METHYLENE METHYL ETHYL DIKETONE $C_6H_{10}O_2$ *i.e.* $C_2H_5.CO.CH_2.CO.CH_3$. *Acetyl-propionyl-methane.* (158°). S.G. ^{15} ·9538. Formed by the action of EtOAc and NaOAc upon methyl ethyl ketone (Claisen a. Ehrhardt, *B.* 22, 1014).—$Cu(C_6H_9O_2)_2$. [179°]. Slender blue needles (from hot alcohol).

METHYLENE METHYL HEXYL DIKETONE $C_{10}H_{18}O_2$ *i.e.* $CH_3.CO.CH_2.CO.C_6H_{13}$. (229°). Formed from methyl hexyl ketone, AcOEt, and AcONa (Claisen a. Ehrhardt, *B.* 22, 1015). Liquid.—$Cu(C_{10}H_{17}O_2)_2$. [122°]. Crystalline.

METHYLENE DI-METHYL DIKETONE $C_5H_8O_2$ *i.e.* $CH_2(CO.CH_3)_2$. *Di-acetyl-methane. Acetyl-acetone.* (136°). S.G. $\frac{15}{}$ ·987 (Combes).

Preparation.—1. By slowly adding acetone (1 mol.) to a mixture of acetic ether ($3\frac{1}{2}$ mols.) and dry NaOEt (1 mol.) heated on the water-bath. The product is poured into ice-cold water, and the aqueous liquid mixed with HOAc and cupric acetate, which ppts. $Cu(C_5H_7O_2)_2$. The yield is 35 p.c. of the weight of acetone employed (Claisen, *Bl.* [3] 1, 498).—2. Acetone (5·8 pts.) mixed with EtOAc (33 pts.) is treated in the cold with sodium-wire (2·3 pts.). When most of the sodium is dissolved, the mixture is heated on a water-bath. The product is ppd. as cupric salt, the yield of ketone being 55 p.c. of the acetone employed (Claisen a. Ehrhardt, *B.* 22, 1009). In either case the diketone is obtained from the copper compound by adding dilute H_2SO_4 and extracting with ether.—3. From the compound $C_{12}H_{14}O_8Al_2Cl_6$ (obtained from acetyl chloride and $AlCl_3$) by adding water and extracting with chloroform. The yield is 85 p.c. of the theoretical (Combes, *A. Ch.* [6] 12, 211).

Properties.—Colourless liquid with pleasant acetic odour, sol. water, v. sol. aqueous HCl, miscible with alcohol, ether, and chloroform. Not attacked by PCl_3.

Reactions.—1. *Phenyl-hydrazine* forms phenyl-dimethyl-pyrazole  $CMe\Big\langle{CH \atop NPh.N}\Big\rangle CMe$ (270·5°) (Combes, *Bl.* [2] 50, 145).—2. *Potash* decomposes it into acetone and KOAc.—3. PCl_5 yields HCl and $C_5H_8Cl_2$ (145°), a di-chloro-amylene which readily combines with bromine.—4. *Sodium-amalgam* yields isopropyl alcohol and pinacone. But in acid solution the products of reduction by sodium-amalgam are di-oxy-pentane $CH_3.CH(OH).CH_2.CH(OH).CH_3$, and a tetrahydric alcohol analogous to pinacone.—5. Conc. HIAq at 185° reduces it to pure *n*-pentane (38°). At lower temperatures it forms $CH_2(CHI.CH_3)_2$ and $CH_3.CHI.CH_2.CH_2.CH_3$.—6. Excess of *chlorine* in sunlight yields $(CCl_3.CO)_2CH_2$ as final product.—7. *Bromine* attacks the diketone vigorously, finally producing $(CBr_3.CO)_2CH_2$ [108°].—8. *Oxidation* by CrO_3 or by $KMnO_4$ yields acetic acid.—9. Warm dilute *nitric acid* produces $CH_2(NO_2)_2$ and HOAc.—10. Dry *ammonia* passed into its ethereal solution ppts. white pearly scales of the ammonium salt $CH(NH_4)(CO.CH_3)_2$.—11. *Ethylene-diamine* (2 mols.) forms $C_2H_4(N{:}CMe.CH_2Ac)_2$ [111°] which yields a violet cupric salt $C_{12}H_{18}N_2O_2Cu$ [137°] and a hydrochloride $C_{12}H_{20}N_2O_2H_2Cl_2$ melting above 280°. Other diamines act in like manner (Combes, *C. R.* 108, 1252).—12. Unites with *benzidine* (1 mol.) forming a base melting at 195° (Combes).—13. *Aldehyde-ammonia* ($\frac{1}{2}$ mol.) at 100° forms di-acetyl-tri-methyl-pyridine dihydride $C_{12}H_{17}NO_2$ [153°] (Combes, *Bl.* [3] 1, 14). 14. Tolylene-*m*-diamine at 100°, followed by H_2SO_4, yields amido-trimethyl-quinoline $C_{12}H_{14}N_2$ [191°] (Combes, *C. R.* 108, 1254).—15. SO_2Cl_2 forms the chloro- derivative $C_5H_7ClO_2$ (156°) (Combes, *C. R.* 111, 272).

Salts.—$CH(NH_4)(CO.CH_3)_2$. Pearly scales, ppd. by passing NH_3 into the ethereal solution. Decomposes readily into acetone and acetamide.—Ac_2CHNa. Formed by dissolving sodium in the diketone (Combes, *C. R.* 104, 920). White six-sided prisms, insol. ether. Decomposed by water into acetone and NaOAc. With ethyl iodide at 140° it gives $CHEt(CO.CH_3)_2$, a liquid boiling at 171°. Amyl iodide, in like manner, yields $C_5H_{11}.CH(CO.CH_3)_2$. The second atom of hydrogen in the methylene group may, in such compounds, be displaced by Na, and by acting with an alkyl iodide R'I upon $RCNa(CO.CH_3)_2$ we may obtain compounds of the form $RCR'(CO.CH_3)_2$. These reactions take place with hardly any secondary decompositions. These homologues of methylene dimethyl diketone are decomposed by potash like the diketone itself (Combes, *A. Ch.* [6] 12, 211). $ClCO_2Et$ acting on the sodium derivative of methylene dimethyl diketone forms $C(COMe)_2(CO_2Et)_2$ (Claisen a. Zedel, *B.* 21, 3397).—$KCHAc_2$. White six-sided prisms, sl. sol. alcohol, insol. ether. Formed by adding KOEt to an alcoholic solution of the diketone. Decomposed by hot water into acetone and KOAc.—$Mg(CHAc_2)_2$ (dried at 125°). From the diketone and magnesium carbonate (Combes, *C. R.* 105, 868). Transparent six-sided prisms.—$Al(CHAc_2)_3$. A by-product in the rectification of the diketone, from which it may be obtained by treatment with $AlCl_3$. Small red crystals, insol. water, sl. sol. alcohol, v. sl. sol. ether. Can be partially volatilised. Acts on polarised light. Not decomposed by alcoholic NH_3.—$Cu(HCAc_2)_2$ (dried at 125°). Pale-blue needles, obtained by adding cupric acetate or chloride to an aqueous solution of the diketone. Insol. water, the ppn. being complete in dilute solutions. At 65° it forms with $COCl_2$ dissolved in benzene a crystalline compound melting at 121° (Thomas a. Lefèvre, *Bl.* [2] 50, 193).—$Fe(HCAc_2)_3$. Red crystals, deposited from the ethereal extract of the red solution obtained by adding $FeCl_3$ to the diketone dissolved in water.—$Pb(HCAc_2)_2$. From the diketone and lead carbonate. Transparent crystals, sol. water.

Oxim $CH_3.CO.CH_2.C(NOH).CH_3$. *Anhydride*  $CH\Big\langle{CMe.O \atop CMe{:}N}\Big\rangle$. (142°). S.G. $\frac{15}{}$ ·985. Formed by the action of hydroxylamine on the diketone (Zedel, *B.* 21, 2178). Colourless oil, with peculiar alkaloidal odour.

Di-oxim $CH_2(C(NOH).CH_3)_2$. [150°]. Large transparent crystals (from ether).

Phenyl-methyl-hydrazide $CH_3.CO.CH_2.C(N_2PhMe).CH_3$ (Kohlrausch, *A.* 253, 22).

Di-methylene di-methyl triketone $(CH_3.CO.CH_2)_2CO$. *Di-acetyl-acetone.* [49°]. Formed from its anhydride (*v. infra*). Plates. Sl. sol. water, sol. alkalis, warm alcohol, and ether. $FeCl_3$ gives a deep-red colour. Converted by NH_3 into oxy-di-methyl-pyridine [225°].

Anhydride  $CO\Big\langle{CH{:}CMe \atop CH{:}CMe}\Big\rangle O$. *Di-methyl-pyrone.* [132°]. (249°). Formed by the action of HIAq on dehydracetic acid at a high temperature (Feist, *B.* 22, 1570; *A.* 257, 253). The yield is 70 p.c. of the theoretical. Crystals, v. e. sol. water. Converted by baryta, followed by HCl, into di-methylene di-methyl tri-ketone. The carboxylic acid of this anhydride is dehydracetic acid. The dicarboxylic ether  $CO{<}\begin{matrix}C(CO_2Et){:}CMe\\ C(CO_2Et){:}CMe\end{matrix}{>}O$ [80°]. S. ·8 at 20° is formed by the action of $COCl_2$ on copper acetoacetic ether, and is converted by P_3S_5 into  $CS{<}\begin{matrix}C(CO_2Et){:}CMe\\ C(CO_2Et){:}CMe\end{matrix}{>}O$ [110°] (Conrad, *B.* 19, 22; 20, 152; 2111).

Di-phenyl-hydrazide $(CH_3.C(N_2HPh).CH_2)_2CO$. [142°].

Trimethylene methyl ketone *v.* TRIMETHYLENYL METHYL KETONE.

Tetramethylene methyl ketone *v.* TETRAMETHYLENYL METHYL KETONE.

METHYLENE DIMETHYL ETHER *v.* *Methyl-ether* of FORMIC *orth*ALDEHYDE.

METHYLENE DIMETHYL DIOXIDE *v.* *Methyl ether* of FORMIC *orth*ALDEHYDE, vol. ii. p. 570.

METHYLENE METHYL PHENYL DIKETONE *v.* BENZOYL-ACETONE.

METHYLENE-METHYL-PHTHALIMIDINE $C_{10}H_9ON$ *i.e.*  $C_6H_4\begin{matrix}\diagup C{=}CH_2\\ \diagdown CO\end{matrix}{>}NMe$. Formed by heating phthal-methyl-imidyl-acetic acid  $C_6H_4\begin{matrix}\diagup CC{=}H.CO_2H\\ \diagdown CO\end{matrix}{>}NMe$ above 210°. Colourless crystals. Volatile with steam. V. sol. alcohol, ether, and chloroform, more sparingly sol. water. Very unstable body (Gabriel, *B.* 18, 2454).

METHYLENE METHYL PROPYL DIKETONE $C_7H_{12}O_2$ *i.e.* $CH_3.CO.CH_2.CO.C_3H_7$. (175°). S.G. $^{\underline{15}}$ ·9411. Formed by the action of EtOAc and NaOAc upon methyl propyl ketone (Claisen a. Ehrhardt, *B.* 22, 1015). Formed also from butyric ether, acetone, and NaOEt. Colourless oil. Boiling alkalis yield acetic and butyric acids. Yields $C_6H_5N_2.CHAc.COPr$ [55°] crystallising in yellow prisms.—$Cu(C_7H_{11}O_2)_2$. [161°]. Blue needles.

TETRA-METHYL-TRIMETHYLENE-DI-PYRROLE $C_{15}H_{22}N_2$ *i.e.*  $\left(\begin{matrix}CH{:}CMe\\ |\\ CH{:}CMe\end{matrix}{>}N.CH_2\right)_2CH_2$ [77°]. Formed by heating acetonyl-acetone with alcoholic tri-methylene-diamine at 120° (Paal a. Schneider, *B.* 19, 3157). Crystalline.

METHYLENE DI-METHYL DISULPHONE $(CH_3.SO_2)_2CH_2$. [141°]. Formed from methyl mercaptan and methylene chloride, and oxidation of the product (Baumann, *B.* 23, 1875). Plates. On treatment with bromine-water it gives $CBr_2(SO_2Me)_2$ [234°].

Di-methylene di-methyl trisulphone $(CH_3.SO_2.CH_2)_2SO_2$. [185°]. Formed by saturating a solution of formic aldehyde with H_2S, extracting with ether, evaporating, dissolving the residual oil in aqueous NaOH, adding MeI, and oxidising with $KMnO_4$ (Baumann, *B.* 23, 1872). Prisms, v. sl. sol. cold water, alcohol, and ether. Yields with bromine-water insoluble $C_4H_6Br_4S_3O_6$ [190°].

TRIMETHYLENE TRINITROSAMINE $C_3H_6N_6O_3$ *i.e.* $(CH_2N.NO)_3$. [106°]. Formed by the action of nitrous acid upon hexamethylene-amine (F. Mayer, *B.* 21, 2883). Yellow needles or prisms (from alcohol); v. sol. alcohol, insol. petroleum-ether. Decomposed by water with production of formic aldehyde.

METHYLENE DI-OCTYL OXIDE *v.* *Octyl ether* of FORMIC *orth*ALDEHYDE.

METHYLENE OXIDE is FORMIC ALDEHYDE (*q.v.*).

METHYLENE-DI-OXY compounds *v* *Methylene derivatives* of DI-OXY compounds.

METHYLENE-DI-PHENYL-DIAMINE *v.* DI-PHENYL-METHYLENE-DIAMINE.

METHYLENE-DI-PHENYLENE *v.* DI-PHENYLENE-METHANE.

METHYLENE-DIPHENYLENE OXIDE *v.* DI-PHENYLENE-METHANE OXIDE.

METHYLENE DIPHENYL DIKETONE *v.* DI-PHENYL METHYLENE DIKETONE.

TRIMETHYLENE PHENYL KETONE *v.* PHENYL TRIMETHYLENE KETONE.

Tetramethylene phenyl ketone *v.* *Anhydride* of PHENYL OXYBUTYL KETONE.

METHYLENE-DIPHENYL OXIDE *v.* DI-PHENYLENE-METHANE OXIDE.

METHYLENE HEXAPHENYL PHOSPHONIUM IODIDE *v.* *Methyleno-di-iodide* of TRI-PHENYL-PHOSPHINE.

TRIMETHYLENE-DI-PHTHALAMIC ACID $C_{19}H_{18}N_2O_6$ *i.e.* $CH_2(CH_2.NH.CO.C_6H_4.CO_2H)_2$. [70°–123°]. Obtained by boiling trimethylene di-phthalimide with potash (Gabriel, *B.* 21, 2670). Crystalline. Decomposed by water. On boiling with aqueous HCl it is converted into phthalic acid and trimethylene-diamine.

METHYLENE-PHTHALIDE $C_9H_6O_2$ *i.e.*  $C_6H_4\begin{matrix}\diagup C{=}CH_2\\ \diagdown C{=}O\end{matrix}{>}O$. *Anhydride* of *o-Oxy-vinyl-benzoic acid.* [60°]. Formed by heating phthalyl-acetic acid *in vacuo* (Gabriel, *B.* 17, 2521). Small glistening crystals. Soluble in hot water, easily in alcohol, ether, benzene, &c. Volatile with steam. It readily polymerises. Combines with Br (1 mol.).

Dibromide  $C_6H_4\begin{matrix}\diagup CBr.CH_2Br\\ \diagdown C{=}O\end{matrix}{>}O$ [99°]. Thick glistening crystals. Formed by the combination of methylene-phthalide with bromine. On warming with aqueous KOH it yields acetophenone-o-carboxylic acid $C_6H_4(CO_2H).CO.CH_3$. Boiled with water it gives methylene-phthalide-oxide $C_9H_6O_3$ (Gabriel, *B.* 17, 2524).

Methylene-phthalide-oxide $C_9H_6O_3$. [146°]. Long needles. Formed by boiling the dibromide of methylene-phthalide with water. Formed also by the action of water on the product of the bromination of acetophenone-o-carboxylic acid (Gabriel, *B.* 17, 2524).

Di-chloro-methylene-phthalide $C_9H_4Cl_2O_2$ *i.e.*  $C_6H_4\begin{matrix}\diagup C{=}CCl_2\\ \diagdown C{=}O\end{matrix}{>}O$. [128°]. Formed by passing chlorine into a mixture of *a*-chloro-phenyl-acetic acid (1 pt.) and HOAc (10 pts.). Formed also by warming di-chloro-acetophenone carboxylic acid with conc. H_2SO_4 (Zincke a. Cooksey, *A.* 255, 383). Long slender needles, gradually becoming compact when left in the liquid. The needles are v. sol. hot alcohol, benzene, HOAc, and benzoline, the compact crystals are soluble with difficulty. Alcoholic potash converts it into di-chloro-acetophenone-*o*-carboxylic acid. Forms a dichloride  $C_6H_4\genfrac{<}{>}{0pt}{}{CCl—CCl_3}{CO}O$ which crystallises in colourless prisms [94°], v. sol. alcohol and HOAc, and converted by alcoholic potash into phthalic acid.

Bromo-methylene-phthalide *v.* vol. i. p. 580.

Isomeride of methylene phthalide *v.* METHYLENE-PHTHALYL.

Polymeride of methylene-phthalide $C_{18}H_{12}O_4$. [216°]. Obtained by allowing a solution of acetophenone carboxylic acid (1 pt.) in H_2SO_4 (2 pts.) to stand in the cold, and then ppg. with water (Roser, *B.* 17, 2620; Gabriel, *B.* 17, 2666; *cf.* ACETOPHENONE O-CARBOXYLIC ACID, *reaction* 2). Plates. Insol. water and cold alkalis, sl. sol. alcohol, v. sol. HOAc.

Oxim $C_{18}H_{13}NO_4$. [180°]. Obtained by heating the substance with alcoholic hydroxylamine hydrochloride at 160°. Crystalline granules (from dilute HOAc).

METHYLENE-DI-PHTHALIMIDE  $CH_2(N<\genfrac{}{}{0pt}{}{CO}{CO}>C_6H_4)_2$. [226°]. Formed by heating potassium phthalimide (2 mols.) with methylene iodide (1 mol.) at 175° (Neumann, *B.* 23, 1002). Light-brown crystals (from HOAc); insol. dilute alkalis. Yields phthalic acid on heating with HClAq.

TRIMETHYLENE-DI-PHTHALIMIDE $C_{18}H_{14}N_2O_4$ *i.e.* $C_8H_4O_2:N.CH_2.CH_2.CH_2.N:C_8H_4O_2$. [198°]. Formed by the action of tri-methylene bromide on potassium phthalimide (Gabriel, *B.* 21, 2669). White needles; m. sol. hot HOAc, sl. sol. ether, CS_2, chloroform, and cold alcohol, v. sl. sol. water and petroleum ether. Converted by heating with KOH into tri-methylene-di-phthalamic acid $C_3H_6(NHCOC_6H_4CO_2H)_2$. Decomposed by heating with HCl at 180° into phthalic acid and tri-methylene-diamine.

METHYLENE-PHTHALYL $C_9H_6O_2$ *i.e.*  $C_6H_4<\genfrac{}{}{0pt}{}{CO}{CO}>CH_2$? [219°]. Fine yellow needles. Formed, together with *o*-tribenzoylene-benzene, by heating phthalic anhydride with malonic ether and sodium acetate (Gabriel, *B.* 14, 925).

METHYLENE-DI-PIPERIDINE $CH_2(NC_5H_{10})_2$. (230°). Formed by distilling piperidine with trimethylene oxide (formic paraldehyde) (Ehrenberg, *J. pr.* [2] 36, 126). Liquid, with pepper-like smell. Is decomposed by dilute acids into its constituents. CS_2 forms an addition product $B''CS_2$, [58°]; sol. alcohol and ether, insol. water.

METHYLENE-TETRA-PROPYL-DIAMINE $CH_2(NPr_2)_2$. (220°). Formed by distilling dipropylamine with trimethylene oxide (formic paraldehyde) (Ehrenberg, *J. pr.* [2] 36, 122). Liquid; sl. sol. water, v. sol. alcohol, ether, and chloroform.

METHYLENE DI-PROPYL OXIDE *v.* *Dipropyl ether* of FORMIC *ortho*ALDEHYDE.

TRI-METHYLENE-SELENO-UREA *v.* SELENIUM COMPOUNDS, ORGANIC.

METHYLENE SULPHIDE *v.* THIOFORMIC ALDEHYDE.

Tri-methylene tetrasulphide $C_3H_6S_4$ *i.e.*  $CH_2<\genfrac{}{}{0pt}{}{S.CH_2.S}{S.CH_2.S}>$. [84°]. Formed by the action of H_2S on formic aldehyde (Baumann, *B.* 23, 1869). Colourless needles, insol. water, m. sol. alcohol and ether, v. e. sol. $CHCl_3$ and benzene.

METHYLENE SULPHOCYANIDE $C_3H_2S_2N_2$ *i.e.* $CH_2(SCy)_2$. [102°]. Formed by digesting potassium sulphocyanide (2 mols.) with methylene iodide (1 mol.) in alcoholic solution for 2 or 3 hours on the water-bath, ppg. with water, and recrystallising from alcohol (Lermontoff, *B.* 7, 1282). Crystals; v. sol. alcohol and ether, m. sol. hot, nearly insol. cold, water. Oxidised by conc. HNO_3 to methane disulphonic acid.

TRI-METHYLENE-TRISULPHONE $C_3H_6S_3O_6$ *i.e.*  $CH_2<\genfrac{}{}{0pt}{}{SO_2.CH_2}{SO_2.CH_2}>SO_2$. Formed by oxidising thioformic paraldehyde (trithio-formaldehyde) with $KMnO_4$ (E. Baumann a. R. Camps, *B.* 23, 69). Crystalline powder; insol. water, dilute acids, alcohol, ether, chloroform, and glacial acetic acid; v. sol. cold caustic soda, ammonia (by warming), and sodic carbonate. Expels CO_2 from Na_2CO_3 on warming. Conc. HNO_3 and H_2SO_4 have no action even on warming. Its solution in H_2SO_4 is ppd. by water unaltered. It partially sublimes. The six hydrogen atoms can be displaced by alkyl groups. The hexamethyl derivative

$$CMe_2<\genfrac{}{}{0pt}{}{SO_3.CMe_2}{SO_2.CMe_2}>SO_2$$

is identical with the product obtained by B. Jaffé, E. Baumann, and Fromm (*B.* 22, 2598, 2609) by oxidising trithio-acetone.

TRIMETHYLENE-DI-SULPHONIC ACID so-called *v.* PROPANE-DI-SULPHONIC ACID.

METHYLENE TRI-THIO-CARBONATE  $CH_2<\genfrac{}{}{0pt}{}{S}{S}>CS$. Separates on gently heating $CS(SNa)_2$ with methylene iodide in alcoholic solution (Husemann, *A.* 126, 292). Amorphous yellowish-white powder; insol. water. Converted by fuming nitric acid into methane disulphonic acid.

TRIMETHYLENE-THIO-UREA $C_4H_8N_2S$ *i.e.*  $CH_2<\genfrac{}{}{0pt}{}{CH_2.NH}{CH_2.NH}>CS$. [198°]. Formed, together with ammonium sulphocyanide, by heating the sulphocyanide of trimethylene-diamine $C_3H_6(NH_2)_2(HNCS)_2$ (Lellmann a. Würthner, *A.* 228, 232). White needles (from chloroform mixed with light petroleum). Sol. water, alcohol, $CHCl_3$, and benzene; m. sol. aqueous NaOH, insol. light petroleum. Forms a sparingly soluble compound with $HgCl_2$.

Trimethylene-ψ-thio-urea  $CH_2<\genfrac{}{}{0pt}{}{CH_2.S}{CH_2.NH}>C:NH$. Formed by evaporating a solution of γ-bromo-propyl-amine hydrobromide and potassium sulphocyanide to dryness at 100° (Gabriel a. Lauer, *B.* 23, 94). Liquid, v. sol. water forming an alkaline solution, from which it can be extracted by benzene.—$B'HBr$. [136°].—$B'C_6H_2(NO_2)_3OH$. [128°]. Long needles.

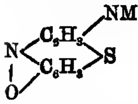
TRIMETHYLENE-UREA $C_4H_8N_2O$ *i.e.*  $CH_2<\genfrac{}{}{0pt}{}{CH_2.NH}{CH_2.NH}>CO$. *Oxy-pyrimidine tetrahydride.* [260°]. Formed by heating trimethylene-diamine (1 mol.) with carbonic ether (1 mol.) for 6 hours at 180° (Fischer a. Koch, *A.* 232, 224).

White needles; v. sol. water, sl. sol. alcohol and ether. Its solution is neutral, and is not ppd. by HNO_3 or oxalic acid. By chromic acid mixture it is oxidised to a compound $C_4H_4N_2O_2$ crystallising in plates [275°].

Trimethylene-ψ-urea  $CH_2<\begin{matrix}CH_2.O\\CH_2.NH\end{matrix}>C:NH$ or  $CH_2<\begin{matrix}CH_2.O\\CH_2.N\end{matrix}\geqslant C.NH_2$. Formed by evaporating a solution of equivalent quantities of potassium cyanate and γ-bromo-propyl-amine hydrobromide (Gabriel a. Lauer, *B.* 23, 95). Thick liquid, v. sol. water.—$B'C_6H_2(NO_2)_3OH$. [200°]. Long yellow needles.

Trimethylene-di-urea $C_5H_{12}N_4O_2$ *i.e.* $CH_2(CH_2.NH.CO.NH_2)_2$. [182°]. Formed by warming a dilute aqueous solution of trimethylene-diamine hydrochloride with silver cyanate (F. a. K.). White needles; v. sol. water, sl. sol. alcohol, insol. ether.

METHYLENE VIOLET $C_{14}H_{12}N_2SO$ *i.e.*



. *Oxy-imido-di-methyl-amido-diphenylene sulphide. Oxy-dimethylamido-thio-diphenylimide.* Formed by boiling a solution of methylene blue (base). Formed also by oxidising a mixture of di-methyl-di-amido-phenyl, mercaptan, and phenol (Bernthsen, *A.* 230, 171; 251, 96). Needles; v. sl. sol. water, sl. sol. alcohol, ether, acetone, chloroform, benzene, ligroïn, and cumene, with a reddish-brown fluorescence; v. sol. aniline, without fluorescence.—B'HCl: v. sl. sol. cold dilute HClAq.

METHYLENITAN *v.* vol. ii. p. 571.

DI-METHYL ENNYLENE DIKETONE $C_{13}H_{24}O_2$ *i.e.* $CH_2(CH_2.CHEt.CO.CH_3)_2$. *Di-acetyl-di-ethyl-n-pentane.* (208° at 110 mm.). Formed from its dicarboxylic ether by treatment with alcoholic potash (Kipping a. Perkin, jun., *C. J.* 57, 33). Colourless oil, with slight aromatic odour, v. sl. sol. water, miscible with alcohol and ether. It dissolves without change in conc. H_2SO_4, forming a yellowish-brown solution. It does not combine with $NaHSO_3$.

Oxim $CH_2(CH_2.CHEt.CMe:NOH)_2$. [111°]. Obtained by heating the ketone with an alcoholic solution of hydroxylamine, evaporating, adding water, and extracting with ether. Minute colourless crystals (from benzene-ligroïn), v. sol. alcohol, ether, HOAc, benzene, and aqueous alkalis.

DI-METHYL ENNYLENE DIKETONE DI-CARBOXYLIC ETHER $CH_2(CH_2.CEt(CO.CH_3).CO_2Et)_2$. *αε-Di-acetyl-αε-di-ethyl-pimelic ether.* [45°]. Obtained, together with compounds of low boiling-point, when sodium ethyl-acetoacetic ether is heated with an alcoholic solution of trimethylene bromide on a water-bath (Kipping a. Perkin, jun., *C. J.* 57, 31). Very slender needles (from ether-alcohol); v. sol. ether and alcohol, v. e. sol. benzene, light petroleum, xylene, and chloroform, insol. cold water. Gives no colour with $FeCl_3$. Readily decomposed by warm alcoholic potash.

METHYL ENNYL KETONE $CH_3.CO.C_9H_{19}$. [16°]. (224°). S.G. $^{\underline{17.5}}$ ·8295. The chief constituent of oil of rue, obtained by distilling *Ruta graveolens* with steam (Greville Williams, *T.* 1858 [1] 99; Hallwachs, *A.* 113, 109; Harbordt, *A.* 123, 293; Giesecke, *Z.* [2] 6, 429; *cf.* Gerhardt. *C. R.* 26, 225, 361; Cahours, *C. R.* 26, 262). Occurs in the essential oil obtained from lime leaves (*citrus Limetta*) (F. Watts, *C. J.* 49, 316). Formed also by distilling a mixture of calcium acetate and calcium decoate (Gorup-Besanez a. Grimm, *A.* 157, 275; *B.* 3, 518); and by boiling octyl-acetoacetic ether with alcoholic potash (Guthzeit, *A.* 204, 4). It is oxidised by chromic acid mixture to acetic and ennoic acids. Sodium-amalgam reduces it, in alcoholic solution, to *sec*-hendecyl alcohol (229°), S.G. $^{\underline{12}}$ ·826. It combines with NH_3. With alkaline bisulphites it forms compounds such as $C_9H_{19}CMe(OH)SO_3NH_4$ aq, which crystallises in pearly plates. PCl_5 converts the ketone into $C_{11}H_{22}Cl_2$, which is resolved by distillation into HCl and $C_{11}H_{21}Cl$ (222°).

Oxim $C_9H_{19}.CMe:NOH$. [42°]. Minute prisms (from alcohol), v. sol. ether (Spiegler, *M.* 5, 242; *B.* 17, 1575).

METHYL ENNYL KETONE CARBOXYLIC ACID $CH_3.CO.CHEt.CH_2.CH_2.CH_2.CHEt.CO_2H$. *ε-Acetyl-αε-di-ethyl-caproic acid.* (254° at 90 mm.). Formed, together with di-methyl ennylene diketone and acetic acid, by boiling di-ethyl ennylene diketone dicarboxylic acid with alcoholic potash (Kipping a. Perkin, *C. J.* 57, 36). Thick oil, miscible with alcohol, ether, and benzene.—AgA'. Amorphous pp., m. sol. hot water.

Oxim $CH_3.C(NOH).C_9H_{18}.CO_2H$. [103°]. Minute plates (from benzene-ligroïn), v. sol. alcohol and benzene, sl. sol. ligroïn, sol. alkalis and conc. HClAq.

TETRAMETHYLENYL-CARBINYL-AMINE $C_5H_{11}N$ *i.e.*  $CH_2<\begin{matrix}CH_2\\CH_2\end{matrix}>CH.CH_2NH_2$. '*Tetramethylenylamine.*' (83°). Formed from the nitrile of tetramethylene carboxylic acid  $CH_2<\begin{matrix}CH_2\\CH_2\end{matrix}>CH.CN$ by reduction in alcoholic solution with sodium (Freund a. Gudeman, *B.* 21, 2692). Oil, with alkaline reaction, which absorbs CO_2 from the air.—B'HCl. [236°]. Crystallises from alcohol-ether, v. sol. water and alcohol, insol. ether.—$B'_2H_2PtCl_6$. Crystalline.

TETRAMETHYLENYLCARBINYL - THIO - UREA $C_6H_{12}N_2S$ *i.e.*  $CH_2<\begin{matrix}CH_2\\CH_2\end{matrix}>CH.CH_2.NH.CS.NH_2$. [68°]. Prepared by the action of ammonium sulphocyanide upon the hydrochloride of tetramethylenyl-carbinyl-amine (Freund, *B.* 21, 2697). Slender needles (from water or alcohol).

TETRAMETHYLENYLCARBINYL-UREA $C_6H_{12}N_2O$ *i.e.*  $CH_2<\begin{matrix}CH_2\\CH_2\end{matrix}>CH.CH_2.NH.CO.NH_2$. [116°]. Obtained by evaporating a solution of tetramethylenylcarbinylamine hydrochloride with potassium cyanate (Freund, *B.* 21, 2697). Needles, sol. alcohol, v. sol. hot, m. sol. cold water.

DI-TETRAMETHYLENYL KETONE $C_9H_{14}O$ *i.e.*  $CH_2<\begin{matrix}CH_2\\CH_2\end{matrix}>CH.CO.CH<\begin{matrix}CH_2\\CH_2\end{matrix}>CH_2$. (205°). A product of the distillation of calcium tetramethylene carboxylate with lime (Colman a. Perkin, jun., *C. J.* 51, 235). Oil, smelling of peppermint; combines with $NaHSO_3$. Bromine reacts, giving off HBr.

Oxim [51°].

TRIMETHYLENYL METHYL KETONE C_5H_8O *i.e.*  $\left.\begin{matrix}CH_2\\|\\CH_2\end{matrix}\right\rangle CH.CO.CH_3$ or  $CH_2{:}CH\left\langle\begin{matrix}CH_2.CH_2\\O-CH_2\end{matrix}\right\rangle$. *Acetyl-trimethylene. Methylene furfurane tetrahydride.* (114°). S.G. $\frac{15}{15}$ ·9047; $\frac{25}{25}$ ·8971. M.M. 5·245 at 22·3°. Formed by distilling its carboxylic acid (Perkin, jun., *C. J.* 47, 836; 51, 832; *B.* 17, 1440). The same substance appears to be formed by treating methyl bromo-propyl ketone with solid potash (Lipp, *B.* 22, 1207). Oil. Sl. sol. aqueous $NaHSO_3$. Gives an oily phenyl-hydrazide. Does not combine with water when left in contact with it in the cold. According to Lipp the formula may be written  $CH_2{:}C\left\langle\begin{matrix}CH_2.CH_2\\O-CH_2\end{matrix}\right\rangle$ since it yields methyl oxy-propyl ketone (acetopropyl alcohol) on heating with dilute HClAq at 100°.

Tetramethylenyl methyl ketone $C_6H_{10}O$ *i.e.*  $CH_2\left\langle\begin{matrix}CH_2\\CH_2\end{matrix}\right\rangle CH.CO.CH_3$ or  $CH_2\left\langle\begin{matrix}CH{:}CMe\\CH_2.CH_2\end{matrix}\right\rangle O$ or  $CH_2{:}C\left\langle\begin{matrix}CH_2.CH_2\\O-CH_2\end{matrix}\right\rangle CH_2$. *Anhydride of methyl oxy-butyl ketone. Anhydride of acetobutyl alcohol. Acetyl-tetramethylene.* (137°). A product of the distillation of calcium tetramethylene carboxylate with lime (Colman a. Perkin, jun., *C. J.* 51, 237; *B.* 16, 1789; 19, 3112). Formed also by heating acetobutyl alcohol (Perkin, *B.* 19, 2558). Oil, smelling of peppermint; combines with $NaHSO_3$, forming a crystalline body, v. sol. water.

TRIMETHYLENYL METHYL KETONE CARBOXYLIC ACID $C_6H_8O_3$ *i.e.*  $\left\langle\begin{matrix}CH_2\\CH_2\end{matrix}\right\rangle C(CO_2H).CO.CH_3$ or  $CH_2{:}C\left\langle\begin{matrix}CH(CO_2H)\\O-CH_2\end{matrix}\right\rangle CH_2$. *Methylene-furfurane tetrahydride carboxylic acid.* Obtained by saponifying its ether which is formed by the action of ethylene bromide and NaOEt on aceto-acetic ether (Perkin, jun., *B.* 16, 2136; 19, 2561; *C. J.* 51, 823; Lipp, *B.* 22, 1210). Thick oil, converted by boiling with water into CO_2 and acetyl-propyl alcohol $CH_3.CO.CH_2.CH_2.CH_2OH$ (145° at 100 mm.).—AgA′. Easily soluble crystalline nodules.

Ethyl ether EtA′. (196°). S.G. $\frac{15}{15}$ 1·0517; $\frac{25}{25}$ 1·0439. M.M. 8·198 at 15°. According to Perkin, the physical constants of this ether indicate the presence of the trimethylene ring. Converted by HBr into bromo-ethyl-aceto-acetic ether $CH_3.CO.CH(CH_2.CH_2Br).CO_2Et$. Phosphorus pentachloride, followed by water, forms an oil $C_8H_{12}O_2Cl_2$ (173° at 150 mm.), which may possibly be chloro-ethyl chloro-crotonic ether $CH_3.CCl{:}C(CH_2Cl.CH_3).CO_2Et$, since it is reduced by sodium-amalgam to di-ethyl-acetic ether, and by zinc-dust and HCl to $CH_3.CCl{:}CEt.CO_2H$ [75°].

Phenyl hydrazide of the *ethyl ether* $C_{14}H_{16}N_2O_2$. Amorphous solid.

Trimethylenyl methyl ketone dicarboxylic acid $C_7H_8O_5$ *i.e.*  $\left\langle\begin{matrix}CH_2\\CH_2\end{matrix}\right\rangle C(CO_2H).CO.CH_2.CO_2H$, or  $CO_2H.CH{:}C\left\langle\begin{matrix}CH(CO_2H)\\O-CH_2\end{matrix}\right\rangle CH_2$. *Methylene-furfurane tetrahydride dicarboxylic acid.* [c. 175°]. Obtained from the ether which is got by acting on sodium acetone dicarboxylic ether with ethylene bromide (Perkin, *C. J.* 51, 847). White crystalline solid, sl. sol. water and chloroform, v. sol. other solvents. Boiling water splits it up into CO_2 and acetyl-propyl alcohol.—Ag_2A''.

Tetramethylenyl methyl ketone carboxylic acid $C_7H_{10}O_3$ *i.e.*  $CH_2\left\langle\begin{matrix}CH_2\\CH_2\end{matrix}\right\rangle C(CO_2H).CO.CH_3$. [115°]. The ether of the acid to which this constitution was at first assigned by Perkin, jun. (*B.* 16, 208, 1787), was subsequently shown by him (*B.* 19, 1244) to be indifferent towards phenyl hydrazine, and to possess a magnetic rotation at variance with this formula, and to behave rather as  $CH_3\left\langle\begin{matrix}CH_2.CH_2\\O-CMe\end{matrix}\right\rangle C.CO_2Et$. The acid is a crystalline solid, obtained by saponifying its ether, which is formed by the action of trimethylene bromide and NaOEt on acetoacetic ether. On boiling with water it is converted into acetobutyl alcohol with evolution of CO_2 (Perkin, jun., *B.* 19, 2557). On distillation it is split up into CO_2 and $C_6H_{10}O$.

Salt.—AgA′.

Ethyl ether EtA′. (224°). V.D. 6·21 (obs.). M.M. 10·195. Does not react with phenyl hydrazine. Concentrated hydrobromic acid in the cold yields methyl ω-bromo-butyl-ketone $CH_3.CO.CH_2.CH_2.CH_2.CH_2Br$.

METHYL-ETHANE *v.* PROPANE.

Di-methyl-ethane *v.* BUTANE.

Tri-methyl-ethane *v.* PENTANE.

Tetra-methyl-ethane *v.* HEXANE.

Penta-methyl-ethane *v.* HEPTANE.

Hexa-methyl-ethane *v.* OCTANE.

METHYL - ETHENYL - TRICARBOXYLIC ACID *v.* PROPANE TRICARBOXYLIC ACID.

Di - methyl - ethenyl - tricarboxylic acid *v.* BUTANE TRICARBOXYLIC ACID.

METHYL ETHENYL ETHYL DIKETONE $C_7H_{12}O_2$ *i.e.* $CH_3.CO.CHMe.CO.Et$. (167°–170°). Formed by the action of NaOEt on a mixture of acetic ether and di-ethyl ketone (Claisen a. Ehrhardt, *B.* 22, 1016). Colourless oils.—CuA'_2. [192°]. Crystalline. Formed from the acid and an ammoniacal solution of cupric oxide.

METHYL-ETHENYL-TOLYLENE-DIAMINE $C_{10}H_{12}N_2$ *i.e.*  $\left[4{:}\frac{1}{2}\right]CH_3.C_6H_3\left\langle\begin{matrix}NMe\\N\end{matrix}\right\rangle CMe$. [192°]. Formed by reducing the acetyl derivative of nitro-methyl-*p*-toluidine with tin and HCl (Niementovsky, *B.* 20, 1878). Cubes (by sublimation at 110°), plates, or needles; v. e. sol. alcohol, ether, and boiling water. Its aqueous solution is coloured red by $FeCl_3$. The solution in alcoholic ammonia exhibits blue fluorescence.—B′HCl ½aq. Needles, v. sol. water.—$B'_2H_2PtCl_6$. [244°]. Tables, decomposed on fusion.—B′HI. Formed by heating ethenyl tolylene-diamine with MeI and MeOH at 130° (Niementovsky, *B.* 20, 1886). Grey plates.

Methylo-iodides B′MeI. [221°]. From $B'MeI_3$ and NaOH. Needles, v. sol. boiling alcohol and water, v. sl. sol. boiling chloroform, insol. ether.—$B'MeI_3$. Formed in small quantity in the preparation of B′HI as described above. Black crystals.

Methylo-hydroxide B′MeOH. [136°]. Formed by heating the methylo-iodide with

KOH on the water-bath. White plates, sol. boiling water, v. sl. sol. cold water, v. e. sol. alcohol and ether. Forms the salts :—*B'MeCl crystallising in rhombohedra, v. e. sol. water.—*$B'_2Me_2PtCl_6$.—Picrate [112°] crystallising in needles, m. sol. boiling water and alcohol.

METHYL ETHER *v.* DI-METHYL OXIDE.

PENTA-METHYL-ETHOL. A name sometimes employed to denote the alcohol $CMe_3.CMe_2OH$ *v.* HEPTYL ALCOHOL.

METHYL-ETHYL-ACETAL *v.* ALDEHYDE.

METHYL-ETHYL-ACETIC ACID *v.* VALERIC ACID.

Di-methyl-ethyl-acetic acid *v.* HEXOIC ACID.

METHYL-ETHYL-ACETOACETIC ETHER *v.* ACETOACETIC ACID.

METHYL-ETHYL-ACETOXIM *v.* *Oxim* of METHYL ETHYL KETONE.

METHYL-ETHYL-ACETOXIMIC ACID *v.* DI-ACETYL.

METHYL-ETHYL-ACETYLENE *v.* PENTINENE.

METHYL-ETHYL-ACROLEÏN *v.* HEXENOIC ALDEHYDE.

METHYL-ETHYL-ACRYLIC ACID *v.* HEXENOIC ACID.

PENTA-METHYL-ETHYL ALCOHOL *v.* *Tert*-HEPTYL ALCOHOL.

DI-METHYL-ETHYL-ALKINE *v.* DI-METHYL-OXY-ETHYL-AMINE.

METHYL-ETHYL-ALLYL ALCOHOL *v.* HEXENYL ALCOHOL.

METHYL-DI-ETHYL-AMINE $C_5H_{13}N$ *i.e.* $MeNEt_2$. Formed by distilling its methylochloride, or by distilling triethylamine methylohydroxide $NEt_3Me(OH)$ (V. Meyer a. Lecco, *A.* 180, 184; Lossen, *A.* 181, 379).—$B'_2H_2PtCl_6$. Monoclinic crystals (Hjortdahl, *J.* 1882, 476).

Methylo-chloride $C_6H_{16}NCl$ *i.e.* Me_2NEt_2Cl. *Di-methyl-di-ethyl-ammonium chloride.* Obtained from the crystalline iodide Me_2NEt_2I, which is formed by heating dimethylamine with EtI or diethylamine with MeI (Petersen, *A.* 91, 122; V. Meyer a. Lecco, *A.* 180, 177).—$(Me_2NEt_2Cl)_2PtCl_4$: yellowish dimetric prisms, m. sol. water, sl. sol. alcohol and ether. S. 1·025 at 15°.—$(Me_2NEt_2Cl)_2HgCl_2$: trimetric crystals (Topsoë, *J.* 1883, 620).—$Me_2NEt_2ClHgCl_2$.—$Me_2NEt_2Cl2HgCl_2$: trimetric crystals.—$Me_2NEt_2ClAuCl_3$: dimetric crystals.

Methylo-picrate [287°]. Needles (Lossen, *A.* 181, 374).

Ethylo-hydroxide *v.* *Tri*-ETHYLAMINE *methylo-hydroxide*, vol. ii. p. 476.

Di-methyl-ethyl-amine NMe_2Et. (41°). A product of the action of heat on trimethylamine ethylochloride (Collie a. Schryver, *C. J.* 57, 770). Formed also by distilling NMe_2Et_2OH.

METHYL-TRI-ETHYL-AMMONIUM COMPOUNDS *v.* *Methylo-hydroxide* of *Tri*-ETHYLAMINE.

Di-methyl-di-ethyl-ammonium compounds *v.* *Methylo-chloride* of METHYL-*di*-ETHYL-AMINE.

Tri-methyl-ethyl-ammonium compounds *v.* *Ethylo-chloride* of *Tri*-METHYL-AMINE.

METHYL-ETHYL-ISOAMYL-AMINE $C_8H_{19}N$ *i.e.* $MeNEtC_5H_{11}$. (135°). Formed, together with ethylene, by the dry distillation of methyl-di-ethyl-isoamyl-ammonium hydroxide $MeNEt_2(C_5H_{11})(OH)$, which is obtained by the action of moist Ag_2O on the product of the union of MeI with di-ethyl-isoamyl-amine (Hofmann, *C. J.* 4, 317). Fragrant liquid, sl. sol. water.—$B'_2H_2PtCl_6$: orange-yellow needles, v. sol. water.

METHYL-ETHYL-AMYL-PHENYL-AMMONIUM HYDROXIDE *v.* *Methylo-hydroxide* of ETHYL-ISOAMYL-ANILINE, vol. ii. p. 476.

METHYL-ETHYL-ANILINE $C_9H_{13}N$ *i.e.* $C_6H_5.NMeEt$. (201° uncor.).

Formation.—1. By methylation of ethyl aniline (Hofmann, *A.* 74, 152).—2. By ethylation of methyl-aniline (Claus a. Howitz, *B.* 17, 1325).—3. From di-ethyl-aniline-methylo-iodide.

Properties.—Crystalline, forming extremely soluble salts. The hydrochloride melts at 114° (Claus a. Hirzel, *B.* 19, 2785).

Methylo-iodide B'MeI: [125°]; identical with di-methyl-aniline-ethylo-iodide (Claus a. Rautenberg, *B.* 14, 620; Hjortdahl, *J.* 1882, 510). Triclinic crystals, v. sol. water and alcohol. Decomposed by boiling with conc. KOHAq, yielding dimethylaniline.—B'HCl: [114°]; very hygroscopic crystals.—$(B'MeI)_2ZnI_2$: monoclinic crystals.—$(B'Me)_3H_5Fe_2Cy_{12}2aq$ (Fischer, *A.* 190, 187).

Ethylo-iodide B'EtI: [102°]; identical with di-ethyl-aniline methyloiodide; by treatment with KOH it gives methyl-ethyl-aniline.

Propylo-iodide $C_6H_5.NMeEtPrI$. *Methyl-propyl-aniline-ethylo-iodide, ethyl-propyl-aniline-methylo-iodide.* Thick syrup, v. sol. water Formed by the combination of methyl-ethyl-aniline with propyl iodide, of ethyl-propyl-aniline with methyl iodide, or methyl-propyl-aniline with ethyl iodide. By boiling with aqueous KOH the propyl group is split off and methyl-ethyl-aniline regenerated (Claus a. Hirzel, *B.* 19, 2785).

Reference.—BROMO-METHYL-ETHYL-ANILINE.

METHYL-ETHYL-ARSINE *v.* ARSENIC COMPOUNDS, ORGANIC.

DIMETHYL-ETHYL-AZONIUM-CHLORIDE $C_4H_{13}N_2Cl$ *i.e.* $Me_2NEtCl.NH_2$. Crystalline compound. E. sol. water. Prepared by the combination of ethyl chloride with dimethyl-hydrazine. On reduction with zinc-dust and acetic acid it gives dimethyl-ethylamine, NH_3, and HCl (Renouf, *B.* 13, 2172).—$(C_4H_{12}N_2Cl)_2PtCl_4$: crystalline.

METHYL-ETHYL-BENZENE *v.* ETHYL-TOLUENE.

Di-methyl-ethyl-benzene *v.* ETHYL-XYLENE.

Laurene $C_{11}H_{16}$ (*Laurol*). (188°). S.G. $\frac{19}{}$ ·887. According to Armstrong a. Miller (*B.* 16, 2258) this liquid is di-methyl-ethyl-benzene $C_6H_3Me_2Et$ [1:2:4]. It is one of the products of the action of $ZnCl_2$ on camphor (Fittig, *A.* 145, 149). It yields di-methyl-benzoic acid on oxidation. Montgolfier (*A. Ch.* [5] 14, 91) described laurene as $C_{10}H_{14}$ (195°). Reuter (*B.* 16, 627) described two laurenes: (*a*)-laurene (190°) yielding $C_6H_3Me_2CO_2H$ [1:4:2] on oxidation by dilute HNO_3, and (*β*)-laurene (185°) yielding on oxidation $C_6H_3Me_2CO_2H$ [1:3:4] and forming a sulphonic acid whose Ba salt is more soluble than that of (*a*)-laurene. According to Uhlhorn (*B.* 23, 2346) laurene contains (1,2,4)- and (1,4,2)-di-methyl-ethyl-benzenes.

o-**METHYL-ETHYL-BENZENE HEXAHYDRIDE** C_9H_{20} *i.e.*

$CH_2<\begin{matrix}CH_2.CHMe\\CH_2.CH_2\end{matrix}>CHEt.$

o-Methyl-ethyl-hexamethylene. (151°). Formed by boiling  $CH_2<\begin{matrix}CH_2.CHMe\\CH_2.CH_2\end{matrix}>CH.CH(OH).CH_3$ with fuming HIAq, diluting with water, extracting with ether, and heating the resulting oily  $CH_2<\begin{matrix}CH_2.CHMe\\CH_2.CH_2\end{matrix}>CH.CHI.CH_3$ (179° at 110 mm.) with excess of HIAq (S.G. 1·96) and amorphous phosphorus for 8 hours at 235° (Kipping a. Perkin, jun., *C. J.* 57, 26). Mobile oil with odour of paraffin, miscible with alcohol and ether.

o-**METHYL-ETHYL-BENZENE** (β) **-SULPHONIC ACID** $C_6H_3MeEt.SO_3H$ [1:2:4?]. Formed by sulphonating *o*-ethyl-toluene (Claus a. Pieszcek, *B.* 19, 3087). Crystalline.—NaA′aq: plates, v. sol. water, insol. alcohol.—KA′aq: plates, v. sol. water. — CaA'_2 2aq: plates grouped in nodules, v. e. sol. water.—BaA'_2 3aq: plates, v. e. sol. water.—PbA'_2 3aq: plates, v. e. sol. water. —CuA'_2 aq: blue plates, v. e. sol. water.

Chloride $C_6H_3MeEt.SO_2Cl$. Oil.

Amide $C_6H_3MeEt.SO_2NH_2$. Yellowish-brown oil, v. sl. sol. cold water, sol. hot water.

m-**Methyl-ethyl-benzene-sulphonic acid** *v.* vol. ii. p. 524.

(1, 2, 4)-Di-methyl-ethyl-benzene sulphonic acid $C_6H_2Me_2Et.SO_3H$. Formed by sulphonating ethyl-o-xylene (O. Jacobsen, *B.* 19, 2516; Stahl, *B.* 23, 991). Large tables. — $BaA'_2$4aq. — BaA'_2 3aq: white plates, m. sol. hot or cold water (S.).—NaA′1½aq. Small white plates, v. sol. water.

Amide $C_6H_2Me_2Et.SO_2NH_2$. [126°]. Long slender needles (from warm, very dilute, alcohol), or large prisms (from alcohol).

Di-methyl-ethyl-benzene sulphonic acid $C_6H_2Me_2Et.SO_3H$. *Laurene sulphonic acid.* Formed by sulphonating laurene. According to Reuter it is accompanied by an amorphous isomeride which forms a gummy Ba salt. Triclinic crystals (Reuter, *B.* 16, 627). When steam is passed into its solution in dilute H_2SO_4, hydrolysis begins when, through concentration, the temperature has reached 120° (Armstrong a. Miller, *C. J.* 45, 148).—BaA'_2 3aq. S. (of BaA'_2) 2·5 at 16°.

Amide $C_6H_2Me_2Et.SO_2NH_2$. [127°] (R.).

(1, 3, 4)-Di-methyl-ethyl-benzene sulphonic acid $C_6H_2Me_2Et.SO_3H$. Formed by sulphonating ethyl-*m*-xylene (J.).—BaA'_2 2aq: trimetric laminæ.—NaA′2aq: prisms.

Amide $C_6H_2Me_2Et.SO_2NH_2$. [148°].

(1, 4, 3)-Di-methyl-ethyl-benzene sulphonic acid $C_6H_2Me_2Et.SO_3H$. Formed by sulphonating ethyl-*p*-xylene (Jacobsen, *B.* 19, 2516). Large plates (from dilute H_2SO_4).—NaA′aq: mass of large tables (from warm saturated solution).—KA′aq: flat needles, v. sol. water.—BaA'_2: long six-sided plates, sl. sol. cold, m. sol. hot, water. —$CuA'_2$8aq: light-blue needles (Stahl, *B.* 23, 990).

Amide $C_6H_2Me_2Et.SO_2NH_2$. [117°]. Pearly plates (from dilute alcohol), or large transparent crystals (from warm alcohol); v. sol. hot alcohol.

METHYL DI-ETHYL BORATE $MeEt_2BO_3$. (100°–105°). S.G. $\frac{0}{}$ ·904. Formed by heating $MeBO_2$ with absolute alcohol at 100°.

PENTA-METHYL-ETHYL BROMIDE *v.* *Tert*-HEPTYL BROMIDE.

METHYL-ETHYL-BROMANILINE *v.* BROMO-METHYL-ETHYL-ANILINE.

METHYL-ETHYL-CARBINOL *v.* *Sec*-BUTYL-ALCOHOL.

Methyl-di-ethyl-carbinol *v.* *Tert*-HEXYL ALCOHOL.

Di-methyl-ethyl-carbinol *v.* *Tert*-AMYL ALCOHOL.

METHYL ETHYL CARBONATE $MeEtCO_3$. [−14·5°]. (109° cor.) (Röse, *A.* 205, 230). S.G. $\frac{27}{}$ 1·002. Obtained by distilling a mixture of potassium methyl carbonate with potassium ethyl-sulphate (Chancel, *C. R.* 31, 521; *A.* 79, 90). Formed also by the action of NaOMe on $ClCO_2Et$, or of NaOEt on $ClCO_2Me$ (Schreiner, *J. pr.* [2] 22, 354).

PENTA-METHYL-ETHYL CHLORIDE *v.* HEPTYL CHLORIDE.

METHYL-ETHYLENE *v.* PROPYLENE.

Di-methyl-ethylene *v.* BUTYLENE.

Tri-methyl-ethylene *v.* AMYLENE.

Tetra-methyl-ethylene *v.* HEXYLENE.

METHYL-ETHYLENE-DIAMINE. *Nitro-derivative* $C_2H_4(NH.NO_2)(NMeNO_2)$. [122°]. Formed by the action of methyl iodide on ethylene dinitramine (Franchimont a. Klobbie, *R. T. C.* 7, 343).

Di-methyl-ethylene-diamine. *Nitro-derivative* $C_2H_4(NMe.NO_2)_2$ [137°]. Formed like the preceding.

Di-methyl-ethylene-diamine *v.* ETHYLENE-DIAMINE.

METHYL-ETHYLENE-TRI-ETHYL-PHOSPHAMMONIUM BROMIDE *v.* vol. ii. p. 509.

DI-METHYL-ETHYLENE GLYCOL *v.* DI-OXY-BUTANE.

TRI-METHYL-ETHYLENE GLYCOL *v.* DI-OXY-PENTANE.

DI-METHYL ETHYLENE DIKETONE *v.* ACETONYL-ACETONE.

DI-METHYL-ETHYLENE DIKETONE DICARBOXYLIC ACID *v.* *Di-aceto-succinic ether* described under ACETYL-SUCCINIC ETHER.

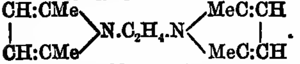
TETRA-METHYL-ETHYLENE-DI-PHENYL-DIPHOSPHONIUM BROMIDE *v.* *Ethylene bromide* of PHENYL-DI-METHYL-PHOSPHINE.

DI-METHYL-ETHYLENE-DI-PHENYL-DIPYRROLE DICARBOXYLIC ETHER $C_2H_4(C_4NHMePh.CO_2Et)_2$. [197°]. Formed from acetophenone-acetoacetic ether and ethylene-diamine (Paal a. Schneider, *B.* 19, 3156). Scales (containing 4aq). Yields on hydrolysis the corresponding acid [181°].

METHYL-ETHYLENE-PYRIDINE TETRAHYDRIDE $C_8H_{13}N$ *i.e.* $C_5H_6NMe(C_2H_4)$. *Tropidine.* (162°). S.G. $\frac{0}{4}$ ·9665. Formed by heating atropine or tropine with fuming HClAq and HOAc at 180°; or by heating tropine with H_2SO_4 (Ladenburg, *A.* 217, 117). Liquid, smelling like coniine; v. e. sol. cold, sl. sol. hot, water, v. e. sol. alcohol and ether. Alkaline in reaction. Its hydrobromide is decomposed by bromine at 175° yielding di-bromo-methyl-pyridine and ethylene. — $B'_2H_2PtCl_6$. — $B'HAuCl_4$. — $B'HI_3$. [93°]. Brown prisms.—$B'C_6H_2(NO_2)_3OH$: yellow needles (from boiling water).

Methylo-iodide B′MeI. Cubes. Decomposed on distillation with KOH yielding tropilene $C_7H_{10}O$, an oil C_6H_8O (?) (202°–207°), dimethylamine and methyl-tropine. With moist Ag_2O it gives a syrupy base which yields the salts: $(B'MeCl)_2PtCl_4$.—B'MeBr.—$B'MeC_6H_2(NO_2)_3O$.

TETRA-METHYL-ν-ETHYLENE-DI-PYRROL $C_{14}H_{20}N_2$ *i.e.*

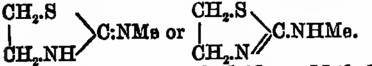


$\begin{matrix}CH:CMe\\ |\\ CH:CMe\end{matrix}>N.C_2H_4.N<\begin{matrix}MeC:CH\\ |\\ MeC:CH\end{matrix}$. [126°]. Obtained by adding ethylene-diamine (1 mol.) to a solution of acetonyl-acetone (2 mols.) in an equal weight of absolute alcohol. White pearly plates. Sublimable. Volatile with steam. V. sol. alcohol, ether, benzene, and petroleum-spirit, insol. water. Colours a chip of pine-wood carmine-red. Gives a purple-red colouration with phenanthraquinone and H_2SO_4 (Paal a. Schneider, *B.* 19, 3157).

DI-METHYL ETHYLENE DISULPHIDE $C_4H_{10}S_2$ *i.e.* $C_2H_4(SMe)_2$. *Di-methyl ether of di-thio-glycol.* (183°). Formed from ethylene bromide and NaSMe (Ewerlöf, *B.* 4, 716).

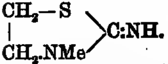
DI-METHYL ETHYLENE DISULPHONE *v.* *Di-methyl ether* of ETHANE DISULPHINIC ACID.

METHYL-ETHYLENE-ψ-THIO-UREA



$\begin{matrix}CH_2.S\\ |\\ CH_2.NH\end{matrix}>C:NMe$ or $\begin{matrix}CH_2.S\\ |\\ CH_2.N\end{matrix}\gg C.NHMe$. *Methyl-imido-thiazole tetra-hydride. Methyl-amido-thiazole dihydride.* [90°]. Formed, together with a crystalline compound $C_6H_{11}N_3O_2$ [70°], by the action of methyl-thiocarbimide on bromo-ethylamine (Gabriel, *B.* 22, 1148). Needles, v. e. sol. water, v. sol. ordinary solvents. Strongly alkaline. Oxidised by bromine-water to an acid (? $NHMe.CO.NH_2.CH_2.CH_2.SO_3H$), which is decomposed by fuming HClAq at 155° into CO_2, methylamine, and taurine.—Picrate [226°]: needles.—Aurochloride: needles.—Platinochloride: needles.

Methyl-ethylene-ψ-thiourea



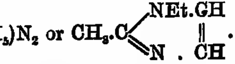
$\begin{matrix}CH_2-S\\ |\\ CH_2.NMe\end{matrix}>C:NH$. *Imido-methyl-thiazole.* Formed by heating ethylene-ψ-thio-urea with methyl iodide (Gabriel). Oil. When it is oxidised by bromine-water it yields methyl-taurine $NHMe.CH_2.CH_2.SO_3H$. Salts.—B'HI. [160°]. Colourless crystals, sol. water and alcohol.—Picrate. [200°-203°].—The aurochloride and platinochloride form long needles, sol. boiling water.

METHYL ETHYL ETHER *v.* METHYL ETHYL OXIDE.

METHYL-ETHYL-ETHYLENE *v.* AMYLENE.

METHYL-ETHYL-GLYOXAL *v.* METHYL ETHYL DIKETONE.

METHYL-ETHYL-GLYOXALINE $C_6H_{10}N_2$ *i.e.* $C_3H_2(CH_3)(C_2H_5)N_2$ or



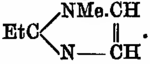
$CH_3.C\begin{matrix}NEt.CH\\ \|\\ N\ .\ CH\end{matrix}$. *Oxal-ethyl-ethyline.* (213°). S.G. $\frac{15}{}$ ·98. Formed by the action of ethyl bromide on methyl-glyoxaline (glyoxal-ethyline) (Radziszewski, *B.* 16, 489). Formed also from di-ethyl-oxamide NHEt.CO.CO.NHEt by treatment with PCl_5 and heating the hydro-iodide (10 g.) of the resulting 'chloroxalethyline' $C_6H_9ClN_2$ with HIAq (7 g. of S.G. 1·9) and amorphous phosphorus (1 g.) for 6 hours at 140°. The product is dissolved in water, rendered alkaline, and extracted with chloroform (Wallach, *A.* 214, 298). Colourless liquid, with narcotic smell. Sol. water and alcohol. $AgNO_3$ gives a crystalline pp., $HgCl_2$ a white pp. The zinc double chloride forms crystals melting at [160°]. Burns with a blue flame. It is a strong base and ppts. metallic oxides from their salts. Its zinc double salt distilled with lime yields pyrrole, ammonia, HCy, ethylene, and methyl-glyoxaline (para-oxal-methyline) (Wallach, *A.* 214, 305). It acts physiologically like atropine (Schulz, *B.* 13, 2353). When heated in a sealed tube with dilute H_2SO_4 at 240° it yields ethylamine. $KMnO_4$ yields oxalic acid, NH_3, and acetic acid. When passed through a red-hot tube it yields HCy and methyl-glyoxaline (para-oxal-methyline). H_2O_2 oxidises it to ethyl-oxamide (Radziszewsky, *B.* 17, 1290).

Salts.—B'HCl: deliquescent crystals.—$B'_2H_2PtCl_6$.—$B'_2H_2ZnCl_4$. [160°].—B'_2AgNO_3.

Methylo-iodide $C_6H_{10}N_2MeI$. Crystals, v. e. sol. water and alcohol. Not decomposed by aqueous NaOH.—$C_6H_{10}N_2MeI_3$.

Benzylo-chloride $C_6H_{10}N_2C_6H_5CH_2Cl$.

Methyl-ethyl-glyoxaline $C_6H_{10}N_2$ *i.e.*



$EtC\begin{matrix}NMe.CH\\ \|\\ N—CH\end{matrix}$. *Oxalmethylpropyline.* The methylo-iodide B'MeI of this body is formed by the action of MeI on para-ethyl-glyoxaline (Radziszewsky, *B.* 16, 490).

References. — DI-BROMO-, and CHLORO-, METHYL-ETHYL-GLYOXALINE.

METHYL-ETHYL-GLYOXIM *v.* *Oxim* of METHYL ETHYL DIKETONE.

METHYL-ETHYL-HYDROXYLAMINE *v.* HYDROXYLAMINE DERIVATIVES.

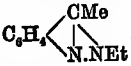
METHYL-ETHYLIDENE ETHYL DIKETONE $C_7H_{12}O_2$ *i.e.* $CH_3.CO.CHMe.CO.C_2H_5$. *Acetyl-propionyl-ethane.* (167°-170°). Formed by the action of NaOEt on a mixture of di-ethyl ketone and acetic ether (Claisen a. Ehrhardt, *B.* 22, 1009). Colourless oil.—$Cu(C_7H_{11}O_2)_2$. [192°]. Blue crystals (from benzene-ligroïn).

METHYL-ETHYLIDENE DI-ETHYL SULPHONE *v.* DI-ETHYL PROPYLIDENE DISULPHONE.

DI-METHYL-ETHYLIDENE-DI-INDOLE $C_{20}H_{20}N_2$ *i.e.* $CH_3.CH(C_8H_5MeN)_2$ or $(NH<\begin{matrix}C_6H_4\\ CMe\end{matrix}>C)_2.CHMe$. *Ethylidene-methyl-ketole.* [191°]. Formed by heating methyl-indole (methyl-ketole), paraldehyde, and $ZnCl_2$ on the water-bath (Fischer, *A.* 242, 376). Colourless prisms, v. sol. alcohol, ether, and acetone.

DIMETHYL ETHYLIDENE DIKETONE $(CH_3.CO)_2CHMe$. (165°). Formed from sodium methylene dimethyl diketone and MeI (Combes, *C. R.* 105, 868).

METHYL-ETHYL-INDAZINE $C_{10}H_{12}N_2$ *i.e.*



$C_6H_4<\begin{matrix}CMe\\ |\\ N.NEt\end{matrix}$. Formed by heating methyl-indazine with EtI at 100° (Fischer a. Tafel, *A.* 227, 303). Liquid, m. sol. water, v. e. sol. alcohol and ether, volatile with steam.—B'HCl: needles.

Methyl-ethyl-iso-indazine $C_6H_4<\begin{matrix}CMe\\ NEt\end{matrix}>N$. *Ethyl-quinazole.* [30°]. (235°). Formed by heating its carboxylic acid at 160°-190° (Fischer a. Kuzel, *A.* 221, 285; *B.* 16, 655). Formed also by reducing the nitrosamine of ethyl-amido-acetophenone, dissolved in dilute acetic acid, with zinc-dust, adding NaOH, and distilling with steam. The oily distillate is dissolved in dilute H_2SO_4, mixed with $NaNO_2$, and extracted with ether (Fischer a. Tafel, *A.* 227, 303). Plates, sl. sol. water, v. e. sol. alcohol and ether. Volatile with steam, giving off a pungent odour. Not affected by nitrous acid or by Ac_2O. Does not reduce Fehling's solution. Forms crystalline pps. with $AgNO_3$ and $HgCl_2$, which may be recrystallised from hot water in slender needles. Its salts are extremely soluble in water.—$B'H_2SO_4$: long needles.—$B'_2H_2PtCl_6$: sparingly soluble orange prisms.—Picrate: yellow needles.

Methylo-iodide B'MeI. [192°].

METHYL-ETHYL-ISO-INDAZINE CARBOXYLIC ACID 
$C_6H_4\left\langle\begin{matrix}C\text{—}CH_2.CO_2H\\ \| \\ NEt\text{—}N\end{matrix}\right.$.
Formed by treating the nitrosamine of ethyl-*o*-amido-cinnamic acid with zinc-dust and acetic acid (Fischer a. Kuzel, *A.* 221, 285). Colourless plates [131°] (from water) or groups of smaller plates [126°] (from chloroform-ligroïn). Sl. sol. water, v. sol. alcohol, ether, and chloroform. Combines with alkalis and with acids. Does not reduce boiling alkaline solutions of silver or copper. With bromine in HOAc it forms a bromo- derivative [173°] and a di-bromo- derivative [196°].

METHYL-ETHYL-INDOLE $C_{11}H_{13}N$ *i.e.*  $C_6H_4\left\langle\begin{matrix}CEt\\NH\end{matrix}\right\rangle CMe$. (292° i.V.). Formed by heating the phenyl-hydrazide of methyl propyl ketone with $ZnCl_2$ at 180° (E. Fischer, *B.* 19, 1565; *A.* 236, 132). Yellowish oil, v. sl. sol. water, v. sol. alcohol and ether. Its picrate crystallises from hot benzene in dark-red needles. With $NaNO_2$ and HOAc it yields a nitrosamine.

Methyl-ethyl-indole  $C_3H_4\left\langle\begin{matrix}CH\\NEt\end{matrix}\right\rangle CMe$. *Ethyl-methyl-ketole.* (288° i.V.). Formed, together with a base boiling at 256°, by heating methyl-indole (methyl-ketole) with EtI and alcohol at 100° (E. Fischer a. Steche, *B.* 20, 2199). Oil, insol. dilute acids. Colours pine-wood red.—Picrate. [146°]. Slender dark-red needles (from benzene).

Methyl-ethyl-indole  $C_6H_3Me\left\langle\begin{matrix}CH\\NEt\end{matrix}\right\rangle CH$. *Ethyl-p-tolindole.* (254°). Formed by heating its carboxylic acid for some time at 205° (Hegel, *A.* 232, 218). Oil, volatile with steam. Resinified by conc. H_2SO_4. Colours pine-wood moistened with HCl red. Fuming HNO_3 gives a red colour and a pp.

Di-methyl-ethyl-indole $C_{12}H_{15}N$ *i.e.*  $C_6H_4\left\langle\begin{matrix}CMe\\NEt\end{matrix}\right\rangle CMe$. (281°). Formed by heating bromo-levulic (bromo-acetyl-propionic) acid with ethyl-aniline (Wolff, *B.* 21, 3363). Yellowish oil, v. sol. ether, alcohol, and benzene, sl. sol. water.—Picrate $B'C_6H_2(NO_2)_3OH$. [105°]. Red needles, m. sol. benzene.

METHYL-ETHYL-INDOLE CARBOXYLIC ACID $C_{12}H_{13}NO_2$ *i.e.*  $CH_3.C_6H_3\left\langle\begin{matrix}CH\\NEt\end{matrix}\right\rangle C.CO_2H$. [202°]. Formed from the *p*-tolyl-ethyl-hydrazide of pyruvic acid by warming with dilute (10 p.c.) HClAq, or with phosphoric acid (Hegel, *A.* 232, 218). V. sol. alkalis, ether, and benzene, insol. ligroïn. With NaOCl it yields a chloro- derivative, which is converted by boiling water into methyl-ethyl-ψ-isatin.

PENTA-METHYL-ETHYL IODIDE *v.* HEPTYL IODIDE.

METHYL-ETHYL-ISATIN *v.* ISATIN.

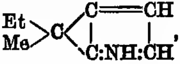
METHYL-ETHYL-KETOLE *v.* METHYL-ETHYL-INDOLE.

METHYL ETHYL KETONE C_4H_8O *i.e.* $CH_3.CO.CH_2.CH_3$. *Methyl-acetone.* Mol. w. 72. (81°) (F. a. D.); (78° at 740 mm.) (Schramm, *B.* 16, 1581). S.G. $\frac{13}{}$ ·8125 (F. a. D.); $\frac{20}{}$ ·8045 (S.).

Formation.—1. By the action of $ZnEt_2$ on acetyl chloride, or of $ZnMe_2$ on propionyl chloride (Freund, *A.* 118, 3; Popoff, *A.* 145, 289).—2. By boiling methyl-acetoacetic ether with potash (Frankland a. Duppa, *A.* 138, 336), or dilute H_2SO_4 (Böcking, *A.* 204, 17).—3. Among the products of the distillation of crude calcium acetate (Fittig, *A.* 110, 18).—4. By distilling a mixture of calcium acetate and calcium propionate (Schramm, *B.* 16, 1581).—5. By the oxidation of *sec*-butyl alcohol (Kanonnikoff a. Saytzeff, *A.* 175, 377).—6. By the action of H_2SO_4 on crotonylene (Lwoff a. Almédingen, *Bl.* [2] 37, 493).

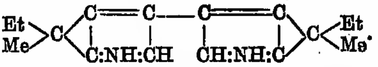
Properties.—Colourless liquid, smelling like acetone, miscible with water and alcohol. With hydrogen sodium sulphite it forms the compound $MeCEt(OH).SO_3Na\ \frac{1}{2}aq$ (Fittig).

Reactions.—1. *Sodium* converts it into homologues of mesityl oxide, of phorone, and of pinacone (Lawrenovitch, *B.* 8, 767). Sodium, added to its solution in benzene, forms an oil $C_{12}H_{20}O$, smelling like camphor.—2. *Chromic acid* in HOAc oxidises it to acetic acid.—3. PCl_5 yields di-chloro-butane $CH_3.CH_2.CCl_2.CH_3$. On treating this body with alcoholic potash at 170° there is formed $CH_3.CH_2.C{:}CH$, which ultimately changes into the isomeric $CH_3.C{:}C.CH_3$, which yields hexa-methyl-benzene on condensation with H_2SO_4 (Favorsky, *Bl.* [2] 43, 112).—4. On warming with *pyrrol*, MeOH, and a little hydrochloric acid, there is formed a butylidene-pyrrole



$$\begin{matrix}Et\\Me\end{matrix}\!\!>C\!\left\langle\begin{matrix}C=\!=CH\\ |\qquad\ |\\ C{:}NH{:}CH\end{matrix}\right.$$

, or di-butylidene-di-pyrrole



$$\begin{matrix}Et\\Me\end{matrix}\!\!>C\!\left\langle\begin{matrix}C=\!=C\text{——}C=\!=C\\ |\qquad |\qquad\ |\qquad |\\ C{:}NH{:}CH\quad CH{:}NH{:}C\end{matrix}\right\rangle C\!<\!\begin{matrix}Et\\Me\end{matrix}.$$

This body, when crystallised as $C_{16}H_{22}N_2\ \frac{5}{3}aq$, melts at 80°, but when anhydrous it melts at 142°. With alcoholic $AgNO_3$ it yields slender needles of B'_2AgNO_3 (Dennstedt a. Zimmermann, *B.* 20, 2454).

Oxim  $\begin{matrix}CH_3.CH_2\\CH_3\end{matrix}\!\!>C{:}N.OH$. (153° cor.). S.G. $\frac{24}{24}$ ·9195. Formed by the action of an aqueous solution of hydroxylamine on methyl ethyl ketone (Janny, *B.* 15, 2779). Colourless liquid, soluble in ten volumes of water, miscible with alcohol and ether. Concentrated NaOHAq forms a crystalline Na salt.

Reference. — HEXA-BROMO-METHYL-ETHYL-KETONE.

Methyl ethyl diketone $CH_3.CO.CO.CH_2.CH_3$. *Diketopentane. Acetyl-propionyl.* (108°). S. 7 at 15°. Formed by the action of amyl nitrite on its mono-oxim (nitroso-di-ethyl ketone) (Manasse, *B.* 21, 2177). Formed also from ethyl-acetoacetic ether by saponifying with dilute (3 p.c.) alkali, treating the product with $NaNO_2$ and H_2SO_4, removing alcohol by distillation, adding dilute H_2SO_4 (15 p.c.) and distilling with steam (Von Pechmann, *B.* 21, 1411, 2140). Dark yellow liquid, smelling like quinone, v. sol. ordinary solvents. Forms an unstable compound with alcohol. Reacts with aniline, forming a compound crystallising in needles and melting at 137°. Aqueous NaOH converts it into a 'quinogen,' and finally into a quinone [112°], which may be reduced to a hydroquinone [220°], and yields a phenyl-hydrazide [225°].

(α)-*Oxim* $CH_3.C(NOH).CO.C_2H_5$. *Isonitroso-di-ethyl ketone.* [59°–62°]. Formed by the action of amyl nitrite and NaOEt upon di-ethyl ketone (Claisen a. Manasse, *B.* 22, 528). Colourless plates.

(β)-*Oxim* $CH_3.CO.C(NOH).C_2H_5$. *Isonitroso-methyl-propyl ketone.* [55°]. (183°–187° cor.). Formed by the action of KNO_2 and H_2SO_4 on ethyl-acetoacetic ether (V. Meyer a. Züblin, *B.* 11, 323, 695). Crystals, v. e. sol. alcohol and ether, m. sol. cold water. Dissolves readily in alkalis, forming a yellow solution.

Di-oxim $CH_3.C(NOH).C(NOH).C_2H_5$. [170°]. Formed by the action of hydroxylamine on the mono-oxim (Schramm, *B.* 16, 180, 2187). Small white needles. May be sublimed.—$C_5H_8N_2O_2Na$: white pp.

Di-acetyl derivative of the *di-oxim* $CH_3.C(NOAc).C(NOAc).C_2H_5$. Prisms, v. sol. alcohol and ether, sl. sol. hot water.

(α)-*Oxim*-(β)-*phenyl hydrazide* $CH_3.C(NOH).C(N_2HPh).C_2H_5$. [128°]. Formed from the (α)-oxim by treatment with phenyl-hydrazine (Otte a. Pechmann, *B.* 22, 2119). Crystallises from benzene and ligroïn.

(β)-*Oxim*-(α)-*phenyl hydrazide* $CH_3.C(N_2HPh).C(NOH).C_2H_5$. [131°]. Formed from the (β)-oxim and phenyl-hydrazine (Otte a. Pechmann, *B.* 22, 2118). Crystallises from benzene and ligroïn.

(α)-*Phenyl-hydrazide* $CH_3.C(N_2HPh).CO.C_2H_5$. [103°]. Formed by the action of phenyl-hydrazine on the diketone (Otte a. Pechmann, *B.* 22, 2115).

(β)-*Phenyl hydrazide* $CH_3.CO.C(N_2HPh).C_2H_5$. [117°]. Formed by saponifying ethyl-acetoacetic ether by allowing it to stand with aqueous KOH, then adding di-azobenzene chloride, and ppg. by sodium acetate solution (Japp a. Klingemann, *C. J.* 53, 519; *B.* 21, 550; *A.* 247, 220). Yellow radiating needles or prisms (from benzene).

Di-phenyl-hydrazide $CH_3.C(N_2HPh).C(N_2HPh).C_2H_5$. [162°] (J.); [166°–169°] (C. a. M.). Formed by the action of phenyl-hydrazine on the diketone, on the (β)-phenyl-hydrazide, or on the (α)-oxim (Von Pechmann, *B.* 21, 1414; Japp, *A.* 247, 221; Claisen a. Menasse, *B.* 22, 528). Yellow needles (from benzene), sol. cold conc. H_2SO_4, forming a brown solution.

METHYL-ETHYL-KETONE CARBOXYLIC ACID *v. Methyl*-ACETOACETIC ACID.

METHYL-ETHYL-MALONIC ACID $C_6H_{10}O_4$ *i.e.* $CH_3.CH_2.CMe(CO_2H)_2$. Mol. w. 146. [119°]. H.C.v. 67,200. H.C.p. 672,300. H.F. 236,700 (Stohmann, Kleber, a. Langbein, *J. pr.* [2] 40, 210).

Formation.—1. By saponifying its ether which is obtained by treating ethyl-malonic ether with MeI and NaOEt, or methyl-malonic ether with EtI and NaOEt (Conrad a. Bischoff, *B.* 13, 596; *A.* 204, 146).—2. Together with a larger quantity of the isomeric *s*-di-methyl-succinic acid [194°], by reducing the anhydride of di-methyl-maleïc acid (pyrocinchonic acid) with HI or sodium-amalgam (Otto a. Beckurts, *B.* 18, 841).

Properties.—Prisms, v. sol. water, alcohol, and ether. At 180° it splits off CO_2 giving valeric acid $CH_3.CH_2.CHMe.CO_2H$. A solution of its ammonium salt gives pps. with $FeCl_3$ and with salts of Hg and Pb.

Salt. — AgA'. Sparingly soluble white crystalline pp.

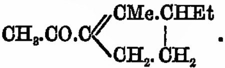
Ethyl ether Et_2A''. (208°). S.G. $\frac{15}{15}$ ·994. Oil, sol. alcohol and ether.

METHYL-ETHYL-METHANE *v.* BUTANE.

Methyl-di-ethyl-methane *v.* HEXANE.

Tri-methyl-ethyl-methane *v. Tert*-HEXANE.

METHYL - ETHYL - PENTAMETHENYLYL METHYL KETONE TRIHYDRIDE $C_{10}H_{16}O$ *i.e.*

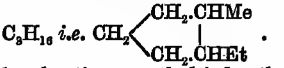


$$CH_3.CO.C\left\langle\begin{matrix}CMe.CHEt\\ |\\ CH_2.CH_2\end{matrix}\right.$$

. *Ethyl-methyl-dihydro-pentene methyl ketone.* (210°–215°). Formed from di-methyl butylene diketone dicarboxylic ether (di-acetyl-adipic ether) by heating with EtI and alcoholic NaOEt. The product is freed from alcohol by distillation, mixed with water, and the oil, which can then be extracted by ether, hydrolysed by boiling alcoholic potash (Marshall a. Perkin, *C. J.* 57, 252).

Oxim $C_{10}H_{17}NO$. Oil.

METHYL-ETHYL-PENTAMETHYLENE



$$C_8H_{16}\ i.e.\ CH_2\left\langle\begin{matrix}CH_2.CHMe\\ |\\ CH_2.CHEt\end{matrix}\right.$$

. (124°). Formed by heating methyl-iodo-ethyl-pentamethylene (obtained from methyl-pentamethylenyl-methyl carbinol and HI) with amorphous phosphorus and HI at 245° (Marshall a. Perkin, jun., *C. J.* 57, 250). Limpid oil, attacked by bromine with difficulty. Rapidly oxidised by boiling dilute HNO_3.

METHYL ETHYL OXIDE C_3H_8O *i.e.* $CH_3.O.C_2H_5$. Mol. w. 60. (11°). S.G. $\frac{0}{0}$ ·7252 (Dobriner, *A.* 243, 2). S.V. 84·0 (D.). V.D. 2·158. H.F.p. 58,450 (Thomsen, *Th.*). H.F.v. 56,420.

Formation.—1. By the action of MeI on NaOEt or of EtI on NaOMe (Williamson, *P. M.* [3] 37, 350 *C. J.* 4, 106, 229).—2. By distilling potassium methyl-sulphate with KOEt (Chancel, *C. R.* 31, 152).—3. By the action of Ag_2O on a mixture of MeI and EtI (Wurtz, *J.* 1856, 563).—4. Together with Me_2O and Et_2O by etherification of a mixture of methyl and ethyl alcohols by H_2SO_4 (Williamson; *cf.* Norton a. Prescott, *Am.* 6, 244).

Properties.—Colourless mobile liquid, with ethereal odour.

METHYL-ETHYL-OXY- *v.* OXY-METHYL-ETHYL.

METHYL-ETHYL-PHENOL $C_9H_{12}O$ *i.e.* $CH_3.C_6H_3Et.OH$. (215°). Prepared by fusing *p* methyl-ethyl-benzene sulphonic acid with potash, dissolving the product in water, acidifying, and extracting with ether (Mazzara, *G.* 10, 256). Oil, sl. sol. water. Gives an azure-blue colouration with $FeCl_3$.

Di-methyl-ethyl-phenol $C_6H_2Me_2Et(OH)$ [6:3:1:2]? [37°]. (245°). Obtained by potash-fusion from the corresponding di-methyl-ethyl benzene sulphonic acid (Stahl, *B.* 23, 990). $FeCl_3$ gives an intense green colour in alcoholic (not in aqueous) solution.

METHYL - ETHYL - PHENYL - AMINE *v.* AMIDO-TOLYL-ETHANE.

Tri-methyl-di-ethyl-phenyl-amine $C_{13}H_{21}N$ *i.e.* $C_6Me_3Et_2.NH_2$ [1:2:5:3:6:4]. (286°–290°). S.G. ·971. Colourless oil. Obtained by heating a mixture of mono- and di-ethyl-pseudo-cumidine with an equal weight of ethyl iodide at 260°–280° for 8–10 hours (Ruttan, *C. J.* 49, 813; *B.* 19, 2383).

Salts.—B′HCl: needles; easily sol. alcohol, v. sl. sol. hot water, insol. cold water. The acetate and sulphate form easily soluble needles. The oxalate forms very sparingly soluble quadratic prisms.

Acetyl derivative $C_6Me_3Et_2.NHAc$: [182°]; needles.

DI-METHYL-DI-ETHYL-*p*-PHENYLENE-DIAMINE $C_{12}H_{20}N_2$ *i.e.* $C_6H_4(NMe_2)(NEt_2)$. (265°). Prepared by heating di-ethyl-*p*-phenylene-diamine with methyl alcohol and HCl (Lippmann a. Fleissner, *M.* 4, 788). Light-yellow oil.

Di-methylo-di-iodide $B''Me_2I_2$. [218°]. Formed by heating di-ethyl-amido-benzene-azo-di-ethyl-aniline with MeI. Transparent four-sided prisms.—$B''Me_2I_2CdI_2$: silky needles.—$B''Me_2PtCl_6$: orange-red needles.—$B''(MeAuCl_4)_2$: yellow leaflets.—$B''2MeOC_6H_2(NO_2)_3$. [235°]. Yellow needles.

DI-METHYL ETHYL PHOSPHATE $C_4H_{11}PO_4$ *i.e.* Me_2EtPO_4. (203° cor.). S.G. $\frac{0}{}$ 1·1752. S.V. 161·1 (Lossen, *A.* 254, 74). Formed from Me_2AgPO_4 and EtI (Weger, *A.* 221, 90).

METHYL-DI-ETHYL-PHOSPHINE $C_5H_{13}P$ *i.e.* Et_2PMe. (111°). Formed by heating tri-ethyl-phosphine methylo-chloride Et_3PMeCl at 300° (Collie, *C. J.* 53, 719). Combines with sulphur and with oxygen. Forms red crystals with CS_2.

Methylo-chloride v. Ethylo-chloride of *Di-methyl-ethyl-phosphine.*

Ethylo-iodide v. TRI-ETHYL-PHOSPHINE METHYL-IODIDE.

Di-methyl-ethyl-phosphine Me_2PEt. (84°). Formed by heating $Me_2PEtHCl$ (the product of the distillation of its ethylo-chloride) with aqueous NaOH (Collie, *C. J.* 53, 720).

Methylo-chloride v. Ethylo-chloride of TRI-METHYL-PHOSPHINE.

Ethylo-chloride Me_2PEt_2Cl. Formed from Me_2PEt_2I, the product of the union of Et_2PMe and MeI. Split up by heat into ethylene and $Me_2PEtHCl$ (Collie).

METHYL - TRI - ETHYL - PHOSPHONIUM CHLORIDE *v. Methylo-iodide* of TRI-ETHYL-PHOSPHINE.

Di-methyl-di-ethyl-phosphonium chloride *v. Ethylo-chloride* of *Di-methyl-ethyl-phosphine.*

Tri-methyl-ethyl-phosphonium chloride *v. Ethylo-chloride* of TRI-METHYL-PHOSPHINE.

METHYL-ETHYL-PINACONE *v.* DI-OXY-OCTANE.

METHYL-ETHYL-PIPERIDINE *v.* METHYL-ETHYL-PYRIDINE HEXAHYDRIDE.

METHYL-ETHYL-PROPIONIC ACID *v.* HEXOIC ACID.

METHYL-ETHYL-PROPYL ALCOHOL *v.* HEXYL ALCOHOL.

METHYL-ETHYL-PROPYL-AMINE $C_6H_{15}N$ *i.e.* C_3H_7NMeEt. A product of the destructive distillation of the methylo-hydroxide of ethyl-codeïne (Von Gerichten a. Schrötter, *B.* 15, 1484). Volatile base, smelling like trimethylamine.—$B'_2H_2PtCl_6$. Long orange needles, v. sol. water, sl. sol. alcohol.

METHYL-ETHYL-PROPYL-CARBINOL *v* *Tert*-HEPTYL ALCOHOL.

METHYL-ETHYL-PROPYLENE *v.* HEXYLENE.

METHYL-ETHYL-PROPYL-METHANE *v.* HEPTANE.

DI-METHYL-DI-ETHYL-PYRAZINE $C_{10}H_{16}N_2$ *i.e.* $N\left<\begin{matrix}CMe.CEt\\ CEt{:}CMe\end{matrix}\right>N$. *Di-ethyl-ketine.* (216° cor.). V.D. 5·63 (calc. 5·68). Prepared by reduction of the oxim of methyl ethyl diketone (methyl nitroso-propyl ketone) Me.CO.C(NOH).Et with tin and HCl, or with sodium-amalgam (Treadwell, *B.* 14, 1461). Colourless oil with narcotic smell and alkaline reaction. It is a weak poison. Combines with water forming a crystalline hydrate. Not affected by MeI, acetic anhydride, or HI. Bromine added to its solution in HOAc ppts. $C_{10}H_{16}N_2Br_2$ as an unstable yellow compound. Very dilute potassium permanganate oxidises it to di-methyl-pyrazine di-carboxylic acid $N\left<\begin{matrix}CMe.C(CO_2H)\\ C(CO_2H){:}CMe\end{matrix}\right>N$, which does not yield an anhydride (Oeconomides, *B.* 19, 2524).—B′HCl. Large colourless crystals.—$B'_2H_2PtCl_6$. Soluble red prisms.—$B'AgNO_3$. Crystals, almost insol. cold water, v. e. sol. dilute HNO_3 (Treadwell, *B.* 14, 2158).

Hydrate B′*x*aq. [43°]. Large prisms (by sublimation). Gives up its water in dry air, becoming liquid.

METHYL-ETHYL-PYRIDINE $C_8H_{11}N$ *i.e.* $N\left<\begin{matrix}CH.CH\\ CMe{:}CH\end{matrix}\right>CEt$. (*α*)-*Collidine.* Mol. w. 121. (179°). S.G. $\frac{0}{}$ ·929 (Richard, *Bl.* [2] 32, 488); $\frac{16\cdot8}{}$ ·929 (Weidel a. Pick, *M.* 5, 659). S.V. 157·9 (Ramsay). A base found, together with many others, among the products of the dry distillation of bones (Anderson, *P. M.* [4] 9, 145, 214; *A.* 94, 360), of bituminous shale (Greville Williams, *C. J.* 7, 97) and of peat (Church a. Owen, *P. M.* [4] 20, 110). It occurs in coal tar. Colourless oil, with unpleasant odour. Fumes with HCl. V. sl. sol. water, separating again when warmed, v. sol. alcohol, ether, and oils. Ppts. ferric, aluminium, chromium, and mercurous oxides from their salts, but not manganese and nickel oxides. Its salts are deliquescent and gummy. $KMnO_4$ oxidises it to pyridine dicarboxylic (lutidinic) acid [219°], which is converted by heat into pyridine carboxylic acid [302°].—$B'_2H_2PtCl_6$. Orange-yellow flakes.

Ethylo-iodide B′EtI. Oil.—$(B'EtCl)_2PtCl_4$. Sparingly soluble crystalline pp. (Anderson, *P. M.* [4] 9, 221).

'*α*'-**Collidine** $C_8H_{11}N$. (179°–183°). This base, according to Oechsner de Coninck (*A. Ch.* [5] 27, 468), accompanies (*β*)-collidine in the product of the distillation of cinchonine with KOH. It is perhaps identical with (*a*)-collidine.

When '*a*'-collidine is heated with *ethylene chlorhydrin* and a little water for a few hours at 100° combination takes place. After removing uncombined collidine and chlorhydrin by shaking with ether, the residue is evaporated *in vacuo*. $PtCl_4$ forms with the product an orange-yellow pp. of $\{C_8H_{11}N(C_2H_4OH)Cl\}_2PtCl_4$. Boiling water removes HCl, forming oxethyl-*a*-collidine chloroplatinite $\{C_8H_{10}N(C_2H_4OH)Cl\}_2PtCl_2$. This forms brilliant scales (from alcohol). Oxethyl-*a*-collidine forms a gold salt, $B'AuCl_4$, crystallising in thin golden needles (Wurtz, *Pr.* 33, 450; *C. R.* 95, 263; *Bl.* [2] 39, 536).

Methyl-ethyl-pyridine $N\left<\begin{matrix}CH.CEt\\CH:CH\end{matrix}\right>CMe.$ (*β*)-*Collidine.* (196°). S.G. $\frac{0}{}$ ·966. V.D. 4·25 (calc. 4·19). Obtained by distilling cinchonine or brucine with KOH (Oechsner de Coninck, *C. R.* 91, 296; *A. Ch.* [5] 27, 469; *Bl.* [2] 37, 457; 42, 100; *R. T. C.* 1, 132; *cf.* Greville Williams, *Tr. E.* 21, Part 2; *A. Ch.* [3] 45, 488). Colourless, mobile, highly refractive liquid, rapidly turning yellow on exposure to air. Sl. sol. water, sol. alcohol and ether. When left in contact with moist air it takes up water (1 mol.) but does not form a well-defined hydrate. Potassium permanganate oxidises it to homo-nicotinic acid $N\left<\begin{matrix}CH:C(CO_2H)\\CH.CH\end{matrix}\right>CMe$, cinchomeronic acid $N\left<\begin{matrix}CH:C(CO_2H)\\CH.CH\end{matrix}\right>C.CO_2H$, and formic acid. It is very poisonous, a sub-cutaneous injection of ·1 g. paralysing the nerve centres. HI reduces it to the hydride $C_8H_{13}N$, and, at 250°, forms a brown oil $C_8H_{12}NI_3$. Sodium in alcohol reduces it to the hexahydride $C_8H_{17}N$ (175°-180°).

Salts.—$B'HCl$. White deliquescent tables. —$B'_2H_2PtCl_6$. S. 2·1 at 60° (Richard, *Bl.* [2] 32, 488). Orange-red powder, converted by boiling water into B'_2PtCl_4, a yellow crystalline powder. — $B'HAuCl_4$. — $B'_2H_2Cl_23AuCl_3$. — $B'_2H_2HgCl_4$. Minute white needles, sl. sol. water, insol. alcohol.

Methyl-ethyl-pyridine $N\left<\begin{matrix}CMe.CH\\CH:CEt\end{matrix}\right>CH.$ *Aldehyde collidine.* (176°). S.G. $\frac{0}{4}$ ·9389 (D.).

Occurrence.—As acetate in fusel oil (Krämer a. Pinner, *B.* 3, 77).

Formation.—1. By heating ethylidene chloride with alcoholic or aqueous ammonia for 12 hours at 160° (Krämer, *Z.* [2] 6, 568; *B.* 3, 202; Dürkopf, *B.* 18, 920). Ethylidene bromide may be used instead of the chloride, the temperature employed being then 125°-140° (Tavildaroff, *A.* 176, 12).—2. By heating an alcoholic solution of aldehyde-ammonia at 120° (Baeyer a. Ador, *A.* 155, 297). 'Para'-collidine, picoline, and lutidine are also formed in this reaction (Vohl, *J.* 1870, 807).—3. By distilling aldol-ammonia (aldehydine) (Wurtz, *Bl.* [2] 31, 433).—4. By heating glycol with ammonium chloride for 8 hours at 185°; the yield being from 15 to 20 p.c. of the theoretical quantity (Hofmann, *B.* 17, 1905).—5. By heating ethylene chloride with ethylamine at 190° (Hofmann, *B.* 17, 1907).—6. By heating paraldehyde with acetamide and P_2O_5 at 160° (Hesekiel, *B.* 18, 3091).—7. By heating aldehyde-ammonia with paraldehyde at 220° (Ladenburg a. Dürkopf, *A.* 247, 42).

Properties.—Oil, with aromatic odour, insol. water and dilute acids, v. sol. alcohol and ether. Fumes with HCl. Oxidised by $KMnO_4$ to methyl-pyridine carboxylic acid $N\left<\begin{matrix}CMe.CH\\CH:C(CO_2H)\end{matrix}\right>CH$ and isocinchomeronic acid $N\left<\begin{matrix}C(CO_2H).CH\\CH:C(CO_2H)\end{matrix}\right>CH$ (Dürkopf a. Schlaugk, *B.* 21, 294; *cf.* Wischnegradsky, *B.* 12, 1506). Bromine forms an oily compound. Fuming HIAq and amorphous phosphorus at 140° yield brownish-blue prisms of $C_8H_{14}NI_3$ or $C_8H_{12}NI_3$ (Ladenburg, *B.* 14, 232). Sodium, acting on its alcoholic solution, forms a hexahydride. Heated for some days at 100° with glycolic chlorhydrin and a little water it forms oxethyl-aldehydine, of which the platinochloride, $(C_8H_{11}N(C_2H_4OH)Cl)_2PtCl_4$, forms orange crystals (from dilute alcohol). It may be decomposed by H_2S; the hydrochloride produced would not crystallise, but it is converted by Ag_2O into a caustic base (Wurtz, *Pr.* 33, 448).

Salts.—$B'_2H_2PtCl_6$. [180°]. Very unstable trimetric crystals.—$B'HAuCl_4$. [72°]. Yellow needles, v. sol. water (Hesekiel, *cf.* Herzig, *M.* 2, 404).—$B'C_6H_2(NO_2)_3OH$. [157°]. Greenish-yellow four-sided tables.

Ethylo-iodide $B'EtI$. Trimetric tables, v. sol. water and alcohol. Yields $(B'EtCl)_2PtCl_4$ crystallising in needles or prisms.

Methyl-ethyl-pyridine $N\left<\begin{matrix}CMe.CH\\CEt:CH\end{matrix}\right>CH.$ (161°). S.G. $\frac{0}{}$ ·9361. Formed by heating (*a*)-methyl-pyridine (*a*-picoline) with EtI at 280°-300° (Ladenburg a. Schultz, *A.* 247, 46; *B.* 20, 2720). Liquid, almost insol. water, but takes up water from the air. Very volatile with steam. Oxidised by $KMnO_4$ to pyridine dicarboxylic acid $N\left<\begin{matrix}C(CO_2H).CH\\C(CO_2H):CH\end{matrix}\right>CH$ [226°]. Sodium reduces it, in alcoholic solution, to a hexahydride.

Salts.—$B'_2H_2PtCl_6$. [174°]. Triclinic tables, sl. sol. cold, v. sol. hot, water, insol. alcohol.—$B'HAuCl_4$. [110°]. Yellow needles, sl. sol. water, v. sol. ether-alcohol.

Methyl-ethyl-pyridine $N\left<\begin{matrix}CMe.CH\\CH:CH\end{matrix}\right>CEt.$ (173°). S.G. $\frac{0}{}$ ·9353; $\frac{20}{}$ ·9218. Formed by heating (*a*)-methyl-pyridine with EtI at 280°-300°, and separated from the preceding by fractional distillation (Schultz, *B.* 20, 2720; Ladenburg, *A.* 247, 46). Colourless hygroscopic liquid, with unpleasant odour, sl. sol. water. Oxidised by $KMnO_4$ to pyridine dicarboxylic acid $N\left<\begin{matrix}C(CO_2H).CH\\CH=CH\end{matrix}\right>C.CO_2H$. Sodium, added to its alcoholic solution, reduces it to the corresponding hexahydride.

Salts.—$B'_2H_2PtCl_6$. [190°]. Reddish-yellow plates, sl. sol. cold, v. sol. hot, water, insol. alcohol.—$B'HAuCl_4$. [90°]. Yellow needles, sl. sol. cold, m. sol. hot, water, v. e. sol. alcohol.—The phosphomolybdate and bismuth-iodide are amorphous, the cadmium iodide and periodide are oily.

Paracollidine $C_8H_{11}N$. (220°-230°). Formed, together with the collidine boiling at 176°, by heating aldehyde-ammonia (Baeyer a. Ador, *A.* 155, 307). Liquid, with pungent aromatic odour. Its salts crystallise with difficulty. Its ethylo-iodide is syrupy. The platinochloride is amorphous.

Isomeride of collidine.—Obtained by the putrefaction at 40° of pancreas (200 g.) mixed with gelatin (600 g.) and water (10,000 g.). After 5 days the liquid is distilled, first with H_2SO_4 and afterwards with baryta. The alkaline distillate is neutralised by HCl, evaporated to dryness, and extracted with alcohol. The hydrochloride of the base crystallises from alcohol in trimetric needles. The free base is got by adding NaOH to the hydrochloride and shaking with ether (Nencki, *J. pr.* [2] 26, 49).—$(B'HCl)_2PtCl_4$. Flat needles. Gives off an odour of xylene when distilled. The base is not identical with collidine (from NH_3 and ethylidene chloride), for it differs in odour, in the crystalline form of the platino-chloride, and in being more soluble in water.

Isomeride of collidine $C_8H_{11}N$. (202°). S.G. $\underline{0}$ ·987). Occurs in the flesh of putrid cuttle-fish (Oechsner de Coninck, *C. R.* 106, 858, 1604). Mobile liquid, v. sol. water, alcohol, and ether. Absorbs moisture from the air, becoming brown. —B'HCl. Deliquescent radiating masses.—$B'_2H_2PtCl_6$. Deep-yellow crystals, almost insol. cold water. Decomposed by hot water, with formation of B'_2PtCl_4, a pale-brown powder.—$B'_2H_2HgCl_4$. Small white needles.—$B'_2H_2Hg_3Cl_8$. Long yellowish needles.

Methylo-iodide B'MeI. Slender needles.

Isomeride of collidine *v.* TRI-METHYL-PYRIDINE.

Di-methyl-ethyl-pyridine $C_9H_{13}N$. *Parvoline.* (199° cor.) (D. a. G.). S.G. $\frac{0}{4}$ ·9419; $\frac{16}{4}$ ·9289 (D. a. S.).

Formation.—1. By heating propionic aldehyde-ammonia (Waage, *M.* 4, 718).—2. By heating methyl-ethyl-acroleïn-ammonia (Hoppe, *M.* 9, 643).—3. By heating propionic aldehyde with acetamide and P_2O_5 (Hesekiel, *B.* 18, 3097).—4. By heating propionic aldehyde-ammonia with paraldehyde in sealed tubes for 10 hours at 210° (Dürkopf a. Schlaugk, *B.* 21, 832).—5. By heating propionic aldehyde-ammonia (4 g.) with propionic aldehyde (6·5 g.) for 6 hours at 210° (Dürkopf a. Göttsch, *B.* 23, 685).

Properties.—Colourless oil, not turned brown by light and air, with faint and not unpleasant smell. M. sol. cold water, sl. sol. hot water, v. sol. alcohol and ether. $KMnO_4$ oxidises it to methyl-pyridine dicarboxylic acid [225°] and pyridine tricarboxylic acid [318°].

Salts.—$B'_2H_2PtCl_6$. [189°]. Large monoclinic crystals, sl. sol. cold water.—$B'HAuCl_4$. [82°]. Glittering lemon-yellow spangles, sl. sol. cold water. Not hygroscopic. — $B'HHg_3Cl_7$. [119°]. Long pointed needles, almost insol. cold water.—$B'C_6H_2(NO_2)_3OH$. [152°]. Yellow plates.

Di-methyl-ethyl-pyridine $C_9H_{13}N$. (217°). Formed, together with the preceding, by heating propionic aldehyde-ammonia with propionic aldehyde at 200° (Dürkopf a. Göttsch, *B.* 23, 692). Colourless liquid, not affected by air and light. Has a faint odour of nicotine. V. sol. alcohol and ether, sl. sol. water. Yields a di-methyl-pyridine carboxylic acid on oxidation.

Salts.—$B'_2H_2PtCl_6$. [above 270°]. Yellowish-red needles, sl. sol. water.—$B'HAuCl_4$. [140°]. Slender lemon-yellow needles, sl. sol. water containing HCl.—$B'HHgCl_3$. [159°]. Long glittering spangles or well-formed monoclinic crystals, sl. sol. cold water.

Di-methyl-ethyl-pyridine $C_9H_{13}N$ *i.e.*

$N{<}{\scriptsize\begin{matrix}CMe.CH\\CMe{:}CH\end{matrix}}{>}CEt$. (187°). S.G. $\underline{14}$ ·916. S. 1·3 at 0°. Obtained by the action of propionic aldehyde and ammonia on acetoacetic ether (Jaeckle, *A.* 246, 45). Formed also by heating to redness a mixture of potassium di-methyl-ethyl-pyridine dicarboxylate (1 mol.) with lime (2 mols.) (Engelmann, *A.* 231, 44). Liquid, more soluble in cold than in hot water. Its solution has a very bitter taste. $KMnO_4$ oxidises it to methyl-ethyl-pyridine carboxylic acid and uvitonic acid.

Salts.—$B'_2H_2PtCl_6$. [211°]. Crystalline pp., v. sol. hot water and alcohol.—$B'_2H_2Cr_2O_7$. Crystalline pp.—Picrate. [120°]. Needles.

METHYL-ETHYL-PYRIDINE DIHYDRIDE $C_8H_{13}N$. (β)-*Di-hydro-collidine.* (200°–205°). Formed by heating (β)-collidine with HIAq and red phosphorus at 140° (Oechsner de Coninck, *Bl.* [2] 42, 116).

Methyl-ethyl-pyridine hexahydride $C_8H_{17}N$. (c. 177°). Formed by adding sodium to an alcoholic solution of (β)-collidine (Oechsner de Coninck, *Bl.* [2] 42, 116).

Methyl-ethyl-pyridine hexahydride $C_8H_{17}N$ *i.e.*

$NH{<}{\scriptsize\begin{matrix}CHMe.CH_2\\CH_2.CHEt\end{matrix}}{>}CH_2$. *Copellidine.* (164°). S.G. $\underline{0}$ ·8653; $\frac{15}{4}$ ·8546. Formed from the collidine derived from aldehyde, by reduction in alcoholic solution with sodium (Dürkopf, *B.* 18, 920; Ladenburg, *A.* 247, 90). Colourless alkaline liquid, al. sol. water. Its physiological action resembles that of coniine, but is weaker.

Salts.—B'HCl. [171°]. Colourless needles, v. sol. water.—B'HBr. [165°]. Tufts of needles. —$B'HAuCl_4$. [104°]. Dimetric prisms, v. sol. hot water.—$B'_2H_2PtCl_6$. [147°]. Long yellow needles, v. e. sol. water.

Acetyl derivative $C_8H_{16}NAc$. (254°). S.G. $\frac{0}{4}$ ·9787; $\frac{21}{4}$ ·966.

Methyl-ethyl-pyridine hexahydride

$NH{<}{\scriptsize\begin{matrix}CHMe.CH_2\\CHEt.CH_2\end{matrix}}{>}CH_2$. (147°–151°). S.G. $\underline{0}$ ·8550; $\underline{20}$ ·8410. Formed by reducing the corresponding methyl-ethyl-pyridine in alcoholic solution with sodium, the product being purified by means of its oily nitrosamine (Schultz, *B.* 20, 2723; Ladenburg, *A.* 247, 95). Colourless alkaline liquid, smelling strongly like ammonia and like piperidine, sl. sol. water.

Salts.—B'HCl. Needles, v. e. sol. water and alcohol.—B'HBr. Needles.

Methyl-ethyl-pyridine hexahydride

$NH{<}{\scriptsize\begin{matrix}CHMe.CH_2\\CH_2\,.\,CH_2\end{matrix}}{>}CHEt$. *Copellidine.* (155°–160°). S.G. $\underline{0}$ ·8515; $\underline{20}$ ·8389. Obtained by reducing the corresponding methyl-ethyl-pyridine in alcoholic solution with sodium, the product being purified by means of the nitrosamine (Ladenburg a. Schultz, *B.* 20, 2723; *A.* 247, 96). Colourless, strongly alkaline liquid. —B'HCl. [c. 213°]. White needles, v. e. sol. water and alcohol.

ν-Methyl-ethyl-pyridine hexahydride

$NMe{<}{\scriptsize\begin{matrix}CHEt.CH_2\\CH_2\,.\,CH_2\end{matrix}}{>}CH_2$. (c. 149°). S.G. $\underline{0}$ ·8495. Formed by the action of MeI on the corresponding ethyl-pyridine hexahydride dis-

solved in MeOH, the product being distilled with strong aqueous NaOH (Ladenburg, *A.* 247, 71). Liquid, smelling like ν-methyl-pyridine hexahydride; sl. sol. water. Its hydrochloride crystallises in small needles.

Di-methyl-ethyl-pyridine hexahydride $C_9H_{19}N$. *Parpevoline.* (177°). S.G. $\frac{0}{4}$ ·8628; $\frac{10}{4}$ ·8542; $\frac{20}{4}$ ·8474. Formed at the same time as di-methyl-ethyl-pyridine (199°), when propionic aldehyde-ammonia and propionic aldehyde are heated together at 200°. Formed also by reducing the same di-methyl-ethyl-pyridine by adding sodium to its alcoholic solution (Dürkopf a. Göttsch, *B.* 23, 690). Very mobile colourless liquid, with penetrating odour like rotten hay, v. sol. ether and alcohol, sl. sol. water. Strongly alkaline in reaction. — $B'_2H_2CdI_4$. [120°–130°]. White sparingly soluble needles (from hot water).—The hydrochloride and hydroiodide are hygroscopic. Chlorides of gold and of platinum give no pp. in dilute solution, and oily pps. in concentrated solutions. Picric acid acts in like manner.

Di-methyl-ethyl-pyridine hexahydride $C_9H_{19}N$ *i.e.*  $NMe<\begin{matrix}CHMe.CH_2\\CH_2.CHEt\end{matrix}>CH_2$. *ν-Methyl-copellidine.* (165°). V.D. (H=1) 139·5 (obs.). S.G. $\frac{0}{4}$ ·8519; $\frac{13}{4}$ ·844. Formed from methyl-ethyl-pyridine hexahydride (164°) and MeI in the cold (Ladenburg a. Dürkopf, *B.* 18, 925; *A.* 247, 90). Strongly alkaline colourless oil, sl. sol. water.—B'HBr [151°]. White needles.—Picrate [162°]. Yellow needles.

Methylo-iodide B'MeI. [268°]. Long white needles, m. sol. water; v. sol. alcohol, ppd. by ether from alcoholic solution. With moist Ag_2O it yields a methylo-hydroxide which is split up on distillation into water and tri-methyl-ethyl-pyridine.

Methylo-chloride B'MeCl. Formed from the iodide by shaking with AgCl.—$(B'MeCl)_2PtCl_4$. Yellow octahedra. — $(B'MeCl)_2HgCl_2$. [108°]. Long white needles.

Di-methyl-ethyl-pyridine hexahydride $C_9H_{19}N$ *i.e.*  $NH<\begin{matrix}CHMe.CH_2\\CHMe.CH_2\end{matrix}>CHEt$. *Parpevoline. Ethyl-lupetidine.* (167°) at 725 mm. Formed by reducing di-methyl-ethyl-pyridine (187°) in alcoholic solution with sodium (Jaeckle, *A.* 246, 45). Liquid. Gives, in a dilute alcoholic solution, dark-brown pps. with silver or mercurous nitrate.—$B'_2H_2PtCl_6$. Orange prisms. —$B'_2H_2Cr_2O_7$. Long prisms.

Tri-methyl-ethyl-pyridine hexahydride $C_{10}H_{21}N$ *i.e.* $C_8H_{15}MeNMe$. *Di-methyl-collidine hexahydride. Di-methyl-copellidine.* (172°). S.G. $\frac{25}{4}$ ·7816. Formed by distillation of the methylo-hydroxide of ν-methyl-copellidine (di-methyl-ethyl-pyridine hexahydride) (165°) (Dürkopf, *B.* 18, 927; Ladenburg, *A.* 247, 94). Colourless alkaline liquid, sl. sol. water. Smells like trimethylamine.—$B'HAuCl_4$. Yellow needles or glistening plates.—$B'_2H_2PtCl_6$. [93°]. Silky yellow needles.

METHYL-ETHYL-PYRIDINE CARBOXYLIC ACID $C_9H_{11}NO_2$ *i.e.*  $N<\begin{matrix}C(CO_2H).CH\\C(CH_3):CH\end{matrix}>CEt$. Formed by oxidising the corresponding di-methyl-ethyl-pyridine with $KMnO_4$ (Altar, *A.* 228, 189).—$(HA')_2H_2PtCl_6$. [195°]. Red prisms.

Di-methyl-ethyl-pyridine dicarboxylic acid $C_{11}H_{13}NO_4$ *i.e.*  $N<\begin{matrix}CMe.C(CO_2H)\\CMe:C(CO_2H)\end{matrix}>CEt$. *Parvoline dicarboxylic acid.* [290°]. Obtained by saponifying its ether with alcoholic potash (Engelmann, *A.* 231, 40). Thick prisms, m. sol. cold water and alcohol; decomposed on fusion. On distillation with lime it yields di-methyl-ethyl-pyridine.—BaA″ 3aq. Plates, v. e. sol. water.—$(H_2A'')_2HCl$ aq. Prisms.

Ethyl ether Et_2A''. (305°–308°). Formed by passing nitrous acid gas into an alcoholic solution of the dihydride. Thick liquid.—$(Et_2A'')_2H_2PtCl_6$. [139°]. Long prisms (from alcohol).

DI-METHYL-ETHYL-PYRIDINE DIHYDRIDE DICARBOXYLIC ETHER $C_{15}H_{23}NO_4$ *i.e.*  $NH<\begin{matrix}CMe:C(CO_2Et)\\CMe:C(CO_2Et)\end{matrix}>CHEt$. *Hydroparvoline dicarboxylic ether.* [110°]. Formed by boiling acetoacetic ether (45 g.) with propionic aldehyde (10 g.) and alcoholic ammonia (Engelmann, *A.* 231, 38). Prisms (from alcohol); v. e. sol. hot alcohol, ether, chloroform, and benzene.

METHYL-ETHYL-PYRIMIDINE $C_7H_{10}N_2$ *i.e.*  $CEt<\begin{matrix}N.CMe\\N:CH\end{matrix}>CH$. (160°). Formed by reducing oxy-methyl-ethyl-pyrimidine with zinc-dust (Pinner, *B.* 22, 1619). Prisms.

(*Py.* 2:3)-METHYL-ETHYL-QUINOLINE $C_{12}H_{13}N$ *i.e.*  $C_6H_4<\begin{matrix}CH:CMe\\|\\N:CEt\end{matrix}$ [56°]. (268° at 710 mm.). Formed by the action of propionic aldehyde and HCl upon aniline (Dœbner a. Miller, *B.* 17, 1714). Large monoclinic prisms. V. sol. alcohol, ether, and benzene, sl. sol. water. On oxidation with CrO_3 and H_2SO_4 it yields (*Py.* 2)-methyl quinoline-(*Py.* 3)-carboxylic acid.

Salts.—$B'_2H_2Cl_2PtCl_4$: fine yellow needles. —Picrate $B'C_6H_2(NO_2)_3OH$: yellow crystals.— $B'_2H_2Cr_2O_7$: small yellowish-brown prisms.

Methylo-iodide B'MeI: [196°]; yellow needles, insol. ether.

(*B.* 2)-Methyl-(*Py.* 3)-ethyl-quinoline  $C_6H_3(CH_3)<\begin{matrix}CH:CH\\|\\N:C(C_2H_5)\end{matrix}$. *Ethyl-toluquinoline.* [60°]. (270° at 718 mm.). Formed by heating its (*Py.* 2)-carboxylic acid (Harz, *B.* 18, 3395). White needles. V. sol. ether or petroleum-ether. Yields on oxidation ethyl-quinoline carboxylic acid (Daniel, *B.* 23, 2267).

Salts.—$B'HCl^{\times}$: small white concentric crystals.—$B'HNO_3{}^{\times}$: fine white needles. — $B'_2H_2SO_4{}^{\times}$: colourless crystals.—$B'_2H_2Cl_2PtCl_4$: fine orange needles, sol. hot water, sparingly in cold.—$B'C_6H_2(NO_2)_3OH$: [244°]; very sparingly soluble yellow microscopic crystals.

(*B.* 4–*Py.* 2)-Di-methyl-(*Py.* 3)-ethyl-quinoline  $C_6H_2(CH_3)<\begin{matrix}CH:C(CH_3)\\|\\N:C(C_2H_5)\end{matrix}$. [44°]. (280° at 717 mm.). Formed by the action of propionic aldehyde and HCl upon *o*-toluidine (Harz, *B.* 18, 3400). Large colourless monoclinic crystals. It is reduced by tin and HCl to a tetra-hydride, which is a yellowish oil of boiling-point 275° at 724 mm. Yields methyl-ethyl-quinoline (*B.* 4)-carboxylic acid on oxidation.

Salts.—$B'HCl^{\times}$: easily soluble fine colourless needles.—B'HI×: very long colourless needles, v. sol. hot water, very sparingly in cold.—$B'_2H_2Cl_2PtCl_4$: large plates.—$B'C_6H_2(NO_2)_3OH$: [187°]; nearly insoluble yellow needles.

Methylo-iodide B'MeI 2aq: white needles. Gives $(B'MeCl)_2PtCl_4$: small glistening orange-red needles.

(*B.* 1or3 *Py.* 2)-**Di-methyl-(*Py.* 3)-ethyl-quinoline**  $C_6H_3(CH_3)\left\langle\begin{matrix}CH:C(CH_3)\\ \vert\\ N:C(C_2H_5)\end{matrix}\right.$. [41°]. (288°–292° at 720 mm.). Formed by the action of propionic aldehyde and HCl upon *m*-toluidine (Harz, *B.* 18, 3397). Colourless trimetric hexagonal plates. It is reduced by tin and HCl to a tetrahydride, which is a colourless oil of boiling-point 282°–285° at 720 mm.

Salts.—B'HCl×: easily soluble colourless prisms.—B'HI×: long colourless needles, soluble in hot water, very sparingly soluble in cold.—$B'_2H_2Cl_2PtCl_4$ 2aq: orange plates or fine needles, sl. sol. cold water.—$B'C_6H_2(NO_2)_3OH$: [220°]; yellow needles, sol. hot alcohol, nearly insol. water.

Methylo-iodide B'MeI aq: yellow needles, v. sol. hot water; gives $(B'MeCl)_2PtCl_4$: small glistening orange-red crystals.

(*B.* 2-*Py.* 2)-**Di-methyl-(*Py.* 3)-ethyl-quinoline**  $C_6H_3(CH_3)\left\langle\begin{matrix}CH:C(CH_3)\\ \vert\\ N:C(C_2H_5)\end{matrix}\right.$ [54°]. (288° at 720 mm.). Prepared by adding propionic aldehyde (60 g.) to a cooled mixture of *p*-toluidine (50 g.) and strong HCl (90 g.), finally heating for a short time on the water-bath. White trimetric crystals. Sparingly volatile with steam. V. sol. alcohol, ether, and benzene, insol. water. It is reduced by tin and HCl to a tetra-hydride (286°). It combines with bromine, forming a dibromide, which crystallises in yellow needles [91°]. By CrO_3 and dilute H_2SO_4 it is oxidised to (*B.* 2)-methyl-(*Py.* 3)-ethyl-quinoline (*Py.* 2)-carboxylic acid.

Salts.—B'HCl: syrup, which slowly crystallises.—B'HBr: easily soluble white silky needles.—B'HI: long colourless needles, v. sol. hot water, sparingly in cold.—$B'_2H_2Cr_2O_7$: sparingly soluble red needles.—$B'_2H_2Cl_2PtCl_4$ 2aq: orange-red needles. [208°] (Jungmann, *B.* 23, 2273).—$B'C_6H_2(NO_2)_3OH$: [177°]; small yellow needles.

Methylo-iodide B'MeI aq: [218°]; monoclinic yellow crystals.

Methylo-chloride B'MeCl, colourless soluble needles.—$(B'MeCl)_2PtCl_4$.

Ethylo-iodide B'EtI ½aq: [114°]; small yellow crystals.—$(B'EtCl)_2PtCl_4$ aq: glistening crystals (Harz, *B.* 18, 3384).

References.—AMIDO-, DI-BROMO-, NITRO-, and OXY-METHYL-ETHYL-QUINOLINES.

(*B.* 2,4 *Py.* 2)-**Tri-methyl-(*Py.* 3)-ethyl-quinoline**  $C_6H_2(CH_3)_3\left\langle\begin{matrix}CH:CMe\\ N:CEt\end{matrix}\right.$ [62°]. (291°). Formed from (1,3,4)-xylidine, propionic aldehyde and HCl (Waldbott, *B.* 23, 2270). Triclinic tables (from alcohol); gives on oxidation (*B.* 2, *Py.* 3)-di-methyl-(*Py.* 3)-ethyl-quinoline-(*B.* 4)-carboxylic acid [183°].—$B'_2H_2PtCl_6$.—B'HCl 3aq.—B H_2SO_4. Monoclinic crystals.—$B'H_2Cr_2O_7$.—$B'HNO_3$. Monoclinic crystals (from alcohol-ether).—$B'C_6H_2(NO_2)_3OH$. [183°]. Yellow needles.

Methylo-iodide B'MeI. Needles.

(*Py.* 2,4)-**Methyl-ethyl-quinoline dihydride**  $C_6H_4\left\langle\begin{matrix}CH:CMe\\ NEt.CH_2\end{matrix}\right.$. (255°). Formed by heating methyl-ethyl-indole with MeOH and MeI for 15 hours at 120° (Fischer a. Steche, *A.* 242, 363). Oil, forming very soluble salts.

Py. (2,3)-**Methyl-ethyl-quinoline tetrahydride** $C_{12}H_{17}N$ *i.e.*  $C_6H_4\left\langle\begin{matrix}CH_2.CHMe\\ \vert\\ NH.CHEt\end{matrix}\right.$. (262° at 720 mm.). Formed by reduction of (*Py.* 2:3)-methyl-ethyl-quinoline with tin and HCl (Dœbner a. Miller, *B.* 17, 1716). Colourless liquid. Fe_2Cl_6 gives a red colouration.—B'HCl: sparingly soluble colourless concentric needles.

(*Py.* 3,4)-**Methyl-ethyl-quinoline tetrahydride** $C_{10}H_{12}NEt$ *i.e.*  $C_6H_4\left\langle\begin{matrix}CH_2.CH_2\\ \vert\\ NEt.CHMe\end{matrix}\right.$. (256°). Obtained by reducing (*Py.* 3)-methyl-quinoline ethylo-iodide with tin and hydrochloric acid (Möller, *A.* 242, 321). Colourless liquid.—$B'_2H_2PtCl_6$. Red granular crystals, decomposed by boiling water.

Methylo-iodide B'MeI. [187°]. Not acted on by KOHAq.

(*Py.* 2,3,4)-**Di-methyl-ethyl-quinoline dihydride** $C_{13}H_{17}N$ *i.e.*  $C_6H_4\left\langle\begin{matrix}CH{=\!=}CMe\\ \vert\\ NEt-CHMe\end{matrix}\right.$. (256° i.V.). Formed by heating methyl ketole (methyl-indole) with ethyl alcohol and ethyl iodide for 15 hours at 100° (E. Fischer a. Steche, *A.* 242, 360; *B.* 20, 2200). Oil. The salts are v. sol. water.

Methylo-iodide B'MeI. [189°]. Colourless crystals; sol. water and alcohol.

Di-methyl-ethyl-quinoline dihydride $C_{13}H_{17}N$. (255° i.V.) at 750 mm. Formed by heating methyl-ethyl-ketole (methyl-ethyl-indole) (1 pt.) with MeI (2 pts.) and MeOH (1 pt.) at 120° (F. a. S.).

(*B.* 4; *Py.* 2)-**Di-methyl-(*Py.* 3)-ethyl-quinoline tetrahydride**  $C_6H_3Me\left\langle\begin{matrix}CH_2.CHMe\\ \vert\\ NH.CHEt\end{matrix}\right.$. (275°) at 724 mm. Obtained by reducing the corresponding di-methyl-ethyl-quinoline with tin and HCl (Harz, *B.* 18, 3400). Yellowish oil; sparingly volatile with steam.

(*B.* 3? *Py.* 2)-**Di-methyl-(*Py.* 3)-ethyl-quinoline tetrahydride**  $C_6H_3Me\left\langle\begin{matrix}CH_2.CHMe\\ \vert\\ NH.CHEt\end{matrix}\right.$. (c. 284°) at 720 mm. Obtained by reducing the corresponding di-methyl-ethyl-quinoline with tin and HCl (Harz). Oil.

(*B.* 2; *Py.* 2)-**Di-methyl-(*Py.* 3)-ethyl quinoline tetrahydride**  $C_6H_3(CH_3)\left\langle\begin{matrix}CH_2.CH(CH_3)\\ \vert\\ NH.CH(C_2H_5)\end{matrix}\right.$. (286° at 720 mm.). Formed by reduction of di-methyl-ethyl-quinoline with tin and HCl (Harz, *B.* 18, 3387). Colourless refractive fluid.

Salts.—B'HCl: colourless needles; sl. sol. cold water.—$B'_2H_2Cl_2PtCl_4$ 2aq: brown plates.

Nitrosamine $C_{13}H_{18}N(NO)$: crystalline solid; sparingly volatile with steam.

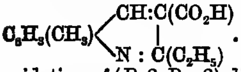
(*B.* 2-*Py.* 2:4)-**Tri-methyl-**(*Py.* 3)-**ethyl-quinoline tetrahydride**

$C_6H_3(CH_3)\left<\begin{matrix}CH_2 - CH(CH_3)\\ \quad\quad | \\ N(CH_3).CH(C_2H_5)\end{matrix}\right.$.

(275°–280° at 720 mm.). Oil. Formed by heating (*B.* 2 - *Py.* 2) - di-methyl - (*Py.* 3) - ethyl - quinoline tetrahydride with methyl iodide.—$B'_2H_2Cl_2PtCl_4$ 2aq: needles (Harz, *B.* 18, 3388).

(*B.* 2,4; *Py.* 2)-**Tri-methyl-**(*Py.* 3)-**ethyl-quinoline tetrahydride** $C_{14}H_{21}N$. (288°). Formed by reducing the corresponding tri-methyl-ethyl-quinoline (Waldbott, *B.* 23, 2272). Oil.—$B'C_6H_2(NO_2)_3OH$ [146°].

(*B.* 2)-**METHYL-**(*Py.* 3)-**ETHYL-QUINOLINE CARBOXYLIC ACID**



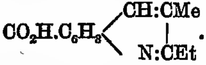
$C_6H_3(CH_3)\left<\begin{matrix}CH:C(CO_2H)\\ | \\ N:C(C_2H_5)\end{matrix}\right.$.

[143°]. Formed by oxidation of (*B.* 2-*Py.* 2)-di-methyl-(*Py.* 3)-ethyl-quinoline with CrO_3 and dilute H_2SO_4 (Harz, *B.* 18, 3392; Daniel, *B.* 23, 2266). Triclinic needles, prisms, or plates (containing aq). Sol. water and alcohol. Yields on distillation methyl-ethyl-quinoline [60°].

Salts.—A′Na 3aq: easily soluble glistening crystals.—A′Ag: granular powder.—$A'_2Ba\frac{1}{2}$aq: soluble needles.—A'_2Cu: microcrystalline blue pp.

Ethyl ether EtA′*x*aq. [170°–190°]. Decomposed on fusion (Harz, *B.* 18, 3394).

Methyl-ethyl-quinoline (*B.* 4)-**carboxylic acid**



$CO_2H.C_6H_3\left<\begin{matrix}CH:CMe\\ | \\ N:CEt\end{matrix}\right.$.

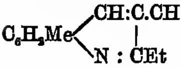
[216°]. Formed by oxidation of (*B.* 4, *Py.* 2)-Di-methyl-(*Py.* 3)-ethyl-quinoline (Miller a. Daniel, *B.* 23, 2266). Insol. water, sl. sol. cold alcohol. Gives on distillation methyl-ethyl-quinoline [56°].—$BaA'_2\frac{1}{2}$aq.

(*B.* 2; *Py.* 2)-**Di methyl-**(*Py.* 3)-**ethyl-quinoline** (*B.* 4)-**carboxylic acid** $C_{14}H_{15}NO_2$ *i.e.*

$\begin{matrix}CMe:CH\text{——}C.CH:CMe\\ CH.C(CO_2H).C.\ N\ :CEt\end{matrix}$.

[183°]. Formed by oxidising (*B.* 2,4; *Py.* 2)-tri-methyl-(*Py.* 3)-ethyl-quinoline by CrO_3 and H_2SO_4 (Jungmann, *B.* 23, 2273). Needles (from alcohol), v. e. sol. alcohol and water, sl. sol. benzene. On dry distillation it gives CO_2 and (*B.* 2; *Py.* 2)-di-methyl-(*Py.* 3)-ethyl-quinoline (254°).

(*B.* 2)-**METHYL-**(*Py.* 3)-**ETHYL-QUINOLINE CARBOXYLIC ALDEHYDE** $C_{13}H_{13}NO$ *i.e.*



$C_6H_3Me\left<\begin{matrix}CH:C.CHO\\ | \\ N:CEt\end{matrix}\right.$.

[57°]. (above 300°). Formed, in small quantity, in the preparation of the preceding acid (Harz, *B.* 18, 3397). Large trimetric prisms (from ether), not very volatile with steam. Reduces ammoniacal $AgNO_3$. Ag_2O oxidises it to the corresponding acid (Daniel, *B.* 23, 2267).

(*B.* 2-*Py.* 2)-**DI-METHYL-**(*Py.* 3)-**ETHYL-QUINOLINE SULPHONIC ACID** $C_{13}H_{14}N(SO_3H)$. [above 290°]. Formed by heating di-methyl-ethyl-quinoline with fuming sulphuric acid (20 p.c. SO_3) (Harz, *B.* 18, 3389). White silky scales or thick trimetric crystals. Easily soluble in hot water, sparingly in cold; insol. strong alcohol.

Salts.—A'_2Ba aq: easily soluble white needles.—A'_4H_2Pb 6aq: easily soluble needles.

METHYL-TRI-ETHYL-RESORCIN $C_6MeEt_3(OH)_2$. [144°]. Obtained by heating with HCl its mono-ethyl derivative $C_6MeEt_3(OH)(OEt)$ which is formed, together with the di-ethyl ether of orcin, by treating orcin with EtI and KOH (Herzig a. Zeisel, *M.* 11, 318). Needles, insol. water, v. sol. ether. Neutralises only 1 mol. NaOH.

Acetyl derivative $C_6MeEt_3(OAc)(OH)$. [c. 73°]. Monoclinic needles.

METHYL TRI-ETHYL SILICATE $C_7H_{18}SiO_4$ *i.e.* $MeEt_3SiO_4$. (156°). S.G. $\frac{0}{}$ ·989. Formed from $MeO.SiCl_3$ by the action of EtOH (Friedel a. Crafts, *A. Ch.* [4] 9, 32).

Di-methyl di-ethyl silicate $Me_2Et_2SiO_4$. (143°–146°). V.D. 6·18 (calc. 6·23). S.G. $\frac{0}{}$ 1·004. Formed from MeOH and Et_4SiO_4. Formed also by the action of EtOH on $(MeO)_2SiCl_2$. Liquid.

Tri-methyl ethyl silicate Me_3EtSiO_4. (134°). S.G. $\frac{0}{}$ 1·023. Formed from $(MeO)_3SiCl$ and EtOH.

METHYL-ETHYL-STIBONIUM SALTS *v.* ANTIMONY, vol. i. p. 294.

METHYL-ETHYL-SUCCINIC ACID $C_7H_{12}O_4$ *i.e.* $CO_2H.CHEt.CHMe.CO_2H$. [168·5°]. Formed by the action of H_2SO_4 on pentane tricarboxylic ether (Bischoff a. Walden, *B.* 22, 1817). It is accompanied by the isomeric 'meso' acid [88°] (Bischoff a. Mintz, *B.* 23, 647). The same acid [160°] appears to be formed in small quantities in the saponification of $CH_3.CO.CMe(CO_2Et).CHEt.CO_2Et$ with HCl (Young, *C. J.* 43, 180). White crystals.

Di-methyl-ethyl-succinic acid $C_8H_{14}O_4$ *i.e.* $CO_2H.CHEt.CMe_2.CO_2H$. Formed by the action of H_2SO_4 on the product of the action of *a*-bromo-isobutyric ether on sodium ethyl-malonic ether (Bischoff a. Mintz, *B.* 23, 651). It occurs in two varieties, one melting at 63° the other at 105°.

DI-METHYL-DI-ETHYL-SULPHAMIDE $C_6H_{18}N_2SO_2$ *i.e.*

$O_2S\left<\begin{matrix}NMe_2\\ NEt_2\end{matrix}\right.$.

(229°). Formed by the action of di-ethyl-amine on di-methyl-amido-sulphonic chloride, or of di-methyl-amine on di-ethyl-amido-sulphonic chloride (Behrend, *B.* 15, 1610; *A.* 222, 125, 136). Volatile with steam. Heavy oil. Insol. water, sol. alcohol, ether, and benzene.

METHYL ETHYL SULPHIDE C_3H_8S *i.e.* Me.S.Et. (67° i.V.). S.G. $\frac{20}{}$ ·837. V.D. 2·61 (calc. 2·63). Formed by distilling an alcoholic solution of NaSEt with MeI (Krüger, *J. pr.* [2] 14, 193; Claesson, *J. pr.* [2] 15, 174; *B.* 20, 3413). Occurs also among the products obtained by heating di-thio-phosphoric ether $Et_3PO_2S_2$ with MeOH at 150° (Carius, *A.* 119, 313; 120, 61). Liquid, with unpleasant odour. Yields ethane sulphonic acid on oxidation with HNO_3.—$EtSMeHgCl_2$: laminæ (C.).—$(EtSMe)_2HgI_2$. Yellow crystalline powder.

Methylo-iodide $EtSMe_2I$ *v.* DI-METHYL-SULPHIDE *ethylo-iodide.*

Ethylo-iodide Et_2SMeI *v.* *Methylo-compounds* of DI-ETHYL-SULPHIDE, vol. ii. p. 516.

METHYL - ETHYL - SULPHONAMIDE *v.* METHYL-ETHYL-SULPHAMIDE.

METHYL ETHYL SULPHONE $C_3H_8SO_2$ *i.e.* $MeEtSO_2$. [36°]. Formed by oxidising MeSEt with $KMnO_4$ (Beckmann, *J. pr.* [2] 17, 455). Formed also by heating $C_2H_5.SO_2.CH_2.CO_2H$ to 190° (Otto, *B.* 21, 993). White needles (from ether). V. sol. water, alcohol, benzene, chloroform, and strong acids. Sl. sol. CS_2 and ether. Not affected by reducing agents.

METHYL ETHYL SULPHONE CARBOXYLIC ACID $C_4H_8SO_4$ *i.e.* $Et.SO_2.CH_2.CO_2H$. *Ethyl-sulphono-acetic acid.* Obtained by saponifying its ether with cold conc. KOHAq. Formed also by oxidising the barium salt of the ethyl derivative of thioglycollic acid with $KMnO_4$ (Claesson, *Bl.* [2] 23, 447). Thick colourless syrup. At 190° it splits up into CO_2 and methyl ethyl sulphone [36°]. Bromine added to its aqueous solution gives a di-bromo-methyl-ethyl-sulphone. Zinc and HCl reduce it to ethyl mercaptan.

Salts.—NaA′. Pearly plates, v. sl. sol. hot alcohol, v. sol. water.—KA′. Small tables (from alcohol).—BaA'_2. Nodules.—CuA'_2 2aq. Broad tables.

Ethyl ether EtA′. Formed by the action of chloro-acetic ether on sodium ethane-sulphinate (Claesson, *J. pr.* [2] 15, 223; Otto, *B.* 21, 993). Oil.

METHYL-ETHYL-THIAZOLE

$$\left\langle\begin{matrix}S\ \ .CEt\\CH:CMe\end{matrix}\right\rangle N$$

(161° cor.). Formed by the action of thiopropionamide on chloro-acetone in alcoholic solution (Hubacher, *A.* 259, 230). Liquid, smelling like pyridine, miscible with alcohol, insol. hot water, sl. sol. cold water.—$B'_2H_2PtCl_6$. [177°].

METHYL ETHYL DITHIOCARBONATE *v.* Ethyl thiocarbonates, vol. ii. p. 521.

METHYL-ETHYL-THIO-UREA $C_4H_{10}N_2S$ *i.e.* NHMe.CS.NHEt. [54°]. Formed by addition of methylamine to ethyl thio-carbimide (Hofmann, *B.* 1, 27; *Z.* 1868, 655). Fine crystals, sol. water, alcohol, and HClAq.

Methyl-di-ethyl-thio-ψ-urea $C_6H_{14}N_2S$ *i.e.* NHEt.C(SMe):NEt. Formed from di-ethyl-thio-urea and MeI (Noah, *B.* 23, 2196). Oil. With alcoholic NH_3 at 100° it yields di-ethyl-guanidine and MeSH.—B′HI.—$B'C_6H_2(NO_2)_3OH$. [116°].—$B'_2H_2PtCl_6$: laminæ.

METHYL-ETHYL-TOLUQUINOLINE *v.* Di-methyl-ethyl-quinoline.

METHYL-ETHYL-UREA $C_4H_{10}N_2O$ *i.e.* NHMe.CO.NHEt. [53°]. (267°) (Wurtz, *Rép. chim. pure,* 4, 199). [92°–112°] (Schreiner). Formed from methylamine and cyanic ether (Wurtz). When methylamine acts on ethyl-carbamic ether there is formed a methyl-ethyl-urea which melts at 105° and solidifies again at 101°. When, on the other hand, ethylamine acts on methyl-carbamic ether the methyl-ethyl-urea which is produced melts at 75° and solidifies again at 72° (Schreiner, *J. pr.* [2] 22, 360). After frequent meltings and solidifyings, both these forms begin to melt at 92° and end at 112°.

METHYL-EUGETIC ACID *v. Methyl derivative* of Eugetic acid.

METHYL-ISO-FERULIC ACID *v.* Iso-Ferulic acid and the *dimethyl derivative* of Caffeïc acid, vol. i. p. 659.

METHYL-FLAVOLINIUM HYDRATE *v. methylo-hydrate* of (*Py.* 3:1)-Phenyl-methyl-quinoline (*flavoline*).

METHYL-FLUORESCEÏN *v.* so-called '*homo-fluoresceïn*,' vol. ii. p. 558.

METHYL FLUORIDE CH_3F. V.D. 1·22 (calc. 1·19). S. 1·66 at 15° (D. a. P.). Formed, together with Me_2O, by the action of KF on $KMeSO_4$ (Dumas a. Péligot, *A.* 15, 59). Formed also, in small quantity, together with NMe_3, by heating NMe_4F at 180° *in vacuo* (Lawson a. Collie, *C. J.* 53, 628; 55, 110). Prepared by the action of MeI upon silver fluoride (Moissan a. Meslans, *C. R.* 107, 1155). Gas, sl. sol. water, v. sol. alcohol and MeI. Liquefied by a pressure of 30 atmospheres. It burns with a blue flame, yielding HF. Saponified with difficulty by heating in sealed tubes with water or dilute aqueous KOH at 120°. In the presence of a little water it forms a crystalline hydrate, decomposing at 18·8° (Villard, *C. R.* 111, 184). Chlorine, acting upon it in sunlight, forms CH_2ClF, a gas which is decomposed by water, and is hardly inflammable.

METHYL-FORMAMIDE *v. Formamide* in the article on Formic acid.

Di-methyl-formamidine $C_3H_8N_2$ *i.e.* $NMe_2.CH:NH$. *Form-imid-di-methyl-amide.* Formed by the action of an alcoholic solution of di-methyl-amine on the hydrochloride of form-imido-ether (Pinner, *B.* 16, 1650).—B′HCl: thick prisms, [169°], v. sol. water and alcohol.

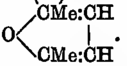
s-**Di-methyl-formamidine** NHMe.CH:NMe. *Form-methyl-imid-methyl-amide.* Formed by the action of an alcoholic solution of methyl-amine on the hydrochloride of formimido-ether NH:CH.OEt.—$B'_2H_2Cl_2PtCl_4$: short red prisms, [172°] (Pinner, *B.* 16, 358, 1648).

METHYL-FORMANILIDE *v.* Formic acid.

DI-METHYL-FUMARIC ACID *v.* Di-methyl-maleïc acid.

METHYL-FURFURALDEHYDE $C_6H_6O_2$ *i.e.* $C_4H_2MeO.CHO$. *Methyl-furfurol.* (187° i.V.). S. 3·3. Appears to accompany furfuraldehyde in the product of the dry distillation of wood (Hill, *B.* 22, 607). Formed also by distilling isodulcite with dilute H_2SO_4 (Maquenne, *C. R.* 109, 604). According to Bieler a. Tollens (*A.* 258, 110; *B.* 22, 3062) fucusol or fucus aldehyde (*q.v.*) is a mixture of furfuraldehyde and methyl-furfuraldehyde. Combines with $NaHSO_3$. Aqueous ammonia converts it into crystalline methyl-furfuramide $N_2(C_6H_6O)_3$ [87°]. Yields, on oxidation, methyl-pyromucic acid $C_6H_6O_3$ [109°]. Reduces Ag_2O. Gives Schiff's reaction with rosaniline and SO_2. Its phenyl-hydrazide is liquid. With resorcin and HCl it yields an orange-yellow condensation-product. Pyrogallol and HCl form a crimson compound. Paper moistened with aniline acetate is coloured yellow, and finally deep orange-red by an aqueous solution of methyl-furfuraldehyde.

(*aa*)-**DI-METHYL-FURFURANE** C_6H_8O *i.e.*



$$O\left\langle\begin{matrix}CMe:CH\\ \quad\ |\\CMe:CH\end{matrix}\right.$$

(94°).

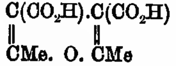
Formation.—1. By dry distillation of pyrotritaric or carbopyrotritaric acid; the yield being 5–7 p.c. — 2. By distilling acetonyl-acetone $CH_3.CO.CH_2.CH_2.CO.CH_3$ with $ZnCl_2$; the yield being 25 p.c. (Dietrich, *B.* 20, 1085).—3. Occurs also in the product obtained by distilling sugar (1 pt.) with lime (3 pts.) (E. Fischer a. Laycock, *B.* 22, 101).

Properties.—Colourless mobile very volatile liquid of characteristic odour. Insol. water; miscible with other solvents. Does not react with phenyl-hydrazine. By PCl_5 or $POCl_3$ it is resinified. By heating with acidified water it is converted back into acetonyl-acetone.

METHYL-FURFURANE CARBOXYLIC ACID v. Methyl-pyromucic acid.

Di-methyl-furfurane carboxylic acid v. Pyrotritaric acid

Di-methyl-furfurane dicarboxylic acid $C_8H_8O_5$ *i.e.*



$$\begin{array}{c}C(CO_2H).C(CO_2H)\\ \| \qquad\qquad \| \\ CMe.\ O.\ CMe\end{array}$$

(Knorr; *cf.* Fittig, *B.* 18, 3410). *Carbopyrotritaric acid.* [230°]. Formed by boiling diacetyl-succinic ether for a long time with dilute H_2SO_4 (Harrow, *C. J.* 33, 425; *A.* 201, 152). Formed also by the action of fuming HCl on acetonyl-aceto-acetic ether $CH_3.CO.CH_2.CH(CO_2Et).CO.CH_3$ (Paal, *B.* 17, 2765).

Properties.—Needles (by sublimation), m. sol. hot water, v. sol. alcohol and ether, volatile with steam. On heating above its melting-point it is decomposed into CO_2 and di-methyl-furfurane carboxylic acid (pyrotritaric acid). Potash-fusion yields acetic and succinic acids.

Salts. — K_2A'': silky needles.—BaA''. — Ag_2A'': white pp. — HAgA'': slender white needles.

Mono-methyl ether MeHA''. [129°]. Formed by leaving a mixture of the di-methyl ether (1 pt.) and fuming HClAq (10 pts.) to stand in the summer-time (K. a. C.). Slender needles.—AgMeA''. Ppd. by adding ammoniacal $AgNO_3$ to a solution of MeHA''.

Di-methyl ether Me_2A''. [64°]. (258°). From Ag_2A'' and MeI at 100° under pressure (Knorr a. Cavallo, *B.* 22, 155). Snow-white crystals, v. sol. alcohol, ether, chloroform, and benzene, v. sl. sol. water, dilute acids, and alkalis.

Methyl ethyl ether MeEtA''. (268°). From AgMeA'' and EtI, or from AgEtA'' and MeI (K. a. C.). The identity of the ethers prepared in these two ways shows that the carboxyls are similarly situated in the molecule of di-methyl-furfurane di-carboxylic acid. MeEtA'' exhibits blue fluorescence. With HCl it yields H_2A'', and the ethers Me_2A'' and Et_2A''.

Mono-ethyl ether EtHA''. [83°]. Formed by heating di-acetyl-succinic ether at 200°, or by allowing it to stand with conc. HClAq for some hours in the cold (Knorr, *B.* 17, 2863). Formed also from AgHA'' and EtI (Harrow). Flat glistening needles, v. sol. alcohol and ether, sl. sol. water. May be distilled. AgEtA''. Bulky white pp. (Knorr a. Cavallo, *B.* 22, 154).

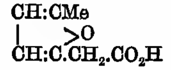
Di-ethyl ether Et_2A''. (275°) at 735 mm. Formed by dissolving di-acetyl-succinic ether in cold H_2SO_4, or by heating it with conc. phosphoric acid (Knorr). Formed also, together with pyrotritaric and iso-carbo-pyrotritaric ethers, by heating diacetyl-succinic ether at 175° (Knorr, *B.* 22, 158). Oil. Does not react with hydroxylamine or with phenyl hydrazine. Easily saponified by alcoholic potash.

Di-methyl-furfurane dicarboxylic acid v. Methronic acid.

METHYL - FURFURINE $C_{18}H_{18}N_2O_3$. Formed by heating (5 g. of) methyl-furfuramide (*v.* Methyl-furfuraldehyde) with NaOH (2·5 g.) dissolved in water (25 c.c.) at 100° (Bieler a. Tollens, *A.* 258, 123). Oil, which solidifies as an amorphous resin.—×B'HNO$_3$: lustrous crystals.—$B'H_2SO_4$: minute needles.—$B'_2H_2PtCl_6$ yellow crystalline pp.

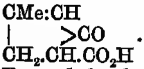
METHYL-FURFUROL v. Methyl-furfuraldehyde.

METHYL-FURFURYL-ACETIC ACID (?) $C_7H_8O_3$ *i.e.*



$$\begin{array}{l}CH{:}CMe\\ |\qquad >O\\ CH{:}C.CH_2.CO_2H\end{array}$$

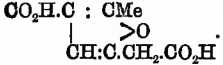
or



$$\begin{array}{l}CMe{:}CH\\ |\qquad >CO\\ CH_2.CH.CO_2H\end{array}$$

. *Sylvane-acetic acid.* [138°]. Formed by heating its carboxylic acid (Polonowsky, *A.* 246, 14). Prisms (from water), v. e. sol. alcohol, m. sol. ether, almost insol. cold water. Somewhat volatile with steam. It gives no colouration with $FeCl_3$, and is dissolved without alteration by conc. H_2SO_4. Nitric acid oxidises it, yielding acetic and oxalic acids.—AgA' ½aq: bulky white pp.—BaA'_2 4½aq: transparent plates or spherical aggregates.

Methyl-carboxy-furfuryl-acetic acid (?) $C_8H_8O_5$ *i.e.*



$$\begin{array}{l}CO_2H.C : CMe\\ \quad|\qquad >O\\ CH{:}C.CH_2.CO_2H\end{array}$$

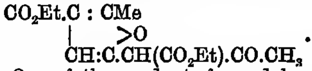
. *Sylvane carboxyacetic acid.* [207°]. Formed, together with methyl-furfuryl-carbinyl methyl ketone carboxylic ether and a neutral substance $C_{14}H_{18}O_8$ [139°], by adding a conc. solution of $ZnCl_2$ to a mixture of glyoxal and aceto-acetic ether in the cold (Polonowsky, *A.* 246, 1). Needles (from hot water), v. sol. alcohol.—$(NH_4)_2A''$ ½aq: minute needles.—BaA'' 2aq: transparent needles.—Ag_2A''aq.

Mono-methyl ether MeHA''. [98°]: needles.—AgMeA''.

Di-methyl ether Me_2A''. Oil.

Mono-ethyl ether EtHA''. [76°].

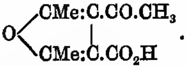
METHYL-FURFURYL-CARBINYL METHYL KETONE DI-CARBOXYLIC ACID. *Ethyl ether*



$$\begin{array}{l}CO_2Et.C : CMe\\ \quad|\qquad >O\\ CH{:}C.CH(CO_2Et).CO.CH_3\end{array}$$

. (c. 295°). One of the products formed by the condensation of aceto-acetic ether (2 mol.) with glyoxal (1 mol.) in presence of aqueous $ZnCl_2$ (Polonowsky, *A.* 246, 18). Light-yellow oil, miscible with alcohol, ether, benzene, and chloroform. Insol. water and alkalis, resinified by warming with conc. H_2SO_4.

DI - METHYL - FURFURYL METHYL KETONE CARBOXYLIC ACID $C_9H_{10}O_4$ *i.e.*



$$O\begin{cases}CMe{:}C.CO.CH_3\\ \qquad\quad |\\ CMe{:}C.CO_2H\end{cases}$$

. *Acetyl-di-methyl-furfurane carboxylic acid.* [152°]. Formed by heating at 225° in a sealed tube a mixture of *β*-acetyl-propionic acid (3 g.) with Ac_2O (15 g.), the product being freed from Ac_2O by distillation *in vacuo* and the residue extracted with water (Magnanini, *B.* 21, 1523). Small needles (from hot water).—AgA': crystalline pp., sl. sol. water.—BaA'_2 aq: crystalline pp.

DI - METHYL - GENTISIC ALDEHYDE v. *Di-methyl derivative* of Di-oxy-benzoic aldehyde.

METHYL-GLUTACONIC ACID $C_6H_8O_4$ *i.e.* $CH_3.CH(CO_2H).CH{:}CH.CO_2H$. [137°]. Formed by boiling methyl-dicarboxy-glutaconic ether (vol. i. p. 706) with conc. alcoholic potash (Conrad a. Guthzeit, *A.* 222, 259). Nodules (from water), v. sol. water, alcohol, and ether.

α-METHYL-GLUTARIC ACID $C_6H_{10}O_4$ *i.e.* $CO_2H.CHMe.CH_2.CH_2CO_2H$. *Butane dicarboxylic acid.* Mol. w. 146. [77°]. H.F. 238,200. H.C.v. 670,500. H.C.p. 670,800 (Stohmann, Kleber a. Langbein, *J. pr.* [2] 40, 214). Formed by saponifying with conc. alcoholic KOH the product of the action of β-iodo-propionic ether on sodium methyl acetacetic ether (Wislicenus a. Limpach, *A.* 192, 133). Formed also by the action of HI and P on γ-oxy-α-methyl-glutaric acid (Krekeler, *B.* 19, 3270), and on saccharonic acid $CO_2H.CMe(OH).CH(OH).CH(OH).CO_2H$ a product of the decomposition of glucose (Kiliani, *A.* 218, 369). Obtained by boiling γ-cyano-valeric acid (*q. v.*) with aqueous NaOH (Wislicenus, *A.* 233, 101). Prisms, v. sol. water, alcohol, and ether. The zinc-salt is a viscid mass.—Ag_2A''.

β-Methyl-glutaric acid $C_6H_{10}O_4$ *i.e.* $CH_3.CH(CH_2.CO_2H)_2$. *Ethylidene-di-acetic acid* [85°–86°]. Formed from malonic acid, paraldehyde, and Ac_2O, by heating at 100° for several days. On rectification the anhydride (282°–284°) is obtained (15 p.c. of weight of malonic acid). Boiling water changes it into the acid (Komnenos, *A.* 218, 150). Colourless glass-like prisms or tables (from CS_2 mixed with $CHCl_3$). V. sol. water, alcohol, or ether, m. sol. cold benzene or CS_2, v. sl. sol. CS_2 or benzoline. On distillation it splits up into H_2O and its anhydride. On distilling its sodium salt with P_2S_3 there is formed, as an oil, the homologue of thiophene  $CH_2\left<\begin{matrix}CMe:CH\\CH:CH\end{matrix}\right>S$, boiling at 134° (Krekeler, *B.* 19, 3270).

Salts.—Ag_2A''.—CaA''.—PbA'' ½aq. Trimetric needles *a*:*b*:*c* = ·6331:1: ·6072.

Anhydride $C_8H_8O_3$ [46°]. (282°–284°). V.D. 4·61 (calc. 4·43). Mass of slender prisms (from CS_2). V. sl. sol. cold water, neutral to litmus, on boiling it dissolves, becoming strongly acid, changing to the hydrated acid. V. sol. alcohol, ether, benzene, chloroform, or glacial acetic acid, v. sl. sol. petroleum.

s-Di-methyl-glutaric acid $C_7H_{12}O_4$ *i.e.* $CO_2H.CHMe.CH_2.CHMe.CO_2H$. [114°] (Z.); [c. 90°] (D.); [101°] (B.); [106°] (A. a. J.). Formed by treating α-cyano-propionic ether with methylene iodide and alcoholic NaOEt, heating the mixture on the water-bath, and saponifying the product with HCl (Zelinsky, *B.* 22, 2823). Formed also by heating pentane tetracarboxylic acid either by itself, or in aqueous solution, or by heating its ether with H_2SO_4 (Dressel, *A.* 256, 184). Obtained from sodium methyl-malonic ether and methylene iodide (Bischoff, *B.* 23, 1464, 1951). Crystals resembling those of di-methyl-succinic acid; v. sol. water, alcohol, and ether. Not volatile with steam. According to Zelinsky the product obtained by his method really consisted of two isomeric modifications, melting at 102°–104° and 128° respectively. A solution of the ammonium salt gives white pps. with $AgNO_3$ and $HgCl_2$, and a brown pp. with $FeCl_3$.—Ag_2A''.

Anhydride  $CH_2\left<\begin{matrix}CHMe.CO\\CHMe.CO\end{matrix}\right>O$. [93°]. Formed by boiling the acid for five minutes or by warming it with AcCl (Auwers a. Jackson, *B.* 23, 1611). Rectangular prisms (from hot ligroïn).

Tri-methyl-glutaric acid $C_8H_{14}O_4$ *i.e.* $CO_2H.CMe_2.CH_2.CHMe.CO_2H$. [97°]. S. 2·2 at 11°. Formed, together with the isomeric tetramethyl-succinic acid, by the action of finely divided silver on α-bromo-isobutyric acid (Hell a. Wittekind, *B.* 7, 320; Auwers a. V. Meyer, *B.* 23, 300). Flat plates (from hot water), sol. cold water, m. sol. CS_2 and ligroïn, v. sol. other solvents. Can be distilled in small quantities. Not volatile with steam. When the acid (6 g.) is mixed in the cold with dry red phosphorus (·8 g.) and bromine (16 g.) the product is bromo-trimethyl-glutaric anhydride [114°].

Anhydride  $CH_2\left<\begin{matrix}CMe_2.CO\\CHMe.CO\end{matrix}\right>O$. [96°]. (262°). Formed by boiling the acid for some time, or by heating it with excess of Ac_2O. Coarse flat satiny needles (from hot ligroïn).

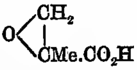
Ethyl ether Et_2A''. (230°). S.G. ^{0} 1·012.

METHYL-GLYCERAMINE $C_4H_{11}NO_2$ *i.e.* $CH_2(OH).CH(OH).CH_2NMeH$. Formed, together with the following body, by heating the (α)-chlorhydrin of glycerin with aqueous NMe_3 in sealed tubes at 100° (Hanriot, *A. Ch.* [5] 17, 62; *cf.* vol. ii. p. 623).

Tri-methyl-glyceramine chloride $CH_2(OH).CH(OH).CH_2NMe_3Cl$. Formed by heating glycerin chlorhydrin with trimethylamine on the water-bath for 12 hours (Hanriot, *C. R.* 86, 1335).—$C_3H_7O_2NMe_3Cl$: syrup.—$(C_3H_7O_2NMe_3Cl)_2PtCl_4$: orange tables, sol. water, insol. alcohol; not decomposed by boiling the aqueous solution.

DI-METHYL-GLYCERIC ACID *v.* DI-OXY-VALERIC ACID.

α-METHYL-GLYCIDIC ACID $C_4H_6O_3$ *i.e.*



. *Propylene oxide carboxylic acid.* Formed by decomposing chloro-oxy-isobutyric acid (the product of the union of HOCl with methacrylic acid) with alcoholic potash (Mélikoff, *Bl.* [2] 41, 311; 43, 115). Thick liquid, v. sol. water and ether.

Reactions.—1. When heated with *water* for half an hour it forms di-oxy-butyric acid $CH_3.CH(OH).CH(OH).CO_2H$ [100°].—2. Heated with *ammonia* it forms oxy-amido-isobutyric acid.—3. Conc. HCl combines, forming chloro-oxy-isobutyric acid [107°].—4. HBr forms bromo-oxy-iso-butyric acid [101°].

Salts.—KA' ½aq: glittering plates, sl. sol. cold alcohol.—AgA': thin needles (from hot water).

Ethyl ether EtA'. (164°). S.G. $\frac{15}{15}$ 1·0546. From AgA' and EtI (Mélikoff, *B.* 21, 2053). Oil.

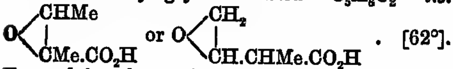
β-Methyl-glycidic acid  . [84°]. Formed by the action of alcoholic potash on chloro-oxy-butyric acid [63°] (the product of the union of HOCl with crotonic acid) (Mélikoff, *Bl.* [2] 43, 115). Trimetric crystals (from ether), v. e. sol. water, m. sol. ether. Volatile with steam.

Reactions.—1. Combines with HCl forming chloro-oxy-butyric acid [86°].—2. HBr yields bromo-oxy-butyric acid [90°].—3. *Ammonia* forms oxy-amido-butyric acid.—4. When heated with *water* it slowly combines, forming di-oxy-butyric acid [80°].

Salts.—KA' ½aq: powder, v. sol. water, sl. sol. cold alcohol.—AgA': crystalline powder.

Ethyl ether EtA′. (174°). S.G. $\frac{15}{15}$ 1·0534 (Mélikoff a. Zelinsky, *B.* 21, 2052).

αβ-Di-methyl-glycidic acid $C_5H_8O_2$ *i.e.*



$$\mathrm{O}\left\langle\begin{array}{l}\mathrm{CHMe}\\ \;|\\ \mathrm{CMe.CO_2H}\end{array}\right. \text{ or } \mathrm{O}\left\langle\begin{array}{l}\mathrm{CH_2}\\ \;|\\ \mathrm{CH.CHMe.CO_2H}\end{array}\right. . \quad [62°].$$

Formed by the action of alcoholic potash on chloro-oxy-valeric acid (the product of the union of HOCl on angelic acid) [45°] (Mélikoff, *Bl.* [2] 47, 166; *A.* 257, 118). Minute prisms, v. sol. water, alcohol, and ether. Unites with HCl, forming chloro-oxy-valeric acid [75°]. Water at 99° converts it into di-oxy-valeric acid [107°].

Salts.—KA′ $\frac{1}{2}$aq: prisms.—AgA′: thin scales.

Ethyl ether EtA′. (178°). S.G. $\frac{15}{15}$ 1·0250. From AgA′ and EtI. Oil.

METHYL-GLYCOLLIC ACID *v. Methyl derivative* of GLYCOLLIC ACID.

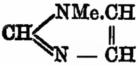
DI-METHYL-GLYCOLURILE *v.* DI-METHYL DIKETONE.

Tetra-methyl-glycolurile *v.* GLYOXAL, *Reaction* 13.

METHYL-GLYOXAL *v.* PYRUVIC ALDEHYDE.

DI-METHYL-GLYOXAL *v.* DI-METHYL DIKETONE.

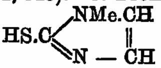
METHYL-GLYOXALINE $C_4H_6N_2$ *i.e.*



$$\mathrm{CH}\left\langle\begin{array}{l}\mathrm{NMe.CH}\\ \qquad\;\,\|\\ \mathrm{N - CH}\end{array}\right.$$

(Japp, *C. J.* 43, 17). *Oxalmethyline. Methyl-imidazole.* [−6°]. (198°). S.G. $\frac{19}{}$ 1·0363.

Formation.—1. By the action of sodium-amalgam on tri-bromo-methyl-glyoxaline (*q. v.*) in alcoholic solution (Wyss, *B.* 10, 1372).—2. By methylation of glyoxaline (Wallach, *B.* 15, 644; *A.* 214, 319).—3. From sulphydro-methyl-glyoxaline



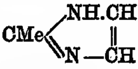
$$\mathrm{HS.C}\left\langle\begin{array}{l}\mathrm{NMe.CH}\\ \qquad\;\,\|\\ \mathrm{N - CH}\end{array}\right.$$

by treatment with dilute nitric acid (Wohl a. Marckwald, *B.* 22, 1359).—4. By reducing chloro-methyl-glyoxaline with HIAq and P at 140° (Wallach, *A.* 214, 310).

Properties.—Liquid, sol. water. With aqueous $HgCy_2$ it gives a pp. composed of slender needles [119°]. Combines readily with MeI, forming a methylo-iodide, whence $B'Me_2PtCl_6$ [206°] may be obtained.

Salts.—$B'_2H_2PtCl_6$. [191°]. S. 4·4 at 13° (W.): 7·55 at 13° (W. a. M.). Orange-red prisms.—$B'_2H_2ZnCl_4$. [128°–131°]. Soluble crystals.—$B'HNO_3$. Prisms.—$B'C_6H_2(NO_2)_3OH$. [158°]. Needles, sl. sol. alcohol and ether.—$B'HAuCl_4$. [120°].

Methyl-glyoxaline



$$\mathrm{CMe}\left\langle\begin{array}{l}\mathrm{NH.CH}\\ \qquad\;\|\\ \mathrm{N - CH}\end{array}\right.$$

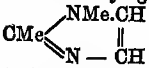
. *Glyoxalethyline. Para-oxalmethyline.* [137°]. (267°).

Formation.—1. By saturating an aqueous solution of glyoxal (1 mol.) and acetic aldehyde (1 mol.) with ammonia (Radziszewsky, *B.* 15, 2706; 16, 487).—2. By passing the preceding methyl-glyoxaline [−6°] through a red-hot tube (Wallach, *B.* 16, 541).—3. By distilling the zinc salt of the preceding methyl-glyoxaline or of chloro-methyl-ethyl-glyoxaline with lime (Wallach, *A.* 214, 296).

Properties.—Long thin needles, v. sol. water, alcohol, and hot benzene, m. sol. cold benzene. Decolourises bromine, forming $C_4H_4Br_2N_2$ [258°]. Yields oxamide on oxidation with H_2O_2 (Radziszewsky, *B.* 17, 1290). Its solutions are ppd by tannin and by picric acid.

Salt.—$B'H_2PtCl_6$. Trimetric needles.

Di-methyl-glyoxaline $C_5H_8N_2$ *i.e.*



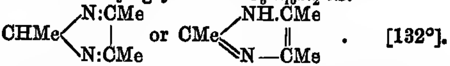
$$\mathrm{CMe}\left\langle\begin{array}{l}\mathrm{NMe.CH}\\ \qquad\;\,\|\\ \mathrm{N - CH}\end{array}\right.$$

. *Oxalmethylethyline.* (206°). S.G. $\frac{11}{}$ 1·0051. Formed by the action of MeI on methyl-glyoxaline (Radziszewsky, *B.* 16, 488). Liquid with narcotic odour, sol. water, alcohol, and ether. Its solution gives with $CuSO_4$ a blue pp., with $AgNO_3$ a crystalline pp., with $HgCl_2$, with tannin, and with phosphomolybdic acid white pps., and with picric acid a yellow pp. All these pps. are soluble in hot water.—×$B'_2H_2PtCl_6$. [138°].

Methylo-iodide B′MeI. Crystalline.

Chloro-di-methyl-glyoxaline $C_5H_7ClN_2$. (213°). Formed by the action of PCl_5 on methyl-ethyl-oxamide (Wallach, *A.* 184, 71).—B′HCl. Prisms.—$B'_2H_2PtCl_6$.—B'_2AgNO_3.—B′MeI.

Tri-methyl-glyoxaline $C_6H_{10}N_2$ *i.e.*



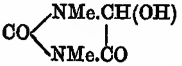
$$\mathrm{CHMe}\left\langle\begin{array}{l}\mathrm{N{:}CMe}\\ \quad\;|\\ \mathrm{N{:}CMe}\end{array}\right. \text{ or } \mathrm{CMe}\left\langle\begin{array}{l}\mathrm{NH.CMe}\\ \qquad\;\|\\ \mathrm{N - CMe}\end{array}\right. . \quad [132°].$$

(271°). Formed by adding di-methyl diketone $CH_3.CO.CO.CH_3$ to an ammoniacal solution of $AgNO_3$, and decomposing the resulting pp. with dilute HCl (Fittig, *A.* 249, 206). Formed also, with other bases, by heating di-methyl diketone with conc. NH_3Aq at 100° for an hour (Von Pechmann, *B.* 21, 1411). Small white needles (from ether or ligroïn). Not affected by nitrous acid.—B′HCl: tufts of snow-white needles.

METHYL-GLYOXIM *v. Oxim* of PYRUVIC ALDEHYDE.

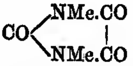
Di-methyl-glyoxim *v.* DI-ACETYL and DI-METHYL DIKETONE.

DI-METHYL-GLYOXYL-UREA $C_5H_8N_2O_3$ *i.e.*



$$\mathrm{CO}\left\langle\begin{array}{l}\mathrm{NMe.CH(OH)}\\ \qquad\;|\\ \mathrm{NMe.CO}\end{array}\right.$$

. Formed by reducing cholestrophane



$$\mathrm{CO}\left\langle\begin{array}{l}\mathrm{NMe.CO}\\ \qquad\;|\\ \mathrm{NMe.CO}\end{array}\right.$$

in aqueous solution with zinc and H_2SO_4 (Andreasch, *M.* 3, 436). Small needles, melting below 100°. May be sublimed. V. e. sol. water and alcohol, insol. ether. Decomposed by boiling baryta-water into CO_2, methylamine, and glyoxylic acid. Readily re-oxidised to cholestrophane.

METHYL-GUANACIL *v.* GUANIDINE, *Reaction* 11.

METHYL-GUANAMINE. The name originally given by Nencki to *Acetoguanamine*, vol. ii. p. 655.

METHYL-DIGUANIDE $C_3H_9N_5$. Obtained, in combination with $CuSO_4$, by adding a 20 p.c. solution of methylamine to a mixture of di-cyan-di-amide $C_2N_2(NH_2)_2$ and copper sulphate; the crystalline $(C_6H_9N_5)_2CuSO_4$ $2\frac{1}{2}$aq which separates is then decomposed by baryta (Reibenschuh, *M.* 4, 388). Thick alkaline syrup, which absorbs CO_2 from the air.

Salts.—Colourless leaflets or prisms; v. sol. water.—$B'_2H_2SO_4$. Prisms, obtained by decomposing B'_2CuSO_4 by H_2S.—$B'H_2SO_4$. From $B'_2H_2SO_4$ and H_2SO_4. Crystalline powder. V. sl. sol. alcohol.—$Cu(C_3H_8N_5)_2$ $3\frac{1}{2}$aq. Formed by shaking di-cyan-diamide with cupric oxide and methylamine. Rose-red crystalline powder.—

$B'_2CuSO_4 2\frac{1}{2}aq$. Pink needles.—The chromate and picrate form yellow prisms.

METHYL-GUANIDINE $C_2H_7N_3$ *i.e.* $NH{:}C(NH_2)(NHMe)$. *Methyl-uramine.*

Formation.—1. By boiling an aqueous solution of creatine with HgO or with PbO_2 and dilute H_2SO_4 (Dessaignes, *C. R.* 38, 839; 41, 1258; *A.* 92, 407; 97, 340).—2. By oxidising creatinin with $KMnO_4$ (Neubauer, *A.* 119, 46).—3. By heating cyanamide with methylamine hydrochloride in alcoholic solution at 100° (Erlenmeyer, *B.* 3, 896).—4. By the action of methyl-cyanamide on NH_4Cl (Tavildaroff, *B.* 5, 477).

Properties.—Strongly alkaline, deliquescent, crystalline mass. Decomposed by KOH, giving off NH_3 and methylamine. When boiled with chloro-acetic acid it yields glycolyl-methyl-guanidine $C_4H_{11}N_3O_3$, which crystallises in tablets, v. e. sol. water, and neutral in reaction, and forms the salts $C_4H_{11}NO_{33}HCl$, and $C_4H_{11}N_3O_3H_2PtCl_6$.

Salts.—$B'_2H_2PtCl_6$. Monoclinic crystals (Haushofer, *J.* 1878, 351). S. 14·3 at 19°.—$B'HAuCl_4$. Trimetric crystals; v. sol. ether, m. sol. water.—$B'_2H_2C_2O_4 2aq$. Crystals; v. sol. water.

Di-methyl-guanidine $C_3H_9N_3$ *i.e.* $NH{:}C(NH_2)(NMe_2)$. Formed by heating equimolecular quantities of cyanamide and dimethylamine hydrochloride at 110° (Tartarinoff, *C. R.* 89, 608).

Salts.—B'HCl. Trimetric crystals, $a{:}b{:}c = {\cdot}862{:}1{:}x$ (Haushofer, *Z. K.* 6, 130).—$B'_2H_2PtCl_6$. Triclinic crystals, $a{:}b{:}c = {\cdot}941{:}1{:}{\cdot}678$; $\alpha = 90° 55'$; $\beta = 90° 20'$; $\gamma = 90° 4'$.—$B'HAuCl_4$. Trimetric crystals (Haushofer, *J.* 1882, 364).

s - **Di - methyl - guanidine** $NH{:}C(NHMe)_2$. Formed by the action of methylamine on cyanogen iodide (Erlenmeyer, *B.* 14, 1868).

Platinochloride $B'_2H_2PtCl_6$. Triclinic crystals, $a{:}b{:}c = 1{\cdot}212 : 1 : 1{\cdot}761$; $\alpha = 90° 22'$; $\beta = 110° 20'$; $\gamma = 90° 5'$.

METHYL - GUANIDO - ACETIC ACID *v.* Creatine.

(α)-METHYL-GUANIDO-BENZOIC ACID $C_9H_{11}N_3O_2$ *i.e.* $NH{:}C(NH_2).NMe.C_6H_4.CO_2H$. *(α)-Benzcreatin.* Formed by methylation of benzglycocyamine (Griess, *B.* 8, 324). Small acicular plates (containing $1\frac{1}{2}$ aq), sl. sol. hot water and alcohol. Decomposed by boiling baryta-water into methyl-amido-benzoic acid and urea.—HA'HClaq: plates; m. sol. water.—$(HA')_2H_2PtCl_6 2aq$.

Anhydride *v.* Benzcreatinine.

(β)-Methyl-guanido-benzoic acid $C_9H_{11}N_3O_2$ *i.e.* $NH{:}C(NHMe).NH.C_6H_4.CO_2H$. Formed by the action of a cold concentrated solution of methylamine on the so-called ethoxy-carbimidamido-benzoic acid (Griess, *B.* 8, 325; vol. i. p. 157). Plates; sl. sol. cold water and alcohol. Decomposed by baryta-water into *m*-amido-benzoic acid, CO_2, and methylamine. — HA'HCl. — $(HA')_2H_2PtCl_6 2aq$.

Anhydride *v.* (β)-Benzcreatinine.

