The Secretary, continuing, said that was an expression of opinion which was bound to be of weight as coming from one of the old members of the Council. The meeting had now to say what was the opinion of the chemists of the district as to the desirability of approaching the Members of Parliament for the district upon the matter.—Mr. Law : Could you tell us what the Bill proposes to do?—The Secretary read the text of the Bill and the explanatory notes issued by the Society.—Mr. Howarth remarked that if the Bill passed every Minor man would be able to be a member of the Pharmaceutical Society. It hardly looked fair to the Major men.—Mr. Law : What objection have the Major men to the Minor men?—Mr. Howarth : The Major men have won their degree by perseverance and study, and they ought to have some advantage and privilege over we Minors. It is only just and right.—Mr. Law : I do not see how the Major man is injured.—Mr. Howarth : Well, he thinks the Minor man has no right to call himself a pharmaceutical chemist.—Councillor Shorrock (Darwen) said that as Secretary of the Darwen Society he had consulted nearly the whole of the members in his district, and he found that they were all in favour of the Bill. With regard to the Major men, it certainly seemed to be a little against them, but at the same time he did not think the point was one of much importance. The Bill merely gave chemists and druggists power to vote and a voice in what was being done in the Council.—Mr. Lord Gifford : They always had the power to vote.—Mr. Shorrock : But not to be on the Council. He thought it was a proper thing that the chemists and druggists should be allowed to send up their representatives to the Council to put before it measures for the benefit of all parties. The Bill proposed to settle a point which under any other circumstances might have dribbled on for years. Having the unanimous support of the chemists of Darwen, he had written to Mr. J. Rutherford, M.P. for the division, asking him to support the measure, and he had replied that the matter should have his attention. He had also written to Mr. Bremridge, who had replied, "Thank you for your prompt opinion of the Pharmacy Bill. Your influence will, I am sure, be of great service to us.—Mr. Lomax (Darwen) remarked that at first he, as a Major man, was afraid that the Bill proposed an injustice to Major men, but on looking further into the matter he had modified his opinion. The main thing to be gained was the bringing of all chemists together. This of course would give greater power to Minor men, but another result would be that there would be more united action, and greater good to the whole body. Of course, at present, to be a member of the Pharmaceutical Society one had to pass the Major examination, unless he were registered as in business before 1868. There was not much opposition to the Bill except from Major men, and it did look a little hard after having gone through the Major that the Minors should be elected as members ; but after all he did not think there was much in it, for the Majors were still pharmaceutical chemists. Personally he thought all who had passed the examination, whether as Major or Minor, ought to be a pharmaceutical chemist. He could not understand the term to mean anything except a chemist in pharmacy as distinguished from an analytical chemist or manufacturing chemist. And that title belonged as much to the Minor as the Major. In giving the title to the Major alone a mistake had been made. If they had to get any benefit from the Pharmaceutical Society they would have to unite and sink their little bits of crotchets. Since the recent dinner at Blackburn there had been a number of Darwen chemists enrolled as members, and now there was not a chemist in the town who was not a member of the Society. That was the best way to help the Society, and by doing that they could demand almost everything within reason. He did not think the Bill would retard any further legislation, and he hoped it would receive the support of the Blackburn chemists.—Mr. C. Critchley thought that if the passing of the Bill would lead to an increase in the membership of the Society it ought not to be opposed.—Mr. Gifford moved that the Association support the Bill, and that the borough members be asked to assist in the measure becoming law. While proposing the resolution he wished to make one or two reservations. He thought the time had come for a general revision of the pharmacy laws. The Pharmaceutical Council pointed out that the measure would be known as "The Pharmacy Amendment Act, 1898," and that caused him to doubt whether Mr. Woolley's answer really met his views. As a Major man he was prepared to sacrifice anything in order to obtain unanimity in the trade, and, taking Mr. Woolley's letter as representing the spirit in which the Council viewed the matter, he had very great pleasure in moving the resolution.—Mr. Law said if they wanted anything doing they must do it themselves. He had not much faith in the Pharmaceutical Society as at present constituted. He thought it would be well if they could introduce new blood into it ; he did not care whether it was Major or Minor. He was willing to support anything which would be of tangible benefit to the chemists and druggists of the country. If they wanted to bring about unity, their best plan was to admit Minor men to the Council He thought he could get Sir Joseph Leese, M.P. for the Accrington division, to support the Bill, if he could persuade him it was for the good of the chemists and druggists of the country.—Mr. Howarth, as a Minor man, supported the resolution, but expressed the hope that if the Act passed the Major men would receive a due reward for what they had gone through.—Mr. Gifford : Give us a wider Pharmacy Bill.—Mr. Howarth : Yes, but we must be thankful for what we can get. In Blackburn they had one-man companies and drug stores, but in the past the Society had not assisted chemists in this matter, and he asked if it would help them in the future.—Mr. Gifford : Mr. Woolley says "help yourselves."—Mr. Howarth : Will they help us?—Mr. Gifford : Yes.—Mr. Howarth : If that is the case I am perfectly willing to support the Bill.—Mr. W. Wells : I do not understand what we gain by this Bill.—Mr. Gifford : An associate can go on the Council.—Mr. Wells : And it makes Minor men eligible for election?—Mr. Gifford : Yes.—Mr. Wells : That being so, I do not see why we should not support the Bill. I do not know anything to be gained if we do not support it, and I think in the long run the Major men will be benefited.—The resolution was then put to the vote and carried unanimously.—The meeting afterwards went into committee.

BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION.

A special meeting of the chemists of Bradford and district was held at the Great Northern Hotel on Tuesday, March 1, to consider

The Pharmacy Acts Amendment Bill

now before Parliament.—Mr. Dunn, President of the Bradford and District Chemists' Association, occupied the chair, and, besides the local chemists, there were present representatives from Leeds, Shipley, Keighley, Dewsbury, and Queensbury.—The Secretary, Mr. S. N. Pickard, read the circular convening the meeting.—The Chairman then called upon Mr. Waddington, the local secretary of Pharmaceutical Society, to explain the Bill.—Commencing with the smallness of the Bill, the speaker remarked that it would be a stepping stone to higher things, when the Pharmaceutical Society represented the trade and not the House of Lords, the value of it being shown by the present opposition of a few pharmaceutical chemists and the apathy of a few chemists and druggists. He stated that the Pharmaceutical Society, as now constituted, did not represent the trade, and gave the number of pharmaceutical chemists and chemists and druggists on Register. Why was this state of affairs? 1. That chemists and druggists by examination cannot be on the Council, whereas chemists and druggists by virtue of being in business before 1868 could, but only in the proportion of seven out of twenty-three. 2. The subscriptions of both are the same—21*s*. 3. That the Pharmaceutical Society is an educational body and not a trade society in any way.

4. The apathy on the part of chemists and druggists who do not understand the Society's powers and responsibility. Describing the history of the Society and the Acts passed since its inauguration, with comments thereon, he mentioned the present privileges to be obtained from the Society, and described them as being only a foundation to build a handsome superstructure, which should benefit the trade largely. Reverting to the proposed Bill, he stated that now the Council had grasped the situation and was prepared to do away with the power of the Society's House of Lords, it was not mending, but ending, and making one house, it was a voluntary Bill proposed by the party at present in power, who simply said, come and help us. The effect of the Bill was to put 1300 chemists and druggists in the position of becoming members, part of whom were at present subscribers and associates having a vote, but being allowed no place on the Council. The title of M.P.S. he considered as of little value, and pharmaceutical chemists would still retain their superior title; but membership was valuable in enabling chemists and druggists to sit on the Council, and to elect the best men in the trade. After the Bill was passed there would be no excuse for chemists not joining the Society. It would be the duty of every chemist to join, and those not doing so would renounce voluntarily all right of criticism. What future Bills may be, depended on the present Minor men, and he related the following present injustices, viz. :—1, company pharmacy; 2, herbalists; 3, smallness of Poison List; 4, dispensing of qualified assistants to doctors; 5, plurality of business with unqualified assistants. In conclusion, Mr. WADDINGTON thanked the gentlemen who were present from other towns, and moved the following resolution :—

> That this meeting of pharmaceutical chemists and chemists and druggists of Bradford and district having considered the Pharmacy Acts Amendment Bill, now before Parliament, decides to support the same, as a measure of equity to chemists and druggists who form a majority of the trade, and also to sign requisitions to local members of Parliament asking them to support the Bill.

This was seconded by Mr. RIMMINGTON, and on being put to the meeting was carried unanimously. The discussion that followed was taken part in by the President (Mr. Dunn), and Messrs. Silson, Waddington, and Pickard (Bradford), Foster (Dewsbury), Kershaw (Keighley), and Pollitt and Anning (Leeds). The following petition was signed by every person present, and a canvass will be made of those chemists not present at the meeting :—

THE PHARMACY ACTS AMENDMENT BILL, 1898.

DEAR SIR,—

We, the undersigned chemists of Bradford and district, desire to draw your attention to the Pharmacy Acts Amendment Bill, introduced on Thursday, February 24, by the Honourable W. F. D. Smith, Member for the Strand division of Westminster.

When we point out to you that it affects the standing of 13,000 chemists in Great Britain, we think you will see the necessity for the alterations in the constitution of the Pharmaceutical Society which it embodies, seeing that a large majority of the chemists of Great Britain are at present prevented from taking any active part in the affairs of the Society and the membership of its Council, in whom is vested the administration of the Pharmacy Acts.

The Bill, of which we send you a copy, is drafted by the present members of the Society, and not by those whose position and privileges it is intended shall be enhanced by the operation of the Bill.

We would respectfully request that you will give this Bill your support, in order that it may be carried through the Houses of Parliament and placed upon the Statute Book.

We are, Sir, yours respectfully,

BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION.

On Tuesday, February 22, at the Great Northern Victoria Hotel, a lecture entitled

Cellulose Products

was given before a moderate attendance of members of this Association by Mr. W. M. Gardner, F.C.S Mr. A. H. WADDINGTON occupied the chair.—The lecturer dealt with the subject in a masterly manner, describing the sources of cellulose, its preparations, and their chemical compositions. He described fully the following products of cellulose and their manufacture, viz. :—Paper (various kinds), Willesden canvas, acetic acid, acetone, methyl alcohol, amyloid, dextrin, glucose, collodion, artificial silk, gun-cotton, lustred cotton, and oxalic acid.—The lecture proved highly interesting and instructive, and was greatly appreciated, the lecturer being warmly applauded at the conclusion.—Messrs. Waddington, Pickard, Jackson, Carson, and Mitchell took part in the discussion which followed.—Mr. WADDINGTON proposed a vote of thanks to Mr. Gardner, which was seconded by Mr. JACKSON, supported by Mr. PICKARD, and carried unanimously.—Mr. GARDNER suitably replied.

LETTERS TO THE EDITOR.

THE USE OF THE METRIC SYSTEM BY PHARMACISTS.

Sir,—Having had difficulty in understanding the equivalents of measures of volume published in the *Pharmaceutical Journal* of February 26, and as others of your readers may have had the same experience, I have communicated with the Board of Trade and should like to explain in your columns how the apparent discrepancy between the equivalent of the litre in fluid grains and that of the kilogramme in grains may be accounted for. Since a litre is the volume of a kilogramme of water at 4° C., weighed *in vacuo*, and one kilogramme is equivalent to 15432·35369 grains, one is apt to think that a litre should equal 15432·35369 fluid grains, forgetting that the gallon, from which the fluid grain is derived, is the measure of a certain mass of water at 62° F., weighed in air. I am given to understand by the Board of Trade that in comparing the masses of imperial and metric volumes of water, the water should be respectively at 62° F. and at 4° C. The mass of water, which has, at 4° C., a volume of 28·4123 millilitres, weighs *in vacuo* 28·4123 grammes, or 438·469 grains. At 62° F. this relation of volume to weight is different, and the same mass has the volume of 28·4752 millilitres or 438·469 grain measures. From these equivalents of 28·4123 millilitres of water at 4° C. it will be seen that, while 1 litre of water at that temperature will weigh 15432·4 grains, it will have a volume equal to that of only 15398·3 grains of water at 62° F. It is well to bear in mind that since the units of volume are derived from standard masses of water under certain physical conditions, those masses and volumes of water are not interchangeable quantities unless the conditions remain constant.

London, February 28, 1898. HAROLD E. MATTHEWS.

Sir,—I have read your last issue with considerable interest, and have been struck with the difficulties raised with respect to so simple a measure as the adoption of the metric system. It seems to me that the waste of time and loss of accuracy entailed in the conversion of one system into another is quite unnecessary. The position in which the English chemist is placed is, if anything, simpler than that of his Jersey brethren, who have to make use of three systems of weights and measures, viz., local, English, and metric, and yet there seems to be no difficulty whatever entailed in their use. Local weights and measures must be used for retailing, English ones are used for dispensing English prescriptions and for making pharmacopœial preparations, whilst the metric system is employed in dispensing Continental prescriptions. It is undoubtedly useful to have a rough idea of the equivalents of these, but is not this as far as one need go?

London, March 1, 1898. P. E. F. PERRÈDÉS.

Sir,—As the metric system has been legalised in many countries in the course of the passing century, practical acquaintance with its working in those countries should be well worth any amount of theorising over the difficulties attending its adoption, and queries as to its advantages. Restricting myself to its use by pharmacists, I beg to say it does not rest with them at all whether it is to be generally adopted in dispensing. It will depend entirely on the prescribers. Those of them brought up under the old *régime* will mostly continue to order ounces and grains; but when a younger generation of medicos have been taught doses in grammes and cubic centimetres, then the pharmacist will have to invest in new sets of weights and measures, if he has not procured them before, and the two systems will be carried on contemporaneously until the old timers have so far died out that the authorities will declare avoirdupois as obsolete as troy and the old wine pint is with us now. Then it may be said of the pharmacists—

> Theirs not to reason why,
> Theirs but to do and—sigh

for the good "Old, well-tried, etc., system." The innovation will have to begin with the authors of text-books and the teachers in the medical schools, and the time of transition will depend on when they decide to drop the old, and confine themselves to the new system. After that it will rarely happen that the dispenser, to whom alacrity and accuracy are paramount, will have occasion to convert fractions of a grain into fractions of a gramme. Even now, thanks to your tables of equivalents, he can multiply 72, 8, and 6 by 0·06479. As to the "trivial error" of misplacing the point, in twelve years' experience I never knew an accident happen from it, which is more than can be said, perhaps, for the ℥, ʒ, and ℈i.

As I have said, both systems will have to be used by pharmacists as long as both are taught, and that may continue for generations, as it has done in South America, yet my native dispensers there had no more difficulty in using the one set of weights and measures than the other set, unless there was a calculation to be made, and then the trouble was not with the metric system. For my own part, at first it was like picking up the language; one had to think in the old and translate into the new, but by daily practice in a very few months one gets to think in the new. I used to mentally reckon from the litre or kilo (*e.g.*, in selecting the size bottle for a mixture).

Gm. or C.c.		
1000	=	℥35
500	=	17·5
250	=	8·75 ($8\frac{3}{4}$ ozs. or ℥8 ℥vi.)
125	=	$\frac{35}{8}$ = ℥35
200	=	$\frac{35}{5}$ = 7
100	=	3·5
50	=	1·75 = ℥14
25	=	℥7

Mixtures are usually prescribed not in decimal parts of a litre, but $\frac{1}{4}$ (250 C.c.), $\frac{1}{8}$ (125 C.c.), etc., and drops, 60· and 30· C.c. There could never be any doubt as to the quantity meant by the prescriber, especially if he complied with the law to write the quantities in words, *e.g.* { "5 centigrammes," "15 milligrammes," etc. It seems to me you, sir, have supplied opponents of the system with a more substantial argument than any they have urged. The "tables" reveal the sad truth that the new religion has already lost its sweet primitive simplicity. Schism has already begun with the difference of 34·1 grains between the litre and the kilo, where will it end? Will a balloon come back from the Pole with the heresy that the ten million metres is all wrong? Even then I suppose the Board of Trade will cling to its iridio-platinum cylinder, unless the L.C.C. sneaks it.

Liverpool, February 28, 1898. J. P. Catford.

Sir,—I am surprised that such a letter as that which appeared in your Journal of February 26 should have been written by Mr. McMillan. We in Aberdeen get many foreign prescriptions—Swedish, Russian, etc.—all written in the metric system, and have no difficulty in dispensing them. If my assistants could not do so they would be no use to me. It is also a common occurrence here for foreign sea captains to get medicine chests fitted under the metric system, which we successfully do. Mr. McMillan is not the only chemist in Great Britain, and others seem to be able to do what he cannot.

Aberdeen, March 1, 1898. David Ritchie.

A Study in Zoology.

Sir,—With many others I had hoped that since the unsuccessful attempt of last year to check the progress of things relating to pharmaceutical education, those responsible for the existence of your contemporary, the *Chemist and Druggist*, would veer round to a better state of mind; that the trade journal which next to our own possesses, we think, the most literary merit would generously recognise its mistake and mend its ways. This hope is once again doomed to extinction. Our Society is an institution founded with the object "of raising up a race of qualified men devoted to the practice of pharmacy as a distinct occupation."—'Historical Sketch,' preface by Redwood. The *Chemist and Druggist* by its own admission has desired "for the past forty years to get as much benefit as possible for the trade out of the reputation, the wealth, and the great opportunities which the Pharmaceutical Society enjoys" (p. 314, Feb. 19, 1898). So have I heard again and again from many quarters since prosecuting my little work as divisional secretary, and so have I had reason to suspect that the rancorous opposition of some and the unaccountable indifference of others are largely traceable to the malign influence of that trade journal. So it comes about that we have a fatal division in our ranks, there being first, the chemist who allows his trade to choke his pharmacy, and, second, he who loyally makes his pharmacy guide and govern his trade. In spite, sir, of the sophisms contained in the article I have just alluded to, I would not have referred to the subject but for the saucy invective contained in this week's issue on the same subject, page 353. As to the respective blood-suckers, if one may in this case answer foolishness by foolishness, it is plain that the *Sanguisuga Pharmaceuticalis* is identical with the *S. Seeandee*, for, by its own frank admission, this latter feeds upon the former as the babe at its mother's breasts—gets all it can out of the Pharmaceutical Society. Perhaps, however, a "transfusion apparatus" would be a better simile by which the life-blood is pumped from plump benevolence into the shrinking system of profligate veins. Taking all things into consideration, I must conclude, therefore—still speaking very foolishly—that the *Sanguisuga Seeandee* equals and is identical with the *S. Pharmaceuticalis*, because—

> The *S. Seeandee* of recent memoree
> Is said by the highest authoritee,
> A getter-out-of-all-it-can to bee,
> From the Pharmaceutical Societee—*Q. E. D.*

39, Church Street, Marylebone, N.W. J. C. Hyslop.
February 28, 1898.

The New Pharmacy Bill.

Sir,—From a letter which has been received from the Western Chemists' Association (London), it is evident that a false impression is abroad as to the attitude of the Manchester Pharmaceutical Association towards the Pharmacy Acts Amendment Bill. We therefore desire to put it on record that the Manchester Pharmaceutical Association is not opposing the Bill, but, on the contrary, is doing all in its power to promote its success.

(Signed) G. S. Woolley *President.*
Harry Kemp } *Vice-Presidents.*
William Kirkby }

Manchester, February 28, 1898.

Sir,—I have forwarded the appended memorial to Mr. H. C. Richards, M.P., as well as our own representatives, Messrs. Labouchere, Drucker, and Sir John Pender, and also enclosed a copy of the draft Pharmacy Bill. The signatures numbered twenty, all of which were chemists on the Register.

Northampton, Feb. 23, 1898. Frederick Chas. Ashford.

[Enclosure.]

We, the undersigned pharmaceutical chemists and chemists and druggists residing in Northampton, do hereby ask your earnest attention to the draft Pharmacy Bill which will be introduced into Parliament by the Hon. Fred. Smith, M.P., during this week, particulars of which are enclosed, and we beg to respectfully ask for your support and influence of same when it comes up for consideration. Thanking you in anticipation of an affirmative reply,

Yours respectfully. (*Signatures.*)

Sir,—In response to a circular sent out asking chemists in this town for their opinions of the Pharmacy Act, numerous replies to hand are all in support of the Bill. Some chemists as yet have not sent in a reply, but among Major men replying no opposition is evident here.

Cambridge, March 1, 1898. Bernhard S. Campkin.

The Orphan Fund.

Sir,—Referring to your issue of 26th ult., and your list of contributions in 1897 to the Society's Orphan Fund, how is it that the £5 donation from Glasgow Committee of B.P.C. is not included? This was sent along with the £10 for the Benevolent Fund, and the latter, I see, is duly entered in your list. Your correction will oblige.

Glasgow, March 1, 1898. John Walker.
Treasurer to Glasgow Committee B.P.C.

*** The Editor is not responsible in any degree for the Benevolent Fund and Orphan Fund lists, but on inquiry in the Secretary's office he learns that the Glasgow contribution was omitted through an oversight, along with several others. [Ed., *P.J.*]

The Applications of Emulsion.

Sir,—Your correspondent (Associate 5/6) will find some reference to emulsion and its applications in the 'Year-Book of Pharmacy' for 1867, page 36. The title of the paper is "Glycelæum, a Proposed Basis for Ointments," and its author was

Weymouth, February 28, 1898. T. B. Groves.

Nitragin.

Sir,—In reply to "P. H. J." (6/4), nitragin is manufactured by Meister, Lucius, and Brüning, Hoechst-on-Maine, the London address of the firm being 46, St. Mary Axe, E.C. Last season the firm did not stock any in London, but some was obtained for me from Germany. Experiments which I made on beans did not show any advantage from its use, there being no greater formation of root nodules and no larger yield of seed.

Spalding, February 28, 1898. E. Wightman Bell, F.C.S.

Medicine Stamp Duty.

Sir,—Referring to the article in last issue on medicine stamp duty, may I be permitted to say I do not agree with the author in the estimate he puts on the point raised by Dr. Symes. If the law says that the grocer or other unqualified dealer may not sell compound drugs unstamped, then the law should be put in force, whether the benefit such action would confer on the chemist be little or none. As a matter of fact, those chemists who are so unfortunately placed as to be in competition with grocers for the sale of the commoner medicines would have a considerable advantage over the grocer who was compelled to sell these medicines stamped. Again, I do not agree with the author when he says at the close of the article that there is really no occasion for a chemist to recommend his preparations in a dutiable manner. Now to my mind this is an extraordinary statement. The British Pharmacopœia contains the formulæ of many lozenges, liniments, ointments, pills, etc., suitable for domestic use. Yet on the container of none of these are we permitted to state the ailments for which they are useful. Is not that a pitiful position for us qualified chemists to occupy? And what is the effect on the public thus kept in ignorance of the uses of standard medicines? Just this—that they know far more about advertised nostrums, and resort to them just because they know most about them, while the contents of most of the bottles and pots ranged round our shelves are so far as the public is concerned left severely alone. Does the author imagine that chemists are satisfied with the permission to use the colourless phrases of which he gives examples? Such are of no value in assisting sales, and afford no information useful to the purchaser. And the author is aware of this, for in the preceding column he shows plainly that one who sells tinct. rhei co. with a label embellished with the smartest of pushful recommendations has a great advantage over him who does not so label it. The fact is these Acts are part of an antiquated system for raising money. They were not passed to protect the public, and they do not help but hinder the chemist. If they cannot be abolished, something ought to be done by our representatives to take chemists out of the ridiculous position they at present hold under them. It may or may not be right to tax proprietary medicines, but it is really too absurd that we qualified chemists are not at liberty to state the uses of the popular medicines of the Pharmacopœia. Our position apparently does no appeal to those who represent us, for the authorities at Somerset House did at one time offer some relief which for some reason was not accepted. I would like to see the question reconsidered.

Dundee, March 1, 1898. William Cummings.

Sir,—In the article on the medicine stamp duty in last week's Journal you appear to argue that the exemption relating to "all mixtures, compositions, or preparations," the properties, qualities, virtues, and efficacies of which are "known, admitted, and approved of in the prevention, cure, or relief of any disorder, malady, ailment, or complaint incident to or in anywise affecting the human body," is in reality no exemption at all, and in that sense you ask, Where does the exemption come in?—as if this provision of the Act had no significance. I venture to think, however, that this conclusion is erroneous, and that a real exemption was contemplated, of such a nature that, within certain limits, the use of medicines could be stated, without incurring liability to duty, by persons qualified to sell them, in so far as the qualities, virtues, and efficacies of those medicines were known, admitted or approved of in the prevention, cure, or relief of any disorder, etc. Thus, for instance, in the case mentioned of tinct. rhei co., B.P., the use of that preparation is known, admitted, and approved of as a remedy for diarrhœa, and the recommendation of the tincture for that purpose seems to be a thing provided for by the exemption, inasmuch as it is a recommendation known, admitted, and approved of, thus differing altogether from the recommendations of secret, proprietary or patented medicines, which are made in the interest of the proprietors of nostrums with the object of promoting their sale and, for that reason, render the medicines liable to stamp duty. This view of the matter appears to have been overlooked by the writer of the article, but it is a point to which attention was directed some years ago at Newcastle when the incidence of the medicine stamp duty was under discussion. The complaint then made was that a chemist could not describe the uses for which medicines are applicable without becoming liable under the Act. But if those uses are "known, admitted, and approved of," the exemption provided by the Act appears to apply to such cases and also to indicate the qualified persons to whom the exemption was intended to be applicable in practice. In any case, the elaborate statement of the third special exemption must be understood as meaning that something was to be exempted and that persons of a certain description were to be exempt from liability to stamp duty which would be incurred by other persons than those specified.

March 1, 1898. Pharmaceutical Chemist.

The Wholesale Druggists' Association of Canada.

Sir,—Referring to the remarks in your issue of February 26 regarding the dissolution of the Wholesale Druggists' Association of Canada, we fear your correspondent has been misinformed when he says that the retailers are not greatly exercised over the matter. Our firm joined the Wholesale Association at the earnest solicitation of many retailers, and they withdrew for the specific reason that the Wholesale Association had failed in its primary and vital object, namely, the benefit of the retail trade. So far from regretting the action of our firm, we may say that the retail trade are almost unanimous in endorsing the decision come to, and our firm has received a large number of letters expressing satisfaction with the attitude which has been taken up. We may say that the Canadian Wholesale Druggists' Association had no parallel institution in this country.

Liverpool, March 1, 1898. Evans, Sons and Co.

Some Explanations from Mr. Jeeves.

Sir,—I deeply regret that you did not extend the process of necessary condensation, employed in the reporting of my paper to the annotated criticism thereof which recently appeared in the Journal. You tell me that I have quite missed the point at issue, and confused conditions with objects to be striven for. Well, sir, I stand corrected but not convinced. I, in common with not a few members of the trade, was certainly under the impression that a chemist kept open shop for the grossly material object of making a living, and very occasionally a moderate fortune, and the conditions to be observed in the carrying out of this very unpharmaceutical object were any and every thing consistent with honour and straightforward dealing. Respecting education my points were that the Minor examination, as now conducted, is quite stiff enough for the requirements of the present-day chemist and druggist, but if the Pharmaceutical Society brings forward a scheme for raising its standard, that scheme should consist of more technical education, and the addition of such subjects as photography, optics, and veterinary medicine, a more or less elementary knowledge of which would be invaluable to a large number of the craft. I then went on to say that the present condition of things in the trade would, I thought, prove to be a tolerably lasting state of things, and I supported this statement by drawing attention to the rapid development of the more commercial part of our business, to the evolution of window dressing, and the fact that dispensing formed a microscopical portion of the business of some 70 per cent. of the trade. "Elegant pharmacy," I said, "is now the order of the day, and pills, capsules, plasters, tablets, etc., are turned out quicker, cheaper, and better by large wholesale firms with their up to-date machinery than by the small dispensing chemist with his tin pot modes of operation." Here I stated what I believe to be a fact, which I neither applauded nor deplored. So how you can interpret that into an advocacy of "penny-in-the-slot pharmacy" is beyond the ken of the "Brighton pseudo-prophet." I see nothing disparaging to the dispensing chemist in the fact that wholesale firms can, and do, with their specially-designed machinery, turn out better results than he can not possessed of their facilities. Why one should not openly acknowledge what to every sane man is obvious enough I cannot for the life of me see. And in spite of your prophetic warning as to the impending doom of the man who makes such an acknowledgment, I shall still cry "truth though the heavens fall." I am only a small dispensing chemist, and have sadly to confess that on my four-foot dispensing counter I really cannot turn out capsules, tablets, or plasters equal to those of first-class wholesale firms, whose space, machinery, and general facilities are almost unlimited. Why the confession of this obvious fact should lead you to the assumption of my holding a brief for a wholesale firm is just a little hard to conceive. In conclusion, I would emphasise the gist of my paper, which was this—that the business of a chemist and druggist, becoming more and more a commercial concern than a scientific calling, next to registration and the education that precedes it, it is essential for the would-be successful men to possess in addition to the *sine quâ non*

education and registration that business ability, by which, looking to no outside agencies such as the Pharmaceutical Society or the P.A.T.A., he goes full steam ahead, self-reliant and self-confident, that by his own energies and merits alone can he attain to the goal of successful pharmacy. I am no opponent of the Pharmaceutical Society; far from it. I also very highly respect its Council, composed of good men and true, whose commercial enterprise has provided them with the means and leisure necessary for the execution of their responsible duties, and not one of whom would, I am sure, endorse your sentiments respecting their humbler associate, who advised his fellow-craftsmen to use their brains.

Brighton, February 21, 1898. Arthur T. Jeeves, A.P.S.

Sale of Food and Drugs.

Sir,—In your issue of February 19 you refer to the report expressing the views of the Council of the Society of Public Analysts on the Sale of Food and Drugs Bill, introduced in the House of Commons last session by the President and Secretary of the Local Government Board. The Select Committee of the House of Commons laid stress on the paramount necessity of the constitution of a board or court of reference, having power to lay down standards and perform various other important functions. The Council of the Society of Public Analysts urges the desirability of comprising in this board or court of reference one or more public analysts. You, sir, criticise this proposition by stating that, "Not content with adding to their only legitimate function of adulteration detector, that of director of prosecutions, as is only too frequently the case, public analysts wish in addition to constitute themselves part of a final court of appeal, which shall decide whether or not their methods of procedure are justified, and their results accurate." This, sir, surely indicates on your part a misapprehension as to the meaning or functions of the court of reference. It was never suggested, either by the Select Committee, or by the Society of Public Analysts, that the court of reference should have anything whatever to do with matters of appeal. Possibly the confusion into which others beside yourself have fallen in this matter is due to the somewhat unfortunate use of the word "court." What is actually proposed is not intended for a moment to be what is ordinarily understood by a "court," but a Board or Standing Committee possessed of functions advisory and legislative rather than administrative. Even in the draft Bill prepared and submitted to the Select Committee by the Society of Public Analysts—a document quite distinct from Mr. Kearley's Bill, to which you also refer—it was never suggested that the existing machinery for the examination of samples connected with disputed cases of alleged adulteration should be altered. That draft Bill, indeed, actually provided that the Government laboratory acting under the direction of the Commissioners of Inland Revenue should be, as heretofore, the laboratory to which disputed analyses should be referred. The functions of the proposed "Court" of Reference are altogether different, and are very fully laid down in the report of the Select Committee. Among these contemplated functions are the prescribing of standards and limits of the quality and purity of food, and no doubt analytical investigations would often form an important part of the duty of such a committee—but not the revision of the decisions or opinions of public analysts in connection with particular samples forming the bases of prosecutions, which would be dealt with, as at present, in the Government laboratory. The Select Committee of the House of Commons desired that the committee should include the principal officer of the Government laboratory, nominees of the Local Government Board and Board of Agriculture, one or more analysts of repute, and representatives of the General Medical Council, the Institute of Chemistry, and the Pharmaceutical Society, other scientists whose services were available and whose presence on the committee might be expected to lend weight to its decisions also finding places thereon. If the object of constituting such a committee is to obtain the fullest possible light on the composition of food and drugs as a means of detecting and putting down their adulteration, surely steps should be taken to ensure the presence on that committee of representatives of the body of officers, the business of whose lives it is to study this very question. To exclude public analysts from such a committee of reference would necessarily be to emasculate it, and render it a sham; and it appears to me that, on the part of anyone really comprehending the proposed functions of the committee, a desire to exclude public analysts is very difficultly reconcilable with an honest desire that such committee shall efficiently perform the duties which the Select Committee of the House of Commons proposed should be entrusted to it. If it were really proposed that such court of reference should be a court of appeal, as you, sir, forgetful of the Select Committee's report, admit that you imagine to be the case, the exclusion of public analysts, for which you ask, might be justified; as would most decidedly be the exclusion—which, however, you do not suggest—of any representative of the Pharmaceutical Society, as representing a class of individuals, the members of which from time to time might be in the position of defendants before the court. But the proposed committee or "court" would really have nothing whatever to do with defendants, or with the hearing of appeals or cases of any kind, and the Select Committee of the House of Commons properly recommended that the Pharmaceutical Society, as well as the General Medical Council, should be represented, in order to give advice and assistance on the Board on the questions of the variations in quality and purity of drugs. It has already been noted above that in the constitution of the Committee or "court" as recommended by the Select Committee of the House of Commons the principal officer of the Government laboratory is included *ex officio*, as well as one or more analysts of repute. If the one or more analysts of repute do not include representative public analysts, it is surely obvious that the Court or Committee would be deprived of members pre-eminently fitted to take part in its deliberations, while at the same time there would be lost the very desirable opportunity which such Board would afford of frequent deliberation, through their respective representatives, between the public analysts and their official brethren in the Government laboratory, for which at present, apart from the matter of personal courtesy, there is no recognised provision.

Bernard Dyer, D.Sc., F.I.C.
President of the Society of Public Analysts

17, Great Tower Street, London, E.C., February 22, 1898.

OBITUARY.

Baxter.—On February 21, Gilbert Buchanan Baxter, Chemist and Druggist, Blackburn. Aged 30. Mr. Baxter was an Associate of the Pharmaceutical Society.

Greaves.—On February 24, Abraham Greaves, Pharmaceutical Chemist, Rye Hill, Chesterfield. Aged 82. Mr. Greaves had been a member of the Pharmaceutical Society since 1853, and was at one time local secretary for the district. He was born near Hucknall Torkard, and commenced business as a chemist at Ironville in 1837. In 1869 he obtained the Chesterfield business (still retaining that at Ironville), from which, on the completion of sixty years of active business life, he retired at the close of 1896. For many years he took an active part in public affairs, and was one of the first members of the Brampton Local Board, and was connected with the Brampton and Walton School Board from the outset. On the extension of Chesterfield borough he was elected as one of the first members for the West Ward (Brampton), and retained the seat until his retirement last November. He was the first Chairman of the Brampton and Walton District Council, and consequently took his seat on the Bench at the Chesterfield Petty Sessions. At the time of his death he was Chairman of the Shirland Gas Company.

Pugh.—On February 24, George Pugh, Chemist and Druggist, 71, Milson Road, London, W. Aged 64. Mr. Pugh, who was one of the earlier associates of the Pharmaceutical Society and the last of his race, was buried in the grave of his mother and brother at Highgate Cemetery on March 1. He was born at Cheltenham and educated at its Grammar School. For some years he was the managing assistant of Mr. Thomas, the photographic chemist, of Pall Mall, afterwards the manager of Messrs. Treacher and Co., Bombay, latterly the London representative of the North British Chemical Co. Amongst the mourners last Tuesday was his old Bloomsbury fellow-student, John Attfield, and amongst the wreaths was one from the widow of another fellow-student, Evan Thomas Prosser, formerly of Colchester, the last manifestations of School of Pharmacy friendships formed in the session 1853-54.

Saccharin and Para-Saccharin.—According to Hefdman, 1 gramme of saccharin is soluble in 132 C.c. of ether; a mixture of 65 parts of saccharin and 3 parts of para-saccharin requires 2900 C.c. of that solvent to dissolve it, while pure para-saccharin requires 7800 C.c. to dissolve 1 gramme.—*Rev. Pharm.*, n.s., iv., 253.

ANSWERS TO QUERIES.

Special Notice.—*Scientific, technical, legal and general information required by readers of the 'Pharmaceutical Journal' will be furnished by the Editor as far as practicable, but he cannot undertake to reply by post. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of senders. Questions on different subjects should be written on separate slips of paper, each of which must bear the sender's initials or pseudonym. Replies will, in all cases, be referred to such initials or pseudonyms and the registered number added in each instance should be quoted in any subsequent communication on the same subject.*

BOTANICAL.—So far as can be judged from your sketches, it is *Draparnaldia glomerata*, Ag. [*Reply to* D. J.—5/20.]

OWNERSHIP OF PRESCRIPTION.—We are not aware that the point has yet been decided. [*Reply to* ENQUIRER.—6/5.]

SHEEP DIP.—We do not profess to know the composition of proprietary preparations. [*Reply to* A. B. C.—5/27.]

INFLUENZA POWDER.—Probably a mixture of quinine sulphate, 3 grains, and sodium salicylate, 10 grains, would be most useful. The liability to stamp duty will depend upon the wording of the label. Send a label to Somerset House, and ask whether or not it renders the preparation liable. [*Reply to* TAKA.—524.]

NITRAGIN.—This germ fertiliser for leguminous crops is prepared by Meister, Lucins, and Brüning, Hoechst-on-Maine, Germany (see letter by Mr. Bell at page 251). Write to the London agents, 46, St. Mary Axe, E.C. [*Reply to* P. H. J.—6/4.]

STAINING AND MOUNTING.—Cross and Cole's 'Modern Microscopy' (Baillière, 3*s.* 6*d.*), and Squire's 'Methods and Formulæ' (Churchill, 3*s.* 6*d.*) contain all you require. We cannot recommend the book you name. [*Reply to* MICROSCOPE.—6/10.]

SEEDS USED FOR DYSENTERY.—They are the seeds of *Plantago ispaghula*, and serve as a very useful demulcent and astringent in diarrhœa. It is better to take a teaspoonful of the seeds than an infusion, as they then give off the mucilage gradually in the alimentary canal. [*Reply to* H. H.—6/1.]

THE MICROSCOPE IN BOTANY.—Yes, certainly you should procure a microscope, and do all your botanical histology practically. It is the only way to learn the subject properly, and you will find the work extremely interesting. Use the books recommended in the Students' Number of the *Pharmaceutical Journal*, published last autumn. [*Reply to* W. E. B.—5/15.]

ISINGLASS CEMENT.—Heat the isinglass in a covered vessel on the water-bath with a little glacial acetic acid, until it is thoroughly softened and forms a stiff mass, then gradually add more acid until it produces a thick solution which is of uniform consistence and just fluid while hot. Then run into wide-mouth bottles and close with good corks. [*Reply to* REBATE.—5/28.]

SUPPOSITORIES OF BELLADONNA AND TANNIN.—Yes; you should add one drop of water to the extract of belladonna to soften it. Then rub down perfectly smooth with a few drops of the oil of theobroma in a warm mortar. Mix the tannin with another portion of the oil of theobroma, and add to the first mixture with constant trituration. Let the mass be nearly set when you pour it into the moulds. [*Reply to* D. J.—5/21.]

VARNISH FOR PAPER LABELS ON DRAWERS.—Sandarach, 20; mastic, 8; camphor, 1; methylated spirit, 48. Digest together with a little pounded glass, shaking occasionally for several days. Then allow to settle bright, and use the clear liquid, after sizing with gelatin. You should size and varnish the labels directly the paste is dry. Under the circumstances the peeling off is not to be wondered at. [*Reply to* S. H.—5/23.]

LIN. CAMPH. B.P. WITH JAPANESE CAMPHOR.—The Japanese flowers of camphor which we have met with in England have not been quite so free from the last traces of oil as the English preparation, and has given distinctly more colour when treated with concentrated sulphuric acid; but it has not contained so much oil that the odour has been so pronounced as you state is the case with what you have had in Hong Kong. Unless we see a sample of your camphor we cannot express an opinion on it. [*Reply to* H. H.—5/34.]

AMERICAN DIPLOMA.—No foreign qualification to practise pharmacy is recognised in Great Britain. [*Reply to* W. G. K.—6/15.]

COMPRESSED TABLETS.—We understand the tablets you send consist of "lactopeptine," and are supplied by J. Morgan Richards, 46, Holborn Viaduct, E.C. [*Reply to* FEROX.—5/13.]

ANALYTICAL CHEMIST.—No qualification is necessary, but you would do well to obtain that of the Institute of Chemistry. Write to the Secretary, 30, Bloomsbury Square, London, for particulars. [*Reply to* A. H. P.—5/31.]

'ZEITSCHRIFT F. UNT. DER NAHRUNGS U. GENUSSMITTEL.'—The London agents of this paper are Asher and Co., 13, Bedford Street, Covent Garden, W.C., and the annual subscription price is twenty shillings, postage additional. [*Reply to* P. H. J.—6/4.]

AMMONIACAL SOLUTION OF PHENOL.—The strength is not specified in the original paper. [*Reply to* J. C. F.—6/18.]

CHILDREN'S COUGH MIXTURE.—Ammonium bromide, 2 drachms; ipecacuanha wine, ½ fl. oz.; oxymel of squills, 1 fl. oz.; tincture of senega, 2 fl. drachms; glycerin, 1 fl. oz.; syrup of lemon, to make 4 fl. ozs. Dose, one teaspoonful. [*Reply to* J. R. P.—6/3.]

COLORATION OF AMMONIUM ACETATE SOLUTION.—We are glad to hear that our advice on this subject has been of service to you. Doubtless the cause was a trace of organic impurity, either in the acid or in the ammonia. [*Reply to* T. D.—6/12.]

PERFUME FOR TOILET OATMEAL.—(1) Neroli oil, 2 fluid drachms; oil of *Myrcia acris*, 30 minims; oil of petit grain, 10 minims; oil of lignaloe, 5 minims; oil of rose geranium, 5 minims. (1) Tincture of orris, 2 drachms; ionone, 30 minims; amyl acetate, 1 minim; terpineol, 1 drachm. [*Reply to* REBATE.—5/29.]

SACCHARIN.—There is no import duty upon saccharin in this country. The "importation and sale" of the article you name cannot be an infringement of any patent; it is the process by which it is produced that may or may not be so. The word "saccharin," however, could not be used, as that is protected and reserved for benzoyl-sulphonic-imide, produced by a certain process. It could be sold under the official title of "gluside," if not produced by a process already patented. [*Reply to* M. P. S.—6/7.]

MEAT AND MALT WINE.—If you use a wine of sufficient alcoholic strength it should not become sour. See that your malt extract is not markedly acid; it is sometimes so. You will do better to use the liquid malt extract, which contains a considerable amount of alcohol. Extract of beef, 1 oz.; warm water, 2 ozs.; liquid extract of malt, 4 fl. ozs.; simple elixir, 4 fl. ozs.; sherry, to produce 2 pints. Rub the beef extract smooth with the water, add the malt and the elixir, then gradually the wine. Set aside for several days, decant, and filter bright through powdered pumice-stone. Of course you know that all such preparations require a wine licence. [*Reply to* F. W.—6/6.]

CLEANSING COLOURED CLOTHS.—*Red*: The aniline dyes are not very satisfactory for this purpose. A more satisfactory preparation is made by boiling together crushed cochineal, 6 ounces, and salts of lemon, 4 ounces, in 1 gallon of rain or distilled water, and straining. This will do for either red or scarlet cloth. *Yellow* cloth is best cleaned with a solution of the best soft soap and ox-gall; or with soap and pipe clay. The two latter should be prepared in the form of a paste, using the requisite quantity dissolved in water as required. Another good general cloth cleanser is made by mixing equal parts of fuller's earth and soft soap. The cloth is first moistened with water, then rubbed with the mixture, allowed to dry, then rinsed with warm water, and rubbed clean. An ounce of ox-gall to every half pound of the mixture improves it. [*Reply to* NEMO.—5/17.]

COMMUNICATIONS, LETTERS, etc., have been received from

Messrs. Andrews, Ashford, Ashton, Atkinson, Barker, Bayley, Beer, Bell Brierley, Butler, Campkin, Cannon, Catford, Cox, Cummings, Curtis, Davies Dobbin, Duncan, Dunlop, Dunning, Eberlin, Evans, Fell, Forster, Gibbard, Groves, Hill, Jackson, Jones, Keen, Kemp, Kerr, King, Levin, Marsden, Mathias, Matthews, Miller, Parry, Pring, Ritchie, Ross, Ruff, Thursfield, Twinberrow, Vallet, Walker, Watson, Williams.

THE PHARMACY OF CANTHARIDES.*

BY PROFESSOR H. G. GREENISH, F.I.C., F.L.S., AND HAROLD WILSON.

For some years past the efforts of pharmacists have been directed to the regulation of the strength of potent remedies. The standardisation of drugs and of preparations made from them has been the subject of many contributions to current pharmaceutical literature, and many suggestions have been made by which such regulation of the strength of potent remedies may be effected. The majority of suggestions have been based upon one of two principles. Either a definite quantity of the pure active constituent of the drug is dissolved in a suitable medium, or the preparation is made from the drug itself, and the proportion of active constituent is regulated by assay.

Now in all cases in which the action of the drug depends upon the presence of more than one constituent, the assay, depending on the determination of one only of those constituents, cannot give an accurate indication of the relative value of the drug. It may be sufficiently accurate to be of service in regulating the potency of the drug within reasonable limits, as in the case of opium, or those limits may be so wide that the assay is devoid of real value, and this latter is the case with all assays in which constituents varying much in their effects are determined together.

A further difficulty is presented by such drugs or preparations as those in which the active constituent is present in so small a proportion, or associated with such other substances, that its accurate determination is a matter of great difficulty.

This is the case with cantharides. The active principle—for we have no reason to suppose the existence of more than one—is present in proportion so small that the assay of most of the official preparations of the drug is impracticable. Of the desirability of regulating the strength of such potent remedies there can, we think, be no question, and it appears to us equally certain that uniformity in them can be obtained by one means only, viz., by preparing them from the pure definite active constituent, cantharidin. Fortunately, the preparation on the large scale of this substance in a state of purity is a matter of no difficulty.

It appeared to us that before we could offer formulæ for preparations made from pure cantharidin to replace those at present official, made from the crude drug, we must know what proportion of cantharidin is really extracted in making the preparations from the drug. We had no definite knowledge of the degree to which the flies are exhausted by the various menstrua used in the official preparations. These menstrua include water, proof spirit, acetic acid, acetic ether, and olive oil, and complete exhaustion, or even uniformly incomplete exhaustion, by such varied menstrua could not be anticipated. Moreover, there is no doubt that the cantharidin is present in the drug in two forms, viz., partly as "free" cantharidin, soluble in chloroform, and partly as "combined" cantharidin, insoluble in chloroform, varying in their solubilities.

We determined, therefore, to proceed as follows:—

First, to obtain a quantity of powdered cantharides of good quality and determine accurately the cantharidin contained in them.

Second, to prepare the official preparations from these assayed flies and determine the proportion of cantharidin extracted.

Third, to propose new formulæ based upon these assays.

Assay of Cantharides.

Numerous processes have been devised and recommended for the assay of cantharides, but none appeared to us free from objection.

The method adopted by one of us* involved the use of petroleum spirit to remove fixed oil from powdered cantharides, and alcohol to wash the cantharidin before weighing it. Both of these solvents dissolve cantharidin, and the corrections made for such loss are of doubtful accuracy.

Gunn's† process is open to the same objection as regards the use of petroleum spirit. Moreover, he dries moist cantharides containing free cantharidin and decolorises with animal charcoal the solution of cantharidin extracted; both operations involve the risk of loss of cantharidin, for this substance volatilises in notable quantity at the temperature of a water-bath, as we have proved by experiment.

Nagelvoort‡ avoids the loss in drying the cantharides by conducting this operation at a temperature of 130° F., but the crude cantharidin is washed with bisulphide of carbon and decolorised with animal charcoal, both of which operations involve loss of cantharidin.

Braithwaite§ extracted African blistering beetles (*Mylabris bifasciata*) with acetic ether, evaporated to dryness, and washed the residue thoroughly with carbon bisulphide, then sparingly with rectified spirit until colourless, the alcoholic washings removing not more than two or three milligrammes of cantharidin. In working upon *Cantharis vesicatoria* we have found that both carbon disulphide and rectified spirit remove notable quantities of cantharidin, and consider acetic ether an unsuitable solvent for the assay, as it extracts some substance that chloroform does not, and this renders the residue more difficult to obtain in a pure state.

Baudin‖ exhausts cantharides with chloroform to remove the cantharidin which exists in them in the free state, and then with chloroform acidified with hydrochloric acid to liberate cantharidin that may occur in a state of combination, in which state it is insoluble in chloroform, determining, therefore, both "free" and "combined" cantharidin. The crude cantharidin is washed with carbon disulphide, for which a correction is made. We have not found chloroform acidified with hydrochloric acid a suitable menstruum for extracting combined cantharidin, nor can we approve of a "correction" for washing with carbon disulphide.

The chief objection to these processes lies not in defective exhaustion of the cantharides, but in loss sustained during the purification of the cantharidin. Although petroleum spirit and carbon disulphide dissolve very small quantities of pure cantharidin, they take up notable quantities in the presence of the fat, to remove which they are usually employed, and especially is this the case when a chloroformic solution of fat and cantharidin is evaporated; part of the cantharidin crystallises from the fat but part remains dissolved in it, and this is carried into solution by petroleum spirit and similar solvents. We have found by experiment quantities varying from 8 to 18 milligrammes thus dissolved by petroleum spirit when employed for removing the fat. From the outset we determined, if possible, to collect and weigh the whole of the cantharidin present. The method of making corrections for the use of carbon disulphide, petroleum spirit, or alcohol is unreliable, as our experiments do not indicate that the same proportion is always removed.

In the following assay process we actually recover the cantharidin removed with the fat. We have also devised a method for separating the whole of the cantharidin from the green resinoid matter with which it is so closely associated, and have thus obviated the necessity of a correction for alcohol.

Determination of Total Cantharidin.

20 grammes of the flies in No. 40 powder are mixed in a small mortar with 25 C.c. of a mixture of—

Glacial Acetic Acid	1 volume.
Rectified Spirit	2 volumes.
Chloroform	3 volumes.

The moistened mass is covered over for about an hour, and then either allowed to dry spontaneously or at a slightly raised temperature. This is easily accomplished without loss of cantharidin. The dried mass is then packed in a Soxhlet extractor and exhausted with chloroform, the latter being first used to rinse out the mortar used.

About one hour will usually suffice for complete extraction if the substance be well packed, but complete exhaustion should always be ascertained by removing the flask with the chloroformic solution, and continuing the extraction with a little fresh chloroform.

The chloroformic solution thus obtained is placed in a separator containing a little water, and the acetic acid, which passes into the water, is almost, but not quite, neutralised with solution of potash, and the whole well shaken.

The chloroformic layer is run off into a glass dish and evaporated, cautiously towards the end. The residue consists of fat, in which can be seen crystals of cantharidin. The fat is removed by washing with petroleum spirit (the washings being set aside), leaving in the dish crystals of cantharidin mixed with a green substance of a resinous nature. This residue is allowed to dry, and is then washed with successive small quantities of absolute alcohol until all green matter is removed, and perfectly white cantharidin remains. The alcoholic washings are carefully evaporated.

The cantharidin, dissolved or mechanically removed whilst washing out the fat with petroleum spirit, is now recovered; 20 C.c. of 10 per cent. solution of caustic potash are added to the petroleum spirit solution, and the mixture warmed until the fat is completely saponified; during this process most of the petroleum spirit is dissipated. The soap solution thus produced is diluted with warm water and transferred to a separator, sufficient petroleum spirit being added to dissolve the fat acids when liberated; it is now acidified with hydrochloric acid, when the fat acids rapidly rise and dissolve in the petroleum spirit. The aqueous layer is quickly run off from beneath the petroleum spirit solution into another separator, the petroleum spirit solution washed with water and the washings added. The cantharidin is then removed by shaking with successive quantities of chloroform as long as cantharidin is removed; this must be ascertained. In the chloroformic solution thus obtained the residue from the alcoholic washings of the crystallised cantharidin is dissolved.

The chloroform now contains in solution chiefly cantharidin and the green resinous matter previously mentioned. It is placed in a separator and shaken with lime water, containing excess of calcium hydroxide suspended in it, and solution of common salt, the latter causing the chloroformic layer to separate more readily.

In this way the cantharidin passes into aqueous solution, probably as cantharidate of calcium, whilst the chloroformic layer containing green resin and colouring matter is rejected.

The aqueous solution is filtered, acidified with hydrochloric acid, and shaken out with chloroform as before. This chloroformic solution is added to the cantharidin previously separated evaporated cautiously, dried in a desiccator, and weighed. In this way a crystalline residue of cantharidin only very slightly coloured is obtained.

Determination of Free Cantharidin.

This is accomplished in the same way as the determination of total cantharidin, with the exception that the drug is not moistened with the acetic acid mixture before extraction, and, no acetic acid being present, the washing of the chloroformic solution with water becomes unnecessary.

Determination of Combined Cantharidin.

The proportion of combined cantharidin present has been determined by difference between cantharidin yielded in determining total cantharidin and that obtained in determining free cantharidin.

We have found by experiment that no cantharidin is lost in filtering the solution obtained by shaking the chloroformic solution of cantharidin with milk of lime and salt solution; at least, when the quantity of cantharidin present is small, as it always is where this process has been employed by us. A test experiment showed that 100 C.c. of the filtered liquid contained ·027 gramme of cantharidin in solution at 15° C. From these figures it will be seen that if a large quantity of cantharidin be present a correspondingly large quantity of milk of lime must be employed.

We have also checked the method employed for recovering cantharidin from its solution in fat by an experiment with a known weight of cantharidin dissolved in fat free from cantharidin; the whole of the cantharidin was recovered.

Although the process is somewhat lengthy we have the satisfaction of knowing that loss of cantharidin has been carefully guarded against.

Assay of Cantharides.

Cantharidin in 20 grammes.

	Free.	Combined.	Total.
No. 1	·1025	·011	·1135
No. 1	·1005	·01	·1105
Mean	·1015	·0105	·112
No 2	·101	·034	·135
No. 2	·102	·035	·137
Mean	·1015	·0345	·136

Cantharidin per cent. (mean).

No. 1	·5075	·0525	·56
No. 2	·5075	·1725	·68

That cantharides vary considerably in the proportion of cantharidin they contain is so well known that although we have examined several samples we quote only the two above as good commercial specimens, showing a considerable difference in the amount of combined cantharidin they contain. We chose sample 2 for making the official preparations, with the view of determining, if possible, the action of the menstrua on the combined as distinct from the free cantharidin.

Assay of Official Preparations of Cantharides.

Liquor Epispasticus.

Preparation.—Five ounces of powdered cantharides from sample 2 were moistened in a mortar with 3 fluid ounces of acetic ether, packed in a cylindrical glass percolator, and allowed to stand for twenty-four hours. The mortar was then rinsed with acetic ether, which was poured on the packed drug, and percolation allowed to proceed until exactly a pint had been collected.

Assay.—Eighty C.c. (equivalent to 20 grammes of cantharides) were measured off and allowed to evaporate. From the residue, consisting principally of fat and cantharidin, the latter was separated by removing the fat with petroleum spirit, and then washing with alcohol; to the residue of pure cantharidin thus obtained was then added that recovered from petroleum spirit and alcoholic washings, as detailed in our assay process.

Cantharidin found = ·141 gramme.

As our assay of this sample of cantharides showed that 20 grammes contained ·136 gramme of cantharidin, it is evident that acetic ether dissolves both free and combined cantharadin.

The marc was assayed and found to have been completely exhausted.

The free acid usually present in commercial acetic ether probably liberates the combined cantharidin, which then passes into solution.

The excess of 5 milligrammes in the cantharidin found over that calculated is probably due to adhering impurity, which acetic ether brings into solution, and from which the cantharidin can only with difficulty be separated.

Tinctura Cantharidis.

Preparation.—One ounce of powdered cantharides from sample 2 was macerated for seven days with 4 pints of proof spirit with occasional agitation.

The tincture was filtered off into a tared vessel as completely as possible, and weighed = 2055·5 grammes. The filter paper containing the whole of the marc was weighed whilst wet, allowed to dry spontaneously, and again weighed. Loss by drying or weight of tincture dried on marc = 51 grammes.

Assay of Tincture.—20 C.c. of 10 per cent. solution of potash were added to fix the cantharidin, the spirit was distilled off, and the solution evaporated to about half a pint. It was then strained into a separator through glass wool, acidified with hydrochloric acid, and shaken out with chloroform.

From this chloroformic solution the cantharidin was recovered as detailed in our assay process.

Cantharidin extracted = ·171 gramme.

Assay of Marc.—The residue was treated in exactly the same way as in our determination of total cantharidin.

Cantharidin extracted = ·023 gramme.

Now the 51 grammes of tincture retained by the marc contain ·004 gramme, therefore the calculated results are :—

Cantharidin extracted	=	·175
,, not extracted	=	·019
		·194

One ounce of cantharides from sample 2 contains ·193 gr. cantharidin. The extraction of both free and combined cantharidin is, therefore, practically complete.

Emplastrum Calefaciens.

Preparation :—20 grammes of cantharides from sample 2 in No. 40 powder were infused in 100 grammes of boiling water for six hours with frequent stirring.

90·9 grammes of liquid were then separated by straining and pressing, leaving 10·4 grammes in the marc, the latter figure being found by loss in weight by drying. The cantharidin was then determined first in the strained liquid and subsequently in the marc.

Assay.—I. Strained Liquid : It being impossible to shake out cantharidin by means of chloroform from an aqueous infusion of cantharides, on account of its emulsifying properties, the following method was adopted :—

The infusion was made alkaline with solution of potash and evaporated to dryness on a water bath, adding asbestos wool towards the end of the process. This wool on which the extract had dried was then packed in a Soxhlet extractor, acidified with glacial acetic acid, and extracted with chloroform. The chloroformic solution was placed in a separator with water and the aqueous layer nearly neutralised with solution of potash. After vigorous shaking the chloroformic layer was run off into a large separator and shaken with a large quantity of milk of lime and salt solution. The aqueous solution was filtered off, acidified with hydrochloric acid, and treated with chloroform in the usual manner.

Cantharidin extracted = ·079 gramme.

II. Marc with Liquid Dried on.—This was assayed by the method for total cantharidin, previously described.

Cantharidin found = ·051 gramme.

Now by calculation the 10·4 grammes of infusion retained by the marc contained ·009 gramme. The result is therefore as follows :—

Cantharidin extracted by water	=	·088 gr.
,, left in flies	=	·042 gr.
		·130 gr.

As 20 grammes of sample 2 cantharides contain ·136 gr. of cantharidin, a loss of ·006 gr. has been incurred in the assays.

Considering the exceedingly small extent to which cantharidin in the free state is soluble in water, these results are somewhat surprising.

Possibly here the cantharidin passes into solution as an ammonium salt, as when solution of potash is added to the infusion during estimation ammonia gas is given off. It would be interesting to know if any appreciable quantity of cantharidin is actually dissolved in the free state by the water, or brought into solution by other bodies dissolved, but the importance of the subject from the point of view of this paper did not warrant us in so great an expenditure of time as the settling of this point would entail.

That the cantharidin is actually in solution we have proved by filtering the solution through kaolin, and then estimating, when results have been obtained identical with those given in the above determination.

Emplastrum Cantharidis.

Preparation.—Four ounces of powdered cantharides from sample 2 was taken, and with them exactly 12 ounces of the official plaster was prepared.

Assay.—A quantity of this plaster was melted over a water-bath and poured on to a filter supported in a hot water funnel, the mixture of filtered fats, etc., being collected in a tared flask.

Fat, etc., filtered off = 67·5 grammes.

This was dissolved in 50 grammes of hot petroleum spirit and poured into a separator standing in warm water and containing 200 C.c. of 10 per cent. solution of potash mixed with the same quantity of boiling water. The solution was acidified with hydrochloric acid, the aqueous layer run off into a flask, made faintly alkaline with solution of ammonia, and filtered through kaolin to remove suspended resin. By repetition of this treatment traces only of cantharidin were removed. The filtered solution was placed in a separator, acidified with hydrochloric acid, and shaken out with chloroform.

As this chloroformic solution was coloured the cantharidin was removed from it by shaking with milk of lime and salt solution, the aqueous layer filtered, acidified, and again shaken out with chloroform, which, on evaporation, gave a residue of cantharidin with some resin, so it was washed with 1 C.c. of absolute alcohol, leaving a residue of perfectly pure cantharidin.

Weight of cantharidin	=	·066
Correction for alcohol	=	.001
		·067

It will be seen that 1 gramme of the filtered plaster contains about 1 milligramme of cantharidin.

Now, 40 grammes of filtered plaster correspond to 20 grammes of powdered cantharides ; by calculating, from the above assay we find that of the ·136 gr. of cantharidin present in 20 gr. of flies, ·040 gr. is dissolved and ·096 gr. undissolved. The residue was not assayed, for the assay is extremely difficult, the wax and resin being particularly troublesome.

Judging from analogy with the ointment, we may say with a fair degree of certainty that no combined cantharidin is extracted, but that is a matter of relatively small importance when we consider the small proportion of total cantharidin which passes into solution. It must also be observed that by keeping the plaster melted at the raised temperature necessary for filtration, facilities must be given for even more cantharidin to pass into solution than would be the case in preparing the plaster by the official process; the proportion of cantharidin is therefore probably above rather than below that of the present official plaster.

Unguentum Cantharidis.

20 grammes of cantharides in No. 40 powder from sample 2 were macerated with 100 grammes (120 C.c.) of olive oil for twelve hours with occasional stirring. The mixture was then subjected to the temperature of a water bath for 15 minutes with constant stirring, placed in calico and pressed.

Oil pressed out	=	98 grammes.
,, left on flies	=	12 grammes.

The cantharidin was then determined first in the oil removed, and then in the residue after pressing.

Assay 1. Oil expressed.—The oil was completely saponified by warming with solution of potash; calcium hydroxide was then added in excess, and the liquid filtered off from the calcium soap thus produced. This liquid was acidified with hydrochloric acid and the cantharidin removed by shaking with successive quantities of chloroform.

The chloroformic solution of cantharidin was carefully evaporated.

Cantharidin found = ·044 gramme.

To this must be added the cantharidin retained by the oil left on the flies which is found by calculation to be ·006, making the total quantity extracted by oil ·050 gramme.

II. Residue of flies with 12 grammes of oil.—The flies were transferred from the calico to a beaker and stirred with petroleum spirit, the mass being transferred to a filter, washed with more petroleum spirit and allowed to dry.

The dried flies were packed in a Soxhlet extractor and extracted with chloroform, the cantharidin being recovered in the usual way.

The petroleum spirit washings (containing the oil from the marc) were treated in the same way as the oil in the previous determination, and the cantharidin added to that obtained from the dried flies.

Cantharidin found = ·041 gr.,

of which ·006 were contained in the oil left on the flies, leaving a difference of ·035 free cantharidin not extracted by oil.

The residue of flies was now removed from the Soxhlet extractor, moistened with acetic acid mixture, and allowed to dry. It was then packed again and exhausted with chloroform, and the cantharidin recovered as detailed in our assay process.

Cantharidin found (combined) ..... = ·034

Results, therefore, are:—

Cantharidin extracted by oil	=	·050
,, left in flies (free)	=	·035
,, left in flies (combined)	=	·034
		·119
,, present in 20 grammes of flies used	=	·136
	Error	·017

In this preparation it will be seen that nearly two-thirds of the free cantharidin has been extracted by the oil, or nearly half a milligramme to each gramme of oil, whilst the combined cantharidin has not been extracted at all.

Acetum Cantharidis.

We have found the official method for making this preparation quite impracticable. The heating with acetic acid, to which the cantharides are subjected, results in the production of a magma which resists all attempts at percolation. By pressure we succeeded in obtaining a certain amount of liquid, but we were unsuccessful in our attempts at assay. The liquid pressed out possessed in a remarkable degree the property of emulsifying chloroform; the substance possessing this property could not be removed by precipitation with alcohol; direct evaporation would probably lead to loss of cantharidin, and we could not devise any means of getting rid of the acetic acid without losing cantharidin. We therefore abandoned any further attempts at this assay.

There is one official preparation of cantharides with which we have not dealt, viz., charta epispastica. Blistering paper made by the official process has proved so unsatisfactory that its existence will probably not be prolonged beyond that of the present pharmacopœia. No one could consider the formula to be or ever to have been in harmony with our knowledge of the active constituent of the drug. Should such a preparation be required by the medical profession, there would be no difficulty in devising a suitable formula based upon the results of our work.

Summary.

Our results, showing the action of the various menstrua upon the cantharidin contained in 20 grammes of cantharides, may be tabulated as follows:—

Liquor Epispasticus.		
Cantharidin in flies		·136
,, extracted		·141
Excess		·005
Tinctura Cantharidis.		
Cantharidin in flies		·136
,, extracted by spirit	·123	
,, left in flies	·014	·137
Excess		·001
Emplastrum Cantharidis.		
Cantharidin in flies		·136
,, extracted		·04
,, left in flies (by difference)		·096
Emplastrum Calefaciens.		
Cantharidin in flies		·136
,, extracted by water	·088	
,, left in flies	·042	·130
Deficiency		·006
Unguentum Cantharidis.		
Cantharidin in flies		·136
,, extracted by oil (free)	·049	
,, left in flies (free)	·036	
,, ,, ,, (combined)	·034	·119
Deficiency		·017

The following table shows the weight (or volume) containing 1 part of cantharidin:—

Emplastrum Calefaciens	5454
,, Cantharidis	1500
Liquor Epispasticus	588
Tinctura Cantharidis	12963
Unguentum Cantharidis	2653

Guided by these figures we propose that preparations made from pure cantharidin, and containing it in the following proportions, should replace the corresponding preparations made from the drug.

	Found.	Proposed.	Dieterich.
Acetum Cantharidis		1 in 2000	
Emp. Calefaciens	1 in 5454	1 in 5000	
Emp. Cantharidis	1 in 1500	1 in 1000	1 in 289
Liq. Epispasticus	1 in 588	1 in 300	1 in 316.
Tinct. Cantharidis	1 in 12963	1 in 10000	
Ung. Cantharidis	1 in 2653	1 in 3000	1 in 1306.

The third column contains the proportion of cantharidin recommended by Dieterich.*

* *Pharmaceutical Journal* [3], xiv., p. 169.

Suggested Formulæ.

The following formulæ have been devised so as to represent as nearly as possible the present official preparations. We have purposely abstained from offering suggestions for new preparations.

Liquor Epispasticus.

Cantharidin		1 part.
Castor Oil		6 parts.
Resin		3 parts.
Acetic Ether	up to	300 fluid parts.

Dissolve.

The castor oil and resin have been added to replace the natural fat of the cantharides; such an addition is necessary to aid the absorption of cantharidin by the skin. The resin renders the oil sufficiently viscid and adhesive to prevent it from easily leaving the spot upon which it has been painted.

Collodium Vesicans.

Pyroxylin		1 part.
Blistering Liquid	(as above)	40 fluid parts.

Dissolve.

This preparation has been tested, and it has been found that when applied to the arm it raises a blister in about eight hours.

Tinctura Cantharidis.

Cantharidin		1 part.
Chloroform		100 fluid parts.
Rectified Spirit	up to	10,000 fluid parts.

Dissolve the cantharidin in the chloroform and add the rectified spirit

Acetum Cantharidis.

Cantharidin		1 part.
Glacial Acetic Acid		200 fluid parts.
Acetic Acid	up to	2000 fluid parts.

Add the glacial acetic acid to the cantharidin, then the acetic acid, and dissolve on a water bath.

The strength of this preparation has been based on the assumption that, by the process now official, the whole of the cantharidin would be removed from flies of average strength (containing ·5 per cent. of cantharidin).

Unguentum Cantharidis.

Cantharidin		1 part
Chloroform		a sufficiency.
Yellow Wax		499 parts.
Olive Oil		2500 parts.

Dissolve the cantharidin in a small quantity of chloroform by the aid of heat, add this to the wax and oil previously melted on a water bath and stir well. Continue the application of heat till the chloroform is dissipated, then stir till cold.

This preparation made 1 in 2000 (instead of 1 in 3000) raises a blister when applied on lint. The strength recommended by Dieterich (1 in 1306) appears to us to be much too strong.

Emplastrum Cantharidis.

Cantharidin		1 part.
Chloroform		a sufficiency.
Yellow Wax		in equal proportions
Prepared Suet		
Resin		999 parts.

Dissolve the cantharidin in a small quantity of the chloroform by the aid of heat, and add to the other ingredients previously melted together on a water bath, and stir well. Continue the application of heat till the chloroform is dissipated, and stir till cold.

This yields an excellent preparation, easy to spread and separating well from the blister produced. We have tried it on the arm, and find that it blisters well in from five to six hours. Dieterich recommends 1 in 289, but we consider that unnecessarily strong.

Emplastrum Calefaciens.

Cantharidin		1 part.
Chloroform		a sufficiency.
Olive Oil		199 parts.
Resin Plaster		4800 parts.

Dissolve the cantharidin in a small quantity of chloroform by the aid of heat and add the olive oil; now add this mixture to the resin plaster previously melted on a water-bath and stir well. Continue the application of heat till the chloroform is dissipated.

On trial this plaster has been found to cause redness of the skin, but no blister.

These formulæ possess two great advantages over those at present official, viz., the definite strength of the product, and the ease with which they can be prepared. They make but little demand upon the time or skill of the pharmacist, and yet we venture to think they are not wanting in elegance or efficacy. They indirectly place at the disposal of pharmacy commercial drugs that are at present excluded, and yet are more active than the official. Chinese, as well as other blistering beetles, might be utilised as a source of cantharidin. The definition of this substance would be attended with little difficulty, for its physical, chemical, and physiological characters are well marked.

We regret that our experiments were commenced too late to be of service to those till recently engaged in compiling a new edition of the Pharmacopœia. We think, however, that is is not too soon to commence work on its successor. We also think it extremely desirable that suggested formulæ should be offered for free criticism before they are made official, and we bring forward these suggestions, in a spirit of constructive criticism, for the first Pharmacopœia of the next century.

THE VITTÆ OF CARAWAY FRUITS.*

BY HAROLD E. MATTHEWS.

Some months ago it was suggested to me by Professor Greenish that it would be interesting to investigate the origin and development of the vittæ of one of the official umbelliferous fruits. Acting upon that suggestion I recently made a histological examination of the flower and fruit of *Carum carui*.

The material on which I worked was collected at the Royal Botanical Society's gardens in 1896, and preserved in a weak aqueous solution of formic aldehyde. It consisted of caraway flowers and fruits, and specimens were selected from among them representing six successive stages of development from flower-buds to mature ripe fruits.

The material was dehydrated with alcohol and imbedded in paraffin. A series of transverse and longitudinal sections was made by means of a rocking microtome, and the sections, when stained appropriately and cleared with clove oil, were mounted in Canada balsam. The preparations thus made show the mode of origin of the vittæ and several steps in their subsequent development

The fruit of *Carum carui* is a cremocarp, and in each of its two mericarps there are six vittæ. Four of these are situated on the dorsal surface, alternating with the five ridges, and two of them on the commissure. They extend longitudinally down almost the whole length of the fruit, and are of considerable size.

Besides the vittæ there are five other secretory cavities of much smaller dimensions, one of which accompanies each of the vascular strands which form the five characteristic ridges on the dorsal surface of the mericarp. The cavities are situated outside the bundles and are not very conspicuous.

The transverse section of a young flower-bud of *Carum carui* shows the relatively broad wall of the bicarpellary ovary surrounding two small loculi in which the rudimentary ovules are just discernible. The bundles which ultimately form the characteristic ridges arise as five groups of elements, differing from the parenchyma of the ovary wall by the smaller cross section of the cells composing them and by the presence of vessels thickened in a spiral manner. The sixth bundle, situated on the commissure originates similarly. At a very early stage in the development of the flower-bud six secretory cavities arise deep in the tissue of the carpel and close to its inner wall; these are the rudimentary vittæ.

In addition a similar gland is formed in the parenchyma of the

* Read before a meeting of the School of Pharmacy Students' Association on Friday, February 18.

carpel outside the vascular bundle of each of the five rudimentary ridges.

The mode of formation of all these glands is schizogenous. Three or four contiguous rows of cells extending vertically through almost the whole length of the carpel become filled with a dense substance of a brownish colour. They then split away from each other and leave a small cylindrical cavity where their angles were before united.

The glands of the bundles are permanently circular in cross section, and are lined with a definite epithelium, which persists until the fruit is fully grown, but becomes obliterated when it

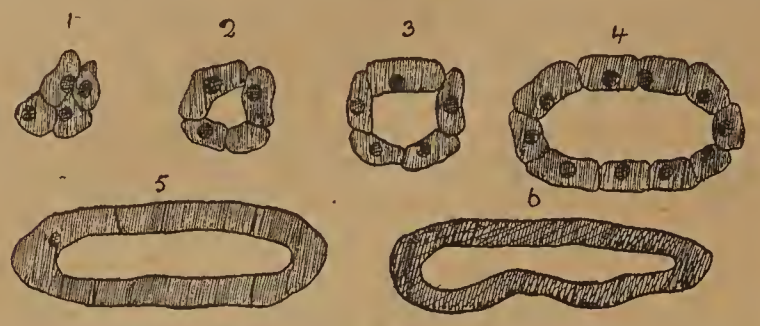

FIG. 1.—DEVELOPMENT OF VITTÆ OF CARAWAY.—1-6, Successive stages: 4, epithelium fully formed; 5, cells of epithelium becoming obliterated; 6, homogeneous wall of vitta as seen in ripe fruit.

ripens. These glands do not increase greatly in size, being approximately two or three times as large in the mature fruit as they are in the youngest flower buds. But the glands which arise deep down in the tissue of the carpel and ultimately form the vittæ undergo considerable changes as to their structure, shape, and dimensions. They lose their circular outline at an early stage, and become more or less elliptical in shape, while their size increases greatly and their epithelial cells become larger and more numerous. The epithelium of the vittæ is composed of cells arising by the multiplication of the cells which split apart to form the original cavity. These epithelial cells are of a brownish

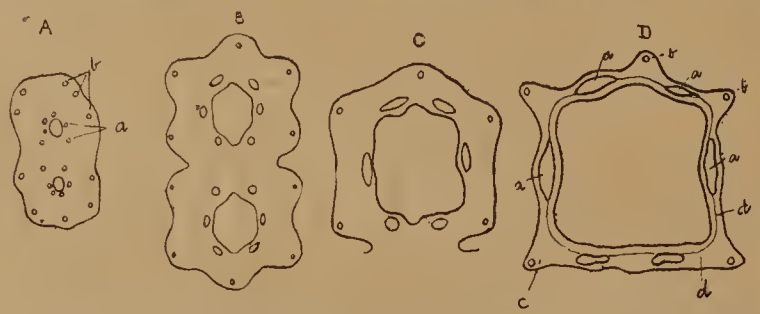

FIG. 2.—STAGES OF DEVELOPMENT OF CARAWAY FRUIT.—A to D, successive stages; *a*, Vittæ; *b*, *c*, ducts of the ridges; *d*, compressed cells of pericarp.

colour, and quite distinct from the surrounding cells, but in spite of their colour nuclei are seen in them up to an advanced stage in the development of the vittæ.

As the ovule grows, the parenchyma lying between the rudimentary vittæ and the inner ovary wall becomes compressed and the cells obliterated. The cells of the pericarp do not keep pace with the rapid growth of the ovule, and so are gradually compressed in a radial direction.

The vascular tissue undergoes considerable development, and, as a consequence, five prominent longitudinal ridges are formed on the outer face of the mericarp. The intervening depressions in which the vittæ lie become less pronounced, so that the mericarp assumes a shape which is more or less pentagonal in cross section. Further radial compression of the cells of the pericarp takes place as the ovule continues to increase, until the pericarp becomes reduced to a very narrow band of tissue with a large ovule within it.

The elliptical cross section which the vittæ assumed shortly after their formation undergoes a slight modification in consequence of the changes in the pericarp, the vittæ become elongated tangentially, but the wall has resistant properties which enable it to retain a convex shape on the side towards the ovule.

At this stage the nuclei of the epithelial cells cease to be visible, and the cells become filled with a dense dark-brown substance showing no differentiation from the walls of the cells, which therefore become obliterated. The epithelium is thus seen to be the only layer concerned in the formation of the vitta wall. It loses all evidence of cellular structure, and finally appears to be quite homogeneous.

Further compression causes the vittæ to assume a slightly irregular shape, elongated and elliptical in cross section.

With the exception of the vascular tissue of the ridges and the vittæ, the structure of the pericarp becomes almost entirely obliterated as the fruit ripens, owing to the great radial pressure to which the cells are subjected; and finally, the ovary wall, which originally was relatively broad, becomes a narrow peripheral layer, and besides the enormous vittæ and the vascular tissue, shows very little structure.

The conclusions of this investigation may be briefly summed up as follows:—The vittæ of caraway fruit arise schizogenously deep in the tissue of the ovary wall, and are lined by an epithelium. The nuclei of the epithelial cells disappear, and the cells become filled with a dark brown substance, which forms with the cell walls one thick homogeneous wall to the vitta. The band of tissue lying outside the vittæ, and constituting the bulk of the ovary wall, then becomes almost entirely obliterated, so that the vittæ are finally situated on the outer surface of the pericarp, although they had their origin deep in its interior.

SELECTED FORMULÆ.

LUBRICANT FOR SOUNDS, BOUGIES, ETC.

The following lubricant is soluble in water, and, therefore, does not coat the mucous surface with a protecting layer; the greasy lubricants which are generally used prevent proper contact of aqueous injections and other medications, since they are insoluble in water. Powdered soap, 6; glycerin, 100; thymol, 1. Dissolve the soap in the glycerin on the water bath, then add the thymol in powder.—*Jour. Pharm. d'Anvers.*

ESSENCE OF VIOLETS WITH IONONE.

Tincture of Florentine orris roots, 3000 parts. Distil off on the water bath 2000; and add to this distillate, extract jasmin, 100; extract of mignonette, 100; extract of cassia, 200; rose water, 200; spirit, 95 per cent., 300; ionone, 16; linalool, 10; oil of orris, 2; essence of musk, 15; essence of civet, 2. Set aside for two or three weeks and filter.—*Pharm. Zeit.*, xlii., 423.

RECIPES FOR OIL FOR THE HAIR.

Orange Blossom: Olive oil, 450; sweet almond oil, 50; oil of lemon, 15; oil of bergamot, 7·5; neroli oil, 1; crystalline nerolin, 0·1. *Rose*: Olive oil, 450; castor oil, 50; palmarosa oil, 15; African geranium oil, 15; oil of cloves, 3; otto, 0·15. *Ylang-ylang*: Olive oil, 450; sweet almond or castor oil, 50; lignaloe oil, 10; cananga oil, 7·5; African geranium oil, 4; ylang-ylang, 3; wintergreen oil, 0·5; oil of nutmeg, 0·2. *Heliotrope*: Olive oil, 450; almond oil, 50; oil of cloves, 15; oil of lignaloe, 6; bergamot, 5; oil of cedar wood, 2; heliotropin, 1; vanillin, 0·4. *Violet*: Olive oil, 450; sweet almond oil, 50; oil of orris, 10; bergamot, 7·5; lavender oil, 6; oil of cedarwood, 5; sandalwood oil, 4; wintergreen, 1. *Macassar*: Olive oil, 400; bergamot, 4; bitter almond oil, 1·5; African geranium, 2.—*Pharm. Zeit.*, lxxii., 515.

PHARMACEUTICAL SOCIETY.

EVENING MEETING IN LONDON.

At the ordinary Evening Meeting of the Pharmaceutical Society of Great Britain on Tuesday, March 8, the chair was taken at 8 o'clock by Mr. Walter Hills, President of the Society.—The first paper read was on

Pharmaceutical Preparations of Cantharides,

by Professor Greenish and Mr. Wilson. The paper is printed at page 255; and gave rise to the following discussion :—

The President said this was a very interesting and practical paper. He was glad it had emanated from the pharmaceutical laboratory of the Society, and hoped it was the precursor of many others of similar character. If they were all equally valuable they would thoroughly justify the existence of that department. He also agreed with the authors that it was not too soon to begin to work for the next Pharmacopœia. He should be glad if Professor Greenish could give any further information as to the combined cantharidin and say what it was associated with, and if it was as efficacious as that in the free state. With regard to the comparative efficacy of different preparations, such as liquor epispasticus and the ointment, he presumed care was taken to apply equal quantities to equal surfaces, otherwise he did not see how a comparison could be made. The specimen of emplastrum cantharidis submitted was certainly superior to what they were in the habit of sending out.

Mr. Martindale said it was highly desirable that more definite preparations of cantharides should be adopted, and he agreed with the suggestion that pure cantharidin should be used instead of the crude article. The difficulty was, however, that the pure article was difficult of solution, and when dissolved by the aid of heat readily crystallised when cooled. Chloroform, which was recommended as the solvent, had its advantages, but when the solution cooled the cantharidin separated in crystals, which were somewhat difficult to manage. Acetone and formic acid were good solvents, and so also was acetic ether, which was used in the present Pharmacopœia, and was more satisfactory than the one named in the 1867 Pharmacopœia, which was glacial acetic acid, followed by ether, to displace it. That was rather a difficult process to carry out, but it made a good liquor epispasticus, in fact, better than the one in the present Pharmacopœia. He was glad to see that the preparation suggested was stronger than the present one. The old preparation, made as directed in 1867, was by no means to be despised, for he remembered once being directed to apply it to a hospital patient's knee, when it not only produced a severe blister, but a considerable amount of strangury. When applied to a small surface to produce quick and efficient blistering it had of late been disappointing, particularly when applied behind the ear or on the temples by aurists or oculists, and he thought the collodion preparation would be a great desideratum in such cases. The question whether the acetum cantharidis was a useful preparation was discussed in a very early volume of the Journal, and Professor Redwood was of opinion that its effect was to a considerable degree due to the action of the glacial acetic acid, others held different views, but he could corroborate what had been said as to the difficulty of making it. It got into a kind of magma which would not percolate, and was very difficult to deal with in any way. He remembered on one occasion, when an apprentice, having, with the assistant, to make some emplastrum cantharidis, and his master thought they had sprinkled the flies in when the mixture was too hot, and that the cantharidin must be volatilised to a considerable extent. He had learned lately, however, that that was quite a mistake, and that it almost wanted digesting. At any rate, it should be fairly warm, and kept warm for some time, in order to make an efficient plaister and get the cantharidin dissolved in the vehicle. He should like to know if cantharidin sublimed readily, and also in what form the combined cantharidin existed. It formed salts with alkalies, and cantharidates of soda and potash had been at one time recommended for hypodermic injection as a cure for phthisis. It was very curious that in making the emplastrum calefaciens, the active principle was taken up by water, seeing that cantharidin was almost insoluble in that liquid.

Professor Greenish said it was so curious that the experiment was repeated three times, but there was no doubt that it was actually dissolved.

Mr. John Umney remarked that liquor epispasticus made with absolutely pure acetic ether, containing no alcohol and no acetic acid, was not nearly so efficient as when it was made with impure acetic ether containing acetic acid and alcohol. That was what might be expected from the liberation of the combined cantharidin, and also from the escarotic action of the acetic acid on the skin when the liquid was applied. He noticed that Professor Greenish proposed a standarised solution of cantharidin in acctic ether, of the strength of 1 in 300, and a liquor epispasticus, having a strength of 1 in 600, and he should like to know if a solution could be made using twice the quantity of flies in the same amount of solvent, in other words twice the strength of the pharmaceutical preparation. As the solubility in acetic ether was said to be 1 in 160, he should presume it could. With regard to making acetum cantharidis by the warm process, he remembered attempting to get some made in that way soon after the 1885 Pharmacopœia came out, but his laboratory assistant suggested that if it were wanted again he had better make it himself, and since then he had always employed the cold process.

Mr. Allen said he was quite sure this paper would well repay careful study. The most important point was the suggestion of formulæ which could be easily adopted, and would give definite results, and anyone who did that deserved the thanks of all practical pharmacists. As he understood, Professor Greenish was not particularly charmed even with his own formula for liquor epispasticus, and seemed to suggest that the crystalline cantharidin was to some extent occluded by the resin.

Professor Greenish said the acetic ether rapidly evaporated, and as there was not much fat present unless successive applications were made, there was not much active principle left to penetrate the skin.

Mr. Allen said he would like to know if any experiments had been made to test the comparative efficacy of the present liquor and the one now suggested. Something which could be relied on as a rapid vesicant was a great desideratum, and it appeared that the collodion would more nearly answer the purpose. He noticed that there were exhibited four potent preparations, which were all colourless, and it occurred to him that if the pharmacy of the future were to resolve itself into the solution of alkaloids in colourless menstrua, very great care would be required in dispensing and handling them.

Mr. Sage agreed with Mr. Umney that pure acetic ether would not extract the whole of the cantharidin. In making comparative experiments some years ago, owing to complaints that the 1885 liquor epispasticus would not blister, he found that the 1867 preparation contained more cantharidin than the 1885, but there was no doubt that the acetic acid used in the former had some influence on the result. On the other hand it seemed rather a retrograde step to give up the old method; he thought rather it should be improved. He had found that by treating the cantharides with acid and a little alcohol, drying them and then extracting with acetic ether he got a much larger proportion of the cantharidin than by following the Pharmacopœia method. He found it more soluble in chloroform than anything else, though acetone was largely used commercially. He had found that cantharidin had a very strong sternutatory effect, for on one occasion having somewhat overheated the solution it set him sneezing so that he was obliged to leave business for the day.

Mr. Collier said cantharides was useful for many purposes, for stimulating lotions and hair washes, as well as for blisters. His experience had shown him that in regard to the latter there was a great difference in the susceptibility of different individuals to the action of such applications, and it was also necessary that certain precautions should be observed in applying them. In many persons the skin required to be cleaned and softened before the blister would act. But on the whole, if due care were taken in these respects, he had found the present preparations satisfactory, and they were largely used at the institution with which he was connected.

Mr. Holmes said there were two important suggestions in this paper; first, that the proportions in the preparations should be given in the metric system, and secondly, that pure cantharidin should be used instead of the flies. It was well known that both Spanish and Chinese flies varied very greatly in the amount of cantharidin they contained, and it would be much more satisfactory to have a uniform product. He could confirm what Mr. Collier had said about individual susceptibility varying. He would like to ask whether, in the case in which the cantharidin

appeared to be dissolved by water, it was the free cantharidin or the cantharidate which was dissolved; secondly, whether the authors had any experience as to the action of heat on the cantharidates causing the setting free of cantharidin; and thirdly, whether any difference had been noticed in the efficacy of preparations made with lanolin and with vegetable fat.

Mr. Sturton asked if Professor Greenish had had any experience of other vesicants, such as Burt's liquor vesicatorius, which was brought to his attention by a surgeon some time ago, who said that the liquor epispasticus was unsatisfactory. It was said to raise a blister in less than half the time of the official preparation.

Professor Greenish, in reply, said they had carefully abstained from proposing any new preparation as yet, but had simply suggested new formulæ for those at present in use, and even in these very possibly experience might suggest further improvements. He could not say with certainty in what form the combined cantharidin existed, but in all probability it was either as a magnesium or calcium salt of cantharidic acid. It was difficult to ascertain the relative efficacy of the liquor epispasticus and other preparations, as it must be remembered that the quantity of liquor one could paint on a part was very small, and would contain much less cantharidin than would be found in the quantity of ointment which could be placed on a piece of lint. If the liquor was to be used as a vesicant its application must be repeated several times. He was aware that acetone and formic acid had been used as solvents, but he did not think either of them had any advantage over chloroform, which was already in the Pharmacopœia, whereas they were not. Some solvent had to be used, because crystallised cantharidin was very slowly soluble in any fat, and not quickly even in chloroform in the cold, but it dissolved readily on warming, and could then be mixed with fat, and on the water bath the chloroform was readily dissipated. Cantharidin volatilised pretty freely, and no doubt in drying cantharides after treatment with acid, as was sometimes done in assaying, cantharidin was lost by volatilisation. Under such circumstances it could be seen subliming on the sides of the dish, but they had not succeeded in recovering the cantharidin in the residues by sublimation. He had very little doubt that the glacial acetic acid in the old formula would considerably aid the action of the cantharidin. There was no doubt that if cantharides were added to melted fat in making the plaster, and it was kept hot for some time, a larger proportion of the cantharidin went into solution, but that was, in his opinion, an additional reason for abandoning that method in favour of an easier and more definite one. He did not know whether the age of the emplastrum cantharidis had any influence on the amount of cantharidin dissolved, but probably it had. In making the liquor epispasticus they were careful to use, not absolutely pure acetic ether, but one such as would ordinarily be found in commerce. The one they used contained traces of acetic acid, but not any large proportion of alcohol; and this extracted the whole of the cantharidin, which absolute acetic ether would not. They had not experimented with double the quantity of flies, but he had very little doubt that such a quantity would be practically exhausted. A liquid preparation which would rapidly produce vesication was no doubt a desideratum, as the application of a plaister in some cases, as behind the ear, was inconvenient; for such purposes he thought the collodion would be valuable. It would be easy to add some colouring matter to the clear preparations if desired, but he should not himself recommend it. They had not noticed the sternutatory effects mentioned by Mr. Sage. They had confined their experiments to themselves, but the existence of personal idiosyncrasies in this matter was well known. It was pointed out by Mr. Squibb that it was desirable to wash the skin not only with soap and water, but in some cases to add a little dilute acetic acid. They had not any experience as to the action of heat on the cantharidates, but he did not think it would have any dissociating effect on cantharidic acid combined with alkalies, such as soda, potash, lime, or magnesia, but it might with ammonia. The condition in which the cantharidin extracted in making the emplastrum calefaciens became soluble in water had puzzled them greatly, and no doubt it was a point on which various theories might be suggested, but he was content with recording the fact. It was not a new fact, because the method of boiling with water was recommended many years ago as a means by which cantharides could be assayed, but it was shown afterwards that only incomplete exhaustion was effected. No doubt lanolin, being a fat easily absorbed by the skin, would be very suitable to use in conjunction with a solution, but they could not employ it because anhydrous lanolin was not over soluble in acetic ether, and no means presented itself for making a preparation which should contain a fair proportion of cantharidin, and at the same time be so viscid that a fair amount could be applied They tried a solution in chloroform containing about one-third of its weight of lanolin, and one in 800 cantharadin, but when painted on the skin and covered with lint it only reddened it, whereas a solution of cantharidin, one in 300, would blister. In conclusion he ought to say that the whole of the experimental work had been carried out by Mr. Wilson under his supervision, and some of the operations dealing with very small quantities of cantharidin in large quantities of fat, resin, wax, etc., were very tedious.

The President then moved a vote of thanks to the authors, which was carried unanimously.

Recent Additions to the Museum.

Mr. Holmes next drew attention to some recent additions to the Museum, including both donations and purchases. First came some specimens of *Rhamnus purshiana*. He had been told that sometimes this bark gave a deep yellow infusion, which was probably due to a mixture of *R. crocea* being present; *R. californica* was also occasionally mixed with it. As a rule the last had a paler colour, and was covered with lichens. There was a very fine specimen presented by Mr. Moss; this was covered with mosses, which he had submitted to Mr. Mitten, the great authority on mosses, who said they were characteristic of the region in which this bark was found. When moss covered a bark it generally prevented lichens growing there, and consequently the purplish-brown tint characteristic of *R. purshiana* bark was shown much better on this specimen than was often the case. Next came some specimens of rhatany, of which there were exhibited the three kinds known in commerce, viz., Savanilla, which had not been obtainable in commerce for many years; the Para, which had been for many years in commerce, but was now somewhat scarce; and Peruvian, which was now more abundant. There was a difference in the practical working of these varieties which he did not think had been sufficiently noticed. Mr. Naylor had prepared for him a tincture of the Para and Peruvian of the Pharmacopœia strength, and although there was not much difference in their appearance, when water in the proportion of 1 to 7 was added the Peruvian gave a cloudy solution, whilst the Para remained clear. Some soap nuts had also been recently presented by Messrs. Hearon, Squire, and Francis. These were the product of *Sapindus mukorossi*. Concerning these, Mr. Holmes said the use of vegetable substances containing saponin has of late years considerably increased. Until quite recently, however, quillaia bark and soap root have been the articles chiefly used. For washing silk, wool, and other fabrics which are likely to be injured by the caustic action of the free alkali or alkaline carbonate, always present in a solution of soap, these two products have been chiefly employed. Quillaia also has largely entered as a constituent into some varieties of soap, and has been employed as a hair wash. For the latter purpose, however suited it may be for the use of Chilian ladies, it is somewhat objectionable to Europeans on account of the unpleasant odour of the tincture. Another purpose for which these vegetable soaps have been used is for the preparation of frothing liquids to give a foamy appearance to aërated waters and alcoholic beverages, and a preparation for this purpose has been made from the fruits of various species of Sapindus, imported from the East or West Indies. Hitherto those imported have been dark in colour and derived apparently either from *Sapindus saponaria* of the West Indies, or *S. trifoliatus* from the East Indies. The fruit to which attention is directed at present is of a pale colour, and might therefore prove useful in some cases in which a dark colour would prove objectionable. These fruits are evidently procurable in considerable quantities, since Dr. G. Watt ('Dict. Econ. Products of India,' vol. vi., pt. II., p. 468) states that the export from the Kumáon forest division amounts to twenty tons per annum. He also quotes a statement to the effect that "some of the tinctorial results for which the Indian dyer is famous can only be produced, it is said, if the fabric be first washed, the fruits of this tree being used as a detergent." It was further suggested that, as plants containing saponine are very rarely attacked by insects, a preparation of the fruits might be worth trial as an insecticide for use in green-houses. A specimen of the crystalline principle of *Daviesia latifolia* had been presented by Mr. Bosisto, of Melbourne. This had been examined by Dr. Paul, who was of opinion that it was a principle not yet described, and was probably of the nature of a glucoside. Specimens of the ingredients forming the essence of lemon and

consisting of the terpene, citral, and citraptene, in the proportions in which they occurred in the ordinary essence, were presented by Messrs. Clayton and Jowett. Two specimens of ipecacuanha represented the two commercial varieties, viz., Carthagena and Rio, and the alkaloids obtained from one pound of each drug. These valuable alkaloids had been presented by Mr. Whiffen. The Carthagena contained much more cephaeline and the Rio more emetine, the former alkaloid being now considered more active as an emetic. The various specimens of asafœtida were interesting from several points of view. The amount of impurity or ash found in this drug varied considerably, ranging from 1½ to 4½ per cent. in the tears which generally came from the Persian Gulf, up to pehaps 12 per cent. in tears of bad quality from Bombay, in which the impurity consisted largely of small flints broken up and mixed with the drug. In ordinary lump asafœtida the impurity varied from 20 to 60 per cent., 36 to 40 being quite usual. When the drug was powdered, which it had to be for making pills, all these impurities went into the powder. In making strained asafœtida, the resin had to be taken out with spirit and the gum with water, and there was a loss of oil during the evaporation, so that the resulting drug was not the same in composition. In his opinion the pure tears only should be used for this purpose, and they only cost about a fourth more than very inferior lump. Of the specimens of the synthetic perfumes presented by Messrs. Schimmel and Co., the jasmine and neroli were specially noteworthy. It was impossible to distil jasmine flowers, so that the perfume had to be extracted by the enfleurage process. This artificial scent was a wonderful imitation, and was both strong and permanent. There was also ionone, which had a powerful odour of violets, and geraniol, the chief principle in otto of roses. There were also a few volatile oils which could be used for making culinary essences for use at times when fresh herbs could not be obtained. Next came a bottle of Japanese wood oil obtained from a euphorbiaceous plant. Some years ago Mr. R. H. Davies read a paper, which was published in the *Pharmaceutical Journal* [3], xv., p. 636, on this oil, and another quite recently by Mr. Dering in the *Journal of the Imperial Institute*. It was largely used in China, where it took the place of linseed oil, and had certain advantages and certain drawbacks. It was drying oil, and when exposed to the air in a thin layer it dried to a white opaque film in twenty hours, whilst linseed oil required sixty hours. Being opaque it was not suitable for some purposes, but was very useful for others, and was worthy of more attention than it had yet received in this country. Some of the newer perfumes having been shown, attention was next called to two oils of amber. One was supposed to be true oil of amber, and was worth about 16*s.* per lb., while the other was sold at 1*s.* or 1*s.* 6*d.*, and obviously could not be obtained from amber. He understood it was produced by the destructive distillation of rosin. In this process a somewhat acid liquid first came off, then a light oil or spirit, known as rosin spirit, and the next product was the thick oil known as rosin oil, a drying oil which was used for many purposes, including the manufacture of printing ink. Another, a bright variety, was used, he was informed, for adulterating linseed oil. Rosin spirit was largely used in making varnishes. Mr. Hart, of Trinidad, had sent a nut called *Omphalea megacarpa*, which was tasteless, and the oil from it was practically tasteless and odourless, and was said to act as efficiently as castor oil without giving so much discomfort; this had already been described in the *Pharmaceutical Journal*. Lastly, there were some specimens of india-rubber from New Guinea, presented by Messrs. Lewis and Peat, one of which was much harder than ordinary rubber, more like gutta percha, and might no doubt be useful for special purposes.

Mr. J. Umney said the different behaviour of tinctures of rhatany when mixed with water was described some years ago by Mr. Braithwaite.

Mr. Moss said he felt much indebted to Mr. Holmes for taking the trouble to identify the cryptogams on the cascara bark, though he knew he was always anxious to clear up any point which was of interest to pharmacists. He should like to know if any opinion had been formed as to the age of the mosses, and, if so, whether that would not be some indication of the age of the bark. He had recently learned from inquiries on the Pacific Ocean that cascara ought not to be described as a shrub, but rather as a tree, and sometimes it was a fairly large tree. One could understand that in different localities the plants would grow to different sizes. He was told that the cascara preferred a damp situation and a loamy soil.

Mr. Holmes, in reply, said one of the mosses might be the growth of one or two seasons, and another species from its size he should think might be five or six years old. The size attained by the plant varied very much with the situation in which the plant grew. Of the two British species, *Rhamnus cathartica* grew only on chalk or limestone in dry situations, and the other, *Rhamnus frangula*, as a rule, in damp sandy woods. About Sevenoaks he had not seen bushes of the latter with a stem larger than his wrist, but on the banks of the Teign he saw one of which the stem was a foot thick, and was a different looking plant altogether. He ought to have stated that he was indebted to Mr. Naylor for determining the amount of ash in the various commercial samples of asafœtida.

The President then proposed a vote of thanks to Mr. Holmes, which was carried unanimously.

DONATIONS TO THE LIBRARY.

At a meeting of the Library, Museum, School and House Committee, on Wednesday, March 9, the Librarian presented the following report of donations:—

To the Library (London).

Radcliffe Library, Oxford:—Catalogue of books added during 1897.

M. A. Petit, Paris:—'Sur deux nouveaux alcaloidos'; 'Contribution à l'étude de la pilocarpine,' etc., 1897.

Pharmaceutical Society of Ireland:—Calendar, 1898.

Surgeon-General, U.S. Army:—Index-catalogue of Library, second series, vol. 2, 1897.

H.M. Secretary of State for War:—'Army Medical Department Report for 1896.

T. B. Browne, Ltd, London:—'The Advertisers' ABC.,' 1898.

Messrs. Street Brothers, London.—'Street's Newspaper Directory,' 1898.

Mr. W. Martindale, London:—'Journal of the Sanitary Institute,' vols. 17-18.

Colonial Pharmacy Board, Cape of Good Hope:—'The Medical and Pharmacy Register,' 1897.

Mr. J. C Sawer, Brighton:—Waller's 'German-English Medical Dictionary, 1884; 'Klinisches Recept-Taschenbuch,' 1883; 'Memoirs of a Stomach.'

To the Library (Edinburgh).

Victorian Pharmaceutical Association:—'Victoria Pharmaceutical Register, 1897.

THE ANNUAL DINNER.

A general meeting of persons interested in the Annual Dinner of the members of the Pharmaceutical Society and their friends took place in the Council Room, 16, Bloomsbury Square, London, W.C., on Wednesday last. Mr. Walter Hills, the President of the Society, presided, and among those present were Messrs. Arkinstall, Eastes, Albert Cooper, Humphrey, Hopkin, Martindale, J. H. Mathews, R. A. Robinson, G. S. Taylor, and Dr. Paul. It was agreed to hold the Dinner on Tuesday, May 17 next, at 6.45 for 7, and the choice of place once more fell upon the Hotel Cecil, though it is to be in the Victoria Hall of that ample building instead of in the Great Hall, which received the Festival diners last year. The price of tickets was fixed at one guinea (including wine), and the usual—one might almost say time-honoured—arrangements for defraying the cost of entertaining guests were also agreed to. After some discussion it was decided that this, the twenty-fifth Annual Dinner, should be graced with the "harmony of sweet sounds"—in other words, that the oratory should be diluted with music. Details were left to the care of a strong Committee, and gentlemen desirous of supporting the President and contributing to the success of the Dinner are requested to communicate their willingness to be enrolled as Stewards to Mr. Bremridge, the Honorary Secretary, 17, Bloomsbury Square, London.

Determination of Phenol in Soap.—Klopine publishes the following method for the assay of phenol in carbolic soap:—Ten grammes of the shaved soap are introduced into a capacious flask with a few fragments of pumice stone and 200 C.c. of 5 per cent. sulphuric acid. This flask is connected on one hand with another flask, which serves as a steam generator, and on the other hand with a condenser attached to a receiver. Steam is then blown through the boiling soap solution, and carries over the phenol. Distillation is continued until 100 C.c. of distillate are obtained, which is then thoroughly cooled, filtered, neutralised with soda, and extracted with ether until no reaction is given by the aqueous solution with ferric chloride. The ether is then evaporated and the phenol either weighed or determined volumetrically.—*Journ. de Pharm.* [6], vi., 165.

LINNEAN SOCIETY OF LONDON.

At the meeting held on Thursday, February 17, Dr. A. C. L. Günther, M.A., F.R.S., President, in the chair.—Professor G. B. Howes exhibited

Specimens of Dog-Fishes.

(1) *Scyllium canicula* from the egg-case, and (2) *Scyllium catulus* prematurely hatched, which he had received from his friend and former pupil, Mr. E. W. L. Holt, of the Marine Biological Laboratory at Plymouth. The specimens showed the dorso-lateral and caudal placoids which led Filippi to propose the species *Scyllium acanthonotum*, shown by Dr. Günther to be based upon a developmental character, and had in recent years been the subject of some interesting speculations by Paul Meyer. For comparison he exhibited also an embryo from the purse of *Callorhynchus antarcticus*, showing a similar set of organs, and gave reasons for surmising that they are not merely transitory vestiges, but of service to the animal while encapsulated within its egg-case.—Mr. J. E. Harting next exhibited a nearly

White Variety of Mus Rattus,

recently obtained in Carnarvonshire, and made some remarks on the difference of haunts and habits in the two species *M. rattus* and *M. decumanus*, and on their usual antagonism. In reply to Mr. H. J. Elwes on the question of occasional hybridism, he stated that no well-established case of the kind had been recorded, although some years ago Mr. Barrett Hamilton had described (*Zool.*, 1888, p. 141) a suspected hybrid which was partly brown in colour, partly black, and exhibited some other intermediate characters. He referred to the so-called Irish rat, *Mus hibernicus* of Thompson, which was now regarded as a permanent black variety of *Mus decumanus* not confined to Ireland. Mr. F. N. Williams then read a paper on

Arenaria,

one of the larger genera of Caryophyllaceæ, which now includes a considerable number of species. *Alsine* and others, usually included as sections of the genus, he thought should be regarded as distinct genera; *Alsine* and *Arenaria* being distinguished by the same cardinal character which separates *Lychnis* from *Silene*. The genus under revision includes species (of which 168 are enumerated) distributed chiefly throughout the north temperate zone, though in the new world a few occur in South America. A few species which extend toward the Tropics occur at considerable elevations on mountain-ranges, reaching, for instance, 19,000 feet in the Himalayas of W. Tibet. In this revision, for the formation of primary groups, the two associated characters relied on are the number of teeth formed by dehiscence of the ripe capsule, and the structure of the disk. An examination of several series of specimens, especially of those of the better known forms growing *in situ*, shows these two characters to be fairly constant, and suitable for the definition of primary groups, although in habit and aspect species of *Alsine* are not readily distinguished from those of *Arenaria*. The author's descriptions are confined to species recognised during the last fifty years (from 1848 to 1897 inclusive), the others being cited in their proper place by name and references.—Mr. G. S. West next read a paper on the histology of the salivary, buccal, and harderian

Glands of the Colubridæ,

with notes on their tooth-succession and the relationship of the poison-duct. The unicellular buccal glands were described especially as concerning their striated free-border, and together with other of the gland-cells treated in relation to their mode of discharge and the presence of "proliferating cells" believed to functionally replace them. The labial glands, which the author regards as mucus-forming, were shown to have their ducts beset in all *Colubridæ* examined by secretory cells similar to those of their alveoli. The parotid gland and poison-duct were next considered; the latter was shown to be much convoluted in the *Hydrophiinæ*, and special attention was given to mucus-secreting glands besetting it already described by Emery in *Naja haje*, accessory alveoli similar to which were discovered, the admixture of this large amount of mucus in the parotid saliva being regarded as peculiar to the Ophidia. Concerning the teeth, it was shown that in *Bungarus* and *Platurus* the poison-fangs are developed not as in Cobra in a single series, but as in the Viperines in two which are parallel; and reason was given for regarding the non-striate muscular cushions present at the bases of the fangs of the *Hydrophiinæ* as representatives of the sphincter muscles of the poison-ducts of the *Crotalidæ*.

NOTICES OF BOOKS.

'Nozioni di Analisi Chimica,' by Dr. Icilio Guareschi (Torino), is an excellent little work of some 170 pages, on chemical analysis. It is such a work as, placed in the hands of a beginner in analytical chemistry, will be found exceedingly well adapted for leading him step by step to the higher branches of applied chemistry. It describes the more important apparatus employed in the laboratory, the operations necessary, and the various reactions, in such a manner as to make all the points clearly understood. It is, moreover, capitally well illustrated. 'Nozioni di Analisi Chimica' is quite worthy of an English translation.

The 'Pocket Formulary,' by Dr. Ludwig Freyberger (London: Rebman Publishing Company. 6*s.* 6*d.* net.), is devoted to the treatment of the diseases of children, and its object is to give the busy practitioner, in a concise and handy form, all the information which may be required as regards the treatment of those diseases by drugs. The monographs are arranged in alphabetical order, and include brief accounts of the properties and uses of medicaments, therapeutics, incompatibles, and doses, besides treating of correction of taste and giving examples of formulæ, together with particulars of antagonists and antidotes. Most of the drugs and preparations referred to are official, and those that are not are distinguished by a variation in the type employed for the names. An appendix includes lists of pharmaceutical preparations suitable for local or hypodermic application, and a therapeutical index gives completeness to the work. It is very tastefully produced, in a most compact and convenient form for the pocket.

'General Elementary Science,' edited by William Briggs, M.A. (London: W. B. Clive, 3*s.* 6*d.*), is a work specially produced to meet the requirements of intending candidates at the University of London Matriculation examination. The new subject in the syllabus—General Elementary Science—includes (1) elementary mechanics; (2) elementary heat, light, and electricity; (3) very elementary chemistry. The wisdom of encouraging such a superficial knowledge of the various sciences may well be doubted, but in any case a handy book is now available, in which all the branche are efficiently treated for examination purposes. The first section is ably dealt with by Professor Bryan, D.Sc., F.R.S., and A. G. Cracknell, M.A., the physics by John Don, M.A., B.Sc., and the chemistry by Drs. G. H. Bailey and Frank Beddow. Such an array of talent was surely never before displayed in connection with so slight a work, but the result is a thoroughly practical book, well arranged for the desired purpose.

'Guide pratique pour les Analyses de Bactériologie Clinique,' is the title of a useful little book of 300 pages, compiled by Léon Feltz and Félix Bouillat (Paris: J. B. Baillière et Fils. 3 fr.) The authors are both pharmaciens of the 1st class, and they have endeavoured to produce a practical guide for the use of medical men and pharmacists, dealing especially with clinical bacteriological analysis. The earlier chapters are devoted to technique and fully illustrated. Then follow detailed descriptions of the more important pathogenic bacteria, coloured illustrations being introduced to show the results of staining by special methods. The analysis of milk, water, urine, etc., receive much attention in the latter part of the book, and tables showing the characteristics of pathogenic microbes are followed by a very complete index. The book is a marvel of cheapness, and it is doubtful if a similar work could be produced at anything like the same price in this country.

CORRECTIONS TO PREVIOUS TABLES.

Most of the following corrections to the tables of metric equivalents recently published are repeated, in order that they may not be overlooked by readers. The Editor will be obliged to any reader who may point out further errors that may be detected :—

Page 209, col. 1, line 24, read "1 Mile = 1,609,342.6 Millimetres."
Page 209, col. 1, line 26, read "1 Grain = 0.0648 Gramme."
Page 209, col. 2, line 15, read "Inches × 0.0254 = Metres."
Page 211, col. 1, line 54, read "77.2" Grains, *not* "74.2."
Page 211, col. 2, line 8, read "Millilitres × 0.035 = Ounces (fluid)."
Page 211, col. 2, line 11, read "Ounces (fluid) ÷ 0.035 = Millilitres."
Page 211, col. 2, line 21, read "Fluid Grains" as "Imperial Measure."
Page 212, col. 1, line 2, read "Fluid Grains" as "Imperial Measure."
Page 212, col. 1, line 50, read "437·5" Fluid Grains, *not* "435.7."
Page 212, col. 1, line 57, read "14.798" Millilitres, *not* "14.394."

THE STUDENTS' PAGE.

EXPLANATORY NOTES ON THE B.P.

SPIRITUS ÆTHERIS NITROSI.—If alcohol be heated with nitric acid alone some of the alcohol is oxidised to aldehyde by the nitric acid, the latter being reduced to nitr*ous* acid. The nitrous acid reacts with more ethyl alcohol to form ethyl nitrite. The distillate obtained in this way and containing chiefly aldehyde and ethyl nitrite dissolved in unchanged alcohol constituted the original sweet spirit of nitre, the nitric acid being at one time formed in the process from potassium nitrate and sulphuric acid. The process in the present Pharmacopœia directs the addition of copper wire, with the intention of thereby reducing the nitr*ic* to nitr*ous* acid, and so increasing the yield of ethyl nitrite. The nitric acid is added in two portions, so as to moderate the rate of reaction. The exact part played by the copper may be interpreted in several ways. Note, however, that the residue after distillation contains the excess of metallic copper with blue crystals of copper sulphate. Probably, however, copper nitrate is first formed, since sulphuric acid of the strength employed has no action on copper. Copper nitrate being first formed would, however, be decomposed by sulphuric acid with regeneration of nitric acid and production of copper sulphate. It is obvious that in the formation of copper nitrate the hydrogen of the acid is displaced by copper—

$$Cu + 2HNO_3 = Cu2(NO_3) + 2H,$$

but this hydrogen never appears as the free elementary gas, but reduces some more of the nitric to nitrous acid.

$$HNO_3 + 2H = HNO_2 + H_2O.$$

The nitrous acid then reacts with alcohol to form ethyl nitrite and water—

$$C_2H_5OH + HNO_2 = C_2H_5NO_2 + H{\cdot}OH,$$

while the copper nitrate is acted upon by the sulphuric acid—

$$Cu2(NO_3) + H_2SO_4 = CuSO_4 + 2HNO_3.$$

Adding these four equations together we get the form in which the initial and final conditions of the reacting substances are usually represented—

$$Cu + HNO_3 + H_2SO_4 + C_2H_5OH = C_2H_5NO_2 + CuSO_4 + 2H_2O.$$

This equation only represents the formation of ethyl nitrite, which, however, is the most valuable constituent of the product. Numerous other reactions occur, which are of subsidiary importance.

Spirit of nitrous ether, when freshly and properly prepared, should be neutral. When old it becomes acid either from oxidation of aldehyde to acetic acid or the hydrolysis of the ethyl nitrite by some of the water present with production of nitrous acid—

$$C_2H_5NO_2 + HOH = C_2H_5OH + HNO_2.$$

The ethyl nitrite should be present to the extent of 2 to 3 per cent. When kept, however, it gradually disappears, partly owing to the decomposition mentioned above and partly to volatilisation, for the boiling-point of ethyl nitrite, 17° C., is so low that it readily escapes, even at ordinary temperature, from the alcohol in which it is dissolved.

The proportion of ethyl nitrite present is determined by measuring the volume of nitric oxide obtained when potassium iodide and dilute sulphuric acid are added to a known volume of the spirit. These two reagents practically yield hydriodic acid, which is very commonly used as a reducing agent in organic chemistry. In the present instance ethyl nitrite, which is an ester of nitrous acid and consequently a derivative of nitrous anhydride (nitrogen trioxide), N_2O_3 yields the lower oxide NO.

$$C_2H_5\text{—}O\,\vdots\,\text{—}NO$$
$$HI$$

The equation usually given is—

$$C_2H_5NO_2 + KI + H_2SO_4 = C_2H_5OH + NO + I + KHSO_4.$$

From this it is evident that 75 grammes of ethyl nitrite (M. Wt. $C_2H_5NO_2 = 75$) will yield 30 grammes of nitric oxide (M. Wt. $NO = 30$) But we know that 30 grammes of nitric oxide measure 22·32 litres at 0° C. and 760 Mm. pressure, because 2 grammes of hydrogen under the same conditions measure this volume, and nitric oxide is fifteen times heavier than hydrogen. Hence 22·32 litres of nitric oxide, or 22,320 C.c., will be obtained from 75 grammes of ethyl nitrite, from which it follows that each C.c. of nitric oxide evolved indicates $\frac{75}{22320}$ gramme of ethyl nitrite in the spirit of nitrous ether taken for analysis. The maximum B.P. requirements are that the spirit shall yield seven times its volume of nitric oxide at 15°·5 C. and 760 Mm. pressure. If, therefore, 5 C.c. of spirit be taken one ought to obtain 35 C.c. nitric oxide under the conditions mentioned. To find the percentage of ethyl nitrite if this volume of gas be obtained proceed as follows:—

35 C.c. nitric oxide at 15.5° C. will measure

$$\frac{35 \times 273}{288{\cdot}5} = 33{\cdot}1 \text{ C.c. at } 0^\circ \text{ C.}$$

$$\text{Now } 22320 \text{ C.c. NO} = 75 \text{ grammes } C_2H_5NO_2$$

$$\therefore\ 1 \text{ C.c. ,,} = \frac{75}{22320} \text{ ,, ,,}$$

$$\therefore\ 33{\cdot}1 \text{ C.c. ,,} = \frac{75 \times 33{\cdot}1}{22320} \text{ ,, ,,}$$

$$= {\cdot}111 \text{ ,, ,,}$$

Therefore the 5 C.c. of spirit of nitrous ether contain ·111 gramme of ethyl nitrite. Taking the specific gravity of the spirit as ·845, 5 C.c. will weigh ·845 × 5 = 4·225 grammes.

Now 4 225 grammes sp. æth. nit. contain ·111 gramme $C_2H_5NO_2$.

$$\therefore\ 1 \text{ ,, ,, ,, ,, ,,} \frac{{\cdot}111}{4{\cdot}225} \text{ ,, ,,}$$

$$\therefore\ 100 \text{ ,, ,, ,, ,, ,,} \frac{{\cdot}111 \times 100}{4{\cdot}225} \text{ ,, ,,}$$

$$= 2{\cdot}63 \text{ per cent.}$$

Note, in passing the isomerism of the nitrites with the nitro derivatives of the hydrocarbons, the empirical formula for both being $R\text{—}NO_2$ where R stands for any organic radicle. They are distinguished by their behaviour towards hydrolytic and reducing agents. In the case of nitro-compounds hydrolysis is not effected and an amine $R\text{—}NH_2$ is obtained by treatment with nascent hydrogen. For these reasons the nitrogen is considered to be linked directly to the carbon of the radicle, and the formula assigned to the nitro compounds is consequently $R\text{—}N\genfrac{}{}{0pt}{}{\nearrow O}{\searrow O}$ In the case of nitrites, under similar circumstances, hydrolysis is easily effected with formation of an alcohol R—OH, and nitrous acid or a salt thereof, while reducing agents also produce an alcohol and ammonia or hydroxylamine. In these reactions the nitrogen is removed from the hydrocarbon radicle, and the formula assigned to nitrites is R—O—NO, which shows that the nitrogen is linked to the radicle, not directly, but through oxygen. Compare the sections on nitro-compounds and esters of nitric and nitrous acids in your text-book of organic chemistry.

SULPHUR PRÆCIPITATUM.—When sulphur is boiled with slaked lime and water a complex mixture of various compounds results, consisting of calcium sulphides and salts of thio acids, of which thiosulphuric acid may serve as a type. When hydrochloric acid is added these calcium compounds are decomposed with formation of soluble calcium chloride and deposition of sulphur, the latter resulting directly from the instability of the corresponding hydrogen compounds or being formed by reaction between other decomposition products, chiefly hydrogen sulphide and sulphurous acid. The absence of ash when this product is burned excludes the use of an old form, milk of sulphur, containing calcium sulphate, which is obtained by using sulphuric in place of hydrochloric acid in the process of manufacture.

SULPHUR SUBLIMATUM.—Prolonged exposure to air and moisture results in the partial oxidation of sulphur to sulphuric acid; hence old samples may redden moistened blue litmus paper. If arsenic sulphide be present this is extracted by digestion with ammonia, forming a soluble sulph-arsenite of ammonium analogous to the compounds obtained in qualitative analysis when the sulphides of the second group are treated with ammonic hydrate or sulphydrate. The filtrate consequently leaves a residue of arsenic sulphide when evaporated.

LONDON: SATURDAY, MARCH 12, 1898.

PROPOSED AMENDMENT OF THE SALE OF FOOD AND DRUGS ACT.

The Bill introduced by Mr. Kearley to consolidate and amend the law relating to the sale of food and drugs is, in most of its essential features, the same as the one introduced by him during the previous session of Parliament, and generally described at the time in this Journal. The provisions of Clause 38, however, relating to the establishment of a Board of Reference, have been altered both in regard to the constitution of the Board and as to its powers. It is now proposed that, in addition to the principal officer of the Government Laboratory, the Board shall include three persons nominated by the Local Government Board, two of whom shall be public analysts, a person nominated by the Board of Agriculture, and persons to be nominated respectively by the General Medical Council, the Institute of Chemistry, the Pharmaceutical Society, the London Chamber of Commerce, the Association of Chambers of Commerce of the United Kingdom, and the Federation of Grocers' Associations of the United Kingdom. The nominations and the appointment of members of the Board are to be subject to approval by the Local Government Board, but it is not stated how the appointments are to be made. The persons nominated as above are to have power to elect three persons representing the principal trade interests affected by the measure to act with them as members of the Board of Reference. This proposed constitution of the Board would afford considerable opportunity for the authoritative expression of opinion on the various subjects which require to be taken into consideration in exercising the powers proposed to be conferred on the Board. It should therefore be useful as a means of removing many of the difficulties which have arisen in the administration of the Food and Drugs Act. Among the most important of its functions will be the settlement of standards for the composition of foods and drugs for the amount of dilution, of deterioration, or natural poverty to be allowed in such articles, and the kind and amount of foreign substances to be allowed for the preservation or flavouring of articles of food. The settlement of those points so as to meet the views of all persons interested and competent to form an opinion will necessarily involve a very considerable amount of work, and from the nature of the evidence given before the Select Committee it may be expected that in some instances at least no little difficulty will be experienced in arriving at agreement. That probability appears to have been anticipated by the provision that the Board shall have power to make rules and regulations as to the right of audience of persons whose interests are affected by the questions under consideration by the Board to call for documents and papers, and compel the attendance of witnesses, and by the further provision that the duties and powers of the Board may be varied from time to time by order in Council.

Another very important function of the Board will be the making of regulations as to the qualification of analysts and inspectors appointed under the Act as well as the form of certificates to be used, and the wording of labels to be used in the sale of mixed or altered articles. In addition to these duties, the present Bill provides that the Board is to have a general power to institute investigations as to the composition of articles of food and drugs, new forms of adulteration or the methods of examination or analysis to be adopted, and to report the results of such investigations to the Local Government Board. The persons appointed members of the Board of Reference are to hold office for three years and be eligible for re-appointment at the end of that period on being nominated and approved as above stated. The definitions, standards, limits, and regulations of the Board are to be fixed by resolutions, each of which is to be subject to approval by the Privy Council, and when approved is to be advertised in the *London Gazette* and become binding in law on the expiration of one month from the date of advertisement. The remuneration of the members of the Board is to be fixed by the Local Government Board and paid out of moneys provided by Parliament.

In order to facilitate the administration of the Act it is provided that inspectors shall have power to purchase samples of food or drugs exposed for sale by retail or deposited in any place for that purpose, and persons refusing to sell, or wilfully obstructing any officer in the course of his duties, or otherwise attempting to prevent their due execution, are to be guilty of an offence under the Act. Inspectors are also to have access at all reasonable hours to public or private sale rooms, warehouses, stores, etc., where food or drugs are offered or deposited for sale, and to purchase, seize, or procure samples. The same may also be done at the port of entry, at the place of delivery, or at any railway station or other place during transit, and for that purpose the inspectors are to be empowered to break open any packages in which food or drugs may be contained. At the hearing of prosecutions the production of the analyst's certificate is to be sufficient evidence of the facts therein stated unless the defendant requires the analyst to be examined as a witness. From Clause 32 it appears to be intended that in the production of evidence for defence the only certificates admissible are to be those of public analysts. In disputed cases the justices or Courts of Appeal are, on request of either party, to cause the article in question to be sent to the Commissioners of Inland Revenue for analysis by their chemical officers. The penalty incurred by conviction under the Act is to be for a first offence a sum not exceeding twenty pounds; for a second offence within two years not less than five pounds or exceeding fifty pounds, and for a third offence within two years, the penalty is to be not less than twenty pounds nor exceeding one hundred pounds, or in the discretion of the justices, imprisonment with or without hard labour for

a period not exceeding three months. In the case of a second conviction the Court or justices may in addition to the penalty inflicted order a notice of the facts to be affixed to the premises occupied by the offender, for a period not exceeding twenty-one days, or to be published by advertisement in newspapers as the Court may direct, and at the cost of the person convicted.

It will be seen from these details of the Bill introduced by Mr. Kearley that the contemplated legislative provisions against adulteration are very stringent, and that in the event of their becoming law the means of punishing offenders will be very considerably extended. The decision of all questions as to what is to constitute adulteration within the meaning of the Act, will be in the hands of the Board of Reference, and consequently the constitution as well as the action of that Board will be matters of the utmost importance to the general public, and to all traders likely to be affected by its decisions. One great advantage of the settlement of such questions will be greater facility of administration. Public analysts will no longer be required to give opinions as to what should be the nature, substance, and quality of articles demanded by purchasers—whether admixtures of any kind in articles of food are to be held as adulterations, by reason of altering their composition, being dangerous or injurious to health, or in the case of compounded drugs, by reason of affecting injuriously their quality or potency—nor will there be any occasion for them to consider themselves called upon to offer such opinions.

THE PHARMACY BILL.

The Pharmacy Acts Amendment Bill passed its second reading on Monday last unopposed. It was on the paper on the previous Thursday, but was not fortunate enough to go through. The Committee stage of the Bill is fixed for Thursday, March 17. The chief feature of the second reading was the evidence, given in a fairly full House, of sympathy with the objects of the measure and a desire that the reasonable reform it proposes should be carried out. If the Bill should be unfortunate in its later stages, it has at least served a useful purpose in educating Members of Parliament on pharmaceutical matters and enlightening them as to the existence and aims of the Pharmaceutical Society. But we are hopeful that no one will wish to hinder the further progress of this little bit of pharmaceutical home rule.

LONDON UNIVERSITY REFORM.

The second reading of the London University Commission Bill occupied the House of Lords on Friday, the 4th instant, for half an hour or so. The Duke of Devonshire, in moving the second reading, stated that the project of reconstructing the present University on the lines recommended by the Gresham University Commission has the overwhelming support of scientific and teaching opinion. It was only opposed by a certain number of persons who obtained their degrees at a more or less remote period, and who had not been brought into very close touch with the progress of university teaching in other parts of the country. This is a particularly dignified way of saying that the opposition is behind the times, and is composed only of antiquated graduates who cannot appreciate modern requirements; but it seems nevertheless calculated to stimulate the opponents of reform to greater activity. The Bill passed its second reading without debate, and passes to Committee.

ANNOTATIONS.

The Registered Chemists of Great Britain have responded nobly to the appeal for support of the Pharmacy Acts Amendment Bill, which passed its second reading on Monday last, and it is satisfactory to find that the spirit still survives which animated the chemists and druggists of half a century ago—who contended so strenuously in defence of their craft. For there appears to be good reason for anticipating that concerted action of a similar nature may shortly be necessary. It is notorious that, for some years past, the Privy Council has steadily refused to accede to the recommendation of the Council of the Pharmaceutical Society, that carbolic acid and other substances should be scheduled under the Pharmacy Act, 1868, as poisons. A question on the subject was asked in the House of Commons on Tuesday, by Mr. S. Woods, Member for Walthamstow, and in reply the Secretary of State for the Home Department explained that he understands the Privy Council thinks it inexpedient to include carbolic acid in the Poisons Schedule, but that body is of opinion, nevertheless, that regulations should be made with regard to the sale of that and other poisonous substances. In accordance, therefore, with that idea, a Bill has been prepared, and will shortly be introduced into the House. Now this matter will require watching very carefully, in case the regulations proposed by the Bill should be incompatible with the principle embodied in the Act of 1868, in accordance with which it is to the public interest that registered chemists should be the sole recognised retailers of scheduled poisons. If the Privy Council, in its promised Bill, takes the position that no special qualification is required in the public interest for the sale of certain poisonous substances, it might subsequently be thought that neither is such qualification required for the sale of poisons now scheduled. And that would imply a total reversal of the policy of the past thirty years, during which the necessity of an educational qualification of chemists and druggists has been amply proved to be indispensable in the interests of the public.

The Proposed General Index to the *Pharmaceutical Journal* has called forth an editorial in the *Journal of Pharmacology*, in which it is stated that the remarkable progress in pharmaceutical journalism across the Atlantic is largely due to the influence of this Journal, whose files "constitute our most important record of pharmaceutical progress published in the English language." This passage is quoted with becoming modesty. At the same time regret must be expressed that though the Journal is regarded in America as "a record which is simply indispensable to every scholarly pharmacist," the projected general index, the appearance of which is anticipated with much satisfaction by our American contemporary, is still apparently a thing of the dim and distant future. The publication of the index is yet far from assured, not more than half the necessary amount having been promised in subscriptions, and unless much greater interest is taken in the matter by those on whose behalf we originally undertook to make the necessary arrangements, it is greatly to be feared that the project will fall through entirely. As a means of affording a further opportunity to those who have not as yet intimated their desire to possess a copy of the proposed general index, an order form will be found in this week's inset. This should be at once filled up and forwarded to the Editor.

The Alleged Decay in the Art of Prescribing, to which Mr. Edmund White once more directed attention in our columns

last week, is engaging the attention of medical practitioners no less than pharmacists, and curiously enough, remarkable confirmation of Mr. White's remarks was afforded in last week's *Medical Press*. It is pointed out that the divorce between medicine and pharmacy inaugurated by the Royal College of Physicians of London threatens to open up a new era in British practice. For though a practitioner who dispenses his own medicines is not likely to go far wrong, as he will hesitate to send out "a grumous concoction of uncertain hue, in view of the reproaches which he may receive on the morrow," prescriptions brought to pharmacists to dispense cause one "to wonder by what occult process of reasoning they have been lucubrated." It is urged that the moment the medical student is absolved from the obligation of acquiring a practical knowledge of pharmacy, the way is paved to technical errors of the most reprehensible kind, the error being rendered the more serious by the fact that the peccant prescriber would probably highly resent any remonstrance, however guardedly put, on the part of the dispenser.

That Three Months' Experience with a hospital dispenser is but a sorry substitute for the year or two which medical students formerly passed as pupils to a dispensing practitioner, few if any persons are prepared to deny, but the remedy is not so obvious. Even the prolonged period now devoted to medical studies is being steadily encroached upon by the need of extra time for other subjects, and it appears hopeless to anticipate that any counter-revolution will be effected which shall have the result of reinstating the old system of apprenticeship in medicine. How then is the newly-fledged practitioner to know what to prescribe, and why should we marvel at the growing tendency on his part to favour factory-made remedies, the manufacturers of which supply him also with ready-made therapeutics to fit? As the *Medical Press* observes, it is so much easier, under the circumstances, to order a tablet containing this or that combination of drugs, than to formulate, with due regard to official requirements a mixture that can be dispensed properly. According to our contemporary, this decadence is yearly becoming more manifest, and if other licensing bodies follow the example of the London College, it must inevitably proceed *crescendo*.

Complaint in The Matter is Attributed by this medical writer to the pharmacist, whose technical skill is, on the other hand, rendered superfluous by the necessity of dispensing ready-made medicaments at "cutting" prices, or on the other hand, he is too severely taxed by having "to combine the uncombinable." But the tendency of the whole business is more to the disadvantage of medical men than pharmacists, for it encourages the already too widely-prevalent practice of self-medication. The services of pharmacists will probably always be required, if only to supply factory-made remedies to the public, but what will the medical position be when the habit the profession now does its best to inculcate has become chronic? Possibly, the only important result will be to hasten the day when the prescribing of unnecessary physic will be a thing of the past, and though, meanwhile, the use of quack remedies by the public may have largely increased, the balance of advantage may actually be on the side of mankind at large. Not, however, that the prospect will be one of unmixed cheerfulness for the average medical man, for he will then be compelled to learn his business much more thoroughly than he appears to do at present. Doubtless, the fittest will always survive, both in medicine and in pharmacy, but woe to the unprepared who cannot rise above the practice of rule-of-thumb and dependence upon tradition.

The Qualifications of Public Analysts are, in some instances, more talked about than realised, for though the members of that estimable class of public servants are generally assumed to be specialised chemists, they not unfrequently manifest a remarkable lack of sweet reasonableness in matters pertaining to their craft. In last week's Journal we were able to record the fact that strong opposition had been offered at a recent meeting of the Institute of Chemistry to a proposal for improving the qualification of members of the Institute, desirous of holding the appointment of public analyst. That proposal was designed to meet the views of the Local Government Board, a body with ideas on the subject under consideration which do not entirely commend themselves to all existing public analysts. Fortunately, however, the opposition was foiled, and the Institute of Chemistry has taken one more step in the right direction. The outcome of the labours of that body may not manifest themselves fully for some years to come, but no doubt need be entertained that, sooner or later, the effect of those labours will be to fit public analysts for a position that many of them now aspire to rather than deserve.

The Editor of the 'Practitioner' endorses this view in the latest issue of his eminently readable paper, and expresses the opinion that the qualification of the Institute of Chemistry will one day be as obligatory for public analysts as that of the Pharmaceutical Society is for chemists and druggists. His objection, that the certificate of the Institute does not yet afford sufficient evidence of a man's competence, will doubtless be met by the decision henceforth to require of all candidates presenting themselves for the final examination in the analysis of food and drugs, a competent knowledge of therapeutics, pharmacology, and microscopy. In Austria it has recently been decided that not only must the advanced studies of candidates for the post of public analyst be pursued in the medical faculty of a university, but the medical officers of health are to exercise a general supervision and control over the laboratories, besides being responsible for all reports and prosecutions, and medico-legal investigations in criminal actions. As the *Practitioner* remarks, the elaborate scheme for the training and qualification of public analysts in Austria will be a revelation to persons accustomed to, and satisfied with "the haphazard way in which such functionaries are made in this country, with little or no inquiry into the means by which they acquire their knowledge."

Dr. Ludwig Mond was presented last week—at a dinner of the Salt Chamber of Commerce, held at Northwich—with a silver casket containing an illuminated address "in celebration of his gift of the Davy-Faraday Institution to the nation," as the *Times* report puts it. Referring to that report, a correspondent of the same newspaper, who signs himself "M.R.I.," has since stated that it gave an impression of the facts, which can scarcely be regarded as strictly accurate. What actually was conveyed to the managers of the Royal Institution by Dr. Mond's deed of gift was the house adjoining the Royal Institution in Albemarle Street, with the fittings, furniture, and apparatus it contained, the total cost of the gift being about £38,000. The balance of the £100,000 popularly supposed to have been presented either in cash or its equivalent to the Royal Institution by Dr. Mond is only to be paid within a period of thirty years from the date of the deed of gift, and it does not follow of necessity, from the wording of the deed, that it need ever be paid at all. For the present, interest on the balance of £62,000, at the rate of 2¾ per cent., is being paid by Dr. Mond to provide the necessary income for the proper carrying on of the Davy-Faraday Laboratory, but that

income may cease at any time, and in the event of three half-yearly payments being withheld, Dr. Mond or his representatives may be released from further obligation to pay either interest or capital.

An Almost Inevitable Result of that contingency would be the closing of the Davy-Faraday Laboratory, which the Royal Institution could not possibly maintain out of its own resources, and as a matter of fact, the Laboratory would become a veritable white elephant. The gift of Dr. Mond, therefore, magnificent as it undoubtedly is, cannot be regarded as perfect and complete in itself. Nor is it in any sense a gift to the nation, for while it is conducted on its present lines it must remain equally open to all the world. The *Times* correspondent sums up the matter by stating that Dr. Mond's annual payments "only suffice to meet expenditure imposed by himself, and may be stopped at any moment. They do not suffice to pay for supreme scientific direction, which is given gratuitously by the professors of the Royal Institution; but, on the other hand, the Royal Institution enjoys the present benefit of a certain amount of accommodation for its own purposes in the adjoining building." This may appear very much like looking the proverbial gift horse in the mouth in a minutely careful manner, but the facts as stated are substantially borne out by the terms of the deed of gift, and if explanation of the true position of affairs should tend to render the existence of the Davy-Faraday Laboratory more secure, as an integral part of the Royal Institution, which has done such good scientific work of the highest class for nearly a century, nothing but good can come of it.

The Sale of Cough Mixture Containing Morphine has brought trouble upon a Derby chemist. The label on the bottle did not indicate that the preparation was poisonous, and as the death of an elderly woman to whom the mixture had been administered was found to have been accelerated by the morphine, a Coroner and his jury severely censured the chemist "for not complying with the law relating to the sale of drugs." The Coroner said it was perfectly clear that the seller had contravened the Act of Parliament, which, in his opinion, required that the cough mixture should be labelled "Poison" and also registered as a poison. Presumably the latter opinion was based on the idea that the sale of a mixture containing morphine is the sale of a poisonous vegetable alkaloid, which must be dealt with according to the provisions applying to poisons in Part 1 of the Schedule. But whether that be so or not, the Coroner was very decided in his views regarding the necessity of the public being protected, and he said he had not the slightest hesitation in stating that the seller had been guilty of a dereliction of duty in not conforming to the Statute. This is strong language and unfortunately, so far as can be judged from the newspaper report, somewhat justified by the circumstances of the case.

The Annual Dinner of the Members of the Pharmaceutical Society and their friends will be held in the Victoria Hall, Hotel Cecil, London, on Tuesday, May 17, at 6.45 p.m. (see p. 263). The President of the Society will take the chair, and those who are desirous of acting as stewards are requested to send in their names at once to Mr. Richard Bremridge, 17, Bloomsbury Square, London, W.C.

The Practice of the Public Analyst is henceforth to be raised to the ranks of a liberal and learned profession in Austria, and the diploma to that of a university degree. The *Maturität Examen* must first be passed from a *Gymnasium* or *Realschule*, the standard of attainment required being equal to that of an ordinary degree in arts at our older universities. The first part of the curriculum which must then be entered upon—for some subjects in which the diploma of pharmaceutist may be accepted as equivalent—comprises courses in inorganic, organic, and practical chemistry; experimental physics; and theoretical and practical botany, whilst it is followed by an examination in all the subjects, including the setting-up and construction of apparatus. The second part of the curriculum occupies three full years, and during that time the would-be analyst must perfect himself in chemical analysis, the microscopical examination of foods, water analysis, toxicology, and a knowledge of the normal composition and adulteration of foods, drugs, and poisons. Other trifles to be thrown in by the way, are courses on the principles of hygiene, physiology of dietetics, elementary bacteriology, practical physiology and physiological chemistry, forensic chemical analysis, sanitary law, and the law and practice of the courts in public health and medico-legal procedure. To crown all comes the final examination in all the subjects specified, and after that the successful student may become a candidate for the post of public analyst.

Mr. Barnard S. Proctor, of Newcastle-on-Tyne, has recently retired from active business, and it has been suggested that, in order to acknowledge his services to pharmacy, his genial assistance, and his educational work, some tangible token of esteem should be presented to him. A Testimonial Committee has accordingly been formed, consisting of the members of the Council of the Newcastle-on-Tyne Chemists' Association, who have power to add to their number. The form which the testimonial will take, and other details, will be arranged in due course. Meanwhile, it is proposed that the presentation shall take place at a time and place suitable to Mr. Proctor's convenience, the state of his health being such that it is desirable to leave the matter open at present. It is also suggested that, to mark the occasion, a dinner be held, and Mr. Geo. F. Merson, 24, Newgate Street, Newcastle-on-Tyne, Hon. Secretary to the Committee, will be glad to hear from anyone who is prepared to support the movement.

The Junior Army and Navy Stores shareholders assembled last week to hear the chairman of that joint-stock concern explain to them his view of a recent unfortunate incident, when an American ham was sold from the Stores as Irish. He said his committee felt that the charge that the Stores were in the habit of doing such things was untrue, and all salesmen now employed by the company are required to sign a declaration to the effect that they will not knowingly sell any article or commodity under a false or misleading description. This is a healthy sign, but it is difficult to see that it affords sufficient justification for the chairman or shareholders to complain because an opportunity has been afforded to every retail shopkeeper and competitor to fling a stone at the Stores. Most stores—and especially those run by civil servants—compete more or less unfairly with retail tradesmen, and it would be nothing short of miraculous if the latter failed to take advantage of any opportunity of this sort that may present itself to them.

The Kinninmont Prize, which is awarded on the results of an annual competition instituted by Mr. Alexander Kinninmont, takes the form of a gold medal and books. The examination is held in Glasgow, in May or June of each year, those eligible to compete being chemists' assistants in Glasgow and the counties of Argyle, Ayr, Bute, Dumbarton, Dumfries, Kirkcudbright, Lanark, Renfrew and Wigtown, who have complied with the stipulated conditions. The subjects of examination are botany, and magnetism and electricity. Intending competitors should send in their names before the end of April to Mr. W. L. Currie, 223, Byres Road, Glasgow.

Pharmaceutical Transactions.

CHEMISTS' ASSISTANTS' ASSOCIATION.

On Thursday, March 3, the King's Hall, Holborn Restaurant, was occupied by nearly three hundred chemists' assistants and their friends, assembled at the

Twentieth Annual Dinner

of the Association. Mr. T. Morley Taylor, President, was in the chair, supported by Mr. Walter Hills, President of the Pharmaceutical Society, Sir Dyce Duckworth, M.D., Mr. G. T. W. Newsholme, Vice-President of the Pharmaceutical Society, Mr. Michael Carteighe, Mr. C. B. Allen, Mr. W. Warren, Mr. R. Bremridge, Mr. W. H. Martin, Mr. Tyrer, Mr. Umney, Mr. Wills, Mr. Wootton, Dr. Charles Symes, President of the British Pharmaceutical Conference, Dr. B. H. Paul, Dr. W. H. Martindale, Dr. J. Attfield, Professor J. Reynolds Green, Mr. J. H. Mathews, President of the Western Chemists' Association (of London), and many other gentlemen well known in pharmaceutical circles.—After an excellent dinner the President, in a few happy and witty sentences, proposed the toast of "The Queen," which was most loyally received, the national anthem being heartily sung.—Mr. F. W. Gamble then gave

The Medical Profession.

He said the toast of the medical profession required no enunciation to an assembly of chemists. The art of pharmacy took its origin from the profession of medicine, and under the fostering care of the Pharmaceutical Society had come to fill an important function under the parental roof. It was to be regretted that the subject of pharmacy should be in course of relegation to the background of the medical curriculum, since through the consequent decadence of prescribing, pharmacy would be injuriously affected no less than medicine. The advancement of learning during the last decade had in no branch of science been more apparent than in that of medicine. In their admiration of those who have wrought this advance they must not forget that many of the foremost workers had been members of their own ranks. He coupled with the toast of the medical profession the name of Sir Dyce Duckworth.—Sir Dyce Duckworth, in responding, expressed his thanks for the hearty way in which the toast had been received. He felt that the high place accorded to it on the programme was a very great compliment to the profession, in whose name he was proud to reply. There had always existed a cordial feeling between medicine and pharmacy, even in the old days when chemists were known as druggists, but during the past twenty or thirty years the general and scientific education of pharmacists had advanced to such an extent that it was a platitude to say that the relations between the two professions grow closer and closer as the years rolled on. The pharmacists of to-day entered upon their work with enormous advantages over those of his own early days, having received an education at the hands of men in the forefront of the profession, and they were, therefore, better qualified to uphold the honourable and dependable position that pharmacy has attained in this country. Pharmacists as a body were one of the most moral bodies in the body politic. He could not remember ever having heard of one of its members being convicted of "infamous conduct," perhaps his friend on the left (Mr. Carteighe), in the course of a long connection with the Pharmaceutical Society, might have known of a few isolated cases, but they had not got into the public press, as did such cases in his own profession. That was a great deal to have to affirm, but it proved that the public were well justified in placing confidence in pharmacists, and that confidence had placed them in a dependable position as parts of the body politic. Speaking of the study of pharmacy by medical men, he thought it does not receive as much attention now as it did in past years, and in that respect the profession would be the poorer, because he believed that medical men cannot do their duty to their profession and to their patients capably and well without a good pharmaceutical training. Some might say that the time of the students of medicine is now spent in gaining more useful knowledge, but he contended that a good knowledge of pharmacy is very essential in a thorough medical education. Sir Dyce concluded his remarks by referring to the forthcoming British Pharmacopœia, which, he said, they might hope to see in a few weeks' time, and he was sure it will be a mine of interest and a source of great credit to those who have had most to do in preparing it, as it will far surpass anything of the kind that has previously been published.—Mr. C. E. Robinson said that, in proposing

The Pharmaceutical Society,

it was necessary to say only a few words. It was with great pleasure that they saw not only the Pharmaceutical Society so well represented that night, but also every branch of pharmacy and those connected with it. In addition to having present the President, Vice-President, several Councillors, examiners, and professors of the Society, they had many of its members and also many who would have the opportunity of becoming members, if the efforts of the Council were successful in passing the Pharmacy Acts Amendment Bill, and he hoped they would not fail to take advantage of it and become members of the Society. He did not claim that the Pharmaceutical Society is a perfect organisation. If it was, many people would have nothing to grumble at and nothing to write about, but the Council had shown that it has the best interests of the craft at heart in extending the basis of its membership, and he was glad to say that the Pharmaceutical Society has some of its most loyal supporters amongst the members of the Chemists' Assistants' Association. He had pleasure in coupling with the toast the name of Mr. Walter Hills.—Mr. Hills thanked the company for the cordial way in which they had received the toast, so kindly and sympathetically proposed by Mr. Robinson. He was always exceedingly pleased to be at a gathering of the Chemists' Assistants' Association, because he knew that, as a representative of the Pharmaceutical Society, he would receive a hearty welcome. Another reason why he was pleased to meet the members of the Association was because he believed that the views which they corporeally hold are those marked by progress and moderation. When he used the words "progress and moderation" he did not mean them in the same sense as applied to the two parties who had that day been struggling for the seats on the London County Council. They were dictionary words with a definite meeting. Those who were true Progressives desired to progress with moderation, and true Moderates also desired to progress with moderation, and he thought the views given expression to by the C.A.A. had those special marks. He claimed for the great body of the Pharmaceutical Society that they also are progressive, and when he said the Society he meant the Council, for the Council is, or ought to be, what the members of the Society make it. He believed that as a Council they should be a kind of concentrated essence, made *secundum artem*, of the whole Society, and that it should contain, as it were, the active principles of the drug, and if it does not contain the active principles of the drug, then it does not represent the Society. He contended that the Council does represent the great body it is supposed to represent, and he claimed for the Society that its recent actions have been marked by progress and moderation. The Pharmaceutical Society is not perfect, and he did not claim perfection as one of its qualities, but it had done much for the body it represents, and would still do more in the future. Mr. Hills then gave two instances whereby the actions of the Society have been marked by progress and moderation. The first being in respect to the amended Bye-laws, which had received the approval of Her Majesty's Privy Council, and he thought no one would deny that they were in the direction of progress because they would raise the standard of education. They had, as it were, placed a six-barred gate instead of a three-barred one before those desirous of entering pharmacy, and the Society was to be congratulated that after 1900 the test for preliminary education will practically be the same as that required by the General Medical Council, thus tending to raise the standard of education amongst pharmacists The second instance was that of the new Pharmacy Bill, which, he said, was then in an interesting condition. It had been drafted in a spirit of moderation, the Council having carefully avoided two extremes. They had not taken what extreme parties on either hand had proposed, but had taken a moderate view of the matter, which they thought was the right one, and which will in due time greatly increase the power of the Pharmaceutical Society. The Bill had been introduced into the House of Commons by the Hon. F. W. Smith (Strand) and it was down on the agenda of the House of Commons that evening, and if the House was not counted out before that came on he had every reason to believe that it would be brought forward for the second reading. If there should be any opposition that night he hoped they would get over the difficulty later on in the

session, and in that case he might appeal to that large and influential gathering to use their influence with Members of Parliament to induce them to support the Bill. He would also appeal to all who have the interests of the Pharmaceutical Society at heart to do all that they can to further those interests in a right direction. The instances mentioned showed that the Society does combine the great principles of progress and moderation so essential to all good public work, and he thought they could not have a much better motto than "*Festina lente.*" On behalf of the members and Council of the Pharmaceutical Society he thanked them most heartily for the kind way they had received the toast, and he could assure them that, as President of the Pharmaceutical Society, he wished every possible success to the Chemists' Assistants' Association.—Dr. C. Symes then proposed

The Chemists' Assistants' Association.

He thought that an association with some 200 members and 50 patrons did not require any apology for its existence. They could not help admiring those gentlemen who, notwithstanding long hours and tedious duties, meet together to devote their spare time to the study of subjects connected with their calling, and he was sure that such study would bring the members to the front rank in the course of their career. He felt that he was there that night as the representative of the British Pharmaceutical Conference, and he thanked them very much for the recognition thus given to the Conference, which did the same kind of work as the C.A.A. and similar associations were doing. He hoped there were many men present who would become creditable members of the Conference. He wished all success to the C.A.A.—The President responded, and in the course of a lively speech said that at this time, when it is necessary for all registered chemists, who themselves appreciate the value of their work and legal responsibilities, to combine in order to obtain recognition of the same, the C.A.A. was not behind in the work of organisation. The Council of the Association had for two or three years taken every possible step to induce assistants to join, and although there was a falling off each year, they had managed to keep up the membership at about one level, fifty new members being enrolled during the present session. At the last meeting of the Association he had intended to bring forward the subject of trades unionism in pharmacy, but unfortunately was prevented by illness. What he wished to have said was briefly that union amongst assistants is in some form necessary, but whatever methods were employed to form a union they must keep in view the fact that they will be the future proprietors and masters, and he was of opinion that no method that could be employed would be more powerful for good than the formation and support of associations of a mutual character, such as the Chemists' Assistants' Association, of London.—Mr. G. E. Pearson then proposed "The Visitors," coupling with it the names of Mr. J. H. Mathews and Mr. G. T. W. Newsholme.—Mr. Mathews and Mr. Newsholme replied, the latter in the course of his remarks stating that he could not help feeling the immense power for good an association such as the Chemists' Assistants' Association could be. For years there had been a considerable amount of apathy connected with the calling of pharmacy, but he was of opinion that the apathetic state was beginning to pass away. It had been very gratifying to himself and to the President of the Pharmaceutical Society and the members of the Council to see the great amount of enthusiasm that had been raised by the Bill now before Parliament, and that enthusiasm alone, by bringing about a more efficient local organisation, would result in good to the whole craft.—The toast list was interspersed with songs and musical sketches by popular artists, accompanied by Mr. A. T. Rugman, which added much to the pleasure of the evening. The dinner was a decided success, praise being due to Mr. G. Roe, the Vice-President of the Association, for the admirable arrangements well carried out under his able supervision. "Auld Lang Syne" was the last item on the programme, and was heartily sung.

PHARMACEUTICAL SOCIETY OF IRELAND.

The monthly meeting of the Council was held on Wednesday 2nd instant, at 67, Lower Mount Street, Dublin. The President, Mr. R. J. Downes, was in the chair, and the other members of Council present were the Vice-President (Mr. Beggs), the Hon. Treasurer (Mr. Grindley), and Messrs. Kelly, Conyngham, Porter, and Dr. Walsh. In reply to a letter from the Privy Council, the Registrar was directed to say, in reference to a proposed new regulation that candidates entering for examination and afterwards failing to present themselves should forfeit half the examiner's fee, that the Council did not desire to reserve to themselves a power of dispensing with the forfeit in cases where the candidates showed cause for absence. Letters were received from Mr. A. L. Doran in reference to an intimation from the Council that he should conduct the examination in general and pharmaceutical chemistry in such a manner as to include recognition by the candidates of the chemical substances of the Pharmacopœia by their physical characteristics as well as by chemical tests. Mr. Doran maintained that the kind of recognition in question belonged to the materia medica branch of the examinations and not to that of the examiner in chemistry ; and he objected to conform to what he believed to be a strained interpretation of the Council's regulation on the subject.—It was ordered that Mr. Doran should be informed that the Council adhered to their requirement.—Two letters were read from Mr. H. R. Scott, a licentiate of the Society, in Johannesburg, in reply to one from the Registrar, asking for information. Mr. Scott said that in the South African Republic, a licentiate of the Irish Society might register on sending his original certificate together with a fee of £12 10*s.*, and on opening a pharmacy he was required to pay an annual fee of £10 for licence. In the Orange Free State the same regulations prevailed excepting that the registration fee was £3. Mr. Scott advised Irish pharmacists not to come out if they had prospects of a comfortable livelihood at home, but if they did come not to sign agreements for three years or any other period.—Professor Tichborne was named as a delegate to the International Congress of Hygiene and Demography to be held at Madrid on April 10.—Thanks were voted for a donation from the Pharmaceutical Society of Great Britain of their Calendar for 1898.—On the motion of the President some amendments were made in the regulations respecting the examinations, which included requirements that candidates at the Preliminary should "translate an easy English sentence into Latin," and that those presenting for the licence should "read in full the Latin prescriptions given to them to translate." Other business having been disposed of, the Council adjourned.

IRISH PHARMACISTS' ASSISTANTS' ASSOCIATION.

At a meeting of this Association on March 4, Mr. W. J. Hardy, President, in the chair, Mr. Robinson, late examiner to the Pharmaceutical Society, delivered a lecture on

Pharmacy in Ireland.

He began by recapitulating the circumstances which in 1875 led up to the Pharmacy Act (Ireland). Pharmacy up to twenty-three years ago was exclusively in the hands of the apothecaries, and it consisted of the compounding of prescriptions and the sale of drugs. Illegal dispensing was largely carried on, and this, combined with the gradual decline in public favour of the "Hall" licence, first suggested to a number of leading druggists in Dublin the idea of forming themselves into a committee with the object of having a Pharmacy Act passed. This they were enabled to do through the energy and zeal of the then chairman, Mr. E. M. Hodgson. The first pharmaceutical Council was composed of men animated by a high sense of their responsibility, and who were determined to establish a race of thoroughly qualified licentiates capable of carrying on the business with credit to themselves and the Society. At the passing of the Act most of the assistants were engaged in apothecaries' halls, and as they regarded their "halls" as stepping-stones to the medical profession, they regarded the new Society as an interloper. Against such prejudice the Council had to fight, their task being to prove that a pharmaceutical chemist could be a good business man and as much a gentleman as if he styled his concern an "apothecaries' hall" or a "surgery." That the Council succeeded in their efforts was fully exemplified by the fact that the pharmacist of to-day is justly proud of his qualification, which, as regarded the curriculum, is second to none in the kingdom. It was no uncommon thing to see as many as forty candidates presenting themselves for examination at one time, and it was gratifying to the examiners that such was the case. The Licence examination was next spoken of, and its merits and demerits pointed out at some length. It was a test requiring study, reading, slow thought, and good experience. The lecturer was in favour of exempting from at least a portion of the pharmacy subject a candidate who had previously qualified at the Assistants' examination, and who at one time had satisfied the examiners in that subject. The compounding might, he thought, be reasonably dispensed with, as no assistant ought to get a certificate unless his compounding was equal

to all the requirements of a pharmacy. The pharmacy of the "seventies" was a practical one indeed, every chemist and apothecary manufactured his own tinctures, liquors, pills, ointments, infusions, etc. The raw material was handled in every pharmacy of repute, and the assistant was enabled to gain an intimate knowledge of his work sufficient to last a lifetime were it not for the occasional appearance of a new B.P. The pharmacist of to-day was surrounded by a regiment of patent and proprietary medicines in the shape of coated pills, capsules, compressed drugs, concentrated infusions and tinctures, liquors for syrups, spread plasters, etc., to all of which the medical faculty was daily becoming more partial, and woe betide the pharmacist who omitted to furnish his compounding room with the thousand and one articles referred to. The much-debated question whether pharmacy should be called a trade or a profession was touched upon. It became a business when the highly qualified medical man who conducted a pharmacy combined the sale of *Sapo mollis* in pennyworths across the counter and was surrounded by kegs of putty. chandlery, and white lead. It was a profession when all things were in keeping with the name, when a request for a jar of blacking evoked a horrified glance from the gold-spectacled, sedate, and dignified pharmacist. The lecturer gave statistics of the population of the chief cities and towns in Ireland, and showed in how comparatively few of those places it was possible to conduct successfully an exclusive pharmaceutical trade. A mixed business outside the larger towns was absolutely necessary, but it was quite possible to carry on a professional trade, notwithstanding. Allusion was made to the recent manifesto by certain Dublin pharmacists against the sale of quack medicines, and the speaker said it became a nice question, What was the limit of professional pharmacy and where did "quack medicines" begin and end. He thought that patent and proprietary articles could be stocked by the most professional pharmacist for the accommodation of the public. As a matter of fact, owing to the large variety of specialties, it was next to impossible to work a pharmacy without dealing in patents and proprietaries. An instructive comparison was made between the profits enjoyed by the apothecaries of twenty-five years ago and those nowadays realised by the average pharmacist. Where the former netted an income of £600 on a gross yearly turnover of £1000, the chemist of to-day could barely live on the profits accruing from a similar turnover. The decrease in prescription profits arose through the increased use by the medical faculty of patent and proprietary drugs, and the "cutting" of prices by dispensers. Generally speaking, 1*s.* 8*d.* was the top charge for an eight-ounce mixture, but when such prescriptions as the following had to be compounded it was not hard to account for the falling away of the prescription profits.

℞	Liq. Fowler	℥i.
	Syr. Cinch. Alch. Schacht	℥i.
	Tr. Gelsen.	℥ii.
	Tr. Nux Vom.	℥iss.
	Inf. Aurant. ad	℥viii.
℞	Lysidine	℥ss.
	Aqua Aurant. Flor ad	℥viii.
℞	Cocain. Hydroch.	gr. iii.
	Salol	℥i.
	Maltopepsin	℥ii.
In cachets, xii.		
℞	Pot. Iodid	grs. 40
	Pot. Bicarb.	℥ii.
	Sodæ Sal.	℥ii.
	Syr. Sennæ	℥ii.
	Tr. Nux Vom.	℥i.
	Tr. Colchici	℥ii.
	Inf. Senegæ ad	℥viii.

The speaker, commenting on these prescriptions, said the first was a fair type of the present-day mixture. The second could not be made up under 2*s.* 3*d.* cost price. The third and fourth were in keeping with the second, and yet these were expected to be dispensed at 1*s.* 6*d.* or less. The cutting of prices was a far more serious evil, inasmuch as it was in the power of the trade to put an end to it if they would only pull together. A uniform system of prescription pricing was badly wanted, and the speaker submitted a specimen tariff which, in his opinion, met all requirements. It was as follows:—*Mixtures*: 1 oz., 8*d.*; 2 ozs., 10*d.*; 3 ozs., 1*s.* 2*d.*; 4 ozs., 1*s.* 4*d.*; 6 to 8 ozs., 1*s.* 6*d.*; 10 ozs., 1*s.* 10*d.*; 12 ozs., 2*s.*; 16 ozs., 2*s.* 6*d.* *Lotions*: 6 ozs., 1*s.* 4*d.*; 8 to 10 ozs., 1*s.* 6*d.*; 12 ozs., 1*s.* 8*d.*; 16 ozs., 1*s.* 10*d.* *Pills*: 2, 3*d.*; 4, 4*d.*; 6, 6*d.*; 12, 10*d.*; 24, 1*s.* 6*d.*; 36, 2*s.* *Ointment*: ½ oz., 8*d.*; 1 oz., 10*d.*; 2 ozs., 1*s.* 4*d.*; 4 ozs., 2*s.* *Powders*: 1, 2*d.*; 2, 4*d.*; 6, 9*d.*; 12, 1*s.* 6*d.*; 24, 2*s.* *Suppositories*: 3*d.* each or 2*s.* 6*d.* per dozen. The lecturer thought if an association of Dublin chemists were formed for the regulating of prices, the benefits to pharmacy could not be over-estimated. Profitable extras were referred to, and amongst them the manufacture of mineral water and the sale of photographic sundries found much favour. The duties of assistants to their employers and of employers to their assistants were laid down in no uncertain strain by Mr. Robinson, who said that, being assistant for many years before he became an employer, he was in a position to speak on both sides of the question. The position of the assistant had enormously improved within the last twenty years, both as regarded hours and salary. Formerly the indoor salary in Ireland was from £20 to £40 a year, and the outdoor from £52 to £80, and for managers from £100 to £120. Nowadays the range was much higher. An indoor assistant was paid a salary of from £30 to £60 per annum, and an outdoor assistant from £60 to £150, while in most houses the day's work finished at 6 p.m. This compared favourably with the days of his apprenticeship, when his daily round of work was from 8 a.m. to 10 p.m. and 11 p.m. on Saturday, and only a few hours off duty every Sunday. Special stress was laid on the careful reading of prescriptions, and amusing recollections of his experiences as an examiner to the Society were given, the former unsatisfactory conditions of the pharmacy portion of the Licence examination being contrasted with the existing complete facilities provided for candidates in the compounding work of the test. In a moderately busy pharmacy one man should copy the prescriptions, write the labels, check and finish off the mixtures. The dispenser should leave in a line until checked all the drugs used by him. Powders should be weighed, not measured, by hand. Pills ought in every case to be made in a good firm mass, small and divided evenly, and finished off with the rounder. Some useful hints for pill silvering, label trimming, and bottle capping were given. Typewritten labels were recommended. Plaster spreading and the making of suppositories were next touched upon, and the lecturer concluded by quoting the chemist's toast, "May his occupation never become a drug on the market as long as he sticks like his own plasters to business. May he never be bruised in the mortar of adversity by the pestle of misfortune, and may his rise in his profession be as accurately marked as his graduated measure. May his career be as unsullied as distilled water and as smooth and pleasant as pure Narbonne honey. May his success never be alloyed by a mixture of ill-luck or a tincture of regret. May his counter prove the crucible in which he transmutes human ailments into precious metal and precipitates the golden deposit into his own pocket. May he never be called on to swallow the bitter pill of disappointment or be macerated in the cruel spirit of enmity. Should fickle fortune refuse him her smiles may he ever find an antidote in the soothing spirit of a woman's love, be strengthened by the tonic of experience, and purified by the sudorific of patience. Thus his best days being evaporated, and the lamp of existence past trimming, when doctor death sends to his shop the dread prescription 'To be taken at bedtime,' may he be found carefully prepared, accurately dispensed, permanently entered in the day book, neatly put up in the white paper of purity, sealed with the melting tears of loving friends, stamped with the trade mark of honesty, and duly labelled for Heaven."—At the conclusion of the lecture there was much applause. Councillor Conyngham spoke in admiring terms of the lecture, and expressed his entire concurrence with the various sentiments of the lecturer. The portion referring to a revision of the existing charges for prescriptions and the formation of a local protective association of chemists met with unqualified approval, and it was hoped that the matter would not be allowed to drop by the employers generally. Some interesting retrospects of the drug and chemical trade were given by Mr. Conyngham, and Mr. Smith's remarks on the lecture were listened to attentively. Messrs. Turner, O'Sullivan, Bolger, Hunt, and the President having spoken, a cordial vote of thanks to the lecturer terminated the proceedings.

PLYMOUTH, DEVONPORT, STONEHOUSE AND DISTRICT CHEMISTS' ASSOCIATION.

In connection with the Junior Section of this Association on Wednesday, the 2nd inst., Dr. W. Cheyne Wilson delivered a most interesting and instructive lecture entitled

Some of our Microscopic Foes,

illustrated by a large number of lantern slides.—Mr. O. A. Reade presided over a large attendance, which included Messrs. G. Breeze, F. W. Hunt, A. P. Balkwill, J. D. Turney, H. C. Cantle, Waldon, etc.—Mr. O. A. Reade, in proposing a vote of thanks to

Dr. Wilson, said he was sure everyone present had enjoyed the clear and concise way in which Dr. Wilson had given the lecture, and he hoped shortly that the junior members of the Association would again have the pleasure of hearing him.—Mr. TURNEY seconded, and Messrs. BALKWILL and HUNT supported the vote, which was carried unanimously.—A vote of thanks to the Chairman concluded the meeting.

BRIGHTON JUNIOR ASSOCIATION OF PHARMACY.

On Wednesday, February 23, a meeting of this Association was held at their headquarters, Newburgh Hall, Cannon Place, at which papers were read by Messrs. S. Ching and A. S. Kent.—Mr. CHING took for his subject

The Structure of the Eye,

a subject which proved extremely interesting, going, as it did, into the smallest details of the structure and functions of that most important of all the senses. The matter was dealt with in a very masterly manner by Mr. Ching, and was highly apprcciated.

Mr. A. S. KENT then read a paper on

Carbon,

in which he said that carbon was probably the most important solid element to all kinds of living organisms, entering as it does into the composition of almost everything. The human body consists of from 13·5 per cent. to 20 per cent. of C.; wood contains 50 per cent., and good coal about 80 per cent. of it. The air contains immense quantities of it in combination with O in the form of CO_2, and though the quantity varies from 3 to 8 or 9 per cent. only, yet this has been estimated to weigh about three billions of tons. The presence of CO_2 in the atmosphere is of great importance, inasmuch as all the carbon of plants is derived from that source, and the quantity necessary must be enormous when a square metre of leaf will decompose, by the aid of chlorophyll and action of sunight, a litre of CO_2 in an hour.

EDINBURGH CHEMISTS' ASSISTANTS' AND APPRENTICES' ASSOCIATION.

At a meeting held on Friday, February 25, Mr. GEORGE SINCLAIR, President, in the chair, a most interesting lecture was delivered by Mr. GEORGE SENTER on

The Simpler Plants and Animals.

The lecturer dealt with the nature and properties of protoplasm and the essential differences between plants and animals, pointing out that at the borderland between the two kingdoms the differences were so slight that scientists were not agreed as to the classification of some individual forms. The lecture was illustrated by living specimens of amœba, diatoms, volvox, hydra, saccharomyces, and chara, shown under the microscope, and by lantern slides of typical fungi and bacteria. On the motion of the CHAIRMAN a hearty vote of thanks was awarded to Mr. Senter, and the meeting closed.

ABERDEEN AND NORTH OF SCOTLAND SOCIETY OF CHEMISTS AND DRUGGISTS.

The sixty-first annual meeting of this Society was held in the rooms, 21, Bridge Street, on Wednesday, 2nd inst., Mr. JOHN JOHNSTON, President, in the chair. The HON. SECRETARY presented

The Annual Report,

which pointed out that the past year had been most successful. Not only was there a large increase in the membership, but there was also a greater interest taken in the work of the Society, giving a larger average attendance at the meetings and also necessitating many special meetings. The Society's School of Pharmacy was reported to be doing good work. The attendance at the classes had been good and the conduct of the students most exemplary. The laboratory and materia medica museum were in good order, and the number of students attending for private study had been greatly in excess of any previous year.—Mr. JAMES PATERSON, Hon. Treasurer, also submitted his annual report, which showed a satisfactory increase to the funds, notwithstanding the increased expenditure on the rooms. The Society then discussed the new constitution and standing order drawn up by a committee, and after some minor alterations they were unanimously adopted. The title of the Society will now be

The Aberdeen Pharmaceutical Association.

The discussion of the Committee's report on the new scheme of education and re-modelling of the rooms was deferred to a special meeting, to be held on Wednesday, the 9th inst.—Mr. JOHNSTON and Mr. J. CRUICKSHANK intimated that they had written respectively to the Rt. Hon. Mr. Bryce, M.P. for the South division, and Captain Pirie, M P. for the North division, asking them to attend and vote for the new Pharmacy Acts Amendment Bill, and had received favourable replies from both gentlemen.—The election of office-bearers for the current year was then proceeded with. Mr. James Clark, Ph.C., was elected President; Mr. Charles Simpson, Vice-President; Mr. Jas. Paterson, Hon. Treasurer; Mr. J. Cruickshank, Hon. Secretary; and Mr. R. Urquhart, Librarian.—Mr. CLARK proposed a vote of thanks to his predecessor for the attention he had given to the work of the Society during the nine years he had been President.—The vote was heartily accorded.

BRITISH PHARMACEUTICAL CONFERENCE.

A meeting of the Executive Committee was held at 16, Bloomsbury Square, on Wednesday, March 2.—Present :—Dr. C. SYMES (President), in the chair, Messrs. Martindale and Martin (Vice-Presidents), Professor Greenish, Messrs. Bird, Collier, Farr, and White, Messrs. Naylor and Ransom (Hon. Gen. Secretaries), and Mr. Nightingale (Assistant Secretary).—The minutes of the previous meeting were read and confirmed. The Secretaries reported that letters had been received from Messrs. Laidlaw Ewing, Walter Hills, Guiler, Payne, Wells, and Wright, regretting their inability to be present.—Mr. NAYLOR reported that on behalf of the Committee he had written a letter of condolence to Mr. Beynon on the death of his father, the late Hon. Colonial Secretary of the Conference for Madras.—Letters were read from Mr. J. J. Prebble accepting the position of Hon. Colonial Secretary for Bengal, and from Mr. J. Stanley Smith accepting a similar position for Bombay.—The following members were appointed a sub-committee to revise the Blue List previous to its circulation :—Professor Greenish and Messrs. Bird, J. C. Umney, White, and Ransom.—A resolution was passed expressing the deep regret felt by members of the Executive at the loss sustained by the Conference by the death of Mr. M. Conroy, of Liverpool, and the Secretaries were requested to write to Mrs. Conroy expressing the deep sympathy felt for her and her family on their bereavement.—The PRESIDENT stated that he had received a letter from Mr. McKnight, the Hon. Local Secretary at Belfast, reporting satisfactory progress in the arrangements for the approaching meeting of the Conference.—A letter was read from Mr. C. J. Park on behalf of the Plymouth Chemists' Association, stating that they were prepared to offer a cordial invitation to the Conference to meet in Plymouth in 1899. The consideration of the subject was deferred until the next meeting of the Executive.—It was reported that letters had been received from various associations thanking the Conference for copies of the 'Year-Book.'—Eight gentlemen, having been duly nominated, were elected to membership.

PHARMACEUTICAL SOCIETY OF IRELAND.

At the evening meeting held at the Society's House, 67, Lower Mount Street, Dublin, on Monday, February 28, the PRESIDENT, Mr. R. J. Downes, in the chair, Professor CHARLES TICHBORNE delivered a lecture on

The Liquefaction of Gases and their Practical Application to Pharmacy.

The lecture, which was substituted by Professor Tichborne in place of one on the new British Pharmacopœia, was illustrated by numerous experiments showing the methods of liquefaction in use and the behaviour of the gases under their altered conditions. A description was given at the commencement of the lecture of what is now understood by modern physicists as a gas, and an explanation of the transition of liquid to gas, the remarks being illustrated by some experiments demonstrating Boyle's law. The idea that permanent gaseous bodies existed was shown to be incorrect, as, providing the temperature employed does not break up the structure of the molecules, every body is capable of existing in the solid, liquid, or gaseous state. The investigations of Faraday, at the request of Sir Humphry Davy, were referred to, and the simple apparatus Faraday used was described, extracts being read from his papers to illustrate the remarks. The lecturer then dealt with the liquefied gases of technical and medical interest, and observed that although oxygen, hydrogen, coal gas, and atmospheric air had all been liquefied, it had been accomplished at too dangerous a pressure for commercial purposes. A list of the most important gases capable of liquefication commercially was

also given, and examples of their use in breweries, bakeries, and other manufactories. The applications of gas to the preservation of food was also referred to.—A most interesting meeting was brought to a close by a vote of thanks to Professor Tichborne, proposed by Mr. Kelly and seconded by Mr. Ashe.

EDINBURGH PHARMACY ATHLETIC CLUB.

The seventh annual general meeting was held in the Pharmaceutical Society's House, 36, York Place, Edinburgh, on Thursday, February 24, 1898, at 9 p.m., Mr. William McBain, President, in the chair. Mr. J. P. Gibb, Hon. Secretary, submitted the annual report, showing a record of a good year's work. The membership now numbered 110.—Mr. A. S. Birnie, Hon. Treasurer, submitted the financial statement, which was satisfactory, and showed a credit balance of £8 4*s.* 1*d.*, notwithstanding a loss, for the first time, on the annual sports, due to very bad weather.—After a general discussion on the work of the Club, the following office-bearers were elected for next year:—Hon. President, J. Rutherford Hill; President, George Somerville; Vice-President, G. H. C. Rowland; Secretary, J. P. Gibb, 8, Cobden Crescent; Assistant Secretary, John Aikman; Treasurer, D. S. Napier; and as members of Committee, Messrs. Anderson, Birnie, Foote, Hendry, Kidd, McBain, and Smith. The meeting then closed.

EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.

The annual supper took place in the Imperial Hotel, Market Street, on Friday, March 4, 1898, when about fifty members and friends were present, including Mr. George Sinclair, President, who occupied the chair, Mr. W. L. Currie (Glasgow), Mr. John Bowman, Mr. George Lunan, Mr. J. A. Forret, Mr. R. L. Hendry, Mr. J. Macintosh Cameron, Mr. John Lothian (Glasgow), Mr. W. B. Cowie, Mr. J. R. Hill, etc. Messrs. J. D. Sinclair, Vice-President, and G. H. C. Rowland, Hon. Secretary, acted as croupiers. Apologies for absence were intimated from Messrs. J. L. Ewing, D. Maclaren, and J. P. Gibb. In proposing the toast of

"The Pharmaceutical Society,"

Mr. J. D. Sinclair referred to the fact that his predecessor, in proposing this toast at last year's gathering, had made a strong statement in favour of the proposal contained in the Pharmacy Bill at present before Parliament. It was a proposal which had their hearty and unanimous approval, and they all hoped that before their next annual gathering came round the Bill would have become law. That the Council had no idea of lowering the educational standard was proved by its action in regard to the Preliminary examination, a policy which had been successful in securing the approval of the Privy Council, and, would, along with the further policy of consolidation, be productive of great good he believed to the Society and to chemists generally.—Mr. W. L. Currie, Vice-Chairman of the Executive, in replying to the toast, said the Society had unquestionably done great good in the past, but he firmly believed it had still an even greater work to do in the future, and the passing of the present Bill would do much to pave the way for the effectual prosecution of much that still remained to be done.—Mr. J. R. Hill proposed "The Edinburgh District Chemists' Trade Association," which was acknowledged by Mr. R. I. McDougall.—Mr. W. L. Currie, in proposing "The Edinburgh Chemists', Assistants', and Apprentices' Association," congratulated them on being still in full vigour in their twentieth session, and hoped he might be present when, next year, with a record attendance, they celebrated their majority.—The Chairman acknowledged the toast.—Other toasts were, the "Pharmacy Athletic Club" and the "Chemists' Golf Club," proposed by Mr. J. M. Cameron, and acknowledged by Messrs. G. Somerville, President, and W. B. Cowie, Treasurer; "The Ladies," proposed by Mr. Rowland, and acknowledged by Mr. J A. Forret, and "The Chairman," proposed by Mr. J. Lothian.—During the evening the Chairman, in the name of the Association, presented three volumes of music—"Nineteenth Century," "Chopin's Nocturnes," and "Songs of Four Nations"—to the accompanist, Mr. James A. Crichton, as an acknowledgment of his efficient services during several years.—An excellent musical programme made the evening pass most pleasantly, and 1 a.m. came all too soon. An interesting item was a clever ventriloquial entertainment by Mr. H. G. Dutton, in which two good jokes were introduced. Mr. Dutton had a ventriloquist's speaking model, who said he was a chemist. He had a very red nose, and explained that this was due to rock oil in his methylated spirit. The following dialogue then took place between the model and Mr. Dutton:—

"A man came into my shop the other day for a pound of sulphur. I charged him a shilling for it."
"You did?"
"I should think I did. Do you know what he said?"
"What did he say?"
"He said he could get it from Inman's for twopence a ton. Do you know what I said?"
"What did you say?"
"I told him to go to the place where *sulphur could be got for nothing.*"

SHEFFIELD PHARMACEUTICAL AND CHEMICAL SOCIETY.

At a meeting of members of the above Association held on Wednesday evening, Mr. G. Squire, the President, in the chair, Mr. A. W. Antcliffe, dispenser to the Sheffield Union, read a paper on the subject of

Poor Law Dispensers.

The object of the reader of the paper was to induce pharmacists to use their influence in securing for the provincial Poor Law dispensers the status, the privileges, and the recognition which are enjoyed by these officials in the Metropolitan area. He stated that in 1871 the Local Government Board made an order establishing dispensaries in the Metropolitan unions, but this order had not been extended to the provinces, and the result was that, although many provincial boards of guardians had appointed dispensers, who were fully qualified, they were not recognised as officers; in fact, they were really known officially as only assistants. The dispensers appointed in accordance with the Local Government order were, however, permanent officials of that department, and, as is the case with the other Poor Law officials, can only be dismissed from their posts by the sanction of the department. The speaker contended that the provincial dispenser holds his office at the will of the guardians, and as regards the permanency of his position, the workhouse porter or the guardians' coachman is far more favourably situated. He thought it was the duty of all chemists to do all in their power to get this state of things remedied in justice to their calling, and he urged the members present to try and persuade the London board of the Pharmaceutical Society to use its influence in the same direction. Sir Walter Foster, M.P., when occupying the position of Under-Secretary to the Local Government Board under the late Government, in a letter to a Sheffield chemist, expressed the opinion that, although the Metropolitan order did not apply to the provinces, yet any provincial board of guardians could obtain such an order on applying to the department. Mr. Antcliffe did not regard this as satisfactory, arguing that such an important matter ought not to be left to the wisdom of individual boards of guardians, but that the Local Government Board should treat all Poor Law dispensers alike, providing they were properly qualified. He complained that for positions of this kind army compounders were allowed to compete, and gave some particulars of the curriculum and examinations which the compounders have to undergo in support of his contention that the qualifications of such men are much below those of the fully qualified chemist. For example, army compounders were not examined by expert pharmacists, but by army medical men who were not familiar with the requirements. In conclusion he gave some hints which he thought would assist in bringing about the remedies he desired to see. Provincial chemists should seek seats upon the local boards of guardians, and insist on the Government recognising all dispensers; the dispensing should be done only by persons legally qualified; dispensaries should be established in large unions which were at present without them. In this policy he believed they would have the support of the general public, who, if they were made acquainted with the facts, would, he was sure, insist that the suffering poor should have equally as good attention as the sailor, the idiot, or the convict, and that the guardians should spend their money for the best interests of the people committed to their charge. Provincial dispensers deserved equal rights and privileges with other officers appointed by the guardians of the poor, and he submitted that the watering down of the qualifications for the office by admitting army compounders who had no standing as dispensers of medicine was most unfair, and called for the strong protest from the Pharmaceutical Society, local societies, and all humane Poor Law guardians.

LEGAL INTELLIGENCE.

PROCEEDINGS UNDER THE APOTHECARIES' ACT.

Illegally Acting as an Apothecary.

At the Blackburn County Court on Monday, before His Honour Judge Coventry, the Apothecaries' Society of London sued John Tempest, Oswaldtwistle, near Accrington, to recover £20 for having acted as an apothecary without having obtained the certificate required by the Apothecaries Act, 1815.

Mr. Slinger (Accrington), who appeared for the plaintiff Society, stated that the defendant had practised in Oswaldtwistle two or three years with no qualification at all, or at least, none that was recognisable by law. He believed the defendant purported to practise under an American diploma, but that was no legal qualification in England, and he would be doing the defendant no great injustice by describing him as a "quack," for he resorted to the methods and artifices of those men by issuing pamphlets and handbills in which he described himself as a properly and legally qualified man. The offence for which the penalty was sought to be recovered was that the defendant had selected and compounded medicines for the use of patients afflicted with a medical disease different from a surgical case. Under the Act a chemist could only sell, and could not select and prescribe. The defendant had described himself as a pharmacist, had practised as a medical man, and had the word "Doctor" painted over his door.

George Beech, a miner, of 25, King Street, Oswaldtwistle, stated that on November 4 last he went to defendant's house. The latter examined him, and told him his heart was affected. He made up a bottle of medicine, for which he charged him 1*s* 6*d*., and made him a present of some powders. He told witness as he was going away that he would find a lot of benefit from his treatment. On the way home witness met Dr. Townley, who asked him how he was getting on. He told the doctor where he had been, and the latter gave him another bottle of medicine, and took away the bottle received from the defendant. Witness had seen the bills (produced) which bore the name of "Dr. Tempest, F.C.S.M."

His Honour: What do those letters mean?

Defendant: "Fellow of the College of Safe Medicine," London. It is a chartered college for botanic physicians, which licenses me to practise in this country.

Witness, continuing, said that when he visited the defendant there were two other patients.

Defendant said that as a duly qualified physician he had the right to attend people. He claimed that being a physician and surgeon, he could legally treat a disorder or cure an accident. There was no law in this country or any other to prevent him doing so.

His Honour said it was clear that defendant had acted as an apothecary.

The defendant urged that he had a licence under the Pharmacy Act to dispense medicines,* and besides that, he had a qualification from London which entitled him to prepare and dispense his own medicine, and act as a doctor of medicine. He handed to his Honour what he said was his qualification from a chartered college.

His Honour having examined the document, said it was nothing of the sort. There was nothing in it about a charter, and it was of no value in that case. If a physician dispensed medicine he must be registered under the Apothecaries Act.

Defendant: I have something here then, from Chicago.

His Honour: That does not entitle you to practise in England.

Defendant said he had still another defence—that of priority. Botanic medicine was practised before the Act of 1815 or any other Act. It was the original system of medicine, and while he practised it he claimed the right to act as a physician without any qualification whatever other than a training in a college. Apothecaries were formerly merely chemists and druggists, and he was legally, morally, and equitably clear of the Apothecaries Act. He did not profess to make medicine of the apothecaries' kind or in their way, and he was also entitled to be registered under the 1886 Act.

His Honour: Then go and get registered. Proceeding to deliver judgment, he said that defendant had practised as an apothecary, which he had no right to do unless he was registered, and had thus brought himself within the four corners of the law. He would have to pay the penalty of £20, as provided by the Act.

Leave to appeal was given.

* The name of John Tempest is not on the Register of Chemists and Druggists for 1898. [Ed. *P. J.*]

HIGH COURT OF JUSTICE.

The Sale of Recipes for Proprietary Preparations.

On Friday, March 4, a motion by Messrs. Elliman, of Slough, against Mr. Sam. Flather, of Chorlton-on-Medlock, came before Mr. Justice North in the Chancery Division of the High Court of Justice.—It appeared that the defendant advertised that he could supply the formulæ for a great number of patent medicines and other proprietary articles, and on his list appeared Elliman's embrocation. Plaintiffs therefore got two persons to write for the recipe, which was sent them in the form of a small book containing a large number of formulæ, and including one which was said to produce a "close duplicate" of Elliman's Universal and Royal embrocations.—The plaintiffs thereupon moved for an injunction to restrain him representing, contrary to the fact, that he was in possession of, and able to communicate, the secret recipes from which the embrocations were manufactured. Mr. Elliman, in his affidavit, swore that the formula sent by the defendant was not that which was employed in the manufacture, which was only known to himself and his manager.—Mr. Swinfen Eady, Q.C., and Mr. Ingpen appeared for the plaintiffs; the defendant did not appear.—Mr. Justice North at first expressed great doubt whether he had jurisdiction to grant an injunction. If the defendant really knew the secret, he did not see how he could be prevented from communicating it, and he did not know that the fact of defendant telling a lie, and saying he had the secret when he had not, gave him jurisdiction to grant an injunction.—Mr. Swinfen Eady, however, having pointed out what facilities for fraud were offered by the defendant, who in one of his publications actually described the size and shape of the bottles in which Elliman's embrocations were sold, and having stated that an injunction had already been granted against the same defendant in respect of the recipe for Yorkshire relish by Mr. Justice Romer, His Lordship made the order asked.—Application was made the same day to Mr. Justice Romer at the instance of Goodall, Backhouse and Co., of Leeds, for a writ of attachment against Flather for breach of an injunction restraining him from advertising that he was in possession of the recipe for manufacturing Yorkshire relish. The defendant humbly apologised to the Court, and His Lordship said he would give him another chance by acccpting the apology, but ordered him to pay the costs as between solicitor and client.

Sale of a Chemist's Business.

Mr. Justice Stirling was occupied for a long time on Tuesday, March 8, with the action of Faithfull *v.* Kemp, although it ultimately turned out that the only substantial question at issue was who should pay the costs. The defendant, who carried on a chemist's business at 10, Bedford Terrace, Kensington, advertised it for sale in the *Pharmaceutical Journal*, and the plaintiff became the purchaser in April, 1896, through Messrs. Berdoe, and immediately afterwards took possession. There was to be a covenant by the defendant not to carry on business within two miles of Bedford Terrace, but there was a verbal arrangement that this should not operate to prevent his carrying on a wholesale and manufacturing business. Disputes soon arose between the parties as to the assignment of the lease, the form of the covenant not to trade, and to plaintiff being sole agent for defendant's chirata preparations, and pending these being settled plaintiff declined to pay the last instalment of the purchase money. An almost interminable correspondence between the parties and their respective solicitors ensued, offers and counter offers for a settlement were made from time to time and withdrawn, and at last the action came on for trial, all substantial points having been agreed. Mr. Jenkins, Q.C., and Mr. Theobald for the plaintiff contended that the plaintiff had been in the right all through, that he had been obliged for his own protection to bring the action, and that he was entitled to his costs. Mr. Rolt on the other hand submitted that the fault was all on the part of the plaintiff in not paying the last instalment of the purchase money. Ultimately his Lordship, who during the argument had remarked that the correspondence reminded him of the story of the Irishman and his pig—*i.e.*, that he must not say where he was going, or the pig would immediately want to go the other way—said he had come to the conclusion that the plaintiff was much more substantially right than the defendant, and he should therefore allow him the costs of the action, but the defendant would be allowed the costs of his counterclaim.

LETTERS TO THE EDITOR.

The Metric System of Weights and Measures.

Sir,—Your advice to chemists to familiarise themselves with the newly legalised system is both wholesome and good. Like other wise men I intend procuring a complete set of weights and measures as soon as I can get them stamped. At the same time it is to me an infinite source of regret that the change has to be made at all. It is not my intention to enter into a discussion of the respective merits of the two systems. There is doubtless much to be said in favour of the newer and more scientific one, especially in certain kinds of work, such as analytical work, etc. But the older system has answered very well, especially for retail work and dispensing, and writing after an experience of thirty five years at the counter, I may say that I hope the change may be long deferred—I mean the compulsory change—and that the present system may last the remainder of my time in the business.

Liverpool, March 9, 1898. Walter A. Grace.

The Benevolent Fund.

Sir,—With all due deference to the Trustees and Committee of the Benevolent Fund, I beg to suggest that portraits of those philanthropists who devised property for the benefit of their unsuccessful brethren would be better than a perpetual reminder of those unfortunates whose hard lives only achieved a failure. Example is more powerful than words, and it may be hoped that the good deeds of the departed may induce wealthy members to "go and do likewise."

March 7, 1898. Old Subscriber (127/43).

The Ancient Use of Savin.

Sir,—Glancing through a collection of old ballads the following verse in 'Marie Hamilton' caught my eye :—

> The King has gane to the Abbey garden
> And pu'd the savin tree,
> To scale the babe frae Marie's heart,
> But the thing it wadna be.

Does not this show a long-standing belief in the efficacy of savin as an abortifacient?

Dover, March 4, 1898. J. F. Brown.

The New Pharmacy Bill.

Sir,—I consider the new Pharmacy Bill of a very inadequate and partial character, and think that until matters connected with the calling of a chemist and druggist, requiring the attention of Parliament, could have been dealt with in a thorough and comprehensive way, it would have been more advisable to postpone legislation than to hurry through an incomplete and ineffectual measure—I say ineffectual because the Bill, being permissive, it is, I think, extremely doubtful if it will succeed in increasing the membership of the Society to the extent hoped for by its promoters. Educationally it may be justly regarded by many of us as of a decidedly retrograde nature, seeking to bring those of a lower professional educational standard up to that of those who have gone to the trouble and expense of qualifying themselves for the grade of "pharmaceutical chemist." If this measure in its present shape becomes law, the effect may be to submerge the Major examination altogether. Certainly there will be far less inducement to secure the higher qualification and diploma, the educational status will be thus lowered, and the more advanced one die out unless some additional inducements and advantages greater than now exist be offered to men who pass the Major. The chance of the calling ever becoming in this country a strictly professional one is most remote, and is not within the range of probable possibilities. The business cannot be dissociated from trade and shop keeping, and I am afraid neither the public nor the medical profession fairly appreciate the title of "pharmaceutical chemist," think but little of it, and do not consider in their dealings with a chemist and druggist whether he is a pharmaceutical chemist or not. As a rule the title does not specially promote trade patronage to any appreciable degree; but even if a distinction had been, and was so acknowledged, to all intents and purposes the new Bill will confer on the ordinary traders any ordinary advantage and distinction the pharmaceutical chemist may have been possessed of in respect to his business, excepting as to serving on juries. In my opinion an Act of Parliament should, in the first place, be compulsory as to membership; give the title of "Pharmaceutist" to all the members with exemption from jury service, and create a new and additional title for the disposed "Pharmaceutical Chemist." For those who pass the Major I suggest "Master of Pharmacy"; I think such a title would be understood by the public, and be of some considerable use in a business and trading point of view, and so would not be without commercial value, and worth attaining. Moreover, I would reserve a certain number of seats on the Council for "Pharmaceutical Chemists and Masters of Pharmacy."

Great Witley, March 1, 1898. John Twinberrow, Ph.C.

The Alleged Decay in the Art of Prescribing.

Sir,—I have read with interest Mr. Edmund White's article in the *Pharmaceutical Journal* of March 5, on "The Alleged Decay in the Art of Prescribing." I agree with him that there is not sufficient scope given to the student of medicine to perfect himself in his knowledge of the medicines used in the "Art of Prescribing." One wonders at it more when the remedy is really the ultimate point of all his learning. The physician may be proficient in applying carefully all that the varied sciences has taught him to arrive at a correct diagnosis, but of what avail is that to the patient if the same exactness cannot be applied in prescribing the remedy? This is an age of progress, yet therapeutics has not kept pace with the other sciences. The same old tinctures, extracts, and infusions are being prescribed as were prescribed one hundred years ago, although for a long time it has been known that they are really compound medicines, uncertain in their composition, through the influences of climate, soil, and other circumstances connected with their growth. Since retiring from practice I have given a good deal of time to the study of organic medicine, and am not the least surprised that I have often been disappointed in the result of my prescribing the pharmacopœial preparations of medicinal plants; now I find I have been blindly using them. Childlike, we have been following the dictates and traditions of our forefathers, believing because we have been taught to believe that certain doses of certain drugs produce certain effects. You will see the fallacy of this when you consider that no two specimens of organic medicine can be found exactly alike; those that I have examined vary as much as 10 per cent. in the quantity of their active principles. Many eminent physicians have told me that for some time they have looked upon organic medicines as uncertain, and that they had almost given up prescribing them. Why should this uncertainty remain? If we must keep to the old preparations, let a standard in strength of the alkaloid be declared. I am inclined to go a great deal further, and boldly advocate the abolition of the whole of the official preparations of organic medicines, and use only the pure alkaloids, emphasising the word pure. A standard solution, alcoholic or otherwise, could be made. The advantages of prescribing the alkaloids are many. Adulteration would be easily detected, our knowledge of the *modus operandi* of the drug in the human body would become more certain, the great diversity of opinion with regard to the therapeutic effects of most plants would be minimised. Several of the alkaloids have been found to have properties entirely different to what we have always been taught to believe.

Stroud Green, N., March 8, 1898. K. J. Dougall, L.R.C.P., etc.

OBITUARY.

Sibary.—On February 27, George Sibary, Chemist and Druggist, Dresden, near Longton (Staffs.). Aged 87.

Curtis.—On March 4, at Sandgate Road, Folkestone, Annie Victoria, the dearly loved wife of F. G. Curtis, Pharmaceutical Chemist. Aged 40.

Bell.—On March 5, Frederick R. Bell, Chemist and Druggist, Swaffham, Norfolk, formerly of Middlesborough. Aged 63. Mr. Bell, who had been a member of the Pharmaceutical Society since 1869, took a great interest in the political, educational, and social matters of the town, and was greatly respected.

Davies.—On March 9, Peter Hughes Davies, aged 83, Pharmaceutical Chemist, March, Cambridgeshire. Mr. Davies had been in business over fifty years, and a member of the Pharmaceutical Society since 1853.

ANSWERS TO QUERIES.

Special Notice.—*Scientific, technical, legal, and general information required by readers of the 'Pharmaceutical Journal' will be furnished by the Editor as far as practicable, but he cannot undertake to reply by post. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of senders. Questions on different subjects should be written on separate slips of paper, each of which must bear the sender's initials or pseudonym. Replies will, in all cases, be referred to such initials or pseudonyms, and the registered number added in each instance should be quoted in any subsequent communication on the same subject.*

NITRAGIN.—See answer to "P. H. J." last week. Read special notice above. [*Reply to* M. F.—6/33.]

BACTERIOLOGY.—Pearmain and Moor's 'Aids to Bacteriology' (Baillière, 3*s.* 6*d.*), is a useful elementary work on the subject. [*Reply to* RODINOL.—6/25, and M. F.—6/34.]

FERRIC CHLORIDE.—Two fluid drachms will contain 0·145 ounce of the anhydrous chloride. [*Reply to* RODINOL.—6/26.]

BOTANICAL.—The flower is that of *Freesia leichtlini major*, apparently from a seedling; the seed is that of *Cæsalpinia bonducella*, Flem. [*Reply to* R. G. M.—6/24.]

MICROSCOPE.—See reply to "Microbe" below. The same outfit, minus the 1/12 inch immersion lens, will serve your purpose, and the cost will be five pounds less. [*Reply to* MICROSCOPE.—5/11.]

QUININE WINE.—It is doubtful if you could dissolve sufficient quinine in port wine, as the tannin present would tend to precipitate it. But in any case the wisest course to pursue is to inquire of the local Excise authorities. [*Reply to* AMMONIACUM.—6/31.]

DIGESTIVE COCOA.—You are undertaking a hopeless task if you attempt to reconcile all statements in advertisements of such articles as you refer to with known facts. Pepsin, of course, requires an acid medium, but cocoa is not necessarily alkaline, though it frequently is so. [*Reply to* PEPSINA.—6/32.]

PRACTICAL PHARMACY.—Borrow the works of Cripps, Proctor, Caspari, Coblentz, and other writers on the subject, from the Pharmaceutical Society's Library, and then decide for yourself which will best suit your purpose. We are unable to decide for you. [*Reply to* PESTLE.—6/27.]

CALCIUM CARBIDE.—It is not explosive, but reacts with water, acetylene gas being evolved. This gas is explosive when mixed with air in certain proportions. Keep the carbide free from moisture in water-tight vessels—iron drums are best—and you will not experience any trouble with it. You must have a licence to store more than five pounds. See page 488 of last volume. Doubtless it can be powdered. [*Reply to* H.F.H.—6/23.]

SYRUP OF CAMPHOR.—The Bristol Royal Infirmary formula is as follows:—℞. Acid. benzoic., ℥iii., acid. acet. glac., ℥iii. ♏. 320; acet. scillæ, ℥xl.; acet. ipecac., ℥xl.; ol. anisi, ℥ij.; camphor., ℥ij.; tinct. opii, ℥x. ♏. 320; sacch. alb. (cryst.), lb. 28; sacch. ust., *q.s.*, to give the colour of tinct. camph. co.; aq. dest. ad. C. iv. Misce. Each fluid drachm contains one minim of tincture of opium. The dose is one teaspoonful occasionally. [*Reply to* J. B.—6/20.]

MICROSCOPE FOR BACTERIOLOGY.—Get Baker's Advanced Student's Microscope (244, High Holborn, W.C.) or Watson's Edinburgh Student's Microscope (313, High Holborn, W.C.), with double nosepiece, two eyepieces, rackwork centreing substage, sliding bar to stage, and graduations on stage to serve as finder. Add a Leitz No. 3 objective, Reichert No. 6, and Leitz or Reichert 1/12 in. oil immersion, together with an Abbe condenser, preferably achromatic, and iris diaphragm. Total cost of outfit, about £18. Schenk's 'Elements of Bacteriology' (Longmans, 10*s.* net.) is a good introduction to the subject, but Crookshank's 'Bacteriology' (Lewis, 21*s.* net.) is the most complete work of reference. [*Reply to* MICROBE.—5/14.]

PERFUME.—Send a small sample, and perhaps we can tell you. It is impossible otherwise. [*Reply to* DUNNO.—6/16.]

INDIAN SNAKE POISONS.—Sir Joseph Fayrer might possibly be willing to investigate them, but you might also communicate with Professor Stockman, of Glasgow University, Professor Cash, of Aberdeen University, and Drs. MacFadyen and Hewlett, of the British Institute of Preventive Medicine. [*Reply to* W. C.—6/28.]

MINOR EXAMINATION.—The requirements are that you must have passed the Preliminary examination or its equivalent, be of the full age of twenty-one years, and be able to produce a certified declaration showing that you have been practically engaged in the translation and dispensing of prescriptions for not less than three years. Write to the Registrar, 17, Bloomsbury Square, W.C., for the printed form on which the declaration must be made. [*Reply to* G. W. B.—6/30.]

BOOKS ON PHYSICS AND BOTANY FOR THE MINOR.—Newth's 'Chemistry' (Longmans, 6*s.* 6*d.*), or Briggs' 'General Elementary Science' (W. B. Clive, 3*s.* 6*d.*), contain all that is required (much more in fact) on every point except the law of gravitation, the balance, and the air-pump. Everett's 'Physics' (Blackie, 3*s.* 6*d.*) will supply the deficiency. Before commencing to study Green's 'Botany' you should read Scott's 'Introduction to Structural Botany' (A. and C. Black, 3*s.* 6*d.*). [*Reply to* A. H. P.—5/32.]

GRAPH INK.—The following has been found very satisfactory for a violet ink:—Aniline violet, 1; methylated spirit, 1; water, 5. For black, use any of the blacks which are soluble in dilute alcohol, or such as the following:—Purple aniline S.B., 1; methylated spirit, 1; glycerin, 1; glucose, 1; hot water, 7. Dissolve the dye in the water, then add the glycerin, glucose, and water. Probably the dyes you have used were not sufficiently soluble for the purpose. [*Reply to* A. D.—6/17.]

WHITE LEATHER.—The white leather used for shoes, etc, cannot be produced by a simple process of bleaching, but the material has to go through a long and very carefully conducted process, or rather series of processes, to produce the white tint. Roughly speaking this is brought about by a kind of fermentation and subsequent exposure of the skins to air, moisture, and sunshine. Probably peroxide of hydrogen would increase the whiteness of discoloured shoes. Moisten the leather with the peroxide, then expose to bright sunlight. [*Reply to* ALBUS.—6/19.]

TO BLEACH SPONGES.—The method given in the 'National Formulary' is a very good one. It consists of soaking the sponge for fifteen minutes in a solution of potassium permanganate, 120 grains to the pint. Then wash with water, squeeze, and place in a solution of sodium thiosulphate, 480 grains to the pint. Then add for every pint of the last liquid 1 fluid ounce of hydrochloric acid diluted with 4 fluid ounces of water. Macerate for fifteen minutes, squeezing frequently, and replacing it in the bath. Then wash free from acid and dry. [*Reply to* SPONGE.—6/14.]

SYNTHETIC ESTERS AND PERFUMES.—No, there is no work devoted solely to the points you name; many of the bodies used are well-known chemical compounds, concerning which you will find full particulars in any work on organic chemistry. On essential oils, Power's 'Descriptive Catalogue of Essential Oils and Organic Preparations,' published by Fritzsche Bros., New York, contains much useful information. The annual reports of Messrs. Schimmel and Co., of Leipsic, also contain information which will be useful to you. Sawer's 'Odorographia' is a work which is both interesting and useful. [*Reply to* ARBEITER.—7/2.]

CORRECTION.

BENEVOLENT FUND.—On page 241 of last week's Journal, the name of Mr. Charles Maw was inadvertently printed as Mr. George Maw, in recording his recent donation of one hundred guineas to the Benevolent Fund.

COMMUNICATIONS, LETTERS, etc., have been received from

Messrs. Barrett, Bayley, Belohoubek, Bienvenu, Blythe, Brown, Coull, Cowley, Cracknell, Crockart, Cruickshank, Dougall, Dutton, Fell, Folkard, Griffiths, Harper, Harris, Heron, Hill, King, Lothian, Lucas, Macartney, Mackenzie, McKnight, Matthews, Miles, Milne, Mumbray, Phillips, Priestley, Saul, Smith, Van, Walker, Yewdall, Zimmermann.

ALKALOIDAL CONSTITUENTS OF CASCARILLA BARK.

BY W. A. H. NAYLOR, F.I.C.

This paper is intended to be a reply in the main to question No. 12 of the 'Blue List' issued by the British Pharmaceutical Conference. The question is:—"A re-examination of cascarilla bark is desirable, and particularly with reference to the observation that it contains an alkaloid closely allied to choline." This particular reference to choline is to be found in a paper by Dr. Boehm, an abstract of which appears in the 'Year-Book of Pharmacy,' 1886, page 168.

Fourteen pounds of bark reduced to No. 40 powder were exhausted by percolation with chloroform water containing 3 per cent. of oxalic acid. The percolate was made faintly alkaline by ammonia evaporated at a low temperature to one-fifth of its volume, allowed to become cold, and filtered from the crystallised magma which had separated out. The filtrate was precipitated by an excess of lead acetate and the precipitate collected on a calico filter and well washed. After removal of the excess of lead by the addition of sulphuric acid the clear liquor from the lead sulphate was rendered faintly alkaline by ammonia and agitated with three successive portions of ether to withdraw the cascarillin that should be present. The same liquid was next shaken in a like manner with chloroform. The chloroformic residue will be referred to presently. The next stage in the series of operations consisted in acidulating the liquid with sulphuric acid (a large excess of acid must be avoided) and adding to it Thresh's reagent in quantity sufficient to effect complete precipitation. The precipitate after being washed on a filter until quite free from free iodine, ammonium or potassium salts, was decomposed by freshly precipitated silver carbonate in the presence of water and filtered. The filtrate was faintly acidulated with hydrochloric acid and evaporated over a water bath and again filtered. This final filtrate was precipitated by platinic chloride, and the precipitate was collected and thoroughly drained. The double compound of base and platinum salt was repeatedly crystallised from water and finally washed with absolute alcohol.

The purified platinum compound crystallised from hot water in dark yellow hexagonal plates, and from weak alcohol in octahedral form. A portion of the product was dissolved in hot water, and decomposed by sulphuretted hydrogen and filtered. The filtrate was evaporated to dryness, and the residue purified by re-solution in a sufficiency of warm water and evaporation until a white minutely crystalline chloride of the base was obtained. This chloride, when perfectly dry, was practically insoluble in alcohol, and when heated it melted with intumescence, and gave off trimethylamine.

Portions of platinum compound were then ignited, with the following results. It should be stated that they represent the product of three different extractions of the bark. Prior to ignition they were dried at 105° C.

(1) 0·215 of platinum compound left on ignition 0·065 of platinum.
(2) 0·335 ,, ,, ,, ,, 0·100 ,,
(3) 0·120 ,, ,, ,, ,, 0·0365 ,,

(1)	(2)	(3)	Theory for Betaïne.	Theory for Choline.
30·23	29·85	30·41	30·28	31·65

Mean 30·16 per cent. of platinum.

That the chloride of this base yields on ignition trimethylamine indicates that it is allied to choline. That its chloride is practically insoluble in alcohol and melts with intumescence on heating, and that its platinum salt yields a mean of 30·16 per cent. of platinum, prove beyond a doubt that the base in question is not choline, but betaïne.

Chloroformic Residue.

It was treated with warm hydrochloric acid, 3 per cent., the filtered solution was made alkaline with ammonia and then shaken with chloroform. After evaporation of the chloroform the residue was taken up with the weak acid, and, after the addition of ammonia, was again shaken with chloroform. The product, which was not quite free from colour, was alkaline and soluble in alcohol, ether, and chloroform. It contained nitrogen. A solution of a portion of it in weak acid was precipitated by ammonia, also by iodine and potassium iodide, Mayer's reagent, Thresh's reagent, cadmium and potassium iodide, and phosphomolybdate of sodium. To the solution of another portion in weak acid the addition of platinic chloride gave a buff-coloured precipitate, which was collected and washed free from platinum chloride. When air-dried it was soluble in alcohol and crystallised from hot water in prismatic plates. This alkaloidal substance was also obtained from the impure cascarillin yielded by Alessandri's process. The existence of a base in cascarilla bark other than one allied to choline has been a debatable point, but may now be accepted as a fact. It is believed that this is the first time that the alkaloid cascarilline has been isolated and its platinum compound prepared.

My thanks are due to Mr. John J. Bryant for his assistance in carrying out the operations described in this paper.

PRACTICAL PHARMACOGRAPHY.

CARDAMOMI SEMINA.

Cardamoms, Engl.; Cardamomes, Fr.; Cardamomen, Germ.

Macroscopic Characters.—Although the seeds are alone official they are usually kept in the pericarp until required for use. The fruits vary much in size, shape, figure, colour, and degree of aroma; the smaller, plumper variety known as Malabar cardamoms (Fig. 1*b*) are the most esteemed. Good samples contain about three-fourths of their weight of fully formed seeds. The fruit is inferior, ovoid, oblong, or almost elliptical, trigonous, with longitudinally striated convex sides, and is crowned with the rim-like remains of the calyx. It is three-celled with axile placentation, the seeds forming two rows in each cell. The pericarp is nearly tasteless and almost inodorous. The seeds are dark brown, irregularly angular, about three millimetres in diameter, transversely wrinkled and covered with a thin membranous aril. They have a depressed

Fig. 1.—Cardamoms—*a*, *b*, *c*, *d*, Commercial varieties of cardamom fruits; *e*, transverse section of fruit; *f*, seeds, natural size.

hilum and a deeply channelled raphe. Bleached cardamoms lose their striations and are easily recognised by the white and smooth appearance of the pericarp. They are probably subjected to steam, and then exposed to the vapour of sulphurous acid.

Microscopic Characters.—The arillus consists of thin-walled linear flexuous cells. The outer coat of the seed (3*a*) consists of a layer of epidermal cells, strongly thickened on the inner and outer walls, usually empty, and presenting in transverse section a

rounded or nearly square outline (2*g*), but on a surface view (4*a*) they are seen to be linear, obtuse, and arranged very irregularly, some patches being nearly at right angles to others. Below this epidermal layer are one or two rows of thin-walled oblong

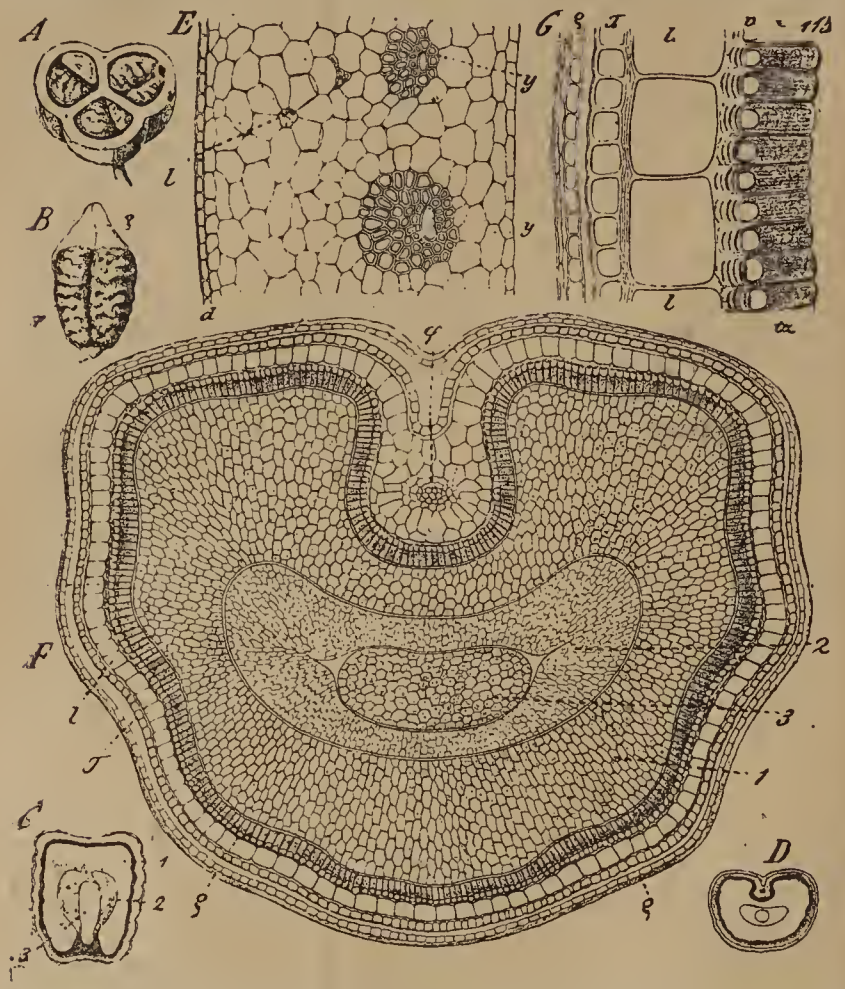

FIG. 2.—CARDAMOMS.—*A*, Transverse section of fruit with seeds *in situ*; *B*, seed magnified, showing base of arillus; *C*, longitudinal, and *D*, transverse section of seed. *E*, Transverse section of pericarp; *F*, transverse section of seed; *G*, transverse section of integuments of seed. After Berg.

pigment cells (3*b*), elongated like the epidermal cells but at right angles to them (4*b*). In transverse section these cells appear to be narrow and oblong. Then follows a row of much larger, nearly square, closely-compacted thin-walled cells (3*c*), some of which contain, in a vacuole-like structure, volatile oil and the remains of a resinogenous layer. Below the large cells are two rows of cells (3*d*), with nodular thickening of the walls. The inner integument of the seed (3*e*, 4*e*) consists of a single layer of sclerotised cells, oblong in transverse section of the seed, but polyhedral on the surface view, where the lumen appears as a rounded dot. The perisperm cells are characterised by a minutely, but densely dotted appearance, (4*f*) which is shown by iodine to be due to minute starch grains, and almost uniformly contain crystals of calcium oxalate (4*g*).

