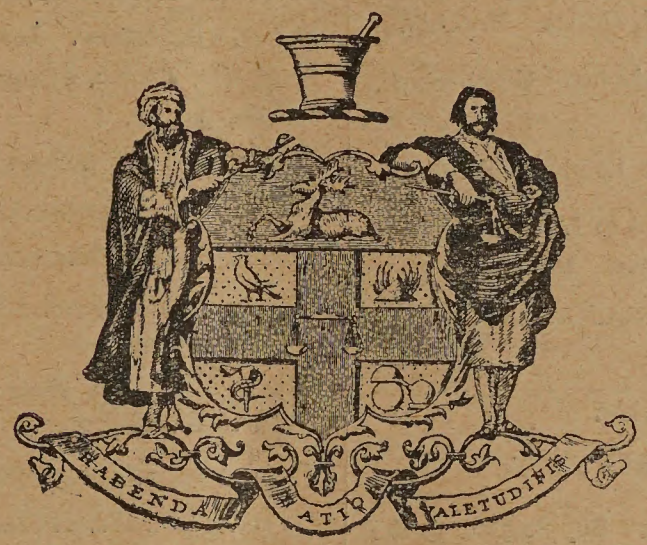
THE

PHARMACEUTICAL JOURNAL

ESTABLISHED 1841.

A Weekly Record of Pharmacy and Allied Sciences.



VOLUME LX.

FOURTH SERIES—VOLUME VI.

JANUARY TO JUNE, 1898.

LONDON:

PHARMACEUTICAL SOCIETY OF GREAT BRITAIN,

17, BLOOMSBURY SQUARE, W.C.

CONTRACTIONS OF TITLES.

The following is a list of the contractions and the corresponding full titles of Journals from which abstracts are most frequently prepared for the "Pharmaceutical Journal." The titles prefixed by an asterisk (*) are those of official Journals.

Amer. Journ. Pharm. = American Journal of Pharmacy. Philadelphia. Monthly.

Annalen = Justus Liebig's Annalen der Chemie. Liepzig. Monthly.

* *Apot.-Zeit.* = Apotheker-Zeitung. Organ of the Deutsche Apotheker-Verein. Berlin. Twice a week.

* *Apot. Zeit. Rep.* = Repertorium der Pharmacie. Supplement to the Apotheker-Zeitung.

* *Archiv* = Archiv der Pharmacie. Berlin: J. Greiss. Monthly.

* *Berichte* = Berichte der deutschen chemischen Gesellschaft. Berlin. Once or twice a month.

* *Brit. Med. Journ.* = British Medical Journal, London. Weekly.

Bull. com. = Bulletin commercial. Supplement to L'union pharmaceutique. Paris: Pharmacie centrale de France. Monthly.

* *Can. Pharm. Journ.* = Canadian Pharmaceutical Journal. Toronto. Monthly.

Chem. News = Chemical News. London. Weekly.

Chem. Zeit. = Chemiker Zeitung. Cöthen. Twice a week.

Chem. Zeit., Rep. = Chemisches Repertorium. Supplement to the Chemiker Zeitung.

* *Comp. rend.* = Comptes rendus des séances de l'Académie des Sciences. Paris: Gauthier-Villars. Weekly.

Deuts. Am. Apot. Zeit. = Deutsch Americanische Apotheker Zeitung. New York.

Int. Photo. Monats. = Internationale Photographische Monatschift fur Medzin. Düsseldorf. Monthly.

* *Journ. Chem. Ind.* = Journal of the Society of Chemical Industry. Monthly.

* *Journ. de pharm.* = Journal de pharmacie et de chimie. Paris: G. Masson. Twice a month.

Journ. Pharm. Elsass-Loth. = Journal der Pharmacie von Elsass-Lothringen. Strassburg. Monthly.

Journ. Zahnheil. = Journal für Zahnheilkunde. Berlin.

Med. Press = Medical Press and Circular. London: A. A. Tindall. Weekly.

Mod. Med. = Modern Medicine and Bacteriological Review. Battle Creek, Mich., U.S.A. Monthly.

Mon. scient. = Moniteur scientifique. Paris. Monthly.

Münch. med. Woch. = Münchener medicinische Wochenschrift. Munich. Weekly.

Nouv. rem. = Les nouveaux rémèdes. Paris. Twice a month.

Pediat. = Pediatrics. London and New York. Weekly.

Petit Mon. Pharm. = Petit Moniteur de la Pharmacie. Paris. Fortnightly.

Pharm. Centralh. = Pharmaceutische Centralhalle Dresden. Weekly

Pharm. Post = Pharmaceutische Post. Vienna. Weekly.

Pharm. Woch. = Pharmaceutische Wochenschrift. Berlin. Weekly.

Pharm. Zeit. = Pharmaceutische Zeitung. Berlin: J. Springer. Twice a week.

Pharm. Zeits. für Russ. = Pharmaceutische Zeitschrifte für Russland. St. Petersburg. Weekly.

Photo. Arch. = Photographisches Archiv. Düsseldorf. Monthly.

* *Proc. Chem. Soc.* = Proceedings of the Chemical Society. London. About twice a month.

Répertoire = Répertoire de pharmacie, archives de pharmacie et journal de chimie médicale réunis. Paris. Monthly.

Scient. Amer. = Scientific American. New York. Weekly.

Schweiz. Woch. = Schweizerische Wochenschrift für Chemie und Pharmacie. Zurich. Weekly.

Therap. Monats. = Therapeutische Monatshefte. Berlin.

Union Pharm. = L'union pharmaceutique. Paris: Pharmacie centrale de France. Monthly.

Wien. Klin. Rund. = Wiener Klinische Rundschau. Vienna: A. Hölder.

Zahn. Rund. = Zahnaertliche Rundschau. Berlin.

Zahntech. Reform. = Die Zahntechnische Reform. Berlin: R. F. Funcke.

THE
PHARMACEUTICAL JOURNAL
VOLUME LX. (FOURTH SERIES, VOLUME VI.)

LONDON: SATURDAY, JANUARY 1, 1898.

Progress in 1897.

THROUGHOUT the past year the subject of organisation has occupied a prominent position in the proceedings of every section of the craft to which recognised definite existence was given by the Legislature in 1868. In various ways a sense of the necessity of corporate action has been manifested more generally, and greater attention has been directed by chemists and druggists throughout the kingdom to making such action the means of protecting and promoting their interests. This tendency has been evident in the formation of numerous local associations, in the attempt to unite such bodies in a federation, in the movement intended to counteract unreasonable trade competition, and in the desire that has been expressed for extended representation in the body entrusted with the administration of the Pharmacy Acts. All these circumstances may be regarded as indications of advance towards the autonomy that the founders of the Pharmaceutical Society desired to establish, and that was rendered possible by the Pharmacy Act of 1868. Disposition to advance in that direction may therefore be taken as the characteristic feature of the past year. The Council of the Society—representing the sentiments of the body at large—having taken the steps requisite for obtaining amendment of the Pharmacy Act that will give full recognition to the principle of self-government, all persons holding the compulsory qualification will be placed in a position of equality in regard to membership of the Society, which holds—on behalf of the State—the control of pharmacy in Great Britain. This action of the Council affords opportunity for supplementing the compulsory examination of all persons entering the business, by amalgamation of the whole trade and thus consummating the wishes of the founders of the Society. To what extent that desirable object may be achieved will depend upon the support given to the Bill when introduced into Parliament; that will be matter for future record. But in any case the attempt made, whether attended by success or failure, will mark the past year as one of the most notable in our pharmaceutical history.

Alteration of the Bye-Laws.

One of the most important transactions of the past year has been the alteration of the Bye-laws relating to the examination and the fee for qualification under the Pharmacy Act, 1868. In pursuance of a desire very generally expressed for improvement in that part of the examination which is intended as a test of fitness to enter upon study of the subjects comprised in the qualifying examination, it was proposed that, in future, the scope of that part of the examination should be extended, and that certificates of approved examining bodies should be accepted in lieu of the examination previously conducted by the Pharmaceutical Society. It was also proposed that the fee for registration under the Act should in future be ten guineas. A draft of the proposed new Bye-laws, approved by the Council at its meeting in March, was confirmed at two subsequent meetings, and at a special general meeting of members of the Society in May. These formalities had to be repeated subsequently in order to embody a change of the time when the increased fee should become payable, and the new Bye-laws were ultimately approved and confirmed by the Privy Council in November. One practical effect of the new Bye-laws will be to place the First examination for the practice of pharmacy more on a level with the Preliminary examinations required for entrance to other occupations and, if the passing of this examination before apprenticeship were made the rule, a decided advance would be made towards realising the desire to attract young men of better general education into the calling. There would then be a better prospect of maintaining for pharmacists the credit of being the most educated among the traders of the country. That object is desirable not only for securing the confidence of the public, but also as the best means of protecting the interests of pharmacists. The increased fee for the qualifying examination is not in excess of what is required for qualification in other capacities and it is necessary to provide for the cost of registration for life, as well as the increasing expenditure incurred in the administration of the Pharmacy Act and other work incidental thereto which is for the benefit of all registered persons. On all these points the views entertained by the Council met with very general approval throughout the country. Registered chemists naturally perceived that they would not be kept out of the trade by the proposed increase of the qualification fee, and that if it had such an effect in the future, any consequent limitation would not unduly relieve their successors from the imminence of having to eat one another in order to exist. Resolutions in favour of the scheme contemplated in the new Bye-laws were passed at several public meetings of the trade, and though some few speakers at the special general meeting expressed different opinions, they related to matters which were irrelevant, and met with no support of any consequence.

Historic truth perhaps requires the statement that in one quarter a spasmodic but ineffectual attempt was made to create opposition under the mistaken apprehension that "journalistic enterprise" was in danger, and for a short time a shocking example was afforded of the terrible possibilities of possession by a single idea. Excited "journalistic enterprise" dressed up a lay figure with many sensational labels of "unfair competition," "iniquitous demand," "Society extravagance," "lavish expenditure," "private indulgences," "funds dissipated," "bankruptcy," "official injustice," and similar stage tinsel, uttering an hysterical invocation to "strike a blow for justice"; but as the sticks and shoddy showed through, the bogey frightened no one very much and, during the early days of November, it shared the fate of other simulacra. The attempt to supply opinions to be echoed without the trouble of thought, like ready-made clothes or quack medicines, that do not

require fitting or dispensing, did not succeed, and "journalistic enterprise" subsided harmlessly into its old familiar groove.

Annual Meeting.

In the report presented by the Council at the anniversary meeting in May, reference was made to the reduction of the balance on the Journal account, which represents the cost of the Journal to the Society, as showing a satisfactory realisation of the improvement anticipated last year. The financial effect of the recent changes in the conduct of the School of Pharmacy had not then become evident, though the number of students had given satisfactory proof of a demand for sound technical education in preference to knowledge hastily gained for the purpose of passing an examination. In connection with the Society's educational work, mention was made of the useful assistance to be derived from attendance at the Libraries and Museums in London and Edinburgh, of the appointment of a Manchester scholar, of the establishment of the Burroughs Scholarship, and of a grant made for the purchase of a materia medica cabinet and specimens for the use of students at Liverpool. With some increase in subscriptions to the Benevolent Fund, there had been a slightly larger expenditure as annuities and grants, but the Fund had become considerably richer by the generous bequests of the late Geo. Nind, G. Dudgeon, and A. H. Thomas.

From the examination returns it was shown that in the exercise of the Society's public functions as an examining body 504 persons had been admitted to registration under the Act out of 1450 recorded entries during the year 1896. The expenditure for prosecutions again showed a large adverse balance over the amount of penalties recovered from offenders and costs allowed, and the case of the Society *v.* Fox was referred to as illustrating the great difficulties encountered in the administration of the Pharmacy Act.

In commenting on the several paragraphs of the Council report, Mr. Hills expressed approval of the capital expenditure for the erection and equipment of premises better adapted for the purposes of the Society, and he supported the view put forward in that respect at the previous anniversary by Mr. Carteighe. In reference to the Journal, the President spoke of his predecessor's hopeful anticipations and the general desire of members as having been fully realised and of the probability of further improvement. Speaking of the difficulty experienced in carrying out the provisions of the Pharmacy Act in Scotland in consequence of the sheriff's assumption that "some private interest" was involved, Mr. Hills showed how much such conditions conduce to the encouragement of offenders. Lastly, in regard to the desire expressed for a change in the constitution of the Society, by which all registered chemists would be eligible as members, the necessity for making that desire known to members of Parliament, so as to secure their interest and thus supporting the action of the Council, was insisted upon as indispensable.

Meetings of the Council.

At the first two meetings of the Council the business transacted was chiefly of a routine character, but at the meeting in March the important subjects of the Preliminary examination, and a proposed increase of the fee for qualification, were brought forward. It was then decided that the production of certificates of approved examining bodies covering a wider area should be substituted for the examination hitherto conducted by the Pharmaceutical Society. It was also decided that in future the fee payable in respect of the qualifying examination should be ten guineas, and that the requisite alteration of the Society's Bye-laws should be made. At the same meeting the amended Bye-laws were read in conformity with the provisions of the Pharmacy Acts.

At the Council meeting in April, an amendment of the proposed alteration of the Bye-laws was agreed to, which necessitated a repetition of the first reading, and resolutions passed by the Nottingham and Cambridge Chemists' Associations, the Liverpool Students' Association, and the Chemists' Assistants' Association, approving of the action taken by the Council were read by the President. A special meeting of the Council was held on April 28 for the second reading of the amended Bye-laws, and they were confirmed at the meeting in May.

At the meeting of the newly constituted Council in June, Mr. Walter Hills was re-elected President; Mr. Newsholme was elected Vice-President, and Mr. Hampson was re-elected Treasurer. A resolution was passed that a congratulatory address should be sent to Her Majesty the Queen on the occasion of her Diamond Jubilee.

At the meeting in July the President drew attention to the subject of eligibility for membership of the Society and to the desire which had been expressed that it should extend to all registered chemists and druggists, pointing out that on several occasions the Council had taken steps for obtaining the requisite amendment of the Pharmacy Act without receiving the support necessary for the purpose, and that if Parliament was to be approached in the coming session active support throughout the country would be indispensable.

At the same meeting the President reported the result of his communication with the Privy Council in reference to alteration of the Bye-laws. The adoption of their Lordships' suggestion that the increase of the fee for qualification should not come into operation until 1900, so as not to apply to any persons but those commencing a three years' apprenticeship after the approval of the new Bye-laws, involved repetition of the formalities of confirmation at three meetings of the Council, and by a special general meeting of members of the Society held for that purpose in August.

At the meeting in November Mr. Bottle, speaking on behalf of his colleagues, congratulated the President on the honour conferred upon him by Her Majesty the Queen in the presentation of a medal to be worn in commemoration of the sixtieth anniversary of her reign, a distinction which might be regarded as recognising the good service rendered by the Society since the grant of the charter at the commencement of that period.

On the presentation of the report of the General Purposes Committee relating to the appointment of local secretaries, the President directed attention to the fact that in many instances no nominations had been sent in, and in the discussion of the subject much regret was expressed at the apparent want of interest in the work, to be done by the Society's local secretaries. It was suggested that the present system did not ensure a sufficiently intimate relation between local secretaries and the London centre, for which purpose a re-arrangement adapted to existing conditions might be desirable.

Draft Pharmacy Bill.

At the December meeting of the Council, a draft of the Bill, relating mainly to the extension of membership of the Society, was submitted for approval and the reasons for limiting the scope of any application to Parliament at the present moment were fully stated by the President. As the draft had been prepared by a committee, including those members of Council who have hitherto, on the one hand, advocated a more comprehensive measure and, on the other hand, opposed extension of membership, the unanimous agreement which it met with from the Council was, therefore, very natural, and it is remarkable that this unanimity should have excited the displeasure of anyone, so far as to be characterised as "deadly," unless

lament for the absence of disagreement instigated that objection and the grotesque fancy that members of Council sit in the committee rooms under the shadow of a suppositious Upas tree which disables them from performing the duty for which they are elected and acting, to the best of their judgment, in the best interest of their own constituency and also of the trade at large. The unanimity with which the draft Bill was adopted by the Council was the result of consideration for facts—viz., that it would in no degree depreciate the qualification of pharmaceutical chemists or curtail their special privileges—that chemists and druggists are now as much entitled to share the responsibilities and privileges of administrative work as pharmaceutical chemists—that they have expressed a desire to have their present disability removed—that their co-operation is necessary in order to secure the hearing of any claim for the redress of grievances affecting the entire trade and, as Mr. Atkins pointed out—that the Bill is free from any conceivable ground for opposition. Both Mr. Harrison and Mr. Storrar admitted that unless the object of this Bill were realised to such an extent that the Society represented the trade as a whole, asking for greater things would be like ploughing the sands, and the fault would not be with the Council or the Society but with the members of the trade who failed to join in helping forward the objects which all should have at heart and support.

The Registers in 1897.

The report presented to the Council by the Registrar in February showed that at the end of 1896 there were 15,166 persons qualified under the Pharmacy Act, 1868, and of that number 2253 also held the higher qualification of pharmaceutical chemist under the Pharmacy Act of 1852.

Of the number of persons on the Register of chemists and druggists, nearly one-third were conneoted with the Society, 2159 as members, and 1682 as associates in business, showing an aggregate increase in these two grades of 132 as compared with the numbers in 1892. This increase was due to the large number of persons joining the Society as associates counterbalancing the decrease in the numbcr of members. At the end of 1896 there were also 984 associates not in business and 846 students.

The proportion of registered persons connected with the Society at that time is shown by the following table with their respective qualifications :—

Pharmaceutical Chemists.	Chemist and Druggists.	Society. Members.	Society. Associates.	Unconnected.
2253	—	1584	—	669
—	1868. 3921	575	—	3346
	8992		1682	6326
			984	
2253	12,913	2159	2666	
15,166		4825		10,341

A comparison of these data with those representing the conditions formerly prevailing is of interest in connection with the proposed alteration in regard to membership of the Society, as it shows the changes that have taken place in the relative proportions of pharmaceutical chemists and chemists and druggists. Taking a period of twenty years, the differences are as follow :—

	1876.	1896.	Differences.
Pharmaceutical chemists	2,321	2,253	−68
Chemists and druggists	10,857	12,913	+2,056
	13,178	15,166	+1,988

These changes may be regarded as natural consequences of compulsory qualification and of the conditions prevailing when the Pharmacy Act, 1868, was passed. The decline in the number of pharmaceutical chemists continued only to 1892, when it amounted to 116, and during the following four years there has been a small but steady increase, reducing the difference between the numbers in 1876 and 1896 to 68. The rate of increase during the period of four years has, however, been much smaller than that of chemists and druggists, or in the ratio of 1 to 12·5.

Membership of the Society.

Passing now to the relations existing between the Society and the whole body of registered persons, comparison of the registers at the two periods shows that there has been a considerable increase in the number of persons connected with the Society, but a slight reduction in the proportion they bear to the entire body.

1876.

		Society. Members.	Society. Associates.	Unconnected.
Pharmaceutical chemists	2,321	2,062	—	259
Chemists and druggists.....	10,857	839	1,520	8,498
	13,178	2,901	1,520	8,757
		4,421		

1896.

		Society. Members.	Society. Associates.	Unconnected.
Pharmaceutical chemists	2,253	1,584	—	669
Chemists and druggists.....	12,913	575	2,666	9,672
		2,159	2,666	10,341
		4,825		

The number of persons connected with the Society in 1896 was larger by 404 than it was in 1876, but it will be seen that this increase was entirely due to the number of persons joining the Society as associates. As a consequence of that addition and the reduction in the number of pharmaceutical chemist members as well as chemist and druggist members, the relative proportions of those connected with the Society and holding different grades of qualification has, in the course of the past twenty years, undergone very great alteration, so that in 1896 the associates outnumbered the members of the Society by 507 and the pharmaceutical chemist members by 1082.

These circumstances are of considerable importance in their bearing on the position of the Society as an organisation representing the entire body of legally qualified chemists and druggists. They have naturally attracted the attention of the Council, and on several occasions provision has been made for extending the scope of membership, so as to afford persons who have obtained qualification under the Pharmacy Act, 1868, opportunity to take a more active part in the work of the Society. The justice of such an arrangement will be apparent when it is considered that by the Statute of 1868 the powers and action of the Pharmaceutical Society in regulating affairs were compulsorily extended to the entire body, instead of applying only to affairs connected with the voluntary qualification of pharmaceutical chemist. After the passing of that Act membership of the Society became a duty rather than the privilege it had been while it was the only criterion of pharmaceutical qualification. In fact, from the point of view of the Society's Charter, the logical sequence of the Act was that eventually every registered person should be a member and have full representation. The popular estimate of the import of membership, formed during the early period of the Society's existence, should in itself be an inducement to take that position, as well as the opportunity of taking part in the management of affairs and, on the other hand, the acknowledged sufficiency of the compulsory examination to prevent incompetent persons from being placed on the Register—a guarantee that the object of the Act is realised in that respect—justifies the recognition of the Minor qualification as a basis of membership. This view of the matter is well stated by Mr. Currie at page 20.

Regard for the superior qualification of pharmaceutical chemist—though not to be considered merely a matter of sentiment—cannot reasonably be urged as a reason for not admitting to membership of the Society persons holding only the Minor qualification. The title of pharmaceutical chemist is protected by the Act of 1852 and it secures exemption from jury service: it is a guarantee—so far as examination can be—that the holder is possessed of more extended and complete knowledge and skill as a pharmacist and it is, in those respects, altogether independent of membership. But the eligibility of pharmaceutical chemist members of the Society as members of Council, is an additional advantage which is not now in accord with existing conditions, though it is a respectable tradition and has probably been productive of good results in the past. The mistake of supposing that there is any necessary connection between membership of the Society and the Major qualification, that does not also exist in the case of the Minor qualification, was shown in the article in last week's Journal. For more than thirty years a large proportion of the members have not been pharmaceutical chemists. But omitting from consideration those members of the Society who hold that position in virtue of having been in business before 1868, the Society now comprises little more than two-thirds of the pharmaceutical chemists. With them is a larger number of persons, holding the Minor qualification, as associates in business and much more than half as many associates not in business. From a financial point of view they contribute more to the support of the Society than the pharmaceutical chemist members and, on that account, as well as by reason of their numerical preponderance, the argument in favour of their admission to membership claims attention.

The apprehension that the interests of pharmaceutical chemists might be prejudiced if the Council were largely constituted of members holding the Minor qualification, is quite inconsistent with past experience. They have never yet been represented so fully in the Council as the Act makes provision for, notwithstanding their preponderance of voting power, and there is no reason for thinking that the members of Council, of that grade, have been less careful of the interests of pharmaceutical chemists than their colleagues. Moreover, election as a member of Council would, as Mr. Carteighe pointed out, still be influenced by considerations whether the candidates were men who would devote themselves to advancing the craft. Even the election of members of the Society is subject to the discretion of the Council and, under the proposed new constitution it would not be necessarily a matter of course in the case of every registered person.

Administration of the Pharmacy Acts.

The number of cases of alleged infringement reported to the Registrar during the past year was somewhat less than in 1896. The total number, however, exceeded three hundred. Each case was duly investigated, and those in which definite evidence of infringement could be obtained were laid before the Council for the necessary authority to proceed for the recovery of the penalties incurred.

In England a very large proportion of the offenders did not attempt to contest their liability, but purged their offences by paying the penalties claimed without going into court. In cases heard before the County Court Judges at Nottingham, Preston, Bradford, Leicester, Edmonton, and Bloomsbury, judgment was obtained for the penalties claimed with costs, but at the Bow County Court Judge French gave another illustration of his strange antagonism to the Act of 1868, by giving judgment for the defendant in a case where an unqualified assistant in sole charge of a branch shop was sued for a penalty in respect of a sale of laudanum. The evidence given on behalf of the Society was uncontradicted, and it was, to a lay mind, absolutely conclusive, but the Judge was of opinion that the attention of the defendant should have been directed to the offence immediately after the sale was made. There is, however, no provision requiring this to be done, and the action was instituted many months within the time limit prescribed by the Statute. The Society's counsel protested against the action of the Judge, but without avail.

A further illustration of the difficulties encountered in endeavouring to administer the provisions of the Act may be instanced in a case heard before Judge Lushington at Reading. It having been reported to the Society that a dealer in garden requisites, etc., was exposing weed-killer in his window, a purchase was made from an unqualified person in defendant's shop which, upon analysis, was found to contain arsenic sufficient to poison 2000 persons. At the hearing of the case it was admitted that neither the defendant nor any person employed in the shop had any qualification to sell poison, the defence relied upon being that the weed-killer had originally been procured for the private use of the defendant, that it was never intended for sale, that defendant did not sell by his own hand, and that he was not liable for the act of a servant who had sold the tin without authority. In the course of the evidence it transpired that defendant had several branches, and that he had a partner who managed the Reading business, which was carried on in the name of the defendant. After a hearing which lasted several hours, His Honour, in giving judgment, stated that an important point of a law had to be decided. Upon a review of the evidence he was content to hold that the defendant did not intend to sell the tin in question. As to the meaning of the word "sell," he held that it meant the physical act of sale. On the question of partnership he was of opinion, having regard to the decision of the House of Lords in the London and Provincial Supply Association case, that partnership was on the same lines as a corporation. He therefore reluctantly gave judgment for the defendant, but willingly gave leave to appeal.

The issues involved being of grave importance to the public and to registered persons, an appeal was entered, which came on for hearing before Mr. Justice Hawkins and Mr. Justice Channell sitting as a Divisional Court in the Queen's Bench. The case was ably argued on behalf of the Society by Mr. Vaughan Williams, and the judges expressed their concurrence with his views that a master, whether he was a member of a partnership or not, would be liable under the Pharmacy Act for offences committed by his servant if there was reasonable ground for supposing that such servant was acting under the ostensible or implied authority of his master. Having regard, however, to the fact, as stated in the notes of the County Court Judge, that the tin of weed-killer in question had been sold by the shopman without any authority, and that the defendant never intended it for sale, the judges dismissed the appeal with costs.

In Scotland convictions were obtained in twenty-three cases, but the Society continues to be much hampered by the action of some of the Sheriffs, who, taking advantage of the power conferred upon them by the Summary Procedure Acts, inflict merely nominal penalties, the result practically being to fine the Society for administering an Act of Parliament passed in the interest of the public.

Treasury Prosecution.

There have been but few prosecutions under Section 17 of the Act of 1868, and the only proceedings to which attention need be directed were those at the instance of the Treasury against a homœopathic practitioner for the sale of a preparation known as Wallace's Specific No. 1 without complying with the regulations

required to be observed in the sale of poisons in Part 1 of the Schedule. The case was heard before Mr. Lushington at Bow Street Police Court in February last. Formal evidence of the purchase having been given, Dr. Luff gave particulars of his analysis, and stated that the bottle handed to him contained aconitine, the quantity present being such, that one-sixth of the contents might prove fatal, and a whole bottle would probably mean certain death. For the defence it was submitted that the preparation was not considered a poison. It was admitted that aconitine was present, but only in infinitesimal quantities. The magistrate said it was evident the mixture contained more than an infinitesimal quantity of poison, and inflicted a fine of £5 and £10 10*s.* costs on the first, and £5 and 2*s.* costs on the second summons.

The defendant subsequently obtained a patent for his specific, and presumably acting under the impression that he was thus outside the Act, continued to sell the preparation without observing any of the formalities required by the Statute. Evidence of this fact having been submitted, the Treasury took out four summonses, charging him with selling aconitine to a person unknown to the vendor, without labelling it with his name and address or the word "poison," and without entering the sale in the poison book.

At the hearing Dr. Luff again gave evidence, and stated that the mixture was very similar to that which was found in the previous case, but the percentage of aconitine was somewhat higher, being 1/23rd of a grain to the fluid ounce. In his opinion there was no reliable chemical test for aconitine. All the authorities recognised that the physiological test was the only one that could be relied upon. He had tested it upon his tongue and had experimented on mice. After a long hearing the magistrate adjourned the case in order that Dr. Luff might make some of the Specific in accordance with the specification, and analyse its contents.

At the adjourned hearing Dr. Wynter Blyth and a clergyman gave evidence for the defence to the effect that the Specific was not poisonous. Dr. Luff was then recalled, and stated that he had prepared the compound according to the directions given in the defendant's specification and analysed the contents, with the result that he found practically the same quantity of aconitine as in the bottle which formed the subject of the prosecution.

Mr. Lushington, in giving his decision, said that notwithstanding the conflict of evidence, he could not doubt that the preparation contained a poisonous dose of aconitine. He therefore convicted the defendant on each summons, and ordered him to pay penalties and costs amounting to sixty-two pounds six shillings.

The Society's Library.

From the Library in London an increased number of volumes has been lent during the past year, the increase being amongst provincial borrowers. The attendances in the Reading Room have not been quite as numerous as in previous years; there have been, however, nearly four thousand signatures in the attendance book. The number of volumes added by donation and purchase is about 200, and among the more important may be mentioned, in botany, the concluding part of the 'Flora of British India,' edited by Sir Joseph Hooker since its commencement, about twenty-five years since; a new volume of the 'Flora Capensis,' under the editorship of Mr. Thiselton-Dyer, in continuation of the work of Harvey and Sonder; the 'Flora of Somerset,' by R. P. Murray, and a complete set of the Annual Reports of the Missouri Botanical Garden from 1890 to 1897. In chemistry, the principal additions, irrespective of the ordinary periodicals, are the General Index to the first twenty volumes of the *Analyst*, including also the first volume of the 'Proceedings of the Society of Public Analysts,' and Guareschi's 'Einführung in das Studium der Alkaloide,' a German translation by H. Kunz-Krause, from the Italian. In pharmacy and materia medica have been added the second edition of the 'Arzneimittel welche in dem Arzneibuch für das Deutsche Reich nicht enthalten sind,' issued by the Deutscher Apotheker-Verein; the second volume of Binz's 'Lectures on Pharmacology,' translated by Dr. Percy Latham, and issued by the New Sydenham Society; the second edition of Kanny Lall Dey's 'Indigenous Drugs of India'; the fifth edition of Mr. Harwood Lescher's 'Recent Materia Medica'; 'Die neuen Arzneidrogen aus dem Pflanzenreich,' by Carl Hartwich, and 'Die Arzneimittel der organischen Chemie,' by Dr. Hermann Thoms. Of works in other subjects there are a new edition of Brannt's 'Treatise on Animal and Vegetable Fats and Oils,' in two volumes; the final volume of 'The Asclepiad,' by the late Sir Benjamin W. Richardson; the third volume of Murray and Bradley's 'New English Dictionary on Historical Principles,' and a number of volumes from the library of the late Mr. W. Dawson Savage, of Brighton, which latter have been useful in filling up several gaps occurring in both the London and Edinburgh libraries.

From the Library in Edinburgh about 1200 volumes have been lent out during the year, of which 209 were to provincial readers. The Library has also been largely made use of for purposes of reference. Upwards of sixty volumes have been added during the year, including Coblentz's 'Handbook of Pharmacy,' Piesse's 'Art of Perfumery,' 5th edition, Taylor's 'Manual of Medical Jurisprudence,' 12th edition, and several duplicate volumes from the Bloomsbury Square Library. The most important matter relating to the Edinburgh Library during the year has been the transference of the Library and Reading Room from the ground floor to the first floor. The old Board Room, with a splendid outlook and excellent light on the north side of the Society's House, has been newly fitted up for the purpose and supplied with electric light. The new Library was opened on November 26, 1897, and the new arrangement is a decided improvement on the old plan, from the point of view of the comfort and convenience of those visiting the Library for purposes of reference or reading. The Society's collection of books is also seen to much greater advantage in the new bookcases.

Museum.

The materia medica collection illustrating the vegetable drugs employed in British pharmacy has been re-arranged in accordance with the lectures given in the Society's School, and on the plan adopted by the late Professor Maisch of classifying drugs according to their character into roots, barks, leaves, fruit, etc. This alteration seems to have given general satisfaction, the specimens being more easily found and compared with one another. Continued interest in the work of the Museum is taken by members and correspondents abroad. A large number of herbarium specimens of Malay medicinal plants illustrating his work on the subject have been forwarded by Mr. H. N. Ridley, M.A. Dried medicinal plants from Central Africa have been presented by Dr. Kerr Cross, and Dr. T. G. Nicholson; from South Africa, by Mr. J. Medley Wood, and African poisons by Drs. Foulerton and Kerr Cross. Professor Planchon, of Montpellier, has contributed others, as well as living specimens of medicinal plants. Messrs. Schimmel and Co. and Mr. Haensel have contributed products connected with essential oils, and numerous donations have been received from correspondents at home. The well-known richness of the Museum has led to various applications from abroad for material for scientific researches. It may also be noted that the collection of microscopical slides belonging to the Society has been revised and added to, and taken under the supervision of the Curator.

Pharmaceutical Work in 1897.

Organisation and Education.

A general survey of the past year's work in pharmaceutical circles leads the observer to the conclusion that the period of twelve months just expired has been marked by a fair display of activity in all matters of pharmaceutical interest. Organisation has been very much in the air, and the dry bones have been stirred to an extent that has probably never been exceeded at any former period. The number of local pharmaceutical associations has been increased to fifty-two, and, without exception, all have done useful work. Not that this implies the reading of an enormous number of cut-and-dried papers, which is probably the least satisfactory way of turning the energies of active workers to account, but subjects of pressing and direct importance to the craft have been deliberated upon, and there has been a marked tendency for the leading associations to unite forces as far as practicable. The object to be aimed at by associations has been clearly indicated by the Vice-President of the Pharmaceutical Society in his Nottingham address; complete local organisation, supplemented by a system of federation, being urged upon chemists and druggists by Mr. Newsholme. Whether in response to his appeal, or to the conjunction of that with other forces at work, local organisation has since proceeded apace, and the close of the year finds us with the path clearly defined along which further progress in this matter must be effected. Awakening has also taken place in regard to the need for systematic training for pharmaceutical students, and it has been a cause for great satisfaction that so many important districts have fallen in with the suggestion originally thrown out in these pages, that a conference should be held at which delegates from the various bodies interested in elementary pharmaceutical education should meet and agree upon a joint line of action for their respective districts. Excellent work is now being done at Nottingham, Sheffield, Plymouth, and elsewhere, in carrying on classes for pharmaceutical students, but there appears to be a lack of system in some cases, and, pending the time when a compulsory curriculum shall prevail in pharmacy as in medicine, it seems extremely desirable that an identical voluntary curriculum should be planned and agreed upon, so that each year the newest comer in the ranks of students may be able to enter upon a well-arranged three years' course of study and practical work, the same course prevailing in whatever part of the country he may be.

Practical Pharmacy.

Turning now to the more technical work done during the year and recorded in these pages, attention may first be directed to the experiments conducted to test the keeping properties of AQUA CHLOROFORMI, B.P. by Peter Boa, who found that the official preparation remains free from alteration for a much longer period than if it contained spirit; then, J. R. Hill pointed out that practice differs considerably in regard to what is supplied in Edinburgh when BELLADONNA PLASTER is prescribed, whilst only in one case out of seven was the official plaster supplied; W. B. Thomson, referring to the great variety found to exist in the composition of BLAUD PILLS, suggested that it would appear reasonable to cease indulging in further theories as to the precise behaviour of the intestinal processes towards foreign substances, and rather see that the state of combination is exactly such as will meet the indications suggesting its use. E. W. Lucas communicated a classification of the OINTMENTS OF THE B.P. which was the outcome of an attempt to improve several of those preparations; P. W. Squire next published the details of experiments in the preparation of UNGUENTUM HYDRARGYRI NITRATIS, and described methods which result in satisfactory products, whilst T. Maben subsequently criticised Mr. Squire's suggestions, and an interesting discussion on the subject followed. R. C. Cowley, in a note on VINUM COLCHICI, showed that a proof spirit menstruum extracts more alkaloid from colchicum corms than acetic acid or sherry; J. H. Pearson contributed a note on GLYCERINUM AMYLI, in which he recommended the addition of a minute quantity of powdered tragacanth to prevent separation of liquid from the mass; Farr and Wright dealt with various pharmacopœial processes in a paper on the DETERMINATION OF ALKALOIDS; and W. Martindale comprehensively summarised what is known about the properties of the more generally employed PRESERVATIVES OF PHARMACOPŒIAL PREPARATIONS. C. J. H. Warden described a simple DRYING BOX FOR PILLS, and also treated of the use of STEAM COILS FOR EVAPORATION; W. S. Glass experimented on the preparation of ESSENCE OF GINGER, obtaining results differing from those of Thresh and showing that African ginger yields the highest percentage of oleo-resin and the strongest essence; George Coull dealt at length with the LATIN OF PHARMACY, and Joseph Ince supplemented that paper, while later he contributed some notes on the PROSODY OF LATIN PHARMACY. Later, N. H. Martin attacked some DANGERS TO PHARMACY in connection with quack medicines and synthetic products; Professor Remington published the results of experiments in which ACETIC ACID was used as a menstruum in place of alcohol, and showed that properly made vinegars might advantageously replace tinctures in many cases. George Sinclair, in a paper on PROGRESS IN PHARMACY, dealt with the development of so-called "elegant" pharmacy; J. Barclay examined several samples of the COCA WINE of commerce, and suggested that a wine prepared from coca leaves should be made up to the required strength by the addition of cocaine; Professor Lewin published the results of experiments on the manufacture of SUPPOSITORIES; and J. C. Hyslop read a usefu paper on PHARMACY ARRANGEMENT.

Conference Papers.

The Glasgow Conference produced a variety of papers of pharmaceutical interest. Dr. J. Attfield showed that ASAFETIDA is the more correct form of the word usually spelt "asafœtida," or the same with the "s" doubled; Farr and Wright contributed a further paper on the pharmacy of CONIUM MACULATUM, and Dr. W. Findlay sent a preliminary note on the action of preparations of hemlock supplied by those investigators, in which he showed that the mixed alkaloids are more toxic than coniine or conhydine alone. J. C. McWalter, in some observations on ORGANOTHERAPY, referred to the fact that compressed tablets of various animal glands have not proved altogether satisfactory in practice, and he expressed the opinion that purified glycerin extracts of the glands will probably be found more efficacious; Umney and Swinton's note on CITRONELLA OIL was devoted to the points of difference between the oil imported from Ceylon and that distilled in England, the former being alleged to contain a sesquiterpene, further investigation of which was promised;

T. Dunlop, having found that price is no criterion of the value of SUMATRA BENZOIN, recommended that the Siam product should alone be employed for pharmaceutical purposes; Dr. G. G. Henderson proposed the medicinal use of soluble combinations of arsenic with acid tartrates of the alkaline metals, compounds analogous to tartar emetic but with the antimony replaced by arsenic, and specially advocated the employment of SODIUM ARSENIO-TARTRATE. Leo Atkinson, in a discourse on PHARMACEUTICAL ETHICS, came much nearer to his subject than is customary with authors of papers on the same topic, and gave utterance to much that is worthy of careful consideration by all pharmacists at the present day; R. Brodie's note on EASTON SYRUP embodied a proposal to substitute quinine hydrochloride for the phosphate ordered in the B.P.C. Formulary; C. Tyrer pointed out that the official characters and tests for HYPOPHOSPHITES are unsatisfactory and indefinite, and described a volumetric method for the quantitative determination of those compounds, based on their reducing action on copper sulphate. F. C. J. Bird, having found that heavy white MEDICINAL PETROLEUM frequently contains notable traces of sulphur, showed how the presence of that impurity can be readily detected; G. C. Druce reviewed the salient features of the SCOTTISH FLORA; C. A. Seyler gave the results of the examination of commercial ALKALOIDAL TINCTURES, which had been found to possess great diversity in strength; W. G. Stratton called attention to the fact that PLATINUM APPARATUS may be damaged or destroyed if phosphates be heated in it in the presence of carbon, and in a second paper the same author showed that the amount of citric acid present in LIQUOR BISMUTHI is sometimes greatly in excess of the quantity specified, whilst a marked deficiency of bismuth was also observed in certain cases. Dr. S. Rideal, in a paper on DISINFECTANT SOAPS, expressed the opinion that an olein soap is preferable as a general basis to one containing stearic or palmitic acid, and that superfatted soaps are useless for disinfecting purposes, since the free fat hinders the action of the disinfectant; Dr. Gordon Sharp emphasised the fact that great confusion has been caused by want of care in naming the MYDRIATIC ALKALOIDS; and J. Bosisto contributed a brief note on KINOS, in which he showed that the question whether the scarce official kino can be effectively replaced by other commercial varieties is answered to some extent from Victoria, Australia, where various kinos are produced, and one—that from *Eucalyptus rostrata*—is obtainable in large quantities as a beautiful ruby-red gum, entirely soluble in water or spirit.

Later Work.

Papers subsequently published include one by Dr. T. D. Reed, on SELENIUM IN COMMERCIAL SULPHUR, and another by the same author on SULPHUR PRECIPITATUM, in both of which it is shown that pure products can be readily obtained if required; J. C. Umney has shown that SODIUM IODIDE as prepared by the principal manufacturers deviates to a marked extent from the official standard; Dr. C. O. Hawthorne has published an instructive lecture on the nature and purpose of the BRITISH PHARMACOPŒIA, more especially intended for students; A. C. Abraham insists on the necessity of greater ACCURACY IN PHARMACEUTICAL EXPRESSION, both in the Pharmacopœia and elsewhere; and J. H. Beal furnishes a much needed reminder of the real purpose of pharmaceutical legislation, in his concise paper on the relation of the pharmacist to PHARMACY LAW. Then, White and Braithwaite have dealt with the difficulty experienced in making medicated SUPPOSITORIES of uniform size, weight, and strength, whilst also devising a novel mould for preparing suppositories in the cold; Professor J. R. Green has given his experience of the condition of PHARMACEUTICAL EDUCATION in the United States, contrasting it favourably with what obtains in Great Britain; B. F. McIntyre describes a useful process for the COLD CONDENSATION of malt extract and other liquids liable to ferment; and formulæ have been published for numerous ANTISEPTIC DRESSINGS and similar surgical accessories. A. Wathes, in a paper on STANDARDISATION, expresses the opinion that the process is quiet feasible in certain cases, though samples of presumably standardised preparations purchased by him prove that it is not carried out in many instances. More recently still, J. R. Hill has shown that SEIDLITZ POWDERS are too frequently sold which deviate from the official standard as regards weight, or contain appreciable quantities of lime, being apparently made with inferior cream of tartar; Farr and Wright have published the results of excellent work on some of the OFFICIAL EXTRACTS, and shown that alcoholic extracts are vastly superior to those at present in general use; W. Martindale appeals to students in a convincing manner, in his address on the use of the FIVE SENSES in PHARMACY; Dr. Gordon Sharp finds that preparations supposed to be made from CEREUS GRANDIFLORUS have really been made from *Opuntia decumana*, and he concludes, as the result of physiological experiments, that both are worthless as drugs. Dr. T. F. Dewar and James Jack have attempted to show how the use of the METRIC SYSTEM in prescriptions may be facilitated; W. Kirkby publishes a formula for fluid extract of SENECIO JACOBÆA; R. D. Gibbs has invented a useful TABLET COMPRESSOR for use at the dispensing counter, and last but not least, the General Medical Council has finally decided upon all the matters of principle involved in the publication of the new BRITISH PHARMACOPŒIA, and the book will be issued within a comparatively few weeks.

Progress of the Journal.

During the past twelve months the *Pharmaceutical Journal* has been steadily developed on the lines indicated in the first issue for 1897 (see p. 12). It has become more and more apparent as months and years have passed that the changes initiated some time ago commend themselves to the general body of readers, and the few who have always been averse to any appreciable alteration in the style and matter of the paper have acknowledged the right of the majority to have their own organ conducted on lines of which they approve. With the beginning of the year the special requirements of students were met by the institution of "The Students' Page," and as events have since proved, it has been one of the most popular and useful features that could have been introduced. Advanced students have also been catered for in various ways, including the much-needed articles on "Practical Pharmacography." The illustration of those articles has been made a special feature, and satisfactory drawings of several important drugs have been published for the first time. All the drawings of crude drugs have been done by a skilled artist, working under the personal supervision of Mr. E. M. Holmes, to whom the Editor is greatly indebted on that account, and the material has, of course, been supplied from the invaluable collection in the Society's Museum. There has been no falling off in the quality or quantity of the scientific papers and abstracts published in the Journal, technical matters of interest to the craft have received their full share of attention, whilst the business requirements of readers have been fully met. The increasing pressure on the correspondence columns reveals, more forcibly perhaps than is otherwise possible, the increasing interest taken in the Journal by its proprietors, the supporters of the Society, and other readers, and at the close of an exceptionally busy year the chief compensation of those responsible for the conduct of the paper is the knowledge that all the efforts made to interest and improve have been duly appreciated.

Chemistry in 1897.

CHEMISTRY has made steady progress during the year, as might be expected from the number of zealous workers who are striving to solve the many chemical problems that daily occur. In this country at all events, notwithstanding our shortcomings in reaping the advantages of the results of investigations which, frequently emanating from us, are worked out by our Continental friends, we are not retrogressing in physical and inorganic chemistry, whatever may be the opinion as to our position in applied organic chemistry.

Liquefaction in Fluorine.

Moissan and Dewar, continuing the researches of Dewar at low temperatures and utilising the intense cold which is produced at the temperature of boiling liquid oxygen, have succeeded in obtaining fluorine, which was isolated by Moissan in 1886, in the form of a mobile yellowish liquid at $-185°$ C. In its liquid form it is almost inert to the many substances, such as glass, silica, etc., on which it has so powerful an action in its gaseous condition.

Researches on Argon.

Argon certainly now remains undisputed as being an elementary gas, and appears to be present in many natural gases. Schloesing has found it in fire-damp and Regnard in the blood, whilst Villard has succeeded in combining it with water to form a crystalline hydrate. Argon, like helium, has been found by Ramsay and Collie to be a most inactive element. Lord Rayleigh has met with helium in the natural gases issuing from the Bath springs to the extent of 1·2 per 1000 volumes, and Olszewski having failed to liquefy it, Dewar has demonstrated how helium can be obtained from the same source in large quantities by his method of liquefaction of the other gases at a low temperature. Dewar has also suggested the method of liquefaction of gases as a means of detecting the impurities that may be contained in air. Arising from the investigations which were made in the isolation of argon, Lord Rayleigh points out how he is unable to corroborate the statement of Sir Humphry Davy that nitrogen dissolved in water is oxidised by electrolysis. If nitrogen could have been oxidised in this manner, argon could have been isolated without difficulty on a large scale.

Metallic Carbides.

Moissan has obtained by direct synthesis a definite crystalline iron carbide of the formula Fe_3C, identical with steel, by the action of the heat of the electric furnace on pure iron and the carbon of sugar, whilst Bone and Jerdan have caused the direct union of carbon with hydrogen at a temperature of 1200° C., forming methane without any acetylene or other unsaturated hydrocarbons. The dangers of calcium carbide as a source of acetylene can be avoided according to Vivian Lewes if the carbide is pure, and is kept perfectly dry, and if proper storage of the carbide is ensured. In this connection Bone and Cain point out that acetylene forms an explosive mixture when mixed with one-fifth to one-fourth of its own volume of oxygen.

The Benzene Formula.

Professor Collie has attacked the benzene formula—that fascinating source of interest to many chemists—and has suggested a conception of its construction that may throw a new light on the constitution of many benzene derivatives. The space formula for benzene, as it is termed by its author, combines the hypothesis of the ordinary formula and of the centric formula for benzene, together with the hypothesis that there are two distinct sets of three hydrogen atoms, and that when one set is inside, the other set is outside the molecule. Matthews has since stated that this new space formula for benzene satisfies unexplained modifications in the hexa-halogen addition compounds.

Purple of Cassius.

The purple of Cassius has been investigated by Antony and Lucchesi, who have been enabled to prepare similarly coloured compounds by adding either cuprous chloride, mercurous chloride, or mercurous chloride and barium sulphate to auric chloride. Inasmuch as the purple precipitates so obtained contain free gold, it is concluded that the original purple of Cassius, which is made by adding a tin salt to auric chloride, is a mechanical mixture consisting of stannic acid coloured with metallic gold. This is one of the views which has been previously held as to its composition.

Potassium, Silver Nitrate, etc.

A simple instrument has been devised by Newth for the detection of potassium by the flame reaction that absorbs all those portions of the spectrum which usually make the indigo prism fallacious as a test when potassium salts are admixed with salts of lithium, strontium, calcium, etc. Warden has drawn attention to a method of precipitating silver nitrate by strong nitric acid, which has been adopted at the Calcutta Medical Depôt to prepare lunar caustic free from copper, also to the apparent action of light in inducing crystallisation of stannous iodide.

Atomic Weight of Carbon.

From the Davy Faraday Research Laboratory doubts have been thrown by Scott on the methods adopted by Stas, Dumas and others in the determination of the atomic weight of carbon, which, it is asserted, is by no means one of those most accurately known, and that careful revision of it is imperative.

Cinchonine and Cinchonidine.

In the chemistry of natural drugs many investigations have been made which are of some interest. Koenigs startled the quinologists by the statement that on the supposition that cinchonine and cinchonidine are stereo-isomeric, he had been enabled to convert five per cent. of the former into cinchonidine by the very simple method of boiling with potash in amylic alcohol. Moreover, Shaw subsequently reported that he had been fortunate enough to effect this change to the extent even of 12 per cent., so if this be correct, quinine manufacturers should have no difficulty in converting a part of the comparatively worthless cinchonine into the more valuable drug cinchonidine. These statements, however, have not been confirmed by Paul and Cownley, who carried out the process exactly as described by Koenigs, and they suggested that the cinchonidine found by Koenigs was more probably due to the known difficulty of separating the cinchona alkaloids and of obtaining them in a state of purity.

Hyoscine and Scopolamine.

Schmidt and Hesse have still to settle the question between them as to the individuality of commercial scopolamine hydrobromide, for whilst Hesse maintains that it consists of hyoscine and atroscine, which are stated to be natural to the root, Schmidt alleges that it is composed of scopolamine and *i*-scopolamine, the latter, which is officially inactive, having been produced in the process of the extraction of the alkaloids. But as L. Merck points out, the real question now between Hesse and Schmidt as to hyoscine and scopolamine is merely a question of name, both agreeing to Hesse's original formula of $C_{17}H_{21}NO_4$, and Merck's opinion from the results of careful extraction of scopola root is more in accord with Hesse, and he believes that there are two natural isomeric bases which can be only differentiated by their optical activity.

Jaborandi and its Alkaloids.

Jaborandi and its alkaloids have received some attention, and we are approaching to a more definite understanding of the nature

of the alkaloids which are present in the various kinds of jaborandi leaves. The early expressed opinion that jaborandi contained only one alkaloid, to which the name pilocarpine was assigned, has been proved to be inaccurate, so that the problem now to solve is to ascertain what is pilocarpine? Paul and Cownley having shown that the several kinds of jaborandi leaves differ considerably in the amount of alkaloid they contain, and that the product obtained is probably always a mixture of two or more distinct alkaloids, and that the pilocarpine salts of commerce differ largely, not only in their physical properties, but also in their physiological action, Petit and Polonowsky have undertaken the study of the two alkaloids pilocarpine and pilocarpidine, and they conclude that the commercial salts of so-called pilocarpine are, for the most part, admixtures of pilocarpine and pilocarpidine, this being especially the case with the nitrate, which frequently contains 50 per cent. of pilocarpidine nitrate. They also state that pilocarpine and pilocarpidine are isomeric—Merck having previously failed to methylate pilocarpidine—and that the former is transformed into pilocarpidine by heating pilocarpine hydrochloride just above its melting point; moreover pilocarpidine is natural to the leaves.

Determination of Digitoxin.

Keller and Fromme have been working at the determination of digitoxin, which, according to Schmiedeberg, is the active principle of digitalis leaves. Fromme finds that the amount of pure digitoxin in digitalis leaves varies from 0·104 to 0·391 per cent.

Constituents of Rose Oil.

The confusion which has been caused by the application of various names to the constituents of rose oil (otto) and some other kinds of essential oil will be found fully described in the Journal (p. 416 *ante*), in which it is shown that an alcohol, $C_{10}H_{17}OH$, is a common constituent of rose oil, geranium oil, and of the various essential oils obtained from species of andropogon, and that the name geraniol, first given to the alcohol obtained from andropogon oil by Jacobsen in 1871, is more entitled to consideration than rhodinol, roseol, réuniol, etc.

Formaldehyde and its Polymer.

Formaldehyde is maintaining its value as an antiseptic as being more suitable for many purposes than other kinds of antiseptics, and Merck has prepared compounds of it with casein, gelatin, and starch. The difficulty of keeping a strong aqueous solution of formaldehyde without its undergoing conversion into its solid polymer, paraformaldehyde, has always retarded its general use. It has, however, been shown by Paul and Cownley how the solid polymer can be readily converted when required into its soluble form, and they suggest that the solid polymer should be manufactured for use as an antiseptic instead of the unstable formaldehyde. The soluble aldehyde which has been prepared from the para compound has been stated by one observer to be even more energetic as an antiseptic than the normally prepared formaldehyde. More information, however, is required on this point.

Synthetic Remedies.

Synthethic remedies are still being actively prepared in Germany, some of which may be found to possess the advantages claimed for them. Eucaine and eucaine B, for instance, are being favourably received as being less toxic than cocaine, whilst holocaine prepared from phenacetin and *p*-phenetidin has met with some measure of success as a substitute for cocaine. Eupthalamine, a new mydriatic, and orthoform, a non-toxic anæsthetic and powerful antiseptic, are among the more important bodies which possess pharmaceutical interest. Euquinine, the ethyl carbonic ester of quinine, is said to be without many of the disadvantages of quinine, and has been found therapeutically to be equivalent to half the quantity of quinine. It has only a slight bitter taste, and is said not to produce cinchonism. Symes has shown how the supposed inimical action of alcohol in pepsin digestion is modified in a membrane receptacle, so that an alcoholic liquid may be used for preparing solutions of pepsin for medicinal use.

Essential Oils.

J. C. Umney has done good work on the essential oils of fennel, J. C. Umney and Swinton on oil of citronella, and Braithwaite has improved Herschon's apparatus for use in the determination of aldehyde or of phenol.

Hydrolysis of Starch.

That there is a relation between the cupric reducing power and the specific rotatory power of the products of hydrolysis of starch by diastase was first asserted by O'Sullivan, the one being inversely proportional to the other for all stages of the reaction. The existence of this relation has since been denied by some Continental chemists, but after a searching inquiry by Brown, Morris, and Miller, it has been thoroughly confirmed. If a solution of such products shows a rotatory power departing from that demanded by its cupric reducing power, it may safely be assumed that an impurity is present. Rolfe and Defren find also that when starch is hydrolysed by dilute mineral acid, a similar relation holds, although the final product is not maltose, as is the case when the conversion is effected by diastase, but dextrose.

Colouring Principles of Tannin.

An investigation of the yellow colouring principles of various tannin matters has been carried out by A. G. Perkin, F.R.S.E. A crystalline yellow substance has been isolated from Cape sumach, the young leaves of *Colpoon compressum* or *Osyris compressa*, which has proved to be a new glucoside of quercitin, and to which the name osyritin has been given. Quercitrin and rutin from quercitron bark and rue respectively are other distinct glucosides of quercitin. Quercitrin yields on hydrolysis one molecule of rhamnose, rutin giving two molecules of the same sugar. Lowe's statement that the colouring matter of gambier catechu is identical with quercitin has been confirmed, and acacia catechu also appears to contain a very small proportion of the same substance. The coloured principle of Sicilian sumach, *Rhus coriaria*, is not quercitin as was formerly supposed, but myricetin, and an investigation of Venetian sumach, *Rhus cotinus*, indicates that its colouring principle is the same substance. The class of tannins found in seeds and fruits contains no member of the quercitin series. They contain, on the other hand, ellagic acid or ellagitannic acid, to which their yellow dyeing property is due. Members of the quercitin group occur in flowers, leaves, and stems, but only rarely in seeds and fruits, notable exceptions being Persian berries, which contain rhamnetin and quercitin, and parsley seeds, which contain apiin. The general results show that a very intimate relation exists between tannins and their accompanying colouring matters. The decomposition products, of which gallic and protocatechuic acids, phloroglucinol, and resorcinol are typical examples, are found to be the same in the case of the colouring matter as in the tannin.

Other Colouring Matters.

An exhaustive series of reactions upon apiin and its hydrolytic product—apigenin—has been made by the same author. Apigenin is found to be closely related to chrysin, the yellow colouring matter of poplar buds, and is very probably hydroxy-chrysin, its decomposition into phloroglucinol and para-hydroxy-acetophenone being then clear. Besides quercitin and its mono-methyl ether—rhamnetin, a third substance occurs in Persian berries named rhamnazin, that has been found to be a quercitin dimethyl ether.

Experiment shows that one methoxyl group is present in the catechol nucleus (using Herzig's formula for quercitin), but no knowledge has been gained as to the position of the other, except the fact that it is not in the phloroglucinol nucleus in the ortho position relatively to the carbonyl. Some new light has been thrown upon the constitution of the colouring matter of cochineal by Liebermann. By the direct oxidation of carmine with potassium persulphate he has obtained two substances to which he gave the names coccinic acid and cochinillic acid. The former proved identical with the oxyuvitic acid of Oppenheim and Pfaff, while the latter was found to be a cresol tricarboxylic acid. The positions occupied by the groups being methyl, 1; carboxyl, 2, 3, and 4, and hydroxyl, 5. The constitution of this nucleus is therefore established.

ALCOHOLIC FERMENTATION.

The views hitherto held with regard to the nature of the action of yeast upon sugar in the formation of alcohol will in future have to be modified. As long ago as 1858 Traube held that fermentation was the result of zymotic action, and later Hoppe-Seyler maintained the same theory. Lately E. Buchner has succeeded in producing alcoholic fermentation without the presence of yeast cells. He took pure beer yeast freed from adhering water and ground it with quartz, sand and kieselguhr, mixed this with a little water, and subjected it to hydraulic pressure, thus obtaining a strong solution of the soluble contents of the protoplasm.

This was made clear by filtration, and constituted a slightly opalescent liquid of specific gravity 1·0416. It gave of carbon dioxide on warming, and at 35° to 40° became coagulated. This liquid, when mixed with a strong solution of cane sugar, induced a strong alcoholic fermentation, during the progress of which no organism made its appearance in the liquid. Even when the yeast juice was contained in a parchment bag suspended in sugar solution it was found that carbon dioxide was given off from outside the bag, so that the fermentative enzyme to which this property is said to be due appears to be dialysable. The property of the liquid disappears with time; being surrounded with ice it became inactive in five days, although, curiously, it continues its activity over two weeks when mixed with sugar solution.

Rigorous tests have been applied to determine whether the property was due to the presence of fragments of protoplasm in the liquid, and it has been found that filtration through the Berkefeld filter produced no effect, while the presence of chloroform did not retard the fermentation. A 1 per cent. solution of sodium arsenite was also without effect. As these things destroy the action of living yeast it is evident any protoplasm unprotected by a cell-wall would be destroyed more rapidly, and there remains no doubt that the activity is due to a zymotic chemical substance and not a living protoplasm. It is important to notice that Professor J. R. Green, working precisely by the method of Buchner, with samples of English yeast, has been unable to confirm these results. No diminution of the specific gravity of the syrup or evolution of carbon dioxide sufficient to account for zymotic action could be observed in the course of several days, and it is, therefore, contended that these yeasts, at any rate, contain no alcohol-producing enzyme. This, however, cannot be taken as conclusive evidence of its non-existence, as Buchner himself failed to produce the enzyme from certain samples of yeast.

SYNTHESIS OF CITRIC ACID.

Among other points of interest may be mentioned a new synthesis of citric acid, which has been effected by W. T. Lawrence, who obtained ethyl citrate by the condensation of ethyl bromacetate with ethyl oxalyl-acetate in the presence of zinc.

NOTICES OF BOOKS.

HAM'S 'INLAND REVENUE YEAR-BOOK' for 1898 (London: Effingham, Wilson and Co., 11, Royal Exchange, E.C. 3*s.* and 4*s.* 6*d.*) will receive a warm welcome from everyone who has had occasion to consult its predecessors of former years, and Mr. E. Grant Hooper and his colleagues are to be congratulated on once more producing a capital work of reference. Following a compact scribbling diary, we find the usual information concerning the Royal Family, Ministers of State, Government Officials, Judges, statistics illustrating the progress of the nation, stamp duties, etc., etc. Then comes a concise digest of Inland Revenue laws, followed by a schedule of licences and information regarding income-tax, probate of wills, etc., concluding with an Inland Revenue directory. As pointed out on former occasions, perusal of the contents of the book enables one to see many things from the point of view of the Inland Revenue officials, and to those who may have occasion to devote careful consideration to any of the matters dealt with in the work the volume should prove invaluable. For all matters connected with the Inland Revenue it fills a similar position to that occupied by Whittaker's 'Almanack' with regard to affairs of more general importance.

THE 'TRANSACTIONS OF THE BRITISH INSTITUTE OF PREVENTIVE MEDICINE' (First Series) enable one to form a fair idea of the position that preventive medicine now occupies, and the extent to which the study of bacteriology has contributed to the results attained. The papers included in the volume have all been contributed by members of the staff of the Institute, and they are edited by the Director, Dr. Allan Macfadyen, an introduction being furnished by Lord Lister, Chairman of Council of the Institute. First, we have "A Contribution to the Study of Streptococcus Pyogenes," by William Bulloch, M.D., which is followed by a paper "On the so-called Pseudo-Diphtheria Bacillus and its Relation to the Klebs-Löffler Bacillus," by R. T. Hewlett, M.D., M.R.C.P., and Edith Knight, M.B. An interesting "Note on a Peculiar Movement of Certain Intra-cellular Particles in Yeast Cells," is contributed by Wm. St. C. Symmers, M.B.; a paper "On Micrococcus Gonorrhœæ and Gonorrhœal Infection," by Alex. G. R. Foulerton, F.R.C.S.; and one on "The Sterilisation of Milk," by A. Macfadyen, M.D., and R. T. Hewlett, M.D. The writers of the last-named paper point out that for a process of sterilisation to commend itself for general use, it must be possible to heat large quantities of milk quickly and uniformly in an apparatus that will enable the process to be readily and cheaply carried out. A new form of apparatus is described and illustrated, which is easily worked, rapid in action, and capable of dealing with unlimited quantities of milk. It can also be automatically cleaned and disinfected before use. A paper on "The Sterilisation of Water by Filtration," by Joseph Lunt, B.Sc., etc., is a record of results obtained with the Berkefeld Filter. A large number of experiments have shown that when the filtering medium is efficiently sterilised, this filter can give an absolutely sterile filtrate on the first day of use; it is essential, however, that re-sterilisation should be effected daily, if the filter is to be used continuously. The remaining papers are on "The Bacillus of Bubonic Plague, *Bacillus pestis*," by R. T. Hewlett, M.D., "Bacteria and Dust in Air," by A. Macfadyen, M.D., and Joseph Lunt, B.Sc., and finally, "On a Convenient Method of Preserving Living Pure Cultivations of Water-Bacteria, and on their Multiplication in Sterilised Water," by Joseph Lunt, B.Sc. The book, which is published by Macmillan and Co., Ltd., is a very creditable production, and its contents ought to interest many of our readers.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australasia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

LONDON: SATURDAY, JANUARY 1, 1898

RICHARD WILLIAM GILES.

THE death of RICHARD WILLIAM GILES has removed from the ranks of the Pharmaceutical Society one of its oldest members and one of the small group of pharmaceutical chemists whose Major certificates were recorded in the Register for 1896 as being numbered with two figures. The son of a Founder of the Society, who had in the early part of the century established at Clifton, a business which rose in celebrity even more rapidly than the locality in which it was situated, R. W. GILES, after apprenticeship to his father, became a student in the recently established School of Pharmacy at Bloomsbury Square, where he distinguished himself by taking prizes in chemistry, pharmacy, botany, and materia medica in the session 1847-48. His reminiscences of that period of his career were given in a recent number of the Journal.

His contributions to the Journal were numerous and important. Among the first was an elaborate historical paper on the Atomic Theory, read before the Bristol Chemists' Association, 1847; also a short notice on "Accidental Poisoning," 1849, which showed the interest he even then was taking in science and practical pharmacy. In another, suggested by a remark in the *Times*, expressing regret at the deficiency of competent chemists, he maintained the principle that pharmacy ought to occupy a much more honourable and scientific relation to the practice of medicine than it had hitherto done. The education of apprentices next engaged his attention. He defended the alleged apathy of assistants, and while urging them to higher exertion, hoped the day would come when greater facilities for study and research would be within their reach. A communication to the British Pharmaceutical Conference, on "Relation of Remuneration to Pharmaceutical Responsibility," reflected the uniform direction of his mind.

"Granted," he remarked, "that pharmacy is a trade, it is, nevertheless, a trade with exceptional responsibilities, and demanding exceptional qualifications which take it out of the category of ordinary trades."

"We also have a right to expect," was his conclusion, "that the importance of our duties; when conscientiously discharged, and the nature of the qualification which we are required to possess, should raise us in the social scale somewhat above the status of ordinary trades, and that the profession of pharmacy, instead of proving as it now does an obstacle to the honourable status of a gentleman, should be held to imply all those qualities which make the name of gentleman desirable."

He insisted in this carefully worded confession of belief on the claim of the pharmacist to better recognition, both as regards his place in science and in his social relationship. The subject was further considered in a letter on "Pharmaceutical Ethics."

Mr. GILES was a member of Council from 1853-56, and for some time a member of the Board of Examiners. On many occasions he appeared before the Society, to defend or propose some public course of action. He was a manly speaker, and marshalled his facts in a clear and consecutive manner—speaking without embarrassment, and with conviction, giving an impression of being perfectly in earnest. In stating his case he was uniformly successful, and details followed in due order. He was conspicuous in the part he took in prolonged discussions relating to the Poison Regulations, and in fact was a prominent speaker on any public question of importance which engaged the attention of the Society. On retiring from the Council in 1856 in order that other localities might be represented, he spoke at the annual meeting of what the Society had done in its collective capacity, and pointed out that much remained to be done by members as individuals by maintaining the credit of their position and performing their duties toward those who were to succeed them by not accepting as pupils those who were imperfectly educated.

Probably nothing was so characteristic of Mr. GILES as his undeviating assertion of the dignity of the pharmaceutical calling, based upon educational qualification. This was conspicuous throughout his public career, and was evidenced even in minor transactions. While at Clifton he had an encounter with a herbalist, who regularly supplied her customers with *Solanum nigrum* instead of *Atropa belladonna*. With unshaken pertinacity she maintained the verity of the specimen and evinced a profound contempt for the different opinion held by the pharmacist. The moral drawn by Mr. GILES deserves to be quoted, as it is but a variation of the constant expression of his views.

"I was entirely unsuccessful in convincing her, and there can be no doubt that the same practice will be continued at the proper season, year after year, so long as an unquestioning market is to be found. It does not, therefore, seem improper to call attention again to an old tale, not for the purpose of repeating the individual caution already given, but to apply the force of it to the whole system, and to conclude that pharmaceutists, who claim a dignity from the responsibility of their duties, cannot without criminal indifference transfer their trust to ignorant and irresponsible herbalists, but that they are required to distinguish carefully for themselves the species of the plants derived from such scources!"

It would not be just to the memory of Mr. GILES to omit a direct reference to his exceptional skill in a different branch of knowledge; he was a born accountant. Evidence of this was found in the record of his business transactions at Clifton; his receipts and expenditure—being entered with scrupulous accuracy, and in the most irreproachable handwriting. He has been known to rise from his bed at night in order to rectify an error which had occurred in the course of the daily takings, and he was able to say with truth that he could at any given time present the statement of his financial standing and produce a balance sheet. On this account his services were greatly in request, and he rendered essential service to the Great Western Railway and in cases of a private nature. We regret the removal of so distinguished a pharmacist, one who so faithfully exemplified in his own career that high standard to which he was anxious his associates should aspire.

ANNOTATIONS.

The Beginning of a New Year finds the world of pharmacy with a good record of useful work to its credit for the past twelve months. The interest taken in the various problems vexing the souls of British pharmacists has been as great as at any previous time, if not even greater, and the prospect at the present moment is therefore far from discouraging to anyone who has the best interests of the craft at heart. For, until a deep and abiding interest is taken by individual chemists and druggists in matters that immediately concern them, it is quite hopeless to attempt to make the influence of the whole body felt as it ought to be. Perfect organisation for defence of professional interests and improvement of the conditions of existence, requires first, that the units to be organised must be in a fit condition of mind, so as to be able to realise the need of defence and improvement. They must next bestir themselves and actively co-operate in all measures taken with the view of forwarding either or both of the specified aims, for the merely passive supporter is apt to become somewhat of a drag on the chariot of progress. Of course, passive assent to what the more progressive members of the craft are doing is preferable to active dissent, but in itself it counts for little, if anything, beyond a slight addition to the ranks of those who approve of what is being done. At the beginning of another year, therefore, it seems desirable to urge upon all active workers in pharmacy the necessity of first converting opponents, and then convincing passive friends of the need for a display of activity on their part.

Local Associations will be found to serve as the best rallying points, as—if properly constituted and conducted—there is no reason why they should not include the whole of the craft in the districts they respectively cover. There the supporters and antagonists of the Pharmaceutical Society, of the Proprietary Articles Trade Association, and of any other more general organisation, can meet on common ground, discuss their differences, and form that better opinion of each other which is an inevitable result of a more thorough understanding of other people. The first step towards a complete union of forces is to become convinced of the sincerity of those with whom one desires to work in unison; due allowance can then be made for personal peculiarities, minor differences can be sunk for the time being, and it becomes possible for persons with the most conflicting notions to work together with a single aim. Ardent supporters of the Pharmaceutical Society, for example, need not worry other people, in season and out of season, to join that body, on the ground that in no other way can their business and professional salvation be effected. They might rather appeal to them on the broader ground of the benefit of the craft, and persuade them to show their sympathy with progressive movements by joining some local organisation. The Pharmaceutical Society stands in no need of apologists, and education of the organising faculty will—indirectly and therefore more satisfactorily than in any other way—bring about the desired result in good time.

There are Fifty Local Associations in Great Britain at the present time, all active and prepared at short notice to deal with any matters of importance to the craft that may be brought before them for consideration. Moreover, most, if not all, of them are kept in close touch with each other through the medium of the Federation of Local Pharmaceutical Associations. The latter is an organisation that, by its very nature, cannot be expected to be ever prominent in the world of pharmacy, but at the same time it possesses an enormous power for good, and by stimulating the constituent associations to consider simultaneously questions of general importance to pharmacy, it has shown in a marked manner of late what it is capable of. There is no reason why many more local associations should not come into existence before the close of 1898, and by affiliation with the Federation each one will have it in its power to direct the attention of most of the thinking chemists and druggists in the country to any point that may be considered desirable. On the other hand, it will thus become possible to evoke general expressions of opinion more readily than has yet been possible. But to that end it is essential that the issues set before the various bodies should be identical, and those in charge of the meetings must prevent speakers rushing off at a tangent and raising side issues. The necessity of such uniformity and limitation will be evident to anyone who reads the reports published in the Journal of recent discussions on identical topics, which had evidently been pre-arranged with a view to simultaneous consideration throughout the whole country, but resulted in some instances in what perilously approached a fiasco.

To Support the New Pharmacy Bill is obviously the duty of all local associations, no one of which has yet found any reason to disagree with the provisions of that Bill. One or two associations have formally resolved to neglect no opportunity of facilitating the progress of the measure and, by implication, it may be assumed that others intend to act in a like spirit. The improvements offered by the Bill may seem slight, but they will at least give homogeneity to a body that is unfortunately distinguished at present by its heterogeneous nature. Reduction in the number of classes into which supporters of the Pharmaceutical Society are divided is an imperative necessity, as much to avoid confusion as to attract support from chemists and druggists who object to join the Society except on equal terms with pharmaceutical chemists. When that simplification has been effected, the only matter connected with the constitution of the Society which is calculated to cause serious disaffection in the ranks will be removed, and the one body which can claim to represent the chemists and druggists of this country in an efficient manner, will be placed in a position which will enable it to approach the Legislature with a greater prospect of obtaining satisfaction than has formerly been possible. Support to the Bill may also reasonably be looked for on the part of chemists and druggists not at present connected with the Society, whilst the pharmaceutical chemists who threaten obstruction will doubtless decide otherwise after reconsidering the matter.

Membership of the Society, it must be pointed out, is no qualification, though no one can become a member except he possesses a qualification. That, however, is in a very large number of instances, as in the case of chemist and druggist members and many pharmaceutical chemists, indicative neither of a special course of training nor of having passed a qualifying examination. And it is surely not contended that an individual who passes the Minor examination to-day is less worthy of becoming a member of the Society than an unexamined chemist and druggist who has secured registration merely by virtue of being in business on his own account before a certain date. Over and above this, it is frequently suggested and probably with good reason, that the Minor examination is now more difficult to pass than the Major was a few years ago. In addition, chemists and druggists in business on their own account are required to pay the same annual subscription to the Society as pharmaceutical chemists, and it is generally accepted nowadays that representation and other privileges should as far as possible accompany and be proportioned to taxation. This would afford another argument in favour of the proposed change, if such were needed. Reason and justice, then, alike point to the

desirability of entitling all chemists and druggists to become full members of the Society, and no petty prejudice should be allowed to stand in the way of this much-needed reform.

Another Direction in which local associations should direct their energies during the year is the improvement of facilities for the education and training of apprentices. It would be well if each association would pass resolutions to the effect that all apprentices ought to have passed the Preliminary examination before entering a pharmacy; that time should then be allowed in all cases for apprentices to attend lectures during the day; and that moral pressure should be put upon the youths to enter for a systematic three years' course of lectures and laboratory work, designed to furnish a substantial foundation upon which to base the studies to be undertaken prior to presenting themselves for the qualifying examination. Having passed those resolutions, the associations might then proceed deliberately to attack the problems involved, and it need not be long before success crowns the efforts put forth.

A Decrease in Rabies Among Dogs is announced by the Board of Agriculture. In the fifty-two weeks of the present year 154 cases of rabies among dogs were reported, as compared with 438 last year and 672 in the year before. The decline in the three years has, therefore, been very marked, the cases last year not being a quarter so numerous as those in 1895. Last week no case was reported, but in the three preceding weeks the numbers were one, seven, and two respectively, making ten for the month in the whole of England and Wales, or rather in such districts as are affected by the muzzling order. The cases of rabies have, therefore, been brought down very nearly to vanishing point. The number of stray dogs removed from the street is, however, still very large, and it is of stray dogs that dog owners have very strongly complained. Mr. Long, the Minister of Agriculture, has admitted the decrease in rabies, and has recently said that the question of giving local authorities wider powers to regulate the conditions under which dogs are kept and the seizure of stray ownerless dogs is now under his consideration, his hope being to make proposals to Parliament on the subject.

Pharmaceutical Examiners in London, observes *Meyer Brothers' Druggist*, a U.S. American organ, may not differ much from those in the United States in some respects, but they must be better natured. If this were not so, it is thought, the editor of an English drug trade paper would find life a burden after Professor McLeod had seen a representation of his countenance that appears in the pages of that paper. Such a caricature is probably hardly possible out of the City of London, and as our U.S. American contemporary remarks, though it may be art it is not of the kind appreciated by druggists. Fortunately for the esteemed professor's peace of mind and capacity for peaceful slumber at night, he is not likely to have the aforesaid caricature brought under his notice, and that is not to be regretted, even though the enterprising editor in question may fail to reap the reward of his doubtless well-meant endeavour to instruct candidates about to present themselves for examination.

"A Technical Offence" is the heading of a paragraph in a Leicester paper, which records the fact that Thomas Young, manager of the Enderby Co-operative Stores, who had been convicted of selling tincture of rhubarb deficient in spirit and saffron, had escaped on payment of the costs of the case. The certificate of Dr. Bernard Dyer, the county analyst, was as follows:—"I am of opinion that the sample contained the parts as under:—Extracted matters, 5·38 per cent.; proof spirit, 72; water, 22·6, and it was, therefore, deficient of proof spirit to the extent of 18 per cent., as compared with tincture of rhubarb properly made according to the directions of the British Pharmacopœia, which should contain at least 90 per cent. of proof spirit. It was also deficient in saffron." For the defence it was innocently stated that the object of the spirit in tincture of rhubarb is simply to preserve it from decomposition, and that, if there had been a contravention of the Act, it was a purely technical one, and one that did not prejudicially affect the purchaser. This particular tincture was obtained from the headquarters of the Co-operative Societies of the kingdom on June 3, and since then the bottle had been opened a number of times, and that was alleged to be the reason why part of the spirit had evaporated. The deficiency of spirit, it was also suggested, did not lessen the efficacy of the tincture (*sic*), and of course a promise was made that care would be taken in future that evaporation should not occur. In conclusion, we are informed that the Bench thought the theory of evaporation was correct, and suggested that a glass-stoppered bottle should be used in future, whilst those sapient magistrates contented themselves, as stated above, with ordering the defendant to pay the costs. That fact alone should render it unnecessary to inform our readers that the defendant is not a registered chemist.

A So-called "Chemist," not registered however, is reported in the same paper as having been fined two pounds, including costs, at Loughborough Police Court. This individual, Richard Parsons by name, keeps a shop at Shepshed, and had been warned against selling methylated spirit without a licence a year ago, but on October 20 he sold some to an agent of the Inland Revenue authorities. Defendant had since taken out a licence, and it was contended on his behalf that as he had properly labelled the bottle containing the incriminating spirit, that should be conclusive of the fact that he was not wilfully breaking the law. It was suggested to be rather a proof that he was acting *bonâ fide*, and that it bore out his explanation that he fully believed an ordinary spirit licence he held covered the sale of methylated spirit. This specious pleading, however, availed the defendant but little, for a fine of two pounds, including costs, was imposed. But it would be interesting to know whether he termed himself a chemist, and if so, why? Some local chemist should see to this matter.

The Death Roll of the past year has, happily, not to be accounted an abnormal one, so far as pharmaceutical mortality is concerned. Notable gaps have, however, been made by death in the ranks of active workers in pharmacy and the allied sciences. In Professor E. Russow, of Dorpat, and Professor Julius von Sachs, of Wurzburg, the Society has lost two distinguished Honorary Members, and botany its most eminent teachers. The untimely death of Dr. P. C. Plugge, a Corresponding Member, has also to be deplored. One regrets to have to record that the names of R. W. Giles and F. M. Rimmington have disappeared from the list of former members of the Council. Mr. Giles had also served on the Board of Examiners for England and Wales. Amongst other noteworthy deaths during the year are those of A. H. Squire; Pope Roach; W. Bower, a former Auditor of the Society and a man of considerable local influence; Thomas Earn, a Founder and a loyal member for fifty-six years; and the following local and divisional secretaries:—G. Nind (Wandsworth), who left two thousand pounds for the Benevolent Fund; E. S. Bradley (Ashbourne); E. H. Dyer (Honiton); W. Sarsfield (Durham); W. P. Hoare (Cromer); and D. Donald (Perth.)

ECONOMIC BOTANY IN 1897.

In the realm of economic botany considerable progress has been made, not only in popularising but also in proving the very great importance to the world at large of this practical side of botanical science. As in the previous years by far the largest amount of attention given to any one product has been directed to the sources of indiarubber, and this is likely to be the case so long as the demand goes on for the tyres of bicycles and the probable future development in the direction of motor cars.

Gutta-Percha.

The allied product, gutta-percha, has also come in for a share of attention, inasmuch as this substance is of scarcely less value than rubber itself, though its popular uses have decreased in recent years, and its scientific application as an insulating material for electrical wires does not so immediately appeal to the general public. It is satisfactory to know, however, that gutta-percha is still obtainable in quantities, though, of course, with the extension of telegraphs, telephones, and electric lighting the demand increases. Whether substitutes will ever take the place of true gutta, the best of which is furnished by *Dichopsis gutta*, is a question that can only be solved by time and the advances of chemical knowledge, but in this connection it will be interesting to quote the following note from the Director of Gardens and Forest Department, Straits Settlements, published in the *Kew Bulletin*. He says, "I have just been down to inspect the little factory where Mr. Arnaud makes his gutta-percha. . . . The leaves are imported in sacks dry from Borneo and Johore. Most of the trees are overcut in Singapore, and there are no more leaves left, I hear. The leaves and twigs cost four dollars and a half a picul (133 lbs.). They are then put damped with hot water into a rolling machine, two rollers worked against each other, which grind them to powder. The powder is thrown into tanks of water and shaken about. The gutta floats in the form of a green mealy-looking stuff, is lifted out by fine copper gauze nets, put in warm water and pressed into moulds. I have samples of the gutta as it comes from the leaves and the pressed out finished article. It is really a very curious little manufactory; I do not know how long it will last, on account of the difficulty of procuring leaves, which must, I think, sooner or later stop the trade." From Mr. Ridley's opinion, the prospect of this article as a trade product does not seem encouraging, but it opens a field for research in many directions that might become profitable. It is interesting and satisfactory to know, on the authority of Mr. Ridley, as recorded in the *Kew Bulletin* for 1897, p. 337, that in connection with the destruction of gutta trees that at one time prevailed "the tree always comes up again when cut down. It can be cut to within six inches of the ground, and will then throw up shoots. Were it not for this, there would hardly be a single specimen in the country. It grows slowly in this manner, but never fails to come up again."

New Tanning Materials.

The subject of new tanning materials has from time to time cropped up as one possessing considerable importance. As a proof of this we need but point to the interest which centred a few years ago around the canaigre, the root of *Rumex hymenosepalus*, and in connection with which a Foreign Office report on the trade and agriculture of California issued during the past year states that the value of canaigre as a tanning agent, etheir alone or in connection with other tannins has been proved beyond question. For light leathers it gives great tensile strength, and is far better for split leather than gambier, oak, or hemlock. It is a quick tanner, and the yellow colour absorbed by the hide in the process of tanning is considered highly desirable for certain leathers. The sliced and dried tubers, containing an average of 30 per cent. of tannic acid, are worth from £8 to £9 per ton. A yield of from 7 to 10 tons per acre would give 2½ to 3½ tons of the dried product, for which there is a constant demand in Europe and America. In consequence of the rapidity of the growth of this plant in countries suited to its cultivation it has been recommended to the notice of farmers of small means. Next to the introduction of new tanning substances that of new dyes is perhaps of the greatest importance, notwithstanding that the fact must always be borne in mind of the brisk competition that has to be met with those of the coal tar series. In this connection may be mentioned extract of "Tengah" bark, which has come before the notice of Kew and reported upon as likely to be of value to dyers, producing either a grey colour in combination with iron, or black in combination with indigo. Tengah is the bark of *Ceriops candolleana*, a close ally to the common mangrove, and a native of the Straits Settlements.

Food Plants.

In the domain of food plants little, perhaps, has been actually accomplished, either in introducing actual novelties or developing old sources. If we may be allowed to take Britain in its widest sense, we may here briefly refer to the West Indian Commission which left England at the beginning of 1897, and whose report has touched the keynote of economic botany, which has vibrated through the whole of the West Indian islands. The results, however, whether affecting our colonies and indirectly ourselves, will have to be written in future years. As the sugar-cane has dominated the West Indies so rice has, and, indeed, continues to be the prevailing food crop in the East. In relation to this universal food plant, it will be interesting to quote the following paragraph on double rice from the *Kew Bulletin*, p. 173, extracted from the 'Proceedings of the Asiatic Society of Bengal.' "This phenomenon of double rice it is said was found in all cases to be due to an increase in the number of ovaries, the other parts of the flower being invariably of the normal number. In the gynæceum of over 150 flowers examined, not one was found with fewer than four ovaries, all apparently perfect; the usual number being five, a few flowers were found to have six, and one or two had seven ovaries. When five, six or seven ovaries were present, sometimes only three, but usually four or five appeared to be perfect. The ovaries may be one, two or three-styled. Usually only two ovaries develop into grain, sometimes three, and their shape is modified accordingly." We have referred to the foregoing plants rather fully in consequence of the possibility of their becoming more important in the future in a commercial point of view, and as indicating the direction in which thought and research may be turned.

Plants of Minor Interest.

With regard to plants of minor interest, but without furnishing useful or interesting products, the following have been brought to notice during the year: Fiji ivory nuts; under this name the Kew authorities have proved, with the assistance of the curator of the botanical station at Suva, that the seeds of *Veitchia joannis*, when they are fully ripe and have become hard and dried, may possibly be turned to account for buttons and other small articles. The palm is known to the natives as the "Niu Sawa," and the kernel or seed in its fresh or soft state is said to have a slightly astringent taste and is eaten by the natives. A new use for *Asclepias curassavica* is also recorded, namely, as an insecticide. The plant under the name of "chilpati" is said to grow everywhere about the Isthmus of Tehuantepec, in Southern Mexico, where it is used by the Indians to keep away vermin, especially

fleas. A rough broom is made of the plant, and the floors and walls of the huts are swept with it, when it is said they are not troubled with fleas for a considerable time afterwards. It is further said that these brushes have been used for brushing the coats of dogs when they are full of vermin, and have been found equally successful.

PHARMACOGRAPHY IN 1897.

THE record of work done during the past year included very little of first-rate importance to pharmacy. Some of the investigations concerning the active principles of plants have contradicted previous observations without adding any new elements of certainty.

Norbitz has obtained a crystalline body having the composition $C_{35}H_{54}N_3O_4$ from capsicum, to which he has given the name of capsacutin, stating that it is the active principle, but which evidently differs from the capsaicin of Thresh in containing nitrogen. The work of numerous investigators on scopolamine results, according to Merck, in the discovery that in scopolamine hydrobromide there are present two isomeric bases differing in their rotatory power, but whether the less optically-active of the two is produced by the mode of chemical treatment, and whether or no it is identical with atroscine, is still a vexed question.

On the other hand, the discovery by Dr. Pfaff of toxicodendrol as the active principle of *Rhus toxicodendron* seems to rest on a sound foundation of physiological evidence, and the presence of the alkaloid paucin in the seeds of *Pentaclethra macrophylla* does not appear to be questioned. The investigation of asafœtida by Polasek has shown the presence of traces of vanillin, and that the ether-insoluble resin consists of asaresinol tannol, $C_{24}H_{38}O_4 \cdot OH$, and the ether-soluble one of its ferulic acid esters. Sassarini, working on gamboge, has found an oil boiling between 160°-210°, and containing a terpene and a camphor, isovitinic and acetic acids, a phenolic ester, a resin, methyl alcohol and higher homologues, and a liquid, either a ketone or an aldehyde, having a fruity odour, but thinks that the phloroglucin found by other workers is a decomposition product.

Chinese insect wax examined by Henriques has been found to consist chiefly of the cerotinic ester of ceryl alcohol, for which he gives the formula $C_{26}H_{31}O_2,C_{28}H_{53}$; ceryl alcohol, $C_{26}H_{54}O$, can be converted by the action of soda lime into cerotinic acid. Our knowledge of essential oils is continually being added to by numerous workers, as the complex nature of these bodies becomes better known. In cultivated French bitter fennel oil Tardy has found—besides fenchone and anethol—phellandrene, estragol, anisic aldehyde, anisic ketone, anisic acid, and a crystalline body, $C_{13}H_{14}O_2$.

Otto of rose and its chief constituent has formed the subject of numerous investigations, leading to the result that an alcohol, $C_{10}H_{17}OH$, is a common constituent of rose oil, rose geranium oil, and of various essential oils obtained from species of *Andropogon*. As to the name to be applied to this alcohol, geraniol seems to have the priority, although rhodinol is obviously more appropriate.

The odorous principle of celery has been named sedanolide, $C_{12}H_{18}O_2$, by Ciamician and Silber. It is the anhydride of sedanolic acid, and with it occurs sedanonic acid, which can be separated by means of warm sodium carbonate solution. Mr. J. C. Umney has contributed information on the fennel oils derived from different commercial fennel fruits, showing that the constituents vary in kind and in quantity, the Saxon, Galician, and Russian being the richest in fenchone, and the French sweet fennel containing none, the German yielding the largest amount of oil; he has also directed attention to the adulteration of star anise oil with petroleum, and to the presence in some samples of citronelle oil of a new sesquiterpene. He has also pointed out that oil of verbena varies much in its percentage of citral, and that, in estimating it, calculation must be made for the presence of methyl heptenone. The properties of pure essence of lemon have been shown by Robins to be sp. gr. 862 at 15° C., and an optical rotation of + 123° in a 200 Mm. tube.

Mr. H. N. Ridley has made an important contribution to materia medica in the publication of a list of the native plants used as medicines by the Malays.

Mr. J. Medley Wood has pointed out the value of *Monsonia ovata* and *M. biflora* in diarrhœa and dysentery. Holmes believes that he has identified the plant yielding the "white woolly" strophanthus seeds of commerce as those of a new species, *Strophanthus nicholsoni*, and has proved that sumbul can be cultivated in the open air in this country successfully, whilst alkanet cannot.

Mr. J. Bosisto, of Melbourne, has directed attention to the properties of *Daviesia latifolia* as worthy of investigation, on account of its febrifuge properties.

The materia medica of East Africa is now focussed into one volume in Engler's 'Mitzpflanzen Ost-Afrika." Dr. Greshoff has published a third part of the 'Economic Plants of the West Indies,' including eleven fine drawings, one of them being styrax benzoin. Several medicinal plants have been figured by Sir Joseph Hooker in the 'Icones Plantarum,' including *Dracæna ombet*, *Glossostemon bruguierii*, *Machilus thunbergii*, and *Balsamodendron playfairii*. Tschirch and Hildebrand have found in the yellow resin of *Xanthorhœa hastilis* 4 per cent. of paracumaric and a little cinnamic acid, free and also combined with tannol esters, the bulk of the resin consisting of the paracumaric ester of xanthoresinol tannol. The red resin of *X. australis* contained no cinnamic acid but a homologous tannol called erythroresinol tannol.

In wool-fat Darmstaedter and Lifschütz find myristic acid, melting at 53°-54, carnaubic acid at 72°-73°, a new oxy-acid (lanopalmitic acid), at 87°-88°, also a new dioxy-acid (lanoceric acid) at 103°-104°, lanopalmitic acid having the property of forming an emulsion when melted with water. They found also a new alcohol, carnaubyl alcohol, ceryl alcohol, an unsaturated alcohol not isolated, and cholesterin.

Coblentz controverts Robin's statement that gelsemic acid is identical with æsculin, gelsemic acid melting at 205°·5 to 206° C., and æsculin at 160° C. Sayre finds that the active principles of gelsemium are absent or only present in minute quantity in the stems. W. S. Glass has shown that African ginger yields the highest percentage of the oleoresin and the strongest essence, although inferior in appearance. Umney has indicated that Japanese chillies, although superior in colour to other varieties, are deficient in pungency.

A new alkaloid obtained from *Retama sphærocarpa*, and named retamine, $C_{15}H_{23}N_2O$, appears to be regarded as an oxy-sparteine. From *Palicourea rigida*, known as "Douradinha" in Brazil, a very poisonous acid called myoctonic acid has been isolated, which seems worthy of further investigation. The active properties of the alkaloids derived from various species of Anhalonium have been receiving attention in this country.

The histological contributions of the year include Part 12 of Tschirch and Oesterle's 'Anatomischer Atlas,' which treats of nutmeg and mace, linseed, valerian root, coca, and maté. Dr. C. Hartwich has published information concerning Winter's bark from Chili, and abnormal structures in aconite roots. Herr A. Schad has published, under the direction of Professor Tschirch, a very full description of the cardamoms met with in commerce;

Professor J. Moeller, a very careful paper on the structure of all the known varieties of aloes wood in commerce; and Drs. A. Schneider and H. Geiger's brochures on the jaborandi leaves of commerce, showing that they present sufficient structural difference for their identification in powder, especially in the relative size of their palisade cells and epidermal cells.

G. E. Cooley has shown that the bark of *Prunus serotina* collected in autumn contains very little starch and much less tannin than if collected in spring, when starch formation again begins, and that by this means it is possible to distinguish bark collected as officially directed in the U.S.P. He has also found that the root bark of *Juglans cinerea* may be distinguished from that of *J. nigra* by the presence of cluster crystals in the rows of parenchymatous cells accompanying the strands of long bast fibres, whilst in *J. nigra* the raphides consist of klino-rhomboidal single crystals only. Professor L. E. Sayre finds that the barks of *Rhamnus purshiana* and the *R. californica*, with which it is sometimes mixed, may be distinguished by the powder of the former giving an orange-yellow colour when macerated in dilute alcohol and a deep red with solution of potash, whilst the latter gives a purple colour with the alcohol and an orange colour with the alkali.

Several adulterations have been detected during the year, that of balsam of tolu with an unknown resinous body, by Braithwaite; of Japan wax with 20 to 25 per cent. of starchy matter by C. H. La Wall; of saffron with 36 per cent. of barium sulphate; of pimento with Armenian bole, by C. A. Macpherson; and of the substitution of the flowers of *Opuntia decumana* for those of *Cereus grandiflorus*, by Holmes.

Attention has also been directed to the variable quantity of impurities of a mechanical character present in some specimens of guaiacum and benzoin, followed by the suggestion that a limit of impurity in these drugs should be imposed in the forthcoming British Pharmacopœia.

The illustrated articles on Practical Pharmacography, published at intervals during the year, have been exceptionally well received, as they have served to meet a pressing want. It is a curious anomaly that no text-book or atlas has yet been published in England which fully meets the needs of the time.

BACTERIOLOGY IN 1897.

IN bacteriology a number of researches have been devoted to the bacillus of bubonic plague. Yersin has announced considerable success in the treatment of the disease with his antitoxic serum, but independent observers on the spot are somewhat sceptical of the results obtained.

Haffkine and Lustig and Galeotti have devised vaccines prepared with cultures of the bacillus (*Brit. Med. Journ.*, 1897). Haffkine has also drawn attention to curious stalactite down-growths occurring in broth cultures of the bacillus (*Brit. Med. Journ.*, i., 1897, p. 1461), and Hankin has observed large swollen involution forms when the organism is grown on a salt-agar (*Centr. f. Bak.*, xxii., 1897). Hankin and Nutall suggest the possible spread of the disease by insects and animals, such as rats and monkeys (*ib.*). Three suspicious cases occurred in London the latter part of last year (*Loc. Gov. Board Rep.*, 1896-97), and in one the plague bacillus was undoubtedly isolated by Hewlett (*ib.* and *Trans. Brit. Inst. of Prev. Med.*, i., 1897). In these cases Bucanan ascribes the source of infection to articles of clothing.

The spread of the rinderpest at the Cape has also occasioned considerable attention to be paid to this disease. So far no organism has been isolated, but means of prevention have been devised by Koch and his co-workers by the use of the bile of affected animals and of the serum of "salted" ones, *i.e.*, beasts which have recovered from an attack. Incidentally it may be not out of place to remark that while German and French commissions are investigating rinderpest, and German, Austrian, Italian, French, and American bacteriologists are studying plague, the British Government has remained completely inactive, not a single British bacteriologist having been deputed to investigate either of these scourges!

In diphtheria there is not much of importance to record. Diphtheria antitoxin has maintained its position as the most valuable remedy in the disease. Neisser has found that the diphtheria bacillus produces little or no acid during the first nine hours; after that, up to the end of the first twenty-four hours, a considerable quantity is formed, which increases somewhat until the end of the second day, when it ceases. The same observer has devised a double stain for the bacillus, which, he states, is almost diagnostic (*Zeitschr. f. Hyg.*, xxiv., 1897, p. 443).

The Widal reaction for enteric fever is still considered to be one of the most reliable tests. It is recognised, however, that the dilution should not be less than one in ten, and a time limit of half an hour or so must be adopted. Foreign substances must be excluded, for Malvoz has found that corrosive sublimate, alcohol, salicylic acid, and safranin cause agglutination of the typhoid bacillus. Safranin agglutinates the typhoid bacillus but not the colon bacillus (*Ann. de l'Inst. Pasteur*, xi., 1897, p. 582).

Copeman and Blaxall have published a paper on the influence of glycerin, etc., on the growth of organisms in vaccine lymph, showing that glycerinated lymph after storage becomes sterile, though still retaining its vaccinating properties unimpaired (*Report of the Medical Officer of the Local Government Board*, 1895-96). In the same volume Klein reports his examination of a number of cases of suspected cholera with negative results. In the succeeding volume (1896-97) Klein details the characters of the bacillus of bubonic plague with experiments on immunisation. He also describes the characters of Copeman's variola bacillus. In both these volumes a good deal of space is devoted to vaccine establishments and forms of vaccination and lymphs.

Sanarelli has discovered a bacillus which he believes to be the cause of yellow fever. It is a small organism, forming on gelatin bright opaque drops, like droplets of milk, without liquefaction. It stains by Gram's method, but is difficult to demonstrate in the tissues (*Il Policlinico*, *Brit. Med. Journ.*, and *Ann. de l'Inst. Pasteur*, 1897). Sternberg claims that this organism described by Sanarelli is identical with his bacillus X, obtained in 1889 (*Centr. f. Bak.*, xxii., 1897, p. 145).

The epidemic of beri-beri in Dublin has spread, and more than 100 cases have occurred. In two cases of this disease Hunter has isolated a coccus apparently identical with that described by Pekelharing and Winkler (*Lancet*, 1897, ii., p. 240).

PHOTOGRAPHY IN 1897

IN a review of the progress in photography during the past year, one cannot help being struck with the fact that there is practically no striking advance to record in any particular direction save one, but that photography is becoming more and more essential to commercial life and science cannot be denied.

ASTRONOMICAL PHOTOGRAPHY.

The international photographic chart of the sky has been steadily worked upon by the eighteen observatories engaged in the work, and in the warmer regions where cloudless skies are more general than with us, and the more temperate zones, the total number of fields of the sky allotted to the observatories have been successfully photographed, and good progress has been

everywhere except in South America, where political clouds have prevented observers from working. Nebular and general stellar photography has been by no means neglected, but the richest results have been obtained in the department of stellar, nebular, and planetary spectroscopy, and not only can we now determine the motion of a heavenly body in the line of sight to within an error of a mile a second, but we can also prove most conclusively that whether they are themselves suns emitting light the same as our sun, or merely dead and inert bodies reflecting light like our attendant satellite the moon. By the aid of photography the spectrum of any celestial body can be obtained, and the negatives afterwards submitted to examination to determine the actual composition of the body or the nature of the light, and it is impossible to state what is to be the future of this the new astronomy.

Commercial Applications.

The most striking advance in commercial photography is the increasing use made of the photo-mechanical processes for the illustration of magazines, books, catalogues, price-lists, etc. The advance recently made in the three-colour printing process is likely to lead to the illustration of magazines by this process, and to the displacement of lithography for many of the purposes for which it is now used. It is satisfactory to have to record considerable advance in the theory of the subject of the ordinary half-tone block making.

Apparatus.

The hand camera, which has of late years been so much to the front, has, if possible, increased in favour; the ordinary stand camera shows, however, no improvement, in fact, it is difficult to see how, except in minor details, it could be improved, if we except, of course, the agreement of all camera makers to adopt standard gauges for dark slides, which would enable the interchange of any slides with any camera. This is, however, probable in the Greek kalends. In lens construction there is, however, considerable advances to record. The old type of rapid rectilinear or doublet lens, composed of symmetrical doublets of flint and crown glass, are gradually giving way to the anastigmatic type, which have also two combinations, but these are composed of five, six, eight, or ten glasses, by which means spherical and chromatic aberrations and astigmatism are eliminated. The latest form of these lenses is the Planar, of Zeiss and Co., which, though only possessing three elements in each combination, has the outer one separated by an air space from the other two, so that the air space acts like a lens and helps in the correction of the lens. The Planar is constructed of foci varying three-quarters of an inch up to 33 inches, the smaller sizes are provided with the English Microscopic Society screw, and are specially adapted for photo-micrographic enlargements. The aperture of the lenses varies from F/3·6 to F/6, according to focus, and from their large angular aperture they are the most rapid lens yet constructed of the newer type. Dallmeyer and Co. have also utilised an air lens in the construction of their new lens, the Stigmatic, and they have also introduced a stigmatic corrector, which may be applied to any portrait lenses of the old Petzval type, thus making them far more perfect instruments.

Sensitive Surfaces.

For negative work, notwithstanding the increasing use of celluloid, glass still forms the principal support for the sensitive emulsion. Probably time, or the more perfect manufacture of celluloid, will lead to the replacement of glass entirely for tourist photography, but at present there is still a strong prejudice against celluloid, in consequence of many unexplained markings that have been met with. More attention has been paid to the use of paper as a negative support, and whilst this is to a great extent a reversion to the ideas of over forty years ago, there in no doubt that for artistic work and large cameras, negative paper is very satisfactory. Manufacturers have steadily increased the speed and the quality of their plates, and many are now issuing their plates backed with a viscous and rapidly drying solution of caramelene, one of the constituents of caramel, which has for its purpose the prevention of that annoying reflection from the back of the glass support known technically as "halation." Increasing attention is being paid by manufacturers also to the ortho-chromatising of emulsions, that is to say, to rendering them more sensitive to the less refrangible colours of the spectrum.

Printing Processes.

Gradually but surely the more permanent processes, platinotype and the so-called carbon or pigment printing, are replacing the evanescent silver processes, and particular attention has been directed lately to the gum-bichromate method, which was first suggested by Pouncy in 1857. In this process paper is saturated with potassium bichromate, allowed to dry, and then coated with a solution of gum arabic and colouring matter, and dried. After exposure the print is merely washed in water, and those parts which have not been affected by light are washed away, leaving the image intact. Practically, this is the carbon process without the transference of the image, which is usual. For many years albumen paper was considered the paper for printing, but in consequence of the small proportion of sulphur in the albumen and the difficulty of removing the last traces of the thiosulphate used in fixing, the silver image was very liable to be converted by the action of these and the atmosphere and damp into the pale yellowish silver sulphide. As an improvement, gelatin was used as a support, but this has its disadvantages, and to replace both albumen and gelatin many substances have been suggested; for some time collodion has again sprung into favour, but it is possible that the experiments of Drs. Jolles and Lilienfeld, of Vienna, as to the utilisation of the proteids and nucleoproteids of maize and other cereals which have resulted in the preparation of albumen free from sulphur, may again revive the use of albumenised paper which, when properly used, was by no means easy to excel. The most valuable researches in connection with printing processes are those which have been carried out by Messrs. Haddon and Grundy, and which have been continued this year, and they have proved that fixation is quicker and more complete when a 10 per cent. solution of hypo. is used than at any other concentration. An analogous case is found in the solubility of silver chloride in ammonia, as determined by M. Jarry in *Comptes Rendus*, which proves that up to a certain concentration increase of strength in the ammonia solution brings about an increase in the amount of chloride dissolved, but that when a certain point is reached any further strengthening of the ammonia leads to a decrease in the silver chloride dissolved. There has been considerable increase in the use of bas-relief prints, which are made by pressure on damp print in a mould which is either cut by the graver or a fret-saw.

Lantern Work.

In this department alone, and in one particular branch of it, namely, animated photography, has there been any revival of the fast-waning interest. Of the increase of animatography it is hardly needless to speak. At every music hall, at every entertainment, the results are shown and are known to all. Springing, in the first place, from the old and well-known zoetrope and wheel of life, which was followed by the praxinoscope and Edison's kinetoscope, there is no doubt that the further applications will be extended in many directions—the latest that of taking cinematographic pictures of the forthcoming eclipse, showing that the principle may be

usefully applied to other purposes than mere entertainment of the masses.

The use of acetylene has considerably increased, and it is interesting to note that the theoretically interesting discovery of this gas (generally known till recently as ethine) by Davy in 1836, and its scientific investigation by Berthelot in 1859, should have led up to the accidental discovery by Wilson, and independently by Moissan, of this useful gas. Acetylene is formed by the action of water on calcium carbide, CaC_2, according to the following equation:—

$$CaC_2 + H_2O = C_2H_2 + CaO,$$

the latter, of course, being quickly converted into slaked lime with the evolution of heat, which, converting a little of the water into vapour, necessitates the use of a cooling chamber for the gas or some method of withdrawing the subsequently condensed water. Calcium carbide is formed by the direct union of the elements in the shape of coke and lime in the elcctric furnace, and 60 per cent. of lime and 40 per cent. of carbon are thus fused the result should be about 81 per cent. of the carbide. It is important that the limestone should be fairly pure, or if phosphatic limestone be used, phosphuretted or siliciurretted hydrogen may also be given off with disastrous results. The theoretical yield of acetylene is about 5·8 cubic feet of acetylene per lb., and provided, as is generally the case, with English carbide, the yield is 5 cubic feet, we may be satisfied, but some of the Swiss and German carbides yield as low as 3·5 cubic feet per lb., and generally contain dangerous impurities. As regards the illuminating power of acetylene, it may be stated that at a distance of 1 foot from the burner it is one-third that of sunlight from a heliostat, or from 15 to 20 times greater than ordinary coal-gas. Researches have also pointed out that mixtures of the carbides of calcium, aluminium, and manganese will probably give greater illuminating power still.

PHOTO-MECHANICAL PROCESSES.

To such perfection has the ordinary process or half-tone block been brought that it is seriously damaging collotype printing, which has been hitherto (with the exception of photogravure) the best process for reproduction processes. Many attempts have been made to utilise zinc instead of copper for blocks, and probably now only the prejudice founded on experience prevents the increasing use of the former metal. It is an open question whether in long runs zinc would be an improvement.

PHOTOGRAPHY IN NATURAL COLOURS.

The photographic world was convulsed in February by the startling announcement, supported by two such eminent workers as Captain Abney and Sir H. Trueman Wood, that MM. Chassagne and Dansac had discovered a method of obtaining photographs in natural colours by the use of three solutions, and that the silver of the print exerted what was described as a selective absorption. In July a demonstration of the process was given before the Photographic Convention of the United Kingdom, when it was at once seen that there was selective action but not exerted by the silver image but by the operator who wielded the paint brush, the process being nothing more than a process of painting prints with three aniline or similar colours—red green, and blue—a method which possesses absolutely no novelty. The other processes, such a Lippmann's interferential method, Bennetto's, Ives', etc., are simply in *statu quo*. Finally, it may be said that although we cannot record any striking advance, yet there has been advance all along the line, not only in technique, but in artistic work and also in the perfection of processes and in the application of photography and kindred arts and sciences, and it is difficult to gauge exactly the limits of such applications and advances.

PARLIAMENT AND ITS WORK IN 1897.

THE session of 1897 opened earlier than usual, with every evidence of unusual vigour. On January 19 the legislative menu—if the speech from the Throne may, without *lèse majesté*, be so described—was published for the nation's delectation, and the nation ought no doubt to have indulged in pleasing anticipations of the delicacies therein tabled. But menus, like tombstones, have ever been renowned for the unreliable nature of their announcements, and few persons nowadays view either bills of fare or epitaphs with much confidence. To drop the gastronomic metaphor, the Queen's Speech promised much, and told flattering tales of expected legislation, but time proved a great deal of it to be fiction.

ADULTERATION OF FOOD AND DRUGS.

The chief interest at the opening of the House centred in the omissions from the Speech, and Mr. Kearley, the Liberal member for Devonport, with characteristic energy and tact, seized an opportunity of directing a large share of attention to one of those omissions. For many months a Select Committee of the House had been sifting evidence on the important subject of adulteration, more especially in relation to food products. A large amount of valuable information bearing on the inadequacy of the existing Statutes regulating adulteration had been gathered, tabulated, reviewed, commented upon, and digested. The Committee had embodied its opinions in a report and a series of recommendations, and yet the Government had ignored the whole thing. Such was Mr. Kearley's case, and upon it he felt impelled to move an amendment to the Address. Naturally the amendment did not pass; in fact, it was not persisted in, but the mover, in placing it on the Paper, secured attention, and wrung a vague assurance from the Government that ministers were very desirous of dealing with the subject, and hoped to introduce a thoroughly comprehensive measure thereon. Mr. Kearley did not, however, suffer his judgment to be deceived by the blandness of ministerial promises. The session had not far advanced before he secured the co-operation of Sir James Woodhouse (Huddersfield), Mr. Plunket (South Dublin), Mr. Lambert (South Molton), Mr. Jeffreys (Basingstoke), Mr. Nicol (Argyll), and Maurice Healy (Cork), a truly representative assembly of supporters, and launched a Food and Drugs Bill of his own.

A FOOD AND DRUGS BILL.

Perhaps one ought not to attribute the Bill to its introducer, for, as a matter of fact, it emanated from the Society of Public Analysts, and was practically a *réchauffé* of the draft measure published in the *Analyst* some few years back. The details of the Bill have already been given in the *Pharmaceutical Journal*. It was not a perfect Bill—perfection being as rare in measures as in men—but it possessed several points of value. It defined a "drug," which was certainly a step in advance, though there is room for more than one opinion as to the sufficiency of the definition. It increased the penalties for offences, and discouraged the adulterator by threats of advertising his convictions; and it provided for a board of reference of experts to deal with the difficult question of standards. Not an ideal Bill, perhaps, but still something which had possibilites in it after judicious amendment in committee. But it did not reach Committee, for it faded from the Order Paper towards the dog days. Mr. Chaplin, probably to ease his official conscience, introduced the much promised Government Food and Drugs Bill on a peculiarly inappropriate date—August Bank Holiday. It was, so to speak, flung at the House, and the introductory speech might well have been paraphrased thus:— "Here you are, this is the Government Bill. We are not going to proceed

with it, but as you have been howling for it, you can have it." And what a Bill it was! A thorough measure had been promised, but the actual outcome left the chief evils of the existing law practically untouched. The Council of the Pharmaceutical Society has already hinted at the probability of having to express its disapproval if the Bill be re-introduced next session.

Petroleum and Merchandise Marks.

If one had to describe the past session by its general characteristic, it might be fittingly said that it was a session of select committees. The Petroleum Committee was reconstituted, as well as that on Tuberculosis. The House of Lords re-enacted the farce of the Companies Bill Committee, and the condition of the Science and Art Department was also made an object of another inquiry. Merchandise Marks occupied a number of gentlemen several months in hearing conflicting evidence on the value of the Merchandise Marks Act, 1887, whilst various other committees of no special interest to chemists, saved Parliament the necessity of legislating on the matters referred to them. Few of these committees reported in a definite manner, except those on Science and Art, and on Merchandise Marks. The former revealed the unprotected state of the national treasures at South Kensington and the risk they ran from fire, and recommended that immediate steps be taken to minimise the risk. It was called an urgency report, and created a nine days stir. Later in the session it was explained that £5000 was available for immediate expenditure in carrying out the essential work recommended, and as the Committee will doubtless be re-appointed next session, there is some hope that South Kensington will be gradually made safer and more suitable for the important *rôle* it has to fulfil. The general report of the Committee on Merchandise Marks was favourable to the 1887 Act, which had been proved by a number of witnesses of commercial standing to have been instrumental in stopping many irregular practices formerly operating to the prejudice of British trade. Among suggestions for still further improving the Act was one for the substitution of the words "made abroad" instead of specific mention of the country of origin. The Committee also recommended the formation of an international league to put down bounties and subsidies, and to promote legislation on the lines of the British Act—a consummation devoutly to be wished, but scarcely to be looked for this side of the millennium.

Companies Bill Committee.

The other committees will be again in evidence next session, and their work needs little comment. With reference to the Companies Bill Committee, however, it may be said that the general trend of the evidence taken during the session was in favour of leaving the evils of "one-man" incorporation untouched for fear of restricting industrial enterprise. Witnesses seemed to think that the tares should be allowed to luxuriate because their eradication might possibly damage a few ears of wheat. A notable exception to this type of evidence was that of Lord Justice Lindley, who emphatically stated his opinion that it was dangerous to the community to permit one man to be a trader in the form of a limited company.

Registration of Firms and Early Closing.

An epidemic of registration seemed to rage among private members. Sir Stafford Northcote (Exeter) again introduced his measure for the Registration of Firms, which was designed to give traders an opportunity of knowing who they are dealing with, but the Bill failed to advance beyond the initial stage. A similar fate befel the projects for registering midwives, boiler-minders, and accountants, whilst the unfortunate Plumbers' Registration Bill fell to the opposition of the Radical benches. Early closing was represented by three Bills introduced respectively by Sir John Lubbock, Sir Charles Dilke, and Mr. Duncombe. All three died before their second reading. Sir John Lubbock is now trying to induce the Government to take up his Bill for next session, and there is hope that he may be more successful in 1898 than he has been during the past two years. Poor Law dispensers were introduced to the House on July 8, by a question addressed to the President of the Local Government Board by the Hon. Alfred Lyttelton (Leamington). Mr. Lyttelton had been inspired to ask why the qualification for dispensers had been watered down to admit Army compounders, and Mr. Chaplin was, in turn, inspired to answer that the compounding in the Army is most satisfactory, and that he sees no reason to alter the order placing compounders on a level with men holding the qualification prescribed by the Pharmacy Act, 1868. Further attempts to remedy the injustice will have to be made, and the dispensers in Poor Law Unions are already banding themselves in an Association by way of preparing for the fray.

Calcium Carbide, Payments in Bankruptcy, and the Metric System.

Calcium carbide came in for a share of Parliamentary attention; Mr. Kearley calling attention to the dangers attending the storage and conveyance of the carbide. He suggested that the substance should be placed under the restrictions provided by the Petroleum Act, and this was eventually done. The Home Office documents have already been printed in this Journal, and the conditions attaching to the conveyance, storage, and sale of carbide will be duly set forth in the new edition of the Society's Calendar. A useful minor Bill passed in the Preferential Payments in Bankruptcy Act (1889) Amendment Bill. One abuse of the Companies Acts has been removed by its means. Its object is to give to the employés of bankrupt companies priority as to wages and salary over payments to debenture holders. Henceforth clerks and others employed by companies are on the same footing as those in the service of individuals or unincorporated firms. Another positive piece of legislation during the session was the passing of a Bill to legalise the use of weights and measures of the metric system. The Pharmaceutical Council threw the weight of its influence on the side of the Government, and by sending a petition to Parliament in favour of the measure, may probably take some credit for persuading Mr. Ritchie not to drop the Bill.

The Bills That Failed.

These were, as usual, very numerous. Reference has already been made to some of the unfortunates, but among the others meriting attention, either on account of their intrinsic value or their inherent absurdity, were Mr. Macdona's project for rendering return railway tickets available during the year of issue; Mr. Carlile's Vaccination Bill for improving the supply of pure lymph; Bills for abolishing street noises, for paying the expenses of jurors, and for protecting the mental offspring of mediocrities (copyright amendment). The London University Bill was again introduced, and an undignified rush was made by the Ministerial party to get it through. But the attempt failed. The measure was announced as a tactful compromise between the various interests involved. It proved to be a mild travesty of the 1895 Bill, and the amount of opposition it aroused may be taken as a good object-lesson on the practical uses of compromises. London's Teaching University on the lines advocated by the Cowper Commission will not apparently become a *fait accompli* just yet. One incident during the past session of Parliament might well arouse envy in pharmaceutical breasts, namely, the good fortune of the Incorporated Law Society in obtaining official financial support for the discharge of public duties. On May 11 the House resolved, on the motion of Mr. C. Harrison (the recently deceased member for Plymouth), that a portion of the expenses incurred in keeping the Rolls clear of black sheep should be paid by the Treasury.

PHARMACEUTICAL SOCIETY.

MAJOR EXAMINATION PAPERS.

PRACTICAL BOTANY AND MATERIA MEDICA.

December 30, 1897.—10 *a.m. to* 1 *p.m.*

[*N.B.—In awarding marks the manipulation of the Candidates will be taken into account.*]

1. Identify and describe concisely A and B. Refer the plant C to its Natural Order, giving your reasons.
2. Cut a transverse section of the leaf D. Mount your preparation in dilute glycerin, and leave for examination with an explanatory sketch and brief description, illustrating the most important structural features.
3. Prepare and mount transverse and longitudinal (median) sections of the root provided. Leave them with a sketch and description, pointing out the histological characteristics of the drug.
4. Identify and report on the powder provided.

PHYSICS.

December 29, 1897.—2 *to* 5 *p.m.*

[*Not more than six questions are to be attempted.*]

1. Describe the construction of the barometer and state what corrections must be applied to the readings in order to obtain exact results. For what purposes is it used by the scientific chemist?
2. What is meant by radiation of heat? Describe experiments illustrating your answer.
3. Describe a calorimeter, and show how it could be used to determine the heat of combustion of a substance.
4. What is a kaleidoscope? State the principles on which its action depends.
5. Describe some form of photometer and show how it is used.
6. How may heat and light be produced by means of electricity, and what are the conditions under which they are produced?
7. Describe some form of constant battery and show how it differs from an ordinary voltaic couple.
8. If a thin magnetised bar of steel is broken into several pieces, what properties do the parts exhibit? How has this phenomenon been explained?
9. Describe methods by which a steel bar can be magnetised.

CHEMISTRY.

December 29, 1897.—10 *a.m. to* 1 *p.m.*

[*Not more than six questions are to be attempted.*]

1. How is nitrous oxide prepared, and how could you distinguish this gas from oxygen? What method would you use to determine the percentage composition (by volume) of a mixture of nitrous oxide and air?
2. A sample of milk of sulphur is supposed to be adulterated with gypsum. How would you test for, and, if necessary, estimate this impurity?
3. Describe experiments illustrating the use of four different reducing agents. Give equations.
4. Provided with blue vitriol, acetic acid, and ordinary laboratory reagents, how would you prepare a specimen of crystallised cupric acetate?
5. Describe the more important physical and chemical properties of the following compounds:—Arsenious oxide; mercuric chloride; lead acetate; benzaldehyde; urea.
6. You are required to ascertain whether a given liquid hydrocarbon is a paraffin, an olefine, or a member of the benzene series. Describe and explain the qualitative tests you would apply.
7. Describe the manufacture of salicylic acid and name any by-products which may be formed in the process. How would you satisfy yourself that a specimen of salicylic acid was free from impurity? What is "salol"?
8. What is an essential oil? Name three such oils and the important constituents of each. Mention some substances which are prepared artificially and used as substitutes for natural oils.
9. Analyses and molecular weight determinations having shown that a certain pure liquid has the molecular formula C_4H_8O, what steps would you take in order to determine the constitutional or structural formula of the compound?

BOTANY AND MATERIA MEDICA.

December 30, 1897.—2 *p.m. to* 5 *p.m.*

1. What do you understand by cross-fertilisation? Describe the flowers of two British plants illustrating different methods by which cross-fertilisation is favoured.
2. What are the chief reserve food-stuffs found in plants? How would you distinguish them (*a*) histologically, (*b*) chemically? How are such reserves made available for the nutrition of the protoplasm?
3. Contrast a seedling Oak or other tree with an Oak tree five years old as regards the structure of the stem.
4. Describe the different official varieties of Buchu; state their botanical and geographical sources and discuss their relative medicinal values, having regard to their chief constituents.
5. How would you isolate the following alkaloids from their respective drugs:—1, Cinchonidine; 2, Strychnine; and by what tests would you demonstrate their purity?

LETTERS TO THE EDITOR.

"Mr. Currie and the New Pharmacy Bill."

Sir,—In the Journal for December 18, a letter appears under the above heading from "An Old Pharmaceutical Chemist," in which he calls upon me to give an explanation regarding a statement which I am "reported" to have made at the opening meeting of the Glasgow and West of Scotland Pharmaceutical Association. I would just like to say that, on this occasion, report is quite correct, and to emphasise it more, I repeat the statement, that "the Society has too long ignored the claims of those whose support would be a valuable acquisition." But I have yet to learn that repeated attempts have been made by the Council to obtain authority for admitting as members all registered chemists and druggists. So far as I can find out, two attempts have been made (and they only half-hearted); once in 1867, when chemists and druggists then in business by registration and payment of a fee would become members, and be eligible in certain proportion for election to the Council; and again, three years ago, it was proposed to admit all qualified men as members with certain restrictions. But between those dates I am not aware of any attempt having been made, and the Bill now before us is the first occasion on which it has been proposed to admit to the full privileges of membership all registered men. When I made the statement I had no idea as to what form the impending Bill would take, but I say now, without hesitation, that the Council has taken a step which should receive the support of everyone desirous of seeing the Society truly representative. As a local secretary of a few years' standing, I know much, but as a very small unit of the Society I know more, and when I quoted what had been said by the late Mr. Sandford, as his opinion regarding examination and membership, it was simply to show that what was said in 1868 had truly come to pass, inasmuch as the qualifying (Minor) examination of to-day is as great a test of a candidate's capacity as was the Major of not so many years ago, and, being so, is entitled to recognition. If it was for nothing else, than that the Minor is recognised as the legal qualification, the claim for membership is well founded. All honour to the man who possesses the Major qualification. Protect his title of "pharmaceutical chemist" by all means. Give him a higher one if it is possible; it will not make much difference so far as a man of business is concerned, but is it fair, nay, is it just, to the Minor men who have qualified since 1868 that they can have no representation on the Council? It is all very well for "An Old Pharmaceutical Chemist" to say that if the claims have been "ignored." it has been by the members failing to support their executive, but it is not such an easy matter when a meeting is called in London to decide even such an important question, for provincial men to take part in it; but if voting papers were issued, and local secretaries and local associations asked to take the matter up, I think a different result would be obtained. Though not a Major graduate, I have the best interests of the Pharmaceutical Society as much at heart as if I were, and will regret exceedingly if moderate counsels do not prevail, so as to afford the opportunity of consolidating what up till now has been a disunited body.

Glasgow, December 22, 1897. William L. Currie.

*** Mr. Currie has overlooked the Bills prepared in 1890 and 1891. [Ed., *P. J.*]

The New Pharmacy Bill.

Sir,—In your leader of last week you imply that those chemists who are opposed to the draft Pharmacy Bill have overlooked the fact that the title pharmaceutical chemist is not to be bestowed on Minor men. Such, however, cannot be inferred from the proceedings held at Manchester last Friday week, though several provincial associations have gaily passed resolutions recommending that each Minor man should be styled a pharmaceutical chemist. One would like to have a record of the number and qualification of the chemists present at such meetings, and particularly the qualification of the local wire puller. The object of the Bill is stated to be "consolidation of the Society," which of course means increase of subscribers. The means proposed to be taken to effect this is to lower the qualification necessary for membership. Now, sir, suppose the Bill were passed and still "consolidation" was *non est*, would the Council advance another step, and as an inducement to non-subscribers throw open the membership to "student-associates"? It would be a perfectly logical sequence, and none the more absurd than the present proposal. [This remark fully demonstrates how completely Mr. Sargeant fails to

comprehend the subject on which he writes.—Ed., *P. J.*] Again, who will look after the interests of pharmacists if we have a Council composed of chemists of the second class? Who will appoint the examiners, who shall conduct the Major examination, Minor men? This latter point, however, has not much significance, since the Major, robbed of its principal privilege, would not be much patronised. With respect to the number of subscribers to the Society, the proposed change would probably reduce rather than increase them. It is hardly likely that a Major man would remain in a society which gave him no credit for his superior qualification. There is a feeling prevalent amongst pharmaceutical chemists generally that this Bill has been suggested by a few interested Minor men who would like to obtain a higher position in the Society than at present possible. This seems the more likely since the younger and more highly educated chemists and druggists do not call for the proposed change. All the enthusiasm in support of the Bill comes from Minor men of from twenty to thirty years' standing, who are beginning to feel the loss of the higher qualification, and are now suffering for their past indifference. The aspirations of these men may be noble, but pharmaceutical chemists of to-day will not yield one of their few emblems of superiority to satisfy such aspirations. The sister profession and the public generally understand by M.P.S. a chemist of the first class. That understanding would not easily be removed. The Minor examination, also, is too technical as a qualification for membership. All other societies of standing have advanced scientific examinations as qualification for the highest grade. Why should the Pharmaceutical Society, having raised the value of its two lower stages, undo all the good done by reducing to a minimum the qualification of the highest stage? Give associates a limited number of seats on the Council by all means. Let them have a voice in the management of the Society, but for the sake of the dignity of the Society as a corporate body, let the membership be as select as possible.

Manchester, December 27, 1897. F. PILKINGTON SARGEANT, PH.C.

Sir,—Since the Journal is not the organ of any one section of the Pharmaceutical Society, and since you have opened its columns to the expression of opinion regarding the Pharmacy Bill, I venture to ask for the insertion of this short note. Believing collective action to be more effective than that of the individual, I would suggest to those members of the Society who disapprove of this Bill the desirability of organising meetings—as in Manchester—in as many towns as possible. If this suggestion be favourably received, I should be glad if such members, resident in or near London, would communicate with me with a view of meeting to decide upon a course of action. I feel very keenly the injustice of the Bill in its present form, and it is evident from a perusal of recent correspondence in the Journal that others are similarly affected.

1, Harewood Place, Marylebone Road, N.W. December 27, 1897. F. A. HOCKING.

Sir,—I was astonished, when I read your leader in Saturday last's issue, to find how totally you had misrepresented the nature of the Manchester Meeting of Pharmacists, and applied to the members of the same ideas which they never entertained. I conclude you drew your information exclusively from your own report on page 575, which I can only describe as most inaccurate and misleading. As one illustration of this, I must point out that the resolutions, as you printed them, were not passed. They should have read as follows :—

(1) That this meeting, having read the Draft Pharmacy Bill, is strongly dissatisfied with the terms contained in Clause 3, and whilst admitting that Associates should be granted increased privileges in connection with the Pharmaceutical Society, to confer upon them the title of Member will be misleading and calculated to decrease the value of the Major qualification, and it is hereby resolved that unless such condition be excluded from the Bill, this meeting will use all legitimate means to prevent the same becoming law.

(2) That no proposal to make chemists and druggists Members can be accepted unless a corresponding advantage be conceded at the same time to pharmaceutical chemists who join the Society.

From this you will see that we advocate the principle of chemists and druggists, as associates, being eligible for election on the Council, but we deprecate any attempt to make them "members." This is because of the confusion that is sure to arise between the titles "Member of the Pharmaceutical Society" and "Pharmaceutical Chemist," and I cannot understand how the most ordinary mind should fail to see this. It must be remembered that the question of qualification does not interest simply the body of chemists, but the outside world generally, then how are the unitiated to understand the difference, when in the past they have learned to understand that M.P.S. was practically equivalent to Ph.C.? Those who framed the Act of 1852 are responsible for this, by creating a distinction and a position that is no longer of fictitious value. We hold no confused idea about a "necessary connection between membership . . and . . qualification." The fact that the Society holds the Major examination and offers the opportunity of becoming a "Member" as an inducement to undertake the same, is an indication of some connection between the two. By having offered this inducement the Council enters into a contract, which it now proposes to break. The meeting did not advocate the creation of Fellowships, etc., and only passed the second resolution as an alternative, which they would accept (reluctantly) as a compromise. One great absurdity about making chemists and druggists members of the Council is that they, being still eligible to enter for the Major, will have the selection of their own examiners. Comment is unnecessary. We oppose the Bill on strong educational grounds, but really I fear I have already taken too much of your space, and must content myself by saying that we were unanimously of this opinion: That if this Bill becomes law an incentive to study will be removed, and a blow struck at pharmaceutical education that will undo most of the good of the past. In conclusion, I may say that we have received strong promises of support from one half of the pharmaceutical chemists in this district, besides from several chemists and druggists, and furthermore, letters have been received from all parts of the country offering assistance to our opposition, and I take this opportunity to invite communications from all others similarly minded, so that our already strong position may be able to conclusively assert itself.

Manchester, December 29, 1897. WALTER GIBBONS.

*** The resolutions were printed as received from our reporter and were presumably officially supplied to him. The confusion of "Member of the Pharmaceutical Society" with the title of "Pharmaceutical Chemist" apparently exists in the mind of Mr. Gibbons but probably nowhere else, and that fallacy is the basis of his argument. [ED., *P. J.*]

THE METRIC SYSTEM IN PRESCRIPTIONS—A CORRECTION.

Sir,—In my letter of the 21st inst. I notice with regret that 67·6 minims appear as equivalent to 1 fluid drachm. This is an error of transcription on my part, which I hasten to correct. There should have been another line, thus—

4 C.c. = 67·6 minims,

instead of "about 73 minims," as stated in the paper referred to.

Wolverhampton, December 27, 1897. A. E. JOHNSON, F.I.C.

THE P.A.T.A. AND ITS LIST.

Sir,—As you are aware, we some time since asked the trade by advertisement and otherwise to let us know whether or not they wished us to join the P.A.T.A., and it will doubtless interest your readers to have some information respecting the replies which we received. In spite of the extensive nature of our advertisement and the publicity given to the matter by the trade journals, in addition to the special appeal made by the *Anti-Cutting Record* to the members of the P.A.T.A. to send replies to us, the total number received out of the 32,000 odd "patent" medicine sellers in this country was only 1104. Of these, most of the writers are members of the P.A.T.A., and therefore naturally expressed the hope that we would join their Association. Thirty-two correspondents expressly objected to the P.A.T.A.; six expressed their objection to any kind of interference with the trade; and twenty-seven expressed themselves indifferent about the P.A.T.A., so long as selling prices were protected in some way; 861 correspondents were in favour of selling the articles at face values; while 188 were in favour of selling at prices somewhat below the full face values. With respect to the terms of supply to the retail trade, 532 were in favour of continuing our present terms of supply to the retail trade, 71 correspondents did not care so long as they secured 20 per cent. profit on their turnover, while 195 wanted 25 per cent. on their turnover. As to the wholesale houses, 119 correspondents expressed their desire to secure 10 per cent. profit on their turnover, while 14 expressed their satisfaction with existing arrangements. Of the whole number of correspondents, 47 retailers expressed their desire to be supplied on the best terms irrespective of the size of order. Altogether the result of our application to the trade was a very disappointing one, and we can only construe it as indicative either of the greatest apathy or of widespread satis-

faction with the old arrangement. If a large proportion of the members of the retail trade wished us to place our articles on the P.A.T.A. list, or otherwise to protect the selling prices, its seem incredible that such a limited number of replies should have been received in answer to our application. The decision we have come to in the matter is expressed in the advertisement that is now appearing in the trade journals, from which it will be seen that while we have not seen our way—anyhow at present—to place our articles on the P.A.T.A. list, we have made some very considerable concessions to the trade, and for those concessions, to a certain extent at least, the trade have to thank Mr. W. S. Glyn-Jones.

December 29, 1897. C. T. Kingzett,
Managing Director of the Sanitas Co., Ltd.

The Explosion of Erythrol Tetranitrate.

Sir,—The inquiry into the unfortunate accident with erythrol tetranitrate has not elicited very clearly the cause of the fatal explosion. The opinion held as to the value of erythrol tetranitrate in cases of angina pectoris, for which it is claimed to be far more lasting in its effects than either amyl nitrite or nitroglycerin, gives a special interest to anything connected with it at the present time. During the last two years we have used erythrol tetranitrate somewhat extensively at this hospital, and have had occasion to present it for administration in various forms, all of which have necessitated a considerable amount of pulverisation, which has, of course, been conducted with a due regard for that class of explosive compounds to which erythrol tetranitrate is so closely related. In no case whatever have we had anything approaching trouble or danger with it, although we might add that for all our experiments a perfectly clean and dry glass mortar was used, which would, of course, only permit of very little detonating power. It would be very interesting to know the experience of others with this, for the moment, dangerous compound.

St. Bartholomew's Hospital, E.C., William Parsons.
December 29, 1897. J. Langford Moore.

ANSWERS TO QUERIES.

Special Notice.—*Scientific, technical, legal and general information required by readers of the 'Pharmaceutical Journal' will be furnished by the Editor as far as practicable, but he cannot undertake to reply by post. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of senders. Questions on different subjects should be written on separate slips of paper, each of which must bear the sender's initials or pseudonym. Replies will, in all cases, be referred to such initials or pseudonyms and the registered number added in each instance should be quoted in any subsequent communication on the same subject.*

Pazo Compressor.—The address of the inventor was given in last week's Journal, page 580, in answer to J. D. D. T. [*Reply to* A. E.—2/31.]

Face Powder.—Boric acid, 2 parts; zinc oxide, 1 part; rice starch, 1 part; add sufficient oil of neroli and otto of rose to perfume to the desired odour. For a dusting powder for infants nothing is better than boric acid alone, perfumed with a little otto.—[*Reply to* E. H. W.—2/22.]

Remedy for Chilblains.—A mixture of four parts of oil of cajuput and one part of liniment of opium is an excellent remedy for chilblains. Boeck also recommends resorcin as an application for these troublesome affections. *Vide P. J.* [4], ii, 119. [*Reply to* A. H. P.—2/20.]

Oil of Garlic.—In reply to our inquiry, Messrs. Schimmel and Co., of Leipzig, inform us that they have no knowledge of oil of garlic ever being used medicinally. It is far too powerful a body for such purposes, unless very freely diluted. The chief consumers, are, they inform us, manufacturers of American condiments. When the oil is being distilled, the whole town of Leipzig is said to be redolent with the odour. [*Reply to* A. P. S.—2/7.]

Hair Preparation.—Take castor oil, 2 drachms; add to it an excess of solution of ammonia, and warm on the water bath until the uncombined alkali is driven off, and a little of the residue, on being dropped into water, dissolves without showing any oily globules. Dissolve it in 2 ozs. of water, add 1 drachm of tincture of cantharides, 2 drachms of jockey club, and make up to 4 fl. ozs. with proof spirit. Filter bright through powdered pumice stone. *Reply to* E. H. W.—2/23.]

Blistering Ointment for Horses.—This contains nothing but red iodide of mercury, the colour of which is covered by mixing some ultramarine or other blue pigment with the mass. It contains no cantharides. The red iodide of mercury present amounts to 13·3 per cent. This is rather stronger than the usual veterinary red mercuric iodide ointment, which is generally made to contain about 10 per cent. of the iodide. [*Reply to* Blister.—1/29.]

Cement for Glass.—Take shredded isinglass, 2 parts, and glacial acetic acid, 1 part; heat them together on the water bath until a perfectly homogeneous mass results, keep in the vessel covered to prevent evaporation as far as possible of the acid, and add more isinglass from time to time until a stiffish paste results, then drop by drop add more acetic acid until the mass is just pourable; run while hot into small wide-mouthed bottles, and cork up tight. Before using soften the cement by standing the bottle in hot water. [*Reply to* F. W. G.—2/5.]

Soda Lime.—This is used in analytical work for liberating nitrogen in the form of ammonia. It is made by slaking quicklime with strong solution of caustic soda thus:—Quicklime, 2; caustic soda, 1; distilled water, 2. Dissolve the soda in the water. Pour evenly over the lime, dry, heat to redness, cool, powder, and keep in a bottle with a well-fitting, vaseline-smeared stopper. It is a mixture of sodium oxide and hydroxide. Yes, it can be easily made on the small scale. Most analysts make their own, as a rule. [*Reply to* H. G.—1/32.]

Non-Excisable Coca Wine.—We have no formula for a coca wine which is at the same time palatable and not liable to a wine licence. The Excise regulations are framed with the intention of preventing the sale, as a medicated wine, of a preparation sufficiently palatable to be taken as a pleasant beverage. The amount of half a grain of alkaloid in each fluid ounce, which is required by the authorities to be present, is specified for this very purpose. You will be infringing the law if you sell coca wine which contains less alkaloid than this. If you obtain a wine licence, you can then sell the wine with only a trace of alkaloid or a flavour of the leaf, if you are so disposed. We do not, from an ethical point of view, recommend you to push the sale of coca wine at all. In our opinion it should only be given upon the direct prescription of a medical man. [*Reply to* Questus.—1/34.

Vegetable and Sewage Contamination of Drinking Water.—Roughly speaking, a high figure for chlorine in excess of the normal figure for well waters from the same geological strata, in the same district, and an excess of free and albuminoid ammonia may indicate sewage contamination. The presence of nitrites also points in the same direction. A lower figure for chlorine and free ammonia, with a high one for albuminoid ammonia and a large amount of oxidisable matter, as shown by the "oxygen absorption," indicates the presence of vegetable organic matter. The presence of an excess of nitrates will often show that a water has, at a more remote period, been contaminated with animal organic matter. There is no single test that will discriminate between animal and vegetable organic matter, but the various figures obtained in the course of an analysis, as indicated above—taken together with the general surroundings of the source of supply—will often give a fairly clear indication of the source of the contamination. [*Reply to* P. D.—2/19.]

OBITUARY.

Sharp.—On December 11, Thomas Robert Sharp, Chemist and Druggist, Owston Ferry, Lincolnshire. Aged 60.

Jones.—On December 18, Henry Richard Jones, Chemist and Druggist, Wolverhampton. Aged 79.

Watt.—On December 23, John Charles Watt, Chemist and Druggist, Ealing. Aged 32. Mr. Watt was an Associate of the Pharmaceutical Society.

Giles.—On December 25, Richard William Giles, Pharmaceutical Chemist, London. Aged 73. Mr. Giles had been a member of the Pharmaceutical Society since 1847.

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Ayrton, Barbour, Baxter, Christy, Clague, Currie, Davies, Davis, Dowdy, Elborne, Evans, Gadd, Hanbury, Hardwick, Henry, Hetherington, Hocking, Johnson, Johnston, Lescher, Lunan, Macdonald, MacGeorge, Mackenzie, Moore Mumbray, Oldham, Parke, Phillips, Ransom, Robb, Sargeant, Shorthouse, Smith, Swinton, Symes, Taylor, Tocher, Webb, Wilkinson, Wyatt.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

Basis for Gelatin Suppositories.

L. A. Mieux has read a paper before the Wisconsin Pharmaceutical Association, in which he recommends the following formula for a gelatin basis for suppositories :—Gelatin, 40 parts ; glycerin, 25 parts ; water to make 100 parts, or, if a softer mass is required, 120 to 130 parts. The product is said to be well adapted for use with alum and other salts. The addition of 25 parts of powdered acacia or dextrin in place of an equivalent amount of water renders the mass more suitable for use in summer or in a warm or moist atmosphere. In either case the gelatin should be soaked in 200 parts of water until soft, the glycerin (and gum, if required) added, and the whole heated on a water bath until complete solution is effected and the excess of water evaporated. Stir gently whilst heating, and keep the temperature well below boiling point. If air holes appear in the mass on cooling, it must be re-heated with 100 parts of water, and the whole again evaporated to the required bulk. The moulds should be oiled before filling, and, if made of metal, should previously be heated to about 50° C.

Dispensing Compressed Tablets.

A correspondent of the *Druggists' Circular* points out that no great trouble need be experienced in dispensing compressed tablets ordered in prescriptions, provided a good machine be available, elaborate preparation of the ingredients being unnecessary. As a rule, if the operator has first studied the different substances he is likely to be called upon to compress, and understands well how to regulate the pressure, no lubricant will be required for compressing a dozen tablets. Previous spraying with ether or alcohol, however, will often facilitate matters, though the powder must not be subjected to compression whilst wet. It should scarcely be necessary to say that in dealing with prescriptions, no permanent addition ought to be made to the powder that is to be compressed, without due authority. Ready-made tablets are usually unsuitable for dispensing purposes on account of the presence of gum, boric acid, or other foreign material added to facilitate granulation of the powder or to act as a lubricant. As regards the pressure to be applied, it is to be noted that insufficient force may leave the tablets in a crumbling condition, whilst too great a pressure will render them hard and more difficult to dissolve.

Some Pill Excipients.

Professor W. L. Scoville, in addressing the Massachusetts Pharmaceutical Association, observed that though crumb of bread has long been recommended as an excipient for making pills of fluid bodies, it is seldom used—"probably because the pharmacist generally prefers to eat outside the store." It is only useful as an excipient when fresh, in which condition it is not often available, and wheat flour has been found to be the best simple excipient for such bodies as creosote, camphor-chloral, volatile oils, etc. The fluid is first absorbed by a slight excess of flour, making a some what granular paste, then sufficient syrup is added to make a plastic mass, the presence of a slight amount of aqueous fluid being necessary to secure plasticity and adhesiveness. A two-grain creosote pill, so made, is about the size of a four-grain quinine pill, as ordinarily made. Smaller pills can be made by the use of gelatin. Dissolve 5·5 parts of gelatin and 2·5 parts of sugar in 12 parts of hot water, then allow to cool, and preserve in a wide mouth bottle, with a layer of dilute alcohol covering the jelly, so as to prevent drying and hardening. One grain of this gelatin basis is added to each minim of creosote, oil, or other fluid to be massed, then warmed to liquefy it and thoroughly mixed with the medicament, after which it is then kneaded with a sufficient quantity of powdered marshmallow to make a mass. A three-grain creosote pill made in this manner is about the size of a four-grain quinine pill. Phosphorus pills may be produced satisfactorily by dissolving 2 grains of phosphorus in 90 minims of chloroform, adding the solution to a mixture of 60 grains of powdered liquorice and 5 grains of tragacanth, incorporating thoroughly, and, when most of the chloroform has evaporated, adding 10 drops of glycerin and sufficient syrup to make a mass.

Modified Goulard Extract.

F. W. Haussmann, at a Philadelphia College of Pharmacy Meeting, stated that he had obtained satisfactory results with the cold maceration process of the Austrian Pharmacopœia for Goulard extract of lead, and the following modification of that process was recommended :—Graduate a strong bottle to 730 C.c. and pour in distilled water, that has been heated to boiling, up to that point. Then quickly add 170 Gm. of selected crystallised lead acetate, previously broken into small pieces, and cork the bottle. As soon as the salt is dissolved add 100 Gm. of sifted lead oxide, in divided portions, and shake the bottle thoroughly after each addition. In less than ten minutes the yellow oxide should have become white, and after occasional agitation during two hours, or until the liquid is cold, filtration may be effected.

Cod-liver Oil Emulsion.

J. K. Williams, at a meeting of the Connecticut Pharmaceutical Association, described how it is possible to make a simple emulsifier by fitting a narrow tin or earthenware vessel with a wooden cover, dasher, and handle, like an old-fashioned churn. The interior being quite dry, place in the vessel 3 ounces of powdered acacia, 16 fluid ounces of cod-liver oil, and sufficient of the desired flavouring essence ; mix with a spatula, then add all at once 9·5 fluid ounces of water, fix the dasher and cover in position, taking care that the former is quite below the surface of the fluid, and churn until emulsification is effected. Next add the remainder of the water or other liquids, churning meanwhile. No oil must be added at this stage nor should an oily measure be used for the other liquids, else there will be a risk of separation.

Useful Practical Hints.

A gritty preparation frequently results in making zinc ointment, even when the zinc oxide is sifted into the melted benzoated lard, and J. K. Williams suggests that this may be obviated by replacing 10 per cent. of the lard with castor oil. The oxide is placed in a warm mortar, the castor oil added hot, and the whole rubbed into a smooth paste. The lard is then added cold and mixed without heating, thus avoiding precipitation of any of the benzoin constituents present, and securing a perfectly smooth product. According to this writer it is useless to attempt to benzoate lard properly by digesting benzoin in hot melted lard, as benzoin is quite insoluble in hot fats. He prefers to mix with cold lard an equivalent quantity of an ethereal solution of benzoin, prepared by dissolving the resin in its own weight of ether, adding 10 per cent. of castor oil, and evaporating by air exposure to a syrupy consistence. In like manner, it is stated, tolu balsam may with advantage be kept dissolved in alcohol, so that an ounce by weight of the solution represents half an ounce of the balsam.

Commercial Calcium Glycerophosphate.

Adrian and Trillat, as a preliminary step in the investigation of this salt, have examined a number of commercial samples, which have been found to vary very much in physical and chemical characters. Seven samples examined contained from 19·5 to 24·5 per cent. of lime, and from 26 to 33 per cent. of phosphoric acid. In six of these two were neutral to litmus, one alkaline, and three acid. The solubility of the acid samples in distilled water at 25° C. was markedly in excess of the others, the most soluble dissolving to the extent of 7·6 in 100, while of the neutral sample only 4·05 in 100 was dissolved. The residues left by this treatment differed widely in composition, being composed chiefly of phosphate of lime, with some sulphate; the latter being probably derived from washing the precipitate with calcareous water. On extracting different samples with boiling alcohol and distilling off the solvent, residues varying in amount from 1·8 to 4·2 per cent. were obtained. These were found to consist of glycerin and free phosphoric acid, the percentage of the former varying from 3·4 to 1·3, and of the latter from 1·5 to *nil*. It is evident, therefore, that commercial calcium glycerophosphate is, at present, far from being a definite body.—*Journ. de Pharm. et de Chim.* [6], vi., 435.

Solvents for Gun-cotton.

T. Schlumberger finds that even highly diluted alcoholic solutions of certain salts possess the property of dissolving pyroxylin without any addition of ether. These salts are chloride of ammonium, calcium chloride, magnesium chloride, aluminium chloride, zinc chloride, sodium lactate, potassium acetate, and ammonium acetate. The risk of explosion and fire which attends the use of ether in preparing these solutions are for the most part avoided, or at any rate decreased, by the employment of these saline solutions. The solutions can also be prepared by impregnating the wool with the salts mentioned and dissolving in alcohol.—*Pharm. Centr.*, xxxviii., 722.

Hydrastine Monocalcium Phosphate.

The fact that the number of soluble salts of hydrastine is limited, has induced T. H. Norton and H. E. Newman to endeavour to add to their number. They have succeeded in preparing a soluble double salt of calcium and hydrastine combined with phosphoric acid, by digesting an excess of the alkaloid in an aqueous solution of pure calcium monophosphate. This salt so obtained, however, could not be crystallised, forming, on evaporation, a resinoid mass soluble in 10 parts of water. The amount of the alkaloid combined with the phosphate appeared to vary with the time in which they were left in contact. After three minutes' maceration the product contained 42·27 per cent. of alkaloid, corresponding to the salt $2Ca(H_2PO_4)_2 \cdot C_{21}H_{21}NO_6$, but after macerating for eighty hours, a body having the formula $2Ca(H_3PO_4) \cdot 3C_{21}H_{21}NO_6$ was obtained, giving 7·01 per cent. of the alkaloid.—*Journ. Amer. Chem. Soc.*, xix., 838.

The Rate of Solution.

A. A. Noyes and W. R. Whitney claim to have experimentally established the law according to which solid substances are dissolved in their own solutions, and they express it in the following terms:—"The rate at which a solid substance dissolves in its own solution is proportional to the difference between the concentration of that solution and the concentration of the saturated solution." This law has been proved to be correct in the case of substances so widely differing in chemical nature and physical properties as benzoic acid and lead chloride, and it is therefore assumed by the authors to be of general application.—*Journ. Am. Chem. Soc.*, xix., 930.

Peptone in Sweet Almonds.

Peptone has been repeatedly detected in several members of the vegetable kingdom. The various discoverers have not, however, been able to isolate pure peptone, but a mixture of peptone and albumose. Lupin seeds, for instance, showed after three days 0·2 per cent. of this mixture, determined by the colorimetric method. E. Lemport has used phospho-molybdic acid for detecting peptone in sweet almonds. The almonds were extracted without heat, the albuminoids being precipitated with picric acid solution. The peptone mixture obtained as a yellow mass, readily soluble in water, insoluble in ether or strong alcohol. The respective reactions had a positive result, the filtrate of the ammonium sulphate precipitate giving with tannin a voluminous precipitate revealing the presence of peptone, together with albumose. In spite of considerable loss the author obtained 0·25 per cent. of peptone mixture from almonds.—*Pharm. Zeit. f. Russl.*, 1897, 527, and *Pharm. Centralh.*, xxxviii., 737.

Rhamnus Frangula Bark.

In addition to emodin, frangulin, and chrysophan, all definite crystalline chemical bodies known to exist in the bark of *Rhamnus frangula*, and the so-called frangulic acid isolated by Kubly, and stated by him to yield, on purification, a glucoside, Dr. E. Aweng has added further bodies. He regards the so-called pure frangulic acid of Kubly as a decomposition product, aud terms it pseudo-frangulin; the original crude acid of Kubly he calls "primary glucoside." When hydrolysed, pseudo-frangulin furnishes pseudo-emodin. Both these are slightly aperient. The emetic action of the green bark is attributed to a hydrolytic ferment, which is destroyed by heating. In preparing the fluid extracts of *Rhamnus frangula* the author suggests that the glucosides should first be hydrolysed by heating with citric acid solution, evaporating to dryness, and then extracting with alcohol 96 per cent. The citric acid may if desired be removed.—*Journ. der Pharm. v. Els.-Lothr.*, 1897, 183.

Oil of Cusparia Bark.

Beckurts and Troeger find that cusparia bark gives a light yellow aromatic oil, which darkens on keeping. It is not easily fractionated, as it appears to undergo decomposition; but a yellow aromatic alcohol, optically inactive, galipene alcohol, $C_{15}H_{26}O$, boiling between 264° and 265° C., and a sesquiterpene, $C_{15}H_{24}$, were isolated.—*Archiv der Pharm.*, 1897, 518.

Preservation of Ergot.

L. Aymonier recommends the following process for preserving ergot. Immerse the fresh ergot in an ethereal solution of tolu balsam, take out to dry, and preserve in a stoppered bottle. The author preserved ergot in this way for eight months without any change, and states that there is no doubt that it could be kept in this way for an indefinite period, although it is advisable to renew the ergot after each harvest. The treatment gives the ergot a slight taste without otherwise affecting its properties.—*Journ. de Pharm. et de Chim.* [6], vi., 359.

New Mucilage Gum.

A variety of gum has been imported from Angra Pequena, in German South-West Africa, since last spring. It consists of round colourless to faint yellow pieces with sharp edges. The gum is readily soluble in water. The solution 1:3, compared with the official mucilage, was found to be greatly superior to the latter. 20 C.c. of gum arabic flowed out of a burette in 29 seconds, 20 C.c. of Senegal gum in 50 seconds, and 20 C.c. of Angra Pequena gum in 63 seconds. Hartwick states that the Angra Pequena gum is derived from *Acacia horrida*. —*Chemik. Ztg.*, xxi., 256.

Study of Mustard Seeds. L. H. Pammel gives an excellent bibliography of mustard seeds, with an illustration comparing the structure and histology of the seeds of *Brassica alba* and *Camelina sativa*. This is only one of a series of illustrated articles on the seeds and testa of some Cruciferæ, which should prove of value to those desirous of identifying the commercial seeds of this natural order.—*Amer. Monthly Micro. Journ.*, xviii., pp. 206 and 313.

Varieties of Matico. G. Dethan and R. Bertaut point out that the matico of commerce contains two varieties of *Piper angustifolium*, which differ somewhat in the shape of thc leaves. These are present in herbaria under the names of variety α *cordulatum* (*Artanthe elongata*, Miq.), and variety β *ossanum*, which corresponds to the *Piper angustifolium* of Ruiz and Pavon. The former has the leaves larger, shorter, and broader in proportion, and obliquely cordate at the base. There are also, in the anatomical structure, differences by which the two varieties can be recognised. The midrib of *A. cordulatum* is much less convex below than in the variety β *ossanum*. The fibro-vascular bundles form a shallow arc and not a circle, and no stone cells are visible. Where the secondary nerves join the midrib there is a special cavity containing hairs and stomata. Such cavities are formed by the growing together of the nerves, owing to hypertrophy of the tissue, which separates them.—*Journ. de Pharm. et de Chimie* [6], vi., 537.

Preservation of Algæ. A method of preserving algæ for demonstration purposes is published by C. Thom, which has the advantage of preventing shrinkage. The plants are killed and fixed by the use of Flemming's weaker solution (10 C.c. of 1 per cent. osmic acid, 10 C.c. of 1 per cent. acetic acid, 25 C.c. of 1 per cent. chromic acid, and 55 C.c. of distilled water). This may be used from half a hour to twenty-four hours or more without injury to delicate tissues. Next add 10 per cent. of glycerin, allowing each drop to diffuse before adding more, so as to prevent the shrinkage caused by diffusion currents if glycerin is added too rapidly. Continue adding glycerin until enough has been added to cover the specimens, when the fixing solution has evaporated from a watch-glass in which they are exposed for the purpose. The red algæ retain their colour almost perfectly, but green algæ lose more or less colour, although the chromatophores retain their shape perfectly, and the cells become clearer than fresh material.—*Botanical Gazette*, xxiv., 373.

Mixed Plant Grafts. The term "mixed grafts" is applied by L. Daniel to those grafts in which some of the buds of the stock are still allowed to remain instead of all being destroyed. This brings about, in his view, a certain degree of symbiosis between the graft and the stock, the former acquiring some of the characters of the latter. The process is recommended when it is desired to produce new varieties, rather than when the object is to perpetuate existing forms.—*Comptes rendus*, cxxv., 1897, p. 661.

Pitchers in Plants. Prof. S. H. Vines gives a useful *résumé* of the present state of our knowledge of the structure and function of pitchers in plants. The known examples belong to the orders Sarraceniaceæ, Nepenthaceæ, Asclepiadaceæ, Saxifragaceæ, and Lentibulariaceæ, with which may also be associated the underground scales of *Lathræa* (Scrophulariaceæ). In the great majority of cases these structures are traps for insects; while others have apparently no such function. Among insect traps, the greater number (Sarraceniaceæ, *Genlisia*, *Utricularia*), appear to be incapable of digesting the insects which they capture absorbing only the products of the decomposition caused by micro-organisms; these therefore are not correctly termed carnivorous plants. The pitcher of the various species of *Nepenthes*, and possibly also that of *Cephalotus* (Saxifragaceæ), undoubtedly secretes a digestive enzyme. When pitchers are not insect traps, they have some function in connection to the supply of water to the plant; either relieving it of an excess of water which it may have absorbed, or storing it up for future use.—*Journ. R. Hort. Soc.*, 1897.

New Mode of Grafting. L. Daniel advocates a new process of grafting, which he terms the *greffe en flûte-approche*, and which he claims to combine the advantages of the flute-method (*greffe en flûte*) with those of the cushion method (*greffe en écusson*). It is described as being certain in its results, but it takes more time than the methods already in use, and is applicable rather to the perpetuation of special varieties than to use for ordinary purposes of cultivation.—*Bonnier's Rev. Gén. de Botanique*, 1897, p. 213.

Water in Plants. C. B. Davenport points out the important part played by water in the growth of plants, and compares the developmental processes which go on in the tip of a twig to those which occur in the animal embryo. In both there is first a period of rapid cell-division with slow growth; next a grand period of growth in which the general form of the embryo is acquired, the rudiments of the organs are established, and the organism increases rapidly in size by the imbibition of water; whilst, finally, there is a period in which the histological differentiation is carried on, while the absolute growth increments cease to increase. —*Proc. Boston Soc. Nat. Hist.*, 1897, p. 73.

Spanish Silkworm Gut. To prepare this useful material, after the grub has eaten enough mulberry leaves and before it begins to spin, it is killed by being thrown into vinegar for several hours. The substance which the grub would have spun into a cocoon is then forcibly drawn out into a much thicker and shorter silken thread. Two such threads are placed for about four hours in clear cold water, after which they are immersed for ten or fifteen minutes in a caustic solution, prepared by dissolving soft soap in water. This serves to loosen a fine outer skin, which is next removed by the hands while the workman holds the thread between his teeth. The silk is then hung up to dry in a shady place. In some cases the silk "guts" are bleached with sulphur vapour, which makes them look beautifully glossy and snow-white, like spun glass, while those naturally dried retain always a yellowish tint.—*Journ. Soc. Arts.*, xlvi., 78.

Pigment from Yeast. Dr. Casagrandi publishes a note on a yeast producing a red pigment, which he considers to be an offshoot from the red yeast, known as *Saccharomyces ruber* discovered by Demme some seven years ago. Demme stated that his variety was not endowed with any fermentative properties, but that isolated by Casagrandi ferments glucose very readily. Both Demme's and Casagrandi's specimens are pathogenic to guinea-pigs, rabbits and rats, when subcutaneously introduced into these animals; whilst when grown in milk they are both capable of so modifying the character of this liquid that dogs and rabbits fed with it develop diarrhœa, and the same symptoms have been observed in babies which had partaken of milk in which red yeast had been growing. The yeast appears to be present in our surroundings, and may, therefore, at any time make its presence felt by obtaining access to milk if the latter is left unduly exposed.—*Annali d'Igiene Sperimentale*, through *Nature*, lvii., 158.

POISONS AND POISONERS.

There has attached to the subject of poisons from the earliest ages an interest and importance, both deep and easily to be accounted for. The mysterious and terrible power of dealing death in a cup of wine, a dish of food—a breath of perfume even, or by the needle-scratch of a poisoned weapon—all these combined with the absence of antidotes, and the lack of all certain knowledge of the mode of action, the terrible pain and quickly fatal termination of the tragedy, have combined to attract and fix a fascinated attention to the subject.

It would seem that the first poisonous effects noticed, were due to blood poisoning from infected wounds. The term "Toxicology" (the science of poisons) is derived from the Greek τοξον, a weapon or bow. The savage probably found that the weapon, when stained with the blood of former victims, inflicted more deadly wounds than when clean. The next step would be to smear the blade with all manner of evil-smelling pastes, and with the juices of plants deemed unfit for food. Many of these would be quite innocuous, but continual experiments *in corpore vili* would point to the effective ones. Examples of this class of poison still exist in the Wourali poison of the South American natives, described by the great naturalist Waterton as a fearsome mixture of the juice of a poisonous vine containing a substance similar to strychnine, now known to chemists as "curarine," the pounded bodies of red ants, the fangs of serpents, etc. Mystic rites attend the fabrication of the drug; the hut in which the operation is conducted is deserted, all vessels used are burnt, and the secret of the process is carefully preserved from coming to the knowledge of the women of the tribe. The last two seem to be reasonable precautions. The natives of the Malay Archipelago use the dried juice of a tree, the *Antiaris toxicaria*, as an arrow-poison, and similar compounds are found in use by the Andaman islanders, the bushmen of South Africa, and by the dwarf race described by Stanley in Central Africa.

From the poisoned weapon, dealing its slight but deadly wound, it is not a long step to the more subtle and much less easily-detected method of administering poison in food or drink. Here the limitations are more stringent. Such a poison must have little taste, so as not to excite suspicion at the time of consuming the deadly food or drink. It should be free from any immediate irritant effect, and the symptoms should simulate those of some common disorder. Such a substance has for long ages been known in India in the *Datura* (Sanskrit, *Dhatoora*) class of plants. Three varieties are common, *Datura alba*, *D. fastuosa*, and *D. ferox*. All yield the drug atropine, well named after the eldest of the three Fates, whose duty it is to cut short the thread of life at its appointed place. *Datura* was frequently used in India for the purpose of terminating domestic quarrels, and to this practice may be traced the origin of the custom of "suttee" or widow burning. The Brahmin priesthood, who were also the law-giving class, found that by making a wife's life conterminous with the husband's, the average husband lived considerably the longer. The drug also held an important place as a state agent. The effect of a number of doses insufficient to kill is to cause insanity, thus affording a ready means of rendering harmless subjects deemed too powerful and influential.

The ancient Egyptians were acquainted with prussic acid prepared from peach-kernels, as appears from the words, "Pronounce not the name of A. I. O. under the penalty of the peach," deciphered by M. Duteil on a papyrus in the Louvre. Here is evidently a threat, to such as reveal priestly secrets, of death by waters distilled from the peach-kernel, which we know to contain prussic acid. From Egypt the knowledge of the fatal potion seems to have passed to Italy. A Roman knight in the reign of Tiberias, accused of high treason, swallowed a draught of poison, and fell dead at the feet of the senators. Unless we fall back on the theory of some sudden syncope from natural causes, nothing but prussic acid, and that fairly strong, can account for this sudden death. A further example of the use of prussic acid in Rome is the murder of Britannicus by his brother Nero. Hot water was a favourite drink in fashionable Roman circles at this time. One day, after dinner, a slave brings to Britannicus his beverage. It is too hot. Cold water is added, presumably containing the poison. Immediately on drinking the victim lost power of speech. The breathing ceased. His mother and sister were horror-stricken. Nero, the murderer, looked coldly on, remarking that such fits often happened to him in infancy without evil result. In a minute or two the banquet proceeds. If this, again, were not sudden brain or heart disease, the cause of death must have been prussic acid.

Owing to the loss of the ancient knowledge of anatomy and physiology possessed by the Egyptian embalmers, no post-mortem was possible. In the absence of such knowledge, much importance was attached to outward signs. Doubtless many persons must have died from poison, and the reason of their death remained unknown, while others, who died naturally, but whose bodies putrefied rapidly, were supposed erroneously to have died from poison. Indeed, up to the present day there lingers a belief in these outward and visible signs. When Pope Alexander VI. died, probably enough from poison, his body (according to Guicciardini) became a fearful sight, too unclean to describe here. When the Duke of Burgundy wished to raise a report that John, Dauphin of France, had been poisoned he described the imaginary event thus:—

"One evening our most redoubtable lord and nephew fell so grievously sick that he died forthwith. His lips, tongue, and face were swollen. His eyes started out of his head. It was a horrible sight to see, for so look people that are poisoned."

In point of fact, these extraordinary symptoms are less likely to ensue in cases of poisoning, for, as a rule, a poisoned man is cut off while healthy, and with his tissues sound and less liable to rapid decay than if he had suffered from disease.

The use of poison is entirely opposed to the Anglo-Saxon habit of thought. To what anger the people were wrought by the detection of poisoners is shown by the execution at Smithfield in 1542 of a young woman convicted of poisoning three households. She was boiled alive. But at about this time we find the Venetian and other Italian courts formally treating poisoning as a legitimate method of securing their ends. Especially is this the case at Venice. In the dark records of the "Council of Ten" we find the names of those who voted for and against each assassination, the reasons adduced, and the sum to be paid the agent. For example: On December 15, 1543, a Franciscan brother, John of Raguba, offered a selection of poisons and declared himself ready to remove any objectionable person out of the way. For the first successful case he required a pension of 1500 ducats yearly, with an increase of pay for further services. The Presidents Guolando Duoda and Pietro Guiarini placed the matter before the "Ten" on January 4, 1514, and on a division (ten to five) it was resolved to accept so patriotic an offer, and to experiment first on the Emperor Maximilian. The bond laid before the "Ten" contained a regular tariff of charges, ranging from 500 ducats for the Grand Sultan to 100 for the Pope, and 50 for the Duke of Mantua. The Council appears to have quietly arranged the deaths of many public men. In successful cases we find the single grim marginal note, "factum," accomplished.

The drugs used by the Venetian poisoners are not cer-

tainly known. Baptista Porta, writing in 1589, includes a vast mass of information on poisons in the cookery section of his book in "Natural Magic!" It seems to be an open question whether cooks most needed a knowledge of poisons or poisoners a knowledge of cookery. We have a more certain knowledge of the methods of the Italian schools of the sixteenth and seventeenth centuries. The iniquitous Toffana made solutions of white arsenic of various strengths, and sold them as "Acquetta di Napoli." She is said to have poisoned more than 600 persons, including two popes, Pius III. and Clement XIV. The composition of the Acquetta di Napoli was for a long time a secret, shared, strange irony of fate, by the reigning pope, and by the Emperor Charles VI. The "Acquetta di Perugia" was another choice preparation. Its manufacture is thus described: "A hog was killed and cut into joints, which were rubbed with white arsenic. The juice which dripped from them was preserved and accounted far more deadly than the ordinary arsenical solution." In view of recent work on bacteriology this seems extremely likely. Secchi has actually succeeded in preparing highly poisonous organic compounds of arsenic by allowing animal matters to putrefy in contact with white arsenic; the liquids swarm with bacteria. The talented lady who dispensed this brew was arrested in 1709, but availing herself of the protection of the church, continued to sell her wares unmolested for nearly twenty years longer. She taught her art to Hieronyma Spara, who formed an association of young married women in the papal reign of Alexander VII. for criminal purposes. They were detected and convicted on their own confession. The persuasive measures employed to secure confession have not been officially recorded! It would almost seem as if "suttee" might well have been introduced into Italy three hundred years ago.

In the letters of Mme. de Sevigny and in Voltaire's 'Siècle de Louis XIV.' are written accounts of another school of poisoners, that of St. Croix and Mme. de Brinvilliers, the pupils of Keli. The lady appears to have been as cold blooded as Toffana. She made experiments on the patients in the Hôtel Dieu in order to test the strength of her preparations, and invented "les poudres de succession," an arsenical preparation. She poisoned her father, brothers, sister, and others of her family. St. Croix was killed by the fumes of a preparation on which he was engaged. Mme. de Brinvilliers was detected, but sought safety in a convent. She was enticed thence by a police officer disguised as an abbé. She was afterwards beheaded and burnt near Nôtre Dame.

Since the times of Toffana, Keli, and St. Croix, such progress has been made in pathology and analytical chemistry as to render a repetition of these crimes impossible, by making detection certain. Arsenic, the darling of the mediæval poisoners, is rendered worse than useless by the delicate tests which have been placed in the hands of the expert. Chemical research has indeed placed new and subtle weapons in the hands of the poisoner, but it has rendered his detection inevitable.

ORTHO- AND PARA-CHLORSALOL AS DISINFECTANTS. — Both ortho- and para-chlorsalol—occur as white, slightly-soluble powders. The ortho derivative melts at 56° C., the para form at 70° C. The former smells slightly of salol, while the latter is odourless and tasteless. According to Karpow, chlorsalol is free from toxic properties and is much more active as a germicide than salol. The ortho modification is recommended for external use in the dressing of wounds, etc., and *p*-chlorsalol internally as an intestinal disinfectant.—*Chem. Zeit.*, xxi., 223.

REVIEWS AND NOTICES OF BOOKS.

DIE PROTEIDE DER GETREIDEARTEN, HÜLSENFRÜCHTE, UND OELSAMEN SOWIE EINIGER STEINFRUCHTE. Von Dr. VICTOR GRIESSMAYER. Pp. xvi. + 301. Price 10 marks. Heidelberg: C. Winter's Universitätsbuchhandlung. 1897.

The proteids or albuminous bodies are a class of substances which are of supreme importance to the student of biology, physiology, and dietetics. So far as one can speak with certainty concerning the composition of living protoplasm, proteid forms its essential constituent, and the chemical phenomena of life resolve themselves largely into the chemical changes of albuminous matter. In spite of this, chemists have not yet succeeded in unravelling the constitution of the proteids; it is known that their molecules are heavy; something is also known of their percentage composition, and we know that on decomposition they yield numerous, and often complex derivatives, principally of the fatty, amido-fatty, cyanogen-yielding, and aromatic groups. How these are fitted together into the proteid molecule is a matter at present of mere speculation.

The classification of proteids which is now in vogue depends principally on their solubilities in certain reagents, particularly in solutions of neutral salts of varying strengths. This is largely empirical, but it is nevertheless convenient and practicable.

Animal proteids have received more attention than those which originate in the vegetable kingdom; the most prominent chemical substances in plants are the carbohydrates, but the classification of the vegetable proteids is now attracting the attention of numerous physiological chemists.

The pioneer in this direction was Ritthausen. His work was of an extraordinarily laborious kind, and though his results are now largely called in question, the credit is due to him of being practically the first to enter the untrodden forest. A few isolated pieces of work, chiefly directed to the occurrence of crystallisable proteids in plants, bridged across a long interval, till Vines made his masterly researches into the composition of aleurone grains. Later, Sidney Martin, employing the modern methods of chemical physiology, did much to add to our knowledge of the proteid matter in wheat and other grains, and in America the subject was taken up by Chittenden. Among Chittenden's pupils was one Thomas Osborne, who, at first in conjunction with his master, and then independently, pursued, and is still pursuing, this line of research; and in the present volume we have translated into German a series of his most important contributions. They were originally published in America, mostly in the *American Chemical Journal*, and although Dr. Victor Griessmayer has done the good service of collecting these papers together, it should be as editor and translator that he should appear on the title-page, and not as author. There are some fourteen papers altogether, and this review will be concluded with a brief *résumé* of each one of them.

The first paper relates to the proteids obtainable from maize. They consist of three globulins, one or more albumins, and a proteid soluble in alcohol. The two principal globulins exist as such in the flour, and can be extracted by means of a 10 per cent. solution of sodium chloride; they differ from one another in composition and coagulation points. During the process of recrystallisation from warm dilute salt solution, a proteose, probably a product of hydrolysis, makes its appearance. One of these globulins resembles myosin; the other, vitellin; the latter is identical with a proteid subsequently dubbed "edestin" by Osborne in his later work. The third globulin is characterised by its solubility in much weaker saline solutions. Both it and the myosin-like globulin are con-

vertible into insoluble albuminates by the action of water and salt solutions. The two albumins present no special points of interest, but the existence of a proteid soluble only in alcohol is particularly noteworthy. The existence of a proteid which is dissolved by weak—though not by strong—alcohol is not unique in the vegetable kingdom. Ritthausen made that out, and termed the proteid in question maize-fibrin. Osborne calls it "zein." It is characterised by a high percentage of carbon, by its resistance to the action of alkalis, and by the ease with which it passes into an insoluble modification by warming with water or very dilute alcohol.

The next series of proteids which are considered are those of oats, and to this subject two papers are devoted. Here also the proteid soluble in alcohol is the chief point of interest; like that from maize, it is readily made insoluble, and it has a remarkably high percentage of sulphur, so resembling keratin in the animal kingdom. The principal proteid present is a myosin-like globulin; another globulin is deposited as sphæroliths by warming to 65°, and then cooling a 10 per cent. sodium chloride extract of the flour. By recrystallisation regular octohedra were obtained. Small quantities of acid-albumin, proteose and albumin were also separated out. The great difficulty encountered in these researches is to distinguish between proteids present in the flour or grain, and those which are produced by the methods of extraction. Even water will sometimes cause a soluble proteid to become insoluble, and the existence of ferments similar to those which cause coagulation in animal fluids, like blood and milk, is mooted. The general conclusion drawn is, however, that the proteids present in the oats are three in number, namely, that soluble in alcohol, avenalin (the crystallisable globulin), and a proteid which is especially easily extractable by means of dilute alkali.

Wheat comes next, and this, from the point of view of diet, is of special importance. The formation of gluten is the most familiar instance of the formation of an insoluble proteid under the action of water. Sidney Martin considers its precursors in the flour to be partly globulin, partly proteose, and he was the first to suggest the idea of ferment activity involved in the change. This conclusion is, however, strenuously resisted by Osborne, and in this country O'Brien, while admitting the change is of a hydrolytic nature, also denies the existence of a ferment.

The nomenclature adopted by Osborne is the following:—The proteids in wheat are (1) a globulin, the edestin previously mentioned; (2) an albumin, which is termed leucosin; (3) proteoses, which are regarded as artificial products; (4) gliadin, which, like zein, is soluble in alcohol (the formation of gluten is specially dependent on changes in this substance); and (5) glutenin, which can only be dissolved out with dilute alkali.

Rye forms the subject of the next chapter. The results here are very similar; leucosin, proteose, edestin, gliadin, and glutenin were separated out, and in their reactions and elementary composition are similar to those obtained from wheat. The percentage of these substances in the meal is given as follows:—Glutenin, 2·4; gliadin, 4; leucosin, 0·4; edestin and proteose, 1·7 per cent. Rye flour also yields gluten, and thus like wheat is available for bread-making.

Barley contains leucosin, a small quantity of proteose, edestin, hordein (a proteid soluble in alcohol, and identical with Ritthausen's mucedin) in somewhat different proportions. One may here remark in passing the almost constant presence of proteoses, which in animals are found only as the result of digestive processes. These antecedents of peptone are probably in plants formed also by a species of digestion in the seed, analogous to that which produces sugar from starch, and by this means the growing plant is provided with soluble nitrogenous materials in its circulating sap.

This view is confirmed by the investigation of malt, where, in addition to albumin and globulin, proteoses were found in considerable amount, and are divisible into three varieties. Bynin is the name given to the proteid which is soluble in alcohol.

Leaving the cereals and coming to leguminous plants, we find that the proteids contained in the kidney bean are two in number, and both are globulins; one named phaseolin forms about 20 per cent. of the seed, the other, named phaselin, differs from the first in being more soluble, and in containing less nitrogen and more oxygen. In peas and vetches the legumin of Ritthausen is shown to be a globulin; in addition to this a small quantity of another proteid, coagulable by heat, is present, and in all cases proteose was found as well.

In potatoes the small amount of proteid matter present is divisible into a globulin (tuberin) and a proteose.

In flax seed a globulin, a proteid soluble only in alkali, and proteoses were separated out; whereas in cotton seed the proteid present is nearly all proteose; there is a little edestin and alkali-soluble proteid as well.

The last two papers relate to subjects of more purely scientific interest; the first of these treats of crystallised vegetable proteids, where, after an excellent historical sketch, the author describes his own methods and results. It is a pity that Dr. Griessmayer has not seen fit to reproduce the very excellent photo-micrographs of the crystals that accompany the original paper. The last paper on conglutin and vitellin discusses these proteids as originally described by Ritthausen and prepared from numerous plants in the light of new experiments, and the methods of modern physiological chemistry.

Such a brief abstract can give but little idea of the monumental labour involved in these investigations. The tables of analyses are complete, and the details of the reactions of each proteid are given in full. For these the reader must consult the original memoirs. To those interested in the subject from either the scientific or economic standpoint they will amply repay careful study.

The Practice of Medicine, a Text-book for Practitioners and Students, with Special Reference to Diagnosis and Treatment. By James Tyson, M.D., Professor of Clinical Medicine in the University of Pennsylvania. Illustrated. Pp. 1184. Price 37*s.* 6*d.* net. Manchester: John H. King and Son.

The writing of a serious text-book on medicine at the present day is an undertaking of the most arduous character, and the result must be either a woeful waste of energy or a work of encyclopædic character and of great utility. There is no doubt that Dr. Tyson's work belongs to the best kind of works on medicine. Every page bears the impress of personal experience and thought, and at the same time of wide information. The work does not exceed the author's intention of making it a text-book, and yet the essential features of every phase of disease are given clearly and sufficiently. Thus in the description of the symptoms of typhoid fever, the likeness of many cases of typhoid to cases of meningitis is insisted on. "The popular term 'brain fever,' now passing into disuse, doubtless included many cases of nervous typhoid." The forms of malarial fever which resemble typhoid are also duly noted. Among the sequelæ of typhoid, bone lesions are rightly given prominence: "They include osteitis, necrosis, and periostitis. Ebermaier, in 1887, obtained from two cases of suppurative post-typhoid periostitis the bacillus of Eberth in pure culture." In the treatment of typhoid the cold bath method is described at length, and the description

is aided by clear illustrations. Note may be made of one trait in the directions given for the management of special symptoms in typhoid: "Methods more directly adapted to control delirium are a soothing touch and voice, the bromides, etc." In placing the soothing touch and voice before the drugs the author shows a true physicianly instinct. Another feature may also be noted, *i.e.*, the expression of quantities of drugs in both English and the metric systems, thus recommending turpentine, as indicated by a dry, leathery tongue in typhoid, the author writes: "It should be administered in doses of ten minims (·66 Gm.) in mucilage of acacia every six or eight hours." This method of denoting quantities is used all through the book, and forms an excellent example to writers on medicine who may be thus able by degrees to help to hasten the universal adoption of the metric system, and so the removal of a heavy hindrance to scientific teaching in this country.

The illustrations are all clinical rather than pathological in character. Thus temperature-charts, laryngoscopic views, pulse-tracings, a few clear diagrams of simple brain and nerve physiology form the bulk of the ninety figures, which are all clear and serviceable. The book has the desirable quality of being of even merit and soundness throughout, and this merit is of the very highest. The order of the work would be improved if Section IX., "constitutional diseases," *e.g.*, rheumatism, gout, etc., were made to come before diseases of special systems, *e.g.*, the digestive, respiratory tracts, etc. This is a detail which does not detract from the high merit of this important work, which contains, clearly expressed in good English, the venerable truths of the vast accumulation of observations which constitutes the science of medicine, as well as the most recent additions to medical knowledge, wherever they have been indisputably established. Two most important qualities of the work are, first, evenness of merit in every article and detail, and, secondly, the impress of the author's personal supervision of every line. Professor Tyson's book must rank with that of the late Hilton Fagge as among the best text-books on the subject with which it deals. The print is clear, and the type large and good. The book would be an invaluable possession to any medical practitioner or student.

ETIDORHPA. By Professor JOHN URI LLOYD. Pp. xvi. + 386. English Edition. London: Potter and Clarke, 60, Artillery Lane.

The author of this work is not unknown in pharmaceutical circles as a scientific writer. It was, therefore, with some considerable curiosity that the book was taken up to dip into it, but it was found at once that the customary skimming was useless, the book had to be read through carefully. In the first place, it will strike the casual reader as being only worthy of the companionship of Verne and later writers of the same class, but there is far more in the book than is at first sight apparent, and to the more earnest thinker there will be opened up a vast field of speculation not only on the generally accepted "laws" of science but on many a moral law. In his prologue the author states that the work "recites the physical, mental, and moral adventures of one whose life history was abruptly thrust upon my attention, and as abruptly terminated." The story is supposed to be told by one Llewellyn Drury, to whom the MS. is read by a supernatural visitor who calls himself "The-man-who-did-it." For thirty years the story is buried, as Drury is afraid to publish it, but at last, through the agency of Professor Uri Lloyd, after it had been in his possession for seven years, it sees the light of day.

One naturally desires to know who "The-man-who-did-it" was, and what he did, and apparently he was a member of a hermetic secret society who reveals the secrets, is kidnapped by his brethren and condemned to "pass on in consciousness of earth and earthly concerns when we are gone. Your name will be known to all lands, and yet from this time you will be unknown. For the welfare of humanity you will be thrust to a height in our order that will annihilate you as a mortal being, and yet you will exist suspended between life and death, and in that intermediate state will know that you exist." Throughout the book runs an evident undercurrent of freemasonry, and the judges evidently are of this order.

Kidnapped and prematurely aged by the application of some liquid, the supposed author is taken down one of the curious sink-holes in Kentucky, and thence through the underworld by a sexless, eyeless guide, who sees more perfectly in the interior of the earth than man does above earth, and one explanation of this is somewhat interesting in the face of the recent experiments of Woodward and Goldstein as to the non-existence of light as we understand it outside our world and its atmosphere. The guide asks the following question: "You have used the term sunshine freely; tell me what is sunshine? Ah! you do not reply. Well, what evidence have you to show that sunshine (heat and light) is not earth-bred, a condition that exists locally only, the result of contact between matter and some unknown force expression? . . . . What reason have you to believe that a force current is not circulating to and from the sun and earth, inappreciable to man, excepting the mere trace of this force, which, modified by contact action with matter, appears as heat, light, and other force expressions?"

To trace the wanderings of "The-man-who-did it" and his guide, to attempt to criticise the experiences met with, or describe in detail or even sketch in outline the arguments advanced to account for certain phenomena, would take up at least four or five pages of this Journal. We cannot extract even a tithe of the many truisms or statements on little known or understood natural phenomena. Suffice it to say that probably no finer sermon has been preached than that portion which treats of drunkenness. Finally, the supreme creation of the book, "Etidorhpa," is met with, "The beginning and end of earth, the antithesis of envy, the opposite of malice, the enemy of sorrow, the mistress of life, the queen of immortal bliss."

If there is a fault to be found, and possibly it may be put down to a spirit of carping criticism, one might object to the interpolated arguments and conversations between "The-man-who-did-it" and Llewellyn Drury—these are apt to make one lose the continuity of the story, and they would be equally as forcible and equally as interesting, for they are by no means dull if included as an appendix; and, further, we are left in a condition of uncertainty, and one that was evidently shared by Llewellyn Drury, for he presses his supernatural visitor to recount his experiences in the land of Etidorhpa, but with no success. Of such a nature is the work that one naturally longs for more. One feels that, instructive and entrancing as has been the journey in the underworld, the land of Etidorhpa must be still more inviting, though possibly it would have to partake rather of a speculative character and deal with the fourth dimension of space, the hereafter and moral arguments, for everyone will see from the extract that we have quoted that the title of the work is but Aphrodite spelt backwards.

The book is odd but full of the fire of imagination, as fascinating as any romance by Dumas, not extravagant, and here and there rises to a height of word painting which has been rarely excelled. To the lover of the frothy neurotic novel of the day it is not a work we can recommend, but for one who desires to possess a work into which he can dip and always be sure of present entertainment and food for future thought and speculation, it is the book of the day.

PHARMACY IN FRANCE.*

BY E. C. SPURGE.

The objects of this paper are to sketch briefly some of the conditions under which the French pharmaceutical student obtains his diploma, afterwards to give details of the privileges and protection which he enjoys, and in conclusion to make a few general remarks upon pharmacy in France. The conditions for qualification in that country are prescribed by the Government, which, however, was urged to frame the laws regulating those conditions by the pharmacists themselves.

A would-be pharmacist must spend three years in a pharmacy and three years in a recognised school of pharmacy before he can obtain his diploma. The period of three years in a pharmacy must be completed before the embryo chemist can commence his scholastic training, and those three years are verified by means of periodical registrations. The embryo chemist on entering a pharmacy must register himself as a pupil in pharmacy either at a school of pharmacy or at the office of the Justice of the Peace of the canton. He must be at least sixteen years old before he can commence the "stage," as the three years' period is termed, and he must also produce as a preliminary either the diploma of Bachelier es Lettres or of Bachelier es Sciences (complete). These are required from intending first-class pharmacists; intending second-class pharmacists must have passed either one of the same examinations, or an examination in chemistry, physics, and natural history.

The conditions having been complied with and registration effected, the embryo chemist now becomes a "stagiaire" or probationer, and must renew his registration yearly. At the first registration a certificate is given to the probationer and is endorsed each year. So particular and punctilious are the authorities about registration that when a "stagiaire" leaves a pharmacy and enters another he is required to get a certificate from the employer whom he is leaving, stating the date of his departure, and a similar certificate from his new employer, stating the date on which he entered the pharmacy, and these two certificates have to be produced at the annual registration. If the removal is distant and out of the circuit embraced by the previous registry office, then a fresh registration must be made within a fortnight at the registry office of the circuit into which the "stagiaire" has moved, and an extract of his previous registrations must be produced at the same time. Any period of time passed in a pharmacy which is not registered as described does not count.

After having finished his three years, the "stagiaire" has yet to pass an examination—"L'examen de Validation"—before he can be received as a student of pharmacy. The subjects of this examination are:—

1. Preparation of a compound, either chemical or galenical, selected from the 'Codex.'
2. The dispensing of a prescription.
3. Recognition of thirty plants and of ten medicinal compounds.
4. Questions on various pharmaceutical operations.

Four hours are allowed for the first subject, and half-an-hour for each of the others, and it will be noted that the requirements exacted from a "stagiaire" are much more severe than those demanded from the English apprentice.

Assuming that the "stagiaire" passes the "Examen de Validation" satisfactorily, study at any recognised school of pharmacy may be commenced; of course, the student need not go to college immediately after the expiration of his three years' stage, but can work years in a pharmacy as an assistant if he likes, and this time it is not necessary to register. The student who wishes to qualify can enter either for the—

Diploma of First-Class Pharmacist, or
Diploma of Second-Class Pharmacist.

The period of time required to be passed in a school of pharmacy is the same for each, viz., three years; the course of study is nearly and the subjects are the same for each, but the examination is rather more difficult for the first-class diploma than for the second-class diploma.

Here it would be well, perhaps, to mention that in France there are several kinds of schools of pharmacy. There are—

1. Superior schools of pharmacy.
2. Mixed schools of medicine and pharmacy.
3. Schools in full exercise of medicine and pharmacy.
4. Preparatory schools of medicine and pharmacy.

* Read before the School of Pharmacy Students' Association.

The first two schools mentioned are controlled and supported by the State. The two latter are under municipal control and support. Training for the First-Class Diploma may be obtained at the superior schools, mixed faculties, or at the schools in full exercise, and training for the Diploma of the Second Class either at these schools or at the preparatory schools of medicine and pharmacy. On entering a school of pharmacy the student has to deposit his certificate of registration.

During the three years of study the students have to register themselves every three months in a register kept at the school, thus making twelve registrations during the three years. The first registration is made on entering the school upon production of the *certificate de validation*. This registration having been made, the student can commence his studies.

The scholastic year is from November to the following August, and the subjects for study are distributed as follows:—

First year.—Inorganic chemistry; organic chemistry; physics; cryptogamic botany; general botany; mineralogy; hydrology.

Second year.—Materia medica; inorganic and organic chemistry; chemical pharmacy; general botany; toxicology; analytical chemistry.

Third year.—Zoology; materia medica; galenic pharmacy; analytical chemistry.

It will be noted that galenic pharmacy is not taken up until the third year, possibly because it is considered that unless one possesses a knowledge of chemistry and allied sciences it is impossible to apply oneself to the study of galenic pharmacy with profit. Practical laboratory work is obligatory during the whole three years. Botanising excursions are arranged by the professors at certain times. At the end of each year there is an examination bearing on the subjects taught during the year. The examination is held in August, and if the student does not pass it satisfactorily he can submit himself for re-examination in November when the school re-opens (August to November is the vacation). Supposing the student to fail again then he has to wait till next August for re-examination, and cannot register himself again till he has passed the examination, so that a whole year is lost to him, as he is debarred from taking the next course of lectures and can only do practical work during that time.

In addition to these yearly examinations candidates for the Diploma of the First Class have to pass an examination held in the middle of their last year, and with regard to this examination in case of failure, the same conditions apply as described for the yearly examinations. There are plenty of precautions taken to ensure the candidate putting in all the required time, and also to ensure that the student shall have a good grasp of the subjects taken up each year before being allowed to proceed further with his studies. If a candidate does not understand his subjects, it is not the fault of the persons who framed the regulations just mentioned.

Assuming the student to have passed the school examinations successfully, and that his registrations are in order, he is entitled to present himself for the final examinations. Candidates for the Diploma of the First Class are examined in the school at which they have studied during their third year. Candidates for the Diploma of the Second Class must be examined at the school in whose circuit they wish to open a pharmacy, because pharmacists of the second class can only open a pharmacy within the circuit embraced by the particular school of pharmacy from which they have obtained their diploma, whereas, pharmacists of the first class can open anywhere in France or her colonies. The final examinations are held in August and November, and are three in number.

The first examination is divided into two parts:—

Part I. Practical chemical analysis.

Part II. Oral examination in physics, chemistry, toxicology, and pharmacy.

The second examination is also divided into two parts:—

Part I. Practical microscopy.

Part II. Oral examination in botany, zoology, materia medica, hydrology, and mineralogy. (This second portion of the examination can be omitted in certain cases.)

The third examination is also in two parts:—

Part I. Oral examination on five chemical preparations and on five galenical preparations.

Part II. The preparation of five chemical compounds and of five galenical preparations.

Four days are allowed for this second part, and if the candidate

is rejected in this latter part he has only to present himself for re-examination in it. A candidate who has been rejected cannot present himself again until the expiration of three months at least.

The fees payable by candidates for the diploma of the second class are :—

First Qualifying Examination	50 fcs.
Second ,, ,, ...	50 ,,
Third ,, ,, ...	100 ,,
Materials for Third Examination.....	100 ,,
Three Certificates corresponding to the Three Qualifying Examinations, each 40 fcs.	120 ,,
A Diploma	100 ,,
Total	520 ,,

equal to about £20 16*s*. English money.

The examination fees payable by candidates for the Diploma of the First Class are :—

First Qualifying Examination	80 Fcs.
Second ,, ,, ...	80 ,,
Third ,, ,, ...	100 ,,
Cost of Materials	100 ,,
Three certificates corresponding to the three Qualifying Examinations, each 40 Fcs.....	120 ,,
A Diploma	100 ,,
Total.....	580 ,,

equal to about £23 4*s*. English money. The fees are appropriated by the State.

The actual cost of examination for the Diploma of the First Class is but little more than the cost of the examination for the second class, whilst the advantage of being able to move anywhere is great.

It is much more difficult to obtain a qualification in France than in England, but the French pharmacist appears to be much more protected than his English colleague. A superior diploma of Pharmacist of the First Class is granted, but I shall not discuss the conditions under which it may be obtained, but will turn to consider some of the privileges and the protection accorded to the pharmacist. Recently the French pharmacists have drafted a new law regulating the practice of pharmacy, and this law has passed its first reading. As this new law represents the feeling and requirements of the pharmacists of to-day, and as the conditions relating to qualification are unaltered by it, I shall base many of the following remarks upon its provisions.

At the present time in France the pharmacists have a very decided feeling that they ought to be well protected, and a feeling that their high standard of education and training demands it. One or two quotations from the address of the Commission which presented the new measure will bring forth this point excellently :—

"We (the Commission) have advised the suppression of the Diploma of the Second Class, thinking that the better education one demands the greater is the guarantee of security to the public."

This paragraph at once calls to mind a similar view which is held by many English chemists, and on this point I should like to make a few remarks. Whilst admitting that education is extremely desirable, yet there is a danger that in highly educating a man one is apt to give him a distaste for the trade portion of his business, and conscientiously no one can deny that (in England, at any rate) there is a good deal of the trade element in pharmacy which, in the great majority of cases, must be carefully attended to if success is to be attained. Many French pharmacists feel that the time and money spent in obtaining their diploma does not place them proportionately in such a good financial or social position as that obtained by doctors and dentists. In fact, speaking generally, the profession or calling of pharmacy does not appear to be a particularly happy one ; in Germany and Italy the chemists are dissatisfied ; in England, as you know, we are anything but united or contented. However, the French pharmacists are trying hard to better their position, as will be seen from the following quotation :—

"We, the Commission, have removed from the law everything that could give to pharmacy a too accentuated commercial character. We are all in accord in opposing the exaggerated commercial extension of pharmacies open to the public. All think that there is a better guarantee for patients to come to a pharmacist—a man of science and probity—rather than to one of those large businesses which have, and can only have, no other care than to withdraw from them a rapidly acquired fortune."

With these sentiments many will doubtless agree, and personally I am inclined to favour them, although many objections can be raised against them. Such sentences could easily convey to an English mind that a monopoly was being aimed at, and monopolies are not popular in England. However, they are not regarded with such disfavour in France as in England.

Besides the pharmacists of the first and second classes there are druggists and herborists. The pharmacists alone have the right to sell all drugs and medicaments in medicinal quantities. Herborists can sell fresh and dried indigenous herbs, and in order to be allowed to do that the herborist must pass an examination which has for its object to ascertain whether the herborist can recognise and describe the herbs, and whether he knows the seasons for collecting them and the best methods of drying and preservation. Druggists can only sell simple substances in wholesale quantities, and poisons under certain restrictions. Amongst the provisions of the new law is one which provides that the granting of certificates to herborists is to be stopped after the expiration of five years from the passing of the law.

The herborists being somewhat numerous, and not without some influence, are naturally enough protesting vigorously against this treatment, which would, unless the provision be altered, eventually divert their business into the hands of the pharmacist. Here it may be noted that French people are very fond of buying herbs and such-like simples and making them into infusions termed tisanes ; consequently the herborist often does a considerable amount of business. Dried lime-flowers and mallow are much used for "tisanes."

Each pharmacist must be the proprietor of the pharmacy which he works ; he may not own more than one pharmacy, and neither can he carry on in his shop any other business beside that in drugs and in general medical and pharmaceutical requisites. There are certain exceptions made as to the proprietorship, viz., in such a case as results from the death of the proprietor, the widow is allowed to carry on the pharmacy under the management of a qualified man for a limited time. With regard to patent medicines or "nostrums," at present secret remedies can be made up and sold, provided that the maker of them submits his formula to an official, together with the claims he makes as to the curative properties of the combination.

The official notes of the doses of the substances entering into the composition are safe and proper, and whether there is in the composition anything likely to be deleterious to health. Supposing the preparation to be approved, the official fixes a price at which the remedy is to be sold. The price fixed generally allows a good margin of profit, but varies according to the excellence of the preparation, which seems quite fair. If the new law should be passed, the pharmacist will be able to make up specialties, but as he will be obliged to indicate the full formula of the preparation on the label of each bottle his preparations will cease to be secret remedies.

The French pharmacist, dreading the establishment of company pharmacy, has several clauses devoted to it in his new measure, and of these I will give a brief *résumé*.

"Any association having for its object the working of a pharmacy is forbidden, unless it consist of an association of qualified pharmacists known by the collective names of the partners, and the pharmacy can only be managed by one or more of the partners themselves." Thus a company consisting of Brown, Jones, Robinson and Smith, all being duly qualified men would be a legal company, whilst Brown and Co., where Brown is the qualified man, and the company consists of his mother-in-law and one or more maiden aunts would be an illegal company. All wholesale establishments selling pharmaceutical preparations must be managed by a qualified pharmacist, on whom rests the sole responsibility. The sale of simple substances in wholesale quantities which are used in medicine is free to anyone.

In conclusion I wish to add just a few words on doctors and dispensing. Doctors are not allowed to supply medicines or drugs to their patients, unless there be no pharmacy within six kilometres distance, or the doctor reside six kilometres from a pharmacy and people come to consult him. Exception is made, however, in the case of certain urgent remedies, and a list of such is drawn up by the administration. Chemists cannot deliver to the public without a doctor's prescription simple poisons, compounds or preparations endowed with poisonous properties, and also certain medicaments of which a list is inserted in the 'Codex.' Besides, there are drugs which if contained in a prescription, the prescription cannot be repeated unless the doctor either gives a fresh prescription or writes the word "Repeat" upon the old one and signs and dates the same. The French physician is

required to sign his surname in full on his prescriptions. The regulations relating to the sale of poisons are similar to the English poison regulations, so that I won't trouble you with them.

Respecting the visitations made to pharmacies by the authorities at least once a year, in order to inspect the stock of drugs, the severity of these varies a good deal. A friend told me that in his case the inspector merely looked at the extract of ergot, at the rose water, and at the prescription book, spending the rest of the time in chatting to the proprietor of the pharmacy. There remain many points about which much could be said, but I will only remark further that although the English chemist is below the standard of the French pharmacien in theoretical and scientific training, yet Continental employers frequently speak highly of the workmanlike and finished manner in which the English chemist executes and sends out his work.

PRACTICAL PHARMACOGRAPHY.

CANNABIS INDICA.

Indian Hemp, Guaza; Chanvre, Fr.; Hanf., Germ.; Canama, Sp.

Macroscopic Characters.— The *Cannabis indica* of commerce consists of the flowering tops of the female plant collected when the fruits are forming. The tops are usually compressed or flattened,* from 2 to 3 ins. (50 to 75 Mm.) in length, with

Fig. 1.—Cannabis Indica.—*a*, Young leaf. *b*, Female flower, with linear bract. *c*, Perianth unrolled. *d*, Longitudinal section of ovary. *e*, Fruit. *f*, Ditto, transverse section. *g*, Ditto, longitudinal section.

more or less stem attached to them, and about 2 Cm. in diameter. The bracts and flowers and fruits are more or less agglutinated together by the resin. When the pieces, which are brittle, are broken across, the stigmas and fruits are easily recognised under a lens. The colour of the drug is dark or brownish-green, according to age, the odour is characteristic, and the taste acrid and faintly bitter. The female flowers consist of a single cordate-ovate, hairy, glandular five-veined leaf sheathing around and enclosing the ovary, with two filiform hairy stigmas protruding beyond it; the flower is subtended by a linear-lanceolate tapering hairy bract (Fig. I., *b*, *c*). The ovary is ovoid, smooth, one celled, with a single pendulous ovule (Fig. I., *d*). The fruit is about $\frac{1}{8}$ in. (3 Mm.) long, oval, and compressed, the brownish-grey, faintly reticulated pericarp separating into two valves on pressure. The seed completely fills the fruit and contains a curved embryo peripherally placed, so that it almost surrounds the oily albumin (Fig. 1, *e*, *f*, *g*). The leaves, or rather fragments of leaves, are scabrous with curved rigid hairs. The structural details of the flower and fruit are given by Bentley and Trimen, 'Med. Pl.,' vol. iv., pl. 231.

* The drug usually met with in English commerce is imported from Bombay; a much more active form of the drug, in more cylindrical, not flattened, pieces, is occasionally imported from Calcutta.

Microscopic Characters.—The transverse section of the leaf shows a layer of large epidermal cells below the cuticle, and a single row of long palisade cells, occupying about two-thirds of the thickness of the leaf (Fig. 2, I.). There are stomata only on the under surface of the leaf (Fig. 2, II.). The hairs of the leaves are one-celled, and swollen at the base (Fig. 2, I., *h*), which is sunk in the tissue below

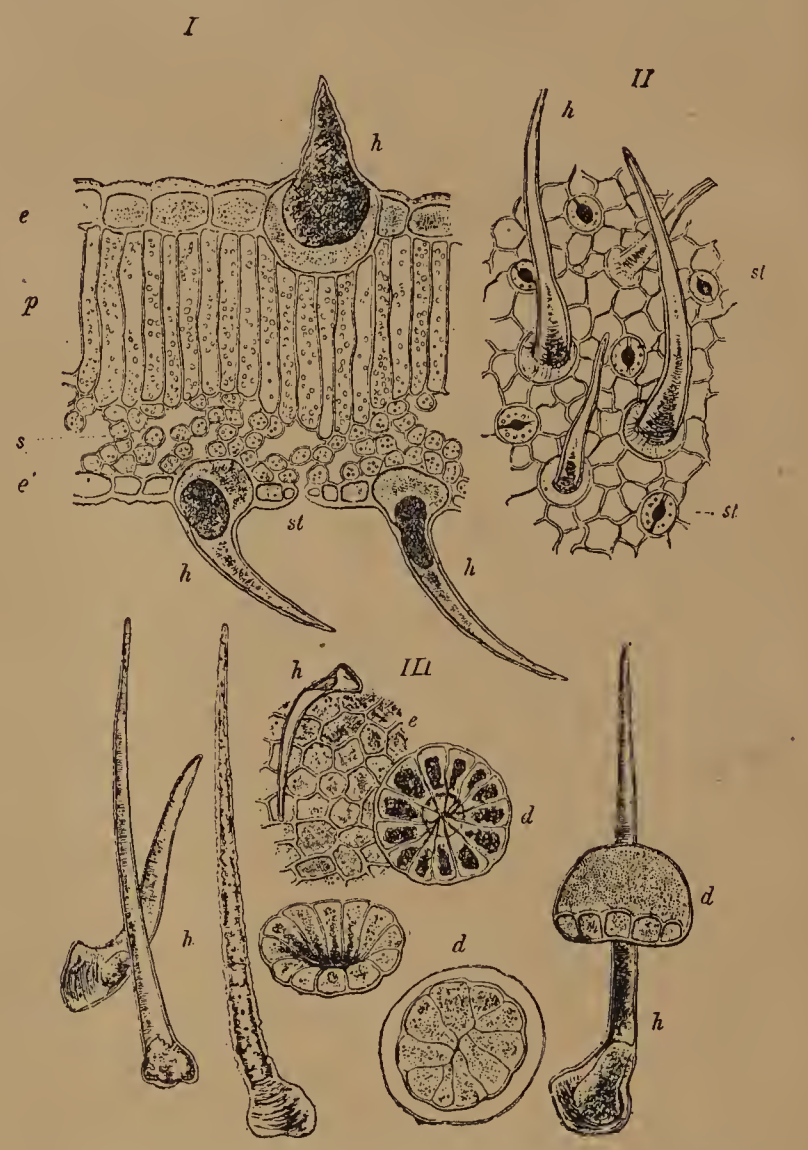

Fig. 2.—Cannabis Indica.—I. Transverse section of leaf. II. Lower epidermis showing hairs and stomata. III. Hairs (*h*), and glands (*d*). After Vogl.

the epidermis. The hairs contain a cystolith suspended from the upper part of the cell. The hairs are shorter and thicker on the upper surface of the leaf. On the flowers and bracts are found sessile and stalked glands (Fig. 2, III., *d*), which are here more numerous than on the stem. These contain a secretion which is either a colourless oil or a brownish-yellow resin. These features will serve to distinguish it from any other official drug, whether whole or in powder.