METHYL-GUANIDO-ETHANE SULPHONIC ACID $CN_3H_3Me(CH_2.CH_2.SO_3H)$ or probably $NH{:}C(NHMe)NH.CH_2.CH_2.SO_3H$. Formed by heating methyl-amido-ethane sulphonic acid (2 grms.) and cyanamide (·7 grms.) with enough water to dissolve them, for 5 hours at 120°. Crystals of the new body are found in the tube (E. Dittrich, *J. pr.* [2] 18, 72). Transparent monoclinic prisms. Crystallises with a molecule of water that goes off at 110°. V. sol. hot, m. sol. cold, water; insol. alcohol and ether. Turns brown at 285°, giving off methylamine. Does not form salts.

METHYL-GUANIDO-VALERIC ACID. *Anhydride* $C_7H_{13}N_3O$ *i.e.*

$$(CH_3)_2CH.CH\Big\langle{NMe \atop CO.NH}\Big\rangle C{:}NH.$$

Isovalercreatinin. Formed by heating methyl - amido-isovaleric acid with cyanamide and ammonia (Duvillier, *Bl.* [2] 39, 539). Sol. alcohol.

METHYL-HEMIPIC ACID *v. Methyl ether* of Hemipic acid.

METHYL HENDECYL KETONE $C_{13}H_{26}O$ *i.e.* $CH_3.CO.C_{11}H_{23}$. *Methyl undecyl ketone.* [28°]. (263°). S.G. (liquid) $\frac{28}{}$ ·823. Formed by distilling a mixture of barium laurate and barium acetate (Krafft, *B.* 12, 1667; 15, 1724). Yields acetic and hendecoic acids on oxidation.

Isomeride $C_{13}H_{26}O$. (265°–275°). S.G. $\frac{15}{}$ ·887. One of the products of the action of CO on a mixture of NaOAc and $NaOC_5H_{11}$ at 180° (Poetsch, *A.* 218, 62). Liquid.

METHYL HEPTADECYL KETONE $C_{19}H_{38}O$ *i.e.* $CH_3.CO.C_{17}H_{35}$. [56°]. (267° at 110 mm.). S.G. (liquid) $\frac{56}{}$ ·811. Prepared by distilling a mixture of barium stearate and barium acetate. On oxidation it gives margaric acid (Krafft, *B.* 12, 1672; 15, 1724).

Methyl heptadecyl ketone $C_{19}H_{38}O$ *i.e.* $CH_3.CO.CH(C_8H_{17})_2$. *Di-octyl-acetone.* (325°–330°). Formed by boiling di-octyl-acetoacetic ether with alcoholic potash (Guthzeit, *A.* 204, 10). Liquid.

METHYL HEPTINYL KETONE $C_9H_{14}O$ *i.e.* $CH_3.CO.CH(C_3H_5)_2$. *Di-allyl-acetone.* (175°). Formed by boiling di-allyl-acetoacetic ether with conc. KOHAq (Wolff, *A.* 201, 48). V. sol. alcohol and ether.

METHYL HEPTINYL OXIDE $C_8H_{14}O$ *i.e.* $CH_3.O.CH(C_3H_5)_2$. (136°). S.G. $\frac{0}{0}$ ·8258. Formed from $NaOCH(C_3H_5)_2$ and MeI (Riabinin, *J. pr.* [2] 23, 270). Yields, on oxidation by cold $KMnO_4$, $CH_3O.CH(CH_2.CO_2H)_2$.

METHYL HEPTYL KETONE $C_9H_{18}O$ *i.e.* $CH_3.CO.CHPr_2$. *Di-propyl-acetone.* (174°). Formed by heating di-propyl-acetoacetic ether with alcoholic potash (Burton, *Am.* 3, 390) Liquid. Appears not to combine with $NaHSO_3$

Methyl heptyl ketone $CH_3.CO.C_7H_{15}$ (177°). Formed by the decomposition of *sec*-hexyl-acetoacetic ether by KOH (Lundahl, *B.* 16, 789).

METHYL HEPTYL OXIDE $C_8H_{18}O$ *i.e.* $CH_3.O.C_7H_{15}$. (161°). S.G. $\frac{16{\cdot}5}{}$ ·830. V.D. 4·2 (calc. 4·5). S.V. 194·6 (Lossen, *A.* 254, 57). Formed by the action of MeI on $NaOC_7H_{15}$ derived from œnanthol (Wills, *C. J.* 6, 314). Mobile liquid, with strong odour; insol. water, v. sol. alcohol and ether.

METHYL-HESPERETIC ACID *v. Dimethyl derivative* of Caffeïc acid.

METHYL-HEXADECYL-BENZENE *v.* Hexadecyl-toluene.

Di-methyl-hexadecyl-benzene *v.* Hexadecyl-xylene.

Tri-methyl-hexadecyl-benzene *v.* Hexadecyl-mesitylene.

METHYL-HEXANE *v.* Heptane.

METHYL-HEXOSE $C_7H_{14}O_6$ *i.e.* $CH_3.CH(OH).CH(OH).CH(OH).CH(OH).CH(OH).CHO$.

[181°]. Formed by reducing the lactone of rhamnose carboxylic acid with sodium amalgam (Emil Fischer, *B.* 23, 936). Crystallises from methyl alcohol. Hydrogen cyanide yields $C_8H_{15}O_6N$, which on saponification forms methyl-heptonic acid $C_8H_{16}O_8$, the lactone of which crystallises easily, and gives rise, on reduction, to methyl-heptose $CH_3(CH.OH)_5.CHO$, of which the phenyl-hydrazide is sl. sol. water.

Phenyl-hydrazide. V. sol. water.

Osazone. [200° with decomposition].

METHYL-HEXYL-CARBINOL *v.* OCTYL ALCOHOL.

DI-METHYL HEXYLENE DIKETONE $C_{10}H_{18}O_2$ *i.e.* $(CH_3.CO)_2CH.C_5H_{11}$. *Iso-amyl-acetyl-acetone.* (c. 222°). Formed by heating $(CH_3.CO)_2CHNa$ with isoamyl iodide at 180° (Combes, *A. Ch.* [6] 12, 249). Liquid. Decomposed by caustic potash into acetic acid and $CH_3.CO.CH_2.C_5H_{11}$.

Di-methyl hexylene diketone $C_{10}H_{18}O_2$ *i.e.* $CH_3.CO.CH_2.CH_2.CH_2.CH_2.CHMe.CO.CH_3$. *a-methyl-αε-di-acetyl-pentane.* (232°–235°). Formed by decomposing its carboxylic ether with alcoholic potash (Kipping a. Perkin, *C. J.* 55, 346). Colourless mobile oil. Dissolves in a solution of $NaHSO_3$, and is reprecipitated by K_2CO_3.

DI-METHYL HEXYLENE DIKETONE CARBOXYLIC ETHER $C_{13}H_{22}O_4$ *i.e.* $CH_3.CO.CMe(CO_2Et).CH_2.CH_2.CH_2.CH_2.CO.CH_3$. (255°–260°). Formed by the action of NaOEt and $BrCH_2.CH_2.CH_2.CH_2.CO.CH_3$ on methyl-acetoacetic ether (Kipping a. Perkin, *C. J.* 55, 346). Colourless liquid, with faint odour, v. sl. sol. water.

METHYL-HEXYL-GLYOXALINE $C_{10}H_{18}N_2$

i.e. $C_6H_{12}.CH\left\langle\begin{array}{l}NMe{:}CH\\ \quad\;\;|\\ N=CH\end{array}\right.$. (262°). S.G. $\frac{16\cdot5}{}$ ·928.

Formed by heating hexyl-glyoxaline with a solution of MeI in methyl alcohol (Karcz, *M.* 8, 221). Colourless oil, insol. water, sol. alcohol and ether. Gives the alkaloidal reactions.—$B'_2H_2PtCl_6$: yellow plates, sol. water.

Methylo-iodide B'MeI. [124°]. V. sol. alcohol and ether.

METHYL *n*-HEXYL KETONE $C_8H_{16}O$ *i.e.* $CH_3.CO.CH_2.CH_2.CH_2.CH_2.CH_2.CH_3$. (172°). S.G. $\frac{20}{4}$ ·8185 (Brühl, *A.* 203, 29); $\frac{0}{}$ ·835 (C.). S.V. 186·6 (R. Schiff, *A.* 220, 103). $\mu_\beta = 1{\cdot}4213$. R_∞ 63·29. H.C. 1,209,510 (Louguinine, *Bl.* [2] 41, 389).

Formation.—1. By distilling sodium ricinoleate with NaOH (Limpricht, *A.* 93, 242; Bouis, *A.* 97, 34).—2. By distilling a mixture of calcium acetate and calcium *n*-heptoate (œnanthate) (Städeler, *J. pr.* 72, 246).—3. From octoic aldehyde by treatment with PCl_5, decomposing the resulting $C_7H_{15}CHCl_2$ by alcoholic KOH, and adding the octinene $C_6H_{13}.C{:}CH$ so formed to cold H_2SO_4, diluting and distilling with water (Béhal, *Bl.* [2] 47, 33; *A. Ch.* [6] 15, 275).—4. Together with ethyl amyl ketone by treating $C_5H_{11}.C{:}C.CH_3$ with H_2SO_4 and water successively (Béhal, *Bl.* [2] 48, 704).—5. 'Oil of wine' contains a methyl hexyl ketone (164°), which yields hexoic and acetic acids on oxidation (Hartwig, Scholl, *J. pr.* [2] 23, 449).—6. By heating octyl alcohol with boracic acid at 170°, and distilling *in vacuo* (Councler, *B.* 11, 1108).

Properties.—Colourless, mobile liquid, smelling like apples and tasting like camphor; sol. alcohol and ether, insol. water. Combines with $NaHSO_3$, forming a compound sol. alcohol, but decomposed by hot water. Does not reduce ammoniacal $AgNO_3$ or Fehling's solution. Chromic acid mixture oxidises it to acetic and hexoic acids (Béhal a. Combes). Nitric acid oxidises it to heptoic acid (Petersen, *A.* 118, 78). PCl_5 forms $C_8H_{16}Cl_2$ (190°–200°) (Dachauer, *A.* 106, 271).

Combinations.—$C_8H_{16}OKHSO_3\ \frac{1}{2}aq.$—$C_8H_{16}ONH_4HSO_3$. V. sol. water (L.).

Oxim $CH_3.C(NOH).C_6H_{13}$. (214°) at 725 mm. (*B.* 21, 509; *cf.* Béhal, *Bl.* [2] 47, 163).

Methyl isohexyl ketone $CH_3.CO.CH_2.C_5H_{11}$. *Isoamyl-acetone.* (170°). Formed by the action of KOH upon di-methyl hexylene diketone $(CH_3.CO)_2CH.C_5H_{11}$ (Combes, *A. Ch.* [6] 12, 249). Limpid liquid, with agreeable odour. Combines with $NaHSO_3$.

Methyl hexyl ketone (?) $Me.CO.C_6H_{13}$ (208°–210° cor.). S.G. $\frac{15}{}$ ·843. Occurs in small quantity (40 g.) among the products of the passage of CO over a mixture of sodic acetate (546 g.) and sodic iso-amylate (746 g.) (Poetsch, *A.* 218, 60).

Methyl hexyl diketone $C_8H_{14}O_2$ *i.e.* $CH_3.CO.CO.CH_2.CH_2Pr$. (165°) (Von Pechmann, *B.* 21, 2140).

DI-METHYL-HEXYL-PYRIDINE $C_{13}H_{21}N$

i.e. 
$C_6H_{13}.C\left\langle\begin{array}{l}CH.CMe\\ CH{:}CMe\end{array}\right\rangle N$. *n-Hexyl-lutidine.*

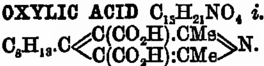
(250°) at 719 mm. Obtained by distilling its dicarboxylic acid with lime (Jaeckle, *A.* 246, 41). Colourless liquid, with faint blue fluorescence.—$B'_2H_2PtCl_6$. [163°]. Orange prisms.—B'_2AgNO_3. [65°]. White needles, sol. hot water and alcohol.

Hexahydride $C_{13}H_{27}N$ *i.e.*

$C_8H_{12}.CH\left\langle\begin{array}{l}CH_2.CHMe\\ CH_2.CHMe\end{array}\right\rangle NH$. *Hexyl-lupetidine.*

(240°) at 715 mm. Obtained by the action of sodium-amalgam on an alcoholic solution of di-methyl-hexyl-pyridine (J.). Colourless oil, not exhibiting fluorescence. Its dilute alcoholic solution gives a dark-brown pp., with mercurous nitrate. Its platinochloride and dichromate could not be obtained in a crystalline state.—B'HCl: long white prisms, v. sl. sol. water.

DI-METHYL-HEXYL-PYRIDINE DICARBOXYLIC ACID $C_{15}H_{21}NO_4$ *i.e.*



$C_8H_{13}.C\left\langle\begin{array}{l}C(CO_2H).CMe\\ C(CO_2H){:}CMe\end{array}\right\rangle N$. *Hexyl-lutidine dicarboxylic acid.* The potassium salt is formed by saponifying its ether with boiling KOHAq (Jaeckle, *A.* 246, 40). The free acid has not been prepared.—PbA″ $1\frac{1}{2}$aq.

Di-ethyl ether Et_2A''. Formed by oxidising its dihydride with nitrous acid. Yellowish-brown oil, forming salts with mineral acids.—$H_2A''H_2PtCl_6$. [141°]. Orange plates.

Dihydride *Di-ethyl ether*

$C_8H_{18}.CH\left\langle\begin{array}{l}C(CO_2Et){:}CMe\\ C(CO_2Et){:}CMe\end{array}\right\rangle NH$. [54°]. Formed by the condensation of heptoic aldehyde (œnanthol) (1 mol.) with acetoacetic ether (2 mols.) and ammonia (1 mol.) (J.). Yellow prisms, crystallising with difficulty from a dilute alcoholic solution.

DI-METHYL-HOMO-CAFFEÏC ACID *v.* *Di-methyl derivative of* (4:3:1)-DI-OXY-PHENYL-CROTONIC ACID.

METHYL-HOMO-FERULIC ACID *v.* *Di-methyl derivative* of (4:3:1)-DI-OXY-PHENYL-CROTONIC ACID.

METHYL-HYDANTOÏC ACID $C_4H_8N_2O_8$ *i.e.* $NH_2.CO.NMe.CH_2.CO_2H$. *Methyl-uramido-acetic acid.*

Formation.—1. Occurs in the urine of a dog whose food is mixed with methyl-amido-acetic acid (Schultzen, *B.* 5, 578).—2. By digesting an aqueous solution of sarcosine with potassium cyanate and ammonium sulphate for two days at 40° (Baumann a. Hoppe Seyler, *B.* 7, 35).—3. By boiling methyl-amido-acetic acid with urea and excess of baryta-water, or by digesting the same mixture for two days at 40° (B. a. H.).—4. By the action of potassium cyanate and H_2SO_4 on methyl-amido-acetic acid (E. Salkowsky, *B.* 7, 116).

Properties.—Transparent plates (from alcohol), m. sol. cold water and cold alcohol, v. sol. hot water and hot alcohol. Acid in reaction. When the concentrated aqueous solution is boiled it is partially converted into methyl-hydantoïn; this dehydration is more rapidly effected by boiling with water and $PbCO_3$ or $BaCO_3$, only traces of the acid then passing into solution. When heated in a sealed tube with a saturated solution of baryta at 140° it yields NH_3, methyl-amido-acetic acid, and CO_2. Moist Ag_2O forms laminæ of silver methyl-hydantoïn.

Salts.—$^{\times}BaA'_2$. Ppd. by adding alcohol to its aqueous solution.—$^{\times}CuA'_2$. Amorphous.

Di-methyl-hydantoïc acid *v.* ACETONURAMIC ACID.

METHYL-HYDANTOÏN $C_4H_8N_2O_2$ *i.e.* $CO\!<\!\begin{matrix}NMe.CH_2\\ NH\,.\,CO\end{matrix}\!>$. *Anhydride of methyl-uramido-acetic acid.* Mol. w. 114. [182°] (F. a. K.); [156°] (E. Salkowsky, *B.* 7, 119); [145°] (N.).

Formation.—1. By heating creatinin with baryta-water at 100° in a sealed tube (Neubauer, *A.* 137, 288).—2. By boiling methyl-hydantoïc acid with water and $PbCO_3$ or $BaCO_3$.—3. By melting methyl-amido-acetic acid with urea (Huppert, *B.* 6, 1278).—4. By the action of cyanogen chloride on melted methyl-amido-acetic acid (Traube, *B.* 15, 2110).—5. By warming caffuric acid with baryta-water (Fischer, *A.* 215, 286).—6. By the reduction of methyl-allantoïn by HI (Hill, *B.* 9, 1091).—7. By heating a mixture of hydantoïn (3 pts.), MeI (6 pts.), methyl alcohol (16 pts.), and KOH (2 pts.), for three hours at 100°, and extracting the product with boiling alcohol (Franchimont a. Klobbie, *R. T. C.* 8, 289).

Properties.—Short prisms, v. sol. boiling water, sl. sol. cold water, v. sol. alcohol, v. sl. sol. ether. May be sublimed. It does not unite with baryta, but its hot solution dissolves Ag_2O, and the alkaline filtrate then deposits $C_4H_5AgN_2O_2$ as groups of thin laminæ. The mercuric compound, obtained in like manner, forms nodular groups of minute needles, very soluble in water. Nitric acid (S.G. 1·5) converts methyl-hydantoïn into the nitramine $CO\!<\!\begin{matrix}NMe{-}CH_2\\ N(NO_2).CO\end{matrix}\!>$ which crystallises from alcohol in scales [168°], v. sl. sol. cold water, decomposed by boiling water.

(*a*)-**Methyl-hydantoïn** *v.* LACTYL-UREA.

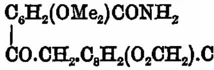
Di-methyl-hydantoïn $C_5H_8N_2O_2$ *i.e.* $CO\!<\!\begin{matrix}NH.CMe_2\\ \quad\ \ |\\ NH.CO\end{matrix}$. [175°]. Formed by slowly adding HCl to commercial potassium cyanide (containing cyanate) covered by acetone. The liquid, after the action is completed, is left to evaporate, and the crystals which separate extracted with ether, and finally sublimed (Urech, *A.* 164, 264). Large prisms, v. sol. water, alcohol, and ether. Slowly converted by boiling baryta-water into acetonuramic acid $NH_2.CO.NH.CMe_2.CO_2H$. By heating in a sealed tube with fuming hydrochloric acid at 160° it is resolved into CO_2, ammonia, and α-amido-iso-butyric acid $CMe_2(NH_2).CO_2H$.—$C_6H_7AgN_2O_2$: crystalline powder, sl. sol. hot water.—$C_5H_8N_2O_2AgNO_3$: large prisms, v. sol. water.

METHYL-HYDANTOÏN CARBOXYLIC ACID $C_5H_6N_2O_4$. Formed by boiling caffuric acid with baryta-water (E. Fischer, *A.* 215, 286). The free acid is decomposed into CO_2 and methyl-hydantoïn when its aqueous solution is warmed.

METHYL-HYDRASTINE $C_{22}H_{23}NO_6$ *i.e.*

$$\begin{matrix}CH_2O.\underset{\cdot\cdot}{C}.C(OMe){:}\underset{\cdot}{C}.CO\\ H\overset{\cdot\cdot}{C}.CH\ =\ \overset{\cdot}{C}.C\end{matrix}\!>\!O\quad\begin{matrix}\underset{\cdot}{C}H{:}C_2(O_2CH_2)\\ =CH.\overset{\cdot}{C}{:}C(C_2H_4NMe_2)\end{matrix}\!\!>\!CH$$

[156°]. Formed, together with hydrastine methylo-hydroxide, by the action of alkalis on a solution of hydrastine methylo-chloride. Prepared by adding potash to a hot aqueous solution of hydrastine methylo-iodide until no further ppn. takes place (Freund a. Rosenberg, *B.* 23, 406). Small yellow needles (from alcohol), almost insol. water, sol. chloroform, benzene, CS_2, ether, and dilute alcohol. With sulphomolybdic acid (Fröhde's reagent) it gives a violet colour, changing through blue to green. Forms sparingly soluble double salts with $SnCl_2$, zinc chloride, and $HgCl_2$. Ammonia converts it into the amide $C_{22}H_{26}N_2O_8$ [180°] which forms a crystalline hydrochloride $C_{22}H_{28}N_2O_6HCl\,2aq$, and on boiling with dilute nitric acid yields hemipic acid (Freund a. Heim, *B.* 23, 2902). The formula of this amide may be written



$$\begin{matrix}C_6H_2(OMe_2)CONH_2\\ |\\ CO.CH_2.C_8H_2(O_2CH_2).CH_2.CH_2NMe_2\end{matrix}$$

and it may also be got by heating hydrastine methylo-iodide with alcoholic ammonia. The corresponding methylamide $C_{28}H_{28}N_2O_8$ [182°], ethylamide $C_{24}H_{30}N_2O_8$ [162°], allylamide $C_{25}H_{30}N_2O_8$ [158°], and amylamide $C_{27}H_{36}N_2O_8$ [171°] have been prepared.

Salts.—B'HCl. [241°]. M. sol. hot water. Decomposed on fusion. A 1 p.c. solution is inactive.—$B'_2H_2PtCl_6$: sl. sol. water.—$B'H_2SO_4$. [250°]. Less soluble than the chloride.—$B'HNO_3$. Decomposes at 250°. V. sl. sol. water.

Methylo-iodide $C_{22}H_{23}NO_8MeI$. Yellow needles, more soluble in water than in alcohol. Decomposes at 250°. On warming with aqueous KOH it gives off trimethylamine.

Methyl-hydrastimide $C_{22}H_{24}N_2O_5$ *i.e.*

$$C_6H_2(OMe)_2\!<\!\begin{matrix}CO.NH\\ \rule{2em}{0.4pt}\end{matrix}\!>\!C{:}CH.C_6H_2(O_2CH_2).CH_2.CH_2.NMe_2$$

[192°]. Formed by the action of dilute H_2SO_4 on the amide (Freund a. Heim, *B.* 23, 2899). Yellow needles, insol. water, sl. sol. alcohol.—B'HCl. [227°].—B'HCl *x*aq.—$B'_2H_2PtCl_6$. [205°].

—$B'H_2SO_4$. [218°]. Yellow crystals (from alcohol).—$B'HNO_3$ aq.

Methylo-iodide B'MeI ½aq. [245°].

Methyl-hydrasteïne $C_{22}H_{27}NO_8$. [151°]. Formed by warming hydrastine methylo-chloride with excess of KOHAq; or, better, by warming methyl-hydrastine with strong caustic potash (Freund a. Rosenberg, *B.* 23, 408). Colourless needles (containing aq) (from water), sl. sol. cold water, more sol. hot water and alcohol. Decomposed by long heating at 110°. Very soluble in alkalis, but reppd. by CO_2; insoluble in aqueous Na_2CO_3. It dissolves in aqueous NH_3, but is ppd. on evaporation. It also dissolves in HClAq. In a 5 p.c. hydrochloric acid solution it is inactive. Tertiary base. Coloured reddish-brown by chlorine-water and ammonia. Iodine has no action. Hot conc. HBrAq reconverts it into methyl-hydrastine. Its salts are colourless.—B'HCl aq. [290°]. Compact groups of crystals.

Methyl-hydrastinine. *Methylo-iodide* $C_{12}H_{18}NO_3I$ *i.e.* $CHO.C_7H_4O_2.CH_2.CH_2.NMe_3I$. [267°]. Formed by heating hydrastinine with MeI (Freund, *B.* 22, 2329). Pale-yellow needles (from alcohol or water). AgCl gives $C_{13}H_{18}NO_3Cl$ [213°], which forms white crystals (containing aq).—$(C_{12}H_{18}NO_2Cl)_2PtCl_4$: yellow crystalline pp.

Oxim of the *methylo-iodide* $HO.N:CH.C_9H_6O_2.NMe_3I$. Yellowish needles, decomposed at 250°. V. sol. alkalis and ppd. unchanged by acids. Gives a dark reddish-brown pp. with platinic chloride.

METHYL-HYDRAZINE CN_2H_6 *i.e.* $CH_3.NH.NH_2$. (87° i.V.) at 745 mm. Formed by treating methyl-urea nitrate with $NaNO_2$, reducing the resulting nitroso-methyl-urea [124°] with zinc and dilute acetic acid, and decomposing the product with HCl (Brüning, *B.* 21, 1810; *A.* 253, 7). Mobile liquid with strong ammoniacal odour, soluble in water (heat being evolved), miscible with alcohol and ether. Reduces Fehling's solution.

Salts.—$B'H_2SO_4$. [139·5°]. White needles v. sol. water, sl. sol. alcohol.—B'HCl: v. sol. water and alcohol.—$B'C_8H_2(NO_2)_2OH$. [162°]. Yellow needles, decomposed on fusion.

Di-benzoyl derivative $CH_3N_2HBz_2$. [c. 143°]. Colourless needles (from water); m. sol. hot water, v. sol. alcohol, sl. sol. ether. Does not reduce Fehling's solution.

Picryl derivative $CH_3N_2H_2C_6H_2(NO_2)_3$. [171°]. Obtained from the hydrazine and picryl chloride (chloro-tri-nitro-benzene) in diluted alcoholic solution. Yellow plates; v. sol. alcohol and ether, m. sol. chloroform. Decomposed on fusion.

Oxalyl derivative $CH_3N_2H_2.CO.CO.N_2H_2CH_3$. [221·5°]. Formed by adding an aqueous solution of methyl-hydrazine to oxalic ether. White needles; v. sol. alcohol, m. sol. water, v. sl. sol. ether. Sublimes at about 160° in needles. Reduces Fehling's solution. Nitrous acid forms the nitrosamine $CH_2.N_2H(NO).CO.CO.N_2H(NO).CH_3$ [147°].

Di-methyl-hydrazine $C_2H_8N_2$ *i.e.* $NMe_2.NH_2$. (63°) at 720 mm. S.G. $\underline{11}$ ·801. V.D. (H=1) 30. Prepared by reducing di-methyl-nitrosamine $(CH_3)_2N.NO$ with zinc-dust and acetic acid (Fischer, *B.* 9, 111; Renouf, *B.* 13, 2171). Formed also by reducing di-methyl-nitramine $(CH_3)_2N.NO_2$ (Franchimont, *R. T. C.* 2, 123). Light volatile liquid with ammoniacal odour, v. sol. water, alcohol, and ether. Its haloid salts volatilise without decomposition.

Reactions.—1. CS_2 forms di-methyl-thiocarbazic acid $NMe_2.NH.CS_2H$.—2. *Phenyl-thiocarbimide* (phenyl mustard oil) forms $C_6H_5NH.CS.NH.NMe_2$.—3. *Oxalic ether* produces $NMe_2.NH.CO.CO.NH.NMe_2$. — 4. *Alkyl iodides* unite, forming azonium iodides, such as $NH_2.NMe_3I$.—5. $K_2S_2O_7$ forms $NMe_2.NH.SO_3K$, which crystallises in white plates, v. sol. water. It is split up by hot HClAq into dimethylhydrazine and H_2SO_4.—6. HgO oxidises it, forming tetra-methyl-tetrazone $NMe_2.N:N.NMe_2$, a yellow oil (130°) which explodes when heated above its boiling-point. It forms a mirror with ammoniacal $AgNO_3$, even in the cold, and is decomposed by boiling dilute acids into formic aldehyde, NH_2Me, nitrogen, and $NHMe_2$. The tetrazone is a strong base.—7. *Nitrous acid* decomposes it into N_2O and dimethylamine.—8. *Acetophenone* at 100° forms $NMe_2.N:CMePh$, a liquid (165° at 100 mm.). It is split up again by acids into its generators (Reisenegger, *B.* 16, 663).

Salts.—B'HCl.—$B'H_2Cl_2$: hygroscopic crystals.—$B'_2H_2PtCl_6$: orange-yellow prisms, v. sol. water, sl. sol. alcohol.—$B'_2H_2SO_4$. [105°]. White needles.—$B'_2H_2C_2O_4$: colourless plates, v. sol. water and alcohol, sl. sol. ether.

Ethylo-chloride $NH_2.NMe_2EtCl$. Crystallises with difficulty; v. e. sol. water. The ethylo-hydroxide is reduced by zinc-dust and acetic acid to HCl, ammonia, and NMe_2Et.—$(NH_2.NMe_2EtCl)_2PtCl_4$. Crystals.

DI-METHYL-DI-HYDRO-ANTHRACENE *v.* Di-methyl-anthracene-di-hydride.

METHYL-HYDRO-ETHYL-PYRIDINE *v.* Methyl-ethyl-pyridine hydride.

DI-METHYL-HYDRO-HOMO-CAFFEÏC ACID *v. Di-methyl derivative* of (4:3:1)-Di-oxy-phenyl-iso-butyric acid.

METHYL-HYDRO-HOMO-FERULIC ACID *v. Di-methyl derivative* of (4:3:1)-Di-oxy-phenyl-iso-butyric acid.

METHYL-DI-HYDRO-PARVOLINE *v.* Penta-methyl-pyridine dihydride.

METHYL-HYDRO-PYRIDINES *v.* Methyl-pyridine hydrides.

METHYL-HYDRO-QUINALDINE *v.* (*Py.* 3:4)-Di-methyl-quinoline tetra-hydride.

METHYL-HYDRO-QUINOLINES *v.* Methyl-quinoline hydrides.

DI-METHYL-HYDROQUINONE *v. Di-methyl derivative* of Hydroquinone.

DI-METHYL-HYDROQUINONE-TRI-METHYL-AMMONIUM-IODIDE *v. Methylo-iodide* of the *di-methyl derivative* of Di-methyl-amido-hydroquinone.

METHYL-HYDRO-TOLUQUINONE *v. Di-methyl derivative* of Hydrotoluquinone.

METHYL-HYDROXYLAMINE *v. Alkyl derivatives* of Hydroxylamine.

METHYL HYPOPHOSPHATE $Me_4P_2O_6$. S.G. $\underline{15}$ 1·109. From MeI and $Ag_4P_2O_6$ (Sänger, *A.* 232, 11). Saponified by water.

Methyl-hypophosphate of calcium $MeCaHP_2O_6$ 5aq. Needles.

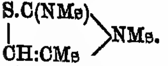
METHYLIA. A name formerly used for Methylamine.

METHYL-IMESATIN. Described as *Imide of Methyl-isatin* under Isatin.

METHYL-IMIDAZOLE. A name employed by Wohl and Marckwald (*B.* 22, 1359) to denote the substance usually called Methyl-glyoxaline.

METHYL-IMIDAZYL MERCAPTAN *v.* Sulphydro-methyl-glyoxaline.

METHYL-IMIDO-DI-METHYL-THIAZOLE



$\begin{smallmatrix}S.C(NMe)\\ |\\ CH:CMe\end{smallmatrix}>NMe$. [96°]. Formed by the action of chloro-acetone on di-methyl-urea (Traumann, *A.* 249, 49). White needles (from water), with strong alkaline reaction. Is identical with di-methyl-amido-methyl-thiazole.

METHYL-IMIDO-DI-(β)-NAPHTHYL SULPHIDE $NMe<\begin{smallmatrix}C_{10}H_6\\C_{10}H_6\end{smallmatrix}>S$. [285°]. Formed by heating imido-di-naphthyl sulphide (10 g.) with MeI (5 g.) and MeOH (12 c.c.) for five hours at 150°. Formed also by heating di-(β)-naphthyl-methyl-amine with sulphur (Kym, *B.* 23, 2459). Lemon-yellow plates or needles. Gives a blue colour with H_2SO_4 containing HNO_3.

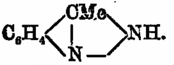
METHYL-IMIDO-PHENYL-NAPHTHYL SULPHIDE $NMe<\begin{smallmatrix}C_{10}H_6\\C_6H_4\end{smallmatrix}>S$. [133°]. Formed by heating $NH<\begin{smallmatrix}C_{10}H_6\\C_6H_4\end{smallmatrix}>S$ with MeI and MeOH at 150° (Kym, *B.* 23, 2466). Light greenish-yellow needles, sl. sol. hot spirit, v. e. sol. hot benzene.

METHYL-IMIDO-DI-PHENYL SULPHIDE $C_{13}H_{11}NS$ *i.e.* $S<\begin{smallmatrix}C_6H_4\\C_6H_4\end{smallmatrix}>NMe$. [99·3°]. (c. 363°). Formed by heating imido-di-phenyl sulphide (thiodiphenylamine) with MeI and MeOH in sealed tubes at 110° (Bernthsen, *A.* 230, 88; *B.* 16, 2899). Long white prisms (from alcohol), insol. water, v. sol. ether, benzene, and hot HOAc. Its alcoholic solution is coloured brown by $FeCl_3$. Nitric acid forms a yellow nitro- derivative which, unlike that of imido-di-phenyl sulphide, is insol. NaOHAq. The nitro- derivative may be reduced to an amido- compound which gives a deep bluish-green colour with $FeCl_3$.

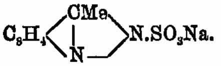
Isomeride $C_{13}H_{11}NS$ *i.e.* $S(C_6H_4)_2NMe$ or $C_6H_5.N<\begin{smallmatrix}C_6H_4\\CH_2\end{smallmatrix}>S$ (?). [79°]. Formed by the action of SCl_2 dissolved in petroleum on di-phenyl-methyl-amine $NMePh_2$ (Holzmann, *B.* 21, 2065). Thin yellow scales (from hot benzene-alcohol), insol. water, sl. sol. hot alcohol and ether, v. sol. hot benzene. On heating with copper it yields di-phenyl-methyl-amine.

METHYL-IMIDO-DI-PHENYL SULPHONE $C_{13}H_{11}NSO_2$ *i.e.* $NMe<\begin{smallmatrix}C_6H_4\\C_6H_4\end{smallmatrix}>SO_2$. [222°]. Formed by the action of $KMnO_4$ on methyl-imido-di-phenyl sulphide suspended in water (Bernthsen, *A.* 230, 91). Chains of white needles, often slightly reddish (from alcohol) or small compact prisms (from glacial acetic acid). V. sl. sol. cold alcohol, glacial acetic acid or ether. Insol. acids or alkalis; not affected by boiling KOH or HCl. Boiled with conc. H_2SO_4 it forms a splendid blue liquid, turned pale violet-brown by pouring into water. Its nitro- derivative after reduction gives no colour with $FeCl_3$.

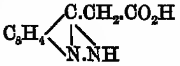
METHYL-INDAZINE $C_8H_8N_2$ *i.e.*



$C_6H_4<\begin{smallmatrix}CMe\\ |\\ N\end{smallmatrix}>NH$. *Quinazole. Methyl-indazole.* [113°]. (281° i. V.) at 736 mm. V.D. 4·37 (calc. 4·53). Formed by slowly adding $NaNO_2$ to a paste composed of o-amido-acetophenone and HClAq. The resulting diazo-compound is soluble in water, and the liquid is poured into a solution of Na_2SO_3. The product at first contains $CH_3.CO.C_6H_4.NH.NHSO_3Na$, but it gradually loses its reducing power, and deposits needles of



$C_6H_4<\begin{smallmatrix}CMe\\ |\\ N\end{smallmatrix}>N.SO_3Na$. When these needles are heated with HClAq they yield methyl-indazine and H_2SO_4 (Fischer a. Tafel, *A.* 227, 303). Methyl-indazine is also formed, together with carbonic acid gas, when indazyl-acetic acid

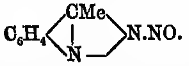


$C_6H_4<\begin{smallmatrix}C.CH_2.CO_2H\\ |\\ N.NH\end{smallmatrix}$ is heated.

Properties.—Colourless needles (from water), m. sol. hot water, v. sol. alcohol, ether, and chloroform, almost insol. conc. NaOHAq. May be sublimed. Does not reduce Fehling's solution. Gives crystalline compounds with metallic salts.

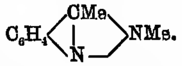
Salts.—B'HCl. [177°]. Needles, v. sol. water and alcohol.—Sulphate: needles.—Picrate: yellow crystalline powder.—Platinochloride: yellow needles.

Nitrosamine $C_8H_7N_3O$ *i.e.*



$C_6H_4<\begin{smallmatrix}CMe\\ |\\ N\end{smallmatrix}>N.NO$. [60°]. From B'HCl and cold aqueous $NaNO_2$. Yellow needles, v. sol. alcohol, ether, and chloroform.

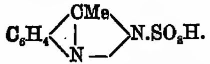
Di-methyl-indazine $C_9H_{10}N_2$ *i.e.*



$C_6H_4<\begin{smallmatrix}CMe\\ |\\ N\end{smallmatrix}>NMe$. [80°]. Formed by methylation of the preceding. Colourless plates, v. sol. alcohol, ether, benzene, and hot water.

Di-methyl-ψ-indazine $C_6H_4<\begin{smallmatrix}CMe\\NMe\end{smallmatrix}>N$. [36°]. Formed from methyl-o-amido-acetophenone by conversion into the nitrosamine $CH_3.CO.C_6H_4.NMe.NO$ and reducing this body with zinc and HOAc (Fischer a. Tafel, *A.* 227, 336). Yellow oil, solidifying on cooling as nearly colourless plates. Very volatile with steam. It forms crystalline compounds with metallic salts.—The chloride forms colourless needles.—The sulphate crystallises in needles, and the picrate in rectangular tables.

METHYL-INDAZINE ν-SULPHONIC ACID $C_8H_8N_2SO_3$ *i.e.*



$C_6H_4<\begin{smallmatrix}CMe\\ |\\ N\end{smallmatrix}>N.SO_3H$. The sodium salt of this acid is formed as described under methyl-indazine. It is m. sol. cold water, but ppd. on addition of NaOH or NaCl. It does not reduce HgO or Fehling's solution. Boiling conc. HClAq splits it up into $NaHSO_4$ and methyl-indazine.

METHYL-INDAZOLE *v.* Methyl-indazine.

DI-METHYL-INDIGO *v.* Indigo.

METHYL-ISO-INDILEUCINE *v.* Indigo.

(*In*. 1)-**METHYL-INDOLE** C_9H_9N *i.e.*  $C_6H_4<\substack{CMe\\NH}>CH$. *Scatole. Skatole.* [95°]. (266° i.V.). V.D. (H=1) 65·2 (calc. 65·5).

Occurrence.—The chief volatile constituent of human fæces, but not present in that of dogs (Brieger, *J. pr.* [2] 17, 129; *B.* 12, 1986). It occurs among the products of the putrefaction of albuminous substances (Brieger, Nencki, *J. pr.* [2] 17, 98; *H.* 4, 371; E. a. H. Salkowsky, *B.* 12, 651).

Formation.—1. By fusing egg-albumen with KOH (Nencki).—2. By reducing indigo with tin and HCl, and distilling the product with zinc-dust. A mixture of indole and scatole is thus obtained, and these are combined with picric acid. When the picrates are distilled with conc. NaOHAq the indole is destroyed, and the scatole passes over, and may be crystallised from water. The yield is ·3 p.c. Scatole prepared in this way has no fæcal odour (Baeyer, *B.* 13, 2339).—3. By heating aniline-zinc-chloride with glycerine (Fischer a. German, *B.* 16, 710).—4. By adding nitro-cuminic acid (6 pts.) to amido-cuminic acid (obtained by reducing 4 pts. of the nitro-acid), mixing with baryta (10 pts.), drying, and distilling (Fileti, *G.* 13, 358, 378).—5. The phenyl-hydrazide of propionic acid is warmed with $ZnCl_2$, and the product distilled with steam (E. Fischer, *A.* 236, 138).—6. In small quantity in distilling strychnine with lime (Stoehr, *B.* 20, 1108; Löbisch a. Malfatti, *M.* 9, 629).—7. By heating its carboxylic acid (Arnold, *A.* 246, 335).

Preparation from pancreas.—2,300 grms. pancreas and 500 grms. flesh are freed from fat, cut up and put into a loosely covered pot containing 8 litres of water. The whole is left for 5 months at the ordinary temperature. At the end of the fourth month the odour of skatole appears. The liquid is acidified with acetic acid and distilled. The distillate is acidified with HCl and picric acid is added. Red needles of skatole picrate, $C_9H_9N.C_6H_2(NO_2)_3OH$, separate. This is decomposed by ammonia, and the skatole is distilled over with steam and crystallised from water (Nencki, *J. pr.* [2] 20, 467).

Properties.—Glittering plates of powerful fæcal odour, sl. sol. water. It differs from indole in giving no colour when its solutions are treated with chlorine water. Its solution gives with fuming HNO_3 an opalescence; with KNO_2 and acetic acid a white pp. of the nitrosamine; with CrO_3 a red amorphous pp. in concentrated solutions; and with $FeCl_3$ no colour (Brieger, *J. pr.* [2] 17, 130). It is not attacked by warm dilute HNO_2. It colours pine-wood moistened with HCl red; this is best seen by dropping pine-wood saturated with an alcoholic solution of scatole into cold conc. HClAq (Fischer, *A.* 236, 138).

Reactions.—1. *Potash-fusion* yields the corresponding indole carboxylic acid (Ciamician a. Magnanini, *B.* 21, 673).—2. By passing CO_2 over a mixture of *sodium* and scatole, heated at 240° there is formed indole (*In*-1)-carboxylic acid (C. a. M.).—3. With *chloroform* and NaOEt it yields a chloro-methyl-quinoline $C_{10}H_8ClN$.—4. *Benzoic aldehyde* and $ZnCl_2$ form, slowly at 100°, $C_6H_5.CH(C_9H_8N)_2$ which crystallises from alcohol [142°] (Fischer, *B.* 19, 2989).—5. When administered to animals it appears in the urine in the form of the chromogen of a red pigment and as methyl-indyl sulphuric acid $C_9H_8N.SO_4H$ (?) (Brieger, *H.* 4, 414; Mester, *H.* 12, 130).

Salts.—B'_2HCl. Ppd. in needles when ether is added to its alcoholic solution (Wenzing, *A.* 239, 239). [168°]. Insol. ether, v. sl. sol. water, v. sol. alcohol.—Picrate $B'C_6H_2(NO_2)_3OH$. Red needles.

Acetyl derivative so-called *v.* METHYL-INDYL METHYL KETONE.

Dihydride $C_9H_{11}N$ *i.e.*  $C_6H_4<\substack{CHMe\\NH}>CH_2$. (232° i.V.) at 744 mm. Formed by reducing an alcoholic solution of scatole with zinc-dust and HCl (Wenzing, *A.* 239, 242). Colourless oil, resembling quinoline and piperidine in odour. V. sol. alcohol, ether, and ligroïn. Its alcoholic solution stains pine-wood, moistened with HClAq, orange. It reduces $AgNO_3$ and $FeCl_3$ on warming. It yields a nitrosamine which may be reduced to an oily hydrazine. With phenyl thiocarbimide it forms a compound melting at 125°.—× B'HCl: sol. alcohol and water, insol. ether.—Oxalate: [126°]; insol. ether.—$B'_2H_2PtCl_6$: yellow needles, sl. sol. water, decomposed by hot water.—Picrate: [150°]; yellow granular crystals (from benzene).

(*In*. 2)-**Methyl-indole** C_9H_9N *i.e.*  $C_6H_4<\substack{CH\\NH}>CMe$. *Methyl-ketole.* [60°]. (272° i.V.) at 750 mm. V.D. 4·75 (calc. 4·54) (Treadwell, *B.* 14, 1466).

Formation.—1. By nitrating benzyl methyl ketone with fuming HNO_3, reducing the resulting [2:1]$C_6H_4(NO_2).CH_2.CO.CH_3$ with zinc-dust and ammonia, and distilling with steam (Baeyer a. Jackson, *B.* 13, 187; 14, 879).—2. Obtained by heating the phenyl-hydrazide of acetone $(CH_3)_2C:N.NHC_6H_5$ (1 pt.) with $ZnCl_2$ (5 pts.) for half an hour at 100° and then for some minutes at 180° (E. Fischer, *B.* 19, 1564; *A.* 236, 124).

Properties.—Needles or plates (from ligroïn), sl. sol. hot water, v. sol. alcohol and ether. Smells like indole. V. sol. cold HClAq, but decomposed on boiling with conc. HClAq. HNO_2 colours its solution yellow, and soon gives a yellow amorphous pp. which does not give Liebermann's reaction. Colours pine-wood, moistened with HClAq, red.

Reactions.—1. $KMnO_4$ oxidises it to acetyl o-amido-benzoic acid.—2. *Potash-fusion* yields indole (*In*.2)-carboxylic acid (Ciamician a. Magnanini, *B.* 21, 673).—3. By heating with *sodium* in a stream of CO_2 at 240° there is formed methyl-indole carboxylic acid (Ciamician a. Magnanini, *B.* 21, 671).—4. *Reduced* by tin and HCl to a hydride, although sodium-amalgam does not act upon it.—5. With *chloroform* and NaOEt it yields chloro-methyl-quinoline [71°]. *Bromoform* and NaOEt yield the corresponding bromo-methyl-quinoline (Magnanini, *G.* 17, 246).—6. On heating with conc. HClAq for 7 hours at 225° there is formed aniline and a liquid base $C_{10}H_9N$ (250°) which smells like quinoline and forms the salts $B'_2H_2PtCl_6$ and $B'HAuCl_4$ (Magnanini, *B.* 20, 2609).—7. *Benzoic aldehyde* at 100° forms  $C_6H_5CH\left(C<\substack{C_6H_4\\CMe}>NH\right)_2$ which separates from acetone in colourless shining crystals

[247°], insol. water, v. sl. sol. hot alcohol and ether. On boiling with Fe_2Cl_6 in HOAc it is converted into di-methyl-rosindole (Fischer, *A.* 242, 373; *B.* 19, 2988).—8. *Nitro-benzoic aldehyde* heated with (*In.* 2)-methyl-indole on the water-bath forms the corresponding $[3:1]C_6H_4(NO_2).CH(C_9H_8N)_2$, small crystals (from acetone), sl. sol. alcohol, ether, and HOAc. This body melts at 263°, and is reduced by zinc-dust and ammonia to $C_6H_4(NH_2).CH(C_9H_8N)_2$ a yellow crystallisable oil (Fischer, *A.* 242, 375).—9. By fusing with *phthalic anhydride* and a little $ZnCl_2$ there is formed an acid $C_{17}H_{13}NO_3$ probably $C_9H_8N.CO.C_6H_4.CO_2H$ which crystallises from alcohol in colourless prisms, insol. water, sl. sol. ether, v. sol. hot alcohol and HOAc (Fischer).—10. On heating with *benzoyl chloride* and a little $ZnCl_2$ the products are di-methyl-rosindole $C_{25}H_{20}N_2$ and benzoyl-methyl-indole.—11. On heating with *zinc chloride* alone, a small quantity of quinoline is formed (Fischer a. Steche, *B.* 20, 819).—12. *Diazo-benzene chloride* and NaOAc form compact red crystals (from petroleum-ether) of $C_6H_5.N:N.C<\substack{C_6H_4\\CMe}>NH$, [116°], insol. water, v. sol. alcohol, ether, and benzene, m. sol. petroleum-ether. This body is split up again, by reduction, into aniline and amido-methyl-indole $C_6H_4<\substack{C(NH_2)\\NH}>CMe$ [113°] (Fischer, *A.* 242, 384).—13. When (*In.* 2)-methyl-indole (1 pt.) is heated with MeI (2½ pts.) and a little methyl alcohol at 100° for 15 hours, there is produced di-methyl-quinoline dihydride (243°) (Fischer a. Steche, *B.* 20, 818, 2199).

Salts.—B'HI. Formed by passing dry HI into a solution of the methyl-indole in ether (Wagner, *A.* 242, 388). Flocculent pp., very easily decomposed by water and by moist air.—$B'_2H_2PtCl_6$ 3aq: yellow needles, decomposed by water.

Acetyl derivative $C_6H_4<\substack{CH\\NAc}>CMe$. (200°–210° at 40 mm.). Formed in small quantity, together with methyl-indyl methyl ketone (*q.v.*), by heating (*In.* 2)-methyl-indole with Ac_2O and NaOAc. The product is extracted with chloroform, and the extract distilled *in vacuo* (Magnanini, *G.* 18, 95). Pale-yellow liquid. Decomposed by boiling aqueous KOH into KOAc and methyl-indole. Yields indole carboxylic acid on fusion with potash. $KMnO_4$ oxidises it to acetyl-*o*-amido-benzoic acid (Ciamician a. Magnanini, *B.* 21, 673).

(β)-***Acetyl derivative*** *v.* METHYL-INDYL METHYL KETONE.

Benzoyl derivative C_9H_8NBz. [82°]. Formed, together with di-methyl-rosindole, by heating (*In.* 2)-methyl-indole with BzCl and a little $ZnCl_2$ on the water-bath (Fischer a. Wagner, *B.* 20, 817). Glittering plates (from alcohol), v. sl. sol. hot water, m. sol. alcohol and ether.

Dihydride $C_9H_{11}N$ *i.e.* $C_6H_4<\substack{CH_2\\NH}>CHMe$. *Hydromethylketole.* (228° i.V.) at 742 mm. Prepared by reduction of (*In.* 2)-methyl-indole with tin and HCl (Jackson, *B.* 14, 883; Wenzing, *A.* 239, 244). Colourless oil with powerful odour. Heavier than water. Strong base. With phenyl-thiocarbimide it forms a compound $C_{16}H_{16}N_2S$, which crystallises from ether in prisms [101°].—$B'_2H_2PtCl_6$: orange-yellow needles; decomposed by water.—**Oxalate**: [130°]; crystalline.—**Picrate**: [151°]; crystalline.

Acetyl derivative $C_9H_{10}NAc$. [56°]. From the dihydride and Ac_2O. White needles, insol. water, sol. most other solvents.

Nitrosamine $C_9H_{10}N.NO$. [55°]. Formed by adding $NaNO_2$ to a solution of the hydrochloride of (*In.* 2)-methyl-indole dihydride (Jackson). Yellow crystals (from ligroïn), v. sol. alcohol, ether, and boiling ligroïn. On treatment with tin and HCl, methyl-indole dihydride is regenerated. On reduction with zinc-dust and HOAc it yields the hydrazine $C_9H_{10}N.NH_2$, which crystallises from ligroïn in prisms [41°], and yields a crystalline sulphate and hydrochloride.

(*In.* 3)-Methyl-indole $C_6H_4<\substack{CH\\NMe}>CH$. (240° i.V.) at 720 mm. S.G. º 1·0707. Obtained by long heating at about 205° from its carboxylic acid [212°], which is formed by the action of HCl on the phenyl-methyl-hydrazide of pyruvic acid (Fischer a. Hess, *B.* 17, 562). Formed also by heating ω-chloro-methyl-*o*-amido-styrene $C_6H_4(NHMe).CH:CHCl$ with NaOEt at 135° (Lipp, *B.* 17, 2510).

Properties.—Yellowish liquid, nearly insol. water, v. sol. alcohol, ether, and benzene. Volatile with steam. A chip of pine-wood, dipped in HClAq, is coloured violet-red by its vapour or solution. It dissolves in conc. HClAq, and is reppd. by addition of water. Fuming nitric acid added to (*In*-3)-methyl-indole suspended in water gives a deep red colour and finally a red pp.

Reactions.—1. An alkaline solution of *bromine* (NaOBr) converts it into di-bromo-methyl-oxindole $C_9H_9Br_2NO$, which crystallises in transparent tables, melting at 204°. It is converted by heating with alcoholic potash into methyl-ψ-isatin, which is ppd., after boiling off the alcohol, by adding HCl.—2. (*In.* 3)-methyl-indole (2 mols.) heated with benzoic aldehyde (1 mol.) and $ZnCl_2$ for 2 hours on the water-bath forms $C_6H_5.CH(C<\substack{C_6H_4\\CH}>NMe)_2$, which crystallises in colourless prisms [197°], insol. water, sl. sol. alcohol and ether, v. sol. hot acetone and HOAc. It yields a red dye on heating with $FeCl_3$ in HOAc (Fischer, *A.* 242, 377; *B.* 19, 2988).—3. On fusing equal weights of *phthalic anhydride* and (*In.* 3)-methyl-indole with a little $ZnCl_2$ at 100° there is formed $C_6H_4:C_2O_2(C_9H_8N)_2$, which crystallises from acetone in colourless prisms [300°]. It is insol. water and alkalis, v. sl. sol. ether and alcohol, but v. sol. hot acetone (Fischer, *A.* 242, 382; *B.* 19, 2989).—4. Scarcely attacked by MeI at 100°, but at 120° it appears to yield a methyl-quinoline dihydride (Fischer a. Steche, *B.* 20, 2199).

Picrate $C_9H_9NC_6H_2(NO_2)_3OH$. [150°]. Long dark-red prisms or needles, v. sol. benzene, sl. sol. ether. Decomposed by alcohol.

Chloro-derivative *v.* DI-CHLORO-METHYL-INDOLE.

Dihydride $C_6H_4<\substack{CH_2\\NMe}>CH_2$. (216° i.V.) at 728 mm. Formed by reducing (*In.* 3)-methyl-indole with zinc-dust and conc. HClAq (Wenzing, *A.* 239, 246). Liquid, sl. sol. water, v. sol. alcohol and ether, volatile with steam. Most of its salts dissolve in alcohol and water.—$B'_2H_2PtCl_6$:

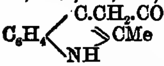
yellow needles, decomposed by boiling water.—Oxalate: [105°].—Picrate: [155°]; yellow tables (from benzene).

(*B.* 2)-Methyl-indole

$\begin{array}{l}\text{CMe:CH.C.CH}\\ |\qquad\quad \|\qquad >\text{CH.}\\ \text{CH :CH.C.NH}\end{array}$

Tolindole. [58·5°]. Formed by heating at 240° its carboxylic acid, which is obtained from the *p*-tolyl-hydrazide of pyruvic ether (Raschen, *A.* 239, 226). Needles (from water), m. sol. hot water, v. sol. alcohol, ether, benzene, and ligroïn. Volatile with steam. Reacts like indole with pine-wood and with nitrous acid.—Picrate $B'C_6H_2(NO_2)_3OH$. [151°]. Red needles (from water).

(*In.* 1,2)-**Di-methyl-indole** $C_{10}H_{11}N$ *i.e.* $C_6H_4{<}\genfrac{}{}{0pt}{}{CMe}{NH}{>}CMe$. [108°]. (285° i.V.). Formed by heating the phenyl-hydrazide of methyl ethyl ketone with $ZnCl_2$ at 180° (E. Fischer, *B.* 19, 1565; *A.* 236, 126). Formed also by heating bromo-acetyl-propionic acid $CH_3.CO.CHBr.CH_2.CO_2H$ (1 pt.) with aniline (3 pts.) at 100° (Wolff, *B.* 20, 427; 21, 123). Obtained likewise by heating



$C_6H_4{<}\genfrac{}{}{0pt}{}{C.CH_2.CO_2H}{NH}{>}CMe$ at 225° (Fischer).

Properties.—White plates (from dilute alcohol). Smells like indole. V. sl. sol. hot water, v. e. sol. alcohol and ether, sl. sol. cold ligroïn. Dissolves in conc. HClAq but is reppd. on dilution with water. Does not colour pine wood.

Reactions.—1. $NaNO_2$ added to its solution in HOAc forms a nitrosamine [63°], crystallising in yellow needles, v. sl. sol. water, v. sol. alcohol. By zinc-dust and HCl it is re-converted into di-methyl-indole. It exhibits Liebermann's reaction.—2. MeI in MeOH converts it into tri-methyl-quinoline dihydride.

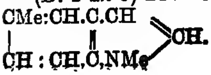
Picrate $B'C_6H_2(NO_2)_3OH$. [157°]. Brown needles (from alcohol).

Dihydride $C_6H_4{<}\genfrac{}{}{0pt}{}{CHMe}{NH}{>}CHMe$. (231°) at 750 mm. Formed by reducing di-methyl-indole with zinc-dust and HClAq (Steche, *A.* 242, 371).

(*In.* 2,3)-**Di-methyl-indole** $C_{10}H_{11}N$ *i.e.* $C_6H_4{<}\genfrac{}{}{0pt}{}{CH}{NMe}{>}CMe$. [56°]. Formed by heating the phenyl-methyl-hydrazide of acetone (1 pt.) with zinc chloride (5 pts.) for 3 hours at 130° (Fischer, *B.* 19, 1565; Degen, *A.* 236, 153). Formed also by heating its carboxylic acid $C_6H_4{<}\genfrac{}{}{0pt}{}{C(CO_2H)}{N(CH_3)}{>}CMe$ at 200° (D.). White needles, v. sol. alcohol, ether, benzene, and ligroïn, v. sl. sol. water, v. sol. conc. HClAq. May be distilled without decomposition. It gives the pine-wood test very distinctly. Nitrous acid forms a complicated product. The picrate crystallises in dark-red needles. The hydride is v. sol. weak acids.

(*In.* 1,3)-**Di methyl-indole** $C_6H_4{<}\genfrac{}{}{0pt}{}{CMe}{NMe}{>}CH$. (230°-255°). Formed by heating the phenyl-methyl-hydrazide of *n*-propionic aldehyde (1 pt.) with $ZnCl_2$ (5 pts.) at 135° (Degen, *A.* 236, 163). Oil.

(*B.* 2-*In*-3)-**Di-methyl-indole** $C_{10}H_{11}N$ *i.e.*



$\begin{array}{l}\text{CMe:CH.C.CH}\\ |\qquad\quad \|\qquad >\text{CH.}\\ \text{CH : CH.C.NMe}\end{array}$ *Methyl-p-tolindole.* (242°-245°). Formed by heating its carboxylic acid at 225° (Hegel, *A.* 232, 216). Liquid, volatile with steam; v. sol. alcohol, ether, and benzene. Dyes pine-wood, moistened with HCl, red. Fuming HNO_3 gives a red colour and, finally, a pp. The picrate is crystalline.

(*B.* 2, *In.* 2)-**Di-methyl-indole** $C_{10}H_{11}N$ *i.e.*

$\begin{array}{l}\text{CMe:CH.C.CH}\\ |\qquad\quad \|\qquad >\text{CMe.}\\ \text{CH : CH.C.NH}\end{array}$ *Methyl-p-tolindole.* [114°-117°]. Formed by heating the *p*-tolyl-hydrazide of acetone with $ZnCl_2$ (Raschen, *A.* 239, 227). May be distilled without decomposition. Almost insol. hot water, v. sol. hot alcohol, ether, and benzene.—$B'C_6H_2(NO_2)_3(OH)$. [155°]. Dark-red needles (from benzene).

(*B.* 4, *In.* 2)-**Di-methyl-indole** $C_{10}H_{11}N$ *i.e.*

$\begin{array}{l}\text{CH : CH.C.CH}\\ |\qquad\quad \|\qquad >\text{CH.}\\ \text{CH:CMe.C.NMe}\end{array}$ *Methyl-o-tolindole.* Obtained by the action of heat on its carboxylic acid, which is derived from the o-tolyl-methyl-hydrazide of pyruvic acid (Hegel, *A.* 232, 220). Liquid, smelling like indole, volatile with steam. Dyes pine-wood, acidified by HCl, violet-red. Behaves like indole towards nitrous acid.

Di-methyl-indole $C_{10}H_{11}N$. (275°). Formed by allowing a solution of the hydrochloride of (α)-di-methyl-dipyrrole in dilute H_2SO_4 to stand for some time in the cold (Dennstedt, *B.* 21, 3439). Liquid, volatile with steam.—Picrate $B'C_6H_2(NO_2)_3OH$. [156°]. Dark-red silky needles (from benzene).

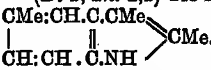
Di-methyl-indole $C_{10}H_{11}N$. (c. 270°). Formed from (β)-di-methyl-dipyrrole in the same way as the preceding isomeride (D.). Liquid. Smells like scatole.—Picrate $B'C_6H_2(NO_2)_3OH$. [149°]. Red silky needles.

(*In.* 1,2,3)-**Tri-methyl-indole** $C_{11}H_{13}N$ *i.e.* $C_6H_4{<}\genfrac{}{}{0pt}{}{CMe}{NMe}{>}CMe$. (280°). Formed by heating di-methyl-indyl-acetic acid for several hours at 210° (Degen, *A.* 236, 160). Formed also by heating the phenyl-methyl-hydrazide of methyl ethyl ketone with $ZnCl_2$ at 180° (D.). Yellow oil with characteristic odour. Miscible with alcohol and ether. Gives no colour to pine-wood. Picrate $B'C_6H_2(NO_2)_3OH$. [150°]. Dark-red needles (from hot benzene).

(*B.* 4, *In.* 1, 2)-**Tri-methyl-indole** $C_{11}H_{13}N$ *i.e.*

$\begin{array}{l}\text{CH : CH.C.CMe}\\ |\qquad\quad \|\qquad >\text{CMe.}\\ \text{CH:CMe.C.NH}\end{array}$ [79°]. (283° uncor.). Formed by heating bromo-acetyl-propionic (bromo-levulic) acid $CH_3.CO.CHBr.CH_2.CO_2H$ with o-toluidine (Wolff, *B.* 21, 3362). White plates, v. sol. alcohol, chloroform, and petroleum-ether, v. sl. sol. water. Volatile with steam.—Picrate $B'C_6H_2(NO_2)_3OH$. [152°]. Purple-red scales.

(*B.* 2, *In.* 1,2)-**Tri-methyl-indole** $C_{11}H_{13}N$ *i.e.*



$\begin{array}{l}\text{CMe:CH.C.CMe}\\ |\qquad\quad \|\qquad >\text{CMe.}\\ \text{CH:CH . C.NH}\end{array}$ [121°]. (297° cor.). Formed by warming β-bromo-acetyl-propionic acid (1 pt.) with *p*-toluidine (3 pts.), and finally heating the mixture to boiling (Wolff, *B.* 21, 3361). Plates, v. sol. alcohol, chloroform, and petroleum-ether, v. sl. sol. water. Does not give the pine-wood reaction. The solution in HOAc, mixed with $FeCl_3$, becomes green on boiling, and finally blue. *Picrate* $B'C_6H_2(NO_2)_3OH$. [189°]. Brownish-red needles, v. sol. benzene and alcohol.

Nitrosamine

$C_7H_6<\begin{smallmatrix}CMe\\N(NO)\end{smallmatrix}>CMe$. [73°]. Golden-yellow needles, v. e. sol. alcohol and HOAc, sl. sol. water.

Tetra-methyl-indole $C_{12}H_{15}N$. (285°). Light-yellow oil, with characteristic odour (Dennstedt, *B.* 22, 1924). *Picrate* $B'C_6H_2(NO_2)_3OH$. [100°]. Shining red needles.

METHYL-INDOLE ACETIC ACID *v.* METHYL-INDYL-ACETIC ACID.

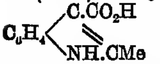
(*In.* 1)-METHYL-INDOLE (*In.* 2)-CARBOXYLIC ACID $C_{10}H_9NO_2$ *i.e.*

$C_6H_4<\begin{smallmatrix}CMe\\NH\end{smallmatrix}>C.CO_2H$. *Scatole* (β)-*carboxylic acid* [165°]. Formed by saponifying with alcoholic potash its ether which is obtained by boiling with alcoholic hydrogen sulphate (10 p.c.), the phenyl-hydrazide of ethyl-glyoxylic ether $CH_3.CH_2.C(N_2HPh).CO_2H$ (Wislicenus a. Arnold, *B.* 20, 3395; *A.* 246, 335). Formed also by heating scatole with sodium in a current of CO_2 at 240° (Ciamician a. Magnanini, *G.* 18, 61; *B.* 21, 672, 1927; *Rend. Accad. Linc.* [4] 4, 740). Thin white needles (from boiling water), v. sol. alcohol and benzene, v. sl. sol. water. Its alcoholic solution is coloured deep red by $FeCl_3$. On heating above 165° it is split up into CO_2 and scatole [95°].—AgA′: white powder, insol. water.

Ethyl ether EtA′. [134°]. Needles (from alcohol), insol. water, v. e. sol. benzene and ether.

(*In.* 1)-Methyl-indole carboxylic acid $C_{10}H_9NO_2$. *Scatole* (α)-*carboxylic acid.* [164°]. (Possibly identical with the preceding acid). Occurs among the products of the putrefaction of serum-albumen, and of muscular tissue (H. a. E. Salkowsky, *B.* 13, 191, 2217; *H.* 8, 23; 9, 8). Small plates (from benzene). Decomposed on heating above its melting-point into CO_2 and scatole. V. sl. sol. cold water, v. sol. alcohol and ether, m. sol. benzene. $FeCl_3$ colours its dilute solution (containing HCl) violet on boiling. Nitrous acid colours its dilute solution cherry-red, and presently gives a pp. Bleaching powder colours a dilute solution, acidified by HCl, purple; this reaction, and that with nitrous acid, are not exhibited by (*In.* 1)-indole (*In.* 2)-carboxylic acid.—AgA′. Sparingly soluble pp.

(*In.* 2) Methyl-indole (*In.* 1)-carboxylic acid

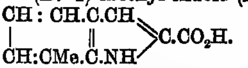


$C_6H_4<\begin{smallmatrix}C.CO_2H\\ \| \\NH.CMe\end{smallmatrix}$. *Methyl-ketole carboxylic acid.* [172°] or [183°]. Prepared by heating (*In.* 2)-methyl-indole (10 g.) mixed with sodium (3·6 g.) in a current of dry CO_2 first at 235° and finally at 315°; the unaltered methyl-indole is removed by steam distillation, and the acid recrystallised from acetone (Ciamician a. Magnanini, *G.* 18, 60; *B.* 21, 672; *Rend. Accad. Linc.* [4] 4, 740). White crystalline powder, completely decomposed at its melting-point into CO_2 and methyl-indole (methyl-ketole); this decomposition is partially effected by merely boiling the aqueous solution. Sl. sol. water and benzene, v. sol. alcohol and acetone. It gives white pps. with lead and mercuric salts, and a green pp. with a cupric salt.—AgA′: white crystalline pp.

(*In.* 3)-Methyl-indole (*In.* 1)-carboxylic acid

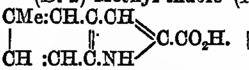
$C_6H_4<\begin{smallmatrix}C(CO_2H)\\N(CH_3)\end{smallmatrix}>CH$. [212°]. Obtained by heating the phenyl-methyl-hydrazide of pyruvic acid (1 pt.) with 10 p.c. aqueous HCl (15 pts.) on the water-bath (E. Fischer a. Hess, *B.* 17, 559). White needles, v. sol. hot alcohol, ether, and benzene, sl. sol. hot water, nearly insol. cold water. Its solution in H_2SO_4 is red. By prolonged heating at its melting-point it is split up into CO_2 and (*In.* 3)-methyl-indole. Readily oxidised by $KMnO_4$. An alkaline solution of Br or Cl oxidises it to methyl-ψ-isatin and CO_2.

(*B.* 4)-Methyl-indole (*In.* 2)-carboxylic acid



$\begin{matrix}CH:CH.C.CH\\ | \quad\quad \| \\ CH:CMe.C.NH\end{matrix}>C.CO_2H$. [171°]. Formed by saponifying with alcoholic potash its ethyl ether which is obtained by heating the o-tolyl-hydrazide of pyruvic ether (1 pt.) with $ZnCl_2$ (1 pt.) at 220° (Raschen, *A.* 239, 228). Needles (from water), v. sol. alcohol, ether, and HOAc.

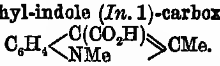
(*B.* 2)-Methyl-indole (*In.* 2)-carboxylic acid



$\begin{matrix}CMe:CH.C.CH\\ | \quad\quad \| \\ CH\ :CH.C.NH\end{matrix}>C.CO_2H$. [228°]. Formed from its ethyl ether which is obtained by heating the *p*-tolyl-hydrazide of pyruvic ether with $ZnCl_2$ at 220° (Raschen, *A.* 239, 228). Needles (from water), m. sol. hot water, v. sol. alcohol, ether, chloroform, and HOAc. Decomposed on fusion into CO_2 and (*B.* 2)-methyl-indole.

Ethyl ether EtA′. [160°]. Colourless needles or plates.

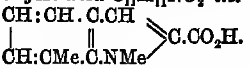
(*In.* 2, 3)-Di-methyl-indole (*In.* 1)-carboxylic acid $C_{11}H_{11}NO_2$ *i.e.*



$C_6H_4<\begin{smallmatrix}C(CO_2H)\\NMe\end{smallmatrix}>CMe$. [185°]. Formed by saponifying its ether which is obtained by heating the phenyl-methyl-hydrazide of acetoacetic ether with $ZnCl_2$ (Fischer, *B.* 19, 1569; Degen, *A.* 236, 157). Six-sided plates, m. sol. hot alcohol and chloroform, sl. sol. water, ether, benzene, and ligroïn. Splits up at 200° into CO_2 and (*In.* 2-3)-di-methyl-indole. The Na salt is insol. conc. NaOHAq. The Ag salt is insol. NH_3Aq. Colours pine wood.

Ethyl ether EtA′. [95°]. Colourless needles (from alcohol-ligroïn), v. sol. alcohol ether, benzene, and chloroform, sl. sol. ligroïn.

(*B.* 4, *In.* 3)-Di-methyl indole (*In.* 2)-carboxylic acid $C_{11}H_{11}NO_2$ *i.e.*



$\begin{matrix}CH:CH.C.CH\\ | \quad\quad \| \\ CH:CMe.C.NMe\end{matrix}>C.CO_2H$. [210°]. Formed by warming the o-tolyl-methyl-hydrazide of pyruvic acid (1 pt.) with phosphoric acid (20 pts. of S.G. 1·17) on the water-bath (Hegel, *A.* 232, 220). Colourless needles (from benzene), v. e. sol. alcohol. Splits up on heating into CO_2 and the corresponding di-methyl-indole. When its alkaline solution is warmed with NaOCl and the product heated with water there is formed di-methyl-ψ-isatin

$C_6H_3Me<\begin{smallmatrix}CO\\NMe\end{smallmatrix}>CO$ [157°].

(*B.* 2, *In.* 3)-Di-methyl-indole (*In.* 2)-carboxylic acid

$\begin{matrix}CMe:CH.C.CH\\ | \quad\quad \| \\ CH\ :CH.C.NMe\end{matrix}>C.CO_2H$. [221°]. Formed by warming the *p*-tolyl-methyl-hydrazide of pyruvic acid (1 pt.) with HCl (20 pts. of 10 p.c.), the acid being ppd. (Hegel, *A.* 232, 216). Needles (from hot alcohol), sl. sol. ether, sol. hot benzene, chloroform, and glacial HOAc, insol. ligroïn. Forms the corresponding di-methyl-indole on heating. A neutral solution of its Na salt gives with NaOCl a yellow crystalline pp. [135°], which on boiling with water is changed to di-methyl-ψ-isatin  $C_6H_3Me{<}\begin{matrix}CO\\NMe\end{matrix}{>}CO$ crystallising in red needles [148°].

METHYL-INDONAPHTHENE $C_{10}H_{10}$ *i.e.*  $C_6H_4{<}\begin{matrix}CMe\\CH_2\end{matrix}{>}CH$. *Methyl-indene.* (206°) (Roser); (201°) (Von Pechmann, *B.* 16, 516). Formed by distilling methyl-indonaphthene carboxylic acid with soda-lime (Roser, *A.* 247, 159). Transparent highly refractive liquid, smelling somewhat like naphthalene. Absorbs oxygen from the air, becoming gummy. On heating with conc. HClAq it also becomes gummy, and H_2SO_4 has a like effect. By heating with HIAq at 180° it is converted into a solid body, fusible under water, v. sol. ether, sl. sol. alcohol.

Picric acid compound $C_{10}H_{10}C_6H_2(NO_2)_3OH$. [76°]. Unstable orange powder (Von Miller, *B.* 23, 1882).

METHYL-INDONAPHTHENE CARBOXYLIC ACID $C_{11}H_{10}O_2$ *i.e.*  $C_6H_4{<}\begin{matrix}CMe\\CH_2\end{matrix}{>}C.CO_2H$. '*Dihydronaphthoic*' *acid.* [200°]. Formed by gently warming benzyl-aceto-acetic ether (1 pt.) with conc. H_2SO_4 (7 pts.), and pouring the product into water (Von Pechmann, *B.* 16, 516; Roser, *B.* 20, 1574; *A.* 247, 158). White needles (from alcohol), almost insol. water, m. sol. hot alcohol and ether. Crystallises from glacial acetic acid in prisms (containing HOAc). May be distilled with slight decomposition, but when boiled for a long time it splits up into CO_2 and methyl-indonaphthene. On oxidation it yields phthalic acid.

Methyl ether MeA′. [78°]. Small needles, v. sol. alcohol and ether.

Di-bromide  $C_6H_4{<}\begin{matrix}CMeBr\\CH_2—\end{matrix}{>}CBr.CO_2H$. [215°]. Formed by exposing the acid to bromine-vapour. White crusts (from ether). On warming with HOAc it gives off HBr and leaves  $C_6H_4{<}\begin{matrix}CMeBr\\CH==\end{matrix}{>}C.CO_2H$ [245°], which forms a methyl ether melting at 100°.

Methyl ether $C_{10}H_9Br_2CO_2Me$. [157°]. White needles, sl. sol. methyl alcohol.

METHYL-INDONAPHTHENE DIHYDRIDE CARBOXYLIC ACID $C_{11}H_{12}O_2$ *i.e.*  $C_6H_4{<}\begin{matrix}CHMe\\CH_2\end{matrix}{>}CH.CO_2H$. *Methyl-hydrindonaphthene carboxylic acid.* [80°]. (300°–310°). Formed by the action of sodium-amalgam on an alkaline solution of methyl-indonaphthene carboxylic acid (Roser, *B.* 20, 1574; *A.* 247, 165). Small needles (from hot water), v. sol. alcohol and ether, scarcely volatile with steam. On continued heating above 310° it becomes viscid, but the crystalline acid is reproduced on treating this viscid mass with alkalis.—AgA′.—BaA′$_2$ 2aq: needles (from alcohol), v. sol. water.

METHYL-INDONAPHTHOQUINONE $C_{10}H_8O_2$ *i.e.*  $C_6H_4{<}\begin{matrix}CO\\CO\end{matrix}{>}CHMe$. *Methyl-di-keto-hydrindene.* [85°]. (c. 150° at 18 mm.). Formed by the action of sodium on a mixture of ethyl propionate and phthalate (Wislicenus a. Kötzle, *A.* 252, 80). Blunt pyramids (from alcohol) or needles (from light petroleum), sol. ether and hot water. The sodium derivative $C_{10}H_7NaO_2$ crystallises in small dark-red prisms.

Di-oxim  $C_6H_4{<}\begin{matrix}C(NOH)\\C(NOH)\end{matrix}{>}CHMe$. [117°]. Needles, sol. alcohol, ether, alkalis, and HOAc.

Mono-phenyl-hydrazide  $C_6H_4{<}\begin{matrix}C(N_2HPh)\\CO——\end{matrix}{>}CHMe$. [164°]. Crystals, v. sol. ether and benzene. Forms a green solution in HOAc.

Di-methyl-indonaphthoquinone $C_{11}H_{10}O_2$ *i.e.*  $C_6H_4{<}\begin{matrix}CO\\CO\end{matrix}{>}CMe_2$. [108°]. (c. 250°). Formed by heating methyl-indonaphthoquinone with MeI and MeOH at 100° (W. a. K.). V. sol. alcohol, ether, and benzene.

Phenyl-hydrazide  $C_6H_4{<}\begin{matrix}C(N_2HPh)\\C(N_2HPh)\end{matrix}{>}CMe_2$. [184°–187°]. Slender yellowish prisms (from alcohol), sol. ether and HOAc. $FeCl_3$ colours its solution in H_2SO_4 intensely dark green.

METHYL INDOPHENINE *v.* INDOPHENINE.

METHYL-INDYL-ACETIC ACID $C_{11}H_{11}NO_2$ *i.e.*  $C_6H_4{<}\begin{matrix}\overset{CH_2.CO_2H}{C}\\ \|\\ NH.CMe\end{matrix}$. [195°–200°]. Formed by warming the phenyl-hydrazide of acetyl-propionic (levulic) acid with $ZnCl_2$ at 125° (E. Fischer, *B.* 19, 1565; *A.* 236, 149). Colourless plates, sl. sol. hot water and chloroform, m. sol. ether, v. sol. hot alcohol, v. e. sol. acetone and hot HOAc. Nitrous acid yields a nitrosamine. At 225° it is split up, slowly into CO_2 and di-methyl-indole. Its picric acid compound crystallises in slender dark-red needles.

Di-methyl-indyl-acetic acid $C_{12}H_{13}NO_2$ *i.e.*  $C_6H_4{<}\begin{matrix}\overset{CH_2.CO_2H}{C}\\ \|\\ NMe.CMe\end{matrix}$. [188°]. Formed by saponification (by alcoholic KOH) of its ether, which is obtained by warming the phenyl-methyl-hydrazide of acetyl-propionic ether with $ZnCl_2$ (Fischer, *B.* 19, 1568; Degen, *A.* 236, 158). Colourless plates, sl. sol. water, ether, and benzene, v. sol. alcohol and chloroform. Its alkaline salts are v. e. sol. water, but ppd. on addition of caustic alkalis. At 210° it is split up into CO_2 and (*In*-1,2,3)-tri-methyl-indole. Does not give the pine-wood reaction.

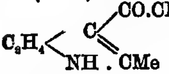
METHYL INDYL KETONE *v.* (β)-*Acetyl*-INDOLE.

(*In.* 1)-**METHYL-INDYL METHYL KETONE** $C_{11}H_{11}NO$ *i.e.*  $C_6H_4{<}\begin{matrix}CMe\\NH\end{matrix}{>}C.CO.CH_3$. *Acetyl-scatole.* [148°]. Formed by heating (*In*-1)-methyl-indole (scatole) (1 g.) with AcCl (10 g.) and $ZnCl_2$ (½ g.) (Magnanini, *G.* 18, 99; *B.* 21, 1938). Long needles (from dilute alcohol), insol. cold water, v. sol. hot alcohol and acetone, m. sol. ether. Volatile with steam. Not affected by KOHAq, but conc. HCl forms scatole. Hot conc. H_2SO_4 gives a purple solution.

Picrate [156°]. Yellow needles, sl. sol. cold, v. sol. hot, benzene.

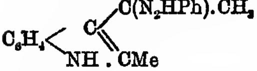
Oxim $C_6H_4\!<\!\genfrac{}{}{0pt}{}{CMe}{NH}\!\!>\!C.C(NOH).CH_3$. [119°]. Small needles, decomposed by acids and alkalis, reproducing the ketone.

(*In*. 2)-Methyl-indyl methyl ketone



Acetyl-methyl-ketole. [196°]. Formed by heating (*In*-2)-methyl-indole (methyl-ketole) (1 pt.) with Ac_2O (5 pts.) and NaOAc (1 pt.) for six hours with inverted condenser (Jackson, *B.* 14, 879; Fischer, *A.* 242, 379). Colourless needles (from acetone), sl. sol. water, v. sol. alcohol and hot benzene. Dissolves in HClAq. Not decomposed by boiling NaOHAq, but boiling conc. HClAq regenerates the ketone. $KMnO_4$ oxidises it to acetyl-amido-benzoic acid (Magnanini, *G.* 18, 97).

Phenyl-hydrazide $C_{17}H_{17}N_3$ *i.e.*



. [c. 136°]. Formed by heating the ketone with phenyl-hydrazine hydrochloride and NaOAc. Colourless plates, m. sol. hot benzene, v. sl. sol. petroleum-ether.

DI-METHYL-INOSITE *v.* DAMBONITE.

METHYL-IODAMINE *v.* METHYLAMINE.

METHYL IODIDE CH_3I. *Iodo-methane.* Mol. w. 142. (42·8°) (Dobriner, *A.* 243, 23); (42·3°) (Perkin, *C. J.* 45, 459). S.G. $\frac{0}{0}$ 2·3346 (D.); $\frac{15}{15}$ 2·2852; $\frac{25}{25}$ 2·2529 (P.). S. ·008 at 15° (Bardy a. Bordet, *A. Ch.* [5] 16, 569). C.E. (0°–10°) ·00118 (D.). S.V. 64·1 (Lossen, *A.* 254, 69); 64·8 (Ramsay); M.M. 9·009 at 19·5°. H.F.p. (gas) + 3420. H.F.v. (gas) 2840 (Thomsen, *Th.*). Obtained by distilling phosphorus (1 pt.) with iodine (8 pts.), dissolved in moist methyl alcohol (14 pts.), or phosphorus (60 g.) with iodine (1000 g.) and methyl alcohol (500 g.) (Dumas a. Péligot, *A.* 15, 30; Pierre, *A.* 56, 147; Landolt, *A.* 84, 44; Hofmann, *C. J.* 13, 69). Prepared also from red phosphorus (10 pts.), MeOH (35 pts.), and I (100 pts.) (Personne, *J.* 1861, 607; Butlerow, *B.* 6, 561), and from KI, MeOH, and gaseous HCl (De Vrij, *J.* 1857, 441). The distillate is washed with water and rectified over $CaCl_2$ and lead oxide. Colourless, slightly combustible liquid. Not attacked by gaseous HCl.

Reactions.—1. *Chlorine* converts it into MeCl.—2. When heated with *zinc* it forms IZnMe. The moist copper-zinc couple forms methane (Gladstone a. Tribe, *C. J.* 26, 682).—3. When heated with alloys of K or Na with As or Sb it yields methides of arsenic or antimony.—4. With Mg and Al it forms methides.—5. When heated in a sealed tube with aqueous NH_3 it forms mono-, di-, and tri-methylamine and NMe_4I.—6. With EtOH at 125° it forms EtI and MeOEt (Busse a. Kraut, *A.* 177, 272).—7. Heated with *water* (15 pts.) at 100° it is converted into methyl alcohol (Niederist, *A.* 196, 350).—8. With H_2S and water it forms $MeI(H_2S)_2 23aq$ (Forcrand, *A. Ch.* [5] 28, 21).—9. *Sulphur* at 160° to 190° forms SMe_3I and other products (Klinger, *B.* 10, 1880).

Hydrate $(MeI)_2aq$. [−4°] (F.); [4·8°] (Villard, *C. R.* 111, 185). Formed by passing a current of moist air through the iodide (Forcrand, *C. R.* 90, 1491).

METHYL-IODOFORM *v.* TRI-IODO-ETHANE.

METHYL-ISATIC ACID *v.* ISATIC ACID.

METHYL-ISATIN *v.* ISATIN.

METHYL-ISATOÏC ACID *v.* ISATOÏC ACID.

METHYL-ISATOID *v.* ISATOID.

METHYL-ITACONIC ACID $C_6H_8O_4$. [166°]. A product of the distillation of methyl-paraconic acid (Fränkel, *A.* 255, 37). Formed also by heating a solution of methyl-citraconic acid at 150° in sealed tubes. Prisms, sol. water, insol. chloroform. When distilled it partially carbonises, and is partially converted into the isomeric methyl-citraconic acid. Nitric acid appears to convert in into methyl-mesaconic acid [195°]. Sodium-amalgam reduces it to ethyl-succinic acid.—$BaA''\frac{1}{2}aq$.—$CaA''aq$.—Ag_2A''.

TETRA-METHYLIUM HYDROXIDE *v.* *Methylo-hydroxide* of TRIMETHYLAMINE.

DI-METHYL-KETINE is TETRA-METHYL-PYRAZINE.

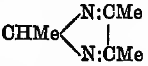
DI-METHYL-KETOL *v.* METHYL-OXYETHYL KETONE.

METHYL-KETOLE *v.* (*In.* 2)-METHYL-INDOLE.

DI-METHYL-KETONE is ACETONE.

Di-methyl di-ketone $C_4H_6O_2$ *i.e.* $CH_3.CO.CO.CH_3$. *Di-acetyl.* (88°). S.G. $\frac{22}{}$ ·9734. S. 25 at 15°. Formed by heating its dicarboxylic acid (ketipic acid) either by itself or with dilute H_2SO_4 (Fittig, *B.* 20, 3179; *A.* 249, 200). Formed also from its mono-oxim (nitroso-methyl-ethyl-ketone) by successive treatment with $NaHSO_3$ and dilute acid: $CH_3.CO.CMe:NOH + H_2SO_3 + H_2O = CH_3.CO.COMe + NH_4SO_4H$ (Von Pechmann, *B.* 20, 3162). Most easily prepared by saponifying methyl-aceto-acetic ether with dilute (3 p.c.) alkali, treating the product with $NaNO_2$ and H_2SO_4, removing alcohol by distillation, adding dilute H_2SO_4 (20 vols. of 15 p.c.), and distilling with steam (Von Pechmann, *B.* 21, 1411). Yellow mobile liquid, smelling like acetone and quinone, miscible with alcohol and ether. Decomposed by alkalis or hot alkaline carbonates. Forms metallic derivatives of trimethyl-glyoxaline with ammoniacal solutions of silver nitrate and of cuprous chloride. With alcohol it forms an unstable compound $C_4H_6O_22HOEt$, boiling at 75°. With water it forms a crystalline hydrate $(C_4H_6O_2)_3 2aq$, insol. water, alcohol, and ether. Yields a very unstable compound with SO_2. Combines with $NaHSO_3$.

Reactions.—1. With HCy it forms the nitrile of di-oxy-di-methyl-succinic acid.—2. *Bromine* dissolved in CS_2 forms a di-bromo- derivative $C_4H_4Br_2O_2$ [117°].—3. *Ammonia* forms tri-methyl-glyoxaline



$CHMe\!<\!\genfrac{}{}{0pt}{}{N:CMe}{N:CMe}$ [133°] (271°).

4. When warmed with *o-tolylene-diamine* acetate it is converted into tri-methyl-quinoxaline $C_6H_4Me\!<\!\genfrac{}{}{0pt}{}{N:CMe}{N:CMe}\!>$, which crystallises from light petroleum in prisms [91°] (270°).—5. *Aniline* forms the anilide PhN:CMe.CMe:NPh, which crystallises from alcohol in lustrous sulphur-yellow scales [133°], v. sol. ether, m. sol. alcohol, insol. water.—6. On adding dilute aqueous NaOH or Na_2CO_3 to an aqueous solution of the diketone until it becomes colourless, then at once acidifying with dilute H_2SO_4 and extract-

ing with ether, the product is di-methyl-quinogen $CH_3.CO.CMe{:}CH.CO.CO.CH_3$, a yellowish bitter syrup, which forms a phenyl-hydrazide $C_8H_{10}(N_2HPh)_3$ [205°], and is converted by excess of alkali into *p*-xyloquinone.—7. Heated with an aqueous solution of *urea* it forms di-methyl-glycolurite $C_6H_{10}N_4O_2$ (Franchimont a. Klobbie, *R. T. C.* 7, 251).—8. Reduced in alkaline solution to a product ($CH_3.CO.CH(OH).CH_3$?), which instantly reduces Fehling's solution in the cold.

Mono-oxim $CH_3.CO.C(NOH).CH_3$. *Iso-nitroso-methyl-ethyl-ketone.* [74°]. (186°). V.D. 3·51 (calc. 3·49). Formed by treating methyl-aceto-acetic ether (1 mol.) with aqueous KOH (3 mols.), followed by nitrous acid (V. Meyer a. Züblin, *B.* 11, 322). Prisms (from chloroform) or plates (from water), v. e. sol. alcohol, ether, and chloroform. Decomposed by heating with dilute HClAq at 140° into ammonia and acetic acid. Boiling conc. HClAq yields HOAc, hydroxylamine, and a little of the dioxim (Schramm, *B.* 16, 177). By boiling with dilute H_2SO_4 it is split up into hydroxylamine and the diketone (Von Pechmann, *B.* 20, 3213). Treatment with aqueous $NaHSO_3$ and dilute H_2SO_4 also forms di-methyl diketone (Von Pechmann, *B.* 20, 3162). Alkaline K_3FeCy_6 oxidises it, even in the cold, to acetic and nitrous acids (Gutknecht, *B.* 12, 2290). On reduction by $SnCl_2$ and HCl, followed by removal of tin by H_2S and addition of alkali, tetra-methyl-pyrazine is obtained. But if the solution is allowed to stand when acid another base is got (Braun, *B.* 22, 559).

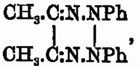
Methyl ether of the mono-oxim $CH_3.CO.C(NOMe).CH_3$. (125° uncor.). Colourless oil, lighter than water (Ceresole, *B.* 16, 834).

Di-oxim $CH_3.C(NOH).C(NOH).CH_3$. *Methyl-ethyl-acetoximic acid.* [234°]. Formed by the action of hydroxylamine on the mono-oxim (Schramm, *B.* 16, 179; Auwers a. V. Meyer, *B.* 21, 3527) or on the diketone (Fittig, *A.* 249, 204). Small colourless needles, insol. water, v. sol. alcohol and ether. May be sublimed.

Oxim-phenyl-hydrazide $CH_3.C(NOH).C(N_2HPh).CH_3$. [158°]. Formed from the oxim and phenyl-hydrazine (Von Pechmann a. Wehsarg, *B.* 21, 2997). Large crystals (from alcohol). Its solution in H_2SO_4 is coloured bluish-violet by $FeCl_3$.

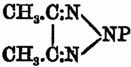
Phenyl-hydrazide $CH_3.CO.C(N_2HPh).CH_3$. [133°]. Formed by running a solution of diazobenzene chloride into one of methyl-acetoacetic acid, the reaction being completed by adding a solution of NaOAc (Japp a. Klingemann, *B.* 21, 549; *A.* 247, 218; Von Pechmann, *B.* 21, 1411). Yellow tables (from benzene). Forms a yellow solution in conc. H_2SO_4.

Di-phenyl-di-hydrazide $CH_3.C(N_2HPh).C(N_2HPh).CH_3$. [243°] (Japp); [239°] (Fittig). Formed by treating the mono-phenyl-hydrazide with phenyl-hydrazine (Japp, *A.* 247, 218), or by the action of phenyl-hydrazine on an ethereal solution of di-methyl diketone (Fittig, *A.* 249, 203; Von Pechmann, *B.* 20, 3164). Formed also by heating the phenyl-hydrazide of pyruvic acid (Japp a. Klingemann, *B.* 21, 550). Yellowish needles, almost insol. water, alcohol, and ether, sl. sol. chloroform, m. sol. acetone and hot benzene. Dissolves in cold conc. H_2SO_4 forming a brown solution, which after some time becomes dirty-wine red, appearing green in thin layers. $K_2Cr_2O_7$ in HOAc oxidises it to the 'osotetrazone'



$$\begin{array}{l}CH_3.C{:}N.NPh\\ \quad\;\;|\quad\;\;\;|\\ CH_3.C{:}N.NPh\end{array}$$

, which crystallises in matted red needles [169°], insol. water, sol. chloroform and benzene, m. sol. ether, sl. sol. acetone and alcohol, almost insol. HOAc. This 'osotetrazone' is reduced to the original diphenyl-dihydrazide by warming with phenyl-hydrazine. HCl converts the 'osotetrazone' into an 'osotriazone'



$$\begin{array}{l}CH_3.C{:}N\diagdown\\ \quad\;\;|\qquad\;\;\rangle NPh\\ CH_3.C{:}N\diagup\end{array}$$

, which is a very weak base, [35°], (c. 255°), insol. water, sol. alcohol and ether (Von Pechmann, *B.* 21, 2759).

DI-METHYL-DI-KETONE DICARBOXYLIC ACID $C_6H_6O_6$ *i.e.* $CO_2H.CH_2.CO.CO.CH_2.CO_2H$. *Di-keto-adipic acid. Ketipic acid. Ketipatic acid. Oxalyl di-acetic acid.* Obtained by warming its ethyl ether with cold conc. HClAq (Fittig a. Daimler, *B.* 20, 203; *A.* 249, 183). White amorphous powder, insol. or v. sl. sol. cold water, alcohol, chloroform, CS_2, benzene, and petroleum-ether. On heating alone or with dilute H_2SO_4 it is converted into dimethyl diketone.

Ethyl ether Et_2A''. [77°]. Prepared by warming oxalic ether with chloro-acetic ether and amalgamated granulated zinc at 80° for three days. The mass is extracted with water and the insoluble portion treated with dilute H_2SO_4, and the solution so obtained extracted with ether. The ether is distilled off, and the ketipic ether left recrystallised from alcohol (Fittig a. Daimler). Formed also by the action of NaOEt and oxalic ether on acetic ether (Wislicenus, *B.* 20, 589; *A.* 246, 328). Colourless plates or prisms, insol. cold water, v. sol. ether and chloroform, m. sol. hot alcohol, benzene, and CS_2. Decomposed by boiling water. $FeCl_3$ colours its alcoholic solution deep red.

Reactions.—1. *Bromine* added to a warm solution of the ether in CS_2 forms $CO_2Et.CBr_2.CO.CO.CBr_2.CO_2Et$ [119°], which is converted by ammonia into oxamide and di-bromo-acetamide [156°]. Bromine added to a solution of ketipic ether in cooled CS_2 forms $CO_2Et.CHBr.CO.CO.CHBr.CO_2H$, which is deposited in colourless plates [70°].—2. *Chlorine* passed into a boiling solution of the ether in chloroform forms $CO_2Et.CCl_2.CO.CO.CCl_2.CO_2Et$ [93°], which is also produced by chlorinating di-oxy-quinone dicarboxylic ether (Böniger, *B.* 22, 1285).—3. *Phenyl-hydrazine* forms a phenyl-hydrazide

$CO_2Et.CH_2.C(N_2HPh).C(N_2HPh).CH_2.CO_2Et$ crystallising from chloroform in light-yellow needles [160°–180°].

DI-METHYL-KETOXIM *v.* ACETOXIM.

METHYL-LEPIDONE *v.* OXY-DIMETHYL-QUINOLINE.

METHYL-PARA-LEUCANILINES *v.* METHYL-TRI-AMIDO-TRI-PHENYL-METHANES.

METHYL-LUTIDONE *v.* OXY-TRI-METHYL-PYRIDINE.

METHYL-PSEUDO-LUTIDO-STYRIL *v.* OXY-TRI-METHYL-PYRIDINE.

DI-METHYL-MALEIC ACID $C_6H_8O_4$ *i.e.* $CO_2H.CMe:CMe.CO_2H$. *Pyrocinchonic acid. Di-methyl-fumaric acid. Di-methyl-ethylene di-carboxylic acid. Butylene dicarboxylic acid.*

Formation.—1. Its anhydride is formed by the dry distillation of cinchonic acid $C_7H_6O_6$ (Weidel a. Schmidt, *B.* 12, 1151; Weidel a. Brix, *M.* 3, 608).—2. The anhydride is formed by distilling the mother-liquor from the preparation of terebic acid by oxidation of turpentine with HNO_3 (Roser, *B.* 15, 1318).—3. By heating the lactone $\underbrace{CH_3.C(CO_2H).CH(CO_2H).CH_2.CO}_{O}$ at 180° (Rach, *A.* 234, 39).—4. Together with di-chloro-di-methyl-succinic acid $CO_2H.CClMe.CClMe.CO_2H$ by the action of reduced silver upon di-α-chloro-propionic acid (Otto a. Beckurts, *B.* 18, 825).—5. By the action of reduced silver upon di-chloro-di-methyl-succinic acid (O. a. B.).—6. The anhydride is formed by treating either 'anti' or 'para' di-methyl-succinic acid in the fused state with bromine (Bischoff a. Voit, *B.* 23, 646).

Properties.—The free acid is unstable; on adding an acid to its salts the anhydride is at once ppd. The sodium salt gives a dark-red colouration with $FeCl_3$, and crystalline pps. with $Pb(NO_3)_2$ and $HgCl_2$.

Salts.—$Na_2A''\frac{1}{2}aq$: white crystalline solid. —$Na_2A''1\frac{1}{2}aq$.—CaA'': small needles, less sol. hot water than cold (Roser).—$CaA''aq$: small white plates (O. a. B.).—BaA'': white glistening plates, more sol. cold water than hot.—Ag_2A'': sparingly soluble pp., decomposed on heating into Ag_2O and the anhydride.

Methyl ether Me_2A''. Colourless oil.

Ethyl ether Et_2A''. (240°). Oil. Formed by treating the anhydride with alcohol and HCl.

Anhydride  $\begin{array}{l}CMe.CO\\ \|\\ CMe.CO\end{array}>O$. [96°]. (223°). V.D. 4·2 (calc. 4·3). Formed as above. Crystallises in glistening white leaflets or trimetric tables (from water); $a:b:c = ·626:1:1·521$ or $·201:·332:1$. V. sol. alcohol, ether, and benzene, sl. sol. cold water. The aqueous solution is acid and has a sweet but burning taste. Volatile with steam. Readily sublimes. Not attacked by HNO_3. Chromic acid mixture oxidises it to acetic acid and CO_2. Reduced by sodium-amalgam to *s*-di-methyl-succinic acid [194°] and two isomeric acids [241°] and [120°], the last acid being methyl-ethyl-malonic acid (Otto a. Rössing, *B.* 20, 2736). Conc. HIAq at 220°, and zinc filings in water or ammonia also reduce it to *s*-di-methyl-succinic acid. The anhydride is not attacked by PCl_5 or AcCl. It is dissolved by aqueous alkalis, forming the sodium salt of the acid. Potash fusion yields oxalic acid. By heating with bromine and water at 100° there is formed di-bromo-acetic acid. When it is dissolved in benzene and shaken with phenyl-hydrazine in the cold the anhydride forms the compound $CH_3.C(CO.N_2H_2Ph):CMe.CO.O.N_2H_4Ph$, which, when shaken with HClAq, regenerates the anhydride, but when heated at 115° yields CO_2, phenyl-hydrazine, and  $\begin{array}{l}CMe.CO.NH\\ \|\qquad\qquad|\\ CMe.CO.NPh\end{array}$ [129°], which crystallises from dilute alcohol in yellow monoclinic prisms, and yields di-methyl-maleïc acid when warmed with KOHAq or HClAq (Otto a. Holst, *J. pr.* [2] 42, 67).

Chloride  $\begin{array}{l}CMe.COCl\\ \|\\ CMe.COCl\end{array}$. (220°–230°). Formed by the action of PCl_5 on the anhydride (O. a. H.). Yellow oil. When acted upon by the Na salt it yields the anhydride. NH_3 converts it into the imide. Phenyl-hydrazine forms the compound  $\begin{array}{l}CMe.CO\\ \|\\ CMe.CO\end{array}>N.NHPh$ [187°] isomeric with the body melting at 129° (*v. supra*).

Imide  $\begin{array}{l}CMe.CO\\ \|\\ CMe.CO\end{array}>NH$. [118°]. Formed by heating the anhydride with alcoholic NH_3. Triclinic plates, m. sol. hot water, v. sol. alcohol. May be sublimed.—$^{\times}B'_2H_2PtCl_3$.

Anilide  $\begin{array}{l}CMe.CO\\ \|\\ CMe.CO\end{array}>NPh$. [96°]. Formed by heating the anhydride with aniline at 180°. Prisms (from alcohol).

METHYL-MALONIC ACID $C_4H_6O_4$ *i.e.* $CH_3.CH(CO_2H)_2$. *Iso-succinic acid.* Mol. w. 118. [130°]. H.C.v. 365,100. H.C.p. 364,800. H.F. 218,200 (Stohmann, Kleber, a. Langbein, *J. pr.* [2] 40, 207). S.H. (0°–50°) ·3372 (Hess, *P.* [2] 35, 410).

Formation.—1. By decomposing α-cyano-propionic acid with potash (Wichelhaus, *Z.* 1867, 247; Byk, *J. pr.* [2] 1, 19).—2. From sodium-malonic ether and MeI (Züblin, *B.* 12, 1112).

Preparation.—By acting on potassium α-bromo-propionate with pure aqueous KCy, and saponifying the product by boiling with aqueous KOH (Cohn, *A.* 251, 335).

Properties.—Long prisms or tables (by sublimation). Decomposed on distillation into CO_2 and propionic acid. $FeCl_3$ gives no pp. in neutral solutions. Fuming HNO_3 decomposes it into tri-nitro-ethane, CO_2 and acetic acid (Franchimont, *R. T. C.* 5, 281). Electrolysis of a concentrated solution of its potassium salt yields hydrogen, CO_2, and oxygen.

Salts.—$NaHA''\frac{1}{2}aq$.—$Na_2A''2aq$.—KHA''.—$K_2A''aq$. — $CaA''\frac{1}{2}aq$. — $CaA''aq$. Solubility: Miczynsky (*M.* 7, 269).—$BaA''2aq$.—$ZnA''3aq$. —$PbA''\frac{1}{2}aq$. — Ag_2A'': heavy granular pp. gradually becoming crystalline.

Methyl ether Me_2A''. (179°). S.G. ^{15} 1·107. When treated with HNO_3 (S.G. 1·5) it gives a small quantity of $CH_3.C(NO_2)(CO_2Me)_2$.

Ethyl ether Et_2A''. (196·5° cor.) (Krestownikoff, *B.* 10, 409); (199°) (Perkin, *C. J.* 45, 510). S.G. $\frac{22}{15}$ 1·021 (Conrad a. Bischoff, *A.* 204, 146); $\frac{15}{15}$ 1·0213; $\frac{25}{25}$ 1·0130 (P.).

Di-amide $CH_3.CH(CO.NH_2)_2$. [206°]. Formed, together with methyl carbonate, by treating the compound $CH_3.C(NO_2)(CO_2Me)_2$ (*v. supra*) with ammonia (Franchimont, *R. T. C.* 8, 286). V. sl. sol. alcohol.

Di-methyl-di-amide $CH_3.CH(CO.NHMe)_2$. [154°]. Formed by the action of methylamine on the ether (Franchimont, *R. T. C.* 4, 204). Small needles (from benzene), v. sol. water and alcohol, sl. sol. ether and benzene. Fuming HNO_3 decomposes it, forming CO_2 and N_2O.

Di-methyl-malonic acid $CMe_2(CO_2H)_2$. *Isopyrotartaric acid.* Mol. w. 132. [186°]. H.C. 515,300. H.F. 230,700 (Stohmann, Kleber, a. Langbein, *J. pr.* [2] 40, 208). S.H. (0°–50°) ·310 (Hess, *P.* [2] 35, 410).

Formation.—1. By heating bromo-isobutyric acid with KCy and decomposing the resulting nitrile with potash or HClAq (Markownikoff, *B.* 6, 1440; *A.* 182, 324).—2. By boiling di-methyl-barbituric acid with potash (Conrad a. Guthzeit, *B.* 14, 1644).—3. From methyl-malonic acid, NaOEt, and MeI (Thorne, *C. J.* 39, 543).—4. By oxidising β-acetyl-di-α-methyl-propionic acid with nitric acid (3 pts. of S.G. 1·4 and 1 pt. water) (Anschütz, *A.* 247, 105).

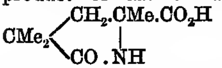
Properties.—Transparent four-sided monoclinic prisms, sl. sol. alcohol, v. sol. water and ether. Sublimes in white needles, even at 100°. Split up on melting into CO_2 and isobutyric acid. Not attacked by boiling dilute HNO_3, and scarcely at all by boiling chromic acid mixture.

Salts.—×Na_2A'': small efflorescent needles, sl. sol. water.—×BaA'': stellate groups of thin needles.—×CaA'': nodules, m. sol. cold water, deposited on warming its solution.—×MgA'': crystalline, v. sol. water.—$PbA''\frac{1}{2}$aq: insoluble pp., changing to shining scales on boiling.—ZnA''aq. S. ·68 at 24°. Monoclinic pyramids (Thorne).—ZnA''3aq. S. ·94 (Markownikoff).—Ag_2A'': small needles, insol. water.

Ethyl ether Et_2A''. (194·5°) (Thorne); (196·5° cor.) (Perkin, *C. J.* 45, 511). S.G. $\frac{25}{15}$ ·9965 (T.); $\frac{15}{15}$ 1·0015; $\frac{25}{25}$ ·9936 (P.). M.M. 9·268 at 14·4°.

Amide $(CH_3)_2C(CO.NH_2)_2$. [197°]. From the ether and alcoholic NH_3 at 120° (Thorne).

Amic acid $CO_2H.CMe_2.CO.NH_2$. [85°]. A product of the oxidation of mesitylic acid



$$CMe_2\left\langle\begin{matrix}CH_2.CMe.CO_2H\\ \quad\quad\ \ |\\ CO\,.\,NH\end{matrix}\right.$$

by $KMnO_4$ and H_2SO_4 (Pinner, *B.* 15, 580). At 135° it decomposes, giving off CO_2. Boiling KOHAq forms NH_3 and di-methyl-malonic acid. The potassium salt KA' 2aq crystallises in prisms, v. e. sol. water, m. sol. alcohol.

Di-methyl-di-amide $CMe_2(CO.NHMe)_2$. [123°]. Long needles (from benzene), v. e. sol. water and alcohol, sl. sol. ether, m. sol. benzene (Franchimont, *R. T. C.* 4, 206). Fuming HNO_3 attacks it, forming N_2O, methyl nitrate, and dimethylmalonic acid.

Tetra-methyl-di-amide $CMe_2(CO.NMe_2)_2$. [80°]. (276°). Long prisms (from ligroïn), v. e. sol. water, alcohol, and benzene. Fuming HNO_3 forms di-methyl-malonic acid and di-methyl-nitramine.

DIMETHYL-MALONYL-UREA *v.* Di-methyl-barbituric acid.

METHYL-MANDELIC ACID *v. Methyl derivative* of Mandelic acid and Oxy-tolyl-acetic acid.

Tetra-methyl-mandelic acid *v.* Oxy-duryl-acetic acid.

METHYL-MELAMINE *v. Methyl-cyanur-amide* in the article Cyanic acids.

METHYL MERCAPTAN CH_4S *i.e.* $CH_3.SH$. *Methyl sulphydrate.* (5·8°) at 752 mm. (Klason, *B.* 20, 3407); (20°) (Gregory, *A.* 15, 239); (21°) (Obermeyer, *B.* 20, 2919). H.F.p. 5,950. H.F.v. 6,370 (Thomsen, *Th.*). Occurs in human excrement (Nencki, *M.* 10, 863). Obtained by distilling $KMeSO_4$ with KHS. Prepared by diluting with ice a cold mixture of MeOH (500 c.c.) and H_2SO_4 (750 c.c.), adding (2·75 kilos. of) Na_2CO_3 10aq, and evaporating until most of the Na_2SO_4 has separated. The mother-liquor is mixed with a solution of potash (500 g.) in water (1,000 c.c.) previously saturated with H_2S. The mixture is distilled from a water-bath, and the gases evolved are passed first through a concentrated aqueous solution of KOH (50 g.) and then into a solution of KOH (350 g.) in water (700 c.c.). A small quantity of lead acetate is added to the last solution to ppt. H_2S, and the methyl mercaptan is then liberated by HCl, dried, and distilled. The yield is fair (200 g. of MeSH and 40 g. of Me_2S) (Klason, *B.* 20, 3407).

Properties.—Thin, colourless, highly refractive liquid with very repulsive odour. Yields a crystalline hydrate.

Salts.—$Hg(SMe)_2$. [175°]. Obtained by treating HgO with MeSH, or by passing the gas through an aqueous solution of $HgCy_2$. V. sl. sol. water.—$Pb(SMe)_2$: minute tables.—$Bi(SMe)_3$: minute yellow needles.—AgSMe: yellow crystalline pp.

Reference.—Per-chloro-methyl mercaptan.

DI-METHYL-MESIDINE $C_{11}H_{17}N$ *i.e.* $C_9H_{11}NMe_2$. (214°). S.G. ·908. Formed by methylation of mesidine (Hofmann, *B.* 5, 718; Klobbie, *R. T. C.* 6, 33). By treatment with H_2SO_4 and HNO_3 (S.G. 1·5) it is converted into $C_6Me_3(NO_2)_2.NMeNO_2$ [138°].—$B'_2H_2PtCl_6$.

METHYL-METHANE *v.* Ethane.

Di-methyl-methane *v.* Propane.

Tri-methyl-methane *v.* Iso-butane.

Tetra-methyl-methane *v.* Pentane.

METHYL-PENTAMETHENYL TRIHYDRIDE DICARBOXYLIC ACID $C_8H_{10}O_4$ *i.e.*

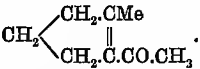
$$CO_2H.CH\left\langle\begin{matrix}C(CH_3)\\ CH_2.CH_2\end{matrix}\right\rangle C.CO_2H.$$

[188°]. Obtained by saponifying its ether which is among the products resulting from the distillation of di-methyl butylene diketone dicarboxylic (di-acetyl-adipic) ether with KOH (Perkin, jun., *C. J.* 57, 227, 233). Glistening needles or groups of plates, v. sol. hot water, alcohol, and acetone, sl. sol. cold light petroleum, benzene, CS_2, and chloroform.

Reactions.—1. Its aqueous solution decolourises *bromine* in the cold, and on evaporating to a syrup it gives off HBr.—2. HBrAq in sealed tubes at 110° forms $C_8H_{11}Br$, a light-brown oil, probably bromo-methylpentamethylene.—3. *Sodium-amalgam* has no action.

Salts.—×$(NH_4)A''$: gelatinous.—Ag_2A'': heavy white pp. which darkens in daylight.—$AgHA''$: slender needles, v. sol. hot water.

METHYL-PENTAMETHENYLYL METHYL KETONE TRIHYDRIDE $C_8H_{12}O$ *i.e.*

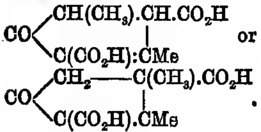


$$CH_2\left\langle\begin{matrix}CH_2.CMe\\ \quad\quad\ \ \|\\ CH_2.C.CO.CH_3\end{matrix}\right.$$

. *Methyl dihydropentene methyl ketone.* (191°). Formed by the action of boiling alcoholic potash on di-methyl butylene diketone dicarboxylic (di-acetyl-adipic) ether (Marshall a. Perkin, jun., *C. J.* 57, 232, 244). Colourless mobile oil, smelling like peppermint. Lighter than water. V. sol. alcohol and ether. Readily reacts with phenyl-hydrazine. May be reduced to the alcohol $C_8H_{16}O$, whence HI at 250° yields C_8H_{16}.

Oxim $C_8H_{12}(NOH)$. [85°]. Formed by the action of hydroxylamine hydrochloride on the ketone dissolved in methyl alcohol. Thick colourless prisms, v. sol. alcohol, ether, acids, and alkalis. May be distilled with slight decomposition. — $(C_8H_{13}NO)_2H_2PtCl_6$: tufts of orange crystals, v. sol. boiling alcohol; decomposing at 192°.

METHYL-METHRONIC ACID $C_9H_{10}O_5$ *i.e.*



$$CO\left<\begin{array}{l}CH(CH_3).CH.CO_2H\\ \qquad\qquad|\\ C(CO_2H){:}CMe\end{array}\right. \text{ or } CO\left<\begin{array}{l}CH_2\text{——}C(CH_3).CO_2H\\ \qquad\qquad|\\ C(CO_2H).CMe\end{array}\right.$$

. *Di-methyl-keto-pentene dicarboxylic acid.* [198°]. Formed by heating acetoacetic ether, sodium pyruvate, and Ac_2O at 140°, and saponifying the resulting ether with baryta or NaOH (Fittig, *A.* 250, 195). White needles, v. sol. HOAc, ether, hot alcohol, and hot water, sl. sol. cold water, CS_2, and benzene, almost insol. petroleum-ether. At 250° it is split up into CO_2 and methyl-uvic acid $C_6H_{10}O_3$ [98°], which on prolonged boiling yields

$$CO\left<\begin{array}{l}CH(CH_3).CH_2\\ \qquad\qquad|\\ CH\text{═══}CMe\end{array}\right. \text{ or } CO\left<\begin{array}{l}CH_2.\ CH.CH_3\\ \qquad\ |\\ CH\text{═}CMe\end{array}\right.$$

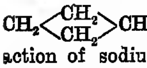
, an oil, boiling at 119°.

Salts.—$BaA''2aq$: small needles, v. e. sol. water.—$CaA''\ 3aq$: small prisms.—Ag_2A'' : silky nodules, sl. sol. water.

Mono-ethyl ether $EtHA''$. Obtained by boiling the di-ethyl ether with alcoholic potash. Yellow syrup, sl. sol. water.—$Ba(EtA'')_2aq$: yellow gummy pp., v. e. sol. water and alcohol.—$Ca(EtA'')_2\,2aq$: needles, m. sol. water, v. sol. hot alcohol.—$AgEtA''$: flocculent pp., sl. sol. water, v. sol. alcohol and ether.

Di-ethyl ether Et_2A''. (280° uncor.). Heavy oil, miscible with alcohol and ether.

METHYL-TETRAMETHYLENE C_5H_{10} *i.e.*



$$CH_2\left<\begin{array}{l}CH_2\\ CH_2\end{array}\right>CHMe.$$

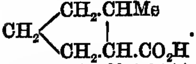
(c. 40°). Formed by the action of sodium on αδ-di-bromo-pentane dissolved in toluene (Colman a. Perkin, *C. J.* 53, 201). Very volatile oil. Does not combine with conc. HIAq.

METHYL-PENTAMETHYLENE C_6H_{12} *i.e.*

$$\left<\begin{array}{l}CH_2.CH_2\\ CH_2.CH_2\end{array}\right>CHMe?$$

Formed by the action of finely-divided sodium on αε-di-bromo-hexane dissolved in toluene (Perkin, *C. J.* 53, 214). Oil, not attacked by HI.

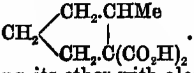
METHYL - PENTAMETHYLENE CARBOXYLIC ACID $C_7H_{12}O_2$ *i.e.*



$$CH_2\left<\begin{array}{l}CH_2.CHMe\\ \quad\ |\\ CH_2.CH.CO_2H\end{array}\right.$$

. (220°). S.G. $\frac{15}{15}$ 1·0205; $\frac{20}{20}$ 1·0174; $\frac{25}{25}$ 1·0144. M.M. 6·914. Formed by heating methyl-pentamethylene dicarboxylic acid a little above its melting-point (Colman a. Perkin, jun., *C. J.* 53, 194). Colourless oil. Bromine at 110° attacks it with evolution of HBr.—BaA'_2: syrup.—AgA'' : white amorphous pp.

Methyl-pentamethylene dicarboxylic acid $C_8H_{12}O_4$ *i.e.*



$$CH_2\left<\begin{array}{l}CH_2.CHMe\\ \quad\ |\\ CH_2.C(CO_2H)_2\end{array}\right.$$

. [175°]. Obtained by boiling its ether with alcoholic potash (C. a. P.). Prisms (from ether), or plates (from water), v. sol. alcohol, ether, and hot water, m. sol. cold water.—Ag_2A' : white pp.

Ethyl ether Et_2A''. (244°). Obtained from $CH_3.CHBr.CH_2.CH_2.CH_2Br$, malonic ether and NaOEt. Thick oil.

METHYL - HEXAMETHYLENE CARBOXYLIC ACID $C_8H_{14}O_2$ *i.e.*

$$CH_2\left<\begin{array}{l}CH_2.CHMe\\ CH_2.CH_2\end{array}\right>CH.CO_2H.$$

o-Toluic acid hexahydride? (236°). S.G. $\frac{4}{4}$ 1·0079; $\frac{10}{10}$ 1·0033; $\frac{20}{20}$ ·9966. M.M. 7·975. Formed by decomposing the dicarboxylic acid by heat (Perkin, jun., *C. J.* 53, 208, 213). It is also one of the products of the electrolysis of methyl-hexamethylenyl methyl ketone carboxylic ether by alcoholic potash. Colourless oil.—AgA': white pp.

Methyl - hexamethylene dicarboxylic acid $C_9H_{14}O_4$ *i.e.*

$$CH_2\left<\begin{array}{l}CH_2.CHMe\\ CH_2.CH_2\end{array}\right>C(CO_2H)_2.$$

[147°]. Obtained by hydrolysing its ether with alcoholic potash (Perkin, *C. J.* 53, 207). Crystalline powder, v. sol. ether, alcohol, and hot water, sl. sol. cold water.—Ag_2A'' : white amorphous pp.

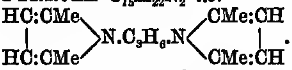
Ethyl ether Et_2A''. (c. 263°). Obtained from $CH_3.CHBr.CH_2.CH_2.CH_2.CH_2Br$, malonic ether, and NaOEt (Perkin, jun., *C. J.* 53, 206). Thick oil, with unpleasant odour.

METHYL-TETRAMETHYLENE-KETONE *v.* TETRAMETHYLENYL METHYL KETONE.

METHYL - TRI - METHYLENE KETONE CARBOXYLIC ACID *v.* TRI-METHYLENYL METHYL KETONE CARBOXYLIC ACID.

METHYL-PENTAMETHYLENE METHYL KETONE *v.* METHYL-PENTAMETHYLENYL METHYL KETONE.

TETRA-METHYL-ν-TRIMETHYLENE-DI-PYRROLE $C_{15}H_{22}N_2$ *i.e.*



$$\begin{array}{l}HC{:}CMe\\ |\\ HC{:}CMe\end{array}\!\!>N.C_3H_6.N\!\!<\begin{array}{l}CMe{:}CH\\ \qquad\ |\\ CMe{:}CH\end{array}$$

. [77°]. Formed by heating acetonyl-acetone (2 mols.) and tri-methylene-diamine (1 mol.) in conc. alcoholic solution at 120°. Crystalline solid. Sol. alcohol and ether, insol. water (Paal a. Schneider, *B.* 19, 3157).

DI-METHYL-TRI-METHYLENE-TRI-SULPHONE $C_3H_4(CH_3)_2S_3O_6$. [330°–340°]. Two bodies of this formula are produced when 1 g. tri-methylene-tri-sulphone in 10 c.c. of 5 p.c. caustic soda is heated with an equal volume of methyl iodide. These two substances crystallise together in glittering needles. By further methylation the hexamethyl derivative is formed (E. Baumann a. R. Camps, *B.* 23, 72).

Tetra-methyl-di-methylene disulphone

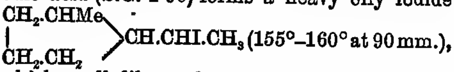
$$CMe_2\left<\begin{array}{l}SO_2\\ SO_2\end{array}\right>CMe_2.$$

Di-isopropylidene di-sulphone. [220°-225°]. Obtained from acetone (1 pt.) by heating it with P_2S_3 (1 pt.) at 125° for 7 hours, distilling with steam, and oxidising the resulting 'duplo'-thio-acetone $S_2(CMe_2)_2$ with $KMnO_4$ (Autenrieth, *B.* 20, 373). Slender white needles, v. sol. alcohol and ether, sl. sol. hot water. Not attacked by HNO_3 and H_2SO_4, nor by boiling dilute aqueous KOH.

METHYL-PENTAMETHYLENYL-METHYL-CARBINOL $C_8H_{16}O$ *i.e.*

$$\left.\begin{array}{l}CH_2.CHMe\\ |\\ CH_2.CH_2\end{array}\right>CH.CH(OH).CH_3.$$

(180°). Obtained by reducing the corresponding ketone in ethereal solution with sodium (Marshall a. Perkin, jun., *C. J.* 57, 247). Colourless liquid, with strong odour of menthol, sl. sol. water, v. sol. alcohol and ether. On boiling with Ac_2O it yields a strongly refracting acetyl derivative with agreeable odour. Excess of solution of hydriodic acid (S.G. 1·96) forms a heavy oily iodide



$CH_2.CHMe \atop CH_2.CH_2$ $>CH.CHI.CH_3$ (155°–160° at 90 mm.),

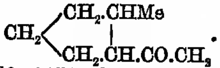
which smells like *sec*-hexyl iodide, and is slightly decomposed on distillation.

METHYL-HEXAMETHYLENYL-METHYL-CARBINOL $C_8H_{18}O$ *i.e.*

$CH_2<{CH_2.CHMe \atop CH_3.CH_2}>CH.CH(OH).CH_3$.

Hexahydride of o-tolyl-methyl-carbinol. (195°–200°). Formed by reducing tetrahydro-tolyl methyl ketone in ethereal solution with sodium (Kipping a. Perkin, jun., *C. J.* 57, 22). Thick, colourless liquid, smelling like menthol, sl. sol. water, miscible in alcohol and ether. When mixed with conc. HIAq it dissolves with evolution of heat and separation of the corresponding iodide.

METHYL-PENTAMETHYLENYL METHYL KETONE $C_8H_{14}O$ *i.e.*



$CH_2<{CH_2.CHMe \atop CH_2.CH.CO.CH_3}$ (CHMe and CH joined).

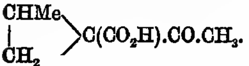
(171°). S.G. $\frac{4}{4}$ ·9222; $\frac{10}{10}$ ·9174; $\frac{15}{15}$ ·9136; $\frac{25}{25}$ ·9070. M.M. 8·019. Obtained as one of the products of the hydrolysis of its carboxylic ether by alcoholic potash (Colman a. Perkin, *C. J.* 53, 198). Colourless oil, smelling of peppermint. Readily combines with phenyl-hydrazine and with hydroxylamine. Dissolves with difficulty in a solution of $NaHSO_3$.

Methyl-hexamethylenyl methyl ketone

$CH_2<{CH_2.CHMe \atop CH_2.CH_2}>CH.CO.CH_3$.

o-Tolyl methyl ketone hexahydride. (198°). Obtained as one of the products of the hydrolysis of its carboxylic ether by alcoholic potash (Perkin, *C. J.* 53, 213). Colourless oil, smelling, when in small quantities, like new-mown hay.

METHYL-TRIMETHYLENYL METHYL KETONE CARBOXYLIC ACID $C_7H_{10}O_3$ *i.e.*

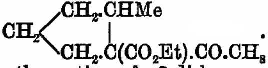


${CHMe \atop CH_2}>C(CO_2H).CO.CH_3$.

Propylene-aceto-acetic acid. Obtained by saponifying its ether, which is produced by treating acetoacetic ether with NaOEt and propylene bromide (Perkin, jun., *B.* 17, 1443). Thick oil, splitting off CO_2 when heated.—AgA': amorphous powder, sl. sol. water.

Ethyl ether EtA'. (210°–215°) at 720 mm.

Methyl-pentamethylenyl methyl ketone carboxylic ether



$CH_2<{CH_2.CHMe \atop CH_2.C(CO_2Et).CO.CH_3}$.

(238°). Obtained by the action of αδ-di-bromopentane on sodium-aceto-acetic ether (Colman a. Perkin, jun., *C. J.* 53, 197). Thick, colourless oil. On hydrolysis with alcoholic potash it yields the corresponding ketone as well as the acid.

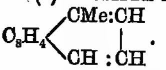
Methyl-hexamethylenyl methyl ketone carboxylic ether

$CH_2<{CH_2.CHMe \atop CH_2.CH_2}>C(CO_2Et).CO.CH_3$.

Hexahydro-o-tolyl methyl ketone carboxylic ether. (257°). Formed by the action of di-bromo-hexane $CH_3.CHBr.CH_2.CH_2.CH_2.CH_2Br$ and NaOEt on aceto-acetic ether (Perkin, *C. J.* 53, 212). Colourless oil with disagreeable odour. Yields on hydrolysis methyl-hexamethylenyl methyl ketone as well as its carboxylic acid.

METHYL-MORPHINE *v.* CODEÏNE.

(α)-METHYL-NAPHTHALENE $C_{11}H_{10}$ *i.e.*



$C_6H_4<{CMe:CH \atop CH:CH}$.

Mol. w. 142. (242° i.V. (S.); (232°) (F. a. R.). S.G. $\frac{11\cdot5}{}$ 1·029. Occurs, together with (β)-methyl-naphthalene, in the fraction of coal-tar oil boiling between 200° and 300° (Schulze, *B.* 17, 844).

Formation.—1. By the action of sodium on a mixture of MeI and (α)-bromo-naphthalene (Fittig a. Remsen, *A.* 155, 114).—2. By distilling colophony, gum-benzoïn, or aldehyde-resin with zinc-dust (Ciamician, *B.* 11, 269; *M.* 1, 193).—3. By distilling (α)-naphthyl-acetic acid with lime (Boessneck, *B.* 16, 1546).

Properties.—Colourless liquid, not solid at −18°. Boiling conc. HNO_3 oxidises it to (α)-naphthoic acid.

Picric acid compound $C_{11}H_{10}C_6H_2(NO_2)_3OH$. [117°]. Long, slender orange needles (from alcohol).

(β)-Methyl-naphthalene $C_{10}H_7(CH_3)$ *i.e.*

$C_6H_4<{CH:CMe \atop CH:CH}$.

[33°]. (242° i.V.). Occurs in the fraction of coal-tar oils boiling at 200°–300°. The oil is shaken with NaOH and with H_2SO_4, to remove phenols and bases, and fractionally distilled. By cooling the fraction 239°–242° to 0° the (β)-methyl-naphthalene separates out, leaving the liquid (α)-methyl-naphthalene (Schulze, *B.* 17, 842, 1203; Reingruber, *A.* 206, 367). Could not be obtained from (β)-bromo-naphthalene MeI and Na (Brunel, *B.* 17, 1179). White plates; insol. water; sol. alcohol, ether, and benzene; volatile with steam. Completely decomposed on oxidation. Yields, on chlorination at 245°, $C_{10}H_7.CH_2Cl$ [47°].

Picric acid compound: [115°]; yellow needles.

Di-methyl-naphthalene $C_{12}H_{12}$ *i.e.* $C_{10}H_6Me_2$. (110° at 6 mm.); (c. 265°) at 760 mm. S.G. $\frac{0}{0}$ 1·0283; $\frac{12}{0}$ 1·0199 (C. a. C.); $\frac{20}{}$ 1·0176 (G.); $\frac{16\cdot4}{}$ 1·0180 (Nasini, *G.* 15, 84). R_∞ 87·25 (N.).

Formation.—1. From di-bromo-naphthalene [81°], sodium, and MeI (Mono, *B.* 13, 1517).—2. By heating santonin, or the dimethyl-naphthol derived therefrom, to redness with zinc-dust (Cannizzaro a. Carnelutti, *G.* 12, 410).—3. By heating dimethyl-naphthol hydride with sulphide of phosphorus (Cannizzaro, *G.* 13, 393).

Preparation.—Di-bromo-naphthalene dissolved in toluene is heated with MeI and sodium, the product is heated to 150° to remove MeI and toluene, and the residue extracted with ether. The extract is fractionally distilled, and the fraction 260°–270°, after rectification under 12 mm. pressure, is heated with sodium at 100° to remove any unaltered di-bromo-naphthalene. The di-methyl-naphthalene is finally obtained pure by means of its compound with picric acid (Giovanozzi, *G.* 12, 147).

Properties.—Colourless, highly refractive oil, not solid at −18°. With bromine it appears to form $C_{12}H_{12}Br_6$ and $C_{12}H_9Br_3$.

Picric acid compound: [139°]. Orange needles; sol. alcohol and ether.

Hexahydride $C_{12}H_{18}$. S.G. $\frac{19.4}{}$ ·922. R_∞ 86·14 (Nasini a. Bornheimer, *G.* 15, 93). Formed by treating the di-methyl-naphthalene with HIAq and phosphorus (Zuco, *G.* 15, 81).

Di-methyl-naphthalene $C_{12}H_{12}$ (265°). Occurs in coal-tar (Emmert a. Reingruber, *A.* 211, 365). Not solid above −18°.

Picric acid compound $C_{12}H_{12}C_6H_2(NO_2)_3OH$. [118°]. Orange prisms.

Trimethyl-naphthalene $C_{13}H_{14}$ *i.e.* $C_{10}H_5Me_3$ (275°). Obtained (according to Maschke, *C. C.* 1886, 824) by heating di-methyl-(β)-naphthylamine methylo-iodide at 320°, and distilling the resinous product with steam.

Picric acid compound: [133°].

References.—Bromo- and Chloro-methyl-naphthalenes.

(α)-METHYL-NAPHTHALENE SULPHONIC ACID $C_{10}H_6Me.SO_3H$. Obtained by sulphonating (α)-methyl-naphthalene (Fittig a. Remsen, *A.* 155, 115).—BaA'_2: sl. sol. water.

(β)-Methyl-naphthalene sulphonic acid $C_{10}H_6Me.SO_3H$. Obtained by sulphonating (β)-methyl-naphthalene (Reingruber, *A.* 206, 377). Syrup.—BaA'_2: amorphous mass.

Di-methyl-naphthalene sulphonic acid $C_{10}H_5Me_2.SO_3H$. Obtained by the action of H_2SO_4 at 120° on the di-methyl-naphthalene derived from di-bromo-naphthalene [81°] (Giovanozzi, *G.* 12, 147). Deliquescent scales.—KA'aq: iridescent laminæ.

Di-methyl-naphthalene sulphonic acid $C_{10}H_5Me_2.SO_3H$. Obtained by heating the di-methyl-naphthalene of coal-tar with fuming H_2SO_4 (Emmert a. Reingruber, *A.* 211, 365).—$^xBaA'_2$: sl. sol. water.

Di-methyl-naphthalene di-sulphonic acid $C_{10}H_4Me_2(SO_3H)_2$. Formed at the same time as the preceding, from which it differs in having an easily soluble barium salt (E. a. R.).

METHYL-NAPHTHAQUINOLINE *v.* Methyl-naphthoquinoline.

(*In.* 2)-METHYL (α)-NAPHTHINDOLE $C_{13}H_{11}N$ *i.e.* $C_{10}H_6\langle\begin{smallmatrix}CH\\NH\end{smallmatrix}\rangle CMe$. [132°]. Obtained by heating (1 pt. of) the (α)-naphthyl-hydrazide of acetone with $ZnCl_2$ (2 pts.) at 180° (Schlieper, *A.* 239, 237). Slender needles (from water); v. sol. alcohol and ether. Colours pine-wood, acidified by HCl, bluish-violet. $FeCl_3$ imparts a cherry-red colour to its solution in HOAc, and on adding water a pp. is formed.

Picrate: [168°]; dark-red needles (from hot benzene).

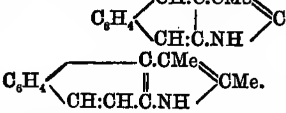
(*In.* 2)-Methyl-(β)-naphthindole $C_{10}H_6\langle\begin{smallmatrix}CH\\NH\end{smallmatrix}\rangle CMe$. (314°–320° at 223 mm.). Prepared by heating the (β)-naphthyl-hydrazide of acetone with $ZnCl_2$ at 175°, dissolving the fused mass in water, and extracting with ether (Schlieper, *A.* 236, 182). Liquid; v. sl. sol. water, v. sol. alcohol, ether, and benzene. Colours acidified pine-wood violet. $NaNO_2$ added to the acetic acid solution gives a brown pp.

Picrate: [176°]; reddish-brown needles (from hot benzene).

Dihydride $C_{13}H_{13}N$ *i.e.* $C_{10}H_6\langle\begin{smallmatrix}CH_2\\NH\end{smallmatrix}\rangle CHMe$. (190°–200° at 20 mm.). Obtained by treating methyl-(β)-naphthindole with zinc-dust and HClAq, until it ceases to give the pine-wood reaction, then adding NaOH and extracting with ether. Yellow oil, which in an ethereal solution exhibits blue fluorescence. Forms soluble crystalline salts with mineral acids. Reduces $AgNO_3$ on warming. Gives an oily nitrosamine.

(*In.* 1, 2)-Di-methyl-(α)-naphthindole $C_{14}H_{13}N$ *i.e.* $C_{10}H_6\langle\begin{smallmatrix}NH\\CMe\end{smallmatrix}\rangle CMe$. [150°]. Formed by heating bromo-acetyl-propionic (bromo-levulic) acid $CH_3.CO.CHBr.CH_2.CO_2H$ (2 pts.) with (α)-naphthylamine (7 pts.) (Wolff, *B.* 21, 3365). White granules or prisms (from alcohol), v. sol. ether and benzene, m. sol. cold alcohol and HOAc, insol. water. Its solution in conc. HClAq is ppd. by water. $FeCl_3$ colours its solution in HOAc cherry-red, whilst $K_2Cr_2O_7$ give a deep-blue colour.

(*In.* 1, 2)-Di-methyl-(β)-naphthindole



[132°]. (above 360°). Prepared by the action of bromo-acetyl-propionic acid on (β)-naphthylamine (Wolff, *B.* 21, 3363). Plates (from alcohol), v. e. sol. ether and benzene, m. sol. cold alcohol and HOAc, insol. water. $FeCl_3$ colours its solution in boiling HOAc green. The concentrated alcoholic solution exhibits violet fluorescence.

Picrate: [175°]; dark-brown needles.

(*In* 1, 2)-Di-methyl-(β)-naphthindole $C_{10}H_6\langle\begin{smallmatrix}CMe\\NH\end{smallmatrix}\rangle CMe$. [126°]. Possibly identical with the preceding body. Formed by heating (*In* 1, 2)-methyl-(β)-naphthindyl-acetic acid at 210° (E. Fischer a. Steche, *A.* 242, 370). Six-sided plates, insol. water, v. sol. alcohol and HOAc. $FeCl_3$ gives a blue colouration to its solution in HOAc. Yields a crystalline nitrosamine. Reacts with MeI forming di-methyl-(β)-naphtho-quinoline dihydride.

Picrate: dark-red crystals.

Dihydride $C_{14}H_{15}N$ *i.e.* $C_{10}H_6\langle\begin{smallmatrix}CHMe\\NH—\end{smallmatrix}\rangle CHMe$. Obtained by reducing the di-methyl-(β)-napthindole with zinc-dust and HCl. Oil, turning red on oxidation. Forms a crystalline platinochloride, decomposed by boiling water.

(*In* 1, 2)-METHYL-(β)-NAPHTHINDYL-ACETIC ACID $C_{15}H_{13}NO_2$ *i.e.* $C_{10}H_6\langle\begin{smallmatrix}CMe\\NH\end{smallmatrix}\rangle C.CH_2.CO_2H$. [210°]. *Di-methyl-naphthindole ω-carboxylic acid.* Formed by heating the (β)-naphthyl-hydrazide of β-acetyl-propionic ether with $ZnCl_2$ at 135° (Steche, *A.* 242, 368). Small crystals containing $\frac{1}{2}C_3H_6O$ (from acetone), v. sl. sol. water, benzene, and chloroform, v. sol. alcohol, ether, acetone, and HOAc. Loses CO_2 on heating.—AgA': white pp. which yields a silver mirror on boiling with water.

METHYL-NAPHTHOCOUMARIN *v. Anhydride* of Oxy-naphthyl-crotonic acid.

METHYL-(α)-NAPHTHOFURFURANE

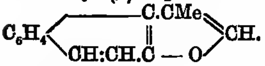
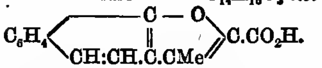
$C_{12}H_{10}O$ *i.e.* $C_6H_4\left<\begin{matrix}\text{———C—O}\\ \| \\ \text{CH:CH.C.CMe}\end{matrix}\right>CH.$ [35°]. (298°). Obtained by distilling its carboxylic acid alone or with KOH (Hantzsch a. Pfeiffer, *B.* 19, 1304). Very volatile with steam. Reduces $AgNO_3$ on boiling. Its solution in H_2SO_4 becomes green, and finally violet, on warming; on dilution with water it becomes green again.

Methyl-(β)-naphthofurfurane



$C_6H_4\left<\begin{matrix}\text{———C.CMe}\\ \| \\ \text{CH:CH.C — O}\end{matrix}\right>CH.$ [59°]. Obtained by distilling its carboxylic acid alone or with soda-lime (H. a. P.). Resembles the preceding isomeride.

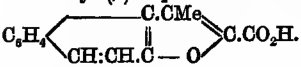
METHYL - (α) - NAPHTHOFURFURANE CARBOXYLIC ACID $C_{14}H_{10}O_3$ *i.e.*



$C_6H_4\left<\begin{matrix}\text{———C — O}\\ \| \\ \text{CH:CH.C.CMe}\end{matrix}\right>C.CO_2H.$ [245°]. By the action of chloro-aceto-acetic ether on sodium (α)-naphthol there is formed $C_{10}H_7O.CHAc.CO_2Et$, and this ether is then mixed with H_2SO_4, and the product poured into water. The ppd. ether is then saponified by alcoholic potash (Hantzsch a. Pfeiffer, *B.* 19, 1301). Needles (from HOAc), which may be sublimed; v. sl. sol. alcohol and ether, almost insol. water.

Ethyl ether EtA′. [108°]. Flat needles (from alcohol), v. sol. ether and hot alcohol.

Methyl-(β)-naphthofurfurane carboxylic acid



$C_6H_4\left<\begin{matrix}\text{———C.CMe}\\ \| \\ \text{CH:CH.C — O}\end{matrix}\right>C.CO_2H.$ [254°]. Formed in the same manner as the preceding isomeride, which it greatly resembles, by using sodium (β)-naphthol (H. a. P.).—NaA′ 4aq: blue fluorescent needles.

(β)-METHYL-(α)-NAPHTHOL

$C_{11}H_{10}O$ *i.e.* $C_{10}H_6Me.OH$. [89°]. Formed as a by-product, together with phenyl-butylene, by distilling (α)-phenyl-methyl-paraconic acid

$\underbrace{C_6H_5.CH.CH(CO_2H).CHMe.CO}_{O}$ (Fittig a. L. Liebmann, *A.* 255, 263). Long slender elastic needles, v. sl. sol. water. $FeCl_3$ gives a white pp. Bleaching powder produces a green pp. which becomes yellow. On distillation with zinc-dust (β)-methyl-naphthalene is formed.

(β)-Methyl-(α)-naphthol $C_{10}H_6Me.OH$. [92°]. Formed by distilling (β)-phenyl-methyl-paraconic acid (Fittig a. Liebmann, *A.* 255, 272). Long elastic white needles (from boiling water), volatile with steam. $FeCl_3$ gives a white pp. which becomes yellow on standing. Bleaching powder forms a green pp., quickly becoming yellow. On distillation with zinc-dust it yields (β)-methyl-naphthalene.

Di-methyl-naphthol $C_{10}H_5Me_2.OH$. [136°]. Obtained by heating santonous or isosantonous acid with $Ba(OH)_2$ above 360°. The product is dissolved in water, and on passing CO_2 through the solution di-methyl-naphthol is ppd. together with $BaCO_3$, which is removed by HClAq (Cannizzaro a. Carnelutti, *G.* 12, 406). Glistening needles (from alcohol), v. sl. sol. water, sol. alcohol and ether. Begins to sublime at 100°. Chromic acid in HOAc oxidises it to $C_{12}H_{12}O_2$, crystallising in tables [105°], which may be reduced to di-methyl-naphthol by HI and phosphorus. On heating to redness with zinc-dust it yields di-methyl-naphthalene identical with that obtained from di-bromo-naphthalene [81°].

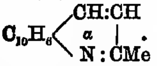
Methyl ether $C_{12}H_{11}.OMe$. [68°]. Prisms, sol. alcohol and ether.

Ethyl ether $C_{12}H_{11}.OEt$. Viscid liquid.

Acetyl derivative $C_{12}H_{11}.OAc$. [78°]. Laminæ.

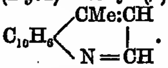
Dihydride $C_{12}H_{14}O$. [113°]. Obtained by saponification of its propionyl derivative, which is one of the products of the dry distillation of santonous acid. Separated from accompanying di-methyl-naphthol by frequent crystallisation from light petroleum (Cannizzaro, *G.* 13, 390). Glistening white needles, v. sol. ether and alcohol, insol. water. Volatile with steam. P_2S_5 converts it into di-methyl-naphthalene.

(*Py.* 3)-METHYL-(α)-NAPHTHOQUINOLINE



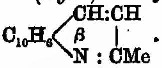
$C_{10}H_6\left<\begin{matrix}CH:CH\\ \alpha\quad | \\ N:CMe\end{matrix}\right.$. *α-Naphthoquinaldine.* (above 300°). Heavy liquid. Formed by heating (α)-naphthylamine with paraldehyde and HCl. Its salts have a blue fluorescence in dilute solution.—$B'_2H_2Cl_2PtCl_4$ 2aq: concentric needles.—$B'_2H_2Cr_2O_7$: yellow crystals (Doebner a. Miller, *B.* 17, 1711).

(*Py.* 1)-Methyl-(β)-naphthoquinoline $C_{14}H_{11}N$ *i.e.*



$C_{10}H_6\left<\begin{matrix}CMe:CH\\ | \\ N=CH\end{matrix}\right.$. [c. 112°]. Formed, together with (β)-naphtho-acridine and a base $C_{24}H_{20}N_2$, by the action of a mixture of methylal, acetone, and HCl upon (β)-naphthylamine (Reed, *J. pr.* [2] 35, 316).—*Picrate* $B'C_6H_2(NO_2)_3OH$.

(*Py.* 3)-Methyl-(β)-naphthoquinoline

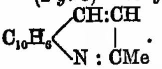


$C_{10}H_6\left<\begin{matrix}CH:CH\\ \beta\quad | \\ N:CMe\end{matrix}\right.$. (β)-*Naphthoquinaldine.* [82°]. (above 300°). Formed by heating (β)-naphthylamine with paraldehyde and HCl (Doebner a. Miller, *B.* 17, 1711; Seitz, *B.* 22, 254). Large colourless needles. V. sol. alcohol and ether, sl. sol. water. With chloral it forms a crystalline compound $C_{13}H_8N.CH_2.CH(OH).CCl_3$ [185°].

Salts.—$B'_2H_2Cl_2PtCl_4$ 2aq: yellow, sparingly soluble needles.—$B'_2H_2Cr_2O_7$: small yellow needles, sl. sol. hot water.—B′HCl 2aq: slender needles, sl. sol. cold water.—$B'HNO_3$ aq: slender needles, becoming rose-coloured in air.—$B'H_2SO_4$ 2aq: very slender needles, v. e. sol. hot water.—$B'C_6H_2(NO_2)_3OH$. [221°]. Minute needles, v. sl. sol. boiling water, v. sol. HOAc.

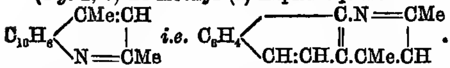
Methylo-iodide B′MeI. [241°–247°]. Straw-coloured needles, v. sol. boiling water, sl. sol. alcohol.

(*Py.* 3)-Methyl-(β)-naphthoquinoline



$C_{10}H_6\left<\begin{matrix}CH:CH\\ | \\ N:CMe\end{matrix}\right.$. [92°]. Possibly identical with the preceding isomeride. Formed by heating (*Py.* 1, 3)-oxy-methyl-naphthoquinoline to redness with zinc-dust (Knorr, *B.* 17, 544). Crystalline. May be distilled. Its acid solutions fluoresce blue when dilute, green when concentrated.—$B'_2H_2PtCl_6$: sl. sol. hot dilute HClAq.

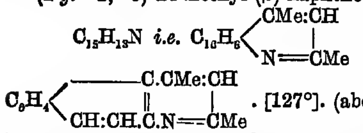
(*Py.* 1, 3)-Di-methyl-(α)-naphthoquinoline



$C_{10}H_6{<}\begin{matrix}CMe{:}CH\\ |\\ N{=}CMe\end{matrix}$ *i.e.* $C_6H_4{<}\begin{matrix}\text{———}C.N{=}CMe\\ \Vert \qquad |\\ CH{:}CH.C.CMe.CH\end{matrix}$.

[44°]. (361°). Formed by heating at 100° a mixture of (α)-naphthylamine with ethylidene-acetone, derived from acetone and paraldehyde (Reed, *J. pr.* [2] 35, 312). Formed also by heating (α)-naphthylamine (1 mol.) with acetyl-acetone (1 mol.), and heating the product with H_2SO_4 at 100° (Combes, *C. R.* 106, 1536). Needles (from petroleum-ether); v. e. sol. ether, insol. 90 p.c. alcohol. Somewhat volatile with steam. Its solution in H_2SO_4 is coloured purple by $K_2Cr_2O_7$. The solutions of its salts fluoresce violet (C.). The hydrated platinochloride is violet; after drying *in vacuo* it melts at 260° (C.).—$B'C_6H_2(NO_2)_3OH$. [223°]. Needles.

(*Py.* 1, 3)-Di-methyl-(β)-naphthoquinoline



$C_{15}H_{13}N$ *i.e.* $C_{10}H_6{<}\begin{matrix}CMe{:}CH\\ |\\ N{=}CMe\end{matrix}$ *viz.* $C_6H_4{<}\begin{matrix}\text{———}C.CMe{:}CH\\ \Vert \qquad |\\ CH{:}CH.C.N{=}CMe\end{matrix}$. [127°]. (above 300°).

Formed from (β)-naphthylamine hydrochloride by heating at 100° with ethylidene-acetone, the product of the condensation of paraldehyde with acetone in presence of hydrochloric acid, as follows: $C_{10}H_7NH_2 + Me.CO.CH{:}CHMe = C_{15}H_{13}N + H_2O + H_2$ (Reed, *J. pr.* [2] 35, 299). Flat needles (from ether); v. sl. sol. boiling water; hardly volatile with steam. $KMnO_4$ oxidises it to (β)-di-methyl-phenyl-pyridine dicarboxylic acid. It does not yield a nitrosamine.

Salts.—Picrate $B'C_6H_2(NO_2)_3OH$. [215°]. — $B'H_2Cr_2O_7$. [c. 115°]. — $B'_2H_2PtCl_6$ 2½aq. — $B'H_2SO_4$.—$B'HNO_3$. [181°].—B'_2HBr_5. [207°].—B'HBr 2aq.

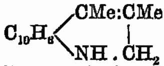
Methylo-iodide B'MeI: needles.

Sulphonic acid $C_{15}H_{12}(SO_3H)N$ 1½aq: minute needles, insol. water and alcohol.

Disulphonic acid $C_{15}H_{11}(SO_3H)_2N$ 4½aq: needles, v. e. sol. water and alcohol.—$CuH_2A''_2$ 5aq.—BaA'' 7aq. Potash fusion produces $C_{15}H_{11}(OH)(SO_3H)N$.

Di-methyl-(β)-naphthoquinoline $C_{15}H_{13}N$. [67°]. (380°). Obtained by heating (β)-naphthylamine with acetyl-acetone and H_2SO_4 at 100° (Combes, *C. R.* 106, 1537). Its yellow sulphonic acid $C_{15}H_{13}NSO_3$ is also ppd. on adding ammonia to the aqueous extract of the product. The base forms a greenish-yellow platinochloride, decomposing at 220° without melting.

DI-METHYL-(β)-NAPHTHOQUINOLINE DI-HYDRIDE $C_{15}H_{15}N$ *i.e.*



$C_{10}H_6{<}\begin{matrix}CMe{:}CMe\\ |\\ NH\,.\,CH_2\end{matrix}$. [115°].

Formed by heating (*In.* 1, 2)-di-methyl-(β)-naphthindole with MeI in sealed tubes for 15 hours at 100° (Fischer a. Steche, *B.* 20, 820; *A.* 242, 364). Plates; v. sl. sol. water, v. sol. ether, alcohol, and mineral acids; volatile with steam. With nitrous acid it yields a crystalline nitrosamine.—B'HI. Needles (from water); sl. sol. water and alcohol.—The platinochloride is sl. sol. water and alcohol.

METHYL-NAPHTHYLAMINE *v.* NAPHTHYL-METHYL-AMINE.

Methyl-di-naphthyl-amine *v.* DI-NAPHTHYL-METHYL-AMINE.

DI-METHYL-NAPHTHYLENE-DIAMINE *v.* NAPHTHYLENE-DI-METHYL-DI-AMINE.

METHYL-NARCEÏNE *v.* NARCEÏNE.

METHYL-NARINGENIC ACID *v.* *Methyl derivative* of *p*-COUMARIC ACID.

METHYL-NICOTINE *v.* NICOTINE.

METHYL-NICOTINIC ACID *v.* METHYL-PYRIDINE CARBOXYLIC ACID.

METHYL-NITRAMINE *v.* METHYLAMINE.

METHYL NITRATE $CH_3.NO_3$ *i.e.* $CH_3.O.NO_2$. Mol. w. 77. (65°). S.G. $\frac{15}{15}$ 1·2167; $\frac{25}{25}$ 1·2032. M.M. 2·057 (Perkin, *C. J.* 55, 682). S.V. 69·3 (Lossen, *A.* 254, 73). Obtained, together with methyl nitrite, by distilling wood-spirit with $NaNO_3$ and H_2SO_4 (Dumas a. Péligot, *A. Ch.* [2] 58, 37). Prepared by distilling methyl alcohol (200 c.c.) with urea nitrate (40 g.) and HNO_3 (150 c.c. of S.G. 1·31) free from nitrous acid. When two-thirds have passed over, an additional quantity of MeOH (170 c.c.) and HNO_3 (110 c.c.) may be added and the distillation continued (Carey Lea, *Am. S.* [2] 33, 227). The process may also be conducted in a continuous manner (*v.* ETHYL NITRATE).

Properties.—Colourless liquid, exploding when struck or when its vapour is heated. With solid KOH it yields Me_2O (Berthelot, *A.* 113, 80). When diluted with MeOH (⅛ vol.) and treated with a current of gaseous NH_3 it gives methylamine nitrate and $NMe_4.NO_3$ with only traces of di- and tri-methylamine. Aqueous ammonia forms $NMeH_2$ (13 pts.), NMe_4NO_3 (10 pts.), and a small quantity (1 pt.) of the bases NMe_2H and NMe_3 (Duvillier a. Malbot, *A. Ch.* [6] 10, 284).

METHYL NITRITE CH_3NO_2 *i.e.* $CH_3.O.NO$. Mol. w. 61. (−12°). S.G. (liquid) $\frac{15}{}$ ·991. Produced by treating methyl alcohol with nitric acid and copper turnings or arsenious acid (Strecker, *C. R.* 39, 53; *A.* 91, 82). The product is passed through a receiver at 0° and the gas after purification by passing through potash, a solution of ferrous sulphate, and dry $CaCl_2$, is condensed at −40°. It may also be prepared from methyl alcohol, $NaNO_2$ and H_2SO_4.

Properties.—Gas, smelling like nitrous ether. Burns with a green-edged flame.

METHYL-NITRO-AMIDE *v.* METHYLAMINE.

METHYL-NITRO-ANILINE *v.* NITRO-METHYL-ANILINE.

METHYL-NITRO-BENZAMIDE *v.* *Amide* of NITRO-TOLUIC ACID.

METHYL-NITROLIC ACID $CH_2N_2O_3$ *i.e.* $CH(NO_2){:}NOH$ or $CH_2(NO_2)(NO)$. Mol. w. 90. [64°]. Prepared by dissolving nitro-methane (15 g.) in water, adding a solution of KNO_2 (8 g.), cooling to 0°, and adding a very dilute ice-cold solution of H_2SO_4 (4 g.). Caustic potash solution is added till the liquid turns red, and then more dilute H_2SO_4. The liquid is then shaken with a little $CaCO_3$ and extracted with ether (Tscherniak, *B.* 8, 114; *A.* 180, 166). The result is very uncertain (V. Meyer a. Constam, *A.* 214, 335).

Properties.—Long needles (from ether). Decomposes slowly in the cold, rapidly at 64°, into formic acid, NO_2, and nitrogen. By boiling dilute H_2SO_4 it is resolved into formic acid and N_2O. Sodium-amalgam reduces it to methyl-azaurolic acid $CH(NOH).N{:}N.CH{:}NOH$ an amorphous powder which is violently gasified above 100°.

DI-METHYL-NITROSAMINE *v.* Di-methyl-amine.

METHYL NITROSO-ETHYL KETONE *v.* *Mono-oxim* of Di-methyl-diketone.

TETRA-METHYL-NITROSO-PHENYLENE-DIAMINE *v.* Nitroso-phenylene-tetra-methyl-diamine.

METHYL NONYL KETONE *v.* Methyl ennyl ketone.

METHYL-NOROPIANIC ACID *v.* Opianic acid.

METHYL *n*-OCTYL KETONE $C_{10}H_{20}O$ *i.e.* $CH_3.CO.CH_2.CH_2.CH_2.CH_2.CH_2.CH_2.CH_2.CH_3$. [4°]. (214°) (J.); (211°) (K.). S.G. $\frac{17.5}{17.5}$ ·8294; $\frac{0}{4}$ ·838; $\frac{20}{4}$ ·825 (K.). Formed by boiling heptyl-aceto-acetic ether with dilute alkalis (Jourdain, *A.* 200, 106). Formed also by distilling a mixture of barium acetate and barium ennoate (Krafft, *B.* 15, 1695). Liquid, with pleasant odour, insol. water, solidifying in a freezing mixture. Forms a crystalline compound with $NaHSO_3$.

Methyl octyl ketone $C_{10}H_{20}O$ *i.e.* $CH_3.CO.CH_2.CHMe.C_5H_{11}$. *Heptyl-acetone.* (197°). Formed by the action of baryta-water on *n-sec*-heptyl-aceto-acetic ether (Venable, *B.* 13, 1651). Colourless liquid, lighter than water.

METHYL OCTYL OXIDE $C_9H_{20}O$ *i.e.* $CH_3.O.C_8H_{17}$. (173°). S.G. $\frac{0}{0}$ ·8014. S.V. 219·8. C.E. (0°–10°) ·00101 (Dobriner, *A.* 243, 3).

METHYL-OCTYL-PHENYL-AMINE *v.* Octyl-tolyl-amine.

METHYL-OCTYL-THIOPHENE $C_{13}H_{22}S$ *i.e.*

$S{<}\genfrac{}{}{0pt}{}{CMe{=\!=}CH}{C(C_8H_{17}):CH}{>}$. [10°]. (272°). Formed by the action of sodium upon an ethereal solution either of MeI and iodo-octyl-thiophene or of octyl bromide and iodo-methyl-thiophene (Schweinitz, *B.* 19, 648). Bromine forms $C_{13}H_{21}BrS$ [20°].

METHYL OXALATE *v.* *Methyl ether* of Oxalic acid.

METHYL-OXALACETIC ETHER $C_9H_{14}O_5$ *i.e.* $CO_2Et.CO.CHMe.CO_2Et$. *Oxaloxyl-propionic ether.* (138° at 23 mm.). Formed by the action of NaOEt on an ethereal solution of oxalic and propionic ethers (Wislicenus a. Arnold, *B.* 20, 3394; *A.* 246, 329). Formed also from sodium oxalacetic ether and MeI at 100°. Colourless oil, v. sol. alcohol and ether. Its alcoholic solution gives a red colouration with $FeCl_3$. Split up by boiling alcoholic potash into oxalic and propionic acids. Boiling dilute H_2SO_4 yields ethyl-glyoxylic acid.

Salt.—$CO_2Et.CO.CNaMe.CO_2Et$. Does not crystallise from alcohol.

Phenyl-hydrazide $CO_2Et.C(N_2HPh).CHMe.CO_2Et$. [100°]. Small plates, v. sol. ether and benzene. Its solution in conc. H_2SO_4 is coloured reddish-violet by $FeCl_3$. At 120° it gives off alcohol, forming a derivative of pyrazole.

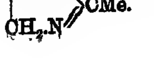
METHYL-OXALYL-UREA *v.* Parabanic acid.

METHYL-OXAMIC ACID *v.* Oxalic acid.

METHYL-OXAMIDE *v.* Oxalic acid.

METHYL-OXANTHRANOL *v.* Oxanthranol.

METHYL-OXAZOLE DIHYDRIDE C_4H_7NO *i.e.*



Formed, in small quantity, by the action of Ac_2O and NaOAc on bromo-ethylamine $Br.CH_2.CH_2.NH_2$ (Gabriel, *B.* 22, 2221; 23, 2502). Oil, with sweet smell, somewhat like quinoline.—$B'C_6H_2(NO_2)_3OH$. [149°]. Yellow plates.

METHYL-OXETHYL- *v.* Methyl-oxyethyl-.

DI-METHYL-OXETONE *v.* *Anhydride* of Di-γ-oxy-di-butyl diketone.

DI-METHYL OXIDE C_2H_6O *i.e.* $(CH_3)_2O$. *Methyl ether.* Mol. w. 46. (−24°) (Regnault, *J.* 1863, 70). V.D. 1·617. S. (gas) 37 at 18°. H.F.p. 49,640 (Thomsen), 56,800 (Berthelot, *A. Ch.* [5] 23, 185). H.F.v. 48,190 (T.). H.C.p. 344,200 (B.). Formed by heating MeOH with H_2SO_4 (Dumas a. Péligot, *A.* 15, 12; Kane, *A.* 19, 166) or with B_2O_3 (Ebelmen, *A.* 57, 328). Formed also, together with NMe_4Cl and NMe_3HCl, by heating NH_4Cl with excess of MeOH (Weith, *B.* 8, 458). Prepared by heating MeOH (13 pts.) with H_2SO_4 (20 pts.) at 140°. The gas is passed through aqueous KOH to remove SO_2, CO_2, and MeOH, and then into conc. H_2SO_4 which absorbs 600 vols. It is obtained by dropping the solution in H_2SO_4 into an equal volume of warm boiled water, and is dried by passing through tubes containing $CaCl_2$ (Erlenmeyer a. Kriechbaumer, *B.* 7, 699; *cf.* Tellier, *Ar. Ph.* [3] 10, 57).

Properties.—Gas. Combines with HCl forming Me_2OHCl which boils at 2°.

References.—Chloro- and Di-iodo-di-methyl oxide.

METHYL-OXINDOLE C_9H_9NO *i.e.*

$C_8H_4{<}\genfrac{}{}{0pt}{}{CH_2}{NMe}{>}CO$. *Oxy-methyl-indole.* [88°]. Obtained from methyl-indole carboxylic acid by the action of NaOBr, the resulting di-bromo-methyl-oxindole heing suspended in alcohol and reduced by sodium-amalgam (Colman, *C. J.* 55, 7; *A.* 248, 120). White needles, sl. sol. cold water and light petroleum, v. sol. alcohol, ether, acetone and benzene. Dissolves in hot alkalis without change. Partially decomposes when heated much above its melting-point. Does not react with phenyl-hydrazine. Bromine-water gives a crystalline pp. Nitrous acid converts it into

$C_6H_4{<}\genfrac{}{}{0pt}{}{C(NOH)}{NMe}{>}CO$, the oxim of methyl-ψ-isatin.

Di-chloro-methyl-oxindole

$C_6H_4{<}\genfrac{}{}{0pt}{}{CCl_2}{NMe}{>}CO$. [147°]. Formed by adding a solution of sodium methyl-indole carboxylate to a cold solution of NaOCl (Colman). Colourless needles, v. sol. hot alcohol and acetone, m. sol. ether. Not decomposed at 210°.

Bromo-methyl-oxindole

$C_6H_4{<}\genfrac{}{}{0pt}{}{CHBr}{NMe}{>}CO$ [134°]. Formed, together with methyl-oxindole, by reducing di-bromo-methyl-oxindole with sodium-amalgam. Lustrous white plates, v. sl. sol. cold water, v. sol. hot alcohol. Not decomposed by boiling aqueous KOH.

Di-bromo-methyl-oxindole

$C_6H_4{<}\genfrac{}{}{0pt}{}{CBr_2}{NMe}{>}CO$. [204°]. Formed by the action of NaOBr on methyl-indole carboxylic acid (Fischer, *B.* 17, 564). Yellowish-white tables, v. sol. alcohol, insol. cold water. Melts at 204° when quickly heated, but 180° when slowly heated. Converted by boiling water into methyl-ψ-isatin. Phenyl-hydrazine gives the phenyl-hydrazide of methyl-ψ-isatin.

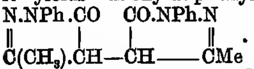
Di-methyl-oxindole $C_{10}H_{11}NO$ *i.e.* $\left[5:3:\frac{1}{2}\right]C_6H_2(CH_3)_2<\begin{matrix}CH_2\\NH\end{matrix}>CO$. *Carbomesyl. Anhydride of amido-di-methyl-phenyl-acetic acid.* [232°]. Prepared by reduction of (2:5:3:1)-nitro-di-methyl-phenyl-acetic acid with tin and HCl (Wispeh, *B.* 16, 1580). Sublimable. White needles. Sol. hot alcohol and hot benzene. sl. sol. hot water and cold alcohol and ether, insol. cold water.

Methyl-di-oxindole $C_6H_4<\begin{matrix}CH(OH)\\NMe\end{matrix}>CO$. *Di-oxy-methyl-indole.* [151°]. Formed by reducing methyl-ψ-isatin with sodium-amalgam or with zinc and HCl (Colman, *C. J.* 55, 8; *A.* 248, 121). Needles or prisms (from benzene); m. sol. water, alcohol, and benzene. Oxidising agents reconvert it into methyl-ψ-isatin.

METHYL-OXY-BENZOYL-GLYCOCOLL *v.* ANISURIC ACID.

METHYL OXYBUTENYL KETONE DICARBOXYLIC ACID ANHYDRIDE $C_8H_8O_5$ *i.e.* $CH_3.CO.CH<\begin{matrix}C(CO_2H)\\CO.O\end{matrix}>CMe$. *Isocarbopyrotritaric acid.* Obtained from its ether by boiling with 20 p.c. aqueous NaOH, and ppg. with dilute H_2SO_4 (Knorr, *B.* 22, 163). Possesses great reducing power. Decomposes at 200°–209°, leaving an oil $C_7H_8O_3$, which solidifies on cooling. This is composed of two bodies, one being an acid v. sl. sol. most solvents and melting at 175°, the other crystallising from ether in long prisms [60°], and giving an acid solution in water. Water forms acetonyl-acetone.

Ethyl ether EtA′. [110°]. (c. 280° at 15 mm.). Obtained by heating di-acetyl-succinic ether at 170°–180°, pyrotritaric and carbopyrotritaric ethers being also formed (Knorr, *B.* 22, 159). Slender needles (from hot water), v. sl. sol. water and dilute acids, v. sol. alkalis, ether, chloroform, and hot alcohol. Possesses great reducing power. $FeCl_3$ gives a fine blue colour to its solution. With phenyl-hydrazine it yields di-oxy-di-phenyl-di-methyl-dipyrazyl



$$\begin{array}{llll}N.NPh.CO & & CO.NPh.N & \\ \| \quad\quad\quad | & & | \quad\quad\quad \| & \\ C(CH_3).CH & - & CH \text{———} CMe & \end{array}$$

. Hydroxylamine appears to form the corresponding di-oxy-di-methyl-dioxazyl

$$\begin{array}{l}N.O.CO\ CO.O.N\\ \|\quad\ \ |\quad\ |\quad\ \ \|\\ CMe.CH.CH\text{———}CMe\end{array}$$

.

DI-METHYL-DI-OXY-BUTYLENE DIKETONE $CH_3.CO.CMe(OH).CMe(OH).CO.CH_3$. [96°]. Formed by reducing di-methyl diketone with zinc-dust and dilute H_2SO_4 (Von Pechmann, *B.* 21, 1411). Needles (from ligroïn). Reduces Fehling's solution in the cold. $FeCl_3$ re-converts it into Me.CO.CO.Me.

METHYL OXY-BUTYL KETONE $C_6H_{12}O_2$ *i.e.* $CH_3.CO.CH_2.CH_2.CH_2.CH_2OH$. *Acetyl-butyl-alcohol.* (227°). S.G. $\frac{4}{4}$ ·997; $\frac{15}{15}$ ·989; $\frac{25}{25}$ ·982. M.M. 6·502 at 18·5°. Obtained by boiling the anhydride of its carboxylic acid with water, CO_2 being evolved (Perkin, jun., *C. J.* 51, 717). Thick oil with sweet burning taste. Does not reduce Fehling's solution or ammoniacal $AgNO_3$ in the cold, but reduces both these reagents on warming. Yields an oily phenyl-hydrazide. Warm conc. HNO_3 gives a dark-pink colour. Iodine and KOH give iodoform. Chromic acid mixture oxidises it to acetic and succinic acids.

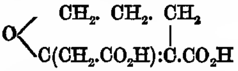
METHYL OXY-BUTYL KETONE ANHYDRIDE $C_6H_{10}O$ *i.e.* $O<\begin{matrix}CH_2.CH_2\\CMe:CH\end{matrix}>CH_2$. *Methyl-furidane dihydride. 'Acetyl-tetramethylene.' 'Tetramethylene methyl ketone.' Anhydride of aceto-butyl alcohol.* (109°). S.G. $\frac{4}{4}$ ·9227; $\frac{15}{15}$ ·9127; $\frac{25}{25}$ ·9050. M.M. 6·074 at 22·5°. Formed by distilling its carboxylic acid at 150° (Perkin, jun., *C. J.* 51, 723; *B.* 19, 2558). Colourless mobile liquid with ethereal odour. On prolonged standing in presence of water it is converted into methyl oxy-butyl ketone.

Methyl oxy-butyl ketone anhydride carboxylic acid $C_7H_{10}O_3$ *i.e.* $O<\begin{matrix}CH_2.CH_2.CH_2\\CMe:C(CO_2H)\end{matrix}>$. [119°]. Obtained by saponifying its ether with alcoholic potash (Perkin, jun., *C. J.* 51, 715). Colourless needles, v. sol. hot benzene, alcohol, chloroform, and light petroleum, v. e. sol. water. Decomposes above 119° into CO_2 and the preceding body. When heated with aqueous NH_3 at 200° it yields CO_2, methyl oxy-butyl ketone, and a volatile base (probably a derivative of pyridine). Bromine-vapour gives $C_7H_9BrO_3$, a thick syrup. Conc. HBrAq yields methyl bromo-butyl ketone.

Salts.—NH_4A': white crystalline solid, v. sol. water.—CuA'_2 aq: light-green powder, v. sl. sol. water, decomposed at 90°–100°.—AgA′: white crystalline solid, v. sol. water, decomposed on boiling with water or exposure to light.

Ethyl ether EtA′. [9°]. (227°). V.D. 6·21. M.M. 10·069 at 23·7°. S.G. $\frac{15}{15}$ 1·069; $\frac{25}{25}$ 1·0626. μ_A 1·4697. μ_D 1·4772. Formed by heating a mixture of NaOEt with aceto-acetic ether and trimethylene bromide (Perkin, jun., *C. J.* 51, 709). Colourless oil, with a disagreeable camphor-like odour. Does not react with phenyl-hydrazine. Does not contain an atom of hydrogen displaceable by sodium. With PCl_5 it forms $C_8H_{13}O_2Cl$, a colourless oil (212°–215°).

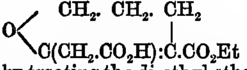
Methyl oxy-butyl ketone anhydride dicarboxylic acid $C_8H_{10}O_5$ *i.e.*



$$O<\begin{array}{l}CH_2.CH_2.CH_2\\ \qquad\qquad\quad\ \ |\\ C(CH_2.CO_2H):C.CO_2H\end{array}$$

. [185°–190°]. Obtained by saponification of its ethers by boiling alcoholic potash (Perkin, jun., *C. J.* 51, 744). Colourless hexagonal plates, v. sol. hot water and hot alcohol, sl. sol. acetic ether, benzene, and ether. Decomposes on fusion, giving off CO_2, and leaving a red liquid.

Mono-ethyl ether



$$O<\begin{array}{l}CH_2.CH_2.CH_2\\ \qquad\qquad\quad\ \ |\\ C(CH_2.CO_2H):C.CO_2Et\end{array}$$

. [114°]. Obtained by treating the di-ethyl ether with conc. alcoholic potash in the cold. Transparent four-sided triclinic needles, $a:b:c = ·774:1:·337$; $\alpha = 89°\ 40'$; $\beta = 98°\ 18'$; $\gamma = 89°\ 50'$. V. sol. alcohol and ether, sl. sol. hot water.—$AgEtA''$: white curdy pp., sl. sol. water.

Di-ethyl ether Et_2A''. (239° at 150 mm.). Obtained by the action of NaOEt on a mixture of trimethylene bromide and acetone di-carboxylic ether $CO_2Et.CH_2.CO.CH_2.CO_2Et$ (Perkin, jun., *C. J.* 51, 739). Thick, colourless oil, with disagreeable odour.

METHYL-OXY-CONIINE *v.* CONIINE.

METHYL-OXY-ETHYL-AMIDO-PHENOL. *Methyl ether* $C_{10}H_{15}NO_2$ *i.e.* $[2{:}1]C_6H_4(OMe).NMe.CH_2.CH_2OH$. *Methyl-oxy-ethyl-anisidine.* (290°). Formed by the action of $C_6H_4(OMe).NHMe$ on ethylene chlorhydrin (Knorr, *B.* 22, 2098). Liquid.

Anhydride $C_6H_4\left<\begin{matrix}O\text{—}CH_2\\ |\\ NMe.CH_2\end{matrix}\right.$. *Methyl-quinazoxine dihydride.* (261°). Formed by boiling the methyl ether with caustic soda (Knorr, *B.* 22, 2098). Liquid, with irritating smell, volatile with steam, very easily oxidised by contact with air.—$B'HCl$. [162°]. Short four-cornered plates (from alcohol).

METHYL-OXY-ETHYL-AMINE C_3H_9NO *i.e.* $CH_3.NH.CH_2.CH_2OH$. (130°–140°). Formed from ethylene chlorhydrin (1 mol.) and methylamine (1 mol.) (Knorr, *B.* 22, 2088). Oil, with strong ammoniacal smell, v. sol. water, alcohol, and ether.—Aurochloride. [110°–120°]. Anhydrous prisms, v. sol. water.

Methyl-di-oxy-di-ethyl-amine $C_5H_{13}NO_2$ *i.e.* $CH_3.N(CH_2.CH_2OH)_2$. (250°–255°). Formed by heating ethylene chlorhydrin with excess of aqueous methylamine at 100° (Morley, *B.* 13, 222). Formed also by the action of ethylene chlorhydrin on the preceding body (Knorr, *B.* 22, 2081). Viscid oil, v. sol. water, not volatile with steam.—$B'HCl$: thick syrup.—$B'_2H_2PtCl_6$: orange-red prisms.—Aurochloride: v. sol. water.

Methylo-chloride $C_6H_{16}NO_2Cl$ *i.e.* $ClNMe_2(CH_2.CH_2OH)_2$. Formed by heating ethylene chlorhydrin with a solution of dimethylamine at 100° (Morley, *B.* 13, 223). Formed also from di-methyl-oxy-ethyl-amine and ethylene chlorhydrin (Knorr, *B.* 22, 2089). Thick syrup.—$(C_6H_{16}NO_2Cl)_2PtCl_4$ aq. [218°]. Small yellow crystals, v. sol. water, sl. sol. alcohol.—Aurochloride: [233°]; small plates, v. sol. hot water.

Anhydride $CH_3.N\left<\begin{matrix}CH_2.CH_2\\ CH_2.CH_2\end{matrix}\right>O$. *Methyl-pyroxazine tetrahydride.* (117°). Formed by heating methyl-di-oxy-di-ethyl-amine with SO_3 (K.). Mixes with water, alcohol, and ether. Readily combines with MeI.—Hydrochloride: [205°]; long hygroscopic prisms.—Platinochloride: needles (from dilute alcohol), v. sol. water.—Aurochloride: [183°]; small needles, m. sol. water.

Methylo-iodide of the anhydride. Long needles. With Ag_2O it yields a methylo-hydroxide, which is split up by heat into aldehyde and di-methyl-oxy-ethyl-amine.

Methylo-chloride of the anhydride. Crystalline mass. Forms a platinochloride crystallising from alcohol in needles, and an aurochloride, both being v. sol. water.

Di-methyl-oxy-ethyl-amine $C_4H_{11}NO$ *i.e.* $NMe_2.CH_2.CH_2OH$. *Di-methyl-ethyl-alkine.* (130°). Prepared from dimethylamine and ethylene chlorhydrin (Ladenburg, *B.* 14, 2408). Formed also by heating 'methyl-morphimethine' (*v.* Morphine) with Ac_2O at 160°–190° (Knorr, *B.* 22, 1114). Liquid.—B'_2HAuCl_4: needles, sol. hot water.—$B'_2H_2PtCl_6$: easily soluble prisms.

