, or 26.45 per cent.; freight service, $1,826,209,111, or 70.62 per cent., and miscellaneous earnings, $75,722,970, or 2.93 per cent. The gross earnings averaged $11,463 per mile. This average exceeds the like average for any prior year since the Commission was organized. The gross earnings the year before averaged $10,460. The operating expenses of the roads covered by the 1907 preliminary report were $1,746,097,122, equivalent to $7,740 per mile. Net earnings were $839,815,880, or $3,723 per mile, and the net earnings for the corresponding roads for the year 1906 were $787,420,827.

The total income of the operating roads covered by the preliminary report was $997,350,465. There was charged against this amount for interest, rents, betterments, taxes and miscellaneous items the sum of $605,916,745, and also as dividends the sum of $259,233,580, leaving a surplus for the year of $132,200,140. The amount of taxes charged to income during the year was $73,617,082. Since the preliminary report pertains to operating roads only, it does not include any dividends paid by leased lines from the income which they received as rent. It may be said, however, that the dividends declared by subsidiary leased lines for the preceding year ending June 30, 1906, amounted to about $43,000,000.

The report also gives an abstract of the final report of the statistics for the year ending June 30, 1906. These statistics were reported in the *Railroad Gazette*, September, 20, 1907.

The Maffei Locomotive Works of Munich has delivered to the Baden State Railroad an express locomotive described as of the "Pacific" type, with frame of American design, which has made satisfactory trial trips with 13 eight-wheeled cars, and speeds reaching 68 miles per hour.

Car Surpluses and Shortages, Jan. 22.

The following table, from the current Bulletin of the American Railway Association's Committee on Car Efficiency, summarizes the situation of Jan. 22, in comparison with previous periods, as follows:

Date.	No. of roads	Surpluses Box	Flat	Coal gondola and hopper.	Other kinds.	Total.	Shortages Box.	Flat	Coal gondola & hopper	Other kinds	Total
Jan. 22, 1908	153	125,226	26,[illegible]58	110,928	45,111	339,053	392	132	79	135	738
Jan. 8, 1908	160	149,624	23,059	127,126	41,874	341,683	457	34	42	120	653
Dec. 24, 1907	158	87,714	14,740	62,150	42,276	206,880	187	81	191	265	724
Dec. 11, 1907	153	48,977	9,888	27,462	33,012	119,339	2,506	429	746	848	4,529
Nov. 27, 1907	160	16,246	3,645	10,028	10,429	40,348	11,908	868	2,964	2,224	17,964
Nov. 13, 1907	161	4,103	1,298	2,365	4,525	12,291	37,473	3,008	10,314	[illegible]	57,[illegible]93
Oct. 30, 1907	161	780	600	1,285	1,275	3,940	61,592	3,516	15,987	9,632	[illegible]

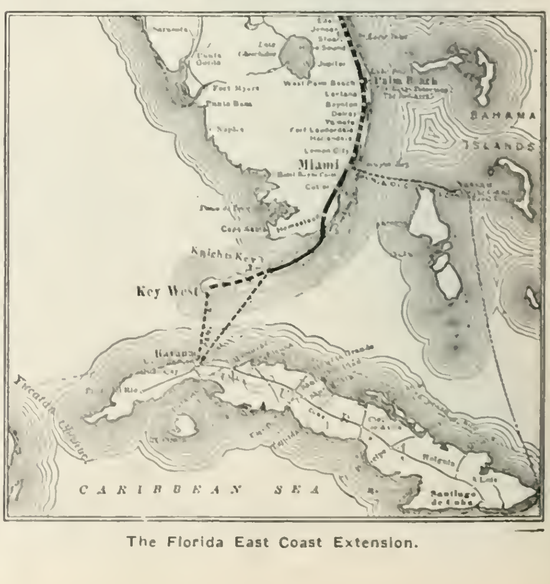
From Oct. 30 we see the conditions changing with each fortnightly report until on Jan. 8, 1908, there is a total of 341,683 idle cars of all classes on 160 roads, and on Jan. 22, 339,053 surplus on 153 roads. The figures for Jan. 22, while representing fewer roads than previous reports, include all the larger roads and are fairly comparable with figures for earlier dates.

While the most severe effects, as indicated by the surplus figures, were felt in the eastern and middle states, comprising roads, a large proportion of whose business is iron, steel and coal, it is notable that the earliest indications of surplus are in the northwestern states, which on Nov. 13 reported a large net surplus of box cars, while other groups still reported large shortages of all classes of equipment. On Nov. 27 the grand total surpluses exceeded the shortages, not only in the total cars, but also by classes. The surplus was still heaviest in the northwest, while the Eastern, North Atlantic, Southern, Pacific and Canadian roads still reported more shortages than surpluses of box cars. Coal and gondola cars had, however, begun to grow plentiful in the eastern and middle states, and by Dec. 11 there was a large surplus of cars in these classes.

The Canadian roads reported gradually diminishing shortages and increasing surpluses until Dec. 24, when the conditions quite suddenly became aggravated, and the reports for that and subsequent dates denote conditions similar to those existing in the United States. From the reports for Jan. 22 an improvement in the box car situation seems quite general, while the western roads have also reduced their accumulation of gondola and coal cars. These latter classes, however, still show large surpluses in the east, which will be gradually reduced if there is an improvement in the general business situation. What effect the unusual conditions of the past few weeks have had on the general car performance can only be estimated until such time as complete statistics covering this period are available. There is little doubt, however, that one of the results which will be shown is an enormous increase in empty car mileage, a large proportion of which would seem to have been unnecessary.

The Florida East Coast Extension.

The extension of the Florida East Coast Railway southwest along the Florida Keys to Key West has often been described in the *Railroad Gazette*. Articles describing the nature of the work



The Florida East Coast Extension.

or the progress made were published on Oct. 6, 1905; April 20, 1906; April 26, 1907; Aug. 30, 1907, and Oct. 11, 1907.

About the middle of January, track was laid on the extension as far as Knight's Key, 109 miles south of Miami and 47 miles short of the eventual terminus at Key West. On Feb. 5 the first train for which tickets were sold was run and on Feb. 6 regular passenger service was begun, with through connection to Cuba by a new steamer service from Knight's Key to Havana, 115 miles away, the Havana service of the Peninsula & Occidental Steamship Company from Miami being at the same time abandoned. Passengers leaving Miami at 11 a.m. are due to reach Knight's Key at 4 p.m. and Havana at 6.30 a.m. the next day.

The Ocean Viaduct. Trains in Crossing It Go out of Sight of Land.

The remaining 47 miles to Key West of the extension are to be finished within a year. Key West is only 90 miles from Havana, and it is planned eventually to connect the two points by a car-ferry service which will take trains straight through, making direct connection with the standard gage railroad system of Cuba. The accompanying photographs show typical scenes along the line of the extension and the temporary terminal at Knight's Key from which the boats for Havana start. The longest of the viaducts on the whole extension is from Long key to Grassy key, 5½ miles over the bed of the ocean. This is on the road already in operation. The rails are carried 31 ft. above the mean surface level of the water on a reinforced concrete viaduct. On this viaduct trains go out of sight of land. The accompanying map shows the route of the extension, the steamer connection from Knight's Key to Havana, and the proposed car-ferry connection from Key West to Havana.

Cocoanut Palms Along the Beach of One of the Keys.

It is expected that the completed route will get a large part of the passenger, express and light freight traffic between Cuba and the United States, besides a certain share in through freight traffic. Florida tourists in particular will be likely to take a trip to Cuba. Cuba is only about one-tenth under cultivation and there are great possibilities for profitable investment there which would be likely to be taken up if brought directly to the attention of Americans. On the other hand, a large proportion of even the wealthy Cubans have never left the island because of the dread of seasickness. A route which requires only five or six hours water trip is likely to attract many of these. One great advantage of the extension will be that deep draft vessels can be used between Florida and Cuba. Previously only light draft vessels could be used on account of the shallow water in Miami harbor.

The Florida East Coast Railway is the personal property of Henry M. Flagler, of the Standard Oil group of capitalists, and the extension is his personal enterprise. Every share of stock and every bond of the company is owned by Mr. Flagler, except $3,500,000 three-year 6 per cent. notes dated August 1, 1907, secured by all the outstanding first mortgage bonds of the Florida East Coast and also by the personal endorsement of Mr. Flagler, which were issued to provide funds for the construction work.

One of the results of the building of the Siberian Railroad has been the establishment of 2,200 creameries in Siberia. A large part

Temporary Terminal at Knight's Key for Havana Steamers.

Work Train on Ocean Viaduct.

of the butter made in them is exported to Germany and western Europe. Regular dairy trains with refrigerator cars carry this butter to Baltic ports, distant 1,830 to 2,550 miles. The number of creameries and the quantities of butter exported increase constantly. In the four months to July 31 over 11,000,000 lbs. were shipped.

Accident Bulletin No. 25.

The Interstate Commerce Commission has issued Accident Bulletin No. 25, giving a summary, in the usual form, of the railroad accidents in the United States during the three months ending September 30, 1907. The number of persons killed in train accidents was 346, and of injured, 4,990. Accidents of other kinds bring the total number of casualties up to 23,063 (1,339 killed and 21,724 injured). These reports deal only with (*a*) passengers and (*b*) employees on duty.

TABLE NO. 1.—*Casualties to Persons.**

	Passengers Kil'd.	Passengers Inj'd.	Employees† Kil'd.	Employees† Inj'd.	Tot'l persons reported Kil'd	Tot'l persons reported Inj'd.
Collisions	77	1,563	119	1,182	196	2,745
Derailments	33	1,076	80	713	113	1,789
Miscellaneous train accidents		24	37	432	37	456
Total train accidents	110	2,663	236	2,327	346	4,990
Coupling or uncoupling		.	87	986	87	986
Other work about trains or switches	.	.	81	4,910	81	4,910
In contact with bridges, structures, etc.	2	18	37	424	39	442
Falling from or getting on cars or engs.	60	672	227	3,534	287	4,206
Other causes	23	872	176	5,318	199	6,190
Total, other than train accidents	85	1,562	908	15,172	993	16,734
Total all classes	195	4,225	1,144	17,499	1,339	21,724

*In Table No. 1 "passengers" includes passengers travelling on freight trains, postal clerks, and express messengers, employees on Pullman cars, newsboys, live-stock tenders, and men in charge of freight.

†Accidents to employees resulting in slight injuries which do not prevent the employee injured from performing his accustomed service for more than three days in the aggregate during the ten days immediately following the accident are not reported.

That the enormous activity in traffic, which has been a factor in the explanation of previous bulletins, was still undiminished in the period here reported on, is indicated by the marked increase in casualties to passengers from causes not connected with train accidents (85 now, 58 a year before); for this item undoubtedly contains a proportion, larger than others in the table, of accidents which, from the railroad standpoint, are to be classed as unavoidable, and therefore in the long run showing totals more directly proportionate to the number of persons traveling.

Increases are shown in the other principal items (see Table 1*a* below), except Item No. 1; but in this connection it is to be borne in mind that Bulletin No. 24 represents a quarter in which the volume of traffic, and consequently the number of casualties, usually is lighter than in either of the other quarters of the year.

As to Item No. 1—passengers killed in train accidents—a black record is again presented. Three collisions (Nos. 26, 27 and 30, in Table 2*a*) and one derailment being responsible for 80 deaths in this class, an average of 20 passengers to each of the four accidents. Particulars of these and other notable collisions and derailments are given, following Table 2*a*.

TABLE NO. 1*a*. *Comparison of Principal Items with Last Bulletin and with One Year Back.*

	Bulletins No. 25.	No. 24.	No. 21.
1. Passengers killed in train accidents	110	48	52
2. Passengers killed, all causes	195	111	110
3. Employees killed in train accidents	236	202	215
4. Employees killed in coupling	87	72	81
5. Employees killed, all causes	1,144	954	1,072
6. Total passengers and employees killed, all causes	1,339	1,065	1,182

The total number of collisions and derailments in the quarter now under review was 4,279 as below.

TABLE NO. 2.—*Collisions and Derailments.*

[NOTE.—Collisions and derailments which cause no death or personal injury and which cause not over $150 damage to the property of the railroad are not reported.]

	No.	Loss.	Persons Killed	Persons Injured.
Collisions, rear	508	$524,607	31	605
" butting	277	570,473	121	1,229
" trains separating	128	52,848		68
" miscellaneous	1,332	617,613	44	843
Total	2,245	$1,765,541	196	2,745
Derailments due to				
Defects of roadway, etc.	111	$117,761	17	601
Defects of equipment	865	827,287	16	297
Negligence, train or signalmen, etc.	141	119,574	17	176
Unforeseen obstruction of track, etc.	87	135,020	12	122
Malicious obstruction of track, etc.	24	64,061	7	65
Miscellaneous causes	506	476,452	44	528
Total	2,034	$1,840,155	113	1,789
Total collisions and derailments	4,279	3,605,696	309	4,534

Following is the usual list of Class A train accidents—all in which the damage is reported at $10,000 or over; notable cases in which passengers are killed, and those doing damage less than $10,000 and down to $2,000, wherever the circumstances or the cause may be of particular interest.

TABLE 2*a*. *Causes of Forty-Nine Prominent Train Accidents (Class A).*

[NOTE.—R stands for rear collision; B, butting collision; M, miscellaneous collisions; D, derailment; P, passenger train; F, freight and miscellaneous trains.]

COLLISIONS.

No.	Class.	Kind of train.	Killed.	Injured.	Damage to engines, cars & roadway.	Reference to record.	Cause.
1	R	F. & F.	0	0	$2,300	83	Engineman on duty 17 hrs. and asleep; passed automatic block signal set against him; also passed flagman.
2	B	P. & F.	0	23	2,600	12	Freight train wrongfully admitted to block section; struck passenger train standing at station; in freight part of air brakes had been cut off, but trainmen had not discovered the fact; had not tested at proper time.
3	R.	F. & F.	0	3	3,252	98	Engineman asleep; approached station at uncontrollable speed; 2 a. m.
4	M	P. & F.	0	1	3,400	4	Error in despatcher's order; two words, including name of station, written twice by receiving operator; despatcher did not detect error when order was repeated.
5	B	F. & F.	5	6	4,300	85	Approached station at uncontrollable speed; victims were employees in caboose of work train.
6	B.	P. & F.	8	32	4,600	7	Engine in charge of hostler encroached on time of passenger train; 8 passengers killed; hostler had been misinformed as to lateness of passenger train by operator, who had misread an order.
7	R.	F. & F.	0	0	4,800	2	Failure of air brakes; angle cock having been shut between first and second engines of "double-header." Angle-cock lever had been moved by cylinder-cock rod pressing against it.
8	R	F. & F.	0	0	5,000	101	False clear telegraph block signal.
9	B	F. & F.	0	1	5,550	52	Despatcher's order copied incorrectly (1,381 for 1,382), was repeated correctly.
10	M	F. & F.	2	8	6,500	51	Freight waiting on side track, 2 a. m.; men failed to see green signals carried by passing train; signals dim; train on side track 50 ft. from main track, not seen by men on passing train and whistle signal consequently not given.
11	B.	F. & F.	0	6	7,460	14	Careless management of block signals and failure to deliver meeting order; responsible operators had had only five months' experience.
12	B.	P. & P.	1	11	7,700	99	Engineman forgot meeting point (Sunday schedule), though he had been cautioned by conductor at beginning of trip; engineman killed.
13	R	F. & F.	0	2	7,704	88	Engineman, on duty 17 hrs. in last 19 hrs., fell asleep and passed automatic block signal set against him; also passed flagman.
14	B	P. & P.	1	7	8,200	10	Despatcher completed meeting order to inferior train before properly placing order for superior train.
15	B.	F. & F.	1	2	9,300	58	Failure to deliver meeting order; operator, without leave, had put substitute in his place for 30 minutes and had not properly informed substitute about the order.
16	R.	P. & F.	1	2	10,000	91	Freight train, 1 a. m., unexpectedly stopped, was not protected by flagman.
17	B	F. & F.	4	1	10,185	51	Conductor and engineman of extra freight overlooked schedule of regular train.
18	M	F. & F.	1	2	11,350	92	Cars escaped from yard and ran on main track; had been left unsecured by negligent switchmen.
19	B.	P. & F.	3	53	11,433	17	Freight train ran over misplaced switch and through crossover track into passenger train.
20	M	P. & F.	0	0	12,963	8	Collision at crossover; train approached station at uncontrollable speed.
21	R	F. & F.	0	2	13,710	18	Runaway on 3 per cent. grade; carelessness in starting from side track on grade, three trainmen being on the ground instead of at their posts on the cars or engine.
22	B	F. & F.	4	5	14,261	86	Operator (in service one month) accepted meeting order after train had passed, having been asleep.
23	R	P. & F.	0	5	14,350	40	Runaway on 1½ per cent. grade; insufficient brake power. In taking on cars trainmen had neglected to connect and test air brakes.
24	B	P. & F.	3	27	15,000	59	Conductor and engineman forgot meeting order.
25	M	P. & P.	0	36	16,080	95	Approached station at uncontrollable speed. (See text below.)

Grand total.			141	641	$732,709		

Collision No. 27 was between a westbound local freight train and an eastbound passenger excursion train of 11 cars. Twenty-eight passengers and two trainmen were killed and 102 passengers and three trainmen were injured. The freight train was running about 30 miles an hour and the passenger train about 40 miles an hour immediately before the collision. Both engines, six passenger cars, and three freight cars were wrecked. The men in charge of the freight train misread an order which they had received from the despatcher giving them the time at which the excursion train was due at the several stations. This order read:

Salem 9.10
Plymouth 9.25

But these men read it "Salem......9.25," and therefore allowed themselves 15 minutes more time in which to reach Salem than they could rightfully do; consequently they met the excursion train 1½ miles before reaching Salem. The figures "9.10" were not exactly opposite the word Salem, and this appears to be the explanation of the mistake in reading, though the operator in writing the order had made dotted lines from the name of the station to the figures showing the time, in order to insure a correct reading. In consequence of the figures being nearer the top of the sheet, as related to the words, these lines inclined upward from left to right. The engineman did not read the order aloud to the conductor, nor was it read either by the fireman or by any brakeman, though all these readings are required by the company's rules. The station operator who delivered the order (but who was not the same one who had written it) says that the conductor in his presence read the order correctly.

Butting collision No. 30, between eastbound passenger train No. 30 and a westbound freight train about 4 o'clock on a very foggy morning, killing 26 and injuring 33 persons, was due to an error in sending or receiving the number designating one of the trains in a despatcher's order. Two passenger trains running in the same direction, Nos. 30 and 34, being behind time, the train despatcher sent an order to the freight train giving it notice that the passenger trains would be a certain number of minutes late, respectively, between certain stations, thus permitting the freight to continue on its journey to meeting points different from those at which it would have met the passenger trains normally. One order was sent and delivered correctly. A second order, dealing with only one of the two passenger trains, was wrong. As delivered, it named the passenger train as "No. 30 thirty"; but it should have read "No. 34 thirty-four." Being read "30," it gave a wrong number of minutes as regards that train, and this led to the collision. Train No. 30 was represented to be an hour and ten minutes late, when, in fact, it was but 40 minutes late. A number of other orders were sent about the same time, so that the despatcher had both these train numbers in his mind; and the state railroad commissioners, who investigated the case, believe that the preponderance of evidence is in favor of the theory that the despatcher made the error in sending; but, so far as can be learned from the records at the despatcher's office and in the station telegraph office, and the testimony of the despatcher and of the station operator, the officers of the road say that it is impossible to decide which of these two persons committed the error. The operator wrote "No. 30 thirty," and declares that in repeating the order to the despatcher he sent in the same way that he had written. The despatcher, on the other hand, declares that he sent "No. 34 thirty-four," and that the operator in repeating wrote "No. 34 thirty-four." The operator had been in the service of the company at different stations for 23 years, and the despatcher had served as despatcher six years. The company gives good reputations to both of these men.

Derailment No. 8, causing the death of 14 persons and the injury of 19, is reported as due to some cause undiscovered. The train was running about 35 miles an hour on a 3-deg. curve, and it was thrown off the track just as it was passing a station. The cars in the front portion of the train ran to one side and were crushed against a locomotive standing on a side track, and the baggage car, reported as one of strong construction, penetrated the first passenger car—a smoking car—and killed or injured every person in this car, all the deaths being of persons riding in this car. The track was reported as in excellent condition, the rails weighing 80 lbs. per yard. The weight of the engine was 41 tons.

Collision No. 26, causing the death of 10 persons and the injury of 32, was due to a misplaced switch. The telegraph operator at S. turned an eastbound passenger train coming from single track to the left-hand instead of the right-hand of the two main tracks extending eastward from S.; that is, to the westbound track; and, after proceeding about three-fourths of a mile on the westbound track, this train collided with a westbound freight train. Under a general rule it is allowable for the operator at S. to send trains eastward to B. on the westbound track, and therefore the engineman took it for granted that the operator, in turning the train to the left-hand track, was acting in accordance with instructions from the despatcher; but in point of fact no such order had been given, and the operator had given a "proceed" signal under the mistaken assumption that the switch was set for the eastbound track. As soon as the train had passed his office he endeavored to telegraph to B., the next station east, and prevent the collision, but he was too late to do so. This operator had been in service at this office 15 days and in the service of the company five months 17 days. He had been on duty 20 hours, 50 minutes.

Collision No. 25 was due to the carelessness of an engineman in not keeping in mind a detail of a meeting order. Northbound train No. 38 and southbound train No. 35 were to meet at C at about 10 p.m. The order required the southbound train to enter the side track at a certain switch, and the train was passing from the main line to the siding at this point when it was struck in the side by the northbound train. The engineman of the northbound, contrary to the terms of the order, assumed that the southbound was to enter the side track at another switch, and, although he saw it approaching, he thought that it was already on the side track. The northbound engine and four cars were badly damaged, and the wreck took fire from an explosion of gas in the tank of one of the passenger cars. Of the total damage of $16,000, more than one-half is estimated as having been due to the fire, which includes the damage to five freight cars standing on the side track.

Collision No. 28 between a northbound and a southbound freight train was due principally to the failure of an operator to deliver a meeting order. He accepted the order from the despatcher after the freight train to which it was addressed had gone beyond his control. This operator, at L., had delivered a meeting order to two sections of a northbound regular freight train but on account of damage to one of the engines, which necessitated changing them, so that the engine and engineman of the second train were assigned to the first one, both trains were delayed about an hour. In consequence of this delay, the despatcher sent a second order changing the meeting point, but this later order was not delivered. The men of both the freight trains claim that, just before departing, they asked the operator if he had further orders for them, and that he replied that he had none. The operator denies this conversation. The operator, a few minutes after receiving the second order, was relieved by the night operator and in transferring his orders to the night man, informed him that the trainmen would come back to the office to sign for the order. This they did not do. The train despatcher is also held blameworthy for allowing the northbound train to pass another station 10 miles farther north, about an hour afterwards, without taking measures to stop it.

Collision No. 31, causing the death of two passengers and two trainmen, was due to errors in the writing of a telegraphic order, leading to its non-delivery, thus allowing a train to run past the meeting point fixed by the order. The order was to the conductor and engineman of train No. 412, and the train to be met was No. 611. In copying the order, the last number, 611, was copied 411. The order was received by the manager of the telegraph office in place of Operator B., who usually receives such orders, but who was temporarily out of the office. Just as the manager had finished, B. returned and took up the work of repeating the order to the despatcher. When he reached the last line and sent "411," the despatcher broke him and said "for 611." The operator acknowledged the correction but he did not properly correct his manuscript. He thought it was the address of the order (112) which was to be changed to read 611. After acknowledging the correction he sent the conductor's signature. An apparently correct repetition having thus been received at the despatcher's office, the despatcher authorized the order to be delivered to the inferior train at another station, so that it proceeded and met train 412. While the order was being written and repeated, the conductor of train 412 was standing at the window waiting for whatever orders the operator might have to give him; but he had not signed this order, and the operator committed a gross breach of the rules in telegraphing the conductor's name before the conductor had signed the order. After finishing with the despatcher, Operator B. gave to the waiting conductor two other orders, but omitted to deliver the one which he had just repeated. Operator B decamped and would not appear at the investigation of the accident which was held by the superintendent. He wrote, however, to the superintendent of telegraph claiming that he had not sent the conductor's signature over the wire. In the wastebasket of the office there was found the original order, with the address of the order, "To train 112," changed to read "To train 411," while on the table was a new order addressed to 411 which, evidently, Operator B. had made in place of the original, on the assumption that the correction which he had received from the despatcher referred, not to the train number at the end of the order, but to that in the address.

Table No. 3 gives the usual details of causes of accidents to employees in coupling and uncoupling cars, Table No. 3a the nature of such injuries, and Table No. 4 the details of causes of accidents to employees in falling from and getting on or off cars and engines.

Car Elevator for the Hudson & Manhattan.

At the Hoboken terminal of the Hudson & Manhattan Railroad's tunnels under the Hudson river a car elevator has been installed to carry passenger cars to and from the tunnels and the subway connecting with them. The passenger cars are 48 ft. long over all and 9 ft. wide; they weigh 61,000 lbs. empty and 85,000 lbs. loaded. The elevator has 100,000 lbs. lifting capacity and its platform is 50 ft. long and 12 ft. wide.

The elevator is in a wellway with reinforced concrete walls from the ground level to the tunnel. On the side walls are six steel columns supporting a steel girder framing directly over the hoistway and carrying the hoisting apparatus. This consists of two drum shafts each 50 ft. long, one placed near each side of the wellway. They are driven at their centers by four balanced worm gears, arranged so that the load on all four is equally distributed under varying platform loads. All thrusts are balanced by the worm shafts, which have right and left hand worms operating the worm gears. Both worms and gears run in oil baths in tight casings. They are driven by one 100-h.p. motor.

The main members of the platform are the two longitudinal steel girders, one under each rail. The floor is covered with diamond pattern steel floor plates. The platform is hung from 32 steel cables, ¾ in. in diameter, which pass under suspension sheaves below the floor and return to anchorage in the overhead structure. Half of the load is thus suspended directly from the overhead structure and half from the drums. In addition to these cables, there are eight counterweight cables of the same size. The platform weighs 32,000 lbs. and the counterweights, 64,500 lbs. The approaches to the elevator are protected by iron frame gates which close when the elevator platform is not at the landing. The movement of the elevator is controlled by a pilot switch operated by a hand shipping cable; the speed can be varied by the operator from 10 to 20 ft. per minute, the platform stopping automatically at the track levels. The rise from tunnel track to surface track is about 30 ft. The platform will be equipped with the third rail, charged only when the platform is at a track level, so that the cars may be run on or off under their own power. Provision has been made to hold the elevator platform securely in position while the cars are run on it.

Car Elevator; Hudson & Manhattan Railroad.

In addition to the usual service of handling cars to and from the tunnels, the elevator can be used for quickly changing motor trucks under a car body. For this purpose, the platform travels three feet above the surface tracks, blocks are put in place under the car body, the trucks are disconnected and the platform descends, leaving the car body suspended on the blocks.

This elevator has been in uninterrupted operation since it was installed, handling rails, ballast and other material in loads as high as 65 tons. It is believed to be the largest elevator in size and lifting capacity ever constructed. It was built and installed by the George T. McLauthlin Co., Boston, Mass., according to the design and patents of Martin B. McLauthlin.

Committee Reports at the Maintenance of Way Convention.

The ninth annual convention of the American Railway Engineering and Maintenance of Way Association will be held at the Auditorium Hotel, Chicago, on March 17, 18 and 19. Secretary Fitch has prepared the following outline of the committee reports to be submitted at this convention:

The committee on Roadway has had under consideration during the past year the subject of track elevation and depression inside cities, and also the practical work of grade and curve improvements outside cities, and presents in addition to its conclusions a summary of replies to its inquiries on track elevation and depression.

The Ballasting committee presents only a brief report.

The Tie committee presents a valuable report on the future policy of railroads with reference to sources of tie supply; a compilation of answers as to causes of failure of ties; also additional information on the live subject of tie preservation, together with a list of tie-treating plants in the United States.

The committee on Rail submits a series of blank forms for use in reporting rail failures.

The Track committee presents a report on turnouts and turnout material, including the recommended types of switch stands, switch points, frogs, guard rails and throat clearance; a report on the tiling of wet cuts and the curing of slides; a report on the subject of widening of gage on curves, the latter subject being a joint recommendation of the Track committee and a sub-committee of the Master Mechanics' Association.

Locomotive coaling stations and the use of reinforced concrete for roundhouses form the main features of the report on Buildings. Other subjects dealt with in this report are the best method of smoke removal, ventilation and heating of roundhouses; the use of movable and fixed cranes for facilitating locomotive repairs in roundhouses; arrangement of windows and roof lights, and proper ratio of light to floor surface in roundhouses.

The committee on Wooden Bridges and Trestles submits a valuable report on the cost of construction, maintenance and life of ballast floor trestles of the different types now in use, with designs explanatory of and types considered, an extension of the list of recommended safe unit stresses for timber; a report on the methods of preserving structural timber, their cost and efficiency, and their influence on the strength of timber; a report on the question of a standard specification for structural timbers.

The Masonry committee presents for final adoption the specifications for stone masonry, and in addition a report on the most economical size or combination of sizes for stone to be used in stone concrete, as applied to the different classes of railroad work. This committee has also in preparation an exceedingly valuable report on typical standard designs now in use for masonry, culverts, both stone and concrete. The last-mentioned subject will be published after the convention in a special bulletin.

The subject of snow fences, snow sheds and other means to prevent snow accumulating, and best methods of clearing tracks and of snow removal, form the principal feature of the report on Signs, Fences, Crossings and Cattle-Guards.

The report on Signaling and Interlocking will be of especial interest not only to engineers, but to transportation officials as well. The committee has prepared a valuable report on the subject of a comprehensive system of signaling; and in addition presents as an appendix three interesting papers by members of the committee dealing with the matter of signaling.

The committee on Records, Reports and Accounts presents a report on the subject of individual ledger accounts and on the proper system of right-of-way and track maps.

Rules governing supervision of signals is the subject of the report on Uniform Rules. Rules governing supervisors of track and structures have already been adopted by the association in previous years.

The Water Service committee has taken for its subject this year a revision of matters previously adopted by the association, and the committee submits a condensation of the recommendations heretofore approved by the association.

The committee on Yards and Terminals presents an interesting and comprehensive report on the subject of hump yards. The report contains a large number of diagrams showing the practice of various companies in reference to hump yards.

Under the auspices of the committee on Iron and Steel Structures a series of experiments have been made during the past year on the effect of moving loads on railroad bridges. The tests have been made with 12 instruments specially constructed for this purpose, and the work of making the experiments has been performed by a number of experts, under direction of the sub-committee above named. A preliminary report is presented on the tests already made, and forms a valuable contribution to the literature on this mooted question. The experiments referred to have been made on the Illinois Central, Rock Island, Burlington and Nickel Plate roads. In addition to this feature, the committee's report contains a discussion on the care of existing bridges—inspection, methods of field work and records of inspection; also a report on the classification of bridges as to safe carrying capacity. As an appendix to this report is to be considered an interesting and instructive paper by A. F. Robinson, Bridge Engineer of the Atchison, Topeka & Santa Fe Railway System, on "Open versus Ballasted Floor Bridges," giving the results of the use of ballasted floor structures on the Santa Fe.

The committee on Economies of Railway Location presented an exhaustive report on the matter of train resistance in 1907. A report of progress will be presented this year, in addition, as an appendix, an interesting paper by A. K. Shurtleff (C., R. I. & P.), entitled "Time as an Element to be Considered in Grade Reductions."

The convention will open in the banquet hall of the Auditorium Hotel on the morning of March 17. Both morning and afternoon sessions will be held. An evening session will be held on the night of the first day of the convention. The annual dinner will be given on the night of the second day.

Railroad Station Improvement.*

At the beginning of 1907 I congratulated myself that all the railroads in the country were not only convinced of the desirablity and the advantages of artistic and well-kept station surroundings, but that they were rapidly becoming so interested and enthusiastic in the work of co-operation with the Railroad Department of the American Civic Association that my work of persuasion was a thing of the past, and that in the future it would be simply a steady growth and development along the lines of artistic education, and the carrying on of missionary work in the railroad towns by the establishment of village improvement associations.

But last spring, instead of the encouragement to which we had become acquainted, orders were issued on many railroads, "no parking this year." This was followed from time to time with like orders regarding all improvements which were not absolutely necessary; in other words, retrenchment was the order of the day.

At first it seemed possible that this condition was confined to the West, or particularly where adverse state legislation had affected the business of the railroads, but I was soon led to fear that it was national in its scope and was the result of the governmental attacks which had disturbed the entire railroad world. To verify my suspicion I wrote to the heads of various railroads throughout the country, and the almost universal reply was along this line:

"I beg to advise that under existing financial conditions we are not giving much thought to questions of esthetic character, but we are trying to maintain the condition of our property for safe operation, also to maintain a sanitary condition in and about our coaches and buildings; we are not doing, nor do we contemplate doing in the near future much, if anything, for purely esthetic reasons."

All the officials assured me of their interest and appreciation of the work and of their keen regret for the conditions which compelled them to relinquish the work. And I am glad to say that orders have been universally given to preserve and care for the work which has already been done along the line of station ground improvements. The few railroads, I am advised, that are contemplating new work this year are the Delaware, Lackawanna & Western, the Grand Trunk and the Norfolk & Western.

I find my consolation in knowing that the work which we have already done can never be wholly undone. Many village improvement associations have emanated during the past five years from the little station park which was the nucleus for future park systems and general civic improvement. The massed planting to shut off the unsightly secondary buildings at the station was a suggestion to the villagers to be carried out in screening off their backyards, the grouping of the shrubs at the corners of the grounds where the blending of the different foliage made a beautiful and ever-changing picture was a desirable contrast to the straight lines of shrubs from the front door to the gate. The manner in which we have proven to the people the uselessness of fencing off the parks and converting them into a graveyard scene has led to the obliteration of door yard fences, thus transferring the ugly village streets into beautiful boulevards. All know how infectious the spirit of civic improvement is. From this beginning has usually come the improvement of the high school grounds, the courthouse square and the formation of a village improvement society and the general crusade against all that detracted from civic beauty.

There is a mistaken idea in some minds that railroad station ground improvements emanate from the village improvement association. The reverse is generally true. I have known many instances when the townspeople have sent their earnest request to the railroad officials to improve their station surroundings, but where upon investigation it was found that for many blocks on every side of the railroad property there was not one redeeming feature. Tumble-down buildings covered with circus posters, stock-pens, garbage piles, filth and squalor of every description led up to the railroad property, which although not in any sense artistic or attractive, was usually decent looking. The inconsistency of the request, under those conditions, was the first thought that occurred to the officials, and the suggestion that they clean up the town before troubling about the railroad property was a remark that might reasonably be pardoned. It is a most unusual thing for railroad officials to refuse to co-operate with a town on village improvement lines, although they sometimes balk at the suggestion of the townspeople that they lead the procession. I would suggest to any interested in this matter that any time they want a new depot or station park, or improvements along these lines, the best way to interest and influence the officials would be to clean up and improve the streets and property leading to the railroad, so that the contrast would reflect discredit upon the latter. I doubt if co-operation on the part of the railroad officials would ever be refused.

I will give as one illustration something that has come under my observation during this last year. In a northern Wisconsin lumber town (Tomahawk, on the C., M. & St. P.) an interest in civic improvement which had been created by illustrated lectures through the efforts of the railroad department led to the formation of an active village improvement organization and the formulation of plans for a more beautiful town. This meant the removal of the warehouses from the heart of the village to the suburbs, necessitating a heavy expense, but a purse was made up to assist in this work, and a committee waited upon the officials of the railroad ,who without the slightest hesitancy promised to build tracks to the new location, remove the old tracks and convert the property on which the warehouses stood into a beautiful park extending for several blocks through the center of the town. This work is now in progress and it is expected that before another year a wonderful transformation will be effected.

Other interesting work which has been accomplished by this town was the passing of city ordinances regulating the width and style of sidewalks, which are to be concrete, with combination concrete gutter and curbings, grass park midway between gutter and sidewalk, trees of uniform variety, and sizes to be planted at certain distance in the parkway, the removal of telegraph and telephone poles into the alleys and various other reforms. A carload of shrubbery (purchased at wholesale through the railroad company by a public-spirited citizen, who, by the way, is a member of the American

*A report, presented at the annual meeting of the American Civic Association at Providence, R. I., by Mrs. A. E. McCrea, chairman of the Railroad Department.

Civic Association), and the services of a landscape architect, were placed at the disposal of the town people who for a nominal sum could avail themselves of the opportunity to have their grounds planted and arranged artistically. Those who were too poor to pay were given the same consideration as the others, and the whole town is transformed from ugliness to beauty through this kindly act of one public-spirited man.

I could give many more examples of similar nature, but I only want to urge on the department the greatest of all advantages—that of co-operation between the people and the railroad.

Othniel Foster Nichols.

Othniel Foster Nichols, one of the consulting engineers of the Department of Bridges, New York, and well known to readers of the *Railroad Gazette*, died suddenly of apoplexy at his home, 42 Gates avenue Brooklyn, February 1. His death was without warning, as he had been in his usual good health, and on Monday, barely 12 hours before he died, he had taken lunch with his friends at the engineers' table in the Astor House.

Mr. Nichols was born July 29, 1845, at Newport, R. I., and received his education at the Brooklyn, N. Y., public schools and at Rensselaer Polytechnic Institute, where he graduated as a civil engineer in the class of 1868. Immediately after graduating he began his professional career as assistant engineer on the work of laying out Prospect Park in Brooklyn. His next position was assistant engineer of the Greenwich Street elevated railroad in New York, and he built the first elevated railroad foundations north of Cortlandt street. In 1870 and 1871 he became assistant to Edward Cooper, President of the New Jersey Steel & Iron Company, and from this office he went in 1871 to the Lima & Oroya Railroad in Peru as assistant engineer. He remained two years in charge of tunnel location and construction on this road and then became division engineer of the Chimbote Railroad, where he had charge of work of the same kind.

Mr. Nichols returned to the United States in 1876 and was assistant superintendent and engineer of the Edgemoor Bridge Company in its contract for building the Sixth Avenue Elevated Railroad in New York. The work was delayed by injunction and Mr. Nichols entered the service of the Park Department in charge of sewer work in the annexed district. In 1878 he went to South America again, this time as resident engineer of the ill-fated Madeira & Mamore Railroad project in Brazil, and subsequently spent the first half of 1879 in London in connection with litigation which grew out of this enterprise.

O. F. Nichols.

Mr. Nichols always retained a vivid impression of his South American experiences. He saw clearly the possibilities of development in the region where he had worked but had profound respect for the difficulties of getting anything done there on account of the climate, of labor conditions, and the distance from the base of supplies.

In 1879 and 1880 Mr. Nichols was assistant engineer in the bridge shops of the New Jersey Steel & Iron Company. In 1881 he was for a time assistant superintendent of the Peter Cooper glue factory, and from that time until 1885 he was resident engineer of the Louisville & Nashville bridge over the Ohio river at Henderson, Ky. In 1886 he was made chief engineer of the waterworks at Westerly, R. I., but resigned his position to become principal assistant engineer for the Suburban Rapid Transit Company in New York City. When this company was consolidated with the Manhattan Railway he became chief engineer of the Brooklyn Elevated and designed and built about half of the elevated roads in Brooklyn belonging to that company. In 1892 and 1893 he was general manager as well as chief engineer of the company, and at that time made his first surveys for the Williamsburgh bridge, which was then intended to be built by a private company allied with the Brooklyn Elevated. When Leffert Buck was made chief engineer of the Williamsburgh bridge, in 1895 he named Mr. Nichols as his principal assistant, and Mr. Nichols held this position until July, 1903, when he was appointed chief engineer of the Department of Bridges. Since 1905 he has been consulting engineer of the Department of Bridges, in charge of the Manhattan and Blackwells Island bridges. He was awarded the Telford premium by the British Institution of Civil Engineers in 1897. He was also ex-president of the Brooklyn Engineers' Club and a member of the American Society of Civil Engineers, American Society of Mechanical Engineers, Society of Municipal Engineers, New York Engineers' Club, Brooklyn Institute of Arts and Sciences, American Geographical Society and the Institution of Civil Engineers of Great Britain.

The engineering profession will be shocked and grieved by the news of the sudden death of Othniel Foster Nichols, one of its distinguished members. The city of New York loses a most faithful servant, whose value was never greater than at present when enormous bridges are being built, to the design and construction of which Mr. Nichols has given the best years of his life—a life ripe in experience covering a wide field of railroad practice, shop practice, bridge engineering and erection, and especially the study and solution of transportation problems. In all these branches Mr. Nichols was an expert of high rank, and his professional attainments were united with rare executive ability. He had a live interest in everything pertaining to the welfare of the profession and to its progress. Membership in the American Society of Civil Engineers, in the Institution of Civil Engineers, in the Society of Municipal Engineers, in the Alumni Association of his *alma mater*, and in the other organizations to which he belonged, he did not regard merely as recognition of professional standing. To him it meant opportunity for further work with corresponding duties, which he fulfilled as few men have the energy to do in continuous efforts for the elevation of the profession and the maintenance of its dignity. Witness his contributions to its literature in the Proceedings of these learned bodies and his eager part in their discussions, his loyal service as head of the Engineering Section of the Brooklyn Institute of Arts and Sciences.

He was a most devoted friend. His friendship was not confined to intimates, but numberless acquaintances have reason to bless his memory for acts of unvarying kindness and substantial aid. Not only to young engineers just starting in the profession, but to men of every rank and calling, to widows and the fatherless, and to those otherwise unfortunate was he especially helpful. A most genial companion, he was a strong, energetic, generous, wise, hopeful man. His public and private career was beyond reproach. An inspiration to his fellows, a model of fidelity to duty, his place cannot be filled and his memory will be kept green by all who knew him. N. F. B.

The Prussian State Railroads have had since 1901 an uninterrupted growth in traffic and gross earnings, and until this year also a satisfactory yearly increase in net earnings, which in 1906 were 2½ per cent. more than in 1905 and 35 per cent more than in 1901. This year the increase in gross has continued, but as in some countries not so far off, the expenses have increased so much more that there will be a decrease in net. The reasons given for this are precisely the same as those which account of the notable decrease in net earnings in this country in 1907. The Prussian fiscal year ends with March. The latest reports do not show any decrease in gross earnings, such as has occurred here recently. In November the Prussian State Railroads had an increase of nearly 5 per cent. in gross earnings, while for the eight months of the fiscal year the increase was 5½ per cent. The railroads of the whole German Empire had an increase of more than 4¾ per cent in November. The demand for coal could not be satisfied; but the iron works were not the urgent buyers.

Transmission Line Crossings Over Railroads.

BY RALPH D. MERSHON.

The rapid increase in the number of electric transmission lines and the distributing circuits therefrom, is rendering every day more important and more perplexing the question so frequently encountered as to the protection, if any, which should be provided at railroad crossings.

The fear which the steam railroad operator has in regard to such crossings arises from two sources. He fears the damage which might result through mechanical agencies, in case the transmission line should fall upon the track. He fears, also, the damage which he thinks might result through electrical agencies. The fear of the electric current is usually the greater, probably because of the fact that most steam railroad operators have had little, if any, experience with electricity, and they attach to it more or less of the mysterious dread which people have for it generally.

The protection for which the railroad man generally asks, is a steel bridge constructed underneath the transmission line for that portion of its length which is across the railroad company's right-of-way; or at least for that portion of its length which is across the tracks. In some cases, it has been required that the transmission line be carried on insulators attached to this structure; such a requirement is an undesirable one from every standpoint.

There can be no question that a transmission line can be made as strong as any steel protecting bridge that can be installed, and, in general, strength can be obtained at a great deal less expense than is involved in installation of the bridge. A simple span of wire or cable supported at each side of the right-of-way, on steel structures if necessary, can be made as strong, both as to supporting structures and as to the cables, as any bridge which can be erected. It seems foolish, therefore, to insist upon the installation of a bridge below a transmission line for fear that, through mechanical agencies, the transmission line may be thrown down.

Probably no railroad operator would make special objection to have built across his tracks a construction similar to that of a well designed transmission line, if he knew no current was to be put upon it; but, in some instances, the mere idea of having current on the wires seems to introduce immediately a fear of the construction—both mechanically and electrically. In such cases, the ultimate source of the fear and objection to the transmission line crossings may be said to lie in the fact that the lines carry an electric current; and it is well, therefore, to examine into the possible ways in which the existence of an electric current on the lines may affect the safety of the property or employees of the railroad.

Assume a crossing with the same side clearance, overhead clearance and factor of safety as would be allowed in the case of a bridge. Assume that there is no electric current on the wires. Under such conditions, no damage except such as is equally likely in the case of a bridge can result to the property or employees of the railroad company.

Now assume that the electric current is put on the crossing. The added possibilities of danger are as follows:

(1) The possibility of overhead contact either direct or through some conducting object.

(2) The presence of the electric current in case the structure is thrown down by a train wreck, by wind, or other mechanical forces.

(3) The possible effect of the electric current in causing the line wires to fall.

The probability of (1), overhead contact, can be indefinitely reduced by increasing the overhead clearance, if such clearance as would be allowed for a bridge is not considered a sufficient insurance.

The probability of (2) can, so far as wrecks are concerned, be indefinitely reduced by sufficient overhead and side clearance; and, so far as wind or other forces are concerned, by proper design and construction with reference to ice and wind loads. The practice in these matters in the case of bridges would seem to be amply sufficient, especially in view of the fact that, as mentioned later on, in a well designed and properly operated transmission system, anything which would cause the line wires to be thrown down, would cause the power to be cut off by reason of the resulting short circuit.

The question, therefore, finally resolves itself into an examination of (3), the effect which the presence of the electric current might have in causing the line wires to fall upon the tracks.

The only conceivable way in which the presence of the electric current could be the cause of the contingency mentioned is that of the establishment of an arc which should burn off one or more of the line wires. Such an arc might be established between two or more of the line wires, or between one or more of the wires and the structures supporting the transmission line. An arc between a line wire and the supporting structure could occur only in case the structure is metal, or in case the insulators are supported upon metal pins connected to each other or to ground.

An arc between the line wires, if it be instituted at a point distant from the supporting structures, can hardly be conceived of as due to anything other than the swinging together of the wires, or to their having thrown across them, either maliciously or by accident, some conducting object. The chance for an arc to be started by the wires swinging together can be removed entirely by putting them sufficiently far apart. The chance for an arc to be established by something being thrown across the line wires can be made very small by recourse to the same expedient.

The occurrence of an arc between one or more of the line wires and the insulator pins or the steel structures carrying them, might be due to a direct puncture of the insulator by electrical means, or to breakage of the insulator by mechanical means, or to the establishment of an arc around the insulator to the pin by an initial creepage of current over the insulator surface, when the insulating value of such surface had been reduced by a film of moisture, dirt or other conducting or semi-conducting substance. It should be noted that the first and last of the three possible causes mentioned would be extremely unlikely except in the case of high voltage lines, and, even then, not at all likely, if the insulator be well designed, except in the case of lightning.

In the case of the occurrence of an arc from any of the causes mentioned, the arc would not, with a properly designed transmission system, exist for any considerable portion of time, since its occurrence would cause the automatic circuit breaking appliances in the generating station to operate, thus opening the circuit and stopping the arc. The amount which such an arc could do towards burning a line wire asunder, or otherwise damaging the crossing, would depend upon the amount of power behind the arc, the length of time it lasted, and the size or mass of the metal from which the arc was drawn. That is to say, it would depend upon the amount of heat generated in the arc tending to melt the wire or other metal concerned, and the amount of metal there was present to conduct away and absorb this heat, and thus diminish the melting action of the arc. The size and weight of the wires and other metal parts involved could be so proportioned relative to the destructive potency of any arc which might be formed that they would easily withstand the melting action, without being burned off, until such time as the automatic protective devices at the generating station opened and the arc ceased.

It would even be possible to make such provision that, in case an arc formed, it would rupture itself, even if the automatic protective devices at the generating station did not operate; and so that it would rupture itself before any serious damage to the crossing could occur. To accomplish this, it would be necessary to properly proportion not only the metal parts, but also the distances separating those parts between which an arc could occur; that is, the distances between the line cables and between the line cables and the supporting structures. Such proportioning should be done with reference to the voltage and power capacity of the transmission system; the less the voltage, the less the distances would have to be; and the less the power capacity of the system, the lighter could be the metal parts.

It would appear, therefore, perfectly possible to design a transmission line crossing so that it could not constitute a source of danger from either a mechanical or electrical standpoint. Such a crossing would preferably be one along the following lines:

(a) It should be so constructed that the line conductors (line wires or cables) and the supporting structures at each side of the track would be of proper strength to withstand the ice and wind loads which might come upon them. It should be self-sustaining; that is, should be capable of standing up under the action of wind and ice without reference to the remainder of the line, so that the line, on one or both sides of the crossing, might break without interfering with the crossing itself.

(b) There should be sufficient overhead clearance between the line and the track, so that there would be no possibility of contact except by deliberate intent.

(c) The line conductors should be far enough apart so that they could not swing together.

(d) The line conductors should be sufficiently massive so that an arc might exist between them for several seconds, without danger of burning or melting them off.

(e) If the supporting structures are of steel, or the insulator pins are of metal and the pins connected to each other, or to ground, the insulators should have cast metal caps cemented upon them. These caps, or extensions of them, should extend out on each side of the insulator for some distance along and underneath the conductor, in order to further protect the conductor, or else the conductors should have, in addition to the caps, a protection from arcs in the form of a serving of wire upon them for some distance on each side of the insulator. The result of such protection will be that an arc formed near the insulator will expend itself upon the serving wire, or metal casting, instead of upon the conductor itself.

It is not to be understood from the above that a crossing would necessarily consist of a single span. It might consist of a series of spans, meeting the above requirements, where several spans were necessary for crossing a number of tracks, such as would be found in a railroad yard.

A crossing constructed on the above lines would be as safe as any reasonable individual could ask, and at the same time would be a great deal cheaper than the steel bridges sometimes insisted upon.

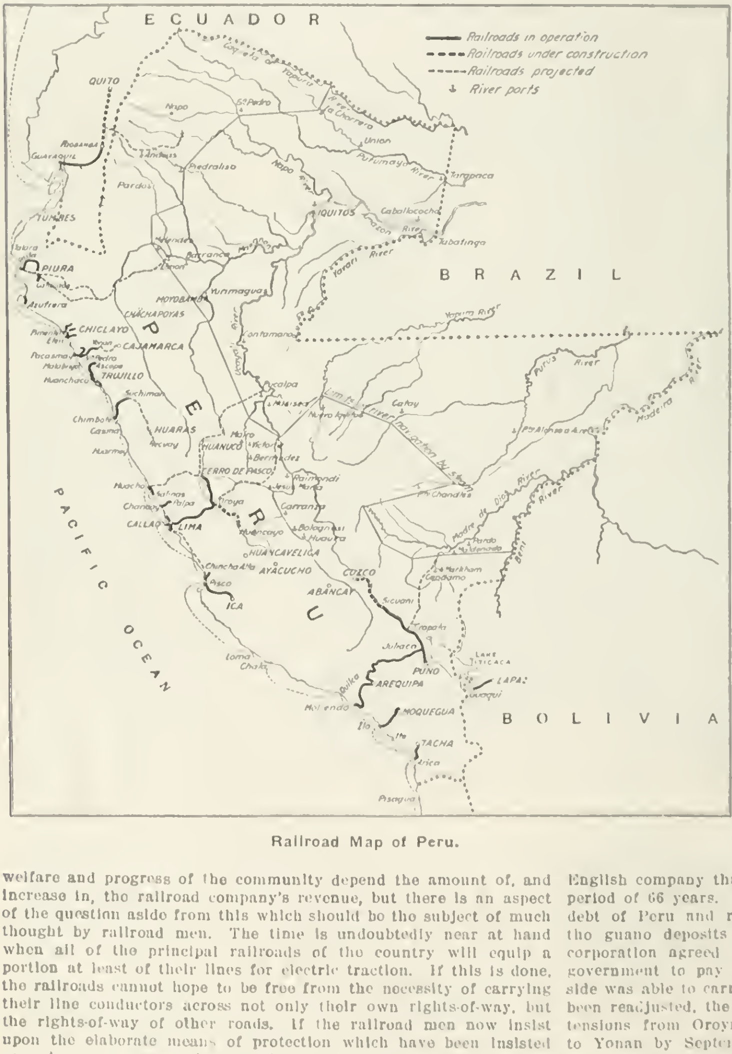
The matter of steel protective bridges is a very serious one to the transmission companies, not only on the score of expense of the bridges themselves, but because of the difficulty often met in installing them or getting permission to install them, especially when they are required in towns and are objected to by the municipality. If they are insisted upon, it will greatly retard the development of those sections of the country fortunate enough to be within electric reach of cheaply generated power, since the requirement of a bridge for a railroad crossing will, in many cases, prohibit the supplying of small customers with power. This, of itself, is a matter of importance to the railroads in that on the welfare and progress of the community depend the amount of, and increase in, the railroad company's revenue, but there is an aspect of the question aside from this which should be the subject of much thought by railroad men. The time is undoubtedly near at hand when all of the principal railroads of the country will equip a portion at least of their lines for electric traction. If this is done, the railroads cannot hope to be free from the necessity of carrying their line conductors across not only their own rights-of-way, but the rights-of-way of other roads. If the railroad men now insist upon the elaborate means of protection which have been insisted upon in some cases, and crystallize public opinion to the idea that such elaborate protection is necessary, they themselves will be confronted with the necessity of making use of the elaborate and expensive protection in question.