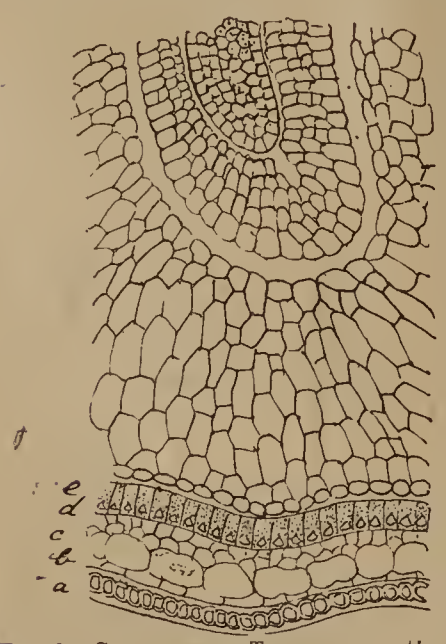

FIG. 3.—CARDAMOMS.—Transverse section of seed; *a*, Epidermal layer; *b*, pigment layer; *c*, large cells with oil cells intermixed; *d*, cells with nodular walls; *e*, sclerotic cells of inner integument; *f*, perisperm cells. After Tschirch.

In the powdered seeds the characteristic and most easily recognised features are the starch-bearing cells of the perisperm and the dark-coloured polyhedral cells of the inner integument, and the thick-walled linear cells with oblique ends of the epidermal layer. If the powder contains the pericarp as well, the latter may be detected by the thick-walled polygonal cells of the epidermal parenchyma, spiral vessels, and bast cells with oblique pits.

NON-OFFICIAL CARDAMOMS.—There are three varieties of cardamoms that occasionally come into commerce which possess a very similar aroma, viz., Ceylon cardamoms (*Elettaria cardamomum*, Maton, var. *major*, Smith), Siam cardamoms (*Amomum cardamon*, Linn.), and Korarima cardamoms (*Amomum korarima*, Pereira). The Ceylon cardamoms may be detected in powder by the relatively smaller size, 10-20 μ, of the epidermal cells of the seeds, and by their thicker walls, the same cells of the Malabar cardamoms being 20-30 μ in diameter. In the Korarima cardamoms the thick-walled epidermal cells are radially elongated, rectangular, and the tangentially elongated pigment cells immediately beneath are short and small. The cells of the inner integument are 25 μ high and 17 μ broad, and are very thin-walled in the upper part (5*a*). In the Siam cardamoms the structure of the seed coat is very different from that of the official cardamom, the thick-walled epidermal cells being much larger, 60 μ high by 25 μ broad. The pigment layer beneath consists of small roundish or oval cells filled with dark red pigment, and are only 25 μ in diameter. The stone cells of the inner integument are rather broader in proportion than those of the Malabar cardamom, but only 25 μ high, and the lumen occupies nearly half of the cells (6*a*). Full details of these and of other cardamoms more rarely imported are given in *Schad, Untersuchungen ueber den Malabar Cardamomen, Bern*, 1897.

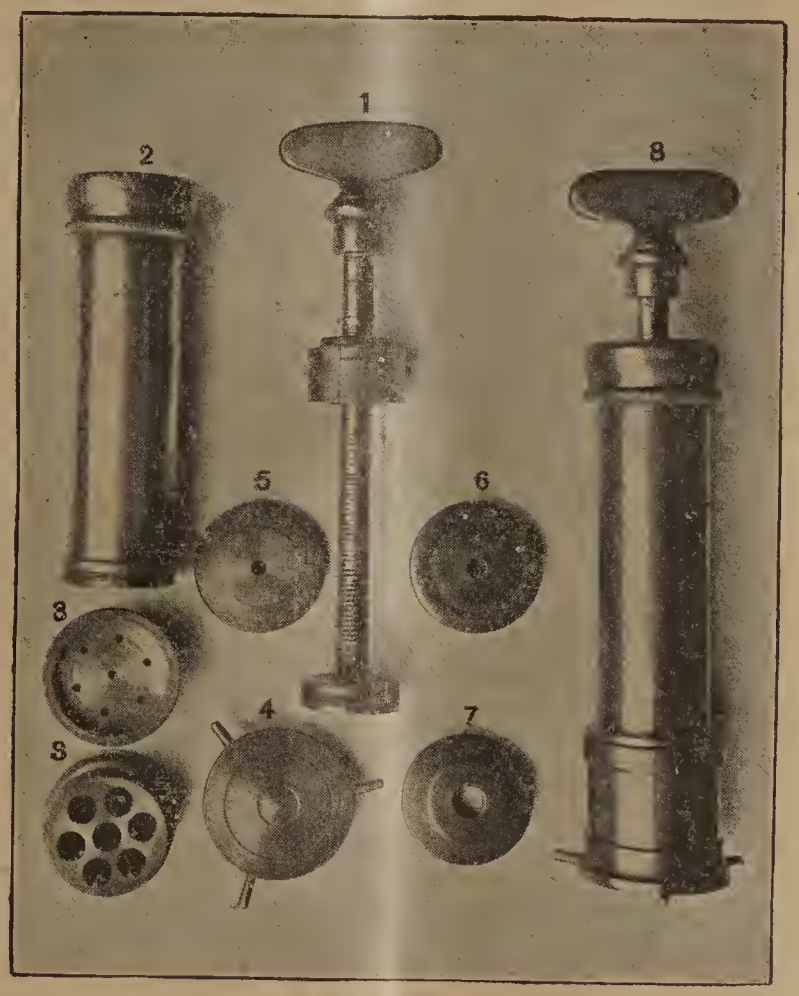
CHEMICAL ANALYSIS OF CACAO BUTTER.—Cacao butter is adulterated with coco-nut oil and the surrogate fat which is prepared from it, also with fine preparations of tallow, and with fatty oils, principally sesame oil. The iodine number throws the most light upon the question of adulteration. The number varies from 33·4 to 37·5. The addition of coco-nut oil or its preparations (iodine number 4 to 8), or of preparations of tallow and sesame oil (iodine numbers 40 to 45 and 108 to 110), respectively lower or raise this figure. The saponification numbers of cacao butter and of coco-nut oil are 195 and 250 respectively. It has not long been known that the acid number may rise as high as 40 to 50, though when this is the case the iodine number is found to rise with it. The melting point of pure cacao butter varies from 32·0 to 33·6.—*Analyst*, xxii., 130, after *Zeit. für off. Chemie*, iii., 34.

A SIMPLE MOULD FOR SUPPOSITORIES.

BY H. P. HEARDER.

As much interest appears to be taken at the present time in the preparation of suppositories in the cold by compression, I venture to submit a description of a mould devised by myself, by means of which I have for some time past been able to turn out suppositories, pessaries, and bougies much more rapidly than is possible in any other way known to me. Moreover, it is possible by this means to secure greater uniformity in the composition of the mass employed, whilst each suppository, pessary, and bougie can be made to contain an exact amount of the active medicament. The necessity of a detailed description of the apparatus is obviated by the accompanying illustration. Referring to that, it will be seen that the principle adopted is substantially that of an ordinary syringe, save that the piston rod is screwed in and out instead of simply sliding. The method of procedure is, briefly, as follows:—



First take the required weight of theobroma oil, or other basis ordered by the physician, powder in a mortar, then add the medicament and work together as though working a pill mass, with about thirty minims of castor oil or other suitable oil to each ounce of theobroma oil. When the mass is thoroughly homogeneous, break it up with a knife into fairly small pieces and it is then ready for the mould (Fig. 8). Next withdraw the piston (Fig. 1), fill the cylinder (Fig. 2) with the substance prepared as above, press the mixture down firmly with the piston-rod, then put in a little more, so as to fill to within about an inch or an inch and a half from the top, replace the piston and secure it by means of the bayonet-catch attached to the cap through which the piston screws. The cylinder will hold sufficient material to make about four dozen 15-grain suppositories, but as few as six can be made at a time if desired. The actual mould (Fig. 3) and the cap (Fig. 4) must not be removed before the substance is placed in the cylinder. Having closed the cylinder, commence to screw the piston down by means of the handle, and by thus compressing the substance force it through the small holes shown in Fig. 3 into the moulds (Fig. 3 lower drawing), then continue to screw until a firm resistance is felt, unscrew the cap (Fig. 4), and if the moulds are not sufficiently full, replace the cap, and screw a little more until they are quite full. The cap (Fig. 4) is then again removed, and, if necessary, in order to have the bases of the suppositories even, the superfluous material is cut or scraped off level with the mould; now give an extra turn, and the suppositories will be thrust out clear of the mould. Take each by its base, give it a short twist, and it can easily be detached from the fine thread that connects it to the mass within the mould.

For pessaries or bougies remove the mould and cap (Figs. 3 and 4), and replace by one of the other caps (Figs. 5, 6, 7). The cacao-butter or other basis is treated as for suppositories, but the mass should be screwed out a short distance and the end rounded by the fingers, then screwed further, and cut to the desired length. This can easily be ascertained by weighing the first pessary or bougie, or by forcing the whole length out on the counter, measuring, and then cutting to the correct length.

The machine should be washed thoroughly, cleaned and dried after using, especially after the manipulation of tannic acid, copper sulphate, iodoform, and the like.

PALLADIUM HYDROGEN.

BY JOHN SHIELDS, D SC., PH.D.

At a meeting of the Royal Society of Edinburgh on March 7, 1898, the author communicated the results of a research to determine the conditions under which hydrogen is occluded by metallic palladium. In the paper, there were three theories put forward generally to explain the phenomenon of occlusion.

1. The hydrogen is liquefied and contained in the capillary pores of the metal. This theory was disproved by the fact that no matter what the condition of the metallic palladium might be as regards the aggregation of its constituent particles, the quantity of hydrogen occluded was always the same.

2. The hydrogen is dissolved by the palladium, and the phenomenon is one of solid solution. This theory did not agree with the conditions of the occlusion as regards the effects of temperature and pressure, which would produce wide variation if it was merely a case of solid solution.

3. The hydrogen is chemically combined with the palladium in the form of a definite hydride. The author gave details of an elaborate series of electro-chemical experiments, all of which pointed to the conclusion that the hydrogen and the palladium are chemically combined as a definite hydride. The research did not quite clearly prove the actual formula for the palladium hydride, but there was good reason to believe that it was Pd_3H_2, and not Pd_2H, as had been previously stated by Troost and Hautefeuille.

GRANULINE is a new cleansing and washing preparation—consisting principally, according to Gochlid, of sodium carbonate, soda soap, and traces of sodium chloride and sodium sulphate—which has been introduced into German commerce. Granuline is a whitish yellow brittle substance somewhat fatty to the touch, and having a slight bergamot colour. It is readily soluble in cold and hot water, forming a fluid which has a strong alkaline reaction. 100 parts of granuline contain 87·5 per cent. of soap, and 12·5 per cent. of sodium carbonate. It appears to resemble certain English and American "soap extracts."—*Pharm. Post*, xxx., 588.

THE DETERMINATION OF ASH AS AN ANALYTICAL METHOD.*

BY D. B. DOTT, PH.C.

By the determination of ash we understand the incineration of a substance which is mainly organic, and the weighing of the residual inorganic matter. I remember two men, who were well informed in theoretical chemistry and in general analysis, both finding an extraordinarily high percentage of ash in sulphate of quinine. They had not understood that the carbon must be entirely burnt away. This is occasionally a matter of some difficulty, and the burning may be aided by the introduction of a small stream of oxygen into the crucible. The oxygen may be conveniently prepared by the action of peroxide of hydrogen on granular binoxide of manganese. In some cases, as when an ash is rich in potassium carbonate, the salts fuse before the carbon is burnt off, and the latter becomes occluded in the former, so that the oxygen cannot readily reach the carbon. In such a case it is better to dissolve the soluble ash and ignite the insoluble and carbon together, then evaporate the solution to dryness and ignite. It need hardly be said that the ash does not in general represent the composition of the salts, as they exist in the original substance. Organic salts, for the most part are converted into carbonates, alkaline nitrates into hydrates, hydric phosphates into pyro-phosphates, sulphates are partially reduced to sulphides, and so on. As a rule, the substance is incinerated in a platinum crucible, because that is the most convenient plan. Platinum is not easily oxidised or attacked, and stands the heat of the blow-pipe, but it is not without its weak points. Salts of readily reducible metals, as silver, lead, and even copper, cannot be safely ignited in platinum, not at least if there is anything to reduce them. Potash and soda, and therefore, their nitrates, quickly attack platinum. The proportion of nitre recommended in some books to be used with the carbonate as a flux, seriously acts on the crucible, and gives a considerable amount of platinum in the analysis. The ignition of a little hypophosphite will speedily make a hole in a platinum dish. A porcelain crucible is free from these defects, but possesses the great practical inconveniences of being difficult to heat through, on account of inferior conductivity, and of being very liable to crack in the course of ignition. Ammonium nitrate is sometimes added to aid the combustion, which it does fairly well. It may be dropped in a platinum crucible with safety, but is liable to crack a porcelain crucible, unless added very cautiously. It may be noted that ammonium nitrate is not admissible when great accuracy is desired, as it alters the composition and weight of the ash.

The subject of ash determination may be divided into two sections: First, that in which the mineral matter is present as a natural and proper part of the substance, and where it is present in a certain proportion, though that proportion may have a maximum and minimum, as in plant analysis generally; secondly, that in which the inorganic matter is present wholly as impurity, as in an alkaloid or glucoside.

In the first of these classes the determination of the amount of ash is often of great importance, and may be conclusive evidence of the species or variety from which a powder has been derived. The usefulness of the method is limited by the fact that in many cases the mineral matter varies greatly with the conditions of cultivation, and to some extent with the age of the plant. Yet, after all deductions, much may be learnt, not only from the amount of ash, but also from its composition. The British Pharmacopœia not infrequently states the yield of ash which is not to be exceeded, and there is much useful information in "Pharmacographia." But a great deal of good work in this department remains to be done. In the examination of powdered drugs it is often of service to know the amount of ash which is left by the genuine article, and where stems are apt to be mixed with roots, or stalks with leaves, it is well to known the proportion of ash in the different parts.

Let us consider a few particular examples. Opium is not a drug in regard to which the inorganic constituents readily attract attention, because its active principle can be easily assayed, and that is all the information we usually require. The ash is stated to vary from 4 to 8 per cent. in the dry opium. I have found 7·51 in a sample of Turkey, and 5·85 in a sample of Persian. The interesting fact about the ash of opium is the exceptionally large proportion of sulphate which it contains, probably more than that of any other plantstuff. Lobelia is not a drug as to which I have observed any authoritative statement. In a sample of powder which gave distinct indication of lobeline, 11·85 per cent. of ash was found. Lobelia especially powdered gave 12 58 per cent. Rhubarb root is a substance in which the amount of inorganic matter varies widely. Boni gives the percentage of ash from East Indian rhubarb as 20 to 25, from English as 8 to 11. In a sample which was said to be East Indian I found 9·25 per cent. of ash. In English 6·95 and 8·8 per cent. were found, while a sample grown in Scotland gave 7·35 per cent.

Saffron is very liable to adulteration, and in its case the ash is an important criterion of purity. The B.P. gives the ash as about 6 per cent. I have found in evidently genuine saffron 5·12, 5 46 per cent.; in undoubtedly adulterated 17·0, 22·59, 31·80 per cent. In one plausible but partially adulterated sample 6 68 was the percentage of ash. Only once have I found a sophisticated specimen giving under the right percentage, viz., 3·8. Of course, the microscopic examination and colour tests are important, and perhaps sufficient in themselves to determine the purity or otherwise of a sample; but a determination of the ash is often conclusive evidence of adulteration, anything over 7 per cent. being unknown in the pure drug. An addition to the usual tests may be made by comparing the colour of an infusion with the colour of a solution of potassium bichromate. A good saffron has about twenty-five times the colouring power of potassium bichromate. A tinctorial power of twice that strength does not indicate a pure saffron.

The B.P. gives the percentage of ash in honey as not more than 0 2 per cent. Allen gives it as from 0·1 to 0·25 per cent. I have found in a sample which was genuine 0 24 per cent., while in a sample of adulterated honey so little as 0·01 per cent was found. This ash, though small in amount, gave a very marked sulphate reaction, indicating probably that the honey was mixed with a very pure glucose. An exceptionally small proportion of inorganic matter may suggest adulteration as well as an excessive amount.

Indigo is a material which always contains inorganic matter to the extent of, say, 5 or 6 per cent., arising from the process of manufacture. One sample indicated 49·36 per cent. of ash, largely iron and calcium. Another gave 32·07 per cent. These amounts are unpardonable.

Silk is often heavily weighted with inorganic salts, so much as 30 per cent. of ash being sometimes found. I have incinerated some of the silk sutures used by surgeons, and found 1·31 per cent. of ash, which is within the limit of purity, and quite satisfactory.

The Pharmacopœia does not state a maximum ash for starch. I have found from 0 1 to 0·4 per cent. Neither does the B.P. give any limit to inorganic matter in sugar. In a sample of well-crystallised sucrose, not absolutely free from colour, there was

* Read before the Pharmaceutical Society at an Evening Meeting in Edinburgh, on Wednesday, March 16.

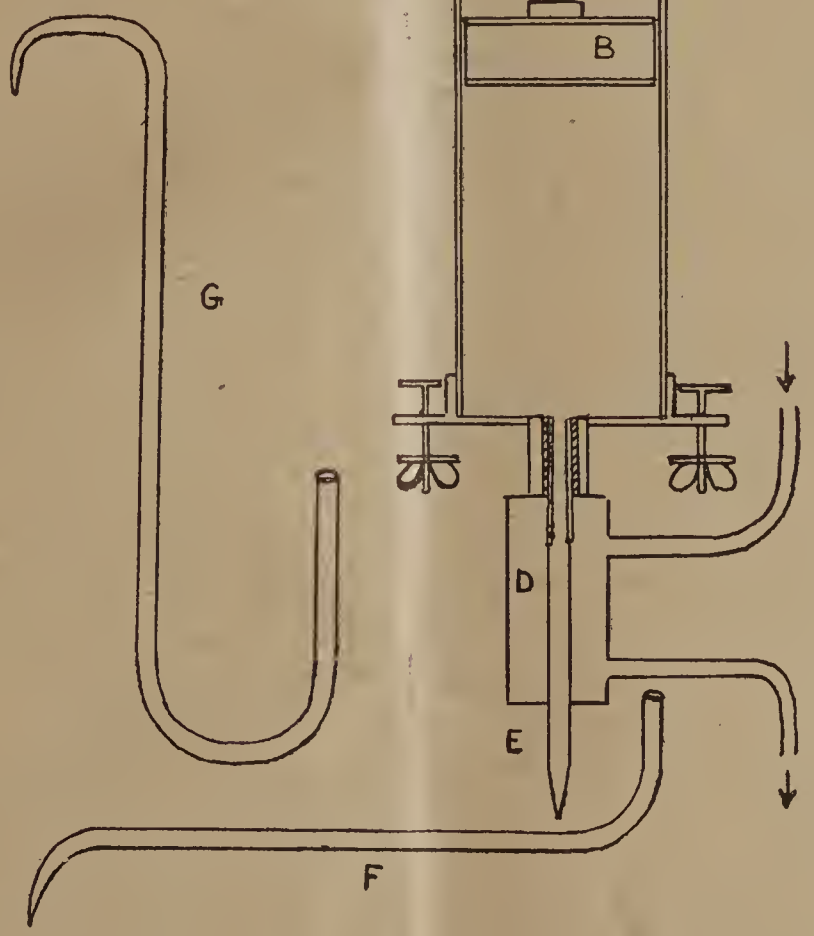
found 0·024 per cent. ash. A good sample of sugar of milk left 0·04 per cent. on incinerating. Oxalic acid, which gave 0·4 per cent. ash, indicated, as might be expected, a distinct amount of sulphate. As a rule the amount of ash in organic acids should not exceed 0·1 per cent.

As regards alkaloidal salts and crystalline active principles, the percentage of inorganic matters is generally very small, as a result of the purification to which they are necessarily subjected. But exceptions are occasionally found, and the determination of ash is an essential part of their examination.

A SYRINGE FOR FILLING CAPSULES.

BY J. A. FORRET.

Gelatin capsules are now largely used for administering such drugs as are nauseous or unstable, insoluble in water or otherwise unmanageable, or on account of their portability. Liquids of such consistence as flow freely through a nozzle of suitable bore may be conveniently run into capsules by means of a syphon fitted with a screw or spring-clip; but viscid liquids or material of the consistence of a soft extract require more or less pressure. The syringe shown in section was devised for manipulating the latter.



An efficient appliance for this purpose should provide for complete control over its contents; the operator should be able, with moderate pressure and a minimum of movement, to start, stop, or reverse the flow instantly, and to discharge the contents rapidly through a nozzle sufficiently small to pass within the capsule.

A is a brass cylinder of any suitable size. The piston, B, with a feathered screw rod passing through the cap of the cylinder, is lowered or raised by turning the wheel, C, which carries a key fitting loosely into the slot in the piston rod. The syringe is screwed to a projecting piece of wood, securely fixed to the dispensing counter at a convenient height, by two bolts and nuts. A straight nozzle, E, may be used when each capsule is held under it by the fingers. When the capsules are arranged in a tray a projecting nozzle, F, is necessary, to permit of the tray being moved so as to bring each capsule under the nozzle. A curved nozzle, G, is sometimes useful, when the operator wishes to have both hands about the same level.

An important feature in the wheel, C, is that from the beginning of the operation till the syringe is empty, the hand of the operator remains at the same level.

In the case of mixtures in which the heating of the whole mass it undesirable, but the filling of which is facilitated by gently warming just at the moment when it leaves the nozzle, the water jacket, D, has been found a convenient arrangement. This jacket is fitted to the nozzle, and, by the two tubes shown, a current of warm water is passed through it. The upper tube is conveniently connected with a syphon dipping into a vessel of warm water; the exit is by the lower tube, and the flow is regulated by a screw-clip. By increasing or reducing the flow the temperature is readily raised or lowered. The nozzles may be of glass or any other suitable material, having points adapted to the different sizes of capsules, and they may be readily fitted to the syringe by means of a rubber stopper.

* Read before the Pharmaceutical Society at an Evening Meeting in Edinburgh, on Wednesday, March 16.

GLUCOSE DETERMINATION AT THE DISPENSING COUNTER.*

BY R. C. COWLEY AND J. P. CATFORD.

Quantitative analysis is rarely practised in chemists' shops, and still more rarely, probably, in doctors' surgeries. The want of special apparatus, room, and time to devote to it are generally regarded as insuperable obstacles. It is proposed in this paper to give an example of what may be accomplished with only the ordinary utensils of the dispensing counter. The subject chosen being the determination in a few minutes of the percentage of glucose in urine or other material.

The apparatus required will be a ℥ij. cylindrical minim measure, to serve as a burette; a small porcelain capsule, such as is often used in making suppositories; a piece of stout wire as support for the capsule, to be bent at one end into a ring and the other end to be twisted around the gas-standard above the sealing-jet. One chemist, to whom this was suggested, finds it convenient to keep a small shallow kettle of water suspended over the sealing-jet, thus having a little hot water always ready.

Fehling's solution is commonly kept ready made; but if not, or if from age, unreliable—it may be made with the dispensing scales and weights—assuming they have passed the official inspection. The alkaline tartrate solution need not be very exact as to strength. The cupric solution is usually directed to be made 34·64 grammes in 500 C.c. Exactly the same strength may be obtained by dissolving ℥i. cupri sulphas B.P. in ℥ii. of water, or if desired to be quite exact, as follows:—Weigh into a ℥ii. tared vial

* Read at a meeting of the Liverpool Chemists' Association, on March 10.

(the long shape used for draughts) 2 ounces avoirdupois less 7 grains (*i.e.*, 866 grains) of distilled water, mark the point it reaches to, pour out a little, introduce the ℥i. cupri sulph. (B.P. quality), dissolve and make up to the mark again with water. Each fl. ℥j, or rather 63 minims, will contain 1 grain of metallic copper. Granulated zinc, about 10 grains, with as many drops of pure sulphuric acid, will precipitate 5 grains of copper from fl. ℥$35\frac{1}{4}$ (*i.e.*, ♏ 315) of the above solution. It may be done in a test tube, which should be inclined at an angle of about 45°, the spurting from effervescence will fall against the inside of the tube. Towards the end, immerse the lower part of the tube in the water bath; and when effervescence ceases decant the clear liquid, refill the tube several times with hot water until free from zinc; then rinse out the copper into the little capsule, drain off the water, moisten with S.V.R., dry on water bath and weigh. Two check experiments, somewhat roughly performed, gave the following results:—

315 minims yielded, with 10 grains of granulated zinc, 5 grains and 1/22nd of a grain, *i.e.*, 1·74 per cent.

25 C.c. from pipette yielded, with 20 grains of zinc, 0·447 gramme (1/5th grain too much), *i.e.*, 1·79 per cent. Difference due to impurity in commercial granulated zinc.

This may serve to test any old and doubtful sample of No. 1 Fehling, but a solution made as before described will not require testing. The strength is generally expressed by stating that of the mixed solutions.

10 C.c. are reduced by 0·05 gramme of glucose, or, in other words, 200 C.c. are reduced by 1·00 gramme of glucose, so that 200 C.c. are reduced by 100 C.c. of a 1 per cent. glucose solution; therefore it follows that 200 minims are reduced by 100 minims of the same glucose solution, or by 50 minims of a 2 per cent. solution, by 25 minims of 4 per cent. solution, 20 minims of 5 per cent. solution, 125 minims of 0·8 per cent. solution, 200 minims of 0·5 per cent. solution. The number of minims used, divided into 100, gives the percentage.

Any strength between 0·5 and 5 per cent. is thus easily determined, but beyond those limits a slight modification is advisable. If it be found that less than 20 minims of the glucose solution are required, *e.g.*, ♏10 = 10 per cent., it is better to dilute the glucose solution to 1/10th (fl. ℥j. + fl. ℥ix. of water). Then the percentage is found by dividing 1/10th the number of minims used into 100. Then 100 minims of the dilute, containing ♏10 of urine, = 10 per cent., 125 minims containing ♏ 12·5, = 8 per cent., 160 minims containing ♏ 16, = 6·25 per cent., 200 minims containing ♏ 20, = 5 per cent.

If the glucose solution is so weak that much more than 200 minims is required, the Fehling solution should be diluted to 1/10th and then if 200 minims, containing 20 normal Fehling, are reduced by 100, this contains only 0·1 per cent. of glucose, if by 50 it contains 0·2 per cent., if by 25 it contains 0·4 per cent., and if by 20 it contains 0·5 per cent.; 100 divided by the number of minims required gives the percentage in tenths.

The actual process is conducted as follows:—100 minims of each of the Fehling's solutions (cupric and tartrate) are measured into the capsule, the measure rinsed once or twice into the same. Set it on the ring—support over the gas-jet to gently simmer. Fill the measure with the liquid to be estimated and add it gradually to the Fehling solution until the blue colour disappears. The final point is best indicated by a solution of a small crystal of KFCy in acetic acid. Drops of this, to be spotted on an ointment slab or pill tile by a bit of glass rod, will show the approaching finality of the reduction from cupric to cuprous oxide far more sharply than the disappearance of the faint blue colour. The whole operation takes less time than it has taken to describe it, especially after a few trials, which may be practised on honey or milk sugar, or even cane sugar, after converting it into glucose by heating with 1 per cent. hydrochloric acid. The purest cane sugar is the granulated, containing 99·9 per cent. The brand known as Tate's crystals, or Macfie's chemists' grade, is over 99 per cent., so it may be used to standardise the Fehling. Beetroot sugar contains often only 92 per cent. sucrose.

4·75 of cane sugar	=	5 of glucose.	
0·95 ,, ,,	=	1 ,, ,,	

By the above simple process it would be possible to estimate and report on a sample of diabetic urine in the time that the medical man is writing a prescription, and the chemist would gain in reputation for smartness.

QUICK DOUBLE-STAINING WITH HÆMATOXYLIN AND SAFRANINE.*

BY F. A. UPSHER SMITH.

This method gives excellent results where it is required to contrast the commoner kinds of vegetable tissues, especially wood, bast and cambium. The hæmatoxylin is also useful for showing the presence of mucilage and for nuclei.

The general method is not original, but there are some details of manipulation not generally found in text-books, and only acquired by actual practice, that may prove useful to some workers.

1. Let the sections be as thin as possible; this is best effected by flooding the freshly-stropped razor with liquid like that in which the material is softened, in most cases dilute spirit. When the material has been softened in a moist atmosphere it is generally preferable to cut with a dry razor. Holding the razor in a perfectly horizontal position, draw it firmly and steadily through the material held between the thumb and forefinger of the left hand, and take care that nearly the entire cutting surface of the razor comes in contact with the material in cutting each section. Never cut more than six or eight sections without re-stropping the razor. Attention to this detail is of the utmost importance.

2. Place the sections on a clean glass slide and wash with spirit of the same strength as the hæmatoxylin stain. Cover with hæmatoxylin stain and leave for a definite time, which must vary according to the thickness of the sections and the structure of the tissues. From one to five minutes will generally be found sufficient. The slides of lycopodium on the table before you have been stained for different periods between one minute and twenty hours. It will be noticed that five minutes is ample time for the material in question. It is well to remember that where, as in this case, the lignified tissue is very dense and becomes deeply stained with safranine it is necessary so to regulate the hæmatoxylin that it gives equally definite results.

3. Wash again with spirit of the same strength as the hæmatoxylin solution. This washing with spirit of a properly adjusted strength must be carefully performed to ensure success. Spirit solutions of a different strength tend to deposit dense particles of colouring matter in the sections. Now cover with safranine solution, and allow to stand from one to thirty minutes, according to the material employed. The sections of lycopodium stain well in two minutes.

4. Dehydrate the sections. This is effected by washing with 50 per cent. spirit, then with absolute alcohol, and finally transferring them to clove oil. If only one section is required, choose the best and manipulate it so that when soaking in clove oil it takes up a position about one-third the length of the slide from one end.

5. Mount permanently by thoroughly drying the central part of

* Read before the School of Pharmacy Students' Association.

the slide, placing upon it a drop or two of Canada balsam and quickly transferring the section to the balsam by means of a mounted needle. Blotting paper should be at hand in order to quickly absorb the trail of clove oil and prevent it diffusing into the balsam. Place the coverslip in position by lowering it with the left hand until the left side of it dips in the balsam; on lowering the slip rapidly by means of a mounted needle held in the right hand, all bubbles of air may be excluded. If bubbles remain and interfere with the usefulness of the section there is no objection to dissolving away the balsam with clove oil and absolute alcohol and remounting, so long as the washing is not carried too far.

6. Cause the balsam to set by exposing the slide to a temperature of about 55° C. for about six to forty-eight hours. The longer period of time should be preferred whenever possible. Xylol is the best solvent for Canada balsam, which must first be dried by artificial heat in order to drive off the natural oil contained in it. Chloroform evaporates less quickly than xylol.

Round cover-slips have a more elegant appearance than squares. Cover-slips are more firmly fixed, and a more finished preparation results on gently smearing round the edge of the cover-slip with a fine brush, to distribute the superfluous mountant evenly.

Coloured ringing solutions are refinements that few busy histologists trouble about, and rightly so; but it is important that a preparation should be well and permanently mounted. For this purpose balsam is in most cases far superior to glycerin preparations.

The wash-spirit is added from a wash-bottle, and drained down the slide into a galipot. Chalk bottles are preferable for the absolute alcohol and clove oil, as they greatly facilitate work.

The chief points in this method have thus been briefly dwelt upon; it will be found by practice that staining sections on a slide is quicker, cleaner, and safer than using a watch-glass. It is obvious that a good section may easily be lost when immersed in a watch-glass containing a comparatively deep layer of a dark stain, and this danger increases with the thinness of the section.

Safranine solution is made by saturating absolute alcohol with safranine, and mixing with an equal volume of water. There are many varieties of safranine, and it is important to get a good one. Grübler's O brand is as good as any for general purposes, but special tissues may require special brands.

There are many formulæ for the hæmatoxylin stain. Lee's 'Microtomist's Vade Mecum' speaks highly of Mayer's hæmalum. That stain is made by dissolving a salt of hæmatein and ammonia in spirit, and adding it to a large volume of alum sulphate in solution. The alum is supposed to be precipitated by some substance present in the cellulose walls, and carries down with it a certain quantity of colouring matter. Lee's valuable book, referred to above, gives the fullest details concerning these and all other known staining reagents.

Many of the manipulative details, especially that of staining on the slide, were introduced to my notice by my friends Messrs. Lloyd Williams and Horrell, of the Royal College of Science, and I have pleasure in acknowledging the valuable suggestions which they have given me from time to time.

Fixing Leather to Metal.—Digest crushed galls, 9, in water, 8, for six hours, and strain through linen. Soak glue, 1, in water, 1, for twenty-four hours, then melt. Coat the leather surface with the warm gall-nut extract and the warm metal surface, previously roughened, with the glue, then fix together and allow to dry in the air.—*Scient. Amer.*, lxxvii., 326.

MEETINGS OF SCIENTIFIC SOCIETIES

CHEMICAL SOCIETY.

At a meeting held on Thursday, March 3, Professor Dewar, F.R.S., President, in the chair, the following papers were read by John Wade, B.Sc., and L. C. Panting, M.B., B.Ch. :—

Note on the Preparation of Dry Hydrogen Cyanide and Carbon Monoxide.

By the action of sulphuric acid on potassium cyanide, if the acid be concentrated, carbon monoxide as well as hydrogen cyanide is produced, and the authors find that by a proper regulation the reaction may be made to produce either of these substances quantitatively; a fact of some importance in consideration of the relative cheapness of potassium cyanide. If the sulphuric acid be mixed with its own volume of water and allowed to drop slowly upon lumps of potassium cyanide contained in a suitable flask, anhydrous hydrogen cyanide distils over. By using a stronger solution of sulphuric acid, carbon monoxide is formed, and by keeping the temperature low the gas is obtained free from sulphurous and carbonic anhydrides.—Papers by Professor J. Norman Collie, Ph.D., F.R.S., Mr. Thomas Tickle, and Miss L. Hall were summarised together. They dealt with

The Production of Some Nitro and Amido Oxylutidines.

The object of this work was to bring into relation the properties of simple pyridine derivatives with those of the more complex derivatives such as the alkaloids. As the latter are characterised by particular colour reactions, the conditions affecting the production of these ought to be studied. In a paper recently read before the Society by Professor Collie and Dr. Lapworth, a description was given of the properties of β amido, α, γ, dioxy-pyridine, a substance yielding by oxidation with different reagents a series of very characteristic colours. In the present papers this work was followed up in dealing with substances having the same substituting groups in other positions. The first paper dealt with an amido derivative of pseudo-lutido-styril, the β amido, α hydroxy $\alpha'\gamma$ dimethyl-pyridine, and the second paper with β amido $\alpha\alpha'$ lutidone. These substances are obtained by reduction of the nitro compounds with tin and hydrogen chloride. The positions of the substituting groups in the former compound seem to favour a maximum production of colour reactions combined with a minimum reducing power; it gives with sulphuric and nitric acids a bright purple colour, and with ferric chloride a red colour followed by a green, while on the other hand, their arrangement in the latter compound gives a maximum reducing power and but little tendency to the production of colours. As many alkaloids probably contain hydroxyl groups in the pyridine nucleus these relations are of some importance. When the platinum salt of the second substance is warmed with water, decomposition sets in with the formation of a much less soluble platinichloride, which on analysis, proved to be that of an unsaturated compound, propine diamine. This behaviour is interesting, being an unusual instance of the hydrolytic splitting of the pyridine ring. The question was asked by Dr. Wynne how the authors were assured that the amido group occurred in the β position, and not in that of β', in reply to which it was stated that this was dealt with in the paper. The nitro and amido compounds obtained had been identified with those produced through the nitration of a carboxylic acid of pseudo lutido-styril, in which the β' position was blocked by a carboxyl group, which was subsequently eliminated. —Professor Dunstan recalled another unusual behaviour of an alkaloidal platinichloride, by which hydrogen chloride was separated, and a platinichlor substitution product remained.—The President also remarked upon the conditions under which quinoline could be oxidised so as to produce at will either an aniline compound or a carboxylic acid of pyridine, according as the breaking down took place in the benzenoid or pyridinoid nucleus. In a paper by Mr. F. E. Matthews, Ph.D.,

On Benzene Hexabromide,

the author briefly described the results of his experiments. He had not succeeded in obtaining the β form of benzene hexabromide by a certain method recently described by another worker. He also recorded his failure to obtain the hexabromide or hexachloride of brombenzene. On hydrolysing benzene hexabromide with alcoholic soda more bromine was split off than corresponded with

three molecules of hydrogen bromide, and the residue consisted of di- and tri- brom benzene.—Professor Tilden remarked that it would be interesting to observe the conditions of light and temperature affecting these experiments.

The next communication was a note by Professor J. Norman Collie, Ph.D., F.R.S., and Colin C. Frye, on

The Action of Bromine on Benzene.

It was stated by Ador and Rilliet that when the product of the action of bromine on benzene—probably a dibromide—was heated with zinc ethyl, compounds of the formula $C_6H_6(C_2H_5)_2$ were formed, from which, upon oxidation with chromic acid, meta- and para-phthalic acids were isolated, but no ortho-phthalic acid. This result was so remarkable that the experiments had seemed worth repeating, and since it had been shown by Dr. Armstrong that phthalic acid is destroyed by chromic acid, permanganate had been used instead. In a first experiment, carried out in the absence of light, ortho- and para-phthalic acids were found, but none of the meta compound; but in a second experiment, in which the mixed bromine and benzene were exposed to daylight while being maintained at a low temperature, small quantities of the meta acid were obtained. These results must have considerable influence upon theorics respecting the formula of benzene, but no conclusions were drawn by the authors, the facts only being so remarkable were worth recording.—Dr. Armstrong said he considered the matter one of great importance, but no conclusions ought yet to be drawn; phthalic acid could be produced by oxidising benzene itself, and it was desirable that this work should be carried out on very large quantities of material.—Mr. C. E. Rice, B.A., then read a

Note on Manganic Salts.

When the higher oxides of manganese are dissolved in hydrogen chloride it had been supposed by Fischer that the tetrachloride $MnCl_4$ was formed. Pickering criticised this assumption, and asserted that manganic chloride, $MnCl_2$, might with equal probability account for the behaviour observed. Attempts to prepare the latter had, however, failed. By dissolving manganous chloride in chlorine hydrate contained in a closed tube, a solution is obtained exactly resembling that of the supposed $MnCl_4$. An attempt was made to isolate double salts of $MnCl_4$ with potassium chloride and ammonium chloride, and when a strong solution of the manganese salt was saturated with ammonium chloride and hydrogen chloride at a low temperature, crystals of a double compound were obtained, which proved, however, on analysis to have a composition represented by the formula $2NH_4ClMnCl_3H_2O$. A potassium salt of the same nature was also obtained. These are stable in dry air, but when heated to 100° give off chlorine; they are also decomposed by water, a hydrated oxide of manganese being precipitated.—Dr. Armstrong and Professor Tilden favourably criticised the paper, and the President said it would be important to study the optical and magnetic propcrties of these compounds.

Finally, Mr. W. C. Reynolds read a communication on

Some Chemical Properties of Concentrated Solutions of Certain Salts. Part I., Potassium Carbonate.

When copper sulphate is added to a concentrated solution of potassium carbonate, a solution is obtained from which crystals of a double carbonate of copper and potassium are deposited. The ame is obtained in a purer state by means of copper acetate and potassium carbonate, and can be washed free from potassium acetate with alcohol mixed with glycerin. Strontium and barium do not give corresponding compounds, but the author has prepared a series of compounds with other metals having the following general composition:—$M''K_2(CO_3)_2$, with the metals copper, ferrous iron, manganese, cobalt, and nickel. The bismuth salt has the formula $Bi_2OK_4(CO_3)_4H_2O$. The magnesium salt and the silver salt, which latter has the formula $AgKCO_3$, have been previously prepared and described. A lead salt also exists, but if made from a solution containing excess of lead the proportion of lead carbonate approaches that of two molecules to one of potassium carbonate. All these double salts are decomposed by water and cannot, therefore, be re-crystallised; the ferrous compound, moreover, is readily oxidised.—Professor Tilden pointed out that in concentrated solutions potassium carbonate appeared to exist as ions of K and KCO_3, instead of as K_2 and CO_3. It was to be noticed that the valencies of all the heavy metals corresponded with the number of (KCO_3) groups united to them.—Mr. Ling was surprised that such compounds had not been studied before; the copper solution mentioned has long been well known among sugar chemists.—Mr. A. G. Bloxam said if carbonic acid were regarded as a hydroxy acid its behaviour in this respect would be brought into relation with that which was well known of other hydroxy acids.

ROYAL INSTITUTION.

On Friday, March 4, a lecture was delivered by Professsor T. E. Thorpe on

Recent Results of Physico-Chemical Inquiry.

Until thirty-five or forty years ago the domain of chemical physics was a dark continent; like Africa, it had been penetrated by but a few, and its riches were unknown; and, like Africa, it has many regions still unexplored, with paths that are few and difficult to traverse. He had on one occasion, over a friendly cup of tea, ventured to remark to a lady, "Why, when a cup of tea is stirred, does it not go on moving for ever?" "Certainly it cannot," was the reply, "unless you go on stirring it for ever." The scientific reply, however, was that tca is not a perfect fluid, and the question arises what is a perfect fluid? That may be defined as a fluid, all the parts of which are under the same pressure. Liquids may be divided into two classes, thick and thin. The thin are those that, when stirred, continue to move longest. With a pair of pipettes he proceeded to show the different speeds with which two liquids flowed from them. One filled with a mobile fluid paraffin emptied itself in about fiftcen seconds, while the other, filled with glycerin, took half an hour. In the Government laboratories, where they are concerned with the determination of alcohol in various liquids, they must first free these liquids from carbonic acid, an object that can be accomplished by merely pouring from one vessel to another, but this leads to an inaccuracy through the escape of alcohol. To free the liquid from the dissolved gas without exposure, therefore, a paddle, driven by an electric motor is caused to revolve in it while contained in a closed vessel. This was experimentally illustrated to the audience with two liquids, water and glycerin, which were seen to behave very differently, thc water being churned up into a foam, while the glycerin, which has a viscosity about two thousand times that of water, was but slightly affected. By such apparatus the Revenue is saved £100 a year, which, although a small amount in the Revenue, is a commensurable quantity compared with what is dealt out by the Government to promote scientific education. He was able to show other substances, moreover, that were even more viscous than glycerin; a vessel containing meta-phosphoryl chloride could be inverted without any of the liquid flowing out, and an indentation on its surface would take weeks to disappear. Some complex silicon compounds also, for which he was indebted to Professor Emerson Reynolds, showed similar properties. In fact it became difficult to lay down a hard and fast line between liquids and solids. The metal lead that is commonly regarded as a solid has some of the property spoken of. On some old cathedrals the flowing of the lead on the roofs is evident, and by means of a hydraulic press he was able to demonstrate the property in a more striking manner. The press acted on a cylinder containing lead, which, on the application of strong pressure, was caused to flow out through a small hole, forming a long wire. Freshly-cut lead surfaces, too, adhere readily when pressed together. Even steel shows viscosity in a small degree. By the kindness of Professor Roberts-Austen he was able to exhibit a section of a steel railway metal, the surface of which had been etched with dilute acid. The etched surface exhibited the lines of flow in the steel, due to pressure. Glass also must be included among viscous substances. Professor Kohlrausch had found that when a magnet was suspended by a glass fibre the latter suffered a permanent twist by the action of the earth's magnetism. Among liquids might be mentioned a substance named isoprene, discovered by Professor Tilden, and obtainable from turpentine, which possesses a viscosity only one-fifth that of water. But of all liquids those formed by condensed gases are most mobile. Among these but few determinations have been made. The viscosity value of liquid carbonic acid has, however, been carefully examined, and found to be fifteen times less than that of water at the same temperature. It decreases gradually with rise of temperature until at 38° the liquid is converted into gas, but even the gas shows it slightly, viscosity in fact being a property of all matter. The viscosity of a liquid varies considerably with temperature and slightly with

pressure. An experiment showing the different viscosities of hot and cold glycerin was performed and diagrams illustrating its rate of change by curves were shown. The units employed in its measurement are taken from the common units of length, mass, and time, the co-efficient of viscosity being the force required to maintain a velocity of one centimetre per second in a surface of area one square centimetre moving tangentially over a pond of the liquid one centimetre deep. It must be remembered, however, in comparing viscosities, that different liquids are not under the same thermal conditions at a given temperature. At 20°, for example, water and alcohol are at very different ranges of temperature from their respective freezing and boiling points. But among liquids whose thermal conditions are more comparable, such as water and formic acid, which latter freezes at 8° and boils at 100°, the changes of viscosity with temperature vary with different rates. At zero the viscosity of water is six and a half times greater than at 100°, while that of formic acid is only four and a half times greater. The co-efficient sinks more rapidly in the case of water than in the case of paraffin, and still more rapidly in the case of glycerin. Viscosity appears to be in no way connected with the expansion due to heat, for while at 4° water attains a maximum density, the rate of change of its viscosity passes through this temperature without alteration. But there are anomalies in the behaviour of water in other respects than its co-efficient of expansion; one is the effect of pressure on its viscosity, and another the fact that it is more compressible at low than at high temperatures. The reason is to be looked for in the fact that water is an associated substance. Below 4° ice particles exist, dissolved in the water and producing the same effect as dissolved saline substances. There are thus two factors affecting its viscosity, the simple effect of change of temperature and the effect of association of the molecules.—Professor Thorpe would draw the notice of physiographers to a fact that had apparently escaped attention. Saline water is more viscous than pure, and the viscosity increases largely with the fall of temperature; and the Gulf Stream, which sweeps round the shores of Brazil and Mexico with a considerable velocity, owes the loss of this velocity very largely to the cooling it experiences in these northern latitudes.

LINNEAN SOCIETY OF LONDON.

At a meeting held on March 3, Dr. St. George Mivart, F.R.S., Vice-President, in the chair, Mr. Thomas Christy exhibited specimens of

The Mora Nut

of British Guiana (*Dimorphandra Mora*, Schomb.), of which some had been lately introduced into London by colonial brokers as the kola nut (*Cola acuminata*). It appeared, however, on analysis that the former contains no caffeine, a product for which the latter is of definite commercial value. It remained to be ascertained whether the mora nut has any economic value.—Prof. W. A. Herdman, F.R.S., then read a paper by Mr. F. J. Cole, entitled "Observations on the Structure and Morphology of the Cranial Nerves and Lateral Sense-Organs of Fishes, with especial reference to the genus *Gadus*." It contains the first description of

The Lateral-Line Organs of Gadus,

and pit-organs were shown to be present. The author concludes that the lateral-line system of fishes was not originally metameric and that it has nothing to do with the branchial sense-organs. He regards it and the auditory organ as parts of a system, and their nerves (viz., the superficial ophthalmic, buccal, external mandibular, lateralis, and lateral-line nerves) together with the auditory as of a series *sui generis*, and shows that the so-called lateral-line nerve of *Petromyzon* really belongs to the lateralis accessorius system (ramus lateralis trigemini, auct.), the morphology of which he fully describes. The paper deals exhaustively both with the aforementioned and the subsidiary branches of the subject, which is treated in detail and historically, with an accompanying exhaustive bibliography.

Mr. G. Claridge Druce next read a paper on

The Occurrence of Carex Helvola, Blytt,

in Britain, in which he gave an account of his discovery of this plant on Ben Lawers, Perthshire, in August, 1897. He found it growing in some abundance at an elevation of about 3200 feet. Professor Blytt and Doctor Christ, to whom specimens had been submitted, both agreed in naming it *C. helvola*, which by many botanists is considered to be a hybrid. Professor Blytt says that it grows with *C. canescens* and *approximata* (*lagopina*), but he has never found ripe fruit. Doctor Christ says: "Il me semble d'être une ancienne hybride fixe et plus ou moins stable." Mr. Druce could readily believe that *C. helvola* was a hybrid of which *C. canescens* was one parent, but he had more difficulty in stating definitely the name of the other. From the close resemblance borne by *C. helvola* to *C. Zahnii* (an acknowledged hybrid of *C. canescens*, in one of its forms, with *C. approximata*), this combination might well be the origin of the Ben Lawers plant, but against that was the fact that the presence of *C. approximata* in the Breadalbanes had never been proved. *C. echinata*, on the contrary, was plentiful there, but Mr. Druce could see no positive evidence of the occurrence of that species in the foliage or inflorescence. He would have expected the offspring of two plants with nerved perigynia to have exhibited that character even in young specimens; as is shown in *C. pseudo-helvola*, an acknowledged hybrid of *C. canescens* and *norvegica*. The foliage too was slightly glaucous, a character not possessed by *C. echinata*. Although the Ben Lawers plant was less luxuriant than Blytt's Norwegian specimens, Mr. Druce was unable to separate it specifically from that plant.—The last communication was a report by the Rev. O. P. Cambridge, F.R.S., upon

The Spiders Collected by Mr. Fisher,

of the Jackson-Harmsworth Polar Expedition, was read by Mr. A. D. Michael, F.L.S. They consisted of three species, all belonging to the genus *Erigone*, one of which had been previously described, though not figured by Thorell, and another was new, but closely allied; the author proposes to call the latter *E. Fisheri*. Mr. Michael remarked that *Erigone* was a genus of small spiders chiefly found in the northern and mountainous parts of Europe. In the views of some writers it included the two later genera, *Neriene* and *Walckenaera*, in the view of others the former only. Out of about 150 known species nearly 100 had been found by Mr. Cambridge in Dorsetshire, so that it appeared that the Arctic *Arachnida* were not so different from English and Central European types as might perhaps have been anticipated.

PHARMACEUTICAL SOCIETY.

At the meeting of the Library, Museum, School, and House Committee, on Wednesday, March 9, the Curator presented the following report of donations:—

To the Museum in London.

Messrs. Horner and Sons, London:—Specimen of fine Patchouli Oil and of the Leaves from which it was distilled.

Mr. H. Haensel, Pirna-on-the-Elbe:—Specimens of Terpeneless Oils of Lemongrass, *Pinus picea*, and Turmeric.

Messrs. Schimmel and Co., Leipsic:—Specimen of the Synthetic Oils of Jasmine, Neroli and Ylang Ylang, Citronellol, Citronellal, Geraniol, Geranyl Acetate and Formate, Linalyl Acetate and Formate, Methyl Chavicol, Santalol, Methyl-Heptenone, Geranyl, Methyl Ether, Benzyl Benzoate, and Ethyl Benzoate.

Messrs. Hodgkinsons, Prestons, and King:—Specimen of Crude Amber Oil and of the Rectified Oil.

Messrs. Lewis and Peat, London:—Two specimens of Indiarubber from New Guinea.

Mr. J. H. Hart, F.L.S., Curator Botanic Gardens, Trinidad:—Seeds of *Omphalea megacarpa*.

Messrs. Hearon, Squire and Francis:—Specimens of the Fruits of *Sapindus mukorossi*.

The African Lakes Co., Glasgow:—Specimen of *Strophanthus kombé*.

Mr. F. A. Upsher Smith, London:—Two Microscopic Slides.

To the Museum in Edinburgh.

Messrs. T. and H. Smith and Co., 21, Duke Street, Edinburgh:—Gallic Acid, Jalapin, Jalap Resin, Scammony Resin, Scammonin, Caffeine, Papaverine, Codeine, Narceine, Xanthaline, Xanthaline Muriate, Tannic Acid, Morphine, Tartrate of Morphine, Salicin, Aloin, Piperin, and *Tela vesicatoria*.

To the Herbarium.

Mr. H. Marston Morgan, Kingston Hill, Surrey:—Fifty specimens of Medicinal Plants from Singapore.

NOTICES OF BOOKS.

'Doctors and Patients: Hints to Both,' by Dr. Robert Gersuny, of Vienna, is a distinctly readable little book. The English translation of it, published by John Wright and Co., of Bristol (2*s.* net), is by A. S. Levetus, and Dr. D. J. Leech, of Manchester, contributes a preface. The object the author has had in view—a highly commendable one—has been to discuss the commonest relations between doctor and patient, "not with the intention of presenting them in full detail, nor with the pretension of drawing up any stereotyped method of conduct, but looking at the matter from the purely subjective point of view." The book is, of course, primarily intended for medical men, but the writer has endeavoured, and with much success, to make it readable for the general public. Amongst the matters advantageously dwelt upon are the relative position of patient and doctor, the frequency and length of doctors' visits, misconstruction and abuse of the doctor's statements, harmful influence of the persons about the patient, household remedies, "patent" medicines, quack doctors, consultations, fees, etc. Much practical common sense is displayed throughout, and the book can therefore be warmly commended.

Street's 'Newspaper Directory' for 1898 (London: British, Foreign, and Colonial Advertising Offices, 30, Cornhill, E.C. 3*s.* 6*d*) affords further testimony, if such were needed, of the enormous growth of newspaper enterprise in Great Britain and Ireland. But, more than that, it is a striking example of the manner in which the convenience of advertisers is catered for by the agencies, amongst which Street and Co. occupy a leading position. The arrangement adopted in the work is one which experience has proved to be at least as good as any. Beginning with an alphabetical list of newspapers, magazines, etc., next come separate alphabetical lists of London periodicals, local and suburban newspapers, provincial newspapers, class and trade papers, etc. The bulk of the work, however, is occupied with more detailed lists of the various publications, in which all imaginable particulars are given respecting them, and anyone who wishes to find trustworthy information in the direction indicated will in most cases find all he requires in this 'Newspaper Directory.'

Willing's 'British and Irish Press Guide' for 1898 (London: 162, Piccadiliy, W. 1*s.*), is a more modest work of similar nature. But it evidently supplies a want, for this is the twenty-fifth annual issue of the book, and is certainly produced in a more handy form than works of greater pretensions. It embodies the usual alphabetical and detailed lists of London and provincial newspapers, class organs, colonial, American, and continental papers. Information is also given respecting all titular changes and amalgamations, reporting and telegraphing facilities, news agencies, etc., whilst there is an interesting list of existing newspapers and periodicals which date from the seventeenth and eighteenth centuries, arranged chronologically.

'The Calendar of the Pharmaceutical Society of Ireland' for 1898 (Dublin: 67, Lower Mount Street. 1*s.* 6*d.*) includes the usual information regarding matters pharmaceutical across St. George's Channel. The statistics of the Society show that up to the end of December last there were 550 persons registered as pharmaceutical chemists under the Pharmacy Act (Ireland), 1875, 181 members, 299 chemists and druggists, 424 registered druggists, 60 associate druggists, and 17 assistants to pharmaceutical chemists. Of these, only the members and associate druggists appear to be connected with the Society, making the total strength of that body 241, out of a grand total of 1531.

'The Medical Annual and Practitioners' Index' (Bristol John Wright and Co. 7*s.* 6*d.* net) has reached its sixteenth year of publication, and is as thorough a summary of medical progress during the past twelve months as ever. The chief sections at the beginning of the book are a therapeutic review of the past year; a dictionary of new remedies; an article on electro-therapeutics by Dr. A. D. Rockwell, of New York; another on hypnotism and suggestion by Dr. C. Lloyd Tuckey. Then follows the dictionary of new treatment, which constitutes the bulk of the book, and is the chief reason for its existence. This extends to nearly five hundred pages, and is illustrated by photogravures and process blocks. Our readers will be specially interested in the atlas of bacteria, pathogenic in the human subject, by S. G. Shattock, F.R.C.S., which is commenced in this year's annual, and is to be completed in the next issue. The object of this atlas is to present graphically the appearance of original preparations of those bacteria. All the drawings have been made from cultures in an active stage of growth, in order that abnormal, degenerate forms might be eliminated. The precise mode of preparation, the age of the culture, and its original source are given in connection with the several figures. The drawings are magnified to about 1000 diameters and all are beautifully coloured, nothing better of the kind having yet been published. They include representations of *Saccharomyces albicans*, typhoid bacilli, colon bacilli, *Staphylococcus pyogenes aureus*, plague bacilli, gonococci, anthrax bacilli, and tubercle bacilli in sputum. Legal decisions of the year and particulars of new books, apparatus, etc., complete the book as a work of reference.

The 'Pharmacopée Homœopathique Française' (Paris: J. B. Ballière et Fils, 6 fr.) is published under the patronage of the Société Française d'Homœopathie, and edited by H. Ecalle, L. Delpech, and A. Peuvrier, pharmaciens, of Paris, with the collaboration of Doctors Jousset and Léon-Simon. It extends to 400 pages, and the monographs are divided into three groups. The first deals with vehicles, fundamental preparations, mother tinctures, and triturations, attenuations and precautions to be observed in preparing the same, globules, homœopathic dispensing, and the preservation of the medicaments employed. Part two is devoted to vegetable substances used in medicine, part three to animal medicaments, and the last section to mineral substances and chemical products. The information given in the monographs is very exhaustive, and the indexes appended to the work seem full and complete. Taken as a whole, the book should constitute a mine of wealth to all who dissent from allopathic principles, and even supporters of those principles may find much to instruct them in the well-arranged pages.

'The Tallerman Treatment,' by Arthur Shadwell, M.B., M.R.C.P. (London: Ballière, Tindall and Cox. 3*s.* 6*d.* net.), is a record of results obtained by treating cases of rheumatism, gout, rheumatic arthritis, stiff and painful joints, sprains, sciatica, and other affections with superheated dry air. It is illustrated with 63 plates, showing the appearance of patients before and after treatment.

'Geschichte der Pharmazie,' by Dr. J. Berendes (Leipzig: Ernst Günther. M. 2 each part), is to be completed in ten parts. It is apparently intended to be a history of pharmacy and all connected with it from the earliest times, and the first scene is laid in Egypt. The early records of the Semitic peoples are next laid under contribution, the Phœnicians, Babylonians, Arabs, and Israelites being discussed as pioneers of medicine and the pharmaceutic art. Thus much is included in part 1 of this interesting work.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australasia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

LONDON: SATURDAY, MARCH 19, 1898.

SIR RICHARD QUAIN.

Sir Richard Quain, whose death occurred on Sunday last, had been an honorary member of the Pharmaceutical Society since 1868, that is to say, during the whole of the time the Pharmacy Act of 1868 has been in operation, and he was always a warm friend of pharmacists, deeply interested in any movement that tended to their permanent benefit. He was strongly imbued with the importance of what pharmacists have done for the medical profession, as witness his remarks on the occasion of Mr. Walter Hills' address to the students of the School of Pharmacy (*P. J.* [3], xxv., 283). Ready-made physic was one of the things to which he then took objection; he compared it to ready-made clothes which fit badly and are not generally of good quality. It was doubtless because of the intensity of his feeling on this subject that he took so marked an interest in the British Pharmacopœia, a work which he desired should truly become, for the medical and pharmaceutical professions, the "uniform standard and guide" it was originally designed to be. On that account universal regret will be felt that he was not able to see the publication of the Pharmacopœia of 1898, though as a matter of fact he had been able to see the work carried to its practical completion, as if not now actually in the press, it very shortly will be. No one was more ready than he was to acknowledge the obligations under which the Council and Pharmacopœia Committee of the Pharmaceutical Society had placed the General Medical Council, by the valuable assistance rendered in revising the Pharmacopœia, and at the time the Addendum of 1890 was published he went so far as to say that the labours of his colleagues and himself, in connection with that work, would have been in vain if it had not been for the assistance of the Pharmaceutical Society. On the other hand, pharmacists owe him no slight debt of gratitude for his persistent and earnest endeavours to secure for them due representation on the revising body.

Regarding Sir Richard Quain's career, it is impossible, in the limited space available here, to give more than the briefest sketch. He was born at Mallow, near Cork, in 1816, and after leaving school was articled to a medical practitioner at Limerick. Later, however, his medical training received a temporary check which might easily have been a permanent stop, as a relative was anxious that he should succeed him in his business as a tanner. Fortunately for medicine the project fell through, after steps had been actually taken to carry that desire into effect. Young Quain then became a student of University College, London, and in 1842 he became M.D., Lond., being the only candidate of his year who received honours in medicine. Nine years later he was elected a Fellow of the Royal College of Physicians of London, and at that time he already had the reputation of being the most capable young physician of the day. Selected by the Queen in Council, in 1860, to be a member of the Senate of London University, he subsequently took a very prominent part in all the ordinary business of the University. Then, in 1865, he was appointed a member of the Royal Commission for the Investigation of the Cattle Plague, and it is acknowledged that he contributed far more than any other member of that Commission to the complete attainment of the objects for which it had been constituted. It is reported that Lord Sherbrooke, who was himself a member of the body, said this was the only Royal Commission which had ever done any good. But, be that as it may, there is no doubt that Dr. Quain's services were highly appreciated by those in authority, as well as by the profession of which he was so distinguished an ornament. He became one of the most influential Fellows of the College of Physicians, and came very near being elected President of that body, the fact that he was not elected being probably due to the fact that he was already President of the General Medical Council.

Sir Richard's connection with the General Medical Council dates from 1863, when he was appointed by the Queen in Council, for the usual term of five years, to be one of the six Crown members of the Council, and he has since been re-appointed six times. He was one of the trustees of the Council and acted as treasurer until his election as President in 1891, the year in which he was created a baronet. He was also Chairman of the Pharmacopœia Committee of the General Medical Council, and in that capacity took an important part in the preparation of the first two issues of the book and of the successive addenda, as well as in the preparation of the Pharmacopœia shortly to be published. It is noteworthy that the failing health of the last year has only twice been suffered to interfere with his attendance at a meeting of that Committee, and it has never prevented his close attention to the business to be transacted. As President of the Council his complete acquaintance with every detail of the past proceedings of the body was of the greatest value to his colleagues, and his services to the country in the promotion of medical education cannot be over-estimated. As an author he has not been very prolific, but he originated and edited a very important work in his 'Dictionary of Medicine,' written by various authors. He is said to have read and considered the proofs of every line of that work, with its 2500 pages of double column printing. Elected a Fellow of the Royal Society in 1871, the noted physician contributed at least one notable paper to the proceedings of that body, and he also conducted valuable researches into the causes and effects of fatty degeneration of the animal tissues. In everything he did he brought the same degree of thoroughness to bear, and it is mere matter of fact to say that there never was a busier man. The result of his persistent activity was to make him one of the most remarkable men in London professional and social life for a period of nearly half a century. His loss will be widely felt, and the extreme importance of the services he has rendered to society will only gradually be realised.

ANNOTATIONS.

Scopolamine Hydrobromide as met with in commerce has not always the same rotatory power, and while Dr. Hesse is of opinion that the approach to inactivity observed in some instances is due to the presence of another base of the same composition, to which he has given the name of atroscine, Professor Schmidt holds that it is due to the action of strong bases used in the process of extraction. In the current number of the *Archiv der Pharmacie* three papers in support of that view are published, and experimental evidence is brought forward to show that atroscine is the same thing as inactive scopolamine. It is there shown that the crystalline form of the hydrobromide of low rotatory power is the same as that of the salt having high rotatory power. Both yield a gold salt, melting at 210° to 212° C., and the scopoline produced by the action of baryta water was in both instances the same—optically inactive, melting at 109° to 110° C., and boiling at 241° to 243° C. In like manner the medicinal action of the salt is said to be practically the same, whether it has a high or low rotatory power. The composition of the salt is represented by the formula $C_{17}H_{21}NO_4HBr + 3H_2O$, and when dried over sulphuric acid the normal salt melts at 193° to 194° C., while that now obtainable in commerce—consisting of a mixture of the normal and inactive salts—melts at 180° to 181° C. The German Pharmacopœia gives the melting point as "about 190° C.," and Dr. Hesse gives it as 181° C.

The Rectification of the Register of Chemists and Druggists again necessitates the publication of a lengthy list of individuals (see p. 300*d*) who have not taken the trouble to notify the Registrar of their changes of address. It is only four months since a similar list was published in the Journal, whilst the new Register has been published but a very few weeks. Already, however, there appear to be some four hundred wrong addresses in the book, almost the whole of which are attributable to pure carelessness on the part of the individuals whose names appear in the list. If they, or some of their friends or acquaintances, do not notify their present addresses to the Registrar, at 17, Bloomsbury Square, London, W.C., by December 30 at latest, their names will be removed from the Register in due course.

The Aberdeen Pharmaceutical Association is taking steps which show that it is very much in earnest on the subject of pharmaceutical education, and so long as the Association does not subsidise classes so as to encourage the innate tendency to pauperisation that is too apt to prevail amongst students, everyone interested in the progress of pharmacy will be glad to note the evidence of activity afforded by the Report of the Education Committee of the Association, referred to at page 297 and summarised below. The report states that the Committee sent a circular letter to all the Local Secretaries of the Pharmaceutical Society north of, but not including, Dundee — fifteen in number— explaining that it was desired to establish a permanent school of pharmacy in Aberdeen, where students could have a regular course of study in all the subjects embraced by both the Minor and Major examinations. The Committee having been appointed to gather all the information they could, requested the recipients of the letter to answer certain queries to the best of their ability. Those questions were:—(1) What might be the number of unqualified assistants and apprentices in your district? (2) Have you any idea where they usually go for study? (3) Are there any classes in your district suited for pharmaceutical students? (4) Do you think it likely that students in your district would prefer Aberdeen to other and more expensive centres if a good school was established?

Thirteen of the Local Secretaries replied, and their general opinion was that if a properly equipped School of Pharmacy were established in Aberdeen, under a capable teacher, the young men from their districts would prefer to go to Aberdeen rather than to other centres, in the South. The number of apprentices and unqualified assistants in the various districts was found to amount to about 300, which, added to the number in Aberdeen, gave a total of over 400 available students. The Committee then resolved to write to a few pharmacy teachers, asking the probable cost of efficiently fitting up a laboratory capable of accommodating twenty students. In reply to this a very valuable and exhaustive report was received from Mr. G. F. Merson, Newcastle-on-Tyne, and, after consideration of that by the Committee, it was unanimously decided that, provided the Association could secure the services of a capable and energetic teacher, an arrangement might be come to whereby the rooms at present occupied by the Association could be remodelled and properly equipped at an outlay of a sum not exceeding fifty pounds, over and above what is now in hand for such a purpose. The Committee resolved unanimously, therefore, to recommend to the Association that the rooms should be remodelled, suitably equipped, and a properly qualified teacher appointed.

That the Chemists' Ball was this year a great success is no news, but it will be gratifying to many of our readers to learn that the financial position has also proved to be exceedingly satisfactory. The Hon. Secretary, Mr. William Warren, intimates that he has reported to his Committee the existence of a balance to the good of more than thirty-one pounds, and in accordance with the usual practice, the Committee has recommended that the sum of twenty-five guineas be paid to the credit of the Benevolent Fund of the Pharmaceutical Society.

Adulteration and Misrepresentation served the London Chamber of Commerce as a topic for discussion after a dinner held at the Trocadero Restaurant on Tuesday last. Sir Charles Cameron, M.P., was the Chairman, and in opening the debate, he sagely remarked that in any legislation dealing with the subject of adulteration an endeavour must be made by the would-be reformers to carry with them the goodwill and sympathy of the whole commercial community. He had uniformly found that every organised body of traders had done its best to put down adulteration, that practice being regarded on all sides as an unfair form of competition. The Bill introduced by the Government last Session was said to be unsatisfactory, and Sir Charles expressed the hope that the measure which was to be brought in this year would proceed more closely on the lines recommended by the Select Committee which had reported on the subject. The next speaker was Mr. Kearley, M.P., who spoke of the importance of establishing a Board of Reference, as suggested by the Select Committee. He described adulterators of the present day as scientists; and, on the principle of setting a thief to catch a thief, he thought it was necessary to organise a thoroughly scientific body, consisting of analysts of great repute and of traders having a practical acquaintance with the products under examination. Mr. Innes Rogers, in turn, urged that the law, as now administered, is unfair, because it does not attack the real adulterator, but simply tradesmen who, in nine cases out of ten, are entirely ignorant of what they are doing. It may be asked, however, whether tradesmen ought not always to know what they are doing. The next speaker was Mr. Bannister, of the Government Laboratories, who said that in any new legislation the Government should be given power to compel local authorities to take a suffi-

cient number of samples to carry out the provisions of the Act properly. Much more was said by various other speakers, all of whom were doubtless in that placid state of mind which is wont to accompany the digestion of a substantial and well-cooked meal. But will the Government regard this as serious business? It is a significant fact that nothing was said about the matter at the Annual Meeting of the Association of Chambers of Commerce of the United Kingdom, held on Wednesday last.

The 'Berichte der Deutschen Pharmaceutischen Gesellschaft' (Berlin: Gebrüder Borntäger) is a monthly publication, in which the proceedings of the German Pharmaceutical Society are reported, and its appearance is one of the signs of useful activity by which that young Society has been characterised for several years. The first number of the eighth volume has just come to hand. It contains a short report of the last meeting of the Society in January and a list of papers recently published in various journals on subjects relating to pharmaceutical botany and chemistry. The papers read at the last meeting of the Society are published in this number of the *Berichte*; they are on recent improvements of polarising apparatus by W. Wicke, on new drugs by P. Siedler, and a short note on the use of ammoniacal chloroform in the extraction of alkaloids from material containing sugar. There are also reviews of works on chemistry, pharmacognosy, etc. The journal is in every respect a creditable production, and the matter it contains is generally of great interest.

"For Private Circulation Only," is the heading to a circular that has been sent to a correspondent, who doubtingly asks if the articles referred to therein are genuine. The reverend (*sic*) gentleman who has discovered, not for the first time, how to effect a "certain" cure of many habits and weaknesses that are more frequently hinted at than named, is apparently a new acquaintance of our correspondent, but the latter may rest assured that the extracts of "Corrassa Apimis," "Selarmo Umbelifera," and "Carsadoc Herbalis," as well as powdered "Alkermes Latifolia," exist solely in the imagination of their reverend discoverer. If then, as suggested in our correspondent's letter, the price of the "Corrassa Compound," prepared from the above mystic drugs, seems "an extra large one," he must attribute that to the necessity of properly recompensing the efforts of genius. And, despite the apparently respectable—nay, almost sacred—source of the circulars, it seems rash, on the whole, heedlessly to put away from one's mind the thought that the outpourings of genius read "like so much quackery." For, after all, have we not heard on other occasions of self-styled reverend gentlemen who were in reality nothing but impudent scamps, thriving on the credulity of people who assume that what is printed must necessarily be true? Let our correspondent take courage, then and exercise his common sense in this matter as in all others.

The Value of the Metre as the only standard of measurement of length, the name of which is not ambiguous, is ably summed up by Professor E. W. Morley, who says he once read a statement which had been translated from German into French, then from French into English, and in which a certain length was given in feet, inches, and thousandths of an inch. The question immediately arose, What foot and inch were meant—the English, French, or one of the many German standards? But, observes the puzzled Professor, "the only solution of the whole matter was that the truth could not be learned from the announcement unless I could find whether the Austrian author had used the Austrian standard, or that of Heidelberg where he wrote, or that of Leipsic where publication was made, what course the French translator took, and what the English." In fact, the metre is the only standard of length, the name of which invariably possesses the same meaning, and the same is true of the kilogramme as a weight and of the litre as a fluid measure. But how many different pound weights are there and how many different pint measures?

Sir Henry Bessemer's Death, on the 15th inst., ends the remarkable career of one of the epoch-making men of the century. His great success in life was due to the somewhat uncommon union in the same personality of a fruitful and persevering inventor and a shrewd man of business. He is said to have spent some ten thousand pounds in patent fees alone and, as the *Times* puts it, his inventive faculties covered a very wide area, ranging from gold paint to sugar machinery, and from the designing of steam-boats to the making of huge telescopes. The so-called gold paint was the origin of his fortune, as by keeping secret his methods for the production of the bronze powder employed in the manufacture of the paint considerable profits were realised. But Bessemer's great claim as an inventor is in connection with his metallurgical work, for it is no exaggeration to say that, by the improvements he effected in the manufacture of steel, he brought about a world-wide revolution. Prior to his day the decarbonisation of iron was invariably secured by the operation of puddling, the semi-fluid metal being worked about in heavy masses at the end of long rods so as to expose it to air and ensure oxidation of the carbon.

Bessemer's Idea, however, was that the operation might be simplified if the air could be forced through the molten iron. He experimented in that direction at St. Pancras, and in the *Pharmaceutical Journal* for December, 1856, p. 328, will be found an illustration of the original Bessemer converter, as used by the inventor. The new process was not received favourably by scientific workers, and though Bessemer read a paper on the subject at a meeting of the British Association at Cheltenham, it was not thought worthy of being even summarised in the official report of the proceedings of the Association. Though a few of the large iron-smelters purchased licences to work the process, it was generally regarded as a visionary project, and would probably have been entirely forgotten but for the fact that Bessemer, with characteristic energy, established works at Sheffield, where he was soon able to undersell the other steel-makers by some £20 per ton. After that success was assured, and Bessemer was able to devote his attention to the development of the multitudinous other ideas that presented themselves to his fertile brain. He was elected a Fellow of the Royal Society in 1879, received the honour of knighthood the same year, and died—wealthy and full of honours—in his eighty sixth year.

The Unqualified Dispenser is the subject of a note in the *Therapist*, the editor of which paper says he fails to see that the General Medical Council is justified in countenancing the unqualified dispenser any more than the unqualified assistant. The registered chemist, it is pointed out, has to undergo a severe training and to pass a rigorous examination; it seems, therefore, inconsistent on the part of the Council to specify that any person, without the slightest qualification, shall be allowed to act as a dispenser. Care and accuracy in the dispensing of medicines are urged to be as essential as an accurate diagnosis of a case, seeing that an error in dosage, etc., might be productive of much more serious results to the patient than a slight error of diagnosis on the part of the physician. Yet the General Medical Council apparently lends its countenance to the employment of unqualified men to perform the responsible work of dispensing.

Linde's Air-Liquefying Machine has been on view this week at the rooms of the Society of Arts, where it was to be seen at work. The action of this machine is based on the fact that air, not being a "perfect gas," is reduced in temperature when suddenly allowed to expand through a narrow orifice from a high to a low pressure. The slight cooling effect thus obtained is rendered cumulative by the cooled air being used to abstract heat from the air that has not yet passed the orifice. Each successive portion of air is therefore cooler when it reaches the orifice than was its predecessor, and thus in time so low a temperature is reached, provided due precautions are taken to insure thermal isolation, that a change of state occurs and air appears in the form of liquid. The particular machine which has been on view circulates each hour about 15 cubic metres of air, which is expanded from a pressure of 200 atmospheres to one of 16, and produces about 0·9 litre of liquid air an hour with a continuous expenditure of three-horse power. Although the oxygen and nitrogen of the atmosphere liquefy simultaneously, the latter evaporates more quickly, and that fact can be utilised to obtain a liquid which is very rich in oxygen.

Liquid Air as an Explosive is one of the latest ideas in applied science, the liquid containing 40 or 50 per cent. of oxygen being mixed with powdered charcoal and then caused to explode by using a detonator. Experiments have been carried out with this material in a coal mine at Penzberg, near Munich, and they are claimed to have given very satisfactory results. The explosive is cheap, its cost being practically that of liquefying air; but owing to evaporation, it is only capable of exploding for a few minutes after being mixed. It is stated, also, that it would be neither economical nor convenient except in cases where a large amount of blasting is to be done at or about one place and during a long period of time. Professor Ewing has suggested that a large slate quarry or stone quarry, or an engineering work, such as the cutting of an Alpine tunnel, would afford a likely field for the use of the new explosive.

Insusceptibility of Insects to Poisons (see *ante*, p. 186) is discussed by a correspondent of *Nature*, who remarks that the observation that one insect's food is another insect's poison, is applicable to a single insect at different stages of development. The scarlet fungus, *Agaricus muscarius*, derived its name from use in an old-fashioned decoction for fly-papers; nevertheless, it is eaten freely by maggots. Other poisonous fungi, such as *A. æruginosus*, *A. phalloides*, *Russula emetica*, etc., are evidently innoxious to maggots and slugs. With regard to the effect upon more highly-organised animals, it may be noted that *Boletus luridus* is eaten by mice and rabbits, and that squirrels are very partial to several species of *Tricholoma* and *Boletus*. There is some doubt as to whether squirrels are not occasionally poisoned by eating fungi, but this observer has not noticed any suspicious mortality in the case of the rabbits or mice.

Millionaires in Pharmacy are scarce, and when they exist their accumulated funds are usually the result of the exploitation of profitable side-lines. Such was certainly the case with Mr. Charles W. Lea, pharmaceutical chemist, whose will has just been proved at Worcester. But, in this instance, the practice of pharmacy may fairly be considered to have led directly to the accumulation of the vast fortune, for, as is well known, it was whilst engaged in business as a retail pharmacist—in partnership with Mr. Perrins, another millionaire—that Mr. Lea commenced the manufacture of Worcester sauce, that wonderful fluid which has enabled him to turn condiments into gold. The personalty amounts to £1,070,391, the realty to £29,432, and the probate duty exceeded £88,000.

Pharmaceutical Transactions.

NEWCASTLE-ON-TYNE AND DISTRICT CHEMISTS' ASSOCIATION.

The usual monthly meeting of this Association was held in the Hotel Métropole, on Wednesday, March 9. Mr. T. Maltby Clague, President, occupied the chair, and there was a good attendance.—The usual routine business having been disposed of, and half-a-dozen new members elected, the Chairman called upon Mr. Geo. F. Merson, F.C.S., to open a discussion on

Apprentices—Their Duties and Ours.

Mr. Merson said he had brought the subject before the meeting with a view to opening up for discussion the question of apprenticeship, and because he thought there is room for improvement in that direction. Therein lay, in his opinion, the whole crux of the large percentage of failures in the Minor examination. He considered that the present system of apprenticeship to the art of pharmacy, if not a complete failure, is only a very qualified success. The examination results show that there is a radical flaw somewhere. Is it the examination? Is it the candidate? or is it the teacher with whom the fault lies? asked Mr. Merson. He considered it was not the examination, but after careful consideration he had come to the conclusion that, with a few exceptions, the large percentage of failures at the Minor examination is chiefly due to inefficient training during apprenticeship. He believed that if the pass list was analysed it would be found that a good number of the passes would be at "first attempt," which would go to show a large section of unsuitable material is attempting to qualify at each succeeding examination. In his own experience, the men who failed came from shops where during a three or four years' apprenticeship they had not made a pill, had not seen a suppository mould, or made a tincture (or if they had it had been from Somebody and Co.'s liquor, not *à la* B.P.), and had not the faintest idea of the construction and use of an infusion pot or a percolator. He had found that men trained in shops where they get a fair amount of practical work invariably make better and more successful students.—At the conclusion of the paper Mr. Merson was cordially thanked for his paper, and an interesting and animated discussion took place, joined in by Messrs. Gilderdale, G. Duncan, Kerr, Jones, Buckley, Graham, F. R. Dudderidge, Kerse, the President, and others.—At the close the meeting went into committee to consider details connected with the proposed testimonial to Mr. Barnard S. Proctor, F.I.C. The Secretary and Mr. Kerse, Treasurer, both reported a gratifying response to their circular. Final arrangements were deferred till later on in the month.

CHEMISTS' ASSISTANTS' ASSOCIATION.

This Association met on Thursday, March 10, at 73, Newman Street, W., when Mr. T. Morley Taylor, President, occupied the chair.—Mr. H. Cracknell, 17, Craven Road, W., was elected a patron, and Mr. F. A. Hocking a member of the Association.—The President then called upon Mr. J. Fothergill to read a paper

On Mercury.

Mr. Fothergill divided his subject into four divisions, in which he treated of mercury historically, chemically, medicinally, and as it is applied to pharmacy. The first mention of the metal mercury was to be found in the works of Theophrastus, about B.C. 300, where liquid silver is spoken of as being obtainable by rubbing cinnabar and vinegar together in a copper vessel with a copper pestle. Mercury was also known to the older chemists, who were much interested in the examination of its properties, inasmuch as they believed it to be one of the component parts of all metals, and it was not until the time of Lavoisier that it was classed as an elementary substance. The metal occurring naturally was described by Pliny as argentum vivum, and that obtained from cinnabar, hydrargyrum. Pliny supposed that hydrargyrum was a spurious imitation of quicksilver, and a fraudulent substitute for it. At the present time two methods are carried on for the purpose of extracting the metal from its ores, of which the chief is known as cinnabar (HgS). 1. The sulphides are roasted, whereby the sulphur is oxidised to SO_2 and the metal liberated. 2. By distillation in closed retorts with lime, when calcium sulphide and sulphate are formed and mercury set free, the former method seeming to be

pre-eminently employed. A rough test for the purity of mercury is to allow a globule of the metal to run over a slightly inclined surface, when a streak or tail left behind is a sure sign of its impurity, the tail being due to the preponderance of foreign metals dissolved in it. The poisonous effects of mercury were known to Dioscorides and Pliny, and it appears that even in those days it was employed as a medicine. From that period up to the fifteenth century, however, it was but sparingly used in medicine, and then for external purposes only. At the beginning of the sixteenth century the few physicians who had dared to employ mercurial ointment were vigorously assailed, but the employment of mercurial preparations was afterwards introduced by Paracelsus, and by degrees became common. Mr. Fothergill then read a number of abstracts from an old book dated 1733, in the Library of the Pharmaceutical Society. This book, written by a moderately eminent doctor of that period, claimed to give an account of the several diseases incident to mankind as well as their cures, with a special treatise on the use and abuse of mercury. At that time it seemed to be recognised as a sovereign remedy for all kinds of ills—in fact, a general panacea. The abstracts were both curious and amusing, as showing the extent to which mercury was employed. The author, whilst denouncing the crude methods employed in administering mercury, on the other hand upheld the view that syphilitic complaints could only be eradicated by means of putting the patient through a system of profuse salivation. The medical opinion of the present day with regard to mercury and its salts was then summed up. Turning to the aspect of mercury as applied to pharmacy, Mr. Fothergill said it would at once be seen that it receives a greater amount of attention than almost any other metal not only in the multiplicity of its preparations but also in the general demand for it in some form or other by the public. Taking the metal itself as used in pharmacy there are two preparations, blue pill and grey powder, which have practically the same physiological effect, but in which different methods are used in killing the metal. With regard to these two preparations he quoted some remarks made by Mr. Barnard Proctor, who was of opinion that blue pill is more reliable, milder, and more uniform than the grey powder of commerce, and, moreover, that hyd. c. cret. invariably contains mercurous oxides, and sometimes even the poisonous mercuric oxide. Professor Remington had found as much as 14 per cent. of mercuric oxide in one sample. Such discrepancies, Mr. Fothergill thought, accounted for the somewhat violent action this preparation sometimes exerts on the human economy. With regard to the two oxides, inasmuch as the yellow oxide is in a finer state of division, it was to be infinitely preferred. Mr. Proctor had denounced in no uncertain terms the use of red oxide, being of opinion that the retention of the red oxide is a consequence of habit and prejudice rather than of reason and experience. Within Mr. Fothergill's own experience he had not yet met with a commercial sample of hyd. ox. rub. which stood the test of heating in the tube. All samples examined having given off more or less nitrous fumes, which phenomenon the B.P. expressly forbids. Apart from the use of $HgCl_2$ in medicine, it had been in considerable demand as a disinfectant, a solution of 1 in 1000 preventing the germination of seeds and destroying the life of plants, leeches, and fish, it having a greater germicidal power than that of any other substance. Among recent applications the most striking is its use as a dressing for wounds, mortality being diminished to a great extent in surgical and accidental wounds, its leading advantages being that the dressings need not be frequently changed, pain and fever reduced to a minimum, and a rapid union of the several parts secured. A mercury chloride solution had also been successfully used as a preventive of potato disease. The seed potatoes steeped for about five minutes in a 0·015 solution, prepared and coloured with copper sulphate, are thrown into heaps for planting, immunity from the disease being the result. Returning to its application to pharmacy, Mr. Fothergill said an aqueous solution of $HgCl_2$ is liable to decomposition, Hg_2Cl_2 being precipitated, water decomposed, HCl formed, and oxygen gas evolved. For this reason the B.P. recommends an excess of NH_4Cl, with a portion of which the $HgCl_2$ forms a double salt and prevents decomposition, the presence of alkaline substances in the water employed or in the glass being the chief cause of the instability of solutions of $HgCl_2$. Organic matter also assists in decomposing such solutions, but the decomposition might be prevented by adding dilute HCl or an alkaline chloride. NH_4Cl prevents decomposition by ammonia or albuminoid matter present in the water, but not that caused by the alkalies or alkaline carbonates, NaCl checking the injurious action of the latter; a mixture of the chlorides is therefore considered the most efficient. The medicinal action of Hg_2Cl_2 does not differ very much from that of uncombined mercury. When the cure of syphilis was believed to depend upon the process of profuse salivation, calomel was greatly employed. Besides being incompatible with alkalies and alkaline earths, calomel is also decomposed by the alkaline carbonates, soaps, and sulphydrates. According to experiment, calomel is decomposed by bitter almonds and by prussic acid, corrosive sublimate being formed, as well as mercuric cyanides and NH_4Cl; in the latter $HgCl_2$ and $HgCN_2$ only; hence the danger incurred if prescribed with almonds and prussic acid in prescriptions. Recently he had occasion to dispense a prescription in which the following ingredients were ordered:—

Hyd. Subchlor..... gr. iss.
Pot Bicarb..... gr. v.
Ft. cachet. Mitte vi. One to be taken every fourth night.

Having weighed the ingredients and placed them in a mortar, he began triturating them together, and was surprised to find that the powders quickly changed colour, rapidly darkening to a dark grey. He had since rubbed Hg_2Cl_2 and $KHCO_3$ together in known weights and found that the chemical action was governed in the degree in which the $KHCO_3$ was moist. If there was much moisture present then reduction at once took place, whilst on the other hand, if dry, the chemical activity was much less pronounced. K_2CO_3 might have been present as an impurity and if so would have reduced the calomel at once, the reaction terminating in the formation of corrosive sublimate. As the preparation could not be sent out as ordered without subjecting the patient to considerable risk, it was decided to give as a substitute $NaHCO_3$. The action of this salt owing to its comparative dryness does not exert so sudden an action as that of $KHCO_3$, but even with this, at a period of six weeks corrosive sublimate had been found present. Mr. Fothergill then read an abstract from the *American Journal of Pharmacy* on the action of carbonate on calomel, and concluded his remarks by enumerating a few of the less known salts of mercury used in pharmacy.—The President thanked Mr. Fothergill for his interesting paper, and remarked that although they all thought they knew something about mercury, it was one of the subjects they were apt to let pass out of mind.—A short discussion followed, in which Messrs. Pearson, Langford Moore, Gamble, and Strother took part.

MANCHESTER PHARMACEUTICAL ASSOCIATION.

A meeting of the above Association was held on Wednesday evening. Mr. G. S. Woolley, President, occupied the chair, and there was a fair attendance.—Before the paper of the evening was read by Mr. Grier, the Chairman said he had great pleasure in presenting the prizes to the successful competitors in the recent examinations. He was glad to say that the examiner (Mr. Wm. Kirkby) reported that the four gentlemen who had been successful had handed in very good papers in the senior division. The two prize papers were described by Mr. Kirkby as nearly equal, and he hoped the second would be in the first place next time. Mr. Woolley, in a few graceful phrases, presented the prizes as follow:—Senior division: 1, Mr. E. J. Chatburn; 2, Mr. W. L. Greenwood. Junior division: 1, Mr. Barnes; 2, Mr. H. Y. Yates. —Mr. James Grier then read the following paper on

The Melting Point of Soft Paraffins.

He had found that the ordinary capillary tube method of determining melting points was not of much use for substance of this nature, as the transition from the natural semi-solid to the liquefied condition is very ill-defined and most difficult to detect. Several other methods were therefore tried, including (1) the ordinary capillary tube method; (2) the capillary U tube method; (3) the conical capillary tube (Kopp's method); the float method (Cross and Bevan); (5) Redwood's method; and (6) the thermometer bulb method. Water is used as the heating medium in the first two methods, mercury in the others.

1. The Ordinary Capillary Tube Method is described in the B.P. under Cera Flav., for which it is well suited, the change being easily detected. It consists in drawing up into the tube a little of the melted substance, then fixing it to the bulb of a thermometer, and immersing the whole in a beaker of water. To ensure uniform heating this is placed in a second beaker of water, a circular stirrer being also used. This method is applicable for substances like cera flav., where the transition from solid to fluid

is easily seen, but as shown by Clague in the case of ol. theobroma, the bore of the tube affects the melting point, which is lower the smaller the internal diameter. It is also advisable to allow it to stand to become quite solid before taking the melting point.

2. IN THE SECOND METHOD the capillary tube is U-shaped. A little of the melted base is drawn into one arm to within 3/4ths of an inch from the bend, and allowed to cool. It is now fixed to the bulb of a thermometer, and placed in the beaker of water, so that both ends shall project above the surface of the liquid. The temperature at which the melted base falls in the tube is taken as the melting point. The advantage of this method is that it can be seen readily in any light with all substances, but it gives results which are obviously too high, the viscous nature of the substance, especially marked in adeps lanæ, preventing the fall of the melted base for several degrees beyond its real melting point, while in one experiment with ol. theobrom. it fell before it had actually melted.

3. KOPP'S METHOD (*vide* 'Year-Book of Pharmacy,' 1873) was also tried. A conical capillary tube filled as before is placed just below the surface of mercury, and the temperature noted when the melted substance rises and floats on the surface of the Hg. It did not seem suitable for substances which go through an intermediate softening stage, the fat being forced up by the pressure of the mercury at this stage and before it has really melted.

4. THE FLOAT METHOD of Cross and Bevan (*vide* 'Year-Book of Pharmacy,' 1882) has the same disadvantage. A little platform of platinum or ferrotype metal is fixed to the bulb of a thermometer. A little glass float with a platinum wire, fused into its apex and bent at right angles in the form of a loop, is inserted in the melted base, which fills a depression in the platform and held there till the fat solidifies. The whole is then plunged beneath the surface of mercury, which is then gently heated and the temperature at which the float rises noted. This method, although easy of observation in any light, does not seem suitable for soft paraffins, as the float rises when these begin to soften and before they have properly melted.

5. IN REDWOOD'S METHOD small pieces of the solid fat are placed on the surface of mercury, which is then gently warmed, and the first appearance of a ring of melted fat noted. It is well suited for hard substances like ol. theobrom., which do not pass through an intermediate softening stage, but is not suitable for soft paraffins, which are mixtures of semi-fluid substances.

6. THE BULB METHOD has been specially devised and found very suitable for such semi-solid substances as soft paraffin. The bulb of a thermometer is thinly coated with the base and is fixed so as to dip just below the surface of mercury contained in a beaker, standing on a piece of wire gauze, and heated slowly and gradually by means of a small flame from a rose burner. As soon as the base liquefies it appears on the surface, forming a ring round the stem of the thermometer, and the temperature is noted. A second determination is made, and when the temperature approaches within two degrees of the melting point found in the first experiment the flame is removed, when the temperature usually rises at least one degree more. Concordant results were obtained by this method. The points to be noted are (1) the bulb should have a thin coating, else the base will be forced up a little below its melting point, although it is easily seen to be still unliquefied, and (2) the heating must be very gradual. The thin coating of the bulb has no appreciable influence on the thermometer reading, and even if it had, a second check thermometer could be used.

The following are the results arrived at :—

	Bulb Method.		Capillary U Tube Method.
	Melting Point.	Solidifying Point.	Tempt. at which it Falls in the Tube.
Salvo Petrolia, Red	35·5° C.		40·5° C.
,, Golden	36·5	34° C.	45
,, Yellow	36·5		45
,, Lemon	37 5		45
,, White	37		40·75
Minerolin, White	39	37·5	45
,, B	40	39	51
,, A	45	45	53·5
Ung. Petrolei	34	33.5	40·75
Ozokerine	39·5	37.5	47 5
Vaseline	34		44 5
,, White	31·5	29·5	37·5
Fossiline	45·7	42	54 5
Cosmine	37·25		43·6

Soft paraffins being mixtures of bases of varying composition, are allowed considerable latitude in their melting points, and all the specimens examined, although they show considerable variation among themselves, may be said to conform to the official requirements that "paraffinum molle should melt from 35° C. to 40° 5 C. or even somewhat higher." In the U.S.P. the melting point of petrolatum is given as 40° C. to 45° C. The melting point of paraffinum durum, B.P., is given as 43° 3 C. to 62°·8 C., and it will be noticed that the melting points of the soft paraffins, as taken by the U tube method, would nearly all come within this range.

In order to compare the results arrived at by the bulb method with those got by other methods, the following substances were examined :—*Ol. Theobrom.*—The thermometer bulb was somewhat thickly coated with the base, melted at the lowest possible temperature, and then allowed to stand for half an hour. The fat rose to the surface at 32° C., but with a second trial and a thinner coating, at 33° C. Another trial also gave 33° C. after standing seventeen hours. Redwood's method also gave 33° C. A small portion of the melted bases, drawn up into a piece of millimetre tubing and left half an hour to cool, began to liquefy at 31° C., but the bulk remained solid and melted at 33° C. When introduced into a U-shaped capillary tube of very fine bore and the melting point taken immediately it had set, it behaved rather peculiarly, falling to the bend in the tube at 23° C. while still apparently solid, and melting at 24° C. In a second experiment, using capillary tubing of somewhat wider bore and standing over night, it melted at 29° C. and began to fall in the tube at 34° C.

Substance Used.	Bulb Method.	Capillary Tube, 1 Mm. diam.	Capillary U Tube.
Ol. Theobrom. (1)	33° C.	33° C.	Moved 23° C. Melted 24° C.
ditto (2)			Melted 29° C. Moved 34° C.
Cera Alb.	62° C.	Melted 63° C. Solidified 61°·5 C.	Melted 62°·5 C. Moved 63° C.
Cera Flav.	60°·5 C.	Melted 63° C. Solidified 61° C.	Melted 61°·5 C. Moved 62°·5 C.
Adeps Lanæ (Anhydrous)	39° C.	39° 5 C.	Melted 39° C. Moved 48° C.
Adeps Præparat.	Melted 41° to 42° C Solidified 36° to 38° C.		Began to liquefy 38° C. Quite clear 45° C. Moved 77° C. Solidified 27° C.

For soft, buttery substances, like lard, wool fat, soft paraffin, which pass through an intermediate semi-fluid condition before actually liquefying, the bulb method of taking melting points seems to possess special advantages. For firm substances like waxes and cacao butter, which pass at once to the liquefied state without previous softening, Redwood's or the capillary tube method may be employed, but with the latter it is suggested that capillary tubing of a definite internal diameter, say 1 Mm., be officially recommended, and that the substances be allowed to stand for at least half an hour before taking the melting point. The bent capillary tube offers the advantage of being free from contact with the water, but the fall of the melted base does not as a rule correspond to the real melting point. The other two methods tried seem to be indicated in the case of firm fats or waxes where an indifferent light is being used, but are not suitable for substances of the nature of soft paraffin.—Mr. GRIER, who thanked Mr. T. O. Barlow for assisting him with the foregoing experimental work, also communicated a short paper on

The Detection of Water in Ether.

For the detection of water in ether I used carbon bisulph. and benzol. I found carbon bisulph. the more delicate reagent, giving a turbidity with samples of ether, which with benzol remained clear. The following are the results obtained, using ether which had been freed from water and alcohol, and to which 1 per cent. by weight of water had been added :—

Pure Anhydrous Ether + 1 per cent. by Weight of Added Water.
2 C.c. + 0 2 to 0·3 C.c. CS_2 gave turbidity.
2 C.c. + 0·5 C.c. C_6H_6 ,, ,,

Anhydrous Ether + 0·5 per cent. by Weight of Added Water.
2 C.c. + 0 9 C.c. CS_2 gave turbidity.
2 C.c. + 10 C.c. C_6H_6 remained clear.

Anhydrous Ether + 0.25 per cent. by Weight of Added Water.
2 C.c. + 1·9 C.c. CS_2 gave turbidity.
2 C.c. + 10 C.c. C_6H_6 remained clear.

Anhydrous Ether + 0·125 per cent. (or 1/8th per cent.) of Added Water.

2 C.c. + 3·7 to 4 C.c. CS_2 gave turbidity.
2 C.c. + 10 C.c. C_6H_6 remained clear.

Anhydrous Ether + 0·0625 per cent. (or 1/16th per cent.) of Added Water.

2 C.c. gave very faint turbidity with 5 to 5·5 C.c. CS_2, which was not intensified even with 10 C.c. CS_2, and went quite clear and bright on standing.

2 C.c. remained clear with 10 C c. C_6H_6.

From this it follows that carbon bisulph. scarcely detects 1/16th per cent. by weight of water in ether, while benzol does not detect ½ per cent. of water in ether. Experiments were also made adding gradually-increasing quantities of alcohol, and it was found that this addition of alcohol exercised a marked influence on the experiments. It was found (using 2 C.c. in each case) that the presence of about 18 per cent. by weight of alcohol made it impossible to detect the presence of 1 per cent. by weight of water in ether by means of CS_2, while with benzol the presence of about 8 per cent. by weight of alcohol was sufficient. The results are here given:—

Pure Ether + 1 per cent. of Added Water.

2 C.c. required 0·3 C.c. CS_2 to give turbidity.

2 C.c. + 0·1 C.c. absolute alcohol required 1·5 to 1·7 C.c. CS_2 to give turbidity.

2 C.c. + 0·2 C.c. absolute alcohol required 3·6 to 3·7 C.c. CS_2 to give turbidity.

2 C.c. + 0 3 C.c. absolute alcohol required 5·2 to 5·4 C.c. CS_2 to give turbidity.

2 C.c. + 0·4 C.c. absolute alcohol required 8·2 to 9 C.c. CS_2 to give turbidity.

2 C.c. + 0·5 C.c. absolute alc hol required 11·9 C.c. CS_2 to give turbidity.

2 C.c. + 0 6 C.c. absolute alcohol began to show temporary turbidity with 11·8 C.c. CS_2, but no permanent turbity even with 20 C.c. CS_2.

Pure Ether + 1 per cent. of Added Water.

2 C.c. + 0·1 C.c. absolute alcohol required 4 6 to 4·8 or 5 C.c. of C_6H_6 to give turbidity.

2 C.c. + 0 2 C.c. absolute alcohol did not give turbidity even with 15 C.c. benzol.

The Chairman expressed the obligations of the meeting for these interesting papers. He said that Mr. Grier's method seemed a useful and simple process, and asked if it could be used for beeswax. —Mr. Grier said it could be used, and it gave results similar to those got by the capillary tube.—Mr. Kirkby, Mr. Duncan, Mr. J. H. Hoseason, and other gentlemen took part in the discussion.—Mr. Duncan remarked that the Food and Drugs Committee which sat two or three sessions ago recommended strongly that there should be a Reference Committee to say how the standards should be taken and what methods were to be adopted in all these cases. In the matter of the Pharmacopœia, they would have a new one issued shortly, and it would be a long time before they got another, in the meantime improved methods appeared, but the old standards remained the same. He hoped Mr. Grier would continue his experiments and tell them how they could detect alcohol in ether and the estimation of the quantity. If Mr. Grier would do that he would ascertain something which would be of considerable value.—The Chairman moved a hearty vote of thanks to Mr. Grier for his valuable papers, and Mr. Kirkby, in seconding, referred to the valuable figures furnished by Mr. Grier in enabling them to draw proper conclusions.—Messrs. Dawson (Wigan), Barlow (Bowdon), and Young (Manchester), who had been proposed at the previous meeting, were elected members of the Society.—The Hon. Secretary (Mr. A. Blackburn) regretted that there was not a larger attendance, and expressed a hope that they would have a larger number of people present at the meetings next season.

GLASGOW AND WEST OF SCOTLAND PHARMACEUTICAL ASSOCIATION.

At the usual meeting of this Association held on February 22, Mr. W. L. Currie presiding, short papers by members formed the chief business, Mr. Thomas Dunlop contributing the first paper on

Extract. Ipecac. Acet.

Mr. Dunlop said that considering the voluminous literature relating to this subject it might need an apology for introducing it, but the widely expressed dissatisfaction with the B.P. direction to evaporate to dryness, and some doubt of its desirability in his own mind, had led him to experiment with the subject. He had not found the attempt to evaporate to dryness a failure, but the extract was not easily removed from the evaporating dish, and was brittle and hygroscopic. He had been led to adding glycerin, ℥j, when evaporation had been brought to between 1 and 2 ounces, and carrying it on till the extract was of the consistence of jelly, and the result gave every satisfaction. A sample of sherry wine and a sample of vin. ipecac. prepared from it with this extract was handed round to show the pure vinous odour which could only be got when free acetic acid was entirely driven off. Remarks were offered by Messrs. Brodie, McKellar, Robb, Laing, and the Chairman, who proposed a vote of thanks, Mr. Dunlop replied. Afterwards, Mr. Priestly read an interesting paper on

Life on the Summit of Ben Nevis,

giving a very instructive account of the nature of the observations and conditions of living in that the most elevated habitation in Scotland. The descriptive power of Mr. Priestly in giving an idea of the force of gales and the difficulties to be overcome in contending with snow and ice was well displayed; and a hearty vote of thanks, proposed by Mr. Robb, seconded by Mr. McKellar, was readily accorded.—The President then referred to

The Pharmacy Acts Amendment Bill,

and suggested taking steps to support it.—After some discussion, Mr. Anderson Russell moved that Members of Parliament within the area covered by the Association be written to, asking them to give their support in Parliament, Mr. Laing seconded, and the motion was unanimously agreed to, the President being agreeable to prepare, with the Secretary, the necessary letter.—The President said he was glad the meeting had carried the motion, as they were already committed to some such course of action, and he hoped every member and associate in business would write to his respective Member at once.

At the meeting held on Tuesday, March 8, Mr. W. S. Currie in the chair, Mr. Arthur McKellar read a paper on

Drug Journals and Their Advertisers,

in the course of which he stated that a trade journal, if managed on strict commercial lines, finds its best interests to be those of its readers, and endeavours always to supply information that shall be of greatest value to its patrons; in short, to make itself absolutely necessary to the business life of the pharmacist. All items of trade interest must be recorded in its pages, and its readers supplied with any information of general interest that they may require. Scarcely any trade could present a more varied list of commodities dealt in than their own, and it was no small matter to run a journal of interest and information to every section of the drug business, in one and the same issue to discuss the latest about erythrol nitrate and the latest formulæ for the manufacture of sticky fly-gum. All this requires, on the part of the editor, a grasp of trade and trade topics, and a versatility that can only come by long experience. He should never cease to admire the ease with which the contents of, say, "Anxious Subscriber's" "Tonic Liver Syrup" are detected, down to the actual (approximate) amount of those ingredients present; it is only an instance of the aforesaid editor's versatility, and no doubt satisfies "Anxious Subscriber." The regular perusal of such a journal becomes a necessary portion of a druggist's education and of his business library, and its regular use for reference becomes an inducement for advertisers to introduce their merchandise; consequently, the larger the circulation, the correspondingly greater the amount of advertisements. Also, the more advertisements, the more their authors will strive to make them interesting and attractive so that they will not become lost to sight in the mass. Mr. McKellar then proceeded to criticise certain advertisements as seen through a retailer's spectacles.—The paper was discussed by Messrs. Dunlop, Russell, Watson, and the Chairman.—Subsequently, referring to

The Pharmacy Acts Amendment Bill,

the Chairman intimated that the letter sent by the Secretary and himself had brought replies from fourteen Members of Parliament, and only one Member denounced the Bill in strong terms and threatened to oppose it.

LIVERPOOL CHEMISTS' ASSOCIATION.

At the usual monthly meeting of this Association, held on Thursday, March 10, Mr. J. Bain, President, in the chair, a fine specimen of loofah, the "pepo" of *Luffa ægyptica* (N.O. Cucurbitaceæ), grown by Mr. Gutteridge, the Director of the Liverpool Botanic Gardens, was shown by Mr. Wardleworth, and excited considerable interest.—Mr. Prosper H. Marsden asked if there was any demand for the true mandrake root, *Mandragora officinalis* (N.O. Solanaceæ) in England. A friend of his could get it in large quantities in India if it would be a profitable article to export to England. As the alkaloid to which it owes its activity—mandragorine—is said to be identical with atropine would it be likely to be of use for extracting this alkaloid?—Messrs. Wardleworth and Cowley, in reply, expressed their opinion in the negative, mainly on the ground that even if mandragorine has the same chemical formula assigned to it as atropine, it did not follow that its physiological action would be similar, and until this point had been thoroughly investigated by a skilled medical pharmacologist the substitution of mandragorine for atropine would be inadmissible.—A specimen of Smyrna opium very freely adulterated or weighted with swan shot was passed round by Mr. J. Hornblower as the worst sample of that particular form of clumsy sophistication he had yet come in contact with.—Mr. Cowley then contributed a note on

Glucose Determination at the Dispensing Counter,

which he had prepared with the collaboration of Mr. J. P. Catford (see p. 283).—In the subsequent discussion Mr. J. Smith expressed his preference for Fehling's solution in such determinations, as his experience of Gerrard's potassium cyanide modification was by no means satisfactory, the end reaction being anything but sharp and easy to observe. The rate of addition of the glucose solution made a certain small amount of difference in the readings. Mr. P. H. Marsden had from time to time observed this too, and he asked Mr. Cowley if he had observed it, and what was the explanation?—Mr. R. C. Cowley, in answer to these and other questions, reiterated that his object in reading the note was to show how a rapid and sufficiently accurate glucose determination could be made at the counter in a short space of time, and with the ordinary appliances available. Mr. Smith had taken exception to a remark of his that a burette was of rare occurrence at the dispensing counter; still, he adhered to the statement and would further add that his remarks were for the benefit of the ordinary dispenser, and not for those who could be considered scientific chemists. Gerrard's cyanide process was very accurate, providing that fresh solutions were used, but he could see no great advantage in it over those presented by Fehling. The point to be noticed in adding the glucose solution was that it should be run in in a steady stream with constant stirring, and not added all at once, for that vitiated the results, as Mr. Marsden had remarked. A short historical sketch entitled

Necrology—The Disposal of the Dead,

was then read by Mr. H. B. Morgan, in the course of which he reviewed the various modes of sepulture in vogue at the earlier periods of the world's history, in addition to cremation, embalming, and the exposure of dead bodies to birds of prey, and to the attacks of marine animals, reptiles and fishes when thrown into the sea or rivers. The process of embalming was explained at some length by the lecturer, who mentioned the methods used at present on the Continent for the purpose, and alluded to the fact that it was the pharmacist and his assistants who were entrusted with this gruesome but lucrative operation. The dangers of cemeteries being allowed in the heart of thickly-populated districts were pointed out, and the various arguments in favour of the more rational, decent, and hygienic process of cremation were put before his audience. At the close a cordial vote of thanks was accorded the lecturer for his interesting remarks.

Some Uncommon Specimens.

Mr. Theo. H. Wardleworth exhibited some pikea or piquia oil, a concrete-yellow fat with a fresh and agreeable odour resembling that of pineapples, used by the Brazilians instead of butter. It is yielded by the nuts of a tree of the Souari nut family, probably *Caryoca brasiliense*, N.O. Rhizobolaceæ. Pichurim beans, or sassafras beans, the produce of *Nectandra pichuri*, N.O. Lauracæ, were also shown. They were of the "minor" variety, and were said to be used largely for flavouring chocolate. Another substance not often seen in English pharmacy, but official in the U.S.P. dispensatory for making a demulcent mucilage with, is sassafras pith, a specimen of which Mr. Wardleworth also passed round.

The Death of Mr. A. H. Mitchell,

a member of the Association, was mentioned by Mr. Wardleworth, who proposed that a letter of condolence should be sent officially by the Association to the late member's widow in recognition of the good work done by her husband in furthering the advancement of pharmacy in Liverpool. This was agreed to unanimously, and a very successful meeting came to an end.

NOTTINGHAM AND NOTTS. CHEMISTS' ASSOCIATION.

On Thursday evening, March 10, the twenty-ninth annual dinner of this Association took place at the Albert Hotel, Derby Road. Mr. Richard Fitzhugh, the President, occupied the chair, and was supported by Mr. G. T. W. Newsholme (Vice-President of the Pharmaceutical Society) and a large number of local chemists and friends.—Mr. Gill, in proposing the toast of

The Pharmaceutical Society,

said the Society commanded universal respect, and he thought every unbiassed observer of the work of the Society would acknowledge that it had done its duty to the State. Amongst other things it had steadily increased the stringency of the test examination which had to be passed by everyone who desired to enter upon a pharmaceutical career, and it had also taken care to maintain the Pharmacy Act in its integrity. Although some of them had felt that in certain cases justice might have been tempered with mercy, while in others not quite so much mercy might have been shown, yet if they knew all the circumstances they would acknowledge that the Society had done its work in a fair spirit, and done it well. If all chemists were united in one organic whole he was sure their position would be higher than it is at present. As far as the policy of the Society was concerned, he was convinced that the Society was a little too much afraid of the bogey of free trade. He should be pleased to see the Society take up a more forward policy and exhibit a little more backbone—for example, in the direction of protection. There were a great many things which ought to be in the hands of pharmacists alone, and the public safety demanded that it should be so.—Mr. Newsholme, in responding, said Mr. Gill had dealt with some of the things the Pharmaceutical Society could do and some that it could not do. Unfortunately, it had not all the chemists of the country at its back, and that was the sole cause why the Pharmaceutical Society did not carry such weight as it ought throughout the country. People were apt to ask how it was that all the chemists did not belong to the Society. He knew some chemists thought they had a grievance because the Society had not done certain things. In the first place, he had to reply that the Society had to administer the Pharmacy Act, which in itself was not one of particular popularity, because it trod upon the corns of those people who did not agree with the Pharmacy Act. Then, again, the Society was an examining body, and as such it could never be particularly popular if it "plucked" candidates. One frequently found that men did not succeed in passing the qualifying examination the first time, and one could easily imagine that a man who had not succeeded the first time was apt to think that he had been badly treated, and that, perhaps, prevented such men from becoming members when they did pass. That was unfortunate but not reasonable. He ventured to think that in the course of a few years the position of pharmacists would be distinctly improved. It might be that there would be fewer real pharmacists in the country, but he thought they would have a recognised position, which they had not had in the past. Their business could not be otherwise than general, because, as things were at present, the supplying of drugs and dispensing was not sufficient to support every man who had passed the qualifying examination. There were many things which required to be done. They knew that the medical man of the present day was not sufficiently educated to practise the art of pharmacy. If he devoted his time fully to the study of human ailments it was impossible for him also to devote time to the study of pharmacy. The average medical man, therefore, found it impossible to undertake dispensing as well as medicine. With regard to the prospects of the Society, he believed they were getting nearer to the time when it would have the majority of registered chemists at its back. He had seen evidence of that during the past fortnight or three weeks in connection with the Pharmacy Acts Amendment Bill,

which is now before the House of Commons. In connection with that Bill there had been a great deal of evidence in support of the Pharmaceutical Society—in fact, it had been almost astounding. The chemists of the country had risen to the occasion—small as the Bill is—and written to their local members to support it, many of the Nottingham chemists being among the number. He hoped, therefore, before very long to see a much more united body of chemists than is the case at present.—Mr. Radford, in proposing

The Nottingham and Notts Chemists' Association,

said the Association afforded facilities to students in prosecuting their studies, and also in promoting gatherings for social intercourse and good fellowship amongst themselves. The Association owed a very great deal to its officers. Their President and Treasurer had rendered magnificent service, and the Secretary had been a tower of strength during the whole of the time he had been in office.—Mr. Fitzhugh, in reply, said he had been President of the Association for many years, and should continue to take the same interest in it he had always manifested, especially in the youngsters. He hoped the time would never come when their students would be put to the expense of going to London to prepare for the Minor examination. He trusted that as long as he continued President —with the assistance always so generously afforded him—the Association would never look back.—Mr. Welford, Treasurer, said the funds of the Association were in a very flourishing condition, and Mr. Eberlin, Hon. Secretary, who also acknowledged the toast, said he was very happy to tell them that the Association was in a very flourishing condition. Its membership now stood at fifty-one. It had forty-one associates, and its classes had been attended this session by numbers in excess of any previous season. In chemistry there were thirty-nine students, and the attendance in the materia medica classes had been seventeen. The students were attending the classes regularly, and showing great interest in their work. Testimony was borne on every hand as to the way in which the Association promoted improved education, and so long as they did not fail in their duty in seeing that education was kept well to the front, and facilities were given to students to attend classes, legitimate pharmacy had nothing to fear. Pharmacists stood on a level far and away above that of the drug stores, and he thought when the public learnt—as they were learning—the difference between chemists proper and the drug stores, they would begin to appreciate more and more an association such as that.—Other toasts followed, and the speeches were interspersed with a very enjoyable musical programme.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

At a meeting held in the Society's House, on March 4, Mr. H. Payne in the chair, a paper was read by Mr. T. E. Wallis entitled

What is a Microscope?

Beginning with the principle of a simple lens, Mr. Wallis went on to explain the compound microscope of two lenses, showing its defects of "spherical" and "chromatic" aberrations, and the way these are overcome in the modern microscope by the combination of several lenses of different curvatures and densities. The various forms of the instrument in the market were described, the best foot, stage, tube, coarse and fine adjustments, mirror, substage, etc., being pointed out. Then the methods of illumination with "bull's-eye," "stand," and "substage" were demonstrated, and the use of diaphragms and stops. Lastly, many valuable hints as to arrangements for work were given. The large amount of information contained in the paper was of a most useful character, and was greatly appreciated by the many practical microscopists present. Messrs. Perrèdès, Smith, Wilson, Nelson and Durbin having spoken, and Mr. Wallis replied, the meeting terminated.

CAMBRIDGE PHARMACEUTICAL ASSOCIATION.

On Friday, March 11, at the University Herbarium Lecture Room, Professor J. Reynolds Green, F.R.S., Sc.D., was to have delivered a lecture on "Some of the Mechanisms of Plants" but was prevented by a severe cold. Mr. Ald. Deck, F.C.S., presided over a large attendance of members and friends, among those present were Messrs. C. S. Addison, G. McAvoy, A. Sidney Campkin, J. P. Bernhard, S. Campkin, and H. F. Cook. Mr. E. Saville Peck, B.A., kindly offered to give an account of a trip to the

Norwegian Fiords,

illustrating it by means of lantern slides from photos, mostly taken on the journey. Embarking from Newcastle-on-Tyne, after a most delightful passage for thirty-six hours, the first glimpse of Norway was caught in the Bukke Fiord, thence on through the Hardanger Fiord to Adde, whence an excursion to Espelandsfor Waterfall was made. A short stay at Bergen proved most interesting, visits being made to the Hanseatic Museum and fish market. The Sogni Fiord was next entered, and on arrival at Gudvangen a trip was taken up the world-famed Naevodal, with its majestic peak, the Jordalsnut, to Stalheim; here, after several heavy showers of rain, the sun burst forth, and formed innumerable rainbows of surpassing beauty. Balholm was unfortunately passed, and the Nord Fiord entered. From Visnaes an excursion up the Loen valley, although somewhat hazardous in the small Norwegian rowing boats on the lake in such squally weather, proved most enjoyable. From Visnaes the steamer was left for a couple of days, when a walk over the mountain pass of Glasdal was indulged in. After tramping eight hours the Dynpvandshut was reached, consisting of one small hotel stationed at the edge of a lake and surrounded by glaciers and snow mountains. The next day the descent to Marak was made, and the steamer rejoined. The Geivanger Fiord was traversed and Naess reached the following morning. Here the Rondalshorn was seen with its imposing peak amongst others of nearly equal grandeur. The return journey was then commenced, and after again just touching at Bergen the final farewells to Gamle Norge were made.—At the conclusion the Chairman proposed a vote of thanks, which was seconded by Mr. A. Sidney Campkin, who spoke as to the great disappointment they felt at the sudden indisposition of the gentleman who was to have given the lecture, Professor J. Reynolds Green, and of the courteous-like conduct of Mr. Peck, who, at a few hours' notice only, came forward and filled the void, thus saving the credit of the Association. They felt especially indebted to him for the very entertaining and instructive lecture he had given, also to Mr. A. Shrubbs, who exhibited, the lantern views, their mutual relationship being that of the organist to the one who manipulated the stops and otherwise assisted. This vote was carried with acclamation.—Mr. Peck briefly acknowledged the vote, and expressed regret that at so short a notice he had been unable to obtain all the views he had intended to exhibit had his lecture been given at the date originally fixed—a fortnight hence.

ABERDEEN PHARMACEUTICAL ASSOCIATION.

The annual meeting of this Association, adjourned from March 2, was held on March 9, when the President, Mr. James Clark, pharmaceutical chemist, was in the chair. The object of the meeting was to discuss the Committee's report on education.—Mr. Giles, Convenor of the Education Committee, in moving that the report be adopted, fully explained all the steps taken by the Committee and the plan they proposed to adopt to thoroughly equip the rooms and likewise be able to guarantee a minimum salary to a capable leader.—Mr. A. L. Bruce seconded the motion.—A considerable discussion followed, which was freely taken part in by the members present, but so well had the Committee done its work that almost every point brought forward had been anticipated. Ultimately the report was unanimously adopted, and the following gentlemen were appointed to make the necessary arrangements for altering the rooms and appointing a teacher, viz., Messrs. Clark, Giles, Paterson, and J. Cruickshank.

BRIGHTON JUNIOR ASSOCIATION OF PHARMACY.

A meeting of this Association was held on Wednesday, March 9, when a lecture was delivered by Dr. F. J. Paley on

Food and its Digestion.

He said that food and air are the material factors of life, the object of the former being to replace the waste of the body, which is like a furnace, whilst the fuel is the food we eat. The subject was elaborated at considerable length, the lecturer showing how all products of digestion are carried into the circulation, every portion of the body being visited by the blood, every fibre and every muscle having blood brought to it, which contains material for growth, and by reason of the presence of oxygen (owing to respiration through the lungs), vital force or energy and heat are developed by oxidation.

PHARMACEUTICAL SOCIETY.

The fifth meeting for the session of the North British Branch of the Pharmaceutical Society of Great Britain was held at the Society's House, 36, York Place, Edinburgh, on Wednesday evening. In the absence of Mr. J. L. Ewing, the Chairman, who had been suddenly called to London, Mr. Peter Boa presided. There was a fair attendance. The Chairman also intimated that in consequence of Mr. J. R. Hill having also been called away on business, the two papers in his name, "Invisible and Sympathetic Inks" (with demonstrations) and "Methylated Spirit in Photography," would be postponed till the April meeting. Mr. Nesbit (Portobello) also sent an apology.—Mr. Tait read the minutes of the February meeting, which were approved, and a paper by Mr. D. B. Dott, on

The Determination of Ash as an Analytical Method,

was then read. The paper is printed in full at p. 282.—The Chairman intimated that Mr. Dott had caught the current influenza and was quite unable to be out of doors.—In connection with the paper, by means of a Kipp's apparatus containing peroxide of hydrogen, and granular binoxide of manganese, oxygen was generated and directed on the crucible so as to show its action in facilitating complete incineration. There was also shown an infusion of saffron (5 grains to 1 pint) and a solution of bichromate of potassium containing twenty-five times the quantity of bichromate (125 grains to 1 pint).—Discussion having been invited, Mr. George Coull said this was not a subject which lent itself very readily to discussion. They would require the public analyst to contradict it, but Mr. Dott's statements were usually very reliable, and they would accept what he said.—Mr. Coats said he would like to know whether Mr. Dott as a rule preferred a platinum dish to a porcelain dish. His experience was that a porcelain dish always gave a higher reading. It would be interesting to get Mr. Dott's experience on that matter. —A vote of thanks having been awarded to Mr. Dott for his paper, Mr. J. A. Forret then described

A Syringe for Filling Capsules,

which he had invented. This apparatus is described at page 283. —Mr. Coull said it was one of those little triumphs of mechanical ingenuity for which Mr. Forret had acquired a name. There was only one question he wished to ask him: What was the piston composed of or lined with in order to make it air-tight.—Mr. Lunan said they were indebted to Mr. Forret for bringing this ingenious apparatus before them. He knew he had spent a good deal of time on the subject, and he had done his work well. When one had time to examine it he thought it would be found to work very well for the purpose. He asked if Mr. Forret used it for liquids, or only for thicker masses, and how did he manage to get the water round the jacket D? He supposed it was merely by an inlet and an outlet pipe to run through. They were heartily indebted to him for showing them what had cost him a lot of time and labour.—Mr. Mackenzie asked how the wheel was maintained at the same level. He did not understand how that could be done. Did he get a shaft or piston to play upon it by means of a screw or in what way did he manage to maintain his hand at the same level? Did the wheel not slide up and down according to the action of screwing?—Mr. C. F. Henry said he wished to supplement what had been said by Mr. Lunan as to their indebtedness to Mr. Forret for reading that paper to them and for other notes. Not only were they indebted to him, but all the chemists in Edinburgh were indebted to him for such notes. Many a one would have said nothing about it, but kept it to themselves and made it a valuable asset to their business. Mr. Forret had not only in this but in many other papers, some of which had been read there, while others had been published, given to them many valuable hints; and they were indebted to him for this result of his experience.—Mr. Coats asked Mr. Forret what he meant by the feathered screw? Was that the size of the thread, or what?—Mr. James Nesbit said he was very interested in the paper because he had just had a machine delivered for filling capsules. He asked if the screw arrangement was for stopping the delivery of the liquid.—Mr. Lunan said, with regard to the jacket, that Mr. Forret had the jacket on the nozzle arrangement, which went into the capsule, but he asked was it not necessary in filling some capsules to have the whole slowly evaporated to a pretty thick consistency? If the jacket were only on the nozzle, it would not have any effect, or it might be very apt to get liquefied in the cylinder.—Mr. Thomson said he was sorry he had not heard Mr. Forret's paper, but he had explained the syringe to him on the previous night, and he had it fully under control with one hand.—Mr. Forret, in reply, stated that the piston lining was the same as that used for air pumps. It required renewal occasionally from wearing, but they had simply to undo it, and take off a leather ring, and put a fresh piece on. He was obliged to Mr. Lunan for what he had said. In answer to his question, he said he had not used the syringe for liquids, but he did not see why such a syringe should not be used for liquids such as castor oil, as it was absolutely tight. Those he had were used for a special purpose and were kept for the special purpose. By the jacket current in the rubber tube he was able to regulate the flow by a screw-clip. A temperature a trifle over a hundred was quite sufficient for any purpose that he used it for. He explained to Mr. MacKenzie how the wheel was maintained at the same level, and he further explained to Mr. Coats why the screw was called a feather screw. He further stated that they must be able to start it at once, stop it at once, or reverse it at once, and they could do the whole of these in an instant if it was steadily fixed. The masses he had used it for were semi-fluid.—A vote of thanks was given to Mr. Forret for his paper.—The Chairman intimated the additions to the Museum and the Library, and in doing so referred to the xanthaline in a show-case presented by Messrs. T. and H. Smith as one of the newest, if not the newest, of the alkaloid products of opium. The meeting terminated with a vote of thanks to the Chairman.

BRISTOL PHARMACEUTICAL ASSOCIATION.

The annual dinner of this Association was held on Wednesday, March 16, at Bristol. Mr. Alderman Townsend presided, and was supported by Mr. Walter Hills (President of the Pharmaceutical Society of Great Britain), Dr. Baron, Messrs. G. H. Perrin, G. W. Isaac, B. Allen, B. Keen. Alderman Gadd (Exeter), Whitson (Bath), E. Young, R. S. Atkins (Salisbury), J. G. Plumley, H. E. Boorne, J. Stroud, J. Pitman, T. Buxton, J. W. White, W. Berry, G. T. Turner, J. Cooper (Weston-super-Mare), etc.—The President gave "The Queen and the Prince and Princess of Wales and the rest of the Royal Family," observing that the Queen's influence upon European politics at the present time was invaluable, as it made for peace. The President next gave the toast of

The Pharmaceutical Society of Great Britain.

He welcomed the President as the successor of a long line of distinguished men, many of whose names were familiar to them all. Two hundred years ago a very celebrated author of a pharmacopœia said: "Man being made of the slime of the earth, a slimy substance recovers him when he is wasted." That was the pharmacy of two centuries ago, and he had no doubt that Mr. Hills could show that the pharmacy of the present day was a very different thing. He did not intend to touch upon questions of trade, because this was a social occasion, and if the Pharmaceutical Society had done nothing else—and it had done much more than promote social intercourse—that would have been a great deal. But there was a point he would like to say was worth introducing, and that was that they had established a noble benevolent fund, and he was quite sure as time went on its usefulness would not only be increasingly felt but it would be more and more liberally supported. After an allusion to the death of Mr. Schacht who did so much for the interests of the craft, he said he was interested to learn from Mr. Hills that the new Pharmacy Bill might possibly get into Committee on Thursday in the House of Commons, and he was very gratified to find that the whole of the present Council were agreed upon the point that it was necessary to enlarge their boundaries, and that a large number of men who had passed the Minor examination, which was far better than the Major of years ago, should be eligible for election to the Council. He thought that was a step in the right direction. —Mr. Walter Hills, who was received with applause, said: My first visit to Bristol in 1875 was on the occasion of the meeting of the B.P.C.—under the presidency of Mr. T. B. Groves—my uncle, Mr. T. H. Hills, being present as a Vice-President, and as President of the Pharmaceutical Society, Mr. G. F. Schacht was at that time Treasurer of the Conference. My second visit was on the occasion of Mr. Schacht's funeral, a little more than twelve months ago. One cannot but realise, on visiting Bristol for the third time, what a great gap the death of that distinguished man has made in the ranks of the Bristol Pharmaceutical Association, and I feel that even on a festive occasion like the present, I must pay another

tribute to his high and amiable character and to his great intellectual powers. Twelve months later you lost another distinguished citizen in the person of Mr. R. W. Giles, a man of exceptional ability and strong character, and ever a loyal supporter of the Pharmaceutical Society. Schacht and Giles, together with Stoddart, who was a Vice-President of the B.P.C. in 1875, were all men of whom Bristol pharmacists may well be proud, and the record of whose lives will long live in the memory of the thoughtful inhabitants of this important city. In these days of free discussion many criticisms, friendly and occasionally unfriendly, are passed on the Society, but consider for a moment or two what might be the condition of affairs if the Pharmaceutical Society did not exist.—"What would life be without Yum-Yum?"—It is only necessary to take up the Calendar to see the amount and variety of work carried out under its direction. Imagine examinations conducted and qualifications granted by a department of State, or under medical supervision. Picture to yourselves proceedings against persons for carrying on the business of chemists and druggists otherwise than according to law, taken at the instance of a public department and not by the Society. Think of the distressed members of our calling without the relief so generously and considerately granted by the Benevolent Fund of the Society. Realise that there might be no School of Pharmacy with its high ideas of pharmaceutical education; no *Pharmaceutical Journal*, with its weekly budget of useful information; no Library, with its countless volumes of useful knowledge, and no Museum, famed throughout the world for its valuable treaures of materia medica. Think of no headquarters for useful information at the service of all who need it, and of no organisation to resist unfavourable, or to promote beneficial, legislation. It is well sometimes to try and realise what might now be the condition of affairs if clear-headed and earnest men had not taken steps to found and develop the Pharmaceutical Society, which I now have the honour to represent as President. Now, although, alas! the majority of registered chemists and druggists have not as yet voluntarily associated themselves with the Society, there is abundant evidence that there is at the present time a very valuable *esprit de corps* amongst those who are connected with it. I have found this remarkably so during the last few weeks, whilst I have been endeavouring to further the progress of the Pharmacy Acts Amendment Bill through the House of Commons. You all know that the Pharmacy Acts Amendment Bill has passed the second reading, and I have been struck with the amount of support the Society has received from every part of Great Britain. I am glad to say that the opposition of Manchester has been withdrawn, and I take this, the first opportunity, of thanking our friends there for their loyalty to the majority of those connected with the Society. Although that opposition has disappeared another has cropped up from Glasgow. There are certain amendments down, but I have strong hope that when the honourable member who has given notice of them fully understands the Bill, he will withdraw, and afford the Bill an opportunity of passing unopposed, which is its only chance, and I am very sanguine that this will be so. But if we do not succeed now, it is early in the session, and we must try again. Referring to other subjects, Mr. Hills said the position of local secretaries was not satisfactory, and might be improved. He had been much struck with the strong power that the past few weeks had revealed, and he could only hope that they would always use that power for the public good as well as their own good.—Mr. Atkins then gave the toast of

The Medical Profession,

observing that even chemists when seriously ill did not prescribe for themselves, but sent for the medical man. The medical profession had the confidence and gratitude of the public. Dealing with the lines of delimitation between medical men and pharmacists, he said medical men diagnosed, then prescribed, and pharmacists prepared and distributed medicines. Those were the lines of delimitation. But when they came to the Hinterland what did they see there? How different it was in the Hinterland. As a member of the Council he could say that the policy of that body was to preserve the lines of demarkation between the two, and no house had done more to insist upon that than the house with which the President of the Society was connected.—Dr. Barclay Baron responded, and acknowledged the closeness of the ties between his profession and that of the pharmacist. In Bristol the pharmacists did not go into the horrible Hinterland, but observed the lines referred to by Mr. Atkins. They kept doctors up-to-date as to new drugs with unpronounceable names, and they so modified prescriptions sometimes as to improve and beautify them.—Mr. Alderman Gadd proposed "The City and Trade of Bristol," to which Mr. G. H. Perrin replied.—Mr. J. Cooper proposed

The Bristol Association,

and spoke of the advantages of discussion which such associations afforded, and said if the Bill now before Parliament passed there would not be the slightest excuse for any member of the craft remaining outside the Society. Speaking of the Bristol Association, he said they had in Mr. Keen an Hon. Sec. who could not do more for the members if they paid him £1000 a year.—Mr. B. Keen, who was heartily cheered, said in reply, he thought local associations should stand to their own districts in the same relation as the Society did to the whole country; that might be a high ideal, but they should have high ideals, and they must not rest and be thankful. The Association had subscribed £5 last year to the Benevolent Fund, and last week he had the pleasure of handing £10 from the Fund to an old chemist in Bristol, to whom it was very welcome indeed. That was one thing which he might say in reply to those who asked "What good does the Association do?' Pharmacists had still grievances, and one was that what was utterly illegal for one man to do became perfectly legal if he got six others to join him. He was sorry to some extent for the members of the craft who sold themselves, he was going to say, to this kind of corporation. What they would do when their hair became grey he did not know. Then there was the perennial question of education, and their difficulty in Bristol was to get men to come to classes. What was wanted was a compulsory curriculum, just as they had for young men entering the medical profession.—"Our Visitors" was given by Mr. G. Young.—Mr. Hills then proposed "The Chairman," and Mr. Townsend having responded, the proceedings terminated.

BRITISH PHARMACEUTICAL CONFERENCE.

A meeting of the Ulster Executive Committee was held in 10, Garfield Chambers, Royal Avenue, Belfast, on Tuesday, 15th inst., at 11.30 a.m., Mr. J. C. C. Payne, J.P., in the chair. There were present Dr. Fielden, Messrs. Tate, Guiler, S. Gibson, Elliott, Moffatt, Rankin, and R. W. McKnight.—The minutes of the previous meeting having been read by the Local Secretary, a considerable amount of business was transacted with regard to excursion arrangements and other matters of importance.—Dr. Fielden, Secretary to the Sub-Committee, who waited on the President of the Queen's College, reported with regard to their interview. The report, briefly, was that the President kindly offered the whole College buildings for the use of the Conference.—The Hon. Local Secretary was instructed to write to Dr. Hamilton, thanking him for the kind manner in which he received the deputation, and his generosity in placing the College at the service of the Conference. — A deputation consisting of Sir James Haslett, M.P., Mr. Payne, J.P., Mr. S. Gibson, and Dr. Fielden, was appointed to wait on the Lord Mayor, to ask him to receive the delegates at the College on August 9, and on behalf of the citizens of Belfast to offer them a hearty welcome.—Mr. Payne explained that this had been done on former occasions at places where the Conference met.—The Secretaries reported favourably on the progress of the guarantee fund, and they were instructed to issue a circular asking the gurantors to send half of their amounts guaranteed to the Hon. Treasurer, Mr. S. Gibson, King Street, Belfast, as funds are wanted to meet current expenses.

EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.

The eighth meeting of the twentieth session was held in the Pharmaceutical Society's House, 36, York Place, Edinburgh, on Friday, March 11, 1898, at 9.15 p.m., Mr. George Sinclair, President, in the chair.—The minutes of last meeting having been read and adopted, Mr. W. B. Cowie gave an interesting lecture and demonstration on

The Volumetric Composition of Hydrochloric Acid, Water, and Ammonia.

By means of elaborate apparatus, Mr. Cowie illustrated his remarks by both analytical and synthetical methods, the current for the electrolytical decompositions being conveniently obtained from the City Corporation supply now in use in the Society's House.—On the motion of the Chairman a vote of thanks was awarded to the author, and the meeting closed.

OXFORD AND DISTRICT CHEMISTS' ASSOCIATION.

At the annual meeting held at the Clarendon Hotel on March 8, the following officers were elected for the ensuing year :—President, Mr. H. Mathews; Vice-Presidents, Mr. G. C. Druce, Mr. H. Thurland, and Mr. Prior; Committee, Messrs. Burbank, Dolbear, Jessop, and Jenkins; Hon. Secretary and Treasurer, Mr. C. P. A. Morrison.

PARLIAMENTARY NOTES.

The Pharmacy Bill has attracted the unwelcome attention of Mr. Alexander Cross, the Unionist Member for the Camlachie Division of Glasgow, and it must now be numbered with the opposed Bills whose hope of consideration before midnight is more or less forlorn. The amendments Mr. Cross has put upon the notice paper are not particularly relevant, and if they should be submitted to the judgment of the House, the result may prove instructive to the honourable member. But, unfortunately, the question of relevancy does not arise, as any motion to amend a non-official bill is an effective block to progress. Judging from the terms of his notice, it would appear as if Mr. Cross had been approached by those who desire that apothecaries' assistants shall be exempt from the provisions of the Pharmacy Act, 1868, for in the remarkably innocent Clause 2 of the Bill which relates to the admission of "Student-Associates" to the voluntary Society, he has proposed the insertion of the words "or who is the assistant of a legally qualified apothecary, having served not less than three years at the trade." Fancy insisting that eligibility to join the Society should be made to depend upon serving behind a counter! And how would legally qualified apothecaries like to be classed among the trades? What makes the thing more ridiculous is that even supposing the words had been inserted in the Bill, assistants who were unregistered would still have been amenable to the provisions of the Pharmacy Act, 1868. With reference to Clause 3, the amendment only proposes to insert "legally qualified apothecary" after the words "chemist and druggist," thus making the medical man eligible to become a member of the Pharmaceutical Society!

Clauses 4 and 5 of the Bill are to be struck out, Mr. Cross being apparently quite satisfied with the present procedure as to the election of Council and the reception of voting papers. But there irrelevancy terminates, and business begins. Mr. Cross desires the alteration of the 1868 Act, and proposed to do it by adding the following clause to the Bill now before the House :—

> That nothing in this Act nor in the Act to regulate the sale of poisons—31 and 32 Vict., c. 121, entitled The Pharmacy Act, 1868—shall apply to or interfere with the business of persons who are engaged in the sale, distribution, or manufacture of insecticides, destroyers of vermin or disease germs in plants, of ant destroyers, of preparations for prevention of disease in potatoes, grain, or other field or garden crops, or for the preservation and protection of plants from disease in greenhouses, or in the open air, or for other such or similar purposes.

Comment is quite unnecessary. It may be remarked, however, that, whilst the Pharmacy Act, 1868, may or may not be of public utility, and its administration offers legitimate scope for praise or blame, the present Bill has nothing to do with such considerations, and there is no more logic in his stopping the internal readjustment of the affairs of a voluntary association of chemists than there would be in the Society demanding a voice in the management of the honourable gentleman's club. As we go to press we learn that Mr. Cross has added one more amendment to his list, viz., one that is intended to knock the bottom out of Clause 3 by restricting membership to persons who have passed a "pharmaceutical examination."

The University of London Commission was constituted in Committee of the House of Peers on Tuesday last. The names of the Commissioners are: Lord Davey, the Bishop of London, Sir William Roberts, F.R.S., Sir Owen Roberts, Professor R. C. Jebb, Professor Michael Foster, F.R.S., and E. H. Busk, Chairman of Convocation. Thus, Law, Medicine, Arts, Sciences, and the Church are admirably represented, and equitably balanced. Sir Owen and Sir William Roberts are pretty well known to pharmacists, the former as a prominent member, and Vice-President of the Society of Arts, and the latter as an authority on the chemistry of urine. Professor Jebb occupies the Regius Chair of Greek at Cambridge, and Professor Foster, who needs no introduction to the members of the Pharmaceutical Society, also hails from that University. Oxford is not specifically mentioned, but as Lord Davey is a Fellow of University College, the sister university cannot be said to be unrepresented.

The Petroleum Inquiry is to be continued, and the first step took place on Monday last, when the Selcct Committee to inquire into the sufficiency of the law relating to the sale, storage, and conveyance of petroleum and similar inflammable liquids was nominated. The personnel of the Committee is considerably changed, and of the fifteen names submitted to the House little more than half were included in the first Committee; the deaths of Mr. Mundella and Mr. Wootton Isaacson, amongst other circumstances, necessitating the introduction of new members. One thing worthy of note is that only one metropolitan Member of Parliament is on the Committee, viz., Mr. Macdona, M.P. for Rotherhithe.

It is a Bold Government which is sufficiently sustained by conscious virtue to deal with the vaccination question. But Mr. Chaplin has done it on behalf of his colleagues, and appears to have come through the ordeal with *éclat*. The right honourable gentleman on Tuesday, in moving for leave to introduce his Bill, explained that the object of the Government was to remedy every reasonable grievance against vaccination, and the discovery of the preservative and germicidal properties of glycerin in preparation with calf lymph made it possible to go far in the desired direction. The Bill may be said to effect four radical changes :—

1. Abolition of compulsion in respect of vaccination by any other means than by calf lymph, and the adoption of the recommendation of the Royal Commission as to an adequate supply of lymph.
2. Attendance at Public Vaccination Stations to be replaced by the attendance of the vaccinator at the child's home.
3. Extension from three to twelve months of the period within which a child must be vaccinated.
4. Abolition of repeated penalties in cases where there is conscientious objection to vaccination.

It will thus be seen that the objectionable "arm-to-arm" method is to disappear altogether, and that the risk of disease is to be greatly minimised by the proposal to provide a system of home vaccination. The Bill revolutionises the present procedure of the Local Government Department, and will involve a largely increased expenditure, but when Sir W. Priestley and Sir Walter Foster approve of the alterations there is little doubt that they are worth the money. The nation cannot afford to be niggardly in the matter of insurance against disease. The second reading of the Bill is to take place on Monday.

Companies Committee.—The first business meeting of this Committee this session took place on Monday last under the presidency of the Lord Chancellor. The principal witness was Mr. F. B. Palmer, a barrister, who claimed to have assisted at the birth of some thousands of companies—perfectly honest companies, naturally. His view is that only some 2 or 3 per cent. of the companies formed are of fraudulent origin, and that it is thus inexpedient to place restrictions and fetters on the formation and working of industrial corporations. He was against restrictions being placed on the issue of debentures at the same time as ordinary and preference shares. In short, he did not favourably regard an extension of the present law, except in regard to define more specifically the duties and liabilities of promoters. In regard to that point he saw no objection to retaining the words requiring "reasonable care and diligence" in directors if those words expressed the present law, but if they went beyond the present law they should be struck out. He further expressed the opinion that the clauses referring to directors' liabilities as to debts would probably have the effect of throwing the direction of companies into the hands of second-rate men. That may be, but the question arises, Would it not be better for shareholders to have their interests rather in the hands of second-class directors who are honest than in the case of less scrupulous, but smarter men?

[Many Answers to Correspondents are unavoidably held over on account of pressure on our space.]

COMMUNICATIONS, LETTERS, etc., have been received from

Messrs. Ashford, Atkins, Bayley, Beacock, Beeny, Blake, Brown, Bussy, Cooper, Cruickshank, Cumming, Davis, Deed, Gardner, Gledhill, Grimble, Harrison, Hill, Hodder, Jackson, Kendall, Kent, Nicholls, Picken, Priestley, Robb, Russell, Vibert, Warren, Williams, Wilson, Wyatt.

Pharmacy, and the Allied Sciences.

A REVIEW OF CURRENT WORK.

Action of CO on Platinum and Palladium. According to E. Harbeck and G. Lunge, both platinum and palladium form, with carbon monoxide, a compound which is stable enough to be called a true chemical compound. One reason advanced in favour of this view is that the carbon monoxide cannot be displaced by another gas, whilst the quantity of it taken up is unaffected by previous treatment of the metal with hydrogen. Again, on heating the compound of platinum and carbon monoxide to 250°, the gas is given off suddenly, whilst a third reason for assuming the chemical nature of the compound is that, when it exists, the free surface of the metal is prevented coming in contact with ethylene and hydrogen that may be passed over it, and the reaction which normally takes place—expressed by the equation $C_2H_4 + H_2 = C_2 + H_6$ —is also prevented.—*Zeit. f. Anorg. Chem.*, Jan. 18, 1898.

Vanilla and Vanillin. Simultaneous treatment of vegetable products on more than one side is becoming characteristic of scientific workers in pharmacy across the Atlantic. As a result the number of monographs produced which treat of drugs, etc., is continually increasing. The latest contribution of this kind is that in which Professor H. H. Rusby deals with the species, distribution, and habits of vanilla plants, and the cultivation and curing of vanilla, whilst Dr. S. E. Jelliffe treats of the microscopical character of vanilla, and Dr. Virgil Coblentz of the chemistry of vanillin (*Journ. of Pharmacology*, v., 29, *et seq.*). Concerted work of this nature might profitably be conducted by British pharmacists, as it is only by the union of purely botanical with histological and chemical research that a complete knowledge of any given drug or other plant product can be attained.

Ichthyol Suppositories. Ichthyol suppositories require a certain addition of wax to bring the basis to a firm consistence. Eschenburg states that the melting-point of cacoa-butter and wax mixtures (which is higher than the temperature of the body) is considerably lowered by the addition of ichthyol. For instance, a mixture of 3 parts cacao-butter, 0·2 part white wax, and 1 part ichthyol melts at 36° C., and 2 parts cacao-butter, 0·05 part white wax, and 0·5 part ichthyol at 33° to 34° C. The ichthyol should be added when the basis just commences to congeal.—*Pharm. Centr.*, xxxix., 7.

Chemistry of Writing Inks. Professor C. A. Doremus has lectured before the American Chemical Society on the chemical examination of writing fluids, describing their behaviour on heating or on applying reagents. Of the sympathetic inks, the colour of which is developed by heat, those containing a cobalt salt become blue, whilst a nickel salt turns green, and onion juice brown. Lead acetate in ink is blackened by hydrogen sulphide, a copper salt gives a brown with potassium ferrocyanide, and a mercuric salt reacts with very dilute potassium iodide solution, forming a red precipitate. Potassium ferrocyanide yields a blue coloration with ferric chloride, tannin a violet black with the same reagent, pyrocatechin turns green with iron salts, and dimethaniline becomes violet in the presence of chromic acid. Amongst other constituents of inks, eosine produces an orange-yellow colour with hydrochloric acid, whilst corallin turns yellowish with the acid and red with alkaline β-naphthol. Amine turns yellow with hydrochloric acid (original colour with β-naphthol), safranine blue, chrysaniline yellow (purplish-red with β-naphthol), carmine has its intensity reduced, and fuchsine is bleached (red with β-naphthol). Logwood ink darkens to purple with sodium nitrite, is bleached by hydrochloric acid, and its colour is restored by β-naphthol. Brazil wood turns darker red with the nitrite, is not affected by the acid, but becomes reddish-purple with β-naphthol.—*Amer. Drug.*, xxxii., 70.

Dicamphor and Dicamphendion. According to the patent for the preparation of these bodies, sodium is allowed to act on camphor bromide in the presence of an indifferent solvent (toluol), and at a temperature of about 90° C. Besides an acid, small volumes of camphor, dicamphor $(C_{10}H_{15}O)_2$, and dicamphendion $(C_{10}H_{14}O)_2$ are formed. These can be separated by crystallisation from diluted alcohol, and then from petroleum ether. Dicamphor crystallises in colourless needles, melting at 165° to 166° C., and dicamphendion in yellow prismatic needles, melting at 192° to 193°. With hydrazine hydrochloride in acetic acid solution, dicamphenpyridazine, $(C_{10}H_{15})_2N_2$, and dicamphenyl-pyridazine, $(C_{10}H_{14})_4N_2$, are formed.—*Chem. Zeit.*, xxi., 964.

Anethol and its Isomers. The researches of Orndorff, Terrasse, and Morton may be summarised as follow:—Methylchavicol of Eykman and estragol of Grimau have the same molecular weight and are metameric forms of anethol. From the results obtained by various investigators it must be concluded that they are identical. Fluid metanethol has the same molecular weight as anethol, and is a metamer of this substance. From its chemical behaviour and its physical properties it must be a stereoisomer of anethol, and it is probably $\underset{CH_3CH}{\overset{\|}{HC}}C_6H_4OCH_3(p)$. Anisoin, a resinous polymeric modification of anethol, which acts as a colloid towards the solvents, acetic ether, acetone, benzol, etc. Solid metanethol and the fluid isoanethol have both the same molecular weight and are polymers of anethol. As their molecular weight is twice that of anethol it is proposed to call them solid and liquid dianethol respectively; as both act like saturated compounds they may possibly be derivatives of tetramethylene. Anethol, heated under pressure to 250-275° C., is converted into isoanethol, the methyl ester of paracresol, $C_6H_4{<}^{OCH_3}_{CH_3\,(p)}$, and the methyl ester of parapropylphenol, $C_6H_4{<}^{OCH_3}_{C_3H_7\,(p)}$. Under these conditions there is apparently a tendency to form saturated compounds.—*Chem. Zeit. Repert.*, xxii., 10, after *Amer. Chem. Journ.*, xix., 845.

Reduction of SO_2 to H_2S. Hot solutions of stannous chloride and sulphurous acid decompose, forming sulphuretted hydrogen, which is, however, usually transformed to sulphur on the continued action of the sulphurous acid. The reaction probably occurs as follows:—

$$3SnCl_2 + SO_2 + 6HCl = 3SnCl_4 + 2H_2O + H_2S.$$

The reaction is of practical use in separating small volumes of arsenic and antimony from a large excess of tin. For this purpose the solution is mixed with a little fresh stannous chloride solution strongly acidulated with HCl, and after it has been brought to boiling-point a solution of sodium sulphite is added drop by drop. The sulphides of arsenic and of antimony are precipitated. Sulphuric acid can also be tested for arsenic thus:—10 to 15 C.c. of the acid are diluted with an equal volume of water and added to a strongly acid solution of stannous chloride; after heating to

boiling-point a solution of sulphite is added drop by drop. When arsenic is present the separation of the characteristic sulphide is distinctly apparent, while if none be present the fluid is merely opalescent from the separated sulphur.—*Chem. Zeit. Repert.*, xxi., 322.

Orcein Stain for Flagella of Bacteria.

T. Bowhill finds the following solutions and method to give excellent results in staining the flagella of bacilli. No. 1 solution: Orcein, 1 gramme; absolute alcohol, 50 C.c.; distilled water, 40 C.c. No. 2 solution: Tannin, 8 grammes; distilled water, 40 C.c. Equal parts of 1 and 2 are mixed before using. Two platinum loops of material are taken from the surface of a young agar-agar culture and suspended in 2 C.c. of sterile water. One drop of this suspension is placed on a cover-glass and dried, then fixed in the flame. It is then stained in the above orcein solution by heating without boiling, and leaving the specimen in the solution for ten or fifteen minutes, then washing and drying. A drop of Erlich's aniline-water-gentian-violet solution is filtered on to the cover-glass, and heated gently until it steams. Then wash off, dry, and mount in xylol balsam.—*Vet. Record*, x., 395.

Bismuth as a Cider Preservative.

L. Defour and Daniel find that the addition of 10 Gm. of bismuth subnitrate to each hectolitre of cider prevents, or materially retards, the hardening of the beverage on exposure to air during use from casks; not only so, but the presence of the bismuth salt renders alcoholic fermentation more complete.—*Comptes rendus*, cxxv., 1125.

Poisoning by Picric Acid Dressings.

La Touche sounds a note of warning with reference to the indiscriminate use of dressings of saturated solution of picric acid in the treatment of burns. In a communication to the Société de Chirurgie de Paris, he states that he has observed serious symptoms of poisoning, vomiting, colic, diarrhœa, and tendency to jaundice following the application of this solution. Others present at the meeting confirmed these unfavourable results, sometimes produced by the remedy in certain cases.—*Répert.* [3], x., 83.

X-Rays and Germination.

Maldeney and Thouvenin find that seeds of *Convolvulus arvensis*, *Lepidium sativum*, and *Panicum miliaceum* all germinate more rapidly when exposed for a few hours daily to the action of the Röntgen rays. In the experiments, electrical influence was eliminated by using a sheet of aluminium which was connected to the earth as a screen between the lamp and the seeds. No notable rise of temperature, not even sufficient to effect a pair of thermolectric needles attached to a Thompson's galvanometer, was observed after exposing the earth containing the seeds to the rays for two hours. The influence on germination must therefore be due to the *x*-rays alone.—*Comp. rend.*, cxxvi., 549.

Preservation of Eggs.

Extensive experiments have been conducted at Freiburg for the purpose of discovering the best method of preserving eggs, twenty eggs having been prepared by each of twenty different methods and kept for a period of eight months prior to examination. Fresh eggs only were used, the test of freshness being inability to float in a solution of 120 Gm. of common salt in 1 Lit. of water. Of the twenty methods of preservation only three yielded universally satisfactory results. Those three depended upon the use of water-glass, lime water, and vaseline respectively. A solution of water-glass was found to be best of all, as lime water tends to communicate a disagreeable odour and taste to the eggs, whilst coating them with vaseline is too tedious an operation.—*Journ. Soc. Arts*, xlvi., 370.

FORMULÆ FOR PERFUMES.

The following formulæ have been arranged for the benefit of readers who ask for information on the subject from time to time. They should also refer to the special article on the subject which appeared in the *Pharmaceutical Journal* of Feb. 26 last, page 197.

Essence of White Clover.

Vanillin, 20 grains; heliotropin, 20 grains; coumarin, 20 grains; tincture of storax, ½ ounce; tincture of civet, ½ ounce; tincture of orris, 1 ounce; otto of rose, 60 minims; oil of bergamot, 60 minims; oil of neroli, 90 minims; extract of tuberose, 4 ounces; extract of jasmin, 8 ounces; oil of cloves, 5 minims; oil of bitter almonds, 5 minims; terpineol, 60 minims; rectified spirit, 8 fluid ounces; glycerin, 1 fluid drachm.

Essence of Crab Apple.

Hyacinthin, 5 minims; cratægin, 10 grains; oil of ylang ylang, 30 minims; volatile oil of nutmeg, 10 minims; oil of lignaloe, 20 minims; oil of wintergreen, 2 minims; musc baur, 10 grains; extract of cassie, 2 fluid ounces; extract of violet, 4 fluid ounces; tincture of orris, 1 fluid ounce; glycerin, 30 minims; extract of jasmin, 4 fluid ounces.

Essence of White Iris.

Ionone, 3 minims; oil of orris, 10 minims; heliotropin, 30 grains; terpineol, 60 minims; oil of ylang ylang, 20 minims; oil of lignaloe, 5 minims; solution of amyl acetate, 10 per cent., 5 minims; glycerin, 20 minims; essence of jasmin, to make 10 fluid ounces.

Essence of White Violet.

Ionone, 60 minims; musc baur, 10 grains; essential oil of orris, 10 minims; extract of violet, 18 fluid ounces; extract of rose, 2 fluid ounces; oil of sweet orange, 5 minims; oil of neroli, 5 minims; tincture of orris, 4 fluid ounces; heliotropin, 30 grains; terpineol, 5 minims; solution of oil of patchouli (1 in 10), 20 minims; glycerin, 30 minims.

Essence of Wallflower.

Essential oil of orris, 2 minims; oil of sweet orange, 1 minim; heliotropin, 5 grains; oil of neroli, 2 minims; extract of orange, 2 fluid ounces; extract of tuberose, 2½ fluid ounces; extract of jasmin, 15 fluid ounces; coumarin, 3 grains; glycerin, 30 minims; oil of bitter almonds, 5 minims.

Essence of Heliotrope.

Heliotropin, 30 grains; essence of jasmin, 4 ounces; oil of ylang ylang, 5 minims; oil of bitter almonds, 2 minims; cratægin, 1 grain; oil of neroli, 10 minims; oil of lignaloe, 30 minims; terpineol, 10 minims; otto of rose, 5 minims; rectified spirit, 10 fluid ounces.

Essence of White Lilac.

Terpineol, 3 drachms; heliotropin, 30 grains; extract of rose, 2 fluid ounces; oil of ylang ylang, 10 minims; extract of jasmin, 4 fluid ounces; rectified spirit to produce 20 fluid ounces.

Essence of Lily of the Valley.

Extract of tuberose, 6 ounces; extract of jasmin, 8 ounces; tincture of civet, 1 ounce; oil of lignaloe, 30 minims; terpineol, 10 minims; oil of sweet orange, 2 minims; heliotropin, 20 grains; oil of neroli, 3 minims; glycerin, 20 minims; tincture of chlorophyll, 30 minims; extract of rose to produce 20 fluid ounces.

Essence of Narcissus.

Caryophyllin, 10 minims; extract of tuberose, 16 fluid ounces; extract of jasmin, 4 fluid ounces; oil of neroli, 20 minims; oil of ylang ylang, 20 minims; oil of cloves, 5 minims; glycerin, 30 minims; solution of amyl acetate, 10 per cent., 20 minims.

Essence of Wood Violet.

Ionone, 10 minims; extract of violet, 18 ounces; extract of cassie, 4 fluid ounces; extract of jasmin, 4 fluid ounces; tincture of orris, 10 fluid ounces; tincture of musk, 20 minims; otto of rose, 5 minims; glycerin, 30 minims.

NOTES ON CEYLON, GENERAL AND PHARMACEUTICAL.

BY OPHIR.

Occasionally vacancies on the dispensing staff of commercial houses here in the "Spicy Isle" are advertised, and to those who may contemplate applying for these posts, a little information regarding the nature of the business, the climate, country, vegetation, etc., may not be unacceptable; to the general readers also of the *Pharmaceutical Journal*, these short notes may be of interest.

The majority of our pharmacies exist in connection with general "stores." We have very few purely pharmaceutic establishments, but a number of merchants have a "dispensing, drug, and patent" department combined with their ordinary business or "store." I am attached to one of these latter in the capacity of dispenser. By the way, the "chemist" and "pharmacist" of home is invariably the "dispenser" out here. The scene of my humble labours is situated in the heart of one of the largest tea districts in the island, at an altitude of some 4000 feet above sea level. My remarks throughout will, therefore, apply more particularly to the hill districts. The actual work is very similar to that of a good-class business at home. The dispensing is up to-date, gelatin and other coated pills, capsules, cachets, and other refinements being in daily demand. The various proprietary preparations so well known at home are prescribed frequently. New drugs and synthetic remedies quickly find their way to us. Relations between doctor and pharmacist are rather more friendly than in the home land, at least, such is my experience. It is very unusual to find a doctor dispensing his own medicines, except in remote districts; the dispenser accordingly avoids "counter practice" as much as possible, as prescriptions are obliged to come to him for preparation. Our hours of business are, generally speaking, shorter than those at home, averaging about nine hours daily, including an hour for breakfast or "tiffin" in the morning. From 8 a.m. to 5 p.m. is the general rule. Tamil coolies bring the orders to the store, and squat in the veranda until the medicines, etc., are ready.

These coolies often come long distances, sixteen or eighteen miles being not uncommon. They make the return journey the same day, frequently bearing heavy loads on their heads. A jog trot is a favourite pace, and they will continue this for some hours without tiring. In passing, I would remark that a good practical knowledge of the preparation of galenicals is very useful, as being so far from the wholesale depôts you have often to depend on your own exertions in order to keep up a proper stock. The salary which dispensers receive in Ceylon is similar to that in India, while the currency, the rupee with its divisions, is the same. The rupee fluctuates considerably in value almost daily, and this fact should be taken into consideration on signing agreements. Although the rate of pay is higher than at home, the cost of living is proportionately greater, while the dispenser has in almost every case to bear the cost of his home passage, with its incidental expenses. It will be seen, therefore, that the financial gain during a term of, say, three years, cannot greatly exceed that accruing from a similar time spent in a pharmacy at home. These remarks do not, of course, apply to the not uncommon case of a man staying for a further term at an increased salary, with perhaps a good commission in addition. But there are many evident advantages other than those of a financial nature which result from a few years' experience abroad.

The climate of Ceylon is influenced chiefly by the two monsoons, the south-west, prevailing from May to October, and the north-east, from November to April. Both are usually ushered in by a violent storm—the "burst" of the monsoon. Ceylon being in the direct track of these monsoons receives an abundance of rain, which is, however, somewhat unequally distributed, the variations being caused mostly by the different positions of districts with regard to mountain ranges, some places receiving only 40 inches or so annually, and others 250 inches or even more than this large amount. The influence exerted by the mountain systems on our climatic conditions is seen in a striking manner at Nuwara Eliya, our sanatorium in the hills. Here, during the south-west monsoon, rain pours incessantly for weeks together; everything is thoroughly soddened and the general aspect most cheerless; but one has to go only some four miles eastward—on the other side of the range—to enter warm bright sunshine with a deep blue sky overhead. During the north-east monsoon these conditions are exactly reversed. The mean shade temperature of the air in the low-lands is about 80° F., the maximum rarely going beyond 100° F., or the minimum much below 70° F. In the hill districts the temperature is, of course, modified by the altitude. Where I reside the yearly mean is 66° F. The mercury is seldom seen above 86°. Night and early morning during the dry, hot north-eastern monsoon are often very cold; then 40° down to 34° is common in the veranda of my bungalow at 6 a.m., but by 10 a.m. it has run up to 78° or 80°. These extremes are unpleasant until one is accustomed to them. At Nuwara Eliya (at 6200 feet) a thin film of ice is sometimes formed; the inhabitants relate this fact with pride.

Europeans enjoy, on the whole, very good health in Ceylon. Malarial fever, liver disorders, dysentery, are the most frequent complaints. With proper precautions the conditions of life seem as favourable as at home. Temperance in all things is most emphatically a golden rule. Adequate protection to the head and neck from the intense heat of the sun's rays is very necessary, and undue exposure to the sun should be carefully avoided; new comers are often indiscreet with regard to this—walking in the direct sun just as they would at home—with results which are sometimes serious.

As regards the country itself, the whole of Ceylon abounds in the picturesque and the beautiful, the hill districts especially so. Here panoramic views greet the eye—grand mountains, lovely valleys, winding rivers, charming waterfalls meet the gaze in every direction. The roads are good, though sometimes steep, and one of the most pleasant of recreations is a spin on a bicycle, or in a ricksha, during the cool of early morning.

The vegetation of Ceylon is proverbially luxuriant, and comprises many plants of interest to pharmacists. Tea is now the chief staple of the island. Coffee held this position up to a few years ago, when the ravages caused by a fungus together with other enemies rendered coffee-growing unprofitable. At this juncture tea-planting was vigorously introduced, and the new industry has now almost entirely supplanted the old. The hardy tea plant flourishes everywhere—from sea-level districts to the summits of our highest hills at some 7000 feet. The tea plant in its natural state grows to a height of 20 feet or more, but under cultivation is kept by pruning to about 3 feet, forming a large spreading bush. Plucking is carried on continuously; in this respect we differ from China. The young and tender leaves only are used. The majority of the gardens, or "estates" as they are usually styled, have their own factories close at hand, water from our numberless streams being the popular motive-power for the machinery. It is most interesting to watch the process by which the green and almost inodourless "leaf" is tranformed into the black and fragrant tea we all know so well. Briefly, the manufacture is as follows: First, the fresh, green "leaf" is allowed to "wither" or slightly dry at the air temperature for some forty-eight hours; secondly, the "withered" leaf is "rolled" in a machine-roller

for an hour or so. During this operation the vegetable tissues are thoroughly crushed, and each leaf assumes a more or less cylindrical form; thirdly, the "rolled" leaf is allowed to ferment in heaps for a short time. Much depends on the proper regulation of this stage, as important changes take place during fermentation; fourthly, the fermented leaf is re-rolled and then submitted to the action of a current of hot, dry air (at about 210° F.) for a certain time. The tea is now in a manufactured state, and has only to be sorted into the different grades. Loss of weight from green leaf to made tea is from 75 to 78 per cent. The characteristic of the beverage produced from tea grown in the lowlands is its "strength," and that of high-grown tea delicacy of flavour. A cup of tea prepared from a high-grade product of an up-country factory is a revelation to lovers of the fragrant beverage.

Many tea-planters have a block of cardamoms on their estates. There are also plantations devoted solely to the culture of cardamoms. In addition to the export trade in this article to Europe and India, a large local demand exists, as the natives use it in their curry, etc. The theobroma cacao is largely grown in some districts. Its product is highly esteemed, having a fine flavour. The cocoanut-palm is a most important member of our flora, as it is capable of supplying every need of the native. It is computed that eighteen of these trees form a competency for a whole family. These graceful palms are quite a feature of the island, in many places they fringe the sea-shore for miles, giving the coast a very picturesque appearance. They are often so near the water's edge that the fruits when detached fall into the sea with a loud splash. The export trade in the cocoanut and its oil is very large. Cinnamon, the spice with which Ceylon has been associated from time immemorial, is still carefully cultivated. The plant is grown chiefly in the neighbourhood of Colombo, where is found the siliceous soil which it prefers; but a good amount of the spice is obtained from wild jungle bushes in the hill forests. The collection of cinnamon is in the hands of a distinct caste of Ceylonese.

Several species of eucalyptus, imported from Australia, grow well in our hills, and are largely planted on many tea estates to supply the fuel for the tea factory, being well adapted for this purpose, as they "form wood" rapidly. Great numbers of cinchona trees are felled to be used as firewood, and in the majority of cases the bark is not removed, as at the present rates the collection is unremunerative. A few years ago Ceylon exported enormous quantities of bark, but from various causes, chiefly, it seems, from the large output of Java's rich barks, the industry has almost completely decayed. The cinchona tree has pretty foliage, and is on this account frequently planted around bungalows. The papaw tree flourishes in the warmer districts. It is grown for ornamentation and shade, also for its fruit. The tree has a remarkably quick growth, especially in the hot, moist situations, which appear to suit it best; but even at my elevation it springs up rapidly to a good-sized tree. I have several in my garden, the largest, aged about three years, has a maximum girth around trunk of 33 inches and is about 16 feet in height. The fruit, green when unripe, a rich yellow when ripe, has a very luscious pulp; in fact, from personal experiments I think it one of the nicest of our numerous fruits. The leaves are sometimes used to wrap around tough meat in order to make it tender. A scratch on any part of the tree is sufficient to cause an instant flow of the "milk," which quickly solidifies to a gelatinous mass. The plantain is cultivated everywhere by the natives, who are very fond of its nourishing fruit. Plantain trees almost invariably accompany native dwelling places, the tiny huts forming, with the background of graceful foliage, a very pleasing picture. The cultivation of rice or "Paddy" as it is generally named, gives employment to the bulk of the Ceylonese peasantry, rice being the staple food of the natives and the Indian coolies. The erythroxylon coca, introduced from Kew some years ago, does well in our hills at about 2500 feet, but not at greater elevations. Considerable quantities of the leaves are exported.

Among a host of other interesting plants grown in Ceylon are: rubber, cloves, pepper, croton (wild and cultivated), tobacco, sugar, vanilla, cubebs, bael fruit. The lovely botanic garden, near Kandy, of which the late Dr. Trimen was director, contains a vast number of tropical and sub-tropical plants. Prominent features of the garden are its enormous rubber trees and fine avenues of nutmeg trees.

One short note in conclusion. Life in the out-stations of Ceylon is a very solitary one, and unless a man likes quietude, and can enjoy his own society, he would probably, after a month or so, find the monotonous routine of every day almost insufferably dull. His only neighbours are the planters. Unfortunately these gentlemen, from some occult reason, elect to be very exclusive. They form socially one large clique, the doors of which are barred to business and semi-professional men. This is regrettable, as it places the latter in an unpleasantly isolated position, and is apt to engender ill-feeling. This subject deserves the careful consideration of any fellow-craftsman who may think of embarking for the "Land of palms and pearls."

NOTE ON THE INDIAN AND AMERICAN RESINS OF PODOPHYLLUM.

BY EDGAR J. MILLARD.

Since attention has been drawn to the larger yield of resin obtained from Indian podophyllum (*P. emodi*), it is not surprising that manufacturers have prepared it in increasing quantities and supplied it under the name of podophyllin.

A recent examination of a number of commercial samples obtained from American, German, and English manufacturers showed that the latter are sometimes supplying the product of *P. emodi* under the title of podophyllum resin B.P.

Over a year ago E. Merck issued a warning against the use of yellowish-green podophyllin, based apparently upon H. J. Lohman's remarks,* adding that preparations which are not perfectly soluble in alcohol (1:10) and ammonia (1:100) should by all means be rejected as not conforming to the requirements of the Pharmacopœia. If this was intended to distinguish the resin of the Indian drug from that of the American it was not very useful. It has been repeatedly pointed out that colour is no criterion of the purity of podophyllin, and it may be added that it is still less an indication of origin. Moreover, when properly prepared, the resin of *P. emodi* is perfectly soluble in alcohol. In liquid ammonia (0 880) a difference is perceptible, but the official resin is not wholly soluble in the proportion of 1 in 100.

I have noticed that the Indian resin gives an orange to red colour with strong sulphuric acid when a minute quantity is sprinkled on a few drops of the acid placed on a white surface. The official resin gives a yellow coloration tending to brown, according to the quantity used. But a more useful test is the following:—To 6 grains (0·4 Gm.) of the resin in a test-tube add 1 drachm (3 C.c.) of diluted alcohol (s.g. 0·920) and 8 or 10 drops (0·5 C.c.) of solution of potash, B.P.; shake gently by rotating the test-tube. In the case of the Indian resin, the mixture assumes in a few seconds a semi-solid gelatinous mass, so that the test-tube can be safely inverted. If this does not occur quickly the mixture should be heated until it just begins to boil, and when cold it will

* *Pharm. Journ.* [4], vol. iii., page 179.

be found to have gelatinised. The official resin similarly treated gives a dark fluid that shows no signs of gelatinising even after standing for days.

A tincture made from the Indian resin can also be recognised by evaporating 6 drachms (20 C.c.) to dryness and warming with the proportion of proof spirit and alkali mentioned above.

Several of the American samples were by no means completely soluble in rectified spirit, and one, labelled podophyllin, "not prepared according to the official process," gavc a vivid red coloration on the addition of the alkali, but did not gelatinise.

Without entering into the question of the relative value of the two resins, which is still under discussion, it is obviously improper for manufacturers to describe the Indian resin as podophyllum resin, B.P., and in the production of those miscible preparations of podophyllin, which depend upon the use of an alkali, it is probable that the Indian resin, even if equal in therapeutic properties to the official, is unsuitable from the readiness with which it forms a gelatinous compound.

ENGLISH PHARMACISTS AND RUSSIAN PHARMACY.

BY P. SPEHR, M. Pharm.

(Concluded from page 232.)

James Frencham returned to Russia in accordance with the wish of the Court of the Tsar. The English resident, Richard Lea Knight, who lived in Moscow, as well as the Russian agent, Gregory Mikvolin, who was sent to England especially for the purpose, carried to Queen Elizabeth the request that the apothecary Frencham would enter again into the service of the Tsar, whereupon the queen again sent him to Russia with a recommendatory letter to the Tsar, Boris Godovnow, dated March 11, 1601. This letter, which still exists, consists of a cross-cut folio sheet, ornamented at the head with a broad golden border of festoons of flowers, and edged on both sides with golden lines; the names of both the monarch and queen were also written in gold, while the rest of the text was written in black. The letter runs thus:—

"Elisabeth, by the Grace of God Queen of England, France, and Ireland, Defender of the faith, etc., To the Right-high, Right-mighty, and Right-noble Prince Boris Pheodorovich, great Lord, King and Great Duke of all Russia, Volodemer, Musko, Novgorod, King of Casan and Astracan, Lord of Vobsko and Great Duke of Smolenskey, Twer, Ughory, Perme, Viatskey, Bulgarhy and other Places, Lord and great Duke of Novgorod in the lower Countries of Chernigo, Rasan, Polotskey, Rostovskey, Yaroslavely, Bealozero and Liefland, of Oudorskey, Obdorskey, Condinskey, and Commander of all Seberland and the Northe Coasts, great Lord over the countreys of Igcrskey, and Lord of many other Kingdoms and Dominions, our most dear and loving Brother, Greeting.

"Whereas we are advertised that this Bearer, James Frencham, hath heretofore served our loving Brother the Emperour Iwan Basilowich, Your Ma^{tis} most noble Predecessor, for his Apothecary, and that as well by mocion made by Your Highness' Chancellor unto our late Ambassador, Sir Richard Lea Knight, as by Your Ma^{tis} own Ambassador also, our said subject hath been requested to repaire unto Your Ma^{tis} service, with promise of entertaynment for his said Art and faculty, being both for his Skill and trust, sufficiently alredye knowne, unto Your Ma^{tie}, we have therefore, upon his humble suite unto us made, given hym our free leave and libertye to depart forth of our Kingdome for Your service. Praying Your Ma^{tie} that seing our saide subject for love and true affection towards Your Highness, hath a desire to leave his natyve country, and to undertake so great a journey with his wife and children for the same; that You will accordingly accept of his endevors and gyve hym that Employement, as his knowledge shall best desearve. Assuring Your Ma^{tie} hee is a man very skylfull in his profession and for his honesty hath byn employed under us in a office of good reputation and trust. And so leaving to trouble Your Highness any furder at thys tyme, wee commit the same to the dyvine protection. From our Royal Pallace of Richmond the eleventh of March Anno D^{ni} 1601 and of our most happy Raigne 44. Elisabeth R."

On November 7, 1601, James Frencham arrived for the second time in Moscow, after an absence of many years, this time with his whole family, consisting of his wife, three daughters, and two sons. It seems, therefore, as if Frencham were decided to settle in Russia permanently, but how long he remained in Moscow after his second emigration and what became of his family is unknown. It appears from an official record that he had, on his second journey to Russia, noticed the pestilence in several cities and districts of Germany and other countries. According to his own statement, this was principally the case in Stettin, Dantzic, Vilna, Riga. He had found many smaller places so desolate "that there were not enough healthy people to take care of the sick and to bury the dead."

From this document it is therefore apparent that Frencham did not take the maritime route *viâ* Archangel, and from there by Vologola to Moscow, which was most used in those days, but that he took the land route across Germany, Riga, Vilna, etc., though the latter may probably hardly be considered as the more convenient, on account of the many government formalities and molestations.

Unfortunately there is absolutely no information to be found as to the names of the other apothecaries who emigrated at the same time with Frencham to Moscow in 1581. Only some scanty biographical memoranda of later times, about several English apothecaries who entered into service at the Court drug store in the seventeenth century, can be found.

In those days considerable courage was required to undertake the emigration to the empire of the Tsars—especially to the Court of John IV., though foreigners enjoyed far better treatment from him than did his own subjects. That he was especially favourably disposed towards the English is to be seen in the negotiations which were entered into with a view to the marriage of John with an English lady of high rank, Mary Hastings. Another indication of John's prepossession in favour of the English is the derisive tone in which a Russian dignitary, Schelkalov, addressed the English ambassador directly after John's death: "The English Tsar is dead now, and they (the Englishmen) have lost their protector." However, there were occasionally times during John's lifetime which were not favourable to the English residents, and it is not astonishing in a country where, in those days, there were scarcely any germs of a nation's rights and culture according to Western ideas, and where the will, the whim, and the arbitrariness of the Tsar were law, without appeal. Cases of very inhuman treatment were common among the Russians, and were not rare among foreigners.

The drugs and utensils that belonged to the outfit of an apothecary's shop in those days were probably brought from England in 1581 or shortly afterwards. A considerable addition to the drug store, which had then already been in existence for a score of years, took place on James Frencham's return in 1601, as will presently be seen. It is characteristic of the manner of importation of foreign merchandise at that time that foreigners who were going to western Europe temporarily, were requested to bring goods with them on their return; this mode of proceeding had been usual for a long time, the formation of a regular postal system not taking place in Russia until the end of the seventeenth

century. The list of goods Frencham brought with him has only been preserved in a Russian-Latin translation, which has been made much worse by the attempt to correct it, *i.e.*, it really represents a Latin register written in Russian letters. On account of the interest it represents for the materia medica of that time, it may be given here in a modified form.

FRENCHAM'S LIST OF MEDICAMENTS.*

Confectio eryngae, Confectio prunorum, Conditum cydoniorum, C. baccae uvae, Prunadamascenacondita, Conserva berberum, Conserva ribium, Conserva rorismarini, Conserva symphyti, Succus liquiritiae inspissatus, Cydonia in succo non salito, Syrupus acetositatis citri, Oleum cydoniorum, Oleum cinnamomi, Oleum nucis moschatae aethereum, Oleum macidis, Oleum caryophyllorum, Oleum anisi, Vitrioli, Vitrioli amygdalarum, Aqua vita, Rossolis dicta, Spiritus vini, Spiritus cinnamomi, Spiritus D^ris Stephani, Spiritus juniperi, Spiritus juniperi compositus, Spiritus cochleariae, Cortex citri, Cortex capparis, Cortex liqui sancti, Cortex granatorum, Cortex aurantiorum, Cortex tamarisci, Cortex mandragorae, Radix brusci, Radix ciperis, Radix paeoniae, Radix eryngal, Gummi benzoë, Gummi ladani, Prix burgundica, Gummi elani, Storax calamita, Gummi laccae, Mastix in sortis, Mastix electa, Gummi ammoniacum, Gummi hederae, Gummi olibanum, Gummi tragacanthae, Gummi sanguinis draconis, Gummi bdellium, Gummi bdellium optimum, Gummi sarcocollae, Gummi tacamahacae, Gummi galbanum, Gummi carannae, Gummi asafoetidae, Gummi opoponax, Pyrethrum, Adianthus aureus, Spica celtica, Radix rubiae tinctorum, Lignum santalinum rubrum, Lignum santalinum citrinum, Lignum santalinum album, Baccae myrtyllorum, Tartarus albus, Radix carlinae, Bolus armena, Radix aristolochiae longa, Radix aristolochiae rotunda, Borax, Pistachiae, Spodium ustum, Citragosen melissa, Semen cynae, Agaricus albus, Radix turpethae, Radix polypodii, Folia mandragorae, Lignum aloës, Manna, Spica nardica, Sorbes aucuparia, Mespili, Folia sennae, Folia sennae alexandrina, Nuces cupressus, Amygdalae amarae, Farina hordei, Radix galangae, Myrobalani indici, Myrobalani citrei, Myrobalani nitrici, Myrobalani bellirici, Diacrydium, Sulfur citrinum, Herba salviae, Herba rorismarini, Aloë, Corallia rubra, Corallia alba, Crocus martis, Crocus flores sulphuris, Confectio alkermes, Sapo venetus, Terebinthina veneta, Semen synapi, Semen apii, Semen agnus casti, Semen carthami, Siler montanum, Semen paconiae, Semen psyii, Semen aquilegiae, Os sepiae, Semen portulacae, Semen cydoniorum, Semen thymi, Semen calendulae, Semen foeniculi, Lumbrici terrestres, Hyssopus, Flores balaustuorum, Soldonella, Stachydis, Origanum, Gentiana, Colocynthides, Terra sigillata, Herba capillorum veneris, Radix calami aromatici, Herba scordii, Lignum sassafras, Cubebae, Cantharides, Lapis smiridis, Cerussa veneta, Squilla praeparata, Hypocystissen lapis osteocollae, Bolus alba, Lythargyrium, Camphora, Piper album, Piper longum, Opium, Lapis judaei, Vermillon vel cinnabaris finissima, Blattae byzantinae, Lapis lazuli, Lapis spongiae, Flores anthos, Herba magoranae, Herba thymi.

The form of the present sketch does not admit of a detailed statement of the mode of carrying on business. What is proposed is to give a sketch of the apothecaries who were of English origin and employed in the seventeenth century at the drug store of the Tsar. We have very scanty information as to the apothecary Ranwall Warley. Whether he was the husband of the apothecary's wife who was noted down in 1625 as godmother in an old Moscow parochial register—"M. Rendels, the English apotheker's, his wife"—cannot be decided. That an apothecary, Warley, had already been, before 1630, in the service of the Court drug-store can be deduced from a letter of King Charles I. of England. In this letter the fact is mentioned that the apothecary Ranwall Warley had died in Moscow, and, it is added, that the king considered it his duty to send the Tsar another apothecary. The letter was dated January, 1630, was addressed to the Tsar Michael and his father, the patriarch Philaret Nicettitch, and was handed to them on June 14 of the same year. It referred also to certain commercial relations between England and Russia. The bearer of the letter was the English subject and apothecary, Philip Briott, the son of an officer of the English Exchequer. In the letter the king recommends this Briott as a man who had successfully learned and practised pharmacy, thanks to his diligence for many years, and wished to enter into the Tsar's service in succession to the apothecary Ranwall Warley, who had died in Moscow. This letter, which has been preserved in the Russian translation, runs thus (that is, re-translated): "August Sire and dearest Brother and Friend, Philip Briott, the bearer of this letter, is the son of an officer of our exchequer, and after some years of study has attained to the dignity of an apothecary and physician, and wishes to serve your Majesty as our subject Jan Martynov, who was Briott's cousin, has served you. Briott and his friends (? relatives) asked us to write to You in this case, and as we know that the apothecary Ranwall Warley is dead, it seemed just to Us to inform Your Majesty of the aforesaid Philip and to beg you to take him, for our sake, into your service, instead of Warley, or give him another place suitable to his talents, and when his terms of service will be over to dismiss him and send him back in order that he may continue his studies and become more worthy of the service at Your Majesty's, and that he may be able to talk of it to his parents, who have reached an advanced age. . . . etc.—1630, in the month of January, King Charles." Though the king recommended him warmly and praises his "experience," and stated in the letter that he possessed, besides the dignity of an apothecary, that of a physician. This Briott seems yet to have been a young man and a beginner, at least the closing words of the letter as to the necessary continuation of his studies may be thus understood. As to the effect of this personal intercession of the king, we know that the solicitation had been taken into consideration, and Philip Briott (of reformed confession) was engaged after an examination by the then Court physician, Arthur Dee (also an Englishman).

On May 31, 1645, he was dismissed after having (? in vain) asked for an increase in his salary, giving, amongst other things, the following reasons for his solicitation. . . . "In order that I may not stand before my colleagues insulted and grieved, and starve with wife and children." The cousin of Briott, the "Jan Martynov" mentioned in the king's letter, is worthy of notice. He is called by a russified Christian name, with the addition of the patronymic appellation. The family name is not given, yet it can only have been an Englishman who had been in the Tsar's service almost as Frencham's contemporary. He is not mentioned in any of the official documents that have become known. One of the most prominent apothecaries of the seventeenth century was Romanus Thius (in Russian, Roman Ulianov Thius, also Thii). He had been for many years in service at the drug store of the Tsar, but we do not know in what year this apothecary, who was a native of England, had come to Russia. At his dismissal, on July 4, 1655, he received an excellent letter of recommendation, in which stress was expressly laid upon his having been active in the office for many years and his being pensioned off only on account of his advanced age and his increasing feebleness. He is mentioned, during his time of service, in a document of December 19, 1644, where he is called Reynold Tiu. As at that time only recom-

* It is extremely difficult to say what many of the articles are, the more especially as the manuscript is far from intelligible in places. [ED., *P.J.*]

mendations from very highly-placed or renowned personages were recognised, it is an extraordinary proof of the high consideration which this apothecary Thius enjoyed that the Tsar had charged him with the honourable commission to engage another apothecary in his place according to his own judgment, and to send him to Moscow.

Though the apothecary Romanus Binian, whom Thius recommended, arrived soon after his retirement from service as his successor, the Tsar tried afterwards to induce Thius to undertake again the administration of the Court drug store. Thius seems to have returned to England after his retirement, which may be seen from the fact that the English agent at the Tsar's Court, John Hebdon, was charged to call Thius again to Russia. The latter seems not to have followed this invitation for the reasons given on the occasion of his dismissal. There is no information to be found as to any later service. It is not impossible that a son or grandson of his might have studied pharmacy as an apprentice in the new second drug store which was founded towards the middle of the seventeenth century, as a young man by the same name is afterwards mentioned in this office; but whether this young Thius remained in Russia as an apothecary remains an open question.

The aforesaid Romanus Binian having been engaged by Thius, who was pensioned in 1655, came to Moscow in 1656, *vid* Archangel. Though he seems to have enjoyed a good reputation as a skilful apothecary, and had been promised the same concessions as his predecessor Thius, yet he must have enjoyed the confidence of the Tsar and of the pharmaceutical magistracy (founded 1620) in a less degree than Thius; later, another effort was made to secure Thius for the administration of the Tsar's drug-store. That Binian had doubtless been a skilful professional man is proved by an extensive record that has been preserved of the laboratory of the Court drug-store, according to which it was his duty to provide for the most complicated and difficult preparations. As to his former mode of living, we know nothing.

It is occasionally mentioned in a document dating from the year 1676, that an apothecary named Robert Benshom, a native of England, had been appointed at the new Court drug-store, but his personalities remain quite unknown.

This is about all that can be found out concerning the Englishmen who were employed in Russia in the sixteenth and seventeenth centuries in the profession of apothecaries, and unfortunately it is very little. There is more known about the personal situation of the professional representatives of other nations, but that, of course, does not interest us here. There is almost no information with reference to the external furnishing of the old Court drug-store of the Tsar founded by Englishmen, and of the ways in which they carried on their business during the first decenniums of its existence, but there is some, though in many respects very incomplete, to be obtained from contemporaries of the second half of the seventeenth century.

The entire administration was probably entirely concentrated, up to the foundation of a special pharmaceutical magistracy (in the first quarter of the seventeenth century), in the hands of the chief apothecary, while a dignitary of the Court, the so-called "aptekarskoy boyarin," had the formal control. The order and the scrupulousness of the preparation and dispensing of medicaments, as follows from old written account-journals, was an almost pedantically accurate one, which is not astonishing considering that the drug-store delivered medicaments almost exclusively for the Tsar's family, and only in very exceptional cases, with the permission of the Tsar, for high dignitaries and persons of rank. Neither could physicians practise freely, they could only treat private persons in exceptional cases and with the imperial permission; therefore they led a very quiet life, and almost always remained at home or in the drug-store, as an old writer of travels, Olearius, ironically reports. The ancient Court drug-store was not only provided with all that was necessary, but even with considerable luxury; the glasses were of the finest cut crystal; many vessels and the screw-lids of the boxes were of chased silver, richly embellished with ornaments, the inscriptions pompously gilt, the cupboards and tables of the most precious kinds of wood. ". . . . So that I can say with truth that I have not seen any such drug-stores far and wide." Thus a writer of travels of the seventeenth century, Schleissing, closes his description of the magnificence of the old Court drug-store of the Tsar.

Perhaps more details can be found in the native country of those ancient English apothecaries who emigrated to Russia, and I should feel very grateful to my present colleagues if such information were forwarded to me through the mediation of the Editor; it would make a valuable contribution to my work concerning Russian pharmacy, soon to be published.

THE DISPENSER'S ART—ITS DEMANDS, CLAIMS, AND RESPONSIBILITIES.*

BY H. MACNAUGHTON-JONES, M.D., M.A.O., M.CH., F.R.C.S.I. AND E.

(*Continued from page* 234.)

Therefore I may say on your part, I hope with perfect truth, that whatever be your aims, scientific, social or financial, they are all subsidiary to the advancement, in the highest sense of the word, of your calling. If this be true, then I am heart and soul with you, for you are fighting the battle of an art which has before it a great future, in its scientific developments and discoveries, an art which, side by side with medicine, tends to the alleviation of human and animal suffering, and rescue from disease and death. Medicine is indeed beholden of her handmaiden. How much does she not owe to botanical research, and who will measure her indebtedness to chemical investigations? What untold suffering in the past has not been prevented, and what immeasurable pain will not be relieved, not to speak of the incalculable saving of human life in the future by anæsthesia, asepsis, and antisepsis?

Let me now ask, Is the art of the dispenser worthy of being designated an art? What does the work you have to perform demand of you in capacity, intelligence, training, education, aptitude, and experience? I will here take it for granted that the Pharmaceutical Society's conditions for chemists and druggists, and still more for pharmaceutical chemists, may be taken as a measure of the minimum standard aimed at as a necessity at the close of your educational career. For I am not to-night addressing imperfect, immature, inexperienced, or bungling workers, but I am discussing the type of work to which I have just referred. It is the work of men responsible for carrying out, with skilful accuracy its details, an accuracy on which hangs the safety of the lives of those who rely upon it. And in order to approach a satisfactory answer to this question, I must ask you to recall to mind how pharmacy has advanced in this country for the last two hundred years. For it is by reviewing thus the traditions and growth of any profession in the past, and the work, of our pioneers and forerunners, and in justly appraising that work that we may best come to realise our own responsibilities and duties.†

If we look back to the commencement of the sixteenth century, and review during this time the relationship of the College of Physicians of London to the Society of Apothecaries and to the Pharmaceutical Society, we see the part played by the latter in

* Inaugural Address to the Public Dispensers' Association.

† I have to acknowledge as the source of most of this historical retrospect the work on the 'Progress of Pharmacy in Great Britain,' by Jacob Bell and Theophilus Redwood.

securing for the public a trained body of men, whose business it should be to dispense skilfully and accurately physicians' prescriptions. And the desire was not only to improve this art of dispensing, but also to fit this same body of skilled pharmacists to carry out difficult chemical analysis, examine into the purity of drugs, assist in the compilation of national pharmacopœias, aid the State in the prohibition of the sale of poisonous remedies, and generally instruct those interested in the progress of pharmacy. Hence the Society took an active part in furthering legislative enactments dealing with the control, education, and sphere of action generally of chemists and druggists and pharmaceutical chemists.

For a period of three hundred years that retrospect shows the gradual evolution of the pharmaceutical art, side by side with the science of chemistry and its twin sister, experimental physics.

From this retrospective perusal, if we take the dates of the foundation of the Society of Apothecaries in 1617 and the publication of the first Pharmacopœia in the year following, we find, as a starting-point, that throughout the seventeenth century there was a struggle between the apothecaries and physicians as to the rights and privileges associated with the selling of physic and the compounding of prescriptions. The eighteenth century was prolific, but not more so than the nineteenth, in the production of pharmacopœias, Edinburgh producing those of 1722, 1736, 1783, and 1792, while in London we have those of 1721 and 1748. The eighteenth century was remarkable for the contests between the chemists and druggists and the apothecaries, and the reading of the recriminations between the two is not pleasant. The chemists vituperated the apothecaries for their inordinate charges and useless prescriptions, the apothecaries retaliated by charging the druggists with usurping the apothecaties' functions through the intrusion of uneducated and unskilful persons into professional practice, holding up to ridicule their ignorance and inefficiency. And here we find the first necessity for a more liberal education, both in regard to general culture, pharmacy and therapeutics, forced upon the druggists by the attitude of the apothecaries, who assailed the former as incompetent dispensers through this want of education. Two amusing instances of this were quoted by a hostile critic; one, of the foreman of a druggist at Croydon, seeking in vain amongst the different preparations in his dispensary for a sample of *Cucurbita cruenta*, and finding a satisfactory explanation in the translation, "an electric shock," while another searched the city of Worcester for a quantity of a "tincture ejusdem," which he found it difficult to obtain.

History has a tendency to repeat itself, and, as we have found in recent years a leaning towards the indiscriminate sale of medicines in places of business in which we should not, under ordinary circumstances, be inclined to look for such, so at the end of the eighteenth century we find it stated that in many places "the grocers took upon themselves this very benevolent office, or at least a part of it," and it would appear that even in some places the grocer went a little further, and prescribed, as well as sold, his drugs. In 1794 this feud between the apothecary and chemist led, on the part of the former, to the formation of the Pharmaceutical Association of 1794, and this Association led to a combination between the higher class chemists and druggists and the apothecaries, to guard their interests against the consequences of injurious Acts of Parliament, which aimed at interferences with their rights and privileges, and it also tended to encourage the formation of a line of demarcation between the functions of the apothecary and those of the dispenser. It also led to another effect —the independent criticisms on the part of skilled pharmacists, both apothecaries and chemists, of the various pharmacopœias, and proved the need for associating in the compilation of the national formulæ expert pharmacists selected from the ranks of the chemists with the members of the Colleges of Physicians and Surgeons.

The value of such association has been evident in the compilation of the different pharmacopœias of this century, from that of 1809 to the one just now being issued. We may hope that modern materia medica and pharmacy have their full and liberal recognition in this edition. Such recognition is sadly wanted. There can be no greater stumbling block in the way or pharmaceutical advance than the appearance of a pharmacopœia that requires re-editing before it leaves the printer's hands. Names of eminent chemists and pharmacists who have served in this capacity will be familiar to you, household names in the progress of pharmacy during the last fifty years, ending with that of one who is now doing yeoman service in this cause—that of Professor Attfield. It is remarkable how certain names of men, who are now active as leaders in the pharmaceutical world, were amongst those most prominent in the early years of this century. At the meeting held on March 14, 1813, to consider an important Bill then before Parliament we find, amongst others, those of Allen, Bell, Curtis, Hudson, and Savory, who were placed on a committee. And again in 1841, to resist another unfair and one-sided enactment, at a public meeting of chemists and druggists, we find the same firms represented, with such well-known ones as Corbyn, Dan. Hanbury, then found added to those of Allen, Dinneford, Hodgkinson, and Stead, Battley, Squire, and others. The active progress of pharmacy during the first half of this century is evidenced by the appearance of the Scotch Pharmacopœias of 1804, 1806, 1839, and 1849, with the English ones of 1809, 1824, and 1836, and the Dublin ones of 1805 and 1806. The criticisms and the suggestions of chemists and druggists—notably those of Mr. Phillips—largely helped to amend and complete all these successive editions, and the collateral works and abridgements bearing on them were largely contributed by pharmaceutical chemists and teachers of the cognate subjects of botany and chemistry. We physicians and surgeons should never forget this.

In Ireland an interval of nineteen years elapsed between the Pharmacopœia of 1807 and that of 1826, the third edition being published in 1851. Pharmacy was then in the hands of the licentiates of the Apothecaries' Hall of Dublin, but has now passed, as you are aware, into those of the members of the Irish Pharmaceutical Corporation.

Following on the formation of another temporary yet necessary and protective body, the Association of Chemists, in 1829, came the efforts to improve the position of pharmacists, in which Mr. Savory took so active a part. Then appeared the London Pharmacopœia of 1836. The parliamentary inquiry which embraced in its scope the relation of the medical profession to the chemists and druggists, was held in 1839, in which year we find, for the first time, the assistants of the druggists and chemists asserting themselves in an effort to secure an amelioration of their position in regard to Sunday closing and better hours generally. But the meeting fraught with the most important issues to pharmacists was the little tea-party held in the house of Mr. Bell, of Oxford Street, which took place on March 20, 1841, at which was determined the basis of a new and independent Society, to be called the "Pharmaceutical Society of Great Britain." Mark its recorded objects: "To benefit the public and elevate the profession of pharmacy; to protect the collective and individual interests of all its members in the event of any hostile attack in Parliament or otherwise; to establish a club for the relief of distressed or decayed members." This early definition of the objects of the Society was subsequently further amplified

and altered. It was stated to be "the union of the members of the trade into one body, for the protection of general interests, and the improvement and advancement of scientific knowledge." These objects brought the Society into line with the corporate medical bodies in the desire to obtain a higher standard of education, and a uniform system of examination, with proper registration. Pioneers of your art were those who met at the "Crown and Anchor" tavern in the Strand, on April 15, 1841, and for ever to be held in reverence are those who were chosen that day to form a committee to carry out the wishes of the meeting. The same impulses that prompted that meeting are those which bring you here to-night. I may venture to summarise these—to elevate the position and character of the dispensers, to obtain a wider recognition of your scientific and general attainments, to separate yourselves out clearly and as a class from all other so-called "assistants" in trade or business, to obtain credit for the conditions you are compelled to fulfil in order to arrive at your positions; in short, to stand together as an independent body of educated men, highly skilled in your technical art, with a trained intelligence which is the guarantee of security you give to us doctors and the lay public of the trust and confidence reposed in you.

(*To be continued.*)

DENTAL NOTES.

Refitting Rubber Dentures.

Rubber dentures can be refitted by first scraping the palatal safe of the old plate, then using a mix of thin plaster. Replace in the mouth, close the teeth tightly with the plate in place, varnish the impression flask, and pour the impression. Then separate the flask, remove the thin coat of plaster, roughen the plate and pack in enough rubber to fill the space.—*Dominion Journal.*

Quick Soldering.

Wrap the tooth well with asbestos cloth, cutting out the wrapping just where the solder is to flow, then make a pit in the solder block, into which place the wrapped tooth, and pack asbestos fibre round it. This investment is said to be as efficient and safe as one of plaster or sand.—*British Journal of Dental Science.*

A Low Fusible Metal.

A mixture of bismuth, 48 parts; cadmium, 13 parts; and tin, 19 parts, melts below the boiling point of water and is very hard. It melts at so low a temperature that it can be packed with the fingers. An ordinary plaster impression can be poured at once without waiting for it to dry.

Drawing Teeth Together.

In regulating teeth when the central incisors stand apart, dry the teeth, wrap No. 5 linen thread carefully round them three or four times and tie it. The shrinkage of the thread when moistened with the saliva will draw the teeth together.

Practical Hints.

When the fingers will not hold on a smooth surface such as glass, etc., use a piece of rubber dam to catch hold with.

A pellet of cotton held with a pair of pliers is superior to a camel-hair brush for applying varnishes, etc.; one is not then troubled with loose hairs.

To prevent tartar rinse the mouth freely once a day with water, in which a pinch of alum has been dissolved. It is harmless to the teeth and keeps the gums in good condition, preventing the accumulation of tartar.—*International Dental Journal.*

A substitute for articulating paper can be supplied by taking a piece of thin paper, wetting the finger with alcohol or water, and rubbing on a little polishing rouge. This dries quickly, and only takes a few moments to prepare.—*Brit. Journ. Dent. Science.*

Cases of white spots of decay on front teeth treated by burnishing them with a steel burnisher moistened with pyrozone will prevent recurrence of decay and save the teeth.—*Cosmos.*

A new formula for a local anæsthetic is given in *Zahnarz. Wochenblatt*, as follows:—Chloroform, 10 parts; ether, 15 parts; menthol, 1 part. Apply the spray to the surface, carefully guarding the nostrils meanwhile.

NOTICES OF BOOKS.

The 'Cumulative Index,' by Cedric Chivers and Armistead Cay (London: 10, Bloomsbury Street, W.C. 1*s.* 6*d.*), gives full particulars of all recent new books, under author, subject, and title, with cross references. It is published monthly, and each month's record is a permanent contribution to the year's bibliography.

The 'Scientific American Supplement' is perhaps not so well known in this country as the *Scientific American* itself, and it may be explained, therefore, that it is a periodical each number of which partakes of the nature of a monograph on some particular subject of scientific interest. The price of each part is 10 cents, post free, and a 'Reference Catalogue' just published (New York: Munn and Co., 361, Broadway), gives particulars regarding the contents of more than a thousand numbers.

The 'Handbook on the Workmen's Compensation Act, 1897. by M. Roberts-Jones (Cardiff: 'Western Mail,' Limited, 2*s.* 6*d.*), is a handy little book, now in its fifth edition and should be possessed by all employers of labour. It includes approved schemes of compensation, the Statutes referred to, notes, explanatory remarks, and other useful information.

The "Journal of Applied Microscropy" is a monthly publication, recently started by the Bausch and Lomb Optical Company, of Rochester, N.J. The second part of the journal contains articles on the study of the Myxamœbæ and the plasmodia of the Mycetozoa, a method of preserving the eye for sectioning, photography in the biological laboratory, the sectioning of seeds, and several others of a practical nature. Abstracts of important papers are also given, and a notes and queries column is begun. The annual subscription to the paper is five shillings post free, and the London publishers are Messrs. Dawbarn and Ward, Ltd., 6, Farringdon Avenue, E.C.

The Philadelphia Museums were established in 1894, after the close of the World's Columbian Exposition, with the view of gathering from all parts of the world, and to make immediately available to business men, full and specific information concerning trade conditions and trade connections. It was also proposed to place on exhibition manufactured products from other countries, in order that American manufacturers may be properly informed concerning the requirements of markets which it may be possible for them to enter; to bring before the manufacturers, dealers, and consumers of the United States samples of all the varied products of the world, that they may know and choose such as are useful to them; and to make complete examinations, analyses, and tests of these products, and to publish such information concerning them as may lead to a general understanding of their usefulness. There is a scientific department, the work of which is directed toward the collection and exhibition of the world's raw products, and the analysis and examination of all such materials. In addition, there is a bureau of information, the work of which is directed toward securing complete and practical information concerning all the principal trade centres of the world, the character of the business houses located in each centre, and the local demand for commodities of every description. The information collected is of such a kind as to render material assistance to any manufacturer or exporter who may be desirous of a more extended trade in foreign markets. The above particulars are gleaned from the official report of the museums, and fuller information concerning the institution may be obtained from the Secretary, 233, South Fourth Street, Philadelphia, Pa., U.S.A.

THE STUDENTS' PAGE.

EXPLANATORY NOTES ON THE B.P.

Spiritus Rectificatus.—The ultimate source of most of the alcohol used is starch from grain or potatoes. In the former case the grain is malted, that is, allowed to germinate. During germination there is formed in the embryo an unorganised ferment known as diastase, whose function is to convert the insoluble starch in the endosperm into a soluble form of sugar, to be utilised for the growth of the seedling. At a certain stage the germination is stopped by drying at a temperature sufficiently low not to destroy the diastase. The dried product, when ground, constitutes malt and contains sufficient diastase not only to convert its own starch remaining unconverted, but also the starch of a considerable quantity of unmalted grain, when the latter is mashed up with water and digested with it. The action of diastase on starch produces dextrin, of which several varieties are known, and ultimately maltose, a form of sugar directly fermentable by yeast. Malt extract is made by digesting ground malt in water. The expressed liquor is strained and evaporated *in vacuo* at a low temperature to avoid destroying the diastase which, during the digestion converts the starch almost entirely into maltose. The thick extract consists chiefly of maltose, and should contain also the mineral salts characteristic of cereals as well as diastase. The presence of the latter is recognised by the ability of the extract to convert a relatively large quantity of starch in the form of thick mucilage into a limpid solution of maltose and dextrin. Starch may also be converted into a fermentable form of sugar by boiling its mucilage with dilute sulphuric acid. The starch in this case is first hydrolysed to dextrin, but the final product is dextrose, not maltose.

When sugar solutions are fermented by yeast about 95 per cent. of the sugar is converted into ethyl alcohol and carbon dioxide, the remaining 5 per cent. appearing as glycerin, succinic acid, and the various forms of butyl and amyl alcohols, which together constitute the fusel oil of commerce. The exact mode by which the yeast produces its fermentative effects is unknown: it has been suggested, however, that the sugar molecules are taken up by the yeast cell and that the substances found in the fermented liquor are excretory products formed as the result of metabolic changes in the yeast protoplasm. Possibly the yeast retains a small fraction of the material for its own growth. Yeast, like all other forms of living matter, requires certain inorganic salts for its proper development. The actual amount is, however, relatively small, and sufficient is always present in ordinary fermenting liquors, derived from the water used or associated with the saccharine materials employed. In some breweries, by carrying on fermentation in vats of suitable construction, the carbon dioxide evolved during the process of fermentation in making beer is collected, and liquefied by pressure. The liquefied gas, preserved in steel tubes, is utilised for various industrial purposes, *e.g.*, the production of aërated waters.

The separation of the alcohol from the fermented liquor is one of the oldest applications of the process of fractional distillation. The distillate from the fermented solutions described above, when fractionated until the product has a sp. gr. of ·838 at 15·5° C. constitutes spiritus rectificatus, B.P. Spiritus vini gallici, or brandy, is defined in the Pharmacopœia as spirit distilled from French wine this being an alcoholic fluid obtained by the fermentation of grape juice, which contains both dextrose and lævulose. The distillate from such wine will be colourless and contain various esters and other volatile bodies derived from the wine, to which its characteristic flavour is due, while the colour of brandy is supposed to be derived from the casks in which it is stored. Much of the brandy found in commerce, and particularly the cheaper qualities, is nothing but plain spirit artificially flavoured to imitate the genuine and coloured by caramel. In some cases a certain quantity of real brandy is added to make the product resemble more nearly the article it is intended to represent. Brandy as imported is usually about "proof" strength. Fractional distillation is not capable of eliminating the whole of the water from alcohol, and commercially it is only applied to the extent of obtaining a distillate containing about 90 cent. of alcohol. The remaining 10 per cent. of water is abstracted by distillation after the addition of hygroscopic substances, such as anhydrous calcium chloride and potassium carbonate. The distillate will now contain something less than 1 per cent. of water, and constitutes the alcohol ethylicum or absolute alcohol of the Pharmacopœia. The removal of the last traces of water may be effected by the addition of a small quantity of metallic sodium, which reacts with the water to form sodium hydroxide. Even after this it is exceedingly difficult to obtain a distillate perfectly free from water, owing to the hygroscopic nature of ethyl alcohol, which causes it to absorb moisture rapidly from the air.

Sulphuris Iodidum.—The proportions of iodine and sulphur, 4 : 1, are almost exactly in the ratio of their atomic weights, 127 : 32. The compound, however, is a very unstable one, for although it dissolves in glycerin, in which free sulphur is insoluble, other solvents, *e.g.*, alcohol and ether, extract iodine and leave the sulphur.

Suppositoria.—The soap suppositories of the Pharmacopœia have not met with any success and will probably be omitted from the next edition. In making suppositories with oil of theobroma, care should be taken to keep the temperature of the melted oil as low as possible, and the mixture should not be poured into the moulds until it is beginning to thicken preparatory to setting. In making any desired number of suppositories—say six or twelve—it is necessary to mix materials for one or two extra to allow for the inevitable loss in manipulation. Do not add a piece of oil of theobroma without the corresponding quantity of medicament, for in this case 15 grains of your mass will not contain the full quantity of medicament ordered. It is usual to lubricate the surface of the moulds with oil, soft soap, or soap liniment; these can, however, be dispensed with if the moulds be well cooled, and the mixture poured in just before it is going to solidify.

Succior Expressed Vegetable Juices.—Preparations of the type of the official *Succi* were formerly more employed in medicine than they are at present. Investigations have shown that they are liable to very considerable variations in medicinal activity. It was held by many medical authorities, and is now by some, that the expressed juice containing the active principle or principles in their natural combinations was a more desirable form in which to administer certain drugs than a preparation obtained by the selective effects of a solvent, or by extraction with chemical substances. The introduction of liquor morphinæ bimeconatis is due to this idea, and is an attempt to imitate the action of morphine, as it occurs naturally in opium.

Syrups.—The official syrups are solutions or liquors (prepared by infusion, percolation, etc.) of various substances nearly saturated with refined cane sugar. In making them, care should be taken to accurately adjust the weight or volume of the finished product as directed. If this precaution be neglected, the syrup may be too strong or too weak in sugar; in the former case, some of the sugar will crystallise out on standing, and in the latter the syrup will be liable to ferment. For although a syrup of the strength indicated in the Pharmacopœia will keep perfectly well under proper conditions, weak solutions of sugar form a very favourable nutrient medium for the cultivation of moulds and bacteria. The weight of the pan or other vessel in which the syrup is finished off should, therefore, be carefully recorded so that the final adjustment may be accomplished without the necessity of transferring its contents to another vessel.

Terebinthina Canadensis.—This substance is always called by the synonym "Canada balsam," although it does not belong to this class of bodies, if the definition be accepted that balsams are resinous bodies containing benzoic or cinnamic acid. Note, however, that it is called Canada balsam in the official formulæ for the preparation of Blistering Paper and Flexible Collodion. Canada balsam is an oleo-resin; on exposure to the air it therefore solidifies, partly by evaporation of the oil and partly by the oxidation and consequent resinification of the oil. The solidification of resinous bodies by addition of magnesia or lime is due to the acid constitution of resin. Resins, therefore, combine with bases to form complex salts—the so-called resin soaps, and in the case of the two bases mentioned we get insoluble magnesium and calcium soaps. For this reason the addition of magnesia or lime to resinous or oleo-resinous bodies which are to be made into pills should be avoided. The addition of these substances, although greatly facilitating the formation of a pill mass, renders the product practically insoluble in the fluids of the body. Aqueous solutions of potash, soda, or ammonia usually react with resins with formation of soluble soaps. The chief use for Canada balsam is for mounting microscopical specimens. As the natural balsam hardens so slowly it is best to replace the oil by some more volatile solvent, such as benzol, xylol, or chloroform. For this purpose the balsam is heated on a water bath until the residue becomes brittle on cooling, and then the solvent is added until the desired consistency is obtained.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australasia, South Africa, etc.

THE BRITISH PHARMACOPŒIA.

In anticipation of the publication of the 'British Pharmacopœia, 1898,' the *British Medical Journal* has devoted a timely leading article to consideration of the scope and object of the national medicine book. All that is specified on these points by the Medical Act, 1858, is that the General Council shall cause to be published a book to be called 'The British Pharmacopœia,' "containing a list of medicines and compounds, and the manner of preparing them, together with the true weights and measures by which they are to be prepared and mixed, and containing such other matter and things relating thereto as the General Council shall think fit." The interpretation of this clause practically leaves the Council a free hand, and that body in turn has, for the most part, left the arrangement of details to its Pharmacopœia Committee. The original idea of the compilers appears to have been to include only drugs of established reputation, reflecting current practice, and establishing a standard of purity, without assuming the task of instructing. Almost of necessity, however, the Pharmacopœia has become not only a standard for the purity and strength of drugs and their preparations, but also a guide to the most appropriate association of remedies, and a basis for text-books of materia medica and therapeutics. Nevertheless, it is not itself a text-book, to be read through page by page; for the expert it is a work of reference, whilst for the student it is a book full of information to be assimulated gradually, and requiring for its interpretation frequent reference to many other works, to say nothing of the necessity of experimental illustrations. But above all else, the Pharmacopœia should be regarded as a uniform standard and guide, enabling everyone engaged in the prescribing and dispensing of medicine to obtain and employ drugs, chemicals, and galenical preparations of undoubted purity and uniform strength.

In the opinion of Dr. A. T. Wilkinson, as expressed in a lecture delivered before the Manchester Therapeutical Society, it would be an advantage to the medical profession if there were three recognised books, revised at stated intervals by competent authorities. First, an extra-pharmacopœia, in which proposed new remedies could be included until they acquired established reputation; second, the British Pharmacopœia, containing none but well authenticated remedies; and third, a sort of index expurgatorius or list of medicaments that have been tried and found wanting. At the same time, he thinks that, as a book, it is surely unique; for "everbody professes acquaintance with it, hardly anybody possesses it, and the bulk of its preparations are rarely if ever used." This, of course, is the medical position, as explained by a leading Manchester physician. He is of opinion, and with some show of reason, that a medical Cromwell is needed to purge the Pharmacopœia, to rid it of its redundancies, and also to effect some radical changes in its constitution. The Pharmacopœia itself Dr. Wilkinson regards as the heirloom of the profession, and a very valuable one at that. Though the work has been much modified in the course of years, he thinks it still needs considerable reconstruction before it can be said to match modern medicine. Possibly, however, the work now in the press may meet his ideas on this point to a great extent, though he is not likely to find elegant pharmacy run riot to such a degree as he would seem to desire. His complaint concerning the old Pharmacopœia (? 1867) is, that whilst it rightly kept prominently before it the "fortiter in re," to a large degree it ignored the "suaviter in modo." In strict homœopathy there is little but the latter principle left, but it is thought that present-day medical practitioners may nevertheless learn a lesson therefrom. All are now said to feel that it is a matter of duty to present medicines to patients, and especially to children, in the least objectionable form, and it is urged that the time has gone by when the administration of medicine was considered wholesome discipline—good for the soul as well as for the body.