Acetyl derivative $C_4H_{10}AcNO$. Forms an aurochloride $B'HAuCl_4$, crystallising in plates.

Methylo-hydroxide v. Neurine.

TRI-METHYL-OXYETHYL-AMMONIUM HYDROXIDE *v.* Neurine.

METHYL-OXYETHYL ANILINE $C_9H_{13}NO$ *i.e.* $C_6H_5.N(CH_3)(C_2H_4.OH)$. *Methyl-phenyl-ethyl-alkine.* (218° at 110 mm.). S.G. $\frac{0}{}$ 1·0806. Obtained by heating methyl-aniline with ethylene-chlorhydrin at 100° (Laun, *B.* 17, 675). Colourless oil. Weak base. By exposure to air it is oxidised to a thick blue syrup.

Methylo-iodide $B'MeI$: colourless plates or tables.

Methylo-periodide $B'MeI_5$: [87°]; greenish glistening plates.

METHYL α-OXY-ETHYL KETONE $C_4H_8O_2$ *i.e.* $CH_3.CO.CH(OH).CH_3$. (142°). *Ketoxy-butane.* Formed by reducing di-methyl diketone with zinc and H_2SO_4 (Von Pechmann, *B.* 22, 2214; 23, 2421). Colourless liquid, miscible with water. Reduces Fehling's solution. Reacts with phenyl hydrazine, with formation of the compounds $CH_3.C(N_2HPh).CH(OH).CH_3$ [84°] and $CH_3.C(N_2HPh).C(N_2HPh).CH_3$.

METHYL-OXY-ETHYL-PYRIDINE *v.* Tropine.

METHYL-OXY-ETHYL-*p*-TOLUIDINE $C_{10}H_{15}NO$ *i.e.* $CH_2OH.CH_2.NMe.C_6H_4Me$. (290°–300°). Formed from oxy-ethyl-toluidine and MeI at 60° (Demole, *A.* 173, 129). Liquid.—$B'HI$.—$B'_2H_2PtCl_6$.

Methylo-iodide $B'MeI$. Liquid. Yields $B'_2Me_2PtCl_6$ and $B'MeAuCl_4$.

METHYL-OXY-GLUTARIC ACID *v.* Oxy-methyl-glutaric acid.

TRI-METHYL-TRI-OXY-HYDROBENZAMIDE *v.* Anishydramide.

TETRA-METHYL-OXY-TRIMETHYLENE-DIAMINE $C_7H_{18}N_2O$ *i.e.* $HO.CH(CH_2.NMe_2)_2$. *Tetra-methyl-oxy-propylene-diamine. Tetra-methyl-allyl-alkine.* (170°–185°). Formed by heating *s*-dichlorhydrin $CH_2Cl.CH(OH).CH_2Cl$ with dimethylamine in a sealed tube at 60° (Berend, *B.* 17, 510). The liquid is rendered alkaline by KOH and extracted with chloroform. Liquid, v. e. sol. water.—$B'_2H_2PtCl_6$: yellow plates, m. sol. water.

DI-METHYL-TRI-OXY-PHENYL-BENZYL-KETONE *v.* Anisoïn.

DI-METHYL-OXY-PROPYL-AMINE $C_5H_{13}NO$. (126°). Prepared by the action of dimethylamine on propylene chlorhydrin at 100° (Morley, *C. R.* 91, 333; Ladenburg, *B.* 14, 2407). Liquid.—$B'_2H_2PtCl_6$: prisms, v. sol. water.

Methylo-chloride $B'MeCl$. Prepared by heating aqueous trimethylamine with propylene chlorhydrin at 100° (Morley, *C. R.* 91, 333; *B.* 13, 1805). Colourless, very hygroscopic crystals, turning brown in light. Forms a platinochloride $B'_2Me_2PtCl_6$, crystallising in yellow feathery plates, insol. alcohol and ether, v. sol. water.

Methylo-hydroxide $B'MeOH$. From the chloride and moist Ag_2O. Alkaline syrup. Decomposed on distillation into NMe_3 and propylene glycol (Morley, *C. J.* 41, 389).

Di-methyl-dioxypropyl-amine $C_5H_{13}NO_2$ *i.e.* $NMe_2.CH_2.CH(OH).CH_2(OH)$. *Di-methyl-propyl-glycolline.* (217°). Formed by heating di-methyl-amine with glycerin chlorhydrin (Roth, *B.* 15, 1153). Colourless oil. Sol. water, alcohol, and ether.—$B'_2H_2Cl_2PtCl_4$.

Methylo-chloride $C_6H_{16}NO_2Cl$ *i.e.* $NMe_3Cl.CH_2.CH(OH).CH_2(OH)$. From glycerin chlorhydrin and NMe_3 at 100° (V. Meyer, *B.* 2, 186; Hanriot, *A. Ch.* [5] 17, 99). Crystals, v. e. sol. water. — $(C_6H_{16}NO_2Cl)_2PtCl_4$: tables. — $C_6H_{16}NO_2AuCl_4$. [190°]. Orange crystals.

METHYL-OXYPROPYL-ANILINE $C_{10}H_{15}NO$ *i.e.* $C_6H_5.N(CH_3)C_3H_6.OH$. *Methyl-phenyl-propyl-alkine.* (262°). Colourless liquid. Formed by heating methyl-aniline with propylene chlorhydrin (Laun, *B.* 17, 678).

METHYL β-OXYPROPYL KETONE $C_5H_{10}O_2$ *i.e.* $CH_3.CO.CH_2.CH_2.CH_2OH$. *Acetyl-propyl alcohol.* (145°) at 100 mm.; (209°) at 729 mm. V.D. 2·25 (calc. 3·53). S.G. $\frac{15}{15}$ 1·0051; $\frac{25}{25}$ ·9990. M.M. 5·544 at 25°. Formed by boiling trimethylene methyl ketone carboxylic acid (derived from aceto-acetic ether, sodium, and ethylene bromide) with water, CO_2 being evolved (Perkin, jun., *C. J.* 51, 829). Formed also by boiling bromo-ethyl aceto-acetic ether with aqueous HCl. Thick syrup, miscible with water, v. sol. alcohol and ether. Decomposed by heat into water and its anhydride, which reunite in the cold; does not reduce cold ammoniacal silver nitrate, but reduces it on warming. Gives with phenyl-hydrazine solution an oily precipitate of $C_{11}H_{14}N_2$ or  $CH_2{<}{\genfrac{}{}{0pt}{}{CMe:N}{CH_2.CH_2}}{>}NC_6H_5$. Oxidised by $K_2Cr_2O_7$ and H_2SO_4 to acetyl-propionic (levulic) acid (Colman a. Perkin, *C. J.* 53, 189; 55, 352; Lipp, *B.* 22, 1196). Reduced by sodium-amalgam to $CH_3.CH(OH).CH_2.CH_2.CH_2OH$ (Perkin, jun., a. Freer, *B.* 19, 2566). With $NaHSO_3$ it forms $CH_3.C(C_3H_6OH)(OH).SO_3Na\,1\frac{1}{2}aq$: needles, v. sol. water and alcohol.

Acetyl derivative $CH_3.CO.C_3H_6OAc$ (214° i.V.) at 728 mm. S.G. $\frac{0}{0}$ 1·0356. V.D. 5·02 (calc. 4·98). Liquid, m. sol. water, v. e. sol. alcohol and ether.

Benzoyl derivative $CH_3.CO.C_3H_6OBz$. (297°).

Anhydride  $CH_3.C{\lessgtr}\genfrac{}{}{0pt}{}{CH.CH_2}{O\ .\ CH_2}$. (72°–75°). Formed by slow distillation of the ketone. Water converts it into the flocculent isomeride  $CH_2{:}C{<}\genfrac{}{}{0pt}{}{CH_2.CH_2}{O\ .\ CH_2}$ (111°) at 718 mm., which reddens pine-wood moistened by HCl *v.* Methylene-furfurane trihydride.

Methyl ω-oxy-propyl ketone $C_5H_{10}O_2$ *i.e.* $CH_3.CO.CH(OH).CH_2.CH_3$. (153°); (77° at 35 mm.). S. G. $\frac{17\cdot5}{4}$ ·972. Formed by reducing methyl ethyl diketone with zinc and dilute H_2SO_4 (Von Pechmann, *B.* 23, 2421). Colourless liquid with sweet smell; sol. water, but separated from the solution by NaCl or NaOH. Readily oxidised to $CH_3.CO.CO.C_2H_5$. Reduced by sodium-amalgam to $CH_3.CH(OH).CH(OH).C_2H_5$ (187°), which is oxidised by bromine-water in sunlight to $CH_3.CO.CO.C_2H_5$. Excess of phenyl hydrazine forms $CH_3.C(N_2HPh).CO.C_2H_5$ [103°].

Methyl α-oxy-propyl ketone $C_5H_{10}O_2$ *i.e.* $CH_3.CO.CH_2.CH(OH).CH_3$. (128°). Formed by adding chloro-acetic ether to sodium under ether, decomposing the resulting sodium compound by HCl, reducing by zinc-dust the ether $C_8H_{13}ClO_4$ (157° at 45 mm.) which is then formed, and boiling the product $C_8H_{14}O_4$ (106° at 14 mm.), with dilute HCl, when it splits up into CO_2, alcohol, and the oxy-ketone (Fittig, *B.* 21, 2138). Colourless mobile liquid, miscible with water. Forms compounds with $NaHSO_3$, and with phenyl-hydrazine.

Methyl ω-oxy-isopropyl ketone. *Oxim of the nitrate* $(CH_3)_2C(ONO_2).C(NOH).CH_3$. *Pentane nitroso-nitrate.* Formed by the action of amyl nitrite and nitric acid on amylene $(CH_3)_2C{:}CH.CH_3$ (38°) dissolved in HOAc (Wallach, *A.* 248, 162). Monoclinic crystals, *a*:*b*:*c* = ·977:1:1·449; β = 83° 32′ (from benzene), or needles (from HOAc).

METHYL-OXY-QUINIZINE *v.* Oxy-phenyl-methyl-pyrazole.

METHYL-OXY-QUINOLINE *v.* Oxy-methyl-quinoline.

METHYL-OXY-SUCCINIC ACID *v.* Oxy-methyl-succinic acid.

METHYL-PARABANIC ACID *v.* Parabanic acid.

METHYL-PARACONIC ACID *v.* *Anhydride* of Oxy-ethyl-succinic acid.

TETRA-METHYL-PARALEUCANILINE *v.* Tetra-methyl-tri-amido-tri-phenyl-methane.

METHYL PENTADECYL KETONE $C_{17}H_{34}O$ *i.e.* $CH_3.CO.C_{15}H_{31}$. [48°]. (246°) at 110 mm.; (320° uncor.) at 760 mm. S.G. (liquid) $\frac{48}{}$ ·814. Prepared by distilling a mixture of barium palmitate and barium acetate (Krafft, *B.* 12, 1671). On oxidation it gives pentadecoic acid.

Methyl pentadecyl ketone $CH_3.CO.CH(C_7H_{15})_2$. *Di-n-heptyl-acetone.* (300°–304°). S.G. $\frac{17}{17}$ ·826. Formed by boiling di-heptyl-acetoacetic ether with dilute aqueous KOH (Jourdain, *A.* 200, 115). Oil, smelling of peppermint. Forms a crystalline compound with $NaHSO_3$.

METHYL-PENTANE *v.* Hexane.

DI-METHYL-PENTENYLAMINE $C_7H_{15}N$ *i.e.* $CH_2{:}CH.CH_2.CH_2.CH_2.NMe_2$. This constitution is assigned by Merling to Ladenburg's di-methyl-piperidine, *v.* Di-methyl-pyridine hexahydride.

Di-methyl-pentenylamine. *Methylo-hydroxide* $C_5H_9NMe_3OH$. Formed from amylene bromide and trimethylamine at 55° (Schmiedeberg a. Harnack, *J.* 1867, 805). — $(C_5H_9NMe_3Cl)_2PtCl_4$ aq. Irregular laminæ.

(β)-METHYL-PENTHIOPHENE C_6H_8S *i.e.*  $S{<}{\genfrac{}{}{0pt}{}{CH:CMe}{CH:CH}}{>}CH_2$. (134°). S.G. $\frac{19}{19}$ ·9938. Formed by distilling sodium α-methyl-glutarate $CO_2Na.CHMe.CH_2.CH_2.CO_2Na$ (5 g.) with P_2S_3 (10 g.) at 180°–250° (Krekeler, *B.* 19, 3270). Colourless oil. When successively mixed with a solution of isatin in HOAc and conc. H_2SO_4 it gives a dark-green colour, and, on adding water, a green pp. Phenanthraquinone and H_2SO_4 (Laubenheimer's reagent) give a dark-violet colour. Phenyl-glyoxylic acid yields a violet dye. Alkaline $KMnO_4$ (·3 p.c.) produces acetic and oxalic acid. Nitric acid forms a nitro-derivative, and bromine a bromo-derivative.

Methyl-penthienyl methyl ketone $C_8H_{10}SO$ *i.e.* $SC_5H_4Me.CO.CH_3$. (234°).

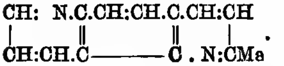
Oxim $SC_5H_4Me.C(NOH).CH_3$. [68°].

METHYL-PHENACYL-ANILIDE *v.* α-Phenyl-amido-phenyl ethyl ketone.

METHYL - PHENACYL - BROMIDE *v.* α-Bromo-phenyl ethyl ketone.

METHYL-PHENANTHRIDENE *v.* Phenyl-indole.

METHYL-PHENANTHROLINE $C_{13}H_{10}N_2$ *i.e.*



$$\begin{array}{l} CH:\ N.C.CH:CH.C.CH:CH \\ |\qquad \|\qquad\qquad \|\quad | \\ CH:CH.C{-}{-}{-}{-}C\ .\ N:CMe \end{array}$$

. [65°]. (above 360°). Formed, together with an isomeride, when *m*-amido-(*Py.* 3)-methyl-quinoline (100 g.) is boiled with o-nitro-phenol (75 g.), glycerin (320 g.), and H_2SO_4 (270 g.). The product is diluted with water and evaporated to remove o-nitrophenol. The resinous mass that is ppd. on adding NaOH is extracted with benzene, and the dark oily mixture of bases so obtained treated with HCl. The hydrochlorides are washed with alcohol, dissolved in water, decomposed by NH_3, and the bases again extracted with benzene. From the crystalline mixture of bases left after evaporating the benzene, ether extracts methyl-phenanthroline only (Gerdeissen, *B.* 22, 246).

Properties.—White needles (containing 3aq). Melts at 50° when hydrated, 65° when anhydrous. Sol. boiling water, alcohol, and ether; v. sol. cold benzene. On oxidation with $KMnO_4$ it yields phenanthroline carboxylic acid $C_{12}H_7N_2.CO_2H$ [209°], which decomposes at 210° into CO_2 and phenanthroline.

Salts.—$B'HClaq$: small snow-white needles, sl. sol. cold, v. sol. hot, water, m. sol. alcohol, insol. ether.—$B'H_2SO_4$ aq: slender silky needles (from alcohol).—$B'_2H_2Cr_2O_7$: red prisms (from hot water).—$B'H_2PtCl_6$ aq: flesh-coloured crystalline pp., insol. hot water, sl. sol. alcohol.—Picrate $B'C_6H_2(NO_2)_3OH$. [217°]. Transparent yellow needles (from boiling alcohol).

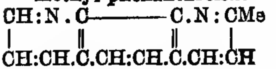
Ethylo-iodide B'EtI 2aq. [100°-110°]. Glittering brown crystals. Yields the platino-chloride $B'EtClH_2PtCl_6$ (?) which forms orange-red crystals.

Isomeride $C_{13}H_{10}N_2$ *i. e.*

$$\begin{array}{l} CH:N.C.CH:C.N:CMe \\ |\qquad \|\qquad |\quad | \\ CH:CH.C.CH:C.CH:CH \end{array}$$

. [109°]. Occurs in the preparation of the preceding, from which it differs in being insol. ether (G.). Crystallises from alcohol in concentric groups of satiny needles (containing 4aq). Melts at 82° when hydrated and 109° when anhydrous. The anhydrous base is a light white powder, v. sol. warm benzene and hot dilute alcohol, insol. cold ether, v. sl. sol. hot ether.

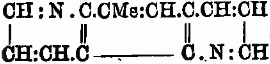
Methyl-phenanthroline



$$\begin{array}{l} CH:N.C{-}{-}{-}{-}C.N:CMe \\ |\qquad \|\qquad\qquad \|\quad | \\ CH:CH.C.CH:CH.C.CH:CH \end{array}$$

. [76°]. Prepared from o-amido-(*Py.* 3)-methyl-quinoline, glycerin, o-nitro-phenol, and H_2SO_4 (Gerdeissen). Crystals (containing 2aq). Melts at 53° when hydrated, and at 76° when anhydrous. V. e. sol. hot benzene, v. sol. chloroform, m. sol. HOAc, sl. sol. ether and light petroleum. Decomposed on distillation.

Methyl-phenanthroline



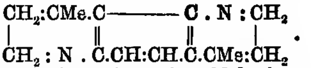
$$\begin{array}{l} CH:N.C.CMe:CH.C.CH:CH \\ |\qquad \|\qquad\qquad \|\quad | \\ CH:CH.C{-}{-}{-}{-}C\ .\ N:CH \end{array}$$

. [96°]. (above 300°). Prepared by boiling *m*-tolylene-diamine hydrochloride (40 g.) with nitrobenzene (30 g.), glycerin (100 g.), and H_2SO_4 (100 g.); and purified by means of the chromate (Skraup a. Fischer, *M.* 5, 523). Short prisms (containing 5aq), more soluble in cold than in hot water, v. sol. alcohol. Its solutions give a white crystalline pp. with $AgNO_3$ and a blue crystalline pp. with cupric acetate. Chromic acid mixture oxidises it to the corresponding phenanthroline carboxylic acid.

Salts.—$B'HCl$ 4aq: transparent needles.—$B'_2H_2Cr_2O_7$: red, sparingly soluble needles.—$B'_2H_2PtCl_6$ 2aq: yellow crystalline pp.—Picrate [253°].

DI-METHYL-PHENANTHROLINE TETRAHYDRIDE

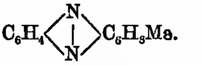
$C_{14}H_{16}N_2$ *i. e.*



$$\begin{array}{l} CH_2:CMe.C{-}{-}{-}{-}C\ .\ N:CH_2 \\ |\qquad\qquad \|\qquad\qquad \|\qquad | \\ CH_2:N\ .\ C.CH:CH.C.CMe:CH_2 \end{array}$$

Formed by the action of acetic aldehyde or paraldehyde upon *m*-phenylene-diamine hydrochloride. The resulting base is ppd. by ammonia, dissolved in aqueous HCl, and ppd. by platinic chloride as $B'_2H_2PtCl_6$ (Schiff, *A.* 253, 323).

METHYL-PHENAZINE $C_{13}H_{10}N_2$ *i.e.*



$$C_6H_4\Big\langle\begin{matrix}N\\|\\N\end{matrix}\Big\rangle C_6H_3Me$$

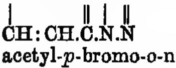
[117°]. (350°). Formed by heating tolylene-o-diamine with pyrocatechin in sealed tubes at 210° (Merz, *B.* 19, 725). Formed also by eliminating the two NH_2 groups by means of the diazo- reaction, from the oxidation product ($C_{13}H_{14}N_4$) of phenylene-*p*-diamine and tolylene-*m*-diamine (Bernthsen a. Schweitzer, *B.* 19, 2604; *A.* 236, 345). Needles (by sublimation), v. sl. sol. water and ligroïn, v. sol. alcohol and ether. Its solution in conc. H_2SO_4 is blood-red. It dissolves in conc. HClAq, but the base is ppd. again on dilution.—Salts.—$B'_2H_2PtCl_6$ 6aq: yellow laminæ (from water).—$B'_2H_2PtCl_6$ 3aq (from dilute alcohol).—Picrate $B'C_6H_2(NO_2)_3OH$. [168°]. Yellow nodules which blacken on fusion.

METHYL-PHENTRIAZINE $C_8H_7N_3$ *i.e.*

$$C_6H_4\Big\langle\begin{matrix}N.CMe\\ |\ \ \|\\ N.N\end{matrix}$$

. [89°]. (250°-255°). Formed by the action of sodium-amalgam on acetyl o-nitro-phenyl-hydrazine in alcohol, the solution being kept acid with HOAc, and the temperature below 30° (Bischler, *B.* 22, 2806). Crystals, partially decomposed on distillation. V. sol. cold water, v. e. sol. alcohol, sl. sol. hot ligroïn.

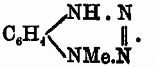
Bromo-methyl-phentriazine $C_8H_6BrN_3$ *i.e.*



$$\begin{array}{l} CBr:CH.C.N.CMe \\ |\qquad\quad \|\ |\ \| \\ CH:CH.C.N.N \end{array}$$

. [115°]. Formed from acetyl-*p*-bromo-o-nitro-phenyl-hydrazine by like treatment (Bischler a. Brodsky, *B.* 22, 2818). Golden plates, sl. sol. cold, v. sol. hot, water.

(α) - **METHYL - PHENTETRAZINE DIHYDRIDE** $C_7H_8N_4$ *i.e.*



$$C_6H_4\Big\langle\begin{matrix}NH.N\\ \quad\ \|\\ NMe.N\end{matrix}$$

. [62°]. Formed by the action of sodium nitrate on a very dilute hydrochloric acid solution of o-amido-phenyl-methyl hydrazine (Hempel, *J. pr.* [2] 41, 176). Colourless plates, v. sol. ether and benzene, sl. sol. alcohol and petroleum ether. Sol. hot conc. NaOHAq. Conc. HNO_3 at 80°-100° yields a product [127°] crystallising from alcohol in golden-yellow prisms and needles.

TRI-METHYL PHENENYL TRIKETONE $C_{12}H_{12}O_3$ *i.e.* $C_6H_3(CO.CH_3)_3$. [163°]. *Tri-acetyl-benzene.* Formed by the action of NaOEt in ether on a mixture of acetone (1 mol.) and allyl formate (1 mol.). Sodium aceto-acetic aldehyde slowly separates, and is then dissolved in ice-cold water and neutralised by HOAc. The free aceto-acetic aldehyde changes to tri-acetyl-benzene and water (Claisen a. Stylos, *B.* 21, 1145). Small needles, sl. sol. water, alcohol, and ether, v. sol. HOAc. Oxidised by HNO_3 to trimesic acid.

METHYL-(αβ)-PHEN-NAPHTHAZINE $C_{17}H_{12}N_2$ *i.e.*

$$C_6H_4\left<\begin{matrix}CH:CH.C.N.C.CH:CMe\\ \quad\quad\quad\quad\| \quad\;\; \ddot{} \quad\quad \dot{} \quad\; .\\ \text{———} \; C.N.C.CH:CH\end{matrix}\right.$$

[142°]. Formed by the action of (β)-naphthoquinone on tolylene-diamine in HOAc (Hinsberg, *A.* 237, 342).

Methyl-(ββ)-phen-naphthazine

$$C_6H_4\left<\begin{matrix}CH:\dot{C}.N.\dot{C}.CH:\dot{C}Me\\ CH:\dot{C}.\dot{N}.\ddot{C}.CH:\dot{C}H\end{matrix}\right..$$

[180°]. Formed by oxidation of a mixture of (β)-naphthol and tolylene o-diamine with alkaline K_3FeCy_6 (Witt, *C. N.* 49, 404). Pale straw-coloured needles, forming an intense red solution in H_2SO_4.

METHYL-PHENOL *v.* CRESOL.

Di-methyl-phenol *v.* XYLENOL.

Tri-methyl-phenol $C_6H_2Me_3.OH$ [1:2:3:5]. *Hemimellithenol. Hemellithenol.* [81°]. Formed by fusing hemimellithene sulphonic acid with KOH (O. Jacobson, *B.* 19, 2518). Needles (from ether). Gives no pp. with $FeCl_3$.

Tetra-methyl-phenol $C_6HMe_4.OH$ [1:2:3:4:5]. [81°] (L.); [87°] (T.); (249° uncor.) (L.); (266° i.V.) (T.). Formed by the action of nitrous acid on the corresponding $C_6HMe_4.NH_2$ [66°] (Limpach, *B.* 21, 644), or by fusing c-tetra-methyl-benzene sulphonic acid with potash (Töhl, *B.* 21, 907). Long white needles (from very dilute alcohol), v. e. sol. alcohol and ether, m. sol. petroleum ether. Volatile with steam. Bromine forms $C_{10}H_{12}Br.OH$ [151°].

Acetyl derivative $C_{10}H_{13}OAc$. [57°]. Prisms.

Tetra-methyl-phenol $C_6H(CH_3)_4.OH$. [81°]. Formed by the action of nitrous acid on tetra-methyl-phenyl-amine [14°] (Hofmann, *B.* 17, 1916). White crystals. Yields a quinone on distillation with MnO_2 and H_2SO_4.

Ethyl ether $C_6H(CH_3)_4OEt$: (236°); liquid. Formed by the action of alcohol upon the sulphate of tetra-methyl-diazo-benzene (Hofmann, *B.* 17, 197).

Penta-methyl-phenol $C_6(CH_3)_5.OH$. [125°]. (267°). Formed by the action of nitrous acid upon penta-methyl-phenyl-amine (Hofmann, *B.* 18, 1826). Fine white needles. Volatile with steam. Soluble in alcohol. Sparingly soluble in alkalis.

Methyl ether $C_6(CH_3)_5.OCH_3$: [64°]; long needles.

METHYL-DIPHENYL $C_{13}H_{12}$ *i.e.* $C_6H_5.C_6H_4Me$ [3:1]. *Phenyl-tolyl.* (275°). S.G. ^{0} 1·031. Formed by the action of MeCl upon melted diphenyl in presence of Al_2Cl_6 (Adam, *Bl.* [2] 47, 689; 49, 98; *A. Ch.* [6] 15, 239). Limpid colourless liquid, not solidified at −21°. V. e. sol. methyl alcohol and acetone. Not attacked by $KMnO_4$ either in neutral or alkaline solution. Chromic acid oxidises it to diphenyl *m*-carboxylic acid [161°]. Bromine at 150° forms $C_{12}H_9.CH_2Br$ which when treated with KOEt yields $C_{12}H_9.CH_2OEt$ whence dry gaseous HI liberates phenyl-benzyl-alcohol.

o-**Methyl-diphenyl** $C_{13}H_{12}$ *i.e.* $C_6H_5.C_6H_4Me[2:1]$. (259°). Appears to be formed by treating bromo-benzene mixed with liquid bromo-toluene with sodium (Barbier, *B.* 7, 1548).

p-**Methyl-diphenyl** $C_6H_5.C_6H_4Me[4:1]$. (263°–267°). S.G. ^{27} 1·015. Formed by the action of sodium on an ethereal solution of bromo-benzene and *p*-bromo-toluene (Carnelley, *C. J.* 29, 13). Formed also by passing a mixture of benzene and toluene through a red-hot tube (Carnelley, *C. J.* 37, 701). Solidifies at −2°. Dilute nitric acid oxidises it to diphenyl carboxylic acid. Chromic acid forms terephthalic acid.

Di-methyl-diphenyl $C_{14}H_{14}$ *i.e.* $C_{12}H_8Me_2$. (284°–290°). S.G. ^{0} 1·025. Formed by the action of methyl chloride on diphenyl in presence of Al_2Cl_6 (Adam). Colourless liquid, not solidified at −21°. Oxidised by CrO_3 in HOAc yielding an infusible diphenyl dicarboxylic acid which cannot be sublimed.

Other di-methyl-diphenyls are described as DITOLYLS.

s-**DI-METHYL-PHENYLACETAMIDINE** $C_{10}H_{14}N_2$ *i.e.* $C_6H_5.CH_2.C(NHMe)(NMe)$. Formed by the action of alcoholic methylamine on the hydrochloride of phenylacetic imido-ether $C_6H_5.CH_2.C(OEt)(NH)$ (Luckenbach, *B.* 17, 1420). Crystalline solid, v. sol. alcohol.—B′HCl: six-sided prisms. — $B'_2H_2PtCl_6$: small glistening crystals, sol. alcohol, sl. sol. water.

u-**Di-methyl-phenylacetamidine** $C_6H_5.CH_2.C(NMe_2)(NH)$. Formed in the same manner as the preceding, using dimethylamine (L.).—$B'_2H_2PtCl_6$: small needles, sl. sol. water, m. sol. alcohol.

DI-METHYL-PHENYL-ACETIC ACID [5:3:1]$C_6H_3(CH_3)_2.CH_2.CO_2H$. *Mesityl-acetic acid.* [100°] (W.); [97°] (Robinet, *Bl.* [2] 40, 316). (273° at 735 mm.). Formed by the saponification of the nitrile obtained by heating mesityl bromide with KCN (Wispek, *B.* 16, 1578). Long white prisms. Sol. alcohol, ether, and hot water, v. sl. sol. cold water.

Salts.—A′K aq: silky needles.—A'_2Ba 4aq: transparent prisms.—A'_2Ca 3aq: easily soluble thick needles.—A'_2Mg 5aq: long silky needles.—A′Ag: long thin needles.

Tetra-methyl-phenyl-acetic acid $C_{12}H_{16}O_2$ *i.e.* $C_6HMe_4.CH_2.CO_2H$ [5:4:3:2:1]. [125° uncor.]. Formed by reducing the corresponding tetra-methyl-mandelic acid with HI (Claus a. Föhlisch, *J. pr.* [2] 38, 234). Slender needles (from hot water), v. sol. alcohol, ether, and chloroform.—CaA'_2 3aq: silky needles.

TRI-METHYL-PHENYL-AMIDO-CROTONIC ACID *v.* ψ-CUMYL-AMIDO-CROTONIC ACID.

Tetra-methyl-phenyl-amido-crotonic acid *Ethyl ether* $C_6HMe_4.NH.CMe:CH.CO_2Et$. [101°]. Obtained by the action of tetra-methyl-phenyl-amine (prepared from ψ-cumidine) on acetoacetic ether (Conrad a. Limpach, *B.* 21, 1655). Large white prisms (from alcohol and ether). At 280°-285° it yields oxy-tetra-methyl-phenyl-di-methyl-pyridine carboxylic acid

$$C_6HMe_4N\left<\begin{matrix}CMe:C(CO_2H)\\ CMe:CH \text{———}\end{matrix}\right>CO.$$

[145°].

METHYL-PHENYL-AMINE *v.* Toluidine and Methyl-aniline.

Di-methyl-phenyl-amine *v.* Xylidine and Di-methyl-aniline.

Tri-methyl-phenyl-amine *v.* Mesidine and ψ-Cumidine.

Tetra-methyl-phenyl-amine $C_6HMe_4(NH_2)$[1:2:3:4:5]. [66°]. (260° uncor.). Obtained by heating isocumidine hydrochloride with MeOH at 250° to 260° under pressure (Limpach, *B.* 21, 644). Nacreous leaflets (from water). May be sublimed. The corresponding $C_6HMe_4(OH)$ melts at 81°.

Formyl derivative [144°]; silky needles (from water).

Acetyl derivative [170°]; silky needles.

Tetra-methyl-phenyl-amine $C_6HMe_4NH_2$ [1:2:3:5:6]. *Isoduridine.* [24°]. (255°). Formed by heating the hydrochlorides of ψ-cumidine or mesidine with MeOH at 300° (Hofmann, *B.* 17, 1912; Nölting a. Baumann, *B.* 18, 1149; Limpach, *B.* 21, 646).—B′HCl.—$B'_2H_2PtCl_6$.

Formyl derivative [183°]; long silky needles.

Acetyl derivative $C_6HMe_4.NHAc$. [215°].

Tetra-methyl-phenyl-amine $C_6HMe_4.NH_2$. *Duridine.* [14°]. (253°). S.G. $\underline{24}$ ·978. A product of the action of MeOH on xylidine hydrochloride at a high temperature (Hofmann, *B.* 17, 1913).—B′HCl.—$B'_2H_2PtCl_6$.

Penta-methyl-phenyl-amine $C_6(CH_3)_5.NH_2$. *Amido-penta-methyl-benzene.* [152°]. (278°). Prepared by heating dimethyl-ψ-cumidine with methyl iodide under pressure at 240°–250° (Hofmann, *B.* 18, 1821). Large colourless needles. V. sol. alcohol and ether, insol. water. On oxidation by arsenic acid in conjunction with aniline it yields a homologue of rosaniline. MeI at 100° forms C_6Me_5NHMe [61°], which is not further acted on by MeI, even at 170°.

Salts.—B′HCl: long thin needles, easily soluble in hot water, sl. sol. cold.—$B'_2H_2Cl_2PtCl_4$: sparingly soluble trimetric tables.—The acetate is very soluble; the nitrate forms sparingly soluble needles; the sulphate and oxalate very sparingly soluble small scales.

Acetyl derivative $C_6(CH_3)_5.NHAc$ [213°]; needles.

METHYL-DI-PHENYL-AMINE $C_{13}H_{13}N$ *i.e.* NPh_2Me. *Di-phenyl-methyl-amine.* (282°) (G.). (292°) at 741 mm. (Brühl, *A.* 235, 21). S.G. $\frac{24}{4}$ 1·0476. Formed by methylation of diphenylamine (Bardy, *Z.* 1871, 649; Girard, *Bl.* [2] 23, 2). Liquid. Gives a violet colour with HNO_3. Fuming HClAq at 150° resolves it into MeCl and diphenylamine (Gnehm, *B.* 8, 1040). By passing through a red-hot tube it is converted into diphenylamine, carbazole, benzonitrile, aniline, benzene, methane, hydrogen, nitrogen, and other products (Graebe, *A.* 174, 181). Nitrous acid passed into its alcoholic solution yields $NMePh.C_6H_4.N_2.C_6H_4.NMePh$. Boiling nitric acid forms a compound which crystallises from alcohol in yellow prisms [234°].

Derivatives.—Tri-bromo- and Bromo-di-nitro-, methyl-diphenylamine.

METHYL-PHENYL-ANTHRACENE *v.* Phenyl-methyl-anthracene.

METHYL-PHENYL-CARBAMIC ACID *v.* Tolyl-carbamic acid.

Di-methyl-phenyl-carbamic acid *v.* Xylyl-carbamic acid.

Tri-methyl-phenyl-carbamic acid. *Ethyl ether* $C_6H_2Me_3.NH.CO_2Et$. *ψ-Cumyl-carbamic ether.* [91·5°]. Formed by the action of chloroformic ether $ClCO_2Et$ on *ψ-cumidine* (Frentzel, *C. C.* 1888, 1361). P_2O_5 converts it into the cyanate $C_6H_2Me_3NCO$ (221°), polymerised by PEt_3 or KOAc into the cyanurate [234°].

Tri-methyl-phenyl-carbamic acid. *Ethyl ether* $C_6H_2Me_3NH.CO_2Et$. *Mesityl-urethane.* [62°]. Formed from mesidine and $ClCO_2Et$ (Eisenberg, *B.* 15, 1016). Long colourless needles, volatile with steam, sol. alcohol and ether.

TETRA-METHYL-PHENYL-CARBAMINE $C_6H(CH_3)_4.NC$ [51°]. White crystals. Formed by heating tetra-methyl-phenyl-amine [14°] with chloroform and alcoholic KOH. It is changed into the nitrile by distillation (Hofmann, *B.* 17, 1914).

Penta-methyl-phenyl-carbamine $C_6(CH_3)_5.NC$. [128°]. Formed by heating penta-methyl-phenyl-amine with chloroform and alcoholic NaOH (Hofmann, *B.* 18, 1824). Colourless crystals. V. sol. alcohol. At a few degrees above its melting-point it is transformed into the nitrile with evolution of heat.

METHYL-TRI-PHENYL-CARBINOL-CARBOXYLIC ACID *v.* Di-phenyl-tolyl-carbinol-carboxylic acid.

METHYL-PHENYLENE-DIAMINE *v.* Phenylene-methyl-diamine.

Di-methyl-phenylene-diamine *v.* Phenylene-di-methyl-diamine.

Tri-methyl-phenylene-diamine $C_9H_{14}N_2$ *i.e.* $C_6HMe_3(NH_2)_2$[1:2:4:3:5]. [84°]. Formed from nitro-ψ-cumidine by reduction (Mayer, *B.* 20, 970). Long needles, v. sol. benzene. $FeCl_3$ colours its solution deep red.

Isomerides *v.* Di-amido-mesitylene and Di-amido-ψ-cumene.

Tetra-methyl-phenylene-diamine $C_{10}H_{16}N_2$ *i.e.* ×$C_6Me_4(NH_2)_2$ [1:2:4:5:3:6]. Formed by reducing di-nitro-*s*-durene with zinc and HOAc (Nef, *A.* 237, 4). Pearly plates, v. sol. chloroform and alcohol, m. sol. ether. Its solutions are coloured green by atmospheric oxidation. $FeCl_3$ yields duroquinone. The hydrochloride is sl. sol. conc. HClAq.

Tetra-methyl-phenylene-diamine $C_6Me_4(NH_2)_2$ [1:2:4:3:5:6]. *Prehnitylene-diamine.* [140°]. Formed by reducing $C_6Me_4(NH_2)(NO_2)$ with tin and HCl (Töhl, *B.* 21, 906). Plates (from water), or needles (from alcohol); v. e. sol. alcohol, sl. sol. ether and ligroïn.—$B''H_2Cl_2$ aq: plates, v. e. sol. water, v. sl. sol. conc. HClAq. Coloured dark red by $FeCl_3$.

METHYL-DIPHENYLENE KETONE OXIDE *v.* Phenylene-tolylene ketone oxide.

DI-METHYL PHENYLENE-DIVINYL DI-KETONE $C_{14}H_{14}O_2$ *i.e.* $C_6H_4(CH{:}CH.CO.CH_3)_2$. [156°]. Formed by the action of NaOHAq on a mixture of acetone (10 pts.) and terephthalic aldehyde (1 pt.) (Loew, *A.* 231, 379). Needles, almost insol. water, alcohol, and ether, v. sol. chloroform, v. e. sol. acetone. With conc. H_2SO_4 it yields a deep-red solution.

METHYL-PHENYL-ETHYL-ALKINE *v.* Methyl-oxyethyl-aniline.

METHYL PHENYL-ETHYL KETONE *v.* BENZYL-ACETONE.

METHYL-PHENYL-GLYOXYLIC ACID *v.* TOLYL-GLYOXYLIC ACID.

Di-methyl-phenyl-glyoxylic acid *v.* XYLYL-GLYOXYLIC ACID.

Tetra-methyl-phenyl-glyoxylic acid [6:5:3:2:1] $C_6HMe_4.CO.CO_2H$. [124°]. Formed by oxidising the ketone $C_6HMe_4.CO.CH_3$ with cold aqueous $KMnO_4$ (Claus a. Foecking, *B.* 20, 3102). White scales, sl. sol. water, v. sol. alcohol and ether. Reduced by sodium-amalgam to tetra-methyl-mandelic acid $C_6HMe_4.CH(OH).CO_2H$.—KA' 5aq: crystalline, v. e. sol. water.—CaA'_2 9aq: nodules.—$BaA'_2$3aq: nodules.—AgA': white pp.

Tetra-methyl-phenyl-glyoxylic acid [6:4:3:2:1] $C_6HMe_4.CO.CO_2H$. Formed by oxidising the corresponding duryl methyl ketone with cold aqueous $KMnO_4$ (C. a. F.). Yellow liquid, sl. sol. water, v. sol. alcohol and ether. Solidifies when strongly cooled. Sodium-amalgam reduces it in alcoholic solution to the corresponding tetra-methyl-mandelic acid.—NaA' 5aq: white crystalline crusts.—BaA'_2 5aq: nodules.—CaA'_2 3aq: granules.—CuA'_2 5aq: green crystals, v. sol. water.—PbA'_2: white pp., v. sl. sol. water.—AgA': white pp., insol. water.

Tetra-methyl-phenyl-glyoxylic acid $C_{12}H_{14}O_3$ *i.e.* [5:4:3:2:1] $C_6HMe_4.CO.CO_2H$. Formed by oxidising the corresponding tetra-methyl-phenyl methyl ketone (Claus, *J. pr.* [2] 38, 232). Oil.—BaA'_3 4aq: needles. — CaA'_2 4aq: needles. — CuA'_2 3aq.

Penta-methyl-phenyl-glyoxylic acid $C_{13}H_{16}O_3$ *i.e.* $C_6Me_5.CO.CO_2H$. [122°]. Formed by the action of $AlCl_3$ on a mixture of penta-methyl-benzene and $ClCO.CO_2Et$ (Jacobsen, *B.* 22, 1218). Formed also by oxidising $C_6Me_5.CO.CH_3$ with alkaline $KMnO_4$. Prisms, v. sl. sol. cold water, v. sol. alcohol.—NaA' 3aq: plates, m. sol. cold water.—BaA'_2 5aq: nodules, v. sl. sol. cold water.—CuA'_2 5aq: needles.

HEXA-METHYL-DI-PHENYL-GUANIDINE $C_{19}H_{25}N_3$ *i.e.* $HN:C(NH.C_6H_2Me_3)_2$. *Di-mesityl-guanidine.* [218°]. Formed by heating $SC(NH.C_6H_2Me_3)_2$ with alcoholic NH_3 and lead oxide (Eisenberg, *B.* 15, 1014). Minute prisms, sol. alcohol and ether, insol. water.

Ennea-methyl-tri-phenyl-guanidine $C_{26}H_{35}N_3$ *i.e.* $C_6H_2Me_3N:C(NH.C_6H_2Me_3)_2$. [225°]. Formed by heating hexa-methyl-di-phenyl-thio-urea with alcoholic mesidine and lead oxide (E.). Small crystals, sol. alcohol, insol. water.

METHYL-PHENYL-HYDRAZINE *v.* PHENYL-METHYL-HYDRAZINE.

Tri-methyl-phenyl-hydrazine $C_9H_{14}N_2$ *i.e.* [1:2:4:5].$C_6H_2Me_3.NH.NH_2$. *ψ-Cumyl-hydrazine.* [120°]. Formed by boiling its sodium sulphonate with water (Haller, *B.* 18, 91). Needles (from ether); insol. water and alkalis, v. sol. alcohol and ether. With aceto-acetic ether it yields oxy-tetra-methyl-phenyl-pyrazole.

Sodium sulphonate $C_6H_2Me_3.NH.NH.SO_3Na$. Formed by warming diazo-ψ-cumene chloride with Na_2SO_3 and reducing the resulting $C_6H_2Me_3.N_2.SO_6Na$ with zinc-dust and HOAc (Haller). White plates (containing 1½aq.), sl. sol. cold water and alcohol, v. sol. hot water.

METHYL-PHENYL-DI-KETONE *v.* PHENYL-METHYL-DI-KETONE.

TRI-METHYL-PHENYL MERCAPTAN $C_9H_{12}S$ *i.e.* $C_6H_2Me_3.SH$. *Mesityl sulphydrate. Thiomesitol.* (229°). S.G. 1·0192. Formed by reducing mesitylene sulphochloride with zinc and H_2SO_4 (Holtmeyer, *Z.* 1867, 686). Liquid, volatile with steam; v. sol. alcohol, ether, and benzene.—$Hg(S.C_6H_2Me_3)_2$: white silky needles.

HEXA-METHYL-DI-PHENYL-METHANE $C_{19}H_{24}$ *i.e.* $CH_2(C_6H_2Me_3)_2$. *Di-mesityl-methane.* [c. 130°]. Formed by the action of H_2SO_4 on a mixture of $CH_2(OAc)_3$ and mesitylene dissolved in HOAc (Baeyer, *B.* 5, 1098). Monoclinic prisms (from ether).

Methyl-tri-phenyl-methane *v.* DI-PHENYL-TOLYL-METHANE.

TETRA-METHYL-PHENYL-DI-METHYL-AMINE $C_{12}H_{18}N$ *i.e.* $C_6HMe_4.NMe_2$. (237°). Formed from tetra-methyl-phenyl-amine [14°] by treatment with MeI and alcoholic soda (Hofmann, *B.* 17, 1914). Colourless liquid.—$B'_2H_2PtCl_6$: crystalline.

Penta-methyl-phenyl-methyl-amine $C_{12}H_{19}N$ *i.e.* $C_6(CH_3)_5.NHMe$. *Methyl-amido-penta-methyl-benzene.* [61°]. Colourless scales. Formed by heating penta-methyl-phenyl-amine with methyl iodide.—$B'_2H_2Cl_2PtCl_4$: needles (Hofmann, *B.* 18, 1824).

Penta-methyl-phenyl-di-methyl-amine $C_6(CH_3)_5.NMe_2$. *Di-methyl-amido-penta-methyl-benzene.* [54°]. Colourless scales. Formed by digesting penta-methyl-phenyl-amine with methyl iodide in presence of an alkali. Its methylo-iodide could not be obtained. — $B'_2H_2Cl_2PtCl_4$: needles (Hofmann, *B.* 18, 1824).

TETRA-METHYL-PHENYL-METHYL-CARBINOL [6:4:3:2:1] $C_6HMe_4.CH(OH).CH_3$. *Duryl-methyl-carbinol.* (above 300°). Formed by reducing duryl methyl ketone with zinc and HCl (Claus a. Foecking, *B.* 20, 3099). Pale-yellow liquid.

Tetra-methyl-phenyl-methyl-carbinol [6:5:3:2:1] $C_6HMe_4.CH(OH).CH_3$. [72°]. Formed by reducing *s*-duryl methyl ketone (C. a. F.). White plates.

METHYL-PHENYL METHYL KETONE *v.* TOLYL METHYL KETONE.

Di-methyl-phenyl methyl ketone *v.* XYLYL METHYL KETONE.

Tetra-methyl-phenyl methyl ketone $C_{12}H_{16}O$ *i.e.* [5:4:3:2:1] $C_6HMe_4.CO.CH_3$. *c-Duryl methyl ketone.* (260°). Formed from c-durene, AcCl, and $AlCl_3$ (Claus, *J. pr.* [2] 38, 231). Brownish, strongly refracting, oil, insol. water, sol. alcohol and ether. Oxidised by $KMnO_4$ to tetra-methyl-phenyl-glyoxylic and c-tetra-methyl-benzoic acids.

Phenyl-hydrazide [129°]. Plates.

Tetra-methyl-phenyl methyl ketone [6:4:3:2:1] $C_6HMe_4.CO.CH_3$. (254°). Formed from *u*-durene, AcCl, and $AlCl_3$ in CS_2 (Claus a. Foecking, *B.* 20, 3097). Colourless oil, v. sol. alcohol and ether. Volatile with steam. Reduced by zinc-dust and alcoholic KOH to the carbinol. Oxidised by $KMnO_4$ to tetra-methyl-phenyl-glyoxylic acid.

Phenyl-hydrazide. Needles, decomposing at 215°.

Oxim. [148°]. Plates.

Tetra-methyl-phenyl methyl ketone [6:5:3:2:1] $C_6HMe_4.CO.CH_3$. [63°]. (251°).

Formed by the action of $AlCl_3$ upon *s*-durene mixed with AcCl in CS_2 (C. a. F.). Plates.

Phenyl-hydrazide. Crystals, decomposing at 225°.

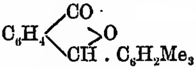
Penta-methyl-phenyl methyl ketone $C_{13}H_{18}O$ *i.e.* $C_6Me_5.CO.CH_3$. [85°]. (286°). Formed by the action of $AlCl_3$ on a mixture of penta-methyl-benzene and AcCl dissolved in CS_2 (Jacobsen, *B.* 22, 1218). Pearly plates, v. sol. alcohol, ether, and HOAc. Oxidised by $KMnO_4$ to penta-methyl-phenyl-glyoxylic acid.

DI-METHYL-PHENYL-PHOSPHINE *v.* PHENYL-DI-METHYL-PHOSPHINE.

METHYL-TRI-PHENYL-PHOSPHONIUM IODIDE *v. Methylo-iodide* of TRI-PHENYL-PHOSPHINE.

TRI-METHYL-PHENYL-PHTHALIDE

$C_{17}H_{16}O_2$ *i.e.*



$$C_6H_4{<}\begin{matrix}CO\\ >O\\ CH.C_6H_2Me_3\end{matrix}$$

. *Mesityl-phthalide. Phenyl-mesityl-carbinol carboxylic anhydride.* [164°]. Formed by treating an alcoholic solution of [5:3:1:2] $C_6H_2Me_3.CO.C_6H_4.CO_2H$ with zinc and HCl (Gresly, *A.* 234, 237). Short thick needles.

Tri-methyl-phenyl-phthalide $C_{17}H_{16}O_2$. *ψ-Cumyl-phthalide.* [140°]. Prepared as above, using the derivative of ψ-cumene instead of that of mesitylene (G.). Small needles.

Methyl-di-phenyl-phthalide *v.* DI-PHENYL-TOLYL-CARBINOL CARBOXYLIC-ANHYDRIDE.

METHYL-PHENYL-PSEUDO-PICOLO-STYRIL *v.* OXY-PHENYL-DI-METHYL-PYRIDINE.

METHYL-PHENYL-PROPYL-ALKINE *v.* METHYL-OXYPROPYL-ANILINE.

HEXA-METHYL-DI-PHENYL DISULPHIDE $C_{18}H_{22}S_2$ *i.e.* $(C_6H_2Me_3)_2S_2$. *Mesityl disulphide.* [125°]. Formed by atmospheric oxidation of tri-methyl-phenyl mercaptan in alkaline solution (Holtmeyer, *Z.* 1867, 688). Light-yellow laminæ or tables; insol. water, sol. alcohol, ether, and benzene.

OCTA-METHYL-DI-PHENYL SULPHONE *v.* DI-DURYL SULPHONE.

Deca-methyl-di-phenyl sulphone $C_{22}H_{30}SO_2$ *i.e.* $C_6Me_5.SO_2.C_6Me_5$. [98·5°]. Formed by the action of $ClSO_3H$ on penta-methyl-benzene (Jacobsen, *B.* 20, 896). Very long, slender needles (from ligroïn); v. sol. alcohol. Yields penta-methyl-benzene when heated with conc. HClAq at 170°, and in smaller quantity when distilled.

TRI-METHYL-PHENYL-THIO-CARBAMIC ETHER $C_{12}H_{17}NSO$ *i.e.* $C_6H_2Me_3NH.CS.OEt$ or $C_6H_2Me_3N{:}C(SH).OEt$. *Mesityl-thio-urethane.* [88°]. Formed by heating the corresponding thiocarbimide with alcohol at 140° (Eisenberg, *B.* 15, 1015). Slender needles; sol. alcohol, ether, and warm alkalis.

TRI-METHYL-PHENYL THIOCARBIMIDE $C_6H_2Me_3.NCS$. *Mesityl mustard oil.* [64°]. Formed by heating mesidine with CS_2 and some alcoholic potash (Eisenberg, *B.* 15, 1012). Long needles; sol. alcohol and ether.

Tetra-methyl-phenyl-thiocarbimide $C_{11}H_{13}NS$ *i.e.* $C_6HMe_4.NCS$. [65°]. Formed by boiling tetra-methyl-phenyl-amine [14°] with CS_2 and a little KOH (Hofmann, *B.* 17, 1915). Crystalline solid.

Penta-methyl-phenyl thiocarbimide $C_{12}H_{15}NS$ *i.e.* C_6Me_5NCS. [86°]. Formed, together with the corresponding thio-urea, by boiling penta-methyl-phenyl-amine with CS_2 (Hofmann, *B.* 18, 1827). Needles (from alcohol); volatile with steam.

TRI-METHYL-PHENYL THIO-UREA $C_{10}H_{14}N_2S$ *i.e.* $NH_2.CS.NH.C_6H_2Me_3$. *Mesityl-thio-urea.* [222°]. Formed by the action of ammonia on the corresponding thio-carbimide (Eisenberg, *B.* 15, 1013). Pearly plates; sol. ether and hot alcohol, insol. water.

Hexa-methyl-di-phenyl thio-urea $C_{10}H_{21}N_2S$ *i.e.* $CS(NH.C_6H_2Me_3)_2$. *Di-mesityl-thio-urea.* Formed by heating mesidine with CS_2 (Eisenberg, *B.* 15, 1013). Formed also by digesting tri-methyl-phenyl thiocarbimide with mesidine in alcoholic solution. White needles. Conc. H_3PO_4 converts it into the thiocarbimide.

Isomeride *v.* DI-ψ-CUMYL-THIO-UREA.

Octo-methyl-di-phenyl-thio-urea $C_{21}H_{28}N_2S$ *i.e.* $SC(NH.C_6HMe_4)_2$. [278°]. Formed by the action of CS_2 on tetra-methyl-phenyl-amine [14°] (Hofmann, *B.* 17, 1916). Four-sided plates (from alcohol); sl. sol. alcohol.

Deca-methyl-di-phenyl-thio-urea $C_{23}H_{32}N_2S$ *i.e.* $SC(NH.C_6Me_5)_2$. [252°]. Formed by the action of CS_2 upon penta-methyl-phenyl-amine (Hofmann, *B.* 18, 1827). White needles; sol. HOAc, v. sl. sol. alcohol.

TRI-METHYL-PHENYL-UREA *v.* ψ-CUMYL-UREA.

Hexa-methyl-di-phenyl-urea $C_{19}H_{24}N_2O$ *i.e.* $OC(NH.C_6H_2Me_3)_2$. *Di-mesityl-urea.* [above 300°]. Formed by the action of mesidine on tri-methyl-phenyl cyanate (Eisenberg, *B.* 15, 1017). Minute prisms; sl. sol. hot alcohol, insol. water.

Hexa-methyl-di-phenyl-urea $OC(NH.C_6H_2Me_3)_2$. *Di-ψ-cumyl-urea.* According to Frentzel (*C. C.* 1888, 1361) this substance melts between 260° and 270° (*cf.* vol. ii. p. 296).

METHYL-PHLOROGLUCINS *v.* PHLOROGLUCIN.

METHYL PHOSPHATES.

Methyl-phosphoric acid $MeO.PO(OH)_2$. Formed by slowly adding methyl alcohol to cooled $POCl_3$ (H. Schiff, *A.* 102, 334).—$BaA''2aq$: laminæ; much less soluble in boiling water than in warm water.—CaA'' (dried at 100°).

Di-methyl-phosphoric acid $(MeO)_2PO.OH$. Formed by pouring $POCl_3$ into methyl alcohol (Schiff). Acid syrup; sol. alcohol and ether. Its salts are more soluble than those of the preceding acid.—BaA'_2 (dried at 150°): pearly plates, nearly insol. alcohol.—$SrA'_2 2aq$.—$PbA'_2 x aq$.—CaA'_2 (dried at 100°): very soluble nodules.

Tri-methyl phosphate Me_3PO_4. (197° cor.). S.G. $\frac{0}{}$ 1·238 (Weger, *A.* 221, 89). S.V. 139·5 (Lossen, *A.* 254, 74).

METHYL-PHOSPHINE CH_5P *i.e.* $CH_3.PH_2$. Mol. w. 48. (−14°). V.D. 24·4 (calc. 24). S. (ether) 70 at 0°. Formed, together with di-methyl-phosphine, by heating PH_4I with MeI and ZnO at 150°. When water is added to the product $MePH_3I$ is decomposed, with evolution of $MePH_2$, while Me_2PH_2I remains (Hofmann, *B.* 4, 605). Formed also by heating chloroform with PH_4I and ZnO (Hofmann, *B.* 6, 302). Gas, with powerful odour. May be condensed by 2 atmospheres' pressure at 0°. Fumes in the air, and takes fire when gently warmed. Feeble base, being absorbed by conc. HClAq or conc.

$HIAq$, producing crystalline salts, which are decomposed by water into $MePH_2$ and the acid. When passed into fuming HNO_3 it yields methane phosphonic acid or 'methylphosphinic acid' $MePO(OH)_2$, which forms crystals, v. sol. water, melting at 105°. This acid is not attacked by aqua regia. It yields the salts $MePO_3Ba$, $MePO_3Pb$, and $MePO_3Ag_2$, and the chloride $MePOCl_2$ [32°] (163°).

Salts.—$MePH_2HCl$: four-sided plates, very volatile in the air, being dissociated.—$MePH_2HI$: laminæ.

Di-methyl-phosphine C_2H_7P *i.e.* $(CH_3)_2PH$. Mol. w. 62. (25°). Obtained by the action of caustic soda on its hydro-iodide, which is obtained as above described (Hofmann, *B.* 4, 610). Very volatile liquid which takes fire in the air. May be oxidised to $Me_2PO.OH$, a waxy solid, v. sol. water. This acid melts at 76°, forms crystalline $Me_2PO.OAg$ and is converted by PCl_5 into the chloride Me_2POCl [66°], (204°). This chloride is reconverted by water into the corresponding acid with less energy than $MePOCl_2$ (Hofmann, *B.* 5, 109; 6, 307).

Tri-methyl-phosphine C_3H_9P *i.e.* $P(CH_3)_3$. Mol. w. 76. (41°).

Formation.—1. By the action of $MeCl$ upon calcium phosphide (Thénard, *C. R.* 21, 144; 25, 892).—2. From sodium or zinc phosphide and MeI (Cahours a. Hofmann, *A. Ch.* [3] 41, 631; *Chem. Gaz.* 1855, 11).—3. From PCl_3 and $ZnMe_2$ (Hofmann a. Cahours, *C. R.* 104, 29).—4. From PH_3 and MeI (Drechsel a. Finkelstein, *B.* 4, 354; Hofmann, *B.* 4, 205, 430).—5. By heating CS_2 with PH_4I at 140° (Drechsel, *J. pr.* [2] 10, 180). 6. From phosphorus and MeI (Friedel a. Silva, *Wurtz's Dict.* 2, 938).

Preparation.—By treating PCl_3 with $ZnMe_2$ in an atmosphere of CO_2, decomposing the product with caustic soda, and distilling in a very slow current of hydrogen.

Properties.—Volatile oil with powerful nauseous odour; heavier than water. Forms readily soluble, crystallisable salts. Unites readily with halogens, oxygen, and sulphur. With $ClCH_2CO_2H$ at 100° it yields $PMe_3Cl.CH_2.CO_2H$ which forms the platinochloride $(C_5H_{12}PO_2)_2PtCl_6$ (Meyer, *B.* 4, 734; *C. J.* 24, 1066).

Salts.—$B'_2H_2PtCl_6$: orange-yellow crystalline pp.—B'_2PtCl_2 (Cahours a. Gal, *Z.* 1870, 662). Combines with CS_2 forming pale-red crystals of PMe_3CS_2, which slowly changes, in ethereal solution, into PMe_3S (Hofmann, *A. Suppl.* 1, 59).

Oxide PMe_3O. [138°] (Collie, *C. J.* 53, 637). (215°). Formed by exposing PMe_3 to a slow current of dry air. Deliquescent crystals. Formed also, together with CH_4, by distilling PMe_4OH. Yields a platinochloride $(PMe_3O)_3H_2PtCl_6aq$ crystallising in orange plates or needles.

Sulphide PMe_3S. [105°]. Obtained by gradually adding flowers of sulphur to PMe_3, or by distilling PMe_3 with cinnabar. Not formed from the oxide and H_2S or ammonium sulphide. Four-sided prisms (from concentrated aqueous solution). When warmed with a solution of a silver salt Ag_2S is deposited as a black mirror (Collie).

Selenide PMe_3Se. [84°]. Formed from PMe_3 and selenium. Blackens in the air, depositing selenium.

Methylo-hydroxide $PMe_4.OH$. Formed by treating PMe_4I with moist Ag_2O. Caustic base, split up on distillation into PMe_3O and CH_4.

Methylo-iodide PMe_4I. *Tetra-methyl-phosphonium-iodide.* Formed from PMe_3 and MeI (Hofmann a. Cahours, *A.* 104, 31). Formed also, together with PMe_3, by heating PH_4I (1 mol.) with $MeOH$ (3 mols.) at 180° (Hofmann, *B.* 4, 208). Silvery crystals.

Methylo-chloride PMe_4Cl. From PMe_4OH and HCl. Deliquescent crystals, decomposed by heat into PMe_3HCl and ethylene (Collie, *C. J.* 53, 637).—$(PMe_4Cl)_2PtCl_4$: glistening yellow octahedra, insol. water.—PMe_4AuCl_4: brilliant yellow needles (from boiling water).

Methylo-sulphate ×$(PMe_4)_2SO_4$. Formed from PMe_4I and Ag_2SO_4 (Collie). Thick deliquescent needles. Does not form an alum with $Al_2(SO_4)_3$. Above 300° it decomposes, giving PMe_3O and PMe_3S.

Methylo-carbonate ×$PMe_4O.CO_2H$. Decomposes above 100° into PMe_3O, CO_2, and CH_4 (Collie).

Methylo-acetate ×PMe_4OAc. Decomposed by heat chiefly into PMe_3O and acetone, with traces of PMe_3 and $MeOAc$.

Benzoate PMe_4OBz. Formed by neutralising a solution of PMe_4OH with $HOBz$ (Collie, *C. J.* 53, 639). Deliquescent crystals, v. sol. water. Decomposes between 250° and 300° almost completely into PMe_3O and acetophenone.

Ethylo-chloride PMe_3EtCl. Obtained from PMe_3EtI (Collie, *C. J.* 53, 718). Decomposes above 300° into PMe_3HCl, PMe_2EtHCl, and ethylene.—$(PMe_3EtCl)_2PtCl_4$: octahedra.

Ethylo iodide PMe_3EtI. *Tri-methyl-ethyl-phosphonium iodide.* From PMe_3 and EtI in ether (Cahours a. Hofmann, *A.* 104, 33). Crystallises from boiling water. Deliquescent; sol. ether.

Isoamylo-iodide $PMe_3C_5H_{11}I$. Deposited slowly from an ethereal solution of PMe_3 and $C_5H_{11}I$ (Hofmann). Needles (from alcohol). Yields $(PMe_3C_5H_{11}Cl)_2PtCl_4$, crystallising from boiling water in splendid needles aggregated in spherules.

Bromo-ethylo-bromide $C_5H_{13}Br_2$ *i.e.* $CH_2Br.CH_2PMe_3Br$. From PMe_3 and a large excess of ethylene bromide in alcoholic solution at 60°. Trimetric prisms; $a:b:c = \cdot568:1:\cdot407$ Hofmann, *Tr.* 1860, 590). With Ag_2O it yields $CH_2(OH).CH_2.PMe_3OH$ whence the platinochloride $(CH_2(OH).CH_2.PMe_3Cl)_2PtCl_4$ may be got.

Ethyleno-di-bromide $(PMe_3Br)_2C_2H_4$. Formed from ethylene bromide and excess of PMe_3 at 100°. Very deliquescent monoclinic crystals, $a:b:c = 1{\cdot}054:1:1{\cdot}126$; $\beta = 37°49'$. Yields $C_2H_4(PMe_3Cl)_2PtCl_4$, which crystallises from boiling $HClAq$ in golden-yellow laminæ. Successive treatment with moist Ag_2O and HI forms $C_2H_4(PMe_3I)_2$, crystallising in sparingly soluble needles.

Tri-methyl-tri-ethyl-di-phosphine ethyleno-dibromide $(PMe_3Br)C_2H_4(PEt_3Br)$. Formed from PMe_3 and $CH_2Br.CH_2.PEt_3Br$. Yields a caustic hydroxide and the platinochloride $(PMe_3Cl)C_2H_4(PEt_3Cl)PtCl_4$.

Tetra-methyl-di-phosphine? P_2Me_4 or $(PMe_2)_x$. (250°). Found among the products of the action of MeCl on calcium phosphide, or of MeI on sodium phosphide (Thénard; Hofmann a. Cahours, *A.* 104, 4). Liquid, with unpleasant odour, taking fire in the air. Insol. water. Decomposed by HCl into PMe_3, and a yellow powder P_4Me_2(?).

METHYL PHOSPHITE MeH_2PO_3. *Methylphosphorous acid.* Formed by gradually adding PCl_3 to methyl alcohol (Schiff, *A.* 103, 164). Acid syrup, resolved by heat into MeOH and phosphorous acid. Its salts are slightly crystalline hygroscopic masses, v. sol. water, sl. sol. alcohol, insol. ether. In aqueous solution they decompose, slowly in the cold, but rapidly on heating, into MeOH and metallic phosphites.— $Ba(MeHPO_3)_2$. — $Ca(MeHPO_3)_2$ 2aq. — $Pb(MeHPO_3)_2$.

Tri-methyl phosphite Me_3PO_3. (185°). S.G. $_{15}$ 1·1785. Formed from PCl_3 and NaOMe (Jaehne, *A.* 256, 281). The compound $Me_3PO_3PtCl_2$ is formed by the action of MeOH on POl_3PtCl_2 (Schützenberger, *Bl.* [2] 18, 101, 157). It crystallises in orange needles and yields $(Me_3PO_3)_2PtCl_2$ and $(Me_3PO_3)_2PtCl_2N_2H_6$.

METHYL-PHTHALIC ACID *v.* TOLUENE DICARBOXYLIC ACID.

Di-methyl-phthalic acid *v.* XYLENE DICARBOXYLIC ACID.

Tetra-methyl-phthalic acid *v.* TETRA-METHYL-BENZENE DICARBOXYLIC ACID.

METHYL-PHTHALIDE $C_9H_8O_2$ *i.e.*

$C_6H_4\left<\substack{CHMe\\CO}\right>O$. (276°). V.D. 74 (obs. and calc.). Formed by reducing acetophenone carboxylic acid with sodium-amalgam and acidifying the resulting $CO_2Na.C_6H_4.CH(OH).CH_3$ (Gabriel a. Michael, *B.* 10, 2205; 20, 2500). Thick oil, solidifying below 0°. Insol. water and cold alkalis, v. sol. alcohol and ether, sl. sol. ligroïn. Boiling alkalis convert it into salts of the acid, which forms a crystalline silver salt $CO_2Ag.C_6H_4.CH(OH).CH_3$.

Di-methyl-phthalide $C_{10}H_{10}O_2$ *i.e.*

$C_6H_4\left<\substack{CMe_2\\CO}\right>O$. [68°]. (160°) at 25 mm.; (271°) at 760 mm. Formed by the action of zinc-dust and MeI on phthalic anhydride at 100° under a slightly increased pressure (Wislicenus, *A.* 248, 56). Crystallises from ether in large crystals which are doubly refracting.

Reactions.—1. Converted by the action of conc. KOHAq into the K salt of o-oxy-iso-propyl benzoic acid.—2. *Sodium amalgam* yields the **dihydride**

$C_6H_4\left<\substack{CMe_2\\CH(OH)}\right>O$ [90°], a yellow amorphous powder, insol. water, sol. alcohol and ether, which reduces Fehling's solution and ammoniacal $AgNO_3$.—3. Reduction with HI yields *o*-iso-propyl-benzoic acid. —4. *Potassium cyanide* at 250° forms *o*-propenyl-benzoic acid $CH_2:CMe.C_6H_4.CO_2H$ [61°].

METHYL-PHTHALIMIDE *v.* *Methylimide* of PHTHALIC ACID.

METHYL-PHTHALIMIDINE C_9H_9NO *i.e.*

$C_6H_4\left<\substack{CH_2\\CO}\right>NMe$. [120°]. (300°).

Formation.—1. By reducing methyl-phthalimide

$C_6H_4\left<\substack{CO\\CO}\right>NMe$ with tin and HClAq (Graebe, *A.* 247, 303).—2. By heating a solution of phthalimidine in aqueous KOH with excess of MeI for 6 hours at 100° (Barbier, *C. R.* 107, 918).—3. By heating phthalide with alcoholic methylamine for 12 hours at 220° (B.).

Properties.—Slender needles or plates, v. sol. water, alcohol, and ether. Oxidised by $KMnO_4$ to methyl-phthalimide and, finally, to phthalic acid. Combines with bromine forming $(C_9H_9NO)_2Br_6$, crystallising in needles [150°].

Salts.—Hydrochloride. [120°]. Prisms. B'_2HAuCl_4: yellow prisms, sl. sol. cold water.

a-METHYL-HOMO-o-PHTHALONITRILE *v.* *o-Cyano-phenyl-propionitrile.*

METHYLPIASELENOL *v.* *Organic* SELENIUM COMPOUNDS.

METHYL-PIAZTHIOLE $C_7H_8N_2S$ *i.e.*

$\left[3:\substack{6\\5}\right]C_6H_3Me\left<\substack{N\\|\\N}\right>S$. [34°]. (234°). Mol. w. (by Raoult's method) 143 (calc. 150). Formed by heating tolylene *o*-diamine with H_2SO_3 at 180° (Hinsberg, *B.* 22, 2900). Yields a periodide when treated with I in HIAq. Br in $CHCl_3$ forms $C_7H_5BrN_2S$ which crystallises in white needles [98°]. A mixture of conc. H_2SO_4 and HNO_3 forms $C_7H_5(NO_2)N_2S$ crystallising in colourless needles [156°].

Salt.—$B'_2H_2PtCl_6$: reddish-yellow crystals, decomposed by water.

METHYL-PIPECOLINE *v.* DI-METHYL-PYRIDINE-HEXAHYDRIDE.

METHYL-PIPERIDINE *v.* METHYL-PYRIDINE HEXAHYDRIDE.

METHYL-PROPARGYL-AMINE C_4H_7N *i.e.* $CH_3.NH.C:C.CH_3$. Formed by the action of MeI on propargylamine in alcoholic solution (Paal a. Hermann, *B.* 22, 3083). Very volatile yellowish liquid, with ammoniacal odour.—B'HI. [83°]. Groups of long hygroscopic needles.—$B'H_2C_2O_4$. [141°]. Slender white needles, sl. sol. alcohol.

METHYL-PROPIONIC ACID *v.* BUTYRIC ACID.

METHYL-PROPYL-ACETAL *v.* ALDEHYDE.

METHYL-PROPYL-ACETIC ACID *v.* HEXOIC ACID.

METHYL-PROPYL-ACETOACETIC ETHER *v.* ACETOACETIC ACID.

METHYL-ISOPROPYL-ACETONE *v.* METHYL ISOAMYL KETONE.

DI-METHYL-PROPYL-ALKINE *v.* DI-METHYL-OXYPROPYL-AMINE.

DI-METHYL-ISOPROPYL-ALLYL-CARBINOL *v.* ENNENYL ALCOHOL.

TRI-METHYL-PROPYL-AMMONIUM IODIDE NMe_3PrI. *Propylo-iodide* of *trimethylamine.* [190°]. Formed by heating propylamine with alcoholic NMe_3 (Langeli, *G.* 16, 385). Long needles. Yields crystalline NMe_3PrCl and $(NMe_3PrCl)_2PtCl_4$. The hydroxide NMe_3PrOH is decomposed by heat into propylene and NMe_3.

METHYL-PROPYL-ANILINE $C_{10}H_{15}N$ *i.e.* $C_6H_5.NMePr$ (212° uncor.). Liquid. Prepared by the action of methyl iodide upon propylaniline (Claus a. Hirzel, *B.* 19, 2785; *cf.* Nölting, *J.* 1883, 702).—B'HCl: very hygroscopic crystals, [106°].

Ethylo-iodide *v.* *Propylo-iodide* METHYL-ETHYL-ANILINE.

METHYL-PROPYL-BENZENE *v.* CYMENE.

s-**Methyl-di-propyl-benzene** $C_{13}H_{20}$ *i.e.* $C_6H_3Me(C_3H_7)_2$[1:3:5]. (243°–248°). Formed by the action of H_2SO_4 on a mixture of acetone and methyl *n*-propyl ketone (Jacobsen, *B.* 8, 1259). Yields uvitic acid on oxidation with dilute HNO_3.

***s*-Di-methyl-propyl-benzene** $C_{11}H_{16}$ *i.e.* $C_6H_3Me_2.C_3H_7$ [1:3:5] (206°–210°). Formed by the action of H_2SO_4 (3 vols.) on a mixture of acetone (4 vols.) and methyl propyl ketone (2 vols.) (Jacobsen, *B.* 8, 1259). Oxidised by boiling dilute HNO_3 to mesitylenic acid.

***u*-Di-methyl-propyl-benzene** $C_{11}H_{16}$ *i.e.* $C_6H_3Me_2Pr$ [1:4:2]. (206°). Formed from bromo-*p*-xylene, propyl bromide, and sodium (Uhlhorn, *B.* 23, 2350). Liquid, not solidified at −20°. Yields a tri-nitro- derivative [85°], and a tri-bromo- derivative [49°].

Sulphonic acid $C_6H_2Me_2Pr.SO_3H$. Salts.—BaA'_2.—NaA' 1½aq.—
Amide $C_6H_2Me_2Pr.SO_2NH_2$. [125°].—
Anilide $C_6H_2Me_2Pr.SO_2NHPh$. [216°].

***u*-Di-methyl-propyl-benzene** $C_6H_3Me_2Pr$[1:3:4]. (208°). Formed from bromo-*m*-xylene, propyl bromide, and Na (Uhlhorn). Liquid, not solid at −20°. Yields a tri-nitro- derivative [110°] and a tri-bromo- derivative [39°]. May be oxidised to (1,3,4)-di-methyl-benzoic acid.

Sulphonic acid $C_6H_2Me_2Pr.SO_3H$. Groups of needles. — Salts. — NaA' 4½aq.— BaA'_2 2aq.—MgA'_2 5aq.—
Amide $C_6H_2Me_2Pr.SO_2NH_2$ [102°].—
Anilide $C_6H_2Me_2Pr.SO_2NHPh$. [c. 182°].

***u*-Di-methyl-propyl-benzene** $C_6H_3Me_2Pr$ [1:2:4]. (209°). Formed from bromo-*o*-xylene, propyl bromide and sodium (Uhlhorn, *B.* 23, 2349). Liquid, not solid at − 20°. Yields on oxidation (1,2,4)-di-methyl-benzoic acid [162°].

Sulphonic acid $C_6H_2Me_2Pr.SO_3H$. Thin needles.—Salts.—BaA'_2 3½aq.—
Amide $C_6H_2Me_2Pr.SO_2NH_2$. [124°].—
Anilide $C_6H_2Me_2Pr.SO_2NHPh$. [214°].

***u*-Di-methyl-isopropyl-benzene** $C_6H_3Me_2Pr$ [1:3:4]. (194°). Formed from bromo-*m*-xylene, isopropyl bromide, and sodium (U.). Liquid. Yields a tri-bromo- derivative [261°] and a tri-nitro- derivative [182°].

Sulphonic acid $C_6H_2Me_2Pr.SO_3H$. Needles.—Salts.—NaA' 4aq.—BaA'_2.—
Amide $C_6H_2Me_2Pr.SO_2NH_2$. [163°].—
Anilide $C_6H_2Me_2Pr.SO_2NHPh$. [207°].

METHYL-PROPYL-BENZOIC ACID $C_{11}H_{14}O_2$ *i.e.* $C_6H_3Me(C_3H_7)CO_2H$. *Carbocymolic acid.* [63°]. Obtained from its nitrile, which is produced by distilling potassium cymene sulphonate with KCy (Paterno a. Fileti, *B.* 8, 442; Paterno a. Spica, *G.* 9, 400).

Amide $C_6H_3Me(C_3H_7).CONH_2$. [139°]. Obtained by boiling the nitrile with alcoholic potash. Needles, sl. sol. cold water.

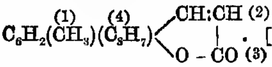
METHYL-PROPYL-CARBINOL *v.* *Sec*-AMYL ALCOHOL.

Di-methyl-propyl-carbinol *v.* *Tert*-HEXYL ALCOHOL.

Methyl-di-propyl-carbinol *v.* OCTYL ALCOHOL.

METHYL PROPYL CARBONATE $C_5H_{10}O_3$ *i.e.* $CH_3O.CO.OC_3H_7$. (131° cor.). S.G. $\frac{27}{}$ ·978 (Röse, *A.* 205, 230).

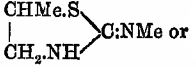
METHYL-PROPYL-COUMARIN $C_{13}H_{14}O_2$ *i.e.*



$$\overset{(1)}{}\overset{(4)}{}C_6H_2(CH_3)(C_3H_7)\left\langle\begin{matrix}CH{:}CH\ (2)\\ |\\ O-CO\ (3)\end{matrix}\right.$$

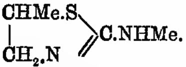
. [53°]. (220°–230°). Formed by heating a mixture of thymol, malic acid and H_2SO_4 (Pechmann a. Welsh, *B.* 17, 1647). Fine white needles. V. sol. alcohol, ether, benzene, acetic acid, and chloroform, v. sl. sol. water.

METHYL-PROPYLENE-ψ-THIO-UREA $C_5H_{10}N_2S$ *i.e.*



$$\left.\begin{matrix}CHMe.S\\ |\\ CH_2.NH\end{matrix}\right\rangle C{:}NMe$$

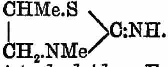
or



$$\left.\begin{matrix}CHMe.S\\ |\\ CH_2.N\end{matrix}\right\rangle C.NHMe$$

. *Methyl-amido-methyl-thiazole dihydride.* [50°]. Formed by the action of methyl thiocarbimide on β-oxy-propylamine (Hirsch, *B.* 23, 971). Long needles (from ligroïn), v. sol. water. Its aqueous solution is strongly alkaline.—$B'_2H_2PtCl_6$. [143°]. Large dark-red needles (from hot water). — $B'C_6H_2(NO_2)_3OH$. [145°]. Needles. — Compound with methyl thiocarbimide B'MeNCS. [64°]. White columns (from MeOH).

Methyl-propylene-ψ-thio-urea $C_5H_{10}N_2S$ *i.e.*

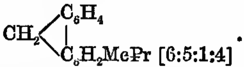


$$\left.\begin{matrix}CHMe.S\\ |\\ CH_2.NMe\end{matrix}\right\rangle C{:}NH$$

. *Imido-di-methyl-thiazole tetrahydride.* Formed from propylene-ψ-thio-urea, MeI, and KOH (Gabriel, *B.* 22, 2989). Converted by bromine water into the acids $NHMe.CH_2.CHMe.SO_3H$ [220°–223°] and $CONH_2.NMe.CH_2.CHMe.SO_3H$. [230°–240°].

METHYL-PROPYL-ETHANE *v.* HEXANE.

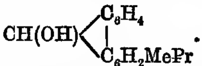
METHYL-ISOPROPYL-FLUORENE $C_{17}H_{18}$ *i.e.*



$$CH_2\left\langle\begin{matrix}C_6H_4\\ |\\ C_6H_2MePr\ [6{:}5{:}1{:}4]\end{matrix}\right.$$

. *Retene-fluorene.* [97°]. Formed by passing the vapour of methyl-isopropyl-di-phenylene ketone (retene ketone) through a red-hot tube (Bamberger a. Hooker, *A.* 229, 142). Formed also by heating this ketone with HIAq and phosphorus in sealed tubes. White plates, v. sol. cold ether, hot alcohol, and HOAc. In the fused state, or in alcoholic solution, it exhibits violet fluorescence. It yields a di-nitro- derivative [245°].

METHYL-ISOPROPYL-FLUORENE ALCOHOL $C_{17}H_{18}O$ *i.e.*



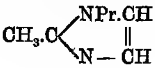
$$CH(OH)\left\langle\begin{matrix}C_6H_4\\ |\\ C_6H_2MePr\end{matrix}\right.$$

. [134°]. Formed by the reduction of methyl-isopropyl-di-phenylene ketone (Bamberger a. Hooker, *A.* 229, 144). White needles, insol. water, v. sol. alcohol and ether. Readily oxidised back to the ketone. The acetate melts at 71°.

METHYL-PROPYL-GLUTARIC ACID $CO_2H.CHPr.CH_2.CHMe.CO_2H$. [102°]. Formed from sodium propyl-malonic ether and bromo-isobutyric ether, the product being saponified, and the resulting $(CO_2H)_2CHPr.CH_2.CHMe.CO_2H$ [168°] being decomposed by heat (Bischoff, *B.* 23, 1940). White aggregates of crystals (from petroleum-ether).

DI-METHYL-PROPYL-GLYCOLLINE *v.* DI-METHYL-DI-OXY-PROPYL-AMINE.

METHYL-PROPYL-GLYOXALINE $C_7H_{12}N_2$ *i.e.*

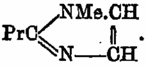


$$CH_3.C\left\langle\begin{matrix}NPr.CH\\ \|\\ N-CH\end{matrix}\right.$$

. *Oxal-propyl-ethyline.*

(225°). S.G. ·9641. Formed by the action of propyl-bromide on methyl-glyoxaline (glyoxal-ethyline) (Radziszewski, *B.* 16, 489). Colourless liquid.

Methyl-propyl-glyoxalins



$$\mathrm{PrC}\begin{matrix}\diagup\mathrm{NMe.CH}\\ \quad\quad\|\\ \diagdown\!\!\diagdown\mathrm{N{-\!\!-}CH}\end{matrix}.$$

Oxal-methyl-butyline. (215° at 722 mm.). S.G. $\frac{20}{}$ ·985. From propyl-glyoxaline and MeI (Rieger, *M.* 9, 606). Oil, v. sol. alcohol, ether, and chloroform.—$B'_2H_2PtCl_6$: orange-red prisms.

METHYL-PROPYL-GLYOXAL *v.* METHYL-PROPYL-DIKETONE.

DI-METHYL-PROPYLIDENE DIKETONE $C_7H_{12}O_2$ *i.e.* $(CH_3.CO)_2CHEt$. *Ethyl-acetyl-acetone.* (179°). Prepared by heating the sodium derivative of methylene di-methyl diketone with EtI at 140° (Combes, *A. Ch.* [6] 12, 248; *C. R.* 104, 920). Colourless liquid with pleasant odour, sl. sol. water, miscible with ether, alcohol, and chloroform. Decomposed by potash into CH_3CO_2K and $CH_3.CO.CH_2Et$. Combines with $NaHSO_3$. Sodium yields $(CH_3.CO)_2CNaEt$ which reacts with alkyl iodides.

METHYL PROPYL KETONE $C_5H_{10}O$ *i.e.* $CH_3.CO.C_3H_7$. *Ethyl-acetone.* (102°). S.G. $\frac{15}{15}$ ·8124; $\frac{25}{25}$ ·8044 (Perkin, *C. J.* 45, 479); $\frac{22}{}$ ·805 (F. a. D.). H.F.p. 72,410. H.F.v. 69,400 (Thomsen, *Th.*). M.M. 5·499 at 16·1° (P.).

Formation.—1. By distilling calcic acetate (48 g.) mixed with calcic butyrate (65 g.), and rectifying the product. The yield (10 g.) is small (Semljanitzin, *J. pr.* [2] 23, 263; *cf.* Friedel, *A. Ch.* [4] 16, 366; *A.* 108, 124; Grimm, *A.* 157, 251).—2. By boiling ethyl-acetoacetic ether with potash or baryta (Frankland a. Duppa, *A.* 138, 216).—3. By the action of $ZnMe_2$, followed by water, on butyryl chloride (Butlerow, *Bl.* [2] 5, 17).—4. By the oxidation of *sec-n*-amyl alcohol (Wurtz, *A.* 148, 133; Schorlemmer, *C. J.* 25, 1085; *A.* 161, 269; Wagner a. Saytzeff, *A.* 179, 322).—5. By the action of water and $HgBr_2$ on valerylene (Kutscheroff, *B.* 14, 1542).—6. By the action of KOH on $(CH_3.CO)_2CHEt$ (Combes, *A. Ch.* [6] 12, 248).

Properties.—Liquid, v. sl. sol. water. Combines with hydrogen sodium sulphite, forming $C_5H_{10}(OH)SO_3Na\ \frac{1}{2}aq$ (Grimm). Reduced by means of sodium-amalgam to *sec*-amyl alcohol $CH_3.CH(OH).CH_2Et$ (119° cor.) (Belohoubek, *Sitz. W.* [2] 74, 80) and a pinacone $C_{10}H_{22}O_2$ (225°–230°). Yields acetic and propionic acids on oxidation (Schorlemmer); Wagner obtained butyric acid (*Bl.* [2] 38, 264). PCl_5 forms $CH_3.CCl_2.CH_2Et$, whence alcoholic potash produces $CH\vdots C.CH_2Et$, and this is converted by alcoholic potash at 170° into $CH_3.C\vdots CEt$ (56°) (Favorsky, *J. R.* 1887. 414). $CH_3.CCl_2.CH_2Et$ is split up on distillation into HCl and C_5H_9Cl (c. 95°). Amyl nitrite and HCl or NaOEt forms the nitroso- derivative $C_3H_7.CO.CH:NOH$ [48°–51°], which is also an oxim of propyl-glyoxal. From this oxim may be prepared the compounds $C_3H_7.C(NOH).CH(NOH)$ [168°] and $C_3H_7.C(N_2HPh).CH(N_2HPh)$ [163°] (Claisen a. Manasse, *B.* 22, 528).

Oxim $C_3H_7.C(NOH).CH_3$. Oil. Converted by gaseous HCl in HOAc at 100° into propylamine and acetic acid (Beckmann, *B.* 20, 2580).

Methyl isopropyl ketone $C_5H_{10}O$ *i.e.* $CH_3.CO.CH(CH_3)_2$. *Di-methyl-acetone. 'Amylene oxide.'* (94°). S.G. $\frac{0}{}$ ·822; $\frac{19}{}$ ·805 (Winogradoff); $\frac{12}{}$ ·810 (F. a. D.). C.E. (0°–18°) ·00118.

Formation.—1. By the action of baryta-water on di-methyl-aceto-acetic ether (Frankland a. Duppa, *Pr.* 14, 463; *A.* 138, 332).—2. By the dry distillation of a mixture of calcium isobutyrate and calcium acetate (Münch, *B.* 7, 1370; *A.* 180, 327).—3. By the action of tin and HClAq on di-nitro-heptoic acid, which is one of the products of the action of nitric acid on camphor (Kachler, *A.* 191, 162).—4. From amylene glycol $(CH_3)_2C(OH).CH(OH).CH_3$ by dehydration with P_2O_5 (Flavitzky, *B.* 10, 2240).—5. From $(CH_3)_2CH.CH(OH).CH_2(OH)$ by dehydration with $ZnCl_2$ or P_2O_5 (F.).—6. From $(CH_3)_2C(OH).CH(OH).CH_3$, by heating with dilute HCl at 100°, and treating the product with potash (Bauer, *C. R.* 51, 55; A. 115, 91; Eltekoff, *J. R.* 14, 358).—7. By shaking $(CH_3)_2CH.C\vdots CH$ with diluted H_2SO_4 (S.G. 1·64) (Flavitzky a. Kryloff, *J. R.* 10, 347).—8. By oxidising Me.CH(OH).Pr by CrO_3 (Winogradoff, *A.* 191, 133).—9. By heating $(CH_3)_2CBr.CHBr.CH_3$ with water and PbO at 150° (Eltekoff, *J. R.* 10, 215), or by digesting it with water alone (Niederist, *A.* 196, 360; Nägeli, *B.* 16, 2983).—10. By heating Me.CH(OH).Pr with excess of dilute (1 p.c.) H_2SO_4 at 100° (Kondakoff, *J. R.* 17, 300).

Properties.—Liquid. Gives the iodoform reaction with iodine and potash. Forms a crystalline compound with $NaHSO_3$. On oxidation it yields acetone and acetic acid, and finally CO_2 and acetic acid.

Oxim $CH_3.C(NOH).CHMe_2$. (158°). From the ketone and hydroxylamine (Nägeli, *B.* 16, 2984). Formed also by heating the oxim of di-methyl-acetoacetic acid above 97° (Wallach, *A.* 248, 178).

Reference.—CHLORO-METHYL ISOPROPYL KETONE.

Methyl propyl diketone $C_6H_{10}O_2$ *i.e.* $CH_3.CO.CO.CH_2.CH_2.CH_3$. *Acetyl-butyryl.* (128°). S.G. $\frac{19}{4}$ ·9343. Obtained by boiling its mono-oxim with dilute H_2SO_4 (Von Pechmann, *B.* 21, 2140). Yellow oil, with irritating odour like quinone.

Mono-oxim $CH_3.CO.C(NOH).C_3H_7$. *Isonitroso-propyl-acetone.* [49·5°]. Formed by the action of nitrous acid on propyl-acetoacetic ether (Treadwell, *B.* 14, 2159). Large plates. With phenyl cyanate it reacts with formation of $CH_3.CO.CPr:NO.CO.NHPh$ [93°] (Goldschmidt, *B.* 22, 3108), whence hydroxylamine yields $CH_3.C(NOH).CPr:NO.CO.NHPh$ [129°–131°].

Di-oxim $CH_3.C(NOH).C(NOH).C_3H_7$. *Methyl-propyl-glyoxim.* [168°]. Formed by the action of hydroxylamine hydrochloride in aqueous-alcoholic solution on isonitroso-propyl-acetone (Schramm, *B.* 16, 2185). Small needles. With phenyl cyanate it reacts with formation of CMe(NO.CO.NHPh).CPr(NO.CO.NHPh), crystallising in pearly plates [164°–170°] (Goldschmidt a. Strauss, *B.* 22, 3108).

Oxim-phenyl-hydrazide $C_{12}H_{17}N_3O$ *i.e.* $CMe(N_2HPh).CPr(NOH)$. [130·5°]. Formed by the action of phenyl-hydrazine acetate on the mono-oxim (Otte a. Pechmann, *B.* 22, 2121). Needles, sl. sol. dilute NaOHAq. Gives a violet colour with H_2SO_4 and $FeCl_3$.

(α)-*Phenyl-hydrazide* $C_{12}H_{16}N_2O$ *i.e.* Me.C(N_2HPh).COPr. [114°]. Formed by the action of phenyl hydrazine on the diketone (O. a. P.). Insol. water and ligroïn, v. sol. alcohol and ether. With conc. H_2SO_4 and FeCl it gives a red colour.

(β)-*Phenyl-hydrazide* $C_{12}H_{16}N_2O$ *i.e.* Me.CO.C(N_2HPh).Pr. [109°]. Formed from propyl-acetoacetic acid by the action of diazobenzene chloride in presence of NaOAc (Japp a. Klingemann, *A.* 247, 220). Colourless needles (from benzene and ligroïn).

Di-phenyl-di-hydrazide $C_{18}H_{22}N_4$ *i.e.* Me.C(N_2HPh).C(N_2HPh).Pr. [136·5°]. Formed as a yellow pp. when excess of phenyl-hydrazine acetate is added to the ketone, its phenyl-hydrazide, or its oxim-phenyl-hydrazide (Otte a. Pechmann, *B.* 22, 2121). Yellow needles (from benzene), more easily soluble than its homologues with fewer atoms of carbon in the molecule.

Methyl isopropyl diketone $C_6H_{10}O_2$ *i.e.* CH_3.CO.CO.CH(CH_3)$_2$. *Acetyl-isobutyryl.* (116°). Formed by boiling its oxim with dilute H_2SO_4 (Von Pechmann, *B.* 21, 2140; 22, 2122). Yellow liquid, with irritating odour, sl. sol. water.

Oxim CH_3.CO.C(NOH).CHMe$_2$. *Isonitroso-methyl-isobutyl-ketone.* [75°]. Formed by the action of nitrous acid on isopropyl-acetoacetic ether (Westenberger, *B.* 16, 2991). White plates, sol. alcohol, ether, alkalis, and hot water.

METHYL-PROPYL-KETONE CARBOXYLIC ACID *v. Ethyl*-ACETOACETIC ACID.

Methyl-propyl-ketone tricarboxylic acid CH_3.CO.CH(CH_2.CO_2H).CH(CO_2H)$_2$. *α-Carboxy-β-acetyl-glutaric acid.* [121°–124°]. The tri-ethyl ether is formed by the action of chloro- or bromo-lævulic (acetyl-propionic) ether upon sodio-malonic ether. Colourless crystalline solid. At 160° it splits off CO_2, giving acetoglutaric acid. The neutral NH_4 salt gives pps. with $AgNO_3$, $BaCl_2$, and Pb(OAc)$_2$. The zinc salt is a very soluble amorphous solid.

Tri-ethyl ether A‴Et$_3$: (285°–295°); oil (Conrad a. Guthzeit, *B.* 19, 43).

METHYL - ISOPROPYL - KETONE - CARBOXYLIC ALDEHYDE. *Di-oxim* $C_6H_{11}N_2O_2$ *i.e.* CH_3.C(NOH).CH_2CMe.CH:NOH. [90°]. Formed from di-methyl-pyrrole and hydroxylamine (Ciamician, *B.* 23, 1788). Small needles or prisms, v. sol. alcohol, and water, sl. sol. ether. Reduces Fehling's solution. Sodium reduces it in alcoholic solution to di-methyl-tetra-methylene-diamine.

METHYL-PROPYL-DI-KETOXIM *v. Oxim* of METHYL-PROPYL-DIKETONE.

METHYL-ISOPROPYL-MALONIC ACID $C_7H_{12}O_4$ *i.e.* CO_2H.CMePr.CO_2H. [124°]. Formed by saponifying its ether (Van Romburgh, *R. T. C.* 5, 236). Crystallises from benzene. Split up at 150°–200° into CO_2 and a hexoic acid.

Salts.—CaA′$_2$. V. sol. water.—AgA′: white pp.

Ethyl ether Et$_2$A″. (221°). S.G. $\frac{15}{}$ ·990. Formed from sodio-malonic ether, MeI, and PrI. Colourless liquid with agreeable odour.

METHYL PROPYL OXIDE $C_4H_{10}O$ *i.e.* CH_3.O.Pr. (38·9°). S.G. $\frac{0}{0}$ ·7471. S.V. 105·1. C.E. (0° to 10°) ·00146 (Dobriner, *A.* 243, 2; *cf.* Chancel, *A.* 151, 305).

METHYL-PROPYL-PHENOL *v.* CARVACROL, CYMENOL, and THYMOL.

Tetrahydride v. BORNEOL and CINEOL.

DI-METHYL-PROPYLPHENYL-AMINE C_6H_4(C_3H_7).NMe$_2$. *Di-methyl-phenpropyl-amine.* (230° uncor.). Formed by the action of sodium on a mixture of propyl bromide and di-methyl-*p*-bromo-aniline (Claus a. Howitz, *B.* 17, 1327). Colourless oil.

Methylo-iodide B′MeI: [168°]; plates.

METHYL - ISOPROPYL - PHENYL CARBAMINE *v. Iso*-CYMYL CARBAMINE.

METHYL-PROPYL-PHENYLENE-DIAMINE C_6H_2Me(C_3H_7)(NH_2)$_2$. Formed by reducing the di-oxim of thymoquinone with tin and HCl (Liebermann, *B.* 18, 3193). Oxidised by CrO_3 or $FeCl_3$ to thymoquinone.—B″H_2Cl_2: needles.

METHYL-ISOPROPYL-DIPHENYLENE KETONE $C_{17}H_{16}O$ *i.e.*  $CO\left<\begin{array}{l}C_6H_4\\ \vert\\ C_6H_2Me(C_3H_7)\end{array}\right.$. *Retene-ketone.* [90°]. Formed by oxidising retene-glycolic acid $C_{10}H_{16}$.C(OH).CO_2H (Bamberger a. Hooker, *A.* 229, 136). Formed also from retene-quinone by the action of alkaline $KMnO_4$ or by passing it over red-hot Ba(OH)$_2$ or PbO (Ekstrand, *B.* 17, 692). Yellow prismatic needles or rectangular trimetric plates (by spontaneous evaporation), v. sol. ligroïn, benzene, chloroform, alcohol, and HOAc. Volatile with steam and with vapour of alcohol. Does not react with hydroxylamine or with $NaHSO_3$. Reacts with phenyl-hydrazine. Reduced by sodium-amalgam to methyl-isopropyl-fluorene alcohol (*q. v.*), and by red-hot zinc-dust to methyl-isopropyl-fluorene.

METHYL - ISOPROPYL - PHENYL - ETHYL-GUANIDINE *v. Iso*-CYMYL-ETHYL-GUANIDINE.

METHYL-PROPYL-PHENYL-GLYOXYLIC ACID $C_{12}H_{14}O_3$ *i.e.* [2:5:1] C_6H_3MePr.CO.CO_2H. Formed by oxidising the ketone C_6H_3MePr.CO.CH_3 with cold aqueous $KMnO_4$ (Claus, *B.* 19, 233). Thick oil, easily decomposing into CO_2 and C_6H_3MePr.CHO. Dilute nitric acid yields C_6H_3Me(CO_2H)$_2$.

METHYL-PROPYL-PHENYL METHYL KETONE $C_{12}H_{16}O$ *i.e.* C_6H_3MePr.CO.CH_3. (248°). Formed from cymene, AcCl, and $AlCl_3$ (Claus a. Cropp, *B.* 19, 232).

METHYL - ISOPROPYL - PHENYL - THIO-ETHYL-UREA *v. Iso*-CYMYL-ETHYL-THIO-UREA.

DI-METHYL-DI-ISOPROPYL-DI-PHENYL-THIO-UREA *v. Di-iso*-CYMYL-THIO-UREA.

METHYL - ISOPROPYL - PHENYL - UREA *v. Iso*-CYMYL-UREA.

METHYL - ISOPROPYL - PHENYL - URETHANE *v. Iso*-CYMYL-CARBAMIC ETHER.

METHYL-ISOPROPYL-PHOSPHINE $C_4H_{11}P$ *i.e.* CH_3.PH.C_3H_7. (79°). Obtained by heating isopropyl-phosphine with MeI at 100° (Hofmann, *B.* 6, 299).

DI-METHYL-DI-PROPYL-PYRAZINE $C_{12}H_{20}N_2$ *i.e.*  $N\left<\begin{array}{l}CMe.CPr\\ CPr{:}CMe\end{array}\right>N$. *Di-propyl-ketine.* (233°–245°). Prepared by the reduction of the oxim of methyl propyl diketone (nitroso-methyl-butyl-ketone) with tin and HCl (Treadwell, *B.* 14, 1461, 2160; Oeconomides, *B.* 19, 2526). Oil, with narcotic odour, turning brown in the air.—B′$_2H_2PtCl_6$: red octahedra, sl. sol. water.—B'AgNO$_3$aq: crystals, insol. cold water.

METHYL-PROPYL-PYRIDINES. Parvoline. The base obtained by the action of P_2O_5 on a mixture of propionic aldehyde and acetamide (Hesekiel, *B.* 18, 3097) has been shown by Dürkopf a. Göttsch (*B.* 23, 685) to yield pyridine tricarboxylic acid on oxidation, and must therefore be di-methyl-ethyl-pyridine (*q. v.*). Parvolines, which must be C_5HMe_4N, $C_5H_3Me(C_3H_7)N$, $C_5H_2Me_2EtN$, or $C_5H_3Et_2N$, occur in crude paraffin oil (Williams, *C. J.* 7, 97), in coal-tar (Thenius, *J.* 1861, 502), in the product of the distillation of cinchonine with KOH (Oechsner de Coninck, *Bl.* [2] 34, 214), and in putrid flesh (Gautier, *Bl.* 48, 11).

Di-methyl-propyl-pyridine $C_{10}H_{15}N$ *i.e.* $C_5H_2NMe_2Pr$ (1:3:5). *n-Propyl-lutidine. Coridine.* (c. 195°) at 718 mm. Formed by distilling potassium di-methyl-propyl-pyridine dicarboxylate with lime (Jæckle, *A.* 246, 37). Colourless liquid; sl. sol. water, v. sol. alcohol and ether. Its hydrochloride is crystalline.—$B'_2H_2PtCl_6$. [185°].

Isomeride *v.* CORIDINE.

ν-Methyl-isopropyl-pyridine hexahydride $C_9H_{19}N$ *i.e.*

$CH_2{<}\begin{smallmatrix}CH_2.CH_2\\CH_2.CHPr\end{smallmatrix}{>}NMe$. (167°). S.G. $\frac{0}{0}$ ·8593. Formed by adding the calculated quantity of MeI to a solution of isopropyl-pyridine hexahydride in MeOH, evaporating and distilling the residue with potash (Ladenburg, *A.* 247, 77). Oil, smelling like coniine.—$B'HAuCl_4$. [131°]. Plates, sl. sol. water.—$B'_2H_2PtCl_6$. [100°]. Plates, v. sol. water and alcohol, insol. ether.—Picrate $B'C_6H_2(NO_2)_3OH$. [149°].

Di-methyl-propyl-pyridine hexahydride $C_{10}H_{21}N$ *i.e.*

$CHPr{<}\begin{smallmatrix}CH_2.CHMe\\CH_2.CHMe\end{smallmatrix}{>}NH$. *Propyl-lupetidine.* (c. [180°]) at 718 mm. Obtained by reducing di-methyl-propyl-pyridine in alcoholic solution with sodium (Jaeckle, *A.* 246, 46). Colourless oil. Gives a brownish pp. with $FeCl_3$, and a yellowish pp. with $MnSO_4$.—$B'_2H_2PtCl_6$. [197°]. Orange stellate needles.

DI-METHYL-PROPYL-PYRIDINE DICARBOXYLIC ACID $C_{12}H_{15}NO_4$ *i.e.*

$CPr{<}\begin{smallmatrix}C(CO_2H).CMe\\C(CO_2H):CMe\end{smallmatrix}{>}N$. [247°]. Formed by saponifying its ether, which is obtained by oxidation, with nitrous gas, from the product of the action of ammonia on butyric aldehyde mixed with acetoacetic ether (Jaeckle, *A.* 246, 36). Colourless prisms (containing aq). When anhydrous it melts at 247°, but at 212° when hydrated. V. e. sol. hot, m. sol. cold, water. Yields di-methyl-propyl-pyridine when distilled with lime.

Ethyl ether Et_2A''. (308°) at 715 mm. Light-yellow oil. Saponified by boiling first with aqueous, and then with alcoholic, potash.—$(C_{16}H_{23}NO_2)_2H_2PtCl_6$. [187°]. Orange prisms.

Dihydride of the ethyl ether

$CHPr{<}\begin{smallmatrix}C(CO_2Et):CMe\\C(CO_2Et):CMe\end{smallmatrix}{>}NH$. [118°]. Formed by condensation of butyric aldehyde with acetoacetic ether and ammonia (Jaeckle, *A.* 246, 34). Yellowish-white prisms; v. sol. alcohol and ether, insol. water.

Di-methyl-isopropyl-pyridine dicarboxylic ether. *Dihydride*

$CHPr{<}\begin{smallmatrix}C(CO_2Et):CMe\\C(CO_2Et):CMe\end{smallmatrix}{>}NH$. [97°]. Formed by the action of alcoholic ammonia on a mixture of isobutyric aldehyde and acetoacetic ether (Engelmann, *A.* 231, 47). Long prisms (from 90 p.c. alcohol). Oxidised by nitrous acid, in presence of alcohol, to di-methyl-pyridine dicarboxylic ether $C_5HMe_2N(CO_2Et)_2$.

METHYL-DI-ISOPROPYL-QUINOLINE DIHYDRIDE $C_{16}H_{23}N$. (299°). Formed by heating di-iso-propyl-indole with MeI and MeOH (Dennstedt, *B.* 21, 3437). Oil.—$B'_2H_2PtCl_6$. [177°].

METHYL PROPYL-STYRIL KETONE $C_{13}H_{16}O$ *i.e.* $C_6H_4(C_3H_7).CH:CH.CO.CH_3$. *Cuminal-acetone.* (181° at 23 mm.). Formed by the action of dilute (10 p.c.) NaOHAq upon a mixture of cuminic aldehyde (20 g.), acetone (20 g.), water (300 g.), and alcohol (170 g.) (Claisen a. Ponder, *A.* 223, 147). Yellow oil.

METHYL ISOPROPYL SULPHIDE $C_4H_{10}S$ *i.e.* MeSPr. (93°–95°). V.D. 45·02. Formed by dissolving sodium in an ethereal solution of isopropyl mercaptan, and slowly adding MeI to the product (Obermeyer, *B.* 20, 2923).

METHYL PROPYL DITHIOCARBONATE $MePrCS_2O$. *Methyl propyl xanthate.* S.G. $\frac{4}{4}$ 1·084 (Nasini a. Scala, *G.* 17, 66).

s-METHYL-PROPYL-THIO-UREA $C_5H_{12}N_2S$ *i.e.* $CH_3.NH.CS.NHC_3H_7$. [79°]. Prepared from methyl-thiocarbimide and propylamine, or from propyl thiocarbimide and methylamine (Otto Hecht, *B.* 23, 284). Transparent glassy plates (from very dilute alcohol); sl. sol. cold water, m. sol. hot water, v. sol. alcohol and wood-spirit, extremely sol. acetone and chloroform, v. sol. ether, benzene, and CS_2, v. sl. sol. warm light petroleum.

DI-METHYL-PYRAZINE $C_6H_8N_2$ *i.e.*

$N{<}\begin{smallmatrix}CMe.CH\\CH:CMe\end{smallmatrix}{>}N$. *Ketine. Di-methyl-aldine* (Meyer, *B.* 21, 19). (170°–180°). Formed by reduction of nitroso-acetone with tin and HCl (Treadwell a. Steiger, *B.* 15, 1059, 1055; Oeconomides, *B.* 19, 2526; Wolff, *B.* 20, 433). Formed also by heating its dicarboxylic acid. Oil, with alkaloidal odour.—$B''H_2PtCl_6$: golden plates sol. hot water.

Tetra-methyl-pyrazine $C_8H_{12}N_2$ *i.e.*

$N{<}\begin{smallmatrix}CMe.CMe\\CMe:CMe\end{smallmatrix}{>}N$. *Methyl-ketine. Di-methyl-ketine. Tetra-methyl-aldine.* [86°]. (190°). Formed by reducing with tin and HCl the oxim of di-methyl-diketone (methyl nitroso-ethyl ketone) $CH_3.CO.C(NOH).CH_3$ (Gutknecht, *B.* 13, 1116; Treadwell, *B.* 14, 1469; Braun a. V. Meyer, 21, 1947). An intermediate base appears to be C_4H_6N (Braun, *B.* 22, 556). Tetra-methyl-pyrazine is also formed, together with CO_2 and other products, by heating $CH_3.CO.CHBr.CH_2.CO_2H$ or $CH_3.CO.CH(OH).CH_2.CO_2H$ with conc. NH_3Aq (Wolff, *B.* 20, 427). Glistening prisms (anhydrous) or long white needles (containing 3aq). Very volatile. Melts at 74°–77° when hydrated, but at 86° when anhydrous. Strong characteristic smell. V. sol. alcohol and ether. By alkaline $KMnO_4$ it is oxidised to pyrazine-tetracarboxylic acid $C_4N_2(CO_2H)_4$.

Salts.—$B''HCl$ 2aq: easily soluble, [91° anhy.].—$B''_2H_2Cl_2PtCl_4$: red glistening needles.—$B''H_2Cl_2PtCl_4$ 4aq orange-red needles.

Methylo-iodide B″MeI: [216°] anhy. Yellow needles (containing 2aq); v. sol. water and alcohol, insol. ether.

Methylo-chloride B″MeCl: [c. 105°]; needles.—B″MeClHClPtCl$_4$ aq: orange-red pyramids (from hot water).

DI-METHYL-PYRAZINE DICARBOXYLIC ACID $C_8H_8N_2O_4$ *i.e.*  $N\left\langle\begin{array}{l}CMe.C(CO_2H)\\C(CO_2H):CMe\end{array}\right\rangle N$. [201°]. Prepared by saponification of its ether, which is formed by reducing nitroso-acetoacetic ether with stannous chloride (Wleügel, *B.* 15, 1050). Formed also by oxidising di-methyl-di-ethyl-pyrazine by aqueous $KMnO_4$, and by condensation of imido-oximido-butyric ether $CH_3.C(NH).C(NOH).CO_2Et$ by warm $ZnCl_2$ (Oeconomides, *B.* 19, 2524).

Properties.—Colourless crystals (containing 2aq), melting at 201° when anhydrous. V. sol. alcohol and acetone, m. sol. hot water and toluene, nearly insol. ether, benzene, and ligroïn. Decomposes when heated above 200° into CO_2 and di-methyl-pyrazine.

Salts.—BaA″3aq: glistening crystals.—*K_2A'': slender felted needles. Gives amorphous pps. with $FeCl_3$ and $CuSO_4$.—Ag_2A'': yellowish-white pp.

Ethyl ether Et_2A''. [86°]. (316° cor.). Long colourless needles, sol. alcohol.

METHYL-PYRAZOLONE v. Oxy-methyl-pyrazole.

(α)-**METHYL-PYRIDINE** C_6H_7N *i.e.*  $N\left\langle\begin{array}{l}CMe.CH\\CH:CH\end{array}\right\rangle CH$. (α)-*Picoline.* Mol. w. 93. (129°) (L.); (133·4° cor.) (Thorpe, *C. J.* 37, 223). S.G. $\frac{0}{4}$ ·9656 (L.); ·9616 (T.). C.E. (0°–10°) ·000975; (0°–100°) ·0010968 (T.). S.V. 111·5.

Occurrence.—In bone-oil (Anderson, *A.* 60, 86; Weidel, *B.* 12, 2008), where it is mixed with a little (β)-picoline and di-methyl-pyridine (Ladenburg, *B.* 18, 49). It is also the chief constituent of coal-tar-picoline (Goldschmidt a. Constam, *B.* 16, 2976).

Formation.—1. By heating pyridine (α)-carboxylic acid with fuming HIAq at 260°, or by treating the acid with zinc and HOAc (Seyfferth, *J. pr.* [2] 34, 244).—2. By the action of aldehyde on aldehyde-ammonia (Dürkopf a. Schlaugk, *B.* 21, 297).—3. By heating pyridine methylo-iodide in sealed tubes at 300° (Ladenburg, *A.* 247, 7; *C. R.* 103, 692).

Preparation.—Crude pyridine (50 g. boiling between 128° and 134°) is dissolved in HClAq (170 g. of 11 p.c.), and a hot solution of $HgCl_2$ (312 g.) in water (4½ litres) is poured in. The double salt crystallises out, and, after recrystallisation, is decomposed by aqueous NaOH (Ladenburg, *A.* 247, 6).

Properties.—Liquid, inactive to light, miscible with water and alcohol. Picoline lessens the heart's action, and acts on the nervous system somewhat like nicotine (Oechsner, *Bl.* [2] 38, 547).

Reactions.—1. Yields pyridine (α)-carboxylic (picolinic) acid on oxidation (Weidel).—2. When heated with sodium it yields di-methyl-dipyridyl. 3. *Methylal* and $ZnCl_2$ yield $CH_2(C_6H_6N)_2$.—4. *Chloral* forms $C_5NH_4.CH_2.CH(OH).CCl_3$ [87°], the hydrochloride of which $C_8H_8NOCl_3HCl$ melts at 202°. Alcoholic potash converts it into pyridyl-acrylic acid (Einhorn a. Liebrecht, *B.* 20, 1592).—5. *Paraldehyde* at 260° forms allyl-pyridine $C_5NH_4.C_3H_5$ (190°), S.G. ^{0} ·9595 (Ladenburg, *A.* 247, 26). Its aurochloride melts at 136°, its platinochloride at 186°. Allyl-pyridine is reduced in alcoholic solution by sodium to coniïne.—6. *Furfuraldehyde* and a little $ZnCl_2$ at 170° yields $C_5H_4N.CH:CH.C_4H_3O$ [53°] (Merck, *B.* 21, 2709), v. Furfuryl-vinyl-pyridine. In alcoholic solution it is reduced by sodium to the hexahydride of furfuryl-ethyl-pyridine (*q.v.*). 7. *Glycolic chlorhydrin* at 140° forms a compound $C_8H_{11}NO$, which yields the salts $B'_2H_2PtCl_6$ [200°] and $B'HAuCl_4$ [100°] (Alexander, *B.* 23, 2714).

Salts.—$B'_2H_2PtCl_6$aq. [178°]. Monoclinic tables or prisms, sl. sol. water.—$B'_2H_2PtCl_6$2aq (Weidel). — $B'_2H_2PtCl_6$. [195°]. Monoclinic plates; $a:b:c$ = ·6636:1:·9078; β = 72° 46′ (Stöhr, *J. pr.* [2] 42, 420).—$B'HAuCl_4$. [168°]. Needles, sl. sol. water.—$B'HHg_2Cl_5$. [154°]. Prisms (from dilute HClAq), v. sl. sol. cold, v. sol. hot, water.—B'_2ZnCl_2 (at 120°). Crystals (from alcohol) (Lachovitch a. Bandrowsky, *M.* 9, 517).

Picrate $B'C_6H_2(NO_2)_3OH$. [165°]. M. sol. water (Lange, *B.* 18, 3436).

(α)-Methyl-pyridine tetrahydride $C_6H_{11}N$ *i.e.*  $NH\left\langle\begin{array}{l}CMe:CH\\CH_2.CH_2\end{array}\right\rangle CH_2$. Formed by the action of alcoholic NH_3 upon methyl ω-bromo-butyl-ketone, probably by elimination of water from the intermediate $CH_3.CO.CH_2.CH_2.CH_2.CH_2.NH_2$ (Lipp, *B.* 19, 2843).

(α)-Methyl-pyridine hexahydride $C_6H_{13}N$ *i.e.*  $NH\left\langle\begin{array}{l}CHMe.CH_2\\CH_2\quad .CH_2\end{array}\right\rangle CH_2$. (α)-*Methyl-piperidine.* (α)-*Pipecoline.* (119°). S.G. $\frac{0}{0}$ ·8600. Obtained by reducing (α)-methyl-pyridine in alcoholic solution with sodium (Ladenburg a. Roth, *B.* 18, 47; *A.* 247, 62; *C. R.* 103, 747). Colourless liquid, smelling like piperidine, v. sol. water, alcohol, and ether. Separated by KOH from its aqueous solution. Inactive, but if a crystal of hydrogen coniïne tartrate be added to a conc. solution of the acid tartrate, crystals of the acid tartrate of dextrorotatory (α)-methyl-pyridine hexahydride separate, while the salt of the lævorotatory isomeride remains as an oil. The rotation of the dextro-(α)-methyl-piperidine is $[\alpha]_D$ = 21°44′, while that of the lævo- base is (probably) equal and opposite.

Reactions.—1. Treatment with Br and NaOHAq yields (α)-pipecoleïn $C_6H_{11}N$, an oily base (126°), S.G. ^{0} ·880 (Ladenburg, *B.* 20, 1645). Its acetyl derivative boils at about 230°.—2. Combines with sulphide of carbon, forming methyl-piperidine methyl-piperyl-di-thio-carbamate $C_6H_{12}N.CS.SC_6H_{14}N$, [119°], v. e. sol. water and alcohol.

Salts.—B′HCl. [189°]. Colourless needles, v. sol. water. Not deliquescent.—B′HBr. [182°]. Silky matted needles, m. sol. water.—The platinochloride is v. sol. water.—The mercurichloride forms sparingly soluble plates.

(β)-Methyl-pyridine C_6H_7N *i.e.*  $N\left\langle\begin{array}{l}CH.CMe\\CH:CH\end{array}\right\rangle CH$. *m-Picoline.* (β)-*Picoline* (144° cor.). S.G. $\frac{0}{4}$ ·9771 (L.); ·9765 (B.).

Occurrence.—In bone-oil (Weidel, *B.* 12, 2008) and in coal-tar (Mohler, *B.* 21, 1009).

Formation.—1. By distillation of acroleïn-ammonia (Baeyer, *A.* 155, 283; *cf.* Claus, *A.*

Suppl. 2, 134; 130, 185; 158, 222).—2. By heating $CH_2Br.CHBr.CH_2Br$ with alcoholic ammonia at 250° (Baeyer).—3. By distilling strychnine with lime (Stoehr, *B.* 20, 2728; Löbisch a. Malfatti, *M.* 9, 632).—4. By heating acetamide (10 g.) with glycerin (32 g.) and P_2O_5 (26 g.) (Zanoni, *J.* 1882, 498; Hesekiel, *B.* 18, 3091).—5. Together with homologues, by distilling glycerin with $(NH_4)_2SO_4$ and a little H_2SO_4 (Storch, *B.* 19, 2458).—6. One of the bases got by distilling brucine with lime (Behrend, *J. pr.* [2] 42, 415).—7. Together with tri-methylene-imine (66°–70°) by distilling tri-methylene-diamine hydrochloride (Ladenburg a. Sieber, *B.* 23, 2729).

Purification.—By digesting in hydrochloric acid solution with $NaNO_2$ on a water-bath, followed by crystallisation of its mercury double salt (Bachér, *B.* 21, 293).

Properties.—Liquid. When prepared from strychnine it boils at 149°, and the base so obtained (called (β′)-methyl-pyridine) is less soluble in water than the variety boiling at 144°, and forms a platinochloride melting at 258° instead of 241° (Ladenburg, *B.* 23, 2688). Optically inactive (Landolt, *B.* 19, 157). Less soluble in water than (α)-picoline. The absorption spectrum has been studied by Hartley (*C. J.* 41, 45). Oxidised by a 2 p.c. solution of $KMnO_4$ to pyridine (β)-carboxylic (nicotinic) acid.

Salts.—$B'_2H_2PtCl_6$ aq. Monoclinic prisms, v. sol. hot water. Melts, when anhydrous, at 191° (L.) or 195° (Stoehr). On heating at 120° for some time it gives off HCl, leaving B'_2HPtCl_5 [214°]. A boiling aqueous solution deposits B'_2PtCl_4, while B'_2HPtCl_5 crystallises from the filtrate—$B'HAuCl_4$. [184°]. Needles (from hot water), v. sol. alcohol.—$B'HHg_2Cl_5$. [143°]. Needles (from water), plates or needles (from HClAq) or prisms (on slow crystallisation); v. sl. sol. water, more sol. HClAq.—B'_2HgCl_2: white pp.—$B'_2H_2ZnCl_4$. [158°]. Pearly needles, v. sol. hot water.—Picrate $B'C_6H_2(NO_2)_3OH$. [145°]. Needles or plates, m. sol. water and alcohol.

(β)-Methyl-pyridine hexahydride $C_6H_{13}N$ *i.e.*

$NH<\begin{matrix}CH_2.CHMe\\CH_2.CH_2\end{matrix}>CH_2$. *(β)-Methyl-piperidine.* *(β)-Pipecoline.* *(β)-Picoline hexahydride.* (125°). S.G. $\frac{0}{0}$ ·8684. V.D. (H=1) 98·14. Obtained by reducing (β)-picoline in alcoholic solution with sodium (Ladenburg, *A.* 247, 67; Stoehr, *B.* 20, 2732; Hesekiel, *B.* 18, 910). Colourless liquid, smelling like piperidine, v. sol. water. When heated with MeI it forms $C_6H_{12}NMe_2I$ [192°]. The hydrochloride of (β)-methyl-pyridine hexahydride is not ppd. by $HgCl_2$.

Salts.—B′HCl. Colourless needles, v. e. sol. water and alcohol.—B′HI. [131°]. Colourless, non-deliquescent needles.—$B'_2H_2PtCl_6$. [192°]. Orange-yellow prisms, m. sol. water.—$B'HAuCl_4$. [131°]. M. sol. water.—$B'_2H_2CdI_4$aq. White plates, melting at 145° when anhydrous. $B'_2H_4FeCy_6$ 2aq: yellow monoclinic prisms, less soluble than the ferrocyanides of homologous bases. Decomposed by water at 75°.—Picrate $B'C_6H_2(NO_2)_3OH$. [138°]. Yellow pp., m. sol. water.

(γ)-Methyl-pyridine C_6H_7N *i.e.*

$N<\begin{matrix}CH.CH\\CH:CH\end{matrix}>CMe$. *p-Picoline.* *(γ)-Picoline.* (143·5° cor.). S.G. $\frac{0}{}$ ·9742.

Occurrence.—In coal tar, from which it may be obtained by preparing its platinochloride from the so-called lutidine (Schulze, *B.* 20, 413; Ladenburg, *B.* 21, 285; *A.* 247, 11).

Formation.—1. By heating di-chloro-pyridine (γ)-carboxylic acid with conc. HIAq and P at 175° (Behrmann a. Hofmann, *B.* 17, 2696).—2. In small quantity by heating pyridine methylo-iodide in sealed tubes at 300°, distilling the product with KOH, converting the fraction (142°–146°) into platinochloride, and decomposing the Pt salt by H_2S (L.).—3. By distilling sparteïne with lime (Ahrens, *B.* 21, 828).

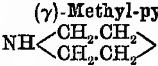
Properties.—Oil, smelling like (α)-methyl-pyridine, v. sol. water, alcohol, and ether. Oxidised by dilute $KMnO_4$ to pyridine (γ)-carboxylic (isonicotinic) acid. [307°].

Salts.—$B'_2H_2PtCl_6$. [231°]. Four-sided plates, sl. sol. cold water.—$B'HAuCl_4$. [205°]. Prisms, v. sl. sol. water.—$B'HHg_2Cl_5$. [129°]. Needles, v. sol. hot, sl. sol. cold, water.—Picrate $B'C_6H_2(NO_2)_3OH$. [167°]. Tufts of needles, sl. sol. cold water.

(γ)-Methyl-pyridine dihydride C_6H_9N *i.e.*

$NH<\begin{matrix}CH:CH\\CH:CH\end{matrix}>CHMe$. Formed from ethyl-pyrrole and HClAq at 130° (Dennstedt a. Zimmermann, *B.* 19, 2197).—$B'_2H_2PtCl_6$; red needles, v. sol. water.

(γ)-Methyl-pyridine hexahydride $C_6H_{13}N$ *i.e.*



$NH<\begin{matrix}CH_2.CH_2\\CH_2.CH_2\end{matrix}>CHMe$. *(γ)-Pipecoline.* (126·5°–129° cor.). S.G. $\frac{0}{}$ ·8674. Obtained by reducing (γ)-methyl-pyridine in alcoholic solution by sodium (Ladenburg, *B.* 21, 288; *A.* 247, 69). Colourless hygroscopic liquid which fumes in the air, and smells like piperidine. V. sol. water.

Salts.—B′HCl: v. e. sol. water.—$B'_2H_2PtCl_6$. [203°]. Prisms, m. sol. water.—$^{\times}B'HAuCl_4$. [127°]. Yellow needles, sl. sol. water.—$^{\times}B'_2H_2CdI_4$. [135°].—Bismutho-iodide: characteristic red plates. The picrate and mercury double chloride are crystalline.

ν-Methyl-pyridine dihydride C_6H_9N *i.e.*

$NMe<\begin{matrix}CH:CH\\CH:CH\end{matrix}>CH_2$ (?). (129°). Obtained by distilling pyridine methylo-iodide with KOH (2 pts.) and a little water (Hofmann, *B.* 14, 1498). Very pungent oil, almost insol. water. Absorbs oxygen from the air. Combines with bromine, with iodine, and with sulphur. Combines with CS_2 and with mercaptan. Conc. HClAq at 180° decomposes it, giving off methylamine.

ν-Methyl-pyridine hexahydride $C_6H_{13}N$ *i.e.*

$NMe<\begin{matrix}CH_2.CH_2\\CH_2.CH_2\end{matrix}>CH_2$. *Methyl-piperidine.* (105°) (L.). Formed by adding potash to the product of spontaneous union of piperidine with MeI (Cahours, *A. Ch.* [3] 38, 76). Formed also by heating piperidine hydrochloride (10 g.) with MeOH (7·5 g.) for 4 hours at 300°, excess of alcohol being distilled off, and the dry residue distilled with aqueous potash (Ladenburg, *A.* 247, 56). Liquid.—B′HCl. Needles.—$B'_2H_2PtCl_6$. Orange crystals, v. sol. water.

Methylo-iodide B′MeI. Crystalline; m. sol. hot alcohol. When heated with solid KOH it yields oily 'di-methyl-piperidine' (118°), a strongly alkaline base, which is decomposed by gaseous HCl into methyl chloride and methyl-piperidine. 'Di-methyl-piperidine' forms the salts $C_7H_{15}NHCl$ and $C_7H_{15}NHAuCl_4$. It combines with halogens, forming crystalline $C_7H_{15}NI_2$, $C_7H_{15}NICl$ (which yields $C_7H_{15}NIClAuCl_3$), and $C_7H_{15}NBr_2$. The latter is converted by moist Ag_2O into crystalline $C_7H_{14}NBr$, whence further treatment with moist Ag_2O produces $C_7H_{14}NOH$ which is split up on distillation into H_2O and 'di-methyl-piperideïne.' Ladenburg suggests the formula $CH_2{:}CH.CH_2.CH_2.CH_2.NMe_2$ for 'di-methyl-piperidine,' and Merling (*B.* 19, 2628) suggests  $CH_2\left<\begin{matrix}CHBr.CH_2\\CH_2.CH_2\end{matrix}\right>NMe_2Br$ for the compound $C_7H_{15}NBr_2$. This dibromide is accompanied by an oily isomeride which may possibly be $CH_2Br.CHBr.CH_2.CH_2.CH_2.NMe_2$, which changes into the other variety on heating its alcoholic solution. The di-iodide $C_7H_{15}NI_2$ is converted, on treatment with Ag_2O into 'di-methyl-piperideïne' $C_7H_{13}N$, a liquid (137°–140°) which forms the salts $(C_7H_{13}N)_2H_2PtCl_6$ and $(C_7H_{13}N)HAuCl_4$, and a methylo-iodide $C_7H_{13}NMeI$. 'Di-methyl-piperidine' combines with MeI forming crystalline $C_7H_{15}NMeI$ [200°] whence moist Ag_2O forms strongly alkaline $C_7H_{15}NMeOH$ which is split up by heat into pirylene C_5H_8, water, NMe_3, MeOH, and di-methyl-piperidine. Di-methyl-piperidine also combines with methylene iodide forming $C_7H_{15}NCH_2I_2$ (Ladenburg, *B.* 14, 1347). Ladenburg suggests for di-methyl-piperideïne the formula  $CH\left<\begin{matrix}CH.CH_2\\ |\\ CH_2.CH.NMe_2\end{matrix}\right.$

Methyl pyridine from Bone-oil. The following salts described by Ramsay (*P. M.* Oct. 1876 and 1877; July 1878) were prepared from a methyl-pyridine obtained from Dippel's oil, which was probably (α)-methyl-pyridine mixed with a little (β)-methyl-pyridine. — ×B'HCl. [160°]. White deliquescent crystals.—B'HBr. [187°]. Deliquescent. Absorbs bromine forming $B'HBr_2$, golden-yellow needles, sl. sol. water.—$B'Br_2$. Needles.—×B'HI. Decomposed by heat, yielding $B'HI_3$ which crystallises in brown needles [79°].—B'ICl: yellow tables.—$B'HgCl_2$.—$B'_2H_2PtCl_6$ (at 100°). Converted by water at 170° into yellow flocculent B'_2PtCl_4 and $B'PtCl_4$, a yellowish-green insoluble powder.—Platinocyanide $B'_2H_2PtCy_6 4aq$: yellow crystals. The crude bone-oil picoline forms the following combinations with alkyl salts.—B'MeCl: deliquescent needles (from alcohol).—$(B'MeCl)_2PtCl_4$: small cubes.—B'MeI. [227°]. Long white deliquescent needles (from alcohol).—$B'MeI_3$. [129°]. Bluish-black feathery plates, insol. water and CS_2, sol. alcohol and ether.—$B'MeNO_3$: transparent prisms.—$(B'C_3H_5Cl)_2PtCl_4$.—$B'_2C_2H_4Br_2$. [276°]. Small prisms. The same picoline forms with acetyl chloride deliquescent brown crystals of B'AcCl. According to Gardner (*B.* 23, 1589) crude picoline forms with acetic and formic acids the salts $(C_6H_7N)_2(HOAc)_3$ (c. 148°) and $C_6H_7N(CO_2H_2)_3$ (156°–159°) which distil unchanged.

Di-methyl-di-pyridine $(C_6H_7N)_2$. *Dipicoline. Parapicoline.* (310°–320°). S.G. 1·12. H.F.p. 8084 (Ramsay; that for picoline being 3753). Formed by boiling bone-oil picoline (6 pts.) with sodium (1 pt.) for two days (Anderson, *A.* 105, 344). Pale-yellow oil miscible with alcohol and ether. Bromine-water gives a pp. of $C_{12}H_{13}BrN_2H_2Br_2$.—$C_{12}H_{14}N_2H_2PtCl_6$: pale-yellow powder. Its aurochloride is decomposed by boiling water (O. de Coninck, *Bl.* [2] 45, 131).

Methylo-iodide $C_{12}H_{14}N_2(MeI)_2$. Yellow powder, v. sol. water, almost insol. alcohol and ether. Yields $C_{12}H_{14}N_2Me_2PtCl_6$ and $C_{12}H_{14}N_2Me_2I_6$.

(αα)-**Di-methyl pyridine** C_7H_9N *i.e.*  $N\left<\begin{matrix}CMe.CH\\CMe{:}CH\end{matrix}\right>CH$. *(αα)-Lutidine. αα-Lutidine.* Mol. w. 107. (142° cor.) (L.); 145° (E.). S.G. $\frac{0}{0}$ ·942.

Occurrence.—In coal-tar, being obtained by extracting with H_2SO_4, ppg. by alkali, and separating from the isomeride (157°) by fractionating (Lunge a. Rosenberg, *B.* 20, 127; Ladenburg a. Roth, *A.* 247, 28). It occurs also in bone-oil, and may be obtained from the fraction (135°–145°) (Roth, *B.* 19, 786).

Formation.—1. By the action of cinnamic aldehyde and alcoholic NH_3 on acetoacetic ether, the resulting dihydride of styryl-di-methyl-pyridine dicarboxylic ether being saponified, oxidised by $KMnO_4$, and the di-methyl-pyridine tricarboxylic acid so produced distilled with lime in a current of hydrogen (Epstein, *A.* 231, 18).—2. By distilling its dicarboxylic acid with lime (Engelmann, *A.* 231, 54).—3. By distilling oxy-di-methyl-pyridine (lutidone) with zinc-dust (Conrad a. Epstein, *B.* 20, 162).

Preparation.—Crude picoline (139°–142°) from bone-oil is dissolved in excess of HClAq and a hot solution of $HgCl_2$ is added. The double salt which is ppd. is recrystallised and decomposed by aqueous NaOH. The base is finally separated by solid KOH (Ladenburg, *A.* 247, 30).

Properties.—Liquid, smelling and tasting like pyridine, sol. cold water, the base separating again on warming. Its aqueous solution ppts. solutions of $ZnSO_4$, $CdSO_4$, $FeSO_4$, and $FeCl_3$. With $CuSO_4$ it gives a pale-blue pp. not turned black by heating. With $AgNO_3$ it gives minute needles of B'_2AgNO_3. Dilute $KMnO_4$ oxidises it to pyridine dicarboxylic acid [227°].

Salts.—×B'HCl. Deliquescent needles.—$B'_2H_2PtCl_6$. [208°]. Orange-red monoclinic plates; $a{:}b{:}c = ·892{:}1{:}·660$; $\beta = 81° 55'$. V. sol. hot, m. sol. cold, water, insol. alcohol.—$B'HAuCl_4$. [124°]. Yellow needles (from very dilute HCl).—$B'HHgCl_3$. [186°]. Thin plates (from acidulated water).—$B'HHg_2Cl_5$ (Mohler, *B.* 21, 1008).—$B'_2H_2Cr_2O_7$. [92°]. Orange prisms.—$B'(NH_3)H_2Cr_2O_7$. [c. 160°].—Picrate [159°]. Yellow needles or thin plates.

(αα)-**Di-methyl-pyridine hexahydride** $C_7H_{15}N$ *i.e.*  $NH\left<\begin{matrix}CHMe.CH_2\\CHMe.CH_2\end{matrix}\right>CH_2$. (127°–130°). S.G. $\frac{0}{0}$ ·8492. Formed by reducing the corresponding di-methyl-pyridine in alcoholic solution with sodium (Ladenburg, *A.* 247, 87; *B.* 18, 54). Colourless liquid, miscible with water, alcohol, and ether.—B'HCl: non-deliquescent needles, m. sol. water.—B'HBr. Needles, v. sol. water.—$B'_2H_2PtCl_6$: [212°]; orange-red crystals.

(αγ)-**Dimethyl-pyridine** C_7H_9N *i.e.*  $N\left<\begin{matrix}CMe.CH\\CH{:}CH\end{matrix}\right>CMe$. *Lutidine.* (157°). S.G. $\frac{0}{4}$ ·9493. S. 20.

Occurrence.—In coal-tar oil, being extracted with other bases by H_2SO_4 (Ladenburg a. Roth, *B.* 18, 913; Lunge a. Rosenberg, *B.* 20, 131); Ladenburg, 21, 286).

Formation.—1. By distilling oxy-di-methyl-pyridine  $CMe<\begin{matrix}CH.CO\\CH:CMe\end{matrix}>NH$ with zinc-dust (Hantzsch, *B.* 17, 2908).—2. By distilling its tri-carboxylic acid with lime (Hantzsch, *A.* 215, 56).—3. By distilling with lime the acid  $N<\begin{matrix}CMe.C(CO_2H)\\CH:CH\text{———}\end{matrix}>CMe$ the ether of which is obtained by condensation of an equal number of molecules of acetoacetic ether, acetic aldehyde, and acetic aldehyde-ammonia (Michael, *B.* 18, 2020).

Preparation.—The fraction of coal-tar bases boiling between 155° and 160° is dissolved in dilute HClAq, conc. HClAq is then added, followed by a hot concentrated solution of $HgCl_2$. The double salt which then crystallises out is decomposed by distilling with NaOHAq (Ladenburg, *A.* 247, 35).

Properties.—Liquid, smelling like pyridine, dissolving in 5 pts. of cold water, less soluble in hot water. Miscible with alcohol and ether. Easily volatile with steam. Oxidised by $KMnO_4$ to pyridine dicarboxylic (lutidinic) acid [235°]. Reacts with benzoic aldehyde and $ZnCl_2$ forming styryl-methyl-pyridine (Bachér, *B.* 21, 3071).

Salts.—$B'HHg_2Cl_5\frac{1}{2}aq$. Needles. Melts at 132° when anhydrous. Mohler (*B.* 21, 1008) obtained from coal-tar lutidine in acid solution a salt $B'HHgCl_3$.—$B'_2H_2PtCl_6$. [220°]. Plates or prisms.—$B'HAuCl_4$: amorphous pp., changing to prisms.—×B'HCl: slender needles.—×B'HBr. Needles.—Picrate. [179°]. Needles, sl. sol. cold water.

(αγ)-Di-methyl-pyridine hexahydride  $NH<\begin{matrix}CHMe.CH_2\\CH_2.CH_2\end{matrix}>CHMe$. (αγ)-*Di-methyl-piperidine.* (141°). S.G. $\underline{0}$ ·8615. Obtained by reducing the corresponding di-methyl-pyridine in alcoholic solution with sodium (Ladenburg, *A.* 247, 88). Colourless strongly alkaline liquid, smelling like piperidine. Fumes with HCl. M. sol. water, v. e. sol. alcohol and ether.

Salts.—B'HCl. [235°]. Long colourless needles, v. sol. water.—B'HBr. [142°]. Short needles, v. e. sol. water.—$B'_2H_2PtCl_6$: groups of yellow needles.

(ββ)-Di-methyl-pyridine C_7H_9N *i.e.*  $N<\begin{matrix}CH.CMe\\CH:CMe\end{matrix}>CH$. (170°). S.G. $\frac{0}{4}$ ·9614. Obtained by heating with lime the di-methyl-pyridine carboxylic acid formed by oxidation of the (ββα)-di-methyl-ethyl-pyridine produced by heating propionic aldehyde-ammonia with propionic aldehyde (Dürkopf a. Göttsch, *B.* 23, 1113). Transparent, strongly refracting liquid, with a pleasant odour characteristic of (β)-alkyl-pyridines; m. sol. cold water, sl. sol. hot water. Yields on oxidation a pyridine dicarboxylic acid [315°].

Salts.—$B'_2H_2PtCl_6$. [256°]. Dark-red needles and plates, sl. sol. water.—$B'HAuCl_4$. [149°]. Yellow needles, sl. sol. water.—Mercury double chloride. [176°]. Long needles, sl. sol. cold water.

(αβ')-Di-methyl-pyridine  $N<\begin{matrix}CMe.CH\\CH:CMe\end{matrix}>CH$. (162°–166°). Occurs in coal-tar (Lunge a. Rosenberg, *B.* 20, 134). Yields isocinchomeronic (pyridine dicarboxylic) acid on oxidation.

(αν)-Di-methyl-pyridine tetrahydride? $C_7H_{13}N$ *i.e.*  $NMe<\begin{matrix}CHMe.CH_2\\CH{=}CH\end{matrix}>CH_2$. Formed, together with MeCl, hydrocarbons, methylamine, NH_3, and other bases, by heating anhydro-ecgonine with conc. HClAq (Einhorn, *B.* 22, 1362). Oil. When heated with conc. HClAq at 280° it yields a mixture of bases which appear to yield methyl-pyridine when distilled over zinc-dust.—$B'HAuCl_4$. [212°]. Small needles, m. sol. water.—$B'C_6H_2(NO_2)_3OH$. Long needles, v. sl. sol. hot water.—×B'HCl: very hygroscopic.

Di-methyl-pyridine of bone oil (156°–159°) is a mixture of (αγ)-di-methyl-pyridine, (αβ')-di-methyl-pyridine, (β)-ethyl-pyridine, and (γ)-ethyl-pyridine. The existence of these bases is shown by the production of the corresponding pyridine di- and mono- carboxylic acids on oxidation by $KMnO_4$ (Weidel a. Herzig, *M.* 1, 1; Weidel a. Pick, *M.* 5, 658; *cf.* Anderson, *A.* 80, 5). Bone oil also contains (αα)-di-methyl-pyridine (*v. supra*). Greville Williams (*C. J.* 7, 97; *Pr.* 13, 311) obtained a lutidine from coal-tar; this has since been shown to contain (αα), (αγ), and (αβ) di-methyl-pyridines (*v. supra*). Oechsner de Coninck (*Bl.* [2] 41, 249) found (γ)-ethyl-pyridine (154°) in coal tar. Lutidines have also been obtained by distilling the bituminous shale of Dorsetshire (Williams) and peat (Church a. Owen, *P. M.* [4] 20, 110). Among the products obtained by distilling cinchonine with KOH Oechsner de Coninck (*C. R.* 91, 296) obtained a lutidine (165°), V.D. 3·8 (calc. 3·7); S.G. $\underline{0}$ ·959, which formed a deliquescent crystalline hydrochloride and a platinochloride $B'_2H_2PtCl_6$ crystallising in orange-red needles, converted by boiling water into B'_2PtCl_4 crystallising in yellow needles. When brucine is distilled with KOH it yields a lutidine (166°) whence $B'_2H_2PtCl_6$ [180°] and B'_2PtCl_4 [205°] (Oechsner de Coninck, *C. R.* 95, 298; 96, 437). Lutidine aurochloride $B'HAuCl_4$ is decomposed on boiling with water, yielding first thin red plates of $B'HAuCl_4B'_2AuCl_3$, and then a red crystalline pp. B'_2AuCl_3 (O. de Coninck, *Bl.* [2] 34, 634).

Di-methyl-pyridine dihydride $C_7H_{11}N$. (199°). V.D. 3·3. Occurs in cod-liver oil (Gautier a. Mourgues, *C. R.* 107, 111; *Bl.* [3] 2, 213). Colourless strongly alkaline and caustic oil; absorbs CO_2 from the air. Poisonous. Its salts taste bitter. Oxidised by boiling aqueous $KMnO_4$ to methyl-pyridine carboxylic acid and a little pyridine carboxylic acid.

Salts.—×B'HCl: confused needles, v. sol. water.—×$B'HNO_3$. Reduces $AgNO_3$.— $B'_2H_2SO_4$. Groups of deliquescent needles.—$B'_2H_2PtCl_6$. Lozenge-shaped plates, loses HCl on boiling with water.

Methylo-iodide B'MeI. Colourless needles, sol. water and alcohol. Yields a tri-methyl-pyridine dihydride on treatment with potash.

Di-methyl-pyridine hexahydride. *Methylo-iodide* $C_7H_{15}NMeI$. [192°]. Formed by heating (β)-pyridine hexahydride with MeI and MeOH at 100° (Hesekiel, *B.* 18, 3099; *A.* 247, 69). Needles (from acetone). Not decomposed by aqueous KOH. Yields $(C_7H_{15}NMeCl)_2PtCl_4$, an orange crystalline pp. turned black at 234°.

(s)-Tri-methyl-pyridine $C_8H_{11}N$ *i.e.* $N\!<\!\begin{matrix}CMe.CH\\CMe{:}CH\end{matrix}\!>\!CMe$. (γ)-*Collidine.* (172° cor.) (H.; M.); (168°) (D.). S.G. $\frac{15}{}$ ·917 (H.); ·922 (M.); $_4$ ·9312 (D.). Occurs in coal-tar, from which it may be obtained by fractional distillation followed by ppn. of the bases by K_4FeCy_6 (Mohler, *B.* 21, 1011). Formed by heating with quicklime the potassium salt of its dicarboxylic acid, which is obtained by the action of nitrous acid on its dihydride produced from acetoacetic ether and aldehyde-ammonia (Hantzsch, *A.* 215, 32). Formed also by heating acetone with NH_4Cl for 3 days at 265°, CH_4 being evolved (Riehm, *A.* 238, 16), and by heating acetone with aldehyde-ammonia for 10 hours at 200° (Dürkopf, *B.* 21, 2713).

Properties.—Liquid which turns brown in the air. More than 3 times as soluble in water as aldehyde-collidine. Less soluble in hot than in cold water. It differs also from aldehyde-collidine in giving a pp. with $AgNO_3$, an orange crystalline pp. with CrO_3, and an aurochloride that melts under water. It is oxidised by $KMnO_4$ to $N\!<\!\begin{matrix}C(CH_3)\ .CH\\C(CO_2H){:}CH\end{matrix}\!>\!CMe$ and uvitonic acid. Bromine added to its solution in CS_2 forms unstable orange crystals of $C_8H_{11}NBr_2$ (Pfeiffer, *B.* 20, 1344).

Salts.—B'HCl. Slender, non-deliquescent needles.—$B'_2H_2PtCl_6$: yellow crystalline pp.—$B'HAuCl_4$. [113°] (H.); [115°] (M.); [106°] (D.). Needles (from hot water).—$B'HHg_2Cl_6$. [155°]. — B'HI. — ×$B'HNO_3$ [above 300°]. — $B'_2H_2Cr_2O_7$. Yellow prisms, decomposing at 190°.—×$B'_2H_2SO_4$. [203°].—Picrate. [156°] (M.). Silky yellow needles, sl. sol. water, v. sol. alcohol.

Reference.—DI-BROMO-TRI-METHYL-PYRIDINE.

Tri-methyl-pyridine dihydride $C_8H_{13}N$. *Dihydro-collidine.* (175°–180°). Formed by heating its dicarboxylic ether (obtained from aldehyde-ammonia and acetoacetic ether) with dilute HClAq at 130° (Hantzsch, *A.* 215, 44). Pungent oil with alkaloidal smell. Alkaline to litmus, v. sol. cold water. Precipitates the hydroxides of Mg, Zn, and Fe from solutions of their salts.—$B'_2H_2PtCl_6$. Minute needles which blacken at 200°.—B'HI.

Polymeride $C_{16}H_{26}N_2$. *Tetrahydrodicollidine.* (255°–260°). Formed at the same time as the preceding. — $C_{16}H_{26}N_2H_2PtCl_6$. — $C_{16}H_{26}N_2HI$.

s-Tri-methyl-pyridine hexahydride $C_6H_{17}N$ *i.e.* $NH\!<\!\begin{matrix}CHMe.CH_2\\CHMe.CH_2\end{matrix}\!>\!CHMe$. *Copellidine.* (146°). S.G. $_4$ ·8475. Formed by reducing s-tri-methyl-pyridine in alcoholic solution with sodium (Jaeckle, *A.* 246, 43). Formed also, together with s-tri-methyl-pyridine, by heating acetone with aldehyde-ammonia at 200° (Dürkopf, *B.* 21, 2715). Liquid, smelling like piperidine, sl. sol. water, miscible with alcohol and ether. Unlike s-tri-methyl-pyridine it gives a brownish-black pp. with $Hg_2(NO_3)_2$. Gives no pps. with $HgCl_2$ or picric acid.

Salts.—B'HCl. Needles or prisms, v. e. sol. water and alcohol.—B'HBr.—$B'_2H_2PtCl_6$. [205°] (J.); [244°] (D.).

Isomerides of tri-methyl-pyridine *v.* METHYL-ETHYL-PYRIDINE, where (α)- and (β)- collidines, aldehyde-collidine and other isomerides are described.

A collidine dihydride $C_8H_{13}N$, (210°), S.G. 1·029, is contained in putrid horseflesh and putrid beef, and forms a crystalline hydrochloride and platinochloride (Gautier, *Bl.* [2] 48, 12).

Tetra-methyl-pyridine dihydride $C_9H_{15}N$ *i.e.* $NH\!<\!\begin{matrix}CMe{:}CMe\\CH_2.CMe\end{matrix}\!>\!CMe$. *Dihydroparvoline.* (159°). Formed by heating potassium pyrrole carboxylate with MeI and MeOH at 120° (Ciamician a. Anderlini, *B.* 21, 2862). Basic liquid.—$B'HAuCl_4$. [110°]. Yellow needles.

Tetra-methyl-pyridine hexahydride $C_9H_{19}N$ *i.e.* $NH\!<\!\begin{matrix}CHMe.CHMe\\CH_2\ .CHMe\end{matrix}\!>\!CHMe$. *Parpevoline* (161°). Obtained by reducing the preceding in alcoholic solution with sodium (C. a. A.). Liquid, smelling like pyridine. Does not turn brown in air.—$B'HAuCl_4$. [119°]. Yellow needles.

Methylo-iodide B'MeI. [262°]. Prisms, v. sol. water, insol. ether.

A parvoline $C_9H_{13}N$ (c. 200°) is present among the products of the putrefaction of horse-flesh (Gautier, *Bl.* [2] 48, 11). It is an oil which resinifies in the air, and forms a flesh-coloured platinochloride.

A parvoline $C_9H_{13}N$ (188°) occurs among the bases obtained by distilling cinchonine with KOH (O. de Coninck, *C. R.* 91, 296).

Penta-methyl-pyridine dihydride $C_{10}H_{17}N$ *i.e.* $NMe\!<\!\begin{matrix}CMe{:}CMe\\CH_2.CMe\end{matrix}\!>\!CMe$. (189°); (46° at 7 mm.). Prepared by heating ν-methyl-pyrrole with MeI, K_2CO_3, and methyl alcohol at 140° (Ciamician a. Anderlini, *Rend. Accad. Linc.* [4] 203; *B.* 21, 2863; 22, 658). Formed also by heating tetra-methyl-pyridine dihydride with MeI (Anderlini, *B.* 22, 2507). Oil, with strong alkaline reaction.—$B'HAuCl_4$. [100°]. Yellow needles. Reacts energetically with MeI, forming an oily product, whence successive treatment with AgCl and $AuCl_3$ yields $C_{12}H_{21}NHAuCl_4$, which crystallises in thin golden-yellow needles [100°].

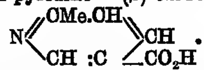
METHYL-PYRIDINE CARBOXYLIC ACID $C_7H_7NO_2$ *i.e.* $N\!<\!\begin{matrix}CMe.CH\\CH\ {:}CH\end{matrix}\!>\!C.CO_2H$. *Picoline carboxylic acid.* Formed by heating methyl-pyridine dicarboxylic (uvitonic) acid at 275° (Böttinger, *B.* 14, 67; 17, 92). Trimetric crystals (containing aq), sol. hot, sl. sol. cold, water and alcohol, nearly insol. ether. Sublimes without melting. Forms salts both with acids and bases. Yields on oxidation with $KMnO_4$ pyridine dicarboxylic (lutidinic) acid.

Salts.—HA'HCl: prisms. — BaA'_2 11aq: very soluble needles.—CaA'_2 aq: very soluble four-sided colourless prisms.—CuA'_2 aq: blue pp.—×AgA': white pp.

Methyl-pyridine carboxylic acid $C_7H_7NO_2$ *i.e.* $N\!<\!\begin{matrix}CH.C(CO_2H)\\CH{:}CH\ \text{———}\end{matrix}\!>\!CMe$. *Homonicotinic acid. Methyl-carbopyridic acid.* [212°]. Obtained by heating methyl-pyridine dicarboxylic (methyl-quinolinic) acid at 170°, or by warming it with HOAc (Hoogewerff a. Van Dorp, *R. T. C.* 2, 21). Formed also by the slow oxidation of (β)-collidine by $KMnO_4$ (O. de Coninck, *A. Ch.* [5] 27, 493; *Bl.* [2] 43, 107). Needles, v. sol. hot water. Oxidised by $KMnO_4$ to pyridine dicarboxylic (cinchomeronic) acid.

Salts.—KA′: small plates.—CuA'_2: small blue crystals.—AgA′: needles.—HA′HCl: small prisms. — $(HA')_2H_2PtCl_6$: orange prisms. — $HA'HAuCl_4$: yellow needles.

(α)-Methyl-pyridine (β)-carboxylic acid $C_7H_7NO_2$ *i.e.*

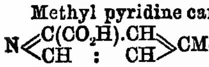


$N\left<\begin{matrix}CMe.CH\\ CH:C\end{matrix}\right>\begin{matrix}CH\\ CO_2H\end{matrix}$. [207°].

Formed by oxidising (α)-methyl-(β′)-ethyl-pyridine (aldehyde-collidine) with a 2 p.c. solution of $KMnO_4$, allowing the mixture to stand for 48 hours, and then heating to 60°. The filtrate from MnO_2 is neutralised by H_2SO_4 and evaporated, the residue is extracted with alcohol and the acid purified by means of its silver salt (Dürkopf, *B.* 18, 3432; Ladenburg, *A.* 247, 43). Prisms, v. e. sol. water and alcohol. On distillation with lime it yields (α)-methyl-pyridine (128°). $KMnO_4$ oxidises it to pyridine dicarboxylic (isocinchomeronic) acid.

Salts.—$(HA')_2H_2PtCl_6$. [240°]. Aggregates of needles, v. sol. water, insol. ether-alcohol.—$(CuA'_2)_2Cu(OAc)_2$. Crystalline powder, formed by boiling a solution of the acid with cupric acetate. The silver salt is amorphous. The aurochloride forms yellow needles [c. 202°].

Methyl pyridine carboxylic acid $C_7H_7NO_2$ *i.e.*



$N\left<\begin{matrix}C(CO_2H).CH\\ CH\ :\ CH\end{matrix}\right>CMe$ (?). [c. 260°]. Formed in small quantity, together with pyridine (αγ)-di-carboxylic acid, by oxidising (αγ)-di-methyl-pyridine with $KMnO_4$ (Bachér, *B.* 21, 3080). Plates (from alcohol), v. e. sol. water. It is possibly identical with the isomeride described by Böttinger (*v. supra*).

(β)-Methyl-pyridine (β′)-carboxylic acid

$N\left<\begin{matrix}CH.CMe\\ CH:C(CO_2H)\end{matrix}\right>CH$. [216°]. Formed by heating (β)-methyl-pyridine (αβ′)-dicarboxylic acid with HOAc and Ac_2O at 225° (Dürkopf a. Göttsch, *B.* 23, 1113). White mass, m. sol. water. Its aqueous solution is not coloured by $FeSO_4$.

Methyl-pyridine dicarboxylic acid $C_8H_7NO_4$ *i.e.*

$N\left<\begin{matrix}CMe—CH\\ C(CO_2H):CH\end{matrix}\right>C.CO_2H$. *Uvitonic acid.* [274°]. Formed by the action of ammonia on pyruvic acid (Böttinger, *A.* 188, 330; 208, 138; *B.* 13, 2032; 16, 35; 17, 144). Formed also by oxidising *s*-tri-methyl-pyridine, or di-methyl-ethyl-pyridine,

$N\left<\begin{matrix}CMe.CH\\ CMe:CH\end{matrix}\right>CEt$, with $KMnO_4$ (Altar, *A.* 237, 191; Dürkopf, *B.* 21, 2717). Minute six-sided trimetric plates (Friedländer, *J.* 1882, 367), v. sl. sol. cold, sl. sol. hot, water, m. sol. NH_3Aq and HClAq, v. sol. aniline, phenol, HOAc, and glycerin, sl. sol. isoamyl alcohol and chloroform, insol. benzene and CS_2. Gives a violet-red colour with $FeSO_4$. It is a powerful antiseptic. Yields (α)-methyl-pyridine on distillation with lime. Split up by heat into CO_2 and

$N\left<\begin{matrix}CMe.CH\\ CH:CH\end{matrix}\right>C.CO_2H$. Alkaline $KMnO_4$ oxidises it to pyridine tricarboxylic acid. Bromine-water forms bromoform, CO_2, and formic acid.

Salts.—$(NH_4)HA''$: powder.—CaA'' 6aq: amorphous.—CaA'' 4aq: prisms.—BaA'' 2aq: slender needles.—CuA'' 4aq.—$Cu_3(OH)_2A_2''$ 9aq: *PbA'': dense pp.—Ag_2A''aq: gelatinous pp.

Methyl-pyridine di-carboxylic acid $C_8H_7NO_4$ *i.e.*

$N\left<\begin{matrix}C(CO_2H):C(CO_2H)\\ CH———CH\end{matrix}\right>CMe$. *Methyl-quinolinic acid.* [c. 183°]. S. ·84 at 10°. Formed by the oxidation of (*Py.* 1)-methyl-quinoline (lepidine) (1 pt.) by $KMnO_4$ (7½ pts.) (Königs, *B.* 12, 983; 14, 103; Hoogewerff a. Van Dorp, *R. T. C.* 2, 15; *B.* 13, 1639; 14, 645). Tables or prisms, sol. hot, sl. sol. cold, water, sl. sol. alcohol, ether, and benzene. Decomposes on fusion into CO_2 and methyl-pyridine carboxylic acid [210°], which on further oxidation yields cinchomeronic acid. $KMnO_4$ oxidises it to pyridine (α)-tricarboxylic acid. The aqueous solution of the acid gives pps. with the acetates of Pb, Ba, and Cu, and a yellow colour with $FeSO_4$.

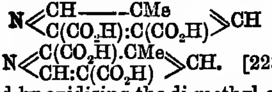
Salts.—KHA'' 2aq: needles.—KHA'' 3aq.—Ag_2A''aq: crystalline powder.

Methyl-pyridine dicarboxylic acid $C_8H_7NO_4$ *i.e.*

$N\left<\begin{matrix}CMe.C(CO_2H)\\ CH:C(CO_2H)\end{matrix}\right>CH$. *Methyl-dinicotinic acid.* [245°–250°]. Formed from methyl-pyridine tricarboxylic acid

$N\left<\begin{matrix}CMe——C(CO_2H)\\ C(CO_2H):C(CO_2H)\end{matrix}\right>CH$ by heating at 150° (Weber, *A.* 241, 9). Spherical groups of needles (containing aq), sl. sol. cold water. $KMnO_4$ oxidises it to a pyridine tricarboxylic acid.—HA′HCl aq: transparent efflorescent crystals.—PbA'' 2aq: crystalline pp.

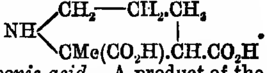
Methyl-pyridine dicarboxylic acid



$N\left<\begin{matrix}CH——CMe\\ C(CO_2H):C(CO_2H)\end{matrix}\right>CH$ or $N\left<\begin{matrix}C(CO_2H).CMe\\ CH:C(CO_2H)\end{matrix}\right>CH$. [223°].

Obtained by oxidising the di-methyl-ethyl-pyridine, which is formed by the action of NH_3 on propionic aldehyde (Dürkopf a. Göttsch, *B.* 23, 688, 1110), and by the action of paraldehyde on propionic aldehyde-ammonia (Dürkopf a. Schlaugk, *B.* 21, 834). White powder (from hot water). The K, Ag, and Cu salts are sl. sol. water.

Methyl-pyridine hexahydride dicarboxylic acid $C_8H_{13}NO_4$ *i.e.*



$NH\left<\begin{matrix}CH_2——CH_2.CH_3\\ \quad\quad\quad\quad\quad |\\ CMe(CO_2H).CH.CO_2H\end{matrix}\right.$. [127°]. *Cincholeuponic acid.* A product of the oxidation of cinchonine by chromic acid mixture (Skraup, *M.* 9, 786). Prisms (containing aq); v. e. sol. water, insol. alcohol and ether. Ac_2O at 125° forms an amorphous acetyl derivative $C_8H_{12}AcNO_4$. Distillation of the lead salt over zinc-dust yields a small quantity of pyridine.

Salts.—PbA'': powder, v. e. sol. water.—$H_2A''HCl$. [194°]. Trimetric crystals. $[\alpha]_D =$ ·34·4° at 18·7°.

Nitrosamine $C_8H_{12}(NO)NO_4$. [163°]. Trimetric crystals, sl. sol. cold water, m. sol. alcohol. Warm conc. HClAq reproduces $C_8H_{13}NO_4$ and nitrous acid.—BaA'' (at 115°). Deliquescent amorphous powder, in sol. alcohol.

In the preparation of cincholeuponic acid a base called cincholeupone $C_9H_{17}NO_2$ is also formed. It yields cincholeuponic acid on oxidation with chromic acid mixture, and ethyl-pyridine on distillation over red-hot zinc-dust. It forms the salts $(C_9H_{17}NO_2)HCl$ [200°], $B'_2H_2PtCl_6$ 3½aq and $B'HAuCl_4$ [203°], an acetyl derivative $C_8H_{15}AcNO_2$ [121°], and a nitrosamine $C_8H_{16}(NO)NO_2$ [84°].

Methyl-pyridine tricarboxylic acid $C_9H_7NO_6$ *i.e.*  $N{<}\begin{array}{l}CMe\text{——}C(CO_2H)\\C(CO_2H):C(CO_2H)\end{array}{>}CH$. [226°]. Formed by oxidising  $N{<}\begin{array}{l}CMe.C(CO_2H)\\CMe:C(CO_2H)\end{array}{>}CH$ with $KMnO_4$ (Weber, *A.* 241, 6). Spherical aggregates (containing sq). At 150° it slowly gives off CO_2, yielding methyl-pyridine dicarboxylic acid [245°–250°].—$KH_3A'''_2$ 6aq: spherical aggregates.—AgH_2A''' 2aq: needles (from hot water).

Methyl-pyridine tricarboxylic acid  $N{<}\begin{array}{l}C(CO_2H).C(CO_2H)\\CH\text{===}C(CO_2H)\end{array}{>}CMe$. *Methyl-carbodinicotinic acid.* Formed by the oxidation of (αγ)-di-methyl-pyridine dicarboxylic acid by $KMnO_4$ (Weber, *A.* 241, 25). Needles (containing aq) or prisms (containing 2aq). Less soluble in water than the preceding acid. Turns yellow at 205°, and completely decomposes at 260°. $FeSO_4$ colours its solutions deep red. The calcium salt yields (γ)-methyl-pyridine on distillation.

Methyl-pyridine tricarboxylic acid  $N{<}\begin{array}{l}C(CO_2H).C(CO_2H)\\C(CO_2H)\text{=}CH\end{array}{>}CMe$. *Picoline tricarboxylic acid.* [238°]. Formed by the oxidation of flavenol (1 mol.) with $KMnO_4$ (9 mols.) (Fischer a. Täuber, *B.* 17, 2926). Formed also by oxidising potassium tri-methyl-pyridine carboxylate with aqueous $KMnO_4$ (Michael, *A.* 225, 140). Slender needles (from water). Does not combine with acids. On further oxidation with $KMnO_4$ it yields pyridine tetra-carboxylic acid [227°]. $FeSO_4$ colours its solution brownish-red.

Salts.—BaA'': amorphous pp.—Ag_2A''.

Methyl-pyridine tetracarboxylic acid $C_{10}H_7NO_8$ *i.e.*  $N{<}\begin{array}{l}C(CO_2H).C(CO_2H)\\C(CO_2H):C(CO_2H)\end{array}{>}CMe$. [199°]. Obtained by boiling potassium tri-methyl-pyridine dicarboxylate with a solution of $KMnO_4$ (Hantzsch, *A.* 215, 57). Small prisms (from water); v. e. sol. water, m. sol. alcohol, sl. sol. ether. Gives (γ)-picoline on distillation with lime. Its neutral salts crystallise with difficulty. Neutral solutions give pps. with salts of Pb and Ag, mercurous salts, and $Ba(OAc)_2$, but no pps. with dilute $BaCl_2$ or with salts of Mg, Zn, Mn, Ni, Co, and Cu, and mercuric salts.—$K_2H_2A^{iv}$ 4aq: large trimetric tables, v. sol. hot water, with acid reaction.—KH_3A^{iv} 2aq.—Ca_2A^{iv} 4aq; ppd. by adding NH_3 and $CaCl_2$.—Mg_2A^{iv} 6aq.

Di-methyl-pyridine carboxylic acid $C_8H_9NO_2$ *i.e.*  $N{<}\begin{array}{l}CMe:C(CO_2H)\\CH\text{———}CH\end{array}{>}CMe$. *Lutidine carboxylic acid.* Obtained by saponifying with alcoholic potash its ether, which is formed by adding acetic aldehyde (50 pts.) to a mixture of aceto-acetic ether (130 pts.) and aldehyde-ammonia (61 pts.); the reaction, which sets in at once, being completed by heating to 100° (Michael, *B.* 18, 2020). Transparent prisms (containing 2 aq); v. sol. water and alcohol. Gives (αγ)-lutidine on distillation with lime. On oxidation with $KMnO_4$ it yields pyridine dicarboxylic (carbocinchomeronic) acid.

Salts.—$HA'HCl$. [166°]. Large prisms or thick tables. — $(HA')_2H_2PtCl_6$ 2aq. [216°]. Reddish-yellow prisms.

Ethyl ether EtA'. (246° uncor.). Yellowish oil, not volatile with steam.—$(EtA)_2H_2PtCl_6$ [191°]. Thin yellow pointed prisms; v. sl. sol. water and strong alcohol.

Di-methyl-pyridine carboxylic acid  $N{<}\begin{array}{l}CMe\text{——}CH\\C(CO_2H):CH\end{array}{>}CMe$. *Di-methyl-picolinic acid.* [153°]. Formed by oxidising s-tri-methyl-pyridine with $KMnO_4$ (Altar, *A.* 237, 183). Small crystals; v. e. sol. water and alcohol, m. sol. ether. Yields (αγ)-di-methyl-pyridine on distillation with lime. Its metallic salts are v. sol. water.—$B'HCl$ aq: minute white needles, v. e. sol. water. — $B'_2H_2PtCl_6$ 4EtOH. [221°]. Prisms.

Di-methyl-pyridine carboxylic acid  $N{<}\begin{array}{l}CMe\text{——}CH\\CMe:C(CO_2H)\end{array}{>}CH$. *Di-methyl-nicotinic acid.* [160°]. Prepared by distilling the mono-ethylic ether of di-methyl-pyridine dicarboxylic acid  $N{<}\begin{array}{l}CMe.C(CO_2H)\\CMe:C(CO_2H)\end{array}{>}CH$ (Weiss, *B.* 19, 1308). Needles (containing ½aq); v. e. sol. water. Oxidised by $KMnO_4$ to the corresponding pyridine tricarboxylic acid.—AgA'.—$HA'HCl$: small prisms.—$(HA')_2H_2PtCl_6$ 2aq: orange needles.

Di-methyl-pyridine carboxylic acid  $N{<}\begin{array}{l}CH\text{——}CMe\\C(CO_2H):CMe\end{array}{>}CH$. [151°]. Formed by oxidising the parvoline obtained from propionic aldehyde and NH_3 (Dürkopf a. Göttsch, *B.* 23, 687; 1110).—$(HA')_2H_2PtCl_6EtOH$. V. sol. water, sl. sol. alcohol. Decomposes at 260°.

Di-methyl-pyridine carboxylic acid $C_5H_2Me_2N.CO_2H$. Formed by saponifying, by alcoholic potash, its ethyl ether, which is produced from acetoacetic ether (30 g.) by heating with formic aldehyde (5 g.) and $ZnCl_2$ (30 g.) for 12 hours at 100° (Canzoneri a. Spica, *G.* 14, 449). Silky needles; v. e. sol. water.—$HA'HCl$ aq. [220°]. Transparent rhombohedra (from water).—$(HA')_2H_2PtCl_6$: red crystals.

Ethyl ether EtA'. (260°). Oil.

Di-methyl-pyridine dicarboxylic acid $C_9H_9NO_4$ *i.e.*  $N{<}\begin{array}{l}CMe.C(CO_2H)\\CH:C(CO_2H)\end{array}{>}CMe$. *(αγ)-Di-methyl-di-nicotinic acid.* [258°]. Obtained by heating (αγ)-di-methyl-pyridine tricarboxylic acid at 175° (Weber, *A.* 241, 20). Formed also by oxidation of the corresponding tetra-methyl-pyridine (Dürkopf a. Göttsch, *B.* 23, 1112). Needles (containing 2 aq (W.) or anhydrous (D. a. G.). Its solution is not coloured by $FeSO_4$.—PbA'': gelatinous pp., becoming crystalline on boiling.—$H_2A''HCl$ aq: slender needles, decomposed by water.—$(H_2A'')_2H_2PtCl_6$: orange tables, melting above 300°.

Di-methyl-pyridine dicarboxylic acid

$N{<}\begin{array}{l}CMe\text{———}CH\\C(CO_2H):C(CO_2H)\end{array}{>}CMe$ or

$N{<}\begin{array}{l}CMe.C(CO_2H)\\C(CO_2H):CH\end{array}{>}CMe$. [245°].

Formed by oxidising s-tri-methyl-pyridine carboxylic acid in neutral solution with $KMnO_4$ (Michael, *A.* 225, 137). Prisms (from water).—CaA''.—MgA'' 3aq.—$(H_2A''HCl)_2PtCl_4$ 6aq.

Di-methyl-pyridine dicarboxylic acid  $N{<}\begin{array}{l}CMe.C(CO_2H)\\CMe:C(CO_2H)\end{array}{>}CH$. *Lutidine dicarboxylic acid.* Formed by saponifying with alcoholic potash its ether, which is produced by passing nitrous acid gas into di-methyl-isopropyl-dicarboxylic ether in alcohol (Engelmann, *A.* 231, 50). Its ether is also one of the products of the action of acetoacetic ether on hexamethylene tetramine at 170° (Griess, *B.* 21, 2740). The same ether appears to be formed by oxidising with nitrous acid gas the product obtained by the action of phenyl-acetic aldehyde on aceto-acetic ether and ammonia (Jeaurenaud, *B.* 21, 1784). Slender needles (containing ½aq). Melts at a very high temperature. V. sl. sol. cold water, alcohol, and ether. $KMnO_4$ oxidises it to pyridine tetracarboxylic acid. On distillation it yields CO_2 and di-methyl-pyridine carboxylic acid. Distillation over CaO yields (αα)-di-methyl-pyridine.

Salts.—BaA'' 2aq.—PbA'' 2aq: amorphous pp. changing to stout prisms.—$H_2A''HCl$ 2aq: prisms.

Mono-ethyl-ether $EtHA''$. [131°]. Obtained by decomposing the di-ethyl ether (1 mol.) with alcoholic KOH (1 mol.) (Weiss, *B.* 19, 1308). Needles (from water). Its neutral solution is ppd. by salts of Ag, Hg, and Cu.—$EtHA''HCl$ 2aq. [90°]. Needles (from water).

Diethyl ether Et_2A''. [72°]. (302°). Long white needles.—$Et_2A''HAuCl_4$: v. e. sol. alcohol.

Di-methyl-pyridine dicarboxylic ether dihydride $C_5H_3NMe_2(CO_2Et)_2$. [170°]. Formed by heating acetoacetic ether (20 g.) with $ZnCl_2$ (20 g.) and hexamethylene tetramine (4 g.) at 100° (Griess a. Harrow, *B.* 21, 2740). Four-sided plates or needles, almost insol. water, sl. sol. cold alcohol and ether, v. sol. chloroform. By treatment with nitrous acid, or even by solution in hot dilute HCl, it is oxidised to $C_5HNMe_2(CO_2Et)_2$.

Di-methyl-pyridine tricarboxylic acid $C_{10}H_9NO_6$ *i.e.*  $\mathrm{N}\left\langle\begin{matrix}\mathrm{CMe{-}{-}{-}C(CO_2H)}\\ \mathrm{C(CO_2H){:}C(CO_2H)}\end{matrix}\right\rangle\mathrm{CMe}$. *Lutidine tricarboxylic acid. Dimethylcarbodinicotinic* acid. [212°]. Formed by oxidation of potassium tri-methyl-pyridine dicarboxylate with $KMnO_4$ in a solution kept neutral by CO_2 (Hantzsch, *A.* 215, 52; Weber, *A.* 241, 20). Crystallises from water in hard crusts composed of rhombohedra (containing 2aq). Split up by heat into CO_2 and (αγ)-di-methyl-pyridine dicarboxylic acid. Yields (αγ)-di-methyl-pyridine on distillation with lime. Its neutral solutions give no pps. with salts of Cu, Ag, or Pb, nor with $FeCl_3$, but with $Hg(NO_3)_2$ a pp. soluble in hot water.

Salts. — KH_2A''' 2aq. — $Ba_3A'''_2$ 8 (?) aq: minute needles.—$Mg_3A'''_2$ 10aq.—$Ca_3A'''_2$ 8aq.—Ag_3A'''.

Di-methyl-pyridine tricarboxylic acid  $\mathrm{N}\left\langle\begin{matrix}\mathrm{CMe.C(CO_2H)}\\ \mathrm{CMe{:}C(CO_2H)}\end{matrix}\right\rangle\mathrm{C.CO_2H}$. S. ·178 at 8°. Formed by oxidising potassium styryl-di-methyl-pyridine dicarboxylate with cold aqueous $KMnO_4$ (Epstein, *A.* 231, 11). Crystallises from water in prisms (containing aq); almost insol. water, alcohol, ether, benzene, and chloroform. Turns brown at about 220° but decomposes without melting. Gives (αα)-di-methyl-pyridine on distillation with lime. A solution of its ammonium salt gives pps. with $CaCl_2$, $CdSO_4$, $Hg_2(NO_3)_2$, $AgNO_3$, $SnCl_2$, $Pb(OAc)_2$, and $Bi(NO_3)_3$, but not with $BaCl_2$, $MgSO_4$, $MnSO_4$, and alum, nor, in the cold, with $ZnSO_4$ or $CuSO_4$. $FeCl_3$ gives a reddish colour.

Salts.—$H_2A'''HCl$: needles, decomposed by water and by alcohol. — $Pb_3A'''_2$6aq. — $Cu(NH_4)A'''$ 4aq.—Ag_3A''' 3aq.

Tri-methyl-pyridine carboxylic acid $C_9H_{11}NO_2$ *i.e.*  $\mathrm{N}\left\langle\begin{matrix}\mathrm{CMe.C(CO_2H)}\\ \mathrm{CMe{=}{=}{=}CH}\end{matrix}\right\rangle\mathrm{CMe}$. *Collidine carboxylic acid.* [155°]. Obtained by saponifying with alcoholic potash its ethyl ether, which is obtained by passing nitrous acid into its dihydride (Hantzsch, *A.* 215, 42) and by heating the mono-ethyl ether of tri-methyl-pyridine dicarboxylic acid (Michael, *A.* 225, 131). Crystallises from water in short needles or cubes (containing 2aq). Melts at 110° when hydrated, or 155° when anhydrous. On oxidation with $KMnO_4$ it yields di-methyl-pyridine dicarboxylic acid, methyl-pyridine tricarboxylic acid, and pyridine tetracarboxylic acid.