It behooves the railroad man, therefore, to consider this matter of crossings very carefully and with the utmost spirit of fairness, since in so doing he will not merely serve the interests of the transmission companies, but also the interests of his own and other railroad companies in the future.

The Railroads of Peru.

BY J. R. CAHILL.

In order to understand the location and workings of the railroad systems of Peru it is first necessary to get an idea of the physical features and industrial condition of the country. In size Peru is nearly one-fourth as large as the United States. It is divided topographically into three zones; the coast region, 1,500 miles long varying from 20 to 80 miles wide; the Sierra or Cordilleras of the Andes averaging about 300 miles wide, and the Montaña on the eastern slope of the Andes extending down way into the basin of the Amazon The Montaña comprises more than half the area of the country and is a tropical jungle immensely rich in rubber, hardwoods and gold. The Cordillera region includes two ranges of the Andes running parallel to the coast. It is the rich mineral belt and also supports a stock raising industry. The coast is given up to the production of sugar and cotton for export and tropical fruits and vegetables for home consumption. It is productive only near the rivers where irrigation is easy, the rest of the land being barren. Irrigation plans are being projected that will bring much more of the land under cultivation.



Railroad Map of Peru.

There are three general types of railroads: Trans-Andine roads, extending from the coast eastward across the Andes; short lines running from the seaboard up into the valleys of the coast region, and lines running in a general north and south direction through the Cordilleras. The first type carries the cotton and sugar produced in the valleys down to the ports at the termini and carries back imported manufactured commodities. The trans-Andine lines carry the products of the Montaña and the mines of the Cordillera down to the coast along with the agricultural products of the coast region. They carry back mainly lumber and other mine supplies. The lines running north and south exist for the immediate purpose of developing the mines and of serving as feeders for the trans-Andine roads. Eventually they will form a means of communication between the trans-Andine roads.

There are at present about 1,340 miles of railroad in Peru. Of these 1,053 miles are of standard gage. The remainder, for the most part unimportant lines, are of 3 ft. or of meter gage. There are two lines that may be called trans-Andine roads: the Central Railroad, from the port of Callao to Oroya on the east slope of the Andes, 138 miles, and the Southern Railroad, from Mollendo to Puno, 325 miles. There are three roads running north and south through the Cordillera: The Cerro de Pasco road from Oroya to Cerro de Pasco, 83 miles long; the Southern Road's branch north from Juliaca to Chiclacupi, 150 miles long; the Central Road's branch south from Oroya, about 30 miles of which has been built. This road is being continued to Huancayo. The Juliaca-Chiclacupi branch is being extended now to Cuzco. Eventually Cuzco and Huancayo will be connected.

Most of the lines are the property of the government of Peru. These are, however, operated by the Peruvian corporation, an English company that in 1890 leased the roads from the state for a period of 66 years. The Peruvian corporation assumed the foreign debt of Peru and received large land grants and a monopoly of the guano deposits together with certain other privileges. The corporation agreed to make certain extensions of roads and the government to pay $400,000 per year to the corporation. Neither side was able to carry out the bargain and the agreement has since been readjusted, the Peruvian corporation agreeing to complete extensions from Oroya to Huancayo, Sicuani to Cuzco and Chilete to Yonan by September, 1908. The road completed a short time ago from Oroya to Cerro de Pasco was built by American capital to develop the Cerro de Pasco copper properties. The road and smelters represent at present an investment of some $17,000,000. This road will also allow the coal fields in this region to be developed.

The railroads of the Peruvian corporation were mismanaged for many years and did not begin to earn money until the Cerro de Pasco enterprise furnished them with increased traffic. This business, combined with the heavy traffic from Mollendo to La Paz

Peruvian Railroad Scenery.

brought about by the extensive railroad building now going on in Bolivia, is now placing the Peruvian corporation on a paying basis. In the year 1905-1906 the preferred stock received a 1½ per cent. dividend, and in the year ending June 30, 1907, the gross traffic receipts amounted to $8,260,000, an increase of $905,000. The Peruvian corporation is now negotiating with American and German capitalists for a loan of $15,000,000 to enable it to improve its rolling stock and roadbed so as to be able to handle the traffic that is now swamping it.

The Central Railroad is a piece of the most difficult mountain construction ever built. In a space of 138 miles the road has six switchbacks, 10 large bridges and a dozen smaller ones, and is operated over 4 and 4½ per cent. grades. The cañons are so steep that tunnels are far more frequent than deep cuts. There are

Arequipa Station; Peruvian Southern.

56 tunnels in 80 miles of road, and very few of these are on tangents. Curves as sharp as 15 deg. are used. The cañon walls are so precipitous that in many cases in side hill cuts heavy retaining walls are built to reduce the amount of fill. At an elevation of 10,920 ft. above sea level at the Infernillo bridge the road plunges from a tunnel out across a steel truss hung between the mouths of two tunnels a couple of hundred feet above the river. At the summit is the Galera tunnel, three-quarters of a mile long at an elevation of 15,700 ft. In 98 miles the road rises 15,160 ft. in elevation. The average grade between Callao and Oroya is 2½ per cent. The 138 miles from Callao to Oroya cost originally $22,000,000, and was built by Henry Meiggs, an American. Twenty-four-ft. rails were used, weighing 60 lbs. per yard, and all rail renewals have been of the same kind of rails. Redwood ties

Mollendo, Terminus of the Peruvian Southern.

brought from California and Oregon are used. There are no tie plates. The curves are so sharp that the rails are tied together with steel rods. Steel rails with steel rail chairs are also used as additional ties on sharp curves. The track is ballasted with rock and gravel. Very little difficulty is encountered with the drainage of the roadbed as the rainfall is not very heavy. The principal difficulty is the frequent occurrence of rock slides resulting from steep slopes in side hill cuts. Owing to the high cost of lumber and its rather short life in parts of Peru, as little wood as possible is used in railroad structures. The main stations are built of Oregon pine, but all sheds and minor buildings are of corrugated iron laid on wooden frames for the smaller buildings. For larger sheds, cast iron columns and steel roof trusses covered with corrugated iron are used. The fences along the right-of-way through the Rimac valley are built of large blocks of adobe about 2 ft. thick. All the telegraph posts are of iron. Very little concrete work was used. Water tanks are of steel supported generally on cast iron columns.

The natives, having been raised in a country devoid of timber, are naturally very skilful in masonry work. The bridge abutments are all ashlar masonry, and the tunnels when not cut through solid rock are lined with ashlar. Side hill cuts are supported by heavy dry rubble retaining walls. The bridges are all steel structures. For short spans, Warren girders are used. The longer bridges are Pratt trusses or viaducts. There is one cantilever bridge. Old style Phoenix columns were used to some extent but most sections are channels and plates. Joints are generally riveted.

These bridges are now proving too light for the heavy locomotives necessary for handling the great increase of traffic, so they are shortly to be replaced. The passenger engines now used are of the Mogul type. The freight engines are of the Consolidation type. The new locomotives are of the Mastodon class, and their weight of 60 tons is proving too great for the present bridges. All the locomotives except a few small switching engines are of American manufacture. The old freight cars were all small ones following the English practice, but after the construction of the American Cerro de Pasco road the English company commenced using the ordinary 36-ft. American pattern car of 50,000 lbs. capacity.

Near Arequipa; Peruvian Southern.

Infiernillo Bridge and Tunnel 32, Elevation 10,920 ft.; Peruvian Central.

There are a few steel ore cars. Corrugated iron is used in repairing the roof of box cars. All the cars bought during the last few years have been of American manufacture.

Train hands and enginemen are for the most part drawn from the best of the native "Cholo" class, a mixture of Spanish and Indian. All track work is done by Cholo laborers, who are paid about 75 cents a day. The station agent and general clerical staff is composed of Peruvians of Spanish descent. The management is, of course, English. The standard of honesty among the train hands and station agents is very low and there is a great deal of difficulty in preventing stealing. The passenger rates, first class, are about 5 cents, gold, per mile. Cholos ride in the second class cars and Gringos and Peruvians ride first class. The freight rates are very high. The road through insufficiency of rolling stock has great difficulty in handling the traffic offered it, and this traffic is bound to increase to still greater proportions as new mines are being opened up and as the Cerro de Pasco mines are not working up to their maximum output as yet.

The Cerro de Pasco road that connects with the Central Road at Oroya is operated by the American capital owning the Cerro de Pasco mines. It is a far more modern road than any of the Peruvian corporation's properties, and is able to deliver more freight at Oroya than the Central Railroad can handle. The lack of facilities on the Central has been a big hindrance to the development of the Cerro de Pasco mines.

The Cerro de Pasco Railroad is 83 miles long, and its elevation ranges from 12,000 ft. to 14,000 ft. The grades are lighter, curves easier and bridges fewer than on the Central Railroad inasmuch as elevation does not have to be developed. The road follows along a cañon for about 15 miles and then crosses a level pampa. The maximum grade is 2¼ per cent. and the maximum curvature is 16 deg. Seventy-lb. rail is used, some of it of English manufacture. All rolling stock is of American manufacture. The output of the Cerro de Pasco mines, after it leaves the Cerro de Pasco Railroad at Oroya is being handled so badly by the Peruvian Corporation that the construction of a road parallel to the Central Road has been considered by the American company.

The Cerro de Pasco company holds a concession for a railroad from the Cerro de Pasco road eastward into the Montaña to the navigable headwaters of the Ucayali river. This will probably be built and will supply the mines with coke and lumber and at the same time open up an immense rubber territory. This means new business for the Peruvian Central and if it does not handle the traffic better it means another reason for a competing road from the Cerro de Pasco line to the coast.

The other of the two most important Peruvian railroads is the Southern Railroad running from the port of Mollendo up to the city of Arequipa, then over the Andes to Puno, on the shores of Lake Titicaca, where it connects by steamer with La Paz, in Bolivia. At Juliaca a branch shoots northward along the Cordillera towards Cuzco. It is now constructed as far as Chicacupi, 150 miles, making the entire mileage of the system 475 miles. This construction is not of the sensational type of the Central Road. The cañon walls are not so steep and precipitous, and the bridges and tunnels of the Central line have their counterpart in deep fills and cuts on the Southern. There is very little rainfall, so drainage channels need not be provided. Sixty-lb. steel is used, but the rails are in very poor condition and are now being replaced with 80-lb. section. Old rails are being sold for almost 2 cents, gold, per pound, for use in the towns for building construction. The rolling stock is of the same general description as on the Central Railroad. The new heavy locomotives are being used on this line, as there are few bridges. Such bridges as there are will be replaced by new structures now being fabricated in the United States. Curves are now being tie-plated.

The employees are of the same class as on the Central Road. Officials of the road blame the poor class of labor for the poor train service, and it is undeniable that the Peruvian Cholo gives poor service, being indifferent whether he works or not. It is also hard to get men of sufficient education to make good station agents and clerks. Owing to the small number of trains run it is very difficult for officials to travel between different points on the line without great waste of time. No motor cycles or motor cars are used.

The principal traffic of the Southern Railroad, at present, is furnished by the eastbound haul of railroad supplies for Bolivian railroad construction and for the extension of the Peruvian road towards Cuzco. Normally the eastbound freight consists of manufactured commodities supplying the mines of Bolivia and the Cordillera of Peru and the towns of Arequipa, La Paz and the other small towns subsisting off the wool industry and farming. The westbound freight is largely mine products and wool. Rubber production in the Montaña bids fair to increase the traffic greatly as several important properties are being opened up. The present congestion of the traffic is shown by the fact that it generally takes a month to get a shipment through from Mollendo to Arequipa, a distance of 106 miles. The Cholo enginemen refuse to take night runs on account of the poor rails, heavy grades and sharp curves, so no trains are operated at night. Probably the congestion will be relieved when the roadbed is placed in good condition. Upon the completion of the railroad from Arica to La Paz, which the Chilean government has agreed to build according to the terms of a recent treaty with Bolivia, the Southern Railroad will have a severe competition for the La Paz business that it will find it hard to meet. The new line will be about 300 miles long and will afford direct communication with the coast. The distance from Mollendo to La Paz via the Southern Road and Lake Titicaca is 563 miles by water and rail, involving a transshipment at Puno. In addition the terminus of the Southern Railroad, at Mollendo, is probably the poorest harbor on the coast of Peru. A breakwater is being built that will improve this somewhat but it will be an expensive work. It was started with riprap but it is now proposed to finish it with five-ton blocks of concrete placed with steam cranes. It is probable, though, that the Arica-La Paz road will not be completed for several years. In the meantime the Southern road will carry the railroad material for the road building in Bolivia.

Mountain Scenery; Peruvian Central.

Bolivia has just received $14,000,000 from Chile and Brazil in indemnities. This will all be devoted to railroad building, and with this money as an inducement, American capital is taking an interest in the construction of the roads. A contract made with Speyer & Co. and the National City Bank of New York provides for building 863 miles of roads. The total cost is estimated at $27,500,000, and the government contributes $12,500,000, which shall be repaid within 25 years. This leaves the government with capital for future extensions. The construction was started in 1906 and is being pushed rapidly. American rolling stock and track material is being used.

There are three roads to be built, the La Paz-Topiza line, the Oruru-Cochabamba line, and the La Paz-Puerto Pando line. The La Paz-Tupiza road will be 530 miles long. It connects with the Antofagasta road at Oruro, giving La Paz another connection with the coast and hence creating more opposition to the Southern Railroad of Peru. It will also connect at Tupiza with the Argentine road, being built into Bolivian territory, joining Buenos Ayres and Tupiza. This will divert more of the Bolivian traffic from the Southern Railroad.

The La Paz-Tupiza road has been graded as far as Oruro, and track has been laid for about 80 miles. The other two roads will serve as feeders that will develop valuable mining districts and open up a rich rubber territory. The Oruro-Cochabamba line will be 133 miles long. The roadbed has been graded a few miles out from Oruro and work stopped pending a change of plans. The La Paz-Puerto Pando line will be 200 miles long. The stimulus these roads will give to the rubber and mining industries in a now almost inaccessible region will create an increase of traffic from Bolivia to the coast that will probably compensate the Peruvian railroad for the diversion of a portion of the business to Chilian and Argentine ports.

The government of Peru has adopted a policy aiming to stimulate railroad building. The state gives concessions or franchises for proposed lines, in some cases guaranteeing interest on investments and in others giving land grants as inducements. It also grants various other privileges such as free passage of railroad material through customs, cash bonus per mile of railroad built and guarantee of freedom from competition for a specified term of years. In order to insure being able to meet such obligations the proceeds of the tobacco tax, amounting to about $1,000,000 yearly, have been set aside as railroad encouragement fund. The general railroad policy is to encourage roads into the Montaña from the two present trans-Andine roads to encourage a third trans-Andine road in northern Peru; to bring about a connection along the Cordillera between the two trans-Andine lines now in existence, and to connect some of the short roads that run from the coast ports into the valleys.

One of the hindrances to railroad operation in Peru is the high cost of fuel. The oil developments promise to lessen this somewhat. In the north of Peru oil fields are being worked and the government is commencing extensive prospecting work in fields that American consulting geologists have pronounced to be oil-bearing. On the Central Railroad of Peru it has been proposed to utilize the Rimac river in developing power and electrifying the road. Government engineers claim that the Rimac can develop 100,000 h.p. This is probably exaggerated, but there is no doubt of its being adequate to supply the demands of the railroad. Such an installation could also do considerable business in supplying power for the mining district that the railroad taps.

All roads that will be built running from trans-Andine roads into the Montaña have as their objective point a terminus on one of the navigable rivers flowing into the Amazon. Peru has 9,300 miles of navigable rivers in its eastern or Montaña territory. The Ucayali river alone flows north and south for almost the entire length of eastern Peru. Hence the roads into the Montaña have a network of water ways serving as feeders. Rubber companies receive large grants of land in return for opening up means of communication between the Montaña and the present railroads. One London company is making surveys now for a railroad from the Cuzco branch of the Southern Road to the Madre de Dios river. Another concession in force is from Huacho, on the coast, to the Cerro de Pasco road and thence east to the Ucayali river. The Peruvian government has made surveys for a third trans-Andine road to develop northern Peru. This will run from the port of Paita through the town of Piura and what is claimed to be the lowest pass in the Andes to the port of Limon on the Marañon river. It is proposed to run this road over the mountains with electric power. Several other minor concessions are in force. Concessions are generally obtained upon depositing with the government a stipulated sum to serve as a guarantee of good faith and which passes to the state if promises of construction are not fulfilled.

One of the most important of the new propositions is the Peruvian Pacific Railroad, a line to run from the port of Chimboto to Recuay in the Huaylas valley. Recuay is 11,000 ft. above the sea level. The road will be 166 miles long. The concession includes valuable coal mines that can give an output of 130,000 tons per year. This will do much to cheapen railroad operation in Peru. The road will open up a good agricultural territory as well as a mining district.

The Ocean Carrier.

BY J. RUSSELL SMITH, PH.D.

V.

Recent Developments in Line Traffic.

The year 1870 may be put down as the fourth important date in the history of line traffic in modern commerce; 1816 was its real transatlantic beginning; the year 1840 had the first steamship line; 1850 marked the advance of steamship lines to economic independence as evidenced by their severe competition with each other and with the packet lines and by the carrying of steerage passengers. Eighteen hundred and seventy may be taken as a kind of focal date rather than as an exact date, marking the virtual disappearance of the packet lines and a great advance in steamer lines. It is true that there was at least one Atlantic sailing packet line running to New York as late as 1873 and one to Montreal in 1875, but 1870 may be safely taken as the date of their virtual disappearance—a process which had gone forward by great strides during the preceding decade.

The period central in 1870 and ending in 1873 was one of great prosperity throughout the commercial world. America was feverishly building railroads, transcontinental and otherwise. Europe was also on a boom and the response in ocean transportation was shown by the rapid establishment of new lines of the now thoroughly-proven ocean steamers.

We had new services to the Continent. In 1866, '67 and '68, the firm of Ruger Bros., of New York, established under different combinations line services to Bremen, and in 1869 they founded one to Copenhagen, Stettin and Christianssand, but all of these failed through the competition of the North German Lloyd. This strong company put on steam service from its home port to Baltimore in 1868, to New Orleans in 1869. In 1870 the Mississippi and Dominion Company started steamers from New Orleans to Liverpool. In 1868 the Boston & American Steamship Company started a steam service to Liverpool, but it did not survive many years.

In 1871 came the establishment of the American Line, running from Philadelphia to Liverpool in connection with the Pennsylvania Railroad. In 1872 there came a line from New York to Bristol, and the next year another from New York to Cardiff. In 1872 the Holland-America Line started its service from Amsterdam and Rotterdam to New York. In 1873 also the State Line was started between New York and Glasgow and the Red Star Line between Philadelphia and Antwerp. But the most significant and epoch making member of this group of new services was the White Star Line. The company back of this line had for several years been planning innovations and in 1871 they launched and sailed from Liverpool to New York their first steamer, the "Oceanic"—larger, longer, faster, more luxurious than anything afloat and with improvements in design that had to be copied in all passenger ships thence forward. Before that time the steamer had merely continued the practice of the sailors and they the practice of the merchant ships of the ages. These vessels had put the crew in the forecastle and more elegant quarters for captain, officers or passengers were erected in the stern of the ship. So in the steamer, but the White Star "Oceanic" ended all this for the better class passengers by appearing with cabins amidships where the motion in all directions is minimized in the same way that there is little motion in that part of a seesaw-board that rests on the fulcrum.

The period of prosperity and boom that was central in 1870 came to a sudden termination in the "crash" of 1873, the start of a long industrial depression which from 1874 to 1878 made great hardship and loss among ocean carriers. Here as on land many smaller and weaker companies disappeared and were absorbed by their stronger rivals.

From 1870 onward has been a period in which line traffic has had few if any epoch-making dates. It has proceeded gradually by improvements in kind of service rendered, in the number of lines and in the portion of the globe that they cover and connect.

In 1874 there was a strictly freight steamship line established between New York and Bristol. A predecessor in this direction had been the National Steam Navigation Company, which was formed in England during the Civil War to carry on trade with the South upon the return of peace. This was so long deferred that the company in 1863 opened service between Liverpool and New York with their large slow steamers, which had been intended to carry on a trade which until that time was entirely served by sail. These steamers were devoted chiefly to freight and emigrants, a very small number of cabin passengers being carried. The strictly freight line of 1874 has since been multiplied until the number almost or quite equals that of the lines carrying passengers also.

The greater part of these strictly freight lines take their departure from the smaller ports where railroad and passenger accommodations are meager and where the distance to Europe is greater than from New York so that there is small reason for a passenger to desire the longer voyage. The steamship owners, therefore, find no inducement to cater to the few passengers whom they might get and whom they could scarcely carry at a profit. As a counterpart to that passengerless traffic we have within the past 15 years had the freightless express steamers from New York in which the combined requirements of large crew and extensive bunkers and machinery for fast speed and large passenger accommodation have practically eliminated freight carrying.

In 1876 the same National Steam Navigation Company that gave so little attention to passengers was the first to carry fresh meat from America to Europe, and the next year they were also the pioneers in the transport of live cattle. Both of these improvements have been widely copied and have become important factors in ocean traffic. The refrigerated chamber has become of wide usefulness in carrying meat not only across the Atlantic, but practically around the world. For many years there have been lines of steamers devoted largely to carrying frozen meat to Great Britain from Argentine Republic, from Australia and from New Zealand. The artificially cooled chamber is also in use over the routes from Australia, South Africa and America to Europe for the transport of dairy produce and fresh fruits, and in all of these commodities the trade is growing rapidly.

In the period since 1870 connections have been established between the leading American ports and every European country of importance. In 1879 the Thingvalla Line from Copenhagen sent its ships to New York. French lines have come from Bordeaux and Marseilles. Spanish and Portuguese lines have been established. The Italian line has come, and in 1891 even the German Lloyd put on a New York-Italian service. Then came lines to the Adriatic and in 1899 to Constantinople.

This process of multiplication of lines went on so rapidly that by 1890 the port of New York alone had no less than 29 steamship lines to Europe, of which six ran express steamers, 23 carried both freight and passengers and six freight only.* Of these lines, 12 had sailings weekly or oftener and employed a total of 84 steamships.

The speed, frequency and excellence of the North Atlantic service centering at New York, but shared in no mean degree by Boston, Philadelphia, Portland, New Orleans and Galveston, partially explains why there are but a small total number of steamship connections between America and other parts of the world, and it has innocently helped to call forth many a bitter American lament because the best, the quickest and cheapest and the usual way to get from America to many parts of the world was via Europe. Typical of these laments is that of Senator Frye, of Maine, in his speech in the United States Senate, April 30 and May 1, 1884.

"A manufacturing concern in my city a few years ago undertook to sell cotton goods in Rio Janeiro. They forwarded them to New York, where they were shipped on an English steamer, carried to Liverpool, reshipped on another English steamer and carried in her to Rio Janeiro, and the mails went the same way."

After citing figures for Spanish-American trade and saying that England, France and Germany have nearly three-fourths of this trade, the Senator continued. "Why do these countries have three-fourths of all that immense trade in supplying these people and in taking supplies from them for their home market? For no assignable reason other than the fact that those countries have regularly established lines of steamers to the South American ports, speedy, prompt and reliable, while we have, comparatively speaking, none."

The answer to the Senator's eloquent lament is not far to seek. New York was then and is now the chief seaport assembling point, as was Liverpool, for the trade of a continent. These are great metropoli. Between them plies the very fastest and finest and most continuous ocean service. If you or your freight are anywhere near either of these ports, the quickest way to reach the other is to go to the nearest one and take the fast steamer for the other. It is just like the travel on land. Between New York and Philadelphia there is a magnificent passenger train service. Those cities are only 90 miles apart, but if a man lives 35 miles north of New York and desires to go to a place 35 miles north of Philadelphia he will probably find that the quickest and even the cheapest way for him to make the journey is to pass through both of the great cities and thus take advantage of the fast trains between them, and of the radial organization of local routes to each city, although this roundabout way nearly doubles the length of his journey.

In identical fashion the North Atlantic trunk route served as

*Scribner's Magazine, 9: 411.

a magnet to draw to itself the trade between all parts of the old world and all ports of the new world, just as the trunk railroads between Philadelphia and New York command the travel of a hundred towns adjacent to each metropolis. Each metropolis has good connection with its hundred towns and with the other metropolis.

Similarly Europe and especially Liverpool has developed connections with all parts of the old world and incidentally with that part of the New World called South America. Europe was the pioneer in getting these services instead of the United States, because those ports of the world were her economic dependencies and she was dependent on them while America was not. Furthermore, these countries are all cultural dependencies of Europe, South America is Latin, South Africa and Australia are British, Asia is sprinkled with European possessions, and 25 years ago as now was a great European market. With emigrants, with mail, with colonial ambitions, with manufactured export and raw import, Europe had need of connection with the ends of the earth and where the need was the lines promptly came. Some of them were subsidized, but most of them were not.

In the meantime we did not have these strong needs to communicate with Africa, Asia, South America and the isles of the sea. We were showering wheat, corn, cotton and meat into Europe by the millions of tons. Manufactures came back over the route, with millions of European emigrants and hundreds of thousands of returning American tourists. Here, to meet these heaviest needs, arose the world's fastest steamship lines. By their connection at Liverpool, New York was but a little farther from Asia and Africa and South America than was Liverpool. In point of time, New York was often no farther away by this devious route than she would have been by a direct one because the small American demand for direct service would have sufficed only to command slow steamers. At the same time the livelier demand and the subsidies paid for connection from Europe had resulted in faster steamers from England, France and Germany, and these, connecting with the Atlantic racers, gave New York as speedy connection with the far corners of the seas as it was possible for her to have, unless her direct lines could be in receipt of other income than traffic earnings—namely, subsidies.

Nor was this roundabout connection necessarily an expensive connection. We still had the charter vessels, both steam and sail, in great numbers plying wherever there was demand for full cargo traffic, or wherever any merchant could load a ship as they were continually doing. It was only a comparatively small traffic, the traffic in manufactured goods that sought the route to market via Europe, and the freights were rarely high for the North Atlantic end of the trip. The steamers that carried the wheat, corn and cotton eastward were always half empty coming west across the Atlantic and the stray products of any non-European clime were gladly taken at a reasonable rate. It was furthermore often the case that the large New York passenger steamers were at certain seasons so pressed even for eastbound freight that they took it at low rates across to Liverpool or Hamburg or Antwerp, whence it could easily go anywhere.

An even more remarkable situation has arisen frequently in the recent export trade from New York. It has been cheaper for the American shipper to have his goods forwarded via Liverpool to Australia or Africa than it was for the Englishman to have his goods go out on the same steamer. This anomalous condition has resulted from rate wars on direct lines from New York at a time when there were no rate wars from Europe, and the trans-shipping lines have had to put the rate via Liverpool down to meet the direct rate from New York.

The trans-shipping of freight due to the excellence of the North Atlantic steamer lines is not a monopoly of Liverpool or of the ports on the European end. New York also has a share of the traffic to those parts of the world where New York's connections are superior to those of Europe, for then it is advantageous for European shippers to trans-ship at New York. The commercial bond between the North Atlantic ports of the United States and the Gulf, Caribbean and West Indian ports is stronger than that of those regions with Europe. We feed them and buy their produce, therefore we have more lines to them than Europe has, and the quickest and best way to and from many of these ports is via New York. As early as 1891 there were 18 lines of steamers with scores of vessels plying from New York to these waters, and European forwarders have for a decade been advertising the speed and excellence of the New York gateway for European goods to the West Indies, for they go as far as New York on the fastest carriers of freight. The backers of a British line to Colon complained of the hardship resulting from the fact that it was four days quicker from Colon via New York than by direct steamer.

In the period since 1890 there have grown up steamer lines, freight steamers in practically every case, between New York and all important quarters of the globe, to wit: The Orient, Australia, South Africa and South America, East and West.

Just when line traffic began with these regions it would be hard to say. In practically every case it has come about gradually and at the hands of some firm that began as a mercantile house of the good old style of 1800. There have been a few large American merchant firms doing business in all these regions. They would load a sailing vessel back in 1850 or 1860 just as Girard did 50 years before and send her out to their agents or branch house at Valparaiso, Buenos Aires, Cape Town, Melbourne or Shanghai. Sometime later they would send another. They would occasionally take such freight as they could get for other shippers, and if trade was good there would be more vessels than when it was not good. When steam vessels became cheap enough to use, they were occasionally employed, and the despatchings of some firms that were dignified by the name of lines, in the prosperity of one year were not worthy of mention in the depression of the next. In 1891* the depression in Argentine Republic due to the Baring failure had disorganized the New York shipping trade. Before that Mr. Norton & Sons, of New York, and other firms had been sending from New York four to 12 steamers a year. They kept their services alive and for a decade have been running lines of slow chartered freight steamers.

The question of just what constitutes line traffic is not always easy to decide. In 1891 two New York firms were receiving about 25 steamers a year chiefly loaded with China and Japan tea. These same vessels went out to any port of the world to which their owners could be so fortunate as to charter them. At the same time Edward Perry & Co. were despatching about one steamer a month to East Asia. They had the habit of sending it when they got enough freight, and while the firm were freight carriers, they could scarcely be called the operators of a line, for a line has a schedule. The *Railroad Gazette* credits the first "line" to East Asia to the year 1899.

The connections between the United States and Australia are typical of the development above described. In 1853 two New York firms that had been despatching vessels for themselves and such others as desired to participate, agreed to take turns in sending out their sailing vessels. In 1878 a Boston firm began to send out sailing vessels regularly and in 1884 it began to alternate with the two New York firms. In 1890 a fourth company was added to the list of turn takers. In 1898 an English firm put on a line of steamers from New York outward, and the four American firms who had been sending sailing vessels only now united to form a rival steamship line. There soon came a third steamship line, European owned, and line traffic, on a modern basis but carrying freight only was thoroughly established.

The same decade, 1890-1900, that saw the phenomenal expansion of American exports and the establishment of line traffic to the Orient and to Australia also witnessed the establishment of two semi-merchant steamship lines from New York to the west coast of South America. During this same period also a transformation occurred in the South African trade identical with that which has just been described in the Australian trade.

The last few years in this decade were important ones in the establishment of steamer lines in the place of the old sailing vessels despatched occasionally. In 1899 the consolidated fleet of sailing vessels engaged in the American coasting trade around Cape Horn were sold and replaced by steamers which plied regularly in the long service between New York, San Francisco, Puget Sound and Hawaii until the opening of the Tehuantepic Railway in 1907, give them a more expeditious way of getting their freight from ocean to ocean.

The line traffic on the Pacific has had a more orderly and normal development than upon the Atlantic. It was well established to the Orient upon the opening of the first trans-continental railroad, and with the building of a new railroad line to each fresh port there has followed the establishment of a new steamship line to the Orient. These will be referred to more fully in the chapter on the railway steamship line.

The evolving ocean service has passed from the individual vessel, operated by its owner in the merchant carrier stage, to the common carrier with a world-embracing system. This evolution has been going on during the past century and it can also be seen to-day in all its stages. The trading schooner picks its way through Polynesia and along the shores of many half civilized lands. The private owner still fills his American coasting vessel, sometimes a steamer, with his own lumber and sends it off to market. The oil producer loads his own cargoes of oil in his own ships for export to foreign countries. A single firm in recent years has sent a full ship load of locomotives of its own manufacture half way round the world for delivery. The west South American and Australian trade of New York was, until recent years, carried on chiefly by merchants who loaded their own vessels,† sometimes filling them partly with the cargo of other shippers and sometimes entirely with a cargo of their own consignments. The cheapening of steam power

*Scribner's Magazine, 10: 597.

†The fact that these vessels were often chartered, does not in any way affect the service.

since 1890 has caused the introduction of steamers on these routes between 1890 and 1900, and the original mercantile firms, which began years ago by sending out their own sailing vessels, turned to the running of lines of steamers. They are now being competed with in some cases by other lines which are public carriers only, and the continuance of the merchant as a carrier in these services is something of a relic in the world's commerce. In time it is likely to disappear here, as in Great Britain, before the more specialized organization in which the shipping firm devotes itself to the business of carrying, and leaves the mercantile operations to other firms. This specialization is the method of the larger commerce as we now see it in the trade between America and Europe. The same change is foreshadowed in these old-fashioned services, as shown in the recent reorganization of the New York-Australian carriers.

Each of four different merchant firms had been for years running sailing vessels to Australasia on its own account. When British steamship companies offered rival service as common carriers, the four firms united and formed a steamship company, also a common carrier. It would be easy for them to sell out the steamship business* and continue as merchants only, thus completing the advance of the common carrier for general traffic in this service, as it has been completed in so many before.

There yet exists along with all the services mentioned above a vast traffic of private character—the so-called tramp or charter traffic in which any individual, who so desires, loads a ship and sends her wherever his interests dictate. Thousands of vessels are hired by any one who can ship a full cargo. Such charter traffic is limited by this fact to cheap and bulky materials. It is also of declining importance in the greatest ports, because in these the line steamers suffice. But for small and out-of-the-way ports, shipping bulky raw produce, the charter or independent vessel will be an important factor for many decades to come. The vessel will in the majority of cases be hired for the particular cargo in question.

It is easy to let an account of the nineteenth century line traffic with its splendid developments cause one to underestimate the present importance of the unobtrusive, eighteenth century survival, the single chartered vessel—the sea beast of burden. According to Mr. Walter Runciman, Jr., M.P., a British ship owner of New Castle on Tyne, in a letter to the North of England Ship Owners' Association,† there were at the end of 1901 the following totals of British shipping: sailing vessels 7,227, steamships 8,147, and of the latter he estimated that 1,247 were liners and 6,900 tramps for hire. Excepting the small Scandinavian fleets and a few continental firms the world tramp shipping is British * * * an investment of over £120,000,000 of genuine unwatered capital * * * 'They do the carriage not only of British and Colonial trade but so far as tramp shipping is concerned 80 to 90 per cent of foreign trade as well.' 'Silent and unseen and unknown of man they are really the backbone of our shipping business.'‡ This statement implies that the German, French, Italian, Japanese and American merchant navies are largely devoted to line traffic. The sailing vessels were almost entirely in the charter class.

(*To be continued.*)

*The vessels themselves are chartered, but the business and good will are valuable.

†*Syren and Shipping*, July 8, 1903.

‡Editorial in *Fairplay*, July 3, 1902, p. 886.

Derailment of a Standard Gage Train by Wind.

Readers of the accident record for the month of December, which was published in the *Railroad Gazette* of Jan. 24, page 109, will recall that one of the derailments, resulting in one death and six injuries, was caused by a severe wind storm. This was on the Colorado & Southern near Marshall, Colo., December 24. Four cars were overturned but the engine remained on the track. We give herewith two photographs showing the scene of this accident, from which it will be seen that it occurred in an open country a few miles from a range of high mountains. These mountains, which are seen in the extreme right of the upper view, seem to have had the effect of deflecting the wind so as to produce an exceptionally high velocity at the point of the derailment. The track it will be seen is in good condition, the rails are 80 lb. and the ballast and drainage good. That high winds are not uncommon in Colorado is evident enough from the somewhat numerous accidents of this kind which have occurred in past years to narrow gage trains, but this is the only accident of the kind, in recent years, to a standard gage train, so far as we recall. Marshall is 24 miles north of Denver and it is 5,410 ft. above the sea.

Derailment of a Passenger Train by Wind Near Marshall, Colorado.

In Italy they are detailing soldiers to learn railroading. They are employed as brakemen, switchmen and in making up trains, and when sufficiently proficient receive a testimonial which entitles them to employment on the State Railroads when vacancies occur. A short road out of Rome is worked entirely by engineering troops.

GENERAL NEWS SECTION

NOTES.

James C. Towers has been sentenced to imprisonment for life at Boulder, Mont., for murder and train robbery on the Northern Pacific, May 7, 1907.

On the Pennsylvania Lines West of Pittsburgh 159 grade crossings of streets and highways have been abolished within the past six years, mostly within cities.

The Missouri Supreme Court has declared unconstitutional the law of that state requiring railroads to give a free return pass to the shipper of each car of live stock.

The Chicago, Burlington & Quincy now uses telephones on its train wire between Aurora, Ill., and Galesburg, 129 miles (double-track). Gill's selector is used for calling the stations.

Chicago papers say that at the end of January many ticket speculators in that city vacated their offices, having concluded that under the recent sweeping decision of the United States Supreme Court it will be useless to try to continue their business.

The Wells-Fargo Express Company has appointed an industrial agent for the state of Texas, who is to confer with producers of vegetables and fruit in that state with a view of promoting their business in distant markets.

The estimate of the expenses of the New York State Public Service Commission, Second District, for the next fiscal year is $262,000, which, however, the legislative committee does not feel certain will be the final maximum.

At the meeting of State Railroad Commissioners held at Oklahoma City last week a "Tri-State Commission" was organized, with J. E. Love, of the Oklahoma Commission, Chairman. This compound "commission" will meet in Galveston, Tex., April 16.

According to a press despatch from Louisville, the Louisville & Nashville announces that in consequence of the prohibitory law now in effect in Georgia and Alabama, the road will not receive shipments of intoxicating liquors to be carried into those states.

The Railway Commission of Canada, reviewing numerous reports of railroad accidents, urges railroads to take more precautions against the injury of employees in clearing up wrecks and in moving disabled engines. Men engaged in such work should perform their duties under the direction of a responsible foreman.

At the end of this week the Black Diamond Express trains of the Lehigh Valley between New York and Buffalo will be discontinued. The company hopes that the causes—adverse legislation, state and federal orders, increasing costs, dull business, etc.—will soon abate so as to permit the reinstatement of the trains.

The coastwise steamship lines carrying freight between North Atlantic and South Atlantic ports have announced uniform freight tariffs showing considerable increases. Southbound, classes one, two and three have been advanced two cents per 100 lbs. and classes four, five and six one cent per 100 lbs. Most of the commodity rates, which cover a large part of the heavier staple articles, remain unchanged.

Texas newspapers say that the Southern Pacific lines in that state will dismiss their "train agents." For the past two years 16 of these men have been employed, their duty being to take the place of the conductor in collecting tickets and fares. An officer of the road says that with the effective operation of the law forbidding the scalping of tickets, the work of the train agent will be less necessary than in the past.

The Trunk Lines announce that after March 1, a carload shipment will not be delivered at a number of different places, except on payment of an additional charge. It appears that carload shipments of provisions and other goods from the West are regularly brought to New York at carload rates and each car taken to a number of different steamship docks to be unloaded. It is proposed now to charge $9 for each delivery after the first one.

The Interstate Commerce Commission, which has been asked by prominent railroad officers to suspend the operation of the law, which goes into effect March 4, limiting the hours of telegraph operators, is now being asked by many telegraphers to refuse any suspension. Over 1,700 telegrams from telegraphers were received in three days. A provision in the law empowers the Commission, after a full hearing in a case, to postpone the date on which a common carrier shall comply, but it is understood that the members of the Commission put on this proviso a very strict construction, holding, in effect, that before ordering a postponement, it would be necessary to have a hearing in respect to each office affected.

The Attorney-General has this week begun suits covering 101 violations of the Safety Appliance Law, the railroads to be prosecuted and the number of violations charged against each being as follows: Atchison, Topeka & Santa Fe, 14; Baltimore & Ohio, 13; Baltimore & Ohio Southwestern, 1; Chicago, Burlington & Quincy, 4; Denver & Rio Grande, 13, Illinois Central and Y. & M. V., 2; Missouri Pacific, 5; Pennsylvania, 2; St. Louis Southwestern, 1; St. Louis & San Francisco, 3; Southern, 4; Southern Pacific, 17; Union Pacific, 2; Wabash, 1; Wabash Pittsburgh Terminal, 14.

William Coffin, Division Freight Agent of the Pennsylvania Railroad at Camden, N. J., has issued a booklet describing the business and industrial advantages of southern New Jersey, in which he offers to give all inquirers any desired information concerning commercial matters in that territory. During the past year 12,000 carloads of perishable freight have been shipped from southern New Jersey to other states over the West Jersey & Seashore, which is the principal part of the Pennsylvania system in that region. During the same time the West Jersey & Seashore carried from the farms 85,000,000 quarts of milk.

The Interstate Commerce Commission holds it to be a discrimination to permit anyone to ride on limited passenger trains between stations where passengers are not carried regularly, and that it is illegal to refuse to sell tickets to stations where such trains stop, unless the exceptions are plainly stated in the tariffs. The decision made was in case of a man who demanded a refund on a ticket he was compelled to buy over the Lake Shore from Chicago to Toledo. He was going only as far as Elkhart, but was made to pay through to Toledo, Elkhart not being a passenger stop. Such limitations must hereafter be shown in the posted tariffs.

Since the first of January the General Manager of the Pennsylvania Railroad, by issuing a suitable notice, has greatly reduced the volume of telegrams sent over the company's wires, the reduction at the main telegraph office of the railroad company in Broad Street Station, Philadelphia, amounting to an average of 1,500 messages a day for the month of January. It is about four years since a similar shrinkage was produced, by a similar order, the reduction in numbers having been somewhat larger then than now. Like the issuing of passes, the writing of telegrams would seem to be a matter which can be kept within satisfactory bounds only by repeatedly "jacking up" the persons responsible.

The special session of the North Carolina Legislature, called to consider the passenger rate question, adjourned on Saturday last. A bill was passed providing for a rate of 2½ cents a mile and, so far as appears from the press despatch, there are no exceptions to this, although, presumably, the law takes into account the proposition, which was made by the Southern Railway, to sell mileage tickets at rates less than 2½ cents. A proposal to delegate extensive authority in this matter to the State Corporation Commission was not adopted, and a resolution was passed expressing the hope that, with the higher passenger rates now permitted, the roads would not find it necessary to reduce the wages of their employees.

Arica-La Paz Railroad.

The Chilean Government has given a German bank and a German firm a $15,000,000 contract for building the Arica-La Paz Railroad. The line will run from Arica, the most northern port of any consequence in Chile, to La Paz, the capital of Bolivia, about 335 miles. It is to be completed within four years. The government is to provide the right of way and to admit free all material and machinery used in building the road. It is understood that the only interest the bank has in the matter is that it takes the government 5 per cent. bonds that are to be issued to pay for the road. It is to be built in accordance with the treaty made with Bolivia on March 21, 1905, when Chile took over that portion of Bolivia that bordered on the Pacific ocean. The address of the contractor is on record at the Bureau of Manufactures, Washington, D. C.—*Consular Report.*

Terms of a Recent Railroad Pool in England.

The consolidation of two English railroads, the Great Central and the Great Northern, under a joint committee composed of the boards of directors of the two companies, was described in the *Railroad Gazette* of January 17, 1908, page 75. Further particulars of this consolidation have been issued to the shareholders of the two companies. With the exception of the Lancashire, Derbyshire & East Coast and the Sheffield District Railway, the undertakings of the two companies are to be worked and maintained by the joint committee. Out of the net receipts for each year, after allowing to each company interest at the rate of 3½ per cent. a year on the authorized capital issued and to be issued, the joint committee is to pay $19,016,660 (£3,803,332) to the two companies in the proportion of 47 per cent. to the Great Northern and 43 per cent. to the Great Central. These are the ratio proportions of their net receipts for the year 1906 to the earnings of both for that year. Out of the balance of the net receipts, if sufficient, the Great Central is to be allowed $500,000 (£100,000) for new capital expenditures. Any net receipts remaining are to be divided between the two companies in the following proportions. Down to and including the year 1910, 57 per cent. to the Great Northern and 43 per cent. to the Great Central. After the year 1910 and down to and including the year 1912, 56½ per cent. to the Great Northern and 43½ per cent. to the Great Central. After the year 1912, 56 per cent. to the Great Northern and 44 per cent. to the Great Central.

Motive Power Apprentices; New York Central.

The following extracts are from an address by J. F. Deems at the annual dinner of the National Society for the Promotion of Industrial Education:

"On March 6, 1906, the present apprentice system was organized on the New York Central Lines. Its object is to provide for the motive power department an adequate recruiting system which will eventually produce from the ranks a large number of skilled workmen, a number of foremen, a sufficient number of good draftsmen, a few master mechanics, and an occasional superintendent of motive power. The interest of the railroad is identical with that of the apprentices in that the better all around training the boy receives, the more valuable he becomes to the railroad. The course of training has been outlined with the intent to educate the boy in the trade and not out of it. The general plan is two-fold and provides for shop instruction of the apprentice in the trade and for his instruction in educational subjects allied to his trade during working hours while under pay. The plan is now in operation at the 10 larger shops and already includes over 500 apprentices. The work is so arranged that each apprentice may go as rapidly or as slowly as his ability will allow. All principles are handled through shop problems and must have practical bearing. We are somewhat handicapped by the lack of text-books for apprentice instruction, as the literature of such instruction has yet to be written. Classes are held from 7 to 9 o'clock in the morning each apprentice reporting for two mornings per week. The immediate and direct results of the system have been: Increased output (notwithstanding the four hours per week spent in class), less spoiled work, ability to read drawings, to lay out templates and to make sketches, a better grade of apprentices, increased interest in the work, suggestions as to improved methods and tools, draftsmen for company drafting rooms and apprentices for special work as needed. The officials of our railroad are already enthusiastic over the results obtained in these courses."

Fire Dangers on Underground Electric Railroads.

On one of the motor cars of the District underground railway in London on January 8 at Sloane Square Station there was an explosion and electric flashing. The Board of Trade made an examination and on January 17 issued a report on this accident, whose conclusions may be summed up as follows, the reference being to a correspondence which had been going on in the daily press: "The apprehensions of danger expressed by the writers . . . . are not justified by the facts. The main danger in any such cases of fire will be from panic. For this reason we deprecate the writing for publication of alarmist letters." This report is signed by Major Pringle and A. P. Trotter, Electrical Adviser, of the Board of Trade.

It was found that above floor level there was some blistering of the varnish on the woodwork around a window and doorway and that two panes of glass were blackened with smoke and fumes. No glass was broken. When the blistering and the smoke was rubbed off, the red paint work underneath was undamaged.

Below floor level the metal pipe carrying the electric light wires and a metal junction box was fused. The under side of the timber flooring just above this pipe and junction box were charred in places, but nowhere deeper than one-quarter of an inch. Inside the car no mark of fire was visible on the flooring, seats or sides. All woodwork in proximity to electric conductors on these cars is non-inflammable. This wood will char under the effect of intense heat from electric flashing, but will not catch fire. "The real combustibles, if we may use the word," the inspectors say, "in this fire were copper, iron and brass." Such electric arcs continue until burnt out or exhausted or until the current is cut off, as happened in this case. The ordinary method of extinguishing a fire is useless for electric arcs.

The cause of this explosion was probably the failure of the insulation on the electric light wires owing to damp. The heating of the wires resulted in the liquefaction of a small block of bitumen; an explosion of bitumen vapor followed causing smoke and fumes. Subsequently there was electric flashing along the pipe and at the junction box under the car.

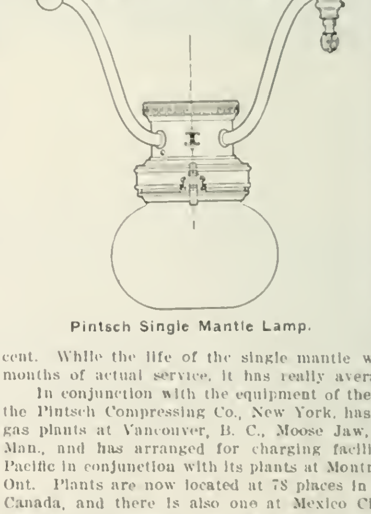
There was no difficulty at all with the center doors and the eight passengers stepped out on the platform without apparent alarm. No complaint of injury or danger was made to any railroad officer.

The Government and the Block System.

When a certain churchman of high rank, after the execution of Anne Boleyn, ventured to remonstrate with Henry VIII., the much-married King of England, for sending his wives to the headsman at the Tower, the King merely smiled pleasantly and assured the ecclesiastic that his point was not well taken, and for reasons that he would at once make clear. "You see, Your Eminence," said Henry, leaning back on the comfortable cushions of his throne and twirling his thumbs reflectively, "you see, when a man runs his matrimonial train in several sections upon a single track, as I do, the safety of the public requires that we shall adopt the block system."—*Harper's Magazine.*

Pintsch Mantle Lamps.

The Safety Car Heating & Lighting Co., New York, has just installed 8,000 of its latest type of single mantle lamps on cars of the Canadian Pacific. This type of mantle lamp, No. 3500, which is shown in the accompanying illustration, is the one introduced some months since. In tests made by J. E. Denton, Professor of Engineering Practice at Stevens Institute of Technology, the hourly consumption of Pintsch gas was found to be 2.12 cu. ft. per hour, giving 99.5 candle power at a cost of 1 cent an hour. When the company introduced the four-mantle or multiple mantle lamp, it was pointed out that such repair parts as the mica chimneys, cup reflectors, ring reflectors, clusters, cluster stems and domes, as used in the four-flame lamps, would be eliminated. With the same consumption of gas, the candle power was increased three times. Now, with the introduction of the single mantles, the same candle power is maintained, the consumption of gas decreased one-third and the necessary maintenance of mantles reduced 75 per cent. While the life of the single mantle was estimated at three months of actual service, it has really averaged four months.



Pintsch Single Mantle Lamp.

In conjunction with the equipment of the Canadian Pacific cars, the Pintsch Compressing Co., New York, has also installed Pintsch gas plants at Vancouver, B. C., Moose Jaw, Sask., and Winnipeg, Man., and has arranged for charging facilities on the Canadian Pacific in conjunction with its plants at Montreal, Que., and Toronto, Ont. Plants are now located at 78 places in the United States and Canada, and there is also one at Mexico City, Mex. At Chicago, gas can be supplied to 25 roads; at Cincinnati, Ohio, to 14; at Kansas City, Mo., to 15; at St. Louis, Mo., to 18, and at the other points to from one to 12 roads. The company has published an interesting map showing the roads using Pintsch light, the supply stations being also indicated.

Radical Reforms.

For a prompt and simple solution of the transit problem, commend us to Assemblyman Cuvillier. He introduced on January 22 a truly epoch-making measure, which requires "that all trains, owned, leased, operated or controlled by the New York Central & Hudson River Railroad Company, the West Shore Railway, the Harlem Railway Company and the Putnam Division of the Harlem Railway Company, and the New York, New Haven & Hartford Railway Company shall, after the passage of this act, stop each and every train at the station now established at Park avenue and 125th street, within the state of New York, borough of Manhattan, for the purpose of receiving and discharging passengers."

For the theory of this measure we have only praise and wonder-ment, but we can, nevertheless, offer a few humble suggestions. For example, if it is practicable to make the West Shore trains traverse a river and four miles or so of intervening house-tops in order to stop at the 125th street station, too much speed cannot be made in ordering the Lackawanna trains to stop, say, at the Fulton street station of the subway, and the Erie trains at Wall street. On the other hand, considerations of fairness would suggest some trifling exemptions. It is unreasonable, we think, to require, as Mr. Cuvillier's bill does, all trains running between Boston and Providence, or between Rochester and Syracuse, to call at the Harlem station. However, these are minor points, and perhaps it is as well to make the railroads do as much for us as possible. The main thing is that we are wasting money on Public Service Commission and new traction lines when we have statesmen who, like Mr. Cuvillier, can make all these appear superfluous.—*New York Evening Post.*

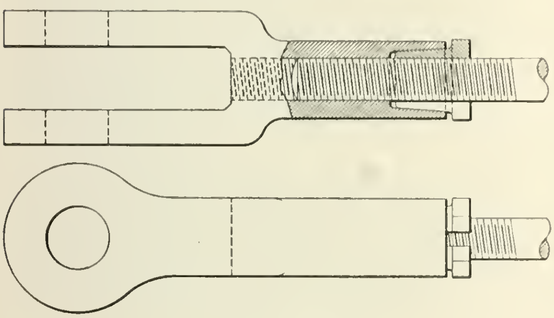
Wages in South America.

The last annual report of the Buenos Ayres Great Southern gives the following comparison of average weekly wages paid on Argentine and English railroads:

	Argentine.	England.
Enginemen	$16.10 to $23.25	$6.90 to $10.20
Firemen	9.70 " 14.15	5.10 " 6.55
Guards	$9.70	4.85 " 7.30
Switchmen	5.80 to 7.30	3.60 " 6.80

The Hillman Locked Clevis.