Accordingly, after quoting the success of prominent proprietary medicines in support of his views, Dr. Wilkinson pleads that, if such medicines are not to be prescribed by the profession, it ought to be possible to present the drugs in equally palatable form, but prepared according to official formulæ. The extended use of tabellæ, granules, compressed tablets, jelloids, capsules, etc., is indicated as suggesting ways by which the older medicinal preparations might be supplemented or supplanted, while the prescribing of proprietary medicines is avoided. Amongst other desiderata called for are "an innocent, well-flavoured, soft, or at any rate easily masticated, lozenge, with which any prescribed drug could be incorporated"; official "formulæ for each of the elementary preparations in which the excipients are alone included," the prescriber thus being left absolutely free in his choice of the active ingredients and able to avoid the everlasting mixture and pills. In like manner there is need for a stable solution of butyl-chloral hydrate to correspond with the syrupus chloralis hydratis; a preparation of "oil" of male-fern "saponified" with senega and suitably flavoured; an alcoholic solution of tar; a revision of existing ointment bases; a simple tincture of benzoin and a good antiseptic varnish. A plea for new flavouring agents, official asthma powders, and the use of more palatable preparations generally concludes the somewhat lengthy list of suggested additions to the "B.P.," at the close of which it is remarked that some of the official preparations were surely never tasted by those who introduced them; or, if once, never again. In fact, says Dr. Wilkinson, they are like a certain tincture which a friend of his only prescribes when he wishes to get rid of a patient. This, however, is criticism of a moribund work which will be replaced in a few short weeks by the outcome of the wisdom of a large number of experts in chemistry, botany,

pharmacology, and practical pharmacy, and as such, though interesting, it comes rather late in the day. The main point to note is that a representative medical practitioner considers that, if the Pharmacopœia "descended a step or two further from its throne," it would not be thought less dignified, nor would the profession disdain to be taught. Moreover, as bearing upon this point, it is suggested that a series of laboratory experiments "at the gustatory expense of the professors" (*sic*) would save the practitioner time and the public nausea, and would afford another illustration of the self-sacrifice of the profession. With this suggestion our readers will cordially agree, and doubtless many of them will be pleased to secure the collaboration of medical men in that direction.

OF PARLIAMENTARY PROCEDURE.

WHEN any statutory body arrives at the conclusion that a change in the legal conditions under which it exists is desirable, it is, of course, first necessary to draft a Bill. That preliminary step accomplished, a Member of Parliament must be found to introduce the Bill, and it is usual to ask others to give him at least moral support by "backing" it, that is by allowing their names to be inscribed on the back of the document. The next thing is for the Member in charge of the Bill to give notice that he intends to move for leave to introduce it, but the introduction is quite a formality, and the first reading of the Bill is a misnomer, for nothing is read but the title, and the actual "Bill" handed to the clerk at the table is seldom more than a blank sheet of paper. Prior to that, however, even if the Bill be nominally an unopposed one, it becomes necessary to decide whether it shall be exposed to the chances of war in discussion, or not. In the former case, and also if the Bill be an opposed one, a place must be found for it, no easy thing for any other than a Government Bill nowadays.

If, however, the Bill be unopposed, it is put down on the order paper for some particular night, and if the absence of opposition continues, the embryo Statute is duly brought up for the second reading after all the other business of the House has been disposed of, *i.e.*, after twelve o'clock at night, and, provided no one objects, is advanced another step in its course. For a Bill to have passed the second reading implies that the House approves of the principle involved. But details have yet to be settled, and the committee stage follows in due course. That is the time for amendments to be proposed, and after this ordeal is passed, the third reading usually follows without question. This is, course, a very bald summary of what actually takes place. The procedure in the House of Lords is much the same, but more speedy. The periods of danger for a Bill, in either House, are the second reading and the committee stage. The former has been successfully passed by the Pharmacy Acts Amendment Bill, so far as the House of Commons is concerned, but a single Member of Parliament has prevented the Bill advancing further. It is hardly desirable that we should consider in detail the object of this quite unnecessary and only temporary check, but it seems quite obvious that it is not caused by any particular regard for public policy on the part of the individual Member concerned. It is, unhappily, quite possible for public and private interests to clash in the fulfilment of what should be a purely public function, but whilst we recognise the pity of it, the only remedy is to wait patiently and work for the removal of the stumbling-block.

ANNOTATIONS.

PHOTOGRAPHIC CHEMISTS are on the increase, the result of recent inquiries being to show that probably not far short of a thousand registered chemists deal to a greater or less extent in photographic materials and appliances. Accordingly, they constitute a very large proportion of those amongst whom the *Pharmaceutical Journal* regularly circulates, and from time to time space has been devoted in these pages to their special requirements. It would appear, however, that more, rather than less information in this special direction would commend itself to our readers, and it is proposed, therefore, to endeavour to treat the subject more systematically in future. Not that any attempt will be made to compete with the regular photographic journals; the intention being rather to supply such information as can be turned to definite commercial advantage. To inaugurate the coming season, a special photographic supplement will be issued with next week's Journal, and in connection with the preparation of that the aid of leading photographers—pharmaceutical, medical, and others—has been invoked.

READERS WHO REQUIRE SPECIAL INFORMATION, advice, formulæ, etc., are once more reminded that they need only ask and receive, arrangements having been made to refer all queries to experts, whilst replies will be published as promptly as possible. If the information supplied does not meet the requirements of the case, like Oliver Twist, the correspondent should ask for more. Frequently, however, queries sent in are far from definite, and in consequence it is not always easy to determine what is actually wanted. On the other hand, readers whose requirements have been met by the replies published, and particularly those who have obtained satisfactory results with the formulæ suggested, are reminded that an acknowledgment of the fact would be a desirable thing, the more especially as the knowledge of success in any case is of value in enabling those who reply to the queries to proceed more confidently in future instances. The equivalent of a correspondent's subscription to the Journal is frequently more than absorbed in replying to one or two queries that he sends, and in common fairness to other subscribers he ought to feel it incumbent upon him at least to intimate whether the process or formula recommended has proved successful. Beyond that, he may often have useful hints to impart, and in such a case it is hardly necessary to state that the hospitality of these pages is freely offered to him.

THE PROCTOR TESTIMONIAL is to be presented on Wednesday next, March 30, on which day the complimentary dinner will take place at the Métropole Hotel, West Clayton Street, Newcastle-on-Tyne. We regret to learn that Mr. Proctor will not be present, as he is unfortunately unable to leave his house, being in a very uncertain condition of health. Nevertheless, it is to be hoped that as many as possible of his old friends and newer acquaintances will make a point of being present on the occasion, in order that they may testify their appreciation of the great work he has done for pharmacy during so many years. Applications for tickets (4*s.* each) should be addressed to the Hon. Secretary (Mr. Geo. F. Merson), 24, Newgate Street, Newcastle-on-Tyne.

THE BRITISH PHARMACOPŒIA, 1898, is now in the hands of the printers, and in response to numerous inquiries, it may be stated that the work will be made accessible to the public in advance of official publication, by placing copies of the book in the Registrar's Offices in London, Edinburgh, and Dublin. The London office is 299, Oxford Street, W.; the Edinburgh office, 1, George Square; and the Dublin office, 35, Dawson Street. Official publication is intimated by advertisement in the London, Edinburgh, and Dublin

Gazettes, and from the date of such advertisement the new Pharmacopœia will be for all purposes deemed to be substituted throughout Great Britain and Ireland for the Pharmacopœia of 1885, now in use. For the information of readers who may not be able to refer to the copies at the Registrar's offices, it may be stated that the Executive Committee of the General Medical Council has formally resolved to send other advance copies to the medical journals and to the *Pharmaceutical Journal*, and that no time will then be lost in rendering the contents generally available.

The Question of Registration, and its necessity or non-necessity in the case of medical men, was recently raised at Westminster Police Court, when an application was made on behalf of the General Medical Council for a summons under the fortieth section of the Medical Act of 1858, against a person who was alleged to have falsely asssumed a medical title. It was stated that the person referred to had for some offence had his name erased from the Medical Register, but notwithstanding that, he continued to practise, using titles implying that he was still a registered practitioner. The magistrate—Mr. Sheil—expressed the opinion that there is nothing compulsory about registration if a man possesses the necessary qualifications, and he asked to be shown anything in the Act which says that a man who has a degree is prevented from practising owing to non-registration. He said that even if a person had been struck off the Register for grave misconduct that would not make him any the less M.D., if he had ever taken that degree, and he did not think there was anything in the Act making it obligatory for a qualified man to be registered. Mr. Shiel thought there ought to be such a provision, but, under the circumstances, he declined to grant a summons. It will be distinctly interesting to watch the developments of this case, if it should be carried further, as we hope it may be.

The Association of Chambers of Commerce, at its thirty-eighth annual meeting, concluded at the Whitehall Rooms, Hotel Métropole, on Thursday, March 17, resolved unanimously that the compulsory adoption within some limited period of the metric system of weights and measures legalised by the Act of last session should be advocated by every possible means, with the view of inducing Her Majesty's Government to afford facilities for the amendment of the law in that respect, and that a copy of this resolution should be sent to the President of the Board of Trade and to the First Lord of the Treasury. Meanwhile, the Association urges the Government to adopt the metric system of weights and measures, as far as possible, in all Government contracts and returns, so as to make it familiar to the people, and has resolved that a communication to that effect shall be made to the President of the Board of Trade. It is further recommended that individual chambers of commerce should press the matter upon the attention of local governing bodies, to the end that those also may employ the metric system in all public contracts, and thus facilitate its general adoption.

The Lord Chief Justice, speaking at the annual dinner of the Birmingham Law Students' Society, held on Saturday last, on legal education, said he recognised the advances which had been made in that direction in some large cities, but expressed the opinion that in the main the education of those who desire to become solicitors is carried on by a system of cramming and not of enlightened study. He acknowledged that in his own branch of the profession things are not much better, and whilst pointing out that there are certain exclusive privileges given to members of the Bar, and certain important offices which are almost exclusively considered to belong to them, he desired to know what right barristers can urge for the maintenance of those exclusive rights and privileges unless they are able to show special and peculiar learning and fitness for the discharge of the duties appertaining to those positions. The Inns of Court have in bygone days done great things, but in the matter of legal education they are lagging far behind the needs of the day. They have means of carrying on legal education on a broad and enlightened basis, but instead appoint a limited number of readers to deliver a certain number of lectures, at which attendance is required, followed by an examination which can, by the cramming of a man of average ability, be mastered in a period not exceeding six months. That, said the Lord Chief Justice, is supposed to be adequate preparation for the pursuit of a profession which involves not only great opportunities, but also grave responsibilities. However, the promised Teaching University for London offers an opportunity, of which he hopes the Inns of Court will avail themselves, of remedying this state of things, by creating a faculty or school of law in connection with that University. By reading "registered chemists" for "barristers," in the above remarks, the position of the former at the present day is not unfairly represented, and it may be suggested that the remedy for existing evils in both cases is obviously the same.

The Encyclopædia Britannica is well known as the leading work of reference in the world. It embraces all branches of human knowledge, and was written by specialists of the highest distinction, including scholars, divines, masters of science and philosophy, statesmen, soldiers, sailors, financiers, jurists, surgeons, artists, engineers, manufacturers, sportsmen and travellers. Unfortunately, this collection of treatises upon all conceivable subjects is not available to the man in the street, the catalogue price of the work being no less than thirty-seven pounds. But, by an unprecedented exhibition of enterprise on the part of the proprietors of the *Times* newspaper, a new re-print of the latest edition of the Encyclopædia is offered complete for fourteen pounds, or on payment of one guinea with the order and thirteen monthly instalments of one guinea each, after delivery of the twenty-five volumes. Readers desirous of taking advantage of this exceptional offer should apply at once to Mr. George Edward Wright, *Times* Office, Printing House Square, London, E.C., enclosing the initial instalment of one guinea.

Analyses by Public Analysts continue to furnish grounds for grave scandals, and on Friday last week, in the House of Commons, Mr. Duckworth asked the President of the Local Government Board whether he was aware that, in the course of a fortnight, three separate analyses of the analyst of the Islington Vestry had been proved to be inaccurate when the samples dealt with were referred to Somerset House. He also asked whether the Local Government Board would take any steps to inquire into mistakes which so seriously affect tradesmen against whom summonses are issued upon such mistaken certificates. Mr. Chaplin, in reply, said he had already taken steps to inquire into the cases referred to, and found that the results of the analyses by the public analyst referred to did not accord with those made at the Government laboratory. The cases were therefore dismissed, the defendants being awarded costs. It would, he said, be impossible to go into the details of those cases as represented by the Vestry and the chief officer of the Government laboratory within the limits permissible in an answer to a question. He remarked, however, that under the existing law the Court, in any case where proceedings are instituted in respect of alleged adulteration, can, on the application of either party, refer the sample to the officers of the Board of Inland Revenue, with a view to its being analysed and reported on by them.

Pharmaceutical Transactions.

LIVERPOOL CHEMISTS' ASSOCIATION.

A very successful and in many respects unique affair was

The Annual Dinner

of the above Association held on Thursday evening, 17th inst., in the Adelphi Hotel, under the direction of the President, Mr. John Bain. The presence of the Lord Mayor of Liverpool (Alderman J. Houlding), the Lord Mayor of Manchester (Alderman Gibson), and the Mayor of Bootle (Dr. McMurray), added considerably to the importance of the occasion, which was further enhanced by the attendance of Professors Boyce, Carter, and Harvey Gibson, Drs. Brannigan, Carthew Davey, O'Flaherty, Barnes and Moore, and the following individuals of note in the world of pharmacy :—Dr. Symes and Mr. J. Rymer Young, members of the Pharmaceutical Council, Dr. Paul, Editor of the *Pharmaceutical Journal*, Mr. J. Smith, Local Secretary for Liverpool, and Messrs. John Evans, E. N. Evans, T. F. Abraham, A. H. Samuel, R. C. Cowley, J. J. Smith, J. Hocken, C. J. S. Thompson, P. H. Marsden, W. Pearson, H. Jackson, A. S. Buck, and a full muster of the councillors and other office bearers of the Association.—After a capital dinner had been duly discussed, the hundred and twenty guests settled down to enjoy a long programme of toasts and musical selections.—The usual loyal toasts having been disposed of, the President proposed the health of

The Lord Mayors of Liverpool and Manchester, and of the Mayor of Bootle.

The Lord Mayor of Liverpool had special claims upon their gratitude for the part he took in philanthropic work, which he had prosecuted among the poor during the whole of his long public career. It was almost unnecessary for him to remind his hearers that in the Lord Mayor of Manchester they had a brother pharmacist of whom they might justly feel proud, and for whom the Manchester people should cherish considerable regard, for it was due in no small degree to Alderman Gibson that the electric light installation of his city was of such a perfect and well-thought-out description. No words were needed to commend the name of the Chief Magistrate of Bootle, for, though the northern township was a separate municipality, from a business point of view it was none the less an important and integral part of the great city of Liverpool, and the centre of a busy shipping trade.—In acknowledging the toast, the Lord Mayor of Liverpool claimed to be as much of a chemist as any of his audience, judging by the chemical operation he conducted weekly, which was one in which, by the aid of barley, malt, and hops, he converted some thousands of gallons of water into what had been aptly characterised by no less an authority than the great Mr. Gladstone himself, as the only modern substitute for the "nectar of the gods." The passing of the Pharmacy Act was one of the best things which had ever happened for the good of the public, and it was only right and proper that the operations of dispensing and selling drugs of a poisonous nature should be confined to the hands of persons properly educated for the purpose, and certified as competent by examination.—Referring to the rivalry said to exist between "Liverpool gentlemen" and "Manchester men," the Lord Mayor of Manchester said facetiously that in Manchester they were determined to take the shipping trade entirely away from Liverpool to their own more convenient port of Manchester. He would act the part of a prophet and say that in the future Liverpudlians would have the mournful consolation of seeing their trade going past their empty docks to the more commodious ones of Salford and Manchester. The time was not far distant when such a state of affairs would come to pass; in fact, he would be more precise, and say that it would take place about the same epoch when the classical New Zealander would be engaged in his mournful survey of the dead city of London. Seriously speaking, however, he trusted that the trade of both Liverpool and Manchester would only grow and expand, for they were so mutually dependent on each other that a misfortune in one was just as greatly felt by the other. If he were to judge by the gathering of that evening, trade amongst his brother chemists must be in a flourishing condition, going far towards justifying the remarks he made at the dinner given to him by the Manchester chemists, where he said that the retail drug trade of to-day was more prosperous than when he first knew it. For this he was taken to task by one of the trade journals, the Editor of which must, he supposed, be a young man, without much experience of the subjects on which he wrote. For that paper taxed him with not only being unduly optimistic, but also with having made his own fortune by leaving the retail drug trade. His answer to that was that the money he had made was due entirely to the fact of the greatly improved condition of the retail chemists as a body, which enabled him to supply the demand their prosperity and increased trade created. He was so satisfied with the good that a training as a chemist conferred on its possessor that, if he had a hundred sons, he should train them all as chemists, for if they wished to go into other businesses afterwards, they would find their previous training invaluable.—The Mayor of Bootle endorsed the remarks of Alderman Gibson, saying that his early training was that of a chemist, in fact he was a pharmaceutical chemist when he joined the medical profession. He had, consequently, very great pleasure in proposing the toast of the

Liverpool Chemists' Association,

coupling with it the name of Mr. T. H. Wardleworth, one of the Hon. Secretaries.—In his reply, Mr. Wardleworth read telegrams from the President of the Pharmaceutical Society and the North Staffordshire Chemists' Association conveying best wishes for the success of the dinner, the Staffordshire chemists, who were also dining at Stoke, expressing regret at the death of Mr. Conroy, who was with them at their last dinner.—The toast of

The Pharmaceutical Society

was given by Professor Harvey Gibson, in a thoughtful speech, in which he pointed out the good work the Society had done, and was doing in the cause of education—the only sure method of raising the pharmacist to equality with the members of other professions and with their continental brethren. The opportunities of the Liverpool Chemists' Association to help in this great work were numerous, the principal being the co-ordination of the means already possessed for teaching the various subjects required by the examinations, so that they in their own town could do something to give that thoroughness to the education of students which he found in his capacity of examiner to the Society they were so often deficient in.—Mr. Rymer Young (Warrington) and Dr. Paul responded to the toast.—The other toasts were "Our Guests" and "The Chemical and Drug Trade." The musical programme, furnished by the Lyric Glee Singers and by Messrs. Raper, Platt, Eyton Jones, Bayard-Haddock, and Mr. R. Savory Ladell, was well rendered and carefully chosen.—The arrangements made by Messrs. Bain, Dutton, Wellings, and A. S. Buck ran smoothly and contributed to make the function, which terminated at midnight, a great success.

NORTH STAFFORDSHIRE CHEMISTS' ASSOCIATION.

The annual meeting of this Association was held at the Copoland Arms Hotel, Stoke-upon-Trent, on Thursday, February 17.—The chair was taken by the President, Mr. J. Averill, J.P., Stafford. The annual reports of the Hon. Secretary, Mr. Edmund Jones, and the Treasurer, Mr. Weston Poole, were read and confirmed. The latter showed a satisfactory balance in hand.—The election of officers resulted in Mr. Averill being re-elected President; Messrs. F. Adams and J. W. Moore, Vice-Presidents; Mr. Edmund Jones, Hon. Secretary; and Mr. W. Poole, Treasurer. A number of gentlemen were elected members of the Committee.—Votes of thanks to the officers for their services during the past year closed the meeting. Afterwards

The Annual Dinner

was held with highly gratifying results from all points of view. Mr. Averill presided, and there were also present the Vice-Presidents, Messrs. F. Adams and J. W. Moore, Mr. G. S. Woolley, (President of the Manchester Association), Mr. W. G. Cross, J.P. (Shrewsbury), Dr. A. R. Moody (Hanley), Mr. Edmund Jones (Hon. Sec., Hanley), Mr. Weston Poole (Treasurer, Newcastle-under-Lyme), and a large number of members and friends.

After the usual loyal toasts, Mr. J. W. Moore gave

Success to the Pharmaceutical Society.

The toast, he said, was one of the most important, in many ways, of the evening. It concerned all who practised the art of pharmacy, and they were glad to recognise in the policy of the Society matters which would benefit chemists generally. During the last thirty years—the period he could best remember—there had always been hopes of an improved condition of things in pharmacy, and although much had been done for which chemists ought to be gratified, there was still room for much advancement.

The policy of raising the standard of examinations with a view of raising the status of the trade seemed satisfactory for districts where select pharmacy was practised, but in districts like the Potteries, where a general trade was principally practised and the higher branch was so little in demand, he questioned very much its beneficial or efficacious results. At the same time he sympathised with the action. The present Bill before Parliament did not contain all he could wish to see, but it was preparing the way for further progress. He hoped all chemists would seize the opportunities which the Society is endeavouring to place at their disposal for their benefit. If they did this the trade would gain much and the Society be encouraged. In conclusion, he referred to the high honour which Her Majesty the Queen had conferred upon the Pharmaceutical Society and the trade generally by presenting Mr. W. Hills with a Jubilee Medal.

Mr. W. Gowen Cross (member of the Pharmaceutical Council) responded. He said he was proud to be present to acknowledge the toast. The Pharmaceutical Society, far from being a small or insignificant society, represented the best features of a true old guild, and was looked up to as being all that was best of pharmacy in Great Britain and the Colonies. The Society was originated by founders who had the cream of businesses of their own in order that others might be better fitted to share in the cream. He referred to the consideration of the Pharmacy Bill by the Council, who, he said, tried hard to find a Bill with which all would be able to agree, and, having found one, they had already made considerable progress in Parliament with it, and there was now every likelihood of it becoming law. Mr. Moreton, M.P., and Dr. Tanner, M.P., who had supported the Bill with great skill and tact, and the President, Mr. W. Hills, through whom it was introduced, deserved the thanks of all chemists and druggists. Speaking of local associations, Mr. Cross was glad to see that they were increasing in number and growing in strength. He believed, and he thought all should believe, that the more chemists combined and formed themselves into local associations for the discussion of matters of interest and concern to themselves, the better chance would they stand of improving their position by political or Parliamentary, as well as by social action. He complimented the North Staffordshire Association upon having so genial and able a President, and he hoped that the members would give the officers, who worked for the success of the Association, their sympathy and support. He wished them the highest success.

Mr. W. Poole proposed the toast of

The Medical Men.

He said he would like to see a closer alliance or relationship between medical men and chemists, and to see a more distinct line of demarcation drawn between prescribing and dispensing. If chemists strove to advance legitimate pharmacy the medical profession and the public would, he thought, recognise that it would be best to have experts to prescribe and experts to dispense, but custom had a great deal to do with the existing state of things which, in his opinion, was neither to the interest of the medical profession nor the pharmacists.—Dr. Moody, who responded, said few medical men were not prepared to admit the help that chemists had rendered, and were rendering, to the medical profession. He thought it would be a very good thing if all the chemists would unite to persuade medical men to give up dispensing. At the same time, he considered it a *sine quâ non* to attaining this end that chemists should abstain from prescribing. Chemists must bear in mind the fact that the British public were somewhat materialistic in their nature, and were scarcely satisfied to pay for advice on paper only, without having something more tangible in the shape of a bottle of physic or a box of pills to carry away with them. He did not think the public at present, especially in manufacturing centres, would welcome the idea of having to pay two fees—one to the doctor for his prescription, and one to the chemist for the medicine. He would gladly welcome an arrangement whereby chemists would give up prescribing and doctors cease to dispense.

Mr. Woolley, in proposing the toast of

The North Staffordshire Chemists' Association,

said he was a believer in provincial associations, and he had worked in connection with the Manchester Association for over forty years. During that time they had not met with the success they could have hoped for, but at the same time, he thought they could claim to have done good work, and they certainly had bright prospects of doing still more. Local associations had done good service in connection with the new Pharmacy Bill. There had been opposition in Manchester, but, fortunately, that had been withdrawn. He believed it was a generous and broad-minded Bill, and it was very much wanted. The Vice-President had alluded to the Bill as not containing all that was wanted, but it was not the slightest use going to Parliament for all they required without the Society had a solid basis. There were 15,000 or 16,000 chemists on the Register, but only 4000 or 5000 were associated with the Pharmaceutical Society. With only a small proportion like that it was impossible for the Society to do all that seemed desirable. He had seen it stated that the present Bill was nothing but a Bill for acquiring guineas. He knew something of the work of the Pharmaceutical Council, and he was sure that nothing was farther from the idea of the Council in presenting the Bill than a desire to acquire guineas. The Council was actuated by something far higher than that—by something that could not be measured by pounds, shillings, and pence. They wanted to get a solid Society, so that concerted action could be taken and some good done for all. It seemed to him that there were considerable elements of danger in a proposed Government Bill to regulate the sale of carbolic acid, and every association in the country ought to work in the direction of averting that danger. The Pharmacy Acts were based upon the principle that the safety of the public lay in the education of the vendor, and the Government ought not to go back upon that principle. If an unsatisfactory Bill was passed a great injury would be done to the trade. It was a matter that all associations should keep before them, and the President of the Pharmaceutical Society would give them the cue how to proceed in the matter. He hoped the North Staffordshire Association would continue to increase.

Mr. Averill, the President, responded. He said the Association could already claim to have done some amount of work, although it had only been in existence a year. The membership had increased and was likely to increase. So firmly was he convinced of the important influence that such associations had that he thought where chemists are not numerically strong enough in a town to form an association themselves they should amalgamate with other towns and form a district association. That would be a benefit to the Pharmaceutical Society in the first place, and consequently a benefit to the chemists. The North Staffordshire Association thoroughly approved of the new Pharmacy Bill, and the members looked forward to great advantages being derived from it. As for the North Staffordshire Association, it had been the means of bringing the chemists of the district together, with the result that they looked upon each other in the most friendly manner. Much praise was due for the Association's success to Mr. Edmund Jones, the Hon. Secretary, who had been the means of working the Association up to the present state of efficiency.—Mr. Jones also responded, and several other toasts were subsequently proposed.

TUNBRIDGE WELLS PHARMACEUTICAL ASSOCIATION

A general meeting of the chemists of Tunbridge Wells and neighbourhood was held on March 11 to consider the desirability of forming a local association. Among those present were Messrs. Booth, Chatterton, Dunkley, Gough, Gower, Green, A. Nicholson, G. Nicholson, Ogle, Pearmund, Robinson, Rogers, Sells, Stanley Smith, Tute, Wardley, and A. E. Hobbs (Local Secretary Pharmaceutical Society and P.A.T.A.). The chair was taken by Mr. R. A. Robinson, L.C.C. It was decided to form an association, and a sub-committee was chosen to arrange rules, etc., for a subsequent meeting to decide on. A cordial vote of thanks to Mr. R. Howard for his services as Local Secretary to the Pharmaceutical Society during a number of years was unanimously passed. A general discussion took place, and several matters of interest were deferred till a subsequent meeting.

CHEMISTS' ASSISTANTS' ASSOCIATION.

On Thursday, March 17, this Association met at 73, Newman Street, W., Mr. T. Morley Taylor, President, in the chair, when Mr. E. W. Hill gave a practical demonstration of

Water Analysis,

this making the third of the series of practical demonstrations given before the C.A.A. this session. At the outset Mr. Hill said he need make no apology for introducing such a well-worn subject, since it was work that could, with care and application, be carried out by the majority of chemists. Although the bacteriological examination of water was of recognised value, yet the science of bacteriology was not so advanced that a chemical analysis could be dispensed with, as in many cases where specific bacteria could

not be recognised a chemical examination revealed the presence of the organic accompaniments or pabulum of bacterial life, and indicated contamination. For the collection of the sample of water to be examined, a clean stoppered Winchester quart should be used, the bottle previously to the final filling being rinsed out with the sample. Care must be taken to collect a fair sample of water. A quantity should be allowed to run from the tap, or a gallon or so pumped to waste before filling the bottle. The water should be examined as soon after collection as possible. The physical appearance of the sample is first noticed and its colour observed in a two-foot glass tube over a white tile. Any smell when warmed is particularly important. Any suspended matter is separated in a depositing jar and examined under the microscope. Mr. Hill had brought a specimen of Cyclops obtained from a sample of water. The total solids are estimated by evaporating 100 C.c. of a clear (filtered if necessary) sample, to dryness in a tared dish and weighing the residue. The weight in milligrammes multiplied by ten gives parts per million the usual mode of expression in water analysis, or if grains per gallon are required, multiply the number of milligrammes by seven and divide by ten. The residue is afterwards strongly heated, any blackening being noted, and then again weighed for total mineral matter. The sample tried blackened considerably, indicating the presence of organic impurity. Total chlorine is estimated by titrating 50 C.c. of the water with solution of nitrate of silver, of which 1 C.c. corresponds to 1 milligramme of Cl, a solution of chromate free from chlorides being used as indicator. The sample contained 120 parts per million, a very high figure. A high chlorine figure implies contamination with animal matter, unless the source of supply is contiguous with the sea or salt deposits. Ammonia is estimated by Nessler's colorimetric method. In a water containing the above large quantity of chlorine, if a reaction with Nessler's solution is obtained with the sample, sufficient evidence has been obtained to justify a condemnation of the supply. Ordinarily it is necessary to distil 250 C.c. of the water in a perfectly clean retort with a little recently-ignited sodium carbonate, until all the ammonia has passed over. The distillate is then placed in a Nessler glass with some Nessler solution, and compared with the colour produced by a known quantity of ammonia contained in a standard solution of ammonium chloride. Free ammonia from shallow wells implies organic contamination, whereas free ammonia from deep artesian wells is of little significance, being derived from the deep-lying strata, especially from albuminoid ammonia, or the ammonia derived from the joint oxidation and hydration of organic nitrogenous matter, as distinguished from that liberated from ammonium salts by alkali, is estimated in the sample used for the previous operation after the removal of free ammonia. 25 C.c. of Wanklyn's alkaline permanganate solution is added to the residual water in the retort with some ammonia-free distilled water if necessary, distillation being continued till no more ammonia passes over. The distillate is then Nesslerised, as previously described. Hardness before boiling and after (total and permanent hardness) is estimated by means of a standard soap solution, which is added to a definite quantity of the sample till a permanent lather is obtained. One degree of hardness in Clark's scale is equal to 1 grain of $CaCO_3$ to the gallon. The amount of oxygen absorbed in fifteen minutes, and four hours from acid solution of permanganate at 80° F. gives an idea of the total oxidisable organic matter contained in the water. The permanganate unreduced is estimated by the addition of iodide of potassium and titration with hyposulphite of soda. Nitrates are estimated by means of the zinc and copper couple. A piece of zinc foil is placed in a 3 per cent. solution of copper sulphate until a layer of copper is deposited. The foil is then washed and placed in a bottle with a quantity of the water for twenty-four hours. Nitrates are reduced to ammonia, which is estimated in the usual way. The presence of nitrates is important, as giving evidence of previous organic contamination. Nitrites are detected by acidified solution of iodide of potassium and starch paste. Their presence indicates recent contamination, but it is sometimes due to the passage of the water through iron pipes, the latter effecting a reduction of the nitrates. To detect presence of lead, copper, or iron, evaporate some of the water to a small bulk, test for lead and copper with ammonium sulphydrate and for iron with potassium ferrocyanide. Having obtained these analytical data concerning the sample of water under examination, it becomes necessary to judge of its suitability for domestic purposes. To this end it is necessary to have information concerning the source of the supply, the nature of the gathering ground, and the depth and position of the well. From a knowledge of the district whence the water is obtained it is often possible to explain an apparent abnormality, and thus save an unnecessary condemnation; but in any case, a water which gives rise to genuine suspicion should be condemned.—Mr. Morley Taylor said this was a valuable addition to the series of practical demonstrations given this session. He thought that the accurate use of colour tests required experience and a practised hand.—Mr. Fell, F.C.S., asked Mr. Hill if he had tried Tichborne's method of making soap solution with oleic acid and solution of sodium hydrate. In the estimation of nitrates he said the figure for albuminoid ammonia must be deducted. He would like to know if Mr. Hill had tried the ammoniacal solution of phenol test recently quoted in the *Pharmaceutical Journal* from a German source. He (Mr. Fell) had found it a failure.—Mr. Hyman recommended the indigo process for the estimation of nitrates. The standard solution was difficult to make, but the results were very satisfactory.—Mr. Pearson said Mr. Hill had omitted to mention peaty waters. In these waters he believed the oxygen absorption figure was very high, and the figures were in many respects misleading.—Mr. E. W. Hill briefly replied.—A splendid assortment of apparatus had been kindly lent by Messrs. Gallenkamp, everything necessary for a complete examination of water being shown. One of Messrs. Burroughs and Wellcome's Water Analysis cases was also exhibited.

PLYMOUTH, DEVONPORT, STONEHOUSE AND DISTRICT CHEMISTS' ASSOCIATION.

In connection with the Junior Section of the above Association, on Wednesday, March 16, at the Rooms, Whimple Street, Mr. J. D. Turney delivered a lecture on

The Structure of Foliage Leaves.

Mr. Turney, with the aid of an excellent lantern, illustrated his remarks in an able manner, and quoted interesting passages from Sir John Lubbock's works to emphasise his remarks.—At the conclusion the lecturer was warmly thanked, and a hearty vote of thanks was passed to Mr. Jas. Maurice for his generous gift of the lantern and accessories.

NEWPORT AND MONMOUTHSHIRE CHEMISTS' ASSOCIATION.

On Tuesday, March 15, this Association met at the Shaftesbury Hotel, Newport, Mr. T. Philip Garrett in the chair.—The P.A.T.A. movement was referred to, and Mr. J. W. Phillips having spoken in favour of the scheme, the Association resolved to use its influence to induce all chemists in the district to join.

The Pharmacy Acts Amendment Bill

then came on for discussion.—The Hon. Secretary, Mr. Benson Harries, who introduced the question, strongly supported the Bill, which he thought would tend to unite chemists into one body and would be of benefit not only to the Pharmaceutical Society, but to the whole trade. The local Members of Parliament had been written to asking them to support the Bill, and favourable replies had been received. Speaking of a curriculum, he advocated that it should include studies of a strictly business character.—After a general discussion a resolution was passed supporting the Bill.

Determination of Caffeine.—Trillich and Göckel give the following method for the determination of caffeine in coffee:—Moisten 10 grammes of finely ground coffee with ammonia in a separating funnel fitted with a glass wool filter. The mixture is set aside for half an hour, and then 200 C.c. of acetic ether is added, and the whole macerated for twelve hours with repeated shaking, the acetic ether solution is then run off, and the residue washed with three successive 50 C.c. of the solvent. The ethereal extract is then distilled and the residue boiled with magnesia, filtered and evaporated to dryness. The caffeine is dissolved out of the residue with acetic ether, or with chloroform, and filtered into a tared basin, the solvent evaporated off, and the residue weighed. A preferable method to the direct weighing of the alkaloid is to determine the amount of nitrogen in the residue by Kjeldahl's method, and from this to calculate the amount of caffeine.—*Pharm. Zeit.*, xlii., 53.

MEETINGS OF SCIENTIFIC SOCIETIES

ROYAL INSTITUTION.

On Friday, March 18, a lecture was given by J. Mansergh on

Bringing Water to Birmingham

from the Welsh mountains. Birmingham has an area of over twelve thousand acres and a population amounting in 1891 to 648,000. It lies on a slope having an altitude of from 300 in the north east to 800 feet in the south-west. The town was formerly supplied with water from the river Tame and by some wells in the red sandstone. It became evident that the sinking of new wells would fail to provide for the increasing population, and in 1892 a Bill was introduced into Parliament to enable a supply to be brought from Wales. By means of lantern slides the districts from which water is brought to Liverpool and Manchester were illustrated, and also that from which the Birmingham supply is obtained. The supply of Liverpool comes from a drainage area double that of Manchester, and the drainage area secured for Birmingham was double that of Liverpool. The Bill met with some opposition in Parliament, notably by the London County Council, who had a scheme for obtaining a supply from the same locality, and also by people interested in angling, for whose benefit a supply of 27,000,000 gallons a day had to be reserved prior to the river being tapped. In order to have a reserve supply for Manchester without lessening the quantity in Lake Thirlmere, from which it is obtained, the surface level of the lake was raised, and for Birmingham a series of six reservoirs will eventually be constructed, one of which—the Caban Goch—will contain more than the reserved supply in Thirlmere. Among causes affecting the constancy of supply the amount of rainfall and the compensating influence of evaporation were allowed for in the calculations. Since an overflow would greatly endanger the dams of the reservoirs, it was necessary to build them to a safe height, which amounted in one case to 128 feet. The water is conveyed by an aqueduct built of concrete and brickwork, which has a gradient of 1 in 4000. For crossing valleys steel pipes are used, which in one case—where they cross the Severn—descend to a depth of 550 feet, giving a high hydrostatic pressure. The service reservoir is situated at Frankley, six miles from Birmingham, where the water is made to pass through a series of filter beds. The structure of dams of earthwork and masonry were illustrated by means of diagrams thrown on a screen with the lantern. Photographic views of the river in the normal state and in time of flood were also shown, the flood, as is usual in mountainous districts, being very high. On the site chosen for one of the reservoirs there stood a church and burial ground, which had to be removed. A new church had to be built, and all the bodies in the graveyard taken up and re-buried. A description of the village built for the accommodation of the workmen employed was given. This village was provided with a school, hospital, and fire brigade. The arrangements made were so good that although small-pox was prevalent in the neighbourhood not a single case broke out in the village, while the children at the school passed their examinations with the highest credit. Views of the work in several stages of completion were shown on the screen, and greatly appreciated by the audience.

CHEMICAL SOCIETY.

At a meeting held on Friday, March 18, Professor Dewar, F.R.S., President, in the chair, it was announced that a notice of resolutions had been received from Messrs. Harden and Hartog, the first of which proposed that a ballot should be taken to determine the opinion of the Society upon the desirability of obtaining

A Supplemental Charter

that would allow of voting at the annual general meeting by proxy or by post. The second resolution proposed that if a majority favoured this scheme the necessary application to obtain it should be made by the Council. These resolutions had been considered by the Council, who had replied to Messrs. Harden and Hartog, pointing out that the first resolution would put into effect the proposed charter before it was obtained; that such action had been shown by counsel to be repugnant to the charter now held; and the resolution would therefore have to be ruled out of order by the President. It would further be *ultra vires* to use the funds of the Society for the purpose of taking such a ballot, but any private individual remained free to do this at his own expense.—A paper by Winifred Judson, B.Sc., and J. Wallace Walker, M.A., Ph.D., was read on

The Reduction of Bromic Acid and the Law of Mass Action.

The reduction of bromic acid had been carried out before with the use of hydrogen iodide as reducing agent, but it appeared that the method involved two things interfering with the observations on mass action. One of these is that the iodine produced, becoming dissolved in the hydrogen iodide solution, renders the reaction slower, and the second effect is that due to the formation of hydrogen bromide. In this work, therefore, the authors had carried out the reduction with hydrogen bromide. The method first employed was that of Harcourt, sodium thiosulphate being added as the bromine made its appearance, but in this way no velocity constant was obtained agreeing for different concentrations. Probably the velocity constant is represented by a cubical equation, but the presence of thiosulphate has a disturbing effect, bromine reacting on it directly in the acid solution. A definite constant was, however, obtained in working in the absence of thiosulphate with many different concentrations. The authors afterwards proceeded to study the action of hydrogen bromide and hydrogen bromate in absence of hydrogen sulphate, and here again a velocity constant was obtained. The velocity constant in the former case belongs to an equation of the fourth degree, and that of the latter to one of the second degree. In the latter case it amounted to 1/58th of that obtained by Ostwald with hydrogen iodide and bromic acid; that is to say, hydrogen iodide works fifty-eight times faster than hydrogen bromide upon bromate. The results of the work confirmed the deductions of Noyes upon the subject.—A paper was read by R. S. Morell, M.A., Ph.D., and J. M. Crofts, B.A., Ph.D.,

On the Action of Ferric Chloride on the Ethereal Salts of Ketonic Acids.

The authors of this paper have been engaged in attempts to isolate some of the brilliantly-coloured substances that are produced when ferric chloride is added to ethereal salts of ketonic acids. Reference was made to the work of Claisen, who believed that the compounds produced were of the type $FeRCl_2$ and FeR_2Cl. When ferric chloride dissolved in absolute ether is added to acetoacetic ether a purple oil is produced, soluble in much ether, giving a solution which is bleached by chloroform. The oil being separated, washed with ether, and dried *in vacuo*, was found to be extremely unstable, oxidation setting in while the iron became reduced. Similar effects were obtained with some other ethers, such as oxalacetic ether, and analyses were made which indicated that the substance was an addition product, but as they oxidised so readily the numbers obtained were only approximate. With ketophenylpyraconic ether a red oil was produced, which set to a solid mass, the analysis of which agreed closely with the formula $RFeCl_2$. On washing with water, ferric chloride separated and a compound of the formula FeR_2OH remained. Operating on the lactone of ethyl oxalcitrate, the authors obtained an oil having the composition of an addition product, which, on treatment with water, regenerated the normal salt of ethyl oxalcitrate.—A contribution by J. C. Porter, M.A., was entitled

Note on the Volatility of Sulphur.

It was observed by Mr. Porter that sulphur is continuously lost by evaporation at the temperature of the water-bath. By keeping a flask containing sulphur at this temperature for several days, a considerable amount of sublimate was obtained, which formed two zones on the neck of the flask, the one consisting of prismatic crystals, the other of octahedral. A neutral layer between these zones was found to have a temperature of 95°, which is the transitional temperature. It was found further that sulphur is easily volatile *in vacuo* at 100°, when it condenses in fairly mobile liquid drops. No diminution of the smaller drops comparable with the behaviour of dew drops could be observed, but it was found that all the drops cleared away around a central larger one, and it was therefore inferred that the greater drops grew at the expense of the smaller through volatilisation.—Professor McLeod remarked that the same observations had been made about the year 1870, and that phosphorus behaves in the same way, the vapour which has not been raised to the liquefying temperature of the substance yielding a

liquid on condensation.—The President remarked that the volatility of sulphur at the ordinary temperature could be easily observed by cooling a part of the vessel with liquid air, when a sublimate is at once visible.—A paper was given by T. B. Wood, M.A., W. T. N. Spivey, M.A., and J. H. Easterfield, M.A., Ph.D.,

On Cannabinol.

From the resin extracted from *Cannabis sativa* by extraction with ether a fraction is obtained which has been named cannabinol. This substance boils at 404° C., at the same time splitting off a hydrocarbon, which does not resinify by exposure. By the action of acetyl chloride on cannabinol a hydrogen atom is replaced, and a substance is obtained of the formula $C_{15}H_{18}O_2$, which has already been described by Messrs. Dunstan and Henry, who considered it the acetyl derivative of a substance $C_{18}H_{24}O$. When oxidised caproic acid and fatty acids of a lower type are produced; there is also obtained a product, oxycannabin, which has been described by Bolas and Francis, who gave it the formula $C_{20}H_{20}N_2O_7$. The composition also agrees, however, with the formula $C_{11}H_{11}NO_4$, while Messrs. Dunstan and Henry found its composition to be $C_{10}H_{10}NO_4$, who also had given it a higher melting point than the present authors. Four papers were given by B. Brauner, Ph.D., on the subject of

Thorium, Cerium, and Didymium,

under the titles of "Contributions to the Chemistry of Thorium," "The Atomic Weight of Thorium," "The Compound Nature of Cerium," and "Praeso- and Neo-Didymium." The first paper treated of the method of obtaining pure thorium compounds. This was done by recrystallising the double salt of thorium oxalate with ammonium oxalate, a compound by the analysis of which the atomic weight obtained for thorium was 232·59. While ammonium oxalate dissolves but little of the oxides of lanthanum, cerium, and others, it dissolves thorium oxide to an extent two thousand times as great, forming not an ordinary double salt but one of complex composition. The tendency of these earths to form such complex salts may be stated to be inversely as their basicity. Didymium was split into praeso- and neo-didymium by Welsbach, who gave the former as atomic weight the number 143·6, and to the latter the number 140·8. A description was given of the separation of lanthanum, praeso- and neo-didymium. On determining the atomic weights, praeso-didymium, to which Welsbach had given the atomic weight 143·6, gave the number 140·8, while neo-didymium gave 140·8 instead of 143·6, as described by Welsbach. The sulphate of praeso-didymium was found to be isomorphous with ythium, sulphate, and the metal therefore belongs to the type of yttrium giving the oxide Pr_2O_3. But a higher oxide also exists, Pr_2O_4, and an investigation was made to determine to which of the two classes of peroxides this one belongs. When treated with dilute acids it gave off oxygen, but formed no hydrogen peroxide, and appeared, therefore, to have the character of manganese peroxide, but it was subsequently found that this was not the case, the hydrogen peroxide produced being destroyed by reaction with the peroxide of praeso-didymium. It therefore belongs to the class of peroxides of which the type is barium peroxide. An analogy is shown by the salts of neo-didymium with those of cobalt, and by the salts of praeso-didymium with those of nickel. In conclusion, Dr. Brauner said that nothing could give him greater pleasure than that this work should be published in England, and in the English language.—Dr. Armstrong rose to congratulate Dr. Brauner upon the importance of this work, and to express the gratitude of the Society for his bringing this before them.—The President also expressed the gratitude of the Society for this valuable contribution which, he wished it to be noticed, was not the first the Society had received from Dr. Brauner.

Silver Sulphocarbolate as an Antiseptic.—This salt is introduced for use in the form of fine prismatic, white, odourless needles, which must be preserved in the dark. The salt commences to decompose at 120° C., liberating vapours of phenol. The residue contains silver sulphate. A still higher temperature decomposes the latter, leaving silver oxide and metallic silver. The solution of the salt is neutral; a black precipitate of oxide of silver is caused by potash solution. No decomposition is effected by ammonia. The salt contains 28·29 per cent. of metallic silver. Silver sulphocarbolate is a powerful antiseptic, and is to be preferred to silver nitrate, as it is non-caustic and is more soluble in water. It has given good results in surgical and ophthalmic clinics.—*Pharm. Zeit. f. Russ.*, xxxvi., 519.

PROCEEDINGS UNDER THE PHARMACY ACTS.

Pharmaceutical Society of Great Britain *v.* Harris.

At the County Court, Haslingden, on the 17th inst., before His Honour Judge Coventry, the Council of the Pharmaceutical Society of Great Britain sued W. Harris, of 69, Abbey Street, Accrington, for a penalty of £5 for selling poison contrary to the provisions of the Pharmacy Act, 1868.

Mr. R. E. Vaughan Williams, instructed by Messrs. Flux, Thompson and Flux appeared for the Society.

Mr. J. N. Withers represented the defendant.

In opening the case Mr. Williams said that the proceedings were taken under Sections 1 and 15 of the Pharmacy Act, 1868, the jurisdiction and mode of procedure being determined by the Act of 1852. After referring to various sections of the Statute which had a bearing upon the action, he stated that by Section 15 it was made unlawful for any person to sell a poison in any part of Great Britain unless such person was a duly registered pharmaceutical chemist or chemist and druggist, and that "to sell" included not merely an unqualified proprietor but also an unqualified assistant who conducted the actual sale. In this case the defendant was employed by a Mr. John Law, who carried on business at 69, Abbey Street, Accrington, and who was a qualified chemist and druggist. On November 13 last, a witness acting upon instructions from the Registrar of the Pharmaceutical Society went to the shop, where he purchased a bottle of Towle's chlorodyne. It was sold to him by defendant, who was not a qualified person. This chlorodyne contained a poison, viz., morphine, which was the chief toxic constituent of opium, and whether as "morphine" or a "preparation of morphine" it was included in the Schedule of Poisons to the Act. Upon these facts he should ask His Honour to find that this sale of poison was made by an unqualified man without the proper supervision of his master or of a qualified person.

Arthur Foulds examined: On November 13 last I went to 69, Abbey Street, Accrington. It was a chemist's shop, and the name over it was Law. I first asked to see Mr. Law, and was told by defendant that he was not in. I asked defendant for some castor oil and a bottle of Towle's chlorodyne. Defendant was the only person in the shop when I went in. He took the bottle out of a glass case on the counter, where there were other bottles of the same article exhibited. He did not refer to anyone before serving me. I subsequently handed the purchase over to Mr. Moon.

Cross-examined: I put my label on the wrapper the same day as I made the purchase.

Re-examined: Defendant told me his name was Willett Harris, and that he was a nephew of Mr. Law.

Harry Moon examined: I am clerk to the Registrar of the Pharmaceutical Society, and conveyed the instructions to Foulds to make the purchase. I received the bottle of chlorodyne from him. The wrapper was then unbroken. Subsequently I handed it to Mr. Eastes. I opened the wrapper in his presence and marked the bottle which was inside, and is now produced.

Cross-examined: The Society is allowed by the Treasury to retain the penalties. The application of penalties is dealt with by the Statutes. The Society does not take into consideration whether the qualified employer is a member.

Re-examined: The Society proceeds in every case of infringement reported to them. The Society is largely out of pocket in taking these proceedings; they are taken for the benefit of the public.

Ernest John Eastes, examined: I am an analyst and Fellow of the Institute of Chemistry. I received the bottle from Mr. Moon. I analysed the contents. I found it to contain 0·85 grain of morphine. That is a dangerous quantity, more than enough to kill a healthy grown-up person.

His Honour: Have you got any decision as to selling by assistants?

Mr. Vaughan Williams: Yes, Wheeldon's case, which I will hand to your Honour.

His Honour: Do you call witnesses for defendant?

Mr. Withers: I am afraid I cannot.

His Honour: Here is a decision directly in point and against you.

Mr. Withers: What I complain of is, if it had been a poison in the first Schedule, there might have been ground for complaint, as the sales of such poisons have to be conducted in a certain way, but here you have a poison not subject to any such regulations,

and the defendant is not told that he must not sell it. It is the defendant who is liable, and not his master, and he ought to have been told that he must not sell. Mr. Law does attend at the shop, and, although possible, it is highly improbable that he was out on the occasion referred to. I can only give general evidence, as it is impossible for Mr. Law to remember, and defendant does not remember whether he was asked by the witness if Mr. Law was in. I am bound to submit to the penalty, but I ask your Honour to exercise your discretion as to costs.

Mr. Vaughan Williams: I would call your Honour's attention to Section 13 of the Act of 1852, which gives the successful party full costs of suit; this, I submit, takes away discretion.

His Honour: There is another case against another assistant for selling Winslow's Syrup.

Mr. Withers: In the other case I shall have to submit to the penalty.

Mr. Vaughan Williams: I am, of course, prepared to prove the other case, which is against another assistant of the same chemist. I may say that the Society is bound to take up these cases in the interest of the public, as it is of the utmost importance that unqualified persons should be stopped from selling these dangerous articles.

His Honour: In these cases there has been not only an infringement of the Act, but an exceedingly bad infringement of the Act. I cannot do better than read the judgment of Mr. Justice Hawkins in the case which has been handed to me. "The facts are few and simple. The defendant was the assistant or servant of a duly qualified chemist, but he was not himself a registered pharmaceutical chemist or a chemist and druggist. It was contended that it was not unlawful under Section 15 for an unqualified assistant to a duly qualified chemist to sell poisons in his master's shop in the ordinary course of his master's business, that the sale being a mere sale by him as a servant in the discharge of his duty, the master was in law, and, in fact, the seller. It was further suggested that great inconvenience and hardship would result to small chemists who could not afford to employ qualified chemists if we were to hold otherwise."

Now the same judgment goes on to say, "We do not agree in the view thus presented, nor are we at all impressed by the suggestion of inconvenience or hardship. Nothing, to our understandings, can be clearer than that the object of the Act was, beyond all other considerations, to provide for the safety of the public and to guard as far as possible all members of the community from the disastrous consequences, so frequent in occurrence, arising from the sale of poisons by persons inadequately acquainted with their baneful properties, and the whole object of the Act would be frittered away and the Act itself become a dead letter were we to declare by our judgment that an unqualified assistant can lawfully and with impunity sell any of the poisons to which the Act applies, unless upon each occasion of such sale he acts under the personal superintendence of a qualified employer, or of a qualified assistant to such employer. By such personal superintendence we mean not mere presence in the shop or room where the sale takes place, but actual personal superintendence, so that every individual sale shall be so guarded round by those precautions prescribed by the Act that the safety of every member of the public may be provided for as far as the law can accomplish that object."

After that it would be absurd of me to give my own opinion. This is a bad case, letting two boys sell poison. I give judgment for the plaintiffs for the penalties with costs.

Pharmaceutical Society of Great Britain *v.* Riley.

At the same Court William P. Riley, of 69, Abbey Street, Accrington, was sued by the Council of the Pharmaceutical Society of Great Britain for a penalty of £5 for selling poison contrary to the provisions of the Pharmacy Act, 1868.

Mr. R. E. Vaughan Williams, instructed by Messrs. Flux, Thompson and Flux, appeared for the Society.

Mr. J. N. Withers represented defendant.

The judgment given in the previous case included judgment against the defendant in this case for the penalty and costs.

Pharmaceutical Society of Great Britain *v.* Chapman.

On the 22nd inst., at the Leicester County Court, the Council of the Pharmaceutical Society of Great Britain sued M. Chapman, of Bull's Head Street, Great Wigston, for a penalty of £5 incurred by keeping open shop for the retailing, dispensing, or compounding of poison contrary to the provisions of the Pharmacy Act, 1868.

Mr. T. R. Grey, instructed by Messrs. Flux, Thompson, and Flux, appeared for the Society.

Defendant appeared in person.

Mr. Grey stated that the Society was sueing the defendant, who kept a shop in Bull's Head Street, Great Wigston, for a penalty for keeping open shop for the sale of poison, viz., a preparation of opium called laudanum. After referring to the Sections having reference to the action, Counsel pointed out that opium and all preparations of opium were included in Part 2 of the Schedule to the Act, and that the sale of poisons in each part of the Schedule was subject to special regulations under Section 17 of the same Statute.

His Honour (to defendant): Do you admit this?

Defendant: I do not know what I am summoned for. I do not sell poison, I never sold a pennyworth of poison in my life.

Arthur Foulds examined: On October 27 last I went to Great Wigston. I went to defendant's shop—a general shop—the name over it being "Matt. Chapman, Football Outfitter and General Dealer," and purchased some tea, castor oil, and one pennyworth of laudanum. Was served by a woman, who poured the laudanum out of a large bottle labelled laudanum, which she took from off a shelf. The bottle into which the laudanum was poured was not labelled.

His Honour: Do you ask any question?

Defendant: I should like to say one thing. I am away in the summer time playing cricket, and I leave the shop in my wife's hands. I know the laudanum was sold, but I did not know it was in the shop. There has only been a shillingsworth in the shop since we opened it. I did not know I could not sell it.

His Honour: Ignorance of the law is no excuse. Dealing in poison is a dangerous thing, and it has to be put under strict regulations. It seems to me you do not dispute the sale.

Defendant: It was bought by my wife and sold by her.

His Honour: You left your wife to sell in your absence: she clearly sold this poison, and you are liable for the penalty. It is a most dangerous thing to allow poison to be sold in this way, and to let a poison go without a label upon the bottle. Is the penalty a fixed amount?

Mr. Grey: Yes. Section 15 fixes the penalty for each offence.

His Honour: I find a verdict for the plaintiffs for the penalty of £5 with costs.

PARLIAMENTARY NOTES.

The Pharmacy Acts Amendment Bill.—Just before the rising of the House on Thursday, March 17, as the orders of the House were being gone through, the committee stage of this Bill was called on, and Mr. Alexander Cross (Camlachie), at once moved to report progress.—Dr. Clark said he believed it was a harmless Bill, simply applying to members of the Pharmaceutical Society.—Mr. Cross: I am strongly of opinion that legislation regarding pharmacy should be all under one Act, and I object to proceeding with this Bill at this hour.—Progress was reported accordingly.

Mr. Cross triumphed, therefore, when the Bill came up for the committee stage. It was several minutes after midnight when the clerk at the table mumbled the name of the Bill, and the Serjeant-at-arms advanced with repeated bows to remove the mace to its committee position "under the table." Nearly two hundred members were present, and their sympathy with the pharmaceutical infant found expression in "Oh, oh!" when the fact of Mr. Cross's opposition was announced. Dr. Clark (Caithness), constituting himself the champion of the Society, appealed to the honourable gentleman to allow the Bill to be reported, and stated his grounds very well. The Bill, he said, only affected certain persons who desired to join a voluntary Society, and moreover, the points to which Mr. Cross desired to draw attention might well be discussed when the Poison Bill, which the Government had promised to submit, had been introduced. But the sweet reasonableness of the Doctor failed to charm the member for Camlachie, who, with the remark that "all amendments to the Pharmacy Acts should be contained in one Bill," sat down with the consciousness that for that night at least there would be no progress. The Serjeant replaced the mace, and the Pharmacy Acts Amendment Bill was deferred till the following day, when the same little drama of

opposition was repeated. The Bill was again down on the order paper for Monday, but no further attempt to advance it will now be made till Monday the 28th instant.

Notices of Motion relating to the Estimates offer conclusive evidence of the difficulty of pleasing everybody. At the present time there are no less than sixteen proposals to reduce the hard-earned salaries of Ministers. No department appears to have escaped the attention of the malcontents, the Home Secretary, Mr. Curzon, Mr. Chamberlain, Mr. Ritchie, Mr. Long, Mr. Chaplin, Sir John Gorst, and the Postmaster-General all being threatened with a more or less serious diminution of official income. Of course, in the long run, no one will be one penny the worse, but the motions for reduction afford a valuable opportunity of bringing to light various grievances which might otherwise never be known. We must confess to a feeling of regret that there are not two additional notices on the paper—one aimed at the Local Government Board in respect of Poor Law dispensers, and the other at the Home Office, touching the administration of the Pharmacy Act in Scotland.

South Kensington Museums.—Replying to Lord Balcarres on Monday, Mr. Akers-Douglas, the First Commissioner of Works, stated that the science collections now housed on the west side of Exhibition Road will in due time be removed to new buildings to be erected on the east side of the same road. The Indian and Oriental collections will follow the scientific treasures to their new home. The disposition of the present buildings has, according to Mr. Akers-Douglas, not yet been decided upon by the Government, and it is premature to discuss the matter until the new buildings for the reception of the various collections approach completion.

Parcel Post with the United States.—Mr. Henniker Heaton is at his usual useful work of urging postal reforms, and it must be confessed that the authorities are doing much to render his task easy. Replying to the Honourable Member for Canterbury on the 21st, Mr. Hanbury pointed out that the delay in establishing a service of parcel post between Great Britain and America has been due to the reluctance of the Government at Washington, which has since 1885 resisted all the attempts of Her Majesty's Ministers to bring about an agreement. There now appears, however, to be a better feeling at Washington and the Post Office authorities are sanguine that it will be possible shortly to announce the establishment of the service.

Adulterated Imports.—Major Rasch (Essex, S.E.) has given notice that he will ask on the 25th instant whether it is true that milk adulterated to the extent of 40 grains of boric acid per gallon is permitted to enter this country from the Continent, and whether it is a fact that such milk is prohibited for retail in the countries exporting it, and is really a specially doctored article for the British market. If the facts are admitted, Major Rasch will ask the Government whether steps will be taken to stop the importation. The object may perhaps be effected by publicity, for it is improbable that buyers here will run the risk of taking an article which may involve them in a Food and Drugs Act prosecution.

The Petroleum Committee met on Tuesday last and arranged its course of procedure. Mr. Jesse Collings was appointed to the chair formerly occupied by the late Mr. Mundella. It was decided to take no further expert evidence, though the advice of Col. Majendie, H.M. Chief Inspector of Explosives, will be invited at the next meeting of the Committee. The Inspector has already given his views to the Committee on a former occasion, when he put his finger on the chief defects of the present law. After the examination of Col. Majendie the Committee will probably utilise its other meetings in considering the stupendous volume of evidence, of a highly contradictory character, which has been addressed during the course of the inquiry from all sorts and conditions of men, commercial and scientific. It is not a light task to face, but the Committee hopes to report early in the Session.

To Drive Away Mice.—According to the *Scientific American*, mice may be driven away by thrusting rags soaked in turpentine down their runs. Substituting crude "carbolic" for the turpentine the same plan has been found effectual near London for banishing rats from a poultry run.

TRADE NOTES AND FOREIGN NEWS.

The Number of Chemists and Druggists and Chemical Manufacturers who were gazetted under receiving orders in bankruptcy in England and Wales during 1897 was 25, out of a total number of 4113, as compared with 27 out of a total of 4155 in 1896. For the month of December the number was 1 out of a total of 318, as against 2 out of 359 in the corresponding period in 1896.

False Trade Descriptions in India.—Copies of reports from the Governments of Bengal, Burma, Bombay, and Madras have been received at the Board of Trade Office with regard to the proceedings taken by the customs officials under the Indian Merchandise Marks Act of 1889. One of the cases in which goods were detained under the Act during the past year is more or less typical of the methods of certain manufacturers and importers of German goods. A consignment of German-made clinical thermometers, marked with the words "5 minutes," "1 minute," or "1½ minutes," was imported by a certain firm. On being tested by the Bombay customs officials the thermometers failed to register the temperature of the human body in the time stated, and the marking was therefore held to constitute a false trade description. Moreover, the goods were invoiced "made in Germany, washable," and on investigation it was found that while the name "F. B. Foster and Sons" was cut into the glass, the words "made in Germany" were marked on in such a manner as to be readily effaceable, thus conclusively proving to the officials that the indication of the country of origin was intended to be removed. A substantial fine was levied, and the thermometers were confiscated subject to redemption for reshipment to Germany on payment of the penalty. As the redemption penalty was not paid, the thermometers were destroyed.

The Rangoon Custom House officials detained amongst other goods fourteen consignments of paints, on the ground that the descriptions on the kegs were "false trade descriptions." The paints were branded and declared as "red lead" "white lead" and "white zinc" paints, the natural inference being that the contents were pure lead or zinc. On subjecting them to analysis, however, the chemical examiner found that the paints contained very varying and in some cases almost infinitesimal percentages of red lead, white lead and white zinc, respectively, the bulk being described as composed of so much sulphate of barium, and in one case of an organic colouring matter and brick dust. The Madras customs officials detected some 203 cases out of 8775 packages opened, involving provisions, paper, paints and oils, turpentine, dry colours, medicines, gilt thread, glassware, hardware, clocks, watches, beer, wine and spirits, piece goods, yarn, etc. The cause of detention in the majority of the cases appears to have been in not distinctly marking the goods, with the country of origin, and in trying to pass foreign goods as of English make. For instance, a consignment of German tobacco bore English descriptive words with the name of the German town of manufacture instead of the country of origin on the labels. German lavender water was found put up in bottles moulded with the English words "lavender water" without any indication that it came from Germany. Italian foolscap paper was imported with the sheets bearing a representation of Britannia on one side and the words "extra strong" on the other. Consignments of Dutch cheese, margarine, and butterine; Belgian gin, sheet and silver plate glass; Japan clocks; French, German, and Italian brandy; German beer, whisky, port wine, and sherry were all detected passing through with English words on the boxes and labels without any indication as to their country of origin. In most cases fines were imposed and the goods allowed to pass after being stamped "Made in Italy, France, or Japan, etc.," according to the country of manufacture. In other cases the goods were confiscated and sold when not redeemed, and the proceeds credited to the Government.

Chinese Oil Tree.—The United States Consul-General at Shanghai in a recent report states that the Chinese oil tree (*Aleurites cordata*) belongs to a family very common in China known as the "tung," the "Ying tzu tung" being especially cultivated for oil production, although it is said to be derived from other varieties. The tree is found chiefly in Hunan, Hupeh, and Szechuen. According to Hosie it grows to the height of fifteen feet, and seems to prefer thin, solid, rocky ground. It has large, beautiful green leaves, small pink white flowers, and large green fruit like an

apple. The oil is expressed from the seeds, which are large and poisonous, the fruit being gathered in August and September. The machinery used for extracting the oil, which is sent to market in tubs with tight-fitting lids, is of a very rude description, consisting of wooden presses with wedges. The oil is used in the manufacture of paint and varnish, waterproof paper, and umbrellas, for lighting purposes, and for caulking boats.

American Caviare.—The American Consul at Hamburg has been studying the demand for American caviare in Europe, and is of opinion that there exists a growing and profitable market for that article. Both lake and river caviare are now sent to Germany, chiefly from the Delaware River, Georgetown, Chesapeake Bay, the Fraser and Columbia rivers, the Great Lakes, and the Lake of the Woods. Lake caviare is preferred to that from the rivers on account of its larger roe, the latter being small and black in the river caviare. It is chiefly consumed in the cheap restaurants of Berlin, and a considerable quantity is also sent to Austria, Italy, and other European countries. United States caviare for the German market is salted in America with German salt, sent thither for the purpose, as it is claimed that this sal possesses preservative properties superior to those of American salt

OBITUARY.

Yeo.—On January 28, Charles Henry Fletcher Yeo, Chemist and Druggist, Brisbane, Queensland, Australia. Mr. Yeo was one of the first members of the Pharmacy Board of Queensland appointed by the Government when the Pharmacy Act came into operation, and has been re-appointed at every election since. He occupied the position of Chairman of the Board for four years, and was recently re-elected Chairman for the current year.

Martin.—On February 26, Richard Martin, Chemist and Druggist, Farringdon Road, London, E.C. Aged 52.

Edwards.—On March 2, Joseph Edwards, Chemist and Druggist, Brighton. Aged 70.

Gibbins.—On March 3, Thomas Henry Gibbins, Chemist and Druggist, Caledonian Road, London, N. Aged 65.

Langbeck.—On March 6, Hugo Waldemar Langbeck, Chemist and Druggist, Leman Street, London, E. Aged 54. Mr. Langbeck was an Associate of the Pharmaceutical Society.

Mitchell.—On March 7, Robert Harry Mitchell, Chemist and Druggist, Old Swan, Liverpool. Aged 32. By the death of Mr. R. H. Mitchell the Liverpool Pharmaceutical Students' Society has lost one of its oldest, hardest, and most enthusiastic workers. One of the original founders of the Society, he successively filled the posts of Secretary, Treasurer, and President, performing the duties of these several offices in a manner creditable to his powers of work and organisation, and to the satisfaction of his fellow "students." He contributed papers and notes on pharmaceutical subjects at each session of the Society, and was to have given an address on the 10th but for his untimely death, due to a heart affection following an attack of influenza. He was also an Associate of the Pharmaceutical Society. Before going into business for himself he had large experience in several good pharmacies in the Liverpool district, and was for some time with Messrs. Symes and Co., as manager of their branch in Tithebarn Street, Liverpool.

Richards.—On March 9, Thomas Lewis Richards, Chemist and Druggist, Borough High Street, London, S.E. Aged 62.

Streater.—On March 9, James Hobbs Streater, Chemist and Druggist, Sloane Street, London, S.W. Aged 50.

Walker.—On March 11, Thomas Walker, Chemist and Druggist, Dumbarton, late of Stirling. Aged 65.

Snook.—On March 19, Joseph John Snook, Chemist and Druggist, Mortimer Street, London, W. Aged 50. Mr. Snook was an Associate of the Pharmaceutical Society, and had long been a familiar figure in the world of pharmacy. He was apprenticed at Bath, and subsequently worked in the Messrs. Corbyn, Stacey and Co.'s Bond Street pharmacy. Later still, he went to Paris, where, as an assistant to Messrs. Roberts and Co., he was a witness of the great siege. Returning to London, he purchased the business of Messrs. Wilcox and Co., and more recently, that of Jozeau, in the Haymarket, as well as that of Roux, in Regent Street. He was very successful in business, and though somewhat blunt in manner, was a man of his word and very straightforward in all his dealings.

EXTRACTS FROM CONSULAR REPORTS.

The Camphor Export from Tainan (Formosa) for the year 1896 was 8001 boxes, a decrease of 2144 boxes on the preceding year, and of 4156 from the export of 1894. First cost prices in the interior during 1896 were—January, 30 dollars per picul (133⅓ lbs.); February to March, 35 to 40 dollars; April to May, 28 to 20 dollars; June, 17 to 13 dollars; November to December, 28 to 24 dollars. The Hong-Kong selling prices were: January to April, 79 dollars; May, 60 dollars; June, 37 dollars; July, 43 dollars; August, 50 dollars; from September to the end of the year, between 45 and 50 dollars. In the month of June the camphor business was practically brought to a standstill in the interior owing to the issue of certain regulations by the Japanese authorities affecting the production and sale of camphor, but repeated remonstrances from the Consular body had the effect of partly alleviating the situation.

The Importation of Opium into Formosa is now a Government monoply. Its importation into Japan, except as a medical necessity, is strictly forbidden, and opium smoking by Japanese is a crime punishable by penal servitude. In Formosa, however, the regulations are not quite so strict; practically every native over the age of twenty is allowed to smoke provided he is supplied with the necessary licence under the regulations and becomes a Japanese subject.

Opium Smoking Licences are issued in connection with the Government Laboratory at Taipeh, where the imported opium is refined and put, in three different qualities, into 1-lb. tins for distribution and sale to licence-holders. The licences are of three kinds, the monthly fees being the equivalent of 6*s*., 3*s*., and 7*d*., according to the class of smokers. A first class licence permits a man to smoke any quality of opium, but a holder of a second or third class licence may not, under a heavy penalty, smoke a higher quality than his ticket indicates.

Opium Police have been established in Formosa, and it is their duty to watch for infringements of the regulations and to enforce the penalty. They have authority, in the discharge of their duty, to enter and search houses informally at all times on a reasonable suspicion. Opium refineries are to be established all over the island, and, it is said, the Government contemplates supplying the outside market after satisfying the home demand.

The Government Sales of Opium in Formosa from April 1 to May 22, 1896, realised 84,384 dollars, and the revenue derived from the sale of smoking licences was £5844. The opium is sold by the Government at a fixed price of 12, 9, and 7 dollars per lb., respectively for the three grades of refined opium turned out from the Laboratory. The first grade is Benares opium, which is imported in its crude state at about 750 dollars per picul, while the refined article is sold at the rate of 1653 dollars per picul, thus leaving a good margin of profit to the Government, even after allowing for considerable waste during the boiling process. The expenses connected with the boiling are calculated to amount to from 20 dollars 22 cents to 21 dollars 3 cents per picul.

British Chemical and Drug Trade in 1897.—While the value of chemicals, dye stuffs, etc., imported into the United Kingdom during past year decreased to the extent of about £770,710 on the previous year, it is satisfactory to note that the export value of chemicals and chemical and medicinal preparations increased by some £431,928. The total figures for the two years 1896 and 1897 are respectively:—Imports, £6,776,920 and £6,006,210; exports, £8,242,936 and £8,674,864.

The Brewing of Beer in Bavaria is subject to certain restrictions imposed by the authorities with regard to brewing substitutes. The brewing must be effected with water, malt, hops, and yeast alone; the addition of any other substance during or after brewing is forbidden, and is punishable as falsification either by fine or imprisonment. Even the addition of compound parts of the beer, such as alcohol or water, after the beer is brewed, is punished as falsification.

LETTERS TO THE EDITOR.

THE NEW PHARMACY BILL.

Sir,—Having read with great interest the correspondence in the *Pharmaceutical Journal* about the above Bill, I should esteem it a favour if you would allow me, as a Minor man, to add my humble quota. Being in an isolated position, I have not yet had an opportunity of expressing any views upon it, either favourable or otherwise. Although an "outsider," I read the reports of the Pharmaceutical Society and its transactions through the Journal, and have not kept aloof through antagonism. I regard the Society as a body having great latent power, which cannot be brought into full action owing to the apathy and indifference of chemists and druggists. The new Bill should remove a great amount of personal animosity and prejudice towards the Society and its work, which so cripples any attempt at legislation. By rendering all Minor men eligible for membership, I confidently hope that it will result in a consolidation of the whole trade, thereby making the Pharmaceutical Society much more powerful than it is at present, able ultimately to approach Parliament with a revolutionary Bill. Why some pharmaceutical chemists oppose the present modest Bill, I cannot see, since it in no way interferes with their distinguishing title. The only equality will be that both pharmaceutical chemists and chemists and druggists will be equally eligible for membership. I am not aware that M.P.S. conveys any impression of qualification; for many old members have not passed either Minor or Major. One of our greatest enemies is illegitimate competition, and after spending time and money in training and qualification, one often finds that he is in a worse position than his unqualified competitor, who ignores Pharmacy Acts entirely. The present Bill appears to be a step in the right direction, and in process of time I trust that we shall see a new Pharmacy Act, having for its main object the improvement of the present wretched condition of pharmacy.

Leeds, March 15, 1898. G. W. KENDALL.

POISONS IN PART I. OF THE SCHEDULE.

Sir,—I should like to suggest a point that, to my mind, requires a little "daylight letting in," viz., the sales of the Syr. Hypophos. Co., whether B.P. or that of any secret manufacture. Such preparations come under the Schedule (I.), and it is very certain that the requirements of the Sale of Poisons Act are not carried out either by bogus or other limited companies. Some customers are quite annoyed when asked for their name and address for the purpose of registration, and retort that the syrup can be purchased elsewhere "without that nonsense." Now, sir, I maintain such laxity ought not to go on unchecked, especially when so much is being poached from the preserves of the law-abiding pharmacist.

Sale, March 23, 1898. ALLEN SMITH.

ANSWERS TO QUERIES.

FORMULÆ FOR PERFUMES.—Your requirements should be met by the formulæ published at page 302. [*Reply to* SYNTHETIC.—7/3.]

NEW BYE-LAWS.—The examination held in September, 1900, will be the first under the new Bye-laws. [*Reply to* A. B. C.—7/6.]

PHONOGRAPHY.—No, but if you already know it, you should make a point of retaining your knowledge. [*Reply to* FONO.—7/5]

NATURE OF POWDER.—The substance is powdered potassium bitartrate, as you should have been able to determine for yourself. [*Reply to* H. M. P.—6/21.]

POTASSIUM CARBONATE.—The first part of your query is founded upon a misconception of terms. You cannot speak of the quantivalence of a compound like potassium carbonate. The word quantivalence is used to indicate the exchange value (in terms of some unit) of elements in chemical reactions. The quantivalence or valency of most elements is variable; for example, sulphur is bivalent in H_2S, and hexavalent in SO_3. The reaction in making potassa sulphurate cannot be indicated by any one equation, because a number of substances are formed in addition to the sulphide, and the proportions in which these various substances are formed depend upon the temperature and other conditions under which the reaction takes place. Do not attach too much importance to equations. [*Reply to* W. M. B.—6/19.]

SANITARY INSPECTORSHIP.—Write to the secretary of the Sanitary Institute, Parkes Museum, Margaret Street, London, W. [*Reply to* SANITARY.—7/14.]

CAPSULE MACHINES.—Messrs. A. and K. Robertson, Rodney Street, Canonmills, Edinburgh, make such a machine as you require. Write to them for particulars. [*Reply to* W. I.—7/12.]

ACID. HYDROCH. PURIS. ON PAPER.—Your query was answered in the *Pharmaceutical Journal* for February 5, page 138. [*Reply to* MONA.—3/29.]

COVERING BY MEDICAL MAN.—The General Medical Council has decided that medical practitioners must not employ unqualified assistants, but no objection appears to be taken by that body to the employment of unqualified dispensers. [*Reply to* NEMO.—7/15.]

DENTAL ACT.—The Act applies only to the United Kingdom, which includes the Isle of Wight, but not the Channel Islands or the Isle of Man. There are no restrictions on the practice of dentistry in those islands, but there are in Australia and, we believe, in South Africa. [*Reply to* DENS.—7/20.]

HEADING THE DAY-BOOK.—If standing by itself, and not forming part of a sentence, Monday is rendered correctly by "Dies Lunæ." In a Latin sentence expressing the fact that something was done on Monday the form "Die Lunæ"—the ablative—would be used. [*Reply to* SIMPLEX.—6/8.]

MICROSCOPY.—Get a copy of Cross and Cole's 'Practical Microscopy' (Baillière, 3*s.* 6*d.*). You should have a good low power aplanatic pocket lens for dissecting purposes and examining botanical specimens, such as are made by C. Baker, 244, High Holborn, London, at fifteen shillings each. [*Reply to* S. P. S.—7/7.]

SPIRIT LACQUER FOR GRATES.—Shellac, 10; sandarac, 2; lampblack or vegetable black, 4; mastic, 1; methylated spirit, 100. Dissolve the resins in the spirit by mixing them and setting aside in a warm place for several days, shaking occasionally. Then stir in the black, and after mixing thoroughly, strain through fine muslin. [*Reply to* F. W. J.—6/13.]

ANALYSIS OF MEAT PREPARATIONS.—There is no work dealing with the analysis of meat preparations in a satisfactory manner. The best book giving analyses of meat preparations, and to some extent methods of separation of albumoses and peptones, is Dr. J. König's 'Die Menschlichen Nahrungs und Genussmittel' (Berlin: Dr. Springer). It must be remembered that the analysis of meat preparations is in a very chaotic condition, and many analyses that are published, extolling certain preparations, are of very little value. [*Reply to* BROCKLEY.—7/10.]

NON-EXCISABLE COCA WINE.—This must contain not less than half a grain of alkaloids per fluid ounce, and the wine must be, in the opinion of the Excise authorities, incapable of use as a beverage. This sometimes necessitates the addition of more extractive matter. Obviously the strength will depend upon the alkaloidal value of the leaves employed, which varies between wide limits. Take 4 oz. of coca leaves in No. 20 powder; moisten them with a little sherry in which a drachm of tartaric acid has been dissolved; pack in a percolator; add more wine, and when percolation commences close the lower orifice and macerate for 24 hours. Then continue percolation until a pint of fluid has been obtained. Determine the amount of alkaloid in this by Gunn's process (*P.J.* [4], iii., 249), and if the liquid is not of the prescribed strength add enough cocaine to bring it to the standard. [*Reply to* VINC.—7/4.]

CORRECTION.

RECTIFICATION OF REGISTER.—The Secretary of the Pharmaceutical Society asks us to state that the following name was inserted in error in the list of names published last week (see p. 300*d*):—

Gilmour, Andrew, 45, Stockport Road, Manchester.

Mr. Gilmour is still carrying on business at the above address.

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Allen, Bedding, Clague, Clarkson, Cribb, Hacking, Harvey, Hasselby, Hogg, MacGregor, Mason, Merson, Presley, Richardson, Shapley, Smith, Toone Tremeer, Wilson, Wyatt.

THE MONTH."

Strophanthin. Commercial strophanthin generally contains a small quantity of a nitrogenous body, which was first noticed by Catillon in strophanthus seeds. H. Thoms has been investigating this substance, and his results show that the seeds of *Strophanthus hispidus* and *Strophanthus kombé* contain, in addition to strophanthin, the two bases choline and trigonelline. The separation of these bases from strophanthin is best effected by precipitating the aqueous solution of the mixed bodies with ammonium sulphate instead of with tannin, as is usually the case. Strophanthin thus precipitated is then purified by several treatments with alcohol and ether, and finally obtained as an amorphous neutral substance perfectly free from nitrogenous bodies. Thoms intends to ascertain the composition of strophanthin so purified and its decomposition products, and hopes to obtain it in a crystalline form.—*Ber.*, 31, 271 and 404.

Chemical Action of the Electric Current. M. Berthelot has been studying the action of the electric current on carbon oxides, and when mixed with hydrogen and nitrogen as well as on alcohols and ethers. The action of the electric current on carbon oxide was to produce the solid brown oxide C_4O_3, and CO_2, and the same reaction ensued when nitrogen was present in equal volume, the nitrogen undergoing no alteration. Its action on carbon oxide or carbonic dioxide in both cases with excess of hydrogen was to cause a condensation forming

$$C_nH_{2n}O_n, \text{ or } (CH_2O)_n - MH_2O.$$

This reaction approaches the physiological condensation of carbon dioxide and water in plants and the pyrogenic reactions which occur in the formation of CH_2O in the dry distillation of formic acid. The addition of nitrogen to the mixture of hydrogen and the oxides of carbon gave, if the oxides were not in excess, a compound very rich in nitrogen of the formula $(COH_3N)_2$ corresponding to the uric and xanthine series of bodies. If the oxides of carbon were in excess the compound resulting from their condensation belonged to the series of ureides. In the case when free water was produced in the course of the re-actions, especially in dealing with carbon dioxide, the normal product of the fixation of nitrogen with the elements of water, namely, ammonium nitrite, was obtained. The action of the electric current on the various alcohols in presence of nitrogen showed that all the alcohols fixed nitrogen forming condensation products of the nature of amides, more especially amidines and their congeners.—*Comp. rend.* cxxvi., 609.

Colouring Matters of Delphinium Zalil. A. G. Perkin and J. A. Pilgrim find that three colouring matters exist in *Delphinium zalil*, which is much used in India for the production of a yellow colour on alum mordanted fabrics in the form of glucosides. The sparingly soluble colouring matter, $C_{16}H_{12}O_7$, forms glistening yellow needles, soluble in alkalies with a yellow colour. Fused with alkali it yielded phloroglucinol and protocatechuic acid, and by means of hydriodic acid it yielded quercetin with the evolution of 1 mol. of methylic iodide. By methylation it was converted into quercetintetramethyl ether, and by acetylation into a tetracetyl derivative of the formula $C_{16}H_8O_7(C_2H_3O)_4$, colourless needles, m. p. 195°-196°. It was evidently isorhamnetin, a quercetinmonomethyl ether, recently isolated from the yellow wallflower, *Cheiranthus cheiri*. By oxidation in alkaline solution it yields vanillic acid, and with alumina as mordant it dyes a purer yellow than quercetin. The chief constituent of the more soluble portion was recognised to be identical with quercetin, the colouring matter of quercitron bark. The residual colouring matthr, present only in small quantity, was not obtained in a pure condition. It resembled quercetin in percentage composition, and in its decomposition products, but differed from it in not reacting with alcoholic potassium acetate, and the melting point of its acetyl derivative. "Asbarg," as the dried flowers and flowering stems of *D. zalil* are called, resembles quercitron bark in dyeing property, but has only 35 per cent. the tinctorial power of that dyestuff. When freed from the flowering stalks, the material contains 3·47 per cent. of the colouring matter (not as glucoside).—*Proc. Chem. Soc.*, 190, 55.

Rhubarb and its Adulterants. L. E. Sayre has made a careful study of U.S.P. official rhubarb (*Rheum officinale* and *R. palmatum*), and compared it with *R. rhaponticum* and *Rumex hymenosepalus*. Thin sections of the first showed that the lighter coloured ground tissue was composed of thin-walled parenchyma, while the dark and contorted areas were principally fibro-vascular tissue, which was sometimes in regularly arranged spots having a radiate structure. In *R. rhaponticum* the parenchyma was also thin-walled, but there was a distinct and plainly-marked radiate structure, unbroken by such an arrangement of vascular tissue as described above. Starch grains, calcium oxalate crystals, and massed acicular crystals of chrysophanic acid were prominent in both specimens. Sections of canaigre root were totally different from those of rhubarb. Thin-walled parenchyma occupied the whole extent of the sections, being marked off into two areas by a concentric cambium line, and the central area occupied about two-thirds the diameter of the sections. About a dozen groups of vessels radiated from the centre to the cambium. When powdered, the two rhubarbs could not be distinguished, and the starch of canaigre was the only diagnostic feature that could be relied upon to differentiate that root in the state of powder—an ineffectual test at best. The grains are described as being long and slender in form, and exhibiting a long, branching hilum, which extends throughout the major portion of the long diameter. But while official rhubarb powder turns a dark, brick-red colour with ammonium hydrate, the powder of *R. rhaponticum* exhibits a distinctly salmon-red shade, whilst canaigre gives a brownish colour. This test, however, also fails in dealing with mixed powders.—*Am. Journ. Pharm.*, lxx., 129.

Pharmacology of Aconite. Dr. J. T. Cash and W. R. Dunstan find that the extraordinary toxic power of aconitine is mainly dependent on the presence of the acetyl radical in the molecule, whilst the specific action of benzaconine depends on the existence in its molecule of the benzoyl radical. Aconine, which contains neither the acetyl nor benzoyl group, is very inert, but both that alkaloid and benzaconine—the latter in less degree—are said to act as antidotes to aconitine. It is stated by the authors that neither the composition nor constitution of aconitine can yet be regarded as settled.—*Proc. Royal Soc.*, lxii., 338.

Characters of Senna Leaves. R. H. Denniston finds that there are more hairs on both the upper and lower surfaces of Alexandrian senna leaves than on those of Indian senna. The average distance the hairs are apart was found to be three epidermal cells in the first case and six in the other. Moreover, the hairs are somewhat straighter in Alexandrian senna than Indian, and the epidermal cells around the hairs are fewer on the whole in the former. The shape of the stomata was not found to be characteristic, nor the number and size of the companion cells, but the

epidermal cells were found to be somewhat smaller on the average in Alexandrian senna.—*Pharm. Rev.*, xvi., 105.

Decomposition of Chloroform. J. J. Waddelow describes how the vapour of pure chloroform was decomposed in the presence of artificial light during an operation. The room in which the operation was being performed was small, not ventilated, warmed by an oil stove, and illuminated by an oil lamp and a candle. Some of the chloroform was accidentally spilt, and almost immediately a most pungent disagreeable smell was noticed, whilst the whole respiratory tract was affected. Violent attacks of coughing seized the operator and his assistants, and it was five days before the irritative effect passed away in one case. The room was pervaded by a strong odour of chlorine the morning after the operation.—*Lancet*, 3889, 749.

Strychnine Hydride. The reduction product obtained by the action of metallic sodium on a boiling alcoholic solution of strychnine is shown by Dreser to be strychnine hydride, which exerts a physiological action markedly different from that of strychnine, and greatly resembles that of morphine. On frogs it acts as a narcotic paralysant, similar to but more powerful than morphine, and does not give rise to tetanic convulsions. Although its narcotic action is very marked and is capable of neutralising the tetanic action of strychnine, it cannot be employed as an antidote for that alkaloid, since it rapidly produces paralysis of the respiratory system.—*Chem. Zeit.*, xxi., 803.

A New False Ipecacuanha. M. Georges Dethan has described in the *Journ. de Pharm. de Anvers*, two roots which he has found mixed with ipecacuanha, one of which he has identified as that of *Polygala violacea*, St. Hil. The lower part of the root bears a considerable resemblance to that of undulated ipecacuanha (*Richardsonia bransiliensis*), whilst the upper pieces are striated like those of *Psychotria emetica*. The *P. violacea* has a creeping root of a deep brown colour rather thicker than a goose quill, and 10 to 20 Cm. long, becoming thinner towards the extremity. It is coarsely striated, and the fracture is whitish and starchy. The root branches, which are numerous, have a yellowish colour, are more or less twisted and smooth and have an amylaceous fracture, the bark is frequently cracked transversely so as to expose the central cylinder. The roots differ, however, from those of *Richardsonia* in being dichotomously branched. The stem of *Psychotria* is dark brown and smooth, and nearly as large as the root, but that of *Polygala violacea* is paler, yellowish, and rugose, and is more slender than the root. The cork is composed of four to eight layers of elongated cells, filled with a brownish colouring matter. The cortical parenchyma consists of large elongated cells, becoming shorter and more rounded towards the centre of the root. These cells are filled with densely crowded starch grains of a more or less spherical form. The woody cylinder exhibits numerous vessels, generally isolated, but rarely in groups of two or three, and scarcely varying in size. The centre of the root is occupied by a group of the vessels. The medullary rays consist of a single series of cells. The thickness of the bark generally equals that of the wood. There are no raphides present in the root, although macles or cluster crystals are present in the stem, both in the cortical parenchyma and in the pith, diminishing in numbers as it approaches the root. The leaves when present have a plano-convex midrib and are seen to be furnished with unicellular hairs, with a swollen base immersed in the epidermis and filled with a yellowish resinous matter. The stem has two or three rows of pericyclic fibres surrounding the central cylinder in a nearly continuous ring, which, however, ultimately splits up into isolated groups. The absence of raphides distinguishes it from *Psychotria*, *Richardsonia* and ipecacuanha; the vessels also from the last, and the colour of the roots from the first two.

Microscopical Examination of Viscous Urines. G. Michel employs the following method for albuminous viscous urines in order to separate the organised deposit for microscopical examination. 50 C.c. of the urine are shaken several times with 20 C.c. of ether in a cylinder of 100 C.c. capacity, and the mixture set aside for some time. The ethereal layer will then contain all the organised elements. It is drawn off with a pipette and exposed on watch glasses; after the evaporation of the ether the residue is removed with a finely-pointed brush on to slides for microscopical examination.—*Chem. Zeit.*, xxi., 316, and *Pharm. Post*, xxx., 607.

Double Staining Wood Sections. H. Pfeiffer recommends the following process for double staining ligneous sections. The sections are hardened in alcohol and then immersed for thirty to fifty minutes in a concentrated aqueous solution of equal parts of naphthylamine-yellow and hæmalum. They are then washed in water for a short time to remove excess of colouring matter, and placed on the slide, which is heated on a small flame, until the preparation begins to curl up at the edges. The preparation is then mounted in Canada balsam. With this treatment the woody portions assume a yellow colour, while the young parenchyma and the nuclei of the cells appear violet.—*Pharm. Centralh.*, 857.

Mercuric Oxide Ointment. The following method is recommended by Dr. Schweissinger as the only reliable manner of procuring a really finely divided ointment. The prescribed quantity of yellow oxide of mercury is calculated into mercuric chloride, which salt is dissolved in water and precipitated with an equal volume of sodium hydroxide. It is washed carefully on a filter and drained until the precipitate is almost dry. This is then mixed intimately with the fatty basis. The weight of the moisture is, of course, deducted from the fatty substance, so that an ointment of exact strength may be prepared. The author suggests that ung. hydrarg. ammon., ung. zinci, and ointments with other moist precipitates, might advantageously be prepared in this way, care being taken to remove as much of the water as possible.—*Zeit. allg. oest. Apoth. Ver.*, lii., 6, and *Pharm. Centralh.*, 50.

Sugar from Larix Occidentalis A kind of manna from British Columbia, produced by the *Larix occidentalis*, has been examined by Professor Trimble, who finds that it is not identical with the melezitose of *Larix europæa*, but that it reduces Fehling's solution.—*Amer. Journ. Pharm.*, p. 152.

Heat of Electric Glow-Lamps. The carbon filaments of incandescent electric lamps offer great resistance to the passage of electric currents, and as a result heat and light are produced, the latter corresponding to but 5 or 6 per cent., at most, of the energy manifested. The heat produced is so great that immersion in a 16-candle power lamp, at 100 volts pressure, in half a pint of water will cause the water to boil in an hour. If the lamp be buried in cotton-wool, that soon begins to scorch and ultimately bursts into flame. Incandescent lamps appear, therefore, liable to start serious fires when inflammable goods are placed too close to them, and as regards articles made of celluloid, it is noteworthy that a 16-candle power lamp has been found to fire that material in less than five minutes.—*Lancet*, 3889, 737.

Sterilisation of Water. Dr. Repin sterilises a cubic metre of water in the following manner at a cost of about one penny, in an apparatus consisting of a series of flasks through which the water flows. Several metal tubes, through which air ozonised by an electrical discharge is introduced into the water, are passed through the necks of the flasks. The ozonised air coming into contact with impure water destroys all organic matter present, killing the most virulent bacteria, and thus changing, in a few minutes, the most polluted fluid into clear and safe drinking water. Another less elaborate process is the following :—One litre of water is coloured reddish with potassium permanganate, and the permanganate in excess removed by filtering through charcoal. An ordinary flower-pot, the hole of which is stopped with wadding, and which contains a few pieces of charcoal, will serve as a filter.—*Pharm. Zeit.*, xlii., 674, after *Ztsche. f. ges. Külteind.*

Australian Perfumes. Although the Australian colonies are rich in plants yielding delicious perfumes and valuable essential oils, little or nothing has been done, it is stated, to utilise the advantages thus afforded. Systematic flower farming is still in its experimental stages, and there exists an almost untouched field of great extent for those possessing the necessary capital and experience in the manufacture of perfumery and essential oils. In New South Wales the garden flowers of Europe and Asia, especially those emitting the richest fragrance, are found growing in unsurpassed luxuriance, many being obtainable nearly all the year round, whilst they are easily reared. Among the native perfume-yielding plants which remain unutilised are several varieties of acacia, including a few which furnish scented wood. The *Acacia farnesiana* grows plentifully in many parts of New South Wales; and another species of acacia, familiarly known as the "Golden Wattle," is equally useful as a perfume plant; as is also the native laurel, or mock orange. Among the plants from which sweet-scented and other oils may be obtained are the native sassafras, peppermint, bloodwood, blue gum, mountain ash, white gum, ironbark, woolly butt, spotted gum, tallow-wood, mcssmate, red gum, poplar, box, ridge myrtle, tea-tree, native peppermint, dogwood, and turmeric. The trees known by the various names are, of course, not always identical with those with which we usually associate the names in this country.—*Colonies and India*, Feb. 26, 13.

Uses of Australian Oils. With regard to the economic aspect of the Australian oil question, it is found that the essential oil of the red gum is a reliable remedy for chronic dysentery and diarrhœa, that of the Moreton Bay ash makes an excellent furniture polish, and the oil obtained from the native sassafras, which resembles in odour ordinary sassafras oil, with an admixture of caraway oil, is used for medicinal purposes. Eucalyptus oil, of course, possesses many valuable qualities, and the leaves of the various kinds of eucalyptus are found useful in preventing or removing scale in boilers. The oil of the "Mountain Ash," a common species of eucalyptus, is said to dissolve gutta percha readily, and to be capable of use, like kerosene, for lamps, having a greater illuminating power, a pleasant odour, and absence of liability to explosion. The oil obtained from the "Stringy Bark" has been found to be more efficacious in many complaints than the English peppermint, and the oil of the "White Gum" has been suggested as a soap perfume. The "Woolly Butt" oil indelibly stains paper; the oil of the "Grey Gum" posscsses a citronella odour and makes an excellent soap perfume; whilst several varieties of the "Tea Tree" furnish an oil said to possess most, if not all, of the properties of cajuput. Practically, the number of native shrubs and trees in New South Wales capable of being utilised in the manufacture of perfumes and essential oils is without limit. The olive, castor plant, and linseed also grow luxuriantly in the Colony, and are easily cultivated.—*Colonies and India*, Feb. 26, 13.

Photo-Micrography with High Powers. J. E. Barnard and T. A. B. Carver explain how they have overcome the difficulty experienced in photo-micrography with high powers and critical illumination, owing to the unequal intensity of the light emitted from the surface of incandescent limes, or the impossibility of controlling the electric arc so as to maintain a constant position and condition of the crater on the positive carbon. The latter difficulty has now been overcome by having a simple form of hand-feed apparatus, with a pin-hole camera attached, through which an image of the carbon points is projected on to a ground-glass screen. With such a form of arc-lamp absolute "centration" of the light can be secured and maintained, without reference to the microscope, after the necessary position of the image of the arc on the screen of the pin-hole camera has been once obtained.—*Nature*, lvii., 448.

Alinit. This is the name applied to a new manure said to be suitable for all kinds of grain. It is described as a creamy yellow powder, containing 2·5 per cent. of nitrogenous constituents, and its action is attributed to a bacillus—*Ellenbachensis alpha*—of which the spores exist in the powder.—*Nature*, lvii., 418.

New British Plant. A new British sedge, *Carex chordorhiza*, is described and illustrated by the Rev. E. S. Marshall, M.A., in the March number of the *Journal of Botany*. The inflorescence consists of a single ovate, or when in fruit, triangular spike, the upper flowers of which are male. The stigmas are two, the glumes light yellowish-brown, somewhat darker in the centre, with a hyaline border, and the fruit is a pale-yellow dotted oblong lanceolate nut, with a slender beak nearly equalling its length, and projecting a little beyond the obtusely bifid beak of the perianth. The rhizome is about the thickness of coarse twine, and is stoloniferous and sulcate. The leaves are about 1 to 1½ lines broad. The plant grows in very wet peat bogs associated with *C. limosa*, and was found by Messrs. Shoolbred and Marshall in the north of Scotland. On the Continent it occurs as far south as Francc, Bavaria, and the Tyrol.

Agar Agar Ointment Basis. Gallois recommends the employment of agar agar jelly for the application of various drugs to the skin. Thus a sublimate jelly composed of agar agar, 1 gramme; water, 100 grammes; corrosive sublimate, 10 centigrammes; tartaric acid, 10 centigrammes, may be taken as a typical formula. Small portions of this rubbed on the affected area quickly dry, giving a closely adherent film, which has been found to be very effective in the treatment of erysipelas. It possesses the great advantage over gelatin, that in drying on the skin, it does not contract. A jelly of zinc oxide for the treatment of eczema may be prepared from water, 200; agar agar, 2; zinc oxide, 20.—*Bull. Gén. de Thérap.*, cxxxv., 223.

Cultivation of the Camphor Tree. A bulletin describing the camphor tree, its uses, conditions of successful cultivation, a map showing the area of the United States where it might be grown, together with some information as to the commercial outlook for camphor, has been issued by the Division of Botany of the United States Department of Agriculture.

PHOTO-MICROGRAPHY.

BY EDMUND J. SPITTA, L.R.C.P. LOND., M.R.C.S. ENG., F.R.A.S.

Owing to the more complete knowledge of the subject gained by the experience of years, and perhaps in a measure to the advent of the perfected dry plate, photography is being rapidly pressed into use to an extent hitherto little dreamed of. In point of fact it may be said to have started in times past as an interesting amusement, but has now become an absolutely scientific and commercial necessity. Indeed, if we look around, what I have said can be easily seen to be true, for there is scarcely any science now-a-days that does not in some way seek its aid. Astronomers, for example, need no longer chart the stars of the heavens as hitherto, by a laborious fashion of eye observation, taking them years and years to finish even an incomplete survey of a portion of the celestial vault, for they can now do in one evening by photography far more than would have been effected by days, or even weeks, of assiduous labour when employing the older method to which reference has been made.

The meteorologist, too, can now record photographically the oscillations of his mecurial column, whether it be of the barometer or thermometer, with the most rigid accuracy, and instruments of this nature are in daily use in all well-appointed observatories. Then, too, of later years the younger, but growing, science of seismometry has taken photography into its confidence, and made it record the tremors of the earth in a fashion that could not have been previously accomplished, except by having a continuous series of ever-watching observers.

But it is not in the sciences only that the action of light on the photographic plate is taken advantage of, for we know that in art, painters not unfrequently take a general view of their subject by photography before, brush in hand, they start their picture; and indeed there are those who find by this method they get an exactitude of detail which is almost beyond their reach by any other method.

Then again, with respect to commercial use, it requires little observation to have noted the number of papers which are illustrated by some form of photography, that is to say, by employing either the collotype or block process, both of which it is well known owe their existence to its use.

But it is of quite recent years that book illustrations of the highest order have been made by this method. Fine hand drawings of objects as seen in the microscope, for example, used to be all in demand, but now photo-micrography has stepped in their place, and pictures are produced with an accuracy hitherto unknown. They leave, too—which is a great advantage—no doubt in the reader's mind as to the accuracy of the final result, for even the most captious critic is unable to state his belief that some of the details have been produced by the imagination of the artist, or by an exaggerated conception of an over-enthusiastic draughtsman.

But the extreme excellency now obtainable by photo-micrography, however, owes much of its increase in accuracy to the introduction of the apochromatic series of lenses constructed by the patience and talent of Dr. Abbe, and the microscopic world owe him a great debt of gratitude.

But, like almost any art or science which reaches to a high degree of perfection, photo-micrography cannot be learnt in a moment, for it requires both knowledge, patience, and skill to carry it out successfully. It is for this object that these articles are about to be written, so as to lay before the reader all the information that it is in the power of the writer to give, after many years of familiarity with the subject. It is hoped, then, it will be distinctly understood that what is to be said is meant to be of real practical service, enabling those interested in the subject to obtain results at once scientific, reliable and accurate. Those who expect to find in these pages information as to the cheapest home-made apparatus capable of producing second-rate results, must, I fear, be content to experience nothing but disappointment.

For convenience of description we may divide our subject into three heads:—

Low Power Work treating with magnitudes from about 1½ to 10 diamcters.

Moderately High Power Photo-Micrography, which deals from 10 diameters to about 700 or 800; and

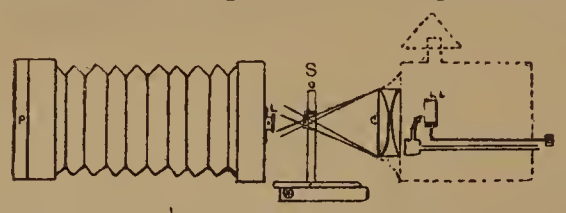
Critical Work, which, commencing where moderately high power work has ended, reaches to above 2000 diameters.

It would seem as if there existed in this arrangement a very unequal division of the subject, especially that low power work should not extend beyond ten diameters; but it must be at once stated that up to this limit photo-micrography is quite a different matter, and indeed requires in point of fact an entirely different form of apparatus. I should, however, recommend those commencing, to begin from the very commencement, inasmuch as the difficulties presented become greater and greater as the initial magnification increases.

Low Power Work of from 1½ to about 10 Diameters.

It may surprise the reader to hear that with low power work the microscope is entirely dispensed with, because the narrowness of the tube so curtails the field of view that the resulting picture is practically of no service. To get over this difficulty resort is made to the ordinary photographic camera, which, for my purpose, should be a quarter-plate one, having an extension of from 12 to 13 inches. I know, in stating this, that many photo-micrographers still prefer a camera of larger size, but I must confess I have never been able to satisfy myself that the gain in use of a larger instrument has ever been commensurate with the increase of cost, both initially and to maintain, for it is self-evident every half-plate costs nearly double that of a quarter-plate.

The arrangement of the apparatus in its entirety is shown in the figure, which in a measure explains itself. Speaking in the first



place quite generally, the camera is supposed to be placed on a rigid support, and the lens is shown fixed in the front of it. The object is placed at S, where it is supported in a manner to be further described, whilst the illuminant I prefer is a limelight enclosed in a box provided with a large condenser, shown at C. The light from the limelight jet, which should be a "mixed one" falls first upon a piece of ground glass which is interposed between the source of light and the condenser.

The box itself enclosing the light may be 16 inches long, 13 inches wide, and 15 inches high. These dimensions, although large, I have found most convenient, inasmuch as there is no fear of the wood becoming injured by the direct heat of the limelight. A suitable chimney to allow the escape of the fumes is shown rising from the summit. The arrangement for turning the lime is also drawn in the diagram, but as this is usually supplied with the best form of jets we need only refer to it.

The actual jet which I have mostly used was made by Mr. Beard, and after an experience of several years, I cannot

too strongly express my satisfaction with its performance. It is at once reasonably cheap, well made, gives an excellent light, is easy to work, not prone to snap, and, moreover, is supplied with a "cut off," which although turning the light nearly ut when temporarily out of use, never quite extinguishes it. I always obtain the best hard limes, and in preference those that are truly "turned." No mention is made of using either a Welsbach gas burner or any other illuminant, for there is no substantial alteration of the arrangement required, save that if a paraffin lamp be employed, one must be chosen with a very shallow cistern, as the wick must be in the axis of the condenser. Neither do I pause to mention the accessories of the limelight, viz., the compressed gas-bottles with their regulators and gauges, as I think it unnecessary.

Between the light and the condenser, as before stated, we usually interpose a piece of ground glass, which causes a general diffusion of light, thus rendering the entire field of the photograph equally illuminated. It is not absolutely necessary that the ground glass should be interposed between the condenser and the light, for there are those who prefer placing it between the two lenses which compose the actual condenser itself. In most condensers this is easily done, but in some the space between the component lenses is so small that it will not admit anything, even the thinnest of ground glass. If placed in this position, too, there is a danger which I feel I ought to point out, namely, that the ground glass may very possibly shake and thereby scratch the surface of one or other lens, and so imperil its perfect performance. If there is no room between the lenses of the condenser there is no option but to put the ground glass where I first mentioned, as it is not a satisfactory plan to place it between the condenser and the object, for if so placed, a curiously granulated effect is ofttimes produced in the final picture, which utterly spoils it.

The compound condenser should be at least 8 in. in diameter, even when using a quarter plate. Its focus is of no material importance, but should not be too short, for if so, the close approximation of the lime which then becomes necessary, may threaten the safety of the back lens, a matter of importance in these large condensers, seeing that they are expensive.

It must not be omitted to state that it has been proposed, and used by many, that an additional protective glass plate should be interposed between the condenser and the limelight, but I have found this to be unnecessary, especially when using the ground glass in that situation, for that in itself affords a protection to the posterior lens, and the less the amount of glass interposed between the light and the object the stronger will be the resulting illumination.

One more point of practical importance must not be overlooked, and that is, the photographer should carefully examine the condenser before using it to see that the lenses are quite loose in their cells, for if they are in the least measure tight when cold the expansion which takes place on their becoming heated will surely cause one or both of them to crack.

Having explained the position and details of the light, its box, and the condenser, we will pass on to consider the support (marked S in the diagram) for the object we propose to photograph. Let this be, for example, a moderately-sized spider, and that we want to enlarge it to fill a lantern slide. These are procurable laid out on an ordinary microscopical slip 3 by 1 inches. It is placed upon the support S (which, it is seen in the diagram, is merely an upright piece of wood with a hole in it), being held there in position by two ordinary clips, such as are used in the microscope. They consist of two pieces of spring, each being mounted on a brass pin. The support is seen to be fixed at right angles to another piece of wood, which is nothing more than the base board of a camera, capable of being racked to and fro by the milled head shown beneath. As will be seen hereafter, this is for the means of final focussing.

We next come to a difficult part of our subject, namely, the selection of a lens. It has been already stated that the microscope affords too limited a field of view for our requirements, a remark which also applies to the use of microscopical objectives. It is easy to understand this, for the field of view for which that class of objective is corrected is naturally small, being only intended to be used with the microscope. The consequence of this is that if a microscopical objective be placed on the camera at L in the diagram, the centre of the field, it is true, will be seen on the ground glass at P, well and clearly defined, but the portion surrounding the centre and extending to the edges will be fuzzy and useless; in other words, the spider's body will be shown sharp and clear, whereas the legs and feet are fuzzy and ill-defined. An ordinary photographic lens is the next thing that suggests itself, but here we are met with a two-fold difficulty: First, suppose, for instance, we were to use a 4 or 5 inch rapid rectilinear, we should require so very great an extension of camera that it would be impossible to reach the focussing screw of the support S without the assistance of a "long arm" such as is used with an astronomical telescope. It is not advisable to make the apparatus more cumbersome than is necessary, and so the only escape from the difficulty is to have a lens of shorter focus.

I must point out here, as perhaps the most suitable place, that the accurate and final focussing should always be done by moving the object rather than by moving the ground glass, as is usual when taking an ordinary photograph. The reason is not far to seek, but to explain it intelligibly we must for a moment enter into the optical aspect of the situation; it is worth a moment's consideration, as it explains the second difficulty connected with using ordinary photographic lenses for photo-micrography.

When photographing in the ordinary manner—say, for instance, taking a view of a landscape—the rays from distant objects impinge on the lens, usually in more or less parallel bundles, and the ground glass is placed at the short conjugate focus, the lens being constructed by the optician with that idea in view. But in making an enlargement with a photographic lens the conditions are exactly the reverse, for then the short conjugate focus is between the lens and the object, and the long one between the lens and the ground glass screen. It will be seen, therefore, that the lens is constructed for one purpose and used for another, hence it is not difficult to understand the absence of critical perfection in the resulting image. It has been suggested, to get over this difficulty, that the lens should, when used for photo-micrography, be turned the opposite way, and this improves the resulting definition with almost any lens excepting a rapid rectilinear, but with this type I have never been able to find any pronounced improvement by so doing, and, indeed, on considering its optical construction I should never suppose that it would.

Another class of lens has been suggested for photo-micrography, and I have often used it where the object is large and the required magnification is small. I refer to a diminutive portrait lens of about 3-inch focus built on the Petzval principle. When it is used in the reversed manner of which I have just spoken, it certainly has given very good results; still, however, if the magnification required was over 1½ to 2 diameters, it was only with difficulty we found ourselves able to reach the milled head to focus with.

Messrs. Dallmeyer, however, have constructed a small rectili-

near about 1¾ inch in focus, which in my hands, with magnitudes over 1½ to 2 diameters, has produced most admirable results, and were it only constructed to work equally well in red, green, and violet rays I should have no fault to find with it, more espccially as it is not at all expensive. But the finest type of lens with which I am acquainted has been recently introduced by the firm of Zeiss, and has been constructed from calculations by Dr. Rudolph for the especial purpose of photo-micrography. It works equally well in all colours of the spectrum, gives a most exquisite definition up to the margin of the plate, and is manufactured in several focal lengths to suit the requirements of different sized objects. The smallest has a focus of 35 Mm., works at F/4·5, and leaves little to be desired, with the exception that its lenses are so closely in contact as to forbid the introduction of any diaphragms whatever, which at times is a great inconvenience. The 75 Mm. is provided with an iris diaphragm, and with it I have been enabled to do anything that I desired, but it is a subject for regret that the firm does not see its way to sell the lenses at lower prices.

The camera, as before stated, that I have found most convenient is a "quarter plate" having an extension of about 12 or 13 inches; but, in addition, I have had made an auxiliary front which drops on where the lens usually fits into the camera, by which expedient we are enabled to increase the camera another 6 or 8 inches, a distance not too great even yet to prevent us focussing at S if the short focus Planar or Dallmeyer lens be used.

Having thus described the apparatus—intelligibly, I hope—only one thing remains before taking the photograph, that is to select a suitably sensitised plate. I have tried most of the brands in the market, but owing to the fact that so few are isochromatic, the selection practically rests with three or four makers. The object of using isochromatic plates will be explained hereafter, and I believe that, as far as isochromatism is concerned, the Cadett plate is the most perfect, but it is very slow, which is a great objection to its use. Not that the exposure need be very long with this class of photo-micrography, but we must never lose sight of the fact that the rays emanating from the limelight being focussed on the object, will very readily make it melt, and therefore it is obvious, within prescribed limits, the quicker the plate the more safety to the specimen. It is quite true that a water-bath can be interposed between the condenser and the object, but it is very inconvenient to use with this lower power work, for the water quickly begins to generate bubbles of steam, which, should they adhere to the sides of the trough, will cause all manner of markings in the resulting picture. I have rarely had the accident happen of melting a slide, although I admit that at times they have become very warm, but I feel certain that if a prolonged exposure had been added to the time necessarily occupied in focussing the object, it is highly probable such an accident would have occurred more frequently.

Lumière's plates are much prized by some photographers, but I must confess that I have little fault to find with the medium isochromatic plates manufactured by Edwards. I have found them most uniform in grain and similar in sensitiveness, easy to develop, and very free from fog, both when using hydrokinone or pyro. I know that others are strong advocates of the Ilford isochromatic plate, but must admit that although they are cheaper I have never felt any inclination to substitute them for the brand I have previously mentioned. In conclusion, whilst making these comments, it should be distinctly understood that many of my friends have different experiences, and I think it only fair to say so.

Every plate must be "backed," and I have no reason to find any fault with the "backing" solution sold in tubes under the name of "Forrester's Effective Backing." It must be dabbed on the glass with a pad and not smeared, as smearing leaves streaks which frequently show in the final picture. The reason of that is this:—When a plate is not "backed" at all, the direct rays impinging upon the film, passing through the emulsion, are reflected off the back of the glass again into the film at definite angles, which depend upon the thickness of the glass and its refractive index. When a plate is "backed," however, these are absorbed by the "backing," and if that is unequally distributed some of them escape, whilst others are absorbed. This would in some cases not so much matter, but as "backing" always sensibly increases the exposure, so if the "backing" be well distributed over one part of the plate and not on another, the bad results referred to are really due to differing exposures on one plate, which are readily manifested when the negative is developed.

Being now prepared to take our photograph we will go practically through the prccess from beginning to end. The mixed limelight being ready, the camera is set in position, the object being placed upside down on the support S. The rays of the limelight are made to converge in such a manner that their point of union is on the lens side of the support. In my experience this is imperative to obtain a good image. They are shown in the diagram crossing both before and behind the specimen. This is readily done by pushing the limelight to and fro, that is to say, nearer or further from the condenser, the tray of the jet being provided with a groove to enable such movement to be done with ease and regularity.

We next look at the ground glass of the camera, which is placed at P (the lens being, of course, screwed in its place at L), and adjust the specimen until it is central. Drawing the head back some 10 or 12 inches will enable the whole field of view to be better scrutinised than it would be if the head were placed nearer. If it is seen that one side is brighter than the other, either the lime jet itself must be pushed a trifle from side to side on the supporting pin provided with the apparatus, or, what is better, the whole limelight box with its condenser should be bodily shifted from side to side. If the light be unequal at the top or the bottom the lime must be raised or lowered as occasion requires. The greatest care should be exercised in getting the illumination equal, and it requires some amount of practice to be able to do it. It repays the trouble, however, for it is exceedingly provoking after taking what might be otherwise a good photograph, to find that a portion of it is not so bright as the rest. There is another reason, too, why the light should be carefully centred, for even in this low power work perfect definition certainly depends in a measure upon it.

Assuming then we have got over this trouble, we now examine our specimen upon the support S, seeing that it is firmly clamped by the spring clips already mentioned. We then push the extended camera quite close to the object—say when using the 75 Mm. lens to about an inch off it. It will be now necessary to push the bellows to and fro till we get the image on the screen. If such image be too large or too small it is very obvious the camera must be removed further off or brought nearer to the object, the bellows being readjusted to obtain the rough focus on the ground glass screen. Some little practice is required in this matter because the exact length of camera and the exact distance of the lens from the object are the factors for producing a definite amount of enlargement. It may be necessary with small objects, when we want 10 diameters magnification, to add the lengthening piece of the camera to which I have already referred; in that case the lens

may have to be pushed up almost in contact with the object When the image is clearly seen and roughly focussed by moving the ground glass it should always be measured, so as to enable the photographer to see whether the magnification is such as he desires. This should never be omitted, for it is often of great service at some future date to be able to refer to the number of diameters an object has been magnified; but besides this, it introduces an element of accuracy which, if the photo-micrographer does not already possess, he must rapidly learn as soon as possible. When taking negatives for the purpose of obtaining lantern slides, this careful measurement is of great importance, for as the size of the ordinary lantern plate is only about 3 inches square, it is very obvious, if the picture be elongated the entire length of the quarter plate, which is 4 inches, a portion of it can never be introduced in the lantern slide at all. To prevent this accident occurring I have found it a good plan to mark upon the ground glass with a pencil two distinct lines, which show the limit of the lantern slide.

The measuring being complete and the amount of magnification noted, focussing is now carefully made by moving the object itself by means of the milled head at S with a faint touch to and fro, and not by moving the screen; for I always have found this to be an unsatisfactory method, only capable of explanation by a study of the optical nature of the image in this situation, which would be unsuitable to an article of this nature.

We now proceed to substitute for the ground glass the photographic plate (carefully backed) in its slide, and having "turned the lime," in case it takes to flaring at the moment of exposure, which would jeopardise the safety of our ground glass, we set the desired diaphragm and place the cap on the lens Sometimes this simple procedure is difficult owing to the fact that the lens is not more than two thicknesses of its cap from the object. When this so happens I have found a black card passed between the lens and the object, resting on the foot of the apparatus just above the screw shown in the diagram, will quite sufficiently cut off the light from the inside of the camera. Having drawn the slide it is well to wait for a few seconds to allow the "shake" in the whole apparatus to settle down.

Exposure will, of course, vary according to the diaphragm employed in the lens. F/16 to F/32 are about the limits which I have used. At the former aperture I have nearly always found the range of exposure is 2 to 5 seconds if the object be an uncoloured one, but much more if it be coloured. The developing formula always employed consists of the following:—

Solution I.

Hydroquinone	160 grains	or	8 Gm.
Potassium Bromide	40 ,,	,,	2 Gm.
Citric Acid	60 ,,	,,	3 Gm.
Water to	20 ozs.	,,	440 C.c.

Solution II.

Sodium Hydroxide	160 grains	or	8 Gm.
Water to	20 ozs.	,,	440 C.c.

Solution III.

Potassium Bromide ..... 1 in 3 of water.

To develop two quarter plates at one time in a half-plate dish, take 6 fluid drachms of Solutions I. and II. and 6 drops of Solution III., filling up to 16 fluid drachms with water.

I have no fault to find with its action, provided that a little extra bromide, about a grain to the ounce of developer, be added during development, which quantity should be renewed once whilst density is being obtained. It has been repeatedly found that this produces a very clear high light in the negative. No special remarks need be made concerning fixing and washing, save that in running water three-quarters of an hour is amply sufficient to eradicate the faintest traces of the hypo with the plates in question.

As regards drying the final negative, I have had so much trouble caused by inequalities in the film, produced by irergularities in the drying, that some time ago I gave much attention to the subject, and seeing that now hardly any trouble in that direction arises, I venture to simply state how it may be avoided.

The negative is placed glass side downwards on a cloth and a fine handkerchief is gently and neatly laid over the gelatine side. It is smoothly and firmly pressed with the hand for two or three seconds, which allows the fabric of the handkerchief to absorb all the superficial moisture. On raising the handkerchief it will be found that the gelatine shows distinct marks of the fabric. This is not of the slightest consequence, for it absolutely and entirely dries out of all existence.

The back must now be carefully wiped, for I found one source of trouble arose entirely from drops of water accumulating there, thus causing an unequal distribution of temperature in the whole plate. A ring of slightly melted gelatine will often be the result, which it is needless to say spoils the picture. This is especially the case when the negative is dried on a hot water tank.

Having superficially dried the plate in this manner, all that is necessary is to separate it from others at least by an inch, for if this be not done what is left of the moisture in the gelatine film of one plate will condense on the back of the other, and this condensation in due course will collect into drops, producing the same effect as if the back of the negative had not been wiped.

Before leaving the subject of low power work I must not omit to describe how to photograph the culture tubes used by bacteriologists, but to that I must refer in another article.

SELECTED FORMULÆ.

Spermaceti Ice.

Olive oil, 1500; spermaceti, 260; lemon oil, 35; bitter orange oil, 15; neroli, 3; otto, 3.—*Pharm. Zeit.*, xlii., 515, after *Seifenfabricant.*

Antiseptic Mouth Wash.

Cresol, 2 grammes; saccharin, 1 gramme; oil of peppermint, 10 drops; aromatic tincture, 25 grammes; tincture of krameria, 50 grammes. Fifteen to twenty drops to be used in a glass of water.—*Odontologie* [2], v., 404.

Depilatory Solution.

Alcohol, 120; collodion, 350; iodine, 7·5; oil of turpentine, 15; castor oil, 20. To be applied in thick layers to the affected parts; when the collodion is removed, the hairs adhere to its surface, and are removed with it.—*Pharm. Zeit.*, xlii., 167.

Powder for Chronic Constipation.

Ewald recommends Pulv. rad. rhei, 4; sod. sulph. ex sicc., 2; sod. bicarbonat., 1. M.d.s.—Up to a teaspoonful according to necessity, to be dissolved in a large tumbler of warm water.—*Pharm. Zeitg.*, xlii., 354.

Solution for Acute Catarrh.

Saenger recommends camphoræ, acid. tannici, aa 2·0; sacch. lactis, 4·0. M. f. plv. To be syringed into the nose.—*Pharm. Zeitg.*, xlii., 354.

New Tooth Powder.

No. 1: Menthol, 0·1; β-naphthol, 0·05; saccharin., 0·025; calc. carbon. ppt., 50·0; saponis, 0·5; ol. rosarum, *q.s.* No. 2: Myrrhæ, 1·0; sodii chloridi, 1·0; saponis, 0·5; calc. carbon. ppt., 50·0; ol. rosæ, *q.s.* Sodium chloride is said to be very efficient for improving the taste of the myrrh.—*Pharm. Ztg.*, xlii., 355.

PHARMACEUTICAL SOCIETY.

PRIZE EXAMINATION QUESTIONS (Session, 1897-98).

MATERIA MEDICA (Advanced Course).

Wednesday, March 23, from 10 to 1 and 2 to 5.

Professor Henry G. Greenish.

1. Prepare, examine, and describe transverse sections of the lamina and midrib of the leaf supplied. Give diagrammatic sketches of the structure and detailed sketches of such parts as may appear to possess diagnostic value. Leave sections mounted in glycerin for inspection.

2. Give a process for the preparation of aloin, stating the reason for each step in the process. What variety of aloes would you select? How would you ascertain the source of commercial aloin? Is it, in your opinion, desirable that the aloin used medicinally should be restricted to one variety or not, and why?

3. Give a process for the assay of ergot. Discuss the desirability of introducing uch a process into the British Pharmacopœia.

4. Describe tbe commercial varieties of *two only* of the following *four* drugs. Point out the means by which each variety may be identified; describe the active constituents (or the composition in the case of benzoin) of each variety, and indicate its relative therapeutic value:—

(*a*) Aconite Root. | (*c*) Jaborandi.
(*b*) Benzoin. | (*d*) Ipecacuanha.

BOTANY (Advanced Course).*

Thursday, March 24, from 10 to 1.

Professor Reynolds Green.

1. Write a short sketch of the most natural system of classification of the Vascular Cryptogams, and briefly describe the chief characteristics of the principal groups, including both ancient and recent forms.

2. What is the *pericycle?* Give a general account of its structure in the axis of dicotyledonous plants; mention any modifications which arise in it during the process of secondary thickening, and explain their several purposes.

3. Give a short account of the peculiar features of the natural order Malvaceæ. Discuss its relationship to other natural orders. What are the chief medicinal plants belonging to Malvaceæ?

4. Give an account of the process of respiration, and discuss briefly its importance to a plant. How is the respiration of a tree related to the structure of the adult trunk?

5. Show in what ways plants respond to changes in their environment. Discuss what happens in the case of differences in intensity and direction of illumination.

PRACTICAL BOTANY (Advanced Course).

Thursday, March 24, from 2 to 5.

Professor Reynolds Green.

1. Prepare delicate sections of the two leaves provided, and mount them in glycerin, after staining them in the manner best adapted to display the different tissues of each.

Sketch them both, and in your sketch call attention to any fundamental differences between them.

To what groups of plants do they respectively belong?

2. Refer the flowers A, B, C, D to their natural orders, giving your reasons in each case. A description of the flowers is not required.

3. Identify and briefly describe the three microscopic specimens E, F, G.

PRACTICAL CHEMISTRY.

Professor Collie.

Friday, March 25, 10 to 1 and 2 to 5.

The salt given you contains two substances:—

1. Determine quantitatively either the constituent soluble in water or the constituent insoluble in water.

2. Determine quantitatively either the acid radicle present in the soluble portion or the basic radicle present in the insoluble portion.

(1) The sample of beer given you is supposed to be poisonous. Determine by analysis whether it is so or not.

(2) Analyse the salt contained in box A.

CHEMISTRY AND PHYSICS.

Professor Collie.

Saturday, March 26, 10 to 1.

Five Questions only to be attempted—two physical and three chemical.

1. If you were given some potassium nitrate, also some tartaric acid, sulphuric acid, benzene and iron filings, how would you proceed to manufacture (*a*) oxygen, (*b*), nitrogen, (*c*) potassium, from the potassium nitrate?

2. Describe fully the properties, reactions, and methods for preparing any two of the following substances:—Phenyl hydrazine, ethylic-aceto-acetate, glycocine, phenol pthaleine, glycerol, allyl alcohol.

3. Caustic potash is often used as a reagent in organic chemistry. State what are its chief uses; also its action on ethylic-aceto acetate, aldehyde, monochlorethane, dibromethylene, chlorobenzene, chloral.

4. How many lactic acids are there, and how may they be prepared? Give a brief account of the formulæ that have been suggested for the optically active forms of lactic acid.

5. Explain the action of a bi-convex lens in magnifying a small object. Show what effects will be produced by altering the distances of the eye, lens and object, from one another.

6. What reasons have we for supposing that light and radiant heat are only different types of the same phenomenon?

7. Describe experiments which show tbat a magnet and a conductor conveying a current mutually affect one another in accordance with certain laws.

* Four questions only to be attempted.

PARLIAMENTARY NOTES.

The Pharmacy Bill and its chances of success need not for a time occupy the mind of froid partisans or perfroid opponents, for its next appearance on the notice-paper is not due till Tuesday, April 19, when there will be a morning sitting for Government measures. This period of truce will afford Mr. Cross time for reflection as to the possible effect of persisting in his attitude of uncompromising obstruction. There is a very trite but particularly pertinent axiom deprecating the throwing of stones by those who live in glass houses, and we invite the honourable gentleman's attention to the same during the Easter recess. After all, obstruction is an accommodating game, which may be played by any number of persons, and it is possible that Mr. Cross may have overlooked the fact that a member having charge of Bills of his own is very much open to reprisals if he wilfully hinders the progress of other members' Bills. It must not be supposed that the Council and its officers will be idle during the interval between this and April 19; it is simply a case of *reculer pour mieux sauter*, and there is some ground for believing that now the obstacles are well defined, and their nature known, the final spring will clear them all.

The Petroleum Committee met on Friday, March 25, when Colonel Sir V. Majendie gave the first part of a report he had prepared on the conflicting evidence submitted to the Committee. His *résumé* dealt chiefly with the evidence respecting the flash point, and he pointed out that the Committee had not been greatly urged to raise the minimum flash point in relation to the storage or conveyance of petroleum, though in respect to oil for illuminating purposes more evidence in favour of raising the safe point had been adduced. Having regard to the fact that low-flashing oil was indispensable in a comparatively large number of industries, and that it had not been shown that oil of even high degrees of inflammability could not be burnt with perfect safety in properly constructed lamps, Sir V. Majendie deprecated any legislation tending to raise the present minimum until other remedial measures had been thoroughly investigated. This is significant, as there is good reason for assuming that this witness's report will practically form part of the Committee's majority report.

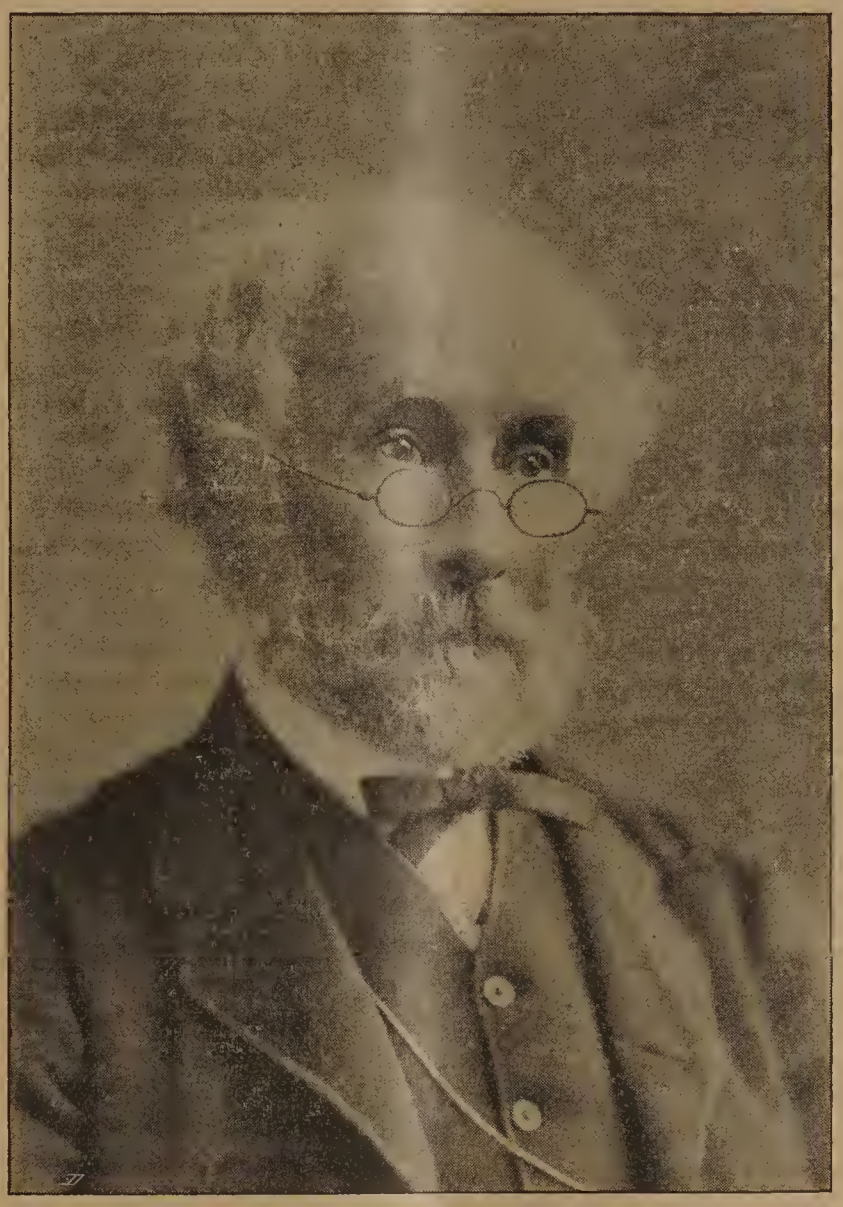
Sir John Lubbock has his hands pretty full just now. In addition to his Shop (Early Closing) Bill, which regularly appears on the paper every Wednesday, only to be as regularly deferred, he has now burdened himself with two brand new Bills, having for their object the amendment of the Companies Acts. Thus, there are now four Bills before Parliament dealing with incorporated abuses, viz., the official Bill of the House of Lords, which is undergoing interminable investigation at the hands of a select committee; the unprinted measure of Mr. Faithfull Begg; and the two proposals of the versatile Baronet. Sir John's object is to repeal Section 25 of the Companies Act, 1867, which deals with the issue of shares, and to remove doubts caused by recent decisions, whether shares honestly issued and taken up as fully or partly paid are, in fact, fully or partly paid in the manner intended. This little matter was before the Departmental Committee of the Board of Trade in 1895, and the report of that Committee recommended the repeal of the section above alluded to, and, in fact, the House of Lords Bill of the present Session embodies the same recommendation. But remedial legislation as to Companies is long, and Sir John Lubbock thinks it well to hasten it, if possible. He hopes to get a second reading on April 20. We hope so too, but are not sanguine.

Adulteration.—Major Rasch called attention to a recent prosecution under the Food and Drugs Act in which it transpired that 40 grains of boracic acid had been added to each gallon of milk in certain imported samples of milk. Mr. T. W. Russell for the President of the Local Government Board sheltered himself under the plea that no decision had yet been given in the case referred to, and that no statement was therefore possible. The gallant member will take the matter up again later on, and will have the assistance of Mr. Flynn and other members who are becoming impressed with the desirability of an alteration of the adulteration law.

BARNARD S. PROCTOR—AN APPRECIATION

NEVER a robust man and always a hard worker and a deep thinker, Mr. Proctor has yielded to the advice of friends and physicians and given up the active engagements of business life. His reputation in pharmacy is world wide, and his place in pharmaceutical history is assured, but for his comtemporaries, and especially for friends and neighbours, there is always the charm that comes from knowing a man who is original, yet tolerant, and whose kindness of heart is as patent as his greatness of mind.

Every one who knows him will wish for him a sunny eventide to his busy life, and vigour enough to give from time to time some literary embodiment of his thought on subjects past or present. He came of a pharmaceutical stock, his forefathers having conducted the business since 1768, when it was established by John Proctor, who came from Dundee to Tyneside. Mr. Proctor's grandfather, though engaging somewhat in the general business of chemist and druggist, was also an apothecary. In a most interesting address to students published in the *Pharmaceutical Journal* [3], vol. xxii., p. 319, Mr. Proctor expressed his indebtedness to his mother for his early training, and this was by far the best he ever had, for the schools to which he was sent were not of a character to equip a youth for the kind of work with which his life has been occupied. In his boyhood his delight was in scientific reading, thought, and experiment, and stories are told of him, as a seven-year-old student in physics, making observations on the effect of the length of a pendulum's cord as he swung his improvised apparatus down the staircase opening, the space in which more boisterous boys are wont to study the law of falling bodies, either human or promiscuous.



BARNARD S. PROCTOR.

As soon as he arrived at business he eagerly entered the avenues of study which radiate from pharmacy and never find a circumference. His associates in study were Mr. Joseph Wilson Swan—whose life researches were rewarded by the discovery of the incandescent electric lamp and others in dry plate photography, and the carbon process of photographic printing, each of these ramifying into many useful and lucrative finds, and gaining for him his F.R.S.—and Mr. John Pattinson, F.I.C., the eminent analyst of the north of England. Each pursuing his own course of study, this triumvirate frequently met to discuss their study and research, and so help each other forward.

In April 1853, shortly after attaining his majority, Mr. Proctor presented himself in London for the Minor examination. In those early days candidates who had declared an intention of so doing were allowed to present themselves for the Minor and then go on for the Major at the same meeting of examiners. Mr. Proctor's modesty had led him to offer himself for the Minor only. One of his examiners was the late Mr. Peter Squire. This keen judge of men soon found his examinee to be specially well up, and asked why he had not elected to take both examinations, and suggested to his colleagues that this should still be allowed. Mr. Proctor, having come up for the Minor, went away with the Major and an honorary certificate as well.

As a writer and an investigator few have contributed more than he has done, and the first paper we find published by him is in the volume of the *Pharmaceutical Journal* for 1862, on "Hyoscyamus." Senna, colocynth, rhubarb, bismuth, tannin, and perhaps more than any, opium, are among the drugs whose nature and whose preparations he has studied, and almost every volume of the Journal has since contained something emanating from his pen, and the result of most thorough and complete work. His literary style has a quaint humour about it, which is characteristic and, indeed, unique. Those who are not familiar with it will find a perusal of some papers distinctly interesting. His philosophic bent is shown in articles on weights and measures, read at the first Pharmaceutical Conferences, and his presidential address to the Newcastle section of the Society of Chemical Industry (*P. J.*, [3], vol. xiii., pages 484, 507, and 525), and in his addresses to students, at Bloomsbury Square, [3], vol. vii., page 303, and in the discussion of the phenomena of solution. His humour comes out in his "Unclean Spirits and the Natural Orders of Men," [2], vol. iv., p. 154, and in the much-questioned paper on "Pharmaceutical Remuneration in Relation to Pharmaceutical Progress" (*P. J.*, [3], xii., 219), offered to, and declined by the Conference at York. Of this paper hardly yet can full discussion take place, but the censors thereof must have possessed less sense of the humorous than modern Caledonians, and what was regarded as the most heretical of his opinions has often recently been preached by the reputedly orthodox.

His seats on the Board of Examiners and on the Council of the Pharmaceutical Society were each occupied for too short a time to permit of extended usefulness. But the weight of his influence has been felt in every movement of the Society, and that, too, through the entire country. But it is most amongst north country pharmacists that he is loved and his advice followed. The University of Durham College of Medicine in 1869 appointed him Lecturer on Pharmacy, and to that appointment we owe the

production of his well-known volume 'Lectures on Pharmacy,' which has done so much to add to his reputation and to the scientific practice of pharmacy among the middle-aged pharmacists of to-day. This work, which has passed through three editions, was, when produced, markedly ahead of the times, and has given an incentive and a model for many others in this and other lands. The lectureship was not a post which brought much financial gain, and the University of Durham authorities sought to show their appreciation by the bestowment of an honorary M.A. This was declined by Mr. Proctor, as he did not think an Arts degree suitable for himself, and as the University did not then confer degrees in science the matter dropped. Locally he has, in addition to the Chemical Society of Newcastle, identified himself with the Literary and Philosophical Society, whose splendid library has long been the envy of many larger cities; as a member of committee for many years he has done much service. He was also President of the local Incorporated Trade Protection Society. The executive of the British Pharmaceutical Conference has often pressed the acceptance of the presidency upon him, but he has felt himself unequal to the strain of its social functions.

Mr. Proctor married Miss Gray, a niece of Michael Faraday, and with just pride their sons, Mr. Charles Faraday Proctor and Mr. Harold Faraday Proctor, M.I.E.E., have been named after their illustrious relative. He is now about to take up his residence in the quiet little town of Bradford-on-Avon. Here, it may be hoped, that his love of Nature and of art may bring to him many pleasant hours, and the milder climate bring with it the capacity for enjoying his lovely surroundings.

REVIEWS AND NOTICES OF BOOKS.

Radiography and the "X" Rays in Practice and Theory, with constructional and manipulatory details. By S. R. Bottone. Pp. 176, with 47 illustrations. Price 3*s*. London: Whittaker and Co., 1898.

Nothing less practical than this excellent little book could have been expected from Mr. Bottone, who, it is almost needless to say, has very properly dealt with his subject from the point of view of an electrician. For if there is one thing certain about the X-rays more than another it would appear to be that they are electric waves. Lucidity and accuracy have been the objects aimed at in treating the subject, and most of the statements made have been verified by personal experiment, whilst where that was not possible the source of the statement or the name of the original experimenter has been given. Finally, considerable prominence has been given to constructional details and measurements, with the view of enabling students to make the apparatus described.

Beginning with effects rather than causes, the author first treats briefly of the action of light, electricity, etc., on certain salts of silver, thus leading up to an explanation of contact pictures. The effects of a partial vacuum on electrical discharges are then explained, and so we come to the details of the construction of Crookes' tubes, whilst the induction coil naturally comes in next for its share of attention, general instructions being given such as will enable anyone gifted with a fair amount of perseverance and a little mechanical skill to construct a coil suitable for X-ray work. The manner in which this is done is simply admirable.

And so the reader is gradually initiated into all the mysteries of the subject in an equally practical manner. The choice of the source of current, and of high vacuum tubes, the use of the Wimshurst and Holtz machines, and the preparation of fluorescent screens are all dealt with at length, whilst there are two especially valuable chapers at the end of the book, the first on general manipulatory details, and the other on theoretical considerations. Excellent illustrations and a comprehensive index conclude the handiest and most practical book on the subject that has yet been produced.

"Introduction to the Study of Organic Chemistry," by John Wade, B.Sc. (Lond.). Pp. xvi. + 460. Price 7*s*. 6*d*. London: Swan, Sonnenschein and Co., Ltd., Paternoster Square. 1897.

Modern investigations have rendered it possible to systematise to such an extent that organic chemistry becomes beautiful in its simplicity, and the student is now led from one group of compounds to another by such easy steps that it becomes possible in a comparatively short time to acquire a knowledge of fundamental principles sufficient to enable one to marshal the apparently inexhaustible number of carbon compounds into an array easy of comprehension. Mr. Wade has realised the importance of treating the subject at the commencement in an objective rather than a subjective manner, and commences with a number of well-known substances whose nature and properties are familiar to the beginner, using these to typify and explain the relationships and reactions of the chief groups of organic compounds. This removes the difficulty felt by students in realising the nature of a reaction when the explanation offered refers to some substance with which they are not familiar. The author, moreover, has extended this subjective treatment to such things as the determination of physical constants, stereoisomerism, hydrolysis, homology, molecular weights, etc. These are explained by reference to actual substances under discussion, as the necessity for dealing with them arises, in place of devoting a few preliminary chapters of a general character to their elucidation.

In an appendix divided into sections corresponding with the chapters in the body of the book the author gives brief details for the practical performance of experiments referred to. This includes a large number of reactions, and should be very useful, since the author states that they are based upon results obtained in dealing with students. The wisdom of thus separating the practical work from the subject-matter is, however, questionable since the student is more likely to perform the experiment if the practical details are given at the place where he is reading the facts and principles which the experiment is intended to inculcate.

A commendable feature of the book is the inclusion in brackets after the name of each important substance or general reaction of the name of the investigator to whom its discovery was due and the year of publication. Mr. Wade is very strong on the use of charts showing the genetic relationship of the members of the various groups of compounds. One of these is introduced at the end of each chapter, and provides a condensed bird's-eye view of the preceding matter, albeit, somewhat difficult of comprehension to the tyro.

The book is clearly written and the statements accurate. It is also nearly free from typographical errors, and may be recommended to pharmaceutical students who do not wish to confine their reading to the examination syllabus. Most of the synthetic remedies used to any extent in medicine are noticed and their preparation described. The chapter on the carbohydrates is well written though perhaps rather condensed, and the same remark applies perhaps with more force, from a pharmaceutical point of view, to the chapters on alkaloids. Seeing the large number of students of organic chemistry interested in medicine and pharmacy, we would suggest that there is ample room for a text-book dealing more in detail with such bodies as alkaloids, essential oils, etc., which, moreover, in many instances possess considerable commercial importance.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australasia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office: 5, SERLE STREET, W.C.

LONDON: SATURDAY, APRIL 2, 1898.

THE CHEMIST AND THE STATE.

For the past thirty years the principle has been legally upheld in Great Britain that the dispensing and distribution of poisons involves the necessity of a professional qualification, and as recently urged in these pages, the experience of that long tale of years has fully justified the application of the principle referred to. It appears necessary, however, at the present time to point out that this position was forced upon chemists and druggists and was never altogether sought by them. When the Pharmaceutical Society was established in 1841, by the leading chemists and druggists of that day, it was with the main object of introducing an efficient system of education and examination for future members of the body engaged in the practice of pharmacy. Eleven years later that object received partial approval by the Legislature, but neither education nor examination was rendered compulsory in the case of those who desired to enter the craft. Subsequently, as time wore on, public attention was especially directed to the danger arising from the free sale of poisons, and to provide against the incompetence of many who dispensed and sold poisons, a Bill was drafted in 1865 to extend the principle of professional qualification to all chemists and druggists. The framers of that Bill wished to avoid making it a Poison Bill, being impressed with the difficulties attending the satisfactory settlement of the questions involved in that part of the subject; but in so far as the Bill proposed to prevent any but examined men from keeping open shop for dispensing prescriptions, it aimed at restricting the dispensing of poisons by any but qualified persons, and would to some extent have restricted the sale of poisons. When, however, the Bill came under consideration in the House of Commons, it was supplemented by another promoted by the United Society of Chemists and Druggists, and eventually, the Select Committee to which the two Bills were referred finding considerable difficulty in making conflicting interests agree, legislation on pharmacy was incontinently blocked for that session of Parliament.

No further steps of importance were taken until 1868, when another Bill was drafted by the Council of the Pharmaceutical Society, and, to meet the tendency of public opinion, clauses relating to the sale of poisons found a place in it. But it was specifically provided that those clauses should not interfere with the business of duly qualified medical practitioners or veterinary surgeons, nor with the making or dealing in patent medicines, nor with the business of wholesale dealers, nor with the retailing of poisons for use in manufactures or photography. To put the matter briefly, the greatest care was taken by the Council to avoid any interference with professions or trades in the conduct of which the unfettered use of poisons might appear to be advisable. With slight modification of the exemption clause, the Bill was introduced in due course, but on the proposition of Mr. Lowe, the words exempting the retailing of poisons for use in manufactures or photography were struck out, and ultimately the Bill was passed as it now stands. That is to say, though the Pharmaceutical Society was willing to assent to a much greater measure of free trade in poisons than is now permitted, Parliament would have none of it. The Bill, as modified, became law, and a schedule of the substances most commonly used at that time for criminal or suicidal purposes became part of the Act of 1868. Power was reserved to the Council of the Pharmaceutical Society to recommend additions to that Schedule from time to time, but the exercise of that power has always been strictly supervised by the Privy Council, so that as a matter of fact that body may be regarded as the really responsible authority in deciding what shall or shall not be deemed to be a poison within the meaning of the Act.

It now becomes necessary to consider that the conditions prevailing in the arts, manufactures, and other departments of human activity are very different from those that existed in 1868. The increased use of toxic substances as disinfectants, in photography, and for other purposes, consequent on the enormous development of manufacturing industries could not be foreseen at that time, and though British laws are usually sufficiently elastic to meet the varying requirements of periods subsequent to the dates at which they are recorded on the Statute book, there has been a growing sense of dissatisfaction of late years at the alleged tendency of the provisions of the Pharmacy Act, 1868, to operate in restraint of trade. Some such feeling indeed has apparently influenced the Privy Council on the occasions when the consent of that authority to schedule carbolic acid, mineral acids, etc., has been withheld, and to meet the feeling so expressed, a Bill was actually drafted by the Pharmaceutical Council in 1883, which recognised that it might be desirable to have a "Schedule of Poisonous Articles," the free sale of which should be permitted, so long as each package was distinctly labelled with the name of the poisonous article contained therein, the word "poisonous," and the name and address of the seller. That Bill was not proceeded with, and the suggestion that a third part of the Poison Schedule might be desirable has since been allowed to lie dormant. Possibly, however, it may be revived in the Bill which the Privy Council is about to bring before Parliament, and in that event it will be necessary for chemists and druggists to reconsider their position in all seriousness. It may be that they will need to be prepared for certain sacrifices in the way of accepting increased restrictions of the practice of pharmacy. But however that may be, and whatever modification of the existing law may commend itself to the present Government, there should be no question as to the necessity of the dispensing and sale of poisons for medicinal purposes being restricted to a class of persons who have been specially educated and examined, to the end that the public may enjoy such security as a professional qualification can alone ensure.

ANNOTATIONS.

The Streatham, Balham, and Tooting Chemists' Association held a thoroughly representative meeting on Monday last, when the relations existing between medical men and chemists were discussed, as well as the questions of recommending and supplying secret proprietary remedies. Mr. John Ingham, of Upper Tooting, formally moved that it should be considered against the best interests of the medical profession and beneath the personal dignity of practitioners, either to recommend secret proprietary medicines or to give testimonials for them. Moreover, as no one is so ready to censure or condemn medical men for so doing, as the average chemist and druggist, Mr. Ingham urged that it logically follows that it is also against the best interests of pharmacy, and lowering to the self-respect of pharmacists, that they should lend themselves to the encouragement and extension of the trade in such articles by readiness to stock and sell practically all nostrums that are foisted on the public—even when many of them are self-condemned by their flagrant and impertinent advertisements, as arrant quackery. He suggested, therefore, that steps should be taken by the Association to try to reduce the evil, and in so doing attempt to bring about a better relationship between the pharmacists and medical men of the district, with regard to prescribing and dispensing generally.

But Mr. Ingham's Proposition found no seconder, though it was received with a good deal of interest and elicited much discussion. The general feeling expressed was that the pharmacist's best policy is to supply everything that the public demands of him, and, further, that it is quite Utopian to anticipate that any attempt to improve the present unsatisfactory relationship between so many medical men and pharmacists, would be productive of any beneficial result. It was alleged that, year by year, there is an increasing tendency on the part of prescribers to supply not only medicines to their patients, but also many sundries. Even Mr. Ingham, we understood, agreed with that statement, and though he was firmly of opinion that a better state of things might be brought about, his motion perforce fell to the ground for want of support. The position of the meeting appears to have been that though reform in the direction indicated is badly needed, it is absolutely useless to attempt to do anything in the matter, and a policy of hopeless inactivity must therefore be allowed to prevail. Whether that is because the chemists of the district are not prepared to yield anything on their side is not clear; all that is certain is that they neither see nor believe that there is any way out of the tangle in which they are involved.

Reverting to the Proposed Resolution, it is perfectly obvious that, whilst the meeting declined to accept it, the first part of it contains nothing incompatible with the views expressed during the discussion. It is not for the pharmacist to say definitely that a certain article shall not be sold, but he may do much to discourage the sale of undesirable articles by declining to stock them to any extent. And most certainly, if he be wise, he will never expose such things for sale, even though he does stock them. As for the rest, the relations existing between medical men and pharmacists will never be modified by passing resolutions at meetings. Whether or not the medical man shall cease to dispense is for him mainly a question of convenience. If his business requirements appear to necessitate the continuance of the practice of supplying patients with medicine as well as advice, the custom is not likely to die out so far as he is concerned, unless its persistence becomes a positive inconvenience. Let the pharmacist show him how he may avoid such inconvenience, by placing improved facilities in his way for prescribing without causing the patient to incur too great expenditure, and the medical practitioner will doubtless lose no time in taking advantage of the opportunity thus afforded him. But it must be a matter of give and take; the pharmacist cannot expect to receive everything and concede nothing.

Opposition to the Pharmacy Bill is not yet at an end, and it is regrettable to find that a member of the Pharmaceutical Society, who happens to be a pharmaceutical chemist, should have so far forgotten what was due to his position as not only to stir up external opposition to the Bill in a questionable manner, but also to congratulate himself upon having done so in the pages of a trade journal which, apparently, was ignorant of his claims to distinction in that respect, and, therefore, not prepared to advertise them. Let us be clearly understood in this matter. Fair and open opposition to the Bill on the part of existing members of the Society would be not only justifiable, but might, from certain points of view, be nothing but what was right. Such opposition was initiated at Manchester, but explanation of the actual position sufficed to avert that danger. In the other instance, however, opposition by an interested person who, by virtue of his seat in the House of Commons, is able to render his opposition effective, is claimed by a Scottish member of the Society to have been instigated by himself. As a pharmaceutical chemist, he objected to the proposal to admit chemists and druggists as members of the Society, but instead of openly expressing that objection, according to his own account, he approached the Member for Camlachie and induced him to oppose the Bill on what, so far as the real objector was concerned, are nothing but side issues. The transaction is not a creditable one, and, if it actually took place, ought to be talked about as little as possible by the person chiefly concerned.

Mr. Chaplin is to receive a deputation at the offices of the Local Government Board on Monday next, April 4, in connection with the proposed amendment of the Sale of Food and Drugs Acts. It is not stated in the daily Press, where this fact is announced, what class or classes of the community will be represented by this deputation, nor is it clear what good can be effected by this method of procedure, but presumably a certain amount of formalities of this and kindred character will be essential before anything is done to reform the adulteration laws.

Milk Made in France is the latest subject of criticism by the ultra-patriotic Press, a new danger to British industry having been discovered through the medium of a consular report on the trade and agriculture of Cherbourg and district. For not only is Norman milk competing with the British product, but, according to this account, it is competing unfairly. Thus, it is stated that a French dairyman near Lyons had for some time been "experimenting in antiseptics for the sterilisation of milk." This statement is somewhat mixed, but its meaning is fairly clear. To proceed, we are told that, ultimately, the dairyman's labours were rewarded by the discovery of a new and very effective though harmless antiseptic—a non-poisonous, wild herb common to the country. It was noticed that the milk of cows which had eaten of this herb did not acidify as rapidly as other milk, and the dairyman accordingly proceeded to experiment "with the antiseptic plant, in the form of a highly-condensed tincture." Needless to say,

the results were extraordinary. "One drop of the tincture added to one quart of milk stopped all fermentation for over six days," whilst excellent butter was made from the cream that subsequently rose, and kept better than any other.

The Saddest Part of the Tale, and one which reveals a marvellous lack of enterprise on the part of mere Britishers, is that when the discoverer of this valuable secret (*sic*) came to London, in the hope of selling his idea, no one would take it up. Perhaps, however, the reason may not be far to seek if, as unkindly suggested, the wonderful antiseptic tincture prepared from a non-poisonous, wild herb is nothing more nor less than a solution of formic aldehyde. But, in that case, it would hardly appear worth while to take shares in the company about to be formed in London to work the business of the Cherbourg firm which did purchase the secret. The Consular Report, from which we glean the above particulars, gravely proceeds to give full details regarding all that it is proposed the new company shall do, and we are warned that Normandy milk treated, of course, with the wonderful antiseptic tincture, may be expected shortly to drive away British milk from London and the provincial towns. If the presence of the marvellous antiseptic be objected to in England, as it probably would be, by the public authorities, the new firm is prepared to rush the market with milk sterilised *à la* Pasteur. On one essential point, and one only, the Report is silent; that is the question who is going to drink the Pasteurised milk. But on this point, probably, the imagination of H.M. Consul at Cherbourg, or that of his informant, failed him. Anyhow, it is interesting to find such pretty romances within the covers of Blue Books.

The Photographic Supplement, which should be inserted in every copy of this week's Journal, speaks for itself, but we cannot refrain from pointing out what an important factor the photographic trade has become in the business of the chemist and druggist. Congratulations have poured in on all sides, in response to our announcement that the Photographic Supplement would appear this week, many of the writers of letters received explaining what an importance the photographic branch of their business has assumed, whilst numerous others who are interested in the art as amateurs express their sense of satisfaction that special arrangements are being made to meet their requirements. So far as can be judged, the novel experiment is a great success, and hopes may therefore be entertained of a repetition at some not far distant date.

Photo-Micrography is a subject that is assuming such importance at the present day, and it suggests itself as such a suitable outlet for the pharmacist's surplus energy, that it has been thought desirable to arrange for a series of illustrated articles showing the most recent advances in the subject. The author of the articles—Edmund J. Spitta, L.R.C.P., M.R.C.S.—is a recognised authority on photo-micrography, and he has produced some most excellent results, many of which we hope to be able to reproduce. In order to present the illustrations in the most satisfactory manner possible, the blocks have been printed in the form of a separate plate, and that will be found inserted in the Photographic Supplement published this week.

The Proctor Testimonial was formally presented on Wednesday last, and though Mr. Proctor was not present to receive it, the proceedings appear to have passed off most satisfactorily. The distinguished recipient of the good-wishes of so many of his fellow craftsmen is, we are glad to state, somewhat better, though not yet able to be out of doors. All our readers will join with us in wishing that he may soon be restored to perfect health.

SIMPLE METRIC CONVERSION TABLES.*

The following abbreviated tables will be found to contain all the equivalents that are usually required for photographic purposes:

Conversion of Grains and Ounces to Grammes, and of Grains per Fluid Ounce to Grammes per 100 Millilitres.

	Grains to Grammes (Gm.)	Ounces to Grammes. (Gm.)	Grains to the Ounce = Grammes to 100 Ml. or C.c.
1	0·06479	28·350	0·228
2	0·12958	56·699	0·456
3	0·19437	85·049	0·684
4	0·25916	113·398	0 912
5	0·32395	141·748	0·140
6	0·38874	170·097	1·368
7	0·45353	198·447	1·597
8	0·51832	226·796	1·825
9	0·58311	255·146	2·053

Explanation of Table.—The first column represents the number of grains or ounces, as the case may be. Thus: 4 grains = 0·25916 Gm., and 4 ounces = 113·398 Gm. The fourth column shows how many grammes to 100 millimetres (Ml.) or cubic centimetres (C.c.) are equivalent to a given number of grains to 1 fluid ounce, thus: 4 grains to 1 fl. oz. = 0·912 Gm. to 100 Ml. or C.c.

Conversion of Minims, Drachms, and Fluid Ounces to Millilitres (Ml.) or Cubic Centimetres (C.c.), and Conversion of Pints to Litres.

	Minims to Ml. or C.c.	Drachms to Ml. or C.c.	Ounces to Ml. or C.c.	Pints to Litres.
1	0·05916	3·552	28·412	0·568
2	0·11832	7·103	56·825	1·136
3	0·17748	10·655	85·237	1·705
4	0·23664	14·206	113·649	2·273
5	0·29580	17·758	142·065	2·841
6	0·35496	21·309	170·474	3·409
7	0·41412	24·860	198·886	3·977
8	0·47328	28·412	227·298	4·545
9	0·53244	31·964	255·711	5·111

Explanation of Table.—The first column represents the number of minims, drachms, fluid ounces, or pints. Thus: 4 minims = 0·23664 Ml. or C.c.; 4 drachms = 14·206 Ml. or C.c.; 4 fl. oz. = 113·649 Ml. or C.c.; and 4 pts. = 2·273 litres.

Conversion of Inches to Micra and Millimetres, of Feet to Centimetres, and of Yards to Metres.

	Inches to Micra (μ)	Inches to Millimetres (Mm).	Feet to Centimetres (Cm.).	Yards to Metres (M.)
1	25399 9	25 4	30·5	0·9
2	50799 9	50·8	60·9	1·8
3	76199·9	76·2	91 4	2·7
4	101599·9	101·6	121·9	3·6
5	126999 9	127·0	152·4	4·6
6	152399·9	152·4	182·9	5·5
7	177799·9	177·8	213·4	6·4
8	203199·8	203·2	243 8	7·3
9	228599·8	228·6	274·3	8·2

Explanation of Table.—The first column represents the number of inches, feet, or yards as the case may be. Thus: 4 in. = 101599 9μ or 101·6 Mm., 4 ft. = 121·9 Cm., 4 yds. = 3·6 M.

Simple Conversion Rule.—When it is desired to convert a formula stated in terms of grains and fluid ounces, into terms of grammes and millilitres or cubic centimetres, regard the grains as grammes and represent each fluid ounce as 440 millilitres (cubic centimetres); the product obtained will then be approximately fifteen and a half times that of the original formula. Or, as the number of grains in the ounce, or of fluid-grains in the fluid ounce, is practically identical with the number of grammes or millilitres (cubic centimetres) resulting when we multiply by 15·432 the number of grains or fluid-grains in a gramme or millilitre (cubic centimetre) respectively, a formula stated in terms of grains and fluid-grains may be expressed in terms of grammes and millilitres, without any calculation being required.

* For more extended tables see the *Pharmaceutical Journal* for February 26, and March 5 and 12. Those tables, with additions, will shortly be re-published in sheet form, for use in the laboratory or dispensary (see advertisement).

Pharmaceutical Transactions.

MIDLAND PHARMACEUTICAL ASSOCIATION.

A meeting of the Midland Pharmaceutical Association was held at Mason University College, Birmingham, on March 24, when Professor Percy Frankland, Ph.D., B.Sc., F.R.S., read a long and interesting paper on

The Bacterial Purification of Water.

In the course of his remarks Professor Frankland said that as a constant reader of the *Pharmaceutical Journal* he had often been impressed with the very wide range of subjects which appeared to be enclosed by the horizon of the pharmacist; in fact, he thought it would be difficult to find any other periodical devoted to the interests of a single profession in which such a great variety of topics were reviewed and discussed. He believed he was right, therefore, in drawing the conclusion that the modern pharmacist in an age of unprecedented specialisation had succeeded in retaining that catholicity of interests which in the past had led to so many brilliant men of science being recruited from the world of pharmacy. Bearing that circumstance in mind, he felt that in addressing a pharmaceutical audience he need offer no apology for having selected a subject which was in some respects very foreign to the interests of the Association of which they were members. About thirteen years ago the chemical examination of water, which had reached its present state of development already more than a decade previously, was supplemented by the introduction of new methods, the virtue of which consisted in their power to reveal the invisible living particles present in all ordinary waters, and to actually estimate the number and ascertain the nature of such living particles, micro-organisms, or bacteria as they commonly called them. Like most other reforms, the new or bacteriological examination of water was at first viewed with much suspicion and disfavour; indeed, it had required many years of hard fighting on the part of its first champions to secure for it that position and respect which it now enjoyed as one of the most valuable weapons of precision at their disposal for combating the subtle germs of water-borne disease. But so great had been the progress in every department of bacteriology during the last twelve years that those who would at the outset have gladly crushed that new science had been obliged to lay aside their attitude of scornful derision, whilst not a few had actually been drawn as zealous converts into its irresistible vortex. A glance at the table of the multiplication of bacteria from one in 0 hours to 280,000,000,000,000 in forty-eight hours conveyed some idea of the fabulous powers of reproduction and rapid multiplication with which some bacteria were endowed. The form and appearance of those minute living particles, which it was the province of bacteriology to study and expose, could only be ascertained by means of the most powerful microscopes. As viewed on the diagram he showed, in their isolated condition, those bacteria looked harmless and insignificant enough, but they presented a far more menacing appearance when seen engaged in their nefarious work, attacking in their millions the vital tissues of their victims, in which they elaborated those poisons which caused disease and death. Of the many bacteria associated with disease they were only that evening concerned with two—the spirullum of Asiatic cholera and the bacillus of typhoid fever, for those were the diseases which had been conclusively proved to be capable of being distributed by drinking water. How the specific bacteria of those two diseases gained access to water was sufficiently obvious when they bore in mind that the drainage from human habitations in which those diseases happened to be prevalent might contain them, and that therefore, all waters exposed to sewage contamination must *primâ facie* be regarded as suspicious. They might conveniently divide the purification processes into two great classes: (1) natural processes; (2) artificial. One of the most striking and remarkable examples of water undergoing natural purification was to be found in the visible improvement which took place in a river during its flow. Now that they recognised in the presence of certain bacteria the great danger connected with water pollution it was obviously of the greatest importance to ascertain how bacterial life was affected by the self-purification of river water. Some years ago he studied the question on the River Dee, in Scotland. The investigation he conducted showed the number of micro-organisms in the water he took at seven different points to vary between 88 and 3780, and was particularly interesting, as the amount of polluting material gaining access at the several points was so small in comparison with the great volume of the stream itself that it was found impossible by chemical analysis to detect any material alteration in the composition of the water of the river, even immediately below each of those sources of contamination. By means of the bacteriological examination, however, each source of pollution was found to have produced an unmistakable although transitory effect on the water of the stream. If they inquired into the mechanism by which that most remarkable disappearance of bacteria in running water was effected, they found that a number of factors must be taken into consideration, and that whilst those factors did not necessarily all come into play at one and the same time, or in every water course, yet, according to present knowledge, they must be held responsible for the bacterial improvement which such running waters underwent during their natural flow. One of the factors to which, perhaps on account of its novelty, great prominence had recently been given in that connection was the remarkable destructive effect which the sun's rays had been found to exert on bacterial life. After referring to the investigations of Downes and Blunt, Momont, Dr. Palermo, and Dr. Geisler, the Professor proceeded to say those present were primarily concerned with the removal of bacteria from water, and the question naturally arose whether that bactericidal action of the solar rays took place when bacteria were immersed in water exposed to sunshine. In that connection he recited the results of experiments he made on anthrax in water for the Royal Society Water Research Committee ('Proceedings Royal Society,' p. 53, 1893). Experiments had also been made to ascertain the precise depth in water at which any bactericidal effect was still exerted by the solar rays. Thus, whilst a photographic plate was still found to be affected by the sun at a depth of 553 feet beneath the surface of the Lake of Geneva, all bactericidal effect was found to disappear at a depth of even ten feet below the surface of clear lake water, whilst with turbid water the range of solar rays was much more limited. Whilst due credit must be given to insolation for what it could actually accomplish, it was obvious that its powers were restricted within comparatively narrow limits, especially in a climate like that of England, in which it frequently happened that for days together, and even weeks at a time, no sunshine was recorded at all. One of the most important natural processes of water purification came into play when water was allowed to remain at comparative rest in the large basins of lakes, or in the still and deep reaches of rivers. Not only did waters under those circumstances become comparatively clear and bright by the subsidence of mechanically suspended particles, but if the storage be sufficiently prolonged, a very considerable reduction in the amount of dissolved organic matter might also take place. That purification of water by sedimentation was largely taken advantage of in the practice of water-engineering; for not only were a number of large communities, like those of Glasgow, Manchester, and Liverpool, supplied with water from lakes, natural or artificial, of great size, but smaller reservoirs were frequently constructed in which more or less turbid waters were permitted to deposit the greater part of their suspended particles before being supplied to the consumer. The question naturally arose as to whether the subsidence of suspended matter was confined to those grosser particles visible to the eye, and giving rise to the appearance of turbidity, or whether the minutest living particles or bacteria shared in that gravitation process also. The answer to that question was furnished by the results of some experiments which he made at the London Waterworks a number of years ago. Samples were collected of the Thames water coming directly from Hampton; secondly, after having passed through one storage reservoir only, and, thirdly, after having passed through two storage reservoirs, and the number of bacteria obtained from 1 C.c. of water were respectively: (1) 1437; (2) 318; (3) 177. Another series of similar experiments was carried out at the Stoke Newington works of the New River Company. At those works the water of the River Lea, mixed with a certain proportion of well-water, was brought along an artificial cutting and was made to pass through two large reservoirs before going on to the filter beds. The number of bacteria obtained from 1 C.c. of water were: (1) cutting above reservoir, 677; (2) outlet of first reservoir, 560; (3) outlet of second reservoir, 183. He had obtained similar results in studying the process of sedimentation in natural lakes. The value of that purification by subsidence was being daily more appreciated, and it should, if possible, be almost invariably resorted to as a prelimi-

nary to other methods of purification. After dealing with the question of temperature he said that by far the most perfect, and on the whole most important, of the natural processes concerned in the bacterial purification of water was filtration through porous strata. The great efficiency of that process was perhaps best illustrated by a bacteriological examination of the water obtained by pumping from deep wells sunk into porous strata like the chalk and new red sandstone formations. Such an examination generally revealed the fact that in those waters bacterial life was almost wholly absent. In the chalk wells of the Kent Water Company he had on many occasions found less than ten microbes in one cubic centimetre. Turning to bacterial purification of water by artificial processes, he said it might be interesting to inquire as to how the bacteria might vary at different depths of one and the same water-basin. Perhaps the most instructive experiments in that direction were those of Karlinski, who examined the water of a lake in Herzegovina with the following results:—Number of bacteria in 1 C.c. at surface of lake, 4000; depth of 5 metres, 1000, 10 metres; 600, 12 to 16 metres, 200—300; bottom (on stirring up mud), 6000. The process of filtration through sand was the most important supplementary purification to which water could be subjected on the large scale. Suitably contrived experiments had demonstrated the factors on which the efficiency of sand filtration depended. The Professor gave many results of experiments bearing on the point, and said that the selection of the finest sand, consistent with obtaining the necessary daily volume of water by means of the available filtering area, was a matter which deserved the most careful attention of waterworks engineers. The influence of frost on the bacterial efficiency of sand filtration had shown a marked increase in the number of bacteria present in the water. Clark's process of purification by treatment with lime was described, and pathogenic and non-pathogenic bacteria in water were next dealt with. Following the results of investigations as to the comparative vitality of typhoid bacillus in Thames, Loch Katrine, and deep well water, the Professor said they clearly showed that typhoid bacilli gaining access to naturally pure water, and especially subterreanean water, would be far more likely to do mischief than if they found their way into naturally impure water exposed to surface influences. It was, moreover, a matter of experience that nearly all the well-defined outbreaks of typhoid had arisen through the contamination of well and spring waters, whilst it had more rarely been found possible to attach the blame of a widely-spread epidemic of typhoid to a contaminated river water. As practical illustration of the value attending the bacterial purification of water, he drew their attention to the great object lesson, one of the most striking in the annals of sanitary science, which was given at Hamburg in the case of the great cholera epidemic of some seven years ago. That, like the recent epidemic of typhoid at Maidstone, was surely sufficient to convince even the most apathetic that the dangers attending the use of contaminated drinking water were not the mere creation of the overwrought imaginations of scientific men and hygienic enthusiasts, but that they were very real dangers indeed, of which everyone should be cognisant, and which it was criminal negligence for public authorities having the health of communities committed to their charge to overlook. No less convincingly did those bitter experiences demonstrate the practical benefits to be derived by the adoption of those methods of bacterial purification the value of which had been ascertained in the laboratory and by patient research.—The interest in the paper was greatly heightened by a numerous series of diagrams illustrating the results of the experiments.

EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.

The ninth meeting of the twentieth session was held in the Pharmaceutical Society's House, 36, York Place, Edinburgh, on Friday, March 25, 1898, at 9.15 p.m., Mr. George Sinclair, President, in the chair. An address was given by Mr. Peter Boa on

Pharmaceutical Reading.

He entered a plea for more extended reading. He had observed a tendency for young men to read only within the barest limits necessary for passing the Minor. He had further observed a tendency after examination not to read at all in the sphere of pharmaceutical literature. That, he thought, was a great mistake. The art of pharmacy was very old, and in the old books were to be found the bases of our present-day procedure. The old books were of higher literary excellence than the modern ones, *e.g.*, 'Pharmacologia,' Pereira's, Neligan's, and Christison's 'Materia Medica.' In the old days one man produced only one book, and on it staked his reputation. Now it was number rather than quality that seemed to be the aim of authors. A run through some of the old books gave an insight into the origin and evolution of many of the formulæ at present in use. Old names, too, that were still in use among the people were learned, and this was useful for business purposes. In materia medica a broader grasp of the subject than was got by regard to the present Minor examination was desirable. As the subject was "got up" at present it was seldom really understood. Some regard to the meaning of specific names, for instance, affords information, and leads to enlightened apprehension of the subject. Fundamental knowledge was preferable to mere memorised information. A wider range of pharmaceutical reading would be found a source of both pleasure and profit, and a sure means of attaining greater professional success in the practice of pharmacy. —Mr. Hill replied to some queries regarding the sale of poisons.—An interesting discussion followed, and on the motion of the Chairman, a vote of thanks was awarded to Messrs. Boa and Hill, and the meeting closed.

GLASGOW AND WEST OF SCOTLAND PHARMACEUTICAL ASSOCIATION.

At the fortnightly meeting held on Tuesday evening, the 22nd curt., Mr. Thomas Dunlop read a

Note on the Dispensing of Antipyrine with Spt. Aeth. Nit.,

which was a criticism of a communication on the same subject by Professor Caspari, which appeared in a recent issue of the *Pharmaceutical Review* (see *P. J.*, *ante* p. 91). The prescription referred to contained as ingredients, antipyrine, spt. aeth. nit., liq. ammon. acet., aqua chlorof., etc. Mr. Dunlop said: The professor disproved the conclusion that aq. chlorof. prevents incompatibility, and then pointed out that if the spt. aeth. nit. be exactly neutralised with a bicarbonate the decomposition of the antipyrine is retarded "only for a time," whilst an alkaline solution does not develop the green colour "even after standing for several days." Guided by this observation he inferred that the correspondent who brought the matter forward "in all probability used a solution of ammonium acetate which was decidedly alkaline in his final experiment," and, acting on this assumption, Professor Caspari did so with satisfactory results. But he did not—as his paper shows—try the effect of a neutral solution of ammonium acetate, and to that extent his conclusion is fallacious. In proof of this I made three experiments. Fifteen grains of antipyrine were dissolved in three drachms of water. This was placed in three test tubes. To one I added 1 drachm of liq. amm. acet., containing 40 min. of spt. aeth. nit.; to another 5 grains of potassium acetate dissolved in 1 drachm of water and containing 40 min. spt. aeth. nit.; to the third, 5 grains of sodium acetate dissolved in 1 drachm of water and containing 40 min. of spt. aeth. nit. These are the relative proportions of antipyrine and spt. aeth. nit. in the prescription. The neutrality of the acetates was confirmed. The liq. amm. acet. gave an acid reaction on the addition of 1 drop of diluted acetic acid to 1 drachm of the liquor. In 48 hours there was a faint development of the green coloration in the tube to which the sodium acetate had been added, but now, at the end of a week, no change has taken place in the other two tubes, whilst the coloration in the sodium acetate tube has not increased since the third day, and is so insignificant that it can only be seen in daylight. Probably more of the acetate would make it inhibitory too. Years ago, before the days of antipyrine, I observed that acetates prevented the incompatible action of spt. aeth. nit. with iodides and bromides, and by inference I expected they would act similarly in the case of antipyrine, and in this I have not been mistaken. But to secure this result the acetate must be mixed with either of the incompatible substances. The acetates in these cases seem to act similarly to the sodium acetate in the old formula for making syr. ferri phosph. The mineral acid displaces the organic acid, which is without decomposing effect. To act on Professor Caspari's suggestion is, therefore, only necessary in the absence of an acetate. I have here the test solutions, and also, for comparison, one with antipyrine and spt. aeth. nit. only, which, since it was mixed, has produced a fine crop of tufted feathery crystals of isonitroso-antipyrine. —An interesting discussion followed.—Mr. David Watson (secretary) pointed out that there was no official formula for ung. bis-

muth. oleat. in any of the publications such as Squire's, and so there was great doubt in dispensing a prescription written in that fashion as to what a medical man actually meant, adding that he would like to see some official, or rather unofficial, formula for it. His custom was to dispense prescriptions containing 20 per cent. of oleate of bismuth when no definite quantity was mentioned, and after consultation with a number of medical men various opinions were expressed as to what was meant. Some maintained it meant pure oleate when dispensed with some other base, others that it meant 50 per cent., and others again did not refer to any definite quantity. He would like some definite ointment of oleate of bismuth to be prepared so that uniformity could be maintained.—Mr. Dunlop said he had always dispensed according to the original prescription of Professor McCall Anderson, which contained 10 per cent. In Glasgow that was the prescription that was meant as a rule by medical men, because they came through Professor McCall Anderson's classes.—The President said he had taken the opinion of the medical men on the matter. Some of them said 5 per cent., and others 20 per cent. It was unfortunate there was no official recognition of these oleates, and he was not sure whether they would be recognised in the new B.P. As a matter of fact, medical men did not know themselves the strength of the various preparations which they prescribed.—The President gave notice of a motion for the annual meeting to the effect that they hold their meetings monthly after this, stating as his reason for so doing that he believed it would result in a better attendance.—Mr. Currie also intimated his resignation.—The opposition of Mr. Alexander Cross, M.P., to the new Pharmacy Bill has not taken the members of the Association by surprise, as his firm, which carries on the business of seed merchants, chemical manufacturers, importers of guano, nitrate of soda, oil-cakes, etc., in Glasgow, was prosecuted a few years ago at the instance of the Pharmaceutical Society. The Glasgow deputation, which was in London last week in connection with the Bill, had previously waited upon Mr. Cross, and while they failed to remove his objection altogether, they succeeded, it seems, in getting him to modify his views in regard to the measure. The deputation had some reason to believe that Mr. Cross would not offer any serious opposition to the progress of the Bill.—Mr. Laing submitted the following prescription :—

℞ Quin. Bisulph. ..... ℥ss.
Ungt. Hydrarg. Oleat..... ℥ss.
Ungt. Zinci Oleat..... ℥ss.
M. ft. Ungt. Oleates to be neutral.

When prepared with white petroleum jelly a blue colour was developed in a comparatively short time; when prepared with yellow petroleum jelly this did not take place. Mr. Laing said he should like to know what caused this blue coloration.—Mr. Watson asked if the white jelly was free from sulphur.—Mr. Dunlop thought it might be due to some acid used in bleaching the white jelly.

NEWCASTLE-UPON-TYNE AND DISTRICT CHEMISTS' ASSOCIATION.

On Wednesday night, the first annual dinner of this Association was held in the Hotel Métropole in that city, and advantage was taken of the occasion to make a

Presentation to Mr. Barnard Simpson Proctor,

who has just recently retired from business as a chemist in Newcastle, with a handsome carved timepiece and a cheque subscribed by his chemist and druggist friends in the district. The interesting proceedings were presided over by Mr. T. Maltby Clague (President of the Association), who presented each of the guests with an excellent photograph of Mr. Proctor. The vice-chairs were occupied by Mr. A. E. Owen, Mr. C. Ridley, and Mr. J. D. Rose (Jarrow). There were also present Alderman John Harrison (Sunderland), Mr. T. Simpson (Newcastle), Councillor R. L. Dunford (Newcastle), Mr. T. Simpson (Newcastle), Mr. R. H. Bell (Sunderland), Dr. Horsfield (Newcastle), Mr. E. W. Penman (Jarrow), Mr. L. Williamson, Mr. J. L. Wilkinson, Mr. W. Kerse, Mr. F. Gilderdale, F.C.S., and Mr. J. Tinline (Newcastle), Mr. S. Richardson (Stockton-on-Tees), Mr. A. T. Maxwell, Mr. J. Scott-Dickson, Mr. J. J. Dakers, Mr. J. R. Jones, and Mr. J. Dakers (Newcastle), Mr. John Gibson, jun. (Hexham), Mr. Jas. Whittle (Morpeth), Mr. R. Wright (Newcastle), Mr. R. Cubey (Blaydon), Mr. W. Pescod and Mr. Geo. Duncan (Newcastle), Mr. R. Brand, Mr. E. Gibbon, and Mr. R. Moncrieff (Wallsend), Mr. P. Bell, Mr. J. Graham, Mr. F. R. Dudderidge, Mr. E. Dean, Mr. A. Napier, Mr. W. Atkins, and Mr. G. F. Merson, F.C.S., Secretary (Newcastle). Mr. Proctor was represented by Councillor R. L. Dunford.

Mr. A. E. Owen (Vice-President) gave the toast of

The Pharmaceutical Society,

and in doing so said he was glad to see a member of the Council present, namely, Alderman Harrison, of Sunderland. He was glad they still had good men to look after the interests of the trade.

Mr. Dudderidge responded to the toast, which was enthusiastically received. He admitted that the Society had made mistakes in the past, but if the Bill to which Mr. Owen had referred was passed through Parliament it would remedy, he believed, to a great extent, the errors of the past. There had been a great and a justifiable outcry on the part of a large and influential section of the trade that the Society had not been representative of the trade. The Bill at present before the House of Commons, which had unfortunately been blocked, would do a great deal to remove that ground of complaint. If the Bill passed they would all have a right to become members of the Society and to have a share in its Council. He trusted they would all embrace the opportunity and become members of the Society and that they would support it. Then, if further legislation was needed, and he thought most of them were agreed that it was, the Society could go to Parliament feeling that they had at their back the whole body of chemists and druggists in the country.

Mr. R. H. Bell (Secretary of the Sunderland Association) proposed

The Newcastle-on-Tyne and Kindred Associations.

He believed the present Bill would be shelved, but was sure that if chemists would only help themselves they would not need the help of anybody else, and he appealed to the members of the Association to back up their leaders.

Mr. Kerse, in responding, said he trusted the trade would become thoroughly united. He hoped that soon instead of their having between forty and fifty members in the local Association they would have over 100. With the number of retailers in Newcastle and district they ought to have a strong association. Together with Sunderland they ought to have an association which would have some weight with members of Parliament, and induce them to support the Bill before the House of Commons.

Mr. Merson (Secretary of the Newcastle Association) also replied. Speaking of the futile attempts which had been made during the past fifteen or twenty years to carry on associations of chemists in Newcastle, he was of opinion that they had hitherto gone on too scientific lines. He thought their monthly meetings might be more of a social character. Their aim was to get the members to know each other in a friendly way.

The Presentation.

Alderman John Harrison then made the presentation. He spoke with a deep sense of personal feeling because he had known Mr. Proctor for many years, and had been indebted to him for many acts of kindness. He had sought Mr. Proctor's advice on many occasions, and had always received it. The occasion was a painful one in this respect, that they felt that, as members of a great craft, they were parting, as it were, with one who had played a very conspicuous part in that craft for nearly half a century. Mr. Proctor passed his qualifying examination on April 19, 1853, or nearly forty-five years ago. Four years later he became a member of the Pharmaceutical Society, and remained a member of it to the present. In its early days he was two years a member of the Council of the Society. Alderman Harrison spoke of the difficulties involved in a journey from Newcastle to London in those days, and proceeded to say that Mr. Proctor found what some of them even found nowadays, that it was a serious drain upon their time and energy to attend the business of the Society in London. Mr. Proctor had also filled another important position in connection with the Society—a position of almost greater importance than that already referred to. He was for some years an examiner of that body, and in that capacity he no doubt made not a few enemies. He also made a very great number of friends. In that national sphere of work as a member of the Board of Examiners, and as a member of the Council, Mr. Proctor had fulfilled honourable, arduous, and responsible positions. He (Alderman Harrison) did not know that if they went through the pages of the *Pharmaceutical Journal* and the Conference 'Year-Book' they would find any other man had played a more important part in those two great works than Mr. Proctor. Advancing years seemed to have in no

way diminished his energies. Having pointed out that the two journals mentioned did not exhaust Mr. Proctor's contributions, Alderman Harrison went on to say that the two leading traits of Mr. Proctor's character were his high sense of duty, and his determination to excel. They saw his sense of duty very clearly marked in his career. He (Alderman Harrison) had turned up a *Pharmaceutical Journal* the other day in which there was reported an address delivered by Mr. Proctor in 1876, at the opening of the School of Pharmacy in London. In that address Mr. Proctor explained that, as a boy, he had no taste for chemistry. His tastes were rather in the direction of mechanics and physics, but he was induced to enter his father's trade. "I never ceased," he said, "to endeavour to make the best of the position to which I was bound by circumstances which had more weight with me than my personal inclinations." His sense of duty led him into his father's pharmacy and kept him there during his apprenticeship. After his apprenticeship was completed he went to Bloomsbury Square and afterwards came down to Newcastle. He realised his early aspirations. He became one of the leading pharmaceutists not only in England but throughout the whole of the world where English pharmacy was known. With regard to his determination to excel, Mr. Proctor, in an address to pharmaceutical students on October 4, 1876, said: "The first and most important thing was that I began my apprenticeship with the intention of making myself as well acquainted with my business as any man in Newcastle, and commenced from the first to pick up information wherever I had an opportunity." He (Alderman Harrison) believed Mr. Proctor fulfilled that particular function. Again, if they took the trouble to read the preface to his well-known work on pharmacy, they would find how he explained the way in which he became to be appointed lecturer upon pharmacy in this great city. He said: "I have retained throughout the feeling that I am by nature a student rather than a teacher, and the fact will be found to have left its mark upon my work." Attempts had been made to form associations in connection with the trade, but without success. That applied to Newcastle as well as other places, and at the time of the passing of the Pharmacy Act there was great alarm amongst some people as to whether the apprentices would be sufficiently well trained to pass the Minor examination. There were at that time efforts made in almost every large town of England, as well as of Scotland, to form local schools of pharmacy so that the young men might be taught the science of their business whilst remaining at home. Mr. Proctor was asked to take up the work, and he consented to do so. He said, "The post was one which I did not seek to obtain nor feel at liberty to decline. It was my duty to do what I could for the general good, and as the department of pharmacy had been allotted to me, it remained only for me to do my best to fill it to the satisfaction of the students who might hear me and to the credit of the College, which had been the first to institute a lectureship in pharmacy." There, again, they saw his strong determination to excel and to do his duty. And right nobly and well had he done his duty. His private character was perhaps better known to many present than to him (Ald. Harrison). Though an eminently scientific man and a man of very high attainments, he was a man of extraordinary modesty—a man whom anybody could approach. He was always ready to give advice and assistance. The time had come when Mr. Proctor must take leave of the active sphere of work in which he had been engaged, and it was a matter of deep regret that his health, even at his advanced age, had compelled such retirement. But if Mr. Proctor felt that his powers were no longer equal to the duties he was called upon to discharge, he had done the wisest and best thing. They hoped he might live many years in comfort, quietude, and peace. But they did not wish him to leave them without some tangible mark of their esteem, and some token of the deep obligations under which he had laid them all. They deplored his absence that night, but he had doubtless taken the right step.

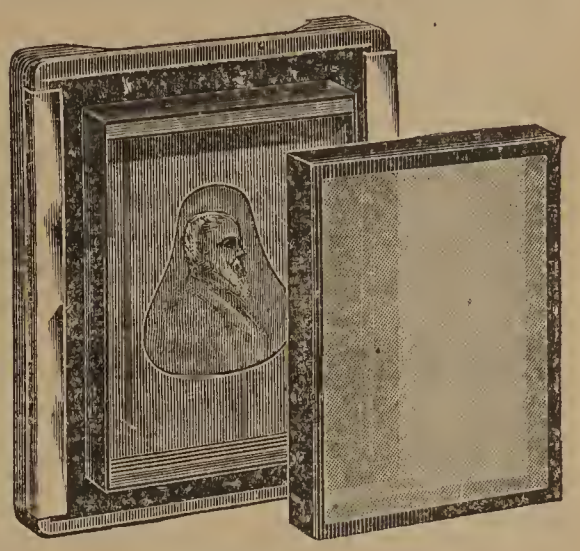
> "Husband out life's taper at the close,
> And save the flame from wasting by repose."

—Mr. Thos. Simpson supplemented Alderman Harrison's remarks, and Councillor Dunford, in acknowledging the gifts for Mr. Proctor, said he could not find words to thank those present. Mr. Proctor had retired, after a long and arduous life—a life not devoted to self-seeking, but to self-sacrifice. He was always desirous that the knowledge he possessed himself should be given to others, and was ever eager to benefit those in the same trade as himself. His works had been of immense service to other writers. Nothing could have pleased him more than to find that the work he had done had been appreciated. He (Mr. Dunford) would have great pleasure in conveying to Mr. Proctor the good wishes to which expression had been given that evening.

NOVEL APPLIANCES.

AN ADJUSTABLE VIGNETTER.

The Patent Vignetter, constructed by Salmon and Son, 169, Hampstead Road, N.W., may be used with any ordinary printing frame and in no way interferes with its use when vignettes are not required. It effects a great saving of time, being attached or detached immediately. It remains secure in any position, being clipped by aluminium slides, allowing of adjustment up and down or sideways, and by means of metallic grooves the vignetting cards (not serrated) can be placed nearer or farther from negative and at an angle or immediately changed for another card of different size opening, producing a vignetted print of the greatest excellence. It will vignette any part of negative, viz.: carte-de-visite bust from three-quarter length cabinet. Unpicturesque surroundings of groups, etc., may be vignetted out, as the cards can be cut to any shape. The prices, including aluminium slides, and 12 vignetting cards (six with openings of different sizes, and six for cutting as desired), are for ¼-plate, 2s.; ½-plate, 2s. 6d.; 1·1 plate, 3s. 6d.

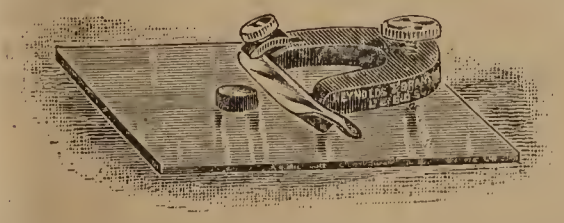


A NEW CLINICAL THERMOMETER.

Messrs. Maw, Son and Thompson, of London, send a specimen of a new patent clinical thermometer which they are putting upon the market. Hitherto the great disadvantage of all forms of thermometers has been the difficulty experienced in shaking down the index after use, but in this new form that difficulty is entirely obviated. The efficiency of the instrument is proved by comparing it with one of the old forms of clinicals by forcing the mercury in each up to 105, then holding the two together side by side in one hand and shaking them in the ordinary way. After one gentle shake of the hand the mercury in the patent instrument goes down about twice the distance it does in the other. This new principle is adapted to all forms of clinical thermometers, whether "½ minute," "1 minute," ordinary or lenticular, etc., and the difference between the price of the new and old forms is only 8s. per dozen.

A STUDENT'S MICROTOME.

Microtomes, properly so-called, are usually somewhat complicated appliances, and also expensive, but the instrument made by Messrs. Reynolds & Branson, of Leeds, and used at the Leeds Medical School is simplicity itself. As will be gathered from the illustration, the instrument is arranged to slide on a glass plate, the substance to be cut being embedded and fixed on that plate. Sections of any degree of thickness may then be cut by simply raising or lowering the screw. The microtome is so arranged that any razor may be clamped to it, and it will be found extremely useful to students in physiology, botany, etc. The price of the microtome, with glass plate, is only 3s. 9d., postage 6d. extra, and suitable razors are supplied at 1s. and 2s. each. No better value has ever been offered for the money.



MEDICAL JOTTINGS.

In the ordinary course the next session of the General Medical Council would not take place till next May, but two events have occurred which have rendered it necessary to summon the Council to meet for special business next Tuesday, the 5th inst. The death of Sir Richard Quain, the President, has made it necessary to appoint his successor, and as the Midwives Bill Committee of the Council has formulated a very large number of amendments to the Bill, which is down for the second reading in the House of Commons on May 11, it has been considered advisable that a plenary session of the Council should be held before that date for their consideration.

A Curious Difficulty has arisen in connection with this special meeting of the Council, which was not timed to meet according to its own standing orders till May. Power to summon a special meeting resides, according to the Medical Act, in the President, either on his own initiative or on the requisition to him of eight members of the Council. The difficulty has been solved by the Senior Treasurer, Sir Dyce Duckworth, who has risen to the occasion and summoned this special meeting on his own responsibility.

Both the *Lancet* and *British Medical Journal* indicate Sir William Turner as the most likely member to succeed to the presidential chair; but the disadvantage is that he resides in Edinburgh, where for many years past he has been Professor of Surgery at the University. During Sir Richard Quain's illness Sir William presided at the Council and conducted the business with fairness and success, and he no doubt would make a most efficient and courteous President. Mr. Bryant, who is well known to have acted on many occasions as Sir Richard Quain's lieutenant, has an excellent grip of the Council's business, and would be a very satisfactory choice to most.

The Question why Medical Prescriptions should be written in Latin has recently been discussed in an evening paper, but, according to the *British Medical Journal*, but little help thereby has been afforded towards its solution. Our contemporary points out that to some minds it might seem well if the point were settled as to whether prescriptions are written in Latin, though it may be admitted that they are written in no other tongue, and that the language, however it may be classed amongst the families of human speech, is at the worst less of a linguistic outrage than law Latin. At any rate, its barbarism is less apparent because it is veiled by the decent obscurity of abbreviations and symbols intelligent only to adepts. The fact is (continues our contemporary), we in this conservative country stick to Latin as being almost the only relic of our ancient reputation for classic learning, and now that science has replaced mystery we could well afford to discard this last vestige of pedantry.

Sir Thomas Smith, Bart., has retired from his post as one of the Surgeons to St. Bartholomew's Hospital, in consequence of the age regulations, and it is understood the vacancy will be filled by the appointment of Mr. Walsham, the Senior Assistant Surgeon.

The Death of Dr. Charles West, at the advanced age of 81, removes from the medical profession one who some years ago was a very prominent figure in it. He graduated at the University of Berlin in 1837, and became a member of the Royal College of Physicians in 1842. Seven years later, in conjunction with the late Bence Jones, he founded the Hospital for Sick Children in Great Ormond Street. Dr. West's name is known to the whole medical world by his writings on children's diseases, a department of medicine in which he was a pioneer and for a long time the leader.

The will has been proved of the late Mr. Ernest Hart, of Fairlawn, Totteridge, and formerly of 38, Wimpole Street, the editor of the *British Medical Journal*. The executors are his widow, Mrs. Alice Marion Hart (daughter of Mr. Alexander Rowland, of Hatton Garden); Mr. Hyam, solicitor, of Finsbury Pavement; and Sir Ernest Clarke, of 13, Hanover Square. Mr. Hart bequeathed to the trustees of the British Museum the signet-ring of Anemophet, King of Thebes, and he appointed the trust fund of the settlement made on his first marriage to his sisters. He left his residuary estate to Mrs. Hart. The testator's personal estate has been valued at £12,114 18*s.* 11*d.*

CANADIAN LETTER.

(*From our Special Correspondent.*)

I observe that in your issue of March 5, Messrs. Evans, Sons and Co. take exception to my remarks regarding the dissolution of the Wholesale Druggists' Association of Canada, and they venture the remark that "Your correspondent has been misinformed when he says that the retailers are not greatly exercised over the matter." If Messrs. Evans, Sons and Co. would read my statement carefully they will see that the words "prospects" and not "matter" was used, and also that I gave reasons for my assertions. I fear the word "misinformed" is more applicable to Messrs. Evans, Sons and Co. than to your correspondent. At the risk of prolixity in a matter which may not be of great interest to your readers, I will take space to correct Messrs. Evans Sons and Co. on the statement made by them—"Our firm joined the Wholesale Association at the earnest solicitation of many retailers." The writer of that most certainly is not informed on the subject with which he deals. The retailers were not in any manner concerned in the wholesale organisation, nor in soliciting any firm to join it. The formation of the Association was entirely among the wholesalers. The Retail Association did solicit and secure the signature of the individual wholesale firms to an agreement not to supply cutters with goods. Messrs. Evans, Sons and Co. signed that agreement, and, as I understand, still consider themselves bound by its conditions, notwithstanding the dissolution of the Wholesale Association. An impression might be conveyed by the disbanding of this organisation that the fight against cutters in this country had been abandoned. Such an impression would be erroneous, as the more powerful organisation of the retailers has yet to be reckoned with. As intimated in my previous letter, the Council of the Ontario College of Pharmacy has taken the matter up and organised a fifth standing committee, the duty of which shall be "the looking after the commercial interests of its members." The College being a wealthy body and the Committee having an assured income its work will be more permanent and systematic than could be that of any organisation depending on voluntary contributions for its maintaining. This Committee proposes completing the organisation begun by the Ontario Society of Retail Druggists, making use of district associations for the purpose. This Union is, then, to be used as a lever for compelling patent medicine proprietors to surround their goods with such safeguard as will prevent their being used as a means of destruction against the pharmacists. While efforts are being put forth on these lines to benefit pharmacy generally, there are forces at work quietly which promise to be no inconsiderable factor in the final solution of the cut-rate problem. The individual pharmacists, finding that the manufacturers were utterly unreliable so far as concerns putting forth an effort to protect their goods, have turned upon erstwhile friend and ally and are rapidly placing themselves in a position independent of the nostrum vendor. The superior education imparted through the medium of our thoroughly equipped College of Pharmacy is the means by which the end is being attained. Students are going forth from this school prepared for the fray. They are putting their attainments to practical use by supplying the needs of customers without recourse to ready-made medicines. Co-operative manufacturing is another factor in a situation which is hastening the downfall of the patent medicines. There is in the province of Ontario one very successful concern of this kind, organised some five years ago when cutting first began. The business established in the cities of Toronto and Hamilton has extended until the goods are now handled by pharmacists throughout the Dominion, from Montreal to Vancouver, B.C. The sale of these goods is confined exclusively to the pharmacists, to whom they are furnished at a price which permits of a good profit to the retailer, and also allows a dividend of 8 per cent. per annum on the capital employed. The formulæ of all preparations supplied by this organisation are furnished to the pharmacist handling the goods if so desired. Quite recently another institution has been established on slightly different lines, but yet co-operative in principle. This enters into direct competition with patent medicines by advertising its goods to the public through the daily Press, a course not pursued by the first-mentioned company. My information is to the effect that the prospects of this Company for success are good. To sum up, then, the cut-rate situation in Canada is this: Cutting exists in some dozen or so cities and towns, and in all cases emanates from

departmental stores or groceries and not from the ranks of the pharmacists. Its effect has been a reduction in the margin of profit on business done, and not a decrease in the number of pharmacists. The reduction in profit has been met by a corresponding curtailing of expenses; consequently the practice has borne more heavily on assistants than principals. The means put forth to counteract the evil are—organisation, individual effort to supply the requirements of customers without the aid of patent medicines, and co-operative manufacturing. Results so far (a knowledge of these has been acquired by conversations with a large number of proprietors)—the demoralisation of the patent medicine business equal to that experienced by the retail druggists, the fostering of a spirit of independence and commercial enterprise in pharmacists which but a few years ago was foreign to them, and also teaching, one might say forcing, them to make practical application of the knowledge acquired during the years of their pharmaceutical training and the lessons learned in their college course.

While the problem forced upon us by the cut-rate practice has occupied much of the time and thought of those who take an interest in the general welfare, it has by no means absorbed all their energy and attention. During the session of 1896-7 the Legislature of the province of Ontario, at the instance of the licensed liquor vendors and temperance people combined, allowed the following stupid amendment to be added to the Licence Act:—

(1) Nothing in this Act contained shall prevent chemists and druggists, duly registered as such under and by virtue of the Pharmacy Act, from keeping liquors for sale for strictly medicinal purposes, or from selling liquors for strictly medicinal purposes in packages of not more than six ounces at any one time, or from selling for strictly medicinal purposes any mixture containing liquors mixed with any other drug or medicine in packages of not more than one pint at any one time, but in either case only under a *bonâ-fide* prescription of such liquor or mixture duly signed by a legally qualified medical practitioner. Comment on this appears superfluous. The proper officer was on hand in the person of a superofficious licence inspector to supply the correct staging for this farce-comedy, and one of our leading pharmacists had to answer a charge of violating the licence law by selling a bottle of patent medicine. The magistrate before whom the charge was tried was a sensible person, and seeing the unreasonableness and injustice of the proceedings recommended the matter back to the Department of Justice to have the charge withdrawn. The matter thus brought to the attention of the Government, redress was speedily promised, notwithstanding which it required most strenuous efforts on the part of those having the case in charge to secure the repeal of this obnoxious clause, and the enactment of sensible regulations governing such matters. Our labours were, however, finally crowned with a fair measure of success, and the law, as it now stands, is more satisfactory than at any previous time. Pharmacists are permitted to sell quantities of not more than one gallon of pure alcohol at a time, all preparations of the B.P. or other standard pharmaceutical authorities, and also all patent or proprietary medicines in the original and unbroken packages which contain only sufficient alcohol to hold the medicinal constituents thereof in solution, or to prevent fermentation. Six ounces of spirits may also be sold in cases of emergency, without special licence or medical certificate.

OBITUARY.

Wilkes.—On March 6, David Wilkes, Pharmaceutical Chemist, Bredon. Aged 77. Mr. Wilkes. who had been a member of the Pharmaceutical Society since 1858, formerly carried on a chemist's business in Bredon for many years, but retired from business about five years ago.

Brookes.—On March 7, Alfred Fincher Brookes, Chemist and Druggist, Birkenhead. Aged 34.

Kersey.—On March 21, Joshua E. Kersey, Chemist and Druggist, Plaistow. Aged 70.

Williams.—On March 22, Walter Williams, Pharmaceutical Chemist, Hereford. Aged 80. Mr. Williams had been a member of the Pharmaceutical Society since 1844, and was local secretary for Hereford for many years. He retired in 1895.

Blood.—On March 23, Charles Blood, Chemist and Druggist, late of Formby. Aged 53. Mr. Blood was with Messrs. John Thompson and Co., of Hanover Street, Liverpool, and was down in the Register as of Waterloo.

LETTERS TO THE EDITOR.

The British Pharmacopœia.

Sir,—I would like to call attention to the advantage of having copies of the B.P. interleaved with blank paper. The student preparing for examination and the chemist in business would soon find the value of such a book after they had begun to use it. When preparing for the Major examination five years ago, I took the trouble to interleave my B.P. with foreign notepaper. The result was by no means elegant, but the volume has been exceedingly useful and handy. If the authorities would issue an edition with blank leaves, I think it would be appreciated. If not, I shall have to spoil the appearance of my new B.P.

March 24, 1898. Quidam (129/13).

*** If an interleaved copy is ordered from the publishers or through a bookseller, there ought to be no difficulty in procuring it. [Ed., *P. J.*]

The New Pharmacy Bill.

Sir,—It will scarcely be expected that the factious opposition of one unsupported M.P. will frustate the intentions of the Pharmaceutical Society, particularly as it seems animus was the motive. Mr. Cross was prosecuted and very leniently dealt with by the Glasgow magistrates, but he seems not to have forgiven the Pharmaceutical Society or the law which he is bound to support. There exists, however, a strong feeling in Glasgow on the subject amongst the leading chemists; probably Mr. Cross will be remembered on the occasion of another election.

March 26, 1898. R. G. Mumbray.

Millionaires in Pharmacy.

Sir,—In an editorial note in the Journal of March 19 I see you refer to the late Mr. Lea, of Worcester, as being one of those extremely rare persons who could trace his wealth directly to pharmacy. You appear to think it matter for congratulation that there should now and then be found a "millionaire pharmacist." I venture to point out that the late Mr. Lea evidently felt no special interest or indebtedness to pharmacy or pharmacists, as, although he was evidently a benevolent man, leaving large sums to local charities, the claims of our Benevolent and Widow and Orphan Funds seem to have been entirely overlooked. Is it that our system of representation in the provinces is at fault? As "millionaires in pharmacy" are so very scarce, surely they should be looked after.

March 29, 1898. Lazarus (129/23.)

A Disclaimer.

Sir,—A person signing himself J. Islop, 72, Albany Mansions, Albert Bridge Road, S.W., has been, and is extensively circulating orders amongst chemists, and as some of my customers have executed such orders thinking that they were for myself or some relation, I think it is due to the firm of Messrs. Warrick Brothers, whom I represent, that I should disclaim any connection with the individual in question.

7, Portpool Lane, E.C., March 30, 1898. Charles C. Islop.

ANSWERS TO QUERIES.

Seltzogenes.—You had better apply to the manufacturer, M. E. Thessier, 9, Rue Castex, Paris, who no doubt will afford you the information required. [*Reply to* Assistant.—7/28.]

Cows Aborting.—This appears to be a case for a veterinary surgeon, not for a chemist. We have no information on the subject.—[*Reply to* Agricultural.—7/13.]

Practical Botany.—If you mean for field work, use Holmes' 'Botanical Notebook' (Christy, 3*s.*), and Hayward's 'Botanist's Pocket-Book' (Bell, 4*s.* 6*d*). [*Reply to* W. H. W.—7/23.]

Photographic Journal.—The best weekly paper is the *Photographic News*, edited by a pharmacist and published at 9, Cecil Court, Charing Cross, London, W.C., on Friday, price 1*d.* [*Reply to* S. H.—7/17.]

Colour for Iodic Hydrarg. Solution.—Probably one of the colours which already contain iodine in combination, such as iodeosin, will answer your purpose. [*Reply to* E. M.—7/31.]

Anti-Halation Backing.—We shall be pleased to report on it if you will forward a sample. [*Reply to* J. J.—8,7.]

Handbook.—As you will see, arrangements are already in progress for such a book as you suggest. [*Reply to* W. J.—8/8.]

Antikamnia.—It is alleged to contain about 70 per cent. of acetanilide, 10 per cent. of caffeine, and 20 per cent. of sodium bicarbonate, but there is reason to believe that its composition is not constant. [*Reply to* Spes Infracta.—8/2.]

Second-Hand Apparatus. — The prices obtainable depend largely upon the demand for the particular articles, and we believe they usually range from half to two-thirds the original retail prices. [*Reply to* C. S. A.—8/6.]

Treatment of Baldness.—No, we do not think your ointment would be of much good. The treatment of Brocq with resorcin and quinine is more likely to be useful. See *Pharmaceutical Journal* [4], iii., 215. [*Reply to* J. C.—7/18.]

Retail Prices.—It is usual to permit customers to use dark-room free of cost; a fair charge to strangers who do not purchase anything would be 1*s*. See the article in this week's Supplement. If you will specify the solutions we shall be glad to suggest suitable retail prices. [*Reply to* G. and S.—8/3.]

Camera.—You do not state as to what price you are prepared to pay, but considering that you want to use the camera for photo-micrography, we should advise you to see Houghton's extra long extension Sanderson camera; at any rate, you must not have very conical bellows. [*Reply to* T. K.—8/1.]

Minor Examination.—Read the special article on the subject in the "Students' Number" of the Journal, published September 11 last. The regulations do not specify where the necessary experience is to be gained, but you must put in three full years altogether. [*Reply to* Medical.—7/30.]

Dead-Black for Camera.—Water, 500 C.c.; borax, 15 Gm.; shellac, 30 Gm.; glycerin, 15 Gm. Boil till dissolved, filter, and add aniline black, 60 Gm. Or, get some drop-black ground in turpentine, add to it a few drops of japanner's gold-size (just sufficient to prevent the paint rubbing off when dry), and thin with turpentine to the required consistency. In either case, apply with a soft brush. [*Reply to* H. H. M.—7/27.]

Neutral Liquid Soap.—Your quickest way to prepare this will be to saponify a little oleic acid with a solution of caustic potash in methylated spirit, using only the exact quantity or a little less of the alkali than is required for saponification. You can readily determine exactly the amount of alkali required by first titrating a known quantity (say 5 C.c.) of the acid in methylated spirit, with normal alkali. You cannot well add lanoline to a fluid preparation unless it be an emulsion. Lanoline is very difficult to saponify. Remember that all soap becomes alkaline in the presence of water by hydrolysis. [*Reply to* Posa.—7/32.]

Crystoleums.—The old method of preparing these was to print on albuminised paper and stick them on to the glass and then remove the paper with sand-paper, but a very much better method is to use the 'Novitas' Stripping P. O. P. (Otto Schölzig, 31, Binfield Road, Clapham, S.W.). This is printed, toned, fixed, and washed as usual, and then the glass coated with gum, water, and the print rubbed into contact, and then after drying soaked in tepid water, when the paper may be entirely removed, leaving nothing but the thin film of gelatin bearing the image. Ordinary photographs may be coloured with either oil or water colours, for the former they should be sized with gelatin first, for the latter rubbed over with ox-gall, 60 grains; alcohol, 2½ ounces; distilled water, 7½ ounces; allowed to dry, and then painted. The best method of colouring them, however, is by the Radiotint process, which consists of three solutions, red, yellowish-green, and blue. This is practically the Chassagne process of photography in natural colours, and the results are very good. The materials may be obtained from 48, Brook Street, Hanover Square, London, W. [*Reply to* Crystoleum.—7/19.]

London Agent.—We will make inquiries for you, but why not advertise the fact that you require a London agent for your yachting photos? [*Reply to* B.—8/10.]

Sachet Powder.—Powdered orris root, 16 ounces; otto of rose, 20 minims; oil of neroli, 20 minims; oil of sweet orange, 2 minims; coumarin, 10 grains; vanillin, 5 grains; musc Bauer, 2 grains; civet, 2 grs.; oil of pimento, 3 mins. [*Reply to* East Anglia.—7/8.]

Mounting Glazed P.O.P.—You can cover the back of the print whilst it is on the glass with the dextrine mountant given elsewhere. Strip the print when dry and then just damp your mount and squeegee the print down. [*Reply to* Amateur.—8/14.]

To Prevent Water Freezing.—Probably 10 or 15 per cent. of glycerin will answer your purpose, but the actual amount will depend upon the temperature to which the pipes are exposed, and in a lesser degree on the calibre of pipes. Crude brown glycerin should be used. [*Reply to* A. H. T.—7/16.]

Laudanum.—The name is synonymous with tincture of opium throughout the whole of the United Kingdom, and it is doubtless regarded as such wherever the British Pharmacopœia is taken as a standard and guide, that is to say, throughout the British Empire. [*Reply to* Apprentice.—7/25.]

Minor Exam.—It is held that you must be of the full age of twenty-one years on the fifteenth day of the month preceding that in which the examination is held. In other words, you must be of full age at the time you pay the examination fee to the Registrar. [*Reply to* Apprentice.—7/25.]

Hydroquinone Developer.—You will find good formulæ for hydroquinone in this week's Photographic Supplement. As a rule, two 8-oz. bottles are sold for 2*s*. Gold toning solutions generally about 8 ozs. for 1*s*.; this naturally depends upon the strength of the gold. [*Reply to* H. E. C.—8/13.]

Composition of Tablets.—These consist mainly of bismuth carbonate, with pepsin and a trace of "capsicine." We could not detect morphine in the amount of material sent; even if it were present the quantity would be too minute to isolate from such a small specimen. [*Reply to* Indigestion.—7,9.]

Laundry Spermaceti Shirt Liquid.—Spermaceti, 1 oz.; mucilage of acacia, 1½ fl. oz.; borax, 1 oz.; glycerin, 1 oz.; tincture of quillaia, 1 oz.; warm water, 16 fl. ozs. Dissolve borax and glycerin in the warm water and add the mucilage. Melt the spermaceti, triturate it in a hot mortar first with the quillaia tincture, then gradually add the warm aqueous mixture. Stir until cold. Use 1 part of the liquid to every 8 parts of hot starch. [*Reply to* H. H.—7/27.]

Ammoniated Solution of Phenol for Detection of Copper.—Probably the reagent should be freshly prepared. It is quite probable that both your solution of ammonia and your phenol contain an infinitesimal trace of metallic impurity, or afterwards dissolve the same from the glass of the bottle. Having had occasion to use solution of ammonia sensibly free from metals (Fe and Pb) we have had considerable difficulty in obtaining it before now. From the gradual development of the colour we should suspect the glass of the bottle. [*Reply to* J. C. F.—7/1.]

Manufacture of Acetylene.—The necessary apparatus for the manufacture of acetylene gas on a commercial sale for illuminating purposes consists of a generator and a gas holder. Your best plan would be to see the price lists of the Fowler Acetylene Gas Company, 298, Marsh Lane, Bootle; Thorn and Hoddle, New Tothill Street, London; the Acetylene Light and Power Company, Cheapside, London, and make your choice. A great deal depends upon the number of lights you require, how far the gas has to be carried, and so forth, but you state nothing about those points. —[*Reply to* J. D.—8/4.]

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Addison, Allenby, Beken, Blythe, Branson, Brown, Clague, Cocker, Cruickshank, Davies, Fraser, Green, Greenwood, Horsfield, Ingham, Ireson, Johnson, Jones, Knaggs, Knight, McAllister, McKinnon, Mumbray, Newsholme, Pickard, Pratt, Reynolds, Ridlington, Smith, Thursfield, Wallace, Widgery Young.

The British Pharmacopœia, 1898.