Salts. — KA': needles (from alcohol). — CaA'_2aq. — $HA'HCl$: needles or prisms. — $(HA')_2H_2PtCl_6$aq.

Ethyl ether EtA'. (256°). S.G. ^{15} 1·0315. Liquid, v. sol. ether, alcohol, benzene, and chloroform, insol. water, sol. dilute acids.—$(EtA')_2H_2PtCl_6$. [193°]. Prisms (from alcohol).—$EtA'MeI$. [128°]. Needles, v. sol. water and alcohol, insol. ether. With Ag_2O it yields crystalline $C_{10}H_{13}NO_2$ 3aq, whence $C_{10}H_{13}NO_2HCl$ aq (Hantzsch, *B.* 19, 35).

Tri-methyl-pyridine dihydride carboxylic ether $C_5H_3NMe_3.CO_2Et$. Formed by warming $C_5H_2NMe_3(CO_2Et)_2$ with HClAq (of 25 p.c.) at 100° (Hantzsch, *A.* 215, 40). Feebly basic oil.—$(HA')_2H_2PtCl_6$: minute needles.

Tri-methyl-pyridine dicarboxylic acid $C_{10}H_{11}NO_4$ *i.e.*  $\mathrm{N}\left\langle\begin{matrix}\mathrm{CMe.C(CO_2H)}\\ \mathrm{CMe{:}C(CO_2H)}\end{matrix}\right\rangle\mathrm{CMe}$.

Formed by saponifying with alcoholic potash its ether, which is obtained by the action of nitrous acid gas and alcohol upon its dihydride, which is itself produced by the action of aldehyde-ammonia on aceto-acetic ether (Hantzsch, *A.* 215, 26). Fluffy mass of needles (from hot water), melting above 300°, v. sl. sol. cold, v. sol. hot, water, v. sl. sol. alcohol and ether. Oxidised by $KMnO_4$ to di-methyl-pyridine tricarboxylic acid, methyl-pyridine tetra-carboxylic acid, and pyridine pentacarboxylic acid. Decomposed by heat into CO_2 and tri-methyl-pyridine carboxylic acid. Bromine acting on an aqueous solution of the K salt yields di-bromo-*s*-tri-methyl-pyridine. The salts which it forms with alkalis and alkaline earths are very soluble, crystallise badly, have an alkaline reaction, and split up on heating into *s*-tri-methyl-pyridine and carbonates. $FeCl_3$ gives an intense red colour to a solution of the K salt.—K_2A''.—CaA''aq: needles. — BaA''3aq. — MgA'' 2aq.—$(CuA'')_2CuO$ 11aq. — Ag_2A''. — $H_2A''HCl$ 2aq. — $(H_2A'')_2H_2PtCl_6$.

Di-methyl ether Me_2A''. [82°]. (286°). Formed by oxidation of its dihydride by nitrous acid (Hantzsch, *B.* 16, 1947). White needles, v. sol. water.—$Me_2A''HCl$ 2aq: long glistening prisms melting, when anhydrous, at 142°.—$(Me_2A'')_2H_2PtCl_6$. [200°]. Orange spangles.—$Me_2A''HAuCl_4$. [105°]. Slender light-yellow needles.—$Me_2A''HNO_3$. [140°]. Prisms.

Mono-ethyl ether $EtHA''$ 2aq. Formed from the neutral ether by boiling with the calculated quantity of potash dissolved in alcohol. Needles in radial groups (from alcohol), v. sol.

water, v. sl. sol. ether. Melts, when anhydrous, at 157°. — HEtA″HCl. [178°]. Cubes. — $(EtHA'')_2H_2PtCl_6$ 2aq: prisms (from cold water). Melts, when anhydrous, at 219°.—$BaEt_2A''_2$ 3aq. — $BaEt_2A''_2$ aq. — $CaEt_2A''_2$ 3aq: needles. — $CuEt_2A''_2$. — $CdEt_2A''_2$ 4aq. — $ZnEt_2A''_2$ 5aq. — $AgHEt_2A''_2$ aq: monoclinic prisms.

Di-ethyl ether Et_2A''. (308°–310°). S.G. $\underline{15}$ 1·087. Formed from its dihydride (*v. infra*) by treatment with HNO_3 or, better, by alcohol and nitrous acid gas (Hantzsch, *A.* 215, 21). Bright-yellow viscid oil with faint odour and burning taste. Not volatile with steam. It has no action on litmus. It does not ppt. metallic salts. With $HgCl_2$ it gives, only after a time, silky needles of a double compound. It dissolves in dilute acids.—$Et_2A''HCl$: very hygroscopic. — $(Et_2A'')_2H_2PtCl_6$: rose-coloured tables. [184°].—$Et_2A''HNO_3$: needles. [92°]. $Et_2A''HI$. [170°–173°]. Dark plates, which dissolve with rotation in cold water.—$Et_2A''HI_3$: violet pyramids.

Methylo-iodide of the diethyl ether $Et_2A''MeI$. [140°]. Formed by heating the ether with MeI and MeOH at 120°. Crystalline mass, more soluble in water or alcohol than $Et_2A''HI$. It is ppd. unaltered from its aqueous solution by NaOH. Its aqueous solution is acid to litmus. It is not affected by fuming HCl at 150° or by alcoholic NH_3 at 150°. Concentrated aqueous KOH forms methyl-di-carbo-collidylium dehydride $C_{11}H_{13}NO_4$. This substance crystallises in needles, [92°], v. e. sol. alcohol, v. sl. sol. cold water, and distils without decomposition at a temperature far above 360°. It has neither acid nor basic properties. When heated with H_2SO_4 at 150°–180° it yields CO_2, HOAc, and methyl-pseudo-lutidostyril $C_8H_{11}NO$. When 'methyl-dicarbo-collidylium dehydride' is heated in a current of HCl it loses CO_2 and forms methyl-carbo-collidylium dehydride $C_{10}H_{13}NO_2$. This is also an indifferent body; it crystallises in needles [103°], v. sol. water, and boils above 340°. On heating with H_2SO_4 it evolves acetic acid and gives methyl-pseudo-lutidostyril (Hantzsch, *B.* 17, 1022).

Methylo-chloride of the *diethyl ether* $Et_2A''MeCl$. Formed by treating $Et_2A''MeI$ with AgCl (Hantzsch, *B.* 17, 1019). Crystals. Yields $(Et_2A'')_2Me_2PtCl_6$ which crystallises in thick yellow prisms.

Tri-methyl-pyridine dihydride dicarboxylic acid $C_{10}H_{13}NO_4$ *i.e.*

$$NH\left\langle\begin{matrix}CMe{:}C(CO_2H)\\CMe{:}C(CO_2H)\end{matrix}\right\rangle CHMe.$$

Methyl ether Me_2A''. [156°]. Formed by the action of methyl acetoacetate on aldehyde-ammonia (Hantzsch, *B.* 16, 1946). When heated with HCl it exchanges CO_2Me for H and yields the methyl ether of the monocarboxylic acid. On oxidation with nitrous acid it gives $C_5Me_3(CO_2Me)_2N$.

Di-ethyl ether Et_2A''. [131°]. Formed by heating aceto-acetic ether (52 g.) with aldehyde-ammonia (13·5 g.) (Hantzsch, *A.* 215, 8).

Properties.—Compact colourless tables with many facets (from alcohol), with bright-blue fluorescence. V. sl. sol. boiling water, sl. sol. cold alcohol, ether and CS_2, m. sol. benzene, v. sol. boiling alcohol, v. e. sol. chloroform. Boils above 315° with decomposition.

Reactions.—1. Boiling conc. KOHAq has no action.—2. Alcoholic NH_3 at 150° has no action. 3. Alcoholic potash slowly decomposes it, forming NH_3 and K_2CO_3.—4. Boiling dilute *acids* do not dissolve it; it forms no platinochloride.—5. Conc. H_2SO_4 dissolves it, but on pouring into water it is reppd. unchanged.—6. Warm conc. HCl completely destroys it, forming CO_2, EtCl, NH_3, aldehyde, and acetone.—7. HCl passed into an ethereal solution removes the H_2 (Hantzsch, *A.* 215, 37), and forms other products.—8. Aqueous HCl (25 p.c.) at 100° forms hydro-tri-methyl-pyridine mono-carboxylic ether.—9. Dilute HCl at 130° forms ethyl chloride, CO_2, and tri-methyl-pyridine dihydride. Another product is an oil composed of a ketone $C_8H_{12}O$ (208°–209°), V.D. 4·20, which combines with $NaHSO_3$, and with bromine, and with hydroxylamine yields crystals [76°].—10. *Nitrous acid* removes H_2, leaving tri-methyl-pyridine dicarboxylic ether.—11. *Bromine* dissolved in CS_2 forms a dibromide of di-bromo-tri-methyl-pyridine dihydride carboxylic ether $NC_8H_7Br_2(CO_2Et)_2H_2Br_2$ [88°]. This is extremely soluble in boiling alcohol, and crystallises as yellow twin-crystals. Fuming HNO_3 converts it into the di-bromide of di-bromo-tri-methyl-pyridine di-carboxylic ether [102°].—12. *Chloride* forms the di-chloride of penta-chloro-tri-methyl-pyridine dicarboxylic ether, crystallising as woolly needles [150°].

Tetra-methyl-pyridine dihydride carboxylic ether $C_{15}H_{23}NO_4$ *i.e.*

$$NMe\left\langle\begin{matrix}CMe{:}C(CO_2Et)\\CMe{:}C(CO_2Et)\end{matrix}\right\rangle CHMe.$$

[86°]. Formed by the action of paraldehyde and H_2SO_4 on methyl-amido-oxy-butyric ether (Kuckert, *B.* 18, 620); and, in small quantity, by the action of methylamine on a mixture of acetoacetic ether and aldehyde (Hantzsch, *B.* 18, 2580). Crystals, with blue fluorescence.

METHYL-PYRIDINE-HYDRIDES *v.* METHYL-PYRIDINE.

DI-METHYL-DIPYRIDYL $C_{12}H_{12}N_2$ *i.e.* $NC_5H_3Me.C_5H_3MeN$. *Dipicolyl.* [84°]. (295°–298°). Obtained by treating (α)-picoline with sodium at 80°–90°, exposing the product to air, and fractionally distilling (Ahrens, *B.* 21, 2930; Heuser, *J. pr.* [2] 42, 430). Very deliquescent yellowish needles. With water it forms a compound (containing 4aq) melting at 38°. When oxidised by potassium permanganate it yields $NC_5H_3Me.C_5H_3N.CO_2H$ [193°], which on heating by itself or with HOAc yields methyl-dipyridyl [94°].—$B''H_2Cl_2$. Hygroscopic plates (from alcohol). Picrate $B''2C_6H_2(NO_2)_3OH$. [240°].—$B''H_2Cl_2 6HgCl_2$. [220°]. — $B''H_2PtCl_6$: small plates; v. sl. sol. water, v. sol. HClAq. Discolours at 235°, but only partially decomposed at 275°. — $B''2HAuCl_4$: nodules (from conc. HClAq) decomposes at 200° (A.); [210°] (H.).—The tin double salt melts at 180°.

Di-methyl-dipyridyl dodecahydride $C_{12}H_{24}N_2$ *i.e.* $MeNC_5H_9.C_5H_9NMe$. *Di-methyl-dipiperidyl.* (230°–235°). Formed, together with tri-methyl-dipyridyl dodecahydride, by treating the product of the action of MeI upon dipyridyl dodecahydride (dipiperidyl) with Ag_2O (Liebrecht, *B.* 19, 2595). Liquid, miscible with water, but separating on addition of NaOH — $B''H_2Cl_2(HgCl_2)_3$:

flocculent pp., sol. hot water.—$B''H_2PtCl_6$: small dark-red crystals.

Tri-methyl-dipyridyl dodecahydride $C_{13}H_{26}N_2$ *i.e.* $NMe.C_5H_9.C_5H_8Me.NMe$. (205° - 212°). Formed as above. Yellowish oil; insol. water.—$B''H_2PtCl_6$: yellowish-red crystals; v. e. sol. water.

TRI-METHYL-PYRIDYLENE DIHYDRIDE DI-METHYL DIKETONE $C_{12}H_{17}NO_2$ *i.e.*

$$N{\lessdot}\begin{matrix}CMe.CH(CO.CH_3)\\CHMe.C(CO.CH_3)\end{matrix}{\gtrdot}CMe$$

[153°]. (250° *in vacuo*). Formed by heating methylene di-methyl diketone (2 mols.) with aldehyde-ammonia (1 mol.) on the water-bath (Combes, *Bl.* [2] 51, 15). Hexagonal prisms (from alcohol); insol. water.

METHYL-PYRIDYL-ACETYLENE TETRAHYDRIDE $C_5H_7NMe.C{:}CH$. Formed by boiling the hydrobromide of anhydro-ecgonine dibromide with aqueous K_2CO_3 (Eichengrün a. Einhorn, *B.* 23, 2879). Oil.—$B'HAuCl_4$. [179°].

DI-METHYL-DI-PYRIDYL-PROPANE DODECAHYDRIDE $C_{15}H_{30}N_2$ *i.e.* $(C_5H_9NMe.CH_2)_2CH_2$. *Methylo-iodide* $B''Me_2I_2$. Obtained by heating $(C_5H_{10}N.CH_2)_2CH_2$ with MeI (Ladenburg, *B.* 21, 3102). White non-hygroscopic crystals; v. sol. hot water. The **aurochloride** $B''(HAuCl_4)_2$ [171°] obtained from the methylo-iodide; crystallises from water in needles.

(*Py.* 1:5) - **DI - METHYL - PYRIDYL** - (*Py.* 3)- **QUINOLINE** $C_{16}H_{14}N_2$ *i.e.*

$$C_5NH_2Me_2.C_6H_3{<}\begin{matrix}CH{:}CH\\ \vert\\ N:CH\end{matrix}$$

. *Lutidyl - quinoline.* [109°]. Colourless glistening crystals. Formed by heating *m*-amido-phenyl-di-methyl-pyridine $C_5NH_2(CH_3)_2.C_6H_4.NH_2$ with glycerine, nitrobenzene, and H_2SO_4. The **chloride** and **nitrate** form white needles; the **platino-chloride** small orange needles; the **auro-chloride** long golden-yellow needles [215°] (Lepetit, *B.* 20, 2399; *G.* 17, 473).

METHYL - PYROCATECHIN $C_7H_8O_2$ *i.e.* $C_6H_3Me(OH)_2$ [1:3:4]. Formed by heating creosol $C_6H_3Me(OMe)(OH)$ [1:3:4] with HIAq (H. Müller, *C. N.* 10, 269). Formed also by the dry distillation of di-oxy-toluic ((α)-homo-protocatechuic) acid (Tiemann a. Nagai, *B.* 10, 210), and from $C_6H_3Me(NO_2)(OH)$ [1:3:4] by displacement of NO_2 by OH (Nevile a. Winther, *B.* 15, 2983). Liquid, which may be distilled; v. e. sol. water, alcohol, and ether. Reduces Fehling's solution and ammoniacal $AgNO_3$ in the cold. $FeCl_3$ gives a green colouration, turned reddish-violet by ammonia.

Mono-methyl ether $C_6H_3Me(OH)(OMe)$ [1:3:4]. *Isocreosol.* (c. 185°). Prepared from $C_6H_3Me(NH_2)(OMe)$ [1:3:4] by the diazo- reaction (Limpach, *B.* 22, 350). Yellow liquid; v. sol. alcohol and ether, sl. sol. water. Volatile with steam.

Mono-methyl ether $C_6H_3Me(OMe)(OH)$ [1:3:4] *v.* Creosol.

Isomerides *v. Methyl ethers* of Pyrocatechin.

TETRA-METHYL-PYROCOLL $C_{14}H_{14}N_2O_2$ *i.e.*

$$NC_4HMe_2{<}\begin{matrix}CO\\CO\end{matrix}{>}C_4HMe_2N$$

[272·5°]. Formed, together with (αβ′)-di-methyl-pyrrole, by heating (αβ′)-di-methyl-pyrrole-(α′β)-dicarboxylic anhydride at 350° (Magnanini, *B.* 21, 2877; 22, 2502). Trimetric yellow needles (by sublimation); insol. water, v. sol. chloroform. Its molecular weight was determined by Raoult's method. Boiling alcoholic KOH gives

$$NC_4H_2Me_2.CO.NC_4HMe_2CO_2K.$$

METHYL - PYROGALLOL $C_7H_8O_3$ *i.e.* $C_6H_2(CH_3)(OH)_3$. [129°]. Prepared by heating the dimethyl ether with HCl to 150°. Sublimes in small needles. Sl. sol. benzene.

Dimethyl ether $C_6H_2(CH_3)(OH)(OMe)_2$. [36°]. (265°). Crystalline. Occurs together with the dimethyl ether of pyrogallol in beech-wood tar-oil, from which it can be isolated by means of its benzoyl compound [118°] (Hofmann, *B.* 12, 1371). With bromine it yields $C_6Br_2(CH_3)(OH)(OMe)_2$ [126°]. If a mixture of the sodium salts of the dimethyl ethers of pyrogallol and methyl-pyrogallol is oxidised by heating in the air or with C_2Cl_6 eupittonic acid (pittakal) is formed.

METHYL-PYROMUCIC ACID $C_6H_6O_3$ *i.e.* $C_4H_2MeO.CO_2H$. [108°]. Formed by the oxidation of methyl-furfuraldehyde (Hill, *B.* 22, 608) and by the action of conc. KOHAq upon that aldehyde (Bieler a. Tollens, *A.* 258, 125). Needles; more soluble than pyromucic acid in water, benzene, and chloroform. With isatin and H_2SO_4 it gives a deep-green colour on warming. $FeCl_3$ gives a brown pp.

Reaction.—*Bromine* (2 mols.) added to its aqueous solution gives off CO_2 and forms an acid $C_5H_6O_3$ (?acetylacrylic), which crystallises in broad flat needles [123°], S. 6·7 (in the cold). This acid is v. sol. alcohol, ether, and hot water; it forms an addition-product [108°] with bromine, a silver salt $AgC_5H_5O_3$, crystallising in slender needles, and a phenyl-hydrazide [157°] apparently identical with that of acetyl-acrylic acid (Hill a. Hendrixson, *B.* 23, 452; *cf.* Bender, *B.* 21, 2494; Decker, *B.* 21, 2937).

Salt.—$AgC_6H_5O_3$: slender needles (from hot water); sl. sol. hot water.

DI-METHYL-PYRONE *v. Anhydride* of Di-methylene di-methyl diketone.

Di-methyl-pyrone carboxylic acid *v.* Dehydracetic acid.

Di-methyl-pyrone dicarboxylic acid *v. Anhydride* of Di-methylene di-methyl triketone.

ν-**METHYL-PYRROLE** C_5H_7N *i.e.*

$$NMe{<}\begin{matrix}CH{:}CH\\CH{:}CH\end{matrix}{>}$$

. *Methyl-pyrroline.* (113°) (B.); (114° i.V.) (C. a. D.). S.G. $\frac{10}{}$ ·9203 (B.). Formed by the dry distillation of methylamine mucate (C. A. Bell, *B.* 10, 1866). Formed also by treating potassium pyrrole with MeI (Ciamician a. Dennstedt, *B.* 17, 2951). Liquid. Resolved by heating with KOH into pyrrole and MeOH. When *ν*-methyl-pyrrole (3 g.) is heated with MeOH (5 g.), MeI (7 g.), and K_2CO_3 (3 g.) for 10 hours at 140° there is formed a tri-methyl-pyrrol (150°-165°) and penta-methyl-pyridine dihydride $C_5H_2Me_4NMe$ (Ciamician a. Anderlini, *B.* 22, 656). Methyl-pyrrole acts on alloxan in warm aqueous solution forming $C_9H_9N_3O_4$ *i.e.* $NH_2.CO.NH.CO.CO.CO.C_4H_3NMe$, which crystallises in white plates; sol. hot water, sl. sol. alcohol and cold water (Ciamician a. Silber, *B.* 19, 1710).

ν - **Methyl - pyrrole dihydride** C_4H_6NMe. *Methyl-pyrroline.* (80°). Formed by reduction of *ν*-methyl-pyrrole with zinc-dust and HOAc (Ciamician a. Magnaghi, *B.* 18, 725). Colourless, strongly alkaline liquid, miscible with water. Tertiary base. Its hydrochloride forms colourless crystals.—$B'_2H_2PtCl_6$: trimetric crystals, v. e. sol. water (Lo Valle, *G.* 15, 490).

Methylo-iodide $C_4H_6NMe_2I$. [286°]. Obtained by the action of MeI on the above or on pyrrole dihydride (Ciamician, *B.* 16, 1541; *G.* 15, 492). Pearly plates. Yields the platinochloride $(C_4H_6NMe_2Cl)_2PtCl_4 x aq$.

Methyl-pyrrole tetrahydride $C_5H_{11}N$ *i.e.* $NMe\left<\begin{array}{l}CH_2.CH_2\\CH_2.CH_2\end{array}\right>$. *Methyl-pyrrolidine.* (82°). Formed by heating the dihydride with fuming HIAq and amorphous phosphorus at 250° (Ciamician a. Magnaghi, *G.* 15, 493). Liquid, miscible with water.

Methylo-iodide $C_4H_8NMe_2I$. Formed by the action of MeI on methyl-pyrrole tetrahydride or on pyrrole tetrahydride. Deliquescent needles, v. e. sol. alcohol, insol. ether and NaOHAq. Ag_2O yields $C_4H_8NMe_2OH$, which is decomposed by distillation into MeOH and C_4H_8NMe. Distillation of the iodide with solid KOH yields C_4H_7MeNMe [89°–92°].

(α)-Methyl-pyrrole C_5H_7N *i.e.* $C_4H_3Me.NH$. (α)-*Homopyrrole.* (148°). Occurs, together with the (β)-isomeride, in bone-oil. The fraction 140°–150° is boiled with KOH, and the potassium derivatives that separate are washed with ether, decomposed by water, and fractionally distilled (Ciamician, Dennstedt, a. Zimmermann, *B.* 19, 173, 2200; 22, 1918; Weidel a. Ciamician, *B.* 13, 77). The isomerides may also be separated by conversion into their carboxylic acids, separation of these by means of their lead salts, and dry distillation of their calcium salts (Ciamician, *B.* 14, 1053).

Properties.—Liquid, smelling like chloroform. Turns brown in air. Resinified by HCl, but more slowly than pyrrole; gives a white pp. with $HgCl_2$. Forms a potassium compound C_4H_3MeNK, which combines with CO_2 at 200°, forming (α)-methyl-pyrrole carboxylic acid. The potassium compound reacts with chloroform, yielding chloro-methyl-pyridine. Potash-fusion yields pyrrole (α)-carboxylic acid. Oxidising agents form HOAc, ammonia, and CO_2. HCl passed into its ethereal solution ppts. di-methyl-dipyrrole hydrochloride $(C_5H_7N)_2HCl$, whence cold dilute H_2SO_4 forms di-methyl-indole (c. 275°), of which the picrate melts at 156° (Dennstedt, *B.* 21, 3439). On heating with phthalic anhydride and HOAc at 240° there is formed a yellow compound $C_{13}H_9NO_2$ [157°], which appears to be the anhydride of an acid, which may be obtained from it by boiling with dilute KOHAq, acidifying, and extracting with ether. This acid forms colourless crystals, and melts at 170°–172° (Ciamician a. Zimmermann, *B.* 19, 2203).

(β)-Methyl-pyrrole C_4H_3MeNH. (143°). Occurs in bone-oil (*v. supra*). Liquid. Resembles the (α)-isomeride in its reactions. Potash-fusion yields pyrrole (β)-carboxylic acid. CO_2 acting on its potassium compound forms (β)-methyl-pyrrole carboxylic acid. HCl passed into its ethereal solution forms the hydrochloride of (β)-dimethyl-dipyrrole $(C_5H_7N)_2HCl$; and when dilute H_2SO_4 is allowed to act for 24 hours on this hydrochloride there is formed a di-methyl-indole of which the picrate melts at 149° (Dennstedt, *B.* 21, 3439). On heating (β)-methyl-pyrrole (5 g.) dissolved in HOAc (3 vols.) with phthalic anhydride (10 g.) for 5 hours at 200° there is formed a compound $C_{13}H_9NO_2$ [215°], which may be purified by crystallisation from alcohol and sublimation, and obtained as lemon-yellow needles, insol. water (Ciamician a. Dennstedt, *B.* 17, 2957; 19, 2201). Dilute KOH converts the compound $C_{13}H_9NO_2$ into an acid $C_{13}H_{11}NO_3$, which forms colourless crystals (from ether), and melts at 159°.

Acetyl derivative of methyl-pyrrole C_4H_3MeNAc. (197°). Formed, together with methyl-pyrryl methyl ketone, by boiling methyl-pyrrole with NaOAc and Ac_2O (Ciamician a. Silber, *B.* 19, 1409). Liquid. Volatile with steam, almost insol. water. Easily saponified by alkalis.

Methyl-pyrrole-tetra-hydride $C_5H_{11}N$ *i.e.* $\left.\begin{array}{l}CH_2.CHMe\\|\\CH_2.CH_2\end{array}\right>NH$. *Methyl-pyrrolidine.* (97° at 737 mm. i.V.). Formed by reduction of oxy-methyl-pyrrole-di-hydride (from γ-amido-valeric acid) in boiling amyl-alcohol with metallic sodium (Tafel, *B.* 20, 250). Colourless mobile liquid. Very volatile at the ordinary temperature. Boiling MeI and MeOH form crystalline $C_5H_{10}MeNMeI$.

Salts (Tafel a. Neugebauer, *B.* 22, 1865).—B'HCl. [210°–220°]. Colourless prisms.—$B'_2H_2PtCl_6$ aq: golden needles (from hot water).—$B'H_2AuCl_5$. [140°–144°]. Golden crystals, v. sol. water and alcohol.—$B'_2H_2C_2O_4$. [165°–168°]. Small needles.

Nitrosamine $C_5H_{10}(NO)N$. Yellow oil.

Methyl-pyrrole tetrahydride $NH\left<\begin{array}{l}CH_2.CHMe\\CH_2.CH_2\end{array}\right>$. (104°). S.G. $\frac{0}{4}$ ·8654. This base is formed by the dry distillation of the hydrochloride of methyl-tetramethylene-diamine $NH_2.CH_2.CH_2.CHMe.CH_2.NH_2$ (Oldach, *B.* 20, 1657). Liquid, fuming in the air, and smelling like piperidine.

Salts.—Hydrochloride: very deliquescent.—$B'_2H_2PtCl_6$. [194°]. Long prisms.—$B'HAuCl_4$. [170°]. Minute tables, v. sol. water. $B'_3HI(BiI_3)_2$.—$B'C_6H_2(NO_2)_3OH$. [105°].

Nitrosamine $C_5H_{10}(NO)N$. (224°).

Di-methyl-pyrrole C_6H_9N *i.e.* $HN\left<\begin{array}{l}CMe:CH\\CMe:CH\end{array}\right>$. (165°). Occurs in bone-oil (Weidel a. Ciamician, *B.* 13, 78).

Formation.—1. By the action of alcoholic potash at 150°–160° on its dicarboxylic ether, which is formed by reduction of a mixture of acetoacetic and isonitroso-acetoacetic ethers with zinc-dust and acetic acid (Knorr, *B.* 17, 1638).—2. By heating its mono- (or di-) carboxylic acid, obtained from di-acetyl-succinic ether (Knorr, *B.* 18, 1565).—3. By heating acetonyl-acetone $CH_3.CO.CH_2.CH_2.CO.CH_3$ with a slight excess of alcoholic NH_3 for an hour at 150° (Paal, *B.* 18, 2254).

Properties.—Colourless liquid with unpleasant odour, almost insol. water, v. e. sol. alcohol and ether. Very volatile with steam. Gives a white pp. with $HgCl_2$. Slowly resinified by HCl. Its vapour colours pine-wood moistened with HCl red. Bromine-water gives a white pp. $FeCl_3$ gives a brownish-red colouration. H_2SO_4 added to its acetic acid solution mixed with phenanthraquinone gives a deep-brownish red colour. H_2SO_4 and isatin give a green colour, changing on warming to brownish-red. Phenyl glyoxylic acid and sulphuric acid also give a brownish-red colour. Hydroxylamine acting on its alcoholic solution forms the di-oxim of acetonyl-acetone $\mathrm{CH_3.C(NOH).CH_2.CH_2.C(NOH).CH_3}$ [136·5°] (Ciamician a. Zanetti, *B.* 22, 3177).

Acetyl derivative $\mathrm{C_4H_3MeNAc}$. Liquid, not solidified at −20°; v. sl. sol. water. Saponified by potash. Does not reduce $\mathrm{AgNO_3}$ in very dilute ammoniacal alcoholic solution.

Di-methyl-pyrrole tetrahydride $\mathrm{C_6H_{13}N}$ *i.e.*

$\mathrm{NH}\left\langle\begin{matrix}\mathrm{CHMe.CH_2}\\ \mathrm{CHMe.CH_2}\end{matrix}\right\rangle$. (107° i.V.). Formed by distilling the hydrochloride of hexylene-diamine $\mathrm{NH_2.CHMe.CH_2.CH_2.CHMe.NH_2}$ obtained by reducing the phenyl-hydrazide of acetonyl-acetone (Tafel, *B.* 22, 1854; Tafel a. Neugebauer, *B.* 23, 1547). Colourless oil, smelling like piperidine, miscible with water, alcohol, and ether. Its hydrochloride crystallises in needles [188°–190°].—$\mathrm{B'_2H_2C_2O_4}$: small needles (from alcohol).—$\mathrm{B'_2H_2PtCl_6}$: golden prisms.

Nitrosamine $\mathrm{C_4H_6Me_2N.NO}$. (135° at 60 mm.). Yellow oil, lighter than water; sl. sol. cold water, v. sol. ether and alcohol. Conc. $\mathrm{H_2SO_4}$ dissolves it without becoming coloured, but on warming the liquid becomes yellow and gives off gas. The nitrosamine may be reduced to an oily hydrazine, which on oxidation with HgO yields the tetrazone $\mathrm{C_{12}H_{24}N_4}$ [43°].

Di-methyl-pyrrole $\mathrm{C_6H_9N}$ *i.e.*

$\mathrm{NH}\left\langle\begin{matrix}\mathrm{CMe{:}CH}\\ \mathrm{CH\ {:}CMe}\end{matrix}\right\rangle$. (171° cor.). Formed by distilling its carboxylic acid (Knorr, *A.* 236, 326). Liquid, with blue fluorescence and characteristic sweet odour, sl. sol. water, v. sol. alcohol, ether, and benzene. Its aqueous solution becomes red on warming with $\mathrm{FeCl_3}$.

Di-methyl-pyrrole tetrahydride $\mathrm{C_4H_7Me.NMe}$. (89°–92°). Formed by distilling the methylo-iodide of methyl-pyrrole tetrahydride with KOH (Ciamician a. Magnaghi, *G.* 15, 485). Liquid, miscible with water. Its hydrochloride is deliquescent.

Methylo-iodide $\mathrm{C_4H_7MeNMe_2I}$. Small needles (from alcohol); v. e. sol. water. Ppd. from its aqueous solution by addition of KOH. On distillation with KOH it yields trimethylamine and butinene $\mathrm{C_4H_6}$.

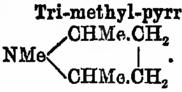
Tri-methyl-pyrrole $\mathrm{C_7H_{11}N}$. (180°–195°). Occurs in bone-oil (fraction 180°–205°); from which it is isolated by conversion into the potassium compound (Ciamician a. Dennstedt, *B.* 14, 1340). Colourless oil. Sol. acids, sl. sol. water. Turns brown in air. Its vapour turns pine-wood moistened by HCl red. Reduces $\mathrm{PtCl_4}$. Gives a white pp. with $\mathrm{HgCl_2}$. Potassium acts on it very slowly with production of the solid compound $\mathrm{C_7H_{10}NK}$. Conc. HClAq at 120° forms ammonia and a di-methyl-pyridine dihydride $\mathrm{C_7H_{11}N}$.

Tri-methyl-pyrrole $\mathrm{C_7H_{11}N}$. (150°–165°). Prepared by heating methyl-pyrrole (3 g.) dissolved in MeOH (5 g.) with MeI (7 g.) and $\mathrm{K_2CO_3}$ (3 g.) for 10 hours at 140°. The product is acidified and distilled with steam (Ciamician a. Anderlini, *B.* 22, 656).

Tri-methyl-pyrrole $\mathrm{C_7H_{11}N}$ *i.e.*

$\mathrm{NMe}\left\langle\begin{matrix}\mathrm{CMe{:}CH}\\ |\\ \mathrm{CMe{:}CH}\end{matrix}\right.$. (173° cor.). Formed by heating its dicarboxylic acid at 260° (Knorr, *A.* 236, 304). Liquid, volatile with steam; v. sol. alcohol and ether. Boiling aqueous $\mathrm{FeCl_3}$ gives an intense red colour.

Tri-methyl-pyrrole tetra-hydride $\mathrm{C_7H_{15}N}$ *i.e.*

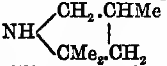


$\mathrm{NMe}\left\langle\begin{matrix}\mathrm{CHMe.CH_2}\\ |\\ \mathrm{CHMe.CH_2}\end{matrix}\right.$. (116°) at 750 mm. Formed by the action of MeI on

$\mathrm{NH}\left\langle\begin{matrix}\mathrm{CHMe.CH_2}\\ \mathrm{CHMe.CH_2}\end{matrix}\right\rangle$ (Tafel a. Neugebauer, *B.* 23, 1549). Liquid, sl. sol. water.—B′HCl: glittering white prisms.—$\mathrm{B'_2H_2PtCl_6}$: yellow oil, sl. sol. alcohol.

Methylo-iodide B′MeI. [256°]. Colourless prisms, v. sol. water, sl. sol. warm alcohol.

A tri-methyl-pyrrole tetrahydride



$\mathrm{NH}\left\langle\begin{matrix}\mathrm{CH_2.CHMe}\\ |\\ \mathrm{CMe_2.CH_2}\end{matrix}\right.$ appears to be formed by distilling oxy-tri-methyl-pyrrole dihydride with zinc-dust (Weil, *A.* 232, 213).

METHYL-PYRROLE-DISAZO- COMPOUNDS *v.* *Dis*-AZO- COMPOUNDS.

(α)-METHYL-PYRROLE CARBOXYLIC ACID $\mathrm{C_6H_7NO_2}$ *i.e.* $\mathrm{C_4H_3MeN.CO_2H}$. (α)-*Homo-pyrroline carboxylic acid. Carbohomopyrrolic acid.* [169·5°]. When crude potassium methyl-pyrrole is heated in a current of $\mathrm{CO_2}$ at 190° there is formed a mixture of the potassium salts of (α)- and (β)-methyl-pyrrole carboxylic acids. These acids may be separated by lead acetate, which ppts. the (β)- acid only (Ciamician, *G.* 11, 230; *B.* 14, 1056). Colourless scales, sol. water. Yields (α)-methyl-pyrrole on distillation with lime.

(β)-Methyl-pyrrole carboxylic acid $\mathrm{C_6H_7NO_2}$ *i.e.* $\mathrm{C_4H_3MeN.CO_2H}$. [142·4°]. Obtained as above, forms a minutely crystalline mass. Its Ca salt yields (β)-methyl-pyrrole on distillation with lime.

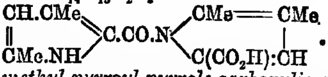
Methyl-pyrrole carboxylic acid $\mathrm{C_6H_7NO_2}$ *i.e.* $\mathrm{C_5H_3MeN.CO_2H}$. [135°]. Formed by heating its methylamide with alcoholic potash at 120° (Chichester A. Bell, *B.* 10, 1861; 11, 1810).

Methylamide $\mathrm{C_5H_3MeN.CO.NHMe}$. [90°]. Formed, together with methyl-pyrrole, by heating methylamine mucate in a paraffin bath (Bell). Scales or prisms; sol. water, volatile with steam.

Di-methyl-pyrrole carboxylic acid $\mathrm{C_7H_9NO_2}$ *i.e.*

$\mathrm{NH}\left\langle\begin{matrix}\mathrm{CMe{=\!=}CH}\\ \mathrm{C(CO_2H){:}CMe}\end{matrix}\right\rangle$. [137°]. Formed by the prolonged action of boiling aqueous KOH on tetra-methyl-pyrroyl-pyrrole carboxylic acid or on tetramethylpyrocoll, which is itself obtained by heating di-methyl-pyrrole dicarboxylic acid (Magnanini, *B.* 22, 38; *Rend. Accad. Linc.* [4] 4, 475). Crystals, v. sl. sol. cold water, dissolves in warm water with partial decomposition into $\mathrm{CO_2}$ and di-methyl-pyrrole. Decomposes on fusion. Boiling $\mathrm{Ac_2O}$ converts it into tetra-methyl-pyrocoll and di-methyl-pyrryl methyl ketone. A solution of its ammonium salt gives with lead acetate a white pp., sol. excess, with cupric acetate a green crystalline pp., and with $\mathrm{FeCl_3}$ a dark-red pulverulent pp.

Di-methyl-pyrrole carboxyl derivative $\mathrm{C_{14}H_{18}N_2O_3}$ *i.e.*



$$\begin{array}{lcl}\mathrm{CH.CMe} & & \mathrm{CMe{=\!=}CMe}\\ \| & \rangle\mathrm{C.CO.N}\langle & \quad |\\ \mathrm{CMe.NH} & & \mathrm{C(CO_2H){:}CH}\end{array}$$

Tetra-methyl-pyrroyl-pyrrole carboxylic acid. Formed by boiling tetra-methyl-pyrocoll with alcoholic potash, diluting with water, and ppg. with acetic acid (Magnanini, *B.* 22, 35; *Rend. Accad. Linc.* [4] 4, 468). At 145° it gives off CO_2 and leaves a residue which may be crystallised from alcohol. Boiling aqueous potash forms di-methyl-pyrrole carboxylic acid. On warming solutions of the salts a pp. of tetra-methyl-pyrocoll is formed. The lead and silver salts are white pps., the ferric salt a red pp., and the cupric salt a green pp.—BaA'_2. Tables.

Methyl ether MeA'. [163°]. Formed from the silver salt and MeI. Monoclinic tables; $a:b:c = \cdot701:1:\cdot443$; $\beta = 80° 59'$. Insol. water, sl. sol. benzene, v. sol. $CHCl_3$. Yields MeOH and tetramethylpyrocoll on fusion.

Di-methyl-pyrrole carboxylic acid $C_7H_8NO_2$ *i.e.*  $NH\left<\begin{array}{l}CMe:C(CO_2H)\\CH=\!=\!=CMe\end{array}\right>$. [183°]. Obtained from its ether, which is produced by heating the mono-ethyl ether of di-methyl-pyrrole dicarboxylic acid  $NH\left<\begin{array}{l}CMe:C(CO_2Et)\\C(CO_2H):CMe\end{array}\right>$ (Knorr, *A.* 236, 325). Crystalline flocculi. Split up on melting into CO_2 and di-methyl-pyrrole. Boiling Ac_2O forms di-methyl-pyrryl methyl ketone $CH_3.CO.C_4H_2NMe_2$ [122°].

Ethyl ether EtA'. [76°]. (291° cor.). Crystalline mass, v. sol. alcohol and ether.

Anilide $C_4H_2Me_2N.CONHPh$. [80°]. Formed by heating the mono-anilide of di-methyl-pyrrole dicarboxylic acid.

Di-methyl-pyrrole carboxylic acid $C_7H_9NO_2$ *i.e.* . Obtained by saponifying with aqueous NaOH its ether, which is formed by heating the mono-ethyl ether of di-methyl-pyrrole dicarboxylic acid  (Knorr, *B.* 18, 1564). Slender needles. Split up at 210–213° into CO_2 and the corresponding di-methyl-pyrrole.

Salts.—PbA'_2: microcrystalline pp.—AgA': white pp.

Ethyl ether EtA'. [118°]. (290° at 731 mm.). Formed as above, and also by slowly adding conc. NH_3Aq to a mixture of molecular proportions of chloro-acetone and acetoacetic ether. Flat prisms, volatile with steam. Sol. alcohol and ether, insol. water.

Di-methyl-pyrrole dicarboxylic acid $C_8H_9NO_4$ *i.e.*  $NH\left<\begin{array}{l}CMe:C(CO_2H)\\C(CO_2H):CMe\end{array}\right>$.

Preparation.—$NaNO_2$ (2 pts.) in conc. aqueous solution is added to acetoacetic ether (7 pts.) dissolved in HOAc. Zinc-dust (25 pts.) is added to the well-cooled product. On adding water the di-ethyl ether is deposited in needles, and this is saponified by boiling NaOHAq (Knorr, *A.* 236, 317; *B.* 17, 1638).

Properties.—Crystalline flakes, v. sol. water and alcohol, less sol. ether. Rapidly turns red in air. Decomposes completely at 260° into CO_2 and di-methyl-pyrrole, without melting. It reduces boiling ammoniacal $AgNO_3$. It forms normal and acid salts which are mostly amorphous.

Mono-ethyl ether HEtA'' *i.e.*  $NH\left<\begin{array}{l}CMe:C(CO_2Et)\\C(CO_2H):CMe\end{array}\right>$. [202°]. Formed by boiling the di-ethyl ether with alcoholic potash. Needles (from alcohol), sl. sol. cold alcohol, insol. water. Split up on fusion into CO_2 and di-methyl-pyrrole carboxylic ether. Its lead and silver salts are white amorphous pps. When heated with Ac_2O in a sealed tube at 200° it it yields  $NH\left<\begin{array}{l}CMe:C(CO_2Et)\\CAc:CMe\end{array}\right>$ [143°], and this ether gives on saponification a crystalline acid [150°–158°], which on dry distillation is split up into CO_2 and di-methyl-pyrryl methyl ketone [123°] (Magnanini, *B.* 21, 2865).

Di-ethyl ether $C_{12}H_{17}NO_4$ or Et_2A''. [135°]. Formed as above. White matted needles, insol. water, acids, and alkalis, sol. alcohol and ether. Split up by heat into CO_2 and di-methyl-pyrrole. Alcoholic potash forms a pp. of $C_{12}H_{16}KNO_4$.

Mono-anilide $C_{14}H_{14}N_2O_3$ *i.e.*  $NH\left<\begin{array}{l}CMe:C(CONHPh)\\C(CO_2H):CMe\end{array}\right>$. Formed by boiling its ethyl ether (*v. infra*) with alcoholic potash. Slender needles which soften at 180° and decompose at 198° into CO_2 and the anilide of di-methyl-pyrrole carboxylic acid. Boiling dilute H_2SO_4 decomposes it in the same way.

Ethyl ether of the mono-anilide $C_{14}H_{13}N_2O_3Et$. [216°]. Formed by the action of zinc-dust on a mixture of equivalent quantities of acetoacetic anilide and nitroso-acetoacetic ether dissolved in HOAc (Knorr, *A.* 236, 327). Crystals, sol. hot alcohol and HOAc. Yields di-methyl-pyrrole on warming with conc. H_2SO_4.

Ethyl ether of the isomeric mono-anilide $C_{14}H_{13}N_2O_3Et$ *i.e.*  $NH\left<\begin{array}{l}CMe:C(CO_2Et)\\C(CONHPh):CMe\end{array}\right>$. [180°]. Formed by the action of zinc-dust on a mixture of equivalent quantities of acetoacetic ether and nitroso-acetoacetic anilide dissolved in HOAc (Knorr). Needles (from alcohol). Yields di-methyl-pyrrole on warming with H_2SO_4.

Di-anilide  $NH\left<\begin{array}{l}CMe:C(CONHPh)\\C(CONHPh):CMe\end{array}\right>$. [255°]. Formed by the action of zinc-dust on a mixture of equivalent quantities of acetoacetic anilide and nitroso-acetoacetic anilide (Knorr). Needles (from alcohol). Yields di-methyl-pyrrole on warming with H_2SO_4.

Anhydride $C_8H_7NO_3$ *i.e.* . Formed by boiling di-methyl-pyrrole dicarboxylic acid with Ac_2O (Magnanini, *B.* 21, 2876). Powder, almost completely insol. water, alcohol, and ether. Turns brown at 300° and at a higher temperature it splits up into di-methyl-pyrrole and tetra-methyl-pyrocoll.—MgA'_2: needles, m. sol. water.—AgA': yellow amorphous sediment.

Ethyl ether of the anhydride $C_8H_6EtNO_3$. [270°]. Formed by boiling di-methyl-pyrrole dicarboxylic ether with Ac_2O. White, sparingly soluble needles.

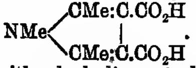
Di-methyl-pyrrole dicarboxylic acid . [250°]. Formed by dissolving di-acetyl-succinic ether in aqueous NH_3, and saponifying the resulting ether with alcoholic potash (Knorr, *B.* 18, 302, 1558). Needles (from alcohol). Decomposes at its melting-point into CO_2 and (αα′)-di-methyl-pyrrole.—BaA″: small needles.—CuA″3aq: slender green needles.—$_xAg_2A''$: microcrystalline powder.

Mono-ethyl ether HEtA″. [227°]. Slender crystals. Evolves CO_2 at its melting-point, giving di-methyl-pyrrole carboxylic acid. It has acid properties, and its Cu, Co, and Ni salts form white felted needles.

Di-ethyl ether Et_2A''. [99°]. Colourless crystals, sol. alcohol, $CHCl_3$, and HOAc, sl. sol. ether, nearly insol. water. Has weak basic and acid properties.—$(C_{12}H_{17}NO_4HCl)_2PtCl_4$. Orange-red crystals.—$C_{12}H_{18}KNO_4$: slender felted needles.

Tri-methyl-pyrrole dicarboxylic acid

$C_9H_{11}NO_4$ *i.e.*



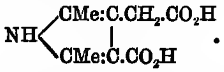
$$NMe<\begin{matrix}CMe:C.CO_2H\\ |\\ CMe:C.CO_2H\end{matrix}$$

Obtained by saponifying with alcoholic potash its di-ethyl ether which is produced by boiling di-aceto-succinic ether with methylamine in glacial acetic acid solution (Knorr, *B.* 18, 303; *A.* 236, 304). Slender needles, insol. water, sl. sol. ether, sol. alcohol. Split up at 260° into CO_2 and tri-methyl-pyrrole.—KHA″.—NH_4HA''.—BaA″.—CoA″.

Ethyl ether Et_2A''. [72°].

Tri-methyl-pyrrole dicarboxylic acid

$C_9H_{11}NO_4$ *i.e.*



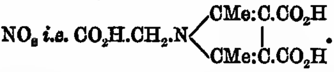
$$NH<\begin{matrix}CMe:C.CH_2.CO_2H\\ |\\ CMe:C.CO_2H\end{matrix}$$

Di-methyl-pyrrole carboxy-acetic acid. [196°]. Formed by saponification by aqueous NaOHAq from its ether which is obtained by boiling αβ-di-acetyl-glutaric ether with a solution of NH_3 in HOAc (Knorr, *B.* 19, 48). Slender prisms. Imparts a red colouration to acidified pine wood.

Di-ethyl ether Et_2A''. [110°]. Glistening plates, v. sol. alcohol and ether, insol. water.

Tri-methyl-pyrrole tricarboxylic acid

$C_{10}H_{11}NO_6$ *i.e.*



$$CO_2H.CH_2.N<\begin{matrix}CMe:C.CO_2H\\ |\\ CMe:C.CO_2H\end{matrix}$$

Di-methyl-pyrrole-dicarboxy-acetic acid. Obtained by saponifying its ether which is produced by boiling di-acetyl-succinic ether with glycocoll and HOAc (Knorr, *A.* 236, 315). Crystalline pp., decomposed at 214° giving off CO_2.—K_3A'''.—Ag_2HA''': crystalline pp.

Di-ethyl ether Et_2HA'''. [169°]. Formed as above. Plates, insol. water, v. sol. alcohol, ether, and alkalis.—$Pb(Et_2A''')_2$: prisms.

METHYL-PYRROLIDINE *v.* METHYL-PYRROLE TETRAHYDRIDE.

METHYL-PYRROLINE *v.* METHYL-PYRROLE and its *Dihydride.*

TETRA - METHYL - PYRROYL - PYRROLE CARBOXYLIC ACID *v.* DI-METHYL-PYRROLE CARBOXYLIC ACID.

DI-METHYL-PYRRYL-BENZOIC ACID *v.* PHENYL-DI-METHYL-PYRROLE CARBOXYLIC ACID.

METHYL-PYRRYLENE-DIBENZOIC ACID *v.* DI-PHENYL-METHYL-PYRROLE DICARBOXYLIC ACID.

ν-METHYL-PYRRYLENE DI-METHYL DI-KETONE $C_4H_2NMe(CO.Me)_2$. *ν-Methyl-di-acetyl-pyrrole.* [134°]. Formed by heating ν-methyl-pyrrole with acetic anhydride for 8 hrs. at 250°. Colourless needles. V. sol. alcohol, ether chloroform, benzene, and hot water (Ciamician a. Silber, *B.* 20, 1368; *G.* 17, 134).

METHYL-PYRRYL-GLYOXYLIC ACID

$C_7H_7NO_3$ *i.e.* $NMe<\substack{CH:CH\\C(CO.CO_2H)}>CH$. [142°]. Formed by boiling methyl-pyrryl methyl ketone with dilute alkaline $KMnO_4$ (De Varda, *B.* 21, 2871; *Rend. Accad. Linc.* [4] 4, 755, 758). Light-yellow needles (from benzene). Bromine added to its solution in glacial acetic acid forms $C_4HBr_2MeN.CO.CO_2H$ crystallising in yellow prisms [160°], oxidised by fuming HNO_3 to the methylimide of di-bromo-maleïc acid.—AgA′: white pp.

METHYL PYRRYL KETONE *v.* PYRRYL METHYL KETONE.

METHYL-PYRRYL METHYL KETONE

C_7H_9NO *i.e.* $NH<\substack{CMe:CH\\C(CO.CH_3)}>CH$. [86°]. (240°). Formed by the action of Ac_2O and NaOAc upon methyl-pyrrole from bone-oil (Ciamician a. Silber, *B.* 19, 1408; 20, 2604; *G.* 16, 352; 17, 269). Small white needles (from water); v. sol. alcohol, ether, and benzene. Not decomposed by boiling alkalis. Yields a methyl-pyrryl-glyoxylic acid on oxidation. Bromine in CS_2 gives $C_7H_7Br_2NO$ crystallising in needles [162°], which is oxidised by HNO_3 to di-bromo-maleïc imide at −18°. Ammoniacal $AgNO_3$ gives with the ketone a white pp. of $C_4H_2MeAcNAg$.

ν-METHYL - PYRRYL METHYL KETONE $CH_3.CO.C_4H_3NMe$. *Pseudo-acetyl-methyl-pyrrole.* (201°). Prepared by boiling ν-methyl-pyrrole (10 g.) with Ac_2O (70 g.) and NaOAc (12 g.) for 12 hours (Weidel a. Ciamician, *B.* 13, 76; Ciamician a. Dennstedt, *B.* 17, 2952; De Varda, *B.* 21, 2872). Colourless liquid, sl. sol. water. Not hydrolysed by boiling KOHAq. Reduces warm ammoniacal $AgNO_3$, forming a silver mirror.

Di-methyl-pyrryl methyl ketone $C_8H_{11}NO$ *i.e.* $NH<\substack{CMe:CH\\C(CO.CH_3)}>CMe$. [123°]. Obtained by distillation of its carboxylic acid (Magnanini, *Rend. Accad. Linc.* [4] 4, 832; *B.* 21, 2867). Monoclinic crystals, $a:b:c = \cdot402:1:\cdot857$; $\beta = 78°\,16'$. At 100° it sublimes in needles. M. sol. hot water, v. sol. alcohol, benzene, and HOAc, sl. sol. petroleum. Not affected by boiling conc. KOHAq. Yields a phenyl-hydrazide.

Di-methyl-pyrryl methyl ketone

$$NH<\begin{matrix}CMe:C(CO.CH_3)\\ |\\ CMe:CH\end{matrix}$$

[85°]. A product of the action of Ac_2O on the corresponding di-methyl-pyrrole (Dennstedt a. Zimmermann, *B.* 19, 2195). Crystals. Reduces $AgNO_3$ in very dilute alcoholic solution.

DI-METHYL-PYRRYL METHYL KETONE CARBOXYLIC ACID $C_9H_{11}NO_3$ *i.e.* $NH<\substack{CMe:C(CO_2H)\\C(CO.CH_3):CMe}>$. [152°–158°]. Formed by saponification of its ethyl ether, which is prepared by heating the mono-ethyl ether of di-methyl-pyrrole dicarboxylic acid (1 pt.) with Ac_2O (5 pts.) at 205° in sealed tubes (Magnanini, *Rend. Accad. Linc.* [4] 4, 830; *B.* 21, 2865). Needles (from HOAc), almost insol. water and cold alcohol, v. sl. sol. ether, $CHCl_3$, and benzene. Completely decomposed on fusion into CO_2 and di-methyl-pyrryl methyl ketone. When heated with isatin and conc. H_2SO_4 it gives a green colour. A solution of its ammonium salt gives pps. with lead, copper, ferric, cobalt, and mercuric salts.

Ethyl ether EtA'. [143°]. Slender needles, v. sol. hot water, alcohol, and ether.

DI-METHYL-*o*-PYRRYL-PHENOL $C_{12}H_{13}NO$ *i.e.* [2:1]  $C_6H_4(OH).N\left<\begin{matrix}CMe:CH\\CMe:CH\end{matrix}\right>$. *Oxy-phenyl-di-methyl-pyrrole.* [95°]. Formed by warming acetonyl-acetone with *o*-amido-phenol in alcoholic solution (Paal, *B.* 19, 558). White plates (from alcohol), turning red in air; sl. sol. water, v. sol. alcohol and ether. Dissolves in alkalis, and is reppd. as needles by CO_2.—NaA': crystalline.—The *picrate* crystallises in reddish-brown plates.

(α)-METHYL-PYRRYL STYRYL KETONE $C_4NH_3(CH_3).CO.CH:CH.C_6H_5$. [193°]. Formed by boiling (α)-methyl-pyrryl methyl ketone and benzoic aldehyde with dilute caustic potash (Dennstedt a. Lehne, *B.* 22, 1918). Sulphur-yellow needles (from alcohol).

(β)-Methyl-pyrryl styryl ketone $C_{14}H_{13}NO$ *i.e.* $C_4NH_3(CH_3).CO.CH:CH.C_6H_5$. [156°–157°]. Formed from (β)-methyl-pyrryl methyl ketone, benzoic aldehyde, and dilute caustic potash (D. a. L.). Small light-yellow plates, v. sol. alcohol.

(αβ')-Dimethyl-pyrryl styryl ketone  $\left<\begin{matrix}CH:CMe\\CMe:N\end{matrix}\right>C.CO.CH:CH.C_6H_5$. [188°]. Formed from (αβ')-di-methyl-pyrryl methyl ketone, benzoic aldehyde, and KOHAq. Yellow shining plates (from alcohol) (Dennstedt, *B.* 22, 1921).

(αβ) (?)-Di-methyl-pyrryl styryl ketone $C_4NH_2(CH_3)_2.CO.CH:CH.C_6H_5$. [166°]. Formed like the preceding. Small yellow plates or needles (from boiling alcohol) (Dennstedt, *B.* 22, 1926).

METHYL-PYRUVIC ACID *v.* ETHYL-GLYOXYLIC ACID. Its nitrile is described as PROPIONYL CYANIDE.

Tri-methyl-pyruvic acid $C_6H_{10}O_3$ *i.e.* $CMe_3.CO.CO_2H$. [88°]. (185°). Formed, together with a little $CMe_3.CO_2H$, by oxidising pinacolin with warm alkaline $KMnO_4$ (Glucksmann, *M.* 10, 770). Small colourless prisms (from ether), sl. sol. cold water, v. sol. hot water, m. sol. ether. Volatile with steam. Gives a silver mirror with ammoniacal $AgNO_3$. May be reduced to $CMe_3.CH(OH).CO_2H$ and oxidised to $CMe_3.CO_2H$.

Salts.—NaA'.—CaA'_2 3aq.—AgA'.

Phenyl-hydrazide $C_{12}H_{10}N_2O_2$. [158°]. Long needles.

METHYL-QUINALDINE *v.* DI-METHYL-QUINOLINE.

METHYL-QUINALDINIUM HYDRATE *v.* *Methylo-hydrate* of (*Py.* 3)-METHYL-QUINOLINE.

METHYL-QUINAZOLINE DIHYDRIDE $C_9H_{10}N_2$ *i.e.*  $C_6H_4\left<\begin{matrix}CH_2.NH\\N:CMe\end{matrix}\right.$. Formed by distilling the acetyl derivative of *o*-amido-benzylamine (Gabriel a. Jansen, *B.* 23, 2812). Colourless tenacious liquid, sol. water. Its solution has a bitter taste and alkaline reaction.—B'HCl: prisms, v. sol. water.—$B'_2H_2PtCl_6$.—*Chromate*: reddish-yellow needles.—*Picrate.* [200°]. Long needles.

DI-METHYL-QUINOGEN *v.* DI-METHYL DIKETONE, *Reaction* 6.

METHYL-QUININE *v.* QUININE.

METHYL-(*pseudo*)-QUINISATIN $C_{10}H_7NO_2$ *i.e.*  $C_6H_4\left<\begin{matrix}CO.CO\\NMe.CO\end{matrix}\right.$ (?). [c. 120°–122°]. Formed by oxidation of (*Py.* 1:2)-di-oxy-(*Py.* 4)-methyl-(*Py.* 3)-pseudo-oxy-quinoline  $C_6H_4\left<\begin{matrix}C(OH).C(OH)\\NMe.CO\end{matrix}\right.$ with Fe_2Cl_6. V. sol. ordinary solvents. Dissolves in alkalis with a yellow colour (Friedlander a. Müller, *B.* 20, 2015).

METHYL-QUINIZARIN *v.* DI-OXY-METHYL-ANTHRAQUINONE.

METHYL-QUINOLINIC ACID *v.* METHYL-PYRIDINE DICARBOXYLIC ACID.

(*Py.* 1)-METHYL-QUINOLINE $C_{10}H_9N$ *i.e.*  $C_6H_4\left<\begin{matrix}CMe:CH\\N=CH\end{matrix}\right>$. *Lepidine. Cincholepidine.* Mol. w. 143. (265° i.V.) (K.); (263° i.V.) (D.). S.G. $\frac{0}{}$ 1·0995; $\frac{20}{}$ 1·0862 (K.).

Formation.—1. Obtained, together with quinoline, by distilling cinchonine with aqueous KOH (Greville Williams, *Pr. E.* [3] 21, 377).—2. By distilling the hydrochloride of quinoline tetrahydride (*Py.* 1)-carboxylic acid (tetrahydro-cinchonic acid) with zinc-dust (Weidel, *M.* 3, 75).—3. Formic aldehyde or methylal is mixed with acetone, the mixture is saturated with HCl, and heated with a solution of aniline in conc. HCl. The bases are separated from the product by potash and fractionally distilled; the equations being: $CH_2O + CH_3.CO.CH_3 = H_2O + CH_2:CH.CO.CH_3$; and the following $CH_2:CH.CO.CH_3 + C_6H_5NH_2 = C_{10}H_9N + H_2O + H_2$ (Beyer, *J. pr.* [2] 32, 127).—4. By heating oxy-(*Py.* 1)-methyl-quinoline with zinc-dust (Knorr, *A.* 236, 94).—4. By heating cinchene with HOAc at 200° (Koenigs, *B*, 23, 2677).

Preparation.—1. The fraction 250°–260° of the distillate from cinchonine and KOHAq is converted into acid sulphate; the acid sulphate of (*Py.* 1)-methyl-quinoline being insoluble in alcohol, whilst the acid sulphate of quinoline is soluble (Hoogewerff a. Van Dorp, *R. T. C.* 2, 1). 2. Obtained in pure state by the action of KOH upon cinchonine in presence of superheated steam (Krakau, *Bl.* [2] 45, 248).

Properties.—Oil, solidifying when cooled below 0°; sl. sol. water, miscible with alcohol, ether, benzene, and ligroïn. Smells like quinoline. Turns brown in air and light. According to Oechsner de Coninck (*Bl.* [2] 38, 546), two lepidines (258°) and (268°) are obtained by distilling cinchonine or brucine, and the base of higher boiling-point alone solidifies in a freezing mixture.

Reactions.—1. *Oxidation* with $KMnO_4$ in alkaline solution gives methyl-pyridine dicarboxylic acid and, finally, pyridine tricarboxylic acid (Hoogewerff a. Van Dorp, *B.* 13, 1639). Oxidation by $K_2Cr_2O_7$ and H_2SO_4 yields quinoline (*Py.* 1)-carboxylic (cinchonic) acid.—2. By adding *sodium-amalgam* to lepidine C. Greville Williams (*C. N.* 37, 85) obtained a base which formed a red crystalline nitrate $C_{20}H_{18}N_2HNO_3$. 3. When heated with an equivalent quantity of *benzoic aldehyde* and $ZnCl_2$ it yields styryl-quinoline (Heymann a. Königs, *B.* 21, 1424).—4. When heated with isoamyl iodide it yields the amylo-iodide (which may be extracted by repeatedly boiling the product with water) and also an insoluble residue whence boiling alkalis liberate 'lepamine' $C_{20}H_{32}N_2$ (Greville Williams, *C. J.* 16, 375). Lepamine is a fragrant oil (c. 275°), V.D. (obs. and calc. 10·4). Lepamine yields the salts $C_{20}H_{32}N_2H_2Cl_2$ (melting below 100°) and $C_{20}H_{32}N_2H_2PtCl_6$.—5. By the action of a boiling aqueous solution of caustic potash upon mixtures of the alkylo-iodides of lepidine and quinoline, blue or green substances, called cyanines are obtained (*v.* QUINOLINE).

Salts.—B'HCl: needles.—$B'_2H_2PtCl_6$ 2aq: orange-red triclinic needles. [226°-230°] (Knorr); [c. 233°] (Königs).—$B'HAuCl_4$. [188°]. Prismatic needles. Decomposed when heated for some time at 110°.—$B'HCdCl_3$.—$B'HNO_3$: slender prisms. —$B'H_2SO_4$. [229°]. S. (alcohol) ·4 at 18°; 1·1 at 78° (Krakan, *J. R.* 17, 362).—$B'_2H_2Cr_2O_7$: yellow needles (from hot water) which decompose at 110°.—B'_2AgNO_3: white needles.—**Tartrate** $B'C_4H_6O_6$ aq. Crystallises from alcohol.—**Picrate** $B'C_6H_2(NO_2)_3OH$. [208°] (H. a. D.); [213°] (Krakau). Small yellow needles (from alcoholic solutions).

Methylo-iodide B'MeI. [174°]. Yellow prisms (from alcohol) (Hoogewerff a. Van Dorp, *R. T. C.* 2, 41, 318).

Ethylo-iodide B'EtI. [143°]. Prisms.

Isoamylo-iodide $B'C_5H_{11}I$. [160°]. Yellow prisms (Hoogewerff a. Van Dorp, *R. T. C.* 3, 352).

Chloro-lepidine *v.* CHLORO-METHYL-QUINOLINE.

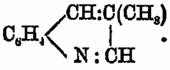
(*Py.* 1)-Methyl-quinoline tetrahydride

$C_{10}H_{13}N$ *i.e.*

$$C_6H_4\left\langle\begin{matrix}CHMe.CH_2\\NH\ .\ CH_2\end{matrix}\right\rangle$$

(250°-253° i.V.) at 740 mm. Formed by adding sodium to a boiling alcoholic solution of oxy-(*Py.* 1)-methyl-quinoline (Knorr a. Klotz, *B.* 19, 3300). Formed also by the action of tin and HCl on lepidine. Colourless oil, with pungent odour.

(*Py.* 2)-Methyl-quinoline



$$C_6H_4\left\langle\begin{matrix}CH{:}C(CH_3)\\ |\\ N{:}CH\end{matrix}\right. .$$

[10°-14°]. (250° at 710 mm.). Obtained by heating (*Py.* 2)-methyl-quinoline-(*Py.* 3)-carboxylic acid with soda-lime or alone at 160°. By CrO_3 and H_2SO_4 it is oxidised to quinoline-(*Py.* 2)-carboxylic acid [273°] (Doebner a. Miller, *B.* 17, 1715; 18, 1642). Formed also by saturating a mixture of propionic aldehyde and methylal with HCl and heating the product with aniline and conc. HClAq (Miller a. Kinkelin, *B.* 20, 1916). Prisms or colourless liquid.

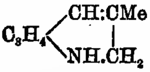
Salts.—$B'_2H_2PtCl_6$ 2aq: orange-yellow needles.—$B'HAuCl_4$: [145°]. Prismatic yellow needles, sol. hot water, sl. sol. cold.—**Picrate** $B'C_6H_2(NO_2)_3OH$: [187°]; fine yellow needles.

Methylo-iodide B'MeI: [221°]; long yellow needles, sparingly sol. alcohol.

Amylo-iodide $B'C_5H_{11}I$: [215°]; yellow needles.

(*Py.* 2)-Methyl-quinoline dihydride

$C_{10}H_{11}N$ *i.e.*



$$C_8H_4\left\langle\begin{matrix}CH{:}CMe\\ |\\ NH.CH_2\end{matrix}\right. .$$

Is one of the products formed by the action of methyl-iodide (*In.* 2)-methyl-indole (methyl-ketole) (Fischer a. Steche, *A.* 242, 358). Oil. Forms a nitrosamine.

(*Py.* 3)-Methyl-quinoline $C_{10}H_9N$ *i.e.*

$$C_6H_4\left\langle\begin{matrix}CH{:}CH\\N\ {:}CMe\end{matrix}\right. .$$

(α)-*Methyl-quinoline. Quinaldine.* (240° at 720 mm.) (D. a. M.); (246·5° i.V.) at 724 mm. (P. a. B.); (240° uncor.) (Drewson). Occurs in coal tar (Jacobsen a. Reimer, *B.* 16, 1084).

Formation.—1. By heating a mixture of aniline, nitrobenzene, and H_2SO_4 with ethylene glycol or paraldehyde (Doebner a. Miller, *B.* 14, 2812).—2. By adding a little NaOH to an aqueous solution of equivalent quantities of *o*-amido-benzoic aldehyde and acetone (Friedländer a. Gohring, *B.* 16, 1835).—3. By the reduction of *o*-nitro-styryl methyl ketone with $SnCl_2$ (Drewson, *B.* 16, 1953).—4. By heating a mixture of aniline, aldol, and HCl (Doebner a. Miller, *B.* 16, 2464; 17, 1699).—5. By heating a mixture of aniline, acetal, and H_2SO_4 (D. a. M.).—6. By heating a mixture of aniline, nitrobenzene, lactic acid, and H_2SO_4 (Wallach a. Wüsten, *B.* 16, 2007).—7. By heating crotonic aldehyde with aniline, nitrobenzene, and H_2SO_4 (Skraup, *B.* 15, 897).—8. By distilling its carboxylic acid with lime (Beyer, *J. pr.* [2] 33, 413; Rohde, *B.* 22, 267).—9. By heating chloro-methyl-quinoline (vol. ii. p. 82) with HI in HOAc in sealed tubes at 260° (Conrad a. Limpach, *B.* 20, 955).—10. By heating methyl-indole (methyl-ketole) with bromoform and alcoholic NaOH and reducing the resulting bromo-methyl-quinoline [78°] with P and HI at 180° (Magnanini, *B.* 20, 2610; 21, 1940; *G.* 17, 246).—11. By heating methyl-indole (methyl-ketole) with conc. HCl at 225° (Magnanini, *B.* 20, 2609).—12. By heating ethyl-acetanilide with $ZnCl_2$ at 225° (Pictet a. Bunzl, *B.* 22, 1847).

Preparation.—A mixture of aniline (2 pts.), paraldehyde (3 pts.), and conc. HClAq (4 pts.), is heated on a water-bath for a few hours (Doebner a. Miller, *B.* 16, 2464).

Properties.—Oil, smelling like quinoline, sl. sol. water. It gives with $AgNO_3$ a compound crystallising in white needles. Not affected by nitrous acid. A solution of chloride of iodine in HCl forms deep-yellow needles of a chloro-iodide [151°] (Dittmar, *B.* 18, 1612).

Reactions.—1. Scarcely attacked even after long boiling with chromic acid mixture, but completely oxidised by CrO_3 in HOAc. CrO_3 and H_2SO_4 yield quinoline (*Py.* 3)-carboxylic acid.—2. $KMnO_4$ oxidises it to acetyl-*o*-amido-benzoic acid (Doebner a. Miller, *B.* 15, 3075).—3. Cold conc. HNO_3 forms (*B.* 3)- and (*B.* 4)-nitro-(*Py.* 3)-methyl-quinolines. Boiling conc. HNO_3 forms nitro-quinoline carboxylic acid [220°].—4. *Tin* and HCl reduce it to a tetrahydride.—5. On heating with *sulphur* H_2S is evolved and the product contains a base $C_{20}H_{16}N_2$aq [162°] which crystallises from alcohol in white needles (Von Miller, *B.* 21, 1828).—6. Combines at once with *formamide* forming a white mass, which crystallises from alcohol or ether in needles of $C_9H_6MeN{:}C(OH)NH_2$ [76°], and is decomposed by water (Cleve, *B.* 20, 76). 7. Combines with *aldehydes*, forming aldol-like products which readily split off water (Von Miller, *B.* 20, 2041). Thus *paraldehyde* when heated with quinaldine for 5 hours at 210° yields (*Py.* 3)-allyl-quinoline (249°-253°) (Eisele, *B.* 20, 2043); *isobutyric aldehyde* with $ZnCl_2$

forms $C_{14}H_{17}NO$ [93°] (Brünner, *B.* 20, 2041); *p-nitro-benzoic aldehyde* at 120° unites forming $C_9H_6N.CH_2.CH(OH).C_6H_4NO_2$ [160°] which when heated with Ac_2O loses water and becomes *p*-nitro-styryl-quinoline (Bulach, *B.* 20, 2046; *B.* 22, 285). In like manner, when quinaldine (1 mol.) is heated with furfuraldehyde (1 mol.) and a little $ZnCl_2$ for 2 hours at 100° the product is $C_9H_6N.CH:CH.C_4H_3O$ which crystallises from ligroïn in tufts of needles (Srpek, *B.* 20, 2044).—8. When heated with *phthalic anhydride* and $ZnCl_2$ at 200° it yields 'quinoline yellow' $C_9H_6N.CH:C_2O_2:C_6H_4$ which crystallises from alcohol in golden needles [235°], may be sublimed, and is insol. water, v. sl. sol. ether, m. sol. boiling alcohol, v. sol. HOAc. It dyes silk and wool yellow (Jacobsen a. Reimer, *B.* 16, 1082).

Salts.—The **nitrate** and **hydrochloride** are easily soluble.—$B'_2H_2PtCl_6$. [226°] (F. a. G.); [229°] (P. a. B.); [230°] (Beyer). Sparingly soluble orange prisms.—**Aurochloride**: yellow crystalline pp.—$B'HHgCl_3$. [165·5°]. White needles.—$B'HI$. [186°]. V. sol. water.—$B'H_2SO_4$. [213°]. Deliquescent prisms (Hoogewerff a. Van Dorp, *R. T. C.* 3, 344).—$B'_2H_2Cr_2O_7$: long yellowish-red needles, sol. hot, sl. sol. cold, water.—**Picrate** $B'C_6H_2(NO_2)_3OH$. [191°]. Needles, sl. sol. water and cold alcohol.

Methylo-iodide $B'MeI$. [195°]. Lemon-yellow needles, v. sol. water, sol. alcohol, insol. ether. Yields $(B'MeCl)_2PtCl_4$ crystallising in orange tables; $(B'MeCl)AuCl_3$ crystallising from hot water in lemon-yellow needles; and $(B'Me)_2Cr_2O_7$ crystallising in orange plates, sl. sol. water, exploding at 90°.

Methylo-oxide $(B'Me)_2O$. Formed by adding aqueous KOH to the methylo-iodide (Bernthsen a. Hess, *B.* 18, 32; Möller, *A.* 242, 302). Yellow amorphous flakes, sl. sol. water, v. sol. alcohol and ether. Easily decomposes, becoming red. HIAq converts it into $B'MeI$, while HCl yields $B'MeCl$.

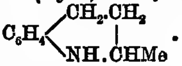
Ethylo-iodide $B'EtI$. *Ethyl-quinaldinium iodide.* [234°]. Prepared by heating quinaldine with EtI at 100°. Yellow prisms (from alcohol), decomposed on fusion (Hoogewerff a. Van Dorp, *R. T. C.* 3, 345, 350; Spaltholz, *B.* 16, 1851). Aqueous KOH converts it into the flocculent oxide $(B'Et)_2O$ which readily changes on exposure to air to a crimson resin. The oxide yields the following salts: $B'EtAuCl_4$: golden needles. — $(B'EtCl)_2PtCl_4$: ruby-red prisms, sol. hot water.—$(B'Et)_2Cr_2O_7$. Reddish-yellow needles, exploding at 100°. On heating quinoline ethylo-iodide (2 pts.) with quinaldine ethylo-iodide (1 pt.) and aqueous KOH diethyl-isocyanine iodide is formed, which crystallises from its crimson alcoholic solution in lustrous green prisms (*v.* QUINOLINE).

Propylo-iodide $B'PrI$. [167°]. Obtained by heating its components on the water-bath (Möller, *A.* 242, 306). Small greenish-yellow prisms (from alcohol), sl. sol. cold, v. sol. hot, alcohol and water. Gives with aqueous KOH a yellow amorphous oxide $(B'Pr)_2O$, sol. alcohol and ether. It yields the salts—$(B'PrCl)_2PtCl_4$ crystallising in orange plates, $B'PrAuCl_4$ crystallising in canary-yellow needles, v. sl. sol. cold water, and $(B'Pr)_2Cr_2O_7$ crystallising in brownish-red prisms.

Isobutylo-iodide $B'C_4H_9I$. [172°]. Obtained by cohobating its components at 115° (M.). Straw-yellow plates, sol. hot alcohol. Yields an unstable oxide which on heating changes to a violet colouring matter.

Isoamylo-iodide $B'C_5H_{11}I$. [175°]. Formed by cohobating its components for 12 hours at 145°. Small yellow prisms, v. sol. water and hot alcohol. Converted by aqueous KOH into an oxide which condenses to a crimson dye on heating.

(*Py.* 3)-Methyl-quinoline tetrahydride



$C_6H_4\left\langle\begin{array}{l}CH_2.CH_2\\ \qquad\ \ |\\ NH.CHMe\end{array}\right.$. *Tetra-hydro-quinaldine.*

(248° at 710 mm.). Formed by reducing $CH_3.CO.CH_2.CH_2.C_6H_4NO_2$ [1:2] (Jackson, *B.* 14, 890). It is also a product of the action of HCl on a mixture of aldehyde and aniline (Doebner a. Miller, *B.* 17, 1698). Prepared by reducing quinaldine with tin and HCl (Doebner a. Miller, *B.* 16, 2467). Colourless liquid with pleasant smell, sl. sol. water, v. sol. alcohol, ether, and benzene. $FeCl_3$ gives a blood-red colour to aqueous solutions of its salts; CrO_3 acts in like manner. Nitrous acid produces an oily nitrosamine and a crystalline nitro-nitrosamine [152°] (Möller, *A.* 242, 314). Heated with benzotrichloride it gives a green dye-stuff.—$B'_2H_2PtCl_6$: yellow needles.

ν-Methyl-quinoline dihydride $C_{10}H_{11}N$ *i.e.*

$C_6H_4\left\langle\begin{array}{l}CH:CH\\ NMe.CH_2\end{array}\right.$. This base is probably formed by heating ν-methyl-indole with MeI (Fischer a. Steche, *B.* 20, 2201).

ν-Methyl-quinoline tetrahydride $C_{10}H_{13}N$ *i.e.*

$C_6H_4\left\langle\begin{array}{l}CH_2.CH_2\\ NMe.CH_2\end{array}\right.$. *Kairoline.* (243° at 720 mm.). Prepared by heating quinoline tetrahydride with MeI (Hoffmann a. Königs, *B.* 16, 731), or by reduction of quinoline methylo-iodide with tin and HCl, the yield by the latter process being 50 p.c. of the theoretical (Feer a. Königs, *B.* 18, 2388). Oil. Resembles quinine in physiological action, and has been used as a febrifuge. Nitrous acid gives a yellowish-red colouration in dilute solutions. Gives a green dye-stuff on heating with benzo-trichloride.

Salts.—$B'HCl$ aq. [244°]. Prepared by heating quinoline tetrahydride with MeOH and conc. HClAq at 160° (Ostermayer, *B.* 18, 595). Crystallises from alcohol or chloroform in tetrahedra; v. sol. alcohol, sl. sol. ether.—$B'HClICl$. [86°]. Large yellow needles.—$B'H_2PtCl_6$. [177°]. Red crystalline pp.—**Picrate.** [125°]. Long yellow needles.

Nitroso-derivative $C_{10}H_{12}(NO)N$. Green plates; v. sol. alcohol, ether, and benzene, sl. sol. ligroïn. Does not give Liebermann's reaction. Not affected by boiling NaOHAq.

Methylo-hydroxide $B'MeOH$. Strong alkaline base; sol. water.

Ethylo-iodide $C_9H_{10}NMeEtI$. [179°]. Formed from ethyl-quinoline tetrahydride and MeI (Claus a. Stegelitz, *B.* 17, 1331). Crystals. Not affected by KOHAq. With Ag_2O it gives a crystalline base. V. sol. water, insol. ether.—$(C_9H_{10}MeEtCl)_2PtCl_4$.

References.—AMIDO-METHYL-HYDRO-QUINOLINE, NITRO-METHYL-QUINOLINE TETRAHYDRIDE, and OXY-METHYL-QUINOLINE TETRAHYDRIDE.

(B. 1)-Methyl-quinoline $C_{10}H_9N$ *i.e.* $\begin{array}{l}CH{:}CMe.C.CH{:}CH\\ CH{:}CH.C.N\ {:}CH\end{array}$ (251°). This is probably the constitution of the base which is formed, together with (*B.* 3)-methyl-quinoline, by heating *m*-toluidine, *o*-nitro-phenol, glycerin, and H_2SO_4 together (Skraup a. Brunner, *M.* 7, 139). Its acid sulphate is more soluble in alcohol than that of the (*B.* 3)-isomeride. The platinochloride melts at 224°, the picrate at 198°. The picrate is much less soluble than that of the accompanying isomeride. The chromate is v. sol. water.

Derivative.—*v.* CHLORO-(*B.* 1)-METHYL-QUINOLINE, which may, however, perhaps be CHLORO-(*B.* 3)-METHYL-QUINOLINE.

(B. 2) - Methyl - quinoline $C_{10}H_9N$ *i.e.* $\begin{array}{l}CMe{:}CH.C.CH{:}CH\\ CH\ {:}CH.C.N\ {:}CH\end{array}$. *p-Toluquinoline.* (258°) at 745 mm. S.G. $\frac{0}{0}$ 1·0815; $\frac{20}{20}$ 1·0681. Formed by heating a mixture of *p*-toluidine, *p*-nitrotoluene, glycerin, and H_2SO_4 (Skraup, *M.* 2, 158). Liquid, smelling like quinoline. Yields pyridine di-carboxylic (quinolinic) acid on oxidation with $KMnO_4$. HOCl forms chloro-oxy-methyl-quinoline $C_6H_3Me\!<\!\begin{array}{l}CH{:}CH\\ NCl.CO\end{array}$.

Salts.—$B'HCl\frac{1}{2}aq$: slender needles; v. sol. water and alcohol.—$B'_2H_2PtCl_6 2aq$: slender yellow prisms.—B'HI. [186°] (Möller, *A.* 242, 307).—$B'H_2SO_4aq$. Prisms; v. e. sol. water.—Picrate $B'C_6H_2(NO_2)_3OH$. [229°]. Yellow powder.

Chloro-iodide $C_{10}H_9NICl$. [c. 170°]; easily soluble in alcohol. The hydrochloride $C_{10}H_9NICl,HCl$ is formed by adding a solution of chloride of iodine in HCl to a solution of (*B.* 2)-methyl-quinoline. It forms easily soluble reddish-yellow needles, [c. 112°], blackened by NH_3 (Dittmar, *B.* 18, 1612).

Methylo-iodide B'MeI. Slender yellowish prisms. When heated with (*Py.* 1)-methyl-quinoline methylo-iodide, and aqueous KOH it forms 'di-methyl-methylo-cyanine' $C_{22}H_{21}N_2I 2aq$, which crystallises from alcohol in violet-blue needles; sl. sol. water, melting (when anhydrous) at 275°-277° (Hoogewerff a. Van Dorp, *R. T. C.* 3, 342).

Derivatives.—*V.* TRI-CHLORO-(*B.* 2)-METHYL-QUINOLINE, CHLORO-OXY-(*B.* 2)-METHYL-QUINOLINE, DI-CHLORO-DI-NITRO-OXY-(*B.* 2)-METHYL-QUINOLINE, and OXY-(*B.* 2)-METHYL-QUINOLINE.

(B. 3) - Methyl - quinoline $C_{10}H_9N$ *i.e.* 
$\begin{array}{l}CH\ {:}CH.C.CH{:}CH\\ CMe{:}CH.C.N\ {:}CH\end{array}$. *m-Toluquinoline.* (250° uncor.); 259·7° cor. at 747 mm.). S.G. $\frac{0}{0}$ 1·0839; $\frac{20}{20}$ 1·0722. Formed, together with smaller quantities of an isomeride, probably (*B.* 1)-methyl-quinoline, by heating a mixture of *m*-toluidine, *m*-nitro-toluene, glycerin, and H_2SO_4 (Skraup, *M.* 3, 381; *B.* 15, 893), or of *m*-toluidine, *o*-nitrophenol, glycerin, and H_2SO_4 (Skraup a. Brunner, *M.* 7, 139). The two bases may be separated by crystallising their acid sulphates from alcohol, in which the sulphate of the base here described is the less soluble. Yellowish, highly refractive liquid; not solid at −20°. Yields on oxidation quinoline (*B.* 3)-carboxylic acid [247°].

Salts.—Hydrochloride: large transparent prisms.—$B'H_2PtCl_6 2aq$. [224°]. Orange prisms.—$B'H_2SO_4$.—$B'_2(H_2SO_4)_3xaq$.—Chromate: [89°]; v. sl. sol. water.—Picrate: [237°].

Methylo-iodide $B'MeI\frac{1}{2}aq$: golden needles.

(B. 4) - Methyl - quinoline $C_{10}H_9N$ *i.e.* $\begin{array}{l}CH{:}CH\ .C.CH{:}CH\\ CH{:}CMe.C.N\ {:}CH\end{array}$. *o-Toluquinoline.* (248° cor.) at 751 mm. S.G. $\frac{0}{0}$ 1·085; $\frac{20}{20}$ 1·073. Formed by heating *o*-toluidine with glycerin, *o*-nitrotoluene, and H_2SO_4 (Skraup, *M.* 2, 153). Strongly refractive liquid, smelling like quinoline; not solidified in a mixture of solid CO_2 and ether; v. sl. sol. water, sol. alcohol and ether. Oxidised by $KMnO_4$ to pyridine dicarboxylic (quinolinic) acid.

Salts.—$B'HCl 2\frac{1}{2}aq$: very soluble transparent prisms.—$B'_2H_2PtCl_6 2aq$: orange prisms.—$B'H_2SO_4$: prisms; sl. sol. cold, v. sol. hot, water.—$B'C_6H_2(NO_2)_3OH$. [200°]. Pale-yellow leaflets.

Methylo-iodide B'MeI. Crystalline powder.

(B. 4) - Methyl - quinoline tetrahydride $C_{10}H_{13}N$. Oil. Obtained by reducing (*B.* 4)-methyl-quinoline (Ziegler, *B.* 21, 866).

Nitrosamine $C_9H_9MeN.NO$. Formed by treating (*B.* 4)-methyl-quinoline tetrahydride with $NaNO_2$ and HOAc (Ziegler). Oil. Slowly converted by alcoholic HCl into an isomeric nitroso-derivative, which crystallises from benzene in lustrous steel-blue crystals [140°], and may be reduced to an amido-(*B.* 4)-methyl-quinoline tetrahydride, giving a hydrochloride melting at 166°.

(B. 2, 4)-Di-methyl-quinoline $C_{11}H_{11}N$ *i.e.* $\begin{array}{l}CMe{:}CH\\ |\\ CH{:}CMe\end{array}\!>\!C_5H_6N$. (268° cor.). S.G. $_4$ 1·0665. Formed by heating (1, 3, 4)-*m*-xylidine with glycerin, nitrobenzene, and H_2SO_4 (Behrend, *B.* 17, 2716). Colourless oil. Yields a sulphonic acid melting at 166°.—$B'_2H_2PtCl_6$: yellow needles.—$B'H_2SO_4$: minute needles. Its bichromate forms long yellow needles.

(B. 1, 2) or (B. 2, 3)-Di-methyl-quinoline $\begin{array}{l}CMe{:}CMe\\ |\\ CH{:}CH\end{array}\!>\!C_5H_3N$ or $\begin{array}{l}CMe{:}CH\\ |\\ CMe{:}CH\end{array}\!>\!C_5H_3N$. (274°). Obtained by heating a mixture of *o*-xylidine $C_6H_3Me_2(NH_2)$ [1:2:4], nitrobenzene, glycerin, and H_2SO_4 (Berend, *B.* 17, 1489).—$B'_2H_2PtCl_6 aq$: minute yellow needles.—$B'H_2SO_4 xaq$: glistening prisms.—$B'H_2Cr_2O_7$: slightly soluble orange prisms.

(B. 1, 4)-Di-methyl-quinoline $C_{11}H_{11}N$ *i.e.* $\begin{array}{l}CH{:}CMe\\ |\\ CH{:}CMe\end{array}\!>\!C_5H_3N$. [5°]. (265°) at 736 mm. S.G. $_4$ 1·0752 (B.); $\frac{21}{}$ 1·070. Formed by warming the sulphate of *p*-xylidine $C_6H_3Me_2(NH_2)$ [1:4:2] with nitrobenzene and glycerin (Berend, *B.* 18, 3165; Lellmann a. Alt, *A.* 237, 308). Oxidised by dilute HNO_3 at 170° to (*B.* 4)-methyl-quinoline (*B.* 1)-carboxylic acid.—$B'_2H_2PtCl_6$: yellow needles.—$B'_2H_2Cr_2O_7$. [149°]. Orange needles.

Tetra-hydride $C_{11}H_{15}N$. (271°). Formed by reduction with zinc and HCl (Berend, *B.* 18, 3165). Pleasant-smelling liquid. — B'HCl: slender needles (from alcohol) or six-sided plates (from water).

(B. 4, Py. 3)-Di-methyl-quinoline $C_{11}H_{11}N$ *i.e.* $\begin{array}{l}CH{:}CH\ .C.CH{:}CH\\ |\qquad\ \ \|\qquad |\\ CH{:}CMe.C.\ N\ {:}CMe\end{array}$. *o-Methyl-quinaldine.*

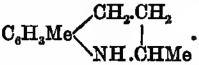
(252°). Formed by heating a mixture of o toluidine, paraldehyde, and HClAq at 100° (Doebner a. Miller, *B.* 16, 2469). Formed also by heating its carboxylic acid with KOH (Panajotoff, *B.* 20, 40). Colourless liquid, v. sol. alcohol and ether, sl. sol. water. Volatile with steam.—*Platinochlorides* $B'_2H_2PtCl_6 2aq$: dark-yellow needles. —$B'_2H_2Cr_2O_7$: orange-yellow needles, sol. hot, sl. sol. cold, water. On oxidation with chromic acid it yields an acid $C_{11}H_9NO_2$ identical with that obtained from *o*-amido-benzoic acid and aldehyde (Von Miller a. R. Meyer, *B.* 23, 2260).

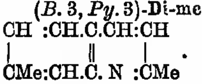
Methylo-iodide B'MeI. [221°]. Prepared by heating the base with MeI at 100° (Möller, *A.* 242, 309). Lemon-yellow needles (from indole). Alkalis liberate an unstable base, which on heating yields the original o-methyl-quinaldine. It also yields the salts: $(B'MeCl)_2PtCl_4$ crystallising in yellow needles, v. sl. sol. cold water, $B'MeAuCl_4$, and $(B'Me)_2Cr_2O_7$ crystallising from water in orange plates.

Ethylo-iodide B'EtI. [229°]. From the base and EtI at 140° (Möller). Lemon-yellow needles (from alcohol). Yields the salts: $(B'Et)_2PtCl_6$, crystallising in orange-yellow needles, and $B'EtAuCl_4$ crystallising in lemon-yellow plates, m. sol. hot water.

Tetrahydride


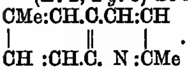
$C_6H_3Me<\begin{matrix}CH_2.CH_2\\ |\\ NH.CHMe\end{matrix}$.

Tetrahydro-methyl-quinaldine. (261°). Formed by reducing (*B.* 4, *Py.* 3)-di-methyl-quinoline (Doebner a. Miller, *B.* 16, 2469). Colourless liquid. Gives a red colouration with $FeCl_3$.—$B'_2H_2PtCl_6$: concentric red needles.

(*B.* 3, *Py.* 3)-**Di-methyl-quinoline** $C_{11}H_{11}N$ *i.e.*


$\begin{matrix}CH\ :CH.C.CH:CH\\ |\quad\ \ \|\quad\ \ |\\ CMe:CH.C.\ N\ :CMe\end{matrix}$. *m-Methyl-quinaldine.*

[61°]. (264°). Formed by heating a mixture of *m*-toluidine, paraldehyde, and HCl (Doebner a. Miller, *B.* 16, 2471). Long colourless needles, v. sol. alcohol, ether, and benzene, sl. sol. water. Oxidised by chromic acid to methyl-quinoline *m*-carboxylic acid [284°] (Miller a. Rist, *B.* 23, 2263, 3483).—$B'_2H_2Cr_2O_7$: thick orange needles, nearly insol. cold water.—$B'_2H_2PtCl_6$: small yellow needles.

(*B.* 2, *Py.* 3)-**Di-methyl-quinoline**


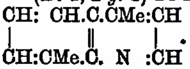
$\begin{matrix}CMe:CH.C.CH:CH\\ |\quad\ \ \|\quad\ \ |\\ CH\ :CH.C.\ N\ :CMe\end{matrix}$. *p-Methyl-quinaldine.* [60°] (D. a. M.); [55°] (Jacobsen a. Reimer, *B.* 16, 2603). (266°) (D. a. M.); (260°) (J. a. R.). Formed by heating a mixture of *p*-toluidine, paraldehyde, and HCl (Doebner a. Miller, *B.* 16, 2470). Large colourless trimetric prisms, smelling like anise-seed. V. sol. alcohol, ether, and benzene, sl. sol. hot water. Oxidised by chromic acid to methyl-quinoline *p*-carboxylic acid [256°] (Miller a. Schunck, *B.* 23, 2263). Heated with phthalic anhydride and $ZnCl_2$ at 200° it yields methyl-quinophthalone or methyl-quinoline yellow $C_{11}H_9N:C_2O_2:C_6H_4$ [203°] which crystallises from alcohol in golden needles (J. a. R.).—$B'_2H_2PtCl_6$: nearly colourless slender needles, sl. sol. hot water. — $B'_2H_2Cr_2O_7$: long yellow needles, m. sol. hot water. — The *hydrochloride, nitrate, sulphate,* and *acetate,* are easily soluble crystalline salts.

Methylo-iodide B'MeI. [237°]. Formed from the base and MeI in the cold (Möller, *A.* 242, 311). Lemon-yellow needles, sl. sol. cold alcohol, insol. ether, v. sol. water. Yields the salts $(B'Me)_2PtCl_6$, $B'MeAuCl_4$, and $(B'Me)_2Cr_2O_7$, all three crystallising in needles.

Tetrahydride

$C_6H_3Me<\begin{matrix}CH_2.CH_2\\ NH.CHMe\end{matrix}$. (267°).

Formed by reducing the base with tin and HCl (Doebner a. Miller, *B.* 16, 2471). Liquid, sl. sol. water, v. sol. alcohol and ether. Its aqueous solution is coloured blood-red by $FeCl_2$.

(*B.* 4, *Py.* 1)-**Di-methyl-quinoline**


$\begin{matrix}CH:\ CH.C.CMe:CH\\ |\quad\ \ \|\quad\ \ |\\ CH:CMe.C.\ N\ :CH\end{matrix}$. (274° i. V.). Formed by distilling oxy-(*B.* 4, *Py.* 1)-di-methyl-quinoline with zinc-dust (Knorr, *A.* 245, 369). Light yellow oil with pungent taste and smell, v. sol. alcohol and ether, almost insol. water. — $B'_2H_2PtCl_6 aq$. [220°].—$B'HAuCl_4$. [181°].

(*B.* 3, *Py.* 1)-**Di-methyl-quinoline**
$\begin{matrix}CH:CH\ .C.CMe:CH\\ CMe:CH.C\ .N\ :CH\end{matrix}$. (c. 283° i. V.). Formed by distilling (*Py.* 3)-oxy-(*B.* 3, *Py.* 1)-di-methyl-quinoline with zinc-dust (Knorr, *A.* 245, 371). Oil, volatile with steam.—$B'_2H_2PtCl_6 2aq$. [227°]. Reddish-brown prisms.

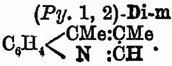
(*B.* 2, *Py.* 1)-**Di-methyl-quinoline**
$\begin{matrix}CMe:CH.C.CMe:CH\\ CH\ :CH.C\ .\ N\ .\ CH\end{matrix}$. *(γ)-Methyl-p-toluquinoline.* (280° i. V.). Formed by distilling (*Py.* 3)-oxy-(*B.* 2; *Py.* 1)-di-methyl-quinoline with zinc-dust (Knorr, *A.* 245, 366). Pungent oil, v. sol. alcohol and ether. Oxidised by chromic acid to a methyl-quinoline carboxylic acid (Von Miller a. Daniel, *B.* 23, 2264).—$B'_2H_2PtCl_6 2aq$: needles, decomposing at 231°.—$B'HAuCl_4$: needles, decomposing near 192°.—$B'_2H_2Cr_2O_7$: needles, decomposing near 150°. — $B'C_6H_2(NO_2)_3OH$: needles, decomposing near 230°.

(*Py.* 2, 3)-**Di-methyl-quinoline**
$C_6H_4<\begin{matrix}CH:CMe\\ N\ :CMe\end{matrix}$. [66°]. (261° uncor.) at 729 mm.

Formed by adding tiglic aldehyde (1 mol.) to a mixture of aniline hydrochloride (4 mols.) and HCl heated to 85° (Rohde, *B.* 20, 1912; 22, 268). Formed also in small quantity by heating a mixture of acetic and propionic aldehydes with aniline and HClAq at 100°. Tables or plates; v. sl. sol. water, v. sol. ether, v. e. sol. alcohol. Chromic acid mixture oxidises it to (*Py.* 3)-methyl-quinoline (*Py.* 2)-carboxylic acid. On condensation with benzil, by heating at 100° for 24 hours, it yields a base [176°], of which the solutions of the salts exhibit green fluorescence. This base changes on heating for some time at 180° to a polymeride [240°].

Salts.—$B'HCl 2aq$: radiating needles, v. e. sol. water and alcohol.—$B'_2H_2PtCl_6 2aq$: orange needles, turning black at 230°.—$B'HNO_3$: prisms, v. e. sol. water and alcohol.—$B'H_2SO_4 aq$. [235°]: slender radiating needles, v. e. sol. water, m. sol. alcohol.—$B'_2H_2Cr_2O_7$: long orange needles, m. sol. hot water; turns brown at 150°. **Picrate:** [225°].

Methylo-iodide B'MeI ½aq. [218°]. Sickle-like groups of needles (from alcohol); m. sol. water and alcohol.

(*Py.* 1, 2)-**Di-methyl-quinoline**


$C_6H_4<\begin{matrix}CMe:CMe\\ N\ :CH\end{matrix}$. [65°]. (290° i.V.) at 737 mm.

Formed by distilling (*Py.* 3, 2, 1)-oxy-di-methyl-quinoline with zinc-dust (Knorr, *A.* 245, 362). On oxidation by chromic acid mixture it yields (*Py.* 2)-methyl quinoline (*Py.* 1)-carboxylic acid (Seitz, *B.* 23, 2277).—$B'_2H_2PtCl_6$ 2aq. [240°].—$B'HAuCl_4$. [177°]. Plates.—$B'_2H_2Cr_2O_7$: red needles.—Picrate $B'C_6H_2(NO_2)_2OH$. [c. 205°]. Yellow needles.

Methylo-iodide B'MeI. [191°]. Light-yellow needles (from alcohol).

(*Py.* 1, 3)-Di-methyl-quinoline

$C_6H_4\Big<\begin{matrix}CMe:CH\\ N\ :CMe\end{matrix}$. (264° uncor.). S.G. ^{15} 1·061.

Formation.—1. By saturating a mixture of paraldehyde (120 g.) and acetone (200 g.) with gaseous HCl, allowing the mixture to stand for a day or two and then pouring it slowly into a solution of aniline (200 g.) in conc. HClAq (400 g.). In this reaction the ketone $CH_3.CH:CH.CO.CH_3$ is doubtless first formed (C. Beyer, *J. pr.* [2] 32, 125; 33, 401).—2. Together with methane, by heating acetone with aniline hydrochloride at 180; the yield being 3 p.c. of the theoretical (Riehm, *A.* 238, 3; *B.* 18, 3296).—3. Together with the bases $C_6H_5N:CMe_2$ (228°), V.D. 66·4 (calc. 66·5), and $C_{12}H_{15}N$(?) (275°), by heating aniline with acetone and a dehydrating agent such as $ZnCl_2$ or P_2O_5.—4. By heating aniline with mesityl oxide at 130° (Engler a. Riehm, *B.* 18, 2245).—5. By heating acetanilide with acetone; the yield being 8 p.c. of the theoretical.—6. From acetone and benzanilide.—7. By the action of NaOHAq on a mixture of *o*-amido-acetophenone and acetone (O. Fischer, *B.* 19, 1037).—8. By dissolving the anilide of methylene di-methyl diketone (acetyl-acetone) in conc. H_2SO_4, warming, diluting with cold water, and neutralising with NH_3 (Combes, *C. R.* 106, 142).

Properties.—Oil, with sweetish smell, somewhat like quinoline; volatile with steam. Not affected by nitrous acid.

Reactions.—1. CrO_3 oxidises it to (*Py.* 3)-methyl-quinoline (*Py.* 1)-carboxylic acid. –2. By heating with phthalic anhydride and a little $ZnCl_2$ at 200° it is converted into a 'phthalone' $C_{11}H_9N:C_2O_2:C_6H_4$, which crystallises from alcohol in orange needles [238°] (Beyer, *J. pr.* [2] 33, 407).

Salts.—B'HCl: slender, stellate flat needles (by sublimation), v. sol. water and alcohol.—$B'_2H_2PtCl_6$. [229°].—$B'_2H_2PtCl_6$ 2aq.—$B'_2H_2ZnCl_4$ 1½aq.—$B'H_2SO_4$. [225°–228°]. Concentric needles, v. sol. water, sl. sol. alcohol.—$B'_2H_2Cr_2O_7$. [172°]. Orange needles, v. sol. hot, v. sl. sol. cold, water.—$B'C_6H_2(NO_2)_3OH$. [190°]. Needles (from acetone).

Methylo-iodide B'MeI. [226°].

Ethylo-iodide B'EtI. [214°]. Needles (from alcohol).

Di-methyl-quinoline $C_6H_4(C_5HMe_2N)$. [65°]. (267°) at 713 mm. Occurs among the products of the action of aniline on a mixture of isobutyric aldehyde, methylal, and HCl (Von Miller a. Kinkelin, *B.* 20, 1937). Monoclinic prisms.—$B'_2H_2PtCl_6$ 2aq. [268°]. Groups of needles (from HClAq).—$B'C_6H_2(NO_2)_3OH$. [220°]. Aggregates of tables (from hot alcohol).

(*Py.* 1, 4)-Di-methyl-quinoline tetrahydride

$C_6H_4\Big<\begin{matrix}CHMe.CH_2\\ NMe\ .CH_2\end{matrix}$. (255° i.V.). Formed by adding Na to a boiling alcoholic solution of oxy-(*Py.* 1, 4)-di-methyl-quinoline (methyl-lepidone) (Knorr a. Klotz, *B.* 19, 3302). Colourless liquid.

(*Py.* 3, 4)-Di-methyl-quinoline tetrahydride

$C_6H_4\Big<\begin{matrix}CH_2\ .CH_2\\ NMe.CHMe\end{matrix}$. (248°) at 710 mm. Formed by heating (*Py.* 3)-methyl-quinoline tetrahydride with MeI (Doebner a. Miller, *B.* 16, 2468). Formed also by reducing the methylo-iodide of (*Py.* 3)-methyl-quinoline with tin and HCl (Feer a. Königs, *B.* 18, 2388). Colourless liquid. On heating with benzotrichloride it gives a green dye-stuff.—$B'_2H_2PtCl_6$: sparingly soluble red granular pp.

Methylo-iodide B'MeI. [205°]. Colourless needles, v. e. sol. water and hot alcohol, insol. ether (Möller, *A.* 242, 318). Not acted on by alkalis, but converted by moist Ag_2O into the ammonium base, which is split up by distillation into MeOH and (*Py.* 3, 4)-di-methyl-quinoline. Yields the salts $(B'Me)_2PtCl_6$ crystallising from water in small brick-red crystals, $B'MeAuCl_4$ crystallising in lemon-yellow needles, and $(B'Me)_2Cr_2O_7$ crystallising in small hexagonal plates.

Di-methyl-quinoline $C_{11}H_{11}N$. (245°). Occurs in commercial quinaldine (Einhorn, *B.* 18, 3144).—$B'_2H_2PtCl_6$. [238°].

(*Py.* 1, 2, 4)-Tri-methyl-quinoline dihydride $C_{12}H_{15}N$ *i.e.*

$C_6H_4\Big<\begin{matrix}CMe:CMe\\ NMe.CH_2\end{matrix}$. (244° i.V.) at 746 mm. Formed by heating methyl-indole (methyl-ketole)

$C_6H_4\Big<\begin{matrix}CH\\ NH\end{matrix}\Big>CMe$ with MeI and a little MeOH for 20 hours at 100° (Fischer a. Steche, *B.* 20, 818; *A.* 242, 353). Formed by heating (*In.* 1,2)-di-methyl-indole with MeOH and MeI in sealed tubes at 100° (Fischer a. Steche, *A.* 242, 364; Wolff, *B.* 21, 125). Formed also by heating indole with MeI, MeOH, and Na_2CO_3 at 130° (Ciamician a. Zatti, *B.* 22, 1980; Zatti a. Ferratini, *B.* 23, 2302; Fischer a. Meyer, *B.* 23, 2631). Formed likewise by heating scatole (1 pt.) with MeI (2½ pts.) and MeOH (1 pt.) for 12 hours at 130° (F. a. M.). Oil, turning red in air, miscible with alcohol, ether, benzene, and chloroform. Nitrous acid gives a reddish-brown oil, becoming crystalline. $FeCl_3$ added to its solution in HClAq ppts. golden-yellow plates or needles of a compound v. sol. hot water, v. sl. sol. conc. HClAq.

Salts.—The hydrochloride is v. sol. water.—Platinochloride [c. 212°].—$B'H_2SO_4$: plates.—B'HI. [253°]. Prisms (from alcohol).—$B'C_6H_2(NO_2)_3OH$. [148°]. Golden-yellow needles (from alcohol).

(*Py.* 1,2,4)-Tri-methyl-quinoline tetrahydride

$C_6H_4\Big<\begin{matrix}CHMe.CHMe\\ NMe.\ \ CH_2\end{matrix}$ (?) (239° i.V.) at 749 mm. Formed by reducing the dihydride with zinc and HClAq (Fischer a. Steche, *A.* 242, 356). Colourless liquid, sl. sol. water, v. sol. ether, alcohol, and benzene. $FeCl_3$ gives a brown amorphous pp. in its solution in HClAq.—Picrate: [162°] (F. a. S.); [164°] (Ciamician a. Zatti, *B.* 22, 1981); yellow plates (from alcohol).—Platinochloride: bright-red crystals.

Methylo-iodide B'MeI. [251°]. Plates or needles (from alcohol), m. sol. water.

(*Py.* 1, 3, 4)-Tri-methyl-quinoline tetrahydride

$C_6H_4\Big<\begin{matrix}CHMe.CH_2\\ NMe.CHMe\end{matrix}$. Hydro-iodide

B'HI. [215°]. Formed from (*Py.* 1, 3)-di-methyl-quinoline by reducing in alcoholic solution with Na and heating the product with MeI and MeOH at 100° (Fischer a. Meyer, *B.* 23, 2631).

(*Py.* 1, 2, 4)-**Tri-methyl-quinoline tetrahydride** $C_6H_4<\begin{array}{l}CHMe.CHMe\\NMe.CH_2\end{array}$. *Hydro-iodide* B'HI. [205°]. Formed like the preceding from (*Py.* 1, 2)-di-methyl-quinoline (F. a. M.). Crystalline.

(*B.* 1, 2, 4)-**Tri-methyl-quinoline** $C_{12}H_{13}N$ *i.e.* $\begin{array}{l}CMe:CMe\\CH\ :CMe\end{array}>C_6H_3N$. [43°]. (286° uncor.). Formed by heating ψ-cumidine [63°] with glycerin, nitrobenzene, and H_2SO_4 (Berend, *B.* 18, 376). White prisms. — $B'HNO_3$: sparingly soluble needles. — $B'H_2SO_4$: white prisms.— $B'_2H_2PtCl_6$ 2aq: very sparingly soluble orange-red needles.

(*B.* 2, 4; *Py.* 3)-**Tri-methyl-quinoline** $C_{12}H_{13}N$ *i.e.* $\begin{array}{l}CMe:CH\ .C.CH:CH\\CH\ :CMe.C.\ N\ :CMe\end{array}$. *op-Di-methyl-quinaldine.* [46°]. (260°) at 719 mm. Formed by heating *m*-xylidine with paraldehyde and conc. HClAq on the water-bath (Panajotoff, *B.* 20, 32). Small plates (from alcohol) or monoclinic prisms (from petroleum-ether); insol. water, v. e. sol. alcohol. Readily volatile with steam. Yields on oxidation (*B.* 4, *Py.* 3)-di-methyl-quinoline (*B.* 2)-carboxylic acid. Forms, with chloral, a compound $C_{14}H_{12}Cl_3N$aq, melting at 108°, and crystallising in yellowish needles, v. sol. alcohol.

Salts.—B'HCl: white needles.— $B'_2H_2PtCl_6$ 2aq: orange-yellow needles, sl. sol. water.— $B'H_2SO_4$ aq: white needles, v. sol. water and alcohol, sl. sol. ether.— $B'HNO_3$: transparent triclinic prisms.— $B'_2H_2Cr_2O_7$: orange-yellow needles.— $B'C_6H_2(NO_2)_3OH$. [185°]. Yellow needles.

Methylo-iodide B'MeIaq. Yellow needles; v. sol. water.

Tetrahydride $C_6H_2Me_2<\begin{array}{l}CH_2.CH_2\\NH.CHMe\end{array}$. (200°-250°). Formed by reducing the base with tin and HCl (P.).— $B'_2H_2PtCl_6$: orange plates.

(*B.* 1 or 3, 2; *Py.* 3)-**Tri-methyl-quinoline** $\begin{array}{l}CMe:CMe.C.CH:CH\\CH\ :CH\ .C.\ N\ :CMe\end{array}$ or $\begin{array}{l}CMe:CH.C.CH:CH\\CMe:CH.C.\ N\ :CMe\end{array}$. Formed from o-xylidine, aldehyde, and HCl (Merz, *B.* 17, 1158). Monoclinic crystals.— $B'_2H_2PtCl_6$: minute needles.

(*B.* 2; *Py.* 1, 3)-**Tri-methyl-quinoline** $\begin{array}{l}CMe:CH.C.CMe:CH\\CH\ :CH.C.\ N\ :CMe\end{array}$. [64°] (P.); [40°] (C.); (278°) (P.); (281°) (C.). Formed by saturating a mixture of acetone (40 g.) and paraldehyde (30 g.) with HCl at 0°, allowing to stand 12 hours in a freezing mixture, pouring into a solution of *p*-toluidine (65 g.) in fuming HClAq (130 g.) and heating on the water-bath for 7 hours (Pfitzinger, *J. pr.* [2] 38, 41). Formed also by dissolving the *p*-toluide of methylene di-methyl diketone $CH_3.CO.CH_2.C(NC_6H_4Me).CH_3$ in conc. H_2SO_4, warming, diluting, and neutralising with NH_3 (Combes, *C. R.* 106, 145). White needles, containing water of crystallisation which is given off in a desiccator, the anhydrous base crystallising in tables and absorbing water (1 mol.) from the air. Sl. sol. water, v. sol. alcohol, ether, and petroleum-ether. Volatile with steam. It has a bitter, acrid taste, and an irritating vapour.

Salts.—B'HCl 2aq: white needles, v. e. sol hot water and alcohol. [260°].— $B'_2H_2PtCl_6$ 2aq: yellow needles, v. sl. sol. water, almost insol. alcohol. [220°] (C.).— $B'H_2SO_4$. [222°]. White needles or rhombohedra (containing aq), m. sol. cold alcohol.— $B'_2H_2Cr_2O_7$. Yellowish-red needles, v. sl. sol. cold water.— $B'C_6H_2(NO_2)_3OH$. [201°]. Greenish-yellow needles (from hot acetone).

Methylo-iodide B'MeI. [226°]. Needles (containing aq), sol. water, alcohol, and ether.

(*B.* 2; *Py.* 2, 3)-**Tri-methyl-quinoline** $\begin{array}{l}CMe:CH.C.CH:CMe\\CH\ :CH.C.\ N\ :CMe\end{array}$. [87°]. (285°). Formed from tiglic aldehyde (1 mol.), *p*-toluidine (4 mols.) and HCl (8 mols.) (Von Miller a. Ohler, *B.* 23, 2268). White nodules (from ligroïn); insol. water, m. sol. ligroïn, v. sol. ether. Yields on oxidation (*Py.* 2, 3)-di-methyl-quinoline (*B.* 2)-carboxylic acid [270°].

Salts.— $B'_2H_2PtCl_6$ 2aq: laminæ. — The chromate crystallises in orange laminæ, v. sl. sol. water.—The hydrochloride and sulphate are v. e. sol. water.—Picrate. [212°]. Straw-coloured laminæ.

(*B.* 4; *Py.* 1, 3)-**Tri-methyl-quinoline** $\begin{array}{l}CH:CH\ .C.CMe:CH\\CH:CMe.C.\ N\ :CMe\end{array}$. (280°). Formed by the action of H_2SO_4 on the *o*-toluide of methylene dimethyl diketone $CH_3.CO.CH_2.C(NC_7H_7).CH_3$ (Combes, *C. R.* 106, 145). Oil.—Platinochloride [257°].

(*B.* 4; *Py.* 3, 4)-**Tri-methyl-quinoline tetrahydride** $\begin{array}{l}CH:CH\ .C.CH_2\ .CH_2\\CH:CMe.C.NMe.CHMe\end{array}$. (244°). Formed by the action of MeI on (*B.* 4; *Py.* 3)-di-methyl-quinoline tetrahydride (Doebner a. Miller, *B.* 16, 2470). Colourless liquid.

(*Py.* 1, 2, 3)-**Tri-methyl-quinoline** $C_6H_4<\begin{array}{l}CMe:CMe\\N\ :CMe\end{array}$. [65°]. (285°). Formed by heating the anilide of di-methyl ethylidene diketone $CH_3.CO.CHMe.C(NC_6H_5).CH_3$ with H_2SO_4, and separated by passing NH_3 through the diluted product (Combes, *C. R.* 106, 144).— $B'_2H_2PtCl_6$. [215°].

Tri-methyl-quinoline $C_{12}H_{13}N$. (270°–280°). A by-product in the preparation of quinaldine from paraldehyde, aniline, and HCl (Doebner a. Miller, *B.* 18, 3352). — $B'_2H_2PtCl_6$ 2aq: pale-yellow needles.

(*B.* 1, 2, 4; *Py.* 3)-**Tetra-methyl-quinoline** $\begin{array}{l}CMe:CMe.C.CH:CH\\CH\ :CMe.C.\ N\ :CMe\end{array}$. [c. 20°]. (300°). Formed by heating solid ψ-cumidine [63°] with paraldehyde and HClAq at 105° (Doebner a. Miller, *B.* 17, 1710). Crystalline; v. sol. alcohol and ether, insol. water.— $B'_2H_2Cr_2O_7$: long yellow needles.

(*B.* 2, 4; *Py.* 1, 3)-**Tetra-methyl-quinoline** $\begin{array}{l}CMe:CH.C.CMe:CH\\CH:CMe.C.\ N\ :CMe\end{array}$. [84°]. (285° uncor.). Formed from acetone and *m*-xylidine (Levin a. Riehm, *B.* 19, 1394). White plates (from ether). — $B'H_2SO_4$: [235°-242°]; needles, v. sol. water, m. sol. alcohol.—B'HCl: white needles (by sublimation). — $B'_2H_2PtCl_6$. — $B'_2H_2Cr_2O_7$: orange needles, sl. sol. water.

Tetramethylquinoline $C_{13}H_{15}N$. (265°-273°). Occurs in crude quinaldine, obtained from paraldehyde, aniline, and HClAq (Einhorn, *B.* 18, 3145). On oxidation with CrO_2Cl_2 it yields an aldehyde $C_{13}H_{13}NO$, crystallising from water in needles (containing 3aq), melting at 74° when hydrated and 102° when anhydrous; it is oxidised by ammoniacal $AgNO_3$ to an acid crystallising in needles [224°].

Salt.—$B'_2H_2PtCl_6$.

References.—AMIDO-, CHLORO-, NITRO-, and OXY-, METHYL-QUINOLINES, and METHYL-DI-QUINOLYL.

(γ)-METHYL-ISOQUINOLINE $C_{10}H_9N$ *i.e.*  $C_6H_4<\begin{matrix}CMe:CH\\CH\ :N\end{matrix}$. (256° uncor.). Formed by the distillation of either of the compounds  $\begin{matrix}CMe_2.CO\\C_6H_4.CO\end{matrix}>NH$ and $\begin{matrix}CMe_2.CO\\C_6H_4.CO\end{matrix}>NMe$ with zinc-dust (Le Blanc, *B.* 21, 2300). Liquid, not solidified at −75°. — $B'_2H_2PtCl_6$. [253·5°]. Brownish-red crystals.—$B'C_6H_2(NO_2)_3OH$. [195°]. Slender needles.

(α)-Methyl-isoquinoline  $C_6H_4<\begin{matrix}CH\ :CH\\CMe:N\end{matrix}$. One of the products got by distilling papaveroline over zinc-dust (Krauss, *M.* 11, 361. Oil. Volatile with steam.—$B'_2H_2PtCl_6$ 1½aq. [229°]. Orange-yellow pp.—Picrate. [210°]. Light yellow pp.

Derivative.—*v.* CHLORO-METHYL-ISOQUINOLINE.

METHYL-QUINOLINE-ACRYLIC ACID *v.* METHYL-QUINOLYL-ACRYLIC ACID.

(*Py.* 3)-METHYL-QUINOLINE (*B.* 2)-CARBOXYLIC ACID $C_{11}H_9NO_2$ *i.e.*  $\begin{matrix}CO_2H.C\ :CH.C.CH:CH\\CH:CH.C.\ N\ :CMe\end{matrix}$ *Quinaldine p-carboxylic acid.* [259°]. Formed by the reaction of a mixture of paraldehyde, *p*-amido-benzoic acid, and HClAq (Doebner a. Miller, *B.* 17, 939). Formed also by oxidation of the corresponding di-methyl-quinoline (Schunck, *B.* 23, 2263). White needles, which may be sublimed. Sol. hot alcohol, v. sl. sol. water. — HA'HCl aq: long slender needles or small prisms.—$(HA')_2H_2PtCl_6$ 4aq: monoclinic tables.—$(HA')_2H_2Cr_2O_7$: red needles, sol. hot water.—CaA'_2 2aq: feathery crystals.—CuA'_2 6aq: small plates.—AgA': sparingly soluble crystalline powder.—$^{\times}PbA'_2$: prisms.

(*Py.* 3)-Methyl-quinoline (*B.* 3)-carboxylic acid  $\begin{matrix}CH:CH.C.CH:CH\\CO_2H.C\ :CH.C.\ N\ :CMe\end{matrix}$ *Quinaldine m-carboxylic acid.* [285°]. Formed by heating a mixture of paraldehyde, *m*-amido-benzoic acid, and HClAq (Doebner a. Miller, *B.* 17, 941). Formed also by the oxidation of the corresponding aldehyde by Ag_2O (Eckhardt, *B.* 22, 281). Formed also by oxidation of the corresponding di-methyl-quinoline (Rist, *B.* 23, 2262), and from the corresponding amido-methyl-quinoline by Sandmeyer's reaction (Rist, *B.* 23, 3485). Long silky needles which may be sublimed. Sol. alcohol, nearly insol. water. — HA'HCl aq: small tables, sl. sol. cold water.—$(HA')_2H_2PtCl_6$: monoclinic prisms. — $(HA')_2H_2Cr_2O_7$: yellow needles, v. sol. hot, sl. sol. cold, water. — CaA'_2 2aq: sparingly soluble prisms.—CuA'_2 3aq: green tables.—AgA': crystalline pp.

(*Py.* 3)-Methyl-quinoline (*B.* 4)-carboxylic acid  $\begin{matrix}CH:CH\text{——}C.CH:CH\\CH:C(CO_2H).C.\ N\ :CMe\end{matrix}$ *Quinaldine o-carboxylic acid.* [151°]. Formed by heating a mixture of *o*-amido-benzoic acid (25 g.), paraldehyde (13 g.), and HClAq at 100° (Doebner a. Miller, *B.* 17, 943). Formed also by oxidation of the corresponding di-methyl-quinoline (R. Meyer, *B.* 23, 2259). Colourless needles (containing ½aq), v. sol. hot water and alcohol. Split up by heat into CO_2 and quinaldine.—HA'HCl: concentric tables, v. sol. water.—$(HA')_2H_2PtCl_6$ 2aq: large red prisms, sol. hot, sl. sol. cold, water.—CuA'_2 1½aq: small dark-green needles.—$^{\times}$AgA': amorphous pp., changing into slender needles when heated with water for a long time.

(*B.* 4)-Methyl-quinoline (*B.* 1)-carboxylic acid  $\begin{matrix}CH:C(CO_2H)\\CH:C(CH_3)\end{matrix}>C_6H_3N$. *o-Methyl-quinoline ana-carboxylic acid.* [286°]. Prepared by heating the corresponding di-methyl-quinoline with dilute HNO_3 at 170° (Lellmann a. Alt, *A.* 237, 310). White powder. Yields (*B.* 4)-methyl-quinoline on distillation with lime. A solution of its ammonium salt gives a dirty-green pp. with $FeSO_4$, a light-green pp. with $CuSO_4$, and a white pp. with lead acetate.

Salts. — HA'HCl aq: silky needles. — $(HA')_2H_2PtCl_6$ 6aq: yellow needles.— $(HA')_2H_2PtCl_6$ 2aq: needles.— $(HA')_2H_2PtCl_6$. — CaA'_2: crystalline pp.

(*Py.* 3)-Methyl-quinoline (*Py.* 1)-carboxylic acid  $C_6H_4<\begin{matrix}C(CO_2H):CH\\N{=\!=\!=}CMe\end{matrix}$. *Aniluvitonic acid.* [242°].

Formation. — 1. By boiling a mixture of aniline and pyruvic acid with water; or by boiling anilpyruvic acid with water. In this reaction $CH_3.CH:CH.CO.CO_2H$ may perhaps be assumed as an intermediate acid (Böttinger, *B.* 14, 90, 133; *A.* 191, 321).—2. By oxidising (*Py.* 1,3)-di-methyl-quinoline with CrO_3 (Beyer, *J. pr.* [2] 33, 411; Seitz, *B.* 23, 2257).—3. By heating isatin with acetone and dilute (5 p.c.) NaOHAq (Pfitzinger, *J. pr.* [2] 38, 582).

Properties.—Laminæ or needles (containing aq); sol. water and alcohol, v. e. sol. dilute acids. Tastes bitter.

Reactions.—1. Yields quinaldine on *distillation with lime* (Küsel, *B.* 19, 2249).—2. *Oxidised* by $KMnO_4$ to pyridine tricarboxylic acid.—3. *Bromine* in chloroform forms an oily addition-product, which gives up all its bromine on treatment with boiling water (Böttinger, *B.* 16, 2357).

Salts.—HA'HCl aq: needles; loses its HCl when treated with cold water.—$(HA')_2H_2PtCl_6$ 2aq. —HA'HBr 2aq.—BaA'_2 aq.—AgA': small plates.

(*Py.* 2)-Methyl-quinoline (*Py.* 3)-carboxylic acid  $C_6H_4<\begin{matrix}CH:CMe\\N\ :C.CO_2H\end{matrix}$ [144°]. Formed by oxidation of (*Py.* 2, 3)-methyl-ethyl-quinoline (derived from aniline and propionic aldehyde) with CrO_3 and H_2SO_4 (Doebner a. Miller, *B.* 17, 1715; 18, 1641). Long silky needles or monoclinic prisms (from ether-alcohol); sol. hot water and alcohol. Split up at 160° into CO_2 and (*Py.* 2)-methyl-quinoline.—CuA'_2: sl. sol. water.

(*Py.* 3)-Methyl-quinoline (*Py.* 2)-carboxylic acid  $C_6H_4<\begin{matrix}CH:C.CO_2H\\N\ :CMe\end{matrix}$. *Quinaldine carboxylic acid.* [234°]. Formed by saponification of its ether, which is produced by the action of o-amido-benzoic aldehyde on an alkaline aqueous solution of acetoacetic ether (Friedländer a. Göhring, *B.* 16, 1836; *B.* 19, 37). Formed also by oxidising (*Py.* 2, 3)-di-methyl-quinoline with chromic acid (Rohde, *B.* 22, 267). Colourless needles, sl. sol. water, m. sol. alcohol. Split up on fusion into CO_2 and quinaldine.

Ethyl ether EtA'. [71°]. Long white needles, insol. water. May be distilled.—$(EtA')_2H_2PtCl_6$ 2aq: sparingly soluble yellow needles.

Methylo-iodide of the *ethyl ether* EtA'MeI. [205°]. Orange needles, sl. sol. cold water and alcohol, v. sol. hot water. Ag_2O converts it into the oxide $(EtA'Me)_2O$, an amorphous pp. which, when freshly prepared, is sol. benzene and chloroform, insol. water, alcohol, ether, and ligroïn; after a time it becomes insol. benzene and chloroform. The oxide decomposes when heated between 180° and 240°. HCl converts it into EtA'MeCl, which yields $(EtA'MeCl)_2PtCl_6$, crystallising in golden plates [217°].

(*Py.* 1)-Methyl-quinoline (*B.* 2)-carboxylic acid

$$\begin{array}{l} CO_2H.C:CH.C.CMe:CH \\ \quad HC:CH.C.\ N\ :CH \end{array}$$

Lepidine p-carboxylic acid. [250°–270°]. Obtained by oxidation of the corresponding di-methyl-quinoline by chromic acid mixture (K. Daniel, *B.* 23, 2264). Stellate groups of needles. Yields lepidine on distillation with soda-lime.

Methyl-quinoline carboxylic acid $C_{13}H_6NO_2$ *i.e.* $C_6H_4(C_5HMeN.CO_2H)$. [190°]. Formed by oxidising the fraction 275°–285° (? di-methyl-quinoline) of the product of the action of aniline on a mixture of isobutyric aldehyde, methylal, and HCl (Von Miller a. Kinkelin, *B.* 20, 1940). Small crystals, m. sol. water and alcohol; gives off CO_2 on fusion.

(*Py.* 4)-Methyl-quinoline tetrahydride (*B.* 3)-carboxylic acid

$$\begin{array}{l} \qquad CH:CH.C.CH_2.CH_2 \\ CO_2H.C\ :CH.C.NMe.CH_2 \end{array}$$

Kairoline m-carboxylic acid. [164°]. Obtained by heating quinoline tetrahydride (*B.* 3)-carboxylic acid with MeI at 150° (Fischer a. Körner, *B.* 17, 765). Needles; sl. sol. water, v. sol. alcohol.

(*Py.* 4)-Methyl-quinoline tetrahydride (*Py.* 1)-carboxylic acid

$$C_6H_4 \lt \begin{array}{l} CH(CO_2H).CH_2 \\ N\ (CH_3)\ .CH_2 \end{array}$$

Methyl-tetrahydro-cinchonic acid. Formed by heating the hydrochloride of quinoline tetrahydride (*Py.* 1)-carboxylic acid with MeOH and MeI at 100°, and decomposing the resulting salt with Ag_2O (Weidel, *M.* 3, 66). Crystallises from cold alcohol in large prisms (containing 2aq); v. sol. water and alcohol, nearly insol. ether. Reduces warm ammoniacal $AgNO_3$. Decomposes on distillation, yielding an anhydride $C_{22}H_{24}N_2O_3$, which is a colourless oil (298° at 744 mm.), insol. ether, alcohol, and dilute acids, and is converted by heating with HClAq at 150° into MeCl and quinoline tetrahydride (*Py.* 1)-carboxylic acid (Weidel a. Hazura, *M.* 5, 643). On heating the anhydride with aqueous KOH it is converted into 'homohydrocinchonic acid' $C_{11}H_{13}NO_2$, which crystallises in pearly leaflets [125°], insol. water, sol. alcohol and ether, and forms a hydrochloride $C_{11}H_{13}NO_2HCl$aq, crystallising in trimetric prisms ($a:b:c = \cdot93:1:2\cdot07$); and a methylo-iodide $C_{11}H_{13}NO_2MeI$aq, forming monoclinic crystals; converted by Ag_2O into $C_{11}H_{12}MeNO_2$aq, crystallising in glittering prisms, v. e. sol. water.

Salts.—The metallic salts are extremely deliquescent. — HA'HCl aq: large monoclinic crystals.—$(HA')_2H_2PtCl_6$: large orange crystals. —HA'HI aq: large monoclinic crystals.

(*B.* 2; *Py.* 3)-Di-methyl-quinoline (*Py.* 1)-carboxylic acid

$$\begin{array}{l} CMe:CH.C.C(CO_2H):CH \\ CH\ :CH.C.N\!=\!=\!=\!CMe \end{array}$$

[262°]. Formed by the action of aqueous NaOH on a mixture of *p*-methyl-isatin and acetone (Pfitzinger, *J. pr.* [2] 38, 584). Shining plates (from water).

(*B.* 4; *Py.* 3)-Dimethyl-quinoline (*B.* 2)-carboxylic acid

$$\begin{array}{l} CO_2H.C\ :CH\ .C.CH:CH \\ \qquad CH:CMe.C.\ N:CMe \end{array}$$

Formed by oxidising (*B.* 2, 4; *Py.* 3)-trimethyl-quinoline with CrO_3 and dilute H_2SO_4 (Panajotoff, *B.* 20, 38). Needles (by sublimation); sl. sol. water and cold alcohol. On distillation with lime it gives (*B.* 4; *Py.* 3)-di-methyl-quinoline.

Salts.—$(HA')_2H_2PtCl_6$ 4aq: orange needles. —BaA'_2: white needles, v. sol. water.—AgA' aq: amorphous precipitate becoming crystalline.—$C_6H_2(NO_2)_3OH$. [221°]. Yellow needles; sl. sol. water, v. sol. alcohol.

(*Py.* 2, 3)-Di-methyl-quinoline (*B.* 2)-carboxylic acid

$$\begin{array}{l} CO_2H.C:CH.C.CH:CMe \\ \qquad HC:CH.C.\ N\ :CMe \end{array}$$

[270°]. Formed by oxidising (*B.* 2; *Py.* 2, 3-tri-methyl-quinoline (Miller a. Ohler, *B.* 23, 2268). Silky needles, sl. sol. water and alcohol. Gives on distillation (*Py.* 2, 3)-di-methyl-quinoline [68°]. —CuA'_2 aq.

(*Py.* 3)-Methyl-quinoline (*B.* 2; *Py.* 1)-di-carboxylic acid

$$\begin{array}{l} CO_2H.C\ :CH.C.C(CO_2H):CH \\ \qquad CH:CH.C.N\!=\!=\!=\!CMe \end{array}$$

Formed by heating *p*-amido-benzoic acid (30 g.) with pyruvic acid (20 g.) and aldehyde (12 g.) in alcoholic solution on a water-bath (Von Miller a. R. Meyer, *B.* 23, 2262). White powder, insol. alcohol and other solvents. Cakes together at 160°. Gives quinaldine on distillation with lime.—CuA'_2: green crystalline pp.

(*Py.* 3)-METHYL-QUINOLINE (*B.* 3)-CARBOXYLIC ALDEHYDE $C_{11}H_9NO$ *i.e.*

$$\begin{array}{l} \quad CH:CH.C.CH:CH \\ COH.C\ :CH.C\ .\ N\ :CMe \end{array}$$

[61°]. Prepared by adding $KMnO_4$ to a dilute solution of sodium methyl-quinolyl-acrylic acid covered with benzene and frequently shaking (Eckhardt, *B.* 22, 277). Slender hair-like crystals (containing $1\frac{1}{5}$ aq!). Melts at 61° when anhydrous and 73° when hydrated. V. sol. dilute HClAq, sl. sol. acetic acid, v. sol. alcohol, ether, and benzene, m. sol. ligroïn and hot water. Volatile with steam. Reduces ammoniacal $AgNO_3$. Gives a crystalline sulphite, and a red colour with phenyl-hydrazine acetate. Ag_2O oxidises it to the corresponding carboxylic acid [285°]. On heating with methyl-quinoline and $ZnCl_2$ for 2 hours at 150° it yields a condensation-product [69°].

Salts.—B'HCl: pale-yellow needles. — $B'H_2PtCl_6$. [211°]. Triclinic crystals (from alcohol containing HCl). — $B'C_6H_2(NO_2)_3OH$. [182°]. Needles, blackening at 174°.

Phenyl-hydrazide $C_{17}H_{15}N_3$. The salt $C_{17}H_{15}N_3HCl$ separated as brick-red hair-like crystals on adding a hot solution of phenyl-hydrazine hydrochloride to a hot solution of the base in HClAq. In presence of H_2SO_4 the salt $(C_{17}H_{15}N_3)_4(H_2SO_4)_3$ 9aq separates in small brick-red needles.

(*Py.* 3)-Methyl-quinoline (*B.* 2)-carboxylic aldehyde $\begin{array}{l}\mathrm{CHO.C\ :CH.C.CH:CH}\\ \mathrm{\quad CH:CH.C.\ N\ :CMe}\end{array}$. [106°]. Formed by oxidising the corresponding methyl-quinolyl-acrylic acid with $KMnO_4$, accompanied by agitation with benzene (Miller a. Kinkelin, *B.* 18, 3237). Needles (from water); m. sol. ligroïn and hot water, v. e. sol. alcohol, ether, benzene, and acids. On heating with quinaldine at 150° it forms $C_9H_6N.CH:CH.C_9H_5NMe$, a yellow insoluble substance melting above 300°.—$B'_2H_2PtCl_6$ 2aq: orange prisms.

Phenyl-hydrazide $C_{17}H_{15}N_3$. [160°]. Golden prisms (from alcohol).

(*B.* 2, 4)-Di-methyl-quinoline (*Py.* 3)-carboxylic aldehyde $\begin{array}{l}\mathrm{CMe:CH\ .C.CH:CH}\\ \mathrm{CH\ :CMe.C.\ N\ :C.CHO}\end{array}$. [107°]. Formed by oxidising (*B.* 2, 3)-di-methyl-quinolyl-acrylic acid with $KMnO_4$ (Panajotoff, *B.* 23, 1471). Yellowish plates, v. sol. alcohol and ether, sl. sol. water. Sol. acids; insol. alkalis.

Tri-methyl-quinoline carboxylic aldehyde $C_{13}H_{13}NO$. [101·5°]. Formed from tetra-methyl-quinoline (derived from paraldehyde, aniline, and HCl) by treatment with CrO_2Cl_2 followed by water (Einhorn, *B.* 18, 3144). Crystallises from water in needles (containing 3aq) which melt at 74°. When anhydrous it melts at 101·5°. It reduces ammoniacal $AgNO_3$, forming a mirror. It yields an oxim [203°] and a phenyl-hydrazide [207°].

METHYL-QUINOLINE MERCAPTAN *v.* METHYL-QUINOLYL MERCAPTAN.

(*B.* 2)-METHYL-QUINOLINE (*B.* 4)-SULPHONIC ACID $C_{10}H_9NSO_3$ *i.e.* $\begin{array}{l}\mathrm{C(CH_3):CH}\\ \mathrm{CH:C(SO_3H)}\end{array}\!\!>\!C_5H_3N$. *p-Toluquinoline sulphonic acid.* Formed by boiling a mixture of *p*-toluidine sulphonic acid, nitrobenzene, glycerin, and H_2SO_4 (Fischer a. Wittmack, *B.* 17, 441). Formed also by the sulphonation of (*B.* 2)-methyl-quinoline (Herzfeld, *B.* 17, 1552). Colourless plates, sl. sol. boiling water.—KA': v. sol. water.—BaA'_2 (dried at 130°): amorphous, sl. sol. water.

(*B.* 4)-Methyl-quinoline (*B.* 1)-sulphonic acid $\begin{array}{l}\mathrm{CH:C(SO_3H)}\\ \mathrm{CH:CMe}\end{array}\!\!>\!C_5H_3N$. Obtained by heating *o*-toluidine sulphonic acid $C_6H_3Me(NH_2)SO_3H$ [1:2:4] with glycerin, nitrobenzene, and H_2SO_4 (Herzfeld, *B.* 17, 904). Formed also by sulphonating (*B.* 4)-methyl-quinoline (Herzfeld, *B.* 17, 1550). Flat prisms (from water); v. sol. water.—KA': long soluble tables.—BaA'_2: soluble trimetric tables.

(*B.* 4)-Methyl-quinoline (*B.* 2)-sulphonic acid $\begin{array}{l}\mathrm{SO_3H.C\ :CH}\\ \mathrm{\quad CH:CMe}\end{array}\!\!>\!C_5H_3N$. Formed by heating *o*-toluidine sulphonic acid $C_6H_3Me(NH_2)SO_3H$ [1:2:5] with glycerin, nitrobenzene, and H_2SO_4 (Herzfeld, *B.* 17, 903). Colourless sparingly soluble prisms.

(*Py.* 3)-Methyl-quinoline (*B.* 2)-sulphonic acid $\begin{array}{l}\mathrm{SO_3H.C\ :CH.C.CH:CH}\\ \mathrm{\quad CH:CH.C.\ N\ :CMe}\end{array}$. *Quinaldine p-sulphonic acid.* Formed in small quantity in the sulphonation of quinaldine. Prepared by heating amido-benzene *p*-sulphonic acid (100 pts.) with paraldehyde (80 pts.) and HCl (100 pts.) for 2 hours on the water-bath (Doebner a. Miller, *B.* 17, 1703). Small monoclinic crystals, v. sol. hot water. On fusion with KOH it yields oxy-methyl-quinoline [213°].

(*Py.* 3)-Methyl-quinoline (*B.* 4)-sulphonic acid $\begin{array}{l}\mathrm{CH:CH\text{——}C.CH:CH}\\ \mathrm{CH:C(SO_3H).C.\ N\ :CMe}\end{array}$. *Quinaldine o-sulphonic acid.* Formed, in small quantity, in sulphonating quinaldine (Doebner a. Miller, *B.* 17, 1703). Long flat triclinic prisms, v. sol. hot water. On fusion with potash it yields oxy-methyl-quinoline [74°].

(*Py.* 3)-Methyl-quinoline (*B.* 1 or 3)-sulphonic acid $\begin{array}{l}\mathrm{CH:C(SO_3H).C.CH:CH}\\ \mathrm{CH:CH\text{——}C.\ N\ :CMe}\end{array}$ or $\begin{array}{l}\mathrm{CH:CH\text{——}C.CH:CH}\\ \mathrm{C(SO_3H):CH.C.\ N\ :CMe}\end{array}$. *Quinaldine m-sulphonic acid.* The chief product of the sulphonation of quinaldine (Doebner a. Miller, *B.* 17, 1703). Glistening monoclinic prisms; sol. hot, sl. sol. cold, water. On fusion with potash it gives oxy-methyl-quinoline [234°]. Distillation with KCy yields the nitrile of the corresponding carboxylic acid (Richard, *B.* 23, 3488).

(*Py.* 1)-Methyl-quinoline sulphonic acid $C_6H_3(SO_3H)\!<\!\begin{array}{l}\mathrm{CMe:CH}\\ \mathrm{N\ :\ CH}\end{array}$. *Lepidine sulphonic acid.* Formed by heating 'homohydrocinchonic acid' $C_{10}H_9NSO_3$ with H_2SO_4 at 180° (Weidel a. Hazura, *M.* 5, 652). Crystallises from water in thin plates (containing aq); nearly insol. cold, v. sol. hot water.

(*Py.* 1)-Methyl-quinoline (*B.* 2)-sulphonic acid $\begin{array}{l}\mathrm{SO_3H.C:CH.C.CMe:CH}\\ \mathrm{\quad HC:CH.C.N{=}CH}\end{array}$. Formed by heating lepidine (1 pt.) with H_2SO_4 (8 pts.) at 300° (Busch a. Koenigs, *B.* 23, 2680). Silky needles (containing *x*aq), v. sol. hot water.—AgA' aq: white jelly, becoming crystalline.

(*Py.* 1, 3)-Di-methyl-quinoline sulphonic acid $C_{11}H_{11}NSO_3$ *i.e.* $C_6H_3(SO_3H)\!<\!\begin{array}{l}\mathrm{CMe:CH}\\ \mathrm{N\quad :CMe}\end{array}$. Formed by sulphonating the corresponding di-methyl-quinoline (Beyer, *J. pr.* [2] 33, 407). Tables or flat needles, not melting below 303°. On fusion with potash it yields oxy-di-methyl-quinoline [44°].

(*B.* 1, 4)-Di-methyl-quinoline (*B.* 2)-sulphonic acid $\begin{array}{l}\mathrm{SO_3H.C\ :CMe}\\ \mathrm{\quad CH:CMe}\end{array}\!\!>\!C_5H_3N$. *p-Xyloquinoline sulphonic acid.* Formed by heating (*B.* 1, 4)-di-methyl-quinoline with fuming H_2SO_4. Formed also from xylidine sulphonic acid by heating with nitrobenzene, glycerin, and H_2SO_4 (Nölting a. Frühling, *B.* 21, 3157).—KA': needles or plates, v. sol. water.—BaA'_2 aq: plates, v. sol. hot water.—BaA'_2 2aq.

(*B.* 1, 4)-Di-methyl-quinoline (*B.* 3)-sulphonic acid $\begin{array}{l}\mathrm{\quad CH:CMe}\\ \mathrm{SO_3H.C\ :CMe}\end{array}\!\!>\!C_5H_3N$. Formed by heating xylidine sulphonic acid (derived from *p*-xylene sulphonic acid) with nitrobenzene, glycerin, and H_2SO_4 (Nölting a. Frühling, *B.* 21, 3156). Short white plates, sl. sol. cold water, v. sol. hot water and dilute acetic acid.—KA'aq: v. e. sol. water.—BaA'_2 aq: needles, v. sol. hot water.

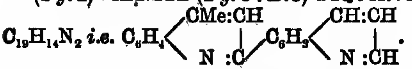
(*B.* 2, 4)-Di-methyl-quinoline sulphonic acid $C_6HMe_2(SO_3H)(C_3H_3N)$. Formed by heating the corresponding di-methyl-quinoline with fuming H_2SO_4 at 165° (Berend, *B.* 17, 2716). Minute needles (from alcohol-ligroïn).

(*B*. 2, 4 ; *Py*. 3)-Tri-methyl-quinoline (*B*. 1)-sulphonic acid. Formed from the corresponding tri-methyl-quinoline by heating with $H_2S_2O_7$ at 125° (Panajotoff, *B*. 20, 36). Small yellow needles (from dilute HClAq), not melting at 260°: insol. cold water.—BaA'_2 3aq: silky needles.

METHYL-QUINOLINIC ACID *v*. METHYL-PYRIDINE DICARBOXYLIC ACID.

METHYL-QUINOLINIUM HYDRATE *v*. *Methylo-hydrate* of QUINOLINE.

(*Py*. 1)-METHYL-(*Py*. 3 : *B*. 3)-DIQUINOLYL



$C_{19}H_{14}N_2$ *i.e.* $C_6H_4<\begin{array}{l}CMe:CH\\ N\ :C\end{array}\!\!\!/\,C_6H_3<\begin{array}{l}CH:CH\\ N\ :CH\end{array}.$

[138°]. Obtained by heating flavaniline (10 pts.), with nitrobenzene (5 pts.), glycerin (30 pts.), and H_2SO_4 (30 pts.) (Fischer, *B*. 19, 1036). Colourless crystals. Strong base. Its salts with mineral acids have a splendid blue fluorescence in dilute solution.

Methylo-iodide B'MeI: fine yellowish needles, easily soluble in water.

Di-(*Py*. 3)-methyl-diquinolyl $C_{20}H_{16}N_2$ *i.e.*

$\begin{array}{l}CH\ :CH\\ CMe:\ N\end{array}\!>C_6H_3.C_6H_3<\begin{array}{l}CH:CH\\ N\ :CMe\end{array}.$

[207°] (above 360°). Prepared by gradually adding paraldehyde (90 g.) to a solution of benzidine (80 g.) in conc. HClAq (400 g.) at 100°. After heating for ten hours the product is diluted with water, treated with $NaNO_2$, boiled, and ppd. by KOH (Hinz, *A*. 242, 326). Slender white needles, sol. alcohol, benzene, and chloroform, sl. sol. water and ether.—$B''H_2PtCl_6$ 2aq: light-yellow pp., sl. sol. hot water.—$B''2HNO_3$: small colourless needles, v. sol. water, sl. sol. alcohol.—$B''H_2Cr_2O_7$: slender yellow needles, sl. sol. hot water.

Di-methyl-diquinolyl $C_{20}H_{16}N_2$aq [162°]. Formed by heating quinaldine with sulphur (Von Miller, *B*. 21, 1828). Crystallises from alcohol in white needles (containing aq). Its picrate crystallises in needles. The platinochloride forms needles, v. sl. sol. water.

Tetra-methyl-diquinolyl $C_{22}H_{20}N_2$ *i.e.*

$\begin{array}{l}CH\ :CMe\\ CMe:\ N\end{array}\!>C_6H_3.C_6H_3<\begin{array}{l}CMe:CH\\ N\ :CMe\end{array}.$

Tetra-methyl-diquinolyline. [232°]. Formed by heating benzidine with acetone and conc. HClAq at 180° (Schestopal, *B*. 20, 2506). White plates, insol. water, sl. sol. ether, v. sol. alcohol. When heated with benzoic aldehyde and $ZnCl_2$ at 180° it forms a compound crystallising from alcohol in yellow needles.

Salts.—$B''H_2Cl_2$. Needles, v. sol. water and alcohol.—$B''H_2SO_4$. Needles (from water) or prisms (from alcohol).—$B''H_2PtCl_6$: needles.—$B''H_2Cr_2O_7$: needles, sl. sol. cold water.—Picrate: insol. water and cold alcohol.—$B''I_2Cl_2$ 2HCl: flesh-coloured needles.

Methylo-iodide $B''Me_2I_2$. [270°].

Ethylo-iodide $B''Et_2I_2$. [158°].

(*Py*. 3)-METHYL-QUINOLYL-(*B*. 2)-ACRYLIC ACID $C_{13}H_{11}NO_2$ *i.e.*

$\begin{array}{l}CO_2H.CH:CH.C\ \ :CH.C.CH:CH\\ \qquad\qquad\qquad\quad CH:CH.C.\ N\ :CMe\end{array}.$

Quinaldine-acrylic acid. Obtained by heating a mixture of paraldehyde (40 g.), *p*-amido-cinnamic-acid hydrochloride (50 g.), and conc. HCl (50 g.) (Miller a. Kinkelin, *B*. 18, 3235). Small concentric needles. Decomposes between 240° and 250°. Sol. hot alcohol, sl. sol. cold alcohol and water. By an alkaline solution of $KMnO_4$ it is oxidised to methyl-quinoline carboxylic aldehyde C_9H_5Me.CHO.

Salts.—A'H,HCl aq: easily soluble concentric prisms.—A'H,HNO_3aq: needles or prisms, sl. sol. dilute HNO_3.—$(A'H,HCl)_2PtCl_4$ 2aq; reddish-yellow prisms.

(*Py*. 3)-Methyl-quinolyl (*B*. 3)-acrylic acid

$C_{13}H_{11}NO_2$ *i.e.* $\begin{array}{l}\qquad\qquad\qquad\quad CH:CH.C.CH:CH\\ CO_2H.CH:CH.C\ \ :CH.C.\ N\ :CMe\end{array}.$

[246°]. Obtained by heating *m*-amido-cinnamic acid with paraldehyde and conc. HClAq at 150° (Eckhardt, *B*. 22, 272). Small white monoclinic prisms (from alcohol), tending to become yellow; sl. sol. ether, chloroform, and petroleum-ether, m. sol. alcohol, benzene, and acetone. When heated above its melting-point a small sublimate of slender needles [223°] is obtained. $KMnO_4$ oxidises it to the corresponding methyl-quinoline carboxylic aldehyde. On warming with chloral on the water-bath two compounds are formed. One of these compounds $C_{12}H_8NO_2.CH_2.CH(OH)CCl_3$ crystallises from alcohol in prisms [201°], which dissolve in nitric acid with violet fluorescence, and which yield the salts $C_{15}H_{12}Cl_3NO_3HCl$ [over 300°] and $AgC_{15}H_{11}Cl_3NO_3$ crystallising in slender needles. The other compound $C_{28}H_{25}Cl_5N_2O_5$ crystallises from alcohol in needles [128°] which dissolve in nitric acid with blue fluorescence, and which forms a salt $C_{28}H_{25}Cl_5N_2O_5HCl$ [217°].

Salts.—HA'HCl aq: deliquescent trimetric needles.—$(HA')_2H_2PtCl_6$ 2aq: yellow needles or plates.—HA'HNO_3 aq: needles, sol. water.—HA'$C_6H_2(NO_2)$OH aq. [152°]. Bundles of slender needles, sol. alcohol, hot water, and HOAc, sl. sol. ether.—CaA'_2 3aq: slender needles (from water), v. sol. dilute HClAq and acetic acid.—AgA'2aq: minute crystalline lancelets.—AgA'4aq: needles.

(*Py*. 3)-Methyl-quinolyl-(*B*. 1 ?)-acrylic acid $C_{13}H_{11}NO_2$. Formed on one occasion in the preparation of the preceding isomeride (E.). Crystallises in yellowish monoclinic plates (containing aq) [184°] and in white crystals (containing ½ EtOH) [204°]. Its ammoniacal solution, unlike that of its isomeride, is not ppd. by salts of Ba, Ca, and Mg.

(*B*. 2, 4)-Di-methyl-(*Py*. 3)-quinolyl-acrylic acid

$\begin{array}{l}CMe:CH\ \ .C.CH:CH\\ CH\ \ :CMe.C.\ N\ :C.CH:CH.CO_2H\end{array}.$

Formed by boiling the compound of chloral and (*B*. 2, 4 ; *Py*. 3)-tri-methyl-quinoline with aqueous K_2CO_3 (Panajotoff, *B*. 20, 42). Yellowish needles, decomposing at 180°, forming a product melting at 210°.

METHYL-QUINOLYL-AMMONIUM IODIDE *v*. *Methylo-iodide* of QUINOLINE.

(*Py*. 1)-METHYL-QUINOLYL ETHYL SULPHIDE

$C_6H_4<\begin{array}{l}CMe:CH\\ N\ :CSEt\end{array}.$

Formed by treating methyl-quinolyl mercaptan with NaOEt and EtI (Roos, *B*. 21, 628). Oil, volatile with steam.—$B'_2H_2PtCl_6$ ½aq.—B'HI. [214°]. Long yellow needles.

(*Py*. 3)-Methyl-quinolyl ethyl sulphide

$C_6H_4<\begin{array}{l}C(SEt):CH\\ N=\!=\!=CMe\end{array}.$

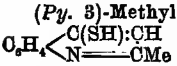
[56°]. Formed from sodium methyl-quinolyl mercaptide and EtI (R.). White needles, v. sol. alcohol and ether, insol. water.

TETRA - METHYL - DIQUINOLYLINE *v.* TETRA-METHYL-DIQUINOLYL.

(*Py.* 1)-**METHYL**-(*Py.* 3)-**QUINOLYL MERCAPTAN**

$C_6H_4\Big<\begin{array}{l}CMe:CH\\N\ \ :C.SH\end{array}$. [253°]. Formed by heating (*Py.* 3, 1)-oxy-methyl-quinoline with P_2S_5 at 150°, extracting the product with HClAq and ppg. with water (Roos, *B.* 21, 625). Brownish needles (from alcohol); insol. water, sl. sol. cold alcohol, v. sol. ether. Not attacked by hydroxylamine or phenyl-hydrazine. H_2O_2 oxidises it to a disulphide. NaOEt and EtI form methyl-quinolyl ethyl sulphide.

(*Py.* 3)-Methyl-(*Py.* 1)-quinolyl-mercaptan.



$C_6H_4\Big<\begin{array}{l}C(SH):CH\\N\!=\!=\!=\!=CMe\end{array}$. [187°]. Formed by the action of P_2S_5 on (*Py.* 1, 3)-oxy-methyl-quinoline (Roos, *B.* 21, 628). Crystallises from water in plates (containing aq); v. sol. hot water, alcohol, and ether. With NaOEt and EtI it yields $C_9H_5MeN(SEt)$ [56°].

Di-(*Py.* 1)-methyl-di-(*Py.* 3)-quinolyl disulphide

$C_6H_4\Big<\begin{array}{l}CMe:CH\\N\ \ :C.\ S.S.\end{array}\begin{array}{l}CH:CMe\\C\ \ :\ \ N\end{array}\Big>C_6H_4$.

[167°]. Prepared by oxidising the corresponding mercaptan with hydrogen peroxide (Roos, *B.* 21, 627). White plates (from benzene); v. sol. alcohol, ether, and benzene, insol. water and alkalis.

(*Py.* 3) - **METHYL** - (*B.* 4) - **QUINOLYL PHENYL KETONE** $C_{17}H_{13}NO$ *i.e.*

$\begin{array}{l}CH:CH\ .\ C.CH:CH\\CH:CBz.C.\ N\ :CMe\end{array}$. (*B.* 4)-*Benzoyl-quinaldine.* [108°]. Colourless felted needles. Formed by boiling *o*-amido-benzophenone (1 pt.) and paraldehyde (2 pts.) with dilute H_2SO_4 (15 pts.) (Geigy a. Koenigs, *B.* 18, 2406).

(*Py.* 3)-methyl-(*B.* 2)-quinolyl phenyl ketone

$\begin{array}{l}C_6H_5.CO.C\ \ :\ CH.C.CH:CH\\\qquad\qquad CH:\ CH.C.\ N\ :CMe\end{array}$. [68°]. (above 300°). Formed by adding paraldehyde (1 mol.) to a hot solution of *p*-amido-benzophene (1 mol.) in conc. HClAq and digesting the mixture on a water-bath (Hinz, *A.* 242, 323). Plates (from alcohol); v. sol. hot water, alcohol, and ether.—$B'_2H_2PtCl_6$2aq: needles. Melts at 110° when anhydrous.—$B'_2H_2Cr_2O_7$: needles.

Methylo-iodide B'MeI. [220°].

(*B.* 2)-**METHYL-QUINOXALINE** $C_9H_8N_2$ *i.e.*

$\begin{array}{l}CMe:CH.C.N:CH\\CH\ \ :CH.C.N:CH\end{array}$. *Toluquinoxaline.* (244° uncor.). Obtained by the action of glyoxal on (1, 3, 4)-tolylene-diamine, and purified by means of its compound with $NaHSO_3$ (Hinsberg, *B.* 17, 321; *A.* 237, 336). Liquid, turning yellow in air and light; miscible with cold water, alcohol, ether, and benzene; less soluble in hot water. With tin and HClAq it gives a blue colouring matter. Forms a dibromide $C_9H_8Br_2N_2$ crystallising from chloroform in needles, which blacken and decompose at 170°.—$B'_2H_2PtCl_6$: yellow needles; sl. sol. water and alcohol.—$B'_2H_2C_2O_4$. Needles [136°]; sl. sol. water.

Compound with sodium bisulphite $B'(NaHSO_3)_2$2aq: slender needles; v. sol. water, m. sol. alcohol.

Ethylo-iodide B'EtI. Colourless crystals; v. sol. water, sol. alcohol and chloroform.

Derivatives.—*V.* CHLORO-TOLUQUINOXALINE.

(*B.* 2; *Qu.* 2) - **Di - methyl - quinoxaline**

$\begin{array}{l}CMe:CH.C.N:CH\\CH\ \ :CH.C.N:CMe\end{array}$. '*Methyl-tolylene-quinoxaline.*' [54°]. (268° uncor.). Formed by the action of chloro-acetone (2 mols.) on an aqueous solution of (1, 3, 4)-tolylene-diamine (Hinsberg, *B.* 19, 485; *A.* 237, 368). Formed also by the action of tolylene *o*-diamine upon methyl-glyoxal or its oxim, nitroso-acetone (Pechmann, *B.* 20, 2544). White crystals, turning red in the air; v. e. sol. cold water, alcohol, and ether. Ppd. from its aqueous solution on boiling or on adding KOH. Not affected by nitrous acid or Ac_2O.—$B'_2H_2PtCl_6$: yellow needles: sl. sol. water.

Tri-methyl-quinoxaline

$\begin{array}{l}CMe:CH.C.N:CMe\\CH\ \ :CH.C.N:CMe\end{array}$. [91°]. (271°). Formed by the action of di-methyl diketone (diacetyl) on (1, 3, 4)-tolylene-diamine acetate (Pechmann, *B.* 21, 1414). Hexagonal crystals (from ligroïn).

Tetra-methyl-diquinoxaline, so called,

$\begin{array}{l}CMe:N.C.CH:C.N:CMe\\CMe:N.C.CH:C.N:CMe\end{array}$. [above 300°]. Obtained by warming tetra-amido-benzene with excess of di-methyl diketone $CH_3.CO.CO.CH_3$ (Nietzki a. Müller, *B.* 22, 444). Reddish star-shaped plates (from aniline). Nearly insol. water, alcohol, and ether. Its solution in conc. H_2SO_4 is bluish-green, and becomes blue on dilution.

METHYL-QUINOXALINE DICARBOXYLIC ACID $C_{11}H_8N_2O_4$ *i.e.*

$\begin{array}{l}CMe:CH.C.N\ :C.CO_2H\\CH\ \ :CH.C.N\ :C.CO_2H\end{array}$. *Toluquinoxaline dicarboxylic acid.* Prepared by the action of an aqueous solution of (1, 3, 4)-tolylene-diamine on sodium di-oxy-tartrate (carboxytartronate) at 80° (Hinsberg, *A.* 237, 353). Colourless needles or prisms; v. sol. water, v. sl. sol. benzene. When crystallised from water its molecule contains $\frac{1}{2}$aq. The anhydrous acid decomposes at 130° into CO_2 and a mono-carboxylic acid. $SnCl_2$ forms a compound crystallising in dark-green needles, sl. sol. water.

METHYL-QUINOXYL *v.* (*Py.* 1)-OXY-METHYL-QUINOLINE.

METHYL-RESORCIN *v.* ORCIN.

Di-methyl-resorcin *v.* *Di-methyl derivative* of RESORCIN.

Tri - methyl - resorcin $C_6H(CH_3)_3(OH)_2$ [1:3:5:2:6]. *Di-oxy-mesitylene. Mesorcin.* [150°]. (275° cor.).

Preparation.—Nitro-mesidine, obtained by partial reduction of di-nitro-mesitylene, is treated with HNO_2 and converted into nitro-mesitol; by reduction of this and treatment again with HNO_2 mesorcin is obtained (Knecht, *B.* 15, 1375).

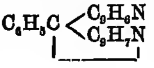
Properties.—White plates: sl. sol. cold water May be sublimed. Reduces ammoniacal $AgNO_3$ in the cold. By Fe_2Cl_6 it is oxidised to oxy-isoxyloquinone. Heated with H_2SO_4 it gives a substance whose alkaline solution is pink with an intense green fluorescence.

Di-acetyl derivative $C_9H_{10}(OAc)_2$. [63°]. (305° cor.).

METHYL-ROSANILINES *v.* METHYL-TRI-AMIDO-DI-PHENYL-TOLYL-CARBINOLS.

Methyl - pararosanilines *v.* METHYL - TRI-AMIDO-TRI-PHENYL-CARBINOLS.

DI-METHYL - ROSINDOLE $C_{25}H_{20}N_2$ *i.e.*



$C_6H_5C\Big<\begin{array}{l}C_9H_6N\\C_9H_7N\end{array}$ (?). [c. 270°]. Formed together with benzoyl-methyl-indole by heating methyl-indole (methyl-ketole) with benzoyl chloride and $ZnCl_2$. Also formed by oxidation of the leuco-compound benzylidene-methyl-indole. Amorphous yellow pp., v. sol. alcohol and ether; or yellowish-red prismatic crystals, sl. sol. alcohol, v. sl. sol. ether. The amorphous modification is converted into the crystalline by long boiling with water. It dissolves in acids and in alcoholic NaOH or KOH with a red colour. Its salts are red dyestuffs closely resembling rosaniline. By zinc-dust and NH_3 it is reduced to benzylidene-methyl-indole [248°].—B'HCl: small metallic green crystals; sl. sol. water (Fischer a. Wagner, *B.* 20, 815).

METHYL SALICYLIC ACID *v.* Oxy-toluic acid and the *Methyl derivative* of o-Oxy-benzoic acid.

METHYL-SALICYLIC ALDEHYDE *v. Methyl derivative* of o-Oxy-benzoic aldehyde.

DI-METHYL-SELENAZOLE *v.* Selenium, organic compounds.

METHYL-SELENIDE *v.* Selenium, organic compounds.

METHYL SILICATE $C_4H_{12}SiO_4$ *i.e.* $Si(OMe)_4$. (122°). S.G. $\underline{0}$ 1·0589. V.D. 5·38 (calc. 5·26). Formed by the action of $SiCl_4$ on dry methyl alcohol (Friedel a. Crafts, *A. Ch.* [4] 9, 32). Colourless liquid with fragrant ethereal odour; m. sol. water, the solution depositing gelatinous silica when kept for a month. When heated with $SiCl_4$ in various proportions it gives rise to the compounds $ClSi(OMe)_3$, (115°), S.G. $\underline{0}$ 1·195, V.D. 5·58 (calc. 5·42); $Cl_2Si(OMe)_2$, (c. 100°), S.G. $\underline{0}$ 1·260, V.D. 5·66 (calc. 5·57); and $Cl_3Si(OMe)$, (c. 84°), V.D. 5·66 (calc. 5·73).

Hexa-methyl disilicate $Me_6Si_2O_7$. (202°). S.G. $\underline{0}$ 1·144. V.D. 9·19 (calc. 8·93). Formed when, in the preparation of Me_4SiO_4, the methyl alcohol is not quite dry. Formed also by heating Me_4SiO_4 (2 mols.) with water (1 mol.) and methyl alcohol.

METHYL-STIBINE *v.* Antimony, *Compounds with organic radicles*, vol. i. 293.

METHYL-STILBAZOL *v.* Styryl-methyl-pyridine.

METHYL-STILBENE *v.* *e*-Phenyl-tolyl-ethylene.

Di-methyl-stilbene *v.* Di-tolyl-ethylene.

Tetra-methyl-stilbene *v.* Di-xylyl-ethylene.

METHYL-STRYCHNINE *v.* Strychnine.

METHYL-STYRENE *v.* Tolyl-acetylene.

METHYL STYRYL KETONE *v.* Styryl methyl ketone.

METHYL-SUCCINIC ACID *v.* Pyrotartaric acid.

u-**Di-methyl-succinic acid** $C_6H_{10}O_4$ *i.e.* $CO_2H.CH_2.CMe_2.CO_2H$. *Isoadipic acid. Isobutane dicarboxylic acid.* Mol. w. 146. [140°]. H.C.v. 671,400. H.C.p. 671,700. H.F. 237,300 (Stohmann, Kleber, a. Langbein, *J. pr.* [2] 40, 212).

Formation.—1. From its imide, which is formed, together with di-methyl-malonamic acid, by oxidising mesitylic acid $C_6H_{13}NO_3$ with $KMnO_4$ in acid solution (Pinner, *B.* 15, 582).—2. By boiling with HClAq the isobutane tricarboxylic ether $CO_2Et.CMe_2.CH(CO_2Et)_2$ obtained by the action of α-bromo-isobutyric ether on sodio-malonic ether (Leuckart, *B.* 18, 2350; Bischoff, *B.* 23, 1943). Formed also by heating the corresponding isobutane tricarboxylic acid (Barnstein, *A.* 242, 133).—3. By oxidising with chromic acid mixture the terpene $C_{20}H_{32}$ obtained from copaiva balsam (Levy a. Engländer, *A.* 242, 192).—4. By oxidising tropilene C_7H_8 with nitric acid (S.G. 1·38) (Ladenburg, *A.* 217, 139).—5. By heating its nitrile (obtained from isobutylene bromide and KCy) with HClAq at 150° (Hell a. Rothberg, *B.* 22, 1740).

Properties.—Thick colourless prisms (from benzene), crystallising from water in efflorescent monoclinic forms; $a:b:c = 2·029:1:1·191$; $\alpha = 118° 36'$; $\beta = 95° 16'$; $\gamma = 101°$. V. sol. water, alcohol, ether, and acetone, v. sl. sol. chloroform and ligroïn. At about 185° it splits up into CO_2 and its anhydride.

Salts.—KHA″ 2½aq: small prisms (P.).—KHA″ 5aq (B.).—NaHA″ 3½aq. Monoclinic prisms; $a:b:c = 1·8365:1:4·1801$; $\beta = 90° 43'$ (L. a. E.).—Na_2A'' 11aq: needles, v. sol. water.—NH_4HA''.—$(NH_4)_2A''$.—BaA″ 2aq (B.).—BaA″ 2½aq: monoclinic plates; $a:b:c = 1·601:1:1·790$; $\beta = 97° 26'$. Sl. sol. hot, m. sol. cold, water, insol. alcohol (L. a. E.).—CaA″ aq: minute plates, sl. sol. water, insol. alcohol.—CdA″ 6aq.—CuA″ 2aq.—PbA″ aq.—Ag_2A'': white pp., v. sl. sol. water.

Methyl ether Me_2A'': (200°). S.G. $\frac{16}{16}$ 1·0568.

Ethyl ether Et_2A''. (215°). S.G. $\frac{17}{17}$ 1·0134 (B.); $\underline{17}$ ·9976 (L. a. E.).

Anhydride  $\begin{matrix} CMe_2.CO \\ CH_2\ .CO \end{matrix}\!>\!O$. [29°]. (218°) (B.); (220°) (L. a. E.).

Chloride $C_2H_2Me_2(C_2O_2Cl_2)$. (201°) (B.); (193°) (L. a. E.). Formed by heating the acid with PCl_5 at 125°. Reacts with phenyl-hydrazide, forming the compound  $\begin{matrix} CMe_2.CO \\ CH_2\ .CO \end{matrix}\!>\!N.NHPh$ [132°], which yields a nitrosamine [76°].

Imide  $\begin{matrix} CMe_2.CO \\ CH_2\ .CO \end{matrix}\!>\!NH$. [106°]. Formed from the chloride and NH_3. Plates (from ether). Yields $C_6H_8KNO_2$ 2½aq, crystallising in prisms, v. sol. alcohol.

Nitrile $CN.CH_2.CMe_2.CN$. *Isobutylene cyanide.* (219°). Formed by leaving a mixture of isobutylene bromide and alcoholic KCy to stand for two weeks, heating to 140° to expel alcohol, and extracting the residue with ether (Hell a. Rothberg, *B.* 22, 1740). Clear liquid, v. sol. water.

Anti-s-**di-methyl-succinic acid** $C_6H_{10}O_4$ *i.e.* $CO_2H.CHMe.CHMe.CO_2H$. *Maleïnoid di-methyl-succinic acid. Butane dicarboxylic acid.* [120°] (O. a. R.; H. a. R.; B. a. V.); [124°] (Z.). S. 30 at 14°.

Formation.—1. Together with the isomeric 'para' or fumaroid acid [194°] by reduction of di-methyl-maleïc acid (Otto a. Rössing, *B.* 20, 2736).—2. Together with the isomeric acid [194°] by heating with HClAq the mixture of their ethers obtained by adding α-bromo-propionic ether to an alcoholic solution of α-cyano-propionic ether and NaOEt (Zelinsky, *B.* 21, 3160).—3. A mixture of the ethers of the two isomeric s-di-methyl-succinic acids is also formed, with other bodies, when α-bromo-propionic ether is heated with finely-divided silver (Hell a. Rothberg, *B.* 22, 60).—4. The mixture of 'anti-' and 'para' di-methyl-succinic acids is also formed by hydrolysis of butane tricarboxylic acid derived from sodium methyl-malonic ether and α-bromo-propionic ether (Leuckart, *B.* 18, 2346; Bischoff a. Voit, *B.* 22, 389).—5. From its anhydride, which is formed, together with the anhydride of the fumaroid isomeride, by heating the fumaroid acid [194°] for several hours at 200° (Bischoff a. Voit, *B.* 23, 641).

Properties.—Concentrically grouped prismatic needles, more sol. hot than cold water, v. sol. ether, alcohol, acetone, and chloroform, sl. sol. CS_2 and benzene, almost insol. ligroïn. A neutral solution of its ammonium salt gives a yellowish-red pp. with $FeCl_3$, a greenish-blue pp. with cupric sulphate, but no pp. with salts of Ba, Zn, Mg, Co, and Ni. Bromine at 130° converts it into di-methyl-maleïc acid [95°].

Salts.—$CaA''2aq$: crystalline powder, sl. sol. cold water.—$BaA''3aq$: thin plates, sl. sol. water.—Ag_2A'': white crystalline pp.

Methyl ether Me_2A''. (200°). From Ag_2A'' and MeI at 100°. Oil, with pleasant odour (Zelinsky a. Krapivin, *B.* 22, 646).

Ethyl ether Et_2A''. (222°). S.G. $\frac{0}{0}$ 1·0218; $\frac{18}{0}$ 1·0072 (Z. a. K.); $\frac{15}{15}$ 1·0315 (B. a. V.). H.C. 1,296,860 (Ossipoff, *C. R.* 109, 224). Oil, decomposed by heat into the anhydride and Et_2O.

Chloride (186°–197°).

Imide  $\begin{matrix}\text{CHMe.CO}\\ \text{CHMe.CO}\end{matrix}\!>\!\text{NH}.$ [106°] (B. a. V.): [110°] (Z. a. K.). Obtained by distilling the dry ammonium salt in gaseous NH_3. Stellate groups of prisms (from dilute alcohol) or thin needles (from benzene), v. sol. water, alcohol, benzene and chloroform, sl. sol. ether, v. sl. sol. ligroin. reconverted into the acid [120°] by alkalis.

Anilide CONHPh.CHMe.CHMe.CONHPh. [222°]. Formed from the chloride and aniline. Needles (from alcohol).

Phenyl-imide  $\begin{matrix}\text{CHMe.CO}\\ \text{CHMe.CO}\end{matrix}\!>\!\text{NPh}.$ [146°]. Formed by heating the acid (1 mol.) with aniline (2 mols.) till the aniline begins to distil. Slender needles, v. sol. alcohol, ether, and benzene, sl. sol. water.

Anhydride  $\begin{matrix}\text{CHMe.CO}\\ \text{CHMe.CO}\end{matrix}\!>\!\text{O}.$ [87°]. When formed by heating the 'anti' acid to 200°, it yields only the 'anti' acid again when heated with water; but when formed from the 'para' acid by like treatment the product (a mixture of anhydrides?) yields a mixture of 'para' and 'anti' acids, the amount of the latter increasing with the duration of the heating. Formed also from the 'anti' acid by heating with AcCl. In all cases it melts at 87°. When heated with bromine in chloroform at 90° it yields di-methyl-maleïc acid.

'*Para*'-*s*-di-methyl-succinic acid $C_6H_{10}O_4$ *i.e.* $MeCH(CO_2H).CHMeCO_2H$. *Fumaroid variety of s-di-methyl-succinic acid. Isoadipic acid. Hydropyrocinchonic acid.* [194°] (O. a. B.); (B. a. V.). (192°) (Z.). H.F. 238,000. H.C.v. 670,700. H.C.p. 671,000 (Stohmann, Kleber, a. Langbein, *J. pr.* [2] 40, 212). S. 1 at 22°.

Formation.—1. By heating α-bromo-propionic acid with reduced silver at 155° (Wislicenus, *B.* 2, 720; *cf. anti*-DI-METHYL-SUCCINIC ACID, *Formation* 3).—2. By boiling (αβ)-di-methyl-acetyl-succinic ether with conc. alcoholic KOH (Hardtmuth, *A.* 192, 143).—3. By boiling an aqueous solution of sodium di-methyl-maleate with sodium-amalgam (Weidel, *A.* 173, 109; *M.* 3, 612).—4. From its amide which is formed by the action of NH_3 on an oily product of the action of bromine on a solution of cyano-ethine in dilute H_2SO_4 (E. von Meyer, *J. pr.* [2] 26, 358).—5. Together with the isomeride [120°] by the reduction of di-methyl-maleïc anhydride by HIAq at 220° or by sodium-amalgam (Otto a. Beckurts, *B.* 18, 838; Otto a. Rössing, *B.* 20, 2736).—6. By heating cyano-di-methyl-succinic acid with HClAq (Zelinsky, *B.* 21, 3166).—7. Together with the 'anti' isomeride, by all the modes of formation described above for that acid.—8. By heating the 'anti' isomeride for several hours with conc. HClAq at 180°–190° (Bischoff a. Voit, *B.* 23, 643).

Properties.—Small triclinic needles (from alcohol), sl. sol. water, m. sol. alcohol. On heating at 200° it yields a mixture of its anhydride and that of the 'anti' acid; after several hours' heating it is almost wholly converted into the anhydride of the 'anti' acid. Its neutral solution is ppd. by $FeCl_3$, $CuSO_4$, $BaCl_2$, and lead acetate. On treatment with bromine it yields di-methyl-maleïc acid.

Salts.—NH_4HA'' (dried at 100°). Monoclinic prisms, v. sol. water.—$CaA''2aq$: prisms (Bischoff a. Rach, *A.* 234, 76).—$CaA''aq$ (Z.).—$CaA''1\frac{1}{2}aq$ (W.). Monoclinic needles.—SrA''.—$BaA''4aq$.—PbA''.—$PbA''\frac{1}{2}aq$: short prisms.—CuA''.—Ag_2A''.