A patent has been granted to E. D. Hillman, M.E., for an adjustable clevis that can be locked at any desired position. The accompanying drawing shows clearly the locking device, which consists of a conical split nut fitting into a conical recess in the stem of the clevis. When the clevis has been properly adjusted, the nut is



Hillman Locked Clevis.

screwed into the recess of the shank until the threads of the rod and nut and the sides of the nut and recess bind. The locking feature can be used in either drop forged, malleable iron or steel clevises. Standard clevises can be treated in the same manner. This device should be of value wherever adjustments are necessary, such as in brake-gear, switch and signal work, cranes, bridges and various rigging. It will be put on the market by the U. S. Metal and Manufacturing Co., New York.

Paint Tests.

The Paint Manufacturers' Association, Chicago, has been arranging for a series of paint tests to extend over five years. Some of the tests are to be made at the Carnegie Technical Schools, Pittsburgh, Pa., where committees of the association and of the faculty will test 232 mixtures to establish standard formulae.

English Electric Railroads.

The London & North Western has announced that its proposed electric line to connect Euston with Watford, for which Parliamentary approval has been granted, will not be built at present owing to the financial situation. This line is to cost between $13,000,000 and $15,000,000 and is to give relief to the main line and a better suburban service to Watford, partly by a subway. During the last year or two there has been little street railway construction work done in the United Kingdom except the underground trolley system of the London County Council, one or two lines on the surface contact stud system and extensions of some of the more important tramway systems. It was hoped that electrical manufacturers would receive enough work from steam railroad electrification to make up for the lack of street railway work, but they have not. What is described as the first single-phase electric line in England is nearly finished. This is a section of the Midland Railway from Morecambe via Lancaster, to Heysham. The London, Brighton & South Coast single-phase line, between London bridge and Victoria, a large undertaking altogether, is not yet anywhere nearly finished.

Electrical Exhibition at Marseilles.

An "International Exhibition of the Applications of Electricity" is to be held at Marseilles in the south of France from April 19 to Oct. 31, 1908. Marseilles, whose population is more than 500,000, has now an elaborate system of distribution of electrical energy. The entire South-East district of France also, which has hitherto received its electrical supply from a few small power stations, will now have the advantages of a great system of distribution by a series of hydro-electric generating stations, which, when completed, with reserve stations, will have a total capacity of 150,000 h.p. A territory with a population of over 3,000,000 is, or shortly will be, thus supplied with electricity and open to all branches of electrical industry. The object of the exhibition is to bring the numerous possible applications of electricity to the attention of the public and to establish new commercial relations for electrical manufacturers in this territory. The exhibition will comprise the following sections:

1. Transmission and Distribution of Electrical Energy;
2. Applications of Electricity to Industries in general;
3. Applications of Electricity to Domestic Industries;
4. Applications to Domestic Economy;
5. Applications to Public and Private Lighting;
6. Applications to Heating and Ventilation;
7. Applications to Machinery for Lifting and Manipulation,
8. Applications to Mines and Quarries;
9. Applications to Traction;
10. Applications to Agriculture;
11. Applications to Military and Naval Engineering;
12. Electro chemistry, Electro-metallurgy and the Allied Sciences;
13. Telegraphy and Telephony;
14. Applications to the Medical and Surgical Sciences;
15. Electrical Instruments for Measurement and Calibration;
16. Raw Materials and Manufacturers used in Electrical Industries;
17. Practical and Theoretical Teaching of the Science of Electricity.

A special corps of engineers under the direction of the General Commissioner will take charge of the erection, repair, maintenance and proper working of the exhibits, as well as their packing and return shipment, at the close, and if desired the commercial interests of those exhibitors who are unable to be present. Paul Dieny, Park Row building, New York, is the Commissioner for the United States.

Resolutions on Forest Preservation.

The Board of Directors of the American Institute of Electrical Engineers adopted the following resolutions on January 10:

Whereas, The American Institute of Electrical Engineers recognizes that water powers are of great and rapidly increasing importance to the community at large, and particularly to the engineering interests of the country; and,

Whereas, The value of water powers is determined in great measure by regularity of flow of streams, which regularity is seriously impaired by the removal of forest cover at the headwaters with the resulting diminution in the natural storage capacity of the watersheds, this impairment frequently being permanent because of the impossibility of reforestation, owing to the destruction of essential elements of the soil by fire and its loss by erosion; therefore

Be it Resolved, That it is the opinion of the American Institute of Electrical Engineers that the attention of the national and state governments should be called to the importance of taking such immediate action as may be necessary to protect the headwaters of important streams from deforestation, and to secure through the introduction of scientific forestry and the elimination of forest fires the perpetuation of a timber supply; and further

Be it Resolved, That the Committee on Forest Preservation be instructed to communicate these resolutions to all members of Congress and to the governors of all the states.

A 25,000-H.P. Rolling Mill Engine.

The Allis-Chalmers Co., Milwaukee, Wis., has shipped to the Carnegie Steel Co., Sharon, Pa., a monster rolling mill engine of over 25,000 h.p. capacity and weighing more than 1,250,000 lbs. Two of the castings weighed 118 tons each after machining, and other parts are in proportion. The heavier parts were shipped on special, reinforced 100-ton cars. The engine is horizontal, twin-tandem, with cylinders 42 in. and 70 in. x 54 in. It runs condensing at 175 lbs. steam pressure and a speed of 150 to 200 r.p.m. In spite of its size and power, it is easily controlled and needs only one engineer. The character of service requires quick reversal at the end of each run of the rolls, and the load varies quickly from nothing to maximum. The reversing mechanism is of the Reynolds-Marshall type, run by a small independent engine with oil cylinder lock, and another small engine works the throttle valves. All these units are under the control of the engineer. The engine can be reversed in a few seconds.

This company is also building 12 gas-engine-driven blowers for the Carnegie Steel Co.'s Homestead plant and the new works of the Indiana Steel Co. at Gary, Ind. It built large vertical steam-blowing engines recently for the Northwestern Iron Co., Mayville, Wis., and other prominent plants, and has on its erecting floor engines of this type for the Wickwire Steel Co., the Tonawanda Iron & Steel Co., the Pennsylvania Iron & Steel Co. and the Republic Iron & Steel Co. Between three and four hundred Allis-Chalmers vertical steam-driven blowing engines, and nearly as many more of the horizontal type, are in service at various iron and steel producing centers of the country.

Advance in Freight Rates in Mexico.

Consul W. D. Shaughnessy states that increases are to be made in freight rates on the Mexican railroads, averaging, on specified commodities, about 12 per cent. The railroads desired average increases of about 20 per cent., but the government commission reduced this. Included under special tariffs are commodities like coal, coke, lumber, grains, sugar, ores, etc., which form the bulk of the freight moved by the railroads. The matter of the classification of ores and the revision of the special tariffs covering ores has been referred to a sub-committee for consideration. It is calculated that these increases will result in the material enlargement of the revenues of the railroads and provide them with the funds for the construction of needed improvements. The railroads have insisted that increases in rates are necessary, for the reason that the cost of labor and of materials has increased from 60 to 150 per cent. since the revision of rates in 1900.

Tug Takes 11,616-Mile Journey.

The newspapers announce the arrival at Panama of the "Catherine Moran," a 154-ton tug, 90 ft. long. Needing a new tug for service at Panama, the Canal Commission bought the vessel from the Moran Towing Company, of New York, and on October 26 it started on its trip. The course was laid close to land, but followed, in the main, the route laid out for the battleship fleet now making its way to the Straits of Magellan. A stop was made at one southern port before the tug entered the Gulf of Mexico, and it touched at six other places for coal and other supplies. A total of 11,616 miles was traversed at 9.13 knots, an average of 219.6 knots a day. The tug burned on the voyage 601 tons of coal.

Annual Dinner of the American Institute of Electrical Engineers.

The annual dinner of the American Institute of Electrical Engineers will be held at the Waldorf-Astoria, New York, on the evening of Wednesday, February 19, at 7 o'clock. As on former occasions, the speeches this year will be on the relation of the electrical engineer to public service corporations. It is called the "Public Service Dinner," and among the speakers who have promised responses to toasts are many men prominently identified with public utilities, either as members of commissions or operating heads of large organizations. The price of the dinner will be $5, not including wine or cigars. As usual, ladies will be present. Guests will be seated at small tables accommodating eight persons. The dinner committee is composed of Robert T. Lozier, Chairman; A. A. Gray, Frederick C. Bates and George H. Guy.

INTERSTATE COMMERCE COMMISSION RULINGS.

Import Rules on Plate Glass Upheld.

The Commission, in an opinion by Commissioner Clements, has announced decision in the two cases of Pittsburgh Plate Glass Co. v. Pittsburgh, Cincinnati, Chicago & St. Louis et al., and of the same complainant against the Illinois Central. The complaints in these cases alleged unjust discrimination in rates against domestic shippers of plate glass in favor of import shipments, because the rates of the former are relatively higher than the inland rail proportion of the total charge from the point of origin in a foreign country; but the Commission held that under the law as interpreted by the United States Supreme Court in the Import Rate case the Commission cannot consider such disparity in rates alone as constituting unjust discrimination.

Further findings of the Commission were as follows:

In considering the question of alleged unjust discrimination in favor of shippers of import plate glass moving from the ports of entry in this and adjacent foreign countries to interior American destinations and against domestic shipments between points in the United States, it is the duty of the Commission to look to the circumstances and conditions affecting the matters involved, not only in this country, but in the entire field of commerce here and abroad. It is well settled by the highest judicial authority that the existence and effectiveness of competition between carriers, whether by rail or water, whether subject to the Rate Law or not, and competition of markets, or the absence of such competition, are, among other things, pertinent to the question of similarity of circumstances and conditions, and as to whether the discrimination complained of and shown is or is not undue or unreasonable.

To make the total through charge from a foreign port of origin the measure of the rate to be charged on domestic traffic from the port of entry in this country through which the import shipment moves, would be to establish a hard and fast rule difficult if not impossible for the rail carriers in this country to conform to in the establishment and publication of their rates in view of that uncertain and flexible element involved in the ascertainment of the total through charges, to wit, ocean rates.

Discriminations of the nature referred to in sections 3 and 4 of the Rate Law, in so far as they result from the *bona fide* action of a carrier in meeting circumstances and conditions not of its own creation, and which are reasonably necessary for that purpose, do not of necessity fall under the condemnation of the law.

Transportation from a seaport of the United States or an adjacent foreign country to an interior American destination, in completion of a through movement of freight from a point in a foreign but not adjacent country, whether on a joint through rate or on a separately established or proportional inland rate applicable only to imports moving through, is not a "like service" to the transportation of traffic starting at such domestic port, though bound for the same destination.

As held in numerous decisions of the Supreme Court, it is neither required by law nor just, that the rates of a carrier on traffic subject to intense competition shall mark the measure or limit of its rates on traffic not subject to such competition. Being bound to consider the more intense competition to which the transportation of the foreign product is subject as one of the "circumstances and conditions" affecting the relative adjustment of rates, the Commission cannot, solely upon the basis afforded by a comparison of the inland proportion of the through rate from the foreign port of origin with the rate applying on domestic shipments of plate glass in this country, condemn the latter as unreasonable or unjustly discriminatory. As rates applying on domestic shipments of plate glass between points in this country were challenged mainly on the ground of unjust discrimination and not on account of their unreasonableness *per se*, and as there is no basis in the record of the case as presented for a determination as to whether these rates are or are not just and reasonable of themselves, the complaint is dismissed without prejudice.

The complaints were dismissed.

TRADE CATALOGUES.

Motor Starting Devices.—Bulletin No. 4559 of the General Electric Co., Schenectady, N. Y., describes d.c. motor starting rheostats and panels. Rheostats with no-voltage release and those with both no-voltage and overload release are illustrated and described, as well as rheostats for starting reversible shunt or compound wound constant speed motors. The bulletin also shows a variety of panels in which different types of starting rheostats are used. Dimension diagrams for different capacities of rheostats and panels are included.

Shay Geared and Rod Locomotives.—The Lima Locomotive & Machine Co., Lima, Ohio, has issued catalogue No. 15. This company makes the Shay geared locomotive and also direct-connected or rod locomotives. Illustrations of the different classes are shown and the principal dimensions and hauling capacities of the different sizes given. The standard specifications for the construction of the locomotives are printed and there is also some useful information on the last pages. Besides locomotives, the company builds logging cars.

Springs.—The Standard Steel Works, Philadelphia, Pa., has published an illustrated catalogue showing types of steam railroad and electric railway springs. These include semi-elliptic springs, single and multiple full elliptic springs, coil, draft, bolster and other springs. Specimen dimension sheets are reproduced on which specifications may be conveniently made when ordering springs.

Heaters.—The Consolidated Car Heating Co., New York, is distributing a circular showing its new vestibule heaters. They are made both stationary and portable and are designed for motormen's vestibules in electric cars and for small ticket offices or other places where but little heat is required. The standard type is arranged for $1\frac{1}{2}$ amperes at 600 volts, consuming 900 watts.

Corliss Engines.—The Murray Iron Works Co., Burlington, Iowa, is distributing a pamphlet giving the nomenclature of Murray Corliss engines. It consists of half-tones and line drawings of different assembled engines and parts, the names of the latter being indicated on the drawings. The nomenclature is quite full, no part being overlooked.

Bolsters.—Part catalogue No. 4 of the Gould Coupler Co., New York, is devoted to the company's Crown type body and truck bolsters. It is illustrated with half-tones and working drawings showing separate bolsters and the body bolster with draft gear applied.

Variable Speed Motors.—The Northern Electrical Manufacturing Co., Madison, Wis., has issued booklet No. 54, discussing variable speed motors and advocating the single voltage shunt field control, which is the system used by the company.

Acetylene Lights.—The Alexander Milburn Co., Baltimore, Md., has issued an illustrated catalogue and price list of several types of portable acetylene lights for different kinds of service. A list of agencies and customers is included. One of these lights was described in the *Railroad Gazette* of January 24, 1908.

MANUFACTURING AND BUSINESS.

The Hess-Bright Manufacturing Co., Philadelphia, Pa., intends to occupy within six weeks a four-story building, with a floor space of 15,000 sq. ft., at Twenty-first street and Fairmount avenue.

The United States Steel Corporation announced on Tuesday that the 25,000 shares of preferred stock offered to employees under the profit sharing plan of 1908 at $87.50 a share have been largely over subscribed.

Raymond D. Carter, formerly Managing Editor of the *Newark Morning Star*, has been appointed General Advertising Agent of the Central Railroad of New Jersey and Editor of its monthly magazine, *The Suburbanite;* office at 143 Liberty street, New York.

H. W. Nutt, who for the past year has represented Buell & Mitchell, New York, in Boston, Mass., has been appointed District Manager for the New England states of the General Fireproofing Co., Youngstown, Ohio, with office at 161 Devonshire street, Boston. Mr. Nutt had previously been Assistant General Sales Agent of the American Steel Hoop Co. (now merged in the Carnegie Steel Co., Pittsburgh, Pa.), Secretary of the American Tube & Stamping Co., Bridgeport, Conn., and Vice-President of the Superior Steel Co., Pittsburgh, Pa.

Iron and Steel.

According to press despatches, British mills have made contracts for 17,000 tons of rails for shipment to Africa and 14,000 tons for Australia.

The New York Central & Hudson River is asking bids, under revised specifications, on 3,500 tons of structural steel for the northeast corner of the new station building at the Grand Central terminal, New York.

The United States Steel Corporation has an inquiry for a large tonnage of rails from an important road for early delivery. The Pittsburgh & Lake Erie is believed also to be in the market for several thousand tons.

Judge Gary, of the United States Steel Corporation, announced last Tuesday that the rail manufacturers and many of the railroads had reached a satisfactory agreement on rail specifications. The new specifications provide, he said, for a heavier rail with improved section and with the practice in manufacture somewhat improved. The additional cost of the new rails, if any, is to be paid by the purchasers.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

American Society of Civil Engineers.

At the meeting of this society held February 5, there was a paper on Overhead Construction for High Tension Electric Traction or Transmission by R. D. Coombs; also one on A New Suspension for the Contact Wires of Electric Railways Using Sliding Bows, by Joseph Mayer. Both of these papers were printed in the proceedings for December, 1907.

ELECTIONS AND APPOINTMENTS.

Operating Officers.

Canadian Northern.—A. Wilcox has been appointed Superintendent at Port Arthur, Ont., in place of J. R. Cameron, promoted.

Canadian Pacific.—J. Brownlee, hitherto Superintendent of the Moose Jaw division, has been appointed Superintendent of the Cranbrook division, in place of John Erickson. Allan Purvis, heretofore Chief Clerk to the General Superintendent of the Pacific division, has been appointed Superintendent of the Kootenay line, with headquarters at Nelson, B. C.

International & Great Northern.—Henry Martin has been appointed Superintendent of the Fort Worth division in place of C. Hightower, resigned; office at Mart, Tex.

Effective Feb. 1, the office of Assistant General Manager is abolished.

Southern.—J. F. Hays has been appointed Manager of the line between Hendersonville and Lake Toxaway (Transylvania Railroad), with office at Brevard, N. C.

Wisconsin Central.—F. M. Gates, Chief Clerk in the car service department, has been appointed Car Service Agent, relieving P. W. Drew. Mr. Drew continues as Superintendent of Telegraph

Traffic Officers.

International & Great Northern.—N. M. Leach has been appointed General Freight Agent in place of G. H. Turner, resigned.

Engineering and Rolling Stock Officers.

International & Great Northern.—J. F. Enright has been appointed Superintendent of Machinery, with headquarters at Palestine, Tex. The office of General Master Mechanic has been abolished.

Southern.—The master mechanics of the Atlanta, Birmingham, Knoxville and Selma divisions have been ordered to be transferred as follows: Master Mechanic John F. Sheahan, of the Atlanta division, to be transferred to Knoxville; Master Mechanic J. B. Michael, of the Knoxville division, to be transferred to Selma; Master Mechanic G. Akans, of the Selma division, to be transferred to Birmingham; Master Mechanic N. N. Boyden, of the Birmingham division, to be transferred to Atlanta.

Union Pacific.—Charles E. Fuller, late Superintendent of Motive Power of the Chicago & Alton, has been appointed Assistant Superintendent of Motive Power of the Union Pacific; office at Omaha, Neb.

CAR BUILDING.

The Woodward Iron Co., Birmingham, Ala., has ordered 10 all-steel hopper cars of 100,000 lbs. capacity.

The National Car Line, Chicago, has ordered 10 tank cars of 60,000 lbs. capacity from the Bettendorf Axle Co.

The Grand Trunk Pacific has ordered 2,400 freight cars from the Canada Car Co. and 500 freight cars from Rhodes, Curry & Co.

The Republic Creosoting Co., Indianapolis, Ind., has ordered five 8,000-gal. and one 10,000-gal. tank cars from the McGuire, Cummings Manufacturing Co. These cars will be 31 ft. 6 in. long and 8 ft. 6 in. wide. The special equipment includes:

Bolsters	Monarch
Brake-beams	Monarch
Couplers	Monitor
Draft rigging	Cardwell

RAILROAD STRUCTURES.

Butler, Pa.—The city council has under consideration a proposition of the Baltimore & Ohio to replace the wooden overhead bridge on Lookout avenue with a steel structure, 27 ft. wide and 57 ft. long.

Cleveland, Ohio.—The Pennsylvania freight house on the lakefront was recently destroyed by fire.

Edmonton, Alb.—An understanding, it is said, has been arrived at between the city of Edmonton, town of Strathcona, province of Alberta, and the Canadian Pacific regarding a high level bridge to be built by the railroad here, at a cost of about $700,000. Bids for the work, it is said, will be asked for at once.

Fort William, Ont.—The McKay & Kakabeka Falls Railway is planning to cross the Canadian Pacific, Canadian Northern and Grand Trunk Pacific tracks at West Fort and the Canadian Pacific tracks in Fort William by overhead bridges or subways.

New York, N. Y.—The New York, New Haven & Hartford has filed plans for putting up four new passenger stations in the Borough of the Bronx on its Harlem River branch, at a total cost of $190,000.

Prince Rupert, B. C.—It is reported that the Grand Trunk Pacific is arranging preliminaries for the construction of a great hotel.

Rennie, Man.—Contract is reported let to S. C. Hill & Co. for putting up two trestle bridges near Cross Lake for the Grand Trunk Pacific. The larger trestle is to have 75 spans and the other 31 spans.

Sacramento, Cal.—The Western Pacific, it is said, will build its main shops here.

Toronto, Ont.—It is thought that City Engineer Rust will be instructed to prepare plans for a street railway bridge over the western gap at Queen's wharf to cost $60,000.

Washington, Pa.—At a joint meeting of the Commissioners of Washington and Westmoreland counties in Pittsburgh, the contract for the proposed bridge over the Monongahela river between Donora, in Washington county, and Webster, in Westmoreland county, was let to the Toledo-Massillon Company, who offered to do the work for $189,000.

Winnipeg, Man.—William Mackenzie, President of the Canadian Northern, is quoted as saying that bids will be asked for early this year to build the proposed union station and hotel here.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

ATLANTIC, QUEBEC & WESTERN.—This company, which has finished its line from New Carlisle, Que., north to Port Daniel, about 20 miles, has given a contract to the New Canadian Co., Ltd., of Paspebiac, and work is under way from mile 20 to mile 102. (Aug. 23, p. 215.)

BATON ROUGE, HAMMOND & EASTERN.—See Illinois Central.

BOSTON & MAINE.—The double-track work between Johnsonville, N. Y., and Troy, about 16 miles, which was started in April, 1907, has been finished and was put in operation last month. The method of abolishing 19 grade crossings between these points has not yet been decided upon.

BRITISH COLUMBIA (ELECTRIC).—Bids, it is said, will shortly be asked for by this company to build about 63 miles through southern British Columbia. Work to be started this spring. R. H. Sperling, General Manager, Vancouver, B. C.

CANADIAN PACIFIC.—This company has been granted an extension of four years to complete the Esquimalt & Nanaimo branch. Location work is about finished and it is expected to ask bids for building the line this month. Contracts for 10 miles from Wellington, B. C., have been let to John Bright, of Nanaimo, and a contract has been given to A. Carmichael to secure the right-of-way. (Dec. 13, p. 732.)

This company, it is said, will this spring extend the line with present terminus at Nominique, Que., west to the line with northern terminus at Maniwaki, 41 miles.

CHARLESTON, PARKERSBURG & WESTERN.—An officer writes that this company has 30 miles of track laid on the line it is building from Charleston, W. Va., north via Sissonville, Spencer and Palestine to Parkersburg, about 60 miles. Some engineering work is now under way on the rest of the line, but it is undecided when grading will be begun. C. P. Peyton, Chief Engineer, Charleston.

DURHAM & SOUTHERN.—This company last year carried out revision work on six miles of its line between Apex, N. C., and Angier.

FAIRCHILD & NORTH CAROLINA.—This company is building with its own men a yard about one mile long at Owen, Wis.

ILLINOIS CENTRAL.—The Baton Rouge, Hammond & Eastern is to be operated by the Yazoo & Mississippi Valley beginning Feb. 27. Work is to be rushed on the section from Baton Rouge, La., east to Covington, 65 miles, of which 20.75 was built in 1907. (Nov. 22, p. 636.)

INDIANAPOLIS, LOGANSPORT & CHICAGO.—This company, which has projected a line from Logansport, Ind., south to Indianapolis, 66 miles, has all the surveys made and rights of way for 25 miles and franchises for entering Indianapolis secured. Grading has been finished on 2½ miles at Indianapolis. Contracts for this work have been let. Walter Osmer, Chief Engineer, Logansport, Ind.. The line is eventually to be extended, to have a total of 163 miles in Indiana and 23 in Illinois. (May 10, p. 663.)

MISSISSIPPI CENTRAL.—Contract is reported let by this company to O. A. Gibson to build 14 miles of its road from Itoxie, Miss., east toward Brookhaven.

MISSOURI & NORTH ARKANSAS.—This company now operates 130 miles of railroad from Seligman, Mo., southeast to Leslie, Ark. Track-laying is just being finished on 31½ miles from Woodruff, which is nine miles north of Seligman, on the St. Louis & San Francisco, northwest to Neosho, where connection will be made with the Kansas City Southern, over which the company has trackage rights into Joplin. The roadbed for 100 miles south of Leslie is being graded by M. C. Burke and L. S. Joseph; 26 miles of track is laid and the grade is practically ready for 20 miles more. It is expected to finish track-laying on this section by July. From Kensett for 30 miles southeast toward Helena grading contracts are let for 14 miles to the Dalhoff Construction Co., of Little Rock, Ark., and the next 15 miles, one-half to the Alabama Construction Co. and one-half to James Dishman. These firms are putting up the embankment across the White and Cache river bottoms with revolving derricks and Page buckets. From Cotton Plant to Helena, 55 miles, grading is 80 per cent. done and track material is being received. It is the intention of the company to finish connecting links for a through line from Joplin to Helena, 361 miles, about Oct. 1 next.

NEW YORK SUBWAYS.—The New York State Public Service Commission of the First district has approved the plans for the Broadway-Lexington avenue subway from the Battery, at the south end of Manhattan Island north, under Church and Vesey streets to Broadway, thence under Broadway and Lexington avenue to the Bronx side of the Harlem river, where it will branch into two spurs, one to Woodlawn Cemetery and the other to Pelham Bay Park. The estimated cost of the work with a line across the Island at Canal street is $67,000,000. The Commission passed a resolution asking the Board of Estimate to assent to the scheme. This consent is necessary because the new route is made up of several modifications of roads laid out by the old Rapid Transit Commission and approved at the time by the Board of Estimate. As soon as the Board of Estimate approves, the Public Service Commission will begin obtaining the necessary consents from property owners, and when these are received will probably advertise for bids. (Jan. 10, p. 73.)

NORTHERN OF MAINE.—Grading is to be started about May 1 on this proposed line, projected from Van Buren, Me., west along the northern boundary of Maine via Grand Isle, Madawaska, Frenchville, Fort Kent and St. John to St. Francis, 62 miles, for which contracts are to be let soon. The work will include one bridge. Edson E. Goodrich, President, Waterville, and Henry F. Hill, Chief Engineer.

OWENSBORO & ROCKPORT BRIDGE & TERMINAL COMPANY.—Plans and specifications are nearing completion and work is expected to be started this year on this proposed line from Owensboro, Ky., north to Rockport, Ind., 12 miles. A. H. Kennedy, President, G. H. Cox, Secretary, Owensboro. (May 24, p. 727.)

PADUCAH NORTHERN.—Incorporated in Kentucky to build a line from Paducah west 13 miles to a point on the Ohio river, where, it is said, the Chicago, Burlington & Quincy and the Cleveland, Cincinnati, Chicago & St. Louis will build a bridge. The company is also to have terminals in Paducah, and its tracks are to be used for an entrance into that city by the C., C., C. & St. L. and the C. & E. I. Surveys are being made. It is reported that the Burlington has projected an extension from Herrin, Ill., to the Ohio river, and will use the tracks of the Paducah Northern into Paducah. G. C. Wallace, President; E. Palmer, First Vice-President; L. M. Rieke, Second Vice-President; M. O. Overly, Secretary, and J. C. Utterback, Treasurer, Paducah.

PARRAL & DURANGO.—This company, which last year built three miles of railroad south of Mesa de Sandia, Durango, has work under way on about nine miles from Kilometer 80 to Paraje Seco. Contract let to R. M. Dudley, of Mesa de Sandia. An extension is projected from Kilometer 95 to Guanacevi, about 115 miles.

PAYETTE VALLEY.—Surveys are being made by this company for an extension from New Plymouth, Idaho, southeast to Falk's Store, seven miles.

PENINSULA RAILWAY (ELECTRIC).—An officer writes that this company, which started work and finished about eight miles from Bartow, Fla., west to Mulberry, last year, has rights-of-way secured and 1,000 tons of rails on hand. The company expects to begin work soon on the remaining 37 miles to finish the line to Tampa. At Mulberry the company has its power stations. The Florida Engineering Company is the resident engineer and W. H. Evers, Bartow, is Chief Engineer.

QUEBEC & NEW BRUNSWICK.—Application is being made to Parliament for permission to build a line from a point near St. Johns Junction, Que., to the State of Maine boundary, and to secure trackage rights over any road in that state. Hon. J. Costigan is President.

ROBERT LEE, FORT CHADBURNE & EASTERN.—This company is building a line from Robert Lee, Tex., northeast via Rawlings to Winters, 35 miles. Work was started last December by J. E. Hunter, of Robert Lee, who has the contract on the section from Robert Lee to Rawlings, 13½ miles. Grading has been finished for 2¼ miles. Additional contracts are to be let during the first half of this year. The company is planning to make other extensions for which definite plans have not yet been decided upon. J. Austin Spencer, President, and S. J. Bross, Chief Engineer, Robert Lee.

ROODHOUSE & VIRDEN RAILWAY.—See St. Louis, Terre Haute & Quincy Traction.

ST. LOUIS, TERRE HAUTE & QUINCY TRACTION.—This company has been incorporated in Illinois with $50,000 capital to build an electric line from Quincy, Ill., southeast and then east to Taylorville, 143 miles. Surveys finished and franchises secured for the entire line and all the rights-of-way secured or guaranteed. E. Yates, President; H. C. Simons, Vice-President; F. W. Knollenberg, Secretary and Treasurer, and G. H. Lawrence, Chief Engineer. Parts of the line are to be built under the names of the Roodhouse & Virden Railway and the Virden & Taylorville Traction, which see below.

Surveys and estimates have been finished by the Roodhouse & Virden Railway, and it is expected to begain work early this year on its proposed electric line from Roodhouse, Ill., east to Virden, 33 miles. H. C. Simons, President, Virden.

The Virden & Taylorville Traction expects to begin grading work early this year on its proposed electric line from Virden, Ill., east to Taylorville, 28 miles, with a branch for which surveys have been made north to Divernon, four miles. The work includes a bridge over the Sangamon river. J. Gelder, President, and G. H. Lawrence, Chief Engineer.

SAVANNAH, AUGUSTA & NORTHERN.—An officer writes that this company is making surveys to build from Savannah, Ga., northwest to Chattanooga, Tenn., with an extension east to Augusta, Ga., in all 425 miles. Grading finished on 58 miles and track laid on 30 miles between Statesboro, Ga., and Garfield. Contracts let to W. J. Oliver, of Knoxville, Tenn. W. H. Lynn, 111 Broadway, New York, is interested.

SPOKANE & INLAND EMPIRE (ELECTRIC).—This company, which built 50½ miles of extensions to its line in Washington last year, has given contracts to Grant, Smith & Co., of Rosalia, Wash., to build an extension of its eastern division from Palouse, Wash., southeast to Moscow, Idaho, 15½ miles.

TAMPA NORTHERN.—This company, which built 39 miles of road in Florida last year, has given a contract to B. H. Hardaway, of Columbus, Ga., for building nine miles from Envill Junction, Fla., to Brooksville. Surveys under way from Brooksville north to Thomasville, Ga.

TUSCALOOSA BELT RAILWAY.—Contracts have been given by this company to the Birmingham & Gulf Construction Company, Birmingham, Ala., for building its proposed line from Tuscaloosa, Ala., northeast to Gadsden, 120 miles. Eleven miles in operation in Tuscaloosa. Geo. H. Ross, Superintendent, Tuscaloosa.

VALLEY RIVER.—This company, which was incorporated last year to build a line from Mill Creek, W. Va., south to Clover Lick, 43 miles, for which surveys have been made, has work under way on the line from Mill Creek south to Valleyhead. (Dec. 6, p. 702.)

VIRDEN & TAYLORVILLE TRACTION.—See St. Louis, Terre Haute & Quincy Traction.

WALCOTTVILLE & COLDWATER.—An officer writes that this company will build its proposed line from Walcottville, Mo., to Coldwater, 30 miles, during 1908. O. G. Wales, Kansas City, Mo., is interested.

WESTERN ILLINOIS & IOWA (ELECTRIC).—Incorporated in Illinois with $2,500,000 capital to build an electric line in Hancock county. The incorporators are P. A. Neuffer, J. E. Hauronick, H. H. Phillips, C. J. Horn and R. M. Cole, all of Chicago

WOLF, MAGANTIC & LOTBINIERE.—This company, which was chartered to build a line from Lime Ridge, Wolf county, Que., north toward Quebec, about 100 miles, has surveys made from Lime Ridge to Lyster, 60 miles. A charter has also been granted to continue the line from Lime Ridge south to Sherbrooke, 20 miles. The company will apply at the next session of the legislature for subsidies, and if its application is granted it is expected to begin construction work early this spring. W. H. Lamby, Secretary, Inverness, Que.

RAILROAD CORPORATION NEWS.

ATCHISON, TOPEKA & SANTA FE.—December gross earnings increased 2 per cent. and net earnings after taxes decreased 13 per cent. The operating ratio for the month was 70 per cent., against 75 per cent. in November, 1907, and 64 per cent. in December, 1906.

See Houston Belt & Terminal.

BUFFALO, ROCHESTER & PITTSBURGH.—William A. Read & Co., New York, have offered at 101½, yielding nearly 4½ per cent., $500,000 consolidated mortgage 4½ per cent. bonds due 1957, a legal investment for savings banks in New York and Connecticut.

CANADIAN PACIFIC.—Gross earnings for December were $6,400,000, against $6,000,000 in 1906. Net earnings were $2,100,000, against $2,300,000 in 1906. For the six months ended December 31, 1907, net earnings were $14,430,000, against $14,590,000 in 1906.

CHESAPEAKE & OHIO.—Gross earnings for December were $2,142,000 against $2,052,000 in 1906, an increase of 4 per cent. Net earnings were $573,000 against $735,000 in 1906, a decrease of 22 per cent. For the six months ended December 31, 1907, net earnings were $5,248,000 against $4,730,000 in 1906.

CHICAGO & MILWAUKEE ELECTRIC.—On January 28 receivers were appointed for this road. An earlier receivership was instituted on the evening of December 31, 1907, but after the road had been for less than three days in the hands of its President, A. C. Frost, as receiver, this was terminated. The institution of this receivership played a large part in injuring the company's credit. It was impossible to sell bonds to get funds to finish the extension to Milwaukee. There are only about eight miles of this to be finished, more than half of the work on which has been done. The total cost of completing the extension, according to President Frost, would be about $250,000. The receivers appointed by Judge Grosscup in the United States Circuit Court at Chicago were as follows: W. Irving Osborne, Vice-President of the Central Trust Co., of Chicago; D. B. Hanna, Third Vice-President of the Canadian Northern Railway, and Albert C. Frost, President of the company. Owing to objections raised to the appointment of Mr. Frost, he withdrew on January 31 and was succeeded by H. A. Haugan, President of the State Bank of Chicago. Receivers were also appointed for A. C. Frost & Co., and a receivership suit was brought against the Republic Construction Co., which was building the Milwaukee extension.

CHICAGO & WESTERN INDIANA.—Proctor & Borden and Potter, Choate & Prentice, New York, have offered at 95 and interest, to yield 4¼ per cent., $400,000 consolidated mortgage 4 per cent. bonds due 1952 of the Chicago & Western Indiana, guaranteed by the Chicago & Eastern Illinois, the Wabash, the Grand Trunk Western, the Chicago & Erie and the Chicago, Indianapolis & Louisville.

CHICAGO, MILWAUKEE & ST. PAUL.—President Earling is quoted as having said at Seattle on January 31 that negotiations have been made for a line of steamships between Puget Sound and the Orient. J. W. Hiland, Third Vice-President, and F. A. Miller, General Passenger Agent, have gone to China and Japan to investigate traffic conditions. The establishment of the line depends on their report.

CHICAGO RAILWAYS.—The North Chicago and the West Chicago Street Railroads were on January 25 sold at foreclosure sale to representatives of the protective committee. These two companies are to be taken over by the Chicago Railways Company. N. W. Harris & Co. and the National City Bank of New York are to buy the $12,000,000 first mortgage bonds provided for in the reorganization plan for the rehabilitation of these properties. These bonds will be a first mortgage on 300 miles of track, serving without competition the north and west side of Chicago, embracing a territory with a population of 1,500,000.

COLORADO & SOUTHERN.—Gross earnings of the system for December increased 17 per cent. and net earnings 26 per cent. For the six months ended December 31, 1907, gross earnings increased 16 per cent. and net earnings 21 per cent.

See Houston Belt & Terminal.

DELAWARE & HUDSON.—Railroad gross earnings for December increased 15 per cent. and railroad net earnings 5 per cent. There was a decrease of 77 per cent. in net earnings of the coal department, so that there was a final decrease of 17 per cent. in net earnings of all departments.

For the year ended December 31, 1907, railroad gross earnings were $20,100,000, against $17,000,000 in 1906, an increase of $3,100,000, or 18 per cent. Expenses and taxes increased $1,500,000, leaving $8,000,000 as the net earnings of the railroad department, an increase of $1,600,000, or 25 per cent. over 1906.

DETROIT, TOLEDO & IRONTON.—On February 1, George K. Lowell, Vice-President and General Manager, and Benjamin S. Warren, General Counsel, were appointed receivers by the United States Circuit Court at Detroit, Mich., following default on $2,776,400 consolidated mortgage 4½ per cent. bonds on which semi-annual interest fell due February 1. The company's directors impute the receivership directly to adverse railroad legislation, particularly that section of the Rate Law which prohibits a railroad from having any interest in coal properties except for its own use. The income results for the year ended June 30, 1907, were however, very unsatisfactory. In 1905 the Detroit, Toledo & Ironton was reorganized from the Detroit Southern and control of the Ann Arbor was acquired, making a through line from Ironton, on the Ohio river, north to Ann Arbor, on Lake Michigan. The owners planned to develop the combined property by an extension across the Ohio river at Ironton, Ohio, to coal lands in northern Kentucky, on which it had acquired options. A bridge at Ironton was begun. The Detroit, Toledo & Ironton itself operates 438 miles of road, and, including the Ann Arbor, 734 miles.

GEORGIA SOUTHERN & FLORIDA.—Samuel F. Parrott, Vice-President of the Georgia Southern & Florida, was, on February 3, appointed receiver of the Macon & Birmingham, which has since February 1, 1904, been operated by the Georgia Southern & Florida. The Macon & Birmingham operates 105 miles from Macon, Ga., to La Grange.

GULF & SHIP ISLAND.—Cramp, Mitchell & Shober, Philadelphia, have offered, to yield 6¼ per cent., $460,000 5 per cent. car trust bonds maturing semi-annually to 1918, secured on

500 freight cars at $774 each	$387,000
3 passenger coaches at $6,900 each	20,700
1 chair car at	12,740
1 combination baggage car at	5,195
1 baggage car at	4,755
2 passenger locomotives at $15,500 each	31,000
6 freight locomotives at $15,250 each	91,500
Total	$552,890

The excess of 17 per cent. is being paid by the railroad company.

GRAND TRUNK PACIFIC.—On January 14 this company offered at 94 in London $5,000,000 (£1,000,000) 4 per cent. debenture stock ranking equally with the same amount already issued and guaranteed by the Grand Trunk. The proceeds are for additional rolling stock, which is to be used by the Grand Trunk until it is required by the Grand Trunk Pacific. The advertisement offering the stock says that about 800 miles of the Grand Trunk Pacific will be ready for traffic this fall.

Hocking Valley.—In December, gross earnings decreased 13 per cent. and net earnings 65 per cent. The decrease in net earnings was more than compensated by an increase in other income.

Houston Belt & Terminal.—The Houston Belt & Terminal Company, of which the Santa Fe, the St. Louis & San Francisco, the Trinity & Brazos Valley and the St. Louis, Brownsville & Mexico, are owners is to take over the Houston terminal property of the Gulf, Colorado & Santa Fe as the nucleus of important terminals to be built at a cost of several million dollars.

Illinois Central.—Gross earnings for the six months ended December 31, 1907, increased 5 per cent.; net earnings decreased 11 per cent.

International & Great Northern.—Estimated gross earnings for the week ended January 31, 1908, were $195,000, against $311,000 in 1907. This is a decrease of 37 per cent.

Louisiana & Arkansas.—Gross earnings for December were $64,188; operating expenses were $63,986, and net earnings were $202, against $16,643 in 1906, a decrease of 99 per cent. For the six months ended December 31, 1907, net earnings were $184,000, against $177,000 in 1906.

Macon & Birmingham.—See Georgia Southern & Florida.

Mexican Central.—See National Railways of Mexico.

Minneapolis, St. Paul & Sault Ste. Marie.—By reason of comparison with a time of severe winter weather in 1906, this company shows a large increase in net earnings for December, which were $512,000, against $350,000 in 1906. The operating ratio was 52.7 per cent. in 1907 and 61.9 in 1906.

National Railways of Mexico.—Earnings in December, 1907, increased as follows over those for December, 1906:

On the National of Mexico there was an increase of 2 per cent. in gross earnings and a decrease of 4 per cent. in net earnings.

On the Mexican International there was a decrease of 5 per cent. in gross earnings and a decrease of 20 per cent. in net earnings.

On the Interoceanic of Mexico there was an increase of 8½ per cent. in gross earnings and 17 per cent. in net earnings.

On the Hidalgo & North-eastern there was a decrease of 7 per cent. in gross earnings and of 9 per cent. in net earnings.

On the Mexican Central there was an increase of 23 per cent. in gross earnings and 8 per cent. in net earnings. Gross earnings of the Mexican Central for the six months ended December 31, 1907, increased 28 per cent. and net earnings 31 per cent.

New York City Railway.—The Metropolitan Street Railway has defaulted the semi-annual interest, due February 1, on its outstanding $12,500,000 general collateral trust mortgage 5 per cent. bonds.

New York, New Haven & Hartford.—Gross earnings for the six months ended December 31, 1907, were $29,500,000; net earnings were $9,100,000. For the six months ended December 31, 1906, gross earnings were $28,300,000 and net earnings were $10,400,000. In 1907 the figures were compiled according to the Interstate Commerce Commission rulings.

Norfolk & Western.—Passenger earnings for December decreased 2 per cent.; freight earnings, 10 per cent., and gross earnings, 8 per cent. Operating expenses increased 4 per cent., leaving a decrease of 30 per cent. in net earnings. The operating ratio was 73 per cent., against 65 per cent. in 1906. For the six months ended December 31, 1907, gross earnings increased 13 per cent. and net earnings 5 per cent.

Pennsylvania.—Shipments of coal and coke originating on the lines of the Pennsylvania Railroad east of Pittsburgh and Erie, were 3,050,000 tons for the 1908 year to January 25. For the 1907 year to January 26 they were 4,127,000 tons.

Gross earnings of the Lines East of Pittsburgh and Erie directly operated by the Pennsylvania Railroad for the year ended December 31, 1907, were $164,800,000, against $148,200,000 in 1906, an increase of $16,000,000, or 11 per cent. Operating expenses increased $17,800,000, or 17 per cent., leaving a decrease of $1,200,000, or 3 per cent. in net earnings.

Gross earnings of the Lines West directly operated by the Pennsylvania Company for the year ended December 31, 1907, were $54,200,000, an increase of $8,100,000, or 12 per cent. over 1906. Net earnings were $14,400,000, an increase of $12,000, or 9 per cent. over 1906.

Reading Company.—The Philadelphia & Reading Railway is one of the very few companies to show an increase in net earnings for December, which were $1,274,000, against $1,218,000 in 1906. This is particularly noticeable because gross earnings show a slight decrease.

St. Louis & San Francisco.—This company has sold $3,000,000 6 per cent. seven months' notes dated January 29, 1907, to Hallgarten & Co., of New York. These notes are issued in denominations of $50,000 and are subject to call on five days' notice in sums or multiples of $150,000. All have been sold, partly in Europe.

See Houston Belt & Terminal.

St. Louis, Brownsville & Mexico.—See Houston Belt & Terminal.

Southern.—Gross earnings for December decreased 14 per cent.; net earnings 30 per cent. and net earnings after taxes 38 per cent. The operating ratio was 82 per cent. against 75 per cent. in 1906. For the six months ended December 31, 1907, there was an increase of 4 per cent. in gross earnings and 8 per cent. in operating expenses. Net earnings decreased 8 per cent.; taxes increased 33 per cent. and net earnings after taxes decreased 12 per cent.

See Georgia Southern & Florida.

Southern Pacific.—Gross earnings for December were $11,073,000 against $10,995,000 in 1906. Net earnings were $3,319,000 against $4,044,000 in 1906. For the six months ended December 31, 1907, gross earnings were $69,100,000 against $62,100,000 in 1906. Net earnings were $20,084,000 against $24,355,000 in 1906. The following official statement is made covering both the Southern Pacific and Union Pacific:

In 1906 only the net revenue from the operation of dining cars, hotels and other facilities used in connection with the transportation lines of the companies was included in the transportation operations. The classification of the Interstate Commerce Commission in effect since July 1 1907, deals with this revenue as "outside operations," and in thus dealing with it, the revenue is included in the gross revenue and the expenses in the operating expenses. To bring last year's gross revenue and expenses in respect of these "outside operations" in accord with those of this year, the gross revenue expenses for the five months ended November, 1906, in the case of the Union Pacific were increased $414,134, and in the case of the Southern Pacific were increased $595,603. Net revenue for Union Pacific amounting to $61,800 and for Southern Pacific amounting to $94,573, is already included in the gross revenue.

Southern Railway.—A. B. Andrews, First Vice-President, was on January 27 appointed receiver of the Tallulah Falls Railway. On January 6 receivers were appointed by a Georgia state court, but these receivers were discharged later in the month. The Tallulah Falls owes about $1,500,000 to the Southern Railway for advances. The application for a receiver was made by the Southern Railway. The Tallulah Falls runs from Cornelia, Ga., north through Rabun gap, to Franklin, N. C., 60 miles. According to the last annual report of the Southern, the Tallulah Falls is eventually to be used as part of a low grade through line from Maryville, Tenn., via Bushnell and Franklin, N. C., between "the Knoxville territory and north and west thereof" and "the consuming territory of Georgia and South Carolina, avoiding the necessity of handling traffic over the heavier grades via Asheville and Spartanburg."

Tallulah Falls.—See Southern Railway.

Third Avenue Railroad.—Frederick W. Whitridge, receiver of this company, was on February 1 appointed receiver also of the Forty-second Street, Manhattanville & St. Nicholas Avenue Railway, and the Dry Dock, East Broadway & Battery, which own street railway lines in New York City. The Third Avenue Railroad owns nearly all the stock of both companies. The Forty-second street company operates 24½ miles of track. Control was bought by the Third Avenue in November, 1905. The company was in the hands of a receiver from March, 1900, to April, 1901. The Dry Dock company has 17½ miles of track. The Third Avenue bought control in 1897.

Toledo & Ohio Central.—On February 1 the Toledo & Ohio Central assumed the operation of the Marietta, Columbus & Cleveland, which runs from Marietta, Ohio, to Palos, on the Toledo & Ohio Central, 45 miles, with a 4 mile branch.

Union Pacific.—Gross earnings for December were $6,530,000 against $6,380,000 in 1906. Net earnings were $2,635,000 against $2,894,000 in 1906. For the six months ended December 31, 1907, gross earnings were $42,900,000 against $39,000,000 in 1906, and net earnings $17,600,000 against $19,000,000 in 1906. See Southern Pacific.

The suit brought by the United States Government to set aside the Union Pacific's control of the Southern Pacific and the San Pedro, Los Angeles & Salt Lake and its stock holdings in other transcontinental lines was filed on February 1 at Salt Lake City.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK
BRANCH OFFICES AT 375 OLD COLONY BUILDING CHICAGO, AND QUEEN ANNE'S CHAMBERS WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. *We give in our editorial columns* OUR OWN *opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.*

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS:

W. H. BOARDMAN, *Prest. and Editor.*
E. A. SIMMONS, *Vice-President.*
RAY MORRIS, *Secretary*
R. S. CHISOLM, *Treas.*
I. B. RINES, *Cashier*
L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Managing Editor*
BRAMAN B. ADAMS
CHARLES H. FRY
FRANK W. KRAEGER
GEORGE L. FOWLER
HUGH RANKIN
BRADFORD BOARDMAN

CONTENTS

VOL. XLIV., No. 7. FRIDAY, FEBRUARY 14, 1908.

The American Railway Association proposes to reduce the per diem rate for interchanged freight cars as soon as possible—that is to say, on March 1—to 25 cents (from 50 cents), and to thereafter fix it at the most equitable figure that can be arrived at through the combined wisdom of five experts. This is the substance of the resolutions providing for a letter ballot, which were adopted at the special meeting called for this purpose and held at Chicago last week. There can be little doubt that the proposition will be adopted. The resolutions are:

That the question of a change . . . be presented to the members for a letter ballot; the rate to take effect on March 1, if approved by a majority of the membership and two-thirds of the cars owned or controlled . . . The ballot to close on Feb. 25.

That a special commission of five be appointed by the Executive Committee to determine: First, the payment per day which the using road should pay the owning road for the use of its cars; second, an effectual method to secure the enforcement of the existing rules for the return of equipment on demand.

The conclusions of the Commission will be submitted to a letter ballot, and if confirmed will become effective on the first of the month following the announcement of the vote by the Secretary.

This would seem to give due consideration to the needs of the most strenuous objector. The only real remaining ground for dissatisfaction is that the rate will still remain arbitrary, in the sense that it cannot be quickly changed, and that it must be the same everywhere. Moreover, the five commissioners will have to exercise their wills rather than their reasoning powers to settle some of the questions that will come before them. But if they make their report with reasonable celerity it will have to be a decidedly poor one not to merit prompt and universal acceptance; for a code of arbitrary rules, universally applicable, seems at present to be the only practicable way of managing freight car interchange in this great country.

Storing coal under water is admittedly the best way known of minimizing deterioration, as well as of avoiding spontaneous combustion or accidental ignition. The advantages of this method of storage have been determined in Great Britain within the past five years. The British Admiralty has been the most noted as well as the most extensive investigator, although its studies were antedated by individual experimenters, who were able to record definite and conclusive results. The methods and conditions of these experiments and their results were given in English engineering journals and are more or less generally known. But that the idea has been in use in this country since about the time attention was first drawn to it in England may be new to many. In 1902 the Western Electric Company, Chicago, having had much trouble from spontaneous combustion with Illinois coal stored in quantity, determined on water storage as the simplest and most effective preventive. A large hole was dug in the ground, the coal dumped in and flooded. When the large new plant at Hawthorne (Chicago) was built something more than a year ago, the scheme was elaborated to its present proportions. A concrete pit to hold 10,000 tons was built, with tracks across on concrete arches, and alongside, and the reserve supply of coal is kept in the bins thus formed. To deposit the coal in these submerged bins costs about 5 cents a ton. It is removed by a locomotive crane with a grab bucket. The water for the bins comes from the roofs of nearby buildings. The cost of the pit, which is 310 ft. x 114 ft. and 15 ft. deep, was at the rate of $7,000 per 1,000 tons of capacity. When the coal is used it is loaded into cars, allowed to stand 24 hours to drain and then put into the overhead bunkers of the power station, from which it feeds to the stokers. It is therefore used within 48 hours after coming from the pit, and burns well. Since the water removes all of the finely pulverized material, it is equivalent to using washed coal. It will be recalled that the British experiments included storage in both sea and fresh water, and in the former instance the quality of the coal actually was improved, presumably from its permeation by the salt. The effect of salting the water has not been tried at the Western Electric Company's pit.

PENNSYLVANIA RAIL ORDER FOR 1908.

We received news after we went to press last week that the Pennsylvania Railroad, on February 6, placed definite orders with steel manufacturers for 55,000 tons of rail to be delivered during 1908, so that this new order, in addition to 30,000 tons on hand from the 1907 order, will give the company 85,000 tons for use this year, or enough rails to lay some 550 miles—considerably more than the main line distance from New York to Pittsburgh. The orders were distributed as follows: United States Steel Corporation, 27,500 tons; Cambria Steel Co., 11,000 tons; Pennsylvania Steel Co., 11,000 tons; and Lackawanna Steel Company, 5,500 tons. These rails will be rolled under entirely new specifications. In view of the increasing severity of road service and the recognized necessity for developing an improved rail, the Pennsylvania has for some months been conducting exhaustive examination of the entire art and practice of rail manufacture. A committee of experts representing the railroad and two important steel manufacturers was appointed last summer to make a special study of the subject and the experiments which this committee made were perhaps without precedent in their completeness and in the importance of the scientific data supplied. A new rail section has been developed and we hope to have the opportunity to show this fully in the near future, but the important point for present consideration is the statement in the official announcement that the company places upon the manufacturer the responsibility for the character of the rail produced, recognizing that it is a purchaser and not itself a manufacturer. In all branches of trade it is the privilege of the purchaser to require results. In few or no branches does the purchaser attempt to prescribe the exact way these results shall be obtained. The new Pennsylvania specifications adhere to this excellent principle and allow considerable latitude in the methods of manufacture so long as the result is a sound rail. We have for a long time maintained that exactly this thing should be done; that the burden of proof should be put upon the manufacturer, not upon the user, and that rigorous and exacting test of the finished product will work better than a set of specifications so minute that the manufacturer, once he has complied with them, places himself beyond criticism, whether the result comes up to expectations or not. The Pennsylvania in this instance has devised tests so exacting that it is to the interest of the manufacturers to discard all material which is in any way open to suspicion.