Hydrargyrol.—Under this name Gautrelet has recommended the use of mercuric paraphenolsulphonate, $C_6H_4 \cdot OH \cdot SO_3 \cdot Hg$, as an antiseptic. The salt is prepared by dissolving mercuric oxide to saturation at 100° C. in paraphenolsulphonic acid, and evaporating to dryness. It forms brownish scales having a peculiar aromatic odour, and a neutral reaction, readily soluble in water, and in glycerin, giving ruby-red solutions. It precipitates alkaloids and basic toxines, but does not coagulate albumin, the latter being a very important property. Its toxicity is much less than that of many antiseptics, being seventy-five times less toxic than mercuric chloride. It is stated to be very efficacious as a germicide and antiseptic.—*Les Nouveaux Rem.*, xiii., 718.

MEMBERSHIP OF THE SOCIETY.

THE charge made by Mr. GIBBONS in his letter last week (see p. 21), that the nature of the meeting of pharmacists at Manchester was "misrepresented" in this Journal, and that ideas were applied to those attending the meeting "which they never entertained," is in itself too serious to be passed over in silence, especially since inquiry into the matter has shown that there is no foundation whatever for Mr. GIBBONS' complaint. Our reporter states that the day following the meeting he read over to Mr. GIBBONS his report of the resolutions, so that he might have the opportunity of making any correction that was requisite.

Mr. GIBBONS is correct in his conclusion that our information respecting the meeting was derived from the report published at page 575, but his statement that the report was "most inaccurate and misleading," is utterly without foundation. The one circumstance he points out as being an illustration of the alleged inaccuracy, does not in the least degree support his statement, as will be seen on comparing the resolutions as given in our report with the version of them in Mr. GIBBONS' letter. The words in both are with one exception the same, the only other difference being the order in which they are placed, and the purport is absolutely the same in both. The one verbal difference is that the term "chemists and druggists" is used in the reported resolutions, while Mr. GIBBONS' version gives the term "associates" as having been used at the meeting. This is a difference so obviously insignificant that we can only express surprise at such a quibble being resorted to for the purpose of attempting to make out an indefensible charge of inaccuracy in the report.

Our representation of the nature of the meeting over which Mr. GIBBONS presided was that it manifested total want of acquaintance with the subject discussed by the speakers, and the letters of Mr. GIBBONS and Mr. SARGEANT may be referred to as fully supporting that statement.

The principle stated by Mr. GIBBONS to have been advocated at the meeting, viz., that of chemists and druggists as associates being eligible as members of Council, is contrary to the spirit and terms of the Society's Charter, according to which members only can hold that position, and the meeting evidently overlooked the fact that eligibility as a member of Council pre-supposes membership of the Society. The resolutions passed at the meeting are therefore self-contradictory, and in themselves as much evidence of deficient acquaintance with the subject as the confusion of the title pharmaceutical chemist with membership of the Society. The notion that admitting Minor men to membership would be prejudicial to pharmaceutical chemists, or lessen the inducement to take that qualification, has no other foundation than erroneous conceptions of those positions and disregard of facts. At the present time there are nearly four thousand chemists and druggists entitled to membership of the Society, and many of them hold that position without detriment to the Major qualification, the value of which rests upon an entirely independent basis, and is in no way determined by membership of the Society. In regard to that point, therefore, the views expressed by Mr. GIBBONS and his friends are entirely erroneous.

Similar evidence of want of knowledge of the circumstances referred to at the meeting was afforded in other respects. Neither Mr. GIBBONS nor any of the other speakers seem to have been aware that one great object of the Society has always been to bring all chemists and druggists throughout the country into one united body, as well as to secure the qualification of everyone engaged in the business. The latter condition has been realised by the Act of 1868, so far as the public interest requires protection, but without regard for the interests of chemists and druggists, the protection and promotion of which can be effected only by that collective action for which membership of the Society affords opportunity. The national organisation of chemists and druggists, from a public point of view, has yet to be followed up by their more extended incorporation for purposes of self-protection and the advancement of their craft, purposes which are as necessary for pharmaceutical chemists as for chemists and druggists. On this point reference to some of the articles which appeared in this Journal thirty years ago would afford useful instruction as to the principles by which admission of members to the Pharmaceutical Society should be regulated, notably one dealing specially with that subject [2], viii., 617. The fact has probably been overlooked that the discussion of this same question of membership then attracted considerable attention. The views put forward at the Manchester meeting were then propounded, and they were at the time shown to be as untenable in principle as they were illiberal and impolitic. Even then the establishment of compulsory qualification was regarded from the point of view of trade organisation as an ample equivalent for extending eligibility for membership, because it would lead to the end aimed at from the beginning.

Subsequent experience has shown that the views then held by the Council, and by a large majority of members of the Society were just and reasonable. Though it is matter for regret that chemists and druggists who were in business before the passing of the Act have not joined the Society to such an extent as might have been expected, notwithstanding the urgency with which they put forward their claim for incorporation, the case is different as regards those who have since then obtained the compulsory legal qualification by examination. A very large proportion of them have become connected with the Society as associates, and the aggregate as well as relative increase in that section of the Society has become so considerable that the claim now made for equal representation as members cannot be disputed. By that means opportunity would be afforded for making the Society thoroughly representative and more influential for dealing with matters in which the entire body are interested.

ANNOTATIONS.

THE APPRENTICESHIP SYSTEM IN PHARMACY is the subject of a pithy note in the *Spatula*, in which reference is made to the fact that, on this side of the Atlantic, it is preferred that shop experience should be obtained before attendance at a college of pharmacy. Without discussing that point, however, the editor of our sprightly contemporary expresses the opinion that where a young man is taken into a pharmacy as an apprentice or pupil, the pharmacist should insure that the student is directed in such a course that he may imbibe right ideas and methods. At the same time, it is desirable that the youth should be impressed with the idea that, no matter how trivial the work he is engaged on, it should be done with care, and that accuracy and intelligence should invariably mark the work of the pharmacist. The *Spatula* is undoubtedly right in this matter, for whatever is worth doing is worth doing well, even to the training of apprentices. The pharmacist—who, above all, should cultivate precision in all that he does—must obviously not neglect the inculcation of a similar spirit in those he has, directly or by implication, undertaken to teach the art of pharmacy. The degradation involved in utilising apprentices merely as a source of cheap labour is pitiful in the extreme, and the harm done to pharmacy as a profession by such practices is incalculable.

ATTENDANCE AT DAY CLASSES IN CHEMISTRY AND BOTANY is, we must reiterate, the best solution of the apprenticeship problem, and such attendance ought to be rendered compulsory by a clause in the indentures or agreement drawn up and signed at the outset of the youth's business career. Having attended classes in chemistry and botany regularly, and worked systematically at those subjects, during three years or more, whilst making a practical acquaintance with materia medica and pharmacy proper during the hours of shop service, the student would be in a condition to reap the utmost advantage possible from a systematic college course, prior to presenting himself for the qualifying examination. This college course ought to be regarded as essential in any case, the class work during apprenticeship being designed to preserve the continuity of the habit of study between leaving school and entering the college, whilst also preparing a substantial foundation on which the knowledge attained as the result of subsequent work may be based. The object of systematising studies during apprenticeship is not to open a "short cut" to qualification as a chemist and druggist, but to secure the reality of the knowledge on the strength of which that qualification is granted.

PROFESSOR REMINGTON IS QUITE JUSTIFIED in expressing doubt as to the efficacy of examinations as educating mediums. At best, they can only serve as tests of education, and bad tests at that. But, as he also remarked when addressing his students on the subject of his European experiences, examinations have become a necessary evil, throughout the United States no less than in Great Britain, since so many institutions in both countries allow examination to be the only test of education and technical training. But, as the test of examination is defective, it is incumbent upon all who are interested in the progress of pharmacy to do their best to minimise the evil that admittedly exists. The only absolute remedy that suggests itself is a compulsory curriculum of study, candidates for examination being required to present a certificate proving that they have studied the specified subjects for a certain period, attending lectures and courses of laboratory instruction in recognised institutions. Unfortunately, the absolute remedy appears, for the time being, to be as difficult of application as absolute perfection in anything is difficult of attainment. The Legislature bars the way, and too many chemists and druggists support the Legislature in so doing. But a similar result could be achieved, without invoking legislative interference, if only every chemist in business were true to his craft, and steadfastly resisted the insidious temptation to sell his birthright for a mere mess of pottage.

A VOLUNTARY CURRICULUM is quite possible, even if only a large majority instead of all chemists and druggists agree as to the desirability of improving and extending the scope of existing educational facilities. Let each one (1) decline to take an apprentice or pupil who has not passed a scholastic examination, the certificate of which will be accepted by the Pharmaceutical Society's examiners; and (2) in drawing up an indenture or agreement, insist on a clause binding himself, on the one hand, to allow the youth to attend suitable day classes, whilst on the other, compelling the apprentice to pass through a systematic course of instruction during the three or more years of his term of service. In last week's Journal it was suggested that local pharmaceutical associations might, with advantage, take the lead in this matter—first, by passing formal resolutions declaring the desirability of taking the proposed steps; next, by proceeding, in conjunction with other associations, to devise a satisfactory scheme for carrying the resolutions into effect. Several associations are now devoting attention to the systematisation of their educational arrangements, and the suggestions repeated above are commended to their careful consideration. For, no improvement that can at present be effected in pharmacy is likely to be productive of such far-reaching effects as the voluntary imposition of a curriculum of study, and the time appears quite ripe for the purpose.

"FELLOW OF THE PHARMACEUTICAL SOCIETY" is a title that seems to possess an attraction for many of our readers, and if the conditions existed, or were likely to exist, which would render such a title of any real value, the question of its adoption might be expected to demand serious consideration. But though it might be a comparatively simple thing for the Society to secure Parliamentary powers, enabling pharmaceutical chemist members to style themselves "Fellows," it is far from certain that the privilege is worth asking for. There are Fellows and Fellows—Fellows of universities or colleges which confer the title after a prolonged curriculum of study, supplemented by examination, and Fellows of so-called learned societies, who obtain admission without much trouble after nomination and payment of certain fees. For the Pharmaceutical Society to grant fellowships at the present time would be practically to reduce itself to the level of the latter, and the title would be regarded as a mere tinsel decoration, bringing no credit to the wearer and laying him open to scorn rather than increased respect. But when, if ever, a real curriculum of study precedes examination for the pharmaceutical qualification, in all cases, the question of a higher title may again be brought forward by those who are interested in it, with a much greater prospect of making their views prevail. Meanwhile, however, they would do well to possess their souls in patience, and help in the good work of familiarising the minds of all their friends and acquaintances with the idea of a proper curriculum of study for everyone engaged in the practice of pharmacy.

As The Pharmacy Ball will be held on Wednesday week, those who are desirous of acting as Stewards should lose no time in sending in their names to the Hon. Secretary, Mr. William Warren, 24, Russell Street, Covent Garden, W.C. Attention is directed to a list of the names already sent in, which appears in the advertisement pages of the Journal this week (p. 3).

Trade Protection is becoming more and more a necessity of the times, but a fear that movements in this direction are not quite "the correct thing" has probably been influential in preventing many chemists and druggists from resorting to combination for such a purpose. They may feel reassured, therefore, on learning that Mr. De Rutzen, one of London's most prominent magistrates, has recently expressed the opinion that to form an association for the purpose of protecting a trade in which the members are interested is "a very natural and proper thing to do." The case in connection with which this remark was uttered was an action by the Bacon Curers' Association of Great Britain and Ireland against the Junior Army and Navy Stores (Limited), for selling a Canadian ham as Irish. The magistrate, in giving judgment for the plaintiff Association, pointed out that it had to compete against the whole world, but if the Association's competitors was to include an institution carried on by fellow-countrymen, who carried on trade in such a manner as had been disclosed in this case, he thought there was every reason to be satisfied with the assistance afforded by the officials of the Association is getting up the case.

A New Variety of the Victoria Regia has been grown at Kew this year. It was raised from seeds received from Philadelphia, and is described in the *Kew Bulletin* as differing from all other forms in the pale green colour of its leaves, of a rich red underneath, the turned-up rim, which is from six to eight inches high, the absence of spines on the calyx lobes, and the time when the flowers expand, which is early in the afternoon instead of about six o'clock. It also grows with extraordinary vigour, and flowers more freely than the type. A second plant sent from Kew to the Royal Botanic Gardens, Glasnevin, is stated to have shown the same characteristics.

'The Model Engineer and Amateur Electrician,' published by Messrs. Dawbarn and Ward, Ltd., 6, Farringdon Avenue, E.C., is a new monthly journal, published in the interests of amateurs who take up mechanical or electrical work as a hobby. It differs from existing journals in being exclusively devoted to mechanics and electricity, and a special feature is made of original working drawings and high-class illustrations. The contents of No. 1 (price 2*d.*) include the first of a series of illustrated interviews entitled "Model Engineers and Their Work," and illustrated articles on "The New Wireless Telegraphy," "Design for a Model Goods Waggon," "How to Make a Useful Bichromate Battery," "Lathe Screw Carriers," and "The Construction of Small Dynamos and Motors." There is also a column devoted to "Workshop Wrinkles and Recipes," and particulars are given of a new system of "Queries and Replies." Several attractive prize competitions for amateurs are announced, which should be of interest to both mechanical and electrical workers.

The Cricket as a Thermometer is the latest scientific novelty, a correspondent of the *American Naturalist* being responsible for the suggestion that the chirps of this irritating insect might be utilised as a temperature indicator. Though an individual cricket chirps with no great regularity when alone, particularly in the daytime, when great numbers are chirping together at night the regularity of the function is described by this observer as astonishing. In fact, the crickets—of what species or genus is not stated—are said to chirp synchronously under those conditions, keeping time as if led by the wand of a conductor. Moreover, the rate of chirp seems to be entirely determined by the temperature, and this to such a degree that one may easily compute the temperature when the number of chirps is known. At 60° F. the rate is 80 chirps per minute, at 70° it increases to 120 per minute, whilst below 50° the crickets have no energy to waste in music (*sic*), and the number of chirps falls to 40 per minute. The relation between temperature and chirp is thus expressed:—Let T stand for temperature, and N the rate per minute. Then, as—

$$T = 50 + \frac{N-40}{4}$$

the temperature when the concert of crickets attains 100 chirps per minute should be—

$$T = 50 + \frac{100-4}{4} = 65°.$$

This is very interesting and may be quite true, but what is to be said of the marvellous powers of observation implied in the statement that, when great numbers of crickets are assembled together, "the resting spells of individuals are unnoticed, but when the latter recommence they not only assume the same rate but the same beat as the rest of the field"? Of a surety, the American naturalist is a remarkably observant individual, and most painstaking in his efforts to carry conviction into the minds of others.

A Case of Poisoning by Carbolic Acid, taken in mistake for rum by a woman at Redcar, is one of the latest incidents in the unchecked career of the deadly fluid. It is almost needless to say that the bottle containing the poison was not labelled. A sufficiently convincing statement of facts for anyone who does not happen to be a Privy Council official has been published by Dr. A. E. Harris, Medical Officer of Health for Islington, who, in a report to the local vestry, has directed attention to the unrestricted sale by grocers and others of carbolic acid, and its free distribution by sanitary authorities, with the result that deaths from this poison have increased from one in 1864, to 201 in 1894, and 258 in 1895, 224 of which, according to the Registrar-General's last-published report, were suicides. Carbolic acid, as Dr. Harris points out, can be purchased as easily as milk at present, and it is declared to be essential, in order to prevent the increasing number of accidental and suicidal deaths from this poison, that restrictions should be imposed upon its sale.

A Novel Adulterant of tincture of rhubarb was indicated by the results of an analysis recently undertaken by Mr. A. H. Allen, of Sheffield. At the Skipton Petty Sessions on Saturday last, John Henry Edmondson, grocer and drug dealer, of Barnoldswick, was summoned, on the information of Mr. A. Randerson, inspector under the Sale of Food and Drugs Act, for selling adulterated tincture of rhubarb. It was proved that a sample obtained from the defendant's shop contained 31·44 per cent. of alcohol, 8·90 of glucose, 7·07 of other extractive matters, and 52·59 per cent. of water. The sample thus contained only about two-thirds of the alcohol that ought to have been present, according to the British Pharmacopœia, whilst the analyst pointed out that the addition of glucose is neither necessary nor useful, and that the sample in question was the first he had met with containing such an adulterant. The defendant, who fainted in court during cross-examination, possibly at the thought that he had added glucose unnecessarily, was fined 20*s.* and £1 4*s.* 4*d.* costs. This is probably a record price for glucose.

SOCIETY OF ARTS.

THE PRODUCTION OF COLOUR BY PHOTOGRAPHIC METHODS.

BY SIR HENRY TRUEMAN WOOD,
Secretary of the Society.

(*Concluded from last volume, page 115.*)

These pictures (Lippmann's) are of marvellous brilliancy and beauty. The colours appeared to be rendered with great accuracy. Unfortunately, they are by no means easy of production, nor are they capable of reproduction as ordinary photographs are. They can be seen by the naked eye, or better when illuminated by a powerful lantern and projected on a screen, but they are only visible as coloured pictures when viewed at a certain angle; looked at directly, or by transmitted light, they show no colour at all. For exhibition in the lantern, they are best seen when specially mounted, with a thin prism in front of them, in order to reflect away light falling on the surface of the glass, and to allow only those rays to reach the eye which are reflected from the surface of the picture itself.

Under these circumstances it is evident that while M. Lippmann's beautiful discovery must always be regarded as of the highest scientific interest and value, it is not, in its present state, likely to be turned to any practical account. What its future development may be nobody can say. As a matter of fact, I believe not very many of them have been made, and those chiefly by M. Lippmann himself, and by the brothers Lumière, who first succeeded in making gelatin plates sufficiently transparent for the purpose. M. Lippmann's first results were all obtained on films of collodion or albumin.

The difficulty of obtaining colour pictures by any direct process has led various inventors to try and discover methods by which the difficulty might be evaded. If several pictures could be taken, each showing the proper tone and gradation of one of the primary colour sensations, and these pictures could be combined into one, it is not unreasonable to expect that a picture with all the colours of nature would be the result. Such is the idea on which Mr. Ives has developed the very beautiful instrument which he calls the photochromoscope, an instrument which beyond any question gives us very vivid and beautiful representations of coloured objects. Mr. Ives has not been alone in his work, few inventors have, but as I believe he alone has succeeded in carrying his ideas into practical shape, I think the full credit of the invention is due to him, especially as he has always, in his published papers, shown the utmost readiness to admit the claims of other workers in the same field.

There is the less reason to describe his apparatus and method at length, inasmuch as he has already given full descriptions of it to the Society; indeed, it was here that the invention was first introduced to an English audience. I may, therefore, content myself with saying that he takes three pictures of his subject, through three coloured glasses, red, green, and blue. He thus obtains a picture formed by the red, green, and blue (or rather blue-violet) rays of light. This picture, remember, is just an ordinary photographic negative taken by light of a particular colour. It has no colour of its own. If now we take a positive transparency from each negative, and illuminate it by its own proper light, we get what we may consider the red, green, or blue image, the version of the original we should get by looking at it through red, blue, or green glass. If, further, we combine these images together, we shall get the effect produced by looking at the original through white glass, that is the original with the colours of Nature—always supposing our coloured glasses are so selected as to give, separately and in combination, the actual colours of Nature. The photochromoscope is an instrument in which, by means of suitable reflectors and coloured glasses, this is done. The three monochrome pictures are each illuminated by its appropriate coloured light, and the three coloured images thus produced are reflected through a single lens, and form a single picture in the eye. By suitable modifications they can be projected by the optical lantern on a screen, and made visible to a large audience.

Another method for producing similar results has also been brought out by the same inventor. Having obtained his three positives as before—this time on films of gelatin or other suitable material—he dyes each film of a colour complementary to that by which the negative was taken, viz.:—lemon yellow complementary to the blue-violet, cyan-blue complementary to the red, and magenta-pink complementary to the green. He then superposes the films one upon the other. On viewing them by transmitted light we get a picture in all its proper colours. The reason for using complementary colours is obvious when we remember that we have here a case of absorption, whereas in the photochromoscope we have a mingling of coloured lights. If we look through blue and yellow glasses superimposed, we get green. If we combine the light passing through separate pieces of blue and yellow glass, we get white. This method has the advantage that it does not require a special apparatus for its exhibition, but I understand there are certain difficulties in carrying it out practically which prevent its becoming as useful as it is certainly promising. At all events, Mr. Ives himself seems to prefer the more complicated method I have previously described.

A very ingenious method has been proposed for printing the three colours on a single film. This depends on the fact, discovered by Messrs. Cross, Bevan, and Green, that certain of the coal-tar colours are sensitive to light.*

When a fabric, stained with one of these "diazo-derivatives," is exposed under a positive transparency, the parts acted on by light lose their power of combining with certain colouring matters (naphthols, phenols, etc.) and remain unchanged, while the shaded parts are dyed, the colour depending on the particular reagent employed. To produce a coloured transparency from three negatives, first, the blue-printing negative is printed in a blue colour (to obtain this, the ferro-prussiate process is used, the diazo-compounds not giving a good blue), then the film is treated with the diazo mixture for producing red, and a print taken from the "red" negative. This combined print is again sensitised with the mixture for producing yellow, and a print from the "yellow" negative taken. The result is said to be a positive in natural colours. Three negatives are required, and three printings, but only one film. One defect in the process is stated to be that the prints fade when used in the lantern, and this is likely to be the case, for the coal-tar colours (or, at least some of them) bleach very rapidly in a strong light.

An obvious objection to Mr. Ives's process is the necessity for using three separate pictures. Dr. Joly and some other inventors have endeavoured to get over this objection by using a single variously-coloured screen composed of fine coloured lines, taking the picture through that, and backing up the finished positive with a similar screen. One would hardly have expected good results from such a process, and yet it does give very fair results. The effect of colour is well produced, but the picture itself shows the grating, and suggests rather a print from a coarse process block than a direct photograph. I have not, however, had an opportunity of seeing many examples, and I believe very few have been publicly exhibited.

We now come to what is, I think, the latest development of colour-photography—the very interesting process of Mons. Villedieu Chassagne, a process which a fortunate accident some time ago brought to my notice, and one which is, I think, of sufficient importance to justify its being brought before the Society even in its present stage.

The actual inventor of the process, I am told, was Dr. Adrien Michel Dansac, and it was worked out jointly by him and Mons. Chassagne; but the illness of the former incapacitated him from pursuing his researches, and the matter was left in Mons. Chassagne's hands alone.

There is this difficulty in the scientific discussion of the subject, that the process is in part a secret one, and it is impossible to regard it with quite the same interest as a process which one can follow out from beginning to end, as was the case with those other methods with the consideration of which we have previously been occupied this evening. Nevertheless, you will understand that I do not think that we have any reason to complain of an inventor who quite reasonably retains in his own hands the secret of his invention in order that he may reap from it his perfectly fair and legitimate profits. But if we admit the inventor's right to reticence, he must admit ours to suspended judgment. He must be content to submit to the severest examination and cross-examination. He must not expect to have any of his statements accepted until they have been verified by independent evidence or

---

* Mr. Cross and his colleagues described the process in a paper read before the Society in January, 1891 (*Journal*, vol. xxxix., p. 150). Mr. Bothamley gave an account of this three-colour printing process, in *Photography*, June 4, 1896. According to his statement, it was devised by Messrs. Lumière and Segewetz.

supported by independent testimony. Let me add that there is a special difficulty in the way of a honest inventor in this particular subject, because so many pretentious schemes for the production of photographs in colour have been at different times foisted upon the public.

It is a matter for sincere regret that the publication of scientific advances should so often be hindered by commercial considerations. But we cannot help this. We must take things as we find them, and it would, I think, be foolish of us to refuse to avail ourselves of limited information because full information is withheld.

Regarding the matter in this light, I have very much satisfaction in being able to bring before the Society a process of extreme interest and great promise, and I do not hesitate to express the opinion that on the whole we ought to feel ourselves greatly indebted to Mons. Chassagne for letting us even as far as he has into his secrets. Few inventors are so liberal as he has been, and I hope it may not be long before he may be in a position to disclose the whole of his process, and give photographers the opportunity of working it out thoroughly for themselves.

The process, so far as we know it, is as follows:—A negative is taken on an ordinary gelatin plate, which has been prepared by treatment with a solution, the ingredients of which are unknown. The negative thus obtained shows no trace of colour, and appears in all respects like any other photographic negative. From it a print is taken on ordinary albuminised silver paper, which has been treated with the before-mentioned solution; or if a transparency is desired, on a gelatin plate prepared in the same manner as that which was used for the negative. This print shows no trace of colour either by reflected or transmitted light. The print when dry is washed over with the solution, and is afterwards treated successively with three coloured solutions—blue, green, and red—the operation being conducted in a bright light. As the solutions are applied the print gradually takes up its appropriate colours, the intermediate tints being, it is supposed, produced by a mixture or combination of the three primaries. That a yellow colour should be produced by a combination of what are presumably green and red pigments is not in accordance with expectation, for though red light and green light when superimposed produce yellow, we do not get yellow by mixing red and green colouring matters. Probably the yellow is produced by the application of a yellow dye mixed in the green solution, and not by a combination of colours.

It is to be noted that the process is not one for the direct reproduction of natural colours. It is rather one for treating a photographic print in such a way that it enables it, one might say, to automatically paint itself, to take up in the proper parts the colours which are required, rejecting them in the parts where they are not required. How this is effected is at present a mystery, and perhaps with the limited amount of information available it is not worth while speculating upon it. How a monochrome negative can confer on a monochrome print this power of selective absorption has yet to be explained. I can offer no suggestion on the subject. I am informed that a negative of a special character is required to produce the coloured positives, and that is all I know about it.

The results certainly are produced, and there seems no reason to doubt the good faith of those who state they were produced in the manner described. Of course when we are thus asked to accept facts without receiving an explanation of them, we require, as I said before, very strong evidence that the facts are genuine. Examination and experiment, so far as they have yet gone, have thrown no doubt on the statements made, and the inventor, I wish to say most distinctly, has offered every facility for inspection so long as the secret of his materials is respected. Sufficient time has not elapsed for crucial tests to be made, but we may reasonably expect that the process will stand those tests as well as it has those to which it has been submitted.

I have myself seen the colours applied in the way I have described, and the promised results produced. Mr. Herbert Jackson and myself took negatives on Mons. Chassagne's plates of various test objects. Mr. Jackson was afterwards kind enough to make some positives from these plates, and neither negative nor positive was touched, or I think seen, by Mons. Chassagne, until we placed them in his hands that they might receive their final treatment. On the application of the colouring solutions, we saw that the proper colours were produced.

Photographically, the results we obtained were very poor; the prints were extremely thin and unsatisfactory, as was not to be wondered at, since the negatives were taken on a dull foggy day. Nevertheless they showed a great deal more than traces of the proper colours. A blue china vase, with a piece of red ribbon tied round it, and containing a bunch of flowers, was reproduced with perfect accuracy, though the image was thin and faint. An Indian brass pot showed not only the yellow colour of the brass, but also distinctly metallic lustre. Altogether I can only say that the results of these experiments, so far as they went, satisfied myself, and I think the others who saw them, that the results were produced in the manner described. Were it not for the novelty of the process, and the difficulty of accounting for its results, it would be accepted without hesitation. Whatever hesitation exists is after all but a testimony to its importance.

I have been taken to task, by some of my friends, for accepting results so remarkable without evidence more substantial. I can only say that I think any of you who saw the process carried out would have arrived at the conclusions at which I arrived. All evidence is a contest of opposite improbabilities. It seemed to me more probable that the colours were produced in the manner stated than that the prints were first painted by hand, then bleached, and then the colours restored under my eyes, by the application of some mordant; or that the operator who seemed to be sluicing and dabbing his colour all over the print, was really painting it on in the proper places. I can think of no other alternative. Still I freely admit I shall myself like further proof. I look forward shortly to being supplied with the materials, and I shall not be absolutely happy until I have myself produced something which—however inferior it may be to the very beautiful examples we have here to-night—shall yet show the colours of an original subject taken by myself.

In a secret process such as this it does not seem worth while to speculate. First, because it is a waste of time guessing how results are produced that we may expect to have fully described to us in a short time; and, secondly, because it does not seem fair to use information published by an inventor for the purpose of finding out the nature of his invention and robbing him of the reward of his work.

I should like, however, to draw your attention to some more or less recent researches which indicate what has been done by workers in the same field, since they may help us to realise what probability there is of success being attained by this, or some similar process.

All I think are based on the process of Becquerel, to which I referred in an earlier part of this paper. Now very much depends on the manner in which the colour of the Becquerel films is produced; whether they are pigmentary or interference colours. If the latter is the case, the only hope for success is on the track which has been so successfully followed by M. Lippmann. If the former, there may be some hope by chemical treatment of so developing or reinforcing the colours as to produce results such as those we have seen this evening.

In an elaborate paper by Otto Wiener, to which my friend Mr. Bolas has drawn my attention, a method is suggested for distinguishing between interference colours and actual pigmentary colours, depending on the fact that interference colours change with the angle of view, while pigmentary colours do not. When tested by this method it was found that colours obtained by Becquerel's method on chlorinised silver plates were due in the main to interference, but that when chloride of silver in a flocculent mass was used the coloration was pigmentary in its nature, and the same colour was observed by reflected or transmitted light.

Up to the present no explanation has been offered why any coloured compound should correspond to the rays which produced it. But Wiener somewhat boldly hazards the theory that there is a potentiality of producing various coloured bodies in the action of light. He suggests that any given colour tends to survive under a radiation corresponding to itself, because it best reflects that radiation, absorbing it least, and being therefore least affected by it. In fact, he lays it down as a probable general law, that coloured illumination acting on suitable material generates pigmentary bodies of corresponding colours. The theory is interesting, and would answer many questions if it could be substantiated, but at present I know of no evidence by which it can be supported.

The chemical treatment of the Becquerel film has been attempted by very many. Success has been frequently announced, but very rarely attained. The most recent publication on the subject is contained in a paper brought by Mons. A. Graby before the Paris Academy of Sciences, an abstract of which, translated from the *Comptes rendus*, appeared in the *Photogram* for the current

month. An exposure is made on the surface of silver chloride in contact with various re-agents. So far as can be gathered from the abstract, it appears to be assumed that red, blue, and yellow sub-chlorides of silver exist in the film, or are produced in it by the preliminary exposure which is made before the exposure to the coloured image. The author appears to argue that the coloured chlorides are preserved in light of their own colour, and are destroyed or converted, by light of another colour acting on them in the presence of the re-agents specified. That chloride of silver can be obtained in a condition showing strong colours we know from the researches of Cary Lea in 1887, researches which attracted a great deal of attention at the time, but have not borne much fruit since.

In the year mentioned, he announced that the haloid salts of silver (chloride, bromide and iodide) could be obtained, by chemical treatment, of various colours, red, purple, and blue. Whether these "photo-salts," as Cary Lea termed them, are definite chemical compounds, or whether they are not of the nature of "lakes" (organic colouring matters precipitated in the presence of a metallic base, generally alumina) "physical combinations of unaltered haloid with the reduction product" (Meldola) is, I believe, still an unsettled question. If these photo-salts are of this character, and if they have the power of combining with colouring matters of their own hue, and if again a process for practically utilising these properties can be worked out, it is conceivable that pictures such as Becquerel produced might—if I may be allowed the expression—be so reinforced by the addition of colouring matters as to be turned into permanent coloured pictures. This, indeed, is mere speculation, and rather crude speculation, for it assumes a very great deal more than we have any right to assume.

At all events, we know that a certain amount of colour can be produced on films of silver chloride, and it is at least conceivable that the condition to which the chloride is brought when it shows colour, is also a condition which enables it to combine with colouring matters, though at present I do not know of a particle of evidence, apart from the evidence afforded by the pictures we have before us this evening, to justify such a proposition. However, we have much to learn on the subject of colour, and I believe M. Chassagne's invention will open up a fresh field for research to those who, like our Chairman, have added so much to our knowledge of photographic theory. I hope that Captain Abney will investigate the problem for us, and that before long he may give us a full and consistent theory of the whole subject. When he does, he will, I imagine, have added a good deal to our knowledge, not only of photography, but of the science of colour.

That the process is capable of very considerable development, I think can hardly admit of much doubt. The colours in themselves are capable of much improvement. The merits of the productions, you can, however, estimate for yourselves from an inspection of the very large number of examples which, by M. Chassagne's courtesy, I am able to show you this evening. The great bulk of them have been prepared during the past three weeks for the illustration of this paper, so that it is evident they can be produced rapidly, and I am informed that their actual cost is very moderate. I think, therefore, that we have here a process, even in its present condition, of considerable practical value, and one capable of producing results more likely to be turned to practical account than any other which I have seen.

The last things I hope to show you this evening are some photographs in colour produced by Mr. Bennetto, of Newquay in Cornwall. Mr. Bennetto tells me that he has been at work for many years upon the subject, and that he would have preferred to have delayed, until he could carry his researches to a further extent, the publication of the results he has obtained. Circumstances led to their publication last year, and as they were only shown to a limited number of persons in Cornwall, a good deal of incredulity was expressed in the technical papers, both as to the results themselves and as to the manner in which they were obtained.

Mr. Bennetto has not yet published his process, but he has kindly undertaken to show some of his results this evening, and this will be, I believe, their first public exhibition. I must allow them to speak entirely for themselves, but I am sure you will agree with me that we are greatly indebted to Mr. Bennetto for showing us the pictures; and, personally, I feel very much obliged to him for enabling me to make this communication as complete as it is by the inclusion of at all events, a reference to what, however they may be produced, are, without any question, among the very latest attempts to solve the problem of obtaining photographs in colours.

Wild, Sydney.
Windemer, Oscar Roxburgh.

EXETER ASSOCIATION OF CHEMISTS.

At the annual meeting, on Tuesday, January 4, Mr. J. Hinton Lake, President, in the chair, the following officers were elected for the ensuing year:—President, Mr. D. Reid; Vice-President, Mr. J. H. Lake, jun.; Hon. Sec., Mr. P. F. Rowsell; Committee, Messrs. Lemmon, Milton, Stone, H. W. Gadd, H. Gadd, and Lake, jun. Mr. J. Hinton Lake was pressed to act as President for another year, but declined.

The Early Closing Question

was then discussed, and it was finally resolved—

That the President and Vice-President form a deputation to wait on the chemists of the city to ascertain their views on the matter and report to a subsequent meeting.

The Annual Dinner.

The meeting next considered the question of holding the annual dinner. It was resolved that the dinner be held, if possible, the first week in February, and that the Right Worshipful the Mayor, Mr. R. Pople, and the Sheriff, Mr. J. Delpratt Harris, be invited to attend. The arrangements were left in the hands of the Committee.

The New Pharmacy Bill.

—The question of the proposed amendment to the Pharmacy Act was then introduced by the Chairman, who said it appeared to him that the objects to be gained by the proposed amendment were these:—That associates, or rather, registered chemists and druggists, would, by the Pharmacy Acts Amendment Bill, 1898, become eligible as members of the Pharmaceutical Society by payment of subscription, and by reason of their membership would be eligible to sit on the Council of the Pharmaceutical Society. The only other advantage that he was aware of was that, by common consent, it had been allowed that pharmaceutical chemists should be exempted from sitting on juries.—Mr. H. Gadd said that was already allowed by Act of Parliament.—Mr. Lake, resuming, said that the exemption of pharmaceutical chemists from service on juries formed no part really of the Pharmacy Act, 1852, but was a provision of the Juries Act, 1862. Chemists and druggists had to serve if summoned. He might say that personally, as a pharmaceutical chemist, he felt extremely jealous of any infringement of the rights of pharmaceutical chemists, or of anything that would raise those who had not passed the Major examination to the status of pharmaceutical chemists; but it appeared to him that the immense amount of benefit which would be gained by the possibility—or he might say more than that, the probability—of increasing the ranks of those who were directly interested in the Pharmaceutical Society would surpass to a very great extent any small loss of dignity to himself and those who were pharmaceutical chemists. The proportion of those who at present were really closely connected with the Pharmaceutical Society was out of all proportion with what it should be, and he could only think that by making chemists and druggists eligible for membership in the Pharmaceutical Society a great advantage would be gained. He should propose that this meeting was of opinion that it was desirable to support the Council of the Pharmaceutical Society in its undertaking of the Pharmacy Acts Amendment Bill, 1898.—Mr. F. W. Vinden said of course if the Bill passed into law, the associates would

only be members, not pharmaceutical chemists.—The Chairman replied that there would still be the distinction of pharmaceutical chemist.—Mr. T. C. Milton said he had much pleasure in seconding Mr. Lake's resolution, because he had always been of opinion that they could not do too much to strengthen the Pharmaceutical Society. At present it was not a representative body. They could not say that it represented the chemists of the kingdom, and if they admitted those who had passed the Minor examination, it would very much strengthen their hands. With regard to the question of jury service exemption, it seemed to him almost a question of right that chemists should be exempted from serving on juries. He believed that, as a rule, pharmaceutical chemists were in such a position that they could better attend than chemists and druggists, and, therefore, the hardship came very much greater on ordinary chemists than on pharmaceutical chemists.—Mr. Lemmon observed that he saw no reason why, if pharmaceutical chemists were exempt, chemists and druggists should not be. The fact of their having passed a chemist's examination ought to exempt them.—Mr. H. Gadd said that the small number of chemists who belonged to the Pharmaceutical Society prevented the Society from having that power with the Government which it would otherwise have.—Mr. Milton again remarked that the Pharmaceutical Society could not be called a representative body.—Mr. Gadd continuing, said the Government knew quite well that the Pharmaceutical Society did not represent more than one-third of the chemists. He believed that if the membership of the Pharmaceutical Society were greatly strengthened, and it could go to the Houses of Parliament with the voice of the majority of the chemists, it would have more power. He was sure many chemists would be induced to join if they knew they could become members, and at the same time, pharmaceutical chemists would lose none of their dignity. He would like to go a step further and see a clause introduced into the Bill, giving pharmaceutical chemists the right of Fellowship to the Society.—The Chairman stated that he was in conversation with Mr. Hills when at Glasgow, and he said he could hardly see how that could be brought about. They would have to obtain a different charter to grant a title of Fellowship to a pharmaceutical chemist.—Mr. Gadd: An addition to the Charter?—Yes.—The Chairman remarked that the main object of the discussion that night was to support the Council of the Pharmaceutical Society in passing the proposed Bill, but they must go further than that if they wished to carry it into effect. They must see their Member of Parliament (Sir Stafford Northcote), and try as far as possible to induce him to fall in with their views on this matter and endeavour to secure his support when the Bill was brought before Parliament.—Mr. Lake's original resolution was carried, and the Chairman then moved that a deputation wait upon Sir Stafford Northcote, drawing his attention to the fact that the Association was in favour of the Bill, and asking him to do all in his power to promote the passing of the Act.—In reply to Mr. Lemmon, the Chairman said that many members of the Pharmaceutical Council were strongly of opinion that the Bill would become law.—Mr. H. Gadd seconded Mr. Lake's motion, and suggested that when the deputation went round to the members of the trade to ascertain their views on the question of early closing, they should also find out if they approved of the Bill. It would be useful to tell Sir Stafford Northcote that every chemist in Exeter approved of the Bill. Sir Stafford Northcote would be in Exeter the first week of February, and the deputation would have an opportunity of interviewing him then.—The resolution was carried unanimously, and the President, Vice-President, and Hon. Secretary were appointed the deputation.

Letters and Resolutions.

The Hon. Secretary reported that he had received a communication from the Federation of Local Pharmaceutical Associations, who held a meeting of delegates of various local associations in Glasgow in August last.—The meeting favourably considered the resolutions embodied in the Federation circular.—The Hon. Secretary also reported that he had received a further communication from the Federation, who had resolved, *re* Sanitas Company's advertisement, "to write inviting them to place their articles on the P.A.T.A. list. The selling price to be face value, supplies to retail at present rates." He did not think it necessary, on receipt of that letter, to call the members together, and he replied to it, stating that they were in favour of the things being placed on the P.A.T.A. list.—The Hon. Secretary's action was approved of.—Mr. Rowsell further reported that he had received a third communication from the Federation of Local Associations, with respect to the proposed amendment of the Pharmacy Acts.

With regard to the question of the Local Government Board and the dispensers, Mr. Rowsell moved:—

> That in the opinion of this Association the action of the Poor Law authorities in recognising dispensing by unqualified men constitutes a danger to the public and is a moral evasion of the Pharmacy Act.

Mr. Lemmon seconded the motion, because he thought that no Local Government Board dispenser should be an unqualified man.—Mr. H. Gadd supported, stating that the Local Government Board, by giving appointments to unqualified officials, constituted a great danger. The resolution was carried unanimously, and the Hon. Sec. was asked to forward the same to the Council of the Pharmaceutical Society.—The Chairman said it had been suggested that it was desirable that this Association should be affiliated to the Federation, whose object was to link together the various local associations for conference.—Mr. H. Gadd concurred. If they had an organised body they would be ready for any emergency at any time. They would be able to present a united front. Chemists' organisations throughout the country were very powerful. A resolution that the Association be affiliated to the Federation was carried.

Vote of Thanks.

Mr. Rowsell moved that a cordial vote of thanks be accorded Mr. Lake for the admirable manner in which he had carried out his duties as President during the past year and for his conduct in the chair.—Mr. H. Gadd seconded the resolution, which was carried by acclamation, and Mr. Lake, having replied, the meeting terminated.

ULSTER PHARMACEUTICAL SOCIETY.

The monthly meeting of this Society was held on Tuesday last, in the chambers of the I.O.F., Royal Avenue, Belfast, Mr. James Tate, M.P.S.I., President, in the chair. Owing to the inclemency of the evening the attendance was not as large as it would otherwise have been. The consideration of the P.A.T.A. movement, and a resolution on the subject received from the Northern Branch of the Chemists and Druggists' Society, was postponed to be a special meeting to be convened in the course of a few days, and some routine business having been transacted, the President called upon Mr. James Guiler, M.P.S.I., to read a paper on "Water, Its Composition and Impurities."—On the motion of Dr. Fielden, seconded by Mr. D. W. Elliott, a cordial vote of thanks was passed to Mr. Guiler, who suitably replied.

BELFAST CHEMISTS' AND DRUGGISTS' SOCIETY.

A specially convened meeting of the members of this Society was held in the Board-room, Garfield Chambers, on the evening of the 31st ult., to consider several matters of trade interest. Mr. John Watson, Vice-President, occupied the chair. There were also present Messrs S. Gibson, J. S. Shaw, W. J. Gibson, Joseph Richardson, James Richardson, James Browne, John Freckleton, S. Suffern, W. Shaw, and W. J. Rankin, Hon. Sec.—The Chairman said the object of the meeting was, among other things, to consider how they could best advance the interests of the P.A.T.A. He would rather, as a matter of fact, put the question thus:—How could the P.A.T.A. best advance their interests? The Society might be a very good one in its own way, and, he believed, was engaged in a good work, but unless the chemists and druggists could utilise it to their advantage, he thought it would be foolish to adopt it. The objects of the P.A.T.A. were, however, commendable. They all knew the prices of goods were very much cut, so if the P.A.T.A. would enable them to get fair prices, they should give it their hearty support. He understood branches of the Association had been formed in connection with different societies, and were working well, so there would be no harm in their giving it a fair trial. With regard to the Pharmacy Bill they were agreed that it was of a rather far-fetched character, and he saw it was down upon the agenda for discussion. He was pleased to say that their Society was on the whole in a flourishing condition, and he hoped the year they had entered upon would be even more successful than the one just completed. They wished their kindred Society—the Ulster Pharmaceutical—every success in their operations, and he was sure every member of the Chemists' and

Druggists' Society would do all in their power to give them a helping hand.—A report on the British Pharmaceutical Conference was presented by Mr. S. Gibson, who reported that the Conference had accepted the invitation from the pharmaceutical chemists and druggists of Ulster to visit Belfast in August, 1898, and hold the Conference there, and stated that both sections were working conjointly, and doing all they could to make the reception as complete as possible.—Subsequently, a somewhat lengthy discussion ensued on the P.A.T.A. question, and ultimately, on the motion of Mr. W. J. GIBSON, seconded by Mr. BROWNE, it was resolved :—

> That this Society thoroughly sympathises with the objects of the P.A.T A., which are deserving, in its opinion, of the hearty co-operation and support of the entire drug trade in the north of Ireland."

A committee, consisting of the Chairman, Messrs. S. Gibson, Jos. Richardson, W. Suffern, and the Secretary, was appointed to confer with the Ulster Pharmaceutical Society should they pass a similar resolution with the view of securing some advantages from the operations of the P.A.T.A. in Belfast and vicinity.—Mr. S. GIBSON reported that the Committee in charge of the Guarantee Fund in connection with the British Pharmaceutical Conference would meet at an early date.

TRADE NOTES AND FOREIGN NEWS.

INDIARUBBER CULTIVATION.—Since cycling has become so universally popular, there has been a greatly increased demand for rubber, and to meet this want numerous companies have been formed to acquire rubber property. But the *Financial News* believes that many of the prospectuses of such companies are prepared, and when circulated are read, in the belief that one tropical country is as good as another for successful and profitable rubber cultivation. Therefore, for the guidance of would-be investors it devotes an article to the subject, which is quoted by the *Chemical Trade Journal*, and gives some interesting particulars with regard to indiarubber-growing centres, the manner of cultivation and gathering, and the results obtained from the same species of plants in various countries. The most valuable rubbers are Bolivian and Para (both have touched 3*s.* 10*d.* per lb.), and are the product of various species of Hevea and of an allied genus, Micranda. There are practically no plantations of Hevea in Brazil, the family thriving best in their natural state, growing on land that is under water six months, more or less, in the year. Every attempt to cultivate Heveas commercially in other countries has failed. In Ceylon the trees appeared to thrive amazingly, but when tapped the yield was only about 25 per cent. of that obtained in Brazil, where the yield per tree varies from 1 lb. to 25 lbs. or 30 lbs., according to age, size, and situation. The best rubber tree for cultivation is said to be the *Castilloa elastica* of Mexico, British and Spanish Honduras, Guatemala, Nicaragua, Costa Rica, the Isthmus, and part of the United States of Colombia. The *Castilloa* is a totally different tree from the Heveas, and belongs to the same botanical order as the bread-fruit, whereas the Heveas belongs to the Spurges. The chief advantage offered by the *Castilloa* from the planter's point of view is that it will flourish on comparatively dry lands, while its yield of milk is nearly if not quite as abundant as the Heveas, but its rubber is of about 40 per cent. less value. West African rubbers are obtained from various species of Landolphia, all climbing plants, from *Ficus vogelii*, and *Kikxia africana*, but West Africa is not, and probably never will be, a favourable field for rubber cultivation, owing to climatic and other conditions. The principal rubber tree of India, Burma, and various other parts of the East is the *Ficus elastica*. It has been cultivated by the Indian Government in Assam, where promising results have been obtained, the average yield of fifty trees in one year amounting to 26 lb. per tree. The rubber from Borneo, Sumatra, and the Malay Archipelago is mostly derived from species of Willughbeia, and it is believed that in fairly healthy countries like the two first named and Java the cultivation of the best Willughbeias, *W. firma*, would pay well. In the United States of Colombia there are a number of rubber-yielders, which in all probability would pay well for cultivation.

ALBUMIN MANUFACTURE IN CHINA.—Several attempts made to establish albumin factories in China have failed in their purpose, but according to a recent report of the United States Consul at Chinkiang, the efforts of a German firm at that place have been attended with success. The surrounding country is noted for the rearing of fowls and ducks, and the eggs are preserved by a process which, it is claimed, will keep them good for ten or twenty years. The process is as follows : A lye of beanstalk and lime is made by burning these to a powder, which is then put in water, black tea-leaves and salt in certain proportions being added. This is boiled until all the water has evaporated, leaving the residue caked and hard. It is then pounded and the fresh eggs are placed in the preparation, with a little rice husk, where they remain 100 days, when they are ready for use. As soon as the eggs are received at the factory they are tested by means of a tin cylinder containing a lamp giving a powerful light concentrated on an opening, before which the eggs are held, when all specks and flaws are distinctly seen, the eggs showing the slightest defect being rejected. The good eggs are then broken and the yolk separated from the white, which is carefully cleaned of all stray clots of yolk, and is then either put through a course of stirring in a large vessel by means of a heavy rod or paddle worked by hand, when it is ready for the drying room, or it is run into large vats and allowed to ferment, the process of fermentation being accelerated by the admixture of certain secret chemicals. When all impurities have been deposited or thrown off in the form of a thick froth, the resulting liquid is albumin, as clear as water, and is ready for the final process of drying. This is accomplished in a series of three rooms, each hotter than the last, the temperature ranging from 40° C. to 50° C. A period of sixty or seventy hours is necessary for drying the albumin, which is run into shallow pans about 1 foot square. When thoroughly dry it has the appearance of isinglass with a yellow tinge, and after cooling it is packed in large square boxes holding about 400 lbs., and is then ready for shipment. The yolk of the eggs is also put through various processes, and is afterwards used in the preparation and dressing of superior leather goods.

TECHNICAL EDUCATION IN GERMANY.—In a report to the Foreign Office on the Leipzig Exhibition, 1897, it is stated that in Saxony almost all "Gewerblichen Schulen" (technical schools) are under the Ministry for the Administration of the internal affairs of the Kingdom. Many of the schools have been founded by the State, the others owing their existence to private enterprise. Early in the present year there existed in Saxony (not counting the mining and shipping schools and three State high schools) 270 trade schools, two of which are devoted to the teaching of druggists. Of these trade schools 166 were founded between the years 1874 and 1894. The sums expended by the Saxon Government for industrial and art teaching at the State schools are shown by the following figures :—In 1874, £11,439 ; in 1884, £23,136 ; and in 1894, £34,983. Forty-six other trade, agricultural, and commercial schools in Saxony were aided by the State in 1873 to the extent of £3090 ; sixty-two in 1883 received £4785 ; and in 1894 125 schools were subsidised with £8572. Very large sums have also been spent in late years on new buildings.

THE DINGLEY TARIFF AND GERMAN INDUSTRIES.—H.M. Ambassador at Berlin, in a memorandum on the influence of the United States tariff on German Industries, speaking of the Leipzig trade, states that the exportation of drugs, chemicals, oils, paints, will depend on the capabilities of American similar industries. The former tariff raised the duties on the chemical imports, but it was found did not affect German exports of the finer preparations, inasmuch as higher wages in America caused a high price there, and thus the profits on the German article were more than before, and it is expected that the same will be the case now, and that even with further high duties the exportation will not diminish. With regard to the whole German trade in chemicals and chemical preparations, it will not be much affected, as it is not much interfered with by the new duties ; and also because the chief German exports—tar colouring matter, scientific and pharmaceutical preparations and photographic chemicals—are so superior to those of all other states that people cannot do without them. A reduction in the exportation to America of textiles in which large quantities of colouring matter are employed is the only damage expected to accrue from the tariff.

ADULTERATED SAFFRON IN BELGIUM.—Breedenraedt reports on a sample of saffron which consisted of over 37 per cent. of exhausted saffron, coloured with vesuvine and dressed with barium sulphate.—*Journ. de Pharm. d'Anvers* 4, iii., 241.

DENTAL NOTES.

BROKEN NERVE BROACHES.

A 25 per cent. solution of pyrozone applied on cotton and left in root canal for a few days is recommended in *Items of Interest* as an easy way of removing broken nerve broaches.

SOME PRACTICAL HINTS.

The addition of 2 per cent. of silica to a gold plate is said to enable it to be melted over a lighted candle. A little resin applied to driving belt of the engine prevents it slipping. Instruments can be sterilised and saved from oxidation by boiling them five minutes in a 1 per cent. solution of sodium carbonate. Two parts of resin and one of bees-wax make a good sticky wax. Heavy pasteboard makes a capital vulcaniser packing. A little gum arabic added when rubbing borax down in water will keep the solder in its place. Oxyphosphate is the best thing with which to repair broken teeth of plaster models if sufficient time is allowed for setting.

HÆMORRHAGE AFTER EXTRACTION.

To stop hæmorrhage after extraction mix ordinary dental plaster quite stiff, and with a tightly-rolled ball of absorbent cotton press the plaster, one piece after another, into the socket until the bleeding stops. The plaster requires no further attention, and as the wound heals it is thrown off without having caused the least irritation.

FINISHING THE GUM.

When using plain teeth and pink rubber, instead of finishing the gum with file and sand-paper, use with the dental engine a large round bur, rather dull, and a smaller bur in the corners between the teeth. With a rapidly revolving bur carve the gum festoons, moving first vertically, then longitudinally. As the carving nears completion pass the bur lightly over the surface, then polish with brush wheels, pumice, and whiting. This gives the granular appearance peculiar to the natural gum, and not a perfectly smooth surface.—*Dominion Dental Journal.*

THE X RAYS IN DENTISTRY.

An interesting case of illustrating the injurious effects which frequently follow the injudicious use of the X rays is reported in the *American Journal of Dental Science.* A young woman suffering from intense pain in the jaw, which was supposed to arise from necrosis, had an X ray photograph taken to assist in determining the exact cause. The first photograph was not a success, so another was taken the next day with an exposure of twenty minutes. A few days afterwards the patient's face began to swell, and grew black. The hair on one side began to fall out, so that in a short time part of the scalp was bare. Her face was blistered, and sores formed all the way down her neck, shoulder, and arm. A scab formed over the blister, and when it fell off disclosed the raw flesh. Her left ear swelled up, and she lost the sense of hearing in it. Constant applications of oil were necessary to allay the pain arising from exposure of the flesh to air.

TREATMENT OF SENSITIVE TEETH.

An ingenious and effective method of treating sensitive teeth is described by Mr. Houghton in the *Journal of the British Dental Association.* A gentleman, aged sixty, had complained of pain in the left upper molar. There was much absorption, but the pulp was quite healthy. A gold plate was fitted over the exposed fangs, a model being first taken, which was pared away at the neck of teeth so that a band would fit beneath the gum. Chloro-percha was painted beneath the gum and the plate fastened with a pin and cemented the same as with a crown. The success was immediate, though before the plate was put on the patient could not bear either hot or cold water in his mouth. The tooth has remained quite firm and is doing good service. In the next case the symptoms were the same, but complicated by decay on the distal surface. The cavity was filled with artificial dentine, then a split band was fitted around the tooth, which was tightened up by means of a screw when in position. This case has proved equally successful.

THIRST AND DRY MOUTH.

Dissolve a teaspoonful of gum arabic in a glassful of water and add two teaspoonfuls of glycerin, then sufficient lemon-juice to flavour agreeably.—*Odontologie* [2], v., 306.

EXTRACTS FROM CONSULAR REPORTS.

THE METRIC SYSTEM OF WEIGHTS AND MEASURES has another advocate in Consul C. S. Dundas, of Christiania. After demonstrating that Germany has a larger share of Norwegian import trade than Great Britain, he states, in a recent report on the trade of Norway, that until British manufacturers are content to put the weights and measures of their goods in accordance with the metric system, they will always be at a disadvantage when dealing with foreigners.

THE EXPORTATION OF COD-LIVER OIL from Bergen amounted to 28,000 barrels in 1896, as against 33,000 barrels in 1895 and 52,000 barrels in 1894. The total produce of oil was smaller than it has been for the last fourteen years, and consequently prices were very high in the beginning of the season, best steam-refined medicinal oil reaching 180 kroner (£10) per barrel. The quotations towards the end of the year, however, were rather lower, being 120 kroner (£6 13*s.* 4*d.*) per barrel.

THE DRY DISTILLATION OF ACETIC ACID, wood naphtha (methyl alcohol) and tar from sawdust is one of the latest enterprises in Norway. A factory has been started at Fredrikstad capable of distilling 10,000 tons of sawdust during the year, and also of manufacturing charcoal briquettes, which are exported to the Netherlands. The acids are chiefly placed on the German market, while the tar is mostly consumed at home. The factory is said to be the first of its kind erected in the country.

THE OUTPUT OF MANGANESE at Kunui (Japan) during 1896 was only 478 tons, although 1591 tons, valued at £2242, were exported from Hakodate, the difference being made up by surplus stocks.

THE SUPERIORITY OF GERMAN TECHNICAL EDUCATION to that of Great Britain, according to Consul Wilfred Powell, is denied by many Germans who have studied the subject in both lands, but they admit that the application of this education in Germany is carried out to a more practical and useful conclusion than in England. Consul Powell thinks that British lads are not sufficiently educated in living "commercial" languages, and he advocates an exchange of pupils between English and foreign schools, so that pupils could acquire a knowledge of a language in its own country.

THE HONG KONG IMPORT OF INDIAN OPIUM for the year 1896 shows a decrease of 2400 chests, and importers have sustained losses owing to the unfavourable rupee exchange without a corresponding rise in the price of the Indian drug in the China market. It has risen sufficiently, however, to give an impetus to the production of the native drug, and this, together with the shortness of the Bengal opium crops year after year and the diminished auction sales of the Indian Government, are factors affecting the price of the Indian drug to such an extent that, if such conditions continue, the native product must eventually supplant the imported drug.

THE NON-EXISTENCE OF PATENT LAWS in Roumania has made it possible for the "Holden" apparatus, for the use of petroleum fuel by locomotives, to be imitated with impunity. According to the British Vice-Consul at Bucharest, twenty of the 450 locomotives in Roumania have already been fitted with this apparatus, and it is ordered to be placed in thirty more, while in three years' time it is expected that the new motive power will be applied to all the locomotives in the country. The "Holden" apparatus, it is understood, is being copied by a Roumanian firm—"E. Wolff"—located near Tilaret, on the outskirts of Bucharest, at a cost of 400 francs less than in England.

STAR ANISE TREES are extensively cultivated in Kwangsi (China), the oil being drawn from the fruits by distillation. The trade is steadily growing, and promises to attain very large proportions £85,600 being realised in 1894 from aniseed and aniseed oil.

THE RICHEST QUICKSILVER DEPOSITS known to the world are reported to be at Kweichow (China), while the mountains of Kwangsi are rich in minerals such as gold, silver, copper, iron, and coal. Another province, Yunnan, furnishes copper and salt. The mines, however, are as yet but little worked.

NEW REMEDIES.

Unfavourable Results with Trional.—Kaempffer gives several instances of persons suffering with cancer of the stomach or liver to whom was given 15 grains of trional, which caused, instead of sleep, restlessness, anxiety, palpitation of the heart, and illusions, which lasted all night. In one case a smaller dose produced sleep for 6 or 7 hours; in others no change resulted from lowering the dose.—*Mod. Med.*, vi., 66, after *New York Med. Journ.*

Di-iodo Acetylene and Tetra-iodo Ethylene.—The latter body has been recommended as a substitute for iodoform, especially in France, under the appellation of di-iodoform. Biltz prepares it from iodine and iodide of potassium by the aid of calcium carbide. Fifty grammes of iodine are dissolved by heating in a concentrated aqueous solution of 25 grammes of potassium iodide, and the solution is cooled to about 0° C. Small portions of roughly-powdered calcium carbide are very gradually added with continual stirring. The equations—

$$C_2Ca + 4I = C_2I_2 + CaI_2$$
$$C_2Ca + 6I = C_2I_4 + CaI_2$$

illustrate the action. The product containing acetylene di-iodide, and ethylene tetra-iodide is separated, the di-iodide obtained in colourless volatile needles, which are readily soluble in most solvents, while ethylene tetra-iodide, which is more difficult to dissolve, forms yellow non-volatile and odourless crystals of the formula C_2I_4, melting at 187°. The author states that acetylene di-iodide is virulently poisonous to micro-organisms, and is one of the most active preventatives of decomposition. It is, in fact, only equalled by the extremely poisonous cyanogen iodide. In the animal body it is apparently effective by liberating iodine, a part, no doubt, passing undissolved through the body. Ethylene tetra-iodide exercises the same healing influence on wounds as iodoform, but is preferable in use, being odourless.—*Pharm. Zeit.*, xlii., 448.

Application for Sycosiform Eczema.—Styrax, 10; ol. amyd. dulc., 30; sulphur precip., 1. For external use.—*Pediatrics*, iii., 357.

Sodium Formate in Pneumonia.—Rochon finds formate of sodium to be a useful remedy in pneumonia, especially in the croupous form to which children are subject. To these it is given in daily doses of 30 to 50 centigrammes; adults may take from 1 to 2 grammes. The fever rapidly diminishes and profuse perspiration is produced, together with a slight looseness of the bowels.—*Pharm. Zeit.*, xlii., 546.

Airol Paste for the Occlusive Dressing of Sutured Wounds.—Bruns recommends the following paste for covering surgical wounds and sutures:—Airol, mucilage of acacia, and glycerin of each 10; white bole, 20. This is applied with a spatula over the wound and adjacent parts, and firmly pressed into the orifices of the sutures with the fingers, then covered with a layer of cotton.—*Therap. Woch.*, xliv., 545.

Further Report on Sanoform.—Originally introduced by Arnheim (*Ph. J.* [4], 11, 422), di-iodomethyl-salicylate or sanoform, has been found by Sternberg to be in every way a desirable substitute for iodoform. It is odourless, gives rise to no irritation, and is perfectly harmless. Employed as a dressing in thirty-seven cases of recent wounds, a complete cicatrisation resulted, in most cases in two to four days with one dressing, and in all, complete healing followed a second application. Similar good results were obtained in the treatment of abcesses and ulcers; fissures were rapidly healed by a 10 per cent. sanoform ointment with lanolin, and the powder itself was successfully employed in slight tearing of the perineum. Sternberg strongly advocates the use of sanoform in private practice.—*Nouv. Rem.*, xiii., 530, after *Therap. Monats.*

Starch Iodide as a Veterinary Antiseptic Dressing.—Perçus calls attention to the value of starch iodide in veterinary work, particularly in the treatment of the wounds and excoriations caused by ill-fitting harness. It does not stain the hands, and is free from the objectionable odour of iodoform.—*Vet. Record.*, ix., 559, after *Journ. Vet. Méd. et Zoot.*

LETTERS TO THE EDITOR.

The New Pharmacy Bill.

Sir,—I have followed with great interest the correspondence respecting the new Pharmacy Bill. The supporters of the measure seem to overlook the fact that the privilege of membership was the chief attraction for students to take the higher degree. In my own case the title Pharmaceutical Chemist offered no inducement whatever, and I continued my studies for the sole object of becoming a member of the Society. This position is now becoming generally understood, not only by the medical profession, but also by the public at large, and it is a most unjust proceeding to rob those who have been more industrious of the fruits of their labours. I feel sure very few of the chemists and druggists on the Register would accept, by paying a subscription, that which might have been easily and honourably won by industry and study. On the other hand, the successful passage of this Bill through Parliament would cause a large secession of pharmaceutical chemists. I sincerely regret to notice that some of the promoters of this change have used the statement (as an argument), "the present Minor is practically as difficult as the Major was ten years ago." Was not the Minor correspondingly easy at that period? In these and all examinations in science it is obviously unfair to compare one at the present time with the other as it was ten or fifteen years ago. Major men are asked to be generous; but it is no small thing when it is proposed to deprive them of the only advantage they enjoy.

Waterloo, December 29, 1897. Wm. Pearson.

Sir,—As a chemist and druggist (Minor) I should like to express my views on this new Pharmacy Act Amendment Bill. I think it only just to the Major men that they should have a distinguishing title, let it be Fellow, or anything they please, but I think they have already one and that a protected one, "Pharmacist," as no one is allowed to assume that title unless they are pharmaceutical chemists. For my part I do not think it will be the question of title that will bring in the outsiders to the ranks of the Society, and I feel that loyalty to the craft as a brotherhood should do more than granting the title of Member, as in every other branch of labour nearly there is federation of members or trades union, and why might not our *confrères* form such a union by joining our legally established union and interest themselves in the government of the Society? It appears to me that the feud arising between Professionalism *versus* Trade is the cause of the mischief, and that while our Society is aiming at the first, affecting to ignore trade interests, our members are aiming at the latter, as they cannot afford to ignore them. If such were not the case, why do we see so much puff by advertisement of So and So's this, that, and the other as reliefs and cures for all kinds of ailments? To take up the professional side of the question, all such advertisement should cease, as with doctors, who are not allowed to advertise in any way. Again, the Society, aided by medical men, ought to be able to put a stop to the indiscriminate manufacture of medicine under cover of the Patent Medicine Stamp (so-called patents), as these may be, and very likely are, made by the greatest amateurs in the knowledge of medicine. The Society, if they have not the power, should seek powers of compulsory registration, licence, and control of every business in the country to see that every man whose name is on the Register is properly qualified and duly carries out the requirements of the Pharmacy Act. It is the *non possumus* attitude of the Society that causes such disaffection in our ranks. I have been tempted to give up paying my annual subscription on account of it. When an unqualified man in this town was prosecuted for infringing the Act and paid four or five penalties into court, thus avoiding publication of the fact that he was not a chemist, I wrote the Registrar of the Society, who told me "the Society could not publish the fact under the law of libel." I naturally asked, Why pay to support such a useless body? Why could they not prosecute and inform defenders that whether they paid penalties into court or not, the offence would be published in the interests of the public, whom the Society are called into existence to safeguard, and their action would be taken as privileged "for the safety of the public"? It is on account of loyalty to the Society that I shall continue to pay my subscription, and I hope many others, in fact, all, will do the same; if not, let it once be known that the Society intends to seek powers of compulsory registration, and paying the fee as a

licence, and then we shall see such a number flocking to the ranks of the Society as we never have had.

Torquay, January 1, 1898. W. J. RAWLING.

Sir,—I notice that although it is stated in the opening sentence of the "Draft Pharmacy A. A. Bill" that "Pharmaceutical Chemist" and "Chemist and Druggist" shall have the same meanings as in the Acts of 1852 and 1868, some of your Major correspondents object strongly to it as an encroachment on their privileges, but yet do not suggest anything in its stead. As there are more sides than one to every question, it may not be amiss to look at it from another point of view. I am an "associate not in business," and subscribe to the Benevolent Fund, the extent of my privilege consists in receiving the Journal, permission to visit 17, Bloomsbury Square, and, so far as the annual subscription goes, the Journal is well worth the money. Of course, perhaps one ought to be in business, but there must be many men like myself who, although no longer young, are not in that position. Many, undoubtedly, must be very capable, both from the professional and business point of view, but on account of not being in business have had neither vote in electing the Council nor voice in its representation; in fact, we have been left decidedly in the cold. I have always thought the Society would eventually alter so unsatisfactory a state of things, and should be sorry to see this attempt by the Council at betterment frustrated. Indeed, looking at the number unassociated with the Society, I cannot help thinking had a more generous spirit prevailed towards the "associate not in business," that the strength of the Society would be much greater not only in Minor men, but also in Majors, as a healthy interest in its matters might have induced many who had the time and means to have gone in for the Major examination; at any rate, many would have been friendly who, to say the least, if not inimical to the Society, seem to take no interest in it whatever. However, the large number outside seems to me to be very unsatisfactory. The fear of the examinations being interfered with and their standard lowered is, I should be inclined to think, groundless, as with the greater facilities for education, the increased opportunities that the present-day student has, which were entirely lacking only a few years ago, any backward movement would be fatal. We must go forward; it is a duty alike binding on masters, assistants, and apprentices. Personally, I should be very sorry to receive any advantage to the detriment of Major men, or to appear anything more than the Minor examination entitles one to, and should regret if the proposed Bill caused any bitterness or ill-feeling; we cannot afford to quarrel. The idea of the Bill, all should remember, is to consolidate and strengthen the Society, and thereby enable it to render services by which we may all reap advantage—Majors and Minors alike.

London, N.E., January 3, 1898. J. WELLBURN.

Sir,—Judging from the correspondence columns of the Journal, there seems to be a considerable amount of irritation amongst certain pharmaceutical chemists concerning the supposed iniquities of the new Pharmacy Bill. Perhaps justice might have been done to chemists and druggists by allowing them a third or half the seats on the Council. Still, it cannot be denied that by the abolition of a privileged party future friction will be avoided. But has the Council acted wisely, or might I say diplomatically, in refusing to give a "Fellowship" to the pharmaceutical chemists? If local association meetings are any indication of the feeling of the country, such a distinction between the two qualifications would have been quite acceptable to the chemists and druggists, and would in all probability have satisfied the malcontent pharmacists. As no difference in privileges would exist between the Fellows and the members, any rivalry between the two would be impossible. The Royal College of Veterinary Surgeons is conducted on similar lines. The highest examination confers a Fellowship of the College, which is purely honorary in character and carries with it no privileges. I cannot but think that the Council will make a mistake by abolishing all differences between the two qualifications. It would be far more to the interest of the Society to give the Minor men the title of "pharmaceutical chemist" and reserve membership for the Majors, thus practically compelling the latter to become members of the Society, whereas under the proposed arrangements large numbers of pharmaceutical chemists who are at present members will probably sever their connection with the Society. It seems a very small matter, but it may be the means of wrecking the Bill.

Eastwood, Notts., January 3, 1898. F. D. F. CHAMBERS.

ERYTHROL NITRATE IN MEDICINE AND PHARMACY.

Sir,—The conditions under which erythrol nitrate is explosive are apparently not well known. After the publication of Professor Bradbury's researches on its physiological action I tried several experiments with it. I was unable to explode it on concussion in its pure state by hammering a little on an iron plate at the ordinary temperature, but if heated to about 130° F. it readily exploded on being struck, and even on rubbing the hammer on a stone to polish and clean it, thus slightly warming it before striking the erythrol nitrate, the latter exploded after two or three strokes. I found, however, that like nitro-glycerin, it was soluble in fats and oils; it readily dissolved in the fat of chocolate, which solution was stable and could be safely cut into tablets for medicinal use. Of these I have prepared a number of small quantities. Since the fatal accident we have further experimented in my laboratory with the object of ascertaining what admixture of other substances used in pharmacy will render it more explosive. (1) We find that if a little be heated on platinum foil it deflagrates with a flicker. (2) A trace triturated violently in a porcelain mortar does cause slight explosions. (3) Mixed with a little milk sugar we could not explode it by striking it with a hammer at ordinary temperature, or even after moistening the mixture with spirit, but only a little was tried. (4) A trace of an oxidising agent such as silver oxide, mercuric oxide, potassium permanganate, potassium chloride, or potassium nitrate, as well as reducing agents, such as reduced iron, charcoal, hypophosphites, pyrogallol, morphine, and creosote, all seemed to render the erythrol nitrate more readily explosive by concussion. Erythrol nitrate melts at 142° F., and neutral fats and oils dissolve it to the extent of one-fourth their weight when gently warmed, but on cooling much of the nitrate crystallises out. Nevertheless, this fatty coating of the crystals is a protective, as I find that chocolate tablets can be prepared to contain a large dose of the nitrate by adding an excess of fat. I have failed to make these explode by violent hammering, although they contain a quantity of the crystals. It is desirable, however, to use such a quantity of chocolate that the erythrol nitrate may be in complete fatty solution in the tablets.

10, New Cavendish Street, W. WM. MARTINDALE.
January 4, 1898

Sir,—I can quite endorse the remarks of Messrs. Parsons and Langford-Moore with regard to the dispensing of erythrol tetranitrate. We, too, have dispensed in this hospital a large quantity of the compound during the last two years, both in the powder and liquid form. We have always powdered it in a dry mortar, exercising due precaution, well knowing it to be of an explosive nature, and in no way have we experienced any trouble with it. With a little care it does not appear to be dangerous. But if Mr. Parsons will take 5 grains of erythrol tetranitrate and rub it gently to powder in a dry mortar, and then strike the powder quickly with his pestle, he will get a report and a flash of light equal to that given off from a small cannon, and his mortar will be blown to pieces. I have some practical experience of this, but not in dispensing the chemical; consequently, I can quite understand that if a report like this can be got from 5 grains, the intensity must have been terrible from 4 ounces. Therefore, it is easy to conceive that the unfortunate chemist must have in some way or other dropped his pestle on the erythrol suddenly and with great force, or possibly for the express purpose of bringing it to powder quickly; hence the explosion. There is a possibility also of the erythrol containing as an impurity some of the allied explosive compounds. I may add that the largest quantity of erythrol tetranitrate we have powdered at one time has been one hundred grains

Bristol Royal Infirmary, F. J. KILNER.
January 4, 1898

Sir,—I have looked through several accounts of this unfortunate affair and have failed to discover what was the kind of mortar and pestle employed in the operation. It surely is a question of some importance, and the facts ought to be recorded. I would venture to suggest that triturations of that dangerous sort should be conducted in a mortar with very smooth surface, that the pestle should be of wood, and the stirring knife of bone

Weymouth, January 4, 1898. THOS. B. GROVES.

The General Index to the Journal.

Sir,—As one of the first to suggest to you the importance of a General Index to the Journal being published, and perhaps one of the most persistent inquirers for it since, may I be permitted to point out to those chemists who are not in the habit of using general indexes some of the advantages such works possess. This seems necessary, because the limited number of those who think such a veritable "Enquire Within" upon everything connected with a chemist's business worth having, appears to indicate either a lack of knowledge or a want of business foresight that in either case is lamentable. The number of applications addressed to me for information almost every day concerning articles that have already been described in the Journal, and concerning which the literature therein is often considerable, indicates that the writers are not in the habit of keeping their Journals bound, or even of keeping a file of the annual indexes. There are constantly coming into vogue new remedies, and as soon as these are described they appear in our Journal, but as it takes usually a year in the larger cities and sometimes three years in provincial towns before new remedies come into demand, the notices in the Journal are by that time forgotten. As a rule, medical men will make inquiries of such chemists as they know and respect concerning new remedies, and the chemist who has on his desk a General Index can refer at once to the literature concerning them, instead of appearing to be behind the times by having to confess ignorance, or writing to the Journal for information. The saving of time so effected and the enhancement of reputation so obtained will repay over and over again the guinea expended on the Index. It is strange to see chemists so blind to their own interests that not even 200 can be found in three months willing to make a business investment of this kind. But when one finds that the last General Index, published in 1880, was given away, and that so many chemists would not even take the trouble to ask for it, it is easy to understand that the Council is not willing to throw away money on work that is not appreciated, and that it is left to private enterprise to furnish what every chemist wide-awake to his own interest should be anxious to have on his desk. Some years ago a very shrewd man of business said to me, "If you want to make a good investment, and earn a reputation for learning, get all the general indexes you can and use them." I was so much impressed with the idea that, since the last General Index was published, I have, week by week, had two copies of the *Pharmaceutical Journals* cut up, and all the scientific information concerning vegetable drugs cut out, pasted on paper of uniform size, and arranged alphabetically in boxes. Although this has entailed a considerable amount of time, it has saved an infinitely greater amount in my daily work as Curator. I may add that I am not personally interested in the matter, but as a member of the Society I do view with regret the apathy which leads chemists to ignore what may be made to add to their income, and to neglect their own interests as in the analogous case of the Council elections, when not half trouble to return the voting papers sent out, or as in that of chemists and druggists who refrain from joining the only corporate body which is, or is likely to be, recognised by Government as representing their interests, and through which alone any measures affecting the craft can be presented for consideration. It is to be hoped that the activity now being displayed by various local associations, and the greater increase in social meetings amongst chemists generally, will tend to promote a state of things that will result in the chemists of this country forming a compact, strong, united, and active body.

Sevenoaks, January 5, 1898. E. M. Holmes, Ph.C.

OBITUARY.

Frost.—On November 26, 1897, Robert Kirton Frost, Chemist and Druggist, Sunderland. Aged 62.

Hares.—On December 19, 1897, Samuel Hares, Chemist and Druggist, Prees, Salop. Aged 81.

Bulmer.—On December 25, 1897, Thomas Porter Bulmer, Chemist and Druggist, York.

Foster.—On December 25, 1897, Frederick Foster, Chemist and Druggist, Brighton. Aged 92.

Wilson.—On December 26, 1897, Isaac Wilson, late of Crook, Durham. Aged 55.

ANSWERS TO QUERIES.

Powder for Sheep and Hoggets.—The braxy powder you send is simply a mixture of ground Epsom salts and nitrate of potash tinted grey with a little lampblack. [*Reply to* J. H.—2/34.]

What to Study.—You should get a good grounding in all the subjects, and would do well to consult our Students' Number (p. 231, *et seq.*), published September 11 last, for advice how to proceed. [*Reply to* S. P. S.—3/10.]

Taxine.—It is evident that your search "in many up-to-date works" has not included the *Pharmaceutical Journal*. In the issue for September 5 last, p. 215, you will find full details of all you require. Wortley (*Ph. J.* [3], xxiii., p. 182) states that the alkaloid only occurs in the male yew, and that the female tree is harmless. [*Reply to* X. Y. Z.—2/29.]

Microscope.—Get a Leitz stand fitted with $\frac{2}{3}$-inch and $\frac{1}{6}$-inch objectives, double nosepiece, and a sub-stage condenser. If, subsequently, you add a $\frac{1}{12}$-inch homogeneous immersion objective, you will have an outfit sufficient for any work you may require to do. C. Baker, optician, High Holborn, W.C., can furnish you with a list of Leitz stands and objectives. [*Reply to* S. P. S.—3/9.]

Chemistry of Ligustrum Vulgare.—According to Polex (*Archiv Pharm.* [2], xvii., 75), the leaves of privet yield a yellow bitter principle—ligustrin, which gives a blue coloration with sulphuric acid and they also contain mannite. Stenhouse (*P. J.*, [1], xiii., 384) states that the leaves of privet contain quinone. Reinweide isolated a colouring principle, which he called ligustrin, from the berries. We are unaware of any recent work upon the plant. [*Reply to* Hammond.—2/4.]

Glycerin Suppositories.—Stearin soap is recommended to make suppositories containing 95 per cent. of glycerin. The basis is made from stearic acid, 2½ drachms; sodium carbonate, 75 grains; glycerin, 5 ozs. by weight. Heat the stearic acid and glycerin together so as to just melt the former; then add the soda, and, when it has dissolved, pour into moulds. These suppositories are very elegant, but are said to become hard on keeping. Practically, the official form, containing 70 per cent. of glycerin, is quite as efficient as any, and that basis keeps well when properly treated. [*Reply to* J. E.—2/16.]

Linimentum Terebinthinæ, B.P.—A great deal depends on the quality of soft soap used, and more still on the degree of rubbing. Following the official directions and gradually adding the camphor and turpentine solution to the mixed soap and water in a mortar, a thick cream-like mass should ultimately result. Professor Redwood, who devised the formula, said (*P. J.* [3], xvii., p. 742) that it should be a thick permanent emulsion. A fluid liniment may be made in the same way by doubling the official quantity of water, but the result will not be lin. tereb., B.P. The variation in colour which you have observed is no doubt due to the soft soap employed. You will find a good deal of information on the subject in *Ph. J.* [3], xviii., pp. 473, 858. [*Reply to* S. P. S.—2/26.]

Beginning Botany.—As far as geographical location goes we cannot agree that you are unfavourably situated for learning botany. Your best plan will certainly be to join the Science and Art Department's class on that subject in your city, and supplement the lectures by work of your own. At first, use Holmes' 'Botanical Notebook' and Oliver's 'Lessons in Practical Botany,' or Scott's 'Practical Botany'; for field work, John's 'Flowers of the Field.' As you get more advanced take Green's 'Botany' and Bentham and Hooker's 'Handbook of the British Flora.' By thus combining reading and practical work you will find the work much more interesting and, therefore, more valuable. For histological work you will find Bower's 'Elementary Practical Botany' a good introduction to more advanced study, which should be based on Strasburger's classical work. We are always glad to answer such queries as yours, so do not hesitate to write again if you require assistance. [*Reply to* S. P. S.—2/27.]

COMMUNICATIONS, LETTERS, etc., have been received from

Messrs. Carter, Chambers, Christy, Curtis, Deed, Evans, Ford, Groves, Hogg, James, Jesper, Jolly, Kilner, Lee, Lewis, McDougall, Masters, Martindale Prebble, Rawling, Reade, Stainer, Stead, Wellburn.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

Percolation of Syrups.

J. K. Williams, whose useful practical paper was referred to last week (see p. 23), proposes a modification of the U.S.P. method of preparing syrups by percolation. In place of the plug of sponge, which is directed to be pressed down into the neck of the percolator, he inserts a grooved cork in the neck, and over that he places "a thin, broad piece of fine sponge, with a nipple-shaped projector, double the thickness of the rest, in the centre, to rest on the cork, serving as a diaphragm." A wedge-shaped stick is used to level and loosen the sugar in the bottom of the percolator, when nearing the end of the process, so that the dropping is maintained uniformly to the end and no channels are formed. Loaf sugar is preferred, and it is recommended that, as soon as the fluid begins to drop, the orifice should be closed for twelve hours, so that the sugar may be partially dissolved before percolation is allowed to proceed.

Extemporised Medicated Waters.

The same worker suggests that essential oil from which a medicated water is to be prepared, should be mixed with equal volumes of alcohol and glycerin. Two filter papers are then folded together, opened out again, and the oily mixture spread on the surface of the inner filter by means of a glass rod. Again fold the filters, place in a funnel capable of resisting heat, and pour in the full quantity of water at about boiling point. The first filtrate is received in the measure in which the oil has been mixed with the alcohol and glycerin, stirred with the glass rod, and returned to the filter. When the whole of the water has passed through, it is again returned, and this operation is repeated two or three times. Camphor water may be similarly prepared, if the camphor be first dissolved in its own bulk of alcohol, and the same quantity of glycerin then added. It is recommended that all medicated waters should be made every two or three weeks.

Pill-coating with Salol.

The following method is recommended in the *Pharmaceutical Era* for giving pills an attractive appearance when coated with salol. A little salol is melted in a dish, and the pills, which must be dry and hard and free from powder, are rotated in the melted substance. The coating will at first be rough, but may be made perfectly smooth by transferring the pills to an empty evaporating dish which has been heated just sufficiently to slightly re-melt the outer surface of the salol. By rotating them on this dish they soon become perfectly smooth and glossy; they should then be turned out on to a wooden slab or burnisher, as they will not stick to wood.

Purification of Wool-fat.

Hurwitz gives the following process for the preparation of medicinal wool-fat from the crude article or "degras." Melt the wool-fat on a water bath in a vessel of large capacity. Add to it sodium carbonate, stirring until the mixture is strongly alkaline to litmus, and add enough water to make a thin emulsion. Boil for about fourteen minutes, then add enough salt until the emulsion is broken up. Remove the partially saponified fat and empty the vessel. Again fill the vessel with water and boil, and while boiling add to it the saponified fat in small portions. Skim off the fat as it rises to the top, and after all is skimmed off knead it with successive portions of water until the liquid remains clear after being kneaded with the fat. Again heat the fat with water and while hot skim off the fat, afterwards evaporating on a steam bath until it is practically anhydrous. Crude wool-fat is bought on the market in America in large quantities at $2\frac{1}{2}$ cents per lb., and in small quantities would probably cost about 4 cents per lb. The cost of obtaining 1 lb. of purified wool-fat is said to be: $3\frac{1}{2}$ lbs. crude wool-fat, 15 cents; sodium carbonate and salt, 2 cents; fuel, 5 cents. Total 22 cents. If prepared on a large scale the cost ought to be, of course, considerably less. From this the author concludes that if the pharmacist uses it in large quantities it would pay him to purify the crude wool-fat himself. At any rate, it shows that the prices charged for the purified fat on the market are too high, even if a fair profit is allowed.—*New England Druggist*, ix., 650.

Commercial Picrotoxin.

According to Meyer, commercial picrotoxin is not constant in composition, the melting point of samples varying between 193° and 200° C. This should not be, since it is easy to obtain the pure article, melting at 199° to 200° C., by a few recrystallisations from alcohol and water. Picrotoxin is stated to be not a simple body but a compound containing 34 per cent. of picrotin, $C_{15}H_{18}O_7$, and 66 per cent. of picrotoxinin, $C_{15}H_{16}O_6$.—*Pharm. Cent.*, xxxviii., 421.

Sodium Flame in Polarimetry.

Those who have occasion to conduct many polarimetric observations will have found sodium chloride, the usual means of obtaining the yellow light, far from being satisfactory for the purpose. According to Dupont, a mixture of sodium chloride and tribasic phosphate, melted together in about molecular proportions, affords a very satisfactory means of producing monochromatic light. The mixture is more easily melted than the chloride alone, and gives a brilliant light of remarkable persistence.—*Ann. de Chim. Analyt.*, ii., 267.

Soluble Starch.

Syniewski reports that starch may be converted into the soluble form without production of dextrin by treatment with sodium peroxide. To a solution of 50 grammes of the peroxide in 500 C.c. of well-cooled water a mixture of 50 grammes starch with 500 C.c. water is added with stirring. A jelly is formed, which becomes perfectly liquid after an hour, copious evolution of gas taking place meanwhile. On adding alcohol (95 per cent.) a viscid precipitate is thrown down. It is separated, dissolved in cold water, neutralised with acetic or hydrochloric acid and again precipitated with alcohol, these operations being repeated until the product is quite free from ash. Finally, the precipitate is triturated with absolute alcohol, washed on a filter with ether, and dried in a vacuum; it then has the appearance of a snow-white amorphous powder, without taste or smell, having a composition represented by the formula $C_{18}H_{32}O_{16} = 3C_6H_{10}O_5 \cdot H_2O$, or a multiple of it. The substance is readily soluble in cold water; it gives, with iodine, a clear blue coloration, and the yield amounts to 90 per cent.—*Berichte*, xxx., 2415.

Densities of some Gases.

Lord Rayleigh, in a paper read before the Royal Society, states that the mean density of carbonic anhydride, after correction for errors of weights and for the shrinkage of the globe when exhausted, is 3·6349, corresponding to 2·6276 for oxygen, the globe being charged at 0° C., whilst the actual pressure was that of the manometric gauge at about 20°, reduction being made to 15° by the use of Boyle's law. Under similar conditions, the mean value for carbonic oxide was found to be 2·29906, and that of nitrous oxide 3·6359. The densities of various gases relatively to air (1·00000) were determined to

be :—Oxygen, 1·10535 ; nitrogen and argon (atmospheric), 0·97209 ; nitrogen, 0·96737 ; argon, 1·37752 ; carbonic oxide, 0·96716 ; carbonic anhydride, 1·52909 ; nitrous oxide, 1·52951. The value obtained for hydrogen upon the same scalc—0·06960—is stated to appear to be a little too high.

Composition of Gutta Percha.

Dr. E. F. A. Obach, who is summarising all that is known about gutta percha in a series of Cantor lectures, shows that the purified substance probably consists of a hydrocarbon (pure gutta), having the formula $C_{10}H_{16}$; albane, $C_{10}H_{16}O$; fluavile, $C_{40}H_{64}O_3$; and a variable component named guttane. Pure gutta possesses all the good qualities of gutta percha in a much enhanced degree, becoming soft and plastic on heating, and hard and tenacious on cooling, without being in the least brittle. The resins appear to be simply accessory components, which have a decidedly detrimental effect when they preponderate. Water, wood fibres, bark, sand, etc., occur, of course, merely as mechanical impurities of gutta percha. —*Journ. Soc. of Arts*, xlvi., 122.

Occlusion by Palladium.

In a paper read before the Royal Society, Drs. L. Mond, W. Ramsay, and J. Shields explain that in their investigation of the nature of the occlusion of gases by finely divided metals they have had occasion to examine the behaviour of palladium to hydrogen and oxygen. The metal was employed in the state of black, sponge, and foil, the palladium black having the following probable composition :—Pd, 86·59 per cent. ; PdO, 12·69 per cent. ; H_2O, 0·72 per cent. When heated in an atmosphere of oxygen the black absorbed the gas at least up to a red heat, with the formation of a brownish-black substance which did not again lose its oxygen at a dull red heat *in vacuo*. The amount of oxygen absorbed—nearly 1000 volumes—was about one and a-half times as much as corresponds with the formula Pd_2O, and it is stated that if the ignition had been sufficiently prolonged the whole of the palladium would probably have been converted into the oxide PdO. When exposed to hydrogen the palladium black absorbed more than 1100 volumes, but only 873 volumes of the gas were really occluded, the remainder having formed water with 139 volumes of oxygen originally contained in the black. Of the occluded portion, about 92 per cent. was pumped off slowly at the ordinary temperature, and almost the whole of the remainder at 444°. Increase of pressure of the hydrogen, from 1 to 4·6 atmospheres, had no influence on the quantity occluded at the ordinary temperature. New palladium foil could not occlude any appreciable quantity of hydrogen until it had been subjected to powerful ignition in the blow-pipe flame. The composition of fully charged palladium hydrogen was found to correspond closely with the formula Pd_3H_2, first suggested by Dewar.

Commercial Calcium Carbide.

H. le Chatelier states that the two elements most abundantly present as impurities in calcium carbide are silicon and iron. The iron is combined exclusively with the silicon in the form of silicide, some small crystals of which have been found to have the formula $SiFe_2$, whilst the excess of silicon appears to unite either with the carbon or calcium, according to the relative proportions of those two bodies. If there be an excess of carbon over calcium, carbon silicide crystallises in hexagonal plates which are generally of a blue colour. On the other hand, excess of calcium results in the formation of calcium silicide, which is found in metallic grains possessing the colour and lustre of zinc. There are apparently two distinct silicides of calcium, one of which is scarcely affected by nitric acid, whilst the other is easily attacked.—*Bull. Soc. Chim.* [3], xvii., 763.

Polymerisation of Chloral.

J. W. Mallet states that 250 Gm. of anhydrous chloral (trichloracetaldehyde), contained in a hermetically sealed glass vial, became suddenly polymerised without any apparent external disturbance. The vial was left on a lecture-room table over night, and next morning it was found in fragments, whilst a thin crust of meta-chloral covered a circular space on the table measuring about half a metre in diameter. The direct rays of the sun could not reach the table, and none of the surrounding bottles had been disturbed. It is assumed that polymerisation must have taken place so rapidly, and to such an extent, that the heat evolved in the unison of the smaller into larger molecules raised the temperature of the remaining liquid chloral to a point at which the tension of its vapour was more than the vial could withstand.—*Am. Chem. J.*, through *Chem. News*, lxxvi., 280.

East African Sandal Wood.

Stuhlmann and Volkens have discovered in East Africa a tree-like shrub, *Osyris tenuifolia*, Engl., belonging to the natural order Santalaceæ. The agreeable smell is due to a brown resin with which the wood vessels are filled ; this originates in the cells of the medullary rays and of the wood parenchyma. The wood is very similar to the genuine Indian sandal wood.—*Chem. Repert.*, xxi., 229.

Anatomy of the Solanaceæ.

According to F. Fedde, the Solanaceæ present a number of characters which differentiate them sharply from all allied orders, rendering it at the same time very difficult to distinguish the sub-orders by anatomical characters. Among the constant characters are the following :—The epiderm always consists of only a single layer of cells ; it is not lignified, and the cuticle is always thin. There is always a layer of collenchyme in the herbaceous parts of the stem. The vascular bundles are always collateral, and never have a protecting sheath. The vessels of the secondary xylem and the tracheids have bordered pits. In most of the genera there are very minute crystals in the cortical and medullary parenchyme and in the leptome. When these are wanting there are larger crystals, or thorns formed. The pith is usually composed of thin-walled cells, and these cells, when lignified, have large round pits.—*Bot. Centralblatt*, lxxii., 1897, p. 144.

Oil in Fruits.

According to C. Gerber, the oil contained in the ripe olive must have been formed at the expense of mannite or of some other carbohydrate. This is shown by the fact that the proportion between the carbon dioxide absorbed and the oxygen given off is less than unity. The same appears also to be the case with other fruits. The value of the proportion between the gases referred to resulting from this assimilatory process differs materially from the proportion in fermentation or in the production of acids.—*Comptes rendus*, cxxv., 1897.

Moisture and Vitality.

From a number of experiments on this subject, Dr. A. J. Ewart concludes that there is no truth in the statement often made that seeds, spores, and mosses can withstand complete desiccation without losing their vitality. It is impossible to deprive anything of a vital nature entirely of water without destroying its vitality. Dr. Ewart found that the minimum percentage of water sufficient to maintain vitality is from 2 to 3 per cent. of the dried weight of the organism. Protoplasm containing the minimum amount of water necessary to maintain vitality is perfectly dormant ; it can neither respire nor assimilate ; it can neither add to its substance nor diminish it.—*Transactions Liverpool Biological Society*, 1897, p. 151.

SOME EXPORTS OF SOUTH CHINA AND INDO-CHINA.

BY AUGUSTIN HENRY, M.A., L.R.C.P., F.L.S.
Corresponding Member of the Pharmaceutical Society.

CASSIA AND CINNAMON BARKS.—From the statistics issued by the Customs of China, and by the French Colony of Indo-China, there appear to be three diffcrent barks of commercial importance. Concerning only one of these, Chinese cassia bark, is our information at all definite or complete. As a result of Mr. Ford's investigations we know that the tree producing this bark is cultivated in the Chinese provinces of Kwangsi and Kwangtung, and the tree is *Cinnamomum cassia*, Blume. This bark reaches Hong Kong by steamer and by junk, and the statistics for 1896 are as follow :—

Canton, Export by Steamer :—

	Piculs.		Taels.
Cassia Lignea	3,333	value	33,432
,, Twigs	9,065	,,	6,040
,, Twig Bark	11,820	,,	25,457

Kowloon, Export by Junk :—

Cassia Lignea	70,138	,,	490,966
,, Broken	3,676	,,	12,865
,, Twigs	2,386	,,	1,731

Thicker barks are distinguished by the Chinese as cinnamon, and a small quantity of this is produced in the same locality as the cassia bark. The figures for 1896 are for cinnamon :—

	Piculs.		Taels.
Canton Export	89	value	4,494
Pakhoi ,,	10	,,	307

Mr. Ford says this bark is simply the thick bark of very old trees of the same species ; and this is correct as regards the cinnamon produced in Kwangsi and Kwangtung. However, the kind of cinnamon most valued by the Chinese is not a product of China ; it comes from the Laos States, now controlled by France.

LAOS CINNAMON.—Most extraordinary prices are paid for this by Chinese, who consider it to be a remedy for all diseases, as much as 50 dollars being given for a "pair of barks," each piece measuring about fifteen inches long by four inches broad. This cinnamon is conveyed by pedlars, merchants, etc., in small quantities, overland from the Laos States through Yunnan and down the West River to Canton, and as it does not touch any customs stations of Indo-China or China, no statistics are available as to its quantity or value. Concerning the botanical source, the only evidence is Thorel's statement in the botanical chapter of Garnier's 'Voyage d'Exploration en Indo-Chine' that *Cinnamomum cassia* grows wild in the forests of Indo-China situated about 19° latitude. He goes on to mention that "the bark of branches, the size of the thumb, is the more common ; but that the bark of great branches, taken off in large rectangular plates, is sent to the Chinese pharmacists, who sell it at an excessive price." I have grave doubts as to Thorel's identification of this wild tree, and it does not appear that he procured any botanical specimens. I do not know that there is in any herbarium a specimen of wild-growing *Cinnamomum cassia*, Bl. I am inclined to think that this Laos tree is different. As French officers are now stationed throughout the Laos States, it would be an easy matter for the Paris botanists to obtain through thcir Colonial Office herbarium specimens of the Laos cinnamon tree, which is so valuable.

ANNAM CASSIA.—The third bark of commercial importance is Annam cassia. It does not appear to be known in the London market, but it is largely imported from Hong Kong into the United States, where it is known as Saigon cassia or Saigon cinnamon. This name is a misnomer, as very little, if any, of the bark sent to the United States is produced in Cochin China, of which Saigon is the capital. It is really produced in Annam. The official figures for 1895 of the export of "Cannelle" are :—

	Kilog.		Francs.
Annam	280,633	value	428,168
Cochin China	1,381	,,	13,830

Nothing definite seems to be known about this article except that the trees occur in the wildest parts of Annam, and there is no evidence of any cultivation. No botanical specimens, so far as I know, have ever been gathered, and it is a mere assumption that the tree is *Cinnamomum cassia*, Bl. The bark is apparently distinct enough from the cassia bark of South China. In this case, as in the preceding, French botanists, by means of official channels, might easily settle an important botanical question.

Cardamoms form another interesting export from Indo-China. The figures for 1895 are :—

	Kilog.		Francs.
Cochin China	15,462	value	106,140
Annam	18,826	,,	17,035
Tongking	68,767	,,	74,489

It is probable that two or three different kinds are lumped together in the Customs statistics. Here again French botanists could do good service by demanding specimens of all the kinds of cardamoms known in the markets of Indo-China, supported by botanical specimens of the plants producing them. Less is known botanically about cardamoms than about any other class of drugs.

DYE-YAM.—This is the root of *Dioscorea rhipogonoides*, Oliver, and is the *Cunao* of the Annamese, *Shu-lang* of the Chinese, and *faux gambier* of the French. It is sent in enormous quantities from Indo-China to Southern China, where it is used for tanning fishing-nets and for dyeing certain fabrics, such as the coarse silk and cotton mixtures of Canton. The figures for 1895 are :—

	Kilog.		Francs.
Tongking export	3,675,176	value	372,176
Annam ,,	681,175	,,	44,521

It occurs in South China and in Formosa as well, but only in sufficient quantity to satisfy local requirements. Considering the cheapness and amount available of this dyeing and tanning material, it might be worth while making some experiments with it in England.

CAMPHOR.—In connection with a note by me in the *Pharmaceutical Journal* for March 6 last, p. 201, concerning the production of camphor on the Chinese mainland, I may now cite the figures shown in the Customs Returns for 1896. The export was : from Wenchow, 11 piculs ; Canton, 332 piculs ; Kowloon, 438 piculs ; Pakhoi, 404 piculs ; all undoubtedly produced in China. The port of Amoy showed an export of 1177 piculs, but there is reason to believe that this was Formosan camphor, smuggled over from the island in junks.

STAR ANISEED.—The tree producing the star aniseed of commerce, *Illicium verum*, Hook. f., is known to occur only in Kwangsi and Tongking. It is equally established that the Japanese species of *Illicium religiosum* (*I. anisatum*, Linn.) produces a very poisonous fruit, which may be distinguished by the Japanese name, "skimmi." It is astonishing then to find that year after year enormous quantities of "skimmi" are sent out of Japan to China. It is only in the statistics of a single Chinese port, Shanghai, that a distinction is made between the true article and its poisonous adulterant. During 1896 there was imported into Shanghai—

	Piculs.*		Taels.*
Star Aniseed	2490	value	52,181
Japan Star Aniseed	2514	,,	7,542

Of course in any other country than China steps would have been

* Picul = 133⅓ lbs. Tael = 3*s.* 4*d.*

taken before now to check an importation, which is not only deleterious to health but also one which must interfere with the profits derived by Chinese producers of the genuine article.

Pakhoi is practically the only port from which star aniseed is exported, the quantity for 1896 being 6691 piculs, valued at 133,817 taels. From Tongking there does not seem to be any export of the fruit itself; but the oil is now being sent in quantity from Haifong to France, as it benefits (over star aniseed oil imported from Hong Kong) by certain fiscal arrangements. Mr. Morse's report from Lungchow gives some particulars concerning the production of star aniseed oil. There appear to be three districts, Langson in Tongking, and Lungchow and Posê in Kwangsi. The export of the oil from Pakhoi in 1896 was 2053 piculs, valued at 410,692 taels. From Tongking, in 1885, the export was 3129 kilogrammes, valued at 36,148 francs; the figures for 1896 are not yet published, but will be much larger. Mr. Morse points out that the native mode of gathering the fruit so damages the trees that a good crop is only possible in one year out of three.

Needs of Economic Botany.—The preceding remarks on cinnamon and cardamoms show that even in a country like Indo-China, perfectly accessible to Europeans, many botanical questions remain unanswered. Residents and travellers in foreign countries are convinced erroneously that any article with a common well-known name must be known in all its bearings to science. For example, two travellers in Tibet and West China, whom I have known, made excellent botanical collections, but they omitted to procure any specimens of the plant yielding rhubarb, which they saw being prepared for the foreign market. When I asked them why this omission, both replied that they thought everything was known concerning such a common article as rhubarb. In the Admiralty 'Manual of Scientific Enquiry' there is a chapter on botanical desiderata, but I do not think, speaking from memory, that it is detailed or explicit enough. A new list ought to be made out of all the articles, like cinnamon, benzoin, etc., concerning which information and botanical specimens are required. Such a list might very well be distributed to Consuls in all parts of the world. But what is really wanted is a good text-book on economic botany, giving succinctly and accurately the facts already known, and pointing out the gaps to be filled in our knowledge. Willis's recently published 'Dictionary of Flowering Plants and Ferns' I find very interesting and useful, but the economic botany in it is far too meagre. A book on similar lines confined to economic plants would satisfy a great want. Such a work would necessitate great labour and involve some years in its preparation; but there is no greater benefactor than the author of a good text-book suitable to the requirements of the intelligent and grown-up public. Time so spent is perhaps as valuable as that devoted to the petty discoveries which everyone now feels bound to make in order to take rank as an "original investigator."

Excretion of Drops of Water from Leaves.—According to Dr. A. Nestler, while the excretion of drops of water from the leaves of plants is frequently effected by special organs (hydathodes), this is not always the case. In *Agapanthus umbellatus*, which has neither epitheme nor water pores, this excretion takes place partly on the upper side of the leaf, partly on the under side of its apex. In grasses it may be brought about in various parts of the leaf. In *Tradescantia viridis* the exudation is effected through water pores placed in a row on the margin of the upper side of the leaf, the only stomates on the upper surface. In *Phaseolus multiflorus* the club-shaped hairs do not appear to have any excretory function. —*Sitzber. k. Akad. Wiss. Wien*, cv., p. 521.

PHARMACEUTICAL SOCIETY.

MEETING OF THE COUNCIL.

WEDNESDAY, JANUARY 12, 1898.

Present:

Mr. Walter Hills, President.

Mr. G. T. W. Newsholme, Vice-President.

Messrs. Allen, Atkins, Bateson, Bottle, Carteighe, Corder, Cross, Grose, Hampson, Martindale, Savory, Symes, Warren, and Young.

The minutes of the last meeting were read and confirmed.

The Late Richard William Giles.

The President said since the last meeting of Council they had lost another of their veterans in pharmacy in the person of the late Richard William Giles, who was well known to many round that table. Mr. Giles was one of the earliest students of the Society, having been in the School in the years 1847 and 1848. He took prizes in chemistry, pharmacy, and materia medica, as well as a second prize in botany, and was one of the earliest to pass the Major examination. Mr. Giles served on the Council from 1853 to 1856, and was a member of the Board of Examiners from 1863 to 1868; he also gave an inaugural address to the students in 1874. A few minutes before coming into that room he (the President) had had an opportunity of running over that address, and he thought he could not do better than ask, especially the younger members of their craft, to read again that address. For grace of diction, its general composition, and for the sentiment which it contained, he could conceive of no better address for any who were interested in pharmacy to read. Perhaps that address was largely summed up in one sentence to be found in it, which all would agree represented the views of the late Mr. Giles in reference to pharmacy, and which was as follows:—"The status of pharmacy will be best raised by the diffusion of a higher educational tone amongst us, which must in the end command respect." Mr. Giles frequently addressed the annual meetings, and was one of the most fluent and forcible speakers on those occasions. He was a man of remarkable business capacity and great intellectual gifts, and in him they had lost one of their most distinguished members. It was a singular thing that Mr. Giles died exactly fifty-two weeks after his friend Mr. Schacht. These two gentlemen lived together for many years side by side in Clifton. It might also be mentioned that some twenty years ago Mr. Giles was called to the Bar in the Middle Temple. The resolution which he (the President) proposed, and to which he felt sure the Council would agree, was as follows:—

> That this Council learns with regret of the death of Mr. Richard William Giles, who rendered good service to the Society as a member of the Council, and subsequently as a member of the Board of Examiners for England and Wales, and that the President be authorised to convey to Mrs. Giles and the family the deep sympathy of the Council.

The Vice-President seconded the proposition, which was agreed to unanimously.

Deaths of Mr. C. Wheeler and Mr. Ernest Hart.

The President said he had also to refer with regret to the death on January 7 of Mr. Christopher Wheeler, of Hackney Road, at the age of 69. He had been a member of the Society for forty years, and was Divisional Secretary for Hackney. He might also refer to the recent death of an eminent man who had been somewhat connected with the work of the Society, viz., Mr. Ernest Hart, editor of the *British Medical Journal*, and a very prominent and active member of the British Medical Association. He had been a frequent visitor at their annual dinners, and took a great interest in the matters connected with pharmacy. Amongst other public services which he rendered he might refer to the fact that the present efficient administration of the Pharmacy Act with regard to secret remedies was almost entirely due to the persistency with which Mr. Hart represented to the Treasury the danger arising from the sale of such remedies. It would be remembered that there was a prosecution at Bow Street arising out of this matter, and it had now been held that secret remedies containing poisons came under the same provisions as similar preparations not bearing a revenue stamp.

The Boards of Examiners.

The Secretary reported that a letter had been received from the Privy Council office enclosing the official approval of the names of the examiners recently submitted.

DIPLOMAS.

The undermentioned, being duly registered as pharmaceutical chemists, were respectively granted a diploma stamped with the seal of the Society :—

Barrie, Thomas Stewart.
Burgin, Mark Fredk.
Evans, Thomas James.
Hacking, Chas. Harold.
Hayley, Benjn. Pawson.
Hill, Philip Robert.
Holmes, John.
Jones, Ernest William.
Pattison, Joseph.
Price, Edward George.
Shaw, William.
Shorrock, Mary.
Wild, Sydney.
Windemer, Oscar Roxburgh.

ELECTION OF MEMBERS.

Pharmaceutical Chemists.

The following, having passed the Major examination and tendered their subscriptions for the current year, were elected "Members" of the Society :—

Ecroyd, Walter ; Keighley.
Evans, Thomas James ; London.
Hacking, Charles Harold ; Darwen.
Haley, Benjamin Pawson ; Bradford.
Hamerton, James ; London.
Hankinson, William ; Manchester.
Martin, William ; Southampton.
Metcalfe, William Edward ; Bradford.
Morris, Ernest William ; London.
Pattinson, Joseph ; Wigton.
Shaw, William ; Huddersfield.
Thompson, Thomas ; Tooting.
Wild, Sydney ; New Mills.
Windemer, O. R. ; Tunbridge Wells.

Chemists and Druggists.

The following, who were in business before August 1, 1868, having tendered their subscriptions for the current year, were elected "Members" of the Society.

Burt, George Edward ; E. Dulwich.
Peck, George ; Cambridge.
Sage, Charles James ; Frome.
Schouver, Leon ; Oxford.
Thomson, George ; Aberdeen.

ELECTION OF ASSOCIATES IN BUSINESS.

The following, having passed the Minor examination, being in business on their own account, and having tendered their subscriptions for the current year, were elected "Associates in Business" of the Society :—

Bennett, Albert Edward ; Tyldesley.
Blomfield, Thomas Nevill ; Hastings.
Blount, George W. ; Newcastle-on-T.
Bremner, William ; Port Erroll.
Briggs, Alfred Radley, Horbury.
Clark, Alexander Robertson ; Braemar.
Dennis, William ; South Shields.
Edmondson, Thomas ; Penrith.
Enoch, Abraham ; Tewkesbury.
Franklin, John William ; Kobe.
Hankinson, A. W. ; Grange-over-Sands
Hodder, H. G. ; Kingston-on-Thames.
Hughes, Richard ; Cardiff.
Lawson, Albert Edward ; London.
McCorquodale, John C. ; Markinch.
Moore, Leopold Frank ; Buluwayo.
Reid, James ; Dumfries.
Rigden, Hubert ; Harrow.
Smithies, William Henry ; Bradford.
Thomson, Gavin R. ; Campbeltown.

ELECTION OF ASSOCIATES.

The following, having passed their respective examinations and tendered their subscriptions for the current year, were elected "Associates" of the Society :—

Minor Examination.

Acton, James Rowland ; Battersea.
Barker, Charles ; Bishop Auckland.
Bennett, Charles Thomas ; Camborne.
Blackburn Albert E. ; Darlington.
Blaker, Ernest James ; Ashford.
Brickell, Ethelbert R. ; Worcester.
Burton, Harry ; Lichfield.
Cathro, Thomas Gorrie ; Dundee.
Coles, Sydney George R. ; Birmingham
David, Idwal ; Cardiff.
Dean, Charley ; Bury.
Dobie, James Turner ; London.
Dudgeon, Tom Skipsey ; Ripon.
Elgar, John Butler ; Fakenham.
Ellis, Hugh Edward ; Aberystwith.
Ellis, John ; Leicester.
Flemming, Thomas H. ; Huddersfield.
Gorst, William ; Warrington.
Grassie, William ; Aberdeen.
Hart, Samuel Henry ; Hull.
Heddle, James S. B. ; S. Ronaldshay.
Hickling, Alfred John ; Stamford.
Hoare, William Harold ; Derby.
Jenner, Percy Greenwood ; Liverpool.
Jones, William Bodwin ; Holyhead.
Jones, William Parry ; London.
Kenway, Ivor ; Neath.
Lacey, William James ; Norwich.
Larder, Frederic ; Louth.
Latham, William Henry ; Wigan.
Leefe, Bernard Wrapson ; Malton.
Low, Joseph ; Edinburgh.
MacKenzie, John Melville ; Edinburgh.
Mossom, Arthur Henry ; Darlington.
Park, Henry Marshall ; Tynemouth.
Porteus, J. P. ; Grange-over-Sands.
Potter, William ; Plaistow.
Pring, William Wallace ; Bromyard.
Profit, Thomas ; Wrexham.
Pyman, Harold ; Stowupland.
Reeves, Horace ; Cheltenham.
Richardson, Edwin ; Nottingham.
Simmons, Edward Harry ; Birkenhead.
Sutherland, James John ; Edinburgh.
Swinn, Charles Gosling ; Manchester.
Thackrey, Frank ; Pateley Bridge.
Todd, Arthur Higgs ; Belfast.
Westerman, Thomas K. ; Huddersfield.
Williams, John ; Nottingham.

Modified Examination.

Hales, Thomas M. ; Warrington.

ELECTION OF STUDENTS.

The following, having passed the First examination and tendered their subscriptions for the current year, were elected "Students" of the Society :—

Allan, Richard Birrell C. ; Dumfries.
Allen, John Rex ; Bloxwich.
Allen, William F. ; Market Bosworth.
Andrews, Frank ; Redditch.
Ashkanazy, Albert W. ; Dartford.
Bailey, Edward Arthur ; Boston.
Barker, Donald William E. ; Cambridge.
Bate, Alexander ; Manchester.
Baxter, Adela Mary ; Cheltenham.
Black, William John ; Tweedmouth.
Bollom, Arthur Harry ; London.
Bunting, Sydney ; London.
Bye, William Luther John ; Llandilo.
Chrystall, C. G. W. ; Buckhurst Hill.
Churchill, Lionel A. ; Burton-on-Trent.
Clay, William Joseph ; Nottingham.
Clement, William Henry ; Barnstaple.
Cocking, Thomas Tustin ; Sheffield.
Cole, William Frederick ; Lowestoft.
Collings, Ellis A. ; Littlchampton.
Collins, Clifford ; Ipswich.
Darroll, John Walter ; Warminster.
Davies, Llewellyn Rhys ; Llanelly.
Davies, William John ; Pontypridd.
Dougall, Thomas ; Conway.
Dunlop, Margaret Kayes ; Glasgow.
Durbin, Herbert Samuel ; Putney.
Dyson, Joshua ; Brighouse.
Eaton, Harry Oswald ; Leeds.
Elliott, John Johnson ; Southport.
Enoch, David ; New Quay.
Falconer, C. ; Barrow-in-Furness.
Falding, Walter Bullock ; Wakefield.
Farnill, Thomas Bentley ; Goole.
Finnemore, Horace ; Seighford.
Foster, Frederick ; Kidderminster.
Frank, John William ; Guisborough.
Franklin, Arthur C. ; Stamford Hill.
Gair, Duncan ; Inverness.
Gale, George Thomas ; Barnstaple.
Gray, William ; Upton Manor.
Greening, Ernest H. ; Dorchester.
Griffiths, Robert Lloyd ; Anglesea.
Gunthorpe, George ; Lincoln.
Harris, John ; Neath.
Hughes, William Henry ; Birkenhead.
Hussey, Herbert Richard ; Weymouth.
Jones, George M. ; Birmingham.
Jones, Thomas ; Llanybyther.
Keall, John ; Cricklewood.
Kluge, Herman James ; Swansea.
Lennox, Sydney Marshall ; Bristol.
Lloyd, Hugh ; Ruthin.
Lord, Nettie ; Forest Hill.
McIntosh, John William ; Portsmouth.
McNeil, Thomas McM. ; Kennington.
MacSweeny, Eugene ; Nice.
Magnay, William ; Wigton.
Makepeace, Harold Edward ; London.
Manning, Henry Reginald ; Modbury.
Masson, Hedley George ; Torquay.
Milne, Peter Duffus ; Insch.
Morris, William ; Llanarmon.
Neal, Joseph Lloyd ; Liverpool.
Nicol, Mary Craigie ; London.
Parry, John Robert ; Clwt-y-bont.
Peck, Alfred Newton ; Newmarket.
Pickering, William ; Barnsley.
Privett, John Warren ; London.
Quibell, John William ; Newark.
Ransford, Arthur T. ; Folkestone.
Richardson, James A. ; Market Rasen.
Robertson, Sidney ; Norwich.
Salter, Leonard Eli ; Trowbridge.
Saltmarsh, Alice Isabella ; Hampstead.
Sinnett, William ; Milford Haven.
Skyrme, Harold Edgar ; St. Arvans.
Spencer, Herbert ; Southwark.
Stables, James Ernest ; Kendal.
Sterling, Joseph W. ; Annfield Plain.
Stevenson, R. H. S. ; Tunbridge Wells.
Stokoe, Thomas Joseph ; Hay.
Stovin, John ; Kilburn.
Summerfield, Alfred W. ; Middlewich.
Tabberner, Thomas K. ; Birmingham.
Thomson, Harry ; New Deer.
Tipping, Albert James ; London.
Vallet, Cyril Edward F. ; London.
Viret, Francis Mervyn ; London.
Walters, Joseph ; Sheffield.
Watt, Robert John ; Ammanford.
White, Gilbert ; Litcham.
Whiting, William ; Hornsea.
White, Charles Alex. B. ; Dunblane.
Whysall, George Ernest ; Grantham.
Wiley, Harold ; West Hartlepool.
Williams, F. J. ; Weston-super-Mare.
Williams, Sydney Rhys ; Llanelly.
Williams, William Parry ; Carmarthen.
Yates, Arthur Gurney ; Sheffield.
Young, Francis Joseph ; Leicester.

RESTORATIONS TO THE REGISTER AND TO THE SOCIETY.

The names of the following persons, who have severally made the required declarations and paid a fine of one guinea, were restored to the Register of Chemists and Druggists :—

Leonard Blakeley, Tower Road, Skirbeck, Boston.
Frank Hoad, 10, London Road, Ore, Hastings.
Charles Lear, 13A, Air Street, Regent Street, W.

Several persons were restored to their former status in the Society upon payment of the current year's subscription and a nominal restoration fee of one shilling.

REPORT OF THE FINANCE COMMITTEE.

The report of this Committee was read, including the recommendation that sundry accounts be paid.

The PRESIDENT, in moving that the report and recommendation be adopted, said there was nothing special to which he need call attention in connection with the General Fund. With regard to the Benevolent Fund, he had the pleasure of announcing that

another donation of £50 had been received from the directors of Camwal, Limited. There had also been a donation of five guineas from Dr. Stevenson, and it was very pleasing to find that a gentleman who was not connected with the Society, except as an honorary member, knowing what the work of the Benevolent Fund was, so highly appreciated it as to give a donation. That morning also £9 had been received from Mr. Moss, being the balance or surplus on the Attfield Testimonial.

Report of the Benevolent Fund Committee.

The report of this Committee included a recommendation of grants to the amount of £66 in the following cases :—

A chemist and druggist member (54), who had been in business for twenty-five years, but had to give up in July last, being a hopeless invalid, and is quite without resources. (London.)

A registered chemist and druggist (81), formerly in business, but for the last thirteen years has had only intermittent employment. (Leicester.)

The widow (68) of a chemist and druggist, who has had twelve previous grants. (Essex.)

The widow (64) of a chemist and druggist, who has had two previous grants. (London.)

The widow (60) of a pharmaceutical chemist, who recently died after a protracted illness, leaving her quite unprovided for. (London.)

A registered chemist and druggist (52), suffering from incurable disease. (London.)

A former pharmaceutical member and subscriber (59), and local secretary. (Sleaford.)

One case was deferred for further information.

The Secretary reported the death of two annuitants, Henry Machon, aged 70, of Saffron Walden, and Maria Collins, 81, of Hornsey. He also reported the resignation by Mrs. Elizabeth Woods of the annuity she has been receiving since 1880, having had a substantial legacy left her.

The Vice-President (as Chairman of the Committee) in moving the adoption of the report, said the Committee had thought it right to make a record, in the Benevolent Fund regulations, of the rules adopted in 1894 for the interpretation of Clause 12 relating to the reduction of annuities. He then gave several instances in which alterations had been made; in one case a lady annuitant, having had a substantial sum of money left to her, resigned her position on the Fund. Unfortunately, since their last meeting they had lost two annuitants, therefore it was felt that the Council had not done very far wrong when they elected six annuitants to the Fund at the last meeting. One old gentleman who had had a certain sum of money voted to him had been good enough to say that he did not require it, as, though over seventy years of age, he had found a situation, and was quite independent of it. Another case he might mention was that of an old gentleman who was over eighty years of age, and although he was obliged to take some little money from the Fund, he said he was not yet too old to work.

Mr. Atkins seconded the motion, which passed unanimously.

Library, Museum, School, and House Committee.

The report of this Committee stated that the report of the Librarian had been received, and included the following particulars :—

		Attendance.	Total.	Highest.	Lowest.	Average.
November	Day		418	27	8	16
	Evening		172	18	4	8

Circulation of Books.	Total.	Town.	Country.	Carriage paid.
November	238	109	129	£1 7s. 8½d.

Several donations had been received (*Ph. J.*, December 11, p. 532), and the Committee had directed that the usual letters of thanks be sent to the respective donors.

The Committee had recommended that the new volumes of the 'Flora of Tropical Africa' be purchased on publication.

The Curator's report had also been received, and included the following particulars :—

		Attendance.	Total.	Highest.	Lowest.	Average.
November	Day		566	33	6	22
	Evening		58	7	1	2

Several donations had been received (*Ph. J.*, December 11, p. 532), and the Committee directed that the usual letters of thanks be sent to the respective donors.

The Committee reported that the microscopes had been placed under the care of the Curator. Also that Mr. Carteighe had presented to the Society as a memento of the Jubilee one of the medals struck by the Royal Mint in commemoration of that event.

The President moved the adoption of the report and recommendations. He said there had been a good deal of routine work before the Committee, but nothing to which he need call special attention. They were all much indebted to Mr. Carteighe for his kind thoughtfulness in obtaining for the Society one of the limited number of medals issued by the Royal Mint. The medal was a very beautiful object and well worthy the occasion.

Dr. Symes said he was very glad to hear that the microscopes had been put under the charge of the Curator, so that they would be kept in good order. He was sorry to say the students had not been as careful of the slides as might have been expected, seeing that they were supplied and kept for their especial benefit. In future those who really desired to use the microscopes for purposes of study would be able to have the full advantage of them.

The resolution was adopted unanimously.

Report of Examinations.

January, 1898.

	Candidates. Examined.	Passed.	Failed.
England and Wales :—			
Major	23	14	9
Minor	247	81	166
Scotland :—			
Major	2	0	2
Minor	146	46	100

First Examination :—Twenty-two certificates were received in lieu of the Society's examination.

Report of the Law and Parliamentary Committee.

The report of this Committee included the draft of a reply to the Pharmacy Board of Victoria on the subject of reciprocity in pharmaceutical certificates (see *P. J.*, lxx., 25). The proposed Pharmacy Act Amendment Bill (see p. 54) was further discussed, and with certain verbal amendments suggested by the Solicitor agreed to; it was also recommended that the President be authorised to take such steps as were necessary to secure the introduction of the Bill into Parliament.

The President, in moving the adoption of the report, said there were two matters especially referred to in it. One was with reference to a reply to a letter received from the Pharmacy Board of Victoria last July, and the other with reference to the proposed Pharmacy Bill. He had nothing to add to the recommendation of the Committee with reference to the latter subject. He wished to refer particularly to the letter which had been received from the Registrar of the Pharmacy Board of Victoria, asking the Council, if possible, to take steps in the direction of accepting certain certificates granted by different boards of pharmacy in Australia and elsewhere. When the letter was received last year they were in the midst of the Jubilee festivities, at which time, as now, there was a growing desire that there should be more and more drawing together of the different parts of the Empire, and it was agreed that the letter should be carefully considered. That had been done, and although there was not much doubt as to what the reply would be, it was well that the matter should be considered very thoroughly. He would read the letter (see p. 54) which the Parliamentary Committee suggested should be sent in reply, first reminding the Council that to a previous communication received some years ago a reply had been sent that the Council was not in a position to recognise any other certificates than those granted by its own Boards.

Dr. Symes said there had been a certain amount of feeling shown amongst pharmaceutical chemists in the country that a Fellowship should be instituted for those who took the higher qualification. He was not intending to advocate it on that occasion, but at the same time he thought, seeing there were a number of men throughout the country—friends of the Society—who held that view, some reasonable answer ought to be given to them, either that it was not practicable or desirable, or else that its feasibility should be discussed. The Council ought not to decide to go on with the Bill and officially ignore the feeling which was entertained by a large body of the members. At the recent meeting at Liverpool, at which there was not a very large attendance, it would have been quite easy to move a resolution supporting the Bill without saying anything farther, though it would have meant a division. But on adding, as a rider, that they regretted that the Council could not see its way to adopt some further title, the resolution was carried unanimously. If that was to be taken as an indication of the general opinion, would it not be possible either to adopt the suggestion of those gentlemen, or, on the other hand, to satisfy them

that it was undesirable? A lot of trouble had been taken not to introduce anything of a contentious nature into the Bill; it seemed as if it would satisfy everybody; but as this question had arisen he hoped the President would make some statement on it. This was not a new matter, for he remembered that ten years ago there were suggestions for the institution of a Fellowship. Of course, they could not institute a Fellowship under their Bye-laws, or in any way other than by an Act of Parliament, because they could not override their Charter.

Mr. MARTINDALE thought it very undesirable to introduce a class of Fellows of the Society. The mischief had been that there had been two grades within the Society, leading to dissatisfaction amongst those who held the lower grade. If anyone desired a higher title, he thought they should seek it elsewhere, but there should be in the Society only one standard for membership—that of the legally qualified man.

The PRESIDENT regretted that Dr. Symes had launched this question, as he was present when the draft Bill was agreed to, and did not then raise it. He had hoped that all who agreed with the report of the Committee would, when they got into the country, speak out and say what they thought of these matters. He did not gather that Dr. Symes was altogether in favour of a Fellowship, but he might say that the question had been considered on several occasions. One of the great objects of the Bill now proposed to be introduced was the consolidation of the Society, and if on one hand it was provided that a certain number of men who had not hitherto been eligible for membership should now be eligible, and on the other hand to push up other men into a superior class, it would be to a great extent undoing the good work which it was hoped to effect. What would be the use of a Fellowship granted by the Society under any conditions which would be possible? He was a Fellow of the Zoological Society, but he was not required to show any anatomical knowledge, but simply to pay a certain subscription. He believed he was entitled to put F.Z.S. after his name, but he did not know that would give him any better position, nor did he think that the title "Fellow of the Pharmaceutical Society" would be of any great value to anyone. He hoped the time was coming when there would be an enforced curriculum, and also when there would be some system whereby there should be some close relationship between the teaching universities throughout the country and pharmacy. When that time came there would be an opportunity for considering the question of any fresh qualification or title. At present he thought it would be a great pity to put this suggestion in the Bill; he hoped members throughout the country would consider the matter very carefully before taking any steps to oppose the Bill. No Bill could be proposed which would meet with universal approval, but there was a very general consensus of opinion in favour of the present Bill, and he would emphasise the appeal made to all pharmaceutical chemists by Mr. Carteighe when the draft Bill was read, to sink any question of this kind for the present in order to realise what they were all anxious to effect—the consolidation of the Society. If the point now mentioned were introduced in order to meet the wishes of a few of their friends, it would immediately raise up a new class of opponents.

Dr. SYMES said he was very glad of the explanation which the President had given. The last thing he wished was to oppose the passing of the Bill, and his only object in mentioning the matter was to elicit a little information for the benefit of their friends in the country. They were often accused of doing too much *in camera*, and he wished, if possible, to secure entire unanimity. He believed that those who had raised this question would to a great extent be satisfied with the reply given by the President, and at any rate that they would all see that the time was not opportune for pressing their particular views.

Mr. CARTEIGHE said he was disappointed to find that the present generation of pharmaceutical chemists who were taking an interest in legislative matters did not take the trouble to read something of the history of pharmaceutical legislation. This question of a Fellowship was raised more than thirty years ago; it was by no means a new one. In some countries logic was one of the subjects in the preliminary examination, and he sometimes thought it would be very useful here. He would remind some of the younger members that the Society was founded with the intention of incorporating the whole of those engaged in pharmacy in one body under the one designation of member, but as soon as examinations were introduced there was a separate grade established, that of associate. In early days associates were those who had the privilege of entering the house, but no other rights; they were comparable to the class of students in many institutions, such as the engineers. They had no votes—they were regarded as *in statu pupillari*, until they should become members, which happened when they went into business, that being for many years the qualification. Mr. Symes and himself, for instance, were associates for some time before they became members. In 1866 and 1867, when the Select Committee was dealing with a Bill with regard to pharmacy and the sale of poisons, there was much opposition on the part of chemists and druggists not connected with the Society, and eventually a sort of compromise had to be effected. It was then conceded that when a man was in active practice as a chemist he ought to be a member of the Society, and the question of what sort of examination he passed did not then arise. When the draft Bill now in question was brought forward a few months ago, the idea was to carry out the original idea of the 1868 Act. The view of Mr. Sandford and himself then, as well as of the Executive of the United Society of Chemists and Druggists (with whom he was on terms of intimacy), was that if the Minor examination was to be taken as the standard of what was necessary in a pharmacist, all who passed that standard should become members of the Society. But owing to the opposition of a certain number of Major men Mr. Sandford's draft Bill was altered at the last moment, and he was obliged by the force of circumstances to appeal to the Council of that day to agree to the alteration in order to secure the passing of the Bill. The present Bill was simply carrying out the definite aim of the most thoughtful men at that time. He would ask any pharmaceutical chemist how he could possibly claim to be put in a superior position as a practitioner because he possessed the advantage of a more complete training than some of his fellows? It was not done in other professions—in medicine, or in law. Men had different titles, but they were content to regard each other all as practitioners. It was very nice to see that a pharmacist was a Bachelor of Science, but were they prepared to tell the public that on that account he was a better pharmacist? Certainly not; he might be inferior. It was simply an indication that he was an educated man in a particular direction. He thought in this matter they might imitate the law. Solicitors had one general examination, and one position in connection with the Incorporated Law Society. If a man desired a higher qualification he took it at one of the Universities, as Bachelor or Doctor of Civil Law, but whoever passed the statutory examination was recognised as a lawyer. He held that it was non-ethical for any man to want a voluntary society to create a degree for which one of the main qualifications would be the payment of a sum of money. Under this Bill the title of pharmaceutical chemist was not touched, nor was that of chemist and druggist. When the law said that a person who passed the qualifying examination was entitled to practise, such a man ought to be a member of the Society. There was another serious drawback to the use of the title associate, for in the public mind it implied youth or semi-qualification—something incomplete. As for the idea that the conferring of titles would stimulate education, which had been suggested at various meetings, he was afraid there was not much in it. Thirty-five years ago he was enthusiastic in the belief that anyone who passed the Minor would, as a matter of course, go on to the Major and become a pharmaceutical chemist, but he had had to admit long ago that he was mistaken. The tendency of the age was to get into an occupation with the smallest amount of qualification, and in this respect pharmacists were no better or worse than other people; and if the Council had not been able from time to time to improve the minimum qualification, he feared the standard all round would have been very poor. He would appeal again, therefore, to pharmaceutical chemists to remember that this subject was not a new one; that the creation of new titles involved all sorts of difficulties, and that after all the educated pharmaceutical chemist, the Major man, had within himself all the benefits which he could, or ought to, desire to have—wider knowledge, greater intellectual enjoyment and so forth, and that he should be the last person to say that he wanted to add a few initials to his name. He ought to be glad to hold out the hand of fellowship to every qualified man who practised pharmacy.

Mr. ATKINS understood that Dr. Symes did not press his part of the argument with regard to the creation of a new title, and, if so, he was glad to hear it. He hoped the statement which the President had made that day would be regarded as a recognition of the opposition that had been expressed, and as an answer to the arguments which were then adduced. Personally he very much

regretted, and did not hesitate to say he was surprised to see, the confusion of ideas with regard to the question of membership. The answer which had been given would, he hoped, dismiss any antagonism in Lancashire, and if it did that he thought the Bill would have a very fair and smooth course.

The President thanked Dr. Symes for giving an opportunity of showing once more that there was practical unanimity at the Council, and said he was sorry he was not more prepared to answer his question, but he thought that what he had omitted to say, or had perhaps said imperfectly, had been largely supplied by his friend Mr. Carteighe, and he hoped their remarks taken together would have some influence with their pharmaceutical chemist friends throughout the country, who were more or less threatening opposition to the Bill.

Dr. Symes said if that were so, his object in bringing the matter forward would be fully served.

The resolution passed unanimously.

The Scheduling of Carbolic Acid.

Mr. Bateson desired to ask if the time had not arrived when further reprcsentation should be made to the Privy Council, urging the necessity of carbolic acid being placed in the Schedule.

The President said the subject was a very important one, and deserved the consideration of the Council. On three different occasions the Council had resolved that carbolic acid should be included in the Schedule, viz., in February, 1882, February, 1886, and October, 1888. Since that time the subject had been brought on two or three occasions before the House of Commons, and on each occasion the answer had been practically the same. The last attempt was made by his predecessor at the request of the Council in 1891, when a letter was written to the Privy Council, asking if their attention was still being directed to this important subject, and the answer was not from their point of view satisfactory. In July last a communication was received by the late Mr. Ernest Hart from the Privy Council, which stated that body did not propose to assent to the inclusion of carbolic acid in the Schedule of the Pharmacy Act, 1868, but that a Bill restricting the sale of such substances was under consideration, and might be introduced into Parliament. With that before them he confessed that he thought it would be impolitic, if not undignified, to approach the Privy Council on this question, unless the Council were furnished with more evidence of a strong public feeling, such as ought to be manifested in some shape or form in the House of Commons. If Mr. Bateson would get his Parliamentary representative to ask a question dealing with the subject in the House of Commons, he thought it might be advantageous, but pharmaceutical chemists might be quite easy in their consciences that the many deaths that occurred through the indiscriminate and careless use of carbolic acid did not lie at their doors.

Mr. Bateson thanked the President for his reply, and said he would take an opportunity of bringing the subject forward on notice.

The British Pharmacopœia, 1898.

The President said he wished to refer to a letter which he had received that morning as President of the Pharmaceutical Society, and as being in that capacity the Chairman of the Pharmacopœia Committee appointed by the Council to work with the Medical Council in the production of the forthcoming Pharmacopœia. The letter, which was from Dr. Tirard, was as follows :—

"Dear Sir,—As Secretary of the Pharmacopœia Committee of the General Medical Council, I am instructed to forward the enclosed to you for publication. This enclosure has also been forwarded to the various medical and pharmaceutical journals: 'With reference to an article in the *Chemist and Druggist* of January 8, 1898, purporting to publish the first part of a critical review of the forthcoming British Pharmacopœia, we are officially informed that such publication is entirely unauthorised by the General Medical Council, and that criticism at present is not possible because the work is still incomplete. We are also officially informed that the article already published contains numerous inaccuracies, and that it bears evidence of having been based upon an early unrevised proof.

"Yours faithfully,
"Nestor Tirard."

Other Correspondence.

A letter had been received from Mr. Walter Gibbons of Manchester, communicating resolutions passed at a meeting of chemists at Manchester on December 17, and suggesting amendments to the proposed Pharmacy Bill. A letter had also been received from the Exeter Association of Chemists, through its Hon. Secretary, enclosing a resolution in favour of the proposed Pharmacy Bill. Those letters would be handed over to and duly considered by the Law and Parliamentary Committee. Letters had been received from various members of the Board of Examiners, thanking the Council for their appointment.

As the subject of carbolic acid had been referred to, he would call attention to a letter which had been received from the Coroner for Rochester, who stated that at an inquest held in that city touching the death of a woman the jury found the cause of death was poisoning by carbolic acid, and expressed the opinion that the sale of this acid in its crude state should be restricted in the same way as other poisons. This gentleman went on to state that this was the third case of suicide by the same means within a period of less than a month, and he hoped the Society would take the necessary steps to get carbolic acid added to the Schedule, as it could at present be purchased without any check at all.

A letter had been received from the New Decimal Association inviting the Society to take an active part in promoting the use of the metric system, and enclosing a report of the work of the Association, which, it was proposed, should be handed over to the consideration of the Library and House Committee.

Report of the General Purposes Committee.

This report, which dealt exclusively with legal matters, was taken as usual in committee. On resuming, the report and recommendations were received and adopted, and special resolutions were passed, authorising the Registrar to institute proceedings against the persons named in the resolution.

EXAMINATIONS IN LONDON.

January, 1898.

MINOR EXAMINATION.

Wise, Guy William.
Wood, William Frost.
Wright, Herbert Henry.

FIRST EXAMINATION.

Certificates by approved examining bodies were received from the undermentioned in lieu of the Society's Examination :—

Butchers, William H. ; Wrexham.
Dunford, Walter Henry ; Clevedon.
Elliott, John Johnson ; Southport.
Finnigan, George ; Hove.
Gardiner, William Z. ; Edinburgh.
Hellyer, Wm. Woodmason ; Plymouth.
Jesson, Albert Robert ; Leicester.
Jones, Henry ; Bedale.
Kieft, Edward James ; Swansea.
Morgan, William ; Kington.
Nation, Arthur William ; Exmouth.
Owens, James Alfred ; Kington.
Pescod, Leonard ; Eastbourne.
Pugh, Richard Jones ; Ogmore Vale.
Richards, Thos. Teverson ; Ashford.
Richardson, Thos. Evans ; Liverpool.
Royce, Septimus ; Oakham.
Scott, Robert Baird ; Wigan.
Sutcliffe, William ; Bradford.
Swire, Percy Wignall ; Halifax.
Walton, Ralph ; Maidenhead.
Wilson, Thomas Ellick ; Southwark.

"FIRST" EXAMINATION QUESTIONS.

January 11, 1898.

LATIN.

Time allowed—from 11 *a.m. to* 12.30 *p.m.*

I. For all candidates. Translate into Latin :—

1. My brother is in the house.
2. These things render life safer.
3. We do not praise a judge by whom all laws are violated.
4. I cannot call myself fortunate on this account.
5. He said he did not know where you were spending the summer.

II. Translate into English either A (Caesar) or B (Virgil).

(Candidates must not attempt both authors.)

A.—CAESAR.

1. Quibus rebus cognitis, quum ad has suspiciones certissimae res accederent ; quod per fines Sequanorum Helvetios traduxisset ; quod obsides inter eos dandos curasset ; quod ea omnia non modo injussu suo et civitatis sed etiam inscientibus ipsis fecisset ; quod a magistratu Aeduorum accusaretur, satis esse causae arbitrabatur, quare in eum aut ipse animadverteret, aut civitatem animadvertere juberet.

2. Dum paucos dies ad Vesontionem rei frumentariae commeatusque causa moratur, ex percontatione nostrorum vocibusque Gallorum ac mercatorum, qui ingenti magnitudine corporum Germanos, incredibili virtute atque exercitatione in armis esse, praedicabant, saepenumero sese cum his congressos, ne vultum quidem atque aciem oculorum ferre potuisse, tantus subito timor omnem exercitum occupavit, ut non mediocriter omnium mentes animosque perturbaret.

GRAMMATICAL QUESTIONS.

(For those only who take Caesar.)

1. Give the nominative singular and the gender of *suspiciones, fines, obsides, magistratu, eum, vocibus, mercatorum, virtute, mentes, animos.*

2. Give the principal parts of all the verbs in Passage 2.

3. Write in Latin :—11, 29, 76, 105, 19th, 28th, ¼ ; and give the Roman numerals for 1898.

4. Give examples of the different ways in which "to," denoting purpose, may be translated into Latin.

B.—VIRGIL.

1. Olli subridens hominum sator atque Deorum
Vultu, quo coelum tempestatesque serenat,
Oscula libavit natae ; dehinc talia fatur :
Parce metu, Cytherea ; manent immota tuorum
Fata tibi ; cernes urbem et promissa Lavini
Moenia, sublimemque feres ad sidera coeli
Magnanimum Aenean ; neque me sententia vertit.

2. Tum sic regnam alloquitor, cunctisque repente
Improvisus ait : Coram, quem quaeritis, adsum
Troius Aeneas, Libycis ereptus ab undis.
O sola infandos Trojae miserata labores,
Quae nos, relliquias Danaum, terraeque marisque
Omnibus exhaustos jam casibus, omnium egenos,
Urbe, domo, socias ! grates persolvere dignas
Non opis est nostrae, Dido, nec quidquid ubique est
Gentis Dardaniae, magnum quae sparsa per orbem.
Di tibi, si qua pios respectant numina, si quid
Usquam justitia est et mens sibi conscia recti,
Praemia digna ferant.

GRAMMATICAL QUESTIONS.

(For those only who take Virgil.)

1. Give the nominative singular, and the gender, of *hominum, Deorum, metu, sidera, undis, labores, maris, Gentis, orbem, numina.*

2. Give the principal parts of all the verbs in Passage 2.

3. Write in Latin :—11, 29, 76, 105, 19th, 28th, ¼ ; and give the Roman numerals for 1898.

4. Give examples of the different ways in which "to," denoting purpose, may be translated into Latin.

ARITHMETIC.

Time allowed—from 12.30 *p.m. to* 2 *p.m.*

[The working of these questions, as well as the answers, must be written out in full.]

1. Divide the sum of 30 ac. 2 ro. 17 per., 17 ac. 3 ro. 38 per., and 22 ac. 1 ro. 27 per. 4 yd. by 3.

2 If a bankrupt's debts are £1920, and his assets only £414, how much in the £ can he pay his creditors?

3. Reduce $\cdot 36\dot{3}$ of £2 1*s.* 3*d.* to the decimal of $\cdot 7\dot{2}$ of £3 6*s.*

4. Divide the product of 2·1825 and ·0046 by ·0002425.

5. A man buys 500 quarters of wheat at 56*s.* per quarter, of which he sells one-half at 6*s.* per bushel. At what rate per bushel must he sell the remainder so as to gain £25 by the whole transaction?

6. A person invests £1365 in the 3 per cents. at 91 ; he sells out £1000 Stock when they have risen to 93½, and the remainder when they have fallen to 85. How much does he gain or lose by the transaction?

The following question must be attempted by every candidate :—

7. Write out the Metric Table of Capacity.

If 61 litres of seed are required for 1 are of land, how much seed will be required for 2 hectares 2 ares?

ENGLISH.

Time allowed—from 3 *p.m. to* 4.30 *p.m.*

1. Analyse :—

"On Linden, when the sun was low,
All bloodless lay the untrodden snow,
And dark as winter was the flow
Of Iser, rolling rapidly."

2. Parse fully :—"Thrice is he armed that hath his quarrel just."

3. Give the meanings of the following prefixes, and a list of words of which they form a part, one for each :—*vice, un, hypo, ante, anti, contra.*

4. In the following passage, supply the necessary capital letters, and put in the stops and the inverted commas where necessary :—this time he believed her he saw that whether she deceived herself or not she thought some deadly peril awaited himself what will they do he asked and why should they seek to kill me she answered almost sullenly i have told you a score of times and so has the girl muriella that you are hated because you are a stranger a meddler as folks think a reformer as you call it you would never believe us because we were women.

The following question must be attempted by every candidate :—

5. Write a short composition on *one* of the following subjects :—

(i.) The evils of extravagance.
(ii.) The reign of Queen Elizabeth.
(iii.) Arbitration in trade disputes.
(iv.) The treasures of the deep.

DRAFT PHARMACY ACTS AMENDMENT BILL.

The object of this Bill is—
To render "Apprentices or Students" eligible to become "Student-Associates" of the Society, instead of "Students," as heretofore;
To render every person whose name appears on the Register of Chemists and Druggists eligible to become a Member of the Society;
To provide for the retirement of one-third of the Council every year by rotation instead of by ballot as is provided by the Charter;
and
To enable the Secretary to receive voting papers for the election of Council up to and on the day of election.

A DRAFT BILL

INTITULED

The Pharmacy Acts Amendment Act, 1898.

1. In this Act—
The term "Chemist and Druggist" shall have the same meaning as in the Pharmacy Act, 1868; and "The Society" shall mean the Pharmaceutical Society of Great Britain. — Interpretation.

2. Every person who at the time of the passing of this Act shall have been duly registered as an "Apprentice or Student," and who, under the provisions set forth in Section X. of the Pharmacy Act, 1852, has been admitted to and at that time remains in the Society as a "Student," shall be registered as a "*Student-Associate*" of the Society; and every person who at the time of the passing of this Act shall have been duly registered, or who thereafter shall become registered as an "Apprentice or Student," shall be eligible to be elected a "*Student-Associate*" of the Society according to the Bye-laws thereof. — "Apprentices or Students" eligible to be elected "Student-Associates."

3. Every person who at the time of the passing of this Act shall have been registered as a Chemist and Druggist or who shall hereafter become registered as a Chemist and Druggist shall be eligible to be elected a member of the Society according to the Bye-laws thereof. — Registered Chemists and Druggists eligible to be elected Members.

4. In lieu of the provisions contained in the Royal Charter of Incorporation of the Society, whereby it is provided that two-thirds of the members of the Council shall in every year go out of office, the following provisions shall, after the passing of this Act, have effect:— — Retirement of Members of the Council by rotation.

(1.) On the ordinary day of election of members of the Council in every year seven members of the Council shall go out of office, and the vacancies shall be filled by election, the retiring members being eligible for re-election.

(2.) The seven members who go out shall be the members of the Council who have been longest in office without re-election.

(3.) If and whenever the number of the members of the Council who have been longest in office without re-election shall exceed seven, the members of the Council to retire shall be determined by lot.

5. At all meetings of the Society at which votes shall be given for the election of officers, all or any of the votes may be given either personally or by voting papers, in a form to be defined in the Bye-laws of the said Society, or in a form to the like effect, such voting papers being received by the Secretary, under cover, not later than twelve o'clock noon on the day on which the election takes place. — Voting papers for election of officers.

6. This Act shall not extend to Ireland. — Extent of Act.

7. This Act may be cited as the Pharmacy Acts Amendment Act, 1898. — Short title of Act.

8. The enactments mentioned in the Schedule to this Act to the extent specified in the third column of that Schedule are hereby repealed. — Repeal.

SCHEDULE.

Enactments Repealed.

Session and Chapter.	Short Title.	Extent of Repeal.
15 and 16 Vict. c. 56	Pharmacy Act, 1852	In Section ten the words, "and every such person duly registered as an Assistant shall be eligible for admission as an Associate of the said Society."
31 and 32 Vict. c. 121	Pharmacy Act, 1868	Sections eighteen, nineteen, twenty, and twenty-one.

PHARMACEUTICAL RECIPROCITY.

LETTER TO THE VICTORIA PHARMACY BOARD.

The following letter was approved at the meeting of the Pharmaceutical Council on Wednesday last, and ordered to be sent:—

THE PHARMACEUTICAL SOCIETY OF GREAT BRITAIN,
17, BLOOMSBURY SQUARE, LONDON, W.C.

Dear Sir,

Your letter of June 1st suggesting the amendment of our Pharmacy Acts with the object of empowering the Registrar of this Society to receive certificates of skill and competency other than those signed by the respective Boards of Examiners appointed by the Council of this Society has been carefully and sympathetically considered.

The general conclusion which has been arrived at is that the time is not yet ripe for any general amendment in this direction.

I may remind you that we are at present in a transitional state. Bye-laws have recently been approved by the Privy Council effecting a considerable improvement in the standard of general education required from those who after August, 1900, seek to enter Pharmacy in Great Britain.

There will, no doubt, be many Colonial, Indian, and Foreign Universities and Colleges amongst the Examining Bodies whose Certificates in general education will be accepted by the Council of this Society.

It is felt, however, that at present it would be almost impossible to ensure in the different parts of the Empire a practical uniformity in the scope and stringency of the technical Examinations.

One step in this direction would be accomplished if the Pharmacy Boards in certain groups of Colonies—for example, those in Australia and New Zealand—could succeed in establishing such uniform Examinations as a basis of Intercolonial reciprocity.

The chief difficulty of extending reciprocity lies in the absence of an adequate compulsory Curriculum applicable to the whole of the Empire, and the removal of this difficulty could be accomplished by obtaining from the different legislatures powers to impose a uniform and sufficient course of study.

My Council regrets that public opinion is not sufficiently advanced to enable us to obtain powers for a compulsory curriculum even in Great Britain, but it is hoped that in the course of time legislation in this direction may be practicable.

I am, dear Sir,
Yours faithfully,
(Signed) WALTER HILLS, President.
To the Secretary to the Pharmacy Board of Victoria.

INFLUENCE OF NUTRIENT MEDIA ON THE DEVELOPMENT OF FUNGI.—A variety of experiments have recently been made on this subject. J. Ray (*Bonnier's Rev. Gén. de Bot.*, vol. ix., 1897), in a lengthy series of observations on *Sterigmatocystis alba*, finds the one character which remains constant under all conditions to be the size of the spores. Almost all other characters, which are usually relied on as specific, he found liable to vary; while those which are regarded as generic are more constant. The size of the cells of which the hyphæ are composed is especially variable. W. Schostakowitsch ('Flora,' 1897, 'Ergänzungsband,' p. 88) finds *Mucor proliferus* to vary greatly according to the temperature and the nature of the nutrient fluid. The height may vary between 0·5 Mm. and 7 Cm. The spores are, in this case, subject to extraordinary variation in size, between a minimum of 2 and a maximum of 67μ; and their form is also exceedingly different under different conditions. From experiments made chiefly on *Aspergillus niger*, *Penicillium glaucum*, and *Botrytis cinerea* (Pringsheim's 'Jahrbuch,' vol. xxx., pp. 665-688), H. M. Richards states that many nutrient substances, both organic and inorganic, have a distinct influence on the growth of fungi. But an increased activity of growth of the mycele is frequently accompanied by a retardation in the production of spores. The colour of the spores is often sensibly affected by the chemical composition of the nutrient medium.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australasia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

LONDON: SATURDAY, JANUARY 15, 1898

BRITISH PHARMACOPŒIA, 1898.

A COMMUNICATION has been received from Dr. NESTOR TIRARD, as Secretary of the Pharmacopœia Committee of the General Medical Council, with reference to an article in the *Chemist and Druggist* of January 8, 1898, purporting to publish the first part of a critical review of the forthcoming British Pharmacopœia. We are officially informed that such publication is entirely unauthorised by the General Medical Council, and that criticism at present is not possible because the work is still incomplete. We are also officially informed that the article already published contains numerous inaccuracies, and that it bears internal evidence of having been based upon an early unrevised proof.

THE COUNCIL MEETING.

AFTER the reading of the minutes of the previous meeting, the PRESIDENT referred to the loss sustained by the death of the late Mr. GILES, and in mentioning the various relations in which he had been connected with the Society's work since 1847, spoke especially of the inaugural address delivered by him at the opening of the School session in 1874 as containing matter that might still be usefully read by anyone interested in the advancement of the status of pharmacy, and he quoted one passage from that address as expressing its general sentiment, as well as the principle underlying all the Society's work. A resolution was then passed expressing regret for the loss of a member who had rendered such good service to the Society and authorising the PRESIDENT to convey to Mrs. GILES and the family the deep sympathy of the Council in their bereavement.

The PRESIDENT also mentioned with regret the death of Mr. WHEELER, who had been a member of the Society for forty years and was divisional Secretary for Haggerston (Shoreditch), and lastly made reference to the death of Mr. ERNEST HART, the editor of the *British Medical Journal*, who had taken great interest in pharmaceutical affairs, and to the fact that, among other public services rendered by him, the present effective administration of the Pharmacy Act in regard to secret remedies containing scheduled poisons was largely due to the persistency of Mr. HART'S representations to the Government authorities of the danger arising from the sale of those preparations contrary to the provisions of the Pharmacy Act.

The SECRETARY reported that a letter had been received from the Privy Council Office approving of the recent appointments of examiners.

The additions to the Society comprised 19 members, 70 associates, and 101 students.

The report of the Finance Committee did not contain any details calling for comment, except the pleasing circumstance mentioned by the PRESIDENT that several donations to the Benevolent Fund had been received—among them a sum of fifty pounds had been received from the directors of Camwal, five guineas from Dr. STEVENSON, and nine pounds from Mr. Moss as an unapplied balance from the Attfield Testimonial Fund.

On the recommendation of the Benevolent Fund Committee, several grants amounting in all to sixty-six pounds were ordered to be paid. The SECRETARY reported the death of two annuitants, and the resignation of one who has had a substantial legacy left to her. In connection with the latter circumstance the VICE-PRESIDENT mentioned that the Committee had in the report made a note referring to the regulation adopted in 1894, as to reduction or discontinuance of annuities, and he mentioned several instances in which annuitants had voluntarily resigned their annuities when their circumstances improved.

The report of the Library Committee gave the usual account of attendances in the Libraries and Museums and of donations, stating also that the microscopes had been placed in charge of the CURATOR, and that Mr. CARTEIGHE had presented to the Society one of the medals struck at the Royal Mint in commemoration of the sixtieth anniversary of Her Majesty's reign.

Dr. SYMES spoke approvingly of the microscopes being placed under the care of the CURATOR, as it would ensure their being kept in good order and properly used.

The report of the Law and Parliamentary Committee included the draft of a letter (see p. 54) to the Pharmacy Board of Victoria on the subject of reciprocity in regard to examination certificates, and a recommendation was adopted that the PRESIDENT be authorised to take such steps as might be necessary for introducing into Parliament the Pharmacy Act Amendment Bill, in which some verbal alterations have been made (see p. 54).

In moving the adoption of the report, the PRESIDENT explained that since the receipt of the letter on the subject of reciprocity in examinations from the Registrar of the Victoria Pharmacy Board, the Council had very carefully considered the possibility of taking steps in that direction in sympathy with the desire, expressed there and elsewhere, that the various parts of the Empire should be drawn closer together, and the conclusion arrived at was set forth in the letter (see page 54).

In reference to the Pharmacy Bill, Dr. SYMES spoke of a desire prevailing with some pharmaceutical chemists that a Fellowship should be instituted for those taking the higher qualification, and though not intending to advocate that proposal, he suggested that a statement might be

officially given showing its impracticability or undesirability, and with the view of removing possible opposition that might be offered to the Bill.

In the discussion that followed, Mr. Martindale expressed the opinion that the institution of a Fellowship is undesirable, because there should be but one standard for admission to membership of the Society, viz., qualification to practise pharmacy.

The President expressed regret that Dr. Symes had not raised the question when the draft Bill was agreed to, adding that though the subject of a Fellowship had been considered on several occasions, any attempt to establish such a distinction between those now eligible as members and those proposed to be admitted to membership would be inconsistent with the object of the present Bill, which is merely to consolidate the Society.

He failed to perceive what use there would be in a Fellowship granted by the Society, as it would be no indication of superior knowledge or give any better position than the protected title of pharmaceutical chemist, unless the institution of a Fellowship were accompanied by an enforced curriculum of education or some close relationship between pharmacy and teaching universities throughout the country. He therefore hoped that pharmaceutical chemists would consider the appeal made to them by Mr. Carteighe to sink personal considerations in order to realise the consolidation of the Society, which all were anxious for.

Dr. Symes thanked the President for his explanation, which he thought would be satisfactory to those who had raised the question, as they would see that the time was not opportune for pressing their views.

Mr. Carteighe expressed disappointment at finding that some pharmaceutical chemists taking interest in legislative matters did not make themselves acquainted with their history. More than thirty years ago this question of a Fellowship was raised, and it would be useful to consider it logically in connection with the original object for which the Society was founded—the incorporation of all persons engaged in the practice of pharmacy in one body and under the one designation of member. When examination was established, the grade of associates was for those who were more or less *in statu pupillari*, and qualification for membership consisted in being in business on their own account. In 1866 and 1867, when the Select Committee dealt with the Pharmacy Bill, it was conceded that all those actually in business should be admissible as members, irrespective of examination. The idea of the present draft Bill was to carry out that original plan. In regard to connection with the Society, the pharmaceutical chemist could not reasonably claim a better position or advantage over his fellows any more than in other occupations, such as the professions of medicine or the law. Solicitors also had but one position in connection with the Incorporated Law Society. If a higher qualification were desired it was taken at a University, but everyone who passed the statutory examination was recognised as a lawyer. In like manner a person who passes the examination giving qualification to practise pharmacy ought to be admissible as a member of the Society. Moreover, there was a practical objection to the title of associate, as it implied youth or partial qualification—something incomplete. The idea that conferring titles would stimulate education he had come to recognise as mistaken. Thirty years ago, when he was younger and more enthusiastic, he fully believed that anyone who passed the qualifying examination would, as a matter of course, go on to the Major and become a pharmaceutical chemist, but he was mistaken. The tendency is to be content with the smallest amount of qualification, and if the Society had not been able to improve the requisite minimum qualification, the standard all round would have been very poor. He appealed, therefore, once more to pharmaceutical chemists to remember that the object of the Bill was not to create new titles, but to consolidate the Society, to consider also that pharmaceutical chemists, possessing a superior education and all the benefits of wider knowledge, should be the last to wish to add a few initials to their names, but should, for the sake of the necessary consolidation of the Society, hold out the hand of fellowship to all qualified to practise pharmacy.

Mr. Atkins hoped that the President's remarks would be taken as an answer to the arguments put forward by the opponents of the Bill. He expressed regret and surprise at the confusion of ideas prevailing as to membership of the Society, and hoped the answer given would dispel all antagonism. Reference may be made to several of the letters appearing in the present number of the Journal as being calculated to exercise influence in the same direction if regard is shown for the facts stated in them, and if Mr. Carteighe's advice is followed to observe the rules of logic in arriving at conclusions from those facts.

The President thanked Dr. Symes for giving opportunity for showing that the Council was practically unanimous, and he hoped his remarks, together with those of Mr. Carteighe, would have some influence on pharmaceutical chemists disposed to object to the Bill, and Dr. Symes added that if that were the case his object would be fully served.

Mr. Bateson asked whether further representations should not be made to the Privy Council urging the necessity of adding carbolic acid to the Poison Schedule, and the President in reply stated what has already been done in the matter, adding that it would be impolitic if not undignified, to go further unless the subject were brought before Parliament. In any case the fatalities caused by carbolic acid did not lie at the door of pharmaceutical chemists. Mr. Bateson, however, announced his intention of giving formal notice to bring the subject forward on some future occasion.

The President then drew attention to a letter from Dr. Tirard, which is printed at page 52, and to a statement relating to a publication purporting to be a "critical review" of the British Pharmacopœia, 1898, which was declared to be entirely unauthorised and inaccurate. Reference was also made to a letter from Mr. Walter Gibbons, communicating a resolution passed at the meeting at Manchester (see *P.J.*, lix., 575). Another letter from the Exeter Chemists' Association enclosed a resolution in favour of the Pharmacy Bill, and various members of the Board of Examiners wrote thanking the Council for their appointment. A letter from the Coroner for Rochester related to the subject of carbolic acid, and another from the Decimal Association requesting the Society to take an active part in promoting the use of the metric system. These letters were referred to committees for consideration.

That part of the General Purposes Committee dealing with legal business having been considered, resolutions were passed authorising proceedings to be taken for infringement of the Pharmacy Act.

ANNOTATIONS.

Mr. Ernest Hart, whose death occurred on Friday, January 7, will be greatly missed in the medical world, where he had attaincd a position of great authority as editor of the *British Medical Journal* and chairman of the Parliamentary Bills Committee of the British Medical Association. In the latter capacity, he was in great measure instrumental in securing the more comprehensive application of the Pharmacy Act, 1868, during recent years, and at the Council Meeting on Wednesday due recognition of that fact was accorded by the President (see p. 48). Mr. Hart received his early education at the City of London School, and subsequently studied medicine at St. George's Hospital, where he had a distinguished career. He became a Member of the Royal College of Surgeons in England in 1856, and acquired an extensive consulting practice as an ophthalmic surgeon. But his energies were chiefly devoted to journalistic work, first as a member of the staff of the *Lancet*, under Thomas Wakley, and later as editor of the *British Medical Journal*, a position he occupied until his death. Mr. Hart was also an occasional contributor to the leading reviews and other publications, the prevention of disease being his favourite subject. He received the honorary degree of D.C.L. from the University of Durham in 1893.

A New Journal on Food and Allied Products has made its appearance, the interesting and valuable periodicals dealing with food products and allied subjects known as the 'Forschungs-Berichte' and the 'Jahresbericht über Fortschritte der Nahrungs und Genussmittel,' which were edited by Dr. Hilger and other collaborateurs, having been combined. The new journal will in future be issucd as a monthly journal under the joint editorship of Drs. A. Hilger, J. König and Buchka, who are chemists well-known in relation to food products. The new periodical will be known as the 'Zeitschrift für untersuchung der Nahrungs und Genussmittel,' and gives promise of being invaluable to all chemists who are interested in the chemistry of food products. In its first number we find original work by König on the determination of fibre in fodder and other products, and by other authors on the analysis of butter, fat, wine, etc., as well as abstracts of many interesting papers on food and forensic chemistry. We wish the new journal the success it deserves to obtain.

The Chemists of Plymouth and District are to be congratulated on losing no time in seeking support for the new Pharmacy Bill. Our readers are doubtless all aware that a Parliamentary contest has just been decided in Plymouth, and in anticipation of that event, on Saturday morning last a deputation, including Mr. J. Cocks, President of the local Association, Mr. C. J. Park, Councillor of the Pharmaceutical Society, Mr. R. E. Roper, and Mr. W. H. Woods, interviewed both candidates, with the object of obtaining promises to support the Bill. It was explained that the proposed amendment would be brought forward to introduce essential alterations of the present Pharmacy Acts, the principal object being to entitle all chemists and druggists to full membership of the Pharmaceutical Society, and that the only fear was that the House of Commons might be counted out when the Bill was introduced. Both candidates promised to support the amendment when it was brought forward, as also did Sir Edward Clarke, M.P., who has asked that a reminder may be sent to him when the Bill comes up for consideration. This is an example which should not be lost sight of in places where elections are pending, whilst existing M.P.'s should be freely canvassed on the same subject.

The Chemists' Ball will take place at the Portman Rooms Baker Street, W., on Wednesday next January 19, and a final reminder of that fact is now published for the benefit of all who have not yet secured tickets. The Honorary Secretary, Mr. W. Warren, 24, Russell Street, Covent Garden, W.C., requests us to state that all further applications for tickets should now be sent direct to him without delay.

Electric Telegraphy without Wires, according to Professor Oliver Lodge—in his concluding lecture at the Royal Institution, on Saturday last—does not differ so much from ordinary telegraphy with wires as is sometimes supposed. Electric and magnetic waves constitute the basis of both systems, but when a wire is not employed the waves spread in all directions, like sound, and cannot be compelled to travel in one direction only, as when a wire is employed. Nevertheless, the waves may be intercepted at a distance if suitable instruments are provided for their detection. The nature of these instruments will be understood when it is explained that there is an analogy between their behaviour and that of tuning-forks. Air waves from one tuning-fork in vibration set up vibrations in another, provided the latter be tuned in syntony with the first, and a similar plan is resorted to for the detection of electric oscillations. Thus, it is known that the oscillations given off by a Leyden jar arranged to discharge through knobs can be detected by a similar independent Leyden jar arranged with a small overflow circuit. Every time a spark passes between the knobs of the first jar a spark is also seen to pass between the knobs of the overflow circuit of the second, if the two main circuits are tuned to each other, and by lengthening or shortening one circuit —tuning the apparatus, in fact—the sparks cease. On placing the overflow knobs so close as almost to touch, and introducing a battery and bell into the circuit, cohesion sets in between the knobs and the bell rings whenever a spark passes.

The Coherer thus formed is somewhat crude and requires very delicate adjustment, but it serves to illustrate the general principle of coherers. A Leyden jar arranged in this way, however, does not give electro-magnetic waves, such as were discovered by Hertz, who spread out the two coverings of a Leyden jar in space so that the current from an induction coil could induce a magnetic field round the wire and create an electrostatic field in the coverings or plates, which then radiated true electro-magnetic waves. The best method of detecting these waves is by means of Branly's coherer, which consists of a tube filled with metal filings, giving a number of loose contacts as in the microphone, and responding to electric waves. An electric wave falling upon such a coherer causes the filings to conduct a current, and they continue in that state until they are decohered by a mechanical jar or knock. In another form of coherer a needle rests lightly on a piece of watch spring. Marconi, a young Italian, who has recently been prominent in directing attention to the possibility of wireless telegraphy, uses a form of the Branly coherer, with relays and suitable mechanical arrangements for decohering, and has succeeded in sending signals over a distance of nine miles. Another method of signalling electrically across space, successfully tried by Preece, is based on the use of the inductive effects produced in one wire by currents passing in another.

An Ideal Hospital Ward is claimed to exist at the Temperance Hospital, Hampstead Road, London, in a new aseptic room that has just been brought into use there. It is described as being a comparatively small apartment—14 feet long by 11 feet wide and 13 feet high—but it is a model of lightness and cleanliness,

with modulated warmth and scientific ventilation. The room has been designed by Dr. Collins, surgeon of the hospital and Chairman of the London County Council, and the ward is intended to serve the double purpose of an operating theatre and a room for convalescents, as required. It is walled with pale pink enamelled glass tiles, floored with marble mosaic, lighted by means of a large single sheet of plate glass, which constitutes one-fifth of the west wall, and warmed by a Teale grate below the window. The beds, furniture, fittings and surgical apparatus are all in the newest style, glass being largely employed. The total cost of the new ward is estimated at five hundred pounds, which has been defrayed by five donors, and the room is to be called the Frank Wright Ward, in memory of a late member of the board of management.

WEIGHTS AND MEASURES are the subject of a report by the Board of Trade, which, somewhat late in the day, records the fact that an Act has been passed to legalise the use in trade of weights and measures of the metric system. It is also noted that a new scientific standard of the imperial yard measure, made of "iridio-platinum," has been obtained during the past year, and a table of new equivalents of metric weights and measures is appended to the report. In this table, which is based on comparisons made by the Comité International des Poids et Mesures, Paris, and by the Standards Department, the value of the metre is given as 39·370113 inches, the square metre = 1·19599 sq. yard, the cubic metre or stere = 1·307954 cub. yard, the litre = 1·7598 pint, and the gramme = 15·432 grains avoirdupois, 0 03215 oz. troy, or 0·77162 scruple (apothecaries' weight). On the other hand, the inch is represented as equivalent to 25·4 millimetres, the square inch = 6·4516 sq. centimetres, the cubic inch = 16·387 cub. centimetres, the fluid ounce = 2·84123 centilitres, the pint = 0·568 litre, the ounce avoirdupois = 28·35 grammes, the pound = 0·45359243 kilogramme, the ounce troy = 31·1035 grammes, and the scruple (apothecaries' weight) = 1·296 gramme.

THE PHILADELPHIA COLLEGE OF PHARMACY, which formerly arranged its classes in accordance with a systematic two years' course of instruction, has now ceased to grant "degrees" except to graduates of the College who have taken a complete three years' course. The reason of the change, reference to which has previously been made in these columns, is that the period of two years has been found too short to educate professional pharmacists. The title of "Doctor in Pharmacy" will henceforth be conferred upon graduates of the College, but in addition to having devoted three years to the acquisition of a pharmaceutical education, they must be prepared to produce ample evidence that the three years of study have been profitable ones, for, as the Philadelphia College authorities pertinently remark, there is no room in the world for half-educated pharmacists. Students from other colleges may be admitted to advanced standing in the College on passing the necessary examination and otherwise giving satisfactory evidence of their ability to derive benefit from advanced instruction, and graduates from other recognised colleges of pharmacy may be admitted to the third year's course.

MATRICULATION AT LONDON UNIVERSITY is conditional at the present time upon an examination being passed in Latin and one other foreign language, English (language, history, and geography), mathematics, mechanics, and one other scientific subject. In January next, however, new regulations will come into force, and will have the effect of lightening the syllabus to some extent. Latin and English will then remain the only compulsory languages, and mechanics will become optional. The complete list of subjects will be: (1) Latin; (2) English; (3) mathematics; (4) general elementary science, including the rudiments of mechanics, heat, light, electricity, and non-metallic chemistry; and (5), one other foreign language or a branch of science. The requirements in Latin and mathematics remain unaltered; in English, elementary questions on English literature will be added; in French or German, easy translation from English will be required; and in chemistry, both the non-metallic and metallic elements must be studied. Modifications are also to be introduced in connection with the intermediate and degree examinations of the University.

THE PHARMACEUTICAL SOCIETY OF CAPE COLONY, which fills the gap left by the extinction of an older society some years ago, ought to have a useful and successful career, and we hope before long to find it in a position to regulate all matters pharmaceutical in the colony. The report at page 60, for which we are indebted to Mr. W. Fick, Secretary of the infant Society, shows that the new organisation will not lack ideas for realisation so long as the first president holds the reins.

THE ROYAL BOTANIC SOCIETY starts the year with more hopeful prospects than the members have been familiar with for some time past. A year ago the outlook was particularly gloomy, as the lease of the gardens was about to expire, there was an accumulated balance of some thousands of pounds on the wrong side of the account, and the Society was prevented from giving prizes at the various fêtes and shows as liberally as could be desired. But the position has been resolutely faced, and the Society is now perfectly solvent, the accumulated debt which has so long been a source of trouble and anxiety having been swept away. Moreover, a new lease for the maximum term of thirty-one years has been promised by the Commissioner of Woods and Forests. As is well known, the gardens are open for study to the pupils of the various medical institutions, and a School of Practical Gardening has recently been started with the aid and concurrence of the London County Council, whilst the Middlesex and Herts Councils have approached the Society with a view to sending students. Further, the Council of the British Astronomical Association is taking steps to erect and equip an observatory in the gardens.

AT THE ROYAL INSTITUTION on Tuesday next, January 18, Professor E. Ray Lankester, F.R.S., the recently-elected Fullerian Professor of Physiology in the Institution, will begin a course of eleven lectures on "The Simplest Living Things"; on Thursday, January 20, Professor Dewar, F.R.S., will deliver the first of a course of three lectures on "The Halogen Group of Elements"; and on Saturday, January 22, Professor Patrick Geddes will begin a course of three lectures on "Cyprus."

BOTANICAL ENTERPRISE IN WEST AFRICA is the subject of an article in the *Kew Bulletin*, in which it is pointed out that the earliest station was started at Lagos by Sir Alfred Moloney, in 1888, and the next at Aburi, on the Gold Coast, in 1890, under the supervision of Sir W. Brandford Griffith, whilst the station at the Gambia was established in 1894, and in 1895 Sir Frederic Cardew was successful in arranging for a station at Freetown, Sierra Leone. In addition to these, a station was established in 1891, under the Foreign Office, in the Niger Coast Protectorate. It is stated that the early attempts to start these stations were necessarily of a tentative character, but the measure of success which attended their efforts to develop the material progress of the West African Colonies led to a desire to place them on a more permanent footing. Accordingly, at a conference held at the Colonial Office, in September, 1893, at which the four West African Governors were present,

steps were taken to extend the botanic station system and to improve the position and standing of the curators. As a result of this conference, the botanic stations in West Africa have been placed on a similar footing to those existing in other parts of the Empire, and their influence and usefulness are steadily increasing. The health of the curators has, on the whole, been satisfactory, the only death having occurred at Aburi, in 1895, when Mr. W. Crowther, a remarkably promising man, died after nearly four years' service. But there is said to be no doubt that the special leave on full pay granted to West African officers is absolutely necessary to the preservation of health in that part of the world. In order to create an efficient body of native officers to assist in the work of the botanic stations, and take charge during the absence of the curators, arrangements have been made to train negro boys in horticultural work, and to make a selection of the most promising for further training in the West Indies or at Kew. Two such boys from Lagos were trained by the Botanical Department in Jamaica, and afterwards received at Kew for nearly eighteen months, returning to West Africa in May, 1894. One is now in charge of the Government House garden and grounds, while the other is Assistant Curator at the Botanic Station. It is hoped that efforts will be made to train similar men in the other colonies, and in the meantime it has been sought to increase the efficiency of the curators themselves, and to afford them opportunities for becoming thoroughly acquainted with the possibilities of development of West African industries.

THE BOTANIC STATION AT SIERRA LEONE is in charge of Mr. F. E. Willey, a member of the staff of the Royal Gardens, who had previously acted temporarily as curator of the botanic station at the Gold State, and Mr. James E. Hartley, a foreman at the Hope Botanic Gardens, Jamaica, acts as overseer under Mr. Willey. The duties of the overseer are to undertake the experimental cultivation of coffee, cacao and other economic plants, and to assist in training native boys in horticultural work. The site selected for the botanic station consists of two pieces of land, one of which—the lower or north garden—is about a mile from the centre of Freetown, at an elevation of 250 feet above mean sea-level, and well sheltered from the prevailing winds. There is a perennial stream flowing through the gardens, and it is intended to tap this at a higher level, and lead the water in small rivulets or in pipes all over the ground. The soil is not all equally good. It is described as rather poor and shallow in places, "while from three to four acres are covered with slab rock and laterite." There is, however, a sufficient area of good soil, especially along the banks of the stream, for nurseries and propagating grounds. Other parts are suitable for being laid out in lawns, and capable, by the addition of manure and soil, for growing specimen trees in specially prepared holes. The other portion of the station is, unfortunately, not accessible from the lower garden. It is an isolated plot situated on a slope at an elevation of 600 feet above the sea, and contains the remains of a small coffee plantation. The trees are looked after and regularly weeded and pruned, but beyond this it is not possible to afford them further attention at present. Mr. Willey has been on leave in this country during the past year, and in accordance with an arrangement made with the Colonial Office he and the Curator of the Gambia Botanic Station have spent eight weeks at Kew in the study of African plants and products in the houses and museums connected with the Royal Gardens, and in acquiring information in the city and elsewhere respecting the commercial value and method of treatment of subjects likely to be successfully and remuneratively taken up in West Africa.

REVIEW OF THE SOCIETY'S CALENDAR.

THE CALENDAR OF THE PHARMACEUTICAL SOCIETY OF GREAT BRITAIN FOR 1898. Price 2*s.*, or by post 2s. 4d. Sent post free to Subscribers to the Society. London: 17, Bloomsbury Square, W.C.

The modern passion for record-making seems to have extended to official publications, for the 1898 issue of this Calendar, which has just emerged from the press, is quite a week in advance of the most forward of its predecessors. This is as it should be, for few things deteriorate so rapidly as compilations of this kind, and it does not add to the prestige of a learned society to attach the corporate seal of proprietorship to a volume which is partially obsolete on the date of its birth. The present Calendar is fairly abreast of pharmaceutical events, and contains the recently approved Bye-laws, together with the modifications in the regulations of the Boards of Examiners necessitated thereby. Time-honoured features are preserved in the examination papers set during the past year for the First, Major, Scholarships, and Prizes examinations, the lists of subscribers to the Society and Benevolent Fund, and the Statutes relating to pharmacy in Great Britain. The information thus afforded should merit a large share of attention among students who desire to shape their studies for the examination room, and it would be well, too, for chemists in business to have available, in a convenient form, the Pharmacy Acts, concerning which they not infrequently come in conflict with coroners and others whose knowledge of the law is sometimes rather nebulous.

The most important part of the Calendar, however, from a business point of view, is that portion which formerly enjoyed the somewhat inappropriate title of the "appendix." It was a collection of statutory scraps, and though one readily concedes its undoubted value, the want of arrangement seriously militated against its practical utility. Recent years have witnessed some improvement in the direction of editing this portion of the Calendar, but much further work is still necessary to render the legal matter what it ought to be and is capable of being—a valuable, if not the best, handbook of the statutes and regulations affecting the pharmaceutical calling issued during the year. In the book under review a further step onwards has been made in disinterring and rendering available for easy reference information on Excise matters which has hitherto been buried deep under the generic epitaph of "Inland Revenue General Orders." Exporters will find, duly headed, the latest modifications in the regulations for packing medicinal spirits, essences, and perfumes; whilst those whose interests make it incumbent upon them to fathom the mysteries of "drawback" or "waste allowance" will find that due provision has been made for their requirements.

Among fresh items in the Calendar are the new regulations relating to naval dispenserships. These positions are to be filled by open competition, quite in the same way as men and boy clerkships of the lower division of the Civil Service. Chemists will receive a rude shock on reading these regulations and discovering that examination by the Pharmaceutical Society is not officially recognised by the Admiralty as sufficient for a person who dispenses for our sick sailors. Other additions include the regulations governing the sale, storage, and conveyance of petroleum; a somewhat tardy note on the position of collodion cotton in relation to the Explosives Act; the 1897 Metric Act and standards; and a memorandum respecting acetylene gas. With a little condensation and arrangement of the somewhat dreary and complex pages which are devoted to the Petroleum Acts and the Sale of Food and Drugs Acts, an already admirable Calendar might be rendered stil more valuable.

PHARMACEUTICAL SOCIETY OF CAPE COLONY.

Some time ago a large gathering of chemists and druggists took place at Cape Town, the matter for discussion which came before the meeting being the formation of a Pharmaceutical Society for the Cape Colony, upon a similar basis to the parent society of Great Britain. Mr. Pocock, who was appointed chairman, gave an explanation of the objects of the meeting and said it was a fitting opportunity to resuscitate the defunct Cape Pharmaceutical Society, which was established exactly ten years ago, but had never assumed a practical form. He felt sure all present would agree with him that the establishment of such a society would greatly benefit the pharmaceutical profession, as it would always be the object of such a society to protect the trade as well as professional interests of all its members. He said that he confidently looked forward to the time when the society would have for its members chemists residing in all parts of the Colony, so that ultimately by obtaining the Government Charter the chemists and druggists would have entire control of all matters affecting them as pharmacists. It would also be one of the chief objects of the society to form a school of pharmacy for the better instruction of the rising generation, and thus afford a better means of of educating apprentices for their future calling. A provisional committee was appointed to draft the rules and regulations and to bring up the same at the next meeting, which took place on November 25 last in the large hall of the Y.M.C.A. Mr. Pocock was again unanimously voted to the chair, and the following gentlemen were present:—Messrs. J. Jones, A. Mathew, jun., L. Mally, H. Cope, W. Jeffreys, Merrington, Fleming, Hutchinson, Edgar, North, Radclyffe, Vogelgezang, M. Tothill, F. Thomas, Smiles, Dunsdon, E. McKenzie, Bull, jun., Carman, Evans, T. Rowe, Wood, Swain, Millar, Linley, Hamilton, Main, Skinner, Yeo, Buckle, Walkden, and W. Fick.—Mr. Pocock stated that the rules would be read *seriatim*, and that the meeting could alter, amend, or rescind them.—After some discussion all the rules were passed with only a few alterations.—The following were then balloted for and elected as office-bearers for the ensuing year:—President, W. Pocock; Vice-Presidents, J. Jones and A. Mathew, sen.; Secretary, W. Fick; and ordinary members of the Council the following:—Messrs. Evans, A. H. Mathew, jun., Thomas, Helmore, Carman, North, M. Tothill, and Gardner. The latter gentleman not being at present in the Colony, his election will be subject to his approval; but in the event of his refusing to be elected, then Mr. Smiles, who was the next highest on the list, will fill the position. After a vote of thanks to the Chairman the meeting adjourned until further notice.

PHARMACEUTICAL SOCIETY OF IRELAND.

On Wednesday, the 5th instant, the monthly meeting of the Council was held at 67, Lower Mount Street, Dublin, the President, Mr. Downes, in the chair, and the other members attending being the Vice-president (Mr. Beggs), Mr. Grindley (Hon. Treasurer), Messrs. Wells, Simpson, Kelly, Baxter (Coleraine), Pouter, Bernard, McKnight, O'Sullivan, Burns, Hayes, Conyngham, Professor Tichborne, Dr. Merrin, and Dr. Walsh. The report to the Lord Lieutenant of Sir George Duffey, M.D., the Visitor of the Examinations, was read. He complained that candidates continued to exhibit a great deficiency in the knowledge of Latin and French, especially the parsing of Latin. The discussion of the report was deferred until the next meeting. A report of the School Committee made certain recommendations as to the marking at the examinations.—These were discussed, and on the motion of the President, seconded by the Vice-President, it was resolved that in future candidates who entered at any examination, but did not afterwards present themselves, should forfeit half the examiners' fees, and that the forfeited half-fees should be given to the examiners.—On the motion of the President, seconded by Mr. Wells, the minimum percentage in the pharmacy part of the Licence examination was raised from 45 to 50; and on the motion of Mr. Kelly, seconded by Mr. O'Sullivan, the maximum marking in the subdivisions of that examination was fixed as follows:—Compounding, 40; paper, 20; prescription reading, 20; British Pharmacopœia, 20.—The following proposals, moved by the President, in relation to the Preliminary Examination were then partly discussed, and the further consideration of them reserved until the next Council meeting:—That the examination shall occupy two days; that on the following subjects and their subdivisions the candidate must obtain 50 per cent.—English, Latin, chemistry, arithmetic, and the British and metrical systems of weights and measures; that 20 per cent. must be obtained in each of the other subjects, and on the entire course 60 per cent., to enable the candidate to pass; spelling and handwriting to be taken into account. In the subdivision the marking is to be as follows:—Latin translation, 10; parsing, 10; English composition and grammar, 10; dictation 10; arithmetic, 10; weights and measures, 5; algebra, 10; geometry, 10; chemistry, 15; optional subject, 10. In the course of the discussion letters were read from the Examiners, Mr. Brown and Dr. Tweedy. The former thought 60 per cent. too high a percentage on the whole course, and Dr. Tweedy said a two-day examination would be inconvenient to both examiners and candidates, and could be avoided by making geometry optional. Four new members of the Society were admitted, and the Council, after having disposed of other business, adjourned.

LINNEAN SOCIETY.

At the meeting of this Society, held on December 16 last, Mr Frank Crisp, LL.B., Treasurer and Vice-President, occupied the chair.—Mr. W. J. H. McCorquodale was admitted a Fellow of the Society, and Messrs. A. Fryer and G. C. Champion were elected Associates.—Mr. W. Carruthers, F.R.S., then exhibited and made remarks upon a fungus, *Rossellinia ligniaria*, which had been found to attack living ash trees, eventually causing the death of the tree.—Additional observations were made by Mr. George Murray and Professor Farmer.—Mr. Edward Step exhibited two specimens of a hermit crab, *Eupagurus prideauxi*, from Portscatho, Cornwall. Both were found naked and in rock cavities, and special interest attached to the fact that, in the absence of the well-known Molluscan shell which the species affects, each specimen was incrusted at precisely the same regions of its exterior by "acorn-shells."—The Rev. T. R. Stebbing gave an account of the habits of this and other species of the genus *Eupagurus*, directing special attention to the work of Aurivillius; and Professor Howes remarked that it was on record that in the absence of a shell the bowl of a clay-pipe did not come amiss to these animals, and that they will readily utilise broken test-tubes.—Mr. H. M. Bernard, read a paper on the affinities of the Madreporarian genus *Alveopora*. The question discussed was one of much interest, owing to the claim advanced by Dana, that *Alveopora* is a survival of the great Palæozoic family *Favositidæ*. This claim was rejected by Milne-Edwards and Haime, but nevertheless was founded on close similarity of structure. Other important characters in common were now indicated, viz., the similarity of the earliest growth-stages and of the method of budding. These were described, and it was urged that there was now no reason to doubt the relationship between *Alveopora* and *Favosites* other than that which arose from the immense interval of time which had elapsed since *Favosites* flourished and from the scarcity of intermediate forms. One only had been described, viz., the genus *Koninckia* from the Cretaceous. Mr. Bernard then discussed the relationship of *Alveopora* with the recent *Poritidæ*, in which family it is usually classed. The author contended that *Alveopora* and the *Poritidæ* stand about as far apart as possible in the madreporarian system, and with regard to the evolutionary stages of the madreporarian skeleton he concluded that the original columniform polyp must be considered to have had the lower portion of its body clothed with a stiff secretion which formed a cup into which the upper flexible portion could be invaginated. This epithecal cup was the primitive madreporarian skeleton. Within this cup—mainly by infoldings, at first simple, but soon increasing in complexity—a new internal skeleton had been developed which had largely superseded the primitive epithecal skeleton. This internal skeleton, he thought, was as much a product of the epitheca as the apodematous systems of Arthropods are products of the chitinous cuticle.—Messrs. H. and J. Groves communicated a paper on some *Characeæ* collected by Mr. T. B. Blow in the West Indies, one of which appeared to be new to science. Specimens of the plants described were exhibited.—Mr. B. Daydon Jackson referred to a correspondence which had taken place between the first President of the Society, Sir J. E. Smith, and Dr. Peter Camper at a time when it was proposed to elect the latter a Foreign Member, an honour which for curious reasons he declined. The correspondence, it was stated, might be produced on another occasion.

PHOTOGRAPHIC NOTES.

The Record Price for Silver Nitrate was lately reached of 23¾*d.* per ounce. Considering the very large quantities used by the manufacturers of gelatin dry plates, bromide and printing-out papers, one would expect a corresponding reduction in the price of these commodities, but so far there has been no sign of such reduction. Glass has advanced considerably in price, but that can hardly account for the delay in the reduction in the price of plates, and possibly the engineers' strike or something else keeps up the price of papers. It has been stated that it does not pay silver mines when the price falls below 2*s.* per ounce, so possibly a closing down of some of the mines, or a corner, may put the price up again considerably.

Phosphalbin or Protalbin Paper are the name of two new papers for printing out, which have been prepared from the results of researches of Drs. Jolles and Lilienfeld, of Vienna. These experimenters have been able to isolate the proteids from maize and other husked seeds, and to prepare a paper which is superior to the old albuminised paper as regards the glaze ; the gradation is good and the shadows are deep and brilliant. As the vehicle contains no sulphur as albumin does, it is probable that more stable prints will be obtained.

Backing Plates.—Dr. E. Vogel strongly recommends the use of coloured collodion for backing plates to prevent halation, and for colour-sensitive plates he strongly recommends the following :—

Acridine Yellow	10 Gm.
Fuchsine	4 Gm.
Alcohol, Absolute	120 C.c.

To make the backing take of—

The above solution	10 C.c.
Plain Collodion (4 per cent.)	25 C.c.
Castor Oil	1 C.c.
Ether-alcohol (p. æq.)	14 C.c.

This need not be removed from the back of the plates prior to development, and it may also be used to make window and lamp screens for the dark room. The only objection to the mixture is that it is by no means easy to coat a sensitive plate with collodion in the dark room.

Ortol Developer.—According to Vogel and Hannecke, ortol developer is a combination of 2 molecules methyl-ortho-amidophenol with 1 molecule hydroquinone. This acts more quickly than pyrogallol, does not colour the plate yellow, and produces as good a negative. By a small addition of potassium bromide the desired development of a well covered negative is obtained. A comparison of a reducing strength of ortol and pyrogallol shows that the developing strength of ortol is as 10 : 8. Ortol as a developer is very economical, and is not quickly exhausted. In the production of bromo-silver paper prints it is said to give excellent results.—*Chem. Zeit.*, xxxv. 304.

Platinotype Paper.—The paper may be prepared by immersion in the following solution :—Iron and ammonium oxalate, 20 grammes ; water, 100 grammes ; solution of potassium chloroplatinite (2 per cent.), 5 C.c. After drying, the paper is ready for exposure. The developer for this paper is composed of water, 250 grammes ; silver nitrate, 1 gramme ; citric acid, 1 gramme ; oxalic acid, 1 gramme ; ammonio-citrate of iron, 2·5 grammes ; solution of potassium bichromate, 10 drops. After washing, the image is fixed in the following bath :—Water, 200 C.c. ; solution of ammonia, 4 grammes ; sodium citrate, 4 grammes. A toning solution may be used composed of (*a*) uranium nitrate, 1 gramme ; water, 100. (*b*) Potassium ferricyanide, 1 gramme ; water, 100 grammes. When required for use, 50 C.c. of (*a*) and 20 C.c. of (*b*) are mixed and 50 C.c. of acetic acid added. Kuhn obtains brown tones by substituting the palladium salt for platinum and intermediate effects by mixtures of the two metals. Another toning effect is produced, according to Pockham, by allowing the prints to remain in a bath obtained by adding to a litre of water 4 C.c. of a 1 in 20 solution of catechu. After three or four minutes' immersion the liquid is decanted and the print treated with 28 C.c. of alcohol.—*Moniteur Scient.* [4], xi., 561, after *Dingler's Journ.*

NEW REMEDIES.

Tannone.—Tannone is a name applied to a condensation product of tannin and urotropin, which, according to Dr. Schreiber (*D. Med. Woch.*, 1897, 49), is useful in affections of the intestines. Tannone contains 87 per cent. of tannin and 13 per cent. of urotropin. It is a light brown, tasteless powder, and is almost insoluble in water, weak acids, alcohol, and ether, but it dissolves slowly in weak alkalis. After its administration, urotropin can be detected in the urine. Schreiber recommends doses of 1 gramme 3 to 4 times daily for adults, and 20 to 50 centigrammes several times daily for children.—*Pharm. Zeit.*, xlii., 828.

Iodocrol.—This name has been applied by Cohn to carvacrol iodide, which is introduced as a substitute for iodoform, and is stated to be a powerful antiseptic. It is soluble in ether, chloroform, and sulphur, and combines the antiseptic properties of carvacrol and of iodine, and possesses the advantage over iodoform of being odourless and five times the strength in bactericidal power.—*Pharm. Zeit.*, xlii., 828.

Extract of Chelidonium Majus in Cancer.—Winter and Schmidt do not report favourably on the action of extract of chelidonium in cancer. After trying it in twelve picked cases, both by injection and by the mouth, they find that it is practically without any beneficial influence on the disease, while the injections are extremely painful and add to the sufferings of the patient. The only beneficial effect observed was the stoppage of the hæmorrhage in three cases.—*Les Nouveaux Remèdes*, xiii., 509, after *Centralb. f. Gyn.*

Parachlorophenol as a Disinfectant.—Dentu reviews the statements of Girard (*Ph. J.* [4], i., 551) with regard to the toxicity and antiseptic properties of parachlorophenol. He finds that it is more toxic than stated by the former investigator, the lethal dose being 25 to 26 centigrammes per kilo., according to Dentu, while Girard gave the figure as 1 gramme per kilo. Dentu finds that a 1 per cent. solution has a marked action on instruments, even on nickel. Besides its microbicidal power being four times greater than phenol, its less powerful and persistent odour, and its less irritating properties are advantages, and it is less toxic, since a 1 in 100 solution is equivalent to a 1 in 20 solution of phenol ; nevertheless its absorption readily gives rise to darkening of the urine, and therefore its employment requires careful watching. Under certain conditions parachlorophenol is to be preferred to phenol.—*L'Union Pharm.*, xxviii., 449.

Antiseptic Inhalation in Phthisis.—Riley has found the following inhalation, combined with other means of treatment, serviceable in cases of pulmonary tubercule. Oil of Scotch pine, 30 M. ; oil of eucalyptus, 60 M. ; oil of cassia, 30 M. ; menthol, 20 grs. ; fluid extract of balm of Gilead buds, 60 M. ; creosote, 60 M. ; tincture of benzoin, 60 M. The patient is placed in a closed chamber, the air of which is saturated with the vapour produced by nebulising this mixture.—*Mod. Med.*, vi., 185.

Quinosol as a Disinfectant.—According to Giovannini, quinosol is not only inferior to corrosive sublimate as a disinfectant, but even less active as a germicide than phenol.—*Therap. Woch.*, iv., 1006.

Urea in Nephritic Calculus.—Klemperer prescribes the following powder in half-teaspoonful doses four or five times daily :—Bicarbonate of sodium, carbonate of calcium, pure urea, equal parts.—*Therap. Woch.*, iv., 479.

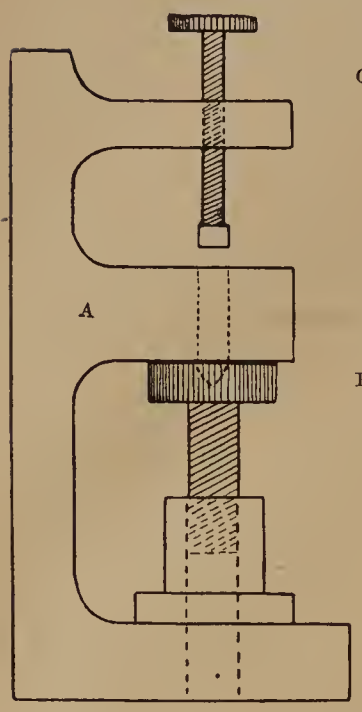
Mercuric Chloride Ointment for Ringworm.—An ointment of 2 grains of mercuric chloride to an ounce of lard thoroughly rubbed into the affected area twice daily, and a daily washing of the affected part with common yellow soap is the remedy suggested by Robinson for ringworm. If the parasite occurs on parts covered with hair this should be cut to the length of half an inch.—*Med. Press.* (*n. s.*), lxiv., 290.

Mercuric Cyanide in Anthrax.—By the use of a 1 per cent. solution of cyanide of mercury combined with cocaine salicylate, Kedroff has successfully treated two cases of anthrax ; a whole syringeful was injected at once, and the part covered with sublimate dressing.—*Rev. de Thérap.*, 235.

NOVEL APPLIANCES,

PHARMACEUTICAL AND CHEMICAL.

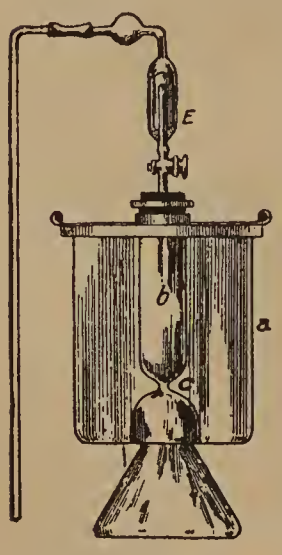
New Suppository Mould.



The suppository mould referred to in Messrs. White and Braithwaite's paper read at an Evening Meeting of the Pharmaceutical Society on November 16 last, and subscquently exhibited to those present at the meeting, is intended to prepare suppositories of equal weight and medicinal strength by compression. The mould is formed by a cylindrical hole drilled through the middle limb of the frame A, and a conical cavity drilled in the top of the screw B. In using the mould the screw B is raised until its upper surface is pressed firmly against the lower surface of the middle limb of the frame. The material to be moulded is then introduced into the cavity in A, and pressure applied by means of the screw C, which carries a plunger accurately fitting this cavity. After applying the necessary pressure the screw B is lowered and the moulded material expelled by further depression of the screw C. The design of the mould is provisionally protected, and it is hoped shortly to place the apparatus on the market.

Voeller's Gas Generator.

This new apparatus is available for the generation of Cl, H, SO_2, H_2S, CO_2, etc. As seen from the accompanying figure, it consists of a cylindrical glass vessel of about 3 litres capacity, whose lower end is contracted and again widened, so as to assume the shape of a Scheibler's dessicator. This vessel holds the acid. The substance to be acted upon by the acid is placed into another cylinder of about 700 C.c. capacity, which is also contracted near the bottom to about 2·5 Cm., and then widens out into an open bell, 5 Cm. high and 8 Cm. wide. The opening at *c* is either closed with a perforated stopper or covered with broken glass to prevent the falling of any of the substance into the acid. The upper opening of the cylinder is closed with a rubber stopper, through which passes the exit tube. Upon opening the stop cock the acid rapidly rises into the cylinder, but can be so regulated as to attack only the lower portions of the material. The resulting solution of salt formed, being heavier, sinks and fills the space beneath the inner cylinder. Upon closing the stop cock the acid is forced back, and the subsequently developed gas fills the bell-shaped extremity of the cylinder. The exit tube can be directly connected with a gas washing apparatus E, as shown in the accompanying figure. The apparatus is made by Kaeher and Martini, Berlin.—*Merck's Bullet.*, after *Ph. Review*.

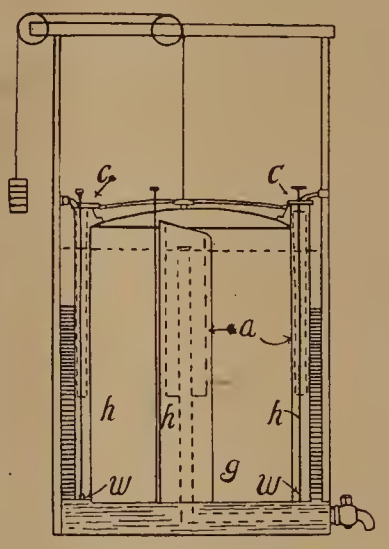


A Simple Self-measuring Tablet Compressor.

A steel cylinder A, turned from a piece of shafting 1 inch in diameter, and 2 inches long, is drilled through its length. The hollow tube thus produced is filled exactly with an upper and lower dies, B and C. The upper die B is graduated into millimetre divisions and is the same length as the cylinder, while the lower die, C, is much shorter. If a convex surface to the tablet is required the face of each die must be slightly hollowed out. The powder, previously slightly damped with an atomiser with or without the addition of acacia, is passed through a sieve and the amount needed for a tablet weighed out and introduced into the cylinder, the latter being held as in Figure 2. The die is now moved up until the powder is level with the top, the number of divisions indicated on the piston read off, the lower die inserted from above and the compressor inserted in a hole F, made for the purpose in a block of wood, and struck a sharp blow with a mallet.

It is then lifted from the lower die and placed in the second hole E, which is open beneath ; a gentle tap suffices to dislodge the tablet. In preparing the succeeding tablets it is only necessary to introduce a quantity of the powder into the box, move the piston up to the same mark, remove excess of powder and proceed as before.—*Merck's Report.*, vi., 400.

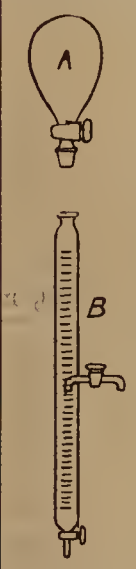
Gasholder for Acetylene.



The calcium carbide chambers H are fitted with perforated sides A, and attached to the movable gasometer G, with which they are connected by apertures C and W. The lower aperture W allows the water to enter into the calcium carbide chamber, while the upper valve C allows the gas generated to pass into the gasholder G. As the formation of a gas proceeds the gas tank rises, and when it is three-fourths filled with acetylene the calcium carbide is raised out of the water and action ceases. As the gas is drawn off the receiver again sinks, and the carbide again comes in contact with the water when evolution of gas is renewed. —*Chem. Zeit.*, xxi., 443.

Woosnam's Apparatus for the Schmidt Process of Butter Analysis.

In order to obviate the error which may arise from a slight loss of butter-fat in the ordinary Schmidt process, Woosnam has devised the apparatus here figured. It consists of (A) a boiling flask with tap, the mouth ground to fit the top of B. (B) A graduated 100 C.c. burette with a small side tap, preferably placed at about the 50 C.c. mark. In making a determination, 25 C.c. of milk are pipetted into the boiling flask A, and about 28 C.c. (roughly) of strong hydrochloric acid added. For this purpose a 25 C.c. pipette, with stem sufficiently small to pass through the tap, is recommended. The flask is then placed in boiling water and agitated frequently until the contents assume a pale brown colour. This will generally take place in about two minutes, and it is important that the action should not be allowed to proceed too far, or the sugar caramelised will be to some extent extracted by the aqueous ether at the next stage. The flask is now cooled thoroughly and 50 C.c. of ether added. The tap with which the flask is fitted is then closed, and the whole shaken vigorously for some moments, after which it is fixed firmly into the top of the burette B, the ground surfaces making a tight joint. When the ether layer has separated the tap is turned on to allow the liquids to flow gently into the burette. The measurement of the ether layer is next read off, and after adjusting the levels of the liquids by manipulating the two taps of the burette, an aliquot part of the ether layer is drawn off from the side-tap into a suitable weighed vessel, the ether driven off, and the fat weighed in the usual manner. The apparatus is made by Müller and Co., 148, High Holborn.



EXTRACTS FROM CONSULAR REPORTS.

OLIVE CULTIVATION.—An effort is being made to introduce the olive tree into the Australian and South African colonies for commercial purposes, and as large numbers of the trees have been exported from the district of Naples, Consul Neville-Rolfe has prepared a very interesting report on the cultivation of the olive in Italy. The origin of the olive is first dealt with, the wild olive or oleaster being described as a tree of small and stunted growth, which can be raised from seed or from the fungoids which olives bear underground at the point where the roots separate themselves from the trunk. The fruit yields very little oil, but a cultivated olive, grafted on the stem of the oleaster, produces good results. The olive tree is evergreen and commences to flower at the base of its foliage. The best crops are obtained when the trees flower early in the spring, but they are very susceptible to cold, and if checked, the flowers do not appear until towards June, when a failure of the crop frequently follows. The various classes of olive, the uses of the oil, the methods of cultivation, together with the climatic conditions under which the tree flourishes most successfully, are described in detail by Consul Rolfe, who hopes that the report may prove useful to the colonists who are importing the tree with a view to its cultivation. Both the cultivated olive tree and the wild variety appear to be very independent of soil, and flourish equally well on a rocky hillside or on the deep soil of the plains.

THE OLIVE GROUND IN ITALY is officially estimated at 908,072 hectares (roughly 2,270,180 acres), and the total produce of oil at 3,350,143 hectolitres. The finest table oil is produced in the small province of Lucca, and in the south of Italy the oils of Bari have the greatest repute.