Methyl ether Me_2A''. (199°). Oil (Zelinsky a. Krapivin, *B.* 22, 650). Yields the acid [192°] on saponification.

Ethyl ether Et_2A''. (220°). S.G. $\frac{0}{0}$ 1·013; $\frac{12}{0}$ 1·002. H.C. 1,303,570. Oil, with pleasant odour. Yields on saponification a mixture of the acids [120°] and [192°].

Chloride (186°–197°).

Imide  $\begin{matrix}\text{MeCH — CO}\\ \text{CHMe.CO}\end{matrix}\!>\!\text{NH}.$ [78°]. From the ether and NH_3. Crystallises from benzene. Yields only the 'para' acid on saponification.

Anilide MeCH(CONHPh).CHMe.CONHPh. [235°]. From the chloride and aniline. Needles, sol. ether and HOAc. Yields only the 'para' acid on saponification.

Phenyl-imide  $\begin{matrix}\text{MeCH .CO}\\ \text{CHMe.CO}\end{matrix}\!>\!\text{NPh}.$ [126°]. Formed by heating the acid with aniline. Caustic potash converts it into a mixture of 'anti' and 'para' acids.

Anhydride  $\begin{matrix}\text{MeCH .CO}\\ \text{CHMe.CO}\end{matrix}\!>\!\text{O}.$ [38°]. Formed from the acid and AcCl. May be reconverted into the original acid. By heating the 'para' acid to 180°–196° a mixture of anhydrides [87°] is formed, which yields on saponification a mixture of 'anti' and 'para' acids.

Derivative.—*v.* DI-CHLORO-DI-METHYL-SUCCINIC ACID.

Tri-methyl-succinic acid $C_7H_{12}O_4$ *i.e.* $CO_2H.CHMe.CMe_2.CO_2H$. [105°]. *Electrical conductivity*: Bischoff, *B.* 23, 1466. Formed by the hydrolising action of H_2SO_4 on pentane tricarboxylic ether obtained from sodium methyl-malonic ether and α-bromo-isobutyric ether (Bischoff a. Mintz, *B.* 23, 649). Yields an anhydride melting between 67° and 82°.

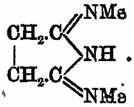
This acid is probably identical with *s*-di-methyl-glutaric acid (Bischoff a. Jannsnicker, *B.* 23, 3403).

Tetra-methyl-succinic acid $C_8H_{14}O_4$ *i.e.* $CO_2H.CMe_2.CMe_2.CO_2H$. *Hexane dicarboxylic acid.* Mol. w. 174. [192°]. Formed, together with the isomeric tri-methyl-glutaric acid [97°], by heating *α*-bromo-isobutyric ether (3 pts.) with dry silver powder (2 pts.) at 125° for 8 hours. The product is fractionally distilled, and the fraction 200°–250° saponified by heating with HBrAq at 100°. The resulting acids may be separated by steam distillation, tetra-methyl-succinic acid alone passing over (Hell, *B.* 7, 320; 10, 2229; Auwers a. V. Meyer, *B.* 22, 2014, 3005; 23, 299).

Properties.—Short branching crystals, melting at 200° when quickly heated, and 192° when slowly heated; sl. sol. cold water, m. sol. hot water, ether, chloroform, and CS_2, v. sol. alcohol and benzene, almost insol. ligroïn.

Anhydride [147°]. (230·5°). Formed by heating the acid alone, with HClAq at 200°, or with AcCl at 100°. Formed also by treating the acid (6 g.) with red phosphorus (·8 g.) and bromine (16 g.). Slender needles (from ligroïn). May be sublimed. Soon becomes resinous. Nearly insol. cold water and cold Na_2CO_3Aq, slowly dissolved by these liquids on heating, being converted into the acid.

DI-METHYL-SUCCINIMIDINE $C_6H_{11}N_3$ *i.e.*



. The hydrochlorides of this base is formed by the action of methylamine on succinimido-ether. — B′HCl: glistening prisms, [248°], v. sol. water, sl. sol. alcohol (Pinner, *B.* 16, 1658).

METHYL-SUCCINURIC ACID. *Amide* $NH_2.CO.NMe.CO.CH_2.CH_2.CONH_2$ (?). [205°–207°]. Formed from methyl-succinyl-urea

$$CO\begin{cases}NMe.CO.CH_2\\NH\ .CO.CH_2\end{cases}$$

and alcoholic NH_3 at 100° (Menschutkin, *A.* 178, 210). Plates, v. sl. sol. boiling alcohol.

DI-METHYL-SULPHAMIC ACID $C_2H_7NSO_3$ *i.e.* $NMe_2.SO_2.OH$ [165°]. Formed, together with hydrogen di-methyl-ammonium sulphate $NMe_2H_2.O.SO_2.OH$, by boiling its chloride with water (Behrend, *B.* 15, 1610; *A.* 222, 130). Large six-sided plates (from alcohol), v. sol. water, m. sol. alcohol, sl. sol. ether. By boiling with water, alkalis, or dilute nitric acid, it is converted into $(NMe_2H_2)SO_4H$. It expels CO_2 from carbonates.

Salts.—BaA'_2 aq: plates, v. sol. water.—PbA'_2 aq.—AgA′ aq: v. e. sol. water, ppd. by adding ether to its alcoholic solution.

Ethyl ether EtA′. From the chloride and NaOEt. Oil.

Chloride $NMe_2.SO_2Cl$. (183° at 760 mm.; 114° at 75 mm.). Formed by heating dimethylamine hydrochloride (1 mol.) with SO_2Cl_2 (1½ mols.) on the water-bath, the yield being 50 p.c. of the theoretical. The product is mixed with water, and the chloride extracted with ether, shaken with aqueous Na_2CO_3, dried over $CaCl_2$, and distilled (Behrend). Golden-yellow oil, partially decomposing on distillation with evolution of HCl. V. sol. alcohol, ether, benzene, and chloroform, insol. water, HClAq, and KOHAq. Boiling water decomposes it into HCl, H_2SO_4, $NMe_2.SO_2OH$, and dimethylamine. Sodium-amalgam reduces it to H_2S, dimethylamine, and H_2SO_4. Tin and HClAq act in like manner. Zinc-dust yields tetra-methyl-sulphamide.

Amide v. DI-METHYL-SULPHAMIDE.

Dimethylamide v. TETRA-METHYL-SULPHAMIDE.

Di-ethyl-amide $NMe_2.SO_2.NEt_2$. (229°). From the chloride and NEt_2H. Oil, partially decomposed on distillation.

***u*-DI-METHYL-SULPHAMIDE** $NMe_2.SO_2.NH_2$. [96°]. Formed by passing NH_3 into the chloride of di-methyl-sulphamic acid (Behrend, *B.* 15, 1611; *A.* 222, 126). Six-sided prisms with pyramidal ends, v. sol. water and alcohol, m. sol. ether.

***s*-Di-methyl-sulphamide** $NHMe.SO_2.NHMe$. [78°]. Prepared by the action of methylamine on SO_2Cl_2 in ethereal solution at 0° (Franchimont, *R. T. C.* 3, 418). Prisms, v. e. sol. water and alcohol, v. sl. sol. benzene. Tastes sweet. Nitric acid converts it into $SO_2(NMe.NO_2)_2$.

Tetra-methyl sulphamide $SO_2(NMe_2)_2$. [73°]. Formed from SO_2Cl_2 and $NHMe_2$ dissolved in chloroform (Behrend, *B.* 14, 722; *A.* 222, 119). Formed also from $NMe_2.SO_2Cl$ and $NHMe_2$. Colourless plates (from alcohol), v. sol. alcohol and ether, v. sl. sol. water, aqueous acids and alkalis. May be sublimed. Dry HCl at 120° decomposes it into $NMe_2.SO_2Cl$ and $NHMe_2$. Conc. HNO_3 yields NMe_2NO_2 (Franchimont, *R. T. C.* 3, 420).

METHYL SULPHATES. Mono-methyl sulphate $CH_3O.SO_2.OH$. *Methyl-sulphuric acid.* Formed by mixing methyl alcohol (1 pt.) with H_2SO_4 (2 pts.), allowing the hot mixture to cool, diluting with water, adding $BaCO_3$, filtering and evaporating. The barium salt thus obtained is then decomposed by H_2SO_4 (Dumas a. Péligot, *A. Ch.* [2] 58, 54; 61, 199; *A.* 15, 40; Kane, *P. M.* 7, 397). Formed also from $Cl.SO_2.OH$ and methyl alcohol (Claesson, *J. pr.* [2] 19, 240). Liquid, not solidified at −30°; v. e. sol. water, m. sol. alcohol, miscible with dry ether. Yields Me_2SO_4 and H_2SO_4 on distillation. When the potassium salt is heated with potassium acetate methyl acetate is formed; methyl ethers of other acids are formed in like manner.

Salts.—$KMeSO_4$ aq: very deliquescent monoclinic tables; $a:b:c = ·742:·779:1$; $\beta = 86° 51'$ (Schabus, *J.* 1854, 552).—$Ca(MeSO_4)_2$: very deliquescent octahedra.—$Ba(MeSO_4)_2$ 2aq: monoclinic tables; $a:b:c = ·824:1·907:1$; $\beta = 83° 30'$. S.G. $\frac{19·2}{}$ 2·273.—$Pb(MeSO_4)_2$ aq: long deliquescent prisms, v. sol. water.—$UrO_2(MeSO_4)_2$ aq: very deliquescent crystals (Péligot, *A.* 56, 231).

Chloride $MeO.SO_2Cl$. (132·5°) at 722 mm. Formed from SO_2Cl_2 (1 mol.) and MeOH (1 mol.) (Behrend, *J. pr.* [2] 15, 32). Formed also from MeOCl and SO_2 (Sandmeyer, *B.* 19, 861). Pungent oil, decomposed by water into HCl and $MeO.SO_2.OH$.

Di-methyl sulphate Me_2SO_4. Mol. w. 126. (188°). S.G. $\frac{22}{}$ 1·324 (D. a. P.).

Formation.—1. From Me_2O and SO_3.—2. By dry distillation of $MeHSO_4$ (Dumas a. Péligot; Claesson, *J. pr.* [2] 19, 244; *B.* 13, 1699).—3. By distilling methyl alcohol (1 pt.) with conc. H_2SO_4 (9 pts.), washing the distillate with water, drying the oily layer with $CaCl_2$, and rectifying (Dumas a. Péligot, *A. Ch.* [2] 58, 32).

Properties.—Oil, decomposed by boiling water and by alkalis into MeOH and H_2SO_4. An ethereal solution of NH_3 forms $MeO.SO_2.ONH_3Me$. Distillation with fused NaCl forms MeCl and Na_2SO_4. Distillation with KOBz yields MeOBz and K_2SO_4. Sodium formate yields methyl formate and sodium sulphate. It forms double compounds with sulpho-acetates, sulpho-benzoates, and isethionates (Geuther, *A.* 218, 288).

METHYL SULPHIDE $(CH_3)_2S$. Mol. w. 62. (41°) (R.); (37°) (K.). S.G. $\underline{20}$ ·845. H.F.p. 12,730. H.F.v. 11,570. S.V. 75·6 (Lossen, *A.* 254, 71). Formed by passing MeCl into a solution of K_2S in MeOH (Regnault, *A. Ch.* [2] 71, 391; *A.* 34, 26). Prepared by distilling a concentrated solution of $MeNaSO_4$ (from 500 c.c. MeOH) with aqueous KOH (500 g.) that has been previously half saturated with H_2S; the yield being moderate (150 g.). Colourless mobile liquid with very unpleasant odour (Klason, *B.* 20, 3407).

Reactions.—1. Takes fire when dropped into dry *chlorine*, but if the temperature be kept low oily substitution products $(CH_2Cl)_2S$, $(CHCl_2)_2S$, and $(CCl_3)_2S$ may be obtained (Riche, *A. Ch.* [3] 43, 283). The compound $(CCl_3)_2S$ boiled at 156°–160° and gave a V.D. 5·68 (calc. 9·41).—2. *Iodo-acetic ether* forms $S(CH_2.CO_2Et)_2$, tri-methyl-sulphine iodide, and $Me_2S(CH_2.CO_2Et)_2$ (Letts, *Tr. E.* 28, 618).—3. *Bromo-acetic ether* forms $Me_2SBr.CH_2.CO_2Et$ which crystallises in pearly scales and yields when treated with moist Ag_2O unstable $Me_2S(OH).CH_2.CO_2Et$ (Letts).

Combinations.—Me_2SBr_2. Crystals (Cahours, *A.* 135, 355). When dissolved in water it gives off HBr. When its alcoholic solution is treated with zinc and the product evaporated and mixed with $HgCl_2$, there is formed a pp. of $(SMe_2)_2HgCl_2ZnBr_2$ (Patein, *Bl.* [2] 50, 201).—Me_2SI_2. Crystals resembling iodine.—Me_2SHgCl_2.—$(Me_2S)_2PtCl_4$ (Loir, *A.* 107, 234). Yellow crystalline powder. Melts with decomposition at 218° (Blomstrand, *J. pr.* [2] 38, 365).—$(Me_2S)_2PtCl_2$. [159°]. Formed by the action of Me_2S on potassium platinum chloride at 60° (Blomstrand, *J. pr.* [2] 38, 358). Exists in two allotropic forms, crystallising in lemon-yellow monoclinic crystals, and in yellow dimetric plates (containing $CHCl_3$).—$(Me_2S)(Et_2S)PtCl_2$. Formed from $(Et_2S)_2PtCl_2$ and Me_2S.—$(Me_2S)_2PtCl_2Br_2$.—$(Me_2S)_2PtBr_4$: reddish-brown monoclinic crystals (from chloroform).—$(Me_2S)_2PtBr_2$. Formed from $(Me_2S)_2PtSO_4$ and KBr (B.). Yellow monoclinic crystals.—$(Me_2S)_2PtI_2Cl_2$: greenish-black crystalline powder. — $(Me_2S)_2PtI_2Br_2$. — $(Me_2S)_2PtI_4$: black crystalline powder.—$(Me_2S)_2PtI_2$. [172°]. Formed from $(Me_2S)_2Pt(NO_3)_2$ and KI (B.). Red crystals.—$(Me_2S)_2Pt(NO_3)_2$. [156°]. Formed from $(Me_2S)_2PtCl_2$ and $AgNO_3$ (B.). Small brownish needles.—$(Me_2S)_2Pt(NO_2)_2$. Formed from $(Me_2S)_2PtSO_4$ and potassium nitrite (B.). Small white plates, soluble in chloroform.—$(Me_2S)_2PtSO_4 2aq$. [91°]. Formed from silver sulphate and $(Me_2S)_2PtCl_2$. Yellowish crystalline mass, v. sol. water.—$(Me_2S)_2PtCrO_4$: reddish-brown pp. got by adding K_2CrO_4 to a solution of $(Me_2S)_2PtSO_4$. Sl. sol. water, insol. alcohol and chloroform.

Methylo-iodide SMe_3I. *Tri-methyl-sulphine iodide.* Formed, even in the cold, by the union of Me_2S with MeI (Cahours, *C. R.* 80, 1317; 81, 1163; *A. Ch.* [5] 10, 13; *A.* 135, 355; 136, 151). Formed also by heating MeI at 100° with ppd. As_2S_3 or with Na_2S (Klinger, *B.* 15, 881; *A.* 252, 357) and by heating SEt_3I with MeOH at 140° (Klinger a. Maassen, *A.* 252, 252). Large prisms (from water), v. sol. hot water, sl. sol. alcohol, insol. ether. Its aqueous solution is partially decomposed on evaporating at 100°, forming Me_2S and iodine. Moist Ag_2O yields $SMe_3.OH$, a strongly alkaline base whence the other salts may be prepared by neutralisation with acids. An aqueous solution of SMe_3I gives with alcoholic $HgCl_2$ a pp. of Me_3SIHgI_2 which forms pale-yellow needles, nearly insol. water and ether, sol. alcohol (Patein, *Bl.* [3] 2, 159). Bromine forms Me_3SIBr_2, which separates from hot alcohol in orange-red crystals [95°] which in alcoholic solution give with platinic chloride a pp. of $(Me_3SCl)_2PtCl_4$ (Dobbin a. Masson, *C. J.* 47, 56). Tri-methyl-sulphine di-bromo-iodide is converted by dry NH_3 into $Me_3SIBr_2N_2H_8$, an amorphous light-green mass [75°–80°]. Chlorine forms Me_3SICl_2, which separates from alcohol in yellow crystals [104°], converted by aqueous ammonia into iodide of nitrogen and by gaseous ammonia into $Me_3SICl_2 2NH_3$ an unstable compound which loses ammonia and absorbs water when exposed to air (D. a. M.). The compound $(Me_3SI)_3As_2I_8$ is formed by heating As_2S_3 with MeI at 100° and crystallises in blue-black needles (Klinger a. Maassen, *A.* 252, 260). The compound Me_3SISnI_2 crystallises in yellow needles, sl. sol. cold water. The compound $(Me_3SI)_2CdI_2$, formed by heating CdS with MeI at 100°, crystallises from water or alcohol in white needles, melting at 185° when slowly heated and 195° when quickly heated, and converted by aqueous CdI_2 into Me_3SICdI_2 [168°].

Methylo-chloride Me_3SCl. From the base and HCl. Deliquescent prisms. Gives the salts $(Me_3SCl)_2PtCl_4$ crystallising from hot water in sparingly soluble orange-yellow prisms and Me_3SAuCl_4 crystallising in thick prisms, v. e. sol. water. Me_3SCl shaken with an ethereal solution of iodine yields reddish-black crystals of Me_3SI_2Cl, which is probably also formed from Me_3SI and ICl (Dobbin a. Masson). Me_3SCl is converted by ICl into Me_3SICl_2. Dry chlorine forms Me_3SCl_3, a yellow liquid, solidifying on exposure to air. Decomposed by water, alcohol, and ether, into Me_3SCl and chlorine.

Methylo-bromide Me_3SBr. Formed from $Me_3S.OH$ and HBr. Also formed from Me_2S and MeBr. Prisms, v. sol. water. Converted by iodine in ethereal solution into Me_3SBrI_2. With ICl it forms $Me_3SClBrI$ as yellow crystals [87°], completely decomposed at 190°.

Methylo-sulphydrate $Me_3S.SH$ aq. From $Me_3S.OH$ and H_2S (Brown a. Blaikie, *J. pr.* [2] 23, 395).

Methylo-sulphide $(Me_3S)_2S$. *Tri-methyl-sulphine sulphide.* An aqueous solution of this body may be got by saturating one half of a conc. solution of $Me_3S.OH$ with H_2S, and adding the other half. This solution, if allowed to evaporate in dry air or in coal-gas, when it reaches a certain strength forms Me_2S, thus: $(Me_3S)_2S = 3Me_2S$ (Crum Brown a. Blaikie, *Pr. E.* 9, 563; *C. N.* 37, 130). On gently heating a solution of $(Me_3S)_2S$ in a sealed tube, Me_2S

separates as an upper layer. The aqueous solution has the characters of an alkaline sulphide, dissolving sulphur (forming $(Me_3S)_2S_5$) and Sb_2S_3. Acids decompose it with evolution of H_2S.

Methylo-thiosulphate $(Me_3S)_2S_2O_3$ aq. Formed by exposing an aqueous solution of $(Me_3S)_2S$ to atmospheric oxidation. Formed also by exposing $(Me_3S)_2S_5$ to air. Hygroscopic four-sided prisms, sl. sol. alcohol. Decolourises a solution of iodine. At 135° it is decomposed into Me_2S and $Me_3S.O.SO_2.SMe$, a white crystalline mass [100°] which does not act upon iodine but slowly oxidises to sulphate (Crum Brown a. Blaikie, *J. pr.* [2] 23, 395).

Methylo-sulphite $(Me_3S)_2SO_3$ *x*aq. Formed from the hydroxide by saturating one half of its solution with SO_2, and adding the other half (Crum Brown a. Blaikie, *Pr. E.* 9, 712). Crystals. Gives off water of crystallisation at 140°. At 170° it gives off Me_2S, leaving a liquid residue, which solidifies on cooling, and is apparently $(Me_3S)SO_3Me$.

Methylo-dithionate $(Me_3S)_2S_2O_6$ aq. Formed from $Me_3S.OH$ and dithionic acid. Deliquescent cubes, insol. alcohol. Decomposes at 220° into SO_2 and $(Me_3S)_2SO_4$, and the latter then further decomposes into Me_2S and $Me_3S.SO_4Me$.

Methylo-metaphosphate $Me_3S.PO_3$. From $AgPO_3$ and Me_3SI. Hygroscopic glassy mass, giving off Me_2S on heating.

Methylo-ferrocyanide $(Me_3S)_4FeCy_6$ 9aq. From Me_3SI and silver ferrocyanide. Transparent green plates, which lose their water in a desiccator, and then give off Me_2S at 220°.

Methylo-ferricyanide $(Me_3S)_3FeCy_6$ 7½aq. From Me_3SI and silver ferricyanide (Crum Brown a. Blaikie, *Pr. E.* 10, 253). Pale-orange efflorescent plates.

The *methylo-chromate* and *methylo-iodate* explode at 140°.

Methylo-carbonate $(Me_3S)_2CO_3$. Formed from Me_3SI and Ag_2CO_3, the liquid being evaporated to a syrup and left to crystallise over H_2SO_4. Deliquescent prisms, with strong alkaline reaction. At 100° it is split up into CO_2, water, Me_2S, and methyl alcohol.

Methylo-oxalate $(Me_3S)_2C_2O_4$ aq. Formed from $Ag_2C_2O_4$ and Me_3SI. Deliquescent crystals. Split up at 140° into Me_2S and methyl oxalate.

Methylo-acetate ×$Me_3S.OAc$. Formed from Me_3SI and AgOAc (Crum Brown a. Blaikie, *Pr. E.* 10, 53; *C. N.* 39, 51). Split up at 100° into Me_2S and MeOAc.

Methylo-benzoate ×$Me_3S.OBz$. From the iodide and AgOBz. Thin plates (from alcohol). Decomposed by heat into Me_2S and MeOBz.

Ethylo-iodide SMe_2EtI. *Di-methyl-ethyl-sulphine iodide.* [110°]. Formed either from Me_2S and EtI or MeEtS and MeI (Klinger a. Maassen, *A.* 243, 212; 252, 246; *cf.* Krüger, *J. pr.* [2] 14, 193). Hygroscopic crystalline mass, v. e. sol. alcohol, insol. ether. Yields on distillation Et_3SI and Me_3SI. In alcoholic solution it reacts with AgCy at 90°, forming $SMe_2EtCyAgCy$, a deliquescent crystalline body, v. sol. alcohol, insol. ether, and decomposed by heat into AgCy and SMe_2EtCy (Patein, *C. R.* 106, 861). Forms the following compounds:—$(Me_2SEtI)_2CdI_2$ [180°], crystallising in small needles, sl. sol. water.—$Me_2SEtICdI_2$ [99°], crystallising from hot conc. CdI_2Aq in long needles.—$Me_2SEtIHgI_2$. [66°] (Patein, *Bl.* [3] 2, 159).

Ethylo-chloride Me_2SEtCl. The following compounds of this body have been prepared (Klinger a. Maassen, *A.* 243, 212):—$Me_2SEtCl(HgCl_2)_2$: [119°]; long needles, insol. hot water.—$Me_2SEtCl(HgCl_2)_6$: [200°]; white crystalline powder, slightly soluble in water.—$(Me_2SEtCl)_2PtCl_4$: [c. 213°]; small orange crystals, sl. sol. water, insol. alcohol and ether.—$Me_2SEtClAuCl_3$: [244°]; long yellow needles, m. sol. hot water.

Di-methyl disulphide $C_2H_6S_2$ *i.e.* Me_2S_2. (117°) (C.); (112° at 744 mm.) (Pierre, *A.* 80, 128). S.G. $\frac{18}{}$ 1·046 (C.). V.D. 3·30. S.V. 100·6 (Lossen, *A.* 254, 71). Formed by passing MeCl through an alcoholic solution of K_2S_2, or by distilling $Ca(SO_4Me)_2$ with K_2S_2 (Cahours, *A. Ch.* [3] 18, 157; *A.* 61, 92). Liquid, with intolerable odour of onions, v. sl. sol. water, miscible with alcohol and ether. Burns with blue flame. Chlorine converts it first into crystalline $Me_2S_2Cl_2$, and finally into a liquid mixture of $(CCl_3)_2S$ and SCl_2 (Riche, *A.* 92, 356). Dilute nitric acid converts it into methyl methane thiosulphonate $MeSO_2.SMe$.

Derivative. — *v.* PER-CHLORO-METHYL DI-SULPHIDE.

Di-methyl trisulphide Me_2S_3. (170°) at 760 mm. S.G. $\frac{0}{0}$ 1·2162; $\frac{10}{0}$ 1·2059; $\frac{17}{0}$ 1·199. Formed together with Me_2S_4 and S from methyl mercaptan and S_2Cl_2 (Klason, *B.* 20, 3414). Formed also from MeCl and K_2S_3 (Cahours). Pale-yellow liquid, with very disagreeable odour.

Derivative.—*v.* HEXA-BROMO-DI-METHYL TRI-SULPHIDE.

METHYL SULPHITE $C_2H_6SO_3$ *i.e.* $SO(OMe)_2$. (121·5°). S.G. $\frac{16\cdot2}{4}$ 1·0456. V.D. 3·68 (calc. 3·80). Formed by the action of methyl alcohol on S_2Cl_2 or on $SOCl_2$ (Carius, *A.* 110, 209; 111, 93). Colourless liquid, with pleasant odour, miscible with alcohol and ether. It dissolves slowly in water with evolution of SO_2 and formation of MeOH.

METHYL SULPHOCYANIDE C_2H_3NS *i.e.* MeSCy. (133°). S.G. $\frac{16}{}$ 1·115 (C.); $\frac{4}{4}$ 1·069 (Nasini a. Scala, *G.* 17, 66). R_∞ 33·8. S.V. 78·1 (Lossen, *A.* 254, 73). H.F.p. −31,410. H.F.v. −31,990 (Thomsen, *Th.*). Obtained by distilling potassium sulphocyanide with calcium methyl sulphate (Cahours, *A. Ch.* [3] 18, 261; *A.* 61, 95). Liquid with alliaceous odour, v. sl. sol. water, miscible with alcohol and ether. Boiling nitric acid oxidises it to methane sulphonic acid. Chlorine acts upon it according to the equation:—$3MeSCN + 11Cl_2 = Cl_3Cy_3 + 2CSCl_4 + CSCl_2 + 9HCl$ (James, *J. pr.* [2] 35, 462). Cold aqueous KOH does not attack it, but alcoholic potash forms Me_2S_2, ammonia, KCy, and K_2CO_3. Alcoholic KSH forms KSCy and Me_2S. When heated at 180° it partially changes to methyl thiocarbimide.

Methyl polysulphocyanide $(CH_3CNS)_2$ (?) [188°]. Prepared by heating methyl sulphocyanide to 180° with a trace of HCl (Hofmann, *B.* 13, 1349). Sublimable. Colourless crystals. Sol. acetic acid, insol. acids and alkalis. By heating with alcoholic NH_3 to 150° it gives a well-crystallising base.

METHYL-SULPHONAMIDES *v.* METHYL SULPHAMIDES.

DI-METHYL-SULPHONE $C_2H_6SO_2$ *i.e.* Me_2SO_2. Mol. w. 94. [109°]. (238°). R_∞ 32·09 in a 2·46 aqueous solution (Kanonnikoff, *J. R.* 15, 451). Formed by oxidising Me_2S with fuming HNO_3 (Saytzeff, *A.* 144, 148) or with aqueous $KMnO_4$ (1:30) (Beckmann, *J. pr.* [2] 17, 454). Thick needles (from alcohol). Not affected by reducing agents.

DI-METHYL-SULPHONE DI-CARBOXYLIC ACID $O_2S(CH_2.CO_2H)_2$. *Sulphono-di-acetic acid.* [182°]. Formed by oxidation of thio-di-glycollic (sulphido-diacetic) acid in alkaline solution with $KMnO_4$ (Lovén, *B.* 17, 2817). Long trimetric tables. V. sol. water, alcohol, and ether. At 200° it splits up into di-methyl-sulphone and CO_2.

Salts.—$A''Ba\,5aq$: fine felted sparingly soluble needles.—$A''Ba\,aq$: small prisms.

Ethyl ether $A''Et_2$: thick oil.

Amide $O_2S(CH_2.CONH_2)_2$: glistening plates, v. sol. hot water, slightly in cold.

METHYL-SULPHONIC ACID *v.* METHANE SULPHONIC ACID.

METHYL SULPHOXIDE $(CH_3)_2SO$. The nitrate $(CH_3)_2SOHNO_3$ is formed by oxidising methyl sulphide with conc. HNO_3Aq and crystallises in deliquescent needles, whence $BaCO_3$ sets free the oxide (Saytzeff, *A.* 144, 148). Oil, v. sol. water. Solidifies when strongly cooled. Reduced by zinc and H_2SO_4 to methyl sulphide Me_2S.

METHYL-SULPHURIC ACID *v.* METHYL SULPHATES.

METHYL SULPHYDRATE *v.* METHYL MERCAPTAN.

METHYL-TARCONIC ACID *v.* NARCOTINE.

DI-METHYL-TARTARIC ACID $C_6H_{10}O_6$ *i.e.* $CO_2H.CMe(OH).CMe(OH).CO_2H$. *Di-oxy-di-methyl-succinic acid.* Formed, together with lactic acid, by the action of zinc and a little HClAq on pyruvic acid in alcoholic solution (Böttinger, *A.* 188, 315; *B.* 9, 1064, 1621). Syrup.—KHA'': small six-sided plates, v. sl. sol. water.—K_2A'': needles, m. sol. water.—$BaA''\,3\frac{1}{2}aq$: prismatic needles, sl. sol. water.—$^{\times}CaA''$: crystalline pp., nearly insol. water.

METHYL-TAURINE *v.* METHYL-AMIDO-ETHANE SULPHONIC ACID.

METHYL-TAURO-CYAMINE *v.* METHYL-GUANIDO-ETHANE SULPHONIC ACID.

METHYL-TEREPHTHALIC ACID *v.* TOLUENE DICARBOXYLIC ACID.

Di-methyl-terephthalic acid *v.* XYLENE DICARBOXYLIC ACID.

METHYL-TELLURIDE *v.* TELLURIUM, ORGANIC COMPOUNDS.

METHYL TETRADECYL KETONE $C_{16}H_{32}O$ *i.e.* $CH_3.CO.C_{14}H_{29}$. [43°]. (231°). Formed by distilling a mixture of barium pentadecoate and barium acetate (Krafft, *B.* 15, 1707). Yields myristic and acetic acids on oxidation.

DI-METHYL-THETINE $C_4H_8SO_2$ *i.e.*

$CH_2{<}{\substack{SMe_2\\CO}}{>}O$. *Anhydride* of the *methylo-hydroxide* of the *methyl derivative* of *thioglycollic acid.* Obtained by decomposing its hydrobromide with moist Ag_2O, or its sulphate with baryta (Crum Brown a. Letts, *Tr. E.* 28, 571; *B.* 6, 1384; 7, 695). Crystals (containing aq). Hygroscopic, but gives up the water over H_2SO_4. V. sol. water, m. sol. alcohol. Neutral in reaction. Decomposes when heated into CO_2 and $(Me_3S)_2CO_3$, the methylo-carbonate of di-methyl sulphide. Yields di-methyl-sulphone when oxidised by $KMnO_4$. The following compounds may be styled its salts:—$Me_2SBr.CH_2.CO_2H$. Formed from bromo-acetic acid and Me_2S. Large deliquescent rectangular plates (from alcohol). Acid to litmus. With lead oxide it forms $C_4H_8SO_22PbBr_2$. Decomposed by heat or by boiling alcohol into SMe_3Br, methyl bromide, and $S(CH_2.CO_2H)_2$ (Letts, *Tr. E.* 28, 591). Yields methane sulphonic acid on oxidation (Letts, *Tr. E.* 28, 601).—$(C_4H_9SO_2Br)_2PtBr_4$ (?): dark-red crystals.—$Me_2SCl.CH_2.CO_2H$. Formed from the sulphate and $BaCl_2$. Deliquescent crystals, v. sol. water, v. sl. sol. alcohol.—$(C_4H_8SO_2)_2HI$(?).—$Me_2SI_3.CH_2.CO_2H$. Formed by leaving di-methyl-thetine in contact with dilute HIAq. Crystals, insol. water, sol. alcohol and ether.—$SO_4(SMe_2.CH_2.CO_2H)$. *Di-methyl-thetine sulphate.* Formed from $Me_2SBr.CH_2.CO_2H$ and silver sulphate. Crystalline mass, sol. water, v. sl. sol. alcohol. Acid to litmus. When heated over 140° it fuses and splits up into CO_2 and $(Me_3S)_2SO_4$, the methylo-sulphate of di-methyl sulphide. — $Me_2S(NO_3).CH_2.CO_2H$. From $Me_2SBr.CH_2.CO_2H$ and $AgNO_3$. Colourless crystals with acid reaction. Yields di-methyl-sulphone when oxidised by conc. HNO_3.

METHYL-THIALDINE $C_7H_{15}NS_2$. [79°]. Obtained on treating crude thio-acetic aldehyde with an aqueous solution of methylamine (W. Markwald, *B.* 19, 2378). Long needles (from alcohol); insol. water, sl. sol. cold alcohol, v. e. sol. hot alcohol and ether. Its solutions possess a feeble alkaline reaction. Volatilises in steam with partial decomposition. With acids it forms very soluble salts.

μ-METHYL-THIAZOLE C_4H_5NS *i.e.*

${\substack{S.CMe\\CH:CH}}{>}N$. (128° cor.). Formed by boiling thioacetamide $CH_3.CS.NH_2$ with chloro-acetal (Hantzsch, *A.* 250, 270), or with di-chloro-di-ethyl oxide (Hantzsch, *B.* 21, 943). Mobile liquid, miscible with water. Its hydrochloride and hydrobromide form hygroscopic needles. With mercuric chloride it forms compounds melting at 112° and 154°. $B'_2H_2PtCl_6$. [199°]. Hexagonal plates or flat needles (from water).—Picrate. [146°]. Yellow needles; sl. sol. water, v. sol. alcohol and benzene.

(*a*)-Methyl-thiazole

${\substack{S{-}{-}CH\\CH:CMe}}{>}N$. (132°).

Obtained by distilling oxy-methyl-thiazole (from chloro-acetone and metallic sulphocyanides) with zinc-dust (Hantzsch a. Arapides, *B.* 21, 942); *A.* 249, 24). Formed also by boiling with alcohol the diazo-compound derived from amido-methyl-thiazole (from chloro-acetone and thio-urea) (Popp, *A.* 250, 277). Colourless liquid, sinking under water, but slowly dissolving; v. sol. alcohol and ether. The hydrochloride is deliquescent. It forms two compounds with $HgCl_2$, melting at 119° and 148°. The aurochloride melts at 185°, and the picrate at 174°.—$B'_2H_2PtCl_6$. [204°]. Orange prisms; m. sol. water, sl. sol. alcohol.

αμ - Di - methyl - thiazole C_5H_7NS *i.e.* $\left.\begin{matrix}\mathrm{S.CMe}\\ \mathrm{CH{:}CMe}\end{matrix}\right>\mathrm{N}$. (145° cor.). S.G. $\frac{15}{}$ 1·0601. Formed from thioacetamide and chloro - acetone (Hantzsch, *B.* 21, 943; *A.* 250, 265). Colourless liquid; more sol. cold than hot water. Reduced in alcoholic solution by sodium to ethylamine and propyl mercaptan (Schatzmann, *A.* 261, 1).—$B'_2H_2PtCl_6$. [215°]. Prisms; m. sol. water.—$B'HCl(HgCl_2)_4 4aq$. [110°]. White needles; v. e. sol. water.—$B'(HgCl_2)_2$. [177°]. Sl. sol. cold water, v. e. sol. dilute HClAq.—*Picrate.* [138°].

Methylo-iodide B'MeI. Pointed crystals; v. sol. water.

βμ-Di-methyl-thiazole $\left.\begin{matrix}\mathrm{S.CMe}\\ \mathrm{CMe{:}CH}\end{matrix}\right>\mathrm{N}$. (150° cor.). Formed by condensing thioacetamide with (α)-chloro-propionic aldehyde (Hubacher, *A.* 259, 240). Oil, v. sl. sol. water, v. sol. alcohol and ether. Volatile with steam.—$B'_2H_2PtCl_6$. [202°].—*Picrate.* [167°].

Tri-methyl thiazole C_6H_9NS *i.e.* $\left.\begin{matrix}\mathrm{S - CMe}\\ \mathrm{CMe{:}CMe}\end{matrix}\right>\mathrm{N}$. (167°). S.G. $\frac{16}{}$ 1·013. Formed by heating thioacetamide with chloro-methyl ethyl ketone at 100° (Poubleff, *A.* 259, 258). Liquid, m. sol. cold, insol. hot, water.—*B'HCl. [174°].—$B'_2H_2PtCl_6$. [233°].—*Aurochloride* [156°].—*Picrate* [133°]. *Mercuric double chloride* [119°].

References.—METHYL-AMIDO-METHYL-THIAZOLE, METHYL-IMIDO-DI-METHYL-THIAZOLE, OXY-METHYL-THIAZOLE, and TOLYL-AMIDO-METHYL-THIAZOLE.

METHYL-THIAZOLE CARBOXYLIC ACID $C_5H_5NSO_2$ *i.e.* $\left.\begin{matrix}\mathrm{S.CMe}\\ \mathrm{CO_2H.C{:}CH}\end{matrix}\right>\mathrm{N}$. [145°]. Formed by heating the dicarboxylic acid [169°] at 171° (Roubleff, *A.* 259, 271). Small needles or prisms, v. sol. cold, v. e. sol. hot, water, m. sol. alcohol, sl. sol. ether, almost insol. benzene.

Methyl-thiazole carboxylic acid $\left.\begin{matrix}\mathrm{S.CH}\\ \mathrm{CO_2H.C{:}CMe}\end{matrix}\right>\mathrm{N}$. [257°]. Formed by saponifying its ether with alcoholic potash (Wohmann, *A.* 259, 299). Pearly plates (from water) or needles (from alcohol), sl. sol. ether and hot water, almost insol. benzene.

Ethyl ether EtA'. [28°]. (233° i. V.) at 726 mm. Obtained from amido-methyl-thiazole carboxylic ether by diazotisation, conversion into chloro-methyl-thiazole carboxylic ether [51°] and reduction of this by zinc-dust and HOAc. Flat prisms, volatile with steam.

Methyl-thiazole dicarboxylic acid $\left.\begin{matrix}\mathrm{S.C(CH_3)}\\ \mathrm{CO_2H.C{:}C(CO_2H)}\end{matrix}\right>\mathrm{N}$. [169°]. Formed by condensing thioacetamide with chloro-oxalacetic ether and saponifying with alcoholic soda (Roubleff, *A.* 259, 268). Long white needles, v. sol. cold water, sl. sol. ether and benzene.—BaA″2aq: needles.—HgA″ 3½aq: crystalline pp.

Di-methyl-thiazole carboxylic acid $\left.\begin{matrix}\mathrm{S.CMe}\\ \mathrm{CO_2H.C{:}CMe}\end{matrix}\right>\mathrm{N}$. [227°]. Formed by saponifying its ether (R.). Silky needles or small prisms, sl. sol. hot water, m. sol. alcohol and ether. May be sublimed. Yields on distillation with lime di-methyl-thiazole.—AgA': white needles, sol. hot water.—HA'HCl: plates.

Ethyl ether EtA'. [51°]. (242° cor.). Formed from thioacetamide and chloro-aceto-acetic ether (Hantzsch, *A.* 250, 269). Needles (from ether); insol. water, v. sol. alcohol and ether.

METHYL-THIAZYL-PROPIONIC ETHER $\begin{matrix}\mathrm{S.CMe{:}N}\\ \diagup\\ \mathrm{CH{:}C.CHMe.CO_2Et}\end{matrix}$. Formed by condensing bromo-methyl-acetoacetic ether with thioacetamide in the cold (Roubleff, *A.* 259, 262). Thick oil. When saponified and heated with lime it yields methyl-ethyl-thiazole.

(αα')-METHYL-THIENYL-GLYOXYLIC ACID $C_7H_6SO_3$ *i.e.* $\mathrm{S}\left<\begin{matrix}\mathrm{C(CO.CO_2H){:}CH}\\ \mathrm{C(CH_3){=\!=}CH}\end{matrix}\right.$. [80°]. Formed by oxidising (αα')-methyl-thienyl methyl ketone with alkaline $KMnO_4$ (Ruffi, *B.* 20, 1747).—$CaA'_2 2aq$: needles.—$Ba'A_2\frac{1}{4}aq$: needles.—AgA'.

(αβ) - Methyl - thienyl - glyoxylic acid $SC_4H_2Me.COCO_2H$. [142°]. Formed by oxidising (α)-methyl-(β)-thienyl methyl ketone with an aqueous solution of $KMnO_4$ and KOH (Ruffi, *B.* 20, 1748). Needles (from water), subliming even in the cold.

Phenyl-hydrazide $SC_4H_2Me.C(N_2HPh).CO_2H$. [141°]. Crystalline.

Oxim $SC_4H_2Me.C(NOH).CO_2H$. [104°].

(αα') - Di-methyl - (β) - thienyl - glyoxylic acid $\mathrm{S}\left<\begin{matrix}\mathrm{CMe{:}CH}\\ \mathrm{CMe{:}C.CO.CO_2H}\end{matrix}\right.$. Formed by oxidation of (αα')-di-methyl-(β)-thienyl methyl ketone with alkaline $KMnO_4$ (Ruffi). Oil, slowly solidifying. Yields leuco-thiophene green when heated with di-methyl-aniline and $ZnCl_2$.—AgA'.

METHYL-THIENYL KETONE *v.* THIENYL METHYL KETONE.

(α)-METHYL-THIENYL METHYL KETONE C_7H_8SO *i.e.* $\mathrm{S}\left<\begin{matrix}\mathrm{C(CO.CH_3){:}CH}\\ \mathrm{C(CH_3){=\!=}CH}\end{matrix}\right.$. *Acetomethylthienone.* [25°]. (233° cor.). Formed by the action of AcCl on (α)-methyl-thiophene in presence of $AlCl_3$ (Demuth, *B.* 18, 3025; 19, 1859; Ernst, *B.* 19, 3275). Large tables. On oxidation with $KMnO_4$ it yields thiophene dicarboxylic acid. Fuming HNO_3 forms a nitro- derivative [121°].

Oxim $C_7H_8S(NOH)$. [125°]. Needles (from dilute alcohol).

Phenyl-hydrazide $C_7H_8S(N_2HPh)$. [128°]. Needles (from alcohol).

(β) - Methyl - thienyl methyl ketone $C_4H_2SMe.CO.CH_3$. (216° cor.). Formed from (β)-methyl-thiophene and AcCl in presence of $AlCl_3$ (Demuth, *B.* 18, 3025).

(αβ') - Di-methyl - thienyl methyl ketone $C_8H_{10}SO$ *i.e.* $\mathrm{S}\left<\begin{matrix}\mathrm{CMe{:}CH}\\ \mathrm{CAc{:}CMe}\end{matrix}\right.$ or $\mathrm{S}\left<\begin{matrix}\mathrm{CMe{:}CAc}\\ \mathrm{CH\ {:}CMe}\end{matrix}\right.$. (227°). Formed by the action of AcCl on (αβ')-di-methyl-thiophene dissolved in ligroïn in presence of $AlCl_3$ (Zelinsky, *B.* 20, 2019). Liquid. Coloured red by isatin and H_2SO_4.

Oxim $C_8H_{10}S(NOH)$. [70°]. Needles.

Phenyl-hydrazide $C_8H_{10}S(N_2HPh)$. [70°].

Di-methyl-thienyl methyl ketone $SC_4HMe_2.CO.CH_3$. (224°). S.G. $\frac{17}{}$ 1·091. Formed from the di-methyl-thiophene of coal-tar by treatment with AcCl and $AlCl_3$ (Messinger, *B.* 18, 2301). Liquid. Gives a red colour with isatin and H_2SO_4. Oxidised by alkaline $KMnO_4$ to thiophene tricarboxylic acid.

Oxim $C_8H_{10}S(NOH)$. [65°]. Needles.

TETRA-METHYL-THIO-ANILINE *v.* TETRA-METHYL-DI-AMIDO-DI-PHENYL SULPHIDE.

METHYL-THIOCARBAMINE CYAMIDE *v.* CARBIMIDO-METHYL-THIO-UREA.

METHYL-THIOCARBAMINE-ETHYL-CYAMIDE *v.* ETHYL-CARBIMIDO-METHYL-THIO-UREA.

DI-METHYL-THIOCARBAZIC ACID $C_3H_8NS_2$ *i.e.* $NMe_2.NH.CS.SH$. [112°]. Formed from di-methyl-hydrazine and CS_2 (Renouf, *B.* 13, 2172). Colourless plates.

METHYL-THIOCARBIMIDE $CH_3.N.CS$. Mol. w. 73. [34°]. (119°). V.D. 2·42 (calc. 2·53). S.G. $\frac{4}{4}$ 1·069. R_∞ 35·75 (Nasini a. Scala, *G.* 17, 66). H.F.p. −24,520. H.F.v. −25,100. H.C. (gas) 392,000 (Thomsen, *Th.* 4, 197). Formed by the action of $AgNO_3$ or $HgCl_2$ on the product of the union of CS_2 on methylamine (Hofmann, *B.* 1, 172). Formed also by heating pure methyl sulphocyanide for some time at 180°–185° (Hofmann, *B.* 18, 2196). Pungent crystals. Reacts with sodium cyanamide and alkyl iodides, forming methyl-alkyl-cyano-thio-ureas. Thus CN_2HNa and MeI give $CH_3NH.CS.NCy.CH_3$ [c. 195°], while allyl iodide yields the compound $NHMe.CS.NCyC_3H_5$ [78°], propyl iodide forms $NHMe.CS.NCy.C_3H_7$ [91°], and benzyl chloride forms $NHMe.CS.NCy.CH_2Ph$ [173°] (Hecht, *B.* 23, 1658).

METHYL THIOCARBONATES.

Methyl dithiocarbonic acid $C_2H_4S_2O$ *i.e.* $CH_3O.CS.SH$. *Methyl-xanthic acid. Methyl-xanthogenic acid. Xantho-methylic acid.* The potassium salt of this acid is formed by adding CS_2 to a solution of KOH in methyl alcohol (Dumas a. Péligot, *A. Ch.* [2] 24, 55; Desains, *A. Ch.* [3] 20, 504). It crystallises in silky fibres, S.G. $\frac{15\cdot2}{}$ 1·6878 (Clarke, *B.* 11, 1505). Iodine converts it into $(CH_3O.CS)_2S_2$. With EtI it yields MeO.CS.SEt (184°).—PbA'_2.

Methyl dithiocarbonate $CH_3O.CS.SCH_3$. (168°) (S.); (171°) (C.). S.G. $\frac{18}{}$ 1·176 (S.); $\frac{15}{}$ 1·143 (C.). Formed from $CH_3.CS.SK$ and MeI (Salomon, *J. pr.* [2] 8, 117). Formed also together with CO and S by heating the compound $(CH_3O.CS)_2S_2$ (*v. supra*) (Cahours, *A. Ch.* [3] 19, 158).

Methyl trithiocarbonate Me_2CS_3. (200°–205°). S.G. $\frac{18}{}$ 1·159. Formed by distilling a mixture of concentrated solutions of K_2CS_3 and $Ca(SO_4Me)_2$ (Cahours, *A. Ch.* [3] 19, 163). Yellow liquid with pungent odour, nearly insol. water, miscible with alcohol and ether. Combines with bromine forming red crystals of $Me_2CS_3Br_2$ (Berend, *A.* 128, 333).

METHYL-THIO-COUMARILIC ACID $C_8H_4(CH_3)O.CO.SH$.

Ethyl ether $C_8H_4(CH_3)O.CO.SEt$: [92°]; glistening yellow needles; v. sol. ether, sl. sol. alcohol. Formed by heating methyl-coumarilic-ethyl-ether with P_2S_5. By treatment with alcoholic KOH it is reconverted into methyl-coumarilic acid (Hantzsch, *B.* 19, 2400).

METHYL-THIOFORMALDINE $C_4H_9S_2N$ *i.e.* $(CH_2)_3S_2NMe$. [65°]. (c. 185°). Formed from an aqueous solution of formic aldehyde by successive addition of H_2S and methylamine (Wohl, *B.* 19, 2346). Needles (from ether) with unpleasant smell, insol. water, sol. acids and alcohol, v. sol. ether. Volatile with steam. On boiling it is converted into a substance melting at 130°–140°. —B'HCl. [188°]. White needles, v. sol. water. Its solution is ppd. by $AgNO_3$, $HgCl_2$, and platinic chloride.

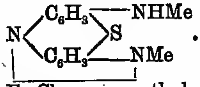
Methylo-iodide B'MeI. [161°–163°]. Slender needles, v. sol. water. Gives rise to B'MeCl and $(B'MeCl)_2PtCl_4$.

METHYL-THIOHYDANTOÏN $C_4H_6N_2SO$ *i.e.* $NH{:}C{<}\begin{smallmatrix}S.CH_2\\NMe.CO\end{smallmatrix}{>}$ (?). Formed by warming methyl-thio-urea with chloro-acetic acid and water (Andreasch, *M.* 6, 840). Thick prisms or needles (from water), sol. hot water and alcohol. Boiling KOHAq yields thioglycollic acid. Nitrous acid forms a nitrosamine $C_4H_5(NO)N_2SO$ which is an orange-red powder, sol. hot water.

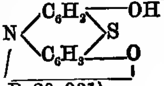
(α)-Di-methyl-thiohydantoïn $C_5H_8N_2SO$ *i.e.* $NMe{:}C{<}\begin{smallmatrix}S.CH_2\\NMe.CO\end{smallmatrix}{>}$. [71°]. Formed by heating di-methyl-thio-urea with chloro-acetic acid in aqueous solution (Andreasch, *M.* 8, 408). Long colourless prisms, v. sol. water, alcohol, and ether. Smells like nicotine. Hot aqueous alkalis convert it into thioglycollic acid. Nitrous acid forms an isonitroso- compound $C_5H_7N_3SO_2$ [220°].

(β)-Di-methyl-thiohydantoïn $NH{:}C{<}\begin{smallmatrix}S.CMe_2\\NH.CO\end{smallmatrix}{>}$. [114°]. Formed from di-argentic thiohydantoïn and MeI (Andreasch, *M.* 8, 416). Thin plates, v. sol. water, sl. sol. alcohol. Oxidised by $KClO_3$ and HCl to urea and other products.

DI-METHYL-THIONINE $C_{14}H_{13}NS$ *i.e.*

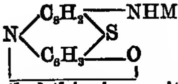


. Obtained by the action of Fe_2Cl_6 upon methyl-*p*-phenylene-diamine in the presence of H_2S and HCl. The free base is a crystalline powder, sl. sol. ether and alcohol, insol. water. The blue alcoholic solution has a strong red fluorescence. The hydrochloride is easily sol. water with a blue colour and reddish-brown fluorescence. The hydroiodide (B'HI) is a dark-blue powder, sol. hot water and alcohol, sl. sol. cold water; dyes silk blue. The free base by boiling with water is converted into methyl-thionoline with evolution of NH_2Me. By treating the product with 70 p.c. H_2SO_4 a second molecule of NH_2Me is split off and thionol

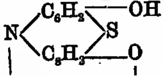


is formed (Bernthsen a. Goske, *B.* 20, 931).

METHYL-THIONOLINE



. Formed by boiling di-methyl-thionine with water, methyl-amine being evolved. By treatment with 70 p.c. H_2SO_4 a second molecule of methyl-amine is split off, and there is formed thionol



(Bernthsen a. Goske, *B.* 20, 932).

Di-methyl-thionoline *v.* METHYLENE-VIOLET.

METHYL-THIOPARABANIC ACID $C_4H_4N_2SO_2$ *i.e.* $CS{<}\begin{smallmatrix}NMe.CO\\NH.CO\end{smallmatrix}{>}$. *Oxalyl-methyl-thio-urea.* [105°]. Prepared by passing cyanogen into an alcoholic solution of methyl-thio-urea and boiling the ppd. $CSN_2H_6MeCy_2$ with conc.

HClAq (Andreasch, *B.* 14, 1447; *M.* 2, 277). Yellow plates, sol. water, alcohol, and ether. May be sublimed. Converted by warming with aqueous $AgNO_3$ into methyl-parabanic acid.

Di-methyl-thioparabanic acid $C_5H_6N_2SO_2$ *i.e.*

$OS<\begin{matrix}NMe.CO\\NMe.CO\end{matrix}>$. *Thiocholestrophane. Oxalyl-di-methyl-thio-urea.* [113°]. Prepared by passing cyanogen into an alcoholic solution of *s*-di-methyl-thio-urea and boiling the ppd. cyanide with HClAq (Andreasch). Yellow monoclinic tables, sl. sol. cold water, v. e. sol. alcohol and ether. Split up by boiling alkalis into di-methyl-thio-urea and oxalic acid. On heating with $BaCO_3$ and water it gives di-methyl-oxamide and CSO. Boiling aqueous $AgNO_3$ forms cholestrophane.

(α)-**METHYL-THIOPHENE** C_5H_6S *i.e.*

$S<\begin{matrix}CMe:CH\\CH:CH\end{matrix}$. *Thiotolene.* (111°). Occurs in coal-tar (V. Meyer, *B.* 18, 3009). Formed by the action of sodium on a mixture of (α)-iodo-thiophene and MeBr (V. Meyer a. Kreis, *B.* 17, 1562; Egli, *B.* 18, 544). Formed also by the action of P_2S_3 on acetyl-propionic (levulic) acid (Kues, *B.* 19, 556). Oil. Forms a tri-bromo- derivative [87°].

(β)-**Methyl-thiophene**

$S<\begin{matrix}CH:CMe\\CH:CH\end{matrix}$. *Thiotolene.* Occurs, together with the preceding isomeride, in crude toluene from which it may be separated by shaking with H_2SO_4, and passing steam through the boiling acid diluted with 20 p.c. water. The mixture of methyl-thiophenes so obtained boils at 113 cor. and has a S.G. $\frac{18}{18}=1·0194$ (Meyer a. Kreis, *B.* 17, 787; Schulze, *B.* 17, 2853). Formed by distilling sodium pyrotartrate with P_2S_3 (Volhard a. Erdmann, *B.* 18, 455). Oil. Oxidised by alkaline $KMnO_4$ to (β)-thiophenic acid. Gives a tri-bromo- derivative [34°], and a bromo-di-nitro- derivative [125°].

Di-methyl-thiophene C_6H_8S. *Thioxene.* Crude thioxene is obtained in considerable quantity by passing steam through sulphuric acid used in purifying xylene diluted with 20 p.c. of water and heated to boiling (Schulze, *B.* 17, 2853).

(αβ')-**Di-methyl-thiophene**

$S<\begin{matrix}CMe:CH\\CH:CMe\end{matrix}$. *m-Thioxene.* (138° cor.). S.G. $\frac{20}{}$ ·9956. V.D. 4·02 (calc. 3·9). Formed by distilling β-acetyl-isobutyric acid with P_2S_3 (Zelinsky, *B.* 20, 2018). Gives on oxidation methyl-thiophene carboxylic and thiophene dicarboxylic acids.

Di-methyl-thiophene $SC_4H_2Me_2$. (139° cor.). S.G. $\frac{21}{21}$ ·9777. Formed from iodo-(β)-methyl-thiophene, MeI and sodium (Demuth, *B.* 19, 1859). Liquid.

(αα')-**Di-methyl-thiophene**

$S<\begin{matrix}CMe:CH\\CMe:CH\end{matrix}$. *Thioxene.* (137° cor.). S.G. $\frac{18}{18}$ ·9755. Occurs in coal-tar. Prepared from crude thioxene by conversion into iodo-di-methyl-thiophene and reducing this body with zinc-dust and alcoholic NaOH (Messenger, *B.* 18, 565, 1606). Formed by heating acetonyl-acetone (di-methyl-ethylene-diketone) $CH_3.CO.CH_2.CH_2.CO.CH_3$ (3 pts.) with powdered P_2S_5 (2 pts.) for an hour at 140°–150°; the yield is 50-60 p.c. of the theoretical (Paal, *B.* 18, 2252). Formed also from (α)-iodo-(α')-methyl-thiophene by leaving it for some weeks in contact with sodium and MeI (Ruffi, *B.* 20, 1747). Colourless mobile liquid of slight odour. Dissolves sulphur considerably. Gives a red colour with isatin and H_2SO_4, a violet with phenanthraquinone and H_2SO_4, and a reddish-brown with phenyl-glyoxylic acid and H_2SO_4. By $KMnO_4$ it is oxidised to thiotolene-carboxylic acid [142°]. The di-bromo- derivative melts at [47°–50°], and the tri-bromo- derivative at [144°]. It also forms a bromo- derivative [194°], a second di-bromo-derivative [46°], a per-bromo- derivative C_6Br_8S [114°], and oily iodo- and nitro- derivatives (Messinger). With phenanthraquinone, HOAc, and H_2SO_4 (Laubenheimer's reagent) it gives a reddish-violet colouration.

(ββ')-**Di-methyl-thiophene**

$S<\begin{matrix}CH:CMe\\CH:CMe\end{matrix}$. (145°). S.G. $\frac{22}{22}$ 1·0078. Formed by distilling sodium *s*-di-methyl-succinate with P_2S_3 (Zelinsky, *B.* 21, 1836). Yellow oil. With a trace of isatin in conc. H_2SO_4 it gives an emerald-green colour. On oxidation it yields an acid crystallising in needles [139°], sl. sol. cold water.

(αβ)-**Di-methyl-thiophene**

$S<\begin{matrix}CMe:CMe\\CH:CH\end{matrix}$. *om-Thioxene.* (137° cor.). S.G. $\frac{21}{}$ ·9938. Formed by distilling β-acetyl-*n*-butyric acid with P_2S_3 (Paal a. Püschel, *B.* 20, 2559; Grünewald, *B.* 20, 2585). Colourless, strongly refracting oil. In the indophenine reaction it gives a bluish-violet colour. Laubenheimer's reagent yields a reddish-violet colour. $KMnO_4$ oxidises it to methyl-thiophene carboxylic acid and thiophene (ββ')-di-carboxylic acid.

Tri-methyl-thiophene $C_7H_{10}S$ *i.e.*

$S<\begin{matrix}CMe:CMe\\CH\ :CMe\end{matrix}$. (162°). Formed by distilling $CH_3.CO.CHMe.CHMe.CO_2H$ with P_2S_3 (Zelinsky, *B.* 20, 2025).

Tetra-methyl thiophene $C_8H_{12}S$ *i.e.*

$S<\begin{matrix}CMe:CMe\\CMe:CMe\end{matrix}$. (184° uncor.). S.G. $\frac{21}{21}$ ·9442. Formed from tri-methyl-thiophene by treatment of this substance (12 g.) dissolved in petroleum-ether with iodine (48·5 g.) and HgO (21 g.), distilling with steam, and allowing the iodo-tri-methyl-thiophene which comes over to stand with MeI and sodium (Zelinsky, *B.* 21, 1837). Oil. Does not give the indophenine reaction.

References. — Di-bromo-methyl-thiophene and Iodo-di-methyl-thiophene.

METHYL-THIOPHENE CARBOXYLIC ACID

$C_6H_6SO_2$ *i.e.*

$S<\begin{matrix}CMe:CH\\CH\ :C.CO_2H\end{matrix}$ or

$S<\begin{matrix}C(CO_2H):CH\\CH=\!=\!=CMe\end{matrix}$. *Thiotolene carboxylic acid.* [119°]. Formed by oxidising the corresponding di-methyl-thiophene with alkaline $KMnO_4$ in the cold (Zelinsky, *B.* 20, 2020). Needles, sl. sol. cold water, v. sol. ether. May be sublimed.—$CaA'_2\,2\frac{1}{2}aq$: plates.—AgA'.

(β)-**Methyl-thiophene** (α)-**carboxylic acid**

$S<\begin{matrix}C(CO_2H):CMe\\CH=\!=\!=CH\end{matrix}$. *c-Thiotolenic acid.* [144°]. Obtained by saponifying its ether, which is formed by the action of $ClCO_2Et$ and sodium-amalgam upon iodo-(β)-methyl-thiophene (Levi, *B.* 19, 656). Formed also by oxidising (β)-methyl-thienyl methyl ketone with alkaline $KMnO_4$ (Demuth, *B.* 19, 680); and by boiling the amide with alcoholic potash. Needles (from water), v. sol. hot water and alcohol. Not attacked by $KMnO_4$. — CaA'_2 4aq: plates. — BaA'_2 5aq: small plates, sol. water.—AgA′.

Chloride $C_4H_2MeS.COCl$. (219°). Liquid, smelling like benzoyl chloride.

Amide $C_4H_2MeS.CONH_2$. [119°] (Z.); [123°] (Levi). Formed by the action of $Cl.CONH_2$ on (β)-methyl-thiophene in presence of $AlCl_3$ (Zelinsky, *B.* 20, 2024; Gattermann, *A.* 244, 58). Needles (from water), v. sol. water.

(α)-Methyl-thiophene (α′)-carboxylic acid $$S\!<\!\begin{matrix}C(CO_2H):\dot{C}H\\ C(CH_3)=\dot{C}H\end{matrix}$$
Methyl thiophenic acid. oo-Thiotolenic acid. [142°] (P.); [137°] (L.). Formed by oxidation of thioxene (from acetonyl-acetone) with alkaline $KMnO_4$ (Paal, *B.* 18, 2253). Obtained also from its ether, which is produced by heating iodo-(α)-methyl-thiophene with $ClCO_2Et$ and sodium-amalgam (Levi, *B.* 19, 656). White needles. Somewhat volatile with steam. Begins to sublime at c. 120° in long needles. V. e. sol. alcohol, ether, and boiling water, sl. sol. cold water. Gives no colour-reaction with isatin and H_2SO_4. Oxidised by alkaline $KMnO_4$ to the corresponding thiophene dicarboxylic acid.—CaA'_2 3½aq.—A′Ag×: white crystalline powder.

Methyl-thiophene carboxylic acid $$S\!<\!\begin{matrix}CMe:\dot{C}.CO_2H\\ CH\ :\dot{C}H\end{matrix}$$
(?). [134·5°]. Obtained by oxidising (αβ)-di-methyl-thiophene with an alkaline 1 p.c. solution of $KMnO_4$ (Grünewald, *B.* 20, 2586).

Di-methyl-thiophene carboxylic acid $C_7H_8SO_2$ *i.e.* $$S\!<\!\begin{matrix}C(CO_2H).\dot{C}:CH_2\\ C(CH_3)\ :\dot{C}H\end{matrix}$$
[172°]. Obtained from its amide by hydrolysis (Zelinsky a. Gattermann, *A.* 244, 59). Needles (from dilute alcohol).—AgA′.

Amide $C_4HMe_2S.CONH_2$. [116°]. Formed by acting on di-methyl-thiophene with $Cl.CONH_2$ in presence of $AlCl_3$. Colourless needles (from water).

Tri-methyl-thiophene carboxylic acid $C_8H_{10}SO_2$ *i.e.* $$S\!<\!\begin{matrix}C(CO_2H):\dot{C}.CH_3\\ C(CH_3)\ :\dot{C}.CH_3\end{matrix}$$
[208°]. Obtained by hydrolysis of its amide (Gattermann a. Zelinsky, *A.* 244, 60). Needles (from alcohol).

Amide $C_4Me_3S.CONH_2$. [147°]. Formed by the action of $ClCONH_2$ upon (αββ′)-tri-methyl-thiophene in presence of $AlCl_3$. Crystallises from water.

(β)-METHYL-THIOPHENE SULPHONIC ACID $C_4H_2MeS.SO_3H$. Formed by warming (β)-methyl-thiophene with fuming H_2SO_4 (Muhlert, *B.* 19, 1620). Syrup, turning red on exposure to air.—KA′ ½aq.—ZnA'_2 3½aq.—PbA″ (at 110°).

Chloride $C_4H_2MeS.SO_2Cl$. Oil.

Amide $C_4H_2MeS.SO_2NH_2$. [80°]. Crystalline nodules (from ether).

METHYL-THIOPHENIC ACID *v.* METHYL-THIOPHENE CARBOXYLIC ACID.

METHYL-THIO-DIPHENYLAMINE *v.* METHYL-IMIDO-DI-PHENYL SULPHIDE.

METHYL DITHIOPHOSPHATES.

Di-methyl-di-thio-phosphoric acid $C_2H_7PO_2S_2$ *i.e.* $Me_2HPO_2S_2$. Formed, together with $Me_3PO_2S_2$, by the action of P_2S_5 (1 pt.) on methyl alcohol (5 pts.) in the cold (Kowalewsky, *A.* 119, 303). Thick liquid, soluble in water. Decomposes below 100°.—PbA'_2: prisms (from alcohol). Melts below 100°.

Tri-methyl dithiophosphate $Me_3PO_3S_2$. Formed as above. Liquid, v. sl. sol. water.

METHYL-THIO-PHTHALIMIDINE C_9H_9NS *i.e.* $$C_6H_4\!<\!\begin{matrix}C(NMe)\\ CH_2\ —\end{matrix}\!>\!S$$
From thiophthalimidine and MeI (Way a. Gabriel, *B.* 23, 2483). It is converted by conc. HClAq at 190° into thiophthalide, and by oxidation into o-di-cyano-dibenzyl di-sulphide $(C_6H_4Cy.CH_2)_2S_2$ [124°].—B′HCl.—$B'_2H_2PtCl_6$.—$B'C_6H_2(NO_2)_3OH$: yellow needles.

METHYL-THIO-UREA $C_2H_6N_2S$ *i.e.* $NH_2.CS.NHMe$. [118°]. Formed from methyl-thiocarbimide and NH_3 (Andreasch, *M.* 2, 277). Prisms, v. sol. water and alcohol, sl. sol. ether.—B′HI: large plates, v. e. sol. water and alcohol. Melts below 100°. Decomposed by Ag_2O into AgI and methyl-cyanamide (Bernthsen a. Klinger, *B.* 11, 492).

Di-methyl-thio-urea $C_3H_8N_2S$ *i.e.* $CS(NHMe)_2$. [51·5°]. Formed from methyl-thiocarbimide and methylamine (Traumann, *A.* 249, 49; Hecht, *B.* 23, 286; *cf.* Andreasch, *M.* 2, 277). Transparent very hygroscopic plates. V. sol. water, alcohol, and acetone, sl. sol. ether and benzene, v. sl. sol. light petroleum.

METHYL-THYMO-ACRYLIC ACID *v. Methyl-derivative* of OXY-METHYL-PROPYL-CINNAMIC ACID.

DI-METHYL-TOLANE *v.* DI-TOLYL-ACETYLENE.

DI-METHYL-TOLENYL-AMIDINE.

Hydrochloride $C_{10}H_{14}N_2HCl$ *i.e.* $(NHMe.C(C_6H_4Me):NMe)HCl$. [200°]. Formed by adding the hydrochloride of *p*-tolenyl imido-ether $(EtO.C(C_6H_4Me):NH)HCl$ to an alcohol solution of methylamine (Glock, *B.* 21, 2654). Long silky needles (from water), v. sol. water and alcohol.—$B'_2H_2PtCl_6$ 2aq. [95°]. Dimetric crystals.

u-Di-methyl-tolenyl-amidine. *Hydrochloride* $(NMe_2.C(C_6H_4Me):NH)HCl$. Formed from the hydrochloride of *p*-tolenyl imido-ether and dimethylamine (G.). Short prisms.

METHYL-TOLINDOLE *v.* DI-METHYL-INDOLE.

METHYL-TOLISATIN *v. Di-methyl*-ISATIN.

DI-METHYL-TOLUBUTYLAMINE *v.* METHYL-BUTYL-PHENYL-DI-METHYL-AMINE.

METHYL-*o*-TOLUIDINE $C_8H_{11}N$ *i.e.* $[2:1]C_6H_4Me.NHMe$. *o-Tolyl-methyl-amine.* (207°). S.G. $\frac{15}{}$ ·973. Prepared by the action of tin and HClAq on the nitrosamine which is obtained from the crude product of the action of methyl alcohol and HCl on o-toluidine (Monnet, Reverdin, a. Nölting, *B.* 11, 2278). Obtained also by heating o-toluidine hydrobromide (or hydroiodide) with 5 p.c. more than an equivalent quantity of methyl alcohol for 8 hours at 150°, the yield being 46 p.c. of the theoretical (Reinhardt a. Staedel, *B.* 16, 29). It is also produced by distilling *o*-tolyl-amido-acetic acid (Widman, *J. pr.* [2] 38, 303). Colourless oil.—$B'_2H_2PtCl_6$.

Acetyl derivative $C_6H_4Me.NAcMe$. [56°]. (251°) (R. a. S.); (c. 260°) (M., R., a. N.).

Nitrosamine $C_6H_4Me.N(NO)Me$. Oil. Converted by alcoholic HCl into the isomeric *p*-nitroso-*o*-methyl-toluidine $[5:1:2]NO.C_6H_3Me.NHMe$ or $$C_6H_3Me\!<\!\begin{matrix}\dot{N}HMe\\ \dot{N}\ —\end{matrix}\!>\!O,$$
which crystallises in green plates, [151°], sol. benzene. On boiling with dilute aqueous NaOH

it is converted into nitroso-cresol and methylamine. Potassium permanganate oxidises it to nitro-methyl-toluidine [134°]. Its hydrochloride $C_8H_{16}N_2OH_2Cl_2$ aq crystallises in yellow cubes [110°]; v. sl. sol. cono. HClAq (Kock, *A.* 243, 308).

Methyl-*m*-toluidine [3:1]C_3H_4Me.NHMe. (207°). Formed by the action of MeI on *m*-toluidine, and purified by means of the acetyl derivative (Nölting, *B.* 11, 2279). Oil.—$B'_2H_2PtCl_6$.

Acetyl derivative C_3H_4Me.NAcMe. [66°]. (c. 250°). Sol. hot water, alcohol, and ether.

Methyl-*p*-toluidine [4:1]C_6H_4Me.NHMe. (208°). Formed by passing MeCl into boiling *p*-toluidine. The ethereal extract of the crude product is freed from *p*-toluidine by ppn. with H_2SO_4, evaporated, and mixed with Ac_2O. The resulting mixture of di-methyl-toluidine and acetyl-methyl-toluidine may then be fractionally distilled, and the acetyl derivative saponified by HClAq or NaOHAq (Thomsen, *B.* 10, 1582). Oil.—$B'_2H_2PtCl_6$.

Acetyl derivative C_6H_4Me.NAcMe. [83°]. (283°). Plates (from ether-alcohol); sl. sol. water, v. sol. alcohol and ether.

Propionyl derivative $C_{11}H_{15}NO$ *i.e.* C_6H_4Me.N(C_3H_5O)Me. (266°-269°). Formed from methyl-*p*-toluidine and propionic anhydride (Norton a. Livermore, *B.* 20, 2270). Converted by dilute nitric acid into tri-nitro-methyl-*p*-toluidine [130°].

Nitrosamine C_6H_4Me.NMe(NO). [54°]. Insol. water, v. sol. alcohol and ether.

Di-methyl-*o*-toluidine $C_8H_{13}N_4O_6$ *i.e.* [2:1]C_6H_4Me.NMe_2. (183°). Formed by distilling its methylo-hydroxide (Thomsen, *B.* 10, 1586; Nölting, *B.* 11, 2279). Prepared by heating *o*-toluidine hydrobromide (or hydroiodide) with a little (5 p.c.) more than two equivalents of methyl alcohol for 8 hours at 150°, the yield being 93 p.c. of the theoretical (Reinhardt a. Staedel, *B.* 16, 29). Oil. Converted by HNO_3 (S.G. 1·5) into di-nitro-o-tolyl-methyl-nitramine (Van Romburgh, *R. T. C.* 3, 395).—$B'_2H_2PtCl_3$.—$B'_2H_4FeCy_3$: white needles.—$B'_2H_6FeCy_6$ 4½aq: yellow unstable crystals (Wurster a. Roser, *B.* 12, 1826).

Methylo-iodide C_6H_4Me.NMe_3I. Formed from *o*-toluidine and MeI (Thomsen). It is also a product obtained by heating di-methyl-aniline methylo-iodide at 220°–230° (Hofmann, *B.* 10, 1585). Needles.

Di-methyl-*m*-toluidine [3:1]C_3H_4Me.NMe_2. (208°) (N.; R. a. S.); (215°) (Wurster a. Riedel, *B.* 12, 1797). Formed from *m*-toluidine and MeI, or by distilling its methylo-iodide (Nölting). When dissolved in H_2SO_4, and treated with HNO_3 (S.G. 1·5), it yields $C_3H(NO_2)_3$Me.NMe.NO_2 (Van Romburgh, *R. T. C.* 3, 413).—$B'_2H_2PtCl_3$.—$B'_2H_4FeCy_6$2aq: white needles.—$B'_2H_3FeCy_6$ 1½aq (Wurster a. Roser, *B.* 12, 1826).

Methylo-iodide B'MeI. Yields (B'MeCl)$_2$$PtCl_4$: yellow cubes.

Di-methyl-*p*-toluidine [4:1]C_3H_4Me.NMe_2. (208°) (R. a. S.; H.); (210°) (Van Romburgh). S.G. ·938. Formed, together with other products, by heating dimethylaniline methylo-iodide at 220°–230° (Hofmann, *B.* 5, 707). Formed also by heating its methylo-iodide with water and PbO and distilling the resulting C_6H_4Me.NMe_3OH (Hübner, Tolle, a. Athenstädt, *A.* 224, 337; *cf.* Thomsen, *B.* 10, 1586). Prepared by heating *p*-toluidine hydrobromide (or hydro-iodide) with rather more (5 p.c.) than two equivalents of methyl alcohol for eight hours at 150°, the yield being 95 p.c. of the theoretical (Reinhardt a. Staedel, *B.* 16, 29). Oil. Converted by fuming HNO_3 and H_2SO_4 into $C_6H(NO_2)_3$Me.NMe.NO_2 (Van Romburgh, *R. T. C.* 3, 404).—$B'_2H_2PtCl_6$.—$B'_2H_4FeCy_6$ aq: white powder.—$B'_2H_3FeCy_3$ 2½aq: yellow crystals (Wurster a. Roser, *B.* 12, 1826).

Methylo-iodide C_3H_4Me.NMe_3I. Formed from *p*-toluidine and MeI. Converted by moist Ag_2O into C_6H_4Me.NMe_3OH. Yields (C_6H_4Me.NMe_5Cl)$_2$$PtCl_4$.

References.—Bromo-di-methyl-toluidine and Nitro-methyl-toluidine.

DI-METHYL-*o*-TOLUIDINE SULPHONIC ACID C_6H_3Me(NMe_2)SO_3H. Formed by sulphonating di-methyl-*o*-toluidine (Michler a. Sampaio, *B.* 14, 2167). Large prisms; v. sol. hot water; insol. alcohol.—BaA'_2: soluble plates.—CaA'_2: small nodules.—ZnA_2: easily soluble needles.

METHYL-TOLUQUINOLINE *v.* Di-methyl-quinoline.

METHYL-TOLUQUINOXALINE *v.* Di-methyl-quinoxaline.

METHYL-TOLYLENE-DIAMINE *v.* Tolylene-methyl-diamine.

METHYL TOLYL KETONE *v.* Tolyl methyl ketone.

METHYL-TOLYL-NITROSAMINE *v.* *Nitrosamine* of Methyl-toluidine.

DI-METHYL-TOLYL-PHOSPHINE *v.* Tolyl-di-methyl-phosphine.

METHYL TRIDECYL KETONE $C_{15}H_{27}O$ *i.e.* CH_3.CO.$C_{13}H_{27}$. [39°]. (294°). S.G. (liquid) $\underline{38}$ ·8182. Formed by distilling a mixture of barium myristate and barium acetate (Krafft, *B.* 12, 1669; 15, 1724). Yields acetic and tridecoic acids on oxidation.

DI-METHYL-TRIDECYL-PYRIDINE $C_{20}H_{35}N$ *i.e.* $C_5NH_2Me_2(C_{13}H_{27})$. (216° at 13 mm.). Formed by distilling its dicarboxylic acid with soda-lime (Krafft a. Mai, *B.* 22, 1758). Oil.—$B'_2H_2PtCl_6$: yellow plates.

DI-METHYL-TRIDECYL-PYRIDINE DI-CARBOXYLIC ACID $C_5NMe_2(C_{13}H_{27})(CO_2H)_2$. Formed by saponifying its ether with alcoholic potash.—H_2A''HCl: crystalline powder; v. e. sol. alcohol.

Ethyl ether Et_2A''. (265° at 10 mm.). Formed from its dihydride by treatment of the alcoholic solution with nitrous acid (Krafft a. Mai, *B.* 22, 1758). Yellowish oil.—Et_2A''HCl: needles.

Di-methyl-tridecyl-pyridine dihydride di-carboxylic ether $C_5NMe_2(C_{13}H_{27})H_2(CO_2Et)_2$. [60°]. Formed by heating a mixture of myristic aldehyde, alcoholic NH_3, and acetoacetic ether (Krafft a. Mai, *B.* 22, 1757). Hard crystalline crusts.

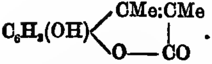
METHYL-TROPIDINE *v.* Tropidine.

METHYL-TROPINE *v.* Tropine.

METHYL-UMBELLIC ACID *v.* Di-oxy-phenyl-crotonic acid.

METHYLUMBELLIFERON *v.* *Lactone* of di-oxy-phenyl-crotonic acid.

αβ-Di-methyl-umbelliferon $C_{11}H_{10}O_3$ *i.e.*



$C_6H_3(OH)\left\langle\begin{array}{l}CMe{:}CMe\\ \qquad\quad |\\ O\text{——}CO\end{array}\right.$

. *Lactone of di-oxy-phenyl-pentenoic acid.* [256°]. Formed by the action of H_2SO_4 on a mixture of methyl-aceto-acetic ether and resorcin (Pechmann a. Duisberg, *B.* 16, 2127). Colourless needles of high refractive power. Its dilute alkaline and H_2SO_4 solutions have a blue fluorescence.

Isomeride v. Lactone of Di-oxy-tolyl-crotonic acid.

METHYL UNDECYL KETONE *v.* Methyl hendecyl ketone.

METHYL-URACIL *v.* Di-oxy-methyl-pyrimidine.

METHYL - URAMIDO - ACETIC ACID *v.* Methyl-hydantoic acid.

***m* - METHYL - URAMIDO - BENZOIC ACID** $C_9H_{10}N_2O_3$ *i.e.* HMeN.CO.NH.C_6H_4.CO_2H. Formed by the action of methylamine upon cyancarboxamido-benzoic acid NC.CO.NH.C_6H_4.CO_2H (Griess, *B.* 18, 2415). White needles; sol. alcohol, v. sl. sol. water.—A′Ag: white plates.

METHYL-URAMINE. An old name for Methyl-guanidine.

METHYL-UREA $C_2H_6N_2O$ *i.e.* NH_2.CO.NHMe. [102°]. Formed from methyl cyanate and ammonia, or by evaporating a mixture of potassium cyanate and methylamine sulphate (Wurtz, *C. R.* 32, 414). It is also a product of the action of HCl and $KClO_3$ on caffeine (Fischer, *A.* 215, 257). It may be prepared by boiling its acetyl derivative with conc. HNO_3 (Hofmann, *B.* 14, 2734).

Properties.—Deliquescent prisms; v. e. sol. water and alcohol. Its aqueous solution is neutral to litmus, and yields with nitric acid a pp. of the nitrate $C_2H_6N_2OHNO_3$ [128°], which is converted by fuming nitric acid into methylamine and ammonium nitrate (Franchimont, *R. T. C.* 3, 220).

Nitrosamine NH_2.CO.N(NO)Me. [124°]. Formed by adding $NaNO_2$ to a solution of methyl-urea nitrate containing ice (Von Brüning, *B.* 21, 1810; *A.* 253, 6). Yellow plates or tables (from ether), v. sol. hot water, alcohol, and ether. Decomposed by long boiling with water. Exhibits Liebermann's reaction. On reducing with zinc-dust and HOAc it yields methyl-semi-carbazide NH_2.CO.NMe.NH_2 whence, by heating with conc. HClAq for 6 hours at 100°, methyl-hydrazine is got.

Acetyl derivative NHAc.CO.NHMe. [180°]. Formed from methyl-urea and Ac_2O. Formed by the action of boiling dilute NaOH on a mixture of bromo-acetamide (CH_3.CO.NHBr) and acetamide. This mixture is prepared by adding aqueous (10 p.c.) NaOH to acetamide (10 pts.) mixed with bromine (13·5 pts.) until the colour changes from red to yellow (Hofmann, *B.* 14, 2725; 15, 408). In this reaction methyl cyanate is perhaps first formed and then unites with acetamide. Monoclinic prisms (Haushofer, *J.* 1882, 365), sol. alcohol, ether, and hot water. Split up by alkalis into NH_3, CO_2, methylamine, and acetic acid. Boiling conc. HClAq forms acetic acid and methyl-urea.

s-Di-methyl-urea $C_3H_8N_2O$ *i.e.* $CO(NHMe)_2$. [102·5°]. (269°). Formed by the action of methylamine on methyl cyanate (Wurtz, *Rép. chim. pure*, 1862, 199). According to Wurtz, the same body when prepared by the action of cold water on methyl cyanate melts at 99·5° and boils between 273° and 288°. *s*-Di-methyl-urea crystallises easily, is v. sol. water and alcohol, and forms a hygroscopic nitrate $C_3H_8N_2OHNO_3$ [c. 65°] which is decomposed by fuming HNO_3 forming methylamine (Franchimont, *R. T. C.* 3, 222).

Cyano-acetyl derivative $C_6H_9N_3O_2$ *i.e.* NHMe.CO.NMe.CO.CH_2Cy. Formed from *s*-di-methyl-urea and cyano-acetyl chloride (Mulder, *B.* 12, 466). Crystals, not melted below 260°. Gives with bromine-water the compound

$CO\left\langle\begin{array}{l}NMe.CO\\NMe.CO\end{array}\right\rangle CBr_2$.

Conc. HNO_3 forms, on warming, two purple-red compounds.

u-Di-methyl-urea NMe_2.CO.NH_2. [180°]. Formed by evaporating the mixed solutions of potassium cyanate and dimethylamine sulphate (Franchimont, *R. T. C.* 2, 122; 3, 222). Large hard crystals with sweet taste, sl. sol. alcohol and ether. Boiling Ac_2O forms NMe_2Ac and cyanuric acid. Aldehyde in the cold slowly forms $CH_3.CH(NH.CO.NMe_2)_2$ [160°]. Chloral forms $CCl_3.CH(OH).NH.CO.NMe_2$ [156°] and $C_5H_{11}Cl_3N_2O_3$ [74°] (Van der Zande, *R. T. C.* 8, 222). Nitrate $B'HNO_3$. [101°]. Very large crystals. Converted by fuming HNO_3 into di-methyl-nitramine.—Oxalate $B'H_2C_2O_4$aq. Decomposes at 105°.—Picrate $B'C_6H_2(NO_2)_3OH$. [130°]. Decomposes on fusion (Van der Zande).

Tri-methyl-urea $C_4H_{10}N_2O$ *i.e.* NMe_2.CO.NHMe. [76°]. (232° cor.). Formed by mixing ethereal solutions of methyl cyanate and dimethylamine (Franchimont, *R. T. C.* 3, 226). Crystallises well from ether; v. sol. water and alcohol, sol. benzene. Fuming HNO_3 forms di-methyl-nitro-amine ($NMe_2.NO_2$) and methylamine.

Tetra-methyl-urea $C_5H_{12}N_2O$ *i.e.* $CO(NMe_2)_2$. (177° i. V.). S.G. $\frac{15}{}$ ·972). Prepared by passing dimethylamine into a solution of di-methyl-chloro-formamide $Cl.CONMe_2$ (derived from $COCl_2$ and NMe_2H) in benzene (Michler a. Escherich, *B.* 12, 1162; Franchimont, *R. T. C.* 3, 228). Oil, v. sol. alcohol and ether. With conc. HNO_3 (S.G. 1·5) it yields $NMe_2.NO_2$ and dimethylamine.

Reference.—Chloro-methyl-urea.

METHYL-URETHANE *v.* Methyl carbamate.

(α)-METHYL-URIC ACID $C_6H_6N_4O_3$ *i.e.*

$CO\left\langle\begin{array}{l}NMe.CO.\underset{\|}{C}.NH\\NH\text{——}\overset{\|}{C}.NH\end{array}\right\rangle CO$

or

$CO\left\langle\begin{array}{l}NH.CO.\underset{\|}{C}.NH\\NMe\text{—}\overset{\|}{C}.NH\end{array}\right\rangle CO$.

S. ·4 at 100°. Formed by heating at 150° acid lead urate with MeI diluted with ether (Hill, *B.* 9, 370, 1090; *Am. S.* [3] 12, 428). Thin prisms, sl. sol. boiling water, insol. alcohol and ether. Sol. conc. H_2SO_4 and reppd. by water. Oxidised by alkaline $KMnO_4$ to methyl-allantoïn $C_4H_5MeN_4O_3$ [225°]. $KClO_3$ and HCl oxidise it to urea and methyl alloxan. By heating with HClAq it is split up into glycocoll, methylamine, CO_2, and NH_3 (Fischer, *B.* 17, 1776).

Salts.—K_2A''3aq. Ppd. by adding alcohol to its aqueous solution.—KHA''aq.—Na_2A''3aq.—$NaHA''$aq.—CaA''3aq.—BaA''4aq.—BaA''3½aq: tufts of delicate needles.

Methyl-uric acid $C_5H_3MeN_4O_3$. Possibly identical with the preceding. Prepared by fusing urea (3 mols.) with methyl-amido-acetic acid (1 mol.), extracting the fusion with water, ppg. by ammoniacal $AgNO_3$ and magnesium mixture, digesting the pp. with an alkaline sulphide, filtering, acidifying, and evaporating to a small bulk (Horbaczewski, *M.* 6, 359). Formed also by heating methyl-hydantoïn with amyl allophanate or with biuret (Horbaczewski, *M.* 8, 584). Micaceous scales, sol. boiling water and alkalis, sl. sol. cold water, dilute acids, alcohol, and ether. Gives the murexide reaction. On heating with HClAq at 170° it gives a product (probably methylamine) which gives the carbamine reaction.

(β)-Methyl-uric acid $C_5H_3MeN_4O_8$ *i.e.*

$$\mathrm{CO}\left\langle\begin{matrix}\mathrm{NH.CO.\underset{\cdot}{C}.NMe}\\ \mathrm{NH{-}{-}{-}\overset{\cdot\cdot}{C}.NH}\end{matrix}\right\rangle\mathrm{CO}.$$

Tri-oxy-methyl-purin. S. ·05 at 100°.

Formation.—1. By heating the di-methyl derivative of chloro-di-oxy-methyl-purin with HClAq at 130° (Fischer, *B.* 17, 332).—2. By heating di-chloro-oxy-methyl-purin with HClAq at 140° (Fischer, *B.* 17, 1777).—3. Occurs in small quantity, together with a much larger quantity of (α)-di-methyl-uric acid, by heating neutral lead urate with MeI at 100° (F.).

Properties.—Slender crystals. Sol. alkalis. Reduces ammoniacal $AgNO_3$ in the cold. Gives the murexide reaction. On heating with PCl_5 it yields di-chloro-oxy-methyl-purin. On oxidation with HNO_3 or with $KClO_3$ and HCl it gives methyl-urea and alloxan. Split up by heating with HClAq into CO_2, methylamine, NH_3, and glycocoll.

(α)-Di-methyl-uric acid $C_5H_2Me_2N_4O_3$ *i.e.* $C_2N_2HMeO_2{:}C_2{:}N_2HMeCO$. [above 340°]. S. ·5 at 100°; ·06 at 20°. Prepared by heating neutral lead urate with MeI in ether for 20 hours at 165° (Mabery a. Hill, *Am.* 2, 306; *P. Am. A.* 15, 256; *B.* 11, 1329; Fischer, *B.* 17, 1779). Slender monoclinic prisms (containing aq), sl. sol. water, sol. conc. H_2SO_4 and HClAq, insol. alcohol and ether. When heated with conc. HClAq at 170° it is resolved into CO_2, ammonia, NH_2Me, and glycocoll. Nitric acid oxidises it, forming methyl-alloxan and methyl-urea. HCl and $KClO_3$ form methyl-urea, methyl-alloxan, and a small quantity of a compound $C_5H_6N_2O_8$ [160°]. The ammonium salt is decomposed on boiling its solution with separation of the free acid (difference from (α)-methyl-uric acid).

Salts.—K_2A'' 4aq: silky needles, v. sol. water. — KHA'' 1½aq: needles, sol. water. — Na_2A' 4½aq: needles, sol. water.—$NaHA''$ 2aq: small needles, sol. water. — BaA'' 3aq: flat prisms, m. sol. hot water.—$BaH_2A''_2$ 3aq.

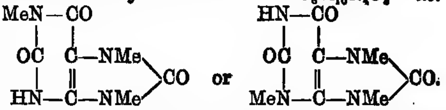
(β)-Di-methyl-uric acid

$$\mathrm{CO}\left\langle\begin{matrix}\mathrm{NH.CO.\underset{\cdot}{C}.NMe}\\ \mathrm{NH{-}{-}{-}\overset{\cdot\cdot}{C}.NMe}\end{matrix}\right\rangle\mathrm{CO}.$$

Tri-oxy-methyl-purin. Formed by the action of H_2SO_4 at 140° on the di-ethoxy-compound obtained by treating di-chloro-oxy-di-methyl-purin with alcoholic NaOH. Formed also by heating di-chloro-oxy-di-methyl-purin with fuming HCl at 130° (Fischer, *B.* 17, 337, 1779). Colourless crystalline powder, v. sl. sol. water, alcohol, and ether. Melts at a very high temperature.

Reactions.—On heating with HCl it is split up into sarcosine, methylamine, CO_2, and NH_3. PCl_5 converts it back into di-chloro-oxy-di-methyl-purin. By $K_2Cr_2O_7$ and H_2SO_4 it is oxidised to cholestrophane. By oxidation with HNO_3 or $KClO_3$ and HCl it chiefly gives a body $C_7H_{10}N_4O_5$, which forms large colourless crystals [174°], v. sol. water, and decomposed on boiling with baryta-water into mesoxalic acid, urea, and probably di-methyl-urea.

Tri-methyl-uric acid $C_8H_{10}N_4O_3$ *i.e.*



[345°]. Formed by heating the lead salt of (β)-di-methyl-uric acid with methyl iodide (Fischer, *B.* 17, 1782). Fine white needles. Sublimable. Sol. hot water, sl. sol. alcohol and chloroform. Dissolves in alkalis. Gives the murexide reaction strongly. Is very unstable towards acids. $C_8H_9O_3N_4Ag$: fine white needles.

Tetra-methyl-uric acid $C_9H_{12}N_4O_3$ *i.e.*

$$\mathrm{CO}\left\langle\begin{matrix}\mathrm{NMe.CO.\underset{\cdot}{C}.NMe}\\ \mathrm{NMe{-}{-}{-}\overset{\cdot\cdot}{C}.NMe}\end{matrix}\right\rangle\mathrm{CO}.$$

[218°]. Formed by heating the silver salt of tri-methyl-uric acid with methyl iodide (Fischer, *B.* 17, 1784). Distils undecomposed. Fine white needles. V. sol. hot water, less sol. cold, sl. sol. ether. Has no acid properties. It is readily decomposed by alkalis, with evolution of methyl-amine. It gives the murexide reaction.

METHYL-UVIC ACID $C_8H_{10}O_3$ *i.e.*

$$\left.\begin{matrix}\mathrm{CO_2H.\underset{\cdot}{C}H\ .CHMe}\\ \mathrm{\dot{C}Me{:}CH}\end{matrix}\right\rangle\mathrm{CO}\ \text{or}\ \left.\begin{matrix}\mathrm{CO_2H.\underset{\cdot}{C}Me.CH_2}\\ \mathrm{\dot{C}Me{:}CH}\end{matrix}\right\rangle\mathrm{CO}.$$

[98°]. Formed by heating methyl-methronic acid to 250° as long as CO_2 is evolved (Fittig, *A.* 250, 205). Needles (from water) or prisms (from other solvents); m. sol. hot, v. sl. sol. cold, water; v. sol. cold, v. e. sol. hot alcohol; v. sol. petroleum ether, $CHCl_3$, benzene, ether, and HOAc; volatile with steam. Yields on distillation CO_2 and oxy-di-methyl-pentamethenyl hydride.

Salts.—$(C_8H_9O_3)_2Ba$ 4aq: trimetric plates; $a{:}b{:}c = 0{\cdot}9937{:}1{:}4{\cdot}9021$. — A'_2Ca 4aq: pearly plates, insol. alcohol.—$A'Ag$: small prisms (from water).

Ethyl ether A'Et. (219°). Colourless oil, heavier than water, volatile with steam.

METHYL-VALERIC ACID *v.* HEXOIC ACID.

METHYL-VALEROLACTONE *v.* *Lactone* of OXY-HEXOIC ACID.

METHYL-VANILLIN *v.* *Di-methyl derivative* of PROTOCATECHUIC ALDEHYDE.

DI-METHYL-DI-VANILLIN *v.* *Tetra-methyl derivative* of TETRA-OXY-DI-PHENYL DICARBOXYLIC ALDEHYDE.

DI-METHYL-VINYL-AMINE. *Methylo-hydroxide* $C_5H_{13}NO$ *i.e.* $NMe_3(C_2H_3)OH$. *Neurine.* Formed by the action of moist oxide of silver on di-methyl-bromo-vinyl methylobromide $NMe_3(CH_2.CH_2Br)Br$, the product of the union of trimethylamine with ethylene bromide (Hofmann, *C. R.* 47, 558; *Chem. Gaz.* 1858, 434; Baeyer, *A.* 140, 311). It is also a product of the decomposition of protagon by baryta (Liebreich, *B.* 2, 12), and of the putrefaction of flesh (Brieger, *B.* 16, 1190, 1406; 17, 516, 1137). It is extremely soluble in water, and is extracted from the solution by ether with great difficulty. (Marino, *G.* 13, 441). Its solution is strongly alkaline, and fumes with HCl. On evaporating its solution it decomposes with evolution of NMe_3. Its aqueous solution is poisonous, and antagonistic to atropine as regards the heart and glandular system (Cervello, *Arch. Ital. Biol.* 7, 232).

Methylo-chloride $^{\times}NMe_3(C_2H_3)Cl$. Very deliquescent needles. — $(NMe_3(C_2H_3)Cl)_2PtCl_4$: yellow crystals, readily changing to neurine platinochloride $(NMe_3(C_2H_4OH)Cl)_2PtCl_4$. — $NMe_3(C_2H_3)AuCl_4$: yellow needles.

METHYL VINYL KETONE CARBOXYLIC ACID $CH_3.CO.CH{:}CH.CO_2H$. *β-Acetyl-acrylic acid.* [125°]. Formed by the action of aqueous sodium carbonate on β-bromo-acetyl-propionic acid $CH_3.CO.CHBr.CH_2.CO_2H$ in the cold (Wolff, *B.* 20, 425). Plates, v. sol. alcohol and ether, m. sol. cold water.—CaA'_2: nodules, v. sol. water.—ZnA'_2: amorphous.—AgA'_2: stellate groups of needles.

Phenyl-hydrazide $PhNH.N{:}CMe.CH_2.CH_2.CO_2H$. [157°]. Formed from the acid and phenyl-hydrazine (Decker, *B.* 21, 2937) or by saponifying its ether. Lemon-yellow needles, m. sol. hot water, v. sol. alcohol and ether.

Ethyl ether $^{\times}EtA'$. *Phenyl hydrazide* $PhNH.N{:}CMe.CH_2.CH_2.CO_2Et$. [117°]. Formed from bromo-acetyl-propionic ether and phenyl-hydrazine (Bender, *B.* 21, 2493). Yellow spangles, sl. sol. cold, v. sol. hot alcohol. On reduction with tin and HClAq it yields methyl-indyl-acetic acid.

Isomeride *v.* Tetric acid.

METHYL-VIOLET. A violet dye obtained by the oxidation of di-methyl-aniline. It consists of a mixture of hexa- and penta-methyl-tri-amido-tri-phenyl carbinols (*q.v.*) (Fischer, *B.* 16, 706, 2904).

DI-METHYL-XANTHINE *v.* Theobromine and Theophylline.

Tri-methyl-xanthine *v.* Caffeïne.

METHYL-XYLENE *v.* Mesitylene and ψ-Cumene.

METHYL-XYLIDINE $C_9H_{13}N$ *i.e.* $C_6H_3Me_2NHMe$. One of the products obtained by heating di-methyl-aniline hydro-iodide at 225° (Hofmann, *B.* 5, 712). Oil.

Di-methyl-xylidine $C_{10}H_{15}N$ *i.e.* $C_6H_3Me_2.NMe_2$. (196°). S.G. ·9293. Obtained by heating methyl-xylidine with MeI (Hofmann, *B.* 5, 712). Oil.

Di-methyl-xylidine $C_6H_3Me_2NMe_2$. (203°). Obtained by methylation of crude xylidine (H.). —B'MeI.

Di-methyl-xylidine $C_6H_3Me_2NMe_2$. [87°]. A by-product in the preparation of methyl-aniline (Sesemann, *B.* 6, 446). Long needles (from ligroïn).—B'EtBr.

Di-methyl-xylidine [1:3:4] $C_6H_3Me_2NMe_2$. (204°). Formed by heating xylidine hydro-bromide with MeOH (Baur a. Staedel, *B.* 16, 32). Oil.—$B'_2H_2PtCl_6$: small yellow crystals.

METHYL XYLYL KETONE *v.* Xylyl methyl ketone.

METHYSTICIN $C_{15}H_{14}O_5$ (P.); $C_{16}H_{16}O_5$ (D.). [139°] (D.); [137°] (P.). Extracted by means of alcohol from Kawa root, the root of *Piper methysticum* (Gobley, *J. Ph.* [3] 37, 19; O'Rorke, *C. R.* 50, 498; Nölting a. Kopp, *Monit. Scient.* [3] 4, 9, 20; Cuzent, *An.* 1, 150; Davidoff, *J. R.* 19, 522; Pomeranz, *M.* 9, 863; 10, 785). White tasteless prismatic needles, sl. sol. hot water, ether, and ligroïn, v. sol. hot alcohol, benzene, and chloroform. Dissolves in NaOHAq, but on heating the solution methystic acid is formed. On fusion with KOH protocatechuic acid is formed. Boiling with KOHAq forms piperonal. Alkaline $KMnO_4$ oxidises it to piperonylic acid.

Acetyl derivative $C_{16}H_{16}Ac_2O_5$. [123°]

Benzoyl derivative $C_{16}H_{16}Bz_2O_5$. [148°].

Methystic acid $C_{14}H_{12}O_5$. [180°]. When 10 g. of methysticin are warmed with 6 p.c. NaOHAq 5 g. of methystic acid are formed. Methystic acid when heated at 180° evolves CO_2, and the product, after cooling, melts at 93°. $KMnO_4$ oxidises methystic acid to piperonal [37°] and piperonylic acid $C_8H_6O_4$ [227°]. Dilute mineral acids convert it into methysticol. Ac_2O has no action.

Methysticol $C_{13}H_{12}O_3$ *i.e.* $CH_2{<}^{O}_{O}{>}C_6H_3(C_6H_7O)\left[{1 \atop 2}\;4\right]$. [94°]. Formed by warming methysticin or methystic acid with dilute HClAq or H_2SO_4 (Pomeranz, *M.* 10, 792). Prisms; insol. alkalis, v. sol. alcohol and ether. Forms a phenyl-hydrazide melting at 143°. According to Davidoff methysticin is $C_{16}H_{16}O_5$ and is decomposed by alcoholic NH_3 into 'methysticin hydrate' $C_8H_{10}O_3$ and a compound $C_8H_{11}NO_2$ which crystallises from water in yellow needles. The 'methysticin hydrate' is also formed by the action of alcoholic KOH on methysticin. It melts at 159°, forms the crystalline salts $KC_8H_9O_3$ and $Ba(C_8H_9O_3)_2$, the ether $EtC_8H_9O_3$ [100°] and the benzoyl derivative $C_8H_9Bz_3O_3$ [122°].

METINULIN *v.* Inulin.

MICROCOSMIC SALT. Sodium-ammonium-hydrogen phosphate, $Na(NH_4)HPO_4.4H_2O$; *v.* Phosphoric acids and phosphates.

MILK. Milk is the secretion of the mammary glands; to the naked eye it appears to be a white fluid, which in thin layers has a bluish tint. Its reaction is alkaline in herbivorous animals and in woman; acid in carnivorous animals. Its specific gravity varies greatly, averaging between 1·028 and 1·035. On microscopic examination milk is found to be an emulsion, consisting of a clear fluid which has a light straw colour, in which are suspended numerous minute fat globules of varying size, each inclosed in an envelope of casein. Numerous particles of casein and nuclein are also seen (Kehrer, *Arch. Gynaek.* 2, 1). The clear fluid in which these float contains proteids, lactose, and mineral salts in solution. During the first few days after parturition the milk contains a larger proportion of solid constituents, and is found microscopically to contain, besides the ordinary fat globules, a number of the secreting epithelium cells of the mammary gland of which the protoplasm has undergone fatty degeneration; this secretion has received the name *colostrum.* The name *uterine milk* is given to the whitish secretion of the uterine glands which is poured out from them during the early months of pregnancy in certain animals.

The following tables adapted from Charles's *Physiological Chemistry,* p. 383, after Gorup-Besanez, Liebermann, Gautier, &c., give quantitative statements of the constituents which occur in the milk of the commoner animals:—

Constituents	Woman		Ass	Cow	Goat	Sheep	Mare
	Milk	Colostrum					
Water . .	87·65	84·08	90·70	86·56	86·76	83·31	82·84
Solids . .	12·35	15·92	9·30	13·44	13·24	16·69	17·16
Proteids	8·07	3·23	1·70	4·08	4·23	5·73	1·64
Fats .	8·91	5·78	1·55	4·03	4·48	6·05	6·87
Milk sugar .	5·01	8·51	5·80	4·60	3·91	3·98	8·65
Mineral salts	0·17	0·35	0·50	0·73	0·62	0·68	

The Ash of Milk in 100 *parts.*

	Woman's Milk (Wildenstein)	Cow's Milk (Weber)	(Haidlen)
Sodium . .	4·21	6·38	8·27
Potassium .	31·59	24·71	15·42
Chlorine . .	19·06	14·39	16·96
Calcium . .	18·78	17·31	56·52
Magnesium .	0·87	1·90	
Phosphoric acid	19·00	29·13	
Sulphuric acid	2·64	1·15	
Ferric oxide .	0·10	0·33	0·62
Silica . .	trace	0·09	

The most abundant salts are thus the phosphates. The excess of potassium over sodium salts is the opposite to what obtains in blood plasma and most other fluids of the body. (See also Bunge, *Dissert.* Dorpat, 1874; *Zeit. Physiol. Chem.* 13, 399). The iron in milk appears to be combined with nuclein (Bunge).

Condensed Milk (*Cane Sugar added*).

Gases of milk at 0° 41 metre pressure (Pflüger):

Carbonic acid	7·6	in 100 vols. of milk
Oxygen	0·1	„ „
Nitrogen	0·7	„ „

Certain preparations (Koumiss, Kephir) are now made from mare's and cow's milk, in which the alcoholic fermentation is allowed to take place, and which are valuable stimulants in cases of disease, especially of disordered digestion (for references on this subject *v.* Maly's *Jahrsber.* 14, 167).

The proteids of milk.—The most abundant is *casein.* This is coagulated by rennet, and the more soluble precursor in the milk of the curd should be more accurately called *caseinogen* (*v.* PROTEIDS). Albumin (*lact-albumin*) which is very similar to serum-albumin is also present. Other proteids have also been described in milk, but their presence is doubtful; thus peptone is described by Schmidt-Mulheim (*Pf.* 28, 287), by Dogiel (*Zeit. Physiol. Chem.* 9, 591), and by Biel (Maly's *Jahrsber.* 15, 193); hemi-albumose by J. Schmidt (Maly's *Jahrsber.* 14, 175). These proteids appear to be primary albumoses formed by the acidification and boiling employed to separate the casein and albumin (Neumeister, *Zeit. Biol.* 24, 271). True peptone is always absent (Neumeister, *loc. cit.*; Sebelien, *Zeit. Physiol. Chem.* 13, 135; Halliburton, *Journ. of Physiol.* 11, 449). Whey-proteid (Hammarsten), the lacto-protein of some observers, is a by-product of the action of rennet on caseinogen. Two other proteids, lacto-globulin, which is identical with paraglobulin (J. Sebelien, Maly's *Jahrsber.* 15, 184), and lacto-syntonin, which resembles acid albumin in its properties (J. Biel, *l.c.*), are also stated to occur in small quantities, but the evidence that they exist is not conclusive (Halliburton, *l.c.*). In koumiss the proteids are stated to consist of albumin, syntonin, and peptone (A. Dochmann, Maly's *Jahrsber.* 11, 190). In colostrum casein is absent, or nearly so, being replaced by globulin (Sebelien).

The fats of milk.—When milk stands, some of the fatty globules rise to the surface, and some of these are possibly freed from their proteid casing (Müller); this forms the layer of cream. Butter is the name generally given to the fat itself, which is separated from the milk globules by mechanical agitation (churning); a certain amount of casein is, however, generally present in butter, and about one-third of the fat of the milk remains in the butter-milk. The fats present are olein, much palmitin, much less stearin; and about two per cent. of the total fats consist of the triglycerides of butyric, caproic, and caprylic acids, with traces of myristic and arachidic acids. Cow's butter contains about 68 per cent. palmitin and stearin, 30 per cent. olein, and 2 per cent. the other fats just mentioned. Rancidity is due to the development of free fatty acids, acrolein, &c., and, according to Hagemann, of lactic acid from the lactose admixed with fat in the butter.

Lactose or milk sugar ($C_{12}H_{22}O_{11}$) may be obtained from milk by evaporation in rhombic crystals containing one molecule of water of crystallisation, which is given off at 140°. It dissolves in 6 parts of cold and 2·5 parts of boiling water. It is not so sweet as cane sugar; its specific rotation is $(\alpha)_D = 59·3°$. Dilute acids and hydrolytic ferments convert lactose into galactose, which is a glucose, and capable of undergoing the alcoholic fermentation, and which yields mucic acid when treated with nitric acid. Lactose reduces alkaline solutions of copper salts, and when oxidised yields mucic, saccharic, tartaric, and oxalic acid. Lactose does not itself undergo the alcoholic fermentation, but when much yeast is added fermentation occurs after some time, mannite being formed. In presence of casein, &c., it undergoes the lactic acid fermentation, and it is the occurrence of this to which the souring of milk is due.

Preservation of milk.—Many different antiseptics have been suggested for the preservation of milk, *e.g.* salicylic acid, ether, benzene, chloroform, borax, boroglyceride, &c. Preservation is, however, usually effected by evaporating the milk to a thick syrup and adding considerable quantities of cane sugar. (For recent papers on this subject *v.* A. Mayer, Maly's *Jahrsber.* 12, 168; P. Biedert, Jacobi, Dietzell. *ibid.* 169:

O. Loew, *ibid.* 171; Morgen a. Fleischmann, *ibid.* 13, 174; A. Baginsky, 175).

Alterations in milk.—Many drugs taken in medicinal doses appear in the milk, *e.g.* salts of arsenic, antimony, lead, mercury (?), zinc, &c.; also organic acids and alkaloids. In various diseases the proportion of solids to water and of the different solid constituents is altered; thus in osteo-malacia the lime-salts are increased. Blood and pus may occur in milk; a blue colour sometimes observed is due to the growth of a chromogenic bacterium (vibrio), which, however, appears to be different from that which produces the blue colour in pus (J. Reiset, *C. R.* 96, 682, 745). In tubercular diseases of cattle there is risk of contamination with tubercle bacilli; milk may also act as the carrier of other infections (scarlet fever, typhoid, &c.).

ANALYSIS OF MILK.

Qualitative.—The specific gravity, which is increased by the removal of the cream, and reaction are ascertained in the usual way; the milk may then be examined microscopically. Casein may be precipitated by acetic or hydrochloric acid, by saturation with magnesium sulphate, or by rennet coagulation. The precipitate contains also the fat which may be separated from the casein by ether. The filtrate contains the sugar, salts, and the other proteids of the milk, which may be identified by their usual tests. The butter is best obtained from milk by adding half its bulk of 10 p.c. caustic potash solution, and then shaking the mixture rapidly with twice its volume of ether; on evaporating the ethereal extract the fat is left as a residue. The milk globules may be separated from the rest of the milk by filtration through porcelain under pressure.

Quantitative.—*Solids.* To 10 grains of dry sand add 5 c.c. of milk, and dry at 100° to constant weight. The increase in weight gives the solids in 5 c.c. of milk. Below 10·5 p.c. of solids in cow's milk indicates dilution.

Butter. This may be estimated by weighing the amount of residue from an ethereal extract of milk to which an equal volume of 10 p.c. caustic potash has been added. The normal minimum for fats is about 2·75 p.c. (Cameron). There are also various optical methods which depend on the degree of opacity of milk, which varies directly as the number of globules present; galactoscopes have been invented by Donné and Vogel. (On the lacto-butyrometer, an instrument for estimating the fat by the ether method, *v.* Tollens a. Schmidt, Maly's *Jahrsber.* 8, 140; Kehrer, *ibid.* 11, 179; F. Soxhlet, 180; Egger, 181; M. Schmöger, 182.) *Cream.* This may be roughly estimated by allowing the cream to rise in a narrow graduated vessel; the thickness of the layer being read off at the end of 24 hours. Good milk should yield 10 to 15 p.c. of cream. *Proteids.* Pfeiffer's method is a good one; the casein is precipitated by acetic or hydrochloric acid, and freed from fat by ether; after filtering off the casein the albumin is precipitated in the filtrate by boiling, and after that has been removed the albumose is precipitated by tannin. It must, however, be remembered, as stated above, that albumose is an artificial product. Each of these precipitates is collected, dried, and weighed (Maly's *Jahrsber.* 13, 170; *v.* also Parr, *ibid.* 15, 185). J. Sebelien (*Zeit. Physiol. Chem.* 13, 135) estimates the proteids by the amount of nitrogen in the precipitates produced by various reagents. *Lactose.* The casein, fat, and albumin having been removed, the milk sugar is converted into dextrose by boiling with sulphuric acid, and this is estimated by Fehling's solution or by the polarimetric method.

[In addition to the papers already quoted abstracts of the most important of recent papers on milk analysis will be found in Maly's *Jahrsbericht* as follows: J. Forster, 11, 177; Giunti, 178; Weiske a. Kennepohl, 187; de Leon, 12, 151; Kraach, 155; Stenberg, 161; Emmerich, 165; Fleischmann a. Morgen, 166; Jörgensen, 167; F. Hofmann, 177; Liebermann, 13, 168; C. H. Wolff, 169; Schrodt a. Haussen, 14, 180; *v.* also Schmidt-Mulheim, *Pf.* 30, 602.] Fleischmann, *Das Molkereiwesen*, and Tatlock, *The Produce of the Dairy*, Glasgow, 1888, should be also consulted. W. D. H.

MILK SUGAR *v.* SUGAR.

MILLET OIL. Appears to contain an acid $C_{18}H_{32}O_3$. On fusion with potash oil of millet yields acetic and lauric acids. On distillation it yields an acid $C_9H_{16}O_2$ or $C_{10}H_{18}O_2$ (216°–220°). Oxidation by $KMnO_4$ forms an hexoic acid $C_8H_{12}O_2$, and two oxy-acids $C_{14}H_{26}(OH)_2O_2$ [60°], and oxy-hexoic acid [108°], which yields an acetyl derivative $C_6H_{11}(OAc).CO_2H$ [71°] (Kassner, *Ar. Ph.* [3] 25, 1081).

MILLON'S REAGENT. A solution of mercuric nitrate containing nitrous acid, prepared by dissolving mercury (1 pt.) in HNO_3 (1 pt.) diluted with water (4½ pts.). It gives a red coagulum when warmed with albumen (Millon, *A.* 72, 349).

MINERAL ACIDS. A term sometimes applied to acids formed of elements other than carbon. The term is chiefly applied to the stronger commonly used acids, sulphuric, nitric, and hydrochloric.

MINERALOGICAL CHEMISTRY. Mineralogical chemistry is that part of chemistry which relates to the mineral products of nature; it is also a part of mineralogy, the science which treats, not only of the chemical characters of these products, but also of their physical and geometrical characters, of their modes and places of occurrence, and of their classification.

Mineral products, as they are found in nature, frequently retain much the same character over a considerable extent of country and sometimes for a considerable depth; to such a product the term *rock* is applied, and to each kind of rock is given a special name. Mineral products are either simple or mixed. When simple they cannot be resolved, by mechanical or optical means, into matter presenting different characters; simple mineral products are briefly designated as *minerals.* Rocks are almost always mixed products. Generally the presence of different substances is obvious to the unaided eye, and the constituents can be readily separated from each other by mechanical means. From the rock termed *granite*, for example, may be got at least three kinds of matter: firstly, a substance yielding rhomboidal fragments when broken (*felspar*); secondly, a glassy substance yielding only irregular fractures (*quartz*); and thirdly, a substance which may readily be split into very thin plates (*mica*). By no mechanical process can these substances be resolved into others having different characters; hence they are termed *minerals*; and as they present manifold differences from each other they have received distinctive names. Sometimes the composite nature of a rock is not evident until a slice, made sufficiently thin to be transparent, is examined with a microscope. Or, again, a rock, as for example *marble*, may consist wholly of a single kind of matter.

All simple minerals having the same essential characters are said to belong to the same *species*; those belonging to the same species may likewise have one or more unessential, yet more or less important, characters in common, and are then said to constitute a *variety* of that species.

It is the province of the mineralogist to discover what characters are presented by minerals, to name the characters, to determine their relative importance, to name the species and their varieties, to classify the species, and so on. Such a study of minerals must have been in progress since the earliest times. Even before 300 B.C. the study was so far advanced that minerals were classified as *metals* (*i.e.* those having a metallic lustre), *stones*, and *earths*; the characters then recognised as pertaining to *stones*, and used in their discrimination, were succinctly referred to by Theophrastus as follows:—

> 'There are in stones of different kinds many peculiar qualities, of which colour, transparency, brightness, density, hardness, and the like are frequent, though other more remarkable properties are not so common. But besides these qualities there are others; such as their acting upon other bodies, or being subject or not subject to be acted upon by them. Some are fusible, others will never liquefy in the fire; some may be calcined, others are incombustible; to which it may be added that in the action of fire on them they show also many other differences. Some, as amber, have an attractive quality. Others serve for the trial of metals, as the Lydian stone. But the most known and general properties of stones are their several fitnesses for the various kinds of work: some of them are proper for engraving on; others may be shaped by the turner's tools; others may be cut or sawn; some also there are which no iron instruments will touch, and others which can with difficulty, or scarcely at all, be cut by them.'

In this way it was possible even for the Ancients, without any knowledge of either crystalline form or chemical composition, to determine more or less satisfactorily the species met with in the mineral kingdom.

The definition and classification of species by means of what have been termed 'external characters' (such as crystalline form, cleavage, density, hardness, colour, lustre, &c.)—*i.e.* characters which can be determined without involving a total change of the characters of the mineral—had been found so far satisfactory that the external characters were used both for the definition and classification of the species by the best mineralogists even so lately as the early part of the present century. The most important of the external characters is now recognised to be the crystalline form. It was shown in the year 1772 that all the crystalline forms of the same substance, whether the substance is natural or artificial, are so closely related to each other that they are derivable by simple laws from a single form; and it has since been proved that the whole series of crystalline forms of the same substance can be defined by means of numerical values which fix the shape of one of its forms; hence the limitation of each species to specimens which can be referred to one fundamental crystalline form became a necessity (*v.* CRYSTALLISATION, vol. ii. p. 278).

The recognition of chemical elements and chemical compounds, and of the constancy of the proportion of the elements in each compound, the setting forth of the atomic theory and chemical formulæ, and the development of analytical methods, had great influence on the advance of mineralogy. When the specimens belonging to a species which had been defined by means of external characters were subjected to chemical analysis, it was discovered that in many cases there was a large variation in the proportion, and even in the nature, of the constituent chemical elements. For a time it was supposed that, while some substances have a great tendency to crystallise, others are comparatively inert; that, for example, the crystalline form of dolomite (carbonate of calcium and magnesium) is due entirely to the crystallising power of the carbonate of calcium, and that the carbonate of magnesium is either a mere inactive inclusion, or so feeble a crystalliser as to be completely overpowered by the carbonate of calcium. The explanation of these variations of chemical composition within species, as defined by means of the external characters, was eventually furnished by the principle of *Isomorphism* (*q. v.*); and it then became possible to define a species by means of a combination of only two characters —chemical composition and crystalline form. In other words, it was found that all specimens which can be referred to the same fundamental crystalline form and to the same chemical type have all other essential characters in common, though they may differ in the less important ones, such as colour or transparency. For example, if the forms of crystals can be referred to the same fundamental figure, the differences of crystalline development are themselves unessential; hence the substances popularly known as *dogtooth-spar* and *nailhead-spar*, which can be crystallographically referred to the same rhombohedron, and chemically are carbonate of calcium, are regarded as varieties of the species *calcite*, which includes all specimens having these two fundamental characters in common. Similarly, colour is another unessential character: the specimens belonging to the species *fluor*, for instance, show a remarkable variation in colour. In some cases a variety characterised by a particular colour receives a distinctive name; *emerald* and *aquamarine*, for example, are respectively dark-green and light bluish-green varieties of the species *beryl*. It is very seldom, however, that varieties are really worthy of being distinguished by special names, and in almost every species the transition from one variety to another is so gradual that it is often impracticable to decide on the single variety to which a specimen may be satisfactorily referred. On the other hand there are specimens which, though chemically carbonate of calcium, can all be referred to a single fundamental crystalline form quite distinct from that of *calcite.* They are therefore regarded as belonging to a distinct species and are grouped together under the name of *aragonite.* That such a separation is a legitimate one is shown by the fact that the two species, as thus defined, differ in other important characters, such as cleavage, hardness, specific gravity, optical constants, &c. Hence the chemical compound calcium carbonate is said to be *dimorphous*; but, as already indicated, the difference between the two kinds of substance is much more than one of form. Titanic oxide, again, is met with in nature as three different kinds of substance, each presenting its own set of characters; they are necessarily to be regarded as distinct species, and have received the specific names *rutile*, *anatase*, and *brookite*: titanic oxide is said to be *trimorphous.* The variety of chemical composition among specimens regarded as belonging to a single mineral species, and which is explicable on the above-mentioned principle of isomorphism, is well illustrated by the results of analyses of specimens of *tetrahedrite* (or *grey copper ore*). The crystals of this mineral belong to the cubic system and are hemisymmetrically developed, being all closely related in figure to the regular tetrahedron; chemically they can be referred to the general formula $4R''S.R'''_2S_3$, where R'' includes chiefly Cu_2, Fe, Zn, Ag, and Hg, and R''' includes Sb, As, and Bi. The composition shows the following variations: copper 15 to 42 p.c., iron 1 to 7, zinc 0 to 7, silver 0 to 31, mercury 0 to 17, antimony 12 to 30, arsenic 0 to 20, bismuth 0 to $1\frac{1}{2}$; a few of the varieties, those containing noteworthy proportions of silver or mercury, for instance, have been distinguished by special names. The difficulty of deciding whether a mineral product is to be regarded as a distinct species or as a variety of another species presents itself in the case of the specimens to which the name of *tennantite* has been given; crystallographically they show the same relationship to the regular tetrahedron which characterises the specimens of tetrahedrite, and chemically they are represented by the same general formula $4R''S.R'''_2S_3$; they are distinguished, however, by the absence of antimony (and bismuth): as in the chemical composition of the specimens belonging to the above crystallographic and chemical type there is thus a sudden transition from 12 p.c. of antimony (generally accompanied by more or less arsenic) to zero, the specimens of *tennantite* are generally regarded as entitled to rank as a distinct species. Similarly *aragonite*, *witherite*, *strontianite*, and *cerussite* belong to one chemical type $R''CO_3$, and are almost identical in their fundamental crystalline forms; for the several minerals R'' is essentially Ca, Ba, Sr, and Pb: they are regarded as distinct species because in nature there is found no gradual transition of chemical composition. On the other hand, the isomorphous rhombohedral carbonates belonging to the above chemical type $R''CO_3$, where R'' is Ca, Mg, Fe, or Mn, present such a gradual shading into each other, both chemically and physically, that a perfect definition of species is impossible. Another instructive illustration of this difficulty is furnished by the group of minerals to which the name *garnet* has been given. The garnets crystallise in the cubic system, and in their forms the decahedron is prominently developed; chemically they are represented by the general formula $3R''O.R'''_2O_3.3SiO_2$. They have in general very similar physical characters, though they differ considerably both in colour and specific gravity; they have in fact every claim to recognition as a natural family or group. But the differences of chemical composition are remarkable. R'' and R''' are essentially, for *grossularite*, Ca and Al; for *pyrope*, Mg and Al; for *almandite*, Fe'' and Al; for *spessartite*, Mn and Al; for *andradite*, Ca and Fe'''; for *bredbergite*, Ca, Mg, and Fe'''; for *uvarovite*, Ca and Cr. As the above kinds of garnet are connected by various transitions, it may easily be imagined that the garnet group presents great difficulty as regards the definition of its species, and that it is possible to introduce a large number of unnecessary names into the science.

There are other natural groups or families, however, as for example, the *augite*, *hornblende*, *scapolite*, *felspar*, *mica*, *chlorite*, and *tourmaline* groups, in which the representation of the chemical composition of the whole group by a single chemical formula presents great difficulties. Indeed, the formulæ which are employed in mineral chemistry are at present for the most part empirical; constitutional formulæ, such as are employed in organic chemistry, are almost unknown. Much work must be done before we obtain a real insight into the structure of the more complex silicates. For attempts in this direction the student may refer to the following:—

Silicates in general: *Z. K.* 17, 25.

Minerals are of interest to the chemist as the source of the various chemical elements, the characters of which, and of their combinations, it is his province to study. A few of these elements are found in the uncombined state, notably carbon, sulphur, arsenic, bismuth, copper, silver, gold, and platinum. Some are present in large proportion in numerous mineral species, the latter themselves plentifully dispersed through the earth's crust; others are found in few mineral species, and these only in small quantities and in few localities.

It is the province of the mineralogical chemist to determine the chemical composition of each species and variety, and to represent it by means of an empirical or constitutional formula. A considerable number of minerals are pure or nearly pure chemical compounds of simple constitution, and these are specially interesting to the chemist, as they often furnish him with beautifully crystallised specimens of compounds which, as laboratory products, are either amorphous or are obtained as minute crystals only with much expenditure of time and trouble; among such compounds we may especially note the sulphides of lead, zinc, copper, iron, antimony, and arsenic; the various sulpharsenites and sulphantimonites; the oxides of aluminium, iron, titanium, silicon, and tin; various silicates; molybdate, tungstate, and chromate, of lead; tungstate of calcium; the sulphates and carbonates of calcium, strontium, barium, and lead; various phosphates, arsenates, and vanadates, of copper, lead, and calcium.

Time and energy are now rarely expended in the chemical analysis of a substance unless there is something extraordinary in its external characters; and it is by means of these characters that it is possible to describe for future recognition the substance of which an analysis has been made.

Mineralogical chemistry deals, too, with the classification of all the chemical compounds met with in the mineral kingdom; in fact, the arrangement in large groups is now generally based on chemical composition, though the definition of the species is made to rest also on the crystalline form. The system of classification now generally adopted is as follows:—

Division I. Native elements; metallic and non-metallic.

Division II. The compounds of metals with elements of the arsenic and sulphur groups, viz. arsenides, sulphides, arseno-sulphides, sulpho-salts; and their analogues.

Division III. Chlorides; and their analogues.

Division IV. Compounds of oxygen: (*a*) oxides; (*b*) oxy-salts; namely, (1) carbonates, (2) silicates and titanates, (3) molybdates and tungstates, (4) chromates and sulphates, (5) borates, (6) nitrates, and (7) phosphates, arsenates, and vanadates.

For details *v.* Groth's *Tabellarische Uebersicht der einfachen Mineralien*; Braunschweig, 1889.

The mineralogical chemist observes the reactions of minerals with various reagents, both in the wet and dry way, and on a large or a microscopic scale, and by a classification of reactions he provides means for the determination of the species by chemical methods.

To the mineralogical chemist is further assigned the most important task of discovering the modes in which the various chemical compounds may be produced artificially, and the investigation of the processes and reactions by which these chemical compounds have been actually produced in nature. In this respect *pseudomorphs* (*i.e.* minerals presenting a form characteristic not of their own but of some other substance) are of great value. They are always results of chemical change, and are produced in various ways. Some are merely due to the investment of a substance afterwards removed from beneath the crust; these have been termed *epimorphs*. For example, hollow, well-defined scalenohedra of *limonite* (hydrated ferric oxide) are met with; they owe their form to crystals of calcite upon which the limonite has been deposited. In other cases the original mineral is altered throughout its mass, and suffers a loss of a chemical constituent, as when *galena* (sulphide of lead) is found with the form of *anglesite* (sulphate of lead). Or, again, there has been an addition of a chemical constituent; as when *chessylite* (a hydrated carbonate of copper) is found with the form of *cuprite* (oxide of copper). Or, again, there has been an exchange of chemical constituents; as when *galena* is found with the form of *pyromorphite* (phosphate and chloride of lead), or *calcite* with the form of *gypsum*. Sometimes there is a complete exchange of material without loss of form; as when copper is found with the form of aragonite. Pseudomorphs illustrate the decomposing influences to which many minerals have been subjected, and throw valuable light on the order of succession in which, and the conditions under which, particular minerals have been formed and deposited; and in furnishing sure proofs of conversions which we cannot hope to effect in the laboratory, they afford a knowledge of facts which can be arrived at in no other way.

The following works, relative to the artificial production of substances met with as minerals, may be consulted:—

Fuchs, *Die künstlich dargestellten Mineralien*, Haarlem, 1872.

Daubrée, *Études synthétiques de géologie expérimentale*, Paris, 1879.

Fouqué a. Lévy, *Synthèse des minéraux et des roches*, Paris, 1882.

Bourgeois, *Reproduction artificielle des Minéraux*, Paris, 1884. L. F.

MINT. The oil of spear mint (*Mentha viridis*) contains $C_{10}H_{14}O$ (225°), S.G. ·952, and a terpene (Gladstone, *J.* 1863, 548; *cf.* Kane, *A.* 32, 286).

Peppermint *v.* Menthol.

MOCHYLIC ALCOHOL $C_{26}H_{46}O$. [234°]. Present in bird-lime as mochyl palmitate $C_{42}H_{76}O_2$ (Divers a. Kawakita, *C. J.* 53, 274). Slender lustrous prisms; insol. water, v. sl. sol. petroleum-ether, v. sol. ether, m. sol. alcohol. Dissolves like birdlime in conc. H_2SO_4 with a red colour. Heated with palmitic acid in sealed tubes to 160° a substance very similar to birdlime is obtained. Yields on distillation a hydrocarbon $C_{26}H_{24}$.

MOLECULAR CONSTITUTION OF BODIES, THEORIES OF. The theory of the molecular constitution of matter now universally accepted was held long before any crucial proof was given of its necessity. For though such phenomena as the enormous changes in volume which take place when a gas condenses to a liquid point most strongly to some such view, they cannot be held to be conclusive, unless it is considered axiomatic that a perfectly homogeneous structure is incapable of dilatation or contraction. The first attempt to give more elaborate reasoning in favour of the molecular theory of the constitution of matter seems to have been made by Cauchy, and was founded upon the dispersion which light experiences when it passes through transparent bodies. Since the velocity of light when passing through such bodies depends upon the wave-length of the light, and also on the nature of the body, Cauchy argued, that since a velocity is not of the same dimensions as a length, the velocity cannot depend upon the wave-length absolutely, but must depend merely upon its ratio to some other length; now the only length available is one derived from the body itself, and since the dispersion does not depend upon the dimensions of the transparent body, this length must be one intrinsic to the body; the body therefore cannot be homogeneous and without structure or there would be no such length available; the body must therefore be coarse-grained. This reasoning, however, is not quite conclusive, for light of different wave-lengths has different times of vibration, and the phenomenon of dispersion might be expected if there were any time connected with the structure of the body which could come into comparison with the time of vibration of the light. Dispersion proves that the transparent body is coarse-grained, either with respect to space or time, but does not prove that it is necessarily coarse-grained with regard to space on a scale comparable with the wave-length of light. In fact, in the theories which have been put forward to explain dispersion, this phenomenon is made to depend upon the ratio of the time of vibration of light to some time of vibration of the molecules of the system. A less ambiguous proof of the molecular structure of gases was given by Osborne Reynolds in his paper '*Some Dimensional Properties of Matter in the Gaseous State*' (*T.* 1879). This proof was founded on the phenomenon called the 'thermal effusion' of gases. This phenomenon is of the following kind:—If we have a vessel divided into two portions by a porous diaphragm, say of stucco or meerschaum, and the gas on one side of the diaphragm is kept at a different temperature from that on the other side, it is found that, in order to prevent the gas flowing from the cold to the hot side of the diaphragm, the pressure of the gas on the hot side must be greater than that on the cold side, and that the difference of pressure required to prevent the flow obeys different laws according as the gas is dense or rare. If the gas is dense, this difference of pressure varies inversely as the density of the gas, while if the gas is rare, the difference of pressure varies directly as the density. Reynolds found that the density of the gas at which the law changed from one form to the other depended upon the fineness of the pores of the diaphragm; the finer the pores, the greater was the density at which the law changed. Thus, since the law connecting the difference of pressure with the density depends upon the diameter of the pores of the diaphragm, there must be some length in the gas with which this diameter of the pores can come into comparison; the gas must therefore have structure, and since the density of the gas when the law changes is greater for small pores than for large ones, the structure of the gas must be finer at great densities than at low ones. The investigations of Sir William Thomson (*Popular Lectures and Addresses*), Loschmidt, and others, have gone further than this, and have not merely furnished proofs that matter has structure, but have given limits below which the coarse-grainedness of matter cannot lie. These investigations are founded on considerations about surface-tension, the difference of potential which occurs when two metals are put in metallic connexion, the amount of polarisation at the surface of an electrode and an electrolyte, the viscosity, the diffusion, and the conductivity for heat, of gases. It will be sufficient for us to show how one of these leads to a limit for the dimensions of molecular structure, and we will take the one depending on the surface-tension. The surface-tension of a film of liquid is not likely to alter until the thickness of the film falls below the distance at which one molecule ceases to exert an appreciable influence on another, for it is only the molecules within a film of this thickness which can exert any influence on those at the surface; so that if we can find a limit to the thickness of a film which possesses an unaltered surface-tension, we shall have a quantity comparable with the distance up to which one molecule exerts an appreciable effect on another. When a film is stretched, work is done on it against surface-tension, and this work is stored up in the film, so that if the surface-tension were the same for an infinitely thin film as for one of finite thickness, an infinite amount of work could be stored up in the film. But the greatest amount of energy which can be stored up in, say, a gram of water must be less than the amount required to separate the molecules to such a distance that they no longer exert any influence on each other; but this is exactly what is done when the water is vaporised, so that the greatest amount of energy which can be stored up in a gram of water is less than the amount required to convert it into steam. To convert one gram of water at 15° into steam requires the expenditure of $621 \times 4{\cdot}2 \times 10^7$ ergs. If T be the surface-tension of water, and if the gram of water is stretched into a thin film whose thickness is x, the work done in stretching it is $\frac{2T}{x}$, but this is not all the energy which is communicated to the film, for, unless heat is supplied to the film as it stretches, it will cool; the amount of heat which must be supplied to the film, when measured in mechanical units, is about half the work done in stretching the film, so that the total energy communicated to the film is $\frac{3T}{x}$; this must be less than the work required to vaporise the film, so that $\frac{3T}{x}$ must be less than $536 \times 4{\cdot}2 \times 10^7$, or putting T at 15° equal to 74, x cannot be less than $8{\cdot}5 \times 10^{-9}$ cm., that is, a thickness of 10^{-8} cm. must be comparable with the range of molecular action of the water molecules.

Quincke (*P.* 137, 402) investigated the range of molecular forces, by finding the thickness of a silver film which when deposited on glass just began to alter the capillary ascent or depression of water in contact with the glass. The results of this, and other investigations with a similar object, are summarised in the following extract from a paper by Rücker (*C. J. Trans.* 1888. 260):—

Table of properties of thin films and of molecular magnitude.

Thickness of film = 118×10^{-7} cm.

Superior limit to the radius of molecular action, deduced from Plateau's experiments (*Statique des Liquides*, 1873, i. 210) on the pressure of a soap-bubble, by using Maxwell's theory that the surface-tension first diminishes when the thickness of the film equals the range of molecular action, $96 \times 10^{-7} - 45 \times 10^{-7}$.

Between these limits the thickness of a film begins to be unstable, that is, the surface-tension begins to diminish. Hence the radius of molecular action must be $< 96 \times 10^{-7}$ and $> 22 \times 10^{-7}$ cm.

50×10^{-7} cm.

Value of the range of molecular action deduced by Quincke (*P.* 137, 402) from experiments on capillary elevation.

12×10^{-7} cm.

Average thickness of black soap films, measured by two independent methods.

As the tension of a black film is equal to that of a thick film, the surface-tension, which begins to diminish at 50×10^{-7} cm., must increase again, and reach its original value at 12×10^{-7} cm. This is also about the thickness below which, according to O. Wiener (*W.* 31, 629), a thin silver plate will no longer produce the same effect on the phase of reflected light as a thick silver plate would do.

$10{\cdot}5 \times 10^{-7}$ cm.

Thickness of the permanent water-film observed by Bunsen (*W.* 24, 322) on unwashed glass at a temperature (23° C.) at which the vapour pressure of water is small.

4×10^{-7} to 3×10^{-7} cm.

Average distance from centre to nearest centre of molecules in gases under standard conditions, calculated by Meyer (*Die kinetische Theorie der Gase*).

3×10^{-7} cm.

Thickness of metal films required to polarise platinum completely (Oberbeck, *W.* 31, 331).

10^{-7} to 2×10^{-9} cm.

Thickness of electric double layer, according to Oberbeck and Falck (*W.* 21, 157).

2×10^{-8} cm.

Smallest thickness of silver which affects the phase of reflected light (Wiener, *l.c.*).

$1{\cdot}4 \times 10^{-8}$ to $1{\cdot}1 \times 10^{-8}$ cm.

Diameter of gaseous hydrogen molecule.

$7 \times 10^{-9} - 2 \times 10^{-9}$ cm.

This is given by combining (1) the specific inductive capacity and coefficient of viscosity; (2) the refractive index and coefficient of diffusion; (3) the law of expansion and the thermal conductivity.

Average distance between centre of molecules supposed arranged uniformly in liquids and solids according to Thomson.

2×10^{-9} cm.

Inferior limit to the diameter of a gaseous molecule according to Thomson. These results may be shortly summed up as follows:—

10^{-7} cm.		
118×1	Superior limit to range of molecular action.	Plateau. Maxwell.
98–45	Range of unstable thickness begins.	Reinold and Rücker.
59	Superior limit to range of molecular action.	Plateau.
50	Magnitude of range of molecular action.	Quincke.
12	Range of unstable thickness ends.	Reinold and Rücker.
12	Action of silver-film on phase of reflected light alters.	Wiener.
10·5	Thickness of permanent water-film on glass at 23°.	Bunsen.
4–3	Mean distance between centres of nearest molecules in gases at 760 mm. and 0° C.	O. Meyer.
3–1	Thickness of metal-films which polarise platinum.	Oberbeck.
1–0·02	Thickness of electric double layer.	Lippmann and Oberbeck.
·2	Smallest appreciable thickness of silver-film.	Wiener.
·14–·11	Diameter of gaseous hydrogen molecule.	Exner. O. Meyer. Van der Waals.
·07–·02	Mean distance between centres of nearest liquid molecules.	W. Thomson.
·02	Inferior limit to diameter of gaseous molecule.	W. Thomson.

Having obtained some idea of the coarseness of the structure of matter, we shall now consider various theories of that structure. In order to see what has been explained by these theories, and what remains to be explained, let us enumerate the most important properties of matter in that state of aggregation when the properties are the most simple, *i.e.* the state of a so-called 'perfect' gas.

1. The relation between pressure, density, and temperature is expressed by the laws of Boyle and Charles, $p = \kappa \rho \theta$, when p is the pressure, ρ the density, and θ the absolute temperature of the gas, and κ is a quantity which remains constant for the same gas. For different gases κ is inversely proportional to their combining weights. In all such gases there is the same number of molecules in unit volume, provided the pressure and temperature are the same.

2. The gases possess viscosity. The coefficient of viscosity (unless the density is very greatly reduced) is independent of the density, but depends upon the temperature. The most recent experiments show that the viscosity varies as the two-third power of the absolute temperature (Barus, *Bulletin of the U. S. Geological Survey*, No. 54, 1889).

3. The gases conduct heat with a facility depending on the temperature.

4. They diffuse into each other with a rapidity depending upon the density and the temperature.

5. They possess specific heats of various kinds, the ratio of the specific heat under constant pressure to that under constant volume being 1·4 for most gases.

6. They exhibit phenomena of the type of those which occur in the radiometer.

7. When they are raised to a high temperature they become luminous, and give out rays of definite periods, the periods being independent of the temperature. They absorb light of the same periods as those they give out when hot.

8. They possess very different electrical properties. For low differences of potential they insulate almost perfectly; but when the electric intensity is raised sufficiently a spark passes through them, and the electricity is discharged.

9. The various gases exhibit very different chemical properties.

According to the kinetic theory of gases a gas consists of a great number of small particles called molecules, moving about with great velocity in all directions, but continually either striking against each other, or coming so near together that they exert forces on each other which produce effects somewhat similar to those produced by the collision of two elastic balls. This theory has been shown by Maxwell and

Clausius (Maxwell's *Theory of Heat*; O. E. Meyer's *Die kinetische Theorie der Gase*) to be sufficient to explain all those properties of gases included under (1). These properties are independent of the nature of the molecule, and of the exact way in which two molecules act upon each other. They could be deduced equally well whether we supposed the molecules to be hard elastic spheres, or systems attracting or repelling each other when they come near together, or vortex rings. When we consider other properties besides those included in (1), we find the explanation less satisfactory. The theory gives an explanation of the viscosity, diffusion, and conduction of heat; but the exact way in which these properties vary with the temperature depends upon the nature of the action between the molecules. Two cases have been worked out by Maxwell. In the first case the molecules were supposed to be hard, perfectly elastic spheres, and which only acted upon other molecules when in collision with them. According to this hypothesis, the coefficient of viscosity would be proportional to the square root of the absolute temperature. The other case which has been worked out by Maxwell is that in which the molecules are regarded as systems repelling each other with forces which vary inversely as the fifth power of the distance between them. According to this hypothesis, the coefficient of viscosity would be proportional to the absolute temperature. The experiments of Barus (*l.* c.) and others show that the coefficient of viscosity obeys neither of these laws, but varies more quickly with the temperature than the result obtained on the first hypothesis, and more slowly than that obtained on the second. Neither of these theories of the action of one molecule on another can be the true one. Sutherland (*P. M.* 24, 113, 168), by considering the results of Thomson and Joule's experiments on the cooling of gases passing through a porous plug, arrives at the conclusion that the force between two molecules must be inversely as the fourth power of the distance between them. The value of the temperature-coefficient of the viscosity on this hypothesis has not, however, been worked out.

The fact that the ratio of the specific heat at constant pressure to the specific heat at constant volume is the same for the perfect gases with the same number of atoms in the molecule has not been explained by the kinetic theory, and in fact the results we should expect from the kinetic theory are so different from those actually observed that they constitute perhaps the gravest difficulty which the kinetic theory has yet encountered. The results to which the kinetic theory leads are easily found. Let T_m be the total kinetic energy of the molecules in unit mass, β the ratio of this to the energy due to the translatory motion of their centres of gravity, p the pressure, v the volume of unit mass, and θ the absolute temperature. Then $T_m=\frac{3}{2}\beta p v$, so that k the specific heat at constant volume will equal $\frac{3}{2}\frac{\beta p v}{\theta}$. If the pressure is kept constant, then, in addition to the energy spent in warming the gas, an amount of work—$p\times$(change in volume for one degree)—is done; but when the pressure is constant the volume is proportional to the absolute temperature; so that the change in volume for one degree $=v/\theta$. Thus, if k_p be the specific heat at constant pressure, then

$$k_p=\frac{3}{2}\frac{\beta p v}{\theta}+\frac{p v}{\theta};$$

$$\text{so that } \frac{k_p}{k_v}=\frac{\frac{3}{2}\beta+1}{\frac{3}{2}\beta}$$

or if the ratio of the specific heats be denoted by γ

$$\gamma=1+\frac{2}{3\beta}; \quad \beta-1=\frac{5-3\gamma}{3(\gamma-1)}.$$

Now $\beta-1$ is the ratio of the internal energy of the molecules to that due to the motion of translation of their centres of gravity, and we see from the preceding equation that this depends only upon the ratio of the two specific heats; the constancy of this ratio for different gases shows that the proportion which the vibratory energy bears to the energy of translation must be the same for all such gases, so that at the same temperature the vibratory energy of all these gases must be the same. Now the number of lines visible in the spectrum of the various gases is very different, and we should therefore expect the gases to have very different capacities for vibratory energy. The fact that it is not so seems to indicate that the vibratory energy is not due, at any rate at low temperatures, to those quicker modes of vibration which manifest themselves as light, but must be due to some other modes common to all gases. This mode in a diatomic gas may, possibly, be the motion of the atoms relatively to each other; and this view is strengthened by the fact that the ratio of the vibratory to the translatory energy increases with the number of atoms in the molecule. Thus, if we take Dulong's values of the ratio of the specific heats for hydrogen, carbon dioxide, nitrous oxide, and ethylene, the values of the ratio of the vibratory energy to the energy of translation are respectively ·75, 1·1, 1·1, and 2; thus, for these gases the ratios are very approximately proportional to the number of atoms in the molecule; and the result suggests that the vibratory energy at these low temperatures is that of the atoms in the molecule relatively to their common centre of gravity, and not of the quicker modes of vibration corresponding to the luminous rays. If experiments on the ratio of the specific heats could be made at temperatures high enough to produce luminosity of the gas, it is possible that the results might be different from those made at lower temperatures, and that they might be found to vary from gas to gas.

Theories of the Constitution of the Molecule. The kinetic theory of gases, as developed by Clausius and Maxwell, dealt chiefly with the behaviour of a large number of molecules, and said little about the constitution of individual molecules. Quite recently, however, Sir W. Thomson (*Lectures on Molecular Dynamics and the Wave Theory of Light*) and Lindemann (*Ueber Molekularphysik*; *Physikalisch. Gesellschaft*, Königsberg, 39 [1888]) have discussed the properties of a molecule consisting of a number of spherical shells, one inside the other, each shell being connected to the one next it by an elastic spring. The external spherical shell is supposed to be acted on by the ether, or, what is the same thing, by a periodic force whose period is that of the vibrations which the ether is transmitting. We may say in passing that many of the results obtained do not depend upon this special view of the construction of the molecule, but would be true if we supposed the molecule to be a dynamical system whose configuration could be fixed by n co-ordinates, that is, a system possessing n degrees of freedom. The behaviour of such systems when light falls upon them is investigated in the papers above mentioned, and expressions are obtained for the refractive index of a medium consisting of molecules of this kind for light of any period. These expressions explain the dispersion of light, and the results deduced from them agree with those found by experiment; they also explain the anomalous dispersion of the rays whose periods nearly coincide with those which are absorbed by the medium—a subject which was investigated experimentally for several substances, especially a solution of fuchsine in alcohol, by Kundt and Christoffel—the periods of vibration of the glowing gas being the periods of vibration of the spherical shells which constitute the molecule. The nature of the molecules assumed in this theory imposes a limit to the amount of energy due to the relative motions of the shells; for it is evident that the amplitude of vibration of any shell cannot be greater than the difference between its radius and that of a neighbouring shell. Thus, on Lindemann's theory, the internal kinetic energy reaches a maximum, and when it has reached this maximum any further exposure to light must lead to an increase in the translatory energy, and thus to an increase in the temperature of the system made up of such molecules.

Lindemann explains the development of heat which occurs on chemical combination by the transference of the internal kinetic energy into translatory energy, the substances after combination possessing less internal energy than before, the heat being produced by a loss of kinetic energy, and not, as in the ordinary explanation, by a loss of the potential energy of separation. If this view is correct, however, the internal kinetic energy must in certain gases be enormously greater than the translatory energy; thus, for example, in the combination of hydrogen and oxygen enough heat is produced to raise the temperature of the mixture nearly 20,000° C.; and even assuming that after combination there is no internal kinetic energy, the internal kinetic energy before combination must be about 70 times the translatory energy. It is very difficult to see how this can be reconciled with the value found by experiment for the ratio of the specific heat at constant pressure to that at constant volume.

According to Lindemann, the electric properties of bodies are to be explained by internal kinetic energy due to vibrations which are too quick to be visible; in fact, roughly speaking, electricity is ultra-violet light. This view is open to many difficulties, one of which is that it would not lead us to expect the great difference that exists between the electrical properties of the atom and the molecule. A molecule seems to be almost electrically neutral; thus it is impossible to communicate a charge of electricity to the molecules of a gas, though when the molecule is split up into atoms it exhibits most energetic electrical properties. Karl Pearson (*Proc. London Math. Soc.*, 20, 38) has developed a theory in which the molecules are supposed to be made up of spheres vibrating in an uncompressible fluid; he obtains results similar to those of Sir W. Thomson and Lindemann. In fact, as we said before, many of these results do not depend upon the nature of the molecule, but would be true if we supposed the molecule to be a dynamical system possessing n degrees of freedom.

Evidence as to molecular structure afforded by the spectra of bodies.—If we consider the oscillations of a dynamical system possessing n degrees of freedom, we find that there are n periods of vibration given by the roots of a determinantal equation, and that the relation between these roots depends on the nature of the system; a system could be constructed having n periods of any given value. If, however, the system possesses an infinite number of degrees of freedom, there will be an infinite number of periods, but the periods will be connected by more or less simple relations. Thus, if the vibrating system were like a stretched string, the periods would be proportional to the natural numbers, while if it were like a bar, the periods would be proportional to the natural numbers for the longitudinal and torsional vibrations, and to the roots of the equation $\frac{1}{x}\left\{\epsilon^{\frac{1}{x}}+\epsilon^{\frac{-1}{x}}\right\}=\pm 2$ for the transversal vibrations. If the system were a circular membrane, the frequencies would be proportional to the roots of an equation formed by equating a Bessels function to zero. If the system were a uniform elastic sphere, the frequencies would be the roots of a complicated equation given by Chree in the *Transactions of the Cambridge Philosophical Society* (14, 316, 317). Other periods which have been worked out are those of circular vortex rings. The frequencies of the higher vibrations about the circular form are proportional to $\sqrt{n^2(n^2-1)}$, where n is a large natural number, and the vibrations about the circular cross section are proportional to the natural numbers (J. J. Thomson, *On the Motion of Vortex Rings*, 35, 74). Many investigations have been made with the object of finding whether or not there are simple harmonics—that is, frequencies proportional to the natural numbers—in the spectra of bodies. In the case of the spectrum of hydrogen, Johnstone Stoney finds that the wave-lengths 4102·37, 4862·11, 6563·93, which occur in this spectrum, are very accurately in the ratio $\frac{1}{32}, \frac{1}{27}, \frac{1}{20}$. Schuster, however, in his 'Report on the Genesis of Spectra' (*B. A. Reports*, 1882) says:

> 'Other writers, as, for instance, Soret (*P. M.* 1871. 464), have from time to time drawn attention to harmonic ratios in various spectra, and the author of this report has during the last ten years collected a large quantity of material bearing on the question. The results have, on

the whole, not been favourable to the theory of harmonic ratios. In any spectrum containing a large number of lines it is clear that, owing to accidental coincidences, we shall always be able to find ratios which agree very closely with the ratios of small integer numbers. It is only by means of a systematic investigation that we can find out whether these coincidences are due to any real cause. We must, by means of the theory of probabilities, calculate the number of the coincidences, which we might expect to find on the supposition that the lines are distributed at random throughout the whole range of the visible spectrum. If on calculating out all fractions which can be formed in a spectrum by any pair of lines the number of ratios agreeing within certain limits with ratios of integer numbers greatly exceeds the most probable number, we should have reason to suppose that the lines are not distributed at random, but that the law suggested by Messrs. Lecoq de Boisbaudran and Stoney is a true one.

'The results of a long investigation conducted in this manner tend to show that the number of harmonic ratios is, if anything, smaller than was to be expected on the hypothesis of no connexion.'

The simple harmonic ratio is not, perhaps, *à priori* the most probable relation between the periods. Balmer (*W.* 25, 80) has shown that the wave-lengths of a series of hydrogen lines are expressed by the formula $\frac{Cm^2}{m^2-4}$, where m is an integer. Hagenbach (*Verhand. d. Naturforsch. Ges. zu Basel*, 1886) has compared the results of this formula with Cornu's measurements of the wave-lengths of the hydrogen lines; the result of the comparison is given in the following table:—

$$\lambda = 3645{\cdot}42\frac{m^2}{m^2-4}$$

Line	m.	Calculated wave-length	Observed wave-length	Difference
Hα	3	6562·8	6563·1	+·3
Hβ	4	4860·6	4860·7	+·1
Hγ	5	4339·8	4339·5	−·3
Hδ	6	4101·1	4101·2	+·1
Hε	7	3969·5	3969·2	−·3
Hζ	8	3888·4	3888·1	−·3
Hη	9	3834·8	3834·9	+·1
Hθ	10	3797·3	3797·3	·0
Hι	11	3770·0	3769·9	−·1
Hκ	12	3749·6	3750·2	+·6
Hλ	13	3733·8	3734·1	+·3
Hμ	14	3721·4	3721·1	−·3
Hν	15	3711·4	3711·2	−·2

These results seem to show that the hydrogen molecule is a system possessing an infinite number of degrees of freedom, and not a finite number of rigid particles mutually attracting each other.

It is worthy of notice that when m is large the formula previously quoted for the frequency of vibrations of a circular vortex ring becomes $\lambda = \frac{Cn^2}{n^4-\frac{1}{2}}$ which is of the same type as Balmer's.

A very striking feature in the spectra of some elements is the recurrence in the spectra of certain groups of lines—for example, triplets in the magnesium, doublets in the sodium, spectrum—and the most promising way of finding whether there is anything corresponding to overtones in the spectrum would be the investigation of the relation between the frequencies of the lines in these groups as they recur in the spectrum. It is stated by Schuster that no simple harmonic relations exist between these groups. Deslandres (*C. R.* 104, 972) has shown that the periods of the recurring bands in the nitrogen spectrum are connected by a relation of the form An^2+B, where n is an integer.

The first explanation of the existence of these groups which suggests itself is that corresponding to a triplet we have three, to a doublet two, similar systems near together. Each of these systems, if free from the other's influence, would vibrate with the same period, but when placed so near together that they influence each other, the system of three will have three, and that of two will have two, nearly equal periods.

The theory of the oscillation of such systems shows that the gravest mode of the combined system will be lower, and the highest higher, than that of the original system. Thus in a triplet corresponding to each line of the original system, there will be three lines. If this view is correct, then any 'element' in whose spectrum doublets or triplets occur is capable of being split up into simpler systems, and the lines of the substance into which it is split up will be intermediate between those of the doublets or triplets. Thus, we should expect to find a tendency for these doublets to disappear as the temperature is raised. Though there does not seem much evidence to show that this tendency is widespread, it does appear to exist in the case of calcium, for in the drawing of the spectrum of this element given in Lockyer's *Studies in Spectrum Analysis* (191) there is in the violet end of the spectrum a doublet where the spark is taken without a jar in the circuit, but when a large jar is placed in the circuit the doublet is replaced by a single line intermediate to those of the doublet.

The widening of the lines of the spectrum of a gas when the pressure is increased might be explained on similar principles. A molecule when free from the influence of other molecules vibrates in certain definite periods, and shows sharp bright lines in its spectrum; when, however, it gets under the influence of another similar molecule its periods are slightly altered, and for each of the original periods we have two periods, the one graver and the other higher than the original period; the departure from the original period depending on the distance between the molecules. Thus, in the case of a gas so dense that the molecules influence each other, the molecules, instead of emitting light of a definite period, would emit light of different periods, some higher and some lower than the undisturbed one; thus, instead of a bright line in the spectrum, we should have a luminous band stretching across the original bright line.

Connexion between spectra of elements and those of their compounds.—One of the most interesting subjects in connexion with molecular theories, and one from which we may hope to gain great insight into molecular structure, is the connexion between the spectrum of a compound and the spectra of its constituents. Mitscherlich showed that compounds have emission-spectra of their own. A considerable amount of work bearing on the subject has been done by Gladstone and Dale, Abney and Festing, Kundt, and others, who have investigated the absorption-spectra of compounds. But, however important these researches are from other points of view, they cannot be said to have as yet thrown much light on the structure of matter.

A relation between the lines in the spectrum of a compound and the lines in the spectra of its elements, based on a mathematical theory, which, however, does not seem yet to have been published, has been enunciated by Grünwald, who states (*P. M.* (6) 34, 354):—

> 'Let *a* be a primary chemical element, which is chemically combined with other elements in a gaseous substance A, and occupies the volume [*a*] in the unit volume of A. Let the substance A combine chemically with another gaseous substance B, to form a third C. In this combination let the element *a* pass into a different chemical condition *a′*, giving up (or in exceptional circumstances taking up) a certain quantity of heat in order to permit the new compound to form, and in consequence chemically contracting (or exceptionally expanding). Let the volume which it occupies in the body C, after the new condition of chemical equilibrium has been established, be [*a′*], then the quotient [*a*]:[*a′*] is generally a very simple rational member in accordance with a known fundamental law of chemistry. If this is the case the wave-lengths λ of all the rays which belong to the element *a* in the line-spectrum of the free substance A, and are therefore radiated by it, are related to the wave-lengths λ′ of the corresponding rays, which the same element emits in the new chemical condition *a′*, in which it exists in the more complex substance A within the newly-formed compound C, as the corresponding volumes [*a*] and [*a′*].'

This relation has been tested in the case of water vapour; as however both this substance and hydrogen have a good many lines in their spectra, it is not surprising that coincidences occur between the observed and calculated values of the wave-lengths of the lines in the water-vapour spectrum. We must, therefore, suspend our opinion as to the value of the relation given by Grünwald until the theoretical grounds on which it is based have been published. See also Ames (*N.* 40, 19).

In a binary compound, A B, we may suppose that the atoms A and B are dynamical systems, which in the molecule of the compound are near together, and that the proximity of A causes the periods of B to be slightly different from the periods when B is vibrating by the influence of other systems, and *vice versâ*. Then the theory of the vibrations of such a system shows that if $p_1—p_2—p_n$ are the frequencies of A when free, $q_1—q_n$ those of B; $\delta p_1 \ldots \delta p_n$, $\delta q_1 \ldots \delta q_n$, the increase in the frequencies p_1—, respectively, due to the proximity of the two systems; then

$$p_1 \delta p_1 = \frac{{f_{11}}^2}{{p_1}^2 - {q_1}^2} + \frac{{f_{12}}^2}{{p_1}^2 - {q_2}^2} + \ldots.$$

With similar expression for $\delta q_1 \ldots$ &c. The quantities $f_{11} \ldots$ are quantities depending on the proximity of the systems.

From this relation we see that the effect on the period, say p_1, of the first system of the existence of a period, say q_2, in the second, is to quicken the period of the first, if the first is quicker than the second, and to retard it, if it is slower than the second. If we observe the spectra, this result could be expressed by saying that the effect of the annexation was to make the line of B repel the lines of A. Thus on this theory the spectrum of the compound may be got by superposing the spectra of its constituents, A and B, and then supposing the lines of A to repel those of B, and the lines of B to repel those of A, the repulsion increasing with the proximity of the lines. Thus if we take two elements A and B, such that A and B have two lines nearly coincident, then in the compound A B these lines will be considerably displaced and the distance between them increased.

Arrangement of the atoms in the molecule on the supposition that the atoms are vortex rings. There is one theory of the structure of the molecule which is worth mentioning, as it affords a possibility of the explanation of that remarkable alternation of properties with atomic weight which is expressed by the periodic law. If we assume that a molecule is built up of a number of vortex rings placed close together, then a section of the molecule, by a plane through the centre at right angles to the planes of the ring, will consist of two groups, each consisting of a number of small circles. The arrangement of the circles in either group will be very much the same as the arrangement, when in steady motion, of the cross sections of the same number of uniform straight parallel vortex columns with circular sections. These, when in steady motion, arrange themselves in a definite way, which may easily be discovered without calculation, as the arrangement is very nearly the same as that of the same number of equal uniform parallel magnets under the attraction of a magnetic pole, some distance away from the nearer poles of the parallel magnets, and of opposite sign to these poles. These magnets will take up definite positions of equilibrium, under the action of their mutual repulsion and the external attraction. The figures of equilibrium of the magnet are given by Mayer (*N.* 18, 258) and Monckman (*Proc. Camb. Phil. Soc.* 6, 169). If we examine these figures, we see that as the number of magnets increase there is a tendency for certain peculiarities to recur, as, for example, the number of planes of symmetry, and the nature of the simpler groups of which we may imagine the more complex ones to be made up. Thus, if we imagine the molecules of all elements to be made up of the same primordial atom, and interpret increasing atomic weight to indicate an increase in the number of such atoms, then, on this view, as the number of atoms is continually increased, certain peculiarities in the structure will recur, which in all likelihood would be accompanied by a recurrence of some of the properties of the elements.

Electrical theory of molecular structure.—There is another view of molecular structure which is almost forced upon us by the laws of electrolysis; this is, that the forces between the atoms in the molecule are electrical in their origin. On this theory, the atoms in the molecule of a compound are supposed to be charged with definite quantities of electricity, the quantity of electricity on the atom being the same for all elements of the same valency, and being positive or negative, according as the element is electro-positive or electro-negative. The charge on an atom of a divalent element is assumed to be twice, and that on an atom of a trivalent element three times, the charge on the atom of a monovalent element (*v.* Von Helmholtz [*Faraday Lecture*], *C. J.* 39, 277). This view of the structure of the molecule at once explains Faraday's law of electro-chemical decomposition. It also explains the difference which exists between the electrical properties of the molecule and the atom; for in the molecule the positive and negative charges neutralise each other's effect at points outside the molecule; the free atom is, however, essentially charged and therefore capable of producing electrical effects. When we dissociate a gas into atoms, the dissociated gas, on this theory, consists of an equal number of electrically charged particles, some being charged with positive electricity, and an equal number (if the constituents of the molecule are of the same valency) charged with negative electricity. This collection of electrified particles would behave like a conductor of electricity, so that, if this theory of the structure of the molecule is correct, a gas whose molecules are dissociated by heat into atoms ought to be a conductor of electricity. J. J. Thomson (*P. M.* [6] 29, 358, 441) has recently made a series of experiments on the conduction of electricity through very hot gases, and has found that while some of these hot gases (hydriodic acid gas, for example) allow electricity to pass through them with ease, others (such as nitrogen) only allow it to do so with great difficulty; and it was found that whenever the electricity passed with ease through a hot gas, the dissociation of the gas could be detected by chemical means. These experiments are, therefore, in accordance with the result of this theory of molecular structure. On this view of molecular structure the 'bonds of affinity' of chemists have a distinct physical meaning, as they are the tubes of electrostatic force connecting the atoms.

A difficulty which arises on this theory, and one that seems to show that it requires modification, is the existence at low temperatures of what are called by chemists unsaturated compounds. For, according to this view of the structure of matter, an unsaturated compound is one in which there are not equal and opposite quantities of electricity in each molecule, so that the molecules of an unsaturated gas, being electrically equivalent to a number of positively and negatively charged particles, ought to behave like a conductor. But gases which are unsaturated at low temperatures, such as NO, behave at these temperatures with respect to electricity like saturated gases; they transmit electric induction. For example, a gold leaf electroscope will work perfectly well inside a glass vessel containing NO, and its leaves will be attracted by an electrified body outside the electroscope; and a current of electricity cannot be driven through a tube containing such gases by a battery containing only a small number of cells. We must therefore conclude that electrically such gases are saturated.

Maxwell, in the article on the 'Constitution of Bodies,' *Encyclopædia Britannica*, introduced the idea that in solids the molecules might arrange themselves in groups, some of which under the action of stresses might split up and form other stable groups in which the molecules are differently arranged, these new groups returning only slowly to their original configuration after the stresses are removed. This behaviour of the molecular groups shows itself in the 'elastic after effect' produced by torsion in metal wires and glass fibres. Ewing (*P. M.* [6] 30, 205) has lately applied the same idea to explain the behaviour of iron when magnetised, and has devised a model which illustrates very clearly the breaking up of the old groups and the formation of new ones. J. J. T.

MOLECULAR WEIGHTS. The article ATOMIC AND MOLECULAR WEIGHTS, in vol. i., describes the limits within which the term molecular weight may be applied with safety to solid and liquid bodies (*v.* especially pp. 347–350). Since that article was printed, an advance has been made in the methods by which the molecular weights of bodies which cannot be gasified without decomposition may be determined. This advance is based, for the most part, on the researches of Raoult. As the result of a long series of investigations into the lowering of the freezing-point of water and various other solvents, produced by dissolving therein quantities of various compounds proportional to the formula-weights, or reacting-weights, of these compounds, Raoult finds that such quantities of chemically similar compounds generally produce equal lowerings of the freezing-points of water and some other solvents (Raoult's Memoirs will be found in *A. Ch.*; *v.* especially [6] 8, 317).

Let P grams of a compound be dissolved in 100 g. of water or other solvent, and let the observed lowering of freezing-point of the solvent be C; then $\frac{C}{P}$ is called by Raoult the *coefficient of lowering of freezing-point* for the compound in question. Putting M as the reacting-weight, or formula-weight, of the compound, then $\frac{C}{P}M$ is called the *molecular lowering of freezing-point* for this compound.

Raoult finds that $\frac{C}{P}M$ is generally constant for all the members of a series of chemically similar compounds. Thus, Raoult gives the following values for $\frac{C}{P}M$, water being the solvent:—

19, for many organic compounds;
35, for salts of monovalent metals with monobasic acids;
40, for normal salts of monovalent metals with dibasic acids.

Raoult also gives the following values for $\frac{C}{P}M$, benzene being the solvent:—

49, for many organic compounds;
25, for the lower members of homologous series of alcohols.

Other values for $\frac{C}{P}M$ were found when other solvents, *e.g.* acetic acid, were used.

Another form in which Raoult's results may be put is the following:—$\frac{P}{C}$ = grams of dissolved body, in 100 g. solvent, that lower freezing-point of solvent 1°. Now $\frac{P}{C} \times c = M$; where c = constant determined experimentally for each series of chemically similar compounds, and for each solvent.

If the value of $\frac{C}{P}M$ is known for a group of compounds, or if the value of c is known in the expression $\frac{P}{C} \times c = M$, it is possible to find the formula-weight of a member of this group. Thus, in the case of ether, the following data were obtained:—

(i) 4·47 g. ether were dissolved in 100 g. water; the freezing-point of the water was lowered by 1·05°; hence $\frac{C}{P} = \frac{1\cdot05}{4\cdot47} = \cdot23°$. But the value of $\frac{C}{P}M$ for organic compounds generally dissolved in water is 19; hence, for ether, $M = \frac{19}{\cdot23} = 82$.

(ii) 2·721 g. ether were dissolved in 100 g. benzene; the freezing-point of the benzene was lowered by 1·826°; hence $\frac{P}{C} = 1\cdot49$; *i.e.* 1·49 g. ether in 100 g. benzene lower the freezing-point by 1°. But the constant for such organic compounds as the ethers dissolved in benzene is 49; hence, for ether, $M = 1\cdot49 \times 49 = 73$.

(iii) The value found for $\frac{C}{P}$ when ether was dissolved in acetic acid was ·529°. But the value of $\frac{C}{P}M$ for organic compounds generally dissolved in acetic acid is 39; hence, for ether, $M = \frac{39}{\cdot529} = 74$.

The mean of these three results gives 76·6 for the formula-weight of ether; the molecular weight of ether-gas, determined by applying Avogadro's law, is 74.

The empirical law of Raoult—quantities of chemically similar compounds proportional to the reacting-weights, or formula-weights, of these compounds produce equal lowerings of the freezing-points of water and some other solvents—has been developed by van't Hoff, Arrhenius, and others (*v.* especially *Z. P. C.* 1, 481 [translation in *P. M.*, August 1888]; and *Z. P. C.* 1, 631; 2, 284, 491). If an aqueous solution of a substance is contained in a vessel the walls of which are permeable by water molecules but not by the molecules of the dissolved substance, and the vessel is immersed in water, water will enter the vessel, and the pressure on the walls will increase until equilibrium results, after which no more water will enter. The pressure on the walls of the vessel is called *osmotic pressure.* If the vessel were furnished with a movable piston, the same condition of equilibrium might be attained, without the entry of water into the vessel, by compressing the solution with a pressure equal to the osmotic pressure. With such an arrangement the concentration of the liquid could be altered by increasing or decreasing pressure by means of the piston; as the process is reversible, the second law of thermodynamics may be applied.

The experiments of de Vries (*Z. P. C.* **2, 415**; **3**, 103), Pfeffer (*Osmotische Untersuchungen* [Leipzig, 1887]), and others, show that the osmotic pressures of dilute aqueous solutions are proportional to the concentrations of these solutions. Now, to say that change of concentration of dilute solutions is proportional to the pressure exerted by the solutions, is equivalent to saying that Boyle's law holds good for dilute solutions. Moreover, the proportionality of concentration to osmotic pressure may be deduced theoretically. If we assume, as seems justifiable, that osmotic pressure is due to the impact of the molecules of the dissolved substance, then the number of impacts in unit time must be proportional to the number of molecules in unit volume (on this point *v.* L. Meyer, *Z. P. C.* 5, 23; and van't Hoff's reply, *Z. P. C.* 5, 174; *cf.* Bredig, *Z. P. C.* 4, 444). But this is the molecular conception of gaseous pressure. Hence, as in gases volume is inversely as pressure, the same proportionality should hold good in dilute aqueous solutions; in other words, Boyle's law should apply to these solutions. Van't Hoff then proceeds to deduce, by thermodynamical reasoning, that osmotic pressure is proportional to absolute temperature, concentration being constant. This conclusion is equivalent to saying that the law of Charles holds good for dilute aqueous solutions, inasmuch as concentration of solution corresponds with gaseous volume.

The experimental results of Pfeffer and of Soret (*A. Ch.* [5] 22, 293) are in keeping, on the whole, with the statement that the laws of Boyle and Charles hold good in dilute aqueous solutions.

Solutions which exert equal osmotic pressures are called *isotonic* solutions. Thermodynamical reasoning applied to these solutions leads to the conclusion that the osmotic pressure of a specified mass of a gasifiable substance in dilute solution is the same as the pressure exerted by the same mass of the same substance existing as a gas at the same temperature. If, then, osmotic pressure may be substituted for gaseous pressure, Avogadro's law may be extended to substances in dilute solution. This extension of the law of Avogadro is thus stated by van't Hoff. '*Equal volumes of different solutions, at the same temperature and osmotic pressure, contain equal numbers of molecules, which numbers are the same as would be contained in equal volumes of gases at the same temperature and pressure.*' This is van't Hoff's *law of osmotic pressure.* Various proofs of the accuracy of this law have been given.

To apply this law, it is necessary to find the mass of a substance present in a solution which is *isotonic* with another solution containing a known mass of a body of known molecular weight. The two solutions then contain equal numbers of molecules of the dissolved substances; and as the molecular weight of one substance is known, the molecular weight of the other can be found. There are many practical difficulties in determining whether or not two solutions are isotonic. Now van't Hoff has shown by thermodynamical reasoning (*Z. P. C.* 1, 496) that solutions of different bodies in the same solvent, having equal freezing-points, are isotonic at their freezing-points. Put into other words, this conclusion asserts that solutions which have equal freezing-points contain equal numbers of molecules in equal volumes; or, that solutions which contain equal numbers of molecules in equal volumes, and are therefore isotonic, have equal freezing-points. But this is the law of lowering of freezing-points empirically established by Raoult. In place of the somewhat vague term reacting-weight, or formula-weight, used in stating the law (*v. supra*), we are now justified in employing the more definite term molecular weight. This law, as developed by van't Hoff, asserts that the product of the lowering of the freezing-point of a 1 p.c. solution into the molecular weight of the dissolved body is a constant for different bodies dissolved in the same solvent. For solutions of most organic compounds in water, the constant is about 18·9.

Van't Hoff then proceeds to show that the molecular lowering of freezing-point of a dilute solution bears a simple relation to the latent heat of fusion of the solvent (for proof *v. Z. P. C.* 1, 496–7). This relation is expressed, for very dilute solutions, by the equation

$$t = \cdot 01976 \frac{T^2}{W},$$

where t = molecular lowering of freezing-point, already expressed as $\frac{C}{P}M$ (p. 417), T = freezing-point of solvent stated in absolute measure, and W = latent heat of fusion of solvent in gram-units (*cf.* Eykman, *Z. P. C.* 3, 203; and especially *ib. Z. P. C.* 4, 512). If this conclusion is granted, it follows that equal numbers of molecules of all bodies dissolved in the same solvent must lower the freezing-point to the same extent, provided the solutions are very dilute.

Let us take a case to exhibit the application of the law of molecular lowering of freezing-point in the form given to it by van't Hoff. Thymol is dissolved in phenol, and the lowering of the freezing-point of the phenol is observed. The constant for molecular lowering of freezing-point of phenol is first calculated by van't Hoff's formula: the freezing-point of the phenol used was 38°, in absolute measure this is 273° + 38° = 311°; the latent heat of fusion of the phenol was found to be 25; hence $t = \cdot 0197 \frac{311^2}{625} = 76$. The solution of thymol used contained ·401 g. thymol in 7·559 g. phenol; the freezing-point was lowered by 2·49°; stating these results in parts of thymol per 100 of phenol, we find that 5·3 g. thymol dissolved in 100 g. phenol lowered the freezing-point through 2·49°. Then $\frac{5\cdot3}{2\cdot49} = 2\cdot12$; *i.e.* 2·12 g. thymol in 100 g. phenol lowered the freezing-point through 1°. But this quantity, 2·12, is $\frac{1}{76}$th of the molecular weight of thymol; therefore molecular weight of thymol $= 2\cdot12 \times 76 = 161$. The molecular weight calculated from the formula $C_{14}H_{10}O$ is 150.

In applying the law of molecular lowering of freezing-point it is necessary to work with dilute solutions. The freezing-point varies somewhat with concentration; in some cases this variation is very marked. Beckmann (*Z. P. C.* 2, 742) recommends that a series of observations should be made, concentration varying so that the lowering of freezing-point may range from c. ·2° to c. 2°. If possible, observations should be made with solutions in different solvents, care being taken to select solvents which do not react chemically, so far as is known, with the dissolved body, and the results should be checked by observations of the lowering of vapour-pressure of some solvent produced by dissolving in it the substance whose molecular weight is being determined (*v. infra*).