The new specifications do not require any fixed discard, responsibility for this being thrown entirely upon the manufacturer, and they provide that rails shall be free from injurious mechanical defects and flaws, without attempting to describe the particular defects or flaws that will cause the rejection of the rail. In other words, instead of saying to the rail manufacturer, you must make us a rail from ingots which have been cropped to a certain specified per cent., the company in effect says merely, you must make us rails that will not break The methods of testing are very complete, and to place the company's rail practice upon a sound historical basis and to insure that whatever future changes are made shall be based upon accurate data, a system has been devised whereby the history of all rails purchased by the company shall be fully recorded. In order to identify the part of the ingot from which a particular rail was made the new specifications require, in addition to the usual marking, that a letter shall be stamped on each rail to indicate its position in the ingot. A special committee has also been appointed to keep continually in touch with the rail question, in order to enable the company to secure the best rails which at the time of any order it is possible to manufacture. In placing its orders, the Pennsylvania specifically invites the steel manufacturers to fill part of the allotment with open hearth rails in order to ascertain more clearly the actual service differences between open hearth and Bessemer. It is understood that standard prices will prevail.

THE SHADOW IN THE RAILROAD FORECAST.

Under normal conditions a period of financial stress, as affecting especially railroad properties, follows certain fixed lines. Economic theory and practical experience alike confirm them. There is first the antecedent process, often reaching over years of time, of undue expansion. The structure of credit and of business becomes topheavy Presently some single failure, usually of magnitude, discloses the general condition. Panic and contraction follow next, at first smiting the financial centers, with its familiar symptoms of tight money, hoarding and swift fall of security prices. It hits business next, and the blow deflects instantly upon the railroads. Earnings fall and compel economies, some of them harsh and painful and not always effective enough to prevent reduction of dividends Next comes the recovery, sometimes slow, sometimes swift The wreckage is cleared away, credit revives, money rates fall. On the railroads, earnings increase, dividends are reassured, and the crisis passes. Such, in the briefest forms of statement and distilled to its final terms, is the normal story of a panic period. Were external conditions now normal also, one might almost consider our period of trouble over and the railroad situation bright. Indeed, the purely fiscal recovery has been quicker than usual, and the actual wreckage to be cut away less.

But, unfortunately for the railroads, external conditions have been rare, and promise for some time to be abnormal. Heretofore the railroads have been able to work back from hard times not only with a large measure of public sympathy and co-operation, but also under the protection of well defined law They could rely on a deep and instant public respect for the basic rights of property and, on the other hand, upon statutes which had stood long, which the courts had interpreted and which rested on the precedents of judicial ruling. The deepest shadow on the railroad situation is the change in these respects which has come to pass. During the last year or two railroad statute making has stretched beyond all bounds. It is not merely that twenty-five or thirty states have passed positively hostile acts, but that the volume of statutes is so vast. They vary in different states and in adjacent states are inconsistent with each other. They impose severe or ridiculous restrictions on railroad operation. The most serious of them veer head-on against the "due process" amendment of the federal constitution, yet even so must travel the long and slow path through the courts that leads to their death, but meanwhile doing their mischief If unrepealed by legislatures, it would take years for the higher courts to expound the statutes of the last twelvemonth. But, luckily for the railroads, many of the worst of those statutes are of such a character that they tend to repeal themselves, and a second legislature undoes the policies of the first. In federal law, with the statutes less in number and not so complex and contradictory, there is much the same uncertainty as in the states. Hardly a day passes that one does not read of some new question raised under the Sherman Act; and, over all, hangs the doubtful action and attitude of Congress.

A railroad situation is unpleasant when the corporations are mired in such a morass of legislation, federal and state. It is worse when it is up against any unfriendly public sentiment. That sentiment left to itself and to logical outworking would have cleared up soon enough. Reverting again to the rule of experience in such cases, any popular movement against a large vested interest is apt to run to extremes. At first started by discolored abuses, civic feeling goes wild in the effort to check them. Honest men, acting under quick impulse, often join in such a movement But presently sobriety succeeds rashness. The pocket nerve of communities begins to be touched, the cry of hardship is heard and the radical turns conservative. But here again we happen now to strike an abnormal condition. From those exalted official quarters whence we should expect the conservative keynote comes instead the word of flame. It is taken up as a countersign by every federal law officer; it stirs up state commissions; it revives the demagogue; it rewakes the anti-corporation spirit of legislatures just beginning to slumber. Shot through it all is "politics" and the issues of personal or party vantage in a presidential campaign near at hand in which corporation questions promise to cut a wide swath; and, if the paradox may be allowed, not a few of the foremost party leaders on both sides vie in striving to prove which party is most like the other. To the railroad manager struggling to make ends meet when engines and empty cars are indefinitely side-tracked, it must be confessed that such a situation is more anomalous than cheering.

Of the final result there can, of course, be no real doubt The underlying forces of conservatism are too strong and the currents of an enlightened public and personal interest too deep not to prevail at last. But meanwhile the shadow remains and the strange situation presents itself of the great railroad interest of the country in a time of industrial stagnation and distress forced to battle with the law that should protect and with the public sentiment that should be sympathetic and helpful. Years hence, when with a broad and landscape view, the political economist or historian writes up the year 1908, in which the railroad faces the combination of hard times, acute politics, befogged law and federal antagonism, there will be a record to which, in uniqueness at least, the history of other fiscal crises in this country have no parallel In the story of the nation and its railroads, the year may also be an epoch.

THE WHEEL SITUATION

Probably no reader of the *Railroad Gazette* can recollect the time when the car wheel of the former day was not better in remembrance than that of the present, and yet the oldest inhabitant would not claim that the first wheel was the best wheel ever made; hence at some time there must have been an improvement of quality The difficulty is that there is no standard of quality with which to make comparisons, since the standard of life and wear becomes utterly worthless because of the changed conditions of service then and now.

In fact, it is only within the past few years that there has been a wheel question as we understand it to-day. It was about six years ago, when cars of 100,000 pounds capacity, had become plentiful enough to be a factor in railroad operation, that indefinite rumors floated into the office of the *Railroad Gazette* to the effect that there was trouble with the wheel. A representative was accordingly sent to enquire, and he found a condition of anxiety in the minds of thoughtful railroad men that would have been panicky with people of smaller caliber. Wheels were breaking in unprecedented numbers under high capacity cars, especially upon mountain divisions, where there were long and heavy brake applications, and users and makers found themselves face to face with the problem of improving the wheel or abandoning the high capacity car. By an increase of weight and a charge in material a better wheel was produced, and a year later these same officials were breathing easier, but they by no means considered that their troubles were at an end. Since that time, the increase in the relative number of high capacity cars has increased the actual number of failures in proportion, and the weakness of wheels, as evidenced in flange breakages, has become one of the vital questions of the hour.

Meanwhile, the wheelmakers are insistent that if the railroads would only pay more for their wheels, better work could be produced. The railroad replies to this, in substance: "You come here and offer a wheel of a certain weight at a given price and guarantee it to render a certain service. If you can make a better proposition, whereby, by paying more, a better wheel and a better guarantee can be obtained, accompanied by a lower cost per 1,000 miles, we will certainly be willing to entertain it." The burden of producing a better and more economical wheel is thus thrown upon the shoulders of the makers. The relations between them and the railroad companies is one that is purely commercial, and it is left to the seller to prove that he can make a cheaper wheel than the one now in use, the word cheaper being used in the sense of a lower ultimate, not of a lower first, cost. Whether this can be done or not remains to be seen, but an outsider would be led to infer that, in the opinion of the users, it cannot be done, if he based that opinion solely upon the external evidence of the action of the Master Car Builders' Association during the past two or three years. Apparently the members of that association have come to the conclusion that the cast iron wheel of the standard contour is insufficient to meet the requirements of the car of 100,000 pounds capacity, and so they have set themselves to work to improve the wheel, not by improving the material of which it is made, but by strengthening the finished article, by increasing its weight and thickness, using the existing grades of iron. In all the reports of the wheel committees and in all the discussion upon the floor of the conventions, there is not one word or hint that an attempt at improvement of material should be made or that it could successfully be made, as a means of strengthening the wheel. It is, apparently, resignedly accepted that the best that can be done along those lines has been done. Wheel users have accepted the metal as it stands and propose to make the best of it.

The result of this position has been the designing of wheels in which there is a progressive thickening of the metal and a corresponding increase of the weight of the wheel as the service rises from that of a 60,000 pound capacity car, through 80,000 pounds to 100,000 pounds.

This is official action, with no official comment other than the bare statement of the necessity that the wheel that has given satisfactory service under cars of 60,000 pounds capacity must be improved if it is to be used under those of 100,000 lbs. capacity.

The whole situation is not defined, however, in official action though it may be, in part, indicated. We have the private expressions of opinion of superintendents of motive power and master car builders, the so-called piazza talk of the conventions, the general gossip that is floating about from untraceable sources, and the discussions at the railroad clubs. As for the position of those men in charge of the rolling stock, it is well within bounds to say that it averages one of anxiety, especially where work has to be done on mountain divisions, while the feeling that there must be eternal watchfulness of the most wide-awake character is universal, in order that flange breakage—that dreaded result—arising from those insidious and non-detectable cracks that are apt to be set up in the interior of the wheel, may be avoided. The general gossip merely confirms this fear of cracks, and solidifies the current impression that the cast iron wheel is not just the thing—not quite safe for use under high capacity cars. As for the club discussions, the case seems to be merely emphasized by them. Two such discussions have taken place this winter, both marked by a practical unanimity of opinion upon the cast iron wheel question. At the Pittsburgh club, in November, there was an address in which the speaker opened with a well-deserved tribute to the cast iron wheel, and an acknowledgment of what American railroad development owed to it, but he followed this by a very vigorous and emphatic attack upon its use under high capacity cars, arguing that it was not safe. This in Pittsburgh, where the cast iron wheel is at home.

Yet, though the speaker was warned in advance that if he attacked the cast iron wheels he must expect a vigorous defense and counter-attack and be prepared therefor, he found himself in the midst of a love feast, and even the wheelmakers agreed with almost everything that he said.

Again, in January, at the Western Railway club, a paper was presented in which the causes of failure of the cast iron wheel were set forth with great elaboration. No excuses were offered, and the case was clearly and definitely stated. In the discussion that followed there was at least one vigorous attack upon the use of the wheel under high capacity cars, followed substantially by a corroboration, or at least, by no refutation of the arguments offered to show that the wheel was not safe. These straws are certainly very indicative of the opinions of men who know; for, in both cases, if railroad officers present had held any opinions contrary to those expressed, or if the wheel makers had any figures or arguments to offer to contradict or meet the opinions set forth, these opinions and arguments would undoubtedly have been brought to light.

Now, there must be a reason, or reasons, for all this, and it appears not unlikely that it is founded upon a mixture of knowledge and ignorance. We know that the cast iron wheel gave satisfactory service under cars of 60,000 lbs. capacity, and that when that capacity was raised to 80,000 lbs., the difference in efficiency was not enough to be noticeable, but when the load was made 100,000 lbs., the crash came. That much represents knowledge. Then came the talk about inferior wheels, brake action, stresses internal and external, soft and hard chills, and all manner of excuses and guesses, of the validity of which we know nothing. Who knows whether there is really any difference in the hardness of the chill of different wheels? We know that there is a difference in the depth of penetration. But how about actual hardness? How many tests have been made of the strength of the chilled metal cut from wheels? Who has ever measured the internal stresses that exist in the average cast iron wheel as it leaves the annealing pits? Has any one ever attempted to measure the effect of brakeshoe action on these internal stresses? Who knows, except in a general way, the effect of the temperature of the metal at the time of pouring, on the internal stresses of the wheel? In short, do we know one single item of what is going on inside that metal, to give us a clue about what should be done to improve conditions?

Who knows very much about external stresses either? With the exception of the investigations of last summer as recently published in the *Railroad Gazette*, nothing is known of lateral stresses, while of vertical stresses our knowledge is still more limited. It is, as the investigator asserts, a case where the merest scratching has been done on the surface of a field that stands inviting a thorough cultivation with the promise of a rich reward to the cultivator. We have no present opinions to express on this subject; we wish merely to record the apparent conditions; the state of the art. But it is quite proper to suggest to wheel makers and to railroad officers that before there is any further condemnation of the cast iron wheel and before there are any further attempts to improve it, it would be worth while to find out definitely what is the matter with it, and what effect brakeshoe and other actions have upon it. When we have learned this, we will all be in a better position to proceed intelligently with improvements, or at least to decide whether improvement is possible or not.

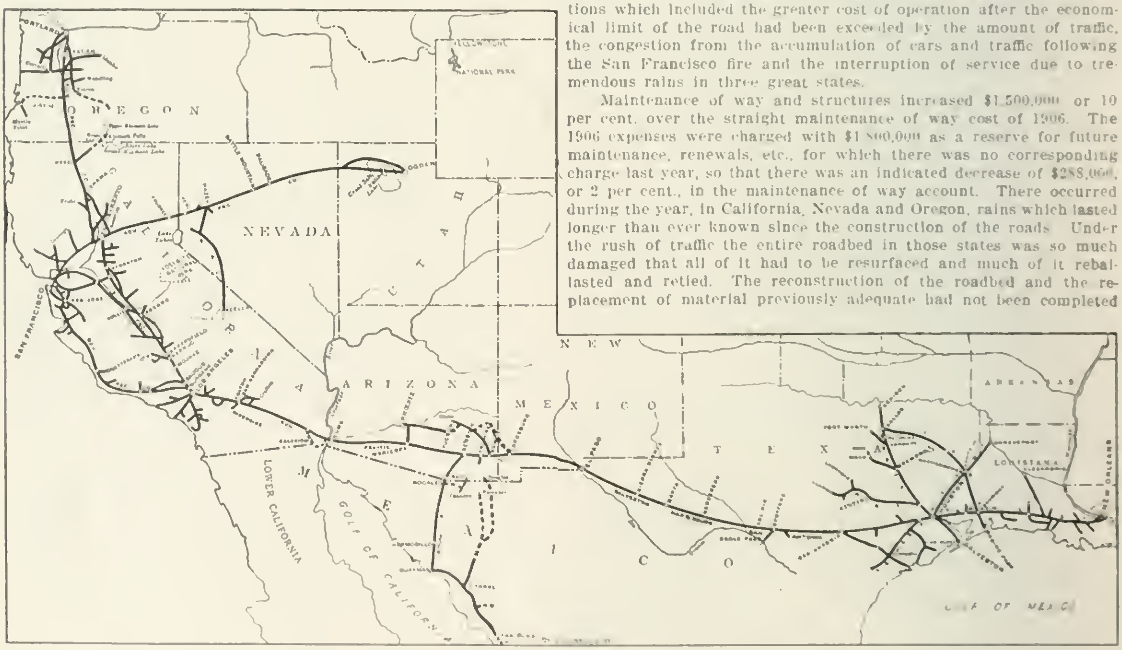
Probably nobody will deny that the case is serious. That a cure is not yet in sight, is evidenced by the large and increasing percentage of steel wheels that are being put under high capacity cars. It is not reasonable to suppose that railroad managers would buy steel wheels for this purpose, if, by an advance in price, they could obtain a cast iron wheel to meet their requirements. It is not a case of obtaining business through advertising the superiority of their equipment, nor would these same managers consider for a moment a proposition to put steel wheels under 60,000-lb. cars. They simply feel that traffic demands have outgrown the capacity of the cast iron wheel, and they are obliged to use steel just as they did years ago in passenger cars and engine truck wheels.

In this there can be no thought of condemnation of the cast iron wheel in itself. At present we know pretty well the extent to which it can be depended upon, but for high capacity service, in order to bring its quality up to the severe requirements, it is certainly better to pry into the present service condition of the wheel, external and internal, and the causes affecting it rather than proceed blindly with no definite idea of what ought to be done. What such an investigation will reveal, no one can say, but it is quite safe to predict that until the cast iron wheel is improved along the lines of positive information, the use of its rival, the steel wheel, will continue to increase and the steel wheel will be placed under a larger and larger proportion of the high capacity freight cars of the country.

For many years the Pullman Company has set the railroads of the country good examples in certain of the details of its dealings with its employees, but in nothing has it done better than in the action reported from Chicago in the following press despatch: "The Pullman Palace Car Company has distributed $171,850 among 5,770 employees of its car service department. The bonus amounts to one month's salary for every conductor and porter who continued on the payroll of the company throughout 1907 and who had no demerits charged against him. The maximum number of porters employed during the year was 4,400, and of conductors, 1,689. It is the intention of the company to grant the bonus of one month's pay each year hereafter to such conductors and porters as make a clean record throughout the year."

Southern Pacific Company.

The twenty-third annual report of the Southern Pacific Company and proprietary companies for the year ended June 30, 1907, was issued on February 6 under date of January 23, 1908. As usual it is a model of completeness; a standard for other companies to follow. Not only is full information given for the holding company, but



Southern Pacific.

most of the important facts are shown in detail for each of the 15 proprietary companies directly included in the system as well as information about four other proprietary companies which are not directly included.

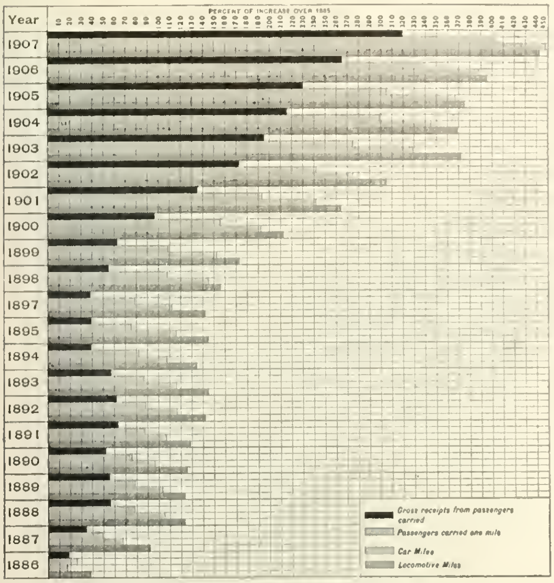
The average mileage of railroad directly operated has risen to 9,400 miles, and the gross transportation receipts from both rail and water lines to just under $125,000,000. The increase in transportation receipts over the year ended June 30, 1906, was $19,300,000, but operating expenses and taxes of all lines increased $12,500,000, leaving net earnings after taxes of $41,800,000 against $35,000,000 in 1906, an increase of $6,800,000. Increases in other income brought up the total amount available to pay fixed charges to $46,800,000, a gain of $8,400,000 over the previous year. Fixed and other charges were $700,000 less and net income $9,000,000 larger than in 1906. From the net income of $[illegible] there was paid in dividends $1[illegible]200,000 and appropriated for betterments and additions or reserved for depreciation of rolling stock $[illegible], leaving a surplus for the year after all charges and payments of $14,4[illegible]. This compares with $11,100,000 in 1906.

Gross railroad earnings were $117,[illegible] against $[illegible] in 1906, an increase of $1[illegible], or 18 per cent. No other railroad in the country except the Pennsylvania had gross earnings last year of as much as $100,000,000. Gross earnings were $12,[illegible] per mile. Railroad operating expenses increased 1[illegible] per cent, leaving net earnings of $43,700,000, an increase of $7,[illegible], or [illegible] per cent over 1906. Passenger earnings increased 15 per cent and freight earnings 19 per cent. Meanwhile the operating ratio was reduced from [illegible] in 1906 to 62.75 per cent. last year.

This was accomplished in a year of exceptional difficulties and rapidly increasing costs by spending a smaller proportion of gross earnings on maintenance than in the previous year. Considering maintenance of way and structures and maintenance of equipment as "maintenance," and conducting transportation and general expenses as "operation," there was a great change in the relation of these two groups to the gross receipts. In 1906 almost as large a percentage of gross was spent on one group as on the other, "maintenance" taking 30.88 per cent. of gross and "operation" 32.43 per cent. Last year, however, "maintenance" was reduced to 26.46 per cent. of gross earnings, while "operation" rose to 36.29 per cent.

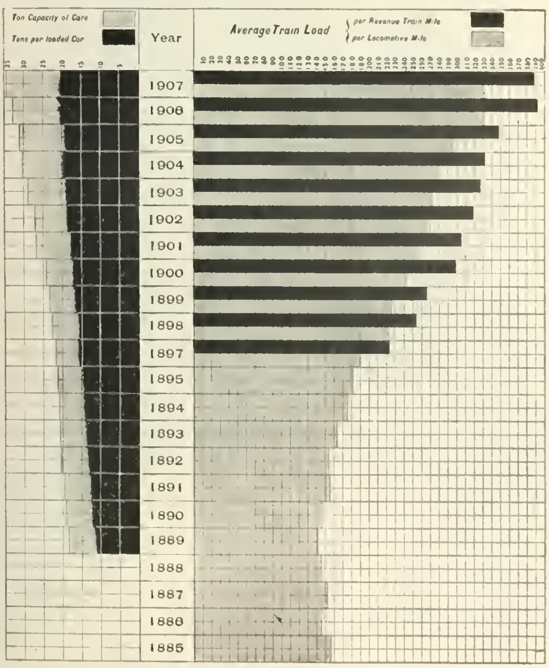
Operating expenses of all lines increased $12,100,000, or 18 per cent., but the actual increase in the cost of carrying on the business was greater than this, for the expenses of 1906 were charged with $2,100,000 which was credited to a reserve fund for future maintenance and renewals for which there was no necessity last year. The increase in actual operating expenses was, therefore $14,200,000, or 22 per cent. There were higher wage schedules, most of which went in effect in the fall of 1906; a larger amount of improvements; greater cost of material, principally of lumber and fuel, more traffic moved; and extra expense of moving traffic under exceptional conditions which included the greater cost of operation after the economical limit of the road had been exceeded by the amount of traffic, the congestion from the accumulation of cars and traffic following the San Francisco fire and the interruption of service due to tremendous rains in three great states.

Maintenance of way and structures increased $1,500,000 or 10 per cent. over the straight maintenance of way cost of 1906. The 1906 expenses were charged with $1,800,000 as a reserve for future maintenance, renewals, etc., for which there was no corresponding charge last year, so that there was an indicated decrease of $288,000, or 2 per cent., in the maintenance of way account. There occurred during the year, in California, Nevada and Oregon, rains which lasted longer than ever known since the construction of the roads. Under the rush of traffic the entire roadbed in those states was so much damaged that all of it had to be resurfaced and much of it reballasted and retied. The reconstruction of the roadbed and the replacement of material previously adequate had not been completed at the end of the fiscal year, but has been increasing the expenses of maintenance in the first six months of the current fiscal year. The cost of repairing damages caused by storms and floods on the lines of the Pacific system west of El Paso amounted to $565,000. Repairs of bridges, culverts and trestles increased $458,000, of which $102,000 represents flood damage and the remaining amount includes the cost of 6,900 ft. of steel and the wooden structures replaced. The average cost of ties during the year increased 23 per cent., from 47 cents to 58 cents, so that although there were over 600,000 less ties laid in track, there was an increase in the cost of tie renewals. Repairs of buildings other than docks and wharves increased $695,000, which includes the cost of repairing damages by fire and earthquake at San Francisco and of repairs to the passenger terminals at Oakland and at Alameda Moles. There is also included in maintenance of way under a separate account $218,000 spent by the Southern Pacific *Railroad* in finishing the work of moving its tracks and of building about 40 miles of new line higher up on the side of the Salton sink. The expenditures in 1906 for this work amounted to $537,000, making a total of $755,000 in the two years. There were 355 miles of new rails laid, a decrease of 64 miles from 1906. The unit cost of maintenance of way per mile of main and second track (including 175 miles of second track in 1907 and 164 miles in 1906) was $1,676, against $1,744 in 1906.



Passenger Service and Traffic.

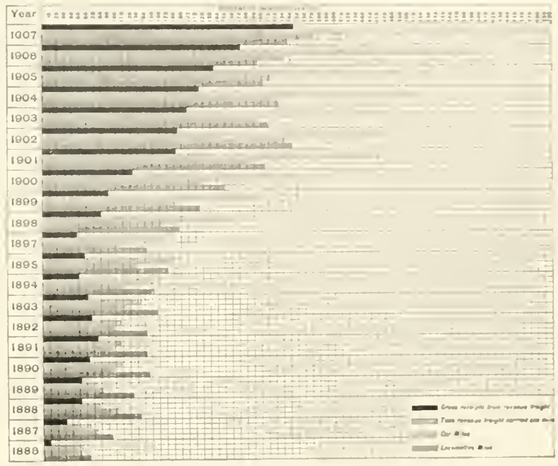
Locomotive miles include revenue passenger train miles, one-fourth of mixed train miles, and helping passenger train miles.



Average Train Load and Tons Per Loaded Car.

Revenue train miles include miles run with freight trains and three-fourths of mixed train miles. Locomotive miles include revenue freight train miles, three-fourths of mixed train miles, and helping freight train miles.

Maintenance of equipment increased 5 per cent. over the figure for 1906, which included $313,000 charged as reserve for future maintenance, renewals, etc., and 7 per cent. over the straight maintenance of equipment cost of that year. With an increase of 12 per cent. in the locomotive mileage, repairs and renewals of locomotives increased 3 per cent. These expenses include $202,000, the difference between the present cost of replacing 44 old light-weight locomotives and the price received for them, if sold, or the value of the old material, if dismantled. With an increase of 10 per cent. in the miles run by passenger cars, repairs and renewals of passenger-train cars increased 12 per cent. They include $140,000 similarly as with locomotives, on account of replacing 31 passenger-train cars. There was an increase of 11 per cent. in the mileage of cars in freight trains and in the cost of repairs and renewals of freight-train cars. These expenses include $1,137,000 for replacing, as above, 2,518 freight-train cars. Repairs and renewals of road service cars include $67,000 for replacing, as above, 139 cars. The unit maintenance of



Freight Service and Traffic.

Locomotive miles include revenue freight train miles, three-fourths of mixed train miles, and helping freight train miles.

YEAR	MILES OF RAILWAY	GROSS TRANSPORTATION RECEIPTS
1885	4,205.43	$30,351,272
1886	4,854.43	31,940,455
1887	5,520.22	38,845,611

Mileage and Gross Transportation Receipts.

equipment costs and the average number of serviceable locomotives and cars owned per year are shown below:

	Average cost per year 1907.	Average cost per year 1906.	Av. serviceable No. 1907.	Av. serviceable No. 1906.
Locomotives:				
For repairs and renewals	$3,144	$3,067	....	....
For replacements	119	464	....	....
Total	$3,563	$3,531	1,692	1,655
Passenger train cars:				
For repairs and renewals	$790	$792	....	....
For replacements	82	90	....	....
Total	$872	$883	1,700	1,621
Freight train cars				
For repairs and renewals	$87	$76	....	....
For replacements	26	29	....	....
Total	$113	$104	43,562	44,172

The great increase in operating expenses came in conducting transportation, where the effect of the unfavorable causes which have already been mentioned was particularly felt. With an increase of 14 per cent. in passenger miles and of 11 per cent. in ton miles the cost of getting and moving the business increased $9,600,000, or 32 per cent. The "total locomotive mileage in service for which the attendant expenses are charged to conducting transportation," increased 12 per cent., while the cost of fuel for locomotives increased 43 per cent. and of locomotive service, other than fuel, 22 per cent. Train service increased 23 per cent. and station and terminal service 26 per cent. As a result of the 50-cent per diem charge and the unusual detention of cars caused by the congestion of traffic throughout the country, payments for car mileage and switching increased from $418,000 in 1906 to $2,156,000 last year, a rise of 415 per cent. The greater cost of handling the business may be briefly and accurately summed up by the statement that the expenses per locomotive mile were 13.353 cents for fuel for locomotives, against 10.475 cents in the preceding year, and for the entire expense of conducting transportation 71.035 cents, against 60.229 cents in 1906. These unfavorable results, it must be remembered, followed a year, in which, with an increase of 8 per cent. in passenger miles and 10 per cent. in ton miles, the cost of conducting transportation was less than in the year 1905.

There was an increase of 36 per cent. in general expenses. Expenses of water lines increased 23 per cent., largely as a result of two additional single trips between New York and New Orleans and 45 additional single trips between New York and Galveston, and the overcrowded dock facilities in New York City.

The trainload on the lines east of El Paso was 346 tons, a decrease of 17 tons, or 5 per cent. from the 1906 figure. West of El Paso the trainload increased 6 tons to 401 tons, making an average for all lines of 380 tons, a decrease of 3 tons. The average loading per loaded car was 20 tons, and the average train had 20 loaded cars. The freight density, including both revenue and company freight, increased from 784,590 tons per mile of road to 848,420, a rise of 8 per cent. The passenger-mile rate, excluding ferry and suburban passengers, was 2.287 cents, an increase of 2 per cent. over 1906, and the ton-mile rate 1.105 cents, an increase of 8 per cent. over 1906. Receipts of passenger trains per revenue train-mile were $1.81, an increase of 6 per cent., and freight trains per revenue train-mile $3.54, an increase of 8 per cent. The train-mileage figures on which each of these results is based include all mixed train miles, but exclude mileage of helping locomotives. Four diagrams, which are given herewith, show by years the growth in mileage, earnings and traffic of the rail and water lines over 1885 (calendar year), the year in which the Southern Pacific Company began operations. The mileage figures show the miles of road in operation at the end of each year.

Six per cent. of the Southern Pacific's tonnage is made up of fruits and vegetables and only 3 per cent. of bituminous coal. Agricultural products make up 20 per cent. of the total, animal products 3 per cent., mineral products 28 per cent., forest products 18 per cent., manufactures 16 per cent., merchandise 12 per cent. and miscellaneous 2 per cent. During the year the proportion of agricultural and mineral products and of manufactures and merchandise increased, while the tonnage of animal and forest products and miscellaneous decreased. The total tonnage of revenue freight was 25,500,000 tons and of company freight 5,300,000 tons.

As on the Union Pacific, separate accounts for betterments and for additions are now kept. The total expenditures last year amounted to $7,600,000, of which $600,000 was paid out of income. There was spent on the lines in Louisiana $927,000, in Texas $444,000 and for the lines west of El Paso and Ogden (Pacific system) $6,300,000, of which $66,000 was spent on the New Mexico & Arizona and the Sonora Railway. One of the most important expenditures, included under additions, is that for signals. On the Pacific system $970,000 was spent during the year. On June 30, 1907, 1,263 miles of these lines were protected by signals and work was in progress or contemplated on 860 miles more. On the eastern lines there was spent $121,000, and 355 miles of lines have, or are shortly to have, signal protection.

Construction work was under way on the date of the report on 15 different new lines. The most far-reaching of these are in Mexico, where a line is now under construction south along the west coast to Guadalajara, 720 miles, and two other lines are being built along the two branches of the Yaqui river, a territory long held in possession by the Yaqui Indians. These northern extensions are shown on the accompanying map; the Guadalajara extension is indicated.

The balance sheet of the Southern Pacific Company and proprietary companies, which excludes all offsetting accounts between the companies and the cost of stocks and bonds owned by the Southern Pacific Company, shows these large construction expenditures. From June 30, 1906, to June 30, 1907, the item "advances for construction and acquisition of new lines, including electric lines in California," increased from $19,200,000 to $39,900,000. This includes the cost of 718 miles of completed railroad and "of work on a part of about 1,700 miles of projected lines," besides 208 miles of finished road in Louisiana and Texas, for which most of the funds were advanced by the Southern Pacific. Cash and cash accounts during the same period decreased from $29,600,000 to $21,600,000, while loans and bills payable increased from $50,000 to $24,700,000. The need for new working capital was met by the issue of $36,000,000 preferred stock, under resolution of the directors of May 9, 1907. This was offered to the stockholders at par and $35,300,000 was subscribed, of which $16,100,000 was paid in by June 30, 1907, and the remaining $19,200,000 has been received since the close of the year. Judging by this showing, the cash assets on June 14, 1907, the day before the first subscription payment on the new issue of preferred stock was due, amounted to only about $5,500,000 against bills payable of probably $24,000,000.

President Harriman describes in some detail the great work which was done in closing the Colorado river crevasse and saving the Imperial valley. This can best be quoted:

> The Colorado river supplies the water for the irrigation of the lands in the Imperial valley. This valley, which is in the southern part of the Salton sink, comprises about 800,000 acres of land as fertile as any in the world, and has a population of about 10,000 persons. Its business is served by a branch line of railroad extending from Old Beach (now Imperial Junction) on the Southern Pacific Railroad, to Calexico, Cal., 41 miles. Work is progressing on an extension of this line from Calexico, through the northern part of Mexico to Yuma, 55 miles, of which 19 miles is completed.
>
> In the spring of 1905 there occurred an enlargement of a small artificial channel, connecting the Colorado river with the California Development Company's canal, which subsequently became the river's low water channel. During a flood stage in November, 1905, the Colorado river made this channel, parts of the Alamo and New rivers, and certain sections of the canal, its main channel. The river, thereupon, flowed inland and discharged into the Salton sink, intead of into the Gulf of California, where its waters had gone for centuries.
>
> The surface area of the Salton sink is about 1,950 square miles and is, at the lowest point, near Salton, about 278 ft. below sea level. The continuous inflow of the river filled up the sink, converting it into a saline lake over 45 miles long and about 15 miles broad, with an extreme depth of about 80 ft. This inflow, unless checked, would ultimately have ruined all improved lands in the Imperial valley as well as the lands along the lower sections of the Colorado river.
>
> After a number of attempts by the California Development Company to close the crevasse, it was successfully accomplished on Nov. 6, 1906. During the last days of November, and the early part of December, 1906, heavy rains on the headwaters of the Gila river sent a further flood, which reached its maximum at Yuma on Dec. 8, 1906, causing a break in the levee some distance below the original break. This rapidly enlarged to a width of 1,100 ft., with a depth in mid-channel of 34 ft., through which the water rushed with a flow of 22,000 seconds feet back again on its inland course and swept to destruction all before it.
>
> It was believed that the work of closing the new break should be undertaken by the United States Reclamation Service, but, failing in having this done, and having been requested by the President of the United States to close the break at once (provision for the equitable distribution of the burden to be made by Congress), the Southern Pacific Company vigorously commenced operations, and men, material, cars, and locomotives were assembled in order to do this work with the utmost expedition. On Feb. 11, 1907, a little over 15 days from the date of the dumping of the first rock, the break was successfully closed.
>
> In that time, there were put in place about 72,000 cu. yds. of rock and 5,000 cu. yds. of gravel and clay. In completing the closure and the necessary protection work, the Southern Pacific Company built 2,250 ft. of dam and put in place 80,000 cu. yds. of rock, 80,000 cu. yds. of gravel and 250,000 cu. yds. of earth, a total of 410,000 cu. yds. of material. It also built 15.6 miles of levee, handling in this work 920,000 cu. yds. of earth, and 215,000 cu. yds. of gravel. To handle and place this material 17 miles of standard gage railroad was built.
>
> The company incurred an outlay of $1,489,784 in aiding the California Development Company in its attempt to close the crevasse of the Colorado river, and $1,663,136 in undertaking the work it was requested to do by the President of the United States. The total outlay amounted to $3,152,920.

There was a notable increase in the number of stockholders during the year. On June 30, 1906, the holders of the preferred and common stock numbered 3,910; 18 months later the number was 14,830. With particular reference to the new stockholders a statement is made summarizing the operations of the company for the past 10 years, during which time the average mileage operated has increased from 7,723 miles to 9,401 miles; gross receipts and income from $58,000,000 to $129,900,000, net earnings after taxes from $21,400,000 to $46,800,000; fixed charges from $15,400,000 to $19,100,000, and surplus after fixed and other charges from $5,900,-000 to $27,700,000. Up to the fiscal year 1905 no dividends were paid, so that the surplus after charges was applicable to the improvement of the property.

The table shown at the end of this review sums up, with certain differences necessary to bring the figures in accord with our usual standards, the operations of the company since the payment of dividends has been begun. This shows that dividend payments have risen from $2,800,000 in 1905 to $13,200,000 in 1907. For the year ended June 30, 1908, based on the present amount of stock outstanding at the present rates, the total dividend requirement will be $17,100,000. In this connection it is interesting to observe that the surplus after fixed charges (including improvement appropriations) and preferred dividends amounted last year to 12.6 per cent. on the $198,849,258 common stock outstanding on June 30, 1907. The present annual rate of common dividends, which was begun in October, 1907, is 6 per cent.

The operating and income results of the Southern Pacific Company for the last three years, ended June 30, are shown in the following table:

	1907.	1906.	1905.
Mileage worked	9,401	9.192	9.138
Passenger earnings	$33,636,377	$29,224,510	$26,412,631
Freight earnings	76,506,135	64,122,439	57,902,855
Gross earnings	117,331,812	99,123,550	89,403,632
*Gross earnings	124,942,798	105,632,550	99,515,158
Maint. of way and structures	16,031,877	16,319,831†	13,731,801
Maint. of equipment	15,017,190	14,286,111‡	12,989,732
Conducting transportation	39,238,102	29,683,882	29,691,601
Operating expenses	73,631,374	62,752,771	58,530,015
*Operating expenses	86,220,800	68,120,893	63,664,235
Net earnings	43,700,438	36,370,779	30,873,617
*Net earnings	44,721,998	37,511,656	31,850,923
*Net income	28,911,816	19,913,371	13,124,415
Dividends	13,157,013	7,716,125	2,769,131
§Improvement appropriations	1,220,711	777,502	5,520,386
*Year's surplus	14,408,585	11,118,837	3,426,798

*Including water lines and the Southern Pacific Terminal Company, which owns the Galveston terminals.

†This includes $1,803,813 charged as reserve for future maintenance, renewals, etc.; no similar charge in 1907.

‡This includes $313,474 charged as reserve for future maintenance, renewals, etc.; no similar charge in 1907.

§Include the following amounts reserved for depreciation of rolling stock owned by Southern Pacific Company and leased to other companies: $609,251 in 1907; $483,793 in 1906; $540,996 in 1905.

NEW PUBLICATIONS.

Specifications and Contracts. By J. A. L. Waddell, C.E., D. Sc., LL. D., and John C. Wait, M.C.E., LL.B. New York: The *Engineering News* Publishing Co., 174 pages; 6 x 9 in. Price, cloth, $1.00.

This book is made up of two lectures, one on specifications and the other on contracts, delivered by Mr. Waddell before the senior class of the Rensselaer Polytechnic Institute, and supplemented with an appendix by Mr. Wait containing Notes on the Law of Contracts. The lecturer apologizes in his opening paragraph for the dryness of his subject and begs for the indulgence of his listeners, and then straightway proceeds to handle it in the most interesting manner and in a way that holds the attention from beginning to end. The whole text of both lectures is indexed by marginal references by which every point is made readily accessible, and the points thus referred to are clearly and concisely set forth. The burden throughout is, Be careful. Know first exactly what it is desired to accomplish and what the parties to the contract wish to agree to, and then express it so clearly that there is no possibility of a misunderstanding in a later interpretation of the document. This excellent advice is followed by driving home the idea that the engineer must above all things be honest with himself, his employer and the contractors with whom he is called upon to deal. But while due importance is put upon the ethical treatment of the subject, it by no means overshadows the purely engineering and commercial features. Then, after touching with clear incisiveness upon the many things that must be taken into consideration in the preparation of specifications, examples of model specifications are given, followed by examples for practice.

The same thoroughness marks the second lecture on contracts, and great attention is paid to the line of demarkation separating them from the specifications proper. There are a multitude of cautions as to what it is essential the contract should contain as well as what is useless and avoidable, and every precaution is taken to warn the unwary against the pitfalls that lie upon all sides of those who have such documents to prepare.

As for the appendix, it will be a remarkably well-informed engineer, or lawyer either, for that matter, who can read it through without finding many things of which he never dreamed, when the laws of liability are expounded. Many a phrase that has been a perfunctory part of contracts from time immemorial is shown to be useless and worthless for the purpose for which it was intended, as it serves, apparently, merely as a sort of bugaboo to those who do not know.

There is the same brief treatment of the headings that is to be found in the lectures, but nothing is slighted or treated cursorily. The book professes to have been prepared for students as a guide to them in the study of the subject, but it can well be made to serve a much broader purpose than that, for there are few engineers who would not find many suggestions in it of great value in the work of preparing specifications and contracts, together with hints about the view the courts will be likely to take of the agreements that they have drawn, as well as hints about the language of the documents themselves.

The Blacksmith's Guide. By J. T. Sallows. The Technical Press, Brattleboro, Vt. 157 pages; 5½ x 7 in.; 161 illustrations. Price, cloth, $1.50; leather, round corners, $2.00.

Once in a while a working book appears that shows all through it that it has been written by a practical man, thoroughly familiar with his subject. That is the case with the book at hand. In his preface the author modestly disclaims to be the only one who knows how to do blacksmithing, and then plunges at once into his work and to the end sticks closely to his text, which, for the most part, is that of telling how particular jobs should be done. He makes no attempts to explain the whys and the wherefores of any of his methods. These he ignores on the general ground that it is needless for the man to know the carbon content of the steel he is handling or the temperature in degrees Fahrenheit to which it should be raised for proper working. "There are books which give this information, which is very useful in its place, but if a spring is brought in for a blacksmith to temper, and he does as I have stated, he will have a position longer than he will by starting out to find the percentage of carbon in the steel and other points that properly concern the scientist."

While the book deals with the details of the manipulation of a multiplicity of jobs, no one of which may come exactly as it is described to the reader, there is an underlying principle in the whole range of the work that is valuable and suggestive and can be utilized by anyone engaged in the same line. The book deals especially with those more delicate branches of blacksmithing in which high grade steels are to be manipulated for tool making and include the forging, hardening and casehardening of the products. The book should be used not only as a reference for the repetition of a piece of work that has been described, but should be carefully read so as not to miss the unexpected suggestions that are frequently made. These suggestions are not grouped but are scattered throughout the work. His explanations for the hardening of tools is particularly explicit and throughout the whole of it the fundamental idea is to get a hard cutting edge backed by a soft, tenacious metal that will have the strength to resist shock, without the brittleness that usually accompanies hardness. Another lesson that is impressed upon the reader is the necessity for a close attention to details. Again and again he emphasizes the importance of points that are apt to be considered of minor importance to the average smith, and insists that success only attends the most careful attention to those details. It is the case of the emphasizing of the value of little things. The book makes no pretense to teach a trade but it cannot fail to be of great value to those who will read it understandingly. It is full of suggestions gleaned from the long practical experience of three generations of blacksmiths.

Bulletins of the Engineering Experiment Station of the University of Illinois.—Bulletin No. 16 briefly presents the results of several years' study of trussed roofs by N. Clifford Ricker, Professor of Architecture. About 50 trusses of a selected type and of different proportions and arrangement were designed in long leaf pine and steel, and were changed until the assumed and actual weights of the trusses agreed. Other trusses were likewise designed in white pine and steel, and a few made entirely of steel. To perform this work as conveniently and as rapidly and accurately as possible, it became necessary to devise simplified formulas, and tables, with a systematic method of treatment, all of which are fully explained in the pamphlet. The results illustrated are mostly shown in graphic tables for ready appreciation. The most important features are a new formula for the weights of trusses; per cent of weight to be added for connections; most economical ratio of depth to span of truss; distance between trusses; number of purlins per panel, and dimensions of panels. It was found that white pine and steel trusses are about 10 per cent. lighter than those of long leaf pine and steel; also, that if carefully designed, steel trusses from 100 to 200 ft. span have about the same weight as those of white pine and steel. It is believed that this bulletin will be valuable and suggestive to all persons interested in the design and construction of trussed roofs.

Bulletin No. 17 is on "The Weathering of Coal," by S. W. Parr and N. D. Hamilton. It relates to the weathering of coal and losses in fuel values which accompany storage under various conditions. The information heretofore available concerning the behavior of coal in storage is exceedingly meager. The results of tests as outlined in this bulletin, add materially to our information and open a way for a better understanding of matters pertaining to weathering, spontaneous combustion and other difficulties which attend the storage of coal in large masses. Deterioration has been studied with samples maintained in the open air, under cover at varying temperatures, in air-tight containers, and in submerged conditions.

Bulletin No. 19 is entitled "Comparative Tests of Carbon, Metallized Carbon and Tantalum Filament Lamps," by T. H. Amrine. It gives a comparative study of the electrical characteristics, life, candle-power maintenance, horizontal and vertical distribution and cost of operation of the three most widely used electric lamps under both good and poor conditions of operation. It is based upon a series of tests in which particular attention was paid to obtain exactly similar conditions for the three types of lamps in order to give a fair basis of comparison between types. Comparative rather than absolute results have been sought, though, in almost all cases, dependable quantitive values have been obtained. In an attempt to explain the reason for high efficiency of the newer lamps a study is made of curves plotted between "filament temperatures" and "candle power per square inch of filament area" and between "watts per candle-power" and "filament temperature." A consideration of these curves leads to the conclusion that the increase in efficiency of the metallized over the carbon filament is due almost equally to higher filament temperature and to selective radiation, while for the tantalum filament it is due almost wholly to higher temperatures.

Cast Iron Car Wheels.

Chicago, Ill., Feb. 8, 1908.

To the Editor of the Railroad Gazette:

It would seem that certain definite things need to be done before relief can be expected from present cast iron wheel troubles. The real difficulty underlying the whole matter is that not enough is known about the chilled cast iron wheel. In the first place there is no text-book or authoritative data on its manufacture, despite the length of time it has been in use on American railroads; therefore, outside of the experienced wheelmakers few have expert knowledge of the subject. But the really serious question is the ignorance regarding certain essential qualities of the finished wheel, and what the wheel must encounter in service. Not only are the nature and magnitude of the stresses imposed on it under a moving car unknown quantities, but much more needs to be known of its strength to withstand these stresses. The wheelmakers claim that the roads generally seem inclined to consider that the responsibilities for the solution of the chilled wheel problem rests with the makers. From the facts above stated it appears to be a two-part problem, on which each side has a special work to do.

With regard to the manufacturing end: The makers have contended all along that the chilled cast wheel, properly made, is fully equal to present service requirements; but that good wheels cannot be made for the price that the railroads, or many of them, will pay; that the price determines the quality, and for this the railroads solely are responsible. This attitude of the wheelmakers is open to criticism; for although what they allege is largely true, they themselves are not free from blame, since they continue to supply wheels that they know to be of inferior quality and therefore unable to stand the service. When manufacturers contract to supply wheels at a price equal to, or even less than, the price of pig iron, they cannot afford to put much new stock into their product. Cheap wheels presuppose the use of poor stock. But the use of good stock does not by any means assure wheels of corresponding quality, for not only can iron unfit for use be drawn from a cupola in which the best stock has been put, but good iron will make poor wheels if the foundry practice is bad. The liability of internal stresses is minimized only by the most careful foundry practice. The temperature in the cupola and of pouring, the temper of the mold, the time of "shaking out" and of "pitting" are all factors affecting the character of each individual wheel. This is the part of the problem that is the province of the wheelmakers to determine. A careful study of the effects of all of the different variations in cupola and foundry practice, and a determination of the limits for each within which the wheels will be of acceptable quality, should be a matter of record. Much, perhaps all, of this the experienced wheelmaker already knows, but it is not in a form to be of use to any one else.

The railroad's part of the work should be to determine as nearly as possible the service stresses of the wheel, the lowest factor of safety that reasonably can be allowed, and a fair price for wheels having this factor of safety. It doubtless will be said in regard to the first of these that the stresses are indeterminate, and there is no practical way to get at even a fair approximation to them. And, of course, this is unfortunately true at present, but ways may yet be found. Bridge engineers in the past have had to guess at the effect of the impact of moving loads on bridges and make liberal allowances for it, because they were only guessing; but they seem in a fair way now, after years of empirical formulas, of arriving at accurate determinations of these stresses by practical methods. This problem contained many and serious difficulties which finally were overcome. The other way may not be any harder to solve.

George L. Fowler said at the January meeting of the Western Railway Club, where certain phases of the cast iron wheel question were discussed (*Railroad Gazette*, Jan. 20), that he hoped to have some data on the stresses imposed on wheels on curves at different speeds for the next M. C. B. convention. As indicative of the excessive loads borne by the wheel when running some investigations of bolster stresses had revealed impact loads on that member of 25 to 30 per cent. of the static load, at speeds of 25 to 30 m.p.h. Whether the correspondence of impact and speed figures was only a coincidence he was unable to say. This impact occurs about three times a second on a track with staggered joints. As to what portion of the blow to the wheel is absorbed by the intervening bolster springs, Mr. Fowler did not hazard a guess. It is his opinion, though, based on his recent wheel investigations, that wheel flanges get their heaviest blows on tangents, when the car starts nosing rather than on curves, and this nosing is an important factor in flange breakages. The shorter the distance between truck centers the more severe the effect. It should therefore be the worst on locomotive tenders. It is studies such as Mr. Fowler is making that will finally solve the wheel problem, and the sooner the parties at interest get together to work it out along these lines the sooner their troubles will end.

WESTERNER.

Car Wheel Tests.

To the Editor of the Railroad Gazette:

New York, Feb. 10, 1908.

The communication in your issue of Feb. 7, from A. T. Perrin in criticism of the results of wheel investigations published under my name, fails at the outset to grasp the situation and the scope of the reports in question. The point is not whether the cast iron wheel is suited for service on the "ordinary freight rolling stock as in use in this country (England) and the Colonies, and especially for narrow-gage light stock of all type," but whether it is suited for use with the excessively heavy wheel loads obtaining with the cars of 100,000 lbs. capacity in use in the United States where the individual wheel may be called upon to carry a static load of more than 19,000 lbs., which may rise to nearly or quite 30,000 lbs. under the shock of running.

It is quite true that with the ordinary 12-ton wagon, and its insignificant wheel load of 11,200 lbs., no trouble will be experienced. This merely checks with the universal experience in the United States where with cars of 60,000 lbs. capacity and wheel loads of approximately 11,200 lbs., no noticeable trouble has been experienced, and it has been demonstrated beyond all peradventure that the cast-iron wheel is eminently well suited for such purposes. Even when the wheel loads have been raised to 14,500 lbs. as they are under cars of 80,000 lbs. capacity, no noticeable increase of wheel failures occurred, and it was only when these loads were again increased by raising the car capacity to 100,000 lbs. that serious trouble was experienced, and it was on the basis of use under such cars, and such cars only, that a doubt was expressed as to the advisability of using the cast-iron wheel.

In further explanation of the articles in question it may be repeated that they were reprinted from a book of reports of investigations that were not originally intended for publication, but were made, as said in the preface, "for the purpose of securing information regarding the standards of quality of metal and workmanship that must be met in the development of a new industry, the success of which depended on the production of a wheel that would at least meet the present requirements of railroad traffic." It was with the steel-tired wheel that the wheel comparisons were made, and the cast-iron wheel was only brought in incidentally and as an after thought. And it was not until the stresses put upon wheels under cars of 100,000 lbs. were measured that any actual data was obtained showing that the cast wheel was not suited for that service.

The position, taken by your correspondent is, therefore, unassailable, but it is doubtful if he would care to sign his own letter if "50-ton wagon" were to be written for "12-ton," and "19,500 lbs." for "11,200 lbs.," and "high capacity mineral wagons" for "ordinary freight and narrow-gage light stock." That would put an entirely different aspect on the matter, and one that is based on an experience in the United States that has caused no small amount of anxiety.

GEO. L. FOWLER.

There is an immense traffic in wine on the Italian railroads; but the consignees this year complain bitterly of the "evaporation" from the casks en route. In a single fortnight a Milan firm found one cask with a gimlet hole and 25 gallons short; another with bung out and also 25 gallons short, three broken open with 60 gallons missing, and another which lacked the bung and 20 gallons of wine. These calamities are doubtless due to the failure of the railroads to keep a supply of water on their freight trains. From time immemorial it has been the custom of wagoners hauling wine into Rome (and doubtless other places) over the Campagna in the heat of the day to take their siesta under the shade of the cask, provided with a gimlet. But they always delivered the casks full, which was easy to do because further on the evaporation could be made good from the aqueducts.

The Brotan Locomotive.

BY WILLIAM C. DREHER.