THE ENEMY OF THE OLIVE most dreaded by the cultivator is a small fly, the *Dacus oleæ*. The female has a spur like a wasp, with which she punctures the fruit and deposits an egg in the lesion. These eggs develop into larvæ, which completely tunnel the olive, leaving nothing but the outer shell and the stone. It is calculated that a single fly will thus destroy three or four hundred olives. The *Coccus oleæ*, another pest, is a parasite which attacks the boughs and leaves, but lime-washing and petroleum sprays are both successful in destroying this pest.

THE LIQUORICE ROOT CROP of 1896-97 in the consular district of Batoum (Russia) is stated to have been of average quantity, but bought at high prices, owing to the scarcity of labour for collecting, curing, and pressing the root. The total crop was approximately 11,000 tons, of which about 3000 tons have been shipped to America. The prospects for the coming season are reported to be doubtful.

CAMPHOR TRADE MONOPOLY.—According to a recent Consular report, there is a probability that in the near future the world's camphor trade will become almost, if not entirely, a monopoly of the Japanese Government. Japan and Formosa are almost the only sources of supply, and as the lands in Formosa, where camphor trees abound, are not privately owned, the Government can appropriate the camphor-producing districts without interfering with vested interests. Formerly the mode of obtaining supplies of camphor from Formosa was for foreign merchants through Chinese agents to advance money to the savage chiefs, in whose country the camphor trees are found, for permission to cut down trees. Stills were erected at the expense of the foreigners, who paid a tax of 8 dollars a still to the Chinese authorities, and a local tax of 10 dollars on each ficul (133 lbs.) of camphor produced. Since the island was ceded to the Japanese there has been a fear amongst the foreigners that they would be debarred from distilling or purchasing camphor in the interior, in which case they would have suffered heavy losses in abandoning the capital already sunk there. But as the present treaty with Japan—which, if strictly enforced in Formosa, would cause foreigners to retire to the treaty ports—has only two more years to run, the Japanese Government has consented to let matters remain as they were. Under the new treaty, foreigners obtain the right to settle anywhere in the interior, and will therefore be able to erect camphor distilleries, but it is expected that the preparation of camphor will be controlled by the Government.

LETTERS TO THE EDITOR.

PROPOSED GENERAL INDEX TO THE 'PHARMACEUTICAL JOURNAL.'

Sir,—I commend to all pharmacists the admirable letter in last week's *Pharmaceutical Journal* on the above subject from Mr. E. H. Holmes. As a reader of the Journal for more than twenty-five years, indeed from the commencement of my apprenticeship, I can fully bear out all that Mr. Holmes says with respect to it. It was my good fortune some years ago to secure bound copies of the Journal from the commencement. The perusal of these has been a source of considerable pleasure and a good deal of business profit to myself, the latter an item which is, I am afraid, even at this day, largely overlooked by many of your readers. To make the past numbers of the Journal more valuable in this direction, it is most important that there should be an index covering the time since 1880, and I trust that the attention called to the matter will be the means of inducing many others to send in their names for copies of the index.

January 10, 1898. PH.C.

THE NEW PHARMACY BILL.

Sir,—It has been with considerable disappointment that I have read the letters addressed to you by pharmaceutical chemists, in opposition to the draft Pharmacy Acts Amendment Bill. Eliminating those that have been written in ignorance of the Pharmacy Acts and the scope of the draft Bill, the feeling expressed in the remainder is one of displeasure because no provision is to be made for some compensation to pharmaceutical chemists for the loss of exclusive eligibility to the membership of the Society. All the arguments that can be urged in favour of the Bill have already been adduced by yourself and others. I cannot hope to put them in a more cogent form; but I should like, if you will allow me, to give the reasons which induce me to give my support to the Bill. And I should like to ask my fellow pharmaceutical chemists to consider them yet once again before they attempt actively to oppose the measure. It does not seem to me to be just or in accordance with modern British views of government that a man who has fulfilled the requirements of the Legislature in qualifying himself for his calling, and the protection of the public, should be prevented from having a direct voice, if he wishes, in the promotion of further legislation affecting his calling. But the chemist and druggist is so prevented unless, in deference to a small body representing only 30 per cent. of the entire pharmaceutical community, he passes an honours examination which the Legislature does not consider necessary for the efficient discharge of his public duty. It is plainly only just that this disability should be removed. It is conceivable that in some circumstances an aristarchy may be a good and desirable form of government; but the circumstances in which pharmacy is placed scarcely seem to be such as to require this form of government which now prevails. In an educated community, especially in one with no very wide divergence of attainments and social rank, a democratic government is undeniably the most acceptable and the most useful. The chemists and druggists form 86 per cent. of the pharmacists on the registers, and 62 per cent. of the qualified men attached to the Pharmaceutical Society. The whole of this predominating class is debarred from representation upon the Council. I do not forget that chemists in business before 1868 are eligible for membership, but that class is a diminishing one and may be ignored in so far as my argument is concerned. There is probably no other body of men in the country that would have endured such a state of things for the last thirty years. There is nothing generous in asking these men to take the places they have a good right to claim. If pharmaceutical chemists are so unwise as to oppose this measure I hope that every chemist and druggist will make his claim in so emphatic a manner as to leave no uncertainty concerning his position in the mind of his Parliamentary representative.

Another reason why I support this Bill is that I am wishful to see pharmacy occupy a higher place in the esteem of the medical profession and the public than it does at present, and I do not see how that is to be brought about, except in individual cases, without more extended Parliamentary powers. Exactly what those extended powers should be it is not now the time to discuss; but it is pretty generally allowed that there is not much hope for real progress without an extended Pharmacy Act. Recent history indicates that, with the present meagre membership, the Pharmaceutical Society cannot make a very great impression upon Parliament. The

average layman, unacquainted with the details of the Society, is excusable if he is indifferent to the desires of a body having, apparently, a membership of only about 2000 out of a possible 15,000. The Consolidation Bill will increase the membership to about 4600, and may possibly still further increase it by attracting fresh adherents to the Society. As a necessary step to further desirable legislation, it is expedient that pharmaceutical chemists should support the Bill. My sympathies are with those who ask for consideration for those who have spent time and money in securing a title which they fear will lose its distinction if this draft Bill becomes law. There is much force in the contention that this is a virtual annulling of the contract made with pharmacists when they passed the Major examination. But I understand that the Bill is not an end in itself; it is a means, and a necessary means, to an end. Without it there appears to be no chance of the amendment of the Pharmacy Acts; but with it pharmaceutical chemists may hope for the betterment of pharmacy and the adequate recognition of their own rights. It would be a great pity, in these circumstances, if pharmaceutical chemists, who have been so loyal in the past, should allow personal interests of doubtful value to interfere with the unanimity of the pharmaceutical body in promoting this Bill.

Manchester, January 12, 1898. William Kirkby.

Sir,—The qualification of pharmaceutical chemist has always carried the optional title of M.P.S. Is this membership of any value to the holder? If so, then to allow persons to become members who are not pharmaceutical chemists lessens such value. Again, is the Pharmaceutical Society a scientific body, or is it a trade union? If the former, then the qualification necessary before membership can be obtained should have a recognised scientific value. The Minor examination is not purely scientific, and the standard of work required is comparatively low, so that whatever claim the Society now has to be regarded as a learned body would fail under the proposed Bill, not perhaps because there would actually be less learning in the ranks, but because of the possibility that the Society might be composed of and governed by Minor men only. Thus the position of the individual pharmacist and the status of the Society compared with kindred societies would both be lowered. This is what the opponents of the Bill, acting with the object of upholding the dignity of the craft and as friends of the Society, wish to prevent, and there appears every indication that they will be successful.

Manchester, January 11, 1898. F. Pilkington Sargeant

*** All Members of the Pharmaceutical Society are not pharmaceutical chemists, nor are all pharmaceutical chemists Members of the Society. As matters stand, pharmaceutical chemist members are in a majority, but if every chemist and druggist at present entitled to become a member availed himself of that privilege the pharmaceutical chemists would be in a minority even now. It is difficult to see, therefore, what force there is in Mr. Sargeant's arguments. [Ed. *P. J.*]

Sir,—Is the pharmaceutical body to remain another forty years in the wilderness? Wisdom and worthiness are of slow growth. Petty jealousy and selfishness seem to be the natural characteristics of the retailer of drugs, and it may take the time required for the evolution of a new species before the pharmacist learns that his jealousy of his neighbour acquiring the "M.P.S." at less cost than himself looks petty in the eyes of the public, and is petty and unworthy of any man who professes to have a good education and a respect for progress. When I first became associated with the Pharmaceutical Society, half a century ago, I had good hopes of what the Society would accomplish. Then I was young, but now I am old. Then the Allens, and Squires, and Bells, and Hanburys, did not grudge the title of Pharmaceutical Chemist to the smaller men who had not borne the burden of study or the stamp of genius. In the brave days of old the heroes were not afraid to associate with their Minor brethren. They saw no glory in a tinsel title, but in the good fruits of an unselfish life when it is done. There is gold without the guinea stamp, and there is many a guinea stamp without the gold. The men who grind that they may be stamped M.P.S. are only false coin. The genuine man of mettle studies that he may be a better and an abler man, and he profits by his superiority—not by his titular letters. Thirty years ago I wrote (*P. J.* [2], ix., 33, July, 1867): "Self-interest has been much too prominent in the letters of several of your recent correspondents. The question 'How it affects me' is one unworthy of being introduced into the consideration of any measure for the public good." I could scarcely say anything more applicable to the present circumstances, but I fear the opponents of the proposed Bill are all too young to see the wisdom of anything that was said thirty years ago. Other thirty years of sticking in the mud may teach them that Jupiter and titular letters will do little to raise them out of the mire. Let us hope that they may at the same time learn that conscientious industry will effectually accomplish that end. The aim of pharmaceutical legislation should be the ensuring that the dealing in drugs should be in the hands of men who are safely to be trusted with that work. Safety is better secured by pharmacists being men who study for improvement and progress rather than those who are satisfied with passing the first mile post. That is "M.," mile; P.S., post. My regret is that it is not at present possible to give the title of pharmaceutical chemist to all who pass the Minor. I should rejoice to see this within the range of practical politics. If public safety requires that a man who is himself qualified to deal in poisons should not entrust his work to juniors in his absence, the law should not require him to absent himself on jury service. The number of Minor men who are thus compelled to close their shops or run the risk of illegal sales and public danger must be much greater than the number of Major men who are exposed to the same difficulty. So long as there remains evidence of the drug trade being moved by selfish motives, so long as the "qualified" men complain of their inability to compete with the unqualified, so long as they seek the aid of Parliament to protect them from competition, fair or foul, so long will Parliament and the public look upon pharmaceutical legislation as a thing unworthy of attention and to be avoided. The Bill now proposed is not likely to accomplish much, but it may prepare a foundation for better things, and I trust all opposition to the efforts of the Council will be withdrawn.

Newcastle-on-Tyne, January 10, 1898. Barnard S. Proctor.

Sir,—The action of the Council in drafting a Pharmacy Bill, and the intention to press it forward if possible during the coming session, will, I hope, commend itself as a wise and proper proceeding to all in our ranks who have the best interests of the profession and trade at heart, and who have given serious consideration to the present position of our affairs. The Bill has been purposely made so non-contentious (or at any rate was thought to be so until quite recently) that I do not stop here to consider whether it ought or ought not to have been of wider scope. I take it as presented by the Council, having for its one great object what they believe to be essential, both as a matter of justice and expediency, viz., the consolidation and the knitting together of the whole body of chemists under the term "Member." And I am very sure it has been so received and approved of by the immense majority of our people of all ranks. Though it may be the case that few direct expressions of approval have been sent to the Council or to the Journal, yet that is by no means either unusual or to be taken as a sign of hostility, but rather that "silence gives consent." Exactly the same thing is constantly seen in political and other spheres. It is therefore with some surprise that I have noticed recently reports of meetings or letters to the Journal condemning the Bill as being unjust to pharmaceutical chemists or to members of the Society (it is not quite clear whether the alleged injustice is to only one or to both those important sections of our community). But it is, I submit, abundantly clear that neither the legal aspect of the case nor due consideration of the facts relating to our business have been correctly thought out or studied from a broad point of view by those gentlemen who have sounded a note of opposition to the Council. And first, I think it is somewhat hard upon the Council that now only at the eleventh hour should they hear of opposition to their Bill, when for the past few years it has been well known that action upon the very lines of this Bill was contemplated, and appeared to give great and general satisfaction to everybody concerned. In 1894, if I remember rightly, there was little or no opposition to the proposal to admit chemists and druggists to membership, and now that the distinction then proposed (to limit the number of such to the Council) has been omitted, I for one certainly thought the Council would have the cordial support of all its members in its efforts to place this Bill before Parliament.

The next point I refer to is the implied or expressed notion that the Bill is demanded only by, or is likely to benefit only, the Associates of the Society. Nothing, I think, could be more inaccurate. I, at least, have always understood it is the leading men of the Society, whether

Major or Minor (and I take the Council as representative of them), who desire to take the steps they consider necessary for the good of the whole body at this present time, and that it is neither for the sake of one section nor another alone, but for the best interests of the Pharmaceutical Society as a whole that this effort is made to unite the members together for the common good. It is probably not necessary to go into great detail on this point; it is, however, well known that the Society wants to attract as many chemists as possible to join its ranks so that a foundation may be laid for concerted action in the future. And this, I suppose, applies to Major as well as to Minor men, it being true, I regret to find, that many of both grades do not join the Society under present conditions. I have referred previously to the legal position, and think it is worth some attention. Whether the decision of Parliament in days gone by was right or not is hardly the question now, but it is certain the exact position of both pharmaceutical chemists and chemists and druggists was clearly defined. The former title was reserved to the Major man, and was the essential thing secured to him (not membership of the Society). It is, of course, true that in future pharmaceutical chemists only were to be eligible for membership, though many thousands of chemists then in business were also eligible without any examination; but membership is quite optional, and can be taken up or dropped at pleasure, and I am told by a high authority it is not a legal title. If, therefore, it is correct to say that the title pharmaceutical chemist and exemption from jury service were the only real legal privileges secured to Major men (beyond others shared by the Minor men), how can it now be successfully contended when both are left intact to be enjoyed by Major men only that any injustice is being done to them? But I look at the question from a broader view than one of privilege. Even if any great change were proposed it might be quite a reasonable thing to do now under the altered position of affairs, if intended and calculated to do good to the whole body, even though it might entail some sacrifice to a part of the community. It might as well be said we have no right to increase the stringency and fees of the Minor examination, yet pharmaceutical chemists and others were quite ready to do so because it was thought to be a necessary and proper act.

Do any of the gentlemen who object to the Bill contend it is quite proper and fair to make the Minor Associates in Business pay the same subscription to the Society's funds as do the members, and yet not allow them the same opportunity of taking part in the work and government of the Society? If so, I venture to say they would soon find out their mistake on the floor of the House of Commons. And when the financial question is further considered, it becomes more apparent that every reasonable and fair-minded person must allow to the body of men who contribute by far the most to the Society's funds, and without whose aid it could not be carried on under its present conditions, the same opportunity of taking part in its work if they wish as is now enjoyed (or shall I say endured) by its members. It will be surmised from the above that I am unable to view the matter from the standpoint that pharmaceutical chemists only have either the better right or are the better fitted to be entrusted with the affairs of the Society. In truth, I am unable to distinguish between them and their *confrères*, though I am most anxious not to say one word to discourage any or all of our students from taking the higher degree, which I believe it will be less difficult to do in the future, provided a man has been well and properly trained before passing the Minor. I do not think it is necessary to enter into or to refute the statements made which appear to suggest personal motives to anyone: it will probably be thought by your readers better to avoid anything of the sort, though I must confess the temptation is not small. Further, it is desirable that the utmost goodwill should be cultivated among our members, and, if possible, we should get rid of the disunion that we are told has in the past been the cause of failure in the consolidation of the Society. I do not wish to repeat what has been previously said or written either by myself or others, but it is impossible not to give some attention to the numerical position of the Society. And may I also add, the Journal has powerfully demonstrated in recent numbers how unwarranted is the attack on the policy of the Council by these opposing gentlemen, and has shown in which direction the future of the Society appears to be rapidly advancing. The Council, in my opinion, may be perfectly assured that their Bill is properly understood by the vast majority, and they need not hesitate to proceed with it to the utmost of their power.

I conclude with the following brief figures and statements:—There are 1584 pharmaceutical chemists who subscribe and belong to the Society, and 669 who do not. Twenty years ago there were over 2000 pharmaceutical chemists who subscribed to the Society, and 259 who did not. The number of chemists and druggists and Associates who subscribe and belong to the Society has, on the other hand, largely increased during the past twenty years, and I believe I am correct in putting the number at the present time at over 3200, some 500 or 600 only of whom are members by reason of being in business when the Acts passed. The Pharmaceutical Society does not belong to or exist chiefly for any one only of these classes. Every person admitted into its fold has certain legal rights. When the ratio of its subscribing members has so materially changed, it is reasonable and proper to enlarge the area of membership. It is the duty of the Council to propose any change they may decide to be necessary for the good government of the Society. The change now proposed is a very moderate one, and does not appear unjust or likely to do injury to the pharmaceutical chemist or anyone else. The Society cannot be kept going by the present members only. It is therefore desirable to make some effort to extend its influence and power for future usefulness. Let us all unite to promote this most desirable and laudable object.

January 11, 1898. R. A. Robinson.

Sir,—The argument put forward in last week's "Annotations" to show the folly of having a "Fellowship of the Pharmaceutical Society" seems in itself very strange. If it should lower the dignity of the Pharmaceutical Society to give a Fellowship to one who has not passed an examination intended for that degree, does it not lower it in the same manner if a Minor man who has passed an examination for the degree of Associate (when a subscriber to the Society) is given that of a member, "who obtain admission without much trouble after nomination and payment of certain fees"? I think it quite as much a "tinsel decoration" to give an associate the title of "Member" as to give a member the title of "Fellow," and am at a loss to understand how the Council, composed mainly of pharmaceutical chemists, has been influenced to agree unanimously to give an unfair title to associates, and no equivalent benefit to existing members, and shall do what little I can to prevent the same becoming law. I have no objection to allowing an equal number of associates to sit on the Council, but, as the Bill now stands, it is most unjust to Major men, and I do not think many will remain members if it passes, as one of the attractions for passing the Major examination would be done away with. I may state that I consider a proper curriculum for everyone wishing to qualify for the business of pharmacy is only what should be, and trust that it will soon be brought about.

Halifax, January 10, 1898. Walter Haigh.

*** We can only repeat that membership of the Pharmaceutical Society is in no sense a qualification, whilst a fellowship ought to be one if it is to possess any real value, but it cannot be regarded as such unless those who hold it have passed through a real curriculum of study prior to examination.—[Ed. *P.J.*]

Sir,—I read with much satisfaction the numerous letters now appearing in your columns relative to the injustice which would be imposed upon pharmacists, and especially those who have passed the Major examination, should the proposed Pharmacy Bill become law. Being myself much interested in the controversy, and as a member of the Manchester meeting convened by Mr. W. Gibbons, I noted with much regret what appeared to me to be a misrepresentation of facts forming the subject of your leading article in the issue of December 25. After reading the published report of the meeting, I am unable to find where the confusion of ideas referred to exists. Your article states that those present assume that there is a necessary connection between "member of the Pharmaceutical Society" and the pharmaceutical chemist qualification. I fail to understand how such an assumption could be deduced from the report, and I believe I am expressing the opinion of those present at the meeting when I state that only this much of a connection was implied—that the majority of pharmacists displaying the letters M.P.S. have only been enabled to do so by treading the narrow and difficult path of the Major examination. The knowledge of this fact is, I think, generally admitted to be fairly well established in the minds of medical men and the educated public, with the obvious sequence of advantages. Such being the case, a Bill which would give to Minor men the privilege of becoming members of the Society would indirectly aim a blow at the qualification "pharmaceutical chemist," and certainly must be confusing to the public generally. The object which the promoters of the Bill have in view, viz., that of strengthening the

Society, is a very desirable one, and in my humble opinion, worthy of support on all sides, and the grievance of Minor men—for it undoubtedly is a grievance—in their lack of representation on the Council, deserves the greatest consideration; but the method of procedure as set forth in the proposed Bill is distinctly revolting to the mind of the modern pharmacist, and unless a little more of the *quid pro quo* principle obtains, the Bill cannot possibly receive that unanimity of support which is so desirable. In conclusion, the opposition which is becoming so extensive leads me to think that the much-wished-for consolidation of the Society would not be attained even though the Bill became law, as that very unsatisfactory state of things, a house divided against itself, might come to pass.

Withington, January 11, 1898. Thomas Woodruff.

Manchester Pharmaceutical Association Resolutions.

Sir,—At the last meeting of the Manchester Pharmaceutical Association, on December 8, the resolutions as below were passed after discussion:—"(1) That the consolidation of the Pharmaceutical Society would be promoted by making eligible for election as members of the society all those who pass the Minor or qualifying examination. (2) That it is desirable that a conference should be called to consider the desirability of formulating a curriculum, and making such other recommendations as may be thought necessary to ensure a satisfactory pharmaceutical education, and that the President of the Pharmaceutical Society be asked to preside at the conference."

Manchester, January 10, 1898. A. Blackburn, Hon. Sec.

ANSWERS TO QUERIES.

The New B.P.—The work is not yet published; in fact, it has not yet emerged from the "draft" form, and is not expected for some time yet. You may be able to procure a copy about midsummer, but it is impossible to say with any degree of certainty. [*Reply to* H. H.—3/15.]

The New B.P.—"Minor" candidates will doubtless be expected to have a reasonable acquaintance with the contents of the book, as soon after publication as possible. Meanwhile, however, there is no occasion to worry yourself about probabilities. Do not make the mistake of assuming that the Pharmacopœia is a book to be crammed, but study it carefully and do not rest until you can explain the why and wherefor of every word it contains. No time that you may spend in studying the existing work will then be lost, as all the facts you learn from the book will be equally true when its successor appears, and the results of your experience with the one will be applicable in the case of the other. [*Reply to* Ajax.—3/11.]

Widal's Test for Typhoid.—On adding a drop of serum from a patient or a drop of blood from the tip of the finger, to ten drops of a young culture in bouillon of typhoid fever bacilli, the bouillon becomes clear and a precipitate is thrown down, which is seen under the microscope to consist of agglomerations of bacilli. See the *Lancet* of November 14, 1896, for further particulars. In a modification of the test by Fiocca, a drop of a recent culture of Eberth's bacillus is spread on a cover-glass in a thin layer, and a minute quantity of the blood to be tested is mixed with it. The cover-glass is then inverted over the cavity of a hollowed-out slide, and examined. The reaction is regarded as conclusive if all the bacilli are motionless, but is not so certain in its indications if any remain free and active. [*Reply to* Bacteriologist.—3/7.]

Picric Acid as an Explosive.—No, picric acid in the free state does not detonate under concussion, and although it burns fiercely, does not explode unless the detonator is used. But its salts are, some of them, powerful explosives. The Memorandum of the Home Office of 1883, and the Explosive Substances Act of that date, rightly includes picric acid in the same way as it includes glycerin, not because it is itself explosive, but because it may be used to manufacture destructive agents. However, picric acid is very inflammable; that is probably the reason railway companies class it as a dangerous body. [*Reply to* A. E. H.—1/33.]

Toilet Powder.—Probably the following will suit you:—Rice starch, 5 ounces; white bole, 5 ounces; boric acid, 2 ounces; French chalk, 2 ounces; apple blossom perfume, *q.s.* to scent nicely; carmine, *q.s.* to produce a pale pink. [*Reply to* Kino.—2/28.]

Affixing Labels to Drawers.—You will find nothing better for the purpose than Remington's flour paste, made as follows: Mix thoroughly 4 ozs. (troy) of wheat flour, 10 grains of boric acid, and 16 fl. ozs. of water; strain the mixture through a sieve, add 1 fl. dr. of nitric acid, then apply heat, with constant stirring, until the mixture thickens. When nearly cold, add 5 minims of clove oil, and strain the paste through coarse muslin if not perfectly smooth. This paste keeps well and improves on keeping; even when dried up it may be rendered fit for use by adding water. If labels are to be pasted on tinned surfaces, add 10 per cent. of glycerin to the above. [*Reply to* S. H.—3/13.]

Lactic Acid in Buttermilk.—This is not a constant quantity, and varies with the progress of lactic fermentation. Fresh buttermilk contains scarcely any, but the quantity rapidly increases, as you will note by the increased "sourness." When the formation of acid has reached a certain point it arrests further fermentation, but if it is neutralised as formed a considerably greater amount may be obtained. In actual practice chalk is employed for this purpose. The following may be taken as approximating to the composition of buttermilk, besides about 90 per cent. of water:—Casein, 4·5 to 5; milk sugar, 4·3 to 4·8; calcium phosphate, 0·2; magnesium phosphate, 0·04; potassium chloride, 0·14; sodium chloride, 0·03; with traces of iron as well as other sodium compounds, and varying traces of unremoved fat. [*Reply to* J. H.—2/33.]

Concentrated Infusion of Hyoscyamus.—Infusion of hyoscyamus is not official in either the U.S.P. or the 'Codex,' but the former allows any herb, at the discretion of the physician, to be administered as an infusion, to be made on the general formula of 1 part of the finely comminuted dried herb to 20 parts of boiling water, infusing for half an hour. The concentrated infusions are generally made by percolating 8 times the quantity of the herb required in the normal infusion, with very dilute alcohol; thus, you could make a concentrated infusion of hyoscyamus as follows: Hyoscyamus, in No. 20 powder, 8 ozs.; water, 4½ fl. ozs.; proof spirit to produce 20 fl. ozs. Mix the spirit and water, damp the powder with a little of the menstruum, pack in a percolator, and slowly percolate with more of the menstruum until 20 fl. ozs. of percolate have been obtained. Of course, 1 volume of this will require diluting with 7 volumes of water before use. [*Reply to* W. J. S.—3/1.]

CORRECTIONS.

Hydrastine Monocalcium Phosphate.—On page 24, column 1, line 49, for "7·01 per cent." read "71·0 per cent."

Pharmacy in France.—On page 31, column 2, line 39, for "of the doses" read "if the doses."

OBITUARY.

Cleghorn.—On December 13, 1897, Alexander Cleghorn, Chemist and Druggist, Cape Town. Aged 47.

Waters.—On December 13, 1897, William Allen Waters, Chemist and Druggist, Rye, Sussex. Aged 66. Mr. Waters had been a member of the Pharmaceutical Society since 1869.

Margetts.—On December 29, 1897, William Burgess Margetts, Chemist and Druggist, late of Kettering. Aged 38.

Wheeler.—On January 2, Christopher Wheeler, Pharmaceutical Chemist, Hackney Road, London, N.E. Aged 69. Mr. Wheeler had been a member of the Pharmaceutical Society since 1854, and was Divisional Secretary for Shoreditch (Haggerston), where he had been in business nearly fifty years.

Dennis.—On January 5, James Edward Dennis, Chemist and Druggist, Nottingham. Aged 63. Mr. Dennis had been a member of the Pharmaceutical Society since 1895.

Stacey.—On January 7, at Elmhurst, Tottenham, Mary, the wife of Samuel Lloyd Stacey, J.P., of the firm of Corbyn, Stacey and Co., one of the Pharmaceutical Society's auditors. Aged 70.

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Adams, Bell, Blackburn, Clarke, Cowley, Cracknell, Dulau, Dunlop, Fick, Gair, Gerrard, Gibbs, Gilligan, Haigh, Hardwick, Harrie, Harvie, Hogg, Johnston, Lloyd, Lothian, MacEwan, Mann, Pater, Pirie, Rankin, Shorthouse, Thompson, Vibert, Wilson, Woodruff, Woods.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

Acetone as a Solvent.

E. T. Hahn has been able to obtain a larger yield of resin from jalap, podophyllum, and scammony by employing acetone as a solvent, than when alcohol is used. Thus, commercial powdered jalap exhausted with alcohol by the U.S.P. process yielded only 6·5 per cent. of resin, whereas acetone extracted 7·5 per cent. under similar conditions. In the case of powdered podophyllum, alcohol extracted 4 per cent. of resin and acetone 4·5 per cent., whilst scammony yielded identical amounts of resin to boiling alcohol and boiling acetone, the yield amounting to less than 60 per cent. for the drug in its original moist condition, or 63 per cent. after drying the scammony to a constant weight. There was no marked difference between the samples of resin extracted from the same drug with the two solvents, and that there was a great similarity in the products is clearly indicated by the fact that they were found to be equally soluble in alcohol and acetone. —*Amer. Journ. Pharm.*, lxx., 21.

Extract of Liquorice.

Working on commercial powdered extract of liquorice, C. O. Kinzey has found a great variation in the amount of glycyrrhizin present in different samples, some containing as little as 5·28 per cent., and others nearly 28 per cent. The insoluble matter present ranged from 5·95 to 36·52 per cent., the moisture from 5 to 9·19 per cent., and the ash left was from 3·7 to 8·18 per cent. The solvent found to give the most satisfactory results for the extraction of glycyrrhizin was a mixture of ammonia water (sp. gr. 0·960), 40 C.c.; alcohol (sp. gr. 0·820), 240 C.c.; and water to make 1 litre.—*Amer. Journ. of Pharm.*, lxx., 23.

Liquid Benzoin.

This name is given by R. M. Shoemaker to a solution of benzoin, used for benzoating lard on similar lines to those recommended by J. K. Williams (see *ante*, p. 23), the object being, of course, to avoid the variable products obtained by using commercial benzoin direct. To prepare the solution, macerate 20 Gm. of benzoin in 40 C.c. of ether for 12 hours; then filter, with proper precautions to avoid loss of solvent, dissolve 15 Gm. of castor oil in the filtrate, and distil off the ether carefully. The deep amber-coloured product contains the benzoic acid and other volatile principles of the benzoin, whilst the residue left after the ether treatment is destitute of odour or taste. To prepare benzoated lard add 15 Gm. of the liquid benzoin to a mixture of 965 Gm. of dehydrated lard and 20 Gm. of white wax. The product should be a yellowish-white solid, possessing in full the characteristic odour of the volatile proximate principles of benzoin. In warm weather 5 per cent. of the lard may be replaced by white wax.—*Am. Journ. Ph.*, lxx., 9·

Soluble Ferric Phosphate.

W. A. Puckner, in a paper read before the American Pharmaceutical Association at its last meeting, explained how soluble ferric phosphate may be prepared. He mixes 20 C.c. of sulphuric acid (92·5 per cent.) with 240 C.c. of water, then adds 156 Gm. of ferrous sulphate in clear crystals, and warms gently until all is dissolved. The ferrous sulphate is oxidised by adding 12 Gm. of potassium chlorate and heating for half an hour, or until a distinct green colour is no longer produced with potassium ferricyanide solution. Next, the oxidised solution is added slowly and with constant agitation to 340 C.c. of ammonia water, and after diluting the mixture with 4000 C.c. of hot water, the precipitate is allowed to subside for half an hour, and the supernatant liquid then decanted. The precipitate is thoroughly washed with 2000 C.c. of hot water, and the operation repeated six times, at least six hours being allowed for complete subsidence to take place on the last occasion. When the supernatant liquid is finally removed, 120 Gm. of citric acid and 200 Gm. of uneffloresced sodium phosphate are added to the moist precipitate, the mixture is warmed gently until solution results, and then evaporated on a water-bath at a temperature not exceeding 60° C. until the solution weighs 500 Gm., when it is spread on glass plates and further evaporated to form scales. If the solution be evaporated until it measures exactly 500 C.c., each 2 C.c. will be equivalent to 1 Gm. of the soluble ferric phosphate.

Sugars in Beetroot.

Friedrich Strohmer points out that the opinion expressed thirty years ago by H. Schacht—that the quality of beetroots depends on the number of developed leaves and the length of life of the plant—is now shown to be free from objections. Sugar is produced in the leaves, either directly as reducing sugar or from starch or other carbohydrate, and migrates through the leaf stems to the root, the production depending on the amount of light, whilst the form and position of the leaves are of importance. When the sunlight passed through white or yellow glass, leaf production was vigorous, but with blue or red glass feeble; and the weight of roots under the influence of yellow light was nearly twice as great as when blue or red light was employed. The percentage of sugar under the different conditions was 7·4 to 8·1 with yellow, 6·4 to 7·4 with red, and 8·0 to 8·4 with blue light. For producing total organic substance in beetroot, rays of medium wave-length are the most favourable, but for converting the products of assimilation into sugar, the so-called chemical rays seem to have a prominent *rôle*. The results of field experiments are said to show that sugar production begins at an early stage in the leaves, but is greatest from the beginning of August to the middle of September, though under favourable conditions there may be a not inconsiderable accumulation of sugar even later. As from the beginning of July, the sum of the percentages of water and sugar in the roots is constant, whilst the percentage of sugar in the roots increases until the leaves die, it would appear that the sugar remains in the roots when once stored there. It is only when the roots are taken out of the soil and the leaves cut off, that the sugar begins to be used up in maintaining the life of the plant and in preparation for a second year's growth.—*Journ. Chem. Soc.* (Abstracts), lxxii., 581.

Action of Nitric Acid upon Tin.

Engel finds that several different compounds, according to circumstances, are formed by the action of nitric acid upon tin. The degree of dilution of the acid, and the temperature at which reaction takes place, have a marked influence on the result. (1) Ordinary nitric acid, diluted with twice its volume or more water, and cooled to 0° C., dissolves the tin in the form of stannous nitrate. (2) When diluted with only 1 volume of water at the same temperature, stannic nitrate is formed as a syrupy liquid, from which the salt may be precipitated by excess of acid. (3) Ordinary undiluted nitric acid gives with tin a white precipitate of the same salt; this is entirely soluble in water, and the same salt is formed at ordinary temperatures; thus the action of the acid upon tin does not differ from that on other metals. But the stannic nitrate so formed is decomposed by water or by heat, and is almost at once converted into stannic acid or a basic nitrate. The second of the above solutions gives a gelatinous mass when diluted with water, and the precipitate obtained from

the third solution soon loses its solubility, and becomes converted, for the most part, into stannic acid. In the presence of water, or on drying, this becomes converted into metastannic acid, and by boiling the metastannic acid for several hours with water parastannic acid, $Sn_5O_{11}H_2,3H_2O$, is formed.—*Compt. rend.*, cxxv., 709.

Cuprous Sulphate Solution.

A. Joannis has made some unsuccessful attempts to isolate cuprous sulphate, but the results of his experiments seem to show that cuprous sulphate can be formed under certain conditions. If finely-divided, obtained by electrolytic deposition on a platinum plate, metallic copper be digested with a solution of cupric sulphate, in the presence of carbon monoxide, slow absorption takes place, the copper dissolving and the solution becoming decolorised. The conditions of the experiment may be varied to some extent, without difference in the result, and it is assumed that cuprous sulphate is probably formed and combines with the carbon monoxide to form a compound analogous to that obtained when that gas is absorbed by a solution of cuprous chloride. Decomposition of the solution resulted, when the gas was removed by the mercury pump, as soon as the pressure was reduced to about 2 or 3 Mm., a pellicle of metallic copper forming on the surface, whilst the solution became blue, the reaction between cupric sulphate, copper, and carbonic oxide being thus shown to be a reversible one.—*Compt. rend.*, cxxv., 948.

Mercuroso-Mercuric Iodine.

Maurice François has repeated the experiments of Boullay, who first prepared what he claimed to be the intermediate iodide of mercury, Hg_4I_6, and whose statement has been accepted in all works on chemistry since 1827. The author finds that the so-called salt is nothing but a mixture, separable by treatment with ether into mercurous and mercuric iodide. The mercurous iodide left insoluble by this solvent was found to be of a bright yellow colour. By fractionally precipitating a solution of freshly-prepared mercurous nitrate with a solution of iodine in iodide of potassium of the strength prepared by Boullay, it was further found that the first three fractions consisted entirely of mercurous iodide and the remainder chiefly of the mercuric salt. Further, that when recently precipitated mercuric iodide was placed in contact with excess of mercurous nitrate solution, yellow mercurous iodide was slowly formed according to the equation $HgI_2 + HgNO_3 = Hg_2I_2 + Hg2NO_3$. On the other hand, when mercurous iodide was treated with a solution of mercuric nitrate, the red iodide is formed thus :—

$$Hg_2I_2 + Hg2NO_3 = HgI_2 + 2HgNO_3.$$

These separate reactions explain the successive formation of mercurous and mercuric iodide under the conditions indicated by Boullay as leading to the formation of the intermediate salt.—*Journ. de Pharm.* [6], vi., 443.

Formation of Chlorophyll.

W. Palladine finds that oxygen is essential for the reproduction of the green colour in etiolated leaves, and in greater quantity than is necessary for respiration. Thus when leaves which had been etiolated for forty-eight hours in the dark in a 10 per cent. solution of saccharose, were exposed to the light, immersed in water in a test-tube, it was found that the green colour was restored most rapidly to those leaves which were in the upper part, in contact with the air, although the light was equally distributed over the whole length of the tube. The action of solutions of various carbohydrates on the formation of chlorophyll was also experimented with. Thus leaves almost entirely free from carbohydrates were obtained by etiolating them in boiled water. A portion of these, when exposed to light, still immersed in water, showed scarcely any development of chlorophyll. When immersed in a 10 per cent. solution of saccharose, however, an intense green colour was developed; raffinose in a 5 per cent. solution acted in a similar manner. Dextrose and fructose gave rise to the green coloration somewhat more slowly, and with galactose, for the first five days, the leaves showed no colour; after then the colour developed very rapidly. Dulcite solution, mannite, asparagin, urea, alcohol, and ammonium hydrochloride prevented the formation of chlorophyll, while inulin and tyrosin appear to be neutral in their action.—*Comptes rendus*, cxxv., 827.

Formation of Antitoxins.

Dr. H. A. Cummins suggests that the principal purpose served by the formation of antitoxins (alkaloids and others) in plants is to protect them against the action of injurious bacteria in the soil. This is confirmed by the fact that the production of poisonous principles varies in the same species with the nature of the soil. Thus, *Cicuta virosa* is said to be not poisonous in the neighbourhood of Edinburgh; while the sale of *Agaricus campestris* is forbidden in the markets of Italy because of its poisonous properties. The antiseptic principles appear usually to be produced as the result of irritation of the cells caused by the entrance of organisms (bacteria), which produce fermentation of the juices of the plant; the antitoxin then killing the invading organism.—*Proc. Asiatic Soc., Bengal*, 1897, p. 15.

Fixing Iridescent Films.

An ingenious method of fixing iridescent films has been devised by C. Henry, Director of the Physiological Laboratory, at the Sorbonne. A sheet of impermeable paper or other material is placed at the bottom of a rectangular vessel furnished with a tap which allows it to be completely emptied. The vessel is filled with water, and a few drops of a solution of a resin, bitumen or tarry body, dissolved in a volatile medium, is dropped on the surface of the water; as the solvent volatilises it leaves a pellicle which is beautifully iridescent. If a whistle or other musical instrument be blown above the surface of this film, the colours will be observed to change, with the vibrations of the particular tone produced. When evaporation has proceeded far enough the tap is opened and the water allowed to run out slowly. In this way the pellicle is fixed to the surface of the paper, which when dried reproduces the iridescence in a very striking manner. A very fine specimen of paper so prepared, which accompanies the note, in appearance resembles watered silk, or the glossy iridescence which is seen on the feathers of certain birds, or scales of insects.—*Répertoire* [3], ix., 493.

Sounds and Colours.

Dr. W. S. Colman describes a number of cases of "colour-hearing," such as are well known to psychologists, in which a sensation of colour associates itself with certain sounds, the colour seen being definite and invariable for the same sound. In one class of cases a crude colour sensation, often very beautiful, is associated with each of the vowel sounds, musical notes, or particular musical instruments, the appearance being usually that of a transparent coloured film, similar to a rainbow, in front of the observer, but not obscuring objects. In a second class there are colour sensations whenever letters or written words (symbols of sound) are spoken or thought of, so that when a word is uttered the subject visualises the letters, each having a distinctive tint. Dr. Colman is of opinion that the phenomena are "associated sensations," analogous to the cutaneous sensation of shivering in certain parts of the body, which vary in different individuals. The tints excited are very definite and characteristic, each for its own sound, and they do not vary as time goes on. The colours are scarcely ever the same in two individuals.—*Lancet*, 3879, 22.

OIL OF THEOBROMA.

ITS SPECIFIC GRAVITY UNDER CERTAIN CONDITIONS.

BY EDMUND WHITE, B.SC. (LOND.), F.I.C.,
Pharmaceutist to St Thomas's Hospital.

In a paper* read before an Evening Meeting of the Pharmaceutical Society, in November last, on Suppositories, by J. O. Braithwaite and myself, certain sources of inaccuracy in the methods of manufacture usually adopted were discussed. We considered it eminently desirable that the sp. gr. of the official suppository masses should be determined, as well as the displacement value in terms of oil of theobroma of those medicinal substances commonly employed in suppository form. Working in this direction I have obtained results which seem to render futile any attempts to arrive at uniformity by this means. For I find that the sp. gr. of oil of theobroma taken at intervals after being melted and cast in moulds increases progressively from about ·950 to ·995 in round numbers, only attaining the highest value after several days. Moreover, the sp. gr. at a constant interval after solidification is slightly affected by the length of time during which the oil has been previously heated, prolonged exposure to heat causing a depression of the sp. gr., which, however, in all cases seems to attain a constant value after a few days. The general trend of these results might easily have been predicted from *à priori* considerations. I was, however, astonished at the magnitude of the variation (·950–·995), and do not think any exact observations have been hitherto published.

My attention was drawn to the matter by some attempts I was making to determine the sp. gr. of suppositoria iodoformi. The values obtained by successive observations on portions of the same material never coincided, and in order to eliminate possible variation due to the iodoform, I returned to the examination of oil of theobroma alone. A portion of oil was cut from a block, some of which had been used in experiments recorded in the paper on Suppositories previously referred to. Its sp. gr. was found to be ·992. Another portion of the same material was then placed in a wide-mouth bottle and just melted at 40° C. A portion poured out and solidified had a sp. gr. of ·969 thirty minutes after solidification. The bottle containing the rest of the oil was then placed in a water oven and heated continuously for eight hours, a portion being poured into a mould at intervals of one hour. The sp. gr. of each portion, taken as before, varied between ·950 and ·975. Although no direct connection could be established between the sp. gr. and the duration of the exposure to heat, the lowest figure was obtained after eight hours in the water oven. The determination of the sp. gr. of each portion was continued at intervals of two hours during the whole day, and repeated daily for the next two days. The total result may be summarised as follows :—The sp. gr. increased during the first day from about ·950 to ·980. On the second day the nine samples ranged from ·984–·986, and on the third day from ·986–·991.

Attention was next directed to the samples of oil of theobroma prepared by Braithwaite and myself from cocoa of known origin. In our paper on Suppositories we published a table of sp. grs. of five varieties obtained after more or less exposure to heat. The observations were not made at the expiration of the same time in each case after solidification, since the serious variation introduced by want of attention to this point was then unknown to us. From what I have already stated, and from the observations now to be recorded, it is evident that the table of results previously published must be rejected.†

* *Pharmaceutical Journal*, November 20, 1897.
‡ *Pharmaceutical Journal*, Nov. 20, 1897, p. 439.

Portions of the five samples of oil were just melted and cast in small porcelain crucibles so as to have, after solidification, the form of flat cakes. This form was adopted in preference to the conical suppository form, as there seemed less risk of including air bubbles in the former case. The sp. gr. of each sample was determined an hour later, then on the three succeeding days, and finally three weeks later, with the results embodied in the following table :—

Variety of Oil.	Specific Gravity.				
	1st day.	2nd day.	3rd day.	4th day.	3 weeks later.
Guaiaquil	·977	·983	·984	992	·995
Grenada	·978	·986	·990	·993	·997
Trinidad	·983	·991	·992	·992	·994
Ceylon	·975	·982	·989	·991	·991
Caraccas	·979	·984	·987	·998	·998

The sp. gr. was in all cases determined by floating the cakes of oil in dilute alcohol at 15° C. The sp. gr. of the alcohol was afterwards determined by a picnometer form of hydrometer, the graduations of which had been carefully standardised by comparison with the results obtained by a Regnault's bottle. It is advisable to keep at hand a series of diluted alcohols so as to get approximately near, at the first attempt, to the sp. gr. required. Final adjustment should be made by addition of more or less dilute alcohol—not strong alcohol, since the latter fluid causes a sensible rise of temperature if it be added to weaker alcoholic fluids. It will usually be found that some air bubbles remain obstinately attached to the piece of floating oil. These may be detached by smartly tapping the piece of oil beneath the surface of the fluid with a glass rod. It is always best to get the substance into a form free from sharp ridges or angles, and with a polished surface.

In order to determine whether the great variation observed in the sp. gr. of moulded portions of oil within the first few hours of solidification might be due to the interior portion of the oil not having attained the temperature of 15° C., the following experiment was made :—A thermometer with a short bulb was fixed centrally by means of a clamp in the cavity of a two-drachm pessary mould. Melted oil was then poured in, covering the bulb entirely. A few minutes after solidification the thermometer stood at 24°·5 C.; the mould was then opened, and the thermometer, with its adherent mass of oil, suspended freely in the air, the temperature of which was 15°·5 C. After twenty-two minutes the thermometer stood at 16°, and five minutes later at 15°·5. The arrangement was then immersed in melting ice, and after fifteen minutes registered 1° C., and five minutes later fell to zero. It was next taken out, wiped carefully, and again suspended in the air. In twenty minutes the thermometer stood at 15° C. It is therefore evident that the observed variations were not due to the cause just mentioned, but originated in some molecular disturbance caused by the heat applied in melting, the effects of the disturbance not passing away entirely until the expiration of several days.

I find that from this cause alone a variation of half a grain in the weight of a 15-grain suppository is possible, according to the time allowed to elapse between the solidification of the mass and its trimming and removal from the moulds.

TOXOIDES.—Erlich declares that toxoides are a modification of toxines produced by bacteria. They are weaker than but still possess affinities to antitoxines. According to the degree of the affinity, protoxoids, syntoxoids, and epitoxoids are distinguished. It is said that toxines frequently change partly to toxoides, as they are extremely unstable.—*Ph. Centr.*, xxxviii., 720.

PHARMACEUTICAL ORGANISATION.*

BY JOHN TAYLOR (BOLTON).

Looking over the letters and papers on this subject contributed to the Journal during the autumn and winter I do not find that they give us much light on the matter. An exception should, perhaps, be made in the case of Mr. Newsholme's contribution. I will say at the outset I do not flatter myself I can illuminate your minds to any greater extent. We have a Charter of Incorporation and Acts of Parliament which confer on us as a trade certain duties and privileges, and up to a certain point lay down the lines of our organisation. In these conditions there is no provision for compelling the adherence of members of the trade to the organisation set up by the Charter. It seems to me rightly so. The problem, then, is this: How shall we best supplement the organisation we have and secure the complete or nearly complete adherence of the trade by its free consent to that Society to which the State has committed certain important duties, viz., the examination and registration of State-licensed sellers of poisons? In dealing with this problem I am not going into the beginnings and history of the Pharmaceutical Society. I am not come to bury the pharmaceutical Cæsar or to praise him, for it seems to me that on these occasions far too much time is taken up with dilating on the heroes and doings of the past. But, to prevent misconception, let me say I acknowledge to the full our indebtedness to those who founded our Society and initiated our organisation. If I say little of them, it is not because I have no reverence for them or admiration of their works, but because the world has moved since their time and their problems are largely not ours. Let us not imitate that class of Christians who refer to the day and hour of their conversion very glibly, and who are so much amazed at the work of grace then accomplished that they make no further advance.

What the Society can do.

The Pharmaceutical Society has a difficult task. Besides the quasi-State functions imposed upon it, it has taken up and well discharged the duty of seeing to the progress of pharmacy. In these respects I think it is very little open to criticism. But when we turn to the commercial side of the problem, I think it must be held to have largely failed. It has dwelt too completely on the scientific and professional side of our calling, to the exclusion of the commercial. I will say at once that I do not hold with the view held by many and voiced by Mr. Newsholme in his address as follows:—"In regard to trade protection in the sense of attempting to regulate prices or solving any other problem of purely commercial importance, the Society and Council cannot take action. It must always be remembered that the Pharmaceutical Society is to some extent an under department of State, and, as such, it must ever maintain itself beyond the suspicion of attempting to fill the pockets of its members at the expense of the public which has delegated to it certain powers." I admit that prices are outside the power of the Society to regulate. I contest the rest of the argument. It is indeed notorious that the Pharmaceutical Society, in doing its work, as an under department of State, has been charged repeatedly with trying to fill its pockets and those of the trade by the prosecution of illegal traders. See, especially, the photographic press. These allegations are as unfounded as they are unjust. My point is that they will continue to be made, and will have to be reckoned with. They should not prevent the Society, as a trade union, safeguarding the interests, commercial and otherwise, of the trade. So much is it felt to be necessary to see to those interests, that for years past the best brains amongst us have been devising schemes and organisations to make up for this shortcoming in our pharmaceutical organisation.

The Local Organisation Scheme.

The latest is the local organisation scheme now being boomed so largely. I have no more faith in the ultimate success of the federation scheme than I had when I last addressed you, now at least three years ago. I think it is based on a wrong idea of the situation. It accepts what I cannot accept, the argument that the Pharmaceutical Society "cannot" take cognisance of commercial or purely trade questions, and that therefore we must erect alongside the incorporated Society a purely trade union to be its complement and recruiter. I say recruiter, for there seems to be an idea that in some mysterious way, when once we are locally well organised, we shall see the trade joining the Society almost in a body. Mr. Newsholme, while disclaiming any intention of pointing to the Society as an easy way out of our difficulties, says, "When any chemist fully realises the full value of combination for mutual defence and professional advancement, it will not be long before he perceives that the Society offers the simplest means of alleviating his position." That is to say the simplest means of alleviating his position is to join a society of which even its most devoted adherents say it cannot or it will not take action on purely commercial questions! Please remember that these same "purely commercial questions" are, for the qualified chemist, the most important. Let us clear our minds of pharmaceutical cant. If the Society is simply to exist to carry out State functions deputed to it, it does not require and need not seek the adherence of the trade. Properly administered and cared for, the funds allocated to it by the State will be sufficient, and it needs not the money of subscribers to carry on its functions. If, then, that is all it is to do, let us be done with the complaint that the trade will not support the Society. On those lines the Society does not need such support. Local organisation is to do all the Society cannot do, and so we shall have two societies virtually, if not in name. I think this is a somewhat clumsy expedient, and also, from the point of view of those who hope that local organisation will lead to a large accession of strength in the case of the Society, a somewhat dangerous one. For, I fear that, if the trade ever becomes commercially well organised, unless the control of such organisation is in the hands of the Society, it is more than probable that it will be antagonistic to the Society. Mr. Newsholme says, "The crying need of the time is a system of local organisation amongst pharmacists which shall embrace the whole body." I agree with him, but I want to see that organisation begun, carried out and sustained by the Pharmaceutical Society of Great Britain. I think that Society should take for its motto, "Nothing that is of interest to pharmacists is foreign to us."

A Trade Union Needed.

You will say that is trade unionism pure and simple. It is, and it is none the worse on that account. Moreover, whatever action the Society takes under its State-delegated powers is credited to its trade unionism by the general public. So there need be no false shame as to the proper discharge of those functions. So long as they are fairly and impartially discharged there will be no discredit to the Society, even if the result be to help to fill the pockets of legally qualified men. We need a trade union. Despite all that can be said, and justly said, of the professional and personal sides of our calling, we are mainly traders, and the law deals with us as such. The only thing that will unite us all—assuming such union to be desirable—is the trading aspect of our calling, for it is given to few to earn a living by such a practice of pharmacy as will deserve the status of a purely professional man, *i.e.*, one who sells his services alone. Assuming then that we need a Society which shall do for us what a trade union does for its members, I think it a mistake to waste money, time, and energy in setting up any new organisation. We have at hand—in the Pharmaceutical Society—a basis for the union desired. I advocate the adaptation of that Society to all that we mean to do for ourselves by union. It cannot regulate prices. Short of the regulation of prices, we ought to be able to do for ourselves, through the Society, all that we propose to do by a federation of local associations. I do not agree with the Editor of the Journal when, writing August 28, 1897, he says the Pharmaceutical Society is practically powerless to deal with such problems as the maintenance of fair prices, the fixing of railway rates, the interpretation of Acts of Parliament by local authorities, etc., etc. Some of you will remember the meeting in this city eight or nine years ago, when Mr. Carteighe addressed a meeting of the trade, at which I spoke. Replying to my remark that the guinea was a consideration not to be overlooked by many small chemists, he pointed out that the cotton-spinner or engineer paid as much or more to his union, and that what they could do, surely we could. Certainly, I reply, for the same value. But it is precisely concerning those things in which we are told the Society "cannot" do anything, that the artisan's union takes the keenest interest. Moreover, when employers want to influence the Railway Commission, or a local authority, they do not despise the help and presence of trade union officials on a deputation. Not to speak of the fact that a member of any trade union is helped when sick or supported if unemployed, these other "purely commercial questions" engage the attention of highly-trained officials, men whose technical skill is of a high order.

* Report of an address to the Manchester Pharmaceutical Association, delivered on Wednesday, January 19, 1898.

A Good Example.

We have, however, a better example than the artisans' unions afford us. The Incorporated Law Society is a body largely analogous to our Society. It examines and registers those who qualify to practise as solicitors. All who practise have to pay to it an annual licence. In that respect it has a great advantage over our Society. All practising solicitors have a voice by vote in its affairs, and every solicitor is eligible for election to its Council or any office under it. It interests itself keenly in the scientific and State aspects of law and legislation. But it does not disdain to look equally keenly after what may be called "the purely commercial" aspect of the solicitors' profession. Let public or private efforts interfere with the financial interests of its members, and it will be found to promptly champion their cause. Most local associations are affiliated with it, and keep it in touch with professional feeling. I am aware this last fact seems to confute my contention as to the undesirability of multiplying associations. Really it does not, for, in fact, every member of a local Law Society is also a member of the Incorporated Law Society of the United Kingdom. These small societies, therefore, amount in practice to branches of the Incorporated Society.

A Few Suggestions.

Since I hold that anyone who criticises existing institutions should attempt constructive, as well as destructive, criticism —otherwise he becomes a mere carper—I therefore offer a few suggestions. The Pharmaceutical Society should be re-organised. Its constitution should be placed on a thoroughly democratic basis. Not only should every subscriber have a vote, but every subscriber should also be eligible for office. The distinction for the office of Councillor should be abolished utterly. When that is done it will, of course, be necessary to safeguard the interests of Major men so far as honours are concerned. I am not now going to suggest how it is to be done. I will only say that if it is made clear in the public mind that a Major man has passed a superior examination the pharmaceutical chemist will have nothing at which to grumble. May I quote my last address (see *P. J.* [3], xxv., 513) to you on this part of the subject? "What we want is not a title; it is the reality of power. We can have that without robbing any man of his rights. We want to meet, as regards the working of the Society, on perfect equality—equality of subscription, equality as members, equality in having the right to fill any office to which the constituency may think it proper to elect us. Give us these things, and as regards titles of honour and merit, or scholarship, let them go to the men who honestly earn them." But I would not rest with re-organisation of the Council and headquarters. For reasons with which you are more or less familiar, I would advocate the division of the contituency, and apportion a certain number of councillors to each, keeping the head offices where they are, adopting, in fact, what has been called the territorial system of representation. Each local association should be affiliated with the parent Society—be a branch of it—and its secretary the local secretary of the Society. These branches, inasmuch as they would affect the voting at any election, would keep the headquarters in touch with the provinces. We might also, I think, with advantage follow the example of the solicitors, and hold the annual meeting of the Society in various places. If that were done it would be possible to make the British Pharmaceutical Conference true to its name.

The Society and Trade Matters.

These are only broad outlines of what may be done. Details would be best settled by a convention. Then I would suggest that the Society openly abandon its neglect of commercial questions. Where the interests of a single member of the trade are involved in such a way as to be of importance to the rest of the trade, the Society ought to intervene. It could, for instance, place at the disposal of the trade for proper remuneration the services of an expert solicitor or expert witnesses. In questions of railway rates, or interpretations of Acts of Parliament by local authorities, the Society could bring to bear as representing a large and important body of traders, an amount of prestige and expert evidence which only the very richest pharmacists could otherwise command. In many ways, a strong trade union—such as the Pharmaceutical Society could be made—can help traders without abuse or abrogation of its quasi-State functions. Briefly, the policy of the re-organised Society should be to safeguard in every possible way the educational, professional, and commercial interests of pharmacists. Suppose the Society were re-organised on the above basis, what would be the good of it and what could it do? Those are fair questions to ask. The first good accomplished would be that it will be possible then to get the support of the trade for the Society. I suppose that would be good. At all events it is what almost all of us want to see. Not 25 per cent. but 75 per cent. of the drug trade in the Society. When men saw themselves in line, pride and interest would point out ways of using their strength. As to what the Society could do if it had the support of the majority it is not easy to dogmatise. It could not save us from competition in the prices of those articles we handle in common with other traders, and ought not to attempt that. Such salvation, if needed, must be got in common with those competitors. But I believe firmly that if seventy-five per cent. of us were members of a society or union, term it what you will, there would grow and strengthen a feeling that would mitigate unfair and unneighbourly competition within our ranks. An ethical code would begin to form.

Another Case in Point.

Many of you know the Cyclists' Touring Club. Its membership has reached at least twenty-five thousand. Some time ago, when it numbered only twenty thousand or less, it was powerful enough to get into the Local Government Acts clauses establishing equal bye-laws over England and Scotland. It has had a powerful effect on the agitation for universal lights, and has even secured from railway companies important advantages, not only for its members, but for all cyclists. In face of facts like these, who shall say that a large and powerful society of pharmacists can have no effect on legislative action? The question of jury service, for instance, would be powerfully affected. Those of you who know me personally will know that I have a strong conviction of the value and need of education to all men. I am in deep sympathy with the attempts to keep up pharmaceutical education to the highest possible level. "Man cannot live by bread alone," but neither can he exist on education alone. Apart from its national and altruistic aspects, a high standard of pharmaceutical education has its chief attraction for those who read it in the added financial value of their attainments. But of what use is such attainment if all except a few find that for lack of union with others of the same class they have not the strength to command a fair return for it and fair conditions under which to exercise it. In the fierce competition and constantly occurring fresh conditions of modern trade, a strong union can be of great service to its members, and those trades will come best out of the conflict which are best organised and most strongly united. You will say, the re-organisation of the Pharmaceutical Society is what our American cousins call

"A Large Order."

It is, but not near so large an order, in my opinion, as the taking in hand the organisation of the scattered members of the drug trade and uniting them in such a way that, whilst on commercial questions they are to fend for themselves, they are to live in closest touch and sympathy with a Society which cares for none of those things. The energy required to do this is sufficient to re-organise the Pharmaceutical Society, and I think with a greater chance of success. Still, it is a great task. Who will undertake it? Are there none of the princes of pharmacy who can be fired with the desire to devote their time and energy to the task? Is it of no use to hope that we may bring the highest in our calling to see that in the ranks there are thousands in a small way of trade, as well educated, as honourable, and as deserving as themselves, who are deeply interested in those questions? They are men to whom matters of education and recognition by learned societies are of less moment than the question of a living and a future for them and theirs. Must they always live and fight alone for want of a society which, studying their interests, shall command their sympathies and enlist their support? I trust not. The success of such a re-organisation as I have roughly sketched does not depend upon whether men are "clubable" or not. It depends on a due recognition that the interests of one man engaged in pharmacy are the interests of all. A man may not care to "club" with you, but show him that, whether he does so or not, you want his help and are willing to give him yours, on matters of common interest, and the facts of life tell us that in most cases you "will get your man." I am not a "clubable" man I fear. I am a busy man and a comparatively poor man, but if I could do anything to bring about the more perfect organisation of pharmacists, I should be intensely proud of such a work.

BOTANIC GARDENS OF THE WORLD.

THE OXFORD BOTANIC GARDEN.

The universities of Italy, France, and Germany were already furnished with physic gardens, when in 1632, Henry, Earl of Danby, who had been a gentleman commoner of Christ Church, presented to the University for the general advancement of learning, and especially of physic, "a spacious illustrious physicke garden," situated "without the east gate of Oxford near the River Cherwell, which was then meadow ground, and had in ancient time been a cemetery for the Jews of Oxon." His gift of £250 enabled the University to purchase this spot. They bought out the lease of the person then in occupation, and obtained one from Magdalene College, to whom they agreed to pay the annual rent of forty shillings. The ground was protected from the river by the introduction of fresh soil, and on St. James' Day, 1632, the Vice-Chancellor went in procession to the Garden, where an oration was spoken by Dr. Clayton, the King's professor of medicine. Then the Vice-Chancellor laid the first stone of the rustic archway, the greater part of the ground having been walled in before under the direction of Inigo Jones. The stocking and other expenses of the laying out of the Garden are said to have exceeded £5000. John Tradescant, whose garden at Lambeth has already been referred to, was the first gardener of "this nursery of simples." He died in the year 1638. In 1640 we find Dr. Clayton, in his address at the beginning of Parkinson's 'Theatre of Plants,' saying that the Garden was then "compleately beautifully walled and gated," and was then "in levelling and planting with the charges and expenses of thousands by the many wayes," Honourable Earl of Danby. "The furnishing and enriching thereof with all usefull delightfull plants will," he adds, "the better be expedited by your painefull happy satisfying work." Jacob Bobart, the elder, a native of Brunswick, seems to have been Superintendent of the Garden from its foundation. Sharrock, in his 'Improvement to the Art of Gardening,' 1694, says, "The artificial bog is made by digging a hole in any stiff clay and filling it with earth taken from a bog. . . . Of this sort, in our garden here in Oxford, we have one artificially made by Bobart, for the preservation of boggy plants, where, being sometimes watered, they thrive for a year or two as well as in their natural places." He published in 1648 a list of the plants then grown in the Garden under the title of 'Catalogus Plantarum Horti medici Oxoniensis Latino-anglicus et Anglico-latinus; Alphabetico ordine.' This little duodecimo includes some exotics, the number of English species given amounting to about six hundred. This catalogue, when reprinted in 1658, was enlarged, the specific names used by Gerard and Parkinson being added to each plant. William Browne, Senior Fellow of Magdalene, took the chief part in the reissue, but was helped by Bobart's son and by Dr. Stephens, Principal of Magdalene Hall. Considered as a flora, it is of little value, containing no new indigenous plants. There is a small full-length portrait of the elder Bobart in the frontispiece to a poem on the Garden, "Vertumnus," published at Oxford in 1713. In 1643 the Earl of Danby died. He had intended, in founding the Garden, that a professor of botany should give lectures at the Garden and show the use and virtues of its simples to his auditors, but he deferred establishing the professorship till the Garden should be thoroughly furnished with simples and they should come to maturity. "Distempers breaking forth, and the Earl dying soon after, nothing was done as to that, save only by his will, dated December 14, 1640, which was three years before he died, he appointed certain persons to settle by legal conveyance to the University the Rectory of Kirkdale in Yorkshire for the use of the said Garden. Afterward, Sir John Danvers, his brother, in pursuance of the will, did settle it on the University to the end that, with the revenues thereof, the Garden be repaired and a stipend be paid to the professor and gardener. But so it was that, the times being unsettled, and the revenues falling shorter than was expected, nothing was done in order to this settling of a professor till 1669, and then, a motion being made by the King's botanic professor for the acceptance of the employment, the University thereupon allowed him an annual stipend of £40, and caused him to read at certain times of the year, not according to Statute, but at such times as he thinks most proper, that is in spring and autumn." During the elder Bobart's superintendentship Evelyn twice visited the Garden in 1654 and 1665, and he attended one of the professor's lectures in 1675. With regard to his first visit, he says that the sensitive plant was exhibited as a great curiosity, and that the fruit of which the ladies tasted was very good. On the occasion of his second visit he noticed specially two large locust trees and some rare exotics.

Dr. Robert Morison, a native of Aberdeen, studied botany at Paris. From 1650 to 1660 he held, on the recommendation of M. Robins, the French king's herbalist and friend of Gerard, the post of superintendent of the Duke of Orleans' fine garden at Blois. There he investigated the flora of France. On the death of the Duke he was invited by Charles II. to become King's professor of botany and physician, with an appointment of £800 a year and a house as Superintendent of the Royal Gardens. In 1669 he published the 'Hortus Blesensis,' containing the rudiments of the system of classification associated with his name. Founded on the work of Bruyner, physician to the Duke of Orleans, it contained notices of many new and rare plants. In a dialogue at the end of this work Morison taught that the genera of plants should depend on the characters of the fruit, and opposed the doctrine of spontaneous generation, which was very popular at the time. This book increased his fame and led to his being offered the Oxford professorship. He delivered his inaugural lecture in the School of Medicine on September 2, 1670, but on the fifth of that month removed to the Physic Garden, where he lectured three times a week to a considerable audience. Though he gave a course of lectures during the following spring and autumn, the prosecution of his great work, the 'Historia Plantarum Oxoniensis,' prevented his continuing them regularly. In 1672 he published at Oxford the first part of this work under the title of 'Plantarum Historiæ Umbelliferarum Distributio Nova,' the first monograph which was intended to carry out systematic principles strictly within the limits of a single large family. His complex arrangement into nine divisions is based on the form of the fruit which he terms the seed. It was the first book to contain careful representations of separate parts of plants executed in copper plate. Eight years later there appeared his "Plantarum Historiæ Universalis Oxoniensis Pars Secunda—seu Herbarum Distributio nova per tabulas cognationis et affinitatis, ex libro Naturæ observata et detecta." Morison deals with herbaceous plants before considering trees and shrubs, because he was unwilling to leave the more complex and difficult part of his work behind him unfinished. His fifteen classes, *Scandentes, Leguminosæ, Siliquosæ, Tricapsulares, Hexapetalæ, Tricapsulares aliæ. Corymbiferæ, Papaveræ lactescentes, Culmiferæ, Umbelliferæ, Tricoccæ purgatrices, Galeatæ et Verticillatæ, Multisiliquæ, et Multicapsulares, Bacciferæ, Capillares, Anomalæ*, are only in part founded on the fruit, and in several instances embrace natural orders not really allied enough to be ranged together. His generical characters are sometimes vague, but to most of the plants are added new specific characters, and an account of the virtues and uses of the plants. Through the encouragement given to Morison by the University, Morison was enabled to illustrate his history of plants with tables of more than three thousand plants. The six tables of mosses, etc., are with the exception of the few cuts in Gerard, the first of the kind engraved in England.

Morison left his history unfinished. It was completed by Jacob Bobart, the younger, who succeeded him as professor. It appeared in 1699 with the life of Morison.

In 1728 the Botanic Garden was set on an entirely new footing through the benefaction of Dr. Sherard, a Fellow of St. John's College, who had attended Tournefort's classes at Paris. As Consul at Smyrna, 1702-1718, he collected specimens of all the plants of all Greece, and commenced his famous herbarium, afterwards presented by him to the University. There, too, he began his "Pinax," a collection of all the botanical names which up to that time had been given by botanical writers to plants, and with the assistance of Dillenius (Dillen), whom he brought to England with him, continued its preparation in London. After his death, which took place in 1728, there "was read in Convocation an Extract of his will, whereby he leaves three thousand pounds to be laid out for the maintenance of a Botany Professor of the Physic Garden; all his Books of Botany and Natural History; also his Drawings, Paintings, and Dried Plants, particularly his Herbarium and Pinax, to be deposited in the Library of the Physic Garden, and appoints John James Dillenius the next Professor." He had during his lifetime given £500 towards the enlargement of the conservatory, and had presented to the Gardens a great number of rare plants and a library of botanical works. His herbarium contained twelve thousand specimens, and with the exception of that of Linnæus was considered to be the "most ample, authentic and botanical record" extant

at that time. There are in it original specimens from most of the writers of the time, named by themselves and accompanied by remarks or by instructive queries. The University accepted the benefaction as laid down in Sherard's will, agreed to supply £100 annually to the maintenance of the Garden, accept Dillenius as first professor, and vest the appointment of subsequent professors in the London College of Professors. Ingram's "Memorials of Oxford," 1837, gives a plan of the Garden by Logan, dated 1675. "The Garden, as it existed in Sherard's time, was divided into quarters by a double yew hedge which extended from the principal gateway to the opposite extremity, and by a similar one, which ran from east to west, intersecting the former at right angles. Between these hedges the public were allowed to walk, and there was at one time a thoroughfare into Christ Church meadow through the centre. But the square plots of ground enclosed within these hedges which contained the plants appear to have been less easy of access, and to have been kept under lock and key. One of these hedges was still standing as late as the year 1834. Two large yews in Bobart's time were clipped so as to represent two giants guarding the Garden on the meadow side. They are celebrated in three ballads preserved in Wood's collection in the Ashmolean Library, and were still standing in 1837. The original conservatory of the Physic Garden was converted after Dr. Sherard's benefaction into a residence for the professor, herbarium, and library, the great central greenhouse having been enlarged in 1715 in order to receive a large number of rarities presented in that year by Bishop Robinson, of Oriel. Soon after the central greenhouse was converted into a library and lecture room.

Dillenius, the first Sherardian professor, first gained fame by his 'Catalogue of Plants Growing in the Neighbourhood of Giessen,' 1719. "It is in this book that the generical terms Bryum, Hypnum, Mnium, Sphagnum, Lichenoides, and Lichenastrum appear for the first time. A hundred and forty new species of Musci and ninety new species of fungi are recorded. The plants are arranged in their order of flowering, and their habitat is given with critical observations on many of the species." It was Dillen's great knowledge of cryptogamic botany that led to Sherard's nomination of him at Oxford, and the great work of his professorship was his 'Historia Muscorum.' Published at the Sheldon press in 1741, it gives for each genus the etymology of the name used with reasons for adopting it, then a definition of the genus, followed by the subordinate distinctions for the arrangement of the species. Under each species is found a new specific character, the description of the species and its varieties, with references to the plates drawn and etched by the author, the habitat, synonyms used by other authors, and a number of critical remarks on the uses of particular kinds. During his professorship Linnæus visited the University and was especially delighted with Sherard's herbarium. An ardent disciple of Ray, Dillenius saw in the Swede "the young man who would confound all botany." This was in the summer of 1736. Later the two botanists corresponded, and Linnæus dedicated his 'Critica Botanica' to the professor, of whom he had said, "In Anglia nullus est qui genera curat vel intelligat praeterquam Dillenius." Dillen died in 1747 of apoplexy, leaving unfinished the 'History of the Fungi' he had planned.

He was succeeded in the professorship by Dr. Sibthorpe, of Magdalen College, who seems to have purchased the drawings, dried plants, and library of Dillenius. His successor in the professorship was his son, Dr. John Sibthorpe, who undertook the office in 1784.

Dr. John Sibthorpe went two journeys into Greece and the Archipelago, which resulted in the enrichment of the Garden. The first, undertaken in 1784, occupied three years. He had with him the celebrated draughtsman, Ferdinand Bauer, and in return for the botanical results thus obtained the Crown made an addition of a hundred pounds a year to his stipend as professor. In 1794 he revisited these districts in company with a botanical assistant. They visited Bithynia, Mount Olympus, the Troad, the Isles of Lemnos and Imbros, Mount Athos, Attica, and Zante. They spent two months of the year 1795 in the Morea, but a severe cold, caught during the return voyage to England, laid the foundation of a pulmonary attack, of which Dr. Sibthorpe died in 1796. He bequeathed to the Botanic Garden all his drawings, books of natural history, and collections. He also bequeathed a freehold estate to the University for the purpose of publishing with coloured plates his 'Flora Graeca' and then endowing a Professorship of Rural Economy at Oxford.

Dr. George Williams, of Corpus Christi College, who gave £500 consols towards the Garden, was Sherardian professor from 1796 to 1834. Then he was succeeded by Dr. Daubeny of Magdalene College, who in 1840 was appointed Professor of Rural Economy. Though a geologist and botanist, his line of work was chiefly chemical even in those studies. He contributed to the "Phil. Trans." papers "On the Action of Light upon Plants and of Plants upon the Atmosphere," a "Sketch of the Writing and Philosophical Character of A. P. De Candolle"; and a paper "On the Influence of the Lower Vegetable Organisms in the Production of Epidemic Diseases," in which he adopts and supports with great ability the fungus theory of epidemics. He was one of the first members of the British Association, and warmly supported Darwin's "Origin of Species" in a paper "On the Sexuality of Plants," read before the Association in 1860. In 1857 he published a volume of "Lectures on Roman Husbandry." He was also the author of "An Essay on the Trees and Shrubs of the Ancients," and two volumes of "Miscellanies on Scientific and Literary subjects" which appeared in 1867. He was a considerable benefactor to the Oxford Botanic Garden, in which he took great interest.

USEFUL INSECT PRODUCTS.

The commercial value of the insects from which cochineal, lac, and Japanese white wax are obtained were briefly referred to by Dr. L. O. Howard, in the course of a short paper on a useful American scale insect, read at the last meeting of the Association of Economic Entomologists. It was pointed out that for many years the cochineal or cactus scale insect, now called *Coccus cacti*, was used as the basis of an important red dye, until practically superseded by the introduction of aniline dyes. In the same way the European Porphyrophora was used in the production of a purple dye. Aside from the dye insects, we have the lac insects, of which a single species, *Tachardia lacca*, produces practically all of the shell-lac, stick lac, and button lac of commerce. This species is Asiatic in its distribution; but in the south-west States, upon the very abundant creosote bush, a lac insect occurs in an enormous quantity, the commercial possibilities of which have not been developed. This is the congeneric species, *Tachardia larreæ* (Comstock). This insect has been known to science only since 1881, but was long prior to that time known to the Indians, who for many years have been in the habit of collecting the scale insects and forming them into more or less elastic balls, which their runners were in the habit of kicking before them as they journeyed from one point to another.

There are other species of the same genus inhabiting North America. The third substance of commercial importance derived from scale insects is a pure white wax, which is secreted by the Chinese and Japanese *Ericerus péla* and by the Indian *Ceroplastes ceriferus*. On account of its expense, and on account of more or less available substitutes, this wax has not become of great commercial importance in Europe, but is much used in the Eastern countries, both in the making of wax candles and in medicine. The Chinese wax is said to have ten times the illuminating power of other waxes. It is a beautiful wax, resembling beeswax in its chemical composition more nearly than the vegetable waxes, and is clear white in colour. Dr. Howard calls attention to the fact that in the far south-west of the United States there is a wax insect (*Cerococcus quercus*) which apparently needs careful investigation from the commercial point of view. Three species of oak are recorded by Professor Comstock as offering food for this insect, viz., *Quercus oblongifolia*, *Q. undulata* variety *wrightii*, and *Q. agrifolia*. Dr. Howard recently received specimens of the insect from Mesa Grande, California. They were not sent in position on the twigs, but had been removed from the twigs, and compressed together by hand into a more or less pliable lump, somewhat resembling a lump of indiarubber, but not possessing the same elasticity. The substance, it is remarked, makes an admirable chewing gum, and it takes and retains flavours better than other gums. Part of it has been proved by chemical analysis to be a true wax, and part resembles rubber in its physical properties. The product is not only interesting from a chemical standpoint, but it may prove to be also of economic value, as the supply is well-nigh inexhaustible. By directing attention to these products of potential importance, Dr. Howard demonstrates the commercial uses of entomology.—*Nature*.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

ARRANGEMENTS FOR THE BRISTOL MEETING.

Last week a meeting of the local Executive Committee which is carrying out the arrangements for the visit of the British Association to Bristol this year, was held under the presidency of the Mayor of Bristol (Sir Robert Symes), who was supported by the Mayor of Bath. It was stated that, in connection with the meeting in the autumn, there will be a biological exhibition, arrangements for which are proceeding. Scientific men have already shown a considerable amount of interest in the proposal, and Professor Lloyd Morgan, Mr. E. J. Lowe, F.R.S., and Dr. Harrison, have been actively engaged in the matter. It was decided to leave the further arrangements to a sub-committee consisting of Professor Lloyd Morgan, Dr. Harrison, Mr. G. H. Wollaston, and the officers. Visits of the British Association involve extensive arrangements in the way of meeting-rooms. It was reported to the meeting that the Museum Committee of the Corporation, the Governors of the University College, the Charity Trustees, the Merchant Venturers, and the R.C. Bishop of Clifton (Dr. Brownlow) have kindly placed rooms at the disposal of the local committee for the purpose of sectional gatherings. Arrangements have also been entered into to secure other rooms, and these the local committee confirmed. It has been decided to hold during the meetings of the Association an exhibition of pictures and works of art at the Drill Hall, combining with it performances by first-class military bands. Details were left to Mr. J. W. Arrowsmith, who has had much experience in such matters.

The Excursions.

As usual an excellent programme of excursions has been arranged for members and visitors. Bristol is a capital centre for such trips. Excursions have been arranged to Bath (where the Mayor and citizens will entertain the visitors), to the sources of Bristol's water supply, Chelvey, Barron, and Blagdon; to Anst, interesting particularly to geologists; to Tortworth, where Lord Ducie will entertain a small party; to the Severn Tunnel; to Stanton Drew, with its Druidical remains, and Cheddar, famous for its gorge and caves; to Wells and Glastonbury, where the Mayor of Wells, and the Dean and Chapter and residents, will entertain the visitors to lunch, tea being provided by the Mayor of Glastonbury in the venerable Abbot's kitchen, which forms part of the celebrated Abbey buildings. Other excursions will be directed to Cadbury Camp, Avonmouth Dock, Nailsworth and Stroud district, Salisbury and Stonehenge, Longleat and Raglan Castle, and the Great Western Railway Works at Swindon. Bristol has also manufactories in which members and visitors will be interested. Circulars will be sent out asking manufacturers what facilities they will offer in this direction, and the Hon. Secs. would be glad to receive information on the subject. It is usual to prepare specially for the visit of the British Association a local hand-book, and this book is in course of preparation. Many subjects will be referred to, and articles will be contributed to by Professor Lloyd Morgan, Colonel Brambley, Messrs. J. Latimer, A. T. Morgan, A. E. Hudd, White, H. C. Playne, James, Dunning, J. McCarrick, D. S. Davies, M.D., A. Prichard, J. Holman, George Pearson, and F. W. Newton. The Committee also had its attention drawn to the sum which it will be necessary to raise, and the Treasurer reported that between £3000 and £4000 will be required. When the Association visited Liverpool, £4000 was raised. The Mayor promised to send out an appeal to the citizens with a view to raising the necessary amount. It was mentioned that committees at Montreal and Toronto, the former having Dr. Bovey and the latter Dr. Macallum as honorary secretary, were acting for the purpose of inducing Canadian visitors to come over to the Bristol meeting. It is expected that a considerable number will come, and communications are being entered into with steamship companies to obtain a reduction of the passenger rates. The Bristol Executive was strengthened by the addition of the following names:—The Bishop of Bristol (the Right Rev. Dr. Forrest Browne), the Rev. W. R. Thomas, the Rev. J. S. Simon, Messrs. F. S. Cotterell, D. Rintoul, G. A. Wills, and Melville Wills.

DENTAL NOTES.

Enamel for Casts.

Powdered stannic oxide mixed with collodion to the consistency of thick molasses, and applied to the surface of a dried cast before packing with rubber, is said to make the inner surface of a plate as smooth and hard as if vulcanised upon metal.—*Pacific Dental Journal.*

Decolorised Aluminium.

The *American Druggist* states that grey or unsightly aluminium may be restored to its white colour by washing with a mixture of 30 Gm. of borax dissolved in 1000 Gm. of water, with a few drops of ammonia added.

Stable Solutions of Eucaine.

To make solutions of eucaine stable they must be boiled. About 1 to 19 is the best strength for general use, and a 9 per cent. solution is about as strong as will remain permanent; when stronger, the eucaine separates after a short time.—*Dental Review.*

Silver Salts as Dental Antiseptics.

Hille has used the lactate and citrate of silver, recommended by Crédé as antiseptics, for cleansing the root canal after removing disorganised pulp, with the best effect. The cavity is first washed out thoroughly with 1-2000 silver lactate solution, and then the citrate is blown in with an insufflator. For recently killed pulp a simple dusting with the citrate is sufficient, but where the pulp is putrid two or three applications of the disinfectant are necessary before stopping permanently. The author considers that the silver salts will prove most serviceable to dentists as antiseptics.—*Journ. Brit. Dent. Assoc.*, xviii., 658, after *Monats. für Zahnheil.*

Use of Elastic Bands in Extraction.

Mr. Storrer-Bennett referred, at a recent meeting of the Odontological Society, to a case of a man who was a hæmophiliac, and for whom it was absolutely necessary to extract a tooth which was causing much trouble to his tongue. Mr. Bennett resorted to the use of an elastic band with success, though it took a good many days to get the tooth out, and a great deal of pain was caused to the patient. In cases where very severe hæmorrhage is feared and expected to be very difficult to control, this method has often been found of great value.

Alloys and Their Melting Points.

The following alloys will melt in boiling water or at a lower temperature:—

	Tin.	Lead.	Bismuth.	Cadmium.	C.	F.
Newton's	3	2	5	0	100°	212°
Rose's	3	8	8	0	95°	203°
Erman's.....	1	1	2	0	93°	199°
Wood's	2	4	7	1	70°	158°
Mellott's	5	3	8	0	93°	200°
Harper's	4	4	7	1	80°	180°

Erman's alloy can be made of equal parts of plumber's half and half solder (equal parts tin and lead) and bismuth. Harper's alloy can be made of 8 parts of plumber's half and half solder, 7 parts bismuth, and one of cadmium, and can be poured into a modelling composition impression. It is hard enough to withstand the hammering required, and makes a smooth, sharp die.

Hydronaphthol as an Antiseptic Dressing.

Hydronaphthol is largely used in America as an antiseptic dressing in dentistry, and, according to Dr. Sidney S. Stowell (*Cosmos*), it is soluble in 2 parts of alcohol, 300 of hot water, 1100 of cold water, 20 of olive oil, 2 of æther, and 2 of chloroform. It is also freely soluble in benzol and the fixed oils. Alkaline solutions dissolve it readily, but greatly reduce its antiseptic properties. Hydronaphthol possesses one-fifth the antiseptic strength of mercury-bichlorid, double that of beta-naphthol and iodoform, three times the strength of salicylic acid, and about fourteen times that of carbolic acid. Unlike all these antiseptics, it is absolutely non-poisonous, and can be used with perfect impunity as a preservative in cases where no other antiseptic could be used.

LEGAL INTELLIGENCE.

PROCEEDINGS UNDER THE PHARMACY ACT.

Police Prosecution under Section 17.

At the Marylebone Police Court on Friday, January 14, before Mr. Curtis Bennett, Julius Cæsar, chemist and druggist, 14, Chippenham Road, W., was summoned for having failed to comply with the requirements of the law respecting the sale of poison. The case was brought before the court by the police, who prosecuted under the 17th Section of the Pharmacy Act, 1868. There were three separate charges, viz., (1) for selling to an unknown person a poisonous preparation of morphine and atropine, (2) for not registering the sale of the same, (3) for selling poison without giving the name and address of the seller on the label.

Mr. G. A. Scott, barrister, said he appeared for the defendant, a registered chemist, who was charged with a breach of the Pharmacy Acts. There were three summonses against his client, and he proposed to plead guilty to technical breaches of two. One offence was in selling a poison without giving his name and address as the seller, and the other was in that he did not enter the sale of the same in a book kept for the purpose. With regard to the first-mentioned offence, he had to say that his client about eighteen months ago bought the business of a Mr. Marsh, and since taking over the business he had used the labels of Mr. Marsh without putting his own name upon them. They, however, gave the name and address of Mr. Marsh, and although that gentleman had ceased to use the labels, he wished to point out that the address on them was the same as it would have been if the defendant had caused new labels to be printed with his own name. In answer to the charge of not registering the sale, he wished to say that his client did keep a poison-book, in which he usually entered the particulars of any sale of poison. In the case in question, however, the poison sold was put up in tubes, and was a preparation of morphine and atropine. Although not strictly a "patent" medicine, it was of a similar character, and was used for hypodermic injection. Moreover, as the person to whom it was sold had previously been supplied on a doctor's prescription, the defendant did not think it was necessary to register the sale. The charge that the defendant had sold poison to an unknown person he did not propose to go into, but as the three summonses were all based on one offence he asked that they might be dealt with altogether, and not separately.

His Worship ruled that the three charges were for separate offences against the regulations for the sale of poison as set out in the Pharmacy Act, and therefore each summons must be taken by itself.

Mr. Scott said if that was His Worship's ruling he would state his case with respect to the first charge. Continuing, he said that the lady to whom the tubes of poison were sold had not only been to the shop before, but there was an account in the books of Mr. Marsh which showed that she had been a customer at the shop for some considerable time. In admitting that there had been a technical breach of the law with regard to the poison-book and to the labels, he hoped that His Worship would take into consideration the fact that the defendant had not gained any pecuniary advantage in the matter, and that the whole case was purely a technical one.

His Worship asked if there was any evidence to be laid before the court, as it was necessary that he should know the facts of the case before giving judgement.

Mr. Gerald Kiely, 43, Essex Road, Church End, Willesden, N.W., was called by the police, and without being sworn, stated that some two or three years ago his wife commenced to take morphine on the prescription of a doctor, and since then she had become addicted to its use. With a view to preventing her obtaining the drug he had placed her under the care of another doctor, and he personally had visited numerous chemists to ask them not to supply his wife with morphine. On November 8, 1897, he called at Mr. Cæsar's shop, where he saw an assistant, whom he told that he believed his wife was taking a preparation of morphine which she obtained there, and as it had virtually ruined his home, he asked that she might not be supplied in future. The assistant said his master was out but that he would inform him on his return. On Christmas Eve his wife wished to return a hypodermic syringe that she said belonged to Mr. Cæsar, so he went with her, and she handed in the syringe. He said to Mr. Cæsar, who was in the shop, "You have been supplying my wife with morphine and atropine. Will you cease to supply her?" Mr. Cæsar replied that if she brought a medical prescription he saw no reason why she must not be supplied with what was ordered. He (witness) said "she has no proper medical prescription," and Mr. Cæsar then said that as he had no desire to cause any difference between he and his wife, she should not be supplied in future. On January 4, 1898, however, he discovered in his wife's possession four tubes of morphine and atropine without any labels attached to them to indicate where they had been obtained. He took possession of them, and she told him that they belonged to Mr. Cæsar. He reported the case to the Pharmaceutical Society and afterwards to the police. He had since found that not only was his wife supplied with the drug upon personal application, but that their children, aged ten and twelve, had on several occasions obtained it from Mr. Cæsar without any written order by simply stating that they came from Mrs. Kiely.

In answer to a question by Mr. Scott, the witness stated that he had not taken a medical prescription from his wife since the summonses had been taken out against Mr. Cæsar. He could not do so because he had never seen a prescription in her possession written either by a Dr. Fitzgerald or any other doctor.

His Worship said the summons for supplying an unknown person must fail, as it was perfectly clear that the defendant did know the person, and therefore that summons would be dismissed.

His worship then proceeded to deal with the charge of selling poison without entering the sale in the register.

Mr. Scott said the previous witness had stated that his wife had seen a doctor, who had given her a prescription, and although he did not put it forward as a defence, he might point out that there is a provision to the Pharmacy Act which states that after the chemist or dispenser of a prescription has once registered the sale of the poison contained therein, it is not necessary for him to enter each repeat order, and the particular case in question would be considered a repeat order.

His Worship said it was quite clear that the defendant should register the sale of the preparation, and in the case before him the fact of the sale should have been entered in the poison-book. The husband had cautioned the defendant not to supply his wife, therefore it was to the interest of everybody concerned, the chemist, the woman, and the husband, that an entry should have been made for each sale; but so far as he could gather there was no entry made at all. He should like, however, before going further, to hear the police evidence.

Inspector Burridge, X Division, said that after receiving the information respecting the case from Mr. Kiely, he saw Mr. Cæsar, and asked to be shown the entry in the poison-book of the sale of certain tubes of poison to Mrs. Kiely. Mr. Cæsar said it was not a poison that needed to be entered in the book at all, and that it had not been entered in his book. He (witness) then showed him the tubes of morphine and atropine alleged to have been supplied by him, and he admitted having sold them.

The tubes were then produced by the Inspector and handed to His Worship, and Mr. Scott pointed out that the labels bore the name of a well-known firm of manufacturing chemists, Messrs. Burroughs, Wellcome and Co.

In answer to a question by Mr. Scott, as to whether Mr. Cæsar did not say something to him about a doctor's prescription, Inspector Burridge stated that the defendant told him that if they wished to stop the woman from procuring the drug they must get possession of the prescription, and he (witness) replied that Mr. Kiely said that his wife had not got a prescription.

His Worship said that in respect to the summons for selling poison without registering the sale in the poison-book he would be fined £3 and 4*s.* costs, for selling poison without the name and address of the seller, the defendant would be fined £5 and 2*s.* costs.

Mr. Scott called His Worship's attention to the fact that the tubes were wrapped in paper bearing the name and address of Mr. Marsh, the defendant's predecessor in the business, and that the address was the same as the defendant's.

His Worship, in reply, said that although it was wrapped in a wrapper giving a name and address, there was nothing on it to show that the defendant was the seller, Mr. Marsh had been away from the shop for some time past, therefore, it was highly important that the name and address of the actual seller should be on the labels and wrappers.

PHARMACEUTICAL SOCIETY.

DONATIONS TO THE LIBRARY AND MUSEUM.

At a meeting of the Library, Museum, School and House Committee, on Wednesday, January 19, the Librarian and Curator presented the following reports of donations :—

To the Library (London).

Prof. Arthur Meyer, Marburg :—'Astasia asterospora,' 1897.

Herr Karl Dieterich, Helfenberg :—'Ueber Perubalsam'; 'Beiträge zur Charakteristik seltenerer Harze,' 1897.

Mr. Horace Woodward, F.R.S., London :—'A Memoir of Thomas Beesley,' 1897.

Mr. F. M. Bailey, F.L.S., Queensland :—'Contributions to the Flora of Queensland.'

To the Museum (London).

Captain Burrows, London :—Specimen of the Root of *Strychnos M'Boundou* from W. Africa.

The Director, Herbarium, Museum d'Histoire Naturelle, Paris :—Specimen of the Fruit of *Strophanthus Paroissei.*

Messrs. W. J. Bush and Co., London :—Specimen of Geranyl Acetate.

Messrs. Clayton and Jowett, Liverpool :—Specimens of Essence of Lemon and of the Terpene, Citraptene, and Concentrated Essence obtained from it.

Mr. J. Bosisto, Melbourne, Australia :—Specimens of *Daviesia latifolia* and of a Glucoside obtained from it.

Dr. F. Bach, La Plata :—Specimens of several varieties of Mica from South America.

Mr. T. Whiffen, Battersea :—Specimens of Emetine Hydrobromide and Cephaeline Hydrochloride representing the amounts yielded by 1 lb. of the roots of Rio and Carthagena Ipecacuanha respectively.

To the Herbarium.

Dr. A. Franchet, Paris :—Small specimens of *Strophanthus Courmontii* and *S. ecaudatus.*

EVENING MEETING IN EDINBURGH.

The third evening meeting of the session in Edinburgh, was held in the Society's House, 36, York Place, on Wednesday night, Mr. J. LAIDLAW EWING, in the chair.

Mr. DAVID STORRAR, Kirkcaldy, read a paper on

Pharmaceutical Ethics.

In this he stated that at the last meeting of the British Pharmaceutical Conference it was strongly recommended that discussions should be held by all the local associations throughout the country during this winter upon the subject of pharmaceutical ethics, so that it might be thoroughly thrashed out. It was for the purpose of assisting in carrying out that recommendation that he proposed to read his paper. He defined what he understood by pharmaceutical ethics so far as pharmaceutical could be differentiated from other ethics, and did so under the following headings, namely, the pharmacist's duty to himself, to his neighbours in the trade, to the medical profession and the public, and to his local and national associations. The paper concluded with a strong appeal for support to the pharmaceutical Benevolent Fund, as a clear ethical obligation resting upon the trade.

Mr. DAVID MACLAREN moved a vote of thanks to Mr. Storrar for his paper, and

Mr. J. ANDERSON RUSSELL, Glasgow, in seconding, said it had been very interesting. Mr. Storrar had dealt with the subject in all its branches. He thought much might be done by local associations to improve the moral tone of the trade in their districts by laying down rules, not too strict at first, and so form an ethical code.

Mr. J. RUTHERFORD HILL said this subject required close attention. At the present juncture many of the difficulties of chemists existed in connection with the co-operative movement, which contained elements of which they strongly disapproved. But they must recognise that movement as part of a world-wide social revolution. Any attempt to get over pharmaceutical difficulties by stereotyping existing conditions most inevitably fail. True security lay along the lines of educational sufficiency and profound efficiency. In any conceivable society there would always be a place and remuneration for the educated and trained pharmacist.

The CHAIRMAN agreed with Mr. Storrar on the question of prices. Chemists did not charge enough for their skill in dispensing, but it was impossible to have a uniform rate of charges in a community. He cordially concurred in the references to the Benevolent Fund, and said he was gratified with the result of the Jubilee effort in Edinburgh. He hoped the impetus would be maintained.

Mr. J. RUTHERFORD HILL then exhibited tubes of argon and helium. The tubes, which had been lent by Professor Norman Collie, F.R.S., London, were subjected to the electrical discharge, and viewed under the spectroscope, showing the distinctive spectrum of each. There were also exhibited specimens of the alkaloids emetine and cephaeline and their salts, prepared from Carthagena and Rio ipecacuanha by Mr. Whiffen, London.

A special meeting was afterwards held, Mr. J. LAIDLAW EWING in the chair, to consider

The Draft Pharmacy Bill.

Mr. C. F. HENRY moved the following resolution :—

> That this meeting of registered chemists and pharmaceutical students, having considered the Pharmacy Acts Amendment Bill drafted by the Council, cordially approves of the same, and especially recognises the prudence and wisdom at the present time of limiting the scope of the Bill to urgent and non-contentious matters relating to the internal organisation and consolidation of the Pharmaceutical Society. The meeting further pledges itself to use every legitimate means to aid the Council in securing its speedy enactment.

He said the Bill was really an attempt to realise the ideal embodied in the Society's Charter. Such a Bill had become a practical necessity. He particularly deprecated the introduction of any contentious matter, otherwise they would jeopardise the passing of the Bill.

Mr. THOMAS DUNLOP, Glasgow, in seconding, said that as a pharmaceutical chemist he cordially supported the proposed resolution and entirely approved of this Bill.

Mr. GEORGE COULL, while not agreeing with the Bill, said he would not propose an amendment.

Messrs. NESBIT, CURRIE, and COATS, agreed with the Bill, the two latter making an exception with reference to the term "student-associates."

Mr. HILL said the intention of this Bill was to consolidate the Society by removing the elements of distinction between the different grades, of which there were at present four. The proposal was that all distinctions should disappear, and that registered chemists should meet in the Society on the common platform of membership. It remained to be seen whether or not this would increase the membership, but altogether apart from that, it was for those already within the Society a pressing and urgent practical necessity.

Mr. D. B. DOTT agreed with the proposals of the Bill, but preferred the term "apprentices" to "student-associates."

Mr. MCLAREN and Mr. BOA also approved of the Bill, and the proposition, on being put to the meeting, was declared carried, Mr. Coull alone dissenting.

Mr. J. ANDERSON RUSSELL suggested the appointment of a special committee to secure the carrying into effect of the resolution, but after discussion it was agreed not to appoint a special committee, it being understood that local associations and local secretaries would see that the matter was fully laid before their respective representatives in Parliament.

Mr. STORRAR said the thing to be aimed at was not so much petitions in favour of the Bill, which would pass if let alone, but rather to prevent petitions against the Bill being presented to Parliament.

PHARMACEUTICAL JOURNAL.

PHARMACEUTICAL ORGANISATION.

THE excellent paper read by Mr. JOHN TAYLOR at Manchester this week (see p. 70) may fittingly be regarded as a corollary to that read by Mr. NEWSHOLME at Nottingham three months ago, and the later expressions of opinion have doubtless been in great measure called forth by the VICE-PRESIDENT'S utterances. Moreover, what may at first glance be considered incompatible in the two addresses becomes less obviously so on careful reconsideration, if due allowance be made for the fact that a speaker occupying an important official position frequently feels the necessity of referring in more guarded terms to many matters than a free-lance may regard it as incumbent upon himself to do. For, private members of any organisation may openly criticise the details of that organisation without any regard to mere expediency, whereas the official heads of the same body, however liberal their tendencies as individuals, have a certain conservatism thrust upon them, which almost unavoidably associates itself with the positions they occupy. If Mr. TAYLOR'S comments, therefore, be regarded as amplifying Mr. NEWSHOLME'S necessarily guarded remarks, and as it were, crossing the t's and dotting the i's of the latter, readers of the two papers will probably not be far wrong if they arrive at the conclusion that similar ideals influence both official and non-official members of the Society, and that these varying symptoms indicate a widely-prevalent desire to arrive at a more satisfactory state of affairs than at present exists in British pharmacy.

It is eminently satisfactory to find this Lancastrian critic admitting—freely and fully—that the Pharmaceutical Society has neglected nothing that might tend to the advancement of pharmacy on the professional side. And the arguments he adduces in support of his contention that the Society both can and ought to do more to advance the trade interests of the craft are far from unfair, if it be borne in mind that he has not made sufficient allowance for the lack of opportunity. The statement of the VICE-PRESIDENT to the effect that the Society and its Council cannot take action with a view to the solution of problems of purely commercial importance affecting the craft, and the passage quoted from the Journal of August 28 last, in which it was stated that the Society is practically powerless to deal with such problems, must be taken in a relative, not in an absolute sense, and as referring especially to the existing condition of affairs. What might be done if the Society included the majority of registered chemists is quite another question, and in that case no doubt most, if not all, of the difficulties dwelt upon by Mr. TAYLOR could be effectively dealt with. It will be observed that he admits it to be outside the power of the Society to regulate prices, but he contests the argument that no other problem of purely commercial importance can be solved by the representative body. Almost immediately, however, he speaks of the Society as a trade union which should safeguard the interests, commercial and otherwise, of the trade it represents. And this is where Mr. TAYLOR fails to make sufficient allowance for the lack of opportunity.

A trade union, we take it, is not of much account as a power to be reckoned with, unless it embodies at least a majority of the skilled workers of the trade it professes to represent. How far is this the case in the present instance? There are more than fifteen thousand registered chemists, of whom perhaps eight thousand are in business on their own account. But less than one-third of the total number, and probably only about half of those in business on their own account, are connected with the Pharmaceutical Society. How then can the Society pose as the recognised exponent of the desires of the whole craft, and why should the minority vex their souls about the commercial interests of those who decline to take their share of the burden? If the responsibility were equally shared by all, many important problems might be solved, for the "reality of power" is already possessed by registered chemists; what is required is that they should all combine and exercise that power. Were every chemist agreed on that point, company pharmacy could be suppressed within a few weeks, for it is only because registered men sell themselves to joint-stock concerns that the latter are enabled to continue to poach upon the chemist's preserves. In like manner, if all or nearly all whose names appear on the Register of Chemists and Druggists would combine they could remedy almost any grievance under which the craft now labours. And this brings us back to the necessity that renders it incumbent upon all registered chemists to help in strengthening the Pharmaceutical Society. That body can indeed exist and fulfil all its statutory duties whether it secures the adherence of the trade or not, but if the professional and commercial interests of the trade are to be sympathetically dealt with, the Society must be a living organisation capable of acting as an incorporation of the entire body for protective purposes, and not merely as an under administrative department of State.

As it happens, Mr. TAYLOR recognises the weakness of the present position in this respect, and whilst urging the Council of the Society to take up every question—whether commercial or otherwise—of importance to chemists, he virtually admits that a necessary preliminary to such a condition of affairs is a large accession of strength to the Society. The latter could have no better motto than that suggested in the paper commented on—"Nothing that is of interest to pharmacists is foreign to us"—but the question of ways and means must first be considered, and those at present constituting the Society cannot with any show of reason be blamed if they object to pay the piper whilst others call the tune. By all means let the Society become a union of the trade on the lines of the Incorporated Law Society, with numerous branches and active representatives all over the country.

Nothing better could be desired, and when the time is ripe the branches that it was formerly sought to organise may be established in full vigour. But the means of securing that end are lacking as yet, and ways of accomplishing the desired object remain to be devised. The first step must be to secure the passing of the Pharmacy Bill now before the trade, which is intended simply to render equal justice to all who possess the legal qualification in pharmacy. Mr. TAYLOR rightly insists upon the expediency of so doing, and makes this the chief of his suggestions for improvement. It may perhaps be regarded as a happy omen that, whilst in the paper he read three years ago, he urged the necessity of a more stringent First examination as the first pressing want of the craft, he now places equality in membership of the Society in that position. The one want has since been met, and we sincerely hope that the present most important desideratum may be supplied within an even shorter space of time than has elapsed in the former case.

THE PHARMACY BILL.

NOTWITHSTANDING the intimation that further letters discussing the Pharmacy Bill should have the names of the writers added for publication, several communications have been received which do not comply with that condition. Their publication in full is not, therefore, desirable, but in order that the arguments put forward by the writers may receive consideration we give a brief statement of them. An old pharmaceutical chemist is disposed to welcome a large number of Minor men as co-members, but in regard to the proposed extension of membership, he is of opinion that logic is on the side of malcontent Major men while expediency may be on the other side. He bases that view on consideration of the question whether the general co-operation of Minor men in advancing the interests of our calling could safely be relied upon. In regard to that question, he points to the fact that those whose sympathy with professional advancement has hitherto been no more evident than their support of the Society, probably constitute the majority of legally qualified persons on the Register, and on that ground he concludes that there should be a preponderance of Major men on the Council. The assumption, underlying this conclusion, that Minor men are less interested in the advancement of the calling or less likely to aid in its promotion than Major men, is not generous, nor is it consistent with the fact that the majority of those connected with the Society are Minor men. Another correspondent, who is a Minor man, not connected with the Society but interested in the Bill, expresses doubt whether it would provide a remedy for the grievances of chemists. In regard to "the one cry of registered chemists for some form of reward for services given to the State in having answered the requirements of the Pharmacy Act," he believes that Parliament never intended to inflict upon chemists the hardships of "expensive education, examination, and registration, with after-imposed duties, without justly granting a *quid pro quo*," and he suggests that a provision giving "power to erase from the Register the name of anyone proved guilty of unprofessional conduct" would be the only means of uniting chemists. No further comment on the views here expressed is necessary beyond reference to the excellent paper by Mr. BEAL on the relation of the pharmacist to pharmacy law (see *ante*, vol. lix., 420).

ANNOTATIONS.

THE DANGER OF PRESCRIBING READY-MADE PHYSIC is well exemplified in the case reported on page 75. According to the evidence, a medical man prescribed morphine and atropine in such a form that the patient—a woman—became fully aware of the nature of the preparation, and was placed in a position to obtain further supplies of it without difficulty. Her husband, finding what mischief was being caused, endeavoured to stop it by visiting numerous chemists and asking them not to supply his wife with the preparation, but in spite of that she managed to procure more, not only on personal application, but also when she sent children of ten or twelve years for it, and that without producing any prescription or other written order. Ultimately the attention of the police authorities was directed to the matter, and as a result a prosecution was instituted under Section 17 of the Pharmacy Act, 1868. The penalties imposed are severe, but under the circumstances none too severe, for if ever there was a case in which a chemist should have exercised more discretion, this particular case appears to be the one. No attempt appears to have been made to prevent the abuse or misuse of the poisonous preparation. The husband's request that his wife should not be supplied in future was wilfully disregarded, and no record of the sales was kept. It should be obvious that such a record ought always to be kept in order to meet the technical requirements of the Pharmacy Act, the repetition of medicine containing poison being indicated in the prescription-book in every instance, whether the medical man order the medicine verbally or by prescription.

THIS QUESTION OF REGISTRATION was raised by the barrister who appeared for the defendant in the case referred to above, but he seems to have got a wrong impression of the legal requirements in the matter, for he stated that according to the Pharmacy Act, after a chemist has once registered the sale of a poison ordered in a prescription, it is not necessary for him to enter each repeat order. The police inspector also stated that defendant had informed him that there was no necessity to record the sale of the preparation supplied, although containing poison. It is distinctly specified, however, in Section 17, that the only case in which the provisions of the Section do not apply to any article, when forming part of the ingredients of any medicine dispensed by a person registered under the Act, is when such medicine is labelled with the name and address of the seller, and the ingredients entered, with the name of the person to whom the medicine is sold or delivered, "in a book to be kept by the seller for that purpose." Otherwise all the usual formalities must be fulfilled as in an ordinary retail sale.

AS MR. CARTEIGHE POINTED OUT some years ago (*P. J.* [3], xxiii., 381), when dealing with the obligations of chemists in the sale of poisons to medical men and to each other, it is essential that a precise record of the sale of all strong poisons should be preserved by the chemist and druggist who supplies them, so that the source of supply can readily be traced in case of need. So far as regards sales to medical men and to other chemists, it may be considered by some that the transactions are not of the nature of ordinary retail sales, but that would be difficult to prove and in any case, the chemist ought to be prepared always to do more than the strict letter of the law requires, if it be to the public interest. Much worry will be avoided if, instead of stopping to consider from time to time what are the exact legal requirements in the case of any particular substance, the most extreme precautions are

adopted in every instance. And this plan may with advantage be adopted in dealing with all dangerous substances, whether they be "statutory" poisons or not. Let all poisonous substances be fully labelled, and their sale recorded if necessary, and no occasion can then arise for accusing chemists of neglecting the public interest in that respect, whilst they will thus help to establish a strong claim for favourable consideration of their own interests by the Legislature when occasion may arise.

ABOUT SALES OF SCHEDULED POISONS TO THE PUBLIC there is no doubt whatever, as those must always be recorded as directed in Section 17 of the Pharmacy Act, in the case of poisons included in Part 1 of the Schedule; poisons ordered in prescriptions are not exempt in that respect unless the full particulars be entered in the prescription book, on the second and every subsequent occasion that the medicine is dispensed no less than on the first. The idea that prescriptions ordering scheduled poisons are unconditionally exempt from the provisions of Section 17, which provide for proper labelling and registration, is not justified by the wording of the Section. In fact, the provisions are even more stringent with regard to prescriptions than to poisons sold by retail, for only a limited number of the latter need be registered, whereas all prescriptions ordering scheduled poisons must be copied in the prescription book, whether the poisons are included in Part 1 or Part 2 of the list of poisons within the meaning of the Act. And, as already stated, the prescriptions should be re-copied on every subsequent occasion that the medicines are dispensed.

THE THIRTY-SECOND CHEMISTS' BALL was held at the Portman Rooms on Wednesday last, and the attendance proved that there is little if any falling off in the attractions of this popular gathering, more than two hundred guests being recorded as present. Dancing commenced at 9 p.m., and after the early part of the evening's programme had been successfully concluded, the chair was taken at supper by Mr. Walter Hills, President of the Pharmaceutical Society, who was well supported by the leading pharmacists of the Metropolitan district and their lady friends. Needless to say, congratulations were showered upon the Honorary Secretary, Mr. William Warren, who made his first appearance in that capacity and fully deserved all the encomiums he received, despite his modest disclaimer and suggestion that much of the credit was due to other persons. Supper ended, dancing was resumed and continued until about four o'clock in the morning, with much satisfaction to all concerned. Mr. T. C. W. Martin occupied the post of M.C. with his accustomed ability, and Godfrey's Quadrille Band did all that was possible to render the Ball the success it undoubtedly was. The general arrangements could not possibly have been better.

"PHARMACEUTICAL ETHICS" was the title of the paper read by Mr. David Storrar at an Edinburgh meeting of the Pharmaceutical Society on Wednesday, and an attempt was made therein to develop the subject on the lines laid down by Mr. Joseph Ince at the British Pharmaceutical Conference in 1866. In Mr. Storrar's opinion that paper, read over thirty years ago, embodies all, or nearly all, that can be said upon the subject, and his only object in reverting to the matter was to initiate discussion upon a subject of importance and interest to all pharmacists, in the hope that such discussion may help to ease the friction which modern business methods tend so much to increase. The best definition of pharmaceutical ethics Mr. Storrar has seen is that contained in a leading article in the *Pharmaceutical Journal* (vol. xii., 369), in which it is stated that "there are in all professions certain rules of conduct, understood if not actually agreed upon, among the members, a deviation from which is held to be unprofessional. These rules have no relation to the law of the land; they constitute a voluntary or self-imposed restraint, having for its object the elevation of the tone and character of those who are under their influence, and the maintenance of harmony and good order in the profession." In his subsequent remarks, Mr. Storrar confined himself to the duty of pharmacists to themselves, to the public, and to their trade organisations. The first ethical duty of pharmacists, he considers, is to see that no individual action of theirs will give away that position which has been secured to them. And they must not rest content with that, but each one should try to add something, however little he may be able to add, to the efficiency and sum total of the knowledge of that profession which he has chosen as his life-work.

ONE-MAN COMPANIES were the subject of some scathing remarks by Sir Michael Hicks-Beach a few days ago. He pointed out that some years ago the House of Commons passed a code dealing with the formation and proceedings of companies under the Limited Liability Acts, but that Parliament had not been entirely successful in the matter, and he expressed the opinion that the law had been abused to defraud the public at large. When he was President of the Board of Trade he did his best to secure that when there was roguery in connection with companies it should at least be brought to the light of day, so that by public examination in the courts the people should know what had been done to their detriment. But, what happened now? A man who was practically a bankrupt formed himself and some of his children into a limited liability company, issued debentures to a confiding public, discharged his personal obligations with its money, taking care to have a nice little plum in reserve, in order to start somewhere else in a different line of business, and then left the public lamenting with assets that were wholly or nearly worthless. Or a man started a company in the same way but took up the debentures himself, got confiding tradesmen to trust him, and then proceeded to liquidation, putting in his debentures as a prior claim on all the assets and leaving the confiding tradesmen lamenting. The present state of the law in this matter, observed the Chancellor of the Exchequer, deliberately encourages fraud upon the public. Unfortunately, he continued, the great lawyers who added lustre to the House of Lords were not very eager reformers in this branch of the law, and they were so timid and so careful that nothing should be done that would prevent responsible men from becoming directors of companies, that he was afraid incubation of remedial measures, which had already been going on during two years, might last a good many years more, unless gentlemen who were engaged in commerce, who knew the truth and who were interested that the commercial morality of this country should be maintained, brought the pressure of public opinion to bear on the matter.

AN EVENING MEETING of the Pharmaceutical Society will be held at 17, Bloomsbury Square, London, on Tuesday, February 8, at 8 p.m., when a paper will be read by Mr. Leo Atkinson on "Bacteriology for Pharmacists." The paper will be illustrated by photo-micrographs and demonstrations of methods of cultivation and staining.

THE SOCIETY OF PUBLIC ANALYSTS continues to be of good cheer, notwithstanding the delay in amending the adulteration laws, and practical proof of the fact was demonstrated on Tuesday evening, when the twenty-third anniversary dinner of the Society was held at the Criterion, London. The president, Dr. Bernard Dyer, occupied the chair, and among those present were Mr. Walter Hills, president of the Pharmaceutical Society; Dr. Stevenson, president of the Institute of Chemistry; Dr. Frank Clowes, president

of the Society of Chemical Industry; and Dr. Seaton, president of the Society of Medical Officers of Health. Regret was expressed by Dr. Dyer that Parliament had not seen fit during the past year to pass an Act giving effect to the recommendations of the Select Committee on Food Products and Adulteration, and reference was also made to the alleged inadequacy of Mr. Chaplin's Bill. Mr. Kearley, M.P., undertook to act as the Society's champion during the coming Session of Parliament, and Mr. Walter Hills, in proposing the toast of the evening, referred to the progressive nature of the Society of Public Analysts, and to the valuable service it has rendered to the community during the twenty-three years of its existence, in carrying out its primary object—the protection of the public. In responding, Dr. Dyer gave utterance to some self-gratulation, as president, which will be endorsed by those who have any knowledge of the Society's affairs, but it is to be feared that he is much too sanguine in hoping that the much discussed food and drugs question will have been "finally settled" by the date of the next annual dinner.

The Idea of a Teaching University for London is a step nearer realisation than it was, a general meeting of convocation having resolved to accept the scheme embodied in the London University Commission Bill of last year. The Bill was a modification of that of Lord Cowper's Commission, and it is thought that it may not improbably become law during the coming session of Parliament. The scheme has already received more support than any other that has been proposed, and brings within view the end of the controversy that has lasted so long. It is thought to be a satisfactory compromise, inflicting no loss or discredit upon any party, whilst safe-guarding three important principles: first, that there shall be one university for London and not two; second, that the standard of the degrees shall not be substantially altered; and third, that the internal students shall not be prejudicially affected. In a letter to the *Daily News*, signed "Sydney H. Waterloo," it is suggested that Christ's Hospital buildings, which will be vacated in a year or two, should be acquired for the purpose of the University of London. The sum necessary for the purchase of the premises and site is estimated at £350,000, but a large proportion of this can be covered by disposing of part of the site to the Governors of St. Bartholomew's Hospital, whilst if the Gresham College authorities could be induced to unite with the proposed teaching university, a further important reduction in the cost might be effected. The existing university buildings are quite inadequate for their purpose, and as the difficulty must be met sooner or later, this suggestion to utilise instead of removing the famous old hall seems quite worthy of serious consideration.

The Royal Photographic Society is organising an exhibition, which will be open at the Crystal Palace from April 27 to May 14. In addition to the exhibits of photographs and apparatus, of which such exhibitions usually consist, a considerable area will be devoted to collections illustrating as fully as possible the many scientific applications of photography; amongst these X-ray photographs play a large part. The committee is very anxious that the exhibition shall be thoroughly representative and illustrate the very large part which photography plays, both as a recording agent and otherwise in so many scientific and manufacturing processes, and asks that any of our readers who may be able to help by the loan of examples of the application of photography to medicine or surgery will kindly communicate with the Assistant Secretary of the Society, Mr. R. Child Bayley, at 12, Hanover Square. Mr. Bayley will be happy to forward to anyone interested a copy of the preliminary prospectus, and adds that the Committee is prepared to pay carriage upon all invited exhibits.

THE WORLD OF PHARMACY.

NORTH STAFFORDSHIRE CHEMISTS' ASSOCIATION.

A meeting of this Association was held at the Copeland Arms Hotel, Stoke-on-Trent, on Thursday the 13th inst. Alderman J. Averill, J.P. (Stafford), presided over a fairly large attendance. After the passing of the minutes the Hon. Secretary Mr. Edmund Jones (Hanley) read a letter from Mr. Walter Hills, President of the Pharmaceutical Society, thanking the Association for the congratulatory epistle forwarded to him on the occasion of his presentation with a Jubilee medal. Mr. Hills said he was glad to hear that the Association was a decided success, and he trusted that it had a useful and prosperous future.

The Draft Pharmacy Bill.

The Chairman, after having read *in extenso* a copy of the draft Bill, moved the following resolution :—

> That this Association agrees with the Pharmacy Acts Amentment Bill, with the exception of Clause 3, which, in our opinion, should read as follows: Every person who at the passing of this Act shall have been registered as a chemist and druggist, or who shall hereafter become registered as a chemist and druggist, shall be eligible as a member of the Society, according to the Bye-laws thereof, and that every person who at the time of the passing of this Act shall have been registered as a pharmaceutical chemist or shall hereafter pass the Major or higher examination of the Society shall have the title of "Fellow of the Society."

The Chairman said he moved the resolution as much in the interests of the Society as of the pharmaceutical chemists. They must remember that members of the Pharmaceutical Society up to the present consisted mainly of pharmaceutical chemists who had qualified for that position by examination, and what he was anxious to see was a Bill which would give satisfaction to the majority of the chemists and druggists. That would consolidate and strengthen the Society, and so make it truly representative of pharmacy throughout the kingdom. Clause 3 seemed to be the bone of contention in the Bill. It would admit all men registered as chemists and druggists to the honour of membership. He believed that Association was in perfect accord as to that step being taken, but the Major man, who had passed a higher scientific examination to qualify himself for the same honour of membership, felt that some distinctive honour should be conferred upon him. He knew it was said that the Major man alone was entitled to style himself a pharmaceutical chemist, but a member of the Pharmaceutical Society and a pharmaceutical chemist so closely resembled each other that they were scarcely distinguishable. He thought the Major man had a good case in asking that upon the admission of associates to membership he should have the title of Fellow given to him. He feared that without some inducement of that kind fewer men would go in for the higher examination. There was a precedent for his proposal in the College of Surgeons and the College of Veterinary Surgeons, in both of which, by passing the higher examination, a member became a Fellow. He thought his proposal, if carried out, would have the effect of appeasing everybody, and would win the support of all parties to the Bill.—Mr. T. C. Cornwell (Hanley), who was called upon to second the resolution, said he would rather someone else had done so. He was a Major men, and his action might be put down as selfish. He believed the Bill would be a very beneficial one, and seconded the resolution with pleasure.—Mr. Ed. Jones, in supporting, said the resolution carried out the ideas he expressed at the previous meeting. He referred to the objection taken to the Bill by Mr. W. Gibbons, and said he thought it would be a great pity to discourage the Society from bringing forward the Bill by stirring up muddy water. He believed that Bill would benefit the Society, and create a great interest in pharmacy throughout the country. He did not think the objectors were so much opposed to the admission to membership as to the conferring of the title of pharmaceutical chemist. Their Association did not ask for that. He did not like the word student-associate. He did not like "associate" connected with "student." He was greatly in favour of the annual retirement of the members of the Council in rotation. He hoped all the associations would express their opinions upon the draft Bill and encourage the Society in taking it before Parliament. If the Society was discouraged now it would be a long time before they ever brought another Bill.—Mr. Marson (Stafford) said he thought the Bill an

excellent one. If passed it would make a strong combination of the whole trade. Limited liability companies might then be dealt with.—Mr. J. W. MOORE (Hanley), Mr. CROYDON, and Mr. ALLISON also supported the resolution, which was carried unanimously and with applause.—A vote of thanks was passed to the Chairman on the proposition of Mr. JENKINS (Stone).—After supper the evening was spent in convivial fashion.

EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.

At a meeting held on Friday, January 14, Mr. GEORGE SINCLAIR, President, in the chair, a communication by Mr. Peter Boa was read on

The Dispensing of Substances Liable to Explosion.

Mr. BOA stated that about sixteen years ago he had the privilege of reading to the members of that Association a paper on the influence exercised by different methods of mixing compound powders on their miscibility with water. On the present occasion he desired to refer shortly to a few substances which either by themselves or when compounded with other materials require special manipulation in preparing them for administration as remedial agents in the treatment of disease. The efficiency of a remedy, as well as the convenience of the patient and the reputation of the dispenser (even his personal safety in some cases), are dependent on the judicious selection of the proper method by which to manipulate it. Quite recently, through the explosion of a quantity of erythrol tetranitrate in course of preparation for medicinal use, a chemist lost his life. As this substance is in fashion in some places, and may possibly come into more general use, he might take it as a convenient basis for the few brief observations which he had to make. Erythrol tetranitrate is admittedly explosive, explosion being occasioned by friction or concussion. So far it had been mostly administered in the form of tablets. It might as well be prescribed in powders. Being crystalline it has to be reduced to powder previous to being made into tablets. Sugar of milk, or some other innocent diluent, is employed in making it into tablets, which are prepared by compression. In preparing tablets with a chocolate basis the crystalline substance may be dissolved in warm cacao butter, but as it would recrystallise on cooling the mass would require to be worked up to ensure uniformity, and, this being so, it seemed preferable to mix in the powdered material from the first. To reduce the erythrol tetranitrate to powder it is necessary to rub it in a mortar, and herein lies danger to the manipulator. When proceeding to reduce a crystalline substance to powder one naturally takes a composition mortar in order to get a "grip" of the material. The "grip" obtained by the use of such a mortar is just what may occasion disaster with explosives. For such substances a mortar and pestle of glass or porcelain with uniformly glazed surface should be selected, and the pressure employed should be uniform and not too heavy, knocking or pounding being carefully avoided. If operations be restricted to the small quantities likely to be prescribed, and the precautions he had indicated observed, there need be no fear of any worse mischief, even in the event of an explosion occurring, than the loss of the mortar. When powdering has been accomplished, further use of a mortar (should mixing with other things be required) is unnecessary and undesirable. Its further use would merely prolong the risk of explosion without satisfactorily influencing the mixing. A mortar is a most inefficient means of mixing compound powders. Suppose, for example, one part of powdered rhubarb is taken, with three or four parts of sodium bicarbonate, and they are rubbed together for ten minutes in a mortar, then transferred to a sheet of white paper, and spread out thinly with a broad spatula. Numerous streaks of the two ingredients will be visible, caused by the breaking down by the spatula of little particles which had escaped the action of the pestle. Had mixing been carried out from the first by the spatula on the paper, half the time and half the labour would have accomplished an infinitely better result. So, when dealing with an explosive substance, the use of a spatula —not necessarily steel, if any other material be considered preferable — and a suitably-sized piece of glazed paper will enable the operator to obtain perfect admixture with other ingredients with confidence in the safety of the procedure. Potassium chlorate, silver oxide, potassium permanganate, hypophosphites, and such other substances liable to explosion, should be powdered or mixed with care on the same principles. When explosion occurs it usually exerts its force upward. It is well, therefore, that the operator should keep his face away from the material. If the contents of a mortar require examination that had better be done while the pestle is at rest. —Mr. DUNCAN said he had doubts about the method of mixing with a spatula. Even in such a case there might be danger if a metal spatula were used. It was known that in places where explosives were manufactured the employés were forbidden to have any articles containing metal in their clothing, or in their pockets or boots. He thought either a bone or wooden spatula should be used.—Mr. HENRY said he thought a sieve might be used safely. He thought the method of mixing by a spatula would not apply well when dealing with large quantities.—The CHAIRMAN also expressed surprise at the suggestion to mix with a spatula. He had frequent experience of a mixture of potassium perchlorate and magnesium chloride, and he found this mixture could be safely manipulated by using the reverse or wooden end of the pestle.—The next communication was by Mr. C. F. HENRY, on

Unguentum Acidi Carbolici, B.P.

The author remarked that it is not correct to say that carbolic acid is soluble in soft paraffin to the extent of 1 in 20, as if a mixture of the two be heated together, then well stirred and allowed to cool, a good proportion of the acid will be found crystallised out at the bottom. That occurs when liquid as well as crystalline acid is used. The practice of stirring when cooling does not facilitate solution, but only tends to form a mechanical mixture of the two substances. These remarks also apply to unguent. acid. carbolic., B.P., where a mixture of hard and soft paraffins is directed to be used as a basis. The presence of hard paraffin and the increase of the strength to 1 in 19 aggravates the difficulty. In a quantity of this ointment in which ʒi. crystal acid was used, 30 grains of an oily liquid separated out in three hours, the ointment having been prepared by heating, stirring in the acid, and then allowing to cool without further stirring. Had the acid been soluble this would not have occurred. For several years it was noticed that in a mixture of soft paraffin and carbolic acid, the latter on keeping for a few days in cold weather, and for a week or two in warmer weather, also crystallised out in fine acicular crystals. It will do this whether liquid or crystal acid is used. Until recently this had never been observed to occur in the B.P. ointment. Possibly it had not been kept long enough for crystals to form. That it should crystallise out is not to be wondered at, the acid not being soluble in a paraffin basis in the proportions of the B.P. ointment. How it crystallises out might form the subject of some interesting theorising. The author's own view is that the acid, being volatile, volatilises at ordinary temperatures; it then becomes hydrated by absorption of water from the atmosphere. Whenever the temperature gets below 40° during the night in summer, or at any time in winter, crystallisation takes place, and from the surface of the ointment minute needle-shaped crystals shoot out in various directions. That these are carbolic acid crystals the application of one of them to the lips or tongue will give convincing proof. It is difficult to understand how, with such a caustic as carbolic acid, the B.P. formula should contain a strength of 1 in 19 when the acid is only soluble in the paraffins to the extent of about 1 in 32 and nothing is put in to retain the acids in solution. Making an ointment of a volatile substance like carbolic acid by means of heat is neither proper nor pharmaceutically correct. To supply these defects was the object of a few experiments with various bases. Those in which the carbolic is most soluble naturally suggested themselves, and of these olive oil, in which it is soluble 1 in 2, and glycerin, $3\frac{1}{3}$ in 1, are the most soluble. The following were found to be the best:—(1) Glycerin, water, and wool-fat; (2) olive oil and simple ointment; (3) glycerin, water, and simple ointment; (4) olive oil and wool-fat. Unfortunately the weather had been too mild to thoroughly test the retentive properties of the ointments, but it is evident that as each is made with a sufficiency of solvent to more than retain the acid in solution, even at a low temperature there is more likelihood of their remaining stable than by using the B.P. formula. Of these four, No. 1 was thought to be the best. No. 2 is also good, but Nos. 3 and 4 are rather soft. The formula suggested is—

℞ Carbolic Acid ...	25 grains or 1 gramme or part.
Glycerin	50 minims or 2 grammes or parts.
Water	50 minims or 2 grammes or parts.
Wool-fat	350 grains or 14 grammes or parts.

Dissolve the acid in the glycerin, add the water, then mix them with the wool-fat. The water is added to hydrate the glycerin. The other formulæ were—

℞ Carbolic Acid....	25 grains	or	1 gramme or part.
Olive Oil	125 grains	or	5 grammes or parts.
Simple Ointment	325 grains	or	13 grammes or parts. M.

℞ Carbolic Acid.....	25 grains	or	1 gramme or part.
Glycerin	50 minims	or	2 grammes or parts.
Water	50 minims	or	2 grammes or parts.
Simple Ointment	350 minims	or	14 grammes or parts.

℞ Carbolic Acid....	25 grains	or	1 gramme or part.
Olive Oil	125 grains	or	5 grammes or parts.
Wool-fat	325 grains	or	13 grammes or parts.

The next communication was also by Mr. C. F. Henry, on—

An Unusual Mixture.

The author was recently handed an order for a Winchester quart of a mixture which must contain certain proportions, equally distributed, of white wax, borax, and water, with the stipulation that no oil must be used in making it up. After trying several methods the following was found to yield the most satisfactory result. Ascertaining that mucilage of acacia and turpentine would not be objectionable, he dissolved the white wax in the latter, then emulsified this mixture with mucilage of acacia, dissolved the borax in the water, and then gradually added it to the emulsion, the result being a white mixture, in which the desired conditions were attained, viz., a white non-oily compound with the wax equally distributed throughout. The formula is—

℞ Cera Alb.	3iv.
Ol. Terebinth.	2 oz.
Mucil. Acaciæ	1 oz.
Aq.	4 oz.
Borax	80 grains.

Soft soap was tried, but it does not give such a good result as the above, nor does it absorb the water so perfectly. The object in bringing this before the meeting was to ascertain if anyone could suggest a better method.—Mr. Duncan and Mr. Boa, mentioned that this matter of crystallisation of the carbolic acid in the ointment had been dealt with before, and the former said he had found the solubility of the acid in soft paraffin to be about 1 in 34. A solution of the acid in water and glycerin before mixing with the basis overcame the difficulty.—Mr. Hill said the crystallisation in this instance seemed to be due to volatilisation of acid which subsequently condensed in crystals in the vacant space in the half empty pot. This could be obviated by sending the ointment out in collapsible tubes.—Mr. Sinclair said he found lanoline and cold cream an excellent basis for this ointment.—The next communication was by Mr. William Duncan, on

Resinous Emulsions or Mixtures.

The author said there was nothing new or original in what he had to say. He merely brought the subject forward because there seemed to be many who were not acquainted with the method. It had been found that in the case of mixtures consisting entirely or nearly so of a resinous tincture and a watery menstruum, a satisfactory and permanent emulsion could be made by filling the bottle three-fourths full of the menstruum and adding the tincture by pouring it through a small funnel into the centre of the liquid and so as not to touch the sides of the bottle, and then shaking thoroughly but not violently or long. He exhibited perfect emulsion made by this method and kept for two years. The emulsions contained half an ounce of tincture of Indian hemp, one ounce of ammoniated tincture of guaiacum, and one ounce of tincture of myrrh, respectively, in six ounces of water. The guaiacum emulsion showed most tendency to deposit, but it could be easily diffused by shaking. The presence of a salt such as potassium bromide tended to interfere with the permanence of the emulsion, and, indeed, care was required in all cases where the menstruum was not mainly of an aqueous character.—The last communication was by Mr. J. Rutherford Hill on

The Pharmacy Act and the Sale of Poisons.

The author gave a historical sketch of the subject of poison regulations in Britain, including the Arsenic Act of 1851 and the Pharmacy Act of 1868, and explained the construction that had been put upon the words and clauses of the Acts by the Supreme Courts in the course of their practical application. He also replied to a series of queries that had been put dealing with details that arise in practice in the sale of poisons.—On the motion of the Chairman votes of thanks were awarded to the authors and to Mr. Duncan, and the meeting then closed.

LIVERPOOL PHARMACEUTICAL STUDENTS' SOCIETY.

The annual dinner of this Society was held at the Bee Hotel, Queen's Square, on Thursday evening, the 13th instant, the President, Mr. Pierson, being in the chair. There was a good attendance of members and their friends, belonging to both the retail and wholesale trade, to whose physical and intellectual enjoyment the Honorary Secretary, Mr. J. Harris Burns, very successfully ministered by his arrangements, which went without a hitch. As usual, the musical programme was carefully compiled and, together with the speech-making, in reply to a not too long series of toasts, served to complete in a satisfactory fashion a successful and altogether enjoyable evening.

PLYMOUTH, DEVONPORT, STONEHOUSE AND DISTRICT CHEMISTS' ASSOCIATION.

The annual ball of this Association was held at the Town Hall, East Stonehouse, on Friday, the 7th inst., and was a complete success. The staircases and approaches to the ball-room were attractively decorated with tropical plants, and the front of the orchestra had been treated in an especially effective manner, while in the centre thereof was proudly displayed the professional badge of the hosts of the evening—a pestle and mortar. Music was rendered by Brock's String Band, and dancing was kept up from 8 till 2. Refreshments were supplied by Matthews and Co. The Committee limited the number of invitations and about 200 were present. The arrangements were admirably carried out by the efforts of the indefatigable Hon. Secretary, F. Maitland, assisted by the following Committee: Messrs. Jas. Cocks, J. H. Bailey, J. D. Turney, C. J. Park, H. C. Cantle, W. H. Woods, E. W. H. Green, C. T. Weary, J. W. Swainson.

SUNDERLAND CHEMISTS' ASSOCIATION.

The quarterly meeting of this Association was held at the Grand Hotel, Bridge Street, on Thursday, January 13, when Mr. G. P. Fairman took the chair in the absence of the President, Mr. C. Ranken. Alderman Harrison also wrote regretting inability to attend. The principal business before the meeting was several suggestions from the Federation of Local Pharmaceutical Associations. These were well discussed and the following riders sent to the Federation for consideration :—

1. That only registered students should be taken as apprentices.
2. That a further distinctive title be given to Major men.

The following resolution was also sent for consideration :—

That the Council of the Pharmaceutical Society be approached with a view to forming a third part of the Schedule, so as to include recent and other dangerous remedies now so indiscriminately sold by unqualified persons.

GLASGOW AND WEST OF SCOTLAND PHARMACEUTICAL ASSOCIATION.

A meeting of this Association was held on the evening of Tuesday, January 11, in the rooms, 94, West Regent Street. Mr. Alexander Laing read a paper on

The Ubiquitous Microbe.

He said that in one of the "fragments" of Professor Tyndall which had been presented to their library by the Pharmaceutical Conference was a dissertation on the origin, propagation, and prevention of phthisis. The subject matter had been reduced from a memoir by Dr. Georg Cornet, of Berlin, one of Dr. Koch's colleagues. Tyndall simply accepted Dr. Cornet's inferences and passed them on, the tubercle bacillus bristling on every page. Mr. Laing criticised the "fragment," which he said was worthy to rank with the penny dreadfuls or shilling shockers of the literary world. Mr. Laing received a hearty vote of thanks for his paper. Owing to the smallness of the attendance, it was agreed to postpone the discussion of the new Pharmacy Bill.—Mr. W. L. Currie, President of the Association, who occupied the chair, intimated that the annual dinner had been fixed to take place in the Grand Hotel on Tuesday, Febuary 8.

MANCHESTER PHARMACEUTICAL ASSOCIATION.

At a meeting of this Association, held at the Victoria Hotel on Wednesday last, Mr. G. S. WOOLLEY, President, in the chair, Mr. JOHN TAYLOR, of Bolton, read a paper on

Pharmaceutical Organisation,

which is printed in full at page 70, and gave rise to the following discussion :—

Mr. WOOLLEY, in proposing a vote of thanks to Mr. Taylor for his excellent and useful paper, said re-organisation was what the Pharmaceutical Society was now aiming at, and it seemed to him that the Draft Bill was a step taken in the right direction, and one which would do a great deal to bring the pharmacists of the kingdom into one united body. Until all chemists, pharmaceutical and otherwise, were united in one solid body there was no hope of re-organisation.—The vote of thanks having been accorded, Mr. TAYLOR, in responding, said he took a view entirely opposite to the Chairman. If they wanted to get more chemists and druggists into the Society, whilst keeping that body intact for discharging State functions, it would be necessary to show that it had at heart the commercial interests of its members. If the Society did not deal with that question it would not get the men.

The Draft Pharmacy Bill.

—Mr. KIRKBY then said he had pleasure in moving that the meeting should cordially approve of the Draft Pharmacy Bill, and pledge itself to do its utmost to pass it into law. The attention of pharmaceutical chemists had been attracted to this Bill, and some were inclined to oppose it, largely as a matter of sentiment rather than of reason, but they must put that feeling on one side and take a more reasonable view. It was simply justice that men who had passed the Minor examination should have some recognition from the Society of the fact that they possessed the full legal qualification, and then it might be hoped to get better recognition from Parliament than chemists had hitherto received, by getting an extended Pharmacy Act.—Mr. HARRY KEMP seconded the proposition, and re-echoed the sentiments of the Chairman and Mr. Kirkby. He then criticised the remarks made at a recent Manchester meeting as to examiners and examinees. He also said that, if it was competent for men in business before 1868, who never passed an examination, to become members, he failed to see how the Society would be weakened by men being brought in who had passed the present qualifying examination. The men who were opposing the consolidation of the Society would be as sorry for their action in the near future, as the men did who opposed it five and twenty years ago.—Mr. HARRISON moved as an amendment that the meeting was not interested in the Pharmacy Bill of a Society which was not competent to deal with trade matters.—This met with no seconder.—Mr. W. GIBBONS said he would have supported the amendment, but it did not go far enough. He wished to record his vote against one of the most obnoxious and destructive measures which had been brought forward by the governing body of any learned Society. Mr. Gibbons repeated views previously expressed by him, and said he had a body at his back which would prevent the Bill becoming law.—The CHAIRMAN said he had received a number of objections to the Bill, which he had acknowledged and promised to lay before the meeting. He also said that, judging from his knowledge of the members of Council of the Pharmaceutical Society, their motives were something far higher and nobler than a mere consideration of pounds, shillings, and pence.—Mr. TAYLOR contended that Mr. Gibbons had vitiated his speech by imputing motives on the part of those supporting the Bill.—Mr. PILKINGTON SERGEANT denied that any imputation was cast on chemists and druggists by implying that it would be an anomalous position for them to nominate their own examiners, supposing they were proceeding to the Major examination. He objected to Minor men having equality in the Society with Major men, and contended that the Bill would have the effect of lessening the status of the body as compared with other societies.—Mr. J. RYMER YOUNG said Mr. Sergeant seemed determined to perpetuate the misconception which seemed to have inspired Mr. Gibbons at the commencement of the opposition—the persistent refusal to see the difference between "Pharmaceutical Chemist" and "Member of the Pharmaceutical Society." If Mr. Sergeant and Mr. Gibbons had educated the public into thinking that the title "Member of the Pharmaceutical Society" was preferable to that of "Pharmaceutical Chemist," and so degraded the latter title, which could only be got by examination, then the evil would fall on their own heads. He thought Mr. Gibbons had shown a lack of charity, and introduced animus which had not been necessary. Mr. Young also defended the Society and the *Pharmaceutical Journal*, and suggested that Mr. Gibbons should try to displace the present members of Council at the May elections by those of his own nomination. He ventured to say he would be defeated.—Mr. HANDFORTH argued that the Council was endeavouring to remove one injustice by perpetrating another. He thought it would have been possible to bring forward a measure which would not have raised such serious opposition.—The CHAIRMAN said the question was whether they were to go on wandering in the wilderness for another forty years or more. Chemists were a disunited body. The Government knew the Pharmaceutical Society consisted of a small moiety of the whole body, and the consequence was, they could get nothing done. He therefore strongly advocated the support of the Bill.—Mr. KIRKBY having replied, the votes were taken and the CHAIRMAN declared the motion carried.

ABERDEEN AND NORTH OF SCOTLAND SOCIETY OF CHEMISTS AND DRUGGISTS.

This Association held an "At Home" in the Douglas Hotel, Market Street, on Wednesday evening, January 19, at 8 o'clock. Upwards of fifty ladies and gentlemen were present, including Surgeon-Major Cheyne, Dr. Innes, Dr. Robertson, Messrs. Black, Clark, G. P. Cruickshank, sen., G. P. Cruickshank, jun., Wm. Cruickshank, Hay, Marr, Urquhart, and Weir, Mr. and Mrs. Craig, Mr. and Mrs. John Cruickshank, Mr. and Mrs. Paterson, Mr. and Miss Reid, Mr. and Misses Ritchie, Mr. and Miss Sim, Mr. and Mrs. Simpson, etc., etc. At 10 o'clock the party sat down to supper, purveyed in Mrs. Stott's usual excellent way. Mr. JOHN CRUICKSHANK occupied the chair. The toast-list was considerably curtailed in order that justice might be done to the long dance and musical programme, which seemed more to the taste of the audience than the speeches. The musical programme was contributed to by Miss Cran, Miss Aggie Ritchie, and Mrs. Jaffray, and Messrs. P. M. Cran, N. B. Cran, and M. F. Ritchie. The party separated at 1.30 a.m., thoroughly satisfied with the evening's entertainment.

BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION.

At a meeting of this Association, held at the Great Northern Hotel, on Tuesday last the 18th, Mr. W. FITZWATER WRAY gave a lecture, entitled

Awheel in Brittany: A Summer Tour of Two Bradfordians.

There was a large audience, presided over by Mr. A. H. WADDINGTON (Vice-President). The lecture consisted of an account of a tour beginning at Cherbourg and touching Mont St. Michel, Rennes, Redon, Ploërmel, Vannes, and the district of megalithic remains on the outward journey, and Le Faoûet, Carhaix, Guingamp, Lamballe, Dinan, on the return journey to St. Malo. A large number of photographs were taken during the tour, and these furnished the lecturer with a hundred very interesting lantern slides of scenery, architecture, and people. Mr. Wray spoke in a bright and entertaining style, and besides touching upon the manners and customs of this old-world corner of France, dealt with the subject of the megalithic remains, gave a brief historical account of Mont St. Michel, and related one or two typical Breton legends. At the close of the lecture Mr. Wray was heartily applauded. A vote of thanks was accorded the lecturer, proposed by Mr. DUNN and seconded by Mr. GIBSON, to which Mr. Wray suitably replied.

THE POISON OF BEES.—It is generally assumed that the poison of the sting of the bee is formic acid. Langer, however, finds that this is only partly true; the bee poison which he examined was a bitter tasting liquid with an agreeable odour, which, although it contained formic acid, when diluted to a 1 per cent. solution, so that it no longer gave an acid reaction to litmus, still possessed appreciable physiological action. Moreover, when kept at a temperature of 100° for over six weeks, so that all the formic acid was entirely volatilised, the liquid still produced hyperæmia of the conjunctivæ when introduced into the sac. Langer has isolated the active principle, which he finds gives alkaloidal reactions, is unaffected by heat or cold, or by acids. Injected into the veins of animals it produces effects similar to the venom of serpents.—*Répertoire* [3], ix., 155.

NEW REMEDIES.

SILVER PREPARATIONS AS ANTISEPTICS.—Itrol, or silver citrate, and actol (silver lactate) are both now recognised as valuable antiseptics. For convenience they may be prepared in tablets, similar to sublimate tablets, containing 10 centigrammes of itrol or 20 centigrammes of actol. These salts are as powerful germicides as sublimate and are practically non-toxic. In addition to these a gauze strongly impregnated with metallic silver is now recommended for dressing wounds. Bougies of itrol containing 2 per cent. of that substance with cacao butter are employed as disinfectants of the urethra and bladder. Silver silk, catgut, and drains are also recommended, and are thus prepared. The material is plunged in a wide mouth brown glass bottle, containing a 1 per-cent. solution of actol. Silk should be immersed thus for fourteen days; catgut and drains for eight days. They are then withdrawn and washed with water until this remains clear, then exposed to sunlight until they assume a brownish-black colour. They are kept wrapped in several folds of gauze, and are dipped in boiling water for a few minutes immediately before use, or they may be kept in alcohol. Silver wool is found very effective in dentistry as a packing to remove the fetid odour of decayed teeth. Silver adhesive plaster is particularly serviceable for strapping up small cuts, etc. The silver dressing is composed of gauze of large meshes covered with silver leaf. The only drawback to the use of these silver antiseptics is that they may give rise to stains on the linen. These may readily be moved by soaking the spots for a few minutes in a solution of mercuric chloride, 10; salt, 25; water, 2000; and then rubbing well in pure water.—*Nouveaux Remèdes*, xiii., 562, after *Pharm. Centralh.*

PHENYLPILOCARPINE AND ASEPTOLINE IN PHTHISIS.—Edson recommends the use of phenylpilocarpine, $C_{11}H_{16}N_2O_2 \cdot OH \cdot C_6H_5$, in the treatment of phthisis and of intermittent fever. It is a colourless oily liquid, soluble in water or in alcohol. It is stated that not only does the phenol, liberated from its decomposition in the system, neutralise the toxines produced by the pathogenic bacteria, but that the pilocarpine molecule provokes leucocytosis and stimulates the activity of the glands. Under the name of "aseptoline" Edson employs a solution of 2 centigrammes of phenylpilocarpine and 2·75 grammes of phenol in 100 C.c. of water. In phthisis from 3 to 5 C.c. of this aseptoline are injected daily into the gluteal region, the dose being gradually increased until a maximum amount of 6 to 7 C.c. is reached. At the same time the patient inhales a 10 per cent. solution of iodoform in ether or in olive oil, or else a 3 per cent. aqueous solution of phenol containing 10 per cent. of glycerin. In recurrent fever the patient on the first day is treated with two injections, each of 6 C.c., of aseptoline on the right and left side of the abdomen. For the following six days only 6 C.c. per diem are employed, after which the same dose is injected but once in three days. It is stated to possess greater efficacy than quinine in the treatment of paludal fevers.—*Nouv. Rem.*, xiii., 524, after *Therap. Woch.*

EFFECT OF VASELINE, PARAFFINUM LIQUIDUM AND MINERAL OIL INTERNALLY.—Shubewrath has made numerous experiments with these substances with various animals and on himself and family. In nearly every case no ill effects whatever were apparent, and the animals (cats and dogs) bore quantities of 120 to 250 grammes of vaseline, cycle oil, and machine oil during a period of from twenty to forty days, very well. The author himself consumed in seven days about 23·5 grammes of yellow vaseline, and his children (three to eight years) from 1·75 to 4·3 grammes in four days without experiencing any change of health. The author points out that these results are in direct opposition to equally numerous and careful experiments carried out some time ago by Dunbar, when the animals under treatment suffered most acutely from diarrhœa, etc., and in many instances died. But the success of his own experiments does not prevent the author from advocating a thorough supervision of the use of these products, especially for confectionery, etc., as he believes that there are many oils which contain poisonous mineral ingredients.—*Münch. Med. Woch.*, xliv., 639.

AMMONOL, AN ANTI-NEURALGIC REMEDY.—According to Beringer, ammonol recommended as an antipyretic and anti-neuralgic remedy is composed of acetanilide, 2; sodium bicarbonate, 1; ammonium bicarbonate, 1; metaniline yellow, 0·001. —*Amer. Journ. Pharm.*

LETTERS TO THE EDITOR.

THE NEW PHARMACY BILL.

Sir,—Since a certain amount of trouble has been taken to frame the "proposed" Pharmacy Bill, permit me to suggest that those responsible for it should go to further trouble (and thus save endless bickering between the Society and pharmaceutical chemists), by obtaining if necessary an alteration of the Charter to enable pharmaceutical chemists to be elected fellows, and further, that a certain number of seats on the Council be reserved for them. I appeal to all supporters of the Society, and pharmaceutical chemists in particular, to unite in opposing the Bill as at present drafted. I believe, if it passed, it would not ultimately be to the Society's benefit. Mr. Hocking, of London, and Mr. Gibbons, of Manchester, have both invited communications, and I trust that all wishing for a true consolidation of the Society will respond, as I am of the opinion that the Bill, as it at present stands, is most unjust. Thanking you for allowing both sides a hearing,

Hitchin, January 14, 1898. RICHARD R. LEWIS, Ph.C.

*** It has been repeatedly pointed out, both at Council meetings and in the Journal, that the provisions of the new Bill as to membership of the Society would not in any degree affect the qualification of "pharmaceutical chemist." We must ask our correspondent to state specifically in what respects he considers the Bill to be unjust. [ED., *P. J.*]

Sir,—As a not uninterested reader of your important record of events and opinions, I take leave to suggest that much of the correspondence that appears from week to week is based upon fallacy. While one writer is hankering after distinction and degrees, others are tenacious of their position and the title of "M.P.S.," and would exclude all others from a share in the privilege. As a fact, I must acknowledge that there are men who are competent to fill any position in the profession, craft, or calling (whichever term is preferred) with credit and efficiency, whilst some others who rely upon their qualification as a claim upon public confidence are lamentably deficient. Assuming that the writers alluded to are all well-meaning and sincere in their convictions, I would beg to ask each one of them what would be the result could he be represented in the proposed Bill—what but an abortive result, and its rejection secured! The structure of the Pharmaceutical Society is based on commercial as well as on scientific interests, and it aims to consolidate both. Everybody remembers the fable of the old man, his sons, and the faggot—let us apply the moral. If "union is strength," disunion means weakness, disintegration, dissolution. The Council has declared that the proposed Bill, like its predecessors, is not intended to be a final measure, and it appears to me, all things considered, to comprise as much as Government is likely to concede during the session of 1898.

Kew, January 14, 1898. R. GOODWIN MUMBRAY.

Sir,—I have read with great interest the letters published in the Journal on the new Pharmacy Bill, and I certainly agree with most of the writers. I feel sure that it is the desire of most of the pharmaceutical chemists that the Minor men should have the right to sit on the Council and have a voice in the management of the affairs of the Society, and also to be free from jury service. I believe that these two objects are all that the Minor men can desire, and all that can be done for the consolidation of the Society, which is, I know, badly needed. In the above alterations the Council have provided abundantly for the chemist and druggist, but they have ignored the just claim of the Major men to a further distinctive title in lieu of the M.P.S., which will become common property when the new Act passes (if ever it does). I cannot understand why the Council should endeavour to raise the status of the Minor men to M.P.S. and leave the Major men in the same grade after they have had the worry, trouble, and expense of taking a higher degree. Some say they still have the title of pharmaceutical chemist. Yes, that is all very well, but still not good enough, because the two, Ph.C. and M.P.S., have always gone together, and I doubt that many will not distinguish the difference, and the Minor man may gain by the change, the Major man cannot. The Minor man has nothing to lose by the change, the Major man has, and I do not think it good enough that we should be swept aside by the remarks of the promoters of the Bill, who say that we have no reasonable claim to a better position over our fellows who have not had the energy to take the Major qualification. I may add that this is not due to petty jealousy on my part (as

Mr. B. S. Proctor would say), but simply because I think that honour should be given where it is due, and I would tell Mr. Proctor that we cannot get further into the mud than we are at present. I regret to think that the past hard workers of the Society have left us so deep in the mire, and I hope the present Council will not be above listening to the voice of the trade in the country.

Sunderland, January 17, 1898. R. H. BELL, Ph.C., M.P.S.

*** The Major man as M.P.S. is now indistinguishable from some 600 registered persons, who are also M.P.S., though not Major men, nor would he be distinguishable from over 3000 possible holders of M.P.S. who are not pharmaceutical chemists. [ED., *P.J.*]

Sir,—Perhaps the "comparatively low" acquirements of a Minor man may account for his inability to grasp the abstruse effusions emanating from the seat of Mr. F. Pilkington Sargeant's cerebral powers; but subject to that limitation I agree with the editorial note which interrupted his communication in the columns of the *Pharmaceutical Journal* on January 1, in thinking that Mr. Sargeant "completely fails to comprehend the subject on which he writes." In reference to the side issues which he raises as to whether the Pharmaceutical Society is a scientific body, or a trade union, whatever are its chief aims, its primary object is certainly not science. The care of the scientific subjects of the Minor and Major examinations is in the hands of the Chemical, Linnean, and Physical Societies; the Pharmaceutical Society not being recognised by scientific men as one of the learned societies. Regarding the "comparatively low" standard of the Minor examination, is the comparison made with the Major examination or with examinations for the science degrees of our universities? If the former, then I challenge Mr. F. Pilkington Sargeant's description of the relation. The papers which were set at the recent Major examination could have been answered by the majority of Minor men who have qualified during the last five years. Mr. F. Pilkington Sargeant labours under the delusion that anyone passing the Major examination is considered to be an individual of considerable scientific attainments, but this is far from being acknowledged by those who are competent to express an opinion. For instance, the physics required under the Major Schedule are of the most elementary kind, and mathematics, without which an intelligent knowledge of physics cannot possibly be acquired, find no place in the Major examination. As to the final statement of successful opposition to the new Pharmacy Bill, perhaps Mr. F. Pilkington Sargeant, Ph.C., will inform those who may be in the dark as to where such "indication" is visible.

Higher Broughton, Manchester, N. HOWARD SCHOLLAR, A.P.S.
January 17, 1898.

CHEMICAL RESEARCH AS MADE IN GERMANY.

Sir,—I observe in the recent issue of the *Journal of the Society of Chemical Industry* a note on the discovery of the active principle of capsicum. J. Morbitz—whose paper seems to have been published in the *Pharm. Zeits. für Russ.*, 1897, and to have been translated, or rather abstracted, from *Pharm. Wochenschrift*, 1897—is alleged to be the discoverer. The discovery is identical with that made by Dr. Thresh several years ago, and fully described by him in the *Pharmaceutical Journal* [3], vi., 941, and subsequent papers. It would be interesting for someone to make a compilation of all the discoveries made on the Continent (particularly in Germany) which had been previously made in England. It is not long since benzoyl-morphine went the rounds as a new thing from Germany, although, as matter of fact, it was first prepared, years ago, by Alder Wright in London, and its physiological action was fully investigated by Stockman in Edinburgh.

Edinburgh, January 13, 1898. D. B. DOTT.

THE CHEMISTS' ASSISTANTS' ASSOCIATION.

Sir,—We have pleasure in submitting to you the programme for the second half of the session, and we invite your support and co-operation in obtaining that of your friends at each of the scientific and social gatherings. The value of the papers to be read this half session is enhanced by the fact that they are contributed for the most part by members of the Association. Opportunity will be given on two occasions for members who hesitate to write on scientific subjects to join in the discussion of matters of pharmaceutical importance. The discussion of the new Pharmacopœia on April 28 will afford members an opportunity of recording their experience in the manufacture of new galenicals, and will, it is hoped, prove an incentive to them to diligently study this new work, produced at an unprecedented cost of energy and toil. The attention of intending competitors for the Association prizes is directed to the regulation that essays and accounts of practical work must be received by the Honorary Secretaries on or before March 31. An evening will be devoted to "Short Papers." It should be understood that "short papers" include dispensing notes and queries, observations of impurities, notes on new drugs, their chemistry and pharmacy, and all kindred matters. Members should notify the Literary Secretary as soon as possible of their intention to contribute a "short paper." The annual dinner will take place in the King's Hall, Holborn Restaurant, on March 3. Full particulars will be shortly announced. The second and third Cinderellas will be held on February 3 and March 24 respectively. Musical and social evenings are arranged for January 20 and April 21 at the Association's rooms, 73, Newman Street, W. Members who have not yet paid their annual subscriptions are requested to forward them to the Financial Secretary at an early date. We have to cordially thank those who have given us their assistance in providing the programme, and to express the hope that you will take a personal interest in the welfare of the Association and in the furtherance of its aims and objects.

73, Newman Street, W. F. W. GAMBLE,
January 11, 1898. GEO. E. PEARSON, } Hon. Secs.

(TEXT OF PROGRAMME.)

January 20.—Musical and Social Evening.
,, 27.—Paper: "How an Evening Paper is Produced," E. W. Richardson.
February 3.—Cinderella Dance, Portman Rooms.
,, 10.—Short Papers by Members.
,, 17.—Paper: "Formaldehyde in Dispensing," G. Roe.
,, 24.—Discussion: "Trades Unionism in Pharmacy." Opened by the President.
March 3.—Annual Dinner, Holborn Restaurant.
,, 10.—Paper: "*Résumé* of Mercury," J. Fothergill.
,, 17.—Demonstration: "Water Analysis," E. W. Hill.
,, 24.—Cinderella Dance, Portman Rooms.
,, 31.—Paper: "The Alternation of Generations," Harold Matthews.
April 21.—Musical and Social Evening.
,, 28.—Discussion: "The New British Pharmacopœia."

THE PREPARATION OF SYRUPS.

Sir,—Some eighteen months since I was rather surprised, in looking through the pages of the French 'Codex,' to find that although simple syrup, 17 of sugar to 10 of water, is ordered to be prepared by boiling, a thicker syrup, 18 to 10, is directed to be prepared cold. Without knowledge of the American method, I tried several ways of dissolving sugar in the cold. One of these was identical with that of Mr. Williams, described in last week's Journal. I found, in trying to make a thick syrup, that the sugar soon coalesced in a thick stratum at the bottom of the vessel. This set me thinking how to avoid that and make the syrup quicker. I cut off the bottom of a Corbyn quart bottle, put a cork in the neck, and passed through it a feeding-bottle tube bent twice at right angles, with one limb longer than the other. Another piece of the same tubing bent at an obtuse angle was connected with the first by a piece of indiarubber tube of similar diameter. Then a bag of fine muslin was made to go inside. The second tube had a turn or two of brown paper about the middle of its length, and was tied rather tightly to the bottle, yet so as to slide up or down. The bottle, neck down, was placed on a retort stand. Then the bag, filled with sugar, and the requisite quantity of fluid added was left to do its work. By a contrivance like this last winter I made two gallons of syrupus scillæ, and afterwards used it as a general percolator where possible, the bottom of the bottle restored to its original site acting as a very good stopper.

January 16, 1898. NEMO (123/6).

OBITUARY.

WHITE.—On January 1, George White, Chemist and Druggist, Havant, Hants. Aged 74.

STRAIN.—On January 5, Thomas Alfred Strain, Chemist and Druggist, Sheffield. Aged 58.

PRIDE.—On January 7, Arthur Edwin Pride, Chemist and Druggist, Old Basford, Notts. Aged 47.

BROOMHEAD.—On January 10, George Emmet Broomhead, Chemist and Druggist, Aberdeen. Aged 45. Mr. Broomhead was an Associate of the Pharmaceutical Society.

LEA.—On January 13, Charles Wheeley Lea, Pharmaceutical Chemist, Parkfield, Hallow, Worcester. Mr. Lea was a member of the firm of Messrs. Lea and Perrins, and had been connected with the Pharmaceutical Society since 1859. He was a life member of the Society, and in 1889 gave a donation of £50 to the Benevolent Fund.

ANSWERS TO QUERIES.

Special Notice.—*Scientific, technical, legal and general information required by readers of the 'Pharmaceutical Journal' will be furnished by the Editor as far as practicable, but he cannot undertake to reply by post. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of senders. Questions on different subjects should be written on separate slips of paper, each of which must bear the sender's initials or pseudonym. Replies will, in all cases, be referred to such initials or pseudonyms and the registered number added in each instance should be quoted in any subsequent communication on the same subject.*

REGISTRATION OF A FANCY WORD.—Apply to the Comptroller, Office for the Registration of Trade-Marks, Staple Inn, Holborn, E.C., for the information you require. [*Reply to* A. G.—3/12.]

STUDY DURING APPRENTICESHIP.—Refer to the "Students' Number" of the Journal, published September 11 last, page 231 *et seq.*, where detailed information is given regarding a suitable course of study. [*Reply to* STUDIOSUM.—3/18.]

HORSE AND CATTLE CONDIMENT.—Sulphur flowers, 2; potassium nitrate, 1; gentian root, 2; aniseed, 2; fennel, 2; long pepper, 2; fenugreek, 2—all in coarse powder; powdered resin, 1; salt, 4; locust bean meal, 8. Mix. [*Reply to* E. B. F.—3/5.]

PHOTOGRAPHY IN NATURAL COLOURS.—You probably refer to Villedieu-Chassagne's process, *vide P. J.* [4], iv., pp. 172, 473. [*Reply to* PHOTO.—3/3.]

BLUE ANILINE DYE.—It is difficult to tell the exact tint you require from a verbal description. Probably a strong solution of methylene blue will answer your purpose. Another tint is rosaniline blue, technically known as Paris blue or spirit blue; the grade "spirit blue 6 B" is the best. [*Reply to* GLYCYRRHIZA.—3/8.]

OINTMENT FOR VETERINARY USE.—The ointment you send is composed of lard, resin, oil of turpentine, and perhaps a little wax. There is a good deal of turpentine in it. You can experiment with these ingredients to match it. A basis similar to unguentum resinæ, with turpentine instead of the almond oil, and lard instead of simple ointment, will give you something very like your sample. [*Reply to* MAJOR.—3/4.]

DEPILATORY.—We are not able to trace any such preparation identified with the name of the late Erasmus Wilson. One of the best and safest depilatories is that of Boudet, prepared as follows:—Crystallised sodium sulphide, 3; quicklime in fine powder, 10; starch, 10. Mix. To be mixed with water to a paste and applied to the skin, then scraped off in 2 or 3 minutes with a blunt knife. The hair will grow again, however, after a time. [*Reply to* J. B. H.—2/32.]

TO DETECT ACETIC ACID IN HAIR WASH.—Distil a small portion of the article until the distillate is barely acid to litmus. If much perfume comes over as well, shake the distillate with petroleum ether and separate the watery layer. Test this in the usual way with neutral ferric chloride. It is well to remove perfumes as much as possible, as some of these give colours with ferric chloride which may obscure the acetic acid reaction. If no perfume comes over, test the distillate direct. [*Reply to* BEETLE.—3/17.]

LIME JUICE AND GLYCERIN.—Yolk of one egg, glycerin, 1 fluid ounce; oil of sweet almonds, 2 ounces; tincture of quillaia, 2 drachms; lime juice, 2 ounces; oil of lemon, 20 ♏; oil of bergamot, 5 ♏; orange flower water to produce 8 fluid ounces. Mix the egg yolk thoroughly with the glycerin, add the quillaia then slowly rub in the oil, add the lime juice in small portions, rubbing well until thoroughly emulsified between each addition, then add the water and the perfumes. It is well to prepare an article containing plenty of glycerin or possibly the public analyst in your district may not be able to find it, and you may have to defend yourself. As the formula given above contains 12½ per cent. by volume of glycerin it ought to be sufficient to render you safe. As you doubtless remember, an over-zealous analyst obtained, last year, the conviction of a pharmacist for retailing the formula lime cream and glycerin, on account of alleged deficiency of the last-named ingredient. *Vide P. J.* [4], iv. [*Reply to* J. R P.]

GLYCERIN JELLY.—Your query is not quite clear. Please repeat, and address to Editor, 17, Bloomsbury Square, not to 5, Serle Street. [*Reply to* J. R. P.—3/24.]

REDWOOD'S 'SUPPLEMENT.'—It is probably not worth more than ten to fifteen shillings, but you could ascertain more definitely by asking for offers in an advertisement. [*Reply to* R. S. D.—3/27.]

DISPENSING BOTTLES.—For large quantities you will probably best get what you require from Messrs. Kilner and Co., King's Cross, London, N. For smaller quantities apply to any of the wholesale firms who advertise in our columns for their lists, and make your own selections. [*Reply to* J. R. P.—3/23.]

STUDY OF THE DIATOMACEÆ.—You will find much information on the subject in any book on the microscope, but the best book is undoubtedly Van Heurck's 'Treatise on the Diatomaceæ,' translated by W. E. Baxter (London: William Wesley and Son, 28, Essex Street, Strand, W.C.). The cost of it is about 30*s.* net. [*Reply to* F. A. W.—3/19.]

BOOK ON THE ART OF PRESCRIBING.—You cannot "learn" the art of prescribing from any book. Besides it is not the province of the pharmacist to prescribe; that should be left to the medical practitioner. It takes him a period exceeding five or six years to learn to diagnose and prescribe. You cannot pretend to make a proper diagnosis, and therefore are not in a position to prescribe. [*Reply to* J. R. P.—3/25.]

PRELIMINARY EXAMINATION.—New regulations come into force after August, 1900 (see the Journal for November 27 last, page 471), and "Minor" candidates will then be required to deliver to the Registrar a certificate of having passed an examination in English Grammar and Composition, Latin, one modern foreign language, and also in Arithmetic, Algebra, and Euclid. But, until the date mentioned the requirements will remain as in the existing syllabus. [*Reply to* COUPE.—3/26.]

COLORATION OF SOLUTION OF AMMONIUM ACETATE.—The probable cause of the yellow coloration is a trace of some organic impurity in the ammonium carbonate. Repeat the neutralisation, using the same acid but another supply of ammonium carbonate. Foreign acetic acid sometimes contains a trace of an organic body which gives a coloration with alkalies. Of course, if there is a heavy trace of iron in either of the ingredients, you will get a distinct coloration, which will be more evident as the liquid becomes nearly neutral. Such impurity is not uncommon in acetic acid. [*Reply to* T. D.—3/16.]

DETECTION OF CANTHARIDIN IN A HAIR WASH.—It will probably not be at all easy to isolate cantharidin from a hair wash, unless you have a large quantity of material to work upon. Evaporate to a low bulk, and shake out the residue two or three times with chloroform. Separate the chloroform solution, evaporate off the solvent, and apply a little of the residue to the tender skin of the forearm, covering the spot with a piece of gummed paper. If there is not enough cantharidin to cause redness and irritation in twenty-four hours, it is hopeless to try to isolate it in sufficient purity to identify it. If you obtain positive results by this means, wash the rest of the chloroform residue, first with a few drops of petroleum ether, then with rectified spirit, and again dissolve the washed residue in chloroform and slowly evaporate. Characteristic crystals of cantharidin may then form; if so, collect, and take the melting point in a capillary tube after thorough drying at 100° C. It should melt at 200° C. The first chloroform residue will often have the peculiar odour of the "flies" if tincture of cantharides has been used in any quantity. [*Reply to* BEETLE.—3/17.]

INFORMATION WANTED.

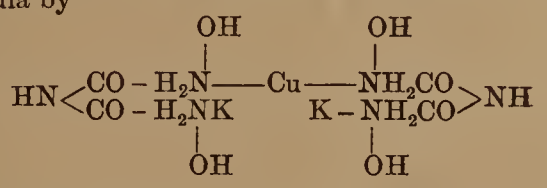
ALLINGHAM'S OINTMENT FOR PILES.—"W. S. B." (3/2) asks what should be supplied for Allingham's ointment, ordered by a London physician to be "introduced" for internal hæmorrhoids?

COMMUNICATIONS, LETTERS, etc., have been received from

Messrs. Athey, Baiss, Bayley, Bell, Blackburn, Burt, Cracknell, Dott, Ferrall, Fletcher, Franklin, Gamble, Green, Hardman, Haworth, Hickling, Hill, Hudson, Jackson, Johnson, Kirkby, Lewis, Lothian, Macdonald, Mercer, Mumbray, Offord, Parry, Pirie, Rankin, Robertson, Robins, Sargeant, Sawer, Schollar, Scott, Spurge, Stewart, Thursfield, Watson, Wilcock, Williams, Wyatt.

"THE MONTH."

Biuret. In his investigation of biuret and the biuret reaction, H. Schiff found that the preparation of pure biuret from urea was best accomplished by the action of dry hydrochloric acid gas at about 135°. In this way about 45 per cent. of the urea was converted into biuret. The separation of the accompanying cyanuric acid was effected by treatment with alcoholic potash, forming potassium biuret, which is insoluble in alcohol, and the biuret is then obtained from the alkaline compound by neutralising it with hydrochloric acid. Pure biuret melts at 192·5 to 193°, and contains in the air-dried substance 12·2 to 12·3 per cent. of water, corresponding to $0{\cdot}8H_2O$. In determining the amount of nitrogen in biuret by Dumas' method, it was found to be impossible to obtain the theoretical quantity of nitrogen, the result always being 2 per cent. too low. Potassium biuret was obtained in the form of large rosette needles, which quickly take up water and carbon dioxide from the air, and is completely decomposed by water. It has the composition $K{\cdot}N{<}^{CONH_2}_{CONH_2},H_2O$. Compounds with sodium, mercuric oxide and with copper salts were also prepared. Although it is fifty years since the biuret reaction was discovered, we are still uncertain as to the composition of the purple-coloured solution which it produces with copper sulphate and potash, owing to the difficulty of obtaining a pure crystalline body. After numerous and ingenious experiments, Schiff produced the red-coloured compound in the form of carmine red needles by mixing pure biuret, potassic hydrate, and moist cupric hydroxide or pure neutral copper acetate. The dry compound takes up CO_2 from the air and becomes blue through separation of copper hydroxide; it is also quickly altered when heated. In alcohol it is insoluble, and it is decomposed by acids, whilst its solution in water is strongly alkaline. Its composition is best expressed by $CuH_2O_2{\cdot}2KOH{,}2C_2H_5N_3O_2$, and its constitutional formula by



—*Annalen*, 299, 236.

Scotch Shale Tar Oil. The views of Berthelot on the polymerisation of acetylene to benzol under the influence of high temperatures have occasioned the supposition that in the destructive distillation of coal, acetylene is first formed, and is then polymerised to the aromatic hydrocarbons. This view is not accepted in its entirety by Heusler, who, in conjunction with Nefgen, has been investigating the composition of Scotch shale tar oil. If this supposition were correct, then the production of the aromatic substances would be a function of the temperature employed, that is to say, a low temperature should produce hydrocarbons of the fatty series and an increased temperature should yield aromatic hydrocarbons. Heusler maintains that in the distillation of bituminous substances the aromatic hydrocarbons are formed not by synthesis only from pyrogenic bye-products as acetylene, etc., but are also in part primary distillation products from the aromatic series of material naturally existing. If the acetylene theory were correct, we must suppose that the very small amount of aromatic substance in shale tar must be due to the low temperature at which the tar has been produced. This has not been found to be the case in practice when dealing with bituminous shale or with coal, but the results obtained are to be ascribed to the difference in the chemical composition of the raw material, the small amount of aromatic hydrocarbons produced from shale being due to its animal origin. From shale tar was obtained paraffin, 40 to 44 per cent., of sp. gr. ·729 to ·765, naptene (polymethylene), a small quantity of benzol, toluol, metaxylol, and cumol, ethylene, and nitriles of fatty acids.—*Berichte*, 30, 2743.

Formation of Carbon Oxides. Engler and Grimm have continued the investigation, suggested by the work of C, Phillips, as to the direct splitting off of CO from organic compounds by heat and its conversion into CO_2 in presence of water, and the temperature at which carbonic oxide is produced in pyrogenic processes. Formic acid heated at 150 to 160° for eight hours evolved about thirty times its volume of gas, of which 98·8 per cent. was CO. Ethyl ester of formic acid at 300° gave forty times its volume of gas, of which 18·2 per cent. was CO; 29·5, CO_2; 45·1, H; and 7·2, C_2H_4. Amyl ester of formic acid at 300° gave a volume of gas containing 23·2 per cent. of CO. Ethyl ester of oxalic acid at 250° C. gave a gas containing 48·4 per cent. CO, and 43·8 per cent. CO_2, according to the equation—

$$(COOC_2H_5)_2 = CO + CO_2 + H_2O + 2C_2H_4.$$

Benzoin heated at 280° for 10 hours in a sealed tube gave a considerable quantity of gas consisting of 92 per cent. CO_2 and 8 per cent. CO. There are several factors that may influence the presence of CO in a natural gas, such as lapse of time and slow oxidation in the presence of water, so that a small amount existing may not be due to the want of a high temperature for its production; in fact, Thomas has found that a gas containing CO is given off from lignite at 50°. The fact that, in the decomposition by heat of ketone bodies, also of compounds which contain the oxygen only in the CO group, a considerable quantity of carbon dioxide is produced, led up to the question whether the change was brought about by the action of atmospheric oxygen on the carbon oxide; but inasmuch as 92 per cent. of carbon dioxide obtained from benzoin could not be due to this cause, suggested the hypothesis, which was eventually found to be correct, that the CO_2 was formed by the joint action of CO and water. When moist carbon oxide perfectly free from oxygen was passed with due precautions through a porcelain tube at 250° to 300° C., there was a distinct production of CO_2, and the result therefore explains the formation of carbon dioxide by the action of heat on ketone bodies, which primarily produces carbon oxide and water.—*Berichte*, 30, 2921.

Colour of Mercurous Iodide. François has found that pure amorphous mercurous iodide, precipitated and washed in the dark, is of a bright yellow colour, resembling the tint of lead chromate. The yellowish-green preparations of commerce were all found to obtain an excess of free mercury, and the varying tints of these samples could be reproduced by mixing pure, bright yellow mercurous iodide by trituration with the indicated excess of metallic mercury.—*Journ. de Pharm.* [6], vi., 529.

Further Notes on Vasicine. The alkaloid vasicine isolated by Hooper has been found by Boorsma to be readily removed from alkaline solutions by chloroform, and it can be obtained colourless by precipitating an alcoholic solution of the crystalline hydrochloride with ether. The precipitate is mixed with dilute potash solution and then shaken out with ether. Vasicine is soluble in water (1 in 270), sparingly so in petroleum ether, benzene, and carbon bisulphide, readily in ether and chloroform. It is markedly alkaline in reaction; its salts crystallise in the same manner

as the alkaloid. The acidulated aqueous vasicine solution (1:1000) is precipitated by most alkaloid reagents, but not by tannin nor by picric acid. In a 1 per cent. solution mercuric chloride and platinic chloride give crystalline precipitates, also picric acid, in a solution as strong as 1 in 50. Concentrated sulphuric acid and Fröhde's reagent give no colour reaction, sulphuric acid and potassium bichromate produce a light blue, sulphuric acid and ammonium vanadate cause a green coloration. Vasicine, in doses of 20 Mgm., produces cramp and paralysis in frogs, and 50 Mgm. produces the same result in guinea-pigs but without lethal effect.—*Pharm. Zeit.*, xlii., 679.

New Antipyrine Compounds.

Schuyten has prepared the following new compounds of antipyrine with metallic salicylates. *Ferri-salipyrine* (iron salicylate antipyrine) of the formula $3(C_{11}H_{12}N_2O),2[(C_6H_4{\cdot}OH{\cdot}CO_2)Fe]$. A yellowish-brown powder, separating from water in ill-defined crystals with a greenish fluoresence, blackening at 67° C., and melting at 70° to 73° C. *Nickel-salipyrine* (nickel-salicylate antipyrine), $3(C_{11}H_{12}N_2O),[(C_6H_4{\cdot}OH{\cdot}CO_2),Ni2H_2O)]$. A pale green powder crystallising from alcohol in almost white needles, which melt at 120°, turning dark green on losing water of crystallisation. The latter is partly taken up again in the air. *Cobalt-salipyrine* (cobalt salicylate antipyrine). A pale red powder having the composition $2(C_{11}H_{12}N_2O),[(C_6H_4{\cdot}OH{\cdot}CO_2),Co]$ crystallising from water in dark red crystals which melt at 106°, turning a fine blue colour.—*Pharm. Post*, xxx., 587.

Alkalies and Diastasic Action.

Terrat finds that the minute traces of alkaline salts often present in drinking water exert a marked influence in modifying the action of diastase on starch. It does not appear to influence the hydrolysis of the starch, but retards the conversion of the dextrin so produced into maltose and secondary dextrin. The 'Codex' directs that ten centigrammes of diastase, mixed with 100 grammes of starch paste—containing 6 per cent. of starch and maintained at 50° C. for 6 hours—should yield a solution, one volume of which should decolorise 5 volumes of Fehling's solution, but the official test says nothing of the water to be employed. The author finds that a sample of diastase which more than met the official requirements when distilled water was used in the experiments, failed to answer the test when drinking water containing the usual trace of bicarbonates of the alkaline earths was employed.—*Journ. de. Pharm.* [6], vi., 494.

Photo-Electric Properties of Salts.

Professors Elster and Geitel find that potassium bromide, sodium chloride, and similar salts, which undergo changes of colour under the action of kathodic rays, are at the same time rendered photo-electrically sensitive, inasmuch as they lose any negative electric charges imparted to them more rapidly in daylight than in the dark. Moreover, the same photo-electric properties appear to be conferred on the salts by heating them in the presence of potassium vapour, whilst they exist more or less in the natural violet and blue varieties of rock-salt, fluor-spar, and similar minerals. Electrometer readings are given for various salts coloured by different methods.—*Wiedemann's Annalen*, through *Nature*, lvii., 255.

Anagyrine.

In the course of his researches on the constitution of the alkaloids, Professor E. Schmidt has examined anagyrine. That alkaloid occurs with cytisine in the seed of *Anagyris fœtida*. The reactions and general properties of anagyrine are very similar to those of cytisine. The beautifully crystalline hydrobromide, hydrochloride, platinum, gold, and mercury double salts furnished on analysis values corresponding to the formula $C_{15}H_{22}N_2O$. The behaviour of anagyrine towards alkaline iodides and nitrous acids is that of a tertiary base. Considering that cytisine is a secondary base, and that the difference between the formulæ of both is only C_4H_8, the hypothesis that anagyrine is related to the butyl cytisines seems well founded. This point is still being determined by comparing with anagyrine the various butyl cytisines obtained by butylising cytisine.—*Pharm. Zeit.*, xlii., 653.

New Synthesis of Glycerin.

O. Piloty has succeeded in effecting a new synthesis of glycerin in a manner that is of especial interest in plant physiology. Starting from formaldehyde, Henry had already prepared nitroisobutyl glycerin, which Piloty and Ruff converted into the corresponding hydroxylamine compound, thence by oxidation into the oxime of dioxyacetone. It is this body which Piloty first converts into dioxyacetone by the action of bromine, thus :—

$$\left.\begin{array}{l}2(CH_2{\cdot}OH)_2C{:}N{\cdot}OH\\2Br_2\\H_2O\end{array}\right\} = \left\{\begin{array}{l}2(CH_2OH)_2CO\\N_2O\\4HBr\end{array}\right.$$

and then reduces the dioxyacetone with sodium amalgam to form glycerin, according to the equation—

$$(CH_2OH)_2CO + H_2 = (CH_2OH)_2CHOH.$$

As it is the view of many chemists that formaldehyde is the first assimilation product of carbon dioxide in the plant from which, through condensation, the sugars are formed, this synthesis of glycerin from dioxyacetone, which has many of the properties of a sugar, is likely to lead to important results in extending our knowledge of the process of assimilation in plants.—*Berichte*, xxx., 3161.

Determination of Fibre.

The determination of fibre in fodders and foods has been investigated by Dr. J. König, who finds that the method of Henneberg, the one frequently employed for the purpose, gives results which are, in some instances, 20 per cent. too high, owing to the imperfect removal of pentosane. König's new process consists in the treatment of the material with boiling acidulated glycerin, either under pressure or in a flask connected with a reflux condenser. When operating in a flask 3 grammes of the air-dried substance are boiled with 200 C.c. of glycerin of 1·23 sp. gr., containing 2 per cent. strong sulphuric acid for one hour at 131° to 133°. The liquid is then cooled to 80 to 90°, diluted with 200 to 250° C.c. boiling water, filtered through an asbestos filter, washed with boiling water, and finally with alcohol and ether-alcohol until the filtrate is colourless. The insoluble residue, after deducting the ash, represents the crude fibre. The results obtained by König's method gave 43·4 per cent. of fibre in rye straw, 30 per cent. in pea straw, 26·2 per cent. in hay, 7·5 per cent. in linseed, etc., against 52·3, 40·5, and 8·9 per cent. respectively as determined by Henneberg's process.—*Zeitschrift für Untersuchung der Nahrungs und Genuss Mittel.*, i., 3.

Notes on Essential Oils.

Gildemeister and Stephan contribute further information respecting essential oils. MANDARIN OIL was first investigated by De Luca in 1857, who obtained it by pressure from *Citrus Madurensis Loureiro*. It gave a dextro-rotating distillate at 178°, consisting of a terpene, $C_{10}H_{16}$, which yielded a crystalline dihydrochloride, $C_{10}H_{16},2HCl$. The boiling point and the rotatory power, together with the formation of a crystalline dihydrochloride, led Gildemeister and Stephan to conjecture that the terpene of mandarin oil was dextro-limonene, which view was confirmed by further investigation. The oil had a specific gravity of 0·855 at 15°, and the rotatory power $[\alpha]_D = +69°{\cdot}54$ at 16°. It began to boil at 175° and distilled at 179°, leaving a small residue.

The fraction between 175° and 177° ($[\alpha]_D = +76°{\cdot}45$) gave limonene tetrabromide (m.p. 104° to 105°). A portion of the same fraction, when treated with hydrochloric acid gas, gave De Luca's product, namely, dipentendihydrochloride. From these results it is concluded that dextro-limonene is the chief constituent of mandarin oil. Evidence was also obtained which pointed to the presence of citral and citronellal in the undistilled residue, but a larger quantity of the oil must be worked up to determine this point satisfactorily. CULILAWAN OIL was obtained from the bark of the *Cinnamomum Culilawan* to the extent of 4 per cent. by distillation with steam. It had a specific gravity of 1·051, and dissolved to a clear solution in about three parts of 70 per cent. alcohol. It was found to contain 61·5 per cent. of eugenol, when determined by Thoms' method, a little methyl eugenol and a small quantity of indefinable bodies. As turpentine is the chief adulterant of ROSMARY OIL, it is important to ascertain definitely whether pinene is a natural constituent of rosmary oil, as its presence might be otherwise ascribed to sophistication. For this purpose a genuine oil was obtained by distillation from the leaves, and the results of the investigation proved that pinene—probably a mixture of dextro- and lævo-pinene—is its normal constituent, so the presence of this terpene, unless in considerable quantity, is no evidence of adulteration with turpentine oil. A pure oil should have a specific gravity above ·900 at 15°; the oil itself, as well as the first 10 per cent. of its distillate, should be dextro-rotatory, and one part of the oil should give a clear solution with 0·5 part of 90 per cent. and with 10 parts of 80 per cent. alcohol. The essential oil from the fruit of *Schinus molle* was investigated in 1884 by Spica, but Gildemeister and Stephan have obtained results which are somewhat different. The fruit yielded by distillation 5·2 per cent. of a thin oil of specific gravity 0·8505, with rotatory power + 46°·4 at 17°. It dissolved in about 3·3 parts of 90 per cent. alcohol, and gave an intense phellandrene reaction. Further examination showed that the greater part of the oil consists of phellandrene—much dextro- and little lævo-phellandrene—a small quantity of carvacrol, and possibly traces of pinene. —*Archiv der Pharm.*, 235, 582.

Chemistry of Spigelia Anthelmintica.

Boorsma has succeeded in isolating an alkaloid from *Spigelia anthelmintica* entirely different in its action from strychnine or gelsemine. It is obtained by rendering the alcoholic extract alkaline with ammonia and shaking out with chloroform, not in a crystalline state, but as light yellowish, soft and hygroscopic varnish. On frogs it produces not tetanic, but spinal paralysis. A dose of 0·5 Mgm. was found to be lethal on guinea-pigs. The author calls the alkaloid spigeline.

Chemistry of Dioscorea Hirsuta.

The statement of Boorsma that two alkaloids exist in the roots of *Dioscorea* is denied by Plugge and Schütte, who can only find one alkaloid (dioscorine), melting at 43·5 C., having the formula $C_{13}H_{19}NO_2$. It is crystalline. The hydrochloride melts at 204° C., and is anhydrous. The action of the alkaloid is similar to picrotoxin, but much weaker (on guinea pigs 16 times less toxic). It produces strong tetanic convulsions, ending in central paralysis.—*Pharm. Zeit.*, xlii., 678.

Cutting "Seed" Potatoes.

As many pharmacists are either themselves interested in horticulture, or may be the advisers in some points of those who are so interested, the following facts with reference to the practice of cutting "seed" potatoes before planting may be of interest. Experiments prove that undivided large seed tubers give far larger crops than the same tubers cut up before planting, and the crop is from 5 to 18 per cent. less if small whole tubers are used instead of those of average size. It is false economy to cut up seed potatoes, the crop from tubers so treated being not more than two-thirds that obtained from the same stock planted whole.—*Cape Agricultural Journal*, xi., 349, after *Mildura Cultivator*.

Artificial Variegated Leaves.

Lindemuth suggests that it is may be possible to produce variegated specimens of almost any species of plant by grafting upon it a form with coloured leaves, not necessarily of the same species, but of a nearly allied form. It is found that if a variegated form of one species be grafted upon a normally coloured plant of another, the green plants produce variegated shoots. Thus a green plant of *Malvastrum capense* on which a variegated *Abutilon* had been grafted produced variegated shoots below the graft; *vice versâ* a green plant of *Kitaibelia* grafted on a variegated *Abutilon* became variegated and gave vigorous cuttings, which, when grown in the open, remained variegated. *Althea officinalis* when grafted on the same *Abutilon* also became variegated. *Petunia hybrida* grows vigorously if grafted upon *Nicotiana glauca*.—*Gard. Chron.*, xii., 434.

The Copper Plant.

According to Sketchley ('Geological Survey of Queensland'), the presence of the Caryophyllaceous "copper plant," *Polycarpœa spirostylis*, is a sure sign of the presence of copper lodes. It occurs all over the copper region of Queensland, but always on, or close to, the deposits of that metal, or along water courses charged with copper in solution. The Government analyst, Mr. Brownlie Henderson, finds distinct traces of copper in the ash of the plant, more than can be accounted for by mere accidental absorption.—*Gard. Chron.*, xxii., 417.

Freezing of Plants.

From a series of observations made on tropical plants, H. Molisch states that the freezing of plants at a temperature above 0° C., independently of their transpiration, is the result of chemical rather than of physical changes in the living substance; some chemical processes, such as the formation of chlorophyll and of etiolin, respiration, and the assimilation of carbon dioxide, being largely dependent on temperature, while others are not.—*Sitzber. k. Akad. Wiss. Wien*, cv., 82.

How Flowers Attract Insects.

In the concluding part of his very interesting paper on this subject (*Bull. Acad. R. Sci. de Belgique*, 1897, p. 847) M. F. Plateau thus sums up his general results. Insects, when seeking pollen or nectar, are guided only to a very secondary extent by their sight. They continue to visit flowers (Compositæ and Umbelliferæ) after the coloured parts have been almost entirely removed. In flowers of the same species which vary in colour they exhibit no preference or antipathy to one colour over another. Green, or otherwise inconspicuous flowers hidden among the foliage are, notwithstanding, freely visited by insects. They pay no attention to artificial flowers brightly coloured and closely resembling real flowers if made of paper or muslin or some similar material; while, if made of green leaves, they are constantly visited. The guiding sense to insects in visiting flowers can be primarily no other than that of smell. When flowers which are habitually neglected in consequence of containing little or no nectar are smeared with honey, insects visit them in abundance; while if the nectary is removed from flowers habitually visited, their visits cease at once. Green or brown, and therefore inconspicuous anemophilous flowers, if scented with honey, at once become entomophilous. At the meeting of the Linnean Society on November 18 Sir John Lubbock read a paper

in reply to M. Plateau's observations, in which he controverted some of his statements and placed a different interpretation on others.

Composition of Plant Sap. M. A. Hébert has investigated the composition of the sap in a species of *Ampelocissus* and in *Musa paradisiaca*. In that of the former plant he finds a comparatively large amount of iron; the sap becomes blue on long exposure, probably in consequence of the formation of iron salts of gallic acid. In the sap of *Musa* potassium oleate was found; hence its use for saponification. In the sap of the wood of vines bearing black grapes he found œnotannins, hitherto known only in the berry.—*Bull. Soc. Chim. de Paris*, from *Beih. z. Bot. Centralbl.*, 1897, p. 280.

Latent Life of Seeds. In a paper on *Science Progress* (1897, p. 585) Mr. F. Escombe sums up the present state of our knowledge respecting the power of seeds to resist unfavourable conditions for germination. When in the latent condition he regards seeds as being, strictly speaking, neither dead nor alive, but as "hypnotes" in a state of "hypnosis." To cell-protoplasm in this condition he applies the term "hypnoplasm." It is at present entirely unknown for what length of time seeds may remain in this condition and still be capable of awakened life. The degree of cold to which they may be subjected without being killed is also uncertain, but it is certainly in some cases as low as – 65° C.

Formation of Proteids by Leaves. According to observations made on a number of different plants by U. Suzuri (*Bull. Coll. Agric. Imp. Tokyo*, 1897, p. 241), the decrease during the night of the amount of sugar and other carbohydrates in the leaves is associated with a decrease also in the amount of proteids. Leaves appear to possess the power of facilitating the formation of proteids in all parts of the plant by assimilating nitrates with production of amido-compounds. Mr. E. Godlewski (*Ann. Agron.*, 1897, p. 310, from *Journ. Chem. Soc.*, 1897, Abstracts, p. 583) states that proteids are formed out of nitrates only in the light. The process is not, however, a direct one; there is first a production of non-proteid substances; exposure to light then bringing about their conversion into proteids.

Assimilating Energy of Blue Light. According to experiments made by F. G. Kohl, the blue rays of the spectrum have a very powerful effect in promoting assimilation in plants, in accordance with Engelmann's general law of the coincidence of the maxima and minima of absorption and of assimilation. The absorption of the blue rays is brought about by the carotin constituent of the chlorophyll; the function of this pigment being the assimilation of these rays.—*Ber. Deutsche Bot. Gesell.*, 1897, p. 361.

Atmospheric Precipitation and Plant Growth. Herr E. Wollny confirms the current belief that plants have no power of absorbing water through their leaves when these are already charged with moisture, and that even when they are withered their power of absorption is very small. The moistening of the leaves has, however, the beneficial effect of checking transpiration. He asserts that when plants are gathered moist, the leaves wither more quickly than when gathered dry; and accounts for this by the explanation that cell-walls swell when in contact with water, and are placed in a state of tension by the pressure of the cell-contents; hence the micellæ of the cell-wall are forced apart, and the movement of water facilitated. Hail has, of course, a very destructive effect on plants, especially on young leaves and buds, though this is often compensated, when the plant is young and vigorous, by the luxuriant growth of lateral shoots induced by the destruction of the primary buds.—*Forsch. aus d. Geb. d. Agricultur-Physik*, xx., from *Beih. z. Bot. Centralbl.*, 1897, p. 306.

Röntgen Rays and Vegetation. In a paper read before the Toronto meeting of the British Association, Professor G. F. Atkinson stated that the effect on the higher plants of exposure to the Röntgen rays varies according to the length of the exposure. In periods varying from one to two hours no perceptible injury appears to result, while an exposure of forty-five hours produces the same effect as total darkness. The rays appeared to be without effect on the growth of filaments of *Mucor* and *Oscillatoria* and on bacteria.

Drugs and Condiments. Hare calls attention to the fact that the absorption of many drugs may be facilitated and a more marked physiological reaction obtained by prescribing with them a stomachic stimulant such as powdered capsicum. Experiments with potassium iodide showed that the characteristic reaction for iodine was much more quickly obtained from the saliva of patients to whom the salt was administered along with the stimulant, than when it was given alone to the same individuals. —*Therap. Gaz.* [3], xiii., 731.

Potassium Iodide Pills. Bultot prepares pills of potassium iodide from the following formula:—Potassium iodide, 0·20; wheat starch, 0·05; dextrin, 0·02 gramme; and simple syrup, *q.s.* The author prefers to use dextrin rather than gum arabic, as it has not an acid reaction. Dry the pills rapidly, coat with tallow and preserve in the dark. Thus stored the pills remain white, and although hard they dissolve in less than two hours in distilled water. —*Chemik. Zeit.*, xxi., 281.

Making Incandescent Mantles. According to Wenghoeffer (*Chem. Centralblat*), the best results with incandescent mantles are obtained with a mixture of 89 parts of thorium nitrate and 1 part of cerium nitrate. The addition of other rare earths does not improve the result. The mantles should be immersed in a bath of the nitrates in the proportion given, in 30 per cent. aqueous solution.—*Bull. Gen. de Therapeut.*, cxxxiii., Appendix ii.

Pure Calcium Glycerophosphate. Continuing their experiments on the glycerophosphates, Adrian and Trillat propose the following method for preparing the pure calcium salt:—Equal parts of glycerin and phosphoric acid are gradually heated on a sand-bath in an enamelled vessel to between 130° and 150° C., and maintained at that temperature for 24 hours, when the dark-coloured viscid mass begins to evolve acrid fumes. Instead of calcium carbonate, the authors use tribasic calcium phosphate to combine the free phosphoric acid, since effervescence is thus avoided. The free phosphoric acid forms with this dibasic calcium phosphate; milk of lime is then added in excess, which combines with the glycerophosphoric acid and again precipitates the phosphoric acid as tribasic calcium phosphate, which is filtered out and again used in subsequent operations. The filtrate is concentrated to a pasty consistence, then poured into 10 parts of alcohol, and boiled for an hour. After draining it is again treated with alcohol and precipitated by heating, collected, and dried on the water-bath. The authors have obtained the salt in the form of a microcrystalline powder by precipitating the aqueous solution by boiling, when it forms minute, well-formed needles. These, however, at once lose their crystalline form on exposure to the air, and disintegrate even on the microscope slide while under observation.

Analysis of the salt gave figures corresponding to the anhydrous salt of Pelouse, and did not support the statement of Portes and Prunier that it contains two molecules of water. The solubility of the glycerophosphate in water at 25° C. was found to be 4·53 in 100.—*Journ. de Pharm.* [6], vi., 481.

Preservation of Ether.

The loss caused by the evaporation of ether from unsealed bottles during hot weather, and in shops that are kept very warm in winter, can be prevented by the following ingenious plan :—Fill the bottle nearly full with ether, pour in sufficient glycerin to bring the surface of the ether nearly to the bottom of the stopper ; then insert the latter carefully, and with a piece of twine of sufficient length suspend the bottle neck downward from a nail or other support, letting the cord pass over the stopper and take a turn around the body of the bottle from each side, so that it will hang perpendicularly and safely. The glycerin descends and fills the neck of the bottle, sealing the latter hermetically, and when any of the contents are required for use it is only necessary to re-invert the bottle, remove the stopper, and carefully wipe the neck before pouring. The glycerin, of course, drops to the bottom, and allows the ether to be poured out almost to the last drop if care be taken. A similar plan is useful for bottles containing benzol.—*National Druggist*, xxvii., 210.

Electro-Chemical Industries.

In an address recently delivered before the Institution of Electrical Engineers, J. W. Swan stated that one-third of all the refined copper required is now produced electrolytically. Gold, aluminium, sodium, and zinc are also extracted from their ores electrolytically ; the electrolytic treatment of brine for the production of soda and chlorine now threatens to displace all the older chemical processes ; and potassium chlorate is largely manufactured by electrolysis in Switzerland and Sweden. Amongst the electro-chemical processes depending on dissociation and combination at extremely high temperatures are the manufacture of phosphorus, carborundum, calcium carbide, and analogous products. The production of ozone and its secondary derivatives, vanillin and heliotropine, is dependent on the employment of intermittent or alternating currents of high tension. The ozone, in turn, is used to oxidise oils, season linoleum, and purify brewers' casks.

Antipyrine and Sp Aeth. Nit.

C. Caspari, jun., suggests that if physicians desire to prescribe antipyrine and spirit of nitrous ether together, they should also order the addition of excess of potassium or sodium bicarbonate, in order to avoid the formation of the undesirable green colour due to the formation of isonitroso-antipyrine. In the presence of water, the ethyl nitrite is then gradually decomposed, with formation of alkali nitrite and ethyl alcohol. If objection be taken to the suggested procedure on this ground, attention should be directed to the fact that decomposition of the ethyl nitrite will occur by the action of water alone, acid being simultaneously liberated. Normal nitrites, of course, do not react with antipyrine. The results of experiments performed by Caspari appear to show that antipyrine is not decomposed by alkaline bicarbonates.—*Pharm. Review*, xvi., 12.

Some Laboratory Notes.

F. A. Sieker discusses the U.S.P. statement that on gently warming a mixture of equal volumes of glycerin and concentrated sulphuric acid the liquid should not acquire a dark colour (absence of readily carbonisable impurities). He finds that on mixing 1 C.c. or less of each liquid the temperature is not appreciably raised, and the test tube should then be immersed in warm water to secure the required degree of heat. When, however, 5 C.c. or more of glycerin and sulphuric acid are mixed the temperature rises to 75° C. or higher, and the application of more heat is therefore undesirable. A sample of resin (colophony) has also been examined by Sieker, with a view to obtaining data that might help in the detection of resin as an impurity in other substances. The acid number was found to be 171·2 (titration of cold alcoholic solution with alcoholic semi-normal potassium hydroxide, and phenolphthalein as indicator), and the iodine number was 165·9 and 166·7 (sixteen hours' contact with iodine and mercuric chloride solution). It is suggested that as resin absorbs iodine very rapidly one hour's exposure may suffice. The same worker states that linseed oil and potash soap which is soft, may contain less water than one of firmer consistency, and he suggests that the use of pure potassium hydroxide for preparing the soap, as directed in the U.S.P., is unnecessary. It is specified by Sieker that a good linseed oil soft soap should be perfectly soluble in water and not contain more than 3 per cent. of matter insoluble in alcohol ; it should be free from unsaponified fat, but should contain about 0·25 per cent. of free alkali ; it should also be transparent and not stringy, contain about 40 per cent. of fatty acids insoluble in water, and be free from alkaline silicates, starch, and other impurities.

Useful Laboratory Superheater.

J. A. Wilson has not obtained entirely satisfactory results from the use of a copper coil heated by a Bunsen burner for laboratory distillation with superheated steam, as the temperature of the steam under such conditions is subject to considerable fluctuation. He prefers, therefore, to place the coil in a cylindrical copper vessel containing hard paraffin or other similar material ; on heating this vessel by a powerful burner the temperature is readily equalised by using a copper stirrer.—*Chem. News*, lxxvii., 25.

Asbestos Furnace Covers.

H. Jervis describes how an extremely light furnace cover may be constructed from asbestos millboard. A piece of the millboard—10 in. × 4 in. × $\frac{3}{8}$ in.—is perforated in about a dozen or more places with glycerined cork-borers, then nicked about an inch from each short end and immersed in water until saturated ; next bend the board from the nicks at right angles and shape the perforated portion by bending it over a bottle with as little force as possible. The result should be a perforated arched tunnel, resting on narrow horizontal ledges at each side. Dry this cover in the furnace, after setting it in position and pressing it well to the supports. Three such covers, weighing one pound, replaced twenty-four fire-clay tiles, weighing thirteen pounds, and a higher temperature was obtained than with the latter. A simple method of constructing a combustion furnace for use with asbestos covers, from a single sheet of mild steel, 5 feet long and about $\frac{1}{32}$ in. thick, is described in the same illustrated article, whilst some further uses of asbestos in the laboratory are also referred to.—*Chem. News*, lxxvii., 5.

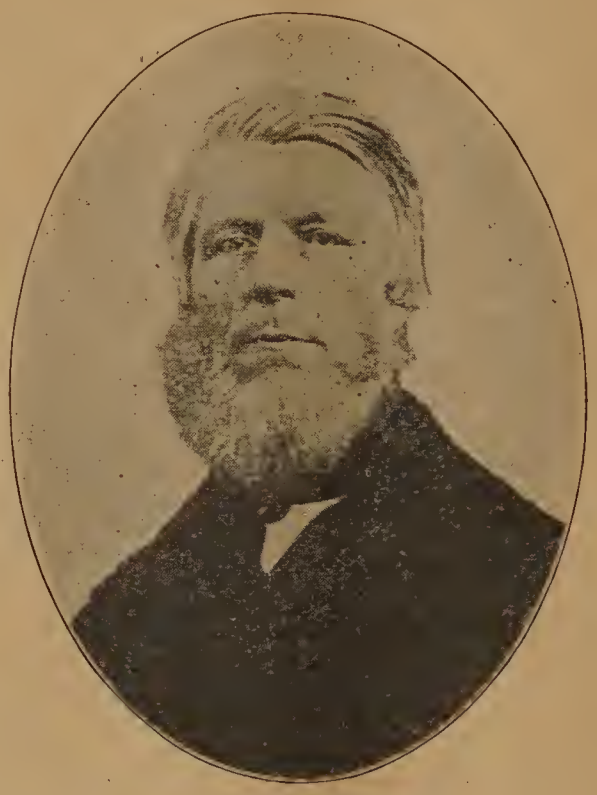
Phosphorescence of Decaying Wood.

Kutscher has succeeded in cultivating the mycelium of a fungus from decaying wood, which is strongly phosphorescent, thus proving that the luminosity of that substance is due to an organised body and not to purely chemical causes, as Hartey and De Bary have assumed. The mycelium obtained from pine trees exhibiting the phosphorescent phenomenon was cultivated in decoctions of beech bark and agar-agar, forming a white brilliantly luminous growth. The fructification of the fungus has not yet been obtained ; consequently its botanical characters cannot be decided.—*Journ. de Pharm.* [6], vi., 504, after *Zeitsch. für phys. Chem.*

The Pharmaceutical Society and its Presidents.

HENRY DEANE.—1853-55.

THE ninth president of the Society was elected to that position in troublous times, on June 1, 1853. The outward presentment of Mr. Deane, always styled "of Clapham," hardly reflected his true character. Not seldom, and especially at the Council, his face wore an appearance of anxiety, approaching even to distress, which was commented on by his friends. But this, as he himself assured them, was purely physical, as no one was more disposed to look on the bright side of life; certainly no one was better pleased to be surrounded by the young. In his public and business relations it is not possible to mention a name more respected by pharmacists universally. He was one of the earliest examiners, and took the subject of botany under his care. He was Member of Council for many years, and President during two years. He was also the first President of the British Pharmaceutical Conference—the choice being fortunate for the association and grateful to himself, for he never failed to express his satisfaction with the reception he met at Newcastle and the friendships which his connection with the Conference created.