To sum up this part of the subject. Known weights of the substance, the molecular weight of which is to be determined, are dissolved in known weights of the solvent, so that the concentration of the solutions varies from, say, 1 to 5 or 6 p.c.; the freezing-point of each solution is determined. The freezing-point of the solvent is determined. Two methods of calculation may then be adopted:—

(i) The lowering of freezing-point, brought about by 1 g. of the substance dissolved in 100 g. of solvent, is calculated from each observation made; let this = A. The value of the constant expressing the molecular lowering of freezing-point of the solvent by the class of bodies to which the substance under examination belongs is known; let this be C. Then $\frac{C}{A}$ gives approximately the molecular weight of the substance.

(ii) The weight of the substance which would lower the freezing-point of the solvent by 1° is calculated from each observation made; let this be B. Then $B \times C$ gives approximately the molecular weight. (C has the same meaning as in (i).)

The values found for mol. w. from the different observations are compared; if the differences are small, the mean is taken; if there are marked differences, experiments are made with other solvents. It may be that the substance undergoes dissociation in all solvents, and that, therefore, the method is inapplicable (*v. infra*).

The molecular lowering of freezing-point of the solvent may be calculated by the use of van't Hoff's formula ($t = \cdot 01976 \frac{T^2}{W}$), provided the latent heat of fusion of the solvent is known; the value thus found should agree with the constant determined by experiment.

The solvents commonly employed are water, benzene, phenol, and glacial acetic acid; naphthalene has also been used for some hydrocarbons; Eykman (*Z. P. C.* 4, 512) recommends urethane, phenyl propionic acid, the higher acids of the acetic series, stearin, and *p*-toluidine. Various modifications of Raoult's original apparatus have been devised; references to the papers in which the most important are described will be found at the end of this article.

There are many apparent exceptions to Raoult's law, and therefore to van't Hoff's law of osmotic pressure. These exceptions are explained by the hypothesis, put into definite form by Arrhenius (*Z. P. C.* 1, 631), that bodies whose behaviour is not directly expressed by these laws are partially dissociated in solution. Here again there is a marked analogy between gases and dilute solutions; as the pressure of the vapour obtained by heating ammonium chloride is greater than the pressure calculated by Avogadro's law, on the assumption that the vapour consists of molecules of NH_4Cl, but as the observed pressure agrees with the calculated pressure when it is assumed that the vapour consists of equal numbers of molecules of NH_3 and HCl, so the apparently abnormal osmotic pres-

The following memoirs deal with relations between osmotic pressures, lowering of vapour-pressure and of freezing-point, and raising of boiling-point, of a solvent by substances dissolved therein:—Arrhenius, *Z.P.C.* 3, 115; van't Hoff, *ibid.* 1, 481; Planck, *ibid.* 1, 577; van't Hoff a. Reicher, *ibid.* 3, 198; Guldberg, *C.R.* 70, 1349; Beckmann, *Z. P. C.* 4, 532; Raoult, *C. R.* 110, 402; Raoult a. Recoura, *C. R.* 110, 402.

The following memoirs contain descriptions of apparatus:—Auwers, *B.* 21, 701; Hollemann, *B.* 21, 860; Hentschel, *Z. P. C.* 2, 306; Beckmann, *ibid.* 2, 638; 4, 543 (raising b.p.); Eykman, *ibid.* 2, 964; 3, 113; 4, 497; Fabinyi, *ibid.* 3, 38; von Klobukow, *ibid.* 4, 10; Raoult, *ibid.* 2, 353 (lowering vapour-pressures); Walker, *ibid.* 2, 602 (lowering vapour-pressures); Heycock a. Neville, *C. J.* 55, 666 (using Hg as solvent); Ramsay, *C. J.* 55, 521 (lowering vapour-pressure of Hg). M. M. P. M.

MOLYBDATES. *Salts of molybdic acid v.* Molybdenum, acids of, p. 422.

MOLYBDENUM. Mo. At. w. 95·9. Mol. w. unknown. S.G. 8·56 (Long, *Am. S.* [2] 45, 131); 8·49 to 8·64 (Bucholz, *Nicholson's J.* 20, 121). Does not melt in O-H flame at temp. at which Pt melts (Debray, *A.* 108, 250). S.H. 5°–15° ·0659 (De la Rive a. Marcet, *A. Ch.* [2] 75, 113). Emission-spectrum (obtained by using electric spark) shows only a few lines, the most prominent in the blue and violet (*v.* Thalen, *A. Ch.* [4] 18, 242). S.V.S. c. 11·3.

Occurrence.—Never uncombined. The sulphide (*molybdenite*, or *molybdenum glance*), oxide (*molybdenum ochre*), molybdate of lead (*wulfenite*), and molybdate of cobalt (*pateraïte*), occur in small quantities in certain localities. Many iron-ores contain small quantities of Mo compounds (Braun, *Fr.* 6, 86; Wöhler, *Mineralanalyse* [Göttingen, 1861]). The residues from the copper smelting ovens at the Mansfeld works sometimes contain as much as 28 p.c. Mo (Heine, *J. pr.* 9, 176; *cf.* Stromeyer, *P.* 28, 551; Steinberg, *J. pr.* 18, 379; Genth, *J. pr.* 37, 193; Steinacker, *Ueber einige Molybdänverbindungen* [Göttingen, 1861] 22). An alloy of Mo and Pb, in plates 30 mm. long, was found in Utah by Silliman (*Am. S.* [3] 6, 128). According to Lockyer (*Pr.* 27, 279), Mo occurs in the sun.

Scheele in 1778 (*Opusc.* 1, 200) distinguished native Mo sulphide from galena. In 1782, Hjehn obtained the metal from the sulphide (*v. Crell. Ann.* for 1790, 1791, 1792, and 1794). For an historical account of this metal *v.* Svanberg a. Struve, *J. pr.* 44, 257. The name molybdenum was given from μολύβδαινα, or *molybdæna*, used by Dioscorides and Pliny to designate galena and other lead compounds.

Formation.—1. By reducing MoO_3 by H, K or Na, C, or KCN.—2. By reducing Mo chlorides by H at a high temperature.—3. By reducing acid K molybdate by C.—4. By electrolysing molten MoO_3, or $(NH_4)_2MoO_4$ in solution.

Preparation.—The starting-point is pure MoO_3 (*v. infra*).—1. MoO_3 is heated in a crucible in a stream of pure H (which must be passed over a long layer of red-hot Cu); the mass is transferred to a tube of unglazed porcelain, and very strongly heated in the H stream; finally the last traces of oxide are removed by gently warming in a stream of dry HCl as long as a white wool-like sublimate ($MoO_3.2HCl$) is formed (Liechti a. Kempe, *A.* 169, 344). The metal in contact with the porcelain tube is not pure (Debray, *C. R.* 56, 732; *cf.* Wöhler a. von Uslar, *A.* 94, 256; Rammelsberg, *P.* 127, 284).—2. MoO_3 is mixed with C and heated in a graphite-crucible, in the O-H flame; the product always contains a few per cents. of C (Debray, *C.R.* 46, 1098).—3. An intimate mixture of 1 pt. MoO_3 and 1½ pts. KCN is placed in a crucible, the cover is luted on, the crucible is placed in another which is filled with C, and the whole is kept at white heat for 12 hours. By this method Loughlin (*Am. S.* [2] 45, 131) obtained metal with 98·7 p.c. Mo.

There are many methods for preparing MoO_3 from Mo ores. Finely powdered *molybdenite* (MoS_2) is roasted in an open porcelain vessel, with frequent stirring, until SO_2 ceases to be evolved; Brunner (*D. P. J.* 150, 672) recommends to mix the ore with its own weight of fine quartz-sand, previously washed with HClAq, and to heat in a flat Pt dish, to incipient redness, till the residue is citron-yellow when hot, and white when cold. The roasted ore is treated with NH_3Aq; to the solution are added a few drops of NH_4 sulphide, the ppd. CuS is removed, the filtrate is evaporated to dryness, the residue is dissolved in NH_3Aq, and the solution is evaporated to the crystallisation-point (Wöhler). Svanberg a. Struve (*J. pr.* 44, 264) add excess of K_2CO_3 to the ammoniacal solution of the roasted ore, separate ppd. Al_2O_3, evaporate to dryness, and strongly heat the residue in a Pt crucible; they treat with water, filter from CuO and Al_2O_3, evaporate to dryness, add S equal to double the weight of the residue, heat in a glass vessel on a sand-bath to full redness till excess of S is burnt off, wash with warm water (the last washings containing a little K_2CO_3) as long as the washings are coloured, and until the MoS_2 is perfectly black, and then roast the pure MoS_2 thus obtained, or oxidise it to MoO_3 by HNO_3Aq. Delffs (*A.* 106, 376) decomposes *molybdenite* by HNO_3Aq. Wittstein forms soluble sulphomolybdates by roasting with S, and decomposes by H_2SO_4Aq, finally roasting the sulphide to MoO_3 (*R. P.* [2] 73, 155; *cf.* Wicke, *A.* 45, 373; Wöhler, *ibid.* p. 374). *Molybdenite* may also be decomposed by calcining with alkali carbonates (*v.* Christl, *D. P. J.* 124, 398; Elbers, *A.* 83, 219); or by the use of H_2SO_4 (Elbers, *l.c.*).

Properties.—As prepared by reducing the chloride in H, Mo appears as dull silver-coloured, somewhat malleable, plates (Wöhler a. von Uslar, *A.* 94, 256). The metal obtained by reducing MoO_3 by H at very high temperatures is lustrous; if the reduction is effected at lower temperatures, an ashen-grey powder is obtained which becomes metal-like when rubbed. The metal obtained by Debray, which contained 4–5 p.c. C, was silver-white, and harder than topaz. The S.G. of Mo is given by Loughlin (*Am. S.* [2] 45, 131) as 8·56; this metal contained 98·7 p.c. Mo. Debray (*C. R.* 46, 1098) gives S.G. 8·6 for the metal obtained by reducing MoO_3 by C, and containing 4–5 p.c. C.

Mo, whether in powder or in pieces, is unchanged in ordinary air; when heated it becomes brown, then blue, then white, on the surface, Missing Page

and at high temperatures it is burnt to MoO_3. It is oxidised by fusion with KNO_3, or slowly by KOH; also by HNO_3, or Cl water; it burns when heated in steam, evolving H. Mo is insol. in HClAq, dilute H_2SO_4Aq, and HFAq; it is not acted on by KOHAq. Mo combines directly with O, Cl, and Br, but not with I. The metal is infusible at white heat (Debray, *A.* 108, 250).

The atomic weight of Mo has been determined (1) by analysing, and determining V.D. of $MoCl_5$ (Liechti a. Kempe, *A.* 169, 344; Debray, *C. R.* 66, 732); (2) by determining S.H. of Mo (De la Rive a. Marcet, *A. Ch.* [2] 75, 113); (3) by determining Cl in MoO_2Cl_2 (H. Rose, *P.* 40, 400; Svanberg a. Struve, *A.* 68, 209); (4) by synthesis of Ag_2MoO_4 (Debray, *C. R.* 66, 732); (5) by analyses of $MoCl_2$ and $MoCl_4$ (L. a. K., *A.* 169, 344; *cf.* L. Meyer, *ibid.* p. 360); (6) by reducing MoO_3 in H (S. a. S., *J. pr.* 44, 301; Dumas, *A. Ch.* [3] 55, 143; Debray, *C. R.* 66, 732; Rammelsberg, *B.* 10, 1776); (7) by oxidising MoS_2 to MoO_3 (S. a. S., *A.* 68, 209); (8) by conversion of $MoCl_4$ and $MoCl_5$ to MoS_2 (L. a. K., *A.* 169, 344; *cf.* Meyer, *ibid.* p. 360). The atom of Mo is pentavalent in the gaseous molecule $MoCl_5$.

Mo is probably both metallic and non-metallic in its chemical relations. Few, if any, definite salts are known obtained by replacing the H of acids by Mo; but Mo_2O_3 and MoO_2 seem to dissolve in acids without evolution of O. The oxide MoO_3 is an anhydride; molybdic acid, H_2MoO_4, and molybdates, besides tri- tetra- *n*-molybdates, are known. MoO_3 also combines with some other anhydrides to form complex bodies which react as acids, *e.g.* $P_2O_5.20MoO_3.38H_2O$; $SiO_2.12MoO_3.26H_2O$. MoS_3 reacts as an acidic sulphide, forming sulphosalts $M^I_2MoS_4$. Several haloid compounds, and many oxyhaloid compounds, of Mo are known. Mo is closely related to Cr, W, and U, and is less closely related to S, Se, and Te. Mo occurs in Group VI. series 6; the following table exhibits the position of Mo relatively to the other members of the group:

Even series —

2	4	6	8	10	12
O = 16	Cr = 52	Mo = 96	—	W = 184	U = 240

Odd series —

3	5	7	9	11
S = 32	Se = 79	Te = 125	—	—

(*v.* CHROMIUM GROUP OF ELEMENTS, vol. ii. p. 168; *cf.* CLASSIFICATION, vol. ii. p. 207).

Reactions.—1. *Heated in air or oxygen*, Mo is burnt to oxide; if the temperature is sufficiently high, MoO_3 is formed.—2. Oxidised, to MoO_3, by *molten nitre*, and slowly by *molten potash*.—3. Heated in *steam*, blue oxide (? Mo_3O_5), and then MoO_3, is formed.—4. Pulverulent Mo is oxidised by rubbing with *silver oxide*, or *mercuric oxide*. 5. Oxidised by *nitric acid*, conc. *hot sulphuric acid*, or *chlorine water*.—6. Mo does not dissolve in *hydrochloric*, *hydrofluoric*, nor *dilute sulphuric, acid*; nor does it react with *potash solution*.

Combinations.—1. Mo combines with *chlorine* to form $MoCl_5$; and with *bromine* to form $MoBr_4$: it does not combine directly with I.—2. Heated in *oxygen*, Mo forms oxides, MoO_3 being the final product of the combination.

Detection and Estimation.—The greater number of the Mo compounds, including most of the molybdates of the alkaline earths and heavy metals, are insol. in water. Lower oxides, and also the sulphides, produce MoO_3 when heated in air; MoO_3 readily dissolves in alkali solutions. Insol. molybdates are brought into soluble forms by fusion with alkali carbonates. All Mo compounds may be changed to soluble alkali sulphomolybdates by fusion with Na_2CO_3 and S. Phosphomolybdates are readily soluble in NH_3Aq. Mo compounds impart a yellow colour to the borax bead when heated in the oxidising flame, the colour disappears on cooling; in the reducing flame, they give a dark-brown colour, the bead is opaque if excess of Mo compound is present. They give a clear green microcosmic salt bead in the reducing flame, and in the oxidising flame a bead which is greenish when hot and colourless when cold. In solution, Mo compounds give a brown-black pp. with H_2S, soluble in NH_4 sulphide; solutions of molybdates give blue-coloured compounds by the action of reducing agents. When MoO_3 or a molybdate is evaporated with conc. H_2SO_4, and then allowed to cool, the acid becomes deep blue in colour; this reaction distinguishes molybdates from tungstates; the blue colour does not appear if antimonic or stannic salts are present, unless the substance has been wetted with a few drops of phosphoric acid, and evaporated to dryness, before addition of H_2SO_4 (Schönn, *Fr.* 8, 379; Maschke, *Fr.* 12, 383). If Zn is put into solution of a molybdate, a few drops of conc. KCNSAq are added, and then enough HClAq or H_2SO_4Aq to cause slow evolution of H, a carmine-red colour is produced, even with $\frac{1}{800,000}$ part MoO_3; ether removes the coloured compound (Braun, *Fr.* 2, 36). Liquids containing molybdates yield deep-red solutions (sulphomolybdates) by boiling with yellow NH_4 sulphide (Braun, *Fr.* 6, 86).

Mo is estimated (1) as metal by reducing in H (Rammelsberg, *P.* 127, 281); (2) as MoO_3 by oxidising in air or by HNO_3Aq (v. d. Pfordten, *B.* 15, 1927); (3) as $PbMoO_4$ (Chatard, *B.* 4, 280; *v.* also Ullik, *A.* 144, 217); (4) by reduction with Zn and titration by means of standard $KMnO_4Aq$ (Werncke, *Fr.* 14, 1; v. d. Pfordten, *B.* 15, 1927); (5) by the reaction of MoO_3 with an acidified solution of KI, whereby I is set free and is determined by standard $Na_2S_2O_3Aq$ (Mauro a. Danesi, *Fr.* 20, 507).

Molybdenum, Acids of, and their salts. The oxide MoO_3 is slightly sol. in water; c. 500 parts cold water dissolve 1 part MoO_3. The solution reddens litmus. Several hydrates of MoO_3 have been isolated. $MoO_3.H_2O = H_2MoO_4$ was obtained by Ullik, and also by Vivier (*v. infra*); the hydrates $MoO_3.2H_2O$, $2MoO_3.H_2O$, $4MoO_3.H_2O$, $5MoO_3.H_2O$, and $8MoO_3.H_2O$, have also been prepared; some of these are soluble, and some are insoluble, in water. Several series of salts are known; these salts may be represented as derived from hydrates of MoO_3; in some cases the hypothetical hydrates have been isolated, and in other cases they have not been isolated. Besides reacting as the anhydride of more than one acid, MoO_3 reacts with some oxides more acidic than itself to form compounds, *e.g.* $MoO_3.SO_3$; it also combines with certain acids—*e.g.* with HCl, H_3PO_4, H_3AsO_4—the compounds thus formed have acidic reactions and yield salts (*v.* Antimono-molybdates, arseno-molybdates, phospho-molybdates, p. 425; *v.* also Molybdenum trioxide, p. 432).

Molybdic acids. 1. H_2MoO_4. The normal hydrate $MoO_3.H_2O$, or hydroxide $MoO_2(OH)_2$, was obtained by Ullik, but only once, by mixing $MgMoO_4$ with an equivalent of HNO_3Aq and allowing to stand (*A.* 153, 374). Vivier (*C. R.* 106, 601) obtained this compound by allowing a solution of NH_4 molybdate in HNO_3Aq to stand for some time, also by heating ordinary NH_4 molybdate solution with its own volume of water to 50°–60° for some days. H_2MoO_4 forms a mass of minute needles; it is quite insol. water.

2. $H_2Mo_2O_7$. The hydrate $2MoO_3.H_2O$ ($=MoO_2(OH)_2.MoO_3$) was obtained by Ullik (*A.* 144, 329) by the action of excess of H_2SO_4Aq on the Ba salt formed by adding $BaCl_2Aq$ to ordinary NH_4 molybdate solution, filtering, placing over H_2SO_4, and drying the gum-like residue over H_2SO_4 for some months, or at 100° (Ullik, *A.* 153, 373). $H_2Mo_2O_7$ is a gum-like amorphous solid, e. sol. water.

3. $H_2Mo_4O_{13}$, and $H_2Mo_8O_{25}$. The hydrates $4MoO_3.H_2O$ ($=MoO_2(OH)_2.3MoO_3$), and $8MoO_3.H_2O$ ($=MoO_2(OH)_2.7MoO_3$) are formed similarly to $2MoO_3.H_2O$, the drying being conducted at 120°, and 160°–170°, respectively (U., *l.c.*). These compounds are amorphous solids, e. sol. water. Sabanejeff (*J. R.* 1889 [1] 515; abstract in *B.* 23 (*Ref.*) 87) obtained a colloidal form of $H_2Mo_4O_{13}$, sl. sol. water, by drying for some weeks over H_2SO_4; the formula was determined by applying Raoult's law (*cf.* Molecular weights, p. 417). For other hydrates of MoO_3, viz. $MoO_3.2H_2O$ and $5MoO_3.H_2O$, *v.* Hydrates of molybdenum trioxide, p. 432.

Graham (*C. J.* 1864) obtained a soluble colloidal form of molybdic acid (he does not give the composition) by dialysing an aqueous solution of Na molybdate, to which excess of HClAq had been added, until the liquid in the dialyser was free from NaCl and HCl. Graham describes the solution of molybdic acid as 'yellow, astringent to the taste, acid to test paper, and possessed of much stability'; it decomposed Na_2CO_3 with evolution of CO_2; and became insol. when heated for some time with a strong acid.

Chloromolybdic acid $H_2MoO_3Cl_2$ ($=MoO(OH)_2Cl_2$). (*Molybdenum hydroxychloride*). This compound is obtained by passing HCl over MoO_3 at 150°–200° (Debray, *C. R.* 46, 1101). It forms a loose, white, crystalline, mass; e. sol. water; sublimed unchanged in HCl.

Thiomolybdic acid and *thiomolybdates*; *v.* Molybdenum, thioacids of, and their salts, p. 434.

Molybdates. A great many molybdates are known; they are more or less closely related to the chromates. The following classification is that given by Ullik (*W. A. B.* 60 [2] 295), and now generally adopted. R = divalent metal. There are a few molybdates which do not belong to any of these classes, *e.g.* $5Al_2O_3.2MoO_3$, and $2BaO.5MoO_3$.

The alkali *monomolybdates* are produced by dissolving $MoO_3.xH_2O$, or MoO_3, in equivalent quantities of alkali, in solution or molten; they are easily sol. in water. The other salts of this series are generally insol. in water; they are produced by ppn. from the alkali salts, or, in crystals by fusing Na_2MoO_4 with NaCl and metallic chlorides (Schultze, *A.* 126, 55). The alkali *dimolybdates* are formed by fusing MoO_3 and alkali carbonates in the proper proportion, or by the action of MoO_3 on molten alkali nitrates (Ullik, *A.* 144, 214). The *trimolybdates* are formed by boiling metallic carbonates with considerable excess of MoO_3 and water, filtering, and allowing to evaporate in the air. These salts are generally easily sol. in hot water, but only slightly sol. in cold water; many of them exist both in crystalline and amorphous forms, the amorphous varieties are readily sol. in cold water (Ullik, *A.* 144, 227; 153, 376). The *tetramolybdates* may be obtained by rapidly evaporating very small quantities of the solutions which yield trimolybdates when allowed to evaporate slowly. They form amorphous, brittle, masses, which slowly decompose with formation of trimolybdates (Ullik, *A.* 144, 321). Crystallisable acid tetramolybdates are sometimes obtained by adding a fair excess of acid to solutions of mono- or dimolybdates; addition of a little acid to such solutions generally throws down trimolybdates. Very few *octo-* or *decamolybdates* have been prepared.

The following table presents the composition of the chief molybdates. The small figures after the formulæ refer to the list of memoirs given after this table:—

Molybdates.

Monomolybdates, $RMoO_4$ or $RO.MoO_3$.

$(NH_4)_2MoO_4$ (also *infra*, Mg salts). (23, 27)
$5(NH_4)_2MoO_4.Mn_2Mo_6O_{21}$. 12aq. (22)
$BaMoO_4$. (1, 23)
$BeMoO_4.BeO_2H_2$. 6aq. (24)
$CaMoO_4$. (7)
$CoMoO_4$. (1, 39)
$CoMoO_4.2NH_3$.aq. (33)
$3CuMoO_4.CuO_2H_2$. 4aq. (11)
$Fe_2(MoO_4)_3.MoO_3$. 7aq. (34, 1)
$Fe_2(MoO_4)_3.2MoO_3$. 16aq. (20)
$5Li_2MoO_4$. 2aq. (17, 26)
$MgMoO_4$. 5aq. (12, 21, 26)
$MgMoO_4.(NH_4)_2MoO_4$. 2aq. (12)
$MgMoO_4.K_2MoO_4$. 2aq. (12)
$MnMoO_4$ (*v. supra*, NH_4 salts; and *infra*, K salts). (1, 22, 39)
Hg_2MoO_4. (29)
$NiMoO_4.2NH_3$.aq. (1, 33)
K_2MoO_4 (also *supra*, Mg salts). (23, 26, 34)
$2K_2MoO_4.Mn_2Mo_6O_{21}$. 12aq. (22)
$K_2MoO_4.2Na_2MoO_4$.14aq. (15, 26)
$3Rb_2MoO_4.4MoO_3$. 4aq. (26, 31)
Ag_2MoO_4. (23)

Monomolybdates, $RMoO_4$ or $RO.MoO_3$;	derived from H_2MoO_4 or $H_2O.MoO_3$.
Dimolybdates, RMo_2O_7 or $RO.2MoO_3$;	" " $H_2Mo_2O_7$ or $H_2O.2MoO_3$.
Trimolybdates, RMo_3O_{10} or $RO.3MoO_3$;	" " *hypothetical* $H_2Mo_3O_{10}$ or $H_2O.3MoO_3$.
Tetramolybdates, RMo_4O_{13} or $RO.4MoO_3$;	" " $H_2Mo_4O_{13}$ or $H_2O.4MoO_3$.
Octomolybdates, RMo_8O_{25} or $RO.8MoO_3$;	" " $H_2Mo_8O_{25}$ or $H_2O.8MoO_3$.
Decamolybdates, $RMo_{10}O_{31}$ or $RO.10MoO_3$;	" " *hypothetical* $H_2Mo_{10}O_{31}$ or $H_2O.10MoO_3$.
Tribasic heptamolybdates, $R_3Me_7O_{24}$ or $3RO.7MoO_3$;	" " *hypothetical* $H_6Mo_7O_{24}$ or $3H_2O.7MoO_3$.

$Ag_2MoO_4.4NH_3$. (35)
$2Ag_2MoO_4.3MoO_3$. (23)
$Na_2MoO_4.2aq$ (also *supra*, K salts). (23, 28, 36)
$SrMoO_4$. (1)
Tl_2MoO_4. (26, 37)
$3Tl_2MoO_4.5MoO_3$. (37)
$8Tl_2MoO_4.3MoO_3$. (37)
$ZnMoO_4$. (1, 39)

Dimolybdates, RMo_2O_7 or $RO.2MoO_3$ or $RMoO_4.MoO_3$.

$Al_2(Mo_2O_7)_3.3(NH_4)_2Mo_2O_7.20aq$. (18)
$Al_2(Mo_2O_7)_3.3K_2Mo_2O_7.20aq$. (28)
$Al_2(Mo_2O_7)_3.3Na_2Mo_2O_7.22aq$. (28)
$(NH_4)_2Mo_2O_7$ (also *supra*, Al salts, and *infra* Cr salts). (23)
$Cr_2(Mo_2O_7)_3.3(NH_4)_2Mo_2O_7.20aq$. (19)
$Cr_2(Mo_2O_7)_3.3K_2Mo_2O_7.20aq$. (19)
$Cr_2(Mo_2O_7)_3.3Na_2Mo_2O_7.21aq$. (19)
$Hg_2Mo_2O_7$. (29)
$Na_2Mo_2O_7$. (2)

Trimolybdates, RMo_3O_{10} or $RO.3MoO_3$ or $RMoO_4.2MoO_3$.

$(NH_4)_2Mo_3O_{10}.aq$. (25, 32)
$(NH_4.Na)Mo_3O_{10}.aq$. (38)
$BaMo_3O_{10}.3aq$. (23)
$CaMo_3O_{10}.6aq$. (7)
$CoMo_3O_{10}.10aq$. (11)
$2CuMo_3O_{10}.9aq$. (11)
$MgMo_3O_{10}.10aq$. (12)
$K_2Mo_3O_{10}.3aq$. (8, 23)
$Na_2Mo_3O_{10}.4aq$, and 7aq. (5, 23)
$(NaNH_4)Mo_3O_{10}.aq$. (38)
$ZnMo_3O_{10}.10aq$. (11)

Tetramolybdates, RMo_4O_{13} or $RO.4MoO_3$ or $RMoO_4.3MoO_3$.

$(NH_4)_2Mo_4O_{13}.aq$. (25)
$BaH_2(Mo_4O_{13})_2.17aq$. (6)
$CaMo_4O_{13}.9aq$. (7)
$CaH_2(Mo_4O_{13})_2.17aq$. (7)
$MgH_2(Mo_4O_{13})_2.19aq$. (12)
$KHMo_4O_{13}.6aq$. (10)
$NaHMo_4O_{13}.8aq$. (14)
$Na_2Mo_4O_{13}.6aq$. (3)
$ZnMo_4O_{13}.8aq$. (11)

Octomolybdates, RMo_8O_{25} or $RO.8MoO_3$ or $RMoO_4.7MoO_3$.

$Na_2Mo_8O_{25}.4aq$. (1^a, 6)
$NaHMo_8O_{25}.4aq$. (1^a, 6)

Decamolybdates, $RMo_{10}O_{31}$ or $RO.10MoO_3$ or $RMoO_4.9MoO_3$.

$Na_2Mo_{10}O_{21}.12aq$. (1^a, 6)

Tribasic heptamolybdates (sometimes called *seven-thirds molybdates*), $R_3Mo_7O_{24}$ or $3RO.7MoO_3$ or $RMoO_4.2RO.6MoO_3$.

$(NH_4)_6Mo_7O_{24}.4aq$ (ordinary ammonium molybdate). (18, 23, 26, 27)
$Ba_3Mo_7O_{24}.9aq$. (23, 31)
$Mg_3Mo_7O_{24}.20aq$. (12)
$K_6Mo_7O_{24}.4aq$. (23, 28)
$Na_6Mo_7O_{24}.22aq$. (13, 26, 38)

Molybdates not included in foregoing classes.

$5Al_2O_3.2MoO_3$. (18, 28)
$4(NH_4)_2O.5MoO_3.aq$. (30)
$2BaO.5MoO_3.6aq$. (23)
$CuO.2(NH_4)_2O.5MoO_3.9aq$. (21)
$7(NH_4)_2O.2Na_2O.21MoO_3.15aq$. (28)
$7(NH_4)_2O.3Na_2O.25MoO_3.30aq$. (28)

For some other complex molybdates, *v.* Bärwald, *C. C.* 1885. 424 (Abstract in *C. J.* 50, 17).

Molybdates of Cd (1), Di (Frerichs a. Smith, *A.* 191, 355), La (F. a. F., *l.c.* p. 365), Pb (23), and Manross, *A.* 82, 358), and Sm (Clève, *Bl.* [2] 43, 170), have also been prepared.

Memoirs where accounts of the molybdates will be found:—(1.) Schultze, *A.* 126, 55. (1^a.) Ullik, *W. A. B.* 60 [2], 295. (2.) Ullik, *A.* 144, 214. (3.) *Ibid. id.* 144, 321. (4.) *Ibid. id.* 144, 227; 153, 376. (5.) *Ibid. id.* 144, 223. (6.) *Ibid. id.* 144, 336. (7.) *Ibid. id.* 144, 231, 327, 334. (8.) *Ibid. id.* 144, 208. (9.) *Ibid. id.* 144, 230. To indicate the methods of preparation and properties of the molybdates, short descriptions are given of the NH_4 and Na salts; for the others, reference must be made to the original memoirs.

Ammonium molybdates. (1) *Monomolybdate*, $(NH_4)_2MoO_4$. Prepared by dissolving MoO_3 in excess of very conc. NH_3Aq, and ppg. by alcohol; obtained in small monoclinic crystals by spontaneous evaporation of the trimolybdate in conc. NH_3Aq. Effloresces in air, with loss of NH_3; with water, forms an acid salt. Forms double salts with $MgMoO_4$ and $Mn_2Mo_6O_{21}$. (2) *Dimolybdate*, $(NH_4)_2Mo_2O_7$. Prepared by evaporating the mother-liquor from which the monomolybdate has separated; a white crystalline powder. Forms double salts with $Al_2(Mo_2O_7)_3$ and $Cr_2(Mo_2O_7)_3$. (3) *Trimolybdate*, $(NH_4)_2Mo_3O_{10}.aq$. Prepared by slow decomposition of ordinary NH_4 molybdate solutions, at temperatures below 10°. Lustrous needles; easily sol. hot water, sl. sol. cold water. Forms a double salt with $Na_2Mo_3O_{10}$. (4) *Tetramolybdate*, $(NH_4)_2Mo_4O_{13}.aq$. Prepared by slowly decomposing solution of ordinary NH_4 molybdate by $HClAq$ or HNO_3Aq; the solution eventually becomes filled with crystals of the tetra- salt, and the liquid is free from Mo. (5) *Tribasic heptamolybdate*, $(NH_4)_6Mo_7O_{24}.4aq$ ($=3(NH_4)_2O.7MoO_3.4aq$). This is the *ordinary* *ammonium molybdate* used as a reagent for phosphoric acid, &c. Crystallises from solution of MoO_3 in NH_3Aq, in large monoclinic prisms, unchanged in air. The same salt crystallises with 12aq from the mother-liquor.

Treatment of ammonium molybdate residues. Venator (*Ar. Ph.* [3] 23, 713) recommends to add enough $FeCl_3Aq$ to give a brownish colour to the solution; to ppt. phosphoric acid by NH_3Aq; to filter, and add $BaCl_2Aq$ whereby Ba molybdate and $BaSO_4$ are ppd. The pp. is thoroughly washed with hot water, and boiled for a long time with $(NH_4)_2SO_4Aq$; NH_4 molybdate separates from the filtrate on evaporation.

Sodium molybdates. (1) *Monomolybdate*, $Na_2MoO_4.2aq$. Prepared by fusing together equivalent quantities MoO_3 and Na_2CO_3, dissolving in water, and evaporating; also by dissolving MoO_3 in Na_2CO_3Aq; also by neutralising the solution of any of the other Na salts by Na_2CO_3. Small lustrous tablets; sol. water, solution has an alkaline reaction. Solutions evaporated under 6° give a salt with 10aq; these crystals effloresce to the salt with 2aq. Forms a double salt with K_2MoO_4. (2) *Dimolybdate*, $Na_2Mo_2O_7$. Prepared by fusing together MoO_3 and Na_2CO_3 in the proper proportion, and treating with a little cold water; also by adding MoO_3 to the equivalent quantity of molten $NaNO_3$ (only half of this is decomposed), and treating with cold water. Small lustrous needles; sol. with difficulty in water, hot or cold. Melts at incipient redness, and crystallises on cooling. An aqueous solution of this salt evaporated to a syrup yields crystals of $Na_2Mo_2O_7.aq$; easily sol. water. (3) *Trimolybdate*, $Na_2Mo_3O_{10}.7aq$. Prepared by saturating warm Na_2CO_3Aq with MoO_3, filtering, and allowing to evaporate spontaneously; also by adding excess of HNO_3Aq to a conc. solution of MoO_3 in Na_2CO_3Aq; also by adding acetic acid to solution of $Na_6Mo_7O_{24}.22aq$; also by spontaneous evaporation of solution of $NaHMo_4O_{13}.8aq$ after addition of 1 or 2 formula-weights of Na_2CO_3. A voluminous pp. consisting of fine needles. Small quantities of a hot conc. solution of this salt give $Na_2Mo_3O_{10}.4aq$ on rapid evaporation; amorphous mass, easily sol. water. Forms a double salt with $(NH_4)_2Mo_3O_{10}$. (4) *Tetramolybdates*; (*a*) *Normal salt*, $Na_2Mo_4O_{13}.6aq$. Prepared by adding the proper quantity of HClAq to Na_2MoO_4Aq, and evaporating; also by apontaneous evaporation of solution of $NaHMo_4O_{13}.8aq$, to which a little NaCl has been added. Easily sol. hot water, al. aol. cold water. (*b*) *Acid salt*, $NaHMo_4O_{13}.8aq$. Prepared by adding the proper quantity of HClAq to Na_2MoO_4Aq. Large monoclinic crystals; sol. water, hot or cold. Melts below redness. (5) *Octomolybdates*; (*a*) *Normal salt*, $Ns_2Mo_8O_{25}.4aq$. Prepared by digesting the acid salt with 1 formula-weight Na_2CO_3 in water. A white insol. powder. (*b*) *Acid salt*, $NaHMo_8O_{25}.4aq$. Prepared by adding excess of conc. HNO_3Aq to boiling Na_2MoO_4Aq. A white pp. (6) *Decamolybdate*, $Na_2Mo_{10}O_{31}.12aq$. Prepared by adding 2HClAq to Na_2MoO_4Aq, and evaporating on the steam-bath. Separates as a white, almost insol., crystalline powder. (7) *Tribasic heptamolybdate*, $Na_6Mo_7O_{24}.22aq$ ($=3Na_2O.7MoO_3.22aq$). Prepared by dissolving MoO_3 in the calculated quantity of Na_2CO_3 in water; also by mixing equivalent quantities of $Na_2Mo_3O_{10}$ and Na_2CO_3 in solution, and evaporating; also from a solution of MoO_3 in NaOHAq or Na_2CO_3Aq, by adding HNO_3Aq as long as the pp. of trimolybdate redissolves and until the liquid acquires an acid reaction. Large, lustrous, monoclinic prisms; easily sol. water; solution reacts acid. Melts when warmed, and crystallises on cooling; the molten salt is insol. water. There are also several *complex double sodium molybdates.*

ANTIMONO-, ARSENO-, FLUO-, PHOSPHO-, SILICO-, VANADO-, MOLYBDATES.

Antimonoso-molybdates. These salts are most simply regarded as compounds of Sb_2O_3 with MoO_3 and basic oxides; they are obtained by boiling SbOCl with an acid molybdate solution (Gibbs, *P. Am. A.* 21, 93).

Antimono-molybdates. Some of these salts, compounds of Sb_2O_5 with MoO_3 and basic oxides, are described by Gibbs (*P. Am. A.* 21, 105).

Arsenoso-molybdates. Described by Gibbs (*l.c.* 21, 81). The former salts are obtained by boiling As_2O_3 with conc. solutions of acid molybdates; the latter by oxidising the former in alkaline solution. (For composition of foregoing complex salts *v.* abstracts of Gibbs' papers in *C. J. Abstracts*, 1886. 426, 511; 1887. 113; *v.* also Pufahl, *B.* 17, 217; Debray, *C. R.* 78, 1408; Struve, *J. pr.* 58, 493.)

Arseno-molybdic acids. Compounds of H_3AsO_4 with MoO_3; *v.* Seyberth, *B.* 6, 391; Debray, *C. R.* 78, 1408; Struve, *J. pr.* 58, 493.

Regarding the relations of the antimono- and arseno- molybdates to the phospho- molybdates, *v. Phosphomolybdates*, p. 426.

Fluo-molybdates. A number of salts are obtained by dissolving molybdates in HFAq and evaporating; others are formed by dissolving metallic oxides along with MoO_3 in HFAq and evaporating; other salts are produced by dissolving hydrated MoO_2 along with metallic oxides in HFAq and evaporating; others by dissolving $MoCl_5$ in alkali fluorides. These salts may be regarded as *fluomolybdates*; most of them belong to one of the series $M^I_2MoO_2F_4$, $M^IMoO_2F_3$, or $M^I_2MoOF_5$; the first may be looked on as salts of the hypothetical acid $H_2MoO_2F_4$, derived from H_2MoO_4; the second may be looked on as salts of the hypothetical acid $HMoO_2F_3$, derived from $H_2Mo_2O_7$; and the third as salts of the hypothetical acid H_2MoOF_5, derived from the hypothetical $H_4Mo_2O_7$. The foregoing, and other, fluomolybdates may also be regarded as compounds of metallic fluorides with MoO_2F_2 and $MoOF_3$, respectively.

Fluomonomolybdates, $M^I_2MoO_2F_4$. These salts, which may also be represented as $2MF.MoO_2F_2$, are generally obtained by dissolving monomolybdates in HFAq; most of them are sol. water, and crystallise well. When carefully heated in air, many form molybdates, others give residues of metallic oxides (Delafontaine, *J.* 1867. 233). The chief fluomonomolybdates are the following. $(NH_4)_2MoO_2F_4.H_2O$; triclinic tables, by adding slight excess of HFAq to a strongly ammoniacal solution of ordinary NH_4 molybdate, and evaporating; when heated, H_2O and HF are evolved and blue oxide of Mo remains. $(NH_4)_2MoO_2F_4$; rhombic plates (Mauro, *Mem. R. Acad. dei Lincei* [4] 4, 481). $CoMoO_2F_4.6H_2O$; dark-red efflorescent crystals, obtained by dissolving equivalent weights of CoO and MoO_3 in HFAq, and evaporating. $K_2MoO_2F_4.H_2O$; lustrous, triclinic crystals, obtained by dissolving K_2MoO_4 in HFAq, also by adding KF to MoO_3 dissolved in HFAq. Other salts of this series are $CdMoO_2F_4$, $NiMoO_2F_4.6H_2O$, $Rb_2MoO_2F_4.H_2O$, $2Na_2MoO_2F_4.H_2O$, $Tl_2MoO_2F_4.H_2O$, $ZnMoO_2F_4.6H_2O$.

Fluodimolybdates, $M^I_3Mo_2O_4F_8$ or $M^IMoO_2F_3$ (Delafontaine, *J.* 1867. 233). These salts may also be represented as $MF.MoO_2F_2$; they are obtained by dissolving dimolybdates in HFAq, or by treating the salts $M^I{}_2MoO_2F_4$ with HFAq. The chief salts of this series are $NH_4MoO_2F_3.H_2O$, and $KMoO_2F_3.H_2O$.

Fluomolybdates other than the foregoing. The salts $(NH_4)_3MoO_2F_5$ (or $MoO_2F_2.3NH_4F$) and $(NH_4)_4MoO_2F_6.(NH_4)_2MoO_4$ (or $MoO_2F_2.4NH_4F.(NH_4)_2MoO_4$) are described by Mauro (*Mem. R. Acad. dei Lincei* [4] 4, 481). The same chemist (*G.* 19, 179; *v.* also *B.* 15, 2509) describes the following salts:—$K_2MoOF_5.H_2O$ (or $MoOF_3.2KF.H_2O$); obtained by dissolving $MoCl_3$, or $MoO_2.xH_2O$, in conc. hot KFAq, and crystallising: $K_5Mo_3O_3F_{14}.H_2O$ (or $3MoOF_3.5KF.H_2O$), by dissolving the preceding salt in HFAq and evaporating: $(NH_4)_2MoOF_5$ (or $MoOF_3.2NH_4F$), by dissolving $MoO_2.xH_2O$ in HFAq, adding NH_3Aq till the green liquid becomes reddish, then adding HFAq till a green colour is produced again, and evaporating considerably at a moderate temperature: $(NH_4)_5Mo_3O_3F_{14}.H_2O$ (or $3MoOF_3.5NH_4F.H_2O$), by dissolving the preceding salt in warm HFAq and evaporating.

Phospho-molybdates. The phospho-molybdates have been examined by Berzelius, Svanberg a. Struve (*J. pr.* 44, 299), Debray (*Bl.* [2] 5, 404), Rammelsberg (*B.* 10, 1776), Finkener (*B.* 11, 1638), and especially by Wolcott Gibbs (*P. Am. A.* 17, 62; 18, 232; 21, 50). These salts are produced when phosphoric acid or a soluble phosphate is added to solution of a molybdate, with or without the presence of a free acid; also by fusing together phosphates and molybdates; by dissolving molybdates insoluble in water in phosphoric acid; by digesting MoO_3 with an alkaline phosphate; and by treating mixtures of insoluble phosphates and molybdates with a dilute acid. The phospho-molybdates of the fixed alkaline bases may be dehydrated by careful heating, but MoO_3 is generally partially volatilised. Solutions of these salts in NH_3Aq are decomposed by H_2S with formation of thio-molybdates.

The phospho-molybdates belong to the general form $mMoO_3.2P_2O_5.nR_2O.xaq$; m is always an even number varying from 10 to 48; n varies from 2 to 6, and is generally $=6$; n may, however, exceed 6, in one case $n=14$ when $R=Ag$; Gibbs); $R=$ basic metal usually Na, K, or NH_4; x is generally large, varying from 8 to 46. The chief sub-classes of these phospho-molybdates are the following (Gibbs):—

$10MoO_3.2P_2O_5.5R_2O.xaq$; $R=NH_4$ and K, $x=7$ and 20.
$10MoO_3.2P_2O_5.6R_2O.xaq$; $R=NH_4$, K, Ag, $x=14$; $R=Na$, $x=28$.
$32MoO_3.2P_2O_5.6R_2O.xaq$; $R=NH_4$, $x=28$.
$36MoO_3.2P_2O_5.2R_2O.xaq$; $R=Na$, x undetermined, >10.
$36MoO_3.2P_2O_5.4R_2O.xaq$; $R=Na$, x „ >8.
$44MoO_3.2P_2O_5.5R_2O.xaq$; $R=K$, $x=22$.
$44MoO_3.2P_2O_5.6R_2O$; $R=NH_4$.
$44MoO_3.2P_2O_5.6R_2O.xaq$; $R=NH_4$, $x=18$ and 24.
$44MoO_3.2P_2O_5.6R_2O.xaq$; $R=K$, $x=24$.
$44MoO_3.2P_2O_5.14R_2O.xaq$; $R=Ag$, $x=28$.
$48MoO_3.2P_2O_5.2R_2O.xaq$; $R=\frac{1}{2}Co_2(NH_3)_8(NO_2)_4O$, $x=46$.
$48MoO_3.2P_2O_5.4R_2O.xaq$; $R=K$, $x=8$.

The only *phospho-molybdic acid* which has been isolated is $48MoO_3.2P_2O_5.6H_2O.xaq$; three hydrates are known in which $x=54$, 92, and 100 (Gibbs).

The salts with $6R_2O$ are regarded by Gibbs as normal salts; those with less than $6R_2O$ generally have acid reactions. To the *ordinary ammonium phospho-molybdate* — obtained by adding excess of a mineral acid to a solution containing MoO_3, P_2O_5, and an NH_4 salt — Gibbs assigns the composition $48MoO_3.2P_2O_5.5(NH_4)_2O.H_2O.16aq$ (*cf.* Svanberg a. Struve, *J. pr.* 44, 291; Nutzinger, *Pharmaceut. Vierteljahresschrift*, 4, 549; Sonnenschein, *J. pr.* 53, 342; Lipowitz, *P.* 109, 135; Seligsohn, *J. pr.* 67, 470; Hundeshagen, *Fr.* 28, 141, 172, who says that when dried above 130° the salt is $12MoO_3.(NH_4)_3PO_4$).

Gibbs (*l.c.*) describes four other series of phospho-molybdates:—

Metaphospho-molybdates, $mMoO_3.nRPO_3.pR_2O.xaq$.

Hypophospho-molybdates, $mMoO_3.nH_3PO_2.pR_2O.xaq$.

Phosphoroso-molybdates, $mMoO_3.nH_3PO_3.pR_2O.xaq$.

Phosphoroso-phospho- molybdates, $mMoO_3.nP_2O_5.n^1H_3PO_3.pR_2O.xaq$.

Metaphospho- molybdates, represented by $10MoO_3.4NH_4PO_3.3(NH_4)_2O.9aq$ and $14MoO_3.3Ba(PO_3)_2.BaO.55aq$ are converted by acids into orthophospho-molybdates (Gibbs, *P. Am. A.* 21, 116).

Hypophospho- molybdates are represented by $8MoO_3.2H_3PO_2 2(NH_4)_2O.2aq$; this salt was obtained by mixing NaH_2PO_2Aq with solution of $(NH_4)_6Mo_7O_{24}$, and adding HClAq (G., *P. Am. A.* 18, 232).

Phosphoroso- molybdates are represented by $24MoO_3.4H_3PO_3.4(NH_4)_2O.xaq$, in which $x=17$ and 25; obtained by adding H_3PO_3Aq (produced by adding water to PCl_3) to solution of $(NH_4)_6Mo_7O_{24}$ (G., *P. Am. A.* 18, 237; 21, 89).

Phosphoroso-phospho- molybdates are represented by $72MoO_3.3P_2O_5.2H_3PO_3.9(NH_4)_2O.38aq$; obtained by adding the product of the decomposition of PCl_3 by H_2O to solution of $10MoO_3.2P_2O_5.6(NH_4)_2O.14aq$ (G., *l.c.* 21, 96).

Note.—*Pyrophospho- tungstates* have been isolated, of the form $22WO_3.9P_2O_5.pR_2O$, $p=13$, 18, and 20; an *ortho-metaphospho- tungstate* has also been prepared,

$22WO_3.3(P_2O_5.3K_2O).6NaPO_3.2K_2O.2Na_2O.42aq$.

Corresponding molybdates have not yet been isolated.

Besides the foregoing phospho-molybdates, representatives of phosphovanado- and phosphostanno-molybdates have been prepared by Wolcott Gibbs.

Phosphovanado- molybdates are represented by $28MoO_3.2P_2O_5.16V_2O_5.16(NH_4)_2O.100aq$, and $48MoO_3.2P_2O_5.V_2O_5.7(NH_4)_2O.30aq$. These salts are obtained by digesting MoO_3 with solution of phosphovanadates, $mP_2O_5.nV_2O_5.pR_2O$; by heating solutions of vanado-molybdates, $mMoO_3.nV_2O_5.pR_2O$, with alkaline phosphates in the presence of acid; and by heating V_2O_5 with solution of an alkaline phospho-molybdate (Gibbs, *l.c.* 18, 253).

Phosphostanno molybdates; the salt $16MoO_3.3P_2O_5.4SnO_2.3(NH_4)_2O.28aq$ is obtained by pouring solution of $SnCl_4.2NH_4Cl$ into a hot solution of the acid NH_4 phospho-molybdate $10MoO_3.2P_2O_5.5(NH_4)_2O.7aq$ (Gibbs, *l.c.* 21, 120).

The arseno-molybdates already referred to (p. 425) belong to the series $mMoO_3.nAs_2O_3.pR_2O.xaq$ (*arsenoso- compounds*) where $m = 6$, 8, and 12, $n = 3$, 2, and 5, $p = 2$ and 3 ($R = NH_4, \frac{1}{2}Mn, \frac{1}{2}Ba$), and $x = 6$, 13, and 24 (Gibbs, *P. Am. A.* 21, 81). The *antimono-molybdates* (*v.* p. 425) belong to the series $17MoO_3.3Sb_2O_3.6(NH_4)_2O.21aq$ (*antimonoso-compounds*); and the series $7MoO_3.4Sb_2O_5.5(NH_4)_2O.12aq$ (*antimono- compounds*) (Gibbs, *P. Am. A.* 21, 93 a. 105).

Silico-molybdates. Alkali molybdate solutions produce yellow pps. when added to solutions of alkali silicates in presence of HNO_3 (Knop, *C. C.* 1857. 691, 861; Richter, *D. P. J.* 199, 183). According to Parmentier (*C. R.* 92, 1234) these pps. have the composition $13MoO_3.M^I_4SiO_4.xH_2O$. P. obtained the acid $12MoO_3.H_4SiO_4.24H_2O$ from the mercurous salt (*C. R.* 94, 213). This acid forms large yellow regular octahedra, melting at 45° and decomposing below 100°; easily soluble in water and dilute acids; decomposed by excess of NH_3Aq or alkali carbonates with separation of silica.

Vanado-molybdates. These salts belong to two series (Gibbs, *P. Am. A.* 18, 240 a. 264).

Vanadio-molybdates. These salts are represented by $6MoO_3.V_2O_5.2(NH_4)_2O.5aq$, $16MoO_3.2V_2O_5.5BaO.29aq$, and $18MoO_3.V_2O_5.8(NH_4)_2O.15aq$; they are obtained by digesting V_2O_5 (free from VO_2) with solutions of alkaline molybdates; by heating together solutions of alkaline vanadates and molybdates especially in presence of acid; by boiling solutions of alkaline vanadates or meta-vanadates (*e.g.* NH_4VO_3) with MoO_3; and by the decomposition of phosphovanadomolybdates (*v. supra*).

Vanadio-vanadico-molybdates. The representatives of this series which have been isolated are $28MoO_3.VO_2.4V_2O_5.11(NH_4)_2O.20aq$ and $30MoO_2.3VO_2.2V_2O_5.14BaO.48aq$. They are obtained by boiling VO_2 and V_2O_5 with an acid molybdate; by the partial reduction of vanadio-molybdates; and by digesting solutions of acid molybdates with solutions containing VO_2 and V_2O_5.

Alumino-, chromico-, ferrico-, and *mangano-molybdates* have been obtained by Struve (*Petersburg Acad. Bull.* 12, 142) and Parmentier (*C. R.* 98, 389). These salts are classed by Gibbs (*P. Am. A.* 21, 121) as belonging to the forms $10MoO_3.M_2O_3.2K_2O.15aq$, where $M = Al,Cr,Fe$; $12MoO_3.M_2O_3.6R_2O.xH_2O$, where $M = Al,Cr,Fe$, $R = NH_4$, K, or Na, and x is generally $= 20$ to 22; and $16MoO_3.Mn_2O_3.5R_2O.12aq$ where $R = NH_4$ and K.

Molybdenum, alloys of. Mo alloys with several metals. With *aluminium*; a crystalline powder consisting of microscopic rhombic prisms, approximating in composition to $MoAl_4$, is obtained by melting together 1 pt. MoO_3 dissolved in HFAq and evaporated to dryness, 2 pts. cryolite, 2 pts. KCl.NaCl, and 1 pt. Al, and dissolving excess of Al from the regulus by NaOHAq (Wöhler a. Michel, *A.* 115, 102). With *iron*; grey, hard, brittle, alloys are obtained by directly fusing the metals together; by reducing $Fe_2O_3.4MoO_3$ in H at full red heat, an alloy of the composition Mo_2Fe is obtained (Steinacker, *Ueber einige Molybdänverbindungen* [Göttingen, 1861]). Alloys with Cu, Au, Pt, and Ag have been described. An alloy of Mo with *lead* was found in plates in Utah (Silliman, *Am. S.* [3] 6, 128).

Molybdenum, bromides of. Mo combines directly with Br to form three bromides $MoBr_2$, $MoBr_3$, and $MoBr_4$; no $MoBr_5$ corresponding with $MoCl_5$ has been isolated. When Br is passed over strongly heated Mo, an oxybromide is formed, then a greenish-grey sublimate of $MoBr_3$ near the heated part of the tube; the metal becomes yellow-red and is eventually converted into $MoBr_2$; between the $MoBr_2$ and $MoBr_3$, isolated lustrous black needles of $MoBr_4$ are formed. The only halogen compound of Mo which has been gasified, and the mol. w. of which is known in the gaseous state, is $MoCl_5$.

MOLYBDENUM DIBROMIDE, $MoBr_2(Mo_3Br_4.Br_2)$. (*Molybdous bromide*).

Preparation.—1. By passing Br vapour, much diluted by CO_2, over strongly heated Mo (Atterberg, *J.* 1872. 260).—2. By passing Br vapour over Mo at a moderate temperature; or over a heated mixture of MoO_2 and C, strongly heating the $MoBr_3$ thus produced, and treating the residue with water whereby unchanged Mo may be washed away (Blomstrand, *J. pr.* 82, 433).

Properties and Reactions.—A golden-yellow powder; unchanged by heat; insoluble in water and in all acids. *Concentrated alkali solutions* produce alkali bromide and $MoO.xH_2O$ (Blomstrand, *J. pr.* 77, 91). *Dilute alkali solutions* produce alkali bromide, and yellow solutions from which CO_2 ppts. $Mo_3Br_4(OH)_2.8H_2O$. This compound, known as *molybdenum bromohydroxide*, is prepared by slowly adding CO_2 to the solution of $MoBr_2$ in KOHAq, or by adding acetic acid and then passing in CO_2, or by decomposing the solution when hot by NH_4Cl (*v. Molybdenum bromohydroxide*). The reaction of $MoBr_2$ with KOHAq points to the formula $Mo_3Br_4.Br_2$ for the dibromide; the radicle Mo_3Br_4 combines with acid radicles to form salts; *v. Molybdenum bromohydroxide*, p. 428.

MOLYBDENUM TRIBROMIDE, $MoBr_3$ (*Molybdo-molybdic bromide*). Obtained by passing Br vapour over gently heated Mo, or by heating a mixture of MoO_2 and C in Br vapour; any $MoBr_4$ and MoO_2Br_2 formed are removed by heating in the stream of Br, as these compounds are more volatile than $MoBr_3$ (Blomstrand, *J. pr.* 82, 433).

Forms a blackish-green mass of small interlaced needles. Sublimes with difficulty; at bright red heat gives $MoBr_2$ and Br. Unchanged by water; insoluble in conc. HClAq and cold dilute HNO_3Aq. Slowly acted on by dilute alkali solutions; decomposed by boiling alkali solution with ppn. of black $Mo_2O_3.3H_2O$ (Blomstrand, *l.c.*).

MOLYBDENUM TETRABROMIDE, $MoBr_4$ (*Molybdic bromide*). Formed in small quantity by heating Mo in Br; appears as single, black, lustrous, needles. Easily decomposed by heat to $MoBr_2$ and Br, the temperatures at which it is formed and decomposed being not very different. Fusible and volatile, forming brown vapours. Deliquescent; soluble in water, forming a brown-yellow solution from which alkalis ppt. rusty-brown $MoO_2.xH_2O$ (Blomstrand, *J. pr.* 82, 433).

Molybdenum, bromochlorides of. $Mo_3Br_4Cl_2.3H_2O$ and $Mo_3Cl_4Br_2.3H_2O$. Produced by adding HClAq to a solution of $MoBr_2$ in KOHAq, and by adding HBrAq to $MoCl_2$ in KOHAq respectively; *cf. Molybdenum bromohydroxide, infra*; and *Molybdenum chlorohydroxide*, p. 430.

Molybdenum, bromochlorohydroxide of. $Mo_3Cl_4.BrOH.xH_2O$; obtained by adding water to an alcoholic solution of $Mo_3Cl_4.Br_2.3H_2O$; *cf. Molybdenum chlorohydroxide.*

Molybdenum, bromofluoride of. $Mo_3Br_4F_2.3H_2O$. Produced by adding HFAq to solution of $MoBr_2$ in KOHAq; *cf. Molybdenum bromohydroxide.*

Molybdenum, bromohydroxide of. $Mo_3Br_4(OH)_2$. Prepared by dissolving $MoBr_2$ in KOHAq, and passing in CO_2 or adding acetic acid, or by adding NH_4Cl to a hot solution of $MoBr_2$ in KOHAq (Blomstrand, *J. pr.* 82, 433; *cf.* Atterberg, *J.* 1872. 260). The yellow crystalline pp., consisting of $Mo_3Br_4(OH)_2.8H_2O$, is dried at 100° or *in vacuo* over H_2SO_4: by placing the pp. over H_2SO_4 the dihydrate $Mo_3Br_4(OH)_2.2H_2O$ is produced.

$Mo_3Br_4(OH)_2$ is a red powder; sol. in KOHAq; this solution probably contains $Mo_3Br_4)OK)_2$. Addition of acids to this solution generally ppts. a compound of the acid radicle with the group Mo_3Br_4; thus HClAq ppts. $Mo_3Br_4.Cl_2.3H_2O$, HBrAq ppts. $Mo_3Br_4.Br_2.3H_2O$, HFAq ppts. $Mo_3Br_4.F_2.3H_2O$, and HIAq ppts. the double compound $(Mo_3Br_4.I_2)_2.Mo_3Br_4(OH)_2.8H_2O$. H_2SO_4Aq ppts. $Mo_3Br_4.SO_4.3H_2O$. $K_2Cr_2O_7Aq$ ppts. black $Mo_3Br_4.CrO_4.2H_2O$. Addition of NH_4 molybdate and acetic acid ppts. the molybdate $Mo_3Br_4.MoO_4.2H_2O$. H_3PO_4Aq, $H_2C_2O_4Aq$, and HNO_3Aq also yield pps.; that by HNO_3Aq dissolves in excess of the acid. Acetic acid and CO_2 reppt. the hydroxide from its solutions in alkalis. The haloid compounds of the radicle Mo_3Br_4 are yellow solids insol. in excess of the haloid acids; they are decomposed by boiling water giving $Mo_3Br_4(OH)_2.xH_2O$. The sulphate is yellow, and is sol. in excess of H_2SO_4Aq; this solution gives no pp. with $AgNO_3Aq$; addition of HClAq ppts. $Mo_3Br_4.Cl_2.3H_2O$.

The compound $MO_3Br_4(OH)_2.8H_2O$ might be represented as an oxybromide of Mo, viz. as $Mo_3OBr_4.9H_2O$; but the production of $Mo_3Br_4(OH)_2$ by drying the hydrate, and the reactions of this compound with acids, are better expressed by representing the compound as a compound of the radicle Mo_3Br_4 than as an oxybromide: a corresponding chlorohydroxide, $Mo_3Cl_4(OH)_2$, exists (*v.* p. 430).

Molybdenum, bromo-iodide of, $Mo_3Br_4I_2$. This compound is only known in combination with $Mo_3Br_4(OH)_2$; the compound has the composition $(Mo_3Br_4.I_2)_2.Mo_3Br_4(OH)_2.8H_2O$, and is produced by adding HIAq to a solution of $Mo_3Br_4(OH)_2$ in KOHAq; *cf. Molybdenum bromohydroxide, supra.*

Molybdenum, chlorides of. $MoCl_5$ is formed when Mo is heated in Cl free from O; by heating $MoCl_5$ in H, $MoCl_3$ is produced; and $MoCl_2$ produces $MoCl_2$ and $MoCl_4$ when heated in CO_2. The formula $MoCl_5$ represents the molecular composition of the gaseous pentachloride; the mol. w. of none of the other chlorides in the gaseous state has been determined.

MOLYBDENUM DICHLORIDE $MoCl_2$(?$Mo_3Cl_4.Cl_2$) (*Molybdous chloride*).

Formation.—1. By heating $MoCl_3$ in an indifferent gas (Blomstrand, *J. pr.* 77, 95; Liechti a. Kempe, *A.* 169, 344).—2. By heating Mo with HgCl.—3. By carefully heating Mo in Cl largely diluted with CO_2.

Preparation.—$MoCl_3$, as pure as possible, is placed in several porcelain boats, which are heated to dull redness in a glass tube, while a slow stream of perfectly dry CO_2, free from air, is passed through the tube; the contents of the first boat are not quite pure $MoCl_2$, but may be purified by gently warming with very dilute HNO_3Aq (Liechti a. Kempe, *A.* 169, 344).

Properties and Reactions.—An amorphous dull yellow powder; unchanged in air, but when heated forms Mo_2O_3 and then MoO_3; volatilised with difficulty; insol. water; dissolves in alcohol and ether (L. a. K., *l.c.*). Dissolves in HClAq and crystallises from this solution as $MoCl_2.H_2O$, $MoCl_2.2H_2O$, or $2MoCl_2.3H_2O$ (Blomstrand, *J. pr.* 77, 95; *v. infra, Combinations*, No. 1). Very slightly sol. in HNO_2Aq; dissolved by H_2SO_4Aq; soluble in NH_3Aq, on boiling a brown powder containing N is ppd. Decomposed by hot conc. alkali solutions with ppn. of $MoO.xH_2O$. Dissolved by dilute alkali solutions to form a yellow liquid from which CO_2 or dilute acetic acid ppts. $Mo_3Cl_4.(OH)_2.xH_2O$; *v. infra Molybdenum chlorohydroxide.* This reaction suggests the formula $Mo_3Cl_4.Cl_2$ for the dichloride (*cf. Combinations*, No. 2); the radicle Mo_3Cl_4 combines with acid radicles to form salts; *v. Molybdenum chlorohydroxide.*

Combinations.—1. With *water* to form the hydrates $MoCl_2.H_2O$, $MoCl_2.2H_2O$, and $2MoCl_2.3H_2O$ (or $Mo_3Cl_4.Cl_2.3H_2O$, $Mo_3Cl_4.Cl_2.6H_2O$, and $(Mo_3Cl_4.Cl_2)_2.9H_2O$). The first of these hydrates is formed by dissolving $MoCl_2$ in rather dilute HClAq and allowing to stand; it forms thin yellow plates, insol. water. The second hydrate is formed by warming a solution of $MoCl_2$ in HClAq on a water-bath, or by slowly diluting a conc. solution; it forms long thin prisms, sol. water, alcohol, and ether. Dilute solutions of this hydrate deposit $Mo_3Cl_4(OH)_2.xH_2O$. The third hydrate is formed by dissolving $MoCl_2$ in hot HClAq and allowing to cool; it forms lustrous needles, insol. water, decomposed by hot water, decomposed by heat with loss of H_2O, Cl, and HCl (Blomstrand, *J. pr.* 77, 95).—2. With the *alkali haloid salts* to form compounds of the type $2MX.Mo_3Cl_4.X_2.2H_2O$

where M = NH_4 or K, and X = Cl, Br, or I (Blomstrand, *l.c.*). Obtained by adding excess of haloid acid, HX, to solutions of $MoCl_2$ in KOHAq or NH_4OHAq, and evaporating. These compounds are decomposed by water, with solution of KX, or NH_4X, and ppn. of $Mo_3Cl_4.X_2.3H_2O$. From solutions of these compounds $AgNO_3Aq$ ppts. only half of the halogen present; thus 4Br is ppd. from $Mo_3Cl_4.Br_2.2KBr$, and 4Cl from $Mo_3Cl_4.Cl_2.2KCl$. These compounds are not decomposed by H_2S in presence of acids, nor by K_4FeCy_6Aq.

MOLYBDENUM TRICHLORIDE, $MoCl_3$ (*Molybdomolybdic chloride*).

Formation.—1. By passing vapour of $MoCl_5$ over heated Mo (Berzelius).—2. By heating $MoCl_5$, by means of an ordinary spirit-lamp, in a stream of H (Blomstrand, *J. pr.* 71, 449).—3. By passing CO_2 charged with $MoCl_5$ through a tube heated in one spot; $MoCl_3$ remains behind the heated place as a thick crystalline crust (Blomstrand, *l.c.*).

Preparation.—$MoCl_3$ is prepared in a hard glass tube, narrowed at intervals so as to form 3 or 4 divisions (*v. Molybdenum pentachloride, Preparation*); the greater part of the $MoCl_5$ is in the second division, while a little is in the first division. Pure dry H is passed through the tube for some time, the second division of the tube is then heated until the $MoCl_5$ begins to sublime into the third division; the temperature of the third division is kept at 250°, at which temperature reduction to $MoCl_3$ proceeds. When reduction is complete (known by the change of colour of black $MoCl_5$ into red $MoCl_3$), the H is replaced by a stream of dry CO_2, and the small quantity of $MoCl_5$ in the first division of the tube is sublimed over the $MoCl_3$ which is not yet quite pure (Liechti a. Kempe, *A.* 169, 344).

Properties and Reactions.—A dark brownish-red solid, resembling amorphous P. Unchanged in air. Heated in a tube drawn to a fine opening, $MoCl_5$ forms as a red crystalline sublimate; heated in air, gives a white woolly sublimate, then brownish-red, and finally dark blue, vapours, while impure $MoCl_2$ remains (L. a. K., *l.c.*). Decomposes at red heat into $MoCl_2$ and $MoCl_4$. Insol. water and HClAq; sol. in hot HNO_3Aq, also in conc. H_2SO_4 forming a deep-blue liquid (L. a. K., *l.c.*). Decomposed by boiling water; also by KOHAq or NaOHAq, with ppn. of $Mo_2O_5.3H_2O$; warm NH_3Aq produces a brown powder which contains N. A compound of KCl with $MoCl_3$ was obtained by Berzelius by the action of K-amalgam on MoO_2 dissolved in HClAq.

MOLYBDENUM TETRACHLORIDE, $MoCl_4$ (*Molybdic chloride*).

Preparation.—$MoCl_3$ is placed in a porcelain boat and heated to dull redness, in a long tube of hard glass, in a very slow stream of pure, air-free, CO_2; $MoCl_2$ remains in the boat, and $MoCl_4$ sublimes, and is carried forward some distance by the CO_2 (Liechti a. Kempe, *A.* 169, 344).

Properties.—A brown semi-crystalline solid; the vapour is intensely yellow. Deliquescent; dissolves in water with hissing sound, the solution shows the reactions of salts of MoO_2. Somewhat sol. in alcohol and ether; dissolved by H_2SO_4Aq with evolution of HCl; sol. in conc. HNO_3Aq.

Reactions.—1. Kept in contact with *air*, oxychlorides are produced.—2. *Heated in air*, MoO_2Cl_2 and $MoO_3.2HCl$ are formed.—3. Heated in *carbon dioxide*, forms $MoCl_5$ and $MoCl_3$; at a higher temperature the $MoCl_3$ is decomposed to $MoCl_4$ and $MoCl_2$.

Combinations.—1. With *phosphorus pentachloride* to form $MoCl_4.2PCl_5$; a bluish amorphous solid, obtained by the reaction of PCl_5 with $MoCl_5$ or MoO_2Cl_2. When this compound is heated, $MoCl_4.PCl_5$ is produced; a metal-like lustrous solid, soluble in water to form a black liquid (Cronander, *Bl.* [2] 19, 500).—2. With *ammonium chloride* to form $3MoCl_4.2NH_4Cl.6H_2O$; obtained by saturating NH_4ClAq with $MoCl_5$, filtering from NH_4Cl which separates, and allowing to crystallise: forms green, deliquescent octahedra (Blomstrand, *J. pr.* 71, 449).

MOLYBDENUM PENTACHLORIDE, $MoCl_5$. Mol. w. 272·75. V.D. at 350° = 137. This chloride was supposed by Berzelius, also by Blomstrand, to be tetrachloride; its composition was determined by Debray (*C. R.* 66, 732).

Formation.—1. By gently heating Mo or MoS_2 in Cl.—2. By strongly heating in Cl a mixture of MoO_2 and C.

Preparation.—A tube of hard glass is narrowed at intervals so that 4 or 5 divisions are formed; a porcelain boat containing Mo is placed in the tube, and the Mo is heated in a stream of dry HCl so long as any white woolly sublimate of $MoO_3.2HCl$ is formed; this sublimate is driven out of the tube by warming in the stream of HCl. After cooling, dry air-free Cl is passed through the tube for at least an hour, to ensure the removal of every trace of air, and the Mo is then gently heated in the stream of Cl. $MoCl_5$ is formed and deposited immediately in front of the porcelain boat; by careful heating while the stream of Cl passes, the $MoCl_5$ can be sublimed into the different divisions of the tube, each of which is then sealed off (Liechti a. Kempe, *A.* 169, 344).

Properties.—A black, crystalline, lustrous mass; a shade of greenish colour indicates presence of oxychloride (L. a. K., *l.c.*). Melts at 194°, and boils at 268° (Debray, *C. R.* 66, 732). The vapour is dark red. V.D. at 350° = 137 (Debray, *l.c.*; Rieth, *B.* 3, 668). May be sublimed unchanged in Cl or CO_2. Decomposed by heating in air with production of MoO_2Cl_2. Fumes in air, and deliquesces to a brown liquid. Dissolves in water with decomposition; solution in a little water is brown, but becomes colourless on dilution. Sol. in alcohol and ether, forming green liquids. Sol. in H_2SO_4Aq and HNO_3Aq.

Reactions.—1. Heated in *air* forms MoO_2Cl_2; same change results by exposure to air.—2. Reacts towards some *organic compounds* as a carrier of chlorine, *e.g.* CCl_4 and S_2Cl_2 are produced by passing Cl into CS_2 mixed with $MoCl_5$ (Aronheim, *B.* 9, 1788).—3. Heated with *ammonia* or *ammonium chloride* produces compounds of Mo with N and H (*v. Molybdenum, nitride of*, p. 430).

Combinations.—With *phosphoryl chloride*, to form $MoCl_5.POCl_3$; large dark-green crystals, melting at 125°–127°, and boiling at 170° with separation into its constituents (Piutti, *B.* 12, 1326). This compound is formed by heating PCl_5 with MoO_3, in the ratio $3PCl_5.MoO_3$, to 170° in a sealed tube, pouring off the brown liquid from the crystals, washing the latter with CS_2 and drying them in a stream of CO_2.

Molybdenum, chlorobromides of, $Mo_3Br_4Cl_2.3H_2O$ and $Mo_3Cl_4Br_2.3H_2O$. Produced by adding HClAq to a solution of $MoBr_2$ in KOHAq, and by adding HBrAq to a solution of $MoCl_2$ in KOHAq respectively (*cf. Molybdenum bromohydroxide*, p. 428, and *Molybdenum chlorohydroxide, infra*).

Molybdenum, chlorobromohydroxide of. $Mo_3Cl_4.BrOH.2H_2O$; obtained by adding water to an alcoholic solution of $Mo_3Cl_4.Br_2.2H_2O$ (*v.* next article).

Molybdenum, chlorohydroxide of. $Mo_3Cl_4(OH)_2.2H_2O$. Prepared by dissolving $MoCl_2$ in KOHAq, and neutralising by acetic acid; the *octohydrate* $Mo_3Cl_4(OH)_2.8H_2O$ is obtained by adding CO_2, or NH_4Cl, in place of acetic acid. The dihydrate a light-yellow amorphous powder; insol. water and alcohol; when freshly ppd. and washed with cold water it dissolves readily in acids, but on boiling the solution in HNO_3Aq or H_2SO_4Aq the hydrate is reppd., and is now quite insoluble in acids. The octohydrate forms yellow lustrous crystals (Blomstrand, *J. pr.* 77, 95).

By adding HBrAq or HIAq to $MoCl_2$, or $Mo_3Cl_4(OH)_2.xH_2O$, warming, and allowing to cool, the compounds $Mo_3Cl_4.Br_2.3H_2O$ and $Mo_3Cl_4.I_2.3H_2O$ are obtained, and by evaporating the mother-liquor from the second of these, on the water-bath, the compound $Mo_3Cl_4.I_2.6H_2O$ is produced. These haloid compounds of the radicle Mo_3Cl_4 are yellowish-red crystals, soluble in alcohol, crystallisable from dilute HBrAq and HIAq respectively. Addition of water to the alcoholic solution of $Mo_3Cl_4.Br_2.3H_2O$ ppts. $Mo_3Cl_4.BrOH.2H_2O$ (Blomstrand, *l.c.*).

The compounds $Mo_3Cl_4(OH)_2.2H_2O$ and $Mo_3Cl_4(OH)_2.8H_2O$ might be represented as oxybromides of Mo, viz. as $Mo_3OCl_4.3H_2O$ and $Mo_3OCl_4.9H_2O$; but the reactions of these compounds with HBrAq and HIAq, and the composition and properties of the salts $2KX.Mo_3Cl_4.X_2.xH_2O$ (*v. Molybdenum dichloride*), are better expressed by representing them as hydrated hydroxides of the radicle Mo_3Cl_4 than as hydrated oxybromides: a corresponding bromohydroxide, $Mo_3Br_4(OH)_2$, exists (*v.* p. 428).

Molybdenum, chloro-iodides of. $Mo_3Cl_4.I_2.xH_2O$; $x = 3$ and 6. Obtained by adding HIAq to $MoCl_2$ or to $Mo_3Cl_4(OH)_2.xH_2O$ (*cf.* preceding article).

Molybdenum, fluorides of. No fluoride of Mo has been isolated. Solutions of $Mo_2O_3.xH_2O$, $MoO_2.xH_2O$, and $MoO_3.xH_2O$, in HFAq may contain the corresponding fluorides (Berzelius). The first of these solutions is purple, on evaporation a purple-coloured varnish is obtained; addition of KF, NH_4F, or NaF, to this solution, and evaporation, ppts. rose-coloured powders which may be double compounds of alkali fluoride and MoF_3. Solution of $MoO_2.xH_2O$ in HFAq is rose-red, but goes colourless on addition of much HFAq; on evaporation it yields a crystalline solid which dissolves in water; KF ppts. a reddish-brown solid. Solution of MoO_3 in HFAq is colourless, on evaporation it yields a yellow syrup; addition of KF produces $2KF.MoO_2F_2.H_2O (= K_2MoO_2F_4.H_2O)$; (*cf. Fluomolybdates* under *Molybdates*, p. 425).

Molybdenum, fluobromide of. $Mo_3Br_4F_2.3H_2O$; prepared by adding HFAq to solution of $Mo_3Br_4(OH)_2$ or $MoBr_2$ in KOHAq: *cf. Molybdenum, bromohydroxide of*, p. 428.

Molybdenum, haloid compounds of. The haloid compounds of Mo which have been isolated are $MoBr_2$, $MoBr_3$, $MoBr_4$, $MoCl_2$, $MoCl_3$, $MoCl_4$, and $MoCl_5$; the three bromides are formed by the direct union of Mo and Br; $MoCl_5$ is produced by heating Mo in Cl, $MoCl_3$ is obtained by partial reduction (by H) of $MoCl_5$, and $MoCl_2$ and $MoCl_4$ are the products of the decomposition by heat of $MoCl_3$. The only one of these compounds whose molecular weight is known in the gaseous state is $MoCl_5$. The reactions of the dibromide and dichloride leave little doubt that the molecular formulæ of these compounds are not less than Mo_3X_6; these compounds react as $Mo_3X_4.X_2$; the radicles Mo_3X_4 combine with acid radicles to form salts such as $Mo_3Br_4.SO_4$ and $MO_3Cl_4.Br_2$. These radicles Mo_3X_4 also combine with alkali haloid compounds to form $2MY.Mo_3X_4.Y_2.xH_2O$ where M = alkali metal and Y = halogen.

No fluoride or iodide of Mo has been isolated with certainty.

Molybdenum, hydroxides or hydrated oxides of; *v. Molybdenum, oxides of*, p. 431; also *Molybdic acids*, p. 423.

Molybdenum, hydroxychlorides of; $Mo(OH)_2Cl_2$ *v. Chloromolybdic acid*, p. 423; $Mo_3Cl_4(OH)_2$ *v. Molybdenum, chlorohydroxide of, supra.*

Molybdenum, hydroxybromide of; $Mo_3Br_4(OH)_2$, *v. Molybdenum, bromohydroxide of*, p. 428.

Molybdenum, iodides of. None has been isolated with certainty. A solution of $MoO_2.xH_2O$ in HIAq gives a crystalline solid on evaporation; this solid is sol. water, on heating it gives MoO_2 and HI (Berzelius).

Molybdenum, iodobromide of. $Mo_3Br_4I_2$. Known only in combination with $Mo_3Br_4(OH)_2$, as $(Mo_3Br_4I_2)_2.Mo_3Br_4(OH)_2.8H_2O$; which is produced by adding HIAq to a solution of $Mo_3Br_4(OH)_2$ in KOHAq; *cf. Molybdenum, bromohydroxide of*, p. 428.

Molybdenum, iodochloride of. $Mo_3Cl_4I_2.xH_2O$, $x = 3$ and 6. Obtained by adding HIAq to $MoCl_2$ or $Mo_3Cl_4(OH)_2.xH_2O$; *cf. Molybdenum, chlorohydroxide of, supra.*

Molybdenum, nitride of. Mo_3N_2, or (?) Mo_5N_3. A greyish-black powder, obtained by passing dry NH_3 over $MoCl_5$ heated to full redness (Uhrlaub, *P.* 101, 605). Heated to whiteness in NH_3, Mo is produced.

Compounds of Molybdenum with Nitrogen and Hydrogen. These compounds are produced by heating $MoCl_5$ or MoO_3 in NH_3, also by heating NH_4Cl with $MoCl_5$. $MoCl_5$ melts when heated in dry NH_3, NH_4Cl volatilises, and on continued warming a blackish mass remains, which when powdered, quickly washed with water, and dried over H_2SO_4, has the composition $Mo_5N_{10}H_4$ (Uhrlaub, *P.* 101, 605). Wöhler (*A.* 108, 258) regarded this compound as $4MoN_2.Mo(NH_2)_2$. By heating to incipient redness, a body of the composition $Mo_3N_{10}H_4$ is produced (Uhrlaub, *l.c.*). Both these compounds are black powders; heated in air they burn to MoO_3 and give off NH_3; with molten KOH they evolve NH_3, and with NaClOAq

Missing Page

latinises after long standing, and dries to a brown-black, insoluble, hydrate (Berzelius, *Lehrbuch*). Moist $MoO_2.xH_2O$ oxidises superficially in air, forming the blue oxide. Heated *in vacuo* MoO_2 is produced. $MoO_3.xH_2O$ is insoluble in caustic alkali solution, but dissolves in alkaline carbonates and bicarbonates; these solutions reppt. the hydrate on boiling, by standing in air molybdates are formed (Berzelius).

$MoO_2.xH_2O$ dissolves in acids to form salts. These salts are generally purple-red to black; only a few are crystallisable; their solutions oxidise in air; alkalis ppt. $MoO_2.xH_2O$ from these solutions. The same salts may be prepared by digesting MoO_3 and Mo with acids till the colour is reddish-brown. Berzelius (*P.* 4, 153; 6, 331, 369; 7, 261) prepared some of the salts of MoO_2, but they have not been examined satisfactorily. By mixing MoO_2 in HClAq with NH_4 molybdate, Rammelsberg obtained a crystalline salt $(NH_4)_2O.2MoO_2.4MoO_3.9H_2O$ (*P.* 127, 281).

MOLYBDENUM TRIOXIDE, MoO_3 (*Molybdic anhydride*). This oxide was obtained by Scheele in 1778 soon after he had distinguished native Mo sulphide from galena.

Occurrence.—As *molybdenum ochre* in small quantities in a few localities.

Formation.—1. By heating Mo, or any of the lower oxides, for some time in air.—2. By prolonged heating of the lower oxides in steam (Regnault, *A. Ch.* 62, 356).—3. By roasting MoS_2 in air, or oxidising it by HNO_3Aq (*v. Molybdenum, Preparation*, p. 421).—4. From NH_4 molybdate, by evaporating with excess of HNO_3 and washing the residue with water (Brunner, *D. P. J.* 150, 372); also by heating in thin layers spread out in a flat porcelain dish (Ullik, *A.* 144, 205).

Preparation.—Impure MoO_3 is dissolved in NH_3Aq, H_3PO_4 is removed by ppn. with $MgCl_2Aq$, the filtrate is evaporated, the crystals of NH_4 molybdate which separate are heated with excess of HNO_3Aq, and the residual MoO_3 is washed with water. (For details as to preparation of MoO_3 from Mo ores *v.* MOLYBDENUM, *Preparation*, p. 421.)

Properties.—A white, light, porous, solid; when thrown into water it separates into small, thin, lustrous, scales. S.G. 4·39 at 21° (Schafarik, *J. pr.* 90, 12). Strongly heated in an open vessel, sublimes in colourless, transparent, rhombic needles (Nordenskjöld, *P.* 112, 160). Melts at red heat. Soluble in 500 parts cold water (Bucholz, *Scher. J.* 9, 485), in 960 parts hot water (Hatchett, *T.* 1795. 323). The solution reddens litmus, tastes metallic (Wittstein, *J.* 1860. 159; Müller, *J. pr.* 80, 119). Soluble in acids; but scarcely soluble after being strongly heated. Dissolves in alkali, alkaline carbonate, and cream of tartar solutions.

Reactions.—1. By heating in *hydrogen* MoO_3 is reduced to MoO_2, Mo_2O_3, or Mo, according to the temperature employed.—2. Reduced to Mo by treating with *potassium* or *sodium*.—3. Reduced to Mo_2O_3 by digesting with *hydrochloric acid and zinc* or *copper*, &c.; also by *potassium-amalgam*.—4. Reduced to the blue oxide (*v.* p. 433) by *a little hydrogen sulphide* (excess of H_2S produces black Mo sulphide), also by *solution of sulphur dioxide, hydrogen iodide solution, boiling hydrochloric acid, nitric oxide*, or *stannous chloride*.—5. Heated with *ammonia*, compounds of Mo with N, and with N and H, are produced (*v. Molybdenum, nitride of*, p. 430).—6. Heated with *sulphur*, MoS_2 is produced.—7. Oxychlorides, along with molybdates, oxybromides, or oxyfluorides are formed by heating MoO_3 with *metallic chlorides, bromides*, or *fluorides* (Schulze, *J. pr.* [2] 21, 440).—8. Various reduction products result by heating with *potassium iodide* (Schulze, *l.c.*).—9. *Hydrogen chloride* produces $MoO_3.2HCl$ ($= MoO(OH)_2Cl_2$; *v. Chloromolybdic acid*, p. 423).—10. *Hydrofluoric acid* probably produces MoO_2F_2 (*v. Molybdenum, oxyfluoride of*, p. 423).—11. Dissolves in fairly conc. *sulphuric acid*; on evaporation, crystals of $MoO_3.SO_3$ separate (*v. infra, Combinations*, No. 3). Hot dilute H_2SO_4Aq, saturated with MoO_3, gelatinises on cooling.—12. Reacts with *alkalis* to form molybdates, R_2MoO_4, &c. (*v.* p. 423).—13. Oxychloride, MoO_2Cl_2, is formed by heating in *chlorine* (H. Rose, *P.* 75, 319).—14. Oxychlorides are produced by heating with *phosphorus tri-* or *penta-chloride* (Michaelis, *J.* 1871. 249; Schiff, *A.* 102, 116).

Combinations.—1. With *water* to form various acidic hydrates (*v. Molybdic acids*, p. 423; also *infra, Hydrates of molybdenum trioxide*).—2. With *hydrogen chloride* to form $MoO_3.2HCl$. This compound is produced as a white, loose, sublimate, by heating MoO_3 in HCl to 150°-200°; it is easily soluble in water, and can be sublimed unchanged in HCl (Debray, *C. R.* 46, 1101). This compound may be regarded as an acid and called *chloromolybdic acid*; $MoO(OH)_2Cl_2$ (*v.* p. 423).—3. With *sulphur trioxide* to form $MoO_3.SO_3$, and with SO_3 and H_2O to form $MoO_3.3SO_3.2H_2O$. $MoO_3.SO_3$ was obtained by Schultz-Sellac (*B.* 4, 14) by evaporating a solution of MoO_3 in fairly conc. H_2SO_4; it forms lustrous, transparent, deliquescent crystals, which lose SO_3 when heated. $MoO_3.3SO_3.2H_2O$ was obtained by Anderson (*J. B.* 22, 161) by adding excess of H_2SO_4Aq to $BaMoO_4$, filtering, and evaporating.—4. Combines with the *oxides of phosphorus, arsenic, antimony, vanadium, and silicon*, in presence of basic oxides, to form salts of complex acids; *v. Antimono-*, &c., *molybdates*, pp. 425 *et seq.*—5. With *ammonium fluoride* to form $MoO_3.2NH_4F$ (? NH_4 salt of $MoO(OH)_2F_2$); obtained in lustrous, light yellow, octahedral crystals, by adding NH_3Aq to an aqueous solution of $MoO_2F_2.3NH_4F$ (this salt is obtained by evaporating a solution of NH_4 molybdate in excess of NH_4FAq acidified by HFAq) (Mauro, *Mem. R. Acad. dei Lincei*, [4] 4, 481).

HYDRATES OF MOLYBDENUM TRIOXIDE. Six compounds $xMoO_3.yH_2O$ have been isolated. Four of these have been described under *Molybdic acids* (p. 423); the remaining two are described here.

Monomolybdic dihydrate, $MoO_3.2H_2O$. A yellow, crystalline, solid. Slowly separates from a solution of 15 grs. ordinary NH_4 molybdate in 1000 c.c. water mixed with 1000 c.c. HNO_3Aq S.G. 1·16; may be washed with cold water; sol. in water and acids; solution reddens litmus and turns turmeric brown; conc. HNO_3Aq separates MoO_3 (Millingk, *Gm.-K.* 2 [2], 170).

Octomolybdic monohydrate, $8MoO_3.H_2O$. Obtained by ppg. solution of ordinary NH_4 molybdate by $BaCl_2Aq$, decomposing the Ba salt by exactly the equivalent quantity of dilute boiling H_2SO_4Aq, filtering, evaporating over H_2SO_4, and drying at 160°-170° (Ullik, *A.* 144, 329; 153, 373). Soluble in water.

OXIDES OF MOLYBDENUM OTHER THAN THE DI-, SESQUI- AND TRI- OXIDE. Several oxides appear to exist intermediate between MoO_2 and MoO_3; their compositions are not yet settled. Some of them form hydrates of which some are soluble and some insoluble in water. The substance known as 'blue oxide of molybdenum,' formed by the action of reducing agents on acid solutions of MoO_3, is probably Mo_3O_8.

References.—Mo_5O_{14}; by heating lower oxides in air (Berzelius, *P.* 6, 331, 369). Mo_2O_5; by heating $(NH_4)_2O.2MoO_2.4MoO_3.9H_2O$ (Rammelsberg, *P.* 127, 281). Mo_3O_8; by heating NH_4 molybdate with MoO_3 (Berlin, *J. pr.* 49, 447; Uhrlaub, *P.* 101, 605); also by electrolysis of molten MoO_3 (Wöhler a. Baff, *A.* 110, 275). Mo_4O_{11}; by heating MoO_3 with KI (Schulze, *J. pr.* [2] 21, 440). $Mo_2O_5.3H_2O$; by adding NH_4 molybdate or MoO_3, to MoO_2 in HClAq (Berzelius, Rammelsberg, *l.c.*). Regarding properties of the blue products obtained by reducing acid solutions of MoO_3, *v.* Schiff, *A.* 120, 47; Maschke, *Fr.* 12, 384; Berzelius, *Gm.-K.* 2 [2], 164; O. von der Pfordten, *B.* 15, 1925. Fairley (*C. J.* 31, 142) obtained indications of an oxide of Mo with more O than MoO_3, by adding H_2O_2Aq to MoO_3 dissolved in excess of alkali solution.

Molybdenum, oxybromide of. MoO_2Br_2. Obtained by passing Br vapour over heated MoO_2; by melting MoO_3 with H_3BO_3, powdering, and then heating with KBr; by the reaction of MoO_3 on many metallic bromides (Schulze, *J. pr.* [2] 21, 442). Yellow crystals; may be sublimed; deliquescent and soluble in water. The compound $Mo_3Br_4(OH)_2.8H_2O$ may be represented as an oxybromide $Mo_3OBr_4.9H_2O$, but is better regarded as hydrated *bromohydroxide* (*q. v.*, p. 428).

Molybdenum, oxychlorides of. Many oxychlorides of Mo exist. They are produced by the reaction of Mo oxides with Cl, Mo chlorides with O, and PCl_5 and metallic chlorides with MoO_3.

I. *Green oxychloride.* $Mo_9O_9Cl_{32}$, more probably $MoOCl_4$ (Blomstrand, *J. pr.* 71, 459; Püttbach, *A.* 201, 123). By heating a mixture of Mo and MoO_2 in air-free Cl; and in many other ways. Melts and sublimes below 100°. Soluble in water. Reduced by H at high temperatures; Püttbach (*l.c.*) describes $Mo_2O_3Cl_7$ as a product of this reduction.

II. *Yellow-white oxychloride.* MoO_2Cl_2. By passing Cl over heated MoO_2, or MoO_3 (H. Rose, *P.* 75, 319); by heating Mo chlorides in presence of O (Blomstrand, *l.c.*); and in many other ways (*v.* Schulze, *J. pr.* [2] 21, 441; Michaelis, *J.* 1871. 249; Schiff, *A.* 102, 216; Püttbach, *l.c.*). Melts at a high temperature when heated under pressure; at ordinary pressure sublimes without melting; soluble in water and alcohol.

III. *Violet oxychloride.* $Mo_2O_3Cl_6$; perhaps $MoOCl_3$ (Blomstrand, *l.c.*). Produced along with the green oxychloride, than which it is much less easily volatilised. Dark violet-red crystals; deliquescent.

IV. *Brown oxychloride.* $Mo_2O_3Cl_5$ (Blomstrand, *l.c.*). Produced, along with MoO_2Cl_2, by heating Mo_2O_3 in dry Cl; purified by sublimation in H. Forms large dark-brown crystals; melts easily; deliquescent and soluble in water. Püttbach (*l.c.*) describes a brown oxychloride, $Mo_2O_3Cl_4$, obtained in the preparation of $MoOCl_4$; also a red oxychloride, $Mo_3O_5Cl_8$, obtained by heating the violet compound in CO_2.

The compound $Mo_3Cl_4(OH)_2.2H_2O$ may be represented as an oxychloride, $Mo_3OCl_4.3H_2O$, but its reactions are more those of *chlorohydroxide* (*q. v.*). $MoO_3.2HCl$, which might be represented as $MoO_2Cl_2.H_2O$, is described as *chloromolybdic acid* (*q.v.*).

Molybdenum, oxyfluoride of. MoO_2F_2. Produced by heating MoO_3 with metallic fluorides, as a blue-white amorphous sublimate (Schulze, *J. pr.* [2] 21, 442). A number of compounds are known which may be regarded as double compounds of MoO_2F_2 with alkali fluorides; others may be regarded as double compounds of $MoOF_3$ with alkali fluorides; these are described as *fluomolybdates* (p. 425).

Molybdenum, phosphide of. Mo_3P_2. A grey crystalline powder; S.G. 6·17; oxidised by heating in air; with conc. HNO_3Aq forms H_3PO_4 and MoO_3; heated in Cl forms $MoCl_3$ and PCl_5; reduces Cu solutions with ppn. of Cu. Produced by heating a mixture of 1 pt. MoO_3 with 2 pts. glacial phosphoric acid to a high temperature for some time, and washing with HClAq and then with NaOHAq (Wöhler a. Rautenberg, *A.* 109, 374).

Molybdenum, salts of. Little is known with certainty of the salts obtained by replacing H of oxyacids by Mo. MoO_2 and Mo_2O_3 dissolve in acids to form salts, but accurate analyses and description of those salts are lacking (*v. Molybdenum dioxide* and *sesquioxide*, p. 431). MoO_3 combines with SO_3 to form $MoO.SO_3$ and with HCl to form $MoO_3.2HCl$, but those compounds are probably rather acids than salts (*v. Molybdenum trioxide*, p. 432). The radicles Mo_3Br_4 and Mo_3Cl_4 combine with certain acidic radicles to form salts (*v. Molybdenum bromohydroxide*, and *chlorohydroxide*, pp. 428, 430).

Molybdenum, selenide of. $MoSe_3$. Obtained, but not free from a greyish-blue substance which is produced along with it, by saturating acid NH_4 molybdate with H_2Se gas (Uelsmann, *A.* 116, 125).

Molybdenum, sulphides of. Three are known; MoS_2, MoS_3, and MoS_4. As none has been gasified the molecular weight of none is known with certainty. MoS_3 and MoS_4, and probably also MoS_2, are all acidic towards the alkali sulphides.

MOLYBDENUM DISULPHIDE, MoS_2. Occurs native, as *molybdenite*; S.G. 4·138 to 4·569. Prepared by heating to redness a mixture of 1 pt. MoO_3 and 2 pts. S, in a crucible, till excess of S is burnt off, and washing the residue with warm water as long as the washings are coloured (Svanberg a. Struve, *J. pr.* 44, 264). According to Carnot (*Bl.* [2] 32, 164) compounds of Mo generally yield MoS_2 when heated in a stream of dry H_2S. A black, lustrous powder; insol. water; sol. conc. H_2SO_4, with evolution of SO_2, and production of a blue liquid. Forms MoO_3 when roasted in air, or heated with conc.

HNO_3Aq; readily attacked by Cl, more slowly by Br; not acted on by aqueous alkali but after fusion with alkali dissolves in water (? with formation of a thio- salt). Slowly reacts with steam at high temperatures (Regnault, *A. Ch.* 62, 385). Reduced to Mo by strongly heating in H (O. von der Pfordten, *B.* 17, 731).

Molybdenum trisulphide, MoS_3. (*Thiomolybdic anhydride.*) Obtained by passing H_2S into solution of a molybdate until decomposition is complete, *i.e.* till all molybdate is changed to a thiomolybdate, adding dilute HClAq in slight excess, warming gently (Atterberg, *J.* 1873. 258), washing, and drying at a moderate temperature. A black powder; red-brown when moist. Goes to MoS_2 when heated. E. sol. alkali sulphide solutions; slowly dissolved by alkali or alkali hydrosulphide solution; the solutions thus obtained contain *thiomolybdates*, $M^I_2MoS_4$ (*v.* Thiomolybdic acids and their salts, *infra*). MoS_3 is reduced to Mo by heating in H (O. von der Pfordten, *B.* 17, 731).

Molybdenum tetrasulphide, MoS_4. Prepared by fusing a mixture of 2 pts. MoO_2 and 1 pt. K_2CO_3, powdering, boiling with water, filtering, diluting, saturating with H_2S, washing the pp. with cold and then with hot water, then treating with HClAq, and heating the chocolate-brown powder thus obtained to 140° in a stream of H_2S (Krüss, *B.* 16, 2044). Also obtained by heating MoS_3 to 100° in H_2S (K., *l.c.*). Also by boiling MoS_3 with K_2MoS_4Aq, washing the pp. of MoS_2 and K_2MoS_5 with cold water, dissolving in boiling water, and adding acid to this solution (Berzelius). MoS_4 is a cinnamon-brown powder; partially oxidised in moist air. With basic sulphides forms *perthiomolybdates* $M^I_2MoS_5$ (*v.* Thiomolybdic acids and their salts, *infra*).

Molybdenum, sulpho-acids of; *v. Molybdenum, thio-acids of, and their salts.*

Molybdenum, thio- acids of, and their salts. A number of molybdates are known in which O is partly or wholly replaced by S. These salts may be divided into two classes; those containing both O and S, these may be called *oxy-thiomolybdates*; and those containing only S, these may be called *thiomolybdates*. The latter salts are classed as thiomolybdates, derived from MoS_3; and perthiomolybdates, derived from MoS_4. The only thio- acid of Mo which has been isolated with certainty is H_2MoS_5.

Perthiomolybdic acid, H_2MoS_5. A red pp. obtained by adding a weak acid to K_2MoS_5 (which separates during the preparation of MoS_4), washing with cold water, and drying over H_2SO_4 (Krüss, *A.* 225, 1). Insol. water, alcohol, and ether. Sol. warm NaOHAq; not acted on by NH_3Aq; evolves H_2S slowly when boiled with conc. HClAq.

Oxy-monothiomolybdates, $M^I_2MoO_3S$. The Na salt is prepared by melting pure MoO_3 with dry Na_2CO_3 till CO_2 is all expelled, powdering the $Na_2Mo_3O_{10}$ thus obtained, dissolving in freshly-prepared NaHSAq, withdrawing the reddish heavy oil which separates, washing the crystals which are formed by allowing this oil to stand, with alcohol, ether, CS_2, and then again with alcohol and ether, and drying over H_2SO_4 (Krüss, *A.* 225, 1). A hygroscopic salt; sol. water.

Oxy-dithiomolybdates, $M^I_2MoO_2S_2$. The NH_4 salt is prepared, as golden-yellow needles, by passing H_2S into NH_4 molybdate dissolved in NH_3Aq, at c. 6° (Krüss, *l.c.*). The K salt is also described by Krüss (*l.c.*).

Oxy-pyrodithiomolybdates, $M^I_2Mo_2O_4S_2$ ($=2M_2MoO_2S_2-M_2S$). The salts of this series at present known are acid salts. The NH_4 salt, $NH_4HMo_2O_4S_2$, is prepared, as a reddish-yellow pp., by adding NH_4HS drop by drop to NH_4 molybdate at c. 90°, filtering after addition of NH_4Cl, washing with alcohol, and drying over H_2SO_4. Corresponding K and Na salts are described by Krüss (*l.c.*).

Tetrabasic dioxy-dithiomolybdates. The salt $K_2O.3K_2S.2MoO_3.2MoS_3$ ($=K_8Mo_4S_9O_7$) was obtained by Krüss (*l.c.*) by adding alcohol to a solution of $K_2Mo_3O_{10}$, repeatedly shaking the oil which forms with alcohol, separating the black flaky crystals from the yellow crystals and the brownish-red powder, all of which are produced on standing, washing and drying.

Thiomolybdates, $M^I_2MoS_4$. These salts are derived from the hypothetical thiomolybdic acid H_2MoS_4, of which acid MoS_3 is the anhydride. The soluble thiomolybdates are obtained by directly combining MoS_3 with basic sulphides, also by passing H_2S into conc. solutions of the corresponding molybdates; the insoluble thiomolybdates are obtained by ppg. salt-solutions by soluble thiomolybdates. The soluble thiomolybdates may generally be crystallised; the crystals show fluorescence, green in reflected, red in transmitted, light. Solutions of these salts are red. The thiomolybdates as a class are decomposed by heat, giving a mixture of sulphide of the basic metal and MoS_2; the K salt is only partly decomposed at white heat. Conc. solutions are stable in presence of excess of MoS_3; when diluted, and especially in presence of free alkali, the solutions become turbid with formation of thiosulphates and thiomolybdates richer in S than the original salts. Boiled in absence of air, the solutions evolve H_2S and form MoS_2 and perthiomolybdates, $M^I_3MoS_5$ (Berzelius, *P.* 7, 261; Krüss, *A.* 225, 1; *cf.* Bodenstab, *J. pr.* 78, 186).

Potassium thiomolybdate, K_2MoS_4. Prepared by gradually heating, finally to a high temperature, a mixture of equal parts K_2CO_3 and S, with a little C, and a large excess of MoS_2, dissolving in water, filtering, and crystallising (Hirzel, *J.* 1850. 319). Krüss (*l.c.*) obtained this salt by dissolving 5 g. K_2MoO_4 in 16 c.c. water, adding 50 c.c. KOHAq, S.G. 1·46, and saturating with H_2S. Red, rhombic, crystals, with greenish fluorescence. Sol. water; acetic acid ppts. $K_2Mo_2S_7$.

The other thiomolybdates which have been examined, more or less fully, are the salts of NH_4, Ba, Cd, Ca, Ce, Cr, Co, Cu, Au, Fe, Li, Mg, Mn, Hg, Ag, Na, Sr, Sn, U, and Zn.

Perthiomolybdates, $M^I_2MoS_5$. The soluble salts of this class are formed by boiling thiomolybdates M_2MoS_4 with MoS_3; the insoluble salts by ppg. salt-solutions by soluble perthiomolybdates. The perthiomolybdates are generally dark red; solutions of the alkali salts give a pp. of MoS_4 on addition of acids (Berzelius, *P.* 7, 261).

Potassium perthiomolybdate, K_2MoS_5. Prepared by saturating an acid K molybdate solution with H_2S (a mixture of K_2MoS_4 and MoS_3 is thus produced), boiling for some hours in a retort, cooling, collecting the pp. of K_2MoS_5 mixed with MoS_2, washing with water till the washings give a flocculent dark-red pp. on addition of HClAq, extracting with boiling water, and evaporating the solution. Also by heating dilute K_2MoS_4Aq with excess of MoS_3 nearly to 100° till the liquid is nearly dry. Also by reacting on MoS_4 with KHSAq. A red mass, resembling an extract; on one occasion Berzelius obtained ruby-red crystalline granules. Insol. cold water, sol. hot water. Scarcely acted on by cold HClAq or KOHAq.

The other perthiomolybdates examined, more or less fully, are the salts of NH_4, Ba, Bi, Cs, Au, Fe, Hg, Ag, Na, Sr, and Sn.

TRIBASIC DITHIOMOLYBDATES. Krüss (*A.* 225, 1) obtained the salt $K_6Mo_2S_9$ ($=3K_2S.2MoS_2 = K_2MoS_4.MoS_3.2K_2S$) by passing H_2S into K_2MoO_4Aq containing KOHAq, S.G. > 1·46 (*cf. Potassium thiomolybdate, supra*). Small reddish-orange rhombic crystals; sol. water, insol. alcohol and ether. Decomposes slowly in air, giving K_2MoS_4. M. M. P. M.

MONARDA OIL. The essential oil of *Monarda punctata*, which smells like thyme, contains thymol $C_{10}H_{14}O$ [48°] and a terpene (Arppe, *A.* 58, 41).

MONO-. This prefix is very seldom used in this dictionary. Compounds whose names begin with mono- are described under the name to which mono- has been prefixed.

MORIN or **MORIC ACID** $C_{13}H_8O_8$ aq (B. a. H.); $C_{15}H_{10}O_7$ aq (from alcohol); $C_{15}H_{10}O_7$ 2aq (from water) (L.). S. ·025 at 20°; ·094 at 100°. Occurs in old fustic (*Morus tinctoria*) to which it imparts its dyeing properties (Wagner, *J. pr.* 51, 82; Hlasiwetz a. Pfaundler, *J. pr.* 90, 445; 94, 65; *A.* 127, 352; Löwe, *Z.* 1875, 117; *Fr.* 14, 119; Benedikt a. Hazura, *M.* 5, 165, 667).

Preparation.—1. Deposited as calcium salt from an infusion of the wood on cooling. This deposit is extracted with alcohol, water is added to the alcoholic extract when calcium morate is ppd. while maclurin remains in solution. The calcium salt is then decomposed by oxalic acid (Wagner).—2. The deposit is washed, heated with very dilute HClAq, freed from $CaCl_2$ by washing, and repeatedly dissolved in alcohol and ppd. by water (H. a. P.; B. a. H.).

Properties.—Needles, v. sl. sol. water, v. sol. alcohol, m. sol. ether, insol. CS_2. The solutions are deep yellow. Blackens at 300°. Conc. H_2SO_4 dissolves it, without change, forming a brownish-yellow solution. Its alkaline solutions are deep yellow. Its solution does not ppt. gelatin. It stains the skin yellow. $FeCl_3$ colours the alcoholic solution deep olive-green. It reduces Fehling's solution on warming and ammoniacal $AgNO_3$ in the cold. Its alcoholic solution exhibits green fluorescence on the addition of an aluminium salt (Goppelsröder, *J. pr.* 101, 406; 104, 10; *Z.* [2] 4, 154, 607). Morin yields resorcin on dry distillation.

Reactions.—1. *Sodium-amalgam* turns the alkaline solution indigo blue and finally yellow, the solution then containing phloroglucin.—2. *Potash-fusion* yields phloroglucin and resorcin. 3. *Nitric acid* in HOAc oxidises it to (4, 2, 1)-di-oxy-benzoic acid.—4. *Bromine* added to its alcoholic solution forms ethyl-tetra-bromo-morin $C_{15}H_5EtBr_4O_7$ 4aq which is ppd. on adding water and melts at 135°. Tin and HCl convert this ether into tetra-bromo-morin $C_{15}H_6Br_4O_7$ 2½aq which becomes anhydrous at 110° and then melts at 258°. It dyes silk and wool yellow without a mordant.

Salts.—$KC_{12}H_9O_8$: yellow needles (from K_2CO_3Aq).—$Ca(C_{12}H_9O_6)_2$: yellow precipitate $Ba(C_{12}H_8O_6)_2$: red-brown powder.—$Zn(C_{12}H_9O_6)_2$: lemon-yellow needles, insol. water, sol. alkalis.—$PbC_{15}H_{12}O_6$: egg-yellow pp.—$Pb_2C_{15}H_{10}O_9$: (L.).

Morin sulphonic acid $C_{15}H_9O_7.SO_3H$ 2aq. Formed by heating morin with conc. H_2SO_4. Golden-brown powder, sl. sol. cold, v. sol. hot, water.—$K_2C_{15}H_8SO_{10}$ ½aq: golden needles. — $BaC_{15}H_8SO_{10}$. Golden flocculent pp., converted by nitric acid into tri-nitro-phloroglucin.

Isomorin. Formed by adding sodium-amalgam to an alcoholic solution of morin containing HCl until the solution is deep-purple, and then evaporating (H. a. P.). Purple-red prisms. When heated alone or in alcoholic solution, or more quickly by treatment with alkalis, it is reconverted into ordinary morin. Its solution mixed with dilute alum is dichroïc.

Paramorin. $C_{12}H_8O_5$. Obtained, together with a larger quantity of resorcin, by distilling morin mixed with sand (Benedikt, *B.* 8, 606). Yellowish, woolly needles (from ether). Tasteless. May be sublimed. Reduces Fehling's solution. V. sol. hot water and ether (unlike morin). It dissolves unchanged in conc. H_2SO_4. Alkalis form a yellow solution. Unlike morin, its alcoholic solution is not ppd. by $Pb(OAc)_2$.

MORINDIN $C_{28}H_{30}O_{15}$ (A.). [245°] (Stein). Extracted by alcohol from the root of various species of *morinda* used as a dye ('Suranji') in India (Anderson, *Tr. E.* 16 [6], 435; *A.* 71, 216). Slender lustrous orange needles; when heated it gives off orange vapours which condense to red needles of morindone. It is insol. ether, v. sl. sol. cold water and alcohol, sol. aqueous KOH and conc. H_2SO_4 forming reddish-violet solutions. Gives a red lake with alum, and a cobalt-blue pp. with baryta-water. Morindin resembles ruberythric acid $C_{26}H_{28}O_{14}$ (Rochleder, *Sitz. B.* 7, 806; Stenhouse, *C. J.* 17, 333) but differs from it in being insoluble in ether and in the behaviour of the red alkaline solution on boiling, for this becomes deep purple in the case of ruberythric acid, but does not change in that of morindin (Stein, *J. pr.* 97, 234; Thorpe a. Greenall, *C. J.* 51, 52; 53, 171).

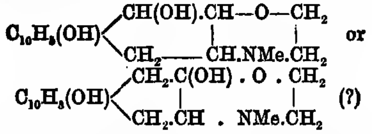
Morindone $C_{15}H_{10}O_5$. *Tri-oxy-methyl-anthraquinone* (?). Formed together with glucose by boiling morindin with dilute mineral acids. Red needles, resembling alizarin. Insol. water, v. sol. alcohol and ether. Its solution in potash is reddish-purple, but fades on standing (unlike alizarin). Conc. H_2SO_4 gives a dark-blue solution (alizarin gives an orange solution). $FeCl_3$ gives a green colour. On distillation with zinc-dust it yields methyl-anthracene.

MORINGIC ACID. An acid supposed by Walter to exist as a glyceride in oil of ben (from

Moringa aptera) but shown by Zaleski (*B.* 7, 1013) to be oleïc acid.

MORITANNIC ACID $C_{15}H_{12}O_7$ (?) If, after the aqueous extract of fustic has deposited morin, the filtrate be shaken with EtOAc, the acetic ether evaporated, and the residue dissolved in cold water and ppd. by NaCl, brown amorphous moritannic acid separates first, followed by maclurin (Löwe, *Fr.* 14, 127). V. sol. water. The solution is ppd. by albumen, gelatin, and alkaloids. $FeCl_3$ gives a brownish-black pp. Alcoholic lead acetate gives a pp. $(C_{15}H_{12}O_7)_2$ 5PbO.

MORPHINE or **MORPHIA** $C_{17}H_{19}NO_3$ *i.e.*



$$C_{10}H_5(OH){<}\begin{array}{l} CH(OH).CH{-}O{-}CH_2 \\ \qquad\qquad\;\; | \qquad\quad\;\; | \\ CH_2{-\!\!-\!\!-}CH.NMe.CH_2 \end{array} \quad \text{or}$$

$$C_{10}H_5(OH){<}\begin{array}{l} CH_2.C(OH)\,.\,O\,.\,CH_2 \\ \qquad\;\; | \qquad\qquad\quad | \\ CH_2.CH\;\;.\;\;NMe.CH_2 \end{array} \quad (?)$$

(Knorr, *B.* 22, 1117). Mol. w. 285. [230°] (Hesse, *Ph.* [3] 18, 801). S.G. 1·32 (Schröder, *B.* 13, 1074). S. ·01 at 10°; ·04 at 40°; ·22 at 100° (Chastaing, *Bl.* [2] 37, 477). S. (absolute alcohol) 1·132 at 10·6°; 8·623 at 78°. S. (alcohol of 90 p.c.) ·377 at 10·6°; 2·991 at 78°. S. (amyl alcohol) ·268 at 11°; 2·247 at 78° (Florio, *G.* 13, 496). S. (ether) ·023 at 10° (F.). S. (chloroform) ·04 at 9·4°; 1·235 at 56° (F.). S. (amyl alcohol) ·26 in the cold (Kubly, *J.* 1866, 823). The solubility of crystallised morphine in boiling liquids is given by Prescott (*Ph.* [3] 6, 404) as follows: S. (ether) ·0163; S. (chloroform) ·023; S. (amyl alcohol) 1·1; S. (benzene) ·0112. The solubility of amorphous morphine in boiling liquids is given by Prescott as S. (ether) ·0473; S. (chloroform) ·0506. The solubility of freshly ppd. morphine in boiling solutions is given by Prescott as: S. (ether) ·094; S. (chloroform) ·116; S. (amyl alcohol) 1·1; S. (benzene) ·05. According to Burg (*Fr.* 19, 222), the solubility of morphine in pure chloroform is ·01, and in a mixture of 9 pts. chloroform and 1 pt. alcohol it is ·9. $[\alpha]_D$ (in a 2 p.c. solution containing 2 mols. NaOH) = −70·23° (Hesse, *A.* 176, 190). $[\alpha]_D$ (in a solution of the hydrochloride) = $-100{\cdot}67° - 1{\cdot}14p$, where p = percentage of salt present (Hesse; Grimbert, *J. Ph.* [5] 16, 295).

Occurs in opium, being known in an impure state as *Magisterium opii* in the seventeenth century, and was first isolated in 1816 by Sertürner (*Gilb. Ann.* 55, 61; 57, 192; 59, 50). Dott (*Pr. E.* 12, 189) found in a sample of opium that half the morphine was present as meconate and half as sulphate. It also occurs in *Eschscholtzia californica* (Baudet a. Adrian, *C. C.* 1889, 197), and in hops.

Preparation.—1. Opium is macerated with water at 38°, the extract evaporated with $CaCO_3$ to a small bulk, and then mixed with $CaCl_2$. The liquid is filtered from ppd. calcium meconate and evaporated. It first deposits calcium meconate, and afterwards a mixture of the hydrochlorides of morphine and codeïne. These crystals are dissolved in water and treated with ammonia, which ppts. morphine, leaving codeïne in solution (Robiquet a. Gregory, *A.* 5, 87; 7, 261).—2. The aqueous extract of opium is boiled with lime, and the filtrate boiled with NH_4Cl, which ppts. morphine (Mohr, *A.* 35, 120).

Properties.—Small trimetric prisms (containing aq), v. sl. sol. water, alcohol, and ether. It has a very bitter taste, and is a powerful narcotic poison. It dissolves readily to the extent of one equivalent in aqueous KOH, lime, baryta, and NaOH, but scarcely at all in ammonia and alkaline carbonates. It readily dissolves in acids. It is lævorotatory. It loses its water of crystallisation at 100° (Dott, *Ph.* [3] 18, 701), and begins to sublime at 150° in dots (Blyth).

Reactions.—1. Very readily *oxidised*, thus ·014 p.c. of the base is sufficient to liberate iodine from iodic acid (Serullas, *B. J.* 11, 238). Morphine is oxidised by alkaline K_3FeCy_6 to pseudomorphine $C_{34}H_{36}N_2O_6$ (Hesse, *A.* 235, 229), and the same substance is formed by the action of nitrous acid on morphine (Schützenberger, *A.* 108, 346; *Bl.* 4, 176), and by allowing morphine to stand in aqueous NH_3 exposed to the air (Polstorff, *B.* 13, 86). Morphine slowly reduces silver nitrate in the cold.—2. On oxidation with alkaline $KMnO_4$ it yields an acid, apparently pyridine tricarboxylic acid (Barth a. Weidel, *M.* 4, 700).—3. *Potash-fusion* yields protocatechuic acid (B. a. M.) and methylamine (Wertheim, *A.* 73, 208). Alcoholic potash at 180° forms methyl-ethyl-amine (Skraup a. Wiegmann, *M.* 10, 110).—4. *Nitrous acid* forms nitroso-morphine, pseudomorphine, and a base $C_{17}H_{21}NO_3$.—5. *Nitric acid*, diluted with (1½ mols. of) water, forms at 100° an acid $C_{10}H_9NO_9$, which can be converted by conc. HNO_3 into picric acid, and which yields methylamine when heated with KOH (Chastaing, *C. R.* 94, 44; *J. Ph.* [5] 4, 338).—6. Converted into codeïne by heating with NaOEt and MeI, the yield being small owing to the formation of morphine methylo-iodide (Grimaux, *A. Ch.* [5] 27, 273; Dott, *Ph.* [3] 12, 1009).—7. On distillation with *zinc-dust* it yields pyridine, NH_3, pyrrole, and a base which may be quinoline, as chief products, together with 4 p.c. of phenanthrene and ½ p.c. of phenanthraquinoline (Gerichten a. Schrötter, *A.* 210, 396).—8. When evaporated with dilute H_2SO_4 till white fumes appear, morphine yields a residue turned brown by alkalis. Morphine (1 pt.), heated with H_2SO_4 (1½ pts.) and oxalic acid (2 pts.), at 120° forms a product which, on diluting with water, leaves a yellowish-white amorphous body undissolved. This substance, $C_{14}H_{17}NO_4$, is soluble in hot water and in alkalis. It turns green in air, and its alkaline solution turns red in air. The reddened alkaline solution gives with HCl a blue pp., 'morphine blue,' $C_{13}H_{11}NO_2$, which can be crystallised from ether. Malonic and succinic acids behave like oxalic acids, forming the compounds $C_{15}H_{19}NO_5$ and $C_{16}H_{21}NO_8$. All these formulæ should perhaps be doubled (Chastaing a. Barillot, *C. R.* 105, 941, 1012).—9. Heating with *oxalic acid* forms trimorphine.—10. Heating with conc. HCl yields apomorphine (Matthiessen a. Wright, *Pr.* 17, 455, 460), and the bases $C_{34}H_{38}ClN_2O_6$, $C_{34}H_{37}ClN_2O_5$, $C_{34}H_{36}ClN_2O_4$, and $C_{136}H_{154}Cl_2N_8O_{24}$.—11. With $Cl.CH_2.OAc$ and H_2SO_4 it gives an intense violet colour, and after dilution with water and addition of NH_3, an amorphous yellow base, possibly $CH_2(C_{17}H_{18}NO_3)_2$, which gives a violet colour with H_2SO_4 (Grimaux, *C. R.* 93, 217).—12. Aqueous *alloxan* and SO_2 form $C_4H_2N_2O_4C_{17}H_{19}NO_3H_2SO_3$ (Pellizzari, *A.* 248, 151).—13. *Bleaching-powder*, acting on a solution of morphine hydrochloride, forms $C_{17}H_{18}Cl_3NO_{10}$, a crystalline body (Mayer, *B.* 4, 121).

Colour-tests.—1. Liberates iodine from iodic acid solution. The brown colour is increased by adding ammonia (Lefert, *J. Ph.* [3] 40, 97). If a layer of very dilute ammonia be poured upon a very dilute solution of morphine containing iodic acid and starch, a brown ring below a blue ring will appear at the junction of the liquids (Dupré, *C. N.* 8, 267).—2. *Chloride of gold* colours the solution blue, being reduced to gold.—3. $KMnO_4$ is reduced, becoming green.—4. *Ferric salts* give a blue colour, destroyed by acids, by heat, and by alcohol (Robinet a. Pelletier, *A.* 5, 172).—5. $FeCl_3$, added to a previously heated solution of morphia in H_2SO_4, gives a deep-red colour, changing to dirty green (Husemann, *A.* 128, 305). According to Lindo (*C. N.* 37, 158), morphine, gently warmed with H_2SO_4 and $FeCl_3$, gives an indigo-blue colour.—6. A solution of *molybdic acid* in conc. H_2SO_4 gives, with solid morphine, a violet colour, changing through blue to dirty green (Fröhde, *Fr.* 5, 214).—7. A solution obtained by adding ammonia to cupric sulphate till the pp. cupric hydrate is just redissolved is coloured green by salts of morphine (Nadler, *Fr.* 13, 235; Lindo, *Fr.* 19, 359).—8. Nitric acid gives an orange-red colour, gradually changing to yellow.—9. H_2SO_4, containing a little nitric acid, gives a violet-red solution (Erdmann, *A.* 120, 188; Husemann, *A.* 128, 305).—10. When morphine is boiled with aqueous phosphorous or hypophosphorous acid, and conc. H_2SO_4 is added, the liquid becomes reddish-violet. On now adding a little nitric acid the solution becomes yellowish, and on warming with copper it assumes a splendid blue colour (Dragendorff, *J.* 1864, 727).—11. $KClO_4$ (free from chlorate), added to morphine mixed with H_2SO_4, gives a dark-brown colour (Grove, *Fr.* 13, 324; Siebold, *ibid.*).—12. Conc. H_2SO_4, followed by water and some oxidising agent (iodic acid, K_3FeCy_6, $K_2Cr_2O_7$, KNO_3, MnO_2, or PbO_2), best in the solid state, gives a deep-red colour on gentle warming (Lindo, *C. N.* 36, 228; Dott, *C. N.* 36, 255).—13. A mixture of K_3FeCy_6, ferric chloride, and HCl is coloured blue. This reagent may be used to detect morphine in quinine salts (Kieffer, *A.* 103, 271; Hager, *Fr.* 12, 220; Armitage, *Ph.* 18, 761). According to Hesse (*Ph.* 18, 801), the blue colour is due to pseudomorphine, not to Prussian blue.—14. Chlorine-water and ammonia give a red colour in a 1 p.c. solution (Flückiger, *Ar. Ph.* [3] 1, 117).—15. Aqueous $K_2Cr_2O_7$ gives a dirty-brown pp. (Plugge, *Ar. Ph.* [3] 25, 793).—16. Conc. H_2SO_4, containing a little K_3AsO_4, gives on warming a blue-violet colour, changing to dark brown-red. Water turns this green, and chloroform on shaking with it becomes violet, while ether becomes violet-red, the liquid below it being brown (Tattersall, *C. N.* 41, 63; Donath, *J. pr.* [2] 33, 563).—17. H_2SO_4 and a little $KClO_3$ gives in the cold a grass-green colour, the edge of the liquid being pale-rose colour (Vitali, *B.* 14, 1583).—18. A mixture of morphine (1 pt.) and powdered sugar (7 pts.) turns purple on addition of a drop of H_2SO_4, the mass gradually changing in colour through bluish-green to yellow (Schneider, *J.* 1872, 747).—19. If morphine is heated with H_2SO_4 at 200°, and the mass poured into water, the liquid becomes blue. If chloroform be shaken with this liquid it acquires a blue colour, while if ether be used the ethereal layer becomes purple (Jorissen, *Fr.* 20, 422).—20. On warming morphine with H_2SO_4 and sodium phosphate a violet colour appears (Vulpius, *Ar. Ph.* [3] 25, 256).

Estimation in Opium.—Opium (200 pts.) is exhausted with warm water and the extract evaporated to a thin syrup, mixed with alcohol (40 pts. of S.G. ·82), ether (380 pts.), and ammonia (45 pts. of S.G. ·935). The mixture is occasionally shaken, and after 18 hours it is filtered and washed with alcohol-ether. The pp. is dried, digested with benzene, dried, and weighed. After weighing the base may be titrated with standard HCl (Teschemacher a. Smith, *C. N.* 57, 93, 103, 244; Flückiger, *J.* 1885, 1962; *Ar. Ph.* [3] 27, 721; Venturini, *G.* 16, 239; Stillwell, *Am.* 8, 307; R. Williams, *C. N.* 57, 134).

Another method consists in exhausting 7 g. of opium with 110 c.c. of water and 4 g. of slaked lime. 50 c.c. of the filtrate are mixed with 5 c.c. of 95 p.c. alcohol, 25 c.c. of ether, and 3 g. of NH_4Cl. After standing for 12 hours the ether is filtered off, and another 10 c.c. of ether added. The entire liquid is then filtered and the morphine collected on the filter determined by direct weighing or by titration (Goebel, *Chem. Zeit.* 11, 508). The morphine may also be extracted from the opium by baryta-water and ppd. by CO_2 (Von Perger, *J. pr.* [2] 29, 97). Indeed, a great many processes for estimating morphine in opium have, from time to time, been proposed (Guillermond, *J. Ph.* [3] 16, 17; [4] 6, 102; Riegel, *Jahrb. pr. Pharm.* 23, 202; Guibourt, *J. Ph.* [3] 41, 97, 177; F. Mayer, *Am. J. Pharm.* 35, 28; Arnoldi, *Russ. Zeit. Pharm.* 1873, 641; Lynn, *Amer. J. Pharm.* [4] 6, 358; *C. J.* 34, 612; Flewry, *J. Ph.* [4] 6, 99; Schachtrupp, *Fr.* 7, 284, 509; Merck, *A.* 18, 79; 21, 202; 24, 46; Stein, *Ar. Ph.* [2] 148, 150; *C. J.* 25, 180; J. T. Miller, *Ph.* [3] 2, 465; *C. J.* 25, 181; Reveil, *Monit. Scient.* 13, 312; *J.* 1871, 821; Kremel, *C. C.* 1887, 1529; Adrian a. Gallois, *J. Ph.* [5] 15, 193; Schlikum, *Ar. Ph.* [3] 25, 13; Dott, *Ph.* [3] 18, 82; Plugge, *Ar. Ph.* [3] 25, 343).

Methods for separating morphine from other alkaloids have been given by Dragendorff (*Ph.* [3] 7, 24), Hager (*C. C.* 1872, 727), Neubauer (*Fr.* 9, 134), and others.

Salts.—B′HCl 3aq: S. 5 in the cold; 100 at 100° (Regnault, *A. Ch.* [2] 68, 131; *A.* 26, 24); 4 at 15° (Hesse, *A.* 179, 190). $[\alpha]_j = -94^\circ$ in a 2 p.c. solution containing excess (10 mols.) of HCl. Silky fibres (from water).—B′HCl: S. (MeOH) 2 at 15°. Minute prisms (from MeOH). The salt B′HCl 3aq is partially rendered anhydrous by solution in alcohol (Hesse, *A.* 202, 151).—$B'_2H_2PtCl_6$: yellow curdy pp., m. sol. water (Liebig, *A.* 26, 46). Decomposed by boiling water (O. de Coninck, *Bl.* [2] 45, 131).—$B'_2H_2PtCl_6$ 6aq (Hesse).—$B'HCl(HgCl_2)_2$. Crystalline pp. (Hinterberger, *A.* 77, 201).—$B'ZnCl_2$ 2aq.—$B'ZnCl_2$ 7aq (Gräffinghoff, *Z.* 1865, 600).—B′HBr 2aq: needles (Schmidt, *B.* 10, 194).—B′HI 2aq: long silky needles grouped in rosettes; sl. sol. cold water (Schmidt, *B.* 10, 194).—B′HI 3aq (Bauer, *Ar. Ph.* [3] 5, 289).—B′HI aq: hair-like needles (Kunz, *Ar. Ph.* [3]

26, 307).—B'_2I_3: crystalline mass (B.).—$B'HI_4$: obtained by ppg. a salt of morphine with iodine dissolved in HIAq. Brown pp., sol. KIAq, from which it crystallises in nearly black prisms, sol. alcohol and boiling ether (Bauer; Jörgensen, *J. pr.* [2] 2, 437; *Z.* [2] 5, 673).—$B'HHgI_3$: crystalline pp., m. sol. alcohol (Groves, *C. J.* 11, 97).—$B'_2H_2SO_4$ 5aq: $[\alpha]_D = -100{\cdot}47 - {\cdot}96p$ in a p p.c. solution at 22·5° (Hesse). S. 4 in the cold (Dott).—$B'HClO_4$ 2aq: needles (Bödeker, *A.* 71, 63).—$B'HVO_3$ (Ditte, *A. Ch.* [6] 13, 237).—$B'HCyS$ ½aq. [100°]. Needles (Dollfus, *A.* 65, 214).—$B'_2H_2PtCy_4$: groups of minute needles (Schwarzenbach, *C. C.* 1860, 304).—×$B'HOAc$. S. 50 in the cold (Dott). Tufts of needles, v. sol. water, m. sol. alcohol (Merck, *A.* 24, 48).—$B'CH_2Cl.CO_2H$ (Florio, *J.* 1883, 1343).—$B'CHCl_2.CO_2H$ ½aq. — $B'CCl_3.CO_2H$ 1½aq. — Butyrate $B'C_4H_8O_2$. S. 14 at 12° (Decharme, *J.* 1863, 444).—Valerate $B'C_5H_{10}O_2$. Large trimetric crystals (Pasteur, *A. Ch.* [3] 38, 455). S. 2·3 in the cold (Dott).—Lactate $B'C_3H_6O_3$: monoclinic crystals. S. 10 at 13° (Decharme).—Trichloro-lactate $B'C_3Cl_3H_3O_3$ 5aq (F.).—Oxalate $B'_2H_2C_2O_4$ aq: prisms. S. 4·8 at 12° (D.).—Tartrates:—$B'_2C_4H_6O_6$ 3aq. Nodular groups of needles, efflorescent at 20° (Arppe, *J. pr.* 3, 332). S. 11 in the cold (Dott).—$B'C_4H_6O_6$ ½aq. Tufts of long rectangular flattened prisms (A.).—Mellitate $B'_3C_{12}H_6O_{12}$: minute needles (Karmrodt, *A.* 81, 171). — Phenyl acetate $B'CH_2Ph.CO_2H$. [92°].—Nitroprusside (Davy, *Ph.* [3] 11, 756).

Metallic derivatives $C_{17}H_{18}KNO_3$ 2½aq. Obtained in a crystalline state by evaporating a solution of morphine in KOHAq in a desiccator over H_2SO_4 (Chastaing, *J. Ph.* [5] 4, 19).—$(C_{17}H_{18}KNO_3)_2K_2CO_3$ 2aq.—$Ba(C_{17}H_{18}NO_3)_2$ 3aq: white crystalline solid.—$Ca(C_{17}H_{18}NO_3)_2$ 5aq.—$Ca(C_{17}H_{17}NO_3)_2$ 2aq.

(α)-*Acetyl derivative* $C_{17}H_{18}AcNO_3$. Obtained, together with the (β) modification, by boiling morphine (1 pt.) with HOAc (2 pts.) for several hours (Wright, *C. J.* 27, 1033; Beckett a. Wright, *C. J.* 28, 315). Crystallises from ether, either with aq or in the anhydrous state. Gives no colour with $FeCl_3$.—$B'HCl$ 3aq: crystals, sl. sol. cold water.—$B'_2H_2PtCl_6$: amorphous.—$B'EtI$ ½aq: crystals (from 85 p.c. alcohol).

(β)-*Acetyl derivative* $C_{17}H_{18}AcNO_3$. The chief product obtained by heating morphine (1 mol.) with acetic anhydride (1 mol.) at 100°. When less acetic anhydride is used a compound $(C_{17}H_{18}AcNO_3)(C_{17}H_{19}NO_3)$ is obtained (Wright). Amorphous.—$B'HCl$: amorphous, v. sol. water. Readily converted into morphine by boiling water, and hence usually gives a blue colour with $FeCl_3$.—$B'EtI$: amorphous.

(γ)-*Acetyl derivative* $C_{17}H_{18}AcNO_3$. Accompanies the (β)-isomeride to the extent of 25 p.c. Anhydrous crystals (from ether).—×$B'HCl$: crystallises with difficulty, v. sol. water.—$B'EtI$ 1½aq: crystals (from 85 p.c. alcohol).

Di-acetyl derivative $C_{17}H_{17}Ac_2NO_3$. [169°]. Formed by heating morphine with excess of Ac_2O at 85° (Wright; Hesse, *A.* 222, 205). The product is treated with water and dilute NH_3Aq, and extracted with ether. Colourless prisms (from ether); v. sol. cold alcohol, m. sol. ether. Gives no colour with $FeCl_3$. Converted by boiling water first into the (α)-acetyl derivative, and then into morphine.—$B'HCl$: crystals, extremely sol. water. — $B'_2H_2PtCl_6$. — $B'MeCl$. Formed by heating morphine methylo-chloride with Ac_2O at 85° (Hesse). Needles, v. e. sol. water.—$B'MeI$. Heated with AgOAc it yields the crystalline di-acetyl derivative of a compound $C_{14}H_{10}O_3$ [143°] (Fischer, *B.* 19, 792).—$B'EtI$ ½aq. Crystals (B. a. W.).

Di-propionyl derivative $C_{17}H_{17}(C_3H_5O)_2NO_3$. Formed by heating morphine with propionic anhydride at 85° (Hesse, *A.* 222, 207). White amorphous powder, v. e. sol. ether, alcohol, and chloroform, sl. sol. water. $FeCl_3$ gives no colouration. — ×$B'HCl$. — $B'_2H_2PtCl_6$.

(α)-*Butyryl derivative* $C_{17}H_{18}(C_4H_7O)NO_3$. Formed by boiling morphine (1 pt.) with butyric acid (2 pts.) for 6 hours (Beckett a. Wright, *C. J.* 28, 16). Crystals (from ether). Gives no colour with $FeCl_3$.—$B'HCl$: more soluble and less readily crystallisable than the hydrochloride of the (α)-acetyl derivative.—$B'_2H_2PtCl_6$.—$B'EtI$: amorphous.

(β)-*Butyryl derivative* $C_{17}H_{18}(C_4H_7O)NO_3$. An amorphous base, accompanying the preceding isomeride. Gives a blue colour with $FeCl_3$.

Di-butyryl derivative $C_{25}H_{31}NO_5$ *i.e.* $C_{17}H_{17}(C_4H_7O)_2NO_3$. Formed by heating morphine (1 pt.) with butyric anhydride (2 pts.) for 3 hours at 140° (B. a. W.). Amorphous. Resolved by boiling water or boiling dilute alcohol into butyric acid and butyryl morphine.—$B'HCl$: amorphous. Gives no blue colour with $FeCl_3$.—$B'EtI$: amorphous. By boiling morphine with a mixture of acetic and butyric acids, Beckett and Wright obtained a product which formed a crystalline double salt with the formula $(C_{17}H_{18}AcNO_3)(C_{17}H_{18}(C_4H_7O)NO_3)H_2Cl_2$ 8aq, resolved into its components by boiling water.

Beneoyl derivative $C_{17}H_{18}BzNO_3$. Formed by heating morphine with benzoic acid at 160° (B. a. W.), and by boiling the di-benzoyl derivative with dilute alcohol. Amorphous.—$B'HCl$: crystalline; v. sl. sol. water. Not coloured by $FeCl_3$.

Di-benzoyl derivative $C_{17}H_{17}Bz_2NO_3$. [188°–191° cor.]. Formed from morphine and Bz_2O at 130° (B. a. W.) or BzCl at 105° (Wright a. Rennie, *C. J.* 37, 609; Dott a. Stockman, *Ph.* [3] 18, 231; *cf.* Broockmann a. Polstorff, *B.* 13, 96). Prisms, insol. water, sol. hot alcohol. Gives no colour with $FeCl_3$.—$B'HCl$: amorphous.—$B'_2H_2PtCl_6$.—$B'EtI$ ½aq: crystals.

Acetyl-benzoyl derivative $C_{17}H_{17}AcBzNO_3$. Formed from the (α)-acetyl derivative and Bz_2O at 130° (B. a. W.). Crystalline.—$B'HCl$: amorphous; v. sol. water.—$B'_2H_2PtCl_6$.—$B'EtI$ ½aq: crystals (from alcohol).

Succinoxyl derivative $(C_{17}H_{18}NO_3)CO.C_2H_4.CO_2H$. Formed by heating morphine (1 pt.) with succinic acid (2 pts.) at 180° (Beckett a. Wright, *C. J.* 28, 689). Separates from alcohol in crystals (containing 4aq); insol. water and ether.—$B'_2H_2PtCl_6$.

Methylo-iodide $C_{17}H_{19}NO_3MeI$ aq. Formed by warming morphine with MeI and alcohol (How, *C. J.* 6, 125; *A.* 88, 338). If NaOEt is also present the product is codeïne (Grimaux, *A. Ch.* [5] 27, 273; *C. R.* 92, 1140).

Methylo-chloride $C_{17}H_{19}NO_3MeCl$ 2aq.

Formed from the methylo-iodide and AgCl (Hesse, *A.* 222, 207). Long needles. Its aqueous solution is coloured blue by $FeCl_3$. Ac_2O forms $C_{17}H_{17}Ac_2NO_3MeCl$.—$(C_{17}H_{18}NO_3MeCl)_2PtCl_4$ aq.

Methylo-hydroxide $C_{17}H_{18}NO_3MeOH$ 5aq. Formed from the sulphate and baryta (Broockmann a. Polstorff, *B.* 13, 96). Colourless needles. Reduces Ag_2O.

Ethylo-iodide $C_{17}H_{18}NO_3EtI$ ½aq. Formed by heating morphine with EtI and alcohol at 100° (How). Needles (from water).

Methyl-morphine *v.* CODEÏNE.

Di-methyl-morphine $C_{17}H_{17}Me_2NO_3$. *Methylmorphimethine.* [118°]. $[\alpha]_D = -208{\cdot}6°$ in a 4 p.c. solution in 97 p.c. alcohol at 15°. Formed by heating codeïne methylo-iodide (1 mol.) with aqueous KOH (1 mol.), adding benzene, and shaking with acetic acid. The acid liquid is saturated with NaCl, and the hydrochloride of di-methyl-morphine then crystallises out. The free base is obtained by adding NaOH and extracting with ether (Hess, *A.* 222, 220). Prisms; m. sol. ether, v. sol. water and alcohol. Conc. H_2SO_4 gives a bluish-violet colour. Conc. HNO_3 forms a yellow solution.

Salts.—B'HCl 2aq. S. 9·2 at 18°.—$B'_2H_2PtCl_6$ aq.

Methylo-hydroxide *$C_{17}H_{17}Me_2NO_3MeOH$. Formed from the iodide and moist Ag_2O (Knorr, *B.* 22, 181). Thick syrup. Split up at 160° into NMe_3 and the phenanthrene derivative $C_{14}H_7EtO_2$. Ac_2O at 160°–200° forms acetyl-methyl-dioxyphenanthrene $C_{14}H_8(OMe)(OAc)$, dimethylamine, and di-methyl-oxyethyl-amine $NMe_2.CH_2.CH_2OH$ (Fischer a. Von Gerichten, *B.* 19, 794).

(α)-*Methylo-iodide* $C_{17}H_{17}Me_2NO_3MeI$ ½aq. Formed from di-methyl-morphine and MeI dissolved in alcohol (Hesse, *A.* 222, 225). Prisms: v. sol. hot water.

(β)-*Methylo-iodide* $C_{17}H_{17}Me_2NO_3MeI$. Obtained by adding KOH to a solution of the (α)-isomeride, allowing the oily pp. to crystallise, and adding KI to the mother-liquor (Hesse, *A.* 222, 227). Crystals.

(α)-*Methylo-chloride* $C_{17}H_{17}Me_2NO_3MeCl$ ½aq. Obtained from the (α)-methylo-iodide by treatment with AgCl. With Ac_2O it forms $C_{17}H_{16}AcMe_2NO_3$ 2½aq crystallising in needles; v. sol. hot water and alcohol.—$(B'MeCl)_2PtCl_4$ 8aq.

(β)-*Methylo-chloride* $C_{17}H_{17}Me_2NO_3MeCl$. Formed from the (β)-methylo-iodide and AgCl. Forms a neutral sulphate and a platinochloride.

Acetyl derivative $C_{17}H_{16}AcMe_2NO_3$. [66°]. Formed from di-methyl-morphine and Ac_2O at 85° (Hesse, *A.* 222, 223). V. sol. alcohol and ether, m. sol. water, insol. KOHAq. Gives a blue colour with conc. H_2SO_4.—B'HCl ½aq.—$B'_2H_2PtCl_6$ 4aq.—$B'HNO_3$ 3aq.—$B'_2H_2SO_4$ 8aq.

Ethyl-morphine $C_{17}H_{18}EtNO_3$. *Codethyline.* [83°]. S. 2½ at 100°. Formed by heating morphine (1 mol.) with NaOEt (1 mol.), alcohol, and EtI (Grimaux, *C. R.* 92, 1140, 1228; *A. Ch.* [5] 27, 278). Hard brilliant laminæ (containing aq); v. sol. alcohol and ether, m. sol. water. Ppd. from solutions of its salts by KOH and Na_2CO_3, but not by NH_3Aq. Gives a blue colour with H_2SO_4 containing $FeCl_3$.—*B'HCl: groups of slender needles.—$(C_{17}H_{18}EtNO_3)MeI$. Hard bulky crystals, converted by moist Ag_2O into a tertiary base [132°].

Di-ethyl-morphine *$C_{17}H_{17}Et_2NO_3$. The iodide of this base appears to be formed by heating morphine with NaOH (1 mol.) and EtI (2 mols.). It is crystalline, and is converted by successive treatment with Ag_2O and MeI into $C_{17}H_{17}Et_2NO_3MeI$, which crystallises from alcohol, and is converted by Ag_2O into an hydroxide which is split up on distillation into NMeEtPr and a derivative of phenanthraquinone $C_{14}H_7EtO_2$ (Gerichten a. Schrötter, *B.* 15, 2182).

Ethylene-di-morphine $C_2H_4(C_{17}H_{18}NO_3)_2$. *Di-codethine. Dicodethylene.* Prepared by boiling morphine with alcoholic soda and ethylene bromide (Grimaux, *C. R.* 93, 67; *A. Ch.* [5] 27, 281). White needles (from alcohol), insol. ether, v. sol. alcohol. Blackens when heated, and decomposes above 200°. With H_2SO_4 and $FeCl_3$ it gives a blue colouration.—*$B''H_2Cl_2$. Hard prisms.

Morphinyl-sulphuric acid $C_{17}H_{18}(OSO_3H)NO_2$ 2aq. *Morphine sulphonic acid.* Formed by shaking morphine (20 g.) with KOH (8 g.), water (25 c.c.), and $K_2S_2O_7$ (15 g.) (Stolnikoff, *H.* 8, 242). Silvery needles (from water), not decomposed at 160°: v. sl. sol. cold water, alcohol, and ether. Hot dilute HClAq hydrolyses it to morphine and H_2SO_4. Does not give a blue colour with $FeCl_3$. Hot conc. H_2SO_4 gives a rose colour, changing to violet. Less poisonous than morphine, producing tetanus.

Nitroso-morphine $C_{17}H_{18}(NO)NO_3$ aq. Formed by passing nitrous acid gas into morphine suspended in water (E. L. Mayer, *B.* 4, 121). Reddish-yellow powder, turned black by $FeCl_3$.

Trimorphine $(C_{17}H_{19}NO_3)_3$. Formed by heating morphine (30 g.) with H_2SO_4 (30 c.c.) and water (30 c.c.) at 100° (Wright, *C. J.* 26, 220). Formed also by heating morphine (1 pt.) with dry oxalic acid (3 pts.) at 145° (Beckett a. Wright, *C. J.* 28, 698). Amorphous, sol. ether. Gives a purple colour with $FeCl_3$.—$B'''H_3Cl_3$. Amorphous. Converted by conc. hydrochloric acid at 100° into $C_{102}H_{112}Cl_2N_6O_{16}6HCl$, a brittle gum.

Tetramorphine $(C_{17}H_{19}NO_3)_4$. Formed, together with trimorphine, by heating morphine with dilute H_2SO_4 at 100°–140° (Wright, *C. J.* 26, 220). Amorphous. On heating with HClAq it forms the salt $(C_{17}H_{19}NO_3)_8(HCl)_8$ (?). On adding HCl to an aqueous solution of tetramorphine a flocculent pp. of $(C_{17}H_{18}NO_3HCl)_4$ is got.—$(C_{17}H_{19}NO_3)_42H_2SO_4$. *Sulphomorphide.* Obtained by heating morphine with dilute H_2SO_4 at 160° (Arppe, *A.* 55, 96; Matthiessen a. Wright, *Pr.* 17, 455; Wright, *C. J.* 26, 220).

Apomorphine $C_{17}H_{17}NO_2$. Formed by heating morphine or codeïne with HClAq at 145° for 2 or 3 hours (Matthiessen a. Wright, *Pr.* 17, 455). Formed also by heating morphine with aqueous phosphoric acid till the temperature reaches 185° (Wright, *C. J.* 25, 652). It is also one of the products when morphine is heated with aqueous $ZnCl_2$ for 20 minutes at 125° (Mayer a. Wright, *C. J.* 26, 211). Amorphous mass, which turns green in moist air. Sl. sol. water, especially if it contains CO_2; sol. alcohol, ether, and chloroform. Emetic; ·02 g. of the hydrochloride being sufficient to produce vomiting. A solution of apomorphine hydrochloride gives with caustic alkalis a white pp., quickly becoming black; with Na_2CO_3 a white pp., turning green; with

HNO_3 a blood-red colour; with $FeCl_3$ an amethyst colour; with $K_2Cr_2O_7$ an orange pp.; with KI an amorphous pp., quickly becoming green; and with platinic chloride a yellow pp., decomposing on warming. It reduces $AgNO_3$. AcCl yields a mono-acetyl derivative (Danckwortt, *Ar. Ph.* 228, 572).—B′HCl: crystals, sl. sol. cold water.

Polymeride of apomorphine $C_{136}H_{136}N_8O_{16}$ (?). Formed, together with apomorphine and several bases, which form the hydrochlorides $C_{136}H_{145}ClN_8O_{20}H_8Cl_8$ (?), $C_{68}H_{68}N_4O_8H_4Cl_4$ (?), and $C_{34}H_{37}ClN_2O_5H_2Cl_2$ (?) by heating morphine with aqueous $ZnCl_2$. It forms a hydrochloride $B^{VIII}H_8Cl_8$ insol. alcohol (Mayer a. Wright).

Diapotetramorphine $C_{136}H_{148}N_8O_{22}$. Formed, together with apomorphine, by heating morphine with aqueous phosphoric acid (Wright). Amorphous, rapidly darkening in air. Evaporation with conc. hydrochloric acid converts it into $C_{136}H_{146}Cl_2N_8O_{20}8HCl$. Evaporation with HIAq and phosphorus yields the corresponding $C_{136}H_{148}I_2N_8O_{28}8HI$ (Wright).

Pseudomorphine $C_{17}H_{17}NO_3\ 1\frac{1}{2}aq$ or $C_{34}H_{36}N_2O_6\ 3aq$ (Hesse, *A.* 235, 229). *Dehydromorphine. Oxydimorphine. Oxymorphine. Dimorphine.* Discovered by Pelletier (1832) in Levant opium. Occurs in morphine hydrochloride made by Gregory's method (Hesse, *A.* 141, 87).

Formation.—1. By heating a solution of morphine hydrochloride with $AgNO_2$ at 60° (Schützenberger, *Bl.* [2] 4, 176).—2. By oxidising morphine with $KMnO_4$, potassium nitrite, or K_3FeCy_6, or by exposing its ammoniacal solution to the air (Polstorff, *B.* 13, 86; *cf.* Pelletier, *A.* 16, 49).

Properties.—White, microcrystalline powder (from NH_3Aq), insol. water, alcohol, ether, and chloroform, sol. KOHAq and NH_3Aq, v. e. sol. alcoholic NH_3. Lævorotatory (Hesse, *A.* 176, 195). Decomposed by heat without melting. It is not affected by reducing agents. It is tasteless and not poisonous.

Colour-tests.—1. When evaporated with dilute H_2SO_4 until fumes of H_2SO_4 appear it becomes bluish-green, and, on adding water, rose-red; if HNO_3 or dilute $NaNO_2$ be now added the colour changes to deep violet. Under similar circumstances morphia gives a rose-red colour, turned brownish-red by water, and raspberry-red by HNO_2 (Donath, *J. pr.* [2] 33, 560).—2. Resembles morphia in its reaction with $FeCl_3$, with molybdic acid in H_2SO_4 (Fröhde's reagent), with HNO_3, and with HIO_3. For the reaction with iodic acid HCl must be absent. NH_4Cl interferes with these tests.—3. Conc. H_2SO_4 forms an olive-green colour.—4. Conc. HNO_3 gives an intense orange-red colour, changing to yellow.—5. A mixture of equal parts of cane-sugar and pseudomorphine is coloured by H_2SO_4 blue, changing to dark green (Hesse, *A.* 234, 255).

Salts.—B′HCl aq. Minute needles. S. 1·4 at 20°. $[\alpha]_D = -103°\ 13'$. — B′HCl 2aq. — B′HCl 3aq. — B′HCl 4aq. — B′HCl 6aq. — B′HCl 8aq. — $B'_2H_2PtCl_6\ 8aq$. — B′HI aq. — $B'H_2SO_4\ 4aq$: small colourless needles; sl. sol. cold water (Polstorff).—$B'H_2SO_4\ 6aq$: laminæ. S. 2·37 at 20°.—$B'_2H_2Cr_2O_7\ 6aq$: crystalline pp. S. ·1 at 18°.—$B'_2H_2C_2O_4\ 6aq$. S. ·05 at 20°.—$B'_2H_2C_2O_4\ 8aq$. — **Tartrate** $B'C_4H_6O_6\ 3aq$: needles.—$B'C_4H_6O_6\ 6aq$. S. 2·4 at 18°.

Acetyl derivative $C_{17}H_{15}Ac_2NO_3$. [276°]. Formed by heating pseudomorphine (1 pt.) with Ac_2O (2 pts.) at 120° (Hesse, *A.* 222, 235; 234, 253). Crystallises from ether in prisms (containing 4 aq). V. e. sol. alcohol, m. sol. ether and chloroform. When mixed with cane-sugar and dissolved in conc. H_2SO_4 it gives a dark-green colour. If the H_2SO_4 contain $Fe_2(SO_4)$, the colour is at first blue.—$B'_2H_2PtCl_6\ 6aq$.

Methylo-iodide $C_{17}H_{17}NO_3MeI\ 2aq$. Formed by the action of HI on the crystalline body $(C_{17}H_{17}NO_3)_2Me(OH)MeI$, which is prepared by oxidising morphine methylo-iodide with alkaline K_3FeCy_6 (Polstorff, *B.* 13, 93). Small prisms.

Methylo-hydroxide $C_{17}H_{17}NO_3Me(OH)\ 3\frac{1}{2}aq$. Prepared by the action of moist Ag_2O on the iodide or of baryta on the sulphate. Crystalline; v. sol. water, insol. alcohol.

Methylo-sulphate $(C_{17}H_{17}NO_3)_2Me_2SO_4\ 4aq$. Obtained by ppg. a solution of the oxyiodide with Ag_2SO_4. Leaflets; v. sol. hot water.

MORPHOTHEBAÏNE *v.* THEBAÏNE.

MORPHOTROPY. This term is applied to the relations between the crystalline form and the composition of those bodies which are chemically similar, and which are derived from the same parent body; *v.* this vol. p. 89.

MORRHUIC ACID $C_8H_{13}NO_3$ *i.e.*

$$CH\begin{cases}CH.C(OH)\\CH_2.NH\end{cases}C.C_3H_6.CO_2H\ (?)$$

Oxy-propyl-pyridine dihydride carboxylic acid. Occurs in cod-liver oil in a combination with glycerin and phosphoric acid, from which it is readily set free by acids and alkalis. Obtained by extracting the oil with dilute (35 p.c.) alcohol containing 5 p.c. of HCl (Gautier a. Mourgues, *C. R.* 107, 740). Square flattened prisms or large lanceolate plates; insol. cold, sol. hot, water; v. sol. alcohol, ether, and alkalis. The solutions have a disagreeable aromatic odour. (Gautier, *Bl.* [3] 2, 233). Morrhuic acid decomposes carbonates. A solution of the potassium salt gives pps. with lead acetate and $AgNO_3$, but not with cupric acetate. The silver salt is readily reduced, even in the cold. Morrhuic acid forms a crystalline platinochloride, an amorphous aurochloride, and a hydrochloride which is decomposed by boiling water. On distilling with lime it yields a basic oil which forms a crystalline methylo-iodide. Potassium morrhuate is oxidised by $KMnO_4$ to an acid which ppts. cupric acetate, and appears to be a pyridine derivative.

MORRHUINE $C_{19}H_{27}N_3$. An alkaloid occurring, together with aselline $C_{25}H_{32}N_4$, in cod-liver oil (Gautier a. Mourgues, *Bl.* [3] 2, 228; *C. R.* 107, 626). Thick oil, smelling like *syringa*; v. sl. sol. water, v. sol. alcohol and ether. Lighter than water. Ppts. copper salts. Strongly alkaline. It forms a very deliquescent **hydrochloride** crystallising in groups of needles, a crystalline **platinochloride** and a yellow **aurochloride**. Morrhuine constitutes one-third of the total bases in the oil, and is a diaphoretic and diuretic.

MORTARS *v.* CEMENTS, in DICTIONARY OF APPLIED CHEMISTRY.

MOSAIC GOLD. An alloy of Cu and Zn in equal parts; *v.* COPPER, ALLOYS OF, vol. ii. p. 254; *v.* also DICTIONARY OF APPLIED CHEMISTRY.

MUCEDIN *v.* PROTEÏDS.

MUCIC ACID $C_6H_{10}O_8$ *i.e.* $CO_2H.CH(OH).CH(OH).CH(OH).CH(OH).CO_2H$. Mol. w. 210. [206°–216°] (K. a. T.). S. ·33 at 14°; 17 at 100°. Formed by the oxidation of milk-sugar, galactose, melitose, dulcite, gum arabic, gum tragacanth, and plant mucus with dilute nitric acid (Scheele, *Opuscul.* 2, 111; Laugier, *A. Ch.* 41, 79; Berzelius, *A. Ch.* 92, 141; 94, 5; 95, 31; Malaguti, *A. Ch.* [2] 60, 195; 63, 86; Liebig a. Pelouze, *A.* 19, 258; Liebig, *A.* 9, 24; 26, 160; Hagen, *P.* 71, 531; *A.* 64, 347; Johnson, *A.* 94, 225; Schwanert, *A.* 116, 257; Tollens, *A.* 249, 220).

Preparation.—1. Milk-sugar (1 pt.) is heated with HNO_3 (2 pts. of S.G. 1·4) and water (2 pts.) until red fumes appear. The flame is then removed until the reaction has abated. The liquid is then evaporated, a further quantity (½ pt.) of HNO_3 being added during the evaporation. The product is washed with water and dried (Klinkhardt, *J. pr.* [2] 25, 43). The yield is 35 p.c.; *cf.* Guckelberger, *A.* 74, 348.—2. Coarsely powdered milk-sugar (100 g.) is heated with HNO_3 (1200 c.c. of S.G. 1·15) in a basin on a water-bath until the volume is greatly reduced (to 150 or 200 c.c.). After cooling, water (200 c.c.) is added, and after some days the mucic acid is filtered off and washed with water (500 c.c.). The yield is good (40 g.). When galactose is treated in the same way the yield is 77 p.c. (Kent a. Tollens, *A.* 227, 221).

Properties.—Colourless tables; sl. sol. cold water, insol. alcohol. It does not reduce Fehling's solution.

Reactions.—1. When *boiled with water* it changes to the isomeric paramucic acid.—2. When heated with water at 180° it yields pyromucic acid.—3. On dry *distillation* it yields CO_2, pyromucic acid, and some diphenylene-oxide. When cautiously heated at 280° it forms a small quantity of de-hydro-mucic acid $C_4H_2O(CO_2H)_2$ which condenses on the neck of the retort as small crystals.—4. Boiling *nitric acid* oxidises it to oxalic and racemic acids.—5. On oxidation with H_2SO_4 and MnO_2 formic acid is given off.—6. *Potash-fusion* yields acetic and oxalic acids.—7. HIAq and phosphorus at 140° forms some adipic acid (Crum Brown, *A.* 125, 19), and diphenylene-oxide (Heinzelmann, *A.* 193, 186).—8. PCl_5 forms di-chloro-muconic chloride $C_6H_2Cl_4O_2$ (Liès-Bodart, *A.* 100, 325; Bode a. Wichelhaus, *A.* 132, 95).—9. When allowed to *ferment* for 9 months it yields alcohol and acetic, butyric, and traces of lactic acids (Béchamp, *Bl.* [3] 3, 770).—10. Ba_2S at 205° forms thiophene (β)-carboxylic acid.—11. Fuming HClAq (or HBrAq) at 100°–150° forms de-hydromucic acid.

Salts.—$(NH_4)_2A''$: flat four-sided prisms (from water), sl. sol. cold, v. sol. hot, water. Decomposed at 220°–240° into pyrrole, pyrrole carboxylic amide, NH_3, and CO_2.—NH_4HA'' aq: needles or thin prisms. More soluble in water than the normal salt.—Na_2A'' 4½aq: transparent triclinic crystals.—Na_2A'' ½aq: white powder.—$NaHA''$ 3½aq: prisms.—K_2A'' ½aq: granules. S. 12·5. Insol. alcohol.—K_2A'' 2aq (Schmidt a. Cobenzl, *B.* 17, 601).—KHA'' aq: decomposes at 150°-180° into CO_2 and pyromucate.—BaA'' 1½aq (dried at 100°).—CaA'' 1½aq.—MgA'' 2aq (at 100°).—PbA'' aq: white pp.—$Pb_3C_6H_4O_8$: obtained by ppg. ammonium mucate with basic lead acetate.—CuA'' aq (dried at 100°): bluish-white pp.—FeA'' 2aq (dried at 100°): yellow powder.—$K(SbO)A''$.—$Na(SbO)A''$ (dried at 100°). Obtained by dissolving Sb_2O_3 in $NaHA''$. Amorphous (Klein, *C. R.* 97, 1437).—Ag_2A'' (dried at 100°): white pp.—Methylamine salt. Decomposed by distillation into methyl-pyrrole and methyl-pyrrole carboxylic methylamide.—Ethylamine salt. Decomposed by distillation into ethyl-pyrrole, ethyl-pyrrole dicarboxylic diethylamide, and ethyl-pyrrole carboxylic ethylamide (Bell, *B.* 10, 1866).—Diethylamine salt. Decomposed by heat giving off $NHEt_2$.—Aniline salt $(C_6H_7N)_2H_2A''$. Insol. boiling alcohol, sol. boiling water (Köttnitz, *J. pr.* [2] 6, 138). Decomposed on distillation into phenyl-pyrrole, CO_2, aniline, and H_2O. On heating with water it forms mucic anilide.

Methyl ether Me_2A''. Laminæ or flattened six-sided prisms (from water), v. sol. hot water, v. sl. sol. hot alcohol. Decomposes at 165°.

Mono-ethyl ether $EtHA''$. Formed by boiling Et_2A'' with alcohol (Limpricht, *A.* 165, 255). Crystals (containing 3aq); sol. water and alcohol. Melts below 100°.—NH_4EtA''.

Di-ethyl ether Et_2A''. [158°]. S. 2·3 at 20°. S. (alcohol of S.G. ·814) ·64 at 15·5°. Formed by heating mucic acid (1 pt.) with H_2SO_4 (4 pts.) till it turns black, leaving it to cool, and adding alcohol (4 pts.) (Malaguti, *A. Ch.* [2] 63, 86). Crystals (from boiling alcohol). Limpricht was not able to obtain this ether by the action of alcohol and HCl on mucic acid. Mucic ether is reduced by sodium-amalgam to an acid which strongly reduces Fehling's solution, and which may be readily re-oxidised to mucic acid (E. Fischer, *B.* 23, 937).

Isoamyl ether $(C_5H_{11})HA''$. Needles.

Amide $C_6H_8O_6(NH_2)_2$. *Mucamide.* S.G. $\frac{18\cdot5}{}$ 1·589. Formed from the normal ether and ammonia (Malaguti, *C. R.* 22, 854). Formed also by the action of ammonia on tetra-acetyl-mucic amide (Ruhemann, *B.* 20, 3366). Minute crystals (from water), v. sl. sol. boiling water, insol. alcohol and ether. Converted by water at 140° into ammonium mucate. On dry distillation it yields pyrrole carboxylic amide, paracyanogen, and a little pyromucic acid.

Anilide $C_6H_8O_6(NHPh)_2$. Formed by heating the aniline salt at 120°, or the ether with excess of aniline (Köttnitz). Plates, insol. water, alcohol, and dilute acids.

o-Toluide $C_6H_8O_6(NHC_7H_7)_2$. Formed like the preceding (K.). Plates.

Tetra-acetyl derivative $C_4H_4(OAc)_4(CO_2H)_2$. [266° cor.]. Formed by boiling mucic acid with Ac_2O and $ZnCl_2$ (Maquenne, *Bl.* [2] 48, 720). Efflorescent needles (containing 2aq), sl. sol. water, v. sol. alcohol.

Ethyl ether of the tetra-acetyl derivative $C_4H_4(OAc)_4(CO_2Et)_2$. [177°]. S. (95 p.c. alcohol) ·4 at 17°. Formed by heating mucic ether with AcCl at 100° (Werigo, *A.* 129, 195). Needles, sl. sol. ether, v. sol. boiling alcohol, v. sl. sol. boiling water.

Di-phenyl-hydrazide $C_4H_4(OH)_4(CO.N_2H_2Ph)_2$. [240°]. Formed by heating mucic acid with phenyl-hydrazine hydrochloride and NaOAc on the water-bath (Bülow, *A.* 236, 196; Maquenne, *Bl.* [2] 48, 722). Pale-yellow plates (from phenyl-hydrazine), v. sl. sol. water, alcohol, and ether. Crystallises unaltered from alcoholic potash.

Paramucic acid. S. 1·36 in the cold; 5·8 at 100°. Formed by evaporating an aqueous solution of mucic acid to dryness, dissolving the residue in alcohol, and allowing the alcoholic solution to evaporate in the air (Malaguti, *A.* 15, 179). Crystalline; more soluble in water than mucic acid. On recrystallisation from hot water it changes into mucic acid. Paramucates, with the exception of the normal ammonium salt, are more soluble than the corresponding mucates, but their boiling solutions deposit mucates.

Dehydromucic acid $C_6H_4O_5$.

Formation.—1. By heating mucic acid in sealed tubes with HBrAq (saturated at 0°) at 100° for two days. The product may be crystallised from water and separated from unaltered mucic acid by crystallisation of the Ba salt (Heinzelmann, *A.* 193, 184).—2. By heating mucic acid with fuming HClAq at 145° (Seelig, *B.* 12, 1083).—3. In small quantity by heating mucic acid at 180° (Klinkhardt).—4. By heating hydrogen potassium saccharate with conc. HClAq at 150° (Sohst a. Tollens, *A.* 245, 19).

Preparation.—Mucic acid (1 pt.), conc. HCl (1 pt.), and conc. HBr (1 pt.) are heated 8 hours at 150° in sealed tubes. The solid contents of the tubes are collected and distilled with steam. If this steam be condensed it is found to contain di-phenylene oxide. The residue is neutralised by ammonia, filtered, and mixed with HCl. The dehydro-mucic acid is then ppd. Yield 20 p.c. (Klinkhardt, *J. pr.* 133, 44).

Properties.—Plates (from alcohol) or needles (from hot water). Does not melt at 320°. V. sl. sol. cold water, alcohol, and ether. May be sublimed.

Reactions.—1. $FeCl_3$ produces, especially on warming, in a solution of dehydro-mucic acid, a transparent gelatinous pp. This result is prevented by the presence of other acids.—2. *Bromine water* converts it into fumaric acid, the reaction being $C_4H_2O(CO_2H)_2 + 3Br_2 + 3H_2O = C_2H_2(CO_2H)_2 + 2CO_2 + 6HBr$.—3. A mixture of HNO_3 and H_2SO_4 converts it into nitro-pyromucic acid (*q. v.*).—4. *Sodium-amalgam* reduces it to two acids of the formula $C_6H_6O_5$, melting at 146° and 173° (Graebe a. Bungener, *B.* 12, 1079). The (α)- acid [146°] crystallises in thin plates and forms the crystalline salts $CaA''3\frac{1}{2}aq$, $BaA''4\frac{1}{2}aq$, and $Ag_2A''\frac{1}{2}aq$. The (β)- acid [173°] forms large crystals (containing aq) and the salts $CaA''1\frac{1}{2}aq$ (amorphous), $BaA''1\frac{1}{2}aq$ (needles) and Ag_2A''.—5. On *dry distillation* it splits up into CO_2 and pyromucic acid (*q. v.*).

Salts.—$BaA''2\frac{1}{2}aq$.—$BaA''6aq$. Sol. water. —$CaA''3aq$.—Ag_2A'': white pp., decomposed by boiling water.

Ethyl ether Et_2A''. [47°].

Chloride $C_4H_2O(COCl)_2$. [80°]. (c. 245°). From PCl_5 on the acid (Klinkhardt, *J. pr.* 133, 46). Smells like $POCl_3$. Sol. ether, alcohol, and $CHCl_3$. At 100° it sublimes forming flat needles. Boiling water reconverts it into dehydro-mucic acid.

Amide $C_4H_2O(CONH_2)_2$. Formed by the action of NH_3 on an ethereal solution of the chloride. Slender needles (from water). Nearly insol. cold water, alcohol, and ether. Does not melt below 240°.

MUCILAGE. The gum of plants from which it is obtained by steeping these in hot water, which on cooling forms a jelly. When linseed mucilage is strained through linen, and the filtrate mixed with alcohol and HClAq, a pp. is obtained which after washing with alcohol and ether has the composition $C_6H_{10}O_5$ (Schmidt, *A.* 51, 50; Frank, *J. pr.* 95, 484; Nägeli a. Cramer, *Pharm. Cent.* 1855, 426; Kirchner a. Tollens, *A.* 175, 215). Brittle gum, resembling bassorin (*q. v.*), sol. cold water, insol. alcohol. Dextrogyrate. Insoluble in ammoniacal cupric oxide. Boiling dilute H_2SO_4 partially converts it into glucose.

Quince-mucilage is coloured blue by iodine, and gives no mucic acid on oxidation with nitric acid. Boiling dilute H_2SO_4 yields a mixture of cellulose, gum, and sugar. The mucilage from salep (*Orchis mascula*), from *Tamarindus indica*, and from some other plants, is also turned blue by iodine (*v.* Starch). Quince-mucilage yields furfuraldehyde on distillation with dilute H_2SO_4, indicating the presence of arabinose or xylose. It contains neither glucose nor galactose, since neither saccharic nor mucic acid is formed on oxidation.

Salep mucilage yields no furfuraldehyde on distillation with dilute H_2SO_4; but on oxidation it yields saccharic (but not mucic) acid. It contains glucose and mannose, but no galactose or arabinose (Gans a. Tollens, *A.* 249, 245).

MUCIN *v.* Proteïds, *Appendix* C.

MUCOBROMIC ACID $C_4H_2Br_2O_3$ *i.e.* CHO.CBr:CBr.CO_2H. *Semi-aldehyde of di-bromo-maleïc acid.* [121°]. Formed by adding bromine to pyromucic acid covered with a little water without cooling. The product is boiled and evaporated, the yield being 70 p.c. of the theoretical (Schmelz a. Beilstein, *A. Suppl.* 3, 276; Jackson a. Hill, *B.* 11, 1671; *Am.* 3, 41). Formed also from (βγ)-di-bromo-pyromucic acid and hot dilute HNO_3 (Hill a. Sanger, *A.* 232, 89) and by oxidation of di-bromo-maleïc aldehyde.

Properties.—White plates, v. sol. alcohol, ether, and hot water, v. sl. sol. cold water. Reddens litmus and decomposes carbonates, but its salts are very unstable.

Reactions.—1. When *heated* it partially sublimes, and the rest decomposes into HBr, di-bromo-maleïc acid, and CO_2 (Hill, *Am.* 3, 105).—2. Boiling *baryta-water* forms CO_2, bromo-acetylene, malonic acid, and formic acid (Jackson a. Hill, *B.* 11, 289). Cold baryta-water forms HBr and bromo-maleïc acid. A cold paste of baryta and water forms bromo-propiolic acid and β-di-bromo-acrylic acid. Baryta-water at 0° forms mucoxybromic acid (*q. v.*).—3. *Bromine-water* forms di-bromo-maleïc acid (Hill, *B.* 13, 734). By heating with water and bromine (3 mols.) in sealed tubes at 125° it is converted into penta- and hexa-bromo-ethane, di-bromo-maleïc acid, and tetra-bromo-butyric acid (Limpricht, *A.* 165, 293). Bromine (1 at.) at 145° forms di-bromo-maleïc acid, mucobromyl bromide, and a little dibromo-succinic acid.—4. PBr_5 forms the bromide (*v. infra*).—5. *Phenol* (25 g.) dissolved in water (30 g.) containing KOH (17·5 g.) converts mucobromic acid (20 g.) into 'phenoxy-mucobromic' acid $C_{10}H_7BrO_4$, which crystallises from water in prisms [105°]. Phenoxy-mucobromic acid forms the crystalline salts KA′ and BaA′$_2$ 3aq, and is converted by Ag_2O in hot water into phenoxy-bromo-maleïc acid $C_{10}H_7BrO_5$, which crystallises in slender needles [104°], and forms a crystalline silver salt Ag_2A'' (Hill a. Stevens, *Am.* 6, 188).—6. Moist Ag_2O oxidises it to di-bromo-maleïc acid. *Nitric acid* acts in like manner.—7. Alcoholic *potassium nitrite* forms a pp. of $K_2C_3HN_3O_7$, v. sol. cold water, converted by hot water into CO_2, HCy, HNO_2, and $KC_3H_2NO_4$. Bromine in CS_2 converts the salt $K_2C_3HN_3O_7$ into $C_3HBr_3N_2O_5$ (Hill a. Sanger, *B.* 15, 1906).—8. KNO_2 at 50° forms the acid $C_3H_3NO_4$, which forms the crystalline salts NaA′ aq, KA′ aq, CaA′$_2$ 4aq, BaA′$_2$ 5aq, PbA′$_2$ 4aq, CuA′$_2$, and AgA′.

Salts.—BaA′$_2$: white plates, sol. cold water and alcohol.—AgA′: felted needles, insol. water.

Ethyl ether EtA′. [51°]. (255°–260°). Formed from the acid, alcohol, and H_2SO_4. Large monoclinic crystals with aromatic odour. KNO_2 converts it into crystalline $C_6H_6KNO_7$.

Mucobromic acetic anhydride $C_4HBr_2O_2.OAc$. [54°]. Formed by heating mucobromic acid with AcCl at 120°. Long needles, v. e. sol. alcohol, ether, and chloroform.

Bromide $C_4HBr_3O_2$. [56°]. Obtained by heating mucobromic acid (1 pt.) with PBr_5 (4 pts.) at 115°. Small slender prisms (from alcohol), sol. alcohol, ether, benzene, chloroform, and CS_2. Boiling water slowly reconverts it into mucobromic acid.

MUCOCHLORIC ACID $C_4H_2Cl_2O_3$ *i.e.* CHO.CCl:CCl.CO$_2$H or CHO.CCl$_2$.C.CO$_2$H. *Semi-aldehyde of di-chloro-maleïc acid.* [125°]. Formed by passing chlorine into a solution of pyromucic acid (1 pt.) in water (10 pts.) at 0° in presence of iodine, the yield being 40 p.c. of the theoretical (Beilstein a. Schmelz, *A. Suppl.* 3, 276; Bennett a. Hill, *B.* 12, 655). Plates, v. sol. hot water, alcohol, and ether, insol. ligroïn and CS_2. Split up by alkalis, even in the cold, into di-chloro-acrylic acid and formic acid.

MUCONIC ACID (of Limpricht) $C_6H_6O_4$ *i.e.*

$$CO_2H.CH_2.C\left<\begin{matrix}CH.CH_2\\O\ .CO\end{matrix}\right>$$

[100°–125°]. Formed by adding silver oxide to a hot solution of di-bromo-adipic acid [175°–190°] (formed by adding bromine to a warm solution of hydromuconic acid in HOAc), and decomposing the resulting silver salt with HCl or H_2S (Limpricht, *A.* 165, 274). Large crystals, v. sol. water, alcohol, and ether. Boiling baryta-water decomposes it into CO_2, acetic acid, succinic acid, and another acid.

Salts.—BaA′$_2$ 4aq: nodules, v. sol. water.

Muconic acid CO$_2$H.CH:CH.CH:CH.CO$_2$H. [above 260°]. S. ·02 at 15°. Formed by the action of alcoholic potash on $\beta\gamma$-di-bromo-adipic acid (Rupe, *A.* 256, 22; Ruhemann a. Blackman, *C. J.* 57, 373). Branching white needles, sl. sol. hot water, m. sol. hot alcohol and HOAc. Completely decomposed by $KMnO_4$ in presence of Na_2CO_3. Combines with bromine forming the acid CO$_2$H.CHBr.CHBr.CHBr.CHBr.CO$_2$H. [c. 250°]. Sodium-amalgam reduces it to hydromuconic acid [195°].