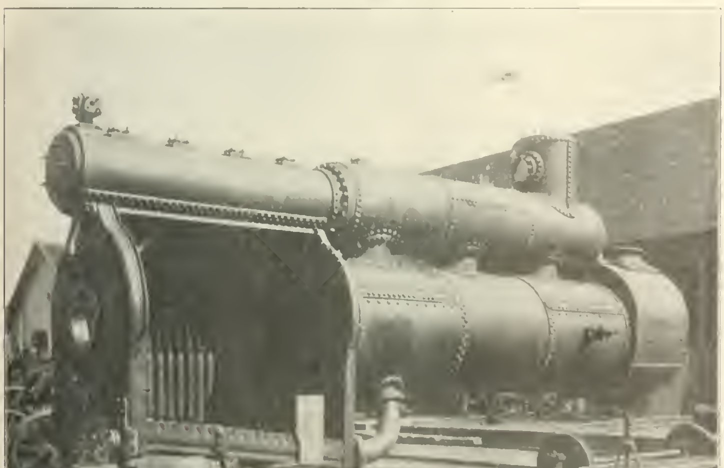
The Brotan locomotive boiler, with a water-tube firebox, has been mentioned occasionally during the last few years in the American technical press; but, so far as I am aware, American readers have not yet had a full description of it, with adequate illustrations, laid before them. It has been advertised to some extent among American locomotive builders and railroad managers, but as the former have been working at their utmost capacity for some years in meeting the demands for locomotives, and the latter have been overwhelmed with larger plans, no attempt has yet been made in America to test the worth of the new boiler.

On the Continent, on the other hand, its use is steadily increasing. Twenty-one are already in operation, and 29 more are building. Austria, where the invention originated, is far in the lead of other countries in introducing it. Of the 21 in use, not less than 14 are on Austrian and Hungarian roads, while 17 of the 29 building are for them. The Prussian State Railroads have had two in use for over a year; two are working on Russian roads, and one on the St. Gotthard Railroad in Switzerland. It will soon be practically tested in other countries; four machines are being built for French, two for Belgian, and one for Swedish roads. Switzerland is to take two more and Russia two.

The new boiler is the invention of the engineer, Brotan, of the Imperial Railroad Ministry of Austria, after long study and experiment. It was first put in operation in January 1901, on one of the Austrian roads, and it immediately established its superiority. In September of that year trial tests were made between the Brotan locomotive and two ordinary ones of about equal load capacity, and it was found that the new boiler consumed 35.8 lbs. of coal per locomotive-mile, as against an average of 49.3 for the other two. The saving of fuel was thus over 27 per cent., or 23.6 per cent. when reckoned on the basis of ton-mileage. In the following month there was a second competition between the Brotan and four other locomotives, including the two of the previous test. This trial showed a saving of 20.7 per cent. on locomotive-miles and 19.5 per cent. on ton-miles in favor of the Brotan locomotive.

Passenger Locomotive for Austrian State Railroads, Fitted with Brotan Boiler.

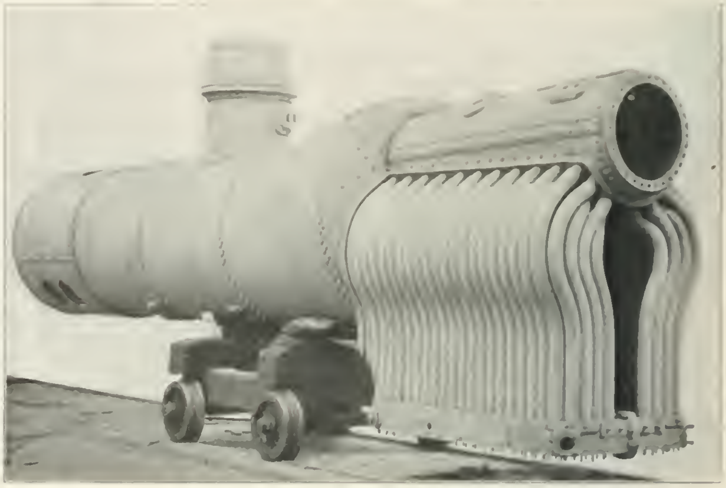
If any mechanical engineer were asked what part of the present locomotive boiler stands most in need of improvement, he would answer, without doubt, the water-chambers, or water-legs, that surround the firebox. These are built somewhat differently in Europe from the system in vogue in America, thick sheet copper being used abroad as casings for the firebox; but on both sides of the ocean these water-legs are the weakest and most troublesome part of the locomotive. Their two sides are held together by a great number of stay and anchor bolts to resist the expansive force of the steam and prevent explosions. For all that, it is precisely here that most of the bad boiler explosions occur. The inner heads of the copper bolts are in time consumed by the fire-gases and leaks develop that are difficult to stop. Repairs are usually made by hammering the heads, but this cannot be continued indefinitely; the sheets must in time be completely overhauled or replaced by new ones. Another great trouble with the bolts is that they become centers for the collecting scale; heavy deposits also accumulate in the corners. This not only causes a serious waste of fuel, but a great loss of time and money while the locomotive is undergoing repairs and cleaning at the shops, the entire machine being dead capital pending repairs and cleaning on a small part.



Brotan Boiler with Water-Tubes on One Side of Firebox Removed.

In the Brotan boiler these troublesome water-legs are done away with, and in their stead a system of water-tubes forms the sides and roof of the firebox. These can be made very thin ([illegible] in.), so that the water passing through them is exposed immediately to the heat of the firebox. They are of the weldless (Mannesmann) type, are made of mild steel, and have an exterior diameter of about $3\frac{3}{4}$ in. They are thoroughly annealed and tested to a pressure of 750 to 900 lbs. per sq. in. They are set up in four rows on each side of the firebox and converge in a Gothic arch at the top where they enter the steam-collector. Strips of copper or asbestos are hammered into the spaces between them, so that each row presents an impervious wall to the fire-gases. Between each pair of tubes in the same row a space of only ¼ in. is left to be thus filled, except at their ends, the tubes being reduced at the top and bottom to about 3 in. diameter, and so leave more space between them. They are made smaller there so as not to weaken too greatly the bottom pipe and the steam collector.

The bottom-pipe is of cast-steel, and, except in small locomotives, is cast in two or three sections, because of the difficulty of making perfect castings in a single piece. An American locomotive builder, however, has expressed the opinion that the best American shops can make these pipes of any desired size in a single casting. The ends of each section are flanged so that they can be screwed together steam-tight. Their cross-section has the shape of a broadened letter D, the flat surface of which is set upright and turned away from the firebox. Their round surface is provided with bosses for receiving the fire-bars and ash-pan. The bottom-pipes have an interior diameter of over 6 in. and are connected with the longitudinal boiler by bent pipes. The bottom-pipes and the grate usually slope upward somewhat from the boiler-head, but sometimes they are set horizontal.



Brotan Boiler, Adapted to American Locomotive, Showing Arrangement of Tubes.

As steam is generated in the upright water-tubes, it rises rapidly to the steam-collector, forcing the water along with it. The collector, which is 28 to 30 in. in diameter, extends the entire length of the boiler and is connected with it by three openings. Through these the non-vaporized water returns to the boiler, and the steam generated in the latter gets into the steam-collector through the same openings. These connections can be seen in the illustrations. The under part of the collector, just above the firebox, is strengthened by a plate of soft steel, making it 1 in. thick. The holes for receiving the water-tubes are cut in this plate on a zig-zag line. The tubes are expanded into the bottom-pipe and the collector, so as to make them water-tight; their projecting ends are then conically enlarged, or bell-mouthed. From three to five holes are cut in the upper surface of the collector, and several in the bottom pipes

for fitting in the tubes and cleaning them. A steel casing encloses the banks of tubes and the space between it and the outer row is filled with a composition of asbestos scraps and other non-conducting material. Fire-bricks fill the space under the firebox door.

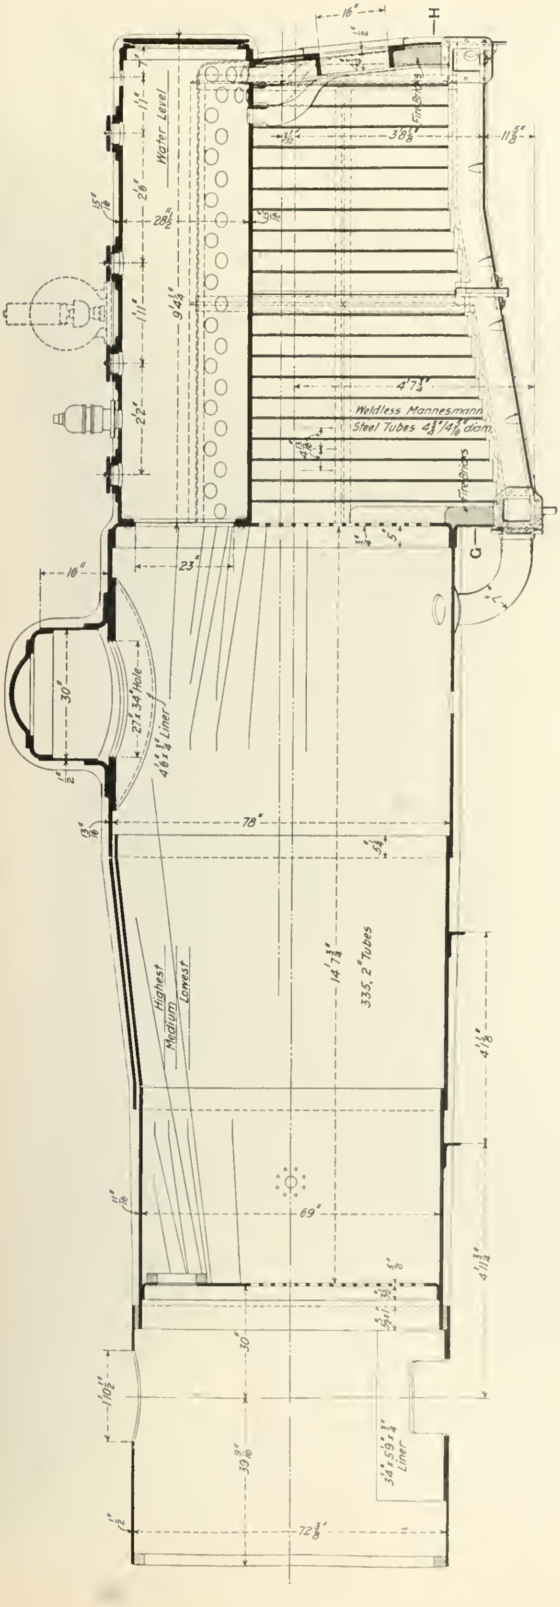
The advantage claimed for the Brotan boiler is that since the water-level is no longer in the longitudinal boiler, but about in the middle of the steam-collector, the former can be completely filled with fire-tubes. Hence the Brotan boiler is usually made considerably smaller than that of the ordinary locomotive, and even then it has about 10 per cent. more fire-tubes than the latter. The upright position of the water-tubes ensures a most active water circulation. As the tubes are very thin and as the heating surface of the firebox is about 50 per cent. greater than that of the common type, steam is generated much more easily and carries the water very rapidly up into the collector. A test made of the first Brotan locomotive put in service in Austria and an ordinary locomotive gave striking proof of the steam-producing capacity of the former. The two boilers were filled with cold water and fired up simultaneously with brown coal, or lignite. After 2 hrs. 34 min. the Brotan boiler had developed a pressure of 171 lbs. per sq. in. having consumed only 624 lbs. of fuel, while the competing machine showed only 142 lbs. pressure after 3 hrs. 24 min., with a fuel consumption of 851 lbs.

The quick and easy repairing of the new firebox is also a great consideration. A tube can be removed and replaced within a few hours. Each one can be cut out with a chisel from the inside of the firebox, and a new one fitted in without disturbing the adjacent row. The holders of the Brotan patent claim that, where proper tubes are kept in stock, the entire system can be taken out and renewed within 14 days, while European shops generally take about four months to renew completely a firebox of the ordinary type. The technical bureau of the Prussian Railroad Ministry has said that the saving in repairs and cleaning is regarded by the Prussian authorities as the chief merit of the new boiler.

The boiler is also claimed to be much safer than that of the ordinary locomotive. The danger from explosions in the firebox is reduced to the danger from the bursting of a tube. There are no rivets or staybolts to "lose their heads"; and the high pressure to which the water-tubes have been tested warrants the engineman's feeling of security.

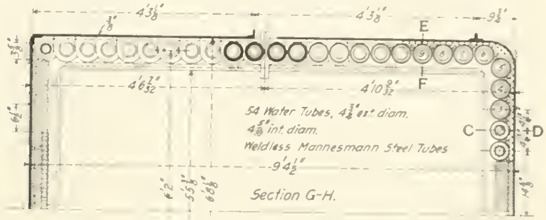
Not only is the cost of maintenance of the Brotan boiler claimed to be much less, but the original cost is also said to be lower. In European shops, where, as already mentioned, thick copper is used for firebox sheets and the staybolts are also made of that metal, 20 per cent. in the cost of construction is saved; in American shops the saving would be somewhat less.

The foregoing description applies to the usual method of construction. It may be worth while for American railroad managers and locomotive builders to know that a different type of boiler has been introduced so that an existing locomotive can be equipped with the new firebox. Any locomotive with a boiler 4½ ft. or more in diameter can be thus converted, and a number of these are already in use in Europe, or in process of transformation. In this form the steam-collector is connected with the longitudinal boiler at the boiler-head. To get sufficient space in the front tube-plate for the connection, the last ring of the boiler-barrel, if necessary, is en-



Longitudinal Section of Brotan Boiler Adapted to American Locomotive.

larged conically at the top, as shown in the cross section taken at the boiler-head. The diagram shows such a locomotive. It was designed for one of the best-known American railroads, but, owing to causes already explained, has not yet been built. A reference to the diagram shows that such a locomotive, from the boiler-head forward, presents no outward difference whatever from the present type. Everything in the machine, indeed, will remain unchanged except the firebox; it is important to note that any ordinary firebox that needs considerable repairs can easily be replaced by the Brotan invention. Such a transformed boiler has a much greater



Section of Firebox on Line G-H.

heating surface, especially in the firebox, and is claimed to be more effective than present boilers.

The following table gives a summary of the principal dimensions of the Brotan boiler both with and without a superheater, as compared with those of an ordinary boiler:

	Brotan boiler — With superheater.	Brotan boiler — Without superheater	Ordinary boiler
Working pressure	200 lbs.	200 lbs.	200 lbs.

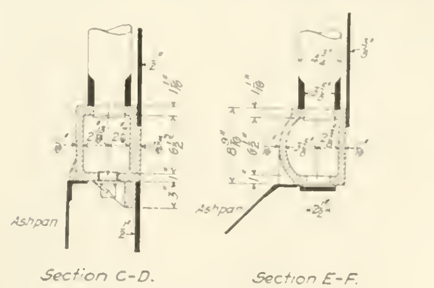
The Brotan patent is held by the Deutsch-Oesterreichische-Mannesmann-Rohren-Werke of Dusseldorf, Germany. It supplies the designs for the firebox and sells the rights to use the patent. The machines themselves have been built by various locomotive shops on the Continent. Owing to the high duty on steel tubing in the



Expansion of Tubes Into Bottom Pipe and Collector.

Dingley tariff law it would not perhaps be profitable for prospective American builders of the new boiler to import their tubes from Germany.

Consumption of Poles in 1906.

The following information is taken from Circular 137, United States Department of Agriculture, Forest Service.

The information in this circular concerning the consumption of poles during 1906 is based upon the number of poles purchased rather than the actual number produced during the year. It seems safe to assume, however, that the two were practically identical. Inquiries were sent out to more than 6,000 companies operating telegraph and telephone lines, electric light and power systems, trolley and street railway lines, and to railroad companies which operate their own telegraph or telephone lines. Practically all replied. The number of poles purchased during the year, as shown by these statistics, was 3,574,666, valued at $9,471,171 at the point of purchase. These figures do not include poles less than 20 ft. long. Shorter poles are used for local lines and for temporary work, but they constitute only a small percentage of the total.

Table 1 shows, by kinds of woods, the quantity and value of round and sawed poles purchased in 1906. In both classes cedar ranks first and chestnut second. These two together furnish nearly nine-tenths of all the poles used, cedar supplying about three-fifths and chestnut over one-fourth.

The telegraph and telephone companies purchased about two-thirds of the total number reported and the street railway, light and power companies about one-fourth. The remainder is credited to railroad companies which own and operate their own telegraph or telephone lines.

SUPPLY.

The regions of supply of the two principal pole timbers—cedar and chestnut—are fairly well defined, and are, unfortunately, extremely limited. The present source of supply of cedar poles in the United States is confined almost entirely to the Lake states. The total purchase of cedar poles reported for the United States in 1906 was 2,174,279. The production of the Northwestern Cedarman's Association, which operates in the Lake States, as shown by the association statistics, was more than 1,700,000. The greater part of the production outside the Lake states can be credited to two sources—Maine and the adjoining states, including the Adirondacks in New York and the Idaho cedar territory. From these districts cedar poles are shipped to practically every state in the Union.

The regions from which the supply of chestnut poles is drawn are even narrower. A small territory—embracing parts of Pennsylvania, Maryland, Virginia and West Virginia—furnishes nearly all of these poles. Cypress poles necessarily come from the South, probably the greater part from the Gulf states; juniper, from Virginia, the Carolinas and other South Atlantic states. Redwood comes wholly from California.

With the regions of supply so restricted, transportation becomes an important factor. The cost of the pole is sometimes doubled by freight charges. This difficulty is obviated, in a measure, by the use of local woods, cypress and pine in the Southern states, for instance, and chestnut and juniper in the Atlantic states. On the Pacific coast cedar is supplemented to a considerable extent by pine and redwood. Both such local supplies are insufficient, and cedar and pine are found everywhere.

There are no data available which show even approximately the quantity of cedar still standing in this country or Canada to meet the enormous demand of 2,000,000 poles each year. It is certain, however, that when the present supply is exhausted it will be gone forever, since the cedar, though it reproduces fairly well, grows so slowly that other kinds of trees, chestnut for instance, will be more profitable to produce by systematic management.

SUITABILITY OF VARIOUS WOODS.

There are several qualities which timber must possess to adapt it to use for poles. The most important of these are durability in contact with the soil, minimum weight, straightness coupled with relatively small size and little taper. The wood must be soft, so that the spikes of a climber may enter readily, and at the same time it must have strength to support considerable weight. These qualities are admirably combined in cedar and in juniper, which commercially is a cedar. No other woods possess so many.

Chestnut and cypress are both durable. Chestnut is not so straight as cedar and is liable to be knotty. The wood, though soft, is not as soft as cedar. It has greater strength, but this advantage is more than counterbalanced by its greater weight, which prohibits long shipments. Cypress frequently is too large for use as a pole and has greater value for lumber. Even when its general diameter is small enough the butt will often be so big that it adds too much weight. Pine, besides being heavier than cedar, is so much less durable that it cannot compete as pole wood without preservative treatment. Redwood possesses durability, lightness and softness, but its size necessitates sawing, which adds to the cost.

PRESERVATIVE TREATMENT.

One of the results of the increased cost of poles and the difficulty of obtaining a sufficient quantity of satisfactory stock has been an effort to increase the period of service of poles by preservatives, generally by applying a liquid to the whole of the pole or, more generally, to the butt, which is most liable to decay. Poles which have not been treated with preservatives may be expected to give from ten to fifteen years of service, roughly speaking.

Creosote is probably more extensively used than any other preservative, though ordinary paint is a common agent. For the butt tar is often employed, and charring by fire is found useful. The American Telephone & Telegraph Company is carrying on extensive experiments in co-operation with the Forest Service to determine the best methods and materials. Several experimental lines of variously treated poles have been erected and careful records of the behavior of each pole is being kept. By the comparatively new open-tank treatment the preservative is forced into the wood of the butt by a much simpler and more inexpensive method than was formerly used.

Successful preservatives make possible the use for poles of a great number of otherwise unsuitable timbers, many of them among the cheaper and more abundant woods.

Cab Signals.

The following discussion of the subject of signaling to and from the cabs of moving locomotives by means of electrical or mechanical contacts between the engine and roadway or roadside fixtures, is taken from the introduction to a paper by Mr. J. Pigg, recently read before the Institution of Electrical Engineers, London, describing the apparatus of Mr. V. L. Raven, in use on the North Eastern Railway. Mr. Raven's apparatus will be described in a future issue.

Of late years the subject of the signaling of railroads has received a good deal of attention, and the difficulties under which drivers labor under exceptional conditions of weather have been officially recognized by references and recommendations from the inspecting officers of the Board of Trade. A number of systems have been devised and put forward during the last 10 or 12 years for supplementing the ordinary outdoor mechanical signals but, practically, no progress has been made in their application. Whatever the merits of the various proposals, not one has made any headway towards adoption, and railroads still continue to use the system of visual signaling—during clear weather—supplemented by the audible, explosive signal during fogs. This delay cannot, however, be laid to the charge of the railroad companies, who have on many occasions furnished opportunities for the trial of apparatus, but whose officers have, necessarily, to gage carefully the merits of proposals from every standpoint.

The problem to be faced is not a simple one.

At high speed the time allowable for the collection of a signal, by any reasonable design or apparatus, is very short, and the apparatus must be exceedingly prompt in operation. Where mechanical impact is relied upon for the operations, the stresses to which the parts brought into contact are subjected are tremendous, and in all forms of actuation involving mechanical contact between parts on the engine and parts on the line, the greatest possible care must be taken to minimize the blow experienced.

The financial difficulties are no less evident. Any system of supplementing the present signaling which does not take into account the cost factor will fail in a most important point. If the proposals hold out any prospect of relief in this respect so much the better. The engineer's object should be the keeping of the cost within the value of the service given, but certain things must be provided for railroad operations, regardless of cost, and signaling is one of these. It is much more difficult to prove that an accident has been averted by some means, than to point out, after the accident has taken place and the circumstances become known, how it might have been avoided by the means referred to.

If we carefully consider the operations involved in that mass of conventions known as the block system (in which term is included all apparatus used for signaling), we find that it implies implicit observance of the signals exhibited. We further find that while the signalmen are provided with reminders to a certain extent, and hedged about more or less completely with restrictions on their actions, the driver must rely upon his physical powers—sometimes under most difficult conditions—to enable him to observe and obey the signals by which he is to be guided * * * Man has many more interests than those appertaining to any one task he may undertake, and to carry out any work requires more or less exclusive concentration of the mind upon its details. Probably nothing is more difficult for the average man to accomplish than to concentrate his attention exclusively upon one subject for any length of time; his other interests will rise in his mind, and engage his attention unbidden, especially if his other duties are monotonous.

During the last two years the author has been associated, in a minor part, in experiments with apparatus which has been designed by Mr. Vincent Raven, the Chief Assistant Mechanical Engineer of the North Eastern Railway. The system is essentially an electrical one, which aims at reproducing in the cab of the locomotive, all the information that the driver now obtains from the present mechanical signals, but is not intended as a substitute for those signals.

The time when the driver most urgently requires supplementary indications is undoubtedly during fogs and snowstorms, but it by no means follows that it is only during such exceptional conditions of weather that supplementary indications are of value. Absence of mind is common. * * * No more strenuous duty can be imposed on a man than the driving of a 100-ton engine, with from 250 to 350 tons behind him, at a speed of 60 or 70 miles per hour, through a gray wall which never seems to end, where sight is useless, and the driver must endeavor to keep track of his position by the "feel" of the road and by the explosive signal which means for him the danger signal—the only practicable signal given to him.

Many suggestions for providing supplementary indications have been made during the last twelve or fourteen years, most of which have had as their object the giving of the indications directly on the engine, in the cab where they are most easily observed. Others, however, have aimed at producing a signal, ordinarily an audible signal, on the line.

The latter are merely variations of the present supplementary explosive signal, with the added disadvantage that they are not so readily heard. Much of the efficiency of the explosive signal is due to transmission through the body of the engine. The difficulty of conveying sounds from the line to the cab of an engine, running at a high speed, under ordinary circumstances is so great as to render such systems totally useless. Cab signaling is undoubtedly the only method worth consideration.

Purely audible signals leave no record; and purely visual signals need more attention than the driver can give. With the first he may forget which indication he obtained after it has ceased, either automatically or by his own action; with the second he may forget to observe it. From these considerations alone it seems imperative that both classes of signals should be employed, the audible signal being of the nature of an alarm, or "call attention" signal, and the visual signals giving the "condition of line" signals, and route indications.

Choice of Design of Apparatus.—The design of the apparatus divides naturally into two parts—that of the indicating apparatus, and that by which the indications are to be produced. The indicating apparatus will be subject to violent vibration whatever arrangements are made, and must be capable of withstanding it. The means by which the indications are produced, if a contact system is used, will necessarily be subject to severe shocks, and must be strong. Purely mechanical apparatus for producing the indications, depending as it does upon impact, involving movement of some part against a resistance, has small chance of adoption on account of liability to failure under the stresses sustained, and the difficulty of operating such devices at the distances rendered necessary by the high speeds of trains. Where off signals are to be given the cumulative effects of the multiplied blows would render such apparatus liable to constant failure. Moreover, mechanical systems, at their best, can never hope to reproduce in the cab, under the driver's immediate notice, all the information he obtains from the line signal.

The use of electricity offers much greater advantages, and enables the effects to be produced at any required distance from the operator without effort. The combinations that may be made with a given apparatus are more numerous, and the methods in which electricity can be utilized preclude the necessity for the violent shocks which are almost inseparable from purely mechanical operation. Nevertheless mechanical means may, if designed with a knowledge of the conditions to be met, be made to form a valuable auxiliary to electrical systems.

The collection of signals on the engine is a matter of the highest importance in any system of cab signaling. In purely mechanical systems, as has already been stated, this is done by contact of apparatus carried on the engine and apparatus fixed on the line which partakes more or less of an impact or blow. This blow may be minimized to some extent by the adoption of yielding devices on the engine or track, or by applying the contact more or less gradually by sloping devices, but the effects are but slightly reduced.

Electrical systems have generally to provide some form of mechanical contact between the circuits on the engine and those on the track, but as they do not necessarily involve the movement of the apparatus, their design need not follow the same lines. If efficient contact is established, that is sufficient. Metallic contact is necessary, and it has been thought that under the conditions of use snow and ice, or dirt, might form an objection by causing failure to make efficient contact. In any system whatever the design is the most important point. If the apparatus brought into contact is not such as will tend to clean, but rather to press and consolidate whatever the bar may be covered with, failure is sure to result.

Considerations like these have given rise to suggestions for contactless systems of collecting indications, of which Mr. W. S. Boult's system is perhaps the best known. These systems depend upon magnetic influence for the operation of the signaling apparatus on the engine, and are therefore independent of such conditions as have to be provided for in contact systems.

Requirements to be Satisfied by Supplementary Apparatus.—The distant signal is the one of greatest importance, since at that signal the driver gains information by which he is guided in his immediate subsequent actions. At that point he is informed of his position relatively to the stopping place of that signaling point, and he there obtains the "condition of line" and route indications if the line has been prepared for his further passage. What is required, therefore, in any supplementary apparatus is that it shall advise the driver, when he is passing a position corresponding to that fixed upon as the distant signaling point, of the condition of the stop signals in advance. If this is done, the driver is informed on all the points which it is necessary for him to know. The following points should be provided for:

1. The first useful operation is to inform the driver, by way of warning, of his position relatively to the signaling point he is approaching, at such a distance as will enable him to carry out any steps that may be necessary.

2. To advise him immediately afterwards of the condition of the stop signals he is approaching.

3. If the off signal is obtained it should be accompanied by a route indication, which will enable him to judge whether the right road has been prepared at a diverging junction. It should be possible to reverse this indication at some point or points before the train passes the home signal, in case of emergency, just as it is possible to reverse an indication with the mechanical signals by throwing them to danger before they have been passed.

4. If the on signal is obtained, the indications on the engine should be maintained until the off signal is received. It should be possible to receive the off signal at some point or points between

the distant signaling point and the home signal to prevent unnecessary delay. It should be possible for the apparatus to indicate to the driver at some point or points how far he has traveled between the distant signaling point and the stop signal when the indication continues at on. It should be possible for the driver to obtain the off indication when standing at the home signal. It should also be possible to give a signal to a train standing at the home signal which would be of a cautionary character and distinguishable from the ordinary authority to proceed.

As corollaries, the following conditions should also be provided for:

(*a*) The warning signal should be given by the natural operations of the apparatus, and should require no action on the part of the driver or signalman to bring it into operation.

(*b*) The "condition of line" and the route signals should be under the sole control of the signalman, should be subject to the control imposed by the interlocking, and must be such that failure shall not be liable to give a dangerous false indication.

(*c*) The signalman shall be provided with indicators which will show him that the apparatus on the line, for giving the signals on the engine is in order, and that the apparatus prepared is in accordance with the positions of the signal levers.

(*d*) The apparatus on the engine should be of a reliable character, easily seen and heard, and such that the indications shall, as far as possible, correspond with the apparatus it is intended to supplement. It should be self-testing and be continually in use, so that failure may be instantly indicated, and it should be so arranged that attention can be readily given and defective apparatus easily removed and replaced.

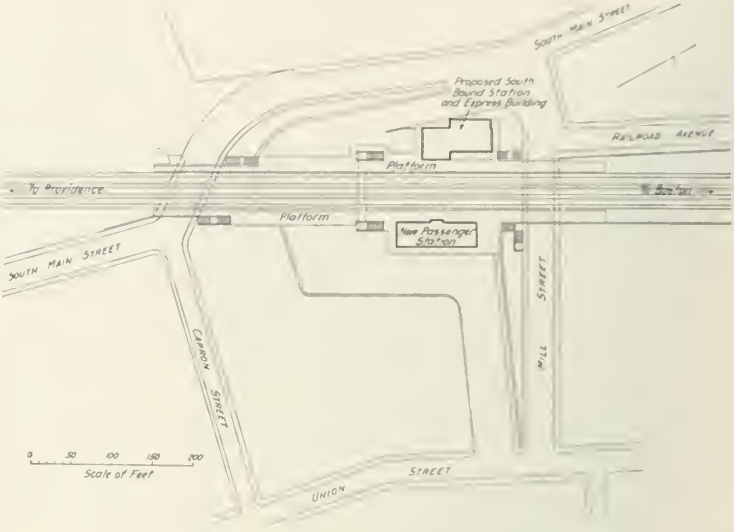
(*e*) The apparatus should be capable of easy adaptation to single or double line working.

Conservative Socialism in Belgium.

Belgium has a new Railroad Minister, by name Helleputte, who as deputy belonged to that section of the clerical majority of the Parliament known as Christian Socialists, especially devoted to the interests of the working man. But like many others who, radical as critics, become conservative when in authority, he finds that there is a limit to what the state can pay the working man; and when his fellow Christian Socialist, the Abbé Daens, moved that the minimum daily pay of an employee in the state railroad, postoffice and telegraph service should not be less than 3 francs (58 cents), he objected, affirming that the working expenses of the railroads had already increased seriously. The mover of the resolution said that at one station laborers were offered only 47 cents a day, and another deputy affirmed that there were employees receiving only 58 cents a day after 23 years service.

New Passenger Stations at Attleboro.

The New York, New Haven & Hartford has built new passenger stations at Attleboro, Mass., which is on the main line of the Providence division, 12 miles northeast of Providence, R. I. Elimination of grade crossings made new stations necessary and the northbound station, shown in the photograph, was built



Stations, Express Building and Passenger Subway at Attleboro.

last year. The stations are between Mill and South Main streets, which the railroad crosses on granite arch bridges. The two stations will be connected by a concrete passenger tunnel under the tracks. At this point the road is on an earth fill so deep that concrete foundations for the stations were necessary, and in the southbound station advantage is taken of this situation to make a lower story, which is to be used for express. An elevator is to be installed to handle loaded trucks of express matter between the delivery floor and the track level. Temporary wooden platforms were laid, as it was not thought best to build concrete platforms until the earth had entirely settled. The lower walls of the southbound station are of granite masonry, harmonizing with the stone arch bridges and the retaining walls. The upper walls of this station and of the northbound station are of red brick with white joints and trimmings of granite and concrete. Both stations and sheds are roofed with red Spanish tile. The interior of the waiting rooms, toilet rooms and ticket offices are plastered, and finished in chestnut, stained dark brown. The other rooms are sheathed with varnished North Carolina yellow pine. An unusual feature

in the waiting room of the southbound station in the alcove, shown in the plan. The southbound station is now heated by a direct hot water system, but it is intended ultimately to heat both buildings by the direct steam system planned for the southbound station.

Picked Up on the Road.

BY GULF.

In these days when railroad managers are vying with each other in fast schedules on paper, and the dear public is left guessing as to the time of arrival and departure of trains, it would be a gracious act on the part of superintendents and general ticket agents to issue instructions to ticket sellers, gatemen and ushers to give such full and complete information to travelers, as to mitigate as far as possible, the irritation felt against their superiors because of the aforesaid paper schedules, and not withhold matters the knowledge of which would serve to allay the hostile feeling that unfortunately exists. To take a concrete case from experience, I was going from X to Z on the A. B. C. through line. There were two trains scheduled to run 15 minutes apart, and I, being somewhat experienced, and knowing that the A. B. C. trains were likely to keep in the fashion and run late, went to the ticket office at X at my convenience and asked, "How late is No. 17?" the first of the two trains. I was told that it was one hour behind. I bought my ticket and went away. Coming back in an hour or more and asking for a Pullman ticket I was informed that the parlor car had gone on No. 13 which had left only 30 minutes late. I really am afraid I said things to that agent for not telling me that 13 would lead 17, when he knew that it would when he sold me the ticket and answered my inquiries. But then, what's the use? No amount of instructions will put common sense into indifferent employees. And then, what could be expected on a line, in one of whose principal depots, I was once unable to find or procure or get access to a time-table?

I sometimes think, oh well! we are all agreed that centralization and consolidation is the order of the day, and also that it is demoralizing to the personnel. Those of us who travel, and have to do with the ticket agents and conductors and baggagemen, sigh for the time when the ear-marks of the superintendent were apparent in the land; when there was some sort of *esprit de corps* due to contact with superiors who could issue an order, and not have it referred up and up until it finally disappeared in the hazy proceedings of the Board. If you want to do business with a man, you go and see him. If you want to have your cavalry charge a success, you don't send a telegram to your men, but you order boots and saddles sounded and head the line yourself. If your ship is in a storm and the seas are boarding her, you are upon the bridge and not asleep in the cabin. But if you are a railroad magnate you expect to reach success through a series of letters and telegrams and reports. Everyone of you appreciates the value of personal contact, but how many of you ever take a trip over your own road in a day coach? How many of your men know you and how many do you know? How often, too, do you ask the conductor of your train to come back into your car for a talk? How much do you know of the ideas held by your men? How often have you consulted them personally before an order was issued? When did you ever sit in a day coach or even in a Pullman and talk to a passenger about your road? And finally, how much can you tell your masters in Wall street of all these things? A certain ruler knows their value. You give him a special train and pay the engineer and fireman and conductor and trainman for the service they give him, but when he reaches his destination, he shakes hands with the whole crew and asks after their babies—and they would vote for him and follow him and back up his policies to the utter damnation of you and your road and their own welfare! He doesn't send an *aide-de-camp* to express his good will, he goes himself. And really, you would be surprised to learn how little of his time it takes, and how little it would take of yours to follow suit. None at all, in comparison with the dividend it would pay.

I wonder how much of the popular hostility to railroad interests is due to the work of politicians and to inflammatory writings that are published to sell, and how much to unfortunate personal experiences? How many commuters have got it in for the road they use every day because of what they read in their morning paper, and how many because of the failure to keep the promise of the guessing sheets, formerly known as time-tables? How many casuals believe in government control with a big C, because of the insolence or indifference of a ticket agent, forgetful of the fact that for supremacy in indifference, insolence and all other aggravating qualities one must go to a government employee? How many women lend their influence to the movement to down the railroads because their trunks came out of a baggage car rather too rapidly, and the corners were not as strong as the conditions demanded? How many regular travelers think "something ought to be done," because they don't make connections and are always late at destination, and yet being regular travelers realize that it's pretty difficult to draw up an exact specification of what that "something" should be? How many employees follow the teachings of the demagogue and the politician one grade removed, because the demagogue and the politician shake hands with them and call them by name and ask after the wife and babies and the general manager doesn't? Every month there is a frantic appeal from some general ticket or freight agent to his men to be polite and to make the public think they are interested in their welfare. They realize that sweet oil is a better lubricant than vinegar, but I doubt if any of them have the time to come into any very close personal contact with their representatives, and so the work of betterment lags.

This placing of blame on the superintendent and general manager to which I plead guilty may, however, partake of the nature of the story of the office boy who when asked who was the responsible party there replied, "I don't know who's responsible, but I'm always to blame." Perhaps, you see I'm repentant now for all the things I've said—perhaps the responsibility lies higher up, while we the public blame the department heads. When locomotives are bought by men who don't know a mogul from an Atlantic, and superintendents of motive power and traffic officers are ignored, and Wall street is all sufficient unto itself, it is quite natural that some things should be as they are. When men get control of a road and do not realize that there are things to be learned beyond the pale of high finance, and pleasure, and the clipping of coupons, the men represented on the Board are apt to be those whose skill in brightening the executive lunch, in percentage calculations, in getting speed out of automobiles, is acknowledged; balanced, perhaps, by some silent men of substance who can clip a coupon with all the dexterity that Louis XVI showed in the opening of an egg, and who have about as much value to the road as he had to the state. Then if there happens to be a busybody in the crowd, a man who takes interest enough to meddle, why, then—ye gods and little fishes!—we have a condition to make the economist weep and the stockholders gnash their teeth. Blame and responsibility then become separate and distinct and we follow the motto of Donnybrook Fair and hit the visible head regardless of its degree of offensiveness. Possibly, quite possibly, we have swung through the whole circle only to locate the seat of public hostility to railroads, of the wariness in taking up railroad securities, of the indifference of employees, of the clerical positions occupied by departmental heads, of the indifference to contract agreements as shown in the issuance of the guessing-sheets, and of the general demoralization that sometimes seems to pervade the service, in the magnates of high finance who do not know that they do not know, and so have not the wisdom to direct what they want accomplished in operation and management and then leave it to the competent men in the service to bring about this result in their own way without let or hindrance or dictation as to details.

People who have traveled and noticed, frequently remark upon the rapidity with which the crowds of the New York Elevated and Subway trains are handled. Away back in 1878, when the Sixth Avenue or Gilbert Elevated Railroad was opened, the guards began urging the passengers to "step lively," and have kept it up ever since, with the result that they do step lively and station stops are materially shortened. Suppose, now, there were to be someone in authority all along the line of—well say the A. B. C. Railroad—or to accompany trains that are late—say all trains, to avoid controversy, and to be on hand at the baggage, express and mail cars to shout a "step lively" to the men at work and thus hasten the movement of the Saratogas and Innovations, thereby cutting down station stop delays? It would help matters somewhat, and serve to put the running time a little more on a par with the representations of the guessing-sheet. It's rather discouraging to the driver who has succeeded in scaling three or four minutes off a run of 40 miles, or made up some time, to lose five minutes of it through the station baggageman's desire to tell the train baggageman about his wife's sister's boy; or through the general indolent handling of baggage and express. He sympathizes with the foreman of a gang of chattering Italians, who, disgusted with their volubility, shouted—"There yez, jist sthop yer dagoing an lift!"

The Bologna Chamber of Commerce recently sent a circular of inquiry to the chambers of commerce of all the other cities and towns of Italy, asking for opinions as to the present handling of traffic on the State Railroads. From one solitary place, Turin, came the answer that it is generally satisfactory. Many said that it is better than formerly, but a large number declared that it continued to be very bad. A summary of the answers is that most of the chambers of commerce find the railroad service unsatisfactory from causes due both to equipment and to the staff of employees. There is negligence in maintenance, delay in making repairs, and indifference in operation. The lower employees are deficient in sense of duty and honor. Complaints bring nothing better than promises. One chamber complains especially that nothing can be done without tips.

Ship Building During 1907.

The world's output of ships in 1907, according to *The Marine Review*, was 3,330 vessels with a tonnage of 3,220,399 tons. In 1906 the world's output was 2,941 ships of 3,323,250 tons.

In point of tonnage the American Ship Building Company, of Cleveland, Ohio, leads the ship builders of the world, having built 34 vessels of 191,602 tons. The next is the corporation of William Doxford & Sons, Sunderland, England, which built 22 vessels of 91,254 tons at one ship yard. The American Ship Building Company has seven yards, so that it is not altogether fair to put it at the head of the list, but it built a greater tonnage than any other company. The following table shows the first nine companies in output of tonnage during 1907:

	Vessels.	Tons.
American Ship Building Co.	34	191,602
William Doxford & Sons	22	91,254
Swan, Hunter & Wigham Richardson	19	75,818
Harland & Wolff	8	74,115
Russell & Company	14	71,705
Workman, Clark & Co.	21	63,245
The Great Lakes Works	10	58,051
The Bremer Vulcan Works	11	49,431
The Fairfield Company	6	48,027

Comparing the different countries of the world, the United Kingdom is not only far and away the leader, but built more ships of a greater tonnage than all the other countries of the world put together. Great Britain and Ireland produced 1,571 ships of 1,724,921 tons during the year; including the colonies, the total output of the British Empire was 1,764 vessels of 1,758,601 tons. As against this, the output of all other countries was 1,566 ships with a tonnage of 1,462,798. The United States comes second with 189 vessels of 488,340 tons. Germany is third with 513 vessels, whose aggregate tonnage however was only 315,518 tons. In this comparison between Germany and the United States is clearly shown the great size of the bulk freighters on the Great Lakes which constituted nearly all of the American output. The following table shows the world's output by nations during 1907:

	No.	1907. Board of Trade, tons.
Great Britain and Ireland	1,571	1,724,921*
The Colonies and dependencies	193	33,680
Total of British Empire	1,764	1,758,601
United States	189	488,340
Germany	513	315,584
France	51	113,345
Belgium	42	17,630
Holland	344	152,371
Denmark	39	24,488
Norway	75	51,523
Sweden	34	15,646
Spain	4	4,341
Italy	26	86,370
Austria-Hungary	48	41,960
Greece	1	150
Russia	13	20,700
Japan	157	126,068
China	30	4,282
Total output	3,330	3,221,399

*51,800 tons warship displacement.

A Comparison of Earnings and Operation of Nine Western Railroads.

The *Wall Street Journal* has made an elaborate analysis of the earnings and operating results for the year ended June 30, 1907, of the four big granger railroads, the four transcontinental lines in the United States north of the Southern Pacific, and the Canadian Pacific. Every one of the roads is an important grain carrier.

The comparisons are made in percentages, using the results on the Chicago North-Western as a standard, the results on that road being taken as 100 per cent. in each case. By this means the other roads can be compared not only with the North-Western but with each other.

The first table gives average mileage operated, gross earnings, operating expenses (not including taxes) and net earnings:

Mileage and Earnings.

Railroad.	Mileage worked.	Gross earnings.	Operating expenses.	Net earnings.
Chicago & North Western	7,550.64	$68,878,931	$44,789,025	$24,089,906
Per cent	100	100	100	100
Chic., Mil. & St. Paul	7,049.46	60,548,554	39,400,410	21,148,144
Per cent.	93	87	88	88
Chic., Burl. & Quincy	8,863.40	82,473,250	58,904,987	23,568,263
Per cent.	117	119	131	98
Chic., Rock Island & Pacific	7,780.26	60,238,419	41,044,142	19,194,277
Per cent.	103	87	90	79
Canadian Pacific	9,153.90	72,217,527	46,914,218	25,303,308
Per cent.	121	105	105	105
Atch., Top. & Santa Fe	9,273.15	93,683,406	58,867,901	34,815,505
Per cent.	123	136	131	144
Great Northern	5,982.31	55,144,402	32,562,775	22,581,626
Per cent.	79	80	73	94
Northern Pacific	5,443.67	68,534,832	37,664,316	30,870,515
Per cent.	72	99	84	128
Union Pacific	5,344.55	76,040,726	40,574,889	35,465,857
Per cent.	71	110	91	147

This table shows that the Burlington, with 117 per cent. of the North-Western's mileage, has about the same ratio of gross earnings. Its operating expenses, however, are 131 per cent. of the other road's and its net earnings in consequence only 98 per cent. of the North-Western's. In the same way, the Rock Island, with 103 per cent. of the mileage, has only 87 per cent. of the North-Western's gross and only 79 per cent. of its net.

On the other hand, the Atchison, with mileage of 123 per cent. and expenses of 131 per cent., has 144 per cent. of the net. By far the best showing is that of the Union Pacific. With but 74 per cent. of the North-Western's mileage it earned 110 per cent. as much in gross, and by keeping operating charges down to 91 per cent. manages to show 147 per cent. for net. The Northern Pacific makes almost as good an exhibit. While the Chicago & North-Western spent 65 per cent. of its total earnings for operation, this road, with almost exactly the same amount of gross earnings, used only 55 per cent. of gross for this purpose.

The following table gives the ton miles, the freight density (tons one mile per mile of road), and the mileage of freight and mixed trains, which in one way expresses the amount of energy used in moving the freight:

Ton Mileage, Freight Density and Train Mileage.

Railroad.	Tons 1 mile revenue freight.	Tons 1 mile per mile road.	Miles of frt & mixed trains
Chicago & North-Western	5,428,771,597	719,042	20,591,011
Per cent.	100	100	100
Chic., Mil. & St. Paul	5,155,662,231	731,403	17,805,620
Per cent.	95	102	86
Chic., Burl. & Quincy	7,169,879,492	808,966	18,410,855
Per cent.	132	111	89
Chic., Rock Island & Pacific	4,281,228,365	550,286	16,084,714
Per cent.	79	76	78
Canadian Pacific	5,789,191,940	632,422	19,599,133
Per cent.	107	88	95
Atch., Topeka & Santa Fe	6,842,669,206	738,021	24,058,639
Per cent.	124	103	117
Great Northern	5,370,157,882	897,719	9,788,355
Per cent.	99	125	48
Northern Pacific	5,504,444,098	1,011,102	13,532,148
Per cent.	101	140	66
Union Pacific	5,704,061,535	1,010,641	14,086,856
Per cent.	105	141	68

The St. Paul, with 95 per cent. of the North-Western's ton mileage, handles it with 86 per cent. of the number of trains, while the Burlington makes a better showing with 132 per cent. of the tonnage and only 89 per cent. of the train mileage. The Rock Island has practically the same ratio as the standard taken. The Northern Pacific and the Union Pacific again make an economical showing in carrying a little more freight than the North-Western with two-thirds as much effort. But the Great Northern easily takes off the palm for economical handling of freight. With about the same amount of tonnage as the North-Western it used only 48 per cent. of the train mileage to move it.

In the next table the revenue trainload, the number of cars per freight train and the average load in each loaded car are shown:

Trainload and Carload.

Railroad.	Av. No. tons rev. frt. per train.	P'r cent.	Av. No. of cars per frt. train.	P'r cent	Av. No. tons loaded frt. car.	P'r cent
Chic. & Nor. West'n	262.65	100	25.5*	100	15.33	100
Chic., Mil. & St. P.	289.55	109	27.1	106	14.72	96
Chic., Bur. & Q.	389.45	147	30.21	119	17.56	115
Chic. R. I. & Pac.	266.17	101	23.07	90	15.27	100
Canadian Pacific	295.38	112	22.96	90	16.67	109
Atch. Top. & S. Fe.	284.42	108	28.61	112	15.46	101
Great Northern	548.68	208	35.54	139	20.44	133
Northern Pacific	406.77	154	28.98	114	17.78	116
Union Pacific	404.92	153	30.02	118	18.2	118

*1906.

The most striking feature of these figures is again the economical handling of freight by the Great Northern. Carrying on an average 20.44 tons per mile in each loaded freight car it makes a showing of 133 per cent. as compared with the Union Pacific's good record of 18.2 tons and 118 per cent. The Northern Pacific is close behind with nearly 18 tons.

The last table shows the average gross revenue received by each road per freight train mile and average ton mile rate.

Train Mile and Ton Mile Revenue.

Railroad.	Av. rev. per frt. train mile.	Per cent.	Av. rev. pr ton pr mile.	Per cent
Chicago & North-Western	$2.40	100	$0.90	100
Chicago, Mil. & St. Paul	2.47	103	.85	94
Chicago, Burl. & Quincy	3.07	128	.79	88
Chicago, Rock Island & Pacific	2.53	105	.95	105
Canadian Pacific	2.29	95	.77	85
Atchison, Topeka & Santa Fe	3.07	128	.95	105
Great Northern	4.27	178	.77	85
Northern Pacific	3.57	149	.87	97
Union Pacific	3.89	162	.96	108

The Great Northern again shows the lowest average rate of the American roads, .77 of 1 cent, which is as low as the Canadian Pacific's, while at the same time it earns the most per train mile. Only the Canadian Pacific earned less per train mile than the North-Western, although five of the other seven roads received a lower ton mile rate. The Union Pacific received the highest ton mile rate, .96, while the Rock Island and the Atchison got .95 of 1 cent each, from which the latter realizes $3.07 per train mile compared with $2.53 for the Rock Island. The Atchison's ton mileage explains this, for it is almost 160 per cent. of that of the other road.

A Locomotive Sled.

The accompanying photographs show a new type of traction engine for hauling logs over snow and ice roads. The boiler is mounted on a heavy channel iron frame. These channels are reinforced and extend from the extreme front end to the rear of the machine, supporting the cab and the coal bin. The water tank is carried under the boiler on the same frame and has a capacity of about 10 barrels (315 gallons) of water, which is enough for a run of five miles. The frame rests on heavy traction wheels in the rear and on a sled in front. The boiler is 30 ft. long and 2 ft. 11 in. in diameter; the working pressure is 200 lbs. The boilers are jacketed with a 2-in. covering of moulded magnesia, outside of which is a heavy iron jacket. The flues are 1½ in. in diameter. There are four upright cylinders bolted in pairs, two on each side, to the frame and the boiler. They are 6½ in. in diameter, with 8 in. stroke, and are heavily jacketed with magnesia and planished iron. The valve gear is a reversing link motion.

That part of the weight of the engine which in an ordinary locomotive would be carried on the drivers, is in this machine carried on a transverse 5½-in. shaft. This shaft in turn rests on steel castings which act in the same way as the runners on a sled, although, as will be seen, they do not touch the ground. These runners carry on each end journals in which auxiliary transverse hammered iron shafts run. On each of these shafts there is a sprocket wheel carrying a tread or lag chain, which is 12 in. wide and about 14 ft. long. Inside of these sprockets are other sprockets carrying steel roller chains. The runners bear on these rollers, which in turn rest on the tread chains when the machine is in operation. Power is transmitted from the crankshaft to the longitudinal driving shafts by spur pinions. The rear ends of the driving shafts are geared to large beveled gears on the single transverse shaft first mentioned. From this shaft the power is transmitted to the rear sprocket by intermediate gears. All gears are cut from solid steel; they are pressed on the shafts under heavy hydraulic pressure. The runner castings, sprockets, tread chains and all parts subject to strains are made from a high grade of cast steel and built for severe work.

In their other fittings these engines in general follow standard locomotive practice. The cabs are fitted up like a locomotive cab, with quadrant, reversing lever and regular locomotive throttle. Each engine is fitted with a double sight feed lubricator and two injectors. Twenty feet of suction hose and 30 ft. of steam hose are also part of the equipment.

Traction Engine for Ice Roads Hauling String of Log Sleds.

Locomotive Sled for Hauling Logs on Ice Roads.

One of these engines weighs 15 tons without water and about 18 tons ready for the road. At 200 lbs. pressure it develops 100 h.p., and has a speed of from four to five miles an hour. While it can be used in rough country, it needs easy grades for satisfactory working. Water must be supplied every four or five miles. On well graded and icy roads it will handle from seven to 15 heavy logging sleds with 5,000 to 7,000 board feet of logs to the sled. Twenty-nine of these engines are now being used in Minnesota, Wisconsin, Michigan and Saskatchewan by 20 lumber companies. Some of these are making 50 miles a day and doing the work of from 12 to 18 four-horse teams. There are three men in an engine crew: the engineman, the fireman and the pilot, who steers the front sled by the wheel shown in the photograph. The engines are built by the Phoenix Manufacturing Co., of Eau Claire, Wis.

The Railroad from the Red Sea to the Soudan.*

The new railroad which the British have built from Atbara to the Red sea begins 200 miles north of Khartum in the heart of the Nubian desert, and runs to Port Soudan, 332 miles. It crosses one of the bleakest deserts on earth. There is no vegetation at all between Atbara and the Red Sea until within about nine miles of the coast, where there is a scanty growth of thorn bush and scrub, which feeds small flocks of camels and sheep. The only inhabitants of the desert are Nubian tribes, who go about from place to place living in tents of matting seeking pasture for their flocks and camping by the occasional wells.

This road was opened in 1906 and now has more freight than cars. All the trade of the Soudan will probably go over it and, it is believed, much of the tourist travel as well. Already the Mohammedan pilgrims from central Africa and the whole Upper Nile valley are taking this railroad on their way to and from Mecca. Some of the tourists who go up the Nile are returning by the Red sea and ships are now sailing regularly from Port Soudan to Suez.