HENRY DEANE.

Mr. Deane was born August 11, 1807. At school he became intimate with Henry and Edwin Doubleday, the entomologists, and he regarded this as an inestimable advantage. "Nothing," he declared, "was better than to have a hobby—one calculated to improve the mind and keep the devil at a respectful distance." Apprenticed when eighteen years old at Reading, he had quite enough to do. He opened the shop at 6 o'clock in the morning, ground Prussian blue and powdered roots and seeds—not seldom he had to carry a dozen or two of soda water to a distance of one or two miles on a hot summer's day; all of which he considered most improving, as he could do a little botanising on the way. Where he contracted the habit of carrying his inseparable black bag remains a mystery; it was omitted in the Council portrait, which to that extent is not true to Nature. The business at Clapham was opened in the autumn of 1837, much indebted at its commencement to the pecuniary aid of Richard Hotham Pigeon. Some of Mr. Deane's well-informed friends predicted failure, but that was an event unlikely to happen to a former assistant of Mr. Jacob Bell. In 1844, he was placed on the Board of Examiners, and he was elected to the Council in 1851. He was an original member of the Microscopical Society, and contributed many papers to the *Pharmaceutical Journal*, one of the best known being "Experiments on Senna," noticed by Dr. Pereira and Dr. Royle. He died Saturday, April 4, 1874, deeply regretted and universally beloved.

At the time Henry Deane became president of the Society, trouble was pending in connection with the new Bye-laws, and during the whole of his two years of office that trouble persisted, to the exclusion of any profitable labours in connection with the advancement of pharmacy, except as regards recognition of pharmacists by the medical authorities as fitting persons to take part in pharmacopœia revision, the first Pharmacopœia Committee of the Pharmaceutical Society being appointed whilst Deane was president. But that matter will be referred to later. Reverting now to the question of chief interest for the moment, we find that Lord Palmerston's confirmation and approval of the Bye-laws was intimated in June, 1853, and the process of electing members in accordance with the new regulations then proceeded rapidly. But the legality of those elections was soon challenged by William Dickinson, a member of Council who had actually seconded the motion for confirming the new Bye-laws at the special general meeting held on December 8. The object this unhappy individual had in view is not clear, but he amply confirmed the views of those who hold that one enemy within the fold may cause infinitely more mischief to the body he is connected with than any number of opponents outside. The case was carried from court to court and only decided in the Society's favour a few days after Deane had retired from the presidential chair.

In his first address at an annual meeting, he emphasised the fact that unity and concord are essential elements of success, and that their absence is a serious evil. He also asked the members to bear in mind that, in carrying out reforms, they were working more for the rising generation and for posterity than for themselves. Improvement of the craft, not individual self-advantage, was to be aimed at, and in proportion to the high and honourable sentiments and conduct of the existing members, so would be the prosperity and development of the trade-profession of pharmacy in the hands of their sons, apprentices, and assistants in future years. Another important point to which attention was directed was that it not only ill becomes pharmacists to be at war with each other, but it will not insure obtaining peaceful, intelligent, and upright men to guide the affairs of the Society, "for such men shrink in dismay from the contact of discord, and will not accept an office in which they would be likely to be pointed at with the finger of scorn, derision, or contempt." Continuing, Mr. Deane remarked that the time of such men is too valuable to be frittered away in bickerings, or in vain and discordant attempts at working out legal technicalities and obscure points of law, which neither the interests of the Society nor the requirements of the public demand, whilst they do not in any way conduce to the general good.

Twelve months later, when the legal struggle had reached an acute stage, Deane reminded the members that they were "but

men, tradesmen, semi-professional, in a laborious and in the main an ill-requited occupation, considering the responsibility that attached to it"; and if, in carrying out their great object of education and improvement in their social position, they should occasionally be at fault as to the best mode of overcoming difficulties as they arose, or if differences of opinion should occur in such cases, they must endeavour to preserve harmony and goodwill in judging of each other. "Those amongst us," he continued, "who accept the office of administering the laws of the Society, must do so purely from a desire to promote the general good, and whether they obtain full credit for their intentions or not, they must rest satisfied with the conviction that they have endeavoured to act for the best." Deane's argument that "the imperative duty of submitting to the majority is essential to prosperity as a general rule, although it does not follow that the majority is in every case on the right side," is particularly applicable at the present time, when some members of the Society seem inclined to repudiate the action of their elected representatives on the Council, though an overwhelming majority is in complete accord with that action. Nor does it appear inappropriate at this juncture to quote his opinion on the value of the title held by pharmacists: "It should be a guarantee of honour, talent, and integrity; and if as a body we do not benefit by it, the fault will rest solely with ourselves."

The title of "pharmaceutical chemist," which had been established by the Society, was then the only recognised qualification for the practice of pharmacy; but it was entirely an optional qualification, and, short of assuming the title, anyone could carry on the business. The members of the Society were all pharmaceutical chemists, and constituted only a small section of the drug trade, though, by the honourable exercise of their calling, they were doing much to convince the public that the pharmacist was not a mere shopkeeper, but, to quote from Deane's address at the Newcastle Conference in 1863, "a veritable and important though humble member of the medical profession."

J. T. DAVENPORT.

JOHN T. DAVENPORT.—1855-56.

The next past-president of the Society to be referred to still survives, and though it is some time since Mr. Davenport retired from public work, he re-appears amongst his London friends on occasions of special pharmaceutical interest. Some yet remember him as an able and impartial examiner. In the days when the Preliminary was in its infancy he would listen with patience whilst a candidate endeavoured to construe a small Latin book, based upon Scripture history and recording the patriarchal age. When this examination was re-modelled Mr. Davenport undertook the reading of autograph prescriptions with a fairness worthy of imitation. Happily he is still amongst us, enjoying a well-earned retirement. A stranger passing the unpretentious establishment in Great Russell Street would never have suspected that for years it had been a centre of high-class pharmacy. The development of the chlorodyne industry has left its mark upon commercial enterprise, and bears witness to energetic business tact.

Shortly after Mr. Davenport's election the harassing litigation about the new Bye-laws terminated, and the Council was once more at liberty to attend to the objects for which the Society was established—the promotion of facilities for acquiring knowledge, protection of the rights of members, and cultivation of harmony and a disposition to co-operate for the general good. In his annual address it was pointed out that the advanced position, increased public recognition, and improved educational status of the pharmaceutical body at that time had been the result of the well-directed labours of the Society, and afforded encouragement to persevere. Brief reference was also made in this presidential address to the Pharmacopœia Committee appointed by the Council of the Society during Mr. Deane's presidency. Prior to 1854 pharmacists as such had never ostensibly taken part in the preparation of a pharmacopœia in this country, for Richard Phillips, who had acted as editor of two editions of the London Pharmacopœia, had long ceased to be engaged in the practice of pharmacy when he undertook the work of revision.

In the fourteenth annual report of the Society (1854) it had been referred to as a source of complaint on the part of pharmaceutical chemists that the Pharmacopœia, by which they were expected to compound their preparations, was compiled without any appeal to their practical experience. It was also pointed out that "they frequently suffered inconvenience, and sometimes incurred discredit, in consequence of changes in the nomenclature and ambiguous terms introduced into that work; their daily manipulations at the counter and in the laboratory enabled them to point out such defects and occasionally to suggest improvements, and yet they were never officially communicated with on the subject." But, by the establishment of the Pharmaceutical Society, a remedy was provided for that anomalous position, and it was rendered possible for the services of pharmaceutical chemists to be called into requisition by the medical authorities entrusted with the compilation of pharmacopœias. Thus, in view of the publication of a new edition of the London Pharmacopœia, the College of Physicians made application to the Pharmaceutical Society for assistance, and on August 2, 1854, the Council of the Society constituted itself a Pharmacopœia Committee, with a working or sub-committee of seven members, afterwards increased to twelve, including the Secretary, Professor Redwood. Henry Deane was the first chairman of this sub-committee, and the work of revision was entered upon without delay. The first report was presented to the College of Physicians on April 2, 1856, towards the close of Mr. Davenport's year of office. Altogether, the proceedings of the committee—which included several active workers—extended over a period of six years, for though the Medical Act of 1858 delegated to the General Medical Council the duty of preparing a British Pharmacopœia, which should supersede the London Pharmacopœia, the Pharmaceutical Society was requested by that body to allow the work of its pharmacopœia committee to continue. The desire of the General Medical Council that this should be done was also formally indicated in a resolution passed at its first meeting, as will be related subsequently.

PHARMACEUTICAL ETHICS.*

BY DAVID STORRAR.

At the Pharmaceutical Conference meeting held in Glasgow last year a paper was read by Mr. Leo Atkinson upon "Pharmaceutical Ethics," and in summing up the discussion which followed, the President, Dr. Symes, said "it was a matter which was worth consideration whether a whole day at some future time should not be set aside for the purpose of such discussions. They were just approaching the opening sessions of all the provincial associations, and he did not see why a paper on the subject should not be read before every association, as well as at Bloomsbury Square, during the coming winter, when the whole matter might be thoroughly sifted."

I thought this suggestion of Dr. Symes so wise that, in a weak moment, I volunteered to read a short paper on the subject here to-night. I say advisedly that I did this "in a weak moment," because, although before I made the promise I had read and re-read the excellent paper by Mr. Atkinson, I had neglected to re-read the paper upon "Pharmaceutical Ethics" which was contributed by Mr. Joseph Ince to the Conference meeting in 1866.

I have re-read that paper since, and Mr. Atkinson is right in calling it a classic. In it, once and for all, Mr. Ince has in perfect language written all, or nearly all, which can be said upon the subject, and the wisest thing I could do would simply be to re-read the paper to you, as I have done to myself.

I cannot well do this, however, but at the same time I cannot say much that is original upon the subject of to-night's paper. No doubt most of you have heard the story of the popular preacher who neither thought his own thoughts nor spoke his own words on the Sabbath day, but built up a wonderful reputation for himself by delivering as his own mosaics composed of bits of other people's sermons. One old lady of his congregation found him out, however, and determined to teach him a lesson, so one day she planted herself in a prominent position in church, and as one eloquent passage after another was declaimed in the preacher's best manner, she remarked, audibly, That's Tillotson, that's Blair, that's Spurgeon, and so on.

At last the preacher got so annoyed that he turned to his tormentor and said, "If you don't hold your tongue I shall have you expelled by the church officer." "That's his own!" was the triumphant response.

In the same way, as I proceed to-night I shall fancy that I hear someone say, "That's Ince"; another, "That's Atkinson"; and a third, "That's Carteighe"; and only when something very commonplace and self-evident is said shall I hear, "That's his own."

From what I have said you will understand that I claim no special knowledge of this subject, and have no panacea for diseased pharmaceutical morals to bring under your notice. My sole object is to initiate discussion upon a subject important and interesting to us all, in the hope that such a discussion may help to ease the friction which modern business methods tend so much to increase.

Since Mr. Ince read his paper, the trade of pharmacy has changed much in character—changed in one way to the better, in another to the worse. In 1866 anyone could start in business as a chemist and druggist; it was a free trade, with no special legal restrictions. Two years later it was considered "expedient for the safety of the public" to render it unlawful for any person to keep open shop for the retailing or dispensing of certain scheduled poisons, or to use the title of chemist and druggist in any part of Great Britain, unless such person was registered as an examined and qualified man. This Act of 1868 was welcomed by pharmacists as not only required for the safety of the public, but as a distinct boon to the trade, carrying with it a certain amount of protection in return for the qualifications which the Act demanded. By-and-by, however, it was discovered that the proverbial coach and four could be driven through this Act as well as others, and that the principal protection it gives is to illegitimate, if strictly legal, trading, so that our strongest opposition now is from co-operative stores and limited companies, which do not even pretend to be composed of qualified men.

It is this state of things which makes the consideration of pharmaceutical ethics more important than ever it was. The question is simply this—How can we best do our duty to ourselves, to each other, and to the public, and at the same time uphold our position as members of a qualified profession against what we consider to be an illegitimate and unfair competition?

The primary question is, of course, what should be our ethical relation to each other, because not until we agree as to that can we hope to agree as to our conduct to those whom we rightly look upon as outsiders.

And first, I think that we ought to define what is meant by ethics. In its simplest form it can best be expressed in the words of the old proverb, "Do to others as you would that they should do to you."

As to pharmaceutical ethics—so far as pharmaceutical can be differentiated from other ethics—the best definition I have seen is that contained in a leading article in the Journal of 1853. It says: "There are in all professions certain rules of conduct, understood, if not actually agreed upon, among the members, a deviation from which is held to be unprofessional. These rules have no relation to the law of the land; they constitute a voluntary or self-imposed restraint, having for its object the elevation of the tone and character of those who are under their influence, and the maintenance of harmony and good order in the profession. It is to such laws which the term ethics is applied." In opening the discussion upon this subject, therefore, I shall largely confine myself to our duty to ourselves, to the public, and to our trade organisations.

1. *Our Duty to Ourselves.*—To the man who has entered into business with the sole object of making money I have nothing whatever to say. To discuss ethics with such a man is useless, as he does not understand the true meaning of the term. He may be "indifferently honest," and, in a sense, honourable and even charitable; but selfishness being the mainspring of his actions, he cannot consider his neighbour's interest as well as his own, which is the foundation of ethics.

It is, I am aware, almost farcical to suppose that, in these days, any sane man would take to pharmacy as a money-making profession, unless, of course, he has invented a pale powder for pink people or a catch-gull syrup, in which case a knowledge of pharmacy would be rather a drawback than otherwise. But even while one may not be able to sell his syrup—or the public—for a cool million, or, retaining the kernel in his own hands, transfer the shells to a confiding public for a consideration on the promise of 10 per cent. dividends, he may have all the will to do so. It is the motive not the result which is objectionable, and it is to the full as deteriorating to sell oneself for coppers as for sovereigns—and does not pay so well.

But while money-making should not be our sole aim in business, it is, and must always be, an important object. We do not "live laborious days" behind the counter simply for the fun of the thing. "The labourer is worthy of his hire," and we must "live to eat as well as eat to live." To make his business pay is every business man's primary object, and to do so honestly and with due regard to his neighbour and the public interest is the aim of every right-thinking man.

Our trade is a poor one financially, and can easily be made a petty one, but rightly pursued it is an honourable and useful calling. Pharmacy may only be the handmaid of medicine, but it can do much to help suffering humanity, and the man who follows it conscientiously and makes it his pride to send out and dispense good, honest, pure drugs is doing the world good service, and will continue to be recompensed for that service.

To secure that recompense, however, a man must be true to himself; he must assert his right to be looked upon as something more than a tradesman. He must lay claim to be something more than simply a seller of patent medicines and perfumery, or even of scheduled poisons. In dispensing he must insist upon payment for something more than the value of what he weighs out and measures, namely, the skill and experience required in so doing, and he must do so not only for his own sake, but for the sake of the profession to which he belongs. I cannot help thinking that for much of the depressed trade and diminishing profits from which we are suffering at the present time we have to blame our own faint-heartedness and want of trust in each other which has led the public to take us at our own valuation. We must uphold the position taken up by those who founded our Society upon the sure grounds of professional education and fitness, and to whom any corporate life or real union we possess is due.

Their action welded together a disunited trade into an organised and influential body, whose position is so recognised that the Government had no hesitation in entrusting to it large

* Read at an Evening Meeting of the Pharmaceutical Society in Edinburgh, on Wednesday, January 19.

administrative powers. Our first ethical duty, then, is to see that no individual action of ours will give away that position which has been secured to us. And we must not rest content with this, but let such of us try to add something, however little we may have the ability to add, to the efficiency and sum total of knowledge of that trade which we have chosen as our life-work.

(2) *Our Duty to Our Fellow Tradesmen.*—I am not Quixotic enough to argue that the interests of our neighbours should be our first consideration. That would be "magnificent but not war," and that we are more or less at war with each other to secure public favour is undoubted.

But while we are, in this sense, at war, we have a bond of union which should be stronger than the force which keeps us apart; a mutual interest which should at least induce us to fight fair. We have to serve the public, in some cases an exacting public, and when "One member suffers the whole body suffers with it." It is only a truism, therefore, that both upon the higher ground of fair and honourable dealing, as well as upon the lower ground of business policy, we should consider our neighbours' interest as well as our own.

This branch of our subject is a large one, and to treat it fully would require much longer time than I have at my disposal to-night.

One or two points only can be touched upon, and (1) there is the question of prices, or perhaps I should rather say of uniform prices, which has been a question of debate and, in some districts, of aspiration ever since I remember. Well, gentlemen, this is a difficult question, and one upon which I confess that I for one have changed my mind. I thought, and still think, that in certain limited districts and in the smaller towns it is possible and even desirable that an understanding as to prices should be come to, but any general agreement would be unworkable. As Mr. Ince pointed out in his paper—which is as true now as it was then—environment, which means the greatest possible difference in rents, rates, and general expenses; the nature of the trade, whether cash or credit, and the class of customers, whether rich or poor, make it impossible to fix a hard and fast scale.

That the same courtesy, attention, and care for their interests should be given to the poor as to the rich goes without saying, but those tradesmen who are forced to carry on their businesses in expensive districts for the convenience of their customers are entitled to be recompensed for the additional expenditure entailed upon them for so doing.

But while any general scale of dispensing charges is, I am afraid, impossible, more especially with our present surroundings, there are certain general ethical principles in relation to the question of prices which we ought to practise. There is, for instance, the principle which I have already referred to—that while the selling of drugs is a trade, the dispensing of medicines is an art or profession for which special education and training is required, and for which the dispenser ought to be paid over and above the selling price of the drugs used. Then again, while a man cannot be blamed for adhering to his own price-list, if founded upon the above principle, he is hitting below the belt when he knowingly and for selfish reasons deliberately cuts in price below his neighbour. It is surely possible to fix at least a point below which a man should not go without being held as not only unjust to his neighbours, but to himself and his profession.

Mutual Accommodation.—This is a question which affects those of us living in small towns more than you who live in a city such as this, where you have so many wholesale houses to draw upon. I am happy to have the opportunity of saying publicly that my experience has been most gratifying. Although I have been over thirty-five years in business I have never once been refused, or had a suspicion of being refused, by a neighbour the supply of anything of which I had run short, and which he had in stock. I am told, however, that this is not a universal experience, and would ask, Why should it not be? Opposition, like the poor, we shall always have with us, and we need not add to the unavoidable worries of life those which are avoidable. And it appears to me that not only are mutual obligation and help required by ethical considerations, but by good business policy. In these days of limited companies with large turn over and large capital enabling them to buy on the best terms, much could be done by legitimate traders to assist each other in holding their own if their policy was combination instead of isolation.

And lastly, under this heading there is the question of assistants and apprentices. It is unfair, as well as illegal, to work a business entirely with unregistered men, and it is also unfair to flood the trade with an unnecessary number of apprentices, and more especially with lads whose education is so insufficient as to handicap them in their attempts to pass the examinations.

I do not mean to assert that there is a great deal of this sort of thing going on, but it does exist, and in these days of keen competition the temptation to it is great, for the purpose of keeping down expenses. A very little consideration, however, will show that it simply aggravates the evil of competition. It is the imperfectly educated apprentices who swell the ranks of failures for the Preliminary and qualifying examinations; it is from these failures that the promoters of bogus companies are recruited, and it is from these companies, conducted upon purely trade and money-making lines, that our keenest opposition comes. Might I add that a good preliminary education is only the foundation upon which the future training must be built up, and that, therefore, another very evident duty of those who have the true interests of the trade at heart is to see that their apprentices receive that training which is necessary to turn them out as efficient assistants.

(3) *Our Duty to the Medical Profession and to the Public.*—Our duty is to dispense medicines, not to prescribe them, and in return we claim from our medical friends a recognition of the converse—that their special duty is to prescribe, and not to dispense.

Of course, this is a general rule which cannot be too rigidly enforced, and must be interpreted in a common-sense way. It would be absurd to refuse to the pharmacist who has some knowledge of remedies what is claimed by every old wife in the country who has none—the right to recommend simple remedies for simple complaints, the right to sell to a customer a liver pill or a bottle of cough mixture; but he goes out of his province when he attempts to diagnose disease, for which he has had no training. For the pharmacist to do this is simply quackery. Then again, it would be against public interest and convenience to prevent medical practitioners in country districts dispensing their own prescriptions.

It is very evident, however, that where both are available the interests of the public lie in separating the duties. If, on the one hand, the pharmacist is untrained in the recognition and treatment of disease, on the other his knowledge of pharmacy is greatly in excess of that of the average medical man.

Living as we do in the east of Scotland, where, happily for us, prescribing and dispensing are, in the main, recognised as separate professions, we have a difficulty in realising how burning a question this is in certain parts of the country, where some of our best men are forced to prescribe in order to make a living. It is satisfactory to know, however, that the recognition of pharmacy as a distinct profession is slowly but surely making its way, and that its rights as such are more and more being recognised by the medical profession.

I think that our duty to the medical profession and the public may be summed up under three headings: (1) that no drug or remedy be taken into stock or sold which is not absolutely genuine, and no preparation made or kept which is not prepared strictly according to the recognised standard; (2) that in dispensing the most rigid adherence be given to the directions of the prescriber; and (3) that no deviation be made from the prescriber's instructions without previous consultation with him—if that is at all possible—and without noting such alteration upon the prescription.

Is it necessary to say a single word in support of these propositions? I think not. They are only those which are acted upon by every self-respecting pharmacist.

To act strictly up to these rules is becoming more difficult every day on account of the ever-increasing number of special preparations which are being pressed upon the notice of medical men. These are largely—much too largely, many of us think—taking the place of the authorised preparations of the Pharmacopœia, and they are becoming the bane of every dispenser. He is called upon to dispense D's capsules or E's liquor, which he does not stock; but he does stock A's, B's, or C's, which he knows to be equally good and is sorely tempted to send out. His duty, however, appears to me to be perfectly clear. In this instance D added to the name of the preparation carries with it as much weight as the magic letters B.P.

(4) *Our Duty to Our Trade Associations—Both Local and National.*—This is the last point upon which I shall speak, and it is one of the most important. A due fulfilment of our ethical obligations is by no means easy. It is our duty, for instance, to love our neighbour, but it is difficult to do so when we only see him

occasionally, and that through the plate-glass window of an opposition shop. The case becomes very different when we meet as fellow members of a local association.

We may realise, and I believe that most of us do realise, that we owe a duty to the trade to which we belong, and we strive to perform that duty, but it is more or less of a task. But when we band ourselves together into local associations that duty becomes in most cases a pleasure. Even when we throw physic to the dogs, and join together into pharmaceutical golf, cricket, cycling or fishing clubs, the benefit is an unmixed one. We find that our neighbour is something more than an opposition tradesman; he is a man, and as often as not a jolly good fellow as well. Let us cultivate the social element, therefore, as much as we can, as it breaks down that petty jealousy of each other, and that want of unity which has hitherto blocked the way to all pharmaceutical progress as a trade or profession.

It is, however, the support of local pharmaceutical associations pure and simple which I would urge upon the trade. We all know the old proverb about the bundle of sticks. Individually they can be broken easily; bound together they are unbreakable. I have a healthy disgust at the abuses of trades unionism and of the policy of some trades unions, but have a thorough belief in the wisdom and necessity of the principle underlying these. By united action we not only acquire the power to help customers and each other, but by comparing notes and by encouraging study, experiment, and research, we can do much to raise the status and efficiency of the trade to which we belong, which is the only true progress. And what I have said of local associations applies, it appears to me, with still more force and truth to the Pharmaceutical Society. The Society can never be, in the strict sense of the term, a trade society. Its constitution and the duties assigned to it by the State prevent it being so. as it must hold the balance even between public and trade interests. It is, however, the only national trade society which can live, and to it our present position as a qualified and trusted profession is due. Surely, therefore, it is the evident duty of every member of the trade to give to this Society his support, and all the more is this the case if he has disapproved of its policy hitherto, as it is only by becoming a member that he can in any way control that policy. Let us hope, therefore, that the proposed widening of the doors of entrance to membership will be fully taken advantage of.

And let me say a single word in the way of appeal for support to the Benevolent Fund of our Society. Surely if any ethical obligation rests upon us to give fair-play to those who are straining shoulder to shoulder with us in the race of professional life, the obligation to help those who have fallen by the way is tenfold stronger.

The help given by the Benevolent Fund is not confined to those who are or have been connected with the Society, or to those who have been subscribers to the Fund. It is given freely and impartially to all who require it whose names are on the Register or to their widows or children. No part of the work of the Council has interested me more than this, and I can testify that no part of the work is done more conscientiously or has done more good. But how much more could be done were the ethical obligation to support this Fund more universally realised and acted upon by the trade!

This finishes my paper, in which I have tried to put before you my view of pharmaceutical ethics. I know that my statement of these views contains little that is new, but it may serve to introduce the discussion which is to follow. How can one expect to say anything new upon ethics, the principles of which are as old as the world itself, and the foundations of which are laid in our own consciences? Let us build upon that foundation and there will be little to find fault with in the superstructure.

SALOL IN TYPHOID.—Dr. Herbert Bramwell has obtained the most gratifying results with salol in the treatment of typhoid during the past ten years. In several slight cases the attack was completely aborted and convalescence established in the course of a fortnight, while severe attacks have been so far modified as to pass through a mild and uncomplicated course of three or four weeks' duration. Salol should be given in the powdered form and not compressed, as in that state it frequently passes through the bowels unchanged. Doses of 5 to 10 grains every four hours are given until the urine is tinged; the dose is then diminished, the drug being continued in just sufficient quantity to maintain a faint tint in the urine.—*Brit. Med. Journ.*, 2, 97.

MEETINGS OF SCIENTIFIC SOCIETIES

CHEMICAL SOCIETY.

At a meeting held on Thursday, January 20, Professor DEWAR, President, in the chair; after the minutes had been confirmed and certificates of candidates for membership read, the PRESIDENT announced that a meeting of the Committee had been held in the afternoon to consider a memorial presented by Messrs. Arthur Harden and Philip Hartog. This memorial, which had been signed by 500 members of the Chemical Society, requested that by the

Alteration of Bye-law V.

members residing at a distance from London might have the power of giving their votes at a meeting without attending it. Legal advice had been taken by the Council, and Mr. Cozens-Hardy, Q.C., had given the opinion that they had no authority under their Charter to alter this bye-law.—The first paper read was by BEVAN LEAN, D.Sc., B.A., and W. H. WHATNOUGH on

The Preparation of Pure Iodine.

Stas had described two methods of making pure iodine, but the authors had found no account of how he had assured himself of the freedom of his product from chlorine and bromine. It was difficult to free it from water, calcium nitrate being the only substance which did not give an impurity to the iodine. Having noticed that while cuprous iodide gives off no iodine when heated either *in vacuo* or in carbonic anhydride, but does so readily when heated in a stream of nitric oxide, the authors proposed to utilise this method for obtaining pure iodine. Although cuprous iodide could be obtained pure in several ways, the importance of having it free from chloride and bromide had induced the authors to prepare it by throwing iodoform upon copper turnings heated in a crucible. The cuprous iodide is heated at as low a temperature as possible in order not to volatilise the compound, but as iodine is given off freely at 220°, while cuprous iodide volatilises only at about 600° to 700°, there is no difficulty in keeping the temperature well within limits. The decomposition of the cuprous iodide is almost quantitative, but it was found that after heating to 400° for eighteen hours there still remained ·15 per cent. of unaltered cuprous iodide. The reaction, it appeared, was independent of the presence of moisture, and could be carried out in a stream of air dried with calcium chloride and sulphuric acid. The iodine thus obtained volatilised without leaving any residue at 70°, and when mixed with coal gas and burnt it gave no indication of the presence of copper in the spectrum. The authors believed this to be perfectly pure, and suggested its use for a redetermination of the atomic weight. Some discussion took place, in the course of which it was stated by one member that besides calcium nitrate, Stas had used baryta to purify his iodine in order to free it from an important impurity, namely, hydrogen iodide. There could be no doubt as to the purity of Stas's material, the numbers he obtained with iodine made by two methods agreeing to seven places.—The PRESIDENT asked why palladium iodide should not be used for the purpose. Commenting upon the accuracy of Stas's work, he remarked that quite recently another striking instance of it was brought to his notice, namely, the fact that iodine when pure is black and opaque.—A paper, by J. T. HEWITT, M.A., D.Sc., and F. G. POPE, was next read on

Derivatives of 1, 3, 6 Bromtolylhydrazine.

This work was a continuation of what was begun five years ago. The object sought was to eliminate the bromine atom with a hydrogen atom in the side-chain, and so produce a closed ring compound. Victor Meyer's method of preparing the hydrazine was preferred to that of Bamberger. Several derivatives were made, the description of which was given in the paper, but not read. Among them were acetyl compounds, semicarbazides, and hydrazones. Isomers of phenyl-bromtolyl thiosemicarbazide probably exist. It appears also that there are two forms of the hydrazones of benzaldehyde and furfuraldehyde. There was no discussion upon this paper, and a vote of thanks to the authors was carried unanimously. The result of the ballot for the election of foreign members was then declared. All were elected, the names of whom are:—S. Arrhenius, T. Curtius, A. P. N. Franchimont, W. Körner, W. Markownikoff, N. A. Menschutkin, H. Moissan, W. Ostwald, F. M. Raoult, T. Remsen, W. Spring, L. J. Troost, P. Waage, and

J. D. Van Der Waals. The next paper was by J. ADDYMAN GARDNER, M.A., and G. B. COCKBURN, B.A. It was entitled

Researches on Terpenes II., The Oxidation of Fenchene.

The reader briefly summarised the work done, alluding only to one or two results. They found that fenchene had a rotatory power of $-6°{\cdot}46$, whereas Wallach had stated it to be inactive; it had also a lower boiling point than that assigned by Wallach. The production of camphopyric acid brought out a strong relationship with camphene, and would perhaps throw some light upon the relative values of Bredt's and Tiemann's formulæ, but the authors did not enter upon the theory.—A vote of thanks to the authors was unanimously passed. Many of the members were now leaving to attend a meeting of the Royal Society, and the meeting was therefore brought to an early close. The following papers were taken as read:—"The Action of Caustic Alkalies on Amides," by Julius B. Cohen, Ph.D., and E. Brittain, B.Sc.; "The Formation of Monomethylamine from Dimethylamine," by J. B. Cohen, Ph.D., and H. T. Calvert, B.Sc.; "Note on the Aluminium Mercury Couple," by the last-named authors; "Action of Chloroform and Alkaline Hydroxides on the Nitro-benzoic Acids," by W. J. Elliott, M.A.,

ROYAL INSTITUTION.

At the first of the series of Friday evening meetings, held on Friday, January 21, a lecture was delivered by the Right Hon. Sir JOHN LUBBOCK on—

Buds and Stipules.

The lecturer said he had hoped that the opening lecture would be given by Lord Rayleigh, but he was still away in the East. He was at a disadvantage in not having the specimens for illustration, which could have been obtained in April or May, but through the mildness of the winter he had still been able to procure several. Some years ago his attention had been drawn to the great variation in the stipules of plants very nearly allied, and with the help of his assistant, Mr. Frazer, he had since studied the subject extensively. The lecture was profusely illustrated with diagrams, the first of which showed the origin of the leaf in the growing point. Buds were protected in very different ways. They are variously covered by older leaves, scales, felted hairs, or gum. In countries where the climate varies greatly with the season the protection is very complete, while in the tropics where the climate changes little the buds are protected merely by the older leaves of the plant. *Uvaria purpurea* shelters its buds from the scorching heat of the sun in this way, as also does the begonia, a fact that probably accounts for the peculiar shape of the leaf of the latter. In other cases protection is afforded by the petiole as in the walnut. In *Actinidia* there is in addition to the petiole a special outgrowth that helps to protect the bud. In the plane the bud lies ensconced in the stalk of the leaf, which covers it like an extinguisher, but when the leaf falls in autumn, the bud is exposed, but other plants like the syringa show a cleverer arrangement. Here the petiole springs off higher up, so that when the leaf falls the petiole parts above the point of its attachment to the stem, the lower part remaining to protect the bud. The barberry has three spines corresponding with a leaf and two stipules, but this is to guard the bud from animals. The importance of protection against cold was shown by a diagram of an expanding bud of the tulip-tree, where the two leaves sheltered by the outermost pair of scales had withered, while those that had had the protection of an additional pair of scales within the first were vigorous. A diagram showing the bud of *Bucklandia* was interesting, as affording the only instance the lecturer knew of a petiole being folded in the bud. The bud of the alder is covered by a complete leaf blade and two stipules, while that of the maple differs from it in being covered by a scale that is a leaf base. Moreover, instead of dropping off they expand and become coloured, and sometimes, as in the Norway maple, leaves grow out from the ends of the scales. The bud of the ash is interesting; its scales have fingers at the extremities which represent leaves. Their black colour is due to a coat of closely-set hairs. In spring the black colour is replaced by green owing to the growth of the tissue without a corresponding increase of the hairs. An interesting contrast is shown between *Magnolia tripetala* and *M. conspicua* in the behaviour of their stipules. Those of the latter fall while the stipules of the former, which appears to be a more highly developed plant, remain as a protection to the young bud. The scale on the bud of the lilac and willow is itself a leaf, and by closely related intermediate forms the two forms merge gradually into one another. The lime is remarkable in that its bud scales are formed of the stipules of the leaves contained in the bud. They are brilliantly coloured, and in expanding exhibit a feature common to many plants in hanging vertically for a time until hardy enough to take the natural exposed position. For a similar reason those of the whitebeam are turned upwards. The bud of the beech resembles that of the lime, but is more complicated. That part where there were stipules and no leaves does not elongate, so that the beginning of every shoot is marked by a number of close rings, which are persistent for, in some cases, even twenty-five years. That of the oak is still more complicated. There are as many as forty coverings to be removed before the leaf is laid bare. In this case the scale is a single stipule, but in the elm, which has a similar arrangement, each scale is formed from two stipules grown together. In the hop, again, where the leaves are opposite, the pairs of stipules that grow together do not belong to the same leaf, but each to one of the opposite leaves. The scales are thus seen to represent very different parts of the plant. In alpine regions, with their coat of hairs, they serve to keep off moisture, while in the dry desert they exert a directly opposite influence in preventing the plant from transpiring too freely. They also serve to protect the bud from caterpillars, and, lastly, acting like a great coat in this country, they keep the bud warm. Some hairs are filiform, but others are glandular, as instanced by the flowering currant. Many secrete gummy matter, and the lavender, that is so pleasant to the smell, is found to be decidedly unpleasant to taste; hence it is protected from browsing herds. The bud of a certain plant is defended from other insects by a species of ant that makes its home in it and lives upon the secretion. Stipules have other various functions They may become cup-shaped leaves when they store up rain water for the plant's advantage. Again, in the *Polygonums*; he stipules form a support to the growing joint. Although the variation in stipules is not so great as in leaves, there is still a great variety. Some species of *Lathyrus* have broad stipules; others have narrow ones. A similar variation is shown in the flower-heads of the red and white clovers, and the reason for it appears on examining the flower-heads. The buds of the red clover remain almost sessile, while those of the white clover spring out on a fairly long stalk, so that wide stipules would be useless to the latter, the narrower ones offering sufficient protection to the bud while young. In the bud of the Scotch fir we have a number of brown leaves enclosing some green ones belonging to the next summer but one. That the bud has a direct influence on the form of the leaf is shown by several considerations. The kidney-shaped first leaves of mustard and cress are differently shaped from the leaves produced after, and the reason is to be traced directly to the fact that the leaves must conform to the shape of the seed. Why the wallflower has not also two kinds of leaves is, of course, because its leaf is not folded in the seed. The same considerations apply to the saddle-shaped leaf of the tulip-tree. The lecturer, after close examination, had satisfied himself that the form of the leaf is due to the peculiar arrangement of the leaf in the bud. The stipules fill up one part of the bud, the stalk occupies another, while the leaf-blade fills the remaining space. Diagrams illustrating this arrangement were shown. Lastly, a description of the circumstances attending the fall of the leaf were given. The chlorophyll is too valuable a substance to be thrown away, and is, therefore, withdrawn from the leaf through the stalk. The process is one not of death but of life; a fresh layer of cells is produced at the base of the leaf, by which it is cut off, and thus a dead branch that does not produce this layer of cells does not shed its leaves.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

The Mayor and Mayoress of Bristol (Sir Robert and Lady Symes) and the local Executive Committee having charge of the arrangements for the Bristol meeting next autumn of the British Association for the Advancement of Science last week gave an interesting conversazione, which was attended by a large and influential committee. The Committee had been most liberal with their invitations, and they met with most generous response, the gathering being the largest of its kind that has assembled in the Victoria Rooms, Bristol, for a long time. Sir William Crookes, the President-elect of the British Association, was among those present, and the Mayor extended to him a cordial welcome. Sir William Crookes, in acknowledging the Mayor's welcome, said if the success of that gathering was an augury of the success of the meeting of the Association in September next, he thought they should have a very pleasant and successful conference.

NOTICES OF BOOKS.

THE 'ELEMENTS OF LATIN,' by G. D. Crothers, A.M., M.D., and H. H. Bice, A.M. (Philadelphia, U.S.A. : F. A. Davis Company, 1914-16, Cheny Street. Flexible Cloth, $1·25 net) is a book for the use of students of pharmacy and medicine, designed to present within the briefest possible compass those principles of Latin etymology and construction which are essential to an intelligent use of the terminology of pharmacy and medicine. Special features of the work are that the simple sentence is used exclusively in the exercises ; parts of the verb not essential to the study of pharmacy and medicine are omitted ; the subjunctive present—in the Hortative or Jussive sense—alone is used ; and there are two independent sets of exercises in each chapter—one pharmaceutical, dealing more especially with medicaments, the other medical and surgical, containing anatomical and pathological terms. In addition, some of the exercises treat of special subjects, such as the eye, the ear, obstetrics, etc., and there is a chapter on prescription-writing. More than forty pages are devoted to detailed descriptive notes on the exercises, following which are tables of declensions and conjugations, a list of anatomical equivalents in English, Latin, and Greek, a table of Greek prefixes and suffixes, and a list of anatomical proper names and their origins. Finally, a very full general vocabulary precedes a usefully arranged index. The book is beautifully printed, well arranged, and should be found of the greatest value by all pharmaceutical and medical students.

'OUTLINES OF RURAL HYGIENE,' by Dr. H. B. Bashore, comes from the same publishers (Extra Cloth, 75 cents net), and treats of water supply, disposal of waste, the soil, habitations, and disposal of the dead, whilst an essay on the normal distribution of chlorine forms an appendix. The book has been written for the guidance of persons living in districts away from large towns in the hope of aiding in the diffusion of sanitary knowledge where it is most needed. For that purpose it should prove extremely useful.

THE 'TUTORIAL CHEMISTRY,' by G. H. Bailey, D.Sc., and William Briggs, M.A. (London: W. B. Clive, 13, Booksellers' Row, W.C. Cloth, 3*s.* 6*d.*), is now complete, the volume on the non-metals, which was favourably referred to some time ago, being now supplemented by part two, dealing with metals. Numerous as students' manuals on the subject are, certain advantages attach to this work and fully justify its existence. Thus considerable prominence is rightly given to chemical physics, the earlier chapters being devoted to the determination of atomic weight, the relations between atomic weights, the constitution of gaseous and liquid compounds respectively, solution, and the nature of the chemical reaction. Then follow chapters on the alkalies, alkaline earths, the magnesium group, the aluminium group, etc., the elements being considered in the order suggested by the periodic system. The characteristic properties of each family are summarised so as to bring out the relationships which exist between the different members of the same family, and thus represent the whole of the chemical elements in a continuous series. Crystallisation and crystallography receive attention in an appendix, as also does spectrum analysis, both these sections being freely illustrated. A third appendix consists of a list of experiments selected to illustrate the text. The merits of the plan on which the book is arranged are undoubted, and the work should commend itself to all students of chemistry.

'INTERMEDIATE ALGEBRA,' by William Briggs, M.A., and G. H. Bryan, Sc.D., F.R.S. (London : W. B. Clive. Cloth, 3s. 6d.), is another work in the "Tutorial Series" which is of more especial interest to those readers of the Journal, and they are numerous nowadays, who are taking an advanced course of mathematical studies preparatory to taking a degree at the University of London. It is a marvellously low-priced book, probably on account of the fact that it is an adaptation of another work—the 'Algebra of Radhakrishman.' The book published by Professor Radhakrishman, a native of India, has been adapted because it possesses peculiar excellences, "the outcome of an intelligent digestion of the best English authorities, particularly of Dr. Morgan, Clifford, and Chrystal." A knowledge of the more elementary properties of quadratic equations and progressions is assumed on the part of students commencing to work with the 'Intermediate Algebra,' but otherwise they will find it contains all they require in the subject of examinations such as the Intermediate B.A., or B.Sc., of the University of London.

'SCIENCE PROGRESS' commences the second volume of the new (quarterly) series with the current issue, and the contents of the number are as varied and solid as could well be desired. Anthropometry is explained by Professor A. C. Haddon, the extent to which Oxford has influenced the history of geology is considered at length by Professor W. J. Sollas, whilst W. Bateson and J. L. Myres continue their respective articles on "Progress in the Study of Variation," and "Prehistoric Man in the Eastern Mediterranean." Metamorphosis in plants receives attention at the hands of Professor S. H. Vines, the bacillus of plague is discussed by Dr. G. A. Buckmaster, and the problems involved in the secretion and absorption of gas in the swimming-bladder and lungs are treated by J. S. Haldane. It is unnecessary to say more than that the fare offered is as good as it is adapted to a variety of tastes.

A 'REPORT UPON THE ESSEX FIELD EXPERIMENTS' carried out for the Technical Instruction Committee of the Essex County Council during 1896-97, has been compiled by T. S. Dymond, the Staff-lecturer in Chemistry, who was formerly on the teaching staff of the School of Pharmacy. The experiments referred to have been conducted during the past two years, and are of four kinds—1. Manurial trials on beans followed by wheat ; 2. Manurial trials on permanent pasture ; 3. Experiments on laying down land to grass ; and 4. Manurial trials on oats followed by mangolds. Their object was to afford a practical demonstration of the principles of manuring, whilst also determining how those principles can best be applied under the particular conditions of soil and climate found in Essex. Detailed results are given, and it is stated that further experiments are proceeding.

THE 'FORMULAIRE DES MÉDICAMENTS NOUVEAUX' for 1898, by H. Bocquillon-Limousin (Paris : J. B. Baillière et Fils. Cloth. 3 francs), is as prompt in appearing as usual, and it is needless to say that it is brought well up to date. Amongst other medicaments, of more or less recent introduction, are mentioned the following, very full particulars of which are given :—Cacodylic acid, cardol, chetidonine, chinaphthol, chrysoidine, eucaine, ferro-somatose, heparadine, holocaine, ichthyalbin, mydrol, protargol, tannalbin, and numerous other synthetic remedies, as well as many of animal origin. As on former occasions when this work has been mentioned in these columns, it is recommended as a most useful work of reference on matters concerning the newer remedies, and the fact that it is printed in French should not deter British pharmacists from attempting to utilise it.

A KEY TO PRINCIPAL PLANT SUBSTANCES.*

BY RODNEY H. TRUE.

The following key is an attempt to arrange for ready use in the laboratory the simpler methods of identifying the commoner plant substances. The device that has proved of service in the identification of plants seemed to the compiler capable of adaptation to the present case, and an experimental trial of this key in laboratory practice during the past two years has seemed to confirm this thought. Standard works on micro-chemistry were used in the preparation of the following, and no claim to originality in subject-matter is made.

The manner of use is so simple that explanation seems hardly necessary. Confirmatory reactions, referred to in the key by numbers in parentheses accompanying the names of the substances, are appended and should be made use of.

One direction must be strictly observed. Each separate reaction demands a fresh section and a clean side and cover-glass.

Zinc Chloriodide.

A. i. Colour red.
  B. i. Cell contents ..... Tannin. (1)
  B. ii. Cell walls ..... Lignin.†
A. ii. Colour brownish, cell contents ..... Protoplasm and proteids. (2)
A. iii. Colour blue.
  B. i. Amorphous mass ..... Plant mucilage. (3)
  B. ii. Granular cell contents ..... Starch.
A. iv. Colour violet.
  B. i. Cell walls ..... Cellulose.
  B. ii. Cell contents ..... Tannin. (1)
A. v. Colour yellow.
  Phloroglucin and HCl.
  B. i. Rose-coloured walls ..... Lignin.
  B. ii. Uncoloured.
    C. i. Unswelled cell walls ..... Suberin. (4)
    C. ii. Swelled cell walls or amorphous.
      D. i. With iodine and H_2SO_4, blue ..... Plant mucilage. (3)
      D. ii. With iodine and H_2SO_4, yellowish or brownish ..... Proteids and Protoplasm. (2)
A. vi. No colour reaction.
  Trommer's reagent. (10)
  B. i. Orange-brown precipitate formed (Cu_2O) ..... Dextrose.
  B. ii. Deep violet colour, no precipitate ..... Cane sugar.
  B. iii. No visible reaction.
    Tincture of alkanet.
    C. i. Red cell contents ..... Resins. (5)
    C. ii. No visible reaction.
      D. i. Crystalline bodies.
        E. i. Crystalline masses, rounded ..... Inulin.
        E. ii. Crystals distinct, not rounded.
          F. i. Dissolves in HCl without effervescence.
          Treat with dilute neutral $AgNO_3$.
            G. i. Assumes yellow colour ... Calcium phosphate. (6)
            G. ii. Does not assume yellow colour .. Calcium oxalate.
          F. ii. Dissolves in HCl without effervescence ... Calcium carbonate.
          F. iii. Dissolves in HCl little or none.
            (Seldom present in plants.) ..... Calcium sulphate.
      D. ii. No crystalline bodies.
        E. i. Soluble in cold absolute alcohol, ropy masses .. Volatile oils. (7)
        E. ii. Insoluble in cold absolute alcohol.
          F. i. Soluble in ether, spherical masses .... Fatty oils. (8)
          F. ii. Insoluble in ether.
            G. i. Incinerating without ash ..... Gums. (9)
            G. ii. Incinerated, leaves ashy skeleton ..... Silica.
              (Treat with HCl to remove Ca salts.)

CONFIRMATORY REACTIONS.

1. *Tannins.*—In sections not wetted either with water or alcohol, when placed in ferric sulphate, tannins take on a deep blue or deep green colour.

2. *Protoplasm and Proteids.*—In Millon's reagent, a rosy-red colour appears after a time, especially after warming. Millon's reagent is mercury dissolved in its own weight of conc. nitric acid, the solution then diluted with an equal volume of distilled water. Reagent to be used when fresh.

3. *Plant Mucilages.*—Usually swell in water. Iodine and H_2SO_4 give either a blue or a violet-brown colour.

4. *Suberin.*—Insoluble in conc. H_2SO_4. In boiling KOH, ochre-yellow, granular masses are exuded. Stains blue in aniline violet, especially plainly when colour is drawn from non-lignified tissues by use of acidulated alcohol.

5. *Resins.*—In sections mounted in water and not previously exposed to alcohol or glycerin, after several days' treatment with copper acetate an emerald green colour appears. Hanstein's aniline violet stains resins blue.

6. *Calcium Phosphate and Oxalate.*—Test does not exclude salts of other bases, but these rarely occur in plants.

7. *Volatile Oils.*—In sections not previously treated with alcohol or glycerin, these stain red in alkanet tincture. Distinguished from resins by copper acetate reaction (see 5 above).

8. *Fatty Oils.*—Treat section with conc. sulphuric acid and oil drops collect, becoming larger and more conspicuous.

9. *Gums.*—Usually swell in water. Not coloured blue by iodine and sulphuric acid.

10. *Trommer's Reagent.*—A moderately thick section is placed for from two to ten minutes in a conc. solution of copper sulphate, Surface then quickly rinsed off with distilled water; section then transferred to a boiling mixture of equal parts by weight of water and KOH.

* From the *Pharmaceutical Review.*

† See for confirmation, test with phloroglucin and HCl.

ORTHOFORM.

Orthoform is a substance discovered by Einhorn and Heinz in the course of an investigation undertaken to discover a chemical compound having the anæsthetising properties of cocaine without its toxic properties; thus these investigators worked in the same direction as Merling, who discovered eucaine. Reflecting that many bodies in the aromatic series, *e.g.*, methyl blue, possessed anæsthetising properties, Einhorn and Heinz directed their attention to the hydro-aromatic group of molecules comprised in that of cocaine, hoping to find therein the seat of the anæsthetic power of the drug. In the research many compounds were synthetised, all possessing more or less of the desired physiological action. H. Neumeyer (*Münch. Med. Woch.*, Nov. 2, 1897) found that two of the synthetised bodies were more powerful than the rest. These were *p*-amido *m*-oxybenzoic methyl ester or orthoform and, almost equivalent to it, *m*-amido *p*-oxybenzoic methyl ester. Both substances have a slight basic reaction, and are but slightly soluble in water. Their salts, especially the chlorides, are easily soluble. Neumeyer found their action on painful tubercular ulceration of the larynx, the persistent pain and its increase on swallowing, were removed on insufflating about 0·2 Gm. of powdered basic orthoform or its hydrochloride. Relief was felt in from 10 to 15 minutes, and lasted for 12 to 24 hours. Similar results were obtained in cases of cancer of the tongue, in ulcerative stomatitis, and other painful conditions.

Neumeyer tried both orthoform and the *m*-amido *p*-oxybenzoic acid methyl ester in a concentrated solution on the hypertrophoid mucous membrane of the nose before using the cautery, but no anæsthesia resulted, whilst cocaine subsequently produced complete anæsthesia. Thus orthoform does not appear to act on an unbroken mucous membrane.

In a case of gastric ulcer Neumeyer found that 0·25 Gm. of orthoform in 20 Gm. of water gave freedom from pain for 3 hours, and this same effect was observed in 4 successive days, and on the fifth and sixth days, orthoform being withheld, the pain returned. After the sixth day the pain was annulled for periods varying from 3 to 6 hours, according to the dose. In other cases of gastric ulcer, and in a case of cancer of the stomach, the drug had a similarly satisfactory result. Injected in a 5 per cent. solution into the injured urethra of a boy, pain was removed and catheterisation was rendered easy. Tried for neuralgias of various kinds, *e.g.*, sciatica, headache, and the lightning pains of tabes, it was found to have no effect when given internally in doses of 2 to 3 Gm. whether as base or salt. Thus Neumeyer concludes that orthoform only acts locally on nerves exposed in ulcers, wounds, burns, etc.

Orthoform does not appear likely to replace cocaine, but it can be used in addition to it. Thus, whilst cocaine will give anæsthesia of short duration in intact mucous membranes, orthoform gives analgesia of long duration in broken or ulcerated surfaces. Neumeyer took doses of from 3 to 4 Gm. without experiencing any toxic effect, nor were any bad local effects observed. Slight smarting of short duration was mentioned in some cases where the hydrochloride was used. In the mouth, whilst pain was removed, the senses of touch, temperature, and taste were unaffected.

The base and its salts have similar actions. The former is indicated when slow solution, and long action is required, and also on painful wounds.

SULPHOBORIC ACID.—This acid is said to be similar to sulphuric acid, but more safe to handle and slower in action. It is prepared as follows:—150 grammes sulphuric acid are stirred in very gradually with 150 grammes pure boric acid, and the paste set aside for 2 or 3 days. It is then powdered and slowly mixed with 450 grammes sulphuric acid. On heating the resulting milky solution till clear, the acid is then ready for use.—*Pharm. Centr.*, xxxviii., 664

THE STUDENTS' PAGE.

EXPLANATORY NOTES ON THE B.P.

SALICIN.—When salicin is boiled with dilute sulphuric acid it undergoes hydrolysis, *i.e.*, a molecule of water is taken up with decomposition of the substance into simpler bodies—in this case two, viz., glucose and saligenin. This reaction is typical of all glucosides, to which class of substances salicin belongs, the name glucoside being derived from the fact that when hydrolysed glucose is always formed, the other substances produced simultaneously being of course different with each glucoside. Since the glucose may be detected by means of Fehling's solution, this hydrolysis with dilute acids forms a general test for all glucosides. In performing the test the substance to be examined should be boiled for three or four minutes in water *acidulated* with sulphuric or hydrochloric acid. Almost any acid will effect the same change, only not so rapidly as the two acids mentioned. After boiling, the fluid should be neutralised or made slightly alkaline with potash or soda, a little Fehling's solution added, and boiled again. Presence of glucose will be indicated by reduction of the Fehling's solution (potassio-cupric tartrate) with precipitation of red cuprous oxide, Cu_2O. It is advisable to neutralise the fluid after boiling because the reaction between glucose and Fehling's solution, as described, only takes place in alkaline solution, and sufficient acid may be present to neutralise the alkali contained in the Fehling's solution added. If only a small quantity of glucoside be taken sufficient glucose may not have been produced to reduce all the cupric salt in the Fehling's solution added; in this case the fluid remains blue, and renders difficult the detection of the correspondingly small quantity of cuprous oxide produced. This may, however, be accomplished by setting the test-tube aside, when even a very small quantity of cuprous oxide will form an easily discernible orange-red layer on the bottom of the tube. Saligenin, the other product of hydrolysis, is interesting on account of its relationship to salicylic acid. It is ortho-hydroxy-benzyl-alcohol, $C_6H_4(OH)(CH_2OH)$, salicylic acid being the corresponding ortho-hydroxy-benzoic acid, $C_6H_4(OH)(CO\cdot OH)$. This is just the relationship that exists, for example, between ethyl alcohol, $CH_3(CH_2OH)$, and acetic acid, $CH_3(CO\cdot OH)$. And just as we can obtain acetic aldehyde, $CH_3(C\cdot O\cdot H)$, as an intermediate oxidation product between ethyl alcohol and acetic acid, so by oxidation of saligenin the corresponding salicylic aldehyde, $C_6H_4(OH)(C\cdot O\cdot H)$ is first produced. It is this aldehyde which is produced in the treatment of salicin with sulphuric acid and red chromate of potassium, and to which the aromatic odour of meadow-sweet is due. Some salicylic aldehyde is also produced when salicin is cautiously heated in a dry tube.

SODII BICARBONAS.—Absence of normal carbonate is roughly indicated by absence of colour in the precipitate produced with mercuric chloride. The volumetric test with standard acid solution requires absolute purity.

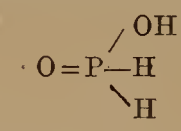
(i.) $\underbrace{2NaHCO_3}_{168} = \underbrace{Na_2CO_3}_{106} + H_2O + CO_2.$

(ii.) $\underbrace{Na_2CO_3}_{106} + \underbrace{H_2C_2O_4,2H_2O}_{126} = Na_2C_2O_4 + 3H_2O + CO_2.$

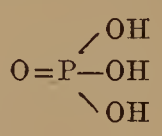
Since 1000 C.c. of normal acid solution contain 63 grammes oxalic acid ($\frac{1}{2}H_2C_2O_4,2H_2O$), this quantity will neutralise the 53 grammes of normal sodium carbonate procurable from 84 grammes of bicarbonate.

SODII BROMIDUM.—The principles involved in the preparation of sodium bromide are precisely the same as those explained under potassium bromide (*q.v.*), but in order to obtain the anhydrous salt, it is crystallised from warm solutions. At ordinary temperatures a salt containing two molecules of water crystallises out. The B.P. volumetric test corresponds to nearly 99 per cent. purity. Presence of alkaline chlorides would increase the quantity of volumetric silver solution required in the titration, owing to the lower molecular weights of NaCl and KCl. For 1 gramme, NaBr requires 97·1 C.c. $\frac{N}{10}$ $AgNO_3$, while 1 gramme of NaCl will require 170·9 C.c.

SODII HYPOPHOSPHIS.—Sodium hypophosphite may be obtained directly by boiling phosphorus with sodium hydroxide solution. It is, however, more conveniently and economically obtained indirectly through the calcium salt prepared in the first place from calcium hydroxide and phosphorus, because in the reaction between sodium hydroxide and phosphorus several secondary reactions occur leading to the formation of a considerable quantity of sodium phosphate. These occur to a much smaller extent in the formation of the calcium salt owing to the sparing solubility of calcium hydroxide, and the yield of hypophosphite from a given weight of phosphorus is proportionately greater. For the same reason the reaction between calcium hydroxide and phosphorus is not so violent and dangerous as is the case with sodium hydroxide. Moreover, any calcium phosphate is readily separated from the hypophosphate owing to the insolubility of the former. The formula of hypophosphorous acid is written usually HPH_2O_2 and not H_3PO_2. The separation of the hydrogen atoms in the formula indicates that only one of the three is replaceable by metals to form salts, and from this fact and certain other considerations the constitution of the acid is usually regarded as—



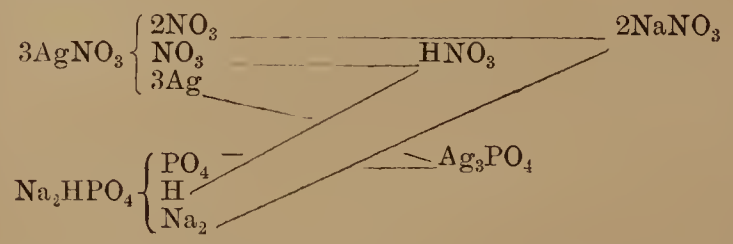
which shows clearly why one of the three hydrogen atoms behaves differently to the other two, this replaceable hydrogen being combined in a hydroxyl group, while the remaining two are linked directly to the phosphorus. On the other hand phosphoric acid is tribasic because all three hydrogen atoms are in the hydroxylic condition, thus—



Consequently the hypophosphite radicle, PH_2O_2, is monobasic, and the calcium salt has the formula $Ca2(PH_2O_2)$. When strongly heated, a complicated decomposition occurs, and a part of the hypophosphite is oxidised to (meta- and pyro-) phosphate, while the phosphorus of another part is reduced to hydrogen phosphide. A similar case of mutual oxidation and reduction between molecules of the same composition is seen in the conversion of manganates into permanganates with simultaneous production of a lower oxide of manganese (see the article on potassii permanganas). Owing to the tendency to absorb oxygen with formation of phosphates, the hypophosphites constitute powerful reducing agents.

SODII IODIDUM.—Compare the remarks made under potassii iodidum.

SODII PHOSPHAS.—When nitrate of silver is added to sodium phosphate solution the normal silver phosphate is precipitated, while the solution becomes acid. This latter effect is due to the fact that the sodium phosphate is an acid salt—that is, only a portion of the replaceable hydrogen of the phosphoric acid is displaced by sodium.



Since, therefore, the silver replaces the remaining hydrogen in the phosphate, the hydrogen will appear combined with the radicle formerly united with the silver, *i.e.*, as nitric acid. When heated to redness sodium pyrophosphate is formed.

$$\underbrace{2(Na_2HPO_4,12H_2O)}_{716} = Na_4P_2O_7 + \underbrace{25H_2O}_{450}$$

This corresponds to a loss of *about* 63 per cent. of its weight, since

716 : 450 :: 100 : 62·8

The pyrophosphate of sodium dissolved in water yields a precipitate of barium pyrophosphate on the addition of solution of barium chloride. This is soluble in dilute nitric acid, while if the sodium phosphate contained sulphate a portion of the precipitate (barium sulphate) would remain undissolved by the nitric acid.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australasia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office: 5, SERLE STREET, W.C.

LONDON: SATURDAY, JANUARY 29, 1898.

OF ETHICS AND ETIQUETTE.

OF all the thankless tasks that a pharmacist can undertake there is probably none less promising in results than an attempt to draft a code of so-called "pharmaceutical ethics," the more especially as it is very doubtful whether those who spend time in propounding and discussing such codes ever devote much consideration to what is actually implied by the term they apply so glibly to rules that have little or no bearing on ethics. Purists object at times, with some reason, to the use of the terms "pharmaceutical chemistry," "pharmaceutical botany," and so forth, but they might object much more forcibly to "pharmaceutical ethics." For the term is not only a misnomer; it implies what cannot possibly be conceived. Ethics is defined by Dr. MURRAY as "the science of morals" or "the department of study concerned with the principles of human duty." Unless, therefore, we grant that pharmaceutical morals differ from morals generally, it is difficult to imagine any correct application of the term "pharmaceutical ethics." The fact of the matter is that many English-speaking people value their language so little nowadays that by their carelessness they foster the tendency to misapply important words, and so minimise their force. For "ethics" and "system of ethics" let us substitute "etiquette" and "code of honour," and we arrive at the real meaning of what is usually meant.

In Mr. STORRAR's paper, printed at page 94, ethics and etiquette are mixed indiscriminately. At the outset he rightly observes that the term "ethics" can best be expressed by the words "Do to others as you would that they should do to you," but immediately afterwards he adopts a definition by a contributor to an old volume of the Journal, in which a professional code of honour is improperly elevated to the position of a system of ethics. Whilst, therefore, we agree with Mr. STORRAR regarding the uselessness of discussing ethics with a man who does not understand the meaning of the term, we fail to see that he cleared the way sufficiently for his own audience. Moreover, the same confusion manifests itself throughout the rest of the paper. How, for example, can morality be affected in any degree whether or not a chemist and druggist does anything that may affect the position secured to the Pharmaceutical Society by Act of Parliament? It is doubtless an imprudent thing to do anything that may risk the security of that position, but indiscretion should not necessarily be branded as immorality. Not that Mr. STORRAR meant it should be, but by speaking of the business and professional relations of pharmacists to each other, to medical men, and to the public, as though they were capable of regulation in accordance with an ethical system, he leaves his remarks open to considerable misapprehension. Anything that may further the establishment and observance of a professional code of honour in pharmacy is of the greatest possible value, but that value will not be enhanced by the use of incorrect and misleading nomenclature.

Such a code of honour can only crystallise itself gradually, and as the nature of those concerned becomes fit for the application of fixed rules. An unwritten code, far-reaching in its scope, already exists in pharmacy, as in other trades and professions, but variations in one direction or another indicate the inexpediency of any attempt to enforce hard and fast rules of business conduct. "Men's thoughts are much according to their inclination," observes BACON, "their discourse and speeches according to their learning and infused opinions; but their deeds are often as they have been accustomed. And therefore . . . . there is no trusting to the force of nature, nor to the bravery of words, except it be corroborate of custom." In other words, if the inclination of thoughts be directed, cautiously and persistently, and right views consistently advocated, in the course of time men will come by force of custom to act in accord with one another, and with the preconceived views of preceptors who are qualified to direct them. And when all realise the necessity of a fixed code of honour, that code will be practically already existent, having gradually and naturally developed as the individual became fitted to practise it. Not only should a man not force a habit, however good, upon himself without intermission, as the Elizabethan philosopher advises, but it is equally inadvisable for others to attempt to perfect him by keeping him ever in practice; otherwise "he shall as well practise his errors as his abilities, and induce one habit of both, and there is no means to help this but by seasonable intermissions." To the well-balanced mind this is self-evident, and a would-be reformer who is fitted for the part he wishes to play will not fret unduly if progress appears slow. As a wise man he will wait upon events, whilst making more opportunities than he finds, whilst ever bearing in mind that "men's behaviour should be like their apparel, not too strait or point device, but free for exercise or motion."

THE LORD MAYOR OF MANCHESTER.

WE have great pleasure in joining our congratulations to Alderman ROBERT GIBSON, Lord Mayor of Manchester, with those of the leading representatives of British pharmacy, and those others, perhaps still more important, of his fellow-craftsmen in Manchester and the surrounding district. The pharmacists of that important centre have, of late, appeared to observers to be somewhat lacking in unanimity, but there seems to have been no indication of the sort in connection with the recent festivities. This should augur well for the prospect of further agreement, such as we earnestly hope may be arrived at before long in connection with the Pharmacy Acts Amendment Bill, the more especially as the influence of the Manchester district cannot make itself properly felt, unless it is a practically unanimous index of local feeling.

ANNOTATIONS.

The Draft Pharmacy Bill continues to be the cause of much misapprehension in quarters where it could hardly have been expected, and with the view of helping to clear away some of the cobwebs that appear to obscure thought in the case of many readers, it may be as well to recapitulate what changes the Bill is intended to effect. Those changes are four in number. Thus it is proposed (1) that those subscribers to the Pharmaceutical Society who are now termed "Apprentices or Students" shall in future be known as "Student-Associates"; (2) that everyone registered as a "Chemist and Druggist" shall be eligible for election as "Member" of the Society, and subsequently, as a matter of course, be eligible for election on the Council; (3) that only one-third of the members of the Council shall retire each year instead of two-thirds as at present; (4) that the Secretary shall be enabled to receive voting papers for the Council election up to twelve o'clock noon on the day of election, whether delivered personally or not.

The Proposed Extension of the Membership Limits is the only point in the Bill that serious objection has been taken to, and there is every reason to believe that the opposition to Clause 3 on the part of a few pharmaceutical chemists is purely based on sentimental considerations. Though our correspondent, whose letter is published this week, raises the plea of an imaginary bargain with "the present 'Major' men" as a ground for not proceeding with the Bill in its existing form, there is little doubt that most, if not all, of the declared opponents of the proposed change have taken their stand upon the necessity of a *quid pro quo*. In other words, they ask what they are to receive as a recompense if they agree to share the privilege of membership with chemists who have not passed the Major examination. They will not recognise that to admit all chemists and druggists to full membership is but to revert to the original intention of the founders of the Society, nor that it is required in common justice. Or, if they do recognise it, they insist, nevertheless, that they must first receive a definite assurance of some personal benefit being forthcoming in exchange.

The Royal Charter of Incorporation, granted to the Society within two years of its foundation, distinctly specifies that "The Pharmaceutical Society of Great Britain shall consist of persons to be called members thereof, and that such members shall be chemists and druggists, who are or have been established on their own account, or who shall have been examined in such manner as the Council of the said Society shall deem proper." The Pharmacy Act of 1852 confirmed the Charter in this respect and, in addition, provided that all chemists and druggists who were then members of the Society should be entitled to assume the title of pharmaceutical chemist. Finally, the Act of 1868 would also have permitted the election of all chemists and druggists as members but for difficulties raised by some pharmaceutical chemists almost at the last moment. And though, rather than sacrifice the measure when it had almost become law, the promoters agreed to admit those who in future qualified as chemists and druggists as associates only, it is well to bear in mind that the Legislature was content to regard qualification under the Act as being sufficient for all practical purposes.

The Only Legal Qualification to practise pharmacy has since been that indicated by a person's name appearing on the Register of Chemists and Druggists. Those who were in business before August 1, 1868, and had not passed any examination, together with "Modified" men, "Minor" men, and "Major" men—all stand in precisely the same position in the eye of the law; they are all registered as "chemists and druggists." The pharmaceutical chemist's qualification is not a necessary one, and is not recognised by the law, except in so far as it protects the title. Beyond this, the pharmaceutical chemist occupies no better position than the chemist and druggist from the public point of view. The personal advantage of exemption from jury service under certain conditions was acquired in 1862, and it was limited to pharmaceutical chemists solely because they were at that time the only persons who possessed a recognisable qualification to practise pharmacy. This exemption had no kind of connection with pharmacy legislation, and an attempt made in connection with the Pharmacy Bill of 1868 to extend the privilege to all chemists and druggists in business, proved futile because the matter was held to be outside the province of such legislation. As regards the Pharmaceutical Society, all chemists in business who are connected with that body —whether they are pharmaceutical chemists or not—already pay the same subscription and they possess the same privileges, except those who have become qualified since 1868, and are not entitled to stand for election as members of the Council.

Chemists and Druggists also constitute the majority of the supporters of the Society, but whilst those who are in business on their own account take an equal share in its burdens, all but a small proportion of them are denied direct representation on the executive body. Not only are chemists and druggists in a majority, but it is a constantly increasing majority, for the roll of members—whether pharmaceutical chemists or chemists and druggists who were in business prior to August 1, 1868—shows a steady decrease. The pharmaceutical chemist members at the end of 1897 numbered only 1552, as against 1584 at the end of 1896; the chemist and druggist members only 556, as against 575; but associates in business had increased from 1682 to 1721, associates not in business had decreased from 984 to 946, whilst the number of students had risen from 846 to 873.

The Total Strength of the Society for the year ending December 31 last shows a slight falling off, the numbers being 5671 for 1896 and 5648 for 1897. Finally, of the 15,166 chemists on the Register twelve months ago, 4825 were connected with the Society, and of the 15,215 now on the Register, only 4775 are members and associates. The significance of these figures is obvious; whilst the Society as a whole is practically at a standstill, and the number of its supporters who are registered is in a decreasing ratio, there is the still more serious symptom of a steady diminution—both relative and absolute—in the proportion of those entitled to exercise the complete functions of members. Everything, therefore, points to the necessity of imposing an effective check, and that as speedily as may be. No better check could be found than throwing open the ranks of membership, so that the proposed step appears as expedient as it is just.

Fears Have Been Expressed lest the granting to associates of the style of "Member" and the right to seats on the Council should result in the relegation of pharmaceutical chemists to a secondary position. But, as has already been pointed out more than once, those are idle fears, the more especially as it is quite possible for an identical state of affairs with that contemplated to exist at the present time. The existing members include 1552 pharmaceutical chemists and 556 chemists and druggists. But there are only 2251 pharmaceutical chemists altogether, whilst there are not far short of 4000 chemists and druggists who were in business prior to August 1, 1868, and are

therefore eligible both as members and for seats on the Council. The danger, therefore, if danger there be, already exists, and it is not likely to be intensified by granting the full franchise to an increased number of persons.

THE SEATS ON THE COUNCIL are only twenty-one, but out of the more than two thousand individuals at present eligible as Councillors there is the greatest difficulty in inducing more than twenty-one to contest those seats. And if it be correct to assume that pharmaceutical chemists constitute the more leisured class in pharmacy, there seems but little risk of displacing any considerable proportion of their direct representatives on the Council. Apart from that, however, why should it be supposed that representative chemists and druggists will be less public-spirited and more petty-minded than those who now serve on the Executive body? The suggestion, we imagine, is too absurd to be entertained for a moment, and that being so, it is difficult to see what possible objection to the passing of the Pharmacy Bill still remains. Expediency suggests the desirability of the step, justice demands it, and no pharmaceutical chemist can honestly assert that it will do him the least harm. As for objectors, not pharmaceutical chemists or chemist and druggist members, they have no status in the matter, and decency bids them be silent.

MR. STORRAR'S REFERENCE to the work accomplished by the founders of the Pharmaceutical Society was not altogether justified by the facts of the case. He said (see p. 94) "their action welded a disunited trade into an organised and influential body," but that is far from accurately representing what was done, and not only so, the disunited trade is still awaiting the welding operation. Out of some fifteen thousand registered chemists, less than one-third lend their adherence to the Society; the rest are badly in need of organisation, but for the most part they are probably as far as ever from becoming united. One must also disagree with Mr. Storrar's assertion that "the Society can never be, in the strict sense of the term, a trade society." Why not? It was founded for that very purpose, amongst others, as witness the words of the Charter—"for the protection of those who carry on the business of chemists and druggists." True, it now performs a dual function, administrative functions having been thrust upon it at a later period, and those administrative functions have, unfortunately, grown out of all proportion to the rest. But they need not prevent the Society developing as a trade society, properly so-called, if only the trade would support it. Let the Society become representative of two-thirds instead of one-third of the trade, and let the members agree upon what they wish to do or have done, and there is little that need remain undone. The administrative work must be carried on and will continue to be carried on in its entirety, whether the Society secures the adherence of the trade or not; but there is nothing to prevent the organisation, which now represents less than five thousand of the craft, becoming a real union of the trade—safeguarding all its interests, commercial and otherwise—if only the trade will agree to make it so.

THE RE-COPYING OF PRESCRIPTIONS ordering scheduled poisons, when the medicine has to be repeated, has been the subject of communications to the Editor since the publication of the note on the subject in last week's Journal, and objection is taken to the suggestion that such re-copying is necessary. In reply it can only be said that the expression of opinion objected to was based on what appears to be the literal interpretation of Section XVII. of the Pharmacy Act. It is there stated that the provisions with regard to labelling poisons and recording their sale shall not apply to any article when forming part of the ingredients of any medicine dispensed by a person registered under the Act,

> "Provided such medicine be labelled in the manner aforesaid with the name and address of the seller, and the ingredients thereof be entered, with the name of the person to whom it is sold or delivered, in a book to be kept by the seller for that purpose."

Confirmation of the view that those words imply copying the prescription on the second and every subsequent occasion that the medicine is dispensed, no less than on the first, appears to be afforded by the provision in the earlier part of the Section—which should, of course, be considered as a whole—that in the case of poisons in the first part of the Schedule, the seller shall, before delivery, make or cause to be made, an entry in a book to be kept for that purpose, "on every sale." And though it may be contended that the dispensing of medicine differs from a mere sale, the use of the words "seller" and "sold" in the passage quoted above seems to indicate that the difference is only one of degree, or to put the matter simply, the delivery of medicine dispensed by a person registered under the Act, and containing a scheduled poison, is a sale under special conditions. Of course, the point has not been decided in a court of law, and the adoption of the extreme precautions advocated last week must of necessity cause much trouble to dispensers, which may appear needless. But that would not be accepted as a valid excuse, if at any time a judge should arrive at the conclusion that, by neglecting such precautions, chemists appeared to desire to evade the Act they are so directly interested in upholding.

TROUBLE SHOULD NOT BE CONSIDERED in such matters, and it may be taken for granted that the chemists of this country are not likely to allow it to enter into consideration when once they have looked at the questions involved in a right light. In the public interest, most chemists already go beyond the strict legal requirements by labelling and otherwise treating carbolic acid, strong mineral acids, and other dangerous articles as though they were scheduled poisons. This plan saves trouble, too, for as suggested last week, it obviates the necessity of stopping to consider what are the exact legal requirements in any particular instance. But it is safe to conclude that this and other precautions adopted by registered chemists in dealing with poisons and other dangerous articles—though not required by the law, and the cause of much trouble that, to some, may appear needless—are not suggested by selfish motives, but in the interest of the public safety, and they are therefore indicative of a highly commendable professional spirit. It is going but a step further to adopt similarly extreme precautions in the case of prescriptions ordering poisonous remedies, and whether such precautions are actually required by the law or not, the pharmacist who does adopt them has no occasion to fear that he will not be fully compensated for the extra trouble involved. What Mr. Goode (see p. 113) describes as being, in his opinion, sufficient in the case of repetitions, might not be considered so in a court of law, but as already stated, the point has not yet been raised. The question is not free from difficulty, and the careful consideration of it by our readers is strongly recommended. Uniformity of practice should be aimed at in dispensing, and that practice must be in complete accord with the legal requirements.

THE NEXT EVENING MEETING of the Pharmaceutical Society will be held on Tuesday, February 8, when Mr. Leo Atkinson will read a paper on "Bacteriology for Pharmacists," illustrated by micro-photographs and practical demonstrations.

Formaldehyde is advocated by Dr. Wyatt Johnston, Bacteriologist to the Board of Health of the Province of Quebec, in the *British Medical Journal* of December 25, as an effective agent in household disinfection. The desiderata in room disinfection consist in efficiency under known conditions, freedom from injury of the goods treated, and the relative cost, which must include not only the direct outlay for the disinfection itself, but the cost of apparatus, means of transportation, etc. All these points are in favour of formaldehyde. The best kind of apparatus for room disinfection is said to be a kind of regenerator made in America, in which the formaldehyde is liberated under pressure, as a gas, from a mixture of equal parts of formalin (the usual 40 per cent. solution) and 20 per cent. calcium chloride solution. Formaldehyde lamps, in which methyl alcohol is used, have not proved satisfactory, as a quantity of the methyl alcohol vapour passes off unconverted. It is important to appreciate the necessity that to obtain successful disinfection with formaldehyde it is advisable to use larger quantities of formaldehyde than is generally recommended, as the results only became satisfactory when using 1 lb. of formaldehyde per 1000 cubic feet, and on prolonging the time of generating the vapour to from one to three hours. As a disinfectant solution for spray work a half or one per cent. solution seems sufficient for the purpose.

The School of Pharmacy Students' Association is again to be favoured by Professor Collie, F.R.S., who is announced to give an account of his mountaineering experiences in the Canadian Rockies to the members, on Friday, February 4. Those who were fortunate enough to hear Professor Collie's account of his experiences in the Himalayas will not need a very pressing invitation to be present on this occasion. Nevertheless, a good audience is desired, and members may obtain tickets for their friends on application to the Secretaries of the Association, 17, Bloomsbury Square, London, W.C.

The Proposed Teaching University of London seems indeed in a fair way to become a reality, as the Duke of Devonshire, speaking on behalf of the Government, has expressed a strong desire to effect the desired reconstitution of the old University. He was addressing a large deputation, including the Vice-Chancellor of the University, the Presidents of the Royal Colleges of Physicians and Surgeons, the President of the Pharmaceutical Society, and representatives of the leading colleges and medical schools, who had waited upon him to urge the desirability of bringing the question within the range of practical politics. The Government was stated to be fully impressed with the importance of the subject, and the members of the deputation were thanked for the trouble they had taken in again appearing to urge the necessity for establishing a real and genuine teaching university. The Duke of Devonshire also said that both political parties are fully in accord as to the desirability of establishing a teaching university in London, and that he would be able to assure his colleagues that the measure asked for would involve a very small sacrifice of time in the future. The delay which had taken place was not lost, because it had served to bring about a compromise which had substantially removed any serious opposition to the measure. With regard to the great work done by the London University in the past, there should be no change made in its constitution which would debar or incapacitate it from continuing the work already well done. Matters were now so advanced that he believed it was in the power of the Senate of the London University to present to the Government a scheme, and ask for a charter that would meet all requirements.

THE WORLD OF PHARMACY.

PHARMACEUTICAL SOCIETY.

EVENING MEETING IN EDINBURGH.

The third evening meeting of the session was held in the Society's Hall, 36, York Place, Edinburgh, on Wednesday, January 19, at 8.30, Mr. J. Laidlaw Ewing in the chair. The minutes of last meeting were read and approved, and an apology for absence was intimated from Mr. Alexander Davidson, Montrose. —A paper was then read by Mr. David Storrar on—

Pharmaceutical Ethics.

This is printed in full at page 94. At the conclusion of the paper, the Chairman said they had all listened with pleasure to Mr. Storrar's wise remarks, and he would be glad to hear what any gentlemen in the meeting had to say.—Mr. David McLaren, in moving a hearty vote of thanks to Mr. Storrar for his paper, said he was sure that every one of its propositions would be adhered to by every respectable chemist. Referring to the latter part, he said he did not think it could be too strongly emphasised. If any scheme deserved the support of every chemist and druggist it was the Benevolent Fund of the Society. There were difficulties which certain of their brethren had to contend with in different parts of the country. In Edinburgh they were peculiarly situated. There medical men did no dispensing at all; but in many outlying districts there were men quite as able as themselves to excel in the race of life who were prevented from doing so owing to their surrounding circumstances. They were in duty bound—as trade unionists should—to join together to help each other when a little difficulty occurred, and the only way they could do that was by supporting the Benevolent Fund as far as their means would permit them.—Mr. J. Anderson Russell (Glasgow), in seconding the motion, said they might listen to a paper such as this, or consider the subject of it by themselves, and say these things were all true, but how were they to maintain them? It appeared to him that associations, or at least committees of associations, might do much to improve the moral tone of the business conducted by pharmacists in their respective districts. They could not compel individuals outside the Association or within the Association to act in accordance with their ideals of right and wrong, but much could be done by laying down rules, non-compliance with which might be considered a breach of the ethical code. He thought it would be inadvisable to lay down very strict rules at the beginning, because they wished to get a very large percentage, if not all the members, to comply with them. When they considered

The Various Sides to the Faults

that had been referred to, one had a difficulty at times in saying whether individuals were more sinned against than sinning. They had an outcry in Glasgow and the West of England against medical men dispensing and chemists prescribing. The medical men had their difficulties to avoid just as the chemists had. Beyond the force which local associations might give to pharmaceutical ethics, he thought the chemists might give it a start, and give the local associations a big lift by approaching the Council of the Society and indicating their feelings on this matter. He thought, if it were permissible, they should send up a resolution to the Council expressing their opinion that it should have disciplinary powers given to it to strike names off the Register in cases of default. While the power at present existed of the Council striking names off from membership the influence bearing upon it would always be towards not using that power, but of keeping up the membership as far as it possibly could.—Mr. J. Rutherford Hill said it seemed to him that while, as Mr. Storrar had already said, the subject of pharmaceutical ethics had been very ably treated by Mr. Ince somewhere about thirty years ago, it was a subject that pre-eminently deserved their close attention at the present time. Mr. Storrar referred to the fact that the main difficulties they had to contend with in regard to trade matters seemed to emerge in connection with what is called the co-operative movement. Now while there were many things in the co-operative movement which they might strongly disapprove of, they were forced to recognise that it was only part of a great social revolution that

was going on all over the world; and it seemed to him that any attempt to get over the difficulty by stereotyping the existing conditions was bound to fail, and that in any readjustment that might take place a knowledge and grasp of the fundamental principles of ethics was of first importance. In that connection it occurred to him to say that for the pharmacist there were two lines of policy which for him would inevitably secure a future. These lines of policy were, first of all, that he should maintain

A High Standard of Educational Sufficiency,

and alongside of that he should also maintain a high standard of professional efficiency. If these were combined, no matter what readjustment might have to be made in the future, there would always be a place and always a remuneration for the pharmacist who was educated and trained for the work he had to do. With regard to dispensing by doctors, he thought that in cities at least they had a very decided grievance when doctors opened retail pharmacies for dispensing medicines not under their own personal charge, but under the charge of assistants, who were in most instances unqualified. But even when they were qualified he thought they had a grievance which ought to receive the attention of the Legislature. They perfectly recognised that a physician ought to have the power to dispense his own medicines to his own patients if he saw fit, but when he opened a pharmacy and conducted a retail business that was wholly outside his professional rights. Another point that occurred to him was that, as Mr. Storrar said, the dispensing of drugs was a professional art. The selling was a trade, but to dispense was a professional art, and there was much in thus being specially trained in having passed a special examination and received a certificate of competency for that work. And yet, strange to say, that professional art was not limited to the men who were trained for doing it, but any man might dispense drugs so long as he did not dispense the few articles included in the Poisons Schedule. It was very strange that in a matter of this kind Ireland, which was often said to be behind them, was in front of them in that department, because in Ireland the dispensing of physicians' prescriptions was absolutely restricted to the hands of trained chemists. That was a matter which ought to receive attention from the Legislature at no distant date. He hoped it was one of the subjects in the future of pharmaceutical politics. Mr. Hill concluded by referring to the value of Mr. Storrar's paper, which was enhanced by the fact that it came with the immense advantage of thirty-five years' experience.—The Chairman said he was sure the vote of thanks would be very cordially adopted. There was only one remark he would like to make, and that was to the remuneration that the qualified pharmacist ought to expect for dispensing prescriptions. He wished to emphasise that point. He thought they too often lost sight of it, and that they did not charge enough for their skill.

The Question of Prices

was one about which he had probably as much experience as any man in the room. He thought Mr. Ince, who had been referred to, said it was a very difficult thing to arrange prices in a community, because environment had to be taken into consideration in every case. There was also the fact that they had to deal with men who had very small businesses, and those also who had large ones, and while, on the one hand, the man with the small business perhaps in a poor locality had to charge prices which were more, perhaps, than he ought to expect, on the other hand, the freedom of the larger house was tied too much. That was his experience in former days, and he always tried to emphasise the fact that while they charged—and he thought rightly charged—for dispensing because there was a certain amount of professional skill, they should be as moderate as they could in serving the public with drugs. As to the question of medical men and their position, he asked them to remember that the teaching of medical men was very much changed within his time. A great deal of the practice of medical men prescribing proprietary medicines was due to the fact of their insufficient acquaintance with materia medica. He hoped the teachers of materia medica and therapeutics in their colleges would pay more attention to that point in future. They often found medical men prescribing in a way that was no credit to them. Another question touched upon by Mr. Storrar was social friendship, and he was glad to say that for the last two years in Edinburgh social friendship had increased, partly by means of their meetings there, and in great measure by those amusements which brought them together and showed them what mettle they were made of, and that one man was not better than another. In regard to the Benevolent Fund, he was glad to say that in Edinburgh they had set a very good example in the Jubilee year. He hoped the impetus thus given to the Benevolent Fund in Edinburgh would be maintained.—The motion was adopted, and Mr. Storrar said he was very much indebted to them for the kind reception they had given to his remarks.

Donations to the Museum.

The Assistant Secretary directed attention to the following donations:—1. Specimens of hydrobromide of emetine and hydrochloride of cephaeline, presented to the Museum by Mr. Thomas Whiffen, Battersea, London. Mr. Whiffen wrote saying he intended to introduce the salts of these alkaloids to commerce, and the specimens sent represented the produce of one pound of Carthagena ipecacuanha root and one pound of Rio ipecacuanha root respectively. Carthagena root was found to yield 1·1 per cent. of pure emetine and 1·2 per cent. of pure cephaeline, and the product of one pound of the root was 113 grains of emetine hydrobromide and 110 grains of cephaeline hydrochloride. Rio root was found to yield 1·8 per cent. of pure emetine and 0·2 per cent. of pure cephaeline, and the product of one pound of the root was 185 grains of emetine hydrobromide and 18 grains of cephaeline hydrochloride. 2. A set of autometric stoppers graduated in cubic centimetres and also in minims and grain measures, and a set of thermo-hydrometers and a thermo-urinometer, presented by Fletcher, Fletcher and Co., of London, through Mr. Alexander Coats. These had been sent on reading the paper on "The Metric System in Prescriptions," by Dr. Dewar and Mr. Jack, and the discussion thereon, at the last evening meeting, the autometric stopper pipettes being well adapted for use in the way suggested in the paper. At the close of the meeting, the Assistant Secretary exhibited a tube of argon and a tube of helium, kindly lent by Professor J. Norman Collie, F.R.S., London. By means of an induction coil and spectroscope, the distinctive spectra of the two elements were shown, and in the case of argon, the change from purple to blue was shown by introducing a Leyden jar into the circuit.—On the motion of the Chairman, cordial votes of thanks were awarded to the donors of specimens and to Professor Norman Collie.—The meeting then closed.

The Pharmacy Acts Amendment Bill.

Subsequently a special general meeting of registered chemists and pharmaceutical students was held for the purpose of considering the Bill drafted by the Council of the Pharmaceutical Society to amend the Pharmacy Acts. On the motion of Mr. D. Storrar, Mr. J. Laidlaw Ewing again occupied the chair.—The Chairman stated the object of the meeting, after which it was agreed to hold the Draft Bill as read, and the Chairman called on Mr. C. F. Henry to propose the resolution of which he had given notice:—

> That this meeting of registered chemists and pharmaceutical students, having considered the Pharmacy Acts Amendment Bill drafted by the Council, cordially approves of the same, and especially recognises the prudence and wisdom, at the present time, of limiting the scope of the Bill to urgent and non-contentious matters relating to the internal organisation and consolidation of the Pharmaceutical Society. The meeting further pledges itself to use every legitimate means to aid the Council in securing its speedy enactment.

Mr. Henry, in submitting the motion, which he said he had much pleasure in proposing, indicated the main features of the Bill. He said it was intended first of all to alter the title of student-apprenprentice to that of student-associate in the case of those who had passed the Preliminary examination and joined the Society. In the second place, it was intended to open the doors of membership of the Society to all registered men. The remaining parts of the Bill he was sure would meet with unanimous approval. They were, that instead of the antiquated system of part of the Council retiring by ballot, a third of the members should retire, namely: The seven who had sat longest on the Council; and there was also provision for receiving voting papers in London up to the last moment. In regard to the alteration of the title to student-associate he thought that would commend itself to everyone. At present, as was pointed out by the President very distinctly, there was no means of differentiating between those students who had passed the Preliminary examination and who did not join the Society and those who did join the Society. In future, it was proposed that those who joined the Society after passing the Preliminary examination should have the title of student-associate. He had no doubt that this would have a good effect upon young men, and was a step calculated to strengthen the Society, because

the time when students were looking forward to a pharmaceutical career was when they could best be got hold of. If they did not join at that time it would probably be difficult to get them to join it in later years. Coming to

The Most Important Part of the Bill,

and the one about which there had been some controversy —the opening of the doors of membership to all registered men—he urged that this was a very advisable step, first of all, because it was indicated in the Charter of the Society. Anyone who had studied the Charter would see that it was originally intended that there should only be two grades in the Society—Members and Associates. It would also be observed that the Associates were not to be registered men. The original intention of the Charter had not been carried out. Why he did not know. In the Act of 1868, and also in the Bye-laws, the present complicated system was introduced, namely, a number of grades which were, as they knew, members of the Society, chemists and druggists in business in 1868, associates in business, and associates not in business, men who became associates, the Modified examination, and students. The object of the Bill was to do away with these grades, and to consolidate the Society by forming two grades only, in fact, to carry out the original intention of the Charter. In answer to those who thought that this was taking away from the title of pharmaceutical chemist by introducing those who were not pharmaceutical chemists into membership of the Society, he would point out, first of all, that membership was not really a qualification, and a large number of the present members of the Society were not pharmaceutical chemists. He gave some very interesting figures, showing that at the end of 1896 out of 2159 members of the Society 1584 were pharmaceutical chemists and 575 chemists and druggists, so that the members of the Pharmaceutical Society included 26 per cent. who were not pharmaceutical chemists, or if they put it in another way, for every three pharmaceutical chemists there was one who was not a pharmaceutical chemist. There was nothing in the nature of the examination which qualified a person to be a member of the Society. There was nothing more in the Major than in the Minor examination to qualify a person to be a member, and the fact of passing only the Minor examination should not therefore debar a person from becoming a member. Again, he would urge that this particular part of the Bill should be allowed to pass, because sooner or later the passing of such a Bill would be

An Absolute Necessity.

In the *Pharmaceutical Journal* of January 1 there were some very interesting figures given, which showed that in 1876 there were 2062 pharmaceutical chemists who were members of the Society. In 1896 they had decreased to 1584. It was therefore only a question of arithmetic to find out at what time in the future there might be no pharmaceutical chemist members at all. Then, again, there were 839 chemist and druggist members in 1876, and in 1896 they had decreased to 574. In the course of nature the chemist and druggist members who were in business in 1868 and who were admitted solely on that account, although they had not passed any examination, must become extinct; therefore, if such a Bill as this did not pass, in course of time there would be no Council, because there would be no members. In 1876 there were 1520 associates of the Society; in 1896 they had increased to 2666, which showed that although pharmaceutical chemists and chemists and druggists in business in 1868 were decreasing, the associates of the Society were increasing in a marked degree. In regard to the Major examination, there were fewer passing now than formerly. That was another argument why the Society should be consolidated and increased in numbers by admitting all persons legally qualified to practise pharmacy. There was some reference in the resolution to recognising the prudence and wisdom at the present time of limiting the scope of the Bill to urgent and non-contentious matters. That would be obvious to them all. If the Council proposed to put anything else into the Bill there might be such opposition that it would be at once swamped, and, as had happened over and over again, the Bill would come to nothing. He thought the Council was wise in going on with one thing at a time and in consolidating the membership of the Society, so that on some future occasion it could move in other matters. At present if a Bill was proposed, and the Government were to inquire into it, the question would be asked how many members there were in the Society, and what proportion these in the Society bore to those not in the Society, and they could only be told that there were something like 5000 connected with the Society out of about 15,000 registered persons. The Government would at once tell them that they could not go forward as representing the body of chemists, because they were in a hopeless minority. The object of the Bill was to do away with that state of things and give the Council some support—some solid basis on which to go in its future efforts for the benefit of the trade.—Mr. T. Dunlop, pharmaceutical chemist, Glasgow, who seconded the resolution, said it was not a new thing for him to advocate

The Membership of Chemists and Druggists.

Three or four years ago, at a meeting of the Glasgow and West of Scotland Pharmaceutical Association, he moved a similar resolution, and since then his opinion had remained unchanged, and he thought the action of the Council in promoting this Bill should meet with the support of all pharmaceutical chemists. He referred to the correspondence which had recently appeared in the *Pharmaceutical Journal*, and said he had noted some of the objections raised on the pharmaceutical side, and the pleas put forward by those who had the Minor certificates. Some chemists and druggists based their claim on right and justice. Of that he disapproved, because, as matters stood, he scarcely thought that any man was entitled to claim as a matter of right and justice a thing to which, as the law at present stood, he had access through the Major examination. There was also the question of the education and status of the men of to-day as compared with the men of many years ago—the Major men of the past and the Minor men of the present. But the chemists and druggists who advocated the extension of the membership to all on the Register on that ground must not forget that if the Minor examination had been raised, so also the Major had been made more thorough than it used to be. As regarded the pharmaceutical chemists, objection was taken to the Bill on the ground that it was like taking away their birthright, while others said the one thing that induced them to go forward for the Major examination was that they might become members of the Pharmaceutical Society. He was sorry to think that men should go forward to the higher examination in that spirit. He looked upon the higher qualification as being an acquisition in itself worth working for, as it gave its possessor an advantage over those with the Minor qualification, and fitted him better for the discharge of his duties to his fellow pharmacists and the public. Personally speaking, he said the Bill had his entire approval. Since he passed the Major examination twenty years ago he had been connected with the Pharmaceutical Society, and he had always felt it was good for him to be so. It had been helpful to himself, and had given him better views of pharmacy than he could have had by remaining outside.

The Preliminary Examination

was to be raised also, so that the Society had been raising the status as regarded education, examination, and fees, and the time had fully come when he thought they would be justified in giving a *quid pro quo*, and in that way induce all those who were registered to become connected with the Society. It was expedient that the Bill should pass, and he had not a shadow of doubt that it would tend to the consolidation of the Society.—Mr. G. Coull did not believe that even if the door was really opened it would do the good which the Council and those who were promoting the Bill thought it would do. In 1868, the Society opened its doors as wide as possible and no advantage was taken of it. He did not agree with the terms of the Bill, but he would not move an amendment.—Mr. Nesbit said Mr. Henry's remarks were not consonant with his knowledge of the case. The Society was altogether a voluntary body prior to 1868, with two grades—pharmaceutical chemists and associates. He thought Mr. Henry told them there were no associates, but there were associates till they commenced business in connection with the Society. When a Bill was promoted at that time by the Society, its terms were not satisfactory, and the Bill was opposed in the country and in Parliament. The Society was not successful in getting what was proposed, and it made the best terms it could. And the terms were that those who were in business were to be members of the Society, but persons not in business, and those who afterwards passed the examination, were not to become members, because the Council anticipated that those men would go on to the higher or Major examination, and become members of the Society in that way. But in that the Council was disappointed, and now it is proposed to open the

doors to those who pass the Minor examination and are qualified to perform their duties. He thought the Council was quite right. Any Bill that might hereafter be presented to Parliament would have a much better chance of passing, because then the Society would have a larger number of members to support it.—Mr. Archibald Currie said he could not agree entirely with the first proposal in the resolution, to change students and apprentices to student-associates. It would in his opinion make them appear ridiculous in the eyes of other bodies. With regard to the second part—to allow those who had passed the Minor examination to become members—he supported that on one ground—

The Consolidation of the Society.

The legal qualification should, he thought, become the qualification for the membership of the Society. Those who were qualified to conduct the business were, he thought, qualified to be members of the Society which regulated the conduct of their business.—Mr. J. Anderson Russell said that every chemist in Glasgow connected with the Association approved of the Bill so far as he was aware. The subject had been again and again before the Association and had always been approved of. It would, he said, be interesting to know the number of students and apprentices who passed the Preliminary examination and joined the Society, compared with those who did not. He was afraid that not many joined the Society. He thought all those who joined became associates. The only advantage he could see to be gained by this Bill was that the Minor men in business were to be elected members of the Society.—Mr. J. T. Coats said he did not think it was necessary to pass a Bill only to get this ethereal title of M.P.S. He asked if a chemist and druggist was not a member of the Society in virtue of being in business in 1868.—Mr. J. Rutherford Hill replied in the negative.—Mr. Coats said he did not wish to contradict Mr. Hill, but he thought he might have a seat on the Council and might become president.—Mr. Hill said he could never be anything but an associate (*sic*).*—Mr. Coats said he believed the proposals in the Bill would have the effect of consolidating the Society, and on that ground he would support the resolution.—Mr. Rutherford Hill said he thought Mr. Currie grasped the kernel of the resolution—that the object of the Bill was the consolidation of the Society, and that was the internal organisation of the Society. It might or might not result in an acquisition to the membership. The proposition just now was not primarily a proposal to increase the membership. It was a remedy of a practical difficulty that existed, and was pressing and urgent, and that practical difficulty was that no person who had passed the Minor examination, and was a chemist and druggist in virtue of that, could have a seat on the Council or a direct voice in the management of the Society. The practical situation was that

The British Pharmacist of To-Day

was the chemist and druggist, and those who had passed the Minor examination ought to-day to represent the pharmacists of Great Britain. A chemist and druggist might be President of the British Pharmaceutical Conference; he might be the president of any local association that might be formed in any part of Great Britain, or he might be chairman of the Executive of the North British Branch. They had illustrations of the fact that among the ranks of those who belonged to the class of chemists and druggists and were associates in business, there was a large number of men whose services would be available and of great practical value to the Pharmaceutical Society. As far as he could make out, the idea of the Bill was to take away everything that prevented registered men from meeting on the same platform in the Society. At present they had four grades—pharmaceutical chemist members, chemist and druggist members (of which there were 4000 eligible persons who had passed no examination whatever, and these 4000 people were fully competent to be full members of the Society and members of Council); there were associates in business who were members in everything except that they could not call themselves members and could not have a seat on the Council; and there were associates not in business. It had been convincingly proved again and again that this element of distinction among registered men was an obstacle and a difficulty. It would be for the advantage of the whole craft, whose interests were one, if they could meet on the same platform as members of the Society. As to the Major men, he did not think their interests were being sacrificed at all. They would always have that position, and hold their own and come to the top if they were otherwise men of sound sense and common prudence. Their only distinguishing mark was their superior education and training.

Membership is not a Distinguishing Mark.

Those might be members who had no qualification whatever. It was on that ground alone that he strongly supported this proposition as one that was wise, urgent, and desirable.—Mr. Coull asked if there were 4000 men when the door was open, why did they not come in?—Mr. Hill said it was not a question of opening the door but of arranging the men already inside the house. It might be that by and by, others might come in, but the difficulty was just now the adjustment of the membership of the Society. The persons inside seemed to be badly arranged, and might be made much better.—Mr. Peter Boa said he should not propose an amendment, but he did not wish to sit still and say nothing in case he might be misunderstood. So far as he understood this Bill, it was simply a movement towards preserving the membership of the Society, which, without some such Bill, would very soon be non-existent. According to Mr. Henry, Major men were passing in such a small proportion that very soon they would be out of existence. Then the men who were in business before the passing of the Pharmacy Act would in course of Nature very soon be all removed. If the membership of the Society was to be maintained he did not see that it could be done in any other way than by a Bill such as this. He thought there had been a certain want of straightforwardness in the promulgation of this Bill. It would have been quite enough for the Council to say that the Bill was necessary on these grounds without taking so much trouble to say there was not much difference between the Major and the Minor qualifications and that no interests were being sacrificed, because that was not the case. A man at present eligible for membership might regard that privilege as a right, and he thought he was perfectly right in regarding it as such, although he did not pass any examination. Still they were the men who were at the forming of the Society into a corporate body, and they might say that as the original members, not of the Society, but of the chemist and druggist body, they were quite entitled to that privilege. The Major men maintain these privileges by taking the superior qualification. Personally he did not object to the Bill—to this clause of the Bill or any part of it—because it was reasonable, and he did not think it at all premature. He would only say, further, that although he did not object to this taking away of what might be regarded as a privilege, he was quite alive to any movement that might be made in any further direction towards the assumption of privileges which had been gained in a legal way.—Mr. Dott said he approved generally of the object of the Bill to consolidate and

Improve the Position of the Society.

He suggested that it might be just as well, when they were going to Parliament, to accept one title and become pharmaceutical chemists. He agreed with the objection to the term student-associate. Apprentice was a very good word.—Mr. D. McLaren entirely supported the Bill. He said he had a decided grievance, because unless he began at the A B C and passed through the Preliminary, the Minor, and the Major examination, he could not be a pharmaceutical chemist. Would it not be a wise step of the Society to make every man in business pay a fee once a year?—Mr. Henry, in reply, said he seemed to have been misunderstood, and he thought Mr. Nesbit and he were in substantial agreement. If there had been anything in the Bill to touch the title of pharmaceutical chemist he would have most strenuously opposed it. The man who passed the Major examination was entitled to the full credit for what he had expended in brains and time in acquiring it. To offer it to those who had not done the same thing would be an act of injustice. It was sometimes said that this Bill would not have much effect. He thought it would have a little effect. It was the experience of some of them who went to men and asked them to join the Society as associates in business. They generally asked "What am I to get?" and the reply was they would get the title A.P.S. He was one of those who would as soon put A.P.S. after his name. He did not think matters would be improved until associates in business and associates not in business were made members. He appealed to all Major men not to be behind their fathers and grandfathers, who admitted all chemists and druggists in business in 1868,

* There appears to be some confusion in the report. A chemist and druggist who was in business as such prior to August 1, 1868, is not only eligible as a member of the Society, but he may also be elected on the Council and even as President. [Ed., *P.J.*]

although they never passed an examination, and to admit to membership all those who had passed the examination.—On being put to the meeting by the Chairman, the resolution was declared carried, Mr. Coull dissenting.—Mr. Lunan pointed out that Mr. Coull was a consenting party to the carrying of this proposal in the Executive.—Mr. J. Anderson Russell then called attention to the last sentence of the resolution, and moved the appointment of a representative committee to take the steps necessary to carry out the resolution. The Bill was not one which would bring powerful opposition interests in contact with it. They should be unanimous and show how they could best organise their forces so that they could press Parliament at the critical moment. He suggested that

A Representative Committee

should be appointed which could divide Scotland and appeal directly to the members representing their respective constituencies in Parliament. That might be done over and above what representations might be made directly from the Council of the Society or the Executive in Edinburgh or by local associations.—Mr. T. Coats asked if the motion was carried, as he intended to move an amendment with reference to the term "student-associate."—The Chairman said the resolution had been already adopted.—Mr. McLaren said he would second Mr. Russell's motion on condition that he handed the matter over to the Executive.—Mr. Russell said he would prefer to put it as individuals, and not as an Executive.—Mr. Hill said he did not think it would be wise to appoint a committee representative of the meeting, because they were all connected with one or other of the local associations already, and they would be starting another organisation, which would be crossing the lines of the different organisations already in existence. He assured Mr. Russell that means were being taken to approach all the Scottish members of Parliament with regard to the Bill.—Mr. Storrar said it might meet Mr. Russell's purpose that this meeting should recommend local associations to appoint a small committee to look after the promotion of this Bill. If they let the Bill alone, it would be passed. What they had to do was to try and prevent petitions against the Bill from being presented to Parliament.—The subject then dropped, and the meeting terminated with a vote of thanks to the Chairman.

PLYMOUTH, DEVONPORT, STONEHOUSE AND DISTRICT CHEMISTS' ASSOCIATION.

The general quarterly meeting of the above Association was held on Wednesday, January 19, Mr. Jas. Cocks, President, in the chair, others present including Messrs. C. J. Park, J. H. Bailey, Condy U'Ren, J. R. Johnson, G. Breeze, W. H. Woods, F. W. Hunt, H. C. Cantle, A. D. Breeze, and F. A. Roper. As it had been decided to pay off three of the furnishing shares, they were balloted for, and fell to the share of Messrs. J. Barge, A. D. Breeze, and W. Mathew.

Educational Report.

Mr. Johnson (Secretary of the Educational Committee) read his report. The Committee regretted that full advantage was not being taken by the students of attending these classes. It had been decided to expend the generous gift of Mr. Jas. Maurice in purchasing a lantern and accessories for lecture purposes. A scheme had also been formulated to approach the local technical schools with regard to establishing classes for a full Minor course.

Trade Section.

Mr. Park (President of the Trade Section Committee) read the following report of this section :—

"In presenting the report of the Committee of the Trade Section, I am very pleased to be able to state that this section has made very marked progress during the past year, and has been the means, I trust, not only of strengthening the Local Association in regard to its membership, but has enabled the members of this section to purchase large quantities of goods, more especially proprietary articles, at very advantageous terms, without the necessity of overstocking themselves.

"The attention of the Committee has been more particularly directed to the purchase of proprietary articles, first, because those articles are the ones that are liable to such excessive competition; secondly, because they are more easily distributed and parcels divided up than would purchases of drugs, chemicals, or sundries. As Chairman of this Committee I see no reason why members should not further benefit themselves pecuniarily by extending their operations to the purchase of original parcels of drugs, chemicals, etc., in the immediate future.

"Speaking approximately, the amount of purchases by members of the trade section in a co-operative sense during 1897 has been £1000. This estimate is really under the actual amount, but owing to want of time I have been unable to get returns from every member. Whilst acknowledging the greater difficulty in arranging for the purchase and distribution of goods other than proprietaries, many members have seen their way clear to co-operate in this direction with considerable pecuniary benefit to themselves without overstocking.

"As Chairman of this section I am pleased to report that this community of monetary interests has, in my opinion had a beneficial and strengthening effect on our Local Association, and tends to the recognition of that community of interests that has been the object of this Association from its commencement.

"Good work has also been done by this section by writing to manufacturers and wholesalers, urging them to join the P.A.T.A. and place their articles on the same, thus assuring the retailer a legitimate profit for handling their goods. Replies to some of the communications have not proved satisfactory from the retailer's point of view, and the question arises whether active measures should not be taken by the retail trade to discourage the sale of those articles which do not give a fair margin of profit.

"In conclusion, I wish to point out to members of this section in particular that in order to make this section a thorough success, mutual co-operation in every way is essential, that it is expected that every member will undertake to purchase and be ready to distribute to other members one or more articles, otherwise they would be reaping the benefit of the other members' time, trouble, and capital.

"I beg to tender my personal thanks to Mr. Condy U'Ren for the very able assistance he has rendered me as Chairman of this section during the past year, and I feel sure that every member of this section feels indebted to him for the large amount of time and trouble he devoted at the starting of this section to make it a success, and I feel sure that in Mr. F. Roper we shall find a worthy successor."

Mr. Park then proposed, and Mr. Turney seconded the proposal, that the following resolution be sent to the Sanitas Co. :—

> That this Association, numbering sixty-three chemists in business, greatly regrets that the proprietors of Sanitas appear to have mistaken the opinion of chemists with regard to their preparations. The fact of so large a number, 3000 belonging to the P.A.T.A., and its Secretary and the Secretaries of various local associations having communicated with them, would render it almost superfluous for individuals to communicate their views.
>
> That this Association begs to point out that the 1s. Sanitas Fluid is listed and sold in this town at 9½*d* per bottle by the Army and Navy Stores. That its members regard it as folly on the part of the Sanitas Company to recommend the endeavour to make mutual agreements locally, as this has been tried and found unworkable.

The proposition was unanimously agreed to.

BRITISH PHARMACEUTICAL CONFERENCE, 1898.

A meeting of the Ulster Executive Committee was held in 10, Garfield Chambers, Royal Avenue, Belfast, on the 18th inst. at 11.30 a.m. There were present Mr. J. C. C. Payne, J.P. (Chairman), Dr. Fielden, Dr. Tweedie, Messrs. Saml. Gibson, J. Tate, T. N. Moffatt, J. H. Shaw, J. Guiler, S. Clothworthy, Saml. Acheson, W. J. Rankin, and R. W. McKnight. A letter of apology for non-attendance was read from Sir J. H. Haslett, M.P.—The Local Secretary read a letter from the Hon. Secs. of the Conference approving of the Local Committee's suggestion as to the date of the opening meeting of the Conference, suggestions as to entertainments, excursions, etc. Although the Secretaries to the Committee reported favourably on the progress of the Guarantee Fund, it was considered advisable to keep it still open for subscriptions, and a small committee was appointed to make a further effort to secure the amount aimed at at as early a date as possible.—The Students' Union buildings, in the grounds of the Queen's College, was considered by all a suitable place for holding the meetings. A sub-committee, consisting of the Chairman, Dr. Fielden, Dr. Tweedie, Messrs. S. Gibson and J. Tate, were appointed to wait on the College authorities to make the necessary arrangements. For an all-day excursion four excursion routes were suggested to choose from, and as it was found difficult to decide which was the most interesting, a sub-Committee was appointed to make full inquiries and report at the next meeting.—The Ulster Local Committee desire the members of the Conference to keep in mind Tuesday, August 9, for the opening

meeting, as that day has been specially fixed to give English and Scotch delegates the opportunity of crossing on Monday night, so as to avoid unnecessary waste of time—and they can assure their friends across the water that everything in their power will be done to make the visit to Belfast an interesting one.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

At a meeting held on January 21, Mr. W. B. Nelson in the chair, a discussion took place on

The Pharmacy Acts Amendment Bill,

when Mr. Perrédès moved, and Mr. F. A. U. Smith seconded, a resolution in favour of the Bill.—Mr. Chambers moved the following amendment, which was seconded by Mr. Morgan.

> That in the opinion of this meeting of the members of the School of Pharmacy Students' Association, Clause 3 of the proposed Pharmacy Acts Amendment Bill is inimical to the interests of the Pharmaceutical Society, and if carried into law would be calculated to lower the standard of pharmaceutical education in this country.

On moving the amendment Mr. Chambers said he had failed to find the jealousy between Major and Minor men to which some had referred. It had been said that pharmaceutical chemist, and not M.P.S., was the legal title of the Major man. Then he maintained that chemist and druggist, and not A.P.S., was the legal title of the Minor man. There was good reason for believing that the Council's principal reason for the production of this Bill was the hope that it would shortly lead to the entire abolition of the Major qualification. There would be reason in talking of perfect equality when there was a compulsory curriculum for the qualifying, and not as the President of the Society had suggested, for the optional examination. The fact that chemists and druggists eligible for membership did not join the Society clearly showed that the membership did not attract them. He asked the members in the interests of the Society and of higher education to protest against the Bill in its present form.—Mr. Wilson remarked that some might have objections to the Bill because it makes it possible for the whole Council to be composed of Minor men, but even admitting this to be a danger, if it should happen, yet what had history shown them? At the time of passing the 1868 Act, roughly about 10,000 men became chemists and druggists, eligible for membership, and therefore capable of electing seven of their number to the Council. But what had they seen? Since that Act became law at no one time had there been more than two members other than pharmaceutical chemists on the Council. Though they would share membership with all registered men, yet they would still have the title "pharmaceutical chemist," a title which they certainly ought to stick to, and one which at present there was, he thought, no fear of losing. The great aim of the Bill was consolidation of the Society, and all proposals for new grades in the way of fellowships and such like were entirely at variance with this principle of the Bill, as they would only produce more dissension in their ranks. He heartily supported the resolution proposed by Mr. Perrédès, and only hoped that if the Bill became law it might lead to that union and good-fellowship which they all desired.—Mr. Smith suggested that they should not dwell on fancied injustice to Major men, but reflect that the one main object for the existence of the Society was to join those engaged in pharmacy into one united whole. The fact that 70 per cent. of the pharmaceutical chemists subscribed to the Society, whilst only 20 per cent. of the chemists and druggists did so, showed that pharmacists were not a united body, and that membership offered a greater inducement for joining the Society than did Associateship. Some of their most gifted men were ineligible for the Council under the present condition of things, and the new Bill would remedy this.—Mr. Dewhirst agreed with previous speakers—supporters of the Bill—that the passing of the Bill would not bring in many more members, since only a small proportion of those chemists and druggists who could become members, did so, and that, therefore, its main object, consolidation, would be defeated. This "small and non-contentious" measure had already received a good deal of opposition from provincial associations. In the first place the designation "student-associate" was a curious glorification of the humble apprentice who knew little or nothing of pharmacy or science till a few months before entering for his Minor. Certain members of the Council had shown that it was their ultimate intention to have only one qualifying examination giving the title of pharmaceutical chemist. In this case it seemed hardly necessary for students to do more than pass the Minor now, as in due course they would all be made pharmaceutical chemists. Surely it was only fair that men who had kept up the tone of pharmaceutical education by passing the highest examination possible, instead of scraping through the Minor after several trials, should be distinguished by some such name as "Fellow," which was neither "tinsel" nor a "title." It was very just that Minor men should be eligible for membership, and that they should have ten instead of seven seats on the Council, but that the rest should be assured to the more highly educated men.—Mr. Matthews said that it was only a matter of common justice for all who passed the qualifying examination and paid the maximum subscription to be admitted to the membership of the Society. The Bill had his entire and hearty support.—Mr. Morgan contended that M.P.S. was associated by the public with the title pharmaceutical chemist. He considered that if such a body as the Royal College of Science granted the title of associate after three years' study, the chemist and druggist need not be ashamed of it. If a Council of Minor men were able to appoint and be appointed members of the Board of Examiners, the Major examination might be in danger. He did not think that for the sake of getting a few more members the Council should offend their loyal Major men.—Mr. Lescher, speaking in favour of the Bill, said it would remove the present anomaly and give all registered men direct representation on the Council. He considered this not a concession by Major men, but a reparation for past wrongs. All had the same interests at stake and all should have equal representation. He was afraid the Bill would not accomplish the bringing of many more members into the fold, as it scarcely went far enough, and only touched the fringe of an important subject.—Mr. Perrédès thought the draft Bill would prove a most useful measure. The fear that in the event of the Bill becoming law the Council of the Pharmaceutical Society might become composed entirely of chemists and druggists was groundless. As things are, if all who are entitled to become members were to join the Society they would outnumber the pharmaceutical chemists connected therewith, but though there might be seven chemist and druggist members on the Council, there are actually only three. The advantage to the Society of giving full membership to Minor men seemed too obvious to require explanation. If the chemist and druggist possessed the right of becoming a member he could become part and parcel of the Society, and if things did not work to his liking he would only have himself to blame for the neglect of his own affairs. The objection that Minor men should not be empowered to decide what Major men should or should not be examined in was met by the arrangements which obtain at the University of London, where B.A.'s, B.Sc.'s, etc., as well as those who hold a higher degree, have the right, under certain conditions, to become members of Convocation and have a voice in the administration of the affairs of that learned body. The suggestion had been made that the name "associate" implied as full qualification as in the case of the Royal College of Science. but whilst the associateship of the Royal College of Science is a very good qualification, the associateship of the Pharmaceutical Society is not a qualification at all. It is only the possession of the legal title of "chemist and druggist," which is a true qualification. Neither is membership of the Society in any sense a qualification. It has been proposed by those in authority that in a possibly near future there might only be one qualification in pharmacy. There is already only one legal qualification, and if that should be obtained on the results of an examination representing the present Minor and Major rolled into one, so much the better. This very course has suggested itself to their French neighbours, who propose to adopt the one qualification of "pharmacien de première classe" alone, and it seems to have been appreciated by them at its just value. Finally, it would be an anomalous thing to give the title of Fellow to Major men, inasmuch as only universities, colleges, and institutes grant the fellowship after examination following a prescribed curriculum of study. Most, if not all, societies which grant fellowships do so on purely honorary grounds, and it would be following a very poor precedent for the Pharmaceutical Society to do the same, or to inaugurate a system of granting fellowships on the basis of examination results only.—Mr. Chambers having replied to the points raised, the amendment was put to the meeting and carried, thirty-one voting for, and thirteen against.—Mr. Matthews proposed that the last clause of the amendment be omitted, but, on a division, only obtained three supporters.—The original amendment was then put to the meeting as a substantive motion, and carried by a large majority. The meeting then adjourned.

CHEMISTS' ASSISTANTS' ASSOCIATION.

A most successful musical and social evening was held on Thursday, January 20, at 73, Newman Street, Oxford Street, W., to inaugurate the second half of the session. The PRESIDENT, Mr. T. Morley-Taylor, on taking the chair, said he wished to call the attention of those present to that handsome piece of furniture —the chair—which was a New Year's gift to the Association from one of its oldest friends, Mr. Michael Carteighe. He was sure it would lend an added dignity to the office of its occupier, They could not look at it without thinking of its considerable intrinsic value, but he thought the donor would rather that they looked at it as a token of his sympathy with the Association's work, and as a tangible expression of his interest in the rising generation of pharmacists, which the Assóciation represented. He had great pleasure in proposing a very hearty vote of thanks to Mr. Carteighe for his generous gift.—This was seconded by Mr. J. C. Strother, and carried with acclamation. An exceptionally good programme had been arranged by Mr. Strother, to whom a cordial vote of thanks was accorded at its conclusion.

MIDLAND PHARMACEUTICAL ASSOCIATION.

The twenty-fifth annual ball of this Association was held in the Grosvenor Rooms, Grand Hotel, on Thursday, January 20. In point of numbers the attendance was not quite so good as previous years, but in all other respects the ball was a most enjoyable and successful one.—Mr. Jas. W. Gilmer contributed much to the pleasure of the company by the efficient manner in which he carried out the duties of M.C., and Mr. A. Gregory's band provided excellent music.—The PRESIDENT, Mr. F. J. Gibson (Wolverhampton), took the chair at supper, and was supported by Mr. J. Poole, Vice-President, Mr. Charles Thompson, Chairman of Committee, and other officials of the Association, together with many of the stewards.—A word of praise is due to the Hon. Sec., Mr. H. S. Shorthouse, who performed his numerous duties well, the whole arrangements being carried out in first-class style without a single hitch.

IRISH PHARMACISTS' ASSISTANTS' ASSOCIATION.

The fortnightly meeting of this Association was held on the 21st inst. at 67, Lower Mount Street. Mr. W. J. DUNWOODY, M.P.S.I., presided. The minutes of the last meeting were read and confirmed. Mr. W. M'Carthy, ex-president of the Association, wrote apologising for his inability to read his promised paper at present. He hoped to do so in the near future. Messrs. McMichael and O'Toole were elected members. The Hon. Treasurer announced that a substantial profit had accrued from the concert held on the 7th inst. in the XL Café. Mr. Turner and the various artistes who assisted at the concert were thanked for their kindness. The arrangements for holding the annual dance on the 26th inst. in the Rotunda were completed, and Messrs. Johnston and Dunwoody were appointed M.C.'s for the occasion. Messrs. Turner and Hunt consented to act as door stewards. Mr. O'Sullivan suggested that a distinctive crest or seal be adopted by the Association, which had latterly become a powerful body. He instanced the Pharmaceutical Society, the College of Surgeons, and other bodies possessing crests, and thought the Association might follow suit. The matter was noted. The remainder of the evening was devoted to a discussion on the following subject :—"Is a Pharmaceutical Training Beneficial to the Physician?" Messrs. O'Sullivan, Johnston, Turner, Dunwoody, and other members contributed to the discussion, and as a result the voice of the meeting was unanimously in the affirmative of the question.

EDINBURGH CHEMISTS' BALL.

The fifteenth annual ball under the auspices of the Edinburgh District Chemists' Trade Association took place on Thursday, January 20, 1898, in the Freemasons' Hall, George Street. There were seventy couples present. Messrs. G. H. C. Rowland and T. Jardine acted as M.C.'s, and the music was supplied by Gilchrist's band. Supper was purveyed by Messrs. Hunter and Glover in two rooms simultaneously, an arrangement that proved more satisfactory than the former plan of two consecutive suppers. —Mr. JOHN BOWMAN, President of the Trade Association, occupied the chair in one room.—Mr. RUTHERFORD HILL proposed the toast "Success to the Edinburgh Chemists' Ball," coupled with the name of Mr. Bowman, who replied.—In the other room Mr. DAVID MCLAREN, Vice-President, occupied the chair, and proposed a vote of thanks to Mr. Rea J. MacDougall, convener of the Ball Committee, to whose excellent management the entire success of the gathering was largely due.—Mr. MACDOUGALL replied.—The pleasures of the ball room were then resumed and kept up merrily till an early hour on Friday.

BRIGHTON JUNIOR ASSOCIATION OF PHARMACY.

On Wednesday, January 19, this Association held their usual fortnightly "Social" at Newburgh Hall, 31, Cannon Place, with the President (Mr. C. A. Blamey) in the chair. There was a very good attendance, and with a capital programme well sustained, a most enjoyable evening was the result. The duties of accompanist were most efficiently carried out by Mr. E. A. Hedgcock.

MANCHESTER PHARMACEUTICAL ASSOCIATION.

The complimentary dinner to the Lord Mayor of Manchester (Mr. Alderman Robert Gibson, Ph.C.), which took place at the Albion Hotel, Manchester, on Wednesday evening last, was in every respect a great success.

Alderman Robert Gibson.

The gentleman whom the Manchester Pharmaceutical Association has delighted to honour is a member of the trade whose private duties and business engagements have not been allowed to interfere with a large amount of devotion to the public service which has culminated in the mayoralty of one of the most enterprising cities in the British Empire. The Manchester pharmacists have not been behind-hand in adding their quota to the honours which have fallen so thickly upon Mr. Alderman Gibson, who has for so many years past taken so great a part in the municipal and social life of Manchester and Salford. It may interest our readers to know that Mr. Gibson was born at Carlton-upon-Trent in February, 1832, and at the age of sixteen was apprenticed to Mr. (afterwards Dr.) Pettinger, of Manchester, who had then a chemist's shop in Newark. In 1850 he came to Manchester, and was for two or three years an assistant to Messrs. Mottershead and Roberts in St. Mary's Gate, afterwards commencing business on his own account in Preston Street, Hulme. In 1867 he purchased a small building in Erskine Street, and began the business of a medicated lozenge manufacturer, which has since developed into large works and embraces a most important industry. Mr. Gibson was elected to represent St. George's Ward in the Manchester City Council in 1882, and amongst other things has done signal service on the Baths, Free Libraries, Waterworks, and Gas Committees. Mr. Gibson was for eight years a member of the Stretford Local Board, and held the position of Chairman two years, his resignation on that body being received with universal regret locally. Having in due time been elected to the dignity of an Alderman of the city, he was, in November last, unanimously elected Lord Mayor in succession to Alderman Ffoulkes Roberts, and although comparatively new to the duties of the office, he has given promise of fulfilling them in a manner which will leave nothing to be desired on the part of the citizens generally. In politics Mr. Gibson has been described as "an ardent Liberal," and there is no doubt that he has rendered yeoman service to the party in South-west Manchester, which, however, in opposition to that distinguished man of science, Sir Henry Roscoe, chose at the last election to transfer its electoral affections to the Marquis of Lorne. Socially, Mr. Gibson is exceedingly popular with all classes, and is highly respected by his masonic brethren who meet at Old Trafford. Although highly honoured by them, we believe he has not yet been accorded "provincial honours," but no doubt those will come in due course. As a churchman he acted with loyalty by appointing as his chaplain the Rev. Kenneth L. Jones, vicar of St. Bride's, Old Trafford. It may be mentioned that Mr. Gibson was an active worker in connection with the Church, and on retiring from the position of churchwarden—an office he held for a number of years —was presented with an illuminated address, expressive of the esteem and regard in which he was held by the officers and congregation.

The Dinner.

Thanks to the excellent management of Mr. Harry Kemp, the details were perfection itself, and both that gentleman and the Committee are to be sincerely congratulated on the result. The menu was exquisite, and did credit to the manager of the "Albion" (Mr. Burkhardt), being in every way calculated to maintain the reputation of this well-known house. There was also an excellently arranged programme of songs and glees carried

out by the Abbey singers—Messrs. Cuthbert Blacow, W. T. Haworth, W. H. Kershaw, and J. W. Maltby, Mr. C. Vickers acting as accompanist.—Mr. G. S. WOOLLEY, the respected President of the Association, occupied the chair, supported by the Lord Mayor, Mr. Walter Hills (President of the Pharmaceutical Society), Mr. Newsholme (Vice-President), Mr. Alderman B. Robinson, J.P., Mr. E. Evans, Junr., J.P., Dr. Symes, Dr. Paul, Professor Leech, Professor Young, Mr. Rymer Young, Mr. S. R. Atkins, J.P., Mr. J. Bain, and many other friends.

After the usual loyal toasts had been given from the chair and duly honoured, the PRESIDENT (Mr. Woolley) proposed the toast of the evening, "The Lord Mayor of Manchester," and said their congratulations must be marked with enthusiasm, seeing he was the first pharmaceutical chemist who had ever occupied the position of Lord Mayor in that or any other city in the United Kingdom. He had also been the means of introducing into Manchester a new industry. For that alone he deserved the thanks of his fellow citizens, for the man who did what he could to promote the prosperity of the city deserved well of his fellows. Their guest, in addition to minding his own business, had devoted a large and generous portion of his time to promoting the comfort and happiness of his fellow citizens. He had taken a leading part in the management of the gasworks, and succeeded their old friend, Mr. Joseph Brooks, also a pharmacist, as Chairman of the Gas Committee. In that position he had brought to bear broad-minded common sense, and his administration had been attended with success to the city. He had also had to undertake the electric installation, which had been successful and had now become a separate department. He took it that this was a record for any man to be proud of. Alderman Gibson was the type of the men who had done so much for the progress of Manchester of to-day. He hoped the Lord Mayor and his family would be spared for many years, to look back upon his year of office of Lord Mayor with pride and satisfaction.—The LORD MAYOR had a most enthusiastic reception, the company rising and cheering again and again. He said words failed him adequately to express his sense of the compliment paid to him. After fifty years' connection with the trade, it would have been impossible outside London to have got together such an assembly as that, uninfluenced as they were by motives of gain. He thought that the druggist of to-day held a far higher social position than he did fifty years ago, and that he said in the presence of the President of the Pharmaceuticel Society, to which Society it was mainly due. It had been said that chemists of to-day did not make as much money as they used to do. He disputed that altogether. There was more money made in this country than ever before, and in that the chemists and druggists participated. Of course, they had a right to grumble, as all Englishmen had, but given industry and ordinary economy, he would rather be connected with the drug trade of to-day than of fifty years ago. He was proud of his position, and he thanked them for the generosity with which they had placed upon the topmost stone of the municipal edifice that bright jewel of their affection, which would be more appreciated by him than anything which might happen to him during the year of his mayoralty.—Dr. LEECH proposed the toast of "The Pharmaceutical Society and Local Associations," and bore testimony to their usefulness generally. He urged the necessity of scientific education, and advocated that students should associate themselves with Owens College, which was the first in the Kingdom to establish a pharmaceutical school. The medical profession was rising in the estimation of the public at large, and they had to thank the Council of the Pharmaceutical Society for the help they had rendered lately in producing the Pharmacopœia. He also praised the work of local associations, which had done so much to help on this work.—The toast having been heartily drunk, Mr. WALTER HILLS (President of the Pharmaceutical Society) in responding, complimented the local associations on the work they had done. Speaking generally, the Society had done a great work in the cause of education, but he looked forward to the time when they would have a compulsory curriculum, and he thought they should encourage young men to study from the first day of their apprenticeship to the close. Although the Council had done nothing heroic during the past few years, yet it had done much for the protection of the members in a quiet way. They must remember the Council had something like a hundred cases before it in a year in which proceedings had to be taken against law breakers, and those proceedings were taken in the public interest and also in the interests, at the same time, of qualified men. In that way the Pharmaceutical Society was doing a great deal for the whole craft. They must fight against bogus companies; against the one-man company. Pharmacy, however, could not hold the position it ought in this country until they had the principal dispensing in their own hands. The Pharmacy Bill was a little baby of his own; the object of the draft Pharmacy Bill was to get more unanimity among themselves. It was to secure consolidation of the Society and to enable them to have more influence in any action they might take. It was evident, when they carefully considered the composition of the Society, that this step was very necessary, and he quoted figures showing that the membership of the Society was decreasing, which it ought not to do. The governing body ought also to have a wider representation. The Bill would be one of simplification, and he trusted they would give it their support.—Mr. NEWSHOLME also responded, and said the work of the Pharmaceutical Society was not done for the members only, but for the whole of the trade. He defended the work of the Pharmaceutical Society.—Alderman B. ROBINSON proposed "The Medical Profession," which was responded to by Professor A. H. YOUNG, who congratulated them as members of the Manchester Pharmaceutical Society on having been able to compliment the Lord Mayor on the honour which had fallen upon him.—Mr. HARRY KEMP proposed "The Visitors," which was responded to by Mr. E. EVANS and Mr. S. R. ATKINS.—The toast of "The President" concluded a very pleasant evening.

BRISTOL PHARMACEUTICAL ASSOCIATION.

The annual meeting of this Association was held at the University College on January 26, Mr. B. ALLEN, President, in the chair.—The Treasurer's report showed that after a donation of £5 5*s*. to the Benevolent Fund of the Pharmaceutical Society there was a small balance in hand.—The HON. SECRETARY read the following report:—

Report of Council, 1897.

"The Council has again to report a year of quiet progress in the cause of pharmaceutical progress. The number of members of the Association remains about the same, though we have, unfortunately, lost several friends by death and removal from the city. The feature of special interest to record this year is perhaps the dinner held in March last. This social event was well attended, and was so much appreciated that it is proposed to make it an annual institution. A meeting was held in April at which it was unanimously decided to support the new Bye-laws proposed by the Council of the Pharmaceutical Society, which regulations having received Government approval are now in active operation. A meeting was held in November to consider the Amendment of the Pharmacy Acts, when resolutions were passed very much on the lines of the Bill which is now to come before Parliament. The Council regret there were an insufficient number of students desirous of attending a materia medica class to justify the class being held this winter, but they are glad to know that a good many pharmaceutical students are availing themselves of the lectures given at University College and Technical College. The Council, in closing their report, desire to express their regret at the recent death of an old member of the Association, R. W. Giles. The records of the Association show that Mr. Giles was one of the earliest members, and as long as he lived at Clifton manifested the greatest interest in the work of the Association."

Mr. PITCHFORD moved, and Mr. PLUMLEY seconded, the adoption of both reports, which were unanimously carried.—Mr. H. E. BOORNE was elected a member of the Association.—Mr. PITCHFORD proposed and Mr. YOUNG seconded a hearty vote of thanks to Mr. B. Allen for the efficient discharge of duties as President for three years, which Mr. ALLEN suitably acknowledged, but desired to be relieved of the office after serving so long.—The following were elected as officers for the ensuing year:—President, Mr. G. W. Isaac; Treasurer, Mr. J. Stroud; Hon. Sec., B. Keen; Council: Messrs. B. Allen, T. Buxton, W. Berry, H. E. Boorne, J. Chandler, W. Pitchford, J. G. Plumley, G. T. Turner, E. Young, J. W. White.—Mr. BUXTON proposed, and Mr. YOUNG seconded, a resolution that as the dinner held last year was so successful, it was desirable to arrange for a similar gathering this year. It was subsequently decided that Wednesday, March 16, was the most suitable date, and a small committee was appointed to carry out details.

LETTERS TO THE EDITOR.

Capsaicin, Thresh.—Capsacutin, Mörbitz.

Sir,—Anent the matter of the debated active principle of capsicum, as described by Thresh in 1876 and by Mörbitz in 1897 (*Pharm. Zeitsch. für Russl.*, 1897, xxxvi., 369, and *P. J.* [4], v., 298), it is only fair to the latter investigator to point out that the formula deduced by him for his capsacutin, $C_{35}H_{54}N_3O_7$, has no resemblance to that calculated by Dr. Buri (see *P. J.* [3], vii., 473) for capsaicin prepared by its discoverer, namely, $C_9H_{14}O_8$.

Twickenham, January 22, 1898. J. Oldham Braithwaite.

The New Pharmacy Bill.

Sir,—I fail to see the point of your reasoning in the footnote appended to Mr. R. H. Bell's letter. You state that "the Major man as M.P.S. is now indistinguishable from some 600 registered persons, who are also M.P.S., though not Major men." With all due deference to your opinion, I maintain that they are distinguishable. Is it not a fact that those 600 men are registered M.P.S. by virtue of their having been in business prior to December, 1868, having paid the necessary fees? And is it not impossible to obtain the coveted M.P.S. to-day unless a man has either passed the Major or was in business prior to 1868? It was held out to the present Major men that, as a reward for their passing the higher examination, that they should have the privilege of becoming M.P.S. and Ph.C's. I say, then, in justice to them, if you raise the qualification of the Minor man, you should confer a higher degree upon the Major man. I am quite in favour of the Bill and desirous for the consolidation of the Society. At the same time, I do not think the rights of the Major men should be ignored.

Faringdon, January 22, 1898. W. R. Cook, Ph.C., M.P.S.

*** For many weeks past we have endeavoured to emphasise the fact that no question of qualification is involved in the proposal to amend the Pharmacy Acts, though apparently with but indifferent success, judging from the above letter. To re-state the facts appended in the note to Mr. Bell's letter last week, more than a fourth of the members of the Society are not pharmaceutical chemists and have passed no examination, whilst there are in all more than 6000 registered chemists entitled to be members of the Society, and of those nearly 4000 are not pharmaceutical chemists and have not been examined. Where, then, can be the harm in admitting men as members who possess a full legal qualification? How one member can be distinguished from another member, as such, is a problem that we doubt even Mr. Cook's ability to solve, since in a democratic body every member must of necessity be entitled to all the privileges of membership without distinction of any kind whatever. No such reward as suggested has ever been held out to "the present Major men." Mr. Cook is also quite in error in assuming that any attempt is being made to raise the "qualification" of Minor men, for the letters "M.P.S." indicate neither a qualification nor a degree. The only legal qualification under the Pharmacy Act, 1868, is that indicated by a person's name appearing in the Register of Chemist and Druggists, and pharmaceutical chemists possess no higher legal qualification than chemists and druggists. With regard to the question of a higher distinction for pharmaceutical chemists, that is worthy of, and will doubtless receive, the most careful consideration at the proper time, but that question is not at present before us, and may safely be left to the future. [Ed. *P. J.*]

Sir,—I would not again take the liberty of intruding on your correspondence pages, but for the fact that the occasion is one in connection with which every true and sympathetic brother in pharmacy should try and disabuse his mind from anything approaching selfish and interested motives in discussing the various phases of this short, but to my mind effective, Bill, and inasmuch that it is a primary endeavour to secure a greater and, I trust, a far happier state of consolidation in pharmacy, an already sadly disorganised body. This, I say, must, if necessary, be my apology for so soon again intruding on your valuable space. The object I have in view in addressing you is to try and attract the attention for a few moments of our "Major brethren," and I propose to use as far as I can similar language to that which I employed at our Plymouth meeting, when we discussed (Minors and Majors) our contemplated altered positions under this new Bill. Personally, I regard the proposed salient alterations, to form themselves into a give-and-take policy by both pharmaceutical sections. I mean, of course, Minor and Major men. As a Minor man I strongly objected at that meeting and used argument in the debate to make my views clear, that it would be most unfair to put mere boys, on their entry into the domain of pharmacy, in a position already for many years occupied by men who had in many instances worked hard and had spent often much time, and also much money, to attain the position of associate of the Pharmaceutical Society. That position, I am glad to say, has been safeguarded by the insertion of the words "student-associate" into the Bill. This suggestion comes from one of your members—Mr. Johnson, a pharmaceutical chemist. Minor men generally have no desire to usurp the position worthily fought for and obtained by our Major brethren. I said at that meeting, in answer to a pharmaceutical chemist, that personally I utterly detested, as did many other Minor men, to receive a position we had never worked for or honestly obtained. Such a position for any A.P.S. to occupy who had not passed the necessary examination would be to make himself the laughing-stock of all honest men. Some of your correspondents are, I am sorry to say, somewhat bitter in their remarks to the Minor men, but when, sir, such a splendid pharmacist as Mr. Barnard Proctor can act so magnanimously towards the Minor men it must surely put to utter shame some of the less shining lights in pharmacy who deign to address you, not knowing, or appearing desirous of knowing, the true state of our positions in the world of pharmacy. We are by far the greater supporters of the Pharmaceutical Society, and, naturally enough, feel we are worthy of a greater share in the administrative work of that Society. Some of the Major men have endeavoured to argue this question in the most childlike manner, and also in the most unbusinesslike language I have ever encountered in the whole of my career in the business of pharmacy. I will, with your permission, conclude with this observation to the Major men; it is also a remark I made at our meeting to the pharmaceutical chemists present, namely: Personally, after a life-long connection with pharmacy, I have nothing, from a business point of view, to feel ashamed of that good old name, "Chemist and Druggist." It answered sufficiently for my late father, and will act, I am quite sure, amply sufficient for myself and the public. The world at large understands the designation to a minute degree, but not so the words pharmaceutical chemist, who, although a more learned man from a scientific point of view, is not, I make bold enough to honestly say, and never will be, I am afraid, thoroughly appreciated and understood in his true position by the general public. By that you will infer that I fail to perceive that Minor men will derive any great benefit by any such alteration. I think the boot can safely be said to be on the other leg; any way, it must be a spirit of concession on the part of both sections to derive any permanent good to a profession or business which has passed through the severest possible trials to sustain its honoured position held in the dear old days of yore, and to this end may all Minor and Major men heartily join in wishing.

Devonport, January 22, 1898. Philip A. Kelly.

Sir,—I fail to see what reasonable objection can be advanced by any Major man to the proposed new Pharmacy Bill. Among a large number of Major friends I never knew one that took his Major qualification for the sake of getting the title M.P.S.; they either undertook the Major work for the sake of the additional experience or for the title pharmaceutical chemist. Personally, I feel sure that the outside public do not generally know the actual difference attached to the titles associate and member of the Pharmaceutical Society, but do generally recognise the title pharmaceutical chemist as a superior one. Believing that the proposed change is a just one and likely to benefit our Society,

Grassendale, Liverpool, Jan. 25, 1897. Thos. S. Wokes.

Sir,—In your footnote to my letter in last week's Journal you state that there are 600 registered men who are M.P.S. I suppose it is generally understood that this class will get less, and need cause no anxiety. The 3000 possible holders, I presume, are honorary members, and I do not look upon these as competitors.

Sunderland, January 24, 1898. R. H. Bell, Ph.C., M.P.S.

*** The 3000 possible members of the Society are registered chemists and druggists who were in business before August 1, 1868, and their legal qualification is identical with that of pharmaceutical chemists. [Ed. *P. J.*]

Sir,—As a member of the Society will you allow me to express my opinion regarding the much-abused Pharmacy Bill. The promoters say that it is intended to be a "consolidating," "non-contentious," and non-final measure. Perhaps a more final measure would be more "non-contentious" and more "consolidating," and also more consoling to the trade. The correspondence has been directed chiefly against Clause 3. There are (1) Those who are in doubt regarding its "consolidating" effects. (2) Those who hold that the title (?) M.P.S. belongs solely to "Major" chemists, and who object to share it with their lesser brethren, and (3) Those who are not so exclusive as Class 2, but in return for M.P.S. they want a distinguishing title such as a "Fellowship." Now, sir, I do not object to the Bill so much

for what is in it, as for what is not in it. Mr. Welborn's scheme in your issue of December 11 is very good, but it is too radical, and is not feasible. The conferring of the degree of "Fellowship" on pharmaceutical chemists is not desirable, at present at least. I regard "student-associate" as very befitting terms for a qualified apprentice. In the beginning of the next century we may hope that many of our "student-associates" will be able to distinguish themselves in science. The degrees of B.Sc. and F.I.C. may be taken quite as easily as the present title of pharmaceutical chemist, and their college certificates will open up the way for such attainments. These degrees are recognised by the professions and the general public as marks of scholarship. By all means let the pharmaceutical chemist retain his title, but let no more pharmaceutical chemists be made. The Preliminary has been abolished, let the Major examination be abolished also.

Some time ago I wrote in favour of dividing the Minor examination—in the interests of assistants and the trade generally. I would now suggest that the Minor examination be the qualifying examination, and let it be divided into two parts. First grade, to be taken at the age of nineteen and to be tacitly recognised as an assistant's qualification; second grade, to be taken at the age of twenty-one (but let there be one year at least between first and second grade examinations). The fee for each grade to be £5 5*s*., and the second grade to confer the title of pharmacist. This seems to be the most appropriate and the most popular designation. This title to confer all the privileges at present possessed by pharmaceutical chemists, chemists and druggists would then be designated pharmacists. The subjects of examination would include: First grade, elementary botany, inorganic chemistry and physics, pharmacy and dispensing; second grade would be a more advanced examination in these subjects, with the addition of organic chemistry. The Major examination is not liked. Those who pass it think it is not worth the time and money spent upon it. Pharmaceutical chemists are not rated by the public at their true—I had almost said intrinsic—value. The present is a favourable opportunity for bringing about a reform something on the lines above indicated, which would be as "non-contentious" as the present meagre attempt by the Council, and would at the same time be for "the safety of the public," the honour of the Society, and the good of all.

Edinburgh, January 25, 1898. W. S. Glass.

Sir,—Since most of the opinions in favour of the draft Pharmacy Bill seem to come from members who are in a position to ignore its commercial aspect, and from chemists and druggists who do not intend to seek the higher qualification, while the opposition is represented chiefly by pharmaceutical chemists who have an eye to the actual monetary value of their titles, and also from men seeking to pass the Major examination, perhaps the opinion of one of the latter may be of service. Is it fair to offer a man distinction in return for time and money spent, and then, to serve another doubtful purpose, to take it away? The whole question turns on the commercial value of "M.P.S., Pharmaceutical Chemist," and since few business men can afford to spend time and money on an empty honour, the extent of the opposition proves that it is matter of fact, and I think the Society should try to keep the distinction as clear as possible, instead of hopelessly muddling it. I am heartily in favour of the idea of consolidation, and I think the same end could be obtained by giving associates (or, still better, licentiates) reasonable representation on the Council, which would bring all into the Society who really cared for its welfare. The student-associate clause is not worthy of remark. Why not errand-boy associates? The position of members who are not Major men cannot be used as an argument in favour of the Bill, because the option of membership was given to them to meet a difficulty which no longer holds good.

Hulme, Manchester, January 25, 1898. A. Rhead.

Sir,—Your correspondent Mr. Schollar misrepresents my statements to such an extent, though he carefully avoids the points at issue, that I feel bound to answer him. In the first place my remark concerning the requirements of the Minor examination could not possibly be translated into a reflection on the acquirements of Minor men. I know too many capable Minor men to cast any such reflection on their abilities. That "the standard of scientific work required for the Minor" is low may be seen not by comparison with graduation examinations, but even with the requirements of the Science and Art Department in science, the intermediate stages of both chemistry and botany exceeding the Minor syllabus. On the other hand, I certainly believe the standard to be high enough for all present purposes. Your correspondent then states that the Pharmaceutical Society is not regarded as a learned Society. I contradict that. The Medical Council recognise it by inviting a representative to sit on the Pharmacopœia Revision Committee, the Royal Botanic Society by electing our President an honorary member of their Society, etc., etc. Again, I would refer my pedantic critic to the remarks made by the various eminent scientists who have delivered their inaugural addresses to the students of the Society's School. Such men are, in my humble opinion, quite "capable of expressing an opinion." With respect to the personal remark your correspondent makes concerning my "delusion" as to the value of the Ph.C. qualification, I venture to suggest that a man who possesses a title knows by experience the value other people attach to such title better than the man who has it not. Anyhow, I would remind your correspondent that the whole (M.P.S.) is greater than its part (A.P.S). Finally, he requests information as to where indications of success in opposing the Bill can be found. Universally, I refer him to your columns. Locally, I refer him to the meeting of the Manchester Pharmaceutical Association, and other chemists at the Victoria Hotel last week, where by their presence and communications twenty-one chemists and pharmacists gave their opinion against the Bill, they constituting a majority over the supporters of the Bill. Unfortunately circumstances prevented many from being present when the vote was taken. There are, however, other indications, concerning which I do not feel disposed to enlighten your correspondent just at present.

Manchester, January, 24, 1898. F. Pilkington Sargeant.

Sir,—I consider the Council is trying to attain its object in a most unsatisfactory manner, *i.e.*, at the Major man's expense by making his privileges common property after he has wasted time and money, which in these competitive times can be ill afforded. He certainly ought to be compensated by extra privileges. According to the Editor's remarks (*vide P. J.*, January 22, p. 85) there are now 3000, other than pharmaceutical chemists, who could enjoy the title M.P.S., yet they do not support the Society. This does not look promising to the new Pharmacy Bill (if passed). The future aspiring Minor will certainly not trouble to entertain the Major examination for an empty title. As the Act stands it will do more harm than good to the Society in my opinion.

Walthamstow, Jan. 25, 1898. Horace Southall, M.P.S., Ph.C.

Prescription Stamps.

Sir,—I dispensed a prescription to-day covered front and back with thirty-two stamps of chemists at whose establishments it had been prepared. The size of the paper was 6 by 4 inches. Query, what are future ones to do? In this instance, at all events, it would be a great advantage if the stamp was a single line of, say, two inches in length. Surely this must be a record case.

Stonehouse, Plymouth, January 22, 1898. Jas. Cocks.

On Re-Copying Prescriptions.

Sir,—The case against Mr. Julius Cæsar, reported in last week's Journal, p. 75, raises the question, what should be done when medicine containing a scheduled poison and ordered by a prescription is to be repeated? You suggest that "the prescriptions should be re-copied on every subsequent occasion that the medicines are dispensed," but in most cases only the bottle is sent to be re-filled, or the registered number in the prescription book is sent as an order. The prescription is not sent. Surely it would be a work of supererogation in such cases to copy the prescription from one part of the book to another. Tracing the poison, and the quantity of it sold, is the object of the poison clauses of the Pharmacy Act. Would not the entering of the patient's name in the prescription book with the words, Rep. Mist. No. 9999, and the initials of the dispenser attached, be considered to answer the requirements of the law? This would be carrying out the system of the old apothecary. His prescription book was his day book and prescription book combined. Would not this fulfil our obligations?

London, January 26, 1898. A. F. Goode, Ph.C.

OBITUARY.

MICHAEL CONROY.

By the death of Mr. Michael Conroy, of Liverpool, on Wednesday, the 19th inst., the English-speaking pharmaceutical world has lost one of the best known and most painstaking and conscientious workers, who by the exercise of rare qualities of mind and body had made a reputation such as falls to the lot of but few men to enjoy. From his earliest youth he had been connected with pharmacy, gaining his first experience in the manufacturing branch in the tincture room of Messrs. Clay, Dod and Case, Liverpool, some thirty years ago. After hard uphill work, he succeeded in gradually qualifying himself by dint of close study in his somewhat scanty leisure moments for the more scientific and important branches of laboratory work, finally accepting a position with Messrs. Evans, Sons, and Co., under Mr. Reginald Evans, whose right-hand man he soon became, and whom he succeeded as laboratory superintendent. His ability soon made itself conspicuous, and by degrees he brought the manufacturing departments of his firm to such a pitch of perfection that it is doubtful if there is at the present time to be found a better managed laboratory or one of such capabilities as regards quality and quantity of output. Though his experience was gained in manufacturing pharmacy, he was utterly unselfish in communicating his results to the retail trade by means of articles in the journals and by papers read at various times before the Liverpool Chemists' Association and at the Pharmaceutical Conferences. Perhaps the first of these papers was one read at a meeting of the Liverpool Chemists' Association in 1879, on an "Improved Formula for Fluid Extract of Yellow Bark." A most valuable, and at the same time, simple test for the purity of olive oil was elaborated in 1880, still known as "Conroy's Test." The method for the estimation of the morphine content of opium adopted by the 1885 Pharmacopœia was worked out by Mr. Conroy from that of the United States Dispensatory, and embodied in a communication to the Liverpool Chemists' Association in 1884. Other eminently practical and useful notes on "Sandal Wood Oil," "Adulterations of Lard," and "Castor Oil," "Determination of the Proportion of Alkaloid in the Stalks and Leaflets of Jaborandi," "Testing of Extracts of Malt," and "Adulteration of Copaiba," just to enumerate a few, were published from time to time, all of them bearing the imprint of that careful work and knack of turning all his knowledge to practical account so characteristic of their author. The Liverpool Chemists' Association, of which Mr. Conroy was a past President, owes not a little of the high reputation it has among provincial pharmaceutical bodies for the standard of its papers to the work he did for it during the last twenty years, and many of its younger members, with whom Mr. Conroy was a great favourite, will sadly miss his kindly encouragement and much-valued criticism. The illness which culminated in his death had been afflicting him for some time, and although he was well enough to make the journey down to Brighton last autumn, the change did him very little good, so that his death, though sudden, was not wholly unexpected. A large and representative gathering of pharmacists attended the funeral on Saturday afternoon, Jan. 22, at Wallasey Cemetery, Messrs. Evans, Sons, and Co. being represented by Messrs J. J. Evans, J.P., Edward Evans, jun., J.P., Wm. P. Evans, J. N. Evans, and Everett Evans, as well as Messrs. W. Willings, John E. Parker, J. Shacklady, and T. H. Wardleworth. The Liverpool Chemists' Association sent a deputation, including the President, Mr. John Bain, and Messrs. Edward Davies, F.C.S., F.I.C., A. C. Abraham, F.C.S., F.I.C., H. O. Dutton, J. J. Smith, and Dr. Symes. Mr. Conroy leaves a widow and daughter and two sons, one of whom, Dr. James T. Conroy, a technical chemist with Dr. Hurter, of the United Alkali Co., had a very successful and brilliant career at the University College, Liverpool, and in Germany.

Intimations of the following deaths have also been received :—

FERGUSON.—On January 8, John Ferguson, Chemist and Druggist, Belford. Aged 67.

KEER.—On January 14, Thomas Henry Keer, Pharmaceutical Chemist, London, W. Aged 46. Mr. Keer had been a member of the Pharmaceutical Society since 1876.

HART.—On January 19, George William Hart, Chemist and Druggist, Hull. Aged 69.

THORNTON.—On January 21, Edward Thornton, Pharmaceutical Chemist, Exmouth. Aged 88. Mr. Thornton carried on the business of a chemist at Lyme Regis, Dorset, for about fifty years, where he held the office of registrar of births and deaths. He was a member of the Pharmaceutical Society from 1853 to 1888, and was the Local Secretary of the Society for the district.

THORNTON.—On January 23, Eliza Thornton, widow of the late Mr. Edward Thornton, Pharmaceutical Chemist, Exmouth. Aged 85. Mrs. Thornton only survived her husband two days, and, owing to her own illness, was not aware of his death.

ANSWERS TO QUERIES.

Special Notice.—*Scientific, technical, legal and general information required by readers of the 'Pharmaceutical Journal' will be furnished by the Editor as far as practicable, but he cannot undertake to reply by post. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of senders. Questions on different subjects should be written on separate slips of paper, each of which must bear the sender's initials or pseudonym. Replies will, in all cases, be referred to such initials or pseudonyms and the registered number added in each instance should be quoted in any subsequent communication on the same subject.*

NEW B.P.—Yes, it will be in force by the time you mention. Meanwhile, however, do not omit to study the existing work. [*Reply to* A. H. P.—3/33.]

FERN.—It may be a young frond of *Aspidium filix-mas*, but in the absence of sori and of scales on the rachis it is impossible to say with certainty. [*Reply to* ASSOCIATE.—3/30.]

PARSLEY BREAKSTONE.—This is *Alchemilla arvensis*, the Ladies' Mantle, sold by herbalists as "parsley piert" or "parsley pert." It is used in cases of gravel, and can be obtained of Messrs. Potter and Clarke, Artillery Lane, E. [*Reply to* C. E. S.—4/5.]

LECTURES ON THE TELEGRAPH.—They have not been reported in full, and we are unable to say whether they will be published in book form. Repeat your question in a few months. We are glad you find the "Students' Page" useful. [*Reply to* J. P. G.—3/28.]

FIRST EXAMINATION.—Having already passed the Society's First Examination, you will not be expected to pass it again, but it will do you no harm to study the extra subjects if you have not already done so. [*Reply to* ARVON.—4/4; F. P.—4/6; PRELIM.—4/10; QUERY.—4/14; POTASH.—4/11; RES.—4/12; RHEI.—4/16; F. H. R.—4/17.]

STRAMONIUM SQUILL.—Surely you could, without much waste of brain power, have arrived at the conclusion that the words "Stramonium Squill" in your copy of the syllabus only required separation by a comma to make the meaning plain. Thus—"Stramonium, Squill." [*Reply to* H. J.—3/32.]

TESTS FOR "OLEUM CETACEI."—We presume by this you mean sperm oil. The following are the characters of the pure oil. Sp. gr. 0·875 to ·883; commences to deposit spermaceti at 43° F. and stearin at 17° F. Koettstorfer's number 130 to 134. Unsaponifiable fatty matter, soluble in ether, 39 to 41 per cent. Compare the viscosity with that of a genuine sample of sperm oil, also the heat produced on mixing a definite quantity with sulphuric acid. African fish oil used as an adulterant gives a much higher temperature than pure sperm oil by this test. You will find full technical details for carrying out the above tests in Allen's 'Commercial Organic Analysis,' vol. ii. [*Reply to* S. P. S.—3/6.]

GLYCERIN SUPPOSITORIES.—You will see an answer to your query in the Journal for Jan. 8, page 44. The stearin soap basis there described is very good for suppositories which are not required to be kept for long. You ought to obtain a perfectly bright and clear basis by using good French gelatin for the B.P. formula. The brand "Gold Thread" gives very good results. You need not boil this with egg albumin. Other kinds of gelatin may require that treatment, but you certainly will not filter any gelatin well through paper. Flannel, wetted with boiling water and thoroughly squeezed out, is the best filtering material. [*Reply to* W. M.—3/14.

COMMUNICATIONS, LETTERS, etc., have been received from

Messrs. Allen, Bathurst, Bell, Bingley, Bostock, Branch, Branson, Chalmers, Cocks, Cooke, Diaper, Downing, Eberlin, Ellington, Ellis, Gair, Gardner, Gibson, Glass, Hetherington, Hill, Ingham, Jackson, Johnson, Kelly, Lee, Matthews, Murray, Peach, Pearce, Porter, Reed, Reynolds, Rhead, Sargeant, Shorthouse, Simpson, Southall, Summers, Tayler, Thompson, Watson, Wilkinson, Wokes.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

Preparation of Crystals.

W. Tassin has reviewed the several methods of preparing crystals for the determination of their geometrical and physical constants, and groups them under the three heads :—Solution, sublimation, and fusion. Solution.—In the first class, crystals of a substance are prepared from its solution in a liquid by evaporating and cooling the solution, by the reaction of soluble compounds, or by chemical changes in general. The general rules to be observed are that crystallisation must proceed as slowly as possible, the solution must be of the least viscosity possible, the crystallising substance must be present in the solution in the greatest quantity, removal of the crystals should preferably be effected when the solution is at its minimum temperature, and crystals desired for measurement must be quickly and completely dried in order to prevent corrosion or etch figures forming. Sublimation.—In this case crystals may be obtained direct, or a non-volatile compound may be obtained as a result of chemical action between two or more volatile substances, or from a volatile substance and a gas. Fusion.—Crystals in the third group are secured, either with or without pressure, by slowly cooling a homogeneous magma, or by a solution of the substance in a molten magma.—*Proc. Am. Chem. Soc.*, xx., 3.

Fixation of Nitrogen.

H. A. Weber has successfully produced root tubercles in water culture, and thus been able to observe what takes place during the process of nitrogen fixation better than when the roots are buried in soil or sand. The apparatus employed consists of an aspirator of four litres capacity, connected with which are two ordinary wide-mouth bottles of two litres capacity, to serve as culture jars. Both culture jars are open, and the second is connected with a small flask with a side tube, as used in fractional distillation, the end of the tube being allowed to project into the neck of a collecting bottle of four litres capacity. At the beginning of a vegetation experiment the flask, culture jars, and aspirator are filled with a nutrient solution, the aspirator having previously been raised above the level of the culture jars and its tubulure closed with a rubber stopper, through which passes a glass tube. On the latter is slipped a short piece of rubber tubing, with a Hoffman clamp to control the flow, and through this the liquid drops from the aspirator into a thistle funnel projecting from the first culture jar. By means of syphons the liquid then passes into the second culture jar and into the small flask, finally arriving at the collecting bottle, the contents of which must be transferred back to the aspirator about once in twenty-four hours. The seedlings are grown to maturity under identical conditions in the two culture jars, and the nutrient solution supplied to them is continually being aerated as it passes through the apparatus, a plentiful supply of free oxygen being thus provided. In the experiments described, two solutions were used. The complete nutrient solution contained 20 Gm. of bone ash dissolved in nitric acid, 11 Gm. of potassium nitrate, 7 Gm. of magnesium sulphate, 3 Gm. of potassium chloride, and a minute quantity of ferrous sulphate. These were dissolved in distilled water, neutralised with sodium carbonate, and diluted to 1 litre. In the second solution (without nitrogen) the bone ash was dissolved in 9 C.c. of sulphuric acid and the potassium nitrate was replaced by 9·5 Gm. of potassium sulphate, but it was otherwise identica with the first. One set of seedlings from dwarf peas germinated in sterilised sand moistened with distilled water was grown in the first solution, another in the second, and those in a third set were inoculated with tubercle germs prior to immersion in the second solution. The first set thrived from the outset and produced flowers and fruit, but the plants in the second set were weak and sickly and soon died. The inoculated specimens did not thrive at first and they began to show the effect of nitrogen starvation in about ten days. On the thirteenth day, however, they began to recuperate, tubercles were observed on the fifteenth day, and after that the plants thrived satisfactorily, producing flowers and fruit like those which had been grown in the complete nutrient solution, containing nitrogen.—*Journ. Am. Chem. Soc.*, xx., 9.

Magnetic Properties of Tempered Steel.

S. Curie gives the results of experiments in which bars and rings of steel were heated in an electric furnace, the spiral current of which at the same time furnished a magnetic field. It was found that steel does not take the temper unless heated to a temperature superior to that at which its magnetic properties change, and that steel containing 1·2 per cent. of carbon is best suited for the construction of permanent magnets, whilst the presence of tungsten or molybdenum is advantageous. The presence of other metals in steel does not usually modify the residual magnetisation, but it often considerably increases the field required to cause demagnetisation. The greater this field, the less do blows affect the stability of magnetisation in bars. As regards the effects of heating, a temperature of 100° or more is detrimental to good magnetic steel, while the best permanent magnets are obtained by heating the steel to 60° only, and partially demagnetising it after having magnetised it to the point of saturation.—*Bull. Soc. Indust. Nation.*, through *Nature*.

Discharger for Spark Spectra.

L. M. Dennis describes a new form of discharger for spark spectra of solutions, which is claimed to be free from the disadvantages that attach to most other forms. The lower terminal consists of a graphite conc bored at the base to receive the end of a platinum wire. The cone is enclosed in a glass tube—30 Mm. long—in which it fits rather loosely, and the apex of the cone is allowed to project slightly beyond the end of the tube, which is placed vertically. The platinum wire is enclosed in a slightly longer but narrower glass tube, the upper end of which is fused to the wire close by the base of the cone, whilst the lower extremity passes through and is held in position by a cork which fits the lower opening of the wider tube. Just above this cork the outer glass tube branches at right angles for 25 Mm., and it is then again bent at right angles upwards, so as to be parallel with the tube containing the graphite cone. This arm, which is 100 Mm. long, is expanded from the bend to about twice the original diameter of the tube, but near its free extremity it is again narrowed so that a piece of small rubber tubing can be slipped over it and firmly hold a narrower glass tube which slides through it and reaches nearly to the bottom of the arm. To fill the apparatus, the last-mentioned tube is removed, the discharger is inclined so as to elevate the part containing the cone, and the liquid is run into the long arm, after which the inner sliding tube is re-inserted and pushed nearly to the bottom of the arm. The apparatus is then brought into the upright position, when the liquid will rise in the short tube containing the cone until it is on a level with the lower end of the sliding tube, and the latter is then raised until the level of the liquid reaches the

top of the short tube, leaving the whole of the cone immersed except the extreme point. As the liquid is evaporated by the spark at the terminal formed by this point, it will be maintained at the same level by the entrance of air through the sliding-tube, and that will continue until the liquid in the long arm has fallen to about the same level. The graphite cone can be replaced by the platinum wire or by an electrode of any other material that may be desired. The upper terminal consists of an insulated platinum wire or a graphite cone around which the conducting wire is wrapped.—*Journ. Am. Chem. Soc.*, xx., 1.

Betaine in Althea Officinalis.

N. Orlow has isolated betaine as well as asparagine also from the root of *Althea officinalis*. Betaine, or trimethyl-glycocoll, is an acid, the aldehyde of which is represented by muscarine and the alcohol by choline. The roots were extracted several times with water, the extracts being finally evaporated, precipitated with basic lead acetate, and the excess of lead removed by sulphuretted hydrogen. The fluid was then evaporated to a small volume and set aside for some days to allow the asparagine to crystallise out. The solution was next drawn off, the crystals washed with weak alcohol, and the united fluids mixed with a solution of mercuric nitrate after the distillation of the alcohol. This precipitated the rest of the asparagine. The filtrate was then treated with sulphuretted hydrogen, evaporated, acidulated with nitric acid and, after adding a solution of sodium phospho-molybdate, set aside for two days. The precipitate was then collected on the filter, washed with very dilute sulphuric acid, mixed with aqueous barium hydrate solution, the solution filtered, freed from the excess of barium by carbonic acid, evaporated to dryness, and the residue extracted with alcohol. After extraction, a yellowish crystalline substance remained, which formed colourless crystals on being recrystallised from alcohol or water with animal charcoal. The substance thus obtained was soluble in water or alcohol, and precipitated by ether rom the alcohol solution. It contained nitrogen. The alcoholic solution of the free base, treated with alcoholic chloride of zinc solution, gave a precipitate, the volume of which increased on standing. The base gave all the characteristic reactions of betaine.—*Pharm. Zeit. f. Russl.*, xxxvi., 631.

Insect Powders.

Professor J. M. Francis comments approvingly on G. R. Durrant's paper on the insect powders of commerce (see *P. J.*, lviii., 505), but takes exception to the advice given therein relative to the kind of insect powder pharmacists should purchase, on the ground that some low-priced powders would be excluded by Mr. Durrant, "which will accomplish the same results and be just as satisfactory . . . . when used in the customary manner." There is no more reason, he asserts, for demanding insect powder made from closed flowers or half-open and open flowers than there would be in insisting on the use of strictly pure sodium chloride in making bread. To exclude stems and flowers in any particular stage of development, hand-picking will be necessary, and that, it is suggested, whether practicable or not, is certainly not worth while. Beyond that, it is stated that a powder made from flowers alone is not essential, as experiments with a powder containing ground flowers and stems in equal parts appeared to be quite as efficacious when sprinkled in the ordinary way, as powder consisting of ground flowers only. When extracted with ether the ground flowers yielded 6·07 per cent. of extract, the stems 2·25 per cent., and the mixed powder 3·82 per cent. The relative toxicity of the ether extracts was tested upon animals, the doses being in proportions relative to the yield of extract, and the powder from flowers proved to be about twice as powerful as that from stems, whilst the mixed powder occupied an intermediate position. In all cases the ether extract had a decided green colour, indicating the presence of chlorophyll, but that, it is suggested, is what may be expected in the case of most, if not all, insect powders. In conclusion, it is acknowledged that the greater the proportion of ground flowers in a powder, the more toxic it will be, but on the other hand, it is claimed that a powder consisting of one-third to one-half stems accomplishes the desired work quite as well from a practical point of view. It is argued, therefore, that it is not to the pharmacist's interest to pay a fancy price for insect powder if he can satisfy himself that a good, effective powder is procurable at a lower rate.—*Bulletin of Pharmacy*, xii., 5.

Death by Electric Shock.

Professor T. Oliver and Dr. R. A. Bolam have obtained evidence which suggests that failure of the respiratory centre is not the cause of death in fatal cases of electric shock. On the other hand, their experiments with alternating currents, admittedly the most dangerous, appear to afford ample demonstration of the fact that death in such a case results from sudden arrest of the heart's action. In some instances—in which there were very high voltages, with currents considerably above the potential usually required to kill the animal—there seemed to be contemporaneous cessation of the respiration and of the heart's action, but in most cases the heart was first affected. Primary cessation of the beat of that organ is, therefore, the general rule, and under no circumstances were the experimenters successful in causing primary arrest of respiration, followed by failure of the heart.—*British Medical Journal*, No. 1933, p. 132.

Röntgen Rays Transformed.

G. Sagnac finds that when Röntgen rays are incident on a metal surface, they are not perceptibly reflected, but the superficial layer transforms them into secondary rays which are capable of producing photographic impressions of exciting fluorescent screens, or of discharging electrification. A difference between these secondary rays and ordinary Röntgen rays is that they are freely absorbed by aluminium, whilst their absorption gives rise to yet a third kind of ray, which is still more readily absorbed by aluminium. It is suggested that the secondary and tertiary rays may be intermediate between true Röntgen rays and those discovered by Lénard.—*Bull. Soc. Franc. de Physique*, No. 16, through *Nature*.

Decalcifying and Desilicating Sponges.

Dr. E. Rousseau decalcifies sponges which contain much lime-salts, such as *Leuconia*, *Leucandra*, *Sycon*, etc., by first hardening and then imbedding in celloidin. The imbedded pieces (not more than 2 Cm. in length) are then immersed for from 12 to 24 hours in a mixture of 15-40 parts nitric acid of sp. gr. 1·4, and 100 parts of 85 per cent. alcohol, and are then transferred to 85 per cent. alcohol containing some precipitated calcium carbonate until every trace of acid is removed. Sections are then made in alcohol of the same strength. For desilification the sponge is treated with fluoric acid after imbedding in celloidin, as in the previous method. One of the small imbedded pieces is then placed in a caoutchouc capsule having a lid and containing at least 50 C.c. of alcohol. To this is added commercial hydrofluoric acid drop by drop up to 20 or 30 drops, according to the amount of silica in the sponge. The desilication takes from one to two days. The pieces are then placed in 85 per cent. alcohol containing some lithium carbonate. As a precaution all the vessels and instruments used must be covered with caoutchouc or paraffin. By this process very good sections may be obtained of *Tethyx*, *Suberites*, *Thenia*, *Glodia*, *Reniera*, etc.—*Zeits. für Angew. Mikros.*, through *Journ. Roy. Micros. Soc.*, 1897, p. 589.

PHILOSOPHICAL CHEMISTRY.

The Principles of Chemistry. By D. Mendeleeff. Translated from the Russian (sixth edition) by George Kamensky, A.K.S.M. Edited by T. A. Lawson, B.Sc., Ph D. In two volumes. Pp. i.-xviii., 1 to 621, and 1 to 518. Price 36s. London: Longmans and Co., 39, Paternoster Row, E.C. 1897.

In an age when everyone knows, or professes to know, something of chemistry, when skill in separating the constituents of mixtures is regarded by sadly too many as the be-all and end-all of the study of the science, when primers, manuals, and text-books dealing with the subject within more or less narrow limits crowd upon us, it is refreshing to turn to a record of a serious attempt to regard chemistry as a connected whole, and as a subject having intimate relations with other branches of science, even though, as in Professor Mendeléeff's case, the arguments employed are in great measure directed to the support of a particular generalisation. Not that the 'Principles of Chemistry' was written to support the hypothesis of a periodic law; the conception of that generalisation occurred whilst the author was preparing the first edition of his work, the object of which was to acquaint students "not only with the methods of observation, the experimental facts, and the laws of chemistry, but also with the insight given by this science into the unchangeable substratum underlying the varying forms of matter." In less than thirty years no fewer than six editions of the book have been called for in Russian, and the second English edition is adapted from the latest of these, the original being reproduced as faithfully as possible without amplification or modification of the author's statements.

The fifth edition, a translation of which was reviewed in the *Pharmaceutical Journal* some six years ago, was considerably enlarged, as compared with the preceding one, and the foundations of the periodic system of the elements were placed much more firmly. Such alterations as were then introduced are retained in the latest edition, but no essential features of the original work are altered. Many newly discovered facts are referred to, and although all aspects of the simplest chemical relations are as far as possible equally developed, the author acknowledges that he has given most attention to the so-called indefinite compounds, examples of which may be seen in solutions. He affiliates to these examples numerous instances of definite compounds, ranging from alloys and silicates to complex acids, and advances reasons to excuse the important part the study of solutions is made to occupy in the work. Mendeléeff's own view is that a solution is "a homogeneous liquid system of unstable dissociating compounds of the solvent with the substance dissolved," but he does not consider his opinion on the subject as proved, and it is therefore given with some reserve as one of several hypotheses. The personal element in the book is strongly marked throughout, and interest in the subject-matter is thus enhanced, the impression left being that what is presented is no mere bald statement of facts and speculations, but a faithful expression of the views of one who has made the subject entirely his own.

Chemistry like every other science, it is pointed out, is at once a means and an end. It is a means of attaining certain practical results, and so promoting the general welfare; whilst as an end there are many lofty aspirations associated with it, the contemplation of which serves to inspire its workers and adherents. That contemplation comprises not only the principal data of the science, but also generally accepted deductions and hypotheses which refer to phenomena as yet but imperfectly known. Scientific contemplation in the latter sense, Mendeléeff shows, varies much with times and persons; it bears the stamp of creative power, and embraces the highest forms of scientific progress. "In that pure enjoyment experienced on approaching to the ideal, in that eagerness to draw aside the veil from the hidden truth, and even in that discord which exists between the various workers, we ought to see the surest pledges of further scientific progress. Science thus advances, discovering new truths, and at the same time obtaining practical results. The edifice of science not only requires material, but also a plan, and necessitates the work of preparing the materials, putting them together, working out the plans and the symmetrical proportions of the various parts." This is the work Mendeléeff has set himself—combining creator, architect, and artisan in his own personality—and though all may not approve of his style of architecture, it cannot be denied that the finished structure faithfully records the ideas embodied in his original design.

The arrangement of the book is practically identical with that of the previous edition. The first volume is prefaced with a lengthy introduction in which attention is directed to the various classes of chemical transformations, whilst the law of the indestructibility of matter is explained, and the limits of chemical transformation are discussed. Experiments are described which illustrate the points the author seeks to elucidate, and in the succeeding chapters a knowledge is imparted of the particular facts of chemistry, with the view of ensuring a thorough grasp of the general and introductory chemical conceptions already referred to. Water, its compounds and constituents, form the subject-matter of four chapters, in the last of which we are gradually led up to the enunciation of Dalton's law of multiple proportions. In like manner, the consideration of nitrogen and its compounds introduces to notice the conception of molecules and atoms, Gay-Lussac's law of combining proportions, and Avogadro-Gerhardt's fundamental law. The properties of carbon and the hydrocarbons, and of the compounds of carbon with oxygen and nitrogen are next described, thus completing the study of the four organogens. The conception of the valency or atomiticity of the elements is then briefly referred to, after which a detailed account of sodium chloride and its properties introduces a very full explanation of Berthollet's laws, that in turn being followed by a comprehensive summary of the properties and relations of the halogens. Similar treatment of the alkali metals is supplemented by a description of the methods and objects of spectrum analysis, and the volume is concluded with a chapter on the valency and specific heat of the metals.

The grouping of the elements in accordance with the periodic law is deferred to the second volume, which is entirely occupied by statements of facts bearing on that hypothesis. A special appendix is devoted to argon, the discovery of which is described as one of the most remarkable chemical acquisitions of recent times. On the assumption that argon is an element, it is pointed out that its atomic weight of nearly 40 does not correspond to the existing data respecting the periodicity of the properties of the elements in dependence upon their atomic weights, for there is no reason on the basis of existing data for admitting any intermediate elements between chlorine (35·5), and potassium (39), whilst all the positions above potassium in the periodic system are occupied. "The hypothesis A=40 does not admit argon into the periodic system. If the molecule of argon be taken as A_2—*i.e.*, the atomic weight as A=20—argon apparently finds a place in Group VIII., between F=19 and Na=23; but such a position could only be justified by the consideration that elements of small atomic weight belong to the category of typical elements which offer many peculiarities in their properties, as is seen on comparing N with the

other elements of Group V., or O with those of Group VI." It is suggested, however, that it is simpler to assume that argon contains N_3, especially as argon is present in nitrogen and accompanies it, and it is claimed that none of the observed properties of argon are contradictory to this hypothesis.

In conclusion, it may be stated that, whilst the author has endeavourcd to concentrate in the main portion of his work all the fundamental, indispensable knowledge required by those who are beginning the study of chemistry, extensive footnotes are printed in small type, and in those certain details are discussed, which serve as further examples, as well as debatable questions on existing ideas, and historical and technical details which have been with advantage withdrawn from the body of the book. Personal views, suppositions, and arguments are similarly relegated to footnotes. It may also prove of interest to quote Mendeléeff's opinion as to what is requisite in order to become "actual chemists." Beginners, he observes, must be well and closely acquainted with three important branches of chemistry—analytical, organic, and theorctical—the part dealt with in the 'Principles' being only the foundation of the edifice. "For the learning and development of chemistry in its truest and fullest sense, beginners ought, in the first place, to turn their attention to the practical work of analytical chemistry; in the second place, to practical and theoretical acquaintance with some special chemical question, studying the original treatises of the investigators of the subject (at first, under the direction of experienced teachers), because in working out particular facts the faculty of judgment and of correct criticism becomes sharpened; in the third place, to a knowledge of current scientific questions through the special chemical journals and papers, and by intercourse with other chemists." An excellent programme, truly, and one the successful accomplishment of which will necessitate frequent reference to the excellent work of which so imperfect an account s hcre given.

SELECTED FORMULÆ.

Glycerin Lanolin Cream.

Glycerin, 12; lanolin, 3; vaseline, 9; otto or oil of ylang-ylang, *q.s.* Mix the lanolin and vaseline, then gradually incorporate the vaseline.—*Pharm. Zeit.*, 42., 340.

Cascara Pills.

Extract of cascara, 2 grammes; extract of rhamnus frangula, 1 gramme; powdered aloes, 4 grammes; powdered gentian, 4 grammes; medicinal soap, sufficient to make eighty pills.—*Pharm. Zeit.*, xlii., 228.

Anæsthetic Tents.

Lefour soaks laminaria tents for eight days before use in ether, 85; iodoform, 10; cocaine alkaloid, 5 parts.—*Practitioner*, liv., 111.

Application for Herpes.

Rcsorcin, 45 grs.; cocaine, 15 grs.; alcohol, 3 fl. ozs. To be applied by means of a swab to the herpetic spot.—*Therap. Gaz.* [3], xiii., 688.

Linimentum Terebinthinæ.

Schuabcl prepares this with potassium carbonate, 5 grammes; sapo mollis, 40 grammes; and oleum terebinth., 55 grammes. The addition of water or spirit of wine effects the decomposition of the liniment. The preparation preserves a uniform consistence for at least three months.—*Pharm. Centralh.*, xxxviii., 364.

FORMULÆ, METHODS, AND REACTIONS,
KNOWN BY THE NAMES OF THEIR AUTHORS.*
(SUPPLEMENTARY LIST.)

Adams (Fat in Milk Analysis).—Dry a known quantity of milk on a fat-free paper coil, which is then extracted by ether in a Soxhlet apparatus.

Alfraise (Iodine).—Water to which 1 per cent. each of starch and potassium nitrate have been added is boiled, and to 10 C.c. of this add 1 drop of hydrochloric acid. A blue colour appears on adding 1 drop of this reagent to a small quantity of the suspected liquid.

Alferow (Silver Staining).—An acid solution of silver picrate, lactate, acetate, or citrate, is prepared by adding to 800 C.c. of the solution 10 to 15 drops of a concentrated solution of the acid of the salt taken.

Allen (Fehling's Test, Modified).—Boil 7 to 8 C.c. of urine, add 5 C.c. of the cupric sulphate solution of Fehling's reagent, cool and add 1 or 2 C.c. of saturated sodium acetate solution with feebly acid reaction. Filter, and to the filtrate add 5 C.c. of the alkaline tartrate solution of Fehling's test, and boil.

Allen (Nitrogen in Urine).—In this modification of Knopp's method treat 25 C.c. of urine in a porcelain dish with 10 C.c. of strong sulphuric acid, and boil until the volume is reduced to about 10 C.c., and fumes of sulphuric acid begin to be evolved. The liquid is then transferred to a Kjeldahl flask and about 5 Gm. of potassium sulphate added, the flask being heated until the liquid is only a pale yellow. It is then cooled and neutralised with very strong caustic soda. The neutral liquid is made up to 100 C.c., 10 C.c. of it taken and treated with alkaline hypobromite reagent, as in the estimation of urea. Each 1 C.c. of nitrogen equals approximately 0·0012 Gm.

Allen (Phenol).—Mix 1 or 2 drops of the suspected liquid with a fow drops of hydrochloric acid, then add 1 drop of nitric acid. A purplish-crimson colour appears if phenol bc present.

Allen (Spirit of Nitrous Ether).—Fill an Allen's nitrometer with saturated brine solution, and introduce by means of the cup funnel 5 C.c. of the spirit to be tested. To this add 5 C.c. of strong solution of potassium iodide, followed by 5 C.c. of diluted sulphuric acid. Agitate well, and when the action has ceased adjust the surface of the liquid in the two limbs of the instrument to the same level; then read off the volume of nitric oxide, add 1·5 C.c. correction for the solubility of the gas in the solution. Multiply the volume by 0·0638 = parts of ethyl nitrite in 100 volumes. The product divided by the observed specified gravity of the spirit will give the weight of ethyl nitrite in 100 parts by weight of spirit.

Allen (Strychnine).—Extract with ether and concentrate the solution by allowing it to fall, drop by drop, into a warmed porcelain capsule. After cooling the residue, treat it with sulphuric acid and manganese peroxide, and if strychnine be present a violet colour will be produced.

Allessandri-Guaceni (Nitric Acid and Nitrates).—Dissolve a few drops of phenol in hydrochloric acid by heating for 12 hours on a water-bath. In the presence of nitric acid an intense violet coloration appears when the dry residue from a suspected solution is heated with 10 drops of this reagent on a water-bath. Ammonia changes the colour to green.

Almén (Albumin).—Urine containing albumin becomes cloudy on adding to 6 parts of it 1 part of a 2 per cent. solution of tannin in dilute alcohol. Another form of this test has been given previously (*P. J.* 4, iv., 491).

Almén (Phenol).—(1) Dissolve 1 part of mercury in 1 part of nitric acid (s.g. 1·4), and dilute with twice the quantity of water. On adding 5 to 10 drops of this solution to 20 C.c. of a liquid containing phenol, and heating to boiling, a yellow precipitate is formed, which dissolves in nitric acid with a red colour. (2) A blue colour appears on adding to phenol solution ammonia and a little chlorinated soda solution.

Altmann (Corrosion Method).—The tissue is injected with olive oil, then thin pieces are immersed for 24 hours in 1 per cent. osmic acid, after which they are treated with eau de Javelle for several hours until corrosion is completed, and finally dried with blotting paper and mounted in pure glycerin.

* After Wilder, Schneider, Altschul, Lee, Squire, Crookshank, and others.

Altmann (Fixing Solution).—A mixture of equal parts of 5 per cent. potassium bichromate solution and 2 per cent. osmic acid.

Altmann (Impregnation Methods).—(1) Small portions of fresh tissue are immersed for 5 to 8 days in a mixture of 2 volumes of olive oil and 1 volume each of ether and absolute alcohol, then thrown into water to precipitate the oil in the tissue, next hardened with osmic acid, corroded with eau de Javelle, and mounted in glycerin as described above. (2) Impregnate with a mixture of 2 volumes of castor oil and 1 volume of alcohol, then proceed as in 1.

Anderson (Papaverine).—A dark red colour appears on adding concentrated nitric acid to a solution of papaverine in dilute nitric acid, and yellow crystals separate.

André (Quinine).—Chlorine and ammonia produce a green colour which changes to blue on saturation with an acid. Excess of acid changes the colour to violet or bright red, but ammonia again turns it green.

Andreasch (Cysteïn).—On adding a few drops of dilute ferric chloride solution, followed by ammonia, to a solution of cysteïn acidulated with hydrochloric acid, a beautiful red colour appears in the liquid, and darkens on shaking after exposure to air.

Andreasch (Iron).—A dark purplish-red colour appears on adding a little ammonia and sulphoglycolic acid to a solution containing iron; the colour soon fades, but reappears on shaking after exposure to air.

Ashby (Mineral Acids in Vinegar).—An infusion of logwood (1 in 50) is made with boiling water. After standing a few hours a few drops are placed on porcclain, a drop of the suspected sample is added, and the mixture evaporated to dryness on a water bath. If mineral acids be present the residue has a red colour. Pure vinegar leaves a bright yellow stain.

Austen-Chamberlain (Nitric Acid).—A rose-red colour is produced with a mixture of 12 Gm. of ferrous sulphate, 6 Gm. of ammonium sulphate, 2 C.c. of sulphuric acid, and 100 C.c. of water.

Babes (Actinomycosis).—Stain sections in Babes' safranine solution (3) for 2 minutes, rinse in alcohol, and decolorise in Gram's solution.

Babes (Safranine Stains).—(1) A mixture of equal parts of concentrated alcoholic and aqueous solutions of safranine. (2) A concentrated or supersaturated solution made with the aid of heat. (3) Mix 100 parts of water, 2 parts of aniline oil, and an excess of safranine. Warm the mixture to 60°–80° C. and filter through a wet filter.

Bach (Solanine).—Treatment with equal volumes of sulphuric acid and alcohol produces a red colour.

Bachmeier (Alkalies).—Tannin solution produces a red to reddish-brown colour, which changes to dirty green.

Bachmeier (Organic Acids in Phenol).—An aqueous decoction of Brazil wood is permanently discoloured by organic acids, but not by phenol.

Bailey (Nitric Acid).—Crystals of the double compound of mercuric cyanide and potassium iodide turn black when introduced into nitric acid, but red in other acids.

Bailey (Sulphur).—A blood-red colour is produced on heating with sodium carbonate, dissolving in water and adding sodium nitro-prusside solution.

Bämes (Tannin).—A solution containing 1 Gm. of sodium tungstate and 2 Gm. of sodium acetate in each 10 C.c. throws down from acid or alkaline solutions of tannin a straw-yellow precipitate which is insoluble in water.

Barbier (Alcohol in Essential Oils).—A dense solution is formed on distilling off about one-tenth and adding to the distillate an excess of dry potassium acetate.

Barbsche (Glycerin).—No blue colour should be produced on adding one drop of ferric chloride solution to glycerin diluted with 20 volumes of water and to which one drop of carbolic acid has been added.

Barff (Preservative Medium).—A saturated solution of boric acid in glycerin (boroglyceride) is prepared by the application of moderate heat for 4 or 5 hours. When required for use 1 part of the solid product is dissolved in 40 parts by weight of water.

Barfoed (Hydrocyanic Acid).—On acidifying a solution with sulphuric or tartaric acid and shaking with ether, the latter will take up hydrocyanic acid, but not hydro-ferrocyanic acid.

Barfoed (Silicic Acid).—On cautiously heating a mixture of 1 part of the suspected substance, and 2 parts of cryolith with 4 to 6 parts of sulphuric acid, and holding near the surface of the mass a thin platinum wire loop containing a drop of water, a white pellicle of silicic hydrate will be formed on the water.

Barreswil (Glucose).—Reduction takes place on boiling a liquid containing glucose with the following solution:—Dissolve 60 Gm. of potassium hydroxide and 40 Gm. potassium tartrate in 200 C.c. of water; then dissolve 65 Gm. of copper sulphate in 560 C.c. of water and add the first solution.

Barreswil (Chromic Acid).—A blue colour appears on adding a few drops of chromic acid solution and a little ether to a very dilute, acidified solution of hydrogen peroxide.

Barry (Hydrocyanic Acid).—Acidify the liquid slightly, if necessary, with acetic acid, then put 2 or 3 drops in a watch-glass. Cover this with another watch-glass containing 2 or 3 drops of 1 per cent. silver nitrate solution, which should become cloudy if hydrocyanic acid be present.

Baumann-Goldman (Cystin).—On adding Baumann's reagent to a solution of cystin, a copious precipitate of benzoylcystin is thrown down.

Bäyer (Eosine).—On shaking with water and sodium amalgam, heating gently, then diluting with water and adding a drop of potassium permanganate solution, an opaque green colour appears in reflected light.

Bäyer (Glucose).—On heating the solution with excess of nitrophenyl-propiolic acid and soda, a blue colour appears in the presence of glucose, owing to the formation of indigo.

Bayrac (Uric Acid in Urine).—Evaporate 50 C.c. of urine to dryness on a water bath, treat the residue with hydrochloric acid (1-5), wash the residue with alcohol, then dissolve in 20 drops of sodium hydroxide solution heated to 90 or 100° on a water bath, and decompose with sodium hypobromite in the apparatus for determining urea. Each 1 C.c. of nitrogen at the ordinary temperature equals 0 00357 Gm. of uric acid.

Beale (Ammonia Carmine).—In addition to the formula previously given (*P. J.* [4], iv., 493), Beale published the following:—Carmine, 15 grains; strong solution of ammonia, 30 minims; glycerin, 2 fluid ounces; alcohol, 6 fluid drachms. This fluid was specially designed for the purpose of staining by means of injection. See also Beale's carmine glycerin injection (*P. J.* [4], iv., 531).

Bell, Carter (Alum in Flour or Bread).—A freshly prepared 5 per cent. tincture of logwood in methylated spirit is used. Ten grammes of the same is moistened with water, then 1 C.c. of the tincture and an equal quantity of saturated ammonium carbonate solution are added. The sample if pure, gives a pinkish colour which gradually fades to buff or brown. If alum be present a lavender or bluish tint is produced which becomes more marked on drying.

Betz (Ammonia Carmine).—A thick syrupy mass is made by rubbing up commercial carmine with water in a mortar, and ammonia is then added, with continual stirring, to effect solution. A large quantity of water is then added, after which the solution is filtered and exposed to the sun in an uncorked green glass bottle until a precipitate is deposited. Expose again and subsequently filter, and repeat the operations a third time. When no further precipitate is deposited the stain is ready for use.

Betz (Hardening Fluid).—A mixture of equal parts of sulphuric ether and alcohol. This is used for hardening the brain of insects prior to cutting sections.

Bird (Sulphur Compounds in Petroleum).—Prepare a solution of sodium plumbate by dissolving 1·5 dr. of caustic soda in sufficient distilled water to make 10 fl. drs., then heat to boiling point, and whilst boiling add litharge to saturation. Decant the clear liquid from undissolved litharge. Place in a test-tube 1 fl. dr. of the white petroleum oil to be examined, add 0·5 dr. of absolute alcohol, and shake well. Then add 2 drops of the test solution, shake again for a few seconds, and allow to stand for half an hour. According to the amount of sulphur present, the mixture assumes a tint varying from deep orange with much sulphur, through orange and yellow to very pale yellow with traces only. See *Pharm. Journ.* August 14, 1897, p. 153, for further details.

(*To be continued.*)

PHARMACEUTICAL SOCIETY.

MEETING OF THE COUNCIL.

WEDNESDAY, FEBRUARY 2, 1898.

Present:

Mr. Walter Hills, President.

Mr. G. T. W. Newsholme, Vice-President.

Messrs. Allen, Atkins, Bateson, Bottle, Carteighe, Corder, Cross, Grose, Hampson, Harrison, Johnston, Martindale, Park, Southall, Storrar, Symes, and Warren.

The minutes of the last meeting were read and confirmed.

Deaths.

The President said he had to refer with regret to the death since the last meeting of two gentlemen whose names were well known. The first was Mr. Lea, of Worcester, a life member, a pharmaceutical chemist, and who some few years ago made a donation to the Benevolent Fund of £50. The other gentleman, whose loss they would all deplore, though he was not connected with the Society, was Mr. Michael Conroy. He was well known to many who were in the habit of attending the meetings of the Pharmaceutical Conference, and he did much for the advancement of pharmaceutical knowledge by the work he did and the papers he published. All would agree that pharmacy had lost an excellent and distinguished man.

The Lot for the Next Council.

The lot having been taken in the usual way to determine the seven members of the Council who shall retire in May next, the following names were drawn:—Messrs. Allen, Atkins, Corder, Grose, Martindale, Savory, and Warren.

The following, who remained in by lot last year, now retire by rotation:—Messrs. Bateson, Cross, Hills, Johnston, Newsholme, Storrar, and Symes.

The following seven remain in office another year:—Messrs. Bottle, Carteighe, Hampson, Harrison, Park, Southall, and Young.

Election of Members.

Pharmaceutical Chemists.

The following, having passed the Major examination and tendered their subscriptions for the current year, were elected "Members" of the Society:—

Hill, Philip Robert; Weymouth. | Holmes, John; Bradford.
Kerruish, Thomas Maltby; Douglas.

Election of Associates in Business.

The following, having passed the Minor examination, being in business on their own account, and having tendered their subscriptions for the current year, were elected "Associates in Business" of the Society:—

Ballard, William; Limehouse.
Freeman, William M.; Birmingham.
Gili, Gerardo; Malta.
Hardy, Robert; Edinburgh.
Henderson, John; Edinburgh.
Jepson, Ewart; Darwen.
Jones, Joseph; Pwllheli.
Lee, George; Barnstaple.

Election of Associates.

The following, having passed the Minor examination and tendered their subscriptions for the current year, were elected "Associates" of the Society:—

Blackmore, Frank; Weston-super-Mare.
Bowell, Horace James W.; Ilfracombe.
Bowman, Edward; Bunker's Hill.
Cannon, Frederick Wm.; Aylesbury.
Clarkson, James Selfe; Whitby.
Davies, David Arthur; Llandovery.
Exelby, George Henry; York.
Fairbairn, James Hume; Edinburgh.
Ireson, Ernest E.; Newport (Mon.).
James, John Earl; Birmingham.
Jarvis, John; London.
Lindsey, Robert William; London.
Lowe, James Tasker; Wigan.
McCutcheon, Alexander; Glasgow.
Macrae, David; Edinburgh.
Martin, Frederick John; Belfast
Martindale, William H.; London.
Mason, Hugh; Bexley Heath.
Mollison, William Whyte; Aberdeen.
Pick, Frank Phillips; Barnsley.
Reid, John Loudon; S. Shields.
Rhead, Alfred; Milton.
Seaborne, Lionel Dunsford; Wombwell.
Stowart, Alexander M.; Lochee.
Stewart, Jeanie; Dumbarton.
Trebilco, Arthur James; Bristol.
Wells, Louis John; Shipley.
Wilson, John Lochhead; Irvine.
Wise, Guy William; Watford.

Election of Students.

The following, having passed the First examination and tendered their subscriptions for the current year, were elected "Students" of the Society:—

Andrews, Ralph Cecil; Winchester.
Archer, William Taylor; Cambridge.
Benson, John; Kendal.
Benton, Alfred; London.
Betts, George Hornbuckle; Stamford.
Bishop, John Henry; Norwich.
Bolus, George; Berwick-on-Tweed.
Brunyee, Nathaniel; Thorne.
Burnell-Jones, Harold S.: London.
Cawkwell, George Adama; Old Basford.
Clunas, John; Nairn.
Cushing, Thomas E., junr.; London.
Duncan, William B.; Portobello.
Dutton, Charles Cecil; St. Helen's.
Finnigan, George; Hove.
Flitcroft, Thomas E; Hiudley Greeu.
Freke, Alice; London.
Grimshaw, Percy George; Hull.
Hazelby, Thomas Weaver; Swaythling.
Hellyer, William W.; Plymouth.
Hicks, Joseph; Ediuburgh.
Hodgson, Alfred; Leicester.
Ingram, Frederick James; Wakefield.
Jenkin, Charles; St. Austell.
Jesson, Albert Robert; Leicester.
Jones, John; Aberystwith.
Laverack, Clyve Cordukes; Malton.
McCallum, William; Edinburgh.
Martin, John; Crieff.
Millidge, Philip; Newport, I.W.
Murdoch, John Gloag; Edinburgh.
Panchaud, Frederick; Cambridge.
Reynolds, Edward; Stow-on-the-Wold.
Royce, Septimus; Oakham.
Saint, Thomas; Derby.
Sayers, Stephen Percy; Ardingley.
Stokoe, John Calvert; Sunderland.
Swan, William; Dumfries.
Traub, Leonard B.; Kinross.
Walton, Ralph, Jun.; Maidenhead.
White, Charles Edwin; Bournemouth.
Williams, William Robert; Cardiff.
Wilson, Alexander W.; Edinburgh.

Several persons were restored to their former status in the Society upon payment of the current year's subscription and a nominal restoration fee of one shilling.

Report of the Finance Committee.

The report of this Committee, which was read by the Secretary, was of the usual character, and included a recommendation that several accounts be paid.

The President moved the adoption of the report and recommendations, which, he said, called for no comment, the receipts and expenditure both being of the usual character.

The motion was at once carried unanimously.

The Registrar's Report.

The Registrar's report on the numerical strength of the Society was laid on the table. It was resolved that the report be entered on the minutes and published in the Journal. It is printed at page 122.

Report of the Benevolent Fund Committee.

The report of this Committee included a recommendation of grants to the amount of £48 in the following cases:—

A registered chemist and druggist (73), formerly in business for thirty years. (Surbiton.)

The widow (72) of a pharmaceutical chemist Member (1851—1868), who has only an annuity of £20 to live upon. (London.)

The widow (68) of a pharmaceutical chemist Member (1853—1860) and subscriber. She has had several previous grants. (Doncaster.)

The widow (66) of a chemist and druggist whose application had been deferred for further reference. (Sheffield)

One case was not entertained.

The Secretary reported the death on January 29, of Ann Parsons, Belfast (aged 87), who was elected an annuitant in December, 1877.

The Vice-President moved the adoption of the report and recommendations of the Committee which was at once agreed to.

Library, Museum, School, and House Committee.

The report of this Committee stated that the report of the Librarian had been received, including the following particulars:—

Attendance.		Total.	Highest.	Lowest.	Average
December	Day	362	27	2	14
	Evening	126	14	1	7
Year 1897	**Day**	**3843**	**28**	**0**	**13**
	Evening	**1122**	**18**	**0**	**6**

Circulation of Books.	Total.	Town.	Country.	Carriage paid.
December	173	88	85	18s. 4½d.
Year 1897	**2219**	**1045**	**1174**	**£13 2s. 3d.**

Several donations had been received (*Ph. J.*, January 22, p. 76), and the Committee had directed that the usual letters of thanks be sent to the respective donors.

The Committee had recommmended that the undermentioned books be purchased :—

For the Library in London :—

Lüpke, 'Elements of Electro-Chemistry,' 1897.
Roscoe and Schorlemmer, 'Treatise on Chemistry,' new edition, vol. 2.
Cambridge University Calendar, 1898.
Oxford University Calendar, 1898.

For the Library in Edinburgh :—

Sadtler and Trimble, 'Pharmaceutical and Medical Chemistry.'

The Curator's report had also been received, and included the following particulars :—

	Attendance.	Total.	Highest.	Lowest.	Average.
December	Day	523	39	2	21
	Evening	52	9	1	2

Several donations had been received (*Ph. J.*, January 22, p. 76), and the Committee directed that the usual letters of thanks be sent to the respective donors.

The President said the Committee had spent a good deal of time over various details connected with the work of the Society, but nothing arose to which he need specially refer. He had simply to move that the report and recommendations be received and adopted.

The motion was carried unanimously.

Report of Examinations.
January, 1898.

	Candidates.		
	Examined.	Passed.	Failed.
First Examination	324	164	160

Thirteen certificates by approved examining bodies were received in lieu of the Society's examination.

Correspondence.

The President said he had received a letter from the Hon. Secretary of the Midland Chemists' Assistants' Association, enclosing the following resolution passed unanimously at a meeting held on January 19 :—

> That this meeting hereby expresses its unqualified approval of the Draft Pharmacy Acts Amendment Bill proposed by the Pharmaceutical Society of Great Britain, and pledges its members to give the measure every possible support.

The Royal Botanic Society.

The President said a letter had been received from the Secretary of the Royal Botanic Society announcing that the time of admission for pharmaceutical students had been extended to 3 p.m. The regulations for the future would be as follow :—Students will be admitted to the Gardens daily from 9 o'clock, except Sundays, Wednesdays, and Saturdays, in May, June, and July, and are required to leave before 3 p.m.

Mr. Symes said this extension of time would be a great advantage to students. The time for leaving used to be 1 o'clock, and he remembered how difficult it was for him to make use of the Gardens.

Mr. Martindale said it was scarcely possible for students who were attending lectures at the School to attend the Gardens and leave by one o'clock, and upon his bringing the matter before the Council of the Royal Botanic Society, the alteration was very kindly agreed to. He should have been glad if the privilege could have been extended to Saturdays as well, but that was a shilling day, when a great number of the public visited the Gardens, and the Council could not see its way at present to admitting students on that day.

Mr. Southall suggested that the Royal Botanic Society should be thanked for this courtesy.

The President said this should certainly be done if it had not been done already.

Carbolic Acid.

The President said he had received a letter from Mr. Coxwell, Coroner for the City and County of Southampton, enclosing the following recommendation of the jury at an inquest held on January 25 :—

> It is considered advisable by the jury that greater caution should be used in the sale of carbolic acid, and that this notice be forwarded to the Pharmaceutical Society of Great Britain, and it ought to be in special bottles.

The Examinations in Scotland.

The President said he had received a rather lengthy but very valuable report from the Examiners for Scotland, with a suggestion that it should be published. It was sent by the Assistant Secretary with a covering letter, saying that it dealt only with the Minor examination, there being so few candidates for the Major and the chief points calling for comment occurring in the former examination. He might add that in consequence of the large proportion of failures, the Scottish Board some time ago suggested that a report should be sent up by them periodically, and after consultation with the Board in London, a reply was sent recommending that one such report should be sent up first as an example of what was intended. That report was now sent in consequence of that suggestion, and he thought it would be very desirable that the report should be published.

The report was as follows :—

Report on the Minor Examination for the Year 1897.

"The Board of Examiners for Scotland has now to submit to the Council the following report on the Minor examinations conducted by them during the year 1897.

"During the year 577 candidatos were examined, of whom 190, = 33 per cent., passed, and 387, = 67 per cent., failed :—

64	failed in	both Practical Chemistry and Practical Pharmacy.
109	,,	Practical Chemistry only.
73	,,	Practical Pharmacy only.
64	,,	Botany.
33	,,	Oral Chemistry.
6	,,	Materia Medica.
5	,,	Prescription Reading.
7	,,	Oral Pharmacy.
26	,,	to obtain the pass aggregate of marks.

"In the case of the Practical Examination the foregoing figures accurately indicate the subjects in which the candidates were deficient. In the case of the oral examinations, the practice of stopping a candidate whenever he fails in any subject introduces a disturbing element into the calculation, and therefore the figures are not sufficient to indicate so accurately the relative deficiencies of the candidates in the different subjects.