AT no time since the appearance of the British Pharmacopœia in 1864 has so much interest been taken in the national medicine-book as now in anticipation of the issue of the new edition. There are three paramount reasons why pharmacists should feel a deeper interest than usual in the forthcoming volume. Excepting the Addendum of 1890, this is the first time that they have been asked as a body to co-operate officially with the General Medical Council. It has been generally understood that an attempt was being made to express the formulæ in the metric system of weights and measures. And there have been good grounds for believing that the new edition would be an Imperial British Pharmacopœia. The labour which has been expended upon it justifies us in entertaining great hopes of its scientific and literary accuracy, and of its usefulness. Committees the world round have debated upon it and made their recommendations. Through the Colonial Office the General Medical Council received reports and recommendations from the Bahamas, Barbados, Bermuda, British Honduras, Cape of Good Hope, Ceylon, Cyprus, Hong Kong, India, Jamaica, Malta, Natal, Queensland, St. Helena, Sierra Leone, South Australia, Canada, New South Wales, Tasmania, Victoria, Western Australia, Zululand. In Great Britain and Ireland help has been rendered by the Royal Colleges of Physicians of London, Edinburgh, and Ireland, by the Royal Colleges of Surgeons of Edinburgh and Ireland, by the Universities of Oxford, Cambridge, Durham, Edinburgh, Glasgow, Aberdeen, and Dublin, by the Victoria University and several other medical corporations. The Therapeutic Committee of the British Medical Association and the Committee of the Pharmaceutical Society assisted in the work of elimination by the distribution of lists of drugs and galenical preparations to medical men and pharmacists, with the view of obtaining statistics as to the frequency with which the articles are used. Over 5600 of these lists were returned to, and analysed by, the Therapeutic Committee, and the Pharmaceutical Committee had to deal with about 230. The more immediate work of digesting, assimilating, and forming into a coherent whole the great mass of statistical and scientific work has devolved upon the Committee of the Medical Council, over which Sir Richard Quain presided, and to which Dr. Nestor Tirard has acted as an enthusiastic and indefatigable Secretary. The editing has been done by Dr. John Attfield, to whom the Council expresses its indebtedness for his scientific and literary services. The Committee has received "assistance of great value" from the Committee of the Pharmaceutical Society. Notwithstanding the experience with the Pharmacopœia of 1864, which Sir Richard Quain* considers "cannot be read as favouring the appointment of special experts in the construction of the Pharmacopœia, inasmuch as the Committee which prepared this issue (1864) was largely composed of eminent experts," the present Committee of the Medical Council ventured to appoint, and have had the assistance of, expert referees:—In chemistry, Drs. Thorpe, Tilden, and Emerson Reynolds; in botany, Dr. W. T. Thiselton-Dyer and Mr. E. M. Holmes; in pharmacology and therapeutics, Drs. T. Lauder Brunton, Walter G. Smith, and Ralph Stockman. It is impossible to estimate, even approximately, the number of persons who have directly, to a greater or less extent, contributed to the compilation of the British Pharmacopœia of 1898. They would form not an inconsiderable army. Will the result justify the labour? In order that our readers may have an early opportunity of judging, we hasten to put before them the changes which appear to us to be the most noteworthy. We are pleased to have the opportunity of so doing. At present we refrain from criticism, not because we think that the work is by any means perfect, but because some of the changes appear to us to be so momentous as to demand some practical and experimental examination before being either commended or condemned. If within the next few months the body of criticism from pharmacists is not commensurate with the expectations they have cherished, we shall feel some little surprise.

* *Pharmaceutical Journal* [3], xxv., 1129.

Eliminations and Additions.

These naturally first claim attention. There have been added seventy-nine drugs and preparations, and 189 have been deleted. Among the additions we note particularly

Bismuthi Salicylas	Liquor Thyroidei
Cocaina	Morphinæ Tartras
Codeinæ Phosphas	Naphthol
Hyoscinæ Hydrobromidum	Salol
Hyoscyaminæ Sulphas	

The omissions are remarkable because of the large number of galenical preparations which they include. The Cataplasm ata Enemata, Essentiæ, Vapores and Suppositoria cum Sapone are abolished completely; the list also enumerates 4 Confectiones, 10 Decocta, 3 Emplastra, 17 Extracta, 7 Infusa, 15 Liquores, 3 Pilulæ, 3 Syrupi, 11 Tincturæ, 7 Unguenta, and 3 Vina. Copious lists of alterations of names and formulæ are given as heretofore.

Imperialism

stands for something large, imposing, if not awe-inspiring. The new Pharmacopœia contains 535 pages, of which 91 are absorbed by the index, while the 1885 edition had 536 and 34 devoted to the index. Imperialism is not, therefore, manifest in increase of bulk. It is not apparent in the body of the work at all; but by careful search we have discovered a hint of it in the table of contents, a few explanatory words in the preface, and one and one-fifth pages—we wish to ascribe due importance to it—on details in an appendix—"Alternative preparations sanctioned for use in India and the Colonies." Permission is given to make the official ointments of such proportions of indurated lard, suet, and beeswax as shall be desirable in the differnt countries, providing always that the proper proportion of active ingredient is maintained. In tropical countries Aquæ may be prepared by triturating essential oils with calcium phosphate and water. The liquid extracts may be prepared with an increase of alcohol when required for their better preservation, as may also Syrupus Rhœados. In India and the Colonies more or less white beeswax may be substituted in suppositories for an equivalent quantity of oil of theobroma, according to the prevailing temperatures. In no instance is permission given to supplant one drug by another. The only approach to such a thing is that it is permitted to use dried lemon peel when fresh lemon peel is unobtainable in India and the Colonies. It is intimated that the Council intends to deal more fully with the trans-oceanic part of the Imperial Pharmacopœia in an Addendum.

Nomenclature.

In a considerable number of cases the names of drugs and preparations have been altered; but only a few chemicals have been so treated, and then always in the direction of greater accuracy. For instance, Æther Purificatus, Ferri Arsenas, and Sodi Arsenas are substituted for the present official names. Alkaloidal Hydrochlorates are converted into Hydrochlorides, and Hydrates into Hydroxides. The English names for chemical substances are brought as far as possible into accord with chemical science; therefore, they are not always translations of the Latin titles. Acidum Carbolicum is rendered into English as Phenol, and Hydrargyri Iodidum Rubrum as Mercuric Iodide. Aloin is made declinable in the form of Aloinum, so also is Kaolinum. Benzol, Salol, and Thymol are therefore, we presume, to take the genitive termination—"is." Some of the names of drugs are extended by having the morphological designation appended, thus:—Ipecacuanha is changed to Ipecacuanhæ Radix. There is one curious instance of the reverse of this procedure in the case of Lini Semina which now appears as Linum. It will be interesting to learn what reasons can be given for adopting this singularly inept variant. The adjective Fortior is uniformly displaced by Fortis. A device which will commend itself to all who have to use the volume frequently has been adopted in the monographs whereby it is possible at once to distinguish between official medicines, official reagents and commercial articles; the names being printed with capital letters (Chloral Hydrate), in italics (*solution of silver nitrate*), or in ordinary Roman characters (benzene) respectively. As far as we can see without attempting to make an accurate calculation, there appears to be no very large increase in the use of synonyms. Those that have been inserted are for the most part useful and informing. Laudanum is still a synonym for Tincture of Opium; but we do not observe, as we were led to expect, Scotch Paregoric under Ammoniated Tincture of Opium. Lac sulphuris is at last doomed, for Milk of Sulphur appears as a synonym for Precipitated Sulphur.

Weights and Measures.

In addition to the imperial system of weights and measures, which calls for no comment, the metric system has been introduced throughout the Pharmacopœia. General satisfaction will be felt that "proportional parts" have been entirely abolished; but whether equal satisfaction will be felt in the mode of setting forth the metric equivalents remains to be seen. All the quantitative tests are described in terms of the metric system alone. The plan adopted for setting forth the proportions of ingredients in preparations is, we fear, a trap for the unwary. We do not apologise for insisting that pharmacists should at once see to it that every person upon their establishment thoroughly comprehends what is the intention of the Pharmacopœia. The explanation of the preface appears to us to need amplification before the matter is quite clear. In order to do that, in some measure, we quote the formula for Ammoniated Tincture of Opium:—

	Imperial.	Metric.
Tincture of Opium	3 fl. ounces	150 cubic centimetres.
Benzoic Acid	180 grains	20·6 grammes.
Oil of Anise	1 fluid drachm	6·25 cubic centimetres.
Solution of Ammonia	4 fl. ounces	200 cubic centimetres.
Alcohol (90 per cent.).....	a sufficient quantity.	

"Dissolve the Oil of Anise and the Benzoic Acid in 12 fluid ounces (or 600 cubic centimetres) of the Alcohol; add the Tincture of Opium and the Solution of Ammonia; mix well; filter; add enough of the Alcohol to form 1 pint (or 1000 cubic centimetres) of the Tincture."

The metric weights and measures, it must be observed, are not the equivalents of the imperial ones. There are two distinct formulæ placed in juxtaposition, yielding different quantities of the preparation—in the one case a pint, in the other case 1000 cubic centimetres.

In every formula it is absolutely necessary that the imperial quantities or the metric quantities should be adhered to throughout. Wherever, in directions for manufacturing, the metric quantities in the brackets are preceded by "or," as in the above formula, it is intended to mark the fact that the quantities are not equivalent to those of the antecedent imperial weights or measures. The descriptions of crude drugs in which measurements and weights are given have the approximate metric equivalents to the imperial units placed in brackets, thus Black Mustard Seeds are said to be "about one twenty-fifth of an inch (one millimetre) in diameter, and one-fiftieth of a grain (one and a third milligramme) in weight." In all such instances the "or" is omitted. Without wishing to appear as alarmists, there appear to us to be such dreadful possibilities in the intermixture of the two systems which has been adopted that we should inscribe over every formula, "All imperial or all metric." There are two things which we think it will trouble even pharmacists to accomplish satisfactorily. One is, to measure to the hundredth part of a cubic centimetre as required by the formula we have quoted above, and the other one is to measure 6·035 fluid ounces as given in the formula for Acidum Hydrochloricum Dilutum. If the latter quantity is expressed in this manner only to indicate the amount of variation between the two formulæ we think it might advantageously have been expressed in minims.

At last uniformity has been attained in the alkaloidal liquors and other allied ones; they are of a strength of 1 grain in 110 minims and 1 gramme in 100 cubic centimetres.

We notice a reference to metric capacity units as defined at 4° C. and metric measures graduated at 60° F., which might be understood as suggesting that a litre at the one temperature differs from the litre at the other temperature, and is perhaps indicative of some misconception of the practice commonly followed by chemists in volumetric analysis.

Drugs.

From the paragraphs describing crude drugs the botanical and zoological synonyms have been deleted. The botanical nomenclature follows that of the 'Index Kewensis,' except in a very few instances. This has necessitated some changes which may appear to old pharmacy students to be almost revolutionary, Cusparia Bark being ascribed to *Cusparia febrifuga*, DC., and Ipecacuanha Root to *Psychotria ipecacuanha*, Stokes. As in the last edition, references are still made to works containing type illustrations of the official plants. As far as possible those references are to books which are readily accessible, and for that reason frequent recourse is had to Bentley and Trimen's 'Medicinal Plants.' Of course, good illustrations of some plants are not to be found within easy reach; when that is the case the references are to botanical periodicals and the rarer botanical works. Araroba and fresh Orange Peel appear to be the only two crude drugs with new headings, although it cannot be said that they are newly introduced into the Pharmacopœia. Liquorice Root is now only official in the peeled state. We observe that great care has been taken to exclude the Carthagena Ipecacuanha. That action is characteristic, as far as we can see, of the attitude of the revisers towards botanical and chemical research in its relation to the Pharmacopœia. They have exercised considerable caution in not placing the official seal upon articles which have not been thoroughly investigated; whether the same care has been bestowed upon the descriptions, tests, and processes of manufacture, as upon the selection of medicaments, remains to be seen.

The "characters and tests" of the drugs have been well revised, albeit in many paragraphs there is a solid substratum

of the 1885 edition. For our own part we should have preferred to see them entirely re-written, and so have avoided the present patchwork impression. The descriptions have gained in exactness, and the metric equivalents of the measurements are given in brackets, as already intimated. In many instances tests have, we think, been advantageously introduced, as in Aloes (for Natal aloes), the umbelliferone test in Ammoniacum (for Asafetida and Galbanum), in Balsam of Peru (for Copaiba, resins, fatty oils, gurjun balsam, ethylic alcohol), and in Saffron (for nitrates). The object with which each test is applied is indicated in brackets; this improvement will commend itself not only to medical and pharmaceutical students, but also to those medical men and pharmacists whose knowledge of chemistry and materia medica has become somewhat rusty, and who have not the time to brighten it by reference to their misplaced text-books. Some of the drugs which are sold in powder form, such as Capsicum (6 per cent.), Caraway Fruit (8 per cent.), and Cloves (7 per cent.), have a maximum limit of ash. The histological notes which are sparsely scattered over the "characters" may, in a few cases, prove to be useful; but in others we fail to see what purpose they can serve, they are so very meagre, as, for instance, Calumba Root—"the vessels are arranged in narrow radially elongated groups. The parenchymatous tissue is largely developed." This is quite true as far as it goes, but it leaves so much unsaid as to be comparatively valueless.

Buchu leaves are to be obtained from *Barosma betulina* only; this is no doubt in great measure the result of the work of our contributor, Mr. C. J. S. Thompson. India-rubber has displaced gutta percha in the manufacture of mustard paper. Despite the researches of Burck, of which we published a copious extract in 1892 (*P. J.* [3], xxii., 817), we observe that Peruvian and Bolivian coca leaves are both ascribed to *Erythroxylum coca*, Lam. Savanilla rhatany is no longer official, being supplanted by the Para variety (*Krameria argentea*). The inevitable organotherapy has succeeded in establishing itself officially in the form of Thyroideum Siccum (Dry Thyroid), a powder produced by drying the minced glands at 32°·2 to 37°·8 C., removing all fat with petroleum spirit, and drying the residue.

Chemicals.

We anticipate that the actual battle of the critics will be waged around the chemicals. As already stated, the English names are brought, on the whole, into line with text-book chemistry, but the familiar Latin names have been retained because of a disposition not to worry the prescriber too much by change. The paragraphs dealing with the processes of manufacture are very considerably condensed, and are so framed as to leave the particular process optional. A good example of this improvement is chloroform; instead of an elaborate formula which it was doubtful if a single manufacturer adhered to, there is the simple permissive statement:—it "may be prepared by heating a mixture of chlorinated lime, slaked lime, ethylic alcohol, and distilled water." Wholesale and retail pharmacists will welcome this relief. There is no indication, however, of any relaxation of the standards of purity. The criteria of purity have simply been shifted from the processes of manufacture to the products themselves. That should act as a direct incentive to manufacturing genius. Of course, there is a danger lest the standards of purity which have been adopted should be too high or too low. The recognition tests, and the tests for all common impurities, instead of being repeated in the various paragraphs, are consigned to an Appendix, with the result that a great amount of space is saved. A delightful feeling of simplicity and satisfaction suffuses us upon reading (see p. 139) that a substance gives "no characteristic reaction with the tests for lead, copper, arsenium, iron, calcium, potassium, sodium, ammonium, chlorides, or sulphates." What could excel that for conciseness and—purity? The meaning, the extent and the content, of "about" have been fairly well discussed, but to very little purpose. Are we to have a ten years' discussion upon the negative "no" with the prospect of learning that it contains a "positive element"? The preface states "that the appended list of tests is not exhaustive, having only been constructed to meet official requirements. Nor are manipulative details set forth at length, either as regards the preparation of a substance for testing, or as regards the selection or application of the tests, the pharmacist being assumed to possess full knowledge on these and all similar points." The reason of every test given in the text is indicated in precisely the same manner as in the paragraphs dealing with drugs. The solubility of substances—not only in water but in other liquids that are likely to be used as solvents—is treated with a due regard to the requirements of the medical practitioner and the pharmacist. Wherever useful for the purposes of identification or as standards of purity melting points are inserted. Quantitative tests are uniformly expressed in relation to one gramme of the substance.

In carrying out the volumetric determinations, the pharmacist will have to rely in most cases upon his own judgment in the choice of indicators. Some help, however, is offered to him in the explanatory notes—which are more general and extensive than those in the 1885 edition—found in the Appendix dealing with volumetric estimations (*sic*). The lists setting forth under each volumetric solution the articles for the analysis of which the solutions were to be used have been dispensed with. Analysts will do well to notice that the equivalence of every standard solution is altered; this, of course, is a necessary consequence to the adoption of the best authenticated values of atomic weights. In place of the standard solution of oxalic acid a normal standard solution of sulphuric acid has been adopted, and this is a questionable change. To return to the official chemicals the formulæ are given in the first paragraph instead of as subheadings, and in the case of organic substances, wherever possible, constitutional have been substituted for empirical formulæ. Among the new chemicals now included in the Pharmacopœia are—

Benzol. (In Appendix, 1885.)	Morphinæ Tartras.
Bismuthi Salicylas.	Naphthol (β-Naphthol).
Cocaina.	Paraffinum Liquidum.
Codeinæ Phosphas.	Physostigminæ Sulphas.
Hyoscinæ Hydrobromidum.	QuininæHydrochloridumAcidum
Hyoscyaminæ Sulphas.	Terebenum.

Among others there are omitted—

Beberinæ Sulphas.	Hydrargyri Persulphas.
Bismuthi Citras.	Morphinæ Sulphas.
Bismuthi et Ammonii Citras.	Physostigmina.
Bismuthum.	Plumbi Nitras.
Bismuthum Purificatum.	Potassii Cyanidum.
Cupri Nitras.	Potassii Ferrocyanidum.
Ferri Peroxidum Hydratum.	Sodii Nitras.
Ferri Sulphas Granulata.	Sodii Valerianas.

Thermometric Memoranda.

It is in connection with this branch of the Pharmacopœia that we may most appropriately draw attention to a new appendix—"Thermometric Memoranda." In it details are given for the taking of melting and boiling points, together with a formula for applying the correction for the emergent mercurial column. The appendix dealing with articles employed in chemical testing has undergone considerable enlargement because there is included in it all chemicals used for the purpose, and

not as heretofore, simply those that are extra-official. This step has been rendered necessary by the typographic differentiation to which we have already referred. The test solutions have also greatly increased in number. Appendix III. deals with reactions of "substances mentioned in the text of the Pharmacopœia." The substances alluded to are only acids and inorganic bases. Notwithstanding the remarks in the preface about "the skill and judgment of workers who are assumed to be duly trained," it appears to us that the information which is given in this section is expressed in such general terms and deals with such elementary facts that this knowledge, as well as the requisite skill and judgment, might have been placed to the credit of the "duly trained" worker. If it was intended to be useful to the student, the average pharmacist, and the medical man, the manner of presentation should have been much more precise and thorough.

Standardisation.

Although at an early stage in the revision of the Pharmacopœia we believe it was intended to apply the principle of alkaloidal standardisation on a much more extended scale than in the previous edition, we see now that further consideration of the matter has greatly curtailed the proposed extension. To the exact and scientific mind the idea of standardisation is at first sight captivating and desirable, but when it is remembered that in only a few instances is it known to be certain that the alkaloidal content of the drug is in direct and constant ratio to its therapeutic activity, it is clear that the application of the principle is not less dependent upon the state of medical knowledge than upon the state of chemical knowledge. This view of the question has evidently prevailed with the revisers, for we find that certain preparations of Belladonna and Ipecacuanha are the only additional ones which are required to contain a definite proportion of alkaloids. In the case of Belladonna a liquid extract standardised to contain 0·75 per cent. of total alkaloids is to be used, in accordance with Cripps' suggestion, for the preparation of an Alcoholic Extract, the Liniment, the Ointment, the Plaster, and the Tincture. The Acetum Ipecacuanhæ and Vinum Ipecacuanhæ are also to be prepared from a liquid extract containing from 2·0 to 2·25 per cent. of total alkaloids. The assay processes for Cinchona Bark and Opium are practically the same as those adopted in 1885 that for Opium being now supplemented by a check titration with decinormal sulphuric acid. Instead of relying, as before, upon assayed Opium for the production of Tincture of Opium of proper morphine strength, it is directed that the Tincture be prepared by a process involving standardisation. A very important improvement has been made in connection with the preparations of Nux Vomica. The standardised extract, which it has been shown again and again, gradually but constantly increases in alkaloida strength, is displaced by a standardised liquid extract which it should be possible to keep under conditions that should ensure a fairly constant strength. It is particularly to be noted that this extract is to contain one and a half per cent. of strychnine, not of total alkaloids. From it the solid Extract (5 per cent. of strychnine) and the Tincture (0·25 per cent. of strychnine) are to be prepared. The strychnine assay is to be accomplished by the potassium ferrocyanide process of Dunstan and Short.

The valuation of Pepsin is directed to be conducted upon the same lines as those laid down in the United States Pharmacopœia, artificial digestion being prolonged for six hours. Accordingly, the numerical standard is 2500 instead of 100. There is a rather serious omission from the details of the process, namely, that the intervals between the times of agitation are not specified, but are left to the discretion of the operator. This should be rectified, because it has been shown by several investigators that the agitation is one of the important conditions influencing the solution of the albumin.

Alcohol and Alcoholic Menstrua.

In connection with alcoholic liquids there has been introduced a nomenclature which is in a large degree artificial, and, therefore, calculated to confuse those who are not careful to thoroughly master it. The official recognition of the researches of Farr and Wright has necessitated the adoption of alcohol of several degrees of dilution for the preparation of tinctures. Six different strengths are official, namely, Absolute Alcohol, Alcohol (90 per cent.), Alcohol (70 per cent.), Alcohol (60 per cent.), Alcohol (45 per cent.), and Alcohol (20 per cent.). The second of these has taken the place of rectified spirit, and, in fact, bears the name Spiritus Rectificatus. Proof spirit is no longer recognised; seeing that this is the pivot of our fiscal arrangements it is to be regretted that a formula for it is not included with the other formulæ for diluted alcohol. The following table will, perhaps, assist to the better understanding of the terms employed in the Pharmacopœia.

Ethyl Hydroxide	C_2H_5OH.
Absolute Alcohol (Alcohol Absolutum) ..	Ethyl Hydroxide with not more than 1 per cent. by volume of water.
Alcohol (90 per cent.) (Spiritus Rectificatus) ..	Ethyl Hydroxide 90 volumes, and Water 10 volumes.
Alcohol (70 per cent.) ..	Ethyl Hydroxide ..... 70 volumes. Water ..... 30 volumes.
Alcohol (60 per cent.) ..	Ethyl Hydroxide ..... 60 volumes. Water ..... 40 volumes.
Alcohol (45 per cent.) ..	Ethyl Hydroxide ..... 45 volumes. Water ..... 55 volumes.
Alcohol (20 per cent.) ..	Ethyl Hydroxide ..... 20 volumes. Water ..... 80 volumes.
Ethylic Alcohol	Applied to alcoholic liquids of varying strengths.

Dosage.

When doses were introduced into the Pharmacopœia for the first time in 1867, the Committee stated that "These doses are indicated in compliance with a generally expressed wish. They are not authoritatively enjoined by the Council." The disclaimer is repeated in the new edition. But the very fact of the inclusion of doses in the medicine-book published "by authority" is itself an injunction which the pharmacist cannot neglect and the medical student must regard. Anything, therefore, which tends to simplify the subject cannot fail to be appreciated by both these classes. From their point of view a very successful effort has been made to arrange the doses of galenical preparations in sections. Considering that this effort has been effected by altering the strengths of a number of preparations, it is doubtful if manufacturers will, at first, welcome it. Having regard to the welfare of the latter class of pharmacists and all those who still continue to make their own galenicals, we propose to indicate as speedily as possible, week by week, such changes as have been made in the strength of these preparations. In this way we hope to render some little assistance in the prevention of financial loss. The most striking instance of the unification of doses is in the tinctures, which, with the exception of Tincture of Iodine, are divided into two sections—the one having a dose of from 5 to 15 minims and the other of from half to 1 fluid drachm. The Decoctions have a dose of from half to 2 fluid ounces. In the Mixtures the greater number have a dose of from half to 1 fluid ounce, and the Pills, with five exceptions, appear with a dose of from 4 to 8 grains, this being a reduction as compared with the last edition, in which from 5 to 10 grains as a dose appeared as the rule. A great improvement in the dosage of the Extracts is apparent, the majority of them having a dose of either from a quarter to 1 grain, from 2 to 8 grains, or from 5 to 15 grains. All the Syrups have a dose from a half to 1 fluid drachm, with five exceptions, in which the maximum reaches 2 fluid drachms. The practice of giving two doses for certain drugs when used for different purposes is con-

tinued; an extension of the idea has been applied to some other drugs and preparations in the direction of stating doses for a single administration and for repeated administration.

Index.

The Index will, no doubt, awaken feelings of pleasure in those gentlemen who cannot fail to perceive in it a very close imitation of their own plan and arrangement. It is evidently intended to be an epitome of the Pharmacopœia for the use of prescribers. The scheme is an ambitious one. It can, perhaps, be justified upon the ground that the prescriber usually only needs to know the dose or the strength of the particular preparation he has in mind, and further, that he is, by tabulating these particulars, relieved from the necessity for further reference to the mono graphs. But we think it can only be so justified when the scheme has been fully and adequately carried out. The Index consists of four columns, with the headings "Name," "Page," "Dose," "Strength." A reference in the preface implying that the lists of the preparations into which official articles entered, which lists in the last edition followed the individual paragraphs, had been substantially incorporated in the Index, has caused us to scrutinise the items somewhat narrowly. This reference and the statement at the beginning to the Index to the effect that every important preparation of a drug would be found under the English name of the drug naturally led us to expect a material increase in the number of items. Instead, however, we find upon making a reckoning, based upon the average number of items upon several pages, that the number of items is less than in the 1885 edition. The decrease is due to some extent to the omission of synonyms from the present Index, but it should be, we think, considerably overbalanced by the cross references which ought to have appeared. Upon turning to the English names of the drugs we first obtain a clue to the principle upon which the selection of the "important preparations" has been made. They are those in which the active component is set forth in the name, and, with a very few insignificant exceptions, only those. To illustrate what we mean let us take Pilula Galbani Composita (Syn.-Compound Pill of Asafetida), in which there are three equally important ingredients:—Asafetida, Galbanum, and Myrrh. Turning up Myrrh in the Index, there is no mention to be found of this pill, and, therefore, no indication that this drug enters into its composition. Besides the separate formulæ there is nothing now to indicate that Myrrh is an ingredient in Compound Decoction of Aloes, Compound Mixture of Iron, Compound Pill of Galbanum, and Compound Rhubarb pills. In fact the Index, in respect of the number of items and their arrangement, remains to all intents and purposes the same as in the 1885 edition, notwithstanding the statements at the beginning of it and in the preface. As we have said before, we are not now concerned with criticism, but we feel that it is our duty to warn pharmacists lest they should be misled by a paragraph implying that information previously given in one place is now to be found in another. The Index does not accord with its pretensions. It is stated that the strengths of the chief preparations are given in the fourth column. But, of the Ointments not 50 per cent. have the strengths set forth in the Index, whilst only about 25 per cent. of Tinctures, about 33 per cent. of the Spirits, only one each of the Confections, Decoctions, Glycerins, and Plasters, and none of the Infusions, have their strengths recorded there. The scheme of the Index is most excellent, but it has been carried out in such an inefficient manner as to be no improvement upon the previous edition in the matter of items, and so as to be of very little value in the tabulation of the strengths of preparations.

PHARMACEUTICAL SOCIETY.

MEETING OF THE COUNCIL.

WEDNESDAY, APRIL 6, 1898.

Present:

Mr. Walter Hills, President.

Mr. C. T. W. Newsholme, Vice-President.

Messrs. Allen, Atkins, Bateson, Bottle, Carteighe, Corder, Cross, Gross, Hampson, Johnston, Martindale, Storrar, Symes, Warren, and Young.

The minutes of the last meeting were read and confirmed.

The Late Sir Richard Quain.

The President said the Society had lost since last month one of its most distinguished honorary members by the death of Sir Richard Quain, President of the General Medical Council. Notices of his distinguished career had appeared in the lay and medical press, and it was not necessary to allude to it at any length, but he should like to recall the fact that Sir Richard Quain had been on the list of honorary members of the Society for the last thirty years. The last occasion when he was present amongst them was three or four years ago at the inaugural meeting of the School, when he expressed the great interest he took in the work of the Society. One of the subjects in which he was most deeply interested was the Pharmacopœia. In 1867 he was Secretary of the Pharmacopœia Committee of the General Medical Council, and in 1885, and again in the compilation of the Pharmacopœia which was about to appear, he was Chairman of the Committee. He might say, by way of parenthesis, that he believed the new Pharmacopœia would be on view at the General Medical Council in a few days, either this week or next. Sir Richard Quain did not live to see the publication of that book, but he was deeply interested in its preparation, and up to the very last, even when confined to his bed, he took the keenest interest in the matters which came under the consideration of the General Medical Council. He had had the opportunity of seeing a great many of Sir Richard Quain's prescriptions, and he scarcely ever ordered anything not in the Pharmacopœia. He felt that the Pharmacopœia should contain what was usually sufficient for the needs of the physician and the patient. He had a great objection to ready-made physic, as he had stated himself. He was a distinguished physician, well-known in the social life of London, and was a man of considerable intellectual power, and they must all feel that the list of honorary members was the poorer by his death. He must add that he was the lifelong friend of his (the President's) late uncle, and attended him during his last illness with the greatest care and kindness.

Mr. John Mackey.

The President also regretted to announce the decease of Mr. John Mackey, of Grange Road, Bermondsey, who joined the Society in 1842, and for many years took an active interest in its work. He served as auditor in 1867, and was well known to many members. He died at the ripe age of 84. They would all sympathise with the families both of Sir Richard Quain and of Mr. Mackey.

Election of Members.

Pharmaceutical Chemists.

The following, having passed the Major examination and tendered their subscriptions for the current year, were elected "Members" of the Society:—

Blakeley, Leonard; Boston.
Burgin, Mark Frederick; Eastbourne.
Cross, Edward Robert; Scarborough.
Shorrock, Mary; Darwen.
Widgery, Ernest; Weston-super-Mare.

Election of Associates in Business.

The following, having passed their respective examinations, being in business on their own account, and having tendered their subscriptions for the current year, were elected "Associates in Business" of the Society:—

Minor.

Anderson, David; Aberdeen.
Barratt, Herbert; Sheffield.
Barton, Francis; Egremont.
Brawn, Harry Samuel; Bedford.
Butterfield, Joseph William; Darwen.
Clarke, Andrew; W. Kensington.
Cook, Samborne; Nottingham.
Corfe, John Martin; Dover.
Cumming, John; Crewe.
Cummings, William; Dundee.
Desmond, Dennis William A.; Londo
Ewell, Richard Michael; Dover.

Eyre, Sidney, Jun. ; Sheffield.
Fearnley, Fairfax ; Leeds.
Fechtner, Arthur Louis W. ; Hull.
Field, Reeve Holyoake ; Sheffield.
Garbutt, Charles H. ; Newcastle-on-Tyne
Harrison, George William ; Reading.
Hooper, Richard J. ; South Tottenham.
Ingle, George ; Northampton.
Jackson, Joseph Gilbert ; Sheffield.
Jarvis, Samuel Horace ; Sileby.
Jewell, Harry, Southampton.
Jones, John James ; Buxton.
Kemp, William ; Inverness.
Lancaster, Bernard ; Sheffield.
Leach, Albert Henry ; Darwen.
Lewis, Albert Wheatcroft ; Newport.
Littlefield, Robert Dexter ; Hove.
Macdonald, Robert ; Inverness.
Moulson, James Ogilvie ; Bradford.
Newbould, John M. W. ; Bradford.
Nidd, John Henry ; Manchester.
Noble, John G. B. ; Newcastle-on-Tyne.
Parker, George Brook ; Bradford.
Raine, James Arthur ; Darwen.
Ramsay, William Christopher ; Dundee.
Ratcliffe, Samuel ; Southport.
Roberts, Edward Orchard ; Manchester.
Slater, Thomas Sutcliffe ; Manchester.
Smith, John Thomas ; Canterbury.
Standing, William, Darwen.
Terry, Ernest Wayte ; Manchester.
Theckston, James ; New Brighton.
Tiley, Arthur Percival ; Burslem.
Tottle, S. Harpham ; Liscard.
Troup, Alexander Stephen ; Monifieth.
Tute, James Scott ; Tunbridge Wells.
Watts, Herbert ; Sheffield.

Modified.

Corbyn, Joseph Hartwell ; Stradbroke.
Dibble, John William ; Bristol.

ELECTION OF ASSOCIATES.

The following, having passed the Minor examination and tendered, or paid as "Students," their subscriptions for the current year, were elected "Associates" of the Society :—

Allan, Wm. Fleming ; Airdrie.
Bowker, James Skinner ; Radcliffe.
Charnley, Arthur Walker ; Blackburn.
Davis, Charles ; Riverhead.
Ellis, Bernard ; Sheffield.
England, Reginald Arthur ; London.
Fawcett, Harry Rowalnd ; Retford.
Foster, Ernest Upsall ; Horncastle.
France, John Richard ; Huddersfield.
Henderson, Alex. K. ; Kirkcudbright.
Jack, William ; Arbroath.
King, Arthur Edward ; Norwich.
Mackie, Alexander ; Fraserburgh.
Marlor, Thomas ; Oldham.
Maxwell, Arthur Thomas ; Gateshead.
Milne, Hamilton ; Dysart.
Newton, John ; Heckington.
Parsons, Harold James ; Exeter.
Ross, Alexander Hovels ; Kirriemuir.
Smallwood, Frederick W. ; Chester.
Steer, James Herbert ; Sheffield.
Sturt, Clifford Henry ; Oakengates.
White, Thomas William ; Stirling.

ELECTION OF STUDENTS.

The following, having passed the First examination and tendered their subscriptions for the current year, were elected "Students" of the Society :—

Baylis, Arthur Edward ; Redditch.
Biffin, Frank ; Brighton.
Batlin, James Franklin ; Liverpool.
Dance, Gilbert Abel ; Cardiff.
Derbyshire, Charles H. ; Middlewich.
English, Robert Coulson ; Pickering.
Gray, George William ; Darlington.
Heslop, C. W. B. ; Newcastle-on-Tyne.
Hewlett, S. A. ; Weston-super-Mare.
Leal, Albert ; Solihull.
Revill, Douglas Charles ; Romford.
Reynolds, Herbert J. ; Plymouth.
Ryder, Arthur William ; Elworth
Talbot, Philip ; Bolton.
Turnbull, Edward ; London.
Weston, Walter ; Todmorden.
Williams, William Robert ; Bangor.

RESTORATIONS TO THE REGISTER.

The names of the following persons, who have severally made the required declarations and paid a fine of one guinea, were restored to the Register of Chemists and Druggists :—

Edward Williams, 146, Walker Street, Hull.
Henry Rutter Baker, 65, Leverton Street, Kentish Town, N.W.

Several persons were restored to their former status in the Society upon payment of the current year's subscription and a nominal restoration fee of one shilling.

NOMINATIONS FOR COUNCIL.

The Secretary reported that he had received seventeen nominations to fill the fourteen vacant seats on the Council, and that the following sixteen nominees had declared their willingness to accept office if elected :—

ALLEN, CHARLES BOWEN, 20, High Road, Kilburn, N.W.
ATKINS, SAMUEL RALPH, Market Place, Salisbury.
BATESON, THOMAS, 23, Stricklandgate, Kendal.
CAMPKIN, ALOERNON SIDNEY, 11, Rose Crescent, Cambridge.
CORDER, OCTAVIUS, 31, London Street, Norwich.
CROSS, WILLIAM GOWEN, 70, Mardol, Shrewsbury.
GIBBONS, WALTER, 41, Market Street, Manchester.
GROSE, NICHOLAS MALE, 8, Temple Street, Swansea.
HILLS, WALTER, 225, Oxford Street, W.
JOHNSTON, JOHN, 45, Union Street, Aberdeen.
MARTINDALE, WILLIAM, 10, New Cavendish Street, W.
NEWSHOLME, G. T. WILKINSON, 27, High Street, Sheffield.
SAVORY, ARTHUR LEDSAM, 143, New Bond Street, W.
STORRAR, DAVID, 228, High Street, Kirkcaldy.
SYMES, CHARLES, 14, Hardman Street, Liverpool.
WARREN, WILLIAM, 24, Russell Street, Covent Garden, W.C.

The following nominee had not expressed his willingness to accept office :—

DRUCE, GEORGE CLARIDGE, 118, High Street, Oxford.

NOMINATION OF AUDITORS.

The Secretary reported that he had received the following five nominations to fill the office of auditor, and that all the nominees had expressed their willingness to accept office if elected :—

BUTT, EDWARD NORTHWAY, 77, Hamilton Terrace, N.W.
LESCHER, FRANK HARWOOD, 60, Bartholomew Close, E.C.
STACEY, SAMUEL LLOYD, 22, Great St. Helens, E.C.
UMNEY, CHARLES, 50, Southwark Street, S.E.
YATES, FRANCIS, "Aysgarth," Surbiton.

GOVERNMENT VISITOR'S REPORT.

The SECRETARY read the report of the Government Visitor on the examinations in London.

"Report on the Examinations held by the London Board of Examiners of the Pharmaceutical Society of Great Britain during the year ending March 31, 1898.

"To the Lords of the Council.

"My Lords,—I have the honour to report for your information that during the year ending March 31, 1898, I attended twelve examinations of the London Board of Examiners of the Pharmaceutical Society of Great Britain held during the months of April, July, October, and January.

FIRST OR PRELIMINARY EXAMINATION.

	Numbers.	Percentages.
Candidates examined	1414	—
,, who passed	677	47·9
,, failed	737	52·1
Failed in Latin	554	39·2
,, ,, English	502	35·5
,, ,, Arithmetic	610	43·1
,, ,, all subjects	311	2·0

"The proportion of failures is not materially different from that of the preceding year. The failures in English are, however, increased, whilst the failures in Arithmetic, on which I specially commented a year ago, are appreciably diminished.

"Happily this imperfect examination will shortly be abolished, and examinations of a more searching character substituted this change ; which ought to secure a better educated class of students, appears to be a change entirely for the good of the calling of chemist and druggist.

MINOR OR QUALIFYING EXAMINATION.

	Numbers.	Percentages.
Candidates examined	913	—
,, who passed	288	31·5
,, ,, failed	625	68·5
Failed in Chemistry	323	35·4
,, ,, Materia Medica	27	3·0
,, ,, Botany	66	7·2
,, ,, Prescriptions	35	3·8
,, ,, Pharmacy and Dispensing	160	17·5
,, ,, obtaining aggregate number of marks for a pass	118	12·9

"The number of candidates who presented themselves was largely in excess of those in the preceding year, whilst the percentage of those who passed was a little decreased. It is obvious that where the percentage of rejections is so high many candidates present themselves again and again. Not a few faces of examinees are familar to the examiners.

"This points to the obvious fact that the preparation of candidates is as a rule inadequate to meet the requirements of the examiners, and to the general insufficiency of pharmaceutical training. The necessity of the chemist and druggist receiving something more than the knowledge attainable in a chemist's shop is year by year becoming better recognised.

MAJOR EXAMINATION.

	Numbers.	Percentages.
Candidates examined	84	—
,, who passed	50	59·5
,, ,, failed	34	40·5
Failed in Chemistry	15	17·9
,, ,, Physics	7	8·3
,, ,, Materia Medica	5	6·0
,, ,, Botany	9	10·7
,, ,, obtaining aggregate number of marks for a pass	14	16·7

"The number of candidates who presented themselves for this higher examination shows a regrettable and notable diminution, but of those who did present themselves a much larger percentage passed. The higher title of pharmaceutical chemist, which the passing of this examination confers, and the superior status which it affords, does not appear to attract as many aspirants as might be wished.

"The standard of the Minor and Major examinations has been well maintained, and great care has been taken to admit to the Register only those who are reasonably equipped for the safe practice of pharmacy.

"(Signed) THOS. STEVENSON.

"*March 8, 1898.*"

Report of the Finance Committee.

The Secretary read the report of this Committee, which was of the usual character, and recommended sundry accounts for payment.

The President, in moving the adoption of the report, said there was nothing special to call attention to, but referred to the fact that ten guineas had been received from Mr. Nathaniel Smith (a Founder), of Cheltenham, as a donation to the Benevolent Fund, for which they were very grateful; twenty-five guineas had been received from the Chemists' Ball. He also had the gratification of announcing, as showing the interest in the Benevolent Fund which was taken by their friends throughout the country, that they had received the sum of £1 13s., which had been collected at a smoking concert held by the Liverpool Pharmaceutical Society at Liverpool, and forwarded as a donation to the Benevolent Fund.

Report of the Benevolent Fund Committee.

The report of this Committee included a recommendation of grants to the amount of £98 in the following cases:—

A pharmaceutical chemist (70) who has had two previous grants. (Oxford.)

The widow (58) of a chemist and druggist member who has had three previous grants. This case was deferred last month. (Felixstowe.)

The widow (63) of a registered chemist and druggist who, previous to his death in 1891, had two grants from the Fund, and she herself has had three previous grants. She is unable to do anything from bad health. (London.)

A member (78) since 1855 to the present time, and a subscriber to the Fund for more than 20 years. This case was deferred last month. (London.)

The widow (54) of a member She is a hopeless invalid, and has had many previous grants. (Harrogate.

The widow (44) of an associate who died in December last in a lunatic asylum, leaving her with four children. (Forest Gate.)

The widow (43) of a registered chemist and druggist who died in 1888. She has had previous grants, and the object of the present grant is to aid in the education of her boy, aged 14 (London.)

One case was deferred for further information, and one was not entertained.

The Vice-President, in moving the adoption of the report and recommendations, said he had not much to say about the cases which came before the Committee. One was that of an old gentleman who had been in business a great many years, and, of course, any grant which could be made was not sufficient to keep such a man in a position as he ought to occupy. The case was deferred from the previous month, and the Secretary had made inquiries and exerted himself very much in the interest of this old gentleman, and had also been the means of getting some of his friends to come forward and assist, so that with the help rendered by the Fund he would at least have enough to live upon.

The report and recommendations were unanimously adopted.

Library, Museum, School, and House Committee.

The report of this Committee stated that the report of the Librarian had been received, including the following particulars:—

	Attendance.	Total.	Highest.	Lowest.	Average.
February	Day	432	27	5	18
	Evening	155	18	3	8

Circulation of Books.	Total.	Town.	Country.	Carriage paid.
February	179	101	78	19s. 8d.

Several donations had been received (*Ph. J.*, March 12, p. 263), and the Committee had directed that the usual letters of thanks be sent to the respective donors.

The Committee had recommended that the undermentioned books be purchased:—

For the Library in London:—
Chaney, Our Weights and Measures.
Dragendorff, Die Heilpflanzen der verschiedenen Völker und Zeiten.
Poulsen, Botanical Micro-Chemistry.
Zimmermann, Botanical Microtechnique.

For the Library in Edinburgh:—
Supplement to German Pharmacopœia.
Newth, Inorganic Chemistry.

The Curator's report had also been received, and included the following particulars:—

	Attendance.	Total	Highest.	Lowest.	Average
February	Day	641	44	12	26
	Evening	76	11	1	3

Several donations had been received (*Ph. J.*, March 19, p. 287), and the Committee directed that the usual letters of thanks be sent to the respective donors.

The President, in moving its adoption, said the report covered a great amount of detail, but there was nothing to which he need particularly refer.

The Financial Statement for 1897.

The President laid on the table the financial statement for the year 1897, together with the Auditor's report.

Report of the General Purposes Committee.

The portion of the report of this Committee containing the reports of the professors on the School examinations in March was read, and in accordance with those reports, the Committee recommended the following awards:—

Prize Awards.

Botany.

Silver Medal ..... Harold E. Matthews.
Certificates of Honour (equal)..... Pierre E. Felix Perrédès. / Frederick A. Upsher Smith.

Chemistry and Physics.

Silver Medal ..... Harold E. Matthews.
Certificate of Honour ..... Tom Farrow.
Do. Do. ..... William B. Nelson.

Practical Chemistry.

Silver Medal ..... Harold M. Morgan.
Certificate of Honour ..... Frederick A Upsher Smith.
Do. Do. (equal) Edgar M. Chapman. / Harold E. Matthews.

Materia Medica.

Silver Medal ..... Harold E. Matthews.
Certificates of Honour (equal)..... Edgar M. Chapman. / Pierre E. Felix Perrédès.

The President moved the adoption of the above recommendations, which was at once agreed to.

Dispensers in Prisons.

The President said he had been in communication during the last two months with the Home Office in respect to the position of dispensers in H.M. prisons, and he was glad to say that the representations which had been made to the authorities had been productive of some good. A number of small reforms had been conceded by the Department, and it was gratifying to him to find that the officials were sympathetic and disposed to treat in a fitting manner the qualified dispenser holding the Minor certificate. At the Home Office at least there was no disposition to belittle the Minor qualification. It was to be hoped that the Local Government Board might yet be brought into a similar condition of mind with regard to Poor Law dispensers.

Correspondence.

The President announced that a letter had been received from the North-East Lancashire Chemists' Association, Blackburn, enclosing a resolution that had been passed unanimously in favour of the Pharmacy Acts Amendment Bill.

The Pharmacy Acts Amendment Bill.

The President said the members of Council were aware of the present position of the Bill, and he had nothing special to report with regard to it. It was down for the committee stage on the 19th inst., and there were still certain amendments on the paper, though he was hopeful that in the meantime all opposition would be withdrawn. He would ask the Secretary to read a letter which had been received from the Secretary of the Manchester District Pharmaceutical Defence Committee.

Manchester, March 9, 1898.

To the President of the Pharmaceutical Society.

Dear Sir,—In reply to your appeal to all chemists for their loyal support to you in the promotion of the Pharmacy Acts Amendment Bill, we beg to inform you that our Defence Committee has again very fully considered the matter, and we have been instructed to communicate with and tell you the result of our deliberations.

Let it be clearly understood that we, equally with the promoters of the Bill, are most anxious that "chemists and druggists" should have representation on the Council, and this purely as a matter of justice. In the first place, we feared that by removing one of the inducements to pass the "Major" a detrimental effect would be produced in pharmaceutical education, which, in our opinion, is already of too low a standard. However, taking into consideration the fact that very shortly the "Preliminary" will have a desirable though slight advance in its standard, and having received the assurance that an advance will be made in the other examinations, we feel that our objections on this score may be removed.

In the second place, as we fear the general adoption of that misleading title "Member of the Pharmaceutical Society," we cannot see our way to conscientiously waive our objections on this point, and would have liked to have seen the Bill amended so as to meet our views. However, as the Bill as a whole has been introduced with a view of so consolidating the body of chemists that the Council may in the near future, with greater power, approach Parliament on the question of certain most desirable reforms, we have determined to loyally remove all obstacles that we have placed in the way by withdrawing our opposition entirely.

The following resolution was adopted :—

"That in consequence of the appeal made to us by the President of the Pharmaceutical Society, and with assurances which we have received not only from the official press, but from the utterances (public and otherwise) of prominent supporters of the Bill, that the true title and qualification of 'Pharmaceutical Chemist' will in the future be duly safeguarded, it is hereby resolved to withdraw our opposition to the said Bill."

In conclusion, having withdrawn our opposition and thus shown our loyalty to the Society, we trust that those who are not already members will join in such numbers as will prove the accuracy of the statements made by local secretaries and others, who have asserted that there is a great demand for this reform.

We are, dear Mr. President,
Yours faithfully,
Walter Gibbons, Chairman.
F. Pilkington Sargeant, Hon. Sec.

Manchester and District Pharmaceutical Defence Committee.

Legal Matters.

The Council subsequently went into Committee as usnal to consider the portion of the report of the General Purposes Committee dealing with legal matters. On resuming, the report and recommendations were received and adopted, and special resolutions were passed authorising the Registrar to take proceedings against the persons named therein.

MAJOR EXAMINATION QUESTIONS.*

April 1 and 2, 1898.

CHEMISTRY.

1. The equivalent of a certain metal is 46·66, and its specific heat ·04479. Calculate its atomic weight.
2. What experimental evidence is there to show that the molecule of hydrogen contains at least two atoms?
3. Excess of a readily oxidisable substance is slowly added to an aqueous solution of potassium permanganate containing (*a*) sulphuric acid, (*b*) potassium hydrate. Describe the changes which the permanganate undergoes in each case.
4. From what raw materials may ordinary window glass be manufactured? Indicate briefly a method for its qualitative analysis.
5. Describe the visible changes, if any, which occur when each of the following substances is strongly heated in the air, and express the chemical changes, if any, by equations:—Copper nitrate, potassium nitrate, ferrous sulphate, ammonium sulphate, oxalic acid, potassium ferrocyanide.
6. Contrast the acetic with the lactic fermentation. How would you prove the presence of lactic acid in presence of acetic acid?
7. Starting from glycerin, how may trichlorhydrin be prepared?
8. Given a mixture of aniline (b. p. 183°) and phenol (b. p. 183°), containing about 10 per cent. of nitrobenzene (b. p. 205°), how would you separate the three compounds and prepare from each a crystalline derivative?
9. What would be the result of treating each of the following substances with (*a*) cold, (*b*) hot concentrated aqueous potash:—Aldehyde, benzaldehyde, resorcin(ol), acetamide, ethyl nitrite, acetyl chloride?

PHYSICS.

1. What is meant by the "diffusion of gases"? Describe generally the methods employed for its investigation.
2. How would you proceed in order to determine the specific heat of a given metal?
3. Describe the uses of the process of distillation, illustrating your answer by some distillation that you have yourself carried out.
4. Explain the term plane of polarisation of light.
5. Describe some of the methods at present in use for artificial illumination, explaining the principles on which they depend.
6. If the spectrum obtained from one source of light be continuous, and that from another source discontinuous, what conclusions may be drawn as to the two sources of light respectively?
7. Describe and explain the construction of some instruments used for measuring electric currents.
8. Under what conditions do electric currents attract or repel one another? Describe experiments illustrating the facts.
9. The earth is often spoken of as a magnet, state what this means, and describe the apparatus employed for investigating the magnetic condition of the earth.

BOTANY AND MATERIA MEDICA (A).

BOTANY.

1. Give an account of the structure, mode of origin, and function of cork. What is bark?
2. Write a concise description, with diagrams, of the structure of a dorsiventral leaf. Point out the functions of the several tissues and show how the leaf as a whole illustrates the principle of the physiological division of labour.
3. Write a *brief* description of the external characters of the following:—An Oak leaf, the leaf of a Bracken fern, the stem of *Equisetum*, and the flowers of a Willow.

MATERIA MEDICA.

1. What official drugs are obtained from plants of the natural order Umbelliferæ? Name and state the average proportion of the principal constituents present in them.
2. How would you prepare (*a*) hydrochlorate of morphine from opium, (*b*) cocaine from coca leaves?

* The time allowed for each of the four papers given to each candidate was three hours. It was not permitted to attempt more than six questions in chemistry or physics. The (A) and (B) papers in botany and materia medica were given to alternate sets of candidates.

BOTANY AND MATERIA MEDICA (B).

BOTANY.

1. Describe carefully the manner of origin of a lateral root, and give an account of its histological structure. What do you understand by an adventitious root?
2. Mention three plants characteristic of each of the following situations:—Seashore, fresh-water ditches and ponds, woods, and sunny meadows. What general differences in structure, external and internal, are there between plants from these several situations?
3. Compare and contrast the organs of absorption and assimilation in the following plants:—*Marchantia*, *Fucus*, *Funaria*, and *Viscum*.

MATERIA MEDICA.

1. What plants belonging to the natural order Compositæ yield official products? State the average proportion of active constituents present in each.
2. How would you determine the proportion of quinine present in a given sample of cinchona bark? Give your reasons for each separate stage in the operation.

PRACTICAL BOTANY AND MATERIA MEDICA (A).

BOTANY.

1. Make a transverse and a longitudinal section of A.
   Draw your preparations, giving explanatory sketches of the structures shown in the sections. To what group of plants does the specimen belong?
2. What is B? Make a careful dissection of it, and draw your dissection. Isolate the embryo, and leave it for examination in a watch-glass.
3. Refer C to its natural order, giving reasons for your reference.

MATERIA MEDICA.

1. Prepare transverse and longitudinal sections of the root provided. Leave your slides for inspection with descriptive sketches pointing out the histological characteristics of the drug. Name any cell-contents present which you may recognise.
2. Identify and report upon the quality of "The Powder."

PRACTICAL BOTANY AND MATERIA MEDICA (B).

BOTANY.

1. Make a transverse section of A, and give a drawing with explanatory references to the features shown in the section. Determine the organ, giving reason for your determination.
2. Give a description of the external morphological features presented by B. Refer the plants C and D to their natural orders, giving reasons for your reference.

MATERIA MEDICA.

1. Prepare transverse and longitudinal sections of the root provided. Leave your slides for inspection with descriptive sketches pointing out the histological characteristics of the drug. Name any cell-contents present which you may recognise.
2. Identify and report upon the quality of "The Powder."

DENTAL NOTES.

A Filling for Roots.

Brubacher recommends an antiseptic composed of iodoform powder, 2; salol, 2; cacao butter, 5. In this form it can be easily packed into devious cavities.

Formaldehyde and Geranium Oil as a Dental Disinfectant.

A solution of formaldehyde, 40 parts, and oil of geranium, 20 parts, in alcohol 80 per cent., so as to produce 100 parts, is recommended by De Marion and André for use in dental easier, for producing perfect asepsis. The authors state that the preparation has given better results than any other disinfectants that they have used. The solution is stated to keep well even when no special precautions are taken with it.—*Monde Dentaire*, xi., 414.

Thymol in Odontalgia.

Hartmann finds thymol preferable to arsenic to obtund the nerve in dental caries. The decayed tooth is simply packed with a plug of cotton wool on which a little powdered thymol has been sprinkled. This does not irritate the mucous surface, and is easily removed by rinsing the mouth. It is non-toxic, and does not at first increase the pain.—*Progrès Dentaire*, xxiv., 224.

Gargle for Fetid Breath.

Dieterich recommends the following as a deodorant gargle:—Saccharin, 0·50; salicylic acid and salol, of each 0·20; vanillin, 0·10; rectified spirit, 100. Half a teaspoonful in half a tumblerful of tepid water as a gargle five or six times a day.—*Odontologie* [2], v., 306.

Concentrated Dentifrice.

Thymol, 50 centigrammes; tincture of krameria, tincture of myrrh, of each 5 grammes; alcohol (90 per cent.), 80 grammes distilled water, 20 grammes; oil of peppermint, 10 drops.—*Odontologie* [2], v., 405.

Table of Thermometric Equivalents

According to the Centigrade, Fahrenheit, and Réaumur Scales.

ROYAL INSTITUTION

On Friday, April 1, a lecture was delivered by Professor Dewar, F.R.S., on

Liquid Air as an Analytic Agent.

Professor Dewar, at the outset, called attention to the increased importance of the study of low temperatures. He had only that morning received a circular from the Society of Chemical Industry, New York, respecting the liquefaction of air on a commercial scale. The statement had been made that our American cousins purvey liquid air in milk-cans. The Professor's assistants, Mr. Lennox and Mr. Heath, were determined not to be beaten, and they had, therefore, prepared for his use that evening some two and a half gallons of liquid air. That was contained in a vessel cased in wood, and having the outward appearance of a common milk-can, and doubtless surrounded by a vacuum chamber, which Professor Dewar's researches have shown to be so efficient in hindering the conduction of heat. In order to demonstrate some of the properties of liquid air a portion was baled out by means of an ordinary measure as used by milkmen, and poured on a silver vessel heated to redness. The liquid remained apparently as quiescent at this high temperature as in cooler vessels, and maintained a spheroidal condition, just as would a drop of water on a red-hot plate. The temperature of the liquid air itself was about −210° C., or 63° in terms of absolute temperature; therefore the red-hot vessel was 10 or 12 times the absolute temperature of the liquid. Professor Dewar then proceeded to refer to various analytical operations in which liquid air is of service, dealing at length with the qualitative separation of mixtures of gases. Coal gas, a mixture of hydrogen, marsh gas, carbonic oxide, and various illuminating gases and impurities, might be placed in a vessel and surrounded by boiling liquid air. It was possible, in these circumstances, to condense all gases except carbonic oxide and hydrogen, and thus leave a mixture of these two gases.

Ultimately, however, the carbonic oxide might be condensed and hydrogen be left alone in the gaseous state. Similarly, any gas less easily condensed than air could be separated from a mixture of the same with air. Hydrogen present in air to the extent of one in a thousand is just detectable by this plan of work, but smaller quantities are missed, since traces dissolve in the liquid. In order to press this inquiry a little further, some natural gas known to contain a different constituent, like helium, suggested itself as being worthy of trial. Lord Rayleigh's analysis of the gas from the King's Well, at Bath, gave 1·2 part of helium per 1000 volumes, so that it seemed admirably adapted for such experiments. By the kind permission of the Corporation of Bath the lecturer had obtained an abundant supply of this gas. Professor Dewar next threw on the screen photographs of the old Roman Bath and the King's Well. Reference was made to a paper read before the Royal Society on December 19, 1833, by Dr. Daubeny, Professor of Chemistry at Oxford University, on the "Quantity and Quality of the Thermal Springs of the King's Well in the City of Bath." Dr. Daubeny's experiments extended over a month, and he estimated the volume of gas given off as from 80 to 530 cubic inches per minute (average 264). Professor Williamson, of University College, had also analysed this gas in 1865, and found a trace (0·2 per cent) of marsh gas.

Concerning his own published work the Professor said the sample of gas from the Bath Spring was treated exactly in the same way as the hydrogen mixtures. During liquefaction there was a marked difference in the appearance of the liquefied gases, for while the hydrogen and air gave a clear, transparent liquid, the product from the Bath gas was turbid, and a precipitate gradually formed which by transmitted light looked yellowish-brown. This experiment was repeated. The yellowish-brown precipitate is a solid body, probably of the petroleum series of compounds, and having a marked aromatic smell. It was probably this gas which Professor Williamson gave as marsh gas in his analysis. Further research will be made on this substance, indeed, a large quantity of gas has recently been collected for the purpose. Another peculiarity of the liquid nitrogen obtained from Bath gas is that, on examining it with a spectroscope, even through a thickness of two inches of liquid, no trace of the characteristic oxygen absorption spectrum could be obtained. In all other attempts to liquefy nitrogen on the large scale, oxygen can readily be detected in the liquid, by means of its absorption spectrum. Another phenomenon was also well shown. The gas from the King's Well could not be entirely condensed by refrigeration with liquid air boiling *in vacuo*. After the cooling had continued for some time, the gas ceased to flow into the condensing vessel, and the upper part of the vessel was occupied by a gas that would not undergo liquefaction or solution. The bulk of this gas was helium, an element long known to exist in the sun, but only recently discovered by Professor Ramsay in anything terrestrial. It is, therefore, possible to separate helium from other gases by liquefaction when it is only present to the extent of one part in one thousand. From this it would appear that helium is less soluble in liquid nitrogen than hydrogen in liquid air, and is of greater volatility than the constituents of the other gases which were condensed. If the sample of the uncondensed gas from the first liquefaction of the Bath gas were again treated in the same way, a much more concentrated specimen of helium could be obtained. Provided helium were wanted on a large scale, then a liquid air apparatus similar to that in use at the Royal Institution, transported to Bath and worked with the gas from the King's Well, could be made to yield a good supply, as the gas contains 12 parts in 10,000.

Argon, which is present in the proportion of 140 parts per 10,000, condenses with the nitrogen, but if the liquid be allowed to slowly boil away, a residuum may be obtained containing about 7 per cent. of argon. An interesting experiment was performed, showing that argon, when frozen, solidifies to a perfectly clear glass, and is only visible when passing to or from the gaseous condition.—The relation of atomic weight to X rays was next discussed, shadows from various liquefied gases being thrown on the screen. The influence of various bodies in assisting high vacuum as a non-conducting jacket to vessels used in experimenting at low temperatures was next demonstrated. Professor Dewar has shown that a good exhaustion reduces the influx of heat to one-fifth of what is conveyed when the annular space of such double-walled vessels is filled with air. If the interior walls are silvered, or excess of mercury vapour is allowed to remain, the influx of heat is diminished to one-sixth of the amount entering without the metallic coating. The total effect due to the high vacuum and silvering is to reduce the ingoing heat to one-thirtieth of the original amount, *i.e.*, roughly, to 3½ per cent. In the experiment performed on Friday three similar double-walled glass tubes were mounted on a common stem. Between the walls of one of the jackets was magnesia; in another finely-divided carbon was used; while the third was vacuous. Since all were mounted on the same stem, all were equally vacuous. These tubes were filled to the same level with liquid air, and the rate of evaporation noted. The liquid contained in the tube isolated by high vacuum alone lost volume much more rapidly than the other tubes. Without altering any other condition, the common stem was broken, so that air was simultaneously admitted into the jackets of the three tubes. The rate of evaporation was at once reversed, and was slowest in the tube jacketted with air alone.

ANALYTICAL NOTES.

Examination of Mace.—Solstein draws attention to a marked difference between Bombay and Banda mace in the amount of extractive soluble in ether yielded by the two varieties after being freed from fat with petroleum ether. The Bombay gives ten times as much ether-soluble extractive as the Banda variety. The weight from this latter kind should not exceed 5·5 per cent. By means of this test the admixture of 10 per cent. of Bombay mace may be detected, as this will bring the amount of ethereal extract up to 6 per cent.—*Pharm. Zeit.*, xlii., 531.

Detection of Para-Amidophenetol in Phenacetine.—Commercial phenacetine almost always contains more or less para-amidophenetol. To detect it a small portion of the sample is melted in a capsule with a little pure chloral hydrate. A brilliant violet colour will be formed if the impurity is present, and varies in intensity with the amount. Even the purest samples give a slight reaction.—*Journ. Pharm. d'Anvers*, liii., 357.

Test for Chloral Hydrate.—Hirschsohn gives the following test for the presence of alcoholate:—1 gramme of the sample is added to 1 C.c. of the nitric acid (1·38 specific gravity). The mixture should not turn yellow or give off yellow vapours in the space of ten minutes either at ordinary temperature or on warming.—*Pharm. Centralh.*, xxxviii., 238.

THE STUDENTS' PAGE.

EXPLANATORY NOTES ON THE B.P.

Tincturæ.—The tinctures constitute a large and important class of preparations. The reasons for their extensive employment in medicine are chiefly two; first, their permanence, owing to the preservative properties of alcohol, and secondly, the facility with which alcohol exhausts certain drugs, such as guaiacum, benzoin, Indian hemp, etc. Subsidiary reasons are to be found in the attractive appearance of tinctures, which can usually be filtered perfectly bright. For alcohol coagulates, and does not extract albuminous and gummy substances, and these form the chief obstacle to the clarification of preparations like the infusions and decoctions. Moreover, the medicinal actions of many carminative and tonic remedies like ginger, calumba, and cinchona is considered to be distinctly promoted by the association of their active principles with alcohol. Proof and rectified spirits are the two strengths of alcohol employed almost exclusively in the official formulæ. There is no doubt that many drugs are exhausted better by alcohol of other strengths than those at present ordered, and in some cases equally well and more economically by weaker alcohol than that of proof strength. In the forthcoming edition of the British Pharmacopœia changes in this direction will doubtless be found, based upon work which has been done mainly since the publication of the 1885 edition. The student will best obtain a useful comprehension of large groups of galenical preparations like the tinctures, by tabulating them for himself instead of merely scanning tables to be found in books. Arrange the members of such groups in tables based upon (*a*) their proportion of active ingredient; (*b*) the nature or strength of their menstruum; (*c*) the processes adopted in making them; and (*d*), lastly, their doses. By the time this is done the student will have acquired, without any effort of memory, a large amount of information of much more value than an ephemeral knowledge acquired by cramming methods. The tabulation will necessitate a critical consideration of each individual preparation, and this will bring into prominence many points easily overlooked. It is not necessary to commit to memory the strength of galenical preparations except in the case of the more potent ones, when such a knowledge acts as a useful check upon one's memory of the dose of the preparation. In the case of compound preparations it is never necessary to commit to memory the proportions of the subsidiary ingredients; for example, in tinctura camphoræ composita the proportion of opium only need be remembered.

Unguenta.—The official ointments may be roughly divided into two classes, those made with paraffins and those made with vegetable and animal fats. Soft and hard paraffin have the advantage of being very inert substances not chemically reacting with the materials mixed with them. Their slow absorption by the skin favours their employment in making ointments intended to have a local action on the skin, as opposed to ointments which have a general constitutional action, *e.g.*, ointment of mercury. The formulæ of the official ointments do not seem in many cases consistent with either of these guiding principles. The employment of a mixture of hard and soft paraffin is rather unsatisfactory owing to the tendency of the hard paraffin to crystallise out during the cooling of the mixture. If an ointment of this nature be rubbed in a mortar or on a slab until cold the product is lighter in colour than one obtained by gently stirring with a spatula in a pot during the cooling owing to the entanglement of air bubbles in the former case. Benzoated lard is better than plain prepared lard, because the benzoic acid and other aromatic bodies extracted from the benzoin prevent the development of the ferment-organisms to whose presence the rancid decomposition of animal and vegetable fats is due. The ointments with simple ointment or lard, when prepared in small quantities, are best made in the cold by incorporating the ingredients on a porcelain slab by means of a long flexible spatula. If large quantities be made, it is more expeditious to melt the fat and stir in the medicament. If this be a powder like boric acid or zinc oxide, it should be passed through a fine sieve just before stirring in. Great care should be taken not to overheat the fat when melting it. Always use a water-bath—never a naked flame; and in most cases it is preferable to heat the fat only a few degrees above its melting point. This shortens the subsequent period of cooling, and obviates the danger of damaging the medicament by heat or volatilisation.

Vapores.—The inhalations of the Pharmacopœia are not much used, preparations of this nature being usually prescribed specially to meet the requirements of each case. The official formulæ do not require much explanation. In *vapor chlori* only a small fraction of the total available chlorine, liberated by the carbonic acid of the air and added water, is utilised. Solution of potash is added to the hemlock juice in *vapor coninæ* to liberate the alkaloid which is volatile in the free state. In the natural juice it is combined with malic acid, and the salts of conine are not volatile at the temperature of boiling water. In *vapor olei pini sylvestris* the light carbonate of magnesium is used to disseminate the oil throughout the water in the inhaler.

Vina.—In ancient and mediæval pharmacy wines of various kind were largely used as menstrua for the preparation of medicines, probably owing to the fact that they formed in former times the most readily available alcoholic fluids. By virtue of the alcohol contained in them, products possessing activity and keeping properties could be obtained, the flavour of the wine serving also to mask to some extent the taste of the medicinal substance. The official wines of aloes, opium, and rhubarb are not much used. Sherry for medicinal purposes is required by the Pharmacopœia to contain about 17 per cent. of alcohol. This excludes the use of the lighter wine imported under the shilling duty on account of its containing only about 12 per cent. of alcohol, while the fortified wine is charged half-a-crown per gallon. A good deal of cheap so-called sherry does not originate from the juice of the grape, but is a concoction of flavoured spirit of Teutonic origin. *Vinum ferri* has been shown to be a very weak and variable preparation of iron. The solution of the small quantity of iron is probably due to the action of the free organic acids or acid salts contained in the wine. *Vinum ferri citratis* was introduced as an alternative preparation to *vinum ferri*, and has the advantage of containing a definite quantity of iron. It possesses also a pleasant flavour, but notwithstanding these recommendations it does not seem to have received the extended use it deserves. *Vinum ipecacuanhæ* is not very satisfactory, for although the acetic acid efficiently extracts the alkaloids of the root, these are injured by the subsequent prolonged evaporation to dry extract.

HOLIDAY BOTANY.

The Easter holidays will afford an excellent opportunity fo botanising on moor and mountain, wood and field, and to the observant eye many beautiful objects will be revealed. The scale-mosses will now be sending up their transparent glass-like fruit stalks everywhere on damp rocks and dripping banks, and are best studied at this time of year. The beautiful peristomes of many of the true mosses will be in fit condition for examination, and of others the male flowers nestling in the cup-like crown of leaves at the top of the stem will be in perfection. The *Nitella* and *Chara* are just beginning to show in pools in shady woods and in calcareous fields, their spring growth having already commenced. *Spirogyra* and other fresh-water algæ will be found in fruit in ditches and runlets, and on fallow fields *Vaucheria* will be found covered with fruit in green patches on the bare patches of soil in damp corners. Several rare and interesting plants are now in flower. The little moschatel (*Adoxa moschatellina*) is now flowering in damp woods, the *Chrysosplenium oppositifolium* on dripping banks or by streams, and are both worth examination. Of rare plants the *Anemone pulsatilla* should now be out on chalky hills, and the *Pulmonaria angustifolia* in the Isle of Wight and the New Forest, *Hutchinsia petræa* in the Derbyshire dales, *Thlaspi perfoliatum* in Oxfordshire and Gloucestershire, and the rare little grass *Mibora verna* will reward those who visit Anglesea. By the sea, especially near the mouth of rivers, the sea grass (*Zostera marina*) will already have its leaf tips covered with various interesting parasitic species of algæ, and on more exposed places the Laminarias will be found exhibiting the remarkable intercalary growth of those plants, and some of the Fuci will be found in fruit, and will well repay examination. Foraminifera may be looked for in the ripples left on sandy shores in the form of slender white lines, and diatoms in the shallow ditches and runlets by roadsides. Those who prefer more serious study will find work in plenty afforded at the Marine Biological stations at Plymouth and Malpas in Cumbrae.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australasia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office: 5, SERLE STREET, W.C.

LONDON: SATURDAY, APRIL 9, 1898.

THE COUNCIL MEETING.

AFTER the reading of the minutes of the previous meeting, the PRESIDENT, referring to the death of Sir RICHARD QUAIN, said that the Society had lost one of its oldest and most distinguished honorary members, who had always taken great interest in the work of the Society, and had long been prominently connected with the revision of the British Pharmacopœia, from 1867, when he was Secretary to the Committee entrusted with that duty by the General Medical Council, down to the time of his death, when, as Chairman of the Committee, he was looking forward to the publication of the forthcoming Pharmacopœia. As a steadfast objector to the use of "ready-made physic," Sir RICHARD would be regretted by pharmacists no less than in other circles where he was conspicuous for his intellectual and social qualities. Reference was also made to the death of Mr. J. B. MACKEY at the age of eighty-four, who had been a member of the Society since 1842, and had served the office of Auditor.

The additions to the Society comprised 5 members, 74 associates, and 17 students.

The Secretary reported that out of seventeen nominations which had been received for the election of fourteen members of Council, sixteen of the nominees had signified their willingness to accept office if elected, the two new candidates being Mr. A. S. CAMPKIN, of Cambridge, and Mr. W. GIBBONS, of Manchester.

The Auditors nominated were the same as last year, and they are willing to accept office if elected.

The report of the Government Visitor to the examinations was read by the SECRETARY, and it showed that the proportion of failures to pass the Preliminary examination has not been materially different from that of previous years, thus confirming the belief that the provision for establishing a higher standard would be the means of securing pharmaceutical students of a better educated class than many of those now entering upon that position, and of effecting a reform beneficial to the public and to the interests of the calling. In regard to the general results of the qualifying examination, Dr. STEVENSON reports that the standard has been well maintained, and that care has been taken to admit to the Register only those who are reasonably equipped for the safe practice of pharmacy. Mention was, however, made of the manifestly deficient preparation of many candidates who present themselves again and again unsuccessfully. Such chronic incapacity to meet the requirements of the examiners is regarded by Dr. STEVENSON as evidence of the general insufficiency of pharmaceutical training. This experience has been continued so long that it has become a point of primary importance in regard to the material interests of the body, and on that account it should be an incentive to fresh endeavours to establish a better system of education. The same inference may be drawn from the fact that the number of candidates for the higher and voluntary qualification of pharmaceutical chemist shows a notable diminution, for though there has been a much larger percentage of successful candidates for the Major examination, the superior status does not appear to attract so many aspirants as might be wished.

The report of the Finance Committee was adopted without comment as being of the usual character. The PRESIDENT mentioned the receipt of ten guineas from Mr. NATHANIEL SMITH as a donation to the Benevolent Fund, and twenty-five guineas from the Chemists' Ball Committee through Mr. WARREN. As a further proof of the interest taken in the Benevolent Fund throughout the country the PRESIDENT also made the gratifying announcement that £1 13*s.* had been received as the amount of a collection made at a smoking concert held at Liverpool by the local students' association.

The report of the Benevolent Fund Committee recommending the payment of seven grants, amounting in all to ninety-eight pounds, was adopted on the motion of the Vice-President, who referred to the successful result of the Secretary's exertions in getting some friends of one of the candidates to supplement the assistance that has been rendered from the Benevolent Fund.

The report of the Library, Museum, School, and House Committee, though it dealt with a number of interesting details, contained nothing calling for particular comment and was adopted.

The PRESIDENT drew attention to the Society's Financial Statement which was laid upon the table together with the Auditor's report for the use of members of Council.

One part of the report of the General Purposes Committee gave the reports of the Professors on the School Prizes Examination in March, in accordance with which the Silver Medal in Botany was awarded to Mr. HAROLD E. MATTHEWS, and equal Certificates of Honour to Mr. P. E. F. PERRÉDÈS and Mr. F. A. UPSHER SMITH.

In Chemistry and Physics the Silver Medal was awarded to Mr. MATTHEWS, and Certificates of Honour to Mr. T. FARROW and Mr. W. B. NELSON.

In Practical Chemistry the Silver Medal was awarded to Mr. HAROLD M. MORGAN; a Certificate of Honour to Mr. UPSHER SMITH, and equal Certificates of Honour to Mr. E. M. CHAPMAN and Mr. MATTHEWS.

In Materia Medica the Silver Medal was awarded to Mr. MATTHEWS, and equal Certificates of Honour to Mr. CHAPMAN and Mr. PERRÉDÈS.

The PRESIDENT mentioned that he had been in communication with the authorities of the Home Office in reference to the position of dispensers in H.M. prisons, and he was glad to say that his representations had been productive of some good by leading to some reform and the expression of a sympathetic disposition on the part of the officials to treat qualified dispensers holding qualification under the Pharmacy Act in a fitting manner. He also expressed a hope that the Local Government Board might yet be induced to take a similar view in regard to Poor Law dispensers.

Among correspondence received during the past month, the President drew attention to a letter received from the North-East Lancashire Chemists' Association, enclosing a resolution in favour of the Pharmacy Acts Amendment Bill. In reference to the position of that Bill, he had nothing to add to what is known in regard to it, except that he was still hopeful all opposition would be withdrawn, and as showing progress in that direction a letter was read from the Secretary of the Manchester and District Pharmaceutical Defence Committee, in which the grounds on which opposition had been offered were explained, and it was stated that on reconsidering the subject and taking into account that the object of the measure is to consolidate the body of chemists, the members of the Committee had loyally determined to withdraw their opposition to the Bill, in the hope that the anticipated accession to the Society would be realised.

After the legal portion of the General Purposes Committee had been considered in committee, its recommendations were adopted, and special resolutions were passed authorising the Registrar to take proceedings in several cases of alleged infringement of the Pharmacy Acts.

COMPANY LAW.

It is gratifying to notice the action recently taken by the Council of the Pharmaceutical Society of Ireland in approaching the Board of Trade with a view to securing much needed amendment of the Companies Acts, as similar steps had already been taken by the Council of the British Society in conjunction with representatives of other corporate bodies. Though it was considered desirable at the time to regard the proceedings as private, no confidence is now being abused by stating that, in December, 1895, a conference was held at 17, Bloomsbury Square, London, for the purpose of discussing the then proposed amendment of the Companies Acts. The delegates attending that conference represented the British Medical Association, the British Dental Association, the Medical Defence Union, the Pharmaceutical Society of Great Britain, the Royal College of Veterinary Surgeons, and the Society of Apothecaries. As an outcome of the deliberations of the conference, a deputation was appointed to wait upon the President of the Board of Trade, with the object of calling attention to the anomalous condition of the present law, in regard to the incorporation of companies formed for the purpose of evading Acts of Parliament passed for the protection of the health of the public, and to urge the importance of inserting provisions in an amending Bill to prevent the incorporation of companies for the purpose of carrying on any profession or calling which it is unlawful for an individual to carry on without possessing a statutory qualification.

A clause was also agreed upon, which it was proposed should be inserted in the Companies Act Amendment Bill, with a view to remedying the anomalous condition of the law. The effect of that clause, when embodied in an Act of Parliament, would have been to prevent the registration of any company under any name or title that cannot be taken or used by a natural person unless that individual possesses some personal qualification. Moreover, any existing company assuming such a name or title would have been deemed to be carrying on business for an illegal purpose within the meaning of the Act, and consequently, subject to the same consequences in all respects as though the company was a natural person. That clause was duly submitted by the deputation which waited on Mr. Ritchie, in February, 1896, but when the Companies Acts Amendment Bill was subsequently introduced into the House of Lords, it was found to be practically identical with the original draft, and the not unnatural conclusion to draw from that circumstance seems to be that the persuasive eloquence of the members of the deputation had counted for as little as the courteous plausibility of the member of the Government who received them.

A further conference then took place, the original delegates being reinforced by the sub-committee of the Law and Parliamentary Committee of the Pharmaceutical Council, and it was then decided to draft a statement for presentation to Sir Courtenay Boyle, Parliamentary Secretary of the Board of Trade, setting forth the objects the members of the conference had in view, the grounds for urging the acceptance of their views, and the evils already created by the abuse of the privilege of incorporation. Such a statement had been suggested by Sir C. L. Peel, Clerk to the Privy Council, who had previously been approached in the matter. The statement was duly presented, but Sir Courtenay Boyle could not be moved from the position that the evils complained of could most properly be dealt with by medical, dental, veterinary, and pharmacy Bills, amending existing Acts. Attempts to influence the Lord President of the Council also signally failed, the law advisers of the Privy Council arguing that the Pharmaceutical Society was the body most interested in the question, and that, so far as that body was concerned, the matter had been definitely settled by the decision in the case of the Pharmaceutical Society *v.* London and Provincial Supply Association, Limited. The effect of that decision was to render every offender under the Act personally liable, and that view was held to be confirmed by the decision in the case of the Pharmaceutical Society *v.* Wheeldon. Such, at least, was the opinion of the law advisers of the Privy Council, who somewhat irrelevantly added that the Pharmaceutical Society had never enforced the regulations for the keeping, dispensing, and selling of poisons, which its representatives had pledged themselves to carry into effect.

It would be tedious to go into the details of all that has since been done in the matter. Suffice it to say that a further attempt to move the Privy Council met with no response beyond a hint that a joint Bill to amend the various professional Acts already referred to might be supported by the Government, if the bodies interested thought fit to leave the Companies Bill alone. Shortly afterwards the Select Committee of the House of Lords on the Companies Bill came into existence, and that body was approached in turn. Evidence was drafted for presentation to the Committee, but the Session of 1896 closed without any advance having been made. Re-appointed in 1897, the Select Committee was again approached, but the only reply to the appeal to be heard—sent after many months—was to the effect that the matter had been delayed owing to the illness of one of the House of Lords' clerks, and that the application would be submitted to the Committee at its next meeting. That meeting has not yet taken place, but as the Select Committee is continuing its labours this Session, there is hope that the efforts put forth during the past two and a half years may receive some recognition even yet.

ANNOTATIONS.

The New Pharmacopœia, a general review of which we publish this week, will be issued to the public in about three weeks from now. Meanwhile, copies will be open to inspection at the offices of the General Medical Council in London, Edinburgh, and Dublin, whilst readers of the *Pharmaceutical Journal* will be supplied by the Editor with detailed information concerning the new processes, formulæ, etc., in next week's issue, a copy of the book having been sent by the General Medical Council in advance of official publication by advertisement in the Gazettes. Naturally, the publication of the work will be followed by a flood of commentaries and students' text-books based thereon; and already Messrs. J. and A. Churchill announce the twelfth edition of Beasley's 'Pocket Formulary and Synopsis of the British and Foreign Pharmacopœias,' which is to be based on the new B.P. The editor of that edition will be Mr. J. Oldham Braithwaite, whose numerous friends will not need to be told that he is producing what is virtually an entirely new book, which should form an essential item on the shelves of every pharmacist and medical man in English-speaking countries. The same firm will also shortly publish a new work on 'Practical Pharmacy,' by Mr. E. W. Lucas, whilst their list of forthcoming publications also includes 'A Manual of Bacteriology,' by Dr. Hewlett, of the British Institute of Preventive Medicine, a former assistant of Professor Crookshank, of King's College, London.

Regulations for the Sale of Poisons, to be effective, must be properly carried out, and registered chemists ought to spare themselves no inconvenience in endeavouring to fulfil the requirements of Section 17 of the Pharmacy Act, 1868, to the utmost. From time to time it is suggested by coroners, ill-informed newspaper writers and others, that chemists have not done all that was necessary in certain instances, but such suggestions usually prove to be based on some misconception of what the law actually requires. Such a point is raised in connection with the regrettable death of the daughter of the late Karl Marx, who poisoned herself by swallowing prussic acid on Thursday of last week. The poison was obtained from a Sydenham chemist, on the strength of a written order, which he understood was sent by Dr. Aveling, the well-known writer and lecturer on scientific and socialistic subjects, whose card was also sent. The poison, which was said to be intended for a dog, was handed over the counter to the maidservant who brought the order, and according to the newspaper reports, the chemist also gave her the poison book in order that she might take it home and have it signed there. The deceased lady initialled the book and returned it in due course. Now, if the transaction occurred as stated in the newspaper reports, and as briefly summarised above, it seems clear that the provisions of Section 17 were not properly carried out. Since, however, the Coroner for the district is expected to take action in the matter, further comment is obviously undesirable at present.

Acetylene Gas Apparatus of various kinds is to be exhibited at the Imperial Institute, the Council of that institution having authorised the holding of an exhibition of such apparatus in the grounds of the Institute, at an early date. In order to ensure that no apparatus shall be admitted to the exhibition unless it is shown to fulfil the requisite conditions of safety, the Council of the Society of Arts has appointed a committee to decide upon those conditions and to lay down rules for the admission of apparatus. Full particulars will shortly be issued as to the regulations and rules laid down, and the following gentlemen have been appointed to act on the committee:—Major-General Sir Owen Tudor Burne (Chairman of the Council), Sir Frederick Bramwell, Professor James Dewar, Mr. Harry Jones, M.Inst.C.E., Professor Vivian B. Lewes, Professor Boverton Redwood, Professor W. C. Roberts-Austen, Professor J. M. Thomson, and Sir Henry Trueman Wood (Secretary).

Payment for Coroners' Juries will henceforth be the rule at the courts of all the London coroners, with the exception of those in the City of London, the London County Council having fixed the amount payable at two shillings per head for fifteen jurymen. It is anticipated that some difficulty may be experienced, as it is usual to summon more than fifteen persons to serve, because experience shows that there are always several persons either incapacitated by illness or legally exempt from service, who do not attend. The fee however will not be paid to persons attending as substitutes, or to those summoned from the street in cases of emergency. The amount of recompense to jurors in the City of London Coroner's Court is fourpence per head for the seventeen jurymen whom it is there customary to summon, not an extravagant sum for the richest city in the world.

Certified Spectaclemakers are to be added to the ranks of individuals holding a personal qualification, as the Court of the Spectaclemakers' Company has now perfected a certification scheme for the examination of opticians. The idea is stated to have received the cordial support of the profession (*sic*), and it is gravely reported that under the new scheme an optician who passes the Company's examination will be granted a diploma, as is done in the case of chemists holding a pharmaceutical certificate. Whilst it is eminently desirable that persons who have occasion to adapt spectacles to the eyes of those whose sight may require such aid should be properly qualified to do so, it seems somewhat extravagant to talk of a City company presenting "diplomas" as evidence of such qualification, whilst the comparison with the case of pharmaceutical chemists is far-fetched, to say the least. What is to be done, however, will presumably be done thoroughly, and we understand that regulations and a syllabus of subjects for theoretical and practical examinations have already been drafted, whilst the first examination will take place in London in November next.

Sir William Turner has been elected President of the General Medical Council, in succession to the late Sir Richard Quain. He represents the University of Edinburgh on the Council, and acted as Sir Richard's deputy at the meeting of that body in November last. It is understood that the new President will meet any objection to his appointment, on the score of his residence being in Edinburgh, by resigning the chair of Anatomy in the University of Edinburgh and removing to London. He is an excellent man of business and his appointment is likely to meet with general approval.

Advertisements of Quack Medicines are doubtless a profitable source of income to newspapers, observes the editor of the *Practitioner*, and so long as the wares which it is sought to sell are harmless he supposes John Bright's principle, *caveat emptor*, must be held to apply. It is asserted, however, that a very large proportion of such advertisements are simply attempts to obtain money under false pretences, and that some can only be regarded as incitements to crime. The money got by quackery is the dirtiest on earth, and there is little between that and money got by quack advertisements, continues this candid critic, and whilst some newspaper managers may pocket the money with a com-

placent *non olet*, he prefers to believe that most of them who publish such advertisements do so in ignorance of their real nature. It is a curious fact, however, that many continue to publish them after their real nature has been exposed.

Postal Reform is always in the air, and at a meeting of the Postal Service Committee of the London Chamber of Commerce, held on Monday afternoon, it was reported that the representations made by the Chamber to the Postmaster-General on the subject of the prohibition against the transmission through the post of samples of liquids, and greasy and colouring substances, had at last borne fruit, a circular notice having been issued from the General Post Office announcing that samples would henceforth be accepted if packed in accordance with the regulations, which are identical with those in force in other countries of the Postal Union. The concession applies to samples for transmission either at home or abroad, and should appeal to chemists and druggists.

Compound Liquorice Powder Without Sulphur can hardly be regarded as a B.P. preparation, and it is not surprising, therefore, that a Woodhouse shopkeeper has been fined at the West Riding Police Court for selling such an article. The wholesale dealer who supplied the powder—F. W. Thackray, Charlotte Street, Sheffield—gave evidence for the defence, stating that he had manufactured compound liquorice powder for the last fifteen years, had bought a large quantity by auction eight years ago, and that it was only recently the Pharmacopœia had directed the addition of sulphur. So far as can be gathered from the press report, this individual had been using the 1874 reprint of the B.P. as his "uniform standard and guide," and if that be so, there would appear to be a fine field amongst Mr. Thackray's customers for the West Riding inspectors of food and drugs.

Ammonia given in Mistake for Gripe Water caused the death of an infant at Chesterfield last week, and a correspondent directs attention to the somewhat apathetic manner in which the matter was treated by the Coroner at the inquest. It appears that the solution of ammonia had been purchased at the door from a person not qualified to deal with poisonous substances, and it was poured into an empty gripe-water bottle. As a matter of course it was not labelled with the name of the contents or the word "poison," and nothing was more likely than that such an accident should happen. The Coroner seems to have contented himself with remarking that it was a great pity the label on the bottle was not removed, and that there was no law to prevent anyone from selling ammonia; the jury then returned a verdict of accidental death, no blame being attached to anyone. Our correspondent thinks that if a chemist had sold the ammonia without labelling the bottle he would not have escaped blame, and that is doubtless correct, for, rightly or wrongly, the opinion is apt to prevail that the public is entitled to think itself safe in the registered chemist's hands. After all, therefore, chemists may regard it as a compliment that what they are expected to do, as a matter of course, other people are considered too ignorant to think of, and therefore not to be severely blamed.

Compounders in Her Majesty's Prisons are henceforth to be selected as far as possible from the officers of the prison hospital staffs, the appointment of compounder being now open to all such officers, subject to their obtaining the Minor qualification of the Pharmaceutical Society and being, in all other respects, suitable for the position. Such is the gist of a circular recently issued by the Prison Commissioners to Governors of H.M. Prisons. How the officers of the hospital staffs are to obtain the Minor qualification is left to the imagination, but it may be anticipated that occasional appointments will still be open to registered chemists who are not on those staffs.

The Post of Public Analyst is vacant for the Borough of Ipswich, the Council of that Borough requiring the services of a person of competent knowledge, skill, and experience. As analyst, the chemist appointed will have to perform all the duties required of him under the Sale of Food and Drugs Act, and any Act amending the same, a retaining fee of five guineas per annum being paid, with a fee for each analysis undertaken at the request of the Local Authority. Applicants for the appointment are requested to specify what their fee will be for each analysis, and applications, together with testimonials, must be sent to the Ipswich Town Clerk on or before April 12.

The Manufacture and Sale of Alcoholic Liquors in Hong Kong is to be the subject of an inquiry, a Commission having been appointed to inquire into and report on the importation into Hong Kong, and the manufacture and sale in Hong Kong, of alcoholic liquors of all kinds, and into the operation of the laws regulating the same; also to ascertain whether any and what descriptions of crude, inferior, adulterated, or deleterious liquors are imported, manufactured, or sold, and by whom and to what extent; and, further, what measures may usefully be taken to improve the laws and to check the importation, manufacture, and sale in licensed houses and elsewhere of such crude, inferior, adulterated, or injurious liquors. The Secretary to the Commission, appointed by the Administrator of the Government of Hong Kong, is Mr. Frank Browne—an old friend of a very large number of our readers, and formerly Demonstrator in the School of Pharmacy.

The Belfast Arrangements for the reception of the British Pharmaceutical Conference in August are now nearing completion. A deputation, consisting of Mr. R. W. McKnight, Sir James Haslett, M.P., and Mr. James Payne, J.P., representing the Ulster Executive Committee, has waited upon the Lord Mayor of Belfast to ask him to receive the members of Conference on August 9. That he has consented to do, and it has also been decided to take the visitors for an excursion on August 11, by train to Larne, thence by cars along the coast, through the Glens of Antrim to Parkmore, returning by train from Parkmore Station. This trip will give the visitors an opportunity of seeing some of the most beautiful scenery in the world. The Committee, in making these arrangements, considered that a one-day excursion to the Giant's Causeway would not be entirely satisfactory, as only about two hours could be spent in exploring the district, and there is so much to be seen that it could not be done in the time. Dinner will be served at Garron Tower Castle, and tea in the Glens of Antrim. There is little reason to doubt that no efforts will be spared to make the Conference of 1898 a record one.

In the North of Ireland, according to a local correspondent, their exists—presumably by a sort of medical "Ulster custom"—a body of practitioners known as "Charmers." These persons ply a lucrative trade with the humbler classes, whose credulity is marvellous. A Mr. M'Govern, of Cavan, is in possession of a traditional receipt for the cure of hydrophobia, which the Irish Chief Secretary was recently seriously asked to substitute for the Pasteur treatment. As herbalists and decocters of strange potions, they affect to cure everything from a sore toe to paralysis. In lieu of payment, which would interfere with the efficacy of the charm, they accept a gift or "honorarium." Needless to say, these persons are never interfered with.

Pharmaceutical Transactions.

CHEMISTS' ASSISTANTS' ASSOCIATION.

On Thursday, March 31, the President, Mr. T. Morley Taylor, took the chair at a meeting of this Association at 73, Newman Street, W., when Mr. Harold E. Matthews read a paper on

Alternation of Generations.

Mr. Matthews, in his opening remarks, said that during the early part of the present century the study of botany became revolutionised, especially with regard to the relations between the phanerogams and cryptogams. The two groups, so long considered to be totally different from one another, being at length studied side by side. As a result came an intelligent conception of their intimate relationship. Between the years 1849 and 1852 Wilhelm Hofmeister brought before the notice of the scientific world a series of researches which showed that the life cycle of a large part of the vegetable kingdom involves an alternation of two generations, one sexual, the other asexual. Among the lowest plants the asexual generation is seen in a very rudimentary form in a few species only, the majority of the *Thallophyta* showing no differentiation of separate plant bodies. In the *Bryophyta* alternation of generations is fully established, the sexual generation largely predominating in vegetative development over the asexual. The *Pteridophyta* exhibit the same alternation, but the sexual generation is reduced to a prothallus and the asexual plant attains large dimensions. From the heterosporous members of the group an interpretation of the significance of the pollen grain and embryo sac of the gymnosperms can be gathered. In the gymnosperms the endosperm formed within the embryo sac prior to the development of egg cells corresponds to the endosporous prothallus of *Salvinia* and *Selaginella*. The homologue of the male prothallus in *Ginkgo* and *Zamia* shows differentiated male zametes, but in the majority of cases plants of this group do not form such definite reproductive bodies. The vanishing point of the female prothallus is reached in the *Spermaphyta*, and it is difficult to find the homologues of the male and female prothalli of the heterosporous Pteridophytes. Alternation of generations prevails as a general law of development through all the long series of these very different plants.—The President, in thanking Mr. Matthews for his paper, remarked that it would have been impossible, throughout the whole field of biology, to have chosen a more striking subject than that of the alternation of generations. The paper was one that would make a valuable addition to the "Proceedings of the Chemists' Assistants' Association," and would be read with great interest.—Mr. Fothergill said that although not of direct interest to pharmacy, indirectly botany was one of the most important subjects that a pharmacist should have a thorough knowledge of, for by its aid he would the more easily detect any spurious drugs, if not at the first glance, with the aid of the microscope. He thought they were very much indebted to Mr. Matthews for bringing the subject before them, especially at a time when he was going through the trying experience that most of them had already passed through—the Major examination—and he was sure they all wished him every success.—Mr. Matthews replied, and the meeting then terminated.

PHARMACEUTICAL SOCIETY OF IRELAND.

At Dublin, on March 28, Dr. H. A. Auchinleck delivered an interesting lecture before the Pharmaceutical Society of Ireland, on

Pharmacy, the Handmaid of Medicine.

The lecturer began by stating that the word handmaid was in no wise intended to convey any degree of subserviency. Pharmacy and medicine should walk together hand in hand, each helping the other. Pharmacy, the younger of the two professions, was not directly related to medicine, and happily so, as, if of the same family, the pharmacist would feel bound to support the medical profession, and *vice versâ*. If they considered that the medical profession was the older of the two professions, how were they to prove that contention? They could not go back farther than the Garden of Eden, and, starting from that point, they came down to the days of primeval man, when hunting and fighting formed the principal part of the day's work. At this time men began to devise means of alleviating pain, and thus the study of medicine began. Animals were observed to eat certain plants when sick, and man, following his instincts, groped, as it were, in the dark, and by chance hit on some herb which he found gave relief in sickness. Recourse was had to the same plant when further similarly affected. Suppose early man was injured in battle by one of the stone hatchets then in use, he cast about for something to defend himself with, and in his search after curative remedies he also found noxious drugs which produced unpleasant effects when applied to the point of a flint knife destined to enter the internal economy of an enemy. This was the very earliest age of poisoning, when pharmacy was made use of for vicious or revengeful purposes. The medicine man thus gained a reputation for knowledge. He could assist his friends or injure his or their foes. Fawned upon and flattered by all, the medicine man enjoyed the love and dread of his fellows. His investigations were conducted secretly. It would not suit him to let others see into his mysteries if he wished to maintain his reputation. Hence he began to pound up plants, thereby becoming a primeval pharmacist. Medicine men in those days had to study different forms of sickness, and they began to acquire a certain amount of knowledge gained from seeing the effect produced by illness or injury. Their knowledge of simples enabled them to diagnose certain well-defined cases of sickness, and in this way they gained a large amount of experience, which they stored up for future use. Certain symptoms in certain cases were noted, but beyond that the why or wherefore was not known. They were simply recognised by their action in reference to plants and herbs, and the knowledge thus acquired was used accordingly. One thing, however, never failed. They knew that the same drugs had the same effect on all persons, and this principle of simple pharmacology formed the leading line in subsequent pharmacy. After a time pharmacy was found at another stage. The physician could not heal unless he gave medicines, believing that if no medicines were used there was no need for his services. The pharmacist started as the assistant to the doctor, but as knowledge increased vice began to show itself. The great fundamental rule of working hand in hand began to be forgotten, and as a result pharmacy went back. The early physicians studied anatomy. In the removal of the brain, etc., they acquired a knowledge of the organs of the human body, and even at that period Harvey's great discovery of the circulation of the blood was foreshadowed, as it was not improbable that the ancient Egyptians knew all about the circulation of the life-giving fluid, even as medical men of to-day knew it. The effects of the action of drugs on each organ of the body led to experiments, and pharmacy again made a great start ahead. Proceeding, the lecturer touched upon the making of extracts and tinctures in their relation to the professional poisoner. The Egyptian pharmacists were referred to, and their wonderfully accurate prescriptions—not unlike those of the nineteenth century in some instances—came in for comment. The origin of embalming bodies was explained, and the Egyptian custom of preserving their dead, in the belief that 10,000 years afterwards the spirit would again inhabit the body, was listened to with great interest. Stripped of their extraneous covering, some of the ancient Egyptian formulæ contained very useful matter, and having regard to the scientific attainments of the sons of the Pharaohs, due respect should be paid to the old-time medicines. Having dwelt on the pharmacy of the early ages, the lecturer brought his hearers down to the later days of the Egyptians, and described the fashion in some Eastern cities of obliging each stranger to pass by certain squares containing sick beds. Every strange medical man had to listen to each case, and say whether he had met elsewhere with similar diseases. It was obligatory on every physician to give his opinion on the malady, whether the opinion be good, bad, or indifferent. Dr. Auchinleck alluded to the Dublin Museum, in which all varieties of the same species were classed and tabulated. Without such classification the collection was of very little use to the student, and so it was with early medicine, which was practised without due knowledge of the art, until with the advent of Hippocrates began the age of classification and tabulation of diseases. Names were given to certain ailments, and these names were not allowed to be forgotten. Some nineteenth-century diseases were mentioned by the lecturer as having been unknown in the time of Hippocrates, notably measles, which would surely have been referred to in the works of Hippocrates had it been known at the time. There was then no typhoid fever. The hygienic age had not yet set in, and the Dublin Corporation was an unknown quantity. The Roman period next came under review. In that age poisoning was reduced to a fine art. The skilled poisoner obtained any money for his services

in proportion to his skill. But the very depth of infamy to which pharmacy had been dragged down resulted in the future advance of both it and medicine. When people began to understand poisons they became aware that certain symptoms were not due to ordinary causes, and at this stage the physician began to be *en évidence*, and antidotes for poisons made their first appearance. Little by little the curative value of the physician increased, and poisoners were obliged to ply their calling more discreetly. Pharmaceutital chemistry was now brought into requisition, and poisons of the most subtle nature were resorted to. Rings, daggers, and other kindred articles were made the medium for the poisoner's art, a single drop of poison concealed in a hollow needle secreted in a ring was the favourite method in vogue. A pressure of the fingers in a handshake effected the object; hence the danger even to the present day of handling some of the trinkets seen in old castles in Italy and elsewhere on the Continent. The hypodermic injection of to-day was largely in use in the time of the Borgias, and in the latter days of the Roman Empire. The favourite methods of poisoning adopted by some of the most skilful of the Borgias were described. The pharmacy of Shakespeare next came under observation, and in this connection the old-time apothecary referred to in Romeo and Juliet was amusingly described, in terms which showed the learned lecturer to be an ardent Shakespearean scholar. The apothecary of that period was not allowed to sell certain of his wares, and was forbidden by law to give poisonous drugs without an order from the physician. This, remarked the speaker, was a good and wholesome law, and might with advantage be occasionally applied to the present day. Another important factor consisted of the pharmacist being allowed to manufacture his own drugs. Medical men then, as now, were glad to get information from all. At this time, when pharmacy and knowledge were going ahead so satisfactorily, they began to wander from the straight and even course of science into the bye-ways of alchemy, and the search for the elixir of life began and continued for one and a half centuries. Men's energies became concentrated on the pursuit of the *elixir vitæ*, and when unsuccessful in finding that which was to ensure perpetual youth they turned their thoughts to the transmutation of metals; and the mad race after the philosopher's stone began the quest, ending, like its predecessors, in disappointment, madness, or death. At the time when pharmacists were searching for two impossible things they became acquainted with other matters. They discovered certain means of obtaining crystalline substances out of plants, such as morphia, and as soon as that stage in pharmacy was reached medical science was pretty fairly set upon its feet. A great deal of facts concerning the human body were put together, and diseases with their causes, effects, and cures began to be more generally understood. Then began the use of reasonable medicines, and soon afterwards the hitherto infallible pharmacy of fasting spittle, live spiders, toads, and other small cattle was enabled to be dispensed with for the cure of ordinary indigestion. The use by the female sex of substances to add to their beauty was next referred to by the lecturer, who said that certain condiments, to add to the brilliancy of the eyes, were to this day largely used by the women of Cairo—not in Ireland—he added gallantly, as the Irish girls had eyes which sparkled naturally like diamonds, and they required no artificial aids to beauty. The discovery of tartar emetic and antimony was referred to, and a pleasant anecdote in connection told *en passant*. Science fell into such disrepute in the Middle Ages that to be a chemist or a pharmacist was a great reproach, but all the time pharmacy and medicine were advancing hand in hand. Coming down to the present age, it was very satisfactory to know by experience that pharmacy was the handmaid of medicine, a maid who did not require to be watched or instructed in her duties. Medical men were satisfied with the pharmacists, and were glad to assist their handmaid in every possible way. It was necessary for both that a thorough harmonic understanding should exist between both branches of the healing art. One should be loyal, true, and faithful to the other; both united could do a great deal of good, but, if hostile, their utility failed. At present there should be a very great bond of unity between the doctor and the chemist. Each had its own province. The sale of dangerous drugs should not, he thought, be permitted unless authorised by a physician. The existing Act of Parliament in this respect needed amendment. The stronger the safeguard around the pharmacist and the doctor the better for both. The law was also defective in regard to the sale of patent medicines, some of which, containing very deadly poison, could be purchased at grocers' shops. The lecturer animadverted strongly against the law which allowed a person without legal qualification to patent a preparation, of perhaps the utmost value from a therapeutic point of view, but which because of its having been registered could not be sold by the name given to it unless as a patent medicine. This was a disadvantage to the chemist, as free trade was restricted. Fellow's syrup, for instance, was a very excellent preparation, but it could not be sold by anyone except under the patentee's name. Regarding the unqualified trader, Dr. Auchinleck said there was no law to prevent the veriest quack setting up next door to the most highly qualified medical man and practising medicine and surgery as long as he did not assume the name of doctor or surgeon. It was only in the event of accident or fatality that the law stepped in. Another anomaly existed in that the Pharmaceutical Society was obliged to prosecute offenders against the Pharmacy Act. The law was made for the protection of the public, and he thought the initiative should be taken by the Government in all cases requiring investigation, and not left to individuals to carry out. Until this was recognised by the Government, the illegal trader would, he feared, continue to flourish. He concluded by likening pharmacy to the little Hebrew maid who knew of a remedy for her master's leprosy, and suggested that remedy. She did not bring the prophet to her master, nor did she get out the Syrian troops to convey Naaman to the river Jordan. She simply suggested the remedy, and that was the way in which pharmacists should act in their relations with the medical faculty, and which, he was glad to say, was his experience of pharmacists in Ireland.—At the close of the lecture, Mr. W. F. Wells (ex-President of the Pharmaceutical Society), in proposing a hearty vote of thanks to Dr. Auchinleck for his very able lecture, said the Society was highly complimented in having prevailed on that gentleman to come there that evening and give such an instructive and educating address. Mr. Wells hit off neatly the growing tendency of medical men to widen out their prescriptions by adding patent and proprietary drugs, and, *à propos*, told a good story of an Irish apothecary whose stock of medicines did not exceed seven or eight, and who retired from business a wealthy man. He agreed with the lecturer on the existing laws, which, so far as illegal trading was concerned, were a *dies non*.—Mr. Doran seconded the vote of thanks, which was carried by acclamation.

IRISH PHARMACISTS' ASSISTANTS' ASSOCIATION.

At Dublin on Friday, April 1, the members of this Association discussed the question whether membership of the Pharmaceutical Society of Ireland should be conferred by examination instead of by payment of a fee, and after a long and interesting debate it was decided, by a majority of seven votes, that the membership of the Pharmaceutical Society of Ireland ought to be conferred upon its Licentiates by examination only and not by the payment of a fee, as at present.

GRIMSBY AND DISTRICT CHEMISTS' AND DRUGGISTS' ASSOCIATION.

The annual dinner of this Association was held at the Oberon Hotel, on Thursday, March 31. The Deputy-Mayor (Alderman Palmer, J.P.) presided, and amongst the company were Councillor Wharton, Messrs. T. C. Palmer, J.P., Robt. Cook, J. A. Hawdon, J. T. Hearne, S. J. North, H. J. Colley, T. D. Sneath, J. A. Moore, J. Willey, C. Dewing, H. W. Colley, and C. Willson. The menu left nothing to be desired, and there was sufficient sociability and entertaining talent amongst the company to make the evening one of very pleasant relaxation. A short toast-list included the usual loyal compliments, "The Association," "The President and Vice-President," "The Town and Trade of Grimsby," and "The Ladies."—Mr. Dewing, in proposing the health and success of the

Grimsby and District Chemists' and Druggists' Association,

remarked that though a junior, he was as old a member of the Association as anyone present. It was proposed to form that Association by Mr. C. Willson and the proposal which was hailed with satisfaction, was almost immediately carried out. Looking back, he thought they must all regard Mr. Willson as a chemists' benefactor. When the Association was formed he scarcely knew one other chemist in the town; but now they all knew each other and met as friends. They were all there to live and plan out lives for themselves in the business best suited to their own requirements and localities. But that was no reason why they should not be friendly one towards another. At chemists it behoved them all to pull together and educate

the public to the fact that the cheapest goods were not always the best. Their Association had done good work, and, he believed, had a future before it so long as the members worked amicably together. Amongst the objects of the Association were: The advancement of chemical science, the better education of apprentices, the discussion of trade interests in general, and the formation of a library and museum. These were all laudable objects, and it behoved the Association to work hard to attain them. He, Mr. Dewing, had been considering for some time the advisability of having a club-room, and if they could get the scientific societies of the town to join them, they could at least have a room to meet in instead of going from bar to bar. After speaking with appreciation of the work of Mr. North, the Secretary, and saying he was glad that gentleman had been re-elected, Mr. Dewing asked the company to drink to the toast.—Mr. North, replying to the toast, said there was not the slightest doubt that combination in any profession was a good thing, and he only hoped such associations would go on increasing throughout the country. Their efforts during the past year had not been unattended with success. He was certain there was a better feeling amongst the chemists than last year, and he was satisfied that the Association had a tendency to stop cutting in a measure, and he asked them individually and collectively to uphold to the utmost the interests of the Association, by which they would assist the Association and also help themselves.—Mr. Hawdon, offering the toast of "The President and Vice-President," said his acquaintanceship with the President extended over thirty years. That Association should be pleased that they had a man like their President to keep them together. Their Vice-President, too, was always courteous and willing to oblige in anything connected with the business. He had the greatest pleasure in giving the toast.—The President said he responded with pleasure, mixed with some alloy. He had pleasure in the fact that he still held their confidence, and that they had done him the great honour to elect him as their President for another year. The alloy came in the circumstances that they had not been able to make a better show. Theirs was only a small town, and their Association was in the position of an acorn which, when buried, took a great many years to come to maturity. They could not grow much more now in the town, because they had a large proportion of their trade already associated, but they might spread out into the district with advantage to themselves and others. Combination was good and necessary, but although cutting shops made a great show, the people of England did not forget their old friends. Chemists had made a great mistake in the past by freely giving information about their commodities to anybody who asked for it—and then letting the people go away to get the stuff a halfpenny cheaper at the grocer's. The druggist of the country lacked independence, and allowed himself to be played upon and cross-examined with regard to his trade for the benefit of other people.—Mr. Cook, who also responded, thanked the members for again electing him as Vice-President. He assured them that he had the love of pharmacy at heart, and anything he could do to further the ends of that cause he would discharge.—The usual toast of "The Town and Trade of Grimsby" was proposed in an able speech by Mr. C. Willson, and responded to by Mr. J. Wharton; the toast of "The Ladies" being afterwards offered by Mr. H. W. Colley, and replied to by Mr. T. C. Palmer.—Cheerful music was discoursed from the piano during the evening by Mr. J. J. Redman, who also delivered two or three of his very droll songs. The vocal entertainment was also assisted by Messrs. J. A. Moore, T. C. Palmer, Sneath, J. A. Wharton, S. J. North, and C. Willson.

Election of Officers.

At the annual meeting of this Association, held at the Hotel before the dinner, the officers were re-elected with the exceptions and additions indicated in the ensuing list:—President, Alderman Palmer; Vice-President, Mr. R. Cook; Treasurer, Mr. J. A. Hawdon; Secretary, Mr. S. J. North; Assistant-Secretary, Mr. C. Dewing; Committee, Messrs. T. D. Sneath, J. Wharton, J. C. White, C. Willson, and J. A. Moore (elected in place of Mr. C. Dewing, retired), with Messrs. Hy. Colley and Herbt. W. Colley as Auditors.

Gilding Copper.—Potassium cyanide, 30; chloride of gold and sodium, 10; water, *q.s.* to form a soft paste. Clean the copper articles to be gilded, then apply the paste, and allow to remain on for several hours, then wash freely in water.—*Pharm. Central.*

LEGAL INTELLIGENCE.

PROCEEDINGS UNDER THE PHARMACY ACTS.

Pharmaceutical Society of Great Britain v. Vickers.

At the Manchester County Court on Friday, April 1, before His Honour Judge Parry, the Council of the Pharmaceutical Society of Great Britain sued A. L. Vickers, 192, Princess Street, Manchester, for a penalty of £5 for selling poison contrary to the Pharmacy Act, 1868.

Mr. T. R. Grey, instructed by Messrs. Flux, Thompson and Flux, appeared for the Society.

The defendant appeared in person.

Mr. Grey, in opening, said the action was brought to recover a penalty for keeping open shop for the sale of poisons contrary to the Pharmacy Act of 1868. The defendant was a manufacturer and dealer in druggists' and grocers' sundries, and on November 27 there were purchased at his shop certain chemical fly papers, which were found on analysis to contain a great amount of arsenic, as much as 6 grains in one of them. The fly paper he should put in had the word "Poison" upon it, and the defendant knew perfectly well what he was doing when he was selling this, and, further, it gave directions as to what ought to be done in regard to its being kept out of the way of children and domestic animals, and also as to its use. The liquid from the moistening of the fly paper contained as much as nine-tenths of arsenic, and was very dangerous, having before now been used for the purpose of murder and so on. The average in the six papers altogether, he thought, amounted to about 7 grains each, so there would be no question of the quantity or dangerous part of the arsenic. There could be no question about that, and the only question for His Honour was whether those fly papers came within the Act, and the only defence which could be advanced was that this was wholesale dealing. He did not think he need mention that to His Honour, because it was clearly a retail transaction. These papers were sold to a gentleman who had not any shop at all, and there was no wholesale dealing in any way whatever. The Act under which they were suing was the 31 and 32 Vic., chap. 121, an Act to regulate the sale of poisons, and was passed as stated in the preamble for the safety of the public, that persons keeping open shop for retailing, dispensing, or compounding poisons should be competent in their business, and also that the several articles named or described in Schedule A should be deemed to be poisons within the meaning of the Act, and on the Schedule arsenic was one of the poisons mentioned. Section 10 made it the duty of the Registrar to keep a correct register in accordance with the provisions of the Act of all persons entitled to be registered, and Section 13 made it evidence in a court of law, so that if defendant's name did not appear on the Register, as it did not, that was sufficient to show that he was not qualified under the Act. Section 15 made it incumbent on the Pharmaceutical Society to see that the Act was carried out, and Section 17 dealt with exceptions and with the business of wholesale dealers in supplying poisons.

His Honour: Supposing this man makes these things wholesale and sells them wholesale?

Mr. Grey: If he sold them wholesale to another shop for the purposes of retailing he will come within the exception, but in this case he sold to a man he had never seen before six of those papers, for which the sum of threepence was paid, and I submit that is clearly retail. They were sold for use; they were not sold for retailing.

His Honour: What is a wholesale sale?

Mr. Grey: There is no definition in any known case. I can give you Webster's dictionary. "To retail, to sell by small quantities and at second hand; secondly, dealing out in small portions. Wholesale: the first is the sale of goods in large quantities to retailers; (2) the whole mass or bulk; (3) by mass or bulk without discrimination or distinction."

His Honour: I do not know what this case is until I have heard the facts. Supposing this man deals wholesale in these articles, and a chemist comes into his place of business and asks for six at chemists' prices, he would sell at wholesale prices. That might be alleged.

Mr. Grey: Yes, that would be, because he would sell to the chemist to sell again, and that is a great distinction.

His Honour: That would be the distinction probably, whether it was sold to the general public or to a druggist, and is probably the right view.

Mr. Grey replied that that was what he should submit. He should also call His Honour's attention to Section 17, in order to show how Parliament had made the sale of arsenic as difficult as possible. It was stated that it was unlawful to sell or retail any poison in Part 1 of the list—this included arsenic—to any person unknown to the seller ("this person was unknown," said Mr. Grey) or unless introduced by some person known to the seller—there was no introducer in this case—and, on the sale of any such article, the sellers shall, before delivery, cause to be made an entry in a book to be kept for that purpose, the name and address of the purchaser, the name and quantity of the article sold, the purpose for which it was stated to be required, signature, etc. This was not done in the present instance. Then, again, there was the Arsenic Act itself, and there it was enacted that poison of a colourless character should be mixed with soot, and the occupation, as well as the name and address, entered in the poison book.

His Honour: You need not go further than that.

Mr. Grey said, that being the case, he would only draw His Honour's attention to three cases shortly. One was the case of the Pharmaceutical Society *v.* Armson, reported 1894, Q.B.D., 2, p. 720, the head-note in the law report being as follows:—"The prohibition in Section 15 of the Pharmacy Act, 1868, against the sale of poisons other than by registered chemists is not confined to the sale of the scheduled poisons in their simple state or of preparations of such poisons, but extends to the sale of a compound containing a scheduled poison as one of its ingredients. The exception under Section 16 of the Act as to the making or dealing in patent medicines does not extend to proprietary medicine."

His Honour: Is that the balsam of aniseed case?

Mr. Grey: Yes.

His Honour: I remember that.

Mr. Grey quoted at length Lord Esher's remarks in dismissing the appeal, in which his Lordship stated that with regard to the facts of the case they were not to depart from the facts as found by the County Court judge. They must take it, therefore, that in the article which was sold by the defendant in that case there was one of the poisons named in the Schedule to the Act of 1868. They did not know what the other ingredients in that bottle were, but they knew that one was one of the poisons named. It was alleged that the defendant did not sell poison, because although nothing had been done to it which altered its chemical nature, it had been mixed with other things. Did that in ordinary language make it not a poison? Did poison put into a bottle of wine or a cup of tea cease to be poison? It was clear that when poison was put into medicine, and a person sold the medicine, he sold the poison that was in it. There was nothing in the Act of Parliament that he could see, reading it in its ordinary language, which said you may sell poison mixed with other things, though you may not sell poison by itself. Lord Justice Kay also, Mr. Grey said, followed, and he held it was a case in which the maxim *de minimis* did not apply at all. He could quite understand that although a case might be otherwise within the meaning of the Act, if the proportion of one of the poisons mentioned in the Schedule were so exceedingly small as to be perfectly innocuous or comparatively innocuous when taken, then the maxim *de minimis non curat lex* might possibly apply in an action of that kind, but that was not such a case.

His Honour: Yes, I remember that case.

Mr. Grey said there was Lord Justice Smith's holding in similar language. Then there was the case of the Pharmaceutical Society *v.* Wheeldon, which he merely drew his Honour's attention to to show the Act did not deal merely with medicines, but with other preparations. In that case it was Battle's vermin killer, and in the last case of all, which he was sorry to say did not go to appeal, and was not reported, except a verbatim report of the action, and as he (Mr. Grey) was there he could vouch for its accuracy, was a case tried before Judge Bacon on January 21, 1896, and he was going to say that the wording on those identical fly papers was almost the same as in this case. There Mr. Danckwerts appeared for the plaintiff, and judgment was given for the Pharmaceutical Society with leave to appeal.

Arthur Foulds stated: On the November 27 last, I went to the shop of the defendant, 195, Princess Street, Manchester, and asked for some castor oil, a bottle of ink, and half-a-dozen fly papers. The label on the bottle of ink was "Vickers' Black Ink, A. L. Vickers, 195, Princess Street, Manchester." On the fly papers is the name Vickers, and the words "it is comparatively safe if not moistened," and "Vickers' Sauce." at the corner. I paid 3*d.* for them. He did not ask me my name or anything of that kind. I handed them over to Mr. Moon in the same condition as I received them, except putting on a label and the date so that I should know them again.

His Honour (to defendant): Do you want to ask any questions?

Defendant: No. I was not aware that a person had to be a qualified chemist to sell fly papers.

His Honour: Where did you get them from?

Defendant: I bought them as an advertising medium.

His Honour: For the sauce?

Defendant: Yes.

In reply to other questions by his Honour, defendant said he had a shop in Princess Street, and dealt wholesale, chiefly with small shops. Of course, if anybody came in he obliged them with anything he had, but it was no stand for a retail shop. There was a window to it.

Witness (Foulds) stated there was a window with the name "Vickers" upon it, and there was a counter in the shop.

In reply to his Honour, defendant said he bought £3 worth of the fly papers twelve months ago from a firm of wholesale drysalters in Liverpool. He had none left, having given most of them away. He did not make a profit, as anyone could have had them for a penny a dozen. They were an advertising medium.

His Honour: You have done very wrong.

Defendant: As soon as I got the notice from the Pharmaceutical Society I at once destroyed them.

Harry Moon, examined: I am clerk to the Registrar of the Pharmaceutical Society, and received from the last witness the fly papers with the other articles named. With the exception of marking them with my initials they are in the same condition as received. I afterwards handed over the fly papers to Mr. Eastes for analysis.

Ernest John Eastes, examined: I received from the last witness six new chemical papers. I took one whole paper, and on analysing it found 6 grains of arsenic in it. I subsequently analysed the others. I cut the remaining five papers in halves, and found 17½ grains, which works out to 7 grains in each paper. If the fly papers were moistened as directed with water the result would be that the arsenic would come out. About 2 grains is stated by medical authorities to be a fatal dose, and the liquid resulting is highly poisonous.

His Honour: Is not that more arsenic than usual in a fly paper?

Witness: It is an average quantity.

Mr. Grey: Not so much as in a previous case, some 8 or 9, and some as many as 11 grains of arsenic. That is the case for the plaintiff. I put in the Register.

His Honour (to the defendant): There seems no defence to this, Mr. Vickers. It is not necessary in the interest of the public that they should be sold, and it is not wise to give away those things. They are very dangerous to get into the hands of bad people, and it is an extremely foolish thing having anything to do with them.

Defendant: As soon as I got notice I stopped the sale.

His Honour: Did you reply to their letter?

Defendant: Yes.

Mr. Grey quoted defendant's letter, in which he stated that his trade was absolutely wholesale, and that, as regarded drugs and poisons, he did not sell any wholesale, let alone retailing them. If he had made himself liable he should, of course, have to pay, but he should like to know what he was charged with selling. The Society then wrote and sent him particulars.

His Honour: Did he write again?

Mr. Grey replied not after they sent him the particulars. Of course, His Honour would see the word "Poison" was on the paper.

Defendant: They said compounding.

His Honour: The word is printed all over it, and they supposed you had had these manufactured for you.

Defendant: From what I understand it is manufactured in the paper.

His Honour (to Mr. Grey): Supposing he gave them away, he would not be liable for any penalty?

Mr. Grey: It is a rather difficult and moot point. There is no question about that.

His Honour (to defendant): I am afraid, Mr. Vickers, you have no case at all, and I must give judgment for plaintiffs with costs. I hope it will be understood that the sale of these fly papers is best left to chemists and other qualified people. This is a loose method of advertising and extremely dangerous.

Judgment was accordingly entered for the full penalty, £5 and costs, His Honour certifying for counsel.

EXTRACTS FROM CONSULAR REPORTS.

A Professional Chemist is employed by Russian manufacturers of beet sugar, his sole duty being to prevent waste. This fact is pointed out by Her Majesty's Consul at Kieff in a recent report, in which he contrasts the Russian method of procedure in the manufacture of sugar and that employed in the West Indies. According to the report of the West India Commission, there, owing to the imperfect method of crushing adopted and the somewhat crude methods of manufacturing sugar, an average of over 2000 lbs. of sugar per acre is left in the canes after crushing, which is burnt in the megass. Thus through imperfect manufacture, there is a loss of 25 tons of sugar for every 100 tons contained in the juice extracted. In Russia, however, every precaution is taken to procure the best results, so that by careful study and cultivation and the selection of seeds from only the best sugar-producing sorts, where comparatively a few years ago it required about 13 tons of beetroot to produce a ton of beet sugar, now the quantity to produce that amount has been reduced to from 8½ to 9 tons of beetroot. The quantity of sugar expected to be produced from the 1897 beet crop is 38,000,000 poods (611,800 tons), being 2,000,000 poods (32,258 tons) less than prospects at same date in 1896. This decrease is accounted for by the dry spring and consequent late germination of the seed, followed by tropical heat in June, July, and August, which caused the bulbs to be smaller in size and to have a lower percentage of sugar than usual.

Phylloxera in the Vineyards of the South of France some years ago was the cause of a great migration of vine growers from that district to Algeria, and consequently for the last seventeen years the manufacture and exportation of wine has formed the chief industry of Algeria. In 1878 the vineyards contained an area of 17,000 hectares* (42,500 acres), 2000 of which were planted in that year, while at the commencement of 1898 the total area covered by the vine amounted to about 125,000 hectares. During that period the cultivators acquired valuable experience in vinification, and realising that quantity is not the sole object, but that good quality is the most important point, scientific methods are being adopted to regulate all processes involved in vinification. The many influences of different climates and soils have been carefully studied, the various qualities of the plants recognised, and the proportion in which the grapes require to be mixed observed, so that now Algerian wines are classified with those of France, and the Algerians can annually export about 4,000,000 hectolitres† of wine, the greater part of which goes to France.

The Importation of Phosphate of Lime and Chemical Manures has increased during the year 1897 by 6500 tons at La Rochelle, Great Britain supplying the greater part.

"Transfer of British Works to France" is the sub-heading of a paragraph in a recent report from La Rochelle, in which Consul Warburton states that he understands a manufacturer has left England and set up his plant in France, where he expects, by the lower wages, longer hours, and freedom from interference in the management of his works, to gain a material advantage with his automatic machinery, and that several other manufacturers are following his example.

The Superior Quality of British Artificial Manures has triumphed over the attempts of the Franco-Belgian syndicate to close French markets to them. During 1897, the British manures imported into the agricultural district of Cherbourg held their own, and maintained their prices, while the Franco-Belgian firms were selling at a loss, several of the firms breaking down under the strain. The Continental superphosphates in many cases proved unsatisfactory, there being a general complaint of the uneven quality of manures from Germany, Belgium, and the north of France, the percentage of phosphoric acid not being uniform, and therefore, could not be depended on. As the use of artificial manures for pasture, potatoes, and market gardening is gradually extending in the district, an advance may be expected in this branch of British imports.

* 1 hectare = 2½ acres nearly.
† 1 hectolitre = 22 gallons.

NEW REMEDIES.

Bromalin as a Sedative.—Under this name bromethylformin has been recommended as a sedative in epilepsy; it may be given several times daily in doses of 2 to 4 grammes without producing bromism.—*L'Union Pharm.*, xxxviii., after *Pharm. Post*, 448.

Calophyllum Oil for Tapeworms and Rheumatism.—The oil of the seeds of *Calophyllum pachyphyllum* and *C. brasilianæ* is used as a remedy for tapeworm and rheumatism. The balsam obtained from the trunk of the tree is stated to be an external remedy for various complaints.—*Pharm. Zeit. f. Russ.*, xxxvi., 385.

Oil of Turpentine for Scarlet Fever.—Pujador recommends oil of turpentine in the treatment for scarlet fever in the form of subcutaneous injections of the oil mixed with a little bicarbonate of sodium. The dose is 1 gramme for children, with a limit of 3 grammes per diem for adults. Internally it may be ordered in gelatin capsules. Pujador states that this treatment prevents nephritis, or quickly suppresses it.—*Pharm. Zeit.*, xlii., 709.

Amyl Nitrite in Apparent Death Under Chloroform.—A case is recorded by Walker in which a girl, aged seven years, who suddenly ceased respiration while under the influence of chloroform, and appeared to be quite dead, was resuscitated by repeated use of amyl nitrite while artificial respiration was conducted. Under the combined influence of artificial respiration and the nitrite the patient was saved, although the writer considers the case to be the nearest approach to death that he has ever seen. He therefore recommends the employment of amyl nitrite in all similar cases of chloroform syncope.—*Brit. Med. Journ.*, ii., 97.

Sulphonal as an Antisudorific in Phthisis.—Combermale and Descheemayer find sulphonal to be very efficient in lessening the night sweats of phthisis. In one case these disappeared entirely after three doses; in others a marked lessening of the perspiration followed. The dose given was 15 to 30 grains at bedtime, which was continued daily for a fortnight.—*Med. Chron.*, viii., 57, after *Med. Mod.*

Creosote in Habitual Constipation.—Holstein finds that creosote given in drop doses in water or milk twice a day after meals, is a valuable remedy in chronic constipation. To accustom patients to the taste, one drop only should be given at first, the dose being slowly increased until seven or eight, or more if necessary, are taken. It is not supposed that cresote itself acts as a laxative, but that it counteracts the effects of some toxin formed in the intestine, which, in patients with chronic constipation, paralyses the action of the digestive canal, and slackens peristalsis.—*Lancet*, i., 97.

Blennostasin in Hay Fever and Influenza.—This is a derivative of a cinchona alkaloid crystallising from diluted solution in large prisms, or from concentrated solutions in the form of needles. It is soluble in water and has a bitter taste like quinine. The action of blennostasin is intense on the vasomotor system of the respiratory nerves, and, although non-poisonous, is similar in effect to belladonna. On the brain it has a sedative influence and diminishes reflex action. Chappel obtained good results with blennostasin for hay fever and influenza. It is better given in pills than in capsules.—*Pharm. Centr.*, xxxviii., 722.

Chlorinated Lime for Chilblains.—Binz recommends the following ointment for chilblains: Chlorinated lime, 1·0; paraffin in ointment, 9·0. Cover the inflamed places well with ointment, and rub for about five minutes before going to bed, cover with a bandage and a stocking, or glove. Inflammation and pain usually disappear within a week. In preparing the ointment lard or lanolin should not be used, as the free chlorine is absorbed rapidly by these.—*Pharm. Zeit.*, xlii., 733.

Cyclea Peltata for Abdominal Complaints.—The leaves and root of this Menispermaceous plant are used as a remedy for abdominal complaints. Dousma isolated from the root 2·5 per cent. of a very bitter non-crystallising alkaloid, which he calls cyclonine. It is said to agree in many respects with buxine.—*Zeit. d. allg. oest. Apoth. Ver.*, li., 692.

NOTICES TO CORRESPONDENTS.

All Communications for the 'Pharmaceutical Journal' must be Addressed to the Editor, 17, Bloomsbury Square, London, W.C., and not in any case to individuals supposed to be connected with the Editorial Staff; no responsibility can be accepted unless this rule be observed. Communications for the Current Week's Journal should reach the Office not later than Wednesday, but news can be Received by Telegraph until 4 p.m. on Thursday.

ADVERTISEMENTS AND ORDERS for copies of the 'PHARMACEUTICAL JOURNAL' must be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Cheques and money orders should be made payable to "Street Brothers."

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size; clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

NAMES AND FORMULÆ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

QUERIES addressed to the Editor will be replied to in the Journal as early as possible after receipt, though not necessarily in the next issue. Replies cannot be sent by post, even though stamped envelopes accompany the queries.

ANSWERS TO QUERIES.

Special Notice.—*Scientific, technical, legal, and general information required by readers of the 'Pharmaceutical Journal' will be furnished by the Editor as far as practicable, but he cannot undertake to reply by post. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of senders. Questions on different subjects should be written on separate slips of paper, each of which must bear the sender's initials or pseudonym. Replies will, in all cases, be referred to such initials or pseudonyms, and the registered number added in each instance should be quoted in any subsequent communication on the same subject.*

CHEMICAL SOCIETY.—Write to the Secretary, Burlington House, W., for particulars. [*Reply to* J. D.—8/4.]

PHARMACOPŒIA.—We have no information on the subject other than is published in the issue you refer to. [*Reply to* B. G.—8/23.]

MENE TOWELS.—The sole inventors and manufacturers of these articles are Messrs. Robinson and Sons, Ltd., Wheat Bridge Mills, Chesterfield. [*Reply to* MALTINE.—8/24.]

OPIUM.—If you will refer to the characters of opium, as described in the B.P., you will find that the masses are stated to be usually covered with "the reddish-brown chaffy fruits of a species of Rumex." That is the answer to your question. *Reply to* FEMINA.—8/21.]

HOUSEHOLD AMMONIA.—Soft soap, 2 ozs.; pearlashes, 1 oz.; strong solution of ammonia, 40 fl. ozs.; distilled water, 3 pints. Dissolve soap and pearlashes in the water, then add the ammonia. Another formula which gives a bright preparation is washing soda, 10 ozs.; strong solution of ammonia, 20 fl. ozs.; distilled water, 30 fl. ozs. [*Reply to* A. P.—8/18.]

PRESERVING SYRUP FERRI IODIDI.—Yes; this should be exposed to full sunlight. Keep it on the sunniest shelf in the laboratory or pharmacy, next the glass of a window. Even if it has developed a slightly yellow tint this speedily vanishes when exposed to direct sunlight. Our experience with syrup. ferri bromid. and liquores ferri brom. and ferri iodid. are the same—they all keep best in bright light. [*Reply to* F.S.H.—8/19.]

COMPOSITION OF CHIMNEY CLEANERS.—You will probably find that this is a mixture of common salt, 2; and sulphur, 1. We have heard of this compound being used for the purpose, also sal ammoniac and sulphur. Nitre mixed with sulphur would probably remove the soot, but too effectually, as gunpowder does. This last, as you probably know, has been used for the purpose with disastrous results. You do not "trouble" us at all, as we are always very glad to help correspondents as far as lies in our power. [*Reply to* FEMINA.—8/11.]

PRESERVATION OF EGGS.—Apparently they are to be kept in the solution, and not simply coated with it. [*Reply to* W. G.—8/25.]

STARCH GLOSS POWDER.—(1) Powdered stearin, 1; starch, 18; powdered borax, 1. Mix. (2) Powdered soap, 2; powdered borax, 1; French chalk, 3. Rub the powder over the surface of the linen with a dry flannel, then iron in the usual way. [*Reply to* EBOR.—8/15.]

COMBINED BATH.—The bath may be used over and over again till the gold is exhausted, but as practically only one sheet of paper can be toned with 2 grs. of gold, you will hardly find a ready sale for the bath at 8 ozs. for 1*s*. Considering that the cost of the gold is only about 3*d*., are you not allowing a very large margin of profit? [*Reply to* F. S. H.—8/20.]

MEAT, MALT, AND QUININE WINE.—Prepare the wine with beef extract and liquid malt, as directed in reply to "F. W." in the *Pharmaceutical Journal*, of March 5, p. 254, adding to the mixture, before filtering, quinine sulphate, 40 grains, citric acid, 60 grains, and using port instead of sherry. If you use less quinine you will require a wine licence to sell the article. [*Reply to* CARNIS.—8/5.]

FRENCH CAMERA.—We are afraid we cannot help you as regards the maker of the camera, as the information is so meagre. You might try Clement and Gilmer, 8, Rue de Malte, Paris, or H. Mackenstein, 15, Rue des Carmes, Paris, or possibly if you wrote to Mr. E. Cecil Hertslet, H.M. Consul-General at Havre, who is an amateur photographer, he might be able to assist you. [*Reply to* D. J. M.—8/12.]

LIQUID BOOT POLISH.—(1) Asphaltum, 4 ozs.; turpentine, 8 ozs.; gold size, 3 ozs.; boiled oil, 3 ozs.; nigrosine, ¼ oz. Heat together until a uniform mixture results, then thin down with turpentine to the desired consistence. (2) Methylated spirit, 1½ pint; shellac, 8 ozs.; castor oil, ½ oz.; yellow resin, 3 ozs.; lampblack, 3 ozs. Macerate the shellac and resin in the spirit, add the oil, and lastly the lampblack. Shake before using. [*Reply to* LYRA.—8/17.]

COLORATION OF AROMATIC ACETIC ACID.—It is impossible to say what may be the cause of the dark brown tint developed by the aromatic acetic acid which was put into the Parma violet bottle. That would result, probably, from one of the ingredients in the perfume acting on a trace of iron in the acid. If vanillin were present it would give a brown colour, such as you describe. The best way to get rid of the colour would be to distil from a flask; if you cannot manage that, try maceration or digestion with a little animal charcoal and filtering. [*Reply to* E. P.—7/22.]

INFORMATION WANTED.

LIQUOR CALCIS GLYCERINATUS.—"Crusader" (7/21) will be glad if any reader can furnish a reference to a formula for this preparation.

OBITUARY.

LEA.—On March 26, at 4, Harbour Street, Folkestone, Carolina Sophia, the wife of John Lea, Chemist and Druggist. Aged 75.

MACKEY.—On March 26, John Brunt Mackey, Pharmaceutical Chemist, Rotherhithe. Aged 84. Mr. Mackey was a member of the Pharmaceutical Society for many years, and was auditor of the Society in 1867. He was one of the founders of the Galen Lodge, and for some considerable time occupied the position of Treasurer

BRAMWELL.—On March 27, James Bramwell, Chemist and Druggist, Liverpool. Aged 62.

KING.—On March 29, Frederick Herbert King, Chemist and Druggist, Market Drayton. Aged 38.

MACDUFF.—On April 1, James Macduff, Chemist and Druggist, Paisley. Aged 61.

COMMUNICATIONS, LETTERS, etc., have been received from

Messrs. Clark, Clayton, Dove, Edwards, Gare, George, Gowing, Griffiths, Guthrie, Harper, Hickman, Horsfield, Knight, McKellar, Millard, North Pegg, Porteous, Rhead, Sampson, Spence, Tierney, Wallbridge.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

Surinam Copaiba Balsam. Poole has examined Surinam copaiba balsam and reports upon it as being of the consistence of wood oil, yellowish, and not very clear (but not opalescent as is generally stated). The specific gravity is 0·942 at 15° C. It mixes in any proportion with petroleum ether, ether, chloroform, and carbon disulphide. A little absolute alcohol produces turbidity, which disappears on the addition of 4 to 5 parts of the solvent; 77 per cent. of ethereal oil is obtained from the fresh balsam, but the amount is diminished considerably on keeping. The saponification number is 34; 1 gramme of balsam combines with 94 Mgm. of iodine. The ethereal oil obtained by distillation is colourless, boiling point 250° to 260°, spec. gravity 0·910. Copaivic acid crystals melting at 130° are obtained by extracting the resinoid residue left after distilling the oil with diluted alcohol.—*Pharm. Zeit.*, xliii., 129, through *Nederl. Tijdschr. voor Pharm.*, 321.

Interaction of Magnesium and Copper Sulphate. Dr. Edward Divers points out that neither Clowes and Caven nor Tilden, in their communications made to the Chemical Society in November last, seem to have recognised the significance of the results of the interaction of magnesium metal and a solution of copper sulphate. A closely analogous case is that of zinc immersed in a solution of an alum. In that case there is free evolution of hydrogen and precipitation of basic sulphate, and, when chromium alum replaces the aluminium salt, there is also reduction of some of the chromic sulphate to chromous sulphate. The only part of the change which finds no parallel in the action of zinc upon chrome alum is that of the deposition of a little copper, but that deposition is quite in accordance with the general behaviour of copper salts. The formation of basic salt and hydrogen is a change independent of that of reduction, and since the alum solution is dialysable into sulphuric acid and basic aluminium or chromium sulphate (besides potassium sulphate), and is also strongly acid in reaction, the action in the case of an alum is really that of dilute sulphuric acid upon the zinc. The gradual precipitation of the previously soluble basic salt as the zinc dissolves in the solution is just what happens when zinc sulphate is dissolved in a dialysed solution of aluminium, or chromium hydroxide, or basic sulphate. Similar changes probably occur between copper sulphate and magnesium, or, in a less degree, zinc; for the solution is here also very acid in reaction, and needs only a little boiling to make it deposit basic sulphate. With regard to the production of cuprous oxide, there would be nothing in that unlike what happens when ferric or chromic sulphate is reduced by zinc or magnesium, could cuprous salt only be found in solution, and it is not altogether improbable that in dilute solution and in presence of much cupric sulphate a little cuprous sulphate may exist for a very short time. It seems, therefore, that the precipitation of cuprous oxide during the action of magnesium upon cuprous sulphate is a fact highly favourable to the view that cuprous sulphate is actually formed, part of it then quickly decomposing into cupric sulphate and metallic copper, and the rest of it being decomposed by the basic cupric salt into normal cupric sulphate and cuprous oxide. When finely divided copper is acted upon by nitrogen peroxide, nitric oxide and a copper nitrate are formed, and no nitrite, and the copper nitrate, when touched with water, decomposes into cupric nitrate and bright metallic copper, thus proving, apparently, that in absence of water cuprous nitrate can exist, and, therefore, by analogy, other oxylic cuprous salts. Tilden has suggested that some of the hydrogen reduces cupric to cuprous oxide, but hydrogen is known not to have such an action, and therefore the usual assumption of there being a more active "nascent" hydrogen has to be made, but also without the least foundation in experience. In the present case it is pointed out, first, that in the reduction of chromic sulphate to chromous sulphate by zinc, hydrogen continues to be evolved, although very great excess of chromic salt is always in contact with the zinc; and, secondly, that in the reduction of ferric salts by zinc it has been established that this takes place much more rapidly when clean zinc dust is put into the ferric solution in the absence of excess of acid, than when, as is usual, an excess of acid is added to generate hydrogen. It may, therefore, with great probability be assumed that the reactions are

$$2CuSO_4 + Mg = Cu_2SO_4 + MgSO_4$$

and

$$Fe_2(SO_4)_3 + Zn = 2FeSO_4 + ZnSO_4,$$

hydrogen apparently having nothing to do in the matter.—*Proc. Chem. Soc.*, 190, 57.

Toxic Boraginaceous Plants. It is stated that extract of *Echium vulgare* is expected to prove a valuable substitute for curare. It furnishes, according to A. Drescher, with acidulated water, solutions which have marked alkaloidal reactions. The extract produces paralysis when administered to guinea-pigs. Buckheim stated as long ago as 1878 that a large number of the Boraginaceæ contain alkaloids, whose action is similar to those of curare, and later *Cynoglossum officinale* was proved to possess a paralysing effect on the nerve system.—*Pharm. Zeit.*, xliii., 129, after *Med. Record.*

Veratria in Bronchitis. Sir Dyce Duckworth has directed attention in the *Practitioner*, March (p. 272), to the fact that errhines are of considerable value when, in suffocative bronchitis, coughing does not cause adequate expectoration. Snuff, as fresh and pungent as possible, or a snuff composed of 1 part of veratria and 20 parts of starch, lycopodium, or liquorice powder, is usually unfailing to provoke effective sneezing and cough, with abundant expectoration, the powder being used two or three times a day. It is presupposed that the patient is already under the internal employment of ammonium carbonate, senega, nux vomica or terebene. The action of errhines appears to be to rouse the respiratory centre in the medulla oblongata reflexly through the nasal branches of the fifth nerve. It is hardly necessary to suggest that veratria requires to be used with considerable caution, and that if mixed with starch, owing to the white colour, accidents might easily happen through its being mistaken for other powders. For most people powdered white hellebore root is an active errhine.

Diastasic Substances from Fungus Growths. At a meeting of the New York section of the Society of Chemical Industry on January 21, M. Jokichi Takamine read a valuable paper on the production of diastase by fungi. *Eurotium oryzæ* is one of those used by the Japanese for this purpose. The growth of the fungus depends on the presence of phosphates, potash, and nitrogen in the substance on which it is developed. M. Takamine finds that wheat bran, containing these ingredients and affording a large surface for the growth of the fungus and a ready access of air, answers well for the purpose, and it is also cheap and abundant. The bran is moistened so as to give it about 30 to 40 per cent. of moisture, and live steam is then

passed through it in order to sterilise the mass and gelatinise the starch grains. It is then cooled below 40° C., and a small quantity of the fungus added (varying from 1-100 to 1 - 1000), and thoroughly mixed. The mass is then spread out in thin layers on a cemented floor, or on shelves in a growing room, where the temperature is kept at about 25° C., and the humidity near saturation point. The temperature, which rises with the growth of the fungus, is kept below 40° or 41° C. by adjusting the thickness of the layer, or the temperature of the room. After about twenty-four hours the growth becomes visible, and diastatic power is acquired. This increases rapidly after thirty-six hours, and reaches its maximum at forty-eight hours, when the mass is removed from the growing room and cooled to the ordinary atmospheric temperature. The mass, called "taka-koji" is of a light yellow colour, and when thoroughly dried can be kept indefinitely. About 20 per cent. of it is soluble in water, which extracts all the diastase generated by the fungus. Such an extract, containing about 4 or 5 per cent. of the soluble matter, is used in alcohol distilleries. The liquid extract, when evaporated, is of a dark brown colour, similar to that of malt extract, half a gallon being about equal to a bushel of the best malt. The residue left after extraction with water is employed over again, usually three or four times, and then used for cattle food.

Preparation of Pure Taka-Diastase.

The simplest method of preparing the pure taka-diastase from the 20 per cent. fluid extract is by precipitation with four or five times its own volume of strong alcohol, added slowly with vigorous agitation. The white flocculent precipitate is separated and further freed from alcohol in a centrifugal machine. The paste is then washed with strong alcohol and placed under hydraulic pressure. The resulting cake, broken and air-dried, forms the taka-diastase of commerce. Thus obtained, it is a yellowish-white amorphous powder, odourless, and possessing a pleasant nutty taste, soluble in water with little or no sediment. It is non-hygroscopic, and is capable of converting at least 100 times its own weight of dry starch into sugar in ten minutes, as determined by the modified Junk's test. Taka-diastase differs from malt diastase in not giving Lintner's characteristic reaction of an intense blue colour with tincture of guaiacum and hydrogen peroxide, but gives a milky appearance instead. It also differs in having three or four times the starch-breaking or liquefying power. In malt diastase the two properties seem equally balanced, but in taka-diastase there is an excess of the liquefying power. M. Takamine has found that a liquid having a saccharifying power can be dissolved out of unfermented grain by water, but the power can only be exercised on broken starch grains. This saccharifying substance is destroyed by boiling. In fermenting rocesses, therefore, it has been found economical to percolate the grain or bran with cold water before mashing it, as the cold saccharifying percolate mixed with taka-diastase possesses more diastatic power than the sum of the two taken separately. In other words, the taka-diastase breaks down the starch for the cold saccharifying liquid to act on. Taka-diastase is affected by heat, like malt diastase; at 70° C. its diastatic power is permanently destroyed. Its action is strongest at 144° to 146° F. (about 62° to 64° C.). In aqueous solution it does not keep very long, decomposing in a few days in an ordinary room. To a certain extent acids destroy its action; of hydrochloric acid it will stand a strength of 1 per 1000. It is not yet clear whether the saccharifying and starch liquefying substances can be obtained separately. It is evident, however, that the action of fungi and the products they form offer a large field for investigation.

Roccella Genus.

Dr. O. V. Darbishire has published a revision of this genus of lichens in the *Ber. der Deutsch. Bot. Ges.*, bd. xvi., heft 1, pp., 6-16. The features of the genus as now limited are: the cortical fibres are perpendicular to the upper surface of the thallus; the spores are colourless, the hypothecium black, and the apothecia circular, and the soredia are coloured red by solution of chloride of lime. He includes seventeen species, of which *R. fuciformis*, D.C., *R. phycopsis*, Ach., and *R. tinctoria*, D.C., are European. *R. balfourii*, Müll. Arg., *R. hypomecha*, Ach., *R. flaccida*, Del., *R. mauritiana*, Darbish., *R. canariensis*, Darbish., are African, and *R. portentosa*, Mtg., *R. gayana*, Mtg., *R. peruensis*, Krphbr., *R. difficilis*, Darbish., *R. dubia*, Darbish., *R. caribæa*, Darbish., *R. decipiens*, Darbish., and *R. montagnei*, Bil., *R. sinensis*, Nyl., are Asiatic, *R. montagnei* and *R. phycopsis* occurring also in Australia. Other species formerly included under *Roccella* are now referred to other genera.

The Bacillus of Plague.

An interesting account of the plague bacillus is given by G. A. Buckmaster in *Science Progress*, pp. 104–119. It appears that its ordinary form is that of a short bacillus with rounded ends and apparent vacuolation in the centre. It is not endowed with movement, and is often surrounded by a capsule. It is rather difficult to recognise microscopically, as it has a marked tendency to the production of polymorphic and involution forms. One of the best cultivating media is a 2 per cent. alkaline peptone solution, with the addition of 1 to 2 per cent. of gelatin. It is easily killed by weak solutions of disinfectants like carbolic acid, lyssol, mercuric perchloride, and milk of lime. It is also easily killed by drying. The germs are quickly killed by boiling the water containing them, and water at 80° C. kills them in five minutes. The microbes can live for weeks in ordinary water, and the disease can be carried by flies, and they may contaminate water or food by their excreta. Rats, mice, shrew mice, fowls, cats, and horses are susceptible of the disease, but pigeons, dogs, and oxen are immune. Infection by the bacillus in the majority of cases is at the surface of the body, minute wounds and abrasions of the skin affording a means of entrance, also lesions in the mouth or tonsils. By employing the serum of horses, that have been immunised by subcutaneous injection of cultures of the plague bacillus, warmed to 58° C., mice and other animals can be protected from and cured of plague.

A New British Flora.

According to the *Journal of Botany* (p. 94), a new British flora is in preparation by the Rev. E. T. Linton, which promises to be a more satisfactory work than any at present in use. The 'London Catalogue' will be taken as the basis, each species will be described anew from living material as far as possible, and a critical view will be given of the distinctive features of closely allied forms. The co-operation of specialists in revising the manuscript of the more difficult genera has been promised. A reference with date of each species will be given. Mr. Linton will be grateful for fresh specimens of interesting plants, which may be sent to his address, "Crymlyn, Bournemouth."

Sorghin and Sorgho-rubin

Sig. N. Passerini has extracted from the red-spotted leaf-sheaths of *Sorghum saccharatum*, *S. vulgare*, and *Zea mays*, a pigment which he terms sorghin. It is a transformation product of the natural pigment sorgho-rubin. The red colour of the spots is due in the first place to this pigment, not directly to bacteria, as has been stated.—*Bull. Soc. Bot. Ital.*, 1897, p. 195.

The British Pharmacopœia, 1898.

Formulæ and Processes—Alterations, Additions, and Omissions.

In the following summary will be found sufficiently full details concerning all medicinal preparations in the British Pharmacopœia, 1898, that the pharmacist usually prepares for himself, to enable him to make the necessary alterations in, and additions to, his existing stock, without waiting until copies of the book can be purchased. The desirability of rendering this information generally available will be evident when it is explained that the new Pharmacopœia may become authoritative the moment its publication is announced in the London, Edinburgh, and Dublin Gazettes. It may be considered that the crude drugs and the chemicals should first have been dealt with, but though that would undoubtedly be the more logical course to pursue, expediency suggests the advisability of publishing all the formulæ, together with such particulars regarding the materials employed as will obviate any difficulty in making or altering the various preparations. All that is necessary is to read the following notes in conjunction with the 1885 Pharmacopœia and its Addendum, and to bear in mind that, unless the contrary is expressly stated here, no change in a formula, process, or dose has been made. All quantities in the new Pharmacopœia are stated in terms of both Imperial and metric systems, but in order to simplify matters as much as possible, whilst the relative proportions have been strictly adhered to in all cases, the formulæ are, as far as possible, given in parts and fluid parts, in accordance with the well-established rule, solids by weight and liquids by measure. In certain cases, however, there are special difficulties that prevent the adoption of this rule, and in such instances definite weights and volumes are given. An asterisk (*) preceding a name indicates that the preparation is new, and a dagger (†) indicates an alternative preparation sanctioned for use in India and the Colonies.

Abbreviations.—To economise space in the following pages, certain abbreviations have been adopted throughout, thus: s. g. = specific gravity; p. c. = per cent.; m. p. = melting point; fl. dr. = fluid drachm; fl. oz. = fluid ounce; Gm. = gramme; Mgm. = milligramme; and C. c. = cubic centimetre, whilst it is hardly necessary to explain that *q.s.* means a sufficiency.

Acetum Cantharidis.—Bruised cantharides, 2; glacial acetic acid, 99 p. c., and distilled water in equal volumes, 18; Macerate for 24 hours, percolate, and add sufficient menstruum to make 20 of product. S. g. not stated.

Acetum Ipecacuanhæ.—Liquid extract of ipecacuanha, 1: alcohol (90 p. c.), 2; diluted acetic acid, 17; mix, filter and, if necessary, add sufficient acid to make 20 of product. Dose: 10 to 30 minims.

Acetum Scillæ.—Bruised squill, 2·5; diluted acetic acid, 20; macerate as directed for tinctures, and make product up to 20. S. g. not stated. Dose: 10 to 30 minims.

Acidum Aceticum Dilutum.—Acetic acid (s. g. 1·044), 2·49; distilled water, *q.s.* to produce 20. S. g. 1·006. Dose: ½ to 2 fluid drachms.

Acidum Carbolicum Liquefactum.—Phenol (m. p. 38°·8 C. and s. g. 1·060 to 1·066) liquefied by the addition of 10 p. c. by weight of distilled water. S. g. 1·064 to 1·069. Dose: 1 to 3 minims.

Acidum Hydrochloricum Dilutum.—Strength unaltered. Dose: 5 to 20 minims.

Acidum Lacticum Dilutum.—Omitted.

Acidum Nitricum Dilutum.—Strength unaltered. Dose: 5 to 20 minims.

Acidum Nitro-Hydrochloricum Dilutum.—Strength and dose unaltered.

Acidum Phosphoricum Dilutum.—Process unaltered. Dose: 5 to 20 minims.

Acidum Sulphuricum Aromaticum.—Tincture of ginger, 10; spirit of cinnamon, 0·5; alcohol (90 p. c.), 29·5; sulphuric acid (s. g. 1·843), 3. Mix acid gradually with alcohol, then add tincture and spirit. S. g. 0·922 to 0·926. Dose: 5 to 20 minims.

Acidum Sulphuricum Dilutum.—Strength unaltered. Dose: 5 to 20 minims.

Adeps.—Additional tests of purity are given.

Adeps Benzoatus.—Lard, 500; benzoin in powder, 15.

† **Adeps Induratus.**—Lard deprived of a portion of its oil by pressure may be employed in India and the Colonies in place of ordinary lard.

Adeps Lanæ.—No alteration.

Adeps Lanæ Hydrosus.—Strength unaltered.

Alcohol.—See Spiritus Rectificatus for strength.

Aqua Anethi.—Dill fruit, not bruised, 1; water, 20. Distil, 10.

Aqua Anisi.—Anise fruit, not bruised, 1; water, 20. Distil, 10.

Aqua Aurantii Floris.—Orange-flower water of commerce, 1; distilled water, 2. Mix immediately before use.

Aqua Camphoræ.—Camphor, 1; alcohol (90 p. c.), *q.s.* to make 3. Dissolve and add in successive portions to distilled water, 1000; shaking after each addition, and subsequently agitate occasionally until all the camphor is dissolved.

Aqua Carui.—Caraway fruit, not bruised, 1; water, 20. Distil 10.

Aqua Chloroformi.—Chloroform, 2·5; distilled water, *q.s.* to produce 1000. Shake together until complete solution is effected.

Aqua Cinnamomi.—Cinnamon bark, bruised, 1; water, 20. Distil 10.

Aqua Fœniculi.—Fennel fruit, not bruised, 1; water, 20. Distil 10.

Aqua Laurocerasi.—Strength and dose unaltered.

Aqua Menthæ Piperitæ.—Peppermint oil, 1; water, 1500. Distil 1000.

Aqua Menthæ Viridis.—Spearmint oil, 1; water, 1500. Distil 1000.

Aqua Pimentæ.—Pimento, bruised, 25; water, 1000. Distil 500.

Aqua Rosæ.—Rose water of commerce, 1; distilled water, 2. Mix immediately before use.

Aqua Sambuci.—Formula unaltered.

† **Aquæ.**—Anise, caraway, cinnamon, dill, fennel, peppermint, pimento and spearmint waters may be prepared in India and other tropical countries by triturating the corresponding oil in each case with twice its weight of calcium phosphate, and five hundred times its volume of distilled water, afterwards filtering.

Argenti Nitras Induratus.—Silver nitrate, 95; potassium nitrate, 5. Fuse and mould.

Argenti Nitras Mitigatus.—Identical with the old Argenti et Potassii Nitras.

Bismuth et Ammonii Citras.—Omitted.

Caffeinæ Citras.—Process unaltered.

***Caffeinæ Citras Effervescens.**—Sodium bicarbonate, in powder, 51; tartaric acid, in powder, 27; citric acid, in powder, 18; refined sugar, in powder, 14; caffeine citrate, 4. Mix the citrate with the acids, then thoroughly incorporate the mixed sodium bicarbonate and sugar, and granulate. Dose: 60 to 120 grs.

Cataplasmata.—All omitted.

Charta Epispastica.—Omitted.

Charta Sinapis.—Black and white mustard seeds, in equal proportion by weight. Bruise, extract the fixed oil by percolation with benzol (s. g. 0·880 to 0·888), dry residue, and reduce to No. 60 powder. Mix this powder, 5 Gm., with solution of india-rubber, 18 C.c., and spread over about 30 square inches of cartridge paper.

Collodium.—Pyroxylin, 1; ether (s. g. 0·735), 36; alcohol (90 p. c.), 12.

Collodium Flexile.—Formula unaltered.

Collodium Vesicans.—Blistering liquid, 40; pyroxylin, 1.

Confectio Opii.—Omitted.

Confectio Piperis.—Formula unaltered.

Confectio Rosæ Caninæ.—Omitted.

Confectio Rosæ Gallicæ.—Formula unaltered.

Confectio Scammonii.—Omitted.

Confectio Sennæ.—Formula unaltered.

Confectio Sulphuris.—Sublimed sulphur, 100; acid potassium tartrate, 25; tragacanth, in powder, 1; syrup, 50; tincture of orange, 12·5; glycerin, 37·5.

Confectio Terebinthinæ.—Omitted.

Decocta.—All omitted except those referred to below.

Decoctum Aloes Compositum.—Extract of Barbados aloes is substituted for extract of Socotrine aloes.

Decoctum Granati Corticis.—Pomegranate bark, in No. 10 powder, 4; distilled water, 24. Boil for 10 minutes, strain, and add sufficient water to produce 20. Differs from Decoctum Granati Radicis in bark of stem being permitted as well as root-bark. Dose: ½ to 2 fl. oz.

Decoctum Hæmatoxyli.—Logwood, in chips, 50; cinnamon bark, bruised, 8; distilled water, 1200. Boil for 10 minutes, strain, and add sufficient water to make 1000. Dose: ½ to 2 fl. oz.

Decoctum Sarsæ Compositum.—Omitted. See Liquor Sarsæ Compositus Concentratus.

Decoctum Scoparii.—Omitted. See Infusum Scoparii.

Emplastrum Ammoniaci cum Hydrargyro.—Formula unaltered.

Emplastrum Belladonnæ.—Liquid extract of belladonna, 4; resin plaster, 5. Contains 0·5 p. c. of alkaloids of belladonna root.

Emplastrum Calefaciens.—Omit expressed oil of nutmeg, and use distilled water. Otherwise unaltered.

Emplastrum Cantharidis.—Cantharides, in powder, 7; yellow beeswax, 4; lard, 4; resin, 4; soap plaster, 1.

Emplastrum Ferri.—Omitted.

Emplastrum Galbani.—Omitted.

Emplastrum Hydrargyri.—Formula unaltered.

Emplastrum Menthol.—Menthol, 3; yellow beeswax, 2; resin, 15. Add the menthol when mixture of melted wax and resin is at a temperature of 71° to 76° C., and stir until dissolved.

Emplastrum Opii.—Unaltered.

Emplastrum Picis.—Omit expressed oil of nutmeg.

Emplastrum Plumbi.—Formula unaltered.

Emplastrum Plumbi Iodidi.—Formula unaltered.

Emplastrum Resinæ.—Hard soap is substituted for curd soap.

Emplastrum Saponis.—Hard soap is substituted for curd soap

Emplastrum Saponis Fuscum.—Omitted.

Enemata.—All omitted.

Essentia Anisi.—Omitted. See Spiritus Anisi.

Essentia Menthæ Piperitæ.—Omitted. See Spiritus Menthæ Piperitæ.

†**Extracta Liquida.**—In India and other tropical countries any liquid extract containing less than one-fourth of its weight of 90 p. c. alcohol, may have the proportion of alcohol increased to an extent not exceeding one-fourth of the weight of the extract.

Extractum Aconiti.—Omitted.

Extractum Aloes Barbadensis.—Formula unaltered, but period of maceration extended to 24 hours and evaporated, liquid to be evaporated at temperature not exceeding 60° C. Dose: 1 to 4 grains.

Extractum Aloes Socotrinæ.—Omitted.

Extractum Anthemidis.—Formula unaltered, but consistence directed to be that of a soft extract. Dose: 2 to 8 grains.

Extractum Belæ Liquidum.—Omitted.

Extractum Belladonnæ.—See Extractum Belladonnæ Viride.

Extractum Belladonnæ Alcoholicum.—Liquid extract of belladonna, 20; milk sugar, *q.s.* Evaporate the liquid extract to a thin syrup, and add sufficient milk sugar to produce, on evaporation, 15 parts of a moderately firm extract containing 1 p. c. of the alkaloids of belladonna root. To determine the quantity of milk sugar that must be added, evaporate 50 C.c. of the liquid extract, in a counterpoised dish on a water bath, to a moderately firm extract, and weigh. The difference between that weight and 37·5 Gm. will indicate the amount of milk sugar that must be used as a diluent for each 5 C.c. of the liquid extract. Dose: ¼ to 1 grain.

***Extractum Belladonnæ Liquidum.**—Belladonna root, in No. 20 powder, is exhausted with a mixture of alcohol (90 p. c.), 7 volumes, and distilled water, 1 volume, by re-percolation. Moisten belladonna powder, 8, with menstruum, 6, and set aside for 6 hours; next pack firmly in a percolator, add menstruum, 6, and when the liquid begins to drop close the lower orifice of the percolator and set aside for 24 hours. Then percolate slowly, adding more of the menstruum as required, collect the percolate in small portions, and use this as the menstruum for percolating a second quantity of belladonna powder, equal in weight to the first. Two more similar quantities must subsequently be treated in like manner, the third portion being extracted with the percolate from the second, and the fourth with that from the third. The product collected from the fourth percolator should measure 12·5. This product is not standardised, so that it shall contain 0·75 Gm. of the alkaloids of the root in 100 C.c. Shake 10 C.c. of the extract with 10 C.c. of chloroform, 50 C.c. of water, and a decided excess of ammonia; separate the chloroformic solution, and twice repeat the agitation and separation with chloroform. Shake the mixed chloroformic solutions with 5 C.c. of diluted sulphuric acid, mixed with twice its volume of warm water, separate, and repeat the operation. Wash the mixed acid liquids with 3 C.c. of chloroform, then agitate with 10 C.c. of chloroform and an excess of ammonia. Separate the chloroformic solution, twice repeat the agitation and separation with chloroform, wash the mixed chloroformic solutions with 5 C.c. of water containing 1 drop of solution of ammonia, evaporate on a water-bath, dry the residue at 100° C., and weigh. Next dissolve the residue in 10 C.c. of decinormal hydrochloric acid, neutralise with centinormal sodium hydroxide, using tincture of cochineal as an indicator, deduct the measure of soda solution required from 100 C.c., and multiply the remainder by 0·00287. The product will be the weight in grammes of alkaloids present in 10 C.c. of the liquid extract; from this weight calculate the amount present in the bulk of strong percolate, and add to the latter sufficient of the alcoholic menstruum to make it contain 0·75 Gm. of alkaloids in 100 C.c.

Extractum Belladonnæ Viride.—Identical with Extractum Belladonnæ of the 1885 Pharmacopœia, except that the consistence is to be that of a soft extract.

Extractum Calumbæ.—Omitted.

Extractum Cannabis Indicæ.—Indian hemp, in coarse powder, is exhausted with alcohol (90 p. c.), and the percolate evaporated to the consistence of a soft extract.

Extractum Cascaræ Sagradæ.—Cascara sagrada, in No. 20 powder, is exhausted with distilled water by moistening and setting aside for a few hours, then percolating. The percolate is then evaporated to dryness.

Extractum Cascaræ Sagradæ Liquidum.—Cascara sagrada, in No. 20 powder, 20; alcohol (90 p. c.), 4; distilled water, *q.s.* Moisten the drug with water, 15, set the mixture aside for 6 hours, then percolate till the powder is exhausted, evaporate the percolate to 12 fluid parts, add the alcohol, and sufficient water to make the product measure 20. Dose: ½ to 1 fl. dr.

Extractum Cimicifugæ Liquidum.—The drug is exhausted with 90 p. c. alcohol instead of rectified spirit. Dose: 5 to 30 minims.

Extractum Cinchonæ Liquidum.—The rectified spirit of the older process is replaced by 90 p. c. alcohol. The finished extract must contain 5 Gm. of the alkaloids of red cinchona bark in 100 C.c. The assay process is practically the same as that official in the 1885 Pharmacopœia, 5 C.c. of the evaporated percolate being placed in a stoppered glass separator, together with 25 C.c. of water, 30 C.c. of benzolated amylic alcohol, and 15 C.c. of solution of potassium hydroxide. After shaking repeatedly, the lower dark-coloured alkaline layer that separates is run off and again shaken with 30 C.c. of benzolated amylic alcohol, the lower layer that now separates being rejected. The two upper layers containing the alkaloids in solution are then mixed, washed with a little water, and agitated thoroughly with 30 C.c. of a warm mixture of 1 volume of diluted hydrochloric acid and 5 volumes of water. This operation is repeated with the alcoholic layer that separates, and the two acid layers are subsequently mixed. The alkaloids are then shaken out with 10 C.c. of chloroform and sufficient solution of ammonia to impart a strongly alkaline reaction; the agitation and separation repeated with two successive quantities of 10 C.c. of chloroform, the chloroformic liquids mixed, evaporated slowly, the residue dried at 110° C., and the residual alkaloids weighed. The liquid extract must now be adjusted, either by evaporation or dilution with water, so that 5 parts of total alkaloid are contained in 85 fluid parts. Now add 12·5 of alcohol (90 p. c.), and make up to 100 with distilled water. Dose: 5 to 15 minims.

Extractum Cocæ Liquidum.—The coca leaves are reduced to No. 20 powder and exhausted with 60 p. c. alcohol. Dose : ½ to 1 fl. dr.

Extractum Colchici.—Process unaltered, but consistence to be that of a soft extract. Dose : ¼ to 1 grain.

Extractum Colchici Aceticum.—Omitted.

Extractum Colocynthidis Compositum.—Extract of Barbados Aloes is to be used in making this preparation, the proportion of curd soap is reduced by one-fourth, 60 p. c. alcohol is ordered instead of proof spirit, and the consistence is to be that of a firm extract. Dose : 2 to 8 grains.

Extractum Conii.—Omitted.

***Extractum Ergotæ.**—Ergot, in No. 40 powder, 1000; alcohol (60 p. c.), 500 ; distilled water, 250 ; diluted hydrochloric acid, 47 ; sodium carbonate, 20. Moisten the ergot with the alcohol and percolate until exhausted, then evaporate to 250, add the water and filter when cold, washing the residue with a little water. Add the acid to the filtrate, set aside for 24 hours, filter, wash the residue with distilled water until the washings no longer have an acid reaction, and add the washings to the filtrate Finally add the sodium carbonate and evaporate to a soft extract. Dose : 2 to 8 grains.

Extractum Ergotæ Liquidum.—Use 90 p. c. alcohol instead of rectified spirit.

Extractum Euonymi Siccum.—Euonymus bark, in No. 20 powder, 20 ; alcohol (45 p. c), *q.s.* ; calcium phosphate, *q.s.* Moisten the drug with the alcohol, 10, and percolate until exhausted, using sufficient of the menstruum for that purpose. Evaporate off the alcohol, thoroughly dry the residue, powder and mix with one-fourth its weight of calcium phosphate, again dry and powder, and immediately transfer to a well-closed bottle. Dose : 1 to 2 grains.

Extractum Filicis Liquidum.—Male fern rhizome, in No. 20 powder, is exhausted by percolation with ether ; and the ether evaporated from the clear percolate, on a water-bath or by distillation, until an oily extract remains. Dose : 45 to 90 minims.

Extractum Gelsemii Alcoholicum.—Omitted.

Extractum Gentianæ.—Gentian root not directed to be sliced, and consistence to be that of a soft extract. Dose : 2 to 8 grains.

Extractum Glycyrrhizæ.—The first period of maceration is extended to 24 hours, and the consistence is to be that of a soft extract.

Extractum Glycyrrhizæ Liquidum.—Liquorice root, in No. 20 powder, 20 ; distilled water, 5 ; 90 p. c. alcohol, *q.s.* Mix the liquorice with half of the water, set aside for 24 hours, strain, press, mixed the strained liquids, heat to 100° C., strain through flannel, and evaporate until the fluid, when cold, is of s.g. 1·200. Finally add to the extract one-fourth its volume of the alcohol, stand for 12 hours and filter. Dose : ½ to 1 fl. dr.

Extractum Hamamelidis Liquidum.—Alcohol (45 p. c.) replaces the mixture of rectified spirit and water formerly employed as a menstruum. Dose : 5 to 15 minims.

Extractum Hæmatoxyli.—Omitted.

Extractum Hydrastis Liquidum.—Alcohol (45 p. c.) replaces the mixture of rectified spirit and water formerly employed as a menstruum. Dose : 5 to 15 minims.

Extractum Hyoscyami Viride.—Identical with Extractum Hyoscyami of the 1885 Pharmacopœia, except that the consistence is to be that of a soft extract. Dose : 2 to 8 gr.

***Extractum Ipecacuanhæ Liquidum.**—Ipecacuanha root, in No. 20 powder, 80 ; calcium hydroxide, 8 ; alcohol (90 p. c.), 3. Moisten the ipecacuanha with the alcohol, pack firmly in a percolator, add more alcohol, and when the liquid begins to drop, close the lower orifice of the percolator and set aside for 24 hours. Then percolate slowly until the product measures 67·5, and set this portion aside. Continue percolation until nothing more is extracted, drain well, mix the lime with the marc, and after standing for 24 hours, continue percolation until exhaustion is complete. Recover the alcohol from the last two percolates by distillation, and dissolve the residual extract in the portion of the percolate that was set aside. The extract is next standardised so that it shall contain 2 to 2·5 Gm. of the alkaloids of the root in 100 C.c. The assay process is as follows :—Dilute 20 C.c. of the strong liquid extract with an equal bulk of water, remove the alcohol by the aid of a water-bath, add to the warm solution an excess of solution of lead subacetate, filter, wash the precipitate with water, and add the washings to the filtrate. Remove excess of lead from filtrate by precipitation with diluted sulphuric acid, filter, wash, and add the washings to the filtrate. Transfer filtrate to a separator, add excess of solution of ammonia (s. g. 0·959), and agitate with 25 C.c. of chloroform. Separate and set aside the chloroformic solution, and twice repeat the agitation with chloroform and the subsequent separation. Then mix the chloroformic solutions, evaporate, dry at a temperature below 80° C., and weigh the residue of total alkaloids. From this weight calculate the amount of alkaloids in the bulk of strong liquid extract, and add to the latter sufficient alcohol (90 p. c.) to make the liquid extract of the required strength. Dose : As an expectorant, ½ to 2 minims ; as an emetic, 15 to 20 minims.

Extractum Jaborandi.—Omitted.

***Extractum Jaborandi Liquidum.**—Jaborandi leaves, in No. 20 powder, 20 ; alcohol (45 p. c.), 10. Moisten the powder with the alcohol, pack in a percolator and set aside for twelve hours ; then percolate with more alcohol, and collect 17 of percolate. Continue percolation until 50 parts more are obtained, distil the latter so as to recover the alcohol, evaporate the residual aqueous liquid to the consistence of a soft extract, add to this the reserved percolate, and sufficient alcohol to make 20 of product. Dose : 5 to 15 minims.

Extractum Jalapæ.—Alcohol (90 p. c.) is substituted for rectified spirit, as the first macerating medium, and the finished product must have the consistence of a firm extract. Dose : 2 to 8 grains.

Extractum Krameriæ.—Coarsely powdered krameria root is macerated in twice its weight of distilled water for 24 hours ; then packed in a percolator and percolated with more water until exhausted. Finally evaporate the liquid to dryness. Dose 5 to 15 grains.

Extractum Lactucæ.—Omitted.

Extractum Lupuli.—Omitted.

Extractum Mezerei Æthereum.—Omitted.

Extractum Nucis Vomicæ.—Liquid extract of nux vomica, 10 ; milk sugar, *q.s.* Distil the alcohol from the liquid extract, and add sufficient milk sugar to produce, on evaporation, three parts of a firm extract containing 5 p. c. of strychnine. To determine the quantity of milk sugar that must be added, evaporate 50 C.c. of the liquid extract in a counterpoised dish on a water-bath to a moderately firm extract, and weigh. The difference between that weight and 15 Gm. will indicate the amount of milk sugar that must be used as a diluent for each 50 C.c. of the liquid extract. Dose : ¼ to 1 grain.

***Extractum Nucis Vomicæ Liquidum.**—Moisten nux vomica in No. 20 powder, 16, with alcohol (70 p. c.), 8 ; set aside in a covered vessel for 6 hours, then pack firmly in a percolator, and add more alcohol, so as to saturate the powder and leave a stratum above it. When the liquid begins to flow, close the lower orifice of the percolator, set aside for 24 hours, then continue slow percolation, and collect the first 12 fluid parts of strong percolate. Change the receiver and continue percolation until the powder is exhausted, press the marc, add the expressed liquid to the weaker percolate, which must then be freed from alcohol by distillation and evaporated to 1 fluid part. To this add alcohol (90 p. c.), 3, mix with the reserved stronger percolate, and, after standing for 24 hours, pour off the clear liquid and filter the remainder. Next determine the proportion of strychnine present in the liquid extract, evaporate 10 C.c. to a thick syrup on a water-bath, dissolve the residue in 20 C.c. of water, heating if necessary, place the solution in a separator, and shake out with 5 Gm. of sodium carbonate dissolved in 25 C.c. of water, together with 10 C.c. of chloroform. Separate, and twice repeat the operation with chloroform only. Then mix 6 C.c. of diluted sulphuric acid with 25 C.c. of water, divide the mixture into three parts, and shake the mixed chloroformic solutions with each in turn. Mix the acid liquids, dilute with water to 175 C.c., and shake well and frequently in a stoppered flask during half an hour with 25 C.c. of potassium ferrocyanide solution (10 Gm. in 200 C.c.). The precipitate formed is transferred to a filter, the flask rinsed with water containing one-fortieth its volume of diluted sulphuric acid, and the precipitate washed until the washings are free from bitterness. Next, shake the precipitate in a separator with 5 C.c. of solution of ammonia, add 15 C.c. of chloroform in two successive portions, shaking well after each addition, separate and mix the chloroformic solutions, evaporate in a counterpoised dish in a current of warm air, the dish being covered to avoid loss of strychnine. The residue is dried for 1 hour on a water-bath, and then weighed. From this weight calculate the amount of strychnine in the bulk of the strong liquid extract, and add to the latter sufficient alcohol

(70 p. c.) to produce a liquid extract of nux vomica containing 1·5 Gm. of strychnine in 100 C.c. Dose : 1 to 3 minims.

Extractum Opii.—The opium is directed to be sliced. Dose : ½ to 2 grains.

Extractum Opii Liquidum.—Extract of opium, 3, distilled water, 64, alcohol (90 p. c.), 16. Mix the extract with the water, and set aside for an hour, stirring frequently ; then add the alcohol, set aside in a cool place for 24 hours, and filter. The product should measure 80 fluid parts ; its s. g. should be from 0·985 to 0·995, and 100 C.c. should contain 0·75 Gm. of morphine. Dose : 5 to 30 minims.

Extractum Papaveris.—Omitted.

Extractum Pareiræ.—Omitted.

Extractum Pareiræ Liquidum.—Pareira root, in No. 40 powder, is moistened with boiling distilled water, set aside for 24 hours, then slowly percolated with more boiling water until exhausted. The proportion of extractive matter in the percolate is determined by evaporating a small weighed quantity in a counterpoised dish on a water-bath to a firm consistence, and weighing the product. Next, evaporate the bulk of the percolate until it contains one-third its weight of such extractive matter, and add sufficient alcohol (90 p. c.) to increase the bulk of the evaporated liquid by one-third. Filter, or otherwise clarify, if necessary. Dose : ½ to 2 fl. dr.

Extractum Physostigmatis.—Alcohol (90 p. c.) replaces the rectified spirit formerly used as a menstruum, and after a very soft extract has been produced on evaporation it is mixed with three times its weight of milk sugar, so as to produce a firm extract. The strength of this preparation is thus reduced to one-fourth of the older extract. Dose : ¼ to 1 grain.

Extractum Quassiæ.—Omitted.

Extractum Rhamni Frangulæ.—Omitted.

Extractum Rhamni Frangulæ Liquidum.—Omitted.

Extractum Rhei.—Rhubarb root, in No. 20 powder, is exhausted by moistening with 60 p. c. alcohol, setting aside for 48 hours, then slowly percolating with alcohol, most of which is subsequently recovered by distillation, and the residual liquid then evaporated to dryness. Dose : 2 to 8 grains.

Extractum Sarsæ Liquidum.—Sarsaparilla, in No. 40 powder, 20 ; alcohol (20 p. c.), *q.s.* ; glycerin, 2. The sarsaparilla is divided into three portions, the first of which is moistened with alcohol, 4 fluid parts, packed in a percolator, set aside for 24 hours, then percolated with alcohol until the product measures 4 fluid parts. Repeat the whole operation with the second and third portion. Moisten the second portion with this, and go through the same steps as before, percolating with a menstruum obtained by further percolation of the first portion. Repeat the whole operation with the third portion, and adjust the final percolate, so that after adding the glycerin it shall measure exactly 20 fluid parts. Dose : 2 to 4 fl. dr.

Extractum Stramonii.—Pack stramonium seeds, in No. 40 powder, in a percolator, exhaust by slow percolation with alcohol (70 p. c.), remove most of the alcohol by distillation, and evaporate the residual liquid to a firm extract. Dose : ¼ to 1 grain.

***Extractum Strophanthi.**—Pack strophanthus seeds, reduced to No. 30 powder and dried at 43° C. in a percolator, moisten with purified ether (s. g. 0·720 to 0·722), set aside for 24 hours, then percolate with ether until it passes through colourless. Remove the marc and dry it, gradually heating it up to 49° C. Then reduce to powder, repack in percolator, moisten with alcohol (90 p. c.), leave for 48 hours, then percolate slowly with alcohol until for each part of the powder 10 fluid parts of liquid have been obtained. Evaporate most of the alcohol, transfer residual liquid to a counterpoised basin and concentrate until it begins to thicken, then add sufficient finely-powdered milk sugar to produce extract, in powder, equal to twice the weight of the strophanthus powder operated upon. Dose : ¼ to 1 grain.

Extractum Taraxaci.—No limit of temperature is specified at which to evaporate the juice, and the final consistence is to be that of a soft extract : Dose : 5 to 15 grains.

Extractum Taraxaci Liquidum.—Alcohol (60 p. c.) is used as a menstruum instead of the proof spirit. Dose : ½ to 2 fl. dr.

Fel Bovinum Purificatum.—Alcohol (90 p. c.) is used as a solvent instead of rectified spirit, and the consistence of the product is to be that of a thick extract. Dose : 5 to 15 grains.

Ferri et Ammonii Citras.—Strength unaltered.

Ferri et Quininæ Citras.—Strength unaltered.

Ferrum Tartaratum.—Strength and dose unaltered.

***Glycerinum Acidi Borici.**—Boric acid, in fine powder, 6 ; Glycerin (s. g. 1·260), sufficient to produce 20 by weight. Heat glycerin, 9 fluid parts by weight, to a temperature not exceeding 150° C., and add the boric acid gradually, constantly stirring until all is dissolved. Maintain the temperature until the mixture has been reduced to 10 parts by weight, then add sufficient glycerin to make 20.

Glycerinum Acidi Carbolici.—Phenol, 1 ; glycerin, sufficient to produce 5 by volume. Dissolve by trituration.

Glycerinum Acidi Gallici.—Omitted.

Glycerinum Acidi Tannici.—Tannic acid, 1 ; glycerin, sufficient to produce 5 by volume. Dissolve by trituration.

Glycerinum Aluminis.—Alum, in powder, 40 ; distilled water, 15 ; glycerin, sufficient to produce 240 by volume. Dissolve by trituration, warming if necessary, set aside to settle and pour off the clear liquid.

Glycerinum Amyli.—Starch, 2 ; glycerin, 13 ; distilled water, 3. Mix, heat, and stir constantly until a translucent jelly is formed.

Glycerinum Boracis.—Borax, 1 ; glycerin, 6. Dissolve by trituration.

***Glycerinum Pepsini.**—Pepsin (2500 times), 16 ; hydrochloric acid, 2 ; glycerin, 105 ; distilled water, sufficient to produce 175. Mix the acid, glycerin, and 52 of water ; then add the pepsin, and, after one week, filter and make up to the required volume with water. Dose : 1 to 2 fl. dr.

Glycerinum Plumbi Subacetatis.—Lead acetate, 5 ; lead oxide, in powder, 3·5 ; glycerin, 20 ; distilled water, 12. Mix, boil for 15 minutes, filter, and evaporate at a temperature not exceeding 105°·5 C. until the product weighs 32·75 and is of s. g. 1·48.

Glycerinum Tragacanthæ.—Tragacanth, in fine powder, 1 ; glycerin, 3 ; distilled water, 1. Mix the glycerin with the tragacanth, add the water, and triturate until a homogeneous paste is produced.

***Hydrargyri Oleas.**—Mercuric chloride, 8 ; hard soap, powdered, 16 ; oleic acid, 1 ; boiling distilled water, *q.s.* Dissolve the mercuric chloride in 80 of water ; triturate the acid with the soap and dissolve in 88 of water. Mix the solutions, boil for 10 minutes, set aside to deposit, decant, wash the precipitated oleate with hot distilled water until free from chloride, and dry on a water-bath.

Hydrargyrum Ammoniatum.—Unaltered.

Hydrargyrum cum Creta.—Unaltered:

†**Infusa.**—In India and the Colonies, dried instead of fresh lemon peel may be used in preparing the compound infusions of gentian and orange peel.

Infusum Anthemidis.—Omitted.

Infusum Aurantii.—Formula unaltered. Dose : ½ to 1 fl. oz.

Infusum Aurantii Compositum.—Formula unaltered. Dose: ½ to 1 fl. oz.

Infusum Buchu.—The buchu leaves are to be freshly broken, not bruised, and infused for 15 minutes only. Dose : 1 to 2 fl. oz.

Infusum Calumbæ.—The calumba root is to be thinly sliced, not cut small. Dose : ½ to 1 fl. oz.

Infusum Caryophylli.—Infuse for 15 minutes only. Dose : ½ to 1 fl. oz.

Infusum Cascarillæ.—Cascarilla, in No. 10 powder, 1 ; boiling distilled water, 20. Infuse for 15 minutes. Dose : ½ to 1 fl. oz.

Infusum Catechu.—Omitted.

Infusum Chiratæ.—Chiretta, cut small, 1 ; boiling distilled water, 20. Infuse for 15 minutes. Dose ½ to 1 fl. oz.

Infusum Cinchonæ Acidum.—Formula unaltered. Dose : ½ to 1 fl. oz.

Infusum Cuspariæ —Cusparia bark, in No. 20 powder, 1 ; boiling distilled water, 20. Infuse for 15 minutes.

Infusum Cusso.—Omitted.

Infusum Digitalis.—Digitalis leaves, in No. 20 powder, 3 ; boiling distilled water, 437·5.

Infusum Ergotæ.—Ergot, freshly crushed, 1 ; boiling distilled water, 20. Infuse for 15 minutes.

Infusum Gentianæ Compositum.—Formula unaltered, but but period of infusion reduced to 15 minutes. Dose : ½ to 1 fl. oz.

Infusum Jaborandi.—Omitted.

Infusum Krameriæ —Krameria root, bruised, 1 ; boiling distilled water, 20. Infuse for 15 minutes. Dose : ½ to 1 fl. oz.

Infusum Lini.—Omitted.

Infusum Lupuli.—Hops, freshly broken, 1 ; boiling distilled water, 20. Infuse for 15 minutes.

Infusum Maticæ.—Omitted.

Infusum Quassiæ.—Quassia wood, finely rasped, 1; cold distilled water, 100. Infuse for 15 minutes. Dose: ½ to 1 fl. oz.

Infusum Rhei.—The proportion of rhubarb is doubled, and the time of infusion reduced to 15 minutes. Dose: ½ to 1 fl. oz.

Infusum Rosæ Acidum.—Formula unaltered. Dose: ½ to 1 fl. oz.

***Infusum Scoparii.**—Broom tops, dried and bruised, 2; boiling distilled water, 20. Infuse in a covered vessel for 15 minutes. Dose: 1 to 2 fl. oz.

Infusum Senegæ.—The senega root is ordered in No. 10 powder. Dose: ½ to 1 fl. oz.

Infusum Sennæ.—Infuse for 15 minutes only. Dose: ½ to 1 fl. oz.; as a draught, 2 fl. oz.

Infusum Serpentariæ.—Serpentary rhizome, in No. 10 powder, 1; boiling distilled water, 20. Infuse for 15 minutes. Dose: ½ to 1 fl. oz.

Infusum Uvæ Ursi.—Infuse for 15 minutes only. Dose: ½ to 1 fl. oz.

Infusum Valerianæ.—Omitted.

Injectio Apomorphinæ Hypodermica.—Apomorphine hydrochloride, 1; diluted hydrochloric acid, 1; distilled water, 100. Boil the water for a few minutes, cool, add the acid, and dissolve the apomorphine hydrochloride in the mixture; if necessary make up with recently boiled and cooled distilled water to 100 fluid parts. Dose: 5 to 10 minims.

***Injectio Cocainæ Hypodermica.**—Cocaine hydrochloric, 10; salicylic acid, 0·15; distilled water, 100. Boil the water, add the acid, and dissolve the cocaine hydrochloride in the solution when cool; if necessary, make up to 100 fluid parts with recently boiled and cooled distilled water. Dose: 2 to 5 minims.

***Injectio Ergotæ Hypodermica.**—Extract of ergot, 50; phenol, 1·5; distilled water, 100. Mix the phenol with the water and boil for a few minutes; cool, add the extract of ergot and, if necessary, make up to 100 fluid parts with recently boiled and cooled distilled water. Dose: 3 to 10 minims.

Injectio Ergotini Hypodermica.—Omitted.

Injectio Morphinæ Hypodermica.—Dissolve morphine tartrate, 5, in sufficient recently boiled and cooled distilled water to produce 100 fluid parts. Dose: 2 to 5 minims.

Jalapæ Resina.—Alcohol (90 p. c.) is used to exhaust the jalap, instead of rectified spirit. The powdered resin should not yield more than 10 p. c. to ether.

Lamellæ Atropinæ.—Formulæ unaltered.

Lamellæ Cocainæ.—Weight of discs increased to 2·17 Mgm., and each containing 1·3 Mgm. of cocaine hydrochloride. Four times the strength of the discs of the 1885 Pharmacopœia.

***Lamellæ Homatropinæ.**—Discs of gelatin, with some glycerin, each weighing about 1 3 Mgm., and containing 0·65 Mgm. of homatropine hydrobromide.

Lamellæ Physostigminæ.—Physostigmine sulphate used instead of physostigmine.

Linimentum Aconiti.—Alcohol (90 p. c.) is ordered instead of rectified spirit.

Linimentum Ammoniæ.—Solution of ammonia, 1; almond oil, 1; olive oil, 2. Shake together.

Linimentum Belladonnæ.—Liquid extract of belladonna, 10; camphor, 1; distilled water, 2; alcohol (90 p. c., *q.s.*) to produce 20. Dissolve the camphor in 6 of the alcohol, add the extract, water, and sufficient alcohol to produce the required volume. Set aside for 24 hours, then filter.

Linimentum Calcis.—Unaltered.

Linimentum Camphoræ.—The camphor is ordered in flowers.

Linimentum Camphoræ Ammoniatum.—This is the Linimentum Camphoræ Compositum of the 1885 Pharmacopœia, with the rectified spirit replaced by 90 p. c. alcohol, whilst a definite volume—20 fl. oz.—is to be produced with the quantities there ordered, the camphor and oil being dissolved in about 5 times their volume of alcohol, the strong solution of ammonia gradually added, with constant shaking, and sufficient alcohol then added to make a clear solution of the required volume.

Linimentum Chloroformi.—Unaltered.

Linimentum Crotonis.—Alcohol (90 p. c.) takes the place of rectified spirit.

Linimentum Hydrargyri.—Ointment of mercury, 30; strong solution of ammonia, 10; liniment of camphor, *q.s.* Add the ammonia solution to sufficient of the liniment to make 45 of product; triturate the ointment with sufficient of the liniment to produce an equal volume; then mix the two liquids.

Linimentum Iodi.—Now official as Liquor Iodi Fortis, which see.

Linimentum Opii.—Formula unaltered, but the product is directed to be set aside for a few days before filtration.

Linimentum Potassii Iodidi cum Sapone.—The curd soap must be recently prepared and in fine shavings.

Linimentum Saponis.—Soft soap replaces the hard soap formerly ordered, and 90 p. c. alcohol is to be used instead of rectified spirit. Dissolve the soap in the water and the camphor and oil in the alcohol, mix the two solutions, set aside for a week, and filter.

***Linimentum Sinapis.**—Volatile oil of mustard, 2; camphor, 3; castor oil, 7; 90 p. c. alcohol, 43. Dissolve the camphor in the alcohol and add the oils.

Linimentum Sinapis Compositum.—Omitted.

Linimentum Terebinthinæ.—Soft soap, 1 5; distilled water, 5 or *q.s.*; camphor, 1; oil of turpentine, 13. Mix the soap with 2 of water, dissolve the camphor in the turpentine, gradually add the second solution to the first, triturate until a thick creamy emulsion is formed, then add sufficient water to make 20 of product.

Linimentum Terebinthinæ Aceticum.—Unaltered.

Liquor Acidi Chromici.—Unaltered.

Liquor Ammoniæ.—Unaltered.

Liquor Ammoniæ Fortis.—Identical with Liquor Ammoniæ Fortior of the 1885 B.P.

Liquor Ammonii Acetatis.—Dissolve ammonium carbonate, 1, in 10 times its weight of distilled water, neutralise with acetic acid, and add sufficient distilled water to produce 20 of the solution. Preserve in a green glass bottle. Dose: 2 to 6 fl. dr.

Liquor Ammonii Acetatis Fortior.—Omitted.

Liquor Ammonii Citratis.—Dissolve citric acid, 2·5, in 5 times its weight of distilled water, neutralise with ammonium carbonate (about 1·75), and add sufficient distilled water to produce 20 of the solution. Preserve in a green glass bottle. Dose: 2 to 6 fl. dr.

Liquor Ammonii Citratis Fortior.—Omitted.

Liquor Antimonii Chloridi.—Omitted.

Liquor Arsenicalis.—Add half a grain each of arsenious anhydride and potassium carbonate to the quantities ordered in the 1885 B.P., to produce one pint.

Liquor Arsenici Hydrochloricus.—Add half a grain of arsenious anhydride to the quantity ordered in the 1885 B.P., to produce one pint.

Liquor Arsenii et Hydrargyri Iodidi.—Arsenious iodide, 1; mercuric iodide, 1; distilled water, *q.s.* to produce 100 of solution. Dose: 5 to 20 minims.

Liquor Atropinæ Sulphatis.—Dissolve atropine sulphate, 1, and salicylic acid, 0·12, in sufficient recently boiled and cooled distilled water to produce 100 of the solution. Dose: ½ to 1 minim.

Liquor Bismuthi et Ammonii Citratis.—Bismuth oxynitrate, 35; potassium citrate, 35; potassium carbonate, 10; nitric acid, 25; solution of ammonia and distilled water, *q.s.* Dissolve the oxynitrate in the acid diluted with an equal volume of water, add more water with constant stirring until the liquid is very faintly opalescent; then add the potassium salts dissolved in a little water, heat the liquid to the boiling-point, cool, separate the precipitate, and wash it with distilled water until free from nitrates. Now gradually add solution of ammonia to the moist precipitate until it is just dissolved, dilute with distilled water to produce 500 fluid parts of the solution, and filter.

Liquor Calcii Chloridi.—Omitted.

Liquor Calcis.—Calcium hydroxide is specified in the formula instead of slaked lime.

Liquor Calcis Chlorinatæ.—Formula unaltered, but it is recommended that the filtered solution should be preserved in a cool and dark place.

Liquor Calcis Saccharatus.—Calcium hydroxide is ordered instead of slaked lime, and the specific gravity is altered to 1·055. Dose: 20 to 60 minims.

***Liquor Calumbæ Concentratus.**—Calumba root, in No. 5 powder, 10; 90 p. c. alcohol, 4·5; distilled water, *q.s.* to make 20. Macerate the calumba for 24 hours with 10 of water, press strongly, macerate the residue for 24 hours with 10 of water, again press strongly, mix the expressed liquids and heat for 5 minutes to 82° C. When cold, add the alcohol, set aside, filter, and add sufficient water to produce the required volume. Dose: ½ to 1 fl. dr.

*Liquor Caoutchouc.—Indiarubber, 1; benzol, 10; carbon bisulphide, 10. Cut the rubber into fine shreds, and place in a well-stoppered bottle containing the previously mixed liquids. Set aside in a cool place, and agitate occasionally until solution is effected.

*Liquor Chiratæ Concentratus.—Chiretta, in No. 40 powder, 10; 20 p. c. alcohol, *q.s.* to produce 20. Moisten the chiretta with 5 of alcohol, pack in a closed percolator, and set aside for three days, then percolate with 20 of alcohol, added in 10 equal portions at intervals of 12 hours, and continue percolation with more alcohol until the required volume of product is obtained. Dose: ½ to 1 fl. dr.

Liquor Cocainæ Hydrochloratis.—Now official as Injectio Cocainæ Hypodermica, which see.

*Liquor Cuspariæ Concentratus.—Cusparia bark, in No. 40 powder, 10; 20 p. c. alcohol, *q.s.* to produce 20. Proceed in the same manner as in preparing Liquor Chiratæ Concentratus. Dose: ½ to 1 fl. dr.

Liquor Epispasticus.—Cantharides, in No. 20 powder, 10; acetic ether, *q.s.* to produce 20.

*Liquor Ethyl Nitritis.—A mixture of 95 parts by volume of absolute alcohol with 5 of glycerin, containing, when freshly made, 3 p. c. by weight of ethyl nitrite, and even when long kept not less than 2·5 p. c. The ethyl nitrite is obtained by the interaction of 90 p. c. alcohol, sodium nitrite, and diluted sulphuric acid at a low temperature. Dose: 20 to 60 minims.

Liquor Ferri Acetatis.—Solution of ferric sulphate, 2·5; solution of ammonia, 4 or *q.s.*; glacial acetic acid, liquefied, 1·5; distilled water, *q.s.* to produce 20 of the solution. Mix the solution of ammonia with 20 of water, gradually add to this the ferric sulphate solution diluted with 20 of water, stir well together, keeping the ammonia in slight excess, and let the whole stand for two hours, stirring occasionally. Next, transfer to a calico filter, wash the precipitate with distilled water until free from sulphates, drain and squeeze to remove superfluous moisture, dissolve the precipitate in the glacial acetic acid, and make up the required volume with distilled water. Finally, allow any insoluble matter to subside and pour off the clear solution. S. g. 1·031. Dose: 5 to 15 minims.

Liquor Ferri Acetatis Fortior.—Omitted.

Liquor Ferri Dialysatus.—Omitted.

Liquor Ferri Perchloridi.—Formula unaltered. Dose: 5 to 15 minims.

Liquor Ferri Perchloridi Fortis.—Formula unaltered.

Liquor Ferri Pernitratis.—Formula unaltered. Dose: 5 to 15 minims.

Liquor Ferri Persulphatis.—Unaltered.

Liquor Gutta-Percha.—Omitted.

*Liquor Hamamelidis.—Macerate fresh hamamelis leaves, 50, in a mixture of water, 100, and 90 p. c. alcohol, 10, for 24 hours; then distil one-half.

Liquor Hydrargyri Nitratis Acidus.—Unaltered.

Liquor Hydrargyri Perchloridi.—The ammonium chloride is omitted from the formula. Dose: ½ to 1 fl. dr.

*Liquor Hydrogenii Peroxidi.—An aqueous solution of hydrogen, prepared by the interaction of water, barium peroxide, and a dilute mineral acid, at a temperature below 10° C. The solution should yield from 9 to 11 volumes of oxygen, and not more than 0·5 p. c. of solid residue should remain when it is evaporated to dryness on a water-bath. Dose: ½ to 2 fl. dr.

Liquor Iodi.—Omitted.

*Liquor Iodi Fortis.—Dissolve iodine, 25, and potassium iodide, 15, in distilled water, 25; then add 90 p. c. alcohol, 180, and shake. This preparation replaces the Linimentum Iodi of the 1885 B.P.

*Liquor Krameriæ Concentratus.—Krameria root, in No. 40 powder, 10; 20 p. c. alcohol, *q.s.* to produce 20. Proceed in the same manner as in preparing Liquor Chiratæ Concentratus. Dose: ½ to 1 fl. dr.

Liquor Lithiæ Effervescens.—Omitted.

Liquor Magnesii Carbonatis.—Unaltered.

Liquor Magnesii Citratis.—Omitted.

Liquor Morphinæ Acetatis.—Dissolve morphine acetate, 1, in a mixture of 90 p. c. alcohol, 25, distilled water, 25, and diluted acetic acid, 2; then dilute with sufficient distilled water to produce 100 of the solution. Dose: 10 to 60 minims.

Liquor Morphinæ Bimeconatis.—Omitted.

Liquor Morphinæ Hydrochloridi.—Dissolve morphine hydrochloride, 1; in a mixture of 90 per cent. alcohol, 25; distilled water, 25; and diluted hydrochloric acid, 2. Then dilute with sufficient distilled water to produce 100 of the solution. Dose: 10 to 60 minims.

Liquor Morphinæ Sulphatis.—Omitted.

*Liquor Morphinæ Tartratis.—Dissolve morphine tartrate, 1, in a mixture of 90 per cent. alcohol, 25, and distilled water, 25, then dilute with sufficient distilled water to produce 100 of the solution. Dose: 10 to 60 minims.

*Liquor Pancreaticus.—A liquid preparation containing the digestive principles of the fresh pancreas of the pig. Digest 5 parts of pancreas—freed from fat and external membrane and finely divided by trituration with washed sand or powdered pumice—in a closed vessel in 20 fluid parts of 20 per cent. alcohol for 7 days, then filter.

*Liquor Picis Carbonis.—Coal tar—prepared by heating the tar of commerce in a shallow vessel at 49° C. for 1 hour and stirring frequently—is emulsified by means of a tincture of quillaia. Moisten quillaia bark, in No. 20 powder, 2 parts, with 1 of 90 p. c. alcohol, and percolate with more alcohol until the product measures 20. To this add 4 of prepared coal tar, and digest the mixture at 49° C. for two days, stirring occasionally. Then cool, and decant or filter.

Liquor Plumbi Subacetatis Dilutus.—Alcohol (90 p. c.) is used in place of rectified spirit.

Liquor Plumbi Subacetatis Fortis.—Unaltered.

Liquor Potassæ.—Strength unaltered.

Liquor Potassæ Effervescens.—Omitted.

Liquor Potassii Permanganatis.—Potassium permanganate, 1, is dissolved in sufficient distilled water to produce 100.

*Liquor Quassiæ Concentratus.—Quassia wood, in No. 40 powder, 2; 20 p. c. alcohol, *q.s.* to produce 20. Moisten the quassia with 2 of alcohol, and proceed in the same manner as in preparing Liquor Chiratæ Concentratus. Dose: ½ to 1 fl. dr.

*Liquor Rhei Concentratus.—Rhubarb root, in No. 5 powder, 10; 20 p. c. alcohol, *q.s.* to produce 20. Proceed in the same manner as in preparing Liquor Chiratæ Concentratus. Dose: ½ to 1 fl. dr.

*Liquor Sarsæ Compositus Concentratus.—Sarsaparilla, cut transversely and bruised, 20; sassafras root, in shavings, 2; guaiacum wood, in shavings, 2; dried liquorice root, bruised, 2; mezereon bark, cut small, 1; 90 p. c. alcohol, 4·5; distilled water, *q.s.* to produce 20. Infuse the sarsaparilla in three successive portions of 100 fluid parts of distilled water, for 1 hour each, at 71° C. Boil the other solid ingredients with distilled water until exhausted, and rapidly concentrate the mixed infusion and decoction until, when cold, the liquid measures 16 fluid parts. Next add the alcohol, set aside for at least 14 days, and filter. The product should measure 20 fluid parts. Dose: 2 to 8 fl. dr.

*Liquor Senegæ Concentratus.—Senega root, in No. 20 powder, 10; a mixture of 2 parts of 20 p. c. alcohol and 1 part of 45 p. c. alcohol, *q.s.* to produce 20. Moisten the senega with 4 of the menstruum, and proceed as in preparing Liquor Chiratæ Concentratus. Dose: ½ to 1 fl. dr.

*Liquor Sennæ Concentratus.—Senna, in No. 5 powder, 20; tincture of ginger, 2·5; 90 p. c. alcohol, 2; distilled water, *q.s.* to produce 20. Divide the senna into three portions and exhaust by moistening with water, setting aside for 24 hours, then percolating and repercolating, as in the process for preparing Extractum Sarsæ Liquidum. Collect 16 fluid parts from the third percolator, heat the liquid to 82° C. for 5 minutes; then cool, and add the alcohol and tincture of ginger, previously mixed. Set aside for 7 days and filter. The product should measure 20 fluid parts. Dose: ½ to 1 fl. dr.

*Liquor Serpentariæ Concentratus.—Serpentary rhizome, in No. 40 powder, 10; 20 p. c. alcohol, *q.s.* to produce 20. Proceed in the same manner as in preparing Liquor Chiratæ Concentratus. Dose: ½ to 2 fl. dr.

Liquor Sodæ.—Omitted.

Liquor Sodæ Chlorinatæ.—Unaltered.

Liquor Sodæ Effervescens.—Omitted.

Liquor Sodii Arsenatis.—Sodium arsenate, recently rendered anhydrous, 1; distilled water, *q.s.* to produce 100. Dose: 2 to 8 minims.

Liquor Sodii Ethylatis.—Unaltered.

Liquor Strychninæ Hydrochloridi.—Dissolve strychnine hydrochloride, 1, in 90 p. c. alcohol, 25, mixed with sufficient distilled water to produce 100. Dose: 2 to 8 minims.

*Liquor Thyroidei.—A liquid prepared from the fresh and healthy thyroid gland of the sheep. Carefully selected glands,

taken from sheep immediatcly after killing, are sliced and bruised thoroughly in a mortar; then, for each entire gland, add 2 C.c. each of glycerin and 0·5 p. c. solution of phenol in distilled water. Transfer the mixture, well stirred, to a flask, and close the neck with a plug of cotton wool. Allow to stand for 24 hours, then strain through linen, with strong pressure, and add to the strained liquid sufficient of the 0·5 p. c. solution of phenol to make 6 C.c. of the thyroid solution for each gland used. The solution must be freshly prepared and kept in well-stoppered, sterilised bottles. Dose: 5 to 15 minims.

Liquor Trinitrini.—Dissolve trinitroglycerin of commerce, 1, in sufficient 90 p. c. alcohol to produce 100. S. g. 0 840. Dose: ½ to 2 minims.

Liquor Zinci Chloridi.—Formula practically unaltered, but the specific gravity is to be 1·530.

***Lithii Citras Effervescens.**—Mix lithium citrate, 5, with citric acid, in powder, 21, then add tartaric acid, in power, 31, and sodium bicarbonate, in powder, 58. Triturate thoroughly, and heat the mixture to a temperature between 93° and 104° C., until granulation is effected. Dry the granules at a temperature not exceeding 54° C. The product should weigh about 100.

Lotio Hydrargyri Flava.—The quantity of mercuric chloride is increased by one-ninth.

Lotio Hydrargyri Nigra.—Each 10 fluid parts must contain 0·5 of glycerin, and 1·25 of mucilage of tragacanth. Triturate the mercurous chloride with the glycerin and mucilage, transfer to a bottle, and add 2 fluid parts of the solution of lime; shake well, then add sufficient solution of lime to make up to 10 fluid parts.

Magnesii Sulphas Effervescens.—Formula unaltered, but it is directed that the granules are to be dried at a temperature not exceeding 54° C. Dose: 60 to 240 grains, for repeated administration; ½ to 1 ounce for a single administration.

Mel Boracis.—Unaltered.

Mel Depuratum.—Should not yield more than 0 2 p. c. of ash, nor contain starch.

Mistura Ammoniaci.—One-sixteenth part of the distilled water is to be replaced with syrup of tolu.

Mistura Amygdalæ—Formula unaltered. Dose: ½ to 1 fl. oz.

Mistura Creosoti.—The glacial acetic acid is omitted, the quantity of creosote increased by one-fifteenth, and the quantity of spirit of juniper is reduced so as to equal the amount of creosote. Finally, the volume of the finished product is increased by one-fifteenth. Dose: ½ to 1 fl. oz.

Mistura Cretæ.—Triturate prepared chalk, 1, with powdered tragacanth, 0·125, and refined sugar, 2, then add gradually sufficient cinnamon water to produce 32 of the mixture. Dose: ½ to 1 fl. oz.

Mistura Ferri Aromatica.—Omitted.

Mistura Ferri Composita.—The quantity of spirit of nutmeg is reduced to 50 minims, and the quantity of rose water is increased so as to make the volume of finished product the same as before. Dose: ½ to 1 fl. oz.

Mistura Guaiaci.—The gum acacia is replaced by 35 grains of powdered tragacanth. Dose: ½ to 1 fl. oz.

Mistura Olei Ricini.—Place mucilage of acacia, 1·5, in a mortar, and add to it, in alternate portions, castor oil, 3, and a mixture of strong orange-flower water, 1, and cinnamon water, 2·5, with constant trituration. Dose: ½ to 2 fl. oz.

Mistura Scammonii.—Omitted.

Mistura Sennæ Composita.—Dissolve magnesium sulphate, 5, in infusion of senna, 10. Then add a mixture of liquid extract of liquorice, 1; compound tincture of cardamoms, 2; and aromatic spirit of ammonia, 1, together with sufficient infusion of senna to make 20. Dose: 1 to 2 fl. oz.

Mistura Spiritus Vini Gallici.—Unaltered.

Mucilago Acaciæ.—The gum is to be rapidly rinsed with a little distilled water before dissolving it, and the mucilage must be strained.

Mucilago Tragacanthæ.—Alcohol (90 p. c.) replaces the rectified spirit, and the volume of finished product is to be that of the quantity of distilled water formerly ordered.

Oleatum Hydrargyri.—Omitted. See Hydrargyri Oleus.

Oleatum Zinci.—Omitted. See Unguentum Zinci Oleatis.

Oleo-Resina Cubebæ.—Omitted.

Oleum Phosphoratum.—This now contains 1 p. c., by weight, of phosphorus. Dose: 1 to 5 minims.

Oxymel.—The specific gravity must be 1·320.

Oxymel Scillæ.—Digest bruised squill 2·5, for 7 days in a mixture of acetic acid, 2·5, and distilled water, 8. Then press strongly, filter, and mix with sufficient clarified honey, liquefied, to produce an oxymel of s. g. 1·320.

Pilula Aloes Barbadensis.—Formula unaltered. Dose: 4 to 8 grains.

Pilula Aloes et Asafetidæ.—Formula unaltered except that the asafetida is directed in powder. Dose: 4 to 8 grains.

Pilula Aloes et Ferri.—The ferrous sulphate is replaced by two-thirds the quantity of the exsiccated salt, and the confection of roses by three-fourths its weight of syrup of glucose. Dose: 4 to 8 grains.

Pilula Aloes et Myrrhæ.—Socotrine aloes, in powder, 2; myrrh, in powder, 1; syrup of glucose, 1·5 or *q.s.* to make a mass. Dose: 4 to 8 grains.

Pilula Aloes Socotrinæ.—Formula unaltered. Dose: 4 to 8 grains.

Pilula Asafœtidæ Composita.—Name altered to Pilula Galbani Composita, which see.

Pilula Cambogiæ Composita.—The syrup is replaced by syrup of glucose. Dose: 4 to 8 grains.

Pilula Coloeynthidis Composita.—Formula unaltered, except that the potassium sulphate is directed to be in very fine powder. Dose: 4 to 8 grains.

Pilula Colocynthidis et Hyoscyami.—Formula unaltered. Dose: 4 to 8 grains.

Pilula Conii Composita.—Omitted.

Pilula Ferri.—Exsiccated ferrous sulphate, in fine powder, 150; exsiccated sodium carbonate, in fine powder, 95; gum acacia, in powder, 50; tragacanth, in powder, 15; syrup, 150; glycerin, 10; distilled water, 20 or *q.s.* In this instance both solids and liquids are to be weighed. Mix the liquids, add the ferrous sulphate, and mix; then add quickly the sodium carbonate and mix, set aside for 15 minutes, or until the reaction is complete, add the gums and incorporate thoroughly. Each 5-grain pill prepared from this mass should contain about 1 grain of ferrous carbonate. Dose: 5 to 15 grains.

Pilula Ferri Carbonatis.—Omitted.

Pilula Ferri Iodidi.—Omitted.

Pilula Galbani Composita.—Identical with Pilula Asafœtidæ Composita, except that syrup of glucose replaces the treacle. Dose: 4 to 8 grains.

Pilula Hydrargyri.—Formula unaltered. Dose: 4 to 8 grains.

Pilula Hydrargyri Subchloridi Composita.—The quantity of castor oil is reduced to 180 grains, and 1 fluid drachm or *q.s.* of 90 p. c. alcohol added. Dose: 4 to 8 grains.

Pilula Ipecacuanhæ cum Scilla.—Syrup of glucose replaces the treacle. Dose: 4 to 8 grains.

Pilula Phosphori.—Melt white beeswax, 12·5, and lard, 12·5, in a slightly warmed mortar, and stir to a creamy consistence. Then carefully mix with this a solution of phosporus, 1, in carbon bisulphide, 3 or *q.s.*, add kaolin, 11·5, and mix well together. Keep the mixture immersed in cold water in a bottle from which light is excluded. When dispensing, incorporate 1 part of powdered gum acacia with every three of the mixture, and varnish the pills. Dose: 1 to 2 grains.

Pilula Plumbi cum Opio.—The confection of roses is replaced by two-thirds its weight of syrup of glucose. Dose: 2 to 4 grains.

***Pilula Quininæ Sulphatis.**—Triturate quinine sulphate, 30, with powdered tartaric acid, 1; then add the product to a mixture of glycerin, 4 (by weight), and powdered tragacanth, 1. Dose: 2 to 8 grains.

Pilula Rhei Composita.—The glycerin and treacle are replaced by syrup of glucose, 2·75 oz. or *q.s.* Dose: 4 to 8 grains.

Pilula Saponis Composita.—The strong tincture of ginger and rectified spirit are replaced by an equal volume of tincture of ginger. Dose: 4 to 8 grains.

Pilula Scillæ Composita.—The treacle is replaced by half its weight of syrup of glucose. Dose: 4 to 8 grains.

***Pix Carbonis Præparata.**—Commercial coal tar is placed in a shallow vessel, and maintained at a temperature of 49° C. for 1 hour, stirring frequently.

Podophylli Resina.—The rectified spirit is replaced by 90 p. c. alcohol, and the distilled water, into which the distilled liquid is poured, is acidulated with one twenty-fourth of its bulk of hydrochloric acid. Dry the washed resin at a temperature not exceeding 38° C. Dose: ¼ to 1 grain.

(Continued on page 378.)

Priestman, William.
Smith, Fredk. Alfred Upsher.
Swinn, Charles Gosling.
Todd, Arthur Higgs.

"FIRST" EXAMINATION QUESTIONS.

April 12, 1898.

ENGLISH.

(Time allowed—from 3 p.m. to 4.30 p.m.)

1. Analyse:—

"Within the girdle of these walls
Are now confined two mighty monarchies,
Whose high upreared and abutting fronts
The perilous narrow ocean parts asunder."

2. Write out the subjunctive present of the verb *to be*, and the passive indicative future of the verb *to love*.

3. What are *primary derivative* adjectives? Form them from the following words:—*fill, pride, three.*

4. In the following passage supply the necessary capital letters, and put in the stops and the inverted commas where necessary:—this is sir charles vandrift the great diamond king marvi lier said introducing us so i see the man answered then you know me charles asked i wouldnt be worth much the detective replied if i didnt know everybody and youre easy enough to know why everybody in the street knows you

The following question must be attempted by every candidate:—

5. Write a short composition on one of the following subjects:—
(i.) The garden in early spring.
(ii.) Free libraries.
(iii.) English colonisation as compared with other systems.
(iv.) "Example is better than precept."

ARITHMETIC.

(Time allowed—from 12.30 p.m. to 2 p.m.)

[The working of these questions, as well as the answers, must be written out in full.]