Salts.—K_2A'': transparent plates, v. sol. water, insol. alcohol.—BaA″.—PbA″.—Ag_2A'': curdy white pp. The cupric salt is a bluish-green heavy amorphous pp.

Methyl ether Me_2A''. [154°]. Fan-shaped groups of needles.

Ethyl ether Et_2A''. [64°]. Plates (from dilute alcohol).

Di-chloro-muconic acid $C_6H_4Cl_2O_4$ *i.e.* CO$_2$H.CH:CCl.CCl:CH.CO$_2$H. S. 10 at 100°. Obtained by heating mucic acid or saccharic acid with PCl_5 and decomposing the resulting chloride with water (Liès-Bodart, *A.* 100, 325; Bode, *A.* 132, 95; Bell, *B.* 12, 1272; Limpricht, *A.* 165, 253; Rupe, *A.* 256, 6). Long needles (containing 2aq), v. sl. sol. cold water, v. sol. alcohol, m. sol. ether. Not decomposed by boiling aqueous alkalis.

Reactions.—1. Reduced by *sodium-amalgam* to two acids of the formula $C_6H_6O_4$, one of which melts at 195°, and yields malonic acid on oxidation; the other melts at 169°, and yields succinic acid on oxidation. Boiling with sodium-amalgam reduces it to adipic acid [148°].—2. Alcoholic *potash* at 190°–200° forms oxalic and acetic acids.

Salts.—The Ba and Ca salts are m. sol. water.—Ag_2A'': insoluble pp.

Methyl ether Me_2A''. [156°]. Pearly plates, v. sol. ether, hot alcohol, and HOAc.

Ethyl ether Et_2A''. [96°]. From the chloride and alcohol (Wichelhaus, *A.* 135, 251; Bell, *B.* 12, 1273). Prisms.

Chloride $C_6H_2Cl_4O_2$. Formed by the action of PCl_5 (6 mols.) on mucic acid (1 mol.). Large crystals (from CS_2), decomposed by moist air.

$\Delta^{\beta\gamma}$-Hydromuconic acid $C_6H_8O_4$ *i.e.* CO$_2$H.CH$_2$.CH:CH.CH$_2$.CO$_2$H. [195°]. S. ·58 at 15°. Formed by reducing di-chloro-muconic acid with sodium amalgam or with zinc-dust and acetic acid. White needles or prisms. Converted by boiling NaOHAq into the isomeric acid [169°]. Oxidised by $KMnO_4$ to oxalic and acetic acids. Its Ba and Ca salts are less soluble in hot than in cold water. Bromine added to its aqueous solution forms bromohydromuconic acid CO$_2$H.CH$_2$.CBr:CH.CH$_2$.CO$_2$H [183°], which yields an ether melting at 80°. Bromine without water forms unstable dibromoadipic acid of the formula CO$_2$H.CH$_2$.CHBr.CHBr.CH$_2$.CO$_2$H.

Ethyl ether Et_2A''. (163° at 35 mm.). Oil.

Amide $C_6H_6O_2(NH_2)_2$. [210°] (Ruhemann a. Blackman, *C. J.* 57, 371).

$\Delta^{\alpha\beta}$-Hydromuconic acid $C_6H_8O_4$ *i.e.* CO$_2$H.CH:CH.CH$_2$.CH$_2$.CO$_2$H. [169°]. S. [illegible] ·9. Formed by boiling the isomeric acid with aqueous NaOH (Rupe, *A.* 256, 13). Nodular aggregates of plates, v. sol. hot, insol. cold water, v. sl. sol. ether. Yields oxalic and succinic acids on oxidation with $KMnO_4$. Bromine forms a mono-bromo- derivative [160°] crystallising in branching needles, but no di-bromo-adipic acid.

Methyl ether. Oil. Forms with bromine CO$_2$Me.CH$_2$.CH$_2$.CHBr.CHBr.CO$_2$Me [85°].

MUCOXYBROMIC ACID $C_4H_3BrO_4$ *i.e.* CO$_2$H.C(OH):CBr.CHO. [112°]. Formed by the action of baryta-water at 0° upon mucobromic acid (Hill a. Palmer, *Am.* 9, 148). Thick prisms, with bevelled ends, v. sol. water, alcohol, and ether, v. sl. sol. chloroform, benzene, ligroïn, and CS_2. $FeCl_3$ gives an intense garnet-red colour. $AgNO_3$ forms a white crystalline pp. On heating with baryta-water it yields oxalate and formate. Bromine-water converts it into bromalhydrate

$CBr_3.CH(OH)_2$ and oxalic acid. Aniline yields $C_4H_3BrO_3(NPh)$.

Salts.—K_2A'' aq: plates, v. sol. cold water, decomposed on warming.—BaA'' 2aq: needles, sl. sol. cold water, decomposed on boiling.—PbA'': yellow pp.—Ag_2A'': crystalline pp.; explodes on heating or on moistening with HNO_3.

Methyl ether Me_2A''. Sticky liquid.

Mono-ethyl ether $EtHA''$. [89°]. Prisms, sol. alcohol and ether.

Di-ethyl ether Et_2A''. Viscous liquid.

'Anilmucoxybromic' acid $CO_2H.C(OH):CBr.CH:NPh$. [132°]. Formed by the action of aniline hydrochloride on a dilute solution of mucoxybromic acid (Hill a. Palmer, *Am.* 9, 156). Pale-yellow needles (containing aq), sl. sol. cold water, v. sol. alcohol, and ether. $FeCl_3$ gives a brown pp. Hot acids and alkalis set free aniline. Phenyl-hydrazine ppts. the phenyl hydrazine salt $(C_6H_8N_2)C_{10}H_8BrNO_3$ aq.

Salts.—K_2A''.—BaA'_2 $\frac{1}{2}$aq: bright yellow crystalline pp.—Ag_2A'': bright orange-yellow pp.

MUCOXYCHLORIC ACID $C_4H_3ClO_4$ *i.e.* $CO_2H.C(OH):CCl.CHO$. [115°]. Formed from mucochloric acid by treatment with a very slight excess of baryta, added slowly at a low temperature (Hill a. Palmer, *Am.* 9, 159). The yield is 73 p.c. of the theoretical. Stout prisms, v. sol. water, alcohol, and ether, v. sl. sol. chloroform and benzene. With $FeCl_3$ it gives a deep garnet-red colour. On heating with excess of baryta it yields oxalate and formate. Bromine-water forms oxalic acid and $CClBr_2.CHO$. Phenyl-hydrazine yields an unstable condensation-product. Aniline produces anilmucoxychloric acid.

Salts.—K_2A'': small tables.—BaA'' 2aq: crystalline pp., sl. sol. cold water, v. sl. sol. dilute alcohol.—BaA''aq.—Ag_2A''.

Mono-ethyl ether $EtHA''$. [95°]. Prisms, which may be sublimed, sol. water, alcohol, and ether, v. sol. boiling benzene.

Di-ethyl ether Et_2A''. Viscous liquid.

Anilmucoxychloric acid $C_{10}H_8ClNO_3$ *i.e.* $CO_2H.C(OH):CCl.CH:NPh$. [147°]. Formed from mucoxychloric acid and aniline. Pale yellow needles (containing aq), becoming brilliant yellow when anhydrous; sl. sol. cold water, v. sol. alcohol and ether. When it is heated with acids or alkalis aniline is split off. $FeCl_3$ gives a deep-brown pp.

Salts.—K_2A''.—$BaH_2A''_2$ $\frac{1}{2}$aq: bright yellow needles.—Ag_2A'': bright orange pp.—Phenylhydrazine salt $PhN_2H_3H_2A''$ aq: white crystalline mass, sl. sol. cold water, v. sol. alcohol.

MUCUS OF PLANTS *v.* Mucilage.

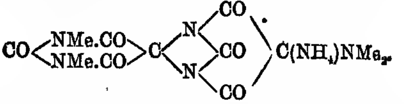
MUNJEET. The root of *Rubia munjista*, used in India as a dye-stuff. If ground munjeet is boiled with a solution of aluminic sulphate, and the red liquid filtered and acidified with HCl, a yellow pp. is formed. If the pp. be boiled with alcohol, pectic acid remains undissolved, and the alcohol contains purpurin and munjistin. They are separated by boiling dilute acetic acid, which dissolves munjistin.

Munjistin is identical with purpuroxanthic acid, $C_{14}H_7(CO_2H)O_4$ [231°] *v.* Di-oxy-anthraquinone carboxylic acid (E. Schunck a. H. Roemer, *C. J.* 33, 422; *cf.* Stenhouse, *Pr.* 12, 633; 13, 86, 145).

MUNTZ'S METAL. An alloy of Cu and Zn; *v.* Dictionary of Applied Chemistry.

MUREXIDE. The ammonium hydrogen salt of Purpuric acid (*q.v.*)

MUREXOÏN $C_{12}H_{18}N_6O_6$ *i.e.*



Formed by converting caffeïne into di-methyl-alloxan (Fischer, *B.* 14, 1912), and reducing this by H_2S to tetra-methyl-alloxantin, which is then subjected to the action of air and ammonia (Brunn, *B.* 21, 514; *cf.* Rochleder, *J. pr.* 51, 405). Red prisms, sl. sol. water and alcohol. Its aqueous solution is purple, resembling that of $KMnO_4$. Sublimes at about 230°. Decolourised by potash (difference from murexide). Dilute HCl decomposes it, forming di-methyl-parabanic acid.

MURIATIC ACID. Synonymous with Chlorhydric acid; *q. v.* vol. ii. p. 5.

MURRAYIN $C_{18}H_{22}O_{10}$. [170°]. A glucoside obtained from the flowers of *Murraya exotica* by extracting with water (Blas, *Z.* 1869, 316; De Vrij, *Z.* 1876, 850; Hoffmann, *Ar. Ph.* [3] 14, 139). White powder, composed of small needles, sl. sol. cold water, v. sol. boiling water and alcohol, insol. ether. Tastes bitter, but is not poisonous. Its solutions in alkalis and in Na_2CO_3 exhibit a greenish-blue fluorescence and turn brown on heating. The aqueous solution is not ppd. by salts of Cu or Hg. $FeCl_3$ colours its solution blue. Lead subacetate gives a pp. It reduces ammoniacal $AgNO_3$ and Fehling's solution on warming. Dilute acids split it up into glucose and murrayetin.

Murrayetin $C_{12}H_{12}O_5$. [c. 110°]. Formed by boiling murrayin with dilute H_2SO_4. Prisms (containing $\frac{1}{2}$aq); sl. sol. cold, m. sol. boiling water, v. sol. alcohol, m. sol. ether. Tasteless. Its solutions exhibit strong greenish-blue fluorescence, which is increased by KOH and by Na_2CO_3. $FeCl_3$ gives a bluish-green colour. Lead acetate gives, after a time, a yellow pp.

MUSCARINE $C_5H_{15}NO_2$ *i.e.* $CH(OH)_2.CH_2.NMe_3.OH$. An alkaloid occurring, together with neurine, in the fly agaric (*Agaricus muscarius*) (Schmiedeberg a. Koppe, *J.* 1870, 875; Ruckert, *N. Rep. Pharm.* 21, 193), in the fungus *Amnaita Pantherina* (Giacosa, *J.* 1883, 1488), and in putrefying flesh (Gautier, *Bl.* [2] 48, 13; *cf.* Brieger, *B.* 17, 2741). Formed by oxidising neurine $CH_2OH.CH_2.NMe_3.OH$ with conc. HNO_3 (Schmiedeberg a. Harnack, *C. C.* 1876, 554). Deliquescent tasteless crystals, v. e. sol. water and alcohol, insol. ether. Its solution is strongly alkaline, ppts. ferric and cupric hydrates from solutions of their salts, and acts as a narcotic poison antagonistic to atropine. Not affected by boiling dilute acids or alkalis. Gives amorphous pps. with mercury-potassium iodide and bismuth-potassium iodide.

Salts.—$(CH(OH)_2.CH_2.NMe_3Cl)_2PtCl_4$ 2aq.—$CH(OH)_2.CH_2.NMe_3AuCl_4$.

Di-ethyl ether $(HO)Me_3N.CH_2.CH(OEt)_2$. Formed by heating chloro-acetal $CH_2Cl.CH(OEt)_2$ (from di-chloro-ether) with tri-methyl-amine (Berlinerblau, *B.* 17, 1139). By heating the compound $C_5H_5NBr.CH_2.CH(OEt)_2$, formed by the action of bromo-acetal upon pyridine, with moist Ag_2O at 80° there is formed syrupy $C_5H_5N(OH).CH_2.CH(OEt)_2$, which is inappropriately termed by Lochert (*Bl.* [3] 3, 859) diethyl-muscarine-pyridine.

MUSCLE. Muscular tissue consists of fibres bound together into fasciculi by connective tissue. The fibres may be transversely striated (voluntary and cardiac muscle) or not (other involuntary muscle). The plain or unstriated fibres are elongated cells with oval nuclei, and inclosed by a delicate envelope; they are singly refracting. The cardiac fibres have no sheath. The voluntary muscular fibres have a well-marked sheath or sarcolemma, under which are situated numerous nuclei; the contents of the sarcolemma (muscle plasma) have a semi-liquid consistency during life. Kühne, and later Eberth, observed a nematode worm (*Myoryctes Weismanni*) crawling up the interior of a muscular fibre (*Zeit. f. wiss. Zool.* 12, 530); the contents of the sarcolemma are not, however, homogeneous; this is denoted by the transverse striping, which is probably an optical effect produced by the presence of certain more solid structures which are described as rods, membranes, tubules, and networks of fibres by different observers; these solid bodies are isotropous and are suspended in an anistropous (doubly refracting) viscous fluid. (For the various theories of the histological structure of striated muscle during rest and on contraction, *v.* Quain, *Anat.* 9th edit., London, 1882, p. 118 *et seq.*; also O. Nasse, *Zur Anat. u. Physiol. d. quergestreiften Muskelsubstanz*, Leipzig, 1882; Schäfer, *Pr.* 1891).

The sarcolemma is homogeneous and elastic; it is composed of an elastin-like substance (Ewald, *Zeit. Biol.* 26, 1).

The muscle plasma, fluid during life, coagulates after death, producing the stiffening called *rigor mortis*. As blood plasma separates into a solid substance, fibrin, and a liquid residue, serum, after it is shed, so the muscle plasma separates into a clot composed of myosin and a liquid residue muscle serum. Like the coagulation of the blood this can be hindered by cold; and by squeezing the frozen muscles of the frog Kühne obtained a liquid muscle plasma, which set into a clot which expressed serum subsequently when it contracted. This occurred most readily at about 30°–40°C. This can also be demonstrated in the muscles of warm-blooded animals, but as *rigor* occurs there more rapidly, great expedition in manipulation is required. *Rigor mortis* is also accompanied by the formation of sarcolactic acid.

Admixture of muscle plasma with solutions of neutral salts prevents the coagulation of the latter. Dilution of such salted muscle plasma brings about coagulation; this occurs most readily at 37°–40° C. Saline extracts of rigid muscle differ from salted muscle plasma in being acid, but resemble it very closely in the way in which myosin can be made to separate from it; myosin in fact undergoes a recoagulation. This is not a simple precipitation; it is first a jellying through the liquid; the clot subsequently contracts, squeezing out a colourless fluid or salted muscle serum. This does not take place at 0°C.; it occurs most readily at the temperature of the body, and is hastened by the addition of a ferment prepared from muscle in the same way as Schmidt's ferment is prepared from blood. The ferment is not identical with fibrin ferment, as it does not hasten the coagulation of salted blood plasma; nor does the fibrin ferment hasten the coagulation of muscle plasma. The recoagulation of myosin is also accompanied by the formation of lactic acid.

The proteïds of muscle plasma are—

1. Paramyosinogen, which is coagulated by heat at 47°C.

2. Myosinogen, which is coagulated at 56°C. It is on the presence of this proteïd that the power of fresh muscle juice to hasten the coagulation of blood plasma depends.

3. Myoglobulin, which differs chiefly from serum globulin in its coagulation temperature (63°C.).

4. Albumin, which is apparently identical with serum albumin α, coagulating at 73°C.

5. Myo-albumose; this has the properties of deutero-albumose, and is identical with, or closely connected to, the myosin ferment.

The first two proteïds in the above list go to form the clot of myosin; paramyosinogen (called musculin by Hammarsten) is, however, not essential for coagulation; the three last remain in the muscle serum.

Paramyosinogen, myosinogen, and myoglobulin are proteïds of the globulin class. They are all completely precipitated by saturation with magnesium sulphate, or sodium chloride, or by dialysing out the salts from their solutions. They can be separated by fractional heat coagulation, or by fractional saturation with neutral salts.

When muscle turns acid, as it does during *rigor mortis*, the pepsin which it contains is enabled to act, and at a suitable temperature (35°–40°C.) albumoses and peptones are formed by a process of self-digestion. It is possible that the passing off of *rigor mortis*, which is apparently due to the reconversion of myosin into myosinogen, may be the first stage in the self-digestion of muscle. The usual theory with regard to the cause of the disappearance of *rigor* is that it is due to putrefaction setting in. Cossar Ewart (*Proc. R. Soc.* 1887) has shown that the disappearance of *rigor* and the appearance of bacteria in the muscle are simultaneous. C. Schipiloff's theory is that the lactic acid which is formed from the glycogen in muscle (Otto) produces *rigor* by precipitating the myosin; and the disappearance of *rigor* is due to more acid being formed, which redissolves the precipitate. R. Böhm has, however, shown that lactic acid is not derived from glycogen, but from a proteïd source; and Latham has been able to deduce a formula which represents the formation of the acid from a combination of cyan-hydrins such as he supposes a proteïd to be.

For the properties of myosin *v.* Proteïds.

S. suppose that the acidity is partially due to the formation of acid potassium phosphate, the phosphoric anhydride being derived from the lecithin and nuclein of the muscle); Berzelius (*Lehrbuch*, 9, 569); Du Bois Reymond (*Gesammelte Abhandl. zur allgem. Muskel und Nervenphysik*, Leipzig, 1877, 2, p. 3); Heidenhain (*Mechanische Leistung*, p. 143); R. Böhm (*Pf.* 23, 44); Hoppe-Seyler (*H.* 666); Latham (*Brit. Med. Journal*, vol. i. 1886, p. 630); C. Schipiloff (*Centralb. f. d. med. Wissens.* 1882, 291); Chittenden (*Studies from Lab. Physiol. Chem.* Yale, 3, 116). Concerning the digestion of myosin, see Kühne and Chittenden (*Zeit. Biol.* 25, 358).

Pigments of muscle.—Hæmoglobin is present in small quantities in nearly all muscles; it is contained in the muscle plasma, and it is especially abundant in the slowly-contracting red muscles which occur in rodents, and occasionally also in other animals. In the gastropods, Limnæus and Paludina, the muscles contain hæmoglobin, but there is none in the blood (Lankester; *v.* also HÆMOGLOBIN).

Myohæmatin is one of a group of colouring matters called histohæmatins, *i.e.* pigments occurring in the tissues. These substances are probably respiratory in function; they have not been definitely separated from the tissues, but are probably proteïd in nature and contain iron; myohæmatin can be recognised most easily, after soaking the muscle in glycerine, by the spectroscope; myohæmatin is contained in the muscle plasma. Myohæmatin exhibits four absorption bands: one just below D, two between D and E, and one just below F. By soaking the muscle in ether, as a result of osmotic phenomena, the liquid separates out two layers, the lower of which is watery, yellowish-red in colour, and contains myohæmatin which presents a slightly different spectrum from that just described, viz. one band between D and E and one between E and *b*. In both cases the bands are very feeble when the pigment is oxygenated, but become well marked on the addition of reducing agents (MacMunn, *Phil. Trans.* 1, 1886, p. 267; *J. Physiol.* 8, 51). Hoppe-Seyler believes myohæmatin is altered hæmoglobin (*Zeit. physiol. Chem.* 13). This, however, has been shown by MacMunn to be untenable (*ibid.*).

Constituents of Muscle.—Muscle contains on the average 75 p.c. of water; this percentage is higher in young animals and in cold-blooded animals; of the 25 p.c. of solids, 21 p.c. consists of the proteïds already described, and the remaining 4 p.c. of extractives and salts (*cf.* Hofmann, *Lehrbuch der Zoochemie*, 104). The extractives are divided into (1) *nitrogenous*, viz.: creatine the most abundant (0·2 to 0·3 p.c. Voit, *Z. B.* 4, 77; increased by starvation, Demant, *Zeit. physiol. Chem.* 3, 387); creatinine, xanthine, hypoxanthine, and carnine; (2) *non-nitrogenous*: viz. fats, glycogen (C. Bernard, *C. R.* 48, 673, Nasse, *Pf.* 2, 97, Brücke, *Sitz. W.* 63, 214, Abeles, *Med. Jahrbücher*, 1877, 551, Külz, *Z. B.* 22, 161); inosite (Scherer, *Annal. d. Chem. u. Pharm.* 73, 322, Gauret a. Villiers, *C. R.* 86, 486); sarcolactic acid and lactic acid. In addition to the ferments already described (pepsin and myosin-ferment), muscle also contains an amylolytic ferment (Nasse, *l.c.*). Fresh muscle yields on ignition 1 to 1·5 p.c. of mineral matters, of which the most important constituents are potassium and phosphoric acid (*cf.* Hofmann, *l.c.*, and Bunge, *Zeit. physiol. Chem.* 9, 60).

Contraction of muscle.—The processes that occur in resting muscle are twofold: one a change of matter; this chemical tonus, as it may be called, is lessened by curare poisoning, by which the influence of the nervous system over the muscular is shut off: and the other set of changes is a change of the potential energy of chemical affinity into actual energy evidenced by the production of heat. On the contraction of a muscle, there is a sudden acceleration of both these changes; viz. an increase in chemical decomposition, and in the conversion of potential into actual energy which is evidenced as heat, electrical inequality, and mechanical motion. It is with the former of these, the chemical changes, that we have here specially to deal. They may be briefly summarised as follows:—

1. *Change in reaction.*—The muscle ordinarily alkaline becomes acid, as it does during *rigor mortis*; and the acid produced is lactic acid. The acidity can be easily demonstrated by litmus paper (Kühne). It is the accumulation of this and other waste products, including alkaloidal substances (Mosso), in the muscle which produces fatigue.—2. There is a relative increase of water (Ranke, *Tetanus*, cap. 2, p. 63). 3. The extractives soluble in water decrease; those soluble in alcohol increase (Helmholtz, *Arch. f. Anat. u. Phys.* 1845. 72; Ranke, *l.c.* 141; Heidenhain, *Pf.* 3, 574).—4. Glycogen diminishes and sugar increases in amount (Ranke, Nasse, *Pf.* 2, 97).—5. Creatine diminishes and creatinine increases in amount (Sarokin, *Virchow's Archiv*, 28; Voit, *Z. B.* 4, 77).—6. Tetanised muscle is not able to oxidise pyrogallic acid as resting muscle is (Grützner, *Pf.* 7, 255).—7. Nitrates are converted into nitrites (Gschleidlen, *ibid.* 8, 506).—8. *Gaseous changes*: The amount of oxygen used and of carbonic acid given out increases; the amount of carbonic acid exhaled is never equal in amount to that of the oxygen absorbed; and during tetanus, *i.e.* continuous contractions, the quotient $\frac{CO_2 \text{ exhaled}}{O \text{ absorbed}}$ increases. The following numbers from Ludwig and Schmidt illustrate the differences in the gases of the blood leaving muscle during rest and activity:

Venous blood.	Oxygen less than arterial blood.	CO_2 more than arterial blood.
Muscle at rest	9 p.c.	6·71 p.c.
„ during activity	12·26 „	10·79 „

(For analyses of the gases of muscle *v.* Hermann, *Stoffwechsel der Muskeln*; Ludwig, Sezelkow u. A. Schmidt, *Sitz. W.* 45; *Sitzungsb. der math.-phys. Classe der k. s. Gesellsch. der Wissensch.* 20, 12; *Arbeiten aus d. physiol. Anstalt zu Leipzig*, 1869. Full references of the literature on the effect of muscular exercise on respiration are given by Gamgee, *Physiol. Chem.* p. 382).

No trustworthy results exist which show that the proteids of muscle undergo any change during activity; and the effect of muscular exercise on the nitrogenous excreta is very small; the increase of urea being quite out of proportion to the amount of work done. (For experiments on dogs *v.* Voit, *Untersuchungen über den Einfluss* *der Kochsalzes des Kaffee's und der Muskelbewegungen auf den Stoffwechsel*, München, 1860. For experiments on man, *v.* Fick u. Wislicenus, *Vierteljahresschrift d. nat. Gesellsch. in Zurich*, 10; Parkes, *Pr.* 15, 339; 16, 44; E. Smith, *Phil. Trans.* 1862, 747; A. Flint, *Journ. of Anat. and Physiol.* 12, 91; F. W. Pavy, *Lancet*, 1876; North, *Journ. of Physiol.* 1, 171; *Pr.* 39, 443).

Hermann's theory of muscular contraction.—No oxygen is obtainable from muscle *in vacuo.* Hermann considers that the formation of carbonic acid is not simply the result of oxidation, but due to the splitting of a complex substance *inogen* into carbonic acid, lactic acid, and a gelatinous proteid myosin; the same occurs, but to a greater extent, in *rigor mortis*; the process of clotting especially going further. Each contraction is thus the partial death of the muscle. This is supported by the fact that the electrical conditions, like the chemical, are similar in dead and contracted muscle. There is, however, no evidence to prove that a clot of myosin is formed at each contraction. Bernstein has more recently formulated a theory in which he seeks to show that changes in form, in composition, and in electrical potential are all parts of the samo mechanism (*Untersuch. a. d. physiol. Inst. Halle*, 1888). See also Burdon Sanderson (*Reports Brit. Ass.* 1889). W. D. H.

MUSTARD OILS. The seeds of black mustard (*Sinapis nigra*) contain potassium myronate, which, in presence of water, is decomposed by the ferment myrosin (also present in the seeds) into $KHSO_4$, glucose, and allyl thiocarbimide or oil of mustard. Small quantities of crotonitrile and free sulphur are formed in the hydrolysis (Förster, *L. V.* 1888, 209). Black mustard seed also contains a fixed oil which yields stearic and erucic acids on saponification (Darby, *A.* 69, 1). The allyl thiocarbimide amounts to about ·5 p.c. of the weight of the seeds. White mustard seed (*Sinapis alba*) yields on pressure 36 p.c. of a fixed oil containing glyceryl erucate. The seeds also contain a glucoside, sinalbin $C_{30}H_{44}N_2S_2O_{16}$ which is decomposed by myrosin into sinapin sulphate $C_{16}H_{23}NO_5H_2SO_4$, glucose, and an oil C_8H_7NSO (Will, *Z.* [2] 7, 89; *A.* 199, 150). The term 'mustard oil' has been applied not only to the fixed and volatile oils from mustard seed, but also to all compounds of the form RN:CS where R denotes a hydrocarbon radicle. In this dictionary these compounds are described as thiocarbimides. Thus the essential oil of black mustard is described as allyl thiocarbimide.

MYCOMELIC ACID $C_4H_4N_4O_2\frac{1}{2}$aq. When alloxan is gently warmed with aqueous NH_3 it forms a yellow solution which deposits on cooling a transparent jelly of ammonium mycomelate, from the hot aqueous solution of which salt H_2SO_4 ppts. mycomelic acid (Liebig a. Wöhler, *A.* 26, 304). Mycomelic acid is also produced by boiling azulinic acid with water (Emmerling a. Jacobsen, *B.* 4, 951) and by heating uric acid with water at 180° (Wöhler, *A.* 103, 118; Hlasiwetz, *A.* 103, 211). Gelatinous pp., drying up to a loose yellow powder. Reddens litmus. Almost insol. cold water, m. sol. hot water and alkalis, insol. alcohol and ether.—$AgC_4H_3N_4O_2$.

MYCOSE *v.* Trehalose and Sugars.

MYOCTONINE $C_{27}H_{30}N_2O_8$5aq. [144°]. Occurs, together with lycaconitine, in *Aconitus lycoctonum* (Dragendorff a. Salomonovitch, *C. C.* 1886, 861). V. sol. chloroform and benzene, nearly insol. ether (difference from lycaconitine). Poisonous; ·01 g. killing a frog. Produces paralysis of the extremities of the motor nerves.

MYO-HÆMATIIN *v.* Muscle.

MYOSIN *v.* Proteïds and Muscle.

MYRICIN $C_{46}H_{92}O_2$. [72°]. The portion of bees'-wax insoluble in alcohol. It is myricyl palmitate (Brodie, *A.* 71, 144). Light feathery crystals (from ether); readily saponified by alcoholic potash. According to Nafzger (*A.* 224, 251) myricin also contains an ether of oleïc acid.

MYRICYL ALCOHOL $C_{30}H_{62}O$ *i.e.* $C_{29}H_{60}.CH_2OH$. [85·5°]. Obtained by saponifying carnaüba wax, in which it occurs both free and combined (Maskelyne, *C. J.* 22, 87; Von Pieverling, *A.* 183, 344; Stürcke, *A.* 223, 294). According to Brodie (*A.* 71, 147) myricyl alcohol is obtained by saponifying the myricin of bees'-wax, but Schwalb (*A.* 235, 106) considers that the myricyl alcohol so obtained has the homologous formula $C_{31}H_{64}O$.

Properties. — Small white needles (from ether); almost insol. cold alcohol, ether, and benzene, but readily soluble in these liquids when hot. On heating with soda-lime at 200° it forms melissic acid $C_{29}H_{59}.CO_2H$ [90°].

DI-MYRICYL-AMINE $C_{60}H_{123}N$ *i.e.* $NH(C_{30}H_{61})_2$. [78°]. Formed by passing NH_3 for 24 hours over myricyl iodide at 120° (Von Pieverling, *A.* 183, 351). Crystalline; nearly insol. boiling alcohol and ether, v. sol. boiling benzene.

MYRICYL CHLORIDE $C_{30}H_{61}Cl$. [64·5°]. Formed from myricyl alcohol and PCl_5 (Von Pieverling, *A.* 183, 348). Waxy mass (from ether); sol. alcohol, benzene, and ligroïn.

MYRICYL CYANIDE $C_{30}H_{61}CN$. [75°]. Amorphous (Von Pieverling, *A.* 183, 357).

MYRICYL IODIDE $C_{30}H_{61}I$. [70°]. Formed by adding phosphorus and iodine in successive small portions to myricyl alcohol heated to 120° (Von Pieverling, *A.* 183, 347). Plates (from ligroïn); v. sol. hot alcohol and ether. When heated with finely-divided potassium it yields $C_{60}H_{122}$ [102°] (Hell a. Hägele, *B.* 22, 502).

MYRICYL MERCAPTAN $C_{30}H_{61}SH$. [94·5°]. An amorphous yellow powder, formed by the action of alcoholic KSH on myricyl chloride (Von Pieverling, *A.* 183, 349). Sl. sol. boiling ether, ligroïn, and alcohol.

MYRISTIC ACID $C_{14}H_{28}O_2$ *i.e.* $C_{13}H_{27}.CO_2H$. Mol. w. 228. [54°]. (250·5° i.V. at 100 mm.) Krafft, *B.* 12, 1668; 15, 1724; 16, 1719). S.G. $\underline{54}$ ·8622. H.F. 107,000 (Von Rechenberg). H.C. 2,061,712 (Louguinine, *A. Ch.* [6] 11, 222). Occurs as glyceryl ether (myristin) in nutmeg-butter (from *Myristica moschata*) (Playfair, *P. M.* [3] 18, 202; *A.* 37, 153; Flückiger, *N. Rep. Pharm.* 24, 213), in Otoba-wax or otobite (from *Myristica otoba*) (Uricoechea, *A.* 91, 369), in dika-bread (prepared from the fruit of *Mangifera Gabonensis*) (Oudemans, *J. pr.* 81, 356) amounting to more than one-half of the fatty acids contained therein, in the oil of *Cyperus esculentus* (Hell a. Twerdomedoff, *B.* 22, 1742), in small quantity in cocoa nut-oil (Görgey, *A.* 66, 314), in common butter (Heintz, *P.* 87, 267; 90, 137; 92, 429, 588; *J. pr.* 66, 1), in croton-oil

(Schlippe, *A.* 105, 1), and in Bicuhyba-wax (from *Myristica Bicuhyba*). It occurs in combination with æthal in spermaceti (Heintz, *A.* 92, 291). It also occurs in the seeds of *Nigella sativa* (Greenish, *Ph.* [3] 11, 909, 1013) and in lycopodium spores (from *Lycopodium clavatum*) (Langer, *Ar. Ph.* [3] 27, 241, 289). Myristic acid is formed by fusing stearolic acid with potash (Marasse, *B.* 2, 361).

Preparation.—By saponifying nutmeg-butter or myristin and distilling the acid obtained under reduced pressure.

Properties.—Shining laminæ (from alcohol); insol. water, v. sol. hot alcohol and ether. A mixture of 30 pts. myristic acid and 70 pts. lauric acid melts at 35°. Nitric acid (S.G. 1·5) readily oxidises it, forming various products (Uverdlinger, *B.* 19, 1893). The dry distillation of the calcium salt yields myristone. Distillation with MeOH *in vacuo* yields tridecane (Mai, *B.* 22, 2133).

Salts.—KA′: crystalline soap; v. sol. water and alcohol, insol. ether (Playfair).—NaA′.—BaA'_2: minute laminæ; v. sl. sol. water and alcohol. —$MgA'_2 3aq$: minute needles (Heintz).—CuA'_2: minute bluish-green needles.—PbA'_2: amorphous mass.—$(PbA'_2)_4Pb(OAc)_2$: insoluble powder.—AgA′: amorphous powder.

Ethyl ether EtA′. [11°] (Lutz, *B.* 19, 1433). (295°). S.G. (liquid) ·864 (Playfair). Formed from the acid, alcohol, and HCl. Crystals; sl. sol. alcohol and ether, m. sol. ligroïn.

Glyceryl ether $C_{45}H_{86}O_6$ or $C_3H_5A'_3$. *Myristin. Trimyristin.* [55°] and [49°]. H.C. 6,601,895 (Louguinine). Occurs in the cases mentioned above, and also in large quantity in the fat of the oil-nut (*Myristica surinamensis*) (Reimer a. Will, *B.* 18, 2011), and to the extent of 1·5 or 2 p. c. in cochineal (Liebermann, *B.* 18, 1975). It is best obtained by extracting powdered nutmeg with ether (Masino, *G.* 10, 72). Brilliant leaflets; v. sol. warm alcohol, ether, benzene, and $CHCl_3$, nearly insol. cold alcohol. It forms two varieties, melting at 55° and at 49°, which are interchangeable by heating 1° above the melting-point for half-a-minute (R. a. W.; L.).

Phenyl ether $A'C_6H_5$: [36°]; (230° at 15 mm.).

p-Tolyl ether $A'C_7H_7$: [39°]; (240° at 15 mm.) (Krafft a. Bürger, *B.* 17, 1379).

Chloride $C_{13}H_{27}.COCl$. [−1°]. (168° at 15 mm.). Colourless liquid (Krafft a. Bürger).

Amide $C_{13}H_{27}.CONH_2$. [102°]. Formed by heating the glyceryl ether with alcoholic NH_3 at 100° (Masino, *A.* 202, 173) or the ethyl ether with aqueous NH_3 at 250°. Formed also by heating the ammonium salt at 230° in a sealed tube (Reimer a. Will, *B.* 18, 2016), and by the action of NH_3 on the chloride (Krafft a. Stauffer, *B.* 15, 1730). Plates (from alcohol); v. sol. benzene, alcohol, and chloroform, sl. sol. ether, insol. water. Bromine and NaOHAq forms $C_{13}H_{27}.NH.CO.NH.CO.C_{13}H_{27}$ [103°].

Anilide $C_{13}H_{27}.CONHPh$. [84°]. Prepared by boiling the acid with aniline for some days (Masino, *G.* 10, 75). Silky needles; sol. ether, benzene, and chloroform.

Nitrile $C_{13}H_{27}.CN$. [19°]. (226·5° at 100 mm.). S.G. $\frac{19}{4}$ ·8281; $\frac{99}{4}$ ·7724. Formed from the amide by distilling with P_2O_5 (Krafft a. Stauffer, *B.* 15, 1730).

Myristic-benzoic-anhydride $C_{13}H_{27}.CO.O.CO.C_6H_5$. [38°]. Formed from BzCl and potassium myristate (Chiozza a. Malerba, *A.* 91, 102). Silky laminæ; m. sol. ether.

Bromo-myristic acid $C_{14}H_{27}BrO_2$. [31°]. Formed from myristic acid, amorphous P and Br (Hell a. Twerdomedoff, *B.* 22, 1745). Needles, insol. water, sol. alcohol and ether.

Tetra-bromo-myristic acid $C_{14}H_{24}Br_4O_2$. Formed from myristolic acid and Br (Masino).

Amido-myristic acid $C_{14}H_{27}(NH_2)O_2$. [253°]. Formed from bromo-myristic acid and alcoholic NH_3 (H. a. T.). Needles, insol. alcohol.

Phenyl-amido-myristic acid $C_{14}H_{27}(NHPh)O_2$. [143°]. Formed from bromo-myristic acid and aniline (H. a. T.). White mass, insol. water, sl. sol. benzene, v. sol. alcohol. Gives a dark-green pp., with cupric acetate in hot alcoholic solution.

Oxy-myristic acid $C_{14}H_{27}(OH)O_2$. [51·5°]. Formed by boiling bromo-myristic acid with excess of aqueous NaOH (H. a. T.). Crystalline; insol. hot water, v. sol. alcohol and benzene.—BaA'_2: flocculent pp., sl. sol. cold water, v. sl. sol. hot water.—AgA′: white pp.

MYRISTIC ALDEHYDE $C_{13}H_{27}CHO$. [53°]. (169° at 22 mm.). Crystalline solid. Prepared by dry distillation of a mixture of calcium myristate and formate (Krafft, *B.* 13, 1415).

Isomeride:—Tetradecoic aldehyde.

MYRISTICIN $C_{12}H_{14}O_3$. [30°]. (c. 145° at 10 mm.). S.G. $\frac{25}{}$ 1·1501. Occurs in oil of mace (Semmler, *B.* 23, 1803). Yields benzene when distilled with zinc-dust. Bromine forms $C_{12}H_{14}Br_2O_3$ [105°].

MYRISTICOL $C_{10}H_{16}O$. (212°–218°). The chief constituent of the volatile oil of nutmeg (Gladstone, *C. J.* 25, 11; Wright, *C. J.* 26, 549, 686). Resinified by heat. P_2S_5 converts it into cymene. PCl_5 yields a chloride, $C_{10}H_{15}Cl$ [100°], slowly split up on boiling into HCl and cymene.

MYRISTIN *v. Glyceryl ether* of Myristic acid.

MYRISTOLIC ACID $C_{14}H_{24}O_2$. [12°]. Formed by passing chlorine into myristic acid heated to 100°, and decomposing the product with alcoholic potash (Masino, *A.* 202, 175). Oil. Not solidified by nitrous fumes. Gives Pettenkofer's reaction with sugar and H_2SO_4.

MYRISTONE $C_{26}H_{54}CO$. [76°]. S.G. $\frac{80}{4}$ = ·801; $\frac{100}{4}$ = ·792. Silvery plates. Formed by distilling calcium or barium myristate with lime (Overbeck, *P.* 86, 591; *A.* 84, 290; Krafft, *B.* 15, 1713). Does not combine with $NaHSO_3$.

Oxim $C_{26}H_{54}.C:NOH$. [51°]. Amorphous; sl. sol. alkalis (Spiegler, *B.* 17, 1575; *M.* 5, 242).

MYRISTONITRILE *v. Nitrile* of Myristic acid.

MYRONIC ACID $C_{10}H_{19}NS_2O_{10}$ (from μύρον, a fragrant ointment). Occurs as potassium salt in the seeds of black mustard (Bassy, *J. Ph.* 16, 39; Ludwig a. Lange, *Z.* 1860, 430, 577; Will a. Körner, *A.* 125, 257), in horse-radish (Winckler, *J.* 1849, 436), in rape seed (*Brassica rapa*), and in turnip seed (*Brassica napus*) (Ritthausen, *J. pr.* [2] 24, 273). This salt may be obtained by boiling mustard seeds (1 pt.) with alcohol (6 pts.), macerating the residue with cold water, and evaporating the aqueous extract after addition of a little $BaCO_3$. The free acid may be obtained by adding tartaric acid to a solution of the potassium salt, evaporating, and extracting with alcohol. Syrup, readily decomposed by heat. Its aqueous solution gives off H_2S on boiling. An aqueous solution of myrosin splits it up into glucose, allyl thiocarbimide, and H_2SO_4. Boiling baryta-water forms a pp. of $BaSO_4$, with evolution of allyl thiocarbimide. Caustic potash solution acts vigorously, yielding allyl cyanide, NH_3, glucose, and allyl thiocarbimide. Conc. HCl sets free H_2SO_4; boiling dilute H_2SO_4 yields H_2S, glucose, H_2SO_4, and NH_3. Zinc and HClAq give off H_2S.

Salts.—KA′. Groups of silky needles (from alcohol) or glassy prisms (from water); v. e. sol. water, nearly insol. alcohol, insol. ether. Tastes bitter. Its solution is hydrolysed by myrosin:

$$KC_{10}H_{18}NS_2O_{10} = C_6H_{12}O_6 + C_3H_5NCS + KHSO_4.$$

The hydrolysis is not brought about by emulsion, yeast, or saliva. Water at 115° yields allyl cyanide, H_2S, and sulphur. Silver nitrate solution gives a pp. $C_4H_5NSAg_2SO_4$.—BaA'_2 (at 100°): plates, v. sol. water.

MYROSIN. A proteïd ferment contained in the seeds of black and white mustard, and of many other cruciferous plants. It may be obtained by exhausting white mustard with cold water, evaporating below 40° to a syrup, and ppg. by alcohol (Bussy, *J. Ph.* 26, 44; Winckler, *Jahrb. pr. Pharm.* 3, 93). Its aqueous solution is coagulated by heat and by alcohol, when it loses its hydrolytic power, but it recovers this after a day's immersion in water. It does not hydrolyse amygdalin.

MYROXOCARPIN $C_{48}H_{70}O_8$. [115°]. Deposited in crystals from an alcoholic solution of white balsam of Peru (Stenhouse, *A.* 77, 306). Trimetric crystals; $a:b:c = 1:·936:·755$. Insol. water, v. sol. hot alcohol and ether. Does not dissolve in acids or alkalis.

MYRRH. A gum-resin which exudes from *Balsamodendron myrrha*, a shrub growing in Arabia and Abyssinia. The resin yields protocatechuic acid and pyrocatechin on potash-fusion (Hlasiwetz a. Barth, *J.* 1866, 630). Besides resin and gum (Bückner, *N. Rep. Pharm.* 16, 76), myrrh contains a small quantity of an essential oil, boiling about 266°, S.G. $\underline{15·5}$ 1·0189, μ_A 1·5196 at 7·5°; μ_D 1·5278; μ_H 1·5472 (Gladstone, *C. J.* 17, 11). The oil quickly resinifies when exposed to atmospheric oxidation. It contains $C_{22}H_{32}O$ (263°) (Flückiger, *B.* 9, 471). According to Köhler (*Ar. Ph.* 228, 291) myrrh contains a gum $C_6H_{10}O_5$, a resin $C_{26}H_{31}O_2(OH)_3$, two dibasic acids $C_{18}H_{16}O_8$ and $C_{26}H_{32}O_9$, and 7 p.c. of an essential oil $C_{10}H_{14}O$.

MYRTLE OIL. A volatile oil obtained from the berries and leaves of the myrtle (*Myrtus communis*) (Riegal, *Pharm. Centr.* 1850, 319). It contains a terpene $C_{10}H_{16}$ (160°–170°), S.G. $\underline{15·5}$ ·891, μ_A 1·462 at 18°, μ_D 1·468, μ_H 1·488 (Gladstone, *J.* 1863, 548). Jahns (*Ar. Ph.* [3] 27, 174) found in Spanish oil of myrtle pinene $C_{10}H_{16}$ (159°) $[\alpha]_D = 36·8$, and cineol (170°).

MYTILOTOXINE $C_6H_{15}NO_2$. Occurs in mussels (*Mytilus edulis*) and in putrid flesh (Brieger, *Die Ptomaïne*; Gautier, *Bl.* [2] 48, 13). Its hydrochloride crystallises in tetrahedra, and is very poisonous, but gradually decomposes, losing its poisonous properties.—$B'HAuCl_4$. [182°]. Minute cubes.

N

NANDININE $C_{19}H_{19}NO_4$. Occurs in the root-bark of *Nandina domestica* of Japan (Eijkman, *R. T. C.* 3, 197). White amorphous powder, insol. water, v. sol. alcohol, ether, benzene, and chloroform. Poisonous. Gives the alkaloidal reactions. H_2SO_4 forms a reddish-violet colour, changed by a drop of HNO_3 to an intense blue. Nitric acid gives a green colour changing to brown.—$B'_2H_2PtCl_6$: turned blue by H_2SO_4.

NAPHTHA *v.* PETROLEUM.

(β)-NAPHTH-ACRIDINE $C_{21}H_{12}N$ *i.e.*

$$C_{10}H_6\left\langle\begin{matrix}CH\\|\\N\end{matrix}\right\rangle C_{10}H_6$$

[216°]. Formed by the action of methylal, and HCl upon (β)-naphthyl-amine (Reed, *J. pr.* [2] 34, 160; 35, 317). Long, straw-yellow, needles, v. sol. alcohol, v. sl. sol. ether. The alcoholic solution fluoresces dark-blue.

Nitrate $B'HNO_3$: small needles.

Picrate $B'C_6H_2(NO_2)_3OH$: amorphous.

Derivative v. PHENYL-NAPHTHACRIDINE.

NAPHTHALDEHYDE *v.* NAPHTHOIC ALDEHYDE.

NAPHTHALENE $C_{10}H_8$. *Naphthalin.* Mol. w. 128. [80·2°] (Reissert, *B.* 23, 2243); [80°] (Landolt, *Z. P. C.* 4, 349); [79·5°] (Vohl); [79°] (Lossen a. Zander, *A.* 225, 111); [80·06°] (Mills, *P. M.* [5] 14, 27). (218°) at 760 mm. (Vohl, *J. pr.* 102, 29; Crafts, *Bl.* [2] 39, 282); (217°) at 740 mm. S.G. $\underline{15}$ 1·152 (V.); $\underline{4}$ 1·145 (Schröder, *B.* 12, 1613). S.G. (liquid) $\underline{79}$ ·978 (Kopp, *A.* 95, 329); $\frac{79}{0}$ ·982 (L. a. Z.). H.C.v. 1,232,400. H.C.p. 1,233,600 (Stohmann); 1,245,000 (Berthelot a. Vieille, *Bl.* [2] 47, 863); 1242000 (Berthelot, *A. Ch.* [6] 13, 302, 326). H.F. −17,600 (Stohmann, Kleber, a. Langbein, *J. pr.* [2] 40, 90); −29,000 (Berthelot a. Vieille, *A. Ch.* [6] 10, 442); −42,000 (von Rechenberg). S.V. 149·2 (L. a. Z.); 148 (Lossen, *A.* 254, 53); 145·46 (Ramsay); S.V.S. 130·61 (Schiff). R_∞ 74·12 in a 6·66 p.c. alcoholic solution (Kanonnikoff); 71·78 (Nasini a. Bernheimer, *G.* 14, 153; 15, 93). S. (toluene) 32 at 16·5°; S. (alcohol) 5·29 at 15° (Bicchi, *B.* 12, 1978). Its absorption in the ultra-violet spectrum has been studied by Hartley (*C. J.* 39, 161).

Occurrence.—In petroleum from Rangoon (Warren a. Storer, *Mem. Amer. Acad.* 9, 208). In coal-tar, from which it may be obtained by shaking the fraction 180°–220° with aqueous NaOH and then with dilute H_2SO_4, and distilling the residue alone or with steam (Garden, *Thomson's Annals*, 15, 74; Faraday, *Tr.* 1826; Kidd, *B. J.* 3, 186; Reichenbach, *S.* 61, 175; 68, 233).

Formation.—1. A product of the passage through a red-hot tube of the vapour of the following substances:—petroleum, alcohol (Reichenbach, *B. J.* 12, 307), ether, acetic acid, essential oils, toluene (Ferko, *B.* 20, 660), xylene, ψ-cumene, a mixture of ethylene with benzene, with styrene, with anthracene or with chrysene (Berthelot, *Bl.* [2] 6, 272, 279), ethylene alone, acetylene, a mixture of benzene and acetylene (Berthelot, *Bl.* [2] 7, 218, 278, 306), oil of turpentine (Schulz, *B.* 9, 548), wood-tar (Letney a. Atherberg, *B.* 11, 1210, 1222).—2. By passing over red-hot quicklime the vapour of the bromide of phenyl-butylene derived from benzyl bromide, allyl iodide and sodium (Aronheim, *B.* 6, 67; *A.* 171, 233).—3. By passing the vapour of isobutyl-benzene over heated lead oxide (Wreden a. Znatovitch, *B.* 9, 1606).—4. By distilling colophony and gum-benzoin with zinc-dust (Ciamician, *B.* 11, 269).—5. By heating dimethyl-aniline (1 pt.) with bromine (1 pt.) at 115° (Brunner a. Brandenburg, *B.* 11, 697).—6. By oxidising pyrenic acid and distilling the resulting naphthalene tetra-carboxylic acid with slaked lime (Bamberger a. Philip, *B.* 19, 1999).—7. By hydrolysis of its sulphonic acids: this takes place when superheated steam is passed through a solution of naphthalene (β)-sulphonic acid in dilute H_2SO_4 at 135° (Armstrong a. Miller, *C. J.* 45, 148).

Synthesis.—By dry distillation of the silver salt of tetra-hydro-naphthalene di-carboxylic acid  $C_6H_4\left<\begin{array}{l}CH_2.CH(CO_2H)\\ \qquad\quad |\\ CH_2.CH(CO_2H)\end{array}\right.$ which **acid** is formed by the action of o-xylylene bromide  $C_6H_4\left<\begin{array}{l}CH_2.Br\\ CH_2.Br\end{array}\right.$ on di-sodio-ethane tetra-carboxylic-ether $C_2Na_2(CO_2Et)_2$, and boiling the product with alcoholic KOH. Naphthalene is also formed by passing the tetra-hydro-naphthalene di-carboxylic acid through a red-hot tube (Baeyer a. Perkin, *B.* 17, 448) (*v.* NAPHTHOL and NAPHTHALENE DERIVATIVES, *Constitution of*).

Purification.—Commercial naphthalene may be purified by sublimation. It may also be purified by repeatedly heating with a little H_2SO_4 (best with MnO_2) at 180° and distilling with steam (Stenhouse a. Groves, *B.* 9, 683).

Properties.—Monoclinic tables, insol. cold, almost insol. hot, water, v. sol. alcohol, ether, fatty and essential oils, and HOAc. Volatile with steam; 1 pt. distilling over with about 570 pts. of water (Naumann, *B.* 4, 646; 10, 2014, 2100; 11, 33). Burns with smoky flame. Boiling naphthalene dissolves S, P, and the sulphides of As, Sb, and Sn; it also dissolves indigo, iodine, $HgCl_2$, HgI_2, and As_2O_2.

Reactions.—1. *Chlorine* forms derivatives by substitution and by addition (Laurent, *A. Ch.* 49, 218; 52, 275; 69, 214).—2. *Bromine* forms derivatives by substitution.—3. *Nitric acid* forms nitro- and di-nitro-naphthalene.—4. The vapour of *aqua regia* in the cold forms $C_{10}H_8Cl_4$ and $C_{10}H_7Cl_5$ (Bunge, *B.* 4, 289).—5. *Phosgene* has no action (Berthelot, *Bl.* [2] 13, 301).—6. The vapour passed through a *red-hot tube* yields carbon, methane (Kletzinsky, *J.* 1865, 561), and dinaphthyl (Ferko, *B.* 20, 662). When passed through a red-hot tube together with hydrogen it is mainly unaltered, but yields some acetylene and benzene (Berthelot, *Bl.* [2] 6, 281). When passed together with acetylene through a red-hot tube it yields much anthracene. At a white heat it reacts with benzene forming anthracene (Berthelot). When passed through a red-hot tube containing charcoal it yields some dinaphthyl. When passed with ethylene through a red-hot tube it yields acenaphthene, phenanthrene, and dinaphthyl (Ferko, *B.* 20, 662).—7. Saturated HIAq at 280° yields the dihydride $C_{10}H_{10}$, and finally ethyl and di-ethyl-benzene and decane (Berthelot, *J.* 1867, 709). When heated with conc. HIAq and red phosphorus the products are naphthalene hexahydride, and oily $C_{10}H_{18}$ (173°–180°) and $C_{10}H_{20}$ (153°–158°) (Wreden, *A.* 187, 164).—8. Boiling aqueous $KMnO_4$ oxidises it to phthalic acid. Aqueous $K_2Cr_2O_7$ and H_2SO_4 yield phthalic acid and dinaphthyl (Lossen, *A.* 144, 71). Dilute HNO_3 at 130° also yields phthalic acid (Beilstein a. Kurbatow, *A.* 202, 215). A mixture of CrO_3 and HOAc oxidises it to naphthoquinone. Oxidation with MnO_2 and H_2SO_4 yields dinaphthyl and a resinous acid $C_{20}H_{14}O_4$, which forms the amorphous salts $Pb_3A'''_2$, $PbHA'''$, and Ag_2HA''' (Lossen).—9. $KClO_3$ and H_2SO_4 form phthalic acid, di-chloro-naphthalenes, and syrupy chloro-oxy-naphthalic acid $C_{10}H_7ClO_5$ (Hermann, *A.* 151, 79).—10. CrO_2Cl_2 yields di-chloro-naphthoquinone.—11. Aqueous *hypochlorous acid* forms $C_{10}H_8(HOCl)_2$ crystallising in prisms, sl. sol. water, converted by alcoholic potash into $C_{10}H_8(OH)_4$ which crystallises in prisms, almost insol. water, v. sol. alcohol, and forms an insoluble lead compound $Pb_2C_{10}H_8O_4$ (dried at 100°) and a sulphonic acid which yields a crystalline calcium salt $CaC_{10}H_{10}S_2O_{10}$ (Neuhoff, *A.* 136, 342).—12. When heated with excess of $AlCl_3$ it forms benzene and hydrides of naphthalene. At 160° iso-dinaphthyl is formed (Friedel a. Crafts, *Bl.* [2] 39, 195; *C. R.* 100, 692).—13. *Methyl chloride* in presence of $AlCl_3$ forms $C_{16}H_{12}$ [181°] crystallising in plates, v. sol. hot ether, sl. sol. cold alcohol (Bischoff, *B.* 23, 1905; *cf.* Liebermann, *A.* 163, 122; Fürth, *B.* 16, 2171).—14. *Iodine* at 250° appears to form a compound $C_{40}H_{29}I$ (Bleunard a. Vrau, *C. R.* 94, 534).—15. On passing a mixture of *cyanogen* and naphthalene vapour through a red-hot tube there is formed the nitrile of (α)-naphthoic acid.—16. Heating with *chloride of sulphur* yields di-chloro-naphthalene (Laurent, *A.* 76, 298).—17. *Nitric peroxide* forms nitro- and di-nitro-naphthalene and, at 100°, the compounds $C_{10}H_8O_4$ [225°] and $C_{10}H_4O_4$ [131°] (Leeds, *Am. Ch.* 2, 283).—18. When heated with *potassium* it forms a black powder $C_{10}H_8K_2$, which is decomposed by water, yielding KOH and $C_{10}H_{10}$ (Berthelot, *Bl.* [2] 7, 110).—19. Naphthalene (2 pts.) fused with *antimonious chloride* (3 pts.) yields on cooling deliquescent crystals of $(C_{10}H_8)_2 3SbCl_3$ (W. Smith, *C. J.* 41, 411).—20. Naphthalene taken internally appears in the urine as (β)-naphthol and (β)-naphthoquinone (Edlefsen, *C. C.* 1888, 1007).

Combinations with nitro-compounds.—$C_{10}H_8C_6H_4(NO_2)_2$ [1:3]. [53°]. Prisms (Hepp, *A.* 215, 379).—$C_{10}H_8C_6H_4(NO_2)_2$ [1:4]. [119°]. White needles, v. sl. sol. alcohol, separated into its components by distillation with steam.—$C_{10}H_8C_6H_3Cl(NO_2)_2$ [1:2:4]. [78°]. Long white needles (from alcohol), decomposed by heating with potash or aniline, naphthalene being set free (Willgerodt, *B.* 11, 603).—$C_{10}H_8C_6H_3(NO_2)_3$. [152°]. White needles, deposited from a mixture of the alcoholic solutions of naphthalene and tri-nitro-benzene (Hepp, *A.* 215, 377). — $C_{10}H_8C_6H_2Cl(NO_2)_3$. [96°]. Flat canary-yellow needles (Liebermann a. Palm, *B.* 8, 378).—$C_{10}H_8C_6H_3Me(NO_2)_2$. [61°]. Formed by mixing naphthalene and di-nitro-toluene dissolved in benzene (Hepp). — $C_{10}H_8C_6H_2Me(NO_2)_3$. [98°]. Formed from (α)-tri-nitro-toluene and naphthalene in alcoholic solution (Hepp). Needles.—$C_{10}H_8C_6H_2Me(NO_2)_3$. [100°]. Formed from (β)-tri-nitro-toluene and naphthalene. Yellowish needles (from alcohol). — $C_{10}H_8C_6H_2Me(NO_2)_3$. [89°]. Formed from (γ)-tri-nitro-toluene (H.).—$C_{10}H_8C_6H_2(NO_2)_3NH_2$. [169°]. Orange prisms. $C_{10}H_8C_6H_3(NO_2)_2OH$. Yellow needles (Gruner, *Z.* 1868, 213). — $C_{10}H_8C_6H_2(NO_2)_3OH$. [73°]. Formed from (β)-tri-nitro-phenol and naphthalene (Henriques, *A.* 215, 332). V. e. sol. alcohol.—$C_{10}H_8C_6H_2(NO_2)_3OH$. [100°]. Formed from naphthalene and (γ)-tri-nitro-phenol (Henriques). Golden needles (from alcohol), al. sol. alcohol.—$C_{10}H_8C_6HMe(NO_2)_2OH$. [106°]. From naphthalene and tri-nitro-o-cresol (Nölting a. Collin, *B.* 17, 271). Yellowish needles (from acetone).—$C_{10}H_8C_6HMe(NO_2)_3OH$. [127°]. From naphthalene and tri-nitro-*m*-cresol (Nölting a. Salia, *B.* 15, 1862).—$C_{10}H_8C_4H_2(NO_2)_2S$. [50°]. Yellow needles (from benzene). Formed from naphthalene and di-nitro-thiophene (Rosenberg, *B.* 17, 1778).

Picric acid compound $C_{10}H_8C_6H_2(NO_2)_3OH$. [149°]. Golden-yellow monoclinic needles, sol. alcohol, ether, and benzene. Slowly separated into its components by boiling water.

Naphthalene dichloride $C_{10}H_8Cl_2$. Formed by passing chlorine over naphthalene. $KClO_3$ and HCl may also be used (E. Fischer, *B.* 11, 735, 1411). Oil, miscible with ether, m. sol. alcohol. Begins slowly to decompose at 40°–50° into HCl and chloro-naphthalene. Alcoholic potash also converts it into chloro-naphthalene. Sodium or sodium-amalgam at 150° converts it into naphthalene.

Naphthalene tetrachloride $C_{10}H_8Cl_4$. Mol. w. 270. [182°]. R_∞ 105·35 in a 2·39 p.c. chloroform solution (Kanonnikoff). Formed by passing a rapid current of chlorine over naphthalene until the product, after having become liquid, thickens again, when it is washed with ether and crystallised from benzene. Formed also by treating naphthalene with a saturated solution of chlorine in $CHCl_3$ (Grimaux, *B.* 5, 222; Schwarzer, *B.* 10, 379), by chlorinating naphthalene in direct sunlight (Leeds a. Everhart, *A. C. J.* 2, 205), and by the action of $KClO_3$ and HCl on naphthalene (Fischer, *B.* 11, 735). Large monoclinic prisms, insol. water, sl. sol. alcohol, m. sol. ether, v. sol. benzene and petroleum. Sublimes at 225°–230°. Decomposed on distillation into HCl and (α)- and (β)-di-chloro-naphthalenes (Krafft a. Becker, *B.* 9, 1088). Alcoholic potash forms (α)- and some (ι)-di-chloro-naphthalene reconverted into naphthalene on digesting with iron (Zinin, *B.* 4, 288). Boiling dilute $AgNO_3$ slowly converts it into $C_{10}H_8(ClO)_2$ [196°]. When boiled with water it yields $C_{10}H_8Cl_2(OH)_2$, which crystallises in prisms (from ether) [156°], S. 3·3 at 100°, and is decomposed on distillation with HCl into water, HCl, and chloro-naphthol. Zn and H_2SO_4 reduce it to (α)-naphthol. It gives rise to $C_{10}H_8Cl_2(OAc)_2$ [131°] and $C_{10}H_8Cl_2(OBz)_2$ [150°].

The existence of an isomeric naphthalene tetra-chloride [118°] has been denied by Atterberg (*B.* 11, 1223; *cf.* Fischer, *B.* 11, 735).

Naphthalene tri-chloro-bromide $C_{10}H_8Cl_3Br$. Formed from the tetrachloride and bromine; after 48 hours the product is washed with warm alcohol and crystallised from ether. Prisms.

Naphthalene dihydride $C_{10}H_{10}$. [15·5°]. (212°). V.D. 4·7 (calc. 4·56). Occurs in heavy coal-tar oil (Berthelot, *Bl.* [2] 9, 288). Formed by heating naphthalene with conc. HIAq for a short time at 280° (Berthelot), and by reducing naphthalene dissolved in isoamyl alcohol with sodium (Bamberger a. Lodter, *B.* 20, 3073). Naphthalene dihydride is formed by distilling the bromide of naphthalene-tetra-hydride, or by heating it with alcoholic KOH (Graebe a. Guye, *B.* 16, 3032). It is likewise obtained by the action of sodium on an alcoholic solution of the nitrile of naphthoic acid (Bamberger a. Lodter, *B.* 20, 1704) and, as a by-product, when (β)-naphthylamine dissolved in isoamyl alcohol is reduced with sodium (Bamberger a. Müller, *B.* 21, 859).

Properties.—Tables. Does not combine with picric acid. By treatment with bromine dissolved in chloroform it is converted into the dibromide $C_{10}H_{10}Br_2$, which crystallises in thick colourless prisms, v. sol. alcohol and ether, and gives off HBr on heating (B. a. L.).

Naphthalene dihydride $C_{10}H_{10}$. (200°). Formed by distilling the dihydride of naphthoic acid with soda-lime (von Pechmann, *B.* 16, 517). Liquid.

Naphthalene tetrahydride $C_{10}H_{12}$ *i.e.*

$C_6H_4<\begin{matrix}CH_2.CH_2\\CH_2.CH_2\end{matrix}$. (205°) at 716 mm. S.G. $\frac{19}{}$ ·978. Formed by heating naphthalene with HIAq at 280° (Berthelot), with PH_4I at 180° (Baeyer, *A.* 155, 276), or by adding sodium to its solution in isoamyl alcohol (Bamberger a. Kitschelt, *B.* 23, 1561). Formed also by suspending the tetrahydride of (α)-naphthyl-hydrazine (1 pt.) in boiling water and allowing a solution of cupric sulphate (2 pts.) to drop in slowly; nitrogen is evolved, and the naphthalene tetrahydride may be separated from ppd. cuprous oxide by steam-distillation (Bamberger a. Bordt, *B.* 22, 631). Prepared by heating naphthalene (10 pts.) with HI (9 pts.) and amorphous phosphorus (3 pts.) for 8 hours at 220°–225°; the yield is good (8 pts.) (Graebe a. Guye, *B.* 16, 3028; *cf.* Graebe, *B.* 5, 678).

Properties.—Oil, slowly turning brown in air. Smells like naphthalene. Its solution in chloroform absorbs bromine, giving off HBr. It immediately decolourises an acid solution of $KMnO_4$, and is oxidised to $C_6H_4(CO_2H).CH_2.CH_2.CO_2H$ (Bamberger). The compound obtained by Baeyer and by Graebe yielded phthalic acid on oxidation by $KMnO_4$. and may perhaps not be identical with Bamberger's tetrahydride. When passed through a red-hot tube it is resolved into naphthalene and hydrogen.

Naphthalene hexahydride $C_{10}H_{14}$. *Hexahydronaphthalene.* (200°) (G. a. G.); (205° at 764 mm.) (A.). S.G. $\frac{0}{0}$ ·9419. C.E. (0°–26·3°) 000817 (Lossen a. Zander, *A.* 225, 112). R_∞ 71·15 (Nasini a. Bernheimer, *G.* 15, 93). S.V.

171·2 (Lossen, *A.* 254, 53). Formed by heating naphthalene with conc. HIAq and phosphorus (Wreden a. Znatovitch, *B.* 9, 278, 1606; *A.* 187, 164). Prepared by heating naphthalene (67 pts.) with HI (100 pts.) and amorphous phosphorus (30 pts.) for 10 hours at 240°–250° (Graebe a. Guye, *B.* 16, 3031); or by heating naphthalene (10 g.), amorphous phosphorus (3 g.), and HIAq (9 g., boiling at 127°) at 235° for 7½ hours (Agrestini, *G.* 12, 495). Liquid, which absorbs oxygen from the air. Does not combine with picric acid. Reacts with bromine, giving off HBr, and forming a product which is converted by alcoholic potash into $C_{10}H_9Br$ (270°).

Naphthalene octohydride $C_{10}H_{18}$. (185°–190°). S.G. $\frac{0}{0}$ ·910; $\frac{22}{0}$ ·892. Formed by heating naphthalene (5 g.) with HIAq (9 g. of S.G. 1·7) and red phosphorus for 15 hours at 260° (Guye, *Bn.* 2, 138). Liquid, smelling like oil of turpentine. Absorbs oxygen from the air.

References.—Tri-amido-, Amyl-, Bromo-, Bromo-iodo-, Bromo-nitro-, Chloro-, Chloro-nitro-, Iodo-, Iodo-nitro-, Nitro-, Di-oxy-, Methyl-, Ethyl-, Propyl-, Phenyl-, and Benzyl-naphthalenes. Also Naphthol, Naphthylamine, and Naphthylene-diamine.

Naphthalene *Peri*-**dicarboxylic acid** $C_{12}H_8O_4$ *i.e.* $C_{10}H_6(CO_2H)_2$ [1:1′]. *Naphthalic acid.* Mol. w. 216. [266°].

Formation.—1. By oxidising acenaphthene with $K_2Cr_2O_7$ and H_2SO_4 or HOAc (Behr a. Dorp, *B.* 6, 852; *A.* 172, 266; Anselm, *B.* 22, 869). — 2. By oxidising pyrene-ketone with $KMnO_4$ (Bamberger a. Philip, *B.* 19, 3040).—3. By saponification of its semi-nitrile $C_{10}H_6Cy.CO_2H$ which is formed by the action of cuprous cyanide upon diazotised *peri*-amido-naphthoic acid (Bamberger a. Philip, *B.* 20, 248).—4. By oxidising di-*exo*-oxy-acenaphthene with alkaline $KMnO_4$ (Ewan a. Cohen, *C. J.* 55, 580).

Properties.—Long silky hair-like needles (from alcohol); almost insol. water, sl. sol. ether. Split up into water and its anhydride by heating alone at 145°, by boiling with HOAc, or even by exposure over H_2SO_4 (Blumenthal, *B.* 7, 1092). Distillation with lime yields naphthalene. Yields a fluoresceïn on heating with resorcin.

Salts.—$(NH_4)_2A''EtOH$. Plates (from alcohol).—Na_2A''.—$K_2A''EtOH$. Plates.—BaA″aq: sparingly soluble white silvery plates—CaA″aq.—$Al_2A''_3aq$.

Di-methyl ether Me_2A''. [103°].

Anhydride 
$C_{10}H_6\left<\begin{matrix}CO\\CO\end{matrix}\right>O$. [266°]. Needles (from alcohol); sl. sol. alcohol and benzene. Not attacked by boiling HNO_3.

Imide $C_{10}H_6\left<\begin{matrix}CO\\CO\end{matrix}\right>NH$. [above 280°]. Formed by boiling the acid or its anhydride with aqueous ammonia. White needles. Sol. warm KOHAq. When $AgNO_3$ is added to its solution in alcoholic NH_3 there is formed a crystalline pp. $Ag_3C_{24}H_{15}N_3O_4$.

Naphthalene dicarboxylic acid $C_{10}H_6(CO_2H)_2$. [255°]. Formed by reducing di-oxy-naphthalene dicarboxylic acid [162°] with HIAq and amorphous phosphorus (Claus a. Meixner, *J. pr.* [2] 37, 8). Flocculent pp., insol. water and ether, sol. alcohol. Yields naphthalene on distillation with lime.—PbA″: greyish-white pp.

Naphthalene ‘α’-dicarboxylic acid $C_{10}H_6(CO_2H)_2$ [2:2′]. Obtained by digesting its nitrile with HClAq at 200° (Ebert a. Merz, *B.* 9, 606). Long needles (from alcohol). Melts far above 300°. V. sl. sol. boiling benzene, toluene, and HOAc, m. sol. boiling alcohol. Yields naphthalene on distillation with lime.—CaA″4aq: minute needles, sl. sol. water.—Ag_2A''.

Nitrile $C_{10}H_6(CN)_2$. [268°]. Formed by distilling naphthalene (α)-disulphonic acid with potassium cyanide. White needles (by sublimation), m. sol. boiling alcohol.

Naphthalene ‘β’-dicarboxylic acid $C_{10}H_6(CO_2H)_2$ [2:3′]. Obtained in the same way as the ‘α’-isomeride, from naphthalene ‘β’-disulphonic acid (E. a. M.). Short needles (from alcohol). Melts far above 300°. Almost insol. boiling benzene, toluene, and HOAc, m. sol. boiling alcohol.—K_2A'' ½aq: tufts of needles, v. e. sol. water.—CaA″ 3½aq: minute needles, almost insol. water.—Ag_2A''.

Nitrile $C_{10}H_6(CN)_2$. [297°]. Long needles (from HOAc). Almost insol. boiling ether, alcohol, and benzene.

Naphthalene (γ)-dicarboxylic acid $C_{10}H_6(CO_2H)_2$. Obtained from its nitrile, which is formed by distilling with KCy potassium bromo-naphthalene sulphonate (obtained by sulphonating (α)-bromo-naphthalene) (Darmstädter a. Wichelhaus, *A.* 152, 309; *Z.* [2] 5, 571). Small needles, v. sol. alcohol, insol. boiling water.—BaA″ 2aq: crystalline grains.

Nitrile $C_{10}H_6(CN)_2$. [204°]. Thin needles, sl. sol. alcohol and ether.

Naphthalene (δ)-dicarboxylic acid. *Nitrile* $C_{10}H_6(CN)_2$. [236°]. Obtained by distilling potassium bromo-naphthalene (α)-sulphonic acid with KCy (D. a. W.). Needles, v. sol. alcohol.

Naphthalene (ε)-dicarboxylic acid. *Nitrile* $C_{10}H_6(CN)_2$. [170°]. Obtained by distilling potassium bromo-naphthalene (β)-sulphonate with KCy (D. a. W.). Small needles, v. sol. alcohol

Naphthalene tri-carboxylic acid $C_{10}H_5(CO_2H)_3$. Obtained by quickly heating the tetra-carboxylic acid to 200°–250° (Bamberger a. Philip, *B.* 19, 3037).

Naphthalene tetra-carboxylic acid $C_{14}H_8O_8$ *i.e.* $C_{10}H_4(CO_2H)_4$ [1:1′:4:4′]. Formed by oxidising pyrenic acid with dilute $KMnO_4$ (Bamberger a. Philip, *B.* 19, 1998; 20, 368; *A.* 240, 182). Colourless glistening plates or needles; m. sol. hot HOAc and water, v. sl. sol. alcohol and benzene. Not attacked by HNO_3 even at 160°. Yields naphthalene on distillation with lime.—Ba_2A^{iv} (dried at 130°).—Ag_4A^{iv}.

Anhydride 
$C_{10}H_4\left(\left<\begin{matrix}CO\\CO\end{matrix}\right>O\right)_2$. Formed by heating the acid at 150°–170° (Bamberger a. Philip, *B.* 19, 3037). Needles (from HOAc).

Sublimes above 300°. Gives a fluoresceïn when heated with resorcin.

Imide  $C_{10}H_4\left(<\begin{matrix}CO\\CO\end{matrix}>NH\right)$. Formed by treating the anhydride with NH_3Aq. Needles and prisms. Sublimes in needles above 270°. V. sl. sol. alcohol, ether, and benzene. Aqueous NaOH colours it yellow (forming the Na salt), without dissolving it; on adding acids it turns white again.

Naphthalene dihydride dicarboxylic acid $C_{10}H_8(CO_2H)_2$. *Dihydronaphthalic acid.* Formed by reducing naphthalic acid with sodium-amalgam (Anselm, *B.* 22, 859). Colourless crystalline solid, v. sol. warm alcohol, sl. sol. ether and water. Reduces alkaline $KMnO_4$. It turns yellow at 150°–160°, froths at 199°, and changes to the anhydride, but is not melted at 275°.

Naphthalene tetrahydride dicarboxylic acid  $C_6H_4<\begin{matrix}CH_2.CH(CO_2H)\\CH_2.CH(CO_2H)\end{matrix}>$. [199°]. When an alcoholic solution of ethane tetra-carboxylic ether $C_2H_2(CO_2Et)_4$ (1 mol.) and NaOEt (2 mols.) is heated at 130° with di-ω-bromo-o-xylene $C_6H_4(CH_2Br)_2$ (1 mol.) there is formed naphthalene tetrahydride tetracarboxylic ether  $C_6H_4<\begin{matrix}CH_2.C(CO_2Et)_2\\CH_2.C(CO_2Et)_2\end{matrix}>$; and when this is saponified with alcoholic potash it loses CO_2 (2 mols.) yielding the dicarboxylic acid. The yield is 70 p.c. of the theoretical (Baeyer a. Perkin, *B.* 17, 448; *C. J.* 53, 11). Minute tables, sl. sol. cold, m. sol. hot, water; v. sol. chloroform, alcohol, ether, and acetone. Splits up at its melting-point into H_2O and its anhydride. On passing through a red-hot tube it yields naphthalene. —Ag_2A'': white crystalline pp. which yields the anhydride and naphthalene on dry distillation.

Anhydride  $C_6H_4<\begin{matrix}CH_2.CH.CO\\ \vert\\ CH_2.CH.CO\end{matrix}>O$. [184°]. Four-sided prisms (from ether) or needles (by sublimation); sl. sol. ether, m. sol. alcohol and chloroform, insol. cold water. Slowly re-converted into the acid by hot water.

Naphthalene tetra-hydride tetra-carboxylic acid  $C_6H_4<\begin{matrix}CH_2.C(CO_2H)_2\\CH_2.C(CO_2H)_2\end{matrix}>$. *Tetrahydronaphthalene tetracarboxylic acid.* The ether is formed by heating an alcoholic solution of sodio-chloro-malonic ether $CNaCl(CO_2Et)_2$ (2 mols.) with *o*-xylylene bromide (1 mol.), reducing the resulting $C_6H_4(CH_2.CCl(CO_2Et)_2)_2$ by means of zinc-dust and HOAc to *o*-xylylene-di-malonic ether $C_6H_4(CH_2.CH(CO_2Et)_2)_2$, and treating the sodium derivative $C_6H_4(CH_2.CNa(CO_2Et)_2)_2$ with an ethereal solution of iodine (Baeyer a. Perkin, jun., *B.* 17, 448). The ether may also be obtained from $C_6H_4(CH_2Br)_2$, sodium ethylate and $C_2H_2(CO_2Et)_4$ (*v. supra*). The free acid, which may be obtained by careful saponification of the ether with alcoholic potash, is a syrup which splits up at 185° into CO_2 and the dicarboxylic acid described above.

Reference.—BROMO-NAPHTHALENE DICARBOXYLIC ACID.

DI-NAPHTHALENE OXIDE *v.* DINAPHTHYLENE OXIDE.

NAPHTHALENE DI-OXIM *v. Di-oxim* of NAPHTHOQUINONE.

NAPHTHALENE - DIPHENYL AZAMMONIUM HYDRATE *v.* AZAMMONIUM COMPOUNDS.

NAPHTHALENE PHOSPHINIC ACID $C_{10}H_7.P(OH)_2$. *Naphthyl-phosphorous acid.* [126°]. S.G. 1·377 (Schröder, *B.* 12, 564). Formed by the action of water on its chloride. Aggregates of small needles, sl. sol. cold water, almost insol. HClAq. Melts under water. Reduces silver solution. It is accompanied by an acid $(C_{10}H_7)_2PO.OH$ [204°] which is insol. water.

Chloride $C_{10}H_7PCl_2$. (above 360°). Formed by heating mercuric dinaphthyl $Hg(C_{10}H_7)_2$ with PCl_3 at 190° for several hours (Kelbe, *B.* 9, 1051; 11, 1499). Liquid. Combines with chlorine forming $C_{10}H_7PCl_4$.

NAPHTHALENE PHOSPHONIC ACID $C_{10}H_7.PO(OH)_2$. [190°]. S.G. 1·440. Formed by the action of water on its tetrachloride (Kelbe). Long needles, v. sol. hot, sl. sol. cold, water. When strongly heated it decomposes, with separation of carbon, into naphthalene and metaphosphoric acid.—Ag_2A'': white pp.

Chloride $C_{10}H_7PCl_4$. Formed from the compound $C_{10}H_7PCl_2$ and chlorine.

NAPHTHALENE-STYRENE *v.* NAPHTHYL-ETHYLENE.

NAPHTHALENE (α)-SULPHINIC ACID $C_{10}H_7SO_2H$. Formed by digesting a solution of the chloride of naphthalene (α)-sulphonic acid in ether with sodium amalgam (Gessner, *B.* 9, 1500; *cf.* Otto a. Mories, *B.* 6, 860). White scales, v. sol. water, sl. sol. HClAq, m. sol. alcohol, sl. sol. ether. Decomposed by HClAq at 180° into naphthalene and SO_2.

Salts.—$KA'\frac{1}{2}aq$: glistening scales. —$BaA'_2 1\frac{1}{2}aq$. Slender needles. S. ·5 at 14°; 2 at 100°.—$PbA'_2 aq$: long branched needles. —AgA′. Soluble plates, not decomposed at 200°.

Naphthalene (β)-sulphinic acid $C_{10}H_7.SO_2H$. [105°]. Formed in the same way as the preceding isomeride from naphthalene (β)-sulphonic acid, and ppd. by adding HCl to a solution of the Na salt as a white crystalline powder, m. sol. alcohol, ether, and water, almost insol. HClAq. Readily decomposed by HClAq at 150° into naphthalene and SO_2.

Salts.—$KA'\frac{1}{2}aq$: scales.—BaA'_2: glistening needles. S. 4·7 at 15°; 6·25 at 100°.—$CaA'_2 3aq$: white crystalline solid, v. sol. water and alcohol.—$MgA'_2 6aq$: scales, more sol. alcohol than water.

References.—BROMO- and CHLORO-NAPHTHALENE SULPHONIC ACID.

NAPHTHALENE (α)-SULPHONIC ACID $C_{10}H_7.SO_3H$. Formed, together with the (β)-isomeride, by dissolving naphthalene in H_2SO_4. At 160°–170° the chief product is the (β)-acid, but at 80°–100° the product consists mainly of the (α)-acid (Merz a. Weith, *B.* 3, 195; *cf.* Faraday, *P.* 7, 104; Berzelius, *P.* 44, 377; Liebig a. Wöhler, *P.* 24, 169; *A.* 37, 197). Naphthalene is converted by $Cl.SO_3H$ (1 mol.) into a mixture of the (α)- and (β)- sulphonic acids (Armstrong, *C. J.* 24, 173). It may be separated from the (β)-isomeride by means of the calcium or lead salts. Crystalline and deliquescent, v. e. sol. water, sol. alcohol, sl. sol. ether. Partially converted into the (β)-isomeride by heating with H_2SO_4 at 100°, more completely at higher temperatures. Decomposed into naphthalene and H_2SO_4 by heating with HClAq at 200°. Oxidised by $KMnO_4$ in acid solution to phthalic acid (Beilstein a. Kurbatoff, *C. C.* 1881, 359; *A.* 202, 216). Alkaline $KMnO_4$ yields $C_6H_4(CO_2H).CO.CO_2H$ (Henriques, *B.* 21, 1607) and phthalic acid. Bromine forms dibromo-naphthalene and bromo-naphthalene sulphonic acid.

Salts.—$KA'\frac{1}{2}aq$. Plates (from alcohol). S. 7·7 at 11°.—$CaA'_2 2aq$. Plates (slowly decomposed at 80°). S. 6 at 11°.—BaA'_2aq. Plates. S. 1·15 at 10° (M.); 1·13 at 15°; 4·76 at 100° (Regnault, *J. pr.* 12, 99).—$PbA'_2 3aq$. Plates. S. 3·7 at 10°.—$Pb_2OA'_2$.—AgA'. S. 10·3 at 10°.

Ethyl ether EtA'. Formed by boiling the chloride (1 mol.) with alcohol (2 mols.) (Kimberly, *A.* 114, 133). Viscid liquid, which slowly solidifies. Insol. water, miscible with alcohol and ether. Decomposed on distillation, giving off SO_2 and naphthalene. Aqueous or alcoholic potash merely saponifies it. Water at 150° resolves it into alcohol, naphthalene, and H_2SO_4. Converted by PCl_5 at 160° into (α)-chloro-naphthalene and $SOCl_2$ (Carius, *A.* 114, 145).

Chloride $C_{10}H_7.SO_3Cl$. [66°]. Glistening plates (from ether), v. sol. ether, CS_2, and benzene (Maikopar, *Z.* 1869, 710; Kimberly, *A.* 114, 129). On passing chlorine into a solution in CS_2 there is formed the tetrachloride $C_{10}H_7Cl_4.SO_2Cl$, a thick liquid, sol. CS_2, chloroform, benzene, and ether, and converted by alcoholic potash into di-chloro-naphthalene sulphonic chloride (Widmann, *B.* 12, 2228).

Amide $C_{10}H_7.SO_2NH_2$. [150°]. Prepared by warming the chloride with conc. NH_3Aq. Sol. water, v. sol. alcohol and ether. Its alcoholic solution gives with $AgNO_3$ a crystalline pp. $C_{10}H_7.SO_2NHAg$, v. sol. alcohol and ether, quickly blackening in light.

Benzoyl derivative of the amide $C_{10}H_7.SO_2NHBz$. [195°]. Formed by heating the amide with BzCl (Kimberly). Minute four-sided prisms (from alcohol) (Wolkoff, *Z.* 1871, 422; *B.* 5, 142). Insol. water, m. sol. alcohol and ether. Decomposed by boiling KOHAq into benzoic acid, NH_3, and naphthalene sulphonic acid. PCl_5 converts it into $C_{10}H_7.SO_2.N:CCl.C_6H_5$, which crystallises from ether in large four-sided plates [94°] and is re-converted by boiling water or alcohol into $C_{10}H_7.SO_2.NH.COC_6H_5$, and by ammonium carbonate into crystalline $C_{10}H_7.SO_2.N:C(NH_2)C_6H_5$. Behaves like an acid, decomposing carbonates, and forming the salts. —$C_{10}H_7.SO_2.NKBz$: prisms, v. sol. water and alcohol. — CaA'_2aq: needles. — BaA'_2: slender needles, sl. sol. water.—AgA': minute needles.

Anilide $C_{10}H_7.SO_3.NHPh$. [112°]. Needles (Carleson, *Bl.* [2] 27, 360).

(α)-*Naphthalide* $C_{10}H_7.SO_2.NHC_{10}H_7$. [82°]. Small needles (C.).

Naphthalene (β)-sulphonic acid $C_{10}H_7.SO_3H$. Produced by the action of H_2SO_4 upon phenyl (α)-naphthyl ketone, the isomeric change resulting from the heat evolved in the reaction (Elbs a. Steinike, *B.* 19, 1966). Prepared by heating naphthalene (500 g.) with H_2SO_4 (400 g.) for 8 hours at 160° and purifying the acid by means of the Ca salt (Merz a. Weith, *B.* 3, 196). Non-deliquescent crystals. Not decomposed by dilute HClAq at 200°. Split up into naphthalene and H_2SO_4 by distilling with dilute H_2SO_4 at 135° in a current of superheated steam (Armstrong a. Miller, *C. J.* 45, 148). Oxidised by alkaline $KMnO_4$ to $C_6H_4(CO_2H).CO.CO_2H$ (Henriques, *B.* 21, 1607). $KMnO_4$ in neutral or acid solution yields phthalic acid (Beilstein a. Kurbatoff, *C. C.* 1881, 359; *A.* 202, 215). CrO_3 and dilute H_2SO_4 yield naphthoquinone sulphonic acid (B. a. K.). The Ca salt yields phthalic acid on oxidation by CrO_2. Bromine-water forms bromo-naphthalene sulphonic acid.

Salts.—$KA'\frac{1}{2}aq$. Plates (from water) or needles (from dilute alcohol). S. 6·6 at 10°. S. (85 p.c. alcohol) ·9.—CaA'_2. Plates. S. 1·3 at 10°. — BaA'_2aq. Plates. S. ·345 at 10°.—$PbA'_2 1\frac{1}{2}aq$. Scales. S. ·9 at 10°.

Chloride $C_{10}H_7.SO_2Cl$. [76°]. Plates; less soluble in ether than the (α)-isomeride (Maikopar). Reduced by HI to (β)-di-naphthyl di-sulphide [139°] (Cleve, *B.* 21, 1100). Combines with chlorine (dissolved in CS_2) forming a tetrachloride $C_{10}H_7Cl_4.SO_2Cl$, which separates from chloroform in colourless cubes [131°]; v. sol. chloroform, CS_2, and hot HOAc, insol. water (Widmann, *B.* 12, 959). The tetrachloride is converted by boiling alcoholic KOH into di-chloro-naphthalene (β)-sulphonic acid

Amide $C_{10}H_7.SO_2NH_2$. [212°] (Cleve, *Bl.* [2] 25, 258). Small thin plates (from alcohol); sl. sol. water and ether.

Ethylamide $C_{10}H_7.SO_2NHEt$. [82·5°] (Carleson, *Bl.* [2] 27, 360).

Anilide $C_{10}H_7.SO_2NHPh$. [132°]. Needles.

(α)-*Naphthalide* $C_{10}H_7.SO_2.NHC_{10}H_7$. [177·5°]. Needles.

Naphthalene tetrahydride sulphonic acid $C_{10}H_{11}.SO_3H$. Formed by heating naphthalene tetrahydride with H_2SO_4 for 3 hours at 40° (Graebe a. Guye, *B.* 16, 3030; Bamberger a. Kitschelt, *B.* 23, 1565). Crystals; v. sol. water and alcohol. Decomposed by distillation with dilute H_2SO_4 and a current of superheated steam at 175°, or by dilute H_3PO_4 at 130° (Friedel a. Crafts, *Bl.* [2] 42, 66; *C. R.* 109, 95).—$NaA'2aq$. Tables; v. sol. water.—$BaA'_2 2aq$. Tables; sol. hot alcohol, sl. sol. cold water.

Naphthalene 'α'-disulphonic acid $C_{10}H_6(SO_3H)_2$ [2:2]. Formed, together with about an equal quantity of the (β)-isomeride and some of the (δ)-isomeride, by heating naphthalene (1 pt.) with H_2SO_4 (5 pts.) for 4 hours at 160° (Ebert a. Merz, *B.* 9, 592; Armstrong, *B.* 15, 204; cf. Berzelius, *A. Ch.* [2] 65, 290; Laurent, *Compt. Chim.* 1849, 390). The acids may be partially separated by their Ca salts, that of the (β)- acid crystallising out first, while that of the (α)- acid is the most soluble. The potassium salt of the (α)- acid is more soluble than that of the (β)- acid, and less soluble than that of the (δ)-acid. Long, very deliquescent needles; sl. sol. cold conc. HClAq. Gives di-oxy-naphthalene [186°] on fusion with KOH (*cf.* Griess, *B.* 13, 1959; Dusart, *C. R.* 64, 859; Darmstädter a. Wichelhaus, *A.* 152, 306). Water at 200° splits it up into naphthalene and H_2SO_4. Fusion with NaOH forms (β)-naphthol (δ)-sulphonic acid $C_{10}H_6(OH)SO_3H$ (Weinberg, *B.* 20, 2906). PBr_5 forms (δ)-di-bromo-naphthalene. Yields di-chloro-naphthalene [114°].

Salts.—$K_2A''2aq$. Transparent needles (from hot saturated solutions). S. (of K_2A'') 71 at 18°.—$Na_2A''6aq$. Glistening needles. S. (of Na_2A'') 45·5 at 18°.—$CaA''6aq$. S. 16 at 18°.—$CaA''3aq$ (from a rapidly-cooled hot saturated solution).—BaA″2aq. Long, broad needles. S. 1·2 at 19°.—PbA″2aq. Long needles; sol. water.

Chloride $C_{10}H_6(SO_2Cl)_2$. [158°] (E. a. M.); [162°] (A.). Obtained by heating the K salt with PCl_5 at 140°. Plates (from benzene), or needles (from ether). S. (benzene) 13·3 at 14°.

Amide $C_{10}H_6(SO_2NH_2)_2$. [243°]. Needles; m. sol. hot NH_3Aq and alcohol.

Naphthalene 'β'-disulphonic acid $C_{10}H_6(SO_3H)_2$. [2:3′]? Almost the sole product obtained by heating a mixture of naphthalene (1 pt.) and H_2SO_4 (5 pts.) for 24 hours at 180° (Ebert a. Merz). Formed also from its 'α'-isomeride by prolonged heating with H_2SO_4 at 180°. Somewhat deliquescent plates. Gives (β)-naphthol 'β' sulphonic acid and (β)-di-oxy-naphthalene on fusion with potash. Yields $C_{10}H_6Cl_2$ [135°].

Salts.—$Na_2A''aq$: aggregates of minute prisms. S. (of Na_2A'') 1·2 at 19°.—K_2A''. Bushy groups of needles. S. 5·2 at 18°.—CaA″aq. S. 6·2 at 18°. When once dry this salt dissolves in water with great difficulty.—BaA″aq.—PbA″aq.

Chloride $C_{10}H_6(SO_2Cl)_2$. [226°]. S. (benzene) ·45 at 14°. Tufts of small needles or thin plates; v. sl. sol. HOAc (difference from the (α)-isomeride), v. sol. benzene.

Amide $C_{10}H_6(SO_2NH_2)_2$. Small needles, v. sl. sol. NH_3Aq, almost insol. alcohol, ether, benzene, and toluene. Not melted at 305°.

Naphthalene (γ)-disulphonic acid $C_{10}H_6(SO_3H)_2$ [1:4′]. Formed by treating naphthalene (1 mol.) with $ClSO_3H$ (2 mols.) below 100° and also by sulphonating naphthalene with SO_3 (Armstrong, *B.* 15, 204; Armstrong a. Wynne, *C. J. Proc.* 2, 230; 3, 42). Its Pb, Ca, and Ba salts resemble those of the (β)-acid, dissolving very sluggishly in water. On fusion with potash it yields di-oxy-naphthalene [260°].—Na_2A'' 2aq.—K_2A'' 2aq: plates, less soluble than the corresponding salt of the 'α'-acid.

Chloride $C_{10}H_6(SO_2Cl)_2$. [184°]. Prisms (from benzene). Yields (γ)-di-chloro-naphthalene [107°] on treatment with PCl_5.

Naphthalene (δ)-disulphonic acid $C_{10}H_6(SO_3H)_2$ [1:3′]. *Also called* (γ). Occurs in small quantity in the product of sulphonation of naphthalene by H_2SO_4 at 160° (Armstrong, *B.* 15, 204). Formed by treating potassium naphthalene (β)-sulphonate with $ClSO_3H$ (Armstrong a. Wynne, *C. J. Proc.* 2, 230).—BaA_2'4aq.—NaA′ 7aq. Formed also by heating naphthalene (β)-sulphonic acid with fuming H_2SO_4 at 100° (Ewer a. Pick, *G. P.* 45,229 [1887]; Armstrong, *C. J. Proc.* 4, 10). Long needles. Gives dioxy-naphthalene [135·5°] on fusion with potash. Yields $C_{10}H_6Cl_2$ [49°]. The potassium salt is more soluble than that of the (α)- or (β)-acid. — K_2A''aq. — Na_2A'' 4aq. — BaA″ 4aq.—CaA″ 4aq.—PbA″$3\frac{1}{2}$aq.

Chloride $C_{10}H_6(SO_2Cl)_2$. [125°]. Small prisms (from benzene). On treatment with PCl_5 it yields di-chloro-naphthalene [59°].

Naphthalene (1, 2′)-disulphonic acid. Formed from (α)-naphthylamine disulphonic acid (Armstrong a. Wynne, *C. J. Proc.* 5, 136). Yields $C_{10}H_6Cl_2$ [62·5°].—K_2A''aq.

Chloride [122·5°].

Naphthalene (1, 3)-disulphonic acid. Obtained from (1′, 1, 3) or (2, 2′, 4′) naphthylamine disulphonic acid by eliminating NH_2 (Armstrong a. Wynne, *C. J. Proc.* 5, 13, 129). Yields $C_{10}H_6Cl_2$ [61°].—K_2A'' 2aq.—BaA″ 4aq.

Chloride [137°].

Naphthalene hexahydride (α)-di-sulphonic acid $C_{10}H_{12}(SO_3H)_2$. Formed by heating naphthalene hexahydride with H_2SO_4 and SO_3, and separated from the (β)-isomeride by means of the K salt (Agrestini, *G.* 12, 495).—K_2A'' (dried at 105°). Nodules, sol. alcohol.

Naphthalene hexahydride (β)-sulphonic acid $C_{10}H_{12}(SO_3H)_2$. Formed as above.—K_2A'' $1\frac{1}{2}$aq. Insol. alcohol.

Naphthalene trisulphonic acid $C_{10}H_5(SO_3H)_3$ [2:4:2′]. Formed from naphthalene and $ClSO_3H$ (Wynne, *C. J. Proc.* 3, 146). Yields $C_{10}H_5Cl_3$ [194°].—Na_3A'''5aq.

Naphthalene tetra-sulphonic acid $C_{10}H_4(SO_3H)_4$. Formed by heating naphthalene with H_2SO_4 and P_2O_5 for three or four hours at 260° (Stenhofer, *B.* 8, 1486; *M.* 3, 111). Two isomeric acids are formed in the process, and when a solution of their Ba salts is slowly evaporated at 30° to 35° the salt of the acid here described crystallises out in striated prisms. Prisms (containing 4aq), v. e. sol. water, sl. sol. alcohol, insol. ether. Decomposes above 170°.

Salts.—K_4A^{iv}2aq: non-deliquescent needles.—Na_4A^{iv} 2aq (at 100°).—Na_4A^{iv} 10aq: very deliquescent prisms. — Ba_2A^{iv} *x*aq: prisms. — Pb_2A^{iv} 6aq: crystalline pp.—Cu_2A^{iv} 12aq: blue prisms.—Ag_4A^{iv} $2\frac{1}{2}$aq: very soluble needles.

References.—Bromo-, Chloro-, Iodo- and Nitro- naphthalene sulphonic acids.

NAPHTHAL-FLUORESCEÏN $C_{24}H_{14}O_5$ *i.e.* $O\begin{matrix}<C_6H_3(OH)\\<C_6H_3(OH)\end{matrix}>C\begin{matrix}<O\text{———}\\<C_{10}H_6\end{matrix}>CO$. [308°]. Formed by heating naphthalic anhydride and resorcin at 250° (Terrisse, *A.* 227, 136). Yellow rhombic prisms. Its alkaline solution is red, with splendid green fluorescence.

Acetyl derivative $C_{24}H_{13}AcO_5$ [191°] $C_{24}H_{13}AcO_5aq$. [120°]. Needles (from acetone). Insol. alkalis, but saponified slowly. By treatment with PCl_5 it is converted into the chloride $C_{24}H_{12}O_2Cl_2$, which crystallises in scales, sol. chloroform, acetone, or glacial acetic acid; hardly sol. benzene, ether, or alcohol.

Naphthal-eosin $C_{24}H_{10}Br_4O_6$. [above 310°]. Formed by adding bromine to an alcoholic solution of naphthal-fluoresceïn. Its alkaline solutions are orange, with yellow fluorescence, and dye silk scarlet.

NAPHTHALIC ACID *v.* Naphthalene dicarboxylic acid.

NAPHTHALIDES. Alkoyl derivatives of Naphthylamine (*q. v.*).

NAPHTHALIDINE SULPHONIC ACID *v.* (1,4′)-Naphthylamine sulphonic acid.

NAPHTHALIN *v.* Naphthalene.

(β)-NAPHTHAMIDINE $C_{10}H_7.C(NH).NH_2$. White crystalline mass, obtained from its hydrochloride, which is prepared by the action of alcoholic NH_3 at 50° to 60° upon (β)-naphthimido-ether $C_{10}H_7.C(NH).OEt$ (Pinner a. Klein, *B.* 11, 1486).—B′HCl. [226°]. Needles.

(α)-NAPHTHAMIDOXIM $C_{11}H_{10}N_2O$ *i.e.* $C_{10}H_7.C(NOH).NH_2$. [149°]. Obtained by mixing the nitrile of (α)-naphthoic acid with hydroxylamine hydrochloride, Na_2CO_3, and alcohol (Ekstrand, *B.* 20, 223). Plates (from dilute alcohol), v. sol. alcohol, insol. ligroïn. On boiling with Ac_2O it yields $C_{10}H_7.C<\genfrac{}{}{0pt}{}{NO}{N}>CMe$. [36°]. $ClCO_2Et$ yields $C_{10}H_7.C(NO.CO_2Et).NH_2$. [111°]. $COCl_2$ forms $C_{10}H_7.C<\genfrac{}{}{0pt}{}{N.O}{NH}>CO$. [189°] (Richter, *B.* 22, 2458).—B'HCl. [160°]. Needles.—$B'_2H_2PtCl_6$: yellow prismatic needles.

Acetyl derivative $C_{10}H_7C(NOH).NHAc$. [129°] (Richter, *B.* 20, 227). White needles, insol. water, v. sol. alcohol and ether.

(α)-*Naphthoyl derivative* $C_{22}H_{16}N_2O_2$ *i.e.* $C_{10}H_7.C(NOH).NH.CO.C_{10}H_7$. [228°]. Needles; almost insol. HClAq.

(β)-Naphthamidoxim $C_{10}H_7.C(NOH).NH_2$. [150°]. Formed from (β)-naphthonitrile and alcoholic hydroxylamine (Ekstrand). Scales, decomposed by boiling water. On heating with Ac_2O it yields $C_{10}H_7.C<\genfrac{}{}{0pt}{}{N.O}{N}>CMe$ [86°], which is also formed by boiling the acetyl derivative with water. (β)-Naphthoyl chloride forms the corresponding azoxim $C_{10}H_7<\genfrac{}{}{0pt}{}{N.O}{N}>C.C_{10}H_7$. [175°]. Acetic aldehyde yields the compound $C_{10}H_7.C<\genfrac{}{}{0pt}{}{N.O}{NH}>CH.CH_3$ [122°] crystallising in needles. Cyanogen passed into an alcoholic solution of (β)-naphthamidoxim forms the compound $C_{10}H_7.C(NOH).NH.C(NH).CN$ [119°] (Brühl, *B.* 23, 1463). $ClCO_2Et$ in chloroform forms $C_{10}H_7.C(NO.CO_2Et).NH_2$ crystallising in needles [121°]. $COCl_2$ yields white felted needles of $C_{10}H_7.C<\genfrac{}{}{0pt}{}{N.O}{NH}>CO$ [216°]. Boiling acetoacetic ether forms $C_{10}H_7.C<\genfrac{}{}{0pt}{}{N.O}{N}>C.CH_2.CO.CH_3$ crystallising in plates [109°].

Salt.—B'HCl. [178°]. Needles, v. sol. water.

Acetyl derivative $C_{10}H_7.C(NOH).NHAc$. [154°]. Faintly yellow needles, insol. water, sl. sol. cold alcohol and ether.

Benzoyl derivative $C_{10}H_7.C(NOH).NHBz$. [179°]. Silky felted needles (from alcohol), insol. water, sl. sol. cold alcohol. On boiling with water it yields $C_{10}H_7.C<\genfrac{}{}{0pt}{}{N.O}{N}>C.C_6H_5$. [116°].

Ethyl ether $C_{10}H_7.C(NOEt).NH_2$. [75°]. Formed from (β)-naphthamidoxim, NaOEt, and EtI at 100° (Richter, *B.* 20, 227; 22, 2455). Shining felted needles, v. sl. sol. water, v. sol. alcohol, ether, chloroform, and ligroïn, sol. HClAq, insol. NaOHAq.

NAPHTHANISOL *v. Methyl ether* of NAPHTHOL.

NAPHTHANTHRACENE $C_{16}H_{12}$ *i.e.*

$C_6H_4<\genfrac{}{}{0pt}{}{CH.C}{CH.C.CH:CH}>C_6H_4$. [141°]. Formed by boiling naphthanthraquinone with zinc-dust and aqueous NH_3Aq till the red colour has disappeared, extracting the residue with alcohol and adding HOAc to the extract (Elbs, *B.* 19, 2211). Large colourless serrated plates with powerful green-yellow fluorescence. May be sublimed. — Picrate $C_{16}H_{12}2C_6H_2(NO_2)_3OH$. [133°]. Red needles (from benzene), decomposed by alcohol.

NAPHTHANTHRAQUINONE $C_{18}H_{10}O_2$ *i.e.* $C_6H_4<\genfrac{}{}{0pt}{}{CO}{CO}>C_{10}H_6$. [168°]. Formed by heating naphthoyl-*o*-benzoic acid with conc. H_2SO_4 (Elbs, *B.* 19, 2209). Glittering deep yellow grains or prisms, sl. sol. alcohol and ether, m. sol. acetone, HOAc, and EtOAc, v. sol. chloroform and benzene, insol. petroleum-ether. May be sublimed as needles arranged in leaflets. Conc. H_2SO_4 forms a brown solution. Sodium-amalgam added to its alcoholic solution forms a dark-violet zone (like anthraquinone), but on warming the liquid becomes red (anthraquinone gives a green liquid). It does not combine with picric acid.

NAPHTHAQUINOLINE *v.* NAPHTHOQUINOLINE.

NAPHTHAQUINONE *v.* NAPHTHOQUINONE.

NAPHTHAZARIN *v.* DI-OXY-NAPHTHOQUINONE.

(αβ)-NAPHTHAZINE $C_{20}H_{12}N_2$ *i.e.*

$C_6H_4<\genfrac{}{}{0pt}{}{CH:CH.C.N.C}{C.N.C.CH:CH}>C_6H_4$. *Naphthase.* [275°].

Formation.—1. By heating (α)-nitro-naphthalene to redness with lime (Laurent), or zinc-dust (Doerr, *B.* 3, 291; 10, 772; Klobulowski, *B.* 10, 570).—2. By the action of (β)-naphthoquinone in HOAc solution upon naphthylene o-diamine (Witt, *B.* 19, 2795).—3. By fusing (β)-naphthoquinone with ammonium acetate, the yield being small (Japp, *C. J.* 51, 100).—4. By heating (α)-chloro-(β)-naphthylamine with lime (Cleve, *B.* 20, 1991).

Properties.—Yellow needles; sl. sol. alcohol and benzene, with pale violet fluorescence, m. sol. phenol and aniline. Conc. H_2SO_4 forms a violet solution becoming orange-yellow on dilution, and finally colourless, depositing the naphthazine. Bromine in presence of iodine yields $C_{20}H_5Br_5N_2$ melting above 320°.

(ββ)-Naphthazine

$C_6H_4<\genfrac{}{}{0pt}{}{CH:CH.C.N.C.CH:CH}{C.N.C}>C_6H_4$. [243°].

Formed by adding a strongly acid solution of diazobenzene chloride to a warm solution of (ββ)-di-naphthylamine (Matthes, *B.* 23, 1333). Woolly bunches of long yellow needles (from hot alcohol or hot HOAc). Its solutions in alcohol and benzene exhibit a blue fluorescence; its solution in HOAc shows green fluorescence.

NAPHTHENES C_nH_{2n}. A class of hydrocarbon, forming the principal constituents of Caucasian petroleum; they are isomeric with the olefines, from which they differ in behaving as saturated compounds. They resemble the paraffins in yielding by substitution chloro-derivatives, readily dissociated into hydrochloric acid and a hydrocarbon of formula C_nH_{2n-2}. On oxidation they are converted into hydrocarbons poorer in hydrogen and oxygenated products, thus resembling naphthalene.

As regards their constitution the carbon atoms are arranged in a closed chain, and the determination of the specific refractive energy of the members of the series appears to show that they contain no olefinoid combination of carbon atoms. They are probably hexahydrides of the aromatic hydrocarbons.

They also probably occur in petroleum from Hanover, Galicia, Borislau, and Burmah, but have been mistaken by former observers for the olefines. They are also formed in the dry distillation of resin (*cf.* Renard, *C. R.* 95, 141, 243).

The following are the physical properties of some of the members examined:

	S.G. $\frac{16-18}{4}$	μ_α	μ_β	μ_γ	μ_D	R_α
Decanaphthene . . .	·7808	1·43066	1·43863	1·4427	1·433	77·2
Endecanaphthene . . .	·8019	1·43883	1·4466	1·45156	1·441	84·2
Dodecanaphthene . . .	·812	1·4438	1·45173	1·45646	1·44606	91·8
Tetradecanaphthene . .	·8215	1·44913	1·45706	1·4619	1·4514	107·1
Pentadecanaphthene . .	·8290	1·4544	1·46136	1·4661	1·4544	114·7

The naphthenes are obtained from the following fractions of Caucasian petroleum:

	Fraction
Octonaphthene C_8H_{16} . .	116°–120°
Nonaphthene C_9H_{18} . . .	135°–140°
Decanaphthene $C_{10}H_{20}$ . .	155°–165°
Endecanaphthene $C_{11}H_{22}$ . .	180°–185°
Dodecanaphthene $C_{12}H_{24}$ . .	196°–197°
Tetradecanaphthene $C_{14}H_{28}$.	240°–241°
Pentadecanaphthene $C_{15}H_{30}$.	246°–248°

(Markownikoff a. Oglobine, *A. Ch.* [6] 2, 446).

Some of these hydrocarbons (*e.g.* octonaphthene and nonaphthene) occur in two isomeric forms. Octonaphthene on treatment with H_2SO_4 and HNO_3 yields tri-nitro-*m*-xylene, and it is therefore probably *m*-xylene hexahydride (Markownikoff a. Spady, *B.* 20, 1851). Nonaphthene (136°), S.G. $\frac{20}{0}$ ·7667 is identical with pseudo-cumene hexahydride, for it yields some tri-nitro-ψ-cumene on nitration and ψ-cumene sulphonic acid with excess of H_2SO_4 (Konovaloff, *C. C.* 1887, 1133; *J. R.* 22, 4, 118). Heptanaphthene C_7H_{14} also occurs in Caucasian petroleum and boils at 101° (Milkowsky, *Bl.* [2] 45, 182).

Hexanaphthene carboxylic acid $C_6H_{11}.CO_2H$. *Hexahydro-benzoic acid?* (216°). S.G. $\frac{18·4}{18·4}$ ·9503. Obtained from the oils of Baku by extracting with caustic soda, and purified by fractional distillation of its methyl ether (Aschau, *B.* 23, 867). Thick colourless oil, smelling like valeric acid. Not solid at −10°. Not attacked by bromine in the cold. HNO_3 and $KMnO_4$ act slowly upon it. It slowly expels HCl from $CaCl_2$. Conc. H_2SO_4 dissolves it, and, on warming, decomposes it. Phosphoric acid decomposes it gradually in the cold.

Salts.—KA′. Very hygroscopic soap-like mass, gradually becoming crystalline; v. sol. water and alcohol.—NaA′. Flat hygroscopic prisms.—$CaA'_2$4aq: long pointed needles. A saturated solution becomes milky on heating and clear again on cooling.—BaA'_2. Large thin plates, v. sol. alcohol, m. sol. water.—BaA'_2*x*aq. Amorphous.—CdA'_2. Pearly plates, sl. sol. cold water.—AgA′. Curdy pp.

Methyl ether MeA′. (167°). S.G. $\frac{18·4}{18·4}$ ·9055. Colourless liquid with sickly odour.

Chloride $C_6H_{11}.COCl$. (168°). Slowly decomposed by water.

Amide $C_6H_{11}.CONH_2$. [123·5°]. Melts under water. Extremely thin pearly plates, m. sol. water, v. sol. other solvents.

Anilide $C_6H_{11}.CO.NHPh$. [94°]. Long elastic needles.

NAPHTHENYL-AMIDINE *v.* NAPHTHAMIDINE.

NAPHTHIDINE *v.* DI-AMIDO-DINAPHTHYL.

NAPHTHIL-BENZOIN *v.* BENZOIN.

(β)-NAPHTH-IMIDO-ACETATE $C_{13}H_{11}NO_2$ *i.e.* $C_{10}H_7.C(NH)(OAc)$. [152°]. Prepared by boiling naphth-imido-isobutyl ether with Ac_2O (Pinner a. Klein, *B.* 11, 1487). White needles.

(β)-NAPHTH-IMIDO-ISOBUTYL ETHER $C_{15}H_{17}NO$ *i.e.* $C_{10}H_7.C(NH).OC_4H_9$. [38°]. Prepared by the action of gaseous HCl on a solution of (β)-naphthonitrile $C_{10}H_7.CN$ in isobutyl alcohol (Pinner a. Klein, *B.* 11, 1487). Long white needles.—B′HCl. Decomposed by heat into isobutyl chloride and the amide of (β)-naphthoic acid.

(β)-NAPHTHIMIDO- ETHYL ETHER $C_{10}H_7.C(NH).OEt$. Hydrochloride B′HCl. Prepared by leading HCl into an alcoholic solution of the nitrile of (β)-naphthoic acid (Pinner a. Klein, *B.* 11, 1485). Decomposed by heat into EtCl and the amide of (β)-naphthoic acid.

(α)-NAPHTHINDOLE $C_{12}H_9N$ *i.e.*  $C_{10}H_6\langle\begin{smallmatrix}CH\\NH\end{smallmatrix}\rangle CH$. [175°]. Obtained by distilling its carboxylic acid (Schlieper, *A.* 239, 229). Plates (from ligroïn), v. sol. alcohol, ether, and benzene, sl. sol. hot water. Colours pine-wood, in presence of HCl, bluish-violet. Its solution in acetic acid gives a red colour with conc. HNO_3, and a bluish-green pp. on boiling with hydrogen peroxide. Its picrate crystallises in needles.—B'_2HCl. Colourless pp., got by adding HCl to the solution in HOAc.

On boiling an alcoholic solution of (α)-naphthindole with zinc-dust and HCl there is formed a hydride which yields an oxalate melting at 166°.

(β)-Naphthindole  $C_{10}H_6\langle\begin{smallmatrix}CH\\NH\end{smallmatrix}\rangle CH$. (above 360°) at 760 mm.; (222° i.V. at 18 mm.).

Formation.—1. By heating ethylidene-(β)-naphthyl-hydrazine with $ZnCl_2$; the yield being small.—2. By heating the (β)-naphthyl-hydrazide of pyruvic ether with $ZnCl_2$ at 195°; the intermediate body being (β)-naphthindole carboxylic acid (Schlieper, *A.* 236, 178).

Properties.—Yellow oil, v. sol. alcohol, ether, benzene, and HOAc, sl. sol. ligroïn. Yields a picrate, crystallising in dark-red needles, and a nitrosamine. Conc. HClAq solidifies the oil. It colours pine-wood, in presence of HCl, violet. Oxidising agents yield a solid product.

(α)-NAPHTHINDOLE CARBOXYLIC ACID $C_{13}H_9NO_2$ *i.e.*  $C_{10}H_6\langle\begin{smallmatrix}CH\\NH\end{smallmatrix}\rangle C.CO_2H$. [202°]. Formed by the action of boiling alcoholic potash upon its ether, which is obtained by heating the (α)-naphthyl-hydrazide of pyruvic ether with $ZnCl_2$ (Schlieper, *A.* 239, 232). Silvery laminæ (from water), v. sl. sol. hot water, v. sol. alcohol and ether. Decomposes above 210° into CO_2 and (α)-naphthindole.

Ethyl ether EtA'. [170°].

(β)-Naphthindole-carboxylic acid $C_{13}H_9NO_2$ *i.e.* $C_{10}H_6{<}\substack{CH\\NH}{>}C.CO_2H$. [226°]. Obtained by saponifying its ether, which is formed when the (β)-naphthyl-hydrazide of pyruvic ether is heated with $ZnCl_2$ (Schlieper, *A.* 236, 181). Colourless plates, insol. water, sl. sol. ether, v. sol. hot HOAc and alcohol. Does not colour pine-wood. Bromine gives a yellow pp.

(α)-NAPHTHINDOLE SULPHONIC ACID $C_{10}H_6{<}\substack{NH\\CH}{>}C.SO_3H$ (?). The sodium salt of this acid, formed by the action of (α)-naphthylamine on the compound of glyoxal with $NaHSO_3$, is converted by mineral acids into (α)-naphthoxindole (Hinsberg, *B.* 21, 116).

β-Naphthindole sulphonic acid $C_{10}H_6{<}\substack{NH\\CH}{>}C.SO_3H$ or $C_{10}H_6{<}\substack{N\\CH_2}{>}C.SO_3H$. The sodium salt of this acid is obtained by the action of (β)-naphthylamine on the compound of glyoxal and $NaHSO_3$ (Hinsberg, *B.* 21, 113). It is stable towards alkalis, but converted by mineral acids into (β)-naphthoxindole.

NAPHTHIONIC ACID *v.* (1, 4)-NAPHTHYLAMINE SULPHONIC ACID.

NAPHTHISATIN *v.* ISATIN.

NAPHTHOACRIDINE *v.* NAPHTHACRIDINE.

NAPHTHOBENZALDOXIM so-called, *v. Oxim* of NAPHTHOIC ALDEHYDE.

NAPHTHOBENZYL ALCOHOL *v.* NAPHTHYL-CARBINOL.

NAPHTHOBENZYLAMINE *v.* NAPHTHYL-CARBINYL-AMINE.

NAPHTHO-CINNAMIC ACID so-called, *v.* NAPHTHYL-ACRYLIC ACID.

NAPHTHOCOUMARIC ACID *v.* OXY-NAPHTHYL-ACRYLIC ACID.

NAPHTHOCOUMARIN *v. Anhydride* of OXY-NAPHTHYL-ACRYLIC ACID.

NAPHTHOCYAMIC ACID $C_{29}H_{18}N_6O_6$. The potassium salt of this acid is prepared by boiling di-nitro-naphthalene with alcoholic KCy (Mühlhäuser, *A.* 141, 214). The free acid is a brownish-black mass, insol. ether, nearly insol. water, m. sol. alcohol.—KA' aq. Dark mass, with coppery lustre, forming a fine blue solution in hot water and hot alcohol. The barium salt is a dark-blue pp., and explodes when heated. The silver salt is insol. water, has a bronze lustre, and explodes violently when heated.

NAPHTHO-HYDROQUINONE *v.* HYDRO-NAPHTHOQUINONE.

(α)-NAPHTHOIC ACID $C_{11}H_8O_2$ *i.e.* $C_{10}H_7CO_2H$. *Naphthalene (α)-carboxylic acid.* Mol. w. 172. [162°]. H.C.v. 1,232,000. H.C.p. 1,232,600. H.F. 77,400 (Stohmann, Kleber, a. Langbein, *J. pr.* [2] 40, 137).

Formation.—1. By saponifying its nitrile by boiling alcoholic potash (Merz, *Z.* [2] 4, 34; 5, 396) or conc. HClAq (Hofmann, *B.* 1, 39).—2. By heating a mixture of bromo-naphthalene and $Cl.CO_2Et$ with sodium-amalgam at 110° for several hours, and saponifying the resulting ether with alcoholic potash (Eghis, *C. R.* 69, 360).—3. By fusing potassium naphthalene (α)-sulphonate with sodium formate (V. Meyer, *A.* 156, 274).—4. By boiling with potash its amide which is formed by the action of $ClCO.NH_2$ on naphthalene in presence of $AlCl_3$ (Gattermann, *A.* 244, 56).

Preparation.—A mixture of 3 pts. of sodium naphthalene-(α)-sulphonate and 2 pts. of potassium ferrocyanide (both quite dry) is distilled from an iron tube, the nitrile is rectified and saponified by heating it with an equal volume of HCl to 200°; the yield is 25 p.c. of the sulphonate (Boessneck, *B.* 16, 639).

Properties.—Needles (from dilute alcohol), v. sl. sol. water, m. sol. hot alcohol. Yields naphthalene on distillation with lime, and phthalic acid on oxidation by CrO_3 in HOAc.

Salts.—BaA'_2 4aq. Needles, sl. sol. water.—$CaA'_2$2aq. S. 1·08 at 15°.—AgA'.

Ethyl ether EtA'. (309° cor.).

Chloride $C_{10}H_7.CO.Cl$. (297·5°). From the acid (4 pts.) and PCl_5 (5 pts.). Hydroxylamine converts it into $C_{10}H_7.CO.NH.OH$ [187°] and $(C_{10}H_7.CO)_2NOH$ [150°] (Ekstrand, *B.* 20, 1358). Reacts with potassium (β)-naphthoate, forming (αβ)-naphthoic anhydride $C_{10}H_7.CO.O.CO.C_{10}H_7$ (Hausmann, *B.* 9, 1515).

Amide $C_{10}H_7.CONH_2$. [202°]. Formed from the chloride and NH_3, or from the nitrile and alcoholic soda (Hofmann; Ekstrand, *J. pr.* [2] 38, 146). Prepared by passing dry gaseous cyanic acid and HCl into a solution of naphthalene in CS_2, containing $AlCl_3$ heated on the water-bath (Gattermann a. Rossolymo, *B.* 23, 1197). Colourless monoclinic tables (from alcohol) (Bamberger a. Philip, *B.* 20, 241).

Anilide $C_{10}H_7.CONHPh$. [160°]. White silky crystals.

(α)-*Naphthalide* $C_{10}H_7.CO.NHC_{10}H_7$. [244°].

Anhydride $(C_{10}H_7.CO)_2O$. [145°]. Obtained by distilling calcium naphthoate with naphthyl chloride (Hofmann). Prisms (from boiling benzene).

Nitrile $C_{10}H_7.CN$. (α)-*Cyano-naphthalene.* Mol. w. 153. [37°]. (298° cor.). *Formation.*—1. By distilling naphthylamine with oxalic acid, and heating the resulting formyl derivative of naphthylamine with HClAq (Hofmann, *A.* 142, 121; *B.* 1, 39).—2. By distilling potassium naphthalene (α)-sulphonate with KCy (Merz, *Bl.* [2] 9, 335; 10, 47) or K_4FeCy_6 (Boessneck, *B.* 16, 639; Hausmann, *B.* 9, 1514).—3. By passing a mixture of cyanogen and naphthalene through a red-hot tube (Merz a. Weith, *B.* 10, 746).—4. By heating di-naphthyl-thio-urea with copper powder (Weith, *B.* 6, 967).—5. By heating tri-(α)-naphthyl phosphate with KCy; the yield being 20 p.c. of the theoretical (Heim, *B.* 16, 1779).—6. By boiling the formyl derivative of (α)-naphthylamine with zinc-dust in a current of hydrogen; the yield being 11 p.c. (Gasiorowski a. Merz, *B.* 18, 1006).—7. By the action of cuprous cyanide on (α)-diazo-naphthalene salts (Bamberger a. Philip, *B.* 20, 257). *Properties.* — Needles. Reduced in alcoholic solution by sodium to the tetrahydride of naphthyl-carbinylamine $C_{10}H_{11}.CH_2NH_2$. On heating with hydroxylamine it yields $C_{10}H_{11}.CONH_2$ and naphthamidoxim [149°].

(β)-Naphthoic acid $C_{10}H_7.CO_2H$. *Isonaphthoic acid.* [185° cor.]. (above 300°). H.C.v. 1,227,800. H.C.p. 1,228,400. H.F. 81,600 (Stohmann, Kleber, a. Langbein, *J. pr.* [2] 40, 137).

Formation.—1. By saponification of its nitrile, which is formed by heating potassium naphthalene (β)-sulphonate with KCy (Merz a. Mühlhäuser, *Z.* [2] 5, 70).—2. By boiling (β)-methyl-naphthalene with conc. HNO_3 (Ciamician, *B.* 11, 272).—3. By oxidising (β)-naphthoic aldehyde with $KMnO_4$ (Schulze, *B.* 17, 1530).

Properties.—Long white needles (from hot water); sl. sol. hot water, v. sol. alcohol and ether. Yields naphthalene on distillation with baryta. Oxidised to phthalic acid by CrO_3 in HOAc. -

Salts.—NaA' ½aq (Vieth, *A.* 180, 314). Small tables, v. e. sol. water.—KA' ½aq.—BaA'_2 4aq.—Needles (from hot water). S. ·07 at 15°.—CaA'_2 3aq. S. ·055 at 15°.—MgA'_2 5aq.—AgA'.

Methyl ether MeA'. [77°]. (290°). H.F. 70,600 (Stohmann, *J. pr.* [2] 40, 353).

Ethyl ether EtA'. (309°).

Chloride $C_{10}H_7.COCl$. [43°]. (305°). Formed from the acid and PCl_5 (Vieth; *cf.* Grucarevic a. Merz, *B.* 6, 1242). Hydroxylamine solution at 100° attacks it, forming the compounds $C_{10}H_7.CO.NH.OH$ [168°], and $(C_{10}H_7.CO)_2NOH$ [171°] (Ekstrand, *B.* 20, 1359). The (β)-naphthoyl hydroxylamine reacts with (α)-naphthoyl chloride forming (αβ)-di-naphthoyl-hydroxylamine [160°]. With urea it forms di-naphthoyl-urea [215°].

Anhydride $(C_{10}H_7.CO)_2O$. [134°]. Plates composed of needles (Hausmann, *B.* 9, 1515).

Amide $C_{10}H_7.CONH_2$. [192°]. Formed by warming the chloride with powdered ammonium carbonate. Formed also by heating the nitrile with alcoholic potash (Leone, *G.* 14, 120). Plates.

Anilide $C_{10}H_7.CO.NHPh$. [170°]. Small plates (from benzene).

p-Toluide $C_{10}H_7.CO.NHC_7H_7$. [191°]. Silky needles.

(α)-*Naphthalide* $C_{10}H_7.CO.NH.C_{10}H_7$. [157°]. Very small needles, sl. sol. ether.

Nitrile $C_{10}H_7.CN$. [66·5°]. (305° cor.). Formed by reactions like those used for preparing its (α)-isomeride (*v. supra*). White mass, nearly insol. water, v. sol. alcohol and ether. When its alcoholic solution is saturated with HCl there is formed the hydrochloride of naphthimido-ethyl ether (*q.v.*) (Pinner a. Lohmann, *B.* 11, 1485). By exhaustive chlorination with $SbCl_5$ it yields per-chloro-benzene (Merz a. Weith, *B.* 16, 2887).

References.—Amido-, Bromo-, Bromo-nitro-, Chloro-, Chloro-nitro-, Nitro-, Oxy-, and Thio-, naphthoic acids, and Amido-, and Bromo-amido-naphthoic anhydride.

(α)-**NAPHTHOIC ACID TETRAHYDRIDE** $C_{10}H_{11}.CO_2H$ [128°]. Formed, together with the amide, by heating its nitrile with alcoholic potash for 5 or 6 hours at 165° (Bamberger a. Bordt, *B.* 22, 629). Slender dendritic prisms, v. sol. alcohol, sl. sol. cold water.—CuA'_2: bluish-green pp.—PbA'_2: needles grouped in stars.—AgA': flaky pp.

Amide $C_{10}H_{11}.CONH_2$. [182°]. Flat needles, v. sol. boiling water.

Nitrile $C_{10}H_{11}.CN$. (278°) at 721 mm. Formed from (α)-naphthylamine tetrahydride by Sandmeyer's reaction, and purified by steam-distillation.

(α)-**NAPHTHOIC ALDEHYDE** $C_{10}H_7.CHO$. '*Naphthobenzaldehyde.*' Mol. w. 156. (292° cor.). Formed from naphthyl-carbinol by oxidation with chromic acid mixture (Bamberger a. Lodter, *B.* 21, 258). Pale-yellow viscid liquid, with faint aromatic odour. Conc. HNO_3 at −5° yields a nitro-derivative [136°]. It forms with $NaHSO_3$ a compound crystallising in glistering leaflets. The phenyl hydrazide [185°] forms yellow leaflets, which turn red on exposure to light. Aniline forms $C_{10}H_7CH:NPh$ [71°]; o-toluidine yields $C_{10}H_7CH:NC_7H_7$ [59°]; *p*-toluidine produces $C_{10}H_7CH:NC_7H_7$ [93°]; and (α)-naphthylamine $C_{10}H_7CH:NC_{10}H_7$ [117°].

Oxim $C_{10}H_7.CH.NOH$. '*Naphthobenzaldoxim.*' [98°]. Colourless needles (from alcohol), sl. sol. water (Brandes, *B.* 22, 2151).

(β)-Naphthoic aldehyde $C_{10}H_7.CHO$. [61°]. Formed by distilling a mixture of calcium (β)-naphthoate and calcium formate at a high temperature (Battershall, *Z.* [2] 7, 292, 673; *A.* 168, 116). Formed also by heating ω-chloro-(β)-methyl-naphthalene ($C_{10}H_7.CH_2Cl$) with lead nitrate (Schulze, *B.* 17, 1530), and by oxidising (β)-naphthyl-carbinol (Bamberger a. Brekmann, *B.* 20, 1118). Silvery plates; volatile with steam. Reduces ammoniacal $AgNO_3$. Alcoholic NH_3 converts it into the hydramide $(C_{10}H_7.CH)_3N_2$ [146°–150°].

(α)-**NAPHTHOL** $C_{10}H_7.OH$. Mol. w. 144, [94°]. (279°). S.G. $\frac{4}{4}$ 1·224 (Schröder, *B.* 12, 1613). R_∞ 76·97 in an 8·6 p.c. alcoholic solution (Kanonnikoff, *J. pr.* [2] 31, 348); 75·25 (Nasini a. Bernheimer, *G.* 14, 153). Occurs in anthracene-oil obtained from coal tar (K. E. Schulze, *A.* 227, 150).

Formation.—1. By the action of nitrous acid on (α)-naphthylamine (Griess, *J.* 1866, 460). 2. From naphthalene (α)-sulphonic acid by potash-fusion (Eller, *A.* 152, 275).—3. By heating γ-phenyl-isocrotonic acid $CHPh:CH.CH_2.CO_2H$ at its boiling-point for 5 or 10 minutes, water being eliminated (Fittig a. Erdmann, *B.* 16, 43; *A.* 227, 242).

Preparation.—By heating naphthalene (1 pt.) with H_2SO_4 (2 pts.) at 60° to 70°, and fusing the sodium salt of the (α)-sulphonic acid formed with three times its weight of NaOH.

Properties.—Short trimetric prisms (Léger, *C. R.* 111, 110); sl. sol. hot water, v. sol. alcohol, ether, and benzene. Volatile with steam. Pine-wood, moistened with an aqueous solution of (α)-naphthol, and then with HClAq, turns green in sunlight, and finally reddish brown. Bleaching-powder gives, in a solution of (α)-naphthol, a dark-violet colour, and ultimately violet flakes, which are turned brown by heating, but are decolourised by ammonia. $FeCl_3$ gives a milky pp., soon becoming violet flakes of (α)-dinaphthol. (α)-Naphthol is a powerful antiseptic, more powerful in this respect than (β)-naphthol, although less poisonous (Maximovitch, *C. R.* 106, 366).

Reactions.—1. On boiling in the air, or on heating in sealed tubes at 350°–400°, it yields dinaphthylene oxide $(C_{10}H_6)_2O$ (Merz a. Weith, *B.* 14, 196).—2. Heated to 270° for 8 hours with four times its weight of *ammoniacal* $CaCl_2$ (damp) it yields about 74 p.c. of (α)-naphthylamine. If ammoniacal $ZnCl_2$ is used instead of $CaCl_2$, the product is 60 p.c. of (αα)-dinaphthylamine (Benz, *B.* 16, 14; *cf.* Merz a. Weith, *B.* 14, 2344).—3. *Aniline* and $CaCl_2$ yield, on heating, a little phenyl-naphthyl-amine (M. a. W.).—4. *Ammonium acetate* at 270° yields the acetyl derivative of (α)-naphthylamine (Calm, *B.* 15, 615).—5. *Ammonium formate* at 250° yields CO and (α)-naphthylamine.—6. When (α)-naphthol (2 pts.) is heated with anhydrous oxalic acid (1 pt.) and conc. H_2SO_4 (1 pt.) at 130°, there is formed a compound $C_{22}H_{12}O_2$, crystallising from chloroform in pale rose-coloured leaflets, insol. alcohol and ether, converted by potash-fusion into the acid $C_{22}H_{14}O_3$ (crystallising in golden-green tables), and yielding the halogen derivatives $C_{22}H_{10}Cl_2O_2$ and $C_{22}H_{10}Br_2O_2$, both of which crystallise in the monoclinic system (Hönig, *M.* 1, 251).—7. Boiling with $KClO_3$ and HCl yields di-chloro-naphthoquinone (Wichelhaus, *A.* 152, 301).—8. *Chlorine*, acting on (α)-naphthol dissolved in HOAc, forms $C_{10}H_5Cl_2OH$ [108°] and $C_6H_4{<}\begin{matrix}CO\ .CCl_2\\CCl{:}CH\end{matrix}$ [121°]. When the liquid is kept cold the product is $C_6H_4{<}\begin{matrix}CO\ .CCl_2\\CCl_2.CClH\end{matrix}$ [157°] (Zincke a. Kegel, *B.* 21, 1030, 1044).—8. PCl_5 at 100° forms di-naphthyl phosphate. At 150° it yields (α)-chloronaphthalene (Oehler, *B.* 15, 312).—9. Conc. HClAq at 200° yields di-naphthyl-oxide.—10. *Aluminium* and *iodine* yield aluminium-(α)-naphthol (Gladstone a. Tribe, *C. J.* 41, 16). On distillation of this body there is formed a dinaphthyl [189°].—11. *Iodine* and *potash* yield a dark-violet compound (Messinger a. Fortmann, *B.* 22, 2322).—12. Somewhat more readily oxidised by $KMnO_4$ than (β)-naphthol (Dreyfus, *C. R.* 105, 523).—13. H_2SO_4 yields mono- and di- sulphonic acids. In presence of HOAc it also forms oxy-naphthyl methyl ketone. 14. HCl, acting on a mixture of (α)-naphthol and aldehyde below 0° forms $CH_3.CH(C_{10}H_6.OH)_2$ (Claus a. Trainer, *B.* 19, 3004).—15. *Di-chloro-ether* $C_2H_3Cl_2OEt$ yields amorphous $C_{32}H_{24}O_6$ or $C_2H_3(C_{10}H_6OH)_3$ (Wislicenus, *A.* 243, 165).—16. *Benzoic aldehyde* yields $C_6H_5.CH(C_{10}H_6OH)_2$, which turns brown in air (Claisen, *B.* 19, 3316). 17. When boiled with *phthalic anhydride* it yields naphthol-phthaleïn $C_{28}H_{16}O_3$ (Grabowski, *B.* 4, 661, 725; 6, 1065).—18. *Pyromellitic anhydride* (1 mol.), heated with (α)-naphthol (4 mols.), at 300° yields the compounds $C_{60}H_{26}O_8$ and $C_{50}H_{28}O_7$ [265°]. When the two bodies are heated together in other proportions at 250° there are formed the compounds $C_{40}H_{24}O_6$, $C_{40}H_{22}O_7$, and $C_{30}H_{16}O_8$ (Grabowski).—19. *Maleïc anhydride* and $ZnCl_2$ at 160° forms $C_{24}H_{16}O_4$ and an acid $CO_2H.CH{:}CH.CO.C_{10}H_6OH$ [90°] (Burckhardt, *B.* 18, 2868).—20. *Benzotrichloride* at 100° forms $\{C_6H_5.C(C_{10}H_8OH)_2\}_2O$, a reddish-brown powder, insol. water, sol. alcohol and ether (Doebner, *A.* 257, 58).

Picric acid compound $C_{10}H_8OC_6H_2(NO_2)_3OH$. [190°]. Orange needles (Marchetti, *G.* 12, 503).

Compound with camphor $C_{10}H_6OC_{10}H_{16}O$. S.G. $\frac{0}{}$ 1·0327. $[\alpha]_D = 10·5°$. Syrupy liquid, not solid at −16°. Not sensibly decomposed by water (Léger, *C. R.* 111, 110).

Acetyl derivative $C_{10}H_7.OAc$. [49°]. Formed by heating (α)-naphthol with AcCl (Schaeffer, *B.* 2, 131). Formed also by heating (α)-naphthol with HOAc at 200° (Graebe, *A.* 209, 151), or with Ac_2O and NaOAc (Tassinari, *G.* 10, 471). Large crystals, sol. alcohol and ether. Split up into (α)-naphthol and acetic acid by distillation with steam. On oxidation with CrO_3 in cold HOAc it yields c-oxy-phthalic acid, and three compounds melting at 114°, 119°, and 121° respectively (Miller, *B.* 14, 1601).

Benzoyl derivative $C_{10}H_7.OBz$. [56°]. Crystals, v. sol. ether (Maikopar, *Z.* 1869, 216).

Methyl ether $C_{10}H_7.OMe$. (270°) (V.); (258°) (S.); (266°) (M.); (265°) (H.); (269° i.V.) (N. a. B.) S.G. $\frac{15}{}$ 1·0974 (S.); $\frac{14}{4}$ 1·0964 (Nasini, *G.* 15, 84). Prepared by the action of MeCl on sodium (α)-naphthol (Viucent, *Bl.* [2] 40, 106) or of MeI (60 g.), KOH (25 g.), and MeOH on (α)-naphthol (60 g.) (Staedel, *A.* 217, 42). Formed also by heating (α)-naphthylamine with methyl alcohol and $ZnCl_2$ at 200° (Hantzsch, *B.* 13, 1347); and by heating MeOH with (α)-naphthol and HCl (Manchetti, *G.* 9, 545). Prepared by boiling (α)-naphthol for several hours with MeOH and $ZnCl_2$ (Green, *priv. com.*). Liquid, smelling like orange-blossom, sol. alcohol, ether, and benzene. With HNO_3 it gives a tri-nitro- derivative [128°]. With picric acid it forms a compound crystallising in red needles, decomposed by alcohol.

Ethyl ether $C_{10}H_7.OEt$. (281° cor.). Formed from (α)-naphthol, KOH, and EtI in alcoholic solution (Schaeffer, *A.* 152, 286); or from (α)-naphthol (25 g.), MeOH (25 g.), and H_2SO_4 (10 g.) at 125° (Gattermann, *A.* 244, 72). Heavy oil. Converted by HNO_3 into a tri-nitro- derivative $C_{10}H_4(NO_2)_3OEt$ [148°] (Staedel, *B.* 14, 899).

Propyl ether $C_{10}H_7.OC_3H_7$. (299° cor.). S.G. $\frac{18·4}{4}$ 1·0447 (Nasini a. Bernheimer, *G.* 15, 84).

Ethylene ether $(C_{10}H_7O)_2C_2H_4$. [126°]. Plates (from alcohol) (Koelle, *B.* 13, 1956).

(α)-*Naphthyl ether* v. DI-NAPHTHYL OXIDE.

Nitroso- derivatives v. Oxim of (α)- and (β)- NAPHTHOQUINONE.

(β)-Naphthol $C_{10}H_7.OH$. Mol. w. 144. [123°]. (286°). S.G. $\frac{4}{}$ 1·217 (Schröder, *B.* 12, 1613). R_∞ 76·43 in an 11·18 p.c. alcoholic solution (Kanonnikoff, *J. pr.* [2] 31, 348). S. ·02; S. (20 p.c. alcohol) ·2 (Bouchard, *C. R.* 105, 702). Occurs in coal-tar (K. Schulze, *A.* 227, 150). Formed by the action of nitrous acid on (β)-naphthylamine (Liebermann, *A.* 183, 268). Prepared by fusing sodium naphthalene (β)-sulphonate (1 pt.) with NaOH (2 pts.) at 300° (Schäffer, *A.* 152, 282).

Properties.—Plates or tables, sl. sol. hot water, v. sol. alcohol, ether, chloroform, and benzene. Readily sublimes. May be distilled by superheated steam. Powerfully antiseptic (Bouchard; Maximovitch, *C. R.* 106, 1441). Pine-wood dipped in an aqueous solution of (β)-naphthol and then in HClAq becomes green on exposure to daylight. Bleaching powder colours a solution of (β)-naphthol slightly yellow, but the colour is destroyed by excess of bleaching-powder; on adding ammonia and warming, yellowish flakes separate. $FeCl_3$ colours its solution slightly green, and, after a time, causes deposition of white flakes (of dinaphthol), which become brown on heating. Its solution in NaOHAq yields with mercuric chloride a pp. $(C_{10}H_7O)_2HgHgCl_2$ 4aq (Pouchet, *C. R.* 106, 276). It may be estimated by adding standard iodine solution to its solution in warm aqueous NaOH (Messinger a. Vortmann, *B.* 23, 2754).

Reactions.—1. Alkaline potassium permanganate *oxidises* it to *o*-carboxy-cinnamic acid $CO_2H.C_6H_4.CH:CH.CO_2H$ [184°], and an acid $C_{20}H_{12}O_4$ [281°] which forms the salts BaA'_2 7aq and AgA′, an ether EtA′ [123°] and a dihydride $C_{20}H_{14}O_4$ [224°] (Ehrlich a. Benedikt, *M.* 9, 527; 10, 115). When (β)-naphthol is boiled with P_2O_6, or even by itself in presence of air, it forms di-(β)-naphthylene oxide.—2. The dry distillation of calcium (β)-naphthylate $Ca(OC_{10}H_7)_2$ yields di-(β)-naphthylene oxide, naphthalene, (β)-naphthol, and a compound $C_{21}H_{14}O$ (?) [300°-305°] (Niederhäusern, *B.* 15, 1122).—3. *Zinc chloride* forms, on heating, isodinaphthylene oxide.—4. *Chloride of sulphur* in presence of CS_2 or benzene forms $(HO.C_{10}H_6)_2S$ and $(HO.C_{10}H_6)_2S_2$ (Tassinari, *G.* 17, 94; Onufrovitch, *B.* 23, 3356).—5. Boiling with *sulphur* and *caustic soda* solution forms $(HO.C_{10}H_6)_2S_2$ [210°] and a compound melting at 170° (Lange, *B.* 21, 260).—6. By heating (β)-naphthol (150 g.) with *aluminium* (10 g.) as long as hydrogen comes off there is formed a mixture of (β)-naphthol and aluminium (β)-naphthylate, which when distilled yields di-(β)-naphthyl oxide (Gladstone a. Tribe, *C. J.* 41, 15).—7. When heated in sealed tubes with *ammonia*, NH_4Cl, acetamide, ammonium acetate or ammonium formate, it yields (β)-naphthylamine. Heated to 270°–280° for 8 hrs. with four times its weight of ammoniacal $CaCl_2$ (damp) it yields 80 p.c. of (β)-naphthylamine and 12 p.c. of (ββ)-dinaphthylamine. If ammoniacal $ZnCl_2$ is used instead of $CaCl_2$ the product is 4 p.c. of (β)-naphthylamine and 82 p.c. of (ββ)-dinaphthylamine (Benz, *B.* 16, 9).—8. Reacts with *nitroso-dimethyl aniline* forming (β)-naphthol-violet $C_{18}H_{16}N_2O$ (Meldola, *C. J.* 39, 37), which is converted by heat into 'cyanamine,' a blue colouring matter $C_{28}H_{23}N_4O_2$ (Witt, *B.* 23, 2247).—9. *Di-chloro-quinonimide* $C_6H_4(NCl)_2$ forms a red colouring matter  $HN:C_6H_2\!<\!\begin{smallmatrix}N\\O\end{smallmatrix}\!>\!C_{10}H_6$ which forms a blue solution in conc. H_2SO_4 (Nietzki a. Otto, *B.* 21, 1744). The free base is a yellow pp., v. sol. alcohol and ether, and is converted by heat into a greenish-blue colouring matter, greatly resembling 'cyanamine' (*v. supra*).—10. *Nitrogen iodide* forms iodo-(β)-naphthol, a substance melting at 223°, and an amorphous body (Willgerodt, *J. pr.* [2] 37, 446).—11. *Di-chloro-di-ethyl oxide* $CH_2Cl.CHCl.OEt$ yields $C_{22}H_{15}ClO$ [174°] crystallising in plates, insol. water, sol. alcohol and HOAc (Wislicenus, *A.* 243, 169).—12. When *chlorine* is passed into a solution of (β)-naphthol in HOAc and the product is treated with an excess of $SnCl_2$ there is obtained [1:2]$C_{10}H_6Cl.OH$ [71°] (Zincke, *B.* 21, 3284). This chloro-(β)-naphthol when dissolved in HOAc or chloroform and treated with chlorine yields  $C_6H_4\!<\!\begin{smallmatrix}CCl_2.CO\\CH\ :CH\end{smallmatrix}$ (Zincke, *B.* 21, 3540). When (β)-naphthol dissolved in HOAc is treated with excess of chlorine there is formed the compound  $C_6H_4\!<\!\begin{smallmatrix}CCl_2\ .CO\\CHCl.CHCl\end{smallmatrix}$ crystallising in plates [103°] or needles [102°] and converted by Na_2CO_3 into chloro-(β)-napthoquinone [172°] (Zincke, *B.* 21, 3550). When chlorine is passed into a well-cooled 10 p.c. solution of (β)-naphthol, there is formed  $C_6H_4\!<\!\begin{smallmatrix}CCl_2.CO\\CH\ :CCl\end{smallmatrix}$ which crystallises from hot alcohol in thick yellow needles [96°] (Z.).—13. *Chloroform* in presence of a small quantity of aqueous NaOH forms on boiling crystalline $C_{22}H_{14}O_2$ or  $C_{10}H_6\!<\!\begin{smallmatrix}C(OH)\\C_{10}H_6\end{smallmatrix}\!>\!C(OH)$, its anhydride $C_{22}H_{12}O$, an aldehyde $C_{10}H_6(OH).CHO$, an alcohol $C_{22}H_{14}O$, and resins (Rousseau, *C. R.* 94, 133; 95, 30, 232).—14. An acetic acid solution of *aldehyde* slowly reacts in the cold forming the di-(β)-naphthyl ether of acetic orthaldehyde $CH_3.CH(OC_{10}H_7)_2$ [201°] (Claisen, *B.* 19, 3318).—15. A few drops of HCl added to a cold solution of *benzoic aldehyde* and (β)-naphthol in HOAc forms $C_6H_5.CH(OC_{10}H_7)_2$ [205°] converted by heating with HOAc and hydrochloric acid solution into  $C_6H_5.CH\!<\!\begin{smallmatrix}C_{10}H_6\\C_{10}H_6\end{smallmatrix}\!>\!O$ [190°] (Claisen, *B.* 19, 3316). On adding H_2SO_4 (2 pts.) to a solution of benzoic aldehyde (3 pts.) and (β)-naphthol (6 pts.) in alcohol (3 pts.) there is formed $C_{66}H_{46}O_3$ [191° uncor.], a crystalline substance, not affected by boiling Ac_2O, and converted by fuming HNO_3 into $C_{45}H_{17}(NO_2)_7O_2$ (Trzciński, *B.* 17, 499).—16. *Benzotrichloride* at 100° forms $\{C_6H_5C(O.C_{10}H_7)_2\}_2O$ which melts above 350° and may be distilled. It crystallises in white needles, insol. water, alcohol, and ether, sol. nitrobenzene (Doebner, *A.* 257, 59).

Combinations.—With picric acid $C_{10}H_8O.C_6H_2(NO_2)_3OH$. [155°]. Orange-yellow needles (from alcohol), almost insol. cold water (Marchetti, *G.* 12, 504).—With aniline $C_{10}H_8OC_6H_7N$. [82·4°]. Crystalline powder (from ligroïn) (Dyson, *C. J.* 43, 469).—With *p*-toluidine $C_{10}H_8OC_7H_9N$. [80·8°] (D.).

Acetyl derivative $C_{10}H_7OAc$. [70°] (O. Miller, *B.* 14, 1602). Small needles.

Benzoyl derivative $C_{10}H_7OBz$. [107°]. Nodular groups of needles (Maikopar, *Z.* 1869, 216).

Methyl ether $C_{11}H_{10}O$ *i.e.* $C_{10}H_7.OMe$. [72°] (Staedel, *A.* 217, 43); [70·5°] (Vincent, *Bl.* [2] 40, 106). (274°) (Marchetti, *G.* 9, 545). Formed from (β)-naphthol, KOH, MeOH, and MeI or MeCl. Formed also by boiling (β)-naphthol with MeOH and $ZnCl_2$. White plates (from alcohol), insol. cold water, v. sol. ether. Volatile with steam. With HNO_3 (S.G. 1·5) it gives at 0° a tri-nitro- derivative [213°].

Ethyl ether $C_{10}H_7OEt$. [33°]. (275°). Formed from (β)-naphthol, KOH, and EtI (Schäffer; Liebermann, *B.* 15, 1428). Crystalline mass, decomposed in a sealed tube at 310° into ethylene and (β)-naphthol (Bamberger, *B.* 19, 1819).

Bromo-ethyl ether $C_{10}H_7.OC_2H_4Br$. [96°]. Prepared by the action of ethylene bromide and KOH on (β)-naphthol (Koelle, *B.* 13, 1954). Colourless plates; sol. alcohol. Alcoholic ammonia at 100° converts it into amorphous $C_{10}H_7.O.CH_2.CH_2NH_2$, while aniline yields crystalline $C_{10}H_7O.CH_2.CH_2.NHPh$ [75°].

Methylene ether $CH_2(OC_{10}H_7)_2$. [134°].

Ethylene ether $C_2H_4(OC_{10}H_7)_2$. [217°]. S. (benzene) ·5. Plates (from benzene); insol. alcohol and ether.

Ethylidene ether v. ALDEHYDE, vol. i. p. 105.

Benzyl ether v. BENZYL- NAPHTHYL OXIDE.

Naphthyl ether v. DI-NAPHTHYL OXIDE.

Nitroso- derivative v. *Oxim* of (β)-NAPHTHOQUINONE.

References.—AMIDO-, AMIDO-DI-IMIDO-, BROMO-, BROMO-NITRO-, CHLORO-, IODO-, IODO-NITRO-, and NITRO- NAPHTHOLS.

(α)-Naphthol tetrahydride $C_{10}H_{12}O$ *i.e.*

$$\begin{array}{l}\mathrm{CH_2.CH_2.C.CH{=\!=}CH}\\ \mathrm{CH_2.CH_2.C.C(OH){:}CH}\end{array}.$$

Tetrahydro-(α)-naphthol. [69°]. (265·5°) at 705 mm. Obtained by reducing (α)-naphthol in amyl-alcoholic solution by sodium. Occurs in the distillate obtained in the preparation of the nitrile of the tetrahydride of (α)-naphthoic acid (Bamberger a. Bordt, *B.* 22, 628; 23, 215). Formed also from the tetrahydride of (α)-naphthylamine by the diazo-reaction (Bamberger a. Althausse, *B.* 21, 1892). Silvery white monoclinic tables, smelling like phenol, and turning red in air; sl. sol. water, v. e. sol. alcohol and ether. Bleaching powder gives only yellowish flakes in its boiling aqueous solution (whereas with (α)-naphthol it gives a deep violet colour). $FeCl_3$ gives no colouration.

Ethyl ether $C_{10}H_{11}OEt$. (259°) at 705 mm. Formed by means of EtOH, KOH, and EtI.

(β)-Naphthol tetrahydride ('aromatic')

$$\begin{array}{l}\mathrm{CH_2.CH_2.C.CH{:}COH}\\ \mathrm{CH_2.CH_2.C.CH{:}CH}\end{array}.$$

ar-Tetrahydro-(β)-naphthol. [58°]. (275°). Formed by the action of nitrous acid on 'aromatic' (β)-naphthylamine tetrahydride (Bamberger a. Kitschelt, *B.* 23, 884). It is also one of the products of the reduction of (β)-naphthol by sodium (*v. infra*). Flat silvery needles, sl. sol. water, v. sol. alcohol and ether. Smells like creosote. Not etherified by heating with alcohol and H_2SO_4 at 100°. Not affected by heating with conc. H_2SO_4; hot dilute H_2SO_4 appears to form di-naphthyl oxide octohydride $(C_{10}H_{11})_2O$ (Bamberger a. Lengfeld, *B.* 23, 1129). Bleaching-powder added to its aqueous solution forms a white flocculent pp. $FeCl_3$ gives a bluish-green colour, and, on warming, a brownish-yellow flocculent pp. Chloroform and caustic soda give a greenish-yellow colour. $NaNO_2$ added to its solution in conc. H_2SO_4 gives a rose-red colour. Forms a wine-red compound with diazobenzene sulphonic acid. The sodium salt $C_{10}H_{11}ONa$ crystallises in silky scales.

(β)-Naphthol tetrahydride ('alicyclic')

$$\begin{array}{l}\mathrm{CH{:}CH.C.CH_2.CH.OH}\\ \mathrm{CH{:}CH.C.CH_2.CH_2}\end{array},$$

ac-Tetrahydro-(β)-naphthol. (178° at 53 mm.); (264°) at 716 mm. Formed by adding sodium to a boiling solution of (β)-naphthol in isoamyl alcohol (Bamberger a. Lodter, *B.* 23, 204), and separated from the accompanying 'aromatic' isomeride by aqueous NaOH, in which it is insoluble (Bamberger a. Kitschelt, *B.* 23, 885). V. sl. sol. water, v. sol. alcohol and ether. On warming with KOH it yields naphthalene dihydride. HI yields an iodide, which readily splits up into HI and naphthalene dihydride. Does not react with diazo- compounds.

Benzoyl derivative $C_{10}H_{11}OBz$. [63°]. (255° at 40 mm.). Formed by heating with HOBz at 170° (Bamberger a. Lodter, *B.* 23, 209). Tables, v. e. sol. warm alcohol and benzene. Split up on distillation into benzoic acid and naphthalene dihydride.

Acetyl derivative $C_{10}H_{11}OAc$. (169° at 84 mm.). Formed by the action of HOAc at 140°–150°. Decomposed at 268°-280° into HOAc and naphthalene dihydride.

NAPHTHO-LACTONE v. *Anhydride* of OXY-NAPHTHOIC ACID.

NAPHTHOL ALDEHYDE v. OXY-NAPHTHOIC ALDEHYDE.

NAPHTHOL-AZO- compounds v. AZO- COMPOUNDS.

DINAPHTHOL v. DI-OXY-DINAPHTHYL.

(α)-NAPHTHOL BLUE $C_{18}H_{16}N_2O$ *i.e.*

$$\mathrm{NMe_2.C_6H_4.N}\Big\langle\begin{matrix}\mathrm{C_{10}H_6}\\ \mathrm{O}\end{matrix}\Big\rangle.$$

Indophenol. Formed by the action of nitroso-dimethylaniline on (α)-naphthol, and by the action of dibromo-(α)-naphthol on dimethyl-*p*-phenylene-diamine in alkaline solution (Köchlin, *Bull. de Mulh.* 52, 532; Witt, *S. C. I.* 1, 255). Obtained also by oxidising a mixture of di-methyl-*p*-phenylene diamine and (α)-naphthol or (α)-naphthylamine with dilute $K_2Cr_2O_7$ and HCl (Pabst, *Bl.* [2] 38, 161; Möhlau, *B.* 16, 2851; 18, 2913). Bluish-violet crystals, with bronze lustre (from alcohol), insol. water. Dissolves in HClAq with yellow colour, being split up into (α)-naphthoquinone and dimethyl-*p*-phenylene-diamine.

NAPHTHOL CARBOXYLIC ACID v. OXY-NAPHTHOIC ACID.

(α)-NAPHTHOL-GLYCURONIC ACID $C_{16}H_{16}O_7$. [203°]. Occurs in urine after taking (α)-naphthol (Lesnik a. Nencki, *B.* 19, 1537). Long needles, v. sl. sol. chloroform. Split up by dilute HClAq into (α)-naphthol and glycuronic acid. Its aqueous solution is coloured a transient green by H_2SO_4.

(β)-Naphthol - glycuronic acid $C_{16}H_{16}O_7$. [150°]. $[\alpha] = -88°$. Occurs in the urine of dogs dosed with (β)-naphthol, and can be separated through the insolubility of the lead salt (Lesnik a. Nencki, *B.* 19, 1534). Needles (containing 2aq), sl. sol. water, v. sl. sol. chloroform. Conc. H_2SO_4 gives an intense green colour. Split up by HClAq into (β)-naphthol and glycuronic acid. —CaA'_2 4aq.

(α)-NAPHTHOL - MALEÏN $C_{24}H_{16}O_4$ *i.e.*

$$\begin{array}{l}\mathrm{CH{:}CH.C(C_{10}H_6.OH)_2}\\ \mathrm{CO{-}{-}{-}O}\end{array}.$$

[118°–120°]. Formed, together with a compound $C_{14}H_{10}O_4$, by heating (α)-naphthol with maleic anhydride and $ZnCl_2$. Violet powder, consisting of microscopic four-sided tablets. Dissolves in alcohol to a red solution, which on addition of NH_3 assumes a deep greenish-red fluorescence. Sol. ether, chloroform, and acetic acid, insol. benzene and CS_2 (Burckhardt, *B.* 18, 2867).

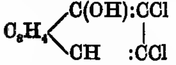
NAPHTHOL SULPHIDE v. DI - OXY - DI-NAPHTHYL SULPHIDE.

(1, 2) - NAPHTHOL SULPHONIC ACID [1:2] $C_{10}H_6(OH)SO_3H$. (α) - *Naphthol 'α' - sulphonic acid.* [101°]. Prepared by heating (α)-naphthol (1 pt.) with conc. H_2SO_4 (2 pts.) on a water-bath (Schaffer, *A.* 152, 293; Claus, *B.* 15, 312; Baum, *G. P.* B 4197 of June 30, 1883; *Monit. Scient.* 1883, 1122). Long, radiating, very deliquescent needles; v. sol. water and alcohol. Dissolves in HNO_3, the solution slowly depositing di-nitro-(α)-naphthol. $FeCl_3$ colours its solution deep blue, changing to green on warming, but becoming blue again on cooling. Gives no colour with bleaching powder. PCl_5 (2 mols.) at 120° yields chloro-naphthol [57°] and di-chloro-naphthalene [94°] (Claus a. Oehler, *B.* 15, 313).

Salts.—$CaA'_2 3aq$. Small laminæ; v. sol. water.—$PbA'_2 4aq$: needles; v. sol. water.—$PbC_{10}H_6SO_4$ (dried at 100°): minute needles.

Ethyl derivative $C_{10}H_6(OEt).SO_3H$. Obtained from the acid by treatment with alcoholic KOH and EtI (Maikopar, *Z.* 1870, 306).—$KA'\frac{1}{2}aq$: crystalline powder; sl. sol. cold water.

(1, 3?)-Naphthol sulphonic acid $C_{10}H_8SO_4$ *i.e.* $C_{10}H_6(OH).SO_3H$. (α)-*Naphthol 'β'-sulphonic acid.* [90° uncor.]. Formed, together with other sulphonic acids by sulphonation of (α)-naphthol in acetic acid solution by means of fuming sulphuric acid (80 p.c. SO_3). It is separated from concomitant products by the sparing solubility of its barium or lead salt. Deliquescent, long, fine needles. Very unstable, being converted into (α)-naphthol and H_2SO_4 by boiling its dilute aqueous or alcoholic solutions. The sodium salt cannot be converted into the chloride by PCl_5, but at once yields di-chloro-(α)-naphthol



[90°].

Salts.—NaA': easily soluble white silvery plates.—×KA': easily soluble needles.—BaA'_2aq: colourless plates; v. sl. sol. cold water.—PbA'_2aq: small plates; v. sl. sol. cold water (Baum; Claus a. Knyrim, *B.* 18, 2924).

Ethyl derivative $C_{10}H_6(OEt)SO_3H$ [1:3?]. Obtained by heating the ethyl ether of (α)-naphthol (7 pts.) with H_2SO_4 (5 pts.) at 100° (Maikopar).—KA'aq: large glittering plates; sl. sol. cold water.—BaA'_2. [55°–60°]. This acid is perhaps identical with the preceding.

(1, 4)-Naphthol sulphonic acid
[1:4]$C_{10}H_6(OH)SO_3H$. [170°]. Formed by diazotising the corresponding (α)-naphthylamine sulphonic acid and heating the resulting diazonaphthalene sulphonic acid with dilute H_2SO_4 (Nevile a. Winther, *C. J.* 37, 632; *Monit. Scient.* 1884, 39; Erdmann, *A.* 247, 341). Plates; v. e. sol. water. Converted by dilute HNO_3 into di-nitro-(α)-naphthol. Chromic acid oxidises it to (α)-naphthoquinone. $FeCl_3$ colours its solution greenish-blue, but on warming the colour becomes red. Its sodium salt is v. sol. 90 p.c. alcohol, from which it crystallises in needles.

(1, 1')-Naphthol sulphonic acid
[1:1']$C_{10}H_6(OH).SO_3H$. [107°]. Obtained from the corresponding (α)-naphthylamine *peri*-sulphonic acid by diazotisation, the product being boiled with water. The resulting anhydride (*v. infra*) is heated with alcoholic ammonia for half an hour at 130°, and the ammonium salt thus obtained converted into lead salt, and thence into the free acid (Erdmann, *A.* 247, 346). Deliquescent crystalline mass (containing aq); v. e. sol. water. Gives with $FeCl_3$ a green colour changing to red.

Salts.—NH_4A': v. sol. water, but not deliquescent.—KA': plates.—$Na_2C_{10}H_6SO_4 1\frac{1}{2}aq$: aggregates of needles.—$PbC_{10}H_6SO_4$ 3aq: white crystalline powder.

Anhydride $C_{10}H_6<\substack{O\\SO_2}>$. *Naphthosultone.* [154°]. Formed as above. Prisms (from benzene); v. sl. sol. CS_2, sl. sol. alcohol, v. sol. chloroform, insol. water. Boils between 360° and 448°. Not attacked by aqueous NH_3, Na_2CO_3, or cold NaOHAq. Boiling NaOHAq converts it into the corresponding acid.

(1, 4')-Naphthol sulphonic acid
[1:4']$C_{10}H_6(OH)SO_3H$. [110°–120°]. Obtained from the corresponding naphthylamine sulphonic acid by diazotising and boiling the product with H_2SO_4 (1 pt.) diluted with water (4 pts.) (Erdmann, *A.* 247, 343). Hygroscopic crystalline substance.

(1, 2')-Naphthol sulphonic acid. Formed by partial hydrolysis of heteronucleal (α)-naphthol disulphonic acid (Liebmann a. Studer, *E. P.* 7812 [1887]). Yields azo- dyes.

(α)-Naphthol disulphonic acid (*Heteronucleal*) $C_{10}H_5(OH)(SO_3H)_2$. Obtained, together with the trisulphonic acid, and probably also the (1, 2, 4) disulphonic acid, by heating (α)-naphthol (1 pt.) with H_2SO_4 (containing an additional 20 p.c. of SO_3) (5 pts.) for two hours on a water-bath (Claus a. Mieleke, *B.* 19, 1182). Best prepared by heating (α)-naphthol (1 pt.) with conc. H_2SO_4 (3 to 4 pts.) at 130°. Yields a nitroso- compound $C_{10}H_4(OH)(NO)(SO_3H)_2$ (Seltzer, *G. P.* 20,716; Jan. 30, 1882). Combines with diazo-compounds. On nitration it forms di-nitro-naphthol sulphonic acid.

Chloride $C_{10}H_5(OH)(SO_2Cl)_2$. Liquid; v. sol. ether. Converted by PCl_5 into tri-chloro-naphthalene [82°].

Ethyl derivative $C_{10}H_5(OEt)(SO_3H)_2$. Formed by sulphonating the ethyl ether of (α)-naphthol with fuming H_2SO_4 (10 p.c. additional SO_3) (*G. P.* D 1501, June 7, 1883). Conc. HNO_3 converts it into di-nitro-naphthol sulphonic acid.

(α)-Naphthol disulphonic acid (*Homonucleal*) $C_{10}H_5(OH)(SO_3H)_2$ [1:2:4]. Formed by heating (α)-naphthol with H_2SO_4 (4 pts.) at 70°. Differs from the preceding acid in not yielding a nitroso-derivative or forming azo- dyes (Schultze, *Dissertation*, Freiburg, 1883; Bender, *B.* 22, 993). It yields di-nitro-naphthol on nitration.

(1, 1', 4)-(α)-Naphthol disulphonic acid [1:1':4] $C_{10}H_5(OH)(SO_3H)_2$. (α)-*Naphthol (δ)-sulphonic acid.* Formed from (α)-naphthylamine *peri*-sulphonic acid by sulphonation and diazotisation. Formed also by sulphonating naphthosultone (Bernthsen, *B.* 23, 3088). Readily forms an anhydride.—×Na_2A'': plates, v. sol. water. $FeCl_3$ colours its solution deep blue.—×BaA''.

Anhydride $C_{10}H_5(SO_3H)<\substack{O\\SO_2}>$. Salts NaA'3aq; m. sol. water. Gives no colour with $FeCl_3$.—×BaA'_2: v. sol. water.

Mono-amide $C_{10}H_5(SO_3H)(OH)(SO_2NH_2)$. From the anhydride and NH_3.—NaA'2aq. Plates.

(1, 1', 3)-(α)-Naphthol disulphonic acid [1:1':3] $C_{10}H_5(OH)(SO_3H)_2$. (α)-*Naphthol 'ε'-disulphonic acid.* Formed from (α)-naphthylamine 'ε'-disulphonic acid by the diazo- reaction (Bernthsen, *B.* 22, 3330; *cf.* Ewer a. Pick, *Monit. Scient.* 1889, 604).—Na_2A'' 6aq: prisms; v. e. sol. water. Its solution is coloured deep blue by $FeCl_3$.

Anhydride $C_{10}H_5(SO_3H)<\substack{O\\SO_2}>$. *Naphthosultone sulphonic acid.* Formed by boiling diazonaphthalene 'ε'-disulphonic acid with dilute H_2SO_4. Needles (containing aq).

Mono-amide [1:1':3]
$C_{10}H_5(OH)(SO_2NH_2)(SO_3H)$. *Naphthol sulphamide sulphonic acid.* Formed by the action of NH_3 on the anhydride. Needles or prisms; m. sol. water.—NaA'aq: needles; v. sol. hot

water.—NH_3NaA'aq: crystals; v. e. sol. water.—BaA'_2 5aq: crystals; m. sol. water.

(α)-Naphthol trisulphonic acid $C_{10}H_8S_3O_{10}$ *i.e.* $C_{10}H_4(OH)(SO_3H)_3$ [1:2:4′:4]. Formed by heating (α)-naphthol with fuming H_2SO_4 (containing 70 p.c. additional SO_3) at 50° (Seltzer, *G. P.* 10,785, Dec. 1879; Caro, *B.* 14, 2028; Claus a. Mielcke, *B.* 19, 1182). Slender needles. Dilute HNO_3 at 50° yields di-nitro-naphthol sulphonic acid. It does not yield azo- dyes or a nitroso-derivative.—$K_4C_{10}H_4S_3O_{10}$; crystals; v. sol. water (Lauterbach, *B.* 14, 2028).

Chloride $C_{10}H_4(OH)(SO_2Cl)_3$. Plates (from chloroform); sl. sol. either; decomposed by fusion. Converted by PCl_5 into tetra-chloro-naphthalene $C_{10}H_4Cl_4$ [140°] and $C_{10}Cl_8$.

(2, 1′)-(β)-Naphthol sulphonic acid [2:1′] $C_{10}H_6(OH)(SO_3H)$ (Pfitzinger a. Duisberg, *B.* 22, 396; Armstrong a. Wynne, *C. J. Proc.* 1889, 50). (β)-*Naphthol 'α'-sulphonic acid. Bayer's acid. Rumpff's acid.* Formed, together with the isomeric acid of Schäffer, by stirring (β)-naphthol (1 pt.) with conc. H_2SO_4 (2 pts.) at about 50° (Bayer a. Co., *G. P.* 18,027, March 18, 1881). When (β)-naphthyl sulphate $C_{10}H_7O.SO_3H$ (obtained by the action of H_2SO_4 on (β)-naphthol at a low temperature) is mixed with H_2SO_4 at 20° it slowly changes to (β)-naphthol 'α'-sulphonic acid. The two isomeric acids of Schäffer and of Bayer may be separated by means of their lead salts (that of the former acid crystallising well) or by treating their sodium salts with 90 p.c. spirit, which dissolves the salt of Bayer's acid but not that of Schäffer's acid. Formed also from (β)-naphthylamine 'α' sulphonic acid (Badische) by diazotising and heating with dilute H_2SO_4 (Forsling, *B.* 20, 2102).

Reactions.—1. Converted by PCl_5 into chloro-(β)-naphthol [101°] and di-chloro-naphthalene [61°].—2. *Potash-fusion* yields di-oxy-naphthalene [175°].—3. With diazotised xylidine it yields in concentrated, but not in dilute solutions, croceïn scarlet.

Salts.—Forms two series of salts—neutral and basic.—NaA': glistening six-sided plates, v. sol. water, sl. sol. alcohol.—$Na_2C_{10}H_6SO_4$: needles, v. sol. alcohol, v. e. sol. water.—ZnA'_2 2aq: needles.—PbA'_2 2½aq: colourless glistening rhombohedra.—$C_{10}H_6SO_5Pb_2$: small yellow crystals.—$C_{10}H_6SO_4(PbOH)_2$: red crystals (Claus a. Volz, *B.* 18, 3154).

(2, 3′)-Naphthol sulphonic acid [2:3′] $C_{10}H_6(OH)(SO_3H)$. (β)-*Naphthol 'β'-sulphonic acid. Schäffer's acid.* [125°].

Formation.—1. By heating (β)-naphthol (1 pt.) with conc. H_2SO_4 (2 pts.) on a water-bath (Schäffer, *A.* 152, 296; Armstrong a. Graham, *C. J.* 39, 135).—2. By fusing naphthalene (β)-disulphonic acid with potash (Ebert a. Merz, *B.* 9, 610; 10, 592).—3. From (β)-naphthylamine sulphonic acid (Brönner's) by the diazo-reaction.

Properties.—Small, non-deliquescent laminæ, v. sol. water and alcohol. $FeCl_3$ turns its solution slightly green and, on warming, brown flakes are deposited. Bleaching-powder gives a yellow colour.

Reactions.—1. *Potash-fusion* yields di-oxy-naphthalene [213°].—2. *Nitrous acid* forms a nitroso- derivative.—3. *Bromine*-water gives mono- and di-bromo- derivatives. The K salt dissolved in HOAc gives with Br yellow plates of $C_{10}H_4BrSO_6K$, which form a blood-red aqueous solution.—4. Conc. HClAq at 200°–210° splits it up into (β)-naphthol and H_2SO_4.—5. The potassium salt (1 mol.) heated with PCl_5 (2 mols.) at 100° forms gelatinous anhydro- naphthol sulphonic acid $C_{10}H_6(OH).SO_2.O.C_{10}H_6.SO_3H$, sol. water, alcohol, and ether. The K salt of this acid crystallises in colourless plates, and is decomposed by boiling alkalis with reproduction of (β)-naphthol sulphonic acid (Claus a. Zimmermann, *B.* 14, 1481). The K salt (1 mol.) heated with PCl_5 (2 mols.) at 150° forms $(SO_3H.C_{10}H_6.O.SO_2.C_{10}H_6)_2O$, an amorphous mass yielding a gelatinous potassium salt K_2A'' (C. a. Z.). The (β)-naphthol sulphonic acid heated with PCl_5 also yields chloro-(β)-naphthol, and finally ε-di-chloro-naphthalene [135°], both of which bodies yield chloro-phthalic acid [148°] on oxidation (Claus a. Dehne, *B.* 15, 319).

Salts.—$KA'x$aq. S. 2 at 15°.—NH_4A'. S. 3 at 24°. Flat prisms or plates (Meldola, *C. J.* 39, 41).—CaA'_2 5aq: silky laminæ, v. sol. water and alcohol, decomposing at 100°.—BaA'_2 6aq: narrow prisms (from boiling saturated solution).—PbA'_2 6aq: small silvery laminæ, v. sol. water.

Ethyl derivative $C_{10}H_6(OEt)SO_3H$. From the (? impure) acid, KOH, and EtI (Maikopar, *Z.* 1870, 366).—KA': needles, sl. sol. cold water.

(β)-Naphthol (γ)-sulphonic acid [2:4′] $C_{10}H_6(OH)(SO_3H)$. Formed from the corresponding (β)-naphthylamine sulphonic acid by the diazo- reaction (Reverdin a. Nölting, *Const. de la Naphthaline*). Yields di-oxy-naphthalene [135°] and di-chloro-naphthalene [48°] (Claus, *J. pr.* [2] 39, 315).

(2, 2′)-(β)-Naphthol sulphonic acid [2:2′] $C_{10}H_6(OH)SO_3H$. (β)-*Naphthol 'δ'-sulphonic acid. Naphthol sulphonic acid* F. [89°]. Formed from (β)-naphthylamine 'δ'-sulphonic acid by the diazo- reaction (Bayer a. Duisberg, *B.* 20, 1431). Formed also, together with Schäffer's acid, by heating (β)-naphthol (100 g.) with H_2SO_4 (70 g.) for 2 or 3 hours at 105° (Green, *B.* 22, 723; *cf.* Armstrong, *B.* 15, 22). It is also a product of the fusion of naphthalene 'α' disulphonic acid with NaOH at 250° (Weinberg, *B.* 20, 2907). Needles (containing aq), v. sol. water and alcohol, insol. ether (W.). PCl_5 (3 pts.) at 165° gives di-chloro-naphthalene [114°], the chief product being a chloro-naphthyl phosphate [215°]. On fusion with potash it yields $C_{10}H_6(OH)_2$ [186°]. Nitrous yields a nitroso- derivative, forming the salt $C_{10}H_5(NO)(OH)SO_3Na$ 2aq crystallising in golden needles.

Salts.—NaA' 2½aq. S. 8 at 15°. Plates.—Ka' aq: crystals, v. sol. water.—MgA'_2 5½aq: plates.—BaA'_2: prisms, sl. sol. water.

(β)-Naphthol sulphonic acid. *Ethyl derivative* $C_{10}H_6(OEt).SO_3H$. Formed by warming the ethyl ether of (β)-naphthol with H_2SO_4 (Maikopar, *Z.* 1870, 366).—KA'aq: needles, sl. sol. cold water.—BaA'_2: needles, v. sl. sol. water.