"*The Practical Examination.*—It is very noteworthy that a large proportion of the candidates who fail do so in the practical portion of the examination. Of the total number of students who failed, 16·53 per cent. failed in both practical subjects, 28·17 per cent. failed in practical chemistry only, and 18·87 per cent. failed in practical pharmacy only. The two practical subjects therefore accouut for 63·5 per cent. of the total failures. Though practical chemistry accounts for the larger proportion, it is to be noted as far from satisfactory that a very considerable proportion fail in practical pharmacy.

Practical Chemistry.—Of the 577 candidates who presented themselves, 30 per cent. failed in this subject.

"There can be no doubt that an undue proportion of the candidates who appear for this examination are insufficiently prepared, but it is still more to be regretted that they so frequently give evidence that the training which they have received has obviously been from the outset altogether faulty in conception, and that the energy, often very considerable, which the candidates have expended in preparation for this examination, has been to so great an extent misdirected.

"The scientific side of the Minor examination is chiefly of use in so far as it leads to a development of the powers of observation and of accurate reasoning on that which has been observed. An unsystematic and superficial acquaintance with a large number of special tests and special reagents is frequently shown by candidates. A really sound knowledge of the general behaviour and use of the common reagents and of the simplest analytical methods is too frequently altogether wanting. It is a matter of common occurrence to see a candidate almost exhausting the resources of the laboratory in the unthinking application of numerous special reagents, in order to settle a question perfectly simple and capable of easy and rapid solution by the careful application of, it may be, a single test of an elementary character. It is of the greatest importance that a good working knowledge of a small number of the more important reagents and methods should be acquired in the first instance. If this be wanting the energy spent in getting up less general tests is worse than thrown away, as it generally leads to mental confusion and to an incapacity to reason correctly on any single observation. The cure for this state of matters can only come as the result of better and more systematic teaching. During the last three years there has not been wanting evidence that such teaching is on the increase, but the progress is slow, and it may be doubted if it can ever be sufficient to meet the wants of the case in the absence of a proper curriculum.

"Much improvement might, however, result if students and their teachers realised that in the purely scientific subjects the examinations are principally directed towards ascertaining whether the candidates have or have not a sound practical but elementary knowledge, and that in their qualitative work they will be expected to give clear and systematic proofs of simple problems, rather than guesses, more or less happy, based upon a number of special tests unsystematically applied. Without entering into details the following may be mentioned as frequently-occurring causes of failure in qualitative analysis :—

"*a.* Inability to make a rapid but reasoned and careful Preliminary examination, chiefly by means of dry way tests.

"*b.* The practice of delaying the writing out of reports until after a conclusion has been come to instead of noting down each observation as soon as it is made.

"*c.* The neglect of a final summing-up of all the evidence which has been accumulated so as to make sure that it all points one way, and that none of it is directly contrary to the conclusion which has been arrived at.

"These defects can only be remedied by constant practice throughout the course of training for the examination.

"*Practical Pharmacy and Dispensing.*—Of the 577 candidates who presented themselves, 24 per cent. failed in this subject. The examiners in this department concur in the view that the failures in this subject are in a great measure due to want of experience, and the absence of a proper training during apprenticeship. Though there has been a manifest improvement generally in the work done, notably in the making of the galenical preparations of the Pharmacopœia,

THE REGISTERS OF PHARMACEUTICAL CHEMISTS AND CHEMISTS AND DRUGGISTS, 1897.

Additions during the year:—

Number of persons who have passed the—

Minor	„	460
Major	„	52*
Number of persons restored to the Register on payment of a fine.....		19
		479

Erasures during the year:—

Deaths	285
Erased at the request of registered persons themselves	8
Erased by the Registrar in pursuance of the provision set forth in Section 10 of the Pharmacy Act, 1868, after sending two registered letters, to which no answer has been received.	137
Increase of numbers on the Register	49
	479

* These having already been included in the number who passed the Minor, do not increase the numbers on the Register.

Number of Pharmaceutical Chemists on the Register, December 31st, 1897 2,251

Chemists and Druggists 12,964

15,215

there is still too frequently evident a want of familiarity with the utensils and methods of working required to turn out well-made products, and the candidates give the impression that they are making their first attempt to compound the preparation in the examination-room. In weighing and measuring there is often much carelessness and want of cleanliness; the products being contaminated by the use of mortars or spatulas not properly cleaned after some previous operation. The following typical examples will serve to illustrate the foregoing points. Many candidates show ignorance of the difference between avoirdupois and troy weights, and there is much confusion as to the difference between a minim and a grain measure. Many candidates are unable to work out a simple percentage calculation. A candidate attempts to prepare two ounces of iodide of sulphur ointment in a glass mortar not more than two and a half inches in diameter. Another candidate puts the ingredients for an infusion in an earthenware infusion pot and sets it on a naked Bunsen flame. Many candidates cannot make a suitable pill mass, and it is here more than anywhere else that the inexperienced man breaks down. One candidate makes a pill mass by kneading the ingredients between his fingers and thumbs on the pill machine, and then divides the mass by weighing each pill separately. A candidate who may otherwise do good work, puts what should be an eight-ounce mixture into a six-ounce bottle, or dispenses six such powders instead of dividing the quantity specified into six powders, or labels a mixture 'a tablespoonful' instead of a 'teaspoonful' for a dose, or dispenses twelve doses of a mixture in a six-ounce bottle, and instead of labelling it 'a twelfth part to be taken,' directs the whole bottleful, twelve doses to be taken, perhaps three times a day. There is also an indiscriminate use of sugar of milk in dividing an active drug. One candidate, for instance, uses it to obtain the fraction of a grain of perchloride of mercury for an eyewash, and others do the same in making small quantities of solutions of arsenic or of strychnine. The examiners believe that this condition of things could be greatly remedied were employers to devote greater attention to the systematic practical training of apprentices during their period of pupilage.

"*Oral Chemistry and Physics.*—Of the 278 candidates who were examined in Oral Chemistry and Physics, 245, = 88·73 per cent., passed, and 33, = 11·87 per cent., failed.

"At the oral examination in chemistry and physics candidates commonly show that they have endeavoured to cover the whole ground laid down in the syllabus without taking care, in the first instance, to master elementary principles. It cannot be too clearly understood that these elementary principles may be mastered by a thorough study of a comparatively small number of typical examples. It is worse than useless to endeavour to make up for the want of a proper understanding of elementary facts and principles by burdening the memory with a further number of facts necessarily undigested.

"As specially significant of defective training it should be mentioned that many candidates admit that they have neither performed themselves, nor even seen performed, the simplest and most important experiments, unless, indeed, these necessarily form part of the ordinary qualitative testing. Such experiments as, for instance, the heating of sulphur, they endeavour to describe, in the words of the text, by an effort of purely verbal memory.

"On the other hand candidates frequently exhibit undue apprehension of the result of a failure of memory in respect of particular facts, and seem unable to realise that it is a lack of understanding of the most elementary part of the subject which prevents them from giving the examiners sufficient evidence of knowledge to justify their passing.

"Here again it is to a want of proper teaching that a very large proportion of the failures must be ascribed. Very many candidates fail not because they have been idle, but because their study has been entirely misdirected.

"*Botany.*—Of the 295 candidates who were examined in botany, 231, = 78 3 per cent., passed, and 64, = 21·7 per cent., failed.

"The chief impression the Examiner in this subject has received during the past year is that far too large a proportion of the candidates come up for examination inadequately prepared and wanting a practical knowledge of elementary fundamental facts.

"There has not perhaps been exhibited an absence of intelligence and perception greater than might fairly be expected, but with few exceptions candidates have failed to show that in their study of botany and in the training they have undergone they have either acquired sound knowledge or have used the science as an educative instrument of their perceptive faculties.

"To the practical recognition of the organs of plants and an acquaintance with the functions severally performed by these the Examiner has attached primary importance in conformity with the terms of the syllabus. In respect of the former the candidates have frequently shown startling ignorance, whilst the knowledge of the latter displayed by them has been in a great many instances not merely deficient but quite wrong and out of date. It is not intended by this last expression to suggest that candidates should know the most recent discoveries in this branch of the subject, but it is expected that physiological information, now part of the common stock of botanical knowledge and which any competent teacher could supply and explain, should be in possession of anyone who desires to pass the examination.

"In considering the cause or causes to which the ignorance and want of training above mentioned may be assigned, a clue is found through the examination itself. If a question be framed in such a way as to allow of a sequential historical reply being given, an answer is usually readily forthcoming, and the candidate will glibly recount, in the most minute detail, events as they are given in some text-book, provided he be allowed to start at some definite point, less glibly if the point of departure in the story be fixed by the Examiner. If now either before or after such a question the objects to which they refer be shown to the candidate, there is great probability he will know nothing about them. The certain conclusion to be drawn from this experience is that candidates absorb information from text-books without digesting it, and without reference to the plants themselves. The whole thing becomes in this way a mere matter of memory, and were the strengthening of this the object of the examination, the learning of a chapter in a classical author would be equally serviceable.

"Of like character as an index is the fact that candidates may know a name for a phenomenon—the more likely if it be some long, high-sounding one—but can neither recognise an instance of it when shown to them, nor give any explanation of its essentials. Acquaintance with the name in this instance does duty for knowledge of the thing. These features are not, indeed, distinctive of this examination and of its candidates only; they are to be found as well in examinations of other boards; but their occurrence here as elsewhere is attributable primarily to faults in the teaching system through which the candidates pass.

"The conditions under which most of the candidates have to study the subjects of examination are anything but favourable; yet still, even amongst those who fail, many appear to have genuinely worked according to their lights, for the examination. But it is neither in the time and other difficulties which the candidates have to overcome, nor yet in the idleness of the individual, that a chief reason for the breakdown that takes place in the examination hall is to be sought. The Board is satisfied that to defective teaching is to be traced the greater part of the failures that occur. Candidates come up crammed. They have not studied. Time after time candidates have told the examiner that they have not had an opportunity, through their teachers, of examining practically the simplest flowers that an examiner can put in their hands, and that their acquaintance with the subject has been derived entirely from the perusal—with such help as the crammer could give—of the subject in one or other of the text-books in vogue.

"It is clear that the weak point that must be reached, if the candidates are to come up decently qualified for examination, is the means and methods of study available to them, and that improvement cannot be expected until the teachers realise that sound practical knowledge is wanted, not the smattering acquired by learning by rote from books. Meanwhile, if any machinery exists at the disposal of the Society through which it can be conveyed to the teachers that the serious deficiences indicated above are a blemish in their work, militating against the success of their students, and which the teachers ought to remove, the Board is of opinion that it should be put in operation.

"*Materia Medica.*—The most important part of this branch of the examination is undoubtedly the recognition of drugs and their adulterations. Accurate knowledge is here essential, and, as a rule, candidates are fairly well prepared. Occasionally one is met with who persists in telling the Examiner that Spanish cantharides is Chinese blistering fly, and *vice versâ*, even although he is shown the specimens side by side. A mistake like this can only be attributed to sheer ignorance, and as an indication of the mental habit of the candidate it is sufficiently serious.

"The purely memory work is fairly well done, and the botanical sources of drugs, the natural orders, and habitats are usually given with readiness and accuracy. The active principles of the more important drugs are also familiar by name to most of the candidates, but relatively few carry their reading sufficiently far to enable them to form more than a hazy idea as to how these principles are extracted. The moment the Examiner leaves the beaten track the average candidate flounders hopelessly. For example: A candidate describes *Digitalis purpurea*, but has not the faintest idea of the meaning of the word '*purpurea*.' Numerous instances of this kind occur. Another candidate recognises or 'spots' a specimen of *Hyoscyamus niger*, but on being shown a second specimen of the same he fails to identify it. A candidate is asked, 'How is scammony obtained?' and glibly replies, 'By means of mussel shells'; but he has no idea of the *modus operandi*. The mention of the habitat of a plant frequently leads to the innocent question, 'Where is that?' and it is a remarkable fact that not one candidate in twenty can answer correctly two consecutive questions in geography. Facts familiarly known to every educated man are apparently unknown to the candidates. For example: To take a few answers given in one morning alone, Sumatra was located repeatedly in South America, North Africa, India and 'China way'; Malabar in North Africa and East Africa; Barbadoes in the Pacific Ocean, South America, and the East Indies; Socotra in the Pacific, the West Indies and East Indies; Senegal in East Africa and North America; Jamaica in the East Indies; Ceylon, off China; Siam on the 'west coast of China'; and so on *ad libitum*.

"Candidates excuse themselves by saying that there is no mention of geography in the syllabus, but obviously it is not too much to expect a man to know what he is talking about. A candidate who says that Ceylon is situated off the coast of China, *ipso dicto*, stamps himself as an uneducated man. While it would be too much to expect an intimate knowledge of geography, it must be confessed that answers such as those given above are distinctly disappointing. To sum up, the general impression is that purely memory work is got up with care by the average candidate, but beyond that there is really little attempted.

"*Prescriptions.*—There are no special observations to be made on this subject, Though candidates generally can read prescriptions fairly well, there is frequently an astonishing ignorance of Latin grammar and terminology considering that they have already passed the First or Preliminary examination in that subject. This ignorance is chiefly apparent in the translation of prescriptions from English into Latin. Many candidates seem to be unfamiliar with ordinary directions written in Latin, and the translation of such directions into accurate and appropriate English is often badly done.

"Failure to detect excessive doses in prescriptions is also very frequent. The chief cause of the comparatively few failures in this subject, however, is ignorance of posology, which seems to be got up by rote from the Pharmacopœia rather than as the result of actual experience and observation in the pharmacy.

"*Oral Pharmacy.*—There are comparatively few failures in this subject, probably because those who are weak have already been sifted out on the practical day. The failures are due to an insufficient knowledge of the Pharmacopœia. Many seem not to know that book practically, but cram up a few strengths of active ingredients, which in the excitement of the moment they often forget. They cannot give an intelligent account of the processes for such preparations as spirit of nitrous ether, aromatic spirit of ammonia, the scale compounds and syrup of phosphate of iron; nor do they show an intelligent understanding of the various steps in the estimation of such drugs as opium and cinchona bark. Many persist in saying ipecacuanha wine is made by dissolving an extract of the root in sherry wine, but they have no idea how the extract is made; others say the wine is made by macerating the root in sherry wine. Many again have no definite idea of the strength of the most active preparations which they are called upon to dispense every day. This condition of things again brings out the fact of defective training during apprenticeship. Many pharmacists seem to take apprentices merely for the services they can get out of them, and without any idea of giving them an intelligent and reasonable knowledge of their business.

"In conclusion, the Board respectfully direct the attention of the Council to the evidence of the great lack of a definite, systematic, and thoroughly practical course of training pursued for a sufficient period under competent teachers as a dominant note of their report. The Board entirely concur in the oft-repeated and now generally recognised necessity for an adequate curriculum. They gladly recognise evidences of improvement, but are unanimously of opinion that the only sufficient security for the adoption of such a curriculum is its compulsory enforcement. Meantime it appears to the Board very desirable that students and teachers alike should be made aware of the main facts embodied in this report."

James L. Ewing, Chairman.

The President said this report would be of great value both to teachers and pupils, and he hoped it would have some effect in hastening what they all desired—an enforced curriculum. In the meantime, however, it would be of great service by showing that it was not, after all, so much a question of the number of facts and figures which a man could commit to memory, which was important, as the attainment of an intelligent knowledge of the principles underlying the subjects in which he was to be examined.

Mr. Symes said the report was very elaborate, and they were much indebted to the Examiners in Scotland for sending it. He hoped every candidate would peruse it and take it to heart. Of course, the best results could only be obtained when the curriculum was in force, but he looked forward to a considerable improvement when the new Bye-laws came into operation.

Mr. Carteighe, by way of emphasising the remarks of the chemical examiner, said he might give an illustration of the want of experimental illustration in teaching. He should be afraid to say how many thousand candidates who had passed through his hands had never seen phosphorus burned in oxygen, even within recent years. A large number of teachers drilled their pupils through the practical subjects and made them perform what they would have to do before the examiner, but did not explain the principles of either botany or chemistry by practical experiment and illustration. As he got older he felt more and more pity for many of the young men who thought that they had been taught the subject in which they were to be examined.

Mr. Bateson thought the principal source of weakness was that students did not avail themselves of the opportunities they had at their own doors. If they did, such a thing as Mr. Carteighe had referred to would not occur. His experience showed him that those who did avail themselves of their own opportunities at home fared far better in the examination than those who came from schools of pharmacy. He could scarcely call to mind the case of a young man who had done his best to study on his own account who had failed.

The President, whilst agreeing with what had been said by Mr. Bateson, pointed out that it was the duty, not only of the pupil to study, but of the master to encourage study, and where there were classes and lectures available, to give facilities for attending them. Even in country districts, where there were few opportunities, there were many ways in which those who took pupils might encourage habits of study and practical observation on the part of those they professed to teach.

Mr. Bateson said many young men relied far too much on their ability to attend a school of pharmacy after their period of apprenticeship was over.

Mr. Allen thought Mr. Bateson had given the gist of the whole matter. He did not understand him to wish to discredit schools of pharmacy, but simply to show that a young man who availed himself of the opportunities he had during his apprenticeship, and did his best to study, had a great advantage over one who relied simply on his pecuniary ability to attend a school, and went there without previous study.

The Vice-President said he noticed at the last examination that a larger proportion of candidates passed the first time than usual. He spoke to several of them and congratulated them, and he generally found that they were men who had worked well during their apprenticeship. One of them, he found, had attended the local classes of the Science and Art Department, and no doubt many others did the same.

Mr. Atkins, after referring to the great importance and value of this report, said there never was a period when young men had so many advantages in the way of study as they had to-day, owing to the efforts of county councils and technical education committees. He knew a village about twelve miles from Salisbury in which a very able and cultured man was located, and a group of five or six villages were supplied with a fair amount of elementary knowledge of botany, physics, and allied sciences. Again and again he had called the attention of young men to the importance of going through a voluntary curriculum of this sort. The great difficulty to be confronted everywhere was the rarity of thinking. Most people, both young and old, took their thinking ready-made, and thus did not understand the fundamental principles of anything.

Mr. Martindale suggested that, in addition to classes which could often be taken advantage of, there were two other helps which were even more valuable—self-help and fellowship, by which he meant the help which an elder apprentice could give to a junior, The great point was to cultivate habits of study during apprenticeship instead of waiting until it was over and then cramming, as that never could yield atisfactory results.

Mr. Johnston regretted that this report should have come from Scotland, and said he should like to know how many of the rejected candidates came from south of the Border. He believed a great many came from England, for he could speak with some knowledge of the candidates from the east of Scotland, and felt quite certain that amongst them, in chemistry at any rate, there was not such a large percentage of failures as was here recorded. It would be far better for both England and Scotland if there were more centres where the education necessary for passing the examinations could be acquired, and if there were, they might hope to see more Major men on the Register. Unless some such course were adopted, he feared they would become fewer and fewer as time went on. He agreed that a compulsory curriculum was the great remedy for the evils complained of. He did not believe any Scotchman would ever make such stupid blunders as some of those mentioned in the report.

The President said they could only take the figures as they stood, and until he knew the contrary he must assume that the majority of the candidates referred to were Scotchmen. With regard to educational centres, he might point out that those already existing were not utilised to anything like the extent they might be. Last week he was at Manchester, and spent some time at Owens College, where every facility was afforded for the study of chemistry and physics, but the complaint was that so few availed themselves of the opportunities offered.

The British Pharmaceutical Conference.

Mr. Symes reminded the Council that the British Pharmaceutical Conference would meet at Belfast on August 9, and hoped members would bear this in mind in arranging for their holidays.

Report of the General Purposes Committee.

The report of this Committee, which dealt only with legal matters, was read and considered in Committee.

On resuming, the report and recommendations of the Committee were adopted, and special resolutions passed authorising the Registrar to take proceedings against the parties named therein.

"FIRST" EXAMINATION RESULTS.

A meeting of the Board of Examiners for England and Wales was held on Wednesday, February 2.

Certificates by approved examining bodies were received from the undermentioned in lieu of the Society's examination :—

Bingham, William Arthur ; Balham.
Birkett, George N. M. ; Manchester.
Burnell-Jones, Harold S. ; London.
Flynn, John P. ; London.
Hughes, Richard Osborne ; Liverpool.
Machin, Harold ; South Tottenham.
Miller, Alfred Edward ; Bath.
Nield, Thomas ; London.
Paynter, Alfred John ; Torquay.
Reeson, Herbert S. ; Rotherhithe.
Smith, Kenneth ; Leigh.
Turnbull, Edward ; London.
Williams, Thomas Hugh ; Barmouth.

The report of the College of Preceptors on the examination held on January 11 was received. 324 candidates had presented themselves for examination, of whom 160 had failed.

The following 164 passed, and the Registrar was authorised to place their names upon the Register of Apprentices and Students :—

Ackerley, Archibald ; Birkenhead.
Aikman, John ; Leith.
Appleyard, Herbert ; Leith.
Backler, Charles L. E. ; Peterborough.
Barrett, Walter Ernest ; Ilkley.
Barrie, Walter ; Tweedmouth.
Bate, Joseph William ; Walsall.
Baxter, Henry Cowan ; Dunfermline.
Bayley, Charles Wesley ; Brighton.
Beacher, Ralph Edward O. ; Sheffield.
Beale, Percy Arthur ; Northampton.
Bell, Edgar Thomas ; Cardiff.
Bell, Ivie Hair ; Glasgow.
Bell, James Thomson ; Dumfries.
Bird, Albert Edward ; Rugby.
Blechynden, A. ; Newcastle-on-Tyne.
Blyth, Charlotte P. P. ; Edinburgh.
Booth, William ; London.

Borrowman, Agnes Thomson ; Melrose
Bott, Graham Ewart ; Lewisham.
Brice, Albert Victor ; Bristol.
Brims, Donald ; Liverpool.
Brooke, Frank ; Doncaster.
Brown, George Steel ; Broughty Ferry.
Bryant, John ; St. Leonards-on-Sea.
Buchanan, Lizzie ; Kirriemuir.
Bullock, James ; Leicester.
Campbell, Robert ; Lancaster.
Cassidy, John Patrick ; Gateshead.
Christie, Benjamin ; Aberdeen.
Christie, James Daniel ; Old Meldrum.
Clark, Frederick H. ; Cockermouth.
Clark, James ; Glasgow.
Clarkson, Joseph Montague ; Edinburgh
Cluett, Charles Preston ; Chester.
Cockrill, Thomas Wilkinson ; Hull.
Cooper, Astley ; Leeds.
Cooper, George Roland ; Southport.
Corson, George Stewart ; Callander.
Corson, Robert Stewart ; Callander.
Craske, Bernard Ivan ; Holt.
Crowden, Samuel Pascoe ; Edinburgh.
Cuthbert, Thomas H. ; Lancaster.
Dainty, E. J. ; Barrow-in-Furness.
Daniel, Arthur W. ; Stoke-on-Trent.
Davies, Edward John ; Llanelly.
Davies, John James ; Llandyssul.
Dewhurst, Harry Edward ; Accrington.
Dobson, Joseph H. ; Great Harwood.
Duncan, George Walton ; St. Andrews.
Dunn, W. H. S. ; Clifton-on-Dunsmore.
Elford, Thomas Mitchell ; Plymouth.
Evans, William ; Llanelly.
Fell, William Henry ; Spilsby.
Fergusson, James ; Edinburgh.
Finch, Jacob ; Norwich.
Finegan, Richard Joseph ; Liverpool.
Firman, Frederick W. C. ; St. Heliers.
Fleming, Arthur Irwin ; York.
Geenty, Owen Charles ; Leeds.
Gibson, Henry ; Lancaster.
Gillett, Francis H. ; Moreton-in-Marsh.
Glass, Julia ; Edinburgh.
Goss, John Osborne ; Plymouth.
Graham, John ; Inverness.
Grainger, George W. H. P. ; Edinburgh.
Gray, Herbert Charles ; Oxford.
Gray, Percy ; Cambridge.
Gray, Sydney Bunting ; Rugby.
Green, Ernest William ; Northampton.
Hands, Harold Frank ; Cheltenham.
Harley, John ; Edinburgh.
Harper, George ; York.
Harris, Thomas ; Seven Sisters.
Hastings, William Ferguson ; Forfar.
Hill, David ; Arbroath.
Hockey, John Aplin ; Trowbridge.
Hollingsworth, A. ; Newcastle-on-Tyne.
Hopkins, Frank Goulding ; Broad Oak.
Hughes, John Henry ; Birkenhead.
Hurn, William Henry ; Norwich.
Hutt, John Bartlett ; Witney.
Jamieson, George Frederick ; Falkirk.
Jessop, John ; Birmingham.
Johnson, William P. S. ; Alnwick.
Jones, Arthur Owain ; Bangor.
Jones, Thomas A. ; Llandrindod Wells.
Kearney, William John ; Duns.
Kent, Joseph Henry ; Mountain Ash.
Kitchen, Clement ; Nantwich.
Knight, Leonard Holder ; Totnes.
Lambshead, Samuel H. ; Paignton.
Lavcrack, Ernest Wilson ; Malton.
Lawrence, Harold ; Penrith.
Leedale, Robert William ; Leeds.
Leese, Elisha Morley ; Alrewas.
Lochran, John ; Motherwell.
MacDonald, James ; Edinburgh.
McDonald, Robert ; Paisley.
Macintyre, John ; Oban.
McLaren, William Berry ; Newport.
McMillan, Hugh ; Kilmaurs.
McMyn, Richard Howarth ; Blackburn.
Maltby, Frank ; Lincoln.
Mannell, William C. ; Okehampton.
Mannox, Margaret M. ; Birmingham.
Mansbridge, Charles S P. ; Cheltenham.
Matthew, Georgina ; Aberdeen.
Mayson, Wilfrid Leslie ; Blackpool.
Milne, Herbert G. ; Aberdeen.
Overton, James Leonard ; Banbury.
Pain, Frederick John ; Folkestone.
Parrott, Jasper William S. ; Watford.
Paterson, Hugh ; Wishaw.
Paterson, Robert ; Leslie.
Peebles, Frederick Charles ; Hamilton.
Peel, Wilfrid ; Elland.
Phillips, John ; Trawsfynydd.
Philpin, William ; Milford Haven.
Pickles, Walter Howard ; Liscard.
Plummer, Frank ; Luton.
Powell, Edward Thomas ; London.
Preston, Ernest ; Eccles.
Quarry, John ; St. Boswells.
Quinn, James Francis ; Douglas.
Rae, David Paterson ; Galloway.
Reid, John ; Port Gordon.
Revill, Douglas Charles ; Romford.
Rixen, Ernest Alfred ; Teddington.
Roberts, Walter Charles ; Broadway.
Robinson, James Edward ; Birkenhead.
Robinson, John Leolin ; New Brighton.
Robinson, William Arnold ; Harden.
Rowland, Ernest O. ; Matlock Bath.
Rutherford, Robert John ; Cambo.
Sanderson, William ; Edinburgh.
Skinner, Duncan David ; Oban.
Smith, Albert Woodall ; Scarborough.
Smith, Alfred ; London.
Souter, James Cooper ; Aberdeen.
Spencer, Rosa K. ; High Wycombe.
Sprott, Charles Edward ; Maryport.
Stephenson, William ; Jarrow-on-Tyne.
Sturrock, John Jarron ; Arbroath.
Swinton, Alice ; Dunfermline.
Symes, May ; Highgate.
Thom, William B. P. ; Linlithgow.
Thomas, John Herbert ; Cellan.
Thomsett, Sidney E. ; Matlock Bath.
Thomson, Arthur ; Grantham.
Tippetts, John William ; Leicester.
Tonkin, John Bassett ; Penzance.
Unsworth, George ; Bury.
Wade, Alfred ; Leeds.
Walker, Francis John B. ; St. Leonards.
Weavers, Horace Percy ; Colchester.
Welton, Ernest ; Attleborough.
Weston, Walter ; Todmorden.
Wilde, Albert Edward ; Denton.
Wilkie, Peter Marshall ; Giffnock.
Wood, Robert ; Carnoustie.
Woolf, Francis William ; Redruth.
Youngson, John ; Aberdeen.
Yoxall, Alfred Newboult ; Belfast.

The questions set at this examination were published in the *Pharmaceutical Journal* for January 15, p. 53.

The following is a list of the centres at which the examination was held, showing the number of candidates at each centre, and the result :—

	Candidates.				Candidates.		
	Examined.	Passed.	Failed.		Examined.	Passed.	Failed.
Aberdeen	10	7	3	Lancaster	8	4	4
Birmingham	13	4	9	Leeds	15	7	8

ANALYTICAL NOTES.

Detection of Turmeric in Rhubarb Powder.—Jaworowsky recommends the following method for detecting turmeric in rhubarb. Shake about 1 gramme of finely-powdered rhubarb for some minutes with 10 C.c. of chloroform and filter through a small filter. Add to the filtrate 15 times its volume of petroleum ether, and shake. The fluid separates into two parts. Shake one part once or twice with 2 to 3 C.c. of pure strong sulphuric acid and the other part with 1 to 1·5 Cm. of a saturated borax solution. If the rhubarb powder is pure, the chloroform solution will be of a light straw colour, which disappears on mixing with the petroleum ether. Shaken with sulphuric acid the latter turns light brown and the mixture remains clear. The second part shaken with borax solution is not altered. If turmeric is present the following reactions are obtained. The chloroform extract is yellow-brownish and with greenish fluoresence, the addition of 15 times its volume of petroleum ether produces a yellow flaky precipitate, the fluid losing neither its yellow colour nor its fluoresence. The petroleum ether chloroform solution shaken with sulphuric acid of sp. gr. 1·04 is coloured violet, the sulphuric acid taking a fushine-red colour, changing quickly to reddish-brown and then slowly to yellowish-brown. On the mixture being shaken with a borax solution, the latter is coloured violet, the top layer remaining unchanged. The reactions are very delicate.—*Zeit. d. oest. allg. Apoth. Ver.*, li., 727.

Phenol as a Reagent for Copper.—Jaworowsky states that an ammoniacal solution of phenol is a most delicate reagent for copper. A solution containing 1 part sulphate of copper in 10,000 parts of water gave light blue coloration with this reagent in 20 minutes, dirty blue after an hour, dark violet blue after 3 hours. 1:100,000 solution was distinctly blue in 20 minutes, greenish, when seen from above, in an hour, brownish-blue in 3 hours, dark green in 18 hours ; 1:1,000,000, light blue after 18 hours. Even in a solution of 1:100,000,000 a coloration was distinctly visible after 24 hours. Ferrocyanide of potassium does not produce any coloration in the last-named dilution.—*Chemik. Ztg.*, xxi., 254.

Testing Lard by its Oleic Acid.—An important clue to the purity of lard is the iodine number of the oleic acid. Mansfield gives the following method of applying the test :—Dissolve 10 grammes of the separated fatty acids in 100 C.c. of ether, and shake with 3 grammes of oxide of zinc until the fluid thickens. The resulting oleate of zinc remains in solution while the non-soluble palmitate and stearate are separated. After the filtration of the mixture and distillation of the ether, the residual soap is decomposed with diluted hydrochloric acid, and the separated oil acid again washed and dried. 0·2 gramme is used for the determination of the iodine number.—*Pharm. Centralh.*, xxxviii., 353.

LONDON: SATURDAY, FEBRUARY 5, 1898.

THE COUNCIL MEETING.

After confirmation of the minutes of the previous meeting the President referred to the death of Mr. Lea, of Worcester, who was a life member and had been a liberal contributor to the Benevolent Fund. The death of Mr. Conroy was also mentioned as a loss to pharmacy.

On taking the lot as to the retirement of members of Council, the names drawn were those of Messrs. Allen, Atkins, Corder, Grose, Martindale, Savory, and Warren. The members retiring by rotation are Messrs. Bateson, Cross, Hills, Johnston, Newsholme, Storrar, and Symes.

The additions to the ranks of the Society comprise 3 members, 37 associates, and 43 students.

The report of the Finance Committee called for no comments, both receipts and payments recommended being of the usual character.

The Registrar's report was presented and ordered to be printed, see page 122. It shows that the additions to the numbers of pharmaceutical chemist and chemist and druggist members have been somewhat less than in the previous five years, and that they have been more than counterbalanced by the deaths, secession, etc., and that while the additions of associates in business have been considerable, the number of associates not in business has decreased.

The number of entries for the qualifying examination were nearly equal to those last year, and the number of successful candidates was smaller. The number of entries for the Major examination was considerably smaller, but the proportion of successful candidates was larger than in the previous year. The increase in the number of registered persons was only forty-nine.

On the recommendation of the Benevolent Fund Committee four grants, amounting in the aggregate to forty eight pounds, were ordered to be paid. The Secretary reported the death, at the age of 87, of Mr. Parsons, who was elected an annuitant in 1877.

The report of the Library, etc., Committee stated that a communication from the Decimal Association has been under consideration, and that the President purposes attending a meeting of the Association to which it referred.

The President mentioned the receipt of a letter from the Honorary Secretary of the Midland Chemists' Association, enclosing a resolution expressing unqualified approval of the draft Pharmacy Bill. A letter from the Secretary of the Royal Botanic Society announced the extension of the time for admission of students to 3 p.m. This is a concession which will afford greater opportunity for study, and it has been obtained in consequence of Mr. Martindale's bringing the matter before the Council.

A letter from the Coroner for Southampton contained a recommendation of a jury that greater caution should be observed in the sale of carbolic acid, and that it should be supplied in special bottles.

The President then drew attention to a report of the Board of Examiners for Scotland, offering explanations of the fact that there are so many failures in the examination. It pointed out that most of the failures are due to deficiency in the practical portions, and in pharmacy as well as chemistry, showing that there is a want of systematic teaching rather than a want of industry on the part of candidates. The report suggested that chemists should give greater attention to directing or facilitating their apprentices' studies, and that the great want was a compulsory curriculum as a remedy for misdirected study. Dr. Symes remarked that some improvement might be expected when the new Bye laws come into operation, and in the course of a discussion which followed the reading of the report, which is published at page 121, Mr. Bateson and Mr. Atkins suggested that greater advantage might be taken of local opportunities for study, which are now so generally provided. In connection with this view the President spoke of the great facilities for the study of chemistry and physics to be obtained at the Owens College, Manchester, and of the very slight extent to which they are utilised.

Dr. Symes mentioned that the meeting of the British Pharmaceutical Conference would take place at Belfast next August, and expressed a hope that the fact would be remembered when arrangements are made for holidays.

On the recommendation of the General Purposes Committee resolutions were passed authorising the Registrar to take proceedings in several cases which have been reported and considered.

THE METRIC SYSTEM.

The use of the metric system of weights and mea ures is now general in scientific work, the result of recent legislation is that its use in British commerce is permitted, and the time appears to have come when the lead taken by science workers should be followed by pharmacists in their daily business as far as possible. The mischief of a permissive system is that what is permitted is often, as a matter of convenience, ignored, and there is little doubt that the mere permission to use metric weights and measures in trade will prove futile in encouraging the general adoption of the system. The suggestion is offered, therefore, that pharmacists should neglect no opportunity of familiarising themselves, and those with whom they come in contact in the course of their business, with the more rational weights and measures that are now legal, the more especially as they appear destined, sooner or later, to supplant the older weights and measures entirely. With the view of encouraging and assisting the reform indicated, it is proposed in future to give all quantities in these pages in accordance with the metric system, and the change will be effected in its entirety at as early a period as may prove convenient. After the new Pharmacopœia is published there will be no excuse for British pharmacists to plead unfamiliarity with the metric system, and contributors and correspondents are requested henceforth to state all quantities in terms of that system, unless the necessity for doing otherwise should be unavoidable.

ANNOTATIONS.

A University Degree in Science is most certainly not gained as easily as the title "Pharmaceutical Chemist," nor is the Fellowship of the Institute of Chemistry so readily obtained as Mr. Glass seems to imagine, judging from his letter in last week's Journal. In the first place, those who desire to matriculate at, say, London University, or to be registered as students of the Institute of Chemistry, must show proof of having attained a much higher standard of general education than is necessary in the case of pharmaceutical students. Then the courses of study required are much longer, and the intermediate and final examinations to be passed are more severe and necessitate more sustained application than is the rule in pharmacy. In fact, no real comparison can be made between such dissimilar requirements. The new Bye-laws will do something towards improving the pharmaceutical position, but the omission of scientific subjects from the new syllabus of the Preliminary examination will prevent it taking equal rank with the London University Matriculation Examination. Again, the requirement that a candidate presenting himself for the Minor examination must present a certified declaration that for three years he has been employed as an apprentice, or has otherwise for three years been practically engaged in the translation and dispensing of prescriptions, is not for a moment to be compared with that of the Institute of Chemistry, the regulations of which stipulate that every candidate for the associateship must have "passed satisfactorily through a systematic course of at least three years' study in the subjects of theoretical and practical chemistry, physics, and elementary mathematics." And these do not, by any means, exhaust the very great differences that exist at all stages of the respective courses.

A Degree in Pharmacy, to be of any real value and receive proper recognition in this country, must be conferred by a university, preferably after a recognised course of study. The proposal to establish a teaching university in London seems to indicate a favourable opportunity for giving serious attention to the demand for some better recognition of advanced work in pharmacy than can at present be obtained, and there is good reason to believe that the authorities of the Victoria University would not be unwilling to entertain suggestions on this point, whatever may be the position of London University in the matter. Of course, in the event of a degree being granted, the requirements would almost certainly be greatly in excess of those that now prevail in connection with the Major examination of the Pharmaceutical Society. Matriculation, on the present London and Victoria University lines, may be expected to be a necessity, and candidates will probably be expected to devote a year at least to higher scientific studies, after attaining the standard of the existing Major examination, an equivalent of which might be regarded as an intermediate examination for the degree. But, in any case, it is well for pharmaceutical chemists to comprehend that their present standing is not in itself sufficient to justify them in asking for such higher recognition as would be indicated by holding a degree in pharmacy.

In that Land of Freedom from Tradition, the United States of America, the titles of "Pharmaceutical Chemist" and "Graduate in Pharmacy" have long been the highest recognition of advanced studies in pharmacy, but of late the further step has been taken of conferring a degree—that of "Doctor in Pharmacy." In one instance, at least, the degree will be granted by a university, but in others independent colleges are taking upon themselves to assume a function that is, by common consent in this country, reserved for universities only. A typical case is that of the Philadelphia College of Pharmacy, and a brief summary of the conditions on which the "degree" is conferred by that institution should be of special interest to our readers at the present time. In the first place, all students matriculating at the College are required to attend two preliminary examinations, one held four weeks, and the other eight weeks, after the opening of a term. Those examinations are based upon the subject-matter of the lectures and laboratory exercises covered by the students prior to the dates of the examinations, whilst with the first is combined an examination in the usual rudimentary branches of English education, unless candidates can present evidence of having already satisfied some similar test. Until these preliminary requirements are met, students are not allowed to proceed further in the special pharmaceutical course.

The Three Years' Curriculum which is compulsory in the case of candidates for the title of "P.D." comprises courses in the theory and practice of pharmacy, chemistry, materia medica, botany, field work in botany, operative pharmacy, analytical chemistry, and laboratory instruction in botany and pharmacognosy. Examinations are held at the end of the first and second years, and any student failing to satisfy the examiners in a majority of the subjects he has studied is required to repeat his year's work. Failure in one or two branches, however, may be compensated for by subsequently satisfying the examiners in those subjects only. At the end of the third year the student must again present himself for examination. If successful he is then permitted to assume the title of "Pharmaceutical Chemist," on condition that he is of good moral character and has produced an original dissertation or thesis on some subject of pharmaceutical interest. To become a "Doctor in Pharmacy" he must, in addition, have served a four years' apprenticeship "with a person or persons engaged in and qualified to conduct the drug business," and he may then be admitted to the final examination and receive the diploma of the College if successful. Another title, that of "Master in Pharmacy," may be conferred on graduates of the College of not less than five years' standing, who have been engaged in the practice of pharmacy during that length of time and are of good moral character and professional repute. An original dissertation is again required in this case.

The Communications on the Pharmacy Bill, published in the Journal this week, deal with the matter in question from many different standpoints, but apparently finality in the arguments is still as far off as ever. Mr. Routley assumes indifference on the part of the general public, in regard to the rank any individual holds in the Pharmaceutical Society, and perhaps he is not far wrong in so doing. It is even thought by some that "chemist and druggist" is a better title, from a business point of view, than "pharmaceutical chemist," because it is more intelligible to the public. The proposition advanced with regard to the Major examination and the imposition of an annual registration fee embodies ideas that may be realised some day, though not exactly in the rough-and-ready manner he suggests, and the time is certainly not yet ripe for such an important change. In Mr. Dunlop's letter the Bill is boldly referred to as a "Reform Bill," and that fact is sufficient to reveal his attitude with regard to the measure. It will be observed, by the way, that he explains the confusion in the official report of the Edinburgh meeting held a fortnight ago, by attributing the remarks of one speaker to another and *vice versâ*. Such an instance of reversion or trans-

position is distinctly curious. Turning to Mr. Woolley's letter we find a definite denial of Mr. Pilkington Sargeant's "facts," but, nevertheless, the Manchester and district chemists are still far from being unanimous in their position with regard to the Bill. Time, however, may work a change even in that part of the country. Mr. Schollar confirms Mr. Woolley's statements, and in other ways combats the arguments that have been put forward by Mr. Sargeant. Mr. Barrass doubtless speaks for many readers when he hints that it was hardly worth while to make so much fuss about so slight a measure, as the limited number of its opponents have done. This is a practical, sensible sort of letter, and it introduces a sense of freshness into the air of the controversial arena, that has been badly needed for some weeks past. As will be seen by the footnote to his letter, all hope of converting Mr. Cook on the point of the value of membership of the Society has been given up, but we have the satisfaction of knowing that he for one fully appreciates the advantages of membership, and that he is not to be classed as an opponent of the Bill. His claim for something more for Major men is not likely to be overlooked in the future, but a suitable opportunity must offer itself before that question can be seriously entertained.

The Registrar's Report (see p. 122) confirms the figures published last week regarding the strength of the Pharmaceutical Society at the end of the year 1897. That is to say, the total number of subscribers at that time was 23 less than at the end of 1896. The elections for January and February this year, however, have been more numerous than for the corresponding months of last year, and there have also been a number of restorations, so that at the present moment the deficiency is practically made up. But the fact remains that the Society is less representative of registered chemists—who have increased in number—than it was twelve months ago, and that fact should be taken into serious consideration by members who have any thought of opposing obstacles to the passing of the Pharmacy Bill. Members go and associates come, the balance between the two classes varying from year to year, but always and steadily in the same direction. If, therefore, the class which is entitled to the full privileges of membership is to be maintained, it seems essential that all registered chemists should be eligible to enjoy those privileges. It may be noted, by the way, that Mr. Makepeace Lock exaggerates somewhat (see p. 133) in speaking of chemists and druggists who were in business before the passing of the Pharmacy Act, 1868, as a "small" class. As a matter of fact the class referred to is far from small, for out of the 15,215 chemists on the Register, more than 3900 have been registered in virtue of having been in business before August 1, 1868.

The London Members of Council are again all on the retiring list, with one exception. As it is, there are but six of them altogether, a much smaller number than seems desirable when the work of the numerous committees is taken into consideration, and in the event of the number being further reduced at the coming election, the inconvenience so caused by the difficulty of obtaining a quorum at times will be considerable, to say nothing of the extra trouble involved in bringing country members of Council up to town more frequently than they care for or than would be at all necessary if there were as many London members as there ought to be. But that, of course, is a matter for the electors to decide in due course, and the only object in referring to the matter now is to show that there are two sides to the question sometimes raised with regard to the relative proportions of metropolitan and provincial members of Council, whilst sight should not be lost of the fact that each individual member represents the whole of Great Britain and not any particular district only.

"Bacteriology for Pharmacists" will be Mr. Leo Atkinson's subject at the evening meeting in London of the Pharmaceutical Society, on Tuesday next, February 8. That it is a subject of great interest it is needless to say, but it may be permitted to point out that Mr. Atkinson's work in bacteriology entitles him in great measure to be regarded as an expert. He has also proved to his own satisfaction the advantage that may accrue to the pharmacist who fits himself to be what may be termed a popular scientific adviser and instructor, and from that point of view his experience should be of value to his fellow-pharmacists. The lecture will be fully illustrated by practical demonstrations of methods of cultivation and staining, as well as by photo-micrographs, and readers are reminded that it is customary at such meetings for the President to take the chair and at once proceed with the business at eight o'clock sharp.

The Period of Balls has almost passed in pharmaceutical circles, but compensation of a sort is provided by the opening of the period of pharmacy dinners. The Cambridge Pharmaceutical Association holds its annual dinner on Thursday next, February 10, and the President of the Pharmaceutical Society will be the guest of the evening; the School of Pharmacy dinner takes place the following week, when the Dean, Professor Greenish, will occupy the chair; and the Chemists' Assistants' Association is to celebrate the termination of another year in its career at a similar festive gathering on March 3, when the President, Mr. T. Morley Taylor, expects to be supported by the Presidents of the Pharmaceutical Society and of the British Pharmaceutical Conference, Sir Dyce Duckworth, Mr. Michael Carteighe, and a host of other friends. Before many weeks are past the annual dinner of the members of the Pharmaceutical Society and their friends will also be announced, indicating what is practically the end of a winter session that seems, as yet, to have but recently commenced.

Sir George King, K.C.I.E., better known as Dr. George King, on whom a mark of distinction was conferred as one of the New Year's honours, well merits his advancement, which at the same time reflects honour on the Pharmaceutical Society, of which he is an honorary member, having been elected in 1892. Sir George King's tenure of office as Superintendent of the Royal Botanic Gardens, Calcutta, has been marked by an immense amount of active and excellent work, and his name will always stand an in association with those of his predecessors, such as Wallich, Roxburgh, and Griffith, historic names in the early records of Indian botany. Previous to his recently conferred honour of knighthood, Sir George King was the possessor of a long list of distinctions, being an M.B., LL.D., F.R.S., and C.I.E. His 'Manual of Cinchona Cultivation in India' is a very complete work on the subject, from the collection of the seeds in South America, introduction and cultivation in India, chemistry of the bark crop, and the local manufacture of cinchona febrifuge. A large number of scientific papers are the work of his pen, the most important, however, are the 'Annals of the Royal Botanic Garden, Calcutta,' and 'Materials for a Flora of the Malayan Peninsula.' On his retirement from the position of Superintendent of the Calcutta Garden, Sir George King will carry with him the best wishes of every botanist and pharmacist.

The British Pharmaceutical Conference arrangements for this year are progressing, the latest information being that the President of Queen's College, Belfast, has kindly consented to place the whole of the Queen's College Buildings at the service of the Ulster Executive Committee for the purposes of the Conference in August next.

THE WORLD OF PHARMACY.

CHEMISTS' ASSISTANTS' ASSOCIATION.

Mr. T. MORLEY-TAYLOR, President, occupied the chair at a meeting of this Association on Thursday, January 27, when Mr. E. W. RICHARDSON, of the *St. James's Budget*, delivered a most interesting lecture on

How an Evening Paper is Produced.

Commencing with the editorial staff, he briefly sketched an outline of the work done in the various departments connected with an evening paper. The work of the news agencies, the tape machine, Mono- and Lino-type machines, and the method of casting stereotype plates were then graphically described, and a very vivid account given of the actual work of printing, and of the extraordinary rapidity with which the machines print and fold the papers, each revolution of the machine printing two papers simultaneously. The listeners were then let into the secret of how it is that within a few minutes of the Oxford and Cambridge boat race, papers can be bought in the streets of London giving a description of the race from the start until the winning post is passed. Briefly told, the secret is that wires are laid along the entire course, these are tapped at various points so that a description of the position of the boats and other little incidents of the race are despatched to the newspaper offices as it proceeds. This is at once put in type, stereotyped, and put on the machines waiting for the result to be flashed along the wires. Space is left in the stereo for a fudge box containing this important item, set in ordinary type, to be inserted. Two boxes are in readiness, so that whichever crew passes the winning post first, as soon as the news reaches the office the box in which its name appears first is inserted, a lever pulled, and the machines are at work turning out copies of the paper at the rate of something like 26,000 per hour. The same secret also applies to horse-racing results. The publishing department was next dealt with, and particular stress was laid upon the routine, precision and discipline required on the part of all concerned in the production of a newspaper, and in placing it in the hands of the public.—At the conclusion of the lecture, numerous questions were asked, and Mr. Richardson briefly replied to them.—In answer to a question by Mr. PEARSON, with respect to the promptness with which a *résumé* of the life of any great man is published almost before the body is cold in death, he explained that in the case of all great personages a record or history of their life is kept in type, strictly up-to-date, together with illustrations of their place of birth, marriage, etc., so that, especially if their death is expected by reason of serious illness, within a short time after the news is announced a life-history is issued to the public.—A vote of thanks, moved by Mr. GAMBLE, and seconded by Mr. E. W. HILL, was then put to the meeting, and carried with acclamation.

LIVERPOOL PHARMACEUTICAL STUDENTS' SOCIETY.

The usual meeting of this Society took place on Thursday evening, the 27th ult., at University College, Mr. PIERSON, the President, in the chair.—The preliminary business having been finished, Mr. T. S. WOKES mentioned that he had had to dispense succinate of iron once or twice of late, and would like to know if it was commonly met with in prescriptions and in what form it was generally ordered.—The PRESIDENT, Mr. Pierson, in reply, stated that it was not exactly of daily occurrence, but he had had it ordered in cachets and also suspended with mucilage in a mixture. The cachets should be moistened on their edges with gum instead of with water to make the two halves adhere, as the use of water has a tendency to cause the iron salt to deliquesce and stain the envelope.—Mr. MARSDEN drew the attention of the meeting to a method in use in the physiological laboratory of the Medical School for dividing albumin when used in pepsin testing. There they drew the liquid albumin up in tubes of small calibre, which were then sealed and exposed to heat to cause coagulation of the contained albumin, which was subsequently blown out in thin pipes like fine vermicelli, very convenient for pepsin examinations.—The HON. SECRETARY, Mr. J. Harris Burns, then read a paper on

The Structure and Functions of the Human Eye.

The lecturer, who was evidently fully master of his subject, the knowledge of which he had gained whilst connected with an eye hospital, proceeded, by means of diagrammatic drawings shown by the electric lantern, to describe the structure and general anatomy of the eye with the wonderful arrangements Nature has provided for ensuring the adaptation of the sight to various distances and the different degrees of illumination. After contrasting the work of Nature with the highest attempt of man—the photographic camera—the lecturer went on to consider the faults to which the eyesight is subject and the artificial means of correcting them at our disposal, in the shape of specially-contrived lenses or glasses. The final portion of the lecture was devoted to an extremely lucid and interesting exposition of the commoner surgical operations on the eye, which were made much more easy of comprehension by demonstration from a magnified model of the organ capable of being readily dissected into its component parts. A good discussion followed, and expressions of satisfaction were general at the clearness with which the various points had been explained, and at the manner in which a difficult subject had been handled by the lecturer.

LIVERPOOL CHEMISTS' ASSOCIATION.

The annual general meeting of this organisation took place at the Royal Institution, Colquitt Street, on Thursday evening, the 27th ult., the PRESIDENT, Mr. J. Bain, occupying the chair. After the usual votes of thanks had been passed to the retiring President, Mr. A. C. Abraham, F.C.S., F.I.C., and the other officers, the TREASURER and SECRETARIES presented very satisfactory reports, which were adopted, and which will be in due course printed and posted to each member. The following gentlemen were elected to the Council: Messrs. A. C. Abraham, Day, Dutton, Hornblower, J. Smith, J. J. Smith, and Pearson.—The PRESIDENT, after mentioning that he had attended, as representative of the Association, a banquet given to the Lord Mayor of Manchester, Alderman R. Gibson, by the Manchester Pharmaceutical Association, proceeded to deliver a short address.

The President's Address.

Mr. Bain said: My first duty is to thank you for the honour you have been pleased to confer upon me in electing me to this chair, a position which, during past years, has been so ably filled by men whose names are distinguished not only in pharmacy, but in the higher realms of science. For one who, like myself, has found his vocation rather on the commercial side of our calling than on the more congenial and inspiring scientific side, it is a somewhat serious matter to be called upon to occupy the presidency of an association such as ours, the members of which have been accustomed to associate more distinguished names than mine with this important office.

We now enter upon the forty-ninth session, and if our Association is not actually adorned with the halo of antiquity, it has acquired during its long career a reputation as a provincial association second to none. It is therefore with a considerable amount of misgiving that I enter upon this office, a feeling that is only assuaged by the kindly words of encouragement I have received from past-presidents and members and the kindly promises of loyal assistance from our honorary secretaries.

I shall be grieved if the Association does not keep up its high reputation during the ensuing session, or if my year of office should cause any dimness on the lustre of its history.

Since its foundation the composition of the Association has changed, and as time has passed over it, the ideas, pursuits, and necessities of its members have altered. In one respect, however, we of this session are at one with those who inaugurated this Association half a century ago—we are still seeking for knowledge, and with good reason; we pursue it more intensely and more eagerly than did ever those who have gone before us. The application of science to the production of medicaments has undoubtedly been the chief feature of the period I refer to, and entails a high state of culture on the part of those who desire to avail themselves of its enormous possibilities. Our success in business depends to a great extent upon our capability of appropriating and utilising the scientific discoveries which have been unearthed. To enable us to do this we must continue, by every available means, the education which, beginning in our apprenticeship, cannot be said to be completed even after a lifetime spent in the attempt to acquire an efficient knowledge of our art, the difficulties of which are only partially surmounted by the oldest and most zealous of its votaries.

I consider it a good sign of the times that local associations

are increasing in numbers, and, let us hope, in usefulness as well organised institutions, with active committees and officers, they stand out all over the country as bulwarks against unfair interference with our rights. They are pioneers in all important pharmaceutical movements, and are ever at hand for counsel or defence in time of need. The support of local associations such as ours is a duty incumbent on every chemist, and he who fulfils this duty reaps a rich reward, not only by participating in the advantages just mentioned, but by assisting in the intellectual improvement of his fellow members, and thereby developing his own knowledge, intelligence, and experience; and last, and by no means least, by forming the acquaintanceship of his fellow townsmen and fellow craftsmen, and gaining respect for and confidence in those whom, under other circumstances, he would only regard as competitors, and perhaps as enemies, who now become his sympathetic and confidential friends.

It is quite conceivable that all those associations scattered over the length and breadth of the land might be doing a very good work locally but yet be capable of doing a great work nationally only. They are like the cells of a great battery, each one perfect in itself, but requiring a connecting wire to be of really potent influence. The Federation of Local Pharmaceutical Associations is this connecting wire which will bind all these associations together, which will collect and focus their force, and bring it to bear effectually on any necessary object or subject. Every association joining this Federation, and I am glad ours is of the number, increases enormously its influence and power for good.

I cannot close these remarks without referring to the loss this Association and pharmacy generally has sustained in the death of Mr. Michael Conroy. He truly adorned chemistry and pharmacy, and his now vacant place at our meetings will long remain painfully conspicuous. As a gentleman he was respected and beloved by all his numerous acquaintances and friends, and as a scientific chemist his name is of world-wide fame. Only two years ago he occupied this chair, and everyone here knows and feels, better than my words can convey, the loss our Association has sustained.—A miscellaneous communication was contributed by Mr. T. H. Wardleworth in the form of a specimen of maize oil, which he shortly described as probably fit for use in pharmaceutical operations from its freedom from taste and unpleasant odour.—Mr. Cockshott was elected a member of the Association.—It was decided to hold a special meeting on the proposition of Mr. T. H. Wardleworth, seconded by Mr. Wellings, and feelingly supported by Mr. A. C. Abraham, in order to appropriately express the loss which they as an Association and individually had recently experienced by the lamented demise of Mr. Michael Conroy, F.C.S., and it was unanimously resolved that Mr. Edward Davies, F.C.S., F.I.C., should be asked to deliver an "In Memoriam" address.—Before the reading of the paper of the evening, Mr. A. C. Abraham said he thought it due to the authors to explain that it should have been read at the December meeting, but in consequence of the amount of business to be transacted that night and the lateness of the hour when their turn came, it was postponed until the present occasion. In the meantime a paper by Messrs. Farr and Wright had appeared in the *Pharmaceutical Journal*, which covered most of the ground Mr. Cowley had gone over, so that he (Mr. Abraham) had thought it as well, in order to protect the *bonâ fides* of Mr. Cowley, and at his request, to hold the paper in his keeping until the present occasion.—The following paper, by Messrs. R. C. Cowley and T. P. Catford was then communicated:—

The Solvent Action of Proof Spirit and Acetic Acid on Colchicum Seeds.

Mr. Cowley said: The subject of this paper is a continuation of the work on colchicum corm undertaken by one of us last winter, and on which a paper was read before this Association last April. It was then the unanimous desire of the meeting that further investigations should be continued on the seed. The result of our work has further proved that acetic acid does not possess advantage over weak spirit as a solvent of the alkaloid of the drug. Two preparations were made from portions of a commercial specimen of powdered colchicum seeds:—

1. A tincture by the pharmacopœial process.

2. An acetum by maceration and percolation with diluted acetic acid until 8 parts of the percolate were obtained from 1 part of the seeds.

The spirituous preparation contained a considerable quantity of a fatty oil, some of which spontaneously separates in cold weather in the form of oily globules and as solid white flakes. The acetic preparation, on the other hand, was found to contain no oily matter, but the dilute acid had the effect of dissolving out a large proportion of mucilaginous matter, thus necessitating a special preliminary treatment in each case.

Several methods were employed to determine the alkaloidal strength of these preparations. Precipitation by the usual alkaloid precipitants proved unsatisfactory, the results in all cases coming out too low to warrant our proceeding with them.

As tannin is one of the most efficient precipitants for the alkaloid, we devoted special attention to it. A very bulky precipitate was obtained, which at first sight led us to believe this method was going to be successful, but the precipitate consisted mainly of the colouring matter of the drug, and when subsequently warmed with lead acetate to decompose the tannate of the alkaloid a resinous matter separates, apparently from the decomposition of the alkaloid, even though the operation was conducted at as low a temperature as possible on a water bath. The result of several attempts gave us low results. It would appear that owing to the tendency of colchicine to decompose, the simplest method for extracting it is the best one.

The alkaloid from our assays was obtained in the form of a pale yellow transparent varnish with, in several instances, a distinct tendency to crystallise. A pecularity of the alkaloid from the acetic preparations and also of that from the B.P. extracts is that it is accompanied by something of a fluorescent character. We do not find that this has ever been noticed before. We found removal of the oil by petroleum ether, as described by Messrs. Farr and Wright, rather troublesome owing to the tendency to form emulsions due to traces of mucilaginous matter so little as to cause only slight turbidity if treated with alcohol as hereafter described. Instead of petroleum ether we have adopted a simpler method, which proves quite effectual.

From 100 C.c. of the tincture in a small flask distil off the greater part of the spirit, evaporate the remainder in a capsule on a water bath to about 10 C.c. The oil will be found floating on the surface of the liquid in globules. Acidulate with acetic acid, and stir in a little kaolin which has been previously washed with acid and water; pour on a moistened filter paper. Allow this to pass through and preserve. Wash the contents of the filter paper with distilled water until no longer acid. Concentrate the washings and transfer, with the first filtrate, to a separator. Add excess of caustic soda and 20 C.c. of chloroform. After well shaking, the chloroform layer is drawn off into a tared flask and distilled on a water bath. The distillate can thus be repeatedly returned to the separator until all the alkaloid is exhausted, about three washings being generally sufficient. The flask with alkaloid is then dried in a water oven until of constant weight. As $CHCl_3$ forms a compound with colchicine, prolonged heating is necessary to drive off the last of it.

We have found by experiment that after the kaolin treatment petroleum ether does not extract even a trace of oil. The average yield of alkaloid from the tincture was ·087 gramme from 100 C.c., equivalent to ·75 per cent. of alkaloid in the seed.

To obtain a good result from the "acetum" we found it absolutely necessary to remove the mucilaginous matter, which we did as follows: 100 C.c. was evaporated on a water bath to a syrupy consistency and poured gradually into several times its bulk of strong alcohol, set aside to completely precipitate the mucilage, etc., which comes out in the form of granular white flakes, easy to filter off. The filtrate was received in a small flask fitted with a perforated cork, through which passes the stem of the funnel. The whole was placed on a water bath. The vapour of the spirit passes through and around the filter, and is condensed on the bottom of a capsule or flask containing cold water, fitting inside the mouth of the funnel, from which the condensed spirit drops back again through the filter into the flask. Complete exhaustion is thus ensured, as shown by the drops becoming colourless. The funnel is then removed, the spirit is distilled off and the residue exhausted as described under the tincture. The average yield of 100 C.c. acetum was ·081 gramme alkaloid, corresponding to ·7280 in the seed.

Assay of Commercial Samples of Extracts of Colchicum.

One specimen each of the acetic and ordinary extracts were dealt with. The chief difficulty in estimating the alkaloidal strength of these consists in removing the large proportion of mucilaginous matter, etc., which makes it quite impossible to exhaust by direct treatment. We removed these by dissolving the extract in a small quantity of water, and then poured it drop by drop into alcohol contained in a bottle, shaking after each addition. The granular precipitate aggregates eventually, but not before the

spirit has had time to thoroughly penetrate it. We proceeded afterwards as in the cases of the acetum. The percentage of alkaloid in the acetic extract was 1·27, corresponding to 1·62, in the extract dried at 100° C., and the percentage in the ordinary extract was 1·23, corresponding to 1·55 in the extract dried at 100° C.

Messrs. Hornblower and Marsden, during the subsequent discussion, asked in what state the colchicum seeds were, and the latter gentleman suggested that as the active principles were said to exist only in the seed-coat, powdering would seem to him unnecessary.—Replying to these and other questions, Mr. Cowley said that why acetic acid was used as a menstruum for colchicum he could not understand, particularly after his experiments. The seed he used had been procured for him in fine powder by Mr. Wardleworth, so that he could answer for its quality, and his reason for using it powdered instead of whole was that, though the active principles were said to reside in the seed-coat alone, it had been proved some time since—by Cripps he believed—that it was absolutely necessary to the proper extraction of these active principles that the sced should be in a fine state of comminution.

NEWPORT AND MONMOUTHSHIRE CHEMISTS' ASSOCIATION.

The annual dinner of the above Association was held on Thursday the 27th ult., at the Westgate Hotel, Newport, and was a complete success.—Alderman Bear (the Mayor) presided over the gathering, and was supported by Dr. Basset, Dr. Garrod Thomas, Dr. Howard Jones, Dr. Gratte, Dr. Hamilton, Mr. Benson Harris, Mr. R. R. Groome, Mr. G. R. Thompson, Mr. H. C. Lewis, Mr. F. G. Young, Mr. J. Lloyd Jones, Mr. A. Gratte, Mr. C. Paine and others.—The loyal toasts having been honoured, Dr. Basset (Secretary of the Medical Society), in proposing the toast of the Newport and Monmouthshire Chemists' Association, expressed great satisfaction at the objects of the Association, which was the first formed in the county. He was very pleased to find that amongst other things they intended arranging for courses of lectures to be delivered on various subjects bearing affinity to their profession, such as chemistry, pharmacy, etc. The advancement of pharmaceutical science was taking place at such a rate that it was essential for them to hear everything that may be said on the subject. These would also be of material service to those who had yet to face their examinations. As far as the Medical Society was concerned, they would be very pleased to work in harmony with their Association, for the chemist and the doctor had many things in common.—In response, Mr. Paine, the Vice-President of the Chemists' Association, referred to the practice of doctors dispensing for themselves. He would be glad to see a change in this respect. With reference to the intended courses of lectures, they would be looking to the doctors for a helping hand, two or three of whom had already promised them a few evenings.—Mr. B. Harris having also made a few remarks, Mr. Smith then proposed "The Town and Trade of Newport," to which the Chairman responded, and remarked on the long hours chemists had to work, and also the competition which they had to contend with. Even the drapers and grocers vended their commodities. He considered the profession one of the most honourable in the kingdom.—Dr. Garrod Thomas also spoke in response to this toast, remarking in the course of his speech that he had come there at great inconvenience to himself in order to show by his presence how high an opinion he entertained for the chemists of Newport, and expressed his gratification at the formation of the Association. It was only by their combining together they would be enabled to do anything in furthering the interests of the profession.—Mr. Collis then proposed "The Medical Profession of Newport," and ventured to express a hope that the doctors would hand over the dispensing to the pharmacists, to whom it legitimately belonged. The sooner this was done the better. He also wished to draw their attention to the subject matter of a letter which he had that day received from the Secretary of the British Pharmaceutical Conference, in which the Secretary asked him and others to use what influence they could to get members to join that Conference, as their ranks had been considerably thinned during the last year by death.—Dr. Howard Jones, in responding, wished the Chemists' Association every success, but was afraid that as matters now stood it would be impracticable to hand over the dispensing to the chemists. He and his brother professionals would only be too glad to do so were it possible.—Mr. Lloyd-Jones having proposed "The Visitors," which, having been responded to by Mr. Thompson, the county analyst, the toast of "The Mayor" was drunk, and "For He's a Jolly Good Fellow" sung heartily. Thus an exceedingly enjoyable evening was spent, and everything augurs well for the future of the Newport and Monmouthshire Chemists' Association, which, by the way, owes a great deal of its vitality and even its existence to its indefatigable Hon. Secretary and Treasurer, Mr. Benson Harris, who fully deserves the praise bestowed upon him.

IRISH PHARMACISTS' ASSISTANTS' ASSOCIATION.

At Dublin on January 26 the second annual ball of this Association was held in the Pillar Room of the Rotunda. Upwards of ninety couples were present. Dancing commenced at 9 p.m., the President, Mr. William J. Hardy, M.P.S.I., leading off in the first of twenty-four up-to-date dances. The music was supplied by Oscar May's string band. The room was prettily decorated for the occasion by Messrs. Ramsay and Co., florists, Ball's Bridge, and Messrs. Millar and Beatty, Grafton Street. The catering arrangements were entrusted to Messrs. Kelly and Co., Lower Baggot Street. Messrs. W. Vincent Johnston, M.P.S.I., and W. J. Dunwoody, M.P.S.I., acted as Masters of Ceremonies, and left nothing undone to secure the comfort of the visitors. Dancing was kept up until 4 o'clock, when the company separated to the refrain of "Auld Lang Syne." The Association is to be congratulated on the success which has attended its second annual re-union, and to Mr. J. Tyrie Turner, M.P.S.I., the Hon. Treasurer of the Association, and the Committee of management are due the best thanks of the members and of all who attended the function.

PHARMACEUTICAL SOCIETY OF IRELAND.

At Dublin on Monday last the usual evening meeting of this Society for the discussion of scientific subjects was held in the Examination Hall, 67, Lower Mount Street, when an interesting lecture on

Insects; and how to Catch, Preserve, and Classify them,

was delivered by Mr. George H. Carpenter, B.Sc., to an appreciative audience, amongst whom were a considerable number of ladies. The President, Mr. P. J. Downes, occupied the chair, and the lecture was illustrated by limelight views.—The President, in introducing Mr. Carpenter, humorously alluded to the not infrequent calls on the chemist for bottles as a means of exterminating insects. He was indebted to a mosquito, which he found in his pharmacy, and which he showed to Mr. Carpenter, for to-night's entertainment. That mosquito was the means of him capturing the learned lecturer.—Mr. Carpenter, whose rising was greeted with applause, proceeded at once to his subject, on which he spoke fluently and without notes for upwards of two hours, holding the interest of all present to the very end. The lecture embraced the life and habits of flying and creeping insects, ranging from the familar cockroach of the kitchen to the denizens of Central Africa, India, and other remote places. The various processes of securing specimens, and the subsequent preservation of the captives alive and dead, formed an important feature in the lecture. Some beautiful reproductions of insect cabinets in museums were shown. The "praying" insect from Madagascar, so-called from its devotional attitude, was spoken of, but, added the lecturer humorously, its instinct was not "praying" but "preying" when so postured. Centipedes and other members of the Arthropoda world, including the familiar prawn or Norway lobster, and the collembola from Mitchelstown cave, came in for due attention. The cuckoo's "spit" was shown to consist of a small insect underneath the froth-like substance. Cochineal insects and cantharides and Spanish fly and their relation to pharmacy were alluded to, as were also plant lice or green fly. Water-bugs and their musical accomplishments caused some amusement. Black beetles from Germany were at present paying a visit to this country, and, like other things made in the Fatherland, were very hard to get rid of once they got a footing. Locusts, grasshoppers, and dragon-flies were dissected verbally, and the adaptation of insects to their surroundings as a means of concealment was strikingly illustrated. The habits, etc., of butterflies, ladybirds, gnats, and stylox, or bee parasites, were described *seriatim*, and an excellent specimen of the tongue of a common blow-fly was thrown on the screen. The lecture concluded by Mr. Carpenter showing that insects were not unlike the *genus homo* in their instincts. They were slave-makers,

like the warlike ants, thieves in their desire to appropriate what was not their own, and charitable one to another in protecting their weaker or smaller kind.—Mr. W. F. Wells, ex-president of the Society, in proposing a very hearty vote of thanks to Mr. Carpenter for his able and instructive lecture, referred in happy terms to the treat they had all enjoyed. He drew an appropriate trade analogy from the predatory instincts of the creatures described and compared them to the larger men in trade whose instinct seemed to lead them to the absorption or swallowing up of their smaller brethren. He believed with Proctor in the survival of the fittest.—Mr. J. Tyrie Turner, M.P.S.I., seconded the vote of thanks, which was carried by acclamation.—Mr. Downes conveyed the vote of thanks to Mr. Carpenter, and hoped they would soon again have the privilege and pleasure of hearing that gentleman.—Mr. Carpenter suitably responded.—The President having announced that Dr. McWalter would read a paper on "Emulsions" on the second Monday in February, and that Professor C. R. C. Tichborne, LL.D , would give a lecture on "The Liquefaction of Gases" on the last Monday in the same month, the proceedings terminated.

LEEDS CHEMISTS' ASSOCIATION.

The adjourned meeting was held in the Café Monaco, Boar Lane, Leeds, on January 27, at 8.30 p.m. The President, Mr. E. Yewdall, in the chair, introduced the subject of

The Early Closing Bill,

and remarked that there was a class of people who put off to the last hour when shops are open the purchase of articles which might easily have been bought earlier in the day, and he thought that if some legislation similar to that of Sir John Lubbock's Bill came into force, it would tend to strengthen the retail shopkeepers who wished to close earlier.—In the discussion which followed Messrs. Hardman, Fourness, Worfolk, and Bowman expressed themselves favourable to the Bill, though it was pointed out by Mr. W. Johnson that if chemists only adopted the arrangement it might prove, commercially, a mistake, as the grocer, having the licence, could sell proprietary articles after the chemist was closed; but eventually it was agreed that the Committee support the Bill when it was opportune to do so.—A discussion was then introduced on

Metric Weights and Measures,

in which Messrs. Bowman, Fourness, Hardman, Pollitt, Beacock, and Worfolk took part, and it was agreed that the Committee should communicate with the Members of Parliament for the city and ask them to give their support to measures tending to encourage the use of metric weights and measures.—Mr. J. H. Fourness thought Leeds was much behind many other cities and towns in not having a yearly convivial meeting of the trade, and suggested an annual Ball. Unless the local Association was better supported, the President did not think they could entertain the suggestion; he should like to see the list of members much increased; but if the proposer would take the initiative he would be glad to join. A committee was then formed with this object, and the meeting terminated.

EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.

The fifth meeting of the twentieth session was held in the Pharmaceutical Society's House, 36, York Place, Edinburgh, on Friday, January 28, at 9.15. Mr. George Sinclair, President, in the chair. The minutes of last meeting were read and approved. The following paper, by Mr. W. Makepeace Lock, was read:—

The Profession of Pharmacy from the Point of View of an Employer.

In former papers the author had discussed the subject from an apprentice's standpoint and from an assistant's point of view. On this occasion he reviewed it from the aspect of an employer. He classed employers under two distinct heads, those who are "pharmaceutical chemists" and those who are not. Those who are not pharmaceutical chemists, again, he sub-divided into two classes, those who were in business before the Pharmacy Act and those who have since become qualified as "chemists and druggists." Regarding such as were in business before the Act the essayist had nothing to say, for, he remarked, "the class being small, they might deem my few remarks personal. Suffice it to say that their calling is no profession." Generally speaking, he continued, the business of a chemist and druggist is chiefly concerned with the selling of medicines, and also, to some extent, with the preparation of them from substances which are procured from the animal, vegetable, and mineral kingdoms. But this latter part of the vocation is not by any means extensively practised by those who sell drugs and style themselves chemists and druggists; as a rule, they purchase their wares from the wholesale manufacturer. Although the chemist and druggist may perchance possess as much knowledge as, and mayhap more brains than, some pharmaceutical chemists, yet he shows no indication of any evidence in support of that idea; and unless he procures for himself the Major certificate, he hardly merits the position of a professional man. The case of the pharmaceutical chemist seems more hopeful. He is at the top of the tree of pharmacy; his education has been prosecuted to the utmost limits required by the regulations, and he holds that diploma which should, but does not, make pharmacy a profession. But even the pharmaceutical chemist, well versed in science as he is, has not reached the goal of professionalism, for, excluding the fact that he is not required to undergo a University training, his business, as at present conducted, effectually debars him from being ranked as a professional man. His perfumery goods, his shaving and other brushes, his patent and proprietary articles, his unmedicated lozenges, his varied assortment of ordinary soaps, his grease paints, his large collection of bath sponges, and a host of other articles too numerous to mention, all should be handed over to the proper vendors. His aërated water trade, too, might, with profit to himself, be confined exclusively to syphons of medicated waters. But in order that such a state of affairs should be brought about it would first be necessary for all chemists to enter into a grand combination, and that they should all be of one mind on the point at issue. This would be essential to the success of the scheme; and the speaker suggested that the Pharmaceutical Society should be empowered to compel all chemists and druggists and pharmaceutical chemists in Great Britain to belong to it. That point gained, a special law should be obtained to enact that all such articles as previously referred to be expunged from the trade, for the purpose of conferring upon it much undoubted good; the registered chemist would then take his stand permanently as a professional man, a position which, by reason of his scientific attainments, he ought certainly to fill. But it was not possible to inoculate the Pharmaceutical Society with those beneficent ideas, and pharmacy would probably continue not to be a profession. Turning to the business aspect of the question, it was pointed out that in pharmacy, as in every other department of human activity, a watchful eye must be kept on one's neighbours, for even here the weakest go to the wall, and the conscienceless business man who holds fast by the great central principle must of necessity see that it is his neighbour who takes that position, and not himself. He takes every opportunity to belittle his "friend" who has an establishment at the next corner or across the street, as the case may be, and hopes that he may be swallowed up in the wild rush for a competency. The higher up in the scale his so-called "friend" may be, the keener the sport to hunt him down, and this is just what he tries to do. As an apprentice the average successful druggist will have had his little trials, but those are past. As an assistant he was kept continually at the wheel, and ground down with excessive work; that, too, is past. He has now, from being a raw, uncultivated, ill-clad, lazy boy, blossomed out into the mature, polished, busy man of the world. Such is the chemist and druggist when he dies—a successful business man. Thus, though no profession, pharmacy is anything but a failure; for, pursued intelligently, it has vast capabilities and an infinitude of resource not to be found in any other occupation. While it undoubtedly suffices to provide one's daily bread, there are many cases in which it has led on to fortune and fame, and that, too, in a comparatively short space of time, so that there is, therefore, hope for the druggist as a business man. But, as in all other occupations, he must needs have a clear head, a seeing eye, and a mind quick to grasp detail. Strict attention to the minor aspects of his business is absolutely essential, both as regards those in the back shop and those in the front; this ensures profit. And the work which he is called upon to perform, not requiring any special physical strength or exhaustive brain power, is healthy; his health, therefore, being practically assured, happiness and pleasure follow as a matter of course, and profit and pleasure are the chief ends of his life. Finally, though there is really very little connection between scientific chemistry and the chemistry of the chemist and druggist, let the pharmacist deserve the title

"chemist" when he has it; let him become a scientific chemist, for it will tend to raise him above the mere vendor of medicines; it will guide him in his wholesale purchases, and will enable him to test the purity of all the articles about him, and to prepare many compounds which he must otherwise buy. Let him summarily eject all articles which savour of other vocations; this he can do with ease, since the profits on most of them are *nil;* and, finally, let him secure the Major qualification. It is much to be desired, also, that pharmacists would join hand in hand with each other and banish for ever that inordinate selfishness which at present is so characteristic of the calling. Why descend to a low standard of business morals and try to crush another? Why not live and let live? Pharmacy is a noble calling, one requiring much self-denial, and pharmacists, who have immense responsibilities and obligations to fulfil, should see to it that, ere long, their vocation be recognised on all hands as the "profession of pharmacy."

The reading of the paper was followed by an interesting discussion, taken part in by Messrs. Currie, Hill, Kidd, McBain, McDiarmid, Mackenzie, Rowland, and Sinclair. The speakers generally agreed with the author, though it was pointed out that so long as doctors did their own dispensing—a practice especially common in the West of Scotland and in England—there was a very serious obstacle to the pharmacist attaining his true position as a professional man. The necessity of earning a living compelled him to add to his stock many things that it would add to his dignity to avoid. The sale of quack medicines was particularly condemned. Another tendency that militated against his professional standing was the extent to which many pharmacists relied entirely on the wholesale manufacturer for ordinary galenical preparations which could easily and more economically be made in any pharmacy. By making his own galencials the pharmacist could not only guarantee what he dispensed, but it had been found that he saved 10 per cent. of the cost. Instances were given of pharmacists who purchased such things as tinctura chloroformi co. and spiritus chloroformi. It was mentioned as a deplorable circumstance that a practice seemed to be growing among medical men of prescribing proprietary secret remedies of the composition of which they had no knowledge.—On the motion of the Chairman a vote of thanks was awarded to the author, and the meeting then closed.

BRIGHTON JUNIOR ASSOCIATION OF PHARMACY.

A discussion on "Should the Contagious Diseases Act be brought into force in England?" was the order for the evening on Wednesday, January 26, when the above Association held their usual weekly meeting. The President, Mr. C. A. Blamey, was in the chair. The subject evoked some good speeches, and an interesting evening was the result.

MIDLAND CHEMISTS' ASSISTANTS' ASSOCIATION.

A meeting was held on Wednesday, January 19, in the Exchange Rooms, Mr. H. Jessop, President, in the chair.—Mr. H. S. Lawton read a paper on

Pharmacy Law,

in which he dealt with the Apothecaries Act, Pharmacy Acts, Poisons Law, etc. There was some considerable discussion, which was joined in by Messrs. Walton, Jessop, Selby, and Osborne. Finally, Mr. Lawton proposed the following resolution, which was seconded by Mr. Walton and carried unanimously:—

> That this meeting of the Midland Chemists' Assistants' Association hereby expresses its unqualified approval of the draft Pharmacy Acts Amendment Bill proposed by the Pharmaceutical Society of Great Britain, and pledges its members to give the measure every possible support.

Test for Beeswax.—Henriques publishes the following modification of Weinworm's test. Three or four drops of melted wax are boiled in a test-tube for several minutes with 5 C.c. of alkaline glycerin. The wax at first dissolves, and then gradually becomes turbid. After three or four minutes' boiling, however, the oily particles run together, and the lower liquid is quite clear. The boiling is then stopped and the fluid decanted into another tube, then cautiously diluted with an equal volume of hot water, and again boiled and set aside to cool. When the wax is pure this sets to a clear transparent jelly, or so slightly turbid that large type can be read through it. The presence of 5 per cent. of foreign hydrocarbons renders the jelly quite opaque. The test is not sufficiently delicate to detect 3 per cent. of added cerasine.—*Pharm. Woch.*, xiv., 524.

ROYAL INSTITUTION.

At a meeting held on Friday, January 28, a lecture was given by Professor C. Lloyd Morgan on

Instinct and Intelligence in Animals.

At the outset he wished it to be understood that biology is a science not only of the dead but of the living, and not only the structure of organisms but their behaviour depend on heredity. Heredity provides fixed stereotyped characters, but these are capable of yielding, and while these fixed characters are referred to instinct, to intelligence belongs the capability of becoming accommodated to circumstances. As examples of the former we have the spinning of its cocoon by the silkworm, and the action of the newly mated bird that builds its nest and brings up its young without any previous training or experience. Instinct may be regarded as congenital, while intelligence is that by which the animal learns the lessons of life, and gains what are called acquired characters. In the study of these, one is concerned not only with biological but with psychological matters, and many difficulties both practical and theoretical are involved. Insects and invertebrates which are most suited for experiment are just those animals in forming conclusions concerning the mental states of which psychologists must exercise great caution, while on the other hand, with the higher animals, observation is more difficult and it becomes hard to distinguish behaviour that is congenital from that which results from imitation. It is to be noticed that the term instinct as used by naturalists and psychologists respectively has different meanings. The naturalist applies it merely to outward behaviour, while the psychologist means it to express the influences behind. A compromise would be desirable by which the term would always be used in the same sense and comprise harmonious doctrine. For the purpose of his experiments the lecturer selected the group of birds in the early days of their lives. Parental influence was removed, the hatching being accomplished by incubators, and it was found that the young soon became ready to nestle in the hand and adopt it for a mother. From the earliest hours the effect of experience may be observed, especially in the case of those birds that are hatched in an active condition, and it becomes difficult to distinguish acquired knowledge from instinct. The two, in fact, work into each other, and it may be said that instinct is shaped more delicately by intelligence. The complete relations of the two it would be impossible to give in detail, and the lecturer therefore selected some of the more important observations and deductions. Those birds that are not active when hatched, such as the blackbird, jay, and thrush, open their beaks for the food to be thrust in. The stimulus to this action may be almost any sound or a shaking of the nest, and even such a mechanical action as this gaping ceases after the bird has been given anything distasteful to eat. They were being fed on raw beef at first, but they did not appear to thrive properly on it, and eventually it was found that if the thread of beef were dipped in sand or the powdered wing-cases of beetles it made a good food. At the point of satisfaction the gaping ceases, and is, therefore, the result of two things, a stimulus from without, and also a prompting or impulse from within, and takes place only when the two are combined. The action of swallowing is very closely connected with gaping; both cease after an experience with unsuitable food. Birds that are more active at hatching, such as the duckling and chick, cannot be induced to peck at anything for twelve hours or more. This is probably due to the shock they receive at the change in being hatched, and the promptings of hunger do not come upon them at once, as they have a supply of food-yolk from the egg. After this period they will peck at anything near them, though not with great accuracy at first. Here again the effect of experience is evident; if they are given pieces of orange peel, which they strongly dislike, they become afraid afterwards to touch any kind of food, and will almost die of starvation. For this reason it is hard to rear some birds, such as plovers, which cannot be provided with proper food in due variety. Pheasants and partridges learn to peck from the example of their mother, and those which are hatched artificially must be taught by imitating the action of pecking with a pencil. The moorhen comes between the types of pheasant and jay. Its young can be taught to peck, but only at an object held above it. Runkin Marshall had said that in a psychological sense instinct was not a definite thing, but the lecturer contended that for a given group of animals it was perfectly definite. Viewed physiologically it

is the result of discharges from the central nervous system, having its basis in congenital preformation. The brain, in fact, is so built as to give these discharges. Beyond this the naturalist does not seek, but the psychologist finds in instinct four things: (1) the internal prompting; (2) the external stimulus; (3) the outgoing discharge producing the movement; and (4) messages going in from the organs concerned in the movement. The outgoing discharge is itself unconscious; it is only when the results give rise to a series of messages that consciousness takes place. The actions of locomotion belong to the instinctive class. The chick that has not learnt to walk does so as soon as it has got over the shock of hatching. Ducklings swim the first time they are placed in water, while the moorhen will swim before it can walk, and even gracefully, with movements that are perfectly definite in character. It will dive also without practice. A young duck was in one case found to dive when only thirty-six hours old, but that is unusually early. Attempts to make a moorhen dive by frightening it with noises and blows altogether failed. The bird had never dived when six weeks old, yet, when frightened by the sudden appearance of a dog, it dived, swam away under water, and brought its head up by the river bank, keeping its body underneath while it waited for the danger to pass. Young swallows were found to be able to fly and balance themselves well, when for experiment they were taken from the nest before the proper time. One of the brood which was not taken out did not fly of its own accord until two days later. It is clear that the internal impulse and external stimulus are there but are not definite enough. It appears they suffer an itching to be active, and the stimulus comes, in the case of swimming by the feeling of the water; in flying, by the pressure of the wings. When placed on a japanned tea-tray, non-swimming birds behaved naturally, while some swimming birds tried to swim instead of walking. Passing from instinctive actions to those of intelligence, it is found that what young birds will peck at is not determined by heredity. Attempts are made to deal with shot, beads, and anything else that is small, but experience tells them what to peck at a second time and what to leave alone. Chickens would swallow pieces of worsted made to look like worms, and in fact were ready to eat up large quantities, but after being given one or two pieces soaked in solution of quinine or very dilute strychnine, they refused even real worms. It has been stated by an American scientist that they have no taste, but it is evident from this experiment that that is erroneous. Similarly, the warning colours of caterpillars are useful to the chick only after its experience has been gained, and when a fox-terrier was first brought to broods of partridges and pheasants they showed no fear, but would even peck impudently at his claws and nose and showed a disposition to nestle with him. They behaved in the same way with a cat, but their indifference was not in this case reciprocated. Thus there is very little evidence of inherited knowledge of this kind, but this does not mean that fear is not a part of the scheme. Several birds are struck with terror at a loud note on the violin; it is the unusual that causes alarm. Anything sudden or rapid frightens at once, while no alarm is caused by a stealthy approach, as of a cat, but after a spring has been made and one of them seized they are equally afraid of the quiet approach. Fear and anger have a close relation to the outward discharge spoken of, which is not evoked by the sight of the object itself. Disturbances taking place in the action of the heart, respiratory, vascular, and digestive organs make the emotional state, and the back stroke from these organs, which is very swift, must be included with the messages going in from the organs of movement. This view, which has been elaborated by Professor William James, affords a consistent scheme, but the exact way in which consciousness exerts its guiding influence is only conjecture. The older psychologists defined intelligence as the faculty by which past experience is brought to bear on present circumstances, but this has been criticised in the argument that present experiences are just as important as past, as when we read a paragraph we are guided by the earlier sentences in reading what follows, but even so, such present experiences must be characterised as past, although happening only five seconds before. It may be said that every experience leaving its impression on the retentive and plastic brain tends to make the being different from what it was before. The distinguishing features between instinct and intelligence are seen clearly in connection with stimuli and responses. Instinct would cause a response in the pheasant to the sight of a dog, but no such response takes place, and a case even more striking is found in the act of drinking. Curiously, the birds do not recognise still water as something to quench thirst. Not until they chance to peck at a bubble or a grain beneath it do they make any attempt to drink, but as soon as they taste the water in their beaks they drink eagerly. Why is there no response to the sight of water while there is to the taste? It appears to be this: The effect of natural selection is shielded by the protecting influence of the mother by whom they are taught to drink. If, on the other hand, some individuals were not to respond to the taste of water natural selection would hold, but here differentiation by natural selection ceases. Experiments have recently been performed with the dog in an endeavour to make it carry out actions involving logical thought, but as yet no definite conclusions have been formed.

LEGAL HINTS FOR CHEMISTS.

The Stamp Acts.

(*Continued from last volume, page 470.*)

Implied Recommendation.—The description of the medicine itself is not infrequently an implied recommendation. Thus, "The A1 Diarrhœa Mixture" conveys, in fact is intended to convey, a certain efficacy, and would not pass muster at Somerset House. Similarly, such names as "Effectual Bronchitis Lozenges," "Celebrated Liver Pills," Infallible Cough Linctus," "The Never-Fail Rheumatic Embrocation," "Speedy Neuralgic Mixture," and the like would be equally open to objection. But there is really no occasion to incur the slightest risk on this score, for ample margin is allowed for what may in no carping spirit be termed legitimate description. The Board of Inland Revenue has always recognised that various medicines must have distinguishing descriptions, and though it has the undoubted right to act otherwise, it does not interfere with the use of purely descriptive words embodying no recommendation. Thus "Diarrhœa Mixture," "Bronchitis Lozenges," "Cough Linctus," "Liver Pills," etc., do not involve liability. One can even go so far as to say "Sedative Cough Linctus" or "Expectorant Cough Pills," or even "Stimulative Influenza Mixture" or Anti-neuralgic Liniment" without inviting the attention of the Authorities. It is indefensible therefore, to use a dutiable description when with a little care an equally effective non-liable phrase is within reach. Who, for instance, would wilfully use "neuralgic cure" when "anti-neuralgic" (which certainly conveys prevention and may so far be considered superior to cure) is allowable? Corns being human ailments, as was pointed out (*ante* p. 479), care must be taken to give no synonym for cure in the description of preparations for those painful inconveniences. "Corn paint"—to "be applied to the corn until relief is obtained"—is permitted, but "corn eradicator," or any similar word conveying in itself the idea of removal, *i.e.*, cure, is deemed a recommendation. Curiously enough, however, "solvent," which indubitably points to the disappearance of the offending excrescence, is held to be quite legitimately descriptive.

Anodyne is another word which should be tabooed by those who do not desire to pay stamp duty. Sedative, astringent, antispasmodic, diaphoretic, alterative, are quite innocent as prefixes, but "anodyne mixture" is a dutiable title. This, perhaps, is because the Schedule to the Statute contains reference to several anodynes, and the Schedule must be regarded as the only authoritative index of the class of preparations intended by the Legislature to be subject to the tax. A curious incident is recorded in connection with a case relating to the sale unstamped of an anodyne mixture. The magistrate seemed to kick at the idea of the word conveying a recommendation. It was a Greek word, and he suggested that very few persons would understand the significance of a recommendation held out in that language. Nevertheless, he convicted, as, in fact, he was bound to do, but he expressed his sense of equity by imposing a reduced penalty. The point the magistrate raised is really a strong argument for the abandonment of the word. If it be "Greek" to the medicine-purchasing public, it possesses little commercial value.

Negative and Indirect Recommendations may, as a rule, be used if no ailment is specified. For instance—

> "Aperient Liver Mixture. Reliable and agreeable. May be used in all cases where an aperient is indicated. It does not cause griping, nor is its administration attended by any of the undesirable after-effects which so often follow the use of many quack remedies. It can be recommended with the greatest confidence."

This is quite a long description, and no complaint can be urged on the ground that it does not "puff" the article enough. It puts

forward the claim that the mixture is a very superior preparation, which is enough for an ordinary vendor, and has the merit of involving no charge for stamp duty.

But add the name of an ailment, and state, for example, that it may be "used without danger for constipation or sluggishness of the liver," and the question of liability would be at once raised.

Again, it is not a legal recommendation to employ inferential phrases, but considerable ingenuity must be exercised in concocting them. Thus—

> "Rheumatic Liniment—contains no poisonous ingredients, and is a safe and valuable household preparation. To be applied on flannel until relief is obtained."

If the liniment were not designed for the alleviation of rheumatic pains there could be no purpose served in using it, but the label in question leaves that obvious deduction to the intelligent public. It does not state that the stuff will be beneficial, and it therefore escapes duty. Very little variation, however, is necessary to bring liability. Substitute "remedy" for "preparation," or say that "when applied on flannel it acts like magic," and a dutiable interpretation is possible. Inference, too, must not be twisted so far as to appear in the questionable guise of a testimonial. There must be no statement that "Dr. Smith prescribes it with benefit to his patients." If an advertisement must be given to Dr. Smith, it will be better to say that "he speaks highly of the preparation." Such phrases as "when the cough is troublesome," "until the pain is relieved," "when the distressing symptoms come on," are examples of the recommendation indirect, but, as indicated above, sailing so close to the wind requires a good deal of circumspection. Our only object in dwelling on the point is to impress upon our readers that there is ample room for making known to the public the nature of medicinal preparations without using liable phraseology.

LETTERS TO THE EDITOR.

The New Pharmacy Bill.

Sir,—I must ask you to allow me to contradict the statement made in your last issue by Mr. F. Pilkington Sargeant, that at the meeting of the Manchester Pharmaceutical Association (to which 500 invitations had been sent out) held at the Victoria Hotel on the 19th inst., "by their presence and communications, twenty-one chemists and pharmacists gave their opinion against the Bill, they constituting a majority over the supporters of the Bill." The voting was eighteen for, and nine against. A few gentlemen left the room before the vote was taken, but the majority of those were in favour of the Bill. I had received seven letters from gentlemen, five of whom were against, and two partially against. One letter, however, did not come into my hands until too late to be used. The writer of that letter is the local secretary in a neighbouring town; he wrote strongly in favour, at the same time stating that the Major men he had seen in his town were also in favour of the Bill. Mr. Sargeant's statement is not in accordance with the facts.

Manchester, January 31, 1898. Geo. S. Woolley.
Chairman of the Meeting.

Sir,—Mr. F. Pilkington Sargeant has executed a wise and becoming retreat from the lofty position which he was claiming for Major men, and we now learn "that the whole (M.P.S.)," by which I suppose he means Ph.C., "is greater than its part (A.P.S.)." Such humility after the somewhat arrogant assumptions of his previous letters leads me to the belief that my communication was not without effect. Mr. Sargeant accuses me of misrepresenting his statements. This I deny. Moreover, I consulted several Minor men before writing, and found that they considered a reflection was cast on their abilities by your more learned and scientific correspondent, and the following letter, which I have received from a London chemist, confirms my arguments. The writer, I may add, is personally unknown to me (name and address enclosed, not for publication, as I have not written for permission):—

London, N.W., January 22, 1898.

Dear Sir,—I congratulate you on hitting a very necessary nail in the matter of pharmaceutical chemist qualification. To hear and read what these gentlemen say one would suppose they had attained considerable eminence in science, etc., whereas the senior or advanced examination of the Science and Art Department is a good bit stiffer than the Major. It appears to me that in the permanent interests of chemists it would be better to have only one qualification. So long as two qualifications exist there is always a certainty of a little extra conceit in one of the sections.

I am, dear sir, yours faithfully, ——

As for avoiding the points at issue, I surmised that as Mr. Sargeant persistently refused to pause and ponder over the substantial and logical arguments advanced in favour of the Bill by gentlemen who are recognised as leading lights in the world of pharmacy, he would never allow himself to be convinced by those adduced by one who at the outset of his communication admitted that his perceptive and comprehensive faculties were not so keen as those of his opponent. As it is not necessary to repeat what has already been refuted, I will confine myself to a remark or two which is to be found in Mr. Sargeant's letter, published on January 1. It reads as follows:—

> "There is a feeling prevalent amongst pharmaceutical chemists generally that this Bill has been suggested by a few interested Minor men who would like to obtain a higher position than at present posssible."
>
> "This seems the more likely since the younger and more highly educated chemists and druggists do not call for the proposed change."
>
> "All the enthusiasm in support of the Bill comes from Minor men of from twenty to thirty years' standing."

Now I took the trouble yesterday to call on five chemists who are in business in this district and who have all qualified within the last few years, and found they were all unanimous in their good expressions of the new Pharmacy Bill. Next I consulted several Minor students, and was gratified to find the same state of feeling existing. Regarding Mr. Pilkington Sargeant's contention that the majority at the recent meeting of Manchester chemists held at the Victoria Hotel gave their opinion against the Bill, I have it on very good authority that of those entitled to vote on the motion proposed, eighteen voted for and only nine against. Once again must I inquire where is the successful opposition to be found? Mr. Sargeant bases one of his claims of the Pharmaceutical Society to be regarded as a learned one upon the fact that the Royal Botanic Society has elected our President to the position of honorary membership. Mr. Sargeant sees in this the recognition of the Pharmaceutical Society as a learned one. On the same principle, if the Fishmongers' Company were to give (as is quite possible) a substantial subscription to the Royal Botanic Society and receive in return, as acknowledgment, the form of honorary membership for its official head, then that body would have to be recognised as one of the learned societies. Mr. Sargeant also advances the remarkable statement that a person who possesses a title knows the value other people attach to it better than one who does not possess it. Here is wisdom indeed! After all the philosophical enunciations of the last 2000 years, there still remains a man who declares that he is a better judge of what other people think about him than these very people themselves.

> "O wad some power the gift to gie us
> To see ourselves as ithers see us."

Finally, I notice on reference that Mr. Pilkington Sargeant has held the distinction of being Ph.C. for one whole year. I wish to be charitable, and therefore suppose that during that time Mr. Sergeant must have been embarrassed by the admiration and homage of multitudes of awestruck juniors, or he would certainly never write such nonsense.

N. Howard Schollar, A.P.S.
Higher Broughton, February 1, 1898.

Sir,—It seems to me that far too much importance is being attached by your correspondents to the proposed amendment of the Pharmacy Acts. The general public know little, and care less, about the difference in value of the designations A.P.S. and M.P.S. I venture to say that, if a hundred persons were stopped to-day in a London street and asked if they knew the difference between the two designations, and what they both mean, about ten per cent. having relations in the trade would know a little about it, while the remaining ninety would have to confess their inability to answer except by guessing, or else would demand to be asked another. While I do not think the change will do any good, it can surely do no harm. After all, what does it matter? It would be as unjust to refuse the ordinary Minor man the opportunity of styling himself M.P.S. without having worked for it, if he wished to do so, as it would be to refuse a thistle to a poor hungry donkey under like conditions. Why does not the Pharmaceutical Council take a decided step forward and make the Major examination the

qualifying one, and make an annual fee obligatory upon those in business? We should not then find the majority of chemists content themselves with securing what after all was only meant to be an assistant's qualification.

Beckenham, January 29, 1898. E. W. Routley, Ph.C.

Sir,—An outsider, glancing over the draft of the proposed Pharmacy Bill, would probably wonder what there was in it to give rise to any difference of opinion among chemists themselves; he might also wonder, and be excused for so doing, that the promoters thought it worth while to make an appeal to the Legislature for the objects aimed at therein. If, however, the Council really considers that the interests of chemists at large are likely to be advanced by this inoffensive measure, and that it is worth while putting such formidable machinery in motion for the purpose, it would seem a pity that any objection of rather a selfish nature on the part of a few Major men should detract from the unanimity which is necessary to force even a Bill so emasculated through the House of Commons. Speaking personally, as a pharmaceutical chemist and member of the Society, I should be very happy to relinquish not only our sole right to use the title of member, but also, if it were deemed advisable for the general welfare of our craft, that of pharmaceutical chemist also. Could pharmacists only be united into one solid body with the exclusive right of dispensing prescriptions, etc., and another class of druggists formed corresponding to that in Ireland, it would indeed be worth while making what might appear to some a little sacrifice. This, of course, is a dream which none of us are ever likely to see realised. I may say that there is no analogy, though such is sometimes averred, between the two classes of "pharmaciens" in France and our own; the former, as regards professional and pharmaceutical qualifications, are on a level. If any of my *confrères* pine for the title of Fellow, the difficulty of obtaining such from the Chemical Society or a similar body is not insuperable. I am afraid, sir, however, that we shall be very sanguine if we imagine that any large immediate accession of strength to the Society is likely to result from the proposed measure. Even should it become law, the inducements held out to those who obstinately stand aloof are too slight to avail much. Had it been possible to attach exemption from jury service to the membership of the Society, that would have been a potent spur to our laggard and suspicious brothers. Perhaps the acquisition of such a privilege for chemists generally, even without the condition of membership, might have induced some out of gratitude to connect themselves with the Society, though I acknowledge this is extremely dubious, gratitude being a broken reed to trust to. Still, notwithstanding these misgivings, I would venture to appeal to my fellow pharmacists to let loyalty to the Council and the Society outweigh any feeling of personal grievance, and though the proposed Bill may not be so complete as might be wished, and may seem to bear rather hardly on one particular section, to support the Council in the matter, hoping that in the future a more comprehensive and beneficial measure may reward the efforts of an enlarged and invigorated Society.

North Finchley, N., January 31, 1898. T. Edward Barrass.

Sir,—I thank you for your insertion of my letter in the Journal of January 22. To that you appended a note asking me to specifically state in what respects I consider the proposed Bill "unjust." What I consider the most unjust portion of the Bill (and which I protest against) is the surrender "unconditionally" of the control of the Society (should the Bill pass and the expectations of its supporters be realised) which pharmaceutical chemists, predecessors and present created, maintained, and very largely supported, and who have ever been most loyal and zealous for its welfare.

Hitchin, February 1, 1898. Richard R. Lewis, Ph C., M.P.S.

Sir,—It may be that I am very obtuse, but certainly your line of argument with regard to this question is incomprehensible to me. In the first place, you see no distinction between the registered M.P.S. and the examined M.P.S. To my mind there is an important difference; the one has the honour by courtesy, the other has fought for and won it. Of course in both cases the fees must be paid. In the second place, you hold that it is not a qualification or a degree. If it is not either, what is it? Nuttall says: "To qualify is to make capable of any employment or privilege." Does not the fact of a man passing the Major make him capable of the privilege of becoming M.P.S.? You quite mistake me if you think I see any harm in admitting chemists and druggists to membership. I only contend that the pharmaceutical chemists have earned a higher distinction, and they ought to be considered in any alteration of the privileges to Minors.

Faringdon, January 29, 1898. W. R. Cook, Ph.C., M.P.S.

*** Since it is still "incomprehensible" to Mr. Cook that we can see no distinction between one member of the Society and another member, *as members*, it appears hopeless to make any further attempt to convince him. With regard to his question as to what "M.P.S." indicates, if not a qualification or a degree, the reply is obviously "Membership of the Pharmaceutical Society," and nothing more. A member of the Society may be a pharmaceutical chemist in addition, but that fact does not in any way distinguish him *as a member*. [Ed. *P. J.*]

Sir,—Please note that in last week's Journal (p. 106, col. 2, line 44) the word "Major" should read "Minor." The word "Minor" really gives the emphasis to what I said about the good to be derived by chemists and druggists from connection with the Society. I am convinced that much of the misconception of the antagonism to the Society's constitution and administration arises from an unsympathetic and imperfect acquaintance with the difficult duties it has to discharge. The question "What has the Society done for the trade?" is frequently asked by outsiders who cannot answer the question "What has the trade done for the Society?" The passing of this Reform Bill would remove the standing grievance of many of the opponents to the Society, and the Council is to be congratulated in its effort to bring to its support for the consolidation of pharmacy the many who have made the M.P.S. question the *bête noir* of their opposition. The report of the Edinburgh meeting was, as you noted, "confused." I was astonished to find, even in Edinburgh, a man standing up at a meeting and exposing his ignorance of the status of different individuals. One of the speakers did not know the difference of the status of Mr. Harrison, of Sunderland, and Mr. J. L. Ewing, our Chairman. Mr. Hill said word for word what you said in your footnote, whilst he is credited with saying what the other man said. And even although Mr. Hill made as pointed a remark as you did, the individual would not be convinced that he was wrong.

Pollokshields, January 29, 1898. T. Dunlop.

*** The report was printed as sent to us officially by the Assistant-Secretary Mr. J Rutherford Hill. [Ed., *P. J.*]

On Re-Copying Prescriptions.

Sir,—I should like to say that your opinion as to the necessity of re-copying prescriptions containing scheduled poisons at every repetition is a little startling. Of course, to the average dispensing chemist, who sees, perhaps, half-a-dozen new prescriptions a week, it would not greatly matter, except that instead of one prescription book lasting for a lifetime, he may require two or three; but in large dispensing establishments the extra labour would be considerable, and surely superfluous. Without for a moment disputing your opinion (for are not Acts of Parliament constantly being interpreted in a manner that would astonish their authors?) I would suggest that, in any case, upon each repetition, an entry in the prescription book as follows:—Rep. Mist. 1468 (containing Liq. Morph. ℥i.) would meet the requirements.

North Finchley, N., January 31, 1898. T. Edward Barrass.

*** There is no need to interpret the words of the Section as to the ingredients of medicine dispensed being entered, whether ordered by a prescription or not. The question is whether one entry is sufficient, with a reference to it when the supply is repeated on a subsequent occasion, and our correspondent's opinion differs from that which we think the words of the Act suggest. [Ed., *P. J.*]

Sir,—I was somewhat surprised to find that in the issue of the *P. J.* for January 22 you gave the weight of your authority to the statement that prescriptions containing scheduled poisons should be re-copied on the second and every subsequent occasion on which they are dispensed, a statement endorsed by you in the current number. As Mr. Goode points out in his letter of the 26th inst., the chemist does not often see the original prescription after the first occasion on which he copies and dispenses it. When the original is subsequently produced with the order for repetition no doubt the re-copying would be a very advisable precaution. But I would strongly support Mr. Goode's contention that, in the absence of the original prescription, the recording of the repeat order in the manner pointed out by him should not only, as he indicates, be sufficient to satisfy legal requirements, but would also remove the quite possible danger of errors occurring in the

process of copying from a back page of the prescription book the previous copy of the original prescription.

Dublin, January 31, 1898. VINCENT T. COLE.

*** The question might arise whether, in such a case as that suggested, medicine containing a scheduled poison should be supplied without the production of the prescription. But in any case pharmacists should protect themselves by preserving a written record of every transaction, since that is the sole condition under which the provisions of Section 17 do not apply to "medicine dispensed." [ED., *P. J.*]

MR. HENRY'S UNUSUAL MIXTURE.

Sir,—I regret I was unable to attend the evening meeting of January 14, at which Mr. Henry brought forward the following as "An Unusual Mixture":—"The author was recently handed an order for a Winchester quart of a mixture which must contain certain proportions, equally distributed, of white wax, borax, and water, with the stipulation that no oil must be used in making it up." After trying many methods the author found it necessary to use turpentine and mucilage acacia. These additions are entirely unnecessary and against the intended use of the preparation. If Mr. Henry would melt the wax and pour it into a well-heated bottle, dissolve the borax in hot water, and add gradually the borax solution to the wax with agitation, he will find a fairly stable emulsion result, and the product required by his customer. The addition of turpentine deteriorates the preparation in every way, as it is more difficult to keep it in emulsification than it is the wax.

Edinburgh, January 29, 1898. APPRENTICE (124/36).

ANSWERS TO QUERIES.

WEIGHT SYMBOL.—The symbol ℥, used in a prescription, indicates the ounce (Apothecaries' weight) of 480 grains. [*Reply to* H. J.—4/8.]

BRITISH MEDICAL JOURNAL.—The address is 429, Strand, London, W.C. [*Reply to* S. H.—4/21.]

BOTANIC GARDENS, KEW.—Address your inquiry to the Director, Royal Gardens, Kew. [*Reply to* W. J. W.—4/13.]

POISONS IN GERMANY.—They may only be supplied when ordered in physicians' prescriptions. [*Reply to* GERMANICUS.—4/15.]

BOTANICAL.—Your specimen consists of the male catkins of *Garrya elliptica*, Dougl. (Cornaceæ), a native of the north-west of America. [*Reply to* W. H. B.—4/23].

TO REMOVE ACID STAINS.—Treat the paper stained yellow, with solution of ammonia; then wash with distilled water and dry, with pressure, by inserting sheets of filter or blotting paper between the pages. [*Reply to* MONA.—3/29.]

SCIENTIFIC BOOKSELLER.—Write to Henry Kimpton, 82, High Holborn, London, W.C., or to H. Grattan, Tabard Book Stores, High Street, Borough, S.E., for list of new and second-hand books on scientific subjects. [*Reply to* F. P.—4/7.]

EGG COLOURING FOR CONFECTIONERY.—This appears to be sugar coloured by the addition of "aniline" dyes. Tartrazine with a slight admixture of a tropæoline orange—probably β-naphthol orange. [*Reply to* A. J. H.—3/21.]

MAKING ELECTRICAL APPARATUS.—A practical work is 'Electrical Instrument Making for Amateurs,' by S. Bottone, electrician, Wallington, Surrey, and others are published by F. C. Allsop, 97, Queen Victoria Street, London, E.C., who is also the author of a series of useful articles on the subject that have appeared in the *English Mechanic*. [*Reply to* H. C. T. G.—4/1.]

LIQUOR SANTAL. C. CUBEB. ET BUCHU.—This is prepared by rendering the volatile oils soluble in a solution of resin soap, prepared from copaiba resin thus: Copaiba resin, 400 grains; caustic potash, 120 grains; fluid extract of cubebs, 2 fluid drachms; boiling distilled water, 2 fluid ounces; boil well, with constant stirring, until the resin is saponified and a soluble soap is formed, adding more water to replace that lost by evaporation. Cool, and add, sandalwood oil, 80 minims; spirit of nitrous ether, 1 fluid ounce; rectified spirit, 2 fluid ounces; concentrated infusion of buchu, *q.s.* to produce 10 fluid ounces. [*Reply to* J. H.—3/34.]

PICRIC ACID IN BEER.—Picric acid, it is said, used to be added to beer, not to increase its intoxicating properties, but as a "hop substitute," to give it a bitter flavour. As far as we know, it is never so used now in this country. The chief uses for picric acid are for dyeing silk and for the manufacture of explosives. You can obtain a small quantity of the acid from any wholesale house. [*Reply to* A. P. S.—4/22.]

HERBARIUM COMPETITION.—You will find full particulars in the last "Students' Number" of the Journal (September 11, 1897). The most useful books are Hayward's 'Botanist's Pocket Book' (London: G. Bell and Co.), Babington's 'British Botany' (London: Gurney and Jackson), Hooker's 'Student's Flora of the British Isles' (London: Macmillan and Co.), and Bentham's 'Handbook of the British Flora,' revised by Hooker (London: L. Reeve and Co.). One or more of these should be used for reference, but you should carry Hayward's book with you. [*Reply to* P. S.—4/20].

ACTION OF $K_2Mn_2O_8$ ON $Na_2S_2O_3$.—The following equation should explain what you want to know:—

$$\left.\begin{matrix}5Na_2S_2O_3\\4K_2Mn_2O_8\\7H_2SO_4\end{matrix}\right\} = \left\{\begin{matrix}5Na_2SO_4\\4K_2SO_4\\8MnSO_4\\7H_2O.\end{matrix}\right.$$

The reaction, however, does not take place exactly as this equation represents (it rarely does), and the result does not work very well quantitatively. [*Reply to* AJAX.—4/9.]

TO CALCULATE AMOUNT OF KCl IN A SAMPLE OF KI BY RESULTS OBTAINED ON TITRATING WITH DECINORMAL SILVER SOLUTION.—We can best explain this by an example:—Suppose 0·745 Grm. of the mixed salt takes 60 C.c. $AgNO_3$. 0·745 Grm. of KCl would take 100 C.c. 0·745 Grm. of KI would take 44·9 C.c. The influence of 100 per cent. of KCl causes an excess of (100 − 44·9) C.c. = 55·1 C.c. in excess. Actual result was 60 C.c. Therefore, 60 − 44·9 = 15·1 C.c. in excess. If 55·1 = 100 KCl, then $15{\cdot}1 = \frac{100 \times 15{\cdot}1}{55{\cdot}1} = 27{\cdot}4$ per cent. KCl. 100 − 27·4 = 72·6 per cent. KI. [*Reply to* AJAX.—4/9.]

STAMP DUTY ON MEDICINES.—Powdered rhubarb root, without admixture, would come within the exemption provided for "entire" drugs. Such drugs may be vended unstamped by chemists who have served a regular apprenticeship, and by persons holding a stamped medicines licence. The words "stomachic" and "aperient" are not in practice held to be dutiable descriptions, but before using your labels and advertisements, send them to the Inland Revenue authorities, Somerset House and make assurance doubly sure by obtaining official sanction. [*Reply to* SYSTEM.—4/3.]

PRACTICAL PHARMACY IN THE MINOR EXAMINATION.—No, you will find candidates are treated with the utmost consideration, and that it is not an examination in mnemonics. The case you give as an example—the preparation of Lin. tereb., B.P.—would be given to prove a candidate's manipulative skill, not the strength of his memory. You will find that copies of the B.P. are furnished for reference in the practical portion of the examination, and that they are available in the examination dispensary just as they are in the pharmacy at home. [*Reply to* H. J.—3/31.]

OBITUARY.

ADCOCK.—On January 26, Robert McIntosh Adcock, Chemist and Druggist, late of Wellingboro. Aged 32.

CHALLICE.—On January 27, Swann Ripsher Challice, Croydon. Aged 63.

PARSONS.—On January 29, Ann Parsons, Belfast. Aged 87. Mrs. Parsons was an annuitant on the Benevolent Fund, having been elected in 1877.

COMMUNICATIONS, LETTERS, etc., have been received from

Messrs. Allan, Atkinson, Barrass, Branch, Brown, Burrell, Campkin, Cole, Cook, Cox, Cragg, Craig, Dixon, Dudgeon, Dunlop, Ellwood, Fairley, Gair, Grenall, Hill, Hogg, Hornsby, Kirkby, Lewis, McKnight, Miller, Neville, Norris, Ord, Owen, Picken, Pollitt, Reynolds, Rheeder, Robins, Roc, Routley, Sleeman, Stephenson, Stiles, Vogelar, Wilkinson, Woolley, Wyatt.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

Sesame Oil in Olive Oil. A. J. Ferreira da Silva confirms the statement of E. Milliau that Baudoin and De Latil's test for the presence of sesame oil in olive oil is not trustworthy, as a similar reaction—the production of a rose coloration when the oil is treated with hydrochloric acid and sugar—may be obtained with olive oils that are known to be pure. If, however, pyrogallol be substituted for the sugar, as in Toches' reagent, more satisfactory results are obtained, whether the oil itself be operated upon or the separated fatty acids. The reagent consists of 2 Gm. of pyrogallol and 30 Gm. of hydrochloric acid. Equal weights of this mixture and the oil to be examined are shaken together, and after being allowed to stand awhile the acid layer is separated and heated for five minutes. If sesame oil be present, a reddish-purple colour appears.—*Bull. de la Soc. Chim.*, xix., 88.

Mechanism of Protoplasm. Professor A. L. Herrera has experimented with the object of explaining by mechanical principles some of the phenomena observed by Dr. Fol in the fertilisation of the eggs of Echinoderms. A thin layer of olive oil was allowed to float on the surface of water contained in a plate, and a little yolk of egg then dropped into the middle glided easily upon the oil. On the approach of any pointed body the yolk rose into a bubble, resembling the cone of attraction observed by Fol before the penetration of the spermatozoid into the vitellus. The emission of pseudopodia which fell back into the yolk as soon as the attractive force was removed, was noted in some cases, and with albumin the phenomenon was still more remarkable, a coin brought near the drop causing it to become slowly distorted as it was attracted by the metal, whilst subsequently it became pear-shaped. Again, when an exceedingly small artificial spermatozoid was floated on cork and brought within four or five millimetres of the yolk, it penetrated slowly and eventually reached the centre of the drop. The analogy with the natural phenomenon is described as being complete, the oil or less dense liquid representing the albumin, while the drop of yolk serves for the vitelline spherc.—*Natural Science*, xii., 74.

Ouabin. Continuing his researches on ouabin, the glucoside of *Strophanthus glaber*, which he regards as identical with strophanthin, M. Arnaud has prepared it in crystals of three different degrees of hydration, according to the temperature at which crystallisation takes place. At ordinary temperatures the compound $C_{30}H_{46}O_{12}9H_2O$ results. The optical rotation of a 1 per cent. aqueous solution is $[\alpha]_D - 30°$. Its solubility in water is 0·93 in 100 at 14·5° C. It is readily hydrolysed by heating with mineral acids, forming rhamnose and a red resinoid body. Ferments do not act upon ouabin.—*Comptes rendus*, cxxvi., 346.

Separation of Halogens. A. Carnot finds that when sulphuric acid, saturated with nitrous acid, is added in the cold to a mixture of haloid salts, only the iodides are decomposed, the chlorides and bromides being unaffected. The liberated iodine may be washed out with carbon disulphide, and titrated direct with thiosulphate. If a little chromic acid and sulphuric acid be now added to the aqueous residue, and the whole heated on the water bath to about 100° C. for an hour, the whole of the bromine is liberated in its turn. This also may be washed out with carbon disulphide, and allowed to act on potassium iodide, whereby its equivalent is liberated and titrated as before. In the residue from these determinations, the chloride may be precipitated in the usual way with silver nitrate. If the precipitated silver chloride is discoloured by adherent chromate, this may be removed by continuous treatment with nitric acid. The method has given very good quantitative results.—*Comp. rend.*, cxxvi., 187.

Action of Hydrogen on Sulphuric Acid. M. P. E. Berthelot finds that when hydrogen and sulphuric acid are exposed to a temperature of 253 C° in a sealed tube for six hours the whole of the hydrogen is absorbed, with the production of water and sulphurous acid. At ordinary temperatures a slow current of hydrogen passed over sulphuric acid does not form enough sulphurous acid in one hour to be determined. If, however, the contact be prolonged, as in a sealed tube, considerable reduction of the sulphuric acid by the hydrogen is brought about. Thus in two months 75 per cent. of the hydrogen contained in such a tube with sulphuric acid, kept at normal temperatures ranging from 19° to 27° C., was converted into water with a corresponding reduction of the acid. Light did not appear to influence the result, nor did the presence of oxygen, although a portion of that gas was used up in reoxidising the sulphurous acid formed. Dilute sulphuric acid, sulphurous, and nitric acids are not acted upon by hydrogen under similar conditions.—*Comptes rendus*, cxxv., 743.

Dehydration of Alcohol. P. Yvon proposes to employ calcium carbide for dehydrating alcohol. If ordinary strong spirit, over 90 per cent. of ethylic alcohol be heated with a little calcium carbide the whole of the water will be removed, acetylene being disengaged. On distilling the liquid, perfectly anhydrous alcohol may thus be obtained. The first portion of the distillate should be collected separately, as it contains a little dissolved acetylene. —*Comptes rend.*, cxxv., 1182.

Preparation of Carbides. H. Moissan finds that when calcium carbide in the state of fusion in the electric furnace is brought into contact with metallic oxides, either double decomposition results, carbides and oxides of the respective metals being formed, as is the case with aluminium, manganese, chromium, molybdenum, titanium, and silicon, or the salt is reduced and forms a button of pure metal, as is the case with lead, bismuth, and tin. It is remarked incidentally that the formation of silicon carbide or carborundum may have an important practical bearing. The crystals of this substance obtained were well formed, characteristic and colourless, or with a faint bluish tint.—*Comptes rendus*, cxxv., 839.

Effect of Rain on Plants. J. Wiesner has come to the conclusion, based on observations made in Java, that the injurious effects alleged to be produced on leaves and flowers, even by tropical rain, have been greatly exaggerated. He never observed any splitting or tearing of leaves or petals, even by the heaviest rain, unless accompanied by a strong wind. When flowers or leaves are bodily torn away by rain, it is only when their tissues have already undergone the change which makes them ready to fall. The immunity from the effects of heavy rain is due to the elasticity of the flower-stalk or leaf-stalk. If these organs are fixed so as to have no power of movement, the impact of a falling body of only one-thousandth of the weight of a heavy drop of rain will have a destructive effect on the leaves or petals. A moderately heavy rain has no effect on the leaves of the sensitive plant.—*Annales Jard. Bot. Buitenzorg*, 1897, p. 277.

Blepharis Capensis in Anthrax.

Dr. Blaine, of Kingwilliamstown Hospital, reports in the *South African Medical Journal* on a typical case of anthrax which was apparently cured by the administration of *Blepharis capensis* in the form of a tincture (1 of the dried plant in 8 of rectified spirit). This plant has a widespread reputation among the Kaffirs as a remedy in anthrax, and these natives are known to be remarkably successful in the treatment of the disease. In the case reported on, 16 minims of the tincture were given every three hours and continued for some days, the dose being gradually lessened as the patient improved. The drug is evidently a powerful one, and has a marked influence on the pulse rate. The natives always employ it with caution. The author does not hazard any theory as to the action of the drug.—*Cape Agricult. Journal*, xi., 696.

Stereum Hirsutum.

Professor H. M. Ward has cultivated the mycelium of *Stereum hirsutum*, Fr., obtained from spores, on sterilised wood, and after several months the cultures developed yellow bosses, which proved to be the hymenophores bearing the basidia. It is pointed out that this fungus has not hitherto been made to produce spores in cultures, and that Basidiomycetes generally have rarely been made to do so. The actions of the mycelium on the wood of *Æsculus*, *Pinus*, *Quercus*, and *Salix* have also been examined, for the first time, it is believed, with pure cultures, and anatomical and histological details with figures are given in the complete paper.—*Proc. Royal Society*, lxii., 286.

Food Material of Algæ and Fungi.

Dr. T. Bokomy gives the results of a series of experiments on the limits of dilution of substances which can be taken up by the lower plants. Among the more noteworthy are the following:—In a 1 : 100,000 solution of fuchsin, *Mesocarpus* and *Spirogyra* became strongly coloured and soon died; a solution of 1 : 1,000,000 produced no effect. In a 1 : 100,000 solution of potassium biniodide starch-grains assumed a violet tint in twenty-four hours; in a solution of 1 : 500,000 the starch-grains were not coloured, but the cells (*Spirogyra*) were killed. Caffeine produces the aggregation reaction in the protoplasm with a dilution of 1 : 10,000; ammonia gives the same result with a dilution of 1 : 100,000. A proportion of 1 : 100,000 of a mixture of potassium phosphate, magnesium sulphate, and calcium nitrate in water, is sufficient to afford the necessary supply of mineral ingredients of the food of Algæ.—*Biol. Cent.*, 1897, p. 417.

Digestion in Pitcher Plants.

Professor S. H. Vines, some years ago, showed an important analogy between the pitchers of *Nepenthes sp.* and the gastric mucous membrane of animals, by preparing from the secreting areas of the pitcher wall, a glycerin extract which had a distinct digestive action on fibrin. This appeared to indicate the formation of a zymogen in the cells and its subsequent decomposition by the action of acids. Later observers having denied the presence of an active ferment, whilst declaring that the disappearance of proteid matter placed in the pitchers is merely a putrefaction set up by bacteria, Professor Vines brings forward additional evidence which confirms his original conclusion, that an active digestive process is set up in the pitcher by a proteolytic ferment formed in the gland-cells of the walls. In one experiment digestion was set up by a glycerin extract of the pitcher in a solution containing 1 per cent. of prussic acid, and it is asked what organism can digest fibrin in such a solution or retain its digestive activity when kept for several weeks in pure glycerin, as must have happened in some of the experiments had any such organisms been actually present.—*Annals of Botany*, xi., 563.

Röntgen Rays and Plant Life.

G. Tolomei is of opinion that the action of Röntgen rays on vegetable life is identical with that of light. When branches of *Elodea canadensis* were immersed in water charged with carbon dioxide and exposed to the rays, evolution of bubbles took place as in the presence of sunshine, and in the same way the rays caused retardation in the absorption of oxygen by *Mycoderma aceti* and in the evolution of carbon dioxide by Saccharomyces, whilst *Bacillus anthracis* was destroyed by the action of the rays in only a less degree than by sunshine. Long exposures to the rays appear to be necessary, and the probable cause of failure in former experiments, by other workers, may have been the comparative shortness of the exposures.—*Atti dei Lincei*, through *Nature*, lvii., 323.

Cathodic Rays and Röntgen Rays.

Prof. A. Battelli concludes a paper on the analogy between the cathodic rays and those of Röntgen by stating that it cannot be asserted that the cathodic rays are reflected, as a whole, according to the laws of regular reflection, and that the rays thrown back from the reflector of a focus-tube may be confidently assumed to possess the same properties as the direct cathodic rays. Moreover, the rays emanating from the posterior part of a very thin sheet, the anterior part of which is struck by cathodic rays, also possess the same properties as the latter. A pencil of cathodic rays is said to appear as if made up of various rays of different natures. When they strike on a substance of very small thickness, they seem to possess the power of passing through it, but in the same way as if they passed through a filter, which would allow a passage more or less easy to some of them than to the others. In another paper, Prof. J. J. Thomson states that he has been led, from the consideration of the effects produced by the sudden stoppage of an electrified particle, to the result that the Röntgen effects are produced by a very thin pulse of intense electromagnetic disturbance. That conclusion is in agreement with the view expressed by Sir George Stokes, that the Röntgen rays are not waves of very short wave-length, but impulses. In a third paper, J. Trowbridge and J. E. Burbank suggest that the term electric rays, or, possibly, rays of polarisation, would appear to be more comprehensive than the terms cathode or cathodic rays, and Röntgen or x-rays. They also point out that a Crookes tube enclosing a continuous conductor is well suited, with the employment of high electromotive force, for the study of electric lines of induction. The direction of the Röntgen and cathodic rays can be changed by electric induction, and the so-called x-ray burn can be produced by an intense state of electrification. Finally, the cathodic and Röntgen rays are given off from every element of a continuous conductor at a high stage of the vacuum in a Crookes tube, both when that conductor constitutes the cathode and when it forms the anode of the electrical circuit.—*Phil. Mag.*, xlv., 163, 172, and 185.

Novel Dispensing Cabinet.

Dr. J. M. Worthington has patented an ingenious arrangement for economising space in dispensing establishments, in the form of a cabinet built on the lines of revolving bookshelves. There are two revolving portions in the upper part of the cabinet, and each of the four sides of these is fitted with shelves for bottles, with a sliding glass door in front. On top of each of the revolving portions is a fixed shelf, and below the wide base supporting them are two similar revolving portions, containing drawers. The cabinet is designed for use in pharmacies, hospitals, dispensaries, chemical laboratories, and other places where economy of time, space, labour, and material is of importance.—*Scientific American*, lxxviii., 68.

BACTERIOLOGY FOR PHARMACISTS.*

BY LEO ATKINSON.

It is my intention during the time at my disposal to convey some definite "information concerning bacteria," and I hope to make it evident that the pharmacist cannot afford to remain in ignorance of the leading facts of bacteriology. Micro-organisms, germs, or bacteria are virtually everywhere. They are in the water we drink, in the air we breathe, and the dust we inhale. They are naturally present either in or on living plants and animals, but let it be clearly understood that bacteria are never found either in the blood, tissues, or different organs of the viscera in the healthy human body.

The study of the life-history of germs, microbes, micro-organisms, or bacteria (as they are indifferently named) constitutes the science of bacteriology. Recent advances in this science enable us to understand the important part they fill in the great scheme of Nature, for exclusively by the agency of these minute organisms the soil is supplied with the requisite nutritive material for plant life. Referring to the diagram (Fig. I.) and commencing at the bottom of the circle, we see that wherever organic matter is present (*i.e.*, the dead and useless substances which are the refuse of life) such material is promptly seized upon by various "germs"—the surface of the earth being liberally supplied not only with

FIG. I.—Nature's Cycle.

"germs" but also with air and moisture, the process of decomposition is rapidly effected. Decomposition of this kind usually means that complex bodies are split up into simpler ones (the nitrogenous elements being converted into ammonia, nitrous and carbonic acid, and water), which supply nourishment for plants. The plant so nourished, and by the agency of the sun, transforms and fixes in its tissues starch, albumens, and fats. Plants form the staple food of animal life, and although a certain portion of this food is given directly back in the shape of carbonic acid gas and urea, the remainder goes to make up the complex framework, tissues, and organs of the body. When the animal dies the decomposition bacteria come into action, and rapidly split up the albumens, sugars, and fats into simpler products; these again are finally transformed by the action of nitrifying bacteria into simple nitrates and water ready for assimilation by a new generation of plants, thus making one continuous chain of plant and animal life. It is thus evident that but for bacterial agency life on this planet would absolutely cease.

In recent years Canadian agriculturists enrich the soil by ploughing down a catch-crop of clover. The bacteria developed on the roots of clover supply a quantity of nitrogen for the benefit of the next crop. In Germany and France attempts are being made to enrich the soil by inoculating it with bacteria which store up nitrogen in the root nodules of leguminous plants. The discovery of the two bacteria which convert different nitrogen compounds into food material for plants is the starting-point of a series of epoch-making researches. One of these bacteria decomposes ammonia, splitting it into nitrous acid and water, whilst the other carries the oxidation further, transforming it into nitric acid, which is assimilated by plants; this last microbe was found in soil imported from Quito. It is well known plants cannot live in soil destitute of nitrogen, but it has been proved that leguminous plants will thrive in pure quartz sand if cultures of bacteria from root nodules are introduced in the sand. These bacteria are supposed to belong to the species *B. radicicola*. The practical results are very promising, and pharmacists living in agricultural districts may find this worth attention, for these bacteria are now being cultivated on a large scale. Small bottles are sold under the name of "Nitragin" for 2*s.* 6*d.*, containing gelatin cultures of several species; this quantity is sufficient for half an acre. The contents of culture tube is dissolved in water and the seeds soaked in the solution previous to sowing.

Such is the progress of science that, looking back only a few years, the very existence of micro-organisms was generally

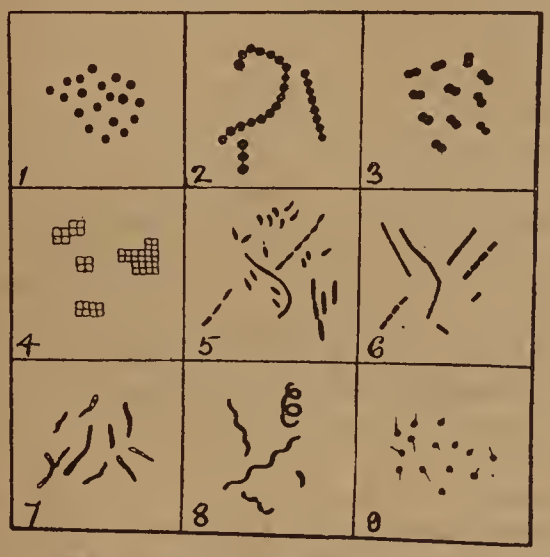

FIG. II.—TYPICAL MICRO-ORGANISMS.—1. Micrococcus; 2. Chains of cocci; 3. Diplococci; 4. Sarcina; 5. Bacilli; 6. Bacteria; 7. Diphtheria bacillus; 8. Spirillum of malarial fever; 9. Tetanus bacillus. All highly magnified.

ridiculed; recorded observations were attributed to defects in lenses or defects in the eye or brain of the observer. Now, however, the reality of germs and microbes has been proved and substantiated beyond all possibility of doubt. The various disease germs of typhoid, consumption, diphtheria, etc., are cultivated just as certainly as the farmer cultivates his cereals or the gardener his flowers.

Consequent on the infinitesimal minuteness of bacteria it has been difficult to determine whether they belong to the animal or vegetable kingdom. It is now definitely decided they are plants nearly allied to the algæ and moulds, familiar examples of which are always found if food is exposed to damp. There are bacteria which are useful and profitablo in various arts and industries, such as those producing bread, beer, wine, vinegar, etc. The flavour and character of cheese and butter is dependent on certain species. In some countries the cultivation of these bacteria is becoming an important business. Again, there are varieties necessary in the manufacture of linen, leather, tobacco, and all agricultural processes.

I am not proposing to say much in regard to the useful or commercial microbes, but rather confine my observations to those which are injurious and deadly, truly the invisible agents o

* Read at an Evening Meeting of the Pharmaceutical Society on Tuesday, February 8.

death. Since pharmacy is the handmaid of medicine, it is naturally the disease germs which claim the attention of the pharmacist.

The diagram (Fig. II.) represents the general features of the most important micro-organisms of disease, and enables one to explain the names commonly employed.

1. Detached round form is a micro-coccus; there are many species, some of which are always present on healthy suppurating surfaces.

2. Similar to the micrococcus, but connected by a fine line—often in long chains resembling beads on a string—typical of erysipelas and unhealthy suppurating surfaces.

3. Diplococcus, or cocci in pairs.

4. Sarcina; cocci in fours, appear like minute bundles of wool tied in two directions.

5. Types of bacilli; "bacillus" is applied to longer motionless rods, and "bacterium" to a shorter motile rod.

6. Rod-shaped square-ended bacterium, single or in chains.

7. Diphtheria bacillus.

8. Spirillum, found in the blood of persons suffering from malarial fever.

9. Tetanus bacillus, peculiar "drum-stick" shaped spore-bearing ends.

These names and others are used for purposes of classification, and roughly these are the appearances under the microscope. Fortunately for the establishment of biological-truth, we are not dependent on the microscope for proving the existence and identifying the various "germs" which so far have been classified.

Before going further, it will be necessary, for the proper comprehension of this subject, to broadly and briefly sketch the history which has gradually led up to our present knowledge of all the facts which constitute the science of bacteriology, or in other words a knowledge of the life-history and character of the microbes which mainly affect the health and prosperity of all civilised communities. The discovery of bacteria is almost coincident with the discovery of the microscope. In 1675, Lewenhoeck, of Delft, constructed a microscope which enabled him to see minute living objects in stagnant water and other putrifying fluids; from this time downwards for some 150 years little progress is recorded. Ehrenberg in 1830 studied bacteria with improved instruments, adding considerably to acquired information. In 1837, Schwan discovered the important fact that fermentation was due to something in the air which could be destroyed by heat. It remained, however, for the genius of Pasteur to elaborate these investigations and place on a solid foundation the modern methods of bacteriological research. The first practical outcome of his discoveries in relation to the silkworm disease has saved France not less than four million pounds sterling per annum.

It is especially interesting to know that Pasteur's earliest experiments were made with a view to disproving the theory of spontaneous generation; this controversy I will briefly explain, as on the issue the future of the germ theory in relation to preventive medicine depended.

Biologists were divided into two schools of thought. One side considered all bacteria or germs were by the process of putrefaction spontaneously generated. This theory was named "abiogenesis." The other side maintained that in all cases already living germs were present. This theory is "biogencsis," or "life for life." The discussion was carried on many years, and was conducted on both sides with conspicuous ability.

Whenever an infusion of meat or vegetable matter is left exposed for a short time, it is invariably found to be swarming with micro-organisms. It was found by boiling such infusions for fifteen to twenty minutes, and then hermetically sealing the containing vessel, it arrested all further development of living organisms. The question was considered settled in favour of the opponents of spontaneous generation, when an unexpected difficulty arose, for in 1872 Dr. Bastian published a research to prove that, notwithstanding all these precautions, living organisms were found in these boiled and sealed tubes. Decoctions of cheese and turnip were filtered, boiled, and hermetically sealed with every care. In five or six days micro-organisms were abundantly in evidence. The cause of this was not for some time explainable, until finally Tyndall found that if the boiling of these sealed tubes were repeated at twelve or twenty-four hour intervals for two or three days, the infusion was permanently sterilised, *i.e*, rendered entirely and perpetually free from any trace of a living organism so long as the containing vessel remains intact. The reason, as we now understand it, is that, although boiling in the first instance was sufficient to destroy any organism present, it was not sufficient to destroy the great resistance of the spores by which many bacteria are propagated. If the spores were not destroyed they would soon germinate, and develop into bacteria. The next boiling would kill this new generation, so that by a few repeated boilings the entire number would be destroyed. It was thus finally established that fermentation or putrefaction never takes place without the action of living organisms. The marvellous advances of antiseptic surgery, the comprehension and prevention of infective diseases, the preservation of food, and improvements in sanitation, have all resulted from knowledge obtained during the scientific battle waged over spontaneous generation.

With the object of affording some relative idea of the extreme minuteness of bacteria, I have photographed under the microscope a fly's tongue. The tongue, when flattened out, measures about 1/6th inch. As you see it on the screen the measurement will be about 75 inches, an enlargement of 450 diameters, or, estimated superficially, 250,000 times larger; this amplification, however, will not enable us to see a trace of most bacteria, many of them only measuring from the 1/25,000th to 1/30,000th of an inch. The power necessary to enlarge these to the size of ordinary type would, in the same ratio, enlarge the fly's tongue to nearly 600 feet, or 1½ times the height of St. Paul's Cathedral. By calculation it is estimated that a cube whose sides are 1/25th inch, about the capacity and size of the eye of an ordinary needle, will contain over a thousand millions.

Incredibly minute as these organisms are, the rapidity of their increase is still more astounding. There are two methods by which bacteria are reproduced: first, by fission, that is, simply splitting or dividing in half, each new half living and dividing in turn; the second method is by spore formation. I have already alluded to the remarkable power of resistance to heat and chemical agents those spores possess. It was this resistance which maintained for a time the fallacy of the spontaneous generation theory. Obviously by either of such modes of rapid reproduction the increase must be stupendous. Assume a germ divides into two within an hour, then again into eight in the third hour, and so on, the number in twenty-four hours would exceed sixteen and a half millions. Now forty thousand millions will only weigh about 1 grain, yet after twenty-four hours the descendants of one organism, assuming the necessary food and space could be supplied, would weigh 1/2260th of a grain, after two days 1 pound, and in three days 7·366 tons. Of course, these figures are theoretical, and could only be realised if there were no conditions to prevent this incomprehensible increase. Fortunately overcrowding is fatal to microbes as well as humanity.

Having given some idea of the size of disease germs and the rapidity with which they multiply, I will endeavour to demonstrate the methods adopted for their separation, cultivation, and examination. Here are some tubes of weak meat jelly which have been sterilised. The jelly is prepared from an infusion of meat with just sufficient gelatin to maintain it as a jelly at ordinary temperatures. The jelly is boiled for half an hour on several successive days and then filtered under suitable conditions into glass tubes which have been previously sterilised; the tubes are quickly plugged with sterilised wool, and can be kept ready for inoculation. Assume there is some suspected organism in this fluid, or it might be a piece of animal or other tissue. This piece of platinum wire is heated in the flame to white heat, clearly destroying anything living. Directly this is cool, the tip of the wire is just dipped into the fluid, rapidly withdraw, just touch the surface of the jelly, and immediately plug with sterilised wool. In the course of twenty-four hours, more or less, a minute speck will be visible, and this will rapidly spread until a large portion of the jelly is infected. It is quite possible several different organisms may have been present in the material from which this

Fig. III.—Plate culture, showing colonies.

culture is made, hence it will be necessary to separate them to obtain a pure culture. Several very ingenious methods have been devised by different workers, but I will follow the one most easily explained.

The contents of the inoculated tube are liquefied and shaken, a drop is then taken on the wire and introduced into a fresh sterile tube of jelly; obviously there can only be a small number of organisms in this. The number may be still further reduced by repeating the process. The jelly is now poured over a glass plate and allowed to set in a sterilised chamber. The few organisms present must necessarily be separated by a considerable space, and as all "germs" form distinct colonies of growth (Fig. III.), it will be easy to pick out any and inoculate a tube therewith, and so obtain a pure culture. A pure culture once obtained can be carried on in successive generations by inoculating from tube to tube (Fig. IV.). It is now possible to study the life-history of the particular germ we have isolated. Much information is gained by observing the form, colour, time of growth, etc. The living organism can be examined under the microscope; its method of development ascertained, as likewise its chemical reactions. We can ascertain the conditions most favourable for its propagation and the conditions under which it cannot exist.

I now show how specimens are stained and mounted for examination. A droplet of sterilised water is placed on centre of cover-glass. The platinum loop, after sterilisation, is made to just touch the culture and then rapidly spread over the cover-glass with the droplet of water. The cover-glass is now passed rapidly three times through the flame of spirit lamp to fix, and prevent organisms being washed away in subsequent operations. A few drops of the staining fluid (almost any of the anilines may be used) is next applied. The cover-glass is now dried over the lamp, and when dry the superfluous stain is washed off either under the tap or with the wash bottle. The preparation is ready for immediate examination. If desired as a permanent specimen it may be dried and mounted in zylol balsam.

Special methods, which, however, can be found in any text-book, must be used for staining tubercle, anthrax, leprosy, etc., the rationale of the process is that these organisms have such powerful affinity for fuchsine, strong acids, 25 per cent. sulphuric or nitric, which remove every trace of colour at once from the general tissue, will not bleach the stained organism. A section thus stained and decolorised may, after thorough washing, be treated with a different stain—violet or methyl green. After clearing and

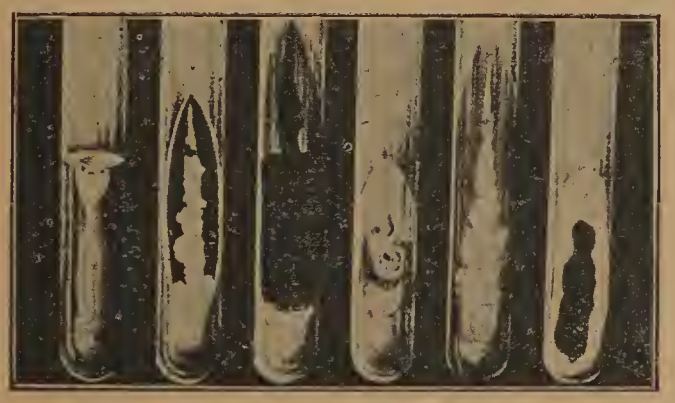

Fig. IV.—Pure cultures in tubes.

mounting the bacteria stand out brilliantly differentiated from the surrounding tissue.

The chemical reactions of anilines on disease germs is truly a marvellous scientific correlation. Our coal fields were probably deposited a million, more or less, years ago; coal we know to be in a great measure a resultant of bacterial agency. The destructive distillation of coal yields the aniline colours; the application of these colours has mainly led to the discovery and identification of the disease bacteria of the present age.

So far as "disease germs" are concerned, no evidence is considered definite until the following series of proofs (known as the postulates of Koch) have been established. This work can only be conducted in a properly-equipped laboratory and by a medical expert or under his direction.

1. Micro-organism must be found in blood or tissue of animal or man.

2. Must be inoculated from blood, tissue, etc., cultivated in a suitable medium, and the cultivation carried on in successive generations,

3. Pure culture so obtained must produce the disease in a healthy animal.

4. When introduced into the body must again be found in the blood, tissues, or organs.

The time necessary for these proofs varies considerably.

The principal methods of infection are—

1. Pulmonary infection ; the bacilli of spores being inspired.
2. Intestinal infection ; the organism being swallowed with food, water, or dust.
3. Inoculation ; through wounded skin or mucous surface.
4. Infection by contagion, in which the entrance of the virus into the body is not yet understood.

I propose to give a few particulars respecting the most prevalent germ diseases, and conclude with some observations on disinfection.

Tuberculosis.

Tuberculosis is found all over the globe, but is much more prevalent in cold and temperate climates than in the tropics. One-seventh of the deaths in England are due to tuberculous disease, mortality being highest in March and April and lowest in August and September. This disease is the most general of all germ diseases, nearly all animals, as well as man, being susceptible. Fifty per cent. of hospital patients have a tubercular history. The tubercle bacillus (Figs. V. and VI.) is most difficult to cultivate artificially, and will not grow outside the human body or animal tissues, except on specially prepared media and under very favourable conditions of temperature. Unfortunately, this organism forms spores

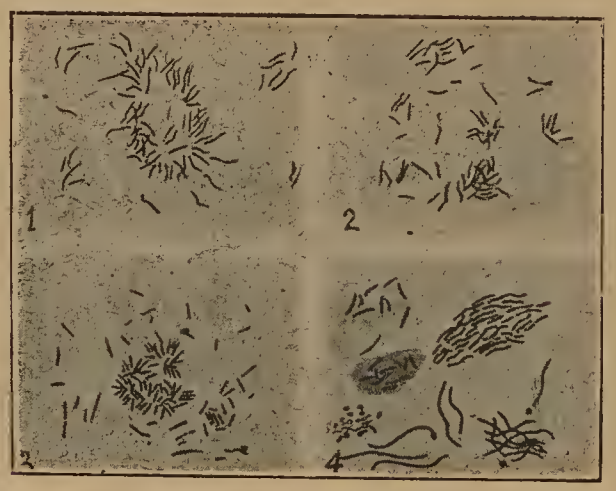

FIG. V.—BACILLUS TUBERCULOSIS.—1. Lung of horse ; 2. Lung of cat; 3. Liver of fowl ; 4. Cover-glass preparation.

whenever the conditions are unfavourable for its growth. It is the obstinate vitality of these spores which renders consumption the most fatal disease of northern climates. As an example of this vitality a portion of a pocket-handkerchief used by a consumptive patient was carefully dried and secured from air and moisture. At the end of eight months it was placed in boiling water and kept boiling for three or four hours. It was found the spores had not lost their vitality. A recently-issued Local Government Report states that the tubercle bacillus is not destroyed by the ordinary methods of cooking if in the centre of a joint of meat weighing over six pounds. The partial immunity of the Jews from consumption has always been considered remarkable, and no sufficient reason has been assigned. From recent research it is probably due to the care taken in their meat supply, and also that a large proportion of their food is cooked in oil. The temperature of boiling oil would be sufficient to destroy spores of bacteria where boiling water or the heat of an oven would fail.

It is now proved that consumptive patients exhale the bacilli. Mice can be infected by causing them to inhale an atmosphere impregnated with the germs.

Consumptive patients and their friends should be made acquainted with the dangers of infection and the best methods of reducing these dangers to a minimum.

In Germany and New York special regulations are enforced, and this disease is classed amongst those subject to notification. Since proper precautions have been enforced the death-rate from consumption has been reduced 7 per cent. If similar regulations were enforced in England it would mean a saving of at least 10,000 lives per annum.

It is asserted by a very competent medical observer that a perfectly healthy individual is never successfully attacked by tubercle bacillus. The active vigorous tissue cells of the body promptly destroy any bacilli that may find their way into the stomach or alimentary tract. Experimentally, tubercle bacilli have been introduced into the tail of a tadpole. Owing to its transparency, the battle between the tissue cells and the tubercle germs could be kept under observation under the microscope. If the bacilli were weak or few in number the cells were invariably the conquerors. On the other hand, if the tissue cells were badly nourished or in a state of low vitality the bacilli were the victors. The moral of this is, that if we wish to escape "germ diseases" we must keep up the general health.

Diphtheria.

First described by Klebs in 1875, but not generally regarded as

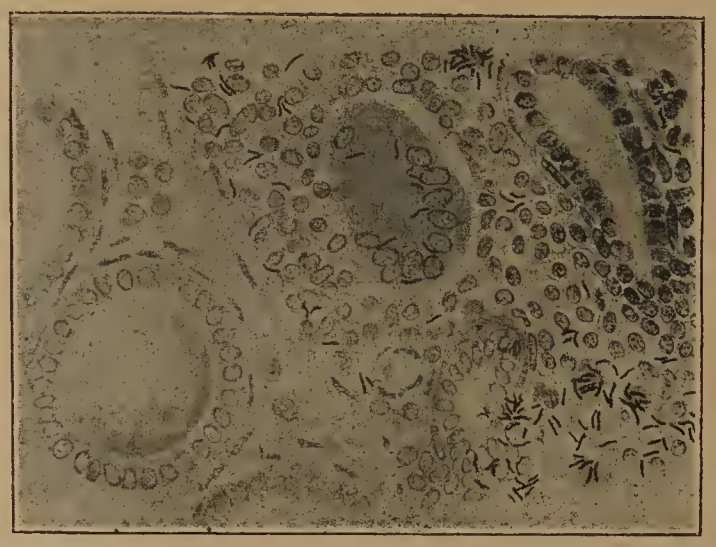

FIG. VI.—Tubercular mammitis.

the cause of the disease until Loeffler obtained pure cultures in 1884. This organism is not motile nor killed by drying ; dust containing the bacillus retains its virulence for months. Diphtheria is one of the few "germ diseases" in which there is a distinct increase. Twenty-five years ago it was much more prevalent in rural districts ; during the last few years it has decreased in the country but increased enormously in towns and cities. The organism has a tendency to reappear at intervals in particular places, pointing to its having a saprophytic existence. Transmission of the disease is by contact, inhaling the breath of patients, etc. ; if the organism finds its way into milk it multiplies with great rapidity. Dogs, cats, and cows suffer from a disease apparently identical with human diphtheria. One attack of diphtheria affords little or no protection against another.

It is not unusual to find the bacillus in the throat without any symptoms of the disease ; so long as the mucous lining of the throat is intact this organism will not flourish. The diphtheria germ is never found in the blood or organs of the body. It is found in the mouth and throat, and grows freely on the false membrane, elaborating a virulent poison which is rapidly absorbed, very frequently with fatal effect. Diphtheria is one of the germs most readily cultivated, hence a suspicious case can be accurately determined within twenty-four hours by anyone who has had training in bacteriology.

(To be continued.)

PHARMACEUTICAL SOCIETY.

EVENING MEETING IN LONDON.

An ordinary Evening Meeting of the Society was held on Tuesday, February 8, when the chair was taken by Mr. Walter Hills, President of the Society, at 8 o'clock.

The paper read was on

Bacteriology for Pharmacists,

by Mr. Leo Atkinson. The paper is printed at page 141, and gave rise to the following discussion.

The President said Mr. Atkinson had shown conclusively that pharmacists could not afford to be altogether ignorant of this very important subject, and at the close he had pointed out certain ways in which they might very usefully apply their knowledge. The paper would be read with great interest by those who had not heard it, but those who had had the opportunity of being present that evening had had the advantage of seeing the very excellent diagrams, for which also they were much indebted to the author. He was sure Mr. Atkinson would be pleased to answer any questions on this rather difficult subject.

Mr. Lomas asked if Mr. Atkinson considered carbolic acid the best disinfectant, as he seemed to lay stress upon it, though he mentioned others. Carbolic acid had the advantage of being readily obtainable, and any chemist would supply it, while he might not feel at liberty to supply some of the more poisonous preparations.

Mr. Stephens asked the author's opinion on formic aldehyde, which seemed coming to the front recently and, he understood, had been found to possess very great disinfecting properties, especially in the case of anthrax, while at the same time it was harmless to human life. He believed it was used largely for the preservation of milk also, though it was a matter of opinion whether that was allowable. He agreed with Mr. Atkinson as to the uselessness of the ordinary carbon filter in most cases, but it was very useful when dealing with a very soft water which passed through lead pipes, because animal charcoal always contained more or less phosphate of lime, which would retain the dissolved lead. He believed there were other filters which would really take out all organisms, and, in fact, all matter in suspension, with the valuable quality that when they got dirty they would allow no water to pass.

Mr. Smith asked if the serum which was injected to produce immunity, say from diphtheria, was obtained from an animal supposed to be immune to that disease.

Mr. Martindale said this paper was most interesting, and the author had certainly condensed the principal features of bacteriology so as to make it intelligible and interesting. He well remembered the battle over the question of spontaneous generation which was carried on by Pasteur, Huxley, and Lister, and which was followed by the researches which had proved of such marvellous benefit to surgery and to the cure of disease. He remembered partly some of Dr. Bastian's experiments, which took place at University College Hospital, the discussion being taken up vigorously by the students at the time, some of them saying that when they saw an elephant come out of a haystack they would believe in spontaneous generation, but until then they could not believe in the origination of life except from previous life. He should like to propose a vote of thanks to Mr. Atkinson for his paper.

Mr. Allen, in seconding the motion, said they were much indebted to Mr. Atkinson for the very clear way in which he had placed this somewhat difficult subject before them. Everyone present must know a great deal more about bacteriological research than he did before. The practical application to disinfection was of immense importance to pharmacists. He remembered very well on the publication of a book by Professor Tyndall, entitled 'Dust and Disease,' being much impressed by it, and undertaking a series of somewhat rough researches on the mode of sterilising vegetable infusions, a subject which had been before pharmacists for many years. He found it was perfectly easy, by taking ordinary precautions to exclude dust and so on, to keep all the vegetable infusions of the Pharmacopœia for a number of years, and he kept most of them for six or eight years. He should like to ask what precautions were taken for sterilising the wool used to stop the tubes.

Mr. Atkinson in reply, said the wool was sterilised in a hot oven, and then passed three or four times through a flame before it was put into the tubes. There were many precautions necessary which he had not particularised, his object being to give a general idea of the process rather than to carry it out perfectly, which would be impossible on such an occasion. He did not think any one special disinfectant could be specified as best for all purposes. Some had advantages for one purpose and some for another. There were certain disease organisms which grew better in a 1/500 carbolic acid solution than without it. His experience of formic aldehyde was very limited, but he was not sure that it was going to prove superior to other things now in use, and he doubted very much whether medical men would look with favour on its use internally. In reply to Mr. Smith, he might say that horses were inoculated with the diphtheria bacillus in order to produce the antitoxin serum. It would not answer the purpose to inoculate an animal which was immune, but this subject was far too large to go into in detail. With regard to filters he was particularly careful to say that they were useless unless they were properly and chemically cleansed at intervals. Some careful experiments had recently been carried out on filters at the Institution of Preventive Medicine, and the results were recorded in a pamphlet published a few weeks ago. It was shown there that with the very best modern filters, the Berkefeld, and others, after being used five or six days without any proper cleansing, disease germs came through. The results were all tabulated, and it was perhaps the ablest work yet done by that Society, and threw a great deal of light on the subject of water filtration.

The President, in putting the vote of thanks, said it was thoroughly deserved. Pharmacists, especially in country districts where there were no medical specialists, might certainly cultivate this subject with advantage; it would bring them into closer contact with medical men, whilst it could not be said to be trenching on their domain.

The vote of thanks having been passed unanimously,

Mr. Atkinson acknowledged the same, and expressed his thanks to Professor Greenish for his kindness in manipulating the lantern.

DONATIONS TO THE LIBRARY AND MUSEUM.

At a meeting of the Library, Museum, School and House Committee, on Wednesday, February 9, the Librarian and Curator presented the following reports of donations:—

To the Museum (London).

Mr. J. Moss, Deptford:—Moss-covered specimens of *Rhamnus purshiana* bark.

To the Museum (Edinburgh).

Mr. T. Whiffen, Battersea:—Specimens of Cephaeline Hydrochloride and of Emetine Hydrobromide, representing respectively the yield of 1 lb. of Carthagena and of 1 lb. of Rio Ipecacuanha.

Messrs. Fletcher, Fletcher and Co., London:—A set each of Fletcher's Patent Autometric Stoppers, Thermo-Hydrometers, and Thermo-Urinometers.

Messrs. Horner and Sons, London: Specimen of Japanese Wood Oil (*Aleurites cordata*, Steud).

To the Herbarium.

Dr. A. Franchet, Paris:—Specimens of *Strophanthus courmontii* and of *S. ecaudatus*.

Mr. J. Wilson, Bath:—Specimens of the Glastonbury Thorn.

The Curator:—Specimens of *Scrophularia scorodonia* and of *Astragalus glycyphyllos*.

To the Library (London).

Professor D. G. Lagerheim, Stockholm:—Ueber Phæocystis Poucheti; Technische Mittheilungen, 1-2.

Resorcin in Whooping Cough.—Roskam has treated 290 children suffering from pertussis by Moncorvo's method, which consists in touching the glottis with a solution of resorcin. Not a single case terminated fatally; 200 were cured in less than fifteen days and seventy more before twenty-five days. Very young children were more readily cured than older ones. With infants less than a year old a 2 per cent. solution was used; from one to two years the same strength for two days, then 3 per cent., and above that age 3 per cent. only. The applications were made every four hours in the day and once or twice at night.—*Bull. Gen. de Therap.*, cxxiii., 189, after *Annales Soc. Med. Chir. de Liege.*

MEETINGS OF SCIENTIFIC SOCIETIES

CHEMICAL SOCIETY.

At a meeting held on Friday, February 3, Professor Dewar, F.R.S., President, in the chair, a paper was read by H. J. H. Fenton, M.A., on

The Volumetric Determination of Sodium.

When dihydroxytartaric acid is oxidised with potassium permanganate in excess of sulphuric acid, the reaction, although it begins slowly, soon becomes rapid and proceeds normally according to the equation: $C_4H_6O_8+3O=4CO_2+3H_2O$. Taking account of this fact and the very sparing solubility of the sodium salt of this acid, it seemed probable that a method of estimation based on these principles could be formulated. In a preliminary experiment, sodium chloride was taken and treated with excess of dihydroxy tartaric acid, the mixture being neutralised with ammonia. The precipitate was collected, drained, dissolved in excess of sulphuric acid and titrated. 0·0918 Gm. was found instead of 0·0975 Gm., the amount taken. This result was not lower than might be expected, as the salts of this acid are unstable in water, decomposing as has been previously shown into the dibasic tartronate and carbonic anhydride, and moreover, the sodium salt is appreciably soluble in water at 15°. But at 0° the solubility is insignificant, ·100 C.c. dissolving only about ·039, which corresponds with about ·006 of sodium, and since the amount of solution used in the experiment amounted with washings to only 30 C.c., the loss in this way can be very much reduced. As it was found difficult to make neutral with ammonia and avoid using excess, which would vitiate the result, potassium carbonate was tried instead, but this was found to give a too high result on account of the relative insolubility of the potassium salt. Finally, it was found that by using an ice-cold solution of the potassium salt to precipitate the sodium, perfectly accurate results could be obtained. Both the solutions, as well as the water for washing, are kept at 0° to prevent loss, while the permanganate solution may with advantage be standardised by means of pure sodium chloride. Experiments were carried out to determine the influence of other substances dissolved in the solution to be estimated. When magnesium sulphate was present, the result was correct, while ammonium chloride made the number slightly too low. A determination of the sodium in Rochelle salt came out accurately. With salts that are alkaline, such as sodium phosphate or the salts of weak acids like acetic, it was found better to precipitate with the free acid. Borax, on the other hand, gives no precipitate whatever with this substance, so boric acid, if present, must be removed before determination. The best results are obtained with sulphate, chloride, and nitrate. The author recorded the result of an experiment made by a student as a first attempt from verbal directions only, which result corresponded with the theoretical. The admissibility of the presence of some other metals has yet to be proved. The final details of the determination can be varied, as explained in the paper, either by measuring the carbonic anhydride given off from the sodium salt or by a method of weighing, and as the results given are as accurate as those obtained of potassium with platinum tetrachloride, the author recommends this method as a preferable alternative to the latter where one has a mixture of sodium and potassium salt, only one of which need be determined. As a qualitative reagent for sodium, dihydroxy tartaric acid, or, better, its potassium salt, is very delicate. One part in five hundred gives a precipitate at once, and if the precaution be taken to cool the solutions to 0°, one part in two thousand can be detected.—Mr. Hehner remarked that he had already used the insolubility of the sodium salt for quantitative purposes, but without cooling. He was of opinion that it would be preferable to convert the sodium salt into chloride, which could be weighed, instead of employing the volumetric method.—Mr. John Newlands said that, in sugar refining, sodium had been estimated by precipitation in the form of sodium hydrogen oxalate, a reaction which formed one of the easiest ways of showing the production of sodium carbonate from sodium chloride, the oxalate being decomposed with calcium carbonate.—Dr. Lawson asked how the dihydroxytartaric acid was obtained, in reply to which question Mr. Fenton stated that a quantitative yield could be obtained by oxidising dioxymaleic acid in presence of iron.—The next paper was by F. B. Armitage, on

The Atomic Weight of Boron.

The atomic weight of boron is based on the determination of the water of crystallisation in borax. The author stated that the uncertainty of this method lay in the fact that it is difficult to obtain the borax dry without losing water by efflorescence. The water used in recrystallising the specimen employed was redistilled twice, and collected in a platinum apparatus. The recrystallised borax, in a finely-divided state, was washed with alcohol, the alcohol being removed by ether, and the ether in its turn by evacuating with the Sprengel pump, admitting air and evacuating a second time. About two grammes were placed in a platinum crucible provided with a perforated lid; this was placed in a test-tube, which was heated in an air-bath at 90° for four hours; the temperature was then slowly raised and kept an hour at 200°; it was then heated for three hours at 400°. Being now heated over a Bunsen burner there was no intumescence, and hence no loss by decrepitation. If heated over the blow-pipe it was found that the borax continually lost weight, while a sublimate appeared on the crucible lid, so the use of the blow-pipe was discarded, the crucible being heated over the Bunsen instead, until the weight became constant, a condition always attained in three-quarters of an hour. As the mean of several experiments, the number chosen by the author for the atomic weight of boron was 10·959. The number previously published by Professor Ramsay is 10·966. The author mentioned incidentally that he had tested the value of anhydrous borax for standardising sulphuric acid solution; and using a solution of the latter which had been standardised both by means of sodium carbonate and gravimetrically with barium salt, he obtained the figure 10·934 as the atomic weight of boron.—Mr. Groves inquired whether it had been determined whether the borax volatilised as such or as boric acid and sodium carbonate.—Dr. Scott stated that the amount of water given off by borax was dependent upon the hygrometric state of the atmosphere.—Mr. Fenton related the result of an experiment upon this point, in which on weighing a quantity of borax day by day during a considerable period it was found to undergo no loss whatever.—The question was asked by Mr. Newlands whether the standard taken was hydrogen as unity or oxygen as sixteen, to which it was replied that oxygen had been taken as the standard. The author also stated, in replying, that the efflorescence of borax had been noted by Ramsay and Aston.—The President expressed the hope that the work would be continued, and suggested that the loss of water by borax per unit of time should be determined.—The next paper was by E. P. Perman, D.Sc., on

The Rate of Escape of Ammonia from Aqueous Solution.

It has been shown previously that the amount of ammonia remaining in a solution can be expressed by an equation of the form: log. $q=a+b\ t$, q being the quantity and t being a factor representing time. The author now finds that a similar equation expresses the loss related to the volume of air passed through the solution. Replacing t by v, which represents the volume of air, the equation becomes

$$\log.\ q = a - b\ v.$$

In the experiments the temperature of the ammonia was maintained constant, and the air was saturated with moisture at the temperature of the solution. Although the numbers obtained in experiment agree remarkably well with the theory for concentrations of about 70 grammes per litre, the formula does not hold for concentrated ammonia. With a concentrated solution, in fact, the temperature falls so rapidly as to nullify the results obtained. In his last paper the author stated that the air passing through the solution did not become saturated with ammonia, but that statement he now wished to withdraw, the result being affected by the volume of air only, and not by the rate. The effect of variation of the temperature was observed by surrounding the apparatus with the vapours of boiling liquids, as carbon bisulphide and chloroform. At the boiling-point of the latter the solution behaved abnormally like the concentrated solution. The effect of different pressure, on the other hand, is small. The factor b of the equation, which is a measure of the rate of escape, is dependent on the temperature, and is also determined by a logarithmic equation—

$$\log.\ b = \alpha + \beta\ t.$$

The two equations may thus be combined. No general conclusions were yet drawn, but the author wished to say that this was only pre-

liminary to more work of the same kind.—The paper was criticised by Mr. Groves, Dr. Wildermann, and the President, who suggested that the tension of the liquid should be observed at the beginning and end of the experiment, since the difference in amount must bear an important relation to the law. It might perhaps be brought into relation with Van der Waal's formula.—The following papers were taken as read :—"On the Dissociation of Potassium Platinichloride in Dilute Solution and the Production of Platinum Monochloride," by E. Sonstadt; "Effect of Mono-, Di-, and Trichloracetyl Groups on the Rotatory Power of Methylic and Ethylic Glycerates and Tartrates," by Percy Frankland, F.R.S., and Thomas S. Patterson, Ph.D.; "The Rotation of Ethylic and Methylic Di-monochloracetyltartrates," by Percy Frankland, F.R.S., and Andrew Turnbull, Ph.D.—The meeting adjourned to February 17.

ROYAL INSTITUTION.

At a meeting held on Friday, February 4, Mr. A. A. Campbell Swinton gave an interesting lecture on

Some New Studies in Cathode and Röntgen Radiations.

The researches of Crookes and Röntgen, the lecturer said, have supplied us with a new eye, have given to nature a new light, and certainly to science a new problem. In the highly-exhausted bulb known as the Crookes tube we have a few billions of molecules of gas of which we know little. If we knew all we should understand the constitution of matter, but here we are certainly dealing no longer with aggregates of matter. When a current is passed through the tube a green fluorescent beam is seen to emanate from the negative electrode, and when a Maltese cross of aluminium is placed in this beam its shadow is clearly defined on the wall of the tube. If the tube be now surrounded by a coil in which an electric current passes, the shadow of the cross becomes smaller, and at the same time turns about its centre. A demonstration of this was given, and then followed a demonstration of the effect of a powerful magnet which is to concentrate the rays. When held over the pole of the magnet the tube must be constantly moved, or the glass will be penetrated, so great is the erosive action of the stream upon it. Pieces of glass are chipped off inside, but whether this is directly due to bombardment by the molecules or is a secondary effect due to heating is uncertain. A cathode ray electric lamp was next shown. In this there are two cathodes with concave surfaces, so that as the rays come off normally to the surface they may concentrate at a focus. A piece of lime situated at this focus incandesces brilliantly. As the current used was an alternating one, the two cups served alternately as cathode and anode. A second piece of apparatus of the same kind containing a smaller piece of lime behaved curiously. Periods of brilliant light and darkness followed each other in regular succession. This appears to be due to the alternate absorption and giving off of the gas by the lime, a thing most unheard of among chemists. With the alternating current the light appears alternately on opposite sides of the ball of lime, which becomes bored through from side to side, showing with what accuracy the rays can be focussed. As to what cathode rays are, it is now almost universally accepted that the original theory of Sir William Crookes is the correct one. The other idea, namely, that the rays are currents of ether, is not supported by experiment. The theory that the molecules themselves are repelled from the cathode with very great velocity is, on the other hand, more and more strengthened. The condition of things in the tube was illustrated by taking a pith ball to represent a molecule and suspending it between the poles of an electrical machine. The pith ball travelled from pole to pole and back with equal velocities, but when one pole was connected with the earth the pith ball was seen to travel in one direction with very much greater velocity than in the other. So in the tube the positive electrode is practically earthed, and that is at least one reason why the molecules travel so much more rapidly in one direction than in the other. The probable arrangement of the molecules in the tube was shown by a diagram which represented the space between the cathode and anode, as well as the space behind the cathode filled with negatively-charged molecules and the positively charged molecules occupying the space behind the anode, and that around by the walls of the tube. This representation is justified by an experiment with a tube containing a vane, the position of which is alterable. When placed in the line of fire, the vane rotates in one direction, and, when out of the line of fire, in another. As the vacuum becomes higher, the conical form of the stream disappears, and when carbon is substituted for aluminium or platinum, a luminous ring surrounding a bright spot is formed at the anode. In a still higher vacuum the rays come from the centre only of the cathode cup, and if this be of carbon, it also becomes luminous. When the luminous ring is deflected by means of a magnet, it moves with the latter without a perceptible lag. On allowing the cathode stream to pass through a slit in the anode and then between the north and south poles of a magnet, it becomes dispersed, producing the analogue of a spectrum. This spectrum shows dark bands, which continuously change their position, never remaining constant. Photographs of these bands were taken with instantaneous exposure, and also photographs of their x-ray effects, it being found that the bands in each coincided in position. If the x-ray effect be dependent upon the velocity of the cathode rays the greatest effect should be produced by the rays that are least deflected, as these have the greatest velocity, and this, in fact, is found to be the case. The size of the cathode is important. An experiment was performed before the audience with a tube containing a large and small cathode which showed that while with the smaller cathode the bones of the hand and arm threw a well-defined shadow, with the larger cathode no bones could be distinguished. The material for the anticathode, is also not without effect. Sylvanus Thompson has found that the best absorbers are also the best emitters. The usual way of altering the kind of rays produced has been to alter the degree of exhaustion, but it was now shown that almost any kind of ray can be obtained by altering the distance of the cathode and anode, and by altering their position in the bulb. x-ray photographs were shown which had been taken with the cathode in different positions in the bulb. The lecturer also showed a bulb containing a glass screen behind the cathode which could be moved up close to the latter or removed from it. It appears that the condition to be sought is that the supply of molecules to the cathode should be restricted; the more limited the number of molecules the more rapid is the discharge. This was shown well with a tube that was formed of a central spherical portion opening into a smaller cylindrical part; when the cathode was in the middle of the bulb the x-ray images were much fainter than when moved back to the mouth of the cylindrical part.—Mr. Swinton also exhibited some curves which he had prepared showing the effects produced relative to different positions of the cathode.

SELECTED FORMULÆ.

Boroglycero Lanolin.

Lanolin cream, for putting up in collapsible tubes for toilet use, may be made by dissolving 8 parts of boric acid in 50 of glycerin, and adding paraffin ointment, 120 parts; anhydrous lanolin, 60 parts. —*Journ. de Pharm. d'Anvers*, liii., 271, after *Nouveaux Remèdes.*

Application for Perspiring Hands.

Borax, salicylic acid, of each 15; boric acid, 5; glycerin and proof spirit, of each 60. Apply with rubbing three times daily. —*Les Nouv. Rem.*, xiii., 601, after *Wien Med. Pr.*

Emulsion of Cod-liver Oil.

Irish moss, 15; water, 1300. Make a decoction and strain. In 150 of this decoction dissolve sugar, 25; and add to the cold solution cod-liver oil, 80. Shake well together in a bottle. A perfect inseparable emulsion will result, in which no oil globules will be visible, even with a lens.—*Répertoire de Pharm.* [3], ix., 479, after *Giorn. de Pharm. de Trieste.*

Non-Poisonous Fly-Paper.

Prepare a strong decoction, or, better still, a tincture, of quassia raspings, and add to it a warm mixture of 300 parts Venice turpentine, 150 parts of poppy seed-oil, and 60 parts of honey. This preparation should be spread thickly on strong paper.—*Pharm. Post*, xxx., 328.

A Perfumed Disinfectant.

To remove the inconvenience suffered by travellers through the disinfecting process of quarantine stations, Gawolowski recommends the application of a disinfectant prepared by introducing sulphurous acid gas at a low temperature into alcohol until saturated, and then adding thymol and suitable perfumes.—*Pharm. Centralh.*, xxxviii., 424.

LEGAL INTELLIGENCE.

PROCEEDINGS UNDER THE PHARMACY ACTS.

Pharmaceutical Society of Great Britain *v.* Siddle.

On the 9th instant, at the County Court, Hull, before Harold Thomas, Esq., Deputy Judge, the Council of the Pharmaceutical Society of Great Britain sued Charles Henry Siddle for a penalty of £5 for selling poison contrary to the provisions of the Pharmacy Act, 1868.

Mr. R. E. Vaughan Williams, instructed by Messrs. Flux, Thompson, and Flux, appeared for the Council.

Mr. H. Wray represented the defendant.

Mr. Vaughan Williams, in opening, said that the proceedings were for the recovery of a penalty under the provisions of the Pharmacy Act, 1868, the particular offence being for selling a poison contrary to the provisions of Sections 1 and 15. He briefly mentioned that Section 1 made it unlawful for an unqualified person to sell a poison, and Section 15 provided that for every offence of selling the seller became liable for a penalty of £5, and the procedure for recovery of penalties was provided for by the earlier Act. The present proceedings were taken against the defendant, who is an assistant in the employ of a company carrying on business in Hull and elsewhere called The Hull Drug Company, Limited. Since the decision of the House of Lords it had been competent for a limited company to carry on the business of chemists and druggists provided that the sale of poison was conducted by a duly qualified person. The particular company employing defendant is what is known as a one-man company. It has a capital of 2000 shares of which a Mr. Millburn holds 1994, the remaining six being held by six other persons. He is the managing director and secretary, and is virtually the company. Under these circumstances it became necessary to proceed against the actual seller as the only way in which there can be protection afforded to the public. He would prove that on October 8 last a bottle of Teasdale's Chlorodyne was bought at the shop of the Hull Drug Company, Limited, 34, Whitefriargate. The chlorodyne contained a scheduled poison, viz., "morphine." He should prove that this poison was sold by defendant, and that he was not a qualified person.

Mrs. Sabina Watson (examined by Mr. R. E. Vaughan Williams): I received instructions from Mr. Mitchinson to make a purchase of poison at 34, Whitefriargate. Mitchinson went with me to the shop. He waited outside.

His Honour: Whom did you see?

Witness: I saw Mr. Siddle; he served me.

Examination continued—I asked him for a bottle of Teasdale's Chlorodyne. I made another purchase, and I handed defendant half-a-crown to pay for them. He passed it to Mr. Millburn, and Mr. Millburn gave me the change I identify the purchase.

His Honour: There is no dispute as to the bottle?

Mr. Wray: No.

Cross-examined by Mr. Wray: I went to Monument Bridge Stores. It was between 2 and 2.30 in the afternoon. Had seen defendant before. There were three persons behind the counter—defendant, Mr. Millburn, and a young man.

Re-examined: I have seen defendant here this morning. I know him by sight.

John Mitchinson, examined by Mr. Vaughan Williams: I received my instructions from the Registrar of the Pharmaceutical Society. I saw Mrs. Watson go in and come out of the shop on October 8. She handed to me the purchases immediately. I handed the chlorodyne to Mr. Moon. I know Mr. John Douglas—he is a qualified man. I saw him leave the shop before Mrs. Watson went in. He did not return before Mrs. Watson came ut.

Harry Moon, examined by Mr. Vaughan Williams: I received the bottle of chlorodyne produced from last witness. It remained in my possession until I handed it over to Mr. Eastes.

Ernest John Eastes, F.I.C., examined by Mr. Vaughan Williams: I am an analyst. I received the bottle produced from the last witness—it had then an unbroken medicine duty stamp over the cork. I have analysed the contents of the bottle. It contains, among other ingredients, morphine and chloroform. The amount of morphine present was four-fifths of a grain. Morphine is the chief toxic constituent of opium.

His Honour: I want to see which schedule this is in. (To witness): Is it a preparation of opium?

Witness: I say that it is a preparation of opium.

Mr. Vaughan Williams: I put in a printed copy of the Register of Chemists and Druggists, and upon reference thereto it will be seen that defendant's name does not appear therein. The case in which it was decided that an unqualified assistant selling poison is liable for penalties is the case of the Pharmaceutical Society *v.* Wheeldon, and I call your Honour's attention to the judgment of Mr. Justice Hawkins.

His Honour (to Mitchinson): Did you notice any name over the shop?

Witness: Yes. Hull Drug Company, Limited.

His Honour: Is the name Douglas there?

Witness: I have not seen it anywhere.

Mr. Vaughan Williams: That is my case.

Mr. Wray: I ask for a non-suit. There is no evidence before the court to show that the person who sold the article is not duly qualified. All that the evidence amounts to is that this bottle was bought at the shop in Whitefriargate, and there is nothing to identify the defendant as the person who sold.

His Honour: I will recall Mrs. Watson. To Mrs. Watson: Had you been in the shop before?

Witness: Yes, many times. I have seen the same young man. I have seen him here this morning and pointed him out. I did not know his name before I went to buy the chlorodyne. I now know his name to be Siddle.

His Honour: Is defendant here?

Mr. Wray: No.

His Honour: It is important to clear this up. I will direct a subpœna to be served upon him for his immediate attendance and adjourn the case until he arrives.

On resuming the case His Honour recalled Mrs. Watson.

His Honour: Is that the man who served you?

Witness: Yes, and his name is Siddle.

Charles Henry Siddle, examined by Mr. Wray: I am not a chemist. I am in the service of the Hull Drug Company. Mr. Douglas is a qualified man. He is manager of the stores. I am under his direction. The business is carried on under Mr. Douglas's supervision. When Mr. Douglas is there I tell him when I have a demand for poison and he then gives directions. Mr. Douglas does the dispensing. If a patent or proprietary medicine containing a poison is called for I refer to Mr. Douglas. I have never sold a poison itself or any medicine containing a poison without first consulting Mr. Douglas. When he is out I do not sell medicines containing a poison at all, but I say we have not got it in stock. I fail to recognise Mrs. Watson.

Cross-examined: I don't recognise the bottle of chlorodyne. The cod-liver oil may have been bought at the shop. Douglas is manager. Millburn is the managing director. I do not know whether Millburn has paid a penalty. Whiteman is the qualified man at Prospect Hill. Wright is at Hessle Road. He is not qualified. I could not contend that he has not paid a penalty.

Mr. Wray: I have no further evidence.

His Honour: The authority cited to me in the case of the Society *v.* Wheeldon makes it clear that an unregistered chemist's assistant, who, in the absence of his master, sells any poison, or preparation containing a poison, is liable to a penalty, notwithstanding that he effects such sale on behalf of his master, and that his master is only registered. I take it for the purposes of this case that Douglas was the master. I find as a fact that Douglas was not present when this poison was sold. I find that Mrs. Watson's evidence is true, and that she did purchase this article from defendant. I therefore give judgment for the plaintiff for the penalty of £5 and costs.

Police Prosecution under Section 17.

At the Dudley Borough Police Court on Friday, February 4, Messrs. Flesher Raybould, Ltd., carrying on business as chemists at Wellington Road, Dudley, were charged with selling prussic acid on January 18 without entering the sale in the poison-book.

The circumstances out of which the case arose are, briefly, that on the day in question Matthias Dimmack (41), metal refiner, purchased at the defendants' shop a quantity of prussic acid without signing the register, and was afterwards found dead in a railway carriage at Tipton Station.

Mr. F. W. Ensor, deputy coroner, subsequently held an inquest, and a verdict that death was due to prussic acid poisoning was returned.

When the case came before the magistrates, Mr. F. W. Ensor, the aforesaid deputy coroner, appeared for the defendants and

asked that the summons be amended, so that the Company should not be made to suffer for the action of an individual. If the summons were amended he should plead guilty.

After some discussion the Bench decided to proceed with the case.

Inspector Hinde then gave evidence to the effect that he visited the shop in Wellington Road and saw Mr. Goldstraw, a director of the firm, to whom he showed a small bottle labelled "Prussic Acid," found in the possession of Matthias Dimmack, who poisoned himself on the railway. There was no entry of the sale in the poison-book. Mr. Goldstraw told him he was very sorry, he had only recently joined the firm, but had known Dimmack for twenty years and he let him have the poison on the understanding that he would call the next day and sign the poison-book, as it could not be found at the time.

In answer to a question by Mr. Ensor, the witness said Mr. Goldstraw had given him every assistance during his inquiries.

Mr. Goldstraw had previously given evidence on oath, at the Coroner's inquest, to the effect that when Dimmack called at the shop and asked for the poison, he said it was to destroy a dog. The poison-book could not be found, but as the man said he wanted to catch a train and would call and sign the book the next day, Mr. Goldstraw, after impressing upon him the necessity for being careful with the poison and to destroy the bottle when the dog was poisoned, allowed him to have the prussic acid.

Mr. Ensor said Mr. Goldstraw was a qualified chemist, and had been in practice at Bilston for twenty years without a complaint being made against him.

The magistrates, in fining the defendants 40*s.* and costs, expressed surprise that Mr. Goldstraw, considering his experience, should have allowed the poison to be sold in the way it had been.

PROCEEDINGS UNDER THE PHARMACY ACT (IRELAND).

In the Queen's Bench Division of the Irish High Court, on Wednesday, February 8, before the Lord Chief Justice, Mr. Justice O'Brien, and Mr. Justice Gibson; Robert Galbraith, grocer and hardware dealer, Main Street, Aughnacloy, co. Tyrone, was prosecuted by Head-Constable Knox under the Irish Pharmacy Amendment Act of 1890. There were two summonses against the defendant, who, it was alleged, had on April 23, 1897, sold laudanum to one James Boyd in violation of Section 30 of the Irish Pharmacy Act, 1875, he not being legally qualified to do so, and that on the same date the defendant unlawfully kept open shop for retailing and dispensing poisons in violation of the same section. The summonses first came on for hearing on June 14, when Robert Orr, an assistant in the defendant's shop, was examined, and proved that he sold a drachm of laudanum to Boyd. It was admitted that the defendant was not qualified; but it was stated in mitigation of the offence that he had succeeded a qualified person in occupation of the shop, and that there was no qualified chemist within ten miles of Aughnacloy, and further that he was qualifying to pass the Pharmaceutical Society's examination as a chemist and druggist. The hearing was adjourned to August 9, and it was then submitted on behalf of the defendant that Section 30 of the Act of 1875, which fixes the penalty for unlawfully selling poisons at £5, was modified by Sections 15 and 23 of the Irish Pharmacy Amendment Act of 1890, and that the magistrates had power to impose as small a penalty as they thought fit, and they were asked by the defendant's solicitor to amend the summonses by citing the Act of 1890 in them. They amended the summonses, and under that, for the unlawful sale, fined the defendant £1, with £3 costs; and as to the summons for keeping open shop they held that the proof given of one sale was not sufficient evidence that the defendant had kept open shop for the retailing of poisons, and made "no rule" on that summons. At the instance of the prosecutor the cases were shelved.

In the course of the arguments of counsel the summons for keeping open shop,

The Court unanimously held that the magistrates were wrong; that the defendant did not come under the Section of the Act of 1890; and that the case should go back to the magistrates for the imposition of a £5 fine for selling.

PARLIAMENTARY NOTES.

The Flood Gates of parliamentary eloquence were flung open on the 8th instant, and the session of 1898 is now in full progress. What will it accomplish? To judge from the indications afforded by the Queen's Speech, the usual congestion in the matter of private members' Bills may be anticipated, for the Government programme is as ample as it is tough. Local Government for Ireland, the Strengthening of the Defences of the Empire, the establishment of the Prime Minister's ideal "London Limited," Church Patronage, Amendment of the Law Relating to Vaccination, Companies, Food and Drugs, and Prisons are not items which the House will be disposed to accept without considerable wordy warfare, and when one adds to the foregoing the London University Bill, and the measures dealing with Secondary Education and Agricultural Holdings, which are also promised by the Government, it is not difficult to appreciate the all but hopeless condition of non-official measures.

The Pharmacy Acts Amendment Bill is not yet a *fait accompli*, and its future, in common with other draft measures, depends upon the fortune of the ballot box. As Sir Stafford Northcote told the Exeter chemists, unless a Bill gets a favourable place it is doomed, and even with a favourable place on the notice paper its prospect of passing is by no means secure. It is a case of the devil take the hindmost. No doubt the promoters of the Pharmaceutical Reform Bill will recognise the force of this dictum, and will see that the all important first days of the session are not allowed to slip by before they commence that essential but ill-defined form of activity known as "wire-pulling." Up to the present time some 250 members have given notice of their desire to ballot.

In the House of Lords the Copyright Bill of Lord Monkswell was read a first time before the session was an hour old, and it is now waiting for second reading. The Bill was in evidence last session, and was dealt with in these columns, but it failed to pass into law. The noble promoter of the measure is evidently determined that he will deserve success this time if he cannot command it.

The Tuberculosis Commission furnishes Mr. Field (St. Patrick's, Dublin) with his first war-cry of the session. He wants to know why the Commission does not report, and whether the Government propose to put a stop to the confiscations and injury to business caused by local maladministrators, for whom "microbe" has the same fascination as the Royal Head had for Mr. Dick in 'David Copperfield.' Mr. Field, as the author of a pamphlet on 'Pleuro-Pneumonia,' is entitled to assume a certain amount of authority on questions relating to the important subject on which the Tuberculosis Commission has been asked to deliberate. The question is to be answered on the 10th.

Mr. Kearley has been spared the necessity of moving an amendment to the Address this session, because the speech from the throne contains a reference to an official Food and Drugs Bill. It is noticeable, however, that the reference is coupled with the saving clause "if the time at your disposal should permit you to proceed" with it. If the Government again introduce last session's Bill they will find it is far from being non-contentious, and that it will satisfy neither the trader, the chemist, nor the analyst. There are rumours that the Local Government Department have drafted an entirely new measure, in which more attention has been paid to the recommendations of the Select Committee. It is to be hoped that something may be done, too, in the direction of differentiating food and drugs.

The Early Closing Campaign has recommenced with undiminished vigour, and the local option principle embodied in Sir John Lubbock's proposals will be placed before the House at the earliest possible moment. It is understood that Sir John has the tacit approval and moral support of the Ministerial front benches. Whether this abstract stiffening will render the good baronet's parliamentary armour opposition proof remains to be seen.

THE STUDENTS' PAGE.

EXPLANATORY NOTES ON THE B.P.

Sodii Sulphas.—Heating with solution of potash shows simultaneously the absence of ammonium salts and metals, iron, *e.g.*, which forms hydroxides insoluble in caustic potash. The weight of barium sulphate obtained in the quantitative test indicates a practically pure salt

$$\underbrace{Na_2SO_4,10H_2O}_{322} + BaCl_2 = \underbrace{BaSO_4}_{233} + 2NaCl + 10H_2O$$

$$322 : 233 :: 100 : 72{\cdot}3$$

Sodii Valerianas.—The oxidation of amylic alcohol by the chromic acid mixture to valerianic acid is precisely analogous to the oxidation of ethyl alcohol to acetic acid. Since, however, the amylic alcohol of the Pharmacopœia is not a pure substance (see the article on Alcohol Amylicum in the Students' Page), but consists of several isomeric and homologous alcohols, the acid distillate will contain the several acids corresponding to these alcohols. Moreover, the acids formed will react with some of the alcohols to form esters, chiefly, of course, amyl valerianates, just as acetic acid reacts with ethyl alcohol to form ethyl acetate. These esters will distil over with the acids and be saponified by some of the caustic soda to form the sodium salt, while the liberated alcohols, being mostly insoluble in, and lighter than, water, rise to the surface in the form of an oily layer. Taking normal amyl alcohol (butyl carbinol), $C_4H_9CH_2OH$ or $C_5H_{11}OH$ as a type, the following equations represent the reactions described above :—

$$C_4H_9CH_2OH + O_2 = C_4H_9COOH + H_2O$$

Amyl alcohol. Valerianic acid.

$$C_4H_9COOH + C_5H_{11}OH = C_4H_9COOC_5H_{11} + H_2O$$

Amyl valerianate.

$$C_4H_9COOH + HONa = C_4H_9COONa + H_2O$$

Sodium valerianate.

$$C_4H_9COOC_5H_{11} + HONa = C_4H_9COONa + C_5H_{11}OH$$

Amyl alcohol.

THERMOMETRIC SCALES.

The conversion of degrees of one scale into those of another is accomplished by an arithmetical process according to certain rules to be found in all text-books dealing with the subject. Before utilising these rules the student should make sure that he can deduce them himself from first principles so as to check his results if need be, but more particularly that he may have an intelligent comprehension of what he is doing, without which no solid progress in any branch of scientific study can be expected. Let us first of all consider why certain numbers are affixed to certain standard points on each scale. Taking the Fahrenheit scale first because of its priority in historical order—why is 32 selected to indicate the freezing-point and 212 the boiling-point of water? These numbers do not bear any simple relationship to each other and the difference between them, viz., 180, has also no simple relationship to either. When compared to the centigrade scale, they appear needlessly complicated; but a consideration of the origin of Fahrenheit's scale will explain the selection of these numbers. Fahrenheit's scale was introduced at the beginning of the last century, and at that time the temperature producible by a mixture of sal ammoniac and snow was regarded as the lowest possible, and was selected by Fahrenheit as zero, so that the degrees of heat were always indicated by numbers having a positive value. Imagine, now, an ungraduated thermometer placed successively in sal ammoniac and snow, melting ice, and steam from boiling water, with suitable precautions in each case. Let the stem be marked A, B, and C, at the three places where the mercury successively stands. Then, assuming the tube to be of uniform bore, and admitting the desirability of indicating the freezing and boiling points by whole numbers without fractions it will be found only possible to do this by using the numbers 8 or 45 or some multiples of them. For if the distances between the points A and B and between B and C be carefully measured and compared, the smallest whole numbers expressing their relative lengths will be found to be 8 and 45. The degrees on a scale so divided would, however, be inconveniently large for most purposes, so four times those numbers was selected, and the distance, A to B, divided into 4×8 degrees, and the distance, B to C, into 4×45 degrees. By thus proceeding, the degrees above and below freezing point are of equal value, and the freezing and boiling points are indicated by whole numbers. And since $32 + 180 = 212$ the reason why apparently awkward numbers were taken is rendered evident. When the centigrade scale was introduced, the fallacy of regarding Fahrenheit's zero as the lowest possible temperature was known, and by putting the freezing point as 0° and marking all temperatures below this with a minus sign, the difficulty introduced by our ignorance as to the lowest possible temperature was overcome. And since the length of the tube between the points B and C in our imaginary thermometer would be divided into 180 parts on the Fahrenheit, and 100 on the centigrade scale, it is evident that each of the latter will be larger than the former in the proportion of 180 : 100 or as 9 : 5. In other words, the length of scale covered by 9° F. will be covered by 5° C. In converting degrees of one scale into the other, the simplest plan is to consider always how many points the given temperature to be converted is above or below the freezing point. In the case of the Fahrenheit scale, where the freezing point is marked 32, this number can only be identical with the scale number in one place, viz., 16°, which is sixteen degrees or points below freezing point. In the case of the centigrade scale, the number of degrees above or below freezing point will always be identical with the scale number, because the freezing point is also the zero point on this scale. Thus, if 50° F. is to be converted into degrees centigrade, 50° F. is 18 divisions (50-32) above the freezing point and these 18 divisions will correspond to $\frac{18 \times 5}{9} = 10$ divisions in the centigrade scale: the required value is therefore 10° C. On the other hand, if 5° C. is to be converted into degrees Fahrenheit, 5° C. is 5 divisions above freezing point, and these five divisions on the centigrade scale are equal to $\frac{5 \times 9}{5} = 9$ divisions Fahrenheit. Since the corresponding point on the Fahrenheit scale is 9 divisions above freezing point its actual value is 41, because the freezing point is already 32. Similarly, to convert 23° F. to degrees centigrade, 23° F. is 9 divisions below freezing point = 5 divisions in the centigrade scale and, therefore, 23° F. = −5° C. Also 10° C. is 10 divisions below freezing point, equal to 18 divisions $\left(\frac{10 \times 9}{5}\right)$ below freezing point on the Fahrenheit scale, and 18 divisions below freezing point will be 14° F. (32-18).

A third case is presented when the given temperature is below zero Fahrenheit. For example, − 4° F. will be 32 + 4 = 36 divisions below freezing-point = $\frac{36 \times 5}{9} = 20$ divisions centigrade, and therefore − 4° F. = − 20° C. On the other hand, − 40° C. is forty centigrade divisions below freezing-point = $\frac{40 \times 9}{5} = 72$ divisions Fahrenheit. And 72 divisions below freezing-point Fahrenheit will be − 40° F., since there are 32 divisions with a positive sign and $32 - 72 = -40$.

The key to the three cases presented above, which include all possible variations, is to find first the number of divisions above or below the freezing-point represented by the degree to be converted. From a consideration of this the rules may easily be deduced, and, in fact, for practical purposes need not be remembered. The remarks made with regard to the centigrade scale apply with equal force to the Reaumer scale if it be remembered that 80 divisions Reaumer are equivalent to 100 divisions centigrade and 180 divisions Fahrenheit, *i.e.*, the relative lengths of the three kinds of degrees are 4, 5, and 9.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australasia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office: 5, SERLE STREET, W.C.

LONDON: SATURDAY, FEBRUARY 12, 1898.

A MATTER OF JUSTICE.

On Tuesday last Parliament reassembled, and an opportunity is at length afforded for doing justice to the claims of examined chemists and druggists who—in regard to membership of the Pharmaceutical Society of Great Britain—are desirous of being placed in a position of equality with the pharmaceutical chemists who, at present, together with a number of unexamined chemists and druggists, constitute the only fully privileged members of that body. The claim of those who ask, but are not as yet legally entitled, to be admitted to full membership of the Society is both logical and reasonable; the great majority of existing members freely admit the force of the arguments employed in defence of the proposal to place all legally qualified men on an equal footing in the Society; and the only opposition so far manifested is, we are fain to believe, based on an imperfect comprehension of the true facts of the case. It seems both desirable and necessary, therefore, that pharmaceutical chemists who persist in their opposition should realise what may be the effect of that persistence, and what difficulties and danger may lie in their path if they continue to allow full play to an unreasoning and unreasonable spirit of obstruction. They should bear in mind that the founders of the Society were simply chemists and druggists, who did not even enjoy legal recognition as such; they should also recall the fact that many pharmaceutical chemists acquired their title without study or examination, and that a very large number of chemists and druggists who are now members or are entitled to membership are in a similar position; finally, they must not lose sight of the fact that ever since 1868—a period of thirty years—chemists and druggists as a class have done quite as much as, if not more than, pharmaceutical chemists in support of the Society.

The present position is that whilst all chemists and druggists in business satisfy the legal requirements to exactly the same extent as pharmaceutical chemists, and, when they join the Society, do quite as much to support it, they occupy an inferior position in the Society and are denied privileges that have been freely accorded to thousands who possess nothing approaching the qualifications of present-day Minor men. When the matter is expressed thus baldly the unfairness of the position is so striking that one can only wonder the undoubted grievance has not been remedied years and years ago. And there is little doubt that it would have been remedied had chemists and druggists only been agreed in this matter and demanded their just rights. It is not at all clear that they are troubling themselves much about the matter even yet, that is to say, generally; but for the sake of those who would appreciate the improvement in their position in the Society, it appears high time to make a sustained effort to secure that improvement. As to the apparently unconcerned majority, no opportunity should be neglected of awaking them to the importance of the present crisis. If chemists and druggists all over the country would but rouse themselves, and in forcible terms express to their parliamentary representatives their desire for the proposed change, the opposition of a few perverse-minded individuals would soon appear to be of the little importance that it really is, and defence associations formed to defend what is as a matter of fact indefensible would shortly expire of mere inanition. The pages of the Journal have been freely opened to all interested parties who were not disinclined to append their names to published communications dealing with the draft Bill, and no partiality has been shown to one side or the other, either as regards the time or order of insertion. But, during all the weeks that the discussion has dragged its weary length along, no good reason has been offered for further delaying the measure of justice, the granting of which has been so long deferred. As a matter of fact, no such argument can be found, for the opponents of the Bill have no case, and are simply beating the big drum of self-interest, without realising that their best interests bid them turn their energies in a diametrically opposite direction.

The time seems opportune, therefore, for asking what may be expected to occur if the threatened opposition to the Bill should prove successful, either owing to the inertness of chemists and druggists or to the triumph of persuasive though fallacious arguments advanced by the few ill-advised pharmaceutical chemists already referred to. In the first place it may be taken for granted that neither the present nor any future Council of the Society is likely to manifest any further desire to experience so decided a rebuff, and as a result the qualification for membership may be expected to remain as it now is. That being so, with the chemists and druggists that are eligible as members dying off and candidates for the Major examination diminishing in number, the lapse of comparatively a few years will bring us face to face with an enhanced difficulty in obtaining Members of Council. Reference has been made times without number to the sufficiently obvious fact that, year by year, barely one or two over the requisite number offer themselves for election to the Council; but how is that difficulty to be met if the members of the Society are a constantly dwindling body, whilst tending in time to become a vanishing quantity? The position of the Society in such a case would verge on the ludicrous. And what is to happen then, unless it be the compulsory adoption of a plan that, if accepted years previously, would have redounded to the credit of everyone concerned, and proved but the first step in a new and prosperous career? But such an event should not be allowed to happen, and those whose opposition may tend to wreck the present Bill are appealed to not to allow sentiment to override their sense of justice. For whilst the time is truly ripe for this reform, justice and the need for extended organisation most certainly demand it. The opportunity is as favourable as could be desired, and all that is required is a united effort on the part of the majority of the supporters of the Society, aided by those unattached chemists and druggists whose interests are almost, if not quite, as deeply involved in the issue at stake.

ANNOTATIONS.

The Use of the Metric System by Pharmacists will henceforth, as announced last week, be encouraged in the *Pharmaceutical Journal* to the exclusion, ultimately, of the older system of weights and measures. With the view of facilitating the change, it is proposed to publish in an early issue such conversion tables as seem likely to be useful, so that when occasion arises to convert quantities stated in terms of the imperial system into their metric equivalents, the trouble of so doing may be minimised. Whilst many expressions of approval have been received since the announcement appeared last week, but one contrary expression of opinion has come to hand so far, and that most unexpectedly from the enlightened and progressive city of Edinburgh. This correspondent, who is a representative Scottish pharmacist, thinks our proposal premature because, in his opinion, very few readers of the Journal are able as yet to think in terms of the metric system. Now that, we take it, is the very best argument that could be advanced in favour of the proposed course. As the result of constant association with the imperial weights and measures, it is quite easy for any of us to conceive approximately what will be the bulk of a certain weight or volume of a given substance. The words grain, drachm, ounce, pound, and pint call up more or less definite pictures in the mind; but not so gramme and litre.

With the Metric System generally it is different as a rule, and we quite agree with our correspondent that only a small proportion of the readers of the Journal are able to form an adequate idea of the value of metric weights and measures, such as they can do when imperial weights and measures are in question. In other words, the terms gramme, litre, metre, etc., do not call up more or less vivid mental pictures such as present themselves when the terms ounce, pint, and yard occur. And it is in the hope of removing this very difficulty that it is proposed to make the use of the less familiar terms more general in these pages. Twelve years of a permissive system have done little or nothing in the direction of familiarising the inhabitants of the United States of America with metric weights and measures, and it is open to serious doubt whether a hundred years would see any change in that respect, either there or here, unless some section of the general public undertakes the task of conversion. The fact that the new Pharmacopœia will adopt the metric system throughout, though, unfortunately, not exclusively, renders it a matter of comparative ease for chemists and druggists to act as pioneers of that system in British home trade, and in our opinion they will be wise to do so.

All that will be necessary in the first place will be that every chemist and druggist should provide himself with a set of metric weights and measures. This is essential, for the trouble and liability to error involved in the use of equivalents in the ordinary weights and measures are alone sufficient to forbid resort to such a crude method of procedure. Having procured the necessary appliances, then, the next step will be to make a practice of making kilogrammes and litres of all pharmaceutical preparations, instead of pounds and pints. That will not cause the least inconvenience as regards dispensing or retail trade, but if at any time a verbal order or written prescription is presented, which requires the use of metric weights and measures, everything will be in readiness to execute the order promptly, in a satisfactory manner. Chemists and druggists, of all people, should not be found in a state of unpreparedness if customers should come to them and ask for so many grammes or millilitres of a medicinal preparation. By adopting the plan suggested they will soon learn to think in terms of the metric system, and all difficulties connected with the adoption of that system will then have vanished, so far as they are individually concerned.

The Question of the Ownership of Prescriptions was raised in a case heard at the Birkenhead County Court on Tuesday last, before Judge Wynne Foulkes, in which Mrs. Horne claimed ten pounds damages from Arthur Dand, chemist, Liscard, for detaining a prescription. A medical man had written the prescription in defendant's shop, and in accordance with what the defendant believed to be the custom, he retained the paper in his possession. Contention having arisen between plaintiff and defendant over another matter, the latter refused to give up the paper without the authority of the medical man. His Honour having heard all the evidence for the plaintiff, and without waiting for the evidence of defendant and his witnesses, commented upon the absence of the prescriber, who had not been called to the Court, and non-suited the plaintiff.

The Example Set by Plymouth, in connection with the draft Pharmacy Acts Amendment Bill, has been followed by Exeter with signal success, as will be gathered from the report on page 153. It will be noted that Sir Stafford Northcote was struck at the outset by the same apparent inconsistency that has been commented on by several correspondents in letters to the Journal, viz., that whilst anyone—who was not in business as a chemist and druggist before August 1, 1868—must at present pass two examinations before he can be eligible to become a member of the Pharmaceutical Society, it is proposed by the draft Bill to admit him to all the privileges of membership after passing the qualifying examination only. Mr. Hinton Lake and his friends, however, were able to satisfy Sir Stafford on this point by explaining that membership of the Society is in no sense a legal qualification, and that it is not proposed to entitle other than those who have passed the Major examination to call themselves pharmaceutical chemists. The real advantage that accrues to those who pass the higher examination lies in the extra knowledge gained and the exclusive right to use this title; such confusion as has arisen with regard to membership of the Society has probably been due to an unjustified comparison with the Royal Colleges of Physicians and Surgeons, membership of which is a real qualification. The facts of the matter are very plainly put by Mr. Hyslop (see p. 160), and those who are as yet unconvinced as to the desirability of proceeding with the draft Bill as it stands, may with advantage peruse his pertinent remarks.