1. Reduce 174 cub. yd. 22 cub. ft. 580 cub. in. to cubic inches.
2. If 1 qr. 2 bus. 2 pk. of corn cost £1 1*s.* 10½*d.*, how many pecks can be purchased for £42 14*s.* 2*d.*?
3. Express 1⅛ of 7 guineas as a fraction of 1⅛ of £7 14*s.* 7*d.*
4. Reduce 2·6 of £·877083 to the decimal of half-a-sovereign.
5. By selling goods for 11*s.* 4½*d.* I lose 5 per cent. What shall I gain or lose per cent. by selling them for 14*s.*?
6. I sold £1000 4 per cent. Stock at £90, and with the proceeds bought a 3 per cent. Stock, gaining £10 per annum in income by the transaction. At what price did I buy the 3 per cent. Stock?

The following question must be attempted by every candidate:—

7. Write out the Metric Table of Weights.
Express 471685 grammes approximately in hundredweights, etc.

LATIN.

(Time allowed—from 11 a.m. to 12.30 p.m.)

I. For all candidates. Translate into Latin:—

1. You will receive great praise.
2. His wife and son have been found.
3. I hear that he sings.
4. The Athenians accused Timotheus of high treason.
5. If you are disgusted with such citizens, judges, show it.

II. Translate into English *either* A (Caesar) *or* B (Virgil).

(Candidates must not attempt both authors.)

A.—Caesar.

1. Is ita cum Caesare egit: Si pacem populus Romanus cum Helvetiis faceret, in eam partem ituros atque ibi futuros Helvetios, ubi eos Caesar constituisset atque esse voluisset: sin bello persequi perseveraret, reminiscretur et veteris incommodi populi Romani, et pristinae virtutis Helvetiorum. Quod improviso unum pagum adortus esset, quum hi, qui flumen transissent, suis auxilium ferre non possent, ne ob eam rem aut suae magnopere virtuti tribueret, aut ipsos despiceret: se ita a patribus majoribusque suis didicisse, ut magis virtute quam dolo contenderent, aut insidiis niterentur.

2. Id ne accideret, magno opere sibi praecavendum Caesar existimabat. Namque omnium rerum, quae ad bellum usui erant, summa erat in eo oppido facultas; idque natura loci sic muniebatur, ut magnam ad ducendum bellum daret facultatem, propterea quod flumen Alduasdubis ut circino circumductum paene totum oppidum cingit; reliquum spatium, quod est non amplius pedum sexcentorum, qua flumen intermittit, mons continet magna altitudine, ita ut radices montis ex utraque parte ripae fluminis contingant.

Grammatical Questions.

(For those only who take Caesar.)

1. Give the genitive singular and the gender of *pacem, eam, Helvetios, bello, qui, flumen, rem, ipsos, partibus* (Passage 1).
2. Give the first person singular of the indicative perfect, and the infinitive present, of all the verbs in Passage 2.
3. What verbs in Latin take a double accusative? Write *two* sentences in illustration.
4. What is meant by the "Sequence of Tenses"? Give, in Latin, *two* sentences in illustration.

B.—Virgil.

1. At puer Ascanius, cui nunc cognomen Iulo
Additur (Ilus erat, dum res stetit Ilia regno),
Triginta magnos volvendis mensibus orbes
Imperio explebit, regnumque ab sede Lavini
Transferet, et Longam multa vi muniet Albam.
Hic jam ter centum totos regnabitur annos
Gente sub Hectorea; donec regina sacerdos,
Marte gravis, geminam partu dabit Ilia prolem.

2. Namque videbat, uti bellantes Pergama circum
Hac fugerent Graii, premeret Trojana juventus;
Hac Phryges, instaret curru cristatus Achilles.
Nec procul hinc Rhesi niveis tentoria velis
Agnoscit lacrymans; primo quae prodita somno
Tydides multa vastabat caede cruentus;
Ardentesque avertit equos in castra, prius quam
Pabula gustassent Trojae, Xanthumque bibissent.
Parte alia fugiens amissis Troïlus armis,
Infelix puer, atque impar congressus Achilli,
Fertur equis, curruque haeret resupinus inani,
Lora tenens tamen: huic cervixque comaeque trahuntur
Per terram, et versa pulvis inscribitur hasta.

Grammatical Questions.

(For those only who take Virgil.)

1. Give the genitive singular and the gender of *juventus, curru, quae, somno, caede, parte, alia, lora, cervix* (Passage 2).
2. Give the first person singular of the indicative perfect, and the infinitive present, of all the verbs in Passage 1.
3. What verbs in Latin take a double accusative? Give *two* sentences in illustration.
4. What is meant by the "Sequence of Tenses"? Give, in Latin, *two* sentences in illustration.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australasia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office: 5, SERLE STREET, W.C.

LONDON: SATURDAY, APRIL 16, 1898.

OPTIMISM AND PESSIMISM IN PHARMACY.

Many of our readers, forgetful of their earlier impressions of the craft and yielding unresistingly to a baseless tendency to despair of improvement, may be inclined to doubt the reality of any optimistic feeling in pharmacy, not recognising that, like the occupants of a slowly moving vehicle, the surroundings of which are also tending in a similar direction, they may easily fail to detect the absolute change of position which is actually being effected. That movement, too, is an advance, in pharmacy as in every other department of legitimate human activity, for the average pharmacist of to-day is infinitely better off, in every way, than his immediate and more remote predecessors, whether he is inclined to acknowledge the fact or not. This position has been maintained in these pages for some time past, and quite recently confirmation of our assertion was supplied by the Lord Mayor of Manchester, who informed an important gathering of representative pharmacists that, in his opinion, based on the experience of fifty years' connection with pharmacy, the druggist holds a far higher social position to-day than he did formerly, that he is also better off financially, and that, given industry and ordinary economy, the chemist and druggist has no cause to grumble at his lot in comparison with that of other craftsmen. Something very like this is also reported from New York, where a well-known pharmacist, Mr. W. C. Alpers, has contrasted the position of the optimist and the pessimist in pharmacy.

As a young beginner, he contended, the pharmacist is generally very optimistic in his attitude. "He considers his stock complete and of the best quality, and there is no question in his mind that others will do the same. Difficulties in answering intricate questions or preparing medicines do not exist in his mind; he has learned enough, he knows it all. His confidence in his own power of attraction and persuasion is unlimited, and any sceptic remark of more experienced friends is lightly brushed aside." But his optimistic expectations are not realised, and he soon learns, by bitter disappointment that perils and dangers lurk at every step. Physicians or others whom he depended upon to support him may not realise his anticipations in that direction, and his hopeful optimism receives its first shock, whilst the public also assists in shattering the ideal. Perhaps the few that patronise him regularly keep running up long accounts, paying absolutely no attention to his monthly statements. Thus his youthful optimism receives another shock, and his confidence in human nature gives way to gloomier contemplations. Then comes the temptation to pernicious and frantic cutting of prices, and it is not long before the optimistic young pharmacist discovers that a bright sunrise does not necessarily usher in a sunny day. Then he becomes converted to pessimism.

A feeling of discontent grows upon him; he feels that he is being abused; his business becomes to him mere drudgery; he talks to everyone about his feelings, and annoys his customers by lamentations about the decadency of pharmacy; he also berates the "cutting" stores, forgetting frequently that he was himself the first to cut prices. Thus he sours on everything and everybody; in order to reduce expenses, he does more work—or puts in more working hours—than he ought; and being most of the time without an assistant, and thus continually confined to his own store, he sees little or nothing of the world, and runs short of the needed current information on political, social, and scientific interests. "This seclusion, this retirement from all social intercourse, is the greatest disadvantage of our profession, and the pharmacist, young or old, who yields to it, thereby takes the first step towards failure. . . . Instead of growing with his profession, he becomes rusty before he is thirty years old, and finds cause to wonder that the world moves at all." This lack of social and literary intercourse and the consequent disgust with the world, observed Mr. Alpers, breed peculiar and sometimes pernicious traits of character, which have earned for the pharmacist the often well-deserved title of "crank," and the worst of those traits is the unmeasured jealousy and envy with which he too often looks upon his neighbour. He objects to any reform, and is reluctant to allow innovations a trial, even though he holds that the general outlook for the profession is gloomy and discouraging. No! he openly avows that pharmacy is on the down-grade road, and makes no concealment of his bitter pessimism in regard to any brighter future. He discourses continually about "The passing of the drug shop," and sees in his own rooted aversion to progress the decadence of pharmacy.

Fortunately the above is only an extreme example, and the individual representative of a limited minority. Opposed to him and his class are many true disciples and exponents of pharmacy, to whom their daily work is not drudgery. They do not envy their fellow-craftsman every penny he earns, nor do they give vent to loud-mouthed and ill-natured plaints at meetings or among neighbours. "Their thoughts and actions take a nobler flight; they are the true working representatives of our profession, on whom its future depends. They will be ready to step to the front at the time when a higher and more professional character of demands will be made on the pharmacist, and the coming generation will then see a better and more satisfactory state of affairs than the present one." It is recognised that the present is a time of danger and doubt as to the outcome in the struggle between the old and the new, and it is consequently a time of strife; but no matter how hard this strife may be, how grave and severe the sacrifices imposed, this healthy-minded critic would have everyone keep the ideal aim ever before him, and he calls upon his fellow pharmacists to fight on with an intelligent, cheerful, but tempered optimism, based on the consciousness that in all struggles of development, the right, the good, and the exalted, must finally win, not by trickery or chance, but by virtue of its own value, greater usefulness, and its blessing to the individual, to the profession of pharmacy, and to the whole of humanity.

ANNOTATIONS.

The New Pharmacopœia now exists in the form in which it will be issued to the public, but the price is not yet fixed, nor the actual date of publication, those matters being dependent on the action of the Treasury authorities. As briefly stated last week, an advance copy of the book was sent to the *Pharmaceutical Journal*, and we were thus enabled to print a complete general review of the work, though no review has yet appeared in any other journal, pharmaceutical or medical. Having dealt with the work on general lines, we commence this week to publish such details as it appears desirable to render generally available in advance of the official publication of the new Pharmacopœia; in fact, the greater part of our present issue is devoted to that purpose. A complete survey is presented of the galenical and kindred preparations of the 1898 Pharmacopœia, and the information provided is so complete that no one with the 1885 Pharmacopœia in his hand, need experience any difficulty in proceeding at once to bring his old preparations up to date or to prepare new ones. If anything should not appear quite clear, an inquiry addressed to the Editor will receive a prompt response, as it is recognised that it is of the highest importance that full information concerning the changes about to be effected should be available as much as possible in advance of the actual publication of the new standard and guide.

The Changes Made in the official formulæ are enormous, and though but few of them are to be regarded as of primary importance, only a small minority of the existing preparations are unaffected by the sweeping wave of reform that is about to break on the devoted pharmacist's head. It may be considered, and with good reason, that a very large proportion of the alterations are hardly required. Apparently, the chief object in view has been to meet the medical practitioner's convenience by minimising the tax on his memory. As a result, the doses of the different classes of preparations have been grouped into as few classes as possible, and minor alterations innumerable have been made in formulæ and processes to enable that to be done more readily. A sense of irritation will doubtless affect many pharmacists when they note how needless and puerile many of those alterations are, and it will be difficult to avoid confessing that the revisers have missed a magnificent opportunity. Pedantry has been rampant in the compilation of the work, whilst an unsuccessful attempt has been made to convert it into a scientific text-book. Nevertheless, the Pharmacopœia of 1898 is a distinct improvement on its predecessors, and if ability has been lacking to make it what it ought to be, that fact can only be regretted.

The Weights and Measures directed to be used in the preparation of medicines are, of course, those of both the Imperial and metric systems, and in that respect alone great lack of judgment has been shown. If there be any good and sufficient reason for postponing the adoption of the metric system in its entirety in the British Pharmacopœia, there can at least be no possible objection to the use of "parts" and "fluid parts." If that plan had been resorted to, either Imperial or metric weights and measures could have been employed at will without any risk of confusion, but that is more than can be said of the arrangement actually adopted. Danger undoubtedly lies in the close juxtaposition of Imperial and metric quantities, for they are never more than approximately equivalent, and in most cases are not even that. Moreover, fractional differences exist in connection with some formulæ, with the result that certain preparations will differ in the proportions of ingredients they contain, according as materials are weighed or measured with Imperial or metric weights and measures. Why, too, should temperatures have been stated primarily in degrees Fahrenheit, with the result that the equivalents in degrees Centigrade more often than not contain awkward fractions? Even the most conservative amongst us would not have been likely to take objection to the sole use of the Celsius scale. Reverting to the metric system, it is stated in the appendix that 1·00016 cubic centimetre = 1 millilitre, and that 1·00016 cubic decimetre = 1 litre or 1000 millilitres. The differences are so trivial that they do not justify the distinction between the quantities in regard to any pharmaceutical operation. Thus the difference amounts to one four-hundredth part (0·0025) of a grain on the cubic centimetre, and only 2·5 grains on the litre. This is a ludicrous pretence at accuracy, and of no practical value. In this respect the Pharmacopœia cannot be regarded as a safe guide, and we must warn our readers not to be too precipitate in purchasing metric measures adjusted at 15°·5 C., for it is more than probable that, for purposes of trade, such measures would be regarded as illegal, and it is also doubtful if the Standards Office would recognise the cubic centimetre or cubic decimetre in connection with fluid measures.

The Alcohol Strengths of the new B.P. are entirely different from those of the 1885 Pharmacopœia. Thus, the three spirits at present in use are Absolute Alcohol (s. g. 0·797 to 0·800), 74·1 to 73·1 over proof; Rectified Spirit (s. g. 0·838), 56 o. p.; and Proof Spirit (s. g. 0·920). At 15°·5 C., proof spirit, according to Stevenson, contains 57·05 per cent. of ethyl hydroxide by volume, and has a specific gravity of 0·9198. Henceforth, there will be the following six strengths of alcohol recognised officially:—

Percentage by volume.	Sp. gr. at 15°·5 C.	Sp. gr. (Stevenson).	Percentage of Proof Spirit.	Proof Strength.
99·95 to 99·4	0·7940 to 0·7969	0·7939 to 0·7957	175·2 to 174·5	75·2 o. p. to 74·5 o. p.
90	0·8340	0·8338	157·7	57·7 o. p.
70	0·8900	0·8899	122·7	22·7 o. p.
60	0·9135	0·9135	105 2	5·2 o. p.
45	0 9436	0·9436	78·8	21·2 u. p.
20	0·9760	0·9760	35·1	64·9 u. p.

It is stated in the preface to the new B.P. that "Alcohol (90 per cent.), is the name given to a mixture containing in one hundred volumes ninety of ethyl hydroxide and ten of water." But such a statement gives a misleading impression, for if ninety volumes of ethyl hydroxide were mixed with ten of water, the product would measure less than one hundred volumes. Similarly, if the ethyl hydroxide in one hundred volumes of alcohol (90 per cent.) were entirely removed, and measured exactly ninety volumes, the residual water must measure more than ten volumes. It would have been better, therefore, to state simply that alcohol (90 per cent.) contains, in one hundred volumes, ninety of ethyl hydroxide, leaving the volume of water present out of the question. Another curious point in connection with the spirits of the new B.P. is that it is necessary to look under "Spiritus Rectificatus" to find what are the strengths of the various spirits to be employed. Rectified Spirit is given as a synonym for alcohol (90 per cent.), but the term "rectified spirit" is not employed in a single formula. Its continued existence seems unnecessary therefore, whilst the monograph on alcohol would have been more in place if it had preceded that on "Alcohol Absolutum."

The Descriptions of Crude Drugs, detailed consideration of which is deferred for the present, are perhaps the most commendable features in the new B.P. It was quite time that steps were taken to prevent the use, in medicine and pharmacy, of the tons of inferior stuff imported into this country, and by amplifying the lists of characters and tests for the official drugs, much has been done in the direction of checking the sale of such inferior material as of B.P. quality, and its employment in the manufacture of official galenical preparations. Standardisation of drugs is, and probably will continue to be, impracticable in a great majority of instances, but whenever a definite test of quality can be resorted to, it most certainly ought to be referred to in our national medicine book. With regard to other points of interest in the new B. P., it is satisfactory to note that all alcoholic solutions of essential oils are now described as "Spirits." They are also in nearly every case made of the strength of one volume of the oil to nine of 90 per cent. alcohol. Each tincture, again, is made with the strength of alcohol that appears best adapted to extract the medicinal principles of the drug. The tinctures of cinchona and opium are, as previously, to contain a definite proportion of "total alkaloid," but tincture of nux vomica is now to be standardised on the proportion of strychnine it contains. Belladonna and ipecacuanha preparations are also standardised, and though it seems a pity nothing is stated with regard to the identity of the alkaloids of ipecacuanha root, satisfaction must be expressed with what has been done, so far as it goes.

Concentrated Infusions have crept into official recognition a last, under the guise of "Liquores Concentrati." They are practically tinctures of the drugs, and their use need not be expected to displace infusions, properly so-called, yet awhile, the more especially as improvement has been effected in the direction of simplifying the preparation of the latter and shortening the time required for their preparation. Several well-known proprietary preparations are officially represented for the first time, and others have been altered so as to resemble their prototypes more closely. It should also be gratifying to the compilers of the B.P.C. Formulary to note how many of their formulæ have been copied or adapted. Possibly if the Conference authorities could see their way to extending the scope of the Formulary, and increasing it largely in size—so as to resemble the German 'Arzneimittel die im Deutschen Arzneibuch nicht enthalten sind'—much trouble would be spared the compilers of future pharmacopœias, whilst more generally satisfactory formulæ would be included therein, and pharmacists would receive more recognition in the work of compilation than they now do. What is required, in fact, is an extra-pharmacopœia such as was recently suggested by Dr. Wilkinson (see *ante*, p. 311), in which suggested new remedies and preparations could be included until they acquired established reputation. The present moment, too, seems a good time to take the matter in hand, so that when pharmacopœia revision is again in the air, the work of organisation will not need to be taken in hand at short notice.

Opposition to the Pharmacy Bill, on the part of Mr. Alexander Cross, M.P., is not yet at an end. At a meeting of the directors of the Scottish Chamber of Agriculture in Edinburgh last week, the Secretary read letters from Mr. Cross regarding the sale of sheep dips, insecticides, etc., in which he advocated amendment of the law "so that the power and monopoly of pharmaceutical chemists" in selling such stuffs would not be increased. The Pharmacy Acts Amendment Bill, it was said, would prevent these being sold by any dealers other than chemists *(sic)*. Mr. Cross, however, desires to extend the privilege of selling such goods, and in effect pleads for free trade in what, he said, are becoming necessities for agriculturists. By the present system, he alleges prices are kept up considerably. After consideration of this extremely one-sided and inaccurate statement, it was agreed, on the motion of Mr. John Spier, of Newton, to petition the Board of Agriculture in favour of the amendments to the Pharmacy Act which Mr. Cross intends to bring forward.

A New Application of the Röntgen Rays is reported from Vienna, some interesting particulars of a new application of the Röntgen rays for curative purposes having been communicated by Dr. Edward Schiff, lecturer at the Vienna University, at the last sitting of the Imperial and Royal Medical Society. It is stated that a series of experiments conducted by Dr. Schiff and his assistant proves that the rays can be used for the cure of disease in a manner capable of perfect control by means of a more or less intense application for a longer or shorter period, producing reaction in the exact degree required. In this way it has been possible for Dr. Schiff, on the one hand, to remove hair from parts of the body where it constituted a disfigurement without causing the slightest inflammation, while, on the other hand, he has been able to treat lupus with uniform success by means of an artificial inflammation, the intensity of which he was in a position to increase or reduce at will. The results secured by the new method both in the removal of superfluous hair and the treatment of lupus were demonstrated in the persons of some of Dr. Schiff's patients.

Sir William Turner, the new President of the General Medical Council, is not, after all, it appears, to take up his residence in London. No condition was imposed upon him when he was appointed to the position, and had the appointment affected his residence or his occupancy of his professorial chair at Edinburgh University, it is said to be more than likely that Sir William would have refused the nomination.

A Botanic Garden at Aberdeen is to perpetuate the memory of the late Dr. Alexander Cruikshank, the fact being intimated at a meeting of the Aberdeen University Endowments Association a few days ago, that a donation of £15,000 had been received from Miss Jane Cruikshank, with the view of providing such a garden in memory of her brother.

Honorary Members of the Pharmaceutical Society may be elected by the Council, from time to time, and in accordance with the Bye-laws a list is at present exhibited in the Society's Library of persons whom it is proposed to distinguish in that way. The following names are on the list:—Daniel John Leech, M.D., F.R.C.P., Professor of Materia Medica and Therapeutics, Victoria University; William Ramsay, Ph.D., F.I.C., F.R.S., Professor of Chemistry, University College, London; Ira Remsen, Professor of Chemistry at the Johns Hopkins University, Baltimore.

Mr. Horace T. Brown, F.R.S., was honoured on Wednesday, April 13, by having the degree of Doctor of Laws, of the University of Edinburgh, publicly conferred upon him. Mr. Brown was a pupil of Hofmann and Frankland, and from an early age has devoted himself to chemical research, so that he now holds a pre-eminent place amongst those experimentalists whose labours have been crowned with fruitful results. The range of his scientific activity has been extensive, and his published papers constitute a massive and important contribution to chemical, biological, and geological literature. In particular, it is worthy of mention that his investigations in connection with plant physiology, the chemistry of carbo-hydrates, and the action of enzymes on starch, cellulose, and other substances, entitle him to be regarded as the chief authority on these subjects.

The British Pharmacopœia, 1898.

Formulæ and Processes—Alterations, Additions, and Omissions.

(Continued from page 373.)

Potassa Sulphurata.—Formula unaltered.

Pulvis Amygdalæ Compositus.—Formula unaltered.

Pulvis Antimonialis.—Formula unaltered. Dose: 3 to 6 grains.

Pulvis Catechu Compositus.—Formula unaltered. Dose: 10 to 40 grains.

Pulvis Cinnamomi Compositus.—Formula unaltered. Dose: 10 to 40 grains.

Pulvis Cretæ Aromaticus.—The saffron is omitted. Dose: 10 to 60 grains.

Pulvis Cretæ Aromaticus cum Opio.—Formula and dose unaltered.

Pulvis Elaterini Compositus.—Formula unaltered. Dose: 1 to 4 grains.

Pulvis Glycyrrhizæ Compositus.—Formula unaltered. Dose: 60 to 120 grains.

Pulvis Ipecacuanhæ Compositus.—Formula and dose unaltered.

Pulvis Jalapæ Compositus.—Formula and dose unaltered.

Pulvis Kino Compositus.—Formula and dose unaltered.

Pulvis Opii Compositus.—Formula unaltered. Dose: 2 to 10 grains.

Pulvis Rhei Compositus.—Formula and dose unaltered.

Pulvis Scammonii Compositus.—Formula and dose unaltered.

Pulvis Sodæ Tartaratæ Effervescens.—Formula unaltered.

Pulvis Tragacanthæ Compositus.—Formula and dose unaltered.

Pyroxylinum.—Formula unaltered.

Scammoniæ Resina.—The rectified spirit is replaced by 90 p. c. alcohol, and the scammony root exhausted by percolation only. Dose: 3 to 8 grains.

Sevum Præparatum.—Melting point 44°·4 to 48°·9 C.; commences to re-solidify at about 37°·8 C.

Soda Tartarata.—Prepared by neutralising acid potassium tartrate with sodium carbonate.

Sodii Citro-Tartras Effervescens.—Formula unaltered. Dose: 60 to 120 grains.

Sodii Phosphas Effervescens.—Formula unaltered. Dose: 30 to 120 grains, for repeated administration; ¼ to ½ an ounce for a single administration.

Sodii Sulphas Effervescens.—Formula unaltered. Dose: 60 to 120 grains, for repeated administration; ¼ to ½ an ounce for a single administration.

Spiritus Ætheris.—The rectified spirit is replaced by 90 p. c. alcohol. S.g. 0·806 to 0·811. Dose: 20 to 40 minims, for repeated administration; 60 to 90 minims, for a single administration.

Spiritus Ætheris Compositus.—Distillation is to be continued until the temperature reaches 171°·6 C. Add to the supernatant liquor with 1·5 fl. oz. of distilled water and, gradually, sufficient sodium bicarbonate to nearly neutralise the liquid. Then separate the ethereal liquid, and add to it ether, 5·5 fl. oz., and 90 p. c. alcohol, 38 fl. oz. Finally, filter. S.g. 0·808 to 0·812. Dose: 20 to 40 minims, for repeated administration; 60 to 90 minims, for a single administration.

Spiritus Ætheris Nitrosi.—The rectified spirit is replaced by 90 p. c. alcohol, half of which is to be placed in the receiver. The finished product must contain 2·5 p. c. of ethyl nitrite, and is recommended to be kept in a cool, dark place in small bottles. S.g. 0·838 to 0·842. Dose: 20 to 40 minims, for repeated administration; 60 to 90 minims, for a single administration.

Spiritus Ammoniæ Aromaticus.—The rectified spirit is replaced by 90 p. c. alcohol. S.g. 0·888 to 0·893. Dose: 20 to 40 minims, for repeated administration; 60 to 90 minims, for a single administration.

Spiritus Ammoniæ Fetidus.—The rectified spirit is replaced by 90 p. c. alcohol. Dose: 20 to 40 minims, for repeated administration; 60 to 90 minims, for a single administration.

*Spiritus Anisi.—Oil of anise, 1; 90 p. c. alcohol, *q.s.* to make 10. Dose: 5 to 10 minims.

Spiritus Armoraciæ Compositus.—The proof spirit is replaced by five-eighths the volume of 90 p. c. alcohol, whilst the quantity of distilled water is doubled.

Spiritus Cajuputi.—Oil of cajuput, 1; 90 p. c. alcohol, *q.s.* to make 10. Dose: 5 to 20 minims.

Spiritus Camphoræ.—Camphor, 1; 90 p. c. alcohol, *q.s.* to make 10. Dose: 5 to 20 minims.

Spiritus Chloroformi.—Chloroform, 1; 90 p. c. alcohol, *q.s.* to make 20. Dose: 5 to 20 minims, for repeated administration; 30 to 40 minims, for a single administration.

Spiritus Cinnamomi.—Oil of cinnamon, 1; 90 p. c. alcohol, *q.s.* to make 10. Dose: 5 to 20 minims.

Spiritus Juniperi.—Oil of juniper, 1; 90 p. c. alcohol, *q.s.* to make 20. Dose: 20 to 60 minims.

Spiritus Lavandulæ.—Oil of Lavender, 1; 90 p. c. alcohol, *q.s.* to make 10. Dose: 5 to 20 minims.

Spiritus Menthæ Piperitæ.—Oil of peppermint, 1; 90 p. c. alcohol, *q.s.* to make 10. Dose: 5 to 20 minims.

Spiritus Myristicæ.—Distilled oil of nutmeg, 1; 90 p. c. alcohol, *q.s.* to make 10. Dose: 5 to 20 minims.

Spiritus Rectificatus.—Alcohol (90 p. c.) of s. g. 0·834. To produce weaker spirits, dilute each 100 fluid parts of 70 p. c. alcohol (s. g. 0·890) with 31·05 of distilled water, at 15°·5 C.; for 60 p. c. alcohol (0·9135), add 53·65 of water; for 45 p. c. (s. g. 0·9436), add 105·34; and for 20 p. c. (s. g. 0·976), add 355·8.

Spiritus Rosmarini.—Oil of rosemary, 1; 90 p. c. alcohol, *q.s.* to make 10.

Spiritus Tenuior.—Omitted.

Spiritus Vini Gallici.—Must contain not less than 36·5 p. c. by weight, or 43·5 p. c. by volume, of ethyl hydroxide.

Succus Belladonnæ.—Preserved with 90 p. c. alcohol.

Succus Conii.—Preserved with 90 p. c. alcohol. Dose: 1 to 2 fl. dr.

Succus Hyoscyami.—Preserved with 90 p. c. alcohol.

Succus Limonis.—Freshly expressed from ripe fruit, and containing 7 Gm. to 9 Gm. of citric acid in 100 C.c. S.g. 1·03 to 1·04.

Succus Scoparii.—Preserved with 90 p. c. alcohol.

Succus Taraxaci.—Preserved with 90 p. c. alcohol.

† **Suppositora.**—In making suppositoria more or less white beeswax may be used in place of an equivalent amount of theobroma oil, in India and the Colonies.

*Suppositoria Acidi Carbolici.—Dissolve phenol, 12 grains, in a mixture of white beeswax, 24 grains, and threobroma oil, *q.s.* to fill twelve 15-grain moulds.

Suppositoria Acidi Carbolici cum Sapone.—Omitted.

Suppositoria Acidi Tannici.—Formula unaltered.

Suppositoria Acidi Tannici cum Sapone.—Omitted.

*Suppositoria Belladonnæ.—Alcoholic extract of belladonna, 18 grains; theobroma oil, *q.s.* to make 12 suppositories, as directed for Suppositoria Acidi Tannici.

Suppositoria Glycerini.—Formula unaltered.

Suppositoria Hydrargyri.—Omitted.

Suppositoria Iodoformi.—Formula unaltered.

Suppositoria Morphinæ.—Morphine hydrochloride, 3 grains; theobroma oil, *q.s.* to make 12 suppositories.

Suppositoria Morphinæ cum Sapone.—Omitted.

Suppositoria Plumbi Composita.—Formula unaltered.

Syrupus.—Formula unaltered.

*Syrupus Aromaticus.—Mix tincture of orange, 5, and cinnamon water, 5; shake the mixture with a little powdered talc, then filter, and add syrup 10. Dose: ½ to 1 fl. dr.

Syrupus Aurantii.—Formula unaltered. Dose: ½ to 1 fl. dr.

Syrupus Aurantii Floris.—Undiluted orange-flower water must be used. Dose: ½ to 1 fl. dr.

*Syrupus Calcii Lactophosphatis.—Add precipitated calcium carbonate, 2·5, gradually to lactic acid, 6, diluted with 4 times its volume of distilled water. When solution is complete, add concentrated phosphoric acid, 4·6, and triturate until the precipitate which forms is dissolved. Next, dilute the solution with a little distilled water, add undiluted orange-flower water, 2·5; then filter and dissolve in the liquid refined sugar, 70. Finally, strain and make up the volume with distilled water to 100. Dose: ½ to 1 fl. dr.

*Syrupus Cascaræ Aromaticus.—Liquid extract of cascara

sagrada, 8 ; tincture of orange, 2 ; 90 p. c. alcohol, 1 ; cinnamon water, 3 ; syrup, 6. Dose : ½ to 2 fl. dr.

Syrupus Chloral.—Formula and dose unaltered.

***Syrupus Codeinæ.**—Dissolve codeine phosphate, 40 grains, in distilled water, 0·25 fl. oz. ; then add to syrup, 19·75 fl. oz. Dose : ½ to 2 fl. dr.

Syrupus Ferri Iodidi.—Iron wire, 25 ; iodine, 83 ; refined sugar, 825 ; distilled water, *q.s.* to make 1000. The process is practically unaltered. S.g. 1·380 to 1·387. The syrup should contain 1 grain of ferrous iodide in each 11 minims.

Syrupus Ferri Phosphatis.—Dissolve iron wire, 8·6, in concentrated phosphoric acid, 62·5, diluted with an equal volume of distilled water, heating gently in a small flask, the neck of which is plugged with cotton wool. When cold filter the solution into syrup, 700, and pass sufficient distilled water through the filter to make the product measure 1000. The syrup should contain the equivalent of 1 grain of anhydrous ferrous phosphate in each fluid drachm. Dose : ½ to 1 fl. dr.

***Syrupus Ferri Phosphatis cum Quinina et Strychnina.**—Proceed as in making Syrupus Ferri Phosphatis, but before filtering the iron solution into the syrup, dissolve in the former powdered strychnine, 0·57, and quinine sulphate, 14·8, for each 1000 fluid parts of syrup required. The finished syrup should contain 1/32 grain of strychnine and 4/5 grain of quinine sulphate, in each fluid drachm. Dose : ½ to 1 fl. dr.

Syrupus Ferri Subchloridi.—Omitted.

***Syrupus Glucosi.**—Mix liquid glucose, of commerce, 1, and syrup, 2.

Syrupus Hemidesmi.—Formula unaltered. Dose : ½ to 1fl. dr.

Syrupus Limonis.—Macerate fresh lemon peel, in thin slices or grated, 1, in 90 p. c. alcohol, 1·5, for 7 days, press, filter, and add sufficient alcohol to produce 2. Then dissolve refined sugar, 38, in clarified lemon juice, 25, by the aid of gentle heat, and when the resulting syrup is cold, add to it the alcoholic liquid. Dose : ½ to 1 fl. dr.

†**Syrupus Limonis.**—In India and the Colonies, dried instead of fresh lemon peel may be used in preparing this syrup.

Syrupus Mori.—Omitted.

Syrupus Papaveris.—Omitted.

***Syrupus Pruni Virginianæ.**—Moisten Virginian prune bark, in No. 20 powder, 3, with distilled water, and set aside for 24 hours in a closed vessel ; then percolate with more water until the percolate measures 9. Dissolve in this, by agitation, refined sugar, 15, add glycerin, 1·25, strain, and pour sufficient water over the strainer to produce 20. Dose : ½ to 1 fl. dr.

Syrupus Rhei.—Alcohol (90 p. c.) replaces the rectified spirit. Dose : ½ to 2 fl. dr.

Syrupus Rhœados.—Alcohol (90 p. c.) replaces the rectified spirit. Dose : ½ to 1 fl. dr.

†**Syrupus Rhœados.**—In India and the Colonies, the proportion of 90 p. c. alcohol in this preparation may be increased to double the proportion stated in the official formula, an equivalent quantity of water being omitted.

Syrupus Rosæ.—Identical with Syrupus Rosæ Gallicæ of the 1885 B.P. Dose : ½ to 1 fl. dr.

Syrupus Scillæ.—The quantity of sugar ordered is reduced by one-twentieth.

Syrupus Sennæ.—Senna, 40 ; 90 p. c. alcohol, 70 ; refined sugar, 50 ; distilled water, *q.s.* ; a mixture of 1 part of oil of coriander and 4 parts of 90 p. c. alcohol, 1 minim for each ounce of sugar, or 1 C.c. for each 500 Gm. Moisten the senna with 40 of alcohol, pack tightly in a closed vessel, set aside for 3 days, press strongly and reserve the liquid obtained. Break up the marc, moisten it with 15 of alcohol, set aside for 24 hours, press, and add the liquid to that reserved ; then repeat the operation with the remaining 15 of alcohol, reducing the time of maceration to 3 hours and evaporating the liquid finally expressed until it is reduced to such volume that, when added to the reserved portion, the whole shall measure 40 fluid parts. Now heat the product in a covered vessel to 82° C. for a few minutes, set aside for 24 hours, then filter, pass distilled water through the filter until the liquid again measures 40, and dissolve the sugar in it, in a covered vessel, by the aid of gentle heat. Finally, cool the syrup, add the solution of oil of coriander, and shake well. The product should weigh 92 parts. Dose : ½ to 2 fl. dr.

Syrupus Zingiberis.—Percolate ginger, in fine powder, 1, with 90 p. c. alcohol, *q s.* to produce 1. To the resulting strong tincture add sufficient syrup to make 20. Dose : ½ to 1 fl. dr.

Syrupus Tolutanus.—Formula unaltered. Dose ½ to 1 fl. dr.

Tabellæ Trinitrini.—These are the Tabellæ Nitroglycerini, doubled in weight, but of the same strength as formerly.

***Thyroideum Siccum.**—Prepared from the fresh and healthy thyroid gland of the sheep, after removing external fat and connective tissue. Mince the glands finely, dry at a temperature of 32° to 38° C., powder the dried product, remove all fat with petroleum spirit, and again dry. Dose : 3 to 10 grains.

Tincturæ.—In several instances the new B.P. processes for preparing tinctures are described in full in the official monographs, and sufficiently so for all practical purposes in the abstracts here given. Where, however, it is simply stated that the solid materials are to be percolated or macerated, one or other of the following methods of procedure must be adopted :—*Percolation* : After moistening with the prescribed quantity of menstruum, set aside in a closed vessel for 24 hours. Then pack in a percolator, in a manner to be determined by the nature of the materials, and pour on successive portions of the menstruum, always maintaining a layer of liquid above the materials. Percolation should proceed slowly at first, and afterwards less slowly, until sufficient menstruum has been used to produce about three-fourths of the required volume of finished tincture, or until the solid materials have been exhausted. Then remove the marc and submit it to pressure. Filter the expressed liquid, if necessary, either at once or after standing for 24 hours ; mix the filtrate with the percolate, and then add sufficient menstruum to produce the prescribed volume of tincture. *Maceration* : Place the solid materials in the whole of the menstruum, in a closed vessel, for 7 days, frequently agitating. Strain, press the marc, mix the expressed with the strained liquid, and filter if necessary.

Tinctura Aconiti.—Moisten aconite root, in No. 40 powder, 1, with 70 p. c. alcohol, 0·5, percolate with that menstruum, so as to produce 20 of tincture. Dose : 5 to 15 minims ; if very frequently repeated, 2 to 5 minims.

Tinctura Aloes.—Macerate extract of Barbados aloes, 0·5, in 45 p. c. alcohol, 16, for 48 hours ; then add liquid extract of liquorice, 3, filter, and pass sufficient of the alcohol through the filter to produce 20 of tincture. Dose : ½ to 1 fl. dr., for repeated administration ; 1½ to 2 fl. dr., for a single administration.

Tinctura Arnicæ.—Moisten arnica rhizome, in No. 40 powder, 1 ; with 70 p. c. alcohol, 1, and percolate with that menstruum so as to produce 20 of tincture.

Tinctura Asafetidæ.—Macerate bruised asafetida, 4, in 70 p. c. alcohol, 15, for 7 days ; then filter and pass sufficient of the alcohol through the filter to produce 20 of tincture.

Tinctura Aurantii.—Macerate fresh bitter-orange peel, cut small, 5, in 90 p. c. alcohol, 20. Dose : ½ to 1 fl. dr.

Tinctura Aurantii Recentis.—Omitted.

Tinctura Belladonnæ.—Add to liquor extract of belladonna, 2, sufficient 60 p. c. alcohol to produce 30 of tincture ; sat aside for 24 hours and filter. The amount of alkaloid in 100 C.c. should be between 0·048 Gm. and 0·052 Gm. Dose : 5 to 15 minims.

Tinctura Benzoini Composita.—The rectified spirit is replaced by 90 p. c. alcohol, in which the other ingredients are macerated for 2 days, with frequent agitation.

Tinctura Buchu.—Moisten buchu leaves in No. 20 powder, 4, with 60 p. c. alcohol 4, and percolate with that menstruum, so as to produce 20 of tincture. Dose : ½ to 1 fl. dr.

Tinctura Calumbæ.—Macerate calumba root in No. 20 powder, 2, in 60 p. c. alcohol, 20. Dose : ½ to 1 fl. dr.

Tinctura Camphoræ Composita.—The powdered opium is replaced by tincture of opium, 585 minims, and the proof spirit by 60 p. c. alcohol. Dissolve the other ingredients in the alcohol, add the tincture, and make up to the specificd volume, filtering if necessary. The finished tincture should contain the equivalent of 1/30 grain of morphine hydrochloride, or ¼ grain of opium (containing 10 p. c. of anhydrous morphine), in each fluid drachm. Dose : ½ to 1 fl. dr.

Tinctura Cannabis Indicæ.—Dissolve extract of Indian hemp, 1, in 90 p c. alcohol, 18 ; filter if necessary and add sufficient alcohol to produce 20 of tincture. Dose : 5 to 15 minims.

Tinctura Cantharidis.—Macerate cantharides, in No. 40 powder, 0·25, in 90 p. c. alcohol, 20. Dose : 5 to 15 minims ; if frequently repeated, 2 to 5 minims.

Tinctura Capsici.—Macerate capsicum, in No. 20 powder, 1, in 70 p.c. alcohol, 20. Dose : 5 to 15 minims.

Tinctura Cardamomi Composita.—The proof spirit is replaced by 60 p. c. alcohol, and the tincture prepared by maceration only. Dose : ½ to 1 fl. dr.

Tinctura Cascarillæ.—Moisten cascarilla, in No. 40 powder, 4, with 70 p. c. alcohol, 3, and percolate with that menstruum so as to produce 20 of tincture. Dose: ½ to 1 fl. dr.

Tinctura Catechu.—Macerate coarsely-powdered catechu, 4, and bruised cinnamon bark, 1, in 60 p. c. alcohol, 20. Dose: ½ to 1 fl. dr.

Tinctura Chiratæ.—Moisten chiretta, in No. 40 powder, 2, with 60 p. c. alcohol, 2, and percolate with that menstruum so as to produce 20. Dose: ½ to 1 fl. dr.

Tinctura Chloroformi Composita.—Omitted.

Tinctura Chloroformi et Morphinæ Composita.—Mix chloroform, 75; tincture of capsicum, 25; tincture of Indian hemp, 100; oil of peppermint, 1·5; glycerin, 250; and 90 p. c. alcohol, 450. Dissolve morphine hydrochloride, 10, in the mixture; add diluted hydrocyanic acid (2 p. c.), 50; then mix with enough of the alcohol to produce 1000 of the tincture. This preparation contains ¾ minim of chloroform, ½ minim of diluted hydrocyanic acid, and 1/11th grain of morphine hydrochloride, in each 10 minims. Dose: 5 to 15 minims.

Tinctura Cimicifugæ.—Moisten cimicifuga, in No. 40 powder, 2, with 60 p. c. alcohol, 1, and percolate with that menstruum so as to produce 20 of tincture. Dose: ½ to 1 fl. dr.

Tinctura Cinchonæ.—Moisten red cinchona bark, in No. 40 powder, 4, with 70 p. c. alcohol, 4, and set aside for 24 hours in a closed vessel; then percolate with more of the alcohol until the product measures 14. Press the marc, add the expressed liquid to the percolate, set aside for 24 hours, and filter. Determine the alkaloidal strength of 10 C.c. of the filtrate by the assay process given for Extractum Cinchonæ Liquidum, and add to the bulk of the strong tincture such a quantity of 70 p. c. alcohol that 100 C.c. of the product shall contain 1 Gm. of alkaloids. Dose: ½ to 1 fl. dr.

Tinctura Cinchonæ Composita.—The red cinchona bark is replaced by an equivalent quantity of tincture of cinchona, and the proof spirit by 70 p. c. alcohol. The orange peel should be well bruised and the serpentary in No. 40 powder. Macerate the solid ingredients for 7 days in a quantity of alcohol equal in volume to the tincture of cinchona, and mix the strained and expressed liquids with that tincture, after which add sufficient alcohol to make up the required volume. Filter after standing for 24 hours. Each 100 C.c. of the product should contain about 0·5 Gm. of alkaloids. Dose: ½ to 1 fl. dr.

Tinctura Cinnamomi.—Moisten cinnamon bark in No. 40 powder, 4, with 70 p. c. alcohol, 4, and percolate with the same menstruum so as to produce 20 of tincture. Dose: ½ to 1 fl. dr.

Tinctura Cocci.—Macerate powdered cochineal, 2, in 45 p. c. alcohol, 20. Dose: 5 to 15 minims.

Tinctura Colchici Seminum.—Moisten colchicum seeds in No. 30 powder, 4, with 45 p. c. alcohol, 2·5, and percolate with that menstruum so as to produce 20 of tincture. Dose: 5 to 15 minims.

Tinctura Conii.—Moisten conium fruit, recently reduced to No. 40 powder, 4, with 70 per cent. alcohol, 4, and percolate with that menstruum so as to produce 20 of tincture. Dose: ½ to 1 fl. dr.

Tinctura Croci.—Macerate saffron, 1, in 60 p. c. alcohol, 20. Dose: 5 to 15 minims.

Tinctura Cubebæ.—Moisten powdered cubebs, 4, with 90 p. c. alcohol, 2, and percolate with that menstruum so as to produce 20 of tincture. Dose: ½ to 1 fl. dr.

Tinctura Digitalis.—Moisten digitalis leaves in No. 20 powder, 2·5, with 60 p. c. alcohol, 2, and percolate with that menstruum so as to produce 20 of tincture. Dose: 5 to 15 minims.

Tinctura Ergotæ.—Omitted.

*__Tinctura Ergotæ Ammoniata.__—Moisten ergot, in No. 20 powder, 5, with 2 parts of a mixture consisting of 2 of solution of ammonia, and 18 of 60 p. c. alcohol; then percolate with the rest of the mixture. Press the marc, mix the expressed liquid with the percolate, and add sufficient 60 p. c. alcohol to produce 20 of tincture. Dose: ½ to 1 fl. dr.

Tinctura Ferri Acetatis.—Omitted.

Tinctura Ferri Perchloridi.—The rectified spirit is replaced by 90 p. c. alcohol. Dose: 5 to 15 minims.

Tinctura Gallæ.—Omitted.

Tinctura Gelsemii.—Moisten gelsemium root, in No. 40 powder, 2, with 60 p. c. alcohol, 1, and percolate with that menstruum so as to produce 20 of tincture. Dose: 5 to 15 minims.

Tinctura Gentianæ Composita.—The quantity of gentian root is increased by one-third, and the proof spirit replaced by 45 p. c. alcohol. Prepare by maceration only. Dose: ½ to 1 fl. dr.

Tinctura Guaiaci Ammoniata.—Macerate powdered guaiacum resin, 4, for 48 hours, in a mixture of strong solution of ammonia, 1·5, and 90 p. c. alcohol, 16. Filter, add 30 minims of oil of nutmeg and 20 minims of oil of lemon for each pint of finished tincture to be produced, and pass sufficient 90 p. c. alcohol through the filter to produce 20 of tincture.

Tinctura Hamamelidis.—Moisten hamamelis bark, in No. 20 powder, 2, with 45 p. c. alcohol, 1, and percolate with that menstruum so as to produce 20 of tincture. Dose: ½ to 1 fl. dr.

Tinctura Hydrastis.—Moisten hydrastis rhizome, in No. 60 powder, 2, with 60 p. c. alcohol, 2, and percolate with that menstruum so as to produce 20 of tincture. Dose: ½ to 1 fl. dr.

Tinctura Hyoscyami.—Moisten hyoscyamus leaves and flowering tops, in No. 20 powder, 2, with 45 p. c. alcohol, 2, and percolate with that menstruum so as to produce 20 of tincture.

Tinctura Iodi.—Dissolve iodine, 0·5, and potassium iodide, 0·5, in distilled water, 0·5; then add sufficient 90 p. c. alcohol to produce 20 of tincture. Dose: 2 to 5 minims.

Tinctura Jaborandi.—Moisten jaborandi leaves, in No. 40 powder, 4, with 45 p. c. alcohol, 2·5, and percolate with that menstruum so as to produce 20 of tincture.

Tinctura Jalapæ.—Moisten jalap, in No. 40 powder, with 70 p. c. alcohol, 2, then pack in a percolator and gradually add more alcohol until the percolate measures 12. Press the marc, mix the expressed liquid with the percolate, set aside for 24 hours, and filter. Determine the amount of jalap resin present in 10 C.c. of the filtrate (see Jalapæ Resina), and add sufficient 70 p. c. alcohol to produce a tincture containing 1·5 Gm. of the resin in 100 C.c. Dose: ½ to 1 fl. dr.

Tinctura Kino.—The rectified spirit is replaced by 90 p. c. alcohol. Mix the glycerin and water, not the kino, to a smooth paste with sufficient of the mixture, then add the remainder; transfer to a closed vessel, add five-sixths of the alcohol, and set aside for 12 hours, frequently agitating. Filter through a plug of cotton wool, and pass sufficient alcohol through the filter to produce 20 of tincture. Dose: ½ to 1 fl. dr.

Tinctura Krameriæ.—Moisten krameria root, in No. 40 powder, 4, with 60 p. c. alcohol, 2, and percolate with that menstruum so as to produce 20 of tincture. Dose: ½ to 1 fl. dr.

Tinctura Laricis.—Omitted.

Tinctura Lavandulæ Composita.—The rectified spirit is replaced by 90 p.c. alcohol, and the tincture prepared by maceration, the oils being added last. Dose: ½ to 1 fl. dr.

Tinctura Limonis.—Macerate fresh lemon peel, cut small, 5, in 90 p. c. alcohol, 20. Dose: ½ to 1 fl. dr.

Tinctura Lobeliæ.—Omitted.

†__Tinctura Limonis.__—In India and the Colonies, dried instead of fresh lemon peel may be used in preparing this tincture.

Tinctura Lobeliæ Ætherea.—Moisten lobelia, in No. 40 powder, 4, with spirit of ether, 2, and percolate with the same menstruum. Dose: 5 to 15 minims.

Tinctura Lupuli.—Macerate hops, 4, in 60 p. c. alcohol, 20. Dose: ½ to 1 fl. dr.

Tinctura Myrrhæ.—Macerate coarsely powdered myrrh, 4, for 7 days, in 90 p. c. alcohol, 16. Agitate frequently, filter, and pass sufficient alcohol through the filter to produce 20 of tincture.

Tinctura Nucis Vomicæ.—Mix liquid extract of nux vomica, 2, with distilled water, 3, and add sufficient 90 p. c. alcohol to produce 12 of tincture, then filter. This preparation should contain from 0·24 Gm. to 0·26 Gm. of strychnine in each 100 C.c., about twice the proportion of the 1885 tincture. Dose: 5 to 15 minims.

Tinctura Opii.—Opium, 3, is rubbed to a paste with distilled water, 10, the water having previously been heated to at least 93° C. After standing for 6 hours, add 90 p. c. alcohol, 10, and, again set aside for 24 hours; then strain, press, mix the liquids set aside for 24 hours, and filter. Determine the proportion of morphine present by evaporating 80 C.c. of the tincture to 30 C.c., mixing the residue with 3 Gm. of freshly-slaked lime, adding water to 85 C.c., and setting aside for half an hour, stirring occasionally. Next, filter off 50 C.c. of the liquid representing 50 C.c. of the strong tincture, add 5 C.c. of 90 p. c. alcohol and 30 C.c. of ether, shake, and add 2 Gm. of ammonium chloride. Shake well and frequently during half-an-hour, set aside for 12 hours for the morphine to separate, filter, wash with morphinated water, and dry the crystals first by gentle pressure between filter paper, then at 55° and 60° C., and finally at 110° C. for two hours. Weigh the crystals and titrate 0·3 Gm. with decinormal solution of sulphuric acid until the liquid, after boiling, slightly reddens blue litmus paper. Add to the weight of anhydrous morphine, thus indicated,

0·05 Gm., to cover loss, and having thus ascertained the proportion present in 50 C c. of strong tincture, dilute the remainder of the latter with sufficient of a mixture of equal volumes of 90 p.c. alcohol and distilled water, to produce a tincture containing the equivalent of 0·75 Gm. of anhydrous morphine in each 100 C.c. Dose: 5 to 15 minims, for repeated administration; 20 to 30 minims, for a single administration.

Tinctura Opii Ammoniata.—The powdered opium is replaced by its equivalent of tincture of opium, the saffron is omitted, the strong solution of ammonia is replaced by the weaker solution, and 90 p. c. alcohol is ordered instead of rectified spirit. The oil and acid are dissolved in three-fourths of the alcohol, the other liquid ingredients added, and after filtration enough alcohol is added to produce the required volume of tincture.

Tinctura Podophylli.—The quantity of podophyllum resin is doubled and 90 p. c. alcohol is the menstruum. Macerate for 24 hours with nine-tenths of the alcohol, occasionally agitating; then filter and pass sufficient alcohol through the filter to produce the required volume of tincture. Dose: 5 to 15 minims.

*__Tinctura Pruni Virginianæ.__—Macerate Virginian prune bark, in No. 20 powder, 4, for 24 hours, with distilled water, 7·5, then add 90 p. c. alcohol, and complete the process. Dose: ½ to 1 fl. dr.

Tinctura Pyrethri.—Moisten pyrethrum root, in No. 40 powder, 4, with 70 p. c. alcohol, 3, and percolate with that menstruum so as to produce 20 of tincture.

Tinctura Quassiæ.—Macerate rasped quassia wood, 2, in 45 p. c. alcohol, 20. Dose: ½ to 1 fl. dr.

*__Tinctura Quillaiæ.__—Moisten quillaia bark, in No. 20 powder, 1, with 60 p. c. alcohol, 0 5, and percolate with that menstruum so as to produce 20 of tincture. Dose: ½ to 1 fl. dr.

Tinctura Quininæ.—Dissolve quinine hydrochloride, 2, in tincture of orange, 100. Dose: ½ to 1 fl. dr.

Tinctura Quininæ Ammoniata.—Dissolve quinine sulphate, 1, in a mixture of solution of ammonia, 10, and 60 p. c. alcohol, 90, Set aside for 3 days and filter. Dose: ½ to 1 fl. dr.

Tinctura Rhei Composita.—The saffron is omitted and 60 p. c. alcohol is ordered instead of proof spirit, whilst one-tenth part by volume of the preparation must be glycerin. The solid ingredients are moistened with one-ninth part of the alcohol and percolated with more of that menstruum until the required volume is obtained. After 48 hours, the percolate is filtered and the glycerin added. Dose: ½ to 1 fl. dr., for repeated administration; 2 to 4 fl. dr. for a single administration.

Tinctura Sabinæ.—Omitted.

Tinctura Scillæ.—Macerate bruised squill, 4, in 60 p. c. alcohol, 20. Dose 5 to 15 minims.

Tinctura Senegæ.—Moisten senega root, in No. 40 powder, with 60 p. c. alcohol, 4, and percolate with that menstruum so as to produce 20 of tincture. Dose ½ to 1 fl. dr.

Tinctura Sennæ Composita.—The quantity of senna is increased by three-fifths, and 45 p. c. alcohol is used instead of proof spirit. Macerate only. Dose: ½ to 1 fl. dr., for repeated administration; 2 to 4 fl. dr., for a single administration.

Tinctura Serpentariæ.—Moisten serpentary rhizome, in No. 40 powder, 4, with 70 p. c. alcohol, 4, and percolate with that menstruum so as to produce 20 of tincture. Dose: ½ to 1 fl. dr.

Tinctura Stramonii.—Moisten stramonium leaves, in No. 20 powder, 4, with 45 p. c. alcohol, 4, and percolate with that menstruum so as to produce 20 of tincture. Dose: 5 to 15 minims.

Tinctura Strophanthi.—Pack strophanthus seeds, in No. 30 powder, 0·5, in a percolator, moisten with one-fourth the volume of 70 p. c. alcohol, and set aside for 48 hours. Then pour on successive quantities of the alcohol, allowing percolation to proceed slowly, until the total volume of percolate measures 10 fluid parts. Filter, and add sufficient alcohol to produce 20 of tincture. Dose: 5 to 15 minims.

Tinctura Sumbul.—Macerate bruised sumbul root, 2, in 70 p. c. alcohol, 20. Dose: ½ to 1 fl. dr.

Tinctura Tolutana.—Dissolve balsam of tolu, 2, in 90 p. c. alcohol, 16; then filter and pass sufficient alcohol through the filter to produce 20 of tincture. Dose: ½ to 1 fl. dr.

Tinctura Valerianæ.—Omitted.

Tinctura Valerianæ Ammoniata.—Macerate valerian rhizome, in No. 40 powder, 4, in a mixture of solution of ammonia, 2, and 60 p. c. alcohol, 18. For each pint of menstruum add oil of nutmeg, 30 minims, and oil of lemon, 20 minims.

Tinctura Veratri Viridis.—Omitted.

Tinctura Zingiberis.—Moisten ginger, in No. 40 powder, 2, with 90 p. c. alcohol, 2, and percolate with that menstruum so as to produce 20 of tincture. Dose: ½ to 1 fl. dr.

Tinctura Zingiberis Fortior.—Omitted.

Trochisci.—In each of the various formulæ for lozenges the quantities are specified for one lozenge only. There are four official bases for lozenges, and the materials ordered for those must, in every instance, be mixed with 500 times the quantity of drug ordered for a single lozenge. *Fruit basis*: Make into a paste refined sugar, in fine powder, 15·5 ounces, and gum acacia, in powder, 300 grains, with mucilage of gum acacia, 1·25 fluid ounce, and black currant paste of commerce, 2 ounces, previously softened with boiling distilled water. Use additional distilled watered if necessary, and after dividing the mass dry the lozenges in a hot air chamber at a moderate temperature. *Rose basis*: Refined sugar, in fine powder, 17·5 ounces; gum acacia, in powder, 300 grains; mucilage of gum acacia, 5 fluid drachms; official rose water, *q.s.* Proceed as in the case of fruit basis. *Simple basis*: Refined sugar, in fine powder, 17·5 ounces; gum acacia, in powder, 300 grains; mucilage of gum acacia, 1·25 fluid ounce; distilled water, *q.s.* Proceed as in the case of fruit basis. *Tolu basis*: Having dissolved what salts of alkaloids may be ordered in distilled water, 3 fluid drachms, mix the solution intimately with refined sugar, in fine powder, 17 ounces, and gum acacia, in powder, 300 grains. Then, thoroughly incorporate any other drugs ordered, together with tincture of balsam of tolu, 3 fluid drachms. Make into a paste with mucilage of gum acacia, 1·25 fluid ounce, and distilled water, *q s.* Then proceed as in the case of fruit basis.

Troschiscus Acidi Benzoici.—Benzoic acid, ½ grain, with fruit basis.

*__Trochiscus Acidi Carbolici.__—Phenol, 1 grain, with tolu basis.

Trochiscus Acidi Tannici.—Tannic acid, ½ grain, with fruit basis.

Trochiscus Bismuthi Compositus.—Bismuthoxy carbonate, 2 grains; heavy magnesium carbonate, 2 grains; precipitated calcium carbonate, 4 grains, with rose basis.

Trochiscus Catechu.—Catechu, 1 grain, with simple basis.

*__Trochiscus Eucalypti Gummi.__—Eucalyptus gum, 1 grain, with fruit basis.

Trochiscus Ferri Redacti.—Reduced iron, 1 grain, with simple basis.

*__Trochiscus Guaiaci Resinæ.__—Guaiacum resin, 3 grains, with fruit basis.

Trochiscus Ipecacuanhæ.—Ipecacuanha root, in powder, ¼ grain, with fruit basis.

*__Trochiscus Krameriæ.__—Extract of krameria, 1 grain, with fruit basis.

*__Trochiscus Krameriæ et Cocainæ.__—Extract of krameria, 1 grain; cocaine hydrochloride, 1/20th grain, with fruit basis.

Trochiscus Morphinæ.—Morphine hydrochloride, 1/36th grain, with tolu basis.

Trochiscus Morphinæ et Ipecacuanhæ.—Morphine hydrochloride, 1/36th grain; ipecacuanha root, in powder, 1/12th grain, with tolu basis.

Trochiscus Opii.—Omitted.

Trochiscus Potassii Chloratis.—Potassium chlorate, 3 grains, with rose basis.

Trochiscus Santonini.—Santonin, 1 grain, with simple basis.

Trochiscus Sodii Bicarbonatis.—Sodium bicarbonate, 3 grains, with rose basis.

Trochiscus Sulphuris.—Precipitated sulphur, 5 grains; acid potassium tartrate, in powder, 1 grain; refined sugar, 8 grains; gum acacia, in powder, 1 grain; tincture of orange, 1 minim; mucilage of gum acacia, 1 minim. Mix the tincture of orange with the powders, and add the mucilage to form a suitable mass. Dry in a hot-air chamber at a moderate temperature.

†__Unguenta.__—In India and the Colonies more or less indurated lard, prepared suet, yellow beeswax, or white beeswax may be employed in the preparation of ointments, but the official proportion of the active ingredients must in all cases be maintained.

Unguentum Acidi Borici.—Boric acid, in very fine powder, carefully sifted, 1; white paraffin ointment, 9.

Unguentum Acidi Carbolici.—Dissolve phenol, 0·5, in glycerin, 1·5, and add white paraffin ointment, 10·5.

Unguentum Acidi Salicylici.—Salicylic acid in powder, 10, white paraffin ointment, 490.

Unguentum Aconitinæ.—Rub aconitine, 10, with oleic acid, 80, and gently warm until solution is effected; then add lard, 140.

Unguentum Antimonii Tartarati.—Omitted.

***Unguentum Aquæ Rosæ.**—Melt together white beeswax, 1·5, spermaceti, 1·5, and almond oil, 9. Pour the mixture into a warmed mortar and add undiluted rose water, 7, gradually with constant trituration. Next add oil of rose, 8, minims, to each 19 ounces, and continue the trituration until cold.

Unguentum Atropinæ.—Rub atropine, 10, with oleic acid, 40, and gently warm until solution is effected ; then add lard, 450.

Unguentum Belladonnæ.—Evaporate liquid extract of belladonna, 2, on a water-bath until it is reduced to one-eighth of its original bulk ; then add benzoated lard, 2·25. Each 100 parts of this ointment should contain 0·6 part of the alkaloids of belladonna root.

Unguentum Calaminæ.—Omitted.

Unguentum Cantharidis.—Cantharides, bruised, 1 ; benzoated lard, 10. Melt the lard, add the cantharides, and digest at about 49° C. for 12 hours. Strain through calico, press the residue gently, and stir the ointment until cold.

***Unguentum Capsici.**—Capsicum fruit, bruised, 6 ; spermaceti, 3 ; olive oil, 22. Digest on a water-bath for 1 hour, occasionally stirring, strain, and cool, without stirring.

Unguentum Cetacei.—Melt together spermaceti, 10, and white beeswax, 4, with almond oil, 36 ; add coarsely powdered benzoin, 1, and apply heat for 2 hours, frequently stirring the mixture. Then remove from the source of heat, strain, and stir until cold.

Unguentum Chrysarobini.—Formula unaltered.

***Unguentum Cocainæ.**—Rub cocaine, 20, with oleic acid, 80, and gently warm until solution is effected ; then add lard, 400.

Unguentum Conii.—Evaporate conium juice, 2, to one-eighth its original volume, at a temperature not exceeding 60° C. ; then add hydrous wool fat, 0·75, and mix by trituration.

Unguentum Creosoti.—Add creosote, 1, to a melted mixture of hard paraffin, 4, and white, soft paraffin, 5 ; stir until cold.

Unguentum Elemi.—Omitted.

Unguentum Eucalypti.—Add oil of eucalyptus, 1, to a melted mixture of hard paraffin, 4, and white soft paraffin, 5 ; stir until cold.

Unguentum Gallæ.—Galls, in very fine powder, 1 ; benzoated lard, 4. Mix by trituration.

Unguentum Gallæ cum Opio.—Gall ointment, 925 ; opium, in very fine powder, 75. Mix by trituration.

Unguentum Glycerini Plumbi Subacetatis.—Glycerin of lead subacetate, 1 ; white paraffin ointment, 5.

Unguentum Hamamelidis.—Liquid extract of hamamelis, 0·25 ; hydrous wool fat, 2·25.

Unguentum Hydrargyri.—Formula unaltered.

Unguentum Hydrargyri Ammoniati.—Ammoniated mercury, 1 ; white paraffin ointment, 9

Unguentum Hydrargyri Compositum.—Mix yellow beeswax, 6 ; olive oil, 6 ; and mercury ointment, 10 ; with the aid of heat. Add camphor, in flowers, 3, and triturate until cold.

Unguentum Hydrargyri Iodidi Rubri.—Mercuric iodide, in fine powder, 20 ; benzoated lard, 480.

Unguentum Hydrargyri Nitratis.—Dissolve mercury, 1, in nitric acid, 3, without the aid of heat, agitating gently from time to time. Then heat together lard, 4, and olive oil, 7, on a sand-bath, so that the mixture, when transferred to a heated stoneware jar capable of holding ten times the quantity, shall have a temperature of about 143° C. Add the cold mercurial solution very gradually, stirring constantly to promote disengagement of the fumes. After frothing has ceased the mixture should have a temperature of not less than 93° C. Stir until cold, when the ointment should be firm in consistence and have a pale lemon colour.

Unguentum Hydrargyri Nitratis Dilutum.—Mercuric nitrate ointment, 1 ; yellow soft paraffin, 4.

***Unguentum Hydrargyri Oleatis.**—Mercuric oleate, 1 ; benzoated lard, 3.

***Unguentum Hydrargyri Oxidi Flavi.**—Yellow mercuric oxide, in very fine powder, 1 ; yellow soft paraffin, 49.

Unguentum Hydrargyri Oxidi Rubri.—Red mercuric oxide, in very fine powder, 1 ; yellow paraffin ointment, 9.

Unguentum Hydrargyri Subchloridi.—Mercurous chloride, 1 ; benzoated lard, 9.

Unguentum Iodi.—Triturate, in a glass or porcelain mortar, iodine, 1, potassium iodide, 1 ; and glycerin, 3. Then add lard, 20, gradually.

Unguentum Iodoformi.—Iodoform, in fine powder, 1, yellow paraffin ointment, 9.

***Unguentum Paraffini.**—Hard paraffin, 3 ; soft paraffin, 7. Melt together in a shallow evaporating dish, and triturate constantly as the mixture cools. When this preparation is used as the basis of white ointments, let the soft paraffin be white ; but for coloured ointments, use yellow soft paraffin. The proportions of hard and soft paraffins in the ointment may be modified to meet the exigencies of climate and prevailing temperature.

Unguentum Picis Liquidæ.—Formula unaltered.

Unguentum Plumbi Acetatis.—Lead acetate, in fine powder, 20 ; white paraffin ointment, 480.

Unguentum Plumbi Carbonatis.—Lead carbonate, in fine powder, 1 ; white paraffin ointment, 9.

Unguentum Plumbi Iodidi.—Lead iodide, in fine powder, 1 ; yellow paraffin ointment, 9.

Unguentum Potassæ Sulphuratæ.—Omitted.

Unguentum Potassii Iodidi.—Dissolve potassium iodide, 50, and potassium carbonate, 3, in distilled water, 47 by weight ; then mix the solution, gradually, with the benzoated lard, in a slightly warmed mortar.

Unguentum Resinæ.—Melt resin, in powder, 8, and yellow beeswax, 8 ; then add olive oil 8, and lard, 6, strain, and stir until cold.

Unguentum Sabinæ.—Omitted.

Unguentum Simplex.—Omitted.

Unguentum Staphisagriæ.—Crush stavesacre seeds, 2, and digest with benzoated lard, 8·5, on a water-bath, for two hours ; then strain and press through calico, add yellow beeswax, 1, heat gently to dissolve, and stir until cold.

Unguentum Sluphuris.—Sublimed sulphur, finely sifted, 1 ; benzoated lard, 9.

Unguentum Sulphuris Iodidi.—Triturate sulphur iodide, 20, and glycerin, 20, in a slightly warmed mortar, until a smooth paste results ; then gradually add benzoated lard, 460, and stir until cold.

Unguentum Terebinthinæ.—Omitted.

Unguentum Veratrinæ.—Rub veratrine, 10, with oleic acid, 40, and gently warm the mixture until solution is effected ; then add lard, 450.

Unguentum Zinci.—Zinc oxide, finely sifted, 3, benzoated lard, 17. Melt the lard at a low temperature, and add the oxide gradually, stirring the mixture constantly until cold.

Unguentum Zinci Oleatis.—Dissolve zinc sulphate, 2, in distilled water, 4 ; also dissolve hard soap, in shavings, 4, in distilled water, 40. Mix the two solutions, collect the precipitated zinc oleate, wash with hot distilled water until free from sulphate, then dry on a water-bath, mix with an equal weight of melted soft paraffin, and stir until cold.

Vapores.—All omitted.

Vinum Aloes.—Omitted.

Vinum Antimoniale.—Strength unaltered, but one-twentieth part of the sherry is replaced by water, in which the tartarated antimony is to be dissolved before mixing with the wine. Dose : 10 to 30 minims ; as an emetic, 2 to 4 fl. dr.

Vinum Aurantii.—Strength unaltered.

Vinum Colchici.—Strength unaltered, but the colchicum corm to be macerated as directed for tinctures.

Vinum Ferri.—Formula unaltered.

Vinum Ferri Citratis.—The iron and ammonium citrate is dissolved in enough orange wine to produce one pint.

Vinum Ipecacuanhæ.—Liquid extract of ipecacuanha, 1, sherry, 19. Mix, set aside for 48 hours, then filter. Dose : 10 to 30 minims, as an expectorant ; 4 to 6 fl. dr., as an emetic.

Vinum Opii.—Omitted.

Vinum Quininæ.—Dissolve quinine hydrochloride, 1, in orange wine, 437·5, set aside, and filter if necessary.

Vinum Rhei.—Omitted.

Vinum Xericum.—Should contain not less than 16 p. c. by volume of ethyl hydroxide.

Pharmaceutical Transactions.

BRITISH PHARMACEUTICAL CONFERENCE.

A meeting of the Ulster Executive Committee of this body was held in 10, Garfield Chambers, Royal Avenue, Belfast, on Wednesday, March 30, at 11.30 a.m. There were present Messrs. J. C. C. Payne, J.P. (Chairman), S. Gibson, J. Tate, J. Guiler, T. Moffatt, J. Acheson, W. J. Rankin, and R. W. McKnight. The minutes of the previous meeting having been read and confirmed, Mr. Payne reported that the deputation, consisting of Sir J. H. Haslett, Mr. McKnight and himself, had waited on the Lord Mayor, and asked him to receive the delegates to the Conference at the Queen's College, Belfast, on August 9, and that he had graciously consented to do so. It was decided to give the Conference delegates an excursion on August 11: Train to Larne, thence by cars along the coast; through the Glens of Antrim to Parkmore, returning by train from Parkmore Station. This trip will give the delegates an opportunity of seeing some of the most beautiful scenery in the world. For those who may wish to visit the Giant's Causeway on Friday, August 12, an arrangement will be made with the manager of the Northern Counties Railway to bring them at considerably reduced fares to Portrush, the tickets being available for return until the Monday following. The Committee, in making these arrangements, considered that a one day's excursion to the Causeway would not be entirely satisfactory, as only about two hours could be spent in exploring the district, and as there is so much to be seen, it could not be done in that time. The Glens of Antrim Excursion will, it is hoped, arouse a keen interest in the delegates to see more of the beautiful province, and induce them to spend a long holiday in the district. Messrs. H. McNeill, Ltd., have secured the contract for catering for the party. Dinner will be served at Garron Tower Castle, which will then be open as an hotel. Tea will be served in the Glens of Antrim.

DEWSBURY AND DISTRICT CHEMISTS' ASSOCIATION.

A meeting of the above Association was held on Monday, April 4, in the Town Hall, Dewsbury, Mr. A. Foster, President, in the chair.—The time was devoted to formulating the rules of the Association and electing members. Councillor S. Ward (Batley Carr) and Mr. R. Broadhead (Batley) were elected members of the Council, and it was also resolved to hold the meetings monthly and on the first Monday in the month.

BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION.

The first annual dinner of this Association was held at the Great Northern Victoria Hotel, on Tuesday, April 5, when there was a moderate attendance to do justice to the occasion. Several of the members were absent on account of there being an important Masonic meeting, or the dinner would have been more successful from a numerical point of view. Those gentlemen whose good fortune it was to be present were highly pleased with the arrangements made, and thoroughly enjoyed themselves. Mr. Waddington, one of the vice-presidents, occupied the chair, in the unavoidable absence of Mr. Dunn, the President, being supported by Mr. Silson (Treasurer) and Mr. Pickard (Secretary). After the repast, the tables having been cleared, the following toast-list was disposed of:—"The Queen and Royal Family," proposed by Mr. A. H. Waddington, and drunk with musical honours; "The Pharmaceutical Society," proposed by Mr. J. A. Mitchell, and responded to by Mr. F. A. Wilcock; "The Bradford and District Chemists' Association," proposed by Mr. Russell (Southport), and replied to by Mr. S. N. Pickard, Hon. Sec.; "Kindred Associations," coupled with "The Visitors," proposed by Mr. J. M. Newbould, and responded to by Messrs. Worfolk (Ilkley), and Eckroyd (Keighley); "The Trade and City of Bradford," proposed by Mr. Briggs (Sowerby Bridge), and replied to by Mr. R. W. Silson; "Mr. Silson," proposed by Mr. A. H. Waddington, to which Mr. Silson replied; "The Chairman" (Mr. Waddington), proposed by Mr. Pickard (with musical honours), and suitably responded to by Mr. Waddington. —The drinking of the toasts was interspersed with music, in which Messrs. Russell, Hanson, and Silson took part, and a most successful and enjoyable evening was spent, the party dispersing shortly after 12 p.m.

PHARMACEUTICAL SOCIETY OF IRELAND.

The monthly meeting of the Council was held on Wednesday, the 6th inst., at 67, Lower Mount Street, Dublin. The President, Mr. R. J. Downes, was in the chair, and the other members of Council present were the Vice-President (Mr. Beggs), the Hon. Treasurer (Mr. Grindley); and Messrs. Wells, Montgomery (Belfast), Baxter (Coleraine), Porter, Bernard, Conyngham, Kelly, Sullivan (Waterford), Hayes, Simpson, and Ryan. Letters from Mr. A. L. Donan were read in reference to his functions as Examiner, and it was decided that the President and one or two members of the Council should have an interview with Mr. Donan. The District Inspector of the Royal Irish Constabulary at Aughnacloy reported that in obedience to an order of the Queen's Bench Division, the magistrates there had increased a fine of £1, imposed on Robert Galbraith for unlawfully selling laudanum, to £5, with costs of the appeal.—Mr. Bernard: Has he appealed to the Lord Lieutenant yet?—President: No, not that we have heard.—Mr. Wells remarked that in another case the judges of the Queen's Bench had said that they did not know where the Lord Lieutenant got his power of reducing penalties.—President: They were referring to a Revenue case.—A letter from Mr. R. McKnight, of Belfast, stated that he had become connected with a limited company; and as he had been co-opted a member of the Council as having no connection with such companies, he thought it right now to resign his seat on the Council. The consideration of the letter was reserved until the next meeting.—Other business having been disposed of, the Council adjourned.

GLASGOW PHARMACEUTICAL ASSOCIATION.

At a Council meeting of this Association, held on Wednesday, the 30th ult., at their rooms in West Regent Street, reference was made to a letter on the Pharmacy Acts Amendment Bill in one of the trade journals, by Mr. A. McKellar (a member of the Council of the local Association).—Mr. Sutherland said he should like an explanation from Mr. McKellar in writing this letter in his private capacity, ascribing apathy to the local Association, of which he was then a member of Executive.—Mr. McKellar replied that his intentions were honest in this matter, but he was asked by Mr. Gibbons, of Manchester, to ascertain what action might be taken with members of Parliament in Glasgow to support the opposition. He also referred to the apathy at a previous meeting of the Association in Glasgow. He now admitted that tactically he was in error in writing the letter referred to. He had withdrawn his opposition to the Bill, and had also written to Mr. Cross, asking him to withdraw his opposition.—Mr. Sutherland further asked Mr. McKellar if he had any communication with Mr. Cross prior to this meeting.—Mr. McKellar said he had interviewed Mr. Cross before the meeting, and had given him information about the Bill. Mr. McKellar said he would formally withdraw his opposition by writing to the trade journals to that effect. —This matter was again referred to by Mr. Moir at a meeting held on the 5th inst.—Mr. McKellar said he had written to the journals* explaining his opposition to the Bill, and had also communicated with Mr. Cross, who replied that he could not withdraw his opposition until he knew what the Government Poisons Bill would do for the agricultural interests. Mr. McKellar said he had also communicated with Mr. Caldwell, M.P., and Dr. Tanner, M.P.

Examination of Peru Balsam.—Hirschsohn proposes the following tests for balsam of Peru:—(1) The balsam mixed with half its weight of calcium hydrate and heated for half an hour on the water bath should not give a firm mass. (Absence of turpentine, resin, Canada balsam, copaiba balsam, storax, alcohol, Siam or Sumatra benzoin, and tolu balsam.) (2) One volume of balsam mixed with four volumes of acetic acid of 80 to 82 per cent. should give an opalescent or only slightly turbid solution, from which no oily drops should separate in about two hours. (Absence of resin oil, copaiba balsam, gurjun balsam, and fatty oils.) (3) The petroleum ether extract of the balsam (1 balsam, 5 petroleum ether), shaken with an equal volume of a diluted aqueous copper acetate solution (1 per mille), should not be coloured bluish-green or green. (Absence of resin, turpentine, Canada balsam, resin oil, copaiba balsam, storax, fatty oils, and tolu balsam). (4) The residue on evaporating the petroleum ether extract covered with hydrochloric acid of 1·19 sp. gr., should not be coloured. (Absence of gurjun balsam.)—*Zeit. d. Allg. oest. Apoth. Ver.*, li., 525.

---

* No such letter, signed by Mr. McKellar, has been sent to the *Pharmaceutical Journal*. [*Ed. P.J.*]

EXTRACTS FROM CONSULAR REPORTS.

A New Item of Export appears in the Cherbourg Custom House returns for 1897, which show that 311 tons, or 76,383 gallons of fresh milk were shipped to England during the months of October, November, and December.

The Sale of Drugs in Las Palmas.—Membership of the Spanish Pharmaceutical Society and special permission is required for the sale of certain drugs and medicines in Las Palmas. The wholesale drug trade is principally worked through agents in Barcelona, but German houses have of late increased their business by sending out price-lists in Spanish weight and metric currency.

British Phosphates have had the preference of intelligent agriculturists in the Italian provinces, because they were recognised to contain phosphoric acid soluble in water, while those imported from Belgium and France contain phosphoric acid only soluble in citrate. The English product is, however, likely to have to compete with a composition manufactured by Signor Angelo Scaini, of Udine, who claims to have succeeded in manufacturing superphosphates soluble in water similar to those of English make, which also contain a quantity of azote.

The Export Duty on Boracic Acid, it is alleged, has caused the boracic products manufactured in Italy to suffer considerably. A project has, therefore, been presented to the Italian Parliament for the abolition of the export duty and the imposition of a duty on the importation of foreign borax and refined boracic acid, which are now admitted free of duty and are chiefly imported from England.

Living British Plants and Bulbs are not allowed to enter Italy without certain formalities are gone through, which, if neglected, frequently result in the plants decaying before reaching their destination. It appears that in consequence of Great Britain not having joined the Berne International Convention, the Customs authorities have no power to permit the introduction of British plants and bulbs. Consul de Zuccato suggests that exporters should therefore ascertain beforehand whether, on their arrival at destination, accompanied by a proper certificate of origin, they might be cleared.

Drugs, Chemicals, and Colours imported into Servia during 1896 amounted to £52,197, about £2000 higher than in 1895. The principal distribution of this trade was: Austria-Hungary, £33,277, and Germany, £11,647. The British trade consisted chiefly of soda, ammonia and varnish, valued at £2237. Chemicals and drugs of various sorts came to £10,226, a falling-off of £4355, and made-up medicines and chemical preparations to £12,468. The value of dyes was £15,542, of which £5980 represented raw colours. For the first nine months of 1897 the importation of drugs, chemicals, and colours was valued at £39,575.

The Imports of Chemicals used in the manufacture of fertilisers at Charleston, S.C., during the year ending August 31, 1897, amounted to 107,828 tons, valued at $810,941, as against 58,938 tons, valued at $433,400, during the corresponding period of the previous year, an increase of 48,890 tons, value $377,541.

Phosphate Rock is found along the margins of most of the navigable rivers in South Carolina and also in the beds of the rivers. The phosphate rock discovered in Tennessee has, during the last few years, been a strong competitor of the Carolina and Florida product, from which, however, it varies greatly, being darker in complexion and denser; also its analysis does not run uniformly, often differing considerably in the same deposit.

Thermal Medicinal Springs occur in the Cape Bon Peninsula to the east of the town of Tunis. The temperature of the hot springs of the Jerid ranges from 90° to 200° F., the water being considered efficacious for nervous diseases, for rheumatic affections, and certain skin complaints.

Rich Deposits of Phosphates are said to exist in Tunisia, those round Gafsa being estimated to amount to 30,000,000 tons, and are about to be worked by a railway between Gafsa and Sfax, by means of which it is hoped that 300,000 tons annually may be put on the market.

LETTERS TO THE EDITOR.

The British Pharmacopœia, 1898.

Sir,—In your issue last week you informed the drug trade, with I presume some semblance of official authority, that the British Pharmacopœia, 1898, would not be published for at least three weeks. Yet on April 9, 1898, a certain wholesale firm, a member of which is one of the Pharmacopœia Committee of the Pharmaceutical Society of Great Britain, issued a "Price-list of New and Altered Preparations, British Pharmacopœia, 1898 (ready for delivery next week)." Furthermore, the same firm is publishing "A Short Guide to the British Pharmacopœia, 1898 (ready on April 14)." Now, I hereby protest, (1) personally on the want of fair-play and justice in conduct of this description, and (2) on behalf of wholesale chemists generally on commercial grounds, *i.e.*, on being handicapped in their business to the extent they will be by this firm getting such a very considerable start of others. I may say that I was deeply incensed on seeing this price-list last night, and doubtless many more have the same feelings, more especially those connected with the wholesale trade. How any firm, apart altogether from motives of right and justice, but with even the most rudimentary idea of the "eternal fitness of things" could take advantage (as has been done) of the position which circumstances, fortuitous or otherwise, have placed them in, to steal a march on their trade competitors passes my comprehension. The General Medical Council is a body exceedingly jealous of the honour of members of the medical profession, and visits heavily any lapses from the straight path. It is to be hoped it is as jealous of the honour of those pharmacists who are temporarily associated with it, but over whom, unfortunately, it has no jurisdiction. The Council of the Pharmaceutical Society has such jurisdiction.

Leith, April 12, 1898. George Coull.

Sir,—Like your correspondent "Quidam," I had a copy of the Pharmacopœia interleaved during my pre-examination days, and found same of exceeding value; in fact, I have rendered my copy of the 1885 work a veritable pharmaceutical gold mine and true *vade mecum* for all time. "Quidam's" suggestion, that the publishing authorities should issue a quantity of interleaved copies of the Pharmacopœia, now in embryo, is a good one, and I hope his suggestion may be taken up and acted upon.

Belfast, April 5, 1898. Samuel Hogg.

OBITUARY.

Leicester.—On April 4, Thomas Leicester, Chemist and Druggist, Burslem (Staffs.). Aged 75.

Taylor.—On April 4, William Reay Taylor, Chemist and Druggist, Middlesbrough. Aged 56. Mr. Taylor had been a member of the Pharmaceutical Society since 1870, and had carried on the business of a chemist in Linthorpe Road for about thirty-six years. Although not a "public man," he was very widely known and was held in high esteem by all who knew him.

Barlow.—On April 5, Samuel Barlow, Pharmaceutical Chemist, Darlington. Aged 78. Mr. Barlow has been a member of the Pharmaceutical Society since 1853.

Stafford.—On April 6, William Stafford, Pharmaceutical Chemist, Gloucester. Aged 89. Mr. Stafford carried on business as a chemist in Northgate Street for nearly sixty years, retiring about five years ago. He was first elected a member of the Gloucester Corporation as long ago as 1853 and was the High Sheriff in 1877, and Mayor in 1889.

Gorrie.—On April 9, Daniel Gorrie, Pharmaceutical Chemist Edinburgh, at his residence, 2, Cameron Terrace. Aged 42.

Leal.—On April 10, Alexander Leal, Chemist and Druggist, Edinburgh, late of Lauder.

COMMUNICATIONS, LETTERS, etc., have been received from

Messrs. Anderson, Barker, Bayley, Bonn, Bristow, Campbell, Cherry, Copestake, Cora, Currie, Davidson, Davison, Evans, Ferguson, Gadd, Gillmour, Greenish, Harries, Hebb, Hill, Hogg, Horsfield, Jones, Lander, McKnight, Marshall, Mason, Payne, Pickard, Reynolds, Richardson, Russell, Smith, Stanley, Stroud, Thomson, Todd, Vizer, Ward.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

Pilocarpine and Pilocarpidine.

In reference to the different views put forward by Hardy and Camels, Knudsen, Petit, and Polonovski as to the relation of the alkaloids of jaborandi, Merck has already shown that the base to which Harnack gave the name of pilocarpidine is not convertible into pilocarpine by methylation, and that the isomer it yields differs from pilocarpine in being insoluble in water (*P. J.*, lviii., 161, 466) Further investigation of the subject has also led Merck to the conclusion that pilocarpine and pilocarpidine are not, as Petit and Polonovski consider, isomeric, but entirely different in composition. He suggests that the discrepancies have arisen by the name pilocarpidine being given to different bases by the several chemists and not confined to that first described by Harnack as having a composition represented by the formula $C_{10}H_{14}N_2O_2$ (*Ann. Chem.*, 238, p. 230). On repeating the experiments of Petit and Polonovski and heating pilocarpine hydrochloride for some time to a temperature of 200° C., Merck obtained similar results, the product having lower rotatory power and the gold or platinum salts lower melting points. But when pilocarpidine hydrochloride (Harnack) was subjected to the same treatment it underwent similar change, though that should not have been the case if the inferences of Petit and Polonovski were correct. Hence it is inferred that the substance to which they give the name ipilocarpidine is merely pilocarpine more or less altered. On subjecting pilocarpine hydrochloride to the action of strong hydrochloric acid, by which treatment Hardy and Calmels state that it is convertible into a salt of pilocarpidine, Merck was equally unsuccessful in obtaining that result (*Bull. Soc. Chem.*, xlviii., p. 234). The effect of long-continued boiling with water is stated by Hardy and Calmels to result in conversion of pilocarpine into pilocarpidine, according to the equation—

$$\left.\begin{matrix} C_{11}H_{16}H_2O_2 \\ H_2O \end{matrix}\right\} = \left\{\begin{matrix} C_{10}H_{14}N_2O_2 \\ CH_3OH \end{matrix}\right.$$

but on repetition of the experiment no indication of such a change could be detected.—*Archiv der Pharmacie*, ccxxxvi., p. 141.

Strophanthin and Strophanthidin.

Further information respecting strophanthin and strophanthidin have been obtained by F. Feist that differs in many respects from the results of other observers. Strophanthin was obtained in the form of a partly crystalline mass, absolutely free from nitrogen and having no reducing action on Fehling's solution. In a 1 per cent. aqueous solution it was optically inactive, a distinction from Arnaud's strophanthin. It absorbs water freely, but yields up the greater part of it over sulphuric acid or at a gentle heat. Strophanthin which has been dried over sulphuric acid melts at 105°, and corresponds in composition more closely to the formula $C_{32}H_{48}O_{16}$ than to Fraser's formulæ $C_{16}H_{28}O_8$ and $C_{20}H_{24}O_{10}$. Strophanthin yields very little, if any, glucose on hydrolysis, but gives, in addition to strophanthidin, a white crystalline substance of the formula $C_{13}H_{24}O_{10}$, melting at 207°, and a sugar of unknown composition. Strophanthidin has the formula $C_{23}H_{28}O_7 + 1\frac{1}{2}H_2O$. It dissolves in concentrated sulphuric acid, giving a pale brick-red colour, but is precipitated white on dilution. It gives no insoluble picrate, does not reduce Fehling, and only slowly decolorises bromine or sodium permanganate. The derivatives are mostly amorphous and have high melting points. Strophanthidin is certainly a benzene derivative. It is converted by boiling caustic alkalies into two yellow crystalline compounds of the formula $C_{20}H_{30}O_5 + 1\frac{1}{2}H_2O$, m. p. 294°, and $C_{24}H_{30}O_5$, m. p. 198°·5, respectively. By the action of bromine strophanthidin gives $C_{39}H_{51}Br_5O_{10}$, m. p. 126°, and $C_{39}H_{31}Br_{11}O_4$, m. p. 160° (*Ber.*, 31, 534). L. Kohn and V. Kulisch have also been investigating strophanthin, but they are inclined to accept Arnaud's formula, $C_{31}H_{48}O_{19}$, and to strongly doubt the correctness of Fraser's view of the glucosidal nature of strophanthin, as, although on hydrolysis the solution reduced Fehling, they could obtain no characteristic reaction for glucose.—*Ber. Pharm. Ges.*, xxxi., 514, through *Apot. Zeit.*, xiii., 232.

Uric Acid and the Murexide Reaction.

It is known that starch granules containing urine no longer gives the iodide of starch reaction. D. Vitali (*Boll. Chim. farm.*, xxxvii., 65) finds that the reason of this phenomenon is due to the reducing action of uric acid. The iodine acts as an indirect oxidising medium, being changed into hydriodic acid whilst the uric acid is oxidised to alloxan. The formation of hydriodic acid is shown if a small quantity of iodine is added to potassium urate. The solution also contains alloxan, and this, on evaporating the solution to dryness, is reduced to alloxantin, which gives the murexide reaction.—*Chem. Zeit. Rep.*, xxii., 81.

Margarine.

Differences of opinion seem to be the chief result elicited from several correspondents in reply to editorial questions as to the best course to be followed in dealing with the addition of margarine to butter and with its detection. It has been suggested that a "latent" colouring matter, such as phenol-phthalein, should be an enforced addition to margarine, or 10 per cent. of sesame oil, either of which lends itself to ready detection.—*Chem. Zeit.*, xxii., 267.

De-emetinised Ipecacuanha.

Ipecacuanha de-emetinised, presumably free from all alkaloids, is advocated by Dr. Owen F. Paget, Honolulu, as a specific for acute and chronic dysentery. A patient was cured of all blood and discharge, from which he had suffered for over a year, in twenty-four hours; 10 grains of the drug were given every four hours.—*Brit. Med. Journ.*, April 16.

Proteolytic Enzyme of Nepenthes.

The nature of the fluid secreted in the pitchers of *Nepenthes* has been carefully investigated by Professor S. H. Vines, the species chiefly examined being *N. mastersiana*. He has definitely determined that the digestive powers of this fluid are due to the action of a true proteolytic enzyme in the presence of an acid, and not merely to the presence of bacteria. The liquid will digest fibrin in the presence of 1 per cent. hydrocyanic acid; active glycerin extract can be prepared from the pitcher-tissue. The enzyme is clearly allied to the peptic group, and is apparently tryptic in its action. The proteid-product of digestion appears to be not peptone, but deuterc-albumose. One peculiarity of the enzyme is its great stability; it is antiseptic and resists decomposition.—*Annals of Botany*, 1897, p. 563.

Phalline.

Professor Kobert applies the term phalline to the poisonous substance present in *Amanita phalloides*. It is a tox-albumin, and causes, when present even in very minute quantities, dissolution of the red corpuscles of the blood, followed by the liberation of certain ferments. The same substance has been detected also in other species of the same genus, viz., in *Amanita virescens, viridis, citrina, virosa, mappa, recutita*, and *porphyria*.—*Trans. Brit. Mycol. Soc.*, 1897, p. 27.

RADIOGRAPHY WITH TESLA'S APPARATUS.

BY T. MALTBY CLAGUE,
Pharmaceutical Chemist.

In certain quarters this method of working has been pronounced impracticable; in others it has met with faint praise, but eighteen months' experience of it in hard practical work has convinced me that its advantages far outweigh its drawbacks, and that where an alternating current such as that so commonly supplied for domestic lighting is available, it is the method which should be adopted.

The trouble and messiness of a battalion of primary cells, or the difficulty of recharging secondary batteries, are such as to deter many from work, and to render very laborious the efforts of those who do attempt it. These form only a part of the reasons in favour of using the method of working now under consideration. There are yet to be named the absolute freedom from dangerous shocks and the amount of control in the spark length obtainable. Of these dangerous shocks there are few workers who do not stand in dread such as interferes with comfortable working, for who that has had a few thousand volts from an induction coil through some portion of his physical economy can feel perfect freedom when in proximity to secondary wires; and to be able to graduate one's voltage to suit any vacuum tube whatever by the mere turning of a milled head of a screw is an immense advantage, for then there is no heating of a tube to bring its vacuum down to the power of the battery, and the vagaries of the tube through the lowering of the vacuum if it heats, or the raising of the vacuum by the prolonged passage of current during an exposure can each be corrected by the operator, who is guided by the colour of his tube or by the cryptoscope which he keeps at hand. The apparatus which I have used is made by Messrs. Miller and Wood, of Gray's Inn Road, W.C., and first some attempt must be made to give an idea of its construction and working. The current supplied by the Electric Lighting Company in my case is an alternating one, and the rate of alternation is one hundred cycles per second, that is one hundred positive impulses and one hundred negative impulses per second. The street voltage is 2000, but a step-down transformer 20 to 1 delivers it to the wires in the building at 100 volts. As the current is already alternating no make and break is necessary, and a wall plug and flexible wire leads it at once to the primary winding L L, and P in Fig. 2.

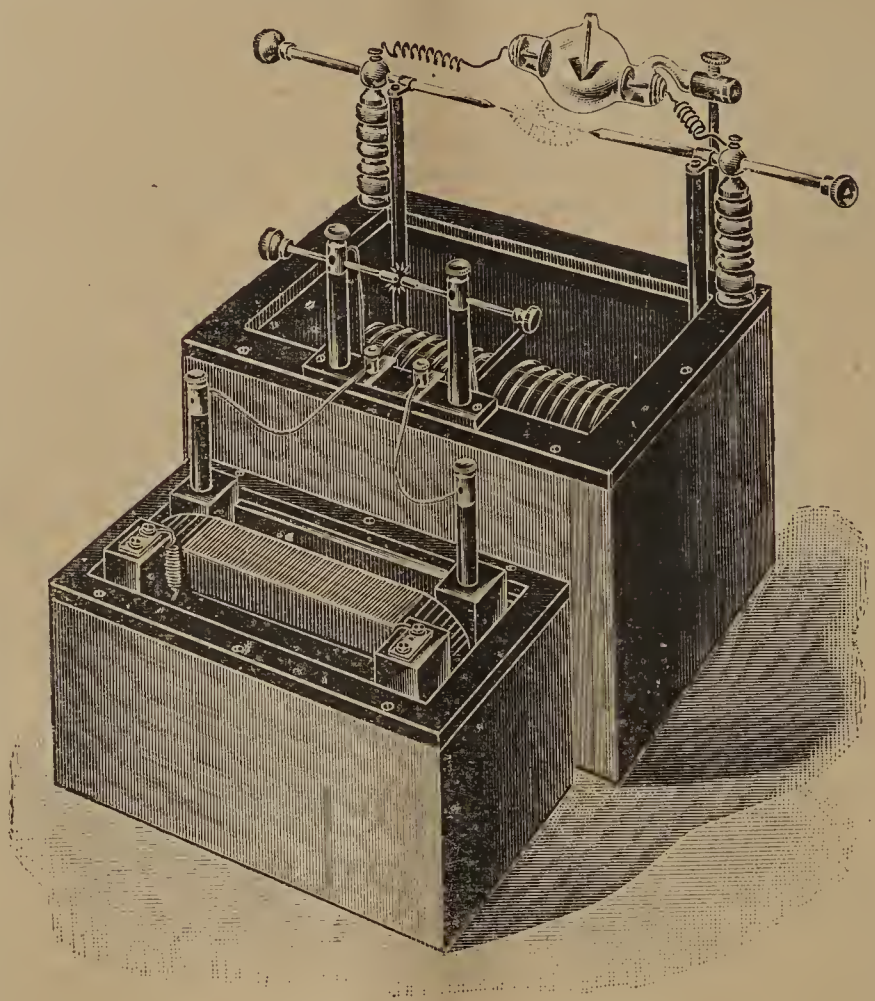

Fig. 1.

The Step-up Transformer.

I found it an advantage to have a small three-way switch put on to the front of the apparatus, two pieces of mahogany, four brass screws, and a piece of thin spring brass, sufficed to make this. The object of the three connections is to enable one to send the current through the whole, or a large or smaller part of the primary, and so vary the voltage obtained from this portion of the apparatus from 3500 to 8000 volts.

A reference to Fig. II. will show the working; I. is a core of soft iron wire, the bundle being about an inch and a half in diameter and the form like that of Faraday's ring transformer, of which it is simply a modification. From L through the primary winding P to La the current passes, magnetising the core I. Round the lower side of the quadrangular core the secondary winding of the transformer is wound, and this receives induced currents of the higher tension named from the core and delivers them at the secondary terminals T T. The whole of this transformer is enclosed in a cell of glass or earthenware and a mahogany case; the former is filled with mineral oil to the level of the primary winding.

From the secondary terminals the current is led to the

Tesla Apparatus.

proper, and becomes, so far as this apparatus is concerned, the primary current by induction to produce a secondary of enormous voltage. Follow the wire leading from the right hand side of the step up transformer (Fig. II) by the aid of the illustrations. L (Fig. III.) connects by a heavy copper wire to the primary winding P (Fig. III.), and collaterally to the condenser at the right (alternate plates, of course). The primary winding consists of nine or ten turns of copper wire, nearly an eighth of an inch thick, and from it the lead is on to the right hand side of the spark gap which stands above the box, and on the side nearest to the observer in the illustration (Fig. I.).

The lead from La (Fig. III.) is to condenser and back to spark gap (left hand pillar).

The condenser consists of nine pairs of sheets of tinfoil, separated by thin glass plates all standing on edge and totally immersed in oil like the primary and secondary. The secondary consists of a coil of fine copper wire supported inside the primary and connected to the terminals, where the discharging rods are shown. No core is used.

The most interesting part of this apparatus, because of the part it plays in producing the modification of the current which has rendered Tesla's work so unique, is the spark gap. Two zinc caps are carried on brass screw rods, and can be made to approach and recede from each other, and so modify the distance which the spark must leap before it can complete the circuit—that is the primary circuit of the Tesla (Fig. III.), or secondary of the step-up transformer (Fig. II.) The milled heads actuating the rods which pass through the upright pillars furnish the control necessary. When the zinc caps are near to each other a small tension suffices to enable the current to leap the gap, and a spark stream at the further discharging pillar of an eighth of an inch can easily be maintained. By separating the caps the ultimate spark may be increased at will, and so a voltage readily secured and

efficiently controlled which will accomplish the work in hand. And now our current is ready for work, and may be led to Geissler tube, Crookes tube, or any other experimental apparatus. The strangest feature about the current is that its oscillation has been enormously increased by the passage through apparatus and over spark gap, and possesses the interesting properties of the high tension, high frequency currents. Foremost, perhaps, is the fact of their harmlessness.

While a spark, several inches in length, is being delivered, a quick grasping of the discharging rod will not give any shock, but the person grasping it becomes an interesting centre of study ; he picks up a vacuous tube and throughout it is filled with a phosphorescence which ranges in colour from purple to pale greenish blue according to vacuum ; he takes hold of a Geissler tube and its lovely play of colours is induced by his grasp ; a dozen people and a dozen tubes alternated, the end persons each grasping a terminal, form a striking and lovely spectacle, and the light

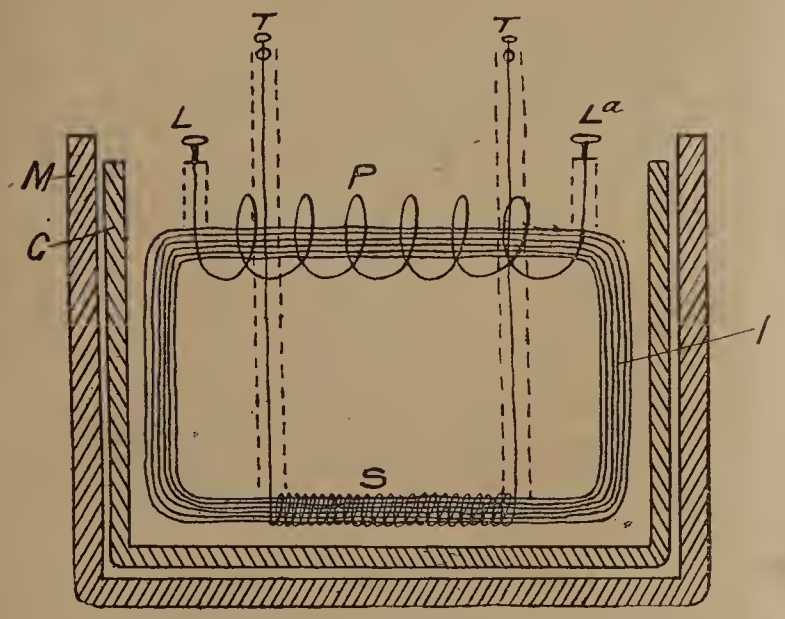

Fig. 2.

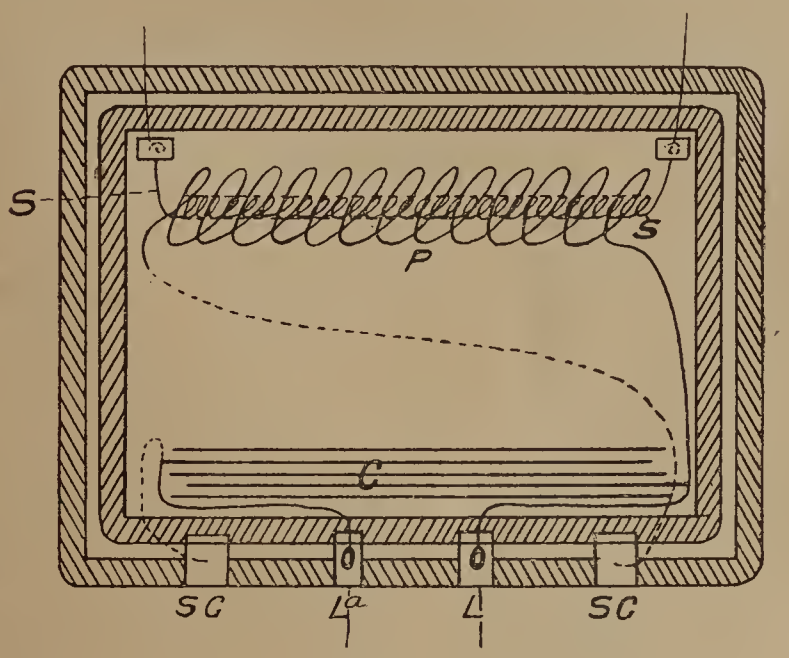

Fig. 3.

given off from the tubes is sufficient to read by. Long wand-like tubes are very effective.

Many other experiments in fluorescence, deflagration, etc., are veritably at the operator's finger ends.

But it is with the working of Crookes tube and its modifications and Röntgen rays that we are concerned, and here the first obvious difference which awaits us is the superior penetrative power of the high frequency current. A tube which requires a six-inch spark from an induction coil of the Ruhmkorf pattern will work well with a two and-a-half inch spark from the Tesla, and so an apparatus giving an 8-inch spark stream will drive any tube to be met with, and is far beyond the requirements of Röntgen ray work as at present practised.

In conclusion, a few hints on practical working may be useful. In connecting up tubes great care should be exercised in avoiding any projection of wire ends towards the tube, as this leads to perforation. Tubes should be chosen which have a long distance between the outside terminals so that outside sparking over may be avoided ; it is always dangerous to the tube. If the tube is found to spark over, it may have its bare terminals protected by a mixture of equal parts of pitch and paraffin wax made into a column an inch thick and as long as necessary. The spark rods should be used as a safety valve. It is much better to begin work with a tube of a moderate degree of exhaustion. One requiring a 2-inch spark from an induction coil will do admirable work in delineating the skeletons of small mammals, snakes, and fishes, and work will run the vacuum up quite soon enough in most cases. If not, a blank run for an hour or two just below its best working current will raise the vacuum greatly and yield a tube which will show a backbone or a heart or liver of a portly patient on a good screen.

A point of great importance is that the full current at which work is to be done should never be turned on at once, and if for any reason the current is turned off the spark gap should be lessened before re-starting. Neglect of this precaution is ruinous to tubes.

To my mind, a pharmacist is from his knowledge of physics and his frequent acquaintance with the technique of photography better qualified than any other man to take up this work, and his natural position as the henchman of the surgeon and the physician points to him as the one to whom the work legitimately belongs. The mere novelty of the thing is over, and now that the interfering amateur who does the work for nothing is out of the way, an adequate remuneration for this work, which requires special knowledge, should be obtained by those of us who engage in it.

Formulæ for "Rubber" Plasters.—*Oxide of Zinc "Rubber" Plaster* : Heat a mixture of olive oil, oxide of zinc, and water for some hours until saponified, then wash the mass out with lukewarm water, press out, and add 30 pints of dammar resin to every 100 parts. This resin must always be in proportion to the prescribed quantity of oxide of zinc or the respective quantity of lanolin or zinc ointment. Spread the substance obtained on linen. Greater adhesiveness is obtained by adding 6 to 10 of well-cleaned Para caoutchouc. *Resorcin "Rubber" Plaster* : Melt resin and yellow wax, add lanolin and soap, and heat for an hour on the water bath. Add the necessary quantity of resorcin. *Salicylic Acid Plaster* : This is prepared in a similar manner. *Tar "Rubber" Plaster* : Melt 20 parts of lead plaster, 1 part of yellow wax, and 1 part of common resin ; add to this mixture 3 parts of juniper tar. Another prescription is, Japanese wax, dammar resin, tallow, and juniper tar. *Iodoform "Rubber" Plaster* : Add 10 of iodoform to the prepared plaster ; the odour of the iodoform will not be noticeable.—*Pharm. Centralh.*, xxxviii., 511.

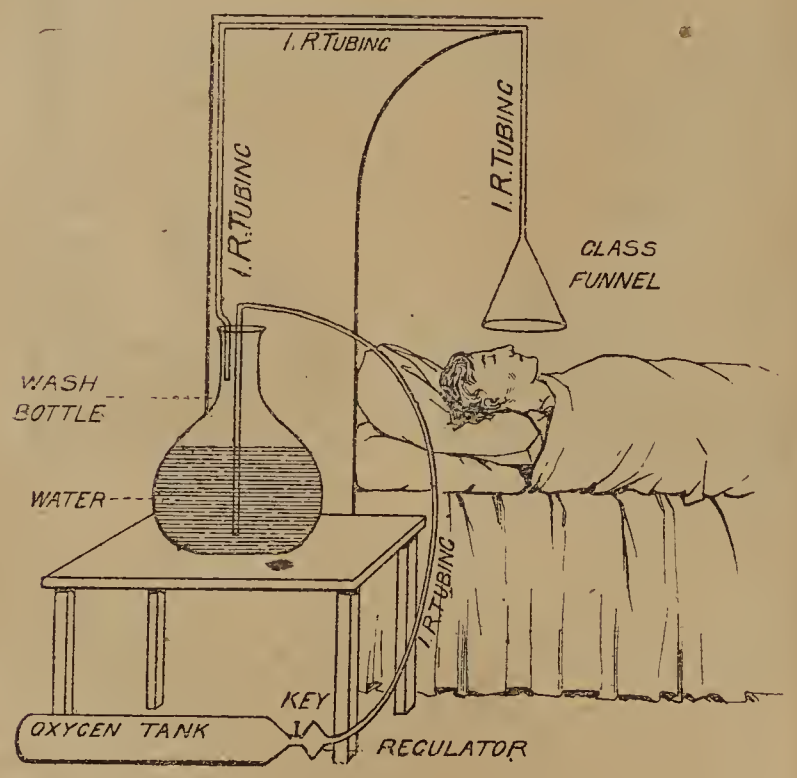
AN APPARATUS FOR ADMINISTERING OXYGEN.*

BY GEORGE LUNAN.

The use of oxygen as a remedial agent is undoubtedly extending. There are frequent inquiries by medical practitioners, and by the general public, by direction of the former, for the apparatus necessary to administer it. The present time is probably the most opportune for dispensing chemists deciding whether they are to control the sale of oxygen for medicinal purposes or to leave it in the hands of dealers in limelight requirements.

Possibly many of you may think that the demand will never be so great in your district as to warrant taking an interest in the subject. My experience is decidedly in favour of giving the subject consideration, for the future I am persuaded will find oxygen as an inhalant in greatly extended use. There is no one better fitted to sell oxygen than the dispensing chemist, from the fact that he is now rightly regarded as specially trained to protect the public from anything inferior or deleterious required for medical purposes.

So long as oxygen was in use for limelight only it did not possess any interest for him, but now that it is required as a remedial



agent it is a matter of great importance to him. Although compressed oxygen as supplied at present is suitable for inhalation, as far as I have been able to determine, no one knows how soon we may have it on the market containing such impurities as carbonic anhydride, sulphurous anhydride, or even nitrous and nitric oxides. There is nothing special or original in the apparatus shown, but it is a practical method of exhibiting oxygen for the purpose of inhalation. The tank is screwed to the regulator in the ordinary way, and the latter connected by rubber tubing to a large wash-bottle containing water. In use the gas is then conveyed through more tubing to a convenient position over the patient's mouth, where it is allowed to diffuse by aid of a glass funnel attached to the tubing, as shown in the illustration. All that is necessary when the apparatus has been conveniently placed is to use the key sufficiently to allow the oxygen to bubble slowly through the wash-bottle.

AN INCOMPATIBLE STRYCHNINE MIXTURE.*

BY J. RUTHERFORD HILL.

The following mixture was brought under my notice the other day by one of our associates, Mr. John Johnstone :—

℞. Potass. Iodid	ʒii.
Liquor Strychninæ	ʒiv.
Infus. Quassiæ ad	ʒvi.
	M.

Sig.—A teaspoonful in water thrice daily.

It was written by an eminent physician, and is an instance of the well-known incompatibility of strychnine solutions with potassium iodide. There is, in a few minutes, particularly on shaking, an abundant separation of fine crystals. I should hardly have brought the matter forward were it not for the information supplied to me in connection with it. The dispenser drew the attention of the prescriber to the incompatibility, who said he had it specially dispensed by a pharmacist to assure himself that it was not incompatible, and the mixture so dispensed had been standing in his room for a week and showed no signs of a deposit. He further said it was a favourite prescription, and had frequently been dispensed by pharmacists without any complaint. The dispenser was able to prove to the prescriber that the mixture could not be dispensed as written without a precipitate of a dangerous kind being formed. Ultimately the difficulty was got over by dispensing the strychnine and potassium iodide in separate bottles and instructing a dose to be taken from each. But the fact that the mixture had been frequently dispensed without any question seems to justify calling attention to the circumstance.

The mixture and the precipitate were examined with a view to ascertain exactly what happens. First of all, what was the precipitate? It might be strychnine hydrochloride salted out by the potassium iodide. Some of it was separated and tested, with the result that it was undoubtedly strychnine hydriodide. This was to be expected, considering the insolubility of the hydriodide, as indicated in a subsequent note. After allowing the mixture to stand for six hours, the strychnine remaining in the clear supernatant liquid was determined by washing out with chloroform. The mixture, to begin with, contained 2·223 grains of strychnine in solution. At the end of six hours only 0·372 grain remained in solution and 1·851 grain had been precipitated. That is to say, five-sixths of the strychnine had been precipitated. Even then precipitation was still going on slowly. After two days, the free hydriodic acid had begun to decompose, and reddish-brown acicular or columnar crystals began to separate. These are the same crystals that form when solution of iodine is added to a solution of strychnine. The quantity was too small for examination. They are heavier than the hydriodide crystals, and are probably the tri-iodide of strychnine mentioned by Bauer ('American Pharmaceutical Association Proceedings,' 1875, page 419). In this way almost the entire quantity of strychnine is precipitated. It almost seems as if the precipitate had been filtered out by some of the dispensers, or it may have been dispensed, labelled, and wrapped up before the precipitation took place.

An attempt was made to prevent precipitation by the addition of rectified spirit, and there was less precipitation after adding ʒss., and still less after adding ʒi., but to add more would have been therapeutically inadvisable. Mr. Duncan has made some experiments, and finds that glycerin retards precipitation better than alcohol, but I think the safest and only satisfactory method is to have two separate solutions.

* Read at an Evening Meeting of the Pharmaceutical Society (North British Branch), on Wednesday, April 20.

STRYCHNINE HYDRIODIDE.*

BY J. RUTHERFORD HILL.

When investigating the precipitate formed in the incompatible strychnine mixture referred to in my previous note, it became necessary to inquire as to the nature and properties of strychnine hydriodide. On referring to the usual authorities, practically no definite information could be found.

A quantity of the hydriodide was prepared by dissolving strychnine in excess of hot, freshly-prepared hydriodic acid. The fine silky acicular crystals, which separated on cooling, were collected on a filter, washed, and re-crystallised from rectified spirit.

The pale straw-coloured crystals so obtained are flatter and less distinctly acicular than those obtained from the hot acid aqueous solution. The latter crystals are of a colour very like tannic acid. When re-crystallised from water, the crystals retain their acicular character more than those from rectified spirit, and they are larger and less coloured than the first crop. The constitution of the salt appears to be the same, however, in both cases.

The character which most attracted my attention was the comparative insolubility of the salt in water. While the hydrochloride is soluble 1 in 35·5 of water and the hydrobromide 1 in 55, I found as the mean of three determinations that 1 part of strychnine hydriodide requires for solution 309 parts of water, and the solubility may therefore be put in round numbers as 1 in 310 parts of water at 15·5° C. I have not yet determined the solubility in rectified spirit.

The percentage of hydriodic acid in the salt was determined by decinormal soda solution, using phenol-phthalein as indicator. Owing to the small quantity of material only one careful titration could be made, and it indicated 24 per cent. The percentage of strychnine was determined by adding ammonia and washing out with chloroform. One careful determination gave 66 per cent. The water of crystallisation was determined by heating a weighed quantity of the salt to 110° C., ultimately raised to 120° C. The mean of three determinations indicated 7·93 per cent.

A salt having the formula $C_{21}H_{22}N_2O_2HI,2H_2O$ requires—

	per cent.		per cent.
Strychnine	67	found	66
Hydriodic Acid	25·7	,,	24
Water	7 23	,,	7·93

The solution of the salt in water is neutral, but after standing for two days there are slight indications of decomposition. The salt itself seems quite stable, and the above formula seems to indicate its true constitution. Some crystals prepared from a hot dilute alcohol solution gave, on drying at 120° C., 3·85 per cent. of water. A salt of the formula $C_{21}H_{22}N_2O_2HI\cdot H_2O$ requires 3·75 per cent. and it would seem possible that there may be two kinds of crystals, but the quantity was too small to determine this point.

Treatment of Trachoma with Solutions of Iodine.—E. A. Nesnamoff recommends the following treatment, which brings about healing in two to three weeks. An application is made two or three times with a 1 to 2 per cent. solution of iodine. It does not produce great irritation. This is followed by a 1 per cent. solution of iodine in white vaseline oil, the eye having previously been dried with a pad of absorbent cotton. Only in obstinate cases is the following ointment necessary :—Iodi., 2 or 3 grammes ; ol. vasel. alb , 100 grammes ; ether to produce complete solution. The author finally observes that iodine in vascline oil is one of the best remedies for inflammation of the lachrymal sac.—*Munich Med. Woch.*, xliv., 1358.

---

* Read at an Evening Meeting of the Pharmaceutical Society (North British Branch), on Wednesday, April 20, 1898.

SELECTED FORMULÆ.

Sticky Fly-Papers.

The following proportions are given for preparing "sticky" fly-papers :—

Resin	550	500	650	600	500
Linseed Oil	350	300	—	—	—
Castor Oil	—	—	350	300	340
Honey	100	200	—	100	—
Glycerin	—	—	—	—	160

Melt together and smear on paper while warm. The addition of strong decoctions of pepper or quassia chips or emetic tartar to the honey kills the flies quicker.—*Pharm. Centralh.*, xxxviii., 448.

Applications for Chapped Hands.

(1) Lanolin, 900 grammes ; liquid vaseline, 25 grammes ; vanillin, 5 centigrammes. (2) Distilled water, 10 ; levulose, 1 ; perfume as required. (3) Alcohol, 90 per cent., 80 ; glycerin, 35 ; rose water, 30 ; salol, 2. The last two lotions should be applied after washing the hands in tepid water with non-irritant soap, and drying. The lotion is applied to the backs of the hands and allowed to dry on. (4) Zinc oxide, 13 ; glycerin, 45 ; rub together, and add lanolin, 40. To be applied at night.—*Bull. Gén. de Thérap.*, cxxiii., 189, after *Rev. de Thérap.*

Unna's Preparations for the Hair.

Borochloroform Alcohol : Boric acid, 1 ; alcohol, 100 ; chloroform, 5. *Acetic Sublimate Solution* : Acetic acid, 1 ; Van Swieten's solution, 100. (Van Swieten's solution is composed of corrosive sublimate, 1 ; alcohol, 10 ; water, 990). *Ichthyol Salicylic Soap* : Ichthyol, 10 ; salicylic acid, 5 ; soap basis, 85. *Iodine Sublimate Solution* : Mercuric chloride, 2 ; glycerin, 100 ; tincture of iodine, 900. *Croton Oil Salve Pencil* : Croton oil, 10 ; lanolin, 5 ; yellow wax, 5. *Ung. Chrysarobin. Comp.* : Chrysarobin, 5 ; ichthyol, 5 ; salicylic acid, 2 ; fat, 30 ; vaselin, 58.—*Pharm. Central.*, xxviii., 840.

Malt Extract.

A practical recipe for the production of malt extract, according to Fellerer (*Sudd. Apoth. Zeitung*, 1897, No. 88), is as follows :—1 kilo of malt is broken up and mixed with 1500 C.c. of water of 50° C. and 10 drops concentrated hydrochloric acid. The mash must be kept for two hours at a temperature of 45° C., after which 3500 C.c. of water at 65° C. is added. After two hours, during which time the temperature must be kept at 60° (not more), it is strained, the liquid filtered through coarse cloth and evaporated *in vacuo*. Malt extract prepared in this way is darker than the usual preparation in the market (which are often clarified by means of albumin), but is sweet and pleasant to the taste. If a lighter colour is desired, the temperature should not be allowed to rise above 45° to 50° C. : this has, however, the disadvantage of producing an extract of less sweetness. The hydrochloric acid aids the diastasic action very materially.—*Pharm. Zeit.*, xlii., 897.

Colours for Liqueurs, Confectionery, and Foods.

Red.—(*a*) Mix cochineal, 6, with chalk, 2, and rub well together, then add gradually alcohol, 95 per cent., 12, and finally water, 15 ; set aside for a time, then filter. (*b*) Dissolve carmine, 2, in solution of potash, 12, and dilute with water to make 100. *Yellow.*—(*a*) Use safflower either as an extract or as a tincture. (*b*) Yellow berries extracted with alcohol. *Green.*—(*a*) Extract of saffron, 1·20 with solution of indigo. The colour is improved by a few drops of chloroform. (*b*) Tincture of saffron with solution of indigo carmine mixed with an equal volume of glycerin. (*c*) Chlorophyll in alcoholic solution—*Pharm. Zeit.*, xlii., 515.

The British Pharmacopœia, 1898.

The Vegetable Materia Medica of the Work.

THE botanical names of plants yielding drugs official in the 1898 Pharmacopœia have, with a few exceptions, been brought into accordance with the 'Index Kewensis,' and many of the illustrations referred to have been selected from more readily accessible works than hitherto. In some cases alterations of the official name have been made for which there is no evident reason, such as *Ipecacuanhæ radix* for *Ipecacuanha*, and *Cascarilla* for *Cascarillæ cortex*, and *Linum* for *Lini semina*. The wording of the descriptions, and of the characters and tests, has, in the majority of cases, been modified, so as to more carefully limit the quality of drugs to be used. Details concerning the more important microscopical characters of drugs have been added, and in over twenty instances the limit of ash has been given, apparently with the view of assisting in the detection of adulteration of powdered drugs. It will be noted also that, except in a very few cases, the geographical source of the drug is not stated. This has apparently been done in order that each colony may use drugs grown there, instead of importing them. It is, in fact, a step towards the introduction of an Imperial Pharmacopœia. There are a few apparent inconsistencies in the adoption of names and of botanical sources or of particular varieties of drugs, a possible explanation of which has been offered in some cases, and where an explanation does not seem possible, the alterations have simply been pointed out.

ACACIÆ GUMMI must be insoluble in 90 per cent. alcohol. One part of the gum, dissolved in an equal weight of water, should not form a glairy mucilage, nor, after admixture with more water, yield a gummy deposit on standing. The translucent viscid solution feebly reddens litmus. With solution of borax it gives a more or less translucent white jelly; is not precipitated by a solution of lead acetate; is not coloured blue or brown by a small quantity of solution of iodine (absence of starch or of ordinary dextrine of commerce), nor bluish black by test solution of ferric chloride (absence of tannic acid); and does not give a red precipitate when boiled with solution of potassio-cupro tartrate (absence of certain sugars). The ash of gum acacia should not exceed 4 per cent. of its weight. Gum arabic is thus limited to the finest qualities, and the use of gums like the Australian varieties, containing tannin, or of gums like that of Sennaar, which gives a glairy mucilage, is excluded, and the adulteration of powdered gum is now precluded by several of the tests.

ACONITI FOLIA.—Omitted.

ACONITI RADIX is to be collected in autumn. Internally the root is whitish and starchy. It is crowned with the remains of an undeveloped bud. It must not be hollow or spongy, and must not retain any portions of the stem. The transverse section exhibits a thick parenchymatous cortex and large stellate pith with about seven projecting angles; the groups of vessels are small and few in number. These directions exclude Japanese and German aconite roots, and confine the drug to fully matured roots. It is one of the few instances in which geographical source is limited.

ALOE BARBADENSIS is obtained from *Aloe vera*, Linn., *Aloe chinensis*, Bak., 'Bot. Mag.,' plate 6301, and probably other species. The opaque variety, examined under the microscope, exhibits numerous minute crystals embedded in a transparent mass. The powder imparts a crimson colour to nitric acid, and when treated with sulphuric acid and the vapour of nitric acid, should yield only a slight bluish-green, not a bright blue colour (absence of Natal aloes). Barbados aloes is almost entirely soluble in alcohol (90 per cent.) diluted with half its volume of water; not more than 30 per cent. should be insoluble in cold water. The words Curaçao and Barbados are spelt correctly in the new edition. Very little aloes now comes from Barbados, and the term both in this case and in that of Socotrine aloes is evidently retained as a convenience to prescribers. The percentage of matter insoluble in water and alcohol limits the official articles to the carefully prepared drug.

ALOE SOCOTRINA is the dried juice, usually more or less viscid and brownish-yellow, but when dried, hard, dark brown, or nearly black, breaking with a dull waxy uneven fracture; taste nauseous and bitter. Zanzibar aloes is usually imported in liver-brown masses. Fracture dull, waxy, but nearly smooth and even It has a characteristic odour and a nauseous and bitter taste. Both varieties are opaque, even in small splinters, exhibit when examined under the microscope numerous minute crystals embedded in a transparent mass, and impart to nitric acid a reddish or yellowish-brown colour. If the vapour of nitric acid is blown over the powder, previously mixed with sulphuric acid, no blue coloration is produced (absence of Barbados and Natal aloes). Socotrine and Zanzibar aloes are almost entirely soluble in alcohol (90 per cent.); diluted with half its volume of water; about 50 per cent. should be soluble in water. Dose of both aloes 2 to 5 grains. The description here is not so carefully worded as it might be. The words "nearly black" applied to Socotrine aloes seem to permit the use of the inferior, badly-prepared drug, and the statement that both varieties are opaque even in small splinters is not true of fine qualities of the Zanzibar drug. The nitric acid test is very necessary, as a good deal of the so-called Socotrine aloes of commerce gives a crimson colour with that acid, and is evidently not the true drug. The solubility test should prevent the use of very bad samples of the true drug.

AMMONIACUM is the gum resin exuded from the flowering and fruiting stem of *Dorema ammoniacum*, D. Don., and probably other species ('Trans. Linn. Soc.', ser. 2, Bot., vol. iii., pl. 23 to 25). The nodular masses vary in size from $\frac{1}{4}$ inch to an inch ($\frac{1}{2}$ to $2\frac{1}{2}$ Mm.) in diameter. The following test is given: If a small fragment be heated to redness in a dry test-tube the contents of the tube, after cooling, yield with boiling water a solution which, when largely diluted with water and made alkaline with solution of ammonia, does not exhibit a blue fluorescence (distinction from asafetida and galbanum). Dose, 5 to 15 grains. The umbelliferone test seems hardly necessary to distinguish this drug from asafetida and galbanum, for no one familiar with drugs could possibly confound either the odour, taste, or appearance of these gum resins.

AMYGDALA DULCIS.—The place of exportation is not mentioned. The testa is cinnamon brown, thin and rough. The seed is exalbuminous, and contains two large plano-convex, oily cotyledons.

AMYLUM.—Illustrations of the plants yielding official starch are added (Bentl. and Trim., 'Med. Pl.,' vol. iv., plates 291 to 296). Rice starch is without evident hilum or striæ. Starch should be free from granules other than those described.

ANETHI FRUCTUS.—The dried fruit of *Peucedanum graveolens*, Benth. and Hook. f. The mericarps are usually freed from the pedicel, and 1/12th to 1/8th inch (2-3 Mm.) broad, very strongly compressed dorsally. The dorsal ridges are inconspicuous, but the lateral are prolonged into paler brown wings. Each mericarp exhibits in transverse section six vittæ. The mention of the presence of six vittæ can scarcely be called a character, since it occurs in several of the official umbelliferous fruits. There is no test given to exclude Indian dill, the fruits of *Peucedanum sowa*, although the oil is known to differ in constitution from that of *P. graveolens*.

ANISI FRUCTUS.—The illustration of Berg and Schmidt is replaced by that of Bentl. and Trim., 'Med. Pl.,' vol. ii., plate 122. The fruit is described as ovoid in form, somewhat laterally compressed, and rough from the presence of short bristly hairs, and the breadth 1/12th inch (2 Mm.) is given. The number of ridges is omitted, and the vittæ are said to be numerous. The taste is aromatic instead of spicy. Anise is frequently sold in powder, and a limit of ash would have been a useful test, as the fruit varies exceedingly in quality and in freedom from extraneous matter. A ready test, indicating the absence of conium, would have been an advantage, for although the mention of numerous vittæ indicate

its absence, it is not without some trouble and expenditure of time that such a test can be applied.

Anisi Stellati Fructus is omitted.

Anthemidis Flores.—The dried expanded flower-heads of *Anthemis nobilis*, collected from cultivated plants. They are about ½ to ¾ inch (12 to 20 Mm.) in diameter, hemispherical in shape, white or pale buff in colour. The involucre is composed of several rows of oblong bracts with membranous margins; the bracts on the receptacle are concave, blunt, narrow, and scaly, and the florets are mostly ligulate and white. The description implies that only double chamomile flowers are to be used. No mention is made of the single chamomile flowers of commerce.

Araroba represents the chrysarobinum of the B.P. 1885, before purification. It is described as a substance found in cavities in the trunk of *Andira araroba*, Aguiar., freed as much as possible from fragments of wood, dried and powdered. The powder varies in colour from brownish-yellow to umber-brown. It should yield to hot chloroform not less than 50 per cent. of a substance which, on evaporating the chloroform from the filtrate and drying and powdering the residue, should have the character of chrysarobin. Allowance is evidently made here for the inferior quality of the drug, which is the only kind said to be obtainable in commerce. Good araroba freed from wood should yield considerably more than 50 per cent. of matter soluble in hot chloroform.

Armoraciæ Radix is to be collected from cultivated plants, which are not now required to be of British origin. It is marked at the crown, where it is somewhat enlarged, with closely approximated semi-amplexicaul leaf-scars.

Arnica Rhizoma.—The description is practically unaltered. The rhizome is horizontal, curved, the leaf-scars are amplexicaul, and the rootlets brittle, and the remains of the stem and leaves are hairy. The transverse section exhibits a number of resin-ducts near the inner margin of the cortex.

Asafetida is obtained from the root of *Ferula fœtida*, Regel. ('Trans. Linn. Soc.,' ser. 2, Bot., vol. iii., pl. 12 to 14). It should be in rounded or flattened tears, usually varying in size from ½ to 1 inch (12 to 25 Mm.) in diameter, or in masses of agglutinated tears, dull yellow in colour, darkening by keeping. When fresh the tears are usually tough at ordinary temperature, but become hard in cold weather. Not less than 50 per cent. should be soluble in alcohol (90 per cent.). If a small fragment be heated to redness in a dry test tube, the contents of the tube after cooling yield with boiling water a solution which, when largely diluted and made alkaline with solution of ammonia, exhibits a blue fluorescence. In the spelling of this word there is somewhat of the "straining at a gnat." In Murray's 'New English Dictionary' it is spelt asafœtida, and there are more instances given of the usc of "œ" than "e," and if this return to the original Latin spelling were carried out logically, a very large number of both Latin and English words would have to be altered. The question of classically correct spelling is a very vexed one, and it is wiser to follow general usage as a rule rather than pedantry. In other Pharmacopœias it is spelt with "œ." Asafetida in the tear is evidently intended to be used, as the ash in lump asafœtida is rarely below 14 and often nearer 40 or even 60 per cent.

Aurantii Cortex Recens (New).—The fresh outer part of the pericarp of *Citrus aurantium*, var. *Bigaradia*, Hook. f., Bentl. and Trim. 'Med. Pl.' vol. i., plate 50. Characters:—Externally deep orange-red, or red in colour and generally rough and glandular. On its inner face there should only be a very small amount of the white spongy portion of the pericarp. It has a pleasant aromatic odour and bitter taste.

Aurantii Cortex Siccatus.—The rind is obtained from *Citrus aurantium*, var. *Bigaradia*, Hook. f. It is in thin strips, of which the surface is rough. On its inner surface there should be only a very small amount of the white spongy portion of the pericarp. The botanical name here given is not strictly speaking the proper one, according to the rules accepted by most botanists. Linnæus called the bitter orange *Citrus aurantium*, regarding it as the type and the sweet orange was a var. *B. Citrus vulgaris*, Risso, is a much earlier name than the one by Hooker here given, and is followed in most pharmacopœias, and it is difficult to understand on what grounds the present name has been adopted, unless for the purpose of bringing in the name *Bigaradia*, familiar to pharmacists as applied to oil of neroli (Bigarade).

Balsamum Peruvianum.—One volume is soluble in 1 volume of alcohol (90 per cent.), but on the further addition of two more volumes turbidity occurs. It is stated that the tests given in the B.P., 1885, are to detect copaiba and resins, and the latter part of the test, *i.e.*, heating the mixture of lime and balsam, is to detect the presence of castor oils or other fatty oils, and that shaking with an equal bulk of water is to detect the presence of ethylic alcohol. The following additional tests are given:—About 40 per cent. of resin should separate when 1 part of balsam is treated with 3 parts of carbon bisulphide, and the clear supernatant liquid should be of a pale brown colour, with only a slight fluorescence (absence of gurjun balsam). If 5 grammes of the balsam be shaken with 5 C.c. of a solution of sodium hydroxide, of specific gravity 1·16, and then washed with three sucessive quantities (each of 15 C.c.) of purified ether, and the ether removed, the residue, dried cautiously, until the loss in two weighings at five minutes' interval does not exceed 1 Cgrm., should weigh between 2·85 and 3 grammes. To this weighed residue add 20 C.c. of normal volumetric alcohol solution of potassium hydroxide, with 40 C.c. of alcohol (90 per cent.). Saponify under a reflux condenser for one hour, then determine the amount of alkali uncombined by means of trituration with the volumetric solution of sulphuric acid. The amount of residue above specified should combine with from 11·9 to 12·8 C.c. of the normal volumetric alcoholic solution of potassium hydroxide (presence of a sufficient proportion of cinnamein). Dose, 5 to 15 minims. The amount of uncombined alkali may be determined in the usual way by means of titration with the volumetric solution of sulphuric acid. Dose 5 to 15 minims.

Balsamum Tolutanum.—A balsam obtained by making incisions in the trunk of *Myroxylon toluifera*. The following test is added:—If 5 grammes are gently warmed with two successive portions of 25 and 10 C.c. of carbon bisulphide, the solution should yield, when evaporated to dryness, not less than one-third of its weight of potassium hydroxide for its saponification (presence of a sufficient proportion of benzoates and cinnamates). Dose, 5 to 15 grains. The statement that the crystals contained in the balsam, as seen under a microscope, are cinnamic acid, is omitted, possibly because benzoic acid is also present in the drug.

Belæ Fructus.—Omitted.

Belladonnæ Folia.—The fresh leaves and branches to which they are attached are to be collected when the plant is in flower. They are glabrous, or nearly so. The corolla is gamopetalous, campanulate, and of a dingy purple colour. The transverse section of the leaf exhibits bicollateral vascular bundles. The mesophyll contains numerous cells filled with very minute crystal of calcium oxalate. The microscopical test should be useful to distinguish the broken leaves from those of stramonium and henbane.

Belladonnæ Radix.—The root collected in the autumn and dried. The geographical source is not now given. Characters and tests: In nearly cylindrical pieces entire or longitudinally split, varying in diameter from about ⅜ to ¾ of an inch (10 to 20 Mm.), and usually from 6 inches to a foot (15 to 30 C.m.) or more in length. Externally it is of a pale greyish-brown colour, and is finely wrinkled longitudinally. The transverse fracture is short. Internally the root is whitish and starchy. Within and mostly near the cambium ring are numerous scattered groups of vessels and fibres, which should not exhibit a prominently radiate arrangement. Most of the parenchymatous cells contain small compound starch grains, and some are filled with numerous very minute crystals of calcium oxalate. The description is here very carefully worded, evidently with the view of excluding old and woody roots containing less alkaloid, and of ensuring a more uniform and active preparation.

Benzoinum.—Known in commerce as Siam and Sumatra benzoin. The mode of obtaining it from the tree is omitted. In curved or flat tears varying in size, but seldom exceeding 2 inches (5 C.m.) in length and ½ inch (12 Mm.) in thickness, yellowish or reddish-brown externally, milky white internally, or in masses composed of tears more or less closely agglutinated, owing to the presence of a reddish-brown translucent or greyish-brown opaque resinous substance. Siam benzoin recalls the odour of vanilla, and Sumatra benzoin that of storax. It is almost entirely soluble in alcohol of 90 per cent. Only the finest qualities will conform to the test of almost entire solubility in alcohol of 90 per cent. It would perhaps have been an advantage if the drug had been limited to the Siam benzoin in tears for medicinal use only, as it is by far the purest, and has a distinctive vanilla odour.

Buchu Folia.—The dried leaves of *Barosma betulina*, Bart. and Wendl., Bentl. and Trim., 'Med. Pl.,' vol. i., pl. 45. The leaves are rhomboid-obovate in outline, rigid, when slightly moist cartilaginous. The surface is glabrous and somewhat warty, the margin usually sharply denticulate. The transverse section exhibits an epidermis whose cells contain yellow spherocrystals; the inner

walls of these cells are thick and rich in mucilage. The restriction of the drug to the variety containing the largest quantity of the antiseptic, diosphenol, is a decided advantage. The term warty is scarcely applicable to the leaves as there are no warts present on them.

Calumbæ Radix.—*Jateorhiza columba*, Miers. In the wood the vessels are arranged in narrow, radially elongated groups. The parenchymatous tissue is largely developed, and contains numerous starch grains, mostly simple, with excentric hilum. The old spelling is here retained, but in the spelling of the botanical name the 'Kew Index' is followed. The native name of the drug, kalumb, was, however, originally spelt with an "a." It should be remembered that in most other Pharmacopœias the word is spelt with an "o."

Cambogia is to be obtained from *Garcinia hanburii* (Hook. f. Bentl. and Trim., 'Med. Pl.,' vol. i., pl. 33). Alcohol of 90 per cent. is used in ascertaining its solubility. When the iodine test is applied the colour should not become distinctly green (absence of more than a trace of starch). When incinerated it should not yield more than 3 per cent. of ash. Dose ½ to 2 grains. The drug varies much in purity, and the ash test is a useful addition.

Camphor is described as a white crystalline substance (Bentl. and Trim., 'Med. Pl.,' vol. iii., pl. 222). In transparent pieces of tough consistence, also in rectangular tablets, or in pulverulent masses known as flowers of camphor. Sp. gr. about 0·995. It is soluble in 700 parts of water, in about 1 part of alcohol (90 per cent.), in ¼ part of chloroform and in 4 parts of olive oil. Very soluble in ether. It forms a liquid when triturated with chloral hydrate, menthol, phenol, and thymol. Dose 2 to 5 grains. The illustration of the plant is one of the worst that could have been chosen, and is veryinferior to either Berg's or Koehler's.

Canellæ Cotex is omitted.

Cannabis Indica.—In compressed, rough, dusky green masses (Bentl. and Trim., 'Med. Pl.,' vol. iii., pl. 231). The upper leaves are simple, alternate, and tripartite; the lower are opposite and digitate, and consist of five to seven linear-lanceolate leaflets with distantly serrated margins. The fruit is one-seeded and supported by an ovate-lanceolate bract. Both leaves and bracts bear external oleo-resinous glands and one-celled curved hairs, the bases of which are enlarged and contain cystoliths. The use of the Bombay drug is evidently intended by the word "compressed," since the Calcutta drug is in more or less cylindrical pieces. This difference in shape should be noted, since the Calcutta drug, which is rarely imported, is much more powerful than that of Bombay.

Cantharides.—*Cantharis vesicatoria*, Latr. Brandt and Ratzeburg, vol. ii., tab. xviii., figs. 1, 2, 3. Reference to illustrations of the animals yielding animal products are given in the new B.P., except in the cases of the common domestic animals.

Caoutchouc (New).—The prepared milky juice of *Hevea brasiliensis*, Muell. Arg. (Collins, 'Report on Caoutchouc,' plate 1), and probably other species. Known in commerce as Pará rubber. In elastic masses or sheets of varying thickness, brownish-black externally, and mottled with a pale tint internally, insoluble in water, ethylic alcohol, alkaline solutions, or dilute acids, soluble in chloroform, oil of turpentine, carbon bisulphide, benzol, and petroleum spirit. When heated to about 257° F. (125° C.) it melts, remaining soft and adhesive after cooling. Odour characteristic, somewhat empyreumatic. Nearly tasteless. The term mottled is scarcely characteristic of Pará rubber, which gradually shades off into a paler tint internally.

Capsici Fructus.—*Capsicum minimum*, Roxb. Bentl. and Trim., 'Med. Pl.,' vol. iii., plate 188. Sometimes attached to a five-toothed inferior calyx and long, straight, slender peduncle. Pericarp leathery, containing ten to twenty seeds, either loose or attached to a thin reddish dissepiment. On incineration capsicum should not yield more than 6 per cent. of ash. The botanical name here given is an earlier one of *C. fastigiatum*. No geographical source is given, although it has recently been shown that some varieties, *e.g.*, Japanese, are much less pungent than others, such as those of Sierra Leone. The ash test is evidently intended to detect impurities in the powder.

Cardamomi Semina.—Bentl. and Trim., 'Med. Pl.,' vol. iv., plate 267. The seeds are about 1/8 inch (3 Mm.) in length and the same in thickness, enclosed in a thin and colourless membranous aril. Incinerated they should not yield more than 4 per cent. of ash. The percentage of ash would detect the presence of pericarps in powdered cardamoms, which in commerce often occur in the powder, the seeds yielding 2 to 4 and the pericarps 10 to 13 per cent. of ash.

Carui Fructus.—The fruit is about 1/25th of an inch (1 Mm.) broad, glabrous. Taste agreeable, aromatic. Incinerated it should not yield more than 8 per cent. of ash.

Caryophyllum.—Bentl. and Trim., 'Med. Pl.,' vol. ii., pl. 112. About 5/8ths of an inch long (15 Mm.). The calyx teeth are thick, rigid, and patent, and the petals imbricated. Incinerated, cloves should not yield more than 8 per cent. of ash. The well-known tests for detecting clove stalks and clove fruits in the powder by means of the stone cells in the former and starch grains in the latter are not given.

Cascara Sagrada.—Official in the B.P., 1885, under the name *Rhamnus purshiani cortex*. Sargent, Silva, vol. ii., pl. 62. In channelled or nearly flat pieces, frequently about 4 inches (10 Cm.) long and about 1/16th of an inch (1½ Mm.) thick. It possesses a nearly smooth purplish-brown cork marked with scattered transversely elongated lenticels, usually more or less covered with patches of silvery-grey lichen, and when these are removed the exposed cork is of a brownish-red colour. The inner surface has faint transverse corrugations. The taste is nauseous and persistent. This drug is now placed under the vernacular name instead of under the botanical name as in the last edition.

Cascarilla.—This is the new name for *Cascarillæ cortex* of the B.P., 1885, Bentl. and Trim., 'Med. Pl.,' vol. iv., plate 238. The outer layer consists of a dull brown or dark grey longitudinally wrinkled cork frequently marked with small longitudinal and transverse cracks, and more or less completely covered with silvery-grey patches spotted with minute black dots. It easily separates, disclosing a brownish or dark grey layer marked with longitudinal and transverse furrows. The transverse section exhibits under a lens a dark reddish-brown secondary cortex traversed by thin whitish medullary rays, but no groups of sclerenchymatous cells. Taste aromatic and bitter. The object of leaving out the word cortex in the case of this drug only is not clear, and is not consistent with the alterations made elsewhere, as under jaborandi.

Cassiæ Pulpa.—The remarks concerning the pulp obtained separately are omitted.

Catechu.—Bentl. and Trim., 'Med. Pl.,' vol. ii., plate 139. The cubes are porous and friable. Almost entirely soluble in boiling water. Seventy per cent. should be soluble in alcohol (90 per cent.). It should not yield more than 5 per cent. of ash when incinerated. Dose, 5 to 15 grains.

Cera Flava.—Brandt and Ratzeburg, 'Med. Zool.,' vol. ii., tab. xxiv. It should not yield more than 3 per cent. to cold alcohol (90 per cent.), nor more than 50 per cent. to cold ether. The reason for the test given in the B.P., 1885, is now stated, viz., to prove the absence of fatty acids, resin, and Japan wax. Sp. gr. 0·960 to 0·970; melts at 144·5 to 147° F. (62·5 to 63·9° C.). Five grammes of beeswax melted in and mixed with boiling alcohol (90 per cent.), with gentle heat, should require for neutralisation not less than 1·6 C.c. of normal alcoholic volumetric solution of potassium hydroxide, using phenol-phthalein as an indicator. Upon the further addition of 20 C.c. of the volumetric solution, and well boiling for one hour under a reflux condenser, not less than 6·2 nor more than 6·8 C.c. should be found to have combined with the beeswax, as shown by the titration of the uncombined alkali with volumetric solution of sulphuric acid. If 5 grammes of beeswax are heated for fifteen minutes with 25 grammes of sulphuric acid to 320° F. (160° C.), and the mixture diluted with water, no solid wax-like body should separate (absence of paraffin). Beeswax should not yield the characteristic reactions with the test for starch.

Cerevisiæ Fermentum.—Omitted.

Cetaceum.—Brandt and Ratzeburg, 'Med. Zool.,' vol. ii., tab. ix., fig. 3. Nearly insoluble in cold alcohol (90 per cent.). Melting point, 114°·8 to 122° F. (46° to 59° C.). 0·2 gramme dissolved by the aid of a water-bath in 20 C.cm. of alcohol (90 per cent.), 2 drops of solution of phenol-phthalein being added, should not require more than 1 drop of volumetric solution of sodium hydroxide to produce a permanent red colour (limit of acidity). Boiled with alcohol (90 per cent.), and the mixture cooled, and filtered, should not afford a flocculent precipitate on the addition of water (absence of stearic acid).

Cetraria is omitted.

Chirata.—*Swertia chirata*, Ham., Bentl. and Trim., 'Med. Pl.,' vol. iii., pl. 183. Collected when in flower. The description of the root is omitted. Stem slightly winged and much branched above, brown or purplish-brown. Branches slender, elongated, decussate. Leaves

opposite, glabrous, entire, with three to seven lateral veins. Fruit superior, bicarpellary, unilocular.

Chrysarobin.—A substance obtained from araroba by extracting with hot chloroform, evaporating to dryness, and powdering. It consists chiefly of a definite chemical substance also known as chrysarobin, but contains a varying proportion of chrysophanic acid. Colour light brownish-yellow. Entirely soluble in hot chloroform, almost entirely in hot alcohol (90 per cent.), partially soluble in petroleum spirit. In solution of potassium hydroxide it partially dissolves and assumes a deep brownish-red colour. Heated with access of air it melts, giving off yellow fumes, and when incinerated does not leave more than 1 per cent. of ash.

Cinchonæ Cortex omitted.

Cinchonæ Rubræ Cortex.—Bentl. and Trim. 'Med. Pl.,' vol. ii., plate 142. The longitudinal ridges are most marked in the branch bark, with numerous warts running into ridges in the larger pieces; in some varieties furnished with numerous transverse cracks which have not thickened edges. This description suggests that quilled bark, and not shavings, are official. The numerous transverse cracks evidently indicate that Jamaica bark, which is derived from the variety *subpubescens*, may be used.

Cinnamomi Cortex.—Bentl. and Trim. 'Med. Pl.,' vol. iii., plate 224. The iodine test is omitted.

Cocæ Folia.—The dried leaves of *Erythroxylon coca*, Burck., and its varieties (*P. J.* [ser. 3], vol. xxii., p. 818, plate, and 'Bot. Mag.' plate 7334). The leaves imported from Bolivia vary usually from 1½ inch to 3 inches (3 to 7 in.) in length, and from 1 to 3 inches (25 to 30 Mm.) in breadth. They are brownish-green in colour, oval, entire and glabrous, the upper surface bearing a distinct ridge above the midrib, and on either side of it a curved line is almost always distinctly seen. The midrib itself is prolonged into a minute horny apiculus, which, however, is frequently broken off. Most of the epidermal cells on the under surface are seen in transverse sections to project in the form of small papillæ. The slightly bitter taste is succeeded by a sensation of numbness. They should be free from mildew. The leaves imported from Peru are somewhat smaller, narrower, and more fragile than those imported from Bolivia; they are pale green in colour and do not exhibit a prominent ridge above the midrib on the upper surface, nor such distinct curved lines on either side of it on the under surface. The referring of plants so distinct in form, texture, and structure of leaf, as well as in habit of growth, as the Peruvian and Bolivian coca, to one species is difficult to understand, since their distinctive features were carefully pointed out some years ago by the Dutch botanist, Burck. (*P. J.* [3], xxii., p. 817), and the authorities at Kew recognised that the Peruvian form is distinct from the typical plant of Lamarck by giving it a varietal name. The leaves so rapidly lose alkaloid when exposed to air and moisture that the requirements demanded are very necessary. The illustration given in the 'Bot. Mag.' is that of *E. novo-granatensis*, Morris. As a matter of fact the leaves of typical *E. coca*, Lam., are not obtainable in commerce. The commercial leaves are those of *E. bolivianum*, Burck., and *E. novo-granatensis*, Morris.

Coccus.—The dried fecundated female insect. Brandt and Ratzeburg, 'Med. Zool.,' vol. ii., tab. xxvi. Reared on *Nopalea coccinellifera*, Salm-Dyck, 'Mart. Fl. Bras.,' vol. iv., pt. ii., tab. lx., and on other species of *Nopalea*. Incinerated with free access of air it should not yield more than 6 per cent. of ash. The limit of ash given in the last edition was 1 per cent.; the allowance for impurities is, therefore, a very liberal one.

Colchici Cormus.—Collected in early summer. Dose: 2 to 5 grains.

Colchici Semina.—Minutely pitted. The endosperm is oily; its cells are seen in transverse section to have thickened walls with large pits.

Colocynthidis Pulpa.—Only traces of fixed oil should be removed from it by ether. It yields, when dried at 212° F. (100° C.) and incinerated, at least 9 per cent. of ash (indicating absence of seeds). It is very difficult to remove the seeds completely from the pulp when dealing with large quantities. The B.P. test for ash allows for the presence of about 10 per cent. of seeds, which seems to be reasonable.

Conii Folia.—Odour resembling that of mice. The ultimate divisions of the leaves terminate in smooth colourless horny points. These serve to distinguish the leaf from that of *Æthusa Cynapium*, which, however, from growing in different situations from hemlock, is less likely to be mixed with it than the hairy leaves of species of *Chærophyllum*, which grow in similar places.

Conii Fructus.—The endosperm is deeply grooved on the commissural surface.

Copaiba.—The sp. gr. varies from 0·916 to 0·993. The test that after removal of the volatile oil the rasidue is hard and easily rubbed to powder, is explained as indicating the absence of fixed oils. The volatile oil should be present to the extent of at least 40 per cent. and should rotate the plane of a ray of polarised light from 28° to 34° to the left (absence of African copaiba) and should not boil under 482° F. (250° C.). Two drops dissolved in 20 parts of carbon bisulphide and a drop of cooled mixture of equal parts of nitric and sulphuric acid added, a transient violet colour is not produced (absence of gurjun balsam). Four drops of copaiba carefully added to a mixture of half an ounce of glacial acetic acid with four drops of nitric acid, should not afford a reddish or purple colour (absence of gurjun balsam).

Coriandri Fructus.—Primary ridges wavy and inconspicuous, secondary ridges straight and more prominent.

Crocus.—Dried saffron, incinerated with free access of air, does not deflagrate, and yields about 7 per cent. of ash. It should not lose more than 12·5 per cent. of moisture when dried at 212° F. (100° C.)

Cubeba Fructus.—'Kew Bullctin,' Dec., 1887, p. 3. Nearly globular, sometimes depressed at the base, Pericarp abruptly prolonged at the base into a slender stalk, which is about one and a half times the length of the globular portion; within it is a single seed attached by the base. A transverse section of the pericarp exhibits two layers of sclerenchymatous cells, one near the outer the other near the inner surface, those of the latter being radially elongated. The crushed fruit imparts a crimson colour to sulphuric acid (presence of cubebin). Dose 30 to 60 grains. The words "sometimes depressed at the base" might have been omitted, as this is a feature of small immature fruits.

Cusparіæ Cortex.—The dried bark of *Cusparia febrifuga*, D.C. Four to five inches (10 to 12 Cm.) long and about an inch (25 Mm.) wide and 1/12 inch (2 Mm.) thick. A transverse section exhibits numerous cells filled with acicular crystals of calcium oxalate and small oil glands, but seldom any sclerenchymatous tissue other than small isolated groups of bast fibres.

Cusso.—*Brayera anthelmintica*, Kunth. The inner whorl of calyx segments is curved inward over the young fruit, and shrivelled.

(*To be continued.*)

CORRECTIONS TO FORMER NOTES.

The British Pharmacopœia, 1898.—The following is a list of misprints and omissions that have been noted in the summary of the new B.P. formulæ and processes, published last week. Though not material except in some three or four instances, they are all indicated in order that readers may mark their copies accordingly, and so prevent any risk of error. This is the more necessary, since the summary is being largely utilised—in accordance with the idea with which it was compiled—as a guide in the preparation of the new and altered galenicals. All the corrections are embodied in the reprints referred to on page 398.

Ext. Aloes Barb.—Delete the word "evaporated" from line 2.
Ext. Belladonnæ Liq.—For "not" in line 15 read "next."
Ext. Opii.—The dose should read "¼ to 1 grain."
Ext. Sarsæ Liq.—Delete the sentence beginning on line 6.
Liq. Hydrogenii Perox.—Read "peroxide" after "hydrogen."
Podophylli Resina.—For "distilled" in line 2, read "alcoholic."
Spirit. Ætheris Co.—Delete the word "with" from line 3.
Spirit. Rectificatus.—For "of" in line 2, read "for."
Syr. Sennæ.—Read "20 p. c. alcohol," not "90 p. c.," in line 1.
Tinct. Jalapæ.—The quantity of jalap powder is 4 parts.
Tinct. Kino.—For "not" in line 2 read "rub."
Tinct. Quininæ Ammon.—Read quinine sulphate, "2," not "1."
Pil. Saponis Co.—The dose should read "2 to 4 grains."
Syr. Zingiberis.—Read "ginger, in fine powder, 0·5," not "1."
Tinct. Lobeliæ Æth.—The percolate should measure 20 parts.
Tinct. Pruni Virgin.—The quantity of alcohol is 12·5 parts.
Tinct. Senegæ.—The quantity of senega root is 4 parts.
Ung. Aconitinæ.—Read lard "410," not "140."
Ung. Potassii Iodidi.—The quantity of lard is 400 parts.

The following paragraph was also inadvertently omitted:—

Pilula Scammonii Composita.—The strong tincture of ginger and rectified spirit are replaced by an equal volume of the new tincture of ginger. Dose: 4 to 8 grains.

THE CHEMICAL MATERIA MEDICA OF THE NEW B.P.

THE chemistry of the Pharmacopœia presents many features of novelty which have been introduced in conformity with modern usage and scientific advance. But even a cursory review of these changes conveys the impression that in some instances they represent theoretical or writing-desk science, rather than practical acquaintance with the subjects referred to. In defining substances corrected data are given for many of the physical characters, and the nomenclature now used by chemists to indicate constitution has been adopted in some instances. Thus the alkalies and analogous substances are now termed hydroxides; alcohol is named ethyl hydroxide; but the principle is not extended to ammonia or to carbolic acid, which is now distinguished by the name phenol, or to water, for which the familiar name is retained without any reference to its chemical constitution. The acids are now described as hydrogen salts, and in some instances their constitution is illustrated by formulæ, the other salts of particular acid radicles being distinguished according to the metal or base they contain, as sodium acetate, calcium acetate, atropine sulphate, and so on. These innovations apply only to the vernacular names, and not to the Latin titles, of which the new names are synonyms rather than translations.

The literature of chemistry and chemical technology being now so readily accessible, descriptions of the sources of official chemical substances and the modes of preparing them are to a great extent rendered superfluous in a Pharmacopœia: consequently those details have been in many instances omitted, though perhaps less completely than was desirable. Thus, for example, the information that sulphuric acid is produced by the combustion of sulphur or that ammonium bromide may be formed by neutralising hydrobromic acid with solution of ammonia appears to be scarcely necessary or quite consistent with the knowledge of chemistry presupposed by the description of acids as hydrogen salts. In connection with most chemical substances, the characters and tests by which they may be identified and their freedom from impurity determined, are described more fully either in the several paragraphs or by reference to methods of testing for particular substances given in the Appendix in order to save repetition. In both cases the descriptions given are likely to prove as insufficient for instructing the inexperienced as they would be superfluous for the practical chemist.

For the purposes of volumetric testing the metric system has been adopted in the manner that has become customary with analysts, the solutions being made up to the volume of one kilogramme of water at 15°·5 C., sub-divided into one thousand parts described as cubic centimetres. This is entirely a conventional proceeding, and though vessels graduated in that manner are suitable for the purpose in view, they are not really metric measures. Thus, for instance, a flask gauged to measure one kilogramme of water at 15°·5 C. is not strictly speaking a "one-litre flask," though it is so described and the one-thousandth part of its capacity is something more than a millilitre. Any other convenient volume than that of a kilogramme of water at 15°·5 C. might be adopted for making volumetric solutions, and for subdivision in gauging and graduating vessels for volumetric analysis and the practical advantage of taking the volume of a kilogramme of water at 15°·5 C. consists in its being a definite standard. There is, however, some reason to regret that the use of volumetric solutions made up to the volume of ten thousand grain measures has now been officially superseded by solutions that are to be measured in nominal cubic centimetres, since the grain is a unit that is, in many respects, very well adapted for medical and pharmaceutical purposes, and is preferable to the gramme or its volume equivalent.

In the definitions of the several mineral acids there has been but little alteration. In the cases of the hydrobromic, hydrochloric, hydrocyanic, phosphoric, sulphurous, chromic, citric, tartaric, and tannic acids processes of preparation are omitted. The melting point of phenol is given somewhat higher, 102° F. (38°·8 C.), and the boiling point lower, 359°·6 F. (182° C.). Under the head of citric acid a new test is described as giving indications of the presence of tartaric acid which is not calculated to inspire confidence. The specific gravity of oleic acid is changed to 0·890-0·910. The melting point of salicylic acid is now given as 312°·8 to 314°·6 F. (156° to 157° C.).

The dilute acids are unaltered, and they continue to lack the convenient uniformity in strength which obtains in these preparations according to the United States Pharmacopœia.

One of the first omissions noticeable in the new Pharmacopœia is ACETUM, its place being supplied by diluted acetic acid, which is very appropriately ordered to be used in the preparation of the several official vinegars. Some of the more doctrinaire public analysts will probably lament the removal of the official definition as a loss of one of the landmarks of their order. The adoption of a similar proceeding in regard to the official wines, and the substitution of dilute alcohol as a medium in place of sherry or the still more questionable orange wine, would probably be beneficial so far as concerns the uniformity and general character of the preparations.

ACONITINE is defined as an alkaloid having the formula $C_{33}H_{45}NO_{12}$, but no authority is given for the doubtful statement. The process of preparation has been wisely omitted, and the melting point is given as 372°·2 to 374° F. (189° to 190° C.)

The formula now given for ALOIN from Barbados aloes is $C_{16}H_{16}O_7 3H_2O$.

APOMORPHINE HYDROCHLORIDE is now stated to be soluble in 50 parts of water and to be more soluble in alcohol of 90 per cent. If the salt imparts an emerald-green colour to 100 parts of water after shaking the mixture it is to be rejected.

ARAROBA is now described as crude chrysarobin, soluble in hot chloroform to the extent of not less than 50 per cent.

CHRYSAROBIN is described as a substance obtained from araroba by extracting with hot chloroform, evaporating to dryness, and powdering. Chrysarobin so obtained would be a crude product, not comparable with commercial chrysarobin of good quality. This is another instance in which wisdom would have been shown by the omission of a method of preparation.

ATROPINE is described as melting between 239° to 240° F. (115° to 115°·5 C.), soluble in 300 parts water, freely soluble in alcohol, ether, or chloroform.

The characters of ATROPINE SULPHATE are more fully described, and its melting point is given as 361°·4 F. (183° C.)

COCAINE is described as melting at 204°·8 to 208°·4 F. (96° to 98° C.), the hydrochloride as melting at 356° to 366°·8 F. (180° to 186° C.), and not readily soluble in ether. Several tests are described, but the one recommended by Maclagan, which gives the most useful indication of purity, is not mentioned.

For detecting in CODEINE the presence of morphine a strong solution of the hydrochloride acidulated is to be tested with ferric chloride and very dilute potassium ferricyanide, without giving a blue colour.

CODEINE PHOSPHATE is described as a crystalline salt soluble in four parts of water and less soluble in alcohol.

ELATERIN in described as sparingly soluble in alcohol, and readily soluble in chloroform.

GLYCERIN is described as a trihydric alcohol having the formula $C_3H_5(OH)_3$ of 1·26 specific gravity, and an improved mode of testing for arsenic is given.

HOMATROPINE HYDROBROMIDE is described as the salt of an alkaloid prepared from tropine.

HYOSCINE HYDROBROMIDE, $C_{17}H_{21}NO_4HBr3H_2O$, is described as the crystalline salt of an alkaloid existing in hyoscyamus leaves and yielding a gold salt melting at 388°·4 F. (198° C.).

SCOPOLAMINE HYDROBROMIDE is given as a synonym of this salt.

HYOSCYAMINE SULPHATE, $(C_{17}H_{23}NO_3)_2 2H_2O$, the salt of another alkaloid existing in hyoscyamus leaves and possibly in other solanaceous plants. Melting point 402°·8 F. (206° F.), distinguishable from atropine by the crystalline form of the gold salt deposited from solution in boiling water acidulated with hydrochloric acid.

The processes of preparing morphine acetate and morphine hydrochloride are omitted, and the salts are described as compounds of an

alkaloid obtained from opium. Morphine tartrate is now official in place of the sulphate.

Betanaphthol, $C_{10}H_7OH$, is described as melting at 251°·6 F. (122° C.), and tests are given for ascertaining the absence of the corresponding alpha compound.

Phenacetin.—The solubility in alcohol (90 per cent.) is given as 1 in 20.

Phenazone.—The melting point is now given at 235°·4 F. (113° C.).

Physostigmine Sulphate introduced in place of the alkaloid.

Picrotoxin described as melting at 378° F. (192°·2 C.).

Pilocarpine Nitrate, $C_{11}H_{16}N_2O_2HNO_3$, described as a white crystalline powder slightly soluble in cold alcohol.

In addition to the quinine salts hitherto official acid quinine hydrochloride, $C_{20}H_{24}N_2O_2 2HCl 3H_2O$, is now introduced and described as a white crystalline powder soluble in less than its own weight of water.

Salol, or phenyl-salicylate, $C_6H_4{\cdot}OH{\cdot}COO{\cdot}C_6H_5$, is described as melting at 107°·6 to 109°·4 F. (42° to 43° C.).

Sulphonal, described as dimethyl-methane-diethyl-sulphone, melting point 258° F. (125°·5 C.).

Terebene is described as a mixture of dipentene and other hydrocarbons obtained by the action of sulphuric acid on turpentine oil. Specific gravity ·862 to ·866, non-rotatory, and distilling between 312°·8 and 356° F. (156° and 180° C.).

In place of processes for making ether, acetic ether, absolute alcohol, and chloroform, the definitions of these substances are accompanied by statements of tests by which the absence of various probable impurities may be ascertained. The specific gravity of absolute alcohol is given more correctly as 0·794 to 0·7969. In the definition of chloroform the specific gravity is now given as 1·490 to 1·495, and the boiling point between 140° and 143°·6 F. (60° to 62° C.).

Creosote is defined as a mixture of guaiacol, creosol, and other phenols; the specific gravity not less than 1·079 and distilling between 392° and 428° F. (200° to 220° C.).

Spirit of Nitrous Ether is to have a specific gravity of 0·838 to 0·842, and the proportion of nitric oxide it is to yield is not to be much less than five times its volume, even after being kept for some time. A solution of ethyl nitrite in a mixture of absolute alcohol and glycerin has also been introduced, which is to contain not less than 2·5 per cent. by weight of ethyl nitrite after being kept, or five-sixths of the original amount.

There are now three kinds of official Paraffin, the solid melting at 130° to 135° F. (54°·4 to 57°·2 C.); the soft paraffin melting at 96° to 102° F. (35°·5 to 38°·9 C.), and free from smell when heated to 120° F.; and liquid paraffin of 0·885 to 0·890 specific gravity, boiling point not less than 689° F.

The application of chemical treatment in the preparation of extracts, etc., with the object of regulating their medicinal potency as measured by the amount of certain constituents of the drugs represented, may fairly be regarded as the first step towards the eventual abolition of galenical preparations that may become possible as well as desirable whenever the action of drugs and medicinal agents is sufficiently well understood. This method of standardising has now been extended to preparations of belladonna and ipecacuanha, so far as determination of the total alkaloid of those drugs is an indication of the therapeutic strength of their preparations, and in the case of nux vomica an improvement has been introduced in the standardising of the extract on the basis of a definite amount of strychnine.

Iron and Quinine Citrate is required to contain 15 per cent. of alkaloid, as ascertained from the weight of the residue (dried at 120° C.) from the ether solution of the precipitate produced by ammonia in a solution of the citrate. This "precipitate" is to be almost entirely soluble in a little "purified" ether, and when neutralised by sulphuric acid it should answer to the characters of and tests for quinine sulphate.

The test for Starch in Catechu by the iodine reaction is now wisely omitted, as the ordinary test for starch is not applicable to catechu, but it would have been as well to have been more definite than merely to state that catechu should not afford any characteristic reactions with the tests for starch.

Pepsin is directed to be tested by what is essentially the method of the United States Pharmacopœia, and by this test it should dissolve 2500 its weight of hard-boiled white of eggs. The test occupies 6 hours, and is a very tedious one. The old B.P. test modified as to shaking, as described in the Journal, gives results in 30 minutes, that are in every way satisfactory when the operation is intelligently performed. The chief requirement was to raise the proteolytic standard of pepsin to 200 or 250, which would be about equal to 2400 to 3000 under the new directions.

The synonym of Spiritus Ætheris Nitrosi is now given as sweet spirit of nitre, a definition that will help to nullify the defence, formerly urged in many prosecutions under the Food and Drugs Act, that the old sweet spirit of nitre is not the same thing as spirit of nitrous ether.

The botanical characters of Coca Leaves are minutely described, but no mention is made as to the amount of alkaloid that they should contain, or if any, though the amount of alkaloid in coca leaves may vary from 0 to $1\frac{3}{4}$ per cent.

Liquid Extract of Ipecacuanha is to be prepared by extraction with alcohol of 90 per cent.; the marc is then to be mixed with 10 per cent. of lime, and the percolation with alcohol continued. After concentrating by distillation, and determining the amount of alkaloids in the final product, it is to be diluted with 90 per cent. alcohol so as to contain 2 to $2\frac{1}{4}$ grains of the alkaloids in 110 minims or 2 to $2\frac{1}{4}$ grammes in 100 C.c.

Pilocarpine Nitrate is vaguely described as the nitrate of an alkaloid obtained from jaborandi leaves. The characters and tests are not sufficient to discriminate between this nitrate and other nitrates shown to be obtainable from jaborandi. It would have been better to prescribe a fixed melting point so as to exclude an admixture of pilocarpidine nitrate, or salts of other bases.

In the Opium Test the use of morphinated water for washing the crystals is introduced and the crystals of morphine are to be titrated. The weight of pure anhydrous morphine indicated by the titration plus 0·104 gramme—representing the average loss of morphine during the process (from 10 grammes of opium)—should amount in total to 1 gramme, that is to say to a total of not less than 0·95 gramme, and not more than 1·05 gramme, corresponding to about 10 per cent. of anhydrous morphine in the dry powdered opium. It will be noticed that a correction is now made for the solubility of morphine and it is implied that the crystals so obtained will contain no impurity such as lime that would be likely to neutralise the sulphuric acid in the titrating operation.

The test for the purity of Quinine Sulphate has been altered, but it is still only an empirical test. It consists in dissolving 4 grammes of the quinine sulphate in 120 C.c. of boiling water, then cooling the solution to 50° C. only, and filtering. This would leave so much quinine salt in solution that the presence of cinchonidine would be to a very considerable extent masked, and rendered unrecognisable at a later stage.

The next step in the process—reducing the solution to 10 C.c., and shaking with 10 C.c. of "purified" ether and 5 C.c. of solution of ammonia—is still more unsatisfactory, on account of the large quantity of solvent that is directed to be used—sufficient to dissolve and retain in solution a considerable quantity of cinchonine even without the assistance of the superabundance of quinine introduced in the first stage of the test. It is stipulated that the crystals separating from ether should not amount to more than 0·12 gramme—that is to say, 3 per cent. of the sulphate tested. Under the conditions prescribed 0·12 gramme of crystals separated will represent only a fraction of the cinchonidine present, and the point naturally suggested is how much cinchonidine would be passed by this test. It is questionable, therefore, whether it would not have been better to have retained the old stipulation that "sulphate of quinine should not contain much more than 5 per cent. of sulphates of other cinchona alkaloids."

Resorcin as a Local Anæsthetic.—Vialle obtained very favourable results in the treatment of a very painful case of stomatitis of the lips, following a rash. The patient was a child of five years. The lips were swollen, coloured blue, and crusted over with black spots. Every movement caused such pain that the patient could not even be induced to take liquid nourishment. The author prescribed frequent irrigation of the mouth with lime water, and painting with resorcin in 1 to 6 aqueous solution. The resorcin only produced a brief burning sensation, and then remained on the lips for a considerable time as a white powder. The paintings were carried out five to six times a day. The first application greatly alleviated the pain, and all suffering entirely disappeared after the fourth dressing, the exudation ceasing after two days, a regular buccal desquamation taking place. The urine gave characteristic reactions for resorcin in a few hours.—*Journ. für Zahnheil*, xii., No. 34, 1.

NOTICES OF BOOKS.

'THE LATIN GRAMMAR OF PHARMACY,' by Joseph Ince (London: Baillière, Tindall and Cox. 5*s.*), has reached its seventh edition, which comes in the now familiar yellowish cover, with such improvements as have been found possible in connection with a book that hardly admitted of improvement. Mr. Ince, however, has found it necessary to re-construct and considerably enlarge the original grammar, sections illustrating every variety of medical formulæ have been introduced, an English-Latin vocabulary has been added, and the work has now become a veritable compendium of Latin medicine and pharmacy. In view of the growing ignorance of Latin amongst medical men and pharmacists, this new edition of a classical text-book should be cordially welcomed, the more especially as there is no better work on the subject extant.

'A SHORT GUIDE TO THE NEW BRITISH PHARMACOPŒIA,' by John C. Umney (London: Wright, Layman and Umney. 1*s.*) is the next best account of the changes to be effected by the work commented on, to the articles now appearing in the *Pharmaceutical Journal*, and it is nothing short of marvellous how a book so free from errors could have been produced so shortly after the 1898 Pharmacopœia was rendered accessible to the public. Within less than a week—which included Good Friday, a Sunday, and a Bank Holiday—the author managed to produce as exhaustive an account of the new B.P. as is possible in the space occupied, and there is no doubt the pamphlet will prove exceedingly useful to anyone who may have occasion to refer to it.

'PRACTICAL RADIOGRAPHY,' by A. W. Isenthal and H. Snowden Ward, F.R.P.S. (London: Dawbarn and Ward. 2*s.* 6*d.* net), is not a new book, but the fact that the earlier edition appeared when the subject of which it treats was less than six months old, has rendered it necessary to re-write it completely. It is now a well-printed, well-illustrated, and exact historical record of the subject, containing very full descriptions of the numerous forms of apparatus used in radiography, whilst manipulation is not neglected, and the varied applications of the so-called X-rays are fully treated of. No one who is interested in or working at the subject of radiography can afford to be without the book, nor having purchased it is he likely ever to regret having done so.

THE 'DICTIONARY OF NATIONAL BIOGRAPHY' is nearing completion, and two supplementary volumes of the work are to be issued. As our readers are doubtless aware, the biographies of living persons are not inserted in that work, but in order to include the names of those persons whom death has qualified for admission during the progress of the publication, extra volumes are required. The first part of a list of names intended to be inserted contains, amongst many others, those of Robert Bentley and Henry Bowman Brady.

THE 'REVUE DES MÉDICAMENTS NOUVEAUX,' by C. Crinon (Paris: Rueff et Cie. 4 francs), is an excellent little book of its class, and the fifth edition now before us is no whit behind its predecessors in regard to details respecting novel medicaments. Its four hundred pages are crammed with useful information concerning new remedies, and a translation of the book should have a wide sale in this country.

ALCOHOLIC MENSTRUA OF THE NEW PHARMACOPŒIA.

BY F. C. J. BIRD.

The strength of the standard alcohol of the Pharmacopœia having been increased by the revisers of the new edition from 56 o. p. to 58 o. p., chemists and druggists will shortly be faced with the necessity of requiring to convert rectified spirit of either strength into alcohol of various degrees of dilution. To facilitate matters the following table is published, as it gives the approximate quantities (sufficiently exact for all practical purposes) of rectified spirit 56 o. p., or alcohol 90 per cent., and water, required to form either 1 gallon or 1 litre of the alcoholic menstrua of the new Pharmacopœia. If the proportions requisite to produce a given bulk of diluted alcohol, after contraction has taken place, are known, further measurement is unnecessary, and generally the method of dilution to a unit volume will be found more convenient than the addition of water to a unit volume of strong alcohol, as indicated officially.

Menstrua, B.P., 1898.	Spt. Rectificatus (56 o. p.), B.P. 1885.		Spt. Rectificatus (Alcohol, 90 p. c.), B.P. 1898.		Product, Sp. Gr., and Proof Strength.		
	S.V.R., 56 o. p.	Water.	Alcohol, 90 p. c.	Water.	Product.	Sp. Gr.	Proof Degs.
Alcohol, 90 p. c. .	142¼ f.oz. 889 C.c.	18 f. oz. (absol'te alcohol) 112 C.c. (absol'te alcohol)			1 gall. 1000 C.c.	·834	40 o. p.
Alcohol, 90 p. c., 7 vol. Water, 1 vol.	144¾ f.oz. 903 C.c.	17¼ f. oz. 108 C.c.	142½ f.oz. 889 C.c.	19½ f. oz 123 C.c.	1 gall. 1000 C.c.	·864	40 o. p.
Alcohol, 70 p. c. .	126¼ f.oz. 789·2 C.c.	36½ f. oz. 228·5 C.c.	12[illegible]f.oz. 777·7 C.c.	38¾ f. oz. 241·6 C.c.	1 gall. 1000 C.c.	·890	22 5 o. p.
Alcohol, 60 p. c. ..	108¼ f.oz. 676·4 C.c.	55½ f. oz. 346·3 C.c.	106¾ f.oz. 666·6 C.c.	57¼ f. oz. 357·3 C.c.	1 gall. 1000 C.c.	·913	5·5 o. p.
Alcohol, 45 p. c. .	81¼ f. oz. 507·5 C.c.	83 f. oz. 518·4 C.c.	80 f. oz. 500 C.c.	84¼ f. oz. 526·6 C.c.	1 gall. 1000 C.c.	·943	21 u. p.
Alcohol, 20 p. c., 2 vol. Alcohol, 45 p. c., 1 vol.	53½ f. oz. 334 C.c.	109¾ f.oz. 686·3 C.c.	52¾ f. oz 328·8 C.c.	110¾ f.oz. 692 C.c.	1 gall. 1000 C.c.	·966	49 u. p.
Alcohol, 20 p. c. ..	36 f. oz. 225·5 C.c.	126 f. oz. 787·3 C.c.	35 f. oz. 222·2 C.c.	126½ f.oz. 791 C.c.	1 gall. 1000 C.c.	·976	65 u. p.

The above calculations are based on a percentage of 88·7 by volume of alcohol in Spiritus Rectificatus, B.P. 1885, and in the table the quantities of alcohol and water required to produce 1 gallon of the required dilute spirit are first given, the quantities required to produce 1 litre being given below. The special mixture of 20 per cent. alcohol (2 vols.) and 45 per cent. alcohol (1 vol.) is that required in the preparation of Liquor Senegæ Concentratus.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australasia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office: 5, SERLE STREET, W.C.

LONDON: SATURDAY, APRIL 23, 1898.

THE GENERAL MEDICAL COUNCIL AND THE BRITISH PHARMACOPŒIA.

In view of censorious comments that have been made with regard to the manner in which the officials of the General Medical Council have carried into effect the desire of that body to do all that was possible to disseminate full information regarding what is novel in the British Pharmacopœia, 1898, in advance of the publication of that work, it seems desirable that the *Pharmaceutical Journal*, as representative of all that is best in British pharmacy, both as a profession and as a trade, should acknowledge the great debt of gratitude which the craft owes, in this matter, to the governing body of the medical profession. Whether with sufficient reason or not, there is a wide-spread impression that the moment a new pharmacopœia is advertised in the London, Edinburgh, and Dublin Gazettes, the work at once replaces the edition formerly in use, and its formulæ and processes become authoritative. Assuming that to be the case, it is not difficult to conceive that inconvenience might easily arise if no inkling of the changes authorised by a new pharmacopœia could be obtained until the book was actually published. That being so, no one can reasonably object to our tendering grateful thanks, on behalf of the whole pharmaceutical body, for the very great service rendered by permitting the contents of the new Pharmacopœia to be made public well in advance of the date when the book will become authoritative. In taking that step the medical authorities were probably influenced by representations made to them by the President of the Pharmaceutical Society, and also by the Editor of this Journal, some months ago, long before the idea had been mooted publicly. But, be that as it may, the effect is the same, the General Medical Council has granted a considerable boon to pharmacists, and they should be grateful inasmuch as they have been enabled to profit thereby.

Regarding the time of distribution of the advance copies sent to the press, it cannot be denied that considerable inconvenience was caused by the fact that the volumes were delivered just on the eve of the Easter holidays, and though at most that was probably due to an error of judgment, those who suffered in consequence look back with no pleasanter recollections on that account to the interference with what is usually a period of rest from toil. So far as can be gathered, the press copies were despatched on Wednesday afternoon of Good Friday week, and the letters announcing the fact —stated to have been sent off by the same post—arrived at their destination the same evening. Journals, therefore, which went to press on Thursday afternoon, had some twelve hours or more in which to prepare advance notices for publication the same week. Unfortunately, in one or two instances, even that brief space of time was not available, for those journals had already gone to press when the book arrived. The conductors of those organs have our deepest sympathy in the matter, and we are cordially at one with them in thinking that this is one of the things that might have been better done otherwise. Such brief intervals of rest from their labours as journalists usually enjoy should not be thoughtlessly encroached upon, and we fail to see that anyone would have suffered disadvantage had the delivery of advance copies of the 1898 Pharmacopœia been more conveniently arranged. As matters were, directly after the publication of the general review of the book in our issue of April 9, the holidays intervened, and not until the following Tuesday could any portion of our summary published last week be got into type. Accordingly, the time available for composing and correcting the article was only forty-eight hours, and it is wonderful, under the circumstances, how few inaccuracies crept into the twelve pages of matter bristling with facts and figures. After all, however, this is but a minor grievance, and it is only aired now—for the journalist is extremely patient and long-suffering—because it may serve, in some degree, as an apology for certain shortcomings in our presentation of facts concerning the new national medicine book, which were painfully obvious to those responsible for the conduct of the Journal, if not so evident to readers.

The moral of the whole question appears to be that there is a great deal of unnecessary secrecy observed with regard to the work of pharmacopœia revision in this country. That revision is public work, and it does not appear unreasonable to suggest that the outcome of the revisers' labours should be made public without any delay. Whenever a decision is arrived at on any matter of principle in connection with the Pharmacopœia, or with regard to any formula or process, there is surely no reason to keep that decision secret for months or years. Indeed, were a monthly or quarterly report issued to the press by the revisers, showing what progress had been made, the result would be to secure the thorough trial and criticism of all proposed new or altered formulæ and processes, in a way that would be to the advantage of all concerned. The long drawn out and detailed criticism that now, on the publication of a new pharmacopœia, overwhelms the world of pharmacy like a second deluge, would spend itself in advance of publication, and the result would be the issue of a pharmacopœia embodying the united wisdom and skill of the world of pharmacy for the time being. Another suggestion is that if an annual or biennial addendum to the Pharmacopœia were published by the General Medical Council, and if successive reprints of the book incorporated all the additions and alterations suggested by experience, there would never be any need for such a great wrench as is caused by an almost entire upheaval of the practice of prescribers and dispensers once in every ten or fourteen years. Failing that, let us have a revised pharmacopœia every five years at least, and let the task of revision be so supervised as to secure the indispensable assistance of pharmaceutical as well as medical authorities, while eliminating all possibility of affording trade advantages which may be considered unfair.

ANNOTATIONS.

THE BRITISH PHARMACOPŒIA (1898) SUMMARY published last week was naturally printed under difficulties, owing to the pressure caused by the Easter holidays, and several obvious misprints crept into the details of the formulæ and processes there given. There were few of any importance, but, for the sake of accuracy, a list of all that seem worth noticing is printed on page 404, in order that copies of the Journal may be duly corrected. In response to requests by readers, the subject matter of the above-mentioned article on the preparations of the new Pharmacopœia has now been carefully revised and reprinted in a suitable form for distribution by chemists amongst their medical friends. Single copies of the book will be sent post free on receipt of 4*d.* in stamps, whilst for quantities the price will be 3*s.* per dozen, 18*s.* per hundred, or £7 10*s.* per thousand. Orders should be sent without delay, addressed to the Publishers, Pharmaceutical Journal, 5, Serle Street, Lincoln's Inn, London, W.C.

THE ALCOHOL STRENGTHS OF THE NEW B.P. continue to attract the attention of many readers, who are naturally anxious to know how they may readily convert their existing stocks of rectified spirit into alcohol of lower percentage. The table compiled by Mr. F. C. J. Bird, whose work can at all times be thoroughly depended upon, and printed at page 386, should therefore prove extremely useful at the present time. In any case the simpler plan would appear to be first to reduce the rectified spirit, whether 56 o. p. or stronger, to 70 per cent. alcohol (s. g. 0·890). This can then readily be reduced to 60, 45, or 20 per cent. alcohol by adding the required volume of water, thus :—

100 vols. of 70 p. c. alcohol + 22·60 distilled water = 60 p. c. alcohol.
100 vols. ,, ,, + 74·29 ,, = 45 ,,
100 vols. ,, ,, + 324·75 ,, = 20 ,,

In the following useful table, published by Mr. J. C. Umney, the original percentages by volume of alcohol are placed at the head of the columns, and those to which they are required to be reduced are indicated in the first column, the quantity of water to be added to 1 litre being first given, and then the quantity to be added to 1 gallon :—

	90 p. c.	70 p. c.	60 p. c.	45 p. c.
70 p. c.	310 C.c. 49·5 fl. oz.			
60 p. c.	536 C.c. 86 fl. oz.	175 C.c. 28 fl. oz.		
45 p. c.	1053 C.c. 168 fl. oz.	577 C.c. 92 fl. oz.	344 C.c 54 fl. oz.	
20 p. c.	3558 C.c. 568 fl. oz.	2525 C.c. 404 fl. oz.	2014 C.c. 322 fl. oz.	1250 C.c. 200 fl. oz.

If it be desired to produce a definite volume of some weaker alcohol from 56 o p spirit, the quantity of the latter required in each case will be approximately as given in the following table, the quantities given being based on those in Mr. Bird's more elaborate table at page 396.

78·92 vols. 56 o p. alcohol + 22·85 distilled water = 100 of 70 p c alcohol
67 64 vols. ,, ,, + 34 63 ,, ,, = 100 of 60 ,, ,,
50·75 vols. ,, ,, + 51 84 ,, ,, = 100 of 45 ,, ,,
22·55 vols. ,, ,, + 78 73 ,, ,, = 100 of 20 ,, ,,

Of course, the water to be added need not be measured ; all that is necessary being to measure the required volume of 56 o.p. spirit and add sufficient water to make the product measure 100 volumes, but that will necessitate waiting for the mixture to cool to 15°·5 C. before the volume can be finally adjusted. To raise the strength of 56 o.p. spirit to 90 per cent. by volume, it will probably be found most convenient to mix it with about an equal volume of 60 o. p. spirit, and then adjust. In all cases, it should be needless to say, the strength ought to be finally adjusted after cooling and determining the specific gravity of the mixture at 15° 5 C , unless the exact quantities required to produce a definite result are known.

THE MAJOR EXAMINATION RESULTS (London) published last week were about the usual average (*vide* Dr. Stevenson's report, p. 348), but yet far from what they ought to be. The larger proportion of failures at this examination usually occurs amongst students who have not been educated at the Pharmaceutical Society's School, and the present occasion is no exception to that rule, as the following table clearly shows :—

	Candidates.	"Square" Men.	Other Candidates
Candidates examined ..	39	17	22
,, failed	18	3	15
,, passed	21	14	7
Percentage of passes ..	53·8	82·3	31·8

These figures afford conclusive evidence of the advantage to candidates of a systematic college course of instruction, and the non-successful would do well to note that fact.

TICKETS FOR THE ANNUAL DINNER of the Members of the Pharmaceutical Society and their friends, to be held on Tuesday, May 17, are now ready, and Mr. Richard Brembridge, Secretary to the Annual Dinner Committee, will be glad to hear as early as possible how many will be required by those intending to be present, and the names of the gentlemen for whom they are intended. It will assist the Committee and ensure friends being seated together if the Secretary is instructed what to do in the matter, but he stipulates that applications for tickets, accompanied by remittances, must be in his hands not later than Saturday, May 14, in order to enable him to make the necessary detailed arrangements. The price of the tickets is one guinea each.

WIRELESS TELEGRAPHY, so-called, has been the subject of experiments in the Solent during the last few months. two stations having been fitted up under the direction of Signor Marconi, one at Bournemouth and the other at Alum Bay in the Isle of Wight. Between those places, which are about 14½ miles apart, regular communication has been maintained without the use of any intervening connecting wires, so the *Times* reports, whilst on occasion an even greater distance has been traversed, for with portable instruments temporaily set up on the cliffs at Swanage it has been found possible to communicate with the station at Alum Bay, nearly 18 miles away. Signor Marconi is now making the necessary arrangements for exchanging signals with Cherbourg, a distance of some 60 miles. The instruments employed consist externally of a tall mast, some 120 feet high, from which depends a metallic conductor, which is either a simple wire or a narrow strip of ordinary wire netting. The transmitter consists of an induction coil capable of giving an 8-inch or 10-inch spark, an appropriate battery, and a key to control the current. The receiving instrument consists of a coherer, a relay, and a Morse printer. The coherer, which detects the presence of the electric waves that travel through space from the sending station, is a short piece of glass tubing into which are sealed two silver pole-pieces. Between these there is a narrow space containing silver and nickel filings, and the whole is exhausted of air so as to prevent oxidation of the filings and consequent impairment of th eirconductivity. These pole-pieces are included in an electrical

circuit with the relay and a single cell, and in addition, one of them is connected with the external conductor and the other with the earth. Normally the coherer does not conduct a current. But by virtue of some action which is not yet fully understood, under the influence of an electric wave this condition is altered, and a current enabled to pass through the filings between the pole-pieces. The armature of the relay is then attracted and the Morse printer or other suitable receiving instrument brought into action An electrical tapper keeps the coherer in a state of constant vibration, and breaks down its conductivity as soon as established.

The Method of Working is for the operator to connect his outside conductor with his induction coil, at the same time disconnecting it from the coherer. Then by means of the key he puts his coil into operation for long and short periods, corresponding to the dashes and dots of the Morse code, thus exciting in the outside conductor groups of electric waves. Some of these fall upon the outside conductor at the receiving station, and convert the coherer there into a conductor; the relay circuit is immediately closed and the Morse instrument begins to print. Of course, during the transmission of one dash the circuit of the coherer is made and broken many times, but the printing instrument treats the quick succession of short currents as a single long one. The rate at which messages are sent in this way is not very great, but according to the *Times* report no efforts have been made to attain speed. The intention has rather been to demonstrate that signals can be sent with accuracy and certainty over a considerable distance without conducting wires. It is stated that experiments have also been carried out between Alum Bay and a ship cruising about between the Isle of Wight and Swanage. In every case communication was easily maintained, whether the ship was moving forwards or backwards or swinging round. Nor was the working of the apparatus adversely affected by bad weather. On the contrary it seemed to act most freely in fog, rain, or wind, and was at its worst on fine, clear, still days. Secrecy is easily observed in this new system of telegraphy, for two stations cannot telegraph across space to each other unless their apparatus is syntonised.

We regret to record the death of Dr. Georg Dragendorff, formerly Professor in the University of Dorpat, who has been an Honorary Member of the Pharmaceutical Society since 1875.

A Somewhat Belated Suggestion is published by Dr. Hooper, of the Surrey Dispensary, in last week's *Lancet*, where he expresses the hope that the new Pharmacopœia will recognise all the drugs and preparations that physicians can possibly require, so that they need never prescribe anything that is not official in the B.P. So far as its contents are concerned, the 1898 Pharmacopœia is now an accomplished fact, and it appears somewhat late in the day to suggest what it should or should not contain. But the idea expressed is excellent, and if all medical men were only reasonable, they would have no difficulty in finding all they require amongst the official remedies. As it is, however, those who know their business properly will find what they need there; others may or may not—probably not. With Dr. Hooper's further suggestion, that physicians should be careful not to prescribe out-of-the-way things they know little or nothing about, chemists will cordially agree. It is decidedly unreasonable that dispensing chemists should be expected to purchase unusual synthetic remedies and proprietary preparations generally, in original packages, at fancy prices, and then have the bulk of the material left on their hands. Yet such is only too frequently the result of prescribing by imperfectly trained medica practitioners who derive their therapeutic information from pamphlets sent to them by the makers of proprietary preparations. The more, therefore, the wiser members of the profession insist upon this and kindred facts the greater will be the advantage to everyone legitimately concerned—prescribers, dispensers, and patients, though it is to be feared that the inventors of new remedies and concocters of ready-made therapeutics will not confirm this view.

"The Indiscriminate Sale of Poisons" is the heading to a *Daily News* report of a recent inquest at Bermondsey Town Hall, touching the death of a young man who had committed suicide by taking a quantity of phosphorous paste. In the course of the case, Mr. E. N. Wood, the Deputy Coroner, asked the chemist who sold the poison what restrictions are placed upon the sale of it. The chemist explained that there are none, except that it has to be labelled "Poison." In the latter respect he was wrong, as was also the Coroner, who insisted that the chemist ought to have put his name and address on the package, and advised him to do so in future, lest he might get into trouble. As a matter of fact, phosphorus and its preparations are not poisons in the eye of the law, and the chemist ought to have been commended for labelling the paste "Poison," rather than blamed for not doing something else that the law does not require. Nor do we agree with the Coroner's remark that the present Pharmacy Act is very inefficient, though he may be right in suggesting that there is no reason whatever why persons purchasing any kind of poison should not give their names and addresses, as that might mean very great protection for the public.

Why Gregory's Powder should ever be compounded with magnesium carbonate instead of magnesia, except on the mistaken score of cheapness, it is difficult to see, for the carbonate has never been recognised as an ingredient of the powder in this country. It is to be regretted, therefore, that several Sunderland chemists should have attempted to "improve" upon the composition of a B.P. preparation by an unwarranted substitution. In a similar case in the London district, some months ago, the magistrate held that the article sold was not to the prejudice of the purchaser, and on that technical ground the case was dismissed. That experience should have operated as a warning to others, and in the present instance, the Sunderland chemists, who have been less fortunate, have little reason to complain of the magnitude of the fines imposed. For the future they will act wisely to conform to established usage, and make all pharmacopœial preparations in strict accordance with the official formulæ, leaving improvement and modification to the Pharmacopœia revisers.

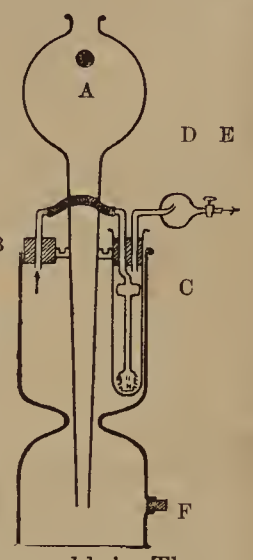
The Adulteration of Food-Stuffs has influenced the Public Health Committee of St. Pancras Vestry to recommend that the Sale of Food and Drugs Bill introduced into Parliament by the President of the Local Government Board should be amended and brought into line with the recommendations of the Select Committee of the House of Commons. In the opinion of the Vestry committee the Bill introduced by Mr. Kearley seems much more adequate than the Government measure, but the committee does not approve of the minimum penalty clauses which appear in both Bills. It would seem improbable that any Bill that can be drafted will commend itself to everyone concerned. Meanwhile, however, the law remains as it was, and only a few busybodies are troubled thereat, whilst the public does not suffer appreciably, if at all, in consequence.

NOVEL APPLIANCES,

PHARMACEUTICAL AND CHEMICAL.

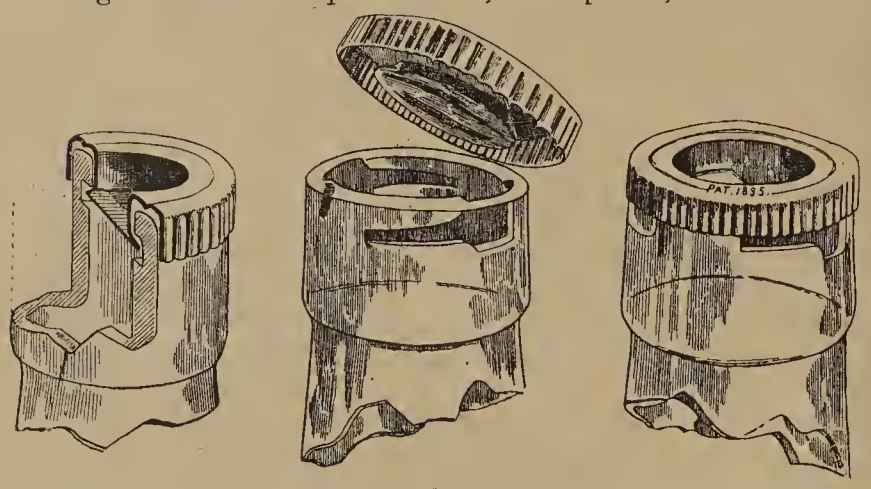
Gas Generator for Laboratory Use.

The apparatus figured is a combination of Kipp's gas generator with the addition of a washing or drying flask constructed so as to make it impossible for the fluid used for washing or drying to be splashed or carried over with the gas. The acid is poured into the bulb funnel, the generated gas passing through the exit tube B into the washer C, any splashing from this being prevented by the splash trap D. When the cock E is closed the pressure inside the apparatus forces the liquid into A until it is removed from contact with the generating material. The exit F serves for the removal of spent liquid. The apparatus is in use at the Royal Chemical Laboratory at Erlangen, where it is chiefly used for reducing oxide of copper. The compactness of the apparatus and the ease with which it may be filled or emptied are apparent from the illustration here given. It is made by R. SCHREIBER, Frauenwald in Thur.—*Chemiker Zeitung.*



Practical Closures.

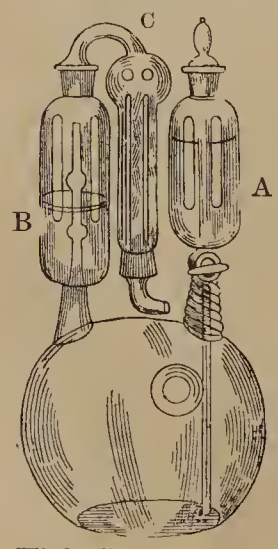
The device here illustrated is intended for use for bottles containing drugs, dietetic articles, and hygroscopic substances. The fittings are made in lacquered metal, nickel plated, or in aluminium

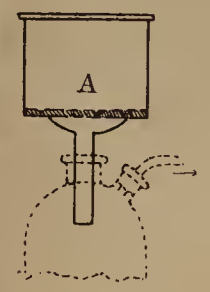


as required. It is claimed that the stopper may be replaced as often as required, and that it is more easy to remove than a tight-fitting cork, is perfectly air- and gas-tight and germ-proof.

Carbonic Acid Apparatus.

Kohn has devised a convenient and compact apparatus for the determination of CO_2, which is a generator combined in a convenient manner with tubes for washing and drying the gas evolved. When the carbonate is decomposed by HCl no provision is made for the absorption of the vapours of that acid either in the Schrötter or Bunsen apparatus, or in the modification of Christomanos of the latter. The apparatus of Kohn consists of an acid funnel A fitted with a glass tap for the gradual introduction of the acid to the carbonate. A tube B containing concentrated sulphuric acid, by means of which moisture is retained, and a further tube, C, filled with pumice saturated with anhydrous cupric sulphate, which retains any trace of HCl, and the issuing gas is pure CO_2. This apparatus may prove useful in other instances besides the determination of CO_2. The apparatus is made in England by C. E. MULLER, 148, High Holborn.—*Chemiker Zeitung.*





A Modified Suction Filter.

In this modification of the ordinary filter pump funnel, which is the invention of Dr. Ackermann, the perforated bottom plate A is removable, so that it can be readily taken out and covered with filter paper or other material. This will be a great improvement on the form at present in use, particularly in those cases where it is desired to recover a fine adherent precipitate, which, in the usual form of funnel, is often difficult to accomplish.—*Pharmaceutical Review.*

New Tablet Machines.

The tablet machines figured below are constructed by KILIANI AND CO., of Berlin. In the first the weighed material is filled into the hollow cylinder (A), a concave die being first inserted, which rests on a moveable plate (B) at the bottom of the cylinder. The material is then inserted and pressure applied by means of the

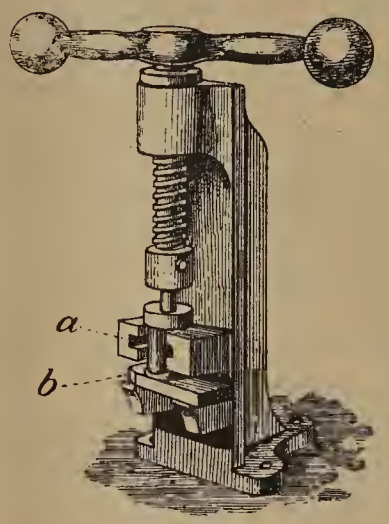


Fig. 1.

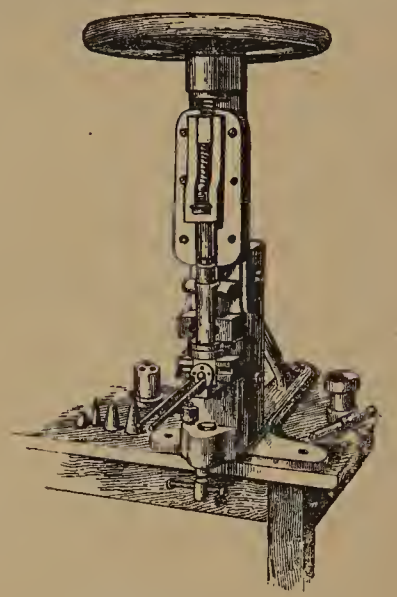

Fig. 2.

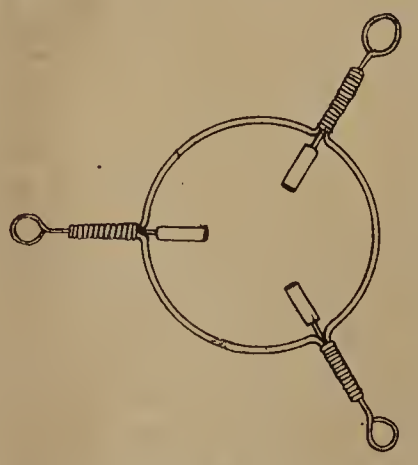
screw. This is then reversed, the movable plate turned outwards, and the tablet forced out with another turn of the screw. Several tablets may be compressed at one time by dropping in between each charge a doubly concave die. The second figure represents a more complicated machine constructed on the same principle, with which it is possible to make several tablets at a time, or to pipe pill mass, or squeeze suppositories.



Adjustable Crucible Holder.

In this apparatus the crucible hangs in the space between three clay rods that are fastened to wires. These wires can be moved so that the space between the points can be increased or diminished at pleasure, and thus furnish room for crucibles of various sizes. Although this device is extremely simple, it will probably be found of great use in the laboratory, and will obviate the necessity for three or four sizes of the old-fashioned triangle.—*Pharm. Review.*

Reyer's Combination Laboratory Bracket.

This useful clamp with rings is so constructed that it can be attached to any shelf or rod. It should prove very useful in the pharmacy or analytical laboratory, where room is generally valuable. The fact that the rings may be readily attached to any support allows of their application in fitting up many forms of apparatus. The rings form admirable supports for percolators. By placing several percolators one over the other a very effective successive percolation may be effected.

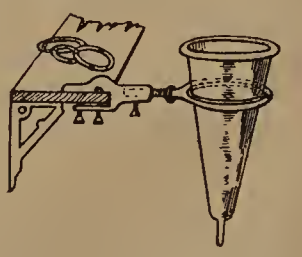


Table of Thermometric Equivalents

PHARMACEUTICAL SOCIETY.

EXAMINATIONS IN LONDON.

April, 1898.

MINOR EXAMINATION.

Candidates examined	310
,, failed	207
,, passed	103

Allen, William Frederick.
Averill, Cecil Hanson.
Bailey, Edward Arthur.
Barton, Harold.
Baylis, Arthur Edward.
Beckwith, Ernest.
Bennion, Richard.
Bidie, Francis William.
Biffin, Frank.
Blake, Ernest Alfred.
Boyes, William Cotnam.
Brewer, Philip James.
Brown, William Ritchie.
Browne, Henry Charles.
Cain, John.
Chandler, Richard Walter.
Chapman, Frank.
Checketts, Mary.
Churchill, Lionel Arthur.
Clement, William Henry.
Clunas, John.
Collins, Samuel Morrison.
Corney, Alfred Ernest.
Coulton, Arthur William.
Davies, William John.
Dolman, Thomas Tustin.
Duncan, Robert.
Dyson, Joshua.
Elliott, Frederick William.
Ellis, William Frederick.
Fawcett, Frank Dalby.
Franklin, Arthur Cawte.
Fullerton, David Noble.
Gale, George Thomas.
Garnett, John Benbow.
Greatrex, Ernest James McWilliam.
Harrison, John Duffin.
Henshaw, William Herbert.
Hoare, Austin.
Hodgson, John Edward.
Hughes, Ernest James.
Hunter, William John.
Jasper, William.
Johnson, Cornelius Trim.
Jones, George Maurice.
Jones, Thomas.
Jordan, Herbert Emlyn.
Key, Harry.
Kluge, Herman James.
Lavcrack, Clyve Cordukes.
Lawrence, Edmund William.
LeDain, Nicholas John Fleming.
Lord, Walter.
McIntosh, John William.
McKenzie, James.
Manning, Henry Reginald.
Manson, Stanley James David.
Masson, Hedley George.
Middleton, Frank.
Moore, Thomas Henry.
Moorhouse, George Henry.
Morgan, Alfred Houlston.
Newey, Walter.
Oliver, John.
Partridge, Sydney John.
Percival, Thomas Henry.
Phillips, Ivor Reginald.
Pimm, William Robinson.
Platt, George.
Plumb, Alfred.
Pollard, Evelyn William.
Powell, Harold.
Pryor, Sydney Hildyard.
Pugh, John James Edgar.
Purdic, Percy Wilfred.
Pye, Harry.
Riley, Stanley.
Ritchie, David French.
Robbins, Robert William
Smith, Ernest Hartmann.
Scholefield, Samuel George Cutler.
Smalley, Robert.
Stevenson, Charles Harry.
Steward, Charles Alfred.
Swift, Herbert Henry.
Tarry, William Clarence.
Tew, Arthur Wilson.
Topping, Edmund.
Trunchion, Herbert Fawdon.
Veon, Samuel Ernest Markey.
Waddington, Frederick Pollard.
Waldby, Harold.
Walton, John.
Walton, Ralph.
Webster, Bertram.
White, Gilbert.
Whysall, George Ernest.
Wilson, Thomas Ellick.
Withington, Henry Martin.
Wooler, Frederic William.
Worrall, Harry.
Wrather, Thomas Edward.
Yeo, John Henry Arthur.

FIRST EXAMINATION.

Certificates by approved examining bodies were received from the undermentioned in lieu of the Society's Examination :—

Arnold, Stanley ; Southsea.
Baker, Cyril Henry ; London.
Blundell, Nellie Muriel Kate ; Caterham.
Cart, John T. ; Shrewsbury.
Clowes, George D. K. ; Manchester.
Crawford, Ernest ; Manchester.
Cromack, Vincent ; Blackpool.
Cross, Ernest Llewellyn ; Shrewsbury.
Davies, John Meurig ; Southwark.
Goodwin, Frederic James ; Balham.
Griffiths, Evan ; St. Davids.
Haslegrave, Edward Ernest ; Wakefield.
Hawkins, Philip ; Hilderthorpe.
Hines, Frank Gladstone ; Ipswich.
Husbands, Herbert Henry ; Edinburgh.
Jones, John Richard ; Rhyl.
Keeton, Percy ; North Leverton.
Kemish, Arthur ; Cambridge.
Kirby, Francis Benson ; Bristol.
Lanham, Hedley George ; Bristol.
Lewis, Edward Davies ; Cardiff.
Lewis, George Walter ; Kidderminster.
Ling, Herbert James ; Diss.
Marshall, William B. ; Liverpool.
Morris, Willliam David ; Clapham.
Nicholson, George France ; Whitehaven.
Overton, Percy John S. ; Liverpool.
Power, James ; Manchester.
Priest, William ; Huddersfield.
Richards, John ; London.
Spanton, George Furley ; Ramsgate.
Tavernor, Joseph Stafford ; Leicester.
Taylor, Samuel ; Southport.
Walker, John Philip ; Shipley.
Webb, Albert Edward ; Brighton.
Whiting, Ernest Milburn ; Credenhill.
Williams, David John ; Cardiff.
Wood, Charles Edmund ; Rock Ferry.

DONATIONS TO THE LIBRARY.

At the meeting of the Library, Museum, School, and House Committee, on Thursday, March 21, the Librarian presented the following report of donations :—

To the Library (London).

Dr. L. Planchon, Montpellier :—Sur les propriétés toxiques du *Diplotaxis erucoides*, DC., 1898.

Linnean Society of London :—Catalogue of Library, 1896.

American Pharmaceutical Association :—Proceedings, 1897.

College of Preceptors, London :—Calendar, 1898.

EVENING MEETING IN EDINBURGH.

The sixth evening meeting of the Session was held in the Society's House, 36, York Place, on Wednesday, April 20, Mr. W. L. Currie, Glasgow, in the chair. Apologies were intimated from Messrs. Ewing, Nesbit, Boa, and Davidson.—Mr. Lunan read a paper on "Oxygen for Therapeutic Purposes," which is printed at page 388.

Mr. J. Rutherford Hill said that nowadays oxygen was being prescribed by physicians all over the country, and he had discovered in his intercourse with pharmacists that while they were perfectly aware of the fact, they were wonderfully ignorant as to how it was to be used. They knew that it was used in cases of pneumonia, but as to the exact *modus operandi*, their information was very vague. It was a very great disadvantage to pharmacists to plead or exhibit such ignorance if they were applied to by medical men for information on a subject of this kind, and one of the uses of the meetings of the Society was that those who had such apparatus might exhibit it to those who had not seen it, but who possibly might be asked for it. The oxygen sent out at present by the makers was very pure, but unless they anticipated a therapeutic use of it, if they imagined it was only to be used for lantern purposes, they might not use the same precaution in keeping it pure, and it was very apt to contain traces of substances which would be extremely objectionable in the therapeutic use of it. It had been widely used in cases of pneumonia where the lung tissue was largely solidified and incapable of securing the aëration of the blood. It was necessary in such cases that the small amount of lung tissue remaining should have supplied to it a large percentage of oxygen so that it might perform the entire function of the whole lung. It had been used with wonderful success in some cases. With regard to the wash-bottle, it served three purposes. In the first place it ensured purity of gas, in the second place it was an indication when the supply of gas was exhausted, and in the third place it moistened the gas. The gas put in a cylinder was frequently very dry, and inhaling gas in such a dry condition would probably have an irritating effect on the mucous surfaces. That would be specially the case if it were inhaled direct. He thought this was a very simple arrangement, and it was an advantage to them to have seen it. He felt personally obliged to Mr. Lunan for his kindness in bringing it forward.

The Chairman said they had only to see the apparatus to be satisfied of its suitability for the purpose for which it was intended. This was a very important subject. They could not contradict the fact that the time was not far distant when they would be called upon to supply oxygen for medicinal purposes, and they should be in a position to know the best ways and means not only of obtaining oxygen and guaranteeing its quality, but of knowing exactly how it should be applied. As Mr. Lunan said, this was a primitive apparatus and

could doubtless be improved, but they were exceedingly indebted to Mr. Lunan for showing the lines on which it could be used. Speaking from his own experience, from a pneumonic point of view, he well recollected the great feeling of oppression he had in breathing the ordinary atmosphere. His medical man considered the advisability of applying oxygen, but unfortunately he was not in a position to know where to get it and the mode of applying it, and it was not done. He quite understood the necessity of chemists and medical men making themselves fully acquainted with all the details of this very interesting process.

Mr. HILL then read his four papers, two of which appear at pages 388 and 389, whilst the others will be published next week. The subjects of the papers were "An Incompatible Strychnine Mixture"; "Strychnine Hydriodide"; "Invisible and Sympathetic Inks"; and "Methylated Spirit in Photography."

Mr. COULL said with regard to the pyroxylin solvent, he did not think it would be illegal to sell a mixture of methylated spirit and ether. Permission could be got to use methylated spirit in making collodion. He did not see why there should be any objection to the sale of such an article. The last paper was an important one, and dealt with a very serious matter. In one case a dispenser might filter out the strychnine, and the prescriber, failing to get the effect, might increase the dose. This might be dispensed by a dispenser who did not filter out the strychnine, and the consequences might be serious. Mr. Hill's paper on "Hydriodide of Strychnine," was a distinct contribution to chemical knowledge. He thought it evident that the formula from strychnine hydriodide was as Mr. Hill stated it. Imperfect drying and volatilisation might account for the slight discrepancies between the theoretical and actual results.

Mr. MCDIARMID said he understood the addition of rock oil to methylated spirit was intended to prevent its being diluted with water before selling. It had not prevented drinking of the spirit. He had observed a strychnine mixture with potassium iodide in *Home Notes*, and its dangerous nature had been pointed out.

Mr. MCPHERSON said he had made some experiments with the strychnine mixture. It was possible that in the cases previous to this one the dose might be a tablespoonful, and not a teaspoonful, and in such a dilute mixture there might be no precipitation. He found that a mixture of potassium iodide, 5 grains, liquor strychninæ, 5 minims, and water, 2 drachms, remained clear. Even with 10 minims there was no precipitate, and in this proportion the mixture might be safely dispensed. With 15 minims precipitation began, and with twenty it was dangerous—the red crystals might be due to free iodine in the iodide.

Mr. DUNCAN said he agreed that dilution would obviate the difficulty. Half an ounce of glycerin added to the mixture retarded precipitation, but not completely; more might have done so. The mixture was one that was largely prescribed just now in Edinburgh, the strychnine being added to counteract the depressing effect of the potassium iodide, and it was likely that many of them might meet with further examples. It was the dispenser's duty to inform the prescriber in these cases, and not merely to dispense the prescription, adding something to prevent precipitation.