In the past all freight for the Soudan has been landed at Alexandria and carried by rail or boat up the Nile to Shellal, a distance almost as great as from New York to Chicago. There it has been taken by steamers to Wady Halfa and thence on trains to Khartum. On the way to Shellal the railroad freight had to be transferred from the broad-gage cars at Luxor to the narrow-gage from Luxor to Assouan. All of these transfers were costly, the freight rates were high and the time slow. Now ships go right through the Suez canal to Port Soudan, on the Red sea, and there land their goods for the Soudan. The freight is transferred almost direct to the cars, which by one continuous 500-mile haul land them in Khartum. In the past, wheat could be sent from Chicago to Liverpool at a lower rate than that which formerly prevailed between

*From a letter written by Frank G. Carpenter to the *Deseret News* (Salt Lake City).

Khartum and Wady Halfa. The cause for this was the high price of coal, all of which had to be brought up the Nile from Alexandria. The coal is now coming in direct from the Red Sea.

Atbara, the station which forms the terminus of the Red Sea railroad, is in the heart of the Libyan desert. It is about 200 miles north of Khartum, at the junction of the Atbara river and the Nile. It is also at the junction of the Red Sea railroad with the great trunk line which may some time go from Cairo to the Cape. The northern section of the latter starts at Alexandria and runs northward through here to Khartum, where the Blue and White Niles come together and form the main stream.

The Atbara river, which can be plainly seen from this station, is the last branch that the Nile has between this point and the sea. The Atbara rises in the Abyssinian mountains and it carries down to the Nile every year millions of tons of the rich Abyssinian mud which makes so fertile the Lower Nile valley. During a part of the year this river has a volume which compares with that of the greatest rivers of the world and at other times much of it is as dry as a bone. From March until June for about 150 miles above Atbara you can walk across it in most places without wetting your feet and there is water only here and there in the depressions and pools. These contain hippopotami, crocodiles, turtles and fish.

The great floods begin in July and last till October. Then the waters are about 30 ft. deep and they roll down in a great river from a quarter to a half a mile wide. They are of a reddish color and are loaded with the volcanic dust of which the Abyssinian highlands are made. When the floods come they bring down masses of driftwood, on which are sometimes the dead bodies of elephants and buffaloes. The waters come with great force. The Atbara bridge, over which the railroad crosses the river, was built by an American bridge-building company, and was sent here in sections. It consists of six great steel spans of 200 ft. each, built on piers which extend 30 ft. down under the river to the bed rock.

Atbara, lying as it does at the junction of the two chief lines of the Soudan, is an important railroad center. The railroad shops, which lie here in the sands of the desert, cover two or three acres of the bleakest part of the earth. They are great sheds, with walls of galvanized iron and roofs of iron and plate glass. The machinists are a mixture of whites, blacks and yellows, representing a half dozen different nations and tribes. There are British overseers, Greek and Italian mechanics, Nubian blacksmiths, and many Nubian boys taking a manual training course in order that they may serve as locomotive engineers, under-machinists and trackmen.

The desert is a great wear and tear on the equipment. The sands ruin the car wheels. The desert is covered with grains as hard as flint. They blow over the rails, and as the cars move they grind out the steel as though they were emery powder. Deep grooves are cut out. As a result a wheel's life is short, and the tires have to be cut down every few months. Moreover, the sand gets in the bearings, and there is continuous wearing which necessitates almost constant repair.

Sandstorms are serious obstacles to traffic. At times they come with such violence that they cover the tracks; they darken the sun so that when you are in one you cannot see your hand before your face. They often spring up afar off, and you can watch them coming. At such times the sand gets in everything and grinds its way through all parts of the machinery.

Another thing to contend with is the extraordinary dryness of the air, which shrinks everything connected with the road. The rolling stock has to be tightened up again and again. One of the passenger cars will shrink as much as 18 in. in one wall alone, and extra boards have to be put in to fill up. This is so with all sorts of woodwork.

Another trouble is the white ant, which eats anything wooden. It chews up the insides of the cars and even attacks the furniture. Where there is any least moisture the ants go for the railroad ties, and they will also chew out the insides of the wood telegraph poles. They always work in the dark, leaving a thin shell of wood outside. The result is that a tie or pole may look sound, but all at once it crumbles to pieces. The road has to be inspected very carefully at regular intervals. Steel shells are now being used as ties. They do not make as smooth a road as the wooden ties, but the ants cannot eat them. Steel telegraph poles are also used.

American locomotives, according to the manager of the road, do not compare well with those from Great Britain. Some American engines were bought seven years ago, and are still in use, but most of them have been repaired and made over. American builders make locomotives, expecting to be run to their full capacity for four or five years and then thrown on the scrap heap. This is not advisable in the desert, where freight costs so much and the trouble of getting rolling stock is so great. What is wanted is machinery that will stand all sorts of trials, including the climate; rustproof and rotproof and heavily made all around. There is not only the dry air and the sand to contend with, but in the neighborhood of the Red sea, also the salt air and the alkali water. The latter ruins boilers, more so, in some respects, than the sand.

The lack of water is one of the chief difficulties. The railroad is over 300 miles long and the track is laid through the sand. For about one-third of the distance inland from the Red sea the country is mountainous, but the rest is flat. There are no streams, and artesian wells furnish the water supply. The water in them in many places is salt. One well had 3 per cent. salt in it, and another 1 per cent. salt. Of course such water is useless for locomotives.

There is also trouble in getting a good water supply at Port Soudan. One well was sunk to a depth of 800 ft. and struck a good flow of fresh water. It was hardly completed, however, before the salt water from the Red sea began to seep in. There are some stretches along the route where there is no water whatever. In such places water has to be carried. For this tanks of galvanized iron, each of which will hold about 1,500 gallons, are used.

This road is the short cut to the Soudan and Central Africa, and it is likely to have the most of the carrying trade of that region. The country is vast, and it is just now on the edge of its development. Goods will be brought over the Red sea road to Khartum and thence sent up the White and Blue Niles. There will be new roads going out from Khartum connecting the Nile with all parts of the country, and both the rivers and the road will be feeders of the Red sea line. A bridge is being built across the Blue Nile, which will carry the road directly into Khartum, and in the near future a bridge will probably be built across the White Nile, which will take the road to Omdurman.

The railroad terminus on the Red sea is known as Port Soudan. The original intention was to end the road at Suakim, but the British surveyors found a much better port a little farther north and located the terminus of the railroad there. This is Port Soudan. It lies about half way down the west coast of the Red sea and just opposite Jeddah, about 500 miles south of Suez. The harbor there is the mouth of a creek shaped like a leaf, with the point inland. The water is 200 ft. deep in places, and there is deep water close to the shore. Just outside is a coral reef, which protects the harbor. The British are now dredging the edge of the harbor, and they will have it so that the biggest ocean steamers can come right up to the quays. They are building a quay wall of granite blocks nearly a mile long, with electric traction cranes running on it. The railroad tracks will come out on the wall and the freight will be loaded and unloaded by the cranes into the ships and the cars. The harbor will be lighted by electricity and the best of coaling arrangements supplied. The government has already planned an expenditure of $4,000,000. Most of the improvements are well under way. Six or seven lines of steamers now make regular callings there, and the prospect is that Port Soudan will be the chief port of the Red sea and the principal place of import and export for lower Nubia, and a large part of central Africa.

Foreign Railroad Notes.

The Austrian State Railroads are to renew the tracks of lines on which express trains run, where 70-lb. rails are the rule now, with 85 and 90-lb. rails.

The German Dining-Car Co. in its last fiscal year had cars on 25 different routes, 15 of which yielded a profit and the other 10 a loss; but the net result made a dividend of 10 per cent. possible. Since June smoking has been prohibited in these cars. The receipts for food have increased since; but there has been a material falling off in the money taken in for drinks.

The French Minister of Public Works recently announced to the Chamber of Deputies that he should soon lay before the Senate what he considered uncontrovertible evidence that the state should immediately acquire the Western Railroad system. The Chamber had already voted in favor of this; but the Senate has delayed action. It is doubtful if it can delay much longer.

There is talk of putting on a limited train between Paris and Munich. The latter city is on the route of the "Orient Express," which, however, adapts its time more to Vienna and the East than to the Bavarian city, and, moreover, is likely to be so crowded that Munich passengers haven't a fair chance. The proposed train would be a sort of through-by-daylight Empire State Express, leaving Paris at 8 a.m. and arriving in Munich at 10.25 p.m. (565 miles), and leaving Munich also at 8 a.m. and arriving in Paris at 9.15. On the route are such important places as Strassburg, Karlsruhe and Stuttgart. This will make a neat little 40 miles-an-hour run.

Russian Turkestan, since the opening of the Orenburg & Tashkend Railroad, may become for Russia what California has become for a large part of this country and some other parts of the world—that is, its fruit garden. It produces very fine fruit, and when it has more skilled fruit growers, and co-operation among them, and cold storage, and refrigerator trains, and reasonable railroad speed, and low freight for Turkestan, like California, is very far from its market it may blossom like San Jose and Riverside.

On suburban lines out of Mayence a trial has been made since last spring of five passenger cars driven by accumulator batteries which for such service had dropped out of sight for some years. These cars are interspersed among the regular steam suburban trains. They make round trips over lines 7.6, 12.7 and 13.2 miles long, respectively, and their batteries must be charged after each round trip, requiring 40 minutes after the two longer runs and 25 minutes for the shorter one. By the end of September these cars had run 60,737 miles, and there had been no irregularities in traffic due to them. The builder of the cars undertook their maintenance, and no data as to their economy are given.

The Ocean Carrier.

BY J. RUSSELL SMITH, PH.D.

VI.

The Normal Type of Steamship Line Organization.

It has been stated that nothing will so prolong the life of a person advanced in years as an annuity. The even and absolutely dependable income gives a certainty, repose and peace that produce a new lease of life. A similar dependable income is about as wholesome and as important for the healthy development of a business corporation as for the individual. The transportation business is uncertain in the amount of its business and its income, so much so that any change tending toward steadiness of business is eagerly sought by the managers of these enterprises. In this fact lies the explanation of much of the recent growth and development of these enterprises.

It is evident that a short railroad serving a small territory, sharing the plenty resulting from good harvest and want of the meager harvests, has much less prospect of steady business than a larger road, serving more territory where local variations tend to be equalized. The strife for regular freights has another phase in the terminal connections which can be made by the company. It is again fortunate, if some other company will promptly carry the freight away from its terminal and pass it on to other territories. It is better yet if some second company delivers goods at its termini for carriage over its lines.

In obedience of these economic forces, transportation corporations may be said to have a law of expansion. Within limits of easy control, the larger they are and the wider their territory, the safer and more reliable is their business. This expansion tends to go on until the carrying unit embraces an economic unit so that there are no commercial wants of the people along the lines that cannot easily be supplied by the great carrier. The people want the ship, and desire to receive goods on through bill of lading with prompt service. The carrier strives to furnish these opportunities. In response to this law the past 40 years have been a period of astounding consolidation and enlargement of the units of management in transportation by land and by sea. Single steamship companies regularly circumnavigate the globe. This has been far eclipsed by the actual labor and capital involved in the operations of railroads which have performed the greater work of crossing an entire continent and establishing subsidiary steamship lines. Connecting railroad lines have been brought closer by through freight agreements, by the leases of long term, 99 or 999 years, and by outright purchase. Great trunk routes have thus been established, branches built, subsidiary industries established, rival trunk lines bought entirely or controlled by majority stock purchase, or by community of interest in which the same men are on several boards of managers so that mutual agreements prevail.

When the railroad was first introduced, people thought of the various roads as connections between certain towns, which was indeed their only early goal. During the past 70 years we have seen the railroad develop from a set of links connecting two or three semi-adjacent cities into vast systems consisting of trunk lines and many branches or feeders.

While we have long since learned to think of railroads as systems, we are still prone to think of steamship lines as doing what the early railroads did—connecting two places. This idea must be discarded. The law of growth among steamship lines works surely to the development of trunks and branches, a development which has already taken place, although the branches are fewer than upon railroads. The improvement of the steamer and the use of the ocean cable gave the needed regularity, dependableness and knowledge for the organization of ocean commerce and transportation into a regular and systematic service akin to that of the railroad. The great ocean lines sail with precision and regularity. To supply these great lines with freight, their managers have been compelled to establish smaller lines to supply and distribute the

Principal Services of the Hamburg-American Packet Company.

necessary cargo. The largest transatlantic lines are, without exception, thus equipped at one or both of their termini. The North German Lloyd and the Hamburg-American connect at their European ends with lines running to South America, East Asia and other distant parts of the world. They also connect with smaller lines plying to the nearby European ports and with steamers on the German rivers. These two German companies carry the same system even further. Their trunk lines to East Asia are fed at Singapore and other eastern ports by lines of smaller German steamers which traverse the eastern archipelagoes and the Asiatic coasts and rivers, collecting cargo for the trunk line stations of the large steamers bound for Bremen or Hamburg, at which ports it is distributed by the European distributors referred to above or sent on to America by the transatlantic lines. The Wilson Line from New York to Hull connects in that city with an enormous fleet of small steamers which thread the coasts of the North Sea and reach all ports of importance in Scandinavia and along the Baltic. Some of the other British transatlantic lines connect with British coasting lines and with the lines to Australia and other British colonies. The French and Italian lines are fed by fleets of Mediterranean coasters and transoceanic liners at Havre, Marseilles and Genoa. The Cunard Line, giving a service from New York to Liverpool and from New York to southern Italy and Fiume, Austria, has a line connecting Liverpool and Fiume. These steamers call at more than 20 ports and gather freight which is to be transferred at the ends of the route to the next steamer bound for America. Other examples of this systematic trunk and feeder development of ocean service might be mentioned; but they would show no feature differing from the development of the examples cited or from the railroad and its branches except that the ocean service of single companies at times circumnavigates the globe and covers a much wider scope of territory than any railroad system the world can ever have.

Steamship Kaiserin Auguste Victoria; Fast Passenger and Freight Service.

The world's greatest steamship company, the International Mercantile Marine, differs from the other giant organizations, such as the Hamburg-American, North German Lloyd, and Peninsular & Oriental, in that, while exceeding any of them in tonnage, it covers a smaller area with its services. This results from the fact that it was formed for a different object. The three European companies referred to are older, and were built up gradually, ship by ship, service by service, as the traffic grew and the service expanded to meet it. One improvement or extension of service to get freight demanded another to dispose of it. The Mercantile Marine Company grew differently. It was the last step in a series of consolidations of equals. The American Line had taken over the Inman Line in 1884. It had later taken over the Red Star Line and become the International Navigation Company. This company now consolidated with four other great lines for the purpose, not of extending service, but of making living rates at a time when severe competition made general loss. Its genesis, therefore, differs profoundly from that of the other great companies.

In some respects the law compelling consolidation and the establishment of feeders works with stronger force among steamship lines than among railroads. The railroad runs through certain territory where it has scores of stations supplying it with traffic and many of them are so situated that they control freight that can find no other suitable outlet. This much the railroad has beyond per-

Steamship Alleghany; West Indian Service.

adventure. The steamship line that serves one port as many of them do, must find its freight there or nowhere, and in the port competition is free and the freight may go to any rival. If it has some coasting lines bringing in freight, the situation is instantly different.

The company that runs a line on one route only is at the mercy of any local fluctuation in traffic. A strike even might spoil the profits of a quarter, so might a drought or any local uncontrollable disturbance. Then, too, there are seasons in nearly all trades during which the traffic is abundant and others in which it is scarce. Just after harvest time, wheat, corn and cotton go forward in quantity and the trade falls away to small proportions as the next harvest approaches. The steamship company with many lines can have its annual work evened up by seasonal prosperity in one quarter as dulness comes in another. Instead of having ships half idle on its one dull route, it can shift them to the prosperous route. As the vessels get old and antiquated for the finer routes they can be shifted to a slower and inferior route. The greatest advantage, however, is the picking up of freight for the main lines, just as the branch roads feed a main trunk railroad.

All these forces are welding the ocean carriers into ever-growing systems. There are, of course, multitudes of small steamer lines as there are many small railroads, but there is a steady tendency toward their consolidation into well articulated groups. The reading public has been thinking of steamship lines as lines, as entities, when really they are parts of systems, and many of the North Atlantic lines have from their inception been but an outreaching arm of a European system.

of the Adriatic, they go in the Baltic to Russia and Sweden and out in the Atlantic to Iceland and North Cape and on to Arctic Spitzbergen. In Africa it touches at Alexandria and down the whole west coast as far as the mouth of the Congo. In Asia it serves Aden, the ports of Arabia, Persian Gulf, Ceylon, Calcutta, Straits Settlements, China, Korea, Siberia, Japan and finally and possibly most remarkable of all it sends steamers thence across the Pacific to Portland, Oregon—a grand total of 57 services crossing every ocean, touching all continents and every commercial zone.

The illustrations accompanying this chapter show the more important of the Hamburg-American Company's* 68 lines and services—an example of equalized traffic through world organization—and also a group of the company's steamers selected as being typical of four distinct types of service. The express steamer "Deutschland," 23 knots per hour, for some years holder of the Atlantic racing record, is 661 ft. long, and of 16,502 gross tons register with 37,000 h.p. This vessel can carry 467 first class passengers, 300 second class, 300 third class, but owing to a large crew and coal consumption and fine lines, she can carry less than 1,000 tons of express freight.

The "President Grant" represents a combination freight and passenger ship purchased and fitted especially for the Hamburg-New York emigrant trade. This steamer, 616 ft. long, gross tonnage of about 17,540, can carry 324 first class passengers, 125 second class, 1,000 third class and 2,320 fourth class on the middle and lower decks. This enormous steerage capacity is the direct result of the enormous westward movement of emigrants and the vessel can, at will, fill a large part of its space with low class passengers

Steamship President Grant; Designed Especially for North European Steerage Trade.

The North German Lloyd was formed in 1856-7 by the consolidation of nearly all the steamship lines, local and otherwise, in Bremen. Since 1827 there has been fairly regular sailing vessel traffic to New York carrying emigrants one way and cotton and tobacco the other. Now that nearly all the lines of the port, the assemblers and distributers of this trade, were consolidated, it was the most natural thing in the world for the company to reach out for the American traffic—and they reached again and again. In 1858 they started the steam service to New York and in 1866 it was made weekly, 1868 a line was sent to Baltimore, in 1869 to New Orleans, 1870 to the West Indies, 1875 to Brazil and Argentina, and so the company has gone on reaching out until with its partner, the Hamburg-American Company, it practically covers the world. The strong hold it had in the local trade of Bremen and nearby waters enabled it to beat off the four American attempts to establish service to Bremen 1866-1870, as it had the previous one of 1858-61.

The Hamburg-American Company, which in the minds of some may be thought of as a New York-Hamburg Line, is really one of the leading factors in the carrying trade of all America and of the old world as well. This one company dominates the metropolitan city of Hamburg and connects it with Montreal, Portland, Boston, New York, Philadelphia, Baltimore, Newport News, New Orleans and Galveston in the eastern United States. It sends steamers to Mexico, Central America, Panama, Colombia, Venezuela and the Lesser and Greater Antilles. They go to the Amazon, to the ports of Central and South Brazil, to Uruguay and Argentine Republic, to Chili and Peru. In Europe they circumnavigate the British Isles, skirt the coasts of France, Spain, Portugal and Italy, to the head

or with freight, having at times a capacity of something like 15,000 tons freight, but this at some sacrifice of full passenger list.

The twin-screw steamer "Kaiserin Augusta Victoria," at 17 knots per hour, 677½ ft. long, 24,581 gross tons, and 43,000 tons displacement, represents the highest type of combination freight and passenger steamer for the North Atlantic. She carries 550 first class, 350 second class, 300 third class and 2,300 steerage passengers, and in addition, about 10,000 tons of freight.

As a subsidiary type we show the "Alleghany," formerly of the Atlas Line; 2,494 gross tons, 2,000 h.p., 12 knots. This vessel is in the New York-West Indian service. It can carry 60 first class passengers and nearly 2,000 tons of freight.

While the Hamburg-American stands as the high type of world traffic development, it does not stand alone, and it differs only in degree from many others. In 1874 the Anchor Line, not particularly well known, because of its chiefly freight service from Glasgow to New York, was heralded by its admirers as the largest steamship company in the world, but it had not become so solely through its 18 years of New York service. Before the New York service began, the Anchor Line was great in the British Mediterranean trade, and for nearly a decade the New York service was a secondary interest to the Mediterranean service from which it had sprung.

The consolidation of a number of local European lines may be taken as the signal for the founding of a new line to some foreign land. In 1875, a period of great depression and failure and, therefore, of ease of consolidation by the hands of the strong, the Wilson Line from Hull to New York was started, but it was merely the

*Hamburg-Amerikanische Packetfahrt Aktien Gesel.

offshoot and distributor for one of the largest collections of coasting steamers that ever fed a port. The head of this firm is often called the largest ship owner in the world. As long ago as 1891 the firm had 140,000 tons of steamers, of which 40,000 tons were trading to the Mediterranean, others to South America, Hindustan and Australia. The Leyland Line, which started a service from Liverpool to Boston in 1876, was an old established firm with a large Mediterranean trade; and the Johnson Line to Baltimore was started in 1880 by a firm with a great business between Liverpool and the Danubian ports. The White Star Line on the Atlantic was the noble effort of old Australian traders, and they are Australian traders yet, despite Atlantic success and the Morgan merger into the so-called shipping trust.

The largest Italian Line, the Navigazione Generale Italiane, was formed in 1881 by the union of smaller lines, and in 13 years it had 105 steamships operated on many seas. A few years ago, the numerous small companies plying about the island capital of Copenhagen united to form the United Companies of Copenhagen and with that basis for distribution they began at once to send steamers to the far East to take their freight and get something for them to distribute.

With these facts and tendencies of line traffic organization in view, it becomes very plain that the forwarding of American goods by foreign steamers was the most natural thing in the world. Not only were the existing lines well equipped and located to render

Steamship Deutschland; Type of North Atlantic Express Service.

the service well, but in dozens of cases the goods could and did pass from the foreign country to Europe and thence to the United States and vice versa in the lines of the same company. One of the lines was merely serving as the feeder to the other as it was meant to do when it was created.

(*To be continued.*)

The Express Business.*

In the early days the stage driver was the expressman. He was indeed an important individual, next to the parson and the judge; not, however, below even them in his own estimation. He carried all sorts and kinds of big boxes, little boxes, band-boxes and bundles. He put them in the boot under his feet, and the letters, bills, orders, etc., into his bell-crowned hat. Many stage drivers became bald in consequence of this practice. The stage driver not only carried the packages, but executed commissions of various kinds at the terminal of his route, and, generally at least, the charges were his perquisite. Long prior to 1820, the grandfather of your speaker was a bank messenger, traveling on horseback, with saddle-bags and a pair of trusty horse pistols, to and fro between the scattered banks and bankers in Central New York, carrying what they considered large sums of money, and protecting his treasure at night in the rude roadhouses where he slept by a stout piece of steel with a fork at each end, one of the ends being forced into the floor and the other end into the door.

The bud of express evolution bloomed in the hand of William F. Harnden, of Boston, about 1839. The great Adams Express Company of the present day is the full-blown flower from that bud. Harnden's office in New York was at No. 1 Wall street.

As far as records are available, Harnden was the first man to make a contract with a railroad for the carriage of express matter. It seems quite an insignificant transaction now; less than 100 miles of railroad; but in the act an acorn of principle that has produced the oak, whose inception, growth and existing status has received the recognition of the Supreme Court of the United States. This contract differentiated Harnden from all who had gone before, and even to this day differentiates the express companies of the United States and Canada from all other freight forwarders in the world.

Let us glance at the statements of the Supreme Court in the Express cases of 1885. The Court said that the express business had become a public necessity, ranking in importance with the mail and the telegraph; that it was used in every conceivable way and for every conceivable purpose by the people and by the government, all have become accustomed to it, and it cannot be taken away without breaking up many of the long settled habits of business, and interfering materially with the conveniences of commercial life. That there never had been a time since the express business was started that it had not been encouraged by the railroad companies and no railroad in the United States had ever refused to transport express matter for the public upon the application of some express company of some form of legal constitution; that every railroad has recognized the right of the public to demand transportation by the railroad facilities which the public has permitted to be created. The Court further noted that the transportation required is of the kind which must if possible be had for the most part on passenger trains; that it required not only speed, but reasonable certainty as to the quantity that will be carried at any one time, as the things carried are to be kept in the personal custody of the messenger or other employee of the express company it is important that a certain amount of car space should be specially set apart for the business, and that this should, as far as practicable, be put in the exclusive possession of the expressman in charge. As the business to be done is express, it implies access to the train for loading at the latest and unloading at the earliest convenient moment. By inference at least, the Court held that it was the duty of the railroad to furnish express facilities.

The language of the Court is that the railroad company performs its whole duty to the public at large, and to each individual, when it affords that public all reasonable express accommodations. If this is done, the railroad owes no duty to the public as to the particular agencies which are selected for that purpose; the public requires the carriage but the company may choose its own appropriate means of carriage, always provided they are such as to insure reasonable promptness and security.

It was also noted by the Court that it was neither averred nor

*From an address before the Traffic Club of New York, by C. H. Crosby, Vice-President and General Manager of the United States Express Company.

shown that any railroad company in the United States had ever held itself out as a common carrier of express companies, that is to say, as a common carrier of common carriers; and then the Court went on to show, at some length, that when a railroad took an express company on its lines it was always under some form of contract. There are many interesting statements in this celebrated decision, but I have cited enough to prove my statement of the great advance made in the evolution of the express, when starting with Harnden, the carriage of the goods by the railroad was done under contract, and besides this, the principle was fixed at that early date that one of the considerations of the contract was the assumption by the express company of the risks of carriage and liability for delivery to consignee.

Outside of the facilities granted the express companies of transportation under contract, another feature of equal importance to the public, and of far greater expense to the express, is that of terminal and accessorial service which, subject to a very slight exception, distinguishes (at least in the United States) the express from the freight. Terminal expenses did not trouble Harnden at first, as for a long time he carried all his express matter in a carpetbag; but the growth of the business soon compelled him to procure horses and wagons, offices, bookkeepers, clerks and all the items of terminal service.

The tremendous increase in terminal service rendered by the express companies to the public is little known. To illustrate its phenomenal growth, there was quite a discussion in June, 1868, about extending terminal service north of Fourteenth street, New York City. At that time the rate to Chicago was $5 per 100 lbs. To-day the terminal service covers Greater New York to 181st street in Manhattan, and 170th street in the Bronx; and the rate to Chicago is $2.50 per 100 lbs. It would be wearisome to go into the details of increase of wages, rents, taxes, horses, wagons and materials.

At the present day the great difference in speed between the express and freight which existed 40 years ago has been materially reduced, and when one reflects that eight to 15 miles per hour used to be good speed for a freight train, and that they now run at anywhere from 25 to 50 miles per hour, it can be readily seen that the express has lost the greater part of its advantage in speed. The express company to-day is hanging on by its eyelids, by virtue of its terminal services, the personal care given to goods in transit, and the fact that it is ready to accept and transact all kinds of commissions. An example is goods carried C. O. D., with privilege of examination. Instruments for a brass band used to be tested in the express office, but recently shippers allow them to be taken away and the torture more widely distributed. Medicines, even, can be tested for a few weeks; if a cure is not effected, put the cork in the bottle and the express will carry it back. Suits of clothing can be tried on in the office, and rumor says that even fighting cocks have been tried out in front of the counter. If you want anything bought, from an early folio of Shakespeare to a bulldog or a Plymouth Rock hen, you merely need mention your wants to the express agent, and he will tell you where to buy, and generally be able to tell you the cost of the article. Information wanted: That is where the express agent comes out strong.

The line of demarcation between the freight and the express is drawn most sharply and effectively by the difference in price of the respective services. The express company cannot escape the cost of terminals, and the cost is just the same whether the goods have come ten miles or a thousand. The terminal costs in New York are just the same on a package from Jersey City as on one from Alaska. The result is frequently that the relative rates of express and railroad exhibit the widest variation. Quite recently the newspapers reported that a member of one of the western railroad commissions said his state did not want any express companies. They had found out that the railroad charged the express company 50 per cent. of what the express company charged the public; therefore, the railroad should do the express business at half the existing rates. This report may not be true, but I have not seen it contradicted.

The wonderful improvement in the construction of roadbed, bridges and rolling stock, and the consequent vastly increased speed of freight trains has gone far to deprive the express of that advantage, and has caused it to lose large lines of traffic formerly enjoyed by it. They are now carried by all sorts of special freight cars and arrangements. In great measure the express business has gone back to the days of its founders. It is largely a business of small parcels, combined with various side lines of collections, money-orders, commissions, etc. Our average transaction, great and small, is not over 50 cents gross. The time when the express practically did all the fast service has departed, and there is no probability that it will ever return.

There can be no competition between the express department of a railroad, or on a railroad, and the freight department of the same road. The severe terminal and accessorial expenses of the express effectually prevent it from meeting even part way the regular freight rates. The slower time and the terminal expense which must be borne by the shipper, prevent the freight from encroaching to any great extent on the express. One supplements the other and together they give to the American public a service that, with all of its occasional imperfections, is not excelled by any service on earth, and equaled by very few.

Pig Iron Production in 1907.

The Bulletin of the American Iron & Steel Association gives the following statistics, received from the manufacturers, of the production of pig iron:

The total production of pig iron in the United States in 1907 was 25,781,361 gross tons, against 25,307,191 tons in 1906. The following table gives the half yearly and yearly production in gross tons during each of the last five years:

Period	1903	1904	1905	1906	1907
First half	9,707,367	8,173,438	11,163,175	12,582,250	13,478,044
Second half	8,301,885	8,323,595	11,829,205	12,724,941	12,303,317
Total	18,009,252	16,497,033	22,992,380	25,307,191	25,781,361

The pig iron production of 1907 exceeded that of 1906 by 474,170 tons, an increase of 1.9 per cent.

Production in the second half of 1907 was 1,174,727 tons less than in the first half of the year. The whole number of furnaces in blast on December 31, 1907, was 167, against 359 on June 30, 1907, and 310 on December 31, 1906. The number of active furnaces at the end of 1907 was smaller than at the close of any year since 1896, when 159 furnaces were in blast. At the close of 1907 there were 276 idle furnaces, as compared with 89 idle furnaces at the close of 1906.

The total production of pig iron by states is shown in the subjoined table:

Total Production of Pig Iron by States.

States.	Blast furnaces: In blast June 30, 1907.	Dec. 31, 1907: In.	Out.	Total.	Production in 1907—Gross tons of 2,240 lbs.*: First half	Second half.	Total
Massachusetts	2	2	0	2			
Connecticut	2	3	0	3	8,746	10,373	19,119
New York	17	9	17	26	859,125	800,627	1,659,752

Washington	0	0	1	1			
California	0	0	0	0			
Total	359	167	276	443	13,478,044	12,303,317	25,781,361

*Includes spiegeleisen and ferro manganese.

The production of pig iron in the United States is classified by kinds and by fuels. There were 13,231,620 tons of Bessemer and low phosphorus pig iron produced in 1907, against 13,840,518 tons in 1906, a decrease of 608,898 tons, or 4.4 per cent. The production of basic pig iron in 1907, not including charcoal of basic quality, was 5,375,219 tons, against 5,018,674 tons in 1906, an increase of 7.1 per cent. The production of spiegeleisen and ferro-manganese was 339,348 tons, against 300,500 tons in 1906, an increase of 38,848 tons, or 12.9 per cent.

In the production of the great bulk of pig iron bituminous coal and coke was used as a fuel, the pig iron made by these fuels amounting to 23,972,110 tons, as compared with 23,313,498 tons in 1906, an increase of 658,912 tons, or 2.8 per cent. The production of pig iron from anthracite coal and coke mixed as a fuel amounted to 1,335,286 tons, as compared with 1,535,614 tons in 1906, a decrease of 200,328 tons, or 13 per cent. Anthracite coal alone was used in the production of 36,268 tons, as compared with 25,072 tons in 1906. The production of charcoal pig iron in 1907 was 437,397, as against 433,007 tons in 1906, an increase of 4,390 tons. There were 437,397 tons of pig iron made in California in 1907 with charcoal and electricity.

The total production of all kinds of pig iron in Canada in 1907 was 581,146 tons, against 541,957 tons in 1906, an increase of 39,189 tons, or 7 per cent. In the first half of 1907 the Canadian production was 270,100 tons, and in the second half 311,046 tons. The growth of the Canadian output of pig iron is shown in the following table, which gives the production during the last 14 years:

Years	Grs tons	Years	Grs tons	Years	Grs tons	Years	Grs tons
1894	44,791	1898	68,755	1902	319,557	1906	541,957
1895	37,829	1899	94,077	1903	265,418	1907	581,146
1896	60,030	1900	86,090	1904	270,942		
1897	53,796	1901	244,976	1905	468,003		

GENERAL NEWS SECTION

NOTES.

At the special session on February 1, the North Carolina Legislature passed the $2\frac{1}{2}$c. fare bill.

The new Pennsylvania state railroad commission took the oath of office at Harrisburg, February 4.

The Interstate Commerce Commission expects to send out during this month forms for recording the depreciation of cars.

It is reported that the Pullman Company will abolish the operation of cars between Chicago and Cincinnati, on grounds of economy.

The Chicago, Milwaukee & St. Paul is reported to be receiving 500 inquiries a day about opportunities for location on its Pacific extension.

A prominent locomotive builder calls attention to the fact that orders from foreign countries are just now as scarce as orders from the United States.

It is understood that the Atchison is going to reduce its passenger train service in Oklahoma on account of the two-cent clause in the state constitution.

The House Committee on Interstate and Foreign Commerce is discussing the transportation of high explosives, and heard testimony by Dr. Charles B. Dudley, of Altoona, on February 7 and 8.

The Pennsylvania's suspension on December 15 of purchase of second-class timber has been supplemented by a notice that no ties of any kind will be bought after December 15 until further advice.

It is reported that the Union Pacific has received an inquiry about its motor cars from the Russian Government, with especial reference to the adaptability of the cars to Russian railroad conditions.

On February 7 the 8-in. pipe line, built by John W. Gates and his associates, from Tulsa, Okla., to Port Arthur, Tex., 582 miles, was opened for regular operation. The cost complete is said to have exceeded $6,000,000.

By the last eastbound transcontinental tariff points on the Northwestern Pacific will have the benefit of common point rates to eastern points. Heretofore points north of Santa Rosa have had to pay an arbitrary in addition to the common point rate.

The Governor of Mississippi has sent a message to both houses urging the passage of a two-cent passenger rate, but giving the State Railroad Commission a certain amount of discretion in the cases of individual roads not able to stand the reduction.

Beginning February 16, the New York, New Haven & Hartford will be operated in seven divisions instead of in 10 as heretofore. The divisions will hereafter be known as the New York, Shore Line, Providence, Boston, Old Colony, Midland and Western.

The Western New York Car Service Association handled 65,828 cars during December, 1907, at 587 stations. The average detention was high, being 2.19 days, of which 48 days were required by railroads and 1.71 by consignees. The percentage of cars released within the limit was 86.6.

Officers of the Atchison estimate citrus fruit shipments from the Coast this season at 32,000 cars as compared with 27,000 cars last year. The company has no surplus of refrigerator cars and has leased 1,000 additional refrigerator cars from Armour & Co. at the rate of $1 per day.

A press despatch says that the Harriman Lines in Texas have discontinued their suits to enjoin the Texas Commission from enforcing its whole group of freight rates, in consideration of the withdrawal by the Commission of the $2\frac{1}{2}$-cent passenger rate ordered on the Houston & Texas Central.

The New York Assembly Railroad Committee has ordered by unanimous vote, without amendment, the Wagner Bill providing for a flat five-cent fare from Brooklyn Bridge to Coney Island. The Assembly Committee has apparently learned nothing from the Governor's veto of the Baldwin two-cent bill last year.

The Mexico-St. Louis Special, which has been running since the beginning of the year for the third season from St. Louis to Mexico City via the St. Louis, Iron Mountain & Southern, the Texas & Pacific, the International & Great Northern and the National of Mexico, has been given up for purposes of economy.

An officer of a Mexican railroad warns railroad men of the United States who have been thrown out of employment that Mexico is crowded with American railroad men looking for jobs. He says that until recently there has been a good demand for Americans on the Mexican roads, but that this demand is now filled.

The Senate committee on interstate commerce has made adverse reports on the bills to allow newspaper publishers to accept railroad passes in payment for advertising and to permit railroads to exchange passes or tickets with passenger transfer companies or with other railroads for their officers and employees.

The Lake Superior Car Service Association reports that 5,518 fewer cars were handled in January, 1908, than in January, 1907, but that the recent cold weather has greatly increased the movement of coal, and also of pulpwood and other forest products, depending on snow in the woods to facilitate their movement.

Blueprint copies of the chart showing the position of all the telegraph wires on the Tucson division of the Southern Pacific are being issued from the office of the road master at Tucson. These charts are given to all of the freight conductors on the division and are to be kept in the cabooses for reference when it is desired to use the telephones with which each car is equipped.

The action of the interstate commission in insisting on the railroad companies keeping on file at each station two copies of all tariffs has caused the legal departments of certain roads to instruct their claim agents that rates quoted by agents or employees are given at the risk of the shipper and that clerks making such quotations are for the time being agents of the shippers.

The live stock agent of the Canadian Pacific in the West shows export cattle shipments from Alberta and Saskatchewan to have been 42,960 head in 1907 as against 71,710 head in 1906. Other live stock shipments also fell off materially, shipments of horses decreasing from 19,549 to 11,352; of all cattle from 114,651 to 80,013; of hogs from 30,099 to 29,588 and of sheep from 57,024 to 28,573.

Beginning February 18, the Missouri, Kansas & Texas will issue 1,000-mile books at 2c. a mile in Texas, being the first road to do so in that state. The Texas state commission has approved the issue of the Rock Island and the Colorado Southern two-cent interchangeable mileage books. They can be used in Texas on the Trinity & Brazos Valley, which, however, can collect the coupons at the rate of $2\frac{1}{2}$c. a mile.

The United States Forest Service announces that 150,000,000 acres of forest land in British Columbia have been placed in reserve by the Canadian government. This includes every acre of timber lands of the Province except what has already been leased. The action was taken to check wasteful exploitation of timber resources and to bring the care and cutting of timber more effectually under Government control.

It is reported that the Rosenbaum Grain Co. is going to sue the St. Louis & San Francisco for recovery of $42,000, alleged to be the loss sustained by failure of the railroad to deliver a large shipment of grain to a steamship on which it was booked to be carried to the Black sea. The matter has been under investigation since 1906, and brings up the question whether a railroad is liable to a shipper for delay which causes the shipper's goods to be sold on a falling market.

The transatlantic steamship war is ended, and substantial increases have been fixed upon as a minimum basis for a three-year period. The minimum rates on the Mauretania and the Lusitania have been fixed at $127.50, first class, as against a minimum rate of $72.50 during the rate war. Other passenger steamers take lower rates, but the minimum is higher than usual, and applies throughout the year instead of changing in the winter season. No agreement has as yet been reached about the freight and steerage basis.

On February 5, the Louisville & Nashville, following the action of the Baltimore & Ohio, the Erie and the Southern Railway, reduced the salaries of all employees making more than $250 a month. Those receiving $400 and over are reduced 10 per cent., while those receiving between $250 and $400 are reduced 8 per cent.

The Mobile & Ohio also announces a reduction of 10 per cent in the salaries of all executive officers, officials and employees receiving $100 a month or more. All employees receiving from $100 to $50 a month are cut 5 per cent., the reductions being effective March 1. Colonel Russell states that among the causes necessitating the changes are the financial crisis and unfair railroad legislation in the Southern states.

Dinner to H. H. Vreeland.

On February 7 a large dinner was given to H. H. Vreeland under the auspices of the New York Railroad Club in recognition of Mr Vreeland's long and successful career as President of the club. W. G. Besler, Second Vice-President of the club, was toastmaster, and at the close of the dinner which was attended by 321 persons, Mr. Vreeland was presented with a silver water pitcher. The speakers of the evening were John F. Deems, William J. Wilgus and George A. Post. Mr. Deems spoke of the foundation of the club and of the helpful part played by Mr. Vreeland in its rapid growth and development, Mr. Wilgus talked on his own subject of electrification, and Mr. Post gave a humorous address on the subject of Mr. Vreeland. Mr. Vreeland replied gracefully to the addresses in his honor and emphasized the point that a man living in the world to-day cannot make a first rate success alone, but must have the help of his friends in order to attain the highest usefulness.

Installation of Dr. Goss at the University of Illinois.

The formal exercises incident to the installation of Dr. W. F. M. Goss as Dean of the College of Engineering of the University of Illinois occurred February 5 in connection with the formal opening of the Graduate School of the University. The exercises of installation included two sessions and a tour of inspection through the laboratories of the College of Engineering.

Among the guests of the occasion were: William McIntosh, representing the American Railway Master Mechanics' Association; J. W. Taylor, representing the Master Car Builders' Association; F. H. Clark and C. A. Seley, representing the Western Railway Club; William Forsyth, representing the American Society of Mechanical Engineers; W. K. Hatt, representing the American Railway Engineering and Maintenance of Way Association; Morgan Brooks, representing the American Institute of Electrical Engineers; O. Stephenson, representing the Engineers' Club of St. Louis; C. F. Loweth, representing the Western Society of Engineers; Robert Quayle, representing the Chicago & North-Western R. R.; T. F. Barton and W. O. Moody, representing the Illinois Central R. R.; C. H. Young and M. H. Wickhorst, representing the Chicago, Burlington & Quincy Ry.; A. F. Robinson, representing the Atchison, Topeka & Santa Fe Ry.; A. L. Kuehn, representing the Cleveland, Cincinnati, Chicago & St. Louis Ry.; George N. Dow, representing the Lake Shore & Michigan Southern Ry.; A. F. West, representing Princeton University; H. C. Hoagland, representing the Illinois Traction System; C. H. Benjamin, M. J. Golden, C. A. Waldo, Stanley Coulter and L. E. Endsley, representing Purdue University; J. J. Flather, F. S. Jones and W. H. Kavanaugh, representing the University of Minnesota; W. H. Siebert, representing Ohio State University; W. D. Pence, representing the University of Wisconsin; C. R. Richards, representing the University of Nebraska; F. L. Bishop, representing Bradley Polytechnic Institute; G. F. Gebhardt, representing Armour Institute of Technology; L. E. Young, representing the Missouri School of Mines; E. C. Woodruff, representing Millikin University; Mrs. Laura B. Evans and F. L. Hatch, representing the Board of Trustees of the University of Illinois.

New Jersey Tax Contest Ended.

New Jersey railroads have given up their contest of the Perkins "Average Rate Main Stem" tax law of 1906, which taxes main stem property at the rate of $18.01 per $1,000 of valuation instead of at the rate of $5 as heretofore. The state treasurer has received more than $2,500,000 of the contested balance due, the principal amounts in arrears having been as follows:

Pennsylvania system	$1,061,089
Jersey Central	552,834
Philadelphia & Reading system	122,152
Erie	176,556
Lackawanna	136,129
Lehigh Valley	237,128

Telegraph Block System on the Wilmington & Northern.

The Philadelphia & Reading is about to install the telegraph block system on its Wilmington & Northern division, single-track, from Birdsboro, Pa., to near Wilmington, Del., 60.5 miles. There will be 19 block stations, eight of which will be operated continuously and 11 closed a part of each night. Communication from station to station will be by Morse telegraph and semaphore signals will be used. The outlets of long sidetracks will be connected to the nearest block station by telephone.

Offer to Buy Town.

Through Chief Engineer Morris the Santa Fe Railroad Company made a proposition to the state corporation commission, Feb. 4, to buy the entire town of Goodwin, Ellis county, reimburse the residents for all the money expended there and move them bodily and free of charge to the new town of Holstein, which the Santa Fe is exploiting on its Panhandle branch near the Texas-Oklahoma boundary. This would be a cheaper proposition for the company, they claim, than to grant the request of the Goodwin citizens to erect for them a station with the necessary switch and platform facilities requiring a deep cut of 15 ft. wide and 3,500 ft. long. The citizens had asked the commission to compel the railroad company to build the station when the counter proposition to buy the town was made.—*Topeka State Journal.*

Life on the Prairies.

A Kansas editor, since his pass has been cut off, has dropped the railroad time-tables from his paper and prints in their place this line: "Trains are due when you see the smoke."

Anderson Controlling Altitude Valve.

The accompanying drawings show the improved type of Anderson controlling altitude valve. A former design was described in the *Railroad Gazette* of September 1, 1905. The present form is simplified. The valve takes the place of a float in maintaining uniform water level in tanks, standpipes and reservoirs. A float is liable to failure through getting either water-logged or lodged in ice formed on the surface of the water. The valve is placed in a pit under the tank or in any other place where it is accessible and protected from frost. The body and top is of heavy cast iron. The upper part of the body is lined with bronze and the piston is solid bronze with rubber cups and seat.

The longitudinal section shows the main valve closed. When

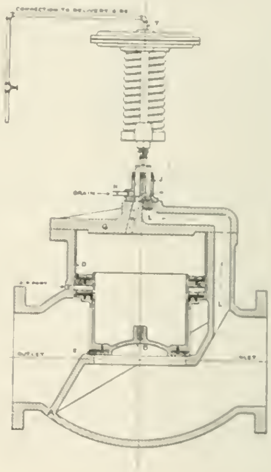

Fig. 1.

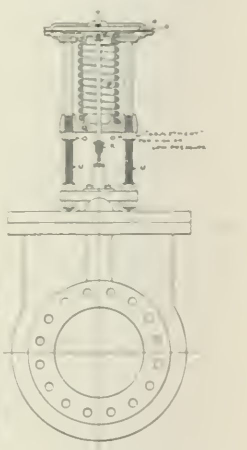

Fig. 2.

water is drawn from the tank, the pressure on the diaphragm, R, Fig. 2, is reduced so that the spring P lifts the valve spindle, K. The high-pressure valve, H, Fig. 1, then closes and the exhaust valve, I, opens, so that the water above the main valve, B, is free to escape through the port M, and the drain N. The pressure of the water in the main inlet pipe now lifts valve B and water flows into the tank. The main valve is cushioned in opening by the water above it which can escape but slowly through the small drain. As the valve moves upward it draws in, through the port, F, air which cushions the valve when it afterwards closes. When the water level in the tank has been restored, the pressure, through the pipe T and diaphragm R, closes the exhaust valve I and opens the valve H. Water now passes through the pipe L and the port M and puts the same pressure per square inch on the top of valve B as there is on the bottom. The top having a greater area than the bottom, the valve closes and shuts off the water from the tank.

The valve is made by the Golden-Anderson Valve Specialty Co., Pittsburgh, Pa.

"Rights of Trains" a Text-book.

The University of Illinois has adopted as a text-book H. W. Forman's "Rights of Trains on Single Track," published by the *Railroad Gazette.*

A New German Cab Signal.

According to a report from Consul T. J. Albert, of Brunswick, Germany, the Prussian railroad administration now has in use a cab signal giving both a visual and an audible indication, in which the connection between the roadside fixture and the apparatus carried in the cab of the locomotive is made by means of a bristly broom of pliable copper wire, carried on an arm projecting from the side of the locomotive and rubbing against two parallel iron bars fixed near together and mounted along the track for several yards. This roadside apparatus is fixed at about 100 meters (330 ft.) in the rear of the ordinary visual signal, and its sole purpose is to warn the engineman that he is near such signal and must look out for it. Thus knowing the precise location of the roadside signal—presumably a distant signal—the engineman will be on the alert so as to bring his train to a stop at once in case, by reason of fog, he fails to see the visual signal.

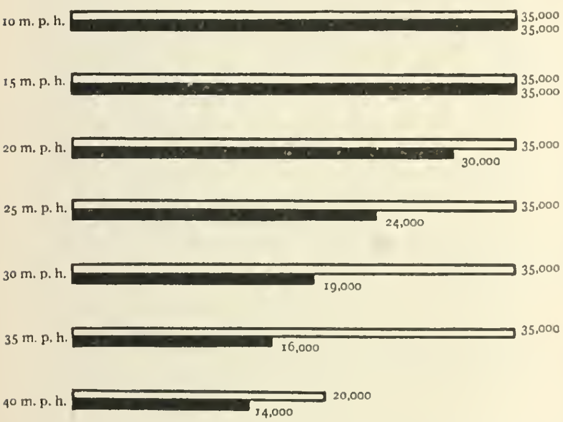
The Anti-Monopoly Crusade.

Uncle Jeptha—The railroad is sellin' tickets ter Chicago fer four dollars. They can't afford ter do it at that price.

Uncle Steven—No; that's what Hiram said. He went an' bought nine tickets an' didn't use one of 'em. Said if he had money enough he'd keep on buyin' tickets till he'd busted up the bull railroad monopoly. He's got it in fer the trusts, Hi has.—*Puck.*

Tractive Effort of New York Central Electric Locomotives.

The accompanying chart, compiled by Muralt & Co., New York, shows the comparative drawbar pull, in pounds, of a New York Central electric locomotive and a Pacific locomotive, at various speeds; that of the former is shown in white. Both locomotives are designed for about the same speed—35 miles an hour. The electric engine weighs 95 tons, with 70 tons on drivers, and the Pacific locomotive weighs 171 tons, with 70 tons on drivers. The former can exert its full power up to 35 miles an hour, after which its efficiency falls, primarily because of internal reactions in the motors. The efficiency of the steam engine decreases rapidly at speeds over 15 miles an hour.



Comparative Drawbar Pulls of Electric and Steam Locomotives.

Exports of Rails, Cars and Locomotives in 1907.

The value of exports of rails, cars and locomotives during 1907 was $30,800,000, which is the largest on record. The value of these exports from the United States in 1906 was $24,700,000, which was the previous high record. The exports during 1907 were almost equally distributed in value between rails, cars and locomotives.

Mexico bought more than $1,700,000 worth of cars, $1,500,000 worth of locomotives and over $860,000 worth of rails. South America took over $2,600,000 worth of cars and $3,000,000 worth of rails. British North America bought nearly $1,500,000 worth of cars and $2,000,000 worth of rails. Locomotives valued at over $1,000,000 were exported both to Mexico and to Central America.

The following table shows the value of the exports of these three items during the last two years:

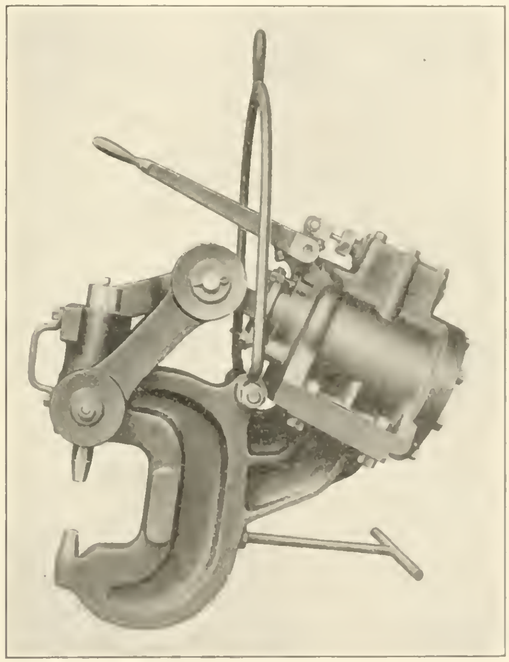
	1907.	1906.
Rails	$10,111,000	$8,903,000
Cars	11,332,000	8,367,000
Locomotives	9,080,000	7,430,000
Total	$30,828,000	$24,700,000

Pennsylvania Stockholders.

The Pennsylvania announces that on January 4, 1908, its stock holdings numbered 57,226, an increase of 16,370 for the year 1907. During the year the average holdings decreased from 150 shares to 110 shares. The number of women stockholders increased from 19,282 to 26,471, and the European investors increased from 7,753 on December 31, 1906, to 9,149 on December 31, 1907. In addition to the figures quoted above there are also 20,793 stockholders in the subsidiary companies; 11,111 for the Lines East and 9,682 for the Lines West.

A Portable Compression Riveter.

On heavy work it is economical to use a portable riveter. A portable hydraulic riveter is not practicable because high pressure water lines are unwieldy and the disposal of exhaust water is difficult. An air-driven machine, however, is well adapted to this work, as the air is carried to it by a comparatively light rubber hose. In the compression riveter shown by the accompanying photograph it will be noted that a comparatively small cylinder is used. The necessary pressure is obtained by the toggle leverage and the rivet is driven by one piston movement. The speed of riveting, therefore, depends mostly on how quickly the machine is moved from one rivet to the next. In one case 12,000 rivets were driven in 10 hours. The work was a long plate girder and the machine was hung from a trolley on an overhead runway. The operator had become very expert in moving the machine from one rivet to the next, the spacing being equal, and several heater-boys kept the holes ahead of the machine full of hot rivets. The rivets were $\frac{3}{4}$ in. in diameter. The hot dies were replaced by cool ones at given intervals. Under quite similar circumstances 10,000 rivets were driven in 10 hours. These figures are of interest merely to show what actually can be done. The class of work is all important, and on boiler work, where the rivet must be steam-tight and well driven, no such record could possibly be made.