The merely Apparent Nature of the Inconsistency above referred to becomes evident when the matter is looked at from a different point of view, for when the actual situation is stated it will be seen that the real inconsistency lies in the fact that whilst those who were in business before August, 1868, can become members of the Society without passing any examination, those who have passed the examination qualifying them to practise pharmacy, cannot become members of the Society without passing another examination which is not required for legal qualification to practise. In regard to the craft organisation, which it was the object of the Society to establish as a basis for the full attainment of its objects, the existing position is both an obstruction to progress and a self-evident absurdity. Turning to the arguments advanced by Mr. Maskew (see p. 160) in opposition to the statement that justice demands the extension of

membership, they can only be described as being quite beside the mark. If, as he thinks, chemists and druggists are disinclined to help forward the movement on their own behalf, that circumstance would only show that the possibility of pharmaceutical organisation is still out of reach. But it cannot be an argument against providing conditions which would make such organisation possible.

A New American Idea that has been brought under notice by the inventor is not likely to be hailed with any degree of enthusiasm by pharmacists who are doing their best to conserve what remains to them of the practice of their peculiar art. This novelty is an emulsifying agent, offered under a fancy name, and consisting of a mixture of gum acacia and dextrin, with some unconverted starch. It is claimed that thirty grains of the powder will emulsify one fluid ounce of cod-liver oil in one or two minutes. That is quite true, it does. But surely chemists who take any pride in their art are capable of making their own emulsions without having recourse to proprietary emulsifying agents! The whole tendency of present-day pharmacy appears to be in the direction of ousting the pharmacist, except in so far as he may be considered such who labours for the profit of someone else in a factory. The pharmacist, as an individual practitioner, is threatened with extinction, and whether or not, therefore, any proprietary medicinal preparation is good in itself, he is a traitor to his profession who does anything to encourage the use of such preparations.

The Evening Meeting on Wednesday must be reckoned as another success of the session, and it is doubtful if a pharmaceutical audience could be more deeply interested by a lecturer in his subject than were Mr. Atkinson's hearers on this occasion. The lecture was well delivered, clearly illustrated, and possessed of all the qualities that tend to prevent a long discourse becoming tedious. The necessity of those conditions becomes apparent when it is considered how long the lecture actually was. Space only permits of half of it being presented to our readers this week, but the remainder will lose none of its attractiveness by the delay in publication, and any one who has thought of devoting his attention to the subject treated of by Mr. Atkinson will do well to devote careful consideration to the complete record of his lecture in our pages.

The Sale of Poisons is wisely restricted by the Legislature, and authority to proceed against persons unlawfully selling poisons is, as is well known, vested in the Pharmaceutical Society. That body has not yet, so far as we know, delegated any of its powers, and we fail, therefore, to comprehend why the Lincolnshire Association for the Prevention of the Administration of Poisonous Drugs, etc., to Horses assumes to itself authority "to prosecute any person unlawfully selling poisons." Such an object is stated in a large poster to be amongst others for which the Association has been formed, but it would have been as well had the founders first ascertained definitely what they might claim to do with any prospect of being able to do it. The administration of poisonous drugs to horses is amongst those things that no pharmacist can have any sympathy with and, of course, it is open to anyone to proceed, under Section XVII. of the Pharmacy Act, 1868, against sellers of poison who do not comply with the necessary formalities, but proceedings against persons for unlawfully selling poisons must, for the present at all events, be left to the discretion of the Council of the Pharmaceutical Society.

THE WORLD OF PHARMACY.

EXETER ASSOCIATION OF CHEMISTS AND DRUGGISTS.

At Exeter, on Thursday, February 3, a deputation from the Exeter Association of Chemists and Druggists waited on the Hon. Sir Stafford Northcote, Bart., C.B., M.P., to ask him, as the member for the city, to support

The Pharmacy Acts Amendment Bill

on its being introduced into Parliament. The deputation consisted of Mr. D. Reid (President of the local Association), Mr. J. Hinton Lake (Local Secretary of the Pharmaceutical Society), and Mr. P. F. Rowsell (Hon. Secretary of the local Association). Mr. J. Hinton Lake, at the outset, explained that the Pharmaceutical Society was formed in 1841 by a number of chemists in business, who thought it desirable to form themselves into an association. At that time it was simply an association. In 1843 they obtained a charter, and it was arranged that examinations should be held, and that those who passed the examinations should have the title of pharmaceutical chemists, which was the title of those who originally were members of the first association. In 1868 the examinations became compulsory, and the arrangement then made was that pharmaceutical chemists should be those who had passed a second examination, and chemists and druggists those who had only passed the qualifying examination, which entitled them to carry on business. It was expected that all persons who had passed the first examination would go on to the second, but such was not the case, and the consequence was that whilst only about one-third of the total number of those who were connected with the craft had joined the Pharmaceutical Society, the majority of those who had joined were not eligible for full membership, though holding the same legal qualification as those who were recognised as members. It had been thought, in order to consolidate the Society, that it would be desirable that all those who were registered as chemists and druggists should be eligible to be members of the Society, and to sit on the Council of the Society.—Sir Stafford Northcote: You mean without passing this further examination?—Mr. Lake: Yes. In other words, to make one examination the only thing necessary to qualify for becoming a member of the Council of the Society, if elected.—Sir Stafford Northcote: And do away with the second examination?—Mr. Lake: Not do away with it.—Sir Stafford Northcote: Then what is the object of passing the second examination if you can become a member of the Council without doing so?—Mr. Lake: That is the point. Those who are chemists and druggists are really eligible to be in business on their own account, but may not be members of the Society or of the Council. The object of the Pharmacy Acts Amendment Bill is that all those persons who are registered as chemists and druggists shall be eligible to be members. Practically that is the whole gist of the Bill.—Mr. Reid: It is to give them an opportunity of showing their interest in the Society, and for increasing the membership of the Society. If the Bill is passed those who are not members of the Society will be eligible for election as members, and for election on the Council.—Sir Stafford Northcote: But will their position be entirely the same as those who have passed the second examination?—Mr. Lake: They will not be entitled to use the title of pharmaceutical chemist. I may say that pharmaceutical chemists generally—I am one myself—have the same view, that it would be desirable that all chemists and druggists should be given the power to sit on the Council of the Society. Throughout the country they are desirous of giving all registered chemists an opportunity of taking a full share in the Society's work. That is practically the whole and sole drift of the Pharmacy Acts Amendment Bill.—Sir Stafford Norhcote: Who introduces this Bill?—Mr. Lake: I do not know who it is. I do not know whether it has really been settled by the authorities. The Council of the Pharmaceutical Society will find some member to do it.—Sir Stafford Northcote: Someone like Sir Walter Foster, I suppose?—Mr. Lake: Yes.—Mr. Reid referred Sir Stafford to a draft of the Bill, which appeared in the *Pharmaceutical Journal* for December 4, and pointed out that if the hon. member would read the speech of Mr. Carteighe, the late President, he would see that the question was put very clearly. Both he and Dr. Symes, speaking in Liverpool, had evinced the greatest interest in the Bill. In 1868, when the Pharmacy Act was being passed through Parliament, there was very strong opposition from a certain party to certain parts of the Bill in connection with the

proposed examination. Parliament had to amend it, and divide the one into two examinations, in order to meet the desires of the opponents; but they were really now, as Mr. Carteighe pointed out in his speech, going back to the original spirit of the Bill, as it was really intended to be in 1868.—Sir Stafford Northcote: Was the opposition in 1868 grounded on the fact that it was unfair to place gentlemen who had passed one examination in the same position as those who passed two?—Mr. Reid explained that there was another society in existence then, called the United Society of Chemists and Druggists, and the two societies were both asking for power. One society was fighting the other, and, of course, the Pharmaceutical Society won, but it had to give way on certain points, and it was those points they really wanted to modify again. The whole idea of the Bill was to unite the chemists of the country on an equal footing, as Mr. Lake had pointed out. Only one-third were now eligible to become members and sit on the Council. The other two-thirds said, What is the use of subscribing to the Society when we are not allowed to become members or to stand for election to the Council. If the other two-thirds could be brought into the Society by equalising the privileges of subscribers, they would be able to present a better front in the case of any further legislation.—Sir Stafford Northcote: Quite so.—Mr. Reid: Another point that has to be remembered is that the qualifying examination to-day—the Minor examination—is very much more severe, and wider in scope altogether, than the qualifying examination was twenty years ago.—Sir Stafford Northcote: That has followed the general rule of examinations.—Mr. Reid: The Bill is a short Bill, and non-contentious, and the Council of the Pharmaceutical Society is perfectly unanimous. The pharmaceutical chemists in the country are also agreed that this would be the right thing to do in order to consolidate the pharmaceutical chemists and the chemists and druggists of the country, so that they may take a general interest in the progress of pharmacy and present a better front to the Legislature at any future time. The Pharmaceutical Society wished to have a curriculum the same as medical men in the near future, but it was felt that all chemists should be of the same way of thinking before they proceeded with such a Bill. At present the forces were rather disunited.—Mr. Rowsell remarked that he did not think the Bill would meet with any opposition on the part of any organised body in Parliament. So far as could be seen, judging by the feeling of chemists throughout the country, there would be very little difficulty in getting the Bill through its various stages if it was brought before Parliament.—Sir Stafford Northcote: I hope you do not come with the idea that I am likely to offer opposition?—Mr. J. Hinton Lake: Oh, no, we feel pretty confident that after you have given the Bill careful consideration you will be quite in accord with it. It is a very reasonable Bill, so far as I can see. The pharmaceutical chemists in Exeter all, with one accord, wish to have the support of all chemists and druggists. They want to form a strong amalgamated Society, not a weak one, as it is at present. It might be afterwards considered desirable to grant a fellowship of the Society for pharmaceutical chemists, but power for that is not asked for to-day.—Sir Stafford Northcote: All you expect from me is that I should read this Bill very carefully. So far as I can see, there is no reason why I should not support the Bill, and I should do so with pleasure.—Mr. Reid: Our object is this: It is a very small Bill, and unless we specially bring it to their notice, members of Parliament may overlook it.—Sir Stafford Northcote: The real difficulty is this: We shall be balloting on Tuesday or Wednesday for the introduction of private Bills, and, of course, the difficulty is that only a few days in a session are devoted to private Bills, so that unless a Bill gets a favourable place in the ballot, the chance is very small. There are so many Bills put down that it is a chance whether a particular Bill is reached. They are entered day after day in the order book, and occasionally it happens with a perfectly non-contentious Bill that when the House is in a good humour they will let it pass through. That, I hope, will be the case here, not that you can bring on a private Bill when you like. It is only when you get the chance, and with a private Bill such as this the chances are not numerous. You might have a chance on Wednesdays between half-past five and six. There is usually a long list of Bills down, and now and then one slips through. The only thing to stop it is for a member to say, "I object." Also between half-past twelve and one you might have a chance.—Mr. Reid: So very little opportunity is given?—Sir Stafford Northcote: Yes. That is the difficulty of passing non-contentious private legislation. What I hope with a Bill like this is, that if you could get it read a second time, probably without opposition, you could get it referred to one of the Standing Committees. Then it might have a chance of passing the third reading and so passing out. It is getting more difficult every year to get private Bills through. I have two down this session. One is non-contentious, but it is a chance whether I shall pass it.—Mr. Reid said it was necessarily left to the Council of the Pharmaceutical Society to decide who should introduce the Bill, but all the different trade societies throughout the country were doing as they were that day, asking for the support of their parliamentary representatives, so that when the Bill came on they would be acquainted with its provisions and help it through.—Sir Stafford Northcote: I imagine that the Society's parliamentary advisers know that if they got Sir Walter Foster on the one side, and Sir William Priestly on the other—both eminent medical men—to put their names on the back of the Bill, such a course would give it the best chance it could have.—Mr. Lake: May we be permitted to offer that suggestion to the Council of the Society?—Sir Stafford Northcote: By all means; but I should think that in all probability it will have occurred to those who are responsible for the introduction of the Bill.—Mr. Reid and Mr. Rowsell agreed that it was desirable that Mr. Lake, as the Local Secretary of the Pharmaceutical Society, should write to the Secretary, informing him of Sir Stafford's suggestion.—Sir Stafford Northcote pointed out that both Sir Walter Foster and Sir William Priestly had done good service in that direction on more than one occasion. They both took a great interest in all questions relating to the medical profession.—Mr. Reid said the deputation felt grateful to Sir Stafford for having given them an opportunity of interviewing him on the proposed Bill; they felt he had done them good service.—Sir Stafford: I am delighted to do so. It has given me very great pleasure to see you.—The deputation then withdrew.

EXETER ASSOCIATION OF CHEMISTS AND DRUGGISTS.

On Wednesday night the annual dinner of this Association was held, the President, Mr. D. Reid, presiding. There were also present the Sheriff of Exeter, Mr. John Delpratt Harris, Mr. J. Hinton Lake (Vice-President and Vice-Chairman), Rev. E. Read, Mr. T. C. Milton, Mr. P. F. Rowsell (Hon. Secretary), Mr. E. Lemmon, Mr. H. W. Gadd, Mr. E. F. Stone, and other friends.—The President, in proposing the toast of "The Queen," said as chemists they would remember that in the present reign they obtained their first Charter.—Mr. Milton having proposed "The Navy and Army," Messrs. W. H. Dalgleish and Linscott responded in patriotic terms, and the President then submitted

The Exeter and District Chemists' Association.

In doing so, he said it was useful to have such trade associations with recognised officials who could call members together at any time to discuss important business. Referring to the Pharmacy Bill, he said that a deputation, consisting of Mr. Lake, Mr. Rowsell, and himself, had waited upon Sir Stafford Northcote, who told them that whenever the Bill came into Parliament he would do all he could to further it. He believed that the measure would consolidate the Society, and enable chemists to present a more solid front in the future. He judged from meetings held throughout the country that a great majority of chemists were in favour of the Bill. In the year 1900 the new Bye-laws would be introduced whereby the first examination would be considerably increased in stringency, so that so many candidates would not be disappointed when they entered for the qualifying examination. Associations throughout the country by their operations gave a great deal of force to the central Council in supporting proposals for legislation which they hoped to carry through.—Mr. Russell, in replying, said that in such associations they had something like a revival of the ancient guilds for the advancement of the trades or professions with which they were connected. He believed the Exeter Association was one of the oldest local associations in the United Kingdom, and he hoped that during the coming year they would hold meetings which would help towards advancing pharmacy in Exeter as well as strengthening the hands of the Council of the Pharmaceutical Society. He supplemented what the President had said regarding the deputation to Sir Stafford Northcote, and said he believed they were taking a step in the right direction in attempting to pass the Pharmacy Bill. It would do more than anything else to consolidate the ranks, and he hoped in time they would be able to do away with the

two classes, of pharmaceutical chemists and chemists and druggists, so that all members would have the same status and qualification.—Mr. Hinton Lake proposed "The Medical Profession," and the Sheriff of Exeter, who is the senior surgeon to the Devon and Exeter Hospital, replied that he was quite sure that the pharmacists of Exeter had done a good thing in binding themselves into a united body.—Mr. Lemmon proposed "The Visitors," speaking of the way in which members of the craft co-operated with medical men, and the toast was acknowledged by the Rev. E. Read, Messrs. Linscott, Ham, and H. J. Dalgleish. The latter desired to do all in his power for the advancement of the trade. His firm had always been ready to support them in many things connected with pharmacy.—Mr. Gadd proposed "The Press," and Mr. S. J. Shapley having replied, a vote of thanks was passed to the Honorary Solicitor, Mr. Clapp, for his past services. The company was glad to hear that Alderman Gadd was convalescent, and a convivial evening was spent.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

"A very pleasant and successful social evening" is the stereotype phrase for describing any meeting of a social character, and, as a rule, it merits the description, even though it is merely a gathering together of the members of an association for a quiet smoke and talk intermingled with music and coffee. Much more, therefore, when an old-established body like this Association holds a "social" open to "old boys" and friends of both sexes. Thus, on Friday, February 4, when the Dean of the School, Professor H. G. Greenish, took the chair at the first social of the session, no one was surprised to see the lecture theatre well filled with present and past students, many well-known pharmacists, and a goodly number of ladies. About twelve months ago, at a similar meeting, Professor J. Norman Collie entertained a large company with an account of his experiences while mountaineering in the Himalayas, and on this occasion he gave a most interesting lecture on

Mountaineering Exploration in the Canadian Rocky Mountains.

Professor Collie commenced by expressing the pleasure it gave him to bring before those present a series of photographs of scenes in the Canadian Rockies, the majority of which had not previously been exhibited in public. He went on to explain that being in Canada last August, he, together with several celebrated English and American mountaineers, decided to explore some glacier regions in the Rocky Mountains that hitherto had not been visited by white men. Provisions having been purchased for a lengthened stay in the mountains, a number of men and ponies were engaged on which to pack the numerous requisites of the party. A Swiss guide was also engaged and a start made from Laggan, a station on the Canadian Pacific Railway, the expedition occupying nearly a month. Before describing the various incidents of the journey, Professor Collie pointed out on a large map the route taken, and gave his hearers some slight idea of the vast tract of mountainous ranges in British Columbia still unexplored. After leaving Laggan the party climbed to the top of Mount Lefroy and Mount Victoria, then a journey was taken up the Bow Valley and an attempt made to climb Mount Balfour, but on reaching the summit they found that particular mountain was still beyond them, so the one climbed was named Mount Gordon. They then went to the head of the Bow Valley and crossed the pass to the Saskatchewan River in search of a high rock peak called Mount Forbes, which they found but did not climb. The Freshfield glacier and peaks around it were next explored, then across the watershed and down the Bleaberry Creek. Finally the party had to leave the Bleaberry Creek and strike south to the north branch of the Kicking Horse Valley, and from there to Field, a station on the Canadian Pacific Railway.—Most of the views, which were thrown on a sheet by a lantern skilfully manipulated by Mr. H. E. Matthews, were from photographs taken by Professor Collie, and as each one was exhibited a realistic account was given of the many interesting and amusing incidents of the expedition. The greatest difficulty the party had to contend with was the thick timber or brushwood through which a path had often to be cut. Even when they found an old trail, made when the railway was being laid some ten or fifteen years ago, it was found to be impassable, being completely blocked by fallen trees, the result of forest fires. Whenever a mountain or glacier was discovered not at present indicated on any known map, a name was given to it. The system adopted was to name the peaks after the various presidents of the Alpine Club, such as Pilkington, Freshfield, and Walker, and a range of unnamed peaks that no one had ever explored before was called the Freshfield Range.—At the conclusion of the lecture Professor Greenish asked those present to express by acclamation the pleasure and appreciation with which, he was sure, they had all listened to the lecture. A storm of applause followed, and in thanking the audience for the hearty way in which they had shown their appreciation of his efforts, Professor Collie advised all who take the trouble to go away for a holiday to go to the mountains. He was sure they would not only enjoy themselves in an excellent way, but would also greatly benefit in health. He was glad that the photographs had come out so well, as it was the first time he had used a camera that required exposure. On previous occasions he had used a snapshot camera.—An adjournment was then made to the examination hall, where the usual pharmaceutical refreshments were provided. Several large photographs of snow-clad peaks, beautiful lakes and valleys, illustrating the magnificent scenery of the Rockies, were exhibited after the lecture, and were greatly admired.

IRISH PHARMACISTS' ASSISTANTS' ASSOCIATION.

At Dublin, on the 4th instant, the usual fortnightly meeting was held at 67, Lower Mount Street, the President, Mr. W. J. Hardy, M.P.S.I., in the chair, when a paper was read by Mr. W. F. Wells, jun., ex-President of the Pharmaceutical Society of Ireland, on

Pharmaceutical Ethics.

Mr. Wells, who was received with applause, said the subject which he had chosen for his paper was one of the utmost importance to chemists, and yet received the least attention at their hands, some not even giving it a passing thought. They were surrounded by certain fixed laws by which their actions were governed, and it was by these laws that their duty to the public, the medical profession, their fellow-craftsmen, and to themselves was made clear. Their duty to the public was defined in the Pharmacy Act and Sale of Poisons Act. The Act of 1875 gave them to understand that they should protect and convenience the public, supplying pure drugs of the B.P. standard, and seeing that prescriptions were properly dispensed. For the public convenience they had to be at their post night and day, and a hard taskmaster was the public. Their duty to one another was to combine for their mutual benefit, not as trades unionists, but as men of education seeking to raise themselves socially and commercially. They should have a written code of laws, even as other professions and trades had. Uniformity of prices should be observed. The relations between the physician and the pharmacist were described, and the need of a clear understanding between them urged. Good drugs and prompt execution of orders were essential to a successful chemist. Assistants should also co-operate with their employers. "Patent" medicines should not be "cut." The public would not swallow a dose of medicine more than was absolutely necessary, or take an extra pill because a quantity was offered cheap. The chemist should take a higher level in his work than he does at present, and should act up to that standard in everything. The taking on of apprentices before they had passed the Preliminary examination of the Society was strongly discouraged by the writer, who maintained that the unqualified apprentice generally ended by becoming the flotsam and jetsam of pharmacy, whence the bogus trader obtained his assistants. The duty of employers to their apprentices was set forth in no uncertain tones by Mr. Wells, as was also that of the chemist to the doctor. *Ne sutor ultra crepidam* was the speaker's keynote in this respect, and the prescribing pharmacist and dispensing physician were roundly condemned. Happily, said Mr. Wells, they had none of the latter class in or around Dublin, and he trusted very isolated cases of the former. The routine of the laboratory, front shop, and despatch departments was commented on, and some practical advice in connection given. Incompatibilities in prescriptions should be referred to the prescriber, due regard being had to discretion and common sense. The great enemy of true pharmacy was company pharmacy, which was in their midst under various names, such as "store chemists," "co-operative stores," and "Codology and Co., Limited," the last-named including grocers, booksellers, leather merchants, etc. Such trading was detrimental to the best interests of pharmacy. In company trading there was no proprietorial personality so essential to success. The concern was generally over-capitalised, the managers of the departments having no stake became mere machines, driven by a board of directors the motive power

being the electricity of good cash results. Cutting of prices led to inferior quality of drugs or substitutions. Much could be done in the direction of reform if the licentiates held aloof from the limited companies, and disregarded the bait of less work and more pay thrown out by the promoters of such concerns. The young man who sold himself to these houses simply bartered his future for the present. The alacrity of the modern chemist in lending his shop windows for the puffing of patent or proprietary medicines was deplored, and the resemblance of the shop windows when so decorated to toy-shops or wax-works was caustically described by the essayist, who humorously pictured the grocer swooping down on the patent medicines after they had become popular through the medium of the "wax-works," and proceeding to undercut the cutter in the matter of prices. The pharmacists as a body were urged to give up the throat-slitting policy of advertising other people's goods, and to act fair and square to the public in not having two prices for the same article. This was dishonourable trading indeed, and its effects on the trade at large were of the worst description. The P.A.T.A. was commended by Mr. Wells, who said that that Association, though not all they might wish, was based on right principles, and was doing good work. Loyalty to the Pharmaceutical Society should be the first law of the licentiate and the registered druggist alike, who should become a subscriber, and thus have a practical interest in the Society's welfare, turning out the Council if those gentlemen were not going on satisfactorily, and replacing them by better men. This alone ought to be worth 20*s.* a year. Local associations were praised by the speaker, particularly the Irish Pharmacists' Assistants' Association. They were beneficial to young men in developing a friendly and helpful spirit between one another, and furthering the best interests of pharmacy. A cordial invitation to the forthcoming British Pharmaceutical Conference in Belfast next August was extended by the ex-president of the Society, who concluded by giving a number of valuable hints on dispensing, including the habits of neatness, accuracy, dispatch, attention to details, and general watchfulness, without which the accomplished dispenser—up to every duty and above none—was wanting.—The paper was criticised in a friendly spirit by Mr. Hunt, Mr. Jones, Dr. McWalter, and others.—Dr. McWalter, however, took exception to the essayist's plea for anti-cutting, on the ground that high prices for medicines drove the respectable to the hospitals or dispensaries, thereby pauperising them. He asked what were the chemists doing to relieve the sum of human misery? Were they doing their duty to their neighbour by their high sense of ethics in charging 1*s.* 8*d.* for an eight-ounce mixture? Between the physician and the high-class pharmacist the "pound-a-week" clerk had a big bite taken out of his week's wages after paying 5*s.* for a prescription and 1*s.* 8*d.* to the chemist. In consequence of these high charges the patient might be tempted to deny himself the requisite medicine, and in this way a grave responsibility was cast on the chemist. As to combination, they had the pharmacy laws for their guidance. These laws were in the favour of pharmacists, and the judges and magistrates were in sympathy with the Society. An easy way to keep pharmacy pure was to keep obnoxious persons outside the Society and sweep out those inside refusing their subscriptions, enforcing the Sale of the Food and Drugs Act, harassing offenders against the law and bringing them into Court on every possible occasion.—A hearty vote of thanks was accorded to Mr. Wells for his very able and instructive paper.—The President of the Association said they were a non-political pharmaceutical body, and never meddled with questions affecting company pharmacy, as a large number of the members were directly connected with the companies, though none the less true pharmacists. The settlement of trade questions was, of course, the function of the parent Society, and they had no desire to usurp its direction.—Mr. Wells having replied to the criticisms and expressed thanks for the kind utterances of the Association, to whose members he conveyed the greetings of the Pharmaceutical Council, who, he stated, were anxious to foster the junior organisation, the proceedings terminated.

PHARMACEUTICAL SOCIETY OF IRELAND.

On Wednesday, the 2nd instant, the monthly meeting of the Council was held at 67, Lower Mount Street, Dublin.—The President, Mr. R. J. Downes, was in the chair, and the other members of Council present were the Vice-President (Mr. Beggs), the Hon. Treasurer (Mr. Grindley), and Messrs. Wells, Hayes, Bernard, Conyngham, Kelly, Dr. Walsh, and Professor Tichborne.—The President reported in connection with the late election for St. Stephen's Green division of the City of Dublin that before the election took place he addressed an identical letter to each of the candidates, Mr. James Campbell, Q.C., and Count Plunkett. Count Plunkett did not reply; Mr. Campbell did, and a deputation consisting of Messrs. Wells, Grindley, Kelly, and himself (President) had an interview with Mr. Campbell, who, they found, thoroughly knew their requirements, and promised to give them every support that he could in any legislation that they should deem necessary. Thereupon he (President) issued a circular letter to the pharmaceutical electors, apprising them of the result of the interview.—A draft reply of the Council to the Lord-Lieutenant and Privy Council of Ireland *in re* the last report of Sir George Duffey, the Visitor of Examinations, was agreed to. It stated as to the

Preliminary Examination

that the original percentages of answering were fixed so as not to make the examination an obstruction to the youths of the country coming into the business, but it was expected that licentiates of the Society would in future expect their apprentices to be better educated than heretofore. "Optional" subjects had been put on not to "stick" the student but to enable him to give proof of having received a liberal education. The Council did not agree with the Visitor that there should be any limit as to the number of times that a candidate might present himself for the Licence examination. The importance of requiring a better knowledge of Latin from "Preliminary" candidates had long been appreciated by the Council. The Society's chemistry school, and materia medica and botany classes had been very beneficial for candidates.—A report on the chemical section of the Licence examination was received from Mr. Doran, one of the examiners. It stated, amongst other things, that with a few brilliant exceptions candidates knew next to nothing of the great leading principles of chemical science, and that rejections on very low scoring in the theoretical portion of the subject by those who had obtained exceptionally high marks in the practical section were of too frequent occurrence. The compulsory "hundred hours'" working at the bench had resulted in a marked improvement in the work done. This suggested that a similar course should be taken with regard to the theoretical work.—The President mentioned that a recommendation that the Preliminary examination should occupy two days had been given up.—On the motion of the President, seconded by Mr. Wells, the following alterations in the regulations for the Preliminary examination were agreed to :—

That the regulation as to marking be altered to read as follows :—

In each of the following subjects, and their sub-divisions, a candidate must obtain 50 per cent., viz. (1) English; (2) Latin; (3) Chemistry; (4) Arithmetic; (5) the British and Metrical Systems of Weights and Measures; 40 per cent. in each of the other subjects, and 50 per cent. on the entire course; to enable him to pass. In awarding marks, spelling and the quality of the handwriting will be taken into account.

That the marking in the sub-divisions shall be as follows :—Latin Translation, 10; Parsing, 10; English (Composition and Grammar), 15; Dictation, 10 Arithmetic, 10; Weights and Measures, 10; Algebra, 5; Geometry, 5; Chemistry, 15; Optional Subject, 10.

In sub-dividing the subjects for examination the Examiner shall maintain in each sub-division the minimum percentage adopted by this Council for the subject of which it is a sub-division.

—Mr. Conyngham leaving at this point, the other business was not disposed of for want of a quorum.

MIDLAND PHARMACEUTICAL ASSOCIATION.

A meeting of the Midland Pharmaceutical Association was held at Mason University College on February 3, under the presidency of Mr. J. Poole, when the subject of

Dispensing Difficulties

was introduced by Mr. F. H. Alcock. In the course of the discussion it was stated by members that during the past few months several prescriptions had been received which appeared to cause difficulty, especially to junior pharmacists, and it was thought that they might be of interest to members. The first was a modification of a copaiba mixture, which to produce a white emulsion requires care, viz. :—

R Olei Resinæ Copaibæ.....	Drachmas duas.
Mucilaginis	Sesqui-drachmam.
Liquoris Potassæ.....	Drachmam.
Aquæ ad uncias quatuor.	
M. Fiat emulsio.	

The method suggested, which gave the best result, was to put 45 grains of gum in powder in a dry mortar, mix with the copaiba, and add 70 minims of a solution containing the liquor potassæ and 7 fluid drachms of water, and triturate the three well until perfectly homogeneous. Then add the remainder of the solution, drachm by drachm, triturating well after each addition, and continuing the addition of the water until the last had been added. The second was a suppository of the tannin and alkaloid class :—

℞ Pulveris Gallæ ..... Grana triginta.
Extracti Belladonnæ ..... Grana tria.
Olei Theobromatis ..... *q.s.*
Ut fiant suppositoria sex.

If the usual plan of moistening the extract with water was followed, when the process of melting the whole mass to pour into the mould was attempted, a gummy mass formed, separated from the molten fat, and could not be further dealt with satisfactorily. If, however, no water was used, and the whole was beaten in the mortar as a pill mass, and melted gently at 110° to 120° F., then no difficulty presented itself. The third problem was—

℞ Pulveris Iodolis ..... gr. i.
Olei Eucalypti ..... ♏ ij.
Olei Theobromatis ..... *q.s.*
M. Fiat cereolus. Mitte vi.

In this case the difficulty was caused by the eucalyptus and iodol causing the theobroma oil to become very soft. The use of a few grains of beeswax per bougie remedied the trouble, but care was required, for if too much wax was used, then disintegration did not take place when the bougie was used ; and it creates much fear in the mind of the patient as to what was going to happen, and what was the cause of obstruction. The amount of wax to use varied according to the sample of theobroma oil and the season of the year, and was best arrived at by experiment. The fourth problem was an ordinary prescription, containing the ingredient mistura ammoniæ, and a difficulty arose because two or more formulæ were published, and unless the prescriber could be consulted, one did not know which to use. In the Paris 'Codex' there was : Am. carb., gr. iv. ; theriaca, ♏20 ; tinct. lav. co., ♏20 ; aq. menth. pip., ad. ℥i. Those were very different things both physically and physiologically, but the latter was intended. The fifth came from the city of Lichfield, and was :—

℞ Liquoris Strychninæ ..... minima 32.
Spiritus Ætheris ..... ℥ii.
Tincturæ Strophanthi ..... minima 32.
Syrupi Aurantii ..... ℥ss.
Infusi Chirettæ ..... ad. ℥8.
M. ft. mist.

It was made on the 5th of the month, and on the 21st was returned because it had changed to a curious jelly-like fluid, not easily to be poured from the bottle. The last was the mixture of male fern, which was taken from Squire's 'Companion to the Pharmacopœia.'

℞ Extracti Filicis Maris ..... ℥i.
Pulveris Tragacanthæ Compositæ .... ℥ss.
Aquæ Menthæ Piperitæ ..... Ad uncias duas.

That formed an unsightly draught, and could not well be considered a type of elegant pharmacy. Tragacanth was not a desirable substance for the production of useful emulsions, although perhaps it was sometimes used with advantage with resins and resinous tinctures. By no way could a presentable product be obtained when the formula was rigidly adhered to. The addition of glycerin had been suggested—so had liquor potassæ ; but the latter altered the odour, colour, and general character of the product, but perhaps, if added in small quantity, it did not materially affect its medicinal efficacy. A very useful way of administering male fern was as follows :—

℞ Extracti Filicis Maris ..... ℥i.
Pulveris Saponis Duri ..... gr. v.
Aquæ ad ..... ℥ii.
M Ft. Haustus.

That did not affect the green colour of the product, nor its peculiar odour, and it rather improves its medicinal effect.

BRIGHTON JUNIOR ASSOCIATION OF PHARMACY.

The meeting of this Association held on Wednesday, February 2, at the headquarters, Newburgh Hall, Cannon Place, was of a social character.—The chair was taken at 9.15 p.m. by Mr. J. R. Gwatkin.—There was a very fair attendance and a capital programme having been provided a very pleasant evening was spent.

CHEMISTS' ASSISTANTS' ASSOCIATION.

The second of a series of Cinderella dances was held at the Portman Rooms, Baker Street, W., on Thursday, February 3. There were about 110 members and their friends present, who spent a most enjoyable evening in dancing to the strains of music produced by Bacon's Quadrille Band. The arrangements which were satisfactorily carried out, were in the hands of the Hon. Secretary, Mr. H. H. Robins.

NOTTINGHAM AND NOTTS. CHEMISTS' ASSOCIATION.

Last week Mr. W. L. Howie, F.C.S., paid his second visit to Nottingham and delivered his very excellent lecture on

The Scottish Alps

under the auspices of this Association.—Mr. Richard Fitzhugh, President of the Association, occupied the chair, and there was an audience of over 400 people. Mr. Howie, as a large number of pharmacists are aware, has earned for himself a wide reputation as a photographer as well as lecturer. The whole of the views used in his lectures have been taken by himself at different times, and from the artist's standpoint are entitled to be included amongst the best. Mr. Howie has also very fine powers of description, which is an immense advantage in a lantern lecture. After the lecture Mr. Howie was entertained to supper at the Albert Hotel, Derby Road, where Mr. Fitzhugh again presided over a good number of local chemists. In the course of a speech after supper, the Chairman, in the name of the Nottingham and Notts. chemists, thanked Mr. Howie very cordially for his kindness in coming to Nottingham and giving the lecture. Meetings like that, he said, did the Association a great deal of good, and he hoped they would keep up their convivial gatherings because it was one way of bringing the chemists of the city together under circumstances which were to the advantage, he trusted, of them all. They had laboured under disadvantages of late years by that abominable "cutting" which had sprung up. Business was not what it was formerly ; there was not half the pleasure in doing business as there was ten, fifteen, or twenty years ago. At that time they had customers who never thought of going to another shop. Fortunately, however, the British public would still go where they could get the best article, and so long as chemists kept good physic he did not think they would lose their dispensing. That was the most profitable part of their trade. His advice was : Keep the best articles at good prices but do not lower the price of dispensing. The other was not a profitable part.—Mr. Howie, in replying, said he need not say that it gave him very great pleasure to stand there to reply to the toast they had so generously drunk. He should be very pleased at any time if he could come and help their Association or any other association connected with the business to which he was very pleased to belong. If he could promote fellowship and good feeling in the trade he was amply rewarded. Mr. Fitzhugh had alluded to the question of "cutting." He said he hoped they would keep on dispensing, but what he (Mr. Howie) thought he meant was, that they should turn out the kind of stuff that no limited company could. He was sure that it was that which kept their customers together.—Mr. A. Eberlin, the Secretary of the Association, was responsible for the arrangements of a very enjoyable evening.

GLASGOW AND WEST OF SCOTLAND PHARMACEUTICAL ASSOCIATION.

The annual supper of this Association was held on Tuesday, February 8, in the Grand Hotel, Glasgow, when about eighty gentlemen were present. Mr. W. L. Currie, President, occupied the chair, and Messrs. John Foster, Vice-President, and Alexander Fraser (Paisley), acted as croupiers. After an excellent supper the loyal toast was duly honoured, and Mr. Alexander Fraser (Paisley), in proposing the toast of "The Medical Profession," said this was always a popular toast, and from their intimate relationship with them in their professional work they as pharmacists had peculiar claims to speak in the highest terms of appreciation of their services to suffering humanity. There was one matter of considerable importance both to the medical profession and to pharmacists. He referred to the great facilities now given to the general public, by means of extensive advertising, for procuring such things as thyroid extract, ovarian substance, and a whole pharmacopœia of drugs which they were invited to come and buy almost without money and without price.

He thought this was a great evil and indicated something rotten in the state of medicine and pharmacy. They were well acquainted with the ordinary quackery, *alias* "patent" medicines, which might be called the constant stream that went to supply the demands of public gullibility. But this other was an evil in stemming the tide of which he thought they might bespeak the moral support of the medical profession. He had pleasure in coupling the toast with the name of Dr. Hector C. Cameron, the highly-esteemed and widely-honoured President of the Glasgow Faculty of Physicians and Surgeons.—Dr. Cameron, in replying, said he deemed it a high honour to reply for his profession to the toast they had so cordially honoured. If there were any two callings, among those who were engaged in serving the public, between which the most kindly feeling should be entertained, it was surely between those who, on the one hand, were engaged in the treatment of serious disease and those who had to dispense the remedial agents used. This year, and indeed this very month, was especially interesting as furnishing a striking instance of the professions of medicine and pharmacy acting as collaborators in the production of the national pharmacopœia. He had had a proof copy of the new British Pharmacopœia in his possession for several months, and it was expected that it would be published some time during the present month. The work had been very carefully gone into by a Committee of the General Medical Council and a Committee of the Pharmaceutical Society, with the aid of specialists like Dr. Lauder Brunton, Dr. Walter Smith, Professor Stockman, and chemists and botanists of the highest repute. In the preface he observed it was stated that the assistance of the Pharmaceutical Society's Committee had been invaluable, and he felt certain the new edition would be a great advance on any of its predecessors, and a most valuable edition, both to pharmacists and medical men.—Dr. Alexander Napier, in proposing the toast of

"The Pharmaceutical Society,"

said he had often wished they had a similar society in his own profession. In medicine a man might call himself an American specialist, or put any letters after his name, or advertise himself in any way so long as he did not use certain letters implying a medical degree. In this way the public were imposed upon and the medical man was defrauded of his legal rights, and there was no society to protect his interests. In their case, however, the Pharmaceutical Society not only took their fees and sent them out with the hall mark of legal qualification, but it did more, and protected their interests by prosecuting all unqualified persons who assumed the title of chemist and druggist or attempted to perform the work which they were declared legally competent to discharge. He felt sure the Pharmaceutical Society performed a most important and beneficial function, and he had pleasure and felt it an honour to propose this toast, coupled with the name of Mr. J. Laidlaw Ewing.—Mr. Ewing, in replying, expressed his regret that Mr. Storrar, who was to reply to this toast, was unable to be present. There was one feature which the Founders of the Society put in the forefront of their aims and duties, and that was education as a means of raising the status of their craft. Though much might yet require to be done, he felt sure all were agreed that this primary aim had been very largely accomplished. Closely connected with education was examination and registration. In that connection he would venture to refer to a formidable document, signed by himself, which appeared in the previous week's report of the Council's proceedings in the *Pharmaceutical Journal*. They were well aware that for some time the percentage of failures in Scotland had been unduly high, and this was a matter of regret to all. He felt bound to say that what was said in that report was from a feeling of the utmost kindliness towards candidates as well as teachers. The examiners were actuated by nothing but the best wishes for both, and he sincerely hoped what was said would have their very careful attention. In regard to the new pharmacopœia, he had officially had an opportunity of looking through that book, and thought it would not only be a monument to the services of those pharmacists who were engaged in its compilation, but also to the zeal and ability of Sir Richard Quain, the Chairman of the Committee. He would now touch upon what seemed to be in some quarters a vexed question, namely, the new Pharmacy Bill. He really thought some of their English friends were inclined to oppose that Bill on entirely wrong grounds, and from misguided motives. It was assuredly the design of the Society, from the very foundation, that every chemist in business should be a member of the Society, and no other plan would ever secure that large adhesion of the members of the trade that was so very desirable. He thought this reasonable scheme of consolidation not only a matter of justice to the great body of registered men, but he believed it would also very soon be a matter of absolute necessity, and the Society would be forced to admit to membership all who held the legal qualification. He would not discuss the police duties of the Society, but he took occasion to refer to its efforts to relieve the distress of unfortunate members of the craft. This was a most important work, and he was glad to think that in this Diamond Jubilee year they had raised more than in any previous of their history for this beneficent object. Mr. Ewing, in proposing "The Glasgow and West of Scotland Pharmaceutical Association," spoke of the good work done by the Association, and paid a high compliment to Mr. Currie, whose name was coupled with the toast, for the immense services he had rendered to the cause of pharmacy in the West of Scotland.—Mr. Currie, in replying, said he hoped the time would come when Glasgow would be a great centre for the Pharmaceutical Society. He made a very strong appeal for shorter hours, and urged that a determined effort should be made to close all pharmacies not later than 8 p.m., and then they could meet at a more Christian-like hour than 9 o'clock, as they had to do at present. He heartily wished that Sir John Lubbock's Bill should speedily become law.—Others toasts were "The Croupiers," by Mr. A. Laing, reply by Mr. John Foster; and "The Chairman," by Dr. John Carswell.—The proceedings were enlivened by songs, recitations, etc., and on the motion of the Chairman, hearty thanks were awarded to the Hon. Sec., Mr. D. Watson.

SHEFFIELD PHARMACEUTICAL AND CHEMICAL SOCIETY.

A general meeting was held in the Society's rooms, Surrey Street, on Wednesday night, when Mr. J. W. J. Turner read a paper on

The Proprietary Articles Trade Association,

and a discussion followed, Mr. G. Squire, the President of the Society, in the chair, and among those present were:—Messrs. J. B. Paton (Hon. Secretary), J. F. Eardley, H. E. Ibbitt, W. Ward, J. Preston, J. Austen, Antcliffe, G. T. W. Newsholme, J. W. J. Turner, Watts, and others. Several letters of apology were received. Mr. Bradwall wrote that he would have been glad to support a vote favourable to the P.A.T.A., believing that it had made a real attempt to meet the difficulties of the situation. Its efforts had already made some favourable difference in the matter. Mr. J. G. Jackson and Mr. W. Smith also wrote favourably to the Association and to the anti-cutting movement. —Mr. Turner, in opening the discussion, said his object was to try to persuade the chemists and druggists of Sheffield to take a more active interest in, and to give greater support to the crusade against the ruinous cutting of the prices of proprietary articles which was causing so much injury to the trade. In the course of his remarks he reviewed the work which had been accomplished by the Proprietary Articles Trade Association, showing that the anti-cutting movement had made very satisfactory progress, and pointed out the advantages which the success of the Association would bring to chemists and druggists. He said that the chemists of the country were gradually realising the gravity of this question. They now deeply resented a condition of things which caused them to work for nothing in handling proprietary articles, and were determined to stem the tide of profitless sales. The aim of the Association was to prevent the extraordinary cutting of prices and to secure fair profits, and it embraced in its membership all those traders who were interested in the distribution of proprietary articles. Its organisation was composed of proprietors and wholesale and retail vendors. It possessed as members 3000 retail chemists, 60 proprietors, and 18 wholesale dealers, the latter including the principal London and several provincial houses, and there were 200 local hon. secretaries. After quoting extensively from reports of the work done during last year and the previous year, Mr. Turner stated that the visits of the deputations of the Association to various towns had aroused into activity chemists' associations which were dormant, and had been the means of bringing new chemists' associations into existence. In some of the towns visited the whole of the chemists had joined hands in order to deal with this question; in others a majority of them had done so. In London alone 400 chemists had become

members. The Association would not cease its labours until its membership numbered at least 5000, then it would be able to convince those proprietors who were waiting to hear the wishes of the trade as a whole. He contended that fully nine-tenths of the retail trade was in sympathy with the movement, but without pressure being brought to bear upon them they were too indifferent to accept a remedy. Chemists as a body were distinctly averse to cutting, and only by keen competition had they been compelled in self-defence to adopt the tactics of their enemies, whose sole aim was to gain a monopoly of trade by methods however questionable. Mr. Turner felt convinced that the manufacturers would in time realise that they would be much better served by gaining the goodwill of 8000 chemists than by the support of 100 cutters, and he alleged that the cutters only used cheap patent medicines as a decoy to the public, substitution being the order of the day with cutters where patents were sold at cost price. Therefore, in the long run the work of the Association would benefit the wholesale dealer. The speaker further stated that the vindictive attacks upon the Association by certain cutting firms had resulted in large accessions to the membership. Various objections and difficulties which had been put forward with respect to the work of the Association were answered and disposed of.—Mr. Turner said that professional chemists might deplore the tremendous growth of proprietary articles, but it was a fact that as a dealer in medicines the chemist could not afford to ignore them. The demands of the public must be met by stocking well-advertised proprietary articles. He did not pay much heed to the fear that the cutting firms, thwarted in respect to proprietary articles, would cut the prices of drugs. The public do not, he said, like cheap drugs; a chemist could always obtain good prices for drugs of the best quality. Dealing with the list of protected articles, which, through the action of the Association, cannot be cut, he said there were 268 items, of which 163 were face prices. To those who protested that this list was not nearly large enough and did not include the more popular articles, his reply was that the remedy would be to join the Association, and then the list would grow larger.—The Chairman regretted to notice that the list of protected articles did not include the most prominent patent medicines; indeed there were very few everyday articles in it. He was sorry to notice the remarkable growth of patent medicines during recent years, and he feared the tendency would continue. The public would have patent medicines and the chemist and druggist must supply them, but he need not push such things nor do anything to encourage their sale and popularity. He did not altogether approve of the formation of the grocers' section, fearing that if it became generally known among grocers that good profits might be made out of the sale of patent medicines, many more of them, and also other trades, would take it up. He approved of the objects of the Association, and thought no article should be sold at less than the advertised price.—Mr. Ward thought the Association had acted wisely in securing the co-operation of the grocers, and he recognised that the organisation had aroused a degree of enthusiasm among the chemists throughout the country which nothing else had ever done. Its growth had been marvellous. The proprietors ought to stick to the advertised prices, as the present practice was demoralising.—Mr. Preston complained that the Association, while professing to exist for the purpose of keeping up prices, actually introduced the system of minimum prices. Thus, instead of operating to abolish cutting, the Association was helping the practice forward, and no honourable man could have anything to do with a society which sailed under false colours. What was wanted was the insistence on the face prices being charged for patent medicines in every case. The chemists had unfortunately given their names and countenance to a system which made the public pay very dearly for their medicine, and he regretted to see that respectable chemists had allowed their names to be used in puffing certain Yankee remedies. He always refused to recommend proprietary remedies, or to express an opinion upon them to his customers. It was demoralising to chemists to have to do with such articles.—Mr. Newsholme said although he was a hearty supporter of the principle of organisation he regretted that he had not yet been able to see his way to join the P.A.T.A. His opinion was that every article should be sold at the advertised price; he regarded it as immoral for a proprietor to have two prices. If a thing was advertised at 1*s.* ½*d.* that should be the selling price. Let the proprietors, if they wished, put up the wholesale price to within a halfpenny of the retail price. That matter was in the hands of the manufacturers entirely, quite independently of the P.A.T.A. or any other body. They possessed the power to dictate terms to the chemists or to the Association. If the retailer was foolish enough to throw away his profit, the proprietor of the article ought to say, "If you don't want this profit I do." It would not seriously affect the sale because if the people wanted patent medicines they would not let a few pence stand in their way. Another point which caused him to disapprove of the policy of the Association was that some of the articles protected were things with which he could not conscientiously identify himself. Again, he objected to chemists, who were the proper persons to sell medicines, allying themselves with grocers, and by that means countenancing the sale of such things by the grocers. He regretted that he was still unable to approve of the methods of the Association and to join it.—Mr. Ibbit having spoken in favour of the Association, Mr. Ward moved—

> That in the opinion of this meeting the P.A.T.A. is worthy of the practica support of the Sheffield Pharmaceutical and Chemical Society, and that all owners of chemists' proprietary articles should take advantage of this means to provide retailers with reasonable remuneration for their services.

—Mr. Watts seconded, and the resolution was carried, several voting against it.—Mr. Turner was thanked for his paper.

MANCHESTER PHARMACEUTICAL ASSOCIATION.

An ordinary meeting of the above Association was held on Wednesday evening at the Victoria Hotel, Mr. G. S. Woolley presiding. It had been decided to postpone the reading of Mr. James Grier's paper on (1) "The detection of water in ether"; and (2) "A comparison of the melting points of commercial specimens of soft paraffin," until the next meeting.—After the reading of the minutes of the previous meeting had been read by Mr. A. Blackburn (the hon. secretary), the Chairman said they would see from the *Pharmaceutical Journal* that Mr. Pilkington Sargeant had thought proper to allege that the votes of those present and the communications of others that were absent, constituted a majority against the Bill, and he dared say they had seen his reply that it was not so. The vote taken was 18 for the Bill, and 9 against. Mr. Walter Gibbons, as he was leaving the room, suggested that his vote should be taken, and he (the Chairman), in his charity, at the time thought that might be done, but afterwards some gentlemen left the room, who were in favour of the Bill. Therefore, it was not fitting that one gentleman's vote should be recorded and everybody else's left out, and, therefore, the vote as taken was 18 to 9, and with that correction he should move the confirmation of the minutes. He had seven letters written to him before the meeting. Five of those letters were from gentlemen who opposed the Bill, and two of them were partially opposed to the Bill, but quite showed, from the tenour of their letters, that they were open to argument. But there was another letter which, unfortunately, did not come into his hands until it was too late to make use of it, and that letter was from the Local Secretary of a neighbouring town, who spoke very strongly in favour of the Bill, and said that he had interviewed some of the Major men in his town, and they were in favour of the Bill. Therefore, how Mr. Pilkington Sargeant could have arrived at his statement, he could not understand. Taking the figures stated at the last meeting, and including all the writers of letters as opposed to the Bill, it was only 18 to 16, so that there was not a majority against, and if he had had the letter he had just alluded to, it would have shown a still stronger majority in favour of the Bill. He thought it was right he should make that statement, and with that correction he had alluded to—that the figures of the voting should be put in—he begged to move that those minutes be declared correctly recorded.—Mr. Wild asked if there was not a special whip sent out by Mr. Gibbons, otherwise the Chairman would not have had those letters?—The Chairman replied that he had no means of answering that question. Mr. Wild: I have heard that.—The Chairman said that hearsay was not evidence.—Mr. A. W. Harrison (Manchester) was unanimously elected a member of the Society, and several nominations were received for election at the next meeting.—The Chairman said they hoped to have a number of young men there next month, when the prizes would be presented to the successful candidates at the examinations about to be held. He added that the Secretary had sent out 130 notices of the meeting, and it was only repeating what he had said before it was disheartening that so few gentlemen attended.—Mr. Kirkby then gave a short address on the use of metric weights and measures.

LETTERS TO THE EDITOR.

The New Pharmacy Bill.

Sir,—Reading the correspondence from week to week in your columns on the proposed Pharmacy Act Amendment Bill, one cannot but notice with satisfaction the advantage that is allowed to the enemy—the general obstructor—in these days, so that what is at length brought about, though it be nothing so widely beneficial as was at first aimed at, is nevertheless so unalloyed with self-destructive influences, the result of the fierceness of unrestrained criticism that has been brought to bear upon it, that it becomes as perfect as the result of human effort can well be, and goes a long way into the future without need of renewal. Not but that one gets a little perplexed at the mutually antagonistic views of the various *Advocati Diaboli*, and, of course, a little vexed at seeing boils and blains and serious chronic swellings breaking out all over a preconceived healthy subject, so that at length one feels impelled by various motives to step in and try his hand at a little original pharmacy to alleviate the surrounding discomfort, and blend, if he can, what seems so diverse and incompatible. Bad reading, sir, is at the bottom of much disorder; see what a fog we are in sometimes over the words "qualification," "public," etc., etc. The stronghold of all kinds of quackery, as it was once of fierce religious dissension, is the inveterate habit of people to scan in print what suits their preconceived fancy and nothing else; they almost never read, they simply fix their eyesight on what tickles their passing fancy and swallow at a gulp the tid-bit, then glide on for another of the same sort. Some one speaks of "Nuttall." Why, who is Nuttall? the book was put together for the sake of ignorant folk who used to idle away their time at "spelling-bees." I am ashamed to hear it mentioned amongst us as an authority at all. Granted "qualify" does mean "make capable," this is its crude meaning, the more customary meaning being "to furnish with legal power." We are "qualified" by Act of Parliament in virtue of the examination certificate, not by being admitted members of the Society. It is to be feared that many of the "qualified" ones are as "incompetent" in respect to pharmacy as they are with respect to logic and the grammar of the English language, and that incompetency to manage their own business lies at the bottom of all the trouble. Qualification has respect entirely towards the public good, which must be attended to. Membership of the Society we may, if we please, take advantage of for our own good entirely. United in one body we stand shoulder to shoulder for the benefit of each other. There is the Charter of Incorporation, a good strong back-bone, and all that is requisite for the advancement of our business interests is that the Society include within its portals almost all of those who are qualified to minister to the public need pharmaceutically; for this end we can with patience wait and work, and be content with slow and steady progress. Justice and fair-play seem to demand that all those who have "qualified" as the law demands should be admitted on equal terms as members of the only organisation that might have potent influence to protect the interests involved in the discharge of their very onerous duties to mankind at large. It seems to me self-evident that the more a pharmacist understands the actual nature of his own business the less will he be disposed to cater for the recognition or support of the uninformed masses of society. It matters but little where he is plying his calling, be it in the various centres of elegance and refinement, or amongst the densely packed abodes of the poorer classes, everywhere he meets with the same sort of needs which he is qualified, *i. e.*, authorised to supply. He is wanted everywhere and everywhere for similar services; and if he will but be content to work up to the level of the intelligent and the good, who in a country such as this pervade the masses in all directions and prevent the total overthrow that dirt and ignorance and greed would bring otherwise upon the poor and the rich alike, he need fear no evil nor much complexity in his business career. One of your correspondents plaintively refers to the "Major man" who has spent his time and his money and finds after all what is elegantly termed the "commercial value of the title M.P.S." to be worthless. Poor fellow! Not much fit for a Major! He who wastes either his time or his money does not deserve much sympathy, but he who wastes both, why the sooner he is eaten up the better for all. Thirty years ago the like controversy was in progress, and in the Journal [2], viii., page 617, is an editorial that closes with these words; as applicable now as they were then, "Some objectors use the very popular plea of £ s. d., and truly it is marvellous to find men charging all their high premiums, lecture fees, laboratory instruction, and travelling expenses to the debit of their account with the Society. Can it be that their success in business depends altogether on the possession of a title, and not at all on their professional ability to practise the art in which they have been declared competent? Do they not carry into their own shops and laboratories some useful knowledge applicable in their every-day requirements—knowledge which gives them a positive advantage over unskilled neighbours? Would they depend entirely on a diploma for success?"

Marylebone, N. W., February 8, 1898. J. C. Hyslop.

Sir,—In your last issue Mr. Woolley remarks that certain of my statements were "not in accordance with the facts." At a meeting held on Saturday last of the committee formed in Manchester to direct the opposition to the proposed Bill, I was requested to state that, in the first place, no numbers were read out at the Victoria Hotel meeting. If this had been done, the vote would have been challenged. We believe that Mr. Woolley has made a mistake, as there were not twenty-seven persons in the room when the vote was taken. Moreover, extracts from nine letters (not seven) were read to the meeting, all opposing the Bill. Taking, however, Mr. Woolley's computation to be correct, namely, that eighteen voted for the Bill, even yet the majority of those who gave their opinions to the meeting opposed the Bill, nine by letter, nine by vote, and two orally, though retiring before the vote was taken. We also do not admit that the majority of those who left the room without giving any opinion were in favour of the Bill, there being no foundation for such assumption.

Manchester, February 8, 1898. F. Pilkington Sargeant.

Sir,—Having followed with much interest the correspondence on the proposed Bill, my opinion is that most of the arguments in favour of it are decidedly weak. It is said that the "Chemists and Druggists" are desirous of the proposed change. That this is not so is evident from the number of that body present at the recent Manchester meeting. The Chairman (Mr. Woolley) in his letter says that 500 invitations were sent out. Upwards of 400 of these must have reached "Chemists and Druggists," and yet out of this number not more than thirteen came to record their vote in favour of the Bill. If they do not think it worth their while to help forward the movement, my opinion is that if the Bill becomes law the membership will be none the larger, and the Society will suffer by loss of many of its present pharmaceutical chemist members. Though I am strongly opposed to the Bill as it at present stands, I think that the associates are deserving of more recognition and privileges. I would suggest that on their being elected, a "diploma of associateship" be granted, and also say, one-third of the seats on the Council be allocated to them. Much of the discontent which now exists would speedily subside, and satisfaction would be given to all parties concerned. Your correspondent, Mr. Schollar, departs entirely from the subject at issue. His letter may be divided under two headings: First, a depreciation of the Major qualification. This recalls the legend of the fox and the unattainable grapes. The remainder is a collection of personalities, the understanding of which may be within the reach of a limited few.

Manchester, February 7, 1898. William Maskew, Ph.C.

Note on Straining.

Sir,—In straining mucilago acaciæ, B.P., according to official instructions, through muslin, an inconvenience arises from the fact that a long period of time is required to complete the operation satisfactorily, and also that, owing to this, the mucilage usually becomes dry and hardened on the muslin. This necessitates frequent cleaning and consequent delay. I have found that an excellent method, described below, obviates all these difficulties, and gives a good preparation. After the solid gum has been wholly dissolved in the proper quantity of water, an ordinary large glass funnel is taken, and the neck loosely plugged with tow. This is fitted into one hole in a rubber bung, which fits the mucilage or other convenient bottle. Through the other hole is a short glass tube, which is then connected with a water aspirator or filter pump. On the latter being set in full operation, and the gum poured on the funnel, in five or ten minutes at the outside the whole is drawn through, perfectly strained. This method is also applicable for gelatin, etc., instead of muslin or wet flannel.

Stourbridge, February 1, 1898. J. Ernest Jones.

Royal Botanic Society's Gardens.

Sir.—As pointed out in your issue of last week, metropolitan students of botany who visit the Botanic Gardens, Regent's Park, are indebted to the Council of the Royal Botanic Society for an extension of the hours of admission. This concession is more particularly due to the kindness of Mr. Martindale, by whom the matter was laid before the Council. It remains for students to avail themselves of this privilege to the full, and thus demonstrate their appreciation in the most practical way.

Watford, February 7, 1898. F. A. Upsher Smith.

An Unusual Mixture.

Sir,—It is gratifying to find "Apprentice," following up the short note read by me before the Edinburgh Chemists', Assistants', and Apprentices' Association, but the method of preparation recommended by him does not result in a satisfactory mixture. His method was tried by a friend a few days after the publication of my "note," the result being inferior to that produced by the use of turpentine and mucilage. If "Apprentice" will allow a day to elapse after preparing the mixture by his method, and then pour out about a drachm on the palm of his hand, rubbing this with the finger will show him that the wax is not in solution, but is present in small particles. Thus, one of the conditions required is not attained, viz., that the wax shall be "equally distributed" throughout the mixture. I did not mention in my paper the purpose for which the mixture is required, but the presence of the wax in small particles renders it unsuitable. I will be pleased if "Apprentice" will experiment further.

Edinburgh, February 5, 1898. Claude F. Henry.

The Banquet to the Lord Mayor of Manchester.

Sir,—I am desired by my committee to ask your kind insertion of the accompanying paragraph in your issue for the current week.

Manchester, February 8, 1898. Harry Kemp,
Hon. Sec. Banquet Committee.

[Enclosure.]

The Lord Mayor of Manchester, in a letter addressed to the Chairman of the Banquet Committee, under date of February 7, after referring to the "unparalleled enthusiasm" of his reception, adds :—

"I am overwhelmed with a sense of deep gratitude to yourself, to all who took an active part in carrying out the arrangements, and to all who came to pay me such a compliment, and who thus contributed to the complete success of a truly unique affair.

"I shall be glad if you will be good enough to make it known as widely as possible how warmly and how heartily I return my sincerest thanks to one and all concerned."

A Degree in Pharmacy.

Sir,—The passage on the above subject in the "Annotations" of last week's Journal is interesting, and brings before us both the desirability and the hope of some higher recognition being made for those who desire to devote themselves to advanced pharmaceutical work. No doubt many chemists will pooh-pooh such an idea as both useless and impracticable in these days of shop-trading, but on the other hand there are many who are just as anxious and willing to increase their knowledge and to attain to a higher state of education than is afforded by the present pharmaceutical examinations. But if any of the universities should entertain any suggestions which might be made to them, first and foremost they would expect matriculation from candidates or an equivalent, and what have we to offer in the Preliminary examination? It cannot rank equally with, say, the London Matriculation, as you say, but one would have thought that in formulating a new syllabus provision would at least have been made to include such subjects as elementary chemistry and pharmacy. It therefore amounts to this—that a candidate would have to matriculate, which would be some drawback (imagine a pharmaceutical chemist starting to grind the Euclid, i.-iv., of his school days), and which, if the Preliminary examination was made to rank equal with any matriculation, would be entirely obviated, and a candidate, after having qualified as a chemist and druggist, could straightway proceed to his university training for the degree in pharmacy. In an article in the *University Correspondent* of January 29, the Colonial Secretary, speaking of a proposed Midland university, said "What did they mean by a university? They meant, he took it, a great school of universal instruction, not confined to any particular branch of knowledge, but taking all knowledge as its province, and arranging courses of complete instruction in all the great branches of information." Why, then, should not pharmacy, in this period of advanced education, take its place with the other sciences and be included in a university?

Liverpool, February 7, 1898. Frederick B. Hirst, A.P.S.

Bacteriology for Pharmacists.

Sir,—I wished, and had intended, to make a few remarks on this subject at the meeting last night, but for the unexpected vote of thanks which was prematurely put before the President had declared the discussion closed; therefore, I ask you to allow me a little space in the Journal. It must be quite twenty years since I last attended an evening meeting of the Socicty, but I was attracted last night alike by the subject of the paper and its author, and I must say I was in no wise disappointed, for a better thought-out and more ably delivered discourse I have seldom had the pleasure of listening to. Mr. Atkinson treated the matter so exhaustively that it would be difficult to find any point of importance which he did not touch upon, but there are one or two points I should like to emphasise. Mr. Atkinson spoke of the importance of keeping the body in a state of good general health as the best preventive against the attacks of bacilli, and when it is considered the vast influence exercised by light and air in this matter, such advice ought to be laid to heart. We have the aerobic and anaerobic growths of organisms, that is those attracting and those repelling oxygen, the hay bacillus (*B. subtilis*) may be taken as illustrating the former, and the *Spirillum* of cholera (Koch's comma bacillus) the latter. It is thus seen that free oxygen either reduces the vegetation of the an-aerobic growths to a minimum, or stops it altogether. Again, Mr. Atkinson mentioned the effect of sunlight, as found by Janowsky, was fatal to certain germs, such as those of typhoid, the rays at the violet end of the spectrum also produce the same result. Hence the primary importance of human beings being supplied with plenty of light and air, and one shudders to think of the condition of those, in some of our large London warehouses, who never get a glimpse of sunlight, or even direct light at all, it being supplied solely by reflection from mirrors or white walls. And is the air in such places any better than the light? Persons living under such conditions are truly alive but etiolated. The influence of temperature was also referred to, and Mr. Atkinson insisted on the importance of cooking as destructive of any bacilli which might be present in meat, but I do not recollect that he referred to milk, at least not in that connection, but it must be remembered that milk is even more likely to convey germs than meat (as has so often been so lamentably proved), and that milk, moreover, is more often taken either in its raw state or mixed with tea, coffee, etc., at which temperature, of course, no disease germs are destroyed. Tuberculous bacilli are most certainly conveyed to the lungs direct through respiration, hence the importance of the advice given by Mr. Atkinson on this head. Cholera germs, on the other hand, get into the intestines through the stomach, but as acid is fatal to them, it would seem that the digestive process must either be in abeyance or in an unhealthy state to allow of this bacillus passing the barrier of the stomach. Nevertheless, cholera is indirectly catching, and those who wash the clothes of a cholera patient are more liable than those who attend personally on the patient. Mr. Atkinson ably demonstrated how to cultivate bacilli, and gave, amongst other things, infusions of hay and turnips; but there is, perhaps, an even simpler and always ready-to-hand method, *i.e.*, a raw potato. Cut this in half and expose it, cut sides upward, anywhere you like. In a few hours the surfaces will be found covered with little colonies of bacilli, some white, some yellow, and some pink, and if these are introduced into tubes of sterilised peptonised gelatin by means of a sterilised platinum wire, as explained by Mr. Atkinson, the gelatin shortly becomes liquefied and is found to be swarming with bacteria. Some six or seven years ago I showed at the soirée of the Croydon Microscopical and Natural History Club, *inter alia*, some tubes of cultivations obtained in this way, and the contents of these tubes under the microscope. There is plenty of material handy, therefore, for the pharmacist to practise on, so that when a serious occasion arises he shall not be found wanting. Mr. Atkinson referred to the importance of cleanliness. Now, it has been well said that the extensive use of heavy hangings and thick piled carpets, especially in bedrooms, though doubtless eminently respectable, is essentially dirty, and the *Hospital* recently remarked that the first thing the housemaid does in the morning is to stir up all the dust with its contained

germs, ready to be respired by herself and all the other members of the household. In short, the whole subject supplies abundance of material for thought and experimental research.

Croydon, February 9, 1898. J. H. Baldock, F.C.S.

ANSWERS TO QUERIES.

Special Notice.—*Scientific, technical, legal and general information required by readers of the 'Pharmaceutical Journal' will be furnished by the Editor as far as practicable, but he cannot undertake to reply by post. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of senders. Questions on different subjects should be written on separate slips of paper, each of which must bear the sender's initials or pseudonym. Replies will, in all cases, be referred to such initials or pseudonyms and the registered number added in each instance should be quoted in any subsequent communication on the same subject.*

Saleratus.—Saleratus, or more correctly sal æratus, is the old name for potassium bicarbonate. [*Reply to* W. H. B.—5/2.]

London Specialist.—We cannot assist you in the matter you mention. [*Reply to* C. J. P.—5/1.]

Medical and Dental Examinations.—A 'Guide to the Medical and Dental Professions,' by Percival Turner, is published by Mr. Henry Kimpton, 82, High Holborn, London, W.C., price 3*s.* 6*d.* [*Reply to* F. H. R.—4/18.]

Books on Physics and Organic Chemistry. — Everett's 'Physics' (Blackie, 3*s.* 6*d*) and Perkin and Kipping's 'Organic Chemistry' (Chambers, 6*s.* 6*d*). Read pages 232-3 of the *Pharmaceutical Journal* for September 11 last. [*Reply to* Ajax.—5/4.]

Minor Examination.—A candidate must have been apprenticed for three years, presumably with a registered chemist, or have been practically engaged for three years in the translation and dispensing of prescriptions. [*Reply to* Percontator.—5/3.]

Botanical.—You do not mention any particular form of *Sphærella*, but if you will refer to Kerner and Oliver's 'Natural History of Plants' (Vol. I., p. 39), you will probably find the information you require. On page 752 of the same volume you will also find a reference to the root-growths you mention. The specimen you send is rotten, so it is impossible to say anything definite with regard to it. [*Reply to* T. H. G.—4/29].

Green Dye for Ivory.—There is a green aniline dye supplied for this purpose, which is used in conjunction with picric acid. You may, however, find it preferable to use a hot solution of picric acid and indigo mixed to the desired tint. The handles should be put in the cool liquor and gradually heated, but not boiled. This should be done before they are attached to the blades. If this mixture does not give the tint you require let us hear from you again. [*Reply to* Minor.—4/26.]

Hydrogen Peroxide, 10 Volumes.—The expression "10 volumes" relates to the number of volumes of "available" oxygen which will be liberated on treating 1 volume of the peroxide with suitable reagents, such as dilute sulphuric acid and potassium permanganate. In this instance half of the oxygen is derived from the H_2O_2 and half from the $K_2Mn_2O_8$; consequently 1 C.c. of good 10 volume H_2O_2 should yield with this reagent nearly 20 C.c. of oxygen, if this be measured or titrated. A convenient method of assaying the commercial article is as follows:—Take 10 C.c. of the sample and make up to 50 C.c. with distilled water. Introduce 5 C.c. of the mixture into a nitrometer over saturated brine, add 5 C.c. dilute sulphuric acid, and 5 C.c. of saturated aqueous solution of $K_2Mn_2O_8$. When action ceases read off the volume of O. It should not be less than 18 C.c., since half the O only comes from the H_2O_2. To test "20 volume" peroxide, take 5 C.c. and dilute to 50; proceed as before. Here, as the 5 C.c. only represents 0·5 C.c. of the original sample, the *whole* of the oxygen should be read as being derived from 1 volume, *i.e.*, it is double that given by the half volume, less the small loss due to the solubility of the gas in the brine solution. The reaction is represented by the equation—

$$K_2Mn_2O_8 + 3H_2SO_4 + 5H_2O_2 = K_2SO_4 + MnSO_4 + 8H_2O + 5O_2.$$

[*Reply to* Ajax.—4/9.]

Spectacle-Makers' Company.—The Clerk's address is Guildhall, London, E.C. [*Reply to* C. F.—5/9.]

Prescription Latin.—You cannot do better than order from your bookseller a copy of Crother's and Bice's 'Elements of Latin,' referred to in the Journal for January 29 last, page 98. [*Reply to* Radix.—4/31.]

Publishers of Books.—Fowne's 'Organic Chemistry' is published by J. and A. Churchill (London), Maisch's 'Materia Medica' by H. Kingston (London), and Vines' 'Botany' by Swan, Sonnenschein and Co. The last-mentioned is published at 15*s.* Apply to the Registrar of the Pharmaceutical Society for copies of examination schedules. [*Reply to* L. S.—5/5.]

Brilliantine.—By inseparable brilliantine we presume you mean the bright preparation in which the oil is in perfect solution. The basis is merely castor oil dissolved in spirit, thus: Castor oil, 1 fl. oz.; rectified spirit, 2 fl. ozs.; oil of rose geranium, 3 ♏; oil of lemon, 10; oil of neroli, 5. Another nicely perfumed but dearer article may be made from castor oil, 1 fl. oz.; rectified spirit, 1½ fl. oz.; jockey club, ½ fl. oz., or any other good perfume. [*Reply to* Parolene.—4/30.]

ADDRESS SUPPLIED.

A Correspondent kindly informs us that the address Mr. G. H. Wilkinson is seeking through the Journal is Messrs. T. Edwards and Co., 61, Oxford Street, London, W.

CORRECTIONS.

Formulæ, Methods, and Reactions.—On page 118, column 2, line 8, for "potassium nitrate" read "potassium nitrite"; in Allen's modification of Fehling's test, the urine should be boiled *after* adding the cupric sulphate solution; on page 119, column 2, line 12 from bottom, for "sodium plumbate" read "sodium plumbite." Mr. Bird also points out that the test associated with his name is improved and rendered more expeditious and sensitive by immersing the test-tube in water at about 70° C. for 5 or 10 minutes. If much sulphur be present, a brown or black colour is produced on heating.

OBITUARY.

Bennett.—On January 24, Samuel Bennett, Chemist and Druggist, Tunstall. Aged 60.

Glaisyer.—On February 4, Thomas Glaisyer, Pharmaceutical Chemist, Brighton. Aged 89. Mr. Glaisyer was one of the founders of the Pharmaceutical Society, and a member of the first Council of the Society, elected after the Royal Charter of Incorporation was granted. He was a man of considerable scientific attainments, and at one time filled the position of President of the Sussex Natural History Society. For many years Mr. Glaisyer was a leading member of the Society of Friends in Sussex, and held various offices in connection with that body.

Edisbury.—On February 8, Henry Edisbury, Chemist and Druggist, Everton. Aged 70.

PUBLISHERS' NOTICE.

COVERS FOR BINDING.

Cloth gilt-lettered covers for binding the half-yearly volume of the *Pharmaceutical Journal* are supplied by the Publishers, at a charge, including postage, of 1*s.* 6*d.* each.

All Orders and Remittances should be Sent to the Publishers, 5, Serle Street, London, W.C.

COMMUNICATIONS, LETTERS, etc., have been received from

Messrs. Andrews, Baldock, Bayley, Bird, Buck, Coull, Cracknell, Dawney, Douzard Dunlop, Ferguson, Flint, Garc, Hebb, Henry, Hill. Hirst, Hyslop, Jackson, Johnson, Jones, Kemp, Leslie, Lloyd, Mackenzie, Maskew, Mumbray, Pater, Pollitt, Read, Sargeant, Seaborne, Wilkinson, Wrenn.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

Dissociation of Platinum Platinichloride. E. Sonstadt points out that whilst a solution of potassium platinichloride in 1000 parts of water undergoes no sensible change on heating for an hour or two, a solution in 10,000 parts of water becomes turbid almost immediately on heating, the turbidity increasing until, after some hours, the liquid becomes nearly opaque. Continued heating during some days, the bulk of the solution being maintained by the addition of water from time to time, results in the formation of a sediment and partial clearing of the liquid, and that clearance is facilitated by increasing the quantity of water during the heating process. In the first place the potassium platinichloride appears to be dissociated, and the resulting platinic chloride is then decomposed, with formation of platinum monochloride, hydrochloric acid, and hydrogen peroxide. The yield of the monochloride in the experiments described was about five-eighths of that theoretically obtainable.—*Proc. Chem. Soc.*, 188, 25.

Soluble Starch and Diastase. In an investigation on the chemical constitution of diastase and the determination of its activity on soluble starch, A. Wroblewski has obtained results showing that in all preparations of diastase the greater part of it consists of the inactive body arabin, and that diastase is a protein substance more resembling albumose than any other known proteid. Soluble starch can be prepared from starch either by boiling with water or with 2 per cent. potash solution; in the latter case acidulating and precipitating with 95 per cent. alcohol. Starch treated in this manner gave 50 to 60 per cent. of snow-white soluble starch, which dissolves to the extent of 3 per cent. in cold water, but is almost insoluble in 40 per cent. alcohol. Soluble starch is no doubt none other than the first product in the hydrolysis of starch. The action of alkalies on starch is similiar to that of diastase, and alkalies, if slower, have greater hydrolytic power.—*Hoppe Seyler, Zeits. Physiol. Chem.* xxiv., 174.

Determination of Uric Acid in Urine. The method of Hopkins for the determination of uric acid in urine has been examined by O. Folin, who suggests the use of ammonium sulphate instead of ammonium chloride for precipitating the uric acid (*Hoppe Seyler, Zeit., Physiol. Chem.*, xxiv., 224). The precipitate obtained by adding 10 grammes of ammonium sulphate to 100 C c. of urine is allowed to settle for two hours, then collected and washed with a 10 per cent. solution of ammonium sulphate until free from chlorine; it is treated with a little dilute sulphuric acid, then with 15 C.c. concentrated sulphuric acid, and titrated with permanganate solution of 1/20 strength, of which 1 C.c. equals 3·75 milligrammes of uric acid. To the result obtained one milligramme is added as a correction for solubility. Drs. Tunnicliffe and Rosenheim have, in the *British Medical Journal*, of February 5, described another modification of Hopkins' method. It consists in titrating the uric acid with a standard solution of piperidine. The uric acid is precipitated by ammonium chloride, as in the original process, from 100 C.c. of urine, and the precipitated ammonium urate decomposed with hydrochloric acid. The uric acid is then washed on a filter with water (15 to 20 C.c.) until free from hydrochloric acid, dissolved in boiling water, and titrated with 1/20 normal piperidine solution, using phenolphthalein as an indicator, until the purple colour is obtained. One C.c. of a 1/20 piperidine solution equals ·00425 gramme piperidine or ·0084 gramme of uric acid.

Assay of Glycerophosphates. A. Astruc has confirmed the view that calcium glycerophosphates in solution are alkaline to methyl-orange, and that they may be either acid or alkaline to phenolphthalein. To determine the amount of phosphoric acid present, he neutralises a known volume of glycerophosphate solution with sulphuric or hydrochloric acid, with methyl-orange as indicator, then titrates the solution with standard alkali and phenolphthalein. In the equation representing the first reaction—

$$2PO\begin{cases}O \\ O \end{cases}\!\!>Ca + H_2SO_4 \\ \quad\ \ \backslash O{-}C_3H_7O_2 \;=\; \begin{cases}(PO_4C_3H_7O_2)_2{\cdot}CaH_2, \\ CaSO_4\end{cases}$$

one molecule of mineral acid corresponds to two molecules of phosphoric acid, and in the second—

$$(PO_4C_3H_7O_2)_2{\cdot}CaH_2 + 2NaOH = (PO_4C_3H_7O_2){\cdot}CaNa_2 + 2H_2O$$

or

$$\left.\begin{matrix}(PO_4C_3H_7O_2)_2{\cdot}CaH_2 \\ 2NaOH\end{matrix}\right\} = \left\{\begin{matrix}PO_4C_3H_7O_2Ca \\ PO_4C_3H_7O_2Na_2 + 2H_2O,\end{matrix}\right.$$

one molecule of phosphoric anhydride corresponds to two molecules of soda. The quantity of phosphorus pentoxide in solution can thus be calculated, the results obtained being about 0·5 per cent. lower than those obtained by calcining a known weight of glycerophosphate, dissolving the ash in hydrochloric acid, and determining the phosphorus as magnesium pyrophosphate. The author concludes that the phosphoric acid in glycerophosphates can be determined very closely and rapidly by the method he describes; that the glycerophosphates of lime appear to decompose, even during their preparation; and that undecomposed calcium glycerophosphate seems to require a quantity of acid equivalent to that of the soda necessary to act on phenolphthalein in order to react on methyl-orange.—*Journ. Pharm. Chim.* [6], vii., 5.

Action of Sulphuric Acid on Mercury. M. P. E. Berthelot finds that concentrated sulphuric acid is not, as is usually supposed, entirely without action on pure metallic mercury at ordinary temperatures. On the contrary, gradual and evident evolution of gas is observed on placing the concentrated acid in contact with the metal, and after the lapse of a few days, and still more at the end of a couple of months, notable quantities of mercurous sulphate will have formed, as well as sulphurous anhydride. The presence of a trace of water arrests the action.—*Comptes rendus*, cxxv., 749.

Salitannol. The action of phosphorus oxychloride on a mixture of molecular quantities of salicylic acid and gallic acid results in a condensation product having the composition $C_{14}H_{11}O_7$. The properties of this body are entirely distinct from those of salicylide or tannin. It forms a white amorphous powder, which is insoluble in water, ether, chloroform, benzol, and scarcely soluble in alcohol. It is insoluble in the cold in alkaline carbonates, readily soluble, however, in caustic alkalis, but is extracted again from the solution by acids. The body melts and decomposes at 210° C. Salitannol is used as an antiseptic remedy for wounds, and is said to combine the antiseptic properties of salicylic acid, gallic acid, and tannin.—*Pharm. Zeit. f. Russl.*, xxxvi., 696.

Captol. This is a condensation product of tannin and chloral, forming a dark brown powder. Iron salts mixed with solutions of captol give dark coloured solutions, which are rapidly discoloured by oxalic or hydrochloric acid. Captol is used as a medical cosmetic for seborrhœa. A 1-2 per cent. alcoholic lotion is rubbed into the scalp morning and evening, the use of fat, pomades, or soap being strictly avoided.—*Pharm. Post*, xxx., 521.

Seed of Ceratonia Siliqua.

Dr. H. Marlière has made a study of the structure and development of the remarkably thick membranes of the cells of the endosperm of the carob seed. He states that, at an early stage, the cell-wall is composed entirely of cellulose, with only a trace of pectic substances. After the secondary thickening has commenced, there is an outer and an inner layer of cellulose, and, between the two, a thick, mucilaginous layer, the result of transformation of the cellulose, and still impregnated by that substance. In the mature seed this secondary membrane has become completely transformed into mucilage; the cellulose remains only in the outermost tertiary layer. The reticulate structure characteristic of cell-walls is still partially retained in the layer of mucilage. The cell-walls of the cotyledons are composed entirely of cellulose without any admixture of amyloid. As regards its chemical and optical properties, the mucilage of *Ceratonia*, if dissolved without inversion, deviates the plane of polarised light 10° to the right at a temperature of 20° C. Hydration in the presence of acids transforms the mucilage into three reducing sugars—dextrose, levulose, and galactose. After hydration analysis indicates the presence of 68 per cent. of glucose, 19 per cent. of levulose, and 12-13 per cent. of galactose.—*La Cellule*, vol. xiii., pp. 1-60.

The Harvest Bug.

It may be consoling to those who have suffered the intolerable discomfort caused by harvest bugs to learn that the identity of the acaroid mite which gives rise to the "bumps" by burying itself in the skin, has been satisfactorily determined. M. Brucker has examined specimens taken from human beings during the last autumn, and has defined them as the hexapod larva of *Trombidium gymnopteron*. The same animal in the larval form has been found by the author on the rat and on the blackbird, as well as on many plants, especially on kidney beans. As other trombidian larva may, in other localities, attack man, it is well to note that those reported on were obtained from Semur-en-Auxois (Cote d'Or), where this autumn plague is especially troublesome.—*Comptes rendus*, cxxv., 879.

Economic Botany.

J. R. Jackson has commenced an interesting series of articles on economic botany in the February number of *Knowledge*, and in the introductory article he points out that the first and by far the most important attempt, in this and perhaps in any other country, to elucidate and make popular the economic side of botanical science was begun by the late Sir W. J. Hooker, when in 1847 one room of the building now known as Museum No. 2 in the Royal Gardens, Kew, was fitted up for the purpose to which it has ever since been devoted. In the same year a building which had hitherto been used partly as a storehouse for fruit was added to the Botanic Garden proper. The nucleus of the museum thus established consisted of the Director's private collections, presented by himself; but no sooner was the establishment and aim of the museum generally made known than contributions to it poured in from all quarters of the globe, until in a few years the ten rooms of the building, with its passages and corners, were absolutely crammed with specimens. Application was therefore made to Parliament by the Chief Commissioner for a grant to defray the expense of an additional building for the proper accommodation of the objects, the house occupied by Museum No. 1 was opened to the public in the spring of 1857, and from that time the collections have gone on increasing in importance and value till at the present time they stand unrivalled all the world over. Besides this, in almost every botanic garden at home and abroad, as well as in most teaching centres and in large towns, museums on the system of those so well known at Kew have been established. The result of all this has been the diffusion of a knowledge of economic botany, which, however, did not command that attention its great importance deserves until the last ten or twelve years. The structure of plants, their affinities, their geographical distribution, and similar points attracted the attention of the scientific worker, who gave no consideration to their properties and uses, though the connection between the purely scientific and the economic sides is very apparent upon a moment's consideration. As Mr. Jackson points out, in some natural orders there is a distinct property running through the plants which constitute the order, which may serve as an indication of their botanical affinities and also prove them to be of economic value or otherwise. Thus, in the Malvaceæ the inner barks for the most part abound in long soft fibres, and the roots and fruits of many are mucilaginous, *e.g.*, the roots of the marshmallow (*Althæa officinalis*) and the fruits of gombo or ochra (*Hibiscus esculentus*), while in the allied order, Sterculiaceæ, the fibrous inner barks are interlaced. In Gentianeæ all parts of the plants abound in a bitter principle, which makes them valuable as tonic or febrifugal medicines. Then, some natural orders abound in milky juices, wholesome or poisonous as the case may be, and others, again, as in such orders as Artocarpeæ, Euphorbiaceæ, Apocynaceæ, and Asclepiadeæ, upon solidifying become elastic, and form caoutchouc or indiarubber. A knowledge of the properties of the several natural orders, or of any group or genus of plants, is thus not only of assistance in their determination, but also of much help in deciding their commercial value.

Larkspur Poisoning.

According to Dr. Knowles, large losses of stock have resulted in Montana from larkspur poisoning. The symptoms are manifested first by the animal straying behind the herd in a lethargic state, and in inability to surmount obstacles. In nearly all cases salivation is evident. The antidote is the inhalation of strong ammonia vapours and the internal administration of a teaspoonful of solution of ammonia in a cupful of water for a sheep every fifteen minutes. Where it is available, the hypodermic injection of a sixtieth of a grain of atropine sulphate for a sheep, or one grain for cattle, will bring about a rapid cure, often reviving apparently moribund animals.—*Therap. Gaz.* [3], xiii., 766, after *New York Med. Journ.*

Scale Preparations.

T. W. Murphy states that, when making solutions of scale preparations of iron salts for preparing syrups containing iron phosphate, he heats the water to boiling, then pours it into a mortar, and adds the scale phosphate gradually to the water, constantly stirring meanwhile. Solution is said to be effected more quickly in this manner than when the scales are heated with the water. In like manner scale pepsin and bismuth ammonio-citrate are said to be much more readily dissolved if they are not powdered, but added gradually to water contained in a mortar, with continual stirring.—*Merck's Report*, vii., 38.

Dangers of Hair Dye.

Cathelineau calls attention to an unpleasant effect that may follow the use of hair dye containing paraphenylene-diamine, which has lately been used for that purpose. He quotes eighteen cases, in some of which the itching and irritation was so great as to prevent sleep; in others, œdema of the eyelids and eruptive lesions, from a simple erythema localised to the part treated, to a dermatitis involving the head, face, and even the feet. Of the eighteen cases, eleven were attacked immediately after the application of the dye. The author attributes this action to the decomposition of the paraphenylene-diamine, which furnishes quinone, which is known to be very irritating.—*Bullet. Com.*, xxvi., 41.

BACTERIOLOGY FOR PHARMACISTS.*

BY LEO ATKINSON.

(Concluded from page 144.)

Typhoid (Bacillus typhi abdominalis).

The bacillus of typhoid or enteric fever first described by Eberth in 1883 is not killed by drying (thermal death point 55° C.) or exposure to low temperature; said not to form spores. Like most pathogenic organisms, is affected by light. Daylight prevents development, and direct sunlight is fatal in five hours. Its microscopic appearance (Fig. VII.) is not sufficient to distinguish it. It is motile with flagellæ, closely resembles coli communis, an organism always present in the intestines of man and animals.

Typhoid being restricted to humanity, the test for exciting cause cannot be applied to animals. Polluted water is the most general conveyance of typhoid; carbon filters have often been found literally packed with typhoid germs. Filters of any description if not constantly cleansed in an efficient manner are productive of more harm than good. The influence of season is considerable, October being the worst month. In summer months rivers contain fewer organisms, being mainly com-

Fig. VII.—Bacillus typhi abdominalis.

posed of spring waters; at other seasons rivers receive the washings of much cultivated land, and therewith spores of various organisms. Typhoid is often conveyed by milk, probably through want of care in washing out cans and dairy utensils. In many cases of water-borne typhoid the amount of organic matter has been so small that the water supplied has been passed by chemical analysis to be of high purity. This fact, together with recent experiences, clearly indicates the necessity for the more refined processes of bacteriological examination.

Influenza.

Organism first described by Pfeiffer in 1892; found in the blood of patients during the febrile period (Fig. VIII.). Influenza is peculiar from the short period of incubation—twelve to twenty-four hours. It is often accompanied by severe complications; one attack is no protection against another; it is not uncommon to have two or three attacks in one year. In this as in other germ diseases, the best precaution is to keep up the general health and place no reliance on sprinkling or spraying fancy but useless disinfectants.

Anthrax.

Anthrax, or splenic fever, is a very fatal malady and very irregular in its behaviour. It is specially interesting as being the first contagious disease in which the presence of a bacterium was positively determined and its full life-history ascertained. Anthrax was long considered by farmers to be non-infectious; it was attributed to improper feeding and climatic conditions. Obviously, so long as the disease was regarded as the result of unknown conditions, no information could be given of its erratic outbreaks, or could any remedial measures be suggested.

Anthrax is always more prevalent on the Continent. In France, Germany, Russia, and in Siberia it is known as the Siberian plague. The spores are highly resistant, and may get into the soil and remain dormant for years. The spores may also be present in grain or hay imported from an infected district, hence the disease may be started in a locality where it was previously unknown.

The malady is readily communicated to man, especially those who handle carcases, wool, or hides of infected animals. Wool-sorters' disease is anthrax of the lungs, acquired by inhaling spores present in the wool of sheep which have died from anthrax.

Dr. Cruikshank relates the case of a veterinary surgeon being called to see a bullock which had died suddenly in a meadow. A

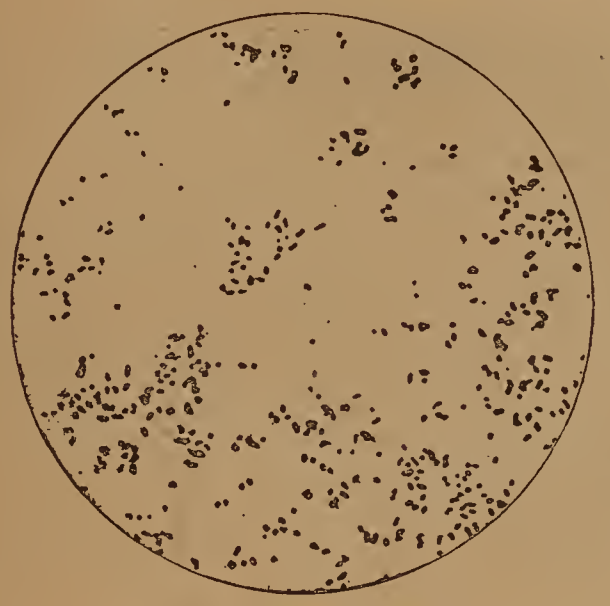

Fig. VIII.—Bacillus of influenza.

post-mortem was made, and the surgeon wiped his hands on some rough grass and then washed them in a stream; the sedgy grass made some insignificant scratches on his fingers, with the result that he was inoculated with the blood of the diseased bullock. Local anthrax followed, two fingers were promptly amputated, and he fortunately recovered.

The following animals are susceptible in the order named:—Mice, guinea-pigs, rabbits, cattle, horses, human beings; whilst Algerian sheep, dogs, and white rats are immune. Grey rats and grey mice are frequently found susceptible to diseases from which white rats and white mice are immune. The introduction of the Algerian breed of sheep has saved France from losing all her flocks by anthrax.

Hydrophobia.

The nature of this organism is still unknown, as, so far, it has not been possible to cultivate it. There is, however, little doubt as to its being a germ disease. The virus is present in the spinal cord and brain. The incubation period is variable, seventy-two days the average. The Pasteur method of inoculation having unquestionably been attended with such excellent results, it is somewhat surprising we have no representative of the Pasteur Institute in this country. Out of 1532 people badly bitten and treated for rabies there were only five deaths. Out of these

* Read at an Evening Meeting of the Pharmaceutical Society on Tuesday, February 8.

patients 122 were bitten by animals proved experimentally to be mad, 949 by animals certified by veterinary surgeons as mad, and 449 suspected of being mad. These facts surely, at least, will show how enormously the danger from hydrophobia is exaggerated in public opinion. There is little question but the disease could be stamped out in England in six months if the muzzling order was general.

Cholera (Spirillum choleræ asiaticæ).

Discovered by Koch in 1884, and known as Koch's comma bacillus The original home of cholera is no doubt the delta of the Ganges and from thence it follows the lines of commerce by ships, railways, caravans, etc. Wherever there is want of proper sanitation and a bad water supply there is a home ready prepared for the reception and propagation of cholera germs. This germ does not form spores and is killed by drying, consequently with suitable precautions this terrible disease may be prevented from becoming epidemic. Cholera was not known in Europe until the beginning of this century. In 1817 there was a violent outbreak in India, thence it spread to the Malay Islands in 1819, to China and Persia in 1821, following on to Russia by slow stages in 1830, and over-

Fig. IX —Tetanus Bacillus.—Spore-bearing organisms with "drumstick" ends

running Poland, Germany, England, and France in 1832. In 1849 it followed the same route, as also in 1853. The three last epidemics—1865, 1873, and 1884—differ in this particular, that they did not follow the Continental route, but came by the Mediterranean Sea, being brought from India to Egypt by the Mecca pilgrims and entering France by way of Marseilles. There are organisms which produce symptoms closely resembling Asiatic cholera, which, nevertheless, are quite distinct. The sudden epidemic in Greenwich is an example. This outbreak lasted three weeks; as there were only 11 deaths out of 245 cases, the virulence was clearly far below that of Asiatic cholera. The comma bacillus could not be detected, but a different organism (*Proteus vulgaris*) was found polluting the water supply. The cause of the outbreak was contaminated water.

Tetanus.

The first pure cultures were obtained by Kitasato in 1889. Tetanus, lockjaw, or convulsions resulting from open wounds, had for some time been considered an infective disease before an organism was separated from which artificial tetanus could be produced. It has long been observed that agricultural labourers, gardeners, or anyone working on the soil were peculiarly liable to lockjaw following any considerable injury. By inoculating mice, rabbits, or other small animals by introducing a small portion of garden earth under the skin, symptoms similar to tetanus were exhibited. From the organs of animals so inoculated pure cultures were obtained. This germ (Fig. IX.) is almost universally distributed over the globe. Soils from different parts of the world have been examined, and from most samples positive results obtained. Soils from Bath, Plymouth, and Manchester produced tetanus, whilst soil from Portsmouth did not. The poisonous property of some soils appears to have been known to savage tribes, who poison their arrows with earth known to produce lockjaw. A kick from a horse may inoculate a man by the earth on its shoe. Stanley gives an interesting account of the pigmy tribes who use arrows from which the slightest scratch produces either tetanus or a violent form of blood poisoning. These arrows are coated with a film of mud containing various septic bacilli, retaining activity for months and sometimes years.

Actinomycosis, or Ray Fungus.

A disease that manifests itself in cattle, commonly known as "Wen," malignant tumour of the tongue, or "wooden tongue." This disease may be acquired by man. The fungus (Fig. X.) is formed in nearly every part and tissue of the body. There is little doubt many deaths from this disease have been attributed to other

Fig. X.—Actinomycosis or ray fungus.

causes; it is, however, comparatively rare in this country, chiefly confined to Norfolk. The spores are highly resistant to heat. Animals suffering from this disease should be destroyed, and in no case used for food.

Erysipelas.

A large number of organisms give rise to the formation of pus on wounded surfaces and after surgical operations. The most general being "Staphylococcus Pyogenes Aureus," "S. P. Albus," and "Streptococcus Pyogenes" (Fig. XI.). These organisms closely resemble each other in microscopical appearance. Streptococcus pyogenes is believed by some observers to be identical with "Streptococcus Erysipelatus," and probably also the general cause of puerperal fever. It is this class of organism which mainly concerns the surgeon and indirectly the pharmacist. It is the knowledge we now possess of these organisms which has rendered possible the wonderful results of modern surgery, constituting the most brilliant application of bacteriology to human preventive medicine. Operations only attempted a few years ago as a last resource are now performed without the slightest hesitation. In former days some operations were scarcely thought possible, or at least it was considered almost certain that fatal results would ensue. At this day these operations are scarcely regarded as serious. We may look upon the rough surgery in the Navy, when

Nelson was making England "Mistress of the seas," as an unconscious example of antiseptic treatment. The freshly amputated stumps were plunged into hot pitch with the object of preventing hæmorrhage. If the patient survived the double shock, recovery was rapid, the coating of pitch effectually excluding all micro-organisms.

The dangers connected with extensive surgical operations are two-fold: First, the shock, and secondly, the complications known as surgical fever, blood-poisoning, gangrene, etc. The first danger has long been provided for by the use of anæsthetics. The second is reduced to a minimum by the Listerian method. The danger from wounds and surgical operations arises, as we now know, from contact with the germ-laden air, dust on instruments, dressings, etc. Sir Joseph (now Lord) Lister's method in its early stages was an appreciative application of observed facts rather than the discovery of a new principle. The subsequent researches of Pasteur, Koch, and others in reality supplied the key to the astounding results accruing from the adoption of surgical methods devised by the clinical genius of Lord Lister. His practical methods of safeguarding open wounds and ruptured tissues from micro-organisms is the actual foundation of antiseptic surgery. The method it is unnecessary to detail, the critical feature is that all operations must be performed with sterilised instruments under the most exacting conditions of cleanliness. Nowadays whenever secondary or inflammatory troubles follow simple operations it is regarded as testimony of surgical carelessness.

Disinfection.

From this brief summary of facts connected with disease germs it must be obvious that popular ideas in regard to disinfection are entirely fallacious, the methods commonly adopted being useless, or worse than useless, by engendering a false sense of security.

Fig. XI.—Streptococcus pyogenes.

The preparation of germicidal solutions, culture media and reagents, antiseptic dressings, and sanitary appliances I claim to be the work of the intelligent pharmacist, without the smallest suspicion of endeavouring to usurp functions not properly pertaining to his legitimate duties. The chemist is popularly regarded as an authority on household disinfection; if he is to be so in reality, surely he should be acquainted with the leading characteristics of disease germs. Our common experience is that whenever a contagious disease breaks out the householder goes to the chemist saying he has been advised to have a little of some disinfectant in two or three saucers distributed on the bedroom floor. The shade of "Sairey Gamp" still hovers round us; one can only suppose those who are responsible for combating contagion on these lines imagine bacteria are like the "Gadarene swine," furious to rush headlong to destruction in these inviting conveniences.

It is useless to try to disinfect the air of a room where a patient is lying, but the floor, walls, ceiling, and furniture can be dealt with. As by far the greater number of bacteria must be on the floor, it is important to destroy them first, and not allow them to be stirred up into the air by those engaged in cleaning operations. The floor should be liberally sprinkled with sawdust mixed with 10 per cent. solution of carbolic acid or mercuric chloride 1 in 1000. A fire should be lighted to cause the air to leave by way of the chimney, and all sweepings and *débris* should be burnt upon the spot. Clearly if any kind of material is swept up, carried through the house, and deposited in the dust-bin, all the conditions for spreading disease are being elaborated. Burning sulphur or using chlorine is probably nearly useless, unless everything has first been made damp by boiling away a quantity of water, and so filling the room with steam. The spraying of rooms with germicidal solutions is more frequently applied abroad, and is a more scientific method, the death of the organism being assured if brought in contact with the disinfecting solution. Hot air does not kill all organisms at any temperature that would not destroy most fabrics. Where steam is not available boiling must be resorted to. Strictly superheated steam has about the same value as hot air for disinfection, but in practice the amount of superheat is rarely sufficient to prevent the steam from being reduced to saturation. Steam that condenses without cooling is saturated steam, such as steam from a kettle or boiler.

Although many disease germs, typhoid, cholera, diphtheria, and others, can certainly be destroyed by exposure to temperatures below 100° C., this does not apply to all, for, as previously stated, dried tuberculous matter has resisted three hours' boiling. Moreover, our present knowledge of other disease-producing

Fig. XII.—Bacilli of malignant œdema.

bacteria is insufficient to justify any definite statement of method that will insure certain disinfection in every case or condition. It is, however, a distinct gain to have some information of the dangers we are exposed to and the best means of resistance. This information, I venture to assert, cannot be too widely disseminated, for we are in a great measure mutually dependent. It is to little purpose any householder may be reasonably careful if his neighbour, either through ignorance or negligence, disregards simple sanitary precautions. Every epidemic bringing death and disaster in its train is a forcible object lesson, demonstrating the desirability for popular information in regard to some of the facts bacteriology has established.

THE DETERMINATION OF SUGAR IN URINE.*

BY ARTHUR MCKELLAR,
Pharmaceutical Chemist.

The analysis of urine, particularly with reference to the presence of sugar and albumin, is a subject which has engaged the attention of the medical profession for a long time, and one can hardly pick up a medical or chemical annual without coming across some newly-devised test for the presence of the two bodies mentioned.

Unfortunately, the bulk of the medical profession possess but a slight knowledge of the necessary tests, or perform them in such a crude manner, that we, as chemists, frequently are called upon to test samples of urine for the medical adviser's better information.

In the case of sugary or diabetic urine, the first test that occurs to the mind is Fehling's, probably the most exact we are likely to have when carefully used, but with drawbacks that are troublesome to the pharmacist, who has little time to spare for what is generally unremunerative work. The test I desire to bring under notice is a modification of Fehling's, particularly suitable for shop use, and for all purposes quite as reliable.

Before describing it, I will briefly recapitulate the processes most in favour, and for this purpose have drawn somewhat upon Dr. Robert's work "On Urinary and Renal Diseases."

Diabetic urine is usually of a very bright clear "lemonady" appearance with a specific gravity varying with the amount of solids present and usually very high. (The highest I have personally tested was 1·049, and contained over 60 grs. of glucose to the ounce.)

For testing purposes such urine may be regarded as a solution of grape sugar in water, the other constituents having little, if any, interfering effect upon the determination. Each method has its particular adherents. Dr. Johnson, an eminent authority, believes strongly in colourometric analysis. The urine is boiled with picric acid, which, by action upon the glucose, forms picramic acid, an intense red solution resulting. By diluting this solution with water until the colour corresponds with that of a standard colour and making appropriate calculation, the amount of sugar per ounce is got at. I have never found this satisfactory somehow; it is difficult for the eye to be certain of the identity of the two colours.

The Fermentation Process.—Yeast is added to the urine and set aside in a warm place for twenty-four hours. A similar quantity of urine, but without the yeast, is placed under the same conditions, and at the expiry of the time the specific gravities of the two liquids are compared. The yeast splits up the glucose into alcohol and carbonic acid gas, thus lowering the specific gravity of the solution; every degree thus lost in comparison with the blank solution corresponds to one grain of sugar per ounce. Owing to the CO_2 being dissolved to some extent by the liquid it is generated in, the fermentation test is unreliable for small quantities of glucose, besides, it takes too long to arrive at the result.

Moore's Test.—About equal proportions of urine and liquor potassæ are boiled together, producing a discoloration varying from a slight brown to a jet black, according to the amount of sugar present. In experienced hands it is valuable as a rough indication of the amount to be looked for in the quantitative determination. But it is also subject to error. It is uncertain for small quantities, say anything under two grains to the ounce, and should the liquor potassæ contain lead—a not infrequent occurrence—or with certain albuminous urines, particularly if blood or epithelial matter be present, this test will show a marked darkening of colour, although the specimen may be quite free from saccharine matter.

The use of Moore's test, therefore, would appear to be confined to the detection of large quantities of sugar.

Trommer's test is perhaps better known. A solution of sulphate of copper and the same amount of liquor potassæ is boiled in a test-tube. To the boiling liquid is added a small quantity of the suspected urine, when, if sugar be present, red suboxide of copper is thrown down. Should the amount of sugar be small the result is not so certain.

The liquid at first assumes an opaque or milky-green colour, just as if a drop of milk had fallen into the tube, very gradually changing from five to twenty minutes to a bright yellow deposit, an appearance, says Dr. Roberts, quite characteristic of sugar. This test allows of the detection of sugar down to about one-quarter grain per ounce, below which it ceases to have any pathological signification. Fehling's solution it is not necessary to dwell upon, being familiar to all of us. Pavy's is a modification of Fehling's, and consists in the addition of ammonia, whereby the produced oxide of copper is dissolved up as fast as it is made, thus giving a sharper end reaction than Fehling's, shown by the total disappearance of the blue colour, and leaving a clear solution when reaction is completed.

I now desire to bring under your notice a test as used successfully in my place of business, and which has advantages over those already mentioned, both for utility and dispatch. Originally devised by my predecessor, it is a combination of Trommer's and Pavy's tests, both in one. I have used it over a considerable period of time, testing its reliability in a variety of manners, and find it answer admirably.

It consists of a solution of copper sulphate in water and glycerin. The exact formula is :—

Pure Sulphate of Copper.....	90½ grains.
Distilled Water	2 ozs., 225 grains.
Glycerin	4 ozs. weight.

Each ½ ounce will decompose ¾ grain sugar.

Pure grape sugar was obtained, rendered perfectly anhydrous, and used as a standardising agent in the preparation of this "copper sugar test." Add to this the great convenience of having a solution always ready, it keeps perfectly in blue-stoppered bottles, and I think you will find it very handy for shop use.

My method in testing urine for sugar, both qualitative and quantitative, is as follows :—

Having noted the specific gravity as well as the presence or absence of albumin, I boil equal amounts of the test and of liquor potassæ together in a test-tube, and while boiling run in a little of the suspected urine, practically Trommer's test, when, if sugar is present, it will be indicated in the manner described under Trommer's test.

If present in any quantity the amount of darkening produced when the specimen is boiled with liquor potassæ is observed as a rough indication of the probable quantity of sugar to expect in the quantitative determination. So far the usual course has been followed.

I now take half an ounce of the glycerin solution of copper and carefully rinse it with a little water into a 4-oz. Florence flask, then add an equal bulk of liquor potassæ, and finally a large excess of liquid ammonia; the whole is then boiled. A small quantity of the urine is appropriately diluted with a definite proportion of water, according to its supposed strength, say, 1 part urine to 2 parts of water, and with the aid of a thin glass stirring rod run in, a few drops at a time, into the boiling liquid. When reaction is complete the blue colour has entirely disappeared and the liquid has become clear. The actual amount of urine used

* Read at a meeting of the Pharmaceutical Society in Edinburgh, on Wednesday, February 16.

in this operation will have contained three-quarters of a grain of grape sugar, and the result calculated to grains per ounce, as it is usually given. The whole operation need not take more than a couple of minutes. The vapour of the boiling ammoniacal liquor serves to keep off the atmospheric influence on the copper oxide, but on the removal of the source of heat oxygen is absorbed from the air and the blue colour gradually returns as the liquid cools.

I cannot claim any originality for this method, but from long experience of its use am fully convinced of its efficiency. Its advantages briefly put are :—

1. A practically permanent sugar test always ready for use.
2. The end reaction is sharp.
3. No special apparatus required beyond what is always in the drug shop.

MICHAEL CONROY—AN APPRECIATION.*

Among the results of advancing years, one of the most sorrowful is the loss of friends. Other gaps may be filled, other losses retrieved, but the opportunities for forming new friendships are not likely to recur. The new generation springing up around us has new training and new aims. Their sympathies are with men of their own time, and if they do not look upon their elders as veterans who "lag superfluous on the stage," they naturally consort with their comrades of their own age. Such thoughts as these filled my mind as I attended the funeral of one with whom my intercourse had extended over many years, and who might have reasonably expected to have rather followed me to my resting place. When I was asked to say a few words to you this evening, such thoughts as I have mentioned returned to me with redoubled force, as I remembered how recently a similar task was laid upon me, when I endeavoured to bring before you a sketch of the work of another of your members, who, like Mr. Conroy, was my junior, and who, like him, was cut down when many years of life and work might have been hoped for. My acquaintance with Mr. Conroy was largely confined to his public life. Various causes prevented me from enjoying the private relations that I had with Mr. Mason, but so far as I had the privilege of knowing him, none but pleasant memories exist. At all times I found him ready to impart any information with regard to the wide field of practical pharmaceutical chemistry of which he possessed such extensive knowledge, and especially in the difficult branch of that science which deals with the analysis of organic compounds. Mr. Conroy also added to our knowledge. He devised new methods of analysis, improved processes of manufacture, and condensed the stray fragments of information on various subjects into *resumés*, and papers, in which the work of many labourers in the field of science was brought together so as to be available for practical use. Owing to the kindness of Mr. Wyatt I am able to bring before you the titles of these contributions of Mr. Conroy to the common fund of pharmaceutical chemistry. Taking them in the order which I have already named I find the following :—

Analysis.

1881, "Test for the Purity of Olive Oil."
1883, "Scammony, a New Adulterant."
1884, "The Assay of Opium" (adopted in the B.P., 1885).
1888, "Lard. Its Adulteration with Cotton Seed Oil and Detection thereof."
1889, "Castor-Oil Adulteration."
1891, "A Note on Proposed Method of Standardising the Extract of Nux Vomica and Opium."
1893, "Note on the Sp. Gr. of Sandalwood Oil."
1897, "Adulterated Copaiba."
1897, "The Purity of Oil of Rose."

Processes.

1879, "An Improved Formula of Liquid Extract of Cinchona."
1886, "Linimentum Terebinthinæ."
1891, "Mistura Olei Ricini."
1891, "A Note on Extractum Euonymi Siccum."
1892, "Collodium Belladonnæ."
1896, "Extract of Malt."

General Papers.

1879, "Fucus Vesiculosus. *Résumé* of History."
1883, "Sesame Oil. Report on its Suitability for Pharmaceutical Purposes."
1895, "Leaflets and Leaf Stalks of Jaborandi."

Eighteen in all, representing an amount of work which only those who have endeavoured to work out a new process of analysis or of manufacture can fully appreciate. Many of these were communicated to our Society, and on few subjects brought before us did Mr. Conroy fail to throw fresh light.

Such was the member whom we have lost, and to us all his example remains as an incitement to work, and also to impart the results of that work. With many such members what a Society would ours be. Let us rejoice that the Liverpool Chemists' Association has never lacked such men, and I cannot better conclude than by an earnest exhortation to all our members, and especially to those endowed with the inestimable blessing of youth, to resolve that the future shall be a fitting sequel to the past, and that whilst we cherish the memory of those who have gone, that the work shall be taken up and carried on in the same spirit, knowing that untrodden continents of research are waiting for ardent explorers.

Mr. Conroy, so far as I can learn, owed most of his knowledge to his own efforts and reading. In the present day there is far too much reliance on machinery, but after all, an ardent student will learn more, and certainly do more, by remembering that unless there be the receptive power, and that be hard worked, the whole resources of a university may be employed in vain. With that power and hard work limited means will do wonders. I do not depreciate the advantages of well-fitted laboratories and every aid that ingenuity can suggest, but I do carnestly warn the student against trusting to them.

* Read by Mr. Edward Davies, F.I.C., F.C.S., at a meeting of the Liverpool Chemists' Association on February 10.

MEETINGS OF SCIENTIFIC SOCIETIES

LINNEAN SOCIETY OF LONDON.

At a meeting held on February 3, Dr. A. Günther, F.R.S,, President, in the chair, Professor Stewart, F.R.S., exhibited (1) specimens illustrative of the articulation between the upper and lower jaw of a skate, *Raia batis*, Linn., upon which remarks were made by Professor Howes and Mr. Holt; and (2) sections of *Puccinia graminis* showing the form of the teleutospores and æcidiospores, upon which some observations were made by Dr. D. H. Scott confirmatory of the exhibitor's views.—Mr. Thomas Christy exhibited a portion of an iron chain, through the links of which a Virginian creeper had grown, and had become naturally intertwined.—Mr. G. C. Crick then read a paper on

The Muscular Attachment of the Animal to its Shell in some Fossil Cephalopoda (Ammonoidea).

Having first briefly noticed previous descriptions and figures of what were believed to be impressions of the muscular attachment of the Ammonoid animal to its shell, the author pointed out the form and position of the "shell-muscles," and of the "annulus" in the recent *Nautilus*, and indicated the form of the impression of these

structures as seen upon an artificial internal cast of its body chamber for comparison with the fossil forms, in nearly all of which any indication of the muscular attachment there may be is similarly preserved upon the internal cast of that chamber. After describing the character of the "muscle scars" in an example of *Crioceras*, in which they were both very perfectly preserved, and the position of the "annulus" as clearly shown in an Ammonite from the Oxford clay, the author described the corresponding impressions in the various forms assumed by the Ammonoids, viz., *Baculites*, *Hamites*, *Ancyloceras*, *Crioceras*, *Macroscaphites*, *Scaphites*, *Turrilites*, *Heteroceras*, and in several Ammonites, as well as in *Clymenia* and in some of the Goniatites.—Mr. W. C. Worsdell next read a paper on

The Comparative Anatomy of Certain Genera of the Cycadaceæ.

The chief points touched upon were:—In *Cycas*, the conduplicate vernation and arrangement of the bundles in the fleshy hypogæal cotyledons, the secondary extrafascicular rings, the concentric cortical strands, and, in one species, the peculiar concentric structure of the leaf-traces, in the stem, and in the hypocotyl some curious concentric strands running obliquely out from the cylinder, and, in a small seedling, the secondary vascular cylinders lying outside the normal stele; in the seedling of *Stangeria paradoxa* the small primary concentric bundles in the stalk common to the two cotyledons, which both higher up and lower down become collateral, and in the adult stem the occurrence of a secondary concentric strand in the periphery of the cortex, which appeared to be the remnant of a once normal system of nude strands; and in *Ceratozamia mexicana* the vertical succession through the pith of a large stem of effete peduncular cylinders, the peduncles which successively terminate the stem being in turn pushed to one side and their basal region enclosed by a lateral shoot which continues the main vegetative axis. In conclusion, the author endeavoured to show that certain characters in the vegetative structure of these plants showed them to be nearly allied to, or descended from, certain fossil fern-like plants, notably Medulloseæ, and these characters were: the extrafascicular zones in the stem of *Cycas*, which really represent the outer portion of the flattened concentric strands in the stem of the Medulloseæ, the inner portion of which has died out; and all the various concentric structures above-mentioned. For the type of structure prevailing in the ancestors of the Cycads would have been the concentric, whereas in their descendants it is the collateral. The significant outcome of this study is to form, in the vegetative characters of these plants, a connecting-link, over and above that already afforded by the discovery of spermatozoids in *Cycas* and *Ginkgo*, between "flowering" and "flowerless" plants.

ROYAL INSTITUTION.

At a meeting held on Friday, February 11, Dr. J. H. Gladstone lectured on

The Metals Used by the Great Nations of Antiquity.

At the beginning of the present century, he said, little was known of the metals used by the ancients, except through the classic poets and Jewish history. Since then excavations have been made that have added much to our knowledge of the subject. Languages previously unknown have been brought to light, inscriptions telling the histories of extinct races have become explained, and, what is more important, the articles themselves have been preserved. Many have taken part in the investigations; some have followed architecture, others sculpture, and others painting, but what had interested the lecturer most was the metals in use in these almost prehistoric times. The material for discussion was very great, and it would be difficult to know what to take up and what to leave out in an hour's lecture. The countries dealt with were those lying around the East of the Mediterranean—Egypt, Assyria, Palestine, and Greece being the most important—during the time from the reign of the first Pharaoh, Menes, about 4400 B.C., down to Alexander the Great. Dealing with these four in order, the lecturer first called the attention of the audience to a diagram of the hieroglyphic inscriptions on a tablet of Seneferu, which dates from nearly 3800 B.C. The tablet represents the conquest of the copper mines at Wady Magharah, and in it was represented a battle-axe, corresponding closely with a specimen on the lecture table. Explaining the hieroglyphics, the lecturer pointed out that the symbol of an axe-head represented copper or bronze. It followed, therefore, that hieroglyphics were invented before this. Since beginning the preparation of the lecture, Dr. Gladstone had fortunately been supplied with history going back to about 700 years before this. At Nagada a large tomb had been discovered, probably that of the Pharaoh Menes, containing besides objects of ivory and precious stones, two articles of copper, and one of gold. The French chemist, Berthelot, who has interested himself in this subject, and whose name is familiar in political as well as scientific circles, has analysed these, and finds the copper to be free from arsenic and tin. These articles must take the place of honour as being the oldest pieces of metal belonging to a date known with certainty, but a harpoon for taking the fishes of the Nile found at Nagada, if not older, must belong to a period very little later. The gold of the Egyptians of this period contains silver, and was probably obtained from Asia Minor, but later they obtained gold from Nubia. The lecture was plentifully illustrated with lantern slides. Some of these were now exhibited, showing drawings taken from the tombs, in which various operations in metallic industry were depicted. One showed the weighing of quantities while a scribe wrote down the amounts. In another a man was seen using a mouth blow-pipe with a furnace, while a third represented a bazaar, where one party was bargaining for a necklace and another for some fish-hooks. Some gold and jewelled necklaces belonging to a period about 1700 B.C. are stated to be scarcely matched in fineness of work at the present day. Copper was employed largely for implements, at this time replacing the older flints. It, of course, had the disadvantage in the pure state of being soft, and it is interesting to note the advances made in hardening it. Hammering and alloying with arsenic or tin were employed. It is not known where this tin was obtained, but it is more probable that it came from the neighbourhood of Etruria than from the British Isles. Tin can at once be detected in the metals by the muddy solution obtained when they are touched with nitric acid. Zinc was not used by the Egyptians, but its use in making brass is first found in the writings of Aristotle. A number of interesting specimens were shown, most of the copper articles being deeply penetrated by a peculiar corrosion, forming the red suboxide. Among them were a knife that had been moulded to shape but left unfinished, a knife covered with silver, and one that had lost its wooden handle but retained the ivory collar. A steelyard and some razors were also preserved. A spear-head, lent by Sir John Evans, bore an inscription showing that its date was about 2300 B.C. Lead was known by the Egyptians, but found no employment. A ring of tin and beads of antimony showed that these metals were also known. The latter was also known in Assyria, but was forgotten and re-discovered in later times. The question as to when iron was first known is a difficult one, but there is no evidence of its use till the time of Rameses II. The lecturer then dealt with Assyria. The Assyrians, like the Egyptians, had a fondness for writing down their history. Among some copper figures at Tello, belonging to a date of 2700 B.C., is a colossal sphere. At Tel-el-Sifr, 1500 B.C., was found a whole coppersmith's shop. In the earlier times of this empire they did not value metals greatly, but later, when they made such terrible campaigns against their neighbours, they prized them highly. A number of illustrations were thrown on the screen showing the tribute brought to Shalmaneser II. Vessels and goblets of silver and gold appeared to be abundant. One of the gates of this king's palace was built of wood bound up with brass. Passing on to Palestine, Dr. Gladstone stated that we first hear of it when in the hands of the Hittites. Their writings cannot yet be read, but there exists plenty of them, and probably they will soon be understood. The first date known accurately is that of the battle of Megiddo, about 1600 B.C., and an account of the tribute paid on that occasion remains. Exodus never mentions iron, while it does gold and silver often; if iron had been known at that time, it would almost certainly have been referred to in the instructions for building the tabernacle. At a later time the Hebrews were amazed at the wealth of some of their neighbours because they possessed iron. For want of time the account of Greece was hurriedly passed over, reference being made to Homer's descriptions, among which was that of Achilles' shield, "which was of gold, silver, copper, and tin, not alloyed, but hammered in layers at the forge of Vulcan." Iron appears only as a precious metal. Lantern-slides were used to illustrate the articles possessed, among which were vessels of various kinds in copper, bronze, silver, and gold, also ornaments, and a remarkable figure of a heifer's head in silver with gilded horns that tallies closely with the description given by Homer. Some cups of gold bore well-executed designs of quiet pastoral scenes contrasted with pictures of the violent behaviour

of wild animals. In conclusion it was pointed out what inference could be drawn from these facts as to the intercourse between the nations of that time. Copper was obtained from Arabia and from Cyprus, which island gave its name to the metal in many languages. Gold came from Asia Minor and Nubia, silver from Spain, lead from Sardinia. The Phœnician merchants travelled not only by sea but also by land, visiting Scandinavia, India, and Britain, bartering and introducing tools. They did not visit Britain, however, in the copper period, but only after bronze became established.

THE BIRKBECK INSTITUTION.

The Birkbeck students' annual conversazione was held at the Birkbeck Institution, Bream's Buildings, Chancery Lane, E.C., on Saturday, February 12, when the Principal, Mr. G. Armitage-Smith, supported by the Council, had the pleasure of greeting about 1500 guests, the company consisting of the students and their friends. After the reception the guests dispersed to various parts of the building, where numerous events were progressing at one and the same time. The ladies found congenial entertainment in the theatre and institute library, where, in addition to an excellent concert, musical selections were given by the Red Viennese Band and a one-act comedy, "The Guinea Stamp," was enacted. For visitors more or less scientifically inclined the programme arranged was of a very varied and interesting character, the chemical laboratories being the scene of numerous experiments, the principles of dyeing and various methods of purifying chemicals being demonstrated, while in the lecture theatre experimental lectures were delivered by well-known scientists. In the biological and geological laboratories, rocks, minerals, fossils, plants, animals, etc., were exhibited, and demonstrations and lantern lectures were given during the evening. Then there were displays of animated photographs, art exhibitions, Röntgen ray demonstrations, and the latest development of colour photography was illustrated by means of the "photochromoscope." To enable visitors to hear a variety of performances taking place in London the electrophone was connected with places of amusement, while another source of attraction was the graphophone. Altogether the conversazione was a brilliant success, the events being instructive, interesting, and amusing. In various parts of the building refreshment buffets had been arranged, the excellent catering of Messrs. J. Lyons and Co. contributing not a little to the enjoyment of the guests.

PHARMACEUTICAL SOCIETY.

EVENING MEETING IN EDINBURGH.

The fourth evening meeting of the present session was held in the Society's House, 36, York Place, Edinburgh, on Wednesday, February 16, 1898, at 8 30. Mr. J. Laidlaw Ewing in the chair.

The minutes of last meeting were read and approved.

Apologies for absence were intimated from Messrs. C. F. Henry and George Coull.

The first paper read was by Mr. Arthur McKellar on

The Quantitative Estimation of Sugar in Urine,

which appears in full on page 168.

Mr. Peter Boa said his own experience was that in Edinburgh they did not get very much of this sort of work to do. The Edinburgh School of Medicine taught their graduates to do this sort of work for themselves. It did sometimes crop up, but very seldom, and not so often as to lead him at any rate to be very particular as to the method he adopted in testing. Mr. McKellar's process seemed to be a very reasonable one, and he had no doubt it would be quite satisfactory. If he found his practice in this line increasing he dared say he would give his attention to Mr. McKellar's suggestion. They were very glad to see Mr. McKellar there, and he hoped they would have more such papers from his district.

Mr. George Lunan said he could corroborate what Mr. Boa had said about the number of samples they got to do in Edinburgh. In Liverpool they had occasionally half a dozen samples a day. He thought it must be that the younger generation of doctors was being so well taught to examine urine that chemists did not get any of that work to do. At all events, he thought it devolved upon them to be able to do it when they were called upon. He had occasionally had a diabetic patient bring urine once a week to him to test. Two years ago his attention was directed to Gerard's method for exactly determining glucose in urine, and again, latterly, he had used that process and had found it very satisfactory. Like Pavy's method, the end reaction was a colourless solution, and there was no free ammonia. Exception might be taken to the use of potassium cyanide. With regard to to Mr. McKellar's criticism of Johnson's picric acid colour test, he had used it ten years ago, and found it worked very well. Mr. McKellar's process was probably an improvement on them all, since no special apparatus was required as in Pavy's process.

Mr. Duncan said he had some years ago to examine a urine from a patient who had been rejected by an insurance company on the testimony of a Glasgow doctor, who reported that his urine was "loaded" with glucose. On examination he found no glucose present. The doctor had used an old vessel with Fehling's solution. Mr. McKellar used a glass rod for running in the urine. He should have thought a burette would have answered the purpose better. One must be working in an atmosphere of ammonia during the process, and he would think that objectionable.

Mr. McDiarmid said he had considerable experience in testing urine; his object was to find a test that would act quickly and sharply, and he came to the conclusion that Sir George Johnson's picric acid test was practically as successful as any mentioned, and he did not agree with the remark that it was unsatisfactory. It had been shown by his son that urine perfectly free from glucose would give a colour reaction due perhaps to creatinine, but this did not amount to more than a half or five-sixths of a grain of sugar per ounce, and that might be ignored. Fehling's test was too tedious and required an expert eye to know when the reaction was finished; his experience of doctors agreed with Mr. Duncan's. A west-end physician was alarmed to find his urine strongly diabetic by his own testing. On examining a sample for him in his presence he found it free of glucose, much to the delight of the physician, who said he would now have a drink of beer, from which and many other things he had been rigidly abstaining for years. He died shortly afterwards, but whether through a reversion to his normal diet he could not say. He asked Mr. McKellar what advantage his process had over Pavy's, in which the ammonia was got rid of by passing it into a solution. He agreed with the remark that the use of a burette would be an improvement.

Mr. J. Rutherford Hill said it was important for pharmacists to be practically familiar with work of this kind. As education increased the public would pay more attention to the laws of health and to the treatment and symptoms of disease, and they would naturally turn to the pharmacist as the man best fitted to do work of this kind. He knew of several instances where this was already done, and constituted a very remunerative part of a pharmacist's work. Mr. McKellar's test seemed identical with that recommended by Purdy in his book on uranalysis.

Mr. Allen said Purdy's process was open to grave objections, and he asked Mr. McKellar if he had tested his process against others. It would improve Mr. McKellar's process to conduct the ammonia fumes into water, as might easily be done by a simply adjusted apparatus. With regard to the time required for an estimation, he thought two minutes must be too short, as in Pavy's process the reaction was slow towards the end. He agreed with Mr. Lunan that Gerard's process was bound to supersede all others. Mr. McKellar's process might be sufficient for ordinary diagnosis, but would be only roughly approximate in its indication of actual percentage of sugar.

Mr. McKellar, in reply, said that two minutes to do the process was perhaps a slight exaggeration. Certainly a burette would be an advantage, but his object in reading the paper was to give a method which could be used in an average retail druggist's shop with the apparatus always at hand. He had not tried Gerard's method, but would take an early opportunity of doing so. As to the ammonia fumes he kept the solutions at a level slightly above his nose, and experienced no greater inconvenience than in the case of filling ammonia bottles. With regard to the advantage of his solution over Pavy's, his reply was that it was more readily made by the average pharmacist. He had tried his process against others, using anhydrous grape sugar, and had found that it was accurate. It had been said that glycosuric acid had a slight effect in reducing the copper. In Glasgow some of them had a fair amount of this work to do, which, unfortunately, was not paid for; he had, however, frequent applications from foreigners, who paid a fee. It appeared to be a specialty with pharmacists generally on the Continent.

Mr. Boa then read a paper on

Fluid Extract of Liquorice.

In this paper, which will appear in full in next week's Journal, Mr. Boa described experiments he had undertaken with the view of satisfying himself that the present official process for preparing the extract is as good as might be. He concludes that water is the best mentruum for extracting the sweetness of liquorice. If percolation of a rougher powder were substituted for double maceration and expression of the root in No. 20 powder as directed in the official formula, it would make the process less messy. Ammonia might be judiciously employed in the way he had indicated to prevent loss of sweetness, and a slight increase in the spirit would make sure work of preservation and produce a cleaner extract.

The Chairman said he always understood that it was to the use of ammonia that the sweetness of liquorice extract was due. Mr. Boa's paper would probably lead Professor Remington to take up the cudgels on behalf of his view.

Mr. Lunan said he did not agree with Mr. Boa that a cold water extract of liquorice with the epidermis removed gave an acid reaction. He had tried it repeatedly with English-grown liquorice. He was surprised to find that Mr. Boa recommended cold water as the best menstruum for exhausting liquorice. He had tried a few experiments, but would not venture to contradict, though he accepted Mr. Boa's statement with some reserve.

Mr. Duncan said he thought Mr. Boa had hit the nail on the head with regard to the use of ammonia. He thought decorticated root should be used. In some experiments conducted by Mr. Burell in 1875, results similar to Mr. Boa's were obtained. He found the sweetest extract was obtained from solazzi juice, the mistake in using ammonia was adding excess. Glycyrrhizin might behave like saccharine, where a trace of alkali increased the sweetness by increasing the solubility.

Mr. Rutherford Hill said he had had an opportunity of examining the samples referred to, and he thought Mr. Boa had done much to prove that Remington's recommendation of ammonia was fallacious ; the ammonia percolate was more deeply coloured, as might be expected, but it was less sweet and did not possess the peculiar earthy liquorice flavour so characteristic of the aqueous percolate.

Mr. Boa, in reply, said he had there a sample of the American fluid extract, which was very deeply coloured, and if they tasted it they would find it far from palatable. As to the question of using decorticated root, his feeling was that such an extract was not an extract of liquorice root, but merely a sweetish solution, the extract was used for disguising the taste of medicines, and one wanted the whole of the root, including the cortical portion. He thought there was some anæsthetic effect got from such an extract. The extract from decorticated root did not mask the taste any better than syrup would. He believed the whole of the commercial extract was made from unpeeled root, and that, therefore, seemed to be what was wanted. He exhibited a sample of fluid extract obtained from a historic house. It was intensely dark in colour, and seemed to be made from solazzi juice.

On the motion of the Chairman, votes of thanks were awarded to the authors, and the meeting closed.

PARLIAMENTARY NOTES.

Food Products Adulteration is evidently to occupy a prominent position at Westminster this session. The House is being inundated by petitions praying for an amendment of the law, and the resources of the "table" to find room for these documents must by this time be almost exhausted. The most striking feature about the petitions is that they nearly all emanate from villages of which the average Londoner has only the remotest geographical conception. It comes almost as a revelation to find that the sparsely inhabited provincial districts of England are so keenly interested in the report of the Food Products Committee. A cynically disposed person might be tempted to suggest that the absence of petitions from large towns and cities is a proof that public opinion is more easily organised in villages. Be this as it may, there is something approaching a "boom" in adulteration just now. Mr. Kearley, not satisfied with the qualified reference to a Food and Drugs Amendment Bill in the Queen's speech, comes forward with an amendment to the Address expressing regret that no assurance is given that legislation on this important subject is in contemplation this session. The object of the Amendment is, of course, to invite a ministerial declaration of faith on the subject. Chemists will await the result with as much anxiety at least as the inhabitants of those advanced villages which have embodied their hopes and fears in formal petitions. Local pharmaceutical associations might profitably discuss the desirability of expressing their views in like manner, for it would be a thousand pities to allow Members to suppose that the food side of the question is the only one needing attention.

Another Interesting Amendment to the Address is that bearing the name of Mr. Cawley (Prestwich), calling attention to the prejudicial operation of the Patent Laws which permit foreigners to obtain patents in this country for inventions they cannot patent in their own. Mr. Cawley is interested in the chemical and bleeching industries, and views with alarm the tactics of the Teuton in taking advantage of the Patent Office to secure a practical monopoly for his goods. It is true that a bad patent may be resisted and set aside, but the process is at best expensive, almost always protracted, and never free from uncertainty.

Bills rained down on the House on Friday in a perfect shower, for members were anxious to take advantage of whatever luck the ballot box had given them. Sir J. Lubbock secured sixty-second place in the scramble and promptly introduced last year's Early Closing Bill, which has been accorded Tuesday 22nd for its second reading. Dr. Farquharson and Mr. Kearley are among the supporters of the measure. The Shops Bill in the joint charge of Dilke, Burns, and Davitt, also made its appearance on Friday, and is equally tabled for its second appearance on the 22nd. Mr. J. B. Balfour's Midwives Registration is fixed for May 11 ; that is a day or two before the Whitsun recess ! Street Noises are to have a chance of consideration on May 25, and the Registration and Inspection of Boilers, together with the Certification of persons in charge thereof, are respectively allotted March 2 and May 11 for second reading. Mr. Faithfull Begg (Glasgow, St. Rollox) has rushed in where the Lords have for two sessions been fearful of treading, and has introduced to the Commons a Bill to amend the Companies Acts. It is down for May 4. In view of its interest we will next week give a *résumé* of its provisions.

Drawback Threatened.—The Commission appointed to inquire into the woeful condition of the British West Indies have made a very conscientious report, and have suggested the application of various species of financial tonics to restore the vanished prosperity of the islands. But the very smartest recommendation is that which proposes a reduction or even abolition of the present differential duty of fourpence a gallon levied on foreign spirits, coupled with a withdrawal of the existing drawback allowance on exported British spirits. The North British distillers of "mountain" and other dew have taken time by the forelock, and have already told the Chancellor of the Exchequer that there is another side to the question.

The Pharmacy Bill is overdue, but is expected to be sighted in Parliament next week. The President and Secretary of the Society are familiar figures to the lobby attendants just now, for they are almost nightly engaged in explaining to more or less indifferent Members of Parliament the innocent character of the Bill. The Council and its representative officers have undoubtedly given evidence of their desire to effect the tardy measure of justice to Associates embodied in the draft Bill. All that is wanted to carry it through is the earnest co-operation of those directly concerned.

Patents and Proprietaries were brought within the pale of practical politics on Wednesday, when Mr. Wootton Isaacson, coal and iron merchant, and Conservative Member for the Stepney division of the Tower Hamlets, brought in a Bill to amend the law relating to patent and proprietary chemical compounds. Is it another Pharmacy Acts Amendment Bill ?

The Companies Bill, which is, word for word, the same Bill as that shelved last session, has passed its second reading in the House of Lords, and is to be again considered by the re-constituted Select Committee. The Government intend to carry the Bill through this session if possible, but *nous verrons*.

THE WEAK SPOT IN PHARMACY.

That insufficient elementary education is one of the chief evils afflicting pharmacy in this country has long been recognised, but as if to emphasise the fact, the recently published report of the Board of Examiners in Scotland on the Minor examination indicates deficiencies in the candidates who present themselves for examination across the border, that would seem in great measure to have their origin in imperfect early education. Doubtless unsatisfactory shop training and lack of system in the later course of study must also be taken into account; but there is good reason to believe that both those factors would lose much of their force if the primary education of candidates for legal qualification in pharmacy were all that it ought to be. And though the Scottish results at the First examination come out generally rather better than those for England and Wales, it would appear from the Examiner's report that the amendment of the Bye-law affecting this matter has been accomplished none too soon According to the Registrar's Report recently published, the preliminary weeding-out process resulted last year in the elimination of more than fifty-two per cent. of those whose inclinations or necessities led them to look with favour upon the idea of adopting pharmacy as a profession. Since however, during the same period, the percentage of rejections at the qualifying examination was not far short of seventy per cent., it appears obvious that the initial weeding out process might be further encouraged with advantage to all concerned. If a high standard is maintained in the Preliminary examination, more particularly as regards the percentage of marks that shall be held to justify a pass, the mental calibre of those who present themselves for the subsequent test cannot fail to be sensibly improved and, as a necessary corollary, better results will be achieved, if for no other reason than that a well-educated youth may be expected to make better use of his opportunities during the qualifying period than one who has not enjoyed the same advantages during his earlier years. By extending the syllabus, which is practically what has been done by deciding to abolish the First examination now conducted by the Pharmaceutical Society, probably still more can be effected in the same direction, so long as a high standard of efficiency in each individual subject is maintained in the examinations, one or other of which must be passed instead. It is fortunate that the means are now available for putting this matter to the test of experience, and within the next five or six years it may be anticipated that the British examiners and Government Visitors will be able to present reports that will fully justify the wisdom of the change so recently effected.

It is much to be regretted that in the sister isle, where—according to Sir George Duffey's report for 1897—similar weakness prevails, equally effective measures are not being taken to remove the reproach of insufficient elementary education. If we consider simply the actual percentage of rejections (46·3) at the Irish Preliminary examination during 1897, the comparison with Great Britain is not in favour of the latter, and the more especially so since the existing syllabus of the Irish examination covers much more ground than ours. But the standard of attainment must also be taken into consideration, and when the low percentage of marks required to secure a pass in Ireland is allowed for, the apparently greater sufficiency of the Irish over the British test vanishes completely. In Sir George Duffey's opinion "the standard of answering" that is required from a candidate to pass in the optional subjects—Elementary Physics and Mechanics, the rudiments of Botany, and a Modern Language—as well as in Latin, Algebra, Botany, and Geometry, is much too low. That tends, he observes, to induce candidates to endeavour "to scrape through with a most superficial acquaintance with the subject, and is prejudicial to the character of the examination as well as to honest education and study. When the maximum mark for a subject is only ten, there are few examiners, perhaps, who will not give a candidate two for even very inferior answering." Similar remarks are said to apply equally to Latin, a subject in which profound ignorance is constantly exhibited, and in which the pass standard is only 20 per cent. Moreover, the marking arrangements are such that though a candidate may be so ignorant of Latin that he cannot parse a few simple words in the language—as evidenced by the examiner marking him a cipher—yet because he gets marks for struggling through a piece of easy translation, that are equivalent to 20 per cent. in the whole subject, he is passed in that subject. Several striking examples of this kind are quoted in the Visitor's Report, and he remarks that when the Preliminary examination in Latin can be passed on such marks, the ignorance of the language exhibited by many of the candidates in attempting to read and translate prescriptions at the qualifying examination is not to be wondered at. There is a 50 per cent. standard in English, in Arithmetic, and in Weights and Measures; and 40 per cent. of marks on the entire course must be obtained by candidates to entitle them to pass, but the percentage in each of the subjects other than the three just mentioned should, in Sir George Duffey's opinion, be higher than at present. The minimum required for a pass in each of the other compulsory subjects—Latin, Algebra, Geometry, and this year Elementary Theoretical Chemistry—is only 20 per cent. Objection is also taken to the total marks in Latin and in English being "arbitrarily decided as they now are."

But the Council of the Pharmaceutical Society of Ireland seems somewhat unwilling to fall in with the views of Sir George Duffey, and in its reply to his comments an attempt is apparently made to minimise the importance of his recommendation. We say "apparently" advisedly, for the well-

known anxiety of the Irish Council to improve the status of its licentiates may be expected to lead to the recommendations being adopted in their entirety after careful consideration. In the letter to the Privy Council, however, it is somewhat illogically urged as a reason for maintaining the present low standard of efficiency that "many of the candidates commence at the business with such knowledge as they obtain from an elementary school, and it is not until they have spent some time at the business that they discover the necessity for anything more than the most elementary education. They then apply themselves to acquire sufficient knowledge to pass the examination. This must always occasion bad results, and accounts for the large percentage of failures." Here, in brief space, we have the whole case for advance and reform given away, and how badly and fully it is given away is obvious when the Irish Council goes on to express its admiration of the perseverance of those who present themselves repeatedly for examination. Pity for the unfortunate candidates could be understood in such cases, but why acknowledge a sense of admiration for their ill-advised perseverance? Then it is stated that the original percentages of marks were fixed with the desire of not making the examination too high, or a mere obstruction to prevent the youth of the country coming into the business. But why continue to act in accordance with the original desire when every rational argument that can now be brought forward is in favour of a diametrically opposite policy? "As the Society ages," the reply proceeds, "it is expected that the licentiates in business will be more careful in the selection of apprentices, and will require a better education as a condition of service," but this is a very weak reed to depend upon. It is beyond question that pharmacists in business have the matter of the quality of apprentices entirely in their own hands, but experience on this side of the water may be expected to repeat itself in the Emerald Isle, to the extent that this best of all defences against lowering the status of pharmacy will be found totally ineffective in practice. Inasmuch, however, as the Irish Council fully appreciates the Visitor's remarks on the whole of the Preliminary examination, and the desirability of requiring more than a superficial knowledge of the subjects, it may be anticipated that steps will be taken ere long by that body to deal with the difficulty as thoroughly as has been the case in Great Britain. In view of a possible future arrangement for the interchange of British, Irish, and colonial certificates, such a solution of the problem is greatly to be desired, and there is perhaps little reason to doubt that a generally satisfactory solution will be forthcoming in due course.

THE SALE OF FOOD AND DRUGS.

The adulteration of food and drugs promises to be a subject of some prominence during the present session of Parliament, and, pending the re-introduction of the Bill introduced last session by the President and Secretary of the Local Government Board, or some similar measure, the Council of the Society of Public Analysts has published its report on that Bill, with the object of securing some modification of the clauses it contains. The great desire of the body referred to is to see a Bill introduced by the Government which shall embody the recommendations of the Food Products Adulteration Committee, with as few modifications as possible. Accordingly, the Bill introduced by Messrs. Chaplin and Russell is regarded by the Society of Public Analysts as unsatisfactory, inasmuch as it does not embody "the most important recommendation" of the Select Committee, viz., that referring to the formation of a Court of Reference. That recommendation, it is urged, should be acted upon if new legislation is to lead to satisfactory results, and it is parenthetically suggested that such Court of Reference ought to include one or more public analysts. That is to say, not content with adding to their only legitimate function of adulteration detector, that of director of prosecutions, as is only too frequently the case, public analysts wish in addition to constitute themselves part of a final court of appeal, which shall decide whether or not their methods of procedure are justified, and their results accurate. The existence of this proposed Court of Reference was provided for in the Bill introduced last session by Mr. Kearley, and shortly to be re introduced by the same Member of Parliament. Clause 38 of that measure specified that immediately after the passing of "this Act" there shall be appointed a court of reference consisting of the principal officer of the Government laboratory at Somerset House, a person nominated by the Local Government Board, a person nominated by the Board of Agriculture, two nominees of the Society of Public Analysts, and one each of the General Medical Council, the Institute of Chemistry, the Pharmaceutical Society, the London Chamber of Commerce, and the Association of Chambers of Commerce of the United Kingdom. But why two, or any, nominees of the Society of Public Analysts?

THE WESTERN CHEMISTS' ASSOCIATION.

The draft Pharmacy Acts Amendment Bill was discussed at a meeting of the above Association on Wednesday night, and it was unanimously agreed to support it. The publication of a detailed report of the discussion is unavoidably deferred until next week; meanwhile it may be useful to refer to one point, raised by Mr. R. H. Parker, a past-president of the Association. With the idea of uniting all pharmaceutical chemists in support of the Bill, Mr. Parker suggested that it might be possible to effect a compromise with those opposed to the Bill by inserting a clause, the effect of which would be to entitle members of the Society who are pharmaceutical chemists to use the title "Fellow of the Pharmaceutical Society." The title would be worth nothing in itself, but if it will satisfy those who would otherwise remain dissatisfied, why not grant it to Major men? Mr. W. Pickard supported Mr. Parker's suggestion, but the views of the meeting being opposed to it, the proposition was withdrawn. In the hope, however, of effecting a compromise by some means, it was decided that a communication should be sent to the Manchester chemists who are opposed to the Bill, asking them to withdraw their opposition, in the best interests of the craft. This is an example that may with advantage be followed by other local associations. Another interesting incident that took place at this meeting was a notice of motion given by Mr. Mathews, the President, to the effect that the title of the Association should be altered to that of the "London Chemists' Association." It is to be hoped that this change may be agreed to, as it cannot fail to be useful by helping to widen the sphere of influence of the body.

ANNOTATIONS.

The Semi-Sporting Character of Mr. Jeeves' address to the Brighton Junior Association of Pharmacy (see p. 178), which is to some extent lost in our necessarily condensed report, must have served to give an enhanced interest to matters that tend to become vapid in the course of years. But he was not too careful to state all his premises correctly and, consequently, it is not surprising to find that he arrived at some wrong conclusions. The first question with which he confronted his audience should not have been "Is the chemist and druggist of to-day a sufficiently educated man to carry out ably and conscientiously the many and varied duties of his business?" but "Is the chemist and druggist of to-day a sufficiently educated man to fulfil ably and conscientiously his duty to the public and to his fellow-chemists?" The standard of education and training required, from this point of view, must of neccssity become higher as the years pass and civilisation progresses, and the educational schemes of the Pharmaceutical Society both can and will help forward that most useful of all ends better than any other method that has yet been tried or even suggested. The weakness of Mr. Jeeves' position is manifest when it is noted that he is prepared to accept what can only be rcgarded as an excrescence upon pharmacy proper, as being itself thc pharmacy of to-day. Any chemist and druggist who acknowledges that wholesale firms can carry out the cssential details of his business better than he can himself fully deserves the non-success from both professional and trade points of view that will almost inevitably fall to his lot.

Penny-in-the-Slot Pharmacy is what Mr. Jeeves advocates, for no other concise term is sufficiently comprehensive to describe the absolute dependence upon manufacturers for tho preparation of "pills, capsules, plasters, tablets, etc.," that this Brighton pseudo-prophet indicates as a position to be acquiesced in. It might almost be imagined that he held a brief for one of the wholesale firms whose products he so unsympathetically compares with medicines dispensed by the "small dispensing chemist," and it is to be much regretted that no one present at the meeting is reported to have called in question the accuracy and good taste of such an unjustifiable comparison. The answer to the second question put before the meeting, "Will an increased standard of education and examination produce in the successful candidate a better chemist or a more successful man in business?" is best supplied by the careers of those whose names are best known in British pharmacy. Of course, neither education nor examinations can compel men who prefer to seek inspiration in the mud to strive after higher ideals, the attainment of which may at times involve some slight degree of personal inconvenience. The man who is successful does not become so by continually brooding on non-success, any more than he who progressively advances is cheered on his way by thoughts of retreat. The fact of the matter is that Mr. Jeeves has quite missed the point at issue, and confused conditions with objects to be striven for. The three great factors influencing success in pharmacy are education, examination, and business capacity. Without the last the others do not count for much, and when a chemist and druggist is found lamenting that education and examination do not assist him much in his business career, it is only reasonable to assume that he is lacking in the third essential of success. If, in addition, he proceeds to throw mud at the Pharmaceutical Society for not having ensured him a business competence in exchange for the few guineas he paid for registration, we must also question his logic or his sanity.

The Present Unusually Mild Weather is naturally being marked by the early development of spring blossoms, etc. Correspondents in different parts of the country are sending plants which are interesting as showing the early dates of flowering. Mr. E. W. Pollard, of Ryde, has sent *Pulmonaria angustifolia* in full flower to the Curator. The earliest date for this plant during the last twenty years has been February 7, and the specimen sent was gathered only four days later. Daffodils and blackthorn, Mr. Pollard reports, are also in flower. Mr. H. James, of Truro, sends *Echium vulgare* in blossom, a plant which usually begins to flower in June. Moreover, the cuckoo was heard in Richmond Park on Monday last, fully six weeks before its usual time.

The 'Nuttige Indische Planten,' by Dr. Greshoff, has reached its fourth part, which contains illustrations of the following plants:—*Acacia farnesiana*, *Bouea macrophylla*, *Calotropis gigantea*, *Coix lachryma*, *Gonostylus miquelianus*, *Morinda citrifolia*, *Nyctanthes arbor-tristis*, *Piper cubeba*, *Ricinus communis*, and *Santalum album*. The majority of the plants are also used in the British Indies, and as each monograph contains valuable information, it should prove useful to all interested in Eastern vegetable products. *Gonostylus miquelianus* yields a fragrant wood, in appearance like sandalwood, but softer. It forms the aloes wood or Kajoe garoo, of the Island of Riouw. The illustration of *Piper cubeba* contains figures of all the adulterations and substitutions of the drug hitherto recorded.

The Return of Empties is frequently a sore point with manufacturers and wholesale dealers, but what cannot well be regarded as an unreasonable appeal to the public has recently been made by a firm of mineral water manufacturers, who point out in a Brighton paper that they received on January 29 last, from a certain place 176 dozens of "empties," and out of that number no less than 39 dozens were destroyed—so far as their business is concerned—by the careless and unfair manner in which the bottles have been put to improper uses. On examination it was found that before being returned as "empties" they had been made receptacles for carbolic acid, paraffin, turpentine, linseed oil, medicine of different sorts, benzoline, neats-foot oil, paint, varnish, etc., and also used as candlesticks. It is not surprising, observes the local paper, that after this experience there should be a very strong feeling on the part of the receivers of the empties, and as, doubtless, in many cases, much of the injury is due to thoughtlessness rather than to malicious intent to destroy the manufacturer's property, it is hoped the appeal may lead to a mitigation of the evil.

The School of Pharmacy Students held their annual dinner at the Holborn Restaurant, London, on Wednesday last, and it was exceptionally successful, great credit being due to Messrs. Lescher and Nelson for carrying out the necessary arrangements. Especially interesting speeches were delivered by the President of the Pharmaceutical Society and Mr. Michael Carteighe, the former explaining at length why the Pharmacy Bill should be generally supported, whilst the School Visitor gave instructions in the art of speech-making, and showed clearly that the existence of the School of Pharmacy had helped largely in securing the passing of the original Pharmacy Act. Detailed reports of those speeches will be published next week. The Dean, Professor Greenish, made an excellent chairman, and the meeting was a highly representative one. Amongst the visitors was Mr. Gwilym Evans, of Llanelly, a former member of Council.

THE WORLD OF PHARMACY.

CAMBRIDGE PHARMACEUTICAL ASSOCIATION.

The annual dinner of this Association was held on Thursday, February 10, at the Victoria Assembly Rooms, Cambridge. The chair was taken by Alderman Deck, who was supported by Mr. Walter Hills, President of the Pharmaceutical Society, and the leading pharmacists of the district.—After dinner and the usual loyal toast, Mr. A. Sidney Campkin proposed the toast of the

Pharmaceutical Society of Great Britain.

He said he did so with peculiar pleasure and pride on this occasion, inasmuch as he had to couple therewith the name of the President, Mr. Walter Hills, to whom their local association was especially indebted for his presence that evening. The position was unique in their history, as it was the first time they had been so favoured. They appreciated it further because of his near relationship with one—present also that evening—who had recently filled with ability and distinction the office of mayor of their ancient borough, and who bore a name of one who, in the past, occupied a high and honourable position in the pharmaceutical world—T. Hyde Hills. They were further interested in their President because he was a successor in the business of one of the most honoured names in connection with the pharmacy of the past generation ; also because of the great ability he had shown in the discharge of the duties connected with the high and honourable office to which he had been appointed. He (the speaker) had been present at the annual meetings of the Society for some years past, and was able to bear testimony to the manner in which he had conducted and addressed the last under somewhat difficult substances. It would ill become him to stand for more than a short time between them and their distinguished guest, but there were a few matters of considerable importance to them to which he would allude, in the hope that the President would make some allusion thereto in his reply. Events of considerable importance to them and pharmacists had happened during the past year or two, and there were now before them proposals for legislation in which they were all interested, to which he was sure they would much appreciate a reference. The recent Bye-laws of the Society had caused much discussion in the press and at the annual meeting in May last, but had now received the assent of the central authority and would be applicable to future entrants ; it remained to be demonstrated if they would fulfil the anticipations of the promoters. Then a Bill had been prepared and approved by the Council, and would shortly be submitted to Parliament, having for its objects the further consolidation of the Society by an extension of the privileges of membership to a number of legally qualified pharmacists who, though supporters, had not the full advantages as some of the members. He hoped the result of the proposed legislation would be to bring every qualified pharmacist into the privilege of full membership with their Society, which, after all, was the only organisation of chemists recognised by the Legislature, and if duly supported would be able to speak in no uncertain tone on any proposals for legislation affecting the body generally. As at present only about a third of the registered chemists in the country were associated, but he claimed it was not only a privilege, but the duty of all to be associated together as members of the Society, and thus assist not only themselves, but the whole body. He had great confidence in the power of unity and federation, and hoped that the jealousies which had existed in the past and prevented their combination for one common purpose would disappear, that there would be complete unity of hearts and interests, which would strengthen and consolidate their Society, and be productive of such results that the future of pharmacy would be brighter than its present, and greater than its past.

Mr. Hills, in the course of a speech of some length, expressed satisfaction at meeting the members of a pharmaceutical association located in a centre so intimately connected with advanced education, and said he looked forward hopefully to the time when the system of education for the calling of pharmacy would be improved and when perhaps universities would eventually grant degrees indicating proficiency in the art. Speaking as President of the Pharmaceutical Society, he wished to take that opportunity of pointing out that the work of the Society was carried on for the benefit of all engaged in the business, and that it was beneficial to every individual so engaged, whether connected with the Society or not. The Bill now in course of introduction to Parliament was intended in that sense, and, consistently with the Charter of Incorporation, to provide that membership of the Society should be open to every person possessing the necessary legal qualification to practise pharmacy. Of the persons registered under the Pharmacy Act, 1868, two-thirds are ineligible as members of the Society and therefore disqualified from serving as members of the Council : they have no direct representation, and they cannot become connected with the Society except as Associates —a position that was intended only for assistants. As membership of the Society is not, in itself, a qualification, there would be no interference with the rights acquired by those who voluntarily took the higher grade of pharmaceutical chemist which the Society would always be the first to protect. Nor was it true that the Bill is, as had been stated, a mere scheme to get "more guineas" and nothing else. What the Society wants and desires to secure is not mere perfunctory payment of subscriptions, but active interest and participation in the work that has to be carried on for the welfare of the whole body of registered chemists. The provisions of the Bill were necessary for admitting registered chemists to participation in that work on a footing of equality to which their legal qualification entitles them. If their connection with the Society was the means of annually placing at the disposal of the Council a few thousands more, any such augmentation of its resources could be well and usefully applied in promoting the objects of the Society, both in the extended administration of the Pharmacy Act and in the provision of facilities for pharmaceutical education in the provinces.

Mr. E. S. Peck next proposed the toast of the

"Medical Profession,"

and said that to his mind the profession of medicine stood out pre-eminently above all others, at least all other secular professions. It controlled our earliest separate existence in the world, fostered a healthy condition during life, repaired our fractured limbs in accidents, and alleviated the pain and discomfiture of man's latest hours ; it did all this and much more with a disinterestedness as remarkable as it was rare amongst the other learned professions. They, as pharmacists, looked up to them with admiration for their knowledge, skill, and patience, and felt proud that they were permitted to act, as it were, as the handmaidens of such a noble profession, and if pharmacy was to succeed it could only do so by going hand in hand with the medical profession. He hoped the General Medical Council would so widen the scope of the Pharmacopœia and keep it so close "up to date" that it would be unnecessary for medical men to order so many proprietary articles, the equivalents of which were not now in the Pharmacopœia. After alluding in laudatory terms to the medical profession in Cambridge, he coupled with the toast the names of Mr. T. Hyde Hills, Mr. W. Penberthy, and Mr. Apthorpe Webb.—All three of the medical men whose names were coupled with the toast having responded

Mr. C. S. Addison, proposed the toast of the

Cambridge Pharmaceutical Association.

He said he had always taken a keen interest in the Association ; in fact, he was one of the founders of it. So far the Association had not sent forth to the world any wonderful pill excipient, nor had it dictated to the Pharmacopœia Committee what it should do or should not do. It had not even criticised the new B.P. before it was published, but it had done a good work in bringing the members of the local trade together and making them know each other, so that when they met they had at least a pleasant nod instead of a scowl, such as members of the same trade in a town are supposed to give each other. The Association had also been ready to discuss any vital trade question whenever it had been necessary to do so. It is more and more being brought before us how essential trade organisation is in other branches of trade and what a great amount it accomplishes, and therefore he hoped that the efforts of the Pharmaceutical Society with its new Bill would be successful, and that it will have the effect of making the Society representative of the majority of the members of the trade and so form a strong, solid organisation. He was sorry to see that what opposition there is to it comes from the Major qualified men. He had always thought that education broadened one's mind, and why they opposed it he could not understand, for surely if a man was qualified to dispense medicines and to sell poisons he was qualified to help manage his own Society. If he is not qualified to manage it, then he is surely not capable of practising pharmacy ; but no one can deny that

amongst the ranks of the Minor men there are many who are quite as successful in business and as intelligent as many who have the Major qualification.—This toast was responded to by Alderman Deck and Mr. B. S. Campkin.

Mr. Cook, in proposing the

Kindred Associations,

endeavoured to explain organisation from two standpoints—scientific and commercial. Taking for the first the Pharmaceutical Society as example, the speaker attempted to show that the difficulty experienced in making progress was not accounted for by lack of material wherewith to organise, but that many whilst doing their share of criticism positively refused to be organised, and whilst condemning the Society on the one hand they neglected the only remedy that offered itself. It was urged that all employés should recognise the desirability of endeavouring to get those under their care to become students or associates of the Society as soon as the opportunity occurred, having been a subscriber himself now close upon twenty years. The speaker's connection with the local association had proved to him—noting the great amount of energy put forth by the officers—that to organise is one thing but to be successful is something to be hoped for. —Mr. Glyn-Jones having responded,

Mr. White, in proposing the toast of

The Pharmaceutical Press,

spoke with approval of the widening of the character of the *Pharmaceutical Journal* as having met with great appreciation. He thought, however, that the complaints made of the Society's journal a few years ago were not quite fair, for if the readers of the Journal failed to benefit from the instructive efforts of the Editor, that was to his credit and to their discredit. It appeared that when chemists had got through their examinations they turned round and complained of the Journal, because they could not understand it. That was really a confession that their education was at present very superficial, or that they suffered from rapid mental decay immediately on leaving the examination room. In regard to the trade journals, Mr. White spoke of their general superiority to other trade journals, and of their value to the trade in giving useful information. He coupled with the toast the names of Dr. Paul, Mr. Wootton, and Mr. Cantwell. —Dr. Paul said that, as Editor of the *Pharmaceutical Journal*, he felt some difficulty in replying to the toast, as he had considerable doubt whether the Society's Journal could be regarded as part of the pharmaceutical press, except in a purely conventional sense. He pointed out the important differences between the conditions under which that Journal was carried on, as the official organ of the Society, and those affecting journals belonging to the pharmaceutical press which were irresponsible and free to criticise, condemn, or even oppose the work of the Society. Considering the incoherent state of the trade, those journals might not unreasonably be expected to represent any opposition that was worth representing. He objected, however, to that form of opposition by the pharmaceutical press which partook of the nature of disparagement of the Society and misrepresentation of its work. —Mr. Wootton and Mr. Cantwell also replied.— Subsequent toasts were those of "The Visitors," proposed by Mr. R. Sturton, and "The Chairman," proposed by Mr. McAvoy.

CHEMISTS' ASSISTANTS' ASSOCIATION.

This Association met on Thursday, February 10, at 73, Newman Street, W., Mr. T. Morley Taylor, President, in the chair. The minutes having been read and confirmed, Mr. Taylor called upon Mr. J. Campbell Fell, F.C.S., to give an account of some experiments made to ascertain

The Solubility of Glass in Water.

—Mr. Fell said that as it was well known that glass is soluble in water, which is said to be the universal solvent, he undertook a number of experiments to ascertain if an appreciable quantity of glass was dissolved in a short time, a quantity that would affect the amount of total solids in an ordinary potable water brought to the water analyst for examination. Of course, the amount of total solids in a sample of water is not a very important item, but as it is usually given it was thought that it might be of interest to see if the quantity was added to by the sample remaining in the bottle until an analysis was made. Six samples of water were examined, two of which were specially collected for the experiments. In five cases pale green Winchester quarts were used; in the sixth a dark blue one contained the sample. 70 C.c. was evaporated on a water-bath, dried and weighed in the usual way, and in most cases duplicate determinations were made. It would be seen from the table he had prepared that only in one case—that in which the dark blue bottle was used—was there any material increase in the amount of total solid residue, and it would therefore seem desirable to employ pale green bottles for the collection of samples for analysis. The table was as follows:—

Sample.	Time. Months.	Time. Days.	Weight of solid residue from 70 C.c.	Bottle.
I.	—	—	0·0110	Pale green.
	8	—	0 0124	
II.....	—	—	0·0115	Dark blue.
	8	—	0·0336	
III.	—	—	0 0246	Pale green.
	—	2	0·0246	
	—	7	0·0246	
	—	35	0·0246	
IV.	—	—	0·0225	Pale green.
	1	—	0 0212	
	1	17	0·0218	
	3	—	0·0222	
V.	—	—	0·0445	Pale green.
	3	—	0·0464	
VI.	—	—	0·0248	Pale green.
	1	—	0 025)	

—The President said it was a thing that probably had occurred to very few people that an appreciable amount of glass could be taken up by ordinary water. It naturally caused them to wonder what might happen amongst many of the bottles in which stronger substances and solutions of chemicals were placed. He should like to ask Mr. Fell if he could give any reason for the dark blue bottle being acted upon as shown by the table.—Mr. Gamble thought it would be interesting to know what influence organic acids or organic salts have upon glass.—Mr. C. Morley asked if pure distilled water had any effect on glass.—Mr. Fell in reply said, the reason he had taken up the work was in consequence of a suggestion made at a meeting of the Association some two or three years ago by Dr. Symons, who in reading a paper on "Analysis," observed that glass was very much more soluble than it ought to be. Being interested in water analysis he made a number of experiments and was astonished to find that it was soluble. He could give no reason for the dark blue bottle being more soluble than the lighter coloured ones, his experiments being carried out simply to ascertain whether the total solids were affected by being in a bottle. He was so astonished when he found that in the case of the dark blue bottle there was nearly three times the quantity of total solids after a few months, that he tried the experiment several times, and the value 0·0336 given in the table was the result The samples did not contain any extraordinary quantity of organic matter. As to the effect of distilled water on glass, he could not speak, not having tried it.—The next communication was by Mr. Herbert Hymans, who gave a short

Note on the Determination of Phenol.

Mr. Hymans stated that in the determination of phenol by means of bromine according to Koppeschaar's well-known process, a possible source of error lies in the loss of bromine vapour, either during the time of standing or in introducing the potassium iodide solution. To obviate this difficulty the following process was devised, and gave results which compared favourably with Koppeschaar's in accuracy and rapidity. In order to liberate a standard amount of bromine, a solution of potassium permaganate of semi-normal strength was run into a solution of hydrobromic acid in the presence of the phenol solution. The permanganate reacting with the hydrobromic acid set free bromine, which immediately combined with the phenol, forming tri-bromo-phenol—

$$C_6H_5OH + 3Br_2 = C_6H_2Br_3OH + 3HBr.$$

The determination was conducted as follows:—Five Gm. of the crystallised phenol was dissolved in water and the solution made up to 100 C.c. Five C.c. of this 5 per cent. solution, and about 10 C.c. of concentrated hydrobromic acid (30 per cent. HBr), were placed in a flask fitted with a good cork or rubber stopper. The semi-normal potassium permanganate was then delivered from a burette in quantities of about 5 C.c. at a time, the flask being thoroughly well shaken after each addition. After about 29 C.c. had been run in, a few drops of chloroform were added in order to cause the bulky precipitate of tri-bromo-phenol to agglutinate and fall to the bottom of the flask, as otherwise it adhered to the glass rod

used for removing a drop of the liquid to test, thereby obscuring the end reaction. Particular care was taken to add just sufficient chloroform to cause the precipitate to settle (not to dissolve it), as if more than that quantity was added, some of the bromine liberated was dissolved in it, thus giving too high results, two or three drops usually being sufficient. After thoroughly shaking, a small quantity of the clear supernatant liquid was removed with a glass rod and tested on a white tile with a drop of carmine solution, made by boiling 1 Gm. of carmine with 80 C.c. of water and 20 C.c. of alcohol, and filtering. The standard permanganate solution was then carefully added until the pink colour of the carmine was completely discharged when tested as described. The semi-normal permanganate was made by dissolving 15·8 Gm. pure $KMnO_4$ in water and making up to 1000 C.c. One C.c. of this solution = ·00781 Gm. phenol; therefore the 5 C.c. titrated would, if the phenol were quite absolute, require 32 C.c. In the case of determining the amount of phenol present in a solution of unknown strength it was necessary to dilute it until 5 C.c. required a convenient quantity of standard permanganate. If the solution was already too weak for semi-normal permanganate, it could be titrated with decinormal. The method was also found to be applicable in the determination of thymol, cresol, naphthol, salicylic acid, etc., as with Koppeschaar's process. In concluding his paper, Mr. Hymans expressed his thanks to Messrs. Wright, Layman and Umney, in whose laboratory the experiments were conducted.—The President said they were very much obliged to Mr. Hymans for his note on this process for the determination of phenol. He had no doubt that many of the processes employed were capable of being much improved in their details, as was shown by Mr. Hymans in the case under notice.

The Re-Copying of Prescriptions.

Mr. F. W. Gamble then directed the attention of the meeting to the subject of the re-copying of prescriptions, on which an editorial opinion was expressed in the *Pharmaceutical Journal* of January 22 and 29 (pages 78 and 103). Having briefly recapitulated the main facts of the legal trial which had led to this expression of opinion, Mr. Gamble observed that the second charge in the indictment was the only one bearing on this subject, that of having "sold morphine and atropine without having registered the sale of the same." It was admitted that the poison had first been supplied to a medical prescription, but afterwards it was handed over on demand, without the prescription being produced. The chemist was apparently under the impression that having once copied the prescription, he had discharged his legal responsibility concerning it for all time. The defending barrister and the police inspector held the same opinion. The magistrate held that the sale should have been registered, and the *Pharmaceutical Journal* supports this contention. Mr. Gamble said this was a matter of considerable moment to chemists. In the course of a long experience in the West-end he had not met with a single instance in which prescriptions were copied afresh at each repetition. Many pharmacists noted each repetition in their prescription book and gave it a number, but the majority, he thought, did not register a repeat order at all, much less re-copy the prescription. The *Pharmaceutical Journal* founded its opinion on the fact that the first part of Section 17 of the Pharmacy Act required the registration, in a book kept for the purpose, "of every sale" of a poison included in Part 1 of the Schedule. The second part of Section 17 says, with regard to the dispensing of poisons, that the ingredients must be entered in a book kept for the purpose, but it does not repeat that a record shall be made "of every sale." Although it is not definitely so stated, it is held that the Act of repetition required in the first part of the section is equally necessary in the second part. Mr. Gamble said the difficulty could perhaps be met by the adoption of a system of registering the name and quantity of every poison dispensed, together with the name of the patient in a dispenser's poison book, "kept for the purpose"; for it was conceivable that in the paragraph of Section 17 quoted in the Journal, "ingredients" would mean "poisonous ingredients," since non-poisonous drugs are not included in the Act. There should therefore be no necessity to recopy the prescription, but only to register the patient's name, and the name and quantity of poison dispensed at every sale. Mr. Gamble had brought the subject forward because he thought it had not received its due mead of attention, and he hoped all members would give it their consideration.—The President said that undoubtedly the matter which Mr. Gamble had brought before them was of extreme interest. He was not aware until that evening of Mr. Gamble's intention to bring the matter before the meeting, and consequently he had not given much thought to the question. It had occurred to him, however, that when once the prescription is entered in the book there is no necessity to recopy it if a memoranda is made of the date each time it is repeated.—Mr. C. Morley thought it is altogether unnecessary to re-write a prescription every time it is dispensed, so long as a record is kept of the date of sale, and a note made of the number in the prescription book.—Mr. Pearson thought, seeing it is prescriptions containing poison for injections that are most commonly repeated, that it is a matter for the General Medical Council to take up, and that medical men should be instructed to state when writing a prescription that it is not to be repeated unless initialled and dated by them on every occasion.—Other Members were of opinion that the suggestion in the *Pharmaceutical Journal* as to the recopying of prescriptions if carried out would involve too much time and trouble, especially where forty or fifty had to be dispensed during the day.—Mr. Fell thought the suggestion as to medical men initialling the prescriptions would not be practicable.—Mr. G. Roe's opinion was that a very serious responsibility rests upon the chemist in dispensing poison, and he ought, therefore, to endeavour to carry out the law to the very letter.—Mr. E. W. Hill then exhibited a small piece of apparatus, the "Pearl Suppository Machine," which makes suppositories and bougies in the cold by compression. Mr. Hill gave a demonstration of the facility with which it turns out suppositories in three sizes, and remarked that the machine possesses many advantages over the old suppository moulds, but unfortunately is not as well known as it deserves to be.—The machine was closely scrutinised by the members present, and the general opinion seemed to be that it is a great improvement on the older methods.—A vote of thanks having been accorded to Messrs. Fell, Hymans, Gamble, and Hill, the proceedings terminated.

NEWCASTLE-ON-TYNE AND DISTRICT CHEMISTS' ASSOCIATION.

A special meeting of the above Association was held in the Lecture Hall of the Church Institute on Wednesday evening, February 9, at 8 o'clock, Mr. George Weddell in the chair.—There was a very good attendance of members and their lady friends.—Mr. Robert Davidson took his audience on a tour in the south and west of Scotland, and Mr. Lionel Williamson manipulated the lantern. Many of the views shown were familiar to those members who attended the Conference meetings in Glasgow last August, and were altogether a choice selection.—Mr. Foggan (Bedlington) moved a vote of thanks to the lecturer, and Mr. Merson seconded.—Mr. J. D. Rose (Jarrow) performed a like office for the Chairman and the lanternist, and Mr. Chas. Ridley seconded and put the motion to the meeting.—The gathering was very successful.

BRIGHTON JUNIOR ASSOCIATION OF PHARMACY.

At a meeting of this Association held on Wednesday, February 9, the President, Mr. C. A. Blamey, in the chair, Mr. A. T. Jeeves read a paper entitled

The Pharmacy Stakes—A Straight Tip.

He said during the past year chemists had chronicled two rather notable events in the history of their craft, (1) the forward policy adopted by the Pharmaceutical Society and (2) the rise and spread of the organisation known as the P.A.T.A. The leaders of the Pharmaceutical Society had said a lot and still had a lot to say respecting what they called raising the status of the trade, and with that ethereal and disinterested view they proposed and sketched out a delightful scheme of a higher standard of education, stiffer examinations, and last, but by no means least, increased fees. But from an unbiassed and more liberal standpoint chemists found themselves confronted with two questions—"Is the chemist and druggist of to-day a sufficiently educated man to carry out ably and conscientiously the many and varied duties of his business?" and "Will an increased standard of education and examination produce in the successful candidate a better chemist or a more successful man of business?" He was of opinion that the knowledge essential to the chemist and druggist is not acquired at pharmacy schools, but at the dispensing counter and under the tuition of an experienced tradesman. The reason a qualificd man is able to command a higher position and a higher salary than an

unqualified one was not because of his scientific knowledge or educational attainments, but rather because, by virtue of his qualification, he is legally entitled to retail poisons and to take entire charge during his employer's absence. An examination for qualification is, of course, a necessity, but a stiffer examination appeared to be not only uncalled for by the requirements of the trade, but unjust to the candidate, and accordingly prejudicial to the craft at large. He maintained, therefore, that the educational schemes of the Pharmaceutical Society could not or would not in any way help forward any useful end. Neither did he think that, taking it for granted that the present-day chemist and druggist is sufficiently, if not more than sufficiently, educated for his position and duties, he is likely, in a more or less distant future, to occupy a position in which a higher standard of both elementary and technical education will be the first essential. Elegant pharmacy is now the order of the day, and pills, capsules, plasters, tablets, etc., are turned out quicker, cheaper, and better by large wholesale firms with their up to-date machinery than by the small dispensing chemist with his tin-pot modes of operation. Again, we cannot blind ourselves to the fact that our fellow craftsmen are relying more and more upon commercial enterprise for the bringing in the needful, paying more heed to the front counter than to the dispensing one. Note also the evolution of window dressing during the last twenty years. Where a couple of specie jars used to be the sole adornment we now find small flower gardens, battalions of frogs, and miscellaneous assortments, whose connection with pharmacy it is just a little hard to discover. Things are certainly not what they used to be, for better or for worse the tide has turned, and the wise man is he who takes time by the forelock and quickly acclimatises himself to the new but tolerably lasting state of things. With regard to the two-year-old P.A.T.A., a very large and influential section cordially sympathised with and supported that body, professing to see in the Association's policy the promise of increased incomes and altogether brighter prospects. But apart from all moral reasons, and regarding it as a political question only, he held that as the very name and existence of the P.A.T.A. supports the heretical doctrine of Protection, and is in direct opposition to Free Trade, no real or lasting benefit can come out of supporting it. It appeared only just and right that the public should be able to get any and every thing at the lowest possible price, and if the chemist does not care to sell an article at cost price, he could see no justice in his policy of trying to stop the drug stores opposite from doing so. Apart from the principles involved, what about the *modus operandi* adopted by the P.A.T.A. in furtherance of its ends? All goods on the P.A.T.A. list are sold under condition of their not being retailed below a certain figure. Firms selling these goods below the fixed price are liable on detection to have their supplies cut off, but to carry out effectually that part of the scheme nothing short of a small army of detectives would be of any use whatever. To successfully carry out a scheme like that of the P.A.T.A. it was essential to have a large display of force, so as to compel those black sheep among the trade, whose word is not their bond, to keep to their agreements, if for no higher motive than that of fear of consequences. But the policy of compulsory limited cutting of patent medicines cannot be even temporarily beneficial to the trade at large, nor ought it to tend to give the chemist an interest in, and an incentive to push, that portion of his business which he, as an educated and ofttimes scientific man, should conduct only on sufferance, compelled thereunto by the demands of untoward circumstances. If there were no pickings to be had in the retailing of quack medicines, that fact would stimulate the chemist to larger efforts and a more ambitious policy in the other and higher departments of his business. His straight tip was that the winner of the Pharmacy Stakes is no other than the perennial evergreen old horse, "Brains," which, when ridden by push, and spurred on by perseverance, is absolutely a dead certainty. The wise man who would raise a superstructure to a height limited only by his own ability and ambition must be self-reliant, and not depend on any society or association, expecting it to carry him over the stream of hard times, and land him down on the dry land of a steady income, out of the reach of the surf of keen competition, and to the windward of the drenching spray of company pharmacy. Another point is to be original in whatever line one strikes out; let it be the honest results of one's own brains, not a more or less bad imitation of the fruits of another man's ideas. New occasions teach new duties, and their conduct should be governed by own tact and brains, quite regardless of the opinions of their fellow-craftsmen. There is no calling which gives more scope for thoughtful enterprise than pharmacy. Beyond the ordinary routine of the business there are so many ways of augmenting slender incomes that it is astonishing there are so many lame men in the ranks who are eternally whining and groaning at the badness of the times, when all that they have to do is to take up their bed and walk. Finally, though money is a great factor in the sum of human happiness, when it is procured at the expense of honour and brotherly kindness the exchange is poor indeed. We cannot but admire the motive which actuates those men who stick to old methods and worn-out systems rather than by adopting an up-to-date policy draw custom from their more conservative brethren. But do not imitate them. With brains, push, and perseverance we can remain no outsiders; a fair field and no favour, and may God help the hindermost.—At the conclusion of the paper a general discussion took place, after which Mr. Jeeves was accorded a very hearty vote of thanks.

SHEFFIELD PHARMACEUTICAL AND CHEMICAL SOCIETY.

The annual ball is quite an institution with nearly all the professional and commercial societies in Sheffield, but although the Sheffield Pharmaceutical and Chemical Society has been in existence fully thirty years, the first event of the kind which its members have promoted was held in the Masonic Hall on Thursday night in last week. The function provided so much pleasure to those who were present, and proved such a complete success that the Committee has decided to make it an annual event. The guests numbered 120, and in addition to the pharmacists the medical profession and local public bodies were well represented. The guests included Dr. Hill, Dr. E. Skinner, Dr. Manton, Mr. W. D. Lovedike, Councillor Furness, Mr. G. Squire (President of the Society), Mr. J. B. Pater (Secretary), Mr. G. T. W. Newsholme, etc. Mr. A. R. Fox was the M.C. Mr. Oxley's Band provided the music, and Messrs. T. and J. Roberts carried out the decorations.

EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.

At a meeting of this Association, held on Friday, February 11, Mr. George Sinclair, President, in the chair, Mr. A. J. Dey read a paper on

Liquid Extract of Taraxacum.

Two commercial samples had been submitted to him which differed so much in appearance that he determined to investigate the subject. In order to fix a standard, a sample was prepared from dandelion root of good quality in strict conformity with the pharmacopœial directions. Seven commercial samples were examined with the following results. Sample A is the standard specially prepared. Copper was found in all the commercial samples.

No.	Sp. Gr.	Alcohol, per cent. by vol.	Extractive from 1 fl. oz. in grains	Copper.
A	1·064	27·95	91·	Absent
1	1·002	35·35	47 5	Distinct
2	0·992	30·65	29·3	,,
3	1 094	27·04	100 5	,,
4	1 088	23·19	121·8	Abundant
5	1·010	19 37	25·	Distinct
6	1·046	40·84	110·8	Trace
7	1·064	30·65	73·	,,

In taste No. 4 was most bitter, the standard sample coming next. All the rest were much alike, except No. 1, which tasted strongly alcoholic. It would seem as if Nos. 1 and 6 were made by the direct percolation process recommended by Squire. A test sample was made by this process, and it was much thicker and darker than any of the samples, but there was not sufficient time to examine it more fully. The results indicate very considerable want of uniformity in this preparation. Some work had been done in the direction of fixing a formula that would yield uniform results, but the experiments had not been completed in time.—Mr. Dey then communicated a

Note on Alcoholic Extract of Belladonna.

A sample which had been standing a few years appeared quite granular, and on examination was found to be full of crystals. A

few of these had been separated and examined, and they proved to be apparently cane sugar. In a paper on this subject (*Pharm. Journ.* [3], xvi., p. 777), Dunstan and Ransom mention that the extract contained much dextrose. But in this case the sugar appeared to be cane sugar because it did not reduce Fehling's solution until after inversion by boiling with dilute sulphuric acid. It had been impossible to trace the history of the sample, and it would be interesting to know if anyone had found cane sugar in any sample previously, and whether it was a natural constituent or added to adjust the percentage of alkaloids.—The same author then read a

Note on Phenacetin.

The author exhibited a sample of phenacetin which, when powdered in a mortar, emitted a strong odour of benzene. The explanation seemed to be that it had been crystallised from solution in benzine, but the odour was so marked as to readily attract the attention of a patient when dispensed in powder form.—The last paper was by Mr. Fred B. Hirst on

The History and Cultivation of the Saffron Plant.

The author gave an interesting *résumé* of the subject and touched upon the uses and adulterations of saffron. The reading of the papers was followed by a discussion taken part in by Messrs. Cowie, Harley, Hill, McBain, McDiarmid, Mackenzie, Reid, Sinclair, and Somerville. In the case of dandelion, it was stated that the official process involved a great waste of spirit. It was mentioned in the case of saffron that Jews purchased it to colour soups, hotel people used it to colour jellies and as an egg substitute. It was used to dye window curtains, and was administered to canaries during moulting. In some parts of the country it was used extensively as a domestic remedy for measles.—On the motion of the Chairman, votes of thanks were awarded to the authors, and the meeting closed.

MIDLAND PHARMACEUTICAL ASSOCIATION.

The Council of this Association held a special meeting on the 9th inst. at Mason University College, Birmingham. Mr. F. J. Gibson (President), was in the chair, and amongst those present were Messrs. A. Southall, J. Poole, F. H. Prosser, F. H. Alcock, C. Thompson, W. C. Scott, and H. S. Shorthouse (Hon. Sec.).—The Chairman pointed out that the business of the meeting was to discuss

The Pharmacy Acts Amendment Bill,

and Messrs. T. W. Chapman, W. R. Selleck, and G. E. Perry, who were unable to attend, had written saying they were in favour of the Bill. In introducing the subject, the Chairman said that the Bill was a good one so far as it went, but he was of opinion that it did not go far enough. Those present agreed with this view, and expressed the hope that the proposed Bill was only an instalment of the more complete statute they required for the proper legal protection of their own and the public interests.—Mr. C. Thompson moved—

> That the Council of the Midland Pharmaceutical Association, having considered the Pharmacy Acts Amendment Bill, are of opinion that it is a step in the right direction, and that it shall receive their support.

—After some further discussion it was thought advisable to wait until it was known when the Bill was likely to be introduced into the House of Commons before appointing a deputation to interview the Members of Parliament for the city and district upon the question of their support to the measure.

LIVERPOOL CHEMISTS' ASSOCIATION.

The usual meeting took place on Thursday evening, the 10th instant, in the Royal Institution, the President, Mr. J. Bain, in the chair. The subject

Maize Oil

was again brought up among the miscellaneous communications, causing a good discussion. Mr. Cowley gave an account of how the Peruvian Indians make an intoxicating drink from maize by chewing it and allowing it to ferment, during which process the oil separates and is used as an article of food, according to his informant, who had resided in the country some time. A method of detecting maize oil as an adulterant of lard might be devised, Mr. Cowley said, on the basis of its high iodine absorption equivalent. A full review of the oil and its various chemical and analytical factors would be found, Mr. Edward Davies, F.I.C., remarked, in a recent number of the *Analyst*, by a townsman of Liverpool—Mr. Smetham, F.C.S., F.I.C. The tale relating to Peru told by Mr. Cowley was very similar to that of the preparation of a drink—kava-kava—in the Pacific Islands.—The President then asked Mr. Edward Davies to read a paper he had prepared (see p. 169) in memory of their late respected ex-President and friend

Mr. Michael Conroy.

At the conclusion the President, Dr. Symes, Messrs. A. C. Abraham, T. F. Abraham, Hornblower, Wardleworth, and Samuel bore feeling testimony to their regret at the loss they as individuals and the Association as a body had suffered by the death of their friend, and it was decided unanimously, on the motion of the President, seconded by Dr. Symes, to instruct the Secretary to convey to Mrs. Conroy and her family the expression of the Association's sympathy in their bereavement. It was mentioned that Mr. Edward Davies at the last meeting of the Council of the Association had been elected an Honorary Member in recognition of his exertions in furthering its work and interests during the thirty or more years he had been connected with it as member, Secretary, Vice-President, and President, and most cordial expression was given generally to the wish that Mr. Davies would long be enabled to take such part in the work of the Association as his advancing years would permit him.—A paper on

Pharmacy in Russia,

was read by Mr. Prosper H. Marsden, at the close of which a few particulars of how to get to Russia, and what was to be seen there in a short visit, were supplied by Mr. A. H. Samuel, who spoke from experience gained by him last autumn, when he attended the Medical Congress at Moscow as a delegate from the Liverpool Chemists' Association. The specimens of labels, price lists, and advertising matter shown by Mr. Marsden were examined with interest by the members, who expressed themselves as being very pleased with the essayist's remarks.

LIVERPOOL PHARMACEUTICAL STUDENTS' SOCIETY.

There was a better attendance at the usual meeting of the above Society at University College on Thursday evening, the 10th instant. The usual routine business having been transacted, the President, Mr. Pierson, asked for

Miscellaneous Communications.

A prescription was shown by Mr. R. H. Mitchell, of which the directions were "Capiat ℥ss, ter die postcibos et post prand.," the proper rendering of which into English was asked for. "A tablespoonful thrice daily after meals" was the result of the general opinion.—Mr. P. H. Marsden wished to draw the members' attention to an obituary notice of their late friend, Mr. Edwin Williams, in the University College magazine, the *Sphinx*.—Mr. H. Wyatt, jun., was then asked to read some

Dispensing Notes.

A good discussion followed, in which most of those present took part.—Mr. Marsden wished to know if it was usual for dilute hydrocyanic acid to be ordered as "drops," unmixed with anything else? He had had an ounce prescribed lately, of which 5 drops in water was ordered for a dose. The prescriber was seen, and the danger of ordering such a powerful remedy in such a fashion was pointed out to him, upon which he ordered a mixture with 5 drops of acid to the tablespoonful.—Mr. Wokes agreed with Mr. Wyatt that alteration of prescriptions was allowable up to a certain point, but that such changes should be always noted on the prescription—a method adopted by Mr. Wyatt he knew, and by the members of the Students' Society generally, but unfortunately rarely by other dispensers. In the case of an ointment of oleate of bismuth containing chrysophanic acid, should heat be used to dissolve the acid or should it be simply rubbed smooth with a little castor oil and then mixed in? Mr. Mitchell thought that bismuth salicylate had the effect of turning the mucilage of acacia made with the powder very acid. As bearing on Mr. Wokes' remarks he would say that he had had to dispense prescriptions which had been previously through Mr. Wyatt's hands, and had found no little benefit from the indications marked by Mr. Wyatt where a departure had been made from the text. He should like to know if a stable solution of salicylate of soda could be made so as to remain colourless or nearly so? In Edinburgh Mr. Harris Burns said it was usual with one prescriber—a

lady—to order quinine and iron mixtures similar to that mentioned by Mr. Wyatt, but without any additional acid. Could Mr. Wyatt say anything as to the solubility of nitrate of silver pills made up with anhydrous wool fat, as he had had a complaint about some recently? Salicylate of soda kept fairly well in a 1 in 2 solution. Weaker solutions soon changed. Bismuth mixtures went best when made with compound powder of tragacanth.—Replying, Mr. Wyatt thought that the practice of ordering potent medicines as "drops" was most reprehensible. English doctors were not by any means the only offenders in this respect, for on the Continent, where most medicines were of such a harmless nature, that prescribers simply ordered them "by spoonfuls," not always specifying whether table or teaspoonfuls were intended, such preparations as "Gouttes de Baumé," containing nux vomica or Ignatius beans, were invariably ordered as drops. Such an ointment as Mr. Wokes mentioned would best be made by dissolving the chrysophanic acid in petroleum ether, or some similar body, and adding to the oleate of bismuth, triturating both in a hot mortar until the solvent was driven off. A fairly stable solution of salicylate of soda could be made as Mr. Burns said, if warm distilled water were used and a suitable glass vessel employed to keep the solution in when made. The iron in the glass, as well as traces of alkali, had more to do with such solutions changing colour than, as many supposed, the much-maligned creosotates had. Lanoline ought to answer well with nitrate of silver in a pill, judging by the results obtained by a member of the Society, Mr. A. C. Shaw, some time since when trying it with permanganate of potash. Mr. Shaw found it answer very well, the pills being easily soluble. He would try and impress on the members the benefit the Society would receive if they would cultivate a few dispensing notes and bring them forward from time to time.

BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION.

On Monday, February 7, at the Bradford Mechanics' Institute, Alderman Henry Dunn in the chair, Mr. W. Lamond Howie gave a lecture, under the auspices of this Association, on

The Scottish Alps.

The lecturer exhibited about 140 photographic lantern slides taken by himself during his own experiences of mountaineering. In the course of the lecture he commented upon the comparative neglect by climbers of the Scottish Highlands during the period of the year when mountaineering can be carried out with the least discomfort and the best results. He recommended from February to May as the period for mountain climbing in this locality.—At the conclusion of the lecture a vote of thanks was accorded to Mr. Howie, who was afterwards entertained at supper at the Victoria Hotel by the members of the Association. After supper the following toasts were proposed:—"Our Guest," proposed by the President, Mr. Hy. Dunn, and replied to by Mr. Howie; "The Pharmaceutical Society"; proposed by Mr. Geo. Rimmington and responded to by Mr. A. H. Waddington; "The Bradford and District Chemists' Association" proposed by Mr. Daniels and responded to by Messrs. Pickard (Hon. Sec.) and Mackay (ex-President); "The Drug Trade," proposed by Mr. Silson, was responded to by Messrs. Wilcock and Newbould; "The President," proposed by Mr. Mitchell, was acknowledged by Mr. Dunn. Messrs. Daniels, Mitchell, and Moulson supplied the musical portion of the evening's festivities, and a very enjoyable evening was spent.

Further Reports on Naphthalan.—Rosenbaum (*Protok. Imper. Kaok. Med Obehch*) states that naphthalan is at one and the same time analgesic, antiphlogistic, antiseptic, and a reducing agent. In therapeutic action it is equal to ichthyol, and it is odourless. It is specially indicated in the treatment of burns, eczema, rheumatism, and acute inflammation of the lymphatic ganglia. It should be applied in the form of a covered dressing, which should be changed daily. On account of the action of air on naphthalan the bottles containing it should be kept well corked. Any stains on the linen which may result from its use may be removed with petroleum or benzene. Joseph (*Deutsch. Med. Woch.*) also reports favourably on this substance, which he has found specially efficacious in the treatment of chronic eczema, particularly that caused by irritating material in certain trades, as among masons, painters, compositors, tanners, etc. In many cases a complete cure was effected by its use in a few days. —*Les Nouveaux Remèdes*, xiii., 567.

LETTERS TO THE EDITOR.

The New Pharmacy Bill.

Sir,—I beg your indulgence to allow me to protest against the action of Mr. F. Pilkington Sargeant in challenging the ruling of the Chairman of the Manchester meeting. The statement from the chair that the majority was in favour of the draft Bill was quite explicit. Those who then neglected to call in question that statement should now abide by their own conduct and take the consequences. To do otherwise is neither courteous nor manly. From the tenour of Mr. Sergeant's letters it is apparent that either he is very simple or imagines other people to be so. How delightful a state of things would ensue if inspired letters to chairmen of public meetings were allowed to count as votes! What a charming and engrossing occupation chairmen would find in speculating upon the "ayes" and "noes" who found it inconvenient to stay until the question was put? If the authors of the said letters were such ardent opponents of the measure why did they not take the trouble to come and record their votes? Perhaps, however, I am doing Mr. Sargeant an injustice. It is possible he is suffering from a disease (*cacoethes scribendi*) which is mildly epidemic in this district just now. If this is so, may I suggest that he should let it run its course in the production of a new 'Chairman's Manual' rather than in impugning the *bonâ fides* of the Chairman of the Manchester meeting?

Manchester, February 19, 1898. William Kirkby.

Sir,—Probably many who, like myself, are merely Minor men would feel some diffidence in pressing their claims to membership, as it "was not in the bond" when they signed articles. Besides, if it is to be grudgingly conceded it will only be lightly esteemed. They have got on very well without it. What to my mind is of much more importance is the way in which many who are legally qualified are throwing away the advantage they possess by dubbing their establishments "stores," and so equalising themselves with the hopeless incapables who sail under that pirate flag. The good old title of "chemist and druggist" has been respectable more years than any other, and is quite good enough for yours truly,

London, February 11, 1898. One of Them (125/30).

Bacteriology for Pharmacists.

Sir,—Will you allow me to make a slight correction in your report of the discussion on my paper? In replying to Mr. Smith, I said horses were inoculated with diphtheria bacillus "toxin" (not the organism), in order to produce "antitoxin serum." The following particulars will make this quite clear. "A diphtheria toxin is prepared by growing a pure culture in alkaline beef broth at 37° C.; this operation takes three weeks. It is then filtered through a Pasteur-Chamberland filter and strength ascertained. This is done by finding the volume required to kill, within twenty-four hours, a guinea-pig weighing 500 grammes. This volume should be at or near 1/10th of a centimetre; if near this standard it is ready to commence immunising animals. Horses are used, as they yield large quantities of serum without injury to health. 10 C.c. is injected into a healthy horse; further injections are made from day to day, until so much as 200 C.c. can be injected without injury. When this point is reached the horse is immunised against the poison to such a degree that it would bear an injection of the living bacillus. All that is necessary is to collect blood from the animal with proper precautions, and reserve the serum for use." It will, I think, be obvious, as I stated at the time, that this is rather outside general pharmacy, and within certain limits this applies also to the physiological effects of formic aldehyde. As a general disinfectant its irritating properties render it objectionable, whilst its specific use for hardening tissues appears to me to supply a sufficient reason against its internal use in even the most dilute condition. From some biological experience and reasoning by analogy, the various mucous linings and delicate villous surfaces in the human body cannot, without injury, be exposed daily to unnatural chemical solutions. My condemnation of "domestic filters" is based on observation, that the average householder who buys a filter considers he has purchased a security against disease contamination, and does not expect (or is he informed?) it is necessary to take the filter to pieces and perfectly re-sterilise at least once a week; "domestic filtration," for manifold reasons, must always be impracticable. The community has a right to insist on the purity of all water delivered for consumption, as well as that milk shall only be drawn from cattle which

have passed the "tuberculin test" and are certified free from tuberculosis. At present it is to the farmer's interest to keep a diseased cow in milk as long as possible, for when killed it would be condemned as unfit for food. There, however, are important questions for general consideration and more likely to ripen when the public become familiarised with the "popular side" of bacteriology. I am obliged to Mr. Baldock for his friendly corroboration, and regret he had not the opportunity he desired of addressing the meeting. He will find I was not unmindful of the conveyance of disease by milk. So far as tuberculosis is concerned, the State can and should provide against it, but the conveyance of typhoid and diphtheria arising from carelessness in cleansing dairy utensils, etc., is beyond legislative control. The public demand "cheap milk," and anything "cheap" means the employment of "cheap labour," with its accompanying dirt, ignorance, and recklessness. A heavy penalty we know is frequently exacted for starvation prices; this argument may be applied with considerable advantage to "cheap pharmacy." Several correspondents I am unable to reply to individually, and will ask them to kindly accept this general explanation, that I did not find it practicable to compress into the time particulars of innumerable culture methods, media, and interesting laboratory experiments. My object was to bring the leading features of bacteriology to the notice of such of my *confrères* who hitherto might have considered this subject outside the province of pharmacy. To those (few in number I hope) who expected a more expansive reposition, I tender apology.

London, February 15, 1898. Leo Atkinson.

The Use of the Metric System by Pharmacists.

Sir,—When I find the editor of the British Pharmacopœia writing so recently as the 19th ult. recommending "*Festina lente*" as the motto for British pharmacists, and adding "that one or two generations will pass before the whole body of medical practitioners will prescribe in terms of the metric system," I think there is some justification for "a prominent Scottish pharmacist" characterising your contemplated action with regard to it as "premature," although I myself should not have chosen so to express my own opinion on the subject, as I think it would be better described as a decidedly forward policy, but one which can scarcely recommend itself to the great majority of your readers, unless you can assure them of the equally strong co-operation of some of the medical journals to endeavour to secure by voluntary means and within a reasonable time the general adoption of the new system in prescribing, for notwithstanding what you maintain, I am unable to see how chemists and druggists as a body can "act as pioneers of the metric system," and individual enterprise in this direction can only have a very limited influence. On the other hand, a very great deal might be done in say three years' time, independently of legislative inactment, by a voluntary and mutual agreement between prescribers and dispensers, and in view of the unpleasantness of working with two such totally different systems of weights and measures, I venture to think that the hearty support of the trade would be assured to any such movement. Then there is a tendency to minimise or to neglect altogether the importance and the urgent need for a full and accurate system of conversion tables for grammes and cubic centimetres. You say quite properly that this is a clumsy method of dispensing prescriptions written in the decimal system, but at the same time it is quite practical, and for many of us most expedient, besides that outside of the Pharmacopœia. In formularies, presciption books, journals, and elsewhere there is a large body of material which it might be desirable or necessary to express in terms of the new system. There is therefore nothing more certain than that proper tables of equivalents will occupy so important a place in the dispensary that their inclusion in the Pharmacopœia itself seems to be the natural corollary to the position the Medical Council have taken up in the matter, an arrangement for which there is abundant precedent in other official publications which deal with factors which are equally difficult of conversion. In connection with this subject I venture to enclose for your inspection the equivalents we have found it necessary to prepare for ourselves. Taken in connection with what precedes they may furnish you with helpful material towards maturing your own projected action, which will I trust be carried out in such a way as to command the interest and support of the whole trade.

Dundee, February 12, 1898. C. Cummings.

Sir,—Your recommendations respecting preparedness in the use of the metric system will doubtless receive the attention it deserves by all who are alive to their own interests. It is very certain educated customers will soon be ordering their goods by the gramme, etc., and it behoves chemists to be abreast of the times. As an ounce of practice is worth a pound of theory, would it not be a great help if you were to print the equivalents in all your reports, and also give test prescriptions with explanations for practice? as old fogeys will need help as much as apprentices, and this would be a great encouragement to work up the subject. Chemists do not like buying the weights and measure before they are stamped, and you might also use your influence, that that might be done at once, without waiting for the inspectors' standards.

February 8, 1898. A Provincial Chemist (125/26).

Public Dispensers' Association.

Sir,—May I, through the medium of your correspondence page, request any public dispenser who does not receive a copy of the rules of the Public Dispensers' Association by February 21 to write to me at this address? All public dispensers are cordially invited to attend the next meeting of the Association at the Bloomsbury Hall, Hart Street, on February 25, at 8 p.m., when Dr. Macnaughton Jones will give an inaugural address.

The Shuttleworth Club, Fye Foot Lane, Queen Victoria Street, E.C., February 15, 1898. G. F. Forster, *Co-Secretary.*

Dispensing Oil of Male Fern.

Sir,—A short report appears in your Journal of last week on a paper read by Mr. F. H. Alcock on "Dispensing Difficulties," in which he comments upon the use of compound tragacanth powder to form an emulsion with oil of male fern; he suggests the substitution of 5 grains of powdered soap in the 2 ounces of water. It would appear that he overlooked entirely the use of fresh mucilage or powdered gum acacia, both of which are recommended in the 'Companion' to which he refers. Acacia was formerly the only substance given in that work for emulsifying oil of male fern, but the use of compound powder of tragacanth could not be ignored, seeing that it has been recommended by several authorities for dispensing this oil, and it certainly answers the purpose, but does not produce quite such a nice looking mixture as acacia, which leaves nothing to be desired. Gum acacia is also distinctly better than powdered soap; it diffuses the oil much better than the latter, keeps it longer in suspension, and does not alter the colour of the product on standing. The best method of making an "elegant" draught with oil of male fern is to use very fresh mucilage made at the time, as in the formula given below, or to use the alternative method given in the 'Companion' under "Acaciæ Gummi," namely to rub the oil with the powdered gum and form an emulsion by the careful addition of water, which must be added in very small quantities at first. Haustus Filicis: Oil of male fern 60 minims; powdered gum acacia, 60 grains; peppermint water to 2 oz.; put the powdered gum into a mortar and make it into a thick mucilage by the addition of 90 minims of water, add the oil and mix thoroughly; whilst continuing the rubbing add carefully the water in small portions at a time until an emulsion is formed, and finally the remainder of the water.

London, February 17, 1898. P. W. Squire.

OBITUARY.

Brown.—On February 10, James Brown, Pharmaceutical Chemist, Birmingham. Aged 52.

Davison.—On February 11, Thomas Davison, Chemist and Druggist, Glasgow. Aged 67.

[Several Letters and Answers are held over.]

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Addison, Andrews, Atkinson, Baldock, Barker, Bayley, Bullen, Campkin, Carter, Cummings, Currie, Forster, Fox, Gamble, Hill, Holliday, Ingham, Jackson, Jones, Kirkby, Lewin, Lockerbie, Merson, Pearson, Peck, Sharman, Smith, Spooner, Stoke, Taylor, Tocher, Van, Vibert, Warrell, Wyatt.

"THE MONTH."

Artificial Indigotine. Synthetically prepared indigotine, according to O. N. Witt (*Chem. Ind.*, xx., 454), has passed the experimental stage, and is now likely to become a successful rival of natural indigo. It can be produced at a price comparable with good quality indigo and cheaper than refined indigo. There are several points in its favour, such as purity of product, fineness of division, and in its being readily tested; whilst the synthetic indigotine dyes wool equally as well as natural indigo, the former, through lack of impurity, does not answer so favourably with cotton until the cotton fibre has been impregnated with certain substances acting as mordants, such as Turkey red oil, glue, albuminoids, etc., but cotton so treated and dyed has a fine purple shade. For the manufacture of indigo extract and indigo carmine, synthetic indigotine is now exclusively used by one firm of manufacturers in preference to refined natural indigo.—*Journ. Chem. Ind.*, xvii., 41.