Mr. LUNAN said he had dispensed such prescriptions in tablespoon and dessert-spoon doses, and he had found that it could be sent out in a presentable condition by adding mucilage, but this was probably quite safe.

Mr. BOWMAN said he had frequently dispensed a mixture of strychnine, potassium iodide, and tincture of cinchona, and he asked if the spirit in the tincture would prevent precipitation of the strychnine. In such a muddy mixture they could not see the precipitate.

The CHAIRMAN said that as an amateur photographer he had encountered the objection to rock oil in the methylated spirit referred to, and he agreed that its presence should be abolished. The addition of rock oil had not stopped the use of the spirit for drinking, and in Glasgow it was rather on the increase—so much so that one or two shops had obtained quite a notoriety in certain districts of the city for selling methylated spirit, even on Sunday. The strychnine mixture was an illustration of the modern tendency among prescribers to order concentrated medicines in small doses. The pharmacist had professional objections to this tendency, and this instance indicated another kind of objection.

Mr. HILL, in reply, said no doubt pyroxylin solvent might be sold by permission, but in this case no permission had been asked. He did not object in the least to the sale, but the legality required looking into. He suggested that Mr. McPherson should keep his solutions a little longer, and he would probably get crystals, the potassium iodide was pure. The free hydriodic acid in the mixture decomposed by oxidation, yielding free iodine, which produced the red crystals. Glycerin retarded, but did not inhibit precipitation, and perfect safety lay in having two solutions. In Mr. Bowman's mixture it was almost certain that strychnine would be precipitated, though the spirit in the tincture certainly lessened precipitation.

On the motion of the CHAIRMAN, votes of thanks were awarded to the authors, and on the motion of Mr. BOWMAN, a vote of thanks was given to Mr. Currie for presiding, and the meeting then closed.

LINNEAN SOCIETY.

At a meeting held on Thursday, April 7, Dr. A. GÜNTHER, F.R.S., President, in the chair, Mr. J. E. Harting exhibited specimens of

The Asiatic Partridge,

Perdix daurica, of which a large consignment has been lately received in London. The species was described from the Altai and Dauria so long ago as 1811 by Pallas ('Zoogr. Ross.-Asiatica'), who regarded it as a variety of *Perdix cinerea*. It was re-described in 1863 by Verreaux and Des Murs ('Proc. Zool. Soc.,' 1863, p. 62, pl. ix.) from specimens procured by Taczanowski in Central Dauria, and was named by them *Perdix barbata*, from the peculiarly elongated feathers of the chin, an excellent coloured figure of the bird by Joseph Wolf accompanying their description. According to Swinhoe this bird is brought in numbers in a frozen state to the Pekin market in winter by the Mongolians, who snare them, and it seemed not unlikely that those received in London had been forwarded by Russian agents *viâ* St. Petersburg, or perhaps from Irkutsk, north of the Mongolian territory, which is the true home of the species.—Mr. Harting also exhibited

The Skin and Skull of a Wild Cat,

Felis catus, recently obtained near Speanbridge, in Inverness-shire. He pointed out the present restricted range of the animal, which had not only disappeared entirely from England and Wales, but was no longer to be found in Scotland south of a line drawn from Oban to Ben Lui, along the southern and eastern boundary of Perthshire, and thence northward to Nairn. He explained the cause of reversion in the colour of emancipated house-cats to the wild type of *Felis catus*, and referred to the skulls of cats which had been exhumed on the site of the Roman city of Silchester, which he thought disproved the view of the late Professor Rolleston (*Journ. Anat. and Physiol.*), to the effect that the domestic cat was not known to the Romans.—Dr. G. ELLIOT SMITH next read a contribution towards a more exact knowledge of

The Anatomy of the Brain in Edentata.

A full account of the brain of *Orycteropus* was first given, and comparisons were instituted with that of a dozen species representative of the leading Edentate families, including *Manis* and *Chlamydophorus*. The structure of the brain was fully described, special attention being given to modification determined by habit, especially as concerning parts associated with the olfactory and visual organs. The cerebellum was dealt with in detail, a terminology being introduced which rendered clear its comparison with that of other mammalia. The pallium was shown to be fissured in all species examined except *Cyclothurus* and *Chlamydophorus*, and the factors which influence fissure-formation in the Edentata were shown to be identical with those which affect very distantly related species among the higher orders of mammals. "Splenial," "sagittal,', and "supra-orbital" fissures were described in various degrees of modification, and the recent conclusion of Huntington that the absence of a Sylvian fissure is an Edentate character was shown to be erroneous.—The last paper read was by Mr. H. FARQUHAR, of Wellington, N.Z., on

Some New Zealand Actiniaria,

in which he described a new genus, *Halcampactis*, and species *Halcampactis mirabilis*, together with the following new species: *Edwardsia elegans* and *neo-zelanica*, *Corynactis Haddoni*, *mollis*, and *gracilis*, and *Actinia tenebrosa*. *Halcampactis mirabilis* he regarded as of special interest, since it appeared to form a link between the Sagartidæ and Halcampidæ, which had hitherto been widely separated by systematists.

ANTISEPTIC DRESSINGS AND SURGICAL ACCESSORIES.*

Sublimate Gauze, 1 Per Mille.—Purified gauze, 100. Moisten in a solution of sublimate, 0·1; sodium chloride, 50; distilled water, 120; glycerin, 20. Subject to pressure for some hours, then dry in the dark.

Sublimate Gauze, 2·5 Per Mille.—Purified gauze, 479. Moisten uniformly with a solution of corrosive sublimate, 1; vaseline oil, 20; ether, 200. Place in a jar, press to distribute the liquid uniformly, and dry.

Arnicated Court Plaster.—Made as the above, medicating the second half of the basis with tincture of arnica, 50. Other medicated taffetas may be prepared, such as iodoform, boric acid, phenol, on similar lines. French taffeta differs from court plaster (known on the Continent as taffeta d'Angleterre) in being spread on gold beaters' skin.

Antiseptic Papers.—Tissue paper or cigarette paper is employed for medication. *Carbolic Paper*: Hard paraffin, vaselin, of each 2; phenol, 1. Melt and dip the paper in the mixture. *Salicylated Paper*: Hard paraffin, vaselin oil, of each 50; salicylic acid, 1. Melt and dip the paper in the mixture. *Sublimate Paper*: (*a*) Sublimate, 2; distilled water, alcohol 90 per cent., of each 500; glycerin, 50. Moisten blotting paper with the solution. (*b*) Sublimate, 20; boiled distilled water, 1000; glycerin, 50; blotting paper, *q.s.* Moisten the paper and dry in the sun. *Hæmostatic Paper*: (*a*) Solution of perchloride of iron, 18; alum, 1. Moisten absorbent paper in the mixture and dry. (*b*) Sulphate of aluminium, 2; hydrate of aluminium, benzoic acid, of each 1; solution of ferric chloride, 6; distilled water, 4. Apply hot with a brush to the surface of absorbent paper.

Adhesive Antiseptic Plaster.—Gum acacia, 15; distilled water, 55; salicylic acid, 1. Paint cigarette papers with this mixture.

Antiseptic Collodions.—These are used as applications to wounds to ensure healing by first intention. The majority of the medicaments, such as iodoform, phenol, iodol, may be simply dissolved in official collodion. The following is the formula for *Salol collodion* of Ferrier and Perdire: Ether, 225; alcohol, 90 per cent., 25; pyroxylin, 10; salol, 10; serves as a type for other medicated collodions.

Steatines.—In preparing these a large piece of wet parchment paper is laid upon the smooth surface of a table and wiped dry with a cloth. A piece of gauze is laid on this paper, and on this the nearly cold ointment is painted evenly with a brush, a uniform smooth surface being finally obtained by means of a warm spatula. *Boric Steatine*, 10 *per cent.*: Benzoated suet, 70; benzoated lard, 20; powdered boric acid, 10. *Carbolic Steatine*, 10 *per cent.*: Benzoated suet, 90; carbolic acid, 10. *Sublimate Steatine*, 0·2 *per cent.*: Benzoated suet, 900; benzoated lard, 50; sublimate, 2; alcohol, 90 per cent., 50. *Sublimate Steatine*, 1 *per cent.*: Benzoated suet, 85; benzoated lard, 5; sublimate, 1; alcohol, 90 per cent., 9. *Mercury and Carbolic Steatine*: Benzoated suet, 35; mercurial ointment, 50; carbolic acid, 5. *Ichthyol Steatine*, 10 *per cent.*: Benzoated suet, 80; benzoated lard, 10; ichthyol, 10. *Iodoform Steatine*, 10 *per cent.*: Benzoated suet, 85; benzoated lard, 10; iodoform, 5.

Adhesive and Antiseptic Plasters.—*Carbolic plaster*: Simple adhesive plaster, 19; phenol, 1. *Salicylic plasters*: Simple adhesive plaster, 95; melt and add a mixture of salicylic acid, 2; lard, 3; *Iodoform adhesive plaster*: Lead plaster, 65; suet, 10; gum dammar, 7; pine tar, 7; Venice turpentine, 1; melt, cool, and when nearly set, add iodoform in finest powder, 10. *Iodoform adhesive plaster*, 20 *per cent.*: Lead plaster, 35; suet, 6; yellow wax, 6; gum dammar, 6; pine tar, 6; Venice turpentine, 1; melt, and when nearly cold add iodoform in finest powder, 25. *Iodol Adhesive Plaster*:—Lead plaster, 65; suet, 3; yellow wax, 7; dammar, 7; pine tar, 7; Venice turpentine, 1. Melt, and when nearly cold add powdered iodol, 10. *Sublimate Adhesive Plaster*: Corrosive sublimate, 2; alcohol, 90 per cent., 10. Dissolve and add castor oil, 15, and pour into adhesive plaster, 100. *Iodoform Rubber Plaster*, 20 *per cent.*: Dammar, 15; benzoated suet, 30; anhydrous lanoline, 20; rubber, 5; glycerin, 10; iodoform, 20; benzene (to dissolve the rubber), 45. *Boric Rubber Plaster*, 20 *per cent.*: Dammar, 20; benzoated suet, 25; white wax, 15; rubber, 8; anhydrous lanolin, 12; boric acid in powder, 20; benzene to dissolve the rubber, 72. *Ichthyol Rubber Plaster*, 20 *per cent.*: Dammar, 5; benzoated suet, 5; yellow wax, 5; rubber, 2; anhydrous lanolin, 3; ichthyol, 5; benzene to dissolve the rubber, 18.

* From the *Bulletin Général de Thérapeutique.*

DENTAL NOTES.

Preparation of Female Dies.

Female dies can be obtained as follows:—Take plaster model of suitable tooth, saw off crown surface, dress the flat surface smooth with coarse file, lay on a flat surface, place a rubber ring over model to hold it in position. While metal is being poured, place point of excavator on model to retain it. Remove the instrument, and when metal is cool, turn model downwards and tap the metal until the model drops out, thus saving model in the event of first cast not being perfect. To make a cast from an artificial tooth, place softened modelling compound in a rubber ring and imbed the tooth, leaving required amount of articulating surface exposed. Cool compound and trim it far enough below the upper surface of ring to give space for cast, or place another rubber ring on the one containing the compound, then the model is ready to pour. To use the metal for dies on which to swage plates, it is necessary to use modelling compound as a counter-die. To make a modelling compound counter proceed as follows:—Soften compound and place in lower part of vulcanite flask, lay rubber dam over the compound, and press the die into it. When cool remove and you have the counter. When swedging, use the dam between the die and counter. To drive plate into small depressions in die, between the teeth, for instance, lay a bar of lead on the plate and drive to place with hammer. This metal will not make a sharp enough die for a plate when cast in modelling composition, as the large amount of metal softens the impression, but for small dies it cools quickly and gives a sharp die; therefore cast in a plaster impression for plate swedging. To obviate taking more than one impression of the mouth, use a die to make an impression in compound, and in the impression pour the metal. This die will do for first swedging and the die made in plaster impression for the final swedge.—*Dental Digest.*

Salivary Calculus in the Parotid Duct.

A communication from Mr. T. E. Constance to the *Journal of the British Dental Association* describes a case of salivary calculus in the parotid duct, causing symptoms simulating alveolar abscess, which occurred to a patient aged fifty. The left cheek was obviously swollen, the swelling having commenced three days previously, being painful and tender, the skin tense but not reddened. The swelling was most prominent in the centre of the cheek. Pressure over the region of the left parotid caused pain. The pain commenced in the last tooth—left upper second molar. This on being tapped caused pain, although apparently sound, and for the last three days had given pain while eating. A greyish appearance was noticed at the most prominent part of the swelling in the mucous surface of the cheek. When a probe was with difficulty passed into the parotid duct this proved to be a small calculus, which upon removal was about the size of a 1-grain cocaine tabloid and of similar shape. Two days later the patient had quite recovered.

Antinosine in Mouth Washes.

Antinosine being very readily soluble in water, odourless, non-poisonous, and almost tasteless, forms a valuable addition to tooth and mouth waters, either by itself in solution, or mixed with an antiseptic. To obtain clear solutions, distilled or freshly-boiled water must be used. Antinosine is best dissolved in glycerin, especially if the solutions are intended to be kept. If a brown precipitate occurs in the aqueous solution, it can be got rid of by boiling. The precipitate is only "nosophen," a compound of antinosine. For daily use, 5 C.c. of a 1 per cent. solution should be diluted in a tumblerful of water. A solution of 1 per cent. has been used for over a month without the teeth becoming discoloured. If it is desired to improve the taste of the solution, the addition of a little peppermint water is recommended. Good results have been obtained with a 2 per cent. solution in caries of the teeth, and in stomatitis mercurialis.—*Journ. f. Zahnleilk.*, xii., No. 3.

Paste for Killing Tooth Nerves.

The arsenical paste in use consists, according to Schuh, of equal parts of arsenious acid and morphine hydrochloride, mixed with liquefied carbolic acid; to a paste; 5 per cent. cocaine hydrochlor. is then added.—*Zeit. d. allg. oest. Apoth. Ver.*, li., 797.

EXTRACTS FROM CONSULAR REPORTS.

Fertilisation of the Cultivated Date Palm, in Tunisia, according to a recent report, is entirely artificial. When the male date palm is in blossom Arabs climb the tree and bring down the great spathe of blossoms, then climb the female tree and either shake the pollen over her, or hang the male blossom alongside.

The Blossom of the Male Date Palm is sold as a commercial article in the market places. It is divided into small pieces, and for a penny sufficient may be purchased to fertilise two or three female palms. Some male date palms are said to be more vigorous than others, and have quite a reputation as sires.

The Almond Trees of Tunis, from the kernels of which an excellent oil, much valued for pharmaceutical purposes, is obtained, are usually disseminated in the gardens and not planted in masses, but Sir H. H. Johnston, Her Majesty's Consul at Tunis, thinks orchards of almond trees could be successfully cultivated. The trees are planted at a distance of 12 metres apart, and as the tree is not an easy one to transplant, two seeds are sown together where it is intended to grow, and the least vigorous plant of the two is pulled up. They are sown at the commencement of the winter, are grafted at between two and three years, begin to produce fruit in the fifth year, but do not arrive at the full bearing stage until the fifteenth or sixteenth year remaining vigorous up till fifty. The trees are not pruned because the scars cause an exudation of gum which weakens the tree, the dead wood only being cut off.

A Profitable Culture, according to Consul Johnston, is that of flowers and herbs for perfumes. The expenses and receipts of growing 100 kilos of roses for perfumes in Tunis are stated to be respectively 104 and 189 francs, thus giving a profit of 85 francs per 100 kilos, while the cost of producing the same quantity of jasmine flowers and turning them into perfume is 127 francs, the product realising 170 francs, a profit of 43 francs.

Prepared Drugs and Medicines of British origin are reported to be in favour in Tunis, but are chiefly supplied by one enterprising London firm, which takes the trouble to describe the medicines and give the particulars as to dose in French. As a consequence the preparations of this firm have obtained a great hold on the French market, while other British druggists have but a poor hold on the market, except in chemicals imported in masses, because they send out their medicines labelled with English descriptions, which are unintelligible to the Franco-Tunisians.

A Great Demand is said to exist at Susa (Tunis), for soda crystals or washing soda, also for English paints, varnishes, and painting oils.

Chemical and Pharmaceutical Goods imported into the Argentine Republic during the year 1897 show an increase of 292,345 dollar over the import of the previous year. In the Foreign Trad Returns it is satisfactory to note that Great Britain stands at the head of total imports, although the importation of British produce has fallen off in 1897 by 8,337,909 dollars. Argentine produce exported to the United Kingdom also shows a decline of 1,404,071 dollars.

The British Admiralty are reported to have caused no small stir in the olive oil trade of Italy by issuing invitations for tenders for over 2000 tons of olive oil, a quantity which represents almost the entire stock of Gallipoli, there being only about 2400 tons at disposal. This large demand has naturally caused a boom, and prices have risen considerably. England is the largest importer of oil from Gallipoli, the total amount forwarded in 1897 being 1757 tons, as compared with 1827 tons in 1896.

The Olive Oil Crop for 1897 has, according to the report of Consul Neville-Rolfe, proved to be an utter failure, so far as the yield of oil is concerned, for, when the olives came to be crushed, they were mostly skin and stones, the pulp having been destroyed by worm. A general advance in price is therefore to be expected, because all the olive oil existing in the provinces is insufficient for one year's ordinary requirements.

LEGAL INTELLIGENCE.

PROCEEDINGS UNDER THE PHARMACY ACTS.

The Council of the Pharmaceutical Society of Great Britain *v.* Howarth.

At the Rochdale County Court, on the 15th inst., before His Honour Judge Jones, the Council of the Pharmaceutical Society of Great Britain sued William Howarth, of 30, Manchester Road, Castleton, for a penalty of £5 for selling poison contrary to the provisions of the Pharmacy Act, 1868.

Mr. T. R. Grey, instructed by Messrs. Flux, Thompson, and Flux, appeared for the Society.

Defendant did not appear.

Mr. Grey stated that the action was brought to recover a penalty of £5, which defendant had incurred through selling poison. Defendant was an assistant in the employ of Mrs. Taylor, whose name appeared upon the Register of Chemists and Druggists. A witness went to 30, Manchester Road, Castleton, where he purchased a bottle of Lavan's Linctus, a compound which contained "morphine." Defendant sold the article to the witness, and at the time he was not acting under any superintendence or control of a duly registered chemist and druggist. After dealing with the various sections of the Act, counsel pointed out that Section 15 was the important Section, which provided that any person selling poison, not being a duly registered chemist and druggist, should be liable for each offence to a penalty of £5. Armson's case, which went to the Court of Appeal, decided that proprietary medicines containing a poison came within the Act, and in Wheeldon's case the Court decided that an unqualified assistant selling poison was liable for penalties.

Arthur Foulds examined: On October 22 last I went to 30, Manchester Road, Castleton—a chemist's shop. I saw defendant in the shop. I asked him for some glycerin and a bottle of Lavan's Linctus. He took the bottle out of a show-case on the counter. No one else in the shop at the time. The bottle of Lavan's Linctus was in the wrapper produced, which was fastened at both ends. Had seen defendant in the shop since.

Harry Moon examined: I instructed Foulds to make the purchase. I was acting upon instructions from the Registrar. Foulds subsequently handed to me the puchases. I opened the wrapper which contained the bottle of Lavan's Linctus in the analyst's presence.

Ernest J. Eastes, F.I.C., examined: I am an analyst. Mr. Moon opened this wrapper in my presence and handed to me the bottle which was contained in it. I have analysed the contents of the bottle; the preparation contained morphine. The amount of fluid in the bottle was nearly 2¼ ounces. The amount of morphine in the whole bottle was 0·47 grain, nearly half a grain.

Mr. Grey: I put in a printed copy of the Register. It is by Statute made evidence, and as defendant's name does not appear therein, it is proof that he is not a chemist and druggist. That is my case.

His Honour: No defendant being here, and you having proved your case, the plaintiffs are entitled to a verdict for the penalty of £5 and costs.

The Council of the Pharmaceutical Society of Great Britain *v.* Taylor.

At the same Court, upon this case being called on,

Mr. T. R. Grey, instructed on behalf of the Society, stated that defendant, who had been sued for a penalty for selling poison, had paid the amount to the Society, the balance having reached them on the 14th. Defendant had not paid the costs, and he now asked that defendant should be ordered to pay costs.

Thomas W. Stroud, clerk to Messrs. Flux, Thompson and Flux, proved receipt of first remittance from defendant, and the reply sent as to payment of balance.

His Honour: I must order defendant to pay costs.

Machinery Polishing Paste.—The following paste is recommended for polishing machinery and iron or steel ware: Oil of turpentine, 5; paraffin, 25; finest emery, 25; fine powdered animal charcoal, 45. The paste thus formed is thinned down with methylated spirit, then applied to the parts to be cleaned with a brush. When the spirit evaporates the surface is well polished.—*Apotheker Zeit.*

LETTERS TO THE EDITOR.

The Council Election.

Sir,—May I through your columns warmly thank the numerous friends who had kindly promised me their support at the forthcoming election of the Pharmaceutical Council, and express my regret that, owing to a non-compliance with a technical regulation, the cause of which was my absence from England, I am disqualified for the present election; at some future time I hope to avail myself of their kind sympathy and support.

Oxford, April 14, 1898. G. Claridge Druce.

The British Pharmacopœia, 1898.

Sir,—In your issue of last week your correspondent, Mr. George Coull, of Leith, addressed you upon the actions of an individual and a certain wholesale firm in connection with the new British Pharmacopœia. As I am the member of the Pharmaceutical Society's Pharmacopœia Committee to whom he refers, I think it expedient to reply to his communication. It is apparent from the opening paragraph in Mr. Coull's letter that he was unfortunate enough not to be in possession of the exact facts connected with the first appearance of the British Pharmacopœia.

It is possible that had he been in London, complete information concerning it might have reached him earlier than it did in Edinburgh, and it is not improbable that Easter holidays rather accentuated than otherwise his inability of making himself "up to date." This was his misfortune and apparently not his fault. Those who were in London on the Thursday (April 7) preceding Good Friday, became aware that the General Medical Council, acting on a resolution of its Executive Committee, February 21, 1898, determined to make the new British Pharmacopœia "accessible to the public" (*sic*) at 10 a.m. on Thursday, April 7. By a paragraph which appeared in the issue of the *British Medical Journal*, dated April 9, which issue was, on account of Good Friday, in the press earlier than usual, a full notification concerning the Council's resolution, exhibit of the Pharmacopœia, etc., was made. It would appear that it was the intention of the Medical Council to make the new Pharmacopœia "accessible to the public" at the Medical Council's Registrar's Offices in Edinburgh and Dublin, as well as in London. Whether the exhibit was to be made in all three centres at the same hour of the same day I do not know, but I am aware that in London and from the offices of the Medical Council, and on Wednesday, April 6, a notice was sent to my firm (and doubtless to other London wholesale druggists) that at 10 a.m. to 4 p.m on Thursday, April 7, and from 10 a.m. to 1 p.m. on Saturday, April 9 (no exhibit on Good Friday), the new British Pharmacopœia could (to use the exact words of the paper which it was required should be signed by callers) "be used in the Medical Council's offices, to be returned every evening to the clerk when done with."

I have not a shadow of doubt that your correspondent had not the "up-to-date" information upon the subject, and may have been, on the Thursday forenoon when the new British Pharmacopœia was already a *fait accompli*, contemplating or arranging for the production of some of its preparations with his firm. I was at that very time discussing its contents with my friend, Mr. F. R. Squire (pharmacist) at San Remo. I am aware that in the forenoon of Thursday (in London at any rate) representatives of the wholesale drug houses did take advantage of the notice that had been sent by the Medical Council the previous night, and called at 299, Oxford Street, W., the Registrar's offices, and "used" the volume. My firm in its call was represented by a partner, Mr. John C. Umney. So much for the time, conditions, place, etc., under which the British Pharmacopœia first saw the light.

Now as to my personal connection with the volume. When I accepted the invitation of the Council of the Pharmaceutical Society to act on the British Pharmacopœia Committee I undertook to treat all proof sheets of the draft work as private and confidential communications, and upon no condition was I to permit the proofs to go out of my possession, neither was I to part with information, and these instructions I carried out to the letter. Further, I should like to add that a complimentary copy of the work, which was sent to me by the General Medical Council prior to Thursday, April 7, the date the work was first put on view, was treated as "private and confidential" (although I was not enjoined to do so in the letter which accompanied it), until the authorised volume had been "accessible to the public." These statements, I am persuaded, will be ample to convince your correspondent, if he had any doubt upon the subject (and there is nothing in the letter to show that he had), that up to the time of the exhibit of the book I carried out that which I undertook to do, and that, when the book was placed for "the use of the public" in the London Office of the Medical Council, the obligations of my trust ceased.

Addressing myself to another point raised by Mr. Coull as to the time that should have intervened between Thursday, April 7, and the issue of a price-list of the new pharmacopœial preparations, I should like to state that I am of opinion that the interval prior to the appearance of such a list must necessarily depend upon circumstances. In my own firm, if I were called upon to decide as to the time that should intervene, I should say that the list should be commenced immediately and proceeded with as rapidly as possible consistent with accuracy. The rapidity of compilation would, of course, depend upon: (1) The individual who was required to do the work, (2) The opportunities such individual had previously had of doing similar work, (3) The data upon the loss in manufacture of preparations generally, that were accessible. Now in my firm's case, the "man at the wheel" was Mr. John C. Umney, and in his start he had this particular subject "at his fingers' ends," for he had during the previous three years or more been constantly working under my instructions upon any subject connected with the British Pharmacopœia that my colleagues and I thought desirable. Mr. John C. Umney decided early on Thursday morning, April 7, that he would publish his firm's price-list without delay, and he accordingly set to his task aided by two typists. He worked the greater part of Good Friday (typists included) and until the small hours of Saturday morning; and, finally, he completed his issue, having circularised between two and three thousand of his firm's clients throughout Great Britain, Ireland, and the Colonies on Saturday afternoon—that is on the third day. Now I do not know that your correspondent can honestly take exception to this close application of Mr. John C. Umney to his firm's business, unless, indeed, it be objected that his Good Friday might have been more advantageously spent in a more genial occupation.

Is it to be presumed that Mr. Coull thought it was possible that the whole of the wholesale druggists of Great Britain and Ireland could, and would, put their prices current on show as the Medical Council did their book (or should have done) at the same hour of the same day?—I feel certain he did not. Surely, therefore, it must go without saying that someone, in the absence of simultaneous publication and distribution, must necessarily have been first, and I cannot imagine that Mr. Coull grudges me the kudos (if any) in my connection with the work, or my firm through me in utilising its opportunity of being in the front rank for the London district, and this more especially when I and my son, Mr. John C. Umney, aided constantly by my firm's chemists, clerks, and typists, had worked without fee or reward, and the firm whose action your correspondent would hold up to public ridicule or upon whose conduct he would cast a slur, has provided not only this labour but all the material, and that during a period of from three to four years, absolutely free of charge. In short, this very wicked firm (I gather that this is Mr. Coull's meaning, has "worked for nothing and found the thread." (Mem.—Other firms and individuals were equally generous, but I was the only London wholesale druggist on Committee).

Now I make bold to assert that your correspondent in this, as in other portions of his letter, is not "in touch" with the true facts. If he were aware of all that I have stated it is to be regretted that to his knowledge he did not add a *soupçon* of charity. As I have not the pleasure of knowing him, neither am I aware that his firm and mine are keen competitors, I cannot think that this attack on me is from "Jealousy, the green-eyed monster" that Shakespeare refers to. Surely such a distemper could not be at the root of his bitter complaining? I venture to hope that the prices current issued by my firm may be of some guide to Mr. Coull in compiling a list for his own firm, and this letter would be incomplete without asking him the favour that he will closely scrutinise the price-list which so "incensed" and which apparently caused him some discomfiture, and when he has come to the conclusion that there are errors in the list (the possible result of excess of zeal and hurried work), I shall esteem it a favour if he will point out the mistakes, which will be gratefully acknowledged. I regret that there has been occasion to enter into so much detail, but I thought it desirable that my case should be made plain, and my position from the beginning (1895), when I was honoured with a seat on the Committee, to the end (April 7, 1898), when the book was made "accessible to the public," clear and

well defined. I have not overlooked your editorial paragraph on page 377 of last issue, in reference to pharmacists and future pharmacopœias. The Medical Council can and will deal with this important subject at the proper time. At present, with the ink of the new volume scarcely dry, any discussion would be premature.

Southwark, London, April 18, 1898. CHAS. UMNEY.

LINIMENTUM TEREBINTHINÆ, B.P., 1898.

Sir,—Amongst a list of the B.P. preparations that have been altered to no advantage I find Linimentum Terebinthinæ. I am sorry a better formula for that preparation has not been found. Not only do I think that the proportions of ingredients are incorrect for a permanent emulsion, but also the directions for manipulation.

Maybole, April 18, 1898. ROBERT TOCHER.

*** Has our correspondent tried the new formula, or is he expressing an opinion only? [*Ed.*, P. J.]

A LECTURE RECORD.

Sir,—It may interest some of your numerous readers to hear that on Thursday, April 14, I delivered my ten thousandth lecture in connection with the Westminster College of Chemistry and Pharmacy. If you consider this incident worthy of notice in your Journal I should be pleased if you would call attention to it in your next issue. With best wishes for the success of the new Pharmacy Bill and the continued prosperity of the Society.

London, April 16, 1898. G. S. V. WILLS.

ANSWERS TO QUERIES.

Special Notice.—*Scientific, technical, legal, and general information required by readers of the 'Pharmaceutical Journal' will be furnished by the Editor as far as practicable, but he cannot undertake to reply by post. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of senders. Questions on different subjects should be written on separate slips of paper, each of which must bear the sender's initials or pseudonym. Replies will, in all cases, be referred to such initials or pseudonyms, and the registered number added in each instance should be quoted in any subsequent communication on the same subject.*

BRITISH PHARMACOPŒIA.—Most probably not, but you cannot afford to ignore the book when it is published. [*Reply to* SALOL.—8/33]

MEDICAL PRELIMINARY EXAMINATION.—Apply to the Registrar, General Medical Council, 299, Oxford Street, London, W., for particulars. [*Reply to* MEDICAL.—8/29.]

DISTEMPER POWDER FOR DOGS.—The powder does not contain a trace of antimony or of mercury, or any heavy metal. Nor does it contain cane sugar, as you state. It is chiefly milk sugar; the lime you found is only a trace, probably present as an impurity in the milk sugar. We cannot tell you more with the amount of material available. [*Reply to* CANINE.—8/26.]

METRIC WEIGHTS.—Pharmacists should not purchase metric weights and measures for use in trade until they can obtain them properly stamped. Those you mention are apparently intended for chemical work, and might be disposed of through our Exchange Column. [*Reply to* S. H.—130/28.]

WOOD VIOLET SACHET POWDER.—Ionone, 20 minims; oil of orris root, 4 minims; heliotropin, 20 grains; oil of ylang ylang, 8 minims; oil of sweet orange, 1 minim; oil of bergamot, 4 minims; musk Bauer, 4 grains; otto of rose, 4 minims; santal oil, 1 minim; orris root, in powder, 4 ounces. We, like yourself, have found that some lots of ionone are more powerful than others. [*Reply to* F. H. S.—9/11.]

PETROLEUM EMULSION.—Sulphur-free heavy white petroleum oil, 2¼ fl. oz.; powdered acacia, 1 oz.; powdered tragacanth, 1 drachm; tincture of quillaia, 2 drachms. Rub down in a warm mortar, then add warm water, 1¾ fl. oz., and emulsify thoroughly. Next gradually add a solution containing calcium hypophosphite, 90 grains; sodium hypophosphite, 90 grains; soluble saccharin, 2 grains; water, 2 ounces. Mix. "Vaseline" is quite "pure enough" to use internally, but the fluid hydrocarbon is better suited for the emulsion. You can use white vaseline oil if you prefer to do so. [*Reply to* PETROLEUM.—9/1.]

BOTANICAL.—1, *Peltigera canina* (Lichenes); 2 and 3, *Pellia epiphylla* (Hepaticæ); 4, *Racomitrium fasciculare* (Musci). [*Reply to* STUDENT.—9/3.]

YACHTING PHOTOS.—The most likely firms to act as London agents for your productions would be Messrs. Erdmann and Schang, 4, Salkott Road, Clapham Junction, S.W.; Messrs. Spooner, 379, Strand, W.C.; Messrs. W. A. Mansell and Co., 271, Oxford Street, W.; and the Autotype Co., 74, New Oxford Street, W. [*Reply to* BEKEN.—8/10.]

PHARMACOPŒIA NOTES.—(1) Probably; (2) We do not state anything of the kind, as you may perceive if you will read the paragraph carefully once more; (3) It is distinctly stated in the introductory paragraph at page 367, that, unless otherwise specified, the rule to be followed is "solids by weight and liquids by measure." [*Reply to* PILULA.—9/10.]

SOOT-REMOVING POWDER.—You are quite right about the composition of the powder. It consists simply of a mixture of about 10 per cent. of sulphur with potassium nitrate. From the amount of material used you will see that it cannot exert much influence in the direction you indicate in your equation, since the weight of sulphur and of potassium nitrate is insufficient to exert any great amount of chemical action on a large amount of soot. Probably the charge acts mechanically by causing a draught, and thus starting combustion, so that the soot is burnt out. [*Reply to* J. A. H.—8/30.]

CONVERSION OF QUININE SULPHATE INTO THE ACID HYDROBROMIDE.—Dissolve the sulphate in water with the aid of a little dilute sulphuric acid. Then add just sufficient barium bromide to precipitate the whole of the sulphuric acid; carefully avoid excess of the barium salt. Acid quinine hydrobromide, $C_{20}H_{24}N_2O_2(HBr)_2 3H_2O$ remains in solution. On filtering off from the barium sulphate, and concentrating by evaporation on the water-bath, the salt will crystallise. The mother liquor must be fairly concentrated, as the salt is soluble in 6 parts of water. [*Reply to* H. D. M.—8/28.]

TESTING CLOTH FIBRE FOR INDIGO.—Material dyed with vat indigo should not be affected with water or with alcohol on gently warming, cold saturated oxalic acid solution, borax, alum, or ammonium molybdate solutions, but the fibre should be immediately decolorised on warming with an acid solution of stannous chloride or ferric chloride. It should give no H_2S on boiling with HCl; after continued boiling, and then adding excess of NaHO, and a few drops of $CHCl_3$, no odour of isonitril should be produced. The colour should be removed by nitric acid. Indigo carmine, on the other hand, is partially removed by borax solution, and the solution coloured blue. Glacial acetic acid removes the colour entirely from fibre dyed with vat indigo, but is without action on those dyed with indigo carmine. For further tests consult Allen's 'Commercial Organic Analysis,' vol. iii., part 1, where you will find full information on the subject. [*Reply to* BETA:—8/27.]

OBITUARY.

LENTON.—On April 3, Joseph Lenton, Chemist and Druggist, late of Biggleswade. Aged 32.

BATES.—On April 13, Henry Bates, Pharmaceutical Chemist, Oldham. Aged 70. Mr. Bates had been a member of the Pharmaceutical Society since 1881, and for many years conducted a successful business in George Street. He retired from active participation in the business some ten years ago, when his brother, Mr. Hiram Bates, succeeded him.

THOMAS.—On April 13, William John Thomas, Chemist and Druggist, Dorrington. Mr. Thomas, who was a student and associate of the Pharmaceutical Society for about ten years, died after a lingering illness of four months' duration.

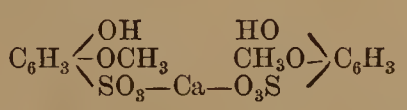
FAULKNER.—On April 13, James Ross Faulkner, Pharmaceutical Chemist, Notting Hill. Aged 57.

COMMUNICATIONS, LETTERS, etc., have been received from

Messrs Baird, Bell, Bird, Bullivant, Clower, Cragg, Cuthbert, Dennis, Dowely, Dowzard, Druce, Farmer, Gibbard, Groves, Hacking, Harmer, Henderson, Hickman, Hogg, Humphreys, Jammie, Lawrence, M'Innes, Martin, Nasif, Newsholme, Parker, Ranken, Smallwood, Squire, Stewart, Thompson, Tocher, Tremeer, Umney, Ward, Watson.

"THE MONTH."

Guajacyl. Guajacyl is the calcium salt of guaiacol-sulphonic acid, and in a 5 to 10 per cent. aqueous solution has been found a good anæsthetic in dentistry and slight surgical operations. It is obtained, according to C. André, by the action of concentrated sulphuric aeid on guaiacol after 48 hours' standing at the ordinary temperature. The red syrupy liquid is neutralised with calcium carbonate, and the filtrate evaporated to dryness. The dried residue is dissolved in four to five times its weight of absolute alcohol, filtered, again dried down, and the guajacyl finally obtained as a greenish-blue powder, which is readily soluble in water and alcohol, but not in oil. It has the composition of—



—*Journ. de Pharm. et de Chim.*, 1898, 324, through *Apot. Zeit.*, xiii., 265.

Determination of Alkaloids in Tinctures and Extracts. J. Katz, in order to avoid the action of heat, which decomposes many alkaloids, has devised a method in which the alkaloid is titrated in the solvent used in the extraction. It is carried out as follows :—25 C.c. of a tincture containing 45 per cent. of alcohol are agitated in a separator with 50 C.c. of ether and 1 C.c. caustic soda solution (33 per cent.). The aqueous solution is separated and shaken twice again with 25 C.c. of ether containing 10 per cent. of alcohol. The ether solution is now agitated with 2 to 3 grammes of plaster of Paris to remove water, and filtered into a stoppered flask. The alkaloid in the ethereal solution is titrated with centi-normal hydrochloric acid, using three drops of an alcoholic solution of iodeosin as an indicator. Alkaloids, such as strychnine, which require chloroform as a solvent, are extracted from tinctures with a mixture containing one part of chloroform and three parts of ether. The chloroform-ether solution is washed with brine, and the separation of the solvent from the aqueous layer is also accelerated by the addition of 2 to 3 grammes of sodium chloride. Tinctures containing more than 45 per cent. of alcohol are diluted with water to this strength, and those containing chlorophyll are first acidulated and the chlorophyll filtered off before determining the alkaloids as above described. Extracts are dissolved in 45 per cent. alcohol and the solution treated as before.—*Pharm. Zeit.*, xliii., 273.

Copper "Pure for Analysis." J. W. Westmoreland has examined a sample of copper-foil, "pure for analysis," which was found to contain copper, 99·30 per cent, together with 0·02 per cent. of lead, and some arsenic. Assuming this copper to be pure, and using it for standardising volumetric solutions, it is evident that concordant yet very erroneous results might be obtained. For example, in testing material containing 5 per cent. of copper, the results would be 0·035 per cent. too high, with 70 per cent. material 0 49 per cent. too high, while metal containing over 99·3 per cent. would apparently contain more than 100 per cent. of copper. Another sample examined contained copper 99·10 per cent., whilst samples marked "Copper Foil Opt," contained copper 99·81 per cent. A specimen marked "Free from Arsenic" was found to contain : Copper, 99·23 per cent. ; arsenic, 0·67 per cent. Three samples obtained in the North of England, marked "Copper, pure for Analysis," contained respectively 99·29 per cent., 99·64 per cent., and 99·87 per cent. of copper. Other provincial samples gave 99 03 per cent., 99 85 per cent., 99·52 per cent., 99·65 per cent., whilst but one was absolutely pure. The author used the electrolytic and iodide methods for determining the percentage of copper in the various samples, and observes that it is evident that although samples which give 100 per cent. by the electrolytic test may possibly not be pure, samples which give lower results, say 99·5 per cent., cannot possibly be pure. The samples stated to be "pure" gave practically 100 per cent. by electrolytic test, and gave results agreeing within the error of experiment when used for standardising thiosulphate solutions for the iodide test, in conjunction with copper obtained by the electrolysis of a solution of the pure sulphate, and of another sample of extremely pure copper, of which the author obtained some quantity. Some of the impure samples were also used in this way (taking the percentage found by the electrolytic test)—and gave results agreeing within the limits of experimental error.—*Analyst*, xxiii., 86.

Acetic Acid as a Menstruum. Dr. E. H. Squibb states that acetic acid has been more extensively used in the past year in the way of applying it to the exhaustion of crude drugs, containing active principles. The drugs have been so completely exhausted as to put beyond all doubt the value of this acid as a solvent. It is found that this acid is so effective that a thoroughly representative extract can be obtained which contains such a slight excess of acetic acid that it may be practically disregarded. Even this excess could be got rid of by heat if its presence was considered detrimental, but when the dose of the extract in question is considered, the amount of acid present is inappreciable. Moreover, such an acetous extract is found to be permanent, showing no signs of deterioration after a lapse of six or eight months. In the case of drugs containing oleoresins even, the exhaustion by this acid has also proved to be quite complete, which proves that its solvent properties may be regarded as fully efficient for all classes of crude drugs—thus substituting it quite completely for alcohol as a solvent in the preparation of both fluid and solid extracts. The ready miscibility of these acetous extracts with water without precipitation, together with the strength and uniformity that can be obtained by the use of this solvent, offsets the objection that may be raised against the small excess of acetic acid in the finished extract, while the greatly decreased cost warrants the use of such extracts even though there were most extreme disadvantages against them. Another very important advantage of these acetous extracts is that their active principles are evidently combined with the acetic acid to form salts which are no longer incompatible with many of the prominent medicaments now found in prescriptions. The latter is such an important advantage that it outweighs many minor disadvantages.—*Ephemeris*, v., 1938.

Oxidases. Prof. J. R. Green has published an exhaustive review of the oxidases or oxidising enzymes, which act by promoting direct oxidation of various substances, chiefly aromatic compounds. Laccase, the earliest of these enzymes to be recognised, is the body which is concerned in the production of lacquer from the crude sap of the lac tree of South-East Asia. Tyrosinase occurs in *Russula nigricans*, Bull., and other fungi which contain chromogens that do not turn blue on exposure to air, but become red and finally black. Œnoxydase plays a prominent part in causing a particular disorder—"casse" or "cassure"—in certain wines. The wine so affected loses its characteristic colour, and after three or four hours contains a red-brown precipitate. Finally, there are various animal oxidases concerning which but little appears to be known at present.—*Science Progress*, vii., 253.

Nascent Hydrogen. D. Tommasi considers that nascent hydrogen is synonymous with H+cal., the greater affinity of the gas in the so-called nascent state being due simply to the fact that the hydrogen, at the moment it is set free, is accompanied by all the heat which is produced while it is being set free. On this assumption, therefore, the differences observed between hydrogen produced by different chemical reactions are explained by the fact that those reactions are not accompanied by the production of the same quantity of heat. Representing nascent hydrogen by H+a (a being the quantity of heat given off by a chemical reaction which results in the evolution of hydrogen), the following results are obtained :—

SO_4H_2+Aq	+Zn	produces	38·0 cals.	(a)
SO_4H_2+Aq	+Cd	,,	23 8 ,,	,,
SO_4H_2+Aq	+Mg	,,	112 0 ,,	,,
2HCl +Aq	+Zn	,,	34·2 ,,	,,
2HBr +Aq	+Zn	,,	34·2 ,,	,,
Sodium Amalgam	+Aq	,,	112·0 ,,	,,

The value of a varies with each chemical reaction, and consequently the hydrogen should be the more active as the value of a increases, bearing in mind that the reaction between the hydrogen and the substance to be reduced may have commenced. In some cases, however, the reduction is not due to H+cal., but to the metal serving for the disengagement of hydrogen (M+cal.), as when potassium chlorate is reduced by zinc and dilute sulphuric acid, or when its solution is electrolysed, zinc being employed for the anode.—*Mon. Scient.* [4], xii., 182.

Gums. Three kinds of gum from the Hinterland of Angra Pequena, South-west Africa, are described by K. Dieterich (*Ber. Deut. Pharm. Ges.*, vii., 3). Gum "Tlach": dissolves in ten parts of water. The solution has a sweet taste, is completely precipitated by alcohol, and does not reduce Fehling's solution. A mucilage of 1 : 2 is of a fine brown colour, somewhat cloudy, and gives a gelatinous precipitate with ferric chloride. Gum "Amrad": a solution 1 : 10 is sweet with an acid reaction, is not precipitated by alcohol and lead salts and does not reduce Fehling; it gives a cloudy mucilage and is gelatinised by ferric chloride. Gum "Auruar": the aqueous solution is rendered cloudy by alcohol and precipitated by lead sub-acetate, but is unaffected by lead acetate. It reduces Fehling's solution. The mucilage 1 : 2 is coloured, not quite clear, and is gelatinised by ferric chloride. All three kinds of gum have good adhesive properties, but as they do not correspond from a chemical point of view with gum arabic or Senegal gum they cannot, for medicinal purposes, be used as substitutes, although adapted for technical use.—*Apot. Zeit.* xiii., 265.

Histology of Veratrums. R. H. Denniston has endeavoured to distinguish the powdered rhizome of *Veratrum album*, L., from that of *Veratrum viride*, Ait., but although certain reactions were found to distinguish the powders when separate, the difference, being mainly one of intensity, proved to be of practically no value when the powders were mixed. The structure of the two rhizomes is identical in almost every detail, whether viewed in transverse or longitudinal sections, and such slight differences as are apparent at times are not constant. In the root structure, however, greater differences are found. Directly beneath the epidermis in *V. viride* there are but two or three rows of large, irregular, distorted collenchymatous cells; in *V. album* the collenchyma consists of seven or eight rows of rounded, thicker-walled, and smaller cells, which are not distorted in the least. As a rule the whole cortical region in *V. album* consists of smaller and more regular cells than in *V. viride*, and in the central bundles of the former there are usually found a somewhat larger number of wood rays, whose largest trachcæ do not approach the size of those of *V. viride*. But when the drugs are powdered these differences in root structure are valueless in helping identification, as the roots of *V. album* are usually removed before powdering. The form and size of the starch grains do not differ essentially in the two rhizomes, and raphides are equally abundant in the phrenchyma cells of both. The use of alkaloidal reagents was next resorted to, and in every instance the powder of *V. album* showed a deeper colour than that of *V. viride*, as was to be expected when the great preponderance of alkaloids in the former is considered. Concentrated sulphuric acid gave a brick-red colour with *V. album*, and an orange-red with *V. viride*, but neither this nor any other test tried was of any use in the case of mixed powders.—*Pharm. Archives*, i., 68.

Yeast and Fermentation. Professor J. R. Green devotes a lengthy paper to the consideration of the relation of yeast to alcoholic fermentation. It is, for the most part, historical, but prominence is given to the widely-different theories that have been offered, from time to time, to account for the phenomena of fermentation, and the paper concludes with the statement that, if Buchner's recently published results should be confirmed, a very heavy blow will be dealt to the vibration theories of fermentation due to Liebig and Naegeli, whose views are only tenable on the supposition that most, if not all, the action takes place in the liquid outside the yeast cells. If, however, Buchner is correct, and the work is done by means of an enzyme, it must necessarily be intra-cellular, for enzymes, so far as is at present known, show no tendency to diffuse through such a membrane as the cell-wall. The latest theory also militates against Pasteur's idea of intra-molecular respiration, which demands the idea of decomposition being brought about by chemical action between the protoplasm and the body from which it is suggested it obtains its oxygen.—*Nature*, lxxvii., 591.

Preparation of Crealbin. This combination of creolin and albumin may be obtained by dissolving 100 of dried egg albumin in water, and to the clear solution adding a mixture of creolin 100 and water 1000. Then add sufficient 10 per cent. dilute hydrochloric acid to precipitate the crealbin. Collect, drain, press, and dry on the water-bath, powder and again dry for three hours at 115° to 120° C.—*Journ. de Pharm. d'Anvers*, liv., 62.

Desichthol. Ichthyol distilled with steam loses about ½ per cent. of a volatile oil, to which the odour is due. The residue is comparatively odourless and is called desichthol. The chemical and therapeutic actions of this body have yet to be determined. If it retains the properties of ichthyol, without the powerful odour, it will prove a useful addition to pharmacy and medicine.—*Pharm. Ztg.*, xliii., 155.

Quinine Glycero-Phosphates. There are two glycerophosphates of quinine —basic and neutral. According to E. Fallieres, the basic glycerophosphate may be obtained by dissolving 75·6 grammes of quinia in 400 or 500 C.c. of ether and mixing with a solution of 17·2 grammes of glycerophosphoric acid in 50 to 60 grammes of alcohol (96 per cent.). An abundant white precipitate is thrown down, which is collected, washed with ether, and dried in the air. For the neutral salt 36 grammes of quinia are taken and treated in a similar manner with 17 grammes of the acid. The salt is precipitated in the form of small needles of a yellowish tint. When collected it forms a yellowish crystalline powder, moist to the touch, which, from its tendency to aggregate, should only be prescribed in pilular form. For general use the basic salt is to be preferred.—*Annales de Pharm.* [9], iv., 123.

Menthoxol, Camphoroxol, and Naphthoxol

These preparations, which consist of a combination of a 3 per cent. hydrogen peroxide solution with alcoholic solutions of menthol, camphor, or naphthol, have been shown by Beck to be powerful germicides. Wagner has employed 10 per cent. solutions of these oxols (*Deutsch. Med. Wochenschr.*) in the treatment of abcesses and suppurating wounds. After, if necessary, opening the abcess and irrigating the wound with the solution, a pad of cotton moistened with a 10 per cent. solution is laid on the surface and kept in position by a bandage. The dressing is changed every second day. All three oxols act alike and are equally efficient, menthoxol in contact with the wound disengages large quantities of gas, so as to form a copious froth. In all cases purulent discharges rapidly cease and healthy granulation supervenes. The oxols are perfectly free from any irritating effect, and prove to be energetic deodorants. Menthoxol is specially useful in this respect.—*Nouv. Rem.*, xiv., 112.

Poisoning by Wormwood Seed.

A fatal case of poisoning with the oil of *Chenopodium anthelminticum* is recorded by Dr. A. R. Bond in the *Maryland Medical Journal*. The victim, a boy of three, succumbed in less than twelve hours after being given a dose of half a teaspoonful of wormseed oil, despite every effort to remove the poison. Wormseed tea is a popular remedy for "worms" in the United States, but the oil is evidently a powerful drug, and should be employed with caution. Many text-books give no indication that oil of wormseed may exert a toxic effect.—*Therap. Gaz.*, xii., 108.

Low Temperatures and Germination.

To test the power of seeds to resist cold, Mr. H. T. Brown and Mr. F. Escombe have subjected a number of air-dried seeds (containing from 10 to 12 per cent. of natural moisture) for 110 consecutive hours to a temperature between − 183° and − 192° C., subsequently thawing them very slowly. The seeds belonged to various natural orders—Gramineæ, Cucurbitaceæ, Leguminosæ, Geraniaceæ, Compositæ, Umbelliferæ, Convolvulaceæ, Liliaceæ. Their germinative power was not appreciably reduced; the resulting plants grew to full maturity and were quite healthy. Some of the seeds experimented on contained endosperm, others did not; the reserve material consisted in some cases of starch, in others of oil or mucilage.—*Proc. Royal Society*, lxii., 1897, p. 160.

Protoplasmic Threads Perforating the Cell-Walls.

Pursuing his investigations on this subject, Mr. W. Gardiner has determined the existence of protoplasmic threads connecting cell with cell in a large number of additional instances. They are often of extraordinary tenuity, and are present in very great quantities. In the case of pitted tissues the pit-closing membrane is invariably traversed by "pit-threads"; but the protoplasmic threads are by no means confined to the pits; "wall-threads" frequently perforate the walls of the cells themselves. When the same cell is provided with both pit-threads and wall-threads, the former are stouter and more readily stainable than the latter. The pit-threads are collected into groups, and in every group the threads are arranged in bundles. The threads appear to be a primary and not a secondary formation in the cell; the whole system of connecting threads arises at an early stage. The author altogether discards the idea of a system of open pits connected with one another. He has little doubt that connecting threads of protoplasm occur universally in all the cells of all the living tissues of all plants. The fundamental unit in vegetable physiology is, therefore, not the cell, but the plant. The following is a list of the tissues in which connecting threads of protoplasm have been observed by the author:—Cotyledons of *Tropæolum majus*; endosperm of *Lilium martagon*, *Fritillaria imperialis*, *Hordeum vulgare*; root of *Ranunculus asiaticus*; leaf-stalk of *Tamus communis*, *Viscum album*, *Aucuba japonica*, *Prunus laurocerasus*, *Nerium oleander*, *Lilium martagon*, *L. candidum*, *Salisburia adiantifolia*, *Asplenium rutæfolium*, *Marattia elegans*; flower-stalk of *Taraxacum dens-leonis*; pulvinus of *Mimosa sensitiva*, *Robinia pseudacacia*; tendril of *Cucurbita pepo*.—*Proc. Royal Society*, lxii., 1897, p. 100.

Antherozoids of the Dictyoteæ.

J. Lloyd Williams confirms his previous statement that the male elements in this class of sea-weeds are motile antherozoids, not passive pollinoids. In *Dictyota dichotoma* and *Taonia atomaria* a single antherozoid is formed from each cell of the antherid. It has only a single long flagellum, which may be as much as six times as long as the diameter of the head, and is often spiral. The greater part of the head consists of hyaline protoplasm, one side being occupied by a thin layer of denser plasm, the flagellum springing from about the centre of this layer. The motility of the antherozoid continues only for a short time, usually about ten minutes, and under unfavourable conditions may be entirely suspended.—*Annals of Botany*, 1897, 565.

Opium Industry in America.

In an article in the *Scientific American*, March 5, p. 147, it is stated by Mr. C. F. Holder that it is estimated that in San Francisco 30 per cent. of the Chinese are addicted to smoking, and that 10 per cent. of the entire population of China Town are habitual opium drunkards. In one year the importations for smoking purposes amounted to 100,000 pounds. In alluding to the habit in China, Mr. Holder states that China is probably the largest poppy producing nation, South-Western China producing 224,000 piculs, as against 100,000 piculs from India. Nearly all the opium smoked in California comes from the Took Hing Co., of Hong Kong, which pays the Government £300,000 for the privilege of carrying on the business.

Asarum Canadense.

Professor H. Kraemer gives illustrations of the wild ginger or *Asarum canadense*, and a plant that has been confounded with it, which was separated as a distinct species under the name of *Asarum reflexum* by Mr. E. P. Bicknell in November last. The species differs chiefly in the shape of the flowers. In *A. canadense* the calyx lobes are spreading, passing gradually into a slender upcurved acumen, and the interior of the calyx tube is purple down to the base, but in the *A. reflexum*, the lobes reflexed and abruptly acuminate into a straight obtuse point, the calyx tube being white within. The *A. canadense* prefers rich hilly woods, often in rocky situations, and the *A. reflexum* low woods along streams or river valleys, often forming extensive beds, rarely in upland woods. It is not yet ascertained which species yields the wild ginger rhizome of commerce, nor whether the rhizomes differ in anatomical structure.—*American Journ. of Pharm.*, pp. 145, 149.

Prophylactic Hair-wash.

For prophylactic purposes P. Eichoff recommends a hair wash composed of captol, which is a tannin chloral compound, and therefore containing no free chloral, acid. tartar, resorcin, each 1 part; salicylic acid, 0·7; ol. ricini, 0·5; ess. flor., *q.s.*; and spirit. vin. rect. (65 per cent.), 100 parts.—*Monat. Prakt. Derm.*, 1898, 361, through *Apoth. Zeit.*, xiii., 266.

THE NEW PHARMACOPŒIA TEST FOR QUININE SULPHATE.

BY A. J. COWNLEY.

The new Pharmacopœia test for quinine sulphate differs in several respects from that prescribed in previous editions, but it cannot be said to be an improvement on it. Considering the number of investigations and criticisms on quinine sulphate testing that have been made since the previous Pharmacopœia, it was to be expected that the official authority in this country for fixing the standard of quinine sulphate would have given us an official test that could be regarded as a scientific method of testing. In default of that, it would have been better to have merely prescribed a limit of impurity, leaving the method of arriving at the result in the hands of those competent to undertake the necessary operation. The test now prescribed can hardly be considered as scientific or accurate. The method given in the 1887 Pharmacopœia, based, as it was on the method suggested in the Journal [3], vii., 653 and 673, was rendered nugatory by unauthorised alterations. The defects in the test have, however, been clearly pointed out (*P. J.*, xvii., 645), and it was only necessary to have added some further modification derived from experience and published work to have given a test worthy of the new Pharmacopœia.

The new test stipulates that 4 grammes of the quinine sulphate are to be dissolved in 120 C.c. of boiling water and the solution allowed to cool slowly to 50° C., with frequent stirring; separate by filtration the purified quinine sulphate which has crystallised out. The filtrate is to be concentrated to 10 cubic centimetres or less, and when cold shaken with 10 cubic centimetres of ether, and half that amount of solution of ammonia. Set aside in a cool place for not less than 24 hours. Collect the crystals, which consist of cinchonidine and cinchonine (*sic*) combined with quinine, on a tared filter, wash with a little ether, dry at 100° C., and weigh. These should not amount to more than 0·12 gramme. Quinine sulphate so tested should not yield more than a total of 3 per cent. of crystals of impure cinchonidine.

The directions also prescribe methods of testing for cinchonine, quinidine, and cupreine, alkaloids which are never present in quinine sulphate of any known commercial manufacture. Moreover, cupreine is a rare alkaloid, met with only in the bark of *Remijia pedunculata*, which at the present time is seldom, if ever employed by quinine manufacturers, and in any case cupreine could only exist in quinine sulphate to the extent of a few hundredths per cent.

For the purpose of ascertaining the value that can be attached to the new test, and the amount of impurity (cinchonidine) that might be passed in following out the directions exactly as described, two samples of quinine sulphate of well-known brands were examined. The following results were obtained:—

SAMPLE A.—This sample contained 15 23 per cent. water of crystallisation. Four grammes of the quinine sulphate were dissolved in 120 C.c. of boiling water in the manner described, and cooled slowly to 50° C. and filtered at that temperature. The filtrate on cooling to 15°·5 C. deposited crystals, and when concentrated to 10 C.c. gave on cooling a heavy magma of crystals. The entire mass of liquid and crystals was shaken with 10 C.c. of ether and 5 C.c. of ammonia, and allowed to stand twenty-four hours. The separated crystals, after washing with a little ether, were weighed, and amounted to 0·099 gramme, or 2·48 per cent. on the quinine sulphate taken.

SAMPLE B.—This sample contained 12·7 per cent. water of crystallisation. Four grammes were taken and dissolved in hot water as directed. In this case also a heavy magma of crystals was obtained on concentrating to 10 C.c. The crystals and adherent liquid together were shaken with 10 C.c. of ether and 5 C.c. of ammonia solution. On standing for twenty-four hours the impure crystals separated, and washed gave 0·222 gramme, or 5·55 per cent. on the quinine sulphate taken.

The results by the new Pharmacopœia test are then—

	Sample A.	Sample B.
Impure crystals	0 099 gramme	0·222 gramme.
Equal to.....	2·48 per cent.	5·55 per cent.

The point now to ascertain is what do these results mean? Is it really supposed by the compilers of the Pharmacopœia that 0·099 gramme, or 2·48 per cent., and 0·222 gramme, or 5·55 per cent., express the maximum amount of impurity as represented by the crystals obtainable in these two samples? In order to answer these questions, and to show the absurdity of such a contention, the two samples, A and B, were submitted to an exhaustive examination, more particularly to obtain the maximum amount of crystals of "impure cinchonidine" separable from quinine sulphate. The method adopted was that of repeated fractionation by crystallisation from water, following in a modified form the directions given in the Journal (B. H. Paul, *P. J.* [3], vii., 673), the operation being continued until no crystals could be obtained from a small volume of ether. In this manner were obtained from—

	Sample A.	Sample B.
Total amount of impure crystals	0·21 gramme	0·428 gramme
Equal to	5·25 per cent.	10·7 per cent.

So that the results thus compare—

	Sample A.	Sample B.
Impure cinchonidine crystals actually obtainable	0·210	0·428
Impure cinchonidine crystals obtained by the new British Pharmacopœia process	0·099	0·222
Impurity passed as crystals.....	0·111	0·206
Or expressed in percentage:—		
Crystals obtained by the B P. process	47·2	51 8
Crystals missed by the B.P. process.....	52·8	48·2
Total crystals	100·0	100·0

These results, therefore, show that the new test misses 52·8 per cent. of "crystals of impure cinchonidine" in Sample A, and 48·2 per cent. in Sample B.

The Pharmacopœia limit is 0·12 gramme of impure crystals, and according to Sample A, which is a sample of recognised high-class quality, only 47·2 per cent. of crystals are obtainable by the B.P. process. The total amount of crystals that could be obtained according to the method above described would be—

$$0{\cdot}12 \times \frac{100}{47{\cdot}2} = 0{\cdot}254$$

The B.P. limit of 0·12 gramme therefore shows a loss, as under:—

	Gramme.		Per cent.
Crystals obtainable by the B.P. process	0·120	=	47·2
,, missed ,, ,, ...	0·134	=	52·8
Total crystals possible to be obtained	0·254	=	100·0

The new Pharmacopœia test therefore misses, in a sample of quinine sulphate answering the B.P. limit of 0·12 gramme from 4 grammes, over 50 per cent. of impurity, as expressed in the empirical term "crystals of impure cinchonidine."

It is necessary, in order to make these results of the Pharmacopœia test intelligible, to obtain some concrete value from them, and to express the impurity in terms of cinchonidine sulphate.

It is now generally acknowledged by quinologists—chiefly from the work of Dr. Hesse—that the cinchona alkaloids are apt to form double compounds when crystallising from such solvents as ether.

The amount of quinine contained in crystals of quinine and cinchonidine separating from ether is dependent to a large extent on the relative proportion of each present, and the object to be obtained in quinine sulphate testing is to eliminate as much as possible by a preliminary operation the greater part of the quinine before treatment with a solvent such as ether.

In the Pharmacopœia test the object seems to be to obtain as much as possible of quinine mixed cinchonidine. For it is directed that the solution should be cooled to 50° C. and filtered, thereby retaining a quantity of quinine sulphate in solution.

On the basis of the crystals separating from ether by the Pharmacopœia method containing 70 per cent. of cinchonidine, the results above obtained are thus stated in terms of crystallised cinchonidine sulphate.

Quinine Sulphate.

	A.	B.	B.P. sulphate of quinine yielding 0·12 gramm of crystals.
	per cent.	per cent.	per cent.
Crystallised cinchonidine sulphate from B.P. results	2·34	5·24	2·83 = 47·2
Crystallised cinchonidine sulphate missed	2·61	4·87	3·16 = 52·8
Total cinchonidine sulphate present in the sample of crystallised quinine sulphate	4·95	10·11	5·99 = 100·0

Therefore the statement that a sample of quinine sulphate answering the requirements of the Pharmacopœia "should not yield more than a total of 3 per cent. of crystals of impure cinchonidine," by the Pharmacopœia test, really means that quinine sulphate containing an admixture of 5·99 per cent. of crystallised cinchonidine sulphate would answer the requirements of the new British Pharmacopœia.

INVISIBLE AND SYMPATHETIC INKS.*

BY J. RUTHERFORD HILL.

So-called invisible and sympathetic inks are well known, and there are many formulæ for their production. They have been used for secret correspondence, but are perhaps of more interest to the conjuror or the romancist than to the prosaic disciple of Galen. And yet the latter is not infrequently applied to by the conjuror, either professional or amateur. Such was my lot on a recent occasion. An invisible or a sympathetic ink was required that would become visible on exposure to the fumes of either chloroform, ether, or ammonia. A reference to the usual authorities gave no practical result, and the case seemed rather hopeless; but it occurred to me that by using a solution of mercurous nitrate and exposing the writing to the fumes of ammonia, a precipitate of black mercurous nitrate would be formed and give the desired result. On writing with such a solution, by means of a quill, on ordinary white paper, the writing, when dry, is invisible. A small quantity of strong solution of ammonia is placed in the bottom of a large cylindrical glass jar, which thus becomes filled with ammonia gas in a suitably moist condition. On placing the paper with the invisible writing inside the jar for a few seconds and then withdrawing it, it will be found that the writing comes out in a very distinct black.

This is an invisible ink, but when once developed it remains. A sympathetic ink, on the other hand, is one that becomes visible and then vanishes again as required. To meet this requirement it occurred to me to try a fairly strong solution of phenol-phthalein. Writing with such a solution on ordinary white paper is quite invisible when dry, but when placed for a few seconds in the jar above mentioned the writing becomes of a beautiful pink colour, which fades as the ammonia evaporates. By breathing upon the paper the colour disappears almost immediately. By a little thought many other devices of a curious and interesting kind might be discovered, and perhaps the addition of the foregoing to the ideas already in existence may be found useful by those who are called upon to cater for the multifarious demands for something new, mysterious, and entertaining.

METHYLATED SPIRIT IN PHOTOGRAPHY.*

BY J. RUTHERFORD HILL.

Certain objections to the use of methylated spirit containing rock oil, in photography, have been brought under my notice by a professional photographer. Thus, in the process of enamelling collodion is used. As received, the collodion is too dense, and has to be diluted in the proportion of one part of collodion, one part of ether, and one part of methylated spirit. Before the addition of rock oil to the spirit this process was in constant use, and gave uniformly satisfactory results. After the addition of the oil it was found that the finished picture was spoiled by a white hazy opalescence, particularly at one corner.

The process of enamelling is as follows:—The diluted collodion is made to flow over a plate of glass, and is then drained off at one corner and allowed to dry. The print is placed in a bath of hot solution of gelatin in water and then "squeegeed" on to the collodion-coated plate. After it is dry the print is peeled off, the resultant picture possessing a highly-glazed or enamelled surface. But after the use of the rock oil spirit, a very large proportion of the pictures were completely spoiled in the way above indicated. At first no explanation of this untoward circumstance was thought of, and it was assumed that the fault lay in the collodion. After several new quantities of collodion had been tried without any improvement, suspicion was ultimately attached to the methylated spirit. This was found to be the source of the evil, and on using methylated spirit free from rock oil the results were again uniformly satisfactory. The explanation arrived at was that rock oil in the spirit and the water in the gelatin were the cause of the opalescence complained of.

It may be interesting to note that a liquid called "pyroxylin solvent" is extensively sold for the foregoing and other technical purposes. To all appearance it is simply a mixture of ether and methylated spirit, free from rock oil. This, of course, is quite free from objection for the purpose, but the legality of the sale of such a mixture is surely a point that requires to be cleared up.

It frequently happens that a picture is wanted in a hurry, and, in such cases, after the negative has been developed and washed, it is dried in a very short time by dipping it into methylated spirit, and then removing it and letting it dry, sometimes in a warm place. In this way, what would take several hours may be done in fifteen or twenty minutes. But one difficulty that occurs if methylated spirit with rock oil is used is that the negative is covered all over with a white fog, which is objectionable, and may interfere with the printing, especially in the case of delicate or faint negatives. This white fog appears to be caused by contact of water in and on the film with oil in the methylated spirit.

Another objection in this dipping and drying process, which is in constant use in every large studio, is that the spirit very soon becomes muddy from precipitation of rock oil by water. It cannot, therefore, be used again and again as was the case with the old methylated spirit. Considering that the addition of rock oil seems to have been quite ineffectual for the purpose for which it was added, and that so much may be said against the addition, it certainly seems as if some good reason should be given to justify the retention of the existing regulation or it should be abolished.

* Read at an Evening Meeting of the Pharmaceutical Society (North British Branch) on Wednesday, April 20.

The British Pharmacopœia, 1898.

The Vegetable Materia Medica of the Work.—(*Continued.*)

DIGITALIS FOLIA.—Bentl. and Trim., 'Med. Pl.,' vol. iii., p. 195. Collected from plants commencing to flower. The lower veins of the leaf are decurrent down the petiole. The leaf has glandular, simple, usually three-celled hairs. The transverse section exhibits a mesophyll free from crystals of calcium oxalate. Dose in powder ½ to 2 grains. The decurrent veins and other characters serve to distinguish the leaves from those of *Inula conyza* and other accidental admixtures.

ELATERIN.—The process of obtaining it is here omitted. Small hexagonal scales almost entirely insoluble in water. Neutral to litmus.

ELATERIUM.—The fresh fruit of *Ecballium elaterium* is no longer official, and the process for preparing elaterium is omitted. When exhausted with chloroform, the solution evaporated, the residue washed with ether and the process of solution, evaporation and washing repeated, elaterium should yield 25 per cent. or not less than 20 per cent. of elaterin. Dose 1/10 to ½ grain.

ELEMI.—Omitted.

ERGOTA.—Bentl. and Trim. 'Med. Pl.,' vol. iv. plate 303. Taste disagreeable. Ergot should be free from mustiness; it is liable to deteriorate by keeping and by exposure to damp. Dose, 20 to 60 grains. Ergot is often slightly damp when received into stock, and needs careful drying and preservation from damp air.

EUCALYPTI GUMMI. Additions, 1890.—Mueller, 'Eucalyptographia.' Characters and tests: In grains or small masses. Thin fragments are transparent, and of a ruby-red or garnet-red colour. It is somewhat tough and has a very astringent taste. When chewed it adheres to the teeth and tinges the saliva red. Dose, 2 to 5 grains.

EUONYMI CORTEX.—Additions, 1890. Sargent, 'Silva,' vol. ii., tab. liii. The outer layer is a soft friable cork. The bark breaks with a short fracture, the fractured surface is yellowish in colour.

FARINA TRITICI is omitted.

FEL BOVINUM.—The word "hygroscopic" is introduced into the character and tests.

FICUS.—The dried fleshy receptacles, Bentl. and Trim., 'Med. Pl.,' vol. iv., pl. 228.

FILIX MAS.—Bentl. and Trim., 'Med. Pl.,' vol. iv., plate 300. The bases of the petioles bear numerous brown membranous scales. The rhizome and bases of the petioles are green internally and the latter exhibits in transverse section about eight pale yellow fibro-vascular bundles in each, arranged in a diffuse circle.

FÆNICULI FRUCTUS.—The word "ripe" is inserted in the description of the fruit. About 1/10 in. (3 Mm.) in diameter, pale yellowish-brown (instead of brown); the primary ridges are prominent. The mericarp exhibits in transverse section six large vittæ. Considering the variation in the constituents of the essential oils of the different kinds of fennel fruits met with in commerce, some indication of the best variety might have been expected, on the score of uniformity of flavour, in preparations containing it.

GALBANUM.—*Ferula rubricaulis* is omitted as a source of galbanum. The tears are usually opaque and yellowish-white internally, sometimes bluish-green in colour and mixed with transverse slices of the root. The taste is not now described as alliaceous. If a small fragment is heated to redness in a dry test tube, the contents of the tube after cooling yield, with boiling water, a solution that when largely diluted and made alkaline with solution of ammonia exhibits a blue fluorescence. Dose, 5 to 15 grains.

GALLA.—*Quercus infectoria*, Oliv. Bentl. and Trim. 'Med. Pl.' vol. iv., p. 249.

GELATINUM. Additions, 1890.—The word "animal" is substituted for "gelatigenous" in the description. The sheets or shreds are almost colourless. A solution in 50 parts of hot water solidifies to a jelly on cooling.

GELSEMII RADIX.—The rhizome has usually a brown or dark brownish violet cork, often much fissured, is nearly straight, and exhibits silky fibres in the bast. The root is yellowish-brown, finely wrinkled and somewhat tortuous. The dose is omitted.

GENTIANÆ RADIX.—The dried rhizome and roots. The rhizome bears closely approximated encircling leaf scars, and is frequently terminated by a bud. Tough when slightly moist, but brittle when dried. The central portion consists principally of parenchymatous tissue, is soft, and is not distinctly radiate. The use of the term "rhizome" here is unnecessarily misleading, as the so-called rhizome and root are continuous. The word root-stock, *i.e.*, the stem-like part of the root, would be much more appropriate. The description in the last edition was much clearer.

GLYCYRRHIZÆ RADIX.—The peeled root and peeled subterranean stem. Before being peeled dark brown in colour, and longitudinally wrinkled, but not scaly; when peeled yellowish with a nearly smooth fibrous surface. The fracture is coarsely fibrous; internally the drug is yellow. A transverse section exhibits a porous distinctly radiate wood, and a thick cortex with groups of bast fibres arranged in radial lines. The taste is free from bitterness. The absence of bitterness is apparently intended to exclude the use of Russian peeled liquorice and other Eastern varieties derived from *G. echinata* or *G. glandulifera*.

GOSSYPIUM.—It dissolves in concentrated solution of copper ammonio-sulphate.

GRANATI CORTEX.—The dried bark of the stem and root. In irregular curved or channelled pieces ½ to 1 inch (12–25 Mm.) in width. The outer surface of the root bark is rough, yellowish-grey, and marked with irregular conchoidal depressions, the stem being smoother and frequently bearing minute lichens, the inner surface yellow, more or less tinged with brown. The transverse section exhibits numerous fine radial and tangential lines. The permission to use stem bark is an advantage, as it is always found in the commercial article in large proportion.

GUAIACI RESINA.—The masses should not contain bark, wood, or other impurities, since the mention of these is now omitted. A solution in alcohol (90 per cent.) assumes a blue colour on the addition of diluted test solution of ferric chloride.

GUAIACI LIGNUM.—For *Guaiacum sanctum*, a reference is given to Sargent, 'Silva,' vol. i., plate 28. Chips, raspings, and shavings are not mentioned.

HÆMATOXYLI LIGNUM.—The heart-wood dull orange to purplish red, but is not described as sliced; and the chips or coarse powder should be unfermented, but their colour is not described as in P.B., 1885.

HAMAMELIDIS CORTEX, Additions, 1890.—The dried bark of *Hamamelis virginiana*, 'Bot. Mag.,' plate 6684. The bark is stated to be about 1/16 in. thick, marked with transverse lenticels frequently freed from the cork, then exhibiting a nearly smooth reddish-brown outer surface. The inner surface is pale reddish-pink; the fracture is laminated and coarsely fibrous. The transverse section exhibits a complete ring of sclerenchymatous cells and numerous tangentially-elongated groups of bast fibres.

HAMAMELIDIS FOLIA, Additions, 1890.—The leaves fresh and dried. Broadly oval in outline. The upper surface is dark green or brownish-green in colour, the under surface paler; the margin is sinuate; the veins are furnished on the under surface with stellate hairs. The leaves have no marked odour. (The fresh leaves exhibit hairs sparingly scattered over the under surface, but they are less visible in dried leaves except on the veins.)

HEMIDESMI RADIX.—Bentl. and Trim., 'Med Pl.,' vol. iii., plate 174. Rigid, seldom exceeding 1/4 in. (6 Mm.) in thickness, and of a reddish-brown or dark brown colour. On one side of the root the cork is frequently separated from and raised above the cortex. The transverse section exhibits numerous laticiferous cells in the cortex.

HIRUDO.—Brand and Ratzeburg, 'Med. Zool.,' vol. ii., tab.

xxviii., fig. 34, and tab. xxx., fig. 1. The anterior end is terminated by a small sucker surrounding the tri-radiate jaws, and the posterior by a large sucker. The body is marked with from 90 to 100 fine annulations.

Hydrastis Rhizoma, Additions, 1890.—The scars are cup-shaped. The fractured surface exhibits a ring of bright yellow, somewhat distant narrow wood bundles. It has a characteristic odour and a bitter taste.

Hyoscyami Folia.—Collected from the flowering biennial plant. No geographical source is given. The leaves are mostly sessile, grandular hairy, particularly along the veins. The corolla is yellowish, with a network of purplish veins. The mesophyll of the leaf contains prisms of calcium oxalate.

Ipecacuanhæ Radix.—The dried root of *Psychotria ipecacuanha*, Stokes. An additional reference to an illustration is given, which represents the short-styled form of the plant, viz., Berg und Schmidt, 'Off. Gewachse,' bd. 1, 11 tab. xv.c., that of Bentl. and Trim., 'Med. Pl.,' vol. ii., pl. 145, representing the long-styled form. The pieces not often exceeding 6 inches in length (15 Cm.) or ¼ inch (6 Mm.) in thickness. It varies in colour from dark brick-red to very dark brown, the annulations not taking the form of narrow merging ridges (distinction from Carthagena ipecacuanha). The fractured surface exhibits a thick greyish cortex, which usually has a resinous, but sometimes a starchy, appearance, and a small dense central portion. When examined under the microscope the cortex exhibits small compound starch grains and raphides. The wood contains no vessels. Dose, as an expectorant, ¼ to 2 grains. It is remarkable that the word radix has been added here, while cortex has been removed from cascarilla, on what grounds it is impossible to guess. The microscopic character, "the wood contains no vessels," distinguishes it from *Richardsonia* but not from *Psychotria emetica*, which also has none. It might have been supposed that Carthagena ipecacuanha, which contains more of the actively emetic principle cephaeline, would have been selected as the official kind. It yields preparations much more active as emetics than the Brazilian variety.

Jaborandi Folia.—The dried leaflets of *Pilocarpus jaborandi*, Holmes ('Bot. Mag.,' pl. 7483, and *P. J.* [3], vol. v., p. 582). The leaflets usually vary from 2½ to 4 inches (6 to 10 Cm.) in length. The mature leaflets are glabrous or exhibit at most a few scattered hairs on the under surface. On the upper surface the lateral veinlets are distinctly prominent. It is to be regretted that an alternative species, *P. selloanus* or *P. microphyllus*, was not admitted, since the genuine leaves are at times not procurable in the market, and a double quantity of the leaves of *P. selloanus* would have been about equal in strength to the genuine leaves.

Jalapa.—Bentl. and Trim., 'Med. Pl.,' vol. iii., pl. 186. Varying in length from 1 to 3 inches (2½ to 7½ Cm.) or more. Examined under the microscope it exhibits numerous compound starch grains, clustered crystals of calcium oxalate, and cells containing resin.

Kamala.—Omitted.

Kino.—Bentl. and Trim., 'Med. Pl.,' vol. ii., plate 81. The juice is evaporated to dryness. Partially soluble in cold water. Not less than 80 per cent. should be soluble in boiling water. Dose, 5 to 20 grains.

Krameriæ Radix.—Pará rhatany (*Krameria argentea*, Mart., 'Fl. Brasil.,' vol. xiii., pt. 3, plate 28) is substituted for the Savanilla kind. In cylindrical pieces characterised by its purplish-brown colour, and smooth thick bark marked at intervals by deep transverse cracks, and adhering firmly to the wood, which is of a pale reddish-brown colour. Details of measurements are not given under this drug.

Lac.—Omitted.

Lactuca.—Omitted.

Laricis Cortex.—Omitted.

Lauro-cerasi Folia.—Practically unaltered.

Limonis Cortex.—*Citrus medica*, var. *B. limonum*, Hook.f.

Linum.—*Lini semina*, B.P., 1885. The surface is minutely pitted. They contain a narrow oily endosperm and two large oily cotyledons. This name is another of the curious anomalies to be met with in the new Pharmacopœia. Whilst *Ipecacuanha* is changed into *Ipecacuanhæ radix*, *Lini semina* is altered to *Linum*, and *Lini farina*, which might have been more correctly called *Lini semina contusa*, is called *Linum contusum*. Literally translated, therefore, into English, the new names mean flax or thread, and bruised flax.

Linum Contusum.—*Lini farina*, B.P., 1885. Linseed reduced to a coarse powder. It should be recently prepared and have a bland, not pungent or rancid odour when mixed with warm water. I should yield not less than 30 per cent. of oil when exhausted by carbon bisulphide, and should not yield the characteristic reactions with the tests for starch. When incinerated with fresh access of air it should leave not more than 5 per cent. of ash.

Lobelia.—The stems have often a purplish tint, and bear one-celled hairs and the scars of alternate leaves. The fruits are inflated, two-celled, and when mature contain oblong minute reticulated brown seeds. The transverse section of the stem exhibits laticiferous vessels in the bast.

Lupulinum.—A brownish-yellow powder. Glands consisting of a single hemispherical layer of cells, the cuticle of which has been raised by the secretion of the oil or oleoresin contained in the gland. It should contain not more than 40 per cent. of matter insoluble in ether, and not more than 12 per cent. of ash when incinerated.

Lupulus.—Hops. No geographical source is given. The strobiles consist of membranous stipules and bracts. The bract at the base and the achene are sprinkled with yellow glands.

Manna.—Omitted.

Mastiche.—Omitted.

Maticæ Folia.—Omitted.

Mel.—Appears only as Mel Depuratum. The characters and tests are those given under "Mel" in the B.P., 1885. Incinerated it should not yield more than 0·25 p. c. of ash.

Mezerei Cortex.—The bark of *Daphne gnidium*, Bentl. and Trim, 'Med. Pl.,' pl. 227, is added. The bark in discs or rolls is not mentioned. The transverse section of mezereon bark exhibits numerous groups of bast fibres in the secondary bast. The bark of *Daphne gnidium* frequently occurs in commerce, and, so far as is known, is equal in activity to the other official species. It is of a deep purplish-brown colour; it is hairy in the younger portions.

Mica Panis.—Omitted.

Mori Succus.—Omitted.

Moschus.—Brandt and Ratzeburg, 'Med. Zool.,' vol. i, tab. vii., viii. On incineration it should yield not more than 8 per cent. of ash.

Myristica.—Divested of its testa.

Myrrha.—*Balsamodendron myrrha*, Nees, 'Plant Med.,' plate 357, and probably other species. When moistened with nitric acid it assumes a violet colour (distinction from bdellium and false myrrh). It is difficult to understand why the genus *Balsamodendron* is retained instead of *Commiphora*, Engler., which is the one adopted in the 'Kew Index,' and which seems to be generally accepted by Continental botanists, the genus *Commiphora* having twenty-seven years' priority.

Nectandræ Cortex.—Omitted.

Nux Vomica.—The dried ripe seeds. Nearly disc-shaped, ¾ to 1 inch (2 to 2½ Cm.), in diameter. The hairs are radiately arranged. The endosperm is large and horny. The cotyledons small and leafy. Dose, in powder, 1 to 4 grains.

Oleum Amygdalæ.—Soluble in ether and chloroform in all proportions. Sp. gr. 0·915 to 0·920. It does not congeal until cooled to nearly −4° F. (−20° C.) If 2 C.c. of the oil be well shaken with 1 C.c. of fuming nitric acid and 1 C.c. of water, a whitish, not brownish, red mixture should be formed, which after standing for 6 hours at 50° F. (10° C.) should separate into a solid white mass, and a nearly colourless liquid (absence of peach-kernel and other fixed oils).

Oleum Anethi.—Sp. gr. 0·905 to 0·920. It rotates the plane of a ray of polarised light not less than 70° to the right at 60° F. (15°·5 C.) in a tube 100 Mm. long. Dose, ½ to 3 minims.

Oleum Anisi.—Distilled from anise fruit or from star anise fruit (*Illicium verum*), Hook. f., 'Bot. Mag.,' plate 7005. It congeals when stirred at temperatures between 50° and 59° F. (10° to 15° C.), and should not again become liquid below 59° F. (15° C.). Sp. gr. taken at 68° F. (20° C.), 0·975 to 0·990. It rotates the plane of a ray of polarised light slightly to the left. Dose, ½ to 3 minims.

Oleum Anthemidis.—Sp. gr. 0·905 to 0·915. Dose, ½ to 3 minims.

Oleum Cadinum. Additions 1890.—Moggridge, 'Flora of Mentone,' tab. 65.

Oleum Cajuputi.—*Melaleuca leucadendron*, Linn. Sp. gr. 0·922 to 0·930. It should become semi-solid on being stirred with a third or half its volume of phosphoric acid of commerce of sp. gr. 1·750 (presence of a due proportion of cineol). Dose, ½ to 3 minims.

Oleum Carui.—No geographical source given. Sp. gr. 0·910 to 0·920. Dose, ½ to 3 minims.

Oleum Caryophylli.—No geographical source given. Sp. gr.

not below 1·050. An alcoholic solution yields a blue colour with solution of ferric chloride. Shaken with its own volume of strong solution of ammonia it forms a semi-solid yellowish mass. Dose, ½ to 3 minims.

OLEUM CINNAMOMI.—Sp. gr. 1·025 to 1·035. One C.c. dissolved in 5 C.c. of alcohol (90 per cent.) and test solution of ferric chloride added should afford a pale green, but not a decided blue coloration (absence of cinnamon leaf oil). If 10 C.c. be well shaken with 50 C.c. of a boiling 30 per cent. solution of sodium hydrogen sulphite an oily layer separates, which, when cooled to 60° F. (15°·5 C.), should not measure more than 5 C.c. (absence of more than 50 per cent. of constituents other than aldehydes). Dose, ½ to 3 minims.

OLEUM COPAIBÆ.—Sp. gr. 0·900 to 0·910. It turns the plane of a ray of polarised light to the left (distinction from African copaiba oil), and is soluble in its own volume of absolute alcohol.

OLEUM CORIANDRI.—Sp. gr. 0·870 to 0·885. If 1 C.c. of the oil be mixed with 3 C.c. of alcohol (70 per cent.), a clear solution results (absence of oil of turpentine and added terpenes). Dose, ½ to 3 minims.

OLEUM CROTONIS.—No geographical source is given. Sp. gr. 0·940 to 0·960. Entirely soluble in absolute alcohol. Freely soluble in ether and chloroform. An alcoholic solution should not redden moistened blue litmus paper. If to 2 C.c., 1 C.c. of fuming nitric acid and 1 of water be added, and the mixture be shaken vigorously, it should not solidify, either completely or partially, but only thicken slightly after standing for two days (absence of other non-drying oils).

OLEUM CUBEBÆ.—Sp. gr. 0·910 to 0·930.

OLEUM EUCALYPTI.—*Eucalyptus globulus* is the only species mentioned by name, although it may be obtained from other species. Sp. gr. 0·910 to 0·930. It should not rotate the plane of a ray of polarised light more than 10° in either direction in a tube 100 Mm. long, and it should become semi-solid, on being stirred, when cold with a third or half its volume of phosphoric acid of commerce of sp. gr. 1·750 (presence of a due proportion of cineol). If to 1 C.c. of the oil there be added 2 C.c. of glacial acetic acid and 2 C.c. of a saturated aqueous solution of sodium nitrite, the mixture, when gently stirred should not form a crystalline mass (exclusion of eucalyptus oils containing much phellandrene). Dose, ½ to 3 minims. It would have been more satisfactory for dispensers if oil derived from a single species were alone official, since the commercial oils rich in cineol differ considerably in odour. The substitution of pure eucalyptol for the oil would have been more satisfactory still.

OLEUM JUNIPERI.—Sp. gr. 0·865 to 0·890. The oil is soluble with slight turbidity in four times its volume of a mixture of equal parts of absolute alcohol and alcohol (90 per cent.). Dose, ½ to 3 minims.

OLEUM LAVANDULÆ.—No geographical source is given. Sp. gr. not below 0·885. It should dissolve in three times its volume of alcohol (70 per cent.). Dose, ½ to 3 minims.

(To be continued.)

THE BRITISH PHARMACOPŒIA, 1898.

CORRECTIONS TO FORMER NOTES.

We are indebted to correspondents for pointing out the following inaccuracies in the summary of formulæ and processes printed in our issue of April 16. A printed slip of the corrections will be sent free, on application, to anyone who has purchased an early copy of the reprint. All the corrections are embodied in the second edition of the *Pharmaceutical Journal* reprint, which is now ready and includes, as additional matter, Mr. F. C. J. Bird's Alcohol Conversion Table, which has been specially revised by the author, and will be found of the greatest service in every pharmacy.

Extractum Belladonnæ Alcoholicum.—In the last line but one of paragraph read "50 C.c.," not "5 C.c."

Extractum Ipecacuanhæ Liquidum.—The finished extract should be standardised so as to contain "2 to 2.25 Gm." of total alkaloid, in 100 C.c., not "2 to 2.5 Gm."

Pilula Saponis Composita.—The paragraph should read: Mix opium, in powder, 1; hard soap, in powder, 3; syrup of glucose, 1. Dose: 2 to 4 grains.

MATERIA MEDICA.

Cocæ Folia.—Read "*Erythroxylum coca*, Lam.," not "*Erythroxylon coca*, Burck," in the first line of paragraph. The leaves which cannot be obtained in commerce are retained as the official variety, for some reason best known to the Editor of the Pharmacopœia and the botanical referees.

NOTES ON PEPSIN ASSAYING.*

BY A. H. ALLEN.

The process of testing pepsin prescribed in the British Pharmacopœia of 1885 has been the subject of severe and richly-deserved criticism. The description given was deficient in the detail desirable in a process of a strictly empirical nature, and the low proteolytic activity required (50) was for years a direct premium on careless preparation or systematic adulteration.

The method of assaying pepsin prescribed in the United States Pharmacopœia of 1890 is in many respects preferable to the B.P. test of 1885, but the prolonged period during which the digestion is directed to be continued is inconvenient and open to objection in other respects. Mainly as a consequence of this lengthened period of digestion, the results obtained by the B.P. (1885) and U.S.P. processes, when applied to the same sample of pepsin, are widely different.

The British Pharmacopœia of 1898 requires pepsin to have a solvent power of 2500. The method of assay closely follows that of the U.S. Pharmacopœia, as is shown by the following table:—

	B.P. (1885) Test.	U.S.P. (1890) Test.	B.P. (1898) Test.
Pepsin	2 grains.	0·00335 gramme.	0·005 gramme.
Albumin (moist)	100 grains.	10 grammes.	12·5 grammes.
Water	1 fluid ounce.	100 C.c.	125 C.c.
Hydrochloric acid	5 minims.	2 C.c. of dilute acid (=0·21 gramme real HCl).	0·25 gramme HCl.
Time of digestion	30 minutes.	6 hours.	6 hours.
Temperature	130° F.	100°·4 to 104° F.	105° F.
Interval between agitations	No definite time stated.	15 minutes.	No definite time stated.
Dissolving power required	50	3000	2500

C. D. Moffat (*Pharm. Journ.* [3], xxv., 813) has compared the B.P. (1885) and U.S.P. methods of testing on three samples of commercial pepsin, with the following results:—

No.	Digestive Power Claimed.	Solvent Power Found.	
		By B.P. (1885) Test.	By U.S.P. Test.
1	1:3000	1:250	1:3000
2	1:3000	1:150	1:1800
3	1:2500	1:150	1:1800

From this it appears that the same sample of pepsin showed by the old B.P. test only one-twelfth of the dissolving power on albumin which is indicated by the U.S.P. test. But it will be observed that in the latter case the operation is prolonged to six hours instead of being brought to an end in half an hour.

It should be borne in mind that the real digestive power of a pepsin is measured by the amount of peptone which it produces in a given time under certain conditions, whereas it is usual to observe the amount of albumin dissolved. A weak pepsin may dissolve all the albumin and convert it merely into syntonin, whilst a much stronger pepsin may carry the action further, even to the last stage, with production of peptone. As the albumin has been wholly dissolved in each case, to all appearance the two pepsins have done an equal amount of work, whereas in reality one may have a far greater activity than the other.

The British Pharmacopœia of 1898 states that "if 12·5 grammes of coagulated and firm white of fresh eggs (previously passed through a sieve having twelve meshes to the centimetre, and used before it has lost moisture), 125 C.c. of acidulated water, containing about 0·2 per cent. of hydrogen chloride (HCl), and 0·005 gramme of pepsin, be digested together at 105° F. (=40°·6 C.) for six hours, and shaken at intervals, the coagulated

* Abstracted from advance sheets of the concluding volume of Allen's 'Commercial Organic Analysis.'

white of egg dissolves, leaving only a few small flakes in an almost clear solution." This process closely resembles that of the United States Pharmacopœia, which it follows in the objectionally long time for which the digestion is continued. But the U.S.P. gives precise directions as to the frequency of stirring, which very important condition is ignored by the B.P.; and the U.S.P. employs a standard solution of pepsin, which allows of an exact quantity being readily taken for the experiment, whereas the B.P. apparently intends the very small quantity of 0·005 gramme of pepsin to be accurately weighed out, presumably with an error of not more than 0·0001 gramme! Nor is any correction made for the solvent action of the acid on the pepsin, the entire effect being apparently credited to the pepsin. It is deplorable that those responsible for the production of the Pharmacopœia should have adopted a process of pepsin-assay so unscientific in its principles and so defective in the details of its application.

At the present time the whole subject of pepin-assay is in a very unsatisfactory, not to say discreditable, condition, for which the unscientific and inadequately described official methods of testing are largely responsible. There has commonly been no marked distinction drawn between the mere conversion of albumin into syntonin or other soluble form and the true peptonisation characteristic of the action of pepsin, both these changes being confounded under the term "digestion." Further, the effect of the hydrochloric acid used in effecting solution of the albumin has been generally ignored or considered insignificant, whereas it has been shown by L. A. Harding (*Pharm. Journ.* [3], xxv., 914) that a material part of the solvent action observed is really due to the acid employed, and hence should be allowed for before coming to a conclusion as to the strength of the pepsin under examination. But the acid, under the conditions of a pepsin-assay, only converts the albumin into syntonin, the peptonisation of this product being due to the pepsin. Hence, as admitted by various authorities, the true gauge of the activity of a sample of pepsin is the amount af peptones, or of mixed peptones and albumoses, formed by its action under specified conditions.

ALCOHOL—ITS OFFICIAL STRENGTHS.*

BY WILLIAM MARTINDALE, F.L.S., F.C.S.

Alcohol Absolutum, Absolute Alcohol (*Off.*). *Syn.* Ethylic Alcohol, B.P. 1885.—Ethyl hydroxide, with not more than 1 per cent., by weight of water. Sp. gr. 0·794 to 0·7969.

In B.P. 1885 this had sp. gr. 0·797 to 0·800, and therefore contained 1 to 2 per cent. of water; the purest alcohol obtained by Squibb had sp. gr. 0·7935 at 60° F.—'Ephemeris,' ii., 562.

Alcohol (90 per cent.), Spiritus Rectificatus. *Syn.* Rectified Spirit (*Off.*).—Contains 90 per cent. by volume, or 85·65 per cent. by weight, of ethyl hydroxide. Sp. gr. 0·8340. Strength 57°·8 O. P. It is slightly stronger (1·35 per cent. by volume) than spiritus rectificatus, B.P. 1885, which contained 84 per cent by weight (=88·65 per cent. by volume) of ethyl hydroxide, and had sp. gr. 0·838; 55°·85 O. P. It is generally manufactured commercially of higher alcoholic strength, *i.e.*, about 70° O. P., sp. gr. 0·809, containing nearly 95 per cent. by weight of ethyl hydroxide, and is diluted as required. The corresponding alcohol, U.S., has sp. gr. 0·820, and contains 94 per cent. by volume of ethyl hydroxide.

Diluted Alcohol (*Off.*). *Syn.* Alcohol Dilutum.—In addition to alcohol (90 per cent.)—see above—there are now official four "strengths," or "degrees of dilution," of ethylic alcohol directed to be prepared from the alcohol (90 per cent.), and containing respectively 70, 60, 45, and 20 per cent. by volume of ethyl hydroxide. Of the following tables, the first compares the new and old official alcohols, and the second, founded on B.P. and Gilpin's tables, shows:—

(i.) The volume of distilled water necessary to be added to 100 volumes of alcohol (90 per cent.) for the production of each strength of diluted alcohol.

(ii.) The volumes of alcohol (90 per cent.) and of distilled water respectively which, when mixed and reduced to 60° F. (15°·5 C.), will produce, allowing for contraction in volume, 1000 C.c., 1 pint, or 1 gallon of each strength of diluted alcohol.

The specific gravity and the exact excise (Sikes') strength at 60° F. (15°·5 C.) in degrees over proof (O.P.) and under proof (U.P.), of each dilution are given in the first column.

As a rule, in B.P. 1898, alcohol (90 per cent.) has replaced rectified spirit, and alcohol (60 per cent.) proof spirit, where these were ordered in the 1885 Pharmacopœia, unless other dilutions have been found more suitable as solvents.

* Abstracted from advance sheets of the 'Extra Pharmacopœia,' new edition.

Alcohol Table.

Volume Percentage, Specific Gravity, and Excise Strength.	Official Names.
99·95 to **99·4** per cent. Sp. gr. 0·794 to 0·7969	Absolute Alcohol, B.P. 1898.
90 per cent. Sp. gr. 0·8340 57·80 O.P.	Spiritus Rectificatus, Alcohol (90 per cent.) *Syn.* Rectified Spirit, B.P. 1898.
88·65 per cent. Sp gr. 0 838 55·85° O.P.	Rectified Spirit, B.P. 1885. Contained 84 per cent. by weight of Ethyl Hydroxide.
57 per cent. (= 49 per cent. by weight) Sp. gr. 0·920 "Proof."	Proof Spirit, B.P. 1885. 5 vols. "Rectified Spirit," Sp. gr. 0·838. + 3 vols. Distilled Water. Contraction in volume about 2·5 per cent. (Not now official.)

Table for the Dilution of Alcohol (90 per cent.) to Weaker Official Strengths.

Volume Percentage, Specific Gravity, and Excise Strength.	Alcohol (90 per cent.).	Distilled Water.	Volume Produced.
70 per cent. Sp. gr. 0·8900 22·78° O.P.	100 vols.	+ 31·05 vols.	= 128·57.
	777·8 C.c.	+ 241·5 C.c.	= 1000 C.c.
	15 oz. 266 m.	+ 4 oz. 398 m.	= 1 pint.
	124 oz. 215 m.	+ 38 oz. 307 m.	= 1 gal.
60 per cent. Sp. gr. 0·9135 5·20° O.P.	100 vols.	+ 53·65 vols.	= 150.
	666·7 C.c.	+ 357·7 C.c.	= 1000 C.c.
	13 oz. 160 m.	+ 7 oz 74 m.	= 1 pint.
	106 oz. 320 m.	+ 57 oz. 112 m.	= 1 gal.
45 per cent. Sp. gr. 0·9436 21·07° U.P.	100 vols.	+ 105·34 vols.	= 200.
	500 C.c.	+ 526·7 C.c.	= 1000 C.c.
	10 oz.	+ 10 oz. 256 m.	= 1 pint.
	80 oz.	+ 84 oz. 130 m.	= 1 gal.
20 per cent. Sp. gr. 0·9760 64·95° U.P.	100 vols.	+ 355 8 vols.	= 450.
	222·2 C.c.	+ 790·7 C.c.	= 1000 C.c.
	4 oz. 213 m.	+ 15 oz. 390 m.	= 1 pint.
	35 oz. 267 m.	+ 126 oz. 243 m.	= 1 gal.

PHARMACEUTICAL SOCIETY.

DONATIONS TO THE MUSEUM.

At the meeting of the Library, Museum, School, and House Committee, on Thursday, April 21, the Curator presented the following report of donations:—

To the Museum.

Dr. F. Bach, La Plata:—Three specimens of Gutta Percha from North Brazil.

Mr. H. Haensel, Pirna-on-the-Elbe:—Wood of *Bulnesia sarmienti*; Terpeneless Oil of Petit Grain.

Messrs. Hodgkinson, Clarke, and Ward:—Three specimens of Decorticated Cardamoms as imported.

Dr. T. G. Nicholson, Marlow:—Specimens of a Leguminous Fruit used as a Fish Poison, of fruits of *Sterculia urens*, of a species of *Strychnos*, and of flowers of a Proteaceous plant from Central Africa.

Dr. Hake, London:—A specimen of "Pilisa" Root from Natal.

Messrs. Potter and Clarke:—Specimens of living plants of *Delphinium staphisagria*.

To the Herbarium.

Mr. E. G. Virtue, British Central Africa:—Specimens of *Strophanthus courmontii*.

The Curator, Biltmore Herbarium, Biltmore, N. Carolina:—One hundred and ninety-nine specimens of medicinal and other plants.

Table of Thermometric Equivalents

According to the Centigrade, Fahrenheit, and Réaumur Scales.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australasia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office: 5, SERLE STREET, W.C.

LONDON: SATURDAY, APRIL 30, 1898.

THE PHARMACY BILL AND ITS OPPONENTS.

Opposition to the Pharmacy Acts Amendment Bill may be inspired by ignorance, lack of disinterestedness, or by petty spite, and it is greatly to be regretted that the Bill has suffered from all three causes. Certain members of the Pharmaceutical Society first opposed it, without taking the trouble to ascertain definitely what changes in the existing position of affairs the Bill could or could not effect if it became law; then came a Member of Parliament who, for avowedly personal reasons, has blocked and still continues to block the way; whilst, last and most puerile of all, is intimated an impudent and spiteful attempt at opposition by the head of a concern which has inflicted irreparable damage on the business of some scores of industrious chemists and druggists, by taking advantage of a flaw in the Pharmacy Act of 1868. Joint-stock companies having been declared to be outside the scope of the Act so far as its main object was concerned, advantage was soon taken of the fact to attempt to delude the public into the belief that medicaments of all kinds are articles that admit of exactly the same treatment from a commercial point of view as groceries, draperies, or other equally familiar commodities. Flashy places of business were opened with the object of supporting this idea, individuals of more or less doubtful qualification were placed in charge thereof, and to a certain extent the public has responded to the advances thus made by interested parties posing as public benefactors. As time wore on it became necessary, in the public interest, to check certain illegal practices in connection with these so-called cheap drug stores, and, making a virtue of necessity, the heads of those establishments have been compelled to protect themselves by securing the services of a few weak-kneed pharmacists who care more for a slight temporary alleviation in their immediate surroundings than for their future prospects. For no joint-stock company, consisting of unqualified persons, could properly carry on the business of a chemist and druggist for a single day unless by the aid of registered men who will only have themselves to thank if, by the rendering of such assistance, pharmacy is spoilt as a career in the future. These facts are well known to the promoters of companies, who drive the proverbial coach and four through the Pharmacy Acts: since they cannot get behind the facts, they vent their spleen and petty spite by constantly throwing mud at the Pharmaceutical Society and at chemists and druggists—who ask the public for nothing but reasonable support in the legitimate exercise of their craft.

The latest incident of this kind is the publication of a circular headed "Pharmacy Acts Amendment Bill—Reasons why the Bill should not be passed." This precious production emanates from Nottingham, and is printed partly in black, partly in red. Commencing with a summarised account of the Bill, we are next met with the statement that though its objects are apparently of a purely formal character, deep designs are masked by innocent sounding words and phrases. We learn, in fact, that the ultimate aim is to make the Pharmaceutical Society a close and exclusive trade corporation. "For years," it is stated, "the Pharmaceutical Society has been trying to obtain increased political power, entirely outside the status conferred on it as a scientific body by the Pharmaceutical Acts" (*sic*). But more dreadful even than this, "by a presumptuous interference in commercial legislation prominent members of the Pharmaceutical Society are even now seeking to take advantage of the Bill for the Amendment of the Companies' Acts by insidious amendments designed to make themselves collectively an exclusive corporation." Red ink is used for this part of the effusion as a matter of course, and the compiler of the circular would appear to have been agitated by contending emotions as he proceeded to unfold the plot in accordance with which those prominent members of the Society have occupied themselves in "misrepresenting the conditions under which the chemist's business is carried on under the auspices of numerous companies, some of them very old established, embracing many thousands of shareholders, and supported by many millions of customers" (*sic*). As if the conditions could be misrepresented, or the commercial immorality be too freely exposed, which permits people possessed of surplus cash to combine together to divert the means of livelihood from honest tradesmen and professional men, who have worked hard and spent freely of their limited means to attain their present position, and are now threatened with ruin because a defect in the law permits seven unqualified persons to do what it forbids to one.

The remainder of the circular is hardly worth quoting, though red ink has been freely spilled in its composition, and the whole affair is not worthy of comment except in so far as it is deserving of high praise as the consummation of impudence. The inaccuracies and perversions of truth are too gross to receive more than passing notice by anyone conversant with the facts, but attention is directed to the matter, in order that registered chemists may be warned of the insidious nature of the attacks that are being directed at their business existence. Whatever the deficiencies of the average chemist and druggist may be, he has served the British public well, on the whole, during the past three-quarters of a century or more; and now that he has attained a position of well-deserved respect, it is hard if, in addition to being deprived of the fruits of his labours by joint-stock companies, he and his institutions are to be flouted and abused by the promoters of trashy concerns which are only enabled to keep open shop by reason of the disloyalty of a few of his fellow craftsmen. Why should such envy, hatred, and malice be displayed by successful adventurers towards those whom they have deprived of a portion of their means of livelihood? The question is easier to ask than to answer, though no one has any reasonable doubt of the existence of the feelings named on the part of those who attempt to profit by such underhand methods as are illustrated by the publication of the circular commented on.

A LESSON FOR CHEMISTS AND DRUGGISTS.

THE circular referred to in the previous article will have served a useful purpose if it helps chemists and druggists to realise what opportunities they miss by not uniting more for self-defence. Thus, it is speciously argued that chemists show no enthusiasm for the Pharmacy Acts Amendment Bill, because, out of "the 15,000 persons registered as Chemists and Druggists, only 2218 are 'Members' of the Pharmaceutical Society." The force of misrepresentation could not go much further than this. More to the point is the statement that, at a meeting held in Manchester to consider the Bill, only about 30 chemists responded to invitations sent to some 500, and that, "of the 27 who took part in the voting on the resolution proposed at that meeting, only 18 supported, while 9 opposed it." Equally significant is the further statement that, "at Glasgow only 13 attended a similar meeting," and thus are the weakness, indifference, and hesitancy of chemists and druggists made to serve as weapons against them. It may interest our readers also to learn that the compiler of this scurrilous circular quotes with approval expressions of opinion adverse to the Bill by a trade organ which is fond of posing as the especial guide, philosopher, and friend of the craft; it is well that chemists should know who are their real friends.

To return to the circular, it may be suggested that the real reason of this latest attempt at opposition to pharmaceutical reform is possibly the same that some time ago led to a curious outburst on the part of the conductor of what the great Nottingham "cutter" is pleased, in his appreciation of its policy, to style "the best and most influential journal of the trade." Praise from such a source must be as balm to the journalist who totally wrecked what little influence he possessed in pharmaceutical circles, properly so-called, in the vain attempt to check inevitable progress. The reason referred to is, of course, the increase in the fee to be charged in the immediate future for registration as a chemist and druggist. That increase naturally worries the directors of joint-stock companies, for it will require to be taken into account in fixing the salaries to be paid to those registered men who are so far lost to all sense of what is desirable in their own interests as to prostitute their qualification to serve the ends of a few capitalists. For the statement that certain companies which were originally mere family parties have now about 2000 shareholders, can hardly be accepted as credible; if true, they must have increased at a truly miraculous rate.

Equally mythical is the suggestion that there is no possibility of any unqualified person selling poisons in a joint-stock drug store, except under the supervision of a properly qualified chemist. For it is neither impossible nor improbable; the difficulty is to detect them in the act or to punish them when detected; as a matter of fact there is no law which can touch corporate bodies for employing unqualified persons. But this and other specious arguments may count for much with members of Parliament, who have no special knowledge of the subject, and are unable to realise the force of the multitude of deliberate falsehoods and misrepresentations set forth so ingenuously in this red and black triumph of the printer's art. Chemists and druggists throughout the country are warned, therefore, that they need to exert themselves to the utmost in self-defence, and to that end they ought to miss no opportunity that may present itself for self-justification in the public view.

ANNOTATIONS.

THE 'PHARMACEUTICAL JOURNAL' SYNOPSIS of the formulæ and processes of the British Pharmacopœia, 1898, went out of print the day it was issued, and a second edition is almost exhausted. Pharmacists have purchased copies for their own information in altering old and making new preparations, or for distribution amongst medical men; wholesale druggists are placing copies in the hands of their travellers and laboratory workpeople; whilst pharmacy teachers find it their most convenient summary to supply to students attending the classes. The second edition has been purged of two or three slight errors which had escaped notice in the first (see p. 416), and readers who possess copies of the latter can obtain a printed "Erratum" slip for insertion in the book, on application. They will do well also to order copies of the second edition, as a useful addition has been made to the book by the insertion of Mr. F. C. J. Bird's "Alcohol Conversion Table," after careful revision by the author. In connection with this table it may be pointed out that the slight differences between Mr. Martindale's figures (see p. 417) and those of Mr. Bird, are due to the fact that the latter represent the nearest conveniently measurable quantities that would give approximately accurate results. Mr. Martindale, however, gives the figures required by theory, and his o.p. strengths have been verified by the Excise authorities. Mr. Bird has also made allowance for the fact that the heat developed on mixing the liquids causes the loss of a certain amount of alcohol by evaporation. All measurements must be effected at 15°·5 C., and whatever table is followed, absolute accuracy can only be ensured in the first instance by determining the specific gravity of each mixture after cooling to 15°·5 C. When that has once been done the operation need not be repeated so long as the same batch of alcohol is used for the dilutions.

THE QUANTITIES GIVEN IN OUR SYNOPSIS of the 1898 B.P. formulæ and processes were purposely so arranged that the general convenience might be served, both of retail pharmacists and manufacturers, whether in England or the Colonies. They appear to trouble a few readers, however, though the difficulty suggested by Mr. Slinn (see p. 427) is a purely imaginary one. Taking the formula instanced by him, that for tinct. quininæ; as stated by us, it reads: "Dissolve quinine hydrochloride, 2, in tincture of orange, 100." Now, regarding the figures as representing ounces and fluid ounces respectively, the only calculation required prior to making a pint of the tincture, is to divide the numbers given by 5, thus 2 ounces = 875 grains, and 875 ÷ 5 = 175, the number of grains required to make 1 pint of tincture. If it be desired to prepare any number of fluid drachms of the tincture, the quantities required will be just as awkward, and the calculations necessary quite as involved, in the one case as in the other, since the formula as stated in the B.P. 1898 reads: "Quinine hydrochloride, 175 grains; tincture of orange, 1 pint." But it must be pointed out, in this connection, that there is no relation between the drachm and the fluid drachm, such as there is between the ounce and the fluid ounce, or between the gramme and the millilitre. Moreover, it ought by this time to be well understood that the use of so-called Apothecaries' weights is not recognised by the Pharmacopœia authorities, and such weights ought never to be used in weighing out material for making official preparations, except as representing a definite number of grains. If dispensers will persist in using scruple and drachm weights for other than dispensing purposes, they will only have themselves to blame if they involve themselves in serious trouble. It is extremely probable that

official preparations are at times made over strength, owing to 1-drachm and 2-drachm Apothecaries' weights being wrongly regarded as equivalent to one-eighth or one-fourth of an ounce. In like manner the scruple may easily be misused, and the only effectual remedy is to abolish the use of such weights entirely for compounding purposes.

Materia Medica and the Doctor's Knowledge thereof furnish the Editor of the *Journal of Pharmacology* with a text upon which he enlarges in a manner that should prove profitable to medical practitioners who may find time to read the article. There was a time, the writer observes, when the physician went out into the woods and fields, collected his own herbs and roots, dried them, and made medicinal preparations therefrom, in the manner which was then considered to be right and proper. Now, however, the physician sits at his office desk, scrawls a well-worn formula on a scrap of paper and commends it to the care of the patient; "or, taking from a set of numbered vials a pill whose particular numeral is calculated to allay the pangs of that particular patient, he leaves it by his bedside, confident that he has shown a discrimination in his treatment of the case that is as up-to-date as the proprietary production he is prescribing." Materia medica is a thing of the past, we are told, an intimate knowledge of drugs being virtually unknown to the average practising physician. "He wants to press the button, and have the right remedy for the disease drop out of the slot, all nicely prepared in palatable form," and believes in making use of all short cuts to success. Professors of materia medica in medical schools are alleged to be other than expert at their subject, whilst the study of it is reduced to a dry accumulation of facts which no student endeavours to recall after his examination is over. In conclusion, it is urged that the medical man must acquaint himself better with the nature and action of drugs, and he is advised to invoke the shades of his ancestors of the Middle Ages, rather than trust himself unreservedly to wholesale manufacturers of pills and potions.

The Major Examination Results, as shown in tabular form last week, were somewhat muddled by a compositor's attempt to improve the appearance of the table after it had been passed for press. It is therefore repeated in a more intelligible form.

A Correct Register of Chemists and Druggists is of the highest importance to the craft, and it is therefore the obvious duty of every registered person to notify any inaccuracy he may note to the Registrar. Usually this is the course pursued, but occasionally the individual who becomes aware of some deficiency in the Register happens to be, in some more or less remote way, connected with a trade journal which seeks to make capital of the fact. Apparently, in the hope of securing a little cheap notoriety, one such organ has recently devoted a lengthy editorial article to a diatribe on the alleged incapacity of the Registrar to attend to his business properly. Such attacks, however, must not be taken for more than they are worth, a truly infinitesimal value, for everyone possessing anything beyond the most imperfect acquaintance with the subject, knows perfectly well that, if the existing Register of Chemists and Druggists is not the best of all possible registers, the fault does not reside with the Registrar or any other person directly concerned in its production. So long as chemists and druggists value registration so little that they will not take the trouble to ensure the accuracy of the entries relating to themselves, so long will the Register remain incorrect, and, in any case, the remedy for any aggrieved person is in his own hands, and does not concern the conductors of any trade journal.

The Midland Pharmaceutical Association holds its Annual Meeting and Dinner on Thursday, May 5, at the Great Western Hotel, Birmingham, and the President of the Pharmaceutical Society, Mr. Walter Hills, has promised to be present. The President (Mr. F. J. Gibson) and Council of the Association express the wish that all Midland pharmacists will make a special effort to be present, and thus show their appreciation of Mr. W. Hills' kindness in visiting the Association. A first-rate musical programme has been arranged, and tickets can be obtained from the Hon. Sec., Mr. H. S. Shorthouse, 144, Edmund Street, Birmingham, at a cost of 5*s.* 6*d.* each.

In the Course of the Present Year the Third International Congress in Relation to Applications of Chemistry will be held in Vienna between July 28 and August 4. The subjects to be considered on that occasion will comprise questions which are of general public interest, arrangements for establishing uniformity in the analytical methods adopted for determining the value of commercial articles and also in the regulation of particular branches of chemical industry, methods of education, and provisional arrangements for friendly intercourse between representatives of applied chemistry in all parts of the world. The discussions at the Congress will be distributed over twelve sections as follow :—Section I.—General analytical chemistry and the application of instruments. Section II.—Chemistry of food, medical and pharmaceutical applications. Section III.—Agricultural chemistry. Section IV.—Sugar industry. Section V.—Brewing. Subsection 1, beer and malt, 2, alcohol and yeast manufacture. Section VI.—Chemistry of wine. Section VII.—Chemical manufactures, sulphuric acid, soda, bleaching powder, manures, cements, gaslighting, glass, porcelain, earthenware and clay goods. Section VIII.—Metallurgy, smelting, and explosives. Section IX.—Dyeing and calico printing, tar colours, pharmaceutical preparations, fats, oils, lubricating materials, paper or wood pulp, tanning, and gelatin making. Section X.—Photo-chemistry, photographic printing. Section XI.—Electro-chemistry. Cards for membership, ten florins each, can be obtained from the General Secretary, F. Strohmer, Schönburg Strasse 6, Vienna, iv/2. The organising Committee in Vienna has for its Honorary President, Hofrath Professor Bauer; Professor H. v. Perger is the Chairman; Professors Ernst Ludwig, Meissl, and Schwackhöfer are Vice-Chairmen.

The Crystal Palace Exhibition, held under the auspices of the Royal Photographic Society, is an unqualified success. A great point was gained when the Prince of Wales attended to perform the opening ceremony, and, as one distinguished photographic editor remarks, it is simply wonderful how so comparatively little preliminary announcement and "boom" should have been required to introduce an exhibition so large, so comprehensive, and so full of varied interest. Details of the various sections are reserved until next week, but it may not be amiss to note that everything seems to have been well planned, the catalogue is o unequalled magnificence, and the entertainments are proving to be as useful from an educational point of view as they are good and attractive.

Pharmaceutical Transactions.

NEWCASTLE-ON-TYNE AND DISTRICT CHEMISTS' ASSOCIATION.

The last monthly meeting for the session was held in the Hotel Métropole, on Wednesday evening, April 20, at 8 o'clock, Mr. T. Maltby Clague, President, in the chair. The minutes of previous meeting having been read and approved and several items of routine business disposed of, the Chairman called upon Mr. F. R. Dudderidge, pharmaceutical chemist, to open a discussion upon the new British Pharmacopœia. The remarks made by the lecturer were naturally somewhat superficial, owing to the fact that the new work is not yet available. Mr. Dudderidge criticised sharply several of the "omissions" and "inclusions" of the book, and his remarks led up to a very comprehensive discussion amongst members present. The *résumé* of the publication given by the *Pharmaceutical Journal* was much appreciated, and those present seemed to have been able to arrive at a fairly accurate judgment of the changes made, by the aid of the reports which have appeared. A cordial vote of thanks was awarded the lecturer for his paper.

MIDLAND CHEMISTS' ASSISTANTS' ASSOCIATION.

There was an unusually large gathering of the members of this Association at the Exchange Restaurant, Birmingham, on the 20th inst., when Mr. F. H. Alcock gave an address on

The New Pharmacopœia.

—Mr. Casson took the chair.—Mr. Alcock explained at the outset that he had made a special journey to London to inspect the advance copies of the B.P., facilities having been granted by the General Medical Council. He proceeded to recount a number of questions which he had himself submitted to representatives of large dispensing houses and medical friends, who were of opinion that an authoritative statement should be issued by the General Medical Council concerning them. What, he asked in the first place, was the pharmacist to do with his old stock, seeing that as soon as the new B.P. received official sanction it was imperative upon the dispenser to use that as his guide? In the second place, was the pharmacist to make up ante-dated prescriptions according to the new formulæ? Thirdly, have prescriptions to be so dispensed when the prescriber has not yet had an opportunity of consulting the work and noting if any changes have taken place in the composition he desires to prescribe? The composition of chlorodyne, for instance, now became much stronger in alkaloidal constituents; morphine suppositories were now half their previous strength, and such a common preparation as chloroform water had had its strength halved. Again, if a sample was seized under the Food and Drugs Act, when would the inspector require the article to be of the new standard, and what would happen if it was the proper standard according to the older book? A point which concerned junior members of the craft was as to when the new book would be accepted as the students' text-book. To him it seemed that no period less than six months could be allowed for a student to make himself acquainted with the work, unless the Pharmaceutical Examining Board desired to favour a system of cram. Tracing the history of the work, Mr. Alcock referred to the part which pharmacists had taken in its preparation, mentioning that the whole had been supervised by Dr. Attfield. The changes were very important and would necessitate a better education than had hitherto been obtained. The microscope, for example, and other apparatus necessary for the determination of what were known as physical constants would require to be used freely. The introduction of the process of sterilisation seemed to be the first step towards the complete study of bacteriology. The chemistry part of the work was now relegated to text-books, but on the other hand the work of the students was diminished, for under the tests, when the test was made, a statement was made as to what it was intended to detect. The probability was that under the new B.P. dispensers would follow the metric system, so that it would be necessary for students to make themselves thoroughly acquainted with the working of the system. The botanical part had been entirely re-written, and no better guarantee of its accuracy could be given than the fact that Mr. E. M. Holmes had had much to do with it. Proceeding to mention what he called the omissions and additions, as well as the list of substances which had changed their name, formulæ and composition, Mr. Alcock spoke of the introduction of animal products, which, he said, would call for a special study of zoology. Which of them, for instance, knew where to search for the thyroid gland of the sheep, or when it had been obtained, could say whether it was healthy or not? The same remark applied to the pancreas of the pig and its proper manipulation for the production of liquor pancreaticus. With reference to galenical preparations of pharmacy, this had been dealt with by the trade journals, and it was only necessary for him to recommend students to read these statements, taking care that one or two initial errors, which had since been rectified, were corrected in their books, if they made any preparations from them before the new B.P. saw the light. Generally speaking the new preparations seemed to be in advance of the old ones. More sensible methods had been adopted. The processes of percolation, classification, and extraction were more in harmony with modern methods. They seemed to bear the imprint of the pharmacist's own work, and no doubt would meet with favourable criticism from pharmacists. Whether the medical man would be so satisfied remained to be seen. On the subject of posology, an attempt had been made to unify doses at the expense of the alteration of strength of composition. This no doubt would meet with general approval, for with the dose the medical man had much to do. Mr. Alcock explained, in conclusion, the modes of standardisation, and although he disclaimed any intention to criticise the processes, which would be unfair on such a short acquaintance with the work, he alluded to much that those present could reflect upon so as to prepare themselves to take part in a discussion at a future meeting.

PLYMOUTH, DEVONPORT, STONEHOUSE AND DISTRICT CHEMISTS' ASSOCIATION.

The quarterly meeting of the above Association was held on Wednesday, the 20th inst. Mr. Jas. Cocks, President, occupied the chair, and a large and representative attendance included Messrs. C. T. Weary, Hon. Sec., J. H. Bailey, J. Barge, C. J. Park, G. Breeze, O. A. Reade, W. Blackman, H. D. Davey, H. C. Cantle, F. W. Hunt, P. A. Kelly, J. D. Turney, W. H. Woods, etc.—Mr. Elford was elected a new member.

The Government Poisons Bill.

Mr. Cocks introduced a discussion on what steps the Association should take with regard to the new Poisons Bill which the Government intend shortly to introduce, and after a lengthy discussion Mr. Park proposed, Mr. Bailey seconded, and it was unanimously carried,

> That the Secretary write to the Registrar asking him what steps the Pharmaceutical Council would advise the Association to take with regard to the new Poisons Bill, and that immediately upon the receipt of an answer the Secretary shall call a special general meeting.

—Mr. Hearder then exhibited his new suppository, pessary, and bougie mould, practically demonstrating the same, at the conclusion of which a hearty vote of thanks was passed to him —An exhibition of microscopic lantern slides by Messrs. O. A. Reade and H. C. Cantle terminated a very successful meeting.

LIVERPOOL CHEMISTS' ASSOCIATION.

The last meeting of the session 1897-8 took place at the Royal Institution, Colquitt Street, on Thursday evening, the 21st instant, the President, Mr. J. Bain, in the chair.—After reading the minutes of the last meeting, the Secretary, Mr. T. H. Wardleworth, announced the fact that he had received letters from the families and widows of their lately-deceased members, Messrs. M. Conroy and R. H. Mitchell, acknowledging the votes of condolence passed by the members of the Association at recent meetings, and thanking them for their sympathy.—Mr. E. Taylor was elected a member.—A paper was then read by Mr. H. Wyatt, junr., on

L'Assistance Publique of Paris and its Internes en Pharmacie,

which had been written by a friend of his, Monsieur Serée. pharmacien de la Première Classe ex Interne des Hôpitaux de Paris.—At the close a vote of thanks was passed to the author, Monsieur Serée, for his interesting paper, and, at the suggestion of Mr. Wardleworth, it was resolved to appoint M Serée a corresponding member of the Association. In acknowledging the vote of thanks and the honour done to his friend, Mr. Wyatt said he knew how Monsieur Serée would appreciate the manner in which his efforts had been received, and he would promise the Associa-

tion other papers from the same source on future occasions The mode of conducting examinations in France was considerably different to our English way, but the results seemed about equal. This examination for the Internat was quite honorary and optional, giving the successful ones no very great material advantages certainly, but the amount of esteem in which it was held by the students themselves was on a par with that felt in England for Bell scholarships. In France the superiority of their method of making a pharmacist seemed to be that they first of all ensured getting suitable men to work upon by insisting on a high standard of preliminary education. Before a youth could hope to set out on the course which was to make him a first-class pharmacien he must have obtained a diploma either as bachelier ès lettres, bachelier ès sciences, or bachelier de l'enseignement sécondaire, any one of which examinations may be said to at least equal our London matriculation. Mr. Wyatt then ran over the principal points in the subsequent "stage" or apprenticeship examinations and those of the School course, finishing up with a glance at the amount of protection afforded to the French pharmacist and the consequent condition of things pharmaceutical among our near neighbours across the Channel.

EDINBURGH DISTRICT CHEMISTS' TRADE ASSOCIATION.

On Tuesday last a meeting of this Association was held in the Pharmaceutical Society's House, 36, York Place, Edinburgh, Mr. Bowman, President, in the chair.—Mr. C. F. Henry, Hon. Sec., read the minutes of last meeting, and intimated apólogies for absence from Messrs. Coats, Lunan, A. Clark, A. Spence, and W. Spence.

Chemists and Service on Juries.

Mr. Henry stated that he had received a letter from Mr. Spence, Linlithgow, who had given notice of a motion on this subject, asking him to propose the motion for him. Mr. Henry read a statement, which accompanied the motion, in which Mr. Spence said he had again had the misfortune of being cited to jury service and had a sitting of nearly twelve hours. There was surely something radically wrong with the Juries Act generally. Was it not time the Association had taken the matter up in the interests of chemists? He understood that doctors were exempt from jury service and also dentists. He could understand why doctors were exempted, but as regarded dentists, an hour or two longer in having an old stump extracted would only inconvenience not injure the general public, whereas an hour or two longer in procuring medicine from a chemist's might result in injury or death. He knew of two instances where chemists in country towns had been this year summoned to jury service who had no one but apprentice boys to leave in their shops. One of them was kept for four days and the other for one day, and they had to imagine the inconvenience to which the general public were put if they had to wait for the legally qualified chemist coming to business. He referred to the obligation laid on the qualified chemist under the Pharmacy Act in the dispensing of poisons, and said that the Juries Act entirely ignored that Act when it called legally qualified chemists from their posts of duty and thus endangered the public weal. This liability to be cited for jury service was a hardship on all chemists who could not afford the regular services of a legally qualified assistant, and was detrimental to the welfare of the public. He hoped the Association would take the matter up and invite other associations to co-operate with them in getting the Juries Act amended so as to exempt chemists from service. His motion was—

> "That it be referred to the Committee to communicate with other associations, and also with the Council of the Pharmaceutical Society, as to the best means to obtain exemption of chemists from jury service, and to take action in whatever way it was thought best to attain this end."

Mr. Henry added that Mr. Spence had sent him several documents, including a list of those persons entitled to be exempted.—Mr. Nesbit (Portobello) said he had often suffered very great inconvenience from having to serve on juries, and he thought it very unfair that he should be taken forcibly away from business in that way while others were exempted, and he thought they should do their best to have the liability done away with. He was a pharmaceutical chemist, and would be exempted south of the Tweed. But he was not exempted because he was a pharmaceutical chemist in Scotland, but they should endeavour to exempt not only pharmaceutical chemists, but all register chemists in England and Scotland.—Mr. Mackenzie asked what the law was on the subject? He thought there was a law to the effect that pharmaceutical chemists in England were exempted.—Mr. Rutherford Hill said pharmaceutical chemists were exempted in England under the Juries Act, 1862. He had no doubt at all that, under the Act of 1862, every chemist and druggist would have been exempted if they had been wise enough to be members of the Pharmaceutical Society. When they made a claim for exemption, the reply was, Who are you? There were some twenty or thirty thousand of them, but who could define a chemist and druggist who was not a member of the Pharmaceutical Society? For the reason that it was impossible to define them, or say who they were, they could not get exemption. It was in that way that the undesirable distinction cropped up. The reason why there was no exemption of any kind at all in Scotland for chemists was because the Juries Act of 1862 was an English Act exclusively, and had no reference to Scotland. With regard to the action of the Pharmaceutical Society, the subject had been very frequently brought up, and had been often under the notice of the Council. The Pharmaceutical Society and the Council were, he thought, perfectly unanimous in expressing their strong desire that all registered chemists should be exempted from jury service, and time and again attempts had been made to do that in connection with a Pharmacy Bill. But the reply had always been "It is not a question for a Pharmacy Bill, but for a Juries Bill." Now as to the Juries Act, he had taken the trouble to look up that morning how it came about that dentists were exempted. They got exemption in 1878—very recently—and they got it in connection with the Dental Act. This was very important for pharmacists; dentists were exempted by a special provision in their own Act. He thought that was an important precedent for them. It showed that the Legislature so recently as 1878 passed an Act relating exclusively to dentists, in which they embodied a section exempting dentists from jury service. Mr. Spence stated in his letter that there was nothing in the duties of a dentist that could be urged as furnishing a stronger reason, or even as strong a reason, as a great deal that could be urged on behalf of registered chemists, and therefore he thought it worth while to keep this in view—that it was not necessary to wait for a Juries Act, but that an exemption clause in favour of registered chemists would be perfectly cognate to a Pharmacy Act.—Mr. Mackenzie said they all felt indebted to Mr. Hill for his last statement. Mr. Hill seemed to him to have hit the very point that they wished to emphasise. The Legislature had made it the law that a chemist must be at his post to carry out the provisions of the Pharmacy Act. The Legislature, then, could not conceivably ask a chemist to break one law in order to fulfil another. That had always seemed to him to be the strongest argument in favour of their exemption. If a chemist were to fulfil his duty to the public, and in compliance with the Pharmacy Act, he must be there in person. How could he be there in person if he was liable to be a juryman? He asked if it would be possible for the Secretary, in forwarding this resolution to the Pharmaceutical Society, to state the very argument which had been made use of by Mr. Hill. The Society might perhaps have noted the fact that the exemption of dentists had been obtained as part of the Dental Act, but he thought it would be important that the Secretary, in forwarding this motion as the finding of this association, should mention that fact.—Mr. Forret said Mr. Hill had stated in explanation that he did not think they would allow any clause providing for such an exemption to be tacked on to a Pharmacy Bill, but he had showed that such an exemption had been allowed in the case of the Dental Act, which was ten years younger than theirs. If it had been tacked on to the Dental Act, it seemed quite reasonable that the same could be done to a Pharmacy Bill.—The Chairman thought the best way would be to approach the Pharmaceutical Society and ask their support in this matter. He suggested that it might be left in the hands of Mr. Storrar and Mr. Johnston to bring it before the first Council meeting, and ask them to give it their support.—Mr. Hill said he would be inclined to suggest that they should send the resolution to the Secretary, and he might also ask Messrs. Johnston and Storrar to give attention to it.—Mr. Nesbit said he thought it would be well to draw attention to the exemption provided by the Dental Act, for they had been told over and over again in London that they could not get such an exemption tacked on to a Pharmacy Act that belonged to a Juries Act. He thought that those in London were under a misapprehension as to this, and that attention should be called to it.—Mr. McLaren said if the exemption had been made in regard to dentists in the Dental Act it was quite possible an exemption might be made in the same way

for pharmacists.—Mr. Nesbit did not suggest that it be inserted in the present Pharmacy Bill, but that it might be inserted in any future Pharmacy Bill.—The motion was then adopted.

The Sale of Methylated Spirit.

The Secretary reported that following up the recent resolution of the Association in regard to the addition of rock oil to methylated spirit, the Committee had adopted the plan of writing direct to the Inland Revenue authorities. As they were not members of the Federation, they had not approached that body, but had written direct to the Inland Revenue, and might have the reply by next meeting.—Mr. Hill said he perhaps might mention that one of the largest distillers in Leith had written to him on the subject, evidently thinking they were not aware of the regulation by which methylated spirit could be obtained without rock oil if it were taken in quantities of 5 gallons. The firm entirely sympathised with them in the objections they were taking to rock oil and to the prevention of the spirit being used for the purposes he had referred to. The firm also agreed with them that the only reason for adding rock oil was to prevent the spirit being used for drinking purposes. It was rather important that they found a large and well-known firm of distillers agreeing with them to that extent.—The subject then dropped.

The Annual Picnic.

Mr. David McLaren said, after very careful inquiry the Committee had fixed upon St. Fillans, five miles from Comrie, as the place for the annual picnic. They would go by Caledonian train to Comrie and drive to St. Fillans, where there was excellent hotel accommodation for two hundred or two hundred and fifty. It was arranged that pharmacists from Glasgow might join them at Larbert, and they might also have contingents from Dundee and Perth. The excursion had been fixed for Thursday, June 9, and tickets would be as formerly, 10*s*. 6*d*. each.—This arrangement was agreed to.

Election of Auditors.

It was dccided to re-elect the auditors, Messrs. McKenzie and Wylie.

Wholesale Houses and their Prices.

Mr. C. F. Henry said that a short time ago the price-list of a limited liability company came into his hands, and on looking over it he noticed a two-page advertisement, which seemed to him to be an advertisement of proprietors and paid for by them. In that advertisement there appeared in one case the minimum price and in the other case the reduced price of their specialties. That appeared to him to be an entirely new departure on the part of proprietors, and there seemed to him to be an element of unfairness in it to those chemists who had a booking trade, because the public from this advertisement would get to know what was the minimum price of their goods, and would expect to get them at that price. He thought the Association should draw attention to the matter, with the view of getting it remedied. He wrote to the firms, but unfortunately he made nothing of it. In the one case it turned out, according to the statement made by the firm, that the advertisement was not paid for by them, but was put in by the company. In the other case he got a rather curious letter, saying that the price of these articles had been reduced. They said they had been compelled, in order to meet competition, to reduce their retail price-list. The third case, brought under his notice by a member of the Association, had been put right. He did not know that they could do anything in this matter, but he had thought it right to bring it before the Association in order to draw attention to it in case this reprehensible practice should extend.—Mr. Mackenzie said that for his own part he did not think they could make anything of this or look for success in tackling the proprietors, as they had a decided antipathy to interfering with the sellers of their goods.—Mr. Forret asked whether they could as an association have anything to do with the prices. When the P.A.T.A. people were there he thought that was the Association's excuse, urged by the Secretary, for not associating themselves with them, that they as an association had nothing to do with prices.—The Secretary said this was quite a different matter He was not drawing attention to prices nor the way in which any one charges, but to the matter of advertising these as the prices of their goods. He did not mind what prices they were sold at, but he thought the point was if a proprietor advertised these as the reduced prices and the minimum prices of their goods.—Mr. Mackenzie asked if the articles referred to by Mr. Henry are included in Mr. Glyn-Jones' Association.—The Secretary: No. Perhaps attention having been called to this, it may be sufficient without any further resolutions.—With a vote of thanks to the Chairman the meeting terminated.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

At a meeting held in the Hanbury Library, 17, Bloomsbury Square, London, on Friday, April 22, Mr. T. E. Lescher in the chair, Mr. Evans read a paper entitled

An Examination of Commercial Samples of Benzoin and Guaiacum.

The conclusions drawn by Mr. Evans from his investigation, which was undertaken at the suggestion of Professor Greenish, were to the effect that a very necessary test for these resins was the quantity of residue, organic and inorganic, left after complete exhaustion with spirit. The Siam benzoin was shown to be much superior to the Sumatra in this respect, and those samples of Sumatra benzoin considered best by experts were also found to yield less residue than the inferior samples, so that it afforded a reliable test to chemists of less experience. Not more than 10 per cent. of such residue was suggested as the limit. Similar results were obtained in the case of guaiacum resin, the residues varying between 1·5 per cent. and 10 per cent. Mr. Evans considered that the maximum should be 5 per cent.—Messrs. Lescher, Wilson, Dewhirst, Durbin, Matthews, Payne, and Turner discussed the paper, the opinion being expressed that English merchants could compel more careful collection of the resins.—Mr. Evans replied to the various criticisms, and the meeting adjourned.

IRISH PHARMACISTS' ASSISTANTS' ASSOCIATION.

At Dublin, on April 9, the third annual dinner of this Association was held in the Gresham Hotel. The attendance was large, and representatives of medicine, surgery, and the allied professions were present. The President, Mr. W. J. Hardy, occupied the chair, and was supported by many prominent gentlemen. The vice-chair was occupied by Mr. H. Hunt, Vice-President.—After the removal of the cloth, the toast of "The Queen" was drunk with musical honours.—The President proposed "The Health of the Pharmaceutical Society," coupling with the toast the names of Councillors Kelly and Dr. Walsh. He said the Pharmaceutical Society had acted very kindly to the Association since it started three years ago, and the assistants were fully sensible of that kindness, and were prepared to help the Society in carrying on the good work so ably conducted by Mr. Downes and his respected colleagues. He paid a high tribute to the zeal and energy of Councillors Kelly and Walsh.—The toast was drunk amid cheers.—Mr. Kelly, in reply, said the Council almost to a man was kindly disposed to the Association. They recognised that the assistant of to-day would be the employer of to-morrow, and that the young men were the future Pharmaceutical Society. He thought Irish pharmacists were not sufficiently assertive. He observed that not an Irishman was on the British Pharmacopœia Committee, although no fewer than twelve gentlemen representing England and Scotland had been placed thereon. This was another injustice to Ireland. Irishmen were looked up to at home and abroad, and there was no reason why they should have been ignored in the compilation of the new B.P. The Pharmaceutical Society wanted the Association to prosper, and were ever prepared to give it a helping hand. He exhorted his hearers to persevere in well-doing and acting as men and gentlemen in the daily round of life.—Dr. Walsh also spoke. He endorsed Mr. Kelly's sentiments, and referred to the receipt by the President of the Pharmaceutical Society of Great Britain of a Jubilee Gold Medal. He complained that a similar distinction had not been conferred on the President of the Irish Pharmaceutical Society. Attention had been called to the matter, but they were told the donors were considering the subject. That was many months ago, and they were still deliberating, as the medal had not yet arrived. He hoped to see Irish pharmacists better treated in future, but they must not fear to assert themselves.—The toast of "The Medical Profession" was responded to by Dr. McWalter, an ex-pharmacist, who said that all over the world were to be found the "old boys" of pharmacy occupying high positions in the medical world. Formerly the compounding room was the ante-chamber to medicine, and the pharmacist looked forward to a medical career. Not a few of the most prominent doctors owed their success to their pharmaceutical training, and however questionable might have been the old practice to the interests of pure pharmacy, its benefits to the medical profession could not be over-estimated. As to the new

B.P., it should not be forgotten that Dr. Tichborne was a member of the General Medical Council, and was connected with the compilation of the volume. Although an Englishman, Prof. Tichborne was a Hibernian by adoption, and became more Irish than the Irish themselves. They should see that Ireland was fairly represented on the next B.P. revision five years hence. He complimented the assistants on their splendid association, which was second to none in the United Kingdom, and thanked the members for so kindly honouring the profession he represented.—The toast of "The Visitors" was acknowledged by Messrs. M'Clintock, Tyrie, and Farquhar.—At this juncture an interesting feature occurred, a presentation of a purse of sovereigns being made to Mr. J. Tyric Turner, Hon. Secretary of the Association. In conveying the gift, the President referred at some length to the zeal and ability of the recipient, who had acted as general organiser since the Association started, and to whom they owed its present flourishing state.—Mr. Turner suitably replied.—Mr. Kelly proposed the toast of "The President," which was drunk with enthusiasm.—The President, in replying, gave a brief retrospect of his connection with the Association, and alluded to the abolition of night lectures in the schools of medicine. He believed in the pharmacist making the best of his position and determining to excel in that direction. The chemist's calling was a very honourable one, and the only way to obtain recognition by the public was to keep together and come well to the front. —Mr. Hunt replied to the toast of "The Vice-President," after which a similar tribute of esteem was accorded to the Hon. Secretary, and was responded to by Mr. Johnston.—During the evening songs were contributed by Messrs. Cochrane, Tyrie, G. G. and J. Fetherston, M'Clintock, Cooper, and others. Mr. Bowles presided at the piano with his usual ability.—The function was brought to a close by the singing of "Auld Lang Syne," the company separating for the season amid cordial good wishes.

CHEMICAL SOCIETY.

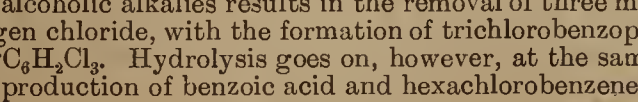
Professor Dewar, F.R.S., presided at a busy meeting on Thursday, April 21, at 8 p.m. Before calling on the new Secretary, Dr. Wynne, to read the minutes of the previous meeting, Professor Dewar paid a tribute to his distinguished services in chemical science, which eminently fitted him for that position.—The first paper, by Messrs. C. F. Cross, E. J. Bevan and Claud Smith, on

The Carbohydrates of Barley Straw,

was read by Mr. Cross. The main object of this paper was the determination of the constitution of the carbohydrates of cereal crops. Since pentoses are never found as such in plants, the authors surmised that they were down-grade products. Cereal straws yielding furfurol were experimented on; these harvested straws contain one-third of their weight of furfurol-yielding carbohydrates, green fodder plants containing one-fourth and woods one-fifth their weight of the same material. A series of physiological experiments was conducted. Plants were grown in both poor and well-manured soil, and it was found that differences in soil nutrition had no effect on the proportion of pentoses to hexoses in the carbohydrates obtainable from these plants. In the years 1894-96, during which time remarkable variations of climate took place, especially with regard to sunshine and rainfall, it was found that the relative proportions of furfurol-yielding carbohydrates remained the same. The authors went one step further in 1897 and removed the ears at the time of flowering. These vivisected plants threw out fresh shoots just above ground, and, when harvested, were greener than is normally the case. The straw was then examined by means of the usual constants. It was noticed that, while the permanent tissue amounts to 61·6 per cent. in normal straws, in plants thus vivisected only 53·5 per cent. is permanent tissue. The amount of cellulose also varied in the proportion of 43·3 to 33·0 per cent. The relative proportions of furfuroids was unaffected. A curious fact was mentioned, that the earless plants contained 30 per cent. more nitrogen than the normal. On hydrolysis with dilute acid—1 or 2 per cent., under a pressure of 3 atmospheres for fifteen minutes—the furfurol number in June was 13; in July, 25; in August, 33; and in matured straw, 48. The matured straw offers greater resistance to fermentation with yeast. Pure pentoses are assimilated by yeast, which builds up substances not pentoses.—In the discussion that followed, it was asked. What are the constituents that determine the value of different straws? It was remarked that the value of straws differs widely according to the time of reaping, and that the cutting of clover crops induces a spreading of roots and increase of nitrogenous matter in the soil.—Dr. Horace Brown asked what was the nature of the fermentable carbohydrates, and whether fractional fermentation would not clear up this point?—Mr. Cross, in replying to the several questions, mentioned that the extreme resistance to fermentation offered by carbohydrates in matured straw might be accounted for by the fact that the carbohydrates were in a condensed state.—The next paper by Mr. M. O. Forster, dealt with

Isomeric Bornylamines.

Camphor heated with ammonium formate to a high temperature gives bornylamine. Bornylamine bears the same relation to camphor as isopropylamine bears to acetone, *i.e.*, the carbonyl residue of the ketone is replaced by the $CH{\cdot}NH_2$ group, thus:



This bornylamine has a melting point of 159—160°, and is optically active $[\alpha]_D = -186°$.

It is known that ketoximes reduced with ethylic alcohol and sodium are converted into bases. Camphor oxime was so reduced, and gave a small yield of bornylamine. Dr. Forster had obtained a larger yield of the base by substitution of amylic for ethylic alcohol. This bornylamine melts at 172° to 173°, its optical activity = − 10°. The base obtained by heating camphor with ammonium formate in a sealed tube melts at 172° to 173°; its optical activity = − 17°. The author proposed to call the dextro-rotatory base bornylamine, and the lævo-rotatory base isobornylamine. The formyl, acetyl, and benzyl derivatives were prepared and examined. Those of "bornylamine" had a higher melting point than those of "isobornylamine" and were more soluble. The menthylamines afford a parallel case. Although the acetyl derivatives of "isobornylamine" are lævo-rotatory, those of "bornylamine" also are lævo-rotatory. Dr. Lapworth remarked that the use of the term isobornylamine implicd that the substance was derived from isoborneol, which is not the case.—A question was asked whether there is any difference in the stability of the two bornylamines, as is the case with the amincs of the isomeric borneols.—Professor Dunstan suggested the name "pseudo-bornylamine" for "iso-bornylamine."—In reply, Dr. Forster objected to the name pseudo-bornylamine, on the ground that the substance *is* bornylamine. He had found no chemical difference between the two bornylamines.—A paper on

Some Derivatives of Benzophenone

was next read by Mr. F. E. Matthews. Benzophenone readily yields chlorine addition compounds by dissolving benzophenone in chloroform, covering with a layer of water, and passing in chlorine to saturation. On exposure to sunlight the colour of chlorine disappears, and a crystalline solid separates out, the hexachloride of benzophenone, $C_6H_5{\cdot}CO{\cdot}C_6H_5{\cdot}Cl_6$. It was remarked that acetophenone does not yield a hexachloride under similar conditions, but methyl groups are substituted. This compound possesses less interesting properties than might have been expected. It crystallises especially readily from xylene, and its m. p. is 214° C. The action of alcoholic alkalies results in the removal of three molecules of hydrogen chloride, with the formation of trichlorobenzophenone, $C_6H_5{\cdot}CO{\cdot}C_6H_2Cl_3$. Hydrolysis goes on, however, at the same time, with the production of benzoic acid and hexachlorobenzene—

$$\begin{array}{c|c} C_6H_5CO & C_6H_5Cl_6 \\ OH & H \end{array}$$

The nitro-derivative of benzophenone undergoes similar reactions. —Dr. S. B. Schryver followed with a paper on—

Some Researches on Camphoric Acid.

As various lactone acids on treatment with sodium ethoxide lose water, yielding isomeric unsaturated bodies, the author subjected camphoric acid to the same treatment. But no isomeric unsaturated body could be obtained. Oxidation of lauronolic acid with potassium permanganate gave nothing but oxalic acid. Finally, on treating lauronolic acid with nitric acid he obtained nitrolactone, which gave aminolactone on reduction with tin and hydrochloric acid. Lauronolic acid treated with nitrogen peroxide gave nitro-campho-lactone, which by reduction gave the hydroxylamino compound, from which, by partial oxidation, nitroso-campholactone was produced.—In the discussion Mr. Marsh pointed out that while chlorocamphoric anhydride is easily

obtained, there is some difficulty in getting the bromo- compound. —An extremely interesting paper followed on

The Drying of Ammonia and Hydrogen Chloride,

by Mr. H. BRERETON BAKER, M.A. It will be remembered that Mr. Baker's important statement that hydrogen chloride and ammonia gases do not combine when perfectly dry created much interest, and was disputed by Gutmann early in the year. An experiment was shown by Mr. Baker in proof of this fact. The two gases in a wide glass tube were separated by a glass partition, the ends of the tube being bent over so as to dip in mercury. On breaking down the partition wall no rise of mercury should result. Mr. Baker had performed this experiment successfully many times, but on this occasion, owing to disturbances caused in transit, a slight rise of mercury was noticed. Though Gutmann had disputed the above statement, the author had verified it beyond the possibility of doubt. Gutmann's results were doubtless due to the fact that the phosphoric anhydride which he used to dry the gases contained large quantities of trioxide and tetroxide of phosphorus and meta-phosphoric acid. Ordinary phosphoric anhydride distilled in dry air yields as much as 80 per cent. of meta-phosphoric acid. A mixture of potassium and copper oxides, which has received the name of stas, as well as sulphuric acid, were both ineffective for the purpose of drying the gases; indeed, air passed over concentrated sulphuric acid wets phosphoric anhydride. Mr. Shenstone, however, had kindly prepared for Mr. Baker a quantity of very pure phosphoric anhydride.—Mr. SHENSTONE confirmed the statement that sulphuric acid is useless for dehydration of gases. The distillation of phosphoric anhydride must be slow in order to be successful; in fact, he had distilled it so slowly that only 2 grammes a day were collected. —Professor DEWAR warmly congratulated Mr. Baker on his important communication, proving his original statement. He hoped Mr. Baker would go further and show whether or not the latent heat of ammonium chloride is the same as that of a mixture of ammonia and hydrochloric acid gases.—At this late hour few remained to hear Mr. H. G. MADAN, M.A., give some notes on

The Properties of Methylene Di-iodide.

The author mentioned its use during the past ten or twelve years by mineralogists, on account of its high density, in the separation of minerals, its density being three or four times that of water. It is prepared by the action of hydriodic acid on iodoform. Glass was shown floating in the liquid, and fluospar floated like an iceberg with quite half its volume above the liquid. Topaz, however, sinks to the bottom. The high refractive index of methylene di-iodide (1·756, as determined by Dr. Gladstone) calls for special comment; and on this account it might well replace inflammable carbon disulphide in prisms for optical work. Unfortunately light has some action upon it, causing a yellow coloration. Tubes of this substance were exhibited, showing the effect of light upon it. One, kept in the dark, remained colourless; others, exposed to sunlight for four hours, two and ten days respectively, had assumed increasingly dark tints of yellow. This is the only objection to its use in microscopic work. Attention was called to the extreme solubility of phosphorus in methylene di-iodide. A solution containing equal proportions by weight has a refractive index of 1·95. Like all phosphorus and iodine solutions this is acted on by light with the formation in this case of red phosphorus. On exposing this solution in a watch glass and on blotting paper for a week no oxidation took place. The author suggested that the solvent formed a kind of varnish, which protected the phosphorus from oxidation. Sulphur is also soluble in methylene di-iodide, and the solution has a high refractive index.—Professor DEWAR suggested that possibly either there was moisture in the tubes or else that the oxygen in the air above the liquid had caused the yellow coloration. He would like to see the experiment repeated *in vacuo*, in the absence of moisture. The solubility of phosphorus in methylene di-iodide was a fact of no mean importance, as also the freedom from oxidation when poured on filter paper and exposed to air. The author, in reply, said that he had not dried the air in the tubes, and had dried the liquid by means of calcium chloride.—The PRESIDENT then announced that thirteen other papers would be taken as read, including the following: "The Sulphonation of Benzophenono," by A. Lapworth, D.Sc.; "The Condensation of Chloral Hydrate with Orcinol," by H. T. Hewitt, M.A., D.Sc., and F. Dixon, B.Sc.; "The Yellow Colouring Matter of Arctostaphylos Uva-Ursi," by Dr. Perkin, and "The Preparation of Ammonium Cyanate," by Messrs. Walker and Wood.

NOTICES TO CORRESPONDENTS.

All Communications for the 'Pharmaceutical Journal' must be Addressed to the Editor, 17, Bloomsbury Square, London, W.C., and not in any case to individuals supposed to be connected with the Editorial Staff; no responsibility can be accepted unless this rule be observed. Communications for the Current Week's Journal should reach the Office not later than Wednesday, but news can be Received by Telegraph until 4 p.m. on Thursday.

ADVERTISEMENTS AND ORDERS for copies of the 'PHARMACEUTICAL JOURNAL' must be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Cheques and money orders should be made payable to "Street Brothers."

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size; clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

NAMES AND FORMULÆ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

QUERIES addressed to the Editor will be replied to in the Journal as early as possible after receipt, though not necessarily in the next issue. Replies cannot be sent by post, even though stamped envelopes accompany the queries.

LETTERS TO THE EDITOR.

THE *P. J.* SYNOPSIS (B.P. 1898) AND ALCOHOL CONVERSION TABLE.

Sir,—May I be allowed to express my appreciation of the useful synopsis of the galenical preparations of the new British Pharmacopœia, which appeared in your issue of April 16, and has since been reprinted in book form. The idea of giving a general summary of the preparations was a most excellent one, and the manner in which it was carried out beyond all praise, for naturally both the practical retail chemist and the wholesale manufacturer were anxious to know as early as possible what changes were to be effected in the composition of the official galenicals. This is of much greater importance than the alterations in the lists of chemicals and drugs, and it was a happy thought to deal with the pharmacy of the book first. Your article has proved of the greatest assistance in the laboratory, and the earnest thanks of all who have to deal with the making of galenical preparations are due to you for providing so conveniently arranged a working guide. In the Alcohol Conversion Table published last week there is an obvious printer's error, the proof strength of 90 per cent. alcohol appearing as 40 o. p. instead of 58 o. p. The sp. gr. of the 2 and 1 mixture should also be 0·967 rather than 0·966, and although the quantities given are roughly approximate more exact figures are the following :—

(Spirituous Menstrua for Ext. Bellaaon. Liq and Liq. Senegæ Conc.)

Alcohol, 90p.c., 7 vol Water, 1 vol. = 79·6 p. c.	143¾f.oz. 897·7 C.c.	18f. oz. 112·6 C.c.	141¾f.oz. 884·6 C.c.	20f. oz 127·1 C.c.	1 gall. 1060 C.c.	0·8645	40 o p.
Alcohol, 20p.c., 2 vol Alcohol, 45p.c., 1 vol. = 28·5 p. c.	51½ f. oz. 321·4 C.c.	111¾f.oz. 698·2 C.c.	50¾ f. oz. 316·7 C.c.	112½f.oz. 703·4 C.c.	1 gall. 1000 C.c	0 967	50 u p.

In using the above, however, on account of the sensitiveness of alcohol to small variations of temperature, care must be taken that both the water and spirit are at 15°·5 C., otherwise inaccuracy will result. The quantities of spirit throughout the table are slightly higher than indicated by theory (viz. the nearest ¼ fl. oz. above the calculated decimal), in order to compensate for the slight loss of spirit which easily occurs unless special precautions are taken. This small excess tends to keep any possible error on the right side. It may also happen that during summer weather the spirit and water cannot be conveniently reduced to 60° F. As a proper temperature is essential for even approximate results, it is quicker in such cases to weigh the liquids. The necessary

figures are shown in the accompanying table, which in other respects corresponds with the one on page 396. It may also be mentioned that the specific gravities are calculated to the nearest 0 or 5 in the fourth decimal place, the proof strength to the nearest half degree, and that one-eighth of the gallon quantities gives the proportions required for one pint of the respective alcohols.

Laurence Pountney Lane, E.C. F. C. J. Bird.
April 27, 1898.

*** The new table referred to by Mr. Bird will be published next week.—[Ed. *P. J.*]

Sir,—I notice in your list of B.P. Formulæ and Processes, Alterations, etc., page 367, that you state, *inter alia*, "All quantities in the new B.P. are stated in terms of both Imperial and metric systems, but in order to simplify matters as much as possible—whilst the relative proportions have been strictly adhered to in all cases, the formulæ are, as far as possible, given in parts and fluid parts, in accordance with the well-established rule, solids by weight, liquids by measure." Do you not think it would have been better, say in the case of tinct. quininæ or tinct quin., ammon., or sp. camph., or any other form including a solid or liquid, to have stated so many grains, etc., to the ounce or pint? For instance, anyone preparing, say, 100 drachms of tinct. quininæ (a far more usual quantity than 100 ounces) would get totally wrong by using 2 drachms quininæ hydrochlor., the correct quantity being only 109·4 (nearly) grains. So, too, with sp. camph., 1 drachm, dissolved and made up to 10 drachms (fl.) is totally different to 1 oz. dissolved and made up to 10 ozs. (fl.)., the former being equivalent to 48 gms. in ℥i. (fl.) and the latter (correct one) 43·75 gms. in ℥i. (fl.). While pharmacists have to use the old-fashioned grain (*sic*), scruple, and drachm alongside of the Imperial weights and measures, I think it is much better to leave "parts and fluid parts" alone. Otherwise I think your synopsis an excellent "advance copy." The alcohol tables by Mr. Bird, too, are excellent and very practical.

Nuneaton, April 26, 1898. A. E. Slinn.

*** Mr. Slinn's criticism is replied to in a note at page 420.—[Ed. *P. J.*]

The New Pharmacopœia.

Sir,—On page 376 of the *Pharmaceutical Journal* you call attention to the new Pharmacopœia as it will be issued to the public. As an old pharmacist I should like to make a few observations on the very drastic changes which will be enforced on chemists in making several of the preparations, changes so drastic that they will practically compel the chemist, who has long prided himself on making his own preparations, to fall back on the wholesale house. I have always thought that the Pharmacopœia should be compiled as far as possible so that the average chemist should be able to make and to teach an apprentice to make most if not all the preparations ordered in it. Allow me to ask how many men in the course of business will undertake to prepare tincture of opium by the new process? In what was the old formula unsatisfactory? I have found that carefully dried Turkish opium with proof spirit makes at all times an excellent and reliable tincture. The directions for tincture kino, to say the least, are confusing, possibly a certain amount of revision will be brought to bear on the case. My fruiterer tells me that Seville oranges are only in perfect condition for eight or nine weeks in the year. I must, therefore make an absurd quantity of the tincture, or again present the wholesale house with a share of my profits. Why should Socotrine aloes be displaced by Barbados in most preparations? I have never found any difficulty in obtaining the former. I remember an excellent authority say "that Barbados aloes are stronger, but they are more apt to occasion hæmorrhoids and to gripe! With spirit of rosemary, 1 to 9, in place of 1 to 49, which strength shall be used in future for Wilson's and other hair washes? Syrup of senna carefully prepared by the old process produces a very satisfactory and reliable preparation. Will the new one be as good, and if spirits of wine is required to exhaust the leaves in this preparation, why should water be ordered for the same purpose in liquor senna concentratis? How will our customers accept the new tincture of rhubarb without the fine colour imparted by the saffron? or is the chemist to keep two tinctures of this—one for dispensing, and the other for the retail counter? Liquor chirata looks like an imitation of a well-known stamped nostrum now almost out of date. In infusion of buchu the leaves are ordered to be broken, not bruised. I wish whoever is responsible for this would tell me how to do it; the finger and thumb process is distinctly tedious. Ung. Aqua Rosæ reminds me of cremor frigidus fifty years ago, only more watery. These few remarks are only a tithe of what might and probably will be noted; but I think I am justified in asking who will benefit by these changes? Certainly not the chemist, and as far as I can judge not the public, but very decidedly the wholesale houses. In conclusion, what is to become of our present stock of tinctures, etc, prepared according to the Pharmacopœia of 1885? I suppose they must be used for all prescriptions written before April, 1898—but how are they to be distinguished? The use of the new tinctures especially would lead to endless confusion, and unpleasantness to our customers.

Norwich, April 26, 1898. Octavius Corder.

Sir,—Amongst the most noteworthy alterations of the new British Pharmacopœia, shortly to be published, is the substitution of fresh orange peel for the dried, as hitherto used. Now, this year's crop of bitter oranges has, at the finish, turned out very short, and the prices therefore considerably advanced. At the present time there are practically no bitter oranges here, and what few are here are realising very high prices, and there are no more to come forward. By this you will see that there will be in a few days' time no fresh oranges until next November, when the new crop will commence to arrive.

London, April 21, 1898. Sparks, White and Co.

Sir,—It is perhaps unnecessary for me to reply to the somewhat lengthy and detailed communication of your correspondent, Mr. Chas. Umney, of Southwark, only I should like to correct one or two misconceptions under which Mr. Umney is labouring. In the first place, as being the most important point raised by him in his reply, I wish to state most emphatically that there was nothing personal in my letter, and by no straining of its meaning can it be made out that such is the case. This is what is termed raising a side issue, and as Mr. Umney recurs to it in different ways during the course of his letter, as when he says the price-list "apparently caused him some discomfiture," and "I cannot think that this attack on me is from jealousy, the green-eyed monster that Shakespeare refers to. Surely such a distemper could not be at the root of his bitter complaining," I cannot too strongly repudiate the suggestion that I was actuated by any personal feeling against Mr. Umney or his firm. I wrote simply as a pharmacist to express publicly my disapproval of a certain line of conduct which has privately been much commented on. I think Mr. Umney practically admits he has made a tactical error, and were his admission a little more open I doubt not that those in the drug trade who feel aggrieved by his recent action would freely forgive him. He practically gives the case away when he says:—"Now in my firm's case, the 'man at the wheel' was Mr. John C. Umney, and in his start he had this particular subject 'at his fingers' ends,' for he had during the previous three years or more been constantly working under my instructions upon any subject connected with the British Pharmacopœia that my colleagues and I thought desirable." But the sole head and front of Mr. Umney's offending is his taking too early advantage of his son's having "this particular subject at his fingers' ends." That is the whole matter in a nutshell. Mr. Umney was not in London, but at San Remo when the Pharmacopœia was made "accessible to the public," but to carry his allegory about the "man at the wheel" a little further—is it not the custom in nautical life that when the skipper leaves the deck he gives the helmsman directions what course to steer? Had Mr. Umney given his son (for whose work and attainments I have the highest respect) instructions not to be indecently hasty in utilising the knowledge gained by his work during the last three years or more, there would have been no occasion for grumbling. The honour attaching to the position which Mr. Umney was called upon to fill is or ought to be, like virtue, its own reward.

Leith, April 26, 1898. George Coull.

Re Paraffinum Liquidum, B.P.

Sir,—You are aware that this article has recently formed the subject of discussion before pharmaceutical societies. We are fully in accordance with the criticism passed on the specific gravity adopted by the new British Pharmacopœia, and we fully endorse the opinion that the limits laid down are too close.

Foreign pharmacopœias admit paraffinum liquidum of 0·880 to 0·885 gravity, and even 0·870 to 0·875 gravity, and there is no reason why, considering the great perfection of existing methods of purifying this oil, paraffinum liquidum of 0·865 gravity should not also be admitted by any pharmacopœia, and speaking from our practical experience we have no hesitation in saying that our light paraffinum liquidum 0·865, as supplied by our works, is neither inclined to change its colour on being exposed to the air nor will it develop any odour. The limitation of the sp. gr. on the part of the British Pharmacopœia to 0 885 to 0·890 is a mistake for this reason, viz., that the raw material contains too many tarry constituents, which have to be removed by the process of purification, to allow of such a high gravity being attained, and when the oil is sufficiently refined to answer the other tests laid down by the British Pharmacopœia, it is found that the highest gravity attainable is 0 882, and it is generally reduced to even 0·880. If a new material could be found which did not possess tarry ingredients to such an extent, and which could be used for manufacturing the purest and most perfect article, we should be able to supply a heavier oil. Over twenty-five years' experience has shown us that American oil is not so suitable for this purpose, as white oils of best quality cannot be produced therefrom. We trust that these remarks will assist pharmacists in choosing the oil which is most adapted for their purposes.

London, April 21, 1898. Stern Bros.

New Drugs and Preparations.

Sir,—In my letter to the *Lancet*, I said: "I hope the new B.P. will contain all the drugs and preparations, new and old, that we can possibly require." In your Journal of April 23, p. 399, you say this is "a belated suggestion," because "the Pharmacopœia, so far as its contents are concerned, is an accomplished fact." But, in the same Journal, you say the B.P., 1898, is "not yet issued to the public," and "the date of its publication is not yet announced"; therefore, of course, it was not published three weeks ago, when I wrote to the *Lancet*. Before a book is published, it cannot be too late to express a hope that, when it is, it will be found to contain certain things, nor can such hope be called a "suggestion." I have not yet been able to buy or even to see a copy of the new B.P., and I still hope that, when I do see one, I shall find in it all the new and old drugs and preparations that a prescriber can possibly want.

9, Trinity Square, S.E., April 25, 1898. D. Hooper, B.A., M.B., *Physician to the Surrey Dispensary.*

*** Dr. Hooper does not seem to understand that at the time his letter was written the 1898 Pharmacopœia was already completed, printed ready for issue; between the printing and publication of a book it is impossible to make any alteration in the text. Lists of the new and old drugs official in the work appear in last week's Journal and this, and full particulars of all the preparations are given in our Synopsis, a copy of which has been sent for Dr. Hooper's information.—[Ed. *P. J.*]

Linimentum Terebinthinæ, B.P. 1898.

Sir,—Mr. Tocher's objection to the new lin. tereb. must be only "an expression of opinion." I have made half a pint of it, and the result is perfection.

April 23, 1898. T. D. (131/31).

*** The same result has been arrived at by another pharmacist, and we know for a fact that a specimen of liniment made by the formula in question has kept perfectly for more than two years. [Ed., *P. J.*]

The Council Election.

Sir,—The report of the meeting of the Glasgow Association was exceedingly interesting and opportune. On the eve of the election of members of Council, we are told that the opposition to our Pharmacy Bill by Mr. Cross was instigated by Mr. McKellar, who in his turn worked at the suggestion of Mr. W. Gibbons, of Manchester, who now seeks our votes to place him on the Council. —*Verb. Sap.*

April 26, 1898. Associate in Business (131/36.)

The B.P. (1898) Formulæ and Processes.

Sir,—Accept my thanks for reprinting in book form your "British Pharmacopœia (1898) Formulæ, Processes, etc." It is wonderfully comprehensive and singularly free from clerical errors. From the data supplied the new and altered preparations can be properly made. The inclusion of the tests for determining the strengths of such preparations as are standardised is unique. As a pocket guide to the 1898 Pharmacopœia it will prove serviceable long after the publication of the official volume.

Southwark Street, S.E., April 28, 1898. W. A. H. Naylor.

ANSWERS TO QUERIES.

Publishers of Pharmacopœia.—It is printed and published by Messrs. Spottiswoode & Co., Gracechurch Street, London, E.C. [*Reply to* P. G. and Co.—9/12.]

"Tablespoonsful" or "Tablespoonfuls."—The former term is totally incorrect, as usually employed. You do not, as a rule, take two tablespoons and fill them full; the general custom being to take one tablespoon and fill it twice. [*Reply to* J. J.—9,24.]

Work for the Minor.—Refer to the Students' Number of the Journal, published on September 11 last, for advice in the matter. The only advantage of a correspondence class is that it may ensure systematic working. Yes, every pharmaceutical student ought to possess a microscope and use it. [*Reply to* Anxious.—9/14.]

The New B.P.—Order an interleaved copy from your bookseller. It is not unreasonable to assume that candidates ought to know something about the contents of the book at the first examination after it is published, but ignorance on the subject is not likely to prove fatal to success before six months have elapsed since the date of publication. [*Reply to* C. G.—9/20.]

Botanical.—Both are specimens of *Polytrichum juniperinum*, one illustrating the sporophyte stage, the other bearing antheridia. Your request—which, by the way, is somewhat an unreasonable one—has been notified to the Curator, but why not send the specimen to a professional, such as Mr. Ernest Hinton, 12, Vorley Road, Upper Holloway, N.? [*Reply to* C. T. J.—9/13.]

Perfume Bottles.—If you have tried nearly all the English houses we presume you have applied to Messrs. Maw, Son, and Thompson, Aldersgate Street, E.C., who can usually supply anything that is required in this line. In that case you might try Messrs. Schindler and Co., 7, Aldermanbury Avenue, E.C.; Messrs. M. and J. Guggenheim, 70 and 71, Fore Street, E.C.; and the French Flint Glass Bottle Co., 6 and 7, Long Lane, Aldersgate Street, E.C. [*Reply to* Pomet.—8/32.]

British Pharmacopœia, 1898.—You do not seem to appreciate the difference between linear and cubic measure. A cubic decimetre equals 1000 cubic centimetres, not 10 as you seem to imagine. If, therefore, 1·00016 cubic centimetre = 1 millimetre, then 1·00016 cubic decimetre = 1000 millilitres or 1 litre. With regard to the matter of spelling you refer to, "Asafetida" is now the recognised form of the word, and you will observe that the form "Asafœtida" is only adopted in the notes referring to an old preparation. [*Reply to* Geohnz.—8/34.]

OBITUARY

Wright.—On April 12, at Hyères, France, Frederick Wright, Pharmaceutical Chemist, of Knutsford, Cheshire. Aged 24.

Green.—On April 13, at Deal, Herbert John Green, Pharmaceutical Chemist, eldest son of John Green, Pharmaceutical Chemist. Aged 32.

Foster.—On April 17, Edwin Foster, Chemist and Druggist, Morley, Yorks. Aged 66.

Hewlett.—On April 18, at Cannes, France, Caroline Julia, wife of John C. Hewlett, of Hillside House, Beckenham, Kent, and Charlotte Street, E.C.

Andrews.—On April 20, at St. George's Hospital, John Henry Andrews, Chemist and Druggist, 45, High Street, Kensington. Aged 32.

Tough.—On April 25, George Tough, Chemist and Druggist, late of Colpy. Aged 80.

Fielden.—On April 24, at 23, Madstock Road, Fairfield, Liverpool, M. Oliver Fielden, for very many years representative of Messrs. Meggeson and Co., 14 and 15, Miles Lane, London. Aged 66.

COMMUNICATIONS, LETTERS, etc., have been received from—Messrs. Alcock, Attfield, Beckett, Beckwith, Bird, Druce, Gardner, Garlett, Gibbons, Gibson, Grennan, Henry, Heron. Hill, Hirst, Holifield, Hooper, Jackson, Jinks, Johnson, Jones, Mackie, Naylor, Penistan, Pinkerton, Powell, Round, Scupham, Shorthouse, Skyrme, Slinn, Stern, Sykes, Thompson Tippetts, Watson, Whittle, Woolley, Wright.

ANNUAL REPORT OF THE COUNCIL.

In presenting the fifty-seventh Annual Report and Financial Statement, it is unnecessary to refer in detail to the work of the Council during the past year, as the proceedings have been fully reported each month.

Libraries. The value of the Libraries in London and in Edinburgh has been still further enhanced by the addition of important new books, partly by purchase and partly by donation. The attendances, and the circulation of books, remain satisfactory.

Museums. The materia medica collection of the Museum in London has been rearranged in accordance with the classification adopted in the lectures in the Socicty's School, and the new arrangement appears to have facilitated the work of students and to have given general satisfaction. Numerous donations have been received from home and foreign correspondents, and the Herbarium has been enriched by more than 300 specimens of medicinal plants.

Considerable alterations have been made during the year in the Museum of the Society in Edinburgh with a view to placing in position the College of Physicians and Scoresby-Jackson collections of materia medica referred to in the last report, and this work is still in progress. A handsome central floor case, presented by the College of Physicians, has been placed in the front portion of the ground floor apartment, the whole of which is now devoted to Museum purposes.

Examinations. For the "First" examination 1414 candidates were examined during 1897, and 678, or 47·95 per cent. were successful. The number examined was 119 less than in 1896, and the percentage of rejections shows an encouraging diminution. The statistics for the qualifying examination exhibit an unsatisfactory increase in the percentage of failures. The number of Candidates was 1441, but no fewer than 981, or over 68 per cent., failed. In the case of the Major examination fewer entries have to be recorded, 106 candidates having presented themselves as against 130 for the preceding year. The proportion of passes has, however, shown a considerable improvement.

Reference was made in the last report to the proposed changes in the "First" examination. The alterations in the Bye-laws of the Society to effect this object were finally approved by the Privy Council on November 11, 1897. The new regulations will come into force in August, 1900, and it is confidently hoped that they will tend to materially advance the interests of pharmacy. In his last report on the examinations in London, Dr. Stevenson, the Government Visitor, expresses to the Lords of the Privy Council the opinion that the necessity for the chemist and druggist "receiving something more than the knowledge "attainable in a chemist's shop is year by year becoming "better recognised," and he further endorses the policy which the Council has followed in the matter of preliminary education by saying that the change effected by the Bye-laws "ought to secure a better educated class of students, "and appears to be a change entirely for the good of the calling "of chemist and druggist."

During the year the Government Visitor, Dr. Balfour Marshall, made his first report to the Privy Council on the Examinations in Edinburgh. After deploring the evidence of "cram" in candidates, and want of sufficient training in the subjects so closely allied to the pharmacist's everyday work, Dr. Marshall expresses an opinion that the remedy lies in the establishment of a regular curriculum.

Benevolent Fund. At the Decennial Festival in May, a total sum of £2260 was subscribed, which is by far the largest amount realised at any festival since the establishment of the Fund. Of this amount £2084 has been added to the invested capital, and the remaining £176 has been transferred to the current account. The present charge on the Fund in respect of annuities now amounts to £2055, and, thanks to the liberality of subscribers, the Council has been able to distribute in relief during 1897 the sum of £3043—the largest expenditure in any one year.

Evening Meetings. Papers of much pharmaceutical interest have been contributed at the Evening Meetings, which have been well attended. In London they included "Pharmacy at Some of the American Universities," by Professor Reynolds Green; "Suppositories," by Mr. Edmund White and Mr. J. O. Brathwaite—former Bell scholars; "Notes on Official Extracts," by Messrs. Farr and Wright; and "Pharmacy of Cantharides," by Professor Greenish and Mr. Harold Wilson. Mr. Leo Atkinson also gave a lecture on "Bacteriology for Pharmacists," which was much appreciated. The Introductory Address in Edinburgh was given by Profcssor James Walker, D.Sc., and valuable papers were read at subsequent meetings by Dr. Gordon Sharpe, Dr. Dewar and Mr. Jack, Messrs. Storrar, Dott, Boa, Lunan, and others.

Hanbury Medal. The ninth award of the Hanbury Gold Medal took place in May, when the President, as one of the adjudicators under the Memorial Trust, announced that the choice of the Committee of adjudicators had fallen on Dr. J. E. De Vrij. The medal was presented at the Inaugural Meeting of the Society's School in October; a representative of the Netherlands Government attending officially to receive it in the absence of Dr. De Vrij.

Honorary Members. At the last meeting of the Council, Dr. D. J. Leech, Professor of Materia Medica and Therapeutics in the Victoria University; Professor W. Ramsay, of University College, London; and Professor Ira Remsen, the Professor of Chemistry at the Johns Hopkins University, Baltimore, were elected Honorary Members of the Society.

Legal. The number of cases of alleged infringement of the provisions of the Pharmacy Acts reported to the Registrar during the year was 309. Each case was carefully investigated, and those in which satisfactory evidence of an infringement of the law could be obtained were placed in the hands of the solicitors to the Society, that proceedings might be taken. As usual a large proportion of the offenders paid the penalties claimed without going into Court.

The only case to which special attention need be directed is that heard before the County Court Judge at Reading, where a sale of weed killer containing arsenic sufficient to poison 2000 persons was virtually admitted. The defence relied upon was that the weed killer had originally been procured for the private use of the defendant, that it was never intended for sale, that defendant did not sell by his own hand, and that he was not liable for the act of a servant who had sold the tin without authority. During the course of the evidence it transpired that the defendant had other branches and that he had a partner who was in charge of the Reading business. The case lasted five hours and, upon reviewing the evidence, the Judge held that the defendant did not intend to sell the tin in question. He also held that the word "sell" meant the physical act of sale, and on the question of partnership he was of opinion, having regard to the decision of

Subscriptions and Donations	28 5 6	Balance, December 31st, 1897 :—London and Westminster Bank	158 15 3
Interest on Invested Capital	9 15 0		
Interest on £1000 lent to the Benevolent Fund	35 0 0		
	£188 15 3		£188 15 3

AUDITORS' REPORT.

We, the undersigned Auditors, have examined the accounts of the Pharmaceutical Society of Great Britain, as presented in the Financial Statements of the General Fund, the Benevolent Fund and the Orphan Fund Accounts, and find them correct. We have inspected the Deeds relating to the House Property and Ground Rents named below, and also find that there were standing to the account of the Society at the Bank of England, and in the hands of the Society's Bankers, on the 31st December, 1897, the following, viz. :—

General Fund	Freehold Ground Rents at Paddington Green, London, W., cost	£5551 5 6		
	House in Edinburgh, cost	1931 10 0		
	,, ,, Additional Building, cost	3111 4 9		
	Leasehold Premises :—Galen Place, cost	10,606 10 2		
	,, 15 and 16, Bloomsbury Square, cost	9527 5 3		
				30,727 15 8
Benevolent Fund	Two and three-quarters per cent. Consols	£6050 0 0		
	Freehold Ground Rents at Strawberry Hill, cost	£1020 12 6		
	Do. Battersea, cost	12,213 0 0		
	Do. Broomwood Park Estate, cost	7454 7 10		
	Do. West Kensington, cost	5809 2 1		
			26,497 2 5	
	St. Paul, Minneapolis and Manitoba Railway 4 per cent. Bond		100 0 0	
	Chemists' Aërated and Mineral Waters Association, Limited, fully paid-up £1 Shares		100 0 0	
				32,747 2 5
Orphan Fund	Two and three-quarters per cent. Consols			355 0 0

In addition to the above the following Securities were standing to the credit of the Society on December 31st, 1897 :—

Pereira Memorial Fund	Two and three-quarters per cent. Consols	100 0 0	
Bell Memorial Fund		2050 0 0	
Hanbury Memorial Fund		400 0 0	
Redwood Memorial Fund	Great Indian Peninsula Railway Stock		400 0 0
Hills Prize Fund	Russian Bonds		316 8 0
Manchester Pharmaceutical Association Scholarship Fund	Manchester Ship Canal Co. 4 per cent. Debentures	700 0 0	
	Two and three-quarters per cent. Consols	52 4 6	
			752 4 6
The Burroughs Scholarship	4 per cent. New Zealand Consolidated Stock		720 0 0

F. HARWOOD LESCHER,
CHARLES UMNEY,
FRANCIS YATES,
Auditors.

February 22, 1898.

the House of Lords in the London and Provincial Supply Association case, that partnership was on the same lines as a corporation, He therefore reluctantly decided against the Society, but willingly granted leave to appeal.

The issues involved being considered of great importance, especially with regard to the partnership question, an appeal was made to the Court of Queen's Bench. This came on for hearing in December last, before Mr. Justice Hawkins and Mr. Justice Channell, who concurred with the views put forward on behalf of the Society, that a master, whether he was a member of a partnership or not, is liable under the Pharmacy Act for offences committed by his servant, if there is reasonable ground for supposing that such servant was acting under the ostensible or implied authority of either of his masters. Seeing, however, that the County Court Judge had found, as a fact, that the weed killer had been sold by the assistant without any authority, and that the defendant did not intend it for sale, they dismissed the appeal with costs, but expressed the opinion that the Society had succeeded in all points of public interest.

Parliamentary. For many years successive councils have given evidence of a desire to remove certain anomalies of the Pharmacy Act, 1868, which Act has shut out from direct representation on the Council all who are registered by virtue of having passed the Minor or the Modified Examination. The Council having reason to believe that a large measure of support would be given to a proposal for amending the law in this direction, has prepared a Bill with this for its chief object. The draft Bill has been generally approved by registered persons, in fact, the only opposition from within was due to misconception, and the Council is glad to be able to record that after an amicable exchange of opinions resulting in a clearer comprehension of the aim of the proposed amendments, the opposition has been loyally abandoned. The Bill was introduced into Parliament on February 24 by the Hon. W. F. D. Smith, supported by Mr. Brodie Hoare, Dr. Farquharson, Mr. Boulnois, Mr. Thomas Shaw, Mr. Brookfield, Mr. Kearley, and Mr. Schwann, and it passed the second stage on March 7. Since that time Mr. A. Cross, M.P. for one of the divisions of Glasgow, has given notice to amend the Bill by the insertion of words which are intended to effect a repeal of the Pharmacy Act, 1868, so far as insecticides and other poisonous pest destroyers used in agriculture are concerned. The effect of the notice has been to prevent the further progress of the Bill, but the Council is hopeful of overcoming the difficulty before the end of the Session.

The influence which every Local Secretary is capable of exerting has been admirably exemplified in the case of the Pharmacy Acts Amendment Bill. The Council recognises and appreciates this loyalty and devotion to the interests of the Society.

North British Branch. The Report of the Executive of the North British Branch was presented to the Council at its May meeting. The Council has cause for congratulation in the zealous and efficient service rendered by its officers north of the Tweed.

Obituary. The deaths during the year include Dr. Julius von Sachs, Sir Richard Quain, Bart., F.R.S , and Professor G. Dragendorff, Honorary Members of the Society; Professor P. C. Plugge, Corresponding Member; T. Glaisyer, Founder and Member of the first Council); R. W. Giles and F. M. Rimmington (former members of Council); W. Bower and J. B. Mackey (former Auditors); A. H. Squire, Pope Roach, C. W. Lea, and the following local officers of the Society: W. P. Hoare (Cromer), W. Donald (Perth), W. A. Waters (Rye), C. Wheeler (Haggerston), F. R. Bell (Swaffham), Henry Bates (Oldham), and P. H. Davies (March).

PHOTO-MICROGRAPHY.

BY EDMUND J. SPITTA, L.R.C.P. LOND., M.R.C.S. ENG., F.R.A.S.

In the last article (*ante*, p. 326) the description of the subject of photo-micrography was divided into three sections—low, medium, and high power work. It was then endeavoured to explain the general arrangement of the limelight, condenser, object-holder, and camera, and the most suitable forms of lenses for the work were indicated. It was further explained that no microscope or microscopical objective is required for low power work, whilst I was permitted to add, through the courtesy of the proprietors of the Journal, a supplemental plate showing reproductions of photographs taken by my son and myself, which were produced by the methods described.

There were a few remarks, however, directly bearing on the subject which I might have then made, but which were purposely deferred until now, as they will be the better appreciated by those who may in the interval have been attempting to try their skill in the direction indicated. It was stated that the camera and object-holder should be firmly supported, and that to obtain the right amount of magnification the camera must be pushed up to the

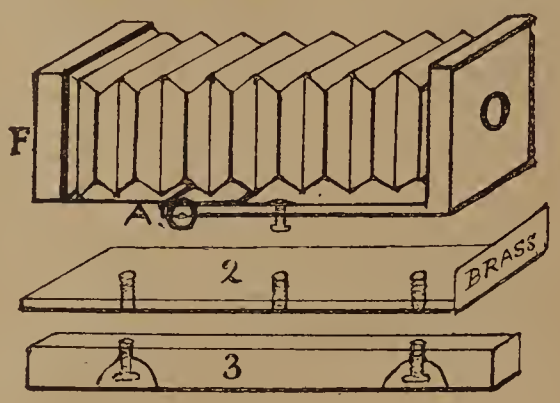

Fig. 1.

object to be photographed, or away from it, according to whether it required enlarging more or less. Those who have been making any attempt at trying this, the most primitive form of photo-micrography, will have already found such apparently simple movement of the camera is often a very troublesome matter. After having put the specimen in the centre of the ground glass, and made the light uniformly even over the whole field, they may have proceeded, as it was pointed out they should never neglect to do, to measure the image, and note by comparison with the object the amount of magnification they were obtaining. Perhaps they then found the image too large or too small. It seems now such a simple matter to shift the camera forwards or backwards, but, as a matter of fact, they most likely found it a very troublesome operation because, unless it was shifted exactly in the same axis, all the centreing of the light and the placing of the object into the middle of the plate, had to be done over and over again until the magnification was exactly what was wanted. I recognised this trouble when commencing the work some years ago, and then devised a simple form of arrangement which was so cheap and effective that I feel it may be of service to others to describe it somewhat fully. In Fig. 1 is shown my camera—roughly depicted, but clear enough, I hope, for the purpose— thoroughly extended to about 12 or 13 inches, the base-board of the camera being seen at A, the focussing screen marked F.

The dotted lines through the base-board indicate where the ordinary screw hole is placed, by which in the field the camera is attached to the tripod. Below the camera in the drawing is seen another board marked 2; it is large enough to hold the camera, the face of which fits well against the metal end marked "Brass" in the diagram. Three holes are seen in it (the board), the centre one to take the ordinary tripod head screw (shown in its place in the base-board of the camera) which fastens the board

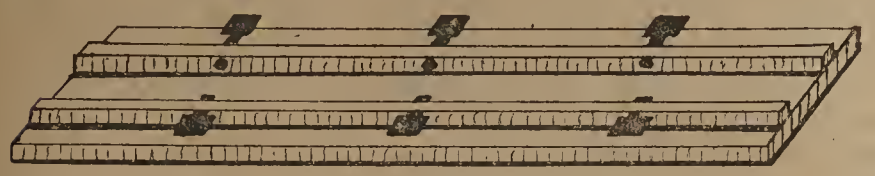

FIG. 2.

quite securely to the camera. It should be mentioned a little exactness is here required, so as to make the camera fit well home against the brass end referred to, but it repays the trouble, for if well done the camera should be quite firm and rigid, even though it is secured by this single screw. The other two holes are tapped to take the thumb screws which attach No. 3 board firmly to No. 2.

It may be convenient to give the exact dimensions of my apparatus :—

Camera length from end to end	13	inches.
Width	$5\frac{3}{4}$	,,
Board 2.—Length	$13\frac{1}{2}$	,,
Width	$5\frac{3}{4}$	,,

Five-eighths of an inch thick with a thin piece of brass at the end.

Board 3.—Length	16	inches.
Width	$3\frac{1}{2}$	,,
Thickness	2	,,

All these three pieces are seen fixed together in Fig. 3, but the camera is not shown fully extended. When all three pieces shown in Fig. 1 are firmly fixed, it is easy to see the camera will travel in the slide shown in Fig. 2. This can be made to fit piece 3 in Fig. 1 without any trouble, but the board of which it is made should be constructed of $1\frac{1}{2}$ inch stuff, and the guide rails (which are tapped

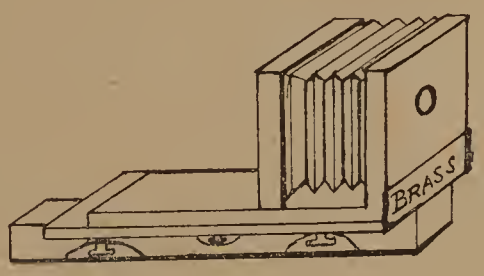

FIG. 3.

for the thick wooden screws shown black in the drawing) not cut out of too thin material. Mine were made of mahogany 1 inch wide and $1\frac{1}{2}$ inch thick. The length of the board I have found most convenient is 3 feet, and the width about 8 or 9 inches. Care should also be taken to get a well-seasoned flat piece of timber for this purpose.

It is very obvious now that if to the end of the railed board, Fig. 2, the object holder (shown at S in Fig. 1 of our last article) be firmly attached, the whole apparatus can be easily placed on an ordinary studio camera stand and clamped in position. One important convenience of this arrangement lies in the fact that a great amount of possible shake is thereby lessened, for, even if the camera, lens, or object be jarred the whole piece is thereby shaken in one mass, which does not effect the centreing of the picture or its adjustments; whereas, if the object had been separately supported apart from the camera, any touch to either would immediately have imperilled the focussing of the picture. This little point is well worthy of notice, as it is a help towards getting perfect results, saves time, and reduces failures.

In taking the photograph then, as described at the conclusion of the previous article, the camera can be slid with perfect trueness to and fro, until, in fact, the magnification required is obtained; and it has only to be clamped by the wood screws passing through the mahogany rails, for all to be complete.

Another convenient arrangement is that shown in Fig. 4, for attaching to the support S in the diagram with the previous article. It is practically something like a stage of a microscope. The slide is seen *in situ* and is capable of being moved in two

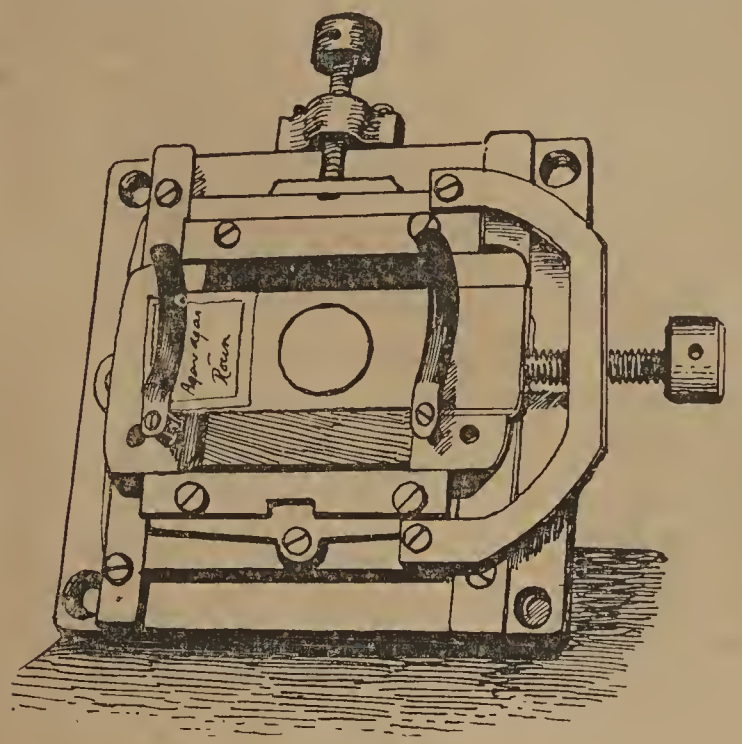

FIG. 4.

directions by the capstan-headed screws shown in the drawing. A further improvement is to have the whole made to revolve on its axis. It may seem an unnecessary extravagance to have an arrangement of this costly description for low-power work; but the comfort obtained by its use, and the time saved thereby, must be experienced to be believed.

Before quitting the manufacture of apparatus, let another board be made about two-thirds the length of Fig. 2, to place on the studio stand when required. This should have no support for the object, but should have two levelling screws, one at each end, for purposes to which we shall refer very shortly.

I have been reminded of one more application of low-power photo-micrography which has been omitted, and it is this, how to produce large pictures—say to fill a sheet of this Journal, for example—of an insect or other object, such as a specimen of botanical nature. It is obvious this can easily be done by using a 10 by 8 camera instead of a quarter-plate one; but it is an expensive method, and the same object can be attained by using the apparatus already described quite easily, without further expense. The arrangement is shown in the annexed diagram (Fig. 5), wherein it is seen the large condenser and limelight are again used, but the camera is reversed in position.

We proceed as follows :—The object, say a house fly, is obtained, mounted on a slip. Care should be exercised to get as transparent a one as possible, especially about the body, and with perfect wings; if a botanical or other specimen with plenty of contrast and not too dense. A negative on the quarter-plate (Edwards' isochromatic medium) is obtained, using either a 75 or 50 Mm. lens of the planar type, as they photograph so well in the yellow at F/16,

exposing for about 16 seconds with mixed jet. This is dried and placed in the ordinary dark slide, both shutters being drawn up, as shown in the diagram. The light will now pass through the negative first (the plane side being turned towards the condenser), and after that through the lens, which should be of about 6-inch focus, or more will not matter. There is no lens in our experience, after absolutely trying several kinds, save perhaps one of the new anastigmatic series, equal to an old-fashioned triplet by Ross or Dallmeyer, which can often be purchased second hand for a few shillings. If it can be had with rack and pinion it is all the better.

The photographer now pins on the wall a piece of paper and projects the rays on to it. Having got the picture the right size, he waits for night-time. Before doing more he must obtain an old champagne box and fit over the front a piece of red glazed calico, sold at any photographic dealer's. He must also purchase a gas burner with tap, having attached to it a piece of rubber pipe tubing of sufficient length to fit on to the gas-pipe of the apartment. A little hole in the back or bottom of the box (covered with a loose-fitting piece of red calico) is to be made, through which the gas can be ignited with a taper. He must also purchase two iron elbows about

1½ inch diameter, and having fitted one into the other thus fix one end by means of a common socket to the side of the box, that side which when the box stands on end will become the top. These allow the fumes to escape, the gas bracket being fixed to the opposite side, that side which is to be the bottom of the lamp. Night having come, he focusses the specimen carefully on a piece of paper pinned to the wall, which is then removed, having carefully marked the place. The bromide paper, upon which the enlargement is to be made, is then taken out of the packet, the light being turned out *pro tem.* A piece of deep yellow glass should now be fixed over the lens or held there by an assistant whilst the photographer turns up the limelight to see if the position is quite correct. Yellow glass will be quite enough to prevent the limelight from acting on the paper, and red we have usually found too dense. The focus had better not be touched, even though it appears to require it, for the yellow rays often seem to spoil the sharpness of the image on the screen. He now removes the yellow glass and exposes, if with Ilford Rough Rapid Paper for about three minutes at F/16 and mixed jet at full work. Development by ferrous oxalate is the cheapest, but some prefer amidol. Bromides do well with hydroquinone, the same formula as used for the plates, mixing equal parts of Sol. 1 and 2 and no extra bromide, but it is costly for large size enlargements, although the solution can be used over and over again, the strength being kept up by adding a little more of both solutions each time. We hope to be able to give an illustration shortly.

I promised before quitting "low-power work," however, to add a paragraph or two upon the subject of photographing the culture tubes of bacteriologists at about 1¼ to 2 diameters. Culture tubes are really test tubes plugged with cottonwool and occasionally paraffin wax in addition, which contain gelatin or some other cultivating medium, and which the bacteriologist either stabs down its centre, or streaks along its surface after inclining the tube at an angle of about 45° to the vertical. Each requires speaking about.

The appearance of the stabbed culture is readily imagined, but it requires some knowledge of the subject to know what the bacteriologist requires to be especially shown in the photograph of it. Sometimes he wishes features illustrated that necessitate the use of reflected light, whilst at others that which requires transmitted rays for its reproduction.

(*To be continued.*)

PHARMACEUTICAL SOCIETY.

MEETING OF THE COUNCIL.

WEDNESDAY, MAY 4, 1893.

Present:

Mr. Walter Hills, President.

Mr. G. T. W. Newsholme, Vice-President.

Messrs. Allen, Atkins, Bateson, Bottle, Carteighe, Corder, Cross, Grose, Hampson, Harrison, Johnston, Martindale, Savory, Southall, Symes, and Warren.

The minutes of the previous meeting were read and confirmed.

The Late Dr. Dragendorff.

The President announced that, since their last meeting, they had lost another of their distinguished honorary members by the death of Dr. Geo. Dragendorff, who died at Dorpat on April 7. Knowing that Professor Greenish was formerly a pupil of the late Professor Dragendorff, he had asked him one or two particulars of his career, and he thought he could not do better than read what Professor Dragendorff's former pupil had written, which was as follows:—

"Professor Dragendorff was a native of Rostock, in Meeklenberg. He was trained as a pharmacist; he took the degree of Doctor of Philosophy in Rostock in 1861, and went soon afterwards to St. Petersburg as editor of the Russian Pharmaceutical Journal and Director of the Chemical Laboratory of the Russian Pharmaceutical Society. In 1864 he was called to the Chair of Pharmacy and Directorship of the Pharmaceutical Institute of Dorpat, where he remained till 1891, when the Russification of the University forced him to resign. On leaving Russia he returned to Rostock, and was engaged in a compilation of an important work on medicinal plants when he died. His first important work—perhaps the most important of all—was the detection of poisons, which was followed by smaller contributions in the same field. He then turned his attention to the assay of drugs, and established many valuable contributions to a subject of which little at that time was known, but which from the foundations laid by Dragendorff has assumed the importance it possesses to-day. This has been mainly brought about by the work done by Dragendorff himself, and by numerous pupils working in his laboratory under his superintendence. These experiments and this work enabled him to write in 1881 his work on the "Analysis of Plants," which has been of the greatest service to all who have taken up the chemical examination of drugs. These are only the principal works he published. Innumerable smaller contributions have appeared from time to time, mostly in the Russian Pharmaceutical Journal. As a scientific man he was gifted with great acumen, quick to see the course to take, and prompt in action, imbued with a rare enthusiasm for his favourite subject, and capable of imparting that enthusiasm to his pupils. Under his directorship the Pharmaceutical Institute in Dorpat acquired a world-wide reputation, and boasted for several years of over 100 students. Dragendorff was awarded the Hanbury Gold Medal in 1885, and was an Honorary Member of the Society from 1875."

He was sure they would all regret that such a distinguished man had been called away, and would wish that their sympathy should be conveyed to the family of the deceased in their great loss.

Diplomas.

The undermentioned, being duly registered as pharmaceutical chemists, were respectively granted a diploma stamped with the seal of the Society:—

Barlow, Thomas Oldham
Black, Wm. Reynolds
Blackmore, Frank
Burnett, John
Chapman, Edgar Marsh
Coley, Jas. Wm. Ernest
Day, John Edwin
Evans, John Richard
Exelby, George Henry
Farrow, Tom
Happold, Carl
Henderson, Henry John
Hornby, Frederick Wm.
Laird, James Craigie
Matthews, Harold Evan
Morgan, Harold Marston
Nelson, William Brown
Perrédès, Pierre Elie Felix
Priestman, William
Smith, Fredk. Alfred Upsher
Swinn, Charles Gosling
Todd, Arthur Higgs

Election of Members.

Pharmaceutical Chemists.

The following, having passed the Major examination and tendered their subscriptions for the current year, were elected "Members" of the Society:—

Allen, Samuel Joseph; London
Barlow, Thomas Oldham; Kensington
Blackmore, F.; Weston-super-Mare
Burnett, John; Pickering
Chapman, Edgar Marsh; Scarborough
Coley, James William E.; Stroud
Day, John Edwin; Horncastle
Evans, John Richard; Llanrhaiadr
Farrow, Tom; Stokesley
Hankinson, Herbert Stanley; Ilford
Happold, Carl; Barrow-in-Furness
Hornby, Frederick W.; Bournemouth
Matthews, Harold Evan; Cirencester
Nelson, William Brown; Thorney
Perrédès, Pierre Elie Félix; Jersey
Smith, Frederick Alfred U.; London
Swinn, Charles Gosling; Manchester
Thomspon, Sidney Cooke; Rock Ferry

Election of Associates in Business.

The following, having passed the Minor examination, being in business on their own account, and having tendered their subscriptions for the current year, were elected "Associates in Business" of the Society:—

Anderson, James; Edinburgh
Ault, Percy; Usk
Bristow, Ralph Pratt; High Wycombe
Cashmore, Montague; Johannesburg
Cleave, Thomas William; Ealing
Coulson, Thomas; London
Cruikshank, Alexander; Musselburgh
Day, Charles Frederick; Lewisham
Dodge, Morten; Manchester
Donald, James Jameson; Perth
Faraday, George; Saffron Walden
Fernie, James; Newport-on-Tay
Flood, Frank; Leamington
Gelling, John Alexander; Douglas
Gelling, William Clucas; Douglas
Gilchrist, Robert; Scarborough
Gordon, John Alexander; Stirling
Griffiths, Alfred; Cardiff
Haining, Edward; Sheffield
Holroyd, James; Ashton-under-Lyne
Hunter, Andrew; Edinburgh
Hurst, Richard Proudman; Gt. Grosby
Killon, Alfred Ernest; Liverpool
Lewis, David Evan; Mardy
Lloyd, John Ambrose; Liverpool
Moore, Francis Henry; London
Oliver, Arthur; Salford
Pilsbury, William; Birmingham
Pratt, Charles Andrews; Saltash
Riddell, James Hamilton; Glasgow
Roberts, William; Beaumaris
Rose, James D., jun.; Jarrow-on-Tyne
Ruff, William; Whitby
Shattock, John Bellett; Lancaster
Spencer, John Christopher; Nottingham
Steel, Cecil Thomas; Southampton
Sturrock, James N. L.; Edinburgh
Taylor, Percy William; Notting Hill
Thomson, John Henry; Singapore
Volans, John Russell; Sunderland
Wade, Thomas; Lees
Walker, William; Dundee
Wilkinson, George Henry; Wednesbury
Williamson, Frederick Arthur; Preston
Wilson, William Wood; Glasgow

Election of Associates.

The following, having passed the Minor examination and tendered, or paid as "Students," their subscriptions for the current year, were elected "Associates" of the Society:—

Allen, William F.; Market Bosworth
Bailey, Edward Arthur; Boston
Baker, Thomas; Oldham
Barton, Harold; Southport
Baylis, Arthur Edward; Redditch
Biffin, Frank; Brighton
Blake, Ernest Alfred; Leighton Buzzard
Boyes, William Cotnam; Bradford
Brewer, Walter Joseph; Redhill
Brunyee, Nathaniel; Thorne
Cain, John; Douglas
Chandler, Richard Walter; Bristol
Chapman, Frank; Aylesbury
Churchill, Lionel A.: Burton-on-Trent
Clarke, John; Rotherham
Clement, William Henry; Barnstaple
Collins, Samuel Morrison; Norwood
Davies, John Osborne; Llanfyllin
Davies, William John; Pontypridd
Doig, William, Jun.; Dundee
Dolman, Thomas Tustin; Cheltenham
Doughty, Thomas Herbert; Lewisham
Duncan, Robert; Leeds
Dyson, Joshua; Brighouse
Ellis, William Frederick; London
Fawcett, Frank Dalby; Bebington
Franklin, A. Cawte; Stamford Hill
Fullerton, David Noble; Aintree
Gale, George Thomas; Barnstaple
Garnett, John Benbow; Manchester
Greatrex, Ernest J. McW.; Liverpool
Hardman, James Chevalier; Leeds
Harrison, John Duffin; Cudworth
Henshaw, William H.; Macclesfield
Hoare, Austin; Ilfracombe
Hodgson, John Edward; Scorton
Holdsworth, Joseph; Bradford
Jelly, John William; Pendleton
Johnson, Cornelius Trim; Falmouth
Jones, George Maurice; Birmingham
Jones, Thomas; Llanybyther
Jones, William Luther; Menai Bridge
Key, Harry; Birmingham
Kluge, Herman James; Swansea
Laverack, Clyve Cordukes; Malton
Lawrence, Edmund W.; Knaresboro'
Le Dain, Nicholas John F.; Jersey
Livesey, Henry Ayrton A.; Bradford
McIntosh, John William; Portsmouth
McKenzie, James; Cullen
McVitie, David William; Maryport
Manning, Henry Reginald; Modbury
Manson, John; Glasgow
Masson, Hedley George; Torquay
Middleton, Frank; Rainford
Newey, Walter; Stechford
Orme, Arthur John; Nottingham.
Percival, Thomas Henry; Walthamstow
Platt, George; Ashton-under-Lyne
Plowright, Alfred; London
Plumb, Alfred; Cambridge
Pollard, Evelyn William; Ryde
Powell, Harold; Dover
Pugh, John James Edgar; Leominster
Rayner, Alfred; Camberwell
Robbins, Robert William; Bath
Sloan, Charles Alexander; Dumfries
Speechly, Guy A.; Bishop Stortford
Stokoe, John Calvert; Sunderland
Stubbs, William Campion; Easington
Tarry, William C.; Hemel Hempstead
Tew, Arthur Wilson; Warwick.
Trunchion, Herbert Fawdon; London
Venn, Samuel Ernest M.; Devonport
Waddingham, George Albert, Batley
Walton, John; Margate
Walton, Ralph; Maidenhead
White, Gilbert; Litcham
Whitworth, Frederick W.; Nottingham
Wilkie, John Matthew; Montrose
Wrather, Thomas Edward; Bewdley

Election of Students.

The following, having passed the First examination and tendered their subscriptions for the current year, were elected "Students" of the Society:—

Arnold, Stanley; Southsea
Atkinson, John Wilson; York
Baker, Cyril Henry; London
Bingham, William Arthur; Balham
Blundell, Nellie Muriel K.; Caterham
Cart, John T.; Shrewsbury
Coulthard, Abram; Silloth
Cross, Ernest Llewellyn; Shrewsbury
Cruse, Thomas Edward C.; Southsea
Davies, John; Treherbert
Francis, Aaron; Llanidloes
Gibbs, Harold Rodeir; Birmingham
Hackforth, J. E. Swithin; Leyland
Haslegrave, Edward E.; Wakefield
Hey, Frederick Cooper; York
Hills, James Stuart; London
Hines, Frank Gladstone; Ipswich
Howitt, Walter Henry; London
Kemp, Leonard John; Southsea
Kieft, Edward James; Swansea
Knowles, Fred.; Melbourne
Lewis, Edward Davies; Cardiff
Lewis, George Walter; Kidderminster
Lloyd, Edward Neville; Bridgend
McKinnell, Donald F.; Northampton
Morgan, Daniel; Llanfyrnach
Morgan, Edwin Abraham; Callington
Northey, Sydney Moore; Bodmin
Overton, Percy John S.; Liverpool
Palmer, Collis Unwin; East Molesey
Power, James; Manchester
Poxon, Alfred; Brownhills
Prosser, Thomas William; Oxford
Richards, Thomas Teverson; Ashford
Smith, Thomas Connell; Edinburgh
Snook, John Francis; London
Taylor, Samuel; Southport
Walker, John Philip; Shipley
Wardle, Arthur Hampton; Maidenhead
Wilbourne, E. W.; Hucknall Huthwaite
Williams, David John; Cardiff

Restorations to the Register.

The names of the following persons, who have severally made the required declarations and paid a fine of one guinea, were restored to the Register of Chemists and Druggists:—

Thomas Edmunds Morris, 83, Northumberland Terrace, Everton, Liverpool.
Clement Thomas Rutter, 61, Bartholomew Close, London, E.C.
Charles Henry Walker, 9, Oxford Street, Liverpool.

Several persons were restored to their former status in the Society upon payment of the current year's subscription and a nominal restoration fee of one shilling.

Honorary Members.

The President moved that the following be elected Honorary Members of the Society:—

Dr. Daniel John Leech, Professor of Materia Medica and Therapeutics at the Victoria University.

Dr. Wm. Ramsay, Professor of Chemistry at University College, London.

Prof. Ira Remson, Professor of Chemistry at the Johns Hopkins University, Baltimore.

In accordance with the Bye-laws, these names were selected last month, and had since then been exhibited in the Library, and he had no doubt the resolution would be cordially accepted, and it was hardly necessary to say anything of the merits of these gentlemen as they were so well known. Dr. Leech was a member of the General Medical Council, representing Victoria University, and was also an active member of the Pharmacopœia Committee, and took a great interest, not only in materia medica and therapeutics, but also in the cause of pharmaceutical education in its widest sense. Professor Ramsay was well known as one of the greatest authorities in the science of chemistry, and his name had been very prominent recently in connection with the valuable work which he had done with regard to the discovery of argon and helium, in conjunction with Lord Rayleigh. Professor Ira Remson had a world-wide reputation as a teacher of chemistry, and was, perhaps, best known in this country by his admirable text-book on Organic Chemistry.

The Vice-President seconded the motion, which was carried unanimously.

Report of the Benevolent Fund Committee.

The report of this Committee included a recommendation of grants to the amount of £81 in the following cases:—

A registered chemist and druggist (56) who was in business for some years, but is now a hopeless invalid. (Edinburgh.)

A former associate (80), who has had a grant annually for the last seven years. (Croydon.)

A former member (73) formerly in business, is very deaf and hardly capable of doing anything. (London.)

The widow (55) of an associate in business, who died in 1896. She endeavours to support herself by needlework. (Liverpool.)

The widow (73) of a chemist and druggist who has had eleven previous grants. (Birmingham.)

The widow (53) of a chemist and druggist member and subscriber, who has had two previous grants. (Morecambe.)

The widow (53) of a chemist and druggist who was dispenser at a workhouse and died in March last, leaving her without any means. (London.)

A former associate (57), in business, and subscriber, who suffers from epilepsy. (Horncastle.)

One case was deferred for further information, and one was not entertained.

The VICE-PRESIDENT, in moving the adoption of the Report, said there was nothing that need be specially referred to, except that the applications were, perhaps, more numerous than usual.

The resolution was carried.

REPORT OF THE FINANCE COMMITTEE.

The SECRETARY read the report of this Committee, which was of the usual character, and recommended sundry accounts for payment.

The PRESIDENT, in moving its adoption. said there was nothing to which special attention need be called.

The resolution was carried.

LIBRARY, MUSEUM, SCHOOL, AND HOUSE COMMITTEE.

The report of this Committee stated that the report of the Librarian had been received, including the following particulars :—

	Attendance.	Total.	Highest.	Lowest.	Average.
March	Day	464	33	6	17
	Evening	144	16	1	6

Circulation of Books.	Total.	Town.	Country.	Carriage paid.
March	226	125	101	19*s.* 8*d.*

Several donations had been received (*Ph. J.*, April 23, p. 403), and the Committee had directed that the usual letters of thanks be sent to the respective donors.

The Committee had recommended that the undermentioned books be purchased :—

For the Library in London :—
Pharmacopée Homœopathique Française.
Strasburger, Text-book of Botany, 1898.
British Pharmacopœia, 1898. (3 copies).
For the Library in Edinburgh :—
British Pharmacopœia, 1898. (2 copies).
Scottish Medical and Surgical Journal for 1898.

The Curator's report had also been received, and included the following particulars :—

	Attendance.	Total	Highest.	Lowest.	Average
March	Day	727	43	13	27
	Evening	54	6	1	2

Several donations had been received (*Ph. J.*, April 30, p. 417), and the Committee directed that the usual letters of thanks be sent to the respective donors.

The SECRETARY read the report of this Committee, from which it appeared that Mr. H. A. Lee had resigned the office of Lecture Assistant.

The PRESIDENT, in putting the resolution, said a good of detail work had occupied the attention of the Committee, but there was nothing deserving of special mention, with the exception of the Annual Report, the draft of which was before the members, and which, in accordance with custom, would be considered in Committee later.—The resolution was carried.

The following report was presented :—

REPORT OF EXAMINATIONS.
April, 1898.

	Candidates.		
	Examined.	Passed.	Failed.
England and Wales :—			
Major	39	21	18
Minor	310	103	207
Scotland :—			
Major	3	1	2
Minor	145	44	101
First Examination	438	189	249

Forty-seven certificates were received in lieu of the Society's examination.

THE BRITISH PHARMACOPŒIA, 1898.

The President said he might take the opportunity of saying a word in reply to many inquiries which had been received as to the use of the new Pharmacopœia in the Minor examination. It had been decided that whilst it was of the highest importance that candidates for the Minor examination should, without delay, make themselves acquainted with the British Pharmacopœia, 1898, which was now official, their knowledge of what was special to that Pharmacopœia would not be tested by the Board of Examiners before the examination in January, 1899.