Albree Portable Compression Riveter.

The riveter illustrated herewith is made by the Chester B. Albree Iron Works Co., Allegheny, Pa. It weighs 850 lbs., has 6 in. reach, and drives $\frac{7}{8}$ in. rivets.

The Eleventh Avenue Controversy.

The New York Public Service Commission, First District, considers that it is unwise to place a freight line either below or above Eleventh avenue, and recommends that an electric freight structure be built on the so-called marginal way along the North river water front between West street and the piers. The Commission says there is no doubt that an elevated freight road along the river front would some time be of advantage to shippers, although it holds that the present pier uses are such that there is no great demand for freight car connections, as the docks are used more and more for passenger and package freight and freight intended for the interior can be cheaply delivered to railroads. The Commission says: "The best available plan would seem to be to let some company build at its own expense—the New York Central if it would undertake the work on more favorable terms than any one else. An arrangement might be made analogous to that made by the authorities for the continuation of the McAdoo tunnel route through Sixth avenue to 33d street, which was substantially that the city could buy at its then value at any time after twenty-five years and in the meantime a fair consideration was made payable to the city for the franchise privileges."

Direct Current in Belgium.

The management of the Belgian State Railroads, after long investigation, has decided to use direct current and the third rail on several miles of road at the Parc de Laeken, near Brussels. This decision was made in accordance with the recommendations of a report by E. Lytboreck, electrical engineer of the government railroads, who some months ago visited the United States and spent considerable time investigating the operation of the New York Central, the New Haven and other installations, visiting manufacturing companies and fully acquainting himself with the state of direct current and single-phase development in this country. The Belgian government has been given a license to use the Wilgus-Sprague type of protected third rail, and orders for much of the necessary materials have already been placed in this country. The road on which this installation is to be made is new, but it is understood that this is the initial step in the electrification of certain lines near Brussels.

INTERSTATE COMMERCE COMMISSION RULINGS.

Midland Valley Need Not Re-establish Station.

The Commission, in an opinion by Commissioner Prouty, has announced decision in the case of Eddleman et al. v. Midland Valley. The complainants asked the Commission to order the railroad to re-establish its station at Elder, Okla. (formerly Indian Territory), which was removed in December, 1906. The complaint was dismissed by the Commission on the ground that the interest of the general public does not require such re-establishment. The Commission further found that the location of this station at Elder would be an unnecessary burden on the defendant. The Commission also declared that if the complainants had a contract with the carrier to locate and maintain its station at Elder, they may perhaps maintain a suit at law for breach of that contract; but that the Commission has no power to award damages for failure to perform such a contract.

Freight to be Billed at Actual Weights.

The Commission, in an opinion by Commissioner Lane, has announced decision in the case of Romona Oolitic Stone Company v. the Vandalia Railroad. The Commission decided that a rule of a carrier, subject to the act to regulate commerce, by which shipments of stone from non-scale points are billed from such points at weights equal to the marked capacity of the cars, subject to correction when weights are taken, is unreasonable, because on such cars as are not in fact weighed before delivery the carriers proceed to collect freight upon such marked capacity weights. A change of such rule to a rule that such shipments shall be billed at the published carload minimum is held to be also indefensible. The Commission ordered the defendant to desist and refrain from showing purported weights upon its billing until such weights shall have been ascertained either by weighing or by some fair method of computation from cubic contents.

Classification of Wire Coat Hooks.

The Commission, in an opinion by Commissioner Cockrell, has announced decision in the case of the Forest City Freight Bureau v. the Ann Arbor Railroad and 58 other carriers in official classification territory. The complainant asked that a change be made by these carriers in the classification of wire coat hooks packed in cases, when shipped in less than carload lots. As the classification now stands, these coat hooks are in the third class, being included in "hardware specialties not otherwise specified." It was asked that they be transferred to the fourth class, but the Commission held that the present classification of these articles in official classification territory is not shown to be unreasonable and ordered the complaint dismissed.

The Commission said that while it is evident that wire coat hooks are but little more valuable than the raw material from which they are made and no more liable to damage in transit, still the present classification is not unreasonable. The comparison as to their value and that of the spring hinges shows a wide discrepancy, but it is not shown that these hinges are typical of the bulk of the articles placed in the third class. It appears, moreover, that many articles of less value than wire coat hooks are also in the third class. It is true that these articles introduced at the hearing by the defendants are generally made of cast metal somewhat more liable to breakage than the wire coat hooks. It does not appear, however, that any considerable loss to the carriers is caused by breakage of these cast iron hardware specialties.

Freight Bureau Competent to Bring Complaint; Classification of Brushes.

The Commission, in an opinion by Commissioner Lane, has announced decision in the case of the Forest City Freight Bureau v. the Ann Arbor Railroad and others. The Commission held that the bureau, a concern which admits members upon written contract to perform certain services in return for an annual fee, is an association competent to bring a complaint before the Commission under the act to regulate commerce. The fact that it may not be able to answer in costs in case such should be awarded against it on appeal from the Commission to the courts does not take away its right to bring complaint under the act. The Commission decided in this case that the inclusion of wire brushes and brooms, not toilet, in cases in less than carloads, in the first class in official classification is unreasonable. Defendants were ordered to classify such brushes and brooms in official classification territory in the third class.

Grain Differentials from St. Louis and Kansas City to the Southwest.

The Commission, in an opinion rendered by Commissioner Prouty, has announced decision on motion for rehearing in the case of the Traffic Bureau of the Merchants' Exchange of St. Louis v. Missouri Pacific and St. Louis, Iron Mountain & Southern. In the original case the Commission ordered the carriers to cease from exacting for transportation of grain and products thereof from St. Louis, Mo., to Little Rock, Ark., a rate of 18 cents per 100 lbs. on wheat and its products and of 15 cents per 100 lbs. on coarse grains, so far as applied to such transportation after the traffic has been carried by railroad to St. Louis from points outside that city. The defendants were required to put in rates on wheat not to exceed 13 cents and on coarse grain not to exceed 11 cents per 100 lbs.

Defendants filed motion for rehearing on the grounds that the lower rates from St. Louis will necessitate a reduction in rates from western points of production, and that these lower rates will enable the St. Louis merchants to handle grain into territory which is now covered by Little Rock. The Commission refused to modify its former order on these grounds. A third reason was that if the rate from St. Louis to Little Rock was reduced, the Kansas City Southern will reduce its rates to Texarkana and corresponding points. The Commission did not think this was any justifiable reason, but in order to avoid giving any possible color to such action on the part of the Kansas City Southern, decided to make the differential between Kansas City and St. Louis into this territory 1 cent less than its former order contemplated; that is to say, 12 cents on coarse grains and their products, and 14 cents on wheat and its products.

Accordingly the Commission denied the petition for rehearing, but struck off its former order and issued a new order putting in effect these revised rates.

TRADE CATALOGUES.

Mill Type Motors.—The motors described in bulletin No. 4562 of the General Electric Co., Schenectady, N. Y., are the d.c. M D type and the a. c. M I type. They are built in sizes from 30 h.p. to 150 h.p. The d.c. motors, while generally rated at 220 volts, can be supplied for 500 volts with a slight variation from standard speed, and the a.c. motors are wound for either 220 or 440 volts, 25 cycles, three-phase. They are for operating rolling mills, hoists, turntables, conveying machinery, etc.

Lifting Magnets.—The Electric Controller & Supply Co., Cleveland, Ohio, is distributing a well illustrated pamphlet describing several types of lifting magnets for handling iron and steel to and from cars, in shops, in scrap storage yards, etc. Different types are furnished for handling different shapes of material. The pamphlet includes the list of the company's customers of the past three years.

Air-Brake Lubrication.—The Joseph Dixon Crucible Co., Jersey City, N. J., has issued a pamphlet calling attention to graphite air-brake and triple valve grease. It mentions the parts on which this lubricant can be used to advantage, and the lubricating troubles ordinarily experienced with the air-brake system are pointed out and the remedies given.

Illinois Central.—A folder issued by the passenger department calls attention to the coming Mardi Gras carnival at New Orleans. The folder is illustrated with photographs taken during last year's carnival, and describes train service from various points to New Orleans via the Illinois Central.

Lifting Magnets.—The Cutler-Hammer Clutch Co., Milwaukee, Wis., is distributing a booklet entitled "Lifting Magnets and Recent Improvements in Them." The booklet is a miniature reproduction of *Cassier's Magazine* for October, 1907, in which the article originally appeared.

Roofing.—A pamphlet issued by the Eastern Granite Roofing Co., New York, describes Granite roofing and shows photographs of buildings roofed with it. This material is made of alternate layers of wool felt and granite composition, surfaced on the outside with sea grit.

Second Hand Metal Working Machinery.—List No. 15 of the Niles-Bement-Pond Co., New York, is a catalogue of a large variety of second-hand metal working machines, which the company has for sale. Each machine is briefly described, with dimensions.

Valves.—Jenkins Bros., New York, have issued catalogue supplement No. 1, which describes and illustrates, with price lists, extra heavy gate valves for 250 lbs. working steam pressure and medium pressure gate valves for 150 lbs. pressure.

MANUFACTURING AND BUSINESS.

Robert W. Hunt & Co., Chicago, have established their St. Louis, Mo., office, which is in charge of C. W. Gennet, Jr., at 1415 Syndicate Trust building. Their chemical and cement laboratory will be in the same building.

The Sellers Manufacturing Co., Chicago, maker of railroad supplies and equipment, has bought a 16-acre tract adjoining its present plant. The land lies between north 45th and 47th avenues, adjacent to the St. Paul and the North-Western tracks.

J. W. Duntley, President of the Chicago Pneumatic Tool Co., Chicago, sailed for Europe on Feb. 4 to attend to business matters abroad. It is stated that the January business of the company in America showed a considerable improvement over December.

The usual convention of branch managers of the H. W. Johns-Manville Co., New York, was held in that city from January 29 to February 1. There was a general discussion of the business affairs of the company and on the evening of January 31 a banquet was given at the Union League Club.

William J. Seaton, Jr., Second Vice-President of the C. W. Hunt Co., West New Brighton, New York, died at his home at Clifton, Staten Island, on January 18, from typhoid fever. Mr. Seaton was 36 years old and had been with the company for 17 years. He began as office boy and was steadily promoted.

J. F. Donahue, for five years Secretary and Manager of Sales of the New Castle Forge & Bolt Co., New Castle, Pa., has been appointed Western Sales Manager of the Russell, Burdsall & Ward Bolt & Nut Co., Port Chester, N. Y., with headquarters in the Commercial National Bank building, Chicago.

The G. Drouve Company, Bridgeport, Conn., at the annual meeting of directors on February 3 elected G. Drouve President and Treasurer, and William V. Dee, Secretary. Mr. Dee, who recently resigned from the *Railway Age*, has been appointed also General Sales Manager. The company makes the "Anti-Pluvius" skylight, the Lovell window operating device, Drouve ventilator, drying stove, etc.

Iron and Steel.

The Pennsylvania has ordered 55,000 tons of rails. Details are given in our editorial columns.

The New York City Railway has ordered 2,500 tons of rails from the Pennsylvania Steel Co.

The Canadian Pacific is said to have ordered 40,000 tons of 85-lb. rails from the Lake Superior Corporation.

It is reported that certain western railroads are in the market for an aggregate of 100,000 tons of rails and that two eastern railroads are also making inquiries.

The Chicago, Milwaukee & St. Paul has ordered 3,000 tons of bridge material from the Pennsylvania Steel Co. According to Chicago despatches, the Chicago, Burlington & Quincy is about to order 1,600 tons of bridge material, and the Great Northern and the Chicago & North-Western have ordered, or are negotiating for, large amounts.

OBITUARY NOTICES.

Richard Tull, Treasurer of the Philadelphia & Reading Railway and the Philadelphia & Reading Coal & Iron Co., died at his home in Philadelphia on February 9.

Charles L. Francisco, for many years Superintendent of Building at the Grand Central Station, New York City, died at his home at Yorktown Heights, N. Y., on January 29.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Baltimore & Ohio Southwestern.—E. W. Scheer has been appointed Assistant Secretary, with office at Cincinnati, Ohio, in place of J. G. Walber.

Canadian Pacific.—W. R. Baker, Assistant to the President, has been appointed also Secretary, succeeding Charles Drinkwater, resigned.

Macon & Birmingham.—S. F. Parrott, Vice-President, has been appointed Receiver by the Superior Court at Atlanta, on petition of the Old Colony Trust Company.

Minneapolis & St. Louis.—W. W. Cole has been appointed Assistant Treasurer, with headquarters at Minneapolis, Minn., in place of Joseph Gaskell, deceased.

Mississippi Central.—John T. Porter has been chosen Treasurer and G. F. Royce, Secretary, both with offices at Scranton, Pa.

Mississippi Valley.—This company operates the Portland & Southeastern under lease. J. H. Byrd is President and M. G. Price, Vice-President and General Manager. Office at St. Louis, Mo.

San Antonio & Aransas Pass.—J. W. Terry has been elected Secretary. He will retain the position of Auditor.

Susquehanna & New York.—W. R. Campbell has been appointed Assistant to the President, with office at New York.

Western Allegheny.—The officers of this road, formerly the Western Allegheny division of the Bessemer & Lake Erie, are: Emmet Queen, President; Thos. Liggett, Vice-President; A. H. Eames, Secretary and Treasurer. Offices at Pittsburgh, Pa.

Operating Officers.

Annapolis, Washington & Baltimore.—Joseph O'Hara has been appointed General Superintendent, with office at Baltimore, Md., to relieve W. E. Slaughter, who continues as Traffic Manager. Henry Donavan is Master Mechanic, with office at Odenton, Md.

Canadian Northern Quebec.—R. S. Richardson has been appointed Assistant General Superintendent, with office at Montreal.

Canadian Pacific.—C. Murphy, hitherto Superintendent of district No. 2, Ontario division, has been appointed Acting General Superintendent of the Lake Superior division, taking the place of F. B. Brady, who is absent on account of ill health.

Fort Smith & Western.—W. E. Crane, Vice-President and General Manager, has resigned.

Gulf Line.—W. T. Hargrett has been appointed Superintendent in place of D. L. Turner, resigned; office at Sylvester, Ga.

Intercolonial.—J. H. Brassard, hitherto chief train despatcher, has been appointed Inspector of Transportation, to travel throughout the company's lines and co-operate with other officers in securing efficient service. John Stewart has been appointed Traveling Inspector of Locomotives and Cars, with similar authority and relations to other officers.

Louisiana Western.—See Morgan's Louisiana & Texas.

Mississippi Valley.—H. L. Pitman is Superintendent, office at Portland, Ark.

Missouri Pacific.—M. M. Richey, heretofore with the Southern Railway, has been appointed Superintendent of the Arkansas division, with office at Little Rock, Ark.

Morgan's Louisiana & Texas.—W. M. Hobbs, hitherto Vice-President and General Manager of the San Antonio & Aransas Pass, has been appointed General Superintendent of Morgan's Louisiana & Texas and of the Louisiana Western, with headquarters at New Orleans, La., in place of E. B. Cushing, assigned to other duties.

Morrissey, Fernie & Michel.—J. D. Hurd has been appointed General Manager, with office at Fernie, B. C.

New York, New Haven & Hartford.—In connection with a radical rearrangement and enlargement of divisions, assignments of Superintendent to the several new divisions are announced as follows: New York, J. P. Hopson, office at New York City; Shore Line, C. N. Woodward, office at New Haven; Western,

C. S. Lake, office at New Haven; Midland, B. R. Pollock, office at Hartford; Providence, J. A. Droege, office at Providence; Old Colony, Andrew Ross, office at Taunton; Boston, A. W. Martin, office at Boston. Each Superintendent will have a master-mechanic.

The new divisions are as follows:

Old Colony—From South Braintree to Provincetown, including the Easton, Fall Haven, Woods Hole, Hyannis and Chatham branches; from South Braintree to Plymouth, including the Hanover, Bridgewater and Plymouth branches; from Braintree to Kingston, including the Nantasket Beach branch; from Mayflower Park, Mass., to Newport, R. I., from New Bedford to Lowell and Fitchburg, including the Watuppa, Somerset, Middleboro, Marlboro and Sterling branches.

Midland—From Hartford to Readville, including the Hartford terminals; Hartford to Springfield via Melrose, Cedar Hill to Dike street, Providence, R. I., via Willimantic and Plainfield, including the Colchester branch; from Groton, Conn., to Worcester, including the Southbridge branch.

Western—From Bridgeport to Pittsfield, Mass., including the New Haven, Litchfield, Brookfield Junction and State Line branches; from Naugatuck Junction to Winsted, including the Watertown branch; from Hartford to Hopewell, N. Y., including the branch from Waterbury to Meriden; from New Britain to Berlin.

New York—From the Grand Central Station, New York, to Stamford, the New Canaan branch and the line from Harlem river to New Rochelle, including the New York and Harlem river water terminals.

Shore Line—From Stamford to Midway (near New London); New Haven to Turners Falls and Shelburne Falls, including the New Hartford, Holyoke and Williamsburg branches; Cedar Hill (New Haven) to Springfield, Mass., including the Suffield branch; Fenwick to Hartford; Wilson Point to Danbury, including the Ridgefield branch.

Providence—From Midway to Readville, including the Providence terminals, the Providence, Warren & Bristol, the Hope, Pascoag, Valley Falls, Franklin, Ashland, Wrentham, Stoughton, Attleboro and East Providence branches; Boston Switch, R. I., to Worcester, Mass., including the Woonsocket branches.

Boston—From the Boston Terminal Company's connection to Readville on the present Providence and Midland divisions; to Needham Junction; to Cook street; to South Braintree and all intermediate branch lines, including the South Boston freight terminals.

Northwestern Pacific.—W. J. Hunter has been appointed Superintendent of the Southern division, with office at Sausalito, Cal.; and John H. McRae, Superintendent of the Northern division, with office at Albion, Cal.

Ohio River & Western.—J. K. Geddes has been appointed General Manager in place of W. R. Crumpton; office at Woodsfield, Ohio.

Orange & Northwestern.—J. E. Kelly has been appointed Superintendent; office at Orange, Tex.

Quebec & Lake St. John.—Jas. J. Sunderland has been appointed Acting Superintendent in place of James Bain; office at Quebec, P. Q.

San Antonio & Aransas Pass.—W. M. Hobbs, Vice-President and General Manager, has resigned. J. S. Peter has been appointed General Manager.

Tallulah Falls.—J. A. Dodson has been appointed Superintendent in place of W. S. Irwin, resigned; office at Cornelia, Ga.

Western Allegheny.—H. F. Bickell has been appointed Superintendent.

Traffic Officers.

Canadian Pacific.—G. H. Smith, hitherto Assistant General Freight Agent at Vancouver, B. C., has been appointed Assistant General Freight Agent of the Central division in place of W. H. Robertson, who has been transferred, office at Winnipeg, Man.

W. H. Robertson has been appointed Assistant General Freight Agent of the Pacific division, changing places with G. H. Smith.

Chicago, Burlington & Quincy.—See Quincy, Omaha & Kansas City.

Great Northern.—M. J. Costello has been appointed Assistant Traffic Manager in place of H. M. Adams, resigned, office at Seattle, Wash.

Iowa & St. Louis.—See Quincy, Omaha & Kansas City.

Quincy, Omaha & Kansas City.—A. J. Handy is in charge of the Freight and Passenger Departments, with the title of General Freight and Passenger Agent; and he has charge of the same department of the Iowa & St. Louis, which road is leased to the Chicago, Burlington & Quincy.

Engineering and Rolling Stock Officers.

Chicago, Rock Island & El Paso.—J. G. McLaren has been appointed Master Mechanic, with office at Dalhart, Tex., in place of J. McDonough.

Chicago, Rock Island & Pacific.—H. F. White, Engineer of Maintenance of Way, has resigned, and the position has been abolished.

Union Pacific.—John A. Turtle, hitherto Assistant Superintendent of Motive Power, has been appointed Master Mechanic of the Colorado division, with headquarters at Denver, in place of E. F. Fay, transferred to Cheyenne, Wyo.

Purchasing Agents.

Chicago Great Western.—A. D. Ward has been appointed Purchasing Agent in place of V. F. De Vinney, resigned. Mr. Ward held the position until he resigned two years ago.

Delaware & Eastern.—K. H. Dunham has been appointed Purchasing Agent.

Mexican Central.—E. V. Dexter has been appointed Purchasing Agent, with headquarters in the City of Mexico. The offices of Acting Purchasing Agent in the city of New York, and Assistant Purchasing Agent in the City of Mexico have been abolished.

Pere Marquette.—W. C. Atherton has been appointed Purchasing Agent; office at Detroit, Mich.

LOCOMOTIVE BUILDING.

The New York, New Haven & Hartford has ordered six electric locomotives from the Westinghouse Electric & Manufacturing Co. They will be similar to those now in use on the road.

CAR BUILDING.

The Atlanta & West Point is ordering accessories for 150 freight cars.

The Atlanta, Birmingham & Atlantic has ordered 188 box cars from the American Car & Foundry Co.

J. D. McArthur & Co., Ltd., Winnipeg, have ordered 50 flat cars of 60,000 lbs. capacity from the Hicks Car & Locomotive Works.

The Texas Interurban Company, which plans to build about 30 miles of road in Texas, is figuring on gasolene motor cars. T. Moore, Elizabeth, N. J., is interested.

The West Chester & Wilmington (Electric), which is to build 17 miles of road this spring, expects to ask bids on rolling stock in March. T. E. O'Connell, Wilmington, Del., is President.

The Charleston & Summerville (Electric), under construction in South Carolina, will shortly ask bids on rolling stock. W. O. Sprigg, 15 Whitehall street, New York, is Chief Engineer.

The Great Cosmopolitan Shows have ordered four 60-ft. flat cars of 60,000 lbs. capacity from the Mount Vernon Car Manufacturing Co. The special equipment includes: Mount Vernon brake-beams, brake-shoes and wheels.

The Colorado & Southern, as reported in the *Railroad Gazette* of January 10, has ordered for the Denver & Interurban eight interurban motor and four interurban trailer cars from the St. Louis Car Co., for April, May and June delivery. The motor cars will weigh 55 tons, and measure 55 ft. 6 in. long, 10 ft. ¼ in. wide over all, and 11 ft. 3 in. high from rail. The trailer cars will weigh 35 tons, and measure 53 ft. 10 in. long, 10 ft. ¼ in. wide and 11 ft. high, over all. The special equipment for all includes:

Brake-shoes	Sargent
Brakes	Westinghouse American
Brasses	Hewitt
Curtain fixtures	Forsyth
Curtain material	Pantasote
Heating system	Consolidated
Journal boxes	Franklin
Paint	Murphy
Seats	St. Louis Car Co. standard
Springs	Railway Steel Spring Co.
Trucks	American Locomotive Co.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

ABERDEEN & ASHBORO.—The Carthage branch of this road has been opened for business from Pinehurst, N. C., north to Carthage, 13 miles. (Dec. 6, p. 701.)

BLUE RIDGE TRACTION.—This company, operating seven miles of electric roads in Pennsylvania, proposes to build extensions to various points aggregating 16 miles. The principal extension will be through Cherryville, Weaversville and Bath. A bridge is also to be built at Alliance. The headquarters of the company is at Bethlehem.

Cananea, Yaqui River & Pacific.—See Southern Pacific.

Central California.—See Southern Pacific.

Coast Line Railway.—See Southern Pacific.

Colorado & Southern.—On the terminals that the Galveston Terminal Company is building at Galveston, Tex., for the Chicago, Rock Island & Pacific, the St. Louis & San Francisco, the Colorado & Southern, the New Orleans & Pacific and the St. Louis, Brownsville & Mexico, $850,000 has already been spent filling in and putting up a freight house. About $5,000,000 is to be spent altogether. Over 40 miles of track has been laid and large repair shops, roundhouses and other buildings will be put up. In addition to the six blocks of water front, which the company owns, as a site for extensive shipping facilities, the company has 130 acres of land on which the railroad terminal will be established. About $3,000,000 will be spent for improving the water front, including the dredging of a 30-ft. channel, so that large steamers may load at the railroad docks.

Columbus & Erie.—See Erie.

Columbus, Magnetic Springs & Northern.—This company, which is a consolidation of the Delaware & Magnetic Springs Railway and the Richwood & Magnetic Springs Railway, operates 18 miles of line from Delaware, Ohio, via Magnetic Springs to Richwood, of which a length of five miles was built last year. The company intends to extend the line from Richwood north to La Rue, 12 miles. W. M. Galbraith, President; C. Magee, Vice-President and Treasurer, Pittsburgh, Pa.; H. E. Buck, Secretary, Delaware, Ohio.

Cortland & Auburn.—An officer writes that this company expects to begin grading work early this spring on its proposed line from Cortland, N. Y., northwest via Homer, Scott, Glenhaven and Owasco to Auburn, 36 miles. It has not yet been decided whether the road shall be operated by steam or gasolene. Walter L. Webb, Ch. Engr., 2221 Land Title building, Philadelphia, Pa.

Erie.—The Columbus & Erie will soon be finished. It is a single-track line from Columbus, Pa., to Niobe, and a double-track line from that point to Lakewood, N. Y., a total of 23 miles. The work was done by Burke Bros., of Scranton, Pa., and J. G. White & Co. About 8.34 miles of this line was finished last year. The line is a part of the improvements being carried out to reduce the grades and improve the alinement of the main line.

Eureka Hill.—This company has finished its line from Silver City, Utah, via Dragon Hollow to the Beck tunnel and the Colorado mine, and is now in operation hauling ore to Silver City, at which point a smelter is being built by Jesse Knight, President of the company. J. William Knight, Vice-President; R. E. Allen, Secretary and Treasurer, and W. Lester Mangum, Director and General Manager, Provo, Utah.

Florida Central.—This road is now opened for business from Thomasville, Ga., south to Roddenbery, 13 miles, and from Fanlew, Fla., south to Veren, 12 miles. Work is under way from Roddenbery, Ga., south to Fanlew, 34 miles. (Jan. 3, p. 36.)

Galveston Terminal.—See Colorado & Southern.

Grand Trunk Pacific.—Bids, it is said, are wanted March 10 by P. E. Ryan, secretary of the Transcontinental Railroad Commission, Ottawa, Ont., for building the following sections:

District D.—From a point designated on the plans of the commissioners, about 8 miles west of the Abitibi river, crossing in Ontario, west about 100 miles.

District E.—From a point 19½ miles west of the crossing at Mud river, near Lake Nepigon, for about 75 miles.

Bids are also wanted for building 195 miles in New Brunswick and 52 miles in Quebec.

The company, it is said, has settled the differences with the British Columbia government in regard to the lands around Prince Rupert, B. C., and a contract for the first 100 miles from Prince Rupert eastward is to be let within three months.

Indianapolis, Huntington, Columbia City & Northwestern (Electric).—This company, of which William Self, Syracuse, Ind., was the receiver, was sold Feb. 1 by order of the Superior Court of Marion county at Warsaw, Ind., to Melvin A. Peoples, of Chicago. This line is built for five miles from Syracuse, Ind., to Vawter's Park, and has about five miles additional graded toward Goshen, Ind. The company was organized to build an electric line from Goshen, Ind., south via Syracuse, Wawasee Lake and Columbia City to Huntington. Mr. Peoples, associated with Burns & Company, Isabella building, Chicago, plans reconstructing and extending the line as projected.

Inter-California.—See Southern Pacific.

Interstate Railway (Electric).—This company expects to start grading this spring on its proposed electric line from St. Joseph, Mo., to Kansas City, 47 miles. Right-of-way secured. Smith H. Bracey, 1606 Tribune building, Chicago, will have charge of the construction work.

Joliet & Southern Traction.—This company which last year built about three miles of line in Joliet, Ill., and seven miles from Joliet to New Lenox, expects to finish work on the last named, the Blue Island division, this year; also south from Joliet through Ellwood to Wilmington, 16 miles.

Kanawha Central.—This road is opened for business from Broundland, W. Va., where connection is made with the Coal River Railway, to Olcott and Dungriff, five miles.

Kansas City, Mexico & Orient.—The Chihuahua division has been extended from Picachos, Mex., to Falomir, eight miles.

Kansas Southern & Gulf.—This company expects to build this year an extension from Westmoreland, Kan., to Manhattan, 22 miles. The work will include a 300-ft. bridge over the Blue river. Surveys are made for an extension from Blaine, Kan., to Falls City, Neb., 65 miles. Grading is to be begun about May 1. O. J. Collman, General Manager, Lincoln, Neb., and J. E. Williams, Chief Engineer, Westmoreland, Kan.

Kentucky & Tennessee.—This company, building from Stearns, Ky., west to Rockcreek, 20 miles, has finished the line to Oz, 10.5 miles. Work on the rest of the line has been indefinitely suspended.

Laramie, Hahn's Peak & Pacific.—An officer writes that contracts are about to be let for some of the work on the extension from Centennial, Wyo., south to Hebron, Colo. Part of the work is being done by J. F. White and some by the company's men. (Jan. 17, p. 105.)

Lima & Toledo Traction.—See Ohio Electric Railway.

Lincoln Northern Railway.—See Southern Pacific.

Manistique.—This road has been extended from Curtis, Mich., to Wilman, three miles.

Mexican Pacific Coast.—See Southern Pacific.

Nevada County Narrow Gage.—This company began work last year on a cut-off between Colman Station, Cal., and Long Ravine to shorten its line about two miles. Work is being done by the company's men. Grading finished for 1½ miles and track laid for about three-quarters of a mile. The work includes putting up a steel bridge 190 ft. high and about 800 ft. long, which is to be begun April 1.

Norfolk & Southern.—The Columbia branch has been extended from Creswell, N. C., south to Columbia, nine miles.

Ohio Electric Railway.—The Lima & Toledo Traction, building an extension from Deshler, Ohio, northeast about 30 miles to Toledo, has finished a reinforced concrete bridge 1,220 ft. long over the Maumee river near Waterville. Grading has been finished to the Toledo city line. Work has been suspended, but will be resumed this spring, and the line finished into Toledo this summer. (Dec. 6, p. 701.)

Oregon Eastern.—See Southern Pacific.

Oregon Railroad & Navigation.—This company has opened the Pilot Rock branch for business from Pilot Rock Junction, Ore., south to Pilot Rock, 14 miles.

Oregon Western.—See Southern Pacific.

Peninsular Railroad.—See Southern Pacific.

Philadelphia & Reading.—Bids are wanted February 27 by W. Hunter, Chief Engineer, Philadelphia, Pa., for work in connection with the elimination of grade crossings on the Philadelphia, Germantown and Norristown as follows:

Contract No. 28 car cleaning yard Huntington street.

Contract No. 30 coal pocket yard between Berks and Norris streets (East Side).—(Nov. 22, p. 636.)

Portland, Eugene & Eastern (Electric).—This company, which has projected an electric line from Portland, Ore., via Eugene to a point in eastern Oregon, about 182 miles, has grading work under way from Eugene to Springfield, six miles, and track laid in Eugene for three miles. The work includes putting up three bridges. Under the name of the Salem-Mehama, a line is projected from Salem, Ore., southeast to Mehama, 24 miles. Surveys and rights-of-way secured by Walters Bros., of Salem. The project is financed by A. Welch, of Portland.

Port Simpson & Fort Churchill.—Application is being made for incorporation by this company, with a capital of $100,000, to build a line from Port Simpson, B. C., northeast to Fort Churchill on Hudson Bay. The incorporators include, W. H. C. Duvall, Surveyor General for Canada; J. Brandon, Victoria, B. C.; H. White, former Mayor of Seattle, Wash.; J. McLaughlin, Los Angeles, Cal., W. H. Harding, New York; S. Shenstone representing the Rothschild; E. B. Dean, Scranton, Pa., and A. C. Latimer, Washington, D. C.

St. Joseph Valley Railway.—See St. Joseph Valley Traction.

St. Joseph Valley Traction.—This company is building a line from Middlebury, Ind., east via Shipshewana to La Grange, and, under the name of the St. Joseph Valley Railway, from that point via Mongo and Orland to Angola, 43.7 miles. Construction work is about finished with the exception of some grading, on which work will be resumed this spring. Preliminary surveys have been made from Middlebury west to South Bend; also from Angola east to Pioneer, Ohio, and Montpelier. G. T. Moore, General Manager.

Sacramento Valley & Eastern.—This company is building with its own men from Pitt, Cal., to Delamar, 16 miles. Contract for the bridge work let to the Globe Construction Co., of San Francisco. Address T. J. Dearborn, Winthrop.

Salem-Mehama.—See Portland, Eugene & Eastern.

South Dakota Central.—This company has opened for business the extension from Arlington, N. Dak., north to Hayti, 21 miles. (Aug. 30, 1907.)

Southern Pacific.—The report of this company for the year ended June 30, 1907, shows that work was under way as follows:

Grading is finished on a line from Benedict, Cal., to Smeltzer, about six miles, and about seven miles of track has been laid on a line from Empire to Rossi, about eight miles, and the grading finished on the remaining mile.

The Bay Shore Line cut-off, a double-track line from San Francisco to San Bruno, about 10 miles, during the year was finished for about nine miles. The line will be finished during the early part of 1908.

Central California.—Organized to build from Niles, Cal., to Redwood City, about 16 miles. Grading finished on three miles and work in progress on the remainder.

Coast Line Railway.—Building north from Santa Cruz, Cal., about 12 miles; nine miles finished and work on the remaining three miles progressing.

Peninsular Railroad.—Building from Mayfield, Cal., to Vasona, about 16 miles; nine miles graded and grading work under way on the remainder of the line.

Lincoln Northern.—Organized to build a line from Lincoln, Cal., to Dairy Farm Mine, about 11 miles.

On the Inter-California branch line from Old Beach (now Imperial Junction), Cal., on the main line of the Southern Pacific, south to Calexico, 41.36 miles, an extension is building east from Calexico, Cal., through the northern part of the Republic of Mexico to Yuma, Ariz., 55 miles. About 19 miles of track laid and three miles additional graded. Work under way on the remaining 33 miles.

Central Pacific.—A spur track from Tacoma, Nev., to the Ore Bins of the Salt Lake Copper Company, about 3.88 miles, was opened September 6.

Oregon Eastern.—On the 152 miles projected by this company, the surveys between Natron, Ore., and Klamath Falls, and between the eastern side of the Cascade Mountains and Ontario have been finished and considerable right of way secured.

Oregon Western.—Projected line 82 miles. Surveys made from Drain, Ore., via Marshfield to Ward and considerable right of way secured. Grading and tunneling on the line is progressing, and a large part of the steel bridges, rails, ties and other track material for the line were bought during the year.

Texas & New Orleans.—A line from West Port Arthur, Tex., to Port Arthur, about three miles, was opened for traffic on September 15.

Cananea, Yaqui River & Pacific.—On this line, from Empalme, Mex., a point on the Sonora Railway, to Tonichi, about 159 miles, the line from Corral north to Buena Vista, about 18 miles, was opened for traffic in February, 1907, making a total of 82 miles in operation. Work is progressing on the remaining 73 miles. On the extension from Corral southeast to Alamos, about 92 miles, the line from Corral to Velderrain, about 27 miles, was also opened for traffic in February, 1907, and from Velderrain to Navojoa, about 27 miles, was opened in May, making a total of 54 miles in operation. Work on the remaining 38 miles is progressing.

Mexican Pacific Coast.—Building from Navojoa, Mex., on the Cananea, Yaqui River & Pacific, southeast to Guadalajara, about 720 miles. About 10 miles was finished from Navojoa, south, and work is progressing on other sections of the line.

Morgan's Louisiana & Texas.—On the extension from Lafayette, La., to Port Allen (opposite Baton Rouge), about 21 miles is finished and work on the remaining 32 miles is in progress. On the extension from Bayou Sale to South Bend, about 11 miles, grading is finished.

Louisiana Western.—On the extension from Eunice, La., to Mamou grading is finished on about 10 miles and work under way on the remaining seven miles.

Other improvements during the year include: second main track on the Pacific system between Burbank, Cal., and Los Angeles, 8.10 miles. The 15 miles between Elvas, Cal., and Roseville will probably be finished early in 1908. Work is under way on three miles between Shriever, La., and Thibodaux. About 24.75 miles of narrow gage was changed to standard. Work is also under way on a change of line near Palisade, Nev., on 1.48 miles of main track where the line is to be shortened, also near Santa Barbara on 1.60 miles of main track and second track.

Union Central.—This company, it is said, has announced that work on its main line from Dallas, Tex., to New Orleans is to be started this month and pushed to completion. The first section to be built will be from Dallas to Irondale, 60 miles. A branch is already finished from Irondale to Wortham, 30 miles. The office of the company is at Dallas. W. J. Hogue is President.

RAILROAD CORPORATION NEWS.

Detroit, Toledo & Ironton.—Thomas D. Rhodes, of New York, formerly receiver of the Detroit Southern, has been appointed a third receiver of the Detroit, Toledo & Ironton on the application of the Knickerbocker Trust Company on behalf of security holders in New York. Officers of the railroad were appointed as the first two receivers.

Great Northern.—The approximate gross earnings for January were $3,316,130, an increase of $769,604. For the seven months ended January 31, gross earnings were $38,906,974, an increase of $4,885,204.

Illinois Central.—Decision is to be given on February 20 on the right of E. H. Harriman to vote 281,231 shares of Illinois Central stock held by outside corporations, principally by the Union Pacific.

Louisville & Nashville.—Gross earnings for December were $3,358,000, against $4,053,000 in 1906, a decrease of 17 per cent. Net earnings were $379,000, against $1,371,000 in 1906, a decrease of 72 per cent. For the six months ended December 31, 1907, gross earnings increased 3 per cent. and net earnings decreased 22 per cent. The 1906 figures are revised so that the comparison is not vitiated by the Interstate Commerce Commission's classification of earnings and expenses in use since June 30, 1907.

This company has issued a circular to its stockholders, giving information about the Louisville Property Company, in whose stock an extra dividend of 1 per cent. was paid this week to Louisville & Nashville stockholders. The Louisville Property Company is a Kentucky corporation whose entire capital stock, amounting to $50,000, was owned by the Louisville & Nashville. It held many tracts of land adapted to the uses of the railroad and also considerable bodies of coal lands, chiefly in Kentucky. Because of the provision of the Rate Law against transportation of coal in which a railroad has an interest direct or indirect, the close relations between the two companies were severed by dividing the railroad's interest in the property company among the railroad's stockholders. To this end the capitalization of the property company was increased from $50,000 to $600,000 and certain conveyances of land were made in order that the large indebtedness of the property company to the railroad company should thereby be reduced. "It is believed that the shares of the Louisville Property Company are reasonably worth their par value, if not more."

Norfolk & Southern.—J. F. Pierson, Jr., & Company, New York, are offering at 91 and accrued interest, netting about 8½ per cent., $500,000 of the $2,750,000 three-year 6 per cent. collateral trust notes dated November 1, 1907, and subject to call at 102½ and interest. First and refunding mortgage 5 per cent. bonds are reserved to retire these notes, which are secured on $2,040,000 general mortgage 5 per cent. bonds, $1,200,000 5 per cent. equipment trust bonds and $1,000,000 first and refunding mortgage 5 per cent. bonds. The notes were issued to provide funds for finishing the new construction connecting the various lines of the company and for working capital.

Phillips & Rangeley.—See Sandy River.

Sandy River.—There is a report that the Phillips & Rangeley, which runs from Phillips, Me., to Rangeley, 29 miles, and has been for two years in the hands of a receiver, is to be freed from its receivership and merged in the Sandy River Railroad, which runs from Farmington, Me., to Phillips, 18 miles. The Sandy River has acquired all the outstanding bonds of the Phillips & Rangeley and of the Eustis Railroad, which runs from Eustis Junction to Berlin Mills Camp, 15 miles, and the Madrid Railroad, which runs from Madrid to a point in Township No. 6, six miles, both of which are operated by the Phillips & Rangeley. All these roads are 2-ft. gage railroads, their business is principally lumber.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK

BRANCH OFFICES AT 375 OLD COLONY BUILDING CHICAGO, AND QUEEN ANNE'S CHAMBERS WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. *We give in our editorial columns* OUR OWN *opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.*

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS:

W. H. BOARDMAN, *Prest. and Editor.*
E. A. SIMMONS, *Vice-President.*
RAY MORRIS, *Secretary*
R. S. CHISOLM, *Treas*
I. B. RINES, *Cashier*
L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Managing Editor.*
BRAMAN B. ADAMS
CHARLES H. FRY
FRANK W. KRAEGER
GEORGE L. FOWLER
HUGH RANKIN
BRADFORD BOARDMAN

CONTENTS

VOL. XLIV., No. 8. FRIDAY, FEBRUARY 21, 1908

Colonel Prout, editor of the *Railroad Gazette* from 1887 until 1903, contributes this week a letter on the Soudan Railroad from the Red Sea to the Nile, which brings vividly to remembrance a piece of uncommonly interesting history, in the making of which he had an important part. We printed in the issue of February 14 an account of the operation of the railroad which has been built just about where Colonel Prout made surveys, more than 30 years before. If this line had been built at the time when he recommended it the political and economic history of the Soudan would have been changed radically. Colonel Prout is quite wrong in supposing that there is anyone on the editorial staff of the *Railroad Gazette* to-day who is ignorant of his work, first as Major and then as Colonel in the army of the Khedive, and as Governor-General of the Provinces of the Equator, succeeding General Gordon while Gordon was in command at Khartoum. If those who served with him on the *Railroad Gazette* fail to grasp all the detail of his remarkable work in the East, it is because the Colonel combined performance with silence, to a degree unknown in most offices, and conspicuously absent in the government of this country. It is very much to the Colonel's credit that those who worked with him and knew him best have learned most of what they know about his record in the Nile country from outside sources.

It is announced that the Interstate Commerce Commission on February 27 will take testimony as to the need of action by the commission postponing the day on which railroads shall comply with the law limiting the working hours of telegraphers and signalmen. This law goes in effect March 4, unless the commission shall issue an order modifying it. The proviso giving power to the commission in this respect applies only to these classes of employees (not to trainmen) and the commission has issued a notice holding that the proviso is extremely limited. It is believed to apply only in exceptional instances of unusual conditions which could not have been foreseen. Conditions common to many railroads cannot be deemed "a particular case" for relief by the commission. The fact that business is small at a given station can have no weight; neither can the commission accept testimony as to a scarcity of operators, if it appears that higher wages would secure as many as are needed. The commission cannot postpone the taking effect of the law because compliance will be inconvenient or costly, nor can a suspension be ordered after the law has taken effect. It has been given out in the newspapers, though not in a formal statement that the commission has received thousands of telegrams informing it that operators are plenty. As these telegrams appear to have had their inception in a request sent broadcast by an officer of the Order of Railway Telegraphers and as no evidence is adduced to support the statement as to the number of operators available it remains to be seen how much force it should have. In his telegram to the commission one of the operators said that "10,000 telegraphers were being turned away by the railroads" and he pleaded that "the law should remain as it stands for humanity's sake." It is greatly to be regretted that this law was not subjected to a little more rational discussion before its terms were crystallized. "Humanity" would be much better subserved by the application of more rational methods of improvement to the telegraph and signal departments of most of our railroads, than by a "strike law" which gives some men too little work and to others allows much. There is evidence a-plenty that in Maryland, where an eight-hour law for telegraphers has been in force for a year or two, the charge has done little or nothing to promote increased safety while some of its results have been demoralizing, as where a man works eight hours a day for one company and another period of eight hours for another. In putting such a strict construction on the law the Interstate Commerce Commission seems to be only following the policy which it has adopted with rate and tariff questions and all other points which have arisen since the amendments of 1906 were passed; and the strict construction would seem to be one which the courts would be likely to sustain. But to appeal to Congress for a modification will probably be as futile as were the appeals for more rational treatment of the question a year ago.

INCREASING THE CAPACITY OF THE BROOKLYN BRIDGE.

The Brooklyn Bridge is the most congested passenger terminal in the world. For half an hour on four afternoons of every week, from 5.40 to 6.10 p.m., passengers come into the Manhattan terminal at the rate of 1,000 a minute. This does not include those who walk across the bridge. For years it has been the practice during rush hours to carry passengers bound for points on the elevated railroads in Brooklyn across the bridge in trains of bridge cars operating by cable, necessitating a change at the Brooklyn terminal. An article in another column describes the most important physical changes which have been and are being made to increase the capacity of the bridge. The extension of the Manhattan terminal over Park row, which was put in service on January 27, has made it possible to run elevated trains from Brooklyn to and from Park row direct during the whole day, doing away with the change at the Brooklyn terminal. The chief engineer of the Public Service Commission for New York City, in a report to the commission published last Saturday, criticized the new system and urged a return to the old method of running trains of bridge cars, on the ground that a test made on February 3 showed that the new service does not furnish sufficient capacity to do the work required, and that with it it would be impossible to carry as many people as were accustomed to use the bridge before the subway tunnel to Brooklyn was open. The principal reason for arriving at this conclusion was the fact that a bridge car being wider and having center doors, thus saving the space which would otherwise be used in the middle of the car by seats, can accommodate more people than an ordinary elevated car.

In answer to this report of the commission's engineer, the Bridge Department of the city, which has had direct charge of the Brooklyn Bridge improvement, on Monday, February 17, between the hours of 4 and 7 p.m., made a count of passengers using the elevated and surface lines on the bridge and a comparison of their number with the number of passengers who by actual count had used the bridge during the same hours on the afternoon of Thursday, October 10, 1907, before the Brooklyn subway was in operation. It should be observed that Monday is the day of heaviest travel of all the week.

The surface lines in the February count ran 987 cars in the three hours, or at the rate of 329 cars an hour, which is 26 cars more than were run in the October count. These cars carried 5,321 less passengers than were carried during the corresponding three hours in October. The elevated lines between the same hours ran 1,026 cars, carrying 59,994 passengers, as against 700 cars carrying 57,207 passengers in October, an increase of 326 cars and 2,787 passengers. The comparison, both for the elevated and surface lines, is affected by the fact that in October the local traffic across the bridge was carried in elevated cars, but now is carried in trolley cars. In the three hours on the afternoon of October 10 there were 4,518 such local passengers carried on the elevated, so that the increase in the number of people who used the elevated lines for through srvice on February 10 over October 10 was really 2,787, plus 4,518, or 7,305. Correcting the comparison, from the standpoint of the trolley traffic, the 4,518 local passengers must be added to the decrease of 5,321 trolley passengers, making a total falling off in through travel on the trolley cars of 9,839 people. The through elevated service over the bridge has apparently attracted a total of 7,305 passengers to the elevated who formerly used trolley cars. The net decrease in the number of people carried over the bridge on both elevated and trolleys was 2,534, which may fairly be said to represent the number of passengers who formerly used either one service or the other on the bridge, but now use the subway tunnel. This number would represent the loss in through travel to the Brooklyn Rapid Transit, which operates the elevated lines and all but two of the trolley lines. In order to gage the whole effect of the subway tunnel on the whole business of the company, however, it would be necessary to know the increased number of passengers who take the Brooklyn Rapid Transit elevated lines and trolley lines at or in the neighborhood of Borough Hall, Brooklyn.

These figures of the number of passengers carried across the bridge are surprisingly close to the previous estimates made by the Bridge Department of the new service as compared with the old. They show that the present elevated service, which is the crux of the operating problem at the bridge, has a greater capacity than the old service of bridge shuttle trains.

Further improvements to the bridge will increase this capacity. Some of these are outlined in the accompanying article. In addition, contracts have already been let for eliminating the grade crossing of trolley cars at Sands street at the Brooklyn terminal of the bridge. When this crossing is done away with the ease of moving the trolley cars across the bridge will be increased. It has already been arranged with the Brooklyn Rapid Transit that, as soon as this change is finished, a service of elevated trains originating at Sands street will be begun, to which people crossing the bridge by the local trolley service can transfer direct and take elevated trains not already filled with passengers.

The arrangements which have been made for handling the crowds at the large Manhattan terminal are interesting. The general plan of the terminal is shown in one of the drawings with the article. Passengers come from the street up a stairway 40 ft. wide to a mezzanine floor, from which there is access to each of the different tracks [illegible] of the elevated lines. One of the greatest [illegible] is to handle the crowd when getting into the trains, for it is here that the most disgraceful crowding occurs. Experiments are being made to solve this problem. Two iron fences or railings have been built parallel to the tracks, one with a 1 ft. clearance between it and the edge of the platform, the other about 1 ft. further back from the platform edge. The 1 ft. clearance between the nearest railing and the edge of the platform, together with the 8 in. of additional clearance between the edge of the platform and the side of the cars, leaves a total clearance wide enough to prevent accident to any one who should happen to be caught between this railing and a train. There is an opening in the nearest railing opposite the gates of the cars when they are lying in the terminal. In the morning rush hour the outside railing will be opened opposite this same point to let passengers out of the train.

When the rush of travel is inward instead of outward, that is, in the afternoon, passengers of incoming trains are unloaded on outside platforms, and this opening in the second railing will be kept closed. At a point opposite the middle of each car there is another opening in this outside railing, through which, whether there is a train ready or not, passengers will be allowed to go, walking from here to the open part of the inner railing nearest the track and opposite the car gates. The space between the two railings is designed to be just large enough to hold half a carload of passengers, the passengers for the other half of the car being in a similar space facing the other way. The total capacity of all these spaces is the capacity of the trains. When one of these spaces is filled the opening in the outside railing is closed by an iron bar and no more passengers are allowed to crowd inside. When the train pulls up to the platform, the passengers who arrived first are nearest the door and the passengers who arrived last furthest from it. Instead of crowding toward the two car platforms from three directions, all going to one platform proceed in the same direction, those coming to the adjoining platform of the other car, coming in the opposite direction. The train can be loaded in this way in 40 seconds. In order to make passengers walk as fast as possible the interval which now exists of about 8 in., between the edge of the station platform and the edge of the car platform is to be bridged by an iron grating filled with carborundum to prevent people's feet slipping, and lighted from underneath by an electric light. An interesting fact in this connection is that the spaces designed to hold half a carload each will probably be made larger for some lines than for others. It has been found that the passengers on the lines serving the better parts of the city will not crowd together as closely as those bound for other parts.

The principal disadvantage of the system of running through elevated trains on the bridge is that for 20 to 30 minutes on Monday, Tuesday, Wednesday and Thursday, the four busy evenings of the week, a delay of two or three minutes to an elevated train will result in blocking the platform. That is, so many passengers will arrive in this time that the entrance gates will have to be closed until the platform is cleared. It would appear, however, that this is a defect which will steadily grow less with experience. In order to prevent a crowd thus detained from rushing the entrances where the chopping boxes for tickets are, partitions have been built in the entrances to prevent shoving from side to side. If this plan is not successful, these partitions are to be extended out from the railings so as to effectually separate the crowd 5 or 6 ft. away from the barrier.

A further improvement to increase capacity is the installation of automatic block signals across the bridge. This is already under way. These are to be worked on a new system developed especially for this use. Each block is 700 ft. long. This is to be the minimum interval between two trains, but each block is divided into seven sections of 100 ft. each, so that as soon as a train in the block ahead moves 100 ft. ahead, the following train can move 100 ft. ahead also instead of having to wait until the leading train has cleared the 700 ft. block. This system, it is believed, will give the maximum efficiency of the tracks. Still other improvements are to be made. The yard at the Brooklyn end of the bridge is to be rebuilt to allow trains to be more promptly and efficiently handled and better interlocking mechanism is to be put in at the terminals to provide for quicker operation of switches and signals.

In one sense these improvements are temporary, for when the subway between the Brooklyn and the Williamsburg Bridge is finished, there is to be through service over the two bridges as a loop. The immediate changes, however, are of special interest as examples of the way in which the largest and most violent body of concentrated rush hour traffic in the world is handled.

STEAM AND TROLLEY DURING HARD TIMES.

The present period of financial and industrial strain will, before it ends, test for the first time in this country the relative strength of the steam railroad and the electric railway in resisting, as investments, the shock of hard times. It is true that in the latter part of the year 1893 and the twelvemonth following, there was financial depression that rested heavily upon the railroads and, in less degree, upon the street railway properties also. But at that time the street railway had barely emerged from its "horse railroad" character. It was still in its infancy of the "novelty" traffic that increased receipts; it had not settled down to business; and what is of more importance in the comparison, it had not reached its high expansion of these later times when, in many quarters, it competes with the steam lines. But now steam and the trolley, with both their systems greatly developed, face together the ebb of the industrial tide which has been running out for two months. Such a period is a short one for the test. The returns from the steam roads are still pretty meager; from the electric roads, only fragmentary. But from the best information available, it appears that a group of eighteen fairly representative electric properties actually *increased* their earnings 2 per cent. in December, as compared with December, 1906, while 61 steam roads decreased 4.28 per cent. in the same month. In January, six electric properties (including the Chicago elevated lines) increased their earnings 3.6 per cent., while 53 steam roads (including certain lines in Canada and Mexico) decreased 7.45 per cent.