Separation of Mercury and Bismuth. The separation of mercury and bismuth salts can be accomplished, according to Vanino and Treubert (*Ber.*, 31, 129), by adding to the slightly acid solution of the mixture of mercuric chloride and bismuthic oxychloride an excess of a solution containing hypophosphorous acid and hydrogen peroxide, 1 drop of the former to 1 C.c. of the latter. The mercury separates in about one hour as calomel, which is filtered off, washed with dilute hydrochloric acid and cold water, then dried at 105°. The filtrate is warmed, after the addition of caustic soda to alkalinity, and the bismuth precipitated as metallic bismuth by the addition of a further quantity of hypophosphorous acid.

Rhodinol or Geraniol? Poleck maintains (*Ber.*, 31, 29), as the discoverer, with Eckart, of the alcohol $C_{10}H_{18}O$ in German and Turkish rose oil, the right to decide that the name rhodinol and not geraniol should be applied to this constituent of rose oil, notwithstanding that Bertram and Gildemeister have shown that the rhodinol of Poleck is identical with the alcohol of geranium oil and called geraniol by Jacobsen several years previously. The reasons for preferring the name geraniol to rhodinol have already been fully discussed in the Journal (see *P. J.*, 59, 417).

Malt Extracts. According to the results obtained by O'Sullivan (*Journ. Chem. Soc.*, 1876), the digestive action of diastase on soluble starch is not increased or diminished by varying the temperature up to and below 70° C. The only difference is in the relative proportions of the products formed. That is to say, at a temperature below 63° C. diastase has the same starch-converting power as at a temperature between 68° to 70° C., and *vice versâ*. The following results of O'Sullivan show this:—

	68-70°		below 63°
Maltose	17·40	..	67·85
Dextrine	82·60	..	32·15
Product	100·0	..	100·0

Therefore, the actual starch-converting power of a malt extract is the same whether tried at 70° or at 60°. It would be erroneous to state that a malt extract is better for yielding 67·85 per cent. of maltose, and 32·15 per cent. of dextrine at 60° than a malt extract giving 17·4 per cent. of maltose, and 82·6 per cent. dextrine at 70° when the starch-converting value of the malt extract is the same at both temperatures. Hence it gives a wrong impression to say that a malt extract forms 2·9 times its weight of maltose at 70°, and three times as much at 60° (see *B. M. J.*, Feb. 5, p. 383), when the potentiality of the malt extract is the same at both temperatures

Albumoses. The usual method of determining the amount of albumoses in meat preparations by precipitating with ammonium sulphate has many disadvantages in the course of the subsequent operations, especially when the amount of nitrogen in the precipitate is ascertained by Kjeldahl's process. Bömer has previously suggested zinc sulphate for the purpose, and Baumann and Bömer now find that the use of zinc sulphate is in every way more advantageous and quite as efficacious for complete precipitation of the albumoses, moreover, the subsequent separation of peptones, meat extractives, and ammonium salts, can be accurately carried out by precipitation in the filtrate with phospho sodic tungstate in the usual manner.—*Zeits. für Untersuchung der Nahrungs und Genussmittel*, 1898, 106.

Determination of Nitrogen. K. Wedemeyer endorses the statement of Gunning and others as to the advantage of the addition of potassium sulphate in the determination of nitrogen by Kjeldahl's method, as the reaction is so accelerated that the operation can be completed within one hour.—*Chem. Zeit.*, xxii., 21.

Romanium. This is the name given to a new alloy of aluminium with tungsten and nickel. It is comparatively light and resists acids well. It is said to have the consistence of good manganese bronze, and is extremely malleable; it contains 95 per cent. of aluminium.—*Scient. Amer.*, lxxviii., 51.

Density of Gases. T. Schlœsing has devised an ingenious method of measuring the density of gases, which is based upon the balancing of two columns in an apparatus consisting of two vertical tubes, each 1 M. long, communicating at their lower ends by a three-way tap. Carbon dioxide or some other easily absorbed gas of known density is passed into one tube and the gas to be examined in the other; after allowing them to communicate by opening the tap, a state of equilibrium between the two gases and the air is set up in about four minutes, and the level of the invisible surfaces of separation is then determined by absorbing the carbon dioxide with potash.—*Comp. rend.*, cxxvi., 476.

Testing Formaldehyde. C. E. Smith describes a modification of Legler's ammonia method for testing formaldehyde, which yields results closely agreeing with those obtained by the hydroxylamine, fixed alkali, and ordinary ammonia methods. The following is the method of procedure:—Dissolve 2 Gm. of pure neutral ammonium chloride in 25 C.c. of water and introduce the solution into a flask provided with a well-fitting stopper. Then add 2.25 Gm. of the sample, run in from a burette 25 C.c. of normal potassium or sodium hydroxide, add a few drops of solution of rosolic acid, and determine the excess of ammonia with normal sulphuric acid. Each 1 C.c. of potassium hydroxide solution used indicates 0·5 per cent. of formaldehyde. The ammonia combines with the formaldehyde nearly as fast as it is liberated, and the final excess is exceedingly small.—*Am. Journ. Pharm.*, lxx., 91.

Laudanum. C. Wolley Dodd asks why the name laudanum was transferred from the gum of the *Cistus* to a tincture of opium? That laudanum, ladanum, labdanum are different ways of spelling the same word there can, he says, be no reasonable doubt. Clusius, writing in the sixteenth century ('Rariorum Plantarum Historia,' p. 81), says "the gum of the *Cistus* is called in Greek and Latin ladanum, and in shops laudanum." Skeat ('Concise Etymological Dictionary,' p. 239) fully discusses the word laudanum, and shows that it is certainly the same as ladanum. Whilst recently reading the "Life of Paracelsus" in the 'Penny Cyclopædia," Mr. Dodd found

that this alchemist, before the middle of the sixteenth century, was the inventor of a wonderful panacea, which he called laudanum. In the dictionary at the end of his biography it is thus described :—"Laudanum Paracelsi est medicina *laude digna*, cx duabus tantum rebus constans, quâ morbos fere omnes curabat." As the same biography tells us that Paracelsus was the first to bring opium into general use as a medicine, and as the composition of laudanum was kept by him a secret, it is highly probable that it was a mixture of opium and the gum of the *Cistus*, which would operate powerfully as an anodyne, and become as universal a popular remedy as chlorodyne at present is in France. The words *laude digna* in the above passage show the probable origin of the absurd derivation *laudandum*, *i.e.*, "to be praised," which will be found given for laudanum in almost all old dictionaries.—*Gardeners' Chronicle*, xxiii., 166.

False Kola Nut.

Two years ago some false kola nuts came into the London market from San Domingo, and were identified as, probably, the seeds of *Mora excelsa* (*P. J.* [4], iii., p. 380). Mr. J. H. Hart, a corresponding member of the Pharmaceutical Society in Trinidad, writes to say that he has compared a specimen received from London and has compared it with the genuine seed of *Mora excelsa*, and finds that the peculiar form of the starch granules is the same in each.

Omphalea Megacarpa, Hemsl.

Mr. Hart also wishes to direct attention to the value of the oil obtained from the seeds of this euphorbiaceous tree as a purgative. The government chemist in Trinidad, Professor Calmody, has obtained from the seeds a beautiful bland, tasteless oil. Half the oil contained in a single seed is a brisk purgative, acting in about three hours, and not causing pain, and the action is of short duration. The seed is described as follows :—The shell of the seed is hard, rough black, and somewhat brittle, whilst the interior is edible and of sweet, nutty flavour, without any prominent characteristic. The fruit in which they are contained is some 3½ in. in diameter, and has a glabrous outside skin, which is a quarter to three-eighths of an inch in thickness, and somewhat pulpy and fibrous. Surrounding the seeds there is found a thin parchment covering, but this is partly aborted. Beneath this is a large quantity of starchy tissue, three-eighths of an inch in thickness. The seed alone weighed only 13·150 grammes, but the starchy pulp surrounding a seed of medium size weighed 31·175 grammes, fully 50 per cent. of which was found to be pure starch, having peculiarly irregular, partly triquetrous, and partly spherical grains, which adhere together in the first instance in masses of 10 to 20 grains, the triquetrous and irregular side inwards, and the rounded side outwards. The nuts are said to be eaten in the woods by travellers and hunters, and are hence known as the "Hunterman's nut." Unless the purgative principle can be driven off by heat, it seems more probable that the starchy part (? arillus) would be the edible portion. Mr. Hart has forwarded a few of these seeds to the Museum of the Society. The seed is without any disagreeable flavour, but has a sweetish taste like an ordinary nut. So prompt and agreeable a purgative, causing no pain and acting for a short time only, seems worthy of attention. Although this new species of *Omphalea* is at present considered to be rare, it may be pointed out that similar properties are attributed to the oil of *Omphalea oleifera* or tambor, a tree found at Acajutla, near Sonsonate, and described by Mr. Hemsley (see *Pharm. Journ.* [3], xiii., p. 301). There can be little doubt, therefore, that the trees of the genus are widely distributed over Central America. The fruit appears to be ripe in February and March.

Hydrocinchonine.

Dr. Hesse has been further investigating hydrocinchonine, which was first obtained by Caventou and Willm by oxidation of commercial cinchonine sulphate with potassium permanganate. It has already been pointed out that hydrocinchonine naturally exists with cinchonine, and can be separated from it in several ways, whilst the einchonine of *Remijia purdieana* has been found by Dr. Hesse to contain it in relatively larger quantity. The two mixed bases are best separated by converting them into platinum salts in a very slightly acid solution, so that the excess of hydrochloric acid does not exceed ¼ molecule HCl, and removing the flocculent hydrocinchonine salt from the granular platinum salt of cinchonine. Hydrocinchonine was then obtained by treating the platinum salt with ammonia and recrystallising from hot alcohol. Hydrocinchonine melts at 268° to 269° C., and has a rotatory power of $[\alpha]_D = + 204°{\cdot}5$ in absolute alcohol at 15° C. The sulphate $(C_{19}H_{24}N_2O)_2H_2SO_4{\cdot}12H_2O$, and sulphates containing 9, 6, or 2 molecules of water have been obtained. They all lose the water of crystallisation at 100° to 120° C. Hydrocinchonine sulphonic acid, $C_{19}H_{23}N_2O,SO_3H$, H_2O was obtained by dissolving hydrocinchonine in sulphuric acid (1·84 sp. gr.), allowing to stand 48 hours, adding water, and nearly neutralising with ammonia. The greater part of the sulphonic acid separates out, and can be recrystallised from boiling water. Dr. Hesse differs in several instances from Skraup's work on hydrocinchonine, and also objects to Skraup substituting the name "cinchotine" for that body.—*Annalen*, 300, 42.

Alkaloids of Lycoris Radiata.

Morishima has isolated two alkaloids from *Lycorisradiata*—lycorine, precipitated by sodium carbonate from sulphuric acid solution, and sekisanine. Lycorine, $C_{32}H_{32}N_2O_8$, forms large colourless polyhedric crystals, which turn yellow at 235° C., and decompose at 250° C. to a deep-brown resinous mass ; they are barely soluble in water, sparingly so in ether, alcohol, and chloroform. The solutions in acids give precipitates with the usual alkaloidal reagents. The gold salt is easily decomposed, and the platinum salt melts at 210°. $K_2Mn_2O_8$ in neutral solution furnishes a brown precipitate, which is dissolved with a fine fluorescence by an excess of hydrochloric acid. The fluorescence is also produced by dilute bromine water. The hydrochloride, $C_{32}H_{32}N_2O_8{\cdot}2HCl + 2H_2O$, crystallised from hot water in colourless bitter shining needles, melting at 208° C. It produces general paralysis on frogs, and death through paralysis of the heart muscles ; on warm blooded animals it gives rise to vomiting, diarrhœa, and finally collapse. No special influence is apparent on the arterial or respiratory organs. Subcutaneous injections produce no irritation. Sekisanine, $C_{34}H_{24}N_2O_9$ or $C_{34}H_{36}N_2O_9$, crystallises from dilute alcohol in long colourless anhydrous columns, which are odourless and tasteless, melting at about 200° C. It is scarcely soluble in boiling water, sparingly in ether, chloroform, and benzol, readily in alcohol. It is only partially precipitated from acid solutions by sodium carbonate and alkaline solutions, being soluble in excess of the latter. The platinum salt melts at 194° C. It gives no precipitates with the usual alkaloid reagents, and no fluorescence with bromine water, or $K_2Mn_2O_8$. Crystallised salts could not be obtained. Physiologically, it is quite inactive.—*Chem. Zeit. Rept.*, xxii., 13, after *Arch. Experiment. Pathol.*, 40, 221.

Peru Balsam.

K. Dieterich has obtained authentic samples of Péru balsam from Honduras which represent the pure natural product of the tree. The author distinguishes three qualities of the product, representing the first, second, and third flow respectively, mixed with a few traces of bark. The three

varieties differ from the commercial products by being much thicker, also much clearer and of darker colour, and having a more intense balsamic odour. The author contradicts the usual supposition that the same tree furnishes balsam of the same quality, since the three samples examined showed different ester numbers. The balsams examined furnished 77 per cent. of aromatic bodies (cinnamein, etc.), and only 13 per cent. of resin ester, while the commercial products never have more than 65 to 75 per cent. aromatic substances. The proportion of cinnamein differs to the same extent, and the residue insoluble in ether was found to be 4·38 per cent., or 1·5 to 3 per cent. more than those of the commercial products. On this basis a balsam having less than 65 per cent. of aromatic substances and more than 28 per cent. of resinous matter should be considered as doubtful quality.—*Berichte d. Pharm. Ges.*, 1897, 437.

Filtration through Cotton.

D. R. Dom strongly recommends absorbent cotton as a filtering medium, the chief advantage claimed for it being its rapidity of action, which renders it of special value in filtering preparations containing volatile or readily oxidisable constituents, such as medicated waters, spirits, and ferrous preparations. The difference in viscosity of preparations requiring filtration must be allowed for by greater or less compression of the cotton plug. As a general rule, however, the cotton should be rolled into a cone-shaped plug, which is then to be pressed down carefully into the neck of the funnel in such a manner that the bulk of the cotton remains in the body of the funnel. A glass rod is then pressed gently on the cotton and the liquid poured down the rod. In the case of fluid extracts and other preparations containing much suspended or sedimentary matter, cotton is not suitable for filtering purposes.—*Bulletin of Pharmacy*, xii., 54.

Glutamin and Ricidin.

E. Schulze has isolated glutamin, $C_5H_{10}N_2O_3$, from the etiolated germinating shoots of the castor oil plant, and also a new nitrogenous body, which he calls ricidin, and to which the formula $C_{12}H_{13}N_2O_3$ is given. It crystallises in small colourless prisms, melting at 193° C. Ricidin is present to the extent of 3·5 per cent. in the cotyledons, and a little over 1 per cent. in the hypocotyl and the root.—*Berichte*, xxx., 2197.

Comparative Structure of Leaves.

J. O. Schlotterbeck and A. Van Zwaluwenburg have undertaken the comparison of the structure of the leaves of *Datura stramonium*, *Atropa belladonna*, and *Hyoscyamus niger*, in the hope of determining their characteristic features, so as to help in their identification in the form of fine powder. Unbroken dried leaves when very brittle were soaked in 50 per cent. alcohol and then spread out, whilst before cutting sections they were transferred to 96 per cent. alcohol. The sections were mounted in chloral hydrate solution, which acts as a clearing fluid. Stramonium leaves appeared smooth, sinuate, unequal at the base, with round perforations, and a prominent midrib underneath; the belladonna leaves were broadly ovate, narrowed into a petiole, and the entire margin is smooth; hyoscyamus leaves were hirsute, deeply sinuous, and clasping at the base. The dry powders from the leaves were mounted in chloral hydrate solution direct. The stramonium powder contained elongated palisade-cells, stellate crystals, a few cubes, and thick-walled, warty hairs; belladonna powder contained large round crystal cells, full of crystal sand or acicular crystals; whilst hyoscyamus powder contained prismatic crystals and, occasionally, some stellate ones. —*Pharm. Archives*, i., 1.

Selective Stain for Fat.

For detecting fatty degeneration of the tissues Herman Rieder reports favourably of the method first recommended by Daddi, of Turin, of staining reactions of suspected organs with "Sudan III." Frozen sections give the best results, or those fixed in Mueller's fluid and glycerin. The tissues must not be hardened with absolute alcohol nor cleared in bergamot oil, cedar oil, or xylol, nor mounted in balsam. Glycerin only should be used. The tissues other than fat may be counter-stained in hæmatoxylin. A saturated solution of "Sudan III." in 96 per cent. alcohol is prepared, which is then diluted with two-thirds of equal volumes of water and alcohol. A few minutes' immersion is sufficient to stain sections, which should then be washed out in 60 to 70 per cent. alcohol. The coarse granules of the oxyphile or eosinphile bodies of the blood do not take the stain, thus affording additional proof that these bodies are albuminoid and not fatty.—*Deutsch. g. Archiv für Klin. Med.*, through *Intern. Med. Mag.*, vii., 59.

Tyrosin and Viper's Venom.

In the course of his researches on the venom of serpents, C. Phisalix has found cholesterin, extracted from biliary secretion, to exert a marked immunising action on the venom of vipers. He has followed this discovery by finding that the same property is shared by tyrosin. He has experimented with the pure substance, obtained by G. Bertrand from a species of *Russula*, and also from that derived from the juice of dahlia tubercles. Although the injection of a small quantity of tyrosin suspended in water allows an animal to subsequently receive a lethal dose of viper's venom without harm, it does not, unfortunately, have the same effect when administered subsequently to the poison; in this case death is merely retarded for some hours. The effect of dahlia juice is remarkable, since it is more markedly antagonistic to the serpent venom than can be accounted for from the amount of tyrosin it contains. It is the first instance in which a vegetable juice has been found serviceable as a vaccine to snake poison.—*Comptes rendus*, cxxvi., 431.

Röntgen Rays and Bullet Wounds.

The eminent German military surgeon, Professor Von Bergmann, does not consider that the Röntgen rays will prove of very great service in the treatment of bullet wounds where the projectile is still left in the wounds, since he points out that the bullet, *per se*, is generally harmless, as it is usually aseptic. The danger of such wounds arises not from the bullet, but from small particles of septic matter, such as cloth, which it carries into the wound in its course. Removing the bullet shortly after an injury would still leave such germ-harbouring substances in the track, and by cutting down upon it the entrance of air into the wound would be facilitated, favouring the growth of pyogenic organisms.—*Med. Rev.*, through *Inter. Med. J.*, vii., 15.

Novel Vacuum Tubes.

Professors Trowbridge and Burbank, in their interesting paper on the source of the x-rays (see *ante*, p. 140), describe a novelty in vacuum tubes depending upon the abolition of the space between the anode and cathode. A continuous wire passes through the exhausted tube, and the tube itself is placed in a circuit containing a spark gap and a Trowbridge rheostatic machine, which is charged by means of a battery of ten thousand storage cells. The condensers of the machine are charged in parallel and discharged in series, the voltage obtained approaching a million. As a result the tubes glow all over with a brilliant phosphorescence, and *x*-rays are freely given off. A beam of cathode rays can be reflected upon the wall of the tube by means

of an aluminium mirror attached to the wire inside, and *x*-rays can then be detected outside the tube, opposite the fluorescent spot caused by the mirror. Moreover, the beam can be deflected by a piece of tinfoil stuck on the tube over the fluorescent spot. There is no distinction apparent between anode and cathode rays at extreme exhaustions. The *x*-rays are given off both when the wire constitutes the cathode of the circuit and when it forms the anode; it is suggested, therefore, that the term electric rays might be a more comprehensive one than either cathode rays or *x*-rays.—*Phil. Mag*, xlv., 185.

Ripening of Cheese.

H. L. Russell and S. M. Babcock consider that profound changes of a physical and chemical nature, which occur in milk from which bacterial fermentations have been excluded, are of a non-vital character and due to the presence of ready formed enzymes in the milk as obtained from the cow. Moreover, they have separated out proteid converting enzymes, and proved that they exert a curdling as well as a digesting function when applied to milk. They believe, therefore, that the ripening of hard cheese is caused by the joint action of bacteria and enzymes.—*Nature*, lvii., 373.

New Hydrostatic Balance.

Dr. B. W. Gerland describes a new hydrostatic balance, the beam of which has two knife-edges of steel working on agate planes, the end one being placed parallel with the central knife-edge. The divisions are sharply cut and the riders have a V-shaped edge, so that they necessarily fall into their true position without loss of time. The horizontal arm of the stand carries a circular spirit level, in addition to a divided arc, and two levelling screws in the feet serve to adjust the position. The end knife-edge supports a stirrup suspender with an agate plane, to which the platinum wire of the sinker is hooked. An instrument provided with a Reimann's sinker, displacing 5 Gm. of water at 150° C., works accurately to the fourth decimal.—*Journ. Soc. Chem. Ind.*, xvii., 13.

Oat Smut as a Pigment.

D. Paterson recommends the use of the deep brown or sepia-coloured spore dust often seen on cereals as an artist's pigment. Twelve heads of smutty oats yielded 6 Gm. of the dust, and this was mixed with gum and water to form a water-colour pigment, after a preliminary moistening with a few drops of alcohol. The pigment is not appreciably affected by light or air, even when exposed for several months, and with mild diffused daylight—such as that of an ordinary, well-illumined room—the colour remains quite fast and unaltered. In its deepest tones it is of a fine sepia shade, deepening to a brown-black, and on diluting with water or Chinese white, pleasing tints of a flat brown, of the pheasant-egg cast, are obtained.—*Nature*, lvii., 364.

Insects and Poisons.

W. A. Dixon records a case in which wheat poisoned with strychnine was devoured by weevils with impunity, his note being called forth by a reference to the caterpillar of the Spurge Hawk Moth, which feeds exclusively on the exceedingly poisonous Sea Spurge. It is suggested in the same paper that the reason certain insects are so little susceptible to powerful poisons is probably the fact that they are less highly organised than animals to which the same substances prove fatal. Dr. T. R. Fraser has shown that the caterpillar of *Deiopeia pulchella* is unaffected by the eserine contained in the kernel of the seed of *Physostigma venenosum*, which it feeds upon, though the same insect is quickly killed by means of hydrocyanic acid. On the other hand, a weevil named *Anthonomus druparum* is alleged to be unaffected by the last-named poison, because it feeds with impunity on the kernel of *Prunus cerasus*. The question arises, however, whether or not hydrocyanic acid enters as a factor into the last-mentioned case.—*Nature*, lvii., 365.

Thyroid as a Galactogogue.

From observations on a few cases Dr. Stawell is inclined to attribute a marked galactogogue action to thyroid extract. In a communication to the *Intercolonial Med. Journ. of Australia*, he states that in certain cases its effect is very marked, and the milk secreted appears to be perfectly normal in character. No alteration in the diet or habits of the patient were made during treatment.—*Therap. Gaz.*, xxii., 49.

Isolation of Bacillus Typhosus from the Soil.

Availing himself of the well-known fact that *B. typhosus* is an extremely mobile organism, Sheridan Delépine has been able to isolate it from the soil of privy pits, an extremely unfavourable source, by the following device. A small quantity of the filth was placed at the bottom of a sterile test-tube, another smaller tube with a pin hole at the bottom was inserted into the larger one, and ten C.c. of alkaline peptone bouillon cautiously introduced. The tubes are plugged with wool in the ordinary way and incubated at 37° C. Drops of fluid from the inner tube were then removed and cultivated. It was found that the motile Erbeth bacillus had the power of penetrating the aperture of the inner tube, and thus a purer culture was obtained from the liquor contained in it.—*Pub. Health*, x., 155.

Prescribing Methylene Blue.

Dr. Harrington calls attention to the importance of care on the part of prescribers when ordering this remedy that the name should be written in full, and not contracted to "methyl. blue." He quotes a case in which poisoning occurred where a prescription was written "methyl. blue, 3 grains" instead of "methylene blue." Pyoctanin, Merck's methyl blue, was supplied, and produced purging and vomiting. Prescribers should be aware that methyl blue and methylene blue are two totally distinct bodies, and that only the latter is suitable for internal use.—*Canad. Pract.* through *Therap. Gaz.*, xxii., 44.

Value of Antiseptic Soaps.

M. Curzio relates his experiments on the value of so-called antiseptic soaps, basing his results on the effect of the soap on *B. pyogenes aureus*. He finds that 1 per cent. *sublimate soft soap* is neither aseptic nor antiseptic even after twenty-four hours' contact with the micro-organism. *Sublimated hard soap* is but little more active. *Carbolic soap*, 10 per cent., has no antiseptic action whatever, but *salicylic acid*, 3 per cent., and *boric acid*, 5 per cent., soaps are aseptic and antiseptic, the former being the most powerful, arresting the development of the micro-organism after a few minutes' contact.—*La Semaine Médicale*, through *Therapist*, viii., 9.

Low Temperature Thermometer.

Kohlrausch has found an easy solution of the difficulty in obtaining a suitable liquid for filling thermometers intended for the measurement of very low temperatures. Alcohol congeals at −100, toluol only a very little lower. Ordinary petroleum ether, however, is stated to be applicable as low as −190, the boiling point of liquid air, without congealing.—*Pharm. Ztg.*, xlii., 772.

Acerdol.

The compound named acerdol, to which Foerster, its discoverer, attributes the formula MnO_2K_2KOH, is obtained by oxidising manganese and potash, and dissolving the resulting compound in water, and crystallising after concentration. Acerdol forms brilliant crystals, which give a green solution with water.—*Petit Mon. P.*, xlviii., 2766.

DAVIESIA LATIFOLIA.

BY J. BOSISTO,
Victoria, Australia.

In directing attention to this plant, as a suitable subject for investigation, I may mention that I have learned from repeated statements by persons resident in the districts where the plant abounds, that its infusion has proved to be a remedy for hydatids, low fevers, etc. Whether this be so or not it is not for me to assert.

The plant being in bloom during the past and present months (September and October) a favourable opportunity was offered for its examination. This I have made, and deeming its characters somewhat out of the ordinary run of vegetable tonics, I have taken upon myself to forward a parcel of the plant to the Pharmaceutical Society's Museum for further examination. It is indigenous to Victoria, Australia, and belongs to the sub-order Papilionaceæ, of the extensive N. O. Leguminosæ. This order, says Lindley, "is not only among the most extensive that are known, but also one of the most important to man, whether we consider the beauty of the numerous species, which are among the gayest coloured and most graceful plants of every region, or their applicability to a thousand useful purposes."

Almost in every part of the known world species of one or other of the sub-orders of this family of plants are to be met with. They appear to be distributed in extremely unequal proportions over the earth's surface. According to the table given by the author just quoted, the far greater number of the species are indigenous to the tropical parts of America, the Cape of Good Hope, and throughout Australia. The species of the genus *Daviesia* belonging to Australia have received but little investigation under phytochemical analysis. We have, therefore, in this genus alone a field for interesting work.

R. Brown, in his 'Prodromus of the Flora of New Holland,' named this genera *Daviesia*, in honour of the Rev. Hugh Davies, a Welsh botanist. The name which this plant commonly bears among the country people in the districts where it is found growing is similar to that given elsewhere to other bitter plants similar in appearance to the present one, as for instance, the Goodenias. It is termed the "Native Hop Bush," not that it resembles the well-known *Humulus lupulus* climber, but possibly derives its name from its bitter taste resembling that of the hop. It is regarded by the selector of land (although a low-growing shrub) as a weed, and being difficult of extermination the land if possible is avoided.

Many species of Daviesia are mentioned in volumes of the late Baron von Mueller's 'Fragmenta Phytographiæ.' The botanical and physical characters may be briefly stated as follow: The shrub grows in height from two to three feet, the leaves are abundant from top to bottom, and are of a bright green colour, each strongly veined and from one to three inches long, rising irregularly from the stem by a petiole of about half an inch in length. The peduncles are axillary, solitary, and many flowered. The flowers are as the sub-order indicates, pea-shaped, very minute, of a bright golden hue on the outer portion of each petal, and of a dark purple in the inner part. The legumes are in shape triangular, containing in each one or two seeds, bean-shaped, very small, and spotted purple and brown. The whole plant is bitter, the leaves and flowers especially, the stem but slightly; the bitter is not unpleasant, but very persistent on the palate. It grows abundantly on lands of a light loamy and sandy character at the foot of the Dandenong Ranges, some twenty miles from Melbourne, and extends into the hilly districts of Gipps Land, Victoria. The late Baron von Mueller mentions that it is to be found in parts of Tasmania and New South Wales, but not in South Australia or Queensland.

The cursory examination of this plant carrics a convincing impression that it should not be left alone in the wild bush without further investigation. The bitter crystalline principle is obtained with remarkable ease, and, together with the semi-volatile oleo-resin remaining, gives the full chemical character of the plant. The crystals are soluble in warm water, also in weak spirit. The method of obtaining these principles is as follows: The leaves (and flowers if in season) are infused in cold water, gradually increasing the temperature up to 190° F., and the infusion allowed to remain in this condition for about two hours, strained, and allowed to cool; the sediment found at the bottom is filtered off and then evaporated very slowly at a low temperature to about one-half; the liquid is then placed in an evaporating dish, and allowed to remain quiescent for two or three days. Crystals will, in the meantime, form on the surface, and fall to the bottom of the dish; these are removed and the liquid evaporated further but slightly; a further crop will be obtained. The oleo-resin remaining will be found to have a bitter taste.

In conclusion, I would like to say that for medical uses (if our bushmen and settlers are any guide) the infusion to the extent of a teacupful two or three times in a day is the best mode for its administration for the purposes herein indicated.

Examination of the Crystalline Substance obtained from Daviesia Latifolia.

BY DR. B. H. PAUL AND A. J. COWNLEY.

The crystalline substance received from Mr. Bosisto as representing the bitter crystalline principle of *Daviesia latifolia* was examined primarily to ascertain as far as was possible with the small amount of material at our disposal—1·5 gramme—whether it was a new and definite body, and therefore sufficiently interesting to warrant its extraction in larger quantity for further examination.

It was a bitter neutral substance readily soluble in hot water, crystallising out on cooling in the form of fine white needles, which were rendered anhydrous at 100-120° C. It was insoluble in ether, soluble in boiling chloroform and readily dissolved by weak alcohol, from which it was left as an amorphorus residue on evaporation, but soon crystallised on the addition of a little water. It was soluble in caustic soda, and re-precipitated apparently unchanged by acids. On purification of the original crystals by re-crystallisation from water the substance still retained its bitter taste and had a constant melting point, after having been dried at 120°, of 146° C. Fusion with sodium gave no indication of nitrogen. It did not reduce Fehling's solution until after hydrolysis by boiling with acid. Its aqueous solution was precipitated by ammoniacal lead acetate, but not by neutral lead acetate.

These results point to the crystalline substance sent by Mr. Bosisto being either of a glucosidal character or of the nature of a plant sugar, as many of the above reactions are common to both classes of bodies. The persistent bitter taste, after re crystallisation from water, unless it could be eliminated by further purification, is certainly in favour of the crystalline substance of *Daviesia latifolia* being a glucoside.

From the small quantity of leaves deprived of flower and stem, amounting to 100 grammes, also received from Mr. Bosisto, we were not successful in obtaining the crystalline body by extraction with water in the manner described by him, owing to the fact that water extracted other substances, which always, more or less, hinder crystallisation of many plant principles when operating on a small scale, but no doubt by a more suitable method, which might be suggested by some of the reactions obtained in the course of this investigation, it could be more readily obtained.

The crystalline substance and the plant itself are of sufficient interest to require further investigation, more particularly to determine whether the medicinal action ascribed to the leaves is to be attributed to the crystalline substance or to some other bitter principle, and this inquiry we hope to continue on receiving a larger supply of the leaves.

FLUID EXTRACT OF LIQUORICE.*

BY PETER BOA.

Some months ago I was accidentally led to give consideration to the subject of liquid extract of liquorice. A brother pharmacist in my hearing impugned the efficiency of our pharmacopœial process for its preparation, and said we were behind other countries in our official method. Having a strong conviction that our Pharmacopœia—much abused though it be—is not in its practical aspect second to the corresponding book of any country, I took the liberty of questioning the statement. Since then I have from time to time, as limited leisure permitted, looked into the subject and carried through a few experiments for my own satisfaction. The subject became interesting, although I have not yet gone very deeply into it. I can scarcely hope that you will follow my description with the same interest, experimental work of even the mildest sort being always more entertaining than bare narration of what has been done. Besides, this fluid extract is generally regarded as unimportant.

A look at the official process for its preparation will show that the method is somewhat different from the process adopted for any other fluid extract in the Pharmacopœia. I may be pardoned for reminding you that it is a process of double maceration with cold water, heating to boiling-point, straining, evaporation to a specified gravity when cold, and preservation by spirit. Two points deserve notice as being characteristic of this fluid extract. One is that it has to be evaporated so that, when cold, it shall have a specific gravity of 1·160; the other is that only one sixth of its volume of spirit has to be added, presumably to preserve it. In short, the object is to extract the sweet principle with water, which at the same time takes out albuminous and mucilaginous matter; to coagulate the albumin by heat and remove it by straining, and finally, for preservative purposes, to add the spirit which still further clears the extract by throwing down part of the mucilaginous matter.

Many years ago, at an evening meeting in London, so good an authority as Mr. Charles Umney stated that the process was in principle a sound one, and with this observation my experience leads me entirely to agree. In some respects objection may be taken to it, but these are only matters of detail. In working it is a very "messy" process, and the quantity of spirit is not sufficient in all cases to preserve it. Evaporation to a specified gravity when cold is also a troublesome feature. Percolation naturally suggests itself as a remedy for the trouble of double maceration and expression. If the weather be warm, however, sufficient percolation cannot be accomplished quickly enough to prevent fermentation beginning in the percolate and giving rise to loss of sweet principle. Evaporation to a given gravity is no doubt designed to permit of the manufacturer using any sort of root, some roots being so poor that evaporation to a given volume would yield a very poor extract. The quantity of spirit ordered has always been with me sufficient for preservative purposes, but I have frequently been told that it is not enough. Storage, or climate, or preparation from a root with a relatively large proportion of mucilaginous matter, may account for its failure. Samples of extract that have gone wrong in this way invariably have a very acid reaction, and throw down a deposit. The expressed liquor, previous to evaporation, is not acid, but neutral, and so long as it remains so it does not deposit. If the liquor be allowed to stand until acidity appears, deposition of sweet principle begins. Reference to the processes of other countries shows that some follow our method, while others use ammonia or alcohol, or both together, in the menstruum which they employ. The United States official process orders a menstruum consisting of dilute alcohol, with 3 per cent. of water of ammonia. Having prepared some fluid extract according to this process, I found it compare very unfavourably in taste with our fluid extract. It had a very acrid bitter flavour, which quite overpowered the sweetness; ours, on the other hand, possessed a sweet mellow taste, free from acridity and with only a faint bitterness. If we bear in mind that the root contains, besides the sweet principle, an oleoresinous acrid substance and a bitter principle, both more soluble in alcohol than water, this is only what we might expect. The use of ammonia is based on the circumstance that the sweet principle is a salt (glycyrrhizate) of ammonia, and exists in the root as such. The use of ammonia in the menstruum is presumably to improve upon nature; on what theory the use of alcohol in the extracting fluid is based I fail to apprehend.

Professor Remington ('Proceedings of the American Pharmaceutical Association,' vol. xxvi.) gave in 1878 the result of a series of experiments with different menstrua carried out to "ascertain the best menstruum, and to discover the bearing that an addition of solution of ammonia to the menstruum would have upon the finished product." The results led him to conclude that the addition of ammonia very perceptibly diminished acridity (of a fluid extract made by an alcoholic menstruum), and increased the quantity of glycyrrhizin (in one sample nearly 50 per cent.). Since then ammonia has commanded great respect in connection with liquorice. It is worth noting, however, that the increase of glycyrrhizin and decrease of acridity in Professor Remington's experiments are coincident with the increase of water in the menstrua which he employed.

In order to ascertain how the addition of ammonia to the menstruum used in our Pharmacopœia process influenced the resulting extract I prepared several batches, in the making of which ammonia was used in varying proportions. For convenience I used crushed root, extracted by percolation, heated the percolate to 212° F., strained, evaporated the liquor from 16 ounces of the root to 12 fluid ounces, added 4 fluid ounces of rectified spirit, allowed to stand a day, and filtered. For comparison I made corresponding extracts by percolating with cold water and finishing by exactly the same routine. Both sets were prepared from the same root and care taken to secure impartial treatment during the process. The same amount of percolate was taken from all of them. On estimating the quantity of dry extract obtainable from the percolates previous to treatment, I found that from 10 to 12 per cent. more was afforded by the ammoniacal percolate than by the purely watery percolate. However, after conversion into fluid extract had been completed, and time allowed for "settling," the precipitate or thrown-out matter, resulting from the addition of the spirit, occupied almost double the space taken up by the corresponding deposit from the aqueous extract. This bulky deposit was, moreover, sludgy in character and rendered filtration difficult. The actual yield of finished fluid extract was smaller than that obtained by the other method. Compared as to specific gravity, the two extracts were practically identical, *e.g.* :—

* Read at an Evening Meeting of the Pharmaceutical Society in Edinburgh on Wednesday, February 16.

1	with water and ammonia, specific gravity	..	1·050
2	,, ,, ,,	..	1·050
3	with water only ,,	..	1·052
4	,, ,,	..	1·042

In order to compare the two products as to appearance, flavour, and volume of sweetness, one fluid drachm of each was diluted with water to an ounce. The dilution from the ammonia extract had a much darker and richer colour than that from the aqueous extract. In volume of sweetness, however, it was distinctly inferior, and its flavour thin and wanting in character. In this test I did not depend on my own palate but had the opinion of several other pharmacists, who unanimously confirmed my opinion. The use of ammonia in the menstruum employed in the preparation of fluid extract of liquorice appears to me therefore to be not only unnecessary, but distinctly objectionable. It alters the character of the taste of the extract, while it does not, in my opinion, increase the yield of sweetness. In regard to this latter statement, I can by a very simple experiment bring home to you its reasonableness. I have here a percolator containing a quantity of liquorice root which has been well exhausted with water. On passing through a little more water you can see that it runs almost clear, and it has a very faint taste of sweetness. Now, letting some ammoniated water run through, you see that it comes away quite dark in colour. It must be noted, however, that this dark liquor has not any more sweetness than the clear percolate obtained when water only is passed through the marc.

Ammonia, although objectionable in the liquid used in the process of extraction, may be employed with advantage in another way. I have said that percolation as a means of exhausting liquorice root is open to the objection of not being rapid enough to let exhaustion be sufficiently completed before acidity develops in the percolate. Having observed that ammoniacal percolates did not exhibit the same tendency to throw down a deposit of glycyrrhizin as was shown by the watery ones, it occurred to me to add ammonia to the aqueous percolate just in sufficient quantity to maintain alkalinity while percolation was proceeding. This procedure I found to be extremely convenient. It quite prevented the loss of sweet principle while percolation was going on, and relieved one from anxiety as to hurrying the operation. Later, I carried the use of ammonia still further. The fluid extract prepared by the official method usually gave when finished a faintly acid reaction. I added ammonia just in sufficient quantity to carry it over the border line of neutrality into alkalinity. That, is I do not use ammonia in extracting the sweetness but in keeping it when I have got it. The best extracts which I have prepared have been made in this way. So long as the alkalinity is main tained there is no falling of the dirty-looking deposit which is often seen at the bottom of the fluid extract of liquorice bottle.

In some of my comparative experiments I used a larger quantity of spirit than is directed by the Pharmacopœia for the official extract, and I observed that I obtained a cleaner extract, that is, more free from mucilaginous matter which is more completely thrown out by the increased spirit than it is by the quantity ordered in the official process. Apart from the question of preservation an increase in the quantity of spirit seems advantageous.

My conclusion is that water is the best menstruum for extracting the sweetness of liquorice. If percolation of a rougher powder were substituted for double maceration and expression of the root in No. 20 powder, as directed in the official formula, it would make the process less messy. Ammonia might be judiciously employed in the way I have indicated to prevent loss of sweetness. And a slight increase in the spirit would make sure work of preservation, and produce a cleaner extract.

A NINETEENTH-CENTURY GOLD FACTORY.

BY ADOLF G. VOGELER, PH.G. (CHICAGO, ILL.).

That which but yesterday would have been pronounced the height of absurdity to mention even as a possibility is to-day, in the year of our Lord 1898, on the very threshold of the twentieth century, a solemn fact—there is in existence and in full operation a large, well-equipped manufactory for the making of gold and silver out of baser material. For the benefit of future historians who may be called upon to write the chapters on the history of chemistry and the evolution of psychological phenomena in the nineteenth century it may be profitable to examine and record the facts as they appear on the surface.

Early last year there suddenly came to the surface a man by the name of Edward C. Brice (a Scotchman, and a distant relative of Senator Calvin S. Brice), understood to be a practical metallurgist and prospector, who startled the world by making application in Washington for a patent on a process for making gold by transmutation. The patent was denied on the grounds that by the process described no more of the noble metals could be obtained than was residually present in the material operated upon.* Little further was heard until recently, when in this city (Chicago), at the intersection of 39th Street and Lowe Avenue, there was opened for work a factory for the creation of gold and silver out of antimonial ore; and this factory is in full operation at the time of writing. This interesting spot, armed with a letter of introduction, was lately visited by the writer, accompanied by Professor C. S. Hallberg of the Illinois University School of Pharmacy.

The concern is incorporated as the National Metallurgical Company, with a capital of 75,000 dollars, divided into shares of the face value of 10 dollars each. Mr. Brice himself holds the office of president, while a Mr. E. E. Shaw is secretary and treasurer. The stock has not been placed on the open market, but there is said to be at least one person who is selling shares at 250 dollars, or just twenty-five times the subscription basis. One of the stockholders, an intelligent lawyer, claims to have refused 10,000 dollars for his holdings, representing 1000 dollars, and which in all probability cost him nothing. Mr. Brice professes to discourage this kind of gambling, but report has it that the individual in question seems to experience no trouble in obtaining as much of the stock as he may require for customers. Of the capital stock 40,000 dollars is supposed to be invested in antimony lands in southern Utah, and 25,000 dollars in the factory, leaving 10,000 dollars reserve for incidental expenses. Why the happy mortal possessed of the real philosopher's stone should find it necessary to raise money upon stock certificates is one of those things no fellow can find out—as Lord Dundreary is in the habit of saying.

Entering the front door of the barn-like structure, the visitor stands in a small vestibule and is accosted by a man peeping through a small opening in the partition, at whose right suggestively reposes a glistening repeating rifle. Once inside, a well-appointed smelting works is discovered. There are tons of stibnite just from the mines and a mill for grinding the ore; there are heaps of scrap iron, lead scraps, and charcoal; the centre of the place is occupied by a battery of modern bricks, encased reducing furnaces. All the flues from these furnaces run into an underground tunnel which ends in the factory-yard in a long coil of heavy iron pipe, probably two feet in diameter and at the end of which is located a suction fan, the pipe finally opening into a

* The real reason, according to Mr. Brice, was that the authorities feared a monetary panic. To the writer Mr. Brice has said the patent was not denied, but the application was withdrawn.

dust-proof chamber. The observer also discovers long rows of cupels. The capacity of the plant is given at 10,000 lbs. per day.

As partially witnessed, and further explained by Mr. Brice, the process gone through is briefly as follows:—The ground stibnite is placed into one of the furnaces, whence the volatile constituents pass into the tunnel. In the exposed pipe in the yard the vapours are condensed, and the fine powder is gathered in bags in a closed chamber, or bag-house, at the other end, the carbon dioxide and other gases passing off into the outer air. This powder, chiefly oxide of antimony, is mixed with clay and water, the mass is formed into bricks, and the ore subjected to the heat of a furnace for forty-eight hours. On being broken these bricks show a crystalline structure of variegated colour; and this, the inventor says, is the first stage in the evolution, the result of the intense heat, alleged to be 5000° F. The bricks, after being ground, are shovelled into a furnace, covered with scrap lead, and roasted for thirty minutes. The product is a crystalline metal said to contain whatever noble metals have been created out of the original antimony. Broken into small lumps this metal is packed in graphite crucibles, covered with a charcoal compound, spoken of as a flux, and once more subjected to a temperature of 5000° F. for forty-eight hours. The composition of this "flux," be it said, is the one secret of the inventor which he declines to divulge, and he mixes and applies it personally, "because of its explosive nature and because he knows how to handle it properly." The results are a slag and a brilliant crystalline metal—antimony, which latter is supposed to contain the precious metals in a concentrated form. This goes into scorifying pots with litharge, and, lastly, is treated according to the ordinary refining and cupellation process for extracting gold and silver.

In reality the foregoing is the process as detailed in an article in the *Tribune* which Mr. Brice pronounced to be substantially correct. His verbal explanation differed somewhat. After coming from the bag-house, he said, the oxide of antimony is mixed with sulphur, made into a paste with water, and this is heated in a second furnace; the resulting mass, reduced to powder, is then heated with the flux, then comes the heating with lead, and finally the gold is extracted as before stated.

Mr. Brice was closely questioned as to his theory on the subject, but he failed to commit himself, adroitly evading all these questions, excepting that he claimed that no substance which could be obtained in non-gaseous state is an element, but is a compound, and, further, that he was "not yet prepared to make public his theory of the transmutation of metals and the philosophy of his process." He admitted not being a chemist, and he had not heard of the experiments of Dewar and others in reducing the so-called permanent gases. "If the atmospheric gases have been solidified," he said, "well, then, they must have formed some kind of compound or other." He is not as yet decided as to whether oxygen or sulphur play the more important rôle in the transmutatory process. He further said: "How much gold and silver I succeed in creating out of antimony, and whether the operation is remunerative, concerns the stockholders alone; the only thing of interest to scientists and the public is the fact that I do create these metals."

To newspaper reporters and capitalists not versed in chemistry, our alchemist has expressed himself freely, however. To quote from the *Chicago Sunday Tribune* of December 12 last: "He depends almost entirely upon a decomposition of the atomic properties of the antimony and a radical reconstruction as a new body under the influence of intense heat and the free admission of atmospheric oxygen. This is nature's process, and is exemplified in the volcanic action by which most of the gold existing in a natural state was formed. Long study of Montana mines and careful research of scientific works gave rise to the belief that at some long-ago period tremendous convulsions of subterraneous gases threw up from the earth's interior some metallic substance, which underwent a transmutation into gold. What this may have been is not known, but antimony is selected as a likely material, mainly because it is found in considerable quantity in many forms of gold ores." The strong proof advanced by him that gold is a compound body is the fact that it requires a combination of two different acids to effect its solution. Mr. Brice has made a special trip to Mount Vesuvius "with the hope of being able to reproduce its action in a furnace." In conformity with this theory he calls his furnaces "vulcanic furnaces," and speaks of "vulcanic heat."

According to the *Tribune* a specimen of the artificial bullion, taken by its reporter at random, was assayed by Messrs. Weis and Gibson, professional assayers of this city, and they reported a yield of 3·62 dollars in gold and 13·26 dollars in silver, 16·88 dollars in all, to the ton. This same firm made a test of bullion supplied by Mr. Brice last spring, which indicated 86 dollars in gold and 13,714 dollars in silver to the ton. Mr. Brice claims to produce gold ranging in value up to 3900 dollars to the ton. Mr. Robt. C. Hunt, of the assayer's firm of Hunt and Co., is reported to have said that he has purchased antimony absolutely free from gold and silver, that he has treated this according to Brice's method—laboratory formula communicated to him—and that he has actually found small amounts of the precious metals, as though they had been created.

Mr. Brice claims it to be in his power to interrupt the process at any stage, and so, pure antimony being a saleable commodity, he finds it profitable not to convert all into gold and silver, but to leave some to be sold for use in type metal, Babbitt's metal, Britannia, etc.

Mr. Brice received his visitors hospitably, and displayed an apparent readiness to give all legitimate information in his power. But the close observer found him an unwilling witness, afraid, apparently, to speak in the presence of men whose knowledge of chemistry would readily uncover any attempt at exploiting a pseudo-science, with which laymen are so easily dazzled and bamboozled. He was decidedly guarded in his language, and while speaking in a straightforward manner, there was that peculiarity about his gaze which, in German, is described as a "veiled eye," that something which seems to hide from you the soul and thoughts behind the visual orb.

After taking everything into careful consideration, the writer has arrived at a theory substantially as follows: Mr. Brice, as a prospector, has become acquainted with a mine of antimony ore of very good quality and unusually auriferous. He has worked out an improved process for producing pure antimony. He has found a means, perhaps, of extracting from this ore proportionately more gold and silver than was hitherto practicable. He produces enough pure antimony at a cost to make, apparently, the undertaking profitable. He does not, as alleged, get his precious metals out of the distilled oxide of antimony, but extracts them from the slag of the initial roasting. If a crucial test becomes imperative the secret "flux" furnishes sufficient opportunity for introducing as much gold as the exigencies of the case may require.

No one should presume to pronounce the transmutation of one element into another an impossibility, but it seems an infinite improbability. At any rate, we would expect first to see transmutation accomplished in the case of closely-allied elements, such as nickel into iron, for instance. A far more plausible proposition is that of Emmens, of New York, who pretends to convert silver

into gold by doubling its molecular weight by hammering, the consequent rise of temperature being obviated by appropriate means. This, at least, sounds plausible, even if it be not true as a matter of fact.

After the foregoing was written there has appeared in the *Western Druggist* a lengthy communication from Mr. Brice himself, in which he tries to defend himself and show how he came to make his discovery. He also gives a sort of theory, partially covered, in this paper. And to prove his sincerity he makes public his formula—laboratory formula he styles it—for producing gold from antimony on a small scale. Here is what he says :—

"I herewith give you the formula, which, if you so desire, you can have tested by any responsible and well-known chemist. This formula is incorporated in an application for patent in the United States patent office and elsewhere, and is commonly known as the laboratory formula :—

"Take five (5) parts chemically pure antimony, (ten (10) parts sulphur, one (1) part of iron, and four (4) parts of caustic soda ; place in a graphite crucible, heat these ingredients to a white heat for at least eight hours, but it will be better to heat for forty-eight hours. Take the resulting fused mass, slag and metallic button as well, and powder the whole mass. Mix this powdered mass so that the metal will be thoroughly incorporated with the powdered slag. Combine this with one (1) part of charcoal, five (5) parts of litharge or oxide of lead, add four (4) parts of caustic soda, and fuse the whole until the metallic button is obtained. Scorify and cupel this metallic mass, and the resulting bead will be gold and silver.

"In making the above test every care should be taken to determine that all ingredients used are free from either gold or silver.

"The salient feature in this discovery is combining the sulphur in such a way that it will unite with the oxide of antimony, which is produced and evolved at a white heat. The soda fusing prevents the escape of the oxysulphide. It is in the union of this oxide with the sulphur present that the creation of gold is had.

"To state this process more closely, it consists of forming a sulphide of antimony, next forming a sulphide of iron, and thirdly forming a sulphate of lead. Therefore, the ore produced prior to scorification and cupellation is a sulphide."

THE SELECTION OF PHOTOGRAPHIC APPARATUS.

Now that the days are lengthening, and Spring with its accompaniments of bright weather and sunshine is almost upon us, the amateur photographer will begin to think about unearthing his apparatus from winter quarters and preparing it for work again ; while there will be those who, tempted to investigate the great unknown in photography, will be considering the question of purchasing suitable apparatus with which to pursue this delightful pastime. For the latter this short article is written, offering suggestions and advice in this matter, while a word or two will also be given to those already advanced in the art.

It is so often the case that the beginner, when looking about for apparatus with which to commence photography, purchases a hand camera frequently at considerable expense. This is the worst possible procedure, and is the direct cause of keen disappointment, and often of the abandonment of the hobby altogether. It should be remembered that the successful use of the hand camera can only be accomplished after a complete mastery of the processes of development in instantaneous work has been obtained, and it is courting failure for anyone with practically no knowledge of photography to commence work in this way.

The beginner is, therefore, strongly advised to purchase at the outset a good field camera, for with it instantaneous pictures can always be taken, if desired, by means of a shutter attached to the lens ; while there are makers who construct cameras which, although essentially designed for use on a stand, can with equal ease be used in the hand. As to the size of plate to be carried, that of most general utility is undoubtedly the half plate, because, in the first instance, when the beginner will be experimenting with his apparatus and making preliminary trials, a smaller plate may always be used—and, in fact, is recommended—by means of carriers in the dark slide.

The amateur with a moderate sum at command will naturally require apparatus at as reasonable a figure as possible. There is no advantage in going to the very extreme as regards cheapness, but under such circumstances a complete outfit should be purchased in one set. A thoroughly reliable half-plate set with good camera possessing modern movements, rapid rectilinear lens, book form dark slides, etc., may be obtained through a good photographic house for five guineas, and is capable of turning out really first-class work.

To those budding amateurs possessed of a longer purse, and who are desirous of commencing photography under the most favourable conditions, each piece of apparatus should be purchased separately.

The principal feature of every photographic outfit is the lens, and in selecting this much care should be exercised. A couple of good R.R. lenses may be purchased, one having a focus of about 7 inches, for landscape work, and one of about 4 inches focal length, for wide-angle work or photography at close quarters. Good foreign lenses can be procured at the most reasonable prices, and they are instruments, too, which are capable of doing splendid work, but there is always a certain amount of risk with them. Where price is no object the beginner is recommended to invest in a lens of modern make, such as a Dallmeyer's Stigmatic, which can truly be termed a universal lens ; in fact, as the maker asserts, it is capable of doing the work of four lenses. A lens of this description, covering at its full aperture a quarter-plate can, by inserting a smaller stop, be made to cover a half-plate, thus becoming at once a wide-angle lens ; or, by removing the front combination the focal length is doubled, when it may be utilised as a long-focus landscape lens. Every lens should be kept in a separate chamois leather bag, free from dust and grit, and when cleaned it should be carefully wiped with a very soft old silk handkerchief.

As regards the special form of camera, the best for every purpose is one built with square bellows, and although the beginner may not at first appreciate its value, the time will arrive when, having become proficient, he will find such a camera simply indispensable. Cameras with conical bellows are generally lighter in weight and more elegant in appearance, but when they are being used under extraordinary circumstances, where it becomes necessary to employ the rising front or swing back to its utmost limit, parts of the image are cut off, and troubles soon arise. Then, too, when using a wide-angle lens, it is very seldom that a camera of this description can be satisfactorily and easily manipulated, and in other ways the tapering bellows become a source of annoyance. In the matter of the tripod the principal points are that it should be perfectly rigid when set up, not liable to vibration ; and nothing in it should be sacrificed to lightness.

When the beginner has completed the outfit he should become thoroughly acquainted with the working of every part of the apparatus by setting it up and mastering the details of manipulation ; and if a photographic friend be available, a few lessons should be taken. The preliminary chapters of a work like the

'Ilford Manual' are very useful for conveying information in this respect.

To the amateur who, having made progress in photography, is desirous of purchasing a hand camera, a few words of advice may not be out of place here.

In the first place it should be decided whether roller films, flat films, or glass plates are to be used. The writer still adheres to the latter, but most hand cameras designed to carry plates will admit of the employment of flat celluloid films. When selecting a hand camera the following points should more particularly be considered :—

1. The lens.
2. The method of plate changing.
3. The shutter.
4. The particular form of shutter release (the trigger).

According to the quality of the lens will be the price of the camera. The ideal lens for hand-camera work is one which will give absolutely sharp images to the corners of the plate when used with the full aperture of about F/6, allowing exposures to be made with a quick shutter and in a dull light. Most hand cameras are fitted with lenses of much too short a focus. If possible, one having a focal length of not less than 5 in. for a quarter-plate should be chosen, provided with an iris or revolving diaphragm. The great objection to so many hand cameras is that the lens is built into the body, being extremely difficult to reach for cleaning ; whereas if it be simply screwed into its flange in the ordinary way it can not only be taken out easily and cleaned when necessary, but it may, if required, be used in a stand camera, in which case, of course, an extra flange would have to be provided. There should also be a flap or sliding panel to protect the lens from dust when not in use.

Regarding the method of plate changing, in the writer's opinion there is nothing equal to the changing bag, where the fresh unexposed plate is transferred to the bag by means of a plate-lifter and shifted into position in front. The whole operation is under the worker's control, and there is practically no chance for the plate to become fixed. Dark slides for the hand camera have their good points, but in many respects it is doubtful if they are superior to a well-made magazine. There is one particular, however, in which they are extremely useful, in that they may be filled with plates of different speeds and time and instantaneous exposures made at will, whereas if this were done in a magazine camera there is great danger of losing their whereabouts. Some cameras have an extra chamber, into which each plate falls as it is exposed. Although this is a fairly reliable method on the whole, the size of the camera is somewhat increased.

There is no doubt but that the roller-blind shutter is the best for hand-camera work, and very few are made nowadays without it. Metal shutters actuated by springs are very uncertain. The springs are generally spirals of brass wire, which soon become weak, causing the shutter to work slowly and sometimes to fail altogether. The question of a shutter release may seem so trivial a detail as to be not worth considering, but in point of fact, it has a most important bearing upon the subject, and is more often than not the cause of blurred images and spoilt plates. The proper place for the trigger is undoubtedly in front of the camera, so that it may be pushed backwards towards the lens, thus reducing risk of vibration to the minimum. Some releases are placed on the right-hand side of the camera, and are intended to be pushed downwards with the thumb. This device is not a good one, as often in the excitement of releasing the shutter the camera receives a tilt upwards from beneath. The pneumatic ball, of course, is always good, but it is a question whether the long rubber tube is an advantage in hand-camera work. Of course every worker is prejudiced in favour of his own apparatus, but without in any way wishing to depreciate other makes, the writer has used constantly a Rouch's "Eureka," which is in every way a thoroughly sound and reliable instrument.

LEGAL HINTS FOR PHARMACISTS.

Medicine Stamp Duty.

Exemptions.—These may be classed as statutory, judicial, and departmental, and one may explain the classification by stating that the first is based upon the ordinary interpretation of the words of the Statute, the second on the application given to those words by the Courts of Law, and the third on the practical forbearance of the Commissioners of Inland Revenue in their administration of the law.

At the end of the Schedule to the Act of 1812 (Geo. III., 52, c. 150) there are three saving clauses which, though dignified by the heading of "Special Exemptions," possess the specialty of exempting very little of import to the modern chemist and druggist. In the first place, all drugs enumerated in a 'Book of Rates' dating from the time of Charles II. are free from duty, as are also those referred to in a supplementary 'Book of Rates,' issued by authority when George I. was King. Now these "rates" were merely import duties, and the drugs referred to were crude drugs and drysaltery —the raw material, so to speak, for the manufacture of the specifics chargeable with stamp duty, and it may be that the motive for exempting them was simply the desire to be as just as the Imperial Exchequer would allow, and not to tax an article twice if it could be avoided. Whatever the motive, the special exemption accorded to Sir Harbottle Grimstone's 'Book of Rates' and to Mr. Speaker Compton's supplementary list has survived to this day, though it has long ceased to have any bearing on the daily business of the retail chemist. It may be viewed as an exemption in favour of drysaltery, and its retention is probably desirable to cover one or two articles which might otherwise be held to come within the broad embrace of the stamp charge.

The second clause has at times raised false hopes in the minds of medicine vendors, especially retail chemists. The exact wording of the clause is as follows :—

> "All medicinal drugs whatsoever, which shall be uttered or vended 'entire' without any mixture or composition with any other drug or ingredient whatsoever, by any surgeon, apothecary, chemist, or druggist who hath served a regular apprenticeship, or by any person who hath served as a surgeon in the army or navy under any commission or appointment duly entered at the War Office or Navy Office, or by any other person whatsoever licensed to sell any of the medicines chargeable with a stamp duty."

One feels very much inclined to use the traditional remarks with which the oracular Captain Bunsby was wont to round off his dicta, for it is indeed difficult to discover the bearings of the foregoing. Who are the persons who may not sell "entire" medicinal drugs unstamped? The surgeon, the apothecary, and the chemist may, the regularly apprenticed druggist, and the duly appointed naval and military surgeon (though exempted previously under the word "surgeon"), may also sell, and any person licensed to sell stamped medicines has a similar doubtful privilege. Anyone, then, who desires to be exempt under this clause may purchase the indulgence for five shillings a year. In other words, the exemption is no special exemption in practice, for almost all who aspire to obtain a living by the sale of medicinal drugs must necessarily take out a licence to cover the sale of the stamped medicines they deal in. No one could hope to do much business by confining their operations solely to "entire" substances of a medicinal nature. It may be argued that the grocer or oilman who sold pure glycerin or

vaseline would not be exempt. If that be conceded, what follows? They must stamp the medicine, and, immediately, they become liable for the licence duty; by paying which they not only acquire a right to sell glycerin unstamped, but the privilege of selling any kind of medicinal preparation they choose.

It has been pointed out that the clause draws a distinction between the qualified or professional man and the mere "quack," which is very true, but what privilege does it give the one which it withholds from the other? There is this to be said, a chemist has no need to take out a licence if he does not deal in medicines liable to duty, and though this may appear a barren privilege in the face of the modern mania for medicinal proprietaries, it is worth considering. It means that if a qualified man places more store by his professional services as a dispenser and compounder than by the sale of goods as a tradesman, the Stamp Commissioners will never trouble him. So long, however, as stamped specifics and private remedies form a portion of a chemist's business, and advertisement occupies a place in his business operations, the exemption we are now discussing can have no particle of practical utility for him.

Before proceeding further, attention may be directed, as a matter of academic interest, to the wording of the reference to chemists. At first sight it might be assumed that the exemption, such as it is, did not extend to all chemists, but only to those who had served a regular apprenticeship. It is, however, reasonable to assume that in practice, qualification would presuppose apprenticeship. Moreover, the words "Chemist, or druggist who hath served," etc., etc., may be read as contemplating a distinction, and as classing the chemist with the professional surgeon and apothecary, whilst demanding proof of apprenticeship in the druggist or drug seller. At the time of the passing of the first Stamp Act apprenticeship occupied the place that curricula and examinations do now, and there is probably little doubt that the Courts would read "apprenticeship" as being synonymous with registration. There is on record a case in which a court of first instance took that view. So far as examined men are concerned there would be little difficulty in proving that registration included the production of evidence of at least a three years' term of pupilage, whilst in the older class of pre-Pharmacy Act men "indentures" would probably be the rule rather than the exception.

Now, with reference to the meaning of "entire," what constitutes an entire drug? The statutory definition is a drug "without any mixture or composition with any other drug or ingredient." If the last two words had been omitted there would have been some chance of stretching the application of the exempting clause, for everything would then depend upon the covering power given to the word "drug." But the ambiguities of the Food and Drugs Act in this respect are avoided in the Stamp Act, and nothing but crude, unprepared medicinal agents can fall within the above definition. A good deal of latitude, however, is allowed by the Revenue Department, and more used to be permitted till abuse crept in. Homœopathic medicines, for instance, were formerly regarded as exempt, but now it is found expedient to treat all tinctures alike, and apply all round the dictum pronounced in Smith *v.* Mason, that a tincture is not an "entire" drug, since it is prepared with spirit. A dilution by the addition of water, however, is not held to be an admixture, and, in certain cases, the addition of colouring matter to a pure drug is not objected to. A crude drug which has been purified does not, by the process it has undergone, become a preparation if no ingredient has been added, and it remains exempt. Moreover, a pure drug may be prepared for the market by compression into tablets without forfeiting its right to exemption as an entire drug (*e.g.*, ammonium chloride tablets). Conversely, powdered drugs, such as rhubarb or gentian root, though prepared in a sense, are not preparations, and are not liable to duty.

Medicinal substances exempt under this clause may be recommended for the cure of disease without liability ensuing. But vendors should make sure that what they are selling is an unmixed article. The fact of selling a compound labelled pure this, that, or the other, and fondly imagining it to be what it is represented, will not save a person from the Nemesis of Somerset House, and it ought to be remembered that prosecutions under the Food and Drugs Act in respect of sales of adulterated simple drugs may evoke the attention of the Revenue authorities to possible breaches of the Stamp Act. The necessity for qualified vendors to know what they are selling is therefore not based on ethical grounds entirely.

As an example of articles exempted under this portion of the Statute may be mentioned "menthol cones," "pure pepsin," "corn pencils," "mustard oil," "pure cod-liver oil," "charcoal powder," and other forms of simple substances of a like nature.

We have been asked more than once whether the addition of a preservative to a drug otherwise exempt would take it out of the exemption. There can be no doubt that, according to Statute, it would. But it is almost equally certain that provided no abuse were made of the privilege, the Board would deal with such cases as it does with instances where colouring matter has been used for attractiveness' sake. Then there arises the case of arsenical soap. Whilst the article was innocent of arsenic it could not be reasonably regarded as anything but a toilet necessary, but now that it has become a drug, some anxiety has been experienced as to the attitude the administrators of the Stamp Act might take in regard thereto. It is certainly not an "entire" drug. But soaps have hitherto not been interferred with, even when they have been medicated, so long as they are to be used after the usual manner of soaps.

For example "Cuticura" and similar proprietaries will serve. Yet it must be confessed that a recent case in which a well-known "pine tar" soap was involved, gives some ground for suspicion that some day a "recommended" soap may be held to be a medicine. The soap in question was advertised to cure almost anything from eczema to diphtheria, and the Revenue prosecuted under Section 2 of the Stamp Act, 1812, on the ground that the vendor did not affix a stamp and did not possess a licence. The justices dismissed the case on the ground that no evidence of an offence had been offered. On appeal to the High Court, the decision of the justices was confirmed, not because soaps were exempt from duty, but because it was a question of fact for the Lower Court to find whether the article was a medicine or not, and on that point no evidence had been adduced. Testimony as to the presence of a drug or drugs in the article might have contributed to a different decision.

Up to the present, however, medicated soaps have not been further interfered with.

The Third Special Exemption protects the legitimate practice of pharmacy, and is couched in the following terms:—

> And also all mixtures, compositions, or preparations whatsoever mixed or compounded with or prepared from medicinal drugs, medicated or chemical preparations or compositions, or other ingredients bearing different denominations, or having different properties, qualities, virtues, or efficacies, which shall be uttered or vended by any such surgeon, apothecary, chemist, or druggist as aforesaid, or by any such person who hath served as a surgeon in the navy or army under any such commission or appointment as aforesaid, the different denomination, properties, qualities, virtues, and efficacies of which mixtures, compositions, and preparations as aforesaid are known, admitted, and approved of in the preservation, cure, or relief of any disorder, malady, ailment, or complaint incident to or in anywise affecting the human body, and wherein the person mixing, compounding, preparing, uttering, or vending the same hath not

nor claims to have any occult secret or art for the mixing, compounding, or preparing the same, nor hath nor claims to have any exclusive right or title to the mixing, compounding, or preparing, or to the vending of the same, and which mixtures, compositions, or preparations have not been, are not, nor shall hereafter be prepared, uttered, vended, or exposed to sale under the authority of any letters patent under the Great Seal, nor at any time heretofore have been, now are, or shall hereafter be by any public notice, advertisement, or by any written or printed papers or handbills, or by any labels or words written or printed, and affixed to or delivered with any such packet, box, bottle, pot, phial, or other inclosure aforesaid, held out or recommended to the public by the owners, proprietors, makers, compounders, original or first vendors thereof as nostrums or proprietary medicines, or as specifics, or as beneficial for the prevention, cure, or relief of any such distemper, malady, ailment, or complaint as aforesaid.

Of this long-winded paragraph, the late barrister to the Inland Revenue has written : "It does not take any medicine out of the general charge of duty that would otherwise fall within that charge" ('Handy Book,' p. 106). If that means anything at all, it is difficult to find any ground for Dr. Symes' reading of the Clause. Speaking at a recent Council meeting, Dr. Symes is reported to have said, that "if the Act meant what he thought it said it did a great deal towards bringing the sale of all compound drugs into the hands of qualified persons." However desirable such a consummation may be, the Stamp Acts are hardly likely to be the immediate cause, and the wording of the third clause given above will certainly not lend itself to any such interpretation. The more one reads the clause the more one must be struck by the extremely limited range of relief it confers, and by the infinitesimal amount of practical advantage it possesses for those who wish to sell recommended preparations. On analysis the exemption resolves itself into this. A qualified person, *i.e.*, "a chemist or druggist who hath served an apprenticeship" may sell unstamped medicinal compounds of known and approved virtue or efficacy, whereas persons not qualified within the meaning of the clause must stamp such compounds. But there are a number of considerations to bear in mind. The compound must not be vended as a proprietary ; it must not be either a past or a present "patent," and, unkindest cut of all, it must not be recommended. Where does the exemption come in? As a matter of fact, the Revenue authorities do not interfere with any preparation which is neither a proprietary, a patent, or a recommended article, and the question of the qualification of the vendor does not concern the official mind. Suppose, as a matter of argument, that the Board were urged to give their attention to unqualified persons who sold, say, Tinct. Rhei Co. B.P. unstamped, and that in the result the said vendors had to stamp the article. What advantage could accrue to the qualified man thereby? He could sell the article unstamped, certainly, but he could not recommend it, whereas his unqualified competitor could, under shelter of a three-halfpenny stamp, embellish his label with the smartest of pushful recommendations. The proverb which advises a policy of *laisser faire* in cases of sleeping dogs is peculiarly applicable whenever one is tempted to urge the Board to give a strict interpretation to the words of the Stamp Acts.

Reverting again to the statutory exemption, there is some doubt as to the exact application of "known, admitted, and approved." It may, according to the way one reads it, refer only to preparations known and approved at the time of the passing of the Act—1812—or it may have the wider meaning of "all official preparations." Having regard to the original intention of the Stamp Act as revealed in the parliamentary records of the period, viz., to tax quackery, the balance of probability is in favour of the less restricted interpretation. No judicial pronouncement has, however, yet been requisite on this point, for immediately a qualified vendor steps outside the exemption he is hit by one or more of the definite charges of duty.

The whole of the three clauses of the Schedule may be summarised thus:—I. is a saving clause in favour of drysaltery ; II. may be held to protect simple crude and unmixed drugs uttered by qualified or licensed persons ; and III. removes from the incidence of duty, under certain conditions, official preparations and dispensed medicines when vended by qualified chemists and druggists.

Official Preparations.—It does not seem to be generally understood that the sale of Pharmacopœia compounds may be conducted without the necessity of affixing a medicine stamp, and that in practice the same freedom is accorded in the case of certain medicines in foreign pharmacopœias—Blaud's pill, for instance. So recently as 1889 two prominent associations of chemists passed resolutions urging that steps be taken to secure exemption from duty of any preparation made in accordance with British or foreign pharmacopœias and described and sold as such. Further, the Pharmaceutical Society was asked to use its influence in securing this exemption as well as one which should embrace all medicines for which no exclusive right or secret process was claimed. There was absolutely no need for asking these things, seeing that the exemption existed. Nothing in the recent administration of the Act has touched B.P. preparations if they are not recommended for the cure of disease. Mr. Brown may sell "Brown's compound tincture of rhubarb prepared according to B.P. formula" without fear of transgression. He may even add that it "contains the purest ingredients in the exact proportions which medical knowledge has found to be most efficacious," and he may round off his description by saying that it is "one of the most useful of family medicines." There is surely ample latitude here for description. If the official preparation is to be dispensed, there is no occasion for description and no suspicion of liability. Similarly, with compounds official in other pharmacopœias ; a declaration of the formula on the label or a statement of the fact that it is prepared according to such-and-such a pharmacopœia makes it a medicine "known and approved," and so long as it is not dutiably recommended or otherwise brought within the charge, no stamp is required. With regard to "all medicines" which are not secret or proprietary, we have already shown at some length that considerable freedom is allowed for the proper description of medicines, and that there is really no occasion for a chemist to recommend his preparations in a dutiable manner.

ANALYTICAL NOTES.

Adulterated Insect Powder.—According to the report of Caesar and Lorenz, of Halle, certain insect powders are in the market, which, besides artificial colouring matter, contain finely-ground quillaia bark and euphorbium. These adulterations give the powder a more pungent odour and provoke sneezing. On the insects, however, the admixtures are said to have no effect whatever. —*Pharm. Centr.*, xxxviii., 702.

A Reaction for Santonin.—Jaworowsky identifies santonin as follows : 1 Centigramme to 0·02 Gramme of the substance is mixed with 2 C.c. sulphuric acid, and dissolved carefully by heating. To the warm solution drop by drop 2 C.c. of cerium sulphate solution is added, which contains 2 per cent. of concentrated sulphuric acid, and one per cent. of the cerium salt, stirring constantly. This gives a cherry-red colour with santonin. The solution becomes turbid on cooling, and a violet precipitate results on the addition of 8 C.c. of water. The mixture obtained is shaken with amyl alcohol and set aside. The aqueous layer then appears colourless and the amyl alcohol light brown. The amyl alcohol solution is coloured violet on the addition of phosphorus chloride. Shaken with ether the aqueous layer becomes clear, the ether remaining colourless.—*Ph. Zeit.*, xlii., 738.

The Pharmaceutical Society and its Presidents.

JACOB BELL.—1856-60.

THE Pharmaceutical Society had been in existence for fifteen years when Jacob Bell was at length prevailed upon to accept the office of President. It was at his house of business in Oxford Street that the historic "pharmaceutical tea-party" was held, at which the desirability of establishing the Society was discussed, and he was thenceforth regarded as the chief leader of the movement; later, he became a member of the first Council, and he remained on the Executive until his death, ever taking a most prominent part in helping to advance the interests of the Society.

He was born on March 5, 1810, his father being a member of the Society of Friends and the founder of the historic house in Oxford Street, which dates from 1798. Jacob Bell was noted amongst his schoolfellows for his literary compositions. On entering into business he began his career with no exemption from the regular duties of an apprentice, though in his leisure hours he distressed his surroundings by a not well-regulated attention to comparative anatomy. He was an admirable horseman, passionately fond of animals, and became the intimate friend of Landseer. At one time he desired to adopt painting as a profession, and his artistic tastes found vent in the collection of valuable paintings. He bequeathed his collection of some of the finest productions of the modern school to the nation, the value of the legacy being estimated at £20,000.

JACOB BELL.

At the time of his appearance upon the scene, as a leading pharmacist, Mr. Hawes' Bill for the purpose of amending the laws relating to the medical profession in Great Britain and Ireland had been introduced (1841), and was found to contain clauses vitally affecting the interests of chemists and druggists. The measure was abandoned, but circumstances had revealed the necessity for the formation of a permanent society which might interpose an effectual safeguard for the protection of the interests of the trade. This step was finally decided upon at a public meeting of the members of the trade, held at the Crown and Anchor Tavern, in the Strand, on Thursday, April 15, 1841, and Mr. Bell threw himself into the movement as a leader with life-long enthusiasm. He had recently become a partner in his father's business, the sole management of which was passing into his hands, and as Redwood points out, he had previously taken advantage of all available means to fit himself by study and practical work for the exercise of the responsible duties he had undertaken. He commanded the confidence of the medical profession and the public, and could not be accused of any feeling of self-interest in the matter, for so far as he was individually concerned there was no prospect of any advantage resulting from the measures contemplated for establishing a qualification for the practice of pharmacy, and thus raising the status of chemists and druggists. The Society having been established, the monthly meetings of the body were for some time held at Bell's house, and with the view of recording the proceedings at those meetings he started a monthly publication, which subsequently became known as the *Pharmaceutical Journal*. The first number appeared under his editorship in July, 1841, and the paper remained under his superintendence as a monthly periodical until the completion of the eighteenth volume. Not the least of the benefits conferred by him upon the Pharmaceutical Society was the transfer to that body of the copyright of the Journal shortly before his death. Early steps were also taken to secure for the infant Society a permanent habitation and a Charter of Incorporation, both of which desiderata were soon forthcoming. Not so readily, however, were parliamentary powers obtained, as it was not until eleven years had elapsed that the first Pharmacy Act was passed, after Bell—tired of seeking in vain for a member of Parliament who could pilot a Pharmacy Bill through the House of Commons — had himself entered Parliament, purely in order to advance the interests of chemists and druggists.

In June, 1851, he moved for leave to bring in a Bill to regulate the qualifications of pharmaceutical chemists. It had varied fortunes. In 1852 he again moved for permission, and on the second reading refuted the erroneous impression that the measure was designed to create a trade monopoly. The Bill was referred to a select committee, when innumerable alterations, technically called amendments, were introduced, as described in the account of Thomas Herring's presidency (last vol., p. 492). In this denuded form the Act passed both Houses of Parliament and finally received the royal assent on June 30, 1852. It would be difficult to convey an idea of Mr. Bell's bitter disappointment at the result, but as he said, it was that or nothing, and so far he was content.

Four years after the Pharmacy Act was passed Jacob Bell became President, and—when the termination of the litigation about the new Bye-laws at last permitted the machinery of the Society to go on working as smoothly as of yore — the first annual list of members, associates, and apprentices was published, showing 2223 members, 274 associates, and 226 apprentices. Bell pointed out at the time the great importance of such a register, the identification of the members of a society being necessarily the primary step in organisation. For securing the privileges of membership, the claims of each member must be established and recognised, and all must comply with the conditions which their own laws impose on themselves and on each other. Then, as now, difficulty was experienced in inducing everyone entitled to registration as a pharmaceutical chemist to respond to the official circulars issued by the Secretary, and those who thus

excluded themselves from the privileges of membership were warned that they might, in all probability, have cause to regret their lukewarmness. The Society was acquiring greater influence from becoming known and recognised by the public.

Moreover, new members were coming forward and, by passing the Society's examination, raising the average standard of qualification. This reacted upon the character of the Society and increased the value of membership. The work of the body in promoting improvement in the quality of medicines was another reason urged by Bell why it should include all persons engaged in the craft, and he claimed that there existed a direct connection between their commercial interests and their status as members of the Society, which would in future be manifested in a still more marked degree. The protection of voluntary qualification, which was the sole outcome of the recognition accorded by the Legislature in 1852, was defended by Bell as being a very obvious preliminary step, having obtained which, it depended on chemists to substantiate their claim to further confidence and to an enlargement of the benefits which it was hoped would ultimately result to the profession and the public from the establishment of the Society.

A Government Bill introduced into Parliament to restrict and regulate the sale of poisons, in May, 1857, met with vigorous opposition on the part of pharmaceutical chemists. That measure provided that no poison should be sold to persons under full age and without the presence of a witness of full age, and insisted on the production of a certificate signed by a clergyman, medical practitioner, or justice of the peace, justifying the use for which the poison was required. A complete record was to be kept of the sale of all poisons; soot, indigo, or archil was to be added to all colourless poisons: and the restrictions proposed in respect of the labelling, storing, and dispensing of poisons went into almost inconceivable minute details. In addition, no person other than a legally qualified medical practitioner was to be allowed to sell poisons without a licence to vend drugs, and to obtain that it would have been necessary to pass an examination, other than that conducted by the Pharmaceutical Society, in the conduct of which the College of Physicians and the Society of Apothecaries were to take an equal part with the Pharmaceutical Society, whilst external examiners were to be appointed by the Government. In fact, the promoters of the Bill overreached themselves by the unreasonable nature of its provisions, and prompt action on the part of the Society resulted first in the modification of the obnoxious measure, and subsequently in the withdrawal. But this was not effected without trouble, as the Bill actually passed its third reading in the House of Lords in spite of the determined opposition manifested by the Society.

As Redwood graphically relates, however, within two hours from the time at which the third reading had been carried by the Lords, circulars were in the printer's hands convening a meeting of members of the Society. Other circulars were as expeditiously printed, informing the local secretaries of the critical position of affairs, and suggesting means for opposing the Bill in the Commons. "In twenty-four hours the symptoms of a coming storm were manifest. Petitions began to come in, Members of Parliament received earnest letters from their constituents, and in the course of two or three days the entire House of Commons was sensibly influenced by the pressure brought to bear upon it." Deputations from the country and members of the Council clustered in the lobby of the House to meet their representatives, and within a very short period the Bill was withdrawn, the Minister in charge explaining that communications had been sent to him from every quarter, almost from every village, stating that the chemists had serious objections to the Poisons Bill. This constituted a great victory for the Society, the more especially as the Bill was a Government measure, and its defeat indicated that the means of organisation capable of being exerted by the Society throughout the country were far from insignificant, and not to be despised even by Governments. A similar experience befell early in 1859, when another Poisons Bill was introduced and successfully opposed, the value of the Society's organisation being thus fully evinced. The power the Society possessed in supporting or opposing parliamentary bills was referred to in Jacob Bell's last address as President, which he was unable to deliver in person on account of failing health, and he also referred at length to the varied obstacles that he had encountered in endeavouring to advance the Society's interests.

Meanwhile, the Medical Act of 1858 had been passed and arrangements made for preparing the first British Pharmacopœia. As previously mentioned, the Society had assisted in preparing the last London Pharmacopœia and a request was now made by the newly-constituted British Pharmacopœia Committee that the Council of the Society should appoint a member to co-operate with the London sub-committee. Mr. Peter Squire was selected for this position, and the Pharmaceutical Society was full recognised by the General Medical Council as a body competent to assist in the compilation of a national pharmacopœia. Arising out of this matter, some consideration was devoted at the time to the feasibility of adopting the metric system of weights and measures, or some alternative decimal system, in connection with the Pharmacopœia, but the great diversity of the propositions made, and the differences of opinion expressed regarding them, probably tended as much to perplex as to convince the Committee of the General Medical Council, which had the matter in hand, and the result was that the use of the old weights and measures was continued. The only other question of note that assumed any great degree of prominence during Bell's term of office was the adulteration of food and drink, but nothing definite was effected by the Legislature in that direction as yet.

Bell's office as President and general organiser was far from being a sinecure in those early days of the Society's work. Amongst other evidences of his activity it may be stated that he paid "domiciliary visits" to Bath, Bristol, Exeter, Clifton, Plymouth, Devonport, Birmingham, Liverpool, Manchester, Newcastle, Leeds, Nottingham, Norwich, Dover, Brighton, and other places, in the Society's interest. Those visits were attended with great success, and perhaps all that has since been lacking to ensure the completeness of that success has been the existence of a sufficient number of single-minded enthusiasts like himself.

To give even a sketch of his further efforts would be to write the history of the Society during his lifetime, for—ably seconded by Dr. Redwood and a tried circle of associates—he was continually originating and organising measures tending to the furtherance of the general interest of the body. Daniel Hanbury thus summarises his character. "Let us recollect that Jacob Bell was a member of the Council from the commencement of the Society to the day of his death, and that hardly any engagement was allowed to interfere with his attendance at its meetings. As a member of committees and at the Board of Examiners, and as an attender of the Evening Meetings, his diligence was equally unfailing." The hospitalities of Langham Place, so gracefully dispensed, materially promoted the cause which Bell had at heart; his cheerful pleasantry was contagious, and he was a strange example of the very gaiety of amusement combined with an enviable capacity for work. On leaving that luxurious drawing-room, the walls of which

were hidden with pictures, and a house where the whole appointments suggested ample means, it was pleasant to know that none of these things had turned the possessor from the task he had set himself to perform, namely, the consolidation of British pharmacy and the advancement of the calling which was his own deliberate choice. Jacob Bell was an honorary member of various foreign scientific societies and Fellow of many of the learned societies, and his long friendship with Sir Edwin Landseer must be specially recorded. Towards the end of his career, a painful ulceration of the larynx, a malady to which he had long been subject, recurred with alarming symptoms, accompanied by great weakness. The disease made rapid progress, and to the grief of all who had been associated with him either in public or private life, he died on June 12, 1859; the event occurring during his term of office.

PERFUMERY FOR PHARMACISTS.

In ancient times the manufacture of perfumes was a part of the apothecary's art (Exodus, xxx., 23-25 [O.V.]) During the present century it has become a special business, and pharmacists, who, by reason of their superior knowledge of organic chemistry, are specially fitted to prepare perfumes, have as a rule been content to simply buy and sell ready-made perfumes on the same footing as the hairdresser, draper, stationer, or general stores, instead of preparing special perfumes as proprietary articles of their own, and thus increasing their profits. The knowledge of perfumes is gradually being reduced to a science, and it behoves the pharmacist not to neglect this collateral source fo income but to keep himself abreast of the progress that has been made. For a long time essential oils were regarded as almost simple bodies, and as it was almost impossible to ascertain their purity except by such rough tests as their odour, and their solubility in alcohol of definite strengths, there were few chemicals so much sophisticated as the essential oils. It is even now not many years since it was practically impossible to obtain really pure otto of rose or essence of lemon, and the purer grades of the latter were known as "perfumers."

Recent researches have shown that the volatile oils are in reality very complex bodies, and that the different constituents are normally present in definite proportions and can be separated by fractional distillation, freezing, or by the use of chemica reagents, and consequently definite standards of purity have in many cases been adopted. Some of the constituents have been found to occur in many different oils, in which their odours are modified by the presence of small proportions of other constituents. It has been observed that perfumes may be arranged in groups, in which the type is thus variously modified. The odour of the rose is evident in the Damask, Maréchal Niel, Gloire de Dijon, General Jacqueminot, Maiden's Blush, and other roses, yet each differs from the other in odour. The flowers of *Pæonia alba*, the leaves of Ginger grass, and of the rose geranium have all an odour of rose. Wherever this odour is found in plants it is more or less modified by other odours. It is the same with nearly every other plant perfume in nature. It is by imitating nature, therefore, in this particular that the most satisfactory results are obtained. In other words, every perfume made to imitate the fragrance of any flower must have a basis, and the perfumes that are auxiliary must not be so strong as to overpower it. Odours are like musical notes—they can be combined in an infinity of ways. Artificial perfumes which do not convey the scent of any flower in particular should have a somewhat different character. In them no special odour should be recognisable; they should possess sweetness and diffuse an agreeable but not oppressive odour, and should leave a lasting fragrance when evaporated. The chemical examination of essential oils has confirmed the above view. The fractional distillation of essential oils obtained from plants has shown that they consist of a nearly odourless vehicle, which usually consists of one or more hydrocarbons of the terpene class, a principal odorous constituent which may be an alcohol, phenol, aldehyde, ketone, ether, or ester, accompanied by small quantities of various compounds which have not all been as yet determined. These modifying constituents may vary even in different parts of the same plant. Thus cinnamon bark oil contains cinnamic aldehyde, eugenol, and phellandrene; cinnamon leaves contain in addition saffrol, and cinnamon root oil camphor. Oil of cassia, which also contains cinnamic aldehyde, owes its different odour chiefly to the presence of the ester, cinnamyl acetate.

These differences in the varieties of essential oils of commerce must be borne in mind in mixing perfumes, and care be taken that one commercial variety of oil is not substituted for another. It is also necessary to remember that the amount of the principal ingredient in essential oils often varies. In some cases this is due to the fact that in distilling a large quantity of oil, the earlier and therefore more volatile products are not mixed with the later distillates so as to secure uniformity, and sometimes for less authentic reasons. In many cases the normal amount of the principal odoriferous ingredient has been carefully ascertained by chemists, and essential oils can now be obtained with a guarantee as to the proportion present. There have also been introduced into commerce a number of essential oils which have been deprived of their vehicle or terpene, by distillation *in vacuo* or other means, and are known as terpeneless oils. The principal odorous ingredients of volatile oils can also be obtained in a comparatively pure state from the oil by chemical means or by freezing. These are not as a rule so satisfactory as the terpeneless oils, which usually contain in addition the modifying constituents present in the natural oil. This is so much the case that it has been found necessary to distil geraniol or rhodinol off rose leaves to give it the modifying constituents, when the geraniol has been derived from other sources than the rose. The same is the case with the oil of lemon, citral, its chief constituent, does not wholly represent the flavour of the fresh lemon, and the terpeneless oil is therefore preferable. The chief advantage of employing the terpeneless oils is that they are more likely to be free from adulterants than the natural oils.

In artificial perfumes the natural law is followed. The vehicle used is generally grape spirit for the finer class of perfumes, as it is less apt to contain traces of amyl or other offensive alcohols. If in imitation of a flower, the essential oil of the flower, such as orange blossom, is used, if procurable, but in such cases as the violet, jasmine, and a few others, from which the volatile oil cannot be procured by distillation, an artificial product is substituted; a list of these is given below. If the odour itself is faint or easily passes off, a degree of permanence is given by the addition of a very small quantity of a persistent substance. In some cases where the leading perfume is naturally sweet, as lilac or honeysuckle, an aromatic persistent substance is added, or in cases where the leading odour is aromatic the persistent substance must give sweetness. In the former case, the lasting aromatic odour is given by one or more of the following: ladanum, clove, patchouli, vetivert, sandal wood, almonds, vanilla, tonka bean, verbena, and ylang ylang. In the latter case, liquid storax, musk, civet, bergamot, civet, ambergris, and ambrette or musk seed are the substances chiefly employed. In many cases a tincture is preferable as a separate product, since a small amount of resinous matter tends to make the perfumes more lasting. In using the more powerful

odours, such as patchouli, almonds, cloves, verbena, etc., it is best to use a dilute solution of the oil, so as to add a very little at a time, until the required modification of the principal odour is effected.

In endeavouring to imitate a flower or a perfume, the best time to analyse the constituents by means of the sense of smell is in the morning after being in the open air (*P. J.* [4], iii., p. 12). At that time of the day the olfactory nerve is more sensitive and the difference in odour more readily perceived. To ascertain the mixed odours in a flower, the curious physiological law must be taken advantage of, viz., that it is possible to tire some of the minute terminations of the olfactory nerve—just as those of the eye—so that after fixing the eye upon one colour for some time, the eye becomes temporarily blind to it and can only see the complimentary colours. Thus, after smelling a flower for a few seconds, a different odour is perceived. In the wallflower an odour resembling cassie flowers (*Acacia farnesiana*) is first perceived, then an odour of tonka beans, then a violet odour and an aroma recalling faintly that of cloves. Or in smelling heliotrope, the odour recalls at first that of vanilla and coumarin, and then almonds.

In examining a spirituous perfume a little is rubbed on the back of the hand, and smelt at intervals of a few seconds, inhaling pure air between each interval. In this way, after a little practice it will be comparatively easy to detect the constituent odours Sometimes the addition of a little water to the perfume will render some of the odours more pronounced, or slightly heating the mixture in a test tube and noticing the odours as they are given off, according to their greater or less volatility. It must be further remembered that perfumes in many cases will become mellowed by keeping, and that some aldehydes, like heliotropin and citral, are altered by heat and light or prolonged exposure to air. It may be useful to direct attention here :—

1. To the known constituents of some of the principal oils used in perfumery.

2. To some of the more important artificial synthetic perfumes, and

3. To the more recently introduced natural perfumes.

1. Principal Oils Used in Perfumery.

Bergamot.—The chief constituents are linalool and acetate of linalol

Bay (*Pimenta acris*).—Citral, methyl-chavicol, chavicol, methyl-eugenol, eugenol.

Cassia.—Cinnamic aldehyde and acetate of cinnamyl.

Cinnamon.—Bark : Cinnamic aldehyde and eugenol. Leaves : In addition, saffrol, a larger proportion of eugenol, and benzoic acid. Root : In addition, camphor.

Citronella.—Citronellal, geraniol, and methyl-heptenone.

Clove.—Eugenol, furfurol, amyl, methyl-ketone.

Geranium Oil ; Indian or Turkish : Geraniol, geranyl acetate and caprcnate, methyl-heptenone. Rose Geranium Oil : Geraniol, geranyl tiglinate, and citronellol.

Lavander.—Linalool, linalyl acetate, geranyl acetate, and cineol.

Linaloe.—Linalool, geraniol, methyl-heptenone.

Lemon.—Citral, citronellal.

Neroli.—Linalool, linalyl acetate, geranyl acetate.

Rose.—Geraniol, citronellol.

Rosemary.—Cineol, camphor, borneol.

Sandalwood.—Santalol and santalal.

Verbena.—Geraniol, citral, methyl-heptenone.

Ylang-Ylang.—Linalool, geraniol, and their acetic and benzoic esters, para-kresol-methyl-ether.

It will be seen from the above list that many of these oils contain the same constituents, but, of course, in different proportions and this suggests the idea that many other combinations might be formed artificially. It may be noted here that the odour of Russia leather in perfumes is given by the enpyreumatic oil of *Betula alba*, but a purer odour could probably be obtained by heating betulin, the crystalline principle contained in it.

2. Synthetic Perfumes.

Anisic Aldehyde.—Known commercially as "Aubepine." It possesses the odour of hawthorn flowers, but requires mixing with other odours to render it agreeable.

Benzyl Cinnamate, has the odour of balsam of Peru.

Bornyl Acetate has the odour of fir trees.

Carvacrol has a thyme-like odour.

Cinnamyl Alcohol has an odour of hyacinths.

Citral or Geranic Aldehyde has the odour of lemon, and is more readily soluble in alcohol than essence of lemon.

Cumarin has the odour of new-mown hay.

Eugenol has the odour of cloves.

Geraniol.—Also called rhodinol and limonol. It has the odour of rose. Geranyl acetate has a lavender odour ; geranyl formate is also made.

Ionone.—A ketone obtained from citral. It has a very powerful odour of violets.

Linalool and Linalyl Acetate have an odour between that of bergamot and French lavender. The latter is the "Bergamiol" of commerce (Schimmel). Linalyl formate resembles the odours of petitgrain and bergamot.

Methyl Benzoate.—The "oil of Niobe" of commerce.

Methyl Salicylate.—Artificial oil of wintergreen.

Saffrol has the odour of sassafras.

Salicylal or Salicylic Aldehyde has the odour of meadow sweet.

Terpineol has the odour of lilac.

Vanillin has the odour of vanilla.

There are also to be met with in commerce the synthetic oils of jasmin and neroli (Schimmel), and artificial musk (Baur).

3. Recently Introduced Natural Perfumes.

Canada Snake Root Oil —*Asarum canadense.*

Champaca Oil (Schimmel).—*Michelia champaca* and *M. longifolia.* Has an aromatic odour.

Champaca Oil (Haensel).—Guaiacum wood oil, Schimmel derived, according to Haensel, from *Bulnesia sarmienti*, Lorenz. Used with otto of rose to give the odour of the tea rose, etc.

Costus Oil.—*Aplotaxis auriculata.* It has a violet odour.

Frejar Oil (Haensel).—Botanical source unknown.

Kuromoji Oil.—*Lindera serica.* Has a pleasant, spicy odour.

Ladanum Oil.—*Cistus creticus*, very persistent odour, somewhat like ambergris.

Nagkesar Oil (Haensel).—*Mesua ferrea.* Odour of a violet character.

Nigella Oil.—*Nigella damascena.* It has an odour like raspberries.

Opoponax Oil—*Balsamodendron kafal.* Obtained from the gum resin (Bissa-bol). Odour somewhat aromatic.

Peru Balsam has the odour of the balsam, but less empyreumatic.

Sandalwood Oil, African, has an odour resembling sandalwood.

Spicewood Oil.—*Laurus Benzoin.* Odour somewhat spicy.

Storax Oil has the odour of liquid storax.

Tolu Balsam Oil has a hyacinth odour.

Numerous oils available for culinary essences are also now procurable in commerce, *e.g.*, angelica, basil, celery, cherry-laurel marjoram, parsley, parsnip, sage, summer savory, tarragon, thyme

walnut leaves, etc. Further details concerning essential oils may be found in Sawer's "Odorographia," in the past volumes of the *Pharmaceutical Journal*, and in a handy form in Power's 'Descriptive Catalogue of Essential Oils and Organic Chemical Preparations,' published by Fritsche Bros., of New York.

Those who have sufficient chemical knowledge to form new esters from aromatic acids and various alcohols will find a wide field of possibly new perfumes before them.

THE MEDICINAL PLANTS OF THE WORLD.

Die Heilpflanzen Der Verschiedenen Volker und Zeiten, Ihre Anwendung, wesentlichen Bestandtheile und Geschichte. Dr. med. et phil. Georg Dragendorff. Stuttgart: F. Enke. Large 8vo. Lieferung I. Preis 4 Mark. 1898.

There is no work in the English language which exactly corresponds to the one commenced by Professor Dragendorff. It is practically an enumeration of all the medicinal plants (Heilpflanzen) of all countries and all ages, with references to their uses, chief constituents, and history. It is to be completed in five parts. The first part, which is just issued, contains 160 pages. It commences with the Schizomycetes, as the lowest of the Cryptogams, and extends onwards in the accepted order of development of plants, through the vascular Cryptogams, Coniferæ, and Monocotyledons to the Juglandaceæ, in the apetalous Dicotyledons. In the arrangement of nomenclature of the natural orders, Engler and Prantl's work 'Natürlichen Pflanzen familien' has been followed as far as possible, the 'Genera Plantarum' of Bentham and Hooker, and other works being utilised in some instances.

The work may be regarded as an extended form of Rosenthal's 'Synopsis Plantarum Diaphoricarum,' published in 1862. That work contains about 10,700 plants, whilst Professor Dragendorff's is to include, according to the preface, over 12,700 plants, of which 11,790 are Phanerogams and 915 Cryptogams. The title Heilpflanzen is made to include dietetic and food plants. To extend such a work as Rosenthal's to one-fifth more requires no little research, and an almost encyclopædic knowledge of botany. This is evident under algæ, where *Acrocarpus crinalis* of Kützing, one of the Rhodophyceæ, is enumerated under the Phœophyceæ. Names now out of use are not unfrequently employed, many of the algæ not being placed in the genera given in Engler and Prantl's work. Indeed, the whole list of algæ should have been revised before publication by an expert in this subject. Even some of the statements concerning their uses are open to question. Thus, "*Griffithsia corallina*, Ag.—Küsten England und Schottland.—wie Carragheen gebraucht," is certainly not true of this country. A number of species are mentioned as found in agar agar and Corsican moss, which are certainly merely accidental admixtures, and by no means possess the properties of the articles with which they are mixed, scarcely deserving a place in the list of Heilpflanzen, whilst a number of edible species, forming articles of large consumption in Japan and of commerce between Japan and China, are not mentioned at all.

Under the fungi a large number consist of merely names, with no statement of their uses or properties. On the other hand, however, about twelve of those which are used in pharmacy, such as *Polyporus officinalis* and *Claviceps purpurea*, have very useful bibliographical references attached to them. The identification of ancient plants is in many cases given too positively and without reference to the authority who has identified them. Under lichens the need of expert revision is noticeable. Thus, three lichens, *Pertusaria communis*, *P. discoidea*, and *P. faginea*, which possess different chemical reactions, are given as varieties of one species and are said to afford litmus, which might be possible of *P. faginea*, but could certainly not be true of the other two. The lichens which yield orchill and litmus appear to have been confused by the author, and the names in several cases exhibit incorrect spelling, probably due to uncorrected printers' errors. Except for the references to scientific papers, the cryptogamic part of the work does not do credit to the high reputation of the learned professor.

Under the Coniferæ much more information is given, and references are numerous. Exception must, however, be taken to identifying dammar as a product of *Dammara orientalis*. The resin that appears in European commerce as dammar possesses, as Wiesner has indicated, the properties of a Dipterocarpaceous resin. The resin of *Dammara orientalis* approaches more nearly to kauri. The reference of dragon's blood to a *Pterocarpus* is an error that should not be continued in a work of this kind. The seeds of *Amomum granum-paradisi* and *A. melagueta* appear to have been confused, since the reference to Thresh's paper on the seeds of *Amomum melagueta*, is given under *Amomum granum-paradisi*, which has very different seeds. This is probably due to the fact that the term "grains of Paradise" is given in English text books to the seeds or *Amomum melagueta*. The source of the Ceylon cardamom is erroneously given as *Amomum aromaticum*; but such errors are comparatively few, considering the immense amount of research necessary in a work of this kind, and are only worth notice in order to enable the reader to correct them. So far as printers' errors are concerned, allowance must be made for the fact that the majority of words must almost of necessity be unknown to the compositor. It would perhaps have rendered them less difficult to correct if an alphabetical arrangement of the names had been adopted in each family. In such case it would be recognised at once that *Limethis* was an error for *Simethis*, etc.

Anyone using the work would probably want to know the use of a drug or to identify it from its native name, and it is a waste of time to have to turn first to a botanical work on systematic botany to find out in what section of a natural order the plant is, and then, as in the case of the grasses, to turn over thirteen pages to find out on which the section is, and subsequently to look through perhaps one or two pages for the particular name, unaided by an alphabetical arrangement. The work will need a very full index, including the sub-orders as well as orders. It is also to be regretted that the author has not had the courage to indicate all the natural orders by the termination "aceæ." It is rather puzzling, for instance, to find Hordeaceæ, Festucaceæ, etc., under Gramineæ, and to find that the almost equally large order next to Gramineæ is called Cyperaceæ, with a sub-order Scirpoideæ. It is also equally undesirable to alter the appropriate name of an order long in use. Anyone wishing to find the natural order Palmaceæ would never think of looking for *Principes*—at least, in this country. The chief value of the work is in the bibliographical notes given under the principal drugs, which will be extremely useful to workers in scientific pharmacy, and the more of these that can be introduced into future numbers the more valuable the work will be, although, unquestionably, it would take a large amount of the author's time to do so, even if Just's 'Jahresbericht' of botany alone were consulted. But the information given would have far more practical value than the often doubtful identification of some drug used by the ancients and mentioned by Dioscorides or other old author. It should be mentioned that the bibliographical references given are not merely references, but very frequently contain the pith of the paper quoted in the fewest possible words, and for this readers whose time is limited will be exceedingly grateful. As a work of reference no pharmaceutical library can afford to be without the work.

The Pharmacy Acts Amendment Bill, 1898.

Memorandum.

The Object of the Bill is—

1. To render persons who have passed the "First" or "Preliminary" Examination required by the Pharmacy Acts, and who are consequently registered as "Apprentices or Students," eligible to become "Student-Associates" of the Society instead of "Students" as heretofore. The majority of the "Students of the Society" were not educated in the Society's School, and the term is therefore incorrect and misleading.
2. To render every person whose name appears on the Register of Chemists and Druggists eligible to become a Member of the Society. Two-thirds of the persons entitled to keep open shop as Chemists are ineligible to become Members, and they consequently have no direct representation on the Council of the Society.
3. To provide for the retirement of one-third of the Council every year by rotation instead of by ballot, as is provided by the Charter. The existing procedure makes it possible for a Member of the Council to be balloted out every year.
4. To enable the Secretary to receive voting-papers for the election of Council up to and on the day of election.

A BILL

TO AMEND

The Pharmacy Acts, 1852 *and* 1868.

1. Interpretation.—In this Act the term "Chemist and Druggist" shall have the same meaning as in the Pharmacy Act, 1868; and "The Society" shall mean the Pharmaceutical Society of Great Britain.

2. "Apprentices or Students" Eligible to be Elected "Student-Associates."—Every person who at the time of the passing of this Act shall have been duly registered as an "Apprentice or Student," and who, under the provisions set forth in Section X. of the Pharmacy Act, 1852, has been admitted to and at that time remains in the Society as a "Student," shall be registered as a "Student-Associate" of the Society; and every person who at the time of the passing of this Act shall have been duly registered, or who thereafter shall become registered as an "Apprentice or Student," shall be eligible to be elected a "Student-Associate" of the Society according to the Bye-laws thereof.

3. Registered Chemists and Druggists Eligible to be Elected "Members."—Every person who at the time of the passing of this Act shall have been registered as a Chemist and Druggist or who shall hereafter become registered as a Chemist and Druggist shall be eligible to be elected a "Member" of the Society according to the Bye-laws thereof.

4. Retirement of Members of the Council by Rotation.—Notwithstanding anything in the provisions contained in the Royal Charter of Incorporation of the Society, whereby it is provided that two-thirds of the Members of the Council shall in every year go out of office, the following provisions shall, after the passing of this Act, have effect:—

(1.) On the ordinary day of election of members of the Council in every year seven members of the Council shall go out of office, and the vacancies shall be filled by election, the retiring members being eligible for re-election.

(2.) The seven members who go out shall be the members of the Council who have been longest in office without re-election.

(3.) If and whenever the number of the members of the Council who have been longest in office without re-election shall exceed seven, the members of the Council to retire shall be determined from these by lot.

5. Voting Papers for Election of Officers.—At all Meetings of the Society, at which votes shall be given for the Election of Officers, all or any of the votes may be given either personally or by voting papers, in a form to be defined in the Bye-laws of the said Society, or in a form to the like effect, such voting papers being received by the Secretary, under cover, not later than twelve o'clock noon on the day on which the election takes place.

6. Extent of Act.—This Act shall not extend to Ireland.

7. Short Title of Act.—This Act may be cited as the Pharmacy Acts Amendment Act, 1898.

8. Repeal.—The enactments mentioned in the Schedule to this Act to the extent specified in the third column of that Schedule are hereby repealed.

Schedule.

Enactments Repealed.

Session and Chapter.	Short Title.	Extent of Repeal.
15 and 16 Vict. c. 56	Pharmacy Act, 1852	In Section ten the words, "and every such person duly registered as an Assistant shall be eligible for admission as an Associate of the said Society."
31 and 32 Vict. c. 121	Pharmacy Act, 1868	Sections eighteen, nineteen, twenty and twenty-one.

Explanatory Notes Respecting Clause 3.

The Pharmaceutical Society was founded in 1841 by Chemists and Druggists in business, who voluntarily associated themselves for the promotion of pharmaceutical education and for the protection of common interests.

The Royal Charter of Incorporation, 1843, gave official recognition to the voluntary body, and empowered the making of bye-laws regulating the admission of Members, Associates, and Apprentices. Membership was open to all persons established in business on their own account, also to those who, after examination, should be certified to be competent to carry on business. Associateship was specifically confined to the Assistants of Chemists and Druggists. (Charter, lines 78 and 91.)

The Statute of 1852 created a means of ascertaining the names of persons of known competency, by providing for the maintenance of a Register of Pharmaceutical Chemists. Penalties were imposed on unregistered persons who assumed the title of Pharmaceutical Chemist or Pharmaceutist. The Register was not a register of Members of the Society, and the practice of Pharmacy was not restricted to registered persons. Associateship was confined by the Statute to Assistants. (Pharmacy Act, 1852, Sec. X.)

The Act of 1868 declared it expedient for the safety of the public that "persons known as Chemists and Druggists should possess a competent practical knowledge of their business." (Pharmacy Act, 1868, Preamble.)

A Register of such persons was created, and the following were eligible for registration:—

I. All persons in business on their own account before the passing of the Act. (Pharmacy Act, 1868, Sec. III.)
II. All persons registered under the Statute, 1852.
III. All persons who should obtain from the Statutory Boards of Examiners certificates of competent skill and knowledge.

Connection with the Society continued to be optional, as it ever had been. (Pharmacy Act, 1868, Sec. XVIII., XIX., and XX.)

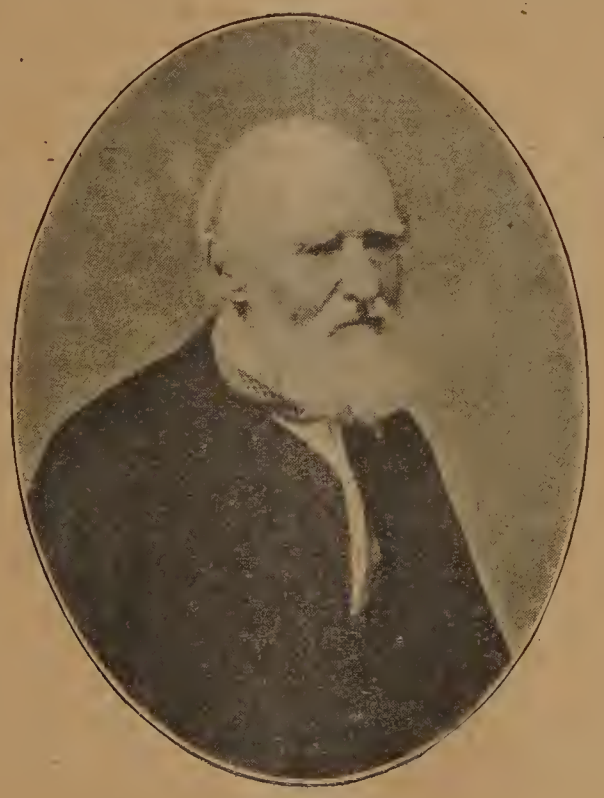
The Act of 1868 thus created a class of persons who are entitled, after passing the requisite Examination, to establish themselves in business on their own account, but who are not eligible for membership of the Society, and can have no representation on the Council of the Society. The Act only provided for their admission to the grade of Associateship, which from the foundation of the Society until 1868 had been exclusively reserved for Assistants. (See Pharmacy Act, 1868, Sec. XX.)

The legal qualification to carry on the business of a Chemist and Druggist is registration under the Pharmacy Act, 1868. Over 15,000 persons possess that legal right in common, but at the present time about two-thirds of them are debarred from membership of the Society and representation on the Council. (Pharmacy Act, 1868, Secs. XIII. and XV.) The present Bill, by Clause 3, proposes to remedy this anomalous condition by seeking for powers to render all registered persons eligible for election as "Members."

THE BENEVOLENT FUND OF THE PHARMACEUTICAL SOCIETY OF GREAT BRITAIN.

BENEVOLENCE is a virtue which it concerns all mankind to cultivate and to practise. That members of the pharmaceutical calling possess in a highly respectable degree the altruistic attributes of virtuous citizenship is revealed in the history of the uninterrupted progress of their own Benevolent Fund. Benevolence occupied a prominent place in the unwritten charter conceived by the founders of the Pharmaceutical Society, and it found honourable mention in the incorporating charter granted to the Society in 1843. But in those early days the first necessity was self-preservation; so much so, indeed, that the first ten years or so of the Society's life may be said to have been passed in fighting hostile Bills, and the infant Benevolent Fund was necessarily to some extent neglected. True, from time to time substantial nourishment in the shape of £500 grants were administered from the Society's General Funds, but no special exertions were officially made to direct the attention of members and Associates to the claims of the Fund until the year 1848. The Council had, in its first Bye-laws, fixed £300 as the minimum annual income upon which the full operation of the Fund could be justifiably inaugurated, and as the necessary capital was slow in accumulating, it became desirable to devise means of hastening the day of awakening. The device, naturally enough, took the form of a Dinner, for, as a writer of the day pertinently remarked, "no undertaking of the kind can flourish until the parties concerned have eaten salt together." This lack of pence, and the difficulty of acquiring it, was the exciting cause of the first Benevolent Fund Dinner which took place on May 16, 1848, at the Albion Tavern, Aldersgate Street – a hostelry still existing under the same name, but modernised out of recognition. Some particulars of the Dinner may be of interest to our readers to-day. The chairman was Mr. T. N. R. Morson, the Vice-President, who officiated for the President, Mr. Savory, and the company seem to have been few but enthusiastic. The usual toasts, loyal and pharmaceutical, were given and responded to, as well as one which is now unusual—"The Ladies"—which seems to indicate that our forefathers appreciated the value of securing the co-operation of the fair sex in the work of extending the influence of the Fund. The forty odd dinner stewards have all passed hence, the last survivor disappearing with the death of Edward Horner a year or two back; but of those who attended the Dinner some are happily still with us; for instance, Mr. A. S. Hill, Mr. A. B. Hill, Mr. T. Morson, and Mr. E. H. Moscrop. The special effort of which the Dinner was the outward and visible sign resulted in an addition of £800 to the resources of the Fund, most of which, say the records, was contributed by the London members of the trade. This accession of comparative wealth, and the removal of the restrictive bye-law which caution had led the Council to enact in 1843, permitted the Fund to commence its noble mission of practical benevolence, and we find that £10 was expended in casual grants during the year 1848. That may be said to be the year in which the Benevolent Fund came into active being, and it is a curious coincidence that on the morning of the very day of the Dinner above referred to, the President presented the sessional prize in materia medica to a "Square" student who is now an annuitant on the Fund.

Enthusiasm, however, is apt to die out quickly if not judiciously promoted occasionally, for the human heart conserves virtuous zeal as the flint bears fire. It is not surprising therefore to find that nothing much was done in the way of organised development of the Fund till the early sixties. Then appeared the individuality to which the trade owes the present splendid position of the Benevolent Fund.



DAVID PEART.

The First Annuitant on the Benevolent Fund.

When Mr. Elias Bremridge became Secretary the Fund was practically living on the interest on its investments, and limiting its operations to small grants amounting in the aggregate to £30 or £40 a year. When he retired in 1886 the annual subscriptions had risen to £1635, whilst the invested capital had grown to £20,433, and the record of good work for the year included the relief of 87 cases at an expenditure of £1870. The example he set of charitable importunity has been maintained to this day, and even improved upon, and no serious backsliding has occurred since the inauguration of Mr. Elias Bremridge's forward policy nearly forty years ago. Dinners became permanent institutions, and instead of one at very irregular intervals, decennial festivals were established, at which the well-meaning but slow-acting chemist might be induced, under the melting influence of presidential oratory and fraternal amiability, to include one or two "back payments" in his donation or subscription. The success of these Festival gatherings culminated in that which took place last year, and which yielded the magnificent sum of £2260 for the benefit of the Fund. Chemists ought to be proud of their Benevolent Fund, and ought to make it their especial concern to extend its influence and advance its work. Since 1848 some £52,000 has been expended in alleviating the distress of those who have been forced to "fall by the way." Imagination reels at the attempt to conceive the amount of human pain assuaged, of human sorrow solaced, represented by that sum of money, for it must be remembered that the distribution of grants has never been recklessly conducted or left to hazard. Is it nothing to registered men that so much has been accomplished? Is it nothing that so much yet remains which they might help to do? If any think it nothing, let him spend half an hour with the Secretary and learn at first hand the nature of the work which his father did so much to develop.

Up to 1865 the practice of granting permanent relief in the form of annuities was not possible, owing to financial reasons, but in that year a bold bid for popularity was made by instituting two annuities of £30 each. At that time the benefit of the Fund was restricted to members and associates of the Society, their widows or orphans. The first pair of annuitants therefore had to come within that category. We are enabled to give in this issue a very excellent portrait of the first male annuitant, David Peart, who was in business at Ewell for many years. The Council had the satisfaction of paying him the annuity for twenty-three years, and of knowing that that period was without that canker of financial worry as to ways and means which had harassed him during the later portion of his business life. He died in June, 1888, at the ripe age of 91. From two annuitants at £30 the permanent relief bill mounted in 1878 to 25 who received £768—that is to say, 13 at £35, and the rest at £30—and a further advance was made when in 1891 Mr. Carteighe raised the pension to the more adequate sum of £50 for those over sixty-five and £40 for those under that age. There are now 34 persons receiving the higher amount and 9 receiving the lower amount, and the total expenditure for 1897 in respect of annuities reached the record sum of £2570.

In 1868 all needless restrictions to practical usefulness were removed, and each chemist who has been registered under the Act is now entitled to participate, if necessity should rise, in the benefits of the Fund. Every registered man should therefore regard the Benevolent Fund as standing between him and possible penury—a joint-stock provision against the unexpected, and as a shareholder in so good a concern he ought to be prepared, nay, he is under a moral obligation, to give consideration for his share in the shape of an annual subscription. Members of the Society have done their part nobly and well, but the Benevolent Fund is neutral territory where pharmaceutical policy and contention have no place, so that all sorts and conditions of chemists may associate with perfect amity in the practical exhibition of benevolence, without regard to the virtues or supposed shortcomings of the Society. The administration of the Fund is beyond reproach, and the cost of distribution is almost entirely borne by the Society, hence there can be no excuse for withholding one's support. Some thousands of registered men still refrain from subscribing, but it is hoped that as the objects and the work of the Fund become more and more recognised that reproach will be gradually removed.

THE BENEVOLENT FUND ALBUM.

The following is a list of past and present Annuitants on the Benevolent Fund whose portraits are not in the above album. The Secretary will be glad to receive copies of photographs in those cases. They should be addressed to him at 17, Bloomsbury Square.

PARLIAMENTARY NOTES.

The Pharmacy Bill, 1898, is no doubt being introduced to the House as we go to press. The Hon. W. F. D. Smith (Strand) gave notice on Tuesday last that he would move for leave to introduce the Bill on Thursday, and there is nothing to lead one to suppose that such leave will not be accorded. Mr. Smith has associated with him as supporters Mr. E. Boulnois (E. Marylebone), Colonel Brookfield (E. Susx.), Mr. E. B. Hoare (Hampstead), Dr. Farquharson (W. Aberdeen), Mr. T. Shaw, Q.C. (Hawick Burghs), Mr. C. E. Schwann (N. Manchester), and Mr. H. E. Kearley (Devonport). The full text of the Bill, its objects, and an explanatory statement of its chief clause is printed on page 200 of this issue. It is one of the most modest of "stepping-stones to higher things," and, as such, should receive the cordial support of all who desire the Society to be strengthened and made more thoroughly representative of the pharmaceutical calling.

Food and Drugs.—Mr. Kearley's amendment to the address was duly moved at midnight on Friday, 18th, and speedily disposed of. It has not disturbed the *statu quo ante* to any appreciable extent, and only afforded ministers an opportunity of showing how wicked obstruction is when such excellent measures as the Government Food and Drugs Bill are awaiting attention. The amendment was rejected by 171 to 66, the voting generally following party lines. Sir Walter Foster and Sir J. T. Brunner were among the Ayes. The hon. member for Devonport does not propose to let matters rest or to wait till the Session is half over before attempting to secure attention for his own Bill.

Early Closing had its chance on Tuesday, when Sir John Lubbock's local option and Sir Charles Dilke's compulsory closing schemes were respectively first and second orders of the day, and, what is more, were both unopposed. But alas! Parliament is as fickle as Fortune, and the uncertainty of parliamentary moods is every bit as proverbial as the unstability of human affairs. In fact, the private member who does not happen to represent an Irish constituency, or to have a numerous following, has to be prepared for "counts out" when everything appears satisfactory and serene. Such a "bolt from the blue" fell on Tuesday at 8 p.m., and practically ruined the prospects of early closing. Sir John was in his place, but even his many-sided individuality could not induce thirty-nine persons to stay with him to make a quorum. Perhaps the weight of Mr. Samuel Smith's Indian motion had crushed out all political ardour in the House.

In the House of Lords the Lord Chancellor introduced the University of London Commission Bill, and it was read a first time. Next Monday it will probably pass its second stage, and will be speedily passed into the arena of political strife, politely

referred to as "another place." The Bill is precisely similar to that introduced last year. It appoints Commissioners (who, by the way, are not yet named) to effect what the London University authorities have declined to do, viz., the reconstitution of the University on the lines recommended by the Gresham Commissioners. They have power to make statutes and regulations for the University in accordance with the scheme, or with such modications as expediency may suggest—a wide power. But there is a safeguard. All such statutes or regulations must be submitted to Parliament, and must be approved by the Queen in Council before becoming operative, and Parliament may, within forty days after the presentation of the Statutes, pray Her Majesty to withhold consent thereto. The minority, therefore, are provided with ample means of obstructing the work of the Commissioners, and the objectors to the whole scheme will no doubt use those means in the event of the Bill becoming law. There is, in schedule form, a series of standing instructions to guide the Commissioners in making regulations, and one of them insists that "University teachers" shall be "members of the teaching staffs of public educational institutions," within thirty miles, "who have been recognised as teachers of the University." There is thus some hope of one day seeing the Pharmaceutical Society's educational work in pharmacy associated with and recognised by London's great Teaching University.

Copyright Amendment will occupy the attention of a Committee of the House of Lords on Monday next.

The Companies Bill (H.L.) is awaiting consideration by the Select Committee, to which it has been referred. The Committee has been constituted, but no day has yet been fixed for the first meeting. We regret that we are not at present able to give the text of Mr. Faithful Begg's attempt at company legislation. The Bill he introduced has not yet been printed, and is not likely to trouble the House much this Session.

The Chemical Compounds Bill is also a delayed measure, owing to the illness of its introducer, Mr. Wootton Isaacson. We regret to have to announce that the honourable gentleman died on Tuesday last of influenza. Second reading of the Bill was down for Monday, but was deferred till Thursday. It has not been printed officially,

---

LEGAL INTELLIGENCE.

PROCEEDINGS UNDER THE PHARMACY ACT.

The Council of the Pharmaceutical Society of Great Britain v. Sutton.

On the 17th instant at the Portsmouth County Court, before His Honour Judge Gye, the Council of the Pharmaceutical Society of Great Britain sued George Sewell Sutton, of 31, Stoke Road, Gosport, to recover a penalty of £5 for keeping open shop for the retailing, dispensing, or compounding of poison contrary to the provisions of the Pharmacy Act, 1868.

Mr. R. E. Vaughan Williams, instructed by Messrs. Flux, Thompson and Flux, appeared for the Society. Defendant appeared in person.

Mr. Vaughan Williams, in opening, said the proceedings were brought under the provisions of the Pharmacy Act, 1868, for the recovery of a penalty of £5. The 1st Section provided that unqualified persons should not sell poisons, and he also referred to various other sections which had a bearing on the case. The 13th Section made the Register evidence, and the 15th Section imposed penalties for offences, and in this case he charged the defendant with keeping open shop for the retailing of poison, not being a duly registered pharmaceutical chemist or chemist and druggist. The 16th Seotion reserved the rights of certain persons, and it might become necessary to direct further attention to that section.

The purchase upon which he relied was made on September 27 last by Mr. Partridge, who was sent by the Registrar of the plaintiff Society. He purchased some drugs, among which was laudanum. Over the shop he found the name George Sewell Sutton, and under those circumstances it would be for the defendant to show that he was not keeping open shop.

Before instituting proceedings the Society's solicitors wrote defendant for the penalty, and the reply sent by defendant indicated that he was going to set up the defence that he was a person entitled to the benefit of one of the reservations contained in Section 16, as the executor of a deceased chemist.

Inquiries were made, and the conclusion come to that defendant was not *bonâ fide* carrying on business as the executor of his father, and it would be for defendant to establish that he was such executor. Defendant had tried to pass an examination, and there could be no doubt that he was fully aware of the requirements of the statute.

His Honour (to defendant): Do you admit the sale?

Defendant: I do.

Mr. Vaughan Williams: I think it is requisite that I should give formal evidence of the offence.

Mr. Partridge, examined: I went to 31, Stoke Road, Gosport, on September 27 last. I made a purchase of twopennyworth of laudanum and twopennyworth of soap liniment. Defendant's name was over the premises.

Cross-examined: The name up was "G. S. Sutton." I made inquiries in the neighbourhood as to defendant's Christian names.

His Honour (to defendant): Was your name up?

Defendant: Yes, on the door.

His Honour: When this stuff was bought was there any other person of that name in the business?

Defendant: No.

His Honour: Are you a chemist and druggist?

Defendant: No, sir.

Mr. Ernest John Eastes, examined: I am an analyst. I analysed the contents of the bottle handed to me by Mr. Partridge. I found it to contain 1 oz. and 3 drachms of a fluid which proved to be laudanum and soap liniment. I found the amount of morphine to be 1·05 grain, equivalent to 10½ grains of opium.

Mr. Vaughan Williams: I put in a print of the Annual Register. Defendant's name is not to be found in it, and he has admitted that he is not a chemist and druggist. I also put in the file of proceedings in the defendant's bankruptcy, as it may be necessary to refer to certain information given by the defendant to the Official Receiver, and appearing on the said proceedings. I submit that I have established my case, and it is for the defendant to establish the defence which he has put forward.

Defendant: My answer to this action is that I come under Clause 16 of the Pharmacy Act, 1868, reserving the rights of certain persons, as the executor of my father, who was a chemist and druggist.

His Honour: How do you propose to do that?

Defendant: By production of my father's will.

Mr. Vaughan Williams: I object to that form of proof. There are decided cases that production of a will is not sufficient proof of executorship.

His Honour, after reading Section 16 to defendant, asked him how he brought himself within any one of the reservations in that section.

Defendant: I am executor or trustee of my father.

His Honour: Have you proved the will.

Defendant: No; I produce the will.

His Honour: I can't look at it. It is not the slightest use keeping up this case further. The only way in which you can establish that you are executor of your father is by production of probate of his will. I have no evidence before me that you are entitled to that position. I must give judgment against you. You have been doing a very wrong thing, and you have no right to carry on the business of a chemist and druggist. The plaintiffs are entitled to judgment against you for the penalty claimed, with costs.

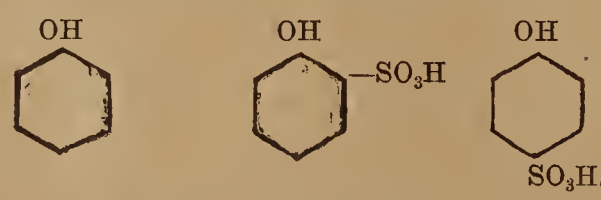
THE STUDENTS' PAGE.

EXPLANATORY NOTES ON THE B.P.

Sodii Citro-Tartras Effervescens.—This compound, as wel as the other effervescent salts described in the B.P. Appendix may be made very well on the small scale by careful manipulation The mixture to be granulated should be placed in a flat-bottomed porcelain basin—a photographic dish answers very well—and the basin heated over a saucepan of boiling water. The basin should be large enough to well cover the saucepan, the water being boiled very gently so as to minimise as much as possible the absorption of moisture during granulation, and consequent loss of effervescent properties. In making effervescent preparations from salts containing water of crystallisation, which is partly or wholly expelled at the temperature of granulation, it is obviously necessary to remove this water by a preliminary application of heat. Otherwise the water would bring about the reaction between the added acid and bicarbonate, and the finished granule would be devoid of effervescent properties.

Sodii Sulphocarbolas.—When phenol is dissolved in strong sulphuric acid a substitution product is obtained, phenol sulphonic acid, which has the constitution $SO_2<^{C_6H_4(OH)}_{OH}$. This may be regarded as a di-substitution product of benzene, and consequently can exist in the three isomeric forms known as the ortho, meta, and para varieties, according to the relative position of the two substituting groups (in this case hydroxyl (OH) and the sulphonic group, SO_3H) in the benzene nucleus. When a mono derivative is thus converted into a di-derivative, the variety of the latter compound obtained depends upon the nature of the substituting group already present in the mono-substitution derivative, and not upon the nature of the second substituting radicle. Although it is difficult to give in any simple manner the general laws which govern the course of the reaction in these cases, the following statement will enable the student to grasp broadly the facts of the case. If the compound formed by adding hydrogen to the radicle already present is readily oxidisable, then the second entering radicle will take up the meta position relatively to the first. This, therefore, applies, for example, to nitro ($\mathbf{H}-NO_2$) carboxyl ($\mathbf{H}-COOH$) and sulphonic ($\mathbf{H}-SO_3H$) derivatives, since nitrous, formic, and sulphurous acids are all oxidisable substances. As a matter of fact, nitro-benzene, $C_6H_5(NO_2)$, benzoic acid, $C_6H_5(COOH)$, and benzene sulphonic acid, $C_6H_5(SO_3H)$, when converted into di derivatives, form the meta variety, no matter what the nature of the second substituting radicle may be. On the other hand, if the compound obtained by adding hydrogen to the first radicle is not easily oxidisable, then the second entering radicle takes up the ortho and the para positions, although the para compound usually predominates. For example, hydroxyl, chlorine, and amidogen derivatives yield ortho and para derivatives, because water ($\mathbf{H}-OH$), hydrochloric acid ($\mathbf{H}-Cl$), and ammonia ($\mathbf{H}-NH_2$) are bodies only oxidised with difficulty.

In the case of phenol and sulphuric acid ortho- and para-phenol sulphonic acids will consequently be obtained—



It must be remembered that this rule is only broadly true, as a *small* quantity of the variety contrary to the rule is obtained in most reactions. Note, in passing, that sulphonates are isomeric with sulphites. In the former the radicle is directly connected with the sulphur, while in sulphites it replaces the hydrogen in a hydroxyl group, as shown by the three following general formulæ :—

Compare in your text-book the difference between the behaviour of sulphites and sulphonates, noting the formation of the latter by oxidation of the thio-alcohols or mercaptans RSH. The phenol sulphonic acids are separated from the excess of sulphuric acid by neutralisation with barium carbonate, barium sulphate being precipitated while the barium phenol sulphonate is readily soluble. By adding now sodium carbonate to the filtrate barium carbonate is precipitated, while the sodium phenol sulphonate, known commercially as sulpho-carbolate of sodium, remains in solution.

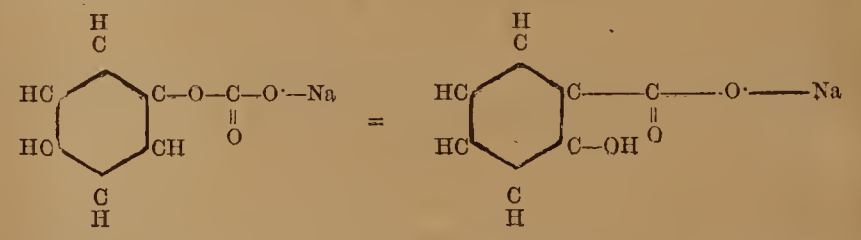
Sodii Salicylas.—The Pharmacopœia recognises both the natural salicylic acid and the synthetic product obtained from phenol. The latter is made by passing carbon dioxide into sodium phenate, C_6H_5ONa (obtained by reaction between sodium hydroxido and phenol) under pressure when phenyl sodium carbonate results—

$$CO_2 + C_6H_5{\cdot}O{\cdot}Na = CO<^{ONa}_{OC_6H_5}$$

This is precisely analogous to the action of carbon dioxide on sodium oxide—

$$CO_2 + Na{\cdot}O{\cdot}Na = CO<^{ONa}_{ONa}$$

By heating the phenyl sodium carbonate it undergoes an intramolecular transformation into the isomeric sodium salicylate, $C_6H_4(OH)COONa$—



Comparison of the two formulæ shows that the change involves the transfer of an oxygen atom from the carbonic radicle to the adjacent carbon atom in the benzene nucleus, with the production of a hydroxyl group. The compound so produced is hydroxybenzoic acid, which, being a di-substitution product, can exist in three forms, ortho, meta, and para, according to the relative positions of the two substituting groups. Salicylic is the ortho variety, as shown above. The meta- and para-acids are well known, and some of the latter is produced in the manufacture of salicylic acid if the temperature be allowed to rise too high. The artificial salicylic acid formerly produced doubtless contained an appreciable quantity of impurities derived in part from impurities present in the phenol—chiefly homologues, like cresol, $C_6H_4(CH_3)OH$, for example, which produces homologous cresotic acids, $C_6H_3(CH_3)OH{\cdot}COOH$. These impurities were said to cause unpleasant symptoms when salicylic acid was administered in large doses. Owing to improvements in manufacture, the artificial salicylic acid can now be obtained practically pure and is consequently used almost to the exclusion of the natural acid obtained from winter-green oil, on account of the high price of the latter. The meta- and para-hydroxy benzoic acids differ from salicylic acid in giving no violet colour with ferric chloride and in not volatilising with steam. In the official tests for sodium salicylate, sulphates and chlorides are detected by the precipitation of barium sulphate and silver chloride in presence of nitric acid, the salicylic acid precipitated by nitric acid being redissolved by the addition of alcohol. Solution in cold sulphuric acid without effervescence excludes the presence of carbonates, while many forms of organic impurity, sugar, for example, will be detected by the more or less charring on the addition of sulphuric acid, with which salicylic acid forms a colourless derivative.

Spiritus.—The official spirits are solutions of various substances for which alcohol forms a convenient solvent and diluent. In most cases the alcohol promotes the action of the remedy dissolved in it, for the official spirits are chiefly stimulants or carminatives. Many of the tinctures might with more justice be called spirits, for instance, tinctura iodi, which is merely an alcoholic solution of iodine.

METRIC UNITS AND VOLUMETRIC SOLUTIONS.

At a meeting of the International Commission on Weights and Measures, held in Paris last year, Mr. Chaney, the British representative member of the Commission, drew attention to the practice adopted by chemists and pharmacists of graduating measures of capacity in such a manner as to have reference to the temperature of 15°·5 C. Thus, for instance, a flask for measuring 100 C.c. that would contain 100 grammes of water at 15°·5 C. would contain at the temperature of 4° C. about 100·16 grammes of water. At the request of the General Medical Council, conveyed through the editor of the British Pharmacopœia, Mr. Chaney wished the Commission to express an opinion as to the directions proposed to be given in the Pharmacopœia for the preparation of volumetric solutions in the manner above referred to. One of the directions submitted to the Commission was as follows :—

"A glass flask which when filled to a mark on the neck contains exactly 1000 grammes of distilled water at 60° F. (15°·5 C.). This measure would represent 1 litre or 1000 C.c."

After discussing the subject the members of the Commission were unanimous in their conclusion that it is necessary to avoid any alteration of the fundamental definitions of metrologic units, and that a measure described as a litre should always conform to the conditions for representing that unit, that is to say it should represent the volume of a kilogramme of water at the point of maximum density or 4° C. In like manner, when measuring water at a different temperature, allowance should be made for the expansion of the water and for the difference between the air it displaces and that displaced by the weights used. It was also agreed at the suggestion of M. Mendeleeff that a further correction should be made if the pressure differs from the normal. On these grounds objection was taken to the definition of the litre, and 1000 C.c. proposed by the Medical Council as involving an alteration of the value of those measures.

But provided that the conditions are borne in mind which are indispensable from the metrological point of view, it was considered admissible that measures of capacity might be adjusted at other temperatures than 4° C., for example, at 15°·5 C. But in such cases it is necessary that a litre measure adjusted for a temperature other than 4° should bear an indication of the temperature at which it has been adjusted and at which it will measure the unit without correction.

The objection made by the Commission appears to have been caused by the last sentence of the passage quoted above and representing the volume of 1000 grammes of water at 15°·5 C. as being a litre, whereas it would be something more than a litre. That is an addition to the description in the present Pharmacopœia (p. 488), which is incorrect, and is quite unnecessary in regard to the preparation of volumetric solutions, as they do not require to be prepared with vessels having the exact capacity of the metric units of volume, but only to have a definite and constant relation to each other and to their subdivisions. In practice metric units of volume are nominally used, but the adjustment of measures, burettes, etc., is made—without regard to metrologic relation between the litre and the kilogramme—at the normal temperature of 60° F. (15°·5 C.), at which analytical operations are conducted.

Another point in the proposed definitions of the new Pharmacopœia to which the International Commission took exception was the statement that the standard cubic centimetre is the volume of one gramme of water at 4° C., 1000 C.c. representing one litre. That statement is not in accord with actual knowledge, since the volume of a cubic decimetre is not identical with the volume of a kilogramme of water at the maximum density or the equivalent of the prototype kilogramme. The difference has not been exactly determined, but it amounts to something near 1/10,000th, and the determination of the exact difference is now engaging the attention of the International Bureau.

A WORD WITH CHEMISTS AND DRUGGISTS.

Sixty years ago chemists and druggists in Great Britain were without organisation of any description; anyone could assume their title and practise their art without let or hindrance, and a craft that contained within itself all the elements required to constitute a professional body was in a condition that can only be described as chaotic. A few individuals in London and the larger towns conducted business on lines that have never been surpassed; but the majority were nondescript dealers in almost everything except what they professed to sell and dispense. The leaders had reached the highest rungs on the ladder that any pharmacist can expect to attain to, but the rank and file followed them at such a distance apart that it is almost impossible they could have conceived they were pursuing the same route. What natural development was slow to effect, however, the incidence of danger quickly brought about. Threats of restriction and control by medical bodies caused the heterogeneous fragments to unite for self-defence with marvellous unanimity, and for a time there was a fair prospect of a body existing in pharmacy which should include all, or nearly all, those who practised the art. With that hope ever in mind, Jacob Bell, a sketch of whose life-work is published this week (see p. 195), struggled on manfully through many weary years, rendered doubly trying by acute personal suffering. On more than one occasion his wonderful personality

attracted the bulk of those whom he had grown to regard as his constituents and kept them in touch with each other temporarily until the work in hand had been accomplished. The original idea was that the Pharmaceutical Society should be a purely democratic body, including as members, all chemists and druggists in business on their own account, on an equal footing, with identical privileges, the same title — pharmaceutical chemist — and everything else in common, so far as the body corporate was concerned. But later the awakening came, and, thirty years ago, the passing of the Pharmacy Act of that day revealed a degree of selfishness on the part of some pharmaceutical chemists, and a lack of interest on the part of chemists and druggists, that together tended to dissipate any idealistic notions that may have influenced Jacob Bell and his friends and fellow-workers in their endeavours to consolidate pharmacy as a profession. A fancied superiority led some of the earlier members to protest against the admittance to their ranks of a large number of worthy practitioners whom reason urged the desirability of including in the Society. The influence of the objectors, weak though their arguments were, sufficed unfortunately to weigh down all that could be said on the other side, and the apathy of the chemists and druggists of 1868 could not be sufficiently shaken off to induce them to overwhelm the opposition by force of numbers and a united claim for justice. The result has been that, ever since, those who have passed the examination to qualify as chemists and druggists have occupied an invidious position in the Society of which they now constitute the main strength, and never during all the years that have elapsed have they combined properly to seek redress.

To-day a further opportunity is thrust upon them, but the prospect of better things is clouded, as in 1868, by threatened opposition on the part of a few pharmaceutical chemists. Possibly obstacles may not actually be interposed in the path of the new Pharmacy Bill, but it is none the less necessary to face the possibility that they may be interposed and become veritable stumbling-blocks. Measures must be taken, then, to repel attacks, and organised defence appears to be a special need of the moment. If, for every objector to the Pharmacy Bill of 1898 who puts himself in communication with his Parliamentary representative, a dozen or a score of chemists and druggists make it their duty to explain to the same representative the reasonable nature of the measure, the harm attempted will be at least neutralised, and perhaps a slightly greater effort might secure a zealous advocate and supporter in the House of Commons. The majority of pharmaceutical chemists are in favour of this Bill for admitting all registered chemists to equal privileges as members of the Society, and many are working steadily and persistently to ensure it becoming law. The text of the measure is printed at page 200, with full explanations of the changes it is intended to effect, and why, after considering these, anyone should go out of his way to protest against what is desired by and due to so many it is very difficult to see. But the key to the situation is now with the chemists and druggists whom it is proposed to benefit, and if they will only take the matter up as it deserves, success is assured. Let each one whose hands this number of the Journal reaches at once sit down and write to the local Member or Members of Parliament, urging unqualified support of the Pharmacy Acts Amendment Bill, and that which the founders of the Society strove after so many years, without avail, will be secure of realisation at last.

ANNOTATIONS.

Criticisms of the Pharmaceutical Society from Without are not uncommon, and usually prove to be as baseless as they are frequent, but criticism from within the ranks does not so readily find expression, though it is always desirable that feelings of dissatisfaction when existent should be manifested on the earliest possible occasion. In Mr. Sharman's letter on page 225, utterance is given to feelings such as are known to exist, though in most instances the grievance felt is so intangible that the individuals concerned cannot be prevailed upon to come into the open. But what is the gist of Mr. Sharman's complaint? Taking the alleged shortcomings of the Society in order, we are asked what steps it has taken to secure fair profits? The answer is: None; and it may be added that it is impossible it ever can take such steps. Mr. Glyn-Jones, of the P.A.T.A., is foremost amongst those who declare that. Coming to the next point, better relationships betwen medical men and chemists have been steadily cultivated by the Pharmaceutical Society for some fifty-seven years, and if those relations are not yet all they might be, the reason is in great measure supplied by the perverse conduct of many of those who grumble most at the Society. The protection of public dispensers, as such, is no more the duty of the Society than the protection of the South Sea Islanders. A certain proportion of those dispensers are registered chemists and druggists. The Society protects their title, and has untiringly urged upon the public authorities the desirability of putting an end to the unfair competition that is manifested by the appointment of unregistered persons as public dispensers. A still smaller proportion of the body referred to consists of supporters of the Society, and they enjoy all the privileges that are available to those of equal rank in the body corporate. As regards frivolous prosecutions, it seems necessary that critics should specify what is to be classed under that head. Is the Society to waste money and lose credit by defending chemists who may have carelessly or wilfully sold medicines lacking in strength or quality, or who have gone outside their proper sphere to act as apothecaries, or what is it to defend? A little more definiteness may reasonably be expected by the Council of the Society before it can be expected to initiate any scheme of protection of trade interests, differing from what has already been done without adequate recognition or support by the greater part of the craft.

The Metric System is, or ought to be, employed by every registered chemist in his scientific work, and as soon as the new Pharmacopœia is issued, and properly stamped metric weights and measures can be procured, the system ought equally to be employed in connection with all compounding work in the pharmacy, as well as in any other way that the pharmacist can introduce it without disadvantage. On a recent occasion the suggestion was offered in these pages that, under the circumstances shortly about to prevail, pharmacists should neglect no opportunity of familiarising themselves with the metric system, and the intention was announced of encouraging and assisting the reform indicated by proceeding at an early date to give all quantities in the *Pharmaceutical Journal* in accordance with the metric system. That intention has so far been generally approved by English pharmacists, and the only objections that have been intimated hail from Scotland, a most incomprehensible fact. But we quite fail to see any good reason for objecting, the more especially as arrangements are being made to facilitate the more general adoption of the metric system of weights and measures, that will reduce the trouble involved to a minimum. A first instalment of useful time-saving tables of

equivalents is published this week (see p. 209, *et seq.*), and others will appear at convenient intervals.

The Tables of Equivalents published this week are partly based on the excellent series printed in the 'Pharmacopœia of the United States,' but as the fluid measures in use across the Atlantic differ from those current here, it has been rendered necessary to compile tables of equivalents for measures of volume entirely afresh. To anticipate criticism of the table printed on pages 211-12 it may be well to state that the metric equivalents given are based strictly on the latest list of equivalents published by the Board of Trade. Those, therefore, who are accustomed to regard "gramme" and "cubic centimetre" as practically interchangeable terms are warned that the matter has already been fully considered. Theory would give the equivalent of the pint as 566·990 millilitres (or cubic centimetres as it is customary to regard them), and that of the fluid ounce as 28·350 millilitres. The equivalents recognised by the Board of Trade, however, are 568·245 Ml. and 28·412 Ml. respectively, and as the Board of Trade is the responsible authority in the matter in this country, whilst the equivalents that body adopts will alone be recognised in stamping weights and measures, it has been thought desirable to give the practical equivalents rather than those indicated by theory. The discrepancy is partly due to the fact that, in determining the equivalents, the weight of water contained in the litre at 4° C. is compared with the weight contained in the gallon at 16°·667 C.

A Simple Conversion Rule, for use when it is desired to express a formula stated in terms of grains and fluid ounces, in terms of grammes and cubic centimetres (millilitres), is given here in the hope that it may prove useful to readers. Since the fluid ounce (437·5 fluid grains) equals 28·412 cubic centimetres, and that number multiplied by 15·432 (the number of grains in 1 gramme) equals 438·5 cubic centimetres, formulæ by which solids are expressed in grains and liquids in fluid ounces may readily be expressed in terms of the metric system, with sufficient accuracy for all practical purposes, by regarding the grains as grammes and each fluid ounce as equivalent to 440 cubic centimetres, the product obtained being then approximately fifteen and a half times that of the original formula. Thus, for example—

Liquor Iodi, B.P.

Iodine,	22 gr.	× 15·432 =	22 Gm.
Potassium Iodide,	33 gr.	× 15·432 =	33 Gm.
Distilled Water to	1 fl. oz.	× 15·432 =	440 C.c.

But an even simpler plan than the above may be based on the following facts :—1 Grain = 1/15·432 Gramme ; 1 Avoirdupois Ounce or 437·5 Grains = 438·5/15·432 Grammes ; 1 Fluid Grain = 1/15·432 Cubic Centimetre ; 1 Fluid Ounce or 437·5 Fluid Grains = 438·5/15·432 Cubic Centimetres. That is to say, the number of grains in the ounce (437·5), or of fluid grains in the fluid ounce (437·5), is practically identical with the number of grammes (438·5) or cubic centimetres (438·5) resulting when we multiply by 15·432, the number of grains or fluid grains in a gramme or cubic centimetre respectively. Accordingly, as in small operations the difference between 437·5 and 438·5 may be ignored, we find that a formula stated in terms of grains and fluid grains may be stated in terms of grammes and cubic centimetres, without any calculation being required. Thus—

Liq. Potass. Permang. B.P.

Potassium Permanganate,	88 gr.	× 15·432 =	88 Gm.
Distilled water, 1 pt. or	8750 fl. gr.	× 15·432 =	8750 C.c.

Ounces and fluid ounces must always, of course, be reduced to grains and fluid grains, as in the last example, but that frequently involves nothing more than substituting the word grain for ounce, as in the formula for

Ung. Hyd. Nit., B.P.

Mercury	4 oz. or 4 gr. ...	× 15·432 =	4 Gm.
Nitric Acid.....	12 fl. oz. or 12 fl. gr.	× 15·432 =	12 C.c.
Prepared Lard ...	15 oz. or 15 gr. ...	× 15·432 =	15 Gm.
Olive Oil.....	32 fl. oz. or 32 fl. gr.	× 15·432 =	32 C.c.

Possibly some of our readers may be able to suggest similarly convenient rules. Any suggestions in this connection, or with regard to the tables of equivalents, will be gladly considered, as it is desired to simplify matters as much as possible.

In Mr. McMillan's Letter, published this week (p. 224), the whole question is raised of the comparative value of the metric system. But it is much too late in the day to do that, and pharmacists ought not to be amongst those who would put back the clock. What is done in Germany and elsewhere has nothing to do with the case, and we are not aware that anyone is contemplating the adoption of the plan of weighing both solids and liquids in dispensing operations. Nor is the question of the use of the metric system in dispensing of primary importance. Even now, medical practitioners throughout the whole of Great Britain order quantities in prescriptions in terms of the practically obsolete Apothecaries' Weight, and it is not likely that they will change their habits in that respect, unless under legal compulsion. It is the much wider question of the public interest and the pharmacist's convenience that is involved, and pharmacists will be adopting an extremely short-sighted policy if they interpose any obstacles in the way of the general adoption of a system of weights and measures that possesses undoubted advantages as compared with any other extant.

The Imperial Institute Myth is gradually ceasing to be regarded as a reality, and the publication of the announcement that the colony of Victoria has decided to withdraw its annual contribution to the "glorified Aquarium" at South Kensington has once more directed attention to the ineptitude of those who were expected by some people to lead the way to Imperial Federation. The *Daily Chronicle* asks what is the value of the Imperial Institute —"the great permanent record of the true Victorian Jubilee?" For a long time, it is remarked, it has been sadly to seek, and every attempt to galvanise the Institute into popularity has failed, even the instrumental music and coloured lights having been unsuccessful in drawing the expected millions to the centre, that was to be, of Imperial unity. "The fact is, and it is no use any longer shirking it, that as a museum the Imperial Institute is, and was from the first, doomed to be a failure, while as a place of resort for jaded folk desiring a gleam of brightness across their lives it could not be said to be 'in the same street' with other attractions in the same quarter. . . . . In the expressive American phrase, we 'have no use for' the Imperial Institute."

Mr. Chamberlain, in the House of Commons on Tuesday, was questioned about the reported withdrawal of the Victorian contribution, and whilst confirming the report, he stated that no reason had been assigned by the Victorian Government for the discontinuance of its subscription to the Imperial Institute. The *Daily News*, therefore, expresses the hope that Victoria may finally vouchsafe some explanation of the matter as "it might furnish critical enlightenment to many who are thoroughly dissatisfied with the management of the Institute, and not a little ashamed of the way in which it has failed to live up to its opportunities in Royal patronage and in bricks and mortar." "What is wrong

with it?" asks this critic. "Will Victoria kindly let us know? It is impossible not to feel that there has been something quite wrong from the first, when we see it condescending to 'entertainment items' as a substitute for its proud programme of dignity and public usefulness. It was not designed for these futilities of a glorified Aquarium. It was meant for a great union of heads and hearts for the promotion of the prosperity of the Empire, and it has wholly failed of its object. Nobody prophesies against it, but nobody minds it; and that is much worse." But extreme bathos is only attained when a writer in the *Pall Mall Gazette* quotes Sir Frederick Abel's opinion on the great value of the work done in the laboratory of the Institute, where many colonial barks have been "scientifically examined and reported upon." The pathetic nature of his remark to the interviewer, that if he did not heartily believe in the high utility of the work carried on at the Institute, he should not have devoted himself to it, "without fee or reward," after forty years of public life, might make angels weep, but is, we fear, much more likely to cause mere mortals to scoff.

The 'Pharmaceutischen Zeitschrift für Russland,' published during the last thirty-six years by the Pharmaceutical Society of St. Petersburg, in the German language, was discontinued at the end of last year, and it will in future be published in the Russian language. But in order to maintain relationship with other countries where that language is not generally understood, a quarterly issue of the *Zeitschrift* in German will be published as a supplement and supplied gratis to subscribers.

The Midland Pharmaceutical Association is actively supporting the Pharmacy Acts Amendment Bill, having addressed a letter to the Members of Parliament for Birmingham and District, signed by Mr. F. J. Gibson, President of the Association, in which, as representing the pharmaceutical chemists and chemists and druggists of the Midland District, they draw attention to the Bill, and ask that it should be kept in mind and receive favourable support. An offer is also made in the letter to arrange for a deputation to wait upon the parliamentary representatives to explain details if it be desired. As we go to press we learn that similar steps have been taken by the chemists of Northampton.

A Chemists' Association has been formed at Scarborough, a meeting having been held at the Albemarle Hotel on Tuesday evening, February 15, to make the necessary arrangements. Mr. John Whitfield occupied the chair, and on the proposition of Mr. E. R. Cross, seconded by Mr. Geo. Whitfield, it was unanimously agreed to form an association to be called "The Scarborough Chemists' Association," having for its object the advancement of chemistry and pharmacy, the discussion of trade questions, and other purposes. All registered chemists engaged in business in the town are eligible for membership, and the annual subscription has been fixed at half a crown. Rules were adopted and the following office bearers elected:—President, Mr. John Whitfield; Vice-President, Mr. Henry Chapman; Hon. Secretary, Mr. R. Gilchrist, 73, Newborough. The committee will consist of the above officers, together with Messrs. F. Foster, George Whitfield, E. R. Cross, and T. W. Longden.

The Chemists' Assistants' Association will hold its twentieth Annual Dinner at the Holborn Restaurant (King's Hall), London, on Tuesday next, March 3, at 8 p.m., when the chair will be taken by the President, Mr. T. Morley. Those who have not yet secured tickets and desire to be present on this occasion, must apply at once to the hon. Secretary, Mr. George Roe, 283, Lillie Road, Fulham, S.W.

DENTAL NOTES.

A Unique Method of Backing a Tooth.

Dr. W. A. Siddall, in describing his method of backing a tooth in the *Ohio Dental Journal*, says he cut out the backing, made holes for the pins, cutting them short, placed the backing on the tooth, and laid the tooth buccal side down on a piece of soft pine. He then took a piece of car spring rubber an inch thick, placed it on the tooth, and struck it two or three sharp blows with a hammer. He found that the porcelain was not fractured, and that the backing was driven to fit quite well. The next time he placed the tooth on a steel anvil, placed rubber over it, and could then strike it with a heavy hammer without fracturing the porcelain, the backing fitting well. It is safe, he says, to lay the tooth on an anvil or hard board if it be a thick tooth, and if there is much convexity of the buccal surface; but if the facing is thin, and the buccal or labial surface is quite convex, place it on soft wood, or even on another piece of rubber. The rubber may vary somewhat in elasticity, but a little experience will enable one to ascertain what strain a porcelain will stand, and the amount of force required to make the backing fit.

Gold Retaining Bands.

Bands that do away with the ugly effect of exposing too much gold (which is often the case where pressure is exerted on the labial side) may be made by taking a band of spring gold, about 1/8th of an inch wide, and forming it to the lingual surface of the teeth, to be retained or regulated, forming a clasp hook at either end. After trying it in the mouth and fitting to position, mark with a fine point the spaces between the teeth. At the places marked solder at right angles to the band strips of spring gold, about ¼ inch in length; these are then divided and turned to right and left, forming hooks. The overlap of these hooks should not be more than 1/8th of an inch; as the tooth comes into the true line, pressure may be increased or diminished to suit the case.—Dr. W. Bryant, in the *Stomatological Gazette*.

Submarine Gold.

According to M. R. Thaile in *L'Odontalgie*, this is the latest invention of Dr. Herbst. It is made in the form of pellets. Proximal as well as crown cavities can be filled with it providing the walls are strong. The instruments used are simple. First, a large polishing bur; second, same as first but unpolished; and two pluggers for soft gold complete the outfit. The use of submarine gold does away with annoyance arising from the presence of saliva. Dr. Herbst recommends dipping the pellet to be used in water so as to facilitate its introduction and increase the density of the filling. The manner of filling is very similar to that used with other soft golds, but the finishing is done with burnishers on a dental engine, and afterwards with carborundum wheels.

Retaining Appliance.

A simple, easy, and accurate method of making a stay appliance for holding two or three teeth that have been moved by regulating appliances is to take an impression in modelling composition and a model with Teague's impression material, burnish thin platinum to accurately fit the teeth, trim it up to where it is required, and while still on the model flow solder over the entire outer surface as thick as desired. This makes a neat and closely fitting appliance.—*Dental Weekly*.

Adjusting Logan Crowns.

There are many ways recommended for adjusting Logan crowns, both practical and otherwise. Of the former, that recommended by Dr. Harper in 'Items of Interest' appears to possess many good points. He writes:—"The root for crowning should be trimmed as desired, bevelling the canal a little at the end; take an impression (I use a cartridge shell), from it make a die and counter die, swage a piece of gold between them, put on root and burnish close. This will form a ferrule, protecting the entire end of root. Leaving the cap on root, take a crown and burnish over its end a piece of gold to fit perfectly as a cap; now put soft wax over it, and adjust to root, placing the crown in exact position. Let the wax harden, remove, trim as you would have it look when finished, remove both caps from crown, invest and flow solder in place of wax; place on crown and soft solder to pin, polish, and crown is ready for adjustment, perfect at all points."

The Metric System for Pharmacists

AS has already been announced, it is proposed henceforth, as far as possible, to state all quantities in these pages in terms of the metric system, and tables of equivalents are now published, in order that the task of conversion, when required, may be rendered as simple as possible to readers. Several of the tables, notably those referring to length and weight, are taken more or less completely from the Pharmacopœia of the United States, but those referring to measures of volume have been specially compiled for the *Pharmaceutical Journal*. The fundamental units of the metric system of weights and measures are, as is well known, the metre, the litre, and the gramme, being the measures of length, volume, and mass respectively, but it is not so generally understood that each of those units has both an ideal value and a practical value.

THE METRIC EQUIVALENTS of the more common Imperial weights and measures as recognised by the Board of Trade in a recent report are the following :—

MEASURES OF LENGTH.

1 Inch.....	=	25.4 Millimetres.
1 Foot (12 in.) ...	=	304.8 Millimetres or 0.3048 Metre.
1 Yard (3 ft.) ...	=	914.4 Millimetres or 0.9143992 Metre.
1 Mile (1760 yds.)	=	1,600,000.0 Millimetres or 1.609 Kilometre.

MEASURES OF MASS.

1 Grain.....	=	0.648 Gramme or 64.8 Milligrammes.
1 Scruple (20 grains)	=	1.296 Gramme.
1 Drachm (60 grains)	=	3.888 Grammes.
1 Troy Ounce (480 grains)	=	31.104 Grammes.
1 Avoirdupois Ounce (437.5 grains)	=	28.343 Grammes.
1 Pound (7000 grains)	=	453.592 Grammes or 0.45359243 Kilogramme.

MEASURES OF VOLUME.

1 Minim	=	0.059 Millilitre (or C.c.).
1 Fluid Drachm (60 minims).....	=	3.552 Millilitres.
1 Fluid Ounce (8 fluid drachms)	=	28.412 Millilitres or 2.84123 Centilitres.
1 Pint (20 fluid ounces)	=	568.245 Millilitres or 0.5682454 Litre.
1 Gallon (8 pints).....	=	4545.963 Millilitres or 4.5459631 Litres.

Measures of Length.

THE METRE (M.) equals 39·370113 inches, and was originally supposed to represent the ten-millionth part of the quadrant of a meridian ; the actual standard is the distance determined, at 0° C., between two points on a bar of iridio-platinum, a copy of which is in the possession of the Board of Trade.

The subdivisions of the metre are the

Decimetre (Dm.).....	=	0·1 M. (3·937 inches).
Centimetre (Cm.) ...	=	0·01 M. (0·3937 inch).
Millimetre (Mm.) ...	=	0·001 M. (0·03937 inch).
Micron (μ)	=	0·001 Mm. (0·00003937 in.).

Measures of Mass.

THE GRAMME (Gm.) equals 15·432 grains, and was originally the mass of one-thousandth part of a cubic decimetre of water at 4° C. ; it is now equal to the mass of one-thousandth part of a solid cylinder of iridio-platinum 39 Mm. high and the same in diameter, a copy of which is in the possession of the Board of Trade.

The subdivisions of the gramme are the

Decigramme (Dgm.) = 0·1 Gm. (1·543 grain).
Centigramme (Cgm.) = 0·01 Gm. (0·154 grain).
Milligramme (Mgm.) = 0 001 Gm. (0·015 grain).

The multiples of the gramme are the

Decagramme (Dcgm.) = 10 0 Gm. (5·64 drachms).
Hectogramme (Hgm.) = 100·0 Gm. (3 53 oz.).
Kilogramme (Kilo.) = 1000·0 Gm. (2 234 lbs.).
Myriagramme (Mygm.) = 10·0 Kilo. (22 lbs.).
Quintal (Q.) = 100·0 Kilo. (1·968 cwt.).
Millier or Tonne (T.) = 1000·0 Kilo. (0·9842 ton).

Measures of Volume.

THE LITRE (L.) equals 1·7598 pint, and was originally the volume of a cubic decimetre of water at 4° C., its point of greatest density; the Board of Trade standard litre is the volume of a kilogramme weight of water at 4° C., and the millilitre or cubic centimetre (C.c.) is the volume of a gramme weight of water at the same temperature.

The subdivisions of the litre are the

Decilitre (Dl.) = 0·1 L. (0·176 pint).
Centilitre (Cl.) = 0·01 L. (0·0176 pint or 0·07 gill).
Millilitre (Ml.) = 0·001 L. (0·0352 fl. oz.).
Microlitre (Mcl.) = 0.001 Ml. (0·0169 minims).

The multiples of the litre are the

Decalitre (Dcl.) = 10·0 L. (2·2 gallons).
Hectolitre (Hl.) = 100·0 L. (2·75 bushels).
Kilolitre (Kl.) = 1000·0 L. (3·43712 quarters).

METRIC TO IMPERIAL UNITS.

MEETINGS OF SCIENTIFIC SOCIETIES

CHEMICAL SOCIETY.

At a meeting held on Thursday, February 17, Professor Dewar, F.R.S., President, in the chair, an announcement was made by the President on behalf of the council relative to the memorial recently submitted by Messrs. Harden and Hartog, desiring that an alteration in the bye-laws should be made so as to allow voting by proxy. Having received the reply of the council stating that they had no power to make such an alteration under their existing charter, Messrs. Harden and Hartog wrote further, inquiring whether steps would be taken by the council in the near future to obtain a supplemental charter that would grant this power. They stated that a similar supplemental charter had recently been obtained by the Institute of Civil Engineers. In reference to this matter Professor Dewar pointed out that it was not yet known whether a majority were in favour of it, and the Chemical Society had a very different object from that of the Institute of Civil Engineers, and was accordingly differently constituted, more resembling the Royal Society. The inducement leading the Government to grant the charter of the Institute of Engineers, which did not exist for the advancement of mechanical science, would not be the same for a purely scientific society. The opinion of Mr. Cozens Hardy, Q.C., had been taken as to the ground upon which a supplemental charter could be sought, who replied that it was improbable that the Government would consent to an alteration unless the Society were unanimous; the value of voting by proxy was open to question; and that the case of the Institute of Civil Engineers formed no precedent. A paper by W. A. Shenstone and W. T. Evans, on the

Influence of the Silent Discharge on Atmospheric Air,

was read by Mr. Shenstone. In a publication by Andrews on the influence of nitrogen on the production of ozone from oxygen, it was stated that after the formation of ozone ceases, if the gases are exposed to sulphuric acid, the production of ozone is continued. If, also, the silent discharge is passed after sparking, no ozone is formed. Both these phenomena had been attributed to the action of oxides of nitrogen. Berthelot and others had confirmed these facts, but the oxides of nitrogen had not been actually found. The author had sought proof of the existence of nitrogen peroxide, and for this purpose had availed himself of the new test for nitrites described by Riegler, which depends on the formation of diazo naphthalene-sulphonic acid, and the conversion of this to a red dye, having first verified the hypothesis that nitrogen peroxide could be distinguished from ozone by this reaction. In the first experiment, after the formation of ozone had been carried to a certain point, the gases expanded again with the decomposition of ozone. On testing the residue, nitrous acid was found present. The experiments were continued with the object of determining the influence of moisture. In three experiments with damp air very high percentages of the oxygen were converted into ozone, one of these amounting to ninety-eight. The formation of nitrogen peroxide was also traced. An experiment with dry air, being stopped when 63 per cent. of the oxygen was ozonised, on applying the test no nitrite was found. A similar experiment with moist air gave the same result. When, however, the air was fully ozonised it was found both when dry and moist to contain nitrogen peroxide. Evidence was also given that the formation of nitrogen oxides is retarded by the presence of water, and that the latter are not formed unless ozone is present. The conclusion was therefore drawn that they are not formed directly, but only by the action of ozone. Since also 98 per cent. of the oxygen in moist air could be converted into ozone, it was evident that the presence of moisture did not further the decomposition of the latter by nitrogen oxides. An experiment upon air containing nitrogen peroxide confirmed the statement of Andrews, that little or no ozone is formed in its presence.—Dr. Armstrong remarked that the experiments should be carried further before exact conclusions were drawn, and he would suggest the taking into account of the electrical conditions. The discussion was also taken part in by Professor McLeod, Dr. Scott, Mr. Walker and the President, who referred to the formation of ozone by the sudden cooling of oxygen heated to the point of dissociation and to the explosive character of liquid ozone under the action of light.—Mr. Shenstone also described two lecture experiments by J. Tudor Cundall,

B.Sc., one of which illustrated the principle of the conservation of mass, the second being a demonstration of Graham's law of diffusion.—"A Note on the Preparation and Properties of Orthochlorbrombenzene," by J. J. Dobbie, M.A., D.Sc., and F. Marsden, M.A., Ph.D.; "The Ultra-violet Absorption Spectra of some Closed Chain Compounds," by W. N. Hartley, F.R.S., and J. J. Dobbie, M.A., D.Sc.; and a "Note on the Absorption Bands in the Spectrum of Benzene," by the same authors, formed the titles of papers briefly summarised by Dr. Dobbie. The conclusions drawn from the two last-named papers are that the absorption bands bear an important relation to the linking of the molecule, as in general, substances of the fatty series show no absorption, while closed chain compounds give strongly defined bands. Many benzene derivatives have been examined, and also other ring compounds, of which thiophene shows a strong absorption. Benzene was described as possessing six absorption bands, of which four were persistent. A series of photographs of these were exhibited. A paper was then communicated by W. R. Dunstan, F.R.S., and T. A. Henry, on the

Constituents of Indian and American Podophyllum.

Podwyssotzki, it was stated, had isolated four substances from *Podophyllum peltatum*—podophyllotoxin, to which the activity of the drug is attributed; picropodophyllin, podophyllic acid, and podophylloquercitin. The authors have examined the properties of podophyllotoxin obtained from the Indian drug, and find it to be identical with that described by Podwyssotzki. It has the formula $C_{15}H_{14}O_6$, and is described by Dr. McKenzie of St. Thomas's Hospital, who has experimented upon it physiologically, as a powerful purgative and intestinal irritant. Podwyssotzki states that this substance is a compound of picropodophyllin and podophyllic acid, but it has been found by the authors to bear a different relation to these substances. When heated with alkalies it takes up water, becoming podophyllic acid, and this on drying loses water again, forming a substance isomeric with the first, which is picropodophyllin. Thus the last-named is the anhydride of podophyllic acid. Attempts to pass from either of these substances back to podophyllotoxin have hitherto been unsuccessful. Among its decomposition products oxalic and acetic acids have been isolated, and the presence of two methoxyl groups in the molecule have been determined. The authors believe it to have the constitution of a hydrogenated pyrone. The colouring matter of both plants is the same, and has been proved identical with quercitrin from quercitron bark, while yield of medicinal podophyllin from the Indian is greater than that from the American variety. It was remarked by Mr. Millard that the resin from *podophyllum emodi* is less soluble than that from *P. peltatum*. Another paper, by the same authors, dealt with the

Volatile Constituents of Goupia Tomentosa.

The wood of this tree, which it has been proposed to use for mechanical purposes, is imported from British Guiana. It has an odour partly resembling that of rancid butter and partly that of valerian. A number of fatty acids were extracted, among which formic, isovaleric and lauric acids, as well as a small quantity of succinic were identified. In answer to a question by Mr. Chapman, Professor Dunstan replied that the wood contained resin, but it was not known that these acids resulted from the oxidation of it; and in reply to a question by Dr. Bernard Dyer it was stated that the smell existed in the fresh wood, and the acids were probably produced as such in the tree, as no glycerides had been found.—A third paper was given by the same authors, on

Oxycannabin from Indian Hemp.

By oxidising extract of Indian hemp with nitric acid a substance is obtained crystallising in yellow needles, to which Bolas and Francis have ascribed the formula $C_{20}H_{20}N_2O_7$. The authors find the composition to agree with the formula $C_{10}H_{10}NO_4$. In the course of investigation the probability was suggested that the substance was derived from cannabinol, a supposition which on experiment proved correct, a large yield being obtained by oxidising the latter. A nitro-compound has been prepared which on reduction yields an amine. Among the decomposition products normal butyric acid has been identified. Cannabinol, it was mentioned, formed an acetyl compound that crystallised well, thus affording an easy method of obtaining it pure, which would otherwise be difficult, as the cannabinol itself does not crystallise. — A ballot was taken, the following being elected members of the Society: Messrs. E. L. Allhusen, B.Sc., W. M. Bailey, C. E. Brittain, B.Sc., C. J. Brooks, B. S. Bull, M.A., B.Sc., Ph.D., C. H. Burge, W. A. Caldecott, B.A., M. J. Cannon, A. J. B. Cooper, J. Cooper, B.Sc., W. R. Cooper, M.A., B.Sc., F. Cowling, F. R. Dodd, J. R. Don, D.Sc., M.A., F. W. Dootson, M.A., W. T. A. Edwards, F. Gilderdale, W. S. Gilles, J. Glaister, M.D., T. H. Hills, D. Homfray, B.Sc., A. F. McEwen, W. H. Mills, B.A., G. T. Morgan, W. E. Moss, H. Poole, T. H. Pope, J. B. Reid, F. F. Renwick, W. C. Reynolds, W. Richards, H. C. Sayer, A. J. Walker, B.A., E. C. Weissmüller.—The following papers were taken as read: "On the Condensation of Formaldehyde with Ethyl Malonate," and on "Cis and Trans Tetramethylene Dicarboxylic Acid," by E. Haworth and W. H. Perkin, jun., F.R.S.; "The Formation of Ethylic Dihydroxy-di-nicotinate from Ethylic Cyanacetate," by S. Ruhemann, Ph.D., and K. C. Browning, B.A.; "The Interaction of Magnesium and Copper Sulphate," by E. Divers, M.D., F.R.S.

CANADIAN LETTER.

(*From our Special Correspondent.*)

I wonder how many of your readers have anything like a correct conception of Canada, its location, geography, or the customs of the people who inhabit it. So many cases of crass stupidity come under one's notice that one cannot but marvel at a people who are essentially a colonising nation knowing so little of the characteristics of their chief possession abroad (as we claim Canada to be). The part taken by Canada in the Jubilee pageant, the visits of the British Association for the Advancement of Science and of the British Medical Association, appear to have failed in disseminating that correct information which such important events should have furnished. I give you three instances which, to my mind, demonstrate the necessity of the "schoolmaster being abroad in your country."

The advertisement of a leading London house in the *Pharmaceutical Journal* mentioned an article which I was anxious to procure, and for which I am convinced there could be found a good sale in Canada. I accordingly wrote asking them for prices and terms. Imagine my disgust on receipt of a reply—addressed to Toronto, United States of America—containing the information that the sales agent for Canada for said article was a firm in Baltimore (a city in the States some 700 miles distant from me)! What would be your thoughts on being informed that the sales agent in England of an article was a firm in Madrid, and the letter containing such information was addressed to "London, Spain"? One case is no more ridiculous than the other.

Again, there is now teaching in the Normal School in this city a young Englishman who, when contemplating the project of coming to this country, was solemnly informed that it would be necessary for him to have the hob-nails removed from his boots, as by their means the Indians would be enabled to trace him and possibly take his life, and, believing such stuff, he actually had the nails removed.

There is at present in the city of Vancouver, B.C., a party of young Englishmen on their way to the Klondyke. A detachment of this same party procured several tons of hay in London, England, had it neatly baled up and shipped to this country for the use of horses which they intended purchasing at Edmonton. It cost them 70.00 dollars per ton to land it at its destination, and when they arrived on the scene they discovered that a better article could be had for less than one-tenth the cost. "Carrying coals to Newcastle" pales into insignificance as a comparison beside such asinine stupidity as this displays. Why, there are grazing and hay-lands enough in the Canadian North-West to make three or four Great Britains, and still have enough to feed the "cattle on a thousand hills." Now, apart from the ignorance displayed in such instances as the above is the more serious business considerations. It should be borne in mind by your foreign merchants that this continent is a hot-bed of protective custom tariffs, and for me to have procured the article that I wished would have meant the paying of two duties on it—first into the United States and from there into Canada. This fact should be kept in view when appointing sales agents for this country. British merchants are seeking after extended trade connections; would it not be well for

them to give some attention toward acquainting themselves with the conditions which prevail in Canada? This country is without a doubt entering upon a period of prosperity and great commercial expansion. Our vast territories of agricultural lands, unsurpassed for productiveness on the earth's surface, are just being opened up; our mountain ranges of "Ophir" richness but await the "Midas touch" to turn to gold. The men are even now with us, or have their faces turned toward the setting sun, who are destined to transform these millions of acres of idle lands into waving fields of golden grain, or unlock the portals which lead to Nature's treasure. house, so jealously guarded through the circling ages of the past. These toilers of the field and mine will require the product of laboratory and factory to supply their multifarious needs; we are not a manufacturing people as yet, but must look abroad for such supplies. Why not Briton rather than Yankee fill the want? But I linger on these topics after starting out to write on matters pharmaceutical. As a beginning, I may say that in Canada each of the provinces is supreme within its own domain in the matters of education and the regulation of the learned professions. This fact is necessary to be borne in mind, as I may refer to events transpiring in different provinces which might appear contradictory, or not be understood, if the different conditions prevailing were not stated. Thus, while we in Ontario have been "fighting with the beasts at Ephesus" to secure the removal of unjust restrictions placed upon us by the legislature a year ago, our *confrères* of Quebec have had to "lock horns" with their enemies in that province to prevent a repeal of their model Pharmacy Act, at the instance of the Grocers' Association acting as cat's-paw for the departmental stores chestnuts, yet in neither of these struggles were the pharmacists of other provinces interested.

In glancing back over the year that has just closed, to ascertain "just where we are at," it is noticeable that, if no marked advance has been made, at least no retrograde movement requires to be chronicled; we have safely held our own. During the year the trade generally recovered from the panic into which it had been thrown by the price-cutting epidemic which threatened to sweep over the country in the closing months of '96. In Canada, as elsewhere, that pernicious practice was established by the departmental stores: its introduction caused a feeling of nervous apprehension to spread amongst the pharmacists, a few of whom showed a disposition to follow the lead. Better counsel, however, prevailed, and the disaster was averted. For this good result credit is due to the Ontario Society of Retail Druggists, an organisation formed much on the same lines as that of your own Proprietary Articles Trades' Association. Coincident with this movement among the retail men, and as part of the plan to save the trade from utter destruction, the wholesale jobbers also formed an association, and an agreement for mutual protection and benefit was entered into between the two. These associations, acting in harmony, were able to secure the consent of nearly all the leading manufacturers to confine their sales to such parties as maintained prices. The carrying out of that agreement was instrumental in checking the spread of the evil, but was not successful in eradicating it where it had already taken root, so that we are still wrestling with the grievance in some of the larger centres of trade. Most of the cutting is confined to the province of Ontario, and as a result the trade is more prosperous in all the other provinces. In view of the good work done under the above arrangements, it is regrettable that the wholesale association decided at their last meeting, held in Montreal on February 1, to disband; this decision was arrived at on account of the withdrawal of Messrs. Evans and Sons from the association. The reason given by this firm was "the lack of good faith on the part of some members of the association, that by violation of their agreement some houses had secured an unfair advantage over their competitors who had been more careful to adhere to its conditions." What effect this action of the wholesale men will have on the trade generally remains to be seen. The retailers are not greatly exercised over the prospects; they are more determined than ever to stand together in defence of their rights. As an evidence of this the Council of the Ontario College of Pharmacy at its last meeting practically assumed the work done in the past by the Ontario Society of Retail Druggists, and appointed an extra standing committee to take charge of it. This will assure permanency to the work, as the resources of the college will be behind it, and this institution is a wealthy body.

Pharmaceutical Transactions.

SCHOOL OF PHARMACY (LONDON).

The annual dinner of the students of the School of Pharmacy took place on Wednesday, February 16, the Dean, Professor Henry G. Greenish, occupying the chair. The gathering was attended by many former students and by Professors, members of the Council, and Board of Examiners. Among those present were the President, Mr. Walter Hills, Mr. Michael Carteighe, Professor Norman Collie, F.R.S., Dr. Attfield, Dr. Lapworth, Messrs. W. Martindale, Joseph Ince, W. M. Holmes, C. B. Allen, Edmund White, W. Arkinstall, G. S. Taylor, F. Ransom, Richard Bremridge, Gwilym Evans, F. H. Lescher, and J. S. Ward.—The Royal toast was followed by the toast of

The School of Pharmacy,

proposed by Mr. M. Carteighe, who said he did not know why he was always asked to speak among his fellow pill-rollers, but the task this evening was a pleasant one. The School of Pharmacy of the Pharmaceutical Society was a name that had not so high-sounding a character as similar institutions with the title of Institute or College in the United States. The founders of the School were practical men who believed in calling a thing what it was. In this country a college is a training institution in which the student not only works but lives, and there were difficulties in the way of establishing such. It was an astounding fact that the richest and most populous city in the world was without a teaching university. The founders of the School, who were good, sturdy men, many of them Quakers, wished to make affairs as simple as possible in matters of money and of respectability. They resolved to join together to provide education for the rising generation. Mr. Morson at that time was closely in touch with French pharmacy, and it was following the example of the École de Pharmacie that the School was instituted. There were now two classes of people, one of which said there ought to be thousands in the School, while the other maintained that it mattered less whether the institution was a select one than that it should be able to turn out men more capable and better than all others. The work of the world is done by a few people, and as in other things so it had been with this. In 1852 Jacob Bell left £2000, which was used to render the School efficient. Yet that was the smallest thing that he did. He went to Parliament on the plea that a man once educated should be able to command respect. In 1868 there was much political talk and there were difficulties to be faced, but after much fencing the then President, Mr. George Webb Sandford, succeeded in obtaining recognition. There was then a genial fellow, Mr. Thomas Hyde Hills, who induced his friends in Parliament to pay a visit to Bloomsbury Square and inspect the School, with the result that, seeing the sacrifices being made in the interest of education, these men were forcibly convinced of the respect due to pharmacists, and, in fact, the School of Pharmacy was the *raison d'être* of the powers they have. The feeling of many during the following few years, 1869, 1870, and 1871 was *cui bono?* A great number of candidates came rushing up for examination without any preparation, and it was during that time that he (Mr. Carteighe), being a member of the Board of Examiners and responsible for the weeding of many unfit candidates, became regarded as a monster. After this rush they were more settled, and people learnt that it pays to have a good education. A few years ago when the system of technical education under the county councils was instituted it was said they were doing great things. Mr. Gwilym Evans would tell them what is being done in Wales. Elementary science is taught and the general education is so good that if pharmacists do not advance they will soon be ploughed by the boy who comes to buy a pennyworth of pills. If they were to escape the criticism of their educated customers they must not only prepare for the Board of Examiners, but aim at a higher standard. Education was slower in his younger days, but what is wanted now is a general knowledge reaching above the ordinary. In the School of Pharmacy was an association for learning to talk. There was a little one in his own time, but it had grown since. His advice to them for speech-making was this. Every member there had in him the material for making a good speaker, but the

thing most wanted was pluck. "Never begin with a prologue, but go straight to the subject and finish without an epilogue." One should not be discouraged by having a weak voice; by practice a low voice can be made audible in the largest room, and it is as easy to overcome nervousness by pluck as to go into a football scrummage. It was very gratifying to know that the School was now full, a fact that expressed the credit due to the professors and teachers. They had had brilliant men in the teaching staff before—a respected former professor, Dr. Attfield, was present that night—but his business was to refer to the present individuals and the appreciation of their worth throughout, from the Dean downwards.—Professor Greenish, in responding to the toast, said he was going to show Mr. Carteighe how soon they could learn a lesson, as he should follow the principles laid down for speech-making. It was a great pleasure to see so large a gathering. Mr. Carteighe had referred to the desire of the founders to provide a good education; it was not for him (Professor Greenish) to speak of the quality given, but he would say that the teaching staff would do the best they could. Deficiencies there might be; he would not suggest that there was perfection, for the good reason that when imperfections are seen they may be remedied. It was gratifying to know that, among men who passed the last examination, no fewer than four out of every five returned to take the advanced course. This shows pre-eminently that they know the value of what they are getting, and as evidence of the flourishing state of the School, he pointed to the fact that applications for admission had had to be declined for want of accommodation. A short time ago the course of tuition had been materially changed, with a result that, although not at first evident, has since proved highly satisfactory. He hoped the Students' Association would take Mr. Carteighe's words to heart. The Association was also useful in bringing the members into contact, and when their meetings had a social character he hoped Mr. Carteighe and other members of Council would be present. It would give everyone pleasure to note the presence among them of Dr. Attfield and Mr. Ince. He thanked Mr. Carteighe for the kind and encouraging way in which he had proposed the toast, and he hoped and believed that the School had a long and prosperous career before it. The toast of the

"Pharmaceutical Society"

was proposed by two of the Bell Scholars, one of the seniors, Mr. H. Matthews, and a junior, Mr. H. Payne.—Mr. Payne said he had great pleasure in proposing this toast, and coupling therewith the name of the President, Mr. Walter Hills. Much had been done by the Society, yet much remained to be done. Evidence of the vitality of the Society was seen in the Bill that was being brought into Parliament, which it was hoped would consolidate the members of the craft.—Mr. Matthews hoped that those present who would shortly be fully-fledged pharmacists would have fully realised the objects for which the School was founded and would afterwards do their part in keeping it up and educating those coming after.—Mr. Hills, replying, said as it was now late he would have wished for the sake of the guests to content himself with thanking the proposers of the toast, but, speaking on behalf of the Society at that moment, he felt there were a few things he ought to say. For the encouragement of those interested in Mr. Carteighe's speech he would say that he was nervous himself as a beginner, but was no longer so. It gave him great pleasure to attend the dinner of the students, where the toasts were of the order of a family party. The toast of the child had first been drunk, and now that of the parent, for which he had to express thanks. But there was another child, by which allusion he meant the proposed Pharmacy Bill. He had been at the House of Commons a great deal lately, but it was not to be supposed that he took all the credit; that was shared by the Council. He congratulated the students on their wisdom in seeing the advantage of the extended curriculum; the necessity for it becomes more and more evident. Those present were showing others an object lesson, as it had been always seen that the students at the School of Pharmacy turned out good and successful men. But he wanted to see other schools as well, and they should be connected with a public institution; within a few years he hoped pharmacy would be connected with various teaching universities. One of those present, he hoped, would win the Percian medal; all could not win it, but he hoped the best man would and that he would be one of their own. He also hoped there would be some to go in for advanced study and research, under the distinguished professor, Dr. Norman Collie, and further that the Council would not be ashamed at receiving no candidates for the scholarships offered. He trusted, too, that they would not in after life forget their "alma mater"; he was afraid there had been some such tendency among their successful men They should be loyal and enthusiastic. It had been said that the Society wanted guineas, but that was not the most important thing; what they wanted rather was the men. With reference to the Bill, he was not then going to find fault with the resolution lately passed by the students; that, he believed, had been partly due to a misconception of words of his own, and he would take that opportunity of making his point clear. The remarks in question, as printed in the *Pharmaceutical Journal*, were as follow:—"Up to a certain extent he was in favour of dividing the qualifying examination, but he was entirely opposed to anything like an intermediate qualification. The division of the examination, as distinct from the qualification, might be advocated with a view to encourage students to commence their work on first entering the business, and to continue their studies throughout their apprenticeship. The question of jury service, too, was one which affected many men, but it was impossible to deal with it directly in a Pharmacy Bill; it could only be done indirectly, by providing that every one who passed the Minor should become a pharmaceutical chemist. That had been advocated by some, but he was not prepared to go to that length himself, and was quite sure that if a clause of that kind were inserted it would excite a good deal of opposition. He was in favour of considering a scheme for having only one qualifying examination, which should give the title of Pharmaceutical Chemist, with possibly a further honorary examination for those who liked, as he had shown by supporting a Bill brought forward some years ago, in which it was suggested that there should be a curriculum and an intermediate examination, the title of Pharmaceutical Chemist to be given to all who passed the qualifying examination; but it was distinctly on the understanding that there was a system of training to be taken into consideration as well as the examination." This statement he wished to adhere to. At present only about 13 per cent. of chemists and druggists go on for the Major examination; if that state went on, what condition could they expect? He trusted, however, that matters would soon be different. If the opposite proportion of men took the Major examination nothing would have been said; but, as things are, there is great necessity for the consolidation of the Society. The examination that it was proposed to introduce would be divided into two parts, of which the first would carry no qualification at all, while the second would make the successful candidate a pharmaceutical chemist. The Bill, it was hoped, would be brought into Parliament next week, and all should help to further it wherever they could throughout the country. It was important that all who became qualified should be eligible for membership, and should be ready to stand shoulder to shoulder to promote their common welfare. In conclusion he thanked everyone for the kind way they had received the toast and listened to his remarks, and trusted the School would continue to flourish.—Mr. Edmund White proposed the health of those who had so successfully arranged the evening's programme, Messrs. Lescher, Wilson, and Evans, to which Mr. Lescher replied.—A musical programme, contributed by Messrs. W. W. Ellis, W. Owen, A. Turner, H. R. Jones, M. Carteighe, J. Day, and Smorthwaite, added much to the evening's enjoyment.

CHEMISTS' ASSISTANTS' ASSOCIATION.

On Thursday, February 17, Mr. T. Morley Taylor, President, occupied the chair at a meeting of this Association, at 73, Newman Street, W., when Mr. George Roe read a paper on

Formaldehyde.

The author said the value of formaldehyde in preserving infusions and other substances, as well as its antiseptic properties, had been the subject of several interesting papers, and in his remarks on its use in pharmacy he should not produce anything particularly new, but more confirm the work of previous writers. It must not be understood by what he said that he laid down any rule as to what should be done with preparations requiring some preservative; every dispenser must be guided by circumstances as to how far he could go, but in no case should he make any change in the prescription that would be disadvantageous to the patient or not added by the next dispenser to whom it might be presented, and to ensure this the addition should be noted on the prescription. Formaldehyde, formic aldehyde, or formalin, was discovered by Hofmann in 1869, and is said to occur in those plant cells which

contain the green colouring matter. In the formation of starches and sugars from the carbon-dioxide which the plant absorbs from the air it is believed that formic aldehyde is formed as an intermediate product. Chemically it is prepared by the limited oxidation of methyl alcohol, or when calcium formate is subjected to dry distillation. The gradual oxidation of methyl alcohol occurs when a stream of air saturated with the vapour of methyl alcohol is drawn through a tube containing a copper spiral or platinised asbestos heated to redness, a process of oxidation. The result is a pungent-smelling liquid of sp. gr. 1·080 to 1·088 at 15° C., and may under favourable circumstances contain 30 to 40 per cent. of formaldehyde, together with methyl alcohol and water. In more concentrated solution it has a tendency to revert to its solid polymeric modification paraformaldehyde, which remains as a white solid. The aqueous solution of formaldehyde has a penetrating, suffocating odour, and a neutral reaction ; and its tendency to readily oxidise to formic acid causes it to be a powerful reducing agent. Added to ammoniacal solution of silver oxide a mirror is produced. Mercuric chloride becomes mercury, mercurous chloride being the intermediate product ; it reduces Fehling's solution even in the cold, but when treated with reducing agents it again becomes methyl alcohol. It is incompatible with ammonia salts, giving very curious reactions. In the cold it becomes strongly acid, and dissolves calcium, phosphate, chalk, etc. It coagulates gelatine into a tough, indiarubber-like substance insoluble in water, and acts similarly on albuminoid substances ; hence it has been used in photography in the place of alum for hardening the films of negatives. When once added to a solution it cannot be driven off; on boiling the fluid it is converted into trioxymethylene.

Formaldehyde is a Powerful Germicide

due to its combination with gelatinous and albuminoidal substances; in consequence of its chemical reaction with the various volatile products of decomposition it is a decided deodorant. Its great antiseptic properties were discovered by Berlitz and Trillat, who found that an addition of 1 in 50,000 was sufficient to prevent the development of bacteria in meat juice, while Leow recognised it as a powerful poison to vegetable protoplasm. Its non-poisonous character makes it extremely useful in preserving certain preparations, and in pharmacies, especially dispensaries where there is much dispensing done, it can be used in some cases with good results. This is particularly so where large quantities of fermentable mixtures have to be kept ready made, and often enough to last some days or even weeks. It was with a desire to obtain a preservative with little taste or smell and therapeutic inactivity that he used somewhat extensively formalin. In hospitals, dispensaries and establishments where a large amount of dispensing has to be done in a very short time it is necessary to prepare beforehand many preparations which in some cases must last a considerable time, and, as may be expected, a preservative of some kind must be added, such as alcohol, salicylic acid, chloroform, and now formaldehyde. The addition of alcohol is costly, and unless a large quantity be added it becomes sour, due to the action of a living ferment which exists in the air finding its way into the fluid and causing the alcohol to absorb oxygen and become converted to acetic acid. Salicylic acid is objectionable in many ways. Camphor and chloroform have a taste and smell which many cannot tolerate ; so there still remains to be found a preservative that can be used without having any particularly objectionable points. He had for a considerable time used chloroform, and, experimentally, formaldehyde in all cases where experience had taught him that a preservative must be used. These cases are numerous, such as in making fresh infusions and decoctions sufficient to last perhaps weeks, in solutions of the alkaloids, such as morphine, cocaine, and many others—mixtures which, if dispensed as written, would keep only a few days, whereas they are often expected to remain good for two or four weeks. Many such could be mentioned, the most typical being those containing organic substances in which bacteria grows with extraordinary rapidity, such as mixtures of ergot with bromides and strychnine. These at times assume the appearance of mucilage in a few hours. It would be absurd not to take this fact into consideration, and suggest the use of a preservative. Almond mixture was one which fermented in a few days, and he had often had to make enough of this to last a patient two weeks, and had not been able to find anything act so well as a small quantity of formaldehyde ; 1 in 10,000 keeping it for weeks, and causing no inconvenience to the patients. That was the best example of the value of formaldehyde that had come to his notice, and had been exceedingly useful. Chloroform did not answer nearly so well in that case, but for vegetable infusions he found it to be excellent. In preserving milk, formalin was found to act splendidly, and although it might not perhaps be used by the vendors it could with safety be adopted for domestic purposes as well as in hospitals. Milk required for future analysis could also be kept sweet for some weeks by adding 4 or 5 drops to each 100 C.c. of milk, but it was stated to have the curious effect of slightly increasing the total solids in some cases. He had used formaldehyde for infusions, and found 1 in 1000 to 1 in 3000 answer the best ; but taking into consideration its powerful effect on animal tissue, and how intensely irritating even a weak solution is, he doubted if the former strength could be used for the purpose until its action on human beings is better understood. When used for concentrated preparations the case is somewhat different, and no harm could possibly result from its use. It has the advantage of having little, if any, taste or smell in such small quantities, and thus differs from chloroform.

For Preserving Infusions

which it is an advantage to keep for one or two weeks it is decidedly useful, but when required to be kept longer he found nothing answer so well as chloroform, 1 in 500 or 1 in 1000 ; such as infusions of gentian, calumba, and quassia, either single or four times the strength of the pharmacopœia ; these, when diluted, have little of the smell or taste of chloroform. When patients are put on digitalis, jaborandi and a few others, and only small quantities of stock need be made, formalin answers well. For the purpose of this paper he used Schering's formalin (the 40 per cent.), the quantities stated as used being pure formaldehyde, using 2½ of the former to 97½ of water to make a one per cent solution. Infusions of calumba, ergot, gentian, digitalis, jaborandi, and many others kept quite sweet for nearly fourteen days. In all cases they were bottled cold, and the corks were taken out for a time each day. When a few drops of formalin was placed on cotton-wool and suspended over a fluid, as suggested by Mr. F. C. J. Bird, it was remarkable what a long time the fluid remained free from growths, but he had not found it answer so well for large quantities. Its power to destroy the bacteria of fermentation and putrefaction is its strongest point, and is thus of great service in pharmacy for preparations which have a tendency to ferment. By the judicious use of formalin it is possible to obtain pure cultures of yeast, since the difficulties experienced in conducting processes of fermentation generally arise from the development of bacteria, mostly lactic and butyric ; these require much less formalin to either paralyse or even destroy them than yeast. Consequently, during fermentation, the inhibitory action of the antiseptic reduces the acidity, and thus enables the brewer or distiller to conduct his process at a much lower temperature. In practice it is found that 1 in 20,000 of formaldehyde arrests lactic and butyric fermentation. Mr. Roe then dealt with the use of formalin in the manufacture of mineral waters of a sweet nature, 1 in 20,000 being considered sufficient to prevent fermentation, and for washing the utensils of manufacture 1 in 1000. He also referred to its use in medicine having been recommended in cases of diphtheria as a spray, ½ to 1 per cent., and as a paint, 1 in 500; also as an inhalation for consumptives, diluted with carbonic acid gas ; and in ophthalmic practice. Its use for ringworm had been tested at Guy's Hospital with good results. In dentistry, too, it was found to exert an extremely powerful astringent action. For preserving urine for future analysis it was found to be excellent, a very small quantity keeping it weeks. For preserving vegetable products a 1 to 2 per cent. solution had been found best, very little of the fresh appearance being lost, and the odour well preserved and quite distinguishable after the lapse of some months. In nutrient gelatine for biological specimens it must be used early in those cases where the bacteria liquefy the gelatine. For hardening tissue it is used somewhat extensively and saves a considerable amount of time, being considered much better than alcohol, chromic acid, pot. bich., and many others. It does not cause shrinkage of the cells. Tissue ½ to ¾ inch thick hardens in twenty-four hours in pure formalin ; 5 to 10 per cent. is best for loose tissue. In another method by which time can be saved, and which he believed to be quite new, instead of placing the specimen in the formalin and afterwards in mucilage, prior to cutting sections, make the mucilage with 2 per cent. (or stronger) formalin water, and it will then answer both purposes at the same time.

For Preserving Specimens

a 2 per cent. answers best, and is now being used instead of methylated spirit. The uses of formalin in surgical operations were next dealt with, and as a general disinfectant for purifying rooms in which contagious or evil-smelling cases have been lodged, the best method being by spraying the room with a 5 per cent. solution, and placing small quantities in shallow vessels in various parts. The use of the Alformant lamp was also referred to, and its great success in reducing the number of organisms in sick rooms. — The President said they were all very much indebted to Mr. Roe for his very practical and interesting paper. He (the author) had opportunities of experimenting with formaldehyde under exceptionally privileged circumstances, because in hospital dispensing large quantities of mixtures had to be prepared at one time, whereas the ordinary chemist, on account of the small quantities required, did not need to add a preservative as a rule. One in 1000 of chloroform, for instance, added to a bottle of medicine would be quite out of the question, and he thought it would be inadvisable to use formalin of that strength.—Mr. Pearson thought formalin would be very useful in dentistry, and in solution should prove very serviceable as a mouth-wash.—Mr. Fothergill said, taking into consideration the great chemical activity of formaldehyde, medical men had been somewhat reticent in their method of using it. This was probably on account of the secondary action it might set up.—Mr. Tompsett had personally tried a solution of formalin as a gargle, and was agreeably surprised at the result. He thought it would also prove useful as a nasal douche. He had noticed that it has an odour very much like witch-hazel.—Mr. Hymans said, with regard to witch-hazel, there seemed to be a very great difference of opinion as to whether formalin is present in it or not.—Several other members having expressed their appreciation of the value of the paper, Mr. Roe replied. Referring to the President's remark as to its being objectionable to add chloroform and formalin to a bottle of medicine, he did not lay down any rule as to what should be done in particular cases. If an addition was made, however, it should be noted on the prescription.—On the motion of Mr. Strother, seconded by Mr. Gamble, a vote of thanks was accorded to Mr. Roe.

WESTERN CHEMISTS' ASSOCIATION (OF LONDON).

A meeting of this Association was held at the Westbourne Restaurant, Craven Road, W., on Wednesday, February 16, Mr. J. H. Mathews, President, in the chair. There were about twenty-five members present, amongst whom were Messrs. Andrews, Cracknell, Dampney, Gulliver, Harrington, Hick, Horsley, Hyne, Hyslop, Parker, Pickard, Taplin, Warren, and others. Letters regretting absence had been received from Messrs. W. Martindale, Robinson, C. B. Allen, Dyce, and Baker.—The usual business having been transacted, Mr. R. H. Parker opened a discussion on

The Draft Pharmacy Acts Amendment Bill.

Mr. Parker, at the outset of his remarks, said that although two months have elapsed since the last draft Pharmacy Bill was published, it must not be considered as indicative of indifference or apathy on the part of the Association that its discussion had been deferred until that night, the reason being that that was the first meeting, the programme for which had not been previously arranged. In opening a discussion on a draft Pharmacy Bill the first question that arose was, Did they want any more Pharmacy Bills? Were they not already suffering considerably from the intricacies and superfluities of existing legislation? and did they not find that the manner in which pharmcy law is now construed hampered and inconvenienced them more than those whose actions they wished to render illegal? It might be so to a very large extent, but in spite of that admission he doubted whether any thoughtful member of the craft having any desire for the welfare of pharmacy would suggest the entire repeal of the existing Pharmacy Acts. He was afraid that by far the greater number of chemists make little, if any, effort to acquaint themselves with the operation of pharmacy law to acquire a clear conception of what sort of legislation is desirable and what practicable. Mr. Parker then alluded to the remarkable rarity of unanimity amongst chemists and the apparent absence of any general desire to unite for common good. This he attributed to the complex character of the chemist's business and the extent to which in certain departments it has become developed on opposite principles so that any influence favourable to one section would be unfavourable to another. For instance, one section of the craft cultivates the professional aspect of pharmacy, believing dispensing to be the chemist's legitimate business, and seeks opportunities for doing chemical, microscopical, and bacteriological analysis for doctors and the public. On the other hand, another and probably much larger section of the craft find themselves placed where no scientific work is required and where almost all the dispensing is done by the doctors themselves. These of necessity cultivate the purely trade aspect of pharmacy, and are compelled to add other departments to such an extent that it becomes a puzzle where to find the pharmacy. In a vocation where commercial interests had become developed in so many diametrically opposite directions could it be wondered at that universal concord does not exist? Only in very limited fields could unity of interest be found, and in those only could they expect united action. In spite of this, he considered it of utmost importance that there should exist a representative organisation, prepared to legislate or to oppose legislation if necessary, for the benefit of the craft; but the confidence and help of the majority of those in business would be essential to its usefulness. The Pharmaceutical Society, he contended, is *par excellence* the organisation which should occupy this position. All that is wanted is to make it thoroughly representative of the craft by giving a comprehensive membership and by endeavouring to make each member take an active interest in the welfare of the body corporate. These objects, he considered, are comprised in the draft Pharmacy Bill now under discussion, the main points of which are (1) To make all registered chemists and druggists eligible as members of the Society, with full voting power and equal right to a seat on the Council; (2) "Registered Students" to be called "Student-Associates"; (3) One-third of the members of the Council to retire every year in rotation, instead of by ballot. Mr. Parker then systematically considered the opinions that have been expressed concerning the Bill by the various provincial associations. It was found that only Newcastle objects to Clause 2 of the Bill, that Manchester, Liverpool, and Newcastle are more or less at variance with Clause 3, while the remainder of the Bill meets with no hostile criticism. Mr. Parker pointed out that Clause 2 confers the title "student-associate," therefore the Newcastle objection to the title "associate" does not apply; moreover, the new title was no more open to abuse than the present one, "apprentice or student." In reference to Clause 3, it was shown that the principle of extending the title "member" to all associates received universal approbation, all objection being on the ground that a higher title is not provided for the present member. He contended that the objections urged against such a title as "Fellow of the Pharmaceutical Society" were not weighty; whereas the refusal of such a distinction would create dissatisfaction, and diminished membership amongst pharmaceutical chemists, and particularly would constitute the sacrifice of an important inducement to pass the Major examination. For his own part, he was perfectly willing to extend full membership to all associates without any condition as to a fellowship title, but he certainly did think that the best interests of the Society would be served, and an additional inducement to pass the Major secured, by granting the title of "Fellow of the Pharmaceutical Society" to the pharmaceutical chemist. He repudiated the idea that "associates" are jealous simply because "members" have a higher title, but claimed that the former have reason for dissatisfaction on the ground, (1) that the title "associate" implies incomplete qualification, and (2) because the "associate in business" pays his guinea just as a "member," but has no voice in the management of affairs. Mr. Parker then alluded to the numerical constitution of the Society, and the manner in which it would probably be affected by the proposed Bill; he thought that in course of time, if not immediately, the effect would be that the Pharmaceutical Society would number among its members the majority of the craft, and until then no useful legislation could be effected. Mr. Parker then moved—

> That this meeting of the Western Chemists' Association (of London) cordially approves the draft Pharmacy Bill, but considers that its beneficial effect would be enhanced by granting the title "Fellow of the Pharmaceutical Society" to pharmaceutical chemist members.

—Mr. Taplin was not quite in accord with the suggestion as to "Fellowship of the Pharmaceutical Society," as he considered the title "pharmaceutical chemist" is a sufficient distinction from the Minor man, but in order to help forward or encourage the Bill he had much pleasure in seconding Mr. Parker's proposition. He thought the Bill about to be introduced into Parliament to be

a most excellent one, and that if passed into law will strengthen the Society to a very great extent They ought all to consider that the Pharmaceutical Society is made for the chemist, and not the chemist for the Pharmaceutical Society.—Mr. H. Cracknell (Hon. Secretary) said with respect to the last part of the proposed resolution he felt that it would undo any good they might hope to do. The Bill was intended to bring about the consolidation and unification of the Society, the object of the Council being that all qualified chemists should be on one footing with regard to the Pharmaceutical Society. If the suggestion as to the "Fellowship" was allowed to stand, he was afraid it would be opposed to what the Council are trying to do. He would much rather that the Association sent in a resolution supporting the Bill as it now stands, and therefore he would like to propose as an amendment—

That this meeting of the Western Chemists' Association (of London) cordially approves the draft Pharmacy Bill.