Dr. SYMES said he understood the President to say that the new Pharmacopœia was now official, and he was sure that statement would be of great interest in the country, for many chemists were feeling very uncertain about it, especially as to whether it became compulsory immediately it was published. He was not aware that any official statement had appeared whether there would be one, two, or three months' interval allowed, or whether it became official immediately on publication. This was a matter of some importance in case they were favoured with the attention of public analysts, and supplied articles in accordance with the old Pharmacopœia, when they ought to be guided by the new one. There was a general feeling that there should be some time given, and he should be glad to know if the President, the highest authority they knew of in the matter, could make any statement on the subject. He was sorry there should be so much secrecy about the matter altogether, and did not see what necessity there was for it. At the same time, he was not criticising it in any way, only asking for information for the benefit of the country members.

The PRESIDENT said he should like to give an answer to the rather rambling question which had been put, but was not in a position to give one with any authority. He found the British Pharmacopœia was published in the *London Gazette* last Friday, and that being so, technically it came into operation at once, both for prescribers and dispensers, but practically it was obvious it could not. When it actually would he could not say. He deplored equally with Dr. Symes that the law was as it was, and that apparently there was so much secrecy about this sort of thing. He should like different conditions altogether to obtain with regard to the preparation of future pharmacopœias, but it was prepared under the authority of an Act of Parliament, and neither the General Medical Council nor anyone else could make any alteration except by another Act of Parliament.

Mr. HARRISON said this question was both interesting and important. They could all understand the practical difficulty of the new Pharmacopœia coming into actual operation at once, but the great point was when would that practical difficulty be removed? Probably the new book had not been seen by nine-tenths either of chemists or medical men He thought, therefore, it would be a wise thing if some arrangement could be come to with the Medical Council by which a date might be fixed when it would be understood all round that the new Pharmacopœia should come into practice, and all prescriptions written after that date should be made up in accordance with it; and before that date the old Pharmacopœia should be followed. Otherwise he feared they might be in serious difficulties. Many alterations, some of them serious, had been made, and it would be awkward if one thing were ordered and another thing were supplied.

Dr. HAMPSON said there was no question that it was rather an anomalous position, but he was rather hopeful that the time would arrive when a greater anomaly would be removed. When the Medical Act was altered an opportunity would arise by conference with their medical friends who had taken an interest in the Pharmacopœia, for giving the Society their proper status with regard to the preparation of the Pharmacopœia. He did not know that his remarks were perfectly opportune, but he could not resist the opportunity of referring to the humiliation of the Society with regard to the Pharmacopœia. They should be on equal terms with the medical profession with regard to its preparation. The Society had occupied the position simply of servants. They had no voice in the actual selection of preparations even. The pharmaceutical chemists of this country did not want any special authority; but he thought the chemists of this country should rank with foreign countries in the compilation of their Pharmacopœia. In other countries which had a Pharmacopœia, pharmacy was more distinctly recognised.

Mr. CROSS could not help thinking that a great deal of fuss was being made about nothing. One would imagine that pharmacists, on reading the discussion which had taken place at that meeting, had come suddenly to the conclusion that there had never been a Pharmacopœia before. He remembered the last Pharmacopœia coming out, and the conditions that then obtained were pretty nearly the same as the conditions which existed at the present time. On that occasion they had no fuss about it. In due course the preparations were prescribed and properly dispensed, as they would be now. The medical men were no better acquainted with the volume than the chemists were.

The PRESIDENT said he thought the debate was entirely out of order. It was not quite the time to raise the general question, but he might just supplement the remarks he had made in answer

to Dr. Symes by saying that he believed the Pharmacopœia was really not obtainable until the 11th inst.; therefore, it was obvious that no one would be under any special disability until that time. He did not think there could be any possibillty of an agreement between the General Medical Council and the Pharmaceutical Society as to the date when the new Pharmacopœia should actually come into practical use, because the Act of Parliament already defined it. His suggestion would be that they should each endeavour to get their own medical men to indicate for a little time which Pharmacopœia they wished to be used in the preparation of their prescriptions.

Dr. SYMES said he had not raised an imaginary difficulty. He knew of two cases, one where a chemist intimated to his medical man that he should dispense every prescription according to the new Pharmacopœia, and another chemist had intimated to the medical men that he should not use the new Pharmacopœia until he found that the medical men so desired. For himself he rather favoured the latter view of not using the new Pharmacopœia until he found that medical men were doing the same.

REPORT OF THE NORTH BRITISH BRANCH.

The PRESIDENT said they had a very interesting report from the Executive of the North British Branch, which showed how careful those who represented the Society there were of its interests. He would move that the report be received and entered on the minutes.

The motion was put and unanimously carried.

The report was as follows :—

"The Executive of the North British Branch has now to submit the following report on the work of the year March, 1897, to March, 1898.

"At a meeting of Executive held on April 23, 1897, it was arranged that the Annual Election should take place on Friday June 18, 1897, and the present Executive was accordingly elected at a meeting of Members and Associates in business of the Society residing in Scotland, held on the above date.

"The Executive has held three meetings during the year. At the first meeting on June 25, 1897, Mr. James Laidlaw Ewing, Edinburgh, was elected Chairman, and Mr. William Little Currie, Glasgow, Vice-Chairman.

"The resident members, with the Chairman and Vice-Chairman, were appointed a General Purposes Committee to attend to business arising between meetings of Executive, or remitted to them by the Executive.

"A Committee was also appointed to prepare a report on the nomination of Examiners.

"The General Purposes Committee has met six times and has had charge of the Evening Meetings, and of the important and extensive alterations connected with the rearrangement of the Society's House, consequent on the transference of examination work to the new premises and the adjustment of the older portion of the House for Museum, Library and Office purposes.

"The Committee for nomination of Examiners met twice and reported to the Executive on November 26, 1897, when the following were nominated for election by the Council as the Board of Examiners for Scotland for 1898 :—Professor Isaac Bayley Balfour, Edinburgh; Professor John Gibson, Edinburgh; Alexander Davidson, Montrose; James Laidlaw Ewing, Edinburgh; James Jack, Arbroath; George Lunan, Edinburgh; Thomas Maben, Hawick; and John Nesbit, Portobello.

"The financial statement for the year ending December, 1897, showing a total expenditure of £1489 6s. 2d., as compared with a total of £1533 10s. 11d., or deducting exceptional and ordinary expenditure, of £1401 7s. 7d. for the previous year, has already been forwarded to the Council. There is, therefore, an apparent increase of £87 8s. 7d. There is an increase of £87 18s. 9d. under the heading of furnishing and repairs, due to exceptional expenditure for fittings and electric light installation for new Library. Thus this item alone accounts for the total increase for the year. There is an increase of £6 14s. 9d. in the item of cleaning and service, due to special service in connection with alterations. There is also an increase in the item of fuel, light, and water, which may be expected to increase still further, on account of the extension of the premises and the larger number of meetings. The examination expenses amount to £1007 7s. 11d. as compared with £1151 18s. 1d. last year—a decrease of £144 10s. 2d.

"The following particulars indicate that the departments connected with the Branch continue in a satisfactory state :—

"THE EXAMINATIONS.—The number of candidates continues large, though not quite so large as last year.

"During the year 9 Major candidates were examined, of whom 1 passed and 8 failed; and 548 Minor candidates were examined, of whom 181 passed and 367 failed.

"There has been a marked decrease in the number of Major candidates, 9 as compared with 16, and the fact that only 1 candidate has passed at Edinburgh during the year cannot be regarded as satisfactory. The total number examined is so small as to render a percentage statement of passes misleading, but it is significant that the figures for three years are 44·4, 25, and 11 per cent. respectively.

"The number of Minor candidates shows a decrease, 548 as compared with 623. Again, the results indicate a further slight decrease in percentage of passes, 33 per cent. as compared with 33·87 per cent. last year and 40 per cent. in the previous year. The Executive have observed with much interest the valuable and exhaustive report on this examination submitted to the Council by the Board of Examiners for Scotland at the meeting of Council in February last. The particulars there given, the Executive believe, throw a great deal of light on the causes of failure, and a careful study of the report on the part of students as well as those engaged in the training of them, would, the Executive feel sure, be productive of very beneficial results. The lighting of the Examination Hall has been much improved by the introduction of a handsome electric light installation. The ventilation of the laboratories is still engaging the attention of the Executive, some difficulty having been encountered in deciding on a plan which would be at once efficient and reasonably economical.

"EVENING MEETINGS.—The Executive determined to hold these meetings on Wednesdays instead of Fridays, and it was arranged to have a meeting on the third Wednesday of November, December, January, February, March, and April. The opening address was given by Professor James Walker, D.Sc. of University College, Dundee, and the whole six meetings were successfully carried through. With the exception of the opening meeting, the attendance was not so large as it might have been, and for this and other reasons it is not yet quite clear that the change from Friday to Wednesday has been justified. The Executive has to express thanks to those gentlemen who, by contributing papers or otherwise, assisted in making the meetings a success.

"LIBRARY.—The Library continues to grow, and a number of valuable books have been added during the year. The large room on the first floor, formerly occupied as a Board Room, has now been handsomely fitted up, and supplied with electric light, as a new Library and Reading Room. It is admirably adapted for this purpose and a very great improvement on the former arrangement. The number of volumes circulated during the year is seen from the following statement :—

		To provincial readers.
April, 1896, to March, 1897.....	1242	185
" 1897 " " 1898.....	1086	212
Decrease	156	Increase 27

This shows a decrease of 156 in the total circulation, which may be accounted for partly by the fact that the Library was in disorder for some time during the alterations and removal to the new room, and partly by the fact that it is becoming more the custom to read volumes in the now comfortable Reading Room instead of taking them away. There is, again, a satisfactory increase of 27 volumes circulated to readers outside Edinburgh and Leith, indicating an extended usefulness of the Library for provincial readers.

"The Library and Reading Room continue to be largely utilised for purposes of reference, and there are not wanting indications that the greatly improved accommodation is likely to lead to a considerable increase in this department of its useful ness.

"The Executive has to record thanks to those who have given donations of books during the year.

"MUSEUM.—The removal of the Library to the first floor has enabled the Executive to devote the whole of the ground floor to Museum purposes. It has been found easy to transform the former book-cases into very suitable cases for museum specimens, and an electric light intallation has also been introduced. The Executive were fortunately successful in arranging with the Royal College of Physicians so that they generously made the Society a gift of their large centre floor-case, containing the Martius' collection, and this very handsome case has now been fitted up in the Society's Museum. The large collection of specimens is at present being arranged, but some time must necessarily elapse before this work can be completed.

"THE ATTENDANCE.—The Library and Museum continue to attract large numbers of visitors. The Executive feel that some apology is due to many visitors, who were put to some unavoidable inconvenience during the progress of the alterations that have been going on for several months. The Society's House has come to be recognised as the headquarters for all organisations in which pharmacists, as such, are interested, and there has been a considerable increase in the number of meetings held during the year.

"HOUSE.—The Society's premises in Edinburgh are in thorough repair and good order. During the fitting up of the electric light in the Examination Hall in December it was discovered that damp was making its appearance, in a rather alarming way, in the west wall of the Hall. A thorough examination, under the supervision of Mr. Hippolyte J. Blanc, architect, revealed the fact that the water was flowing from a spring on the west side of the mutual wall between the Society's property and that of the neighbouring proprietor. Immediate and very ample means were at once taken to effectually cure the evil, and the Executive are now satisfied that this has been done, and that no further trouble from this source need be anticipated. This has involved an unexpected expenditure, which may amount to £25 or £30, but it is fortunate that the damp was discovered so soon, as otherwise it would almost certainly have involved a very much more serious expenditure. The Examination Hall and Laboratories have been thoroughly cleaned and painted. Very extensive alterations and improvements, which have been in abeyance for some time, have been carried out during the year to readjust the Society's House for the various departments. The alterations affecting the Library and Museum have been already referred to. The former Laboratory and Examiners' Cloak Room and Lavatory have been entirely cleared out, and fitted as a Board Room and Office, and supplied with electric light. These rooms have also been put in telephonic communication with the Examination Hall and Laboratories. The larger room is admirably adapted for meetings of Executive and other business purposes, while the smaller room has been fitted up as a private office for the Assistant Secretary. The work is practically completed, but the accounts have not yet been made up, and the cost cannot, therefore, be accurately determined. But the whole estimates have been very fully considered, and the carrying out of the work has been carefully supervised so as to secure the utmost economy consistent with thoroughness and efficiency.

"*36, York Place, Edinburgh, April 29, 1898.*" "J. LAIDLAW EWING, *Chairman.*"

CORRESPONDENCE.

The PRESIDENT said a letter had been received from Messrs. Matthews and Upsher Smith, thanking the Council for the privilege extended to them of working in the Research Laboratory during the summer term.

JURY SERVICE.

The PRESIDENT said the Secretary had received a letter from the Hon. Secretary of the Edinburgh and District Trade Association, communicating a resolution passed at a meeting of that body on April 26 :—

> That it be referred to the Committee to communicate with the Council of the Pharmaceutical Society as to the best means of obtaining exemption of chemists from jury service, and to take action in whatever way was thought best to obtain this end.

Attention was drawn in the letter to a precedent for including an exemption clause in the next Pharmacy Bill, in the fact that dentists did so in their Act in 1878. He would suggest that the letter be referred to the Law and Parliamentary Committee.

Dr. SYMES thought a good point was made in referring to what had been accomplished by the dentists, as they were often told that exemption from jury service could only be dealt with in a Jury Bill.

Mr. CARTEIGHE said Dr. Symes and the gentlemen at the meeting in Edinburgh evidently did not remember the discussions which had taken place since the Dentists Bill passed. He had pointed out scores of times that the Government would probably refuse to agree to any Pharmacy Bill if it contained a clause referring to jury service. The whole question of jury service had been under consideration, and it was the feeling that exemptions should not be increased, but rather the reverse, and the Privy Council, therefore, would not give their sanction to any Bill which included such a clause. If the Society ever got so strong as to be able to dictate to the House of Commons, anything could be done, no doubt, but at present it was not in a position to dispense with the support of the department (the Privy Council) which was supposed to control its operations in the interests of the public. He had every sympathy with chemists and druggists in this matter. They were as much entitled to exemption as pharmaceutical chemists, lawyers, or doctors, but he had been told more than once in the lobby of the House of Commons that chemists could not be exempted because they were the most intelligent members of the community. He was convinced, however, that these exemptions would come to an end. No recent effort to extend them had met with any encouragement, and the permanent officers of the State were distinctly in favour of sweeping away such exemptions, so that the burden of fulfilling this duty should be more evenly distributed. He was quite satisfied that whichever party were in power the result would be the same, and that no Government would consent to exempt intelligent men from this important public duty.

THE ANNUAL REPORT.

The Council went into Committee to consider the draft annual report.

On resuming, the report, as verbally amended, was adopted, and ordered to be printed (see p. 429).

GENERAL PURPOSES.

The Council then went into Committee to consider the report of the General Purposes Committee dealing with legal matters.

On resuming, the report and recommendations were received and adopted, and special resolutions passed authorising the Registrar to take proceedings against the persons named therein.

NORTH BRITISH BRANCH.

A meeting of the Executive of the North British Branch was held in the Society's House, 36, York Place, Edinburgh, on Friday, April 29, 1898, at 11 a.m. Mr. W. L. CURRIE in the Chair. The Executive met for the first time in the new Board Room. Present: Messrs. Bowman, Coull, Currie, Fisher, Henry, Jchnston, Kerr, Lunan, McAdam, Mitchell, Russell, Storrar, and Strachan. Apologies for absence were received from Messrs. Ewing, Hardie, McLaren, Moir, and Paterson. The minutes of last meeting were read and approved.

The ASSISTANT SECRETARY read the report of the

General Purposes Committee,

from which it appeared that various estimates had been accepted, and the work all carried out in a thoroughly satisfactory manner. The report also mentioned that during the fitting up of the elcctric light in the Examination Hall, it was discovered that there were serious indications of damp, which was traced to a spring. Very stringent measures had been immediately adopted, and it was believed with entire success to check the evil. The Committee also reported that the following proposal of Mr. Russell, which had been remitted by the Executive, had been considered at one of their meetings.

> That this Executive of the North British Branch of the Pharmaceutical Society of Great Britain resolve itself into a Committee to consider the constitution and objects of the Branch and the functions of the Executive, with a view towards increasing their usefulness, also to consider the question of pharmacy law administration in Scotland.

The CHAIRMAN had ruled that the proposal was out of order, inasmuch as it dealt with matters outside the scope of the functions of the Executive, and consequently no further action could be taken regarding it. The Committee had also considered the proposal remitted to them as to framing standing orders. The Chairman had, at the request of the Committee, consulted the President when in London. After full consideration, and in view of the fact that the Executive really acted under the instructions of the Council, to whose control it was subject in all its procedure, it was considered best to adhere to the compromise which was unanimously agreed to on both sides when the Executive was instituted by a resolution of the Council in 1886. The Committee therefore recommended to the Executive that no further action should be taken. With regard to the remit anent nomination of local secretaries, the Committee was of opinion that it would be an advantage to appoint local secretaries for a period of, say, five years instead of annually as at present. And, further, that it might be an advantage if the Council would select and appoint local secretaries directly without the formality of a local nomination. This, of course, would leave it open to local associations or other parties to make a recommendation to the Council if they so desired. The Committee regretted that pharmacists in so many districts manifested so much apathy in regard to this matter. The service that could be rendered by local secretaries was of the highest value, and this had been illustrated in many conspicuous examples, which deserved the grateful recognition of the Executive. The Committee felt that the power of the Society for ready and effective public action depended largely on the maintenance of a fully manned and thoroughly efficient staff of local secretaries. The Committee also submitted a suggestion that there might be a meeting of Executive on the same date as the annual meeting for the election of the Executive.

On the motion of Mr. MCADAM, seconded by Mr. STRACHAN, the report was adopted.

The Executive then went into Committee to consider the annual report to the Council.

On resuming, the CHAIRMAN said he thought they could congratulate themselves on the admirable re-arrangement of the Society's House, which had now been nearly completed. It reflected great credit on Mr. Ewing, who, he regretted, was not present to receive their expression of thanks. It was mainly due to him and to the confidence placed in him by the Council that this excellent result had been attained.

On the motion of Mr. FISHER, seconded by Mr. JOHNSTON, the report was approved of and ordered to be forwarded to the Council.

It was moved by Mr. BOWMAN, seconded by Mr. LUNAN, and agreed—

> That the next election of Executive take place on Friday, June 17, 1898, and that the Chairman and Vice-Chairman act as scrutineers of the voting papers, with power to add to their number.

On the motion of Mr. RUSSELL, seconded by Mr. COULL, it was agreed that the Executive should meet on Friday, June 17, 1898, at 10.30 a.m.

Mr. HENRY said that in view of the present position of pharmaceutical politics he had deemed it advisable to postpone consideration of the motion of which he gave notice at last meeting, and he now begged leave to withdraw it.

This was agreed to, and the meeting closed.

FRAENKEL'S NARCOTIC.—Tatschmer chronicles having obtained very favourable results with the combination of morphia atropine chloral chloroform invented twenty-two ycars ago by Fraenkel, and has yielded surprisingly favourable results in almost all departments of surgery. The injection is composed of morphine hydrochloride, 15 centigrammes; atropine sulphate, 15 milligrammes; chloral hydrate, 25 centigrammes; distilled water, 25 grammes. 1 C.c. of this liquid is injected and the coma completed by the use of Billroth's chloroform mixture (chloroform, 3; ether and alcohol āā, 1) or with pure ether. The author states that with the exception of alcoholic patients, the narcotic was taken in every instance very quietly, the narco-excitement of ordinary narcotics being entirely absent. Vomiting resulted only in very few cases, although several amputations were carried out, and some of the patients were operated on when the stomach was full. The greatest advantage was noticeable in the universal well-being of the patients after the operation, freedom from cerebral excitement, or depression, or loss of appetite.—*Journ. f. Zahnheil*, xii.

PHARMACEUTICAL JOURNAL.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office: 5, SERLE STREET, W.C.

LONDON: SATURDAY, MAY 7, 1898.

THE COUNCIL MEETING.

Before entering upon the regular business, the President referred to the death of Dr. Georg Dragendorff, and mentioned some particulars relating to his scientific career, which had been furnished by Professor Greenish, who was formerly one of his pupils at Dorpat.

The additions to the Society comprised 18 members, 126 associates, and 41 students.

The President then moved the election, as honorary members of the Society, of Dr. Daniel John Leech, Professor of Materia Medica and Therapeutics at Owens College, Victoria University; Dr. William Ramsay, Professor of Chemistry at University College, London; and Dr. Ira Remsen, Professor of Chemistry at Johns Hopkins University, Baltimore, giving a brief *résumé* of their several contributions to the advancement of science. The motion was seconded by the Vice-President and carried unanimously.

On the recommendation of the Benevolent Fund Committee eight grants amounting in all to eighty-one pounds were ordered to be paid.

The report of the Finance Committee was adopted without comment as of the usual character.

The report of the Library, Museum, School, and House Committee was also adopted without comment.

After the report on the examinations had been read, the President said he would take that opportunity of replying to numerous inquiries as to the use of the new Pharmacopœia in the Minor examination, by stating that candidates would not be tested as to their acquaintance with it before the examinations to be held in January, 1899. At the same time he remarked that it was, nevertheless, of the highest importance that candidates should without delay make themselves familiar with the new Pharmacopœia that has now become official.

Dr. Symes, referring to the feeling of uncertainty prevailing among chemists as to when the new Pharmacopœia became compulsory, said that he was not aware of any official statement on this point, though it was a matter of considerable importance to chemists. He, therefore, wished to know whether the President could give any information as to whether the Pharmacopœia became official immediately it was published, or whether some time would be given before it did so. He also expressed regret that there has been so much secrecy about the production of the Pharmacopœia altogether. Though he thought such secrecy was unnecessary, he did not speak critically, but only with the view of obtaining information for the benefit of country members.

The President, in reply, said he should have been glad to give an answer to the question, but was not in a position to do so with any authority. Judging from the fact that the publication of the British Pharmacopœia was announced in the *London Gazette* last Friday, he inferred that technically the Pharmacopœia came into operation at once, both for prescribers and dispensers; but it was obvious that it could not do so practically. He agreed with Dr. Symes in deploring that the law created this difficulty, and that there was so much secrecy about a matter of great public interest. He should like very different conditions to prevail in the preparation of future Pharmacopœias, but under existing conditions the work had been produced under the authority of an Act of Parliament, and neither the General Medical Council nor any other body could alter the procedure without an amendment of the law.

Mr. Harrison suggested that some arrangement might be made by which the unavoidable practical difficulty of a new Pharmacopœia coming into operation could be mitigated for general convenience, either by fixing a future date when it should be understood that the new Pharmacopœia would be in force for the making up of prescriptions, or by some other plan for avoiding the serious difficulties which might arise in consequence of differences between the preparations of the new and the old pharmacopœias.

Mr. Hampson recognised the anomalous position, and drew attention to a still greater anomaly which he hoped would be removed in future. He trusted that when the Medical Act was amended opportunity would arise for giving the Pharmaceutical Society a proper status in regard to the revision of the Pharmacopœia. He could not resist the opportunity of referring to the humiliating position of the Society in that respect, and of expressing the opinion that pharmaceutical chemists should be in a position of equality with the medical profession instead of simply servants. He thought the pharmaceutical chemists of this country should have the same rank that they held in other countries.

Mr. Cross objected to the apparent exaggeration of the difficulties attending the substitution of a revised Pharmacopœia for the one which had been in force. On the last occasion the conditions were nearly the same as at present, but in due course the new preparations were prescribed and dispensed properly, as he thought they would be now.

The President was of opinion that the whole discussion had been entirely out of order, and it was not the time to raise the general question as to the revision of the Pharmacopœia. In further reply to Dr. Symes, he mentioned that the Pharmacopœia would not be obtainable until the 11th inst., and no one would be under any special disability until then, and he suggested that meanwhile they should each endeavour to get medical men to indicate which Pharmacopœia they wished to be followed in dealing with their prescriptions.

The annual report of the North British Branch was presented and ordered to be entered on the minutes. It is printed in full at page 437.

A letter was read from Messrs. Matthews and Upsher Smith, thanking the Council for permission to continue work in the Research Laboratory, and another from the Secretary of the Edinburgh District Trade Association, enclosing a resolution passed at a meeting of that body in reference to

exemption of chemists from jury service (see p. 437), and stating that, in seconding the resolution, he had drawn attention to a clause in the Dentists Act, 1878, as constituting a precedent for inserting a similar exemption clause in the next Pharmacy Act. On the suggestion of the President, the letter and resolution were referred to the Law and Parliamentary Committee.

Dr. Symes remarked that the exemption from jury service obtained by dentists might be useful, since chemists had been told hitherto that this was a matter which could only be dealt with in a Juries Bill.

Mr. Carteighe reminded Dr. Symes that he and the members of the Edinburgh Association had overlooked the discussions of the subject since the Dentists Act was passed, and the fact that the Government has for many years refused to agree to any Pharmacy Bill containing a clause referring to jury service. The feeling was that these exemptions should not be increased, and the Privy Council would not sanction a Bill in which such a clause was included. Though he sympathised with chemists and druggists in this respect and thought they were as much entitled to exemption as pharmaceutical chemists, lawyers, or doctors, he was convinced that there was no prospect of exemption from jury service being extended, but rather the contrary. No doubt if the Society ever became so strong as to be able to influence the House of Commons anything might be done, but at present it was not in a position to dispense with the support of the Government department which controlled its operations in the interest of the public.

The annual report of the Council was considered and ordered to be printed (see page 429).

After considering the report of the General Purposes Committee dealing with legal matters, special resolutions were passed authorising proceedings to be taken in several cases of alleged infringement of the Pharmacy Acts.

COMPANIES ACTS AMENDMENT BILL.

Mr. Faithfull Begg (Glasgow St. Rollox) has at last given to the world his Companies Acts Amendment Bill, which was ordered to be printed as far back as Feb. 11. It has the support of Sir John Lubbock, Mr. Gordon (Elgin and Nairn), Mr. Hedderwick (Wick Burghs), and Mr. Marks (Tower Hamlets, St. George's), and is chiefly directed to protect investors from the allotment fraud which is now so common a cause of loss. To prevent a company going to allotment on insufficient subscription, the Bill proposes that the directors shall, in the prospectus, state the minimum amount on which they intend to allot. If, therefore, investors care to subscribe to a doubtful concern, Mr. Begg's measure will at any rate enable them to do so with their eyes open. In the event of irregular allotment, the director is to be made liable for the loss sustained by the company and the allottee. Provision is made for a number of returns with the object of making the true position of companies easily ascertainable by the investing public. The Bill also deals with the vexed question of honesty in prospectuses and balance sheets, and plunges into troubled waters by establishing a public register of directors. As a whole the Bill is nothing like so thorough a measure as the Board of Trade Bill now in Select Committee of the House of Lords, and though good as far as it goes, it can only be regarded as an attempt to patch up a few of the evils in a notoriously rotten system. Mr Begg will no doubt be as surprised as we shall if the Bill gets beyond a second reading.

ANNOTATIONS.

The British Pharmacopœia, 1898, was formally gazetted on Friday, April 29, notice being given, in the London, Edinburgh, and Dublin gazettes, "that the British Pharmacopœia, having been revised, has been re-published under the direction and by the authority of the General Council of Medical Education and Registration of the United Kingdom, and that the same has been printed and published by Messrs. Spottiswoode and Company, of 54, Gracechurch Street, in the City of London." But we understand that the publishers have, so far, declined to supply copies to applicants and it is doubtful if any will be available until next week. This is decidedly inconvenient to pharmacists who are anxious to place themselves in a position to execute orders for the new and altered preparations, but the inconvenience has been minimised by the publication, in the *Pharmaceutical Journal*, of full working details of all the formulæ and processes, and judging from the number of copies of the reprinted synopsis that have been applied for and distributed, there cannot be many chemists and druggists in a position to say they are, as yet, unable to make the preparations. The third edition of the reprinted synopsis is now nearly exhausted, and further applications for copies should be sent to the Publishers, 5, Serle Street, Lincoln's Inn, W.C., without delay.

The Question of the Authority of the 1898 Pharmacopœia has been raised, and, in this connection, it is noteworthy that the leading wholesale firms have notified their customers that from Monday last, May 2, all B.P. preparations ordered from them would be supplied in accordance with the formulæ of the new Pharmacopœia, unless the orders specified otherwise. There would appear to be no great objection to this course being pursued, so long as there is unanimity in the matter, but it is not altogether obvious that dispensers are bound as yet to adopt the new work as their sole standard and guide for medicinal preparations. The legal position of new editions of the British Pharmacopœia is sadly lacking in definiteness, and the officials of the General Medical Council are careful not to commit themselves in an attempt to define that position. All that was done by the Medical Act of 1858 was to empower the then newly-created General Medical Council to publish a book to be called the "British Pharmacopœia," and to authorise that body to alter, amend, and re-publish that work as often as it should deem necessary. The Act of 1862, again, whilst recapitulating the provisions of the previous Act, did no more than authorise the substitution of the British Pharmacopœia for all kindred works previously published in the United Kingdom. Notice in the London, Edinburgh, and Dublin Gazettes was to be deemed sufficient evidence of the publication of the Pharmacopœia, but nothing was stated with regard to re-publication, and no powers were granted to make the work in any way binding on anyone as a standard.

The Actual Position, of course, is that the British Pharmacopœia is not a legal standard except for the compounding of medicines described in that work. The Pharmacy Act, 1868, makes it an offence, punishable by a fine, for any person to "compound any medicines of the British Pharmacopœia, except according to the formularies of the said Pharmacopœia." As regards prosecutions under the Sale of Food and Drugs Acts, they have been successful when it has been proved that the article required by the purchaser, but not supplied by the seller, was asked for by a name given as a synonym in the British Pharmacopœia. Supposing, however, a case were brought against a registered chemist during the next few weeks for selling tincture

of myrrh not in accordance with the requirements of the British Pharmacopœia, and it were argued that he ought to be convicted because he had supplied the 1885 preparation, and not that of the 1898 Pharmacopœia, the case would almost certainly be dismissed, because it could not be proved that it was yet customary to supply tincture of myrrh containing four ounces of myrrh to the pint, instead of two ounces and a half. For it may fairly be assumed that the Pharmacopœia can only be accepted as a standard in respect of the sale of medicines when it accords with what is customary throughout the country. When the articles mentioned in its pages are sold for other than medicinal purposes it is not a standard for legal purposes. Accordingly, before the 1898 Pharmacopœia is entitled to rank as a standard for ordinary trade purposes, its formulæ must become the customary ones; and for compounding purposes, the intentions of the prescriber must supply the chief clue to what ought to be supplied. For the rest, the chemist must freely exercise his common sense, whilst it is greatly to be desired that uniformity in practice should prevail.

As to Examination Purposes, it will be observed (see p. 436) that a decision has been arrived at postponing a compulsory knowledge of the new Pharmacopœia on the part of Minor candidates, until January next. Eight clear months are, therefore, available in which the differences between the new and old Pharmacopœias may be mastered by candidates, and that period ought to prove more than sufficient to do the work thoroughly. It is satisfactory to be able to record this concession, which places candidates in a position to know definitely when they will be required to show an acquaintance with the pages of the new medicine book, but as we have already had occasion to point out, it will be far from a disadvantage if candidates entering for examination at an earlier date than January, 1899, are able to show that they know something about the contents of the work. Examiners are sometimes charged with asking questions outside the syllabus of some given subject, but we doubt whether any candidate has ever suffered from inability to answer such a question, whilst ability to give a satisfactory answer is certain to be amply rewarded and may even be regarded as sufficient to compensate for deficiency in what candidates quite understand they ought to know.

The Annual Dinner of the Pharmaceutical Society will be held on Tuesday, May 17, and persons intending to be present should communicate with the Hon. Secretary, Mr. Richard Bremridge, not later than Saturday next, the 14th inst., in order that the necessary arrangements may be made. As an additional attraction it may be mentioned that the Dinner Committee has secured the services of the Calliope Trio (ladies) for the musical entertainment of the guests after dinner. The inclusive price of the tickets is one guinea each, and friends who wish to be seated together at the dinner table should not neglect to notify that fact promptly.

The Edinburgh District Chemists' Trade Association has resolved to institute a prize scheme for answers to questions bearing on the legal and commercial aspects of Pharmacy. Two prizes will be given this year, viz., a First Prize of £2 2*s*. 0*d*. and a Second Prize of £1 1*s*. 0*d*. The competition is open to all assistants and apprentices engaged in the practice of pharmacy within a distance of about thirty miles from Edinburgh. The questions are:—1. What does the law require in regard to the storage and sale of Benzol? 2. What are the regulations as to the retail sale of Methylated Spirit? 3. State particularly what constitutes a medicated wine of ginger, coca, pepsin or quinine, such as may be sold without a licence? 4. You receive two orders for Arsenic from two farmers, one for seven pounds and the other for twelve pounds. How would you execute these? 5. What regulations govern the use of stills by chemists? 6. What is your opinion of the liability, or otherwise, to Medicine Stamp Duty of the following label? Further, if you consider it "liable," in what respects is it so, and if you think it "not liable" what alteration would make it "liable"? The information required may be derived from any source, and the answers must be sent to Mr. Claude F. Henry, 1, Brandon Terrace, Edinburgh, the Hon. Secretary. The idea of the competition is a capital one, and much benefit from increase of knowledge will accrue to all who attempt to answer the questions.

A Kekulé Memorial has been proposed and a circular issued on the subject, in which it is pointed out that the death of August Kekulé two years ago terminated a career rich in scientific achievement, as in him was lost an investigator who has exerted a profound influence on the development of chemistry. The theory of valency and of the linking of atoms, and present views as to the structure of carbon compounds, have acquired their definite form and clearness by the labours of Kekulé, his theory of benzene derivatives in particular having given the most powerful impulse to investigation in the domain of pure chemistry; while no scientific theory has done more to promote the development of chemistry as a branch of industry. But while Kekulé is eminent by his scientific achievements, he is not less so by reason of the effects produced by his teaching. The publication of his 'Lehrbuch der Organischen Chemie' is claimed to mark an epoch in the history of chemistry, as that treatise has done more to familiarise chemists with modern views than any other work of the kind. It is proposed that the memorial should take the form of a statue in bronze of the founder of structural chemistry, which would fitly be placed in front of the Chemical Institute at Bonn, where for thirty years he lived, taught, and worked. Subscriptions should be forwarded to Dr. Hugo Müller, 13, Park Square East, Regent's Park, London, N.W., who will transmit them to the Central Committee at Bonn.

The Proprietary Medicine Question and its solution have occupied the attention of Dr. C. C. Fite, of New York, with the result that he arrives at the sage conclusion that "the farther the Pharmacopœia gets away with the physician's needs, the farther the physician gets away from the Pharmacopœia." But this self-evident remark helps to solve no problem. What is required is to convince medical practitioners that there is a work worth consulting in the national Pharmacopœia, and that they may do better to refer to it rather than to the lists of wholesale makers of proprietary medicines. As things are, the young practitioner gets no real training in pharmacy or prescribing, he is hardly cognisant of the existence of the Pharmacopœia, and has no opportunity of becoming acquainted with its object of supplying a uniform standard for prescribing and dispensing. Hospital pharmacopœias are much to blame for this, and their total abolition would be an unmixed advantage for everyone concerned.

Glycerinated Calf Vaccine is increasing in favour, and in a recent number of the *Lancet* a suggestive report is published on results obtained by its use, Mr. Thomas Bond, surgeon to the Metropolitan Police, having submitted for inspection a statement showing the failures experienced by him in his weekly use of glycerinated calf lymph during the whole of the year 1897. An analysis that is quoted, shows that glycerinated calf vaccine has been produced by the Association for the Supply of Pure Vaccine Lymph, which will remain equally active throughout the whole year, and is not injuriously affected by the heat.

NOTICES OF BOOKS.

'THE BRITISH PHARMACOPŒIA (1898) FORMULÆ AND PROCESSES —ALTERATIONS, ADDITIONS, AND OMISSIONS' (London : *Pharmaceutical Journal* Office, 5, Serle Street, Lincoln's Inn, W.C. Price 4*d.*) is exactly what its name implies, a complete account, with full working details, of all the changes in the formulæ and processes of the new B.P. It also contains complete instructions for preparing diluted alcohol of the various official strengths from old and new rectified spirit. The first edition of the book was sold out the day of publication, a second edition was gone a few days later, and a third edition will probably be exhausted before this note meets the eye of our readers. The new Pharmacopœia was gazetted on Friday last, and its formulæ and processes are now held to be official, but copies of the B.P. 1898, may not be available before May 12, or later. Pharmacists, therefore, all over the country, are making the new and altered preparations in accordance with the very complete instructions given in this synopsis reprinted from the Journal, and find no difficulty in so doing. Leading wholesale firms are doing the same, and lecturers on pharmacy are placing copies of the synopsis in the hands of their students. As pointed out by the Secretary of the B.P. Conference last week (see p. 428), the working details of the standardisation processes and tests for standardised preparations have not yet been published anywhere except in the *Pharmaceutical Journal*, and in the synopsis to which attention is here directed. Nor has full information been published elsewhere regarding the dilution of both the old and new rectified spirits to the various weaker spirits ordered in the new Pharmacopœia.

THE 'PRACTICE OF PHARMACY,' by Joseph P. Remington (London : J. B. Lippincott Company, 6, Henrietta Street, Covent Garden, 1898), is the most important work on the subject of which it treats in the United States, and nothing approaching it in size or thoroughness has ever been attempted in this country. The third edition of the book was published in 1893, and commented upon shortly afterwards in these pages, but the continued demand for copies rendered necessary the publication of a reprint of that edition early in the present year. Altogether the book contains 1497 pages, of which 63 are devoted to the very comprehensive index, 18 to a glossary of uncommon names that occur at times in pharmacy, 110 to a reprint of the 'National Formulary,' 6 to formulæ of preparations of the U.S.P. 1880, omitted from the U.S.P. 1890, and 29 to a formulary of unofficial preparations collected with the view of saving the labour and time of the pharmacist when, as frequently happens, he is suddenly called upon to supply some unusual remedy. The introduction treats of pharmacopœias and dispensatories, and part I. contains 20 chapters on metrology and the various operations resorted to by pharmacists in the practice of their art—such as distillation, solution, filtration, crystallisation, extraction, percolation, and many others. Part II. deals with official pharmacy, in 11 chapters; part III. with inorganic substances used in medicine —17 chapters; part IV. with organic substances—14 chapters; and part V. with magistral pharmacy—5 chapters. Each chapter is concluded with a list of questions, complete answers to which will constitute a fairly exhaustive summary of the chapter, and it would be difficult to mention any point in connection with the practice of pharmacy which is not considered more or less fully in the book. In fact, the work is a library in itself for pharmacists and their pupils, and though based on the U.S. Pharmacopœia, is yet of great value as a work of reference for British pharmacists.

THE 'ANNOTATIONS ON THE BRITISH PHARMACOPŒIA OF 1898,' by Thomas Chase (Birmingham : 312, Broad Street. Price 1*s.*), form a dainty little book of forty-eight pages, which the author has compiled for distribution amongst his medical friends in Birmingham and the Midlands. The notes are more brief than those in the *Pharmaceutical Journal* Synopsis, which numerous chemists are utilising for a similar purpose, and bear evidence of being based on the Journal summary. At the end of the book Mr. Chase gives a posological synopsis of the new B.P., together with lists of additions, omissions, and substances the names of which have been altered. There are also a number of blank pages for notes, and the medical men who chance to be recipients of this booklet should be very grateful to the compiler.

'PASTEUR,' by Dr. and Mrs. Percy Frankland (London : Cassell and Co., Ltd. Price 3*s.* 6*d.*), is a sketch of the life and work of one of the most remarkable men of this century, whose achievements, as the authors point out, are so interwoven with circumstances by which our daily life is surrounded that it is all but impossible to find anyone who is not directly or indirectly concerned with some part or other of his great life-work. The sketch begins with a most interesting account of Pasteur's early years at Arbois, where his father owned a tannery ; at Besançon, where he took his degree ; and at the École Normale, Paris. His chemical researches and fermentation studies are next discussed in a sympathetic manner, whilst separate chapters are devoted to the discovery of anaërobic life, the spontaneous generation controversy, and Pasteur's studies on the vinegar organism, the diseases of wine, silkworms, beer, and infectious diseases. The researches on anthrax did not occupy Pasteur's attention until he was fifty-five years old, and his work on immunity and rabies came still later. A description of the Institut Pasteur fitly follows, and in the final chapter is a pathetic account of the closing years of the latest French hero of science, whose scientific life has been described by Rénan as being like "a luminous trail in the great night of the infinitely little, in those ultimate abysses of being where life is born." Everyone should read this book, and pharmacists in particular may learn much from it.

THE 'PROCEEDINGS OF THE CHEMISTS' ASSISTANTS' ASSOCIATION' for 1896-97 (price 2*s.* 6*d.*) constitute a volume of 84 pages, in which are reprinted the various papers that have been read before the Association. Lists of members, patrons, and officers are also given, together with the rules of the Association, etc. The Association appears to be in a very flourishing condition, and this record of the last session's work will be an interesting reminder to the members and their friends.

THE 'YEAR-BOOK OF PHOTOGRAPHY' (London : 9, Cecil Court, Charing Cross Road, W.C. Price 1*s.* net.) comes to hand later than most similar works, but the originality of its contents obviates the necessity of any apology on that score. The first section of the book—Progress and Practice—opens with some extremely useful notes by the Editor, E. J. Wall, F.R.P.S., on chemicals used in photography, which could not well be improved upon. Then follows a practical article on portraiture in rooms, by John A. Randall, and a comparison of the virtues of hand and stand cameras, by C. W. Piper. The "Photographer's Gazetteer," that useful fund of information about holiday resorts, comes next, whilst in the third section Winter Work receives attention. Lanterns and Lantern-Work are very fully treated by R. Child Bayley,

the well-known Secretary of the Royal Photographic Society. Section four is a mass of facts and formulæ, various useful tables being given, including several lists of metric equivalents of Imperial weights and measures, reprinted by permission from the *Pharmaceutical Journal*. Numerous excellent reproductions of photographs are scattered throughout the book, and the novelties of the year are described in an illustrated article, which will be, perhaps, as useful a part as any of this wonderfully good shillingsworth, for chemists and druggists.

'First Stage Electricity and Magnetism,' by R. H. Jude, M.A., D.Sc. (London: W. B. Clive, 13, Booksellers' Row, Strand, W.C., price 2*s.*), is a text-book specially prepared for the elementary examination of the Science and Art Department, the subject being treated from the standpoint of Potential and Potential-Gradient. It is freely illustrated and contains numerous exercises and examination questions. Each chapter concludes with a summary of the most important points dealt with in that chapter, and the book is divided into three parts, the sections being devoted to electrostatics, magnetism, and electrodynamics respectively. The subject is more satisfactorily treated than in any similar book written for examination purposes, and there should be a large demand for the work.

The 'Proceedings of the American Pharmaceutical Association' have always constituted a welcome addition to the pharmacist's library, and the record of the forty-fifth annual meeting, held at Lake Minnetonka, Minn., last year, forms no exception to that rule. Following the lists of present and past officers of the Association come the minutes of the annual meeting, including the reports of Committees on pharmacopœia revision, legislation, transportation, weights and measures, etc., etc. These reports afford indication of a very great amount of steady work being carried on in the interests of pharmacy and the American public, and it is matter of regret that something more on the same lines is not the rule on this side of the Atlantic. The numerous papers communicated at the annual meeting of the Association are also published in this volume, together with a voluminous report on the progress of pharmacy, by C. L. Diehl, consisting of abstracts of all important articles on pharmacy and allied subjects published between July 1, 1896, and June 30, 1897. As a convenient work of reference, this section of the book, covering some four hundred and twenty pages, is unsurpassed.

Chavasse's 'Advice to a Wife,' revised by Dr. Fancourt Barnes (London: J. and A. Churchill, 7, Great Marlborough Street. Price 2*s.* 6*d.*), has now reached its two hundred and ninetieth thousand, that fact affording sufficient evidence of the demand that exists for the information supplied in the work, and also of the satisfactory manner in which the demand has been met. Nearly three hundred pages of this new (fourteenth) edition are filled with advice on the management of the wife's health and on the treatment of complaints incidental to pregnancy, labour, and suckling. The book is eminently suitable for sale by chemists.

Chavasse's 'Advice to a Mother,' revised by Dr. George Carpenter (London: J. and A. Churchill. Price 2*s.* 6*d.*), is identical in character with the work previously mentioned, but it deals especially with the management of children and on first aid in cases of pressing illnesses and accidents. This book is in its two hundred and fortieth thousand, and the present is an entirely new (fifteenth) edition. About a hundred pages of fresh matter have been added to the original work, and most of the older portion has been re-written.

Pharmaceutical Transactions.

FORFARSHIRE DISTRICT CHEMISTS' ASSOCIATION.

At the annual meeting of this Association, held in the Imperial Hotel on Wednesday, April 27, Mr. Charles Kerr, President, in the chair, Mr. J. Rutherford Hill opened a discussion on

Regulations for the Sale of Poisons.

Mr. Hill related the circumstances under which the poisons regulations were drafted, as briefly explained in the Journal a few weeks ago (see *ante*, p. 333), and proceeded to show how the carrying of them out is to the interests of the public. At the close of his remarks Mr. Hill expressed his willingness to answer any questions that might have arisen in the experience of the members.—The Chairman said he frequently had to deal with cases in which very young children were sent by their parents for such articles as laudanum. It was very annoying and sometimes difficult to know what to do when children of tender years were sent as messengers for such articles. There was no legal restriction as to what age one might supply such articles.—Mr. Jack, Arbroath, said there was a matter in Arbroath which was regarded both by the medical practitioners and all the chemists as a grievance and a scandal. They had a public infirmary supported by charity, and poor people were visited by the doctors and prescribed for. These prescriptions were taken to the infirmary and dispensed by the matron, who possessed no qualification for such responsible work. He would like to ask Mr. Hill if no means could be taken to stop such a practice, and if it was not a breach of the Pharmacy Act? Representations had been made to the directors repeatedly, but the Town Clerk, who was a solicitor, had insisted that they were quite entitled to go on, and all representations had been ignored.—Mr. Storrar, Kirkcaldy, said the practice referred to was certainly very wrong, but whether it was illegal was a different matter. He did not think it could be said to be illegal to dispense medicines for patients inside the institution, but this matter of dispensing for out-patients was a different thing, and he thought it should be easy to put a stop to what was so manifestly wrong. Speaking of Mr. Hill's paper, he was glad he had emphasised the point that pharmacists had no wish to harass other trades, or that the Society worked the Pharmacy Acts for trades union purposes. It had never done so, and they should take every opportunity of denying such accusations whenever they were made, as they too frequently were in connection with prosecutions. The regulations for sale of poisons had been put upon pharmacists, and it was well to trace where these hard and fast rules had come from. They were not calculated to secure public safety, and, in fact, frequently defeated themselves. For instance, they were compelled, if they followed out the law, not only to put a poison label upon morphine solution, but also upon morphine lozenges. Such a thing destroyed the value of the warning label, and it was immensely better to leave the whole matter to the discretion of the properly qualified pharmacist, who might be trusted to label so as to secure the public safety.—Mr. Harley, Perth, said he had come across an instance of the grave dangers attending dispensing by hospital nurses. A nurse had put 4 ounces of corrosive sublimate in a Winchester quart of water, and when the latter portion came to be used there was some serious trouble, although the pharmacist who was called in was in time to prevent a disaster. He thought the practice complained of in Arbroath was a very serious matter.—Mr. Naysmith, Arbroath, said he also complained about the loose way in which dispensing was done. At the infirmary the chemist got the scum work to do when the matron was away for a holiday, and the drugs for the infirmary were all procured from a chemist in Bristol.—Mr. J. Russell, Dundee, said they had a case of this kind in Dundee, where an unqualified dispenser at a public institution dispensed a mixture which killed the patient. He was a poor man and had not friends, or the directors would probably have had to pay heavy damages, and as it was a public institution the fiscal would not take proceedings.—Mr. Ruxton said he had only recently come to Arbroath, and he had been worried by this practice at the infirmary ever since he came. He thought the Pharmaceutical Society should interfere.—Baillie Ferrier, Dundee, also strongly condemned the practice.—Mr. Davidson, Montrose, said they had a similar institution in Montrose, and the dispensing was done by the local pharmacists, each one taking his turn. The plan worked perfectly, and he thought the same plan ought to be adopted in Arbroath.

The present system was certainly bad.—Baillie Doig, Dundee, said something ought to be done. They must avoid the appearance of trades unionism. That was not their object, but simply the protection of the public. It might be best if a body such as the Pharmaceutical Society, were to interfere. The poor people especially had a claim to have some guarantee that they were getting what the doctor prescribed, and the present practice was strongly to be deprecated in the interest of the poor.—Mr. Hill, in reply, said there could be no doubt whatever that the practice complained of was a very distinct violation of the spirit and intention of the Pharmacy Act, and he was amazed that such a thing should be done in connection with a public institution, where one would expect most loyal regard to the intentions of the Legislature. The policy of the Act was to prevent poisonous substances being distributed to the general public in any other way than by the hands of duly qualified persons. In all the original drafts of the first poison regulation Bills, giving or delivering was held to be equivalent to selling, but it was found impossible to embody such wide language in an Act, and it was thought that the word "sell" would be enough to effectually strike at the evil to be remedied. Such a case as this might, therefore, not be technically illegal. That was a fine point capable of being argued. But whether technically illegal or not it was unquestionably a flagrant instance of the very evil the Act was meant to stop, and its effect was to frustrate the intention of the Legislature. There must be something seriously wrong in this ancient burgh if the attention thus publicly called to the practice did not lead to its speedy termination and the adoption of the very reasonable and satisfactory plan which Mr. Davidson explained as obtaining in the neighbouring town of Montrose.—Baillie Doig moved a vote of thanks to Mr. Hill, which was cordially awarded, and the meeting closed. The

Annual Dinner

was subsequently held, Mr. James Jack, Arbroath, in the chair, and Mr. Andrew Naysmith, Arbroath, acting as Croupier.—After an excellent dinner, Mr. John Robertson, Arbroath, proposed "The Pharmaceutical Society," and Mr. David Storrar replied.—Mr. Rutherford Hill proposed "The Forfarshire District Chemists' Association," and Mr. James Russell, Dundee, replied.—Baillie Ferrier, Dundee, proposed the "North British Branch and the Board of Examiners," and Messrs. Charles Kerr, Dundee, and James Jack, Arbroath, replied.—Mr. Alexander Davidson, Montrose, proposed "The Chairman," and Mr. J. W. Russell, Dundee, proposed "The Croupier."

DEWSBURY AND DISTRICT CHEMISTS' ASSOCIATION.

A meeting of the above Association was held on Monday evening, May 2, in the Town Hall, Dewsbury, Mr. A. Foster, President, in the chair. Mr. W. Stead, Heckmondwike, gave a short, but interesting paper on the new Pharmacopœia; afterwards a discussion took place on the subject, in which all the members took part. It was resolved to take the matter up again after the Pharmacopœia had been issued. A hearty vote of thanks was accorded to Mr. Stead, to which he briefly replied. It was also resolved that the Secretary should write and obtain two or three dozen copies of the Government Poisons Bill, and let each member have a copy, with a view to a discussion on it at the next meeting. A unanimous vote of thanks was accorded to Mr. J. F. Wilkinson, medical label printer, Manchester, who has kindly given 2000 printed post-cards, envelopes, etc., to the Association.

PHARMACEUTICAL SOCIETY OF IRELAND.

At Dublin on Monday, the evening scientific meetings of this Society for the winter session were brought to a close by an open meeting held at the Pharmaceutical Society's House, 67, Lower Mount Street. The President (Mr. R. J. Downes) occupied the chair, and was supported on the right by Dr. J. A. Walsh, M.C.P.S.I., and on the left by Mr. George H. Grindley, M.C.P.S.I. (Hon. Treasurer). There was an appreciative attendance of members and their lady friends, and amongst those present were:—Mr. W. F. Wells, sen., Dr. McWalter, M.P.S.I., Miss Ada Wyatt, M.P.S.I., Mr. A. L. Doran, M.P.S.I., Mr. J. Smith, M.P.S.I., Mr. and Mrs. W. F. Wells, jun. and Miss Wells, Mrs. Grindley, Mr. J. Tyrie Turner, M.P.S.I., Mr. M. R. Whitla, M.P.S.I., Mr. P. Kelly, M.C.P.S.I., Mr. W. Vincent Johnston, M.P.S.I., Mr. R. Simpson, M.C.P.S.I., Mr. H. O'Connor, M.P.S.I. (Hon. Secretary), Mr. S. Curham, M.P.S.I., Mr. J. Michie, M.P.S.I., Mr. A. T. Ferrall (Registrar), etc., etc. Apologies for non-attendance were received from Mr. G. D. Beggs (Vice-President) and others.—The President regretted they had to close the session at a most interesting period in the development of pharmacy. The new B.P. was on the verge of being made public, and they were all anxious to examine its merits or demerits. However, the volume would give them some occupation in the interval, and he expected they would all be able to discuss it when they reassembled for the winter session. Owing to the work being as yet semi-private, Professor Tichborne was unable to deliver his promised lecture thereon, but they had that treat in store. From what he knew the new pharmacopœia was more exacting and complex than the existing one, and greatly increased their responsibility as chemists. The large number of appendices contained a lot of useful information. He thought it would have been a good move on the part of the compilers if they had sent an advance copy to the Society, but, as a copy had not yet reached the Apothecaries' Hall, they could not say they were slighted. The sessional report for 1897-8 was then read by Mr. H. O'Connor, and went on to say that the evening meetings were opened on November 8 last, and since then lectures and papers had been contributed by members and friends of the Society, amongst whom were Mr. A. L. Doran, Dr. McWalter, Dr. M'Dowel Cosgrave, Dr. Carpenter, Professor Tichborne, and Dr. H. A. Auchinleck, together with discussions on matters of pharmaceutical interest, reports of which have appeared in the *Pharmaceutical Journal*. The present effort to efficiently work the Society as an educational and social body showed that something more was required to encourage the licentiates to become members and stimulate the energies of the existing members. The Committee recommended for the consideration of the Council the providing of accommodation in connection with the classes for post-graduate study, that the books at present in a book-case in the office should be arranged, numbered, and catalogued, and the catalogue published with the Calendar of the Society, and that the books be available to any member of the Society, also that a special glass case be provided for the holding of rare materia medica and other specimens, to be collected by members and presented to the Society. That a reading-room be opened, where the *Pharmaceutical Journal* and periodicals, trade and otherwise, could be read, and the fitting up of an unoccupied portion of the house as a gymnasium, and given over to a Committee who would be responsible to the Council. If these suggestions were acted upon a great boon would be conferred on the juniors, particularly those from the country and without City friends.—Thanks were accorded to those gentlemen who had contributed to the success of the past session, coupling therewith the name of Mr. G. D. Beggs, who worked the lantern on the occasion of Dr. E. M'Dowel Cosgrave's lecture.—On the motion of Mr. W. V. Johnston, seconded by Dr. Walsh, the report was adopted.—The President fully endorsed the Committee's recommendations, and said there was plenty of work for the Council to do, and he hoped they would do it.—Mr. W. F. Wells, in moving a vote of thanks to the Committee, spoke in flattering terms of the President's zeal and ability. It was gratifying to know that the evening meetings had been so successful, and the assistants themselves could do a lot to help on the Society in carrying out its programme during the next session.—The President concurred with the latter part of Mr. Wells' remarks. The co-operation of the assistants was of considerable value to the Society, and he hoped not only they, but the members, would take a more active part than heretofore in the evening meetings. Those who lived afar off and could not possibly attend got the benefit of the proceedings through the medium of the pharmaceutical press. The reports of their meetings circulated all over the world and set people thinking. They had had correspondence, in reference to their discussions, from the provinces of Ireland and from various parts of England, and he was agreeably surprised to find a full report of their discussion on "Pill Making" in a recent issue of the *Bulletin of Pharmacy*. It showed that their friends in America took an interest in their sayings and doings. He invited the country members to send up for discussion memoranda and notes of interest to pharmacy and its followers. This would give them a lively interest in the evening meetings, as the trade press would enable them to see what was said or done in connection.—Mr. Smith, Examiner to the Society, considered that the four members constituting the Committee were insufficient to carry on the work, and proposed the co-option thereto of Messrs. J. Michie and J. S. Ashe.—Mr. Johnston seconded the resolution, which was carried *nem. con.*—Further kind references to the President were made by

Councillor Kelly, who described him as the grand old man of pharmacy, and superior to past presidents in that he had solved the problem of how to inform instinct and amuse the pharmaceutical fledglings. He agreed with all the Committee's recommendations, and said it was a pity that good books should be allowed to get blue mouldy for want of use. In Mr. Downes they had a ruler, a guide, and a friend.—The President gracefully acknowledged the compliment, and said it was his earnest desire to make their meetings as intellectual and popular as possible. He wanted the Society to stand second to none in the kingdom, and believed the fulfilment of his hopes was coming gradually. It was in their power to achieve his desires, and if the members gave the Society their loyal support there was nothing to fear for the future. — At this juncture Dr. Walsh and Mr. Grindley left the platform and shortly afterwards re-appeared, bearing a massive solid silver bowl on an ebony stand, together with a handsome silver frame containing the names of those who had subscribed to the testimonial.—The President said they were now come to a most interesting part of the evening's business, and it was his privilege and duty to make a presentation, on behalf of the subscribers, to their good friend Mr. W. F. Wells, ex-president of the Society. He was a very old friend of Mr. Wells, his acquaintanceship dating back to the time when that gentleman was arrayed in bib and tucker. It was doubly pleasing to see present that evening Mr. W. F. Wells, senior, who claimed the distinction of being the oldest member of the trade in Ireland, perhaps in the United Kingdom, being close on ninety years of age, and still actively engaged at his business. He was proud to say he recognised in Mr. Wells, senior, his old master, under whom, many years ago, he served his lawful apprenticeship, and there was not one in the country who bore a better reputation or was more respected than that venerable gentleman. To inherit a good name was a thing to be desired, but it was a still more honourable distinction enjoyed by the ex-president, and that was the transmission of an honoured name to his own children. In the good old Book which changed not its wisdom it was written that "a good man leaves an inheritance to his children's children," and in the present instance holy writ was exemplified to the full. In the same volume was found the expression, perhaps more congenial to the pharmaceutical mind, that "a good name is better than precious ointment." As ointment was used in ancient times to embalm the body of the illustrious dead, even so the ointment of a good name preserved the memory of the man who had served his people well and truly ; and so it was with Mr. Wells and his respected son, who had earned that good name, which was better than the costliest ointment. It was some twenty-one years ago that Mr. Wells, jun., passed his examination, and since that time he had been in the forefront of all their legal battles, which he fought nobly and won. He was not infallible, but he generally managed to carry the day. Some years ago he and Mr. Wells were at issue on certain matters pharmaceutical, but they were now pulling together in harnesss, and intended to continue doing so through thick and thin. He begged Mr. Wells' acceptance of the testimonial, which had been subscribed by a number of friends as a slight token of their esteem and admiration, and as a tribute of their respect to his answering principles of right and justice.—Mr. Wells expressed thanks for the beautiful and valuable present. He was gratified beyond measure that his discharge of duty should have been deemed worthy of so choice an expression of his colleagues' goodwill. From the moment he joined the council he had but one object in view, and that was to serve the licentiates, advance the interests of the Society, and conserve to the full the right and privileges of pharmacy and those lawfully connected with it. He had the name of being a fighting man. He had no desire to fight, except in defence of the right, and so long as he believed his cause was a good and honourable one he would not count the odds, and was ready to face all comers. Without going over old ground, he took the credit of turning even the President from his— well, into the present happy state of mind, and enabling that gentleman to see matters pharmaceutical in a clear light. It was about nine years ago, when he (the speaker) was elected vice-president of the Society, that he was the recipient of an address as a memento of the crisis of 1890, when the Pharmacy Amendment Bill was enacted. He was one of three sent over to London in connection therewith, and the result was a matter of trade history—a chemical classic in fact. All did not agree with his policy and some thought it a wrong one, but such as it was he would follow as long as he remained on the council. In working for the Society he simply worked for the right, and looking back on the past events he would do the same thing over again if necessary. He thanked the President for his kindly reference to his father, who might justly be called the patriarch of the drug trade, seeing that he was sixty six years in harness and still actively engaged in his business daily, although a good deal over eighty years of age. He believed his father and Mr. E. M. Hodgson were the last of the old stock. He again thanked the subscribers to the testimonial, and hoped it would be handed down to posterity as an honoured memento of his connection with the Society.—Dr. McWalter, Mr. Grindley, Mr. Turner, and others, having spoken in complimentary terms of Mr. Wells and the Society, the proceedings then terminated.

PUBLIC DISPENSERS' ASSOCIATION.

A very interesting lecture on the "Production of Toxin, the Testing of its Strength, the Cognisance of the Animals Employed for the Purpose of the Preparation of Antitoxin, and the Method of Its Preparation, and the Testing of Its Strength," was given by Dr. Dean, of the British Institute of Preventive Medicine, on Friday last, at Bloomsbury Hall. The lecture was well illustrated with lantern slides. Among the number present were several nursing sisters from St. Bartholomew's Hospital, and about twenty-five other members of the Association, including several members of the Poor Law Dispensers' Association. The lecture occupied about two hours. After the lecture a few questions were asked and answered. — The proceedings were then brought to a close by Mr. Duff, of Banstead, who proposed a vote of thanks to the lecturer, which was ably seconded by Mr. Jones, of Poplar, who remarked that it was a large subject and a very complex one, and he had never enjoyed a lecture so much since his student days, and thought that they must be very dull indeed who could not follow all that the lecturer had said.—Dr. Dean, in replying, said he thanked them very heartily for the attention and kindness he had received, and the meeting then terminated. Sundry refreshments had been provided, and were afterwards served to those present.

MEETINGS OF SCIENTIFIC SOCIETIES

MANCHESTER MEDICAL SOCIETY.

On Friday, April 29, Professor Leech, at the request of the Committee, gave an address to the above Society on

The New British Pharmacopœia.

In reviewing the work which had been done by the Therapeutic Committee of the British Medical Association and the Pharmaceutical Society in compiling statistics of the frequency with which certain remedies were used, he threw a curious side-light upon the value of statistics obtained by such and similar methods as those which had been used. The answers elicited by the Therapeutic Committee regarding some preparations were so greatly at variance with anticipation that further inquiry was made in these particular cases with a view to ascertain if there were not conditions which might throw further light upon the apparent anomalies. The further answers in very many cases were such as to quite justify the extra trouble involved. One case which Professor Leech mentioned is typical of a number of others:—A medical man had stated that he frequently used extractum aconite, but when asked further as to the dose and the conditions under which he gave it, he replied that when he bought his practice there was a quantity of the extract in the surgery, and he used it continuously until it was exhausted, and intended to purchase no more. Saffron, Dr. Leech said, was omitted until it was found that its absence from decoct. aloes composit. produced a preparation which was more nauseous than heretofore, hence it was restored to the Pharmacopœia. He specially referred to the liquores concentrati, pointing out that the remarks in the preface do not justify the pharmacist in using them when infusions are prescribed. The medical men, he appeared to think, would quickly avail themselves of the opportunity of using these "concentrated infusions" now that they can be obtained of known and constant composition. Professor Leech spoke with approval of most of the new remedies. The ointments as a class are greatly improved. Upon the whole the Pharmacopœia of 1898 is a great advance upon any which have preceded it.

INSTITUTE OF CHEMISTRY.

The annual dinner of the Fellows and associates of the Institute of Chemistry was held on April 28, at the Trocadero Restaurant, Piccadilly Circus. The President, Dr. T. Stevenson (official analyst to the Home Office), occupied the chair, and the large company present included Lord Reay, Mr. Justice Byrne, Sir J. Evans (treasurer Royal Society), Sir E. Frankland, Sir H. T. Wood (secretary of the Society of Arts), Mr. K. E. Digby, Dr. Bernard Dyer, Dr. M. J. Russell, Dr. Thorpe, Mr. T. H. Elliott, Mr. J. F. Moulton, Q.C., Mr. H. Kearley, M.P., Mr. H. H. Cozens-Hardy, M.P., Professor Dewar, Dr. J. H. Gladstone, Dr. Ludwig Mond, Mr. W. Hills (President of the Pharmaceutical Society), Dr. H. E. Armstrong, Dr. J. A. Voelekler, Mr. Otto Hehner, Professor J. M. Thomson, Mr. D. Howard, Mr. R. J. Friswell, Mr. T. Fairley, Dr. Corfield, Dr. Mynter Blyth, and Mr. R. B. Pilcher (secretary). —The President, after proposing the usual loyal toasts, gave that of "The Houses of Parliament," Lord Reay and Mr. Cozens-Hardy, M.P., responding. — Mr. D. Howard proposed "The Learned Societies."—Professor Dewar, in reply, observed that the learned societies had an enormous piece of work to do, which they were gradually becoming alive to, in the way of cataloguing what had already been done. What was most seriously required in this country was a clear recognition that the time was past when our great public schools should rely entirely on a classical education. As long as that monstrosity remained in our time we should never be able to hold our own as a country, however great we might be as individuals. It was essential that the scientific culture should be recognised.—Mr. Justice Byrne proposed "The Institute of Chemistry" and the President, in responding, mentioned that the register of the Society now contained the names of 826 Fellows and 120 Associates, while there were over 180 registered students training for the examination at the various colleges recognised by the institute. He looked forward to the time when professional chemists would be endowed with the power of conferring diplomas and exercising the same restrictive functions as were already possessed by the professions of the law and physic. Other toasts followed.

PARLIAMENTARY NOTES.

The Pharmacy Bill.—This little non-contentious family re-adjustment of purely family matters is stirring up a good deal of strife. Mr. Weir, the well-known Member for Ross and Cromarty, and Mr. Yoxall, the honourable representative of education and W. Nottingham, have pounced upon the unfortunate measure with all the ardour and lack of reason of modern crusaders. Mr. Weir merely duplicates one of his friend Cross's amendments just to keep up the effectiveness of the block, should the political seedsman be unable to devote every night to the service of his country. Mr. Yoxall's amendment, however, is inspired by some of the candid critics of the Society within its ranks, who, wisely or unwisely, are prepared to demonstrate to the whole world the impossibility of effecting union amongst chemists and druggists on even the simplest matters.

The Effect of Mr. Yoxall's amendment would be to make Clause 3 read as follows:—

"Every person . . . . . who shall hereafter become registered as a chemist and druggist, *and who shall be also an Associate of the Society*, shall be eligible to be elected a member *of the Council* of the Society, according to the Bye-laws thereof, *one-third of the total number of members of the Council shall consist of chemists and druggists who are Associates of the Society.*" The added words are in italics. Which of the persons registered as pharmaceutical chemists has inspired this? It is obviously done in the interests of those whose views were patiently listened to and carefully considered in the early days of the history of the Bill. One would be glad to know the name of the author of this latest attempt to prevent progress, so that it might be preserved for the instruction of pharmacists yet unborn.

On Monday and Thursday the Bill was down on the notice paper, but the opposition is not to be caught napping even after midnight. Mr. Smith deserves well of the promoters and supporters of the Bill for steadfastness with which he carries on the campaign. He is in the habit of being on the winning side and will do his best to maintain the custom.

PHARMACEUTICAL SOCIETY.

"FIRST" EXAMINATION RESULTS.

A meeting of the Board of Examiners for England and Wales was held on Tuesday, May 3.

Certificates by approved examining bodies were received from the undermentioned in lieu of the Society's examination:—

Dunn, Percy; Birmingham.
Emerson, John Scott; Newcastle.
Hanbury, Fredk. Capel; London
Hearle, Joseph; London.
Hills, James Stuart; London
Horton, Albert John; Maidstone.
Hughes, Thomas Kiernan; Llandrillo.
Morrish, Charles Henry; London
Snook, John Francis; London.

The report of the College of Preceptors on the examination held on April 12 was received. 438 candidates had presented themselves for examination, of whom 249 had failed.

The following 189 passed, and the Registrar was authorised to place their names upon the Register of Apprentices and Students:—

Abdurahman, Abdulkariem; London.
Armitstead, John; Middleton.
Armstrong, Robt. Elliot; Alnwick.
Arthur, James Wm.; Peterborough.
Ashworth, Chas. Stanley; Blackpool.
Banner, John F. H.; Sunderland.
Barham, Joseph; Louth.
Barker, Frank H.; Northampton.
Barker, Percy J. W.; Brighton.
Baxter, James R.; Grangemouth.
Bebb, Arthur Percy; Walsall.
Bingham, Arthur H.; Spalding.
Blackhurst, J. F.; Carlton-on-Trent.
Boulton, Jesse; Kidsgrove.
Bowe, James H.; Ulverston.
Bowskill, Ernest Wm.; Grimsby.
Briddon, John E. W.; Ventnor.
Briggs, Ernest E.; Derby.
Brown, Alexr.; Edinburgh.
Brown, Jno. Smeaton; Campbeltown.
Bryce, John; Dumfries.
Bryden, John A.; Barrow-in-Furness.
Bryson, Robt. Dickson; Walker Burn.
Butcher, Arthur R.; Blackpool.
Cable, Alice Mildred; London.
Campbell, Duncan; Doug'as.
Cantwell, Arthur S.; Retford.
Carine, Fredk. Wm. R.; Manchester.
Carson, James; Edinburgh.
Carter, Arthur I.; Blackpool.
Cassie, Rhona C. H.; Hopeman.
Chard, Harold; Louth.
Cook, James; Thornhill.
Cooper, Arthur C.; Plymouth.
Cooper, Walter Mell; Sheffield.
Cornell, James R.; Ipswich.
Cottrell, Clarence; Oldham.
Cowe, John Geo.; Elgin.
Cragg, William; Lincoln.
Crawford, Geo. Whyte; Glasgow.
Crook, Thomas; Darwen.
Crooks, Jno. T. J.; Bishop Auckland.
Daft, George; Southwell.
Dale, John Geo.; Stockton-on-Tees.
Davies, William; Talgarth.
Davis, Albert Hy.; Warwick.
Dickie, John Gibb; Glasgow.
Dinwiddie, Wm. D.; Dumfries.
Dolton, Robt. Wm.; Caversham.
Done, Thomas; Chester.
Dotchin, Wm. A.; Gateshead.
Douglas, Norman McLeod; Aberdeen.
Duncan, Samuel C.; St. Helens.
Duthie, Robt. James; Aberdeen.
Eden, Peter McCulloch; Workington.
Enderby, Geo. Alfred; Boston.
Flew, Wm. Norman; Bradford.
Gardiner, Adam B.; Lockerbie.
Gemmell, Matthew; Paisley.
Gilmour, James P.; Glasgow.
Girdlestone, Walter; Manchester.
Good, Thos. Hy.; Hull.
Graham, Walter; Edinburgh.
Gray, George; Elgin.
Green, Herbert Hy.; Ashbourne.
Gregory, Edward; Stockton-on-Tees.
Guthrie, Robert; Glasgow.
Hamblen, Richd. R. P.; Bournemouth.
Harrop, Samuel; Ashton-under-Lyne.
Harwood, Albert E.; Edinburgh.
Hay, James; Newcastle-on-Tyne.
Hays, Fredk. J. A.; London.
Heggie, John; Lochee.
Henderson, David; Edinburgh.
Hetherington, Hector A.; Tillicoultry.
Hirst, Benjn. A.; Ilkley.
Holroyd, Asa; Queensbury.
Horton, Alexr. H.; Birmingham.
Hunter, Alexr. Sime; Perth.
Huntly, Hilda M.; Preston.
Hutt, Joseph R; Cheltenham.
Irving, Grave; Maryport.
Jack, Robt. Martin; Lochgilphead.
Jenkins, Hy. Watkins; Brecon.
Jessop, Fred.; Oldham.
Joyner, Lily Frances; London.
Kendall, Allan H.; Rawdon.
Kendall, Augustus C.; Rawdon.
Kerr, Wm. Reid; Paisley.
Koop, Charles F. R.; Brighton.
Lees, Herbert Chas.; Nottingham.
Lewis, Edwd. Arnott; Bristol.
Loader, Harry; Leyburn.
McBride, Fredk.; Grantham.
McCrae, Alexr. C.; Newton Stewart.
McKee, Isaac; Glasgow.
McLean, John; Glasgow.
McMillan, James A.; Newton Stewart.
McMurray, Andrew; Castle Douglas.
McNally, David; Wigtown.
McPhail, John; Newcastle-on-Tyne.
Marsden, Joseph; Manchester.
Mathieson, Donald McP.; Leith.
Mellor, Wm. Ernest; Newcastle, Staffs.
Miles, Edwin G.; Penarth.
Moffatt, Wm.; Barnard Castle.
Morgan, Hy. Jones; St. Clears.
Morgan, Wm. Emlyn; Blaenyffos.
Mortimer, Arthur; Shipley.
Mumford, William Jno.; Cardiff.

Murray, Wm. Baxter; Rhynie.
Ness, James F.; Kirkcaldy.
Nicolas, Violet; London.
Norman, Alfred C.; Bromsgrove.
Norman, Geo. E.; Skipton-in-Craven.
Northey, Wm. Geo.; Alford.
Old, Herbert A.; London.
Oliver, John T.; Thornhill.
Ough, Thomas; Liskeard.
Palmer, Washington; Manchester.
Parkinson, Hy. James; Driffield.
Piquet, Arthur Fred.; Winchester.
Pratt, George H.; Huddersfield.
Preece, Percival R.; Hitcham.
Prime, Wm. Arthur; Birmingham.
Raine, Frank H.; Darwen.
Ralston, Thomas; Campbeltown.
Raper, George; Liverpool.
Rayne, Wm. Allan; Dumfries.
Righton, Harry H.; Cheltenham.
Ritchie, Andrew W.; Edinburgh.
Robertson, Andrew; Burntisland.
Robertson, James; Coatbridge.
Robertson, John; Glasgow.
Ross, David; Tain.
Russell, Jas. Reddie; Anstruther.
Rutter, Arthur D.; Warrington.
Sayle, Ernest E.; Huntingdon.
Schofield, John Edwd.; Huddersfield.
Scott, Charles, Falkirk.
Searle, Fredk. Wm.; Plymouth.
Seers, Philip B.; Stafford.
Sewell, Arthur E.; Peterborough.
Shorthouse, Ronald G.; Bilston.
Siddle, Charles Hy.; Hull.
Smith, Alexr. Hunter; Falkirk.
Smith, Arthur N.; Blackburn.
Smith, Hy. Edgar; Padiham.
Spence, Wm. Wilson; Linlithgow.
Stewart, Ernest A.; Glasgow.
Stocks, Alfred B.; Queensbury.
Tait, Adam; Biggar.
Tattersall, Edmund G.; Manchester.
Taylor, Jas. Russell; Dundee.
Tebb, Harry, Hull.
Terry, Louis Geo.; Folkestone.
Thompson, J. H. Osborn; Liverpool.
Tildesley, Robt. Wm.; Rotherham.
Tomkinson, Albert E.; Liverpool.
Toohig, Jno. Hy.; Narberth.
Tout, Wm. Hy.; Plymouth.
Troughton, Charles A. J.; Belfast.
Unthank, Wm. R. E.; Bedale.
Veitch, George T.; Castle Douglas.
Waddell, Robt. Arthur; Sunderland.
Wade, Ernest; Halifax.
Waters, Robt. S.; Wick.
Watson, John; Thirsk.
Watts, Albert A.; Sheffield.
Webb, James T.; Dukinfield.
Weir, Thomas; Innerleithen.
Wells, Wm. Sidney; Newark.
White, Wm. Harold; Cheltenham.
Whitley, Wm. Owen; Rhyl.
Wicks, Fredk. C. G.; Oxford.
Wilbourne, Jno. Hy.; Chesterfield.
Wilkie, Robt. B.; Leven.
Williams, Allan O.; Pontypridd.
Williams, Gwilym E.; Abergele.
Wilson, Edwin O.; Bridlington Quay.
Wilson, Frank; Barnard Castle.
Wilson, Fredk. Chas.; Leeds.
Wood, Denys Richd.; Malvern Link.
Woodward, Geo. Edgar; Truro.
Wright, Ernest James; Witney.
Wright, Robert; Manchester.
Wynne, Edwd. Williams; Aberystwith.
Young, Frank James; Watford.
Young, John; Dumfries.

The questions set at this examination were published in the *Pharmaceutical Journal* for April 16, p. 374.

The following is a list of the centres at which the examination was held, showing the number of candidates at each centre, and the result:—

	Candidates.				Candidates.		
	Examined.	Passed.	Failed.		Examined.	Passed.	Failed.
Aberdeen	15	4	11	Leeds	23	12	11
Birmingham	19	8	11	Lincoln	11	6	5
Brighton	3	2	1	Liverpool	16	6	10
Bristol	2	1	1	London	29	8	21
Cambridge	3	1	2	Manchester	49	20	29
Canterbury	2	1	1	Newcastle-on-Tyne	20	6	14
Cardiff	13	4	9	Northampton	1	1	0
Carlisle	19	9	10	Norwich	4	1	3
Carmarthen	6	4	2	Nottingham	12	6	6
Carnarvon	8	2	6	Oxford	4	3	1
Cheltenham	4	3	1	Penzance	5	1	4
Darlington	15	7	8	Peterborough	3	3	0
Dundee	4	3	1	Plymouth	8	4	4
Edinburgh	38	17	21	Sheffield	11	5	6
Glasgow	47	22	25	Shrewsbury	6	2	4
Hull	8	6	2	Southampton	9	3	6
Inverness	9	4	5	York	4	1	3
Lancaster	8	3	5				

Chelidonine as a Substitute for Morphine.—It was proposed some years ago by Meyer, that chelidonine might be used as a substitute for morphine, and favourable results were said to have been obtained in a large number of cases. Guth now reports that it is useless for the purpose. The sulphate of the alkaloid was tried in nine cases, in doses of 5 to 30 centigrammes, in various painful affections. Not a single patient was benefited by its use and neither a sedative or analgesic action could be detected; on the contrary, in three cases violent nausea and salivation resulted. *Therap Monats.*, ix., 515.

NOTICES TO CORRESPONDENTS.

All Communications for the 'Pharmaceutical Journal' must be Addressed to the Editor, 17, Bloomsbury Square, London, W.C., and not in any case to individuals supposed to be connected with the Editorial Staff; no responsibility can be accepted unless this rule be observed. Communications for the Current Week's Journal should reach the Office not later than Wednesday, but news can be Received by Telegraph until 4 p.m. on Thursday.

Advertisements and Orders for copies of the 'Pharmaceutical Journal' must be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Cheques and money orders should be made payable to "Street Brothers."

Articles and Reports sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

Correspondents should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course not necessarily for publication. No notice can be taken of anonymous communications.

Drawings for Illustrations should be executed twice the desired size; clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

Names and Formulæ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

Queries addressed to the Editor will be replied to in the Journal as early as possible after receipt, though not necessarily in the next issue. Replies cannot be sent by post, even though stamped envelopes accompany the queries.

LETTERS TO THE EDITOR.

The Council Election.

Sir,—The letter of "Associate in Business" is, so far as I am concerned, absolutely untrue, I am therefore not surprised that he conceals his name, and I should have treated it with silent contempt but for the danger of it misleading those who have not the opportunity of obtaining correct information. I have before me now letters which make my position perfectly free from the blame he would like to saddle me with. On February 5, Mr. KcKellar brought Mr. Cross under my notice for the first time, and at a later date wrote and asked him to see me in London. This letter Mr. Cross, in one of his, states he received on March 10 (note the dates). That day Mr. Cross wrote to me, and by return of post I informed him that I had withdrawn all opposition to the Bill; and by the same post I wrote and made the same statement to Mr. McKellar, so that whatever was done afterwards could not have been done at my instigation. At a later date I again wrote to Mr. Cross urging him not to slaughter the Bill. Now I have before me an abstract copy of a letter from Mr. Cross to another pharmacist, in which he states he had information of the Bill and had been put on the alert before receiving Mr. McKellar's letter. Who supplied him with it? Why the Glasgow and West of Scotland Association, for on March 8 their Chairman announced that they had communicated with all their Members of Parliament. Mr. Cross has also stated that his amendments were not framed by Mr. McKellar. Where now is instigation"? In conclusion, I fear I have been as guilty as "Associate in Business" in implying that your readers are so dense that they could imagine for one moment the amendments proposed by Mr. Cross could possibly have been thought of or suggested by any chemist. Perhaps, however, he has one or two odd friends whose intelligence is so defective, and I must thank him for giving me the opportunity of enlightening them.

Manchester, May 4, 1898. Walter Gibbons.

The New Pharmacopœia Test for Quinine Sulphate.

Sir,—Mr. Cownley's note on the new test for quinine is somewhat disappointing, in that he proposes no alternative. The defects he mentions were pretty fully discussed at the meeting of the Pharmaceutical Society, reported in your columns on December 12, 1896, but the discussion did not either then or since elicit any suggestions for improvement. The new test, and all the ammonia tests except the Ph. Ger. III. are empirical, in that they fail to give direct indication of the amount of impurity, and that they allow an amount, not clearly defined, of impurity. The Ph. Ger. III. avoids this by requiring chemical purity, but does so at the cost of being practically ignored in commerce. The suggestion that an amount of impurity should be stated,

and no test given to ascertain it, is so attractively simple that it would no doubt have been adopted everywhere but for the certainty of such a definition leading to hopeless uncertainty. If indirect methods are to be allowed, the literature on quinine-testing "passim" shows how hopeless it is to find doctors agree; if direct determination is required, every chemist who attempts to test quinine must have a skill and patience in fractional crystallisation that is certainly not universal.

Stratford, London, E., May 2, 1898. David Howard.

The New Pharmacopœia.

Sir,—Amongst glycerin preparations of the new Pharmacopœia, one is surprised to see omitted a familiar preparation, and one introduced in the B.P.C. of 1891, viz., glycerinum belladonnæ. Surely this preparation, which has largely supplanted the old breast plasters, etc., is worthy of position, and how convenient for a standard formula, instead of having to prepare 1 in 2, and 1 in 3, or any other strength!

West Norwood, April 29, 1898. Hubert H. Mason.

Sir,—I should like to ask the compilers of the 1898 Pharmacopœia how pharmacists are to obtain 90 per cent. alcohol of s. g 0·8340. So far as my experience goes it is impossible to obtain a specimen in which those two factors agree. If real 90 per cent. alcohol be diluted with the same quantity of water as spirit of s. g. 0·8340, the respective products will be of different strengths. Then, again, there is surely some mistake about the s. g. of spt. ammon. aromat., given as 0 888 to 0·893. The old spirit was officially stated to be of s. g. 0·896, but 0 900 would have been nearer the mark. How can the slight difference in the s. g. of the old and new spirit. rect. cause so great a variation in a preparation the formula for which is otherwise unaltered? Finally, why should the alcohol be weighed in preparing the menstruum for liq. senegæ conc, as would appear to be required by the official instructions?

May 4, 1898. Pharmaceutical Chemist (132/45).

ANSWERS TO QUERIES.

Special Notice.—*Scientific, technical, legal, and general information required by readers of the 'Pharmaceutical Journal' will be furnished by the Editor as far as practicable, but he cannot undertake to reply by post. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of senders. Questions on different subjects should be written on separate slips of paper, each of which must bear the sender's initials or pseudonym. Replies will, in all cases, be referred to such initials or pseudonyms, and the registered number added in each instance should be quoted in any subsequent communication on the same subject.*

Headache Powder.—The powder you send is acetanilide, [*Reply to* Curious.—9/8.]

Detection of Metals.—They will be completed shortly. [*Reply to* Countryman.—9/5.]

Botanical Handbook.—See reply to W. H. W., three weeks ago, on page 341. [*Reply to* Percontator.—9/2]

The B.P., 1898, and the Minor.—See note at page 441. [*Reply to* H. C. T. G.—9/23]

Combined Toning and Fixing Bath.—Dissolve gold chloride, 2 grs.; potassium sulphocyanide, 60 grs.; and sodium hyposulphite, 2 ozs., in sufficient water to make 8 ozs. of solution. [*Reply to* A. H. P.—9/17.]

Smoke Producer.—Probably a mixture of powdered resin, sugar, and soot, with just enough nitre to make it burn, would answer best. Do not use too much nitre, or the mixture will burn too quickly, or even deflagrate. If it is required to burn in a confined space you must use more nitre than if for the open air. [*Reply to* Acacia.—9/22.]

Lemon Squash.—(1) Soluble essence of lemon, 1½ oz.; citric acid, 2 ozs.; freshly boiled water, 6 ozs.; syrup to make 40 fl. ozs.; colour, if desired, with a little saffron. (2) Lemon juice 20 fl. ozs.; boil and filter on to powdered sugar, 30 ozs.; dissolve, with agitation, and add 1 oz. of soluble essence of lemon. [*Reply to* C. G. S.—9/18.]

Crystalline Calcium Tungstate.—This occurs native as Scheelite. It may be obtained in crystals by fusing native wolfram with excess of calcium chloride and then boiling out the soluble chloride from the slowly cooled mass. You will probably find this answer better than the method of precipitation you name, as the slow cooling would enable the calcium salt to separate out in a crystalline form. Possibly you might convert your amorphous salt into the crystalline state, by heating it with lime in a stream of HCl, or even by again fusing with $CaCl_2$ and slowly cooling. [*Reply to* Radiography.—9/19.]

Developer Containing Glycerin.—Presumably you mean the glycerin pyro developer suggested in 1880 by B. J. Edwards, whose formula was:—No. 1: Pyrogallol, 28 Gm.; glycerin, 28 C.c.; methylated alcohol, 170 C.c.: mix the glycerin and alcohol, and add the pyro. No. 2: Potassium bromide, 4 Gm.; liq. ammonia (0 880), 28 C.c.; glycerin, 28 C.c.; water, 170 C.c. These stock solutions will keep for some time. To make the actual developer, mix 1 part of No. 1 with 1 part of No. 2, and add 30 parts of water. The new methylated spirit must not be used for the above. [*Reply to* A. H. P.—9/17.]

Preparation of Water Glass.—The water glass of commerce, or sodium silicate, approximates in composition to the formula $Na_2O \cdot 4SiO_2$. A mixture of 22 or 23 parts of sodium carbonate, 44 or 45 parts of white sand, quartz, or powdered flints (prepared by heating to redness, quenching in water and grinding), and charcoal 3 parts, are fused in a reverberatory furnace for eight or ten hours, then dissolved by prolonged boiling in water. One hundred parts of fused mass generally give 300 parts of solution: sp.g. 1·234 to 1·386. The above details are from 'Thorpe's Dictionary of Applied Chemistry,' vol. iii., 514, where you will find all the further information you require.—[*Reply to* J. F.—9/6.]

Dispensing Difficulty.—In dispensing the prescription—℞ Liq. Hyd. Perch. ℥j., Potass. iodid. gr. xv., quin. sulph. gr. xv., acid. hydroch. dil. ℥ss., aq. chlorof. ad. ℥viij—the mercuric chloride and potassium iodide react to form potassio-mercuric iodide, as in preparing Mayer's solution. This solution has the property of yielding insoluble double compounds with alkaloids, and is therefore used as an "alkaloid reagent." The composition of these precipitates varies to some extent, but usually they contain the hydriodide of the alkaloid, combined with mercuric iodide. There is no means of preventing the precipitation of the quinine ordered in the prescription, as the double quinine and mercury iodide is not soluble even in moderately dilute acid.—[*Reply to* Quæro.—9/21.]

Photographic.—(A) The usual charge for changing plates is 3*d.*, and for developing 1*s.* per hour, free to customers for changing. It is also a frequent custom to issue weekly tickets for 2*s.* 6*d.* You will note that the usual charge for changing is half what you propose to charge; still, many do charge 6*d.* (B) The usual charge would be 1*s.* 6*d.* for two 10 oz. bottles. (C) To make cloud negatives it is advisable to use colour-sensitive plates, such as the Ilford chromatic, Lumière's yellow and green sensitive, Mawson's ortho-chromatic, or Edward's medium isochromatic. The camera should be directed to the sky so as to include sufficient horizon to cover about one sixth of the plate. The clouds must be sharply focussed, the lens stopped down to about F/11, and a yellow screen inserted. An exposure of about one-tenth of a second would then be sufficient for sunlit clouds. The best developer is metol and hydroquinone (see Photographic Supplement, April 2, p. 12) diluted with an equal quantity of water, and development must not be carried too far, or too great contrast will be obtained. It is advisable to note time of day, direction of camera and sun. [*Reply to* S. H.—9/31.]

OBITUARY

Cripps.—On April 26, John Cripps, Pharmaceutical Chemist, Chiswick. Aged 69. Mr. Cripps had been a member of the Pharmaceutical Society since 1853.

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Allen, Beckett, Bird, Chase, Coverdale, Dow, Dunstan, Evans, Hankinson, Harkness, Harrison, Hogg, Howard, Kerr, Mason, Morgan, Morris, Parsons, Pickard, Pollard, Poole, Porter, Reade, Scott, Smith, Speedie, Stephenson, Stinger, Thomson, Thornton, Tweedy, Woodward, Wynne.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

Pilocarpidine. In reference to the results arrived at by Merck (*P. J. ante*, 385), Herzig and Meyer point out that they had already shown that pilocarpine contains only one methyl group attached to nitrogen, and had also expressed a doubt as to the identity of pilocarpidine with the base, obtained from pilocarpine, to which that name was given by Hardy and Calmels. Their view has now been confirmed by Merck, and they have now ascertained that the product obtained by heating pilocarpine hydrochloride, still contains a methyl group attached to nitrogen, while previous observations with true pilocarpidine showed the contrary result. Methyl determinations have also been made with gold salts of the two bases, which fully establish the difference between pilocarpidine and the altered pilocarpine, to which that name was applied by Petit and Polonowsky.—*Monatshefte*, xix., 56.

Cultivation of Pilocarpus in Italy. Gaylio has isolated 0·62 per mille of pilocarpine nitrate from the leaves of specimens o *Pilocarpus pinnatifolius* grown in the Botanical Gardens of Palermo. From commmercial leaves the author finds 0·56 per mille, which is a little lower than the figure of Merck, who found 0·7 per mille. Pilocarpus grows well in the open in Sicily, and its cultivation might, therefore, be a paying industry.—*Pharm. Ztg.*, xliii., 130, after *Arch. de Parmacol.*, 1897, 105.

Euphthalmine. In the first description of the hydrochloride of this base ($C_{17}H_{25}O_3N{\cdot}HCl$) it was stated to be very deliquescent, but C. Harries has since ascertained that by recrystallisation it loses this objectionable character, and can be obtained in the form of a very permanent snow-white crystalline powder, very soluble in water and soluble in about two parts of boiling absolute alcohol, separating again on addition of ether in crystalline aggregates. The salt is anhydrous; it melts at 183° – 184° C. and begins to run together at 181° C. The salicylate, $C_{17}H_{25}O_3N,C_6H_4(OH)COOH$—prepared by mixing ether solutions of the base and of salicylic acid, and recrystallising from absolute alcohol and ether—melts at 115° – 116° C. and is very readily soluble in water.—*Berichte*, xxxi., 665.

Detection of Annatto in Milk. Milk is often coloured with a trace of annatto to give it a fictitious appearance of richness. To detect this addition, A. Leys employs the following test. Fifty C.c. of the sample are shaken out with twice the volume of ether-alcohol mixture composed of alcohol 93 per cent. 240, ether 320, water 20. Solution of ammonia sp. g. 920, 8. After separation, the ethereal layer is rejected, the colouring matter being retained in the aqueous portion. This is transferred to another vessel and half its volume of a 10 per cent. solution of sodium sulphate gradually added, which causes the slow separation of the casein. The clear aqueous portion is decanted and shaken out with amylic alcohol, the washing being conducted in test-tubes to facilitate the separation of the solvent. After shaking, these tubes are plunged into a cold water-bath, the temperature of which is gradually raised to 80° C., when separation will be complete. The amylic alcohol solution is collected and evapo rated. The deep yellow residue is redissolved in warm water containing a little ammonia and alcohol, a strip of bleached cotton is immersed in the solution, and the whole evaporated to dryness. The cotton, which is now of a yellow tint, is washed and plunged into a solution of citric acid. If the colouring be annatto, the thread will at once assume a marked rose tint. Uncoloured normal milk imparts a very slight yellow tint to cotton by this method, but does not give the change of tint with citric acid, which is characteristic of annatto.—*Journ. Pharm.* [6], vii , 287.

MacLagan's Test for Cocaine Hydrochloride. Böhringer and Söhnc reply to the criticisms of F. Guenther, who has asserted that MacLagan's reaction depends on chance, that it does not reveal any definite impurities, and that there is no difference in the physiological action of a cocaine which fulfils the conditions of the German Pharmacopœia, whether it gives the MacLagan reaction or not. Böhringer states that he has always found that a cocaine which does not respond to the test contains isatropyl-cocaine to such an extent as to make it unfit for medicinal use. It is well known to manufacturers of cocaine that it is isatropyl-cocaine which prevents the crystalline separation of cocaine in the ammonia test. The following conditions are necessary to make the test thoroughly reliable. For 0·1 gramme cocaine hydrochloride dissolved 85 C.c. of water, and at least 0·15 to 0·2 C.c. of ammonia (spec. gravity 0 96) must be added. The stirring must be energetic, in a strong beaker, the sides of which must be rubbed with the glass rod immediately after the addition of the ammonia, and the fluid then well whipped. Without energetic stirring no deposition results. Guenther's statement that there is no difference in the physiological action in pure and impure cocaine is entirely without foundation. The absurdity of this will be seen by the report of Dr. Liebreich on isatropyl-cocaine. He states that it is a strongly poisonous alkaloid, differing in action from cocaine or atropine, but acting as a powerful heart poison.—*Pharm. Centralh.*, xxxix., 141.

Nitrogenous Pigments of Fungi. M. R. Van den Dries finds, in *Aspergillus niger*, *A. fuliginosus*, and *Polyporus sulphureus*, nitrogenous pigments of the nature of aspergillin. These substances are nearly related to one another, but are not identical. They have an acid reaction, and are probably true amides. Aspergillin is not a hæmatine; it does not contain a trace of iron, and does not exhibit its characteristic band in the spectrum. Aspergillin is very nearly related to the tannins. In other species of *Aspergillus* and in *Fusarium hordei*, pigments of a very different character were found, one of them having a basic character.—*La Cellule*, vol. xiii., p. 413.

Ammoniacal Fermentation Due to Mucedinæ. According to M. D. Semal, certain simple Mucedineæ, such as *Penicillium*, *Aspergillus*, and *Fusarium*, when cultivated in media containing organic compounds having the amidogenous radicle NH_2, are capable of producing ammoniacal fermentation. The doubling of the nitrogenous compounds takes place with the assistance of a soluble ferment secreted by different fungi. This ferment possesses an individuality belonging to each compound.—*La Cellule*, vol. xiii., p. 255.

Germination of the Mistletoe. Herr J. Weissner asserts, from observation, the inaccuracy of the prevalent idea that the viscin mucilage of the seeds of *Viscum album* is necessary for their germination. The seeds germinate even better without it. They require a six months' period of repose before germinating, while those of tropical species of *Viscum* need no such repose. Light is essential to the germination of the seeds of *Viscum album*, but not to those of *Loranthus europæus*.—*Ber. Deutsch. Bot. Gesell.*, vol. xv., p. 503.

THE ASSAY OF EXTRACTUM BELLADONNÆ LIQUIDUM.

BY HAROLD WILSON.

The details of the process for the standardisation of this preparation in the new Pharmacopœia are as follows :—

"10 C.c. of the strong percolate are agitated with 10 C.c. of chloroform, 50 C.c. of water, and a decided excess of solution of ammonia ; the chloroformic solution is separated, and the agitation with chloroform and subsequent separation is twice repeated. The mixed chloroformic solutions are shaken with 5 C.c. of dilute sulphuric acid mixed with twice its volume of warm water, the chloroformic solution being separated and the treatment with dilute acid repeated.

"The acid liquids are mixed and washed with 3 C.c. of chloroform ; 10 C.c. of chloroform and ammonia in excess are then added and the mixture is agitated ; the chloroformic solution is separated and the agitation with chloroform and separation twice repeated. The mixed chloroformic solutions are then washed with 5 C.c. of water containing one drop of solution of ammonia, run off into a tared dish, evaporated on a water-bath, dried below 100° C. and weighed. This residue is dissolved in 10 C.c. of a decinormal solution of hydrochloric acid ; centinormal solution of sodium hydroxide is then added until the liquid is neutral, tincture of cochineal being used as indicator.

"The measure of soda solution required is deducted from 100 C.c., the remainder being multiplied by ·00287 ; this giving the weight in grammes of alkaloid present in the quantity of the percolate operated on."

On determining the alkaloid in the extract by this process the following questions arose, and the results of some experiments made to settle these points may be of interest :—

(1) Is any alkaloid lost by shaking the spirituous percolate direct with chloroform and water, or should the alcohol be first removed by evaporation ?

(2) Is chloroform the best agent to employ in shaking out the alkaloid ?

(3) Why is the chloroformic solution of alkaloids directed to be washed with water containing 1 drop of solution of ammonia before running off into the tared dish ?

(4) Why are no conclusions drawn from the figure obtained on weighing the alkaloid ?

In order to answer the first query the following experiments were made :—

Ten C.c. of the liquid extract were placed in a separator with 50 C.c. of water, solution of ammonia was added in excess and the alkaloids removed by agitation with successive quantities of chloroform, this treatment being continued until the chloroform no longer extracted any alkaloid. This was ascertained by evaporating the chloroform after agitation with the extract, treating the residue with $\frac{N}{10}$ HCl, and titrating back with $\frac{N}{100}$ NaOH. The calculated quantity of alkali was required, showing that no more alkaloid was removed. The contents of the separator were then placed in a porcelain dish, very slightly acidified with sulphuric acid, and evaporated on a water-bath to a small bulk. This liquid was filtered into a separator, the filter being well washed ; it was then made strongly alkaline with ammonia, and shaken with successive quantities of chloroform ; the mixed chloroformic solutions were evaporated, the slight residue treated with $\frac{N}{10}$ acid, and titrated back with $\frac{N}{100}$ alkali.

This titration showed the presence of only 2 milligrammes of alkaloid. As this loss is very small—amounting to only about 1/40th of total alkaloid present—no serious objection can be raised to this part of the process on the ground of loss alone ; yet it is best to be perfectly accurate, and, moreover, it is a distinct advantage to first remove the alcohol. I have found it best to add water to the extract, and then very slightly acidify with sulphuric acid before dissipating the alcohol on a water-bath, and, after removal of the alcohol, to treat the residue, which is about the consistence of thin syrup, with warm water, filtering into the separator through a plug of cotton wool.

The advantage of having the solution slightly acid during evaporation is that there is no risk of losing alkaloid in the slight deposit formed on the sides of the capsule ; filtering removes much separated fatty matter, thus tending to prevent emulsification of the shaking-out agent by the soap solution, which is otherwise produced when the solution is made alkaline.

Experience gained in performing a number of these assays shows that a mixture of ether and chloroform (equal volumes) is to be preferred to chloroform alone for shaking out the alkaloids, as it is much less readily emulsified, especially if the contents of the separator are slightly warmed. Moreover, a mixture of ether and chloroform removes alkaloids generally in a purer condition than chloroform alone.

It is difficult to see why the operation referred to in the third query is carried out. The weak solution of ammonia, after being used in the manner directed, yields no residue on evaporation, and this step might well be omitted from what is necessarily a somewhat tedious process.

With regard to the last query, no connection is pointed out between the results arrived at gravimetrically and volumetrically ; though this would be patent to those in the habit of assaying drugs, yet in the Pharmacopœia we cannot be too precise. If it were stated that these results should not differ by more than a fixed quantity, it would act as a check on the accuracy of the work. I would suggest that the maximum difference be fixed at ·01 gramme, and think this standard would not be too exacting.

I suggest the following modification of the official process :—

Mix 10 C.c. of the strong percolate with 10 C.c. of water, and very slightly acidify with sulphuric acid ; evaporate in a porcelain dish to the consistence of a thin syrup. Add 20 C.c. of water and filter through a plug of cotton wool into a separator, washing the dish and filter with 30 C.c. of water. Add now 10 C.c. of a mixture of ether and chloroform (equal volumes) and excess of ammonia ; agitate, separate the ether-chloroform solution ; twice repeat the operation and separate as before. Shake the mixed ether-chloroform solutions with 5 C.c. dilute sulphuric acid mixed with twice its volume of warm water, separate and repeat the operation. Wash the mixed acid solutions with 3 C.c. of ether-chloroform ; then agitate with 10 C.c. of ether-chloroform and excess of solution of ammonia. Separate the ether-chloroform solution, and twice repeat the agitation and separation as before.

Place these solutions in a tared dish, evaporate on a water-bath, dry below 100° C., and weigh. Dissolve this residue in 10 C.c. of decinormal solution of hydrochloric acid, and add centinormal solution of sodium hydroxide until the solution is neutral, using tincture of cochineal as indicator. Deduct the measure of soda solution required from 100 C.c. and multiply the remainder by ·00287. The product will be the weight in grammes of alkaloids present in 10 C.c. of the liquid extract. This figure should not differ by more than ·01 gramme from that obtained by titration. From the quantity of alkaloid found by titrating calculate the amount present in the bulk of strong percolate and add to the latter sufficient of the alcoholic menstruum to make it contain 0 75 gramme of alkaloid in 100 C.c.

The foregoing experiments have been conducted in the Pharmacy Laboratory of the Pharmaceutical Society.

The British Pharmacopœia, 1898.

Vegetable and Animal Materia Medica of the Work.—(*Concluded.*)

OLEUM LIMONIS.—The method of obtaining the oil is not stated. The oil is to be obtained from the fresh lemon-peel, and should have the fragrant odour of the lemon. Sp. gr. 0·857 to 0·860. It should rotate the plane of a ray of polarised light not less than 59° to the right in a tube 100 Mm. long, and if 100 volumes be fractionally distilled the 10 volumes first collected should not produce a rotation differing by more than 2° from that produced by the original oil. Dose, ½ to 3 minims.

OLEUM LINI.—Sp. gr. 0·930 to 0·940. It is soluble in 10 parts of alcohol (90 per cent.) and in oil of turpentine. It forms, when spread on a thin layer of glass, a hard transparent varnish. It does not congeal above −4° F. (−20° C.).

OLEUM MENTHÆ PIPERITÆ.—Sp. gr. 0·900 to 0·920. It should dissolve in four times its volume of alcohol (70 per cent.). If a portion of the oil be cooled to 17° F. (−8°·3 C.) and a few crystals of menthol be added, a considerable separation of menthol should take place. Dose, ½ to 3 minims.

OLEUM MENTHÆ VIRIDIS.—Sp. gr. 8·920 to 0·940. The oil forms a clear solution with its own volume of a mixture of equal parts of absolute alcohol and alcohol (90 per cent.) Dose, ½ to 3 minims.

OLEUM MORRHUÆ.—Brandt and Ratzebnrg, 'Med. Zool.,' vol. ii., tab. ix., fig. 3. The solid fat is separated by filtration at about 23° F. (−5° C.). The odour is not rancid. Sp. gr. 0·920 to 0·930. Readily soluble in ether and chloroform and slightly soluble in alcohol (90 per cent.). When nitric acid is carefully poured into some of the oil contained in a test tube a precipitate of coagulated albumen should be formed at the surface of contact of the two liquids. No solid fat should separate on exposure of the oil for two hours to a temperature of 32° F. (0° C.). Dose, 1 to 4 fluid drachms.

OLEUM MYRISTICÆ.—No geographical source is given. Sp. gr. 0·870 to 0·910. The oil is soluble in its own volume of a mixture of equal parts of absolute alcohol and alcohol (90 per cent.). A little evaporated on a water bath should not leave a residue which crystallises on cooling (absence of the concrete oil of nutmeg). Dose, ½ to 3 minims.

OLEUM MYRISTICÆ EXPRESSUM.—Omitted.

OLEUM OLIVÆ.—Sp. gr. 0·914 to 0·919. At 50° F. (10° C.) it is liable to become of a pasty consistence, and at 32 F° (0° C.) to form a nearly solid granular mass. If 10 C.c. of the oil be shaken with 2 C.c. of a reagent prepared by dissolving 1 gramme of silver nitrate in 100 C.c. of absolute alcohol, with the addition of 20 C.c. of ether and one drop of nitric acid, no blackening should occur when the mixture is heated on a water bath for 10 minutes (absence of cotton seed oil).

OLEUM PIMENTÆ.—No geographical source is given. Sp. gr. not below 1·040. It should be converted into a semi-solid mass when shaken with an equal volume of a strong solution of ammonia. Dose, ½ to 3 minims.

OLEUM PINI.—*Pinus pumilio*, Haenke. (Lamb. 'Gen. Pin.,' i., plate 2.) Sp. gr. 0·865 to 0·870. It should rotate the plane of a ray of polarised light 5° to 10° to the left at 60° F. (15° C.) in a tube 100 Mm. long. Not more than 10 per cent. should distil below 329° F. (165° C.).

OLEUM RICINI.—Bentl. and Trim., 'Med. Pl.,' vol. iv., plate 237. Sp. gr. 0·950 to 0·970. Soluble in five times its volume of alcohol (90 per cent.). It dries slowly to a varnish when exposed to the air in a thin layer. If 3 C.c. of the oil be shaken with an equal volume of carbon bisulphide and 1 C.c. of sulphuric acid be then added, the mixture, on being shaken, should not become brown (absence of various fixed oils, including cotton seed oil). Equal volumes of castor oil and petroleum spirit do not yield a clear mixture if kept at 60° F. (15·5 C.), but they yield a perfectly clear solution if other fixed oils be present.

OLEUM ROSÆ.—Oil of rose. Synonym,—Otto of rose. The oil distilled from the fresh flowers of *Rosa damascena*, Linn. Redouté, 'Les Roses,' pl. 109. *Characters and Tests.*—A pale yellow crystalline semi-solid, with the strong fragrant odour of rose and a sweet taste. Sp. gr. 0·856 to 0·860 at 86° F. (30° C.). The congealing and melting points vary according to the proportion of crystalline matter, but should lie between 67° and 72° F. (19°·4 and 22°·2 C.).

OLEUM ROSMARINI.—Taste camphoraceous. Sp. gr. 0·900 to 0·915. It should dissolve in twice its volume of alcohol (90 per cent.) and should not rotate the plane of a ray of polarised light more than 10° to the right in a tube 100 Mm. long (absence of oil of turpentine). Dose, ½ to 3 minims.

OLEUM RUTÆ.—Omitted.

OLEUM SABINÆ.—Omitted.

OLEUM SANTALI.—Sp. gr. 0·975 to 0·980. It forms a clear solution with six times its volume of alcohol (70 p. c.), (absence of cedar wood oil). It rotates the plane of a ray of polarised light to the left, through an angle of not less than 16° and not more than 20° in a tube 100 Mm. long (absence of other varieties of sandal wood oil). Dose, 5 to 30 minims.

OLEUM SINAPIS VOLATILE.—Volatile oil of mustard. Distilled from black mustard seed after maceration with water. Sp. gr. 1·018 to 1·030. It distils between 297° F. (147°·2 C.) and 306° F. (152° 2 C.), and the first and last portions of the distillate should have the same sp. gr. as the original oil (absence of ethylic alcohol and petroleum). The solubility in alcohol, ether, and water is omitted.

OLEUM TEREBINTHINÆ.—Obtained from the oleo-resin of *Pinus sylvestris*, Linn. Bentl. and Trim., vol. iv., pl. 257, and other species of *Pinus*; rectified if necessary. It is soluble in its own volume of glacial acetic acid. It commences to boil at about 320° F. (160° C.), and almost entirely distils below 356° F. (180° C.), little or no residue remaining. Dose: 2 to 10 minims; as an anthelmintic, 3 to 4 fluid drachms.

OLEUM THEOBROMATIS.—A yellowish-white solid, breaking with a smooth fracture. It softens at 80° F. (26·6 C.) and melts at temperatures between 88° and 93° F. (31°·1 and 33°·9 C.) If 1 gramme be dissolved in 3 C c. of ether, in a test tube, at 62° or 63° F. (or 17° C.), and the tube placed in water at 32° F. (0° C.) the liquid should neither become turbid nor deposit a granular mass in less than 3 minutes, and if the mixture, after congealing, be exposed to a temperature of 60° F (15·5 C.) it should gradually afford a clear solution (absence of other fats).

OPIUM.—Any suitable variety of opium may be employed as a source of tincture of opium and extract of opium of the respective official alkaloidal strengths, provided that when dry it contains not less than 7½ p. c. of anhydrous morphine; but, when otherwise used for officially recognised purposes, opium must be of such a strength that when dried and powdered, and the powder heated to 212° F. (100° C.), until it ceases to lose moisture, and the product tested by the appended method, such dry powder shall yield not less than 9½ p. c., nor more than 10½ p. c. of anhydrous morphine. Opium yielding, when dried, more than 10 p. c. of anhydrous morphine may be diluted to that percentage with any opium containing, when dry, between 7½ and 10 p. c. of anhydrous morphine, or with milk sugar.

OS USTUM.—Omitted.

OVI ALBUMEN.—Omitted.

OVI VITELLUS.—Omitted.

PAPAVERIS CAPSULÆ.—The capsules do not now contain slate-coloured or blackish seeds. The geographical source is not given. The pericarp is thin, dry, and brittle.

PAREIRÆ RADIX.—The iodine test is omitted. The zones are described as crenated.

PEPSINUM.—It is described as an enzyme. The process of preparation is omitted. Tested as described in the following paragraph it should dissolve 2500 times its weight of hard boiled white of eggs. If 12·5 grammes of coagulated and firm white of fresh eggs, 125 C.c. of acidulated water containing about 0·2 per cent.

of hydrogen chloride (HCl), and 0·005 gramme of pepsin be digested together at 105° F. (40°·5 C.) for six hours, and shaken at intervals, the coagulated white of eggs dissolves, leaving only a few small flakes, in an almost clear solution. The "white of eggs" should be prepared by boiling quite fresh eggs in water for fifteen minutes, then immersing them in cold water, and, as soon as sufficiently cool for handling, separating the whites, washing off any fragments of yolk or membrane with water, removing the water with a clean towel, then at once rubbing the whites through a sieve having twelve meshes to a centimetre, and using the product before it has lost moisture. For the acidulated water mix the official hydrochloric acid with water in the proportion of 1 gramme to 155 C.c. This will give a solution containing about 0·2 per cent. of hydrogen chloride (HCl). Dose: 5 to 10 grains.

Physostigmatis Semina.—The ripe seeds. Bentl. and Trim., 'Med. Pl.,' vol. ii., pl. 80. The potash test and the solvents for its active constituents and the dose are omitted.

Pimenta.—Crowned with the remains of a four-toothed calyx.

Piper Nigrum.—The seed completely fills the cavity of the pericarp.

Pix Burgundica.—Obtained from *Picea excelsa*, Linke (Bentl. and Trim., 'Med. Pl.,' vol. iv., pl. 261).

Pix Carbonis Præparata.—Prepared by placing commercial coal tar in a shallow vessel and maintaining it at a temperature of 120° F. (48·9° C.) for one hour, frequently stirring. This name, strictly speaking, is incorrectly applied to coal tar, since literally translated it means coal pitch. Tar is Pix liquida, and the name should therefore obviously be Pix carbonis liquida præparata.

Pix Liquida.—Bentl. and Trim., 'Med. Pl.,' vol. iv., pl. 257.—Known in commerce as Stockholm tar. Sp. gr. 1·02 to 1·15. Water agitated with it assumes a red colour with dilute test solution of ferric chloride. Tar is completely soluble in ten times its volume of alcohol (90 p. c.).

Podophylli Rhizoma.—Bentl. and Trim., 'Med. Pl.,' vol. i., pl. 17. The fracture may be pale yellowish-brown and horny.

Virginian Prune Bark.—The bark of *Prunus serotina*, Ehrh. (Bentl. and Trim., 'Med. Pl.,' vol. ii., plate 97), collected in autumn. *Characters:* In curved pieces or irregular fragments, one-twelfth of an inch (two millimetres) or more in thickness. Young bark is frequently covered with a smooth, thin, reddish-brown, papery cork, or, if this has been removed, exhibits a greenish-brown inner layer; it is marked with transversely-elongated lenticels, and breaks with a short granular fracture. The outer surface of old bark is usually rough and nut-brown in colour. The inner surface is finely striated or fissured and reticulated; the fractured surface is reddish-grey. The bark contains numerous groups of sclerenchymatous cells of characteristic irregular shape. Taste astringent, aromatic, and bitter; the odour, which is developed upon maceration in water, resembles that of the bitter almond. Correctness is sacrificed here to convenience. There is a species named *Prunus virginiana*, from which the official bark is not obtained. The official plant is *Prunus serotina*, and the official title is therefore incorrect.

Prunum.—Dried ripe fruit. The geographical source is not given.

Pterocarpi Lignum.—The heart-wood. The raspings or small slices are not mentioned. The colouring matter is soluble in alcohol (90 p. c.), but only sparingly soluble in water. Red sanders wood is now the official vernacular name, instead of red sandal wood, which is given as a synonym.

Pyrethri Radix.—Tapering towards both extremities, the crown often bearing a tuft of nearly colourless hairs. The fractured surface shows the wood to be traversed by large medullary rays in which, as in the cortex, numerous dark resin ducts are scattered.

Quassiæ Lignum.—The wood of the trunk and branches, frequently exceeding 6 inches (15 C.c.) in diameter. The wood is easily split. Chips, shavings or raspings are not mentioned. The longitudinal section exhibits elongated cells containing single crystals of calcium oxalate. The transverse section exhibits medullary rays, mostly 2 or 3 cells in width. The test for tannin is not given.

Quercus Cortex.—Omitted.

Quillaiæ Cortex.—Quillaia bark. Synonym, Panama bark. The inner part of the bark of *Quillaja saponaria*, Molina, 'Bot. Mag.,' plate 7568. *Characters:* Quillaia bark is usually imported in large flat pieces, about $\frac{1}{6}$ in. (4 Mm.) thick and two feet (6 Dcm.) or more long, and 4 in. (10 Cm.) wide. The outer surface is brownish-white, or where the outer bark has been imperfectly removed, reddish-brown or blackish-brown; the inner surface is smooth and white or yellowish-white. The fracture is splintery, the fractured surface is laminated and exhibits under a lens, glistening, prismatic crystals. The transverse section is marked with fine radial and tangential lines. The taste is astringent and acrid; the odour is not marked, but the powder is extremely irritating to the nostrils.

Rhamnus Frangulæ Cortex.—Omitted.

Resina.—It is soluble in alcohol (90 p. c.), ether, benzol, and carbon bisulphide. It leaves no appreciable ash when burnt.

Rhamni Purshiana Cortex.—See Cascara Sagrada.

Rhei Radix.—The rhizome is erect. The surface of the drug is usually smooth, substance yellowish-brown or greyish, nearly always presenting small scattered star-like marks, and in some cases a rhomboidal network of reddish lines.

Rhœados Petala.—"Often nearly black at the base" omitted, also "unequal in size." They are transversely elliptical in outline, about 2 inches (5 Cm.) broad, have a smooth lustrous surface and an entire margin.

Rosæ Caninæ Fructus.—Omitted.

Rosæ Centifoliæ Petala.—Omitted.

Rosæ Gallicæ Petala.—Geographical source not now stated.

Sabadilla.—Omitted.

Sabinæ Cacumina.—Omitted.

Saccharum Lactis.—Syn., Lactose, $C_{12}H_{22}O_{11}H_2O$. Cylindrical masses not mentioned. It occurs in crystals or crystalline masses. It should not leave more than 0·25 p. c. of ash when incinerated with free access of air. One gramme dissolved in 10 C.c. of water gives a red colour with solution of phenol-phthalein after the addition of three drops of the volumetric solution of sodium hydroxide (limit of lactic acid).

Saccharum Purificatum.—Obtained from the juice of the sugar-cane. Colourless and inodorous separate crystals, completely soluble in half its weight of water. Heated to about 180° F. (82° C.) with solution of potassio-cupric tartrate and excess of solution of potassium hydroxide there should not result more than a trace of a red or yellowish precipitate (absence of glucose). Refined sugar should yield no reaction with the tests for calcium, chlorides, and sulphates.

Sambuci Flores.—Separated from the stalks. Geographical source not mentioned. Anthers yellow. The yellow anthers distinguish the flowers from those of *Sambucus ebulus*, which have pink anthers.

Santonica.—Omitted.

Sarsæ Radix.—Sarsaparilla. The root of *Smilax ornata*, Hook. f., 'Bot. Mag.,' tab. 7054. Imported from Costa Rica. The bundles are about 18 inches ($\frac{1}{2}$ M.) in length and 4 or 5 inches (10 to 12½ Cm.) in diameter. The roots are usually $\frac{3}{16}$ (5 Mm.) in thickness, and are deeply wrinkled longitudinally. The transverse section usually exhibits a reddish-brown cortex and yellowish-white wood. The cells of the endodermis are nearly square in transverse section and are uniformly thickened.

Sassafras Radix.—Unaltered.

Scammoniæ Radix.—Usually from 1 to 3 in. (2½ to 7½ Cm.) or more in diameter. Frequently contorted. The fracture is very coarsely fibrous: internally the colour is light or dark grey. The section exhibits an abnormal wood, consisting of numerous irregularly-arranged wood bundles, and, when examined under the microscope, appears beset with starch grains of characteristic shape, especially in the cortical region, with resin cells.

Scammonium.—In thin fragments the drug is brown and more or less translucent. It should afford only the slightest reactions with the tests for starch, and should yield at least 70 p. c. of resin soluble in ether, and not more than 3 p. c. of ash on incineration. An alcoholic solution should not afford a blue colour with test solution of ferric chloride (absence of guaiacum resin).

Scilla.—Practically unaltered.

Scoparii Cacumina.—Geographical source not given.

Senegæ Radix.—The sialogogue properly of the root not mentioned. The cortex is free from starch grains.

Senna Alexandrina.—Greyish-green. The greatest diameter is frequently below the middle of the leaflet. The epidermis bears one-celled, thick-walled hairs.

Senna Indica.—Bentl. and Trim., 'Med. Pl.,' vol. ii., pl. 91. The greatest diameter is usually near the middle of the leaflet.

Serpentaria Rhizoma.—Unaltered

Sevum Preparatum.—Melting point between 112° to 120° F. (44°·4 and 48°·9 C.), commences to re-solidify at about 100° F. (37°·8 C.). Freely soluble in petroleum spirit, slowly soluble in benzol, insoluble in cold alcohol (90 p. c.), slightly soluble in ether or boiling alcohol (90 p. c.).

Sinapis.—A cooled decoction is not rendered brown by a solution of boric acid (absence of turmeric).

Sinapis Albæ Semina.—About one-tenth of a grain in weight (6½ Mg.), almost inodorous when triturated with water. The geographical source is not given.

Sinapis Nigræ Semina.—About 1/50th of a grain in weight (1⅓ Mg.); when entire or when powdered, inodorous. Taste somewhat bitter at first.

Spiritus Vini Gallici.—Matured by age and containing not less than 36½ p. c. by weight or 43 p. c. by volume of ethyl hydroxide.

Staphisagriæ Semina.—Unaltered.

Stramonii Folia (Additions, 1895).—The mesophyll contains cluster crystals of calcium oxalate.

Stramonii Semina.—The surface is marked with reticulate depressions. The embryo is curved and embedded in a white oily albumen.

Strophanthi Semina.—The seeds of *Strophanthus kombé*, Oliv., 'Icon. Plant,' p. 1098. Sulphuric acid colours the endosperm and sometimes the cotyledons dark green (presence of strophanthin). It is to be noted that the term endosperm used in describing this seed is not generally applied to it by authorities on materia medica, who use either perisperm or albumen.

Styrax Præparatus.—Bentl. and Trim., 'Med. Pl.,' vol. ii., pl. 107.

Sumbul Radix.—Practically unaltered.

Tabaci Folia.—Omitted.

Tamarindus.—Practically unaltered.

Taraxaci Radix.—Geographical source omitted. Practically unaltered.

Terebinthina Canadensis.—The mode of obtaining it is not stated. The magnesia used to solidify it is moistened with a little water. Dose omitted.

Theriaca.—Omitted.

Thus Americanum.—Frankincense. Bentl. and Trim, 'Med. Pl.,' vol. iv., pl. 258, 259. By keeping, it becomes translucent. The odour is terebinthinate.

Thymol.—A crystalline substance, $C_6H_3 OH{\cdot}CH{\cdot}C_3H_7$. Process of manufacture omitted; otherwise unaltered.

Tragacantha.—Known in commerce as Syrian Tragacanth. Frequently about 1 inch (2½ Cm.) long and ½ inch (12 Mm.) wide. The temperature at which it becomes pulverisable is omitted, also the remark that after maceration in cold water the fluid portion is not precipitated by rectified spirit.

Uvæ.—Omitted.

Uvæ-Ursi Folia.—Geographical source omitted. The upper surface is reticulated and the veinlets are depressed. The iron test for tannin is omitted.

Valerianæ Rhizoma.—The statement "yields volatile oil and valerianic acid when distilled with water" is omitted.

Veratri Viridis Rhizoma.—Omitted.

Zingiber.—Fracture sometimes resinous.

THE DISPENSER'S ART—ITS DEMANDS, CLAIMS, AND RESPONSIBILITIES.‡

BY H. MACNAUGHTON-JONES, M.D., M.A.O., M.CH., F.R.C.S.I., AND E.
President of the Gynæcological Society.

So far we arrive at the end of the first half of this century, and only one other matter will I delay a moment to comment upon. An organ of opinion is necessary for the protection, advance, and education of any great public body or association. And we look back to the years 1839 and 1841 as the two of most importance in this century with regard to pharmaceutical progress, not only for the events I have referred to, but also because in these years the *Chemist* and the *Pharmaceutical Journal* respectively appeared. It is for you public dispensers to see that, in the pages of the journals that now so ably and fully represent the pharmaceutical chemists, and the chemists and druggists, your interests are protected and your grievances exposed.

From 1841 to 1898 we find in the progress of pharmacy a gradual crystallising process, and the emergence of the art from the colloid state in which the early part of the century found it, to its present stable and more permanent character. During this conversion pharmacy became more organised, and the disintegration of the older methods was followed by an integration, with the gradual evolution of a more complex art. In this metabolisation of pharmacy the name of Jacob Bell stands prominently out, and to him may be attributed the appearance of the 'Pharmaceutical Transactions,' publications which proved the scope and nature of the work of the future pharmaceutical chemists. This was further demonstrated by the appointment of such men as Ure, Percira, Redwood, Fownes, and Thomson to lecture, and thus were incorported in a physiological union the sciences of botany, chemistry, and therapeutics, as the tripod on which the art of pharmacy must rest. If I here dignify the subject of therapeutics by calling it a science, and further say that the pharmacist has to become acquainted with this branch of medicine, I may find some inside and outside your ranks to differ with me. To my mind, however, materia medica is not to be intelligently studied without combining with the knowledge of the physical appearance of drugs and their properties, some acquaintance with their physiological actions and uses. Thus were pharmacists compelled gradually to justify their claims to be called pharmaceutical chemists (though the correct pronunciation of their title was settled for them by a legal luminary)* by being at the same time chemists, botanists, and therapeutists, and having, to a minor extent, a knowledge of physiology. Nor indeed can another department of physical science be well omitted, as will be clear presently when I refer to your curriculum and studies, for, in the understanding of the physical properties and the action of drugs an acquaintance with the laws of hydrostatics, elementary mechanics, light, heat, and electricity is needful. Consequently experimental physics has to be included.

I must pass, without more than a cursory reference, to the part played by the Pharmaceutical Society during the last fifty years in the furthering and completion of those various legislative enactments that have tended to improve and define the position of chemists and druggists generally. A perusal of its history during this time shows how much you owe to this parent Society in securing for you public confidence as analysts, as custodians in whose hands the care, manipulation, and dispensing of subtle poisons might be safely placed. Also, the medical profession in the three divisions of the kingdom have been educated to see that no pharmacopœia could be acceptable or complete which did not bear on its face the evidence of the pharmaceutical chemist's revising finger. To this body also you owe those Pharmacy Acts which have, first in 1862, and again in 1868, placed you in the defined and recognised position you occupy to-day, with the conditions of your enrolment and registration settled, and your privileges secured.

Those years have brought to registered dispensers freedom of service from juries (1862 Act), protection from the competition of unqualified chemists and stricter regulations for the qualifications required for employment in the public services. They have seen many valuable public conferences and original communications, and the Society has of late years pressed in the service such men as Paul, Hanbury, Ince, Carteighe, Gale, Umney, Hill, and others. Now the Pharmaceutical Society of Great Britain, of which you form a part, stands prominently forth as a recognised corporation, with public functions to discharge and duties to fulfil of the utmost value to the State and to society.

Finally, it has been the means of stimulating in other centres

* Referred to under "Calcium Carbonate" in Appendix I.
† Referred to under "Albumen" in Appendix I.
‡ Inaugural address to the Public Dispensers' Association, delivered on Friday, February 25. Concluded from page 309.

* Lord Campbell, Court of Queen's Bench, June 22, 1854, case of Dickinson *v.* Pharmaceutical Society.

kindred bodies with like objects in the large provincial towns of England, thus fostering and developing in these local centres the cultivation of pharmacy, and encouraging that same zeal in the cause which was imbibed through the action of the parent Society.

When I take up these regulations of the Pharmaceutical Society of Great Britain which I hold in my hand, and glance through the subjects required for registration of a youth as apprentice or student, in Latin, arithmetic and English, the syllabus of subjects on examination in chemistry, theoretical and practical; in physics, botany, and materia medica ; in the art of writing prescriptions ; in posology ; in practical dispensing, pharmacy, and toxicology ; in all of which a knowledge is demanded for the Minor examination for registration as chemist and druggist, I find ample evidence of the educational standard that must be attained to before even a candidate can present himself for the Major examination for pharmaceutical chemist. In this latter examination he has to pass far severer tests in chemistry, physics, and materia medica, tests which place beyond doubt his intelligence, training, aptitude, and experience for the discharge of his dutics as a pharmacist. I do not think that the severity of these tests, the care with which they are applied, and the large amount of ground they cover in all the subjects, are as widely apprehended by the medical profession and the public generally as they ought to be, and your Association can do excellent service in drawing attention to the nature of the work your qualifications entitle you to do, its technical nature and its complex character.

A first-class dispenser must have certain qualities. He has to be a man endowed with considerable manipulative dexterity ; he has to be cool and precise in his work ; oftentimes under great pressure and difficulty ; he must have a good memory, and be endowed with a sound physical constitution. There is oftentimes great mental strain, and considerable demands are made by ignorant or thoughtless people on his patience and tact. That this must be so is clear when we remember the multifarious duties dispensers in many public institutions are called upon to discharge. The dispenser has to be occasionally the right-hand man of a medical staff ; not only has he to see to their prescriptions, but also to the provision of belts, bandages, splints, trusses, artificial limbs, and appliances of various descriptions. He may be called on to do a little rough eye-testing and dentistry ; he must be familiar with the use of the microscope, have some knowledge of photography and photo-micrography, and many are now acquainted with the use of the *x*-rays and radiographical examination. The preparation of macroscopic and microscopic specimens are often entrusted to him, so he must have a knowledge of the fixing and staining of sections reserved for pathological examination. In some instances he has to prepare materials for lectures and demonstrations. The care and repair of medical and surgical instruments and appliances is expected of him, and he has to have ready for use, and in working order, various forms of electrical batteries. He has frequently not merely to do the pharmaceutial work of the institution, but to take the position of instructor of pharmacy and demonstrator of materia medica. And while he is thus expected by the authorities and the medical staff to be efficient and ready in regard to all these duties, he has to work his department with the strictest economy, and to make all the pharmaceutical and chemical preparations that it is possible to prepare on the spot. The institutions in which public dispensers are employed comprise, amongst others, hospitals, infirmaries, asylums, prisons, etc., and the remuneration, considering the nature of the duties discharged and the qualifications of those who undertake them, is not, in the larger proportion of cases, more, and is in some instances actually less than that offered to the skilled artisan, the average salary being £100 per annum, though a maximum of £250 may in some exceptional cases be reached.

Taking the enormous number of prescriptions compounded daily in the United Kingdom, and the various other duties that involve risk which are discharged by the dispenser, it is marvellous how few accidents or errors occur. This is the best testimony that can be given to the high character of dispensers as a class and the type of work that they do.

Gentlemen, I think I have shown that your calling makes its special demands on you, demands which are absolute and irresistible if you are to be efficient followers of it ; also that it has its peculiar claims for consideration and recognition at the hands of the State, the medical profession, and the public. And, finally, I have proved that it has attached to it grave responsibilities, the fulfilling of which must often tax your abilities and resources to their utmost limits. It is no matter, then, for surprise that you are associating yourselves together to insure this consideration and recognition, and to safeguard and protect the rights and privileges which are attached to your position. And it is quite within your right to protect yourselves from the encroachments of those who have not your qualifications, and have not passed through the severe preliminary and pharmaceutical training that you have, in order to entitle you to hold certain positions. Such public posts are few enough, considering the number of highly-qualified pharmacists who are ready to fill them. The competition between such is keen enough without handicapping them still further by admitting as candidates ill-educated and unqualified men. Registration should be the *sine quâ non* for all such dispensing posts.

I have tried to show that you dispensers of to-day are the outcome of over two hundred years of growth and development ; that development has associated with it traditions and names of distinguished workers, of whom you may be justly proud, and whose memories you revere. These traditions are the heritage that has been left to you ; those names are the voices from the past urging you to hold them dear. They call upon you, not for any sordid and personal aggrandisements, to hold fast the principles they have bequeathed to you. They bid you to remember that before all other considerations must be placed enthusiasm for that art itself, and a determination that British pharmacy shall hold no second place in the laboratories of the world. In working out the objects you have in hand, you are taking the best means to perpetuate these traditions and principles which are your birthright. In being true to yourselves you are faithful to your parent association, to which you owe so much, while justly mindful of those material interests which are your due, and watchful with a jealous eye of any infringment by interlopers of those rights which the State has given to you, and for which your predecessors have struggled. You will inscribe on the banner of your Association the Greek word παρμακευτικος, and under it a motto : "Non sibi sed arti"—not for ourselves but for the love of our art.

Test for Sandal Oil.—The following test for sandal oil is proposed by Hendrix :—A solution of 3 parts of crystallised phenol in one part of alcohol is prepared. Half a C.c. of the oil is added to 2 grammes of this mixture, in which it is perfectly soluble. Half a gramme of concentrated hydrochloric acid is then added with shaking. Pure sandalwood oil gives a yellow coloration at the zone of contact, which develops to bright red. Copaiba oil gives a mauve coloration. Cedarwood oil gives a milky solution and a brown coloration.—*Annales de Chim. Analyt.*, ii., 298, after *Journ. de Pharm. d'Anvers.*

Royal Society Conversazione.

The annual conversazione was held at Burlington House on Wednesday, May 11, when a large and distinguished company was received by the PRESIDENT, Lord Lister, F.R.C.S., D.C.L.—The exhibits were of a varied and most interesting nature. Specially interesting to pharmacists were those dealing with X-rays and calf vaccine lymph. The leading features of the many exhibits are briefly referred to below.

Professor Hele Shaw, LL.D., described and exhibited some

Experiments on the Flow of Water.

The first series of experiments dealt with the flow of water in layers of appreciable thickness, the lines of flow being made visible by the injection of air. It was then conjectured that the clear film or border line which was visible at the sides of a solid over which the water passed indicated a condition of flow different from that in the main body of the water. The injection of air gave a very complete idea of the behaviour of water flowing round an obstacle or through a pipe; it also enabled the experiment to be reproduced on a screen, since the bubbles of air, which to the eye have a silvery appearance, showed themselves on the screen as dark lines. It was demonstrated conclusively that, if one end of a boat must be broad, it should be the bow, because a broad stern materially lessens the speed, creating a larger wash in the wake of the vessel. This is a point of extreme importance to shipbuilders. Subsequent investigation of the subject proved that in dealing with layers or sheets of inappreciable thickness, corresponding to the width of this thin border line, it was possible to produce stream line motion itself by means of colour bands. The stream lines thus obtained have been compared with those arrived at mathematically for the flow of a perfect liquid, with which they are found to be practically identical. Illustrations of the second investigation showed clearly that round the sides of a submerged obstacle the water for a certain distance glides with parallel flow, whereas further off the water is broken up into a state of sinuous motion, in which the particles are in a state of rotation or whirl. The same method can be used for investigating the flow of electricity and heat. Many photographs were handed round, illustrating the flow of water through pipes, porous diaphragms, and round obstacles of various forms.

Mr. J. Mackenzie Davidson, M.B., showed a useful

Röntgen Ray Apparatus for Localisation Purposes.

The localising apparatus consisted of (1) a horizontal bar with scale and level attached, upon which slides the holder for a Crookes' tube; (2) the cross-thread localiser whereby the paths of the X-rays, which produce two photographs from two different points of view, may be traced by means of fine silk threads. The point of crossing fixes the position of the bullet or other object, which may be embedded in the body.

Stereoscopic X-ray Photographs

were on view in a Wheatstone stereoscope, and Mr. T. Andrews, F.R.S., showed some choice

Micrographic Illustrations of Deterioration in Steel Rails.

The micrographs are illustrations, at a high magnification, of the effects of wear on steel rails under known conditions of main line service. The high power investigations of old rails, which have worn well, afford an indication of the microscopic structure and composition best adapted to ensure endurance and safety in rail service. The micro-crystalline structure of iron was explained. The micrographs show the crystalline structure of iron, and indicate the existence of a primary and secondary crystalline formation in large masses of iron which have been slowly cooled.

Mr. C. Orme Bastian's

Electric Current Meter is worth mentioning.

It acts by electrolysis. The height of a column of liquid (sulphuric acid and water) contained in a glass tube is caused to decrease by electro-decomposition, and this decrease in height is utilised to indicate the quantity of current (in ampère hours) that has passed through the meter in any given time. Assuming the voltage of the supply to be constant, a perfectly accurate measure of the electric energy, which has passed through the meter, is recorded by means of a scale in front of the above-mentioned tube, which can be calibrated in Board of Trade or other units. A hole in a rubber plug at the top of the tube allows the gases resulting from the electro-decomposition of the liquid to pass away into the atmosphere, through the gauze tray and holes in the top of the meter case. Paraffin on the surface of the fluid prevents atmospheric evaporation. The instrument starts registering with an infinitely small current; it is accurate at all temperatures and at all loads; its accuracy is unaffected by temporary excess currents; and it is not capable of being affected by outside disturbing influences.

Mr. Leonard Hill, M.B., and Mr. Harold Barnard, F.R.C.S., exhibited some

Simple Forms of Sphygmo-Manometers.

The instrument, in its simplest form, consists of a glass tube six inches or less in length, expanded at the upper end into a small bulb, at the lower end into a shallow cup. The upper end of the bulb is closed by a glass tap. The cup is covered with an india-rubber membrane, and is filled with coloured liquid. The glass tube is graduated, each division of the scale indicating a pressure of 2 Mm. of mercury. In using the instrument the membrane of the cup is pressed down on the radial artery, the tap being opened. When the fluid reaches zero on the scale the tap is closed. Pressure is then continued until maximal pulsation is obtained. The pressure at which maximal pulsation occurs is the mean arterial pressure, for the wall of the artery oscillates most freely when the pressures within and without are the same. By means of the tap the fluid can be set at zero before each observation; thus changes due to temperature or barometric pressure are avoided. Some interesting

Charts and Sections and Specimens

were displayed by Admiral Sir W. J. L. Wharton, K.C.B., F.R.S., and Professor J. W. Judd, C.B., F.R.S., on behalf of the Coral Reef Committee of the Royal Society, illustrating some of the results of the investigations carried on in the Atoll of Funafuti (Ellice Group), South Pacific. The work has been directed to the investigation of the form and structure of a typical atoll. It has been ascertained that the extent of the atoll is fourteen miles by ten, and the charts on view, drawn to scale, indicated its form; but the structure will not be thoroughly understood until an examination has been made of the materials from a boring about to be carried to a still greater depth; the greatest depth yet attained is 698 feet.

Canadian Insects,

collected by Professor Poulton, F.R.S., formed a pleasing contrast to the display of machinery and apparatus which formed the greater part of the exhibits. The insects were selected from those collected during a visit to Canada in 1897, and served to convey an impression of the general characteristics of the fauna of a part of the Southern Canadian boundary. The common white English butterfly was represented; this butterfly has migrated thither from England. The most remarkable feature in the collection was the general similarity of the *Hepidoptera* to those of Europe.—

The next exhibit of interest was

A Series of large Stone Implements,

collected by Sidney Ryan, Esq., from the tin-bearing gravels of the river Embabaan, in Swaziland, South Africa. These implements mostly consist of siliceous schist, black fine-grained quartzite or chert, and quartzites composed of grit and breccia of quartz, lydite, jasper, etc. The implements measure up to 8 by 4 inches, and weigh from less than 1 lb. to 2 lb. 7½ oz.

A number of attractive experiments by Mr. Alan A. Campbell Swinton dealt with

X-Rays and their Useful Applications.

By experiments upon the circulation of the residual gaseous matter in Crookes' tubes, it was demonstrated that in addition to

the well-known negative stream from the cathode, discovered by Crookes, there exists also a positively electrified stream from the anode, which travels in the opposite direction to the cathode stream, and is exterior to the latter. Mill wheels of various forms and of both non-conducting and conducting material were employed to show these effects.

The Röntgen Ray Camera

should prove a useful appliance. Röntgen ray photographs must be sharp, to be of use for medical purposes. And this quality may be ensured by examining the ray by means of this camera, which shows the position, dimensions and form of the source of the X-rays in a Crookes' tube. The Röntgen rays not being capable of refraction the use of a lens is inadmissible, but by means of a pin-hole the image of the active anti-cathode area is thrown upon a fluorescent screen, or a sensitive plate may be substituted for the screen, and the image photographed. The active area is found to be a small solid spot, or a hollow ring, depending as the anti-cathode intersects the cathode stream at the focus or in the divergent cone. In some cases there are two concentric rings with a central nucleus. X-rays are also given off feebly by all the fluorescent portions of the glass of the tube.

Cathode Ray Lamps

are at present a novelty. It remains to be proved whether they will be used for illuminating purposes. The cathode rays from two concave cathodes placed opposite to one another and supplied with an alternating electric current of about 20,000 volts pressure, are focussed upon a button of refractory material, which is thus raised to a very high temperature and becomes brilliantly incandescent. The efficiency in terms of the amount of light produced for a given quantity of energy supplied to the lamp, appears to be much superior to that obtained in ordinary incandescent electric lamps, and under suitable conditions may even exceed that of the arc.—Mr. J. Wimshurst has invented an

Improved Apparatus for Holding, and for the Excitement of Röntgen Ray tubes.

The apparatus consists of a suitably designed tube-holder, by the use of which little, if any, leakage of electricity occurs. The excitement is produced by means of an influence machine. The direction of the flow of the electrical charges was illustrated by small fans.

Mr Killingworth Hedges, M.Inst.C.E., produced specimens of

Copper Rapidly Deposited at High Current Densities.

The deposit usually discolours and precipitates when the current density exceeds 300 amperes to the square metre. Mr. J. C. Graham obviates this by a novel method of mechanically circulating the electrolyte, and a good deposit has been obtained with current densities exceeding 2000 amperes per square metre. Copper has also been thrown down without any difficulty in the form of wires and sheets from an impure solution containing only about one per cent of copper. This method has another advantage in that the process only takes one hour, wheras by other methods the deposition of copper to the same extent takes five hours.

Photographs of Electrical Discharges

by Mr. K. J. Tarrant were remarkable for their beauty, and Mr. W. Ellis, F.R.S., illustrated the

Smoothed Curves of Sun Spot Frequency (Wolf),

compared with corresponding curves showing the variation in diurnal range of the magnetic elements of declination and horizontal force from observations made at the Royal Observatory, Greenwich. A graphical representation of the periodical variation in frequency of sun spots, and of the amplitude of the diurnal magnetic movement. The average length of the period is about eleven years, subject, however, to a variation of one or two years or more, which the sun spot and magnetic curves alike exhibit. There is also a corresponding variation in intensity at the different epochs of maximum effect.

Mr. R. B. Roxby exhibited

Specimens of "Naturographs"

(produced by Dr. Selle's process of photography in natural colours). Three specially prepared negatives are taken through red, blue, and green glass screens respectively. From the negatives three collodion positives are produced, which, after development in complementary colour baths, are superimposed, the result giving the complete picture. This method is used for producing restricted quantities. For a large number of prints a mechanical process such as collotype is employed. Time of exposure from 3 to 30 seconds. One picture especially, representing a dish of fruits (pineapples, grapes, bananas, etc.), was remarkably natural, the various tints being extremely well produced, excepting perhaps the yellows.

Mr. A. E. Tutton had on view

An Interference Dilatometer of Increased Sensitiveness

This is an instrument for measuring the thermal expansion of solids by Fizeau's method of observing the displacement, with rise of temperature, of dark interference bands. The latter are produced by the interference of monochromatic light reflected from the upper plane surface of the object and the under surface of a glass disc supported at a minute angle immediately above it. In addition to a novel arrangement of the apparatus and constructional improvements a new principle is introduced, that of compensating for the expansion of the screws of the tripod which supports the glass disc over the object. This is effected by taking advantage of the fact that aluminium expands two and a-half times as much as platinum-iridium, the tripod being constructed of the latter alloy, and the compensator of aluminium. This device raises the method from a merely relative to a directly absolute one, and so considerably enhances the sensitiveness that it is unnecessary to employ a block of the substance investigated of greater thickness than five millimetres. Hence the method is particularly applicable to the investigation of the thermal expansion of crystals.

Professor W. C. Roberts-Austen, C.B., F.R.S., exhibited an apparatus to illustrate

Berthelot's Interference Method of Measuring High Temperatures.

One of the beams of light in an interference apparatus traverses a heated porcelain tube, and the other beam traverses a tube of equal length containing rarefied air. When interference takes place it indicates that the air in the two tubes is equally rarefied, and therefore the temperature of the heated tube can be calculated from the pressure of the air in the other tube. This method is an improvement on the air thermometer method for registering high temperatures. The interference apparatus employed was that exhibited by Messrs. Edser and Stansfield at the Conversazione last year.

A Method of Demonstrating the Existence of an Allotropic Change in Iron.

was demonstrated by Mr. A. S. Stansfield, B.Sc. An electric current may be generated by heating unequally a circuit composed of a single metal, if very steep temperature gradients are maintained in the wire of which it is composed. The Thomson E.M.F. must therefore be abnormal under these conditions. Experiments are arranged to demonstrate this in the case of platinum and other metals, and to show readily the allotropic change which takes place in iron at about 800° C.—A complete installation of

Apparatus for the Micro-Photography of Metals

was exhibited by Prof. Roberts-Austen, from whose designs it was constructed by Messrs. Beck for Sir Andrew Noble's use at Elswick works.—Dr. Alexander Muirhead and Prof. Oliver Lodge, F.R.S., had prepared a large display of apparatus, illustrating

Improvements in Hertz-wave Space-Telegraphy

A couple of signalling-stations, on the Lodge sytonic system, each with a tuned radiator and resonator, and with a pair of adjustable single-point coherers, one of them tapped back either by a revolving cam or by a relay. The sender of the message at either end is an automatic transmitter (with specially punched tape), which is thrown in and out of action by a special switch. The receiving apparatus at one end is a siphon-recorder in direct circuit with tapped-back coherer, and displaying on its tape all the fluctuations of the current. At the other end the receiver, in circuit with the simple coherer, is a telephone, wherein the fluctuations of current (*i.e.*, the signals) are easily audible. One station was at the end of the Library, the other in the Secretary's room. Each station received and transmitted alternately.

A group of exhibits by the Hon. C. A. Parsons, attracted a large amount of attention. One of the earlier

Parsons Steam Turbines

of three horse power driving a dynamo; speed of working, 12,000 revolutions per minute. Also photographs of the Turbinia and a screw propeller in motion cavitating the water, the atmospheric pressure being removed from the surface by an air pump. A small screw propeller is driven by an electric motor at a speed of 1000 revolutions per minute within a tank in the form of a hollow oval ring, around which the water flows under the action of the propeller, the conditions of flow resembling closely those in the case of an ordinary screw propeller driving a ship. The illumination is effected by a beam from an electric lamp reflected from a mirror attached to and rotating with the screw shaft, and again reflected on to the propeller by a concave fixed reflector. The propeller thus illuminated appears stationary, and the cavities in the water formed by and around the blades can be clearly seen or photographed. To facilitate the formation of cavities, and to reproduce the conditions of very fast ships at convenient speeds for observation, the whole of the atmospheric pressure is removed from the upper surface of the water by an air pump. The pressure then remaining to hold the water together, is that due to the head of the water above the screws, plus capillarity. The relation holding between the model and screws on fast ships, with the same slip ratio, when cavities are formed appears to be. Lineal speed of blade varies as the square root of the total pressure holding the water together. It will be remembered that the Turbinia attracted much attention by its performance at the Naval Review last year. Its highest speed is 34 knots an hour.

In one recess, Professor W. A. Herdman, F.R.S., and Professor R. Boyce, M.B, had arranged a series of microscopic slides and drawings, showing the

Micro-chemical Reactions of the Pigment in Green Oysters.

It was shown that whereas some healthy oysters are green, from the presence of a natural pigment, others are green from the presence of copper in the tissues. A series of different kinds of oysters was shown, that the different varieties of greenness might be compared. When copper is present, the oysters are unfit for human consumption. The metal is probably absorbed from the sea-water. The usual tests for copper were all shown. Logwood gives a marked reaction in the presence of copper. Oysters have been examined bacteriologically by the exhibitors, but so far no traces of harmful bacteria have been found; some were cultivated resembling typhoid bacteria in form only.—A large exhibit was on view, illustrating the results of the

Observations on the Recent Eclipse of the Sun.

A description of most of the apparatus used, as well as of the photographs taken by the various parties, will be found in our report of Mr. Christie's lecture at the Royal Institution. Sir Norman Lockyer, K.C.B., F.R.S., mentioned one curious point, viz., that during totality fewer stars vere visible than before or after totality; this may be explained by the fact that during totality the corona shines out with extra brilliance. Captain Hills, R.E., was surrounded by his apparatus, and the photographs taken by himself. The greatest novelty, perhaps, of the collection was the silver on glass cœlostat, recently invented by Lippmann, and used in the observations of the eclipse.

Sir Richard T. Thorne, F.R.S., and Dr. Copeman exhibited a collection of cultures, demonstrating the

Bacteriology of Calf Vaccine Lymph.

Glycerin was found to be the best preservative, as shown by the fact that no bacteria were present in cultures of glycerinated calf-lymph which had been kept for more than a week, whereas the unglycerinated lymph becomes more and more infected with bacteria on keeping. The glycerinated calf vaccined lymph is sold in tubes sufficient for one person.

Professor Oliver Lodge, F.R.S., showed some improvements in

Magnetic Space-Telegraphy,

which may be regarded as, in some respects, a modification of the induction method of telegraphy inaugurated by Mr. Willoughby Smith, and practised by Mr. Preece. The magnetic vibrations in the sending current can be maintained in various ways, but the way shown is a device due to Dr. Pupin, with a vibrating string and battery contact. A signalling key enables the ordinary Morse alphabet to be sent without any connecting wire and independently of obstacles.—During the evening Dr. Sorby exhibited on the screen a series of lantern slides of marine animals, mounted in Canada balsam, and Sir Norman Lockyer gave a lantern demonstration of photographs illustrating the recent solar eclipse and the expedition to Viziadrug.

MEETINGS OF SCIENTIFIC SOCIETIES

ROYAL INSTITUTION.

On Friday, April 22, a lecture was delivered by W. H. M. CHRISTIE, C.B., M.A., F.R.S., Astronomer Royal, on

The Recent Eclipse of the Sun.

This total eclipse, which took place on January 22, 1898, has been especially instructive, and a rich harvest of information has already been reaped. Various parties of astronomers, stationed at different points, have made observations, and the reports of some of the parties are not yet made public. In the course of the lecture, however, Mr. Christie was able to project on the screen many interesting slides, accompanying them by a description at once vivid and instructive. The tract of country available for these observations was restricted to India. Somaliland at first presented itself as a favourable situation, but this idea had to be abandoned on account of the difficulties of landing there, and from the fact that quite an army of natives would have been neccssary in order to effect a clearing, that country being densely wooded. India was therefore chosen, and it was fortunate that the eclipse happened at a time when the weather conditions were of a most favourable kind; in fact, meteorologists, prior to the eclipse, even went so far as to say that the chances were twenty-five to one in favour of the observers. Another condition which rendered India eminently suitable for this purpose was the duration of totality of the eclipse; this diminished gradually as the shadow passed from the west towards the east, the times, generally speaking, ranging from 2 to 1½ minutes. Seconds were therefore of the utmost importance, and elaborate mechanical arrangements were made by the different parties for making the most of the opportunity. The stations were fixed by the Joint Eclipse Committee of the Royal and Astronomical Societies, and lay alongside a railway which ran across the country in the direction which the shadow was expected to take. Sardol was one of the best spots, and thither Professor Turner went, but was driven by an outbreak of plague further east to a place of shorter totality, viz., 1 minute 45½ seconds. The remaining parties were under the command of Sir Norman Lockyer, Dr. Copeland, the lecturer, and others, among whom may be mentioned the Viceroy of India, stationed at Benares, a point easy of access from either Calcutta or Allahabad. Many independent observers posted themselves at Jahore, in spite of the plague, among them being Professor Campbell and other Americans, some Japanese astronomers and a party from the Poonah College of Science. The Government of India made elaborate preparations for the reception and accommodation of the observers, the railway companies afforded them every possible facility, and the Admiralty placed H.M.S. "Melpomene" at the disposal of Sir Norman Lockyer's party. So far Mr. Christie dealt with the preparations for the eclipse. Slides were then shown of the eclipse in different stages of its existence, both before and after totality, in many of which the corona was beautifully represented. A view was shown of the camp at Sardol and its fifty tents pitched on a clearing half a square mile in extent, which was made by command of the Government of India. The results of the eclipse were arranged by Mr. Christie under six heads:—1, Photographs of the corona; 2, spectroscopic results; 3, observations made by means of polariscopes; 4, photographs of partial phase for the position of the moon; 5, miscellaneous. 1, Photographs: these were taken on the scale of 4 inches to the sun's diameter. Some of the telescopes were 40 feet long, and propped up by means of scaffolding, a tree, or a mound of earth. In the last case the observer, Mr. Smith, experienced great difficulty in maintaining the correct position, owing to the frequent subsidence of the mound. Mr. Christie's telescope was more wieldy in proportions, being only 11 feet long, with a 9-inch aperture, a focus of 8 feet 6 inches, and a field of view 10 inches in diameter. During the eclipse the seconds were counted for Mr. Christie by some high caste Brahmins, who

caused him much apprehension, lest at the critical time they should obey their religious promptings and leave their counting in order to pray. Happily they were able to combine their religon with duty, and devoted one whole minute to counting and barely 45 minutes to their prayers. Mr. Christie made use of a new instrument known as a celostat, invented in 1895 by Lippmann. A mirror, 16 inches in diameter, is mounted on an axis, which points to the earth's pole. The mirror revolves by means of clock-work once in 48 hours; the earth making one revolution in 24 hours, it follows that a fixed direction for one day is obtained, because the mirror is revolving at one-half the earth's rotation, and incident rays move at twice the rate of the mirror. By this contrivance an advantage is gained in that no rotation of the image is produced. The exposures varied from 5 to 20 seconds. Captain Hills gave 4 seconds' exposure with a Dalmeyer lens. Mr. Thwaites obtained an excellent photograph showing an enormous extension of the corona, and Mrs. Maunder, with a small photographic camera, obtained a valuable picture depicting a streamer reaching two-thirds the distance to the planet Venus, *i.e.*, 4°, or about six million miles. Undoubtedly Mrs. Maunder was to be congratulated on establishing a photographic record. 2, Spectroscopic views: the continuous spectrum of the corona was shown. Capt. Hills endeavoured to photograph appearances before and after totality, so as to get a "flash" spectrum; though his efforts did not meet with the success which they deserved, yet Mr. Newall was fortunate in obtaining a "flash" spectrum at the end of totality. 3, Professor Turner obtained some valuable information with regard to the polarisation of the corona. There is no doubt that the corona suffers polarisation, and this carries with it the fact that the light from the corona is reflected light, and therefore the corona is not entirely, if at all, self-luminous. One observer confirmed these views by means of naked-eye observations, and reported that there was undoubtedly strong polarisation of the atmosphere at all points within 30° of the sun. 5. Miscellaneous items of interest were next brought forward. A kinematograph was successfully brought to bear upon the eclipse, but the operation ended lamentably in the loss of the film. The fall of temperature, due to the sun being obscured, was a noticeable feature of the eclipse, and was experienced by all. The air was dry at the time and decidedly chilly. At Mr. Christie's station totality was reached at 1.40, and at 2 o'clock the greatest fall of temperature took place. This fall affected even the driving clock. Some amusement was caused by the announcement that the only man of the party who saw nothing of the eclipse was told off to take the thermometric and barometric readings. These are of importance, because the time and longitude of the place being known it is possible to calculate Greenwich time, and from that arrive at many points of extreme moment. It was noticed at Greenwich that for some days before the eclipse the lines traced on the daily charts, showing magnetic declination, were disturbed, and that it only assumed a regular course again on January 22. It requires to be determined whether this fact has any connection with the unusual appearance of the sun spots about the same time.

ROYAL INSTITUTION.

A lecture was given on Friday, May 6, at 8 p.m., by Edward A. Minchin, M.A., Fellow of Merton College, Oxford, on

Living Crystals.

By "living" crystals the author meant to imply those crystals which are produced as bye-products in the metabolism which is associated with the life of every living organism. Comparing living crystals with a naturally occurring mineral crystal like the rhombohedral variety of calcite, they do not agree, as we shall see, in crystalline form. Again, these living crystals have planes of cleavage—as shown on striking them with a hammer, or etching them with acids—just as is the case with ordinary crystals. Finally, they stand the optical test when placed between two Nicol's prisms just as ordinary crystals do. As an example of crystals occurring in a living organism, the lecturer proceeded to mention the spicules of sponges. All sponges, as is well known, are skeletons of living organisms and may be calcareous (crystalline), siliceous (non-crystalline) or horny. The calcareous forms are furnished with crystalline projections known as spicules and chemically identical with naturally occurring calcite. These spicules assume various patterns, which may all be traced to a combination of rod-shaped units. In the commoner forms three or four rods radiate from a point. We see, therefore, that these so-called living crystals, though in substance identical with a crystal of naturally-occurring calcite, possess a fantastic geometrical form of their own, and differ in form from calcite only to the same degree that a well-cut diamond differs from one in the natural state. It must not be thought, however, that the simile is exact, since we know that the crystalline spicule is not cut out of an ordinary crystal of calcite. The question arises, What influences have been at work to interfere with the geometrical form ordinarily assumed by calcite? In order to obtain an answer, we must note carefully the conditions under which these sponges are grown. The simplest forms resemble a hollow vase, fixed at one end, and open at the other. The walls are thin and composed of countless cells, each provided with a pore to connect it with the outside air. Some kind of support is necessary, and we find that these rods are so arranged that a maximum of strength is imparted to the structure at the expense of a minimum of material. Indeed, no more exquisite piece of engineering can be conceived than is shown in the completed structure of a sponge. The rod-like spicules are produced as bye-products during the progress of those constructive and destructive metabolic processes which constitute the life of the organism, and in form they are undoubtedly closely adapted to the function they are called upon to perform. The adaptation of form to function is gradual, having gone on probably through long periods of time. These crystals, therefore, being subject to a new influence, must obey laws other than those governing crystals which are not formed in a living matrix. The study of living crystals therefore brings us face to face with the mysterious difference between living and non-living matter, inasmuch as we have seen how the form of a crystal of calcite is influenced by the matrix in which it is produced.

CHEMICAL SOCIETY.

A meeting was held on Thursday, May 5, at 8 p.m., Professor Dewar, F.R.S., in the chair. The minutes of the last meeting having been read and confirmed, Mr. C. F. Cross was called upon to read a paper by C. F. Cross, E. J. Bevan, and Claud Smith, on

The Reactions of the Carbohydrates with Hydrogen Peroxide.

The remarks made were of a preliminary nature, as much more work was required to be done in order to complete the investigation. Solutions of hydrogen peroxide had been taken, yielding different known quantities of oxygen. The two hexoses, dextrose, and lævulose, had been treated with a solution yielding one atom of oxygen for each molecule of carbohydrate. Iron being present it was noticed that a rise in temperature of from 15 to 20 degrees took place, and the hydrogen peroxide disappeared. No action took place in the absence of iron. The action of iron, as a catalytic agent, calls to mind the necessity for the presence of iron in the metabolism of plants. The presence of hydrogen peroxide in solutions of these hexoses was found to have a marked influence on alcoholic fermentation. Four experiments were made, the first blank, and the remainder containing respectively 1/40, 3/40, and 1/10 atom of oxygen, as hydrogen peroxide, to each molecule of carbohydrate. On fermenting these four solutions by the addition of yeast, it was found that whilst the carbohydrate in the solutions containing active oxygen was not entirely fermented, that in the blank experiment left no carbohydrate residue on fermentation. The solutions containing oxygen left respectively 9·2, 14·0 and 20·0 per cent. of unaltered carbohydrate. Solutions were then taken containing larger proportions of hydrogen peroxide, *e.g.*, yielding two oxygen atoms to each molecule of carbohydrate. The usual constants were determined, viz., the total solids, acidity, copper reduction and yield of furfural. The results obtained in this case differed but little from those when less oxygen was present. This pointed to the presence of some substance resistent to oxygen. On taking lævulose instead of dextrose very similar results were observed, except that no furfural was formed. In the discussion that followed it was generally agreed that the subject was at present but little understood, but that future investigations in the same direction might possibly throw more light on our knowledge of the process of lignification in the plant body.—The next paper, by Mr. H. J. H. Fenton, M.A., dealt with

The Oxidation of Tartaric Acid in the Presence of Ferrous Iron.

The action of iron is no doubt catalytic. Ferric iron is inopera-

tive, so too are the chromous salts. The iron may possibly first displace two hydrogen atoms in the tartaric acid, thus—

This action probably takes place only where two CHOH groups are side by side, and not where one CHOH group only is present, as is the case with tartronic acid, $CHOH(COOH)_2$. Citric and malic acids also give no reaction, but saccharic and mucic acids do give a fugitive violet coloration.—Dr. Armstrong objected to the foregoing suggested explanation of the action of ferrous iron in the oxidation of tartaric acid, on the ground that tartaric acid on oxidation should yield a fumaride acid, and not a maleic acid, by the removal of two hydrogen atoms; whereas dihydroxy-maleic acid is the product actually obtained.—In his reply Mr. Fenton admitted the force of Dr. Armstrong's objection, but thought that possibly the malenoid form might be produced from the fumaroid form during the preparation of the acid. He put his view forward merely as a hypothesis.—Mr. S. Skinner, M.A., next read a paper on the

Affinity Constants of Certain Hydroxy-acids,

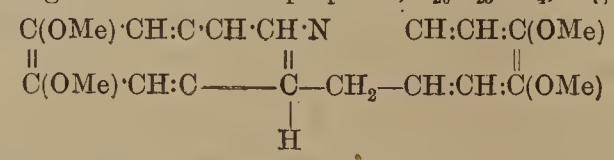
and was followed by Mr. Fenton with a further paper on

The Properties and Relationships of Dihydroxy-tartaric Acid (Part II).

The author had prepared salts of potassium, lithium, rubidium, and cæsium, a useful general method being to neutralise the carbonates with the free acid. The lithium salt he prepared from the chloride of lithium. The formation of the salts of potassium and sodium with this acid might prove a useful method for separating these metals when taken in conjunction with the platinum method of separation. The solubilities of these salts increase with the atomic weights of the metals in the following proportions, lithium alone forming an exception:—Li, 2; Na, 1; K, 66; Rb, 166; Cs, 576. The ammonium salt was prepared at 0° C. by neutralisation of the carbonate in the usual way. It crystallised with two molecules of water, and turned yellow on exposure to air. A curious fact was mentioned, in that it took 101 days' exposure in a vacuum desiccator before the ammonium salt attained a constant weight, and the residue, on examination, proved to be the tartronate. This proves that the salt cannot exist in the anhydrous condition. Dihydroxytartrate of potassium gives a transparent jelly on treatment with calcium chloride, and the barium and strontium salts give a white precipitate with the same reagent; the silver and mercury salts may be easily reduced. The stannous, as well as the ferrous salts, convert dihydroxytartaric acid into the dihydroxymaleic acid.—This paper gave rise to but little discussion.—Mr. T. Tickle asked whether Mr. Fenton had prepared the ethyl salt of the acid in question, as a possible use for it had occurred to him.—Mr. Fenton stated, in reply, that he had confined his attention to the metallic salts of this acid.—Professor Dewar finally called on Mr. W. J. Pope to read a paper on

The Resolution of Tetrahydropapaverine into its Optically Active Components.

Papaverine not having yet been synthesised, it is difficult, if not impossible, to state its graphic formula with absolute confidence. The following formula has been proposed, $C_{20}H_{23}NO_4$, or graphically



The bromcamphor sulphonic acid derivative of tetrahydropapaverine was prepared, and from it were separated the dextro- and lævo-rotatory varieties of tetrahydro-papaverine. The author crystallised out separately compounds of the lævo-base with the dextro acid, and of the dextro-base with the lævo acid. A paper by J. Murray Crofts, B.A., B.Sc., on "The Determination of the Molecular Weights in Solution of Perchlorates and Periodates," was taken as read.

DENTAL NOTES.

Matrix for Contouring Amalgams.

Dr. Bonwill's favourite matrix for contouring amalgams is impression material. His method is as follows:—Place a clamp on the tooth, and having softened the composition pack it round the tooth and clamp, trimming it up to the required shape. It then not only acts as a matrix, but also as a dam to exclude moisture. Pack the amalgam with bibulous paper, using considerable force, and when filling is nearly complete burnish some of the alloy filings into the surface to absorb mercury. This ensures a hard filling, strong at the periphery, full contour and articulation, and whiter in colour than could otherwise be obtained. Quick work is necessary for best results. He deprecates the use of gold or tin to absorb mercury, as a different element is introduced, and the same hardness cannot be obtained. If two adjoining cavities are to be filled place one matrix round them both, and divide with a file afterwards. The matrix can be removed with a hot instrument. His routine plan is to temporarily fill all interstitial cavities with pink gutta percha. This is left in for some months and exercises a separating action on the teeth, which admits of a full contour when permanent filling is introduced. In finishing off cervical edges he has a fine-cut, narrow, right angle, tapering finishing bur, which he runs between the teeth. This bur he also uses to cut out incipient interstitial caries in the lingual surfaces of incisors, taking care to let the tips of the teeth remain in contact. He guarantees that no fresh caries will result in the tissues so treated. He has found that if a carious tooth is thoroughly dried and the caries saturated with paraffin by means of heat, that no fresh trouble commences, as acid has no effect on paraffin. Also after putting in any filling, he runs melted paraffin round the margin, and so fills up any possible leak hermetically. He also uses it in oxyphosphate filling, saturating the filling after insertion, and he claims that such a filling will last five times as long as one not so treated. It will wear away on a grinding surface, but will not wash away as is usually the case in interstitial cavities.—*Brit. Journ. Dent. Science.*

Collection of Saliva.

Sticker recommends the chewing of a dry piece of fine sponge, and states that this is inducive to a large secretion of saliva. By avoiding to squeeze the sponge when breathing, it is soon filled with saliva. Drain the latter into a glass and repeat the process as long as practicable. By washing the sponge after use, boiling it, and preserving it, a highly diluted hydrochloric solution (2 to 3 per cent.), it can be used over again if washed and dried before use. The saliva thus gained is more aqueous than the saliva drawn from a empty mouth, but its composition is more regular.—*Zahnarzt. Rundsch.*, vi., 3703.

The Action of Morphine Hydrochloride on Tetanus.

Babinski has conducted experiments on guinea-pigs, showing that inoculation with tetanine, followed by treatment with morphia, produces not only a retarding action on the tetanus but has also a curative effect.—*Zahnarzt. Rundsch.*, vi., 3890.

Local Anæsthetic (Frohmann's).

Cocaine hydrochloride, 20 centigrammes; morphine hydrochloride, 25 centigrammes; sodium chloride, sterilised, 20 centigrammes; antipyrine, 1 to 2 grammes; guaiacol, 2 drops; distilled water, 100 grammes. To be injected in various portions of the gums near the tooth to be extracted. The extraction usually takes place without any pain.—*Zahnarzt. Rundsch.*, vi., 3932.

Dentifrice Tablets.

Powdered soap, 20 grammes; precipitated chalk, 8 grammes; carmine, 20 centigrammes; oil of peppermint, 50 centigrammes; alcohol, *q.s.* to make a hard mass. Mould into tablets.—*Odontologie* [2], v., 406.

Paste Dentifrice.

Precipitated chalk, 20 grammes; soap, 5 grammes; carmine, 20 centigrammes; alcohol, *q.s.*; glycerin, *q.s.* to form a paste.

Liquid Soap Dentifrice.

Spirit of soap, 8 grammes; glycerin, 6 grammes; oil of peppermint, 20 centigrammes.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences

ESTABLISHED 1841.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

LONDON: SATURDAY, MAY 14, 1898.

OF VOTERS AND VOTING.

Before many days have elapsed, the members of the Pharmaceutical Society and associates in business, or such of them as take the trouble to vote, will have decided which of the candidates whose names are at present before them are to represent them upon the Council during the next twelve months. And, according as they re-elect the whole of the outgoing members or not, it will be fair to judge of the extent to which they approve or disapprove of the policy and actions of the Council during the year that is drawing to a close. That inference will apply to the whole body of electors and not merely to those who exercise their voting power, for inaction in such matters implies agreement with the views of those who return the new Council, usually less than half of the electorate. For of the 3767 voting papers issued last year, only 2035 were returned, and the number of votes recorded in favour of the candidate whose name came first on the list was 1790. In 1896 the figures were: Voting papers issued, 3762; voting papers returned, 2173; highest number of votes polled, 1725. It cannot be said, therefore, that there is any excess of enthusiasm in the matter, since two-fifths or more of the voters fail to recognise the obligation that lies upon them to secure due representation upon the executive body of their craft.

Such apathy is much to be regretted, for although the recording of a largely increased number of votes might make no great difference in the result of the election, the successful candidates would be better able to realise that they had behind them the suffrages of the supporters of the Society as a body. That is a point that voters are apt to overlook; maybe they are satisfied with the manner in which their affairs have been conducted since the last election, and see no reason for any change in the constitution of the Council, but it never seems to occur to them what moral force is lacking when they neglect to vote. If an individual is approved as a fit and proper person to become a representative it is well to show that one thinks so by voting for him, and by persuading others to do likewise; there is just as good reason for so doing as for helping in an agitation to secure the rejection of some one who is assumed to be unsuitable as a representative. Complaint is not uncommon that members of Council are at times lukewarm in advancing the interests of the craft, but how can it be expected that they should constantly exhibit enthusiasm with regard to the affairs of men who will not take the trouble to indicate that they approve of the measures taken on their behalf? The wonder is that a sufficient number of representatives should be found to devote themselves year after year to their self-imposed task, pursuing the even tenor of their way without seeking praise or avoiding blame, and the fact that so many are found to undertake the onerous duties devolving on a member of Council only serves to indicate what might be the result if more enthusiasm were infused into the all too automatic operation of selecting representatives for another year.

The plain duty of electors is to vote whenever there is an election, first taking care to nominate a sufficient number of candidates to make the election something more than a mere formality. Moreover, they ought to exercise their voting power to the utmost; if fourteen members of the Council are required it should be considered obligatory to leave fourteen names not crossed out on the voting paper. The only results of ignoring this rule are to give a vastly unnecessary number of votes, proportionally, to certain favoured candidates, to risk the rejection of one or more efficient representatives in whom the voter may not be personally interested, and to cause a considerable amount of extra trouble to the scrutineers. It may appear very satisfactory to have one's pet candidate at the head of the poll, with five hundred more votes than were necessary to secure his return, but on the whole it would be more encouraging to know that the fourteen candidates one had voted for had been returned in a body, without any great variation in the number of votes each had received. By some accident of position or ability to make eloquent speeches a few representatives loom much more largely in the public eye than others, but that is no criterion of the amount of useful work carried on quietly and steadily at unreported committee meetings by those and other members of the Council. Credit should be given where credit is due, and that is usually to the Council as a body rather than to one or two more prominent members.

THE PHARMACY ACTS AMENDMENT BILL.

This Bill again came up for consideration in Committee of the House of Commons after midnight on Monday, but Dr. Tanner moved to report progress, on the ground that, in his opinion, nothing practical could be done in connection with the Bill at that hour. It is difficult to see what could be done of a more practical nature than to allow the Bill to pass through the Committee stage, but though Dr. Tanner professed to take a sincere interest in the measure, that evidently was not his view, and progress was reported accordingly That, of course, implies further postponement of the Committee stage. There are now about a dozen proposed amendments to the Pharmacy Bill, standing in the names of Mr. Alexander Cross (Camlachie, Glasgow), Mr. Weir (Ross and Cromarty), and Mr. Yoxall (Nottingham, W.); chemists and druggists residing in the constituencies represented by those gentlemen might do worse than remonstrate with them—repeatedly, if necessary—as no public interests are affected in the least degree by the provisions of the Bill.

ANNOTATIONS.

The Metric Equivalents of Imperial Weights and Measures which have been published in the pages of the *Pharmaceutical Journal* during the past few months, have been reprinted in deference to the expressed wishes of several of our readers, and copies of the book may now be obtained through the booksellers or from the Publishers of the Journal, 5, Serle Street, Lincoln's Inn, London, W.C., at 1*s.* 6*d.* each, post free. It was originally intended to produce the book at 1*s*, but, after careful revision, it was found that certain additions to the tables were desirable in order to make them more complete, and the matter as now presented is practically new in its arrangement. In addition to the equivalents of measures of length, mass, and volume, simple conversion tables and rules are given, together with thermometric equivalents—in degrees Centigrade (Celsius), Fahrenheit, and Réaumur—from —40° F. to 600° F. The tables are on stout paper, printed on one side only, so that the pages can readily be removed and pasted on cards to be suspended in the laboratory or dispensary. The whole is enclosed in a tastefully printed wrapper, and the book is of a convenient size to be advantageously kept on the desk for reference. Means having thus been provided—in the Journal and in the separate reprint—for facilitating the employment of metric quantities by pharmacists, we must ask correspondents henceforth to adopt those quantities as far as possible in all communications sent to the Journal. The advantage of this will be all the greater inasmuch as in the British Pharmacopœia, 1898, which is now on sale, all formulæ are stated in terms of the metric system.

The *P. J.* Synopsis of the 1898 B.P. Formulæ and Processes still continues to be in active demand, and it has been found necessary to publish a fourth edition, in which further additional matter appears. Even after the new Pharmacopœia is actually in the hands of chemists they will find this synopsis especially useful as a working laboratory guide, whilst students and medical practitioners can more readily gather from its pages what changes have been effected in the official preparations than from the Pharmacopœia itself. For distribution to medical men nothing more concise has yet been offered, and the attention of individual pharmacists and of pharmaceutical associations who have not yet done anything in that way, may with advantage be directed to this inexpensive pocket guide. A specimen copy will be sent by the Publishers of the Journal, 5, Serle Street, Lincoln's Inn, London, W.C., to any address, on receipt of fourpence in stamps, and prices for quantities will be found in our advertisement pages; requests for free copies cannot be entertained, and should hardly be proffered since the price fixed for the book is a merely nominal one.

Another Synopsis of the principal changes in the British Pharmacopœia has been prepared by Mr. William Martindale for inclusion in the ninth edition of the 'Extra Pharmacopœia,' now in the press. In the space of twelve pages, each containing less than twelve square inches of type, the changes effected by the revision of 1898, as compared with that of 1885, are put as concisely and yet intelligibly as could be desired. Particulars regarding weights and measures, strengths of alcohol, tinctures, infusions, decoctions, extracts, etc., are followed by brief references to changes in appearance of certain preparations, changes of nomenclature, and changes of dosage. Next, we have an admirably arranged list of the more important alterations affecting practical dispensing, together with lists of additions, omissions, and alternative preparations sanctioned for use in India and the Colonies. Finally, there are the alcohol tables recently published in the Journal (*ante*, p. 417).

The British Pharmacopœia, 1898, is now on sale, and the problem regarding its authoritativeness may therefore be expected to assume a more acute form. But whatever position may be taken up by chemists in regard to the supply of the new preparations generally, they are warned to be particularly careful with regard to the supply of those preparations which are now definitely identified with older ones by the simple expedient of introducing the old names as synonyms of the newer preparations. Thus, linimentum camphoræ should now invariably be supplied when comphorated oil is asked for; spiritus ætheris nitrosi should be given to customers who ask for sweet spirit of nitre, and sulphur præcipitatum for milk of sulphur. The strength of linimentum camphoræ has not been altered, but the specific gravity of spiritus ætheris nitrosi is now 0·838 to 0·842, and the preparation must contain not less than 2 per cent., by weight, of ethyl nitrite. Vinegar is no longer official, and inspectors under the Sale of Foods and Drugs Acts are not likely to worry chemists so much in future, as they have been accustomed to do in the past, in connection with the sale of that comparatively innocent fluid.

The Annual Dinner and Annual Meeting of the Pharmaceutical Society will be held in London next week, the former at the Hotel Cecil, on Tuesday next, May 17, at 6.45 p.m. The President, Mr. Walter Hills, will take the chair, and a large gathering of pharmacists and their friends is anticipated. Those who have not yet applied for tickets (21*s.* each, inclusive) should communicate with the Hon. Secretary, Mr. R. Bremridge, 17, Bloomsbury Square, London, W.C., without delay, and any special arrangement of seats that may be desired must be notified at once. Several distinguished guests are expected to be present, including the Hon. W. F. D. Smith, M.P., who has shown himself such a friend to the Society by his persistent support of its claims to consideration by Parliament, in connection with the Pharmacy Acts Amendment Bill. Other Members of Parliament have also accepted invitations, and an attractive musical programme has been prepared. The fifty-seventh Annual Meeting of the Society will be held in the Society's House, 17, Bloomsbury Square, London, on the following day, at 12 o'clock. The report of the Council will then be received and the election will subsequently take place of the Council and Auditors for the ensuing year.

A Curious Case is reported from Southport, where a boy, who appears to have been too susceptible to the influence of penny dreadfuls, recently committed suicide by taking carbolic acid. Probably more ignorance was revealed at the inquest concerning that poison and the law relating to its sale than on any other single occasion. In the first place, a medical man who gave evidence is credited with having stated that the carbolic acid taken by the boy was "what was called 'absolute'; it was obtained in crystals, and would only be legitimately dispensed by a chemist in a physician's prescription" (*sic*). Then the chemist alleged to have sold the carbolic acid—an aged man, registered by virtue of being in business before August 1, 1868—denied that he had done so, and remarked that "people who purchased it had to sign a book, as it came under the first schedule of the Poisons Act" (*sic*). This individual is also reported to have produced a bottle containing potassium permanganate which he said was the only form of "carbolic acid in crystals" he kept. Finally, the Coroner appears to have got

mixed up generally over the evidence, though it is satisfactory to find he stoutly contended that potassium permanganate was not carbolic acid, and ultimately the jury returned a verdict of *felo de se*. The boy was fifteen years old.

Another Coroner has distinguished himself by discovering that Battle's vermin killer is not a poison within the meaning of the Pharmacy Act, 1868. An unrequited love affair caused a young girl, living at Bexhill, to terminate her woes by the aid of the vermin killer, and the Coroner for the Rape of Hastings had to investigate the matter. The manner in which he set to work may be imagined from the following extract from his address to the jury :—"You know Battle's vermin killer is a very common thing. I suppose it is sold by nearly every shopkeeper who sells provisions. It is an easy matter to go into a shop and obtain a packet. It is sold by no end of people. I think I am correct in saying that it is not one of the poisons which come under the Poisons Act, and that the purchaser of a packet is not required to give name and address. I think it is obtainable with very little difficulty." Prior to this statement by the Coroner a medical practitioner had explained that the vermin killer contained a large proportion of strychnine, and that poisoning by strychnine was the cause of death. This makes the Coroner's remarks all the less excusable. It appears that the sale of the poison could not be traced, and that is not to be wondered at if the ignorance displayed by the Coroner is a fair specimen of the state of knowledge with regard to the sale of poisons that prevails in his district.

The Spectacle Makers' Company resolved at the last meeting of the Court of that body that the National Retail Jewellers' Association and the Pharmaceutical Society should each be invited to nominate a member of the Committee, appointed to make arrangements for the examination of opticians, in accordance with the scheme referred to in our issue of April 9, last (see p. 357). So reports the *Optician*, which also states that it was resolved, at the same Court, that donations of two guineas each should be given to the following ophthalmic hospitals, viz., the Western, Gray's Inn, Moorfields, Westminster, and South London.

The Royal Society Nominees selected by the Council of the Society for election this year as Fellows are Mr. H. F. Baker, Professor E. W. Brown, Dr. A. Buchan, Mr. S. F. Harmer, Mr. A. Lister, Lieut.-Gen. C. A. McMahon, Dr. W. Osler, the Hon. C. A. Parsons, Professor T. Preston, Professor E. W. Reid, Mr. A. Scott, Mr. A. C. Seward (Examiner in Botany to the Pharmaceutical Society), Mr. W. A. Shenstone (Pharmaceutical Chemist), Mr. H. M. Taylor, and M. J. Wimshurst.

Ships' Cargoes are many and various, but it is doubtful if such a mixture as was recently carried by the s s. "Legislator" has ever been surpassed as a possible cause of fire. Potassium chlorate in casks was packed side by side with sulphuric acid in leaden tanks, phosphorus in canisters, ether and turpentine in glass and stoneware bottles. Or rather, to be strictly accurate, the packages containing the sulphuric acid and phosphorus were stowed on tops of the casks of potassium chlorate. As might naturally be expected, the vessel caught fire at sea, and had to be abandoned. A Board of Trade inquiry was held, and in the judgment delivered by the court it was very pointedly stated that, though the goods were "properly stowed and secured as regards shifting," they were "improperly stowed as chemicals, from the fact of their being placed together." Beyond this, the chemicals were carefully examined and watched from time to time by the chief officer, who, however, possessed no knowledge of the special dangers connected with such goods, his attention being directed more especially to the shifting of the cargo. There was no evidence to show that anything was wrong with the goods until the outbreak of the fire, which appears to have arisen from the spontaneous combustion of phosphorus, forming part of the deck cargo, and was probably caused by some defect in the tins in which it was packed, attributable to the weakness of the material used in their construction, or possibly to the action of the sulphuric acid leaking on the tins and causing corrosion, thereby permitting the air to come into contact with the phosphorus. Owing to the dense and suffocating fumes of the phosphorus, it was impossible to take any measures to extinguish or to even approach the fire until the chemicals were burnt out and consumed. The ship, of course, was destroyed.

An Automatic Telephone Exchange has been fitted up at 30, Winchester House, London, E.C. The advantages of the system adopted are that it does away with the large staff of skilled attendants at present required at the central and subsidiary exchanges, and gives increased speed and facility in communication. Instead of ringing up the central station, requesting the attendant to put him in communication with the person to whom he wishes to speak, the subscriber to an exchange worked on the automatic plan is himself able to connect his telephone with that of any other subscriber without the intervention of any other person. Each subscriber has upon the front of his instrument a circular disc pivoted at the centre and having one-half of its circumference inscribed with figures from 0 to 9. If he wishes, for example, to call up subscriber 826, he puts his finger in a hole provided in the disc opposite the number 8 and pulls the disc round as far as it will go. He repeats the operation for the figures 2 and 6, and then finds himself connected with number 826. When he has finished his conversation he simply hangs his receiver on its hook, and communication is at once cut off. A third subscriber cannot get possession of the line until the first two have done with it; hence there is no possibility of interruption during a conversation, and secrecy is assured.

Hydrogen was Liquefied by Professor Dewar last Tuesday at the Royal Institution and exhibited to Lord Rayleigh, who was fortunate enough to be on the premises at the time. According to the *Times*, Professor Dewar has actually produced the liquefied gas to the amount of half a wine-glassful in five minutes, by a process which would equally have produced a pailful had the requisite supply of pure hydrogen been forthcoming. The boiling point of the liquid may be placed at from 30° to 35° of absolute temperature, or, in other words, at about 240° below zero on the Centigrad scale. Some conception of the degree of cold attained may be gathered from the fact that a tube closed at the lower end, when immersed in the liquid, was almost instantaneously filled with solid air. The density of the liquid far exceeds that arrived at by calculation, and there is reason to believe that it will be found to be about 0·6, water being unity. That result would agree very closely with the density of hydrogen when occluded by palladium, as established by Professor Dewar twenty-five years ago. Helium was also liquefied on this occasion by the use of the liquid hydrogen. The boiling point of liquid helium appears to lie not very far from that of hydrogen itself.

REVIEWS AND NOTICES OF BOOKS.

Non-Secret Formulas: A collection of over four thousand formulas and one thousand prize prescriptions for the use of physicians and druggists, to which have been added a selection of articles from standard authorities on Photography, Tablet Triturates, Compressed Tablets, Elixirs, Proprietaries, and original formulas for toilet articles, perfumery, and articles of household use, making a valuable book of reference on subjects appertaining to the business of an up-to-date pharmacist. First edition: T. M. Griffiths, St. Louis, U.S.A. Price 5 dollars.

The comprehensive descriptive title-page, which is here quoted in full, will indicate the wide scope of the work under notice. However, this description somewhat over-states the case, as the work, instead of containing over 5000 distinct recipes, only includes some 4115, which will probably be considered by the average purchaser to be sufficient for his money. The business of the pharmacist, pure and simple, requires him to keep available vast numbers of formulæ for ready reference, and he is so frequently consulted on technical points, which do not directly enter into the province of pharmacy, but yet which cannot be regarded as without the scope of his calling, that the possession of a good technical library of reference is to him of prime business importance. Our American cousins rightly pride themselves on being "live men," and we find that they have at their disposal a far greater number of comprehensive works of the nature of the book under notice than is possessed by their English *confrères*. Within the past few years several such works, containing each some four or five thousand recipes, have appeared in the United States, and each one will be found, at times, of the greatest service for reference. These works in general, as well as the particular volume we are now discussing, seem, however, to err in one direction; the aim, apparently, is to produce a vast array of matter, a great battalion of formulæ, for which it is absolutely impossible that the author can vouch from practical experience. There is yet room for a work less pretentious in the number of recipes, but containing only those for which actual personal and individual experience can be given. When each recipe in a book is one which the author has wrought with his own hand in order to prove its practical value, this ideal work, when it appears here or in America, will command success in both countries. Possibly the author of 'Non-Secret Formulas' may be induced to undertake such a publication.

The work contains much valuable matter, which is, on the whole, well arranged. Recipes for proprietary medicines, typical prescriptions, foreign liqueurs, hospital formulæ — including many from the London Children's Hospital — dental recipes, and the inevitable elixirs, which, to their detriment, English pharmacists are so slow to introduce to the notice of the medical profession, photographic notes, perfumery—including recipes using many of the newer synthetic perfumes—and veterinary formulæ, besides many other useful sections, are to be found among the contents. Among much valuable matter we find several points to which attention may be directed with a view to improvement. Many of the formulæ are given for much greater quantities than are usually handled by retail druggists. Thus, the first recipe in the volume calls for "106 gallons of sugar-house syrup, 5 gallons of spirit, 188 per cent., 60 lbs. of potassium iodide, 34 gallons distilled water," etc., etc. Obviously it is easy to divide these wholesale quantities into smaller batches, but in our opinion each recipe should be given in the quantities most often serviceable to the retail reader, to whom the book is chiefly addressed. Another point, which appears to reflect either on the scholarship of the author or of his readers, is the slipshod mingling of Latin and English in the same prescription. Thus, "Three coch. parv. tertia, q. hora"; "one dram 3tis horis"; "one ounce t. d. in each fl. ounce"; "one ounce 3tus (*sic*) hor." On page 82, under the heading "Copaiba mixture," the ingredients are given in Latin, while the next recipe, "Liquor copaiba solubilis," is followed by ingredients in English. It would be preferable to adhere to the vernacular throughout the book, and to delete the jargon which is in many cases neither English nor Latin. Much needless space, too, is occupied by descriptive paragraphs, and even reprints of papers from the pages of pharmaceutical journals. These are mostly on subjects which are useful to the business man, but they might all be materially condensed. In many instances, also, the directions for preparations might be materially cut down. The treatment of inebriety, and similar medical articles, are certainly out of place in a book of this nature; they are not within the legitimate sphere of pharmacy, and the medical practitioner would consult standard works on the treatment of the subject. Similarly the "Table of Terms" used in Latin prescriptions, extending from page 392 to 404, is out of place in 'Non-Secret Formulæ.' The book is not an educational work, and by relieving it of matter such as this and minor defects such as those already alluded to, the author will add to its usefulness to the business man, and to his own reputation.

Anatomischer Atlas der Pharmacognosie und Nahrungsmittel-Kunde. Von Dr. A. Tschirch und Dr. O. Oesterle. Parts XII. and XIII. Price, 1*s.* 6*d.* each. Leipzig: Chr. Herm. Tauchnitz.

These two parts, the last that have been issued, of Professor Tschirch's anatomical atlas contain, as usual, the details of an abundance of interesting matter. Part XII., with five plates, deals with the anatomy of nutmeg and mace, of linseed, valerian root, coca leaves, and maté. No less than fourteen columns of text and two plates are required for the structure and development of nutmeg and mace, and as the investigations of the author have shown that the description of the structure of the nutmeg usually found in modern text-books is incorrect, a very brief *résumé* of his work will doubtless be welcome.

Professor Tschirch shows that the young ovule of the nutmeg tree possesses two integuments, of which one, the inner integument, extends from the micropyle about halfway down the ovule. Now that part of the ovule in which this integument is situated lengthens in its growth very much more slowly than the remaining, chalazal, portion. The inner integument increases but little in size, and may be found in the ripe seed as a tiny disc near the micropyle. The seed is therefore covered by the outer integument alone, and this ultimately forms the hard shell within the mace. But the place of the inner integument is practically supplied by the nucellus, which develops into a perisperm. That part of the young ovule near the chalaza becomes conical in shape, and the ovule develops transverse grooves, due to a swelling of the surrounding tissue; the nucellus thus slightly projects into the embryo sac. In the nucellus merismatic layers are then formed, which produce new tissue, especially on the inside opposite to the projections into the embryo sac, by which these projections are increased in length. Although much of the tissue so produced is absorbed by the growing embryo sac, the outer layers become permanent and the projections into the embryo sac elongate; at the same time delicate fibro-vascular bundles are formed in the secondary perisperm produced as just described by the activity of

the merismatic layer in the nucellus. These projections of secondary perisperm become irregular, and form ultimately the dark ramifications of the ruminate endosperm. In the young fruit they are colourless, but contain oil-cells and tannin. As the seed ripens the latter changes to phlobaphene, and becomes infiltrated into the cell-wall. The primary perisperm gradually obliterates.

The interior of the embryo sac is for a long time filled with a milky fluid. The development of endosperm begins late; it soon absorbs most of the tissue up to the merismatic layer of the secondary perisperm, and fills the interspaces between the projections. This tissue remains hyaline until the fruit dehisces, then aleurone and starch are formed, and it becomes opaque. Even at this period there is but little fat; that makes its appearance when the fruit has dehisced, the cells of the endosperm then containing starch and aleurone grains embedded in abundant fat. Remarkable is the fact that the fully-developed endosperm has a nutty, not aromatic taste; it acquires the latter by infiltration of oil from the perisperm.

The nutmeg of commerce therefore consists, according to these researches, of nothing but the kernel of the seed. The outer brown layer and the brown ruminations consist of secondary perisperm; the white opaque part of the seed is endosperm. The inner integument is all but lost; the outer develops to form the seed-shell, whilst the mace, according to the author, is intermediate between an arillus and arillode, since it is formed first in the funiculus, and afterwards in the outer integument.

This extremely interesting and important monograph concludes with a description of the anatomy of mace.

Under linseed the development of the ripe seed from the young ovule is carefully followed, particular attention being paid to the formation of the mucilage which is deposited on the outer and radial walls of the epidermal cells in proportion as the starch originally contained in them is absorbed. For the student such investigations as these form invaluable object lessons, for it is by such means alone that an intelligent comprehension can be gained of the structure of many, if not most, drugs.

In valerian the chief interest centres in the production of volatile oil in suberized cells of the hypoderma of the root. The anatomy of the coca leaf and maté with which Part XII. concludes, do not present much that calls for special notice. The powder of the latter may, the author thinks, be distinguished by the remarkable cells of the epidermis of the midrib and stronger veins. In most leaves these cells show strong axial elongation, but here they are arranged in several parallel rows and are not much elongated, thus forming a special character of the leaf.

Part XIII. commences with the anatomy of the bark of *Gonolobus condurango*, Triana, a South American climbing plant. The anatomy of this bark possesses less practical interest for the English pharmacognosist, but the study of it is exceedingly instructive. The early formation of cork and phelloderm, the bundles of bast fibres, groups of sclerenchymatous cells, laticiferous cells, and remarkably large and easily demonstrable sieve tubes render it a useful exercise for the student. Very remarkable is the observation of Professor Tschirch, that the bundles of bast fibres which are so conspicuous in the young bark, are separated, by the growth of the bark into smaller groups, so that the older barks contain an abundance of bast fibres, but the groups are small and few in number. Particularly remarkable is the presence of pericycle in the bark. There are surely few barks that will show this tissue as condurango bark does.

Arnica flowers involve a great amount of work, including as they do phyllaries, calyx, corolla, stamens, ovary, and receptacle, the anatomical details of each being minutely described. Very interesting is the production of a brown secretion in the form of dendritically branching masses in the intercellular spaces under the hypoderma of the pericarp. On the epidermis of the pericarp remarkable hairs, consisting of two elongated cells placed side by side and terminating in two separate points, are to be found; in fact, this drug exhibits no less than six different forms of hairs.

The anatomy of juniper berries and golden seal rhizome are fully dealt with, but there is little to which special attention might be directed. In stramonium leaves, it may be observed, the calcium oxalate usually assumes the form of cluster-crystals. This form is constant in the interneural mesophyll, but in the cortex of the midrib both prisms and sandy crystals occur. In this respect stramonium agrees with other solanaceous plants in which a similar variation in the form of the calcium oxalate has been observed.

Stramonium seed is anatomically one of the most interesting seeds. The seed possesses but a single seed-coat, the outer epidermis of which develops into the hard dark layer of cells to which the seed owes its colour. From the upper part of the epidermal cells a number of projections, nearly parallel to the surface of the seed, are produced, and these closely dove-tail with corresponding projections from neighbouring cells. At the same time the cell-wall thickens strongly but irregularly, leaving in the projection small channels. To these conditions are due the extremely unusual appearance of transverse sections of the seed coat, and they cannot be satisfactorily understood until the development of the seed has been followed.

Whilst the contents of the text of these two parts of the Atlas have thus been shown to contain an unusual amount of work, it is scarcely necessary to say that the plates are in every respect equal to those that have gone before. The only improvement that could be suggested is one to which reference has already been made in these columns, viz., the pale colour of the ink that is used. Surely this might be easily remedied.

SELECTED FORMULÆ.

Denzel's Hæmostatic Tincture.

Powdered ergot, 10 grammes; alcohol, 94 per cent., 20 grammes; sulphuric acid, 2 grammes; mix and add hot water, 500 grammes. Boil until evaporated to 200 grammes, then add calcium carbonate, 2 grammes. Strain and press, evaporate to 70 grammes, and add alcohol, 94 per cent., 30 grammes; essence of ginger, 3 drops. —*Pharm. Zeit.*, xlii., 167.

Pastilli Glycyrrhizini.

Vechtmann gives the following recipes for cough pastilles in the *Pharm. Weekblad.* (1) Glycyrrhizini ammon., 1 gramme; amyli, 20 grammes; sacchari, 80 grammes; olei laurocerasi, gutt., 1. For 100 pastilles. (2) Glycyrrhizini ammon., 1 gramme; amyli, 20 grammes; sacchari, 80 grammes; codeinæ hydrochlor., 50 centigrammes; olei laurocerasi, gutt., 1. For 100 pastilles. (3) Glycyrrhizini ammon., 1; amyli, 20; sacchari, 80; codeinæ hydrchlor., 2 grammes; for 100 pastilles. The last two preparations are only given up on a doctor's prescription. To avoid error, No. 3 pastilles are coloured red with carmine.—*Pharm. Centr.*, xxxviii., 721.

Pastilles Glycyrrhizin.

(I.) Glycyrrhizin ammon., 1; pulv. amyli, 20; sacch. albi, 80 grammes; ol. laurocerasi, gtt. 1. M f. Trochisci No. 100. (II.) Glycyrrhizin ammon., 10; pulv. amyli, 20; sacch. albi, 80 grammes; codeini hydrochlor., 80 centigrammes; ol. laurocerasi, gtt. 1. (III.) Pulv. amyl., 20; glycyrrhizin ammon., 1; sacch. albi, 80 grammes; hydrochlor. codeini, 2 grammes. M.f. Trochisci No. 100.—*Zeit. Allg. Oest. Apoth. Ver.*, li., 481.

PHARMACEUTICAL TRANSACTIONS.

PHARMACEUTICAL SOCIETY.

DONATIONS TO THE LIBRARY AND MUSEUM.

At a meeting of the Library, Museum, School and House Committee, on Wednesday, May 11, the Librarian and Curator presented the following reports of donations :—

To the Library (London).

Dr. K. Dieterich, Helfenberg.—'Helfenberger Annalen,' 1897.

Chemists' Assistants' Association, London.—'Proceedings,' 1896 97. Two copies.

Dr. E. F. A. Obach, Old Charlton.—'Cantor Lectures on Gutta Percha,' 1897.

Dr. Squibb, Brooklyn.—'Ephemeris,' Vol. 5, No. 1.

To the Library (Edinburgh).

American Pharmaceutical Association.—'Proceedings,' 1897.

Dr. Squibb, Brooklyn.—'Ephemeris," Vol. 5, No. 1.

To the Museum (London).

Messrs. Hodgkinson, Clarke, and Ward, London :—Specimen of Italian Ergot.

Mr. W. Mair, Calcutta :—Specimens of Indian drugs.

Dr. T. G. Nicholson, London :- Specimen of the fruits of *Brehmia spinosa* and of an undetermined species of Cassia used as a fish poison in Central Africa.

To the Herbarium (London).

Mr. R. I. Lynch, F.L.S., Cambridge :—Specimen of *Salvia chia.*

Mr. W. Mair :—Twelve specimens of East Indian Medicinal Plants.

CHEMISTS' ASSISTANTS' ASSOCIATION.

On Thursday, May 5, Mr. T. MORLEY TAYLOR, President, took the chair at the annual general meeting of this Association, held at 73, Newman Street, W.—The first business was to appoint two Scrutineers to ascertain the result of the election of members for the new Council, Messrs. Makepeace and Latreille being chosen.—Mr. F. W. GAMBLE, the Hon. Secretary, then read the

Twenty-first Annual Report

of the Council, which stated that the membership of the Association now reaches 122, the number of members elected during the year being 43. The patrons of the Association number 49, or one less than the limit imposed by the rules. Ten papers had been read during the session, and three demonstrations had been given on subjects of practical importance to pharmacists. A discussion on the Pharmacy Acts Amendment Bill led to the passing of a resolution supporting the Pharmaceutical Society in its efforts to advance the interests of pharmacy. A pleasing feature of the session had been the fact that no less than nine of the papers and demonstrations had been contributed by present members of the Association. The smoking concert, conversazione, and Cinderella dances had again been great social successes, and the annual dinner was attended by 277 members and their friends, establishing a record attendance. Unfortunately there had been no competition for the medal of the Association, and the research prize offered by Messrs. Burroughs, Wellcome and Co., while the Council regretted that the essay received had not been adjudged by the Prize Committee of sufficient merit for the award of the Essay Prize. The new rooms had been found to afford increased comfort and convenience to members. The financial condition of the Association was extremely satisfactory, the balance in hand, notwithstanding an expensive year, exceeding that of last year by about £7.—The PRESIDENT expressed the pleasure it gave him to move the adoption of the report, the only unfortunate part of which was that the Council had not been able to award either of the prizes. It was extremely important that the standard of the papers should be kept up, and therefore he hoped that the member who had submitted a paper would not be disappointed in not having received a prize.—Mr. C. J. STROTHER, Hon. Treasurer, seconded the motion, which was carried, and then presented the financial statement for the year, which showed that the balance in hand at the commencement of the session was £101 12*s.* 10*d.* The total receipts amounted to £101 2*s.* 1*d.*, making a total of £202 14*s.* 11*d.* The total expenses had been £94 2*s.* 8*d.*, leaving a balance in hand of £108 12*s.* 3*d.* In commenting on the report Mr. STROTHER said he saw no reason why the figures representing the number of members' subscriptions, *i.e.*, 122, should not, next year, be reversed and read 221. This could be easily done if every member would resolve to introduce a new member at the commencement of the session.—The PRESIDENT moved the adoption of the report, which he thought reflected great credit on the ability of the Financial Secretary, Mr. Geo. Pearson.—Mr. C. MORLEY called attention to the fact that no mention was made in the report of any contribution to the Benevolent Fund of the Pharmaceutical Society.—Mr. PEARSON explained that the money contributed to the Benevolent Fund was derived from the sale of programmes at the social evenings, and that the total cost of preparing the programmes was put down in the expenses, but the balance obtained from the sales—16*s.* 8*d.*—was sent to the Secretary of the Pharmaceutical Society without being entered in the books.—Mr. E. W. HILL seconded the motion, which was carried, as were also votes of thanks to the Secretary and Treasurer.—Mr. C. E. PICKERING, having previously given notice of the motion, then moved :—

> That members of the Association who leave London may retain all th privileges of members (except the right of attending the Réunion free) on payment of a modified subscription of 2*s.* 6*d.* per annum.

After a lengthy discussion the motion, which was seconded by Mr. STROTHER, was carried.—Mr. HILL said it would perhaps be as well to state that the new rule which had just been adopted was not intended, by retaining them as members of the C.A.A., to prevent men who left London from joining any of the provincial associations. They would be quite free to join other associations.—Mr. PICKERING assented to that view, and said that his idea was to keep old members in touch with the C.A.A., but not to prevent them joining other associations.—The Scrutineers then announced that forty-three papers had been received—one informal, forty-two correct—and the result of the Council election was as follows :—Mr. C. Morley, 40 ; Mr. T. Morley Taylor, 39 ; Mr. Geo. E. Pearson, 39 ; Mr. C. E. Robinson, 39 ; Mr. F. W. Gamble, 37 ; Mr. E. W. Hill, 37 ; Mr. C. J. Strother, 37 ; Mr. F. Cooper, 35 ; Mr. C. E. Pickering, 32 ; Mr. H. Hymans, 31 ; Mr. H. H. Robins, 28 ; Mr. G. Roe, 28 ; Mr. H. E. Matthews, 23 ; Mr. J. Hamerton, 23. These constitute the Council ; the unsuccessful candidates were :—Mr. J. Fothergill, 21 ; Mr. F. A. Hocking, 20 ; Mr. James, 20.—A vote of thanks having been accorded to the Scrutineers, the PRESIDENT proceeded to deliver his

Valedictory Address.

Mr. TAYLOR said he would not weary the meeting with an egotistical epitome of his own shortcomings, of which he could assure those present he was fully aware, but would rather express his indebtedness to his colleagues, and more particularly to their Hon. Secretaries for the way in which they had strengthened his hand in guiding the business of the Association through another session. As they knew, a wave of correspondence had passed over the pharmaceutical press on the subject of a "Union of Chemists' Assistants." He was still of opinion that the only rational object of such a union would be the prevention of unjust trading, for which object, of course, such a universal *esprit de corps* would be necessary as, in his opinion, is impossible in these days of mutual suspicion and narrow pessimism. It was a deplorable fact that at the present time it should be possible for unqualified cheap-jacks and irresponsible general dealers to publicly boast of their ability to obtain qualified chemists to run their drug departments. But it only emphasised the necessity for supporting associations like the C.A.A., which tend to promote both mutual and self respect. He was happy to say that on the whole the past session would compare very favourably with previous ones. The aggregate scientific value of the communications read before the Association might not have equalled that of certain previous individual years, still considerable moral value must be attached to the fact that papers were mainly contributed by existing members. The social events of the session had been highly successful, and had met with exceptional appreciation, and the several secretaries for the various functions were to be highly congratulated. The Council regretted its inability to award either of the valuable prizes, and in that connection he might mention that it had been suggested to make any paper read during a season, being of sufficient merit, eligible for the Essay Prize at the end of that session. The blot on the Association's escutcheon had been the short paper evenings. Why would not more members contribute short papers? asked Mr. Taylor. Was it disinclination? Work was always compatible with play, and the member who had a sufficiently good head to carry a complete history of the football or cricket season, or brain enough to play a good hand at whist, might apply himself with advantage to a little literary or scientific effort. Was it modesty? Shakespeare said to the modest man, "Our doubts are traitors and make us lose the good we oft might win by fearing to attempt." The C.A.A. not only

gave a man an opportunity of bringing his name forward in an honourable connection, but received every maiden effort with encouragement and every communication with thorough appreciation and fraternal criticism. It was the scientific halo surrounding their business, and the little problems that suggest themselves during their daily work, set off against their more commercial side, that render pharmacy more tolerable as a means of livelihood. The devotion of a few spare hours whilst on duty and the rational application of scientific principles, a knowledge of which had already been acquired, might result in something, not perhaps worthy of an F.R.S., but possibly highly creditable to the member himself, to the C.A.A., and to pharmacy.—This address was enthusiastically applauded, and Mr. C. MORLEY, in moving a very hearty vote of thanks to the President on his vacating the chair, spoke in high terms of his sterling ability as President.—Mr. G. ROE seconded the vote of thanks, which was carried with acclamation, and Mr. TAYLOR having replied, the session closed.

MIDLAND CHEMISTS' ASSISTANTS' ASSOCIATION.

The annual meeting of this Association was held on Wednesday, the 4th inst., at the Exchange Restaurant, Birmingham. The chair was taken by the PRESIDENT, Mr. H. Jessop. The financial statement submitted showed a balance of £2 3*s.* 6*d.* upon the year's working. The Committee was elected by ballot, and the following were chosen:—Messrs. Cox, Cullwick, Davis, Foster, Gateley, Jessop, Lander, Lawton, Mann, Marshall, Osborne, Selby, Thomas, and Walton. Thanks were accorded to the Dinner Secretaries (Messrs. Lawton and Walton), the Ball Secretaries (Messrs. Casson and Mann), and the Scrutineers (Messrs. Brown and Trow).—The PRESIDENT, in a short valedictory address, referred to the year's programme as a most successful one, whether reviewed from the scientific or the social point of view. He urged regular attendance and hearty support on the part of members as the only way of accomplishing the main object of the Association. In conclusion, he expressed thanks for the extreme courtesy shown to him on all hands during his term of office.—Thanks having been given to the President and other officials, a musical programme was proceeded with.

MIDLAND PHARMACEUTICAL ASSOCIATION.

The annual meeting of this Association was held on Thursday, the 5th inst., at the Great Western Hotel, Birmingham. The PRESIDENT, Mr. F. J. Gibson, took the chair.—The adoption of

The Annual Report

(the substance of which was published in last week's Journal was moved by the PRESIDENT, who referred to the work of the year as very satisfactory, though the meetings had not been quite so numerous. It was to be regretted that they had lost £7 on the ball account, but on the whole the financial statement was satisfactory, and all the money had been spent so as to benefit the Association to the fullest extent possible.—Mr. W. JONES seconded the motion, and the Secretary having reported that during the year the *Pharmaceutical Journal*, the 'Year-Book of Pharmacy,' and the 'Calendar,' had been added to the library, it was agreed to.—In accordance with a recommendation by the Council, Mr. C. THOMPSON moved an alteration of Rule 6, so that it should read as follows:—

> That the Council shall be composed of sixteen members, elected by the members of the Birmingham and Aston districts, together with one representative, elected by every town within a radius of thirty miles, the voting to be by proxy, and that, in the event of no representative being appointed, the Council shall have power to elect such representative as they may deem fit.

Up to the present, Mr. Thompson pointed out, the Council had been made up of so many representatives from each of the Parliamentary divisions of the district, elected by the members resident in that district, but the system had not worked altogether satisfactorily. The alteration now proposed would put things on much the same footing as the Pharmaceutical Society.—The motion was seconded by Mr. W. SOUTHALL.—Mr. R. D. GIBBS urged caution in dealing with the matter. Though admitting that a considerable amount of difficulty had been experienced in the past—owing mainly to the apathy of the chemists themselves, who had in many cases failed to fill up the voting papers—he did not think the existing state of things would be remedied by doing away with the Parliamentary districts. He could conceive of no better way of dividing the district, and he therefore moved as an amendment that no alteration should be made in the existing rule.—This was seconded by Mr. E. J. P. FERRIDAY.—Mr. T. BARCLAY said that from the very beginning he had felt that the system of election on the basis of Parliamentary representation would not work satisfactorily, and he could not support it. He could not see how a representative upon the Council could take upon himself special duties for any particular locality. The desirable thing was to get the very best men regardless of local areas, and the change the Council recommended was in every way practical, and, in his opinion, workable.—A vote was taken, with the result that the new rule was approved by a large majority.—On the motion of Mr. SPILSBURY, seconded by Alderman W. G. CROSS, a hearty vote of thanks was passed to the President, officers, and members of the Council.—This concluded the business.

The Annual Dinner.

At the annual dinner, which was held the same evening at the Great Western Hotel, Mr. GIBSON again took the chair, and there were also present, amongst others, Messrs. Walter Hills (President of the Pharmaceutical Society), A. Southall, T. Barclay, W. Jones, C. Thompson, R. D. Gibbs, J. Humphrey (*Pharmaceutical Journal*), P. MacEwan (*Chemist and Druggist*), T. H. Alcock, W. G. Cross, G. E. Perry, A. W. Gerrard, and H. S. Shorthouse (Hon. Secretary).—The toast of "The Queen" was loyally honoured.—Mr. T. BARCLAY, in proposing

The Pharmaceutical Society,

first extended a hearty welcome to the President, and, referring to the origin of the Society, remarked that amongst its founders the name of Jacob Bell stood out prominently. Bell was one of a noble band who found pharmacy in a very primitive state, and who undertook the task of educating the craft and of founding the Pharmaceutical Society. Mr. Barclay spoke of the early history of the Birmingham branch, established in 1847, stating that in the first year there were two courses of lectures, one by Professor Shaw, of Queen's College, on "Chemistry," and the other by Professor Knowles on "Botany." Remarking that in the next session the attendance fell off, Mr. Barclay expressed the opinion that in the provinces little would be done in the way of securing regular attendance and regular studies until they had an enforced curriculum. They could look back with pride and satisfaction upon the way the Society had developed, but there were, nevertheless, many who wished that it had a little more backbone and a little more of the fighting element. The interests of the profession and of the public were identical, and it was to the interest of both that there should be a strong body in the country having such encouragement from the State as would enable them to so found and fulfil the higher destiny which they felt ought to be the portion of chemists. They were weighted with very heavy legal restrictions without having any fair *quid pro quo*. At the same time they were glad to acknowledge that the Society was doing a great deal. That they had succeeded in obtaining a footing upon the General Medical Council for the preparation of the new Pharmacopœia was in itself a step of considerable importance. Greater protection was required, however, in the matter of company promoting. Of course the Society could only go as fast as its members would allow it, and unless it was well supported and was thoroughly representative of the country it was impossible for it to do all that was expected of it. He was glad the Society was pressing forward the new Pharmacy Bill which would allow Associates to become Members, a change that would greatly strengthen the Society, and would enable it to support the Council all the more strongly in any move that was made. Speaking on the relative duties of the medical man and the pharmacist, Mr. Barclay said he was of opinion that as pharmacy advanced, dispensing by the medical man would gradually cease. It was to the interest of the public that the two professions should be kept separate and distinct, because the medical man could not dispense so well as the chemist, any more than the chemist could do medical work as well as the doctor.—The toast was coupled with the name of the President (Mr. WALTER HILLS), who in reply, expressed his gratitude for the hearty welcome extended to him. Referring to Mr. Barclay's remarks upon the origin of the Society, he said that Jacob Bell, Mr. Sandford, and Mr. Carteighe had done more for it, politically speaking, than probably any other three persons. It could not be claimed that the Society always did the thing that was wise and right, but he did assert that the Council did all it possibly could to promote the welfare of all those who followed a common calling. As to the desire for a little more backbone, his reply was that this must be supplied by members of the profession

throughout the country. If all chemists associated themselves with the movement, and then took care to select the right men to represent them on the Council, very much more might be done. He had found during the last few months that the influence the Society exercised throughout the country was very great, and he was glad to acknowledge how grateful the Council was for the loyal assistance given by local secretaries everywhere to its endeavours to get the Pharmacy Acts Amendment Bill through Parliament. Interviewing members of the House of Commons, he always felt able to bring a little more pressure to bear when he felt he had the local people behind him. Mr. Hills went on to read the following communication he had received from the North-East Lancashire Chemists' Association :—

> I am directed to forward you a copy of the following resolution, which has been unanimously passed by the above Association :—"That this Association as a body thinks the retiring members of the Pharmaceutical Council should define their position and show that in the future they intend to pursue a more progressive policy."