These returns, viewed as statistics, are unsatisfactory. We are lumping city elevated lines with interurban lines, and including with the steam roads certain properties in Canada and Mexico which are showing gains instead of losses. The entire number of companies is too small to neutralize these imperfections. But from one quarter, the steam and trolley lines of the New York, New Haven & Hartford, we have returns on so large a scale and representing such a diversity of operating conditions that the figures are very suggestive, even for a brief period.

Alone among steam railroads, the New Haven has made investments in trolleys which may justly be called vast. It holds them in four states, and in two states, Connecticut and Rhode Island, it has almost a street railway monopoly. Its trolley lines represent a market value of considerably more than $100,000,000;; they comprise more than 1,300 single track miles; their gross receipts are upwards of $15,000,000 a year; and they include lines of all types—urban, suburban, cross-country, long distance and short distance, parallels to steam roads and laterals. January, 1908, was the first month of traffic depression in which to measure the steam system against its trolley subsidiaries. Gross earnings from operation of the steam system, as compared with January, 1907, fell off $643,000, or 16 per cent. The trolley earnings fell off only $21,000, or 2 per cent.; and, in one of the four states, there was a positive gain. On both the steam and trolley systems, changes in mileage operated for the year were unimportant. In the year 1894, when the New Haven company first encountered fully the financial setback that began in 1893, its earnings—allowing for earnings of the Old Colony just absorbed—fell off for the whole year only $903,435, or a little more than 5 per cent. At that time the company had only a few miles of street railways, and comparative earnings then are meaningless. But the contrast between the 5 per cent. reduction of 1894 and the 16 per cent. January reduction of 1908 suggests the severe industrial depression in the New Haven's territory which its trolleys have just met with the slight reduction of a little more than 2 per cent.

Pushing the analysis further, it is to be noticed that the New Haven's great street railway system, particularly in Rhode Island and Connecticut, depends in a considerable degree for its earnings on the patronage of factory hands, for whom in places special groups of cars are operated at "rush" hours. That under such conditions street railway gross earnings should all but hold their own during industrial ebb seems strange on its face. But it is to be remembered that an equation of trolley earnings at annual periods means a loss of what, in normal times, would have been an increase; that to the trolleys paralleling the steam lines, particularly on interurban routes there has been perhaps a division of steam passenger traffic due to the lower trolley fares; and that the unemployed may for awhile, until idleness begins to pinch the pocket hard, use the trolleys freely. But even with such modifying elements, the retention of the New Haven's trolley business seems remarkable. It argues, for one thing, for the persistence of passenger business through hard times, as compared with freight, and also for the intensified relation of public necessity which the street railway has assumed—somewhat the same as the telephone in another field.

The more it is looked into, indeed, the New Haven example of comparatively undiminished trolley business seems but a strong illustration of a general truth that hard times hit the freight traffic first and hardest. The great loss of the New Haven in January last was in the freight traffic, the loss in steam passenger business relatively small. Going back again to 1893-94, one finds that the New Haven's freight receipts fell from $8,115,524 to $7,260,433, or somewhat more than 10 per cent. Allowing for the Old Colony merger; passenger business fell off from $9,807,515 to $9,761,201, or hardly at all. In the same period of industrial stringency with due allowance for a nine months report, the passenger earnings of the Boston & Maine actually rose from $7,801,352 to $7,894,968, while freight earnings fell $786,113, or nearly 10 per cent. The New York Central passenger earnings were almost unchanged, while freight earnings fell off $3,267,561, or almost 12 per cent. The Pennsylvania, however, lost about 15 per cent. in passenger receipts and about 12 per cent. in freight, being the exception that accentuates the rule in a somewhat similar group of eastern roads, the Boston & Albany reasserting the rule with about 8 per cent. loss in passenger and more than 17 per cent. in freight. It looks therefore as though in our hard times street railway earnings, almost all of them on our eastern lines derived from passengers, are to prove much more stable than those of the steam roads, and demonstrate even more strikingly than heretofore the general stability of passenger business as contrasted with freight. A few weeks more will tell the full story.

The New Haven returns, so far as they have gone, bring out another bit of comment. President Mellen has been censured by his critics, notably in Massachusetts, for nothing more severely than for his bold excursion into street railways. Many changes have been rung on the rashness of that venture, upon the size of the new liabilities assumed, upon the water solidified by the leases of the parent corporation, and upon reduction of its dividends as the ultimate result. The first returns in hard times now indicate that his trolleys are ballast rather than excess of sail and that it is the old line business, which he has been criticized for not sticking to, that has fallen away. As our troublous times go on it will be an instructive experience to see how far the stability of street railway earnings extends beyond the New Haven system and whether or not it includes, for example, the mixed freight and passenger long distance electric lines of the Middle West. It is one of many lessons that our hard times are to teach, and a lesson that bears directly on the future fiscal relationship of electricity and steam in the land carrying trade.

CONTRIBUTIONS

The Soudan Railroad from the Red Sea to the Nile.

Swissvale, Pa., Feb. 17, 1908.

To the Editor of the Railroad Gazette:

One of several disadvantages of living long in the world is that you become a sort of contemporary ancestor and you have the bitter experience of finding that your progeny forget you. I have just noticed in the *Railroad Gazette* of Feb. 14 an account of the railroad from the Red Sea to the Nile, in the Soudan, but nowhere in that account do I find mentioned the fact that the first suggestion for such a railroad, and the first rough survey for such a railroad, came from a former editor of the *Railroad Gazette*.

Many years ago a young Major of Engineers in the Egyptian army was ordered into the Soudan. He survived, and later became the editor of the *Railroad Gazette*. This Major went into the Soudan by practically the route now followed by the new railroad, the account of which by Mr. Carpenter appears in your issue of Feb. 14; that is, he went to Suakin on the Red Sea, about latitude 19, and crossed the desert to Berber on the Nile. He, being somewhat familiar with railroad enterprises in the United States, was at once struck by the practicability of building a railroad from Suakin to Berber, and by the strategic value of such a railroad for military and for commercial purposes. He made an itinerary of his route, keeping directions by prismatic compass, estimating distances by rate of march, checking directions and distances by sextant latitudes and longitudes, and getting elevations by aneroid barometers. The result was a quick, rough survey, sufficiently accurate for a preliminary reconnaissance. He found that the distance from Suakin to Berber was about 240 miles. In the first 60 miles from Suakin he rose about 3,000 ft., and then for the next 180 miles descended gently and gradually to the Nile. He went through a somewhat rugged range of mountains by a pass not at all formidable or impracticable.

When the Major got to Berber, he sat down and wrote his report to the War Office in Cairo, reporting such things as he had been sent out to observe, and then made an appendix, urging his notion that a railroad ought to be built from the Red Sea to the Nile on something like the line that he had traveled over. Had this road been built troops could have been put into the Soudan from deep water by 240 miles of rail transportation, and probably the Rebellion of the Mahdi would never have taken place and Gordon would have died in his bed if his energetic temperament had permitted him to do so, the development of commerce with the Soudan would have been greatly advanced, and possibly that unhappy country would have been something like 50 or maybe 100 years in advance of its present condition, because the wars following the Rebellion of the Mahdi caused a destruction of population and a desolation which cannot be conceived of by anybody who has no intimate knowledge of the country.

The Khedive of Egypt at that time was Ismail Pasha, who was a very able man indeed, but came far short of being a great man. He was not permitted to keep a navy, and, obviously, was not willing to put the key of the Soudan in a deep water port far down the Red Sea, and so endeavored to hold the Soudan by the tedious and costly line of the Nile Valley; and we know the result.

The young Major's report, with the sketch of his itinerary and with the barometric profile, was printed at the War Office in Cairo, and something of it appeared later in the Bulletin of the American Geographical Society, in the *Railroad Gazette* and in *Engineering News*.

When Gordon was besieged at Khartoum, and England reluctantly decided to do something for his rescue, the project of building a railroad from Suakin to Berber was taken up, and at that time it was spoken of in the English newspapers as the "Prout route." Some light railroad material was shipped out to Suakin, and if I am not mistaken, a few miles of road was laid in and from Suakin. But while it would have been easy to build the road before the rebellion and in times of peace, it was a different thing to do in the face of an active enemy, and the project never went very far. That route for the relief expedition was abandoned and the expedition went up the Nile.

Years later, after the English had thoroughly established themselves in the Soudan and had restored peace and had introduced good government and security to life and property, they took up again the project for the railroad from the Red Sea to the Nile, but they abandoned Suakin and went a little farther north to a better harbor, where they established Port Soudan. They wisely carried the line farther south than the pass by which the Major had gone through the mountains, and so got better grades and lighter work, and having gone so far south they naturally made the Nile terminus at the mouth of the Atbara, between Berber and Khartoum. So instead of a line 240 miles long, as the Major had estimated, they made it 332 miles, but they undoubtedly got a much better line.

This page of history may be new and interesting to some of the present editorial staff of the *Railroad Gazette*, and may possibly amuse for a few moments some of its readers. H. G. PROUT.

Steel Car Design.*

F. W. Brazier (N. Y. C. & H. R.).—I would like to emphasize the importance of standardizing steel cars so as to reduce the number of designs. I can see no reason why we should not have a standard length of flat car, coal car and drop-end gondola car. There is a tendency among car designers to have just enough difference in the design of cars to make them call for a great many different parts for repairs. Not only does this apply to steel cars, but it should apply to what is known as the American Railway Association standard box car. A box car that is suitable for one trunk line could be made standard throughout the country, but to-day each road has its own standards for doors, trucks, size of sills, kind of roofs, and different makes of couplers, which I think is unnecessary. Not that I would cut out competition in such matters, but I believe many of these parts can be standardized as well in steel cars as in box cars.

We have found that the steel cars we have had in accidents can be repaired and in many cases put back in their original shape at a reasonable cost. They certainly will deteriorate fast if allowed to remain idle and I would suggest that steel cars be kept in service in preference to wooden cars, in these days when there is not such a demand for cars.

One of the greatest drawbacks has been to find a paint that would prevent rust. Our experience has been that many of the steel cars began to deteriorate at the joints from, I believe, lack of proper bending or some treatment for stopping corrosion. Possibly this may be overcome in the future. It is only a few years ago that we began to use steel stake pockets on our coal and flat cars, with results well known to us all, they simply rusted to pieces, and to-day nothing remains but streaks of rust in place of the steel. These have been condemned and malleable iron used as a substitute. I believe steel construction for baggage and postal cars or in fact all passenger service cars will be the standard of the future because cars in this service will have better care taken of them.

Twelve months ago car manufacturing companies were filled with orders and were not able to take additional orders for many months to come. To-day, with many of the car manufacturing companies' plants closed down and with all railroads economizing and at least 200,000 empty freight cars standing on side tracks there is time for us all to investigate and look over idle equipment to see what if any are defective and to plan improvements.

G. R. Henderson.—Mr. Waitt speaks of a design to carry all the load on the center sills. This must depend very largely on the type of car. Where we have a car with sides eight feet high there is a great strength available to support the load. I think under conditions like that it would be manifestly unwise to design our car, so that the entire load is carried on the center sills. When you consider a hopper car with the deep hopper possible, you will see that there is no difficulty whatever in transferring the strain from the side sills to the center plate. In other words, the design of the car should depend on the service for which it is intended.

Mr. Waitt makes a point of the necessity of keeping down the various sizes of parts so as to reduce the amount which must necessarily be kept in stock for interchange repairs in the shops, etc. I cannot second this too heartily. Anyone who has had to do with car repairs, particularly in the West, knows the difficulty of getting standard shapes for repairs to these new types of freight cars. It seems to me that the suggestion that merchantable shapes will be generally more acceptable than pressed steel shapes is a very good one. I think that the shapes of structural steel work used in the various industries in this country will indicate the class of merchantable shapes which may be used in car repairs. We should try to regulate our standard shapes so that we will be in a position to repair almost any kind of a car by using these merchantable shapes. I think that this club should initiate some action toward unifying the construction of steel cars, and I do not know of any better way than for it to suggest this subject to the Master Car Builders' Association committee as a subject for action at the meeting of the association next summer.

It is important that the standard sizes be amply strong. Some time ago I prepared the following specifications for sills of 50-ton steel hopper and flat cars:

"For hoppers, the body is to be proportioned for carrying 125,000 lbs. uniformly distributed between bolsters, in addition to the dead weight of the car. For flat cars, the sills are to be proportioned for carrying 125,000 lbs. uniformly distributed in addition to the dead weight, and also for 75,000 lbs. concentrated on a line across the car at any point between the bolsters, the side sills being considered as carrying the same proportion of load as the center sills, to allow for concentrated applications in loading heavy objects.

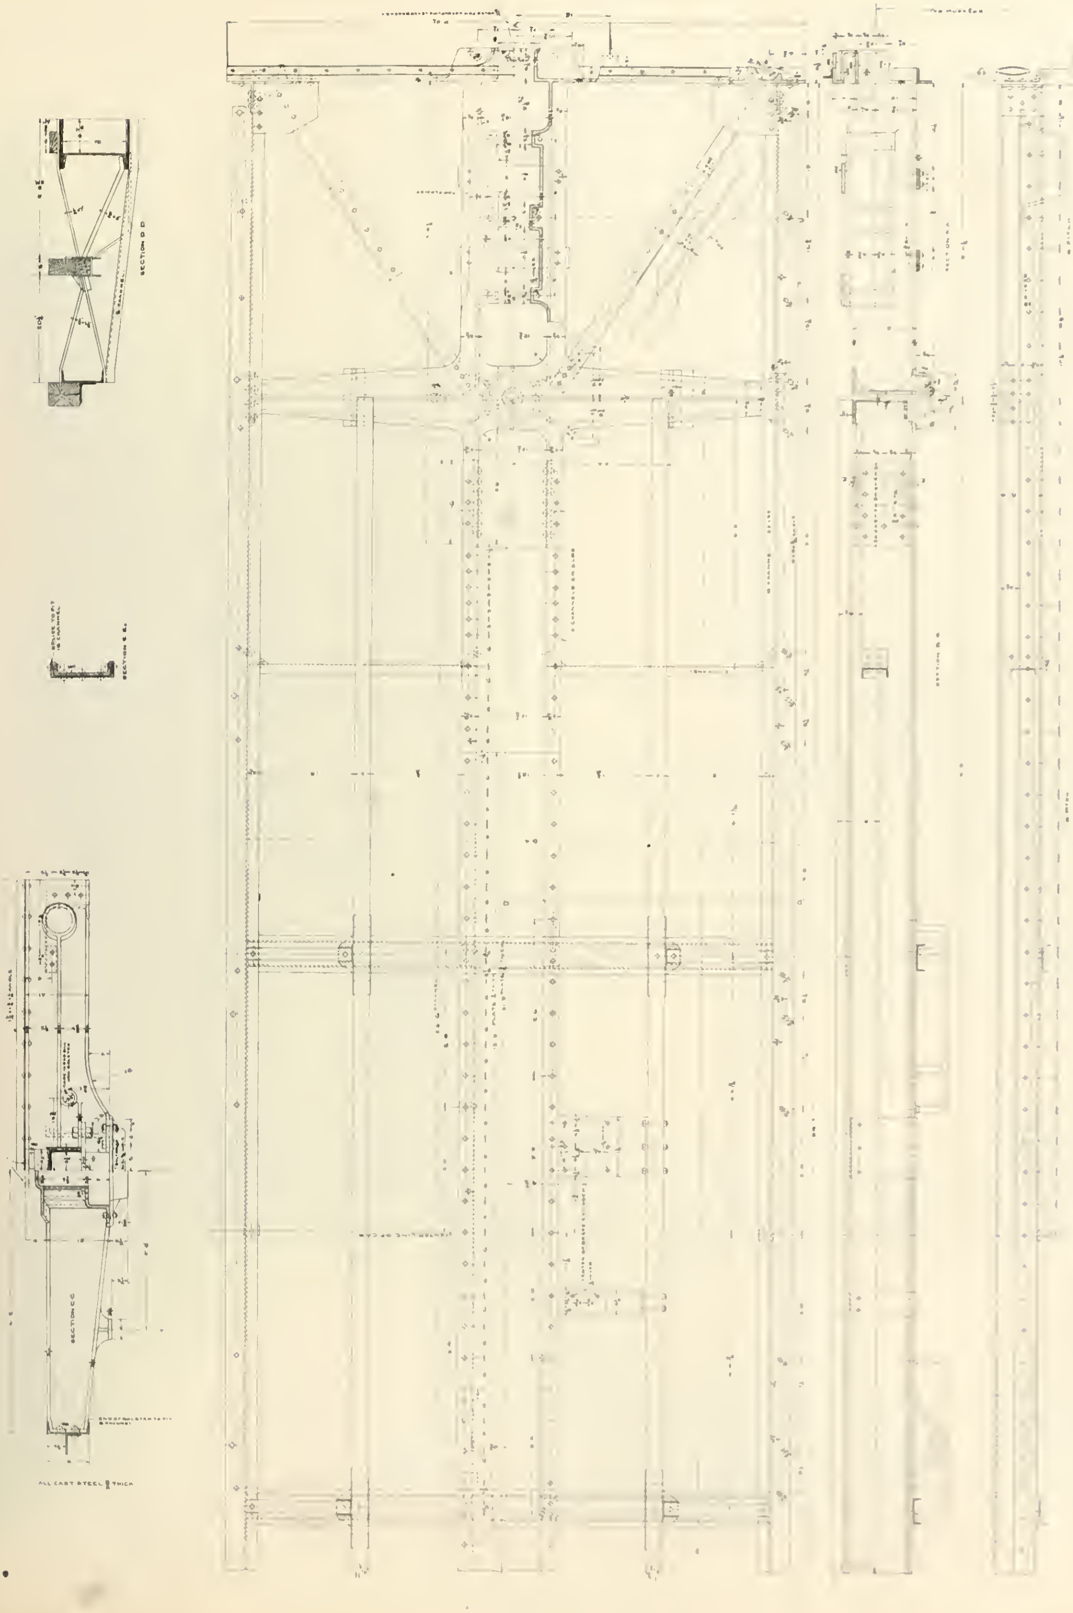
"In both types of car the center sills and draft attachments must be proportioned for a force of 100,000 lbs. pulling, and 200,000 lbs. buffing, and strains due to either or both the horizontal forces and the vertical loading combined must not exceed 12,000 lbs. per square inch in tension (net section), or 12,000—l/r in compression where l = the length and r = radius of gyration, both in inches. The maximum rivet shear must not exceed 8,000 lbs. per square inch and the rivet bearing, 16,000 lbs. per square inch."

There recently appeared in one of the engineering journals a suggestion that 500,000 lbs. buffing strain be provided for. In the same article the author states that he would work up to the elastic limit of the sill on such an allowance. That actually brings it to the same figures which I have here stated, viz., 200,000 lbs. with 12,000 lbs. allowable strain.

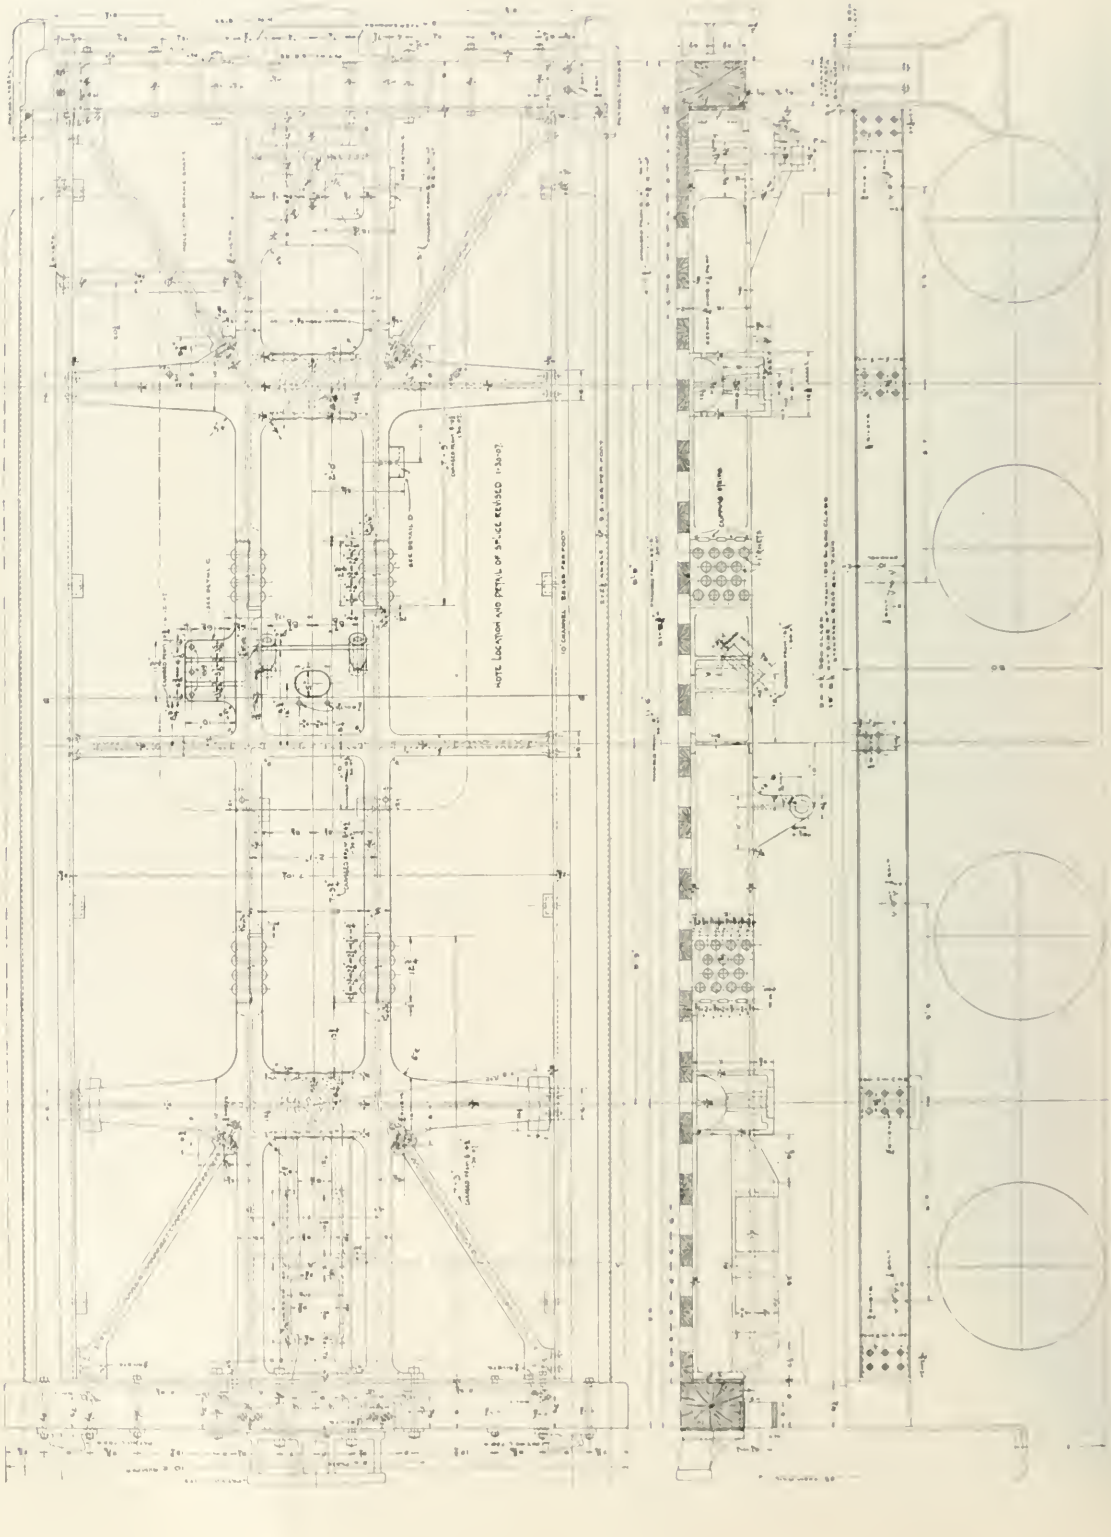
Mr. Waitt refers to the great carrying capacity and reduced traction in large capacity cars as a strong argument in favor of steel car construction. I agree generally with this, but I would call attention to the fact that some years ago there were wooden hoppers of 30 tons capacity which, I think, weighed about 30,000 lbs. Now, if you take the present designs, you will find that they run about 40,000 lbs., so that with the one-third more weight per car we get two-thirds more carrying capacity. I think that is well worth the extra expense, when you take into consideration a great many other points in favor of the larger cars.

Now we come to the question of cost. That is a great bugbear to many railroad companies, especially at present. I know of a railroad that got some figures on steel cars and also cars with wooden frames, and when it was found that for the same money they could obtain a great many more wooden cars, it appealed so strongly to the "powers that be" that they said "well, we will put in the steel cars a little later, but now buy wooden cars which will give us more cars for the same money." In the early part of last year we got bids on steel cars, and the prices ran a little less than three cents a pound. You can get very little structural steel erected for less than four cents a pound, and even at that price very few people would think of putting up a wooden building nowadays. In the long

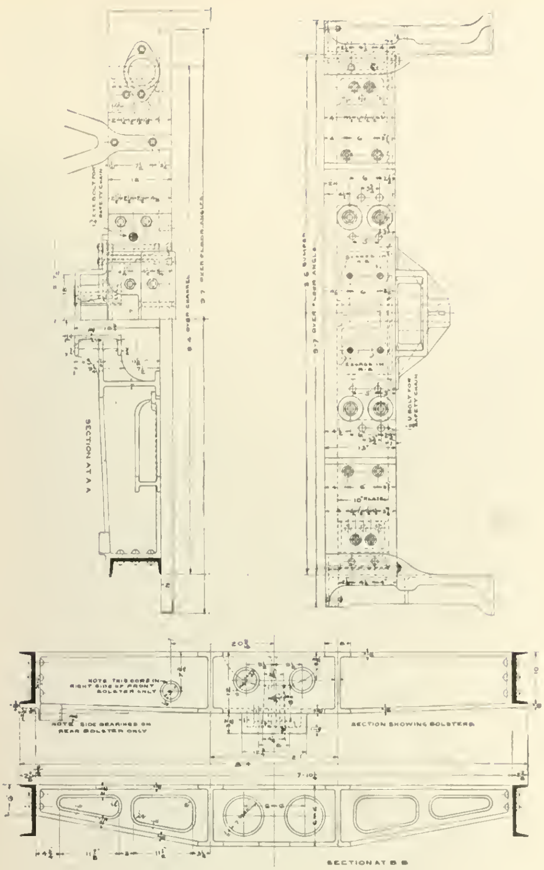
*Discussion of the paper on "The Era of Steel and the Passing of Wood in Car Construction," read by A. M. Waitt before the New York Railroad Club, Jan. 17.



Cast Steel Bolster Applied to Thirty-Ton Box Car; Central of New Jersey.



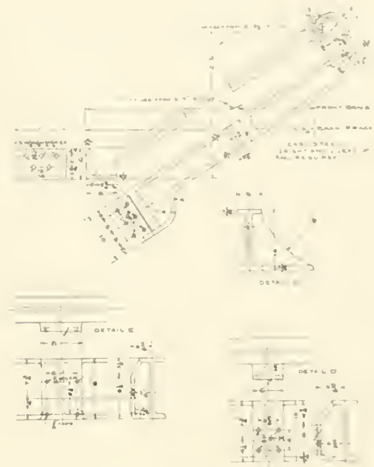
Cast Steel Tender Frame; Central of New Jersey.



Sections and End Elevations of Cast Steel Tender Frame.

run the saving on the steel car is certainly very large, and it seems to me that it is perfectly logical that railroads should put up steel cars rather than continue their old wooden cars on side tracks and hold them there for months for repairs.

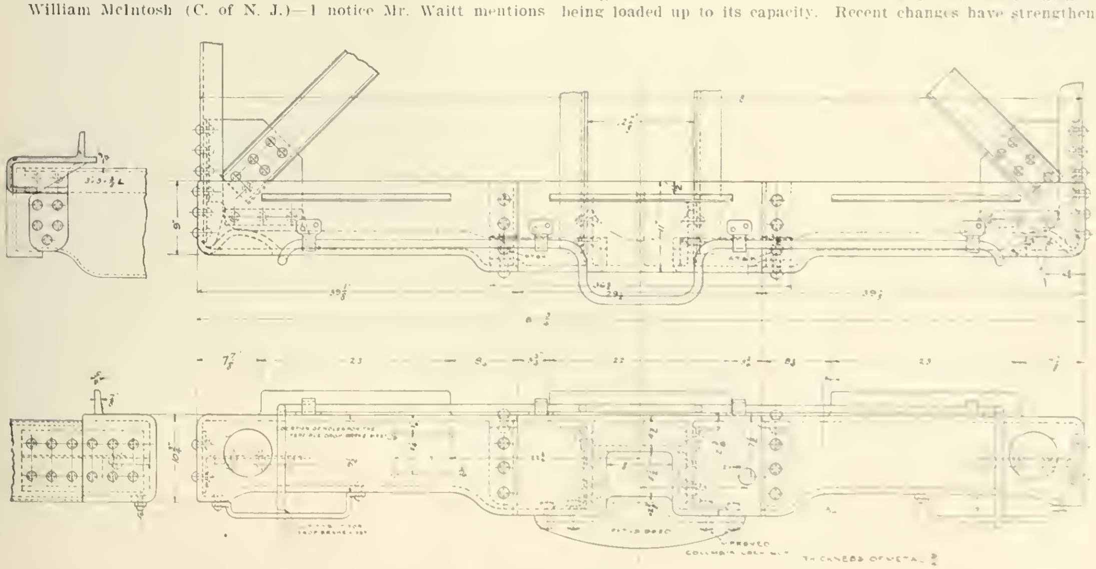
William McIntosh (C. of N. J.)—I notice Mr. Waitt mentions the earlier construction of steel cars built in 1897 to 1900 and a departure from that construction since seems to be largely on account of the difficulty that was encountered in obtaining the pressed steel forms for repairs. I found those same difficulties and rather favored the change to the structural steel forms with the expectation that a good many troubles would be eliminated. We did find less difficulty in making repairs, but I want to pay a tribute to the pressed steel car and say candidly that as far as my observation goes it has given as good an account of itself as any cars that have been produced since, that is, taking into consideration the weight and the results obtained. It seemed to possess a good many elements of



Details of Cast Steel Tender Frame.

resistance that the latter cars do not have to the same extent. In other words, it had some of the interesting features of an old tin can, that it would shove up under stress and if given a little time it would stretch out again like an accordeon and assume its original form. However, I think some of the difficulties we have met with in the later construction are owing to the quality of steel that has been furnished. No doubt a good deal of ordinary Bessemer has been pressed into service in car construction under the stress of scarcity of material, where we supposed we were securing the open-hearth product.

Mr. Waitt comments on the slowness of some of the New England people in taking up the larger forms of cars. This was perhaps owing to the lack of confidence in the cast iron wheel which was being loaded up to its capacity. Recent changes have strengthened



Cast Steel End Sill.

this wheel materially and increased confidence in its ability to carry additional weight.

I am disposed to take exception to Mr. Waitt in his remarks where he mentions three designs of different construction, but does not give cast steel any consideration at all in modern construction. I believe a fourth design ought to be brought in embracing more or less cast steel, which is quite a factor in car construction at present and, I believe, is destined to cut a much larger figure. It is possible in designing cars for withstanding great resistance and weight to use a very considerable proportion of cast steel. We have made some strides in that direction in the construction of cast steel tender frames. My attention was first attracted in that direction by reason of the rapid deterioration of the structural steel frames from corrosion; we found that we could produce a very strong and substantial frame of cast steel or a combination of cast steel and structural steel. We built some tender frames of this kind two years ago which have been in constant and hard service since and have not shown any indications of weakness or being affected unfavorably by corrosion. Mr. Waitt must, therefore, leave a niche for that design.

In the matter of repairs to steel cars, but little need be said. It only requires some capable men of the laboring class, properly directed to do that work and do it well. As has also been said, the proportion of repairs to steel cars is very much less than that to wooden cars.

As to standardization, this is a good time to suggest it, and a great deal can be done in that direction. Of course, as in all new developments, there is a tendency toward introducing many different ideas, and everyone thinks his is the best. He soon finds that somebody is doing as well, if not better, and then the disposition to compromise comes in and there is ultimately the survival of the fittest. We have had experience enough now to get together and appoint some committee with the necessary capacity to select the best and embody those specifications in some form of construction that will meet the requirements of all companies. Then it will remain for the higher officers to secure its adoption and thus eliminate a great deal of the useless designing now going on.

We are satisfied from our experience with the use of cast steel that a similar design to the one used in tender frames can be used in car construction. We have not done much in the way of car design except in the matter of cast steel end sills. We have introduced a great many of these, with much satisfaction. In the early construction of steel car frames, it was not thought necessary to put a great deal of strength in the end sills, as it was figured that the buffing was supported by the center sills. We all know that cars are not always handled in that manner and that they are subjected to a great deal of unnecessary stress. And it is advisable, for self-protection, to provide cars with strong enough ends to resist a considerable amount of unfair treatment and, I think, it is only with cast steel end sills that this can be accomplished. Structural steel ends are either broken or distorted under the force of the cornering blow they so often get in switching, while a well designed end sill of cast steel is not easily distorted under punishment of this kind and seldom breaks.

The cast steel end sill, tender frame and the application of the latter's principle features to a box car under frame, as mentioned by Mr. McIntosh, are shown in the accompanying drawings. Of a number of the tender frames built, some have been in service for two years without developing any indications whatever of weakness. In this construction the members carrying the draft gear attachments are cast in one piece with the body bolster. From the bolster toward the center of the tender extend short I-beam sections to which are riveted the intermediate framing of the tank, which in turn carries the water scoop, etc. The draft gear used in these designs is the ordinary tandem spring type and also the transom gear. The end sills are of wood and plates, and the side sills are channels.

In applying the same bolster and draft gear principle to a freight car, channels are used for intermediate sills largely as a matter of convenience in construction; cast steel center sills could be used if desired. The point considered especially advantageous is the combination of bolster and center sills extending from the bolster to the end of the car, and the short channel-shaped extensions toward the center of the car which make it easy to build up the intermediate framing in any manner desired.

A number of cars have lately been built with the design of cast steel end sill shown herewith, and it has been found entirely satisfactory. It is made either in three parts or in one casting. It has the advantage as compared with wooden or light structural steel sills of being strong enough to resist cornering.

John M. Goodwin (Goodwin Car Co.):—The pioneer steel dump [illegible] car in this country was built by me in 1894. Its weight was 21,000 lbs., with a capacity of 40,000 lbs. It was of structural steel and operated by air pressure. After numerous experiments the capacity was increased to 60,000 lbs. and the weight to 16,000 lbs. A few cars of this design were built by the Goodwin Car Co. in 1895. Years after thorough testing and experimenting, profiting by the service experience with the first cars I produced, in 1896, a steel car in which the weight was reduced to 43,000 lbs. and the capacity increased to 125,000 lbs. This was entirely of structural steel combined with malleable iron and cast steel. All parts were coated before being assembled with a carburet compound mixed with graphite, with very satisfactory results.

In the early part of 1895 the Goodwin Car Co. began to exhibit the operation of their cars to the Carnegie Steel Co. and for several months the cars handled almost every kind of material handled about the furnace yards, including pig iron, rail ends, slag, coal, coke, ore and all such material. I personally operated these cars during this entire period and made copious notes as to costs and methods of operation.

As a result of these exhibitions the Carnegie Steel Co., about a year later, built two all-steel hopper cars of structural forms in its own bridge shops. The weight of these cars was 39,900 lbs., with 95,000 lbs. capacity, estimated to safely carry 125,000 lbs. if the roadbed would allow it. The company exhibited these two cars at the M. C. B. convention at Saratoga in June, 1896. Up to this time the Goodwin company had had only its own equipment to refer to for information as to service requirements.

In 1897 the Carnegie Steel Co. made an arrangement with the Schoen Pressed Steel Co. to design a pressed steel car on the lines of the two structural steel cars of hopper bottom type which had proved too expensive to sell. The understanding was that the weight must be reduced something over 6,000 lbs. and the capacity increased to 100,000 lbs. The Schoen company was then making pressed steel stake pockets and center plates and was just starting to build pressed steel trucks. Mr. Hanson, the designing engineer of the Schoen company, designed and patented the pressed steel forms from which the Schoen company built a number of pressed steel cars of the hopper bottom type in 1897. They weighed 34,100 lbs., with 100,000 lbs. capacity. These were the first pressed steel hopper cars built in this country. As Mr. Waitt has stated these cars "proved somewhat too light to stand in an entirely satisfactory manner the strains of service."

The weight of pressed steel cars has gradually been increased, until to-day it appears to contain sufficient material to meet ordinary service requirements. In a car that has a carrying capacity of 100,000 lbs. and weighs much over 41,000 lbs. the earning capacity must be increased through a special design which saves labor in unloading.

In my research in several foreign countries, I found many designs of steel cars and was able to gather considerable data. I took measurements and photographs throughout Germany and France and even secured full information in the Far East, where steel coal cars were in general use, particularly in Burmah. In considering all of this foreign investigation, I find that my strongest point consists in knowing what not to do.

The problem of building cars for railroads in the United States stands absolutely by itself. Our railroads must have to-day a car that they can buy at a price approximating the present cost of a wooden car for its life service.

As something over 70 per cent. of the freight of this country is coal, if railroads can secure for their coal service a simple two sill design, strong in construction, with discharge hoppers sufficiently enlarged over the present designs to allow free discharge of coke as well as of coal, and if this design produces a car that will carry its 110,000 lbs. of coal with a dead weight not much over 41,000 lbs., I believe that the limit of economy in capacity and in weight will have been reached. The only remaining question will then be the proper distribution and quality of material used, and the class of labor employed in meeting the above requirements.

William Marshall (Anglo-American Varnish Co.):—This subject in different forms has come up a number of times of late, and the matter of a proper protective coating is always sure to be brought to the front. Mr. Waitt practically ignored it in his paper, because he is thoroughly imbued with the idea that steel cars and cars of metal construction have come to stay. Mr. Brazier, who is perhaps more intimately connected with the matter of car building at the present time, touched upon it but slightly. Mr. Goodwin referred to it in the form of pigment he uses on the plates in his cars. Whatever may be done by the Master Car Builders' Association or whatever association may have the final adjustment of this matter, the question of the protective coating must have full consideration. I do not know that anyone can say what may be the best coating to apply to metal. The difficulty seems to lie in the difference between a metal surface and a wooden surface. All paint has a vehicle for the pigment; the vehicle in which most pigment is ground is linseed oil. If you apply paint to a wooden car the wood begins to absorb the oil and the paint grips the wood so that it stays there for an indefinite period. Now when you apply paint to metal it is very different. Metal has very little affinity for linseed oil. It lies on the surface like a skin and has not the "tooth," if I may use the term, on the metal. No matter how good a paint you use, if it has not that clutch on the metal its life is very short. The [illegible] I have is a partial remedy. I suppose that [illegible] the parts of the car are assembled a coat of raw linseed oil be applied to the plates while hot, because while iron is heated the pores are opened up in such a way that linseed oil will be absorbed. Subsequent coats of paint will cling to the oil.

A number of years ago I recommended a paint made of linseed oil and lamp black as being the most desirable for painting iron and steel structures, for the reason that lamp black absorbs more linseed oil in proportion to its weight than any other pigment. This paint has proved to be the most durable and is the nearest approach to perfection in painting metal cars. The Central of New Jersey uses lamp black as a color on all its freight cars.

W. R. McKeen, Jr. (Union Pacific).—The character of steel being so entirely different from that of wood, a great many advantages and possibilities are obtainable in a steel car design which were impossible with wooden cars. The use of steel is no reason why there should be a material increase in weight; my opinion is that it should decrease the weight. I make the following suggestions for steel passenger car construction:

1. Round roof, saving weight and giving greater strength.

2. Induced or mechanical ventilation, instead of the gravity system; intake of fresh air at the floor of car and exhaust ventilation at the top.

3. All laterally disposed steel should be utilized for strengthening the car frame in resisting shock, including side sills, plates, steel side, braces, etc. Sufficient area of cross section provided in center sills for small or ordinary shocks.

4. End construction such as to preclude the possibility of telescoping.

As to Mr. Waitt's item of the sweating of steel box cars with ordinary materials, this is limited to the amount of water contained in the air confined in the car; the volume of water in this condensation is self-evidently very insignificant. With the transportation of moisture bearing materials, however, there may be a slight increase of this condensation, but we have had two steel cars in service over a year, and there has been no damage from this cause so far. It is reasonable to suppose that the slight volume of water that might be condensed in the steel cars from such materials as potatoes, etc. would not be detrimental to the potatoes. Box cars however, are not the proper equipment for shipping such materials as a general proposition. They should be shipped in refrigerator cars, or in such cars as are provided with proper means of ventilation, ventilation being an absolute necessity as a rule for such things.

Mr. Waitt speaks of the trouble from the increased heat incident to the use of steel box cars in railroad yards. We have at present three to four hundred steel cars in railroad yards, and we have experienced no practical trouble from this feature; I believe our hopper bottom and gondola coal cars, so-called "baldheaded box cars," will give off as much heat as box cars would.

It is true, as Mr. Waitt states, that some steel elevators are lined. However, it is also true that for many years it was considered that elevators holding wheat should be made of wood, inside and out, to protect this very valuable grain, but at present there are steel elevators without any lining, the grain coming directly in contact with the steel shell. If these steel elevators are a success, as they unquestionably are, there should be no question as to the practicability of steel cars in the wheat trade. In fact, our steel box cars were used in this wheat traffic for a while with great satisfaction to the shippers.

C. A. Seley (C., R. I. & P.).—It is believed that center sills strong enough to carry their proportion of the lading will also be strong enough to transmit the pulling and buffing stresses. The remainder of the load may then be calculated for the side framing and transmitted by the bolsters to the trucks.

There is not much to be hoped for in standardization of framing of steel cars if we can judge of the record in regard to wooden cars. Such cars were mainly designed by the owning roads who had it in their power to get together on standardization. The majority of steel car designs have been made by the car builders, and because of competition it will be difficult to unify designs. There is not much need for this as an economic proposition as regards interchange repairs. It has been found in repairs of cars of composite construction that two-thirds or more of the cost is for labor leaving a small proportion for new material required. It is well known that heavy repairs of wooden cars reversed these ratios. This proves that the steel, though not indestructible, can in most cases be repaired and returned to service without much new material being required.

There is no doubt this is the era of steel and the passing of wood in car construction, but if in freight car design the sills, plates, posts and braces are of steel, it eliminates all of the expensive lumber, now difficult to obtain, and there is reasonable hope of securing suitable lumber for flooring, roofing, lining and sheathing for many years to come.

R. P. C. Sanderson (Virginian Ry.).—In 1896, a committee of the Master Car Builders' Association made ten recommendations which it believed should be followed by the designers of steel cars as follows:

1. Specially forged, pressed or rolled shapes, cast steel, etc. or patented forms of construction are undesirable for cars to be used in general interchange business.

2. Steel and iron bars and shapes of standard bridge specifications and regular market sizes should be generally preferred, so that railroads and car builders can avail themselves of the competition in open market when purchasing.

3. Accessibility in the design is of the greatest importance in keeping down the first cost and maintenance; parts that are riveted together should be so arranged that they will be equally convenient for hydraulic or power riveting when the car is being built, or for field riveting in repair work.

4. In designing riveted work it should be laid off with plenty of rivets, these to be spaced closely as in the boiler work, and with the same care to insure true, fair holes; hot rivets, well driven, and completely filled holes, as in first-class boiler work, if necessary.

5. If bolts are used to hold iron or steel parts in position, not merely to carry weight, they must be turned bolts (a driving fit) in carefully reamed holes, fitted with the greatest care.

6. Every structure has a foundation, every machine has a bed plate, every animal, bird, fish, and most of the higher works of nature have a backbone or spine on or around which the structure is framed; this cardinal principal of design seems to have been largely overlooked in freight car construction, and it is believed that the center sills of a freight car should be made its main strength and reliance, and that the entire load should be carried from the platform, the upper works being arranged simply as a housing to confine and protect the load.

7. To enable the center sills to withstand collision and every shocks to the best advantage these sills should be spaced so that they will be directly in line with the dead blocks, and thus take the buffing and collision shocks in direct compression. Also their depth should be such that at least the center line of draft and center of the dead blocks will be within the vertical dimensions of the sills.

8. That care should be taken to avoid punching or drilling holes in the flanges of channels or I-beams where these are subject to heavy strains, especially tension or bending strains, unless additional material is added to compensate for this.

9. That with the change from wood to steel the necessity for truss rods no longer exists for cars of reasonable lengths, but that ample and sufficient strength can be obtained within reasonable limits of weights without the use of truss rods and consequent need of adjustment.

10. On account of the sweating and rusting of iron and steel wood is preferable to iron or steel for flooring, siding and lining of merchandise and stock cars.

There is one other cardinal principle of design for steel cars not mentioned by the committee, which I believe to be of the first importance. Wherever possible, parts and attachments, and also the means of attachment, subject to strains in collision shocks etc., beyond their elastic limit should not be strained in reversal whenever it is possible to avoid this; when it is impossible, double or triple the usual margin of security should be allowed, and for this reason it is especially important to-day that collision shocks be transmitted to the underframing through dead blocks and not through the couplers and draft attachments. The dead-blocks, so called man-killers in the day of link and pin couplers, had a bad name then, and there was a strong sentiment against their use based on humane consideration; but since the Interstate Commerce Commission says that no man shall go between cars for the purpose of coupling and uncoupling cars and we have gone to the expense of furnishing automatic couplers, etc., it seems foolish to dispense with this most valuable protection to the steel underframe of the car from the excessive damage which will follow in a collision whether light or heavy when the dead blocks are not used.

The Fortieth Street Track Elevation of the Chicago Junction.

The Fortieth street track elevation work in Chicago of the Chicago Junction Railway, although not unlike much other track elevation work that has been done there in its general features, is of special interest because of the construction by the Chicago Junction, as a part of the work, of branch lines for the South Side Elevated Railroad.

The Chicago Junction is a switching road the chief function of which is to handle the Union Stock Yards business. The 40th street line runs east to connect with the Illinois Central on the lake front and crosses the Lake Shore & Michigan Southern, the Chicago Rock Island & P[illegible] Pittsburg Ft. Wayne & C[illegible] and the Chicago & Western Indiana, all of which [illegible] to the stock yards through it. Built some 3[illegible] years ago [illegible] in a closely built section of the city, occupying the former [illegible] the thoroughfare from which it takes its name.

The South Side E[illegible] runs south to 40th [illegible] turns east for four blocks and [illegible] south[illegible]. It was desired to extend the [illegible] eastward [illegible] 40th [illegible] to traverse the populous [illegible] district [illegible] Kenwood and also to build a line westward in 40th street to the Union Stock Yards. The Chicago Junction agreed to build both lines and lease them to the elevated railroad company. For the eastward extension the Chicago Junction built a three-track line on its raised grade, the two southerly tracks being equipped for the exclusive use of the elevated trains. The westward, or stock yards, extension is the usual steel structure which is being built above the team road as far as Union avenue, two blocks from the yards, where it swings southward to enter the yards.

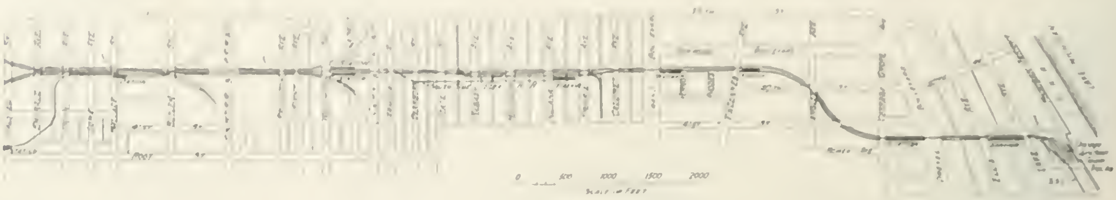


Fig. 1—Map of 40th Street Track Elevation Work; Chicago Junction Railway.

The accompanying map, Fig. 1, shows the extent of the track elevation work, which ends on the west with a run-off starting east of Union avenue. Work was begun in April, 1905, at the east end. As the map shows, besides the Illinois Central connection, the Chicago Junction has some team tracks at this point, which lie at right angles to the general direction of the line. The grade of the north track, used by the Junction, descends gradually from Drexel boulevard, while that of the other two rises from Ellis avenue to enable the elevated railroad's tracks to acquire the requisite head room over the tracks at grade east of Lake avenue. From this avenue eastward the elevated road built its own line on a steel structure. It turns southward to a station on 42d street and Oakenwald avenue, a block further south than the map shows. Adjacent to the station is an elevated yard of several tracks.

The Chicago Junction had a double-track line from the lake to Wentworth avenue before elevation work began, four tracks from Wentworth to Butler, and six from Butler to the stock yards. As already mentioned, the elevation work started at the east end. The south retaining wall of the section east of State street was built first, the adjacent track being used as a construction track and traffic carried on the other. When the south wall was done, a trestle was built to west of Langley avenue and traffic thrown on this while building the north wall from the northerly track, still at grade. From Langley avenue to Grand boulevard there was more room and the line from the trestle was run off on to a partial fill. The north track also was raised by filling as the work advanced, though kept at a lower lever than the operating track. From Grand boulevard to State street the north 26-ft. of the right-of-way had to be given up to the city for a street, under the terms of the ordinance. While this stretch of the north wall was being built the operating track was run outside of same, as the space between walls was too narrow to accommodate the construction and operating tracks conveniently.

The line formerly crossed under the Lake Shore and the Rock Island tracks, already elevated. With the new work the Chicago Junction agreed to go over these two roads. Passing under the South Side Elevated east of State street it rises on a 1.3 per cent. grade to a maximum of 41 ft. above city datum above the two roads mentioned, which depressed their tracks slightly to give an 18-ft. net clearance under the Junction's bridge. From this point the Junction runs down on a 1.33 per cent. grade to an under crossing of the P. F. W. & C. and the Western Indiana. This formerly was a grade crossing, but the grades were separated, the north-and-south roads going overhead, while the Junction raised only about 2 ft. to secure the gradient above mentioned. The grade ascends again to an over crossing of Butler and Wallace streets and Union avenue, the run-off starting a short distance east of the latter, as already mentioned, and extending west of Halsted street.

All masonry work is gravel concrete, the retaining walls being an equivalent 1:3:6 mixture, and the copings and bridge seats 1:2:4. The walls averaged a foundation depth of 6 ft., but where there was a possibility of the walls being in proximity to future large buildings, especially where the soil was mostly sand, safety was assured by going down 10 ft. Piles were used only at two points. The abutments of the Lake Shore-Rock Island crossing are so founded, due to the height of same, the soil conditions and the length of the bridge span. Also, where the elevated railroad structure crosses over the P. F. W. & C. and C. & W. I. the poor bottom and the length of span—230 ft—necessitated piling.

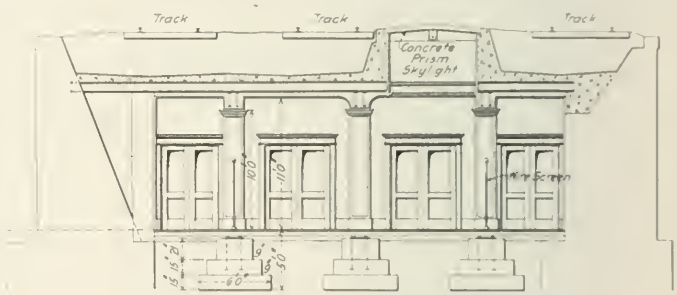

Fig. 2—Cross Section Showing Details of Entrance.

It has already been mentioned that the western extension of the South Side Elevated is built above the Chicago Junction for a part of the distance. As the map (Fig. 1) shows, this is between Armour and Union avenues. The steel structure is carried on the retaining walls, which are widened, or buttressed, at the top, wherever the steel columns occur, to furnish the requisite bearing area for the latter. The load is not sufficient to require any increase in the base dimension of the wall.

An interesting detail of the north wall as far west as Dearborn street is a conduit for telephone, telegraph, signal and electric light wires. It is a four-duct conduit embedded in the wall 12 in. below the top, with openings at intervals of about 300 ft., which are 12 in. wide, 24 in. deep and 48 in. long at intervals, as shown in the