—Mr. Gulliver said he had very great pleasure in seconding Mr. Cracknell's amendment.—The President said with regard to the amendment he must say it had his most hearty support, because he thought that the draft Pharmacy Bill as it now stands is all that they could expect at the present time, and if they introduced any contentious matter it would doom it to failure.—Mr. Hyne said he must say he had been very much surprised to see in the *Pharmaceutical Journal*, and also in the other journals, the amount of antagonism to the Bill, raised by Major men, because he thought that although the Major man has passed an examination the Minor man has not, in very many cases it was not altogether because he had not the ability to pass, but rather for want of opportunity. He thought, therefore, that the pharmaceutical chemist should endeavour to enable the Minor man to attain to the same level as himself in the Society, and the less contentious matter they put in the Bill the better, seeing that its main object is the consolidation of the Society. —Mr. J. C. Hyslop, after paying a tribute to the clear and fair way in which Mr. Parker had brought the question before them, went on to speak in favour of the amendment. He thought the chemist and druggist taken altogether must be a fine specimen of the British lion who is so fond of a quiet dose, otherwise it would not have taken so much worrying and teasing as it has to rouse him to realise the realities of his position. Mr. Hyslop then referred to the original intention of the founders of the Society, which was that there should be but one qualification, but owing to the opposition then raised their idea was not carried into law. He was afraid that if they dallied with the opposition now being raised throughout the country, the modest efforts of the Council to pursue the honourable course of the amelioration of the chemist and druggist, which was started by Jacob Bell, would be thrown back considerably. The Pharmaceutical Society had long given consideration to the subject, and the Council had proposed the draft Pharmacy Acts Amendment Bill as a modest instalment of what is still to follow, for he thought he might venture to say that it is but a stepping stone to further improvements, and if they realised the real nature of the proposal, they would acknowledge it to be a good stepping stone. Those who lived fifty years ago did not think they would get any advantage by legislation, but now that legislation is *fait accompli* as far as the public good is concerned, they, as chemists, must not lose an inch of the ground gained, or some other body, such as the General Medical Council, would be stepping in to guide further legislation. Chemists must therefore, as a united body, keep the advantages they now possess and endeavour to guide future legislation, otherwise they would probably be thrown back a long distance. With regard to the multiplication of titles, he was decidedly opposed to anything of the sort.—Mr. Andrews felt a little difficulty in choosing between Mr. Parker's motion and the amendment, but on the whole he was more favourable to the latter. He sincerely hoped that the efforts of the Pharmaceutical Council in endeavouring to bring the members of the craft more together would be attended with success. They had never yet been united in one body because of the great variety of interests, but he hoped that difficulty would pass away as they gradually became a more educated and scientific body and more truly deserving of the word pharmacist. He thought that the pharmaceutical chemist, without being granted a "Fellowship," will still have an advantage over the Minor man, because he had found that where two men of equal ability apply for any position, one being only a Minor and the other a Major man, the latter invariably got the preference.—Mr. W. Warren, while fully appreciating Mr. Parker's paper, did not quite agree with the assertion as to the greater disunion existing among chemists than is the case with any other body, because he believed there was no more loyal body of men than the members of the Pharmaceutical Society. He would like to know of any other profession in which there are such meetings and associations as those of the elect of pharmacy seeking to improve the craft to which they belong. With respect to the question under discussion, he thought that every individual pharmaceutical chemist should be prepared to make some sacrifice for the benefit of the corporate body. All along the line of history, pharmaceutical chemists, such as Jacob Bell, Allen, and others had proved themselves above any desire for self-seeking; there had been no question of sacrifice with them, they were quite able to stand by themselves, and that Association and all pharmaceutical associations were following in their footsteps in trying to unite their brethren in pharmacy into one strong body.—Mr. W. Pickard said that although the feeling of the meeting seemed to go against Mr. Parker's motion in favour of the amendment, personally he was somewhat in favour of the original motion. All the arguments used had really meant that there should only be one qualification, and that they should all be on one level. Of course that was an argumental position, and he certainly thought there is an advantage in having a second examination, and consequently two grades. He quite agreed that they should all stand upon one legal level, but he thought it only right and just that after a man has devoted a considerable amount of money and time in attaining the position of the pharmaceutical chemist that the work should be recognised in some manner, and by adopting the title of "Fellow" it would be recognised and at the same time there would be an inducement for men to continue their studies. He thought they should not lightly do away with any inducement to young men to go beyond the bare legal requirements, but that they should rather encourage them to pursue their studies, so that they might go on to be the best educated pharmacists it is possible to produce. He was of opinion that by the Bill as it stands at present there would be an identification of the whole trade, which would cause a great amount of confusion, there being no distinction between the Major and Minor members. Of course the Major member would be Ph.C., but he considered "Fellow" a much more distinct title, and he thought the best way of avoiding any confusion would be to adopt that title.—Mr. Gulliver pointed out that the title "Fellow" in connection with the Pharmaceutical Society would be a creation unknown outside pharmaceutical circles; therefore he thought they would do better to retain the M.P.S., because the pharmaceutical chemist would still hold the same position as before.—Mr. Hick favoured the amendment, and remarked that he always advised his assistants to go in for the higher examination. Under the new Bill the pharmaceutical chemist would still have everything he now has, and therefore it would make no difference to him. With respect to the title M.P.S. his experience was that it is rarely used and not generally understood by the public, who, however, do understand the title Ph.C. He thought it far better for them to do all they could to consolidate the Society, especially seeing that the chemist and druggist community connected with the Society increased rapidly, while the Ph.C. section suffered a decrease each year. It was not quite right; in fact, it was not English to take the Minor men's subscriptions without granting them the full privilege of membership, because the Major members have the distinctive title Ph.C.—Mr. Parker, in reply, said that taking into consideration the extremely varied nature of the craft, any measure to be passed at all must be accepted in a spirit of compromise. Someone must yield their principles in order to carry the measure through, and he was quite willing to yield the title of "Fellow" if it could be got through with it. On the other hand, if the Bill could be carried without it, he was quite ready to drop the Fellowship. But before the Bill could pass they would have to get the support of the Manchester chemists, and unless the opposition there could be avoided, the greater good could be done by the use of the title "Fellow." A great deal had been said, both at that meeting and elsewhere, that the object of the Bill is consolidation and levelling. Against that he had nothing to say; indeed, he did not know that it would be much amiss to go one further and grant the title Ph.C. to all in business, to all Associates, and to all who pass the Minor examination. The result would be a levelling of the Society; they would have only one grade, and all would be exempt from jury service, and the Major examination would be done away with. He should very much hesitate, however, to say that that would be the best policy, but he did not think there is much chance of that coming to pass at present. The President had claimed that the introduction of the Fellowship title was the introduction of contentious matter

The great reason why he introduced the title "Fellow" was to avoid the contentious matter. Much had been said as to the levelling of the Society and having only one grade, but whether they had one title or not, there would still be individuals who would make every effort to show the public that they have something better than the qualifying title, and would consequently get it from other scientific societies. Therefore, whatever conditions are instituted by law, there would be a great effort on the part of some to show themselves better than the other members of the craft. He was not in any way strongly opposed to the amendment, his position simply being that whatever conditions are desirable to ensure unanimity on the Bill, either to accept the Fellowship or to leave it alone, he would be willing to give his support to.—Mr. Andrews did not quite understand if Mr. Parker withdrew his motion in favour of the amendment, or whether it would be desirable to vote.—Mr. Parker said he was perfectly willing to leave out the second part of his proposition.—Mr. Taplin also withdrew the seconding of that part.—The President then put the amended motion to the meeting, and it was carried unanimously.—On the suggestion of Mr. Andrews, it was decided that the Secretary should write to the Manchester chemists, who are opposed to the Bill, urging them to withdraw their opposition.—It was also decided to send a copy of the resolution to the Pharmaceutical Society, and to all the local members of Parliament.

Proposed Alteration of the Name of the Association.

The President then said they had received suggestions from several quarters that there should be an alteration in the name of the Association, that it might, as far as possible, embrace the chemists generally of London. The matter had been fully discussed in committee, but the committee had not pledged itself to any course of action, he had been requested, however, to suggest from the chair that some alteration should be made. He had no special name to propose, it being merely desired to bring the matter before the meeting that they might consider it. The question would be brought before the Association, probably at the meeting in March or April, when notice must be given of the alteration to be brought before the annual meeting of members in October. The name that seemed to meet with most favour with those who took an interest in the matter was "The London Chemists' Association," there being no other association in London composed of those who are either owners or managers of businesses. He rather fell in with that suggestion.—The Federation Circular was then mentioned, but as the hour was late, nothing further of importance was done.

IRISH PHARMACISTS' ASSISTANTS' ASSOCIATION.

On Friday, February 18, the fortnightly meeting of this Association was held in the Pharmaceutical Society's house, 67, Lower Mount Street. Mr. J. S. Ashe, M.P.S.I., presided. The minutes of the last meeting were read and confirmed. Apologies for absence were received from Messrs. Hardy and Johnston. Some routine business having been transacted, and March 18 fixed upon as the date of the annual smoking concert, the Vice-President, Mr. H. Hunt, L.P.S.I., proceeded to read a paper on

Photography,

in the course of which he said the art of photography should be taken up by chemists as a source of profit to themselves, and to enable them to set the novice right in the purchase of chemicals. The essayist went back three hundred years, and traced the evolution of photography step by step to the present day, mentioning *inter alia* the discoveries of Shulze in 1727, of Schule in 1770, Wedgwood and Humphry Davy in 1802, and of the partnership some years later on of Niepce and Daguerre, by whom iodine was first used to darken the bright parts of the plate, leading to the invention of the Daguerreotype, the process of which was explained at some length. Fox Talbot's discoveries in 1839 of the properties of sensitised paper for photographic purposes were enumerated. The invention of the dry-plate process, and the substitution of gelatine for collodion as a vehicle for the silver salts in solution, came in for attention, and the utility of gelatine, or an emulsion of bromide of silver in gelatine spread upon glass plates, was shown, the details of the process being fully explained. Photography was next considered as the practical application of the chemical action of light, and demonstrations in connection were given on the blackboard by the essayist, who showed diagrams of light passing through lenses, of which he named the double convex, plano convex and convex meniscus, also the double concave, plano concave and concave meniscus, the convex lenses being called converging lenses and the concave diverging lenses. The several terms in connection with lenses were enumerated, and the composition of prisms and their colours gone into. The refraction of rays of light in lenses owing to the spherical form of the latter, and the method of preventing blurring through the crossing of the rays were next touched upon. The effect of various colours on a sensitive plate was demonstrated by experiments, violet, blue, and indigo being shown to possess the most active effect on the plate, and red and yellow the least. It was incorrect to say that photographs were taken by light, the dark room being dark only in a chemical sense. The camera itself was then considered, and the various kinds of these apparatus discussed. The essayist was of opinion that the camera up to a certain point was a secondary consideration, as the results depended greatly on the skill and experience of the operator. A photograph of an exceedingly fine nature was exhibited, and was stated to have been taken by means of a fourpenny cigar box, an elastic band and a hairpin. Half-plate cameras were recommended for beginners, and promiscuous snap-shots were deprecated. Focussing was next dealt with. The exposure was governed by the character of the light, nature of the subject, time of the year and hour of the day. Sky and sea views required short exposures, while woodland scenery and dark masses of foliage required long exposures. The well-known rule, "expose for the shadows and let the high lights take care of themselves," was quoted. Developing was then treated of, the following formula for a stock developing solution being given :—

Stock Developing Solution.

Pyrogallic acid	1 ounce.
Acid nitre	20 minims.
Aqua	5½

(Add acid before Pyro.)

No. 1.		No. 2.	
Stock solution of Pyro	1 to 2 ozs.	Carbonate of Soda	2 ozs.
Water	to 20 ,,	Sulphite	2 ,,
		Bromide of Potash	20 grs.
		Water	to 20 ozs.

For a correctly exposed plate equal parts of Nos. 1 and 2 were taken, 6 drachms of each would be sufficient for one plate. The developing tray should be kept away from the ruby lamp as far as possible. Place the plate in the tray, film side upwards, and pour on it the mixed developer with a rapid motion so as to completely cover the plate, rocking the tray immediately; in a minute or two the image would begin to appear in patches, the parts where the light was brightest showing up first. In a landscape, the sky would first appear in a dark patch. The developer should consist of three parts, viz., the developer, or reducer-pyro; accelerator-soda, carb.; and restrainer, bromide of potash. The addition of sulphite of soda prevented pyro absorbing oxygen from the air, and bromide of potash kept the pyro from attacking the silver salts too rapidly. Further details of developing were mentioned, particularly as regarded the appearance of "high lights," and some useful hints in cases of over or under-exposure of plates were given. The plate, having been developed, should first be washed and then immersed for five minutes in a solution of alum and water, 1½ oz. and 2½ ozs. respectively, then washed again, and afterwards placed in a fixing solution of a 20 per cent. of $Na_2S_2O_3$, for the purpose of dissolving the unaltered salts of silver on the plate and leave the image only, the resolution being a double salt of hyposulphite of sodium and silver. After removal from this bath, the plate should be washed in running water for two hours. A comprehensive description of the production of the positive was given, after which printing and toning were touched upon, the solution for the latter being given as :—

Toning Solution.

Sulphocyanide of ammonia	30 grains.
Chloride of gold	2½ ,,
Water	16 ounces.

After toning, the prints should be fixed in a solution of $Na_2S_2O_3$ half the strength of that used for the plates. The platinotype was commented on in admiring terms and the method of printing by this process explained. The use of photography in art and commerce was referred to, and some beautiful specimens of portraits and advertising bills, the latter embracing colour photography, were shown by kind permission of Messrs. Lafayette, photographers, by whom they were lent for exhibition. Reference was made to the cinematograph, astronomical photography, and the new *x*-rays, all going to prove the utility of the camera in the heavens, the earth, and the sea, its functions in warfare, as instanced by the Röntgen Rays on the battlefield, and its use in

preserving the features of those "loved since and lost awhile."—Mr. O'Sullivan proposed and Mr. Turner seconded a vote of thanks to the essayist. Photography, according to Mr. O'Sullivan, rightly belonged to chemists, and pharmacists should be thoroughly conversant with the art, as it entered largely into their every-day life, the preparation of solutions being work proper to the pharmacist. The vote of thanks having been conveyed to Mr. Hunt, the proceedings terminated.

PHARMACEUTICAL SOCIETY OF IRELAND.

The usual fortnightly meeting for the discussion of scientific subjects was held at 67, Lower Mount Street, Dublin, on Monday, February 14, the President, Mr. R. J. Downes, in the chair. There was a satisfactory attendance. The minutes of the last meeting having been confirmed, and some complimentary remarks made by the President on the recent public lecture by Mr. Carpenter, B.Sc., on "Insects" (reported in our issue of the 5th inst.), Dr. J. C. McWalter proceeded to deliver a lecture on

"The Pharmacy of the Pancreas,"

which he illustrated by a number of specimens of pancreas handed round on plates. He said the tendency was to crowd the stomach with the lion's share of digestive work. Two-thirds of man's food was of a starchy nature, and therefore they must seek something on which to throw the blame for digestive troubles. The pancreas of calves grazing in the field and that of pigs were spoken of. The Imperial Academy of Medicine at St. Petersburg had recently instituted a most interesting series of experiments on the digestive processes which resulted in confirming many of the views which physiologists had hitherto held concerning that function, and had thrown more light on many obscure points. Practically the bulk of the teaching of the medical schools on the question was based on the experiments of that celebrated physiologist, Claude Bernard, who was a pharmacist. The St. Petersburg scientists had found that almost every kind of food required a different ferment to digest it, and it was to this point that he, the speaker, wished to direct attention, namely, that the stomach did not digest food, and that the normal secretion of that organ had no effect on the food. It had likewise been shown long since that when the pancreas was removed from animals, fat appeared in the fæces, and that in disease in vomiting this aluna there was a considerable wasting of the fatty tissue from the intestinal tract. By offering a fatty substance in a minutely divided and absorbable condition, an emulsion of cod liver oil was almost as efficacious. He, however, did not agree in that view, but there was no doubt that the fatty medicines were often marvellous in the early stages of consumption, and would probably be of immense benefit in the later stages if they could be absorbed. A peptonised cod-liver oil emulsion would seem to be the really simplest form to administer fats where the pancreatic and secretions were both too scanty to cause fat to be absorbed. The organ then which was concerned in the elaboration of fat to serve as food was pancreas which poured the secretion into the duodenum, that portion of the digestive tract which received the contents of the stomach after the process of gastric digestion had been conducted. Peptones were very differently treated by the stomach, and if starch or proteids were introduced, otherwise than by the mouth, into the stomach of an animal, that was without an ordinary psychic stimulus of the sense of humour, they were not diverted, but the secretion of gastric juice was carried on, while the peptones became absorbed by their very presence. It was proved, moreover, that when fat was put into the stomach, no effort was made to digest it, on the contrary it had rather an inhibitory effect and prevented the stomach digesting either species of food. A fatty pancreatic emulsion obtained by mixing the pancreas of the pig with lard, treating the product with ether and evaporating was in repute some years ago, also as a remedy for phthisis. Peptonised beef jellies were on the market, but they were not equal to the freshly peptonised preparation for administration in the stomach. Physicians had long noted that the pancreas was affected in most cases of diabetes. On this point Dr. McWalter spoke at some length. He also referred to the stomach of a young infant, and explained the cause of starchy foods disagreeing with it, on account of the non-development of the pancreas. The curdling of milk due to fermentation was dwelt upon, and the important function of the pancreas alluded to. Where the pancreas was removed the enamel wasted away. The question whether pharmacists could extract from the gland certain active principles was one that called for attention. The peptonising of milk by heat was contrasted with that of powders. It was unwise to allow milk to be wholly peptonised, as it was calculated to cause stomachic disorders, especially with invalids. The speaker condemned strongly the practice of "bolting" food. It, was due to this cause that distressing flatulency and dyspepsia arose. The maceration of the warm gland in a solution of glycerin was advocated, and the difference in quality of the juices of an animal freshly killed with that of the juices twenty hours afterward explained. The preparation of rennet was next spoken of, and extracts of malt, petroleum, and cod-liver oil came in for due attention. Reference was made to Martindale's views on the subject of pancreas, and the lecturer thought it would be for the Pharmaceutical Society to see how they could obtain a pancreatic solution of cod-liver oil in the form of an emulsion.—The lecture was commented on by Messrs. Smith and Johnston, who proposed and seconded respectively a vote of thanks to the lecturer. Mr. Smith gave his views on the peptonising of milk, and related his experience of its preparation by a customer. He found that the difficulty in peptonising the sample in question was due to the presence of boric acid in the milk.—Mr. Johnston had also an encounter with the public in the matter, and he advised writing to the proprietors of the powders in question for an explanation of their failure to act. Now, however, he would be in a position to explain the real cause of failure. The President, in conveying the vote of thanks to Dr. McWalter, spoke in admiring terms of the clear and lucid manner in which the lecture had been delivered. He gave his own opinion on the subject of pepsine, and could not overrate the importance of having the compound fresh and good in starting.—Dr. McWalter suitably replied, after which the making of emulsions was discussed by the meeting, Dr. McWalter taking a leading part in the debate. Oils, old and fresh, olive oil, and their various actions were spoken of in the discussion. The storage of emulsions in dark coloured glass bottles, well corked, was generally approved of.—Mr. Smith gave an illustration on the blackboard of an emulsion which he made up into a nice preparation.—Mr. Johnston varied the subject by inquiring whether it was right to go outside the prescription in order to make a perfect emulsion.—Dr. McWalter agreed to a certain extent, if the compounder knew that in doing so he was carrying out the wish of the prescriber.—Messrs. Brown, O'Connor, and others having spoken, the proceedings terminated.

EXETER ASSOCIATION OF CHEMISTS AND DRUGGISTS.

Mr. D. Reid (President) and Mr. P. F. Rowsell represented the Exeter Association of Chemists' and Druggists' at the Exeter Technical and University Extension College at the Albert Memorial Museum on Saturday, February 12, when the Right Worshipful the Mayor (Mr. R. Pople) distributed the prizes and advanced certificates to successful students of the college, including the following given by members of the Exeter Association of Chemists and Druggists in connection with the classes carried on by Mr. Alan Ware, Ph. Ch. Prize given by Alderman H. Gadd, J.P. (ex-President of the Association and of the firm of Evans, Gadd, and Co., wholesale chemists of Exeter and Bristol) to that student who should do best in the advanced chemistry course: Mr. G. Rae. Prize offered by Mr. J. Hinton Lake (vice-President of the Association and Local Secretary of the Pharmaceutical Society) to the student who should do best in pharmacy and materia medica: Mr. Jordan, who succeeded in passing his Minor examination direct from the college. Prize offered by Mr. G. Stocker to that student who should collect the best herbarium of British plants within a radius of ten miles of Exeter: Mr. Bernini Palmer. Prize offered by Mr. P. F. Rowsell (Hon. Sec. of the Association, and of the firm of Messrs. Holman, Ham and Co.) to that student who should do the best in the elementary chemistry course: Mr. Berg. Special prize given by Mr. J. Hinton Lake for elementary chemistry during the session: Mr. H. Pellow.—Mr. A. W. Clayden (the Principal of the College), in asking the Mayor to distribute the awards, said he had received apologies for non-attendance from Alderman Gadd, J.P., and Mr. J. Hinton Lake. Mr. Lake wrote that, although deeply interested, formerly as a science student and subsequently in the formation of pharmacy and materia medica classes, he regretted he should not be able to attend. He could not help thinking that it must add to the importance of Exeter to send successful students for the qualifying examination of the Pharmaceutical Society direct from the Exeter College. That sentence in Mr. Lake's letter

was a valuable reminder to him (Mr. Clayden) of the fact that the college had started a pharmacy school especially for the education of pharmacy students. Only two candidates went straight from the college to pass the qualifying examination of the Pharmaceutical Society. One failed in one of his subjects, the other passed direct from the college. This was an examination in which he believed something like two-thirds, or even a higher percentage of the candidates were ploughed, and it was greatly to the credit of the pharmacy school that one candidate passed direct from Exeter, and that another almost passed. He wished he had passed. At the conclusion of the proceedings, a vote of thanks was passed to Mr. Clayden and his staff, Mr. Clayden responding.

GLASGOW AND WEST OF SCOTLAND SCHOOL OF PHARMACY.

The students of this School spent a social evening at the Trades' House Restaurant on Thursday, the 17th inst., Mr. Thomas Mackenzie, Ph.C., in the chair. Over eighty students and their teachers were present. Supper having been served, the following toasts were honoured during the course of the evening.—"The Queen," proposed from the chair.—"The Pharmaceutical Society of Great Britain," proposed by Mr. David MacMillan, and replied to by Mr. M. Macfarlane, who urged upon the students to join the Society on passing their examinations.—Mr. A. Sheriffs, in proposing "The Glasgow and West of Scotland School of Pharmacy," complimented Mr. Mackenzie on the success which had attended his efforts since the inauguration of the School, which filled a gap and long-felt want in the West of Scotland.—Mr. Mackenzie replied, and expressed the hope that the time would soon come when students would be able during the course of their apprenticeship to take full advantage of thoroughly systematic and practical courses of instruction.—The other toasts were "The Present Students" and "The Past Students."—A varied programme of songs, recitations, selections on the mandoline, etc., contributed to the harmony of a very pleasant evening.

NORTH-EAST LANCASHIRE CHEMISTS' ASSOCIATION.

On Thursday, the 17th inst., the annual dinner in connection with this Association was held at the White Bull Hotel, Blackburn, Councillor T. Critchley presiding over a large attendance, which included Mr. Edward Evans, J.P., of Liverpool, a member of the firm of Messrs. E. Evans and Co.—Mr. R. L. Gifford, who proposed

"The Pharmaceutical Society,"

coupled with the name of Mr. Evans, remarked that he was anxious to obtain some practical benefit from the gathering. The Pharmaceutical Society was empowered by Royal Charter to regulate admission to the ranks of legal pharmacy and to enforce the provisions of the Pharmacy Acts. It was, therefore, the only means through which their interests were to be protected, and through which all improvements must come. As they were aware, membership of the Society was not compulsory, and by paying the subscription of a guinea they had a voice in its management, received the official Journal, and obtained a certain status. If people did not join the Society they had no right to grumble. In February of last year the Registrar reported that there were 15,166 qualified chemists in the country, but of these, 10,341 were not connected with the Society, leaving only 4825 who had the power of voting for the Council and electing local secretaries. Broadly speaking, what was the effect of this? Seeing that the Society represented less than one-third of the trade, how could they expect to be taken seriously when they approached Parliament for an alteration of the law? As Mr. Hills had said, with these figures reversed they could obtain any legislation of a reasonable character. The Pharmaceutical Council was a body of high-minded gentlemen who did all they could to advance pharmacy, and their estimable President said he had been delivered of a fine healthy baby in the shape of a Pharmacy Bill, which among other things would make every registered chemist eligible for membership of the Society and for election on the Council. To his mind the method of gaining the end was invidious, because it would stir up strife in a way of which they were all aware. It was childish for the Council to go to Parliament with such a Bill. Parliament ought to be approached at an opportune time and when the Society had something definite. He would like the Council to strive for the abolition of Company pharmacy and one man companies, and also to give the members a definite position in the eyes of the public in order that the latter might know "this from that"; they had wholesale manufacturing chemists, drug stores, and goodness knew what, to such an extent that the public was confused. He believed that if the Council agitated for the handling of all potent drugs, herbs, and chemicals by registered people the demand would be considered reasonable and granted without much delay. Common-sense arguments were the only arguments with which to approach Parliament. He did not think the members of the Council knew their trade, and it was time they were educated and made to represent the trade of the country.—Mr. Evans, in responding, said a person engaged as a chemist could not have too much knowledge of his business, and he thought the thanks of the community were due to the Pharmaceutical Society for its efforts in the direction of bringing about a higher standard of education and knowledge, and that it was not right they should be interfered with by a large number of people whose knowledge was absolutely *nil*, and who simply traded under fictitious names or something of that sort. Chemists must bear in mind that, though they were traders, they were also semi-professional men, and that there were two things for which the public would pay—the value of the goods they bought and the professional knowledge which they thought chemists possessed. Despite the extraordinary development of what Mr. Gifford had described as company pharmacy and one-man companies, he thought that there was still scope for a thoroughly competent man with business aptitude to make a very respectable living in the trade. As to the Pharmaceutical Society, he thought the Council was rather governed by the West-end pharmacies in London. They did not realise what he, as a provincial wholesaler and his hearers as provincial retailers, realised, that there was an altogether different trade in the provinces and in Lancashire towns from that of the West-end of London. The solution of this difficulty was for the provincial towns to get as many representatives as possible on the Council. He was optimistic enough to think that, notwithstanding the difficulties which surrounded them, the future before the retailers of the country was as good as in the past.—Mr. H. Hindle, the oldest chemist in Blackburn, gave "The Towns and Trade of North-East Lancashire," Councillor Green, J.P. (Blackburn), responding.—Mr. Grimshaw (Blackburn) proposed "Pharmacy," and Mr. Law (Accrington), who responded, said he would like to have a better opinion of the Pharmaceutical Society than he had. He had not been a member for many years, simply because he could not see what good it was doing the provincial trade.—Mr. Lomax (Darwen), who was entrusted with "The North-East Lancashire Chemists' Association," said he believed that in the past the Association had consisted entirely of Blackburn chemists, but he understood that the members had decided to extend their boundaries so as to include the chemists of neighbouring towns, such as Accrington, Burnley, Darwen, and other places. In doing this he thought they would not only give a helping hand to the smaller towns, but at the same time would strengthen their own position for usefulness in the future. It was quite time chemists combined to defend and protect their interests; unity was a quality that hitherto had not been much in evidence amongst chemists as a class. He was of opinion that every town should have its own local association for purely local interests, but nevertheless he believed that much could be gained by the smaller towns in addition amalgamating with large towns like Blackburn, as it would often be found useful, especially when presenting petitions to the Pharmaceutical Society, or to Parliament, to have a body large in numbers. If in the past chemists had been a united body they would have had better profits than they were receiving to-day, and they could have spoken with a more certain sound to the large proprietors of patent medicines, etc., although he hoped all chemists would bear in mind that they existed for something better than simply to sell patent medicines. There had been much discussion as to whether their calling should be looked upon as a trade or a profession. He thought that question was very nicely handled by Mr. David Storrar, in a paper read at an evening meeting of the Pharmaceutical Society in Edinburgh about a month ago. He said that "while the selling of drugs is a trade, the dispensing of medicines is an art or profession for which special education and training is required, and for which the dispenser ought to be paid over and above the selling price of the drugs used." That paper would be found on page 94 of the *Pharmaceutical Journal*, January 29. He would like to put in a plea for the Pharmaceutical Society. If chemists would only join the Society in large numbers, he believed they could so mould and shape the Society that anything reasonable could be done; thus it would be given a far greater power for

usefulness. The Society required backing up, and if the grumblers could be got to join, much benefit would accrue. An admirable address on pharmaceutical organisation was given by Mr. Taylor, of Bolton, at the meeting of the Manchester Pharmaceutical Association on the same evening that Mr. Storrar read his paper in Edinburgh, and anyone reading the address in the Journal would be amply repaid. A few months ago Mr. Newsholme, of Sheffield, said: "When any chemist fully realises the full value of combination for mutual defence and professional advancement, it will not be long before he perceives that the Society offers the simplest means of alleviating his position." It afforded him great pleasure to propose the toast.—Mr. F. N. Whitehead (Blackburn), the honorary secretary, responded. He remarked that the absolute necessity for combination in trade was bound to be acknowledged by everybody. What the legal and medical professions had done in the matter of combination chemists need not be afraid of doing, nor could they afford to neglect doing it. The efforts of their local Association had not been altogether unattended by success. There was a great deal better feeling among the members of the trade than formerly, and he believed that this in a great measure was due to the fact that they had formed themselves into an association. He appealed to the members to uphold the interests of the Association, and pointed out that by working for the Association and in the interests of the chemists of the town they were also doing something to benefit themselves.—Mr. Garland, the oldest pharmaceutical chemist in the town, gave "The Medical Profession," and observed that he had always been in favour of extending the boundaries of the Association.—Dr. Cunliffe, who responded, said neither profession could be improved without the other reaping some benefit.—Councillor Ralph Shorrock (Darwen), responding to "The Visitors," proposed by Mr. Joseph Hindle, spoke in favour of the extension of the boundaries of the Association, and with regard to the Pharmaceutical Society he said he had always looked upon it more or less as a failure. Business in Lancashire was altogether different to that of the south, but he believed that an association such as that in connection with which they were met that evening would be the means of bringing about such measures as would benefit the chemists and druggists of the North. If they were more united they would have more support from the medical profession.—Mr. J. S. Eatough gave "The Lancashire Witches," the responder being Mr. C. Critchley. "The Health of Mr. Evans" was proposed by Mr. J. R. Parkinson, "The Secretary" found a proposer in Mr. W. Holt, and "The President" was given by Mr. Howarth.

DERBY AND DISTRICT CHEMISTS' ASSOCIATION.

A meeting of this Association was held on Wednesday, February 16, at the Royal Hotel, Derby, the President, Mr. J. A. Cope, in the chair. The chief business of the evening was the discussion of the

Pharmacy Acts Amendment Bill.

Mr. Cope introduced the subject, explaining the different clauses of the Bill and pointing out the position of chemists when the last Pharmacy Acts were passed and their position to-day. After considerable discussion, in which Messrs. Dawson, Hart, Pemberton, and others took part, Mr. Cope proposed the following resolution:—

> That this meeting of the Derby and District Chemists' Association having considered the Draft Pharmacy Acts Amendment Bill approves of the same, and will render to the Council any assistance they are able to give to promote its passing into law.

Mr. Hart seconded, and it was carried unanimously. It was also resolved that the following letter be sent to the local Members of Parliament, signed on behalf of the Association by the President and Hon. Secretary:—

The Pharmacy Acts Amendment Bill.

"The Pharmaceutical Society of Great Britain desire to introduce into Parliament a Bill having the above title. Its object is to remove certain restrictions as to membership and to reconstitute the Council of the Society. At present only those who become 'pharmaceutical chemists' by passing an honorary or 'Major' examination are entitled to become members, whilst the Council must consist of two-thirds pharmaceutical chemists. Those who become chemists and druggists by passing the qualifying or 'Minor' examination may become 'Associates,' having restricted privileges, and must always be in a minority on the Council.

"The number of pharmaceutical chemists on the Register at the present time is 2251, and the number of chemists and druggists is 12,964.

"The Pharmaceutical Society is the only incorporated body representing chemists, and is charged with the administration of the Pharmacy Acts. It is hoped by the Bill to consolidate all those practising pharmacy, and to make all who are legally qualified eligible to become members of the Society and to have an equal right to share in the management of its affairs.

"At a meeting of the Derby and District Chemists' Association held on February 16, it was resolved that particulars of the Bill should be sent to the Members of Parliament representing Derby, expressing the hope that they would give it their consideration and support.

"Should you desire any further information on the subject we shall be happy to supply it.

"(Signed) "——."

Other matters were discussed, principally the subject of local trade protection against misleading advertisements of the so-called pure drug companies.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

At a meeting held on Friday, February 18, Mr. H. M. Morgan in the chair, Mr. H. E. Matthews gave an account of an investigation he had undertaken, at the suggestion of Professor Greenish, to accurately ascertain the development of the

Vittæ of Caraway Fruits.

The paper, which was well illustrated with drawings and microscopic preparations, was followed with interest by a good muster of members.—At the close, Professor Greenish and Mr. E. M. Holmes commented on the paper, the former speaking in high praise of such investigations clearing up doubtful points about which definite information could not be obtained from books.—Messrs. Smith, Dewhirst, and Perrédès also joined in the discussion.—Mr. F. A. U. Smith then gave a description of his

Quick and Permanent Method of Double Staining

of vegetable tissues, giving an admirable practical demonstration of the process. This involves the use of hæmatoxylin and safranin, the resulting preparation leaving nothing to be desired in distinctness and permanence.—Professor Greenish complimented Mr. Smith on the rapidity and excellence of his method, but rather preferred to use staining agents as little as possible, and those generally the temporary ones, which perhaps gave more accurate indications of the nature of the tissues.—Messrs. E. M. Holmes, Matthews, and Perrédès also spoke, Mr. Holmes inviting students to apply to him should they need material to investigate.

PLYMOUTH, DEVONPORT, STONEHOUSE AND DISTRICT CHEMISTS' ASSOCIATION.

At the monthly committee meeting held on Tuesday, February 22, the following new members were elected, Messrs. Pratt (Saltash), and Reed (Devonport) chemists, and Mr. Nicholls (assistant).—In connection with the new Pharmacy Bill which was to be introduced in Parliament this week, it was resolved to write to local Members of Parliament reminding them of their promise to support the Bill, and to ask members of the Association who had votes in other divisions to communicate to their respective Members, urging them to be present in the House at the time and support the Bill.—The Annual Ball Committee also met. The hon. Secretary (Mr. F. Maitland) reported a balance in hand of £1 2*s.*, which was voted to the Treasurer of the General Committee.—In connection with the Junior Section, Dr. W. Cheyne Wilson will deliver a lecture on "Some of Our Microscopic Foes" at the "Technical Schools" on Wednesday, March 2, at 8 p.m.

Intelligent Disinfection.—According to the *Berliner klinische Wochenschrift*, a medical man in Niederlausitz, having notified to the Sanitary Bureau certain cases of typhoid, the thorough disinfection of the dejecta (*Stühle*) was ordered. The police officer charged to execute the order, accompanied by a labourer with a great bucket of limewash, betook himself to the infected houses and consciously whitewashed not only the stools and chairs (*Stühle*) but even the beds, tables, and all the furniture.

NOTICES TO CORRESPONDENTS.

All Communications for the 'Pharmaceutical Journal' must be Addressed to the Editor, 17, Bloomsbury Square, London, W.C., and not in any case to individuals supposed to be connected with the Editorial Staff; no responsibility can be accepted unless this rule be observed. Communications for the Current Week's Journal should reach the Office not later than Wednesday, but news can be Received by Telegraph until 4 p.m. on Thursday.

Advertisements and Orders for copies of the 'Pharmaceutical Journal' must be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Cheques and money orders should be made payable to "Street Brothers."

Articles and Reports sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

Correspondents should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course not necessarily for publication. No notice can be taken of anonymous communications.

Drawings for Illustrations should be executed twice the desired size; clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

Names and Formulæ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

Queries addressed to the Editor will be replied to in the Journal as early as possible after receipt, though not necessarily in the next issue. Replies cannot be sent by post, even though stamped envelopes accompany the queries.

Reprints of Articles cannot be supplied unless authors communicate with the Editor before publication of the articles. The right to reproduce all original matter and illustrations published in the Journal is strictly reserved.

LETTERS TO THE EDITOR.

The New Pharmacy Bill.

Sir,—I have been both surprised and amused by the amount of breezy correspondence that has arisen from the proposal to admit successful Minor candidates to share in the title M.P.S., especially as the title in question is not of the slightest practical value, the rights of a Major man being fully protected by the title Pharmaceutical Chemist. This discussion on pharmaceutical titles reminds me of an anecdote I heard a few weeks ago wherein it was related that a tourist went to stay at a hotel at a fashionable seaside resort almost exclusively frequented by men of letters, so much so, that our tourist having signed his name in the visitors' book as plain Richard Grimston, it was pointed out to him that he had omitted to include his degree, whereupon he affixed to his name B.B.B.B.B.B., which, when the landlord perceived, he made careful search for the meaning of this strange appendage but without success, and was obliged to refer to the owner, when it transpired that the translation was "Best Blooming Blower Birstall Brass Band," which, I think, points the moral that with certain well-known exceptions these alphabetical appendages are not unlikely to be regarded with a good deal of suspicion and indifference by the public. For those of our Major friends who are not contented with the exclusive use of the title "Pharmaceutical Chemist" there is a title with a decidedly distinguished ring about it all ready for appropriation, viz., "Major Graduate in Pharmacy," so that, taking the proposed Bill as passed, they would have the use of Ph.C., M.G.Ph., which, for a man of ordinary appetite, should suffice. As a certain amount of alteration in titles is proposed I think it would be better to deal with the matter once and for all. A man who has passed the Minor is, I think, reasonably entitled to something more up to date than the antiquated title of "chemist and druggist," and I would suggest that all men qualified to practise pharmacy be styled pharmaceutical chemists. If a qualified man, whether he be Major or Minor, is not a pharmaceutical chemist, what is he? A new title would then be required for Major men, such as "Fellow" or "Pharmacist of the First Grade," while this examination should be of such a character that all holding the qualification should be intellectually fit for any company. I think also that exemption from jury service for all qualified men should have been included in the proposed Bill. Both Major and Minor men have the same class of duties to perform, and if one class be exempted the logical conclusion is that both should be, and I fail to see how any real objection could be raised to such an extension. All this, however, is by the way, as the main object of the Bill is to bring all chemists into line, besides which all these trivialities should pale into insignificance. It is beyond doubt that until we are united into one solid body there is not the slightest prospect of the illogical position we now occupy being altered. The common and monotonous custom is to blame the Pharmaceutical Society for things being as they are. It is not my purpose to defend the Society, whose sins of omission and commission may be quite as numerous as they are stated to be; but even accepting that basis, the Society has made continuous effort while the outsiders have proposed no alternative policy. The difficulty to my mind is to discover what the outsiders really wish. The Society is the only chemists' organisation in Great Britain; it is framed on truly popular lines and if it does not reflect the views of the majority of chemists now it can soon be made to do so if those outside will join and bear a hand in shaping its policy. What the chemists of this country who do not belong to the Society have to decide is whether they are prepared to remain under present conditions, or whether they will combine for the definite purpose of improving the material and social position of "the British chemist." If they are prepared to remain as they are, then they cannot reasonably blame the members of the Pharmaceutical Society for the prevailing condition, which is likely to prevail while the present state of disintegration continues. If, however, they go for union and energetic effort it will not be many years before the chemists of this country obtain their deserts.

Ashby-de-la-Zouch, February 14, 1898. G. W. Bullen.

Sir,—I hope that before any further time and money are expended on "Defence Committees," etc., in opposition to the new Pharmacy Bill simple facts will be well considered. These seem to me: (1) That the Society is—nominally—the representative to the outside world of that portion of the community which deals in drugs and dispenses medicines. (2) That it is not really representative, inasmuch as the great majority of chemists in business are Minor men, and, as they are denied any voice in the direction of the Society's affairs, even if they joined it, they naturally prefer not to do so. (3) That it is against all modern ideas that anyone subscribing to a society should not have a voice in its direction. (4) That any legislation which will tend to make the Society really representative deserves careful consideration. (5) That no one covets the title "M.P.S.," and few would use it if they could. (6) That the title "Pharmaceutical Chemist" is the really distinctive one, and that is not to be interfered with. (7) That the proposed change is the only possible way of giving Minor men who subscribe to the Society a share in its affairs which their subscription should entitle them to. As a Minor man, I am surprised that anyone who has his own interests at heart, to say nothing of those of the Society, should fail to see that, as union is strength, so the only way to further his interests is to have a body which shall really represent the whole trade and thus be able to speak out with no uncertain voice were those interests imperilled.

Southport, February 19, 1898. Herbert Roberts.

Sir,—I was much interested in reading the leader in the *Pharmaceutical Journal* of the 12th inst. headed "A Matter of Justice." Although I have been a pharmaceutical chemist for about twenty-eight years I have but seldom troubled the correspondence columns of the Journal, but on this occasion should like to make a suggestion, in order to get at the general opinion of chemists on the Pharmacy Acts Amendment Bill, especially with regard to the privileges of pharmaceutical chemists being accorded to those who are willing to take up their membership of the Society, including exemption from jury service, etc., which in itself is worth a guinea a year to anyone in business, whether he be the proprietor of a single-handed shop or one of larger dimensions. My suggestion is that the Society should issue two sorts of petitions to Parliament, one signed by the chemists and druggists desirous of participating in the privileges, etc., of the Society, and the other signed by pharmaceutical chemists and other members of the Society who think the time has come for the extension of the same. A copy of each should then be sent to every local secretary, with a request that he will call on every chemist in his district and place before him for signature the special petition suited to his position. By this means it would bring the local secretary into closer relations with his neighbours, and tend to foster the ties of brotherhood among chemists. The

wording of the petition might be something in this way: "We, the undersigned pharmaceutical chemists and other members of the Pharmaceutical Society, think that the time has now arrived when, in fairness to those willing to take up their membership, they should be allowed to do so, and should also enjoy the same privileges as a duly qualified pharmaceutical chemist (except the title of pharmaceutical chemist)."

Name and address.	Number of Major certificate.	Year of taking up membership.

Petition No. 2.—"We, the undersigned chemists and druggists, being duly qualified to keep open shop for dispensing prescriptions and the sale of poisons, are desirous of becoming members of the Pharmaceutical Society, and, as leaving our businesses in the hands of others when on jury service is against the safety of the public, we pray that we may be exempt from such service, as are the pharmaceutical chemists."

Name and address.	Number of Minor certificate.	Year of passing.

Of course this is only offered by me as a rough suggestion, leaving others more capable to deal with the detail; but if a more cordial feeling could be engendered between the various chemists in a town, the less they would give way to the cut-throat system of undue competition in prices. Trusting the idea may prove of some service.

Surbiton, February 18, 1898. John Pim Jackson.

The Use of the Metric System by Pharmacists.

Sir,—I noted with regret the announcement of your intention to encourage in the Journal the use of the metric system of weights and measures with a view to the ultimate exclusion of the present and older method. In last week's issue you appear to congratulate yourself that because only one adverse opinion had been received your proposal was accepted with approval. I would humbly desire to be objector No. 2 and to join issue with your Edinburgh correspondent in thinking that the proposal is at least premature. I have no wish "to stop the clock" or to retard what may eventually become the all-prevailing system, but I wish enlightenment to show what great benefits would accrue to practical pharmacists were the metric system generally adopted in dispensing. To carry it out as is done in Germany and some other Continental countries it is necessary that all liquids should be weighed—not measured, and I put it to anyone handling a number of prescriptions daily if this would be conducive to speed or accuracy. I agree with Professor Remington in thinking "that the advantage in supposed greater accuracy of weighing over measuring liquids is more imaginary than real. A careful pharmacist will compound prescriptions just as accurately by measuring liquids as he will by weighing them," and, I would add, much more speedily. Professor Remington further states "that liquid medicines are never administered by weight, but always by teaspoonful, tablespoonful, or other convenient measure." The absurdity, therefore, of prescribing gravimetrically and administering volumetrically is very apparent. In using the C.c. method there is not, of course, the same objection, but personally I require much education to convince me of the greatly superior advantages of the metric system in dispensing over our present method. Then, again, the trivial and easily-produced error of misplacing the point might lead to most serious consequences. You may argue that it is our duty to follow the scientific trend of all Continental countries, and adopt the metric system in its entirety. I know I expose myself to the taunt of being non-progressive, too conservative, etc., etc., but I think we might with advantage exercise a little self-independence and not discard an old, well-tried, and not-so-very-barbaric-a-system after all for a system "made in France or Germany." We all recognise the convenience of the metric system for analytical and highly scientific work where time, as a rule, is of no great moment, but I am objecting from the standpoint of a dispensing pharmacist, where alacrity and accuracy are of paramount importance. A few days ago I had a very good object lesson on the subject at issue. I had the following prescription sent me to be dispensed, accompanied by a request that a copy should be supplied with the weights changed into their metric equivalents, as my customer wished to send the prescription to Germany, and the pharmacist there might not be cognisant of our weights:—

℞ Zinci Valerian..... gr. iii.
Ext. Belladon..... gr. ⅓.
Pulv. Digitalis ..... gr. ¼. M.
Fiat pilula s.a. Mitte tales, xxiv.

This prescription is simplicity itself, and is representative of hundreds passing daily through the hands of pharmacists in this country. Except under the grossest carelessness or ignorance could a mistake be made in dispensing it. Transformed into the metric system it reads thus:—

℞ Zinci Valerian. ..... ·1944.
Ext. Belladon. ..... ·0216.
Pulv. Digitalis ..... ·0162. M.
Fiat pilula s a. Mitte tales, xxiv.

There is of course no difficulty in dispensing this, but I appeal to any practical and busy pharmacist if the same simplicity now exists, and in the calculations necessary to be made if there is not room for easy, though unintentional, blundering. You may of course say that were the metric system adopted it would be advisable to change the style of prescribing. Powders and pills would be ordered in different quantities; the capacity of bottles would require revision, etc. Is the game worth the candle? I can conceive no set of circumstances which cannot be met by our present system. So far as I am able to judge there is as great accuracy, and certainly there is less risk of error; two considerations which outweigh a very large number of hypothetical advantages. The great benefits of the metric system cannot be very obvious when, according to your own showing, "twelve years of a permissive system have done little or nothing in the direction of familiarising the inhabitants of the United States of America with metric weights and measures, and it is open to serious doubt whether a hundred years would see any change in that respect, either there or here, unless some section of the general public undertakes the task of conversion." The tables you purpose publishing will undoubtedly be a great boon, and if I might venture a suggestion I think they should be printed in such a way that they can be detached from the Journal without mutilating it, and so be pasted into our new Pharmacopœia or other convenient book for ready reference. When speaking of weights and measures, if it is not too late, or if it has not been already done, I think the Pharmacopœia Committee should give an authoritative deliverance intimating what "ʒ" means when placed as a quantity for a dry powder. In the preface of the present Pharmacopœia the symbols "℈" and "ℨ" are mentioned as equivalent to 20 and 60 grains respectively, but, oddly enough, the symbol which can bear an uncertain construction is left severely alone. It appears to me that the difficulty would be easily overcome were this symbol entirely disassociated from the word "ounce," and made to represent 480 grains when applied to a dry medicine and 480 minims when applied to a liquid. When an avoirdupois ounce is desired let it be simply written "an oz." or "ounce." I introduce this remark as of late I have asked several medical men what they intend when they prescribe under the symbol, and the opinions expressed are far from unanimous.

Glasgow, February 16, 1898. John McMillan.

Sir,—I notice your proposal to attempt the conversion of pharmacists in the matter of weights and measures, but fear you will have a long, uphill task. Pharmacists seem to differ in no way from other bodies in their modern methods of elementary business education, and I believe that to make the adoption of the metric system a success the only hopeful course will be to drill it thoroughly into the apprentices and students of to-day. My experience has been that students have but an elementary knowledge of the system or the value and facilities offered by it, and as a matter of course they follow the traditions of their elders and stick to the grains, avoirdupois ounce, and troy ounce as their standards. I think the Society's examiners could bear me out in this statement, for, although there are some candidates who appreciate the system thoroughly, yet the majority look upon it as a bugbear and something to be learnt indifferently, solely for the examination. I have heard it objected that grammes and cubic centimetres (or millilitres, if you prefer that term) are only suitable for scientific and analytical work, but I contend that their service would be even

greater in dispensing, and to make this clear I would ask for a comparison of the two following recipes :—

℞ Strychninæ ..... gr. 1/64th.
Ferri Arseniat. ..... gr. 1/6th.
Pil. "Blaud" ..... gr. v.
M. Send 100.

℞ Strychninæ ..... ·001.
Ferri Arseniat. ..... ·01.
Pil. Blaud ..... ·3.
Send 100. M.

The recipe is not by any means an uncommon one, and every dispenser will admit the many difficulties he has with high fractions. A centigramme is about the smallest weight which could be used with accuracy on a dispensing balance, and it would be rarely such a small quantity would require weighing, but between 1 centigramme and 1 gramme there would be 100 weight units. I have to admit that medical men would need educating in the matter, but believe they could as easily be taught it as to order—

"Pil. Blaud c. Ferri Arseniat. et Strychnin. X., Y. and Co. No. 999,"

If chemists would only take a little pains in the matter, instead of it being a hoped-for improvement, it would soon become an actuality. With the advent of the new Pharmacopœia every chemist, who has not already done so, should provide himself with metric weights and measures, and when he has used them for a twelvemonth I feel convinced he will want to find a method for abolishing his troublesome ounces, pounds, and pints.

London, February 23, 1898. C. Edward Sage, F.C.S.

Why the Pharmaceutical Society is not Supported.

Sir,—It is now fifteen years since I entered the ranks of the pill-rolling fraternity, and from that day to this I have been conscious of the weary dirge of begging, beseeching, and urging chemists to join the Society. And what is the result? A decreasing number of subscribers. Why is it? I think because chemists have found that the Council does not and will not trouble about the real interests of the trade at large. I admit there are the prosecutions of unqualified retailers, but this is not voluntary action: that is what chemists look for, and look in vain. What steps has the Pharmaceutical Society taken to secure fair profits, better relationships between medical men and chemists with regard to dispensing, the protection of public dispensers, the defence of its members in frivolous prosecutions, etc.? These would be just a few actions that would appeal to all. But what do we see? In the Journal of 12th inst. there is the report of a meeting at Sheffield in support of the P.A.T.A., and the Vice-President of the Society was the principal speaker against the movement. True, he did not speak in his official capacity, but his remarks cannot fail to make an unfavourable impression against the officials of the Society. Then again, are not Dinneford's Magnesia and Savory and Moore's Food two of the best-known proprietary articles that are cut to the bone, and the proprietors are leading chemists and pillars of the Society? I do not know if they share with Mr. Newsholme such a sacred aversion to any alliance with the grocers, but, at any rate, they have allowed the grocers to take the trade in the articles from us without the least exertion to protect our interests. I verily believe, sir, that if these two preparations were placed upon the P.A.T.A. list, or the profits secured in some way, the popularity of the Council and the Society would be considerably enhanced. The position of Messrs. Carteighe and Savory at the last election proved that all they have done on behalf of the Society for years did not weigh so much as their indifference to our profits on their goods. It is no use the leading pharmaceutical lights preaching about higher education, pharmaceutical ethics, quack medicines, etc. This may be all true enough, and may benefit our successors in twenty years' time, but in the meantime we have to live, and until they condescend to consider the present state of affairs, the Pharmaceutical Society and all its works will be ignored by a large majority. I shall be told that the Society is not a trade Society, and until it is supported more, nothing can be done. The first objection is groundless. If it is not a trade Society, there is no reason on earth why it should not become one by seeking additions to its powers. At any rate it might take an interest in the matters which concern the well-being of the trade. The fact is the professional element in the Society is utterly blind to the interests of the large majority of chemists who have to get their living by trade methods. The higher education, etc., is offering them stones for bread, and although the desire for the better position and training of pharmacists is perfectly legitimate and desirous, this is no reason why scores of chemists should be left almost to starve. It is because nothing is done now to better our condition that the Society lacks support. And the rejoinder of the Society is, "We can do nothing because we are not representative. We are not supported by the majority of chemists. Join, and you will see what we shall do." Such is the ridiculous deadlock to which we have arrived, and so the question arises, "What can be done?" The answer is, "Do what you can?" and if the Society will but try, their efforts will be appreciated. It may be hard work, but so is all reform, and all reformers have to stand alone at first. And we shall find that the apathy of trade will pass away and all chemists will rally to the support of the Society when they see something is actually being done on their behalf instead of so much "speak" of what will be done if they will but send their guineas along. "Come into my parlour," says the Society, but the "fly" chemist stays outside, for he has no guineas to spare to be eaten up and nothing to be had in return.

Northwood, February, 14, 1898. H. B. Sharman.

The Poisoning of Horses.

Sir,—The Lincolnshire Association for the Prevention of the Administration of Poisonous Drugs, etc., to Horses is not unknown to the Pharmaceutical Society, and a deputation from the Association several years ago attended one of the Society's meetings to seek amongst other things its co-operation in checking the sales of poisons to ignorant men without the knowledge of their employers, and which was at the time the occasion of great losses to owners of agricultural horses in this county. The Association does not wish to assume any authority belonging exclusively to the Pharmaceutical Society, and its purpose only is to assist its members in every way to take such measures as may be necessary for the prosecution of chemists and others who supply poisons to farm servants or others unlawfully, and in any such case they will seek the co-operation of your Society.

Lincoln, February 17, 1898. S. Upton, *Secretary.*

Note on Creosote Pills.

Sir,—Probably these cause the pharmacist as much trouble as most formulæ for pills. On looking through the pages of the *Pharmaceutical Journal* many methods have been suggested, all in their way settling the finality of the difficulty. None of them, however, appear to me to be entirely satisfactory, and especially would I take exception to the one in which beeswax is used. Having the following prescription to dispense—

℞ Creosoti ..... minima xviii
Aloes Barb. ..... grana xii.
Misce. Fiant pilulæ xviii.

it was found that the creosote apparently exercised a solvent action upon the aloes, and the whole became very liquid. In order to make a suitable pill mass 36 grains of pure white clay (kaolin) was added as a siccative, and only about 2 minims of mucilage was then required, the whole resulting in an excellent pill mass, which was rolled, cut, and rounded most easily. The final mass weighed 70 grains, and each pill looks about the size of a 3-grain pill, samples of which I enclose for inspection. They are readily disintegrated when placed in water. Thanking you for the help I have received from the articles which you have published on this and other subjects,

Sparkbrook, Birmingham, February 11, 1898. H. Smith.

*** The pills sent are very well made and disintegrate readily in water, as stated. [Ed., *P. J.*]

Sodium Arseniate and the B.P.

Sir,—I have examined several commercial samples of sodium arseniate, and I find that they invariably contain sulphate; but the Pharmacopœia does not take cognisance of the presence of this impurity. There can be no doubt that it finds its way into the compound through the nitrate of sodium which is used in its preparation, and on turning to the official description of this salt it will there be seen that authority permits this impurity. I am led to ask why it permits it in the one instance and not in the case of the sodii arsenias. It is very misleading, especially to young students of pharmacy. May I, while writing upon this subject, also call attention to the fact that potassium citrate invariably contains sulphate, which is derived from the potassium carbonate used in its preparation; but the presence of this impurity is not even referred to under the citrate, and I incline to the opinion that it should not only be referred to, but a limit put to its presence?

Handsworth, Birmingham, Feb. 21, 1898. Percy Dunn.

ANSWERS TO QUERIES.

Special Notice.—*Scientific, technical, legal and general information required by readers of the 'Pharmaceutical Journal' will be furnished by the Editor as far as practicable, but he cannot undertake to reply by post. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of senders. Questions on different subjects should be written on separate slips of paper, each of which must bear the sender's initials or pseudonym. Replies will, in all cases, be referred to such initials or pseudonyms and the registered number added in each instance should be quoted in any subsequent communication on the same subject.*

Equation for H_2O_2.—Obviously, the numeral "2" has been dropped before the formula for manganese sulphate in the answer to "Ajax," on page 162. [*Reply to* J. E. L.—5/18.]

Pricking Cure for Rheumatism.—We are making inquiries in Germany with respect to this. All the information that we have as yet obtained from there is to the effect that it is not considered a serious remedial agent. [*Reply to* J. T.—4/33.]

Emulsin for Making Emulsions.—We are unable to find any record of emulsin having been used for emulsifying cod-liver oil. You should prepare some. Try it with the oil and publish the results of your experience. We doubt if it would be better than a good gum emulsion. [*Reply to* Associate.—5/6.]

Living Statuary.—Yes, zinc oxide mixed with glycerin and water will probably answer best. It is largely used by actors for "making up." Probably the addition of a little rice starch would be useful. It will not harm the skin if thoroughly washed off as soon as possible. [*Reply to* H. J.—5/10.]

Action of Lime on Sewage.—The action of lime on sewage is two-fold, mechanical and chemical. It causes a precipitate of various salts, chiefly calcium carbonate, which, in falling, mechanically carry down much suspended matter. It also causes partial decomposition of certain albuminoid bodies, and at the same time, when in excess, acts as a bactericide. [*Reply to* Associate.—4/32.]

Specific Gravity and Percentage.—The factor given in the "rule" you quote is a purely arbitrary one, for it is impossible to draft any satisfactory rule. No one is expected to carry such information in his head. Your friend should have determined the specific gravity and then asked the examiner for the necessary table to calculate from. [*Reply to* Aro.—5/12.]

Remuneration of Witnesses.—When subpœnaed on the part of the Crown, witnesses are allowed travelling and other expenses according to a fixed scale of allowance. By reference to this scale you can ascertain what the proper fee is. You should claim as a professional man. If called to give evidence by one of the parties in a suit, you should arrange the amount of remuneration in advance and insist on prepayment. [*Reply to* Ferox.—5/13.]

Purifying Distillers' Effluent.—You will probably find that treating the effluent first with a small amount of some cheap ferrous salt, such as crude ferrous sulphate, and then adding just enough milk of lime to produce a clear, not unduly alkaline filtrate, will be the best means of removing the objectionable impurities. Experiment with a pint or a gallon of the stuff first, until you arrive at the proper quantities of material. You will find a great deal of useful information in the recently published book of W. J. Dibdin, 'The Purification of Sewage and Water,' published by the Sanitary Publishing Co., 5, Fetter Lane, E.C. Price 21*s*. [*Reply io* Nemo.—4/34.]

Black Varnish for Grates, etc.—Boil 48 ounces of asphaltum for two hours. During the first part of the time add red lead, 7 ounces; litharge, 7 ounces; and 5 pints of boiled oil. Then add 8 ounces of resin; and further boil until a little, when cool, will roll into hard pills. Then thin down with turpentine. Another formula is: Black pitch, 28 ounces; common asphalte, 28 ounces. Boil together for eight hours, and add 4 pints of boiled oil; gradually add litharge, 10 ounces; red lead, 10 ounces; and again boil until it will roll into pills. Then thin down with turps. [*Reply to* F. W. J.—5/25.]

Ammonium Thioacetate.—This is obtained by neutralising thioacetic acid with ammonia. The acid is obtained by distilling acetic acid with phosphorus pentasulphide; it is also obtained by heating lead acetate and sodium thiosulphate together. [*Reply to* Sulphophobia.—5/9.]

Aperient Syrup.—Fluid extract of cascara, 2 ounces; compound decoction of aloes, 2 ounces; tincture of gentian, 2 drachms; tincture of capsicum, 1 drachm; oil of sassafras, 5 minims; oil of winter-green, 2 minims; borax, 30 grains; treacle, 4 ounces. Mix. [*Reply to* Pestle.—5/16.]

Brown Boot Polish.—Yellow wax, 3½ oz.; yellow soap, ½ oz.; Bismarck brown, 3 drachms; potass. carb., 1 drachm; boiling water, 10 oz.; turpentine, 10 oz. Dissolve the soap, potash, and dye in the water, and add the mixture gradually to the wax and turps melted together. Rub together until quite cold. This will give a good non-sticky polish if only a little be used at a time and the boots be well polished with a soft cloth after applying the paste. [*Reply to* J. B. L.—5/19.]

Cottonseed Oil and Lard.—It is practically impossible to entirely separate cottonseed oil from lard when once they have been mixed, but you may readily detect the presence of the former in the latter. Conroy's modification of Bechi's test (*Pharm. Journ.* [3], xix., 238) is very convenient for this purpose. It is carried out thus:—Make a test solution containing $AgNO_3$, 5, and HNO_3 (sp. gr. 1·42), 1, in S.V.R., 100 fluid parts. Melt a small quantity of the lard to be tested and pour about 100 grains of it into a dry, clean test-tube. Add 20 grain measures of the silver reagent and place the tube in boiling water for five minutes. Pure lard remains perfectly white; with cottonseed oil the colour is more or less olive-brown. The tint is best seen as the lard sets, when the tube is plunged into a vessel of cold water. [*Reply* to S. Q. S.—5/26.]

Syrup of the Glycerophosphates (Robin).—The formula for this is published in the *Bullet. Gén. de Thérapeutique*, cxxviii., 443 (Mai 15/95). The formula is:—Calcium glycerophosphate, 6 grammes; sodium, potassium, magnesium, and iron glycerophosphates, of each 2 grammes; tincture of Ignatia amara, 30 drops; pepsin, 3 grammes; maltine, 1 gramme; tincture of kola, 10 grammes; syrup of cherries, to make 200 grammes. A tablespoonful to be taken in the middle of a meal. The syrup, which the author states is difficult to prepare, should be clear, of a bright red colour, and without deposit. To obviate the necessity of preparing this syrup he also prescribes the following cachets:—Glycerophosphate of lime, 30 centigrammes; glycerophosphates of sodium, potassium, magnesium, and of iron, of each 10 centigrammes; powdered Ignatius beans, 3 centigrammes; pepsin, 15 centigrammes; maltine, 5 centigrammes. Robin does not publish any detailed method of preparing the syrup. [*Reply to* C. L. T.—4/2.]

Formula for Perfume.—Send us a drachm or two of the perfume you would like to make. We may then be able to give you a formula. [*Reply to* J. R. P.—6/2.]

INFORMATION WANTED.

Compressed Tablets.—"Ferox" (5/13) asks if any reader can inform him who is the maker of compressed tablets stamped with the letters "J. M. R." They are taken for indigestion.

Ferrozone and Polarite.—"C. R. P." (4/32) asks for information regarding the composition and action of these substances, which are used in sewage works. Can any reader oblige him?

Shop-Fittings.—"Audax" (5/30) desires to know the addresses of firms dealing in second-hand chemists' shop-fittings and fixtures in good condition.

Nitragin.—"P. H. J." (6/4) wishes to know whether "Nitragin" is procurable in this country, and, if so, where?

COMMUNICATIONS, LETTERS, etc., have been received from

Messrs. Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

Tropin Derivatives. A. van Son, in continuation of the work of E. Schmidt and his pupils on tropin, has studied the action of monochloracetic acid, ethylene chlorhydrin, and ethylene bromide on tropin, and finds that it behaves towards these bodies in a manner analogous to trimethylamine, pyridine and other simply constituted tertiary bases. Tropinbetaine chloride was obtained by the action of monochlor-acetic acid on tropin at 130° C., according to the equation—

$$C_8H_{15}ON + CH_2Cl\cdot CO\cdot OH = C_8H_{15}ON<^{CH_2-CO\cdot OH}_{Cl.}$$

The gold salt, $C_8H_{15}ON<^{CH_2-CO\cdot OH}_{Cl,AuCl_3}+H_2O$, melts at 223° to 224°. The platinum salt, $(C_8H_{15}ON<^{CH_2-CO\,OH}_{Cl})_2PtCl_4+2H_2O$, melts at 227° C. Tropincholine chloride was produced by heating tropin for three hours at 100° with ethylene chlorhydrin, the reaction taking place thus—

$$C_8H_{15}ON+CH_2\cdot OH-CH_2Cl=C_8H_{15}ON<^{CH_2-CH_2\cdot OH}_{Cl}.$$

The gold salt and platinum salt were prepared. As the starting-point for the preparation of tropinneurine, the addition product of tropin with ethylene bromide was obtained, and this by digestion with silver oxide converted into tropinneurine thus—

$$(1)\ C_8H_{15}ON + CH_2Br-CH_2Br = C_8H_{15}ON<^{CH_2-CH_2Br}_{Br}$$

$$(2)\ C_8H_{15}ON<^{CH_2}_{Br}-CH_2Br+Ag_2O=C_8H_{15}ON<^{CH}_{OH}=CH_2+2AgBr.$$

E. Schmidt, Bode, and Nothnagel have shown that trimethylamine ethylene bromide is converted into choline by long heating on the water-bath with aqueous silver nitrate. A similar reaction occurs with the addition product of tropin with ethylene bromide, although it takes nearly three weeks to eliminate the second atom of bromine and to leave tropincholine nitrate. In what respect tropinbetaine, tropincholine, tropinneurine, and the corresponding trimethylamine derivatives resemble in physiological action betaine, choline, and neurine, is left for further investigation.—*Archiv*, 235, 685.

New Tartrate Ferment. L. Grimbert and L. Ficquet have isolated a new bacillus, which rapidly converts tartrates into acetic and succinic acids with the evolution of carbonic anhydride and hydrogen. It acts best under anærobic conditions at about 36° C. The organism has been called *Bacillus tartricus*, and is regarded as quite distinct from the tartaric ferments further to be isolated.—*Journ. de Pharm.*, 6 ser., vii., 97.

Decomposition of Auric Chloride. E. Sonstadt has been unable to observe any decomposition of auric chloride in solution when exposed to light, but was able to produce that effect on heating the same solution for some hours, a precipitate of gold being thrown down. In a second experiment a solution of one part of auric chloride in fifteen thousand parts of water, coloured by the addition of a little bichrome, was distilled with every care to exclude organic matter, and in this case also gold was precipitated on heating. A trace of hydrogen peroxide was detected in both solutions after precipitation had taken place, and it is suggested that if the reaction took place without heating, the peroxide produced would be much more easily recognisable. The reaction appears to be entirely analogous to that which the author has shown to take place when a dilute solution of platinic chloride is similarly heated (see *ante*, p. 163), aurous chloride being formed, but as the latter chloride is decomposed when heated with water, metallic gold only is precipitated. It is thought to be probable that the indicated reaction is a general one for the higher chlorides of the platinum group.—*Chem. News*, lxxvii., 74.

Basic Salt of Magnesium. M. Tassilly has succeeded in obtaining an oxybromide of magnesium, by heating to boiling an aqueous solution of crystallised magnesium bromine, then withdrawing the flame and adding calcined magnesia in small portions, again boiling until the magnesia dissolved, next raising the temperature to 150°, filtering the solution while hot, and preserving it in a well-stoppered bottle. The oxybromide was deposited in about fifteen days, in the form of small needles, the composition of which is given as $MgBr_2 3MgO, 12H_2O$. Half of the water of crystallisation is lost on heating the crystals in dry air to 120°, and the oxybromide, which is decomposed by water, alcohol, etc., also undergoes a change when exposed to air, carbon dioxide being fixed.—*Bull. Soc. Chim.*, xvii., 964.

Formation of Carbides. H. Moissan has established the fact that potassium, sodium, and magnesium carbides cannot be produced at the temperature of the electric furnace. By the action of cold acetylene gas, or of liquid acetylene, with or without pressure, it is possible to obtain the intermediate potassium and sodium acetylenes—C_2KH and C_2NaH—in a state of purity, and by elevating the temperature those bodies can be decomposed, acetylene being disengaged, and potassium and sodium carbides—C_2K_2 and C_2Na_2—left as residues. At a still higher temperature the carbides are dissociated into the metals and carbon, as in the case of the carbides of the alkaline earths, though a much higher temperature is required. The same holds good with magnesium carbide, and it is pointed out that the stability of these carbides, under greater and greater variations of temperature, continues to increase from the alkaline metals up to those of the alkaline earths. Details are given in the same paper of experiments with lithium and calcium carbides, both of which can be decomposed in the electric furnace by currents of high intensity, though the highest temperature is required in the case of the calcium compound.—*Comp. rend.*, cxxvi., 302.

Electro-Synthesis. W. G. Mixter defines electro-synthesis as the chemical union of substances by an electric discharge, as distinct from combination effected by the heat of the discharge. A feeble glow discharge from an induction coil driven by one storage cell, and giving a spark in air about 1 Cm. long, was used in the experiments for effecting combination, and the amount of combination of oxygen with hydrogen in a discharge tube connected in series with the tube under investigation, served in all cases as an arbitrary standard of reference. To obtain a measure of the chemical action the products of the combination were absorbed directly in the vacuum tube, and the corresponding diminution of pressure was noted on a manometer. Experiments were made at varying pressures, and the corresponding values for the mixture of other gases with oxygen—the number of hydrogen and oxygen molecules combining being taken as 100—were as follows:—Carbonic oxide, 113; methane, 149; ethylene, 300; acetylene, 320; ethane, 150. From a consideration of these results the author concludes that the glow discharge renders gaseous molecules chemically active, and that the molecular charges involved

in electro-synthesis are analogous to those often produced by light or by heat at temperatures below that at which gaseous dissociation is measured.—*Am. J. Sci.*, 154, 51, through *J. Am. Chem. Soc.*

Action of H_2SO_4 on Mercury.

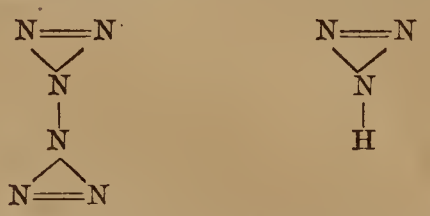
J. R. Pitman controverts the statement previously published by Baskerville and Miller, to the effect that mercury decomposes concentrated sulphuric acid at about 20° C. He was unable to obtain any such result when the acid and metal were left in contact for forty-eight hours, or when they were shaken violently together in the proportion of one part to seventy by volume, and the opinion is expressed that no reaction can take place between mercury and sulphuric acid at the ordinary temperature, and that if Baskerville and Miller noted any reaction, the conditions must have been other than as stated by them.—*Journ. Am. Chem. Soc.*, xx., 100.

Sodium Peroxide as a Reagent.

C. Glaser has failed to confirm O. Kassner's statement that iron is not oxidised to ferric acid by sodium peroxide; the statement only holds good if the reagent is added to a solution of an iron salt, without the precaution of keeping the temperature of the latter sufficiently low. Exception is also taken to J. Clark's statement that the action of the peroxide on coke and coal is too violent to permit of use in analysis, as it has been used in coke, coal, and asphalt analyses for sulphur with perfect success. It is necessary that the material to be analysed should be placed in a sufficiently large silver or nickel dish and covered with about four times its weight of sodium carbonate. Then dust the dry peroxide upon the mass, from a porcelain or platinum spoon, in small quantities at a time, until all the carbon is consumed. Next, heat the mass, if necessary, to perfect fusion, and determine the sulphur present in the ordinary way. Used in this manner sodium peroxide is a very useful and convenient reagent, applicable in a great number and variety of cases.—*Journ. Am. Chem. Soc.*, xx., 130.

Is Argon an Element?

The question as to the elementary nature of argon has induced Goehlich and Dennstedt to attempt its preparation by means of the oxidation of imidozoic acid, N_3H, but without success. Jakobi regards argon as having the same relationship to N_3H as cyanogen has to hydrocyanic acid, thus—



He also favours the view that N_6 rather than N_3 should be considered the formula for the argon molecule, since, apart from the fact that the molecular weight has not yet been satisfactorily established, the acceptance of the formula N_3 would necessitate the assumption of the constitution of the molecule being represented by

the inner bond of which does not harmonise with the views at present accepted. He suggests that an attempt should be made to obtain argon by the action of nitrous oxide on free hydrazine, as shown by the formula—

Kinds of Curare.

Boehm classifies the various forms of curare thus: *Tubocurare*, preserved in hollow bamboo canes, frequently called paracurare, originating from the Amazon. The drug consists of a dark brown substance, which contains well-formed crystals up to 2 Cm. in length. It contains about 11 to 15 per cent. of moisture, and is soluble in water and in dilute alcohol to about 85 per cent. The ash amounts to 12·3 per cent. The lethal dose on a 1 kilo rabbit varies between 6 and 12 milligrammes. The aqueous solution has an acid reaction, depositing a flaky sediment even after filtration. *Tubocurare* contains an inactive basis, curine, and about 9·2 to 11·8 per cent. of tubocurarine, which is the poisonous constituent. The crystals referred to were found to be quercitin. *Gourd curare* has now almost entirely disappeared from the European market. It is derived from *Strychnos toxifera*, Benth., and is a dark brown substance, containing 5 to 12 per cent. of moisture. It is soluble in water from 34 to 75 per cent. The lethal dose pro 1 kilo weight lies between 1·5 to 3 milligrammes. The aqueous solution is faintly acid. It yields 6·1 per cent. of ash. The active principle is curarine and an alkaloid soluble in ether. *Jar curare* (packed in jars) is derived from *Strychnos castelnæi*, Wedd., but has also disappeared from the market. Frequently it possesses a peculiar aromatic odour. It contains 8·33 per cent. of moisture and 7·9 per cent. of ash. The solubility and toxicity of various preparations differ considerably. It contains three bases—protocurine having a slight curare action, the formula for which is $C_{20}H_{23}NO_3$, the non-poisonous protocuridine, and protocurarine, which is extremely poisonous and much more intense in action than curarine. 0·24 milligramme is a lethal dose for 1 kilo for body weight.—*Pharm. Ztg.*, xlii., 41, after *Abh. k. Sachs. Ges. d. Wiss.*, 22, 201.

Jamaica Ginger.

F. B. Kilmer states that Jamaica ginger planters divide ginger into "blue" and "yellow," according to the colour of the rhizome. The two varieties are also known as "turmeric" and "flint." No botanical difference is apparent between the plants producing them, and the "blue" seems to be a degenerate species. Its root is hard and fibrous, yields a smaller proportion of powder, is less pungent, and therefore less valuable commercially. Another division is into "plant" and "ratoon" ginger, the former being planted each season, while ratoon ginger is described as a product of laziness, being a return crop, secured by leaving in the ground, when the crop is harvested, a part of the "hand" containing a bud. Ratoon ginger is much smaller in size of "hand" than the planted, and loses each year in flavour, each successive crop being less and less in amount. It is gathered from March to December, whereas planted ginger is not ready for digging until December or January, and from then to March is the true ginger season.—*Am. Journ. Pharm.*, lxx., 65.

Soap Stone as an Emulsifier.

An argillaceous earth named "Tfol," which contains free gelatinous silica, is largely used in Northern Africa by the Arabs as a substitute for soap in washing linen. Lahache finds that it has great capabilities of absorbing oil, 1 part of this substance completely absorbing 5 parts of heavy tar oil. When the compound is mixed with water a perfect emulsion is formed, which does not adhere to the sides of the vessel. It is proposed to employ this earth for the purpose of emulsifying heavy tar oil for disinfecting purposes. For this purpose the "tfol" is first mixed with an equal weight of water, and then intimately incorporated with sufficient heavy tar oil to make a paste.—*Journ. de Pharm.* [5], vi., 58.

THE ALLEGED DECAY IN THE ART OF PRESCRIBING.

BY EDMUND WHITE, B.SC.,
Pharmaceutist to St. Thomas's Hospital.

From time to time letters appear in this Journal drawing attention to what most of the writers consider the decay of the art of prescribing among members of the medical profession. Usually these communications are sent by pharmacists who have had to obtain a package of some proprietary article of more or less secret composition in order to dispense a physician's prescription.

A letter of this nature appeared in the *Pharmaceutical Journal* for November 13 last, and drew a reply from Dr. A. P. Luff, of St. Mary's Hospital, which was published the following week. Dr. Luff showed that the exigencies of modern medical education hardly allowed sufficient opportunity for the medical student to acquire the necessary facility in prescribing, and that the pressure of work in the out-patient department at St. Mary's Hospital was so great that the physicians in charge were only able to give a limited amount of instruction in prescribing. This pressure in the out-patient department is not peculiar to St. Mary's Hospital, but is well known to exist in a more or less acute form at all such institutions. As Dr. Luff points out, the out-patient departments at the great hospitals to which medical schools are attached provide the training ground where the medical student chiefly acquires his notions relative to the art of prescribing. It would seem, therefore, that in the interests of medical education some modification of the present system of out-patient treatment is desirable. It is not my intention to do more than mention this aspect of out-patient medical treatment, since the whole subject has received, and is now receiving, the earnest attention of hospital authorities, both lay and medical. Whatever alterations or improvements may be effected from the purely ethical point of view there would still remain one obstacle to the full development of the facilities provided by out-patient departments for teaching the art of prescribing, which has a direct bearing upon pharmacy, namely, the amount of labour involved in dispensing, within a limited time, the prescriptions which have formed the basis of the physician's teaching.

This is at present a matter of considerable practical difficulty, which has been met, in a great measure, by each hospital having a book, a so-called hospital pharmacopœia, containing a number of formulæ for the administration of remedies in frequent demand. Now the existence of this book of formulæ is usually held to be justified for two reasons—both economical. In the first place the physician merely has to write the distinctive name of a formula containing several substances, and by so doing economises his own time; and secondly, it becomes possible to prepare in the dispensary beforehand, and in bulk, certain formulæ which are found by experience to be frequently required; this economises time and labour in supplying the medicines to the patients. Only by some arrangement of this sort is it possible to deal with the volume of work in the time available. At the same time it is easy to understand how the student misses the points involved in the compilation of the prescription, for the disease being diagnosed and the remedy indicated, he frequently sees the latter prescribed in the form of a stock preparation, perhaps with a Co. of undefined extent at the end. Even if he be attentive enough to refer to the hospital pharmacopœia in order to see what the full formula contains, one cannot admit a comparison between the information gained by so doing with what he might have acquired from a discussion arising out of the same prescription written in full, perhaps with slight variations, several times on the same day. For example, suppose mistura quininæ is prescribed, containing quinine sulphate, diluted sulphuric acid, compound tincture of cardamoms, and water. A bare knowledge of the formula does not convey any further definite ideas as to the solubility of quinine salts, the selection of a dilute acid for dissolving it, and the amount required, or the employment of flavouring agents; all these points would have arisen in writing a similar prescription for quinine in a soluble form, independently of any book of formulæ. Other examples readily occur: mistura bismuthi, which constitutes a type for the administration of heavy powders insoluble in water, or mistura copaibæ, which furnishes material for illustrating the method of administering certain things in the form of an emulsion.

Now, if it be admitted that the out-patient department chiefly affords the opportunity for teaching prescribing, it is well worth discussing whether the price paid may not be too high for the economy effected. For the old system of apprenticeship or pupilage in the medical profession is extinct, under which the tyro had ample opportunity of practically acquiring that knowledge of the nature and physical properties of drugs upon which the art of prescribing is based. Nothing in the modern medical curriculum adequately replaces this. I have repeatedly found by communications from those who have been my pupils in pharmacy at St. Thomas's Hospital, and who have availed themselves as fully as possible of the necessarily limited opportunities for acquiring a knowledge of the subject, that they have felt keenly the disadvantage of their incomplete equipment in this respect when first going into medical practice.

Let us admit now the possibility of limiting the number of out-patient cases to the extent of rendering easily possible what Dr. Luff says is, under present conditions, very difficult, viz., the writing of a prescription without abbreviation for each case. I maintain then that it would be possible to burn the whole edition of the so-called hospital pharmacopœia and break up the stock-pots in the dispensary. This might also necessitate some increase in the dispensing staff, which, however, would be fully justified if any advantage accrued to medical education. The number of out-patient cases treated under present conditions could hardly be dispensed for in detail by any increase in staff, because the structural arrangements in every hospital dispensary with which I am acquainted would not admit of so many independent prescriptions being dealt with in the manner indicated in the limited time available. The question of time is a very important element in the discussion because of the possible hardships inflicted upon the patients by avoidable causes of delay. It must not be forgotten, also, that charitable institutions, such as our hospitals, are administered on the basis of distributing as much medical relief as possible with a limited expenditure. The governing authorities then would require some tangible justification for incurring an increased expenditure in dispensary administration. Is there any justification? It might be shown that the decay in the art of prescribing is a real evil affecting the efficiency of the medical profession at large and that, as a consequence, the whole community suffers. On the other hand, it might be maintained that absence of knowledge concerning the minutiæ relating to basis, vehicle, adjuvant and corrective do not in any way diminish the ability of the physician to prescribe successfully for the sick. And in this connection it is well to distinguish carefully between cause and effect. That is to say, are prescriptions simpler because the system of medical education does not now supply the necessary knowledge for writing a more or less complete combination, or is the simplification of prescriptions due to a change in medical teaching? I cannot contend that any change in the direction indicated would result in increased benefit to the patients, because, although there is usually a tacit understanding that the formulæ

of the hospital pharmacopœia are, with the object of saving time and labour, to be used as much as possible, there is no hesitation on the part of the medical officers to deviate from the formulæ contained therein if the necessity arises. The abolition of the book of formulæ, from a medical point of view, can then be only demanded for educational reasons. In the best interests of pharmacy I consider its abolition or contraction within the narrowest possible limits eminently desirable. The former consummation is, however, impossible under the prevailing conditions, for the reasons already stated. It remains for medical authorities to decide whether the desirability of any alteration can be used as an argument in favour of the reduction in the number of out-patient cases treated. This is a necessary prelude to any alteration in the method of prescription-writing in the large general hospitals.

It is universally recognised that prescriptions are simpler now than they were formerly when long formulæ containing perhaps half-a-dozen remedies were the rule rather than the exception. The truth probably lies here as it does in most cases, between the two extreme views. Undoubtedly the increasing employment of proximate principles and concentrated extracts rather than the cruder forms of drug, and the introduction of the compressed tablet, cachet and capsule have very much simplified prescribing, compared with what it was in the old days, when the julep, haustus, and plaster prevailed. Yet the old-fashioned bottle of medicine or "mixture" prevails at the present day, and is perhaps the most popular form of medication, apart from the advantages it presents. It will probably be admitted on all sides that instruction in prescribing for the medical student is desirable, somewhat on the altered lines I have sketched, but the question of ways and means is not so simple. Certain phases are purely medical: with these the medical profession must deal. I have only introduced them into the discussion because it is impossible to get the hang of the whole question, even from a pharmaceutical point of view, without involving them. I have endeavoured to show how the practical difficulties, from the pharmaceutical side, may be removed if any alteration in our present methods be considered desirable.

On the subject of hospital pharmacopœias I feel most strongly that some modification is possible, even apart from any change in hospital medical treatment. The bulk of most of the existing ones might be considerably reduced without decreasing, to anything like a proportionate extent, the utility of the compilation for the purpose of saving time. The existence of such a book at all is only a question of expediency, which from economical reasons one is bound to consider.

Pencils of Yellow Oxide of Mercury Ointment for Ophthalmic Use.—Babcock, in the *Ophthalmic Record*, calls attention to an old formula for preparing sticks of this ointment, which, although containing some unusual ingredients, is found in practice to be very serviceable. English graphite, 10 grains; yellow oxide of mercury, 20 to 40 grains; oil of theobroma, 4 drachms; butter of antimony, 2 drops. Mix and mould into pencils. Instead of the butter of antimony any bland oil will do. In applying the stick to the lids, it is rubbed on the eyelids, and the eyes closed for about ten seconds, when any excess is wiped off. If it is to be introduced into the eye, a small piece is picked off, softened between the fingers, and put between the ball and the lower lid, or the upper lid is everted and dressed with the pencil. It is also a good application for any abrasion of the lips or nostrils. *Quart. Med. Journ.*, vi., 179.

ENGLISH PHARMACISTS AND RUSSIAN PHARMACY.

BY P. SPEHR, M. Pharm.

Whilst occupied with the compilation of the history of Russian pharmacy I discovered certain facts which appear likely to excite the interest of my English colleagues. There is an unsatisfactory lack of authentic original materials relating both to the older political history of Russia and to the history of its civilisation, and in a still higher degree relating to special professions like that of pharmacy. Doubtless important documents were lost during the disturbances at the beginning of the seventeenth century, at the almost entire destruction of Moscow, and afterwards, in 1812, when Moscow was burned. Whatever original materials have been preserved have mostly been at a distance from Moscow, and are at present kept in different archives of the State, which are scarcely accessible to private researches.

Fortunately, some secondary original materials have been saved; though very scattered and incomplete, they are still of some use and shed some light on the nature of Russian pharmacy in the past, at the same time supplying interesting details regarding the history of the early English pharmacists. For it has been ascertained from a number of letters sent from English sovereigns to Russian regents that the founders of the oldest State drug store in Moscow, and, therefore, also of Russian pharmacy as a whole, were Englishmen.

As is well known, the first people in the West with whom Russia entered into active commercial intercourse were the English. Though an expedition, under the chief command of Sir Hugo Willoughby, which had been equipped on the suggestion of the famous English navigator, Sebastian Cabot, with the intention of seeking to discover a north-easterly channel to China and India (in which Nordenskjöld was successful in 1878), did not attain its end, one result of it was that one of the commanders of the three ships sent out, Richard Chancellor, reached the mouth of the northern Dwina, where, at that time (1553), a small monastery was the only building that existed.

During his later voyages to Russia in 1555 and 1556, which he undertook with a view to entering into commercial intercourse with Russia, Chancellor was invited by John IV. to Moscow, where he was cordially received, and subsequently honourably dismissed on his return to his country. He was drowned while returning to England during a storm at sea. But soon afterwards English factories and markets arose on the borders of the northern Dwina, and in the year 1583, by order of the Tsar, the commercial town Archangel was established, and began to flourish. This place was almost exclusively the centre of commercial and personal communication with the West, till the foundation of St. Petersburg (1703), when John the Terrible granted to Englishmen considerable trading privileges throughout the whole of Russia, which had been temporarily checked under the Tsar Michael at the beginning of the seventeenth century. The English trading company then founded flourished till the nineteenth century.

The foundation of Russian pharmacy by English pharmacists can be attributed to the direct initiative of the Tsar John IV. Basilzewitsch, Queen Elizabeth having sent him, in accordance with his request, the necessary professional persons and special fixtures for the drug store that was to be founded. There seems to have been nothing in Russia that corresponded with a properly organised pharmacy or pharmaceutics, as we know them, till about the end of the long reign of this despotic and cruel, yet in many respects genial and highly gifted and enlightened, regent, who, however, was intellectually greatly superior to his contemporaries in the Russian society of those days. The increasing feebleness and final pining away of the monarch, his lively correspondence with the

ingenious and well-educated English queen, from which he must have gained a comprehensive grasp of Western culture, may have hastened his decision to introduce the Western European arts of pharmacy and medicine. He addressed himself, therefore, several times to the English Sovereign with an urgent request to send him capable physicians and pharmacists. The letters of the Tsar are not available, but the answers of Queen Elizabeth show that she was complying with a particularly outspoken request of the Tsar when she proved her complaisance by sending her "friend and brother" the wished-for experts, and recommending them to his personal patronage. On September 12, 1557, an extraordinary Russian ambassador, Nepeja, returned from London, and on December 6 of the same year his companion in the voyage, the agent of the newly founded Anglo-Russian Trading Company, Anthony Jenkinson, arrived in Moscow. He had taken with him from England a physician named Standish, a pharmacist (name unknown), different technologists, and finally several apprentices for the aforesaid company. Jenkinson soon afterwards returned to England, apparently again charged by the Tsar to bring a physician, a pharmacist, and several technologists to Moscow. This agent again arrived in Moscow in 1566, bringing for the Tsar a letter from the queen, in which she announced to him, among other things, that she had allowed the persons he had asked for to go to Moscow—the engineer, Humphrey Lock, his assistant, John Finton, the goldsmith and assayer, Thomas Green, and other masters, as well as the physician, Reynolds, and the pharmacist, Thomas Carver, who are said to have reached Moscow in 1567. Thomas Carver is stated to have perished in 1571 during a great fire, caused by an invasion of the Tartars, who destroyed almost the whole city, among other buildings consumed being the saloon under the English company's hall, situated in Warwarka (street in "China-town"), where Carver is said to have met with his death together with thirty other persons.

As an English pharmacist is recorded to have already arrived to Moscow in the year 1557, as mentioned above, and Carver must also have lived in Moscow about four years, it is not improbable that something like an apothecary's shop existed in Moscow long before the arrival of the pharmacists mentioned below, who are generally considered as the founders of the oldest Russian drug-store. But as these two persons almost act in the history of Russian pharmacy the part of mythological figures, and as all demonstrable proofs of the conjecture expressed above are removed, relying on more positive material, we must consider the English apothecary, James Frencham, as the founder of Russian pharmacy. The name of this druggist, who arrived in Moscow in 1581, accompanied by the physician Robert Jacob and several surgeons, is not mentioned in the queen's earliest confidential letter concerning him. Little is to be learned from that first letter who and how many were Frencham's colleagues, yet there were undoubtedly several pharmacists in question. The queen also states positively that she has sent the Tsar, her learned subject, "not spontaneously or because she did not need them, but only because the Tsar had expressly asked her for them, and needed them in his sickness." On account of the interest this document has in connection with the history of Russian pharmacy, as well as English pharmacy, the letter is here given :—

"Elisabeth, by the Grace of God Queen of England, France and Ireland, Defender of the faith, etc., to the most high and mighty Prince and Lord Ivan Bassilzewitch, etc., etc., etc., Our Brother and Friend, greeting. As is to be seen from the letter of Our dear Brother, which is written in the Russian language, You need a learned and skilful man for your health, and therefore We did not wish to have you ask in vain, while keeping back a scrupulous and learned man of my court-physicians, but I sent You the famous Doctor Robert Jacob, who is well versed in the medical science, not because he were not needed here, but because You need him, and We hereby wish to prove to You Our friendship; but receive him kindly and benevolently, wherefore We are interceding. And also receive kindly, according to Our intercession, the respectable and skilful apothecaries and the surgeons who are coming with them, and whom We have not sent spontaneously either, but upon Your request, hereby damaging Ourselves. Appoint and reward them, for We are sending them to serve You truly and rightly. Therefore We pray to God to preserve Your Highness well and happy for many years. Written in Our city of Westminster the 19th of May, Anno Dni. 1581, and of Our most happy reign 23.—Elisabeth Queen of England."

As there are several apothecaries mentioned in this letter it may be taken for granted that Frencham, who was designated as chief apothecary, had received the order to take to Russia the staff that was necessary in order to found the drug store. This supposition gains in probability when we learn that Frencham left Russia for a long time at the end of several years, and returned again only in 1601, without the business of the pharmacy having been interrupted. All doubt appears to be removed by a second letter of the queen, in which she speaks of a "sufficient number of apothecaries being in the service of the Tsar." Her knowledge of this circumstance can only be explained by assuming those apothecaries to have been Frencham's countrymen and by the fact that the queen knew of their emigration to Russia.

In this letter of the queen nothing is said about the personalities of the apothecaries who came to Moscow in 1581, and we should not even know the name of the chief apothecary if the later letters did not give particulars regarding him. Doctor Robert Jacob had already asked to be discharged from the Tsar's service, and at the same time addressed himself to England for support to his petition. On June 8, 1583, the English ambassador, Hieronymus Bowes, arrived in Moscow with two letters from Queen Elizabeth. In the first letter, which was written in Latin, the queen supports the solicitation of Doctor Jacob, and asks the Tsar to dismiss him. In the second one, which bears the same date, there is in the Russian translation the question of the "apothecary Jacob." Here the queen remarks that this apothecary had previously been in her own service for ten years, and asks for his return to England, on account of his old father wishing to bestow upon him his share of his estate before he died. The letter runs thus :—

"August Lord, dear Brother and Friend, etc. . . . . With You stays the apothecary named James, who has previously been in our service for ten years, and whose father has reached an advanced age and is daily expecting to die, wherefore he (the father) has asked us to write to Your Majesty in order to solicit the return of his son, so that he may yet see him again in this life and hand over to him his inheritance. For this old man's sake We could not refuse to solicit Your Majesty for this, so much the more as there are yet other apothecaries in the service of Your Majesty, who are enjoying your complete confidence, and therefore We beseech Your Majesty to kindly do Us this favor in order that the abovementioned old man may also pray to God for you after having happily seen his son again, who will have returned to him thanks to Your inexhaustible kindness. . . . . Anno Domini 1583, June 8th."

Yet, in spite of the warm intercession of the queen, the Tsar hesitated, according to the testimony of Hacluyts, to comply with the request before another apothecary could be sent from England, and this would appear to bear favourable testimony to the great capacity of the first chief apothecary of the Tsar. In the following year, however, the Tsar John IV. died, and the resignation of the "apothecary Jacob" was assented to at the beginning of the reign of the Tsar Theodore Ivannowitch, in 1584, so that he could start upon his homeward voyage together with Bowes, whose departure had also been delayed.

In spite of the second letter, the identity of the "apothecary Jacob" mentioned here with the apothecary James Frencham would not as yet have been proved, if later documents did not shed a complete light upon it. Written documents as well as letters of the queen have been saved, which explain this, and according to these "the apothecary James Frencham, who had been in the service of the predecessors of the Tsar Boris, John IV., came to Russia for the second time" in 1601—during the reign of the Tsar Boris Godoonov. In addition to the name and Christian name of the individual being stated, the patronymic (Ostafiew) had also been added, and it is expressly stated that the same

apothecary had already been in the service of the Tsar John IV. It is plain, therefore, that the "apothecary James" who had been sent to Russia in 1581, and reclaimed by Elizabeth in 1583, and James Frencham who had come to Moscow "for the second time" in 1601, were one and the same person. That he had simply been referred to as "James" in the second letter of the queen is easily explained by the fact that Frencham had probably signed only his Christian name in a former letter to the queen, according to a widely spread custom of those days. At all events, he had received this name, "Jacob" (instead of the English "James"), when he settled in Russia, and John IV. used it afterwards in his letters to the queen. The transformation of foreign names, which the Russians found difficult to pronounce, and in general the diminution of a name in intercourse with persons in high positions, was very common, and whenever a person was called in Russia by his full Christian name and surname it showed that he was a very important personage.

(*To be continued.*)

DISPENSING NOTES.*

BY HAROLD WYATT, JUN., PH.C.

The following notes are simply a record of certain difficulties met with of late in the ordinary course of a dispensing business, and lay no claim to any originality, either of conception or manipulation. Their object is to show the utility of carefully noting in the prescription register any special point of interest worth remembering about a prescription, a method of procedure I have found beneficial not only to any subsequent dispenser, but also to the maker of the note, from the additional interest it gives him in the products of his handicraft.

No. 1.—A pill mass containing nitrate of silver in addition to vegetable powders and an extract.

℞ Argent. Nitratis	gr. vi.
Pulv. Digitalis Fol.	gr. iii.
Ext. Nucis Vom.	gr. vi.
Pulveris Capsici	gr. xii.

In pil. xii., divide.

To minimise the action of the other ingredients on the nitrate of silver this was triturated well with 10 grains of French chalk and massed with resin ointment. The powders and extract were then separately massed with more resin ointment, and the two masses mixed and cut into pills, which kept their colour and shape well.

No. 2.—An extremely unsightly and unsatisfactory mixture, little calculated to do credit to even the best dispenser.

℞ Syrupi Sennæ	℥i.
Sodii Sulphatis	℥ii.
Aluminis Sulph.	gr. 40.
Tr. Carminativæ, B.P.C.	℥iss.
Ext. Glycyrrhizæ Liq.	℥i.
Aquam ad.	℥viii.

Misce fiat mistura.

The solids present being more than enough to saturate the liquids, they were rubbed to a fine powder, then the syrup of senna and extract of liquorice worked in and water added gradually to the required volume, the tincture being added last. In addition to the undissolved sulphate of soda, there is a precipitate caused by the action of the alum on the glycyrrhizin of the fluid extract of liquorice. A few drops of ammonia would dissolve this, but the use of it is not to be recommended in this case, as it would convert the alum salt to hydrate, and cause a further precipitate.

No. 3.—A mixture of syrup of iodide of iron with infusion of calumba.

℞ Potassii Iodidi	gr. 160
Syrupi Ferri Iodidi	℥i.
Inf. Calumbæ ad.	℥viii.

M. fiat mistura.

* Read at a meeting of the Liverpool Pharmaceutical Students' Society on Thursday, February 10.

As will be readily seen, this mixture changed almost immediately, giving a gradually increasing red precipitate of oxyiodides of iron. The patient having to continue the use of this mixture for some time, it was imperative that some preservative should be used to retard the reaction if possible, and so, with the doctor's permission, hypophosphorous acid, B.P.C., was used in the proportion of 40 minims to the bottleful. This had the desired result, as may be seen from the two specimens shown, one containing the acid, and the other not. They were made in May, 1897, that with the acid being still clear, whilst the other is half filled with deposited dark red oxyiodides of iron.

No. 4.—A bismuth salicylate mixture—

℞ Potass. Bromidi	℥ii.
Bismuthi Salicylatis	℥iss.
Pulveris Acaciæ	℥iv.
Sp. Chlorof.	℥ii.
Aquam Cinnamomi ad.	℥viii.

M. ft. mistura.

Make the gum into a mucilage with half the cinnamon water and pour into the bottle. Then rub the salicylate of bismuth down to a very fine powder, to which add the spirit of chloroform, making a smooth cream, which is thinned further with half an ounce cinnamon water, and poured into the mucilage in the bottle, well shaking. The bromide is separately dissolved in the rest of the menstruum and added to the other ingredients, the froth from shaking being removed with a drop or two of spirit of chloroform. The only difficulty in this is that the salicylate has a tendency to float to the surface unless well rubbed down with the spirit of chloroform before mixing with the mucilage.

No. 5.—A dusting powder containing hydronaphthol.

℞ Hydronaphthol	gr. xii.
Pulveris Iridis	℥i.
Zinci Oxidi	℥i.
Cimolite	℥ii.
Pulveris Amyli ad.	℥i.

Misce fiat pulvis aspersorius.

To obviate any chance of small particles of the hydronaphthol irritating the sore surface to which the powder was to be applied, a solution of the salt was made with 2 fluid drachms of ether and poured on the other ingredients previously mixed together and contained in a warm mortar. With brisk trituration the ether was soon dissipated and a smooth, even powder resulted.

No 6.—An eye lotion of cocaine and acetate of lead.

℞ Plumbi Acetatis	gr. xxx.
Cocainæ	gr. x.
Aquæ Rosæ ad	℥x.

M. fiat collyrium.

As the uncombined alkaloid would precipitate part of the lead salt, it was converted into the acetate by the addition of the least possible quantity of acetic acid and mixed with the lead acetate dissolved in the rose water.

No. 7.—A quinine mixture with tincture of perchloride of iron, containing more quinine than the iron would hold in solution.

℞ Quininæ Sulphatis	gr. 24.
Magnesii Sulphatis	℥ss.
Tinct. Ferri Perchlor.	℥i.
Aquæ Chlorof. ad.	℥vi.

M. ft. mistura.

The quinine dissolved at first in the tincture, but dilution caused a precipitate of oxychloride of iron. Enough dilute hydrochloric acid was used to dissolve this precipitate, or rather to prevent its formation, viz., 24 minims. The tincture of iron was found to be much less acid than is usually the case.

No. 8.—A storax ointment:—

℞ Styracis Ppd.	gr. 145.
Adipis ad.	℥i.

M. ft. unguentum.

Melting the storax with 2 drachms of castor oil and rubbing in a hot mortar with enough lard to make 1 ounce was found to give a better ointment than that made with lard alone.

No. 9.—An application for the ear.

℞ Cocainæ ..... gr. iv.
Camphoræ ..... gr. xxiv.
Acid. Carbol. ..... gr. xlviii.
Menthol ..... gr. xlviii.
Olei Petrolei Rect. ..... ad. ℥i.
M. ft. applicatio.

It was certain that the doctor did not intend rectified oil of petroleum to be used, so white liquid paraffin was employed. This afterwards turned out to be correct on seeing the doctor.

No. 10.—A lotion noticeable from the chemical reaction of its contents.

℞ Sodii Hyposulphitis ..... ℥vi.
Acidi Sulphurosi ..... ℥ss.
Glycerini ..... ℥ii.
Aquæ ..... ad ℥viii.
M. ft. lotio.

The sulphurous acid caused a precipitate of sulphur and evolution of sulphuretted hydrogen from the thiosulphate.

No. 11.—Pills containing nitrate of silver and strychnine.

℞ Argent. Nitratis ..... gr. ¼.
Strychninæ ..... gr. $\frac{1}{24}$.
Ft. pilula. Mitte 48.

The doctor, wishing the patient to take these pills for a lengthy period, asked if the blackening he had seen in similar pills could be stopped or hidden, as the patient on seeing the change was under the impression the coloured pills did not have the same effect as the fresh ones. Accordingly they were made in the following manner :—Nitrate of silver, 12 grains, was rubbed well with French chalk, 12 grains, and massed with cacao butter, 12 grains. Another mass was then made of willow charcoal, 6 grains, trituration of strychnine (1 in 8), 6 grains ; and manna. This was mixed with the nitrate of silver mass, made up with more manna to 96 grains, and cut into forty-eight pills.

The charcoal hid the change of colour, which usually takes place in nitrate of silver pills, and which is caused by the action of light, by the action of traces of chlorides contained in the other ingredients, and, lastly, by contact with the metal cutters of the pill machine in making.

No. 12.—Cachets containing Stockholm tar, 2 grains in each, were prescribed for a patient who would not swallow pills. Remembering a remark of a former apprentice of ours that the infusorial earth called dimatos should be good as an excipient for pills containing carbolic acid or creosote from its power of absorption, and its superiority to kieselguhr in point of fineness, I rubbed up the Stockholm tar with enough dimatos to make it into a dry powder, every 2 grains of tar requiring 3 grains of dimatos. This was then weighed out into 5-grain powders, which were enclosed in No. 1 cachets. The powder retained the tar, and caused no coloration of the cachets, even after keeping over a month.

This dimatos has proved in my hands very satisfactory for pills with large quantities of oily liquids. In one case particularly so. A pill of creosote, 1 minim, and valerianate of zinc, 3 grains, mentioned by one of the members of this Society—Mr. R. H. Mitchell—as troublesome to make of small size, I managed to turn out by the employment of a grain of dimatos.

There appears to be some reaction between creosote (Morson's) and valerianate of zinc, for I have noticed that, though at first becoming liquid when mixed together, they rapidly harden, and if massed as pills, get extremely hard in the course of a few days whatever be the excipient used.

THE DISPENSER'S ART ITS DEMANDS, CLAIMS, AND RESPONSIBILITIES.*

BY H. MACNAUGHTON-JONES, M.D., M.A.O., M.CH., F.R.C.S.I. AND E.
President of the British Gynæcological Society.

When you assigned a reason for asking me to give this inaugural address you referred to my personal interest in pharmacy and the dispensing art. In this you were quite right, for my first introduction to medicine was as an apothecary's apprentice in 1859, having then passed the Preliminary examination of the Dublin Hall just before my college matriculation, being then a lad of fourteen. I regularly served my time, becoming an assistant in due course, and subsequently obtaining the Hall diploma. Hard work was the feature of these early years, for attendance on lectures during any spare hours I could obtain was incorporated with my dispensing duties, and a great part of the night was devoted to reading. Still, I had passed all my examinations and had taken my degree of M.D. before the age of twenty, and how far I had included the study of other subjects than that of materia medica is evidenced by the fact that before taking my degree I had obtained honours in the senior subjects of the course, and immediately afterwards was appointed demonstrator of anatomy in the Queen's College, Cork. During the years of my apprenticeship I had learnt many things besides dispensing, for in those days bleeding, both by lance and cupping-glass, had not quite gone out. The extraction of teeth was a common operation for the apprentice, and a large variety of minor operations and attendance on accidents fell to the lot of the apprentice and assistant to attend to. Children of all ages were brought to the pharmacy in which I worked, and at a very early age I had learnt to carry out most of the remedial measures needful in the ailments of children. Thus I had learnt in it far more of the every-day needs of my profession than I did by attendance at hospital during these early years of study. I briefly recount a few first experiences in an open pharmacy, in order to justify my assertion that the pharmaceutical assistant and dispenser can, if he have but zeal and energy, study many subjects collateral to his calling, improve his general culture, and fit himself to occupy that position in society which, as I shall presently show, he is indubitably entitled to hold.

Immediately after taking my apothecary's diploma, I was appointed Visiting Apothecary to the large city gaol, and, by the Government, to the Cork District Lunatic Asylum ; thus am I entitled by my early life to speak to you with the sympathy of an old dispenser myself in public institutions. My first private teaching class was one in materia medica and pharmacy, and my first medical publication, a notice of which will be found in the *Lancet*, I think of the year 1865, was 'A Chart of Medicinal Preparations for the Use of Students,' which contained in one sheet an analysis of the compositions and strength of all the most important preparations to be found in the Pharmacopœia of 1864.

Gentlemen, let me say a few words before speaking to you on the subject matter of this address. Work is the *raison d'être* of our existence, and the gospel of work is the nineteenth-century message, directing us in the road of progress, culture, and social advance. I assume that, as all good workers are, you are naturally proud of the work you profess to do. If a man is not, in the right sense of the term, vain of his work, then, at least in the great majority of instances, that work is but poorly done. Let me then ask you, what are your ideas of work ? the outcome and output of which you may be justly vain of. All work demands certain qualities for its efficient performance. There must be love of it, aptitude for it, knowledge of it, experience in it, self-sacrifice in the performance of it, and perseverance in the carrying out to

* Inaugural address to the Public Dispensers' Association, delivered on Friday, February 25. See page 245.

perfection of its details. These you may say involve high ideals, which few can hope to reach, and a combination of qualities rarely to be found in one individual. This I grant you is true. But it is not by aiming at the readily achievable and surmountable obstacles of life that distinction or eminence in any calling is attained. Ever in the career of each worker who is earnest and ambitious is heard that voice calling from the invisible heights of progress and duty, sometimes so faintly, at other times with louder accents, "Excelsior!" And I take it that the explanation of your presence to-night is to be found in the existence amongst you of ardent spirits who look ever beyond the "topmast crags of duty," who seek, not merely in the routine discharge of ordinary and commonplace work to fulfil their lives' mission, but who, in the words of Arnold, are determined "not in the crowd to be lost, in an eddy of purposeless dust," striving blindly, achieving nothing," but whose ambition it is to be master spirits of their time, and whose destiny it is to add to the nobility of their calling, and increase the scientific and social status of their fellow workers. To repeat Carlyle's appeal from Goethe to the students of Edinburgh University, "Heard are the voices, heard are the sages, the world and the ages. Choose well —your choice is brief but yet endless."*

Well, gentlemen, if these be your ideas of your work's demands, the very initial elements of which are essentially difficult, as in all such human efforts, you require hope to stimulate you and encouragement to inspirit you. Further, you need strength in order to advance, and success to incite you to continue. There is an element which has proved the most powerful in the direction of all human movements, whether in art, science, politics, or social and national economics, and that is the element of association. Men depend on each other for mutual help, guidance, and support. Association involves combination; both demand leadership; leadership requires of the leaders and in the followers self-sacrifice and self-control. These, then, I take it, are the motive principles which have brought you here to-night, and have induced you to ask me to review your position and inquire into your objects. You are a Dispensers' Association, bound together by common hopes and aspirations, and the first question I have to ask you is, Does your work justify your association, and do you bring to its performance those attributes of interest, aptitude, training, knowledge, experience, self sacrifice, and perseverance to which I have referred?

"It is physically impossible," says Ruskin, "for a well-educated, intellectual, or brave man to make money the chief object of his thoughts: just as it is for him to make his dinner the principal object of them."† And he goes on to show that in all professions, whether that of the soldier, the parson, or the doctor, their work is first, their pay is second, and the main object of their calling becomes the main object of their lives. It is not a case of fees—it is a case of work. The work is first and the fee second, and on the choice of this issue depends life or death to the man. And mark this, too—"nobody does anything well that they cannot help doing. Work is only done well when it is done with a will, and no man has a thoroughly sound will unless he knows that he is doing what he should, and is in his place." "Wise work," he says, "must be honest, useful, and cheerful." Could I better such maxims as these in an inaugural address?—"Shoulder to shoulder, right hand to right hand among yourselves, and no wrong hand to anyone else, and you'll win the world yet."

And as to the utility of work, he says: "No man minds, or ought to mind, its being hard if only it comes to something, but when it is hard, and comes to nothing, when all our bees business turns to spiders, and for honeycomb we have only resultant cobwebs, blown away by the next breeze, that is the cruel thing for the worker." Mark you, it is this resultant of our work that inspires love for it and sweetens the labour itself. In short, it is this belief in the eternal consequences and evidences of his work that lifts the worker above his toil and brings that element of cheerfulness to which Ruskin refers.

Think not of the nature of your work, but of the essentials on which its due performance depends. One of the falsest and most accursed of modern teachings is that which tends to incite men to look only to the nature of their work, and the immediate rewards which follow upon its bare performance, leading their minds away from the attainment of those essentials on which progress and advancement in any class of labour, any department of art, any branch of science, depend. Concentrate a man's mind thus, and rivet his attention only on the mere details of his work and their pounds, shillings, and pence equivalent, and you infallibly encourage discontent, for the consequence is not a desire for greater perfection, but for higher remuneration. Then comes the danger of national decadence, and the superiority of technical methods, as well as of labour generally, in countries which are not so subject to the teachings of false prophets and interested leaders. Look to it—that the pharmaceutical art in Great Britain shall hold its own with that of foreign countries. Surely there is no necessity that many valuable drugs should find their way into this country from German and French laboratories, or from across the Atlantic, or that original investigation and research in analytical methods and synthetical combinations should reach us with the name of some continental firm attached to it.

As bearing on this appeal to you as English pharmacists, I ask you to note the words of Doctor Pereira in 1844:—"No country," he says, "in the world has so great facilities for carrying on such inquiries" (referring to the natural history and origin of substances used is medicine, and the nature of various drugs) "as Great Britain." He refers to her numerous colonies, her commercial relations, her enormous possessions, and winds up a patriotic appeal by saying that such investigations in various climes may be made the means of declaring to the remotest part of the Empire the wants of the Mother Country, and conversely, the capabilities of the former to the latter. What would he say to you chemists to-day of your increased responsibilities, consequent upon your vastly enlarged spheres of influence, your proportionately greater sources of information and material, your marvellously improved methods and means of research, communication and experimentation? Truly, Dr. Pereira, were he alive, would not be found amongst the "little Englanders." There is a discontent that is more honourable and praiseworthy than any form of satisfied contentment, and that is, that dissatisfaction with ourselves and our attainments, the discontent that leads to renewed and greater effort, to higher and prouder successes. This is the form of discontent which should bring you together to-night, and which, no matter how worthy be all your other aims, should inspire your future exertions.

(*To be continued.*)

* Inaugural address, Edinburgh University, April 2, 1866.
† Lecture on "Work"—'The Crown of Wild Olive,' by John Ruskin, 7th edition, 1892.

Plants in Rooms as a Source of Infection.—Tailor, of New York, has found that plants were the cause of the infection of several patients with malaria. The removal of the latter was immediately followed by an abatement of the attack. He also found that most gardeners suffer from a form of malaria, and, on examination, their blood was found to contain the characteristic organisms.—*Pharm. Centr.* xxxviii., 537.

PHARMACEUTICAL SOCIETY.

MEETING OF THE COUNCIL.

WEDNESDAY, MARCH 2, 1898.

Present :

Mr. Walter Hills, President.

Mr. G. T. W. Newsholme, Vice-President.

Messrs. Allen, Atkins, Bateson, Bottle, Carteighe, Corder, Cross, Grose, Hampson, Martindale, Park, Savory, Southall, Symes, Warren, and Young.

The minutes of the last meeting were read and confirmed.

The President announced that Mr. Harrison was suffering from a severe cold, and consequently would be unable to be present that day.

The Late Mr. Giles.

A letter had been received from Mrs. Giles acknowledging the vote of sympathy which had been passed by the Council with herself and family in her recent bereavement.

Death of a Founder.

The President then said he had to announce with regret that they had lost one of their oldest members in the person of Mr. Thomas Glaisyer, of Brighton, who died on February 4, at the age of 89. Mr. Glaisyer was a pharmaceutical chemist, and one of the founders of the Society. He was a member of the first Council of the Incorporated Society in 1843. There were now eight founders left. Mr. Glaisyer was a member of the Society of Friends, and it was curious to note how many of those who were interested in the foundation of the Society belonged to that body. He was one of the great authorities on Brighton and its history, and was a man of great scientific attainments. Though he had lived to a good age, they could not but regret that one more link with the past was severed.

Election of Members.

Pharmaceutical Chemists.

The following, having passed the Major examination and tendered their subscriptions for the current year, were elected "Members" of the Society :—

Bell, Arthur Henry ; Llandudno. | Drust, John Hubert ; Bayswater.
Goode, Arthur Frederick ; London.

Chemists and Druggists.

The following, who were in business before August 1, 1868, having tendered their subscriptions for the current year, were elected "Members" of the Society.

Johnson, Robert ; Leek. | Parry, Wm Robert ; Cerrigydruidion

Election of Associates in Business.

The following, having passed the Minor examination, being in business on their own account, and having tendered their subscriptions for the current year, were elected "Associates in Business" of the Society :—

Averill, Morris ; Stafford.
Green, Joseph Henry B. ; Wimborne.
Hudson, John B. ; Hebburn-on-Tyne.
Shackleton, George H. ; Abergavenny.
Tinsley, Samuel Hilton ; Fleetwood.
Winterbottom, Arthur ; Leeds.
Wright, Joseph ; Grimsby.

Election of Associates.

The following, having passed the Minor examination and tendered their subscriptions for the current year, were elected "Associates" of the Society :—

Callander, Robert Andrew ; Falkirk.
Cockburn, Bertram ; Hawick.
Davis, Henry ; Riverhead.
Ellinor, John Thos. ; Sheffield.
Greaves, Henry Eldred ; Ironville.
Hovenden, Sydney C. ; Croydon.
Johnson, John W. Baker ; Nottingham.
Oliver, Joseph ; Hull.
Pennie, William ; Aberdeen.
Robinson, John N. ; Stockton-on-Tees.
Wootton, Joseph Frederick ; Thirsk.
Wright, John ; Edinburgh.

Election of Students.

The following, having passed the First examination and tendered their subscriptions for the current year, were elected "Students" of the Society :—

Anderson, D. W. ; South Queensferry.
Barrett, Thomas Edward ; Portsmouth.
Barritt, Percy ; Norwich.
Batman, John Edwin ; York.
Beale, Percy Arthur ; Northampton.
Bell, Ivie Hair ; Glasgow.
Bird, Albert Edward ; Rugby.
Booth, William ; London.
Bott, Graham Ewart ; Lewisham.
Boulton, Howard ; Nottingham.
Bristow, Herbert, Mere.
Clark, Frederick H. ; Cockermouth.
Coonan, John Woodroffe ; Stockport.
Dales, Joseph Wardle ; Louth.
Dyas, James Edmund ; Bromley.
Faulkner, Sidney H. ; King's Lynn.
Finch, Jacob ; Norwich.
Geenty, Owen Charles ; Leeds
Goss, John Osborne ; Plymouth.
Graham, John ; Inverness.
Gray, Sydney Bunting ; Rugby.
Hands, Harold Frank ; Cheltenham.
Harmer, George Clayton ; Eastbourne.
Hill, John S. ; South Shields.
Hollingsworth, A. ; Newcastle-on-Tyne.
Lane, George ; Wymondham.
Machin, Harold ; South Tottenham.
Mayson, Wilfrid Leslie ; Blackpool.
Murray, Thomas Ninian ; Workington.
Nield, Thomas ; London.
Pinfold, Arthur H. ; Sheffield.
Powell, Edward Thomas ; London.
Pratt, Edgar ; Lancaster.
Preston, Ernest ; Eccles.
Rayner, Edith ; Holloway.
Reeson, Herbert S. ; Rotherhithe.
Reynolds, William ; Bolton.
Rixen, Ernest Alfred ; Teddington.
Sare, Frederick Samuel Thomas ; Bath.
Shrive, William Ernest ; Cambridge.
Thompson, George Pinder ; Malton.
Tippetts, John William ; Leicester.
Tonkin, John Kenyon ; Guisboro'.
Watson, Arthur ; Nottingham.

Addition to the Register.

The name of the following person, who has made the required declaration and paid a fine of one guinea, was restored to the Register of Chemists and Druggists :—

Mill, Samuel Thomas ; 10, Cheeke Street, Exeter.

Several persons were restored to their former status in the Society upon payment of the current year's subscription and a nominal restoration fee of one shilling.

Report of the Finance Committee.

The report of this Committee was read by the Secretary, and included the recommendation that various accounts be paid. It also included a statement of accounts from the North British Branch.

The President, in moving the adoption of the report and recommendations, said there was nothing to which he need call special attention, either in the expenditure in London or in Edinburgh. The accounts showed that, as usual, the greatest care had been exercised by those who had charge of the Society's funds in the north. The expenditure had been rather higher than last year, but the arrangements were not yet quite complete, a few further alterations being still necessary in order to make the premises all that was required. It was intended to enlarge the museum, and make it co-extensive with the ground-floor. There had recently been some valuable additions to the Museum, for which room had to be found. It was also considered advisable that a few other alterations should be made, for instance, that the Assistant Secretary should have a separate room for himself, where he would be a little less accessible than at present. Of course he would always be accessible to members and friends, but it was desirable to protect him a little from the visits of casual callers, who sometimes detained him at undue length. He had an immense fund of information which he was always willing to place at the disposal of others. A new library was also being constructed on the first floor back. There would probably be about another £100 required during the coming year beyond the usual expenditure, about £50 for completing the museum, about £25 for alterations on the first floor, and, perhaps, £25 for sundries. The electric light was already in, and when these alterations were completed the premises would be in a very satisfactory condition. Their thanks were due to the Executive of the North British Branch, and especially to Mr. Ewing, for the very careful way in which they managed the affairs of the Society.

He was glad to announce that a further donation of one hundred guineas to the Benevolent Fund had been received from Mr. Charles Maw, making a total of £525 which that gentleman had contributed to the Fund.

The report and recommendations were unanimously adopted.

Report of the Benevolent Fund Committee.

The report of this Committee included a recommendation of grants to the amount of £37 in the following cases :—

The widow (47) of a former associate (1870-78) who has had three previous grants. (Liverpool.)

A chemist and druggist member (73) (1882–89) and subscriber. (Mablethorpe.)

A registered chemist and druggist (64) suffering from paralysis. (Bristol.)

A registered chemist and druggist (63) who recently failed in business. (Cley, Norfolk.)

Two other cases were deferred for further inquiries, and one was not entertained.

Mr. Bottle, in moving the adoption of the report, said there was no particular item that he wished to comment on, as the recommendations were quite of an ordinary character; four grants were made, two cases deferred, and one case declined.

Mr. Atkins seconded the resolution.

Mr. Bateson said there were two somewhat anomalous cases to which he wished to call attention. One was the case where the applicant had a considerable income from his wife, and the other was a case where 2*s.* 6*d.* had been subscribed to the Fund by the applicant. He could only say that in the latter case the 2*s.* 6*d.* had been returned forty-fold.

Mr. Carteighe said he saw on the agenda a name which he would not mention, but it was an application from a very respectable member of the body, whose case would receive consideration in due course. He was not there to advocate that or any other case, because he knew how carefully the Committee did its work, but he should like to say now that he was relieved from the responsibilities of the chair that he hoped the Committee would during the next year or two consider how far the law of earning a little money should be carried. Hitherto the general view had been that a person should be in real distressed circumstances before obtaining relief. He would suggest whether they could not do as was sometimes done in the case of widows, make a grant to some of their brethren, under certain conditions, to help them along, even though they were earning something at the time. Of course, certain rules and regulations were framed very properly for the guidance of the Benevolent Fund Committee, but, seeing the generous response they had had during the past year to their appeals for funds he should like to encourage in the Committee the view that the best form of benevolence was often that which would give something to a man who was earning a few shillings a week rather than letting him go on till he was absolutely destitute, and had to be kept altogether. He hoped the Committee would understand that he personally was deeply grateful to them for the way the Fund was administered; but he would advocate boldness in the expenditure of their money.

Dr. Symes was afraid that the way in which Mr. Carteighe had shaped his argument might lead their friends who subscribed to suppose that they had a rule not to give aid to anyone who was capable of earning any money. In his experience the Committee had always been quite willing to help such people. The principle laid down was that they should do their utmost to aid those who would help themselves. One rule of the Committee was not to help persons who were still in business. When a man was carrying on a business, and could scarcely make both ends meet, it was not thought fair that he should have something given him to continue him in business, because he must be carrying on business in opposition to somebody who might be a subscriber to the Fund. In his own experience in Liverpool he could remember cases in which men had been acting as *locum tenens* occasionally, and yet had received help from the Fund immediately on their ceasing to earn anything. He did not rise to correct anything that Mr. Carteighe had wrongly stated, but he thought his remarks might create a wrong impression. It would be unfortunate if the idea were to get abroad that they did not help those who were still earning a little money, and who were trying to help themselves.

Mr. Carteighe did not think he had said anything to reflect on the Committee at all. He had not made a speech, but if he were to give notice of motion, he thought he could prove his case. He had ventured to make a suggestion, which he did not think was met by anything Dr. Symes had said.

Mr. Atkins thanked Mr. Carteighe for his expression of confidence in the work of the Committee. He need not tell Mr. Carteighe, as an old officer of the Society, that every case was most anxiously and sympathetically discussed. The amount of time spent over the various cases exceeded that of any committee of which he had any experience. There was one case which was maturing and would come before the Committee again, and when it did so he was perfectly sure that all Mr. Carteighe had said would be most carefully weighed by them. It was a case full of the deepest possible interest.

Mr. Southall was glad to hear what Mr. Carteighe had said, as the Committee did want a little encouragement. They did naturally get into the groove of being perhaps too careful with money that was not theirs.

Dr. Symes hoped that Mr. Carteighe would not think that he found fault with his remarks. It was simply that he thought a wrong impression might go forth.

Mr. Carteighe thought the same observation might be made to Dr. Symes' remarks.

The President, in putting the resolution, would say very little, because the Benevolent Fund Committee was the only Committee in which he had not actively taken any part. He was deeply indebted to the members who went into the case so thoroughly and sympathetically. Mr. Southall had anticipated him when he had said the Committee wanted a little support from those who were not on the Committee to spend the money sometimes even a trifle more freely than they did. They had had a very splendid response during the last few months to their appeals, and therefore there ought to be no case that should not be helped if there was the least occasion for it.

Mr. Hampson quite endorsed what Mr. Carteighe had said, re-affirmed by the President. He would like to refer to an old question, quite incidentally—he did not wish to establish a precedent—that was a bogey word that ought never to be used; but it was very delightful to remember that their Fund was a flourishing one. Last year they had such bountiful help, and he would make this affirmation, that if out of the generous nature of the Council there should arise an abolition of unnecessary strife in obtaining a position at the poll—if there should be a temporary diminution in the Fund, that gap would readily be filled up by the spontaneous and hearty feeling of those who had at present sustained it so ably.

Library, Museum, School, and House Committee.

The report of this Committee stated that the report of the Librarian had been received, including the following particulars:—

Attendance.		Total.	Highest.	Lowest.	Average
January	Day	327	26	4	13
	Evening	116	11	0	

Circulation of Books.	Total.	Town.	Country.	Carriage paid.
January	173	92	81	17*s.* 1*d.*

Several donations had been received (*Ph. J.*, February 12, p. 145), and the Committee had directed that the usual letters of thanks be sent to the respective donors.

The Committee had recommended that the 'Geschichte der Pharmazie, von J. Berendes, be purchased for the Library in London.

The Curator's report had also been received, and included the following particulars:—

	Attendance.	Total	Highest.	Lowest.	Average.
January	Day	514	36	5	20
	Evening	32	7	1	1

Several donations had been received (*Ph. J.*, February 12, p. 145), and the Committee directed that the usual letters of thanks be sent to the respective donors.

The President moved the adoption of the report, which was at once adopted.

The Annual Meeting.

It was resolved that the annual meeting of the Society be held on Wednesday, May 18, at 12 o'clock.

The Annual Report.

The preparation of the annual report was, as usual, referred to the Library, Museum, School and House Committee.

Divisional Secretaries.

The President moved the appointment of the following gentlemen as divisional secretaries, all of whom had expressed their willingness to accept the office.

N. Islington, Mr. H. Cryer.
Haggerston, Mr. J. B. Barnard.
W. St. Pancras, Mr. G. H. Peters.
Wandsworth, Mr. W. H. Williams.

The Pharmacy Act Amendment Bill.

The President said it would perhaps be interesting if he said a word or two with regard to the position of this Bill, which was read the first time in the House of Commons last week. Since the last meeting the following resolutions had been passed in favour of the Bill:—

By the Midland Chemists' Assistants' Association: that it "expresses its unqualified approval of the Bill and pledges its members to give the measure every possible support."

By the Midland Pharmaceutical Association : That the Council having considered the Bill, are of opinion that it is a step in the right direction, and that it shall receive their support.

By the Western Chemists' Association (of London) : That this meeting cordially approves the draft Pharmacy Bill.

By the Derby and District Chemists' Association : Having considered the Bill, approve of the same, and will render to the Council any assistance they are able to give to promote its passing into law.

By the Chemists' Assistants' Association : That in the opinion of this meeting the Bill is calculated to serve the best interests of pharmacy by establishing more efficient union amongst the members of the trade, and this meeting cordially supports the same.

It was, perhaps, not well to go too much into detail, but he might mention one or two facts in regard to the present position of matters. The Bill was introduced last Thursday by the Hon. W. F. D. Smith, and endorsed by Mr. Brodie Hoare, Dr. Farquharson, Mr. Boulnois, Mr. T. Shaw, Mr. Brookfield, Mr. Kearley, and Mr. Schwann, and the second reading was fixed for the next day (Thursday). He had been a good deal in the lobby of the House of Commons lately, and had been received with the greatest kindness and consideration by various members who had expressed interest in the measure. Only that morning he had had a letter put into his hands which was interesting as showing the way in which Members of Parliament regarded the Society. It was from an eminent member, who said he would be truly glad to have a hand in anything which benefited such a body as chemists, for whom he had a great admiration and much gratitude. In connection with the introduction of the Bill, he had been greatly impressed with the immense volume of support accorded to it by both pharmaceutical chemists and chemists and druggists in every part of Great Britain, and he wished to take this opportunity of expressing on his own behalf and that of the Council their sense of the loyalty of their friends in the country, and their appreciation of their active co-operation in facilitating the progress of the measure. He would also say, on behalf of the Secretary, that he had received such a very large number of letters containing proof of practical support from local secretaries, members and associates, that he had been unable to reply to them all, and therefore begged his various correspondents to absolve him of discourtesy and allow him to publicly make this acknowledgment through him. Having regard to the argument which had been raised that the effect of the Bill might be to lower the standard of the examination or qualification, he thought it his duty to submit the Bill to the Privy Council, the department charged in the interest of the public with the surveillance of the examinations, and to ask an expression of their Lordships' opinion. He had received a reply saying that the draft Bill had been submitted the Lord President of the Council with a statement explanatory of Clause 3, and that his Grace saw no objection to the provisions of the proposed Bill. He hoped this would remove any anxiety which might have existed in the minds of any pharmacist as to the possible retrograde or reactionary effect of the Bill. He would repeat that he had been very much impressed with the amount of support which had been received from all parts of the kingdom. He had read something of the history of pharmacy, and had been more or less closely associated with the Pharmaceutical Society and its work during the last fourteen or fifteen years, and he must say that never could he recollect so much unanimity amongst the whole body ; and he did think there was a chance of the Bill going through. It was down for second reading on the morrow, and he hoped the state of public business would allow of its being reached. He also hoped that no one would rise to object to it. Of course there were individuals who were not altogether in favour of it—perfect unanimity could not be expected with respect to a Bill of this kind, and he knew there were individuals who objected, but he would earnestly appeal to those gentlemen to recognise what he had said, that except from one district he had no evidence whatever of any objection or any hostility. He would therefore urge on those gentlemen to put aside their own views, and to come in and show for once at least that the members and associates of the Pharmaceutical Society could show a united front, and work hand in hand for the common good.

Stamped Medicines.

Dr. Symes said two months ago he moved a resolution with reference to the Medicine Stamp Duty Act, which was sent to the Law and Parliamentary Committee for consideration. It had not been yet considered, but an article on the subject appeared in the Journal last week, to which he wished to call special attention. If very fully and ably explained the position, and quoted from the Act of Parliament to which he had referred, and he thought it was well worth the attention not only of the Committee, but of all chemists and druggists throughout the country. If they would peruse that article they would see the object he had in bringing the matter forward, in order to show that the Council really looked after trade interests, which they were often accused of neglecting. Towards the close of the article the writer said that on analysis the exemption resolved itself into this, that a qualified chemist and druggist might sell unstamped medicinal compounds of known, and approved virtue, or efficacy, whereas persons not qualified within the meaning of the Clause must stamp such compounds. That was exactly his contention, and he was glad to see it, though he could not say that the conclusion of the article was altogether satisfactory.

The President said he hoped all his colleagues would read the article referred to, if they had not already done so, for it threw a good deal of light on the subject.

Report of the General Purposes Committee.

The Council then went into committee to hear and consider the report of this Committee, which dealt entirely with legal matters.

On resuming, the report and recommendations were unanimously adopted, and special resolutions were passed authorising the Registrar to take proceedings against the persons named therein.

MEETINGS OF SCIENTIFIC SOCIETIES

ROYAL INSTITUTION.

At a meeting held on Friday, February 18, Professor L. C. Miall delivered a lecture, entitled

A Yorkshire Moor,

Peaty moors, overgrown with heather, are common in Scotland, and reach into Yorkshire and Derbyshire, but become fewer as we go south, and in the south of England, with one or two notable exceptions, such as Dartmoor and Exmoor, are never found. There was an old saying that one could walk from Ilkley to Glasgow without stepping off the heather, and while this was not strictly true, it expressed the abundance of moorland lying in that part. The formation of peat is not dependent on high altitudes ; it may occur at, or even below, the sea level ; but the necessary condition was an impermeable soil. The same may be said of heather, which may occur also where peat is absent. The impermeable bed is provided in Yorkshire by the boulder-clay, which probably owes its existence to the Ice Age. At the borders of the moors, where the boulder-clay disappears, the vegetation is of a different character. A number of pictures were shown by the lecturer illustrating the characters alluded to, and showing how the variety and coloration of the scenery depended on the subsoil. Peat owes its origin, it may be said, almost always to that particular kind of moss which is commonly used for packing plants, and is known as sphagnum moss, although its formation may afterwards be carried on by heather, lichen, and other plants. The explanation of this is seen when one examines the minute structure of this moss. Its leaves are folded in such a way as to give it a great capacity for holding water. If one goes further and examines a section of the leaf with the microscope, one again finds an adaptation for taking up water in the spongy nature of the dead cells lying between the living tissues of the leaf, the internal cavities being connected by canals with the exterior. Masses of moss peat occur to a depth of twenty, thirty, and even fifty feet ; and on the boulder-clay at the bottom of such peat formations tree-stumps are often found. At the present time wood usually gains in growth on peat, but in other periods the peat often overgrew a forest of wood. An instance is known where such an event took place during the memory of one man ; the individual, refusing to believe that what he had known as firm ground could have become a treacherous bog, attempted to cross it, with the result that he narrowly escaped sinking in it. No water is so full of animal life as that of a sphagnum bog, great numbers of desmids, diatoms,

protozoids, and other varieties being found; and it is remarkable that the same species are everywhere associated with this moss, the sphagnum of even Spitzbergen offering no exception. The heather or ling shares many of the characters of the moss described in the provision made for holding water, forming a typical example of what are known as drought plants. A section of the leaf shows large air spaces, communicating with the exterior by a few stomata, none of which appeared on the upper surface or the deep sides of the leaf, but only on the narrow lower surface, which was folded inwards. The bell heather has a similar structure. Protection against drought is not the whole purpose of this structure, however. Exposure to sun, wind, and cold are conditions under which it is experimentally found that a plant must not absorb water, and as it is to these that moorland plants are continuously exposed, the reason is obvious why they behave as drought plants. So great is the tendency of all the plants to keep dry that a moor will take fire and burn over large areas at all times of the year, and even soon after a rainfall. The bilberry is a plant that carries on the work of assimilation even in autumn and winter. Its leaves also contain air spaces, while their margins are provided with grooves, which serve to convey water down by means of the stem to the roots. It has a great power to withstand cold, and is able to flourish much farther north than the common furze. Another plant indigenous to the moor is the crowberry, a plant having the appearance of heather, and which the older botanists always wanted to include among the heaths, while in reality it is not at all related to the group. The leaf of this plant —which is somewhat cylindrical outwardly—is remarkable because the internal cavity is not morphologically the middle of the blade, but is formed with the lower surface as a lining by the downward folding of the leaf, the hairy margins meeting completely. The lecturer was for a long time puzzled because the plants gathered on the moor could not be persuaded to grow in his garden, not even when the garden was adjacent to the moor. At length it was found out that the life of these plants depended on the function of a number of long thin filaments on the root, resembling root-hairs, which penetrate the root-forming nodular masses within it. These filaments belong to a fungus that is parasitic on the root, and yet is different from common parasites in that the plant obtains so much of its nourishment through it that if the fungus is not present the plant cannot live on peaty soil. The coarse moorland grass, Nardus, was also described. Its leaf-blade has the property of rolling up cylindrically and spreading out again to adapt itself to dry and wet weather. All the Yorkshire moorland plants are arctic; they are found also in Spitzbergen and Siberia, and much speculation has taken place to account for it. The glacialists, by which term the lecturer meant "those who see ice in everything," said that at the beginning of the Ice Age the arctic plants were driven southward, and as the ice receded the plants also went back, but some remained on the Alps and on the Yorkshire hills. Dealing with the animal life on the moor, the lecturer named the smaller animals, such as stoats and weasels, and the birds, among which were the curlew and golden plover, kestrel, sparrowhawk and merlin. Formerly the peregrine and golden eagle were also found. Of the larger quadrupeds none now existed, but evidence that they once abounded was supplied by the bones lying on the lecture table which had been found in caves. Among them were a reindeer's horn, an elephant's tooth, the grinder of an extinct species of rhinoceros, and teeth of a hyena. The wolf, bear, lion, and wild boar were also common. Why have all these disappeared? The glacialists here again argue that the reindeer, mammoth, and woolly rhinoceros had to retreat northward at the close of the glacial period. Professor Hiam does not, however, accept this explanation. In the same layers and deposits are found the remains of the southern hippopotamus and other animals belonging to warmer climates, and co-existent with them we find the work of man. Besides flint weapons there are found sketches, rough drawings of these animals, showing that man had seen these animals alive. Moreover, the smaller animals—moles, shrews, and field mice—have gone through all the vicissitudes of climate and remained. It is therefore to be supposed that the larger animals disappeared before the face of man. And one need not look far to see the same work going on to-day in the extermination of the Greenland whale and numerous other animals that provide man with sport or a means of living. He had a few strong remarks to make on the destructiveness of some people who called themselves naturalists. Whatever animal became rare, they were so eager to secure specimens of it that it stood in imminent danger of becoming extinct, which has of late been the case with the Emperor moth. This is not science, but the selfish love of possession; and the fittest occupation for such people was, in the lecturer's opinion, to collect postage stamps. At any rate, they should keep off natural history, and it should be the boast of the student of nature that he leaves as much life as he found.

At a meeting held on Friday, February 25, a lecture was delivered by CAPTAIN ABNEY, on

The Scientific Principles of Modern Colour Photography.

Captain Abney first called the attention of the audience to a curve which showed the relative brightness of simple colours. What has to be kept in view by experimenters on this subject is to reproduce the colours of the spectrum as far as possible. Coloured light has to be introduced, and the first question, is, What are the fewest colours that will suffice? From the observations of Helmholtz we gather that red, green, and blue are alone sufficient to reproduce all other colours, a fact to which confirmation has many times since been given. Combining these three colours in such a way that the ordinates indicating their relative brightness are equal, one obtains white light. It was a notable fact that as long ago as 1861 Clerk Maxwell, a man who had only to touch a scientific matter with his scientist's wand to turn it to gold, had incidentally foreshadowed the process of colour photography now in vogue. A diagram showing colour mixture curves, prepared by him, was shown, and then followed experiments illustrating his theory that the three standard colours being reduced to equal luminosity produced white light. The lecturer also showed the working of an apparatus devised by himself for producing all kinds of light from these colours. A long band of paper was unwound from an axle and caused to pass in front of three slits, admitting light from the red, green, and violet parts of a spectrum. The paper screen being perforated in such a way as to admit the three lights in different amounts as the axle was turned, colours of every variety were produced in succession by their recombination. It was found, moreover, that in this respect the colours to be combined need not be pure, a fact that was very important for the success of the system. It was also shown that a sham spectrum could be produced with the three elementary colours. To produce the coloured picture three photographs must be taken, one with each kind of light, an intensity corresponding to that indicated by the curve. Each photograph, therefore, has a bare space corresponding with the maxima of the curves for the other two kinds of light. By using the three different lights respectively to throw the images thus obtained in combination upon a screen the object becomes depicted in its natural colours. As to how far photographic plates answer the requirements demanded it was pointed out that we have none at present that can be called perfect. The matter has to be compromised by using screens to cut off the requisite quantities of light, and as a plate is about ten times less sensitive to green light than to violet, and ten times less to red than to green, the exposures must be made proportionately, and, moreover, the screens used for taking must be different from those used for viewing. A succession of colour pictures produced by the method described were then thrown upon a screen by means of a lantern, all of which appeared perfect in detail and elicited hearty applause from the audience. Another process based on the same principle, the three-colour theory of vision, was then described. It depended for its success upon an imperfection in the eyesight, which is that coloured lines—red, green, and blue—when sufficiently close together appear grey. Three photographs are taken through glass of orange, green, and blue respectively, and the monochromatic images thus obtained, being backed by a screen, on which red, green, and blue lines are ruled at intervals of 1/200th of an inch, give by recombination a correct image of the object photographed in its natural colours. A number of pictures obtained in this way were also exhibited, by which the natural appearance of flowers, butterflies, etc., were beautifully reproduced. Photographs in a single colour, in combinations of two colours, and in the complete number were shown for comparison. If, however, a photo be viewed by light of the colours used for taking, a dark picture is formed, and therefore glasses of colours complementary to the red, green, and blue used in viewing are employed in taking the photographs.

INSTITUTE OF CHEMISTRY OF GREAT BRITAIN AND IRELAND.

The annual general meeting of the Institute was held at 30, Bloomsbury Square on Tuesday, March 1.

The annual report shows that the register contains the names of 820 Fellows, 125 Associates, and 168 Students, and the balance

sheet shows that the year has left the Institute with £133 13*s.* 4*d.* to the good.

The chief interest at the meeting centred in a discussion of a portion of the report from the Council dealing with the question of granting a certificate or qualification for candidates for

The Position of Public Analyst.

The Local Government Board now receives the Institute qualification as perfect evidence of chemical training and competence, but requires some evidence of a knowledge of therapeutics, pharmacology, and microscopy: to meet this demand the Institute has adopted the following recommendations:—

1. Candidates for the membership of the Institute requiring testimony of their knowledge of therapeutics, in view of qualifying themselves for the appointment of Public Analyst shall be required to pass an examination in therapeutics, pharmacology, and microscopy, on or after presenting themselves for the final examination in Section E (the analysis of food and drugs and of water, including the assay of alkaloids and recognition of impurities, adulterations, and substitutions).

2. It will be open to existing members wishing to receive the certificate of competency in therapeutics, pharmacology, and microscopy, to present themselves for examination in those subjects.

3. The examination will be conducted by examiners appointed by the Council, and the scope of the examination, indicated briefly, will be as follows.

Candidates will be required:—

I. To recognise specimens of any drug or poisonous chemical ordinarily to be found in commerce, or employed for technical purposes in the arts or manufactures.

II. To detect by microscopical or chemical examination, adulterations, substitutions, or impurities in foods and drugs.

III. To show a general knowledge of the therapeutic effects of ordinary drugs, and of the quantities of such drugs and poisonous chemicals which, taken internally, would be fatal to man.

Mr. Cassal, with the Chairman's permission, moved a resolution disapproving of Clause 2 as given above. He said that he was of opinion that it would be a great injustice to men who were already members if all the new Fellows were granted this certificate, and he thought it would be extremely unfair to the older Fellows to expect them to sit for such an examination. He contended that all Fellows who were public analysts should be granted the certificate if it was necessary that any such should be granted, though of that he had doubts, and he could not see that the Local Government Board had power to compel the Institute to hold such an examination or grant such a certificate.

Mr. Bodmer seconded the resolution, and Messrs. Hake, Hehner, and Dr. Dyer spoken in favourable terms on it.

Messrs. Friswell, Carteighe, and others spoke against the resolution, which, when put to the meeting, was lost.

Finally the Council's report was adopted, the censors for the year were elected, and Dr. Thos. Stevenson, F.R.C.P., delivered the annual presidential address.

PARLIAMENTARY NOTES.

Petitions in favour of an amendment of the law relating to food adulteration continue to arrive from the villages of England at the average rate of three a day, but the Government has not yet produced its Food and Drugs Bill. Failing this, Mr. Kearley brought in his remedy on Wednesday evening entitled a "Bill to consolidate and amend the law relating to the sale of food and drugs." The measure made a trial trip last session.

The Cost and Administration of the Science and Art Museums is to engage the attention of a re-constituted Select Committee, consisting of Lord Balcarres (Chorley), Mr. Bartley (N Islington), Sir M. Bhownaggree (N.E. Bethnal Green), Mr. J. Burns, Dr. Farquharson, Mr. Daly (Monaghan), Sir John Gorst, Mr. E. Gray (N. West Ham), Sir H. Howorth (S. Salford), Mr. Humphreys-Owen (Mont.), Mr. Kenrick (N. Birmingham), Mr. Platt-Higgins (N. Salford), Sir Francis Powell (Wigan), Mr. Woodall (Hanley), and Mr. Yoxall (W. Nottingham). If there be abuses in the administration of the Museums coming within the scope of the inquiry, such a Committee may be depended upon to uncarth them, and that is half-way towards removing them.

The Versatility of Dr. Tanner is distinctly Hibernian. His quick changes from "Grave to gay; from lively to severe" may be envied but never imitated. Only the other night the exuberance of his spirits found playful expression in shouts of "Vive la France," and now he has placed upon the notice paper a question purely professional and severely scientific. He proposes to ask the Home Secretary (who, by the way, is the wrong official to ask) whether the calf lymph now used for vaccination is prepared with glycerin, and whether the Government is keeping its eye on the German Commission appointed to investigate the germicidal action of glycerin. It will occur to most people that the Hon. Member for Mid Cork appears to better advantage in these medico-chemical questions than he does in pronouncing benedictions on the Queen's enemies. In dealing with the question of the efficacy of glycerinated lymph, Dr. Tanner will find ample support on both sides of the House, from Sir Walter Foster and Sir W. Priestley downwards.

The Pharmacy Bill, 1898, was duly launched on Thursday by Mr. W. F. D. Smith and the supporters mentioned last week. The second stage of its parliamentary life is, we hope, being inaugurated as this page goes to press. The President, in his remarks to the Council on Wednesday, pretty fully indicated the chances of the measure becoming law, and little more need be said now. The tacit approval of His Grace the Lord President of the Privy Council should make it possible for all opposition to be withdrawn, for it is a fact that what opposition has been manifested has chiefly arisen from the fear that the Bill might indirectly lower the educational standard of the examinations. But that fear may be dismissed as "infinitesimal" if the Privy Council cannot appreciate it.

Carbolic Acid and its unrestricted sale is to the fore again. This time it is Mr. Sam. Woods, the representative for the Walthamstow division of Essex, who raises the question, and he seems particularly well informed of the efforts made by the Pharmaceutical Society to move the Privy Council to schedule the article. He will ask the Home Secretary on Tuesday next whether he is aware that the deadly acid is sold in mineral water and other bottles without a poison label; and whether it is a fact that the Pharmaceutical Society recommended to the Privy Council in 1882, 1886, and 1888 that carbolic acid should be scheduled as a poison. The question is very pertinent thus far, but Mr. Woods proposes to further ask whether the Government will give early effect to the promise of the Privy Council in the matter; and we are at a loss to comprehend to what promise the honourable member refers. Certainly the Pharmaceutical Society has never been able to extract anything approaching a promise, nor was Mr. Macdona more successful. Considerations of public policy demand that some action should be taken to stop the reckless distribution of so potent an article. Chemists who are entrusted by the Legislature with the retailing of legal poisons are particularly anxious to know what that action will be.

Merchandise Marks Amendment.—The Bill to remove some of the unexpected evils of the 1887 Act, and to set upon its legs again the British carrying and transit trade is now waiting its chance of second reading. It bears the names of three Liverpool M.P.'s, Mr. C. M'Arthur, Mr. Drage (Derby), and Mr. J. Samuel (Stockton). Its chief object is to preserve from detention and Customs examination imported goods which are not intended for home consumption but are merely brought here for the purpose of being forwarded to other countries. That object is to be effected by removing from the operation of the Merchandise Marks Act, 1887, all imported goods which, in transit to places outside the United Kingdom. The exemption is to apply not only to goods entered for trans-shipment, but also to those entered for home consumption, though intended for re-shipment. In the latter case, however, the Customs must have notice and satisfactory evidence of the *bonâ fides* of the transaction. The Customs commissioners are to be authorised to make the necessary rules and regulations for carrying the intention of the Bill into effect, provided always that such working details be approved by the Treasury. One curious clause gives a suspicious trader, who may have ground for imagining that his trade mark is being infringed, power to require a Customs examination of the suspected goods, but if, in the result, he is proved to have been mistaken, he becomes liable for any damage occasioned by or in consequence of the detention and examination of the goods. The privilege would seem to be of doubtful practical utility.

The Metric System for Pharmacists

THE following table of equivalents is supplementary to that giving the equivalents of measures of volume, which was published last week (see pp. 211-2). Whilst, however, the former table commenced with the equivalent in minims of the litre and gave special prominence to the fluid ounce and its subdivisions, in the present instance the equivalents in fluid grains and millilitres are given for the number of minims in the fluid ounce and smaller quantities, down to one minim.

Equivalents of Measures of Volume.

LONDON: SATURDAY, MARCH 5, 1898.

THE COUNCIL MEETING.

At the opening of the meeting last Wednesday the President read a note from Mr. Harrison, of Sunderland, apologising for his absence on account of a severe cold. After the minutes of the previous meeting had been read and confirmed, mention was made of a letter received from Mrs. Giles acknowledging the sympathy expressed by the Council with herself and family on their recent bereavement. In referring to the death of Mr. Glaisyer, of Brighton, the President said the Society had lost another of the few remaining founders, who had been a member of the Council in 1843, and was, like many others who took interest in the establishment of the Society, a member of the Society of Friends.

The additions to the Society comprised 5 members, 19 associates, and 44 students.

The report of the Finance Committee recommended the payment of the usual monthly expenses, but it contained no special feature except the statement of outlay in connection with the Society's premises in Edinburgh. In reference to that matter the President spoke approvingly of the great care that had been exercised by the Executive of the North-British Branch and of the endeavour made to promote the best interests of the Society. The fitting of the new premises was not yet complete in all its details and some further expenditure would have to be made in order to provide suitable accommodation for the assistant Secretary and the museum. Before putting the motion for adoption of the report, mention was made of the receipt from Mr. George Maw of a further donation of one hundred guineas to the Benevolent Fund, bringing his contributions up to the sum of £525.

The report of the Benevolent Fund Committee recommending the payment of four grants, amounting in all to thirty-seven pounds, was adopted without discussion on the motion of Mr. Bottle, as acting Chairman of the Committee. Incidentally Mr. Bateson drew attention to some anomalous cases of application for relief. Mr. Carteighe also expressed a hope that the Committee would consider how far the fact of applicants being able to earn a little should be an absolute bar to the grant of aid from the Fund. He expressed the opinion that the generous response made to applications for support should be an encouragement to the Committee to widen its action towards those who were not absolutely destitute as being the best form of benevolence, and, while advocating boldness in that respect, he at the same time felt deeply grateful for the care exercised by the Committee in the administration of the Fund. Dr. Symes said he thought Mr. Carteighe's remarks might be misunderstood as reflecting on the Committee, but Mr. Atkins took a different view, and as a member of the Committee, wished to thank Mr. Carteighe for his expression of confidence. Mr. Southall said a Committee might naturally get into a groove and tend to be too careful of money that was not its own. Dr. Symes disclaimed any intention beyond that of preventing a wrong impression being formed. The President said Mr. Southall had anticipated him in suggesting that the Committee might want a little support towards spending money more freely by helping any case where there was occasion to do so. Mr. Hampson fully endorsed the hint given by Mr. Carteighe and reaffirmed by the President, and he took the opportunity of referring incidentally to the possibility that the generous help accorded to the Fund might lead to abolition of unnecessary strife in obtaining a position at the poll, believing that any temporary diminution of the Fund would be made up for by the spontaneous liberality of those who had hitherto sustained it so well.

On the presentation of the report of the Library, Museum, School, and House Committee it was resolved that the annual meeting of the Society should be held at 12 o'clock on Wednesday, May 18. The preparation of the annual report of the Council was also referred to this Committee.

On the motion of the President divisional secretaries were appointed for North Islington, Haggerston, West St. Pancras, and Wandsworth.

The President then gave a statement of the position of the Pharmacy Acts Amendment Bill, which was introduced last Thursday by the Hon. W. F. D. Smith and read a first time, the second reading being fixed for Thursday, the 3rd inst. Further resolutions in support of the Bill have been received from the Midland Pharmaceutical Association, the Midland Chemists' Assistants' Association, the Western Chemists' Association (of London), the Derby and District Chemists' Association, and the London Chemists' Assistants' Association, all expressing hearty approval of the amendments to be effected by the Bill. It is endorsed by Mr. Brodie Hoare, Dr. Farquharson, Mr. Boulnois, Mr. T. Shaw, Mr. Brookfield, Mr. Kearley, and Mr. Schwann, and in communicating with Members of Parliament in the lobby of the House the President has met with expressions of much interest in the measure. That was also expressed in a letter just received from an eminent Member of Parliament, who said he should be truly glad to have a hand in anything to benefit chemists, for whom he had great admiration and gratitude. The President added that he was much impressed with the very general support given to the Bill by pharmaceutical chemists, and by chemists and druggists in every part of the country, and he wished to take that opportunity of expressing on behalf of the Council and himself a sense of the loyalty shown by friends in the country, and

appreciation of the unprecedented unanimity manifested by them in promoting the progress of the Bill. He also added, on behalf of the Secretary, that he had received such a large number of letters giving proof of approval and practical support as to make individual reply to them impossible, and therefore he wished to make the acknowledgment of them through him.

In regard to the suggestion that the effect of the Bill might tend to lower the standard of qualification, the President has asked for the opinion of the Privy Council on that point, with the satisfactory result that His Grace the Lord President saw no objection to the proposed provisions. In conclusion, the President earnestly appealed to all members of the craft to recognise the fact that there was no evidence of any objection to the Bill, with the exception of a few chemists in one district, and he expressed a hope that, even in that case, personal views would be laid aside in order that all might show a united front, and work hand in hand for the common good.

Dr. Symes recalled the motion brought forward by him in reference to the incidence of the Medicine Stamp Duty, which was referred to the Law and Parliamentary Committee, and also drew attention to the article in last week's Journal on this subject, as showing that matters connected with the business of chemists and druggists received consideration. The President hoped the article would be read, though he was compelled to say that on getting to the end of it no great advance might have been made.

THE PHARMACY BILL.

At the moment of going to press several communications have been received from local secretaries reporting the very satisfactory results of their applications to Members of Parliament in reference to the Pharmacy Acts Amendment Bill. While regretting that neither time nor space admit of the publication of all these letters we take this opportunity of expressing thanks for the trouble taken in bringing the objects of the Bill under the consideration of Members of Parliament. That there is necessity for that being done is evident from the references to the Bill which have appeared in the newspapers. In almost every instance there appears to have been a want of due appreciation of the strangely anomalous position now prevailing as to British pharmacists who have become qualified by examination since a statutory qualification was established in 1868. The achievement of that result was the outcome of many years' strenuous effort on the part of the Pharmaceutical Society, and it necessarily involved the registration of all chemists and druggists then in business, as well as their admission to membership of the Society. But, as *les absents ont toujours tort*, those who have since complied with the provision of the Act of 1868, as to proving their qualification to practise pharmacy, were not equally considered—they were not then in existence, and so it happens that while the examined chemist and druggist cannot become a member of the Pharmaceutical Society, those whose claim to registration rests solely on the fact that they were in business before 1868 can become members. Without instituting any invidious comparison between the two, the obvious injustice and even absurdity of the position only requires to be made clear in order to show that the provision of the third clause of the Bill now before the House is really necessary.

ANNOTATIONS.

The Metric Equivalents published last week, though correct throughout when passed for press, are not uniformly so in the printed copies, the reason being that in printing the exceptionally large issue of the Journal, considerable difficulty appears to have been experienced by the printer in dealing with the tables of figures given on pages 209 to 212, on account of the tendency of the figures arranged in tabular form to drop out of their places. Though the machines were stopped several times during the operation of printing in order to check this tendency, a number of errors crept into the printed copies which did not exist in the proofs when passed by the Editor. A list of such errors is given this week (see p. 240) and the Editor, while expressing his thanks to those readers who have pointed them out, requests that any others that may be detected may be promptly notified to him, as it is proposed to reprint the tables when completed in a more convenient form for reference.

Of the Letters on the Metric System, those by Mr. Matthews and Mr. Perrédès, possess a special value as showing the interest taken by those who are now students in matters that will affect them later in the course of their daily business; Mr. Catford—with others who may hold similar erroneous views to those expressed in his closing remarks—is strongly recommended to study Mr. Matthew's letter very carefully. There is no need for any confusion whatever, if it be borne in mind that in determining the equivalents, as explained last week, the mass of water contained in the litre at 4° C. is compared by the authorities with the mass contained in the gallon at 16° 667 C. (62° F.). This procedure necessarily involves a difference between the equivalents of metric weights and those of metric measures, expressed in terms of imperial weights or measures and the reverse. This difference is proportionate to the difference between the density of water at 4° C. and at 62° F. It amounts in the case of the kilogramme (=15432·4 grains) and the litre (=15398·3 grains or grain measures) to 34·1 grains (=2·213 millilitres), or practically one grain in each fluid ounce. For ordinary practical purposes, this is a difference of no real importance, and it may therefore be ignored.

The Pharmacy Bill continues to attract the sympathy of Members of Parliament, and, at the same time, leading newspapers all over the country have a word in its favour. At the head of the list comes the *Daily News*, with an appreciative reference to the proposal contained in the Bill, and the only objection that can be taken to this is that the writer has not given sufficient prominence to the main point—the injustice of preventing fully examined men from becoming Members of the Society, when so large a number of unexamined persons can legally claim that privilege. The *Echo* also publishes a brief but accurate summary of the Bill, and prominent amongst provincial papers that deal with the matter is the *Western Daily Press*. The last named organ also insists that, sooner or later, some Bill should be submitted to Parliament with the view of more adequately regulating the sale of poisons, but for the present it must suffice to provide for the internal organisation of legally qualified chemists and druggists that is so urgently called for, and for their adequate representation through the Pharmaceutical Society.

The Court of Reference proposed in Mr. Kearley's Sale of Food and Drugs Bill of last year is not to be regarded as what is ordinarily understood by "Court," according to the President of the Society of Public Analysts, a letter from whom is published at

page 253. But neither was there any misapprehension of the kind suggested on our part. The point to which objection was taken is that the proposed Court of Reference—which is intended to be "A Board or Standing Committee possessed of functions advisory and legislative"—is intended to include two nominees of the Society of Public Analysts. Now, if public analysts generally would restrict themselves to their proper function, that of analysing samples taken under the provisions of the Sale of Food and Drugs Acts, and not go out of their way to suggest what samples should be taken, or in any other way act as directors of prosecutions, there would be little reason to object to this proposal. So long, however, as the practice objected to continues to prevail, strenuous opposition may be looked for. And, in any case, one nominee of the Society of Public Analysts should be quite enough.

The Letter from Mr. Jeeves probably explains his position as well as any written communication could do, and it is satisfactory to find that he was only posing as a candid friend on a recent occasion. He is wrong in assuming, however, that the criticism offered in these pages was based on anything but what he was reported to have said. What appeared to be a full copy of the paper was sent to the Journal, and on that full copy the remarks to which Mr. Jeeves objects were based. We still fail to recognise that, as regards quality, a pharmacist working in a factory is capable of turning out better products than he whose sphere of labour is an ordinary pharmacy. The advantage of factory-made medicine is merely that of cheapness, and when, as is often the case, the factory-hand is not a properly trained pharmacist, the comparison ought to be still more in favour of the home-made product. "Space, machinery, and general facilities" are nothing as compared with an individual guarantee, and that cannot be given by any wholesale maker of capsules, tablets, or plasters.

The Chemists of Plymouth and District are anxious to entertain the British Pharmaceutical Conference once more, and for some time past they have been busily engaged in securing promises of support locally. As a result, a guarantee fund has already been formed, and a formal invitation for the Conference to visit Plymouth next year was received at a meeting of the Executive Committee held on Wednesday afternoon. The invitation must, of course, be submitted to the members at the Belfast meeting, but our Plymouth friends are exceedingly sanguine of the result, and feel that the preliminary arrangements cannot be made too early.

The Chemists' Assistants' Association is holding its twentieth annual dinner as we go to press, with the President, Mr. T. Morley-Taylor, in the chair, supported by several distinguished guests, including Mr. Walter Hills, President of the Pharmaceutical Society, Sir Dyce Duckworth, Mr. Michael Carteighe, and many other friends of the Association. The Nottingham and Notts. Chemists' Association will hold its annual dinner on Thursday next, March 10; and on the following Wednesday, March 16, the Bristol Pharmaceutical Association will follow suit. The President of the Pharmaceutical Society is amongst the visitors expected at Bristol on that occasion. The dinner of the Liverpool Chemists' Association is fixed for Thursday, March 17.

A New Type of the Phonograph has recently been on exhibition in London, and it would appear that the difficulties in the way of the instrument becoming useful for commercial and general purposes have now been overcome. The new phonograph is simple and substantial in structure and not expensive, costing as it does about five guineas, whilst the sounds are reproduced with clearness at a speed under the control of the operator. The wax cylinders are capable of recording nearly two thousand words, and the record may be effaced by means of a shaving attachment on the machine, so that a single cylinder is available for sixty or seventy records. The machine weighs less than nine pounds, and may be handled freely without risk to the mechanism. Phonograph records were formerly limited in number, and could only be made by the person whose voice or musical performance it was desired to reproduce. These limitations have now been removed by the application of a very simple process, the cylinder with the original record being placed on the machine, and a tracer passed over the indented lines, which communicates its motion and direction to a second tracer upon a new cylinder, and in this manner a duplicate of the original record is produced.

An Ingenious Fraud has been exposed by a Dundee chemist, in connection with the sale of a so-called "aluminium tincture." Cornelius De Vries, *alias* Henrick Mulern, stated to be a traveller, was charged before Hon. Sheriff-Substitute Paul at Dundee, on Thursday, February 24, with defrauding the public by selling as "aluminium tincture" a preparation of nitric acid, mercury, and potassium bichromate. In pursuance of his ingenious scheme he entered the shop of a chemist and pretended that he was the agent for the firm of De Vries, on whose behalf he was selling a preparation which was manufactured at Schaffhausen, Switzerland, and contained aluminium in solution. The liquid was recommended for silver-plating (*sic*) brass and other metals. The chemist was induced to purchase a dozen bottles of the preparation, and on the fraud being detected, it was found that the defendant had foisted the composition on eleven other persons—chemists and ironmongers. After considerable evidence had been given in support of the charges, defendant was fined £2 or in default thirty days' imprisonment.

Mr. A. H. Ross, senior dispenser at Dundee Royal Infirmary, who has intimated his resignation after occupying the position for fully four years, during which he has had sole charge of the dispensary, was the first to take a skiograph of the human body, and that achievement was taken special notice of by the leading medical journals. A skiograph of the human hand sent to us by Mr. Ross is the finest specimen of the kind we have yet seen, all the blood-vessels being shown, even more distinctly than the bones. Mr. Ross, who is about to start business on his own account, served his apprenticeship with Mr. James Ford, chemist, Kirriemuir, and afterwards studied at the South London School of Pharmacy, where he gained certificates of honour for chemistry, pharmacy, and materia medica. During the time he has been dispenser at the Infirmary Mr. Ross has proved himself an accurate and reliable chemist, and he has manifested a keen interest in microscopy and photography generally. His departure from the Infirmary will be regretted by the members of the staff generally.

The Pharmaceutical Society will hold an evening meeting at 17, Bloomsbury Square, London, on Tuesday next, March 8, when a paper on "The Pharmacy of Cantharides" will be contributed by Professor H. G. Greenish, F.I.C., F.L.S., and Mr. Harold Wilson; and the Curator, Mr. E. M. Holmes, F.L.S., will exhibit and describe some recent additions to the Museum. The chair will be taken by the President at eight o'clock precisely On the following day, at 11 a.m., there will be a preliminary meeting of the Society's House, of those interested in the annual dinner of the members of the Pharmaceutical Society and their friends.

Pharmaceutical Transactions.

CHEMISTS' ASSISTANTS' ASSOCIATION.

This Association met on Thursday, February 24, at 73, Newman Street, W., Mr. George Roe, Vice-President, in the chair. Mr. T. Morley-Taylor, the President, having written expressing his regret at not being able to be present to open a discussion on "Trades Unionism in Pharmacy" as announced, the Chairman asked Mr. Charles Morley, ex-president, to open a discussion on

The New Pharmacy Bill.

Mr. Morley said that as the Pharmacy Acts Amendment Bill was about to be brought before Parliament, it had been thought that the Association ought to put on record its opinion of the same in the form of a resolution, to be submitted to the Council of the Pharmaceutical Society. Having read the Bill, Mr. Morley proceeded to give his views of the matters affected by it. There was, he thought, only one clause that would excite the interest of the meeting, and that was Clause 3, whereby all registered chemists and druggists become eligible for membership of the Pharmaceutical Society, with all the rights and privileges of the pharmaceutical chemist, with the exception of exemption from jury service and the title of Ph.C. He believed the promoters of the Bill were actuated by a desire to

Remedy a Long-Standing Injustice

to the chemists and druggists who, while by law considered to be capable of looking after the interests of the public, have not been recognised and allowed to be capable of managing their own affairs on the Council of the Pharmaceutical Society. True, certain chemists and druggists in business before the passing of the 1868 Act were eligible for election to the Council, but they at the present time only represented about one-third of the total number on the Register, and were gradually dying off. He, as a pharmaceutical chemist, had always thought it to be a great injustice that the registered chemist and druggist who has passed the Minor examination, and paid his guinea to the Society, should not be entitled to full representation on the Council. It might be said that the Minor man could have the privileges of membership by passing the Major examination, but they must take into consideration the fact that frequently, owing to the exigencies of circumstances at the time of passing the qualifying examination, many men were prevented from going on to the higher examination, and afterwards were unable to go in for it. Mr. Morley then dealt with some of the objections that have been raised to the Bill by Major men, who ask, Why they should have been induced to pass the higher examination with the promise held out to them that by so doing they would have certain special privileges, and then afterwards break faith with them by offering to the men who have only passed the Minor examination the same privileges with the exception of jury service? Against that he wished to point out that they still had the distinct title Ph.C., which remained quite intact. Then there was the question of M.P.S. *versus* A.P.S. Under that head it would be well to ascertain how the trade discriminate between the two, and they must all acknowledge that the pharmaceutical chemist must be a man who has passed an examination that is beyond the chemist and druggist examination and he would get due regard for that fact. With respect to the public discrimination there was probably none at all. So long as the "man in the street" got what he wanted, Mr. Morley thought that was all he cared for, and it made not the slightest difference to him whether the chemist was a Major or a Minor man.

The Superiority of the Major Man

had been mentioned in some quarters, and he (Mr. Morley) thought there was a good deal of nonsense going about with respect to that. Some pharmaceutical chemists seemed to have put on a kind of glorified superiority in virtue of the fact that they have passed an examination the Minor man has not. After all, the difference between the two examinations was so small that there was almost no inequality, the Minor man being quite as capable of looking after the interests of the craft as the Major man, and he thought the discrimination between the two should not exist to the extent it does, because to all intents and purposes the chemist and druggist is as capable a man as the pharmaceutical chemist. Another objection that had been brought against the Bill was one which he might term

The Education Bogey,

and he thought a more belated fallacy had never been brought forward than that suggested by some who were of opinion that if the Bill was passed into law it would prevent men from going in for the Major examination. If there was one watchword of the present time it was "Education," and even if the Council of the Society should consist of a majority of chemists and druggists, he had sufficient faith in them as being an intelligent body of men to believe that they would not be left behind in the struggle now going on for a good sound education, and that they would keep up the standard of pharmaceutical education. There was an idea said to be prevalent amongst members of the Council that the Major examination should finally be abolished. Well, he did not think that there could be any very great objection to that, because the Minor examination, instead of being lessened in stringency, would rather be increased to the present standard of the Major.

Another Object of the Bill

that he wished to draw attention to was the consolidation of the Society by the enrolling of a large number of chemist and druggist members. The point he desired to emphasise was that at present the Society does not represent a fair proportion of the trade, and if they wished to get further legislative powers, it was necessary that it should represent a fair proportion of those on the Register. Therefore, if for no other reason, he thought the Bill should be passed. Before closing he could not help expressing his surprise at the hostility of certain pharmaceutical chemists to the Bill. He thought it had been prompted by a most niggardly and narrow-minded spirit, and was of opinion that they, as pharmaceutical chemists, could well afford to wait, and any little ideas of resentment should be put in abeyance for the time being, in order to make a united effort to bring about the consolidation of the Society. He therefore had great pleasure in proposing the following

Resolution.

> That in the opinion of this meeting of the Chemists' Assistants' Association the proposed Pharmacy Acts Amendment Bill as drafted by the Council of the Pharmaceutical Society is calculated to serve the best interests of pharmacy by the establishment of a more efficient union amongst registered members of the trade, and this meeting hereby cordially supports the same.

—Mr. F. W. Gamble, Hon. Secretary, had great pleasure in seconding the proposition. He had not gone very deeply into the question of pharmaceutical politics, but from what he had read of the Bill he had come to the conclusion that it was calculated to carry out the objects mentioned in the proposed resolution. He believed the Bill would have a tendency to bring a larger number of chemists and druggists into the ranks of the Society, and would thus put a greater power into the hands of the Society, inasmuch as it would then represent a much larger portion of the trade.—The Chairman said they were very much indebted to Mr. Morley for the careful way in which he had gone into the question before the meeting. Undoubtedly the Pharmaceutical Society was actuated by the desire to consolidate its ranks, so as to have more power when bringing any other Bills before Parliament. He certainly was of opinion that it was only doing justice to the chemists and druggists, who formed the majority of those in business, that they should have the opportunity of taking a part in the management of the affairs of the Society. With regard to the supposed injustice to the pharmaceutical chemists, he could not see how they were wronged by the Bill, because they retained their distinctive title, Ph.C., and as for the title M.P.S., he did not think that the general public distinguish between associates and members of the Society.—Mr. F. A. Hocking said that although not a member of the Association, the President, Mr. Taylor, had invited him to be present to express his views of the proposed Bill. He then proceeded to criticise the remarks of Mr. Carteighe, printed on page 51 of the *Pharmaceutical Journal*, with reference to the degree of B.Sc. Mr. Carteighe was alleged to have stated that the degree of B.Sc. was simply an indication of education in a certain direction, and that a man could be B Sc. and at the same time not be a good pharmacist. These remarks he (Mr. Hocking) took to apply to himself, or rather to the class to which he belonged. He considered there were also

Three Fallacies

put forth by Mr. Carteighe, the first being with respect to asso-

ciateship, which was said to indicate youth or incompleteness. He thought Mr. Carteighe was guilty of non-observation in not becoming acquainted with the fact that associateship of the Royal Academy, Royal Institute of British Architects, and several other societies does not convey an impression of youth or incompleteness. The second fallacy had to do with the title "Fellow," and he wished to ask if there were not two grades in the Royal College of Physicians and the Royal College of Surgeons, and if the "Fellows" of either College are not considered to be far superior to "Members." In the same way he considered that a pharmaceutical chemist is a far superior man than a chemist and druggist, and is therefore entitled to a higher grade in the Pharmaceutical Society, viz., "Fellowship." The intentions of the founders of the Society had been referred to by some, but he did not see how they could be binding on the pharmacists of to-day. The third fallacy was in respect to

The Strength of the Society.

which it was supposed would be improved by the Bill. This supposition he held was not based upon proof, and he called for proofs. He then dealt with the number on the Register of Pharmaceutical Chemists and Chemists and Druggists. There were, he said, over six hundred pharmaceutical chemists at present outside the Society, and he wished to know how they were to be brought in by the proposed Bill. Then they had over three thousand chemists and druggists who by virtue of their being in business before 1868 were entitled to membership of the Society, but only one out of six of these was connected with the Society. Why did the other five not join? and would they if the Bill was passed into law? He did not think so, seeing that for the last thirty years they have had the opportunity of becoming members of the Society and to enjoy all the privileges therewith, but had not considered it to their interest to join. It seemed to him that these were the very men required to strengthen the Society. Then, of the nine thousand odd who have passed the Minor examination, over three thousand were outside the Society. Would these become members if the Bill became law? From what he could learn by inquiries amongst them, he did not think they would. The pharmaceutical chemists he considered had not been treated fairly by the Council of the Society. He understood the Bill had been submitted to certain associates of the Society before it was brought out, and he was of opinion it should first have been submitted to pharmaceutical chemists. Not being a member of the Association, he could not move an amendment to the motion before the meeting, but he would like them to consider whether those outside the Society at present were likely to be brought in by the proposed Bill or not.—Mr. W. Roberts, who also was not a member of the Association, desired to express his views of the Bill. He was most decidedly opposed to it, as he did not consider it a fair one to the Major men, who all along had been the friends of the Society. He was, however, in favour of the Minor men being eligible for the Council, but not so as to be in a majority. —Mr. Pickering wished to support the motion in favour of the Bill, although in his opinion it did not go far enough; still it was a step in the right direction. The Society should have more members of the trade supporting it, but he did not think the *modus operandi* of the Council was exactly the right way to bring that about. To him the only way of consolidating the trade into one united body seemed to be that every man who passed the Minor examination should be granted his certificate on the condition that he became attached to the Society.—Mr. E. W. Hill said they were very much indebted to Mr. Hocking for the masterly way in which he had laid his case before them. He however believed Mr. Hocking did Mr. Carteighe an injustice with reference to his remarks concerning the degree of B.Sc. His opinion was that Mr. Carteighe meant there was a possibility of a B.Sc. being an inferior pharmacist, just as a pharmaceutical chemist might possibly be inferior to a Minor man. He did not think it was

A Question of Education

that had influenced the Council in bringing forward the Bill under discussion, but rather because in these democratic days it was considered only right and proper that a man who has become qualified by law should have a voice in the management of affairs affecting himself. He had every confidence in the men who would be elected to the Council, however, to believe that they would endeavour to make future pharmacists as competent as possible; therefore he had much pleasure in supporting Mr. Morley's motion. —Mr. J. C. Strother thought it was very regrettable that in days gone by a Bill was not brought forward including a provision dealing with

One Man, One Pharmacy,

then all the present-day trouble would have been wiped out.—Mr. G. E. Pearson was of opinion that if pharmaceutical chemists had the interests of the Society at heart, they would not object to chemists and druggists becoming members, because by admitting them to membership the Society would be strengthened and they themselves would therefore gain a greater advantage by having more power when dealing with any question affecting the craft.—Mr. Morley having replied, the motion was put and carried *nem. con.*

PUBLIC DISPENSERS' ASSOCIATION.

The first meeting of this newly-formed Association was held in the Bloomsbury Hall, Hart Street, W.C., on Friday, February 25, the Chairman of the Association, Mr. R. Welford, Colney Hatch Asylum, presiding, there being a moderate attendance.—The Hon. Secretary, Mr. G. F. Forster, read letters from Mr. Walter Hills, President of the Pharmaceutical Society; Mr. Michael Carteighe, Dr. A. P. Luff, and several other gentlemen, who, while regretting their inability to be present at the meeting, expressed their entire sympathy with the

Objects of the Association,

which are:—

1. To protect and further the interests of public dispensers and generally to improve their position.
2. To provide basis for consultation and united action in all cases of difficulty arising out of the nature and in the discharge of their duties.
3. To secure adequate remuneration for dispensers, and generally raise their status.
4. To hold meetings, institute lectures and demonstrations, promote discussions, and increase practical and theoretical knowledge of subjects pertaining to the calling.
5. To promote occasional social and pleasant evenings for members and their friends.

The Rules of Constitution

are (1) that "the Association shall consist of members and honorary members," (2) that "all duly qualified public dispensers shall be eligible," (3) that "the subscription for members shall be two shillings and sixpence per annum, payable by cash or postal order, on the 1st day of January in each year, to the Treasurer, Mr. S. B. Donnan, 28, Goring Road, Bowes Park, New Southgate, N."—The preliminary business having been despatched, the Chairman called upon Dr. H. Macnaughton-Jones to deliver the inaugural address.—Dr. Jones, on rising, was accorded a most hearty reception, and he at once proceeded with a somewhat lengthy but deeply interesting address, delivered with characteristic vigour, on

The Dispenser's Art: Its Demands, Claims and Responsibilities.

At the close of the address, which is printed at page 233, Mr. W. E. Miller (Vice-Chairman), St. Pancras, moved a vote of thanks to Dr. Macnaughton-Jones for his great kindness in coming to address the Association. He was sure they all owed him a deep debt of gratitude, and he hoped that the sentiments expressed in the address, and the advice given would bear fruit, and that an impetus would be given to all present to endeavour to take their proper place in the world, the place that pharmacy really gives to those whose calling in life it is. If they took Dr. Macnaughton-Jones' advice, and profited by it, he was sure there would be no need for the

Penny-in-the-Slot Pharmacy

of the present time. They, as pharmacists and chemists, were quite capable of doing all that is necessary in preparing drugs for use in the dispensing of medicines, and he hoped the practice of importing foreign ready-made preparations would soon cease. He was most strongly opposed to the medical staff of an establishment using anything that could not be made at home, and was of opinion that many of the drugs and chemicals which frequently appear on hospital and other contract sheets could be easily and economically prepared in their own laboratories. He had great pleasure in moving the vote of thanks to Dr. Macnaughton-Jones.—Mr. Goodall, Shoreditch, seconded, and Mr. Moore, St. Bartholomew's, supported the motion.—The Chairman, in putting the vote to the meeting, expressed his high appreciation of the honour done the

Association by Dr. Macnaughton-Jones, who had shown by his presence amongst them that they would have the sympathy and support of the medical profession, for he did not believo that Dr. Jones was alone, but that many of the medical profession were in sympathy with their endeavours to raise the status of their calling. —The vote of thanks was then accorded amid enthusiastic applause.—Dr. Macnaughton-Jones, in replying, said he supposed they all had a tendency to hark back to their first love and to early recollections. He reverted to his behind-the-counter days with mixed feelings, and should always have the strongest and kindest sympathy with the pharmacist. He had spoken about

The Nature and Character of Work.

Of course, a man might have high ideals concerning his calling, but he could not eat his breakfast on ideals, and if he went to bed on an empty stomach he began to lose respect for his ideals, therefore they must not take it from what he had said in his address that he did not appreciate the importance of remuneration, for he was practical man enough to hold that, as a rule, just as a man is encouraged in and satisfactorily remunerated for his honest labour, so also is he encouraged to advance in his art or profession. He could not help feeling that it is to be regretted that a great deal of the old dispensing art has a tendency to die out in Great Britain and other countries through the various "penny-in-the-slot" preparations referred to by Mr. Miller, which were so convenient for handing out in dispensing pharmacies and elsewhere. He still had the idea that each patient has to be prescribed for and their individual needs considered. Sometimes, no doubt, it was convenient to have preparations in some portable form, especially for carrying to other countries when it was most useful to have preparations in the various forms which modern elegant pharmacy has produced. But, he maintained that in the great majority of cases, if the physician was true to his own profession, he would not rely on those preparations, but would prescribe combinations in fractional doses which would require the greatest skill and accuracy on the part of the dispenser, and there should therefore be in the properly recognised dispensing department of any establishment a registered pharmaceutical chemist to dispense all preparations requiring skill in putting together. He thought that with such an Association as the one he was addressing, if right principles were maintained and continued in the face of any opposition, the meeting that night would mark an era of gradual advancement on the part of the dispensers generally of the United Kingdom. Nothing would give him greater pleasure than to see, in the future, the success and advancement of that Association.—The Chairman then urged all present to join the Association, and to persuade others to join, and to show the public that, as a body, dispensers are not mere hewers of wood and drawers of water, but a body of highly intelligent, educated, and trained men, entrusted with most responsible public duties.

EDINBURGH DISTRICT CHEMISTS' TRADE ASSOCIATION.

At a meeting held on Tuesday, February 22, 1898, at 9 p.m., Mr. Boa introduced a discussion on the subject of

Methylated Spirit without Rock Oil.

Having referred to the reasons which led to the addition of rock oil to the methylated spirit and the regulations prohibiting the sale on Sundays and after 10 p.m. or before 8 a.m. on Saturday and Monday, he said he had never had any sympathy with the measures adopted to render the spirit undrinkable by adding rock oil. There was no difficulty in telling a person who wanted to buy the spirit for drinking, and the adding of rock oil was a very weak device as a preventative. He thought it would have been much better if the Excise authorities had moved in the same way as they did against those who sold whisky illicitly. They might also make more strict inquiries as to the suitability and respectability of those to whom licences were granted. The objection to rock oil was that while it did not render the spirit undrinkable, it made it unsuitable for many technical purposes. For domestic use in lamps for heating coffee or invalids' foods, its bad odour was a frequent cause of complaint since this change was made. For cleaning windows and silver plate it was also unsuitable. In the manufacture of varnishes, fixatives, and furniture oil it was objectionable. In the former case it imparted a fluorescent appearance to the dry varnish. Photographers complained that it was unsuitable for varnishes and collodions, and they had to arrange with a methylater to get a supply free from rock oil. Formerly retail chemists used to supply considerable quantities to photographers in small quantities at a time, and he believed they preferred to buy it in that way. But now all that trade had passed away. Another point was that the Excise had been much freer in granting licences to dealers. Formerly licensed grocers could not hold a licence for methylated spirit, or were only allowed to sell in sealed bottles. Now they could sell it in small quantities. He believed the addition of rock oil had been without material effect in reducing the use of the spirit for drinking purposes, any diminution being due to the other regulations. These regulations, he thought, were quite sufficient. Another means would be a more judicious selection by the Excise of those getting licence to sell. He thought this measure pressed hardly on a great many persons in the community, and he did not know a good word that could be said for it. One reason why he thought they should seek to have this addition withdrawn was that it interfered with the making of many pharmaceutical preparations on a small scale, and compelled them to purchase from large manufacturers. Every self-respecting pharmacist preferred to make these preparations on his own premises.—Mr. Hill said he agreed with Mr. Boa that the addition of rock oil did not prevent the use of the spirit for drinking purposes. He had made some inquiry and found that those who had become habituated to methylated spirit as a beverage did not object to the rock oil at all. Their method was to add a quantity of water to the spirit and get a piece of loaf bread. They took a drink of spirit and then a mouthful of bread, and so on till the liquor was finished. In this way they said they got over the smoky taste and had the full luxury of the alcohol without any trouble at all. He had, shortly after the rock oil was introduced, a complaint from a practical photographer, who complained that the varnish "fogged" his negatives. The photographer was quite at a loss to account for the "fogging," but on having his attention drawn to the rock oil, he tried a varnish made with spirit free of rock oil, and found that the latter was the source of the trouble. The result was that he arranged with a methylater to get a supply of spirit free of rock oil. He agreed that nothing could be said in favour of this addition, and a good deal could be said against it, and he thought if the case were fairly represented to the Excise authorities, they might agree to withdraw the regulation.—Mr. Coats said he had no difficulty in telling a person who wanted to buy the spirit for drinking. He did not think the objections to rock oil were so serious as Mr. Boa represented. He used it for spirit varnish and had no complaints. He had not tried it for window cleaning or for cleaning plate. On the whole, however, he thought it would have been better if the spirit had been left as it was. Ultimately, after a prolonged discussion, the matter was remitted to the Committee, with powers to communicate with the Federation of Local Associations on the subject, and take any steps that might be considered necessary. The arrangements for the annual excursion were remitted to the Committee to report to next meeting, and the meeting then closed.

LIVERPOOL PHARMACEUTICAL STUDENTS' SOCIETY.

A meeting was held on Thursday evening, February 24, at University College, the President, Mr. Pierson, in the chair. Among the

Miscellaneous Communications

was a prescription shown by Mr. Frank Walker, running as follows:—

℞ Tinct. Ferri Perchlor.	.....	℥ii.
Magnesii Sulphatis	.....	℥iss.
Sp. Chlorof.	.....	℥iv. (?).
Syrupi	.....	℥ss.
Aquæ	ad.	℥vi.

The quantity of spirit of chloroform was evidently intended to be ℥iv., and not ℈iv., so the prescription was dispensed accordingly, and a note placed upon it calling attention to the fact.—The President asked if any member could tell him if the new photographic developer—rodinol—had any irritating action on the cuticle of those who used it, for a friend of his had had rather an unpleasant experience with it recently.—Mr. Marsden said he could not say anything of rodinol, but another somewhat similar body—metol—undoubtedly had, so that he generally used a holder extemporised with an elastic band to enable him to remove the plates from the solution during development without staining his fingers.—The subject of the expiring of the antipyrin patent was then brought up by Mr. Marsden, who wished to know whether in future,

when antipyrin was ordered, if phenazonum, B.P., might be used. He personally thought that it could, providing that it answered the tests and that no particular make or brand of antipyrin was specified. The members agreed with Mr. Marsden, and it was remarked that the insertion of characters and tests in the Pharmacopœia for phenazonum seemed to provide for the use of a similar body, whether it were sold as antipyrin, phenazonum, or analgesine.—Mr. Wyatt said that in France analgesine was invariably used, for the simple reason that the importation of antipyrin was prohibited. It might only be a coincidence, but the price of analgesine in France was never below that of antipyrin elsewhere, whilst he was in the country, so that there was reason to suppose that the German patentees had something to do with the control of this analgesine, though it was manufactured in France.—A prescription for syrup of glycerophosphates, *Robin*, had been the cause of some trouble to Mr. Pierson lately, and from the difficulty he had to get information concerning it, he was rather inclined to believe it was a proprietary article of French make; could any member enlighten him on the subject? Formulæ for various glycerophosphate syrups had appeared in the *Pharmaceutical Journal* frequently during the last two years, Mr. Wyatt said, and in addition the chemistry of the glycerophosphates had been discussed in the "Month" column of the *Pharmaceutical Journal*. He could not recollect if the formulæ were in the name of Robin or not, but even if they were it was not by any means improbable that a proprietary syrup of the same character should go by the name "Sirop glycérophosphatique Robin," as French discoverers were just as fond of running "specialités" as English or Americans (see *P.J.*, Feb. 26, p. 226, for these formulæ). An excellent paper on

Plant Defences

was then given by Miss E. M. Wood, who, by the aid of fresh and dried specimens of her own collection, and of a beautiful series of coloured botanical drawings she had prepared, explained the uses of thorns, spines, prickles, and hairs as protective agents during the life history of various plants. These were, however, not by any means the only protections plants had against animals. Water was an important one, as a glance at the *Alchemilla vulgaris* or lady's mantle would show. In this plant the leaves were so contrived that they held the dew or rain for a long time after the grass in their vicinity had become dry, and as cows and other ruminants dislike to graze off herbage with the morning dew thereon, the *Alchemilla* by this arrangement enjoyed immunity for a longer time than its fellows in the same pasture. In the case of *Dipsacus sylvestris*, water was conveyed to the roots by a special modification of the leaves as a protection from drought. Isolation by water was the protection of aquatic plants, although these were in some cases provided with hairs to keep off the water snails, as in *Victoria regia* and many of our own indigenous plants, the pond lilies, frogbit, water plantains. Grasses were protected by their sharp "awns," as well as by the large quantities of silica in their stems, the first being of use against animals, and the latter enabling the plants to maintain their position during high winds and in sandy places. Miss Wood concluded by a detailed account of the mechanism of the stinging glands of the common nettle and a brief glance at the protective effect of poisons and strong fœtid odours.—A good discussion followed, in which Messrs. Wardleworth, Walker, Marsden, and Pierson participated, and the meeting closed by felicitating Miss Wood on her paper and on the excellent illustrations she had provided for her interesting subject.

HALIFAX AND DISTRICT CHEMISTS' ASSOCIATION.

A meeting of this Society was held at the Old Cock Hotel, on Thursday, February 17, Mr. G. M. Cobb, President, in the chair. It was proposed by the President Mr. Cobb, and seconded by Mr. H. C. Brierley, Hon. Secretary, that Mr. H. W. Seely, F.C.S., be selected as a candidate for a seat on the P.A.T.A. Council. The whole Association promised him their votes.—A fine collection of marine algæ, collected and mounted by Mr. E. M. Holmes, F.L.S., the Pharmaceutical Society's Curator, was then exhibited by Mr. Clement Fielding. The collection was greatly admired.

The New Pharmacy Bill.

A special meeting of the Association was held on Tuesday, February 22, to which the whole trade of Halifax and district was invited, and a thoroughly representative gathering of pharmacists was the result, to consider an important communication from the Pharmaceutical Society. Both Major and Minor men were present, and it was proposed by Mr. Councillor Hebden "that th chemists of Halifax and District distinctly approve of the Pharmacy Bill." This was seconded by Mr. J. B. Brierley.—An amendment was moved by Mr. W. Haigh, who opposed Clause 3, and suggested that Major men ought to receive a Fellowship if Associates were to be granted membership. This received no seconder, and the proposition was carried with one dissentient. A deputation consisting of Messrs. Cobb, Seely, J. B. Brierley, Smithies (Elland), and Councillor Hebden, afterwards waited on the Borough members, asking for their support to the Bill, and were favourably received, the M.P.'s promising to give the matter full consideration.

MIDLAND CHEMISTS' ASSISTANTS' ASSOCIATION.

A meeting of the above Association was held on the 23rd ult. at the Exchange Restaurant, Birmingham, under the presidency of Mr. H. Jessop.—Mr. E. Osborne (one of the Hon. Secretaries) announced the receipt of a copy of a circular which had been sent by the Midland Pharmaceutical Association to the local members of Parliament requesting their support to the Pharmacy Acts Amendment Bill, and also the receipt of a letter from the Secretary to the Early Closing Association, acknowledging the contribution of a guinea from the Chemists' Assistants' Association. The principal business of the evening was the reading of a short paper by Mr. F. J. Walton on

The Necessity for Organising a Union of Chemists' Assistants.

Having referred to the various individual associations existing up and down the country, he asked the question whether as chemists' assistants they possessed the influence and held the position they ought to have? If not, was it possible to improve their position? He thought the majority of them would agree they did not hold the position nor exert the influence they might do. He claimed that when a man had passed the Pharmaceutical Society's examinations he had a right to vote and a voice in the selection of the gentlemen who were to control the action of the Society, and not be compelled to wait until he ran a shop on his own account. If they had a union of chemists' assistants representing all shades of opinion, it might become a power in the Pharmaceutical Society, and materially aid in raising it. His idea of a union was that its headquarters should be in London, with a president and two vice-presidents selected from the different associations in the country, and he thought there would be no difficulty in prevailing on one or two of their members to take up the position of secretary. There was no necessity for interfering with any of the existing associations, but by joining in a union they would strengthen each other. He wished it to be distinctly understood that he was not advocating a trades union, as the term was commonly understood, or anything in opposition to the interests of the employers. They were a young Association in Birmingham, it was true, but they were not inactive, and he hoped he was not going too far when he expressed the opinion that the first link in the chain of union might be forged in Birmingham. In answer to Mr. Osborne, Mr. Walton said his idea was to have a union of assistants apart from that of the masters.—Mr. H. S. Lawton thought that Mr. Walton had struck a keynote which would find an echo in the breast of every chemist's assistant, and that was the desire amongst them to improve their positions. That could only be done by united combination, and combination in the right direction could only tend to the good of those engaged in the same occupation. A union of chemist's assistants would inevitably tend to the elevation of the calling, because at the present time they did not, as educated men, receive that protection and recognition they deserved. He hoped the discussion Mr. Walton's paper had given rise to would be continued in different parts of the country, and ultimately lead to practical results.—Mr. F. Casson said that the idea of a union as set forth by Mr. Walton was an excellent one so far as it went, but in his opinion it did not go far enough. He did not see how they were going to get the advantages they claimed unless they were banded together like other trade unions. They must have wise leaders and a united force to enable them to cut off the supply of qualified assistants to company trading. They must have the power to do that, and if they could do it they would have the masters' sympathy in the matter of shorter hours and other privileges.—Mr. Osborne read a letter from Mr. Glyn-Jones, thanking the Association for its goodwill towards the P.A.T.A., and stating that at present the Committee had not

seriously taken into the consideration the formation of an assistants' branch. At the same time the Committee of the P.A.T.A. would be glad to receive suggestions on the point. Mr. Osborne said that he had it in his mind if they had an assistants' branch of the P.A.T.A., with a majority of assistants as members, they might have a bureau for assistants, which would prove most valuable.—The Chairman said that the fcderation of associations had been in his mind for a long time, and he thought it was a pity that they were without a union of some description. He recognised, in a proper sense, what Mr. Casson had said with regard to trades unionism, and that would no doubt follow in the wake of the fcderation of associations. If they were to get advantages, no doubt they must look after themselves. As chemists' assistants they were a floating population, and therefore if the associations would only combine they would be able to keep in touch with each other for general good.—The question of the desirability of joining the P.A.T.A. as a means of securing advantages was briefly discussed.—Ultimately, on the motion of the Chairman, seconded by Mr. Lawton, it was resolved to ask kindred associations to discuss the formation of a union of chemists' assistants, and to communicate their views upon the question to the secrctaries of the Midland Chemists' Assistants' Association, with a view to further action.—In the course of the evening two short papers were read by Messrs. F. Foster and T. H. Thomas.

THE CHEMISTS' AND DRUGGISTS' SOCIETY OF IRELAND.

The annual meeting of the northern branch of this Society was held at Belfast, on Friday, February 25, Mr. John Watson in the chair.—The Honorary Secretary presented

The Annual Report,

which stated that the year just closed has been in many respects one of the most encouraging in the history of the Society. The membership has been steadily advancing, and during the twelve months twenty-five new names had been added over those who paid their subscriptions in the previous half-year. The duties of the Law Committee had been exceedingly light during the year, inasmuch as comparatively few cases arose requiring investigation. The best interests of the trade were, however, carefully watched, and, if necessary, the machinery of the Society was ready to be set in motion at any time. The advisability of proceeding for an amended Pharmacy Bill has been discussed on various occasions, but the Committee felt that such an important step required the most careful consideration, and as the necessary details have not been perfected, no practical steps were taken. In the month of October a meeting of the trade was convened under the joint auspices of the Ulster Pharmaceutical Society and the Chemists' and Druggists' Society. The meeting was called for the purpose of hearing an address from Mr. Glyn-Jones on the aims and objects of the P.A.T.A., and was held in the Imperial Hotel. At the close of the address a resolution was unanimously and enthusiastically adopted, commending the P.A.T.A. to the trade and pledging those present to do their utmost to further its objects in the North of Ireland. A local committee was subsequently appointed, with Mr. Guiler, of the Pharmaceutical Society, and Mr. Rankin, of their own Society, as local secretaries. As the objects of the Association had met with almost universal approval, it was hoped that much good would result from its efforts to mitigate the evils of undue cutting. In May last the Committee was invited to join the Ulster Pharmaceutical Society in extending an invitation to the British Conference to visit Belfast in 1898. A meeting was convened to consider the matter, and in response to a resolution adopted on the occasion an invitation was extended under the auspices of the two societies, and, they were pleased to say, cordially accepted. Several meetings of the joint committee have since been held, and the prospects of being in the happy position of entertaining the Conference in the proverbial Irish style is now assured. The Committee unanimously appointed Mr. R. Diamond, solicitor, Donegall Street, as hon. solicitor to the Society, and it is hoped that members who may have trade grievances which require investigation will at the earliest moment bring the same under the notice of the Law Committee.—Mr. Samuel Gibson, the Hon. Treasurer, then submitted the financial statement, from which it appeared that, after paying all expenses, there was a balance to the credit of the Society of £33 2*s*. 9*d*. He intimated that the subscriptions had increased very considerably during the year, and that the prospects of the Society were eminently encouraging.—Mr. Lyttle, in moving the adoption of the reports, congratulated the Society on its sound financial basis.—Mr. Brown seconded the resolution, and both reports were unanimously adopted.

Election of Officers.

The election of officers was then proceeded with, and resulted as follows:—President, Sir James Haslett, M.P.; Vice-Presidents, Messrs. Thomas M'Mullam, W. Jamison, S. Clotworthy, Wm. Doig, S. Turkington, John Watson, William Lyttle; with S. Gibson, Hon. Treas., and W. J. Rankin, Hon. Sec. The following Committee were appointed:—Messrs. Samuel Acheson, Belfast; Henry Backhouse, Dundalk; James Brown, Belfast; John Campbell, Belfast; J. Freckleton, Belfast; Robert Cambridge, Carrickfergus; Jos. Douglas, Belfast; James Hogg, Belfast; W. J. Gibson, Belfast; John Gray, Armagh; Thomas Gillespie, Banbridge; William Lyttle, Belfast; James K. Miskelly, Belfast; John M'Clements, Newtownards: John M'Crea, Newry; Samuel M'Dowell, Belfast; Thos. W. Reynolds, Dungannon; James Richardson, Belfast; John H. Shaw, Belfast; Samuel Suffern, Belfast; and Jacob Walsh, Belfast; Hon. Solicitor, Mr. Robert Diamond, 46, Donegall Street, Belfast.

British Pharmaceutical Conference.

The Hon. Secretary reported that the progress which was being made with the Reception Fund was very encouraging, and the Committee hoped that the visit to Belfast would be a memorable one, as indications pointed in that direction at the present time.—Mr. Gibson said that each member of the Committee was doing his utmost to make the arrangements as perfect as possible, and they all earnestly hoped that the visit of the British Conference to the North of Ireland would be an exceedingly pleasant and profitable one. He expressed the hope that every member would try to attend the meetings of the Conference, for papers of an exceedingly instructive and interesting character were as a rule read and discussed. The committee in charge of the arrangements would very probably be providing excursions, which all the members of the Society would do well to patronise.—Several matters of local interest regarding the future well-being of the Society were discussed, and a very successful meeting concluded with a vote of thanks to the Chairman for presiding, and to Mr. Hugh Renton, the efficient Secretary of the Belfast and North of Ireland Grocers' association, for the Assistance he gave them at their meetings.

CAMBRIDGE PHARMACEUTICAL ASSOCIATION.

On Friday, February 25, at the Technical Institute, the members of the Association met to hear a very interesting and instructive discourse by Mr. F. J. Stoakley on

Silver.

Mr. Alderman Deck presided over a good attendance.—The lecturer, in a most lucid and practical manner, described silver in its state of absolute purity, and compared it with the standard silver of commerce, and proved experimentally the purity of the former, and presence of copper in the latter. He described the conditions under which it was found in Nature, stating that it was one of the few metals found in a free and uncombined state in Nature, and by practical illustration showed the various forms and colours of silver in a pure form. A practical illustration and theoretical explanation was then given of electro-plating, and lastly, the lecturer dealt with silver, in its relations to photograp hy, at some length, showing what progress photography had made since the chemistry of silver and its compounds had been more thoroughly understood.—An interesting discussion took place after the lecture, in which Messrs. E. Saville Peck, Ald. Deck, F. Sidney Campkin, E. W. Moss, G. McAvoy, and Bernard S. Campkin took part. A very hearty vote of thanks having been accorded the lecturer, Mr. F. J. Stoakley, in reply, thanked the members, and stated in reply to a question his opinion that it was not possible to obtain gold from silver, though under special conditions a substance having the appearance of gold had been obtained.

NORTH-EAST LANCASHIRE CHEMISTS' ASSOCIATION.

A special general meeting of the members of the North-East Lancashire Chemists' Association was held at Blackburn on Tuesday night to discuss the provisions of

The Pharmacy Acts Amendment Bill.

Mr. Councillor Critchley presided, and there was a good attendance.—The Chairman stated that Mr. R. Lord Gifford had written

to Mr. Woolley, of Manchester, and perhaps it would be well to read that gentleman's reply.—Mr. Lord Gifford said he wrote to Mr. Woolley with the idea of doing away with the objections of the Major men. He told Mr. Woolley that he did not think the matter of sufficient importance to divide them, and asked if he thought that by persisting in making this an act of legislation they were not retarding the introduction of something more important in the future.—The Secretary (Mr. Whitehead) read the following letter :—

Victoria Bridge, Manchester.
March 1, 1898.

Mr. R. Lord Gifford, Blackburn.

Dear Sir,—In reply to yours, this short Bill is, in my opinion, not the slightest obstacle to our going to Parliament next session or any time we like. Until we get this or a similar Bill passed it is no use our going to Parliament at all. At present we are a disunited body, and as such quite powerless for any good work. We must consolidate ourselves, and the cry so often raised, "What is the Pharmaceutical Society doing for us?" must be changed to "What are we doing for ourselves?" It has been abundantly proved that the Pharmaceutical Council is practically helpless in the matter of legislation without the trade at its back, and it now makes a generous and broad-minded offer to everyone to unite in forming a really strong body, and one that would make its wants known throughout the country, and those who wish well to pharmacy will do their utmost to forward this good work.—I am, yours faithfully, Geo. S. Woolley.