As one of the retiring members, he thought the present a good opportunity of asking them what he had never asked before, and that was to vote for him at the coming election. He maintained that the policy of the Council had, on the whole, been progressive. The Society was founded to protect common interests, to promote education, and to further benevolence. Taking the last-mentioned first, he pointed out that in 1897 alone they had spent more than £3000 for the relief of their brethren in difficulties. He was glad to say that this branch of their work was growing, because at the last festival the collection reached the record amount of £2000. The policy of the Society with reference to education had also been progressive. During the last twelve months the Privy Council had confirmed the amended Bye-laws, which rendered it necessary that those who entered the calling after July, 1900, should give evidence of a better and more thorough education than their predecessors had found necessary. This alteration was bound to have a good effect upon the future of pharmacy, and was one of the best things the Pharmaceutical Society had been able to accomplish for many a long day. Much was being done, too, for the advancement of education in their own School. As to the protection of their common interests, he admitted there was room for some difference of opinion. This was a wide subject, and was largely ruled by the considerations he had already urged. They could do much if united, but very little otherwise. He agreed with Mr. Barclay that they were only of use so long as they served the public; they could only progress so long as they showed that in their progress they served better the public requirements. The one factor necessary to obtain the better position at which they all aimed was a strong and united opinion within their own body. At present the Council represented only a comparatively small number of registered men, whereas there was no reason why the whole body of registered men should not belong to the Society. Those outside were constantly asking, "What is the Society doing for us?" His answer was that the Society would do what they gave it power to do, always bearing in mind that it must not go contrary to the interests of the public. If they were only loyal to one another, companies would not be able to carry on business for another day. Why at the present time Mr. Jesse Boot was able to flood the House of Commons with a pamphlet, in which he stated that he had 150 qualified assistants. Here were 150 of their own people helping to do the very class of business which was so inimical to the interests of registered and qualified chemists. Touching upon the Pharmacy Bill now before Parliament, Mr. Hills described it as a progressive measure in every respect. It would enable those who had the statutory qualification to take part in the active management of the Society. It had received the support of chemists in all parts of the country, and it would help to make the Society stronger and capable of more good work. So far as he knew, the Bill had no opponents among their own body, but there was opposition of a difficult kind to which he would not further allude. He was hopeful, however, that even yet this opposition might be overcome and that the Bill would become law during the present session. Referring to Mr. Barclay's remarks upon the question of medical men dispensing, Mr. Hills announced himself as one of those who thought that the calling of the pharmacist would never be entirely satisfactory until those who were qualified had in their hands nine-tenths at least of the dispensing of prescriptions. The more medical men were trained in the subjects which pertained to their special department, and the better pharmacists were trained the less likely were the two bodies to trench upon each other's preserves. Having wished the Pharmaceutical Society continued success, the President expressed in conclusion, the pleasure he felt at finding in the city such a thriving assistants' association.—Mr. G. E. Perry proposed "The Medical and Dental Professions," to which Mr. Dencer Whittles, Lecturer on Materia Medica at Mason University College, replied.—Mr. J. Wakefield followed with "Kindred Associations."—Mr. H. Jessop, President of the Midland Chemists' Assistants' Association, in the course of his response, gave the President an assurance that the increased power it was proposed to give assistants under the new Pharmacy Bill would be used in a legitimate manner and for the benefit of the profession. It was a matter for regret that so many assistants had thrown in their lot with the joint-stock companies.—Mr. R. D. Gibbs, Secretary to the Federation of Local Associations, also replied to the toast, remarking that the resolution passed by the North-East Lancashire Association had come too late. Even if the local associations up and down the country supported the view that the Council had not been sufficiently progressive, no harm would have been done, so far as the position of any of the retiring members was concerned. He suggested, however, that the Council might then either retire *en bloc*, or take the hint that they had not quite come up to expectations, and he thought the latter was, perhaps, the wisest course.—Mr. W. Jones, in proposing "The Pharmaceutical Press," referred to the great assistance associations received from the trade journals, and added that the thanks of the craft were especially due to the *Pharmaceutical Journal* for its brilliant article of the previous week upon the Nottingham gentleman who had lately made himself so obnoxious in regard to the new Pharmacy Bill. He did not know what chemists would now do without the *Pharmaceutical Journal*, so well had it adapted itself to the requirements of the trade.—Mr. Humphrey, of the *Pharmaceutical Journal*, and Mr. MacEwan, of the *Chemist and Druggist*, acknowledged the toast.—The health of the President and Secretary was afterwards proposed and heartily received. A capital musical programme added much to the enjoyment of the evening.

EXETER ASSOCIATION OF CHEMISTS AND DRUGGISTS.

At a meeting held on Friday, May 6, the chair was taken by the President, Mr. D. Reid.

The P.A.T.A. and Local Associations.

The minutes of the annual meeting having been read and confirmed, the Hon. Secretary, Mr. P. F. Rowsell, read the following letter, which he had received from Mr. Glyn-Jones, Secretary of the Proprietary Articles Trade Association :—

2 and 3, Stonecutter Street, London, E.C.
April 30, 1898.

Dear Sir,—It has been felt that our Association is not making the best use of the fact that, almost without exception, every local chemists' association in the country is in sympathy with our work. First of all we are anxious upon all our stationery to give a list of all the local chemists' associations which are working in conjunction with us, and I would be glad if your Committee will give your permission to include the name of your Association in such a list.

As you will know, several of the Associations have at different times passed resolutions to be sent to various proprietors, and these have always had a beneficial effect. I think that the usefulness of these resolutions would be very much enhanced if simultaneous representations were made from all the various local chemists' associations throughout the country, and to this end we respectfully suggest that the Committee of your Association should meet once in each month to consider a circular, which will be issued by us to all the local associations working with us. Such a circular would really be an epitome of the work carried on during the previous month at headquarters, and negotiations which would then be pending between particular firms and this Association. It would then be possible for your Committee to pass resolutions and to make representations on behalf of your Association to the particular proprietors, and also to send any suggestions for the consideration of our Council.

This work of course, can be done either by your Executive Committee, or if thought preferable, by a small committee appointed to deal specially with P.A.T.A. matters. It would be of great advantage if the committees in the various towns were to meet during the same week in each month, say for instance, the first week. Proprietors and other firms would then receive from all the important towns in the land simultaneous communications on behalf of the local chemists' association in their district. No doubt if this can be arranged, further good work will grow out of this close connection and active co-operation as between yourselves and our council. I would esteem it a special favour if you will kindly take the earliest opportunity of getting your committee's decision as to the proposals contained in this letter.

I am, yours respectfully,
W. S. Glyn-Jones (Secretary).

Mr. Rowsell said that he believed a meeting of their Association once a month was out of the question. It was bad enough to hold a meeting once in three months, and he suggested that a small committee should be appointed to deal with the matter.—Mr. T. C. Milton thought the question was a very important one, because the work of the P.A.T.A. would be useless unless the Association

was well supported. The Association was undoubtedly worthy of support, but he did not think it was possible for it to make headway unless it was supported by such committees as were suggested. It was very evident that individual chemists would not make any efforts, but if they, as an Association, took action, or if a committee of the Association were formed, as in other towns, they would have greater power in dealing with P.A.T.A. matters. He would propose that a small committee be appointed, and that it should meet monthly at any convenient time, and have power from the Association to act in the way suggested.—Mr. VINDEN said he believed that the chemists of the city were pretty well agreed to put up prices when necessary.—Mr. ROWSELL: I believe they are.—Mr. MILTON: But they are not agreed to meet and discuss the matter. I would suggest that when a committee is appointed to deal with the subject, it be asked to find out from time to time whether the P.A.T.A. prices are being adhered to.—Mr. ROWSELL explained the position of the P.A.T.A., remarking that, having been on the Executive of the P.A.T.A., he perhaps took a greater interest in its doings than the majority of those present. He had been continually watching the progress of its operations, and he had on two or three occasions reported to headquarters cases in which the P.A.T.A. list had not been adhered to. Letters were written to the firms mentioned, and he had found that within a month the prices were altered according to the P.A.T.A. list. In neither case had it been a chemist.—Mr. MILTON: I suppose if it had it would have been through ignorance?—Mr. ROWSELL: If it had been a chemist I would have gone and pointed it out to him.—Mr. LEMMON observed that the stores, who were the first to start the cutting movement, now hated it as much as anybody.—The CHAIRMAN said that even those who were the most careful in the matter of prices sometimes forgot, so that a slip was excusable. He sent up to Mr. Glyn-Jones some time ago a suggestion which he said he would think over, but which he had not done. The suggestion was that instead of printing in the *Anti-Cutting Record* a list of the prices in the ordinary type, he should publish an official list on a cardboard or something of that kind, so that traders could place it up in their establishment and see what articles were protected.—Mr. ROWSELL: At the next Committee meeting in London I will bring your suggestion forward.—Mr. LAKE concurred with Mr. Reid's suggestion. He also thought the list might be printed in larger type, so that the particular prices might be made more prominent. In the course of further discussion the opinion was expressed that to issue the list on cardboard would be very expensive.—Mr. E. LEMMON thought discussions such as this, as to the best means for getting the P.A.T.A. list adhered to, must be of great advantage to chemists.—Mr. LAKE said he understood that the idea was to have a local committee appointed to support the principal Committee and the Hon. Secretary.—Mr. ROWSELL pointed out that in addition to being the Hon. Secretary of the local association he was also acting as the Hon. Secretary in Exeter of the P.A.T.A., but he had no right to act as Secretary to this Association on P.A.T.A. lines. It was, therefore, desirable that a sub-committee should be appointed to meet once a month to discuss P.A.T.A. questions.—Mr. LAKE moved that the President, Mr. Vinden, and Mr. Milton form the Committee.—Mr. MILTON: I propose the whole Association, we shall not be too many.—Mr. REID asked the Hon. Secretary if he could tell the meeting if the P.A.T.A. was very much alive. It seemed to him that lately it had not been doing so much as it had done.—Mr. ROWSELL: I can assure you it is working as hard. It is very difficult to get firms to join the Association individually, and we want to show that local associations, meeting as they do all over the country, do more to help the P.A.T.A. than anything else. Mr. Rowsell then proceeded to refer to a case of a Devonport firm which had joined the Association, and in the course of subsequent discussion, reference was made to a chemist in a town in South Devon who had a list of prices in his establishment, in which, according to Mr. Milton, three-fourths of the articles quoted were from 5 to 10 per cent. under cost price.—After further discussion it was resolved, on the motion of Mr. MILTON, seconded by Mr. VINDEN, that the whole of the members be appointed on the Committee suggested in Mr. Glyn-Jones's letter.

The British Pharmacopœia, 1898.

The subject of the new British Pharmacopœia was next discussed. At the outset the CHAIRMAN explained that on the previous Monday, after he had talked the matter over with Mr. Milton, he had written to Messrs. Wright, Layman, and Umney and told them that the Association was holding a meeting to discuss the advisability of sending out a circular to the medical men of the city with regard to the Pharmacopœia. At his request the firm sent him a number of copies of their synopsis of the new Pharmacopœia, for distribution amongst medical men. Mr. H. Wippell Gadd, of the firm of Messrs. Evans, Gadd, and Co., of Exeter, was also publishing a synopsis of the new Pharmacopœia, the proof of which he now produced to the meeting. Mr. Gadd had kindly promised to supply a number of the copies of his work in a week or so, and he (the President) therefore suggested that copies of the synopsis should be forwarded to the medical men of the city.—Mr. MILTON then proposed that the following circular be sent to the medical men of the city, together with a copy of the synopsis:—

> Dear Sir,—We, the undersigned members of the Exeter Chemists' Association, desire to call your attention to the fact that on the first day of June the new British Pharmacopœia will be in the hands of the booksellers, and, in order to prevent confusion, we have decided to dispense all new prescriptions on and after that date according to the new Pharmacopœia. If you desire to prescribe by the old British Pharmacopœia, will you kindly put 1885 on the right hand side of the article ordered. We take the liberty of enclosing two very useful books showing the alterations made. In thanking you for your past kindness,
>
> We remain, dear sir,
>
> [Then follow the names of the members of the Association.]

—Mr. J. HINTON LAKE, Vice-President, seconded the resolution, and remarked that it was only fair that he should state that he had already received several copies of Mr. Umney's synopsis, and circulated them amongst a number of medical men in Exeter, with a little note similar in effect to that proposed by Mr. Milton. Mr. Gadd's work appeared to him to be an exceptionally useful book for medical men, but, on the other hand, the book published by Mr. Umney was of greater value to pharmacists in assisting them to prepare the medicines of the new Pharmacopœia. [The *P. J.* synopsis is still more useful in the latter respect, as it gives practical working details.—ED. *P. J.*] He begged to add to Mr. Milton's resolution that the gentlemen named be thanked for their kindness in sending copies of their books, and that they accept them as being very useful indeed.—Mr. ROWSELL supported what Mr. Lake had said. He had had a chance of going through Mr. Gadd's proof of his synopsis, and he certainly thought it would be a very useful publication for medical men, more so than for chemists. It was very concise, and dealt with the various preparations under the several headings of drugs and chemicals. They should certainly accept the books with thanks.—The resolution was unanimously agreed to, and the draft copy of the circular approved, after which an interesting discussion took place as to the effect of certain new preparations and changes in the 1898 Pharmacopœia..

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND AND THE PHARMACY BILL.

A meeting of Directors of the Highland and Agricultural Society of Scotland was held in the Society's Chambers in Edinburgh on May 4, Sir JOHN GILMOUR, of Montrave, in the chair, at which Mr. JAMES MACDONALD, the Secretary, read a letter from Mr. Alex. Cross, M.P., asking the Society's support to his opposition to the Pharmacy Act Amendment Bill. The letter is as follows:—

> 19, Hope Street, Glasgow.
> April 13, 1893.
>
> JAMES MACDONALD, ESQ.,
> 3, George IV. Bridge, Edinburgh.
>
> My dear Sir,—I am extremely anxious to have the assistance of your Society in reference to the questions raised by the Pharmacy Act Amendment Bill presently before Parliament. Mr. Isaac Connell tells me he mentioned the matter to you, and he has petitioned the Board of Agriculture on behalf of the Scottish Chamber. I write to beg that you will submit the matter to your Directors, with the view of their likewise assisting in the matter. The situation is as follows:—Under the Act of 1868 the Pharmaceutical Society were constituted, two orders of members were instituted, namely, members and associates, with a separate examination for each. Certain poisons were scheduled under the Act, and these poisons and any articles containing them, in however small proportion, were only allowed to be sold by members of the Pharmaceutical Society. At this time sheep dips, insecticides, articles for the destruction of vermin on plants, weed killers, etc., were all but unknown, or in very restricted use. But things are different now, and the Pharmaceutical Society is alive to the value of this monopoly. They are entrusted with the prosecutions directed against persons who may sell such preparations without being members of the Pharmaceutical Society, and they have been prosecuting freely to vindicate their monopoly. The effects of this monopoly will be obvious to your Directors. Presently sheep dips are sold at an enormous profit, and new sheep dips can hardly go into the market to compete at lower prices, because of the licensed pharmaceutical chemists who are all engaged with the older brands, and do not want any more competition. It appears to me that all such monopolies and restrictions to trade when applied to articles of large consumption necessary for agriculture cannot be defended

and ought to be abolished. Nobody proposes that poisons shall be "dispensed" freely by incompetent persons—in the dispensing of poisons we are agreed and anxious that duly skilled persons shall be employed. What I maintain, however, is that it requires no skill to hand an article across the counter which is made up, sealed, labelled, and prepared, upon the credit of the manufacturer, or to sell a drum of sheep dip similarly packed, or a packet of any of the other insect destroyers, all which articles are necessary for horticulture, and which in my belief will speedily become of great consequence to farmers also. It may be said that accidents may arise with these articles. I do not think that this is likely, but if it be the case it is surely obvious that the mere fact of having been sold by a pharmaceutical chemist does not render the accident less likely to occur with a farmer or a gardener than if the article had been sold by a seedsman or ironmonger. No doubt all poisons should be made up in bottles of a special kind, but the Pharmaceutical Society have never taken any steps to compel this. I think the Privy Council are now going to do so, and I am strongly in favour of Government assuming the responsibility of prosecutions which may be required for infringement of their regulations. I have for some time desired to deal with these matters by special private Bill, but this year a better opportunity occurs. The Pharmaceutical Society themselves have brought in a Bill to amend the Act in some particulars to suit themselves, and there is an opportunity of amending the Act in further particulars, as above mentioned, at the same time. This is what I am trying to do, but as the Government are themselves bringing in a Poisons Act, which is to be before Parliament shortly, and which will deal with carbolic acid, etc., it may be important that all these amendments should be considered together. The chemists and druggists are an influential body. They will desire to fight for their monopoly, probably to increase it if they can, by getting the sale of carbolic acid and all sanitary applications into their hands, which will be a grave mistake in the public interest. Every effort will therefore require to be made now to let these articles become articles of free trade—of course under such restrictions, labels, and in such packages as Government may appoint. To illustrate the importance of this in the future to agriculture, may I mention some surprising results which have been obtained through the application of solutions of nicotine as preventives of disease in potatoes and many field crops, but the development of such will be checked if the salesmen and agents of the farmers engaged in agricultural trade are to be prevented from vending it, and the prices of it will be enormously increased if the chemists and druggists get it into their hands exclusively. It is too late to attempt to stop the sale of poisonous articles when those are really required and useful. You cannot prevent suicide by stopping the sale. On the same principle you would need to prevent the sale of knives and pistols, and to enact that all buildings shall be only one storey high, lest persons should leap over windows, and to abolish rivers, so that people might not drown themselves. To the man who wishes to commit suicide there are too many ways open to him to think of doing it with sheep dips or insecticides. And as for accidents, if these do happen they happen on the farm or in the garden quite irrespective of the kind of shop from which the article came. I submit that the state of affairs now is completely different from what it was when the Act of 1868 was passed and that it is against the public interest to maintain a monopoly of the selling of what have become commercial articles necessary for a large industry. Excuse my having written at such length. I am desirous to carry your Society with me, and that you should urge in a pretty lengthy statement the department of agriculture in London to take action to remedy the state of affairs. The technical position is that a few agricultural members and myself have blocked the druggists' Bill, which has for its object the apparently small desire to ease the examination for members of the Pharmaceutical Society. The gentlemen who are acting with me have no other aversion to the Pharmaceutical Society making itself stronger, but before it is allowed to do so, we think it should be divested of its monopoly.

Yours very truly,
ALEX. CROSS.

In the discussion which followed the reading of the letter, the CHAIRMAN observed that this was a matter that affected agriculturists, and that Mr. Cross proposed that the monopoly created by the Pharmacy Act of 1868 should be abolished.—Sir ROBERT MENZIES asked if there was a monopoly? He did not think there was. It might be contrary to the Act, but they all sold it.—Mr. A. MARTIN, of Auchendennan, pointed out that two years ago some seedsmen were prosecuted for selling insecticide, and it was stopped. He sympathised with Mr. Cross's view, especially if there was any probability of the monopoly being extended to carbolic acid and other things.—Rev. Dr. GILLESPIE, Mouswald, said there was no doubt the persons to whom Sir Robert Menzies referred were technically selling these goods, but they might be doing so through the pharmaceutical chemists, who would try to reconcile this state of matters. Mr. Cross stated in his letter that it was a monopoly. He was a very well-informed man, and what he said was worthy of attention.—Sir JAMES GIBSON CRAIG, of Riccarton, moved that the letter be referred to the Law Committee to ascertain as to the exact position of affairs. What Mr. Cross said was quite contrary to the experience of everyone in the room. They would do better to have the matter looked into from a legal point of view.—Mr. WILSON, Chapelhill, seconded the motion. His experience was that he had no difficulty in buying sheep dip from any person, grocers or ironmongers. He apprehended from the communication of Mr. Cross that there was some clause in this Act which compelled the Pharmaceutical Society to take prosecutions against persons who sold poisons, although under the name of sheep dip. It was undesirable if it was confined solely to chemists. He thought it should be remitted to the Law Committee, who should report to the next meeting.—Several members expressed the opinion that it would be too late then to do anything.—Mr. A. HUTCHESON, Beechwood, Perth, moved that they support Mr. Cross right away. It was investigated in another society of which he was a member (the Scottish Chamber of Agriculture), and he knew quite well the tendency would be for the Pharmaceutical Society to get their own way, and it would make all these things dearer and restrict their sale to the druggist's shop. That was the tendency, and that was what Mr. Cross wanted to prevent. There was no need to refer a matter like that to the Law Committee.—Mr. WILSON, Carnbeth, seconded.—Mr. DUTHIE, Collynie, suggested that, instead of the amendment, the Committee might be instructed to support Mr. Cross's amendment or deal with the matter as they thought fit.—Dr. GILLESPIE said he would support the amendment for this reason, that the Law Committee would not meet for a month, and there was a very vital case to support Mr. Cross. All that Mr. Cross wanted was that the sale of insecticides and sheep dips should not fall exclusively into the hands of chemists, but should be permitted to be sold in packets by other tradesmen.—Sir JAMES GIBSON CRAIG, having been appealed to, said he would stand by his motion to find out their real position. He hoped they would allow the Law Committee to investigate and report to the next meeting.—Mr. HUTCHESON said it would be too late then.—Sir JAMES GIBSON CRAIG said they might petition just now if they liked, but let the Law Committee investigate what the real position was.—The SECRETARY pointed out that there was no amendment before the House to support. Mr. Cross was to propose an amendment when the Bill came up, but they could not support it until it was before the House.—Mr. MARTIN said they could support him in his view, and he could state in Parliament that he was supported by the Highland Society when it came up for discussion.—After some further discussion it was agreed to support Mr. Cross in his action, and it was also remitted to the Chairman and the Secretary, if they thought it necessary to do so, by petition to the House of Commons. At the same time it was remitted to the Law Committee to investigate their position in the matter.

IRISH PHARMACISTS' ASSISTANTS' ASSOCIATION.

At Dublin, on Wednesday, last week, the members of this Association entertained in the Gresham Hotel, the President, Mr. W. J. HARDY, L.P.S.I., to a

Complimentary Dinner,

on the occasion of his departure from the city to take over the proprietorship of Messrs. Prott's Pharmacy, Belfast. There was a large number of visitors, amongst those present being the following:—Messrs. G. G. Fetherston (in the chair), and at his right hand Mr. W. J. Hardy (the guest of the evening), H. Hunt (Vice-President), J. H. Hardy, J. E. Dickson, Dr. McWalter, Charles Kingston, J. Tyrie Turner, W. Cochrane, J. Stokes (J. and D. McNair, Glasgow), C. Doran, Phillips, W. V. Johnston, J. S. Ashe, J. J. Walsh, Bowles, J. B. Bolger, F. J. Parker, D. O'Sullivan, etc. Apologies for non-attendance were received from Councillors Kelly, Dr. Walsh, and several other friends.—At the conclusion of the dinner the toast of "The Queen" having been honoured to the refrain of the National Anthem, the CHAIRMAN proposed the health of Mr. W. J. Hardy, President of the Association. To that gentleman was due the inception of the Assistants' Association. When Mr. Hardy took up the duty of hon. secretary, a number of assistants in Dublin fought shy of the Association, and it was to get under that feeling Mr. Hardy set himself to work, and well he had succeeded, as the Association to-day was equal to the best kindred body in the United Kingdom. He felt regret at parting with Mr. Hardy, but was glad in the knowledge that he was going to better himself. They said a prophet had no honour in his own country, but the converse was proved on the present occasion, as Mr. Hardy, in going North, was returning to his native air to open business on his own account. It was the desire of every well-regulated assistant to become a proprietor. The assistants, he regretted to say, did not command the position to which their attainments and avocation entitled them. He thought pharmacy should be raised to a profession. Referring to the new British Pharmacopœia, he said it was a most elaborate work, but from what he saw in the trade papers he sympathised with the medical men who would have to use it. If Mr. Hardy found the Belfast air not agreeing with him they would be delighted to have him again amongst them.—Mr. W. VINCENT JOHNSTON endorsed the Chairman's remarks, especially as regarded Mr. Hardy's labours on behalf of the Association.—Mr. DAVID O'SULLIVAN followed in a neat speech, in which he traced the Association step by step from its inception to

the present. All along Mr. Hardy's hand was seen in it. The Association, he said, had been formed for the mutual advantage and benefit of the pharmaceutical assistants in Dublin. It supplied a long-felt want, and that it now occupied its present splendid position in the chemical world was due solely to Mr. Hardy's exertions. The Association was the first of its kind in Ireland that had come to stay. The difficulties in starting an association were known only to its promoters.—Mr. J. Fetherston, Mr. Ashe, and Mr. Hunt testified in turn to the sterling qualities of Mr. Hardy.—Dr. McWalter thought it a great honour for Dublin that one of her assistants was going northward as the proprietor of one of the most extensive pharmacies in Belfast.—Mr. Hardy suitably replied.—The toast of "The Chairman" followed.—Mr. Fetherston replied. His connection with the Association was that of an honorary member, but, although an employer, his heart was with the assistants, and he was always ready to do his utmost for them. Speaking on the advantages of the Association, he considered that the papers, debates, and lectures provided for its members were of benefit to the employers as well as the assistants. If education advanced a young man's intellectual powers he would prove of additional value to his employer, who was at the mercy of his assistant every time he left his pharmacy. He held that contact with the Association led a youth to take a more lively and personal interest in his daily work than he otherwise would. He had hoped at some future date to see over his shop the names of Hardy and Fetherston, Ltd., especially the "limited," which was such a good "spec" nowadays, but fate ordained otherwise.—The toast of "The Irish Pharmacists' Assistants' Association," coupled with the name of the President-elect, was proposed by Mr. Hardy, and responded to by Mr. Hunt, after which the visitors and vocalists were similarly honoured.—The Chairman proposed the toast of "The Trade Press." He said they all knew what an important item the trade press was, not only to the Association, but to the pharmaceutical world. They were justly proud of the journalistic enterprise displayed by the several newspapers conducted in the interest of the chemical and drug trade. The news, especially that from Ireland, was invariably racy and crisp. Without the trade press they were like an army going to war without ammunition or provisions. If they escaped annihilation, they would be starved to death; and that was their case with regard to their unequalled business newspapers. If they had no trade press, they would simply be blotted out.—The toast was drunk with musical honours, and was suitably acknowledged by the representative of each paper.—A cordial vote of thanks to Mr. Curtis, the energetic manager of the Gresham Hotel, was then passed for the very excellent manner in which he had looked after the comfort of the visitors.—Mr. Curtis made a capital speech in reply.—During the evening songs and recitations were given by Messrs. Cochrane, C. Doran, G. G. and J. Fetherston, Ashe, Turner, Phillips, and others. Mr. Bowles presided at the piano with his customary ability. The company separated at midnight to the refrain of "Auld Lang Syne," all wishing Mr. Hardy good fortune and long life in his new sphere of work.

PHARMACEUTICAL SOCIETY OF IRELAND.

On Wednesday, the 4th inst., the monthly meeting of the Council was held at 67, Lower Mount Street, Dublin. The President, Mr. R. J. Downes, was in the chair, and the other members of the Council present were the Vice-President, Mr. Beggs, Mr. Grindley, Hon. Treasurer, and Messrs. Wells, Kelly, Conyngham, Hayes, Dr. Walsh, and Professor Tichborne.—Mr. Hayes asked why the report of the last meeting of the Council omitted a matter which was of great interest to the licentiates.—The President said the Council were in committee at the time. The matter arose on a report from the Certificates Committee.—Mr. Hayes denied that the Council were in Committee at the time. The matter arose on the exclusion of Mr. William Conyngham from the examinations.—The President said the reporter had notes of the discussion, and if the Council wished, these could be published.—Mr. Conyngham denied the accuracy of a statement of the President that discussions on reports of committees were committee matter, and in the course of some observations said he saw Mr. Wells nodding to the reporter.—Mr. Wells denied this, and the reporter disclaimed having seen or noticed any signal from Mr. Wells.—Mr. Wells said he was sorry the discussion had not been reported, because a threat was uttered to the Council on the occasion.—The matter dropped.—A letter from Mr. R. W. McKnight tendered his resignation as a member of the Council, and stated that when co-opted he had no connection with any limited company, but that he had since joined the Ulster Chemists' Company.—Mr. Grindley moved that the resignation be accepted.—Mr. Wells said he felt bound to second the motion, although Mr. McKnight was a friend of his, and he should like to see him on the Council.—Mr. Conyngham said that at the last election a cold-blooded lie went forth on a friend of Mr. Wells, and yet Mr. Wells did not lift his voice, but used the lie to defame his friend.—Mr. Wells: If this is to go on I will not sit here.—Mr. Conyngham: It is true, sir, perfectly true.—Mr. Wells: This is a perfectly low, corner-boy sort of thing—to attack me in reference to a matter that I had nothing to do with. Am I to read or answer everything that appears in the journal? I am attacked because I would not stoop to do what other people do. I acted straight in the matter.—Mr. Conyngham repeated his charge, saying that circulars went out which Mr. Wells used.—The Vice-President said there should be some other place besides the Council Chamber for settling these personal matters.—Mr. Wells said Mr. Conyngham had stated what was false, and that he ought to be ashamed of himself.—The resignation of Mr. McKnight was accepted.—Letters were read from the Pharmaceutical Society of Great Britain, the Irish Medical Association, and the Apothecaries' Hall of Ireland, expressing sympathy with the Council of the Irish Pharmaceutical Society in their efforts to obtain an amendment of the Companies Acts.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

Mr. H. S. Durbin took the chair at a meeting held on Friday, the 6th inst., when a paper was read by Mr. H. Payne on

Insectivorous Plants.

The author, in an able and exhaustive manner, described the more typical of such plants, calling special attention to the various devices and mechanisms by which they attract, capture, retain, and frequently digest insects and other small animals. Mr. Payne illustrated his remarks by means of living plants, some of which were kindly lent by the Royal Botanical Society.—An animated discussion followed, in which the Chairman, Secretaries, and Messrs. Smith, Turner, Matthews, Evans, and Battle took part. The meeting then adjourned.

LEGAL INTELLIGENCE.

PROCEEDINGS UNDER THE PHARMACY ACTS.

In the case of the Pharmaceutical Society of Great Britain *v.* Clare, which came before Judge French at the Bow County Court on Monday last, the plaintiffs sued the defendant, Mrs. Clare, carrying on business at 28, High Street, North Woolwich, to recover two penalties of £5 each for having sold on February 21 and March 26 some laudanum and Dr. Collis Browne's chlorodyne, the defendant not being qualified under the Act to sell poisons.—The defendant paid the money into Court.—On the application of Mr. T. R Grey, who appeared as counsel for the Pharmaceutical Society, His Honour made an order for the costs and certified for the costs of counsel.

NEW REMEDIES.

Convallamarin in Chloroform Narcosis.—From experiments on dogs Lewenberg considers that convallamarin will be found of value in preventing the arrest of the circulation during chloroform narcosis.—*Therap. Gaz.* [3], xiii., 674.

Senecio Aureus as a Hæmostatic.—Having used the fluid extract of *Senecio aureus* in all forms of parenchymatous hæmorrhage since 1871, Gundrum finds it the most valuable of all remedies. It is given in doses of 1 to 2 drachms. Since it is not an astringent, it would appear to act through the vasomotor system. It may be prescribed with confidence in all forms of internal bleeding.—*Therap. Gaz.* [3], xiii., 655.

Ammonol Salicylate in Headache.—Ammonol salicylate in doses of half a gramme, accompanied by a gentle mercurial aperient and a hot mustard foot bath, gives a certain and prompt relief in the case of habitual nervous headache in anæmic women.—*Les Nouv. Rem.*, xiii., after *Pharm. Zeit. für Russ.*, 722.

LETTERS TO THE EDITOR.

The New Pharmacopœia Test for Quinine Sulphate.

Sir,—It is satisfactory to find from Mr. David Howard's letter in the Journal of the 7th inst., that he substantially agrees with my adverse criticism of the quinine sulphate test of the new British Pharmacopœia. An alternative test might, in my opinion, have been supplied from information which is accessible to all readers of chemical literature. My contention is that failing the insertion of a satisfactory test, it would have been better merely to have prescribed a limit of impurity, leaving its determination, when necessary, in the hands of those competent to undertake it.

13, Fenchurch Avenue, E.C. A. J. Cownley.
May 9, 1898.

The Council Election.

Sir,—As I have no intention of discussing with the candidate from Manchester the truthfulness or otherwise of the facts referred to in my former letter, especially as I am in no way responsible for them, I must decline to do more than refer him to the report of Mr. McKellar's statements—*vide Pharmaceutical Journal*, page 383—and to that gentleman's letter in the *Chemist and Druggist* of March 26. If the assertions therein contained are untrue, it is a pity that Mr. Gibbons did not deny them earlier.

May 11, 1898. Associate in Business.

Sir,—I desire to draw the attention of my brother chemists and druggists to the fact that Mr. Walter Gibbons, pharmaceutical chemist, is seeking their suffrages at the forthcoming Council Election. I also wish it to be noted that this gentleman was the moving spirit of the Manchester opposition to the Pharmacy Acts Amendment Bill, now before Parliament, which seeks to confer the right of membership of the Pharmaceutical Society upon "Minor" men. This, I think, is sufficient reason why his defeat should be secured. He is evidently not the man to voice our aspirations in the Council.

Cockermouth, May 10, 1898. W. Stanley Scott.

Sir,—I hope the Council of the Pharmaceutical Society will take active steps to remedy the flaw in the Pharmacy Act which enables unqualified companies to use titles which are illegal for individuals to use. As for monopoly in the sale of drugs that is out of the question, but I do think titles ought to be protected, and unqualified companies prevented from trading on other men's qualifications. If it is allowed in the case of chemists, why not have limited companies as cash doctors or cash dentists, on the same lines? Grocers even describe themselves as manufacturing chemists, advertise drugs, etc., at cost prices, and deceive the public, to the detriment of the real chemist.

May 11, 1898. Country Chemist (132/42).

A Dispensing Problem.

Sir,—One of the items on "the prescription" handed to me during the last Minor examination was :—

℞ Glycerin. Borac. ..... 5iv.
Liq Plumbi ..... 5iv.
Ung. Zinc. Benz. ..... ad 5vj.
M. ft. ung. Sig. m. d. u.

I had to make the zinc ointment, and "turned out" what the examiner termed a "dicky" mass. Since then a few of us (students) have made various attempts to produce an "elegant" preparation, but the best results give evidences of granulation when cold. Can any reader of the Journal help in the solution of this problem?

London, May 6, 1898. Aratus Sum (10/6).

Chemists and Jury Service.

Sir,—It was with regret that I read many of the remarks on the above subject which were made at last meeting of Council, and particularly Mr. Carteighe's "non possumus" arguments. Mr. Carteighe is mistaken in thinking that the Edinburgh District Chemists' Trade Association had not considered the discussions which have taken place since the Dentists Act was passed. Although not reported, these were referred to at our meeting, more particularly by Mr. J. Rutherford Hill, and to show that they were not solely of a "non possumus" nature, allow me to quote two extracts from Journal editorials :—"The Council of the Pharmaceutical Society has recognised the principle that chemists and druggists, like pharmaceutical chemists, should be exempt from serving on juries. . . . The Council has also obtained recognition of this principle by the Legislature, and in all probability it might have become law if the Juries Bill of 1872 or 1874 had been passed" (*P. J.*, 1880 [3], xi., p. 355), and, again, "at the present time we have reason for expressing the opinion that no objection would be raised by the Council to the introduction of a clause to effect the desired object (exemption of chemists from jury service) whenever the Pharmacy Bill reaches the committee stage, and, indeed, it would be willing to assist in obtaining its insertion when that opportunity arrives" (*P. J.*, 1890 [3], xx., p. 681). Mr. Carteighe was President at the latter date, and both quotations prove that a clause exempting chemists from jury service would not be out of place even in a Pharmacy Bill, and would not neccssarily be rejected by the Government. It ought to be remembered that we in Scotland have a special grievance, as neither pharmaceutical chemists nor chemists and druggists are exempted, but we do not base our claim for exemption on this, but on "imperative public necessity," in regard to which a strong claim can be made out by chemists both in England and Scotland. No really serious effort has ever been made to obtain exemption, and when this has been done, and when it has failed, then will be the time to say "non possumus." The Privy Council was mentioned during the discussion in the Council, but surely it is no part of their duty to say what shall be or what shall not be the law of the land. They are but the servants of the Legislature, and to the latter only we must look to have this matter remedied, both on grounds of "imperative public necessity" and justice. We have but little to thank the Privy Council for in the past, and we need expect little help from them at any time. Whether the present Pharmacy Bill passes or not, the Council are pledged to bring in others to remedy this and other grievances. One of the main arguments used in the case of the present Bill was that the Society should be consolidated in order to have more weight to carry out other reforms.

Edinburgh, May 10, 1898. Claude F. Henry.

The Medicine Stamp Duty.

Sir,—A certain soap is recommended by pamphlet as a remedial agent for "rash, pimples, boils, stomach ulcers, cancer, chronic rheumatism," etc. ; and that over and above a reference to its fitness for toilet and nursery use, for the laundry, and for bathing and shaving. I was curious to know how Somerset House authorities would view such an article with reference to its liability or otherwise to Stamp Duty, and forwarded specimens of the printed matter referred to ; annexed is a copy of the reply.

Edinburgh, May 9, 1898. J. A. Forret.

[Enclosure.]

Inland Revenue, Somerset House, London, W.C.
April 23, 1898.

Sir,—With reference to your letter . . . I am directed by the Board of Inland Revenue to acquaint you that the pamphlets . . . contain dutiable recommendations, but that soap used in the ordinary way in washing is not regarded as within the charge. If, however, this soap is to be left on the body for a time, it is considered to be used as an ointment or salve, and would then be held liable to duty.

I am, etc.

[Numerous Answers to Queries are held over.]

OBITUARY.

Moor.—On April 26, George Moor, Chemist and Druggist, Droitwich. Aged 37.

Padwick.—On April 29, Thomas Padwick, Pharmaceutical Chemist, Redhill. Aged 53.

Wharrie.—On May 1, Decimus Wharrie, Pharmaceutical Chemist, Liverpool. Aged 69. Mr. Wharrie had been a member of the Pharmaceutical Society since 1854.

Stoddart.—On May 2, Thomas George Stoddart, Chemist and Druggist.

Watt.—On May 9, James Watt, Pharmaceutical Chemist, Haddington. Aged 41. Mr. Watt had been a member of the Pharmaceutical Society since 1889.

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Alcock, Bathurst, Bennett, Bessant, Blair, Blyth, Butterworth, Clark, Clarkson, Dixon, Dunlop, Fick, Gadd, Hallaway, Harrison, Hebb, Hogg, Johnson, King, Parry, Poll, Raimes, Rose, Spooner, Strong, Thomson, Tiessen, Ward, Wynne, Young.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

Maclagan's Test for Cocaine Hydrochloride. In carrying out Maclagan's test for the purity of cocaine hydrochloride it is pointed out in Gehe's Bericht that the normal temperature of 15° is the most favourable for carrying out the operation, and that it is necessary to use absolutely pure distilled water, as the slightest trace of fatty substance in the water, or even introduced by holding the glass rod with greasy fingers, is sufficient to vitiate the test. This is rather a puerile objection even if it were correct, as it is not usual in analytical operations to use greasy liquids or utensils. But Gehe's statement cannot be endorsed as there is no difficulty in obtaining the characteristic crystalline precipitate with a sample of pure cocaine hydrochloride by Maclagan's test, even after greasing the rod with olive oil to such an extent that oily globules separated in the liquid.

Starch Iodide. C. O. Harz (*Apoth. Zeit.*) finds that iodine combines with the three starches enumerated in different proportions in the raw state, and when in the form of mucilage thus, raw rice starch absorbs 6·44 per cent.; the paste, 17·61 per cent.; raw potato starch, 6·73; the paste, 20·68; raw wheat starch, 7·62; the paste, 20·72. The raw starch combination approximates to Payen's formula, $(C_6H_{10}O_5)_{10}I$, while the mucilage accords with the formula, $4[(C_6H_{10}O_5)_4I] + HI$, of Mylius.—*Journ. de Pharm.* [6], vii., 426.

Pure Guaiacol. Pure guaiacol free from homologues and other phenol bodies is obtained by the following patent process:—O-anisidine is diazotised and the diazoanisol obtained is decomposed by being boiled with sulphuric acid of at least 35 per cent. at temperatures above 135° C. The guaiacol liberated is distilled off immediately after formation by a current of steam passing through the solution. The guaiacol thus obtained is re-distilled at about 200° C., and congeals at once to crystals which melt at 30° C.—*Pharm. Centralh.*, xxxix., 89.

Comparative Danger of Acetylene and Coal Gas Inhalation. From experiments on rabbits, Dr. T. Oliver concludes that risk of death from asphyxia after inhaling a mixture of air and acetylene is not so great as from a similar admixture of air and coal gas. The time taken to produce toxic effects is longer in the case of acetylene, and the symptoms are free from the nervous or respiratory excitement seen with other narcotic vapours. Provided asphyxia has not gone too far, recovery is rapid after exposure to fresh air. The subject is receiving further investigation.—*B. M. J.*, 2/98, 1069.

Odours and Tastes in Drinking Waters. Messrs. D. D. Jackson and J. W. Ellms point out that, while some of the Cyanophyceæ (especially *Anabæna*) produce disagreeable odours in surfacc waters by the decay of nitrogenous organic matters, the most common cause of unpleasant odours and tastes occurring in potable water is the secretion by microscopic organisms of compounds of the nature of essential oils as a phenomenon not of decay, but of growth. Among the Cyanophyceæ which produce an offensive odour by the decay of highly nitrogenous organic substances, in which partially decomposed phosphorus and sulphur compounds play a leading part, are *Anabæna*, *Rivularia*, *Clathrocystis*, *Cœlosphærium*, and *Aphanizomenon*. The organisms which emit odours of a fishy or aromatic nature as a phenomenon of growth include Diatomaceæ (*Asterionella*, *Meridion*, *Tabellaria*); Chlorophyceæ (*Volvox*, *Eudorina*, *Pandorina*); and Infusoria (*Uroglena*, *Dinobryon*, *Synura*, *Bursaria*, *Peridinium*, *Cryptomonas*, and *Mallomonas*).—*Technology Quarterly*, vol. x., p. 410.

New Organs of the Plant-Cell. In the superficial layers of the cytoplasm of some Florideæ and Saprolegniaceæ, Mr. W. T. Swingle records the presence in large numbers of bodies, to which he gives the name vibrioids. They are slender, sharply defined bodies, exhibiting rather slow bending or undulatory motions, in addition to movements which are probably due to the cytoplasm. When stained, they are sharply differentiated from the surrounding cytoplasm. They occur constantly in all stages of development of the plant. Another new organ or organoid was detected in the nucleus of the oosphere of *Albuga candidus*. It is a nearly spherical body, but often somewhat flattened on the side adjoining the nucleus. It appears to be more or less granular in structure, and is found before the delimitation of the oosphere within the oogone, and disappears after the fusion of the male and female nuclei.—*Botanical Gazette*, 1898, p. 110.

Cellulose Enzymes. In addition to the examples already well known, Dr. F. C. Newcombe records the extraction of a cellulose-digesting enzyme from seedlings of the date and of *Lupinus albus*, and from the mycele of *Aspergillus orzyæ*. The author does not support the view that the cellulose enzyme is identical with diastase. In all the above cases the enzyme also dissolves starch; but the specific intensity of action is not the same for starch as for cellulose. Thc *Aspergillus* ferment acts most strongly on the cell-wall, the date ferment the least rapidly.—*Bot. Centralblatt*, vol. lxxiii., 1898, p. 105.

Formation of Albumin in Plants. Herr W. Zaleski discusses the controverted question whether albuminoid substances can be formed in the plant in the dark. From a series of experiments on sunflower leaves he has come to the conclusion that the nitrates taken up into the leaves are there decomposed and transformed into other nitrogenous compounds. This transformation is connected with the access of sugar, which renders possible the passage of nitrates into other compounds, probably of the nature of amides. These processes can take place in the dark.—*Ber. Deutsch. Bot. Gesell.*, vol. xv., p. 536.

Biology and Morphology of Pollen. Professor A. Hansgirg proposes the following classification of pollen grains, dependent on their power of resisting moisture, and on their protection against unfavourable atmospheric influences: (*A*) Plants whose pollen is resistent to moisture and germinates in pure water; (*a*) Species in which the sexual organs are more or less protected against rain, etc.; (*b*) Species in which the sexual organs are only slightly or not at all protected against atmospheric precipitation; (*B*) Plants whose pollen is not resistant to moisture, and does not germinate, or only very imperfectly, in pure water; (*a*) Species in which the sexual organs are completely or partially protected against rain; (*b*) Species in which the sexual organs are only slightly or not all protected against rain, usually completely exposed. The class to which any particular pollen grain belongs does not depend so much on the affinity of the species as on its special habit.—*Sitzber. kön. Böhmisch. Ges. Wiss.*, 1897.

PHOTO-MICROGRAPHY.

BY EDMUND J. SPITTA, L.R.C.P. LOND., M.R.C.S. ENG., F.R.A.S.

(*Continued from page* 434.)

With respect to culture tubes requiring reflected light, the apparatus is best arranged as shown in Fig. 6, the tube being placed in a water-bath to do away with the internal reflection of the light in the tube itself. It is not well, I have found, to use a fluid in the water-bath of too high a refractive index—say oil of cedar for instance—as the outline of the tube is too utterly lost. Water seems to do very well, but there are times when even this fluid may do away with the outline of the tube

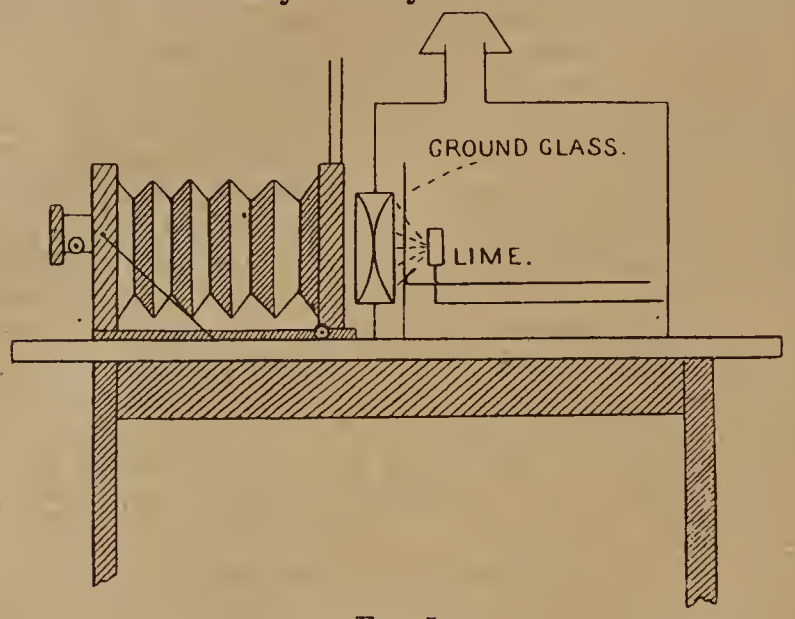

FIG. 5.

rather more than is desirable. Glycerin forms a capital fluid for a bath; its boiling point is so high that it does not easily form bubbles. With respect to the lens to be used for this purpose, a 5 inch rectilinear stopped down to F/22 or F/32 usually fulfils most requirements, but a Goertz 5 inch is superior to any lens we know of, unless it be one of the Zeiss anastigmats. The camera arrangement as previously described (Fig. 3), should now be placed on the additional slide with rails (that which we have just suggested should be made), as it enables the photographer to

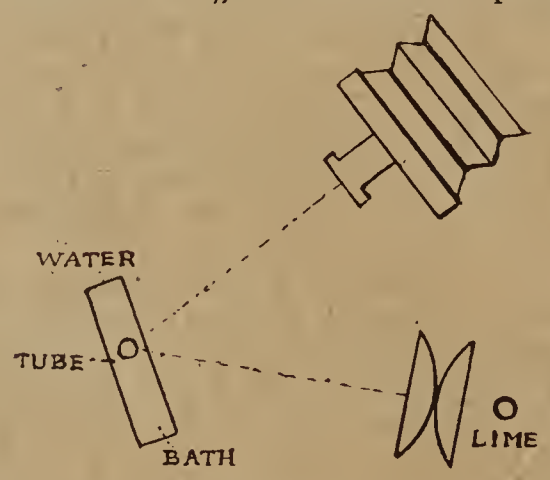

FIG. 6.

obtain his picture with comfort, because the camera slides to and fro with ease and axial precision. The use of the levelling screws I mentioned is now apparent, for by them the photographer can adjust small irregularities in the verticality of the tube without the necessity of touching it in its bath. The position of the lime and condenser are shown in the diagram, Fig. 6. The exposure, when employing an isochromatic medium plate by Edwards, well and evenly backed, is about 30 seconds at F/32.

When transmitted light is required the illuminant should be arranged as shown in Fig. 7, where elevation and plan are both shown. That is, it should shine obliquely on the tube from above downwards. It is best so to arrange the light that parallel rays issue from the condenser upon the water-bath, which is done by pushing up the lime quite close to the condenser, in

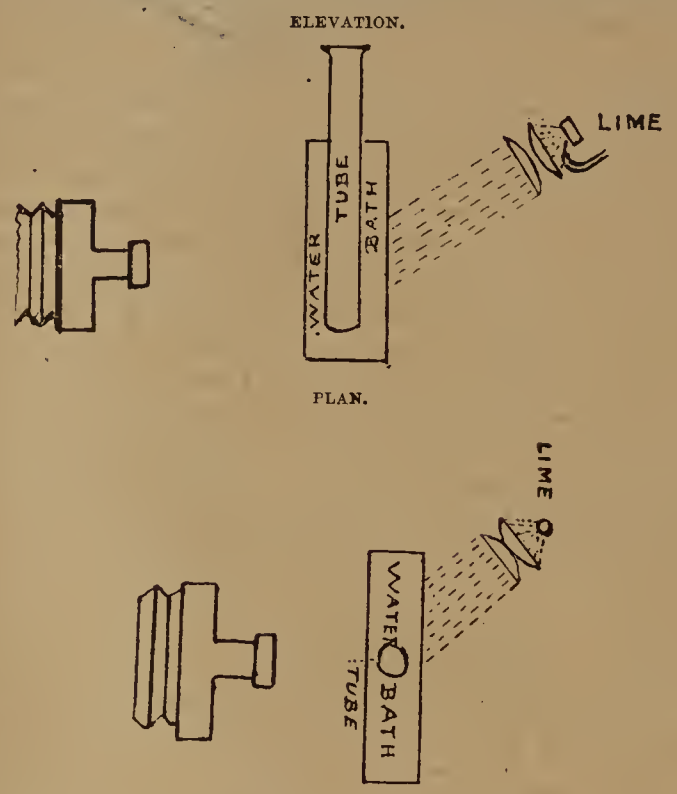

FIG. 7.

point of fact, to place it in its focus. Approximately parallel rays will then issue from the lenses. The water-bath must not be too small; about 4 inches long, 2 inches wide, and 5 inches deep, are convenient dimensions. As a water-bath of this size is not a commercial article, but can be readily made, the following instructions for its manufacture may be useful:—Procure two glasses of the

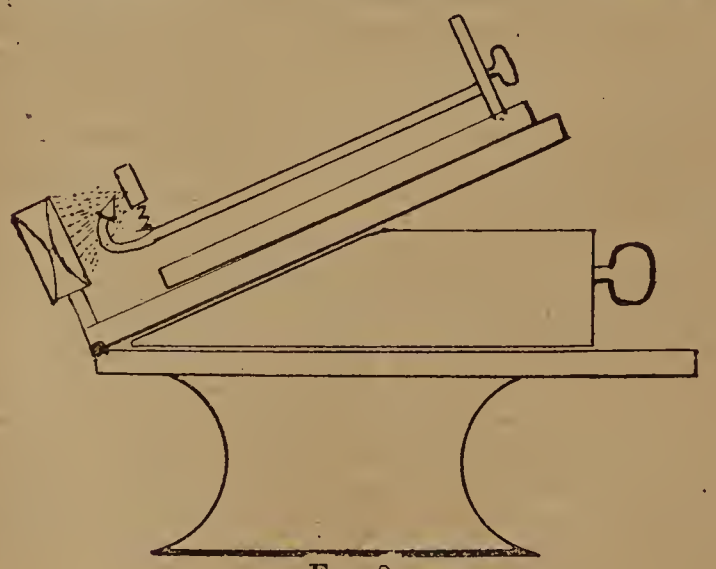

FIG. 8.

correct size, some solid vulcanite (2 inches thick), cut in lengths to form the bottom and sides. Cover each surface of the vulcanite that comes in contact with the glass, as well as the surface of the glasses that come in contact with the vulcanite, with Miller's cement—procurable at any optician's—and firmly press the glasses on to them. Leave to dry for twenty-four hours. Now cut strips of good strong paper, and apply them over the points of union of the glass and the vulcanite inside, and having coated them as well as the glass and vulcanite with cement, again leave for twenty-four hours. After becoming dry, apply one or two more coats

over the joints with the same cement, and all will be complete. To make it more handy and to prevent being easily upset, it is well to arrange a wooden support to take the bath as a whole.

With streaked cultures, the tubes must be inclined at such an angle that the level of the inclined medium is approximately at right angles to the optical axis of the lens, by which means it will be found the upper and lower ends of the gelatin inside the tube can be photographed at one plane of focus. It will now be seen why it was necessary to make the water-bath so wide; it was to allow of this tilting.

Another variety of tube, which the bacteriologist may require to have photographed, has not yet been referred to, namely, the bubble-tube of *Bacillus coli communis*, and that of malignant œdema. Such tubes contain bubbles of gas, which, arising in the substance of the medium, pass through it towards the top. It is no easy matter to take a good photograph of this type of tube, unless the light is placed almost in a line with the lens on the other side of the bath, a piece of ground glass being placed between the condenser and the water. The photographer is reminded to be careful not to focus the ground glass—let him keep it near the condenser.

As my desire is to make these articles essentially practical, a few hints must be given regarding the method of supporting the lime and the condenser. As the light is to be raised vertically up or down to get the required obliquity, so the lime must also be tilted with the condenser to allow the issuing rays to fall upon the tube fixed beneath in its bath. I have found that a convenient arrangement for this tilting is afforded by fixing the tray of the jet upon a piece of wood which is hinged at its ends to another piece, as shown in Fig. 8. A simple wedge is now all that is required to raise or lower the end of the upper board, so as to make the rays tilt enough to impinge on the tube. To make my meaning clear, I may say there are really two movements required; one to raise the light above the object, the other to tilt the condenser sufficiently down to bring the rays obliquely on to it.

In taking these photographs it must be distinctly understood there is no hard and fast rule, each position that we have explained must be tried by direct experiment until the results required are obtained. Occasionally troubles may arise from bubbles forming in the water-bath while the apparatus is being got in order. These must be carefully looked for at the last moment before taking the photograph, as it is annoying to find afterwards that their presence has spoilt the final effect. A pencil or stirring-rod is useful for this purpose, and should always be handy.

If water be used, and not glycerin, it rapidly becomes hot if much time is spent arranging the details for taking the photograph; this, too, should be carefully guarded against, as with some tubes the slightest heat will melt the gelatin and spoil the tube. It is necessary, therefore, to have quite close at hand some cold water to instantly add to the bath, for the slightest delay has, in our hands, on one or two occasions produced the very disaster we wished to avoid.

Another hint to remember is to cleanly wipe out the water-bath each time after using, for if water be left in it when not in use it will slowly evaporate and leave ridges of stain on the inside faces of the glass, which have in our own experience given rise to considerable trouble to remove. (We have found that spirits of wine or very dilute hydrofluoric acid the best for this purpose.) A difficulty arises sometimes when photographing the obliquely filled streaked culture tubes from steaming within the tube itself. This constitutes a most formidable trouble, and one which on some occasions we have been unable to avoid. If leave be granted to move the paraffin wax and woollen plug—to do which gently insert a slightly warmed penknife around the wax at its contact with the glass—the best plan for getting rid of this annoying trouble is to take a stiff roll of blotting paper of the thin filter-paper type, and very gently insert it down the tube. One touch of the culture may spoil it hopelessly, so the treatment requires the greatest of care, and, as before stated, should never be done without the leave of the bacteriologist. It should be recollected, too, that, should the growth be touched, the paper should be at once immediately burned and the wool and wax returned to their place, recollecting to put the wool in first, and then the melted wax seals up the tube.

About Lenses.

It has been mentioned that the distance of the lens from the object and the camera length are factors for producing the required magnification. So they are, but the critic must not think the focal length of the lens itself has been lost sight of. What I have said applies in a fashion to the use of the same lens. Seeing, however, it may be of service to the photographer to rightly understand where the focal length of any lens he may use comes in, I will conclude this section of our subject by giving a few formulæ, which, although they may not be rigidly correct, are quite correct enough for all practical purposes. We shall ignore the distance of the object from the lens and ask ourselves three different questions:

1. Suppose first we want to magnify an object, say a house-fly, four diameters on our ground glass so as to make a lantern slide from our negative, and we do not want to use a camera length of more than, say, 10 inches; what lens is required?—

Let F = focal length of lens required; let M = magnification; let L = camera length.

The formula here is— $F = \frac{L}{(M+1)}$

This becomes $F = \frac{10}{(4+1)} = \frac{10}{5} = 2$ inches.

Therefore we require a 2-inch lens.

If we desire to work in millimetres, then:—

$$F = \frac{L}{(M+1)} = \frac{250}{5} = 50 \text{ Mm.}$$

This means that we must have a lens of 50 Mm. focus to give us a magnification of 4 diameters, with a camera extension of 10 inches (250 Mm.).

2. Suppose now we want to know whether our camera will require the additional front to obtain a picture of 10 diameters on the screen, using the 50 Mm. lens; as we know the limit of our lantern slide is three inches, so the object it is evident must be small or it will not all go on the plate. Presuming we are satisfied with a portion only showing, then the formula becomes

$L = (M+1)F = (10+1)50 = 550$ Mm. or 22 in.;

our camera will need the front it is evident.

Lastly, we want to know what magnitude in diameters would our object be reproduced on the plate with a given lens and a given camera length. Say, for example, what magnification can we obtain with our 13-inch (325 Mm.) camera, and no additional front, using still a 2-inch (50 Mm.) lens. The formula here is—

$$(M + 1) = \frac{L}{F} = \frac{325}{50} = 6{\cdot}5$$

as $M + 1 = 6{\cdot}5$. $\therefore M = 6{\cdot}5 - 1 = 5{\cdot}5$ diameters.

Or in inches—

$$(M + 1) = \frac{13}{2} = 6{\cdot}5 - 1 = 5{\cdot}5 \text{ diameters.}$$

If one wanted to use any other lens it is obvious that the same formula would suit.

The Annual Dinner of the Pharmaceutical Society.

The Annual Dinner of the members and friends of the Pharmaceutical Society of Great Britain took place on Tuesday evening, May 17, at the Victoria Hall, Hotel Cecil, which was well filled. The Chair was occupied by Mr. Walter Hills.

In addition to the cross-table, presided over by the President, Mr. Walter Hills, there were seven spur tables, presided over by Mr. C. B. Allen, Mr. Isaiah Bourdas, Mr. R. Hampson (Treasurer of the Pharmaceutical Society), Mr. G. T. W. Newsholme (Vice-President of the Pharmaceutical Society), Mr. R. Bremridge (Secretary of the Pharmaceutical Society), Mr. R. A. Robinson, and Mr. G. S. Taylor. The following is a complete list of those who were present :—

"The Health of the Queen" having been duly honoured, the President proposed "The Houses of Parliament." He said all would agree that the House of Lords had often acted in the interests of the nation, though the difference between the two chambers was, as he heard remarked by an Honourable Member the other day, that the House of Lords had little to do and did it, whilst the House of Commons had too much to do and didn't do it. Just at present it could not even pass the Pharmacy Acts Amendment Bill, but nevertheless they would not find fault with it, and he must say he had been much struck lately by the courtesy with which members of the House attended to the calls made upon them by their constituents, and others, and the diligence they displayed in carrying out their public duties. Their thanks as pharmacists were specially due to those members of the House of Commons who had given their aid to the Pharmacy Acts Amendment Bill, several of whom he was glad to see present. Their thanks were specially due to the Hon. W. F. D. Smith, the introducer of the Bill and member for the constituency in which they were dining. When he asked him to undertake the duty of introducing the Pharmacy Bill, he, after a few days' consideration, said he would do what he could, and they were not only grateful to him for what he had already done, but for what he would yet do in that connection.

Mr. W. F. D. Smith, M.P., in response, said he once heard it said that no one ever responded for the House of Lords without making excuses for it, but he really thought that was unnecessary. With regard to the House of Commons, he thought of late years the inventive genius of members had largely increased, and it was quite certain that private members had but little chance of passing any measures in which they took an interest. The Pharmaceutical Society had only suffered in this respect in common with others. Still, their Bill had gone further than 90 per cent. of private Bills, having passed the second reading and reached the Committee stage; but, unfortunately, even there it was equally open to obstruction. Still, there was a chance that those who opposed, on mistaken grounds as he thought, might be absent some evening when it was put down—and it would be put down as often as possible; but even if it were not passed this session, arrangements might be made to get as many members as possible to ballot for a place next session, so that it might have a good chance of being pushed through then. Apart from that particular Bill, the House of Commons he felt sure deserved and would always receive the esteem and respect of the country.

The Vice-President (Mr. Newsholme) next proposed "The Medical Profession." He said the benefits they rendered to the public were enormous, their energies being always exerted on behalf of suffering humanity, and no one knew that better or appreciated it more than pharmacists. They were all glad to see the way in which the General Medical Council had of late been upholding the dignity of the profession by putting a veto on unqualified practice, and he wished the Council of the Pharmaceutical Society had the same power, for it would be of immense service to the public. If the Council had more influence with the Government and the public departments, such as the Local Government Board, they would not have seen the office of dispenser under the Poor Law degraded as it had been by being thrown open to anyone who had served a certain time in the Army and who passed a very insufficient examination. He begged to couple with the toast the names of Sir Walter Foster, M.P., and Mr. Thos. Bryant, President of the Royal Medical and Chirurgical Society.

Sir Walter Foster, M.P., in responding, said the profession to which he had the honour to belong and that of pharmacy were closely allied, in fact they were two branches of one great craft

whose object was to serve humanity and the public. In the efforts of physicians to ameliorate suffering, pharmacists were their advisers, and prepared their remedial agents, which were effective or non-effective according to the skill displayed in their preparation. They went on watching the great war which the medical profession waged against disease; they were continually grateful for the opportunities which pharmacists gave them of making the potions they prescribed more palatable and more efficient. As time went on he hoped the General Medical Council would rely more and more on the Pharmaceutical Society for guidance and assistance in the preparation of the Pharmacopœia. During recent years they had had the assistance of Professor Attfield and also of a Committee of that Society, which he trusted would in future be more closely allied to the General Medical Council in that matter. He agreed that the position of Poor Law dispensers ought to be made more satisfactory, and that their qualification should be one sanctioned by that Society. With regard to the Bill, he should be glad to assist his honourable colleague in passing it, and had no sympathy with the persons who, for reason other than the general good, wished to interfere, on commercial grounds, with the rights the Society possessed. He thought the interests of the public required to be safeguarded in all legislation of this kind. The Vice-President had uttered rather a plaintive note with regard to unqualified practice which found an echo in the heart of every medical man, for they had every reason to wish, in spite of recent developments, that such practice might flourish less vigorously. Whenever he took up a daily paper he saw columns of advertisements with reference to certain remedies by some person hailing from America or elsewhere, who by divine inspiration probably were qualified to cure any kind of disease, and he felt that as much in the interest of the chemist as of the general public that kind of thing ought to be stopped. He hoped, however, as education became more general and more scientific, people would be less led astray by the blatant advertisements of persons who had no right at all to act as curers of disease. Both professions had succeeded to a noble heritage, which he was quite sure they would honour and maintain as years rolled on, and both would co-operate to promote the health, wealth, and prosperity of the country in which they had the privilege to live.

Mr. Thomas Bryant, F.R.C.S., said he was always pleased to return thanks for the medical profession, recognising the benefit it was to the public in the way of prevention, relief, and cure of disease, and also the happiness which every man who practised it in a scientific way derived. As a profession it was a noble one, though as a business it was a poor affair; but if they conducted it as the majority did, on the right lines, it gave a considerable amount of pleasure. He was very pleased to hear this toast given by such a body, who knew so well what were the requirements of the physician, and he liked to express his feeling of the good work that the Society had done in helping the General Medical Council in bringing out the Pharmacopœia. They could not but feel that there was so much energy and push in the Pharmaceutical Society that many of the younger members of his profession must be a little scared as to what was right to do. The Pharmacopœia was full of recipes and prescriptions, whilst every post brought them some circulars or letters suggesting preparations which were not in the Pharmacopœia, and many forms of prescription which were unknown; in fact, life would hardly be long enough to attempt to try one-hundredth part of these beautiful preparations they were asked to experiment with. He thought it would be much better for medical men to learn to use fully the materials provided in the Pharmacopœia before going outside it, as they were tempted to do by those seductive influences. He was pleased to hear the remarks made by the Vice-President with regard to the General Medical Council and its work. That Council was much hampered by the Medical Acts, but still he believed they could do more than some supposed in preventing the spread of unqualified practice. He was glad to see that what had been done in this way had been appreciated, and he would point out that there was no real ground for grievance on the part of unqualified men, as they would still be entitled to do useful work so long as they acted under the responsibility of a fully qualified practitioner.

The President then proposed the toast of "Science" which had been defined as the mirror of truth. It was now very popular, and was taught universally, even in elementary schools, more or less satisfactorily, but it was well to remember that in all times it was the individual who would advance science, and not the age. Nowadays it was more difficult than ever to make great discoveries, because science had advanced in such a remarkable way that it required an immense amount of knowledge in any particular department before one could surpass what had been done before. Science was always popular in such an assembly as that, because pharmacy, if not a pure science, was an art which depended on science, and might be called an applied science, and pharmacists in the past had contributed in no small degree to its advancement. With such names as Scheele, Pelletier, Dumas, and others who had worked in pharmacy and had also made great discoveries in chemistry, they would all agree that pharmacists had done something for science. In their day they had had many of whom they had been proud who had also advanced science in one direction or another, such as Henry Brady and Daniel Hanbury. The branch of science to which they were most closely allied was chemistry, and he was glad to see many of the representatives of that science present. But he would couple with the toast the name of Professor Dewar, whom they would all congratulate on having in the last few days produced an appreciable quantity of liquefied hydrogen. He had grave doubts whether that substance would ever be prescribed by recognised practitioners, but if it should be, it was well to know where they could apply for it.

Professor Dewar, in responding, said if they eliminated from science the services of Scheele and Liebig it would be very poverty-stricken, not to mention the work of many other men. Chemistry, and indirectly physics, had been not only immensely benefited, but had derived some of its greatest impulses from members of the pharmaceutical profession. As science developed the complexity of pharmacy increased enormously, and one had only to look at the *Pharmaceutical Journal*, so admirably conducted, and so excellent as a condensation of the progress in organic chemistry, to see the enormous strides which were being made from day to day. The chemist would always confess that he was as much indebted to pharmacists as to any other body of men, and looking back to his early days in Edinburgh, he could not but think, not only of the useful information he received from a Smith and a Macfarlane, but of the kind way in which those firms and others were accustomed to supply both material and information to youthful students, who would otherwise have found great difficulty in carrying on their work. He sometimes thought it a pity that this country had to a large extent ceased to cultivate that branch of organic chemistry which was connected with the physiological action of medicines. This was largely due to indirect causes and prejudices. He remembered studying the physiological action of the quinoline bases, in conjunction with McKenrick, but before going far they found it would be necessary to have a supply of dogs. They accordingly advertised for some useful cats and dogs, but unfortunately the advertisement appeared as "wanted some useless cats and dogs," and it led to such an outcry and panic that their researches had to be abandoned. This work had now therefore largely passed into the hands of German physiologists and chemists. The President had very kindly mentioned some matters connected with his own work, but the importance of that must not be exaggerated. There was a great difference between the credit of a discovery and the credit of the discoverer, who was simply pursuing investigations upon well-known lines. The experiments of the kind referred to involved an enormous expenditure of money, and he should hardly like to say what they had cost the Royal Institution; in fact, such experiments would be impossible in any other country, except by Government aid. That work had been entirely the result of contributions of the personal friends of science, and he had only been the instrument in carrying it out.

The President then proposed "The Pharmaceutical Society of Ireland," which he described as the sister Society, and took occasion to remind the members of the approach of the Conference in Belfast, when he was sure all those who could be present would receive a most hearty welcome. He coupled with the toast the name of Mr. R. J. Downs, the President of the Society.

Mr. Downs responded, but, unfortunately, his remarks were largely inaudible. He was understood to refer to the question of trading by limited companies, and to suggest that something might be done to put a stop to it, if it were pointed out that companies could only be formed for lawful purposes, and that it was not lawful for unqualified persons to deal in poisons in England, or to make up prescriptions in Ireland.

Sir J. Crichton Browne, F.R.S., said he rose with some trepidation to propose the toast of the evening, because when he took part in their proceedings some few years ago he had subsequently had sent to him a copy of the *Pharmaceutical Journal*, in which a hint occurred that the speeches at the dinner were commonplace and

contained nothing particularly new or brilliant. He was under the apprehension that the same stern critic might be lurking somewhere in the room that he had come not merely as a critic of dietetic delicacies or vinous stimulants, but of scientific and rhetorical novelties, and that he might again have to send them empty away, and incur his further censure. After cudgelling or triturating his brains, he could not think of anything sensational to announce, or any startling paradox which would be appropriate to the occasion. It was true that he was privy about eight days ago to a great new original scientific achievement, of which they had heard something that evening, the liquefication of hydrogen and helium by Professor Dewar, one of the greatest scientific advances of the age, but although that was performed by a chemist and carried out in a laboratory, it was scarcely of practical import to pharmacists, for as hydrogen and helium became liquid at about −240° C., and at that temperature the tissues of the body would be shrivelled up, he was not in a position to indicate their therapeutic uses, though he should not be at all surprised if he saw them advertised very shortly in the tabloid or soothing syrup form. In his sense of vacuity, however, he was consoled by the reflection that the stern critic was altogether wrong, and that when they met on such occasions they did not seek intellectual effort so much as emotional complacency; they came not for the feast of reason, but for the flow of soul, and he was quite certain he should not be wanting in a flow of soul in proposing prosperity to the Pharmaceutical Society, a Society which had rendered signal services to its members and to the public at large, and was the right hand of the profession to which he belonged. The art of the pharmacist was very old. The medicinal instinct was of enormous range, extending from the harmless necessary cat that partook of grass up to the author of the *Novum Organon*, who used to regale himself daily with a dose of nitre. It stretched back as far as history could penetrate, for there could be no doubt that the Chinese were largely addicted to drugs a thousand years before the Christian era. It was probable there was a Pharmaceutical Society in Thebes, the records of whose proceedings were to be found in the Papyri. It was certain that the Temples of Æsculapius in Greece were simply druggists' shops, and the priests and priestesses who guarded them compounded remedies and gave directions for their application. Aristophanes mentioned with what avidity, dexterity, and promptitude they swept into their pouches the offerings on the altars, which must be regarded as equivalent to the counters of modern times. But the art, although of great antiquity, had not made much progress until comparatively recent times. Amongst the Romans it was stagnant, in mediæval ages it was mixed up with alchemy, black magic, and superstition; in modern times it had been somewhat retarded by the ignorance and incompetence of those who had pretended to practise it. It was only since the light of chemical and physiological science had been let in upon it—only since the Pharmaceutical Society had taken it in hand, that it had grown apace and assumed comely proportions. It is only since the year 1841, when a group of practical far-seeing men founded that Society, that pharmacology had become a fine art, and that it had obtained the recognition to which it was entitled. It would be difficult to exaggerate the value and importance of the work done by that Society in improving the education of those who practised pharmacy and in protecting the interests of chemists and druggists, and thereby of the public at large. It had greatly advanced their social position. It had provided a means of education, and improvement in libraries, museums, and laboratories; it had organised a system of education that added something of the breadth of a university to the precision of the shop; it had endowed scholarships to encourage research, and it had subsidised a Journal which, notwithstanding its rough handling of after-dinner speeches, he must admit to be able and instructive, and it had established a fund for the relief of distressed members of the craft. In all departments it had been vigilant and vigorous, and there was no abatement of its activity to-day, for he believed it was still grappling with the problem of education, and was promoting a Bill before Parliament to correct some anomalies of the Pharmacy Act. With reference to the promotion of that Bill, he recalled a remark once made to him by an honourable member of their profession, the late Sir Richard Quain, whose recent death they all deplored. He said the chemists and druggists of this country were a very powerful body of men, much more powerful than anybody suspected—even themselves; that in every town and village in this country they exerted an influence much more wide spread than the aromatic fragrance which their shops diffused upon the street. The chemist as a rule was a man above the average intelligence; he had always, at any rate, a smattering of science, and he was an intelligent man and was regarded by the people as having some mysterious powers. The best men in the place were glad to drop in and have a word with him, and long political questions were discussed and thrashed out and settled in a druggist's shop or the back parlour adjoining. There was a great deal of truth in that remark, and he felt sure that if the chemists and druggists would only exert the influence they possessed, the Pharmacy Bill would pass in spite of the block which might be put upon it. It would be superfluous to say that the Society had the goodwill of the medical profession. They were both striving for the relief of human suffering, for the preservation of health, for the overthrow of disease, and the postponement of death, and there ought to be no jealousy or misunderstanding between them, but only co-operation, mutual support, and sympathy. There ought to be no difficulty in dividing their respective spheres of influence. He believed there was still a hinterland about which the dispensing doctor and prescribing chemist disputed, but with a little forbearance and mutual goodwill there ought to be no difficulty even about that. As an instance of co-operation he might also refer to what had been already mentioned, the great new Pharmacopœia. They were meeting under a new dispensation. They had a revised version of their testament and their sacred cabalistic writings, the Pharmacopœia, and in that protracted work the members of the pharmaceutical profession had co-operated with medical men. He would venture to congratulate their President, Mr. Carteighe, Mr. Newsholme, Mr. Cross, Mr. Martindale, and their colleagues on the excellent assistance they had given. Perhaps an uninstructed layman glancing at the new Pharmacopœia and comparing it with its predecessors might not be altogether satisfied; he might regret the disappearance of some fine old crusted tinctures, the essence of peppermint and the syrup of poppy dear to his youth; he might even boggle at some of the new introductions, such as india-rubber, liquid paraffin, and solution of coal-tar, imagining that he was expected to swallow them. But those who looked at the new Pharmacopœia with discerning eyes would recognise in it an enormous advance in scientific method and in confirmity of treatment. It would serve its time, but it would not be the last pharmacopœia. Disease did not stand still. Who could say what new virulence pathogenic microbes might put on? Who could say that, when the existing pathogenic microbes were crushed and banished, as some certainly would be before long, that others more virulent might not take their place? And who could say what new powerful agents, toxins, ferments, and animal extracts modern science might not place in the hands of the physician. The resources of pharmacy were not exhausted, and, notwithstanding the quest of ages, there still lay in the lap of Nature good gifts ready for their acceptance if they would only gather them. In the words of Friar Lawrence:

> Oh, mickle, is the powerful grace that lies,
> In herbs, plants, stones, and their true qualities.
> For naught so vile that on the earth doth live,
> But to the earth some special good doth give.

The Pharmaceutical Society had a worthy history, and it had had a series of worthy presidents, but he did not think it had ever had a more worthy President than the gentleman who now occupied the chair. Mr. Hills had hereditary claims. He was the nephew of Mr. Thomas Hyde Hills, one of their benefactors, to whom he looked back with feelings of gratitude for much personal kindness when he first came to London, a raw Scotch youth, some third of a century ago. He was also the lineal successor of Jacob Bell, the Founder of the Society, and beyond all that he had great personal claims. He was exceedingly zealous in looking after the affairs of the Society, as he knew to his cost, for not long ago he pursued him all over London in a hansom cab to extract from him a promise to deliver an address next autumn, He therefore asked them to drink with great cordiality "Prosperity to the Pharmaceutical Society, and the Health of the President."

The PRESIDENT briefly responded, saying he would not speak at any length then, as he should have occasion on the following day to deal with the work of the Society.

The TREASURER, Mr. R. Hampson, then proposed "The Guests," coupling with the toast the names of Dr. Farquharson, M P., and Professor Clowes, President of the Society of Chemical Industry.

Dr. FARQUHARSON, in responding, said he was so much at home there that he almost felt uncertain whether he was guest or host. He had always taken care to avoid as much as possible personal contact with the products of his friends the pharmacists, though he had no hesitation in prescribing them largely for his patients when he was a practising physician, and since he had the honour of lecturing at St. Mary's Hospital on materia medica the action of drugs and the way in which they were prescribed had almost as much interest for him as politics, to which he now devoted himself. Referring to the Bill in Parliament, he said he should do his utmost to assist in getting it through, and hoped that some occasion might arise when its opponents would be absent. He humorously suggested that the Society should give another dinner to which all his opponents should be invited, when perhaps even the redoubtable Dr. Tanner might be won over. He also recommended pharmacists each in their own sphere to bring pressure to bear upon their respective members, who, he might remind them, were very squeezable. He believed the opposition mainly arose from misapprehension, and perhaps to some extent from sheer cussedness.

Professor CLOWES also responded, and said that the present occasion carried him back to a period recently terminated, when he was connected with one of the larger provincial centres of education, where a provincial Pharmaceutical Association started, some fourteen or fifteen years ago, a very capital system of instruction in connection with the local University College in which he had the honour to be the Teacher of Chemistry. It had been his privilege, therefore, to undertake the chemical education of a large number of young men who passed successfully the examination at Bloomsbury Square. He always looked back to that period with great pleasure, and hoped that he might be considered even more or less a representative of that very enterprising Association at Nottingham, which was the pioneer body in connection with the scheme of provincial pharmaceutical education. At the same time he had the honour to represent a Society which in a large sense was kindred to their own, the Society of Chemical Industry, which he was glad to say was in a very flourishing condition, having now over 3000 members.

During the evening an excellent selection of vocal music was charmingly rendered by the Calliope Vocal Trio (ladies), accompanied by Mr. Harold Jenner.

PHARMACEUTICAL SOCIETY.

MEETING OF THE COUNCIL.

WEDNESDAY, MAY 18, 1898.

Present:

MR. WALTER HILLS, PRESIDENT.

MR. G. T. W. NEWSHOLME, Vice-President.

Messrs. Allen, Atkins, Bateson, Bottle, Carteighe, Cross, Grose, Harrison, Martindale, Park, Savory, Southall, Symes, Warren, and Young.

Several members, associates, and students who had paid their subscriptions since April 30 were restored to their respective positions.

The Council having arranged the order of business at the Annual Meeting, adjourned.

ANNUAL MEETING.

The 57th Annual Meeting of the Pharmaceutical Society of Great Britain was held on Wednesday, the 18th May, at Bloomsbury Square, the chair being taken at 12 o'clock by the President, Mr. Walter Hills.

The SECRETARY read the notice convening the meeting, and the Annual Report was agreed to be taken as read.

The PRESIDENT then said: I rise with great pleasure to move the adoption of the Report, and I feel sure that you will not hold that the amount and value of the work accomplished by the Council during that period of twelve months should be judged by the length of the Annual Report or by the number of paragraphs it contains. I mention this because the fifty-seventh annual report now submitted is somewhat shorter than some of its predecessors, and probably on that very ground may be all the more acceptable to many members and associates of the Society. The reporting, not only of the immediate proceedings of the Council, but also of all that is of interest to pharmacists, is now done with such speed, efficiency, and completeness that it is felt to be wise to concentrate the Council report as much as possible. Whilst on the subject of reporting, I am reminded that at times there are wailings on the part of our journalistic friends that our proceedings are dull, because we are in the habit, at the Council, of settling many of our little differences of opinion beforehand in committee, and afterwards exhibiting, in public debate, that practical unanimity so distasteful to journalism. I am one of those who believe that the amount of work accomplished by public bodies is frequently in inverse proportion to the length of their public discussions, although I am quite ready to admit that there are occasions when public debates are highly desirable. It must be remembered that our duties as members of this Council are largely administrative, and those duties often require a considerable amount of deliberation in committees, and it is in those committees we usually come to a general agreement on matters demanding much consideration, but not involving important questions of principle. In speaking of matters which may be said to belong to the domain of pharmaceutical politics, I may remind you on the subject of the alteration of the Bye-laws, as well as on that of the Pharmacy Acts Amendment Bill, to both of which allusion is made in the report, that there has been a remarkable unanimity in our deliberations.

THE SOCIETY'S FINANCIAL POSITION.

The first subject to which I would call your attention for a moment is that of finance, and I am bound to admit that according to the financial statement before you the expenditure appears to be in excess of the receipts. My regret is not that so much has been spent, but that the receipts have been scarcely sufficient for our needs. If you take the trouble to examine in detail the figures in the statement and compare them with those of 1896 you will find that while the subscriptions have remained about the same, the examination fees have been considerably less. This reduction is partly accounted for by the alteration in the Bye-laws which came into force last year, making the fee for all repeated entries for the Minor examination a uniform one of three guineas, whilst the advanced fee for that examination will not be paid until 1900. But on the expenditure side the figures are in most cases lower than in 1896, although there are exceptions, and those are, I believe, justified by special circumstances. There is only one to which I would call attention for a moment as an example of those, and that is the seven years' premium for insurance, which, of course, does not appear every year, and that amounts to £268. With reference to the Journal, the net cost of which has been considerably reduced, I may remind you of the following paragraph in the 1896 report. "It is satisfactory to note that the anticipations of the Council with reference to the reduction of the balance on the Journal account have been well founded, and it is confidently hoped that the improvement will be continued." The balance exclusive of postage, was in 1895 £2761, which was abnormally high for reasons already given very largely in detail by my predecessor, and for 1896 it was £2229. It has now fallen in 1897 to £1978, thus justifying the remarks I made twelve months ago, when I said that in 1897 there would be a further considerable reduction of net cost. Whilst on the subject of finance, I should like to say that the Council has recently decided, on the advice of a chartered accountant, that the method adopted for keeping the books shall be so modified that the accounts shall be submitted to the auditors in a form more in accordance with general custom. It is proposed that next year a revenue account, taking into account the separate assets and liabilities at the end of the financial year, and also a balance sheet shall replace the present financial statement. I do not propose to speak in detail of this fresh departure, as I feel sure that it will meet with general approval, and it will be more intelligible when practically placed before you twelve months hence. It is satisfactory, however, to find that in the revenue account of 1897, prepared according to the new method to which I am alluding, our income exceeds our expenditure by about £160, the explanation of the apparent difference between the financial statement we now present and the one which we have on the premises, being that our assets as now reckoned were considerably in excess of our liabilities at the end of the year. I may mention that that is the case specially in regard to the Journal account, because we pay everything practically for the Journal by cash, whereas at the end of the year there is always a very considerable balance in our favour arising from

advertisements for which payment is not made for some months after date. I may add that the Council has also decided, by means of leasehold redemption policies paid annually, to create a sinking fund of something like £25,000, payable at the expiration of the leases now held by us, of property in Bloomsbury Square and Galen Place.

The Amended Bye-laws.

Having said so much on finance, I feel that there are several paragraphs in the report to which I need not call your further attention, but there are one or two on which I should like to say a few words. In the first place, I should like to refer with satisfaction to the fact that the amended Bye-laws, to which reference was made last year, and which were considered at a special meeting of the Society after the Annual Meeting twelve months ago, have now been approved by the Privy Council, and I think it is a matter of very great satisfaction that these Bye-laws have been approved. I think the alteration that would be effected by them is one which we may express our unqualified satisfaction. I think it is well that every body of men should endeavour to advance their calling in every possible way, and I think that in no way can we do that better than by providing means for testing that the general education of those who shall come into our craft hereafter shall be up to a fairly high standard. I am very glad to think that those amended Bye-laws have not only been approved by the Society, but have been since confirmed by the Privy Council, and will come into force in two years' time. You will recollect that the opposition was not one of a very terrible character, and I believe it had no general backing behind it, but I am glad to think that in this matter at last we shall have practical unanimity in the desire to provide for the future a body of men who should have a good sound education, and such an education as would enable them to pass with greater ease and facility the subsequent qualifying examination.

Legal Matters.

With regard to the legal paragraph, I do not think I need detain you by speaking at length on the subject of prosecutions. They do present to us a very great monotony, they are not very interesting as a rule, but there is one case to which we have thought it right to call special attention, namely the case which was heard before the County Court Judge at Reading, where the sale of weed-killer containing arsenic sufficient to poison 2000 persons was virtually admitted. The point about that case is this, that although it was decided against us in the appeal on the question of fact, to which it is unnecessary to allude, it was doubtful, according to the judgment of the County Court Judge, whether a partnership was not on the same lines as a corporation. We felt that we must appeal against that decision, or we must have some further light thrown on that doubt in the mind of the County Court Judge. We therefore appealed to the Court of Queen's Bench, and although, as I say, we lost the case on a question of fact, we did gain our point, and were told distinctly by both the learned judges that in so far as all points of public interest were concerned we had succeeded, and it was laid down very clearly by them that under the Pharmacy Act a master, whether a member of a partnership or not, is liable for offences committed by his servant if there is reasonable ground for supposing that such servant was acting under the ostensible or implied authority of either of his masters. The other legal cases, as I say, have a certain monotonous character, but I should like to say one word about what is, I am afraid, a too common practice in this country, of having branch shops under the management of unqualified assistants. I do protest most strongly against this. I think it is a scandal, and it is a matter which really is of very great importance. We ought to put our own house in order, and if we do so we should go with more confidence to Parliament or to the Courts for anything we may want in the future. There is a great deal of this, gentlemen, I am afraid, and there are many cases in which we have had to take proceedings during the past twelve months which have been of this character. I do hope that anybody who may take the trouble to read my words will consider very seriously what their position is in engaging unqualified assistants to have full control of branch shops.

Parliamentary Progress.

Now with regard to the Parliamentary paragraph. That is the one in which, perhaps, I take most interest at the present time. You will recollect that I said last year that "As far as I know the opinion of the members of the Council, they are quite prepared to apply for Parliamentary powers to consolidate the Society by the election to membership of all chemists and druggists"; I also added that "In this, as in all other changes which the Council might from time to time consider to be beneficial for all who practise pharmacy, it is well to remember that unless we are ready at all times to sink individual differences for the common good, very little progress can be expected." Soon after we met in October the Council came to the conclusion that it would be advisable to apply to Parliament for power to make associates eligible for membership, and to introduce into Parliament a simple Bill with that for its chief object. The Council was quite unanimous in this matter; the Bill was drafted, and was then left largely in my hands to get introduced into Parliament. I may mention, though perhaps many of you know it, that there is great difficulty in getting private Bills through the House of Commons at the present time, and there are three general methods by which such Bills can be brought forward. The first way is to get the Government to support the Bill, and if that is done it is quite possible that success will be attained; but with a Bill such as the one we are speaking of it was hardly likely we should get the Government to take it up. There is a second method, that of the ballot, but the chances are about twenty-five to one against getting the Bill introduced at all under that system. But, as Mr. Smith told us last night, it will be possible and advisable, supposing we are not successful this year, that we should get members of Parliament throughout the country to allow their names to be associated with this Bill, so that we may have a large number of chances in the ballot for the ensuing session. We want a large number of members to say they will place their names on this Bill, and if we get perhaps 100 or 150 or 200 members to do so, we shall stand a fair chance of getting within the first dozen Bills, and then we shall perhaps have an opportunity of getting the question discussed before the House. In this session we introduced the Bill as an unopposed one, and that means that there can be no discussion whatever upon it, either at any of the readings or in committee. The Bill was introduced in February, and I think the second reading was successfully passed on March 7. Since then we have been hung up. We have been hung up principally by the opposition of one honourable member, although I am bound to say that there are one or two other amendments placed on the agenda of the House of Commons by other members at the present time. Still, I believe the opposition with which we have to contend comes mainly from one source, and that is on the part of Mr. Alexander Cross, member for one of the divisions of Glasgow. Now, I think that Mr. Cross's chief opposition and chief amendment is one dealing with something that is not germane to the Bill at all. It is quite evident that our Pharmacy Act of 1868 is somewhat of a composite Bill, that is to say, it not only regulates our internal arrangements, but it is also a poison Bill regulating the conditions under which a schedule of poisons shall be retailed to the public. In the Bill which we are submitting to Parliament we are only attacking one portion, that is to say, that portion which concerns our own internal regulations. We are not taking up this great question at all as to whether it is desirable that there should be any alteration in the conditions under which poisons shall be supplied to the public. Now, Mr. Cross has recently written a letter to the Highland and Agricultural Society of Scotland, in which he makes many serious misstatements. I do not say for one moment that he makes them wilfully, but he certainly does make misstatements, and I think attention ought to be called to that, because he does not seem to realise that there is a great difference between the qualification required by the Pharmacy Act in order that a man may have the right to retail these poisons, and the membership or associateship of a voluntary society; for instance, he says in this letter that under the Act of 1868 two orders of members of the Pharmaceutical Society were constituted, members and associates, with a separate examination for each. So far as I understand, under the Act of 1868 members and associates with a separate examination for each were not brought into existence by the Act at all; they were already in existence. Then he says, later on, that certain poisons were scheduled in that Act, and those poisons and any articles containing them in however small a proportion are only allowed to be sold by members of the Pharmaceutical Society. That is not the fact at all, a man may sell poisons without being a member of the Pharmaceutical Society or without being an associate. Then he goes on to say that the Society is entrusted with the prosecutions directed against persons who may sell such preparations

without being members of the Pharmaceutical Society. We have nothing to do with the question whether a man is a member of the Society or not. It is merely a question of whether he is on the Register; if he is, he has a right to sell. Then he goes on to say, "Presently sheep dips are sold at an enormous profit, and new sheep dips can hardly come into the market to compete at lower prices because of the licensed pharmaceutical chemists, who are all engaged with the older brands, and do not want any competition." Surely there are enough licensed pharmaceutical chemists or chemists and druggists who would be willing to take up Mr. Cross's or any other maker's articles if they were likely to be in greater demand than those they already had. And surely, gentlemen, there is enough competition in the present day to supply Mr. Cross with plenty of means for introducing any of his new preparations. I cannot see why registered persons should not be found in every district who would be willing—assuming the preparations are good for the purpose for which they are made—to be the means of supplying them to the public. Then he speaks of the accidents which are likely to arise, and says they are as likely to arise after the sale by a qualified person as by an unqualified. He says, "I do not think that this is likely, but if it is the case it is surely obvious that the mere fact of having been sold by a pharmaceutical chemist does not render the accident less likely to occur with a farmer or gardener than if that article had been sold by a seedsman or ironmonger." I agree with that up to a certain point, but I say that the ironmonger or the seedsman is much more likely to sell one of these dangerous preparations without thought or hesitation than the man who knows the terrible nature of what he is selling, and you would therefore lose very largely the security to the public. I suppose we are the only traders who send people away unsupplied with what they came in for. Continually we are doing it; continually we are sending would-be customers away either with nothing at all or with a very small amount, when they were willing to pay for a large amount of something. That is our duty, and that is one of the securities the public possess, in being obliged to come to registered persons for a supply of such terrible things as those to which reference is made in this letter. I think, therefore, that the security is a very important one, and one which should not be disregarded. Then he says at the end of his letter that the technical position is "that a few agricultural members and myself have blocked the Druggists' Bill, which has for its object apparently some desire to ease the examination for members of the Pharmaceutical Society." That is the class of opposition which we have from Mr. Cross. Now Mr. Cross at the present time is waiting for the appearance of a Bill which was promised some six weeks ago by the Home Secretary—in reply to a question put to him in the House of Commons—a new Poisons Bill which the Privy Council were likely to introduce before long. Until that Bill is introduced of course we have no right, and it would be quite out of place to discuss it or any principles which it is likely to contain, but, judging from the past, I think it very improbable that any Poisons Bill which may be introduced by any Government will contain any clauses which will upset the present arrangements in so far as they concern the poisons in the present Schedule. No Government probably would be bold enough to suggest that the poisons which are now in the Schedule—especially those which are largely used for horticultural and agricultural purposes, to which I alluded just now—should be taken out of that Schedule and be allowed to be sold retail by any persons other than those who are specially educated and qualified for that duty. Of course, when this Poisons Bill is introduced—as it will be perhaps this year, perhaps later—it will be considered very carefully by all registered persons and considered by them, not only as persons directly interested as it were, but as members of the great general public, and bearing in mind that, after all, all legislation is ultimately—or is, at any rate, intended to be—for the public good, I hope, therefore, that when this Bill is introduced we shall all consider it very carefully, but I shall be very much surprised if any new principle is introduced, because I think it would be a retrograde step, and one which no responsible person would be likely to support, that such poisons as corrosive sublimate, arsenic, and the poisonous alkaloids should be sold retail by any other persons than those who know the terrible nature of those articles. With regard to our Bill itself, Mr. Cross's amendment still stands, but we hope that we may succeed in getting it through Committee this session. Those who were present at the Dinner last night heard Mr. Smith's opinion of the Bill, and here I should like to say how much we are all indebted to the Hon. W. F. D. Smith for the support he has given to the Bill, and for the personal interest he had taken in it. I believe I am right in saying that Mr. Smith did not know much about us three months ago, but I am afraid he knows rather too much about us for his own personal comfort now. I know he has given a considerable amount of time and attention to the matter. He is very much respected in the House, and I am sure we cannot have a better representative in furthering our interests. As you know we were able to get also the support of several other members, whose names are mentioned in the report, who were good enough to allow their names to be placed on the back of the Bill, but we have met with support from a large number of members of Parliament also. I am glad to say that there has been evidence of that support on the part of a very large proportion of the members. It is not want of support we are suffering from, gentlemen, we have plenty if we could only be heard, if we could only get the question discussed. Under the conditions under which we are working it is necessary that there should be no opposition, and the opposition of one person, if maintained, is sufficient to spoil our chances for the present year, I am afraid. Here I should like to say how much I and the Council feel indebted to the local secretaries for the admirable way in which they have helped us in getting support in the House of Commons for this Bill, and I am glad to see that there is a paragraph in our annual report referring to this good work, saying: "The Council recognises and appreciates this loyalty and devotion to the interests of the Society." I am sure they mean that thoroughly, and I know perhaps more about it than anyone else. I have been much struck by the amount of interest taken in our Bill by the hon. members of the House of Commons. We were told last night that members were very squeezable. One unfortunate thing that we have to contend with is that we have not many registered persons in some of the districts represented by those hon. members. I am sorry we have not more influence that we could bring to bear on the hon. member for Camlachie, but I believe the Glasgow chemists are almost entirely—I think now without any exception—in favour of the Bill. I forgot to mention that in the preliminary stage of this Bill soon after its introduction we did have to face an opposition from Manchester. That opposition was finally disposed of, and I am glad to be able to publicly thank those who did, after consultation, see their way to remove their objections to the Bill. But I am also bound to say that, as far as I can judge of the matter, that opposition in its early stage was very detrimental to the progress of the Bill, and I believe that in those early days if we had been thoroughly united—as I said twelve months ago it was very important we should be in any matter of this kind—we should have made much better progress, and that we might possibly have already got the Bill not only through the House of Commons, but through the House of Lords. However, it is no use to cry over spilt milk, but I am bound to say now at the present time, as far as I know, there is no organised or unorganised opposition from our own people in any part of Great Britain. So far as I know there is none. I am quite ready to admit, of course, that there may be certain individuals who may object to this Bill, but they have been loyal enough at any rate not to stir in the matter; they have bowed to the views of the majority, and have not in any way interfered or done anything to prevent the Bill becoming law. Therefore, I say at the present time we are united in our desire to see this Bill passed, and, gentlemen, I think we shall do it. If we do not do it in this session we will try to do so in the next, for I believe it is a measure of justice. I had no difficulty in explaining to hon. members of the House of Commons that it is really one which should meet with their approval, because it is giving to the men who have the statutory qualification which the Legislature has pronounced to be sufficient for the public protection, the opportunity of becoming members of this Council and of taking part in the Society's deliberations, and of so helping to guide the policy of the Society in the future.

The Work of Local Associations.

I am afraid I have kept you too long, but I should like before I sit down to say a word about local associations. They have been doing good work with reference to this Bill, and not only with reference to it, but in various other ways, and I am glad to recognise the work which the local associations are doing. There has been an evident stirring amongst what perhaps without offence I might call the dry bones, and it is very satisfactory to us who live in London and are members of the Council to feel that there is activity in different directions throughout the country, and as I have said on more than one occasion when I have had the opportunity of meeting those associations, and occasionally dining with

them, and I believe most firmly that whenever men come together in various centres to discuss matters of interest common to their calling that in the long run such association promotes loyalty to the Pharmaceuceutical Society, and therefore, I for one, and I am sure every member of the Council which I have the honour to represent, are very anxious that these associations should flourish, and we are glad to find that there has been such evidence of their prosperity during the past twelve months.

Now, gentlemen, I have already detained you too long. My journalistic friends suggested last year that I should not stick quite so closely to my notes, and I am afraid the result has been that I have been rather rambling in my remarks, but I must ask you to forgive me and thank you for your presence here to-day. I now formally move that the annual report and statement of accounts as published be received and adopted.

The Vice-President: I second the resolution formally. If it appears to be necessary I may make some observations upon it later on.

Mr. Campkin: Mr. President, I have to leave by an early train, but I could not leave without saying just one word with reference to the address you have delivered, and the action that you have taken during the past year as President of this Society. I am sure we are all of us the better for the work you have done during your year of office, if only in the position of a pharmaceutical missionary. I think if that position were followed more closely by yourself in future years I hope, and those who may succeed you, it would be to the advantage of the whole body of pharmacists generally. I am especially gratified by your allusion to the work done by the local associations, and I think if we had an aggregation of local associations throughout the length and breadth of the kingdom, the position, perhaps, of the Pharmacy Bill, to which you have alluded, would have been better understood by the members of Parliament than it is at the present time. For my own part, at an early stage, acting on instructions, I communicated with our borough member; I forwarded him a draft of the Bill and some printed instructions that were obtainable, and also explained the matter of the Bill to him, and received from him a very courteous reply stating that he would give it his best consideration, and what was better than that, he would place himself in communication with other members of Parliament. Now, sir, if that action had been taken by pharmacists generally, perhaps the assistance that is necessary to be given to a Bill in the House of Commons might have been greater than it has been. We who have had to do with Parliamentary Committees know the difficulties in the way of legislation, especially with regard to private Bills, but we did hope that in view of the small amount of contentious business that was likely to occupy the attention of Parliament during the present session, such a modest Bill as ours would have received the sanction of Parliament ere its close. But judging from your remarks, that does not appear to be likely. I have spoken of the fact that we feel it is a modest Bill, because it is one step in the direction which we ought to take, but only one step, for we all feel that in addition to that Bill something further must be done with regard to an amendment of the Companies Act for our own protection. That has been explained through the pharmaceutical press from time to time, and I need not dilate upon it. It is sufficient to say that even Parliament is waking up to the importance of legislation in that direction, but before we can make an impression upon Parliament in such a way as we should wish we must show that we are a united body, and therein lies the value of federation and association. We have within our Society an organisation which would encompass the kingdom very easily. When I point to the great associated friendly societies and the work that they have done during the past half century, the impression that they have made upon Parliament by means of their federated societies, I say that is only an example that we can well copy. Even as far back as 1870 special legislation in their interest was provided, and even now a commission is sitting or has been sitting, and will soon present a report, and previously to that another commission. More than that, members of the House of Commons are interested in measures that emanate from those societies, and they should not be as influential as a society such as ours. I simply mention that by way of proving how essential it is that we should be united. We have felt that by extending an act of justice to those members of our Society who do not possess equal privileges with some of us, those members who constitute the majority of the Society, we should be assisting in the right direction, so as to gather in the whole of the pharmaceutical body as members of the Society, and if we can get that, then I take it we shall be able to make a greater impression on those who govern us—I mean the Legislature. You, sir, have spoken of the practical unanimity of the Council upon the Bye-laws and upon this Pharmacy Act, but if we could secure practical unanimity among our members generaliy, our position would be much improved. But I am afraid that there is a good deal of apathy even yet, and it is because of that I have ventured to make the suggestion that if possible you and your colleagues should visit all parts of the kingdom during your terms of office in some way or other. Of course, you would not go unless by special invitation, but, I take it, what has been done will lead to a shaking up of the dry bones and an increase in the number of these local associations. I must not trespass any farther on your time, but I feel, however imperfectly I may have expressed these views, that they will be shared by all present, and I hope by many in various parts of the country. I hope that when we meet on another occasion we shall find that the Bill which is so much required will have become law. One word before I sit down with reference to a remark you made a week or so ago, because I think it is important. You pointed out the fact that all those who belonged to our body were not loyal to it, and I take it, sir, if those 150 qualified men to whom you alluded had been loyal to us and had been content to have accepted their present position with a view to an ultimate improvement in that position, it would have been very much better for them and very much better for the Society, and would have rendered such competition as that under which we are suffering at the present time impossible. As I pointed out a year or two ago, these qualified men do not consider their future in any sense. They appear to be willing to barter away their future position for some slightly enhanced present privilege. If they are an increasing quantity, what, first of all, is to become of them in their old days, and what eventually is to become of the trade as we now understand it? There is before everyone of us a prospect with fair competition, and with ordinary care and attention and assiduity to business, of at all events procuring a honourable livelihood, with some slight independence, perhaps, in old age, should we ever live to reach it, but if those of whom mention has been made are content to barter away their present position, the future then will loom out very darkly both for them and for those associated with the trade at the present time, for it is quite understood that there is no comparison after all between the personal interests of those who are associated with these great store-trading companies and those who are in the employ of private individuals with the possibility of opening up a business for themselves, as many thousands have done in years past. If we could only emphasise this and bring it home to those who are at present occupying the position of assistants in our body as they become qualified I think it would be not only better for them, but better for the future of pharmacy.

Mr. Leo Atkinson: Mr. President, although we are not able to congratulate you on the passing of the Pharmacy Acts Amendment Bill, I, nevertheless, can endorse those observations which fell from Mr. Campkin in relation to the actual work you have done and the very excellent report you have given us of the year's proceedings. The Pharmacy Bill, not unlike legendary tradition of Mohammed's coffin, appears to be in suspense, and although it might be premature to assert its absolute security, yet I do not think we are exactly in a position to condole, or rather express our sympathy to you, on its being irretrievably lost. There is much that is extremely instructive in relation to what has happened. We know very well that a large majority of chemists and druggists throughout the country have taken little, if any, interest in this measure; there is another very considerable section who appeared to be desirous of a much more forward policy, but now, I think, gentlemen, if there is anything more certain than another, it is this, and it is demonstrated, how absolutely futile it would be to attempt to secure any kind of ambitious legislation until we arrive, if we ever do, at a greater measure of cohesion and unanimity such as that Bill is specially framed to obtain. I am afraid it is beyond question that the opposition, or the initial opposition to this Bill, did really originate within what I may call a pharmaceutical circle. No doubt those gentlemen have been brought to a better frame of mind; but the mischief has been done, and if, as I am afraid is possible, it might be necessary to inquire at a later period who killed Cock Robin, I do not think we should have very much difficulty in identifying the sparrow. Now, sir, with regard to our Parliamentary

opponent, I do not really consider that he is open to quite so much censure. You must remember that the trump card was handed to him by our own men, and such an opportunity as posing as the champion of his own trade interest was rather too much for even that rigid virtue which you expect to find north of the Tweed. You have all read Mr. Cross's manifesto and his argument, and of course it is an old maxim that when you meet a Scotsman you meet an argument. His argument appears to be that since there is no technical skill required in handling sealed packages of arsenical preparations, therefore all restrictions should be removed from the sale of them. Well, gentlemen, that is a very plausible argument, and one which appears to have found some favour with those unsophisticated gentlemen who form the directorate of the Scottish Agricultural Association. But that argument, plausible as it is, tested by fact and history, is fallacious. It was the want of care that is exercised by responsible men which led to one of the most appalling disasters in the way of wholesale poisoning that is within my remembrance. The Arsenic Act of 1851 provided certain regulations for the sale of arsenic, but it was always felt that the efficiency of that Act was most seriously impaired, because at that date it was impossible to draw a distinctive line as to who was and who was not competent to sell. If any corroboration of the soundness of that opinion were required, it was only too fearfully vindicated in that lamentable calamity to which I have referred, which happened some time later. The Pharmacy Act of 1868, backed by public opinion, settled this question of the sale of arsenic, and the sale of similar dangerous commodities has, until the present time, been restricted to competent men. I do not think for a moment that Mr. Cross does seriously entertain the idea that Parliament would be guilty of such an outrage on common sense and public opinion and public security as to permit what would be practically free trade in arsenic and similar poisonous articles. With regard to the opposition from another source, I mean from that benefactor who is wasting his shareholders' money in disseminating splendid examples of lithography, it is needless, perhaps I ought to say bootless, to say anything. We can estimate the quality of the philanthropy from that source, but seriously I do not think that Mr. Cross, after our Scottish friends have opened his eyes a little better, would care to proceed in senseless opposition, more particularly as his only assistants appear to be the irrepressible Tanner and the unspeakable Weir. Now, sir, there is a little matter on which perhaps you may enlighten me. There seems to be an impression that in the event of this Pharmacy Bill becoming law, certain titles have been promised to those gentlemen who have withdrawn their opposition. Personally, I do not care if you furnish me with a title as long as the tale of a kite, but there is an impression abroad that something of the kind is intended. I do not myself attach very much importance to any number of the letters of the alphabet that a man may put after his name. There are many excellent chemists who do not use F.C.S. after their names, and there are some very indifferent ones who do. I know also that there are gentlemen who are perfectly entitled to use F.Z.S. after their name whose knowledge of zoology and comparative anatomy is limited to the daily experience of the dinner table. But if any one does really want a nice taking title, and a cheap one, for five shillings per annum they can buy a full-blown P.A.T.A., and I owe Mr. Glyn Jones a cheap advertisement, because I notice with considerable satisfaction and pleasure that he has refrained on this occasion from interfering with Parliamentary politics. If you will grant me your forbearance for one minute longer I should like to refer to some observations that I made on the Poisons Schedule at the last annual meeting. I pointed out on that occasion that notwithstanding the enormous increase in poisonous drugs the present Schedule has remained practically unaltered for nearly thirty years. I do not think this is as it should be. Why has the executive refrained from taking any action with regard to cocaine? Is there any doubt whatever that cocaine and its salts are poisonous alkaloids within the meaning of the Schedule? Is not it a matter of common knowledge that the unrestricted and ignorant use of cocaine is undermining the health of thousands? It is being taken under false pretences. If you walk along the streets and look in the shop windows, grocers' shops, stores, chemists—ah! even with M.P.S. after their names—you will see flaring show cards of coca wine, life's invigorator, 1*s.* 3*d.* per champagne quart, made with some sound, nourishing, healthy port. I say the Pharmaceutical Council is incurring a grave responsibility for allowing this sort of thing to continue. We cannot shut our eyes to the great changes that are taking place. It appears to be inevitable that the great bulk of those who are entitled to practise pharmacy are driven away into that seething mass of general traders, where, I am sorry to say, self-respect, integrity and conscience are becoming subordinated to the domain of competition. It is possible that this dead weight may before long absolutely sever the last link which binds it to pharmacy; and it is also possible that the Pharmaceutical Society itself may undergo modification, for before long they will have to reckon with the better educated men whom your extended examinations will bring into the trade. I hold very strongly that it is necessary, nay, imperative, for all who wish well to pharmacy to keep themselves thoroughly well abreast of all modern scientific developments. It is in that way that they can best hope to impress public opinion with the importance of the duties that we are often called upon to fulfil. It is a part of our duty—I am afraid one that is often neglected, to educate the public to understand the professional side of our occupation—and we can demonstrate to them how constantly, not simply their health, but their lives are absolutely dependent on the care, on the conscientious use and selection of the drugs we employ. I know that I may be laying myself open to the charge of claiming too much for the professional side of pharmacy. Well, gentlemen, I prefer to claim too much rather than claim too little. I will quote one of England's most celebrated statesmen when addressing the Royal Athenæum at Manchester. He said every man has a right to aspire. A man who does not look up will look down, and is destined to grovel. We do not want the pharmacist to grovel, we prefer rather to aspire, that he may attain that position in the social scale and public opinion that the responsible character of his duties entitle him to occupy.

Mr. Martin (Newcastle) said: Mr. President, when I left home I did not think I should be called upon to take any part in these proceedings, because I had not read the annual report. I put it in my bag and read it on my way to London in the train, and think I ought perhaps to say a word or two. We have heard a great deal about loyalty. I have been lately to meetings of those who think differently from me, but I have not spoken a word or lifted a little finger in opposition to the Pharmacy Bill. Still there is a loyalty to principle; unless my presence here to-day should lead my friends to suppose that I have altered my principles or views with regard to it, I must offer one or two remarks. I am extremely sorry to find by the report of the Council that what I predicted would result from the action that had been introduced by the new Bill has already taken effect—that is, that the Major men are diminishing in such large numbers. The candidates for the Major examination diminished 20 per cent. last year, and in Scotland, although the successful candidates for the Minor are one-third of the whole candidates, the candidates for the Major are less than one-tenth, and the passing of the Major was less than one-tenth of those who presented themselves. I, who believe the future of pharmacy and its future well-being will be promoted solely by education and by giving every inducement and every opportunity for a higher and better education, can but deplore that result, for it is the direct result of the action which the Council is contemplating. I am rather struck by the omissions from the report, and there is one matter which has bulked somewhat largely in the report during the last few years which is conspicuous by its absence now. It may be that everything is progressing so well that there was no occasion to allude to it, but I think it will be to the interest of the Society generally to know what is being done in the Research Laboratory. A large amount of the capital of the Society was spent on that laboratory, and for a number of years we were told to hope on and to hope on, and the result would be satisfactory, but there is no allusion to it in the report. I think it would be interesting for the members of the Society to hear from the President whether its condition is satisfactory and whether good work—I will not say even good pharmaceutical work, I will take a broader standpoint than that—but whether good work for science is being done with the money which has been expended on it by the Society. There is one other omission which I am somewhat surprised to see, seeing that I think it is certainly the most important event in connection with pharmacy and medicine for the past year. That is that there is no allusion in the report to the publication of the new Pharmacopœia. This is not the time or the place to enlarge upon the merits or demerits of that book, but there is a practical fact connected with it which I think is of the highest importance, and I think it is possible, and that it would be wise for us at this annual meeting to spend a few minutes in considering it, and possibly to hear what are your views on the subject. The Pharmacopœia, as

you all know, was published with all the authority of a State document by announcement in the *Gazette* on April 29, but it was published by the printers on May 11. We hear from an eminent authority in pharmacy that he intended to adopt it on Midsummer Day. Again, we have the *ex-cathedra* statement of the President of the Society that the hall-marking of the legal qualification will be imposed on men up till next January, who may still be ignorant of the existence of the 1898 Pharmacopœia.

The President: I beg your pardon.

Mr. Martin: According to the statement of the President of the Society at the last Council meeting, the 1898 Pharmacopœia will not be used in the examination until 1899.

The President: That is not quite accurate in the way you put it.

Mr. Martin: I say you are stamping men as legally qualified to practise Pharmacy, and yet up to January, 1899, you will not ask them in the examination room whether they are acquainted with the 1898 Pharmacopœia.

The President: With anything special to that Pharmacopœia which is not in both.

Mr. Martin: The Pharmacopœia—this is the important point—is the law of the land, or it is not the law of the land. A cannot make it legal to-day and B to-morrow. From a paragraph in the Journal, which we are told is the wisest pharmaceutical publication ever issued, it appears doubtful whether the Pharmacopœia of 1898 has any authority at all, or ever will have. It commences by stating that the wholesale druggists of London, hard-headed, practical men, adopted the Pharmacopœia on May 2, and I think they were wise. I adopted it and gave instructions to my assistants that every prescription which was received, bearing evidence on its face of having been written after April 29, was to be dispensed in accordance with that Pharmacopœia, which I believe to be the law. But is it the law, or is it not? We cannot make it law at any given time that may be convenient to ourselves any more than we can substitute one preparation for another. Therefore, I hope I am not introducing irrelevant matter, and I think it is of sufficient importance to be considered at this annual meeting and to have an expression of opinion upon. It is extremely desirable that there should be not only consensus of opinion, but uniformity of conduct in this matter, because some preparations differ very widely, such as aconite, belladonna, ipecacuanha, and strophanthus. All these preparations, according to the new Pharmacopœia, differ very much from the old, and if a prescription is dispensed at John Bell and Co.'s to-day with tincture of aconite in it, and it is dispensed with the tincture of the old Pharmacopœia, and next week it is dispensed in Maw's according to the new Pharmacopœia, there can be no doubt that will be a very undesirable state of things. The 1898 Pharmacopœia is either the law or it is not. According to the opinion of the wholesale druggists, and according, I should say, to the opinion of medical men, when the Pharmacopœia is gazetted and published it is the Pharmacopœia which we must use for prescriptions written subsequent to that publication.

Mr. Martindale: Whether the prescriber intends it or not?

Mr. Martin: If there is evidence on the prescription that the 1885 Pharmacopœia is intended, that is quite legitimate. The medical man may indicate the Pharmacopœia Germanica or Pharmacopœia Londoniensis, or any other; but if he does not indicate anything and writes a prescription to-day in England, and orders tincture of strophanthus, or aconite, or belladonna, it is the duty of the chemist, I think—but I am here emphasising my individual opinion—to dispense it according to the Pharmacopœia which is to-day gazetted as having been published by the General Medical Council.

A Member: Irrespective of the dose?

Mr. Martin: The dose is a thing which only the medical man in the presence of the patient can determine, and he only can decide what is the right dose for the patient. A large dose in some circumstances is a very small one in others. If a doctor, being up-to-date with regard to the strength of tincture of strophanthus, prescribed a medium dose, intending the new tincture to be used, and it is dispensed in some pharmacy where that book is not yet adopted, there may be a very serious discrepancy in dose. But it seems to me we must take what is written on the face of the prescription. I am surprised at no mention of the Pharmacopœia being made in the report or in the President's address, and I hope the importance of the matter will justify me in troubling the meeting on the subject.

Mr. Hampson: I always considered that Mr. Martin was a cautious man, but it now appears that he is not. He tells this meeting that he intends to dispense these strengthened preparations without any warning to the medical practitioners.

Mr. Martin: They are not all strengthened.

Mr. Hampson: A certain number are. Now he knows, as we all know, that there is no legal authority in this matter excepting the Statute he refers to, but he also knows that all intelligent pharmacists admit that it is very necessary that in future legislation such should be provided, and that there should be a time allotted by which everbody could become acquainted with the new state of things. I am quite sure, if Mr. Martin re-considers what he intends to do, he would rather hesitate, or else he might find himself before a coroner's jury. It is extremely unfortunate that there is no provision for fixing a time when it should become necessary to use the new Pharmacopœia, but I expect that all gentlemen here present will use better discretion than Mr. Martin in this matter. I am obliged to Mr. Martin for his kindness and courtesy in calling attention to the anomalous position of pharmacists with regard to this matter. Whilst I am upon my feet there is another matter which, with the courtesy of the President, I hope you will allow me to say a few words upon. I refer to the Benevolent Fund. I have given the Council on more than one occasion trouble, and perhaps have caused embarrassment, by my pertinacity with regard to the project that I have in view, and which in a very few words I desire to bring under your notice. According to the present arrangement of the administration of the Benevolent Fund, it is necessary that all candidates desirous of obtaining an annuity shall undergo the painful process of canvassing, spending money, and in doing all other things necessary to attain a position at the poll before he or she can receive an annuity. I have very strong views on this matter, although I may be considered a faddist by some, and may be considered foolish in pressing this matter forward, but it has been my custom through life, and I hope it will remain so to the end of the chapter, that where I maintain a conviction, whether it be with regard to the improvement of the Benevolent Fund or any other matter, that I should feel it my duty to press it on every occasion. You must remember, Mr. President and gentlemen, that the Benevolent Fund Committee is acquainted with all the details of the cases that are brought before that Committee. It is the duty of that Committee to inquire into the most minute matters in connection with each case. Before the cases are placed on the list of candidates, perhaps for several years, every minute detail with regard to the condition of the applicant is in the hands of this Committee, and it appears to me that it is a waste of energy, a waste of money, and an unrighteous thing to make it compulsory upon these candidates to run the gauntlet of an election. I may just tell you for your information that the present Archbishop of Canterbury will not allow his patronage to be attached to any voting body with respect to the administration of charities such as our own. I know there is another side to this question. I am told by some of my colleagues on the Council that I am endangering the Fund, that it is quite possible if this change that I have suggested were to take place the amount subscribed would become less. Well, I have a much better opinion of my friends the chemists and druggists, at any rate of those who contribute to the Fund. The gentlemen who contribute to the Fund do not contribute, I am sure, for the sake of this paltry patronage of giving an individual vote. I have a much more worthy opinion of their benevolent intentions. Two years ago we had an admirable illustration of the inequality which exists in this matter. There was one who was in every sense a gentleman, a member of the Society, a pharmaceutical chemist, and a contributor to the Fund for some number of years, and a man of over eighty years of age, mind you. Surely one would suppose that such an individual would be perfectly safe to come out at the head of the poll. He was not elected, but was told to wait another year. They gave him the opportunity of dying in the meantime, but, happily, he did not die, he came in in the next year. My proposal is simply this, that the present Benevolent Fund Committee, with the assistance of two or three members of the Society and contributors to the Fund, shall finally decide upon the most eligible cases, that reports shall be made to the Council, and that the Council should elect those individuals without the strife and turmoil of a fight. That is my proposition. I want to know what is to be said on the other side with regard to the humanitarian point of view. I admit there is a danger that the Fund may temporarily be lessened in amount, but assuming that human

nature as controlling the Fund shall to a certain extent be of a degraded quality, and that the amount may be lessened for twelve months, I maintain that in the following year every contribution to the Fund will have realised the advantage of this improvement, and that the Fund will not eventually suffer. I may have been irregular, because it is unusual that any member of the Council should take part in the discussion, but I feel this matter so strongly that it is simply unbenevolent and inhuman to ask a paralysed individual of eighty years of age or seventy years, to come out in the open and fight with those who are also candidates for participation in this Fund.

Mr. R. A. Robinson: Although we have had a number of interesting topics this morning, there is yet another point that I thought I would like to bring before the meeting. I do not think that to-day either you or your pharmaceutical press friend will complain of want of copy. The points that have been raised by the various speakers are important, they deserve considerable attention, and no doubt will receive it. I would like to say with regard to the Pharmacy Bill that I do not think that Bill is dead yet; I have very great faith in that Bill. I have known of a Bill that was passed at five minutes to twelve on the last day of the session, two years ago, becoming the law of the land. No doubt all these Bills will excite opposition from somebody, and I appreciate your remark that if it comes under the twelve o'clock rule it will have but a slight chance of being passed, but with a good deal of persistence I believe it is more likely to go through. It is really such a small thing, concerning only a matter of the internal affairs of this Society, and does not concern anybody in such a way as to excite opposition. I am glad to see that the opposition that was excited at first seems to have become allayed. Then I observe you say that our Journal has improved, and that the balance against the Society is less than it was. I am very glad to hear that the Journal is improving. I understood that it was so, and I have heard expressions of opinion from many persons that that was the case. What I would venture to say is: Go on improving it. The advertisers, I believe, are better satisfied with it, and if they want anything further by all means give it them and keep up the Journal in the best manner possible, because we cannot do without it. It is better to make the best of it and run it on up-to-date lines, and make it a first-class journal for all classes of pharmacists, and by that means increase its interest in the Society. I have listened with a great deal of interest to your remarks; you said we ought to put our house in order. You made reference to the desirability of not having branch businesses carried on without qualified men in them. I entirely agree with you there. There is another way in which we might put our house in order to our advantage, and that has not yet been mentioned to-day. I refer to the regulation of storage of poisons. That is a matter of some importance, because it is very well known to most of those present that it was a topic that excited a great deal of attention some years ago. Unfortunately, the Government believe that we will not do something that we promised to do in that matter. The President of the Society at that time, instead of having bye-laws for the regulation of the storage of poisons inserted in the Act, I think said that the Council would by means of bye-laws take precautions to do what the Government believed to be necessary with regard to the storage of poisons. It was left in that way, that the Pharmaceutical Society should adopt bye-laws for that purpose. It was not left in the power of the Council. I believe the Council would have made regulations for the storage and keeping of poisons, but it was left to the Society, and when the President came before the Society there was a very considerable outcry against it. The majority of the members then said that they would not have any regulations of that kind, because they said that it was unnecessary and derogatory. I venture to think that a change has come over the members of the Society, and that as a matter of fact we have all been doing voluntarily that which was attempted to be made compulsory, for our own safety and credit. We have all been keeping poisons separate from other things in bottles distinguished from ordinary bottles, and many probably in cupboards locked up. I have taken some trouble to inquire, of course only in the limited circle to which I have access, but I am inclined to think that the members of the calling at this present day would not object to have poison regulations adopted by the Society and enforced. When I say "enforced" I do not mean for a moment that we should have any inspector coming round, but they would be doing that which we promised to do; that is to say, safeguarding the public in that way. I do not wish to enter into the great question as to whether the sale of poisons is the proper basis on which to give us legislation, but rightly or wrongly, that is how the Government did it; the Government said "we must have poisons properly taken care of." We might have been glad if they gave us the monopoly of dealing in all drugs, but they based it on the sale of poisons. I should regret to see the Government bringing in a new Poisons Bill. There would be great opposition to it not merely among chemists, but with all people, because it would be widening the door by which poisonous substances could be procured. I should regret very much if they did bring in a Poisons Bill, allowing poisons to be sold by other persons than registered chemists, which made it compulsory on those persons to adopt regulations which we have not adopted. If we were to protest against the sale of poisons by others than registered chemists they would say: "We are going to insist on such regulations as you ought to have adopted, but which you have not." We have been told over and over again that if we can gain the goodwill of the Government by being willing to put our house in order in every possible way, especially with regard to this point of the storage of poisons, we should be in a stronger position than if we remained as we are, each man doing as he likes, with the result that in some cases there may not be a proper disposal. That is a view that I would like to put before the trade and the profession. There is no danger of undue interference with us. We are now subject to the ordinary law, we have our weights and measures stamped; but there are many other people who have to be subject to the law, such as lawyers; and medical men in the giving of certificates, and as regard lawyers they can only send in their bills in a certain way, so that I can see nothing derogatory to the body of chemists and druggists in having to adopt regulations of that kind for the better safeguarding of poisons. I do not know whether there will be time for an expression of opinion on all the matters mentioned to-day, but that is a point that I have been thinking about, and I would rather that we should ourselves do it, if it will do us any good, than leave it undone. I have heard a former President of the Pharmaceutical Society say that in the pigeon-holes of the Privy Council there was always the fact to be brought against us that we had not complied with these regulations. I do not think it would be found that there was the same feeling among the same men that there was thirty years ago with regard to this matter. I remember at one time, when I was a young man, that I thought it was not a very necessary thing, and that there was not much in it; but I do think now that it is worth doing. I know there are arguments on the other side, but I do not intend to go into those now. The fact that we have gone on as we are for some thirty years is another side of the question. With regard to my friend Mr. Martin's speech, he said, if I understood him, that it was deplorable if, owing to the policy of the Council, the Major men were going up in smaller numbers. But that is not so; it is because they have been going up in smaller numbers that the Council have moved in the matter. The figures that he quoted were not the result of the action that the Council took a year ago. I suppose the real reason was the legislation which made the Minor examination the qualifying examination, and it is because the Major men have been decreasing for many years past that the Council thought it imperative that some other system should be adopted. We all wanted to keep up the standard of examination, and it has been increased and kept up. I do not think that Mr. Martin ought to fancy that the Council by its action has done anything in the least to reduce the standard of examination, which I quite agree with him is the main thing that we ought to look after. With regard to the Benevolent Fund, I have no doubt that the point mentioned by Mr. Hampson will receive attention. I know that he has been a consistent supporter of the view that he has expressed, and I know the difficulties that he has had to encounter. It has been tried in other societies; in some it has succeeded, and failed in others, but I rather think that in such a Society as this it would be worth a trial. I suppose the Council know best, and that they have some better means of judging public opinion than I have, but it seems a pity to put these persons who are badly off in the position of having to canvass and spend money in order to get an annuity. I should think with so careful a body as a sub-committee of the Council, or even the Council itself, that all the subscribers to the Fund would feel that they did not want to have a personal power of voting. I for one should not wish it. I would rather leave in the hands of the Council or a sub-Committee the election of the annuitants to the Benevolent Fund. Those are the only points that I have to mention, and

I venture to think that they are matters of interest to be brought before the annual meeting.

Mr. Martindale: My friend Mr. Martin has made a pointed allusion to something that concerns me a little. I would like to ask him with regard to the British Pharmacopœia on what authority he said it came into force as soon as it was gazetted. I may say the General Medical Council have never been of that opinion—at least, they have not expressed it in writing. I think he has been a little too previous in bringing it into use as soon as it appeared. How are all the chemists and the doctors to get to know at once what is in that Pharmacopœia? I think it is a great mistake to do anything of the kind. I personally asked some of my medical friends what course they wished me to take, and I have made them acquainted with the fact that after a reasonable time I should be prepared to dispense according to the new Pharmacopœia, but that if in the meantime they would make an indication which Pharmacopœia they intended, I should try to carry out their intentions. In the meantime, I hold it is the duty of the dispenser to carry out the intentions of the prescriber. The prescriber cannot know what is in a book immediately it is published, when he has not had a chance of seeing it. Then there is another matter; all my staff has to be acquainted with the Pharmacopœia, and it is impossible for them to know all the intricacies and changes that have occurred in the making of the prescriptions so as to be able to dispense for it immediately it is published. I think it is reasonable to fix a time as I did with my medical friends in my neighbourbood. I said I should be prepared to carry out their intentions if they would indicate which way they wished to go, and that after a certain date, unless they indicated that they meant the old Pharmacopœia, I should be prepared to dispense according to the new Pharmacopœia.

Mr. Hind: With regard to the Pharmacopœia, I take the same view as Mr. Martindale. I have communicated with the doctors around my neighbourhood, and they have all agreed with me that when they have finished prescribing according to the old Pharmacopœia, they will initial their prescriptions to that effect, but up to the present they do not wish to be interfered with. One of them went so far as to say that he did not know that he would use the new Pharmacopœia at all. I do not think we should dispense on the new Pharmacopœia without giving the doctors some notice of it. There is no doubt that a notice to the effect that it is to come into force at some definite period would be of very great assistance to us, but to actually use it right off, as Mr. Martin suggested, would be very risky.

Mr. Lomas: I should like to say something with reference to the remarks made by the President in his address; and that is that in my opinion these remarks of the President will be very welcome to all true men of the Society, and very unwelcome to a great number who are practising what they should not. I allude to qualified chemists having branch shops carried on with unqualified men. I have felt very strongly on this point for years, and I welcome the President's remarks, coming late as they did, but still they are better late than never. It is more than that. What are these unqualified men doing? What is their position? They are robbing the qualified men. Instead of having a qualified man in their shops they have an unqualified man, and therefore I say, What have you to give the men who have passed their examinations? Surely they have a right to conduct these branch shops. It is more than that. Such practices are sapping the very foundation of the Society, and, Mr. President and the Council, you cannot be too strong on this matter. Then I go from that to another point. I believe that the Council are elected to look after the interests of the members and the craft generally. Very well; but what was the position of pharmacists on the Committee for the Revision of the Pharmacopœia? In my opinion it was a most humiliating one, and they would have done well to have declined to have anything to do in the matter. Therefore I would hope that in any future alteration in the Medical Bill that will be looked after, and that if any qualified man takes part in any of these committees he will be on an equality with the others, or if not that he will decline to have anything to do with it. I commend the remarks that were made by Mr. Hampson at the Council Meeting as conveying all that I have meant to say, and more. I cannot put it in a more forcible way. We are really a sort of servant-of-all-work. It will not do, you know. You do not get what you pay for. Is this doing good? Certainly not. If you cannot have your proper position, decline to have anything do with it, which is what I should have done.

Mr. Griffiths: I only wish to occupy your attention for a very few moments to express my very strong approval of the Bill that the Society brought forward rendering qualified chemists eligible for membership. I do this because I was amongst the minority at the last meeting which voted against the proposed Bye-laws of the Society. I know those Bye-laws have been passed, and I also know that it is no use crying over spilt milk. I am very pleased indeed, and I think I am only saying what most of the country chemists—certainly those in rura districts will agree with entirely—that this Bill is one of the most important Bills, although a small one, that has ever been brought forward. I hope you will persevere with that and get the Bill passed as soon as possible. It will then be the duty of every local secretary of the Society to point out to chemists all over the country the necessity for becoming members of the Society, and then you will be able to go further with really sound legislation in the interests of the public. I do not know whether I should be quite in order in making any remarks with regard to the *Pharmaceutical Journal*, but I believe it has been mentioned in the report. I suppose, to put myself in order, I ought to move that the Editor's salary be reduced, but I do not want to do that. I just wish to make a little protest against the spirit in which criticism is sometimes carried on in that Journal. I have often been somewhat pained to note the spirit in which adverse criticism is made by the Editor, and I give as a case in point especially a comment made in "Annotations" on October 16, 1897, on a speech made by a Mr. Harry Jessop, at the Midland Chemists' Assistants' Association. I have never seen that gentleman, and do not know him in the least, but I do not think that the treatment he received in that article was at all just or at all fair. The only reason for the sneers that were launched against him was that he was a young man. I think we must be very careful in these matters, and even if these young men are a little bit rash in expressing their opinions they must be dealt with fairly, and even generously, because it is from these young men that the ranks of this Society must be recruited. A little care should be exercised on the part of the Editor, and perhaps he will kindly remember that a sneer may be very smart, but it is not argument. Mr. Hampson's suggestion that we should have some different method of electing annuitants to the Benevolent Fund should receive serious attention. I think it is very hard that people who have worked hard and who have not been so successful as they deserve should have added to their troubles the necessity of going round begging.

Mr. Martin: May I answer Mr. Martindale's question?

The President: Was it a direct question?

Mr. Martindale: I asked Mr. Martin what authority he had.

Mr. Martin: It would take me a long time to explain all the anomalies and inconsistencies of the Pharmacopœia, but I would like to answer Mr. Martindale's question by another, and that is, on what authority does he fix any date?

The President, in reply, said: I have a long list of notes of many most interesting points which have been referred to by the various speakers, and I will try in a very few minutes to say just a word with reference to each of those to which I think it is necessary to call attention. Mr. Campkin spoke of the Pharmaceutical missionaries in the persons of the President and the Vice-President and of the advantage derived from those visits being made by one of these officials from time to time at the various centres throughout the country. All I can say is that the few visits I have made in different parts of the country have been to me very pleasurable. Still one has one's other business to attend to, and one cannot always go when one is asked, but I have found very great pleasure in visiting these centres, and I do hope that my visits, as I am sure is the case with those of my predecessor, have done good in the districts which we have visited. I can promise my successor, whoever he may be, that he will receive a very warm welcome wherever he goes as President of the Pharmaceutical Society. Mr. Atkinson has asked a question, I think, as to titles promised to those who withdraw opposition to the Bill. The answer to that, as far as I am able to give an answer, is that no such titles have been promised. With regard to the Poison Schedules, and especially with reference to cocaine, I think that cocaine may be considered to be in the Schedule at the present time if it is a poisonous alkaloid. The question is, Is it a poisonous alkaloid? Could we go before a court of law and say that it was a poison or not? I am a little doubtful on the matter. We may agree, and I am sure we do all agree, with Mr. Atkinson that its use at the present time is very objectionable

in many directions, but the question is, is it a poison? Have there been many cases where it has proved fatal?

Mr. Atkinson: There have been some reported recently.

The President: If such is the case, it is a poisonous alkaloid, and is it present in the Schedule? I am sure we are all very delighted to hear Mr. Atkinson's remarks, and we have been very much edified by the tone of those remarks. I hope they will be read very largely throughout the length and breath of the country by every one connected with our calling. I am sorry to say that Mr. Martin has gone, but he made a wail about this Pharmacy Bill. I will give him credit for this, that although I know he opposed the Bill, he has not tried to stop its progress through the House of Commons. I think Mr. Robinson has already answered his contention that the Major figures have shown a diminution since this Pharmacy Bill was discussed. As Mr. Robinson very well put it, it was for the very reason that the Major candidates were on the increase that it was felt most desirable and necessary that some such action should be taken as that contemplated by this Pharmacy Act Amendment Bill. I have pointed out on more than one occasion that all but something like 13 per cent. who obtain the Minor qualification are satisfied with that. When I say they are satisfied, I do not mean that they themselves would not, if they had the opportunity, prefer to go on to the Major qualification, but as a matter of fact they do not. That is a very small percentage, only 13 per cent. or something like that, now, who go on to the Major examination. I am inclined to think and hope that, under the new regulations affecting preliminary examination, in time we shall have men whose general education will be such that they will see the importance of passing the Minor examination, and I hope that we shall all see in the course of another ten years or so a very much higher percentage of men passing the the Major examination, notwithstanding the fact that the present Pharmacy Act Amendment Bill will by that time, I hope, have been passed. Mr. Martin asked a question about the Research Laboratory. That is not a special department, as it were, of the establishment, and it is not mentioned in the finance statement as a special department, but it is still in existence, and I hope that there will be done in it as good work as is being done in it now. If you refer to the last number of the *Journal of the Chemical Society* you will find some very excellent work that has been done by Professor Collie, Mr. Tickle, and others in that laboratory, but the question is to find workers. I think that difficulty would be got over if some gentleman, either here or outside who might read my remarks, would found a scholarship which would enable some of our Major students to study a year in London after they have qualified for the Major examination. Men sometimes do not find it convenient from a pecuniary point of view to stay afterwards and do work in the Laboratory, so that if anyone who, having read my remarks, has a little surplus cash, he might feel inclined to provide a scholarship which would give something substantial to anyone who is qualified as a pharmaceutical chemist. With regard to the Pharmacopœia, I am always afraid to say a word about it. When such doughty champions as Mr. Martin and Mr. Martindale get on their feet I am afraid to say anything. It is, perhaps, singular that there has been no reference made to the Pharmacopœia in the report. I have said before, I think in public, but, at all events, I say it now, if I have not done so, that I am not satisfied with the position pharmacists have taken with reference to the Pharmacopœia. At the same time I think I cannot agree with Mr. Lomas in what he said. I think we did the right thing in taking the only position which was available, and that we were, as citizens and pharmacists, right to help the Medical Council to make that book as satisfactory as possible. I do hope that even if the law is not altered—and I am afraid there will be considerable difficulty in altering the Statute which deals with this matter—in the preparations that are made for the next edition pharmacists will be recognised in a way that will be more useful to the production of the book, and certainly more in conformity with the position which pharmacists ought to occupy. Now with reference to the discussion between Mr. Martindale and Mr. Martin as to when the Pharmacopœia should come into force, I think Mr. Martin really answered Mr. Martindale very well just now by asking the other question — why should Midsummer Day or any other day be taken as the date on which the new Pharmacopœia should be used and the old eschewed? I must confess—and I here speak, gentlemen, plesae, if I may do so, as Walter Hills or John Bell and Co., and not as President of the Society—I do not pretend to speak *ex cathedra* on this point—that I am at one almost entirely with the remarks that have been made on this point. I understand, at all events, that when the Pharmacopœia is available and can be bought by the public, then it comes into force. I am bound to say that, except under certain conditions and circumstances, and there are exceptions to every rule, my firm has made arrangements that the Pharmacopœia should be recognised as the official medicine book on the day after we were able to buy it from the publishers. I am quite ready to admit that there are inconveniences in this arrangement, but you must recollect in this particular instance there have been many opportunities given both to prescribers and also dispensers, through the enterprise of the Editor of the *Pharmaceutical Journal* and others, to make themselves masters of the chief alterations in the Pharmacopœia, and of all those to which special attention was necessary. I should not have referred to this question had it not been raised, because I do not think it really comes properly before us, but the difficulty is that Mr. Martindale takes a certain day, and tells his medical friends that he will take a certain day. But another gentleman may take July 1, while another may think that the medical prescribers and others will not have mastered the details of this Pharmacopœia till next Christmas, and I merely mention this so that you may know what is done in one establishment. With regard to Mr. Hampson's remarks about the Benevolent Fund, I do not think I can go into that now, but as I have said on many occasions, I agree very largely with what he has said, but at the present time, as a practical man, unless I can see there is evidence of support of the views taken by Mr. Hampson by a very large majority of the subscribers to the Benevolent Fund, I do not dare to take the step which he proposes. I must confess I am against the present practice in principle, but I regard it rather as a necessary evil, and I am afraid there are many necessary evils with regard to the collection of money, for instance, fancy bazaars and balls, and that sort of thing, for Church purposes, which are very objectionable. I think people ought to give money without those inducements, but such is the case, and such is human nature. There is one point to which I should like to call attention for a moment, and that is with reference to some remarks made by Mr. Robinson on the poison regulations. I do not know when I have ever said anything on that point, but I am bound to say that so far as I have been able to read and understand the past history of the Society, and the conditions under which the Act of 1868 passed, I must confess that I gather from the words of the Act that we did promise to make poison regulations, and as far as the Council of some time ago was concerned, it did pass, I believe I am right in saying, poison regulations, but it is the Society which has to pass the resolution, and the Society on some great field-day came to the conclusion by some majority that they would not have these suggested regulations as such, but that they would merely adopt them as recommendations. Now, as Mr. Robinson has well said, I believe the great majority of registered chemists do observe such recommendations as we have suggested. I have no fear of inspectorship, or anything of the kind, and I should be very glad myself if the Society could see its way—which I suppose would be at some special meeting convened for the purpose—to express its willingness to pass a resolution to the effect that these recommendations which have been very useful, as is proved by experience, should be made regulations, I firmly believe that if we, not in any spirit of panic, but quietly took that step we should stand in a better position with the Government Department. I am glad to hear that Mr. Griffiths approves of the Pharmacy Bill, and he has had one little go at the Journal. I hope the Editor will bear in mind what he says. Mr. Griffiths did not explain what the sneer with reference to Mr. Jessop was, but I do not think it is a very dreadful thing to say about a man that he is young. As a rule we can all get over that in time. Mr. Jessop certainly had on that occasion, as he has had to-day, a very good advertisement, and I have no doubt we shall hear more about Mr. Jessop, and I do not suppose he minds a little criticism of that kind. If he was a little too severe at the time, I am sure Dr. Paul will be more careful in future. I think I have now touched upon the main points to which reference has been made, but if I have omitted any perhaps you will be good enough to remind me. We have had very little adverse or unkind criticism, which was perhaps to be expected, and I am very much obliged to the speakers for the remarks they have made

n support of the report. I will now put the resolution—

That the annual report and statement of accounts be received and adopted.

The resolution was carried unanimously.

Appointment of Scrutineers.

The President then read the list of names of gentlemen who had been nominated to act as Scrutineers, and their appointment was unanimously agreed to.

The President then called attention to the fact that the following Registers had been laid upon the table in compliance with the provisions of the Act :—

Register of Members, Associates, and Students of the Society.
Register of Pharmaceutical Chemists.
Register of Apprentices and Students under the Act of 1852.
Register of Chemists and Druggists under the Act of 1868.

Appointment of Auditors.

The following gentlemen were appointed to act as Auditors :—

Butt, Edward Northway, 77, Hamilton Terrace, London, N.W.
Lescher, Frank Harwood, 60, Bartholomew Close, London, E.C.
Stacey, Samuel Lloyd, 22, Great St. Helens, London, E.C.
Umney, Charles, 50, Southwark Street, London, E.C.
Yates, Francis, 101, Southwark Street, London, S.E.

The President then declared the meeting adjourned to Thursday at 3 o'clock to receive the report of the Scrutineers.

A Member: I wish just to remark that we have been in the habit of hearing at these annual meetings the voice of Mr. Percy Wells, and I should like to know whether he is on the sick list at all. I understood last year that he had been here regularly for many years, and I have quite enjoyed the enlightenment that comes from his lips. I came here to-day with the full hope of hearing him, and I did not know whether I should not feel inclined to second any of his remarks. I suppose, as we have not heard from him to-day, we may congratulate our President and Council that he accepts their views. I must congratulate you upon having had such a peaceful meeting.

Mr. Carteighe: As I had occasion once to make the observation when I was in the chair, there have been times when the meeting, after expressing their appreciation of our efforts, have never taken the trouble to move a vote of thanks to the chair. As no other member of the Society seems disposed to do that, perhaps you will allow this old moor to move that a cordial vote of thanks be passed to the Council, including myself, for our services during the past year, and allow me further to say, and I am sure my colleagues on the Council will agree with me, that I think a special vote should be passed to you, sir, for your indefatigable exertions in the chair.

Mr. Cooper seconded the resolution, which was put and carried with acclamation.

The President: I am much obliged to you, gentlemen, for that vote. When that gentleman rose to speak just now I thought he was going to say that he had not heard the voice, not of Mr. Percy Wells, but of my predecessor. I am glad that we have heard him now, and I thank Mr. Carteighe for the vote which he has proposed, and Mr. Cooper for seconding it. On behalf of the Council I thank you all, gentlemen, for your kindly appreciation of our work during the past twelve months.

ADJOURNED GENERAL MEETING.

Thursday, May 19.

MR. WALTER HILLS, PRESIDENT, IN THE CHAIR.

The adjourned meeting for receiving the report of the Scrutineers was held on Thursday, May 19.

The Chairman of the Scrutineers, Mr. George S. Taylor, read the following report :—

Scrutineers' Report.

We, the undersigned Scrutineers, appointed at the Fifty-seventh Annual General Meeting of the Pharmaceutical Society of Great Britain, do hereby certify that we have examined the voting papers committed to us, and report the following :—

Voting papers reported by the Secretary to have been issued ..	3756
Voting papers received	1993
Voting papers issued, but not returned	1763
Voting papers received	1993
Voting papers disallowed :—	
Informal	13
Received by post too late	74
—	87
Voting papers registered	1906

Hills	1754	Savory	1536
Martindale	1732	Warren	1520
Symes	1679	Johnston	1479
Allen	1649	Bateson	1469
Atkins	1637	Grose	1430
Newsholme	1634		
Cross	1630		
Corder	1578	Gibbons	1001
Storrar	1570	Campkin	964

George S. Taylor, *Chairman.*

Leo. Atkinson.	J. W. Bowen.	E. J. Eastes.
W. Prior Robinson.	A. E. Tanner.	J. H. Shacklock.
T. H. Powell.	A. J. B. Cooper.	R. Fisher Young.
W. Arkinstall.	H. Cracknell.	H. Wilson.
A. J. Phillips.	C. E. Garman.	C. E. Robinson.
Frank A. Rogers.	F. Ransom.	W. R. Gossling.
H. Bate.	T. Tickle.	

The New Council.

The President, as Chairman of the meeting, then declared that the following gentlemen would constitute the Council for the ensuing year :—

Allen, Charles Bowen, 20, High Road, Kilburn, N.W.
Atkins, Samuel Ralph, Market Place, Salisbury.
Bateson, Thomas, 23, Stricklandgate, Kendal.
Bottle, Alexander, 4, Godwyne Road, Dover.
Carteighe, Michael, 180, New Bond Street, W.
Corder, Octavius, 31, London Street, Norwich.
Cross, William Gowen, 70, Mardol, Shrewsbury.
Grose, Nicholas Male, 8, Temple Street, Swansea.
Hampson, Robert, Norland House, Sevenoaks.
Harrison, John, 33, Bridge Street, Sunderland.
Hills, Walter, 225, Oxford Street, W.
Johnston, John, 45, Union Street, Aberdeen.
Martindale, William, 10, New Cavendish Street, W.
Newsholme, G. T. Wilkinson, 27, High Street, Sheffield.
Park, Charles James, 1, Mutley Plain, Plymouth.
Savory, Arthur Ledsam, 143, New Bond Street, W.
Southall, Alfred, 17, Bull Street, Birmingham.
Storrar, David, 223, High Street, Kirkcaldy, N.B.
Symes, Charles, 14, Hardman Street, Liverpool.
Warren, William, 24, Russell Street, Covent Garden, W.C.
Young, John Rymer, 42, Sankey Street, Warrington.

After the report of the Scrutineers had been received, the President moved, and Mr. Humphrey seconded, a vote of thanks to the Scrutineers for their labours. This was suitably replied to by Mr. George S. Taylor on behalf of the Scrutineers.

Analysis of Silicates.—Le Claire obviates the difficulty met with in the analysis of silicates—the formation of gelatinous hydrated silica—by the following process: The finely porphyrised silicate is mixed with three times its weight of red lead, or less, if alkalis are present, and heated to orange-redness in a muffle for thirty minutes. A liquid glaze is thus obtained, which solidifies on quickly cooling, and is detached from the sides of the crucible. This is then decomposed with six times its weight of a mixture of ordinary and of fuming nitric acid, heated to about 40° C., the result being lead nitrate and silica. When decomposition is complete, the liquid is treated with boiling water, the silica thrown on a filter, washed until free from lead, calcined and weighed. To obtain the lead oxide suitable for the purpose a 15 per cent. solution of lead nitrate is precipitated with oxalic acid, the precipitate is collected, dried, and calcined below a low red heat. A portion is removed, moistened with nitric acid, mixed with the rest, and again calcined. The resulting oxide is in an extremely minute state of division.—*Comptes rendus*, cxxv., 893.

LONDON: SATURDAY, MAY 21, 1898.

THE ANNIVERSARY MEETING.

Recent experiences have very forcibly demonstrated the absolute necessity of greater cohesion among chemists, not only in order to be able to protect themselves from attack, but also to admit of their making such advance as is essential for keeping abreast of other callings. Under the influence thus exercised there has been throughout the country a very marked increase of activity in local associations, which was in various ways referred to at the meeting last Wednesday, and it may be that the abnormally meagre attendance on that occasion was really a consequence of this change and of the zealous action taken by local associations with the object of obtaining support to the Pharmacy Bill now before Parliament, having extinguished the desire to come and make a speech at the annual meeting. But though the meeting was unusually small, its tone was without exception one of acquiescent response to the President's plea for co-operation as being the first step towards improvement in the future.

The President, in moving the adoption of the Council Report, spoke of the apparent excess of expenditure over receipts during the past year as being partly a consequence of the method of statement and to a great extent due to payments of an exceptional nature as well as the influence of the new Bye-law, by which the fee for repeated entries to the examination has been reduced. He also showed that by comparison with the previous year the ordinary items of expenditure have been reduced. In the case of the Journal the reduction of net cost has been considerable, and it has fully justified the anticipations of last year. In connection with the annual financial statement, the Council has now decided to adopt a modified practice, and to take into account the several assets and liabilities at the end of the year so as to issue a balance sheet in place of the present statement. Meanwhile, however, the President expressed his satisfaction in being able to state that an account prepared on that method for the past year would have shown that the Society's income for 1897 was about one hundred and sixty pounds in excess of the expenditure. Another very important new departure in connection with the finances of the Society is the decision to establish a sinking fund for redemption of the leasehold property held by the Society.

Referring to the amended Bye-laws which have been approved by the Privy Council since the last anniversary meeting, the alteration they introduced was characterised as one for unqualified satisfaction from the point of view that every body of individuals should endeavour to advance the calling in which they are engaged. As a further ground for this satisfaction, the President recalled the fact that though there was some attempted opposition to the new Bye-laws it was neither in itself of very serious character nor had it such support as would detract from the practical unanimity of the desire to provide for sound education of future candidates for qualification.

In regard to the work of administering the Pharmacy Act, the usual monotony of its proceedings has been broken by the case heard before the Reading County Court, in relation to the sale of a packet of weed killer containing enough arsenic to poison two thousand persons, when a question was raised by the County Court Judge whether an ordinary partnership was not the same as a corporation. Though that case was decided against the Society on a question of fact and the decision was consequently upheld on appeal, the judges of the Court of Queen's Bench were distinctly of opinion that whether a principal be a member of a partnership or not, he is equally liable for offences committed by his servant when acting within the ostensible or implied authority of his masters. In this connection the too common practice of having branch shops managed by unqualified assistants was condemned by the President as a "scandal" and he held it to be the duty of registered chemists to put their own houses in order if they hope to be able to go either to the Courts or to Parliament for anything they may want in the future. During the past year the Council has had to take proceedings in many cases of this kind, and the matter is one demanding the serious attention of chemists.

In speaking of the Pharmacy Act Amendment Bill the President recalled his remarks last year as to the necessity of sinking personal differences of opinion for the sake of securing some general improvement, and after discussing the nature of the opposition by which the progress of the Bill is now prevented, reference was made to the opposition offered in the early stage of the Bill by a few pharmaceutical chemists in Manchester. Though he was glad to say that opposition has now been disposed of and also glad to be able to thank its originators for withdrawing their objections, it could not be overlooked that the prospects of the Bill had been prejudiced by the want of united support in its early stage. But for that the Bill might perhaps have been passed. Of the assistance rendered by local secretaries in obtaining support to the Bill, the President spoke in warm terms of appreciation, and in concluding his address he referred to the work of local associations as having also been of great assistance in promoting a healthy feeling of interest in the work upon which the Council was engaged for the advancement of the craft.

In the report of the speeches which followed the President's address will be found matter that is of sufficient importance to merit careful consideration by all members of the craft, and it should be productive of much useful discussion from various points of view.

METRIC WEIGHTS AND MEASURES.

Alteration of the weights and measures of capacity now in use in this country must necessarily be attended with some degree of inconvenience, for a time, whenever it becomes a matter of legislative enactment, and in view of the probability that commercial considerations may before long lead to a recognition that such an alteration is desirable for estab

lishing uniformity with the practice of other countries, any arrangement by which the inconvenience of the change would be reduced is worthy of some attention. In most countries where the French metric system of weights and measures has been adopted it has been the practice to retain, to some extent, the use of the older denominations of weight and measure for particular metric weights and measures that are in common use. Thus in France the denomination "livre" is still understood to apply to the half kilogramme. A similar application of the familiar denominations of British weights and measures to the approximate metric equivalents would probably help to facilitate the adoption of the metric system in this country and to reduce very much the inconvenience attaching to the change from one system to another.

The small difference between the half kilogramme and the avoirdupois pound offers an opportunity for attempting an adaptation of that and other denominations to metric quantities and the similar relation between the half litre and the pint admits of denominations of measure being adapted, in the same manner, to metric measures of approximate magnitude, so as to realise the special advantages of the French metric system and of a decimal sub-division.

In the event of the kilogramme being adopted as the legal unit of weight for trade purposes, and the half-kilogramme distinguished by the denomination "pound," the only effect of that change would be to require an increase in the price of articles sold by the pound, to the extent of one-tenth, that being the difference between the half-kilogramme and the present avoirdupois pound. In the case of transactions in which larger quantities are dealt with, the adaptation of denominations now in use, to metric weights would not involve differences so large as that between the new pound and the avoirdupois pound. Thus, for instance, fifty kilogrammes or one hundred new pounds would be only one pound twelve ounces and a third less than the present hundredweight, while one thousand kilogrammes or two thousand new pounds would be only about three pounds and a half less than the present ton. Consequently the adoption of the metric system with the retention of the denominations now in use, for trade transactions in large quantities, would not require any considerable alteration in the prices of goods so dealt with.

As to the sub-division of the kilogramme to meet the requirements of trade when smaller quantities are to be dealt with, it may not unreasonably be assumed that, without departing from the principle of decimal division, a half pound or five-tenths of a pound = ·25 kilogramme, would be admissible in practice. A decimal sub-division of the pound would give as the tenth part of a pound, or 0·05 of a kilogramme, a weight nearly twice the avoirdupois ounce. If the denomination "ounce" were applied to this weight the price of articles sold by the ounce would have to be nearly doubled, but the half or five-tenths of the new ounce would differ but little from the present avoirdupois ounce and that might take its place for practical purposes, without requiring much alteration of prices. By further decimal sub-division one-tenth of the ounce or 0·005 kilogramme would be a weight approximating to the drachm, and dividing that into one hundred parts, with the denomination of "grain" = 0.00005 kilo., the new grain would equal 0·77162 of the present grain. Another intermediate weight, the tenth part of a drachm (·0005 kilo.) might also be adopted as the scruple. The kilogramme would then be 20,000 grains, the pound 10,000 grains, the ounce 1000 grains, the drachm 100 grains, and the scruple 10 grains. In this way the use of the gramme weight might be altogether avoided, and the risk of its confusion with the grain done away with. For medical and pharmaceutical purposes the alteration of the grain to a somewhat smaller weight would have less disadvantage than its increase.

One great advantage of the metric system over that now in use in this country is the simple relation existing between the units of weights and measures of capacity, the litre being the volume of a kilogramme of water at its greatest density. The advantage of that simple relation could also be secured for British weight and measures if, according to the plan already described in regard to weights, the litre and half-litre were respectively distinguished by the denominations quart and pint. In that case the gallon (5 litres) would be ten new pints and the decimal sub-divisions of the pint would, respectively, bear the same proportionate relations to the ounce, drachm, and grain as the pint and quart to the kilogramme and the litre, that is to say, the kilogramme being two pounds, and the litre two pints, the new pint would be about one-eighth (2·363 fluid ounces) less than the present imperial pint, while the gallon would be about one-tenth (16·369 fluid

	Kilo or Litre.	Pound or Pint.			New Grains.	Imperial Grains.
	1000	2000 = 1 Ton.				
	50	100 = 1 Cwt.				
	5	10 = 1 Gallon.	... ...	... ...		77,161·768
Grammes.						
1000	1	2				15432·35639
500	0·5	1	Ounce.		10,000	7716·17819
50	·05	0·1	1	Drachm.	1000	771·61782
5	·005	·01	0·1	1	100	77·16178
1	·C01	·002			20	15·432
0·5	·0005	·001	·01	0·1	10	7·71618
·1					2	1·5432
·05	·00005	·0001	·001	0·01	1	·77162

ounces) more than the imperial gallon, as shown in the accompanying tabular statement. The fluid ounce (·005 litre) would be the tenth part of a pint, the fluid drachm (·0005 litre) would be the hundredth part of a pint, and the fluid grain (·00005 litre) or the ten thousandth part of a pint, would be equal to ·845 minim.

WHO IS THE SELLER?

In cases under the Pharmacy Act, difficulty has frequently been experienced in fixing the responsibility for offences against the law upon the right shoulders, and it sometimes happens that whilst an unqualified assistant who has actually sold a poison is fined for so doing, the equally unqualified employer who has instigated him to commit the offence escapes scot free. And it is not to be supposed that shopkeepers will go in much dread of the law if the only individuals who can be punished when illegal sales are effected in their establishments are assistants who do not possess sufficient means to pay the fines imposed by the Courts. The maintenance of the Statute thus becomes increasingly difficult, and the only way out of the difficulty appears to be recognition as a seller of the person on whose behalf the sale is made, as well as the individual who actually hands the article over the counter.

A recent case under the Merchandise Marks Act puts the matter on a proper footing. The assistant of a provision dealer sold an American ham as Scotch, ignoring a notice sent by the proprietor to all his places of business to the effect that no hams were to be sold under any specific name or place of origin. The justices who first heard the case held that the defendant had not taken all reasonable precautions against committing an offence against the Act, and convicted him. An appeal was entered and heard before a specially constituted court in the Queen's Bench Division, and a lengthy judgment was delivered last week. In the course of this judgment, the Lord Chief Justice said it was obvious that, if sales with false trade descriptions could be carried out with impunity so far as the principal of a business is concerned, the Act would, to a large extent, be nugatory. He, however, conceived the effect of the Act to be to make the master or principal liable criminally (as he is already by law civilly) for the acts of his agents and servants in all cases within the sections dealt with, where the conduct constituting the offence is pursued by such servants and agents within the scope or in the course of their employment, subject to this—that the master or principal may be relieved from criminal responsibility where he can prove that he has acted in good faith and has done all that it is reasonably possible to do to prevent the commission by his agents and servants of offences against the Act. The result, therefore, was that the conviction was affirmed, and with costs.

This result is extremely satisfactory, and the judgment might possibly be quoted with advantage when a suitable case under the Pharmacy Act is heard. If, as seems not improbable, the principle should be upheld that not only the person who actually hands over scheduled poison is liable under the Act, but also the proprietor or proprietors of the business, there would appear to be some prospect even yet of doing much to check the spread of illegal trading in poisons. Of course, when a registered individual hands over the poison on behalf of a joint-stock company, the case is hopeless, but, apart from that, much good might, and apparently could be effected.

ANNOTATIONS.

The New British Pharmacopœia causes confusion and puts inspectors in a fix, according to the *Morning Leader*, a writer in which paper, probably for lack of war news or other stirring matter, has attempted to grasp the significance of the sweeping changes in the national medicine book. He goes rather astray at the outset by assuming that the Pharmacopœia contains the standards for all drugs, etc., kept for sale and dispensing purposes, but he is not so far wrong in suggesting that the appearance of the new edition has had all the effects of a cat amongst the pigeons as far as chemists are concerned. A food and drugs inspector, for the county of Middlesex, in the course of a conversation with a *Leader* correspondent, is reported to have said that the whole point with his class is to know when the old pharmacopœia ends, and the new commences, operations. Some chemists are said to have the new book, others haven't, and the inspector thinks it is very hard on those who, perhaps, a month ago, got in "a big stock of drugs made up to old standards," to find them illegal now. But inspectors have no need to worry on that ground, since the British Pharmacopœia is not a standard under the Sale of Food and Drugs Acts.

The Altered Strengths of many B.P. preparations, and particularly of potent remedies, are certainly causing some trouble to many pharmacists, who are puzzled to know exactly under what conditions they should dispense the new preparations in preference to the older ones. Undoubtedly, a prescription dated prior to the publication of the 1898 Pharmacopœia ought to continue to be dispensed as formerly, but at what point should the changed conditions take effect. On the one hand, it is urged that the new formulæ alone are now official, and that the new preparations should be dispensed in the case of all new prescriptions. But others contend that, inasmuch as many medical men have not yet had any opportunity of consulting the new Pharmacopœia, it would obviously be improper to supply the new preparations with which those prescribers are not yet acquainted. It is quite clear that, for some time to come, pharmacists who do much dispensing must be prepared to keep two distinct sets of preparations. The newer ones should invariably be supplied in the case of ordinary sales, but the dispenser must exercise his discretion in deciding which to dispense. He will rid himself of some measure of responsibility in the matter by intimating to all the medical men in his district that, after a certain date, he proposes to dispense the new preparations only in the case of new prescriptions, unless others are specially ordered, and if he can persuade prescribers as well as chemists in his district to agree upon a joint plan so much the better. Let the end of June, for example, be the selected date, and intimate that fact at once, whilst enclosing to each medical friend a copy of the *P.J.* synopsis of the changes in the B.P. formulæ. But little difficulty ought then to be experienced.

This Same Subject is touched upon by the *Medical Press*, which thinks there is obviously something wrong in a scheme which pitchforks a new pharmacopœia on to the medical and pharmaceutical public without any provision for a decent interval of time to elapse before it is to be acted upon. How, it asks, is the practitioner to find time all at once to familiarise himself with the multitudinous suppressions and alterations comprised in the new edition, and what ought the chemist to do with his present stock of drugs prepared in accordance with the previous edition? To

the chemist himself that problem ought not to be difficult of solution, as previously suggested. Some have already made known their intentions in the matter, and the *Medical Press* regards it as fortunate that several of the best known dispensing chemists have formally intimated their intention of postponing the adoption of the new formulæ, etc., except when specially enjoined, until Midsummer Day. Moreover, it expresses the belief that this example will be generally followed. That, however, we do not anticipate, the more especially as many chemists are already supplying the new preparations, but undoubtedly uniformity of procedure is greatly to be desired. The difficulty that arises in this connection should, of course, have been foreseen and provided against by the General Medical Council, but as matters now stand prescribers practically have the matter entirely in their own hands. It is essential, however, that they should be acquainted with the contents of the new Pharmacopœia, and if they will not purchase and read the book itself they should at least follow the advice given by our medical contemporary and digest one or other of the epitomes which, with commendable regard for their convenience, have recently been issued.

Professor Dewar is unfortunate in being so persistently and unfairly charged by implication with taking unto himself the fruits of other men's labours, and the reiterated suggestions of scientific piracy on Professor Dewar's part publicly thrown out by another distinguished experimentalist can only be described as being in the worst possible taste. If Professor Olszewski has liquefied hydrogen it ought not to be difficult for him to prove the fact, but a private letter to an acquaintance cannot well be accepted as satisfactory evidence of the authenticity of the alleged results, and a mere statement of the existence of such a letter is even less conclusive. For the present, therefore, and until overwhelming evidence to the contrary is forthcoming, Professor Dewar and his assistants must be regarded as the first persons who have been able beyond question to liquefy hydrogen, and probably helium also.

As Pointed out in a Letter published in the *Pall Mall Gazette* all the statements so often made in disparagement of the work of Professor Dewar are traceable to an assertion made rather more than two years ago by Professor Ramsay, to the effect that he had received the private letter referred to from Professor Olszewski, stating that he had obtained liquid hydrogen in a static condition. Professor Ramsay was then challenged to produce a document so strangely at variance with Olszewski's public claims, but he did not produce it, and has not produced it to this day. In fact, Professor Dewar said, at the meeting reported this week, that, great as is his gratification at obtaining liquid hydrogen, that would be still greater if he could see the letter he has been waiting more than two years for a sight of. Even this direct challenge failed to produce the document which has given rise to so many calumnious and abusive attacks, and as the writer in the *Pall Mall Gazette* observes, men of honour and men of sense may be left to draw their own conclusions.

The Register of Chemists and Druggists does not include the name of John Henry Williams, who pleaded guilty at the Central Criminal Court this week to a charge of uttering forged cheques. It is needless to say, therefore, that the daily newspapers erred in describing him as a chemist. Neither was Thomas Preston, who committed suicide last week, at Leytonstone, by means of prussic acid, a registered chemist. In like manner it will be found that most of the discreditable actions vaguely laid to the account of "chemists" have in reality been performed by other persons who are in no wise warranted to use the title wrongly assigned to them. Chemists and druggists in the respective districts should invariably write to papers publishing reports that are incorrect in this respect, asking that a disclaimer should appear.

"The Three Presidents' Reception" will be held at the Galleries of the Royal Institute of Painters in Water Colours, Piccadilly, W., on Tuesday next, May 24. The three Presidents are the heads of the Institute of Chemistry of Great Britain and Ireland, the Society of Chemical Industry, and the Society of Public Analysts, and they, together with their wives, are expected to receive and entertain a large and distinguished company. The time of the reception is 8.30 p.m.

The Municipal Technical Schools, Plymouth, have been officially recognised by the Conjoint Board of the Royal Colleges of Physicians and Surgeons for their courses of instruction in chemistry, physics, biology, and pharmacy, so that the time spent in study at the schools will count as one "Annus Medicus" in the medical student's curriculum. It is in connection with the same schools that negotiations have been carried on for some time past with a view to the education of pharmaceutical students there.

The Use of Formic Aldehyde as a Disinfectant has been investigatedby Walther and Schlossmann (*Journ. für Prakt. Chem.*, lvii., 173), who find that the various methods employed work unsatisfactorily. All the usual methods dependent on the production of the vapour of formic aldehyde require a large volume of water vapour to prevent the formation of the solid polymer, paraformaldehyde, which is said to be the less active disinfectant. A glycerin solution of formic aldehyde, "glycoformal," overcomes this difficulty and satisfies all the requirements of efficient disinfection when sprayed from a suitable apparatus as devised by the authors. For a room capacity of 15 cubic metres 1 kilo. of "glycoformal" should be sufficient to destroy all pathogenic germs in half an hour. According to G. L. Taylor (*Amer. Journ. Pharm.*, 70, 195), the failure of many investigators to obtain satisfactory sterilisation with formic aldehyde is due not to its lack of germicidal power, but because the test organisms have not been freely exposed to its influence. This is best accomplished by employing loosely twisted threads of cotton which have been steeped in the pathogenic cultures, and then exposing the cultures on sterilised paper for six hours to the action of the vapours of the formic aldehyde. Drs. Park and Guerard have proved that formic aldehyde can be depended on to produce thorough surface disinfection, and that it does not affect metals or colours in any way, and that the cost is not greater than when sulphur is used.

Mr. Griffiths' Remarks at the Annual Meeting appear to indicate that not only is he unacquainted with Mr. Harry Jessop, but that he has not read the report of Mr. Jessop's remarks, upon which our note was based. Nothing in the nature of a "sneer" was printed in these pages, but Mr. Jessop had seen fit to adopt and give currency to a malicious and untruthful statement regarding the object of the Pharmaceutical Council in endeavouring to effect an alteration of the Bye-laws, as Mr. Griffiths will find on referring to the report published by a trade contemporary, and all that was done in the *Pharmaceutical Journal* was to show an individual's unfitness to pose as a critic of matters concerning which he apparently knew little, and that little imperfectly.

NOTICES OF BOOKS.

'A Synopsis of the British Pharmacopœia, 1898,' by H. Wippell Gadd (London : Baillière, Tindall and Cox. Price 6*d.*, or in cloth 1*s.*), has for its aim to show concisely in what way the new Pharmacopœia differs from the old, and also to furnish a complete synopsis of the former. It includes tables of the alterations, additions, and omissions, with explanatory notes, followed by a complete alphabetical list of all the drugs and preparations of the new B.P., giving their characters or strengths, doses (according to both the Imperial and metric systems), and other particulars. This list constitutes the bulk of the book, and must have involved a very large amount of labour in its compilation. Finally, there is an appendix, including tables of weights and measures, thermometric equivalents, atomic weights, etc. In compiling the book the author has had in mind the needs of medical practitioners, pharmacists and students, and though his book is later than other similar works in making its appearance, his labours will doubtless be suitably recognised.

'The Photographic Tourists' Guide' (London : Pharmaceutical Journal Office, 5, Serle Street, W.C. Price 4*d.*, post free) is a reprint of matter that has appeared in the Photographic Supplements published in connection with the Journal, together with other matter likely to prove useful to amateur photographers on tour. In view of the exceedingly large number of chemists and druggists who are engaged in the photographic trade, it has been thought that they would be glad to distribute a book of this kind, which will take up little room in the pocket, and yet provide the photographic tourist with all the information he usually requires when away from home. The book consists primarily of the concise gazetteer reprinted from the Journal, with a list of dark rooms and dealers in photographic materials in the United Kingdom and abroad, but there are also useful hints to photographic tourists, notes on exposure, a calendar with blank spaces for memoranda, exposure tables, etc. Single copies can be supplied by the publishers, at fourpence each, post free, and terms for quantities will be found in our advertising columns this week.

'Metric Equivalents of Imperial Weights and Measures, and Thermometric Equivalents (London : Pharmaceutical Journal Office, 5, Serle Street, W.C. Price 1*s.* 6*d.* net.) is a reprint of the tables that have been published in the Journal during recent months, but considerably extended ; the figures have also been carefully revised. The equivalents of the metric measures of length, mass, and volume are first given, with the necessary factors for converting them into Imperial units, then follow detailed equivalents of measures of length, and a series of useful conversion tables and rules. Equivalents of measures of mass and volume come next, and thermometric equivalents—in degrees Centigrade, Fahrenheit, and Réaumur—from −40° F. to 600° F.—complete the book, which is of a convenient size to lie on the desk for reference. At the same time the separate sheets—printed on one side only—are large enough to be suspended in the laboratory or dispensary, and in view of the fact that all formulæ in the British Pharmacopœia are now stated in terms of the metric system, every pharmacist ought to possess a copy of the tables.

'The British Pharmacopœia (1898) Formulæ and Processes' (London : Pharmaceutical Journal Office, 5, Serle Street, W.C. Price 4*d.*, post free), is now in its sixth edition. This edition contains several pages of additional matter, and the original notes have been revised and extended in places. No better or more readily comprehensible guide to the changes in the B.P. has yet been published, and both pharmacists and students will find it the best practical guide to that work. The additions render the book more suitable than ever for circulation amongst medical men by chemists or pharmaceutical associations, and as the price is merely nominal no one interested in the progress of medicine can afford to be without it. Early application should be made for copies before the book goes out of print, as it will probably do at an early date.

'Notes on Pharmacy and Dispensing for Nurses,' by C. J. S. Thompson (London : The Scientific Press, Limited, Southampton Street, Strand, W.C. Price 1*s.*), is the title of a slight work of about a hundred small pages, which constitutes one of the Burdett Series of popular text-books on nursing, etc. The chief object of the notes is defined to be the presentation to nurses, in simple language, of a description of the various methods employed in dispensing the medicinal agents they so frequently handle in the exercise of their calling. "Mishandle" might be suggested as a more generally appropriate term, but that is a point of comparatively slight importance compared with the suggestion that the manner of preparing remedies in everyday use should be of value to those who are called upon to administer them. For whilst the medical practitioner knows little about the preparation of the remedies he prescribes, the nurse needs to know less, and it is difficult to conceive of any good reason for assuming that matters should be otherwise. The art of dispensing, as we are told in the preface to this little book, is not an easy one to learn, and it is greatly to be regretted that the author should have gone out of his way to attempt to prove himself wrong in that respect. Nurses have a sufficiently wide field open to them without attempting to infringe upon the province of either the medical man or the pharmacist, and that being the case they will be better without the smattering of pharmaceutical knowledge that the most complete digestion of Mr. Thompson's notes can impart.

'Pharmaceutical Formulas,' by Peter MacEwan, F.C.S. (London : Offices of the *Chemist and Druggist*, 42, Cannon Street, E.C. Price 7*s.* 6*d.* net), is a book that fully justifies its sub-title of "A book of useful recipes for the drug trade." To quote the title-page, it comprises formulas for toilet preparations and specialties, preparations for the hair, dentifrices, perfumes, household and culinary requisites, beverages, antiseptics and disinfectants, inks, varnishes, confectionery, medicinal compounds, and many other preparations related to the art of pharmacy. But, it may be observed, it would pass the wit of man to devise, or even to test, any number of formulas for such a variety of purposes ! That may be, and the book under consideration yet prove the most valuable of its kind now on the market. A book of recipes, every one of which could be personally vouched for by the author, would be literally priceless, and is never likely to exist in a world where self-interest prevails as a matter of course. But trade journals nowadays require to furnish information on topics of all kinds, and from the multitudinous formulas published by the journal he so ably represents, Mr. MacEwan has selected a very large number with care and discretion. He has then conveniently classified them, provided a pithy and concise introduction to each section, and last, but far from least, he has rounded off the work of collation by annotating the formulas in a distinctly practical manner. The work involved in the preparation of the six hundred and seventy pages in the book must have been very great, and chemists who first resort to them for aid are not likely to require much further assistance

from other sources. Although the compiler is careful to disclaim the suggestion that the book is a treatise on practical pharmacy, the hand of the practical pharmacist is visible throughout, and whether it be the preparation of a skin lotion, tooth paste, effervescent drink, furniture polish, or some unofficial galenical preparation, no one is likely to delve in this mine of information without finding something at least approaching what he requires. And since, after all, the practical man expects to find little more than a hint in any formula that may present itself to him, the fact that one's exact requirements are not invariably met in a collection of formulas is not necessarily a reflection upon the value of that collection or upon the ability of its compiler. But the 'Practical Formulas' offered by Mr. MacEwan give much more than the mere hint in many, if not most, instances, and it is not surprising to learn that a second edition of the work is already in the press. It is in a spirit of pure selfishness that chemists who have not secured a copy of the first edition are advised to order a copy of the second, for the more frequently the pages of the book are referred to the greater will be the economy of space in the columns of the Journal which are now devoted to answers to correspondents. And, indeed, the book is very good, and therefore cheap.

'Applied Bacteriology,' by T. H. Pearmain and C. G. Moor, M.A., Cantab. (London: Baillière, Tindall and Cox, King William Street, Strand. Price 12*s.* 6*d.* net), is an introductory handbook for the use of students, medical officers of health, analysts and sanitarians, now in its second edition. The matter is conveniently arranged, has been thoroughly revised by expert hands, and ought to supply the needs of all those for whose use the book has been especially compiled. The introduction treats of the nature, structure, reproduction, etc., of bacteria and their resistance to physical influences. The apparatus used in bacteriological research and the preparation of nutrient media are considered next, then follow descriptions of the methods of bacteriological study. The spread of disease, immunity, bacterial toxins, and serotherapy next come in for their share of attention, after which separate chapters are devoted to very complete monographs on tuberculosis, leprosy, anthrax, typhoid, diphtheria, cholera, pyogenic organisms, erysipelas, gonorrhœa, glanders, syphilis, influenza, tetanus, malignant œdema, bubonic plague, pneumonia, relapsing fever, scarlet fever, smallpox and vaccinia, hydrophobia, malaria, actinomycosis, yellow fever, English cholera, autumnal and infantile diarrhœa, diseases due to parasitic fungi, protozoa in disease, and certain diseases of the lower animals and of plants. In each case a brief account of the discovery of the organism particularly associated with the disease is supplemented by descriptions of the most suitable methods of staining it or cultivating it on media. Fermentation and disinfection also receive due attention, as well as the bacteriological examination of water, filters, milk, air, soil, etc., and the concluding chapter is devoted to a summary of the characters of some commonly occurring organisms not previously described. The book is illustrated with some forty wood-cuts and about eighty coloured figures of preparations, cultures, etc. Regarding the practical value of the work, that is almost definitely vouched for by the publication of this second edition, but it may not be amiss to say that the enormous mass of material available has been carefully sifted, and that portion presented in the book judiciously selected. It is a concise guide, prepared by experts for experts, and the practical applications of bacteriology are probably as satisfactorily dealt with as is possible within the limits of a text-book of convenient size, such as the one under consideration is.

Pharmaceutical Transactions.

Midland Chemists' Assistants' Association.

This Association brought the winter session to a close on the 11th inst., when a meeting was held at the Exchange Restaurant, Birmingham. Mr. F. J. Walton, the recently-elected President, took the chair. The evening was devoted to a discussion on

The New Pharmacopœia,

upon which Mr. F. H. Alcock had already addressed the members (see *Pharmaceutical Journal*, April 30, p. 422).—Mr. Alcock was again present, and opened the discussion by showing several standardised preparations new to the present Pharmacopœia. On the subject of parts in the new B.P., he pointed out that in the table of solubilities it was not made clear whether fluid parts or parts by weight were intended. In some instances it would make an important difference in the figures quoted if parts by weight were intended. With regard to liquor concentratus he had communicated with Mr. Bird, who was of opinion that parts in this case meant parts by volume. Some authoritative statement on this subject was desirable. On the subject of animal products he expressed the opinion that the average pharmacist, unfamiliar with the mode of collection, would have considerable difficulty in obtaining what was necessary to meet the new requirements, and would have in most cases to rely upon the wholesale houses.—Mr. Alcock next spoke of the unusually large quantities used in testing the purity of substances, quoting as instances sulphate of quinine and chloroform, in which case a large quantity had practically to be wasted in ascertaining their purity. Although precise directions were given for ascertaining the purity of the official preparations and chemicals no mention was made of the purity of the re agents to be used in testing, and in recent times especially he had frequently found these wanting in average purity.—The Chairman advised members to confine the discussion to the particular points raised by Mr. Alcock, and invited remarks from any gentleman who had had practical experience in the new preparations. He alluded to the omission of so many decoctions and the question of parts as calling for comment.—Mr. R. D. McAllister pointed out that the Pharmacopœia of 1885 did not take effect for about a year, whereas the present new one had been sent flying over the heads of pharmacists and their students without any warning.—Mr. E. Osborne said he had been informed from Durham, where he was presenting himself in September for examination in materia medica and therapeutics, that the new B.P. having become authoritative, students would be questioned upon its contents. This differed from the decision of the pharmaceutical authorities, and seemed to him to savour of cram. He asked why lin. ammonia contained almond oil, and why liq. ammon. acet. fort. and liq. ammon. cit. fort. had been deleted. This was used by nearly all the medical practitioners and chemists he knew, the practice being to dilute it as required for weaker preparations.—Mr. F. Foster, replying to the point raised about almond oil, said it made the preparation more fluid.—Mr. E. W. Mann, who had prepared tincture of orange from the new B.P., said he found it contained a greater quantity of essential oil, and did not therefore mix clear in water. When used for making syrupus aromaticus it remained cloudy. Referring to the subject of the thyroid glands, he said it was necessary to very carefully examine them before using them for a liquor. He mentioned that out of seven or eight thousand recently examined, 20 per cent. showed smaller or larger cists containing a whitish matter, and had, therefore, to be rejected. Tincture of orange did not mix clear with water, and the syrupus aromaticus prepared with it was distinctly opalescent, and of course could not be filtered without injury to its aromatic properties. Hyd. oleas now contained soap as well as oleic acid, and gave a fatty mass. The B.P. ordered it to be dried, but it darkened at the least attempt to heat it. Liq. hyd. perox., one would suppose from a glance at the B.P., required the 20 volumes of gas when estimated, but this was not the ordinary 20 volumes solution, as 10 volumes came from pot. permang., making the solution simply 10 volumes. With regard to ung. paraffin., unless the B.P. paraffinum molle was kept within the range of the melting point given, the ointment would be harder than it should be, but the paraffin. molle at a lower melting point gave a very useful ointment base. Syrup of glucose was now used as a pill excipient instead of treacle, but it would

be found, unless a special quality of glucose was taken, that it would be a variable product. On the question of parts, he thought an authoritative statement should be made by the compilers of the B.P.—Mr. J. Selby asked why the sarsæ was heated to 71° in liq. sarsæ co. conc. He could see no necessity for changing the name when the two preparations were almost identical.—Mr. R. L. Davis was of opinion that the difference between the old tincture of orange and the new would be very considerable as regards price. There would also be some trouble in the dispensing of nux vomica, as the new tincture would give a precipitate with water.—Mr. Cox referred to the mercury oleate as a very troublesome preparation to make, and very difficult to thoroughly dry. It was difficult to separate the precipitate from the water. Zinc oleate was much clearer and easier to make, and with care could be dried and powdered without any trouble. Lin. tereb. now made a very nice preparation. He hoped that if kept for any length of time it would not turn into a jelly, as it was apt to do under the 1885 Pharmacopœia. The almond oil in liq. ammon. made the production more creamy and fluid than when olive oil was used alone. Many who tried to make mist. olei ricini according to the 1885 Pharmacopœia failed, but now they might congratulate themselves that the trouble was over, as the compilers of the new B.P. had given them a form that was in every way satisfactory. It was a nice creamy preparation, pleasant to look at. Tinct. chlorof. et morph. was now a clear bright green tincture, stronger than under the 1885 B.P., and not at all like chlorodyne, which the work tried to imitate. But the concentrated liquors were a puzzle. It was difficult to say whether they were to be used diluted when infusions were ordered, or whether they constituted preparations of themselves. Again, to what proportions were they to be diluted? The Preface said compounds had been obtained to resemble the liquors which manufacturers had termed concentrated decoctions. In the majority of cases manufacturers made them 1 to 7, that was, 1 fluid part added to 7 parts of water was equivalent to 8 of the fresh infusion. The B.P. quantities worked out 1 to 9 to make 10, and he thought the compilers ought to give the dispenser something to guide him. He took it, when infusion extract was ordered, a fresh one must be used, and that no dilution of the concentrated liquor ought to be allowed as a substitute. He thought syrupus limonis ought to make a nice preparation, and he wondered why mist. cretæ did not contain an even quantity of powder to the ounce. The old mist. of Pecini was a very difficult preparation to make; the new one was much easier and gave a more satisfactory result. Mr. Cox also referred, in conclusion, to the alterations in the formulæ of black wash, which now contained some tragacanth to suspend the precipitate and cause it to adhere more firmly.—Mr. T. H. Thomas inquired whether there was much difference between the therapeutic action of Socotrine and Barbados aloes, because he had been given to understand that there was considerable difference in the cost. No mention was made of the fact that a little chloroform in the pill of phosphorus would prevent the phosphorus from taking fire. He asked, why was the water acidulated into which the tincture was poured in the preparation of podophylli resina; why saffron should be omitted from pulvis cretæ aromaticus; and what was meant by washing out the sulphate in the preparation of ung. zinci oleatis.—Mr. E. Osborne followed with a demonstration of the action and use of the thyroid gland, and showed where it was found in the sheep.—Mr. Alcock, summing up the discussion, said the reason for the temperature of 71° in the preparation of liq. sarsæ co. conc. was to prevent any starch being dissolved, and for the same reason the root was to be cut transversely and not longitudinally. The sulphate referred to in the preparation of ung. zinci oleatis was sulphate of sodium formed by the reaction of the oleate of sodium and zinc sulphate. The concentrated liquors were not to be used when infusions were ordered. He did not think they were to be compared with fresh infusions. The expense of tr. aurantii would be much greater than the old preparation. In fact, the new Pharmacopœia would tend to make things dearer all round. He did not think that liq. sarsæ co. conc. should be sold for dec. sarsæ co. conc.—The discussion then ended.

COMPLIMENTARY DINNER AT FALKIRK.

On Thursday, May 12, Mr. David Murdoch, pharmaceutical chemist, High Street, Falkirk, was entertained by a large number of local gentlemen to a complimentary dinner in the Crown Hotel, on the occasion of his retirement from business, which he has conducted for fifty-one years, and his departure to take up his residence in Edinburgh. Provost Weir presided, and Mr. Wilson, Town Clerk, acted as croupier. An apology for absence was intimated from Mr. J. Laidlaw Ewing, Chairman of the North British Branch Executive, who said Mr. Murdoch was one of the oldest members of the Pharmaceutical Society in Scotland. He took an active interest in the formation of the North British Branch, now nearly fifty years ago, and as a member of Executive and as local secretary for Falkirk during the last thirty years he had rendered great service to the Society.—Mr. Wilson, Town Clerk, proposed the toast "Our Guest."—Mr. Murdoch, in responding, said the original occupant of his shop was Mr. Robert Walker, who was in business for fifty years, and for thirty-five years in his shop, which had thus been an established pharmacy for ninety-seven years. He wished he (Mr. Murdoch) could have stayed a few years longer to complete the century, but health considerations had induced him to give it up, and it was now to be carried on by Mr. R. G. Drummond. When Mr. Walker was the occupant of his shop ninety-seven years ago things were different to what they were now. The old gentleman used to lock his shop-door in the forenoons and walk down to his garden in the Howgate and work away at his herbs. The public knew that if they did not find the "old lad" or "the laboratory," as they called him, in the shop, they would find him in his garden. He was always looked upon as a very skilled person, and numbers of people from Slamannan and elsewhere used to come to Falkirk and ask for "the old lad, the laboratory."—Other toasts followed, songs were rendered by members of the company at intervals, and the proceedings throughout were of a highly interesting and enjoyable character.

HALIFAX AND DISTRICT CHEMISTS' ASSOCIATION.

A meeting of this Association was held on Thursday evening at the Old Cock Hotel. There was a good attendance of members.—The President, Mr. G. M. Cobb, was in the chair.—The Hon. Secretary, Mr. H. C. Brierley, read a letter from Mr. Glyn-Jones (see *Pharm. Journ.*, last week, p. 468).—In the discussion which followed, Mr. H. W. Seely, Vice-President of the P.A.T.A., said that the chemists of this country had the remedy in their own hands by simply joining the P.A.T.A. and letting the big manufacturers see that they were in earnest. There was no doubt but that the P.A.T.A. scheme was the best that had ever been introduced. Messrs. Swire, Vice-President, Bottomley, C. Fielding, Patchett, and others took part in the discussion. A sub-committee was formed, consisting of Messrs. Cobb—the President—Seely, Dixon, W. S. Thompson, Tiffany, and H. C. Brierley, Hon. Secretary, to meet once a month to discuss P.A.T.A. matters.—Permission was given to the P.A.T.A. to use the name of the Association on their stationery.—Mr. Tiffany drew the attention of the meeting to the fact that Munyon's had put up the price of their preparations, alleging that it was done to prevent cutting. This position was held to be illogical, and dissatisfaction was expressed by the members at Messrs. Munyon's proceeding.—The Secretary was instructed to write on behalf of the Association to the Chemists' Aërated Waters Association, asking them to engrave their name on the glass of the syphons, thus lessening the chance of their being lost.—The new Pharmacopœia was then discussed.—The question was raised by the Secretary as to the length of time allowed to chemists in order that they might clear off existing stocks of old B.P. preparations without pecuniary loss.

TUNBRIDGE WELLS AND DISTRICT CHEMISTS' ASSOCIATION.

The above Association was successfully started on May 5, when the first annual dinner was held at the Castle Hotel, Tunbridge Wells. A representative gathering was present, including Messrs. Booth, Chatterton, Dunkley, Gough, Gower, Green, Harris, Hobbs, A. Nicholson, Ogle, Pearmund, Robinson, Rogers, Sells, Tute, and Tweedy. At the conclusion of the dinner the toast of "The Queen and Royal Family" was loyally responded to. Mr. R. Sells next proposed "Success to the Tunbridge Wells and District Chemists' Association," to which Mr. R. A. Robinson responded. "The Pharmaceutical Society" was given by Mr. Dunkley, and Mr. A. E. Hobbs (local secretary) replied. Mr. A. Nicholson proposed "The Medical Profession," and Mr. H. Harris responded on their behalf. The "President of the Local Association" (Mr. R. A. Robinson) was proposed by Mr. Ogle. A most enjoyable evening was spent, songs and recitations being ably rendered by Messrs. Booth, Gough, Rogers, and Hobbs, whilst Mr. Pearmund presided at the pianoforte. The officers of the Association were elected by

ballot immediately before dinner, and are as follows:—Mr. R. A. Robinson (President), Mr. G. Cheverton (Vice-President), Mr. O. Rogers (Treasurer), Mr. A. E. Hobbs (Secretary), and Messrs. Gower, Gough, and Ogle (Committee).

MEETINGS OF SCIENTIFIC SOCIETIES

ROYAL SOCIETY.

At a meeting of the Royal Society held on Thursday, May 12, Lord LISTER, F.R.C.S., D.C.L., in the chair, Professor Dewar, F.R.S., communicated a preliminary notiec of the fact that he had for the first time succeeded in accomplishing the

Liquefaction of Hydrogen and Helium.

It will be remembered that these two gases have until now defied all attempts which have been made to liquefy them. It is true that in 1895 Professor Olszewski momentarily obtained indications of the liquefaction of hydrogen, but was baffled in his attempts to obtain even a small quantity of it in the form of a coherent liquid. His method consisted in subjecting hydrogen to great pressure, and the cold produced by boiling liquid oxygen *in vacuo*. By this means a temperature of −211°C was reached, and by suddenly relieving the pressure and allowing the hydrogen to expand, Olszewski observed the indications of liquefaction referred to. He was able, however, to determine approximately the critical temperature (−233°C) and the boiling point (−243°) of hydrogen and came to the conelusion that the critical point of helium is below −233° C., and its boiling point below −264°. These determinations have, however, generally been considered to have been theoretically determined, and until last week it seems highly probable that hydrogen and helium remained unliquefied. In the course of his remarks Professor Dewar recalled the fact that in 1895 he described an apparatus to produce a jet of hydrogen containing liquid, showing how such a jet might be employed as a means of cooling substances below temperatures which can be reached by the aid of liquid air. All his attempts to liquefy the hydrogen were unsuccessful, but up to the present no other investigator has been able to press the investigation further with any degree of suecess. As the apparatus mentioned worked well, the professor had caused to be constructed a larger plant on the same plan, adding to it special arrangements for the liquefaction of hydrogen. The apparatus took a whole year to build and perfect, and after many trial tests followed by defeat he started on May 10 to cool hydrogen down to −205° C., allowing it to escape continually under a pressure of 180 atmospheres from the nozzle of a coil of pipe at the rate of ten to fifteen cubic feet per minute. As it escaped it was conducted directly into a vacuum vessel doubly silvered and of speeial construetion, surrounded by a spaee which was kept below the temperature of −200° C. These elaborate precautions were successful, for liquid hydrogen began to drop from this vacuum vessel into another, doubly isolated by being enclosed within a third vessel, and in five minutes 20 C.c. of hydrogen were collected. Had a sufficient supply of hydrogen been available, Professor Dewar thought he could have obtained a whole pailful of the interesting liquid. As it was, the hydrogen jet quickly beeame frozen up, owing to the solidification of air inside the pipes. The yield of liquid hydrogen was about 1 per cent. of the gas taken. Repeating this operation on May 12, 40 C.c., were collected. The Professor contented himself with mentioning a few characters and properties of the liquid obtained, reserving a more complete description of them for a future communication. Liquid hydrogen, as obtained above, is a colourless liquid, showing a meniscus as distinct as that of water; its refractive index and dispersion are high, and it shows no absorption spectra. A piece of glass tubing was sealed at one end, and this end was immersed in the liquid. Abundance of solid air immediately collected inside the glass tube. A sample of helium most carefully prepared from the gas from the King's Well at Bath was immersed in the liquid hydrogen, when the helium at once appeared as a liquid. Much interest must naturally centre round this experiment, because it will be remembered that there appeared in the Cracow Academy Bulletin of 1896, a paper by Olszewski, announcing a research on the liquefaction of helium. Olszewski considered helium might possibly prove to be a permanent gas, considering that it is much more difficult to liquefy than hydrogen. About that time Professor Dewar suggested that they might prove to possess about the same degree of volatility, just as is the case with oxygen and fluorine. Passing on to the last property of liquid hydrogen that has so far been determined, the lecturer remarked that the density of the liquid hydrogen must be in excess of the theoretical values, viz., about 0·18 or 0·12, deduced respectively from considerations respecting the atomic volume of gaseous compounds and the limiting density found by Amaget for hydrogen gas under infinite compression. Many years ago the professor himself had determined by experiment the density of hydrogen in palladium at 0·62 for the combined substance. It remains to be proved what is the real density of liquid hydrogen at its boiling point. But the boiling point has not yet been determined with accuracy. In conclusion, and speaking more generally, Professor Dewar went on to say that all the so-called permanent gases have now been condensed by the aid of manipulative skill at atmospheric pressure in spite of doubts on the subject expressed by so renowned a physicist as Clark Maxwell. The fact that at last we have arrived at a temperature within 20° or 30° of absolute zero opens up quite a new field to scientific inquiry and investigation, for the problem of the near future will be to find out the properties of matter at absolute zero. It is historically interesting to note that Faraday in 1823 liquefied the first gas, viz., chlorine. Sixty years later air was liquefied by Wroblewski and Olszewski, and now in 1898 the last two gases to resist liquefaction, viz., hydrogen and helium, are obtained as astatic liquids. Assuming, in a thermodynamic sense, the gap bridged over between the liquefaction of chlorine and air to be the same as that between the liquefaction of air and hydrogen, we may take it as an index of the rapid rate of scientific progress at the present day in that the latter was accomplished in one-fourth the time required by the former. But this result must have been long delayed but for the engineering skill which Mr. Lennox has brought to bear on the problem, together with the manipulative ability and loyal perseveranee of both Mr. Lennox and Mr. Heath.

In the discussion that followed, Sir William Crookes, Sir J. Crichton Browne, Sir Edward Frankland, Mr. Ludwig Mond and others expressed their admiration of Professor Dewar's achievement. They all concurred in congratulating him and his assistants on this fine piece of work. Like Alexander, said Sir Edward Frankland, there remained no worlds for him to conquer. Lord Rayleigh testified to having seen the first droppings of this interesting liquid, and said that, from the little he had seen of it, there was no doubt in his own mind that the liquid was hydrogen.

Professor Ramsay questioned the purity of the sample of helium operated upon, and mentioned that, in 1895, Professor Olszewski had written him a personal letter, conveying the information that he had obtained liquid hydrogen. It would be interesting if Professor Dewar corroborated the determinations of critical and boiling points made by Olszewski. In reply Professor Dewar warmly repudiated the suggestion that hydrogen had been liquefied by Olszewski, and called upon Professor Ramsay to produce the letter in public.

A cordial vote of thanks to Professor Dewar was then proposed by the President, and heartily accorded by the meeting.

ROYAL INSTITUTION.

On Thursday, May 12, the Right Hon. Lord RAYLEIGH, M.A., D.C.L., LL.D., F.R.S., Professor of Natural Philosophy at the Royal Institution, gave the first of a series of three lectures on

Heat.

Lord Rayleigh proposed to consider heat in its relation to material bodies, leaving to text-books the subject of radiant heat. In passing, he observed that the term radiant heat is open to objection; it is rather energy of radiation, which when absorbed, becomes heat. Among the various theories that have from time to time been put forward as to the nature of heat, none has retarded progress so much as the theory of "caloric." It is difficult to say to whom this theory is due; no doubt the French mathematicians, Fourier and Laplace amongst the number, and many of the great chemists were largely responsible for its development. It is certain that no physicist of the first rank has looked on the caloric theory with favour. Newton did not believe in it, Rumford and Davy looked upon it with disfavour, and Young spoke of it with sarcasm. The theory that is now very generally held presupposes that the molecules of

a body, being set in motion, cause the phenomenon of heat. The motion of these particles is invisible, since neither the body as a whole nor any part of it can be seen to move. From these preliminary remarks as to the nature of heat the lecturer went on to describe some of its properties and the effects produced by heat on certain material substances. Unlike electricity, heat does not readily lend itself to accurate experimentation ; this is due to its relatively easy conduction through materials of every kind. No substance is impermeable to heat, though some offer more resistance to its passage than others. There is less difference between good and bad conductors in respect of heat than is the case with electricity. Hence heat cannot so readily be isolated. Among so-called poor conductors of heat may be cited paper and wood. Many interesting problems have been solved dealing with the relation of heat to solid bodies, such as a ball of copper. Thus provided the temperature remains constant and the temperature at the surface is known, it is possible to calculate the temperature at any point of the interior. Again, it has been proved that the extremes of temperature always lie on the surface of a conducting body ; therefore no point of the interior can be so hot as the surface of a hot body nor so cold as the surface of a cold body. An experiment (a modification of that originally devised by Sir W. Grove) was shown illustrating the fact that a given volume of hydrogen cools a strip of heated platinum foil more rapidly than does the same quantity of air. An electric current was passed through a piece of platinum foil contained in the centre of a glass globe filled with air. The platinum soon became red-hot. The air was removed as thoroughly as possible by means of a pump and its place taken by hydrogen gas at the same pressure. On passing a current of the same strength it was apparent that the platinum became less hot. This is due to the higher conductivity of hydrogen. Passing on to the question of registration of temperatures, it was demonstrated that the hand alone is capable of appreciating a difference of 1°. It is humiliating to think how comparatively small an alteration of temperature affects the human body prejudicially. The various forms of thermometer were then described and discussed, especially air thermometers for registering temperature at constant volume and at constant pressure. Inasmuch as in using air thermometers we measure the volume of the residual air, it follows that absolute zero cannot be registered by means of this instrument. The law of Boyle must not be pressed too far. An apparatus was described for the registration of temperature which depends on the fact that the electrical resistance of a coil of platinum wire varies directly with the temperature. The thermo-electric junction method was commended for use in furnaces at high temperatures, on account of its wide range and high degree of accuracy. The well-known experiment was performed in which an electric current is passed through a long piece of platinum wire stretched taut between two fixed points. The heat developed causes the metal to expand, and it drops to a considerable extent. The development of terrific forces by the prevention of expansion of various materials and the many applications of this important principle next received attention. The original development of winds was traced to heat, since the sun's rays initiate the upward current of heated air, its place being taken by cold air. Winds are not only horizontal ; vertical winds are very prevalent in some parts. This accounts for the sustained flight of birds, which apparently float in an almost passive manner in the air. The lecturer had spent many hours during last winter watching the flight of birds in India. He noticed that they generally chose a place to windward of some large obstacle, where they were certain to find upward currents of air, because winds beating against an object strike upwards in order to surmount it. Birds, therefore, invariably place themselves in such a position as best enables them to avail themselves of the vertical currents. Lord Rayleigh, in conclusion, pointed to the support given to the above-mentioned theory of heat by the kinetic theory of gases, and mentioned that the only difficulties in the way of its entire acceptance result from considerations with regard to the different specific heats of certain elements at varying temperatures.

On Friday, May 13, Professor W. A. Tilden, D.Sc., F.R.S., gave a lecture on

Recent Experiments on Certain of the Chemical Elements in Relation to Heat.

Professor Tilden confined his attention to the consideration of the specific heats of elements, and discussed their behaviour in regard to the law enunciated by Dulong and Petit, which reads as follows in the *Ann. Chem. Phys.*, 1819: "Les atomes de tous les corps simples ont exactement la même capacité pour la chaleur." In the first place, out of consideration for those of his hearers who were unfamiliar with the subject of specific heat, the lecturer described and demonstrated, in the simplest manner, the nature of specific heat. Thus, repeating Tyndall's well-known experiment, three balls, made of copper, tin, and lead respectively, were transferred from hot oil to a flat cake of wax. They melted their way through in the order given. The same balls placed in water heated it to different temperatures, copper communicating more heat than tin, and tin than lead. Each melted a different weight of ice, in the same order. Again, when placed in a vacuous space it took different periods of time for them to cool down from a given to a lower temperature. By expressing these proportions in figures and referring them all to water as unity, we obtain numbers which are known as specific heats. Adverting for a moment to the history of the development of this subject, it was mentioned that Lavoisier the chemist, and Laplace the mathematician and physicist, about the year 1720, were probably the first to take it up. It was they who invented the first ice calorimeter, but owing to the fact that the atomic theory of Dalton had not been formulated, they were unable to leave any very definite results. Thirty years later Dulong and Petit devised the method of mixture for determination of specific heats. One of the first problems that they attacked and solved was this: Do bodies in cooling, say from 200° to 100°, give out the same amount of heat as in cooling from 100° to 0°? It was found that the value generally increases slightly with higher temperatures. Their method of cooling led to the discovery of the law which bears their name. In this connection it is interesting to note that in published papers of their own time one finds the names reversed, *i.e.*, Petit and Dulong, not Dulong and Petit. They found that on multiplying the observed specific heat of an element by its atomic weight in most cases an approximately constant number was obtained. Twenty years later Regnault investigated this subject. He condemned the method of cooling for the determination of specific heats of solids, and preferred the method of mixture. His memoir on the subject will remain for all time a model of precision. But one great defect marred all his work, and, to his credit be it said, this was due to no fault of his own ; the elements he worked on were not in an absolutely pure condition. Modern methods of purification of substances were yet unknown. Investigators cannot be too particular in starting with pure substances in determining physical constants. After a lapse of thirty-five years Hermann Kopp investigated and discussed at great length the law of Dulong and Petit, but his researches lose part of their value on account of the fact that his methods were less accurate than those of his predecessors. In 1870 Bunsen invented his ice calorimeter. He investigated this subject, not to prove the specific heats of elements, but to justify the method of determining them. Many scientific inquirers have asked the question, Is the law of Dulong and Petit strictly valid in the case of metals, leaving out of the question boron, silicon, carbon, beryllium, and most non-metallic elements? Kopp considered that it was only an approximation to the truth. Though he was probably correct, Dr. Tilden thought his conclusions were based on inconclusive evidence, inasmuch as the atomic weights were not known nearly so accurately as they are to-day, through the careful investigations of Stas and Dumas. The lecturer next discussed those variations of the physical condition of elements that may tend to cause inaccurate determinations of the two factors entering into the equation which tests the law in question. It is essential that these two factors, viz., the atomic weight and the specific heat, should be precisely determined, in order to prove or disprove the law. Among the variations just referred to may be mentioned the unequal distance that separates different metals from their melting point. This was demonstrated by taking balls composed respectively of tin, lead, bismuth, and an alloy of these three metals. On immersing these four substances in water it was noticed that the alloy fused immediately. It follows from this that the fusible metal at normal temperatures is in a different molecular or atomic condition from that of the elements themselves. The influence of change of temperature on the molecular condition was next shown in the case of platinum. It is infusible in the blow-pipe flame, and requires the heat produced by the admixture of oxygen with the coal gas in the blow-pipe flame to fuse it. At ordinary temperatures no amount of hammering will cause two sheets of platinum to weld, but the application of a moderate heat at once enables the operator to weld the metal with the assistance of a moderate application of

pressure. In this instance, at a temperature below the melting point of the platinum, a change has been induced in the relation of its ultimate particles to one another. In the case of platinum, however, difference of temperature causes but little variation in specific heat. A copper wire, coated with silk, was stretched taut between two supports, and heavily weighted. On bringing near it a hot iron, the wire stretched and finally broke in two. It is known that for variations in temperature between, *e.g.*, 100°, 200°, and 300°, copper shows slightly different specific heats. It follows that, though the relative distances of metals from their melting point affects many of their physical properties, yet only slight variations of specific heat for the same element are apparent. Therefore the relative distance of a metal from its melting point will not greatly affect the product of the specific heat into the atomic weight. Another factor, allotropy, was mentioned, which in some cases might affect the equation. It is well known that carbon, sulphur, phosphorus and other non-metallic elements assume allotropic modifications under different conditions; consequently their physical properties, *e.g.*, specific heat and melting point, are considerably modified. This phenomenon is rare in metals. Bunsen determined the specific heat of two varieties of tin, one normal, the other after exposure to a low temperature during several months of an exceptionally cold winter; he found the specific heats were respectively 0·0559 and 0·0545. There is considerable difficulty connected with the determination of some metals; an example was mentioned an alloy of silver and zinc made by Messrs. Haycock and Neville, of Cambridge. It possesses a superficial red colour, which disappears on exposure to the heat of a calorimeter. It cannot be said, however, that allotropy has much to do with the divergence of all the common metals from strict compliance with the aforesaid law. Kopp came to the conclusion that each element, when sufficiently removed from its melting point, has a definite specific heat which is but little affected by alterations in its ordinary physical conditions. The only way open to a sure test of the validity of Dulong and Petit's law is to determine with absolute exactness the values which enter into the equation, viz., the atomic weight and specific heat of one or two elements. Professor Tilden had entered the field at this point, and, by taking two metals closely related as to melting point, etc., in as pure a condition as it is possible to obtain them, he determined and compared their specific heats. Nickel and cobalt were taken in the first place, since their atomic weights (approx. 58 and 59) differ only by about one unit. Next gold and platinum were investigated in the same way, then copper and iron. The apparatus employed was that devised by Mr. Joly and known as the Differential Steam Calorimeter. This method depends on the fact that if a cool body be placed in an atmosphere of steam, water condenses upon it until the temperatures of the body and the steam are equal. By weighing the water and noting the initial and final temperatures of the body, also the initial temperature of the steam, it is possible to calculate the specific heat of the body. The apparatus is excessively simple, consisting of a hollow copper drum in communication with a vessel in which water is boiled. The substances whose specific heats are required to be determined are hung, by means of delicate platinum wires passing through the top of the drum, from the lower surfaces of scale-pans belonging to a balance placed above the calorimeter. In order to demonstrate this method of determination aluminium and lead were taken. Each was hung in the drum containing steam and attached to the scale-pans, as already indicated. In a few seconds, on raising the beam, it was noticed that the aluminium had condensed on its surface more moisture than the lead. Professor Tilden's laborious investigations have led him to the conclusion that the law of Dulong and Petit is only an approximation, working, as he has done, with the greatest care, using the purest substances and the most refined modern appliances. Regnault and Kopp's divergences were due partly perhaps to differences in physical circumstances attending their experiments, but in a greater degree to the presence of impurities in the substances employed. At the same time he considers that these divergences found by all careful investigators are not wholly accounted for in this way, but are due to some extent to some inherent property belonging to the metals themselves. What this property is can only be a matter of speculation. It may be connected with the arrangement of the atoms of a molecule in space. An atom is supposed to be a highly elastic body vibrating in different directions. In order to impress this idea on the minds of his hearers the lecturer scattered some white sand on the surface of a blackened brass plate mounted on a stand. The plate was caused to vibrate by means of a bow, and attention was called to the particles of definite geometrical pattern that was instantly formed by the sand. In conclusion, Professor Tilden remarked that this subject requires, and is receiving, further investigation, because it may ultimately lead to important discoveries in regard to the nature of the chemical elements themselves.

BRITISH ASSOCIATION ARRANGEMENTS.

A meeting of the local Executive Committee of the British Association for the Advancement of Science and Art was held at the Literary and Philosophic Club, Berkeley Square, Bristol, last week, under the Presidency of Mr. J. W. Arrowsmith, when the secretaries reported that a number of gratifying replies had been received from the United States and Canada. Among those expected to be present at the meeting in September are the Mayors of Winnipeg, London, Ontario, Toronto, St. John, N.B., Victoria, B.C., Baltimore and Boston; Dr. John George Bourinot, Honorary Secretary of the Royal Society of Canada; the Hon. G. W. Ross, Minister of Education; Dr. A. B. Macallum, Principal of the University of Toronto; and Dr. H. T. Bovey, Principal of the McGill University, Montreal; the Presidents or other representatives of the Boards of Trade of Toronto, Winnipeg, St. John, N.B., Victoria, B.C., and Montreal; the President of the Harbour Board of Montreal, and the general managers of the Canadian Pacific and Grand Trunk Railways. The following arrangements are proposed for the week: On Tuesday, September 6, advantage will be taken of so many Trans atlantic visitors being in the city to open the Cabot Memorial Tower. The Cabot Committee will probably arrange for the banquet to be held the same evening. On Wednesday the work of the Association begins with the presidential address in the Colston Hall by Sir Wm. Crookes, F.R.S. On Thursday the various sections will meet for business. A biological exhibition will be opened by Sir John Lubbock at the Zoological Gardens, and in the evening there will be a conversazione at the Clifton College, to which invitations will be issued by the Chairman of the Council (the Lord Bishop of Hereford), the Head Master of Clifton College, and Mrs. Glazebrook. On Friday there will be a lecture in the Colston Hall by Professor W. J. Sollas, F.R.S. On Saturday a number of excursions will be arranged. The Mayor and citizens of Bath will entertain a party in that city. Expeditions will also be made to Stanton Drew, Cheddar, Raglan Castle, Aust, the Severn Tunnel works, and Bradford-on-Avon, and there will also be a river excursion to Avonmouth Docks and Chepstow. In the evening there will be a banquet in the Colston Hall, under the auspices of the Bristol Chamber of Commerce, and a lecture to working men by Professor E. B. Poulton, F.R.S., at the Young Men's Christian Association Lecture Hall. On Sunday the Dean of Bristol has arranged for a special service at the Pro-Cathedral. There will be a sacred concert and organ recital in the Victoria Rooms during the afternoon. On Monday there will be a second evening lecture at Colston Hall by Mr. Herbert Jackson, and on Tuesday a conversazione will be given by the Local Committee at the same place. On Wednesday the concluding meeting of the Association will be held, and a banquet will be given to a limited number of invited guests by the Master of the Society of Merchant Venturers. On Thursday excursions will be made to Tortworth, where the Earl of Ducie will entertain a small party of guests; to Nailsworth and Stroud, to the sources of the Bristol Water Supply, to Longleat, to Bowood, to the Swindon Engineering Works, and to Wells and Glastonbury, where the party will be entertained by the Mayor and Dean and Chapter of Wells, and the Mayor of Glastonbury. Communications had been made to Montreal and Toronto as to a long-distance excursion at the end of the meeting, and the representatives of both cities had selected Devonshire as the county they would most prefer to visit, and arrangements are now being made for an excursion through Devonshire *vid* Exeter, Torquay, Dartmouth, Kingsbridge, Plymouth, Tavistock, and across Dartmoor to Newton Abbot.

Halogens in the Hair.—According to Howald (*Zeitschr. fur Physiolog. Chem.*, 1897, 209), iodine or bromine may readily be detected in the hair of patients undergoing treatment with iodides or bromides. These elements form organic compounds which are localised in the hair; they are not found in normal hair.

MEDICAL JOTTINGS.