(β)-Naphthol sulphonic acid. *Ethyl derivative* $C_{10}H_6(OEt)SO_3H$. Two acids of this formula are obtained by treating the ethyl derivative of (β)-naphthol with $ClSO_3H$ (Amphlett a. Armstrong, *C. J. Proc.* 3, 144). The Ba salt of one acid is insol. water, that of the other is sol. water. One of the acids is doubtless identical with the preceding acid.

(2, 1′ 3′)-Naphthol disulphonic acid [2:1′:3′] $C_{10}H_5(OH)(SO_3H)_2$. (β)-*Naphthol ‘β’-disulphonic acid.* (β)-*Naphthol-G-disulphonic acid.* Formed, together with the ‘R’ isomeride, by heating (β)-naphthol (1 pt.) with conc. or fuming H_2SO_4 (2 or 3 pts.) at 100°–110°, and separated from its isomeride through the greater solubility of its Ba salt (Griess, *B.* 13, 1956).

Properties.—Glistening needles, v. sol. water and alcohol. With diazo- compounds it gives scarlets of a much yellower shade than the (α)-acid. PCl_5 (5 mols.) at 210° forms di-chloro-(β)-naphthol [125°] and tri-chloro-naphthalene [90°]; this $C_{10}H_5Cl_3$, when oxidised with CrO_3, yields a syrupy di-chloro-phthalic acid and a tri-chloro-naphthoquinone, whence aniline forms $C_{10}H_3Cl_2(NPhH)O_2$ melting at 228° (Claus a. Schmidt, *B.* 19, 3173).

Salts.—×Na_2A'': tables or prisms, sol. water and dilute alcohol.—BaA'' 8aq: small prisms, v. sol. water.

(2, 3, 3′)-Naphthol disulphonic acid [2:3:3′] $C_{10}H_5(OH)(SO_3H)_2$. (β)-*Naphthol ‘α’-disulphonic acid.* (β)-*Naphthol R-disulphonic acid.* Formed as described above (Griess). White glistening needles, v. sol. water and alcohol, insol. ether. Exhibits a bluish-green fluorescence in ammoniacal solution. When heated in a closed vessel with ammonia it yields a naphthylamine disulphonic acid which, on removal of NH_2, gives rise to naphthalene ‘α’-disulphonic acid of Ebert and Merz (Pfitzinger a. Duisberg, *B.* 22, 398).

Salts.—×Na_2A'': very small soluble needles.—BaA'' 6aq: needles, sl. sol. cold water, v. sol. hot water, insol. alcohol.

(β)-Naphthol-‘δ’-disulphonic acid [2:2′:3] $C_{10}H_5(OH)(SO_3H)_2$. Formed by sulphonating (2, 2′)-naphthol sulphonic acid (Weinberg, *B.* 20, 2911). Solutions of its salts exhibit green fluorescence.—Na_2A'': yellowish powder, v. e. sol. water, sl. sol. 80 p.c. alcohol.—BaA'' 2½aq: prisms. S. ·56 in boiling water.

(β)-Naphthol-‘γ’-disulphonic acid $C_{10}H_5(OH)(SO_3H)_2$. Formed by the action of $ClSO_3H$ on (β)-naphthol (Armstrong, *B.* 15, 204). The Ba salt crystallises in large prisms.

(β)-Naphthol trisulphonic acid $C_{10}H_4(OH)(SO_3H)_3$. Formed by heating (β)-naphthol (1 pt.) with H_2SO_4 (2 pts.) at 70°–80°, adding H_2SO_4 (2 pts.) and heating at 120°, finally adding fuming H_2SO_4 (40 p.c. additional SO_3) (2 pts.) and heating at 150° (Levinstein, *B.* 16, 462). Gives no colour with diazotised xylidine.

References.—Amido-, and Nitro-naphthol sulphonic acids.

(β)-NAPHTHOL VIOLET $C_{18}H_{15}N_2O$. *Meldola's blue.* Formed from nitroso-dimethyl aniline and (β)-naphthol. Dark flocculent powder, forming a red solution in benzene (Meldola, *C. J.* 39, 38).

Hydrochloride B′HCl *i.e.*

$$ClMe_2\overset{\frown}{N.C_6H_3}{<}\genfrac{}{}{0pt}{}{N}{O}{>}C_{10}H_6$$

Bronzed needles, resembling $KMnO_4$. Sol. water and alcohol. Its aqueous solution is violet, but turned blue by H_2SO_4. Reduces to a leuco- base by taking up H_2. Converted by heat into a blue colouring matter

$$NMe_2.C_6H_4.N{<}\genfrac{}{}{0pt}{}{O}{C_{10}H_5.N{<}\genfrac{}{}{0pt}{}{NMe_2(OH)}{C_6H_4}}$$

(Witt, *B.* 23, 2247).

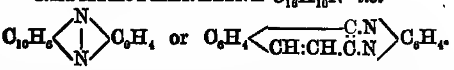
NAPHTHOL-YELLOW S *v.* Dinitro-(α)-naphthol sulphonic acid.

NAPHTHONITRILE *v.* *Nitrile* of Naphthoic acid.

NAPHTHOPHTHALIC ACID. A name for Naphthalene dicarboxylic acid.

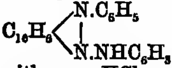
NAPHTHO-OXY-QUINALDINE *v.* Oxy-methyl-naphthoquinoline.

NAPHTHOPHENAZINE $C_{16}H_{10}N$ *i.e.*



$$C_{10}H_6{<}\begin{matrix}N\\ |\\ N\end{matrix}{>}C_6H_4 \text{ or } C_6H_4{<}\begin{matrix}\overline{}C.N\\ CH:CH.C.N\end{matrix}{>}C_6H_4.$$

[142°]. (above 360°). Prepared by boiling sulpho-benzene-azo-phenyl-(β)-naphthylamine with dilute H_2SO_4 (Witt, *B.* 20, 574). Formed by boiling benzene-azo-phenyl-(β)-naphthyl-amine



$$C_{16}H_6{<}\begin{matrix}N.C_6H_5\\ |\\ N.NHC_6H_3\end{matrix}$$

(?) in acetic acid solution with conc. HCl, aniline being eliminated (Zincke a. Lawson, *B.* 20, 1169). Formed also by treating an alcoholic solution of phenyl-(β)-naphthyl-nitrosamine with HCl (Fischer a. Hepp, *B.* 20, 2473), and by distilling with zinc-dust oxy-naphtho-phenazine, which is itself obtained by heating with conc. HClAq at 190° the amido-naphtho-phenazine which results from the action of phenylene o-diamine on benzene-azo-(α)-naphthylamine hydrochloride (Fischer a. Hepp, *B.* 23, 846). Also got by the action of (β)-naphthoquinone (1 mol.) on o-phenylene-diamine (1 mol.) in 50 p.c. acetic acid solution at 0°, and by oxidising a mixture of o-phenylene-diamine and (β)-naphthol with alkaline K_3FeCy_6 (Witt).

Yellowish-white prisms, subliming at about 200° in long flat needles or prisms; v. sol. hot benzene, v. sl. sol. alcohol and ether. Conc. H_2SO_4 dissolves it, forming a brownish-red solution. Its salts are dimorphous. One sulphate crystallises in scarlet needles, the other in garnet-red prisms. One nitrate forms orange needles, the other brick-red needles. One hydrochloride forms long-reddish yellow needles, and changes at 150° into the second form. $SnCl_2$ reduces naphthophenazine to a hydride, crystallising in violet needles.

α-Amido-naphthophenazine $C_{16}H_{11}N_3$ *i.e.*

$$C_6H_4{<}\begin{matrix}\overline{}C.N\\ C(NH_2):CH.C.N\end{matrix}{>}C_6H_4.$$

[264°]. Obtained by heating o-phenylene diamine (1 mol.) with benzene-azo-(α)-naphthylamine hydrochloride (1 mol.) in alcohol at 160° (F. a. H.). Golden needles (from alcohol), insol. water, sl. sol. ether and cold alcohol. Its solutions have a yellowish-green fluorescence. Its solution in conc. HClAq or conc. H_2SO_4 is green.—B′HCl.—$B'_2H_2PtCl_6$.—$B'HAuCl_4$.

Acetyl derivative $C_{16}H_{10}AcN_3$. Yellow crystalline powder.

Amido-naphthophenazine $C_{10}H_5(NH_2):N_2C_6H_4$. [191°]. Obtained by reducing the nitro- compound with alcoholic ammonium sulphide (Zaertling, *B.* 23, 176). Brownish-red crystals, sl. sol. alcohol and ether, v. e. sol. boiling aniline.—B′HCl.

Phenylo-chloride of Amido-naphthophenazine $C_{22}H_{16}N_3Cl$ *i.e.*

$$C_{10}H_6{<}\begin{matrix}N\overline{}\\ NPhCl\end{matrix}{>}C_6H_3NH_2.$$

Formed by the action of quinone dichlorimide on phenyl-(β)-naphthylamine (Nietzki a. Otto, *B.* 21, 1600).

Yields a base which is a bluish-violet pp. and a nitrate $C_{22}H_{16}N_3NO_3$ crystallising in slender needles. Yields naphthophenazine on elimination of NH_2 by the diazo-reaction.

Reference.—Eurhodines.

Nitro-naphthophenazine $C_{10}H_5(NO_2):N_2:C_6H_4$ [222°]. Formed by heating nitro-(β)-naphthoquinone with *o*-phenylene-diamine, HOAc, and NaOAc on the water-bath (Z.). Greenish-yellow prisms, sl. sol. alcohol and ether. Forms a crimson solution in conc. H_2SO_4.—$B'2H_2SO_4$: brown plates.

NAPHTHOPHENAZINE CARBOXYLIC ACID $C_{16}H_9N_2(CO_2H)$. [above 300°]. Obtained by heating its nitrile with KOHAq under pressure at 225° (Brunner a. Witt, *B.* 20, 2663). Needles m. sol. water and most solvents. Conc. H_2SO_4 forms a deep-red solution, becoming yellow on dilution.

Nitrile $C_{16}H_9CyN_2$. [237°]. Formed from sodium naphthophenazine sulphonate and KCy. Forms a cherry-red solution in conc. H_2SO_4, becoming yellow on dilution.

Naphthophenazine sulphonic acid $C_{16}H_9(SO_3H)N_2$. [above 290°]. Formed by sulphonating naphthophenazine with fuming H_2SO_4 (35 p.c.) (Brunner a. Witt, *B.* 20, 2660). Orange-red needles, sol. boiling water and alcohol. KOH yields yellow flakes of a eurhodol. H_2SO_4 forms an orange-red solution.—NaA′ 2aq.

NAPHTHOPIASELENOL *v.* Selenium organic compounds.

NAPHTHOPIAZTHIOLE 
$$C_{10}H_6<\begin{matrix}N\\N\end{matrix}>S.$$

[81°]. Formed by heating (αβ)-naphthylene-diamine (2 g.) dissolved in alcohol, with a conc. solution of sodium bisulphite (15 c.c.) at 190° for 7 hours (Hinsberg, *B.* 23, 1393). Long needles (from MeOH), m. sol. water. Pleasant odour. Somewhat volatile with steam. Weak base. Gives a yellow colour with conc. H_2SO_4. Reduced by tin and HCl to H_2S and naphthylene diamine.

NAPHTHOPICRIC ACID, so-called, *v.* Trinitro-α-naphthol.

NAPHTHO-QUINALDINE *v.* (*Py.* 3)-Methyl-naphtho-quinoline.

(α)-NAPHTHOQUINOLINE $C_{13}H_9N$ *i.e.*

$$C_6H_4<\begin{matrix}CH:CH.C.CH:CH\\ \text{———}C.\ N:CH\end{matrix}.$$

Formed by heating a mixture of (α)-nitro-naphthalene, (α)-naphthylamine, glycerin, and H_2SO_4 (Skraup, *M.* 2, 162; 4, 460). Formed also by distilling its dicarboxylic acid (Doebner a. Peters, *B.* 23, 1235). White prisms (from ether), insol. water, sol. alcohol, ether, benzene, and dilute acids. Smells like naphthylamine. On oxidation with chromic acid it yields the quinone $C_{13}H_7NO_2$ or

$$C_6H_4<\begin{matrix}\text{———}C.\ N:CH\\ CO.CO.C.CH:CH\end{matrix},$$

which forms orange crystals, [205°], sol. alcohol, benzene, ether, and HClAq, insol. water. $KMnO_4$ oxidises it to phenyl-pyridine dicarboxylic acid.

Salts.—Hydrochloride: pale-yellow needles.—$B'_2H_2PtCl_6$ 2aq: bright-yellow prisms, v. sl. sol. water.—$B'H_2SO_4$: yellowish prisms, v. e. sol. water.—$B'H_2Cr_2O_7$ 6aq: needles, sl. sol. cold water.—$B'C_6H_2(NO_2)_3OH$: minute needles.

Methylo-iodide B′MeI 2aq. Needles.

Octohydride $C_{13}H_{17}N$ *i.e.*

$$\begin{matrix}CH_2.CH_2.C.CH:CH.C.CH_2.CH_2\\ CH_2.CH_2.C\text{———}C.NH.CH_2\end{matrix}.$$

Crystals (Bamberger, *B.* 22, 354).

(β)-Naphthoquinoline $C_{13}H_9N$ *i.e.*

$$C_6H_4<\begin{matrix}CH:CH.C.\ N:CH\\ \text{———}C.CH:CH\end{matrix}.$$

[94°] (above 360°). Formed by heating (β)-naphthylamine (28 pts.) with nitro-benzene (13 pts.), glycerin (50 pts.), and conc. H_2SO_4 (40 pts.) at 150°–160° (Skraup a. Cobenzl, *M.* 4, 436). The crude product is neutralised with alkali, extracted with ether, and distilled. In this reaction (1,2)-bromo-(β)-naphthylamine [63°] may be substituted for (β)-naphthylamine, and nitro-phenol may be used instead of nitro-benzene (Lellmann a. Schmidt, *B.* 20, 3154). Formed also by heating (1,2)-nitro-(β)-naphthylamine with glycerin and H_2SO_4 (L. a. S.). Obtained likewise by distilling its carboxylic acids.

Properties.—Colourless crystals, sl. sol. water, sol. ether, alcohol, benzene, and acids. Its alcoholic solution gives a brown colouration with $FeCl_3$, and a green colour with cupric acetate.

Reactions.—1. $KMnO_4$ oxidises it to (β)-phenyl-pyridine dicarboxylic acid.

Salts.—B′HCl 2aq: long needles, v. sol. water, sl. sol. alcohol.—$B'_2H_2PtCl_6$ aq: orange crystalline pp. — $B'_2H_2Cr_2O_7$: short golden prisms.—B′IClHCl. [c. 148°]. Yellow needles, obtained by adding a solution of ICl in HClAq to a solution of the base (Dittmar, *B.* 18, 1616).—Picrate [252°].

Methylo-iodide B′MeI 2aq. [200°–205°]. Light-yellow needles, exhibiting a blue fluorescence in aqueous solution.

Octohydride $C_{13}H_{17}N$ *i.e.*

$$\begin{matrix}CH_2.CH_2.C.CH:CH.C.NH.CH_2\\ CH_2.CH_2.C\text{———}C.CH_2.CH_2\end{matrix}.$$

[60°]. Obtained by boiling (β)-naphtho-quinoline with isoamyl alcohol, and sodium (Bamberger, *B.* 22, 354). At the same time there is formed an isomeric

$$C_6H_4<\begin{matrix}CH_2.CH_2.CH.NH.CH_2\\ \text{———}CH.CH_2.CH_2\end{matrix}.$$

[91°].

Reference.—Oxy-, Oxy-methyl-, and Phenyl-naphthoquinoline.

(β)-NAPHTHOQUINOLINE CARBOXYLIC ACID $C_{14}H_9NO_2$ *i.e.*

$$C_6H_4<\begin{matrix}CH:CH.C.\ N:CCO_2H\\ \text{———}C.CH:CH\end{matrix}.$$

[187°]. Obtained by oxidising methyl-(β)-naphthoquinoline with $KMnO_4$ and H_2SO_4 (Seitz, *B.* 22, 261). White crystalline powder, insol. water, m. sol. boiling alcohol.—NaA′ 2½aq. Crystals, sl. sol. cold water.—BaA'_2 4aq: flocculent pp., becoming crystalline on long boiling; insol. water.—CuA'_2 1½aq: crystalline, insol. water.—B′HCl: yellow needles, v. sl. sol. boiling dilute HClAq.—$B'_2H_2PtCl_6$ 2aq: yellow needles, v. sl. sol. hot dilute HClAq.

(α)-Naphthoquinoline (*Py.* 1, 3)-dicarboxylic acid

$$C_6H_4<\begin{matrix}CH:CH.C.C(CO_2H)\ CH\\ \text{———}C.N{=\!=\!=}C.CO_2H\end{matrix}.$$

[278°]. Formed by oxidising (α)-styryl-(α)-naphthoquinoline carboxylic acid with cold aqueous $KMnO_4$ (Doebner a. Peters, *B.* 23, 1234). Groups of greenish-yellow needles, insol. cold water, sl. sol. hot water, ether, cold alcohol, and dilute HClAq, v. sol. conc. HClAq.

Salts.—The salts of the alkalis and alkaline earths are v. sol. water. The Pb and Cd salts are white pps.—CuA″2aq: dirty-green pp., sl. sol. water.—Ag_2A'': white flocculent pp.

(β)-Naphthoquinolino-(*Py.* 1, 3)-dicarboxylic acid

$C_6H_4<\begin{matrix}CH:CH.C.N{=\!=\!=}C.CO_2H\\ \text{———}C.C(CO_2H):CH\end{matrix}$. [288°].

Formed by oxidation of (α)-styryl-(β)-naphthoquinoline carboxylic acid by $KMnO_4$ (Doebner a. Peters, *B.* 23, 1240). Very slender light-yellow needles, sl. sol. ether, cold alcohol, and benzene, v. sol. HOAc and alkalis.—BaA'_2aq: white flocculent pp.—Ag_2A'': powder, sl. sol. water.

NAPHTHOQUINOLINE SULPHONIC ACID $C_{13}H_9NSO_3$ *i.e.*

$C_4H_3(SO_3H)<\begin{matrix}C.CH:CH.C.\ N:CH\\ O\text{————}C.CH:CH\end{matrix}$

Obtained from (β)-naphthylamine sulphonic acid of Forsling (*B.* 20, 2099) by heating with glycerin, H_2SO_4, and nitrobenzene (Immerheiser, *B.* 22, 404; *cf.* Gentil, *B.* 18, 201). Small needles, nearly insol. water. Very dilute solutions of the acid and its salts fluoresce blue.—$BaA'_2\,4aq$. Splendid prisms.

(α)-NAPHTHOQUINONE $C_{10}H_6O_2$ *i.e.*

$C_6H_4<\begin{matrix}CO.CH\\ CO.CH\end{matrix}$. (α)-*Naphthaquinone.* Mol. w. 158. [125°].

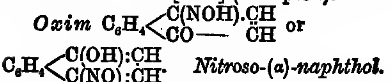
Formation.—1. By oxidation of naphthalene by CrO_3 in HOAc (Groves, *C. J.* 26, 209; *cf.* Hermann, *A.* 151, 63).—2. By oxidising with chromic acid the following bodies: naphthylene-*p*-diamine, and its acetyl derivative (Liebermann a. Dittler, *B.* 6, 945), (α)-naphthylamine and its sulphonic acid (Reverdin a. Nölting, *B.* 12, 2305), (α)-amido-(α)-naphthol (Liebermann, *A.* 183, 242), and the acetyl derivative of (α)-naphthol (Miller, *B.* 14, 1600).

Preparation.—1. Naphthalene (10 g.) is dissolved in HOAc (60 g.); to this is slowly added a solution of CrO_3 (30 g.) in water (20 c.c.). The mixture is heated at 100°. Water (30 g.) is added, and the liquid, when cooled to 20°, filtered from naphthalene. From the filtrate water precipitates naphthoquinone. Recrystallised from light petroleum (Japp a. Miller, *C. J.* 39, 220; *cf.* Groves, *C. J.* 26, 209; Plimpton, *C. J.* 37, 634; Miller, *Bl.* [2] 43, 125).—2. (α)-Naphthol-orange (Tropeoline 000 No. 1) is reduced to sulphanilic acid and (1:4) amido-naphthol, the latter is oxidised and the quinone purified by distillation with steam; the yield is 40 p.c.—3. By oxidation of (α)-naphthylamine (1 pt.) with H_2SO_4 (6 pts.), water (25 pts.), and $K_2Cr_2O_7$ (2½ pts.), in the cold (Monnet, Reverdin, a. Nölting, *B.* 12, 2306).

Properties.—Yellow triclinic needles, which begin to sublime below 100°. Volatile with steam. V. sl. sol. water and ligroïn, v. sol. benzene, CS_2, chloroform, ether, HOAc, conc. H_2SO_4, and boiling alcohol. Smells like quinone. Alkalis form a reddish-brown solution. It is not attacked by SO_2 in the cold. Reacts in alcoholic solution with primary amines forming compounds represented by $C_{10}H_6O_2NR$, which may be considered to be alkyl-amido-(α)-naphthoquinones or more probably as oxy-(β)-naphthoquinone alkylimides. Secondary amines act forming compounds represented by $C_{10}H_5O_2NRR'$; but diphenylamine acts only in presence of HCl. Tertiary amines do not react in this way. Hydro-naphthoquinone may be used instead of naphthoquinone, being oxidised by the air. Salts of amines may be used instead of amines. The compounds crystallise in needles (Plimpton, *C. J.* 37, 633).

Reactions.—1. Naphthoquinone dissolves in aqueous KOH and Na_2CO_3, and on adding acids a red body is ppd. This is also got by oxidising naphthalene with CrO_3 in acetic acid and neutralising the hot liquid with Na_2CO_3 (A. Guyard, *Bl.* [2] 31, 64; Plimpton, *C. J.* 37, 641). It is soluble in benzene and ppd. from it by light petroleum as a dark-red powder. This substance was named carminaphthe by Laurent (*Rev. Scient.* 14, 560), who ascribed to it the formula $C_{18}H_8O_3$.—2. Boiling *nitric acid* oxidises it to phthalic acid.—3. Boiling HIAq and P reduce it to hydronaphthoquinone [176°]. Tin and HCl act in like manner.—4. When boiled with an aqueous solution of an equivalent of *hydronaphthoquinone* there is deposited on cooling dark-purple crystals of naphthoquinhydrone $C_{20}H_{14}O_4$. It is readily converted by oxidising agents into naphthoquinone and by reducing agents into hydronaphthoquinone.—5. *Bromine* in presence of iodine forms di-bromo-naphthoquinone [218°] (Miller, *Bl.* [2] 43, 125).—6. Heated with *benzoic acid* at 160° it forms needles of 'benzonaphthone' $C_{27}H_{12}O_3$? which may be purified by successive boiling with aniline, and alcohol (Japp a. Miller, *C. J.* 39, 221). This body is insoluble in ordinary solvents and in aqueous NaOH. Aqueous $KMnO_4$ oxidises it to phthalic acid. It is not affected by $ZnEt_2$, and therefore contains no hydroxyl.—7. Boiling fuming HClAq forms a green amorphous powder, insol. water, alcohol, and ether, but partially dissolving in HOAc forming a blue solution (Krapp a. Schultz, *A.* 210, 178).—8. *Phenyl-hydrazine* reacts forming benzene-azo-(α)-naphthol $C_{10}H_6(OH).N_2Ph$.—9. On adding aqueous *ammonia* to alcoholic naphthoquinone the liquid becomes brown and, by precipitation by water, a red-brown amorphous body is formed, probably Laurent's 'carminaphthe' (Plimpton, *C. J.* 37, 641).—10. Yellow *ammonium sulphide* produces a red powder melting with complete decomposition at about 300° (Willgerodt, *B.* 20, 2470).—11. When a solution of *methylamine* (acetate) is added slowly to a small quantity of naphthoquinone dissolved in alcohol, methyl-amido-naphthoquinone $C_{10}H_6O_2NMe$ [232° uncor.], is formed. It crystallises from alcohol in red needles, which are reduced by SO_2 forming a substance crystallising in white needles (Plimpton, *C. J.* 37, 639).—12. When an alcoholic solution of naphthoquinone is mixed with excess of aqueous *dimethylamine* the solution neutralised with acetic acid and the liquid allowed to evaporate spontaneously, there is deposited a substance $C_{10}H_5O_2NMe_2$ which crystallises from alcohol in bright-red needles [118°] (Plimpton, *C. J.* 37, 642).—13. With *ethylamine acetate* in alcoholic solution a brown liquid is formed. If this is boiled with charcoal, filtered and evaporated deposits ethyl-amido-naphthoquinone $C_{10}H_6O_2NEt$ as red needles [140°]. It may be sublimed, and is soluble in benzene, hardly so in light petroleum (Plimpton, *C. J.* 37, 640).—14. *Aniline* in alcoholic solution forms a red liquid. If this solution is heated to boiling and poured into water, the pp. washed with dilute acetic acid and crystallised from alcohol, animal charcoal being used, the product is phenyl-amido-naphthoquinone $C_{10}H_6O_2NPh$ [191°] (Plimpton, *C. J.* 37, 635). It crystallises in red needles, v.

sol. hot alcohol, benzene, and ether. Insol. light petroleum. It forms a crimson solution in conc. H_2SO_4 from which it is ppd. unchanged by water. It forms a purple solution in alcoholic potash. It is not attacked by acetic or benzoic anhydride. It is attacked by conc. HCl at 170° and by aqueous SO_2 at 125°, aniline being among the products (Plimpton, *C. J.* 37, 635; *cf.* Zincke, *B.* 12, 1645; 14, 92).—15. *p-Bromo-aniline* forms, in like manner, when heated with (*α*)-naphthoquinone or oxy-(*α*)-naphthoquinone, red needles [266°–269°] (Baltzer, *B.* 14, 1899).—16. *m-Nitro-aniline* yields $C_{10}H_5(NHC_6H_4NO_2)O_2$ [270°] (B.). 17. *p-Nitro-aniline* forms $C_{10}H_5(NHC_6H_4NO_2)O_2$ melting above 270°, which may be reduced to $C_{10}H_5(NH.C_6H_4NH_2)O_2$ [177°] (B.).—18. *Ethyl-aniline* produces $C_{10}H_5(NPhEt)O_2$ crystallising in violet needles [155°] (Elsbach, *B.* 15, 1810).—19. *o-Toluidine* forms $C_{10}H_5(NHC_7H_7)O_2$ crystallising in red needles (Elsbach, *B.* 15, 689).—20. *p-Toluidine* forms $C_{10}H_5(NHC_7H_7)O_2$ crystallising from alcohol in red needles [200°] and forming a crimson solution in conc. H_2SO_4 (Plimpton, *C. J.* 37, 638; Elsbach, *B.* 15, 687).—21. *Diphenyl-amine* forms $C_{10}H_5(NPh_2)O_2$ crystallising from alcohol in needles [164°] (Plimpton).



Oxim $C_6H_4<\begin{array}{l}C(NOH).CH\\CO\text{——}\ \ CH\end{array}$ or $C_6H_4<\begin{array}{l}C(OH):CH\\C(NO):CH\end{array}$. *Nitroso-(α)-naphthol.*

Formed, together with a greater quantity of the (*β*)-oxim of (*β*)-naphthoquinone, by the action of nitrous acid on (*α*)-naphthol (Fuchs, *B.* 8, 626). Prepared by the action of hydroxylamine hydrochloride on (*α*)-naphthoquinone (Goldschmidt, *B.* 17, 2064). Yellowish needles, decomposing at about 190°. V. sol. alcohol and ether, sl. sol. CS_2 and hot benzene. Slightly volatile with steam. Dissolves in alkalis, but is reppd. by CO_2. Does not colour mordants (Kostanecki, *B.* 22, 1347). *Reactions.*—1. *Nitric acid* converts it into di-nitro-(*α*)-naphthol.—2. Alcoholic K_3FeCy_6 forms nitro-(*α*)-naphthol.—3. PCl_5 forms '*β*'-di-chloro-naphthalene [68°].—4. *Phenyl cyanate* unites, forming $C_{10}H_5(OH):NO.CO.NHPh$, which crystallises in yellow prisms [170°] (Goldschmidt a. Strauss, *B.* 22, 3106).—5. Boiling with *aniline* and HOAc yields phenyl-(*β*)-amido-(*α*)-naphtho-quinone anilide $C_{10}H_5(NHPh)<\begin{array}{l}O\\NPh\end{array}$ [187° cor.] (Brömme, *B.* 21, 393).—6. *p*-Toluidine forms, in like manner, *p*-tolyl-amido-(*α*)-naphthoquinone *p*-toluide [183° cor.] (B.).—7. *ψ-Cumidine* forms *ψ*-cumyl-amido-(*α*)-naphthoquinone *ψ*-cumidide [181° cor.].—8. *Naphthylamine* forms (*α*)-naphthyl-amido-(*α*)-naphthoquinone-(*α*)-naphthalide [178° cor.].—9. *Bromine* in HOAc forms di-bromo-(*α*)-naphthoquinone oxim $C_{10}H_4Br_2<\begin{array}{l}O\\NOH\end{array}$ [175°] (Brömme, *B.* 21, 391). *Methyl ether* A′Me. [100°]. Yellow crystals; v. sol. alcohol, ether, and benzene, insol. water; dissolves in H_2SO_4 with a yellow colour (Ilinski, *B.* 17, 2589).

Di-oxim $C_{10}H_6(NOH)_2$[1:4]. [207°]. Formed by boiling the mono-oxim for two days with hydroxylamine and alcohol (Nietzki a. Guitermann, *B.* 21, 433). Slender colourless needles, sol. alcohol and ether; decomposed by melting. With Ac_2O it yields $C_{10}H_6(NOAc)_2$ [160°]. Tin and HCl reduce it to naphthylene-diamine. Alkaline $KMnO_4$ oxidises it to di-nitroso-naphthalene $C_{10}H_6(NO)_2$, a yellow powder, exploding at 120°.

Di-chloro-di-imide $C_{10}H_6(NCl)_2$. [137°]. Formed from naphthylene-*p*-diamine hydrochloride and a cold solution of bleaching powder (Friedländer a. Böckmann, *B.* 22, 591). Yellow needles (from alcohol and xylene), smelling strongly like quinone. Reconverted by reducing agents to naphthylene-diamine. Conc. HClAq in HOAc converts it into di-chloro-(*α*)-naphthoquinone [190°].

Di-phenyl-di-imide $C_{10}H_6(NPh)_2$. [187°]. Formed by heating benzene-azo-(*α*)-naphthylamine with aniline at 150° (Fischer a. Hepp, *A.* 256, 264). Golden plates, sl. sol. alcohol.

Tetrahydride $\begin{array}{l}CH_2.CH_2.C.CO.CH\\CH_2.CH_2.C.CO.CH\end{array}$. [55·5°]. Obtained by oxidising (*α*)-naphthylamine tetrahydride with $Na_2Cr_2O_7$ and H_2SO_4 (Bamberger a. Lengfeld, *B.* 23, 1131).

(β)-Naphthoquinone $C_6H_4<\begin{array}{l}CO.CO\\CH:CH\end{array}$. *Formation.*—By oxidation of amido-(*β*)-naphthol, which is got by reducing its (*α*)-oxim (nitroso-(*β*)-naphthol) (Stenhouse a. Groves, *C. J.* 32, 47; 33, 415; *A.* 189, 153; 194, 202; Liebermann a. Jacobson, *A.* 211, 40). The amido-(*β*)-naphthol may also be obtained by reducing (*β*)-naphthol orange (*v.* Azo- COMPOUNDS).

Preparation.—Amido-(*β*)-naphthol hydrochloride (1 pt.) is dissolved in saturated aqueous SO_2, and when cold the solution is poured into ferric chloride solution (12 pts., containing 1·2 pts. Fe_2O_3). The quinone is deposited as golden needles (Groves, *C. J.* 45, 298).

Properties.—Orange needles (from alcohol) or red needles (from ether). Softens and decomposes at 115°–120°. Has no smell. Is not volatile with steam. Dissolves in alkalis, forming a yellow solution, which absorbs oxygen from the air.

Reactions.—1. Boiling *nitric acid* forms phthalic acid.—2. SO_2 *reduces* it to hydro-(*β*)-naphthoquinone. HIAq acts in like manner (S. a. G.). Tin and HClAq reduce it to 'di-naphthyl dihydroquinone' $C_{20}H_{14}O_4$ crystallising in colourless needles [178°] (Korn, *B.* 17, 3024). 3. Dilute H_2SO_4 forms, on warming, 'di-naphthyl-diquinhydrone' $C_{20}H_{12}O_4$, a black insoluble powder (S. a. G.).—4. *Chlorine* passed into its solution in HOAc forms chloro-naphthoquinone and the compound $C_6H_4<\begin{array}{l}CO.CO\\CHCl.CCl_2\end{array}>$ which crystallises in monoclinic needles (containing 2aq) [112°], and, when anhydrous, melts at 128° (Zincke, *B.* 20, 2892).—5. An alcoholic solution of *aniline* forms the anilide $C_{16}H_{11}NO_2$, probably oxy-(*α*)-naphthoquinone anilide $C_{10}H_6(OH)<\begin{array}{l}O\\NPh\end{array}$ (Liebermann a. Jacobson, *A.* 211, 75; Zincke, *B.* 14, 1494). This substance crystallises in red or yellow needles melting above 240°, insol. water, sl. sol. alcohol and hot benzene. It is split up by boiling acids into aniline and oxy-(*α*)-naphthoquinone. Boiling HOAc converts it into phenyl-amido-(*α*)-naphthoquinone. With NaOEt and alkyl bromides it gives the compounds $C_{10}H_5(OMe)O(NPh)$ [151°], $C_{16}H_{10}EtNO_2$ [104°], $C_{16}H_{10}PrNO_2$ [100°], and $C_{16}H_{10}PrNO_2$ [104°] (Zincke, *B.* 15, 279). The so-called dianilide of (β)-naphthoquinone, which is formed by heating di-bromo-(α)-naphthol with aniline, is probably the anilide of phenyl-amido-(β)-naphthoquinone $C_{10}H_5(NPhH){<}\begin{matrix}O\\NPh\end{matrix}$. It crystallises in orange-red needles [179°] (Meldola, *C. J.* 45, 157; *cf.* Zincke, *B.* 15, 481). This body has also been described as di-phenyl-di-imido-naphthol $C_{10}H_5(OH)(NPh)_2$ (Griess, *B.* 13, 123). The corresponding di-*p*-toluide [o. 175°] and di-(β)-naphthalide [247°], prepared by the same reaction from di-bromo-(α)-naphthol, are probably constituted in a similar manner.—6. *Ethyl-aniline* forms phenyl-ethyl-amido-(β)-naphthoquinone $C_{10}H_5(NPhEt)O_2$? which crystallises in thick red needles [165°], insol. NaOHAq, and is resolved by dilute HClAq into ethyl-aniline and (β)-oxy-(α)-naphthoquinone (Elsbach, *B.* 15, 691).—7. o-*Toluidine* forms $C_{17}H_{12}NO_2$, probably $C_{10}H_5(OH){<}\begin{matrix}O\\NC_7H_7\end{matrix}$, which crystallises in red needles, sol. NaOHAq. It is not affected by HOAc at 150°. Boiling dilute HClAq splits it up into *o*-toluidine and (β)-oxy-(α)-naphthoquinone (Elsbach, *B.* 15, 689).—8. *p-Toluidine* forms the *p*-toluide $C_{17}H_{13}NO_2$, probably $C_{10}H_6(OH){<}\begin{matrix}O\\N.C_6H_4Me\end{matrix}$, which crystallises in red needles [246°], sol. NaOHAq. On heating with dilute HClAq at 130° it forms (β)-oxy-(α)-naphthoquinone, and this body is probably an intermediate product in the conversion of (β)-naphthoquinone *p*-toluide into (α)-naphthoquinone *p*-toluide, which takes place on heating with acetic acid at 150° (Elsbach, *B.* 15, 686). It gives the following ethers:—$C_{17}H_{12}MeNO_2$ [150°], $C_{17}H_{12}EtNO_2$ [137°], and $C_{17}H_{12}PrNO_2$ [139°] (Zincke a. Brauns, *B.* 15, 1969).—9. Boiling with ammonium acetate forms (β)-naphthazine.

Phenyl hydrazide $C_{10}H_6{<}\begin{matrix}O\\N_2HC_6H_5\end{matrix}$. *Benzane-o-azo-(α)-naphthol.* [138°]. Formed by the action of phenyl-hydrazine hydrochloride upon (β)-naphthoquinone suspended in acetic acid (Zincke a. Bindewald, *B.* 17, 3030). Long red needles, sol. hot alcohol and hot HOAc, insol. water. Does not combine with acids or bases. Yields amido-naphthol on reduction with $SnCl_2$. Bromine in HOAc forms $C_{16}H_{10}Br_2N_2O$ [215°–219°].

o-Tolyl-hydrazide $C_{17}H_{14}N_2O$ *i.e.* $C_{10}H_6{<}\begin{matrix}O\\N.NHC_7H_7\end{matrix}$. [156°]. Red plates, with golden lustre, v. e. sol. alcohol. Reduced by $SnCl_2$ to amido-naphthol. Nitric acid oxidises it to di-nitro-naphthol. Bromine forms $C_{17}H_{12}Br_2N_2O$ [254°].

p-Tolyl-hydrazide $C_{17}H_{14}N_2O$ *i.e.* $C_{15}H_6{<}\begin{matrix}O\\N.NHC_7H_7\end{matrix}$. [145°]. Red needles (Zincke a. Rathgen, *B.* 19, 2491). Forms $C_{17}H_{12}Br_2N_2O$ [136°].

(α)-Oxim $C_6H_4{<}\begin{matrix}C(NOH).CO\\CH{=\!=\!=}CH\end{matrix}$. *(α)-Nitroso-(β)-naphthol.* [109·5°]. S. (alcohol) 2·4 at 13°. Prepared by adding a concentrated aqueous solution of $NaNO_2$ (50 pts.) to a boiling solution of (β)-naphthol (100 pts.) and $ZnCl_2$ (75 pts.) in spirit (600 pts.). After cooling, and standing for some hours, the brown zinc salt which separates is washed with alcohol, suspended in water (1000 pts.), and digested for a short time with NaOH (90 pts.). After cooling, the sodium salt is filtered off, washed with a little water, and decomposed by cold HCl. The yield is 110 p.c. of the naphthol (Henriques a. Ilinski, *B.* 18, 704; *cf.* Groves, *C. J.* 45, 295; Stenhouse a. Groves, *C. J.* 32, 47; *A.* 189, 146; Fuchs, *B.* 8, 1026).

Properties.—Thin plates or short thick orange prisms. V. sl. sol. boiling water, sl. sol. ligroïn, v. e. sol. ether, benzene, and HOAc. Volatile with steam (when pure). *Reactions.*—1. Aqueous *ammonia* at 100° forms a compound $C_{10}H_8N_2O$, probably the oxim of naphthoquinonimide $C_{10}H_6{<}\begin{matrix}NH\\N.OH\end{matrix}$, which crystallises from alcohol in green needles [152°], soluble in alcohol, ether, acids, and alkalis. It is converted by nitrous acid into an unstable nitrosamine $C_{10}H_6{<}\begin{matrix}N(NO)\\NOH\end{matrix}$ [244°], which forms the salts $KC_{10}H_6N_3O_2$ and $AgC_{10}H_6N_3O_2$. Naphthoquinonimide-oxim is reduced by ammonium sulphide to a base $C_{10}H_8N_2$ [92°–95°]. Naphthoquinonimide-oxim forms the salts $KC_{10}H_7N_2O$, a red powder; $C_{16}H_8N_2OHCl$, yellow plates; $(C_{10}H_8N_2O)_2H_2PtCl_8\,2aq$, orange needles, and $C_{10}H_8N_2OHNO_3$.—2. Dilute *nitric acid* forms nitro-naphthol.—3. *Ammonium sulphide* reduces it to amido-naphthol.—4. *Chlorine* passed into a cold solution of the oxim in chloroform yields $C_6H_4{<}\begin{matrix}C(NOH).CO\\CH{=\!=\!=}CCl\end{matrix}$, crystallising in yellowish red needles (Zincke a. Schmunk, *A.* 257, 133). This body takes up more chlorine, forming $C_6H_4{<}\begin{matrix}C(NOH).CO\\CCl_2{-\!-\!-}CHCl\end{matrix}$, which crystallises in white needles [186°], and when treated with potash changes to the di-chloro- derivative $C_6H_4{<}\begin{matrix}C(NOH).CO\\CCl{=\!=\!=}CCl\end{matrix}$ [166°].—5. *Bromine* added to its solution in chloroform unites forming $C_{10}H_7NO_2Br_2$ crystallising in colourless needles [131°], which dissolve in alkalis, changing to $C_6H_4{<}\begin{matrix}C(NOH).CO\\CH{=\!=\!=}CBr\end{matrix}$, crystallising in yellow needles [172°]. The last body is also formed by adding bromine to a solution of (β)-naphthoquinone (α)-oxim in cold HOAc. Bromine added to a hot solution in HOAc forms a bromo-naphthoquinone [201°] (Brömme, *B.* 21, 386).—6. *Phenyl cyanate* forms $C_{16}H_6{<}\begin{matrix}O\\NO.CO.NHPh\end{matrix}$, crystallising in felted needles [128°] (Goldschmidt a. Strauss, *B.* 22, 3106).—7. SO_2 or $NaHSO_3$ acting on its alcoholic solution form amido-naphthol sulphonic acid (Schmidt, *J. pr.* [2] 42, 156).—8. *Aniline* in HOAc forms the same phenyl-amido-naphthoquinone anilide as it forms with the two other naphthoquinone-oxims (Brömme, *B.* 21, 393). **Salts.**—NaA′: green pp. (from alcoholic solution), sl. sol. water.—KA′: lustrous green plates, sol. water and alcohol.—NH_4A': green plates.—CoA'_2: brownish-red pp.—CoA'_3: purple-red pp., soluble without alteration in alcohol, aniline, phenol, conc. H_2SO_4, and HNO_3; it is very stable towards acids, alkalis, oxidising agents, and reducing agents (Ilinski a. Knorr, *B.* 18, 699).—NiA'_2: brownish-yellow pp., sl. sol. water and alcohol, easily decomposed by acids (difference from the cobalt salt).—FeA'_3: black pp., insol. water, v. sol. aniline, forming a dark-brown solution.—CuA'_2; lustrous brown pp., sol. dilute HClAq and 50 p.c. acetic acid.—AgA': reddish-brown powder, insol. water and alcohol. $Ag(NH_4)A'_2$; slender green needles, insol. water and alcohol.—$AgHA'_2$; microcrystalline brown pp., sol. alcohol (Ilinski, *B.* 17, 2581; 18, 2728).

Methyl ether of the (α)*-oxim* $C_6H_4\left<\begin{array}{l}\mathrm{C(NOMe).CO}\\ \mathrm{CH{=\!=\!=}CH}\end{array}\right.$. [75°]. Long yellow needles, v. sol. alcohol, ether, and benzene, m. sol. hot water, sl. sol. cold ligroïn. Forms a deep-red solution in H_2SO_4. Yields (α)-amido-(β)-naphthol on reduction with tin and HClAq (Goldschmidt a. Schmid, *B.* 18, 571).

Ethyl ether of the (α)*-oxim* $C_{10}H_6O(NOEt)$. [50°–60°]. Needles (from alcohol-ligroïn) (Ilinski, *B.* 19, 341).

Benzoyl derivative $C_{10}H_6O(NOBz)$. [114°].

(β)*-Oxim* $C_6H_4\left<\begin{array}{l}\mathrm{CO.C(NOH)}\\ \mathrm{CH{:}CH}\end{array}\right.$. (β)*-Nitroso-*(α)*-naphthol.* [148°] (W.); [152°] (G.). This is the chief product of the action of nitrous acid on (α)-naphthol (Fuchs, *B.* 8, 626). It may be separated from the oxim of (α)-naphthoquinone (*v. supra*), which accompanies it by means of their sodium salts (Worms, *B.* 15, 1816). It is also obtained by boiling (β)-naphthoquinone with hydroxylamine hydrochloride for half an hour (Goldschmidt, *B.* 17, 215). Yellow needles (from benzene), almost insol. cold water, m. sol. ether, v. sol. alcohol. Somewhat volatile with steam. Conc. H_2SO_4 forms a deep-red solution. Not decomposed by boiling alcoholic potash.

Reactions.—1. *Bromine* acting on its solution in chloroform unites forming a dibromide $C_{10}H_7NO_2Br_2$, crystallising in grey leaflets [155°] (Brömme, *B.* 21, 390). Bromine acting on its solution in HOAc yields the bromo- derivative $C_{10}H_6BrNO_2$, separating from alcohol in yellow crystals [175°] (B.).—2. Alkaline K_3FeCy_6 oxidises it to (β)-nitro-(α)-naphthol.—3. *Nitric acid* forms di-nitro-(α)-naphthol and phthalic acid.—4. *Phenyl cyanate* unites with it, forming $C_{10}H_6\left<\begin{array}{l}\mathrm{O}\\ \mathrm{NO.CO.NHPh}\end{array}\right.$, crystallising from benzene in greenish-yellow prisms (containing benzene) [120°] (Goldschmidt a. Strauss, *B.* 22, 3106).—5. *Aniline* in HOAc forms the same phenyl-amido-naphthoquinone anilide as with the other two isomeric oxims (Brömme).

Salts.—NH_4A': lustrous green needles.—NaA' (dried at 110°): reddish-brown powder, insol. conc. NaOHAq, m. sol. water and alcohol. —KA': lustrous green plates.—$BaA'_2\,2aq$: bronzed plates.—PbA'_2: dark-brown scales, insol. water.—AgA': brownish-red pp.

Methyl ether of the (β)*-oxim* $C_6H_4\left<\begin{array}{l}\mathrm{CO.C(NOMe)}\\ \mathrm{CH{:}CH}\end{array}\right.$. [98°]. From the Ag salt and MeI (Fuchs). Formed also by heating (β)-naphthoquinone with the hydrochloride of the methyl ether of hydroxylamine (Goldschmidt a. Schmid, *B.* 18, 571, 2224). Yellowish-green needles, v. sol. alcohol. Reduced by tin and HCl to (β)-amido-(α)-naphthol.

Ethyl ether $C_{10}H_6O(NOEt)$. [101°]. Flat greenish-yellow needles.

Benzoyl derivative $C_{10}H_6O(NOBz)$. [162°].

Di-oxim $C_{10}H_6(NOH)_2$. [149°] (G. a. S.); [166°] (B.); [181°] (K. a. M.). Formed by warming either the (α)- or the (β)- oxim in concentrated methyl-alcoholic solution with hydroxylamine hydrochloride at 100° (Goldschmidt a. Schmid, *B.* 17, 2066; Brömme, *B.* 21, 392). Formed also by adding an alkaline solution of hydroxylamine to a cold solution of the (α)-oxim in caustic soda (Kehrmann a. Messinger, *B.* 23, 2816). Yellow needles, forming a reddish-yellow solution in alkalis, and a dark-red solution in H_2SO_4. On warming with dilute H_2SO_4 or with alkalis it is converted into an anhydride. Phenyl cyanate also brings about this change (Goldschmidt a. Strauss, *B.* 22, 3107). Phenyl hydrazine combines, forming $C_{16}H_{16}N_4O_2$, which crystallises from alcohol in tufts of long needles [105°–138°] (Polonovsky, *B.* 21, 182). Stannous chloride reduces it to naphthylene-(1,2)-diamine Alkaline K_3FeCy_6 oxidises it to di-nitroso-naphthalene $C_{10}H_{16}(NO)_2$, which crystallises in needles [127°]; insol. water and alkalis, v. sol. alcohol (Leuckart, *B.* 19, 174, 349). The dioxim colours iron and cobalt solutions brown.—$KC_{10}H_7N_2O_2$: brownish-red amorphous pp., obtained by adding ether to an alcoholic solution of the dioxim and KOEt (Ilinski, *B.* 19, 342).—$AgC_{10}H_7N_2O_2$: dark-red pp., obtained by adding ammoniacal $AgNO_3$ to an alcoholic solution of the dioxim.

(α) *- Methyl ether of the dioxim* $C_6H_4\left<\begin{array}{l}\mathrm{C(NOMe).C(NOH)}\\ \mathrm{CH{=\!=\!=}CH}\end{array}\right.$. [159°]. Formed by action of hydroxylamine on the methyl ether of the (α)-oxim. Insol. water, sol. alkalis.

(β) *- Methyl ether of the dioxim* $C_6H_4\left<\begin{array}{l}\mathrm{C(NOH).C(NOMe)}\\ \mathrm{CH{=\!=\!=}CH}\end{array}\right.$. Formed from the silver salt of the dioxim and MeI; and also by the action of hydroxylamine on the methyl ether of the (β)-oxim. Yellow oil, turning brown in air. Sol. alkalis.

(α) *- Ethyl ether of the dioxim* $C_6H_4\left<\begin{array}{l}\mathrm{C(NOEt){:}C(NOH)}\\ \mathrm{CH{=\!=\!=}CH}\end{array}\right.$. [153°]. Formed by warming an alcoholic solution of the ethyl ether of the (α)-oxim with hydroxylamine hydrochloride. Green needles (from alcohol); insol. water.—$KC_{12}H_{11}N_2O_2$: brown needles.

Anhydride of the dioxim $C_{10}H_6\left<\!\!\!\left<\begin{array}{l}\mathrm{N}\\ \mathrm{N}\end{array}\right>\right.\!O$. [78°]. Formed from the dioxim by the action of AcCl, alkalis, or acids. Formed also by heating the (α)- or (β)-oxim with an alcoholic solution of hydroxylamine hydrochloride at 150° (Goldschmidt, *B.* 17, 216, 801). Long colourless monoclinic needles (from ligroïn). Insol. alkalis.

Peri-**Naphthoquinone** $C_{10}H_6O_2$ *i.e.*

$$\begin{array}{l}\mathrm{CH{:}C{-}C{-}C{:}CH}\\ \mathrm{CH{:}CH.C.CH{:}CH}\end{array}\quad(\text{O—O bridging the two C})$$

Occurs in small quantity in the product of the oxidation of di-bromo-(α)-naphthol by fuming nitric acid (Meldola a. Hughes, *C. J.* 57, 632). Slender, pale-yellow needles; no definite melting-point observed. Blackens and decomposes above 220°. Sl. sol. boiling dilute NaOH. Gives an azo- compound with phenyl hydrazine. Not reduced by cold aqueous SO_2. Zinc-dust and HOAc reduces it to the corresponding dioxynaphthalene, which blackens at 205° and forms a diacetyl derivative melting at 227°.

References. — AMIDO-, AMIDO-OXY-, BROMO-,

Bromo-amido-, Chloro-, Nitro-, and Oxy-naphthoquinone.

NAPHTHOQUINONE-PHENAZINE

$C_6H_4<\begin{matrix}CO.C.N\\CO.C.N\end{matrix}>C_6H_4$. Formed by heating o-nitro-phenyl-amido-naphthoquinone with alcoholic ammonium sulphide (Leicester, *B.* 23, 2797). Green plates (from alcohol). Its alcoholic solution is brown with green fluorescence.

NAPHTHOQUINONE PHENYL-HYDRAZIDE *v. Benzene*-azo-*naphthol.*

NAPHTHOQUINONE-TOLAZINE

$C_6H_4<\begin{matrix}CO.C.N.C.CH:CH\\CO.C.N.C.CH:CMe\end{matrix}$. Formed by reduction of *o*-nitro-tolyl-amido-(α)-naphthoquinone with alcoholic ammonium sulphide (Leicester, *B.* 23, 2797). Steel-blue plates with green lustre, forming a green powder. Conc. H_2SO_4 forms a green solution. Its solutions in alcohol or HOAc are greenish-yellow with faint moss-green fluorescence.

NAPHTHOQUINONE TOLYL HYDRAZIDE *v. Toluene*-azo-*naphthol.*

NAPHTHOQUINOXALINE $C_{12}H_8N_2$ *i.e.*

$C_6H_4<\begin{matrix}\text{———}C.N:CH\\CH:CH.C.N:CH\end{matrix}$. [62°]. Formed by warming naphthylene-($\alpha\beta$)-diamine with the bisulphite compound of glyoxal in presence of some HOAc (Hinsberg, *B.* 23, 1394). Small colourless needles; v. sol. alcohol and ether, sl. sol. hot water. Volatile with steam. Conc. H_2SO_4 gives a deep-red colour, turned yellow by addition of water.—The sulphate crystallises well. The platinochloride is sl. sol. water.

NAPHTHOQUINOXIM *v. Oxim* of Naphthoquinone.

NAPHTHOSTYRIL *v. Lactone* of *peri*-Amido-naphthoic acid.

NAPHTHOTOLAZINE *v.* Tolunaphthazine.

(α)-**NAPHTHOXINDOLE** $C_{12}H_9NO$ *i.e.*

$C_{10}H_6<\begin{matrix}NH\\CH_2\end{matrix}>CO$. [245°]. Formed by the action of mineral acids on the sodium salt of (α)-naphthindole sulphonic acid (Hinsberg, *B.* 21, 116). Colourless needles (from alcohol). Yields a nitroso- derivative, which on reduction and subsequent oxidation forms (α)-naphthisatin.

(β) - **Naphthoxindole**

$C_{10}H_6<\begin{matrix}NH\\CH_2\end{matrix}>CO$. [234°]. Formed by the action of mineral acids on (β)-naphthindole sulphonic acid (Hinsberg, *B.* 21, 114). Faint greenish needles. Sl. sol. water, v. sol. alcohol, ether, HOAc. Not attacked by *mineral acids.* Conc. KOHAq dissolves it without change. Baryta-water at 150° in sealed tubes yields the Ba salt of a strong acid. $NaNO_2$ in HOAc solution gives a nitroso- derivative [c. 240°], crystallising in yellowish-red needles. M. sol. alcohol, ether, HOAc, sl. sol. water.

NAPHTHOXY-ACETIC ACID *v. Naphthyl derivative* of Glycollic acid, vol. ii. p. 639.

NAPHTHOYL-BENZOIC ACID $C_{18}H_{12}O_3$ *i.e.* $C_{10}H_7.CO.C_6H_4.CO_2H$ [173·5°]. Formed by the action of phthalic anhydride on naphthalene in presence of $AlCl_3$ (Ador a. Crafts, *C. R.* 88, 1355). Small white prisms (from dilute alcohol). Its Ba salt crystallises from alcohol in very hygroscopic needles. Conc. H_2SO_4 converts it into naphthanthraquinone  $C_{10}H_6<\begin{matrix}CO\\CO\end{matrix}>C_6H_4$ (Elbs, *B.* 19, 2209).

NAPHTHOYL-CYANIDE *v. Nitrile* of Naphthyl-glyoxylic acid.

NAPHTHOYL-FORMIC ACID *v.* Naphthyl-glyoxylic acid.

($\alpha\alpha$)-**DINAPHTHYL** $C_{20}H_{14}$ *i.e.* $(C_{10}H_7)_2$. Mol. w. 254. [154°]. (above 360°). V.D. 8·67 (calc. 8·77).

Formation.—1. Together with phthalic acid and other bodies by heating naphthalene with MnO_4 and dilute H_2SO_4 (Lossen, *A.* 144, 77).—2. By distilling ($\beta\beta$)-dioxy-dinaphthyl (1 pt.) with zinc-dust (12 pts.), the yield being 65 p.c. of the theoretical (Walder, *B.* 15, 2170; Julius, *B.* 19, 2549).—3. By distilling (β)-' dinaphthyl diquinone ' $C_{20}H_{10}O_4$ with zinc-dust (Korn, *B.* 17, 3019).—4. By diazotising di-amido-dinaphthyl (naphthidine), and boiling the tetra-azo-dinaphthyl sulphate with alcohol (Nietzki a. Groll, *B.* 18, 3256).

Preparation.—Naphthalene is boiled with MnO_2 and H_2SO_4 (diluted with more than its own bulk of water). The product is boiled with water, filtered, and the residue extracted with alcohol, the alcohol boiled off (in a current of air), and the residue distilled. The fraction coming over above 360° is boiled with light petroleum and animal charcoal, filtered, and allowed to crystallise (Watson Smith, *C. J.* 35, 225). No $\beta\beta$ compound is formed.

Properties.—Colourless plates (by sublimation), v. sol. benzene, CS_2, HOAc, and ether, m. sol. alcohol. Its solutions exhibit blue fluorescence (K.).

Picric acid compound $C_{20}H_{14}2C_6H_2(NO_2)_3OH$. [145°]. Reddish-brown needles.

($\alpha\beta$)-Dinaphthyl $C_{20}H_{14}$. [76°] (S.); [80°] (W.). V.D. 8·78 (calc. 8·77). Formed, together with a larger quantity of the ($\beta\beta$)- and a very little of the ($\alpha\alpha$)-isomerides, by passing the vapour of naphthalene, mixed with $SbCl_3$, through a red-hot tube (Watson Smith, *C. J.* 32, 559). Small six-sided tables, m. sol. alcohol, ether, and benzene than the ($\beta\beta$)-isomeride.

Picrate $C_{20}H_{14}.C_6H_2(NO_2)_3OH$. [156°] (Wegscheider, *B.* 23, 3199).

($\beta\beta$)-Dinaphthyl $C_{20}H_{14}$. *Isodinaphthyl* [187°] (S.); [189°] (G. a. T.). V.D. 8·73 (calc. 8·77).

Formation.—1. By passing naphthalene through a red-hot tube (Watson Smith, *C. J.* 24, 1184).—2. By passing naphthalene and CCl_4 through a tube at dull-red heat $4C_{10}H_8 + CCl_4 = 2C_{20}H_{14} + 4HCl + C$ (Watson Smith, *C. J.* 35, 229).—3. By passing through a red-hot tube, naphthalene with chloroform, (α)-bromo-naphthalene, $SbCl_3$ or $SnCl_4$.—4. By heating to redness (α)-bromo-naphthalene with naphthalene and soda lime (S.).—5. By passing $C_{10}H_8$ and $C_{10}H_7Br$ through a red-hot tube packed with Fe_2O_3 (S.).—6. By distilling aluminium (β)-naphthol (Gladstone a. Tribe, *C. J.* 41, 16).—7. By dropping isoamyl chloride upon naphthalene (100 g.) and $AlCl_3$ (25 g.) at 120°; pentane being also formed (Roux, *Bl.* [2] 41, 379).

Properties.—Plates (from benzene), with slight blue fluorescence. Much less sol. alcohol, ether, and benzene than either of its isomerides. On oxidation with $KMnO_4$ or dilute HNO_3 at 160° it yields phthalic acid. CrO_3 in HOAc produces a quinone $C_{20}H_{10}O_4$.

Picric acid compound $C_{20}H_{14}2C_6H_2(NO_2)_3OH$. [184°]. Orange prisms (Wegacheider, *B.* 23, 3200).

(ββ)-Dinaphthyl sulphonic acid $C_{20}H_{14}SO_3$ *i.e.* $C_{10}H_7.C_{10}H_6SO_3H$. Prepared by heating (ββ)-dinaphthyl (15 g.) with conc. H_2SO_4 (3 g.) for 5 hours at 200° (Watson Smith a. Takamatsu, *C. J.* 39, 552).—CaA'_2 2aq: white needles, m. sol. hot water, insol. alcohol, ether, and benzene.—BaA'_3 2aq ?

(ββ)-Dinaphthyl disulphonic acid $C_{10}H_7(SO_3H).C_{10}H_7(SO_3H)$. Two isomeric acids of this formula are formed by heating (ββ)-dinaphthyl (10 g.) with conc. H_2SO_4 (7 g.) at 190° for 5 hours (S. a. T.) One gives an insoluble barium salt, the other forms $BaA''x$aq, v. sol. water, and $PbA''x$aq, a yellowish-white crystalline powder.

(ββ)-Dinaphthyl tetrasulphonic acid $C_{10}H_5(SO_3H)_2.C_{10}H_5(SO_3H)_2$. Formed by heating (ββ)-dinaphthyl with an excess of Nordhausen sulphuric acid (S. a. T.).—Pb_2A^{iv} 6aq: v. sol. water, insol. alcohol, ether, and benzene.

References.—Di-amido-, Di-bromo-, Tetra-chloro-, and Nitro- dinaphthyl.

NAPHTHYL-ACETAMIDINE $C_{12}H_{12}N_2$ *i.e.* $CH_3.C(NH).NHC_{10}H_7$. (α)-*Naphthyl-ethenyl-amidine.* Prepared by the action of (α)-naphthylamine hydrochloride on acetonitrile at 165° (Bernthsen a. Trompettar, *B.* 11, 1758).—$B'HCl$: soluble prisms.—$B'_2H_2PtCl_6$: small yellow tables.—$B'H_2C_2O_4$: small crystals.—$B'_2H_2SO_4$: white crystals.—$B'HNO_3$: oil.

Di-(α)-naphthyl-acetamidine $C_{22}H_{18}N_2$ *i.e.* $CH_3.C(NC_{10}H_7).NHC_{10}H_7$. Formed from (α)-naphthylamine (6 mols.), AcCl (3 mols.), and PCl_3 (Hofmann, *J.* 1865, 415). Resinous.

Di-(β)-naphthyl acetamidine $CH_3.C(NC_{10}H_7).NHC_{10}H_7$. [168°]. Formed by heating (β)-naphthylamine (6 mols.) with AcCl (3 mols.) and PCl_3 (1 mol.) at 150° (Maschke, *C. C.* 1886, 824).

(α)-NAPHTHYL-ACETIC ACID $C_{12}H_{10}O_2$ *i.e.* $C_{10}H_7.CH_2.CO_2H$. [131°]. Prepared by heating (α)-naphthyl-glyoxylic acid with HI and P (Boesaneck, *B.* 16, 641). Long silky needles. Sol. alcohol, ether, acetic acid, benzene, and hot water, sl. sol. cold water.

Amide $C_{10}H_7.CH_2.CO.NH_2$. [181°] (B.); [154°] (W.). Formed from the acid (B.) and perhaps also by the action of yellow ammonium sulphide on (α)-naphthyl methyl ketone (Willgerodt, *B.* 21, 534). Colourless needles, sol. benzene, acetic acid, ether, CS_2, and hot water.

Nitrile $C_{10}H_7.CH_2.CN$. (above 300°). Formed from the amide and P_2O_5. Oil.

DI-NAPHTHYL-ACETYLENE $C_{10}H_7.C{:}C.C_{10}H_7$. [225°]. (above 360°). Obtained by distilling *exo*-di-chloro-di-naphthyl-ethylene or *exo*-tri-chloro-di-naphthyl-ethane (1 pt.) with soda-lime (10 pts.) (Grohowski, *B.* 11, 301). Long silky needles (from alcohol).

(α)-NAPHTHYL-ACRYLIC ACID $C_{13}H_{10}O_2$ *i.e.* $C_{10}H_7.CH{:}CH.CO_2H$. (α)-*Naphthocinnamic acid.* [207°] (L.); [212°] (B.). S. ·014. Obtained by heating naphthoic aldehyde (2 pts.) with sodium acetate (1 pt.) and Ac_2O (20 pts.) at 170° (Lugli, *G.* 11, 394; Brandis, *B.* 22, 2155). Needles, m. sol. hot water, v. sol. alcohol and ether. Oxidised by $KMnO_4$ to naphthoic aldehyde and naphthoic acid. Combines with bromine forming $C_{10}H_7.CHBr.CHBr.CO_2H$ [189°]. HBr at 100° yields $C_{10}H_7.CHBr.CH_2.CO_2H$ [216°].—CaA'_2: plates.—BaA'_2: needles.—CuA'_2.—AgA': white pp., blackening on exposure.

NAPHTHYL-ALLYL-THIO-UREA $C_{14}H_{14}N_2S$ *i.e.* $C_{10}H_7NH.CS.NHC_3H_5$. [145°]. Formed from (α)-naphthylamine and oil of mustard (Zinin, *A.* 84, 346; Prager, *B.* 22, 3000). Crystals, insol. water, v. sol. alcohol and ether.

Dinaphthyl-allyl-ψ-thiourea *v.* Di-naphthyl-imido-thio-carbamic ether.

(α)-NAPHTHYL-AMIDO-ACETIC ACID $C_{12}H_{11}NO_2$ *i.e.* $C_{10}H_7.NH.CH_2.CO_2H$. *Naphthyl-glycocoll.* [199°] (B. a. N.); [198°] (J.); [192°] (M.). Formed from (α)-naphthylamine, chloro-acetic acid, and NaOAc at 100° (Bischoff a. Nastvogel, *B.* 22, 1808; Jolles, *B.* 22, 2372; Mauthner, *M.* 10, 251; Forte, *G.* 19, 361). Needles, insol. water, almost insol. ether, sl. sol. alcohol, v. sol. acetone. Forms a platinochloride and a nitrosamine. The Ca salt distilled with calcium formate gives a product crystallising in colourless plates [163°].—CaA'_2 3aq: tufts of needles.—$BaA'_2$2aq.—CuA'_2: small plates.—AgA'aq: silvery plates.

Anhydride $(C_{10}H_7.NH.CH_2.CO)_3O$. [269°]. Formed by heating the acid at 230°. Scales, insol. ether, sol. alcohol.

Acetyl derivative [154°].—BaA'_2 5aq.

(β)-Naphthyl-amido-acetic acid $C_{10}H_7.NH.CH_2.CO_2H$. [135°]. Formed by heating (β)-naphthylamine (2 mols.) with a solution of chloro-acetic acid (1 mol.) at 100° (Jolles, *B.* 22, 2372; Bischoff, *B.* 23, 2005). Minute crystals (from water), v. sol. alcohol, ether, and HOAc. Yields a nitrosamine $C_{10}H_7.N(NO).CH_2.CO_2H$ crystallising from MeOH in reddish plates [126°].

Salts.—The Ag salt decomposes on drying in the air. (β)-Naphthylamine salt $C_{10}H_7NH_2HA'$. [116°]. Needles.

(α)-NAPHTHYL-AMIDO-CROTONIC ACID. *Ethyl ether* $C_{10}H_7NH.C(Me).CH.CO_2Et$. [45°]. Formed by the action of acetoacetic ether on (α)-naphthylamine (Conrad a. Limpach, *B.* 21, 531). White silky needles, sol. ether and benzene. Yields on heating to 240° (*Py.* 1:3)-oxy-methyl-(α)-naphthoquinoline, with elimination of alcohol.

(β)-Naphthyl-amido-crotonic acid *Ethyl ether* $C_{10}H_7NH.C(Me).CH.CO_2Et$. [66°]. Formed by the action of acetoacetic ether on (β)-naphthylamine at 100° (Conrad a. Limpach, *B.* 21, 532). Large prisms (from alcohol). Yields (*Py.* 1:3)-Oxy-methyl-(β)-naphthoquinoline on heating to 240°.

(β)-NAPHTHYL AMIDO-ETHYL OXIDE $C_{12}H_{13}NO$ *i.e.* $C_{10}H_7.O.C_2H_4NH_2$. Formed by the action of alcoholic ammonia on the chloro-ethyl ether of (β)-naphthol (Koelle, *B.* 13, 1955). Amorphous mass.—$B'HCl$aq: needles.—$B'_2H_2PtCl_6$: needles.

(α)-NAPHTHYL-AMIDO-METHYL-MALONAMIC ACID $CH_3.C(NHC_{10}H_7)(CO_2H)(CONH_2)$. *Ethyl ether* $A'Et$. [159°] Formed by dissolving α-cyano-α-(α)-naphthyl-amido-propionic ether (*q.v.*) in conc. H_2SO_4 (Gerson, *B.* 19, 2969). Long white needles; sl. sol. cold water, more easily in hot water with a beautiful green fluorescence, v. sol. alcohol and ether.

(α) - NAPHTHYLAMIDO - (β) - NAPHTHOQUINONE (α)-*naphthylamide* $C_{30}H_{20}N_2O$ *i.e.*

$C_{10}H_5(NHC_{10}H_7){<}\begin{matrix}O\\ \vdots\\ NC_{10}H_7\end{matrix}$. [178° cor.]. Formed from (α)-naphthoquinone oxim and (α)-naphthylamine (Brömme, *B.* 21, 394). Forms a violet solution in alcohol and a blue solution in conc. H_2SO_4. Gives a green colour on heating with H_2SO_4.

(β)-Naphthyl-amido-(β)-naphthoquinone (β)-*naphthylamide*

$C_{10}H_5(NHC_{10}H_7){<}\begin{matrix}O\\ \vdots\\ NC_{10}H_7\end{matrix}$. [247°]. Formed by heating di-bromo-(α)-naphthol with (β)-naphthylamine (Meldola, *C. J.* 45, 160). Dull, reddish, fibrous needles. Feebly basic. Insol. alcohol, but dissolves when boiled with alcohol and HCl, forming a violet solution. Dissolves in hot toluene or chloroform, giving a reddish-brown liquid.

DI-(α)-NAPHTHYL-DI-AMIDO-OIAZTHIOLE $C_{22}H_{16}N_4S$ *i.e.*

$S{<}\begin{matrix}C(NHC_{10}H_7):N\\ C(NHC_{10}H_7):N\end{matrix}{>}$. [136°]. Obtained by oxidising (α)-naphthyl-thio-urea with hydrogen peroxide and dilute HClAq (Hector, *B.* 23, 359). Crystallises from alcohol in white needles containing HOEt (1 mol.) and melting at 104°. Insol. water. Cyanogen, passed into its warm solution, forms $C_{22}H_{16}N_4SC_4N_4$ [203°].

Salts. — $B'_2H_2PtCl_6$. [225°]. — Picrate $B'C_6H_2(NO_2)_3OH\frac{1}{2}EtOH$. [below 100°]. Small yellow grains.—$B'AgNO_3$. Pp.; insol. alcohol.

Acetyl derivative $C_{22}H_{15}AcN_4S$. [263°]. Needles (from alcohol).

Benzoyl derivative $C_{22}H_{15}BzN_4S$. [270°].

Di-(β)-naphthyl-di-amido-oiazthiole $C_{22}H_{16}N_4S$. [100°–117°]. Prepared from (β)-naphthyl-thio-urea and H_2O_2. Grey powder (from alcohol); more sol. alcohol than the (α)-isomeride. Cyanogen passed into its warm alcoholic solution forms $C_{22}H_{16}N_4SCy_4$ [200°].—$B'_2H_2PtCl_6$. Begins to decompose at 236°–240°. —$B'C_6H_2(NO_2)_3OH$. [178°]. Yellow powder, sl. sol. alcohol.—$B'AgNO_3$: white pp.

Acetyl derivative $C_{22}H_{15}AcN_4S$. [203°]. Needles (from alcohol).

Benzoyl derivative $C_{22}H_{15}BzN_4S$. [247°].

(β)-NAPHTHYL PHENYL-AMIDO-ETHYL OXIDE $C_{18}H_{17}NO$ *i.e.* $C_{10}H_7.O.C_2H_4.NHC_6H_5$. [75°]. Formed by the action of aniline on the chloro-ethyl ether of (β)-naphthol (Koelle, *B.* 13, 1955).

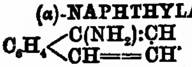
TRI - (β) - NAPHTHYL - TRI - AMIDO - TRI - PHENYL-CARBINOL $(C_{10}H_7.NH.C_6H_4)_3C.OH$. Formed by heating para-rosaniline with (β)-naphthylamine (Meldola, *C. N.* 47, 133, 147). Dyes wool or silk blue.

TRI - NAPHTHYL - TRI - AMIDO - TRI - PHENYL-CARBINYL CHLORIDE $C_{49}H_{36}N_3Cl$ *i.e.*

$(C_{10}H_7.NH.C_6H_4)_2\underbrace{C.C_6H_4N}HCl.C_{10}H_7$. *Phenyl-(α)-naphthyl-amine blue.* Formed by heating phenyl-(α)-naphthylamine with oxalic acid (Hausdörfer, *B.* 23, 1965). Dark brown powder, v. sol. hot aniline, sl. sol. cold alcohol, insol. ether and benzene.

NAPHTHYL-AMIDO-ISOSUCCINAMIC ACID v. NAPHTHYL-AMIDO-METHYL-MALONAMIC ACID.

(α)-NAPHTHYLAMINE $C_{10}H_9N$ *i.e.*



$C_6H_4{<}\begin{matrix}C(NH_2):CH\\ CH{=\!=}CH\end{matrix}$. *Naphthalidine. Naphthalamine.* Mol. w. 143. [50°]. (300°). V.D. (at 194°) 72·6 (calc. 71·5) (Eykman, *B.* 22, 2757). S. ·167 in the cold (Ballo, *B.* 3, 675).

Formation.—1. By reduction of nitro-naphthalene by alcoholic ammonium sulphide (Zinin, *J. pr.* 27, 143), by iron and acetic acid (Béchamp, *A. Ch.* [3] 42, 186; Schützenberger a. Willm, *C. R.* 47, 82; Ballo, *B.* 3, 288, 673), or by tin or zinc and HClAq (Böttger, *D. P. J.* 173, 480).—2. By heating (α)-naphthol with four times its weight of ammoniacal $CaCl_2$ to 270° for 8 hours, the yield being 74 p.c. (Benz, *B.* 16, 14; *cf.* Calm, *B.* 15, 616).

Preparation.—Granulated nitronaphthalene (600 kilos.) is slowly added to a warm mixture of iron borings (800 kilos.), hydrochloric acid (40 kilos.), and some water. The mixture is agitated and kept at about 50° by blowing in steam for 7 hours, after which milk of lime (containing 50 kilos. of CaO) is added. The mixture is distilled in a current of superheated steam (Witt, *Chem. Industrie*, 10, 215).

Properties.—White silky needles, with powerful odour. May be sublimed. V. e. sol. alcohol and ether. Colours pine-wood yellow. When not quite pure it rapidly becomes coloured in the air. Does not turn red litmus blue. Aqueous solutions of its salts give a blue pp. with $FeCl_3$, $AgNO_3$, auric chloride, platinic chloride, $SnCl_4$, $HgCl_2$, chromic acid, H_2O_2, and other oxidising agents (Piria, *A. Ch.* [3] 31, 217; 78, 64; Schiff, *A.* 101, 92; Wurster, *B.* 22, 1910). This blue pp., 'oxynaphthylamine' $C_{10}H_9NO$, is amorphous, v. sol. chloroform, and not reduced by SO_2 (Schiff, *A.* 129, 255). If to a solution of (α)-naphthylamine in alcohol or HOAc there be added a small quantity of nitrous acid and a little HClAq an intense purple colour is produced (Liebermann, *A.* 183, 265).

Reactions.—1. *Heated* with $ZnCl_2$ or $CaCl_2$ at 280° it splits up to some extent into NH_3 and dinaphthylamine.—2. Distillation over PbO yields naphthazine.—3. Boiling *chromic acid mixture* oxidises it to naphthoquinone, phthalic acid, and other products (Reverdin a. Nölting, *B.* 12, 2306).—4. Heated with *nitro-naphthalene* and some HClAq at 200° it yields 'tri-naphthylene-diamine' $C_{30}H_{18}N_2$ (Salzmann a. Wichelhaus, *B.* 9, 1107).—5. *Urea* (1 pt.) heated with (α)-naphthylamine (2 pts.) at 120° forms only di-naphthyl-urea; but both mono- and di-naphthyl-urea are formed on heating (α)-naphthylamine hydrochloride with urea at 160° (Pagliani, *G.* 9, 28).—6. *Cyanic acid* forms (α)-naphthyl-urea.—7. *Alkyl thio-carbimides* form alkyl-naphthyl-thio-ureas.—8. Alcoholic CS_2 forms di-naphthyl-thio-urea.—9. MeOH and $ZnCl_2$ at 190° form the methyl ether of (α)-naphthol (Hantzsch, *B.* 13, 1347).—10. (α)-naphthylamine hydrochloride heated with o-amido-azo- compounds yields azine colouring matters (eurhodines).—11. Readily converted into naphthalene by diazotising, and pouring the alkaline solution of the diazo- compound into a solution of $SnCl_2$ in aqueous NaOH (Friedländer, *B.* 22, 537).—12. SiF_4 in benzene solution forms minute crystals of $Si(NHC_{10}H_7)_4$ (Reynolds, *C. J.* 55, 482).—13. The bisulphite warmed with *benzoic aldehyde* forms $C_6H_5.CH:NC_{10}H_7$, a yellow powder (Papasogli, *A.* 171, 138).—14. *Benzoic aldehyde* and *pyruvic acid* form the compound

$C_{10}H_6{<}\begin{matrix}N:CPh\\ C(CO_2H)\end{matrix}{>}CH$ crystallising in yellow needles [300°] (Doebner a. Kuntze, *A.* 249, 109). 15. *Benzil* reacts on heating, forming the compounds $C_6H_5.C(NC_{10}H_7).CO.C_6H_5$ [139°] and $C_6H_5.C(NC_{10}H_7).C(NC_{10}H_7).C_6H_5$ [219°] both crystallising in yellow needles (Bandrovsky, *M.* 9, 685). — 16. A conc. boiling aqueous solution of *alloxan* forms a compound $C_{14}H_{11}N_3O_4$, which separates in transparent white needles, insol. water, and coloured green by H_2SO_4. Alkalis convert it into a crystalline acid $C_{14}H_{10}N_2O_6$ (Pellizari, *G.* 17, 409).—17. *Cyanuric chloride* forms $N_3C_3Cl_2(NHC_{10}H_7)$ [149°], $N_3C_3Cl(NHC_{10}H_7)_2$ [215°], or $N_3C_3(NHC_{10}H_7)_3$ [223°], according to the proportions used (Fries, *B.* 19, 242; *C. J.* 49, 314). –18. *Citraconic acid* at 145° forms $C_{10}H_7N:C_5H_4O_2$ [143°] (360°) (Morawski a. Gläser, *M.* 9, 284).—19. *Itaconic acid* heated with (α)-naphthylamine in aqueous solution forms $C_{10}H_7N{<}\begin{matrix}CH_2.CH.CO_2H\\CO\ \ .CH_2\end{matrix}$, a white crystalline powder [206°], m. sol. hot alcohol (Scharfenberger, *A.* 254, 151).—20. *Chloro-acetic ether* in ethereal solution forms $C_{16}H_{16}NO_2Cl$, crystallising in prisms [75°] (Bender, *B.* 20, 2750).

Salts.—B′HCl. Needles (by sublimation) or scales (from alcohol); v. e. sol. water, alcohol, and ether.—$B'_2H_2PtCl_6$: yellow pp., sl. sol. water. — B′HBr. —$B'_2H_2SO_4$.—$B'_2H_2SO_4$ 2aq.—$B'HNO_3$: scales.—$B'_2H_2C_2O_4$: stellar groups of small laminæ.—$B'H_2C_2O_4$: nodules. Yields on distillation $C_2O_2(NHC_{10}H_7)_2$ and the formyl derivative $CHO.NHC_{10}H_7$ (Zinin, *A.* 108, 228).—$B'_2H_2PtCy_4$: crystals (Scholtz, *M.* 1, 905).—$B'H_2SO_3$: pearly rosettes. — **Citraconate** [99°]. Formed by mixing solutions of (α)-naphthylamine and citraconic acid in benzene (Morawski a. Gläser, *M.* 9, 285).—**Phenate** $B'C_6H_5OH$. [30·1°]. Formed by heating phenol with (α)-naphthylamine (Dyson, *C. J.* 43, 468). Needles (from light petroleum).—**Benzene sulphonate** [225°] (Norton a. Westenhof, *Am.* 10, 129).—**Toluene *p*-sulphonate** [239°] (Norton a. Otten, *Am.* 10, 140).

Formyl derivative $C_{10}H_7NH(COH)$. [139°]. White silky needles (Tobias, *B.* 15, 2447).

Acetyl derivative $C_{10}H_7NHAc$. [159°]. Formed from the base by treatment with AcCl, Ac_2O, or HOAc (Rother, *B.* 4, 850; Tommasi, *C. R.* 76, 1267; Liebermann, *A.* 183, 229). Formed also by heating (α)-naphthol with ammonium acetate. White silky needles; sl. sol. boiling water, v. sol. alcohol. On heating with sulphur the products are ethenyl-amido-naphthyl mercaptan and $C_{10}H_6{<}\begin{matrix}N\\S\end{matrix}{\gg}C.C{\ll}\begin{matrix}N\\S\end{matrix}{>}C_{10}H_6$, which crystallises in yellow plates [above 300°] (Hofmann, *B.* 20, 1801). The only products of the nitration of acetyl-(α)-naphthylamine are the *o*- and *p*-nitro-derivatives of melting-points [199°] and [190°] respectively; the supposed isomeride of melting-point [170°] is a molecular compound of the *o*- and *p*- bodies, and the so-called 'β- and δ-nitracetnaphthalides' are diacetyl derivatives of the same two nitro-(α)-naphthylamines (Lellmann a. Remy, *B.* 19, 796). Chlorine passed into its solution in HOAc forms $C_{10}H_5Cl_2NHAc$ [214°] (Cleve, *B.* 20, 448).

Chloro-acetyl derivative $C_{11}H_{10}NClO$ *i.e.* $C_{10}H_7NH.COCH_2Cl$. [121°]. Formed from naphthylamine and chloro-acetyl chloride (Tommasi, *Bl.* [2] 20, 21; Abenius, *J. pr.* [2] 40, 437) Silky needles.

Thioacetyl derivative $C_{10}H_7NH.CS.CH_3$ [96°] (B. a. T.); [111°] (*J.*). Formed by heating (α)-naphthyl-acetamidine with CS_2 for several hours at 100° (Bernthsen a. Trompetter, *B.* 11, 1760). Formed also by heating acetyl-(α)-naphthylamine with P_2S_5 (Jacobsen, *B.* 20, 1897). White tables. Gives $C_{10}H_7NH.CH_2.CH_3$ on reduction. Oxidised by K_3FeCy_6 to ethenyl-amido-naphthyl mercaptan $C_{10}H_6{<}\begin{matrix}N\\S\end{matrix}{\gg}C.CH_3$.

Benzoyl derivative $C_{10}H_7.NHBz$ [156°] (W.); [162°] (Kühn, *B.* 18, 1477); [160°] (Hofmann, *B.* 20, 1798). Colourless needles; v. sol. dilute alcohol, sl. sol. absolute alcohol and water (Ebell, *B.* 7, 1317; 8, 562; Worms, *B.* 15, 1814). Yields on nitration $C_{10}H_6(NO_2)NHBz$ [224°]. PCl_5 converts it into $C_{10}H_7N:CClC_6H_5$ [60°] (Just, *B.* 19, 984).

Thiobenzoyl derivative $C_{10}H_7NH.CS.C_6H_5$. [148°]. Formed from the benzoyl derivative by heating with P_2S_5; or from (α)-naphthyl-acetamidine by heating with CS_2 (B. a. T.; *J.*). Yellowish needles or plates. Oxidised by K_3FeCy_6 to benzenyl-amido-naphthyl mercaptan.

(α)-Naphthylamine *ar*-tetrahydride $C_{10}H_{11}NH_2$ *i.e.* $\begin{matrix}CH_2.CH_2.C.C(NH_2):CH\\CH_2.CH_2.C.CH=\!=\!=CH\end{matrix}$ (275°) at 712 mm. S.G. $\frac{16}{}$ 1·0625. Formed by the action of sodium on a solution of (α)-naphthylamine in isoamyl alcohol (Bamberger, *B.* 20, 2916; 21, 1789). Thick colourless oil, sl. sol. water, v. sol. alcohol and ether, insol. NaOHAq. Less basic than the (β)-isomeride. Reduces Ag from hot solutions, but does not reduce Fehling's solution. Readily diazotised. Aqueous $NaNO_2$ (1 mol.) acting on its hydrochloride (1 mol.) at 0° forms $C_{10}H_{11}.N_2.C_{10}H_{10}NH_2$ (Bamberger a. Lengfeld, *B.* 23, 1134). Yields dyes with diazo-compounds. $KMnO_4$ oxidises it to adipic acid.

Salts.—B′HCl: dimetric plates, v. sol. water and alcohol.—$B'HClHgCl_2$: flat white plates, sl. sol. cold, v. sol. hot water.—$B'_2H_2SO_4$ ½aq.—**Picrate**: yellow needles.

Acetyl derivative $C_{10}H_{11}NHAc$. [158°]. Needles, v. sol. ether, chloroform, and alcohol.

(α)-Naphthylamine *ac*-tetrahydride $C_6H_4{<}\begin{matrix}CH(NH_2).CH_2\\CH_2\text{——}CH_2\end{matrix}$ (246·5°) at 714 mm. Formed by adding a 10 p.c. solution of $CuSO_4$ slowly at 100° to a solution of amido-naphthyl-hydrazine tetrahydride derived from (1,4′)-naphthylene diamine (Bamberger a. Bammann, *B.* 22, 963). Liquid, sol. cold water, v. sol. hot water, alcohol, and ether. Unlike its 'aromatic' isomeride it turns red litmus blue. It cannot be diazotised. Does not yield dyes with diazo-compounds. $FeCl_3$ has no effect in the cold, but on warming produces a reddish-brown colour. $K_2Cr_2O_7$ and H_2SO_4 give no colour. $KMnO_4$ oxidises it, in cold dilute solution, to *o*-carboxy-β-phenyl-propionic acid [166°]. — B′HCl: needles, v. e. sol. water.—$B'_2H_2PtCl_6$ 2aq. [190°]. Orange prisms, sol. water.—$B'HNO_3$. [139°]. Needles, v. e. sol. water.—$B'H_2CO_3$: needles.—**Picrate**: needles, sol. hot water.

Acetyl derivative $C_{10}H_{11}.NHAc$. [148°]. Prisms or needles, sl. sol. cold water.

(β)-Naphthylamine $C_{10}H_9N$ *i.e.* $C_6H_4<\substack{CH:C.NH_2\\ CH:CH}$. [112°]. (294°) (Liebermann a. Jacobson, *A.* 211, 41).

Formation.—1. From the acetyl derivative of (α)-naphthylamine by successive bromination, nitration, elimination of Ac, removal of NH_2 by the diazo- reaction, and reduction of the resulting bromo-nitro-naphthalene by tin and HClAq (Liebermann a. Scheiding, *A.* 183, 258).—2. By heating (β)-naphthol with ammonia-zinc-chloride at 200°, di-(β)-naphthylamine being also formed (Merz a. Weith, *B.* 13, 1300).—3. By passing dry ammonia over strongly heated (β)-naphthol (Graebe, *B.* 13, 1850).—4. By heating (β)-naphthol with four times its weight of ammoniacal $CaCl_2$ (prepared by passing NH_3 over ordinary granulated $CaCl_2$ containing about 18 p.c. of H_2O) for 8 hours at 270°–280°; the yield being 80 p.c. on the naphthol, together with 12 p.c. of (ββ)-dinaphthylamine (Benz, *B.* 16, 8).—5. In small quantity, together with a large quantity of dinaphthylamine, by heating (β)-naphthol with ammoniacal $ZnCl_2$ (*B.*).

Preparation.—1. By passing NH_3 under pressure into (β)-naphthol at 150°–160°.—2. By heating (β)-naphthol (10 pts.) with NaOH (4 pts.) and NH_4Cl (4 pts.) (*G. P.* 14,612 [1880]).

Properties.—White plates (from water) without odour. Volatile with steam. Gives no colouration with $FeCl_3$, chromic acid, or bleaching powder. Its alcoholic solution is not coloured by nitrous acid and HCl.

Reactions.—1. Heated with PbO it gives azonaphthalene (Volodkevitch, *Bl.* [2] 45, 178).—2. $SiCl_4$ forms $SiCl_2(NHC_{10}H_7)_2$ (Horden, *C. J.* 51, 40). A benzene solution of $SiCl_4$ forms $Si(NH.C_{10}H_7)_4$ (Reynolds, *C.J.* 55, 481).—3. With *paraldehyde*, *acetone*, and HCl it gives dimethyl-(β)-naphthoquinoline (Reed, *J. pr.* [2] 35, 298).—4. With *methylal, acetone*, and HCl it forms methyl-(β)-naphthoqninoline, (β)-naphthoacridine and a base, $C_{24}H_{20}N_2$, which is probably methyl-amido-naphthyl-naphthoquinoline dihydride $C_{10}H_6<\substack{CMe:CH\\ NH.CH.C_{10}H_6NH_2}$. This base [203° uncor.] forms the following derivatives: $B''C_6H_2(NO_2)_3OH$. — $B''Et_2I_2$. — $C_{21}H_{20}N_4O_2$ [c. 238°]. (R.).—5. *Cyanuric chloride* forms $C_3N_3Cl_2(NHC_{10}H_7)$ [154°], $C_3N_3Cl(NHC_{10}H_7)_2$ [278°], and $C_3N_3(NHC_{10}H_7)_3$ [209°] (Fries, *B.* 19, 2056).—6. *Benzoic aldehyde* in hot alcoholic solution forms $C_6H_5CH:NC_{10}H_7$ [103°] which may be reduced by sodium amalgam to $C_6H_5CH_2.NHC_{10}H_7$ [68°] which forms a nitrosamine $C_6H_5CH_2.N(NO)C_{10}H_7$ [112°] (Claisen, *A.* 237, 272; Kohler, *A.* 241, 360).—7. *Benzil* at 215° forms $C_6H_5.CH(OH).C(NC_{10}H_7).C_6H_5$ crystallising from alcohol in yellow prisms [130°] (Voigt, *J. pr.* [2] 34, 22).—8. The compound of *glyoxal* with $KHSO_3$ yields $C_{12}H_9NSO_3K$ crystallising in white plates (Hinsberg, *B.* 21, 110).—9. *Malic acid* reacts on heating, forming the compounds $C_2H_4O(CO.NHC_{10}H_7)_2$ [263°] and $C_{10}H_7N<\substack{CO.CH.OH\\ CO.CH_2}$ [193°] (Bischoff, *B.* 23, 2046).—10. *Pyruvic acid* and *benzoic aldehyde* form $\substack{N.C_{10}H_6\\ CPh.CH}>C.CO_2H$ (Doebner, *A.* 249, 109). 11. *Quinone chlorimide* acts on an alcoholic solution forming a eurhodine of the formula $C_{10}H_6<\substack{N\\ N}>C_6H_3NH_2$ (Nietzki a. Otto, *B.* 21, 1598).—12. *Chloro-acetic acid* forms $C_{10}H_7NH.CH_2.CO.NHC_{10}H_7$ [170°] (Cosiner, *B.* 14, 60).

Salts.—B'HCl: colourless plates, v. e. sol. water and alcohol, sl. sol. HClAq.—$B'_2H_2PtCl_6$: yellow plates, sol. water.—$B'_2H_2SO_4$: plates, m. sol. cold water.—$B'HNO_3$: colourless plates, sl. sol. cold water.—Picrate. [195°]. Long yellow needles, v. sol. alcohol.—Citrate $B'C_6H_8O_7$. [89°] (Hecht, *B.* 19, 2616).—Citraconate. [173°]. Yellow needles (from acetone) (Morawski a. Gläser, *M.* 9, 285).

Compounds with metallic salts. B'_2CuSO_4 (Lachovitch, *M.* 9, 516). Forms also a compound with mercuric chloride.

Formyl derivative $C_{10}H_7.NH.CHO$. [120°] (C.; Tobias, *B.* 15, 2447). [129°] (L. a. J.). Formed by heating (β)-naphthylamine with formic ether and alcohol (Cosiner, *B.* 14, 58), or with formic acid (Liebermann a. Jacobson, *A.* 211, 42). Small plates, sl. sol. hot water.

Acetyl derivative $C_{10}H_7.NHAc$. [132°]. Long needles or plates, sol. hot water (Merz a. Weith, *B.* 13, 1300; 14, 2343). On heating with sulphur it yields $C_{10}H_6<\substack{N\\ S}>C.C<\substack{N\\ S}>C_{10}H_6$, crystallising in yellow plates, insol. most solvents sol. nitrobenzene (Hofmann, *B.* 20, 1804). Bromine in HOAc forms $C_{10}H_6Br.NHAc$ [140°] (Lellmann a. Schmidt, *B.* 20, 3154).

Thio-acetyl derivative $C_{12}H_{11}NS$ *i.e.* $C_{10}H_7.NH.CSCH_3$. [146°]. Formed by heating the acetyl derivative with P_2S_5 (Jacobson, *B.* 21, 2627). Needles or plates (from alcohol). Oxidised by K_3FeCy_6 to ethenyl-amido-naphthyl-mercaptan $C_{10}H_6<\substack{N\\ S}>CMe$ [81°].

Valeryl derivative $C_{10}H_7.NH.COC_4H_9$. [138·5°] (Bamberger a. Müller, *B.* 21, 1112).

Benzoyl derivative $C_{10}H_7NHBz$. [143°] (Cosiner, *B.* 14, 58); [157°] (Hofmann, *B.* 20, 1803). Minute needles, sol. ether, benzene, and hot alcohol. PCl_5 converts it into the compound $C_{10}H_7N:CClC_6H_5$ [68°] (Just, *B.* 19, 983).

(β)-Naphthylamine *ar*-tetrahydride $C_{10}H_{13}N$ *i.e.* $\substack{CH_2.CH_2.C.CH:CNH_2\\ CH_2.CH_2.C.CH:CH}$. [38°]. (276°) at 713mm. Formed to the extent of 3 or 4 p.c. in the preparation of the alicyclic isomeride by reduction of (β)-naphthylamine (Bamberger a. Kitschelt, *B.* 23, 882). Neutral in reaction. Its salts are acid in reaction. May be diazotised. Yields adipic acid on oxidation.

(β)-Naphthylamine *ac*-tetrahydride $C_6H_4<\substack{CH_2.CHNH_2\\ CH_2.CH_2}$. (162°) at 36 mm.; (249·5 cor.) at 710 mm. S.G. $\underline{^{18}}$ 1·031. Formed by reducing (β)-naphthylamine with sodium and isoamyl alcohol (Bamberger a. Müller, 20, 2916; *B.* 21, 850, 1115; Bamberger a. Kitschelt, *B.* 23, 877). Purified by dissolving in ligroïn and ppg. by CO_2. The carbonate is then dissolved in acetic acid, which leaves a brown oil. Colourless liquid, smelling like piperidine; sl. sol. cold, m. sol. hot water, v. sol. alcohol and ether. Powerful base with alkaline reaction, displacing ammonia from its salts. Absorbs CO_2 from the air. Possesses no reducing power. Carbon disulphide at 0° forms tetrahydronaphthyl-ammonium tetrahydronaphthyl thio-carbamate $C_{10}H_{11}NH_3.S.CS.NHC_{10}H_{11}$ [142°]. Phenyl cyanate forms $PhNH.CO.NHC_{10}H_{11}$ [166·5°]. Does not yield colouring matters with diazo- compounds. Powerful midriatic poison. $KMnO_4$ oxidises it to *o*-carboxy-phenyl-propionic acid and phthalic acid. Benzoic aldehyde forms $C_6H_5.CH:NC_{10}H_{11}$ [52°]. HBrAq at 150° forms naphthalene.

Salts.—$B'_2H_2CO_3$ and $B'H_2CO_3$ are white crystalline pps., giving off CO_2 in the air.—B'HCl. [237°]. Plates, v. e. sol. water and alcohol.—$B'_2H_2PtCl_6$.—$B'HAuCl_4$.—$B'HClHgCl_2$ (?) [241°]. Prisms, sol. hot water.—$B'_2H_2SO_4$.—$B'_2H_2Cr_2O_7$.—$B'HNO_3$. [212°]. White satiny tables, sl. sol. cold water, v. sol. conc. HNO_3. At 220° it dissociates with explosive violence.—$B'HNO_2$. [c. 160°]. Needles (from water), v. e. sol. water, insol. ether. Not decomposed by boiling water.—B'HOAc. [156°]. Thick monoclinic crystals, v. sol. alcohol, sl. sol. ether.

Acetyl derivative $C_{10}H_{11}NHAc$. [107°]. Prisms, v. e. sol. chloroform and benzene, v. sol. hot water, m. sol. ether, insol. petroleum-ether. Not attacked by bromine in the cold.

Benzoyl derivative $C_{10}H_{11}NHBz$. [151°]. Needles, v. sl. sol. water, v. sol. benzene.

Di-(α)-naphthylamine $C_{20}H_{15}N$ *i.e.* $(C_{10}H_7)_2NH$. [111° uncor.]. (L.); [113°]. (G. a. V.). (313°) at 15 mm.

Formation.—1. By heating (α)-naphthylamine hydrochloride with (α)-naphthylamine (Girard a. Vogt, *Bl.* [2] 19, 68).—2. A product in the preparation of methyl-(α)-naphthylamine from (α)-naphthylamine and MeCl (Landshoff, *B.* 11, 638).—3. By heating (α)-naphthol with four times its weight of ammoniacal $ZnCl_2$ to 260°; the yield being about 60 p.c. (Benz, *B.* 16, 15).—4. By heating a mixture of (α)-naphthylamine, (α)-naphthol, and $CaCl_2$ to 260°; the yield being 22 p.c. (B.).—5. In small quantities by heating (α)-naphthylamine with $CaCl_2$ or $ZnCl_2$.

Properties.—Dimetric leaflets (from alcohol), m. sol. alcohol, v. e. sol. ether. $FeCl_2$ gives a green pp. in its alcoholic solution.

Picric acid compound $NH(C_{10}H_7)_2 2C_6H_2(NO_2)_3OH$. [169°]. Small glistening black needles.

Acetyl derivative $NAc(C_{10}H_7)_2$. [217°].

Nitrosamine $(C_{10}H_7)_2N.NO$. [262°]. Formed by adding rather more than the theoretical quantity of powdered $NaNO_2$ to a solution of dinaphthylamine in HOAc (L.; Wacker, *A.* 243, 300). Yellow crystalline powder, v. sl. sol. alcohol and HOAc. On adding alcoholic HCl to its ethereal solution it is changed to the isomeric nitroso-dinaphthyl-amine $C_{10}H_6(NO).NH.C_{10}H_7$ or $C_{10}H_6\left<\begin{matrix}NH(C_{10}H_7)\\ \dot{N}\text{———————}\end{matrix}\right>O$ [169°] (Fischer a. Hepp, *B.* 20, 1248).

(αβ)-Di-naphthyl-amine $NH\left<\begin{matrix}C_{10}H_{7\alpha}\\C_{10}H_{7\beta}\end{matrix}\right.$ [111°]. Formed by heating a mixture of (β)-naphthol and (α)-naphthylamine with $CaCl_2$ or $ZnCl_2$.

Preparation.—A mixture of (β)-naphthol (100 pts.), (α)-naphthylamine (100 pts.), and $CaCl_2$ (200 pts.), is heated for 8 hours to 280°; the yield is 70 pts. (Benz, *B.* 16, 17). Long colourless prisms. Soluble in benzene, alcohol, and ether, sparingly soluble in petroleum-ether.

Picric acid compound $NH(C_{10}H_7)_2 2(C_6H_2(NO_2)_3OH)$: [173°], small dark-brown needles.

Acetyl derivative $NAc(C_{10}H_7)_2$. [125°].

Di-(β)-naphthyl-amine $NH(C_{10}H_7)_2$. [171°]. (471°) (Ris, *B.* 20, 2619).

Formation.—1. Together with (β)-naphthylamine by heating (β)-naphthol with ammonia-zinc-chloride at 200° (Merz a. Weith, *B.* 13, 1300).—2. In small quantity by heating (β)-naphthol with ammoniacal $CaCl_2$.—3. By heating (β)-naphthylamine with $CaCl_2$ or $ZnCl_2$.

Preparation.—1. By heating a mixture of (β)-naphthylamine (100 pts.), (β)-naphthol (100 pts.), and damp $CaCl_2$ (200 pts.) for 8 hours at 275°; the yield being good (130 pts.) (Benz, *B.* 16, 9).—2. By passing HCl into fused (β)-naphthylamine at 180°; the yield being quantitative (Klopsch, *B.* 18, 1585).

Properties.—White silvery leaflets, sol. benzene and HOAc, sl. sol. hot alcohol. Its solutions exhibit blue fluorescence.

Reactions.—1. Conc. HClAq at 150° has no action, but at 200° it forms (β)-naphthol and (β)-naphthylamine (Ris, *B.* 19, 2016).—2. Ammoniacal $ZnCl_2$ and NH_4Cl at 370° forms (β)-naphthylamine: $(C_{10}H_7)_2NH + NH_3 = 2C_{10}H_7NH_2$.—3. *Bromine* in HOAc forms a tetra-bromo- derivative $C_{20}H_{11}Br_4N$ [246°]. Bromine and $AlBr_3$ form $C_{20}H_7Br_3N$ [over 300°] (Ris, *B.* 20, 2621).—4. S_2Cl_2, acting on its benzene solution at 35°, forms two isomeric imido-di-naphthyl disulphides $NH\left<\begin{matrix}C_{10}H_6\\C_{10}H_6\end{matrix}\right>S_2$, one crystallising from benzene in plates [205°], and the other in needles [220°] (Kym, *B.* 21, 2807).—5. *Phosgene* acts in the cold, forming $(C_{10}H_7)_2N.COCl$ [173°] (Kühn a. Landau, *B.* 23, 811; *cf.* Kym, *B.* 23, 427). This chloro-formyl derivative is v. sl. sol. cold alcohol, v. sol. benzene, and reconverted into di-(β)-naphthylamine by alcoholic potash.

Salts.—B'HCl; white crystalline pp.—$B'2C_6H_2(NO_2)_3OH$. [165°]. Brown needles.

Acetyl derivative $(C_{10}H_7)_2NAc$. [115°]. Small colourless needles.

Benzoyl derivative $(C_{10}H_7)_2NBz$. [157°]. Large needles (Klopsch, *B.* 18, 1585).

Nitrosamine $(C_{10}H_7)_2N.NO$. [140°] Needles, m. sol. alcohol and ether, v. sol. benzene (Ris, *B.* 20, 2622).

References.—BROMO-, BROMO-NITRO-, CHLORO-, IODO-, IODO-NITRO-, and NITRO-NAPHTHYLAMINE.

(α)-NAPHTHYLAMINE (α)-SULPHONIC ACID $C_{10}H_9NSO_3$ *i.e.* $C_{10}H_6(NH_2)(SO_3H)$ [1:4]. *Naphthionic acid.* S. ·022 at 15°.

Formation.—1. By boiling nitro-naphthalene (1 pt.) with alcohol (5 pts.) and aqueous ammonium sulphite (5 pts. of S.G. 1·24), and maintaining an alkaline reaction by frequent addition of ammonium carbonate (Piria, *A. Ch.* [3] 31, 217; *A.* 78, 31).—2. By heating the acid sulphate of (α)-naphthylamine (Nevile a. Winther, *C. J.* 37, 632; Witt, *B.* 19, 55).—3. By heating (α)-naphthylamine (1 pt. with H_2SO_4 (4 pts.) at 120° for an hour (Schaal a. Schmidt, *B.* 7, 1368; Erdmann, *A.* 247, 313).—4. By heating (α)-naphthylamine with $KHSO_4$ at 230° (Bischoff, *B.* 23, 1913).—5. By reducing the corresponding nitro-naphthalene sulphonic acid by ammonium sulphide (Cleve, *B.* 23, 961).

Properties.—Small needles (containing ½aq) (from hot water); blackened by heat without melting. V. sl. sol. alcohol, almost insol. water. Not affected by boiling aqueous acids or alkalis. Dilute solutions of its salts exhibit violet fluorescence. The azo- colouring matters (*e.g.* Congo red), formed by its combination with diazo- compounds give on reduction o-naphthylene-diamine-sulphonic acid, proving that they are *ortho*-azo- compounds, and hence that the HSO_3 group occupies the *para-* position to the NH_2 (Witt, *B.* 19, 1719).

Reactions.—1. Split up by *water* at 160° into naphthylamine and H_2SO_4 (N. a. W.).—2. *Chromic acid mixture* forms a brown resinous product.—3. *Benzoic aldehyde*, acting on its sodium salt forms $C_6H_5.CH{:}N.C_{10}H_6.SO_3Na$, crystallising in yellow plates, v. sl. sol. cold water (Erdmann, *A.* 247, 325).—4. *Succinic acid* heated with its K salt at 170° forms $C_2H_4{:}C_2O_2{:}N.C_{10}H_6.SO_3K$, crystallising from water or dilute alcohol in small needles (containing 2aq) (Pellizari, *A.* 248, 157).—5. *Phthalic anhydride* heated with the K salt at 160° forms $C_6H_4{:}C_2O_2{:}NC_{10}H_6SO_3K$, crystallising from hot water in small needles (containing 3aq) (P.).—6. On displacing NH_2 by Cl, and distilling the resulting chloro-naphthalene sulphonic acid with PCl_5, there is formed (1, 4)-di-chloro-naphthalene.

Salts.—KA′: small micaceous laminæ, v. sol. water and alcohol, sl. sol. KOHAq.—NaA′4aq: monoclinic prisms.—BaA′$_2$ 8aq.—CaA′$_2$ 8aq; monoclinic crystals, v. sol. water, almost insol. alcohol.—MgA′$_2$ 8aq: monoclinic prisms.—MgA′$_2$ 10aq.—PbA′$_2$ 2aq; needles, sl. sol. water.—ZnA′$_2$ *x*aq.—CuA′$_2$.—AgA′aq: crystalline grains.—AgA′N_2H_6 2aq.

Amide $C_{10}H_6(NH_2).SO_2NH_2$. [206°]. Formed by reducing the amide of (1, 4)-nitro-naphthalene sulphonic acid with HI in HOAc and P (Cleve, *B.* 23, 961). Needles (from alcohol).—B′HCl: colourless needles, v. sl. sol. water.

Acetyl derivative of the amide $C_6H_4(NHAc).SO_2NH_2$. [241°]. Small needles.

(α)-Naphthylamine (α′)-sulphonic acid $C_{18}H_6(NH_2)(SO_3H)$ [1:4′]. S. ·1064 at 15°.

Formation.—1. By reducing (α)-nitro-naphthalene sulphonic acid by ammonium sulphide (Laurent; Cleve, *Bl.* [2] 24, 511).—2. Together with naphthionic acid by adding (α)-naphthylamine hydrochloride (1 pt.) at 0° to (2 pts. of) fuming H_2SO_4 (containing 25 p.c. additional SO_3) (Witt, *B.* 19, 578; Manzelius, *B.* 20, 3401). 3. Together with a small quantity of the (1, 4) acid from the acetyl derivative of (α)-naphthylamine and fuming H_2SO_4 (Erdmann, *A.* 247, 315; G. Schultz, *B.* 20, 3161; *cf.* Lange, *B.* 20, 2940).

Properties.—Needles. Solutions of its salts exhibit green fluorescence, and reduce $AgNO_3$ on warming. Auric chloride, $FeCl_2$, and $CuSO_4$ colour its solution red, and suffer reduction. By boiling its diazo- compound with HCl a chloro-naphthalene sulphonic acid is obtained, the K salt of which on distillation with PCl_5 yields (γ)-di-chloro-naphthalene [107°] (M.). Benzoic aldehyde, acting on its sodium salt, forms $C_6H_5CH{:}N.C_{10}H_6.SO_3Na$, crystallising in pearly plates, decomposed by boiling water (Erdmann, *A.* 247, 326).

Salts.—KA′aq: needles or prisms, v. e. sol. water.—NaA′aq: plates (C.) or needles (M.).—NaA′5aq: plates (W.).—BaA′$_2$ 8aq (W.).—BaA′$_2$ 6aq (C.; M.).—CaA′$_2$ 6aq (W.): pearly plates, v. e. sol. water.—CaA′$_2$ 9aq (C.; M.): tables, v. sol. hot water.—MgA′$_2$ 8aq: plates, v. sol. water.—PbA′$_2$ 4aq: nodules.—ZnA′$_2$ 9aq: needles, m. sol. cold water.—AgA′.

Amide. [260°]. Tables. Yields an acetyl derivative [232°] and a diacetyl derivative [200°] (Ekborn, *B.* 23, 1119).—B′HCl.—B′H_2SO_4.

(α)-Naphthylamine *peri*-sulphonic acid $C_{10}H_6(NH_2)(SO_6H)$ [1:1′]. *Naphthylamine sulphonic acid* S. S. ·42 at 100°; ·0207 at 21°. Formed, together with the (1, 4′) acid from naphthalene (α)-sulphonic acid by nitration and reduction (Mensching, *Schöllkopf's Aniline Co.*, *G. P.* 40,571; G. Schultz, *B.* 20, 3162). Formed also, together with the (1, 4′) acid, from (α)-nitro-naphthalene by sulphonation and reduction (Cleve, *B.* 20, 1535). White needles (from water) or tufts of needles (from HOAc). Its sodium salt is less soluble than that of the preceding isomeride. $FeCl_3$ colours its cold aqueous solution violet. The diazo- compound treated with PCl_5 gives $C_{10}H_6ClSO_3$, crystallising in yellow needles [175°].—NaA′. S. 2·67 at 100°; 1·13 at 24°.—KA′. Plates. S. 14·9 at 100°; 3·56 at 19° (Erdmann, *A.* 247, 306).

Anhydride  $C_{10}H_6{<}\genfrac{}{}{0pt}{}{SO_2}{NH}{>}$. [167°]. Small crystals, v. sl. sol. water (Cleve).

(α)-Naphthylamine (δ)-sulphonic acid $C_{10}H_6(NH_2)(SO_3H)$ [1:2′ or 3′]. S. ·2 at 15°; ·7 at 100°. Obtained by heating (α)-naphthylamine (1 pt.) with conc. H_2SO_4 (5 pts.) at 125°–130° for 8 hours until the naphthionic acid at first formed has disappeared (Hirsch, *B.* 21, 2370). Plates, sl. sol. water and alcohol, insol. ether and benzene. The K salt is crystalline, and sl. sol. cold water. Gives, on treatment with HNO_2 and HNO_3, di-nitro-naphthol sulphonic acid isomeric with naphthol yellow S.

(α)-Naphthylamine 'β'-sulphonic acid $C_{10}H_6(NH_2)(SO_3H)$ [1:3′]. Formed, together with its (γ) and (θ) isomerides, from naphthalene (β)-sulphonic acid by successive nitration and reduction (Cleve, *Bl.* [2] 26, 447; *B.* 20, 1535). Slender needles (containing 2aq) or anhydrous tables; sl. sol. cold, v. sol. hot, water.—NaA′4aq: thin tables.—KA′aq: needles.—MgA′$_2$ 10aq: rhombohedra.—BaA′$_2$ aq: flat needles, m. sol. water.—CaA′$_2$ 7aq: rhombohedra.

Anhydride  $C_{10}H_0{<}\genfrac{}{}{0pt}{}{NH}{SO_2}{>}$. [180°]. Formed by treating the chloride of 'β' nitro-naphthalene (β)-sulphonic acid with HI and HOAc. Yellow needles, v. sl. sol. HOAc.

(α)-Naphthylamine (γ)-sulphonic acid $C_{10}H_6(NH_2)(SO_3H)$ [1:3]. Formed, with isomerides, from naphthalene (β)-sulphonic acid by nitration and reduction (Cleve, *B.* 19, 2181; 21, 3271). Small needles, sl. sol. water. Gives rise to a di-chloro-naphthalene [61°].

Salts.—NaA′: scales, v. sol. water.—BaA′$_2$ aq: thin plates, v. sol. water.—PbA′$_2$: prisms.—AgA′aq: minute needles.

Amide $C_{10}H_6(NH_2).SO_2NH_2$ aq. [131°]. Needles.—B′HCl: prisms, sl. sol. cold water. With potassium cyanate it forms $NH_2.CO.NH.C_{10}H_6.SO_2.NH.CO.NH_2$ [273°].

Acetyl derivative of the amide $C_{10}H_6(NHAc).SO_2NH_2$. [221°].

Anhydride $C_{10}H_6<\genfrac{}{}{0pt}{}{NH}{SO_2}>$. [124°]. Formed from (γ)-nitro-naphthalene (β)-sulphonic chloride, HOAc, and HI (Cleve, *B.* 20, 1536) Lemon-yellow needles, v. sl. sol. HOAc and alcohol.

(α)-Naphthylamine (θ)-sulphonic acid $C_{10}H_6(NH_2)(SO_3H)$ [1:2′]. Formed, with isomerides, from naphthalene (β)-sulphonic acid by nitration and reduction (Cleve, *Bl.* [2] 29, 415; *B.* 21, 3264). Crystals (containing aq). Gives rise to di-chloro-naphthalene [61°]. Its alcoholic solution yields with nitrous acid a deep violet dye $SO_3H.C_{10}H_6.N_2.C_{10}H_5(NH_2)SO_3H$ 2½aq.

Salts.—NaA′ ½aq: thin needles, v. sol. water. —CaA'_2 2aq: powder, v. sol. water, turning red in air.—BaA'_2: flat needles.—ZnA'_2 4aq: needles.

Amide $C_{10}H_6(NH_2).SO_2NH_2$. [181°]. Needles. B′HClaq.—B′HI aq. Yields the urea derivative $NH_2.CO.NH.C_{10}H_6.SO_2.NH.CO.NH_2$ [225°].

Acetyl derivative of the amide $C_{10}H_6(NHAc).SO_2NH_2$. [213°].

Anhydride $C_{10}H_6<\genfrac{}{}{0pt}{}{NH}{SO_2}>$. [173°]. Formed from (θ)-nitro-naphthalene (β)-sulphonic chloride, HOAc, and HI (Cleve, *B.* 20, 1536). Yellow needles, sol. boiling Ac_2O.

(β)-Naphthylamine 'α'-sulphonic acid $C_{10}H_6(NH_2)(SO_3H)$ [2:1′]. '*Badische acid.*' S. ·059 (Forsling).

Formation.—1. By heating (β)-naphthylamine (1 pt.) with conc. H_2SO_4 (3½ pts.) at 100°–105° for 5 or 6 hours there is obtained a mixture of the 'α,' 'β,' (γ), and (δ) sulphonic acids of (β)-naphthylamine in the proportion of about 50 p.c. of the 'α' acid, 40 p.c. of the 'β' acid, 5 p.c. of the (γ)-acid, and 5 p.c. of the (δ)-acid (Green, *C. J.* 55, 35; *cf.* Badische Anilinfabrik, *G.P.* 14,612, 20,760; Dahl, *G.P.* 29,084, 32,271, 32,276). The same mixture heated at 120° gives a greater quantity of the 'β' acid, and less of the 'α' acid. Fuming sulphuric acid (20 p.c. SO_3 extra) at 70°–80° gives 30 p.c. of the 'α' and 70 p.c. of the (γ)-acid. (β)-Naphthylamine sulphate, shaken with conc. H_2SO_4 for three days in the cold, yields a similar mixture (Dahl): but on heating (β)-naphthylamine with conc. H_2SO_4 for an hour at 160° the 'β' and (δ) acid are formed in about equal quantities (Bayer a. Duisberg, *B.* 20, 1426; G. Schultz, *B.* 20, 1358).—2. By heating the (β)-naphthol 'α'-sulphonic acid (of Bayer) with ammonia in a closed vessel (Pfitzinger a. Duisberg, *B.* 22, 396; *cf.* Landshoff, *B.* 16, 1931).

Properties.—Needles or broad tables, v. sl. sol. water, insol. alcohol. Solutions of its salts exhibit blue fluorescence.

Reactions.—1. Yields naphthalene (α)-sulphonic acid when its amido- group is removed by the diazo- reaction (P. a D.; Nietzki a. Zübelen, *B.* 22, 453).—2. Yields by Sandmeyer's method a bromo-naphthalene sulphonic acid which can be converted into di-bromo-naphthalene [75°] (Forsling, *B.* 22, 619).—3. Yields by Skraup's method (β)-naphthaquinoline sulphonic acid, which may be oxidised to $<\genfrac{}{}{0pt}{}{CO\text{——}}{C_5NH_3}>C_6H_3.SO_3H$, showing that the naphthylamine sulphonic acid is heteronucleal (Immerheiser, *B*, 22, 402, 412; *cf.* Armstrong a, Wynne, *C. J. Proc.* 4, 103; 5, 49).—4. Heating with H_2SO_4 (3 pts.) at 160° for 1½ hours converts it into a mixture of the 'β' and (δ) isomerides (Weinberg, *B.* 20, 3353).—5. Reacts with diazobenzene sulphonic acid, forming a yellow diazo-amido- and not an azo- compound (Witt, *B.* 21, 3483).—6. On conversion into the corresponding chloro-naphthalene sulphonic acid and treatment of this with PCl_5 there is formed di-chloro-naphthalene [61·5°].

Salts (Forsling, *B.* 20, 2099).—NaA′: plates, v. sol. water, insol. alcohol.—KA′ ½aq: tables, v. sol. water.—×NH_4A': large prisms, v. sol. water.—BaA'_2 4aq: columns, v. e. sol. warm water. S. 4·35 in the cold.—CaA'_2 6aq: tables. S. 9·09 in the cold.—MgA'_2 3½aq: nodules, v. e. sol. water.—ZnA'_2 6aq: columns.—PbA'_2: needles.—CuA'_2: crystalline powder.—AgA′.

(β)-Naphthylamine 'β'-sulphonic acid $C_{10}H_6(NH_2)(SO_3H)$ [2:3′]. '*Brönner's acid.*'

Formation.—1. By heating the corresponding (Schäffer's) (β)-naphthol sulphonic acid with ammonia under pressure (Farbfabrik vormals Brönner, *G. P.* 22,547), or by passing a current of ammonia over the potassium (β)-naphthol sulphonate at 200°–250° (Landshoff, *B.* 16, 1931; Green, *B.* 22, 723).—2. Together with the 'α,' (γ), and (δ) isomerides by heating (β)-naphthylamine (1 pt.) with conc. H_2SO_4 (3 pts.) at 105° (Bayer a. Duisberg, *B.* 20, 1426; Green, *C. J.* 55, 35).—3. By heating (β)-naphthylamine with $KHSO_4$ at 230°; the yield being 60 p.c. of the theoretical (Bischoff, *B.* 23, 1914). 4. The chief product obtained by heating (β)-naphthylamine acid sulphate at 200°.

Properties.—Plates or flat needles, sl. sol. warm water (Schultz, *B.* 20, 3158). According to Forsling the laminar crystals contain aq. Its solution exhibits blue fluorescence. Yields, by conversion into diazo-naphthalene sulphonic acid and application of Sandmeyer's reaction, a chloro-naphthalene sulphonic acid whence PCl_5 forms $C_{10}H_6Cl_2$ [136°].

Salts (Forsling, *B.* 20, 76).—NH_4A'aq: large thin plates, v. sl. sol. water, forming a solution exhibiting violet fluorescence (Green).—NaA′2aq: flat needles. S. 2·5 at 15°.—KA′ aq: long needles. S. 2·4.—BaA'_2 6aq: needles. S. ·22 at 15°.—CaA'_2 6aq: laminæ. S. ·44 in the cold.—MgA'_2 6aq: laminæ or broad needles.—PbA'_2 2aq: v. sl. sol. water.—ZnA'_2 4aq.—CuA'_2 4aq: sl. sol. water.—AgA′ aq: powder.

(β)-Naphthylamine (γ)-sulphonic acid $C_{10}H_6(NH_2)(SO_3H)$ [2:4′]. *Dahl's acid.* S. ·077 in the cold (F.). Formed by sulphonating (β)-naphthylamine, and is the chief product when the sulphonation is carried out at 15° to 20° (Dahl, *G. P.* 32,276; Forsling, *B.* 20, 2099; Claus, *J. pr.* [2] 39, 315). Small plates or needles, insol. alcohol. Its solutions show blue fluorescence. May be converted into di-chloro-naphthalene [48°]. Conc. H_2SO_4 (3 pts.) at 160° converts it into a mixture of the 'β' and (δ) isomerides (Weinberg, *B.* 20, 3353).

Salts.—×NH_4A': exceedingly soluble tables. KA′ aq: rhombohedra, v. e. sol. water.—NaA′5aq: tables, v. e. sol. water.—BaA'_2 2½aq: nodules, v. e. sol. water.—CaA'_2 11aq: needles. S. 9·09 in the cold.—AgA'_2 8aq: crystalline.

(β)-Naphthylamine (δ)-sulphonic acid $C_{10}H_6(NH_2)(SO_3H)$ [2:2′]. (β)-*Naphthylamine sulphonic acid F.* *Bayer's acid.* S. ·2857.

Formation.—1. Together with the 'β' isomeride, by heating (β)-naphthylamine with H_2SO_4 at 160°–170° (Bayer a. Duisberg, *B.* 20, 1426, 3158; Schultz, *B.* 20, 1358, 3161). It is also formed when the sulphonation is conducted at temperatures between 105° and 160°, the quantity increasing with the temperature (Green, *C. J.* 55, 36).—2. By heating the corresponding (β)-naphthol sulphonic acid with ammonia at 200° (Weinberg, *B.* 20, 2908; Erdmann, *B.* 21, 637), or by heating naphthalene 'α' disulphonic acid with NaOH at 250°, and afterwards with NH_4Cl (Weinberg, *B.* 20, 2906, 3353).—3. By heating the 'α' or (γ)-isomeride with H_2SO_4 at 160° (B. a. D.).

Properties.—Long silky needles (containing aq), m. sol. hot water nearly insol. cold water. On boiling with water the needles change to an almost insoluble crystalline powder. With tetra-azo-diphenyl it gives a yellowish-red colouring matter (δ-purpurin). Yields by the diazo- reaction the (β)-naphthol sulphonic acid of Weinberg, which by fusion with NaOH is converted into dioxynaphthalene [129°]. Gives rise to (δ)-di-chloro-naphthalene [114°].

Salts.—KA′: needles, v. sol. water.—NaA′4aq: white needles (from water) or plates (from hot 90 p.c. alcohol), v. e. sol. hot water, S. 1·4 in cold water, v. sol. hot spirit (90 p.c.) (difference from 'α' isomeride).—$^{\times}NH_4A'$: small plates, m. sol. water.—BaA'_2 4½aq: plates, sl. sol. cold water (difference from (γ)-isomeride).—MgA'_2 aq: white needles (B. a. D.).—MgA'_2 5aq (W.).—CaA'_2 6aq: plates, with blue fluorescence. S. ·38 at 15°.

(α)-Naphthylamine ν-sulphonic acid $C_{10}H_7.NHSO_3H$. *Thionaphthamic acid.* Formed, together with the (1, 4) acid, by the action of ammonium sulphite on (α)-nitro-naphthalene (Piria, *A.* 78, 54). The free acid, liberated from its salts, splits up at once into naphthylamine and H_2SO_4.—KA′: pearly plates, v. sol. water, sl. sol. KOHAq.—$^{\times}NH_4A'$: plates, sol. water and alcohol.—$BaA'_2$3aq: plates.—PbA′(OAc).

(α)-Naphthylamine 'α' disulphonic acid $C_{10}H_9NS_2O_6$ *i.e.* $C_{10}H_5(NH_2)(SO_3H)_2$ [1:3:3′]. Formed by reducing (α)-nitro-naphthalene 'α'-disulphonic acid by ammonium sulphide (Alén, *Bn.* 2, 407). Crystals, v. e. sol. water and alcohol, insol. ether and benzene. Yields (α)-naphthylamine on treatment with sodium-amalgam. — NH_4HA'' 2aq (?): slender needles. — KHA′ 3aq: needles, m. sol. hot water.—CaA″ 5aq.—BaA″ 4aq: tables, m. sol. water.—PbA″ 4aq (?).

(α)-Naphthylamine 'β' disulphonic acid $C_{10}H_5(NH_2)(SO_3H)_2$ [1:3:2′]. Obtained by reducing (α)-nitro-naphthalene 'β' disulphonic acid (Alén). Small needles (from water), v. sol. water, sl. sol. alcohol. Yields (α)-naphthylamine on treatment with sodium-amalgam.—NH_4HA'': needles, m. sol. hot water.—KHA″: needles.—CaA″ 2aq.—BaA″ aq: minute needles, sl. sol. water.—PbA″.

(α)-Naphthylamine (δ)-disulphonic acid $C_{10}H_5(NH_2)(SO_3H)_2$ [1:1′:4]. *Naphthylamine disulphonic acid S.* (Schöllkopf's *G. P.* 40,571). Formed by sulphonating (1, 1′)-naphthylamine sulphonic acid. — Na_2A''2aq: long needles (Bernthsen, *B.* 23, 3090).

(α)-Naphthylamine (ε)-disulphonic acid $C_{10}H_5(NH_2)(SO_3H)_2$ [1:3:1′]. Formed by heating naphthalene with conc. H_2SO_4 at 90° and fuming H_2SO_4 at 100°-120°, then nitrating, and reducing the product (*G. P.* 45,776, 46,953; Bernthsen, *B.* 22, 3328). Formed also from naphthalene (αβ)-disulphonic acid (corresponding to $C_{10}H_6Cl_2$ [48°]) by nitration and reduction (Ewer a. Pick, *Monit. scient.* 1889, 604; *cf.* Armstrong a. Wynne, *C. N.* 54, 255). Colourless scales (containing 3aq), v. e. sol. warm water.—NaHA″ 2aq: needles or thin prisms, sl. sol. cold water.—Na_2A'' 6aq: needles or prisms, v. e. sol. water.—BaA″3aq.—BaA″4aq: flat needles, v. sol. hot, m. sol. cold, water.—$Ba(HA'')_2$ 5aq: minute needles, sl. sol. cold water.

(α)-Naphthylamine disulphonic acid $C_{10}H_5(NH_2)(SO_3H)_2$ [1:4:2′]. S. ·7 at 20°; 5 at 100°. Formed, together with two isomeric acids, by sulphonating (α)-naphthylamine (1 pt.) with H_2SO_4 (containing 25 p.c. SO_3 extra) (5 pts.) at 120°. The acids are separated by treatment of the lime salts with dilute alcohol, which dissolves the salts of the two isomeric acids (Dahl & Co., *G. P.* 41,957; Armstrong a. Wynne, *C. J. Proc.* 6, 125). Formed, together with a smaller quantity of the following acid, by treating (α)-naphthylamine 'α'-sulphonic acid (1 pt.) with H_2SO_4 containing SO_3 (1½ pts.) at 30°. Groups of needles, insol. 85 p.c. alcohol. Its solutions and those of its salts exhibit blue fluorescence.

Salts.—K_2A'' 3aq.—Na_2A'' 3aq: v. sol. water. CaA'_2 aq: v. sl. sol. water.

(α)-Naphthylamine disulphonic acid $C_{10}H_5(NH_3)(SO_3H)_2$ [1:4:3′]. S. 17 at 20°. Formed in the preparation of the preceding, from which it may be separated by extracting the mixed calcium salts with dilute alcohol. Alcohol of 90 p.c. extracts the salt of a third isomeride, subsequent treatment with alcohol of 85 p.c. extracts the present acid. Needles, insol. alcohol, v. sol. boiling alcohol of 85 p.c. The calcium salt is v. sol. water, insol. alcohol of 90 p.c. The K and Na salts are v. sol. water. Solutions of the acid and its salts exhibit blue fluorescence.

(β)-Naphthylamine 'α' disulphonic acid $C_{10}H_5(NH_2)(SO_3H)_2$ [2:3:3′]. *(β)-Naphthylamine R-disulphonic acid.* Formed by heating the corresponding (β)-naphthol R-disulphonic acid with ammonia. Readily yields dyes with diazo- salts.

(β)-Naphthylamine (γ)-disulphonic acid $C_{10}H_5(NH_2)(SO_3H)_2$ [2:1′:3′]. *(β)-Naphthylamine G-disulphonic acid.* Formed by heating the corresponding (β)-naphthol G-disulphonic acid with ammonia. Formed also by heating (β)-naphthylamine sulphate (10 kilos.) with H_2SO_4 (30 kilos. containing 25 p.c. SO_3 extra) at 110°–140° (Gans a. Co., *G. P.* 35,019). V. sol. water, m. sol. alcohol. Does not react with diazo- compounds (G. Schultz, *B.* 21, 3487). The salts are v. sol. water.

(β)-Naphthylamine disulphonic acid $C_{10}H_5(NH_2)(SO_3H)_2$ [2:1:3′]. Formed, together with the (2, 1′, 3′) acid, from (2, 3′)-naphthylamine sulphonic acid and H_2SO_4 (with 20 p.c. SO_3) at 20° (Armstrong a. Wynne, *C. J. Proc.* 6, 130). Needles. Yields $C_{10}H_5Cl_3$ [92°].

(β)-Naphthylamine disulphonic acid $C_{10}H_5(NH_2)(SO_3H)_2$ [2:3′:x]. Formed by heating (Brönner's) (β)-naphthylamine 'β'-sulphonic acid at 160° to remove water of crystallisation, adding fuming H_2SO_4 (4 pts.) and heating at 110° (Forsling, *B.* 21, 3495). Possibly identical with the preceding acid. White needles, v. e.

sol. water, sl. sol. alcohol. Its dilute aqueous solution fluoresces blue. It gives rise to a tri-chloro-naphthalene [91°].

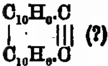
Salts.—$K_2A''2aq$: large needles, v. sol. water.—$KHA''aq$: needles, sl. sol. cold water.—$NaHA''2aq$.—Na_2A'': long needles.—$(NH_4)_2A''aq$: monoclinic crystals.—NH_4HA''.—*CaA'': plates.

(β)-Naphthylamine disulphonic acid $C_{10}H_5(NH_2)(SO_3H)_2$ [2:1:4′]. Formed, together with a greater quantity of the (2, 2′, 4′)-isomeride from (2, 4′)-naphthylamine sulphonic acid and H_2SO_4 (with 20 p.c. SO_3) at 20° (A. a. W.). Yields $C_{10}H_5Cl_3$ [78°].

(β)-Naphthylamine disulphonic acid $C_{10}H_5(NH_2)(SO_3H)_2$ [2:2′:4′]. Formed as above. Yields $C_{10}H_5Cl_3$ [80°].

(β)-Naphthylamine disulphonic acid $C_{10}H_5(NH_2)(SO_3H)_2$ [2:3:2′]. Formed from the corresponding naphthol disulphonic acid.

Di-NAPHTHYL-ANTHRYLENE $C_{22}H_{12}$ *i.e.*



$$\begin{array}{l}C_{10}H_6.C\\ |\quad\ \ |||\\ C_{10}H_6.C\end{array}$$

(?). [270°]. Formed by distilling di-naphthyl-acetylene, or by distilling (β)-di-naphthyl-tri-chloro-ethane (1 pt.) with ZnO (15 pts.) (Grabowski, *B.* 11, 302). Large leaflets (by sublimation).—$C_{22}H_{12}C_6H_2(NO_2)_3OH$: crystals (from chloroform).

NAPHTHYL-ARSENIOUS ACID. Described as *Naphthalene arsonic acid*, vol. i. p. 322.

NAPHTHYL-BENZAMIDINE $C_{17}H_{14}N_2$ *i.e.* $C_6H_5C(NH).NHC_{10}H_7$. [141°] Formed by heating (α)-naphthylamine hydrochloride with benzonitrile at 200° (Bernthsen a. Trompetter, *B.* 11, 1757). Tables (from alcohol); may be sublimed.—$B'HCl$: white prisms.—$B'_2H_2PtCl_6$: yellow needles.—$B'H_2C_2O_4$: prisms, sl. sol. water.—Chromate: yellow pp.

(α)-NAPHTHYL-BENZYL-AMINE $C_{17}H_{15}N$ *i.e.* $C_{10}H_7.NH.CH_2Ph$. [67°]. Formed from (α)-naphthylamine and benzyl chloride (Froté a. Tommasi, *Bl.* [2] 20, 67).

(β)-Naphthyl-benzyl-amine $C_{10}H_7.NH.CH_2Ph$. [68°]. Formed by reducing $C_{10}H_7.N:CHPh$ (Kohler, *A.* 241, 358). Prisms.

Nitrosamine $C_{10}H_7.N(NO).CH_2Ph$. [112°]. Yellow needles, sol. alcohol and ether.

(α)-NAPHTHYL-BENZYLIDENE-AMINE $C_{10}H_7.N:CHPh$. [73°]. Formed from (α)-naphthylamine and benzoic aldehyde or hydrobenzamide (Lachovitch, *M.* 9, 695; *cf.* Papasogli, *A.* 171, 138). Yellow needles (from alcohol).

(β)-Naphthyl-benzylidene-amine. [101°]. Resembles the preceding in preparation and properties (Claison, *A.* 237, 261).

NAPHTHYL BENZYL KETONE *v.* BENZYL NAPHTHYL KETONE.

NAPHTHYL BENZYL OXIDE *v.* BENZYL NAPHTHYL OXIDE.

NAPHTHYL BROMO-METHYL KETONE $C_{12}H_9BrO$ *i.e.* $C_{10}H_7.CO.CH_2Br$. Obtained by adding bromine (9·5 g.) to a solution of naphthyl methyl ketone (10 g.) in CS_2 (Pampel a. Schmidt, *B.* 19, 2898). Pungent oil.

(α)-NAPHTHYL-CARBAMATE $C_{11}H_9NO_2$ *i.e.* $C_{10}H_7.O.CO.NH_2$. [158°]. Formed from (α)-naphthol and $ClCO.NH_2$ (Gattermann, *A.* 244, 43). Needles (from alcohol).

(β)-Naphthyl carbamate. [187°]. From (β)-naphthol and $ClCONH_2$ (G.). Long needles, almost insol. water, v. sol. alcohol and ether.

(α)-NAPHTHYL-CARBAMIC ACID. *Ethyl ether* $C_{13}H_{13}NO_2$ *i.e.* $C_{10}H_7NH.CO_2Et$. [79°]. Formed from (α)-naphthylamine and $ClCO_2Et$ (Hofmann, *B.* 3, 657). Needles, insol. water.

Isopropyl ether $C_{10}H_7NH.CO_2Pr$. [78°]. From (α)-naphthylamine and $ClCO_2Pr$ (Spica, *G.* 17, 168). Groups of needles, sl. sol. water.

(β)-Naphthyl-carbamic acid. *Ethyl ether* $C_{10}H_7NH.CO_2Et$. [73°]. Formed from (β)-naphthylamine and $ClCO_2Et$ (Cosiner, *B.* 14, 60). Needles, insol. hot water, v. sol. alcohol.

Isopropyl ether $C_{10}H_7NH.CO_2Pr$. [70°] Needles, sol. alcohol and ether (S.).

Di-(β)-naphthyl carbamate. *Methyl ether* $(C_{10}H_7)_2N.CO_2Me$. [114°]. Formed from di-(β)-naphthylamine and $ClCO_2Me$ at 155° (Ris, *B.* 20, 2620). Needles (from alcohol and ether), v. sol. cold alcohol and ether.

(α)-NAPHTHYL-CARBAMINE $C_{11}H_7N$ *i.e* $C_{10}H_7.NC$. Formed from (α)-naphthylamine, chloroform, and alcoholic KOH (Liebermann, *B.* 16, 1640). Solid, v. sol. alcohol.

(β)-Naphthyl-carbamine $C_{10}H_7.NC$. [54°]. Formed from (β)-naphthylamine, chloroform, and alcoholic potash (Liebermann, *B.* 16, 1640). Needles, sol. alcohol, ether, and benzene.

(α)-NAPHTHYL-*semi*-CARBAZIDE $C_{11}H_{11}N_3O$ *i.e.* $C_{10}H_7.NH.NH.CO.NH_2$. [231°]. Formed by heating (α)-naphthylamine hydrochloride with urea at 140° (Pinner, *B.* 21, 1219). Thin plates (from boiling isoamyl alcohol), insol. water and ether, sl. sol. dilute alkalis.

(β)-Naphthyl-*semi*-carbazide. [225°] (P.); [221°] (H.). Formed like its isomeride, and also by mixing equivalent quantities of (β)-naphthylamine hydrochloride and potassium cyanate in aqueous solution (Pinner, *B.* 21, 1223; Hillringhaus, *B.* 22, 2657; Hauff, *A.* 253, 28). Silky plates, sl. sol. hot water, v. sol. hot alcohol. Reduces Fehling's solution. With HClAq at 140° it yields a naphthazine.

DINAPHTHYL-CARBAZOLE, so-called, is described as IMIDO-DINAPHTHYL.

(α)-NAPHTHYL-CARBINOL $C_{11}H_{10}O$ *i.e.* $C_{10}H_7.CH_2OH$. *Naphthobenzyl alcohol.* [60°]. (301° cor.) at 715 mm. Formed by warming (α)-naphthyl-carbinylamine hydrochloride with aqueous $NaNO_2$ (Bamberger a. Lodter, *B.* 21, 258). Long needles, v. e. sol. ether and alcohol, v. sl. sol. cold water. Yields (α)-naphthoic aldehyde on oxidation with chromic acid mixture.

(β)-Naphthyl-carbinol $C_{10}H_7.CH_2OH$. [80·5°]. Resembles the preceding in mode of preparation and properties (Bamberger, *B.* 20, 1118).

Tri-naphthyl-carbinol $C_{31}H_{22}O$ *i.e.* $(C_{10}H_7)_3C.OH$. Formed from naphthalene, $C(NO_2)Cl_3$, and $AlCl_3$, the product being boiled with water (Elbs, *B.* 16, 1275). Crystalline powder (from acetone), melting below 278°; v. sol. benzene, sl. sol. ether, almost insol. alcohol.

(α)-NAPHTHYL-CARBINYLAMINE $C_{11}H_{11}N$ *i.e.* $C_{10}H_7.CH_2NH_2$. *Menaphthylamine. Naphthobenzylamine.* (292°). Formed, together with *s*-di-naphthyl-ethane, by reducing the amide of thionaphthoic acid in alcoholic solution with zinc and HClAq (Hofmann, *B.* 1, 101; Bamberger a. Lodter, *B.* 21, 256). Caustic liquid, absorbing CO_2 from the air. Reduced in alcoholic solution by Na to the tetrahydride.—$B'HCl$: long needles, sl. sol. water.—$B'_2H_2PtCl_6$: crystalline pp.—$B'HNO_3$: prisms [148·5°].

Tetrahydride $C_{10}H_{11}CH_2.NH_2$. (270°) at 722 mm. Obtained by reducing the nitrile of (α)-naphthoic acid $C_{10}H_7.CN$ in alcoholic solution by sodium (Bamberger a. Lodter, *B.* 20, 1707).—B'HCl: white needles, v. e. sol. hot water.—$B'_2H_2PtCl_6$: yellow needles, sl. sol. cold water.—$B'C_6H_2(NO_2)_3OH$: needles, v. sol. hot water.

(β)-Naphthyl-carbinylamine $C_{10}H_7.CH_2NH_2$. [60°]. Formed from the amide of thio-(β)-naphthoic acid $C_{10}H_7.CS.NH_2$ by treating its alcoholic solution with zinc and HCl at 35° (Bamberger a. Lodter, *B.* 21, 1117). Prisms, sl. sol. cold water, v. sol. alcohol. It is a powerful base, ppg. the hydroxides from solutions of salts of copper, zinc, and lead.

Salts.—B'HCl. [260°–270°]. Prisms, v. sol. alcohol and water, insol. ether.—$B'_2H_2PtCl_6$: yellow needles. — $B'C_6H_2(OH)(NO_2)_2$: golden-yellow needles, v. sol. hot water.

Tetrahydride $C_{10}H_{11}.CH_2NH_2$. (270° cor.) at 729 mm. Formed by adding sodium to a hot alcoholic solution of (β)-naphthonitrile (Bamberger a. Boekmann, *B.* 20, 1711). Yields an acetyl derivative [65°] (Bamberger a. Helwig, *B.* 22, 1915). Carbon disulphide reacts forming $C_{10}H_{11}CH_2.NH.CS.SHNH_2.CH_2.C_{10}H_{11}$ [128°], which on boiling with alcohol gives rise to $CS(NH.CH_2C_{10}H_7)_2$ [143°].—B'HCl. [229°]. Needles, v. sol. water and alcohol. With potassium cyanate it gives $CO(NH.CH_2C_{10}H_7)_2$ [226°] and $CO(NH_2)(NHCH_2C_{10}H_7)$ [135°].—$B'_2H_2PtCl_6$. Needles.—$B'H_2CO_3$: white needles.—$B'_2H_2SO_4$. Prisms, v. e. sol. water.—$B'C_6H_2(NO_2)_3(OH)$. Yellow prisms, sl. sol. water.

DI-NAPHTHYL-TRI-CHLORO-ETHANE *v.* Tri-chloro-di-naphthyl-ethane.

(α)-NAPHTHYL-CYANAMIDE $C_{10}H_7NH.CN$. [133°]. Formed by heating a solution of oxy-(α)-naphthyl-thio-urea $C_{10}H_7NH.CS.NH.OH$ (Tiemann, *B.* 22, 1940).

Di-(α)-naphthyl-cyanamide $C_{21}H_{14}N_2$ *i.e.* $H_7C_{10}.N:C:N.C_{10}H_7$. *Di-(α)-naphthyl-carbimide. Carbo-di-(α)-naphthyl-imide.* [94°]. Obtained by adding HgO to a boiling solution of di-(α)-naphthyl-thio-urea in dry benzene; the yield being c. 30 p.c. of the theoretical (Huhn, *B.* 19, 2405). Large prisms. V. sol. benzene, sl. sol. cold ether and petroleum-ether. By heating with dilute alcohol it is converted into di-(α)-naphthyl-urea. H_2S passed into the boiling solution in dry benzene converts it into di-(α)-naphthyl-thio-urea. Heated with CS_2 at 200° it yields (α)-naphthyl-thiocarbimide.

Di-(β)-naphthyl-cyanamide $H_7C_{10}.N:C:N.C_{10}H_7$. *Di-(β)-naphthyl-carbimide.* [146°]. Obtained by adding HgO to a boiling solution of di-(β)-naphthyl-thio-urea in dry benzene; the yield being 25 p.c. of the theoretical (Huhn, *B.* 19, 2406). White granular crystals. V. sol. hot benzene, sl. sol. ether and petroleum-ether. By boiling with dilute alcohol it is converted into di-(β)-naphthyl-urea. If H_2S is passed into its solution in dry boiling cumene, di-(β)-naphthyl-thio-urea is regenerated. With CS_2 at 200° it yields (β)-naphthyl-thio-carbimide.

(α)-NAPHTHYL-CYANATE $C_{10}H_7N:CO$. (270°). Formed in small quantity by heating di-naphthyl-urea with P_2O_5, and in larger quantity by the like treatment of naphthyl-carbamic ether (Hall, *Pr.* 9, 366; Hofmann, *Pr.* 19, 108; *C. R.* 47, 425). Pungent liquid. With oxy-azo-benzene it forms $C_6H_5.N_2.C_6H_4O.CO.NHC_{10}H_7$ [149°] (Goldschmidt a. Rosell, *B.* 23, 492).

NAPHTHYL CYANIDE *v.* Nitrile of naphthoic acid.

NAPHTHYL CYANURIC ACID *v. Cyanuric acid* in the article Cyanic acids.

TRI-NAPHTHYL-CYANURATES $(C_{10}H_7)_3C_3N_3O_3$. Formed from cyanuric chloride and sodium-naphthyl dissolved in naphthol (Otto, *B.* 20, 2239). The (α)- compound decomposes between 160° and 225°, the (β)- compound begins to decompose at 220°. Both are powders, sl sol. hot water and alcohol, m. sol. benzene.

NAPHTHYLENE-ACETAMIDINE *v.* Naphthylene-ethenyl-amidine.

o-NAPHTHYLENE-DIAMINE $C_{10}H_{10}N_2$ *i.e.* $C_{10}H_6(NH_2)_2$ [1:2]. *Di-amido-naphthalene. Amido-naphthylamine.* Mol. w. 158. [95°].

Formation.—1. By reduction of *p*-sulpho-benzene-azo-(β)-naphthylamine with tin and HCl (Griess, *B.* 15, 2193; Witt, *B.* 21, 3482).—2. By reduction of benzene-azo-(β)-naphthylamine, of (β)-naphthalene-azo-(β)-naphthylamine, of the dioxim of (β)-naphthoquinone, of (2,1)-nitro-(α)-naphthylamine, or of (1,2)-nitro-(β)-naphthylamine (Lawson, *B.* 18, 800, 2423; Leuckart, *B.* 19, 174; Lellmann a. Remy, *B.* 19, 803; Bamberger a. Schieffelin, *B.* 22, 1376).

Properties.—Silvery trimetric plates (from hot water), sl. sol. water, sol. alcohol and ether. Its ethereal solution quickly turns brown. $FeCl_3$ colours its solution green.

Reactions.—1. *Phenanthraquinone* yields naphthophenanthrazine which forms yellowish-white crystals giving a scarlet solution in H_2SO_4. 2. *Phenyl cyanate* in benzene solution reacts forming $C_6H_5NH.CO.NH.C_{10}H_6NH_2$ [335°] and $(C_6H_5.NH.CO.NH)_2C_{10}H_6$.—3. *Phenyl thiocarbimide* unites forming $(C_6H_5NH.CS.NH)_2C_{10}H_6$ [355°–360°].—4. On heating with excess of *oil of mustard* in alcoholic solution it yields, in like manner, silky needles of $C_{10}H_6(NH.CS.NHC_3H_5)_2$, which decompose at 170°–200° into naphthylene-thio-urea and di-allyl-thio-urea (Lellmann, *B.* 19, 808).—5. An alcoholic solution of benzil reacts forming di-phenyl-naphthoquinoxaline  [148°] (Leuckart, *B.* 19, 174). 6. *o-Aldehydo-benzoic acid* $CHO.C_6H_4.CO_2H$ forms , which decomposes at 280° (Bistrezycki, *B.* 23, 1044).

Salts.—$B''H_2Cl_2$. [90°]. Prisms or plates, v. sol. water.—$B''H_2SO_4$: white plates, sl. sol. water.—Picrate: nearly insoluble powder.

Acetyl derivative $C_{10}H_6(NHAc)_2$. [234°]. White needles.

Propionyl derivative $C_{10}H_6(NHC_3H_5O)_2$. [192°]. Formed from the base and propionic anhydride. Prisms (from alcohol), insol. ether.

Benzoyl derivative $C_{10}H_6(NHBz)_2$. [291°]. Plates, sl. sol. alcohol and HOAc (Hinsberg, *A.* 254, 256).

ar-Tetrahydride $C_{10}H_{14}N_2$ *i.e.* 
$$\begin{array}{l}CH_2.CH_2.C.C(NH_2):C(NH_2)\\ CH_2.CH_2.C.CH{=\!=}CH\end{array}$$

. [84°]. (220°) at 81 mm. Formed, together with a smaller quantity of the alicyclic isomeride, by reducing naphthylene-o-diamine with sodium (Bamberger a. Schieffelin, *B.* 22, 1377). Needles, v. sol. alcohol, ether, and hot water. Reduces $AgNO_3$. Gives a red colour with cold aqueous $FeCl_3$. $KMnO_4$ oxidises it to adipic acid.

Salts.—$B''H_2Cl_2$. [c. 260°]. Tables, v. sol. water.—$B''2HNO_3$. [201°]. Plates, m. sol. water.

Acetyl derivative of the tetrahydride $C_{10}H_6(NHAc)_2$. [245°]. Needles, v. e. sol. alcohol, sl. sol. ether and cold water.

ac-Tetrahydride

$$\begin{array}{l}CH{:}CH.C.CH(NH_2).CH(NH_2)\\ CH{:}CH.C.CH_2\text{———}CH_2\end{array}.$$

Formed as above (B. a. S.). Its hydrochloride and platinochloride crystallise in needles.

Naphthylene-*p*-diamine $C_{10}H_6(NH_2)_2$ [1:4]. [120°] (G.); [118°] (B. a. S.).

Formation.—1. By reduction of naphthalene-azo-(α)-naphthylamine by tin and HCl (Perkin, *C. J.* 18, 173; *A.* 137, 359; Friedländer, *B.* 22, 587).—2. By reduction of *p*-sulpho-benzene-azo-(α)-naphthylamine with tin and HCl (Griess, *B.* 15, 2192).—3. By reduction of (α)-nitro-(α)-naphthylamine (Liebermann, *A.* 183, 238).—4. By boiling benzene-azo-(α)-naphthylamine with zinc-dust and water (Bamberger a. Schieffelin, *B.* 22, 1381).

Properties.—Colourless prisms or needles, sl. sol. water, sol. alcohol and ether. Yields (α)-naphthoquinone on oxidation with $FeCl_3$.

Salts.—$B''H_2Cl_2$: white soluble four-sided plates, nearly insol. HClAq.—$B''H_2SO_4$: needles.

Mono-acetyl derivative $C_{10}H_6(NH_2)(NHAc)$. Formed by reducing the acetyl derivative of (α)-nitro-naphthylamine with tin and HCl (Liebermann).—$B''HCl$: long needles.—$B''_2H_2Cr_2O_7$.—$B''C_6H_2(NO_2)_3OH$: yellow needles.

Di-acetyl derivative $C_{10}H_6(NHAc)_2$. [205°]. Formed from the base or its mono-acetyl derivative and Ac_2O (Kleemann, *B.* 19, 334; B. a. S.). Needles, sl. sol. alcohol, nearly insol. water and ether.

Mono-benzoyl derivative $C_{10}H_6(NH_2)(NHBz)$. [186°]. Formed by reducing $C_{10}H_6(NO_2)(NHBz)$ (Ebell, *A.* 208, 326).—Needles.—$B''HCl$.—$B''HNO_3$.—$B''H_2SO_4$.

ar-Tetrahydride

$$\begin{array}{l}CH_2.CH_2.C.C(NH_2){:}CH\\ CH_2.CH_2.C.C(NH_2){:}CH\end{array}.$$

The sole product of the reduction of *p*-naphthylene-diamine by sodium (Bamberger a. Schieffelin, *B.* 22, 1382). Needles, resinified on exposure to air. Yields adipic acid on oxidation with $KMnO_4$.—$B''H_2Cl_2$: crystalline powder.

Acetyl derivative of the tetrahydride $C_{10}H_{10}(NHAc)_2$. [285°]. Needles, v. sl. sol. cold water, m. sol. boiling alcohol. Reduces ammoniacal $AgNO_3$. $FeCl_3$ colours a solution of its hydrochloride green, changing to brown.

***Peri*-naphthylene-diamine** $C_{10}H_6(NH_2)_2$ [1:1']. [67°].

Formation.—1. By reduction of *peri*-di-nitro-naphthalene with iodide of phosphorus and water (De Aguiar, *B.* 3, 27; 7, 307; Beilstein a. Kuhlberg, *A.* 169, 90; Ladenburg, *B.* 9, 1651).—2. By reducing di-nitro-(α)-naphthoic acid [265°] with tin and HCl (Ekstrand, *B.* 20, 1353; *J. pr.* [2] 38, 263).—3. By the action of ammonia on *peri*-di-oxy-naphthalene at 150°–300° (Erdmann, *A.* 247, 363).

Properties.—Needles (from dilute alcohol), m. sol. water. Gives a reddish-brown colour and pp. with $FeCl_3$. $NaNO_2$ added to a solution of the sulphate ppts. red needles of the azimide. By the diazo- reaction it yields di-chloro-naphthalene [84°]. Benzoic aldehyde forms

$$C_{10}H_6\Big<\begin{array}{l}N{=}CPh\\ N(CH_2Ph)\end{array}\Big>$$

(Hinsberg, *B.* 22, 861). Phenanthraquinone does not yield an azine. Oxalic ether at 100° yields $C_{14}H_{12}N_2O_2$, crystallising from chloroform in red needles, carbonised at 195° (Aguiar).

Salts.—$B''H_2Cl_2$. [c. 280°]. Small plates.—$B''H_2I_2$.—$B''H_2SO_4$.—$B''H_2C_2O_4$.

(1,4')-Naphthylene-diamine $C_{10}H_6(NH_2)_2$ [1:4']. [190°]. Formed by reducing the corresponding di-nitro-naphthalene in alcoholic solution with tin and HCl (Erdmann, *A.* 247, 361; *cf.* Zinin, *A.* 52, 362; 85, 329; Hollemano, *Z.* [2] 1, 555; De Aguiar, *B.* 3, 33; 7, 307). Formed also by heating the corresponding di-oxy-naphthalene with ammonia at 150°–180°, and finally at 250°–300° (E.). Thin white needles, which may be sublimed, sl. sol. cold water, v. sol. alcohol. $FeCl_3$ colours its solution bluish-violet. Converted by the diazo- reaction into di-chloro-naphthalene [107°].—$B''H_2Cl_2$.—$B''H_2I_2$.—$B''H_2SO_4$.—$B''H_2C_2O_4$.

Tetrahydride

$$\begin{array}{l}CH{:}CH\text{——}C.CH(NH_2).CH_2\\ CH{:}C(NH_2).C\text{–}CH_2\text{——}CH_2\end{array}.$$

[77°]. (264°) at 60 mm. Formed by the action of sodium on a solution of the base in isoamyl alcohol (Bamberger a. Hoskyns-Abrahall, *B.* 22, 944). Prisms (from ether) or needles (from ligroïn), sl. sol. hot water, v. sol. alcohol. $FeCl_3$ gives a deep reddish-brown colour in its hot solution, but no colour in the cold. Boiling $K_2Cr_2O_7$ gives a claret-colour. Gives off NH_3 when heated. This base can be separated into dextro- and lævo-rotatory varieties by crystallisation of the bitartrate, for on adding a crystal of dextro-rotatory coniine tartrate, the lævo-rotatory tetrahydro-naphthylene-diamine tartrate crystallises out, while the mother-liquor deposits the dextro-rotatory compound after long standing (Bamberger, *B.* 23, 291). The rotatory powers of the two hydrochlorides, $[\alpha]_D$ are $-7°\ 30'$ and $+8°\ 9'$ respectively. *Reactions.* 1. *Nitrous acid* at 0° forms a diazo- compound which when boiled with water yields

$$\begin{array}{l}CH{:}CH\text{——}C.CH(NH_2).CH_2\\ CH{:}C(OH).C\text{-}CH_2\text{——}CH_2\end{array},$$

the di-acetyl derivative of which crystallises in needles [152°] (Bamberger a. Bammann, *B.* 22, 960).—2. *Diazotisation* and *reduction* by $SnCl_2$ and HCl yields the hydrazine

$$\begin{array}{l}CH{:}CH\text{———}C.CH(NH_2){:}CH_2\\ CH{:}C(N_2H_3).C\text{——}CH_2\text{—}CH_2\end{array}.\text{—}$$

3. A dilute ethereal solution of CS_2 forms $C_{10}H_{10}(NH_2).NH_3S.CS.NH.C_{10}H_{10}NH_2$ [145°], the alicyclic amidogen entering into reaction. By treatment with PbO this substance is converted into the urea $CO(NH.C_{10}H_{10}.NH_2)_2$. Boiling with alcohol yields $CS(NH.C_{10}H_{10}.NH_2)_2$ [155°].—4. A warm alcoholic solution of CS_2 forms

$$C_{10}H_{10}\Big<\begin{array}{l}NH.CS.NH\\ NH.CS.NH\end{array}\Big>C_{10}H_{10}$$

[175°], both amidogens taking part in the reaction. Salts. $B''H_2Cl_2$: trimetric prisms, $a{:}b{:}c = {\cdot}574{:}1{:}{\cdot}906$, v. sol. water, v. sl. sol. alcohol.—$B''H_2PtCl_6$ aq: prisms.—$B''_2H_2PtCl_6$: crystalline solid.—$B''H_2SO_4$ 2aq: triclinic prisms. *Acetyl derivative* $C_{10}H_{10}(NHAc)_2$. [262° cor.]. Prisms (from alcohol), sol. ether, sl. sol. boiling water.

(2,2')-Naphthylene-diamine $C_{10}H_6(NH_2)_2$ [2:2']. [159°] (B. a. S.); [161°] (L.). Formed by heating the corresponding di-oxy-naphthalene [186°] of Ebert and Merz with ammoniacal $CaCl_2$ at 265° (Lange, *B.* 21, Ref. 839; Bamberger a. Schieffelin, *B.* 22, 1384). Plates (from water), v. sol. boiling water, alcohol, and ether.

(2,3′)-Naphthylene - diamine $C_{10}H_6(NH_2)_2$. [218°]. Formed from di-oxy-naphthalene [213°], by heating with ammonia and NH_4Cl at 200°-250° (Lange, *B.* 21, Ref. 839). Its salts are more soluble than those of the (2,2′)-isomeride.

m-Naphthylene-diamine $C_{10}H_6(NH_2)_2$ [1:3]. Obtained by reducing di-nitro-naphthalene [144°] with tin and HCl (Urban, *B.* 20, 973). A solution of its hydrochloride is coloured yellow by nitrous acid.—$B''H_2Cl_2$: v. e. sol. water, m. sol. alcohol, insol. ether.

Acetyl derivative $C_{10}H_6(NHAc)_2$. [156°]. Prisms, v. sol. benzene.

Dinaphthylene-amine $C_{20}H_{13}N$ *i.e.*

$\begin{matrix}C_{10}H_6\\C_{10}H_6\end{matrix}\!>\!NH$ (?) [159° cor.]. Formed by heating (ββ)-dioxy-dinaphthyl with ammoniacal-zinc chloride (Walder, *B.* 15, 2173). White trimetric plates or needles. V. sol. ether, benzene, or acetone, insol. dilute acids.

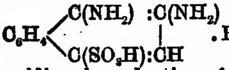
Picric acid compound $C_{20}H_{12}N\ 2(C_6H_2(NO_2)_3OH)$: [219° cor.]: blue-black needles.

Acetyl derivative $C_{20}H_{12}NAc$. [144° uncor.]; fine white needles, v. sol. ether, less sol. alcohol.

Tri-naphthylene-diamine $C_{30}H_{16}N_2$ *i.e.* $(C_{10}H_6)_3N_2$ (?). Formed by heating a mixture of naphthylamine, naphthylamine hydrochloride, and nitro-naphthalene in molecular proportions for 3 hours at 190°-220° (Salzmann a. Wichelhaus, *B.* 9, 1107). Amorphous blue-black powder (containing aq), insol. water and ether, forming a red solution in warm benzene. Begins to decompose at 180°.—$B'HCl$: amorphous violet powder.

References. — BROMO-, DI-CHLORO-, and ETHENYL-NAPHTHYLENE-DIAMINE.

o - NAPHTHYLENE - DIAMINE - 'α' - SULPHONIC ACID

$C_{10}H_{10}N_2SO_3$ *i.e.*


$C_6H_4\!<\!\begin{matrix}C(NH_2)&:C(NH_2)\\&|\\C(SO_3H)&:CH\end{matrix}$. Formed, together with benzidine, by reduction of Congo-red. Not isolated (Witt, *B.* 19, 1719).

o-Naphthylene-diamine 'β'-sulphonic acid
$\begin{matrix}CH:CH.C.C(NH_2):C(NH_2)\\SO_3HC{=}CH.C\text{-}CH{=\!=}CH\end{matrix}$. Obtained by reducing 'gold-brown,' an azo-dye obtained from Brönner's (β)-naphthylamine sulphonic acid, and diazobenzene (Witt, *B.* 21, 3484). Yellowish-white crystals (from alcohol or ether), v. sl. sol. water. Quickly turns brown in air. K_3FeCy_6 turns its solution first brown, then yellow. $FeCl_3$ colours its aqueous solution dirty-green. Phenanthraquinone bisulphite yields, in presence of NaOAc and HOAc, naphthophenanthrazine sulphonic acid, which dissolves in H_2SO_4 with reddish-violet colour, and which is converted by potash-fusion into a eurhodol, forming in H_2SO_4 a solution coloured a pure ultramarine, turned cherry-red by water. Naphthylene-diamine 'α'-sulphonic acid acts in the same way, but the compound formed by phenanthraquinone dissolves in H_2SO_4 with bluish-violet colour, and the eurhodol with indigo-blue colour, the sulphate being ppd. as a crimson crystalline powder.

o-Naphthylene-diamine (γ)-sulphonic acid
$\begin{matrix}CH:CH{-\!-\!-}C.C(NH_2):C(NH_2)\\CH:C(SO_3H).C.CH{=\!=}CH\end{matrix}$. Formed by reduction of azo- dyes prepared from (β)-naphthylamine (γ)-sulphonic acid (of Dahl) (Witt, *B.* 21, 3486). Plates, al. sol. water (more soluble than the 'β'- isomeride). $FeCl_3$ colours its solution emerald-green. The corresponding azines are rendered violet by H_2SO_4, becoming orange on dilution. The eurhodol gives a dark-violet solution in H_2SO_4, becoming cherry-red on dilution, the eurhodol sulphate being deposited in dirty-red flakes.

o-Naphthylene-diamine (δ)-sulphonic acid
$\begin{matrix}SO_3H.C{=}CH.C.C(NH_2):C(NH_2)\\CH:CH.C.CH{=\!=}CH\end{matrix}$. Obtained by reducing azo- dyes prepared from (β)-naphthylamine (δ)-sulphonic acid (W.). Grey powder, more soluble in water than the 'β'- isomeride. Occurs also in a gelatinous (? hydrated) condition, v. e. sol. water. It resembles the 'β'- isomeride in its reactions with $FeCl_3$, with K_3FeCy_6, and with phenanthraquinone.

o-Naphthylene-diamine 'α'-disulphonic acid $C_{10}H_4(NH_2)_2(SO_3H)_2$ [1:2:1′ or 4′:3′]. Obtained by reducing benzene-azo-(β)-naphthylamine 'α'-disulphonic acid formed from (β)-naphthylamine R disulphonic acid (Witt, *B.* 21, 3487).— $NaHA''$: sandy crystalline powder, v. sol. water, forming a solution with green fluorescence. $FeCl_3$ gives a green colour. Yields lemon-yellow sodium naphtho-phenanthrazine disulphonate, which forms a bluish-magenta solution in H_2SO_4. The eurhodol yields a deep greenish-blue solution in H_2SO_4, becoming claret-red on dilution.

Naphthylene-diamine disulphonic acid $C_{10}H_4(NH_2)_2(SO_3H)_2$. Formed by reducing di-nitro-naphthalene disulphonic acid (Alén, *Bn.* 3, 1025).—KHA'' 3aq: needles, m. sol. hot water.—$Ba(HA'')_2$ 6aq.

NAPHTHYLENE-BENZAMIDINE *v.* BENZENYL-NAPHTHYLENE-AMIDINE.

NAPHTHYLENE-ETHENYL-AMIDINE

$C_{12}H_{10}N_2$ *i.e.* [2:3]

$C_{10}H_6\!<\!\begin{matrix}NH\\N\end{matrix}\!\gg\!C.CH_3$. [168°]. Formed by the action of cold conc. alcoholic HCl upon (β)-naphthyl-ethyl-nitrosamine (Fischer a. Hepp, *B.* 20, 1248). Nodules (from water). Crystallises from methyl alcohol in prisms (containing MeOH) [75°]. Sl. sol. hot water.—$B'HCl\ \frac{1}{2}aq$: colourless needles, al. sol. water, m. sol. alcohol. — $B'_2H_2PtCl_6$ 3aq. — $B'H_2SO_4$.—$B'C_6H_2(NO_2)_3OH$: needles.

Naphthylene-ethenyl-amidine

[1:2]

$C_{10}H_6\!<\!\begin{matrix}N\\NH\end{matrix}\!\gg\!CMe$. Formed from the acetyl derivative of nitro-(β)-naphthylamine by reduction with tin and HCl (Liebermann a. Jacobson, *A.* 211, 67). Formed also by the action of cold alcoholic HCl on (β)-naphthyl-ethyl-amine (Fischer a. Hepp, *B.* 20, 2472).—$B'HCl$ 2aq: needles, v. sol. water.

NAPHTHYLENE-ETHYL-DIAMINE

$C_{10}H_6(NH_2)(NHEt)$ [1:4]. Formed by reducing nitroso-(α)-naphthyl-ethyl-amine with $SnCl_2$ (Kock, *A.* 243, 312). The free base is unstable. It yields (α)-naphthoquinone on oxidation.— $B''H_2Cl_2$. [152°]. Plates.— $B''2C_6H_2(NO_2)_3OH$. [180°]. Needles, sl. sol. water and alcohol.

DI-NAPHTHYLENE-GLYCOL, so called. $C_{22}H_{14}O_2$ *i.e.* $\begin{matrix}C_{10}H_6.C.OH\\C_{10}H_6.C.OH\end{matrix}$ (?). Formed by the action of chloroform and aqueous NaOH on (β)-naphthol (Rousseau, *A. Ch.* [5] 28, 151). Small crystals, insol. water and alkalis, v. sl. sol. alcohol, HOAc, and chloroform, m. sol. ether.

Reactions.—1. *Chromic acid mixture* yields crystalline $C_{21}H_{12}O$ [188°].—2. Red-hot *soda-lime* forms dinaphthyl [187°].—3. Fuming *hydrochloric acid* (15 pts.) at 160° forms $C_{22}H_{14}Cl_2O$ 3aq crystallising in red needles.—4. With fuming *hydrobromic acid* it forms the corresponding $C_{22}H_{14}Br_2O$ 3aq crystallising in lustrous green plates; whence alcoholic ammonia produces $C_{22}H_{12}(OH)(NH_2)$ crystallising from benzene in needles and forming the crystalline salts $B'H_2Cl_2$, $B'_2H_2PtCl_6$, and $B'H_2Br_2$. The compound $C_{22}H_{14}Br_2O$ 3aq is converted by hot HOAc into $C_{22}H_{12}BrOHOAc$ crystallising in lustrous green tables and giving off HOAc at 100°.—5. *Bromine* in CS_2 forms orange plates of $C_{22}H_{13}Br_3O$.—6. HIAq (S.G. 1·7) forms, on boiling, crystals of $C_{22}H_{13}I_0O$.—7. Dilute *nitric acid* (S.G. 1·2) forms $C_{22}H_{12}(OH)(NO_3)$, which separates from HOAc as a red crystalline mass $C_{22}H_{12}(OH)(NO_3)HOAc$. Boiling dilute nitric acid forms red needles of $C_{22}H_{12}(NO_3)_2$ [190°].—8. H_2SO_4 (5 pts.) at 100° forms $C_{22}H_{12}(OH)(SO_4H)H_2SO_4aq$ crystallising in red needles with golden lustre, and separating from HOAc as $C_{22}H_{12}(OH)(SO_4H)HOAc$.

Di-acetyl derivative $C_{22}H_{12}(OAc)_2$. [192·5°]. Needles, sl. sol. alcohol, v. sol. C_6H_6.

Anhydride $C_{22}H_{12}O$. [198·5°]. Formed by heating 'dinaphthylene-glycol' with PCl_5. Formed also by the action of boiling alcohol on the compounds $C_{22}H_{13}Br_2O$ and $C_{22}H_{13}ClO$ (*v. supra*). Yellow needles (from benzene), almost insol. cold alcohol, v. sol. boiling benzene. Yields on reduction a compound $C_{22}H_{14}O$.

(α)-DI-NAPHTHYLENE KETONE OXIDE $C_{21}H_{12}O_2$ *i.e.* $C_{10}H_6<\begin{matrix}O\\CO\end{matrix}>C_{10}H_6$. [240°]. Formed by boiling (α)-naphthyl ethyl carbonate (Bender, *B.* 13, 702). Yellow prisms, sl. sol. alcohol.

(β)-Dinaphthylene-ketone-oxide (?) $C_{21}H_{12}O_2$ *i.e.* $C_{10}H_6<\begin{matrix}O\\CO\end{matrix}>C_{10}H_6$. [194°]. Formed, together with (β)-naphthol, alcohol, and CO_2, by long boiling of di-(β)-naphthyl-di-ethyl-ortho-carbonate $(C_{10}H_7O)_2:C:(OC_2H_5)_2$; its formation is explained by assuming the intermediate formation, by molecular change, of (β)-naphthol-carboxylic ether $C_{10}H_6(OH)CO_2Et$, which by elimination of H_2O and di-ethyl-carbonate would give dinaphthylene-ketone-oxide. Thin colourless prisms (from benzene). V. sl. sol. alcohol (Bender, *B.* 19, 2267).

NAPHTHYLENE MERCAPTAN $C_{10}H_8S_2$ *i.e.* $C_{10}H_6(SH)_2$. [181°] (G.); [174°] (E.). (210° at 15 mm.). Prepared by reducing the chloride of naphthalene 'α'-disulphonic acid with zinc-dust and H_2SO_4, and extracting the product with ether (Grosjean, *B.* 23, 2370; Ebert, *B.* 24, 145). Pearly leaflets (from alcohol), v. sl. sol. cold alcohol and ether. Its alcoholic solution gives a yellow pp. with lead acetate. Its alkaline solution is rapidly oxidised by air.

Acetyl derivative. [110°]. Crystals.

Benzoyl derivative. [153°].

NAPHTHYLENE-DI-METHYL-DIAMINE $C_{10}H_6(NH_2)(NMe_2)$ [1:4]. Formed by reducing nitroso-naphthyl-di-methyl-diamine or benzene-azo-dimethylnaphthylamine (Friedländer, *B.* 21, 3124). Liquid, m. sol. hot water.

Acetyl derivative $C_{10}H_6(NHAc)(NMe_2)$. [195°].

NAPHTHYLENE-(α)-NAPHTHYL-DIAMINE $C_{20}H_{16}N_2$ *i.e.* [1:4] $C_{10}H_6(NH_2)(NHC_{10}H_7)$. Formed by reducing nitroso-di-(α)-naphthylamine with $SnCl_2$ and HCl (Wacker, *A.* 243, 303). Minute crystals (from benzene), v. sol. alcohol.

NAPHTHYLENE-NAPHTHYL-BENZAMIDINE $C_{27}H_{18}N_2$ *i.e.* $C_6H_5.C\begin{matrix}NC_{10}H_7\\N.C_{10}H_6\end{matrix}$. [163°]. Formed by reducing benzoyl-nitro-di-(β)-naphthyl-amine with tin and HCl (Ris, *B.* 20, 2626). Slender needles (containing C_6H_6) [114°], m. sol. alcohol and ether.

NAPHTHYLENE-DI-NAPHTHYL-SULPHIDE OXIDE $C_{30}H_{20}SO$ *i.e.* $C_{10}H_7.O.C_{10}H_6.S.C_{10}H_7$. [111°]. Formed in small quantity as a by-product in the preparation of (α) and (β)-naphtho-nitrile by distilling a mixture of (α)- and (β)-potassium naphthalene-sulphonate with potassium ferrocyanide (Ekstrand, *B.* 17, 2601; *J. pr.* [2] 38, 140). Long needles. By $K_2Cr_2O_7$ and acetic acid it is oxidised to a compound [162°]. By heating with dilute HNO_3 at 130°–140° it yields a body $C_{20}H_{12}N_2SO_4$ which crystallises from hot acetic acid in small yellow prisms [231° uncor.], nearly insoluble in alcohol and CS_2. Br and I in CS_2 yield $C_{60}H_{17}Br_3SO$ [182°].

(α)-DINAPHTHYLENE OXIDE $C_{20}H_{12}O$ *i.e.* $\begin{matrix}C_{10}H_6\\C_{10}H_6\end{matrix}>O$. [182°]. Formed by distilling (α)-naphthol (1 pt.) with lead oxide (3 pts.), the yield being 7 p.c. (Knecht a. Unzeitig, *B.* 13, 1724; *A.* 209, 134), and, together with naphthalene, by heating (α)-naphthol at 350°–400° (Merz a. Weith, *B.* 14, 195) or distilling it with an equivalent quantity of lime (Niederhäusern, *B.* 15, 1121). Colourless needles, insol. water, sl. sol. alcohol, v. sol. ether.

Picric acid compound $C_{20}H_{12}O\ 2C_6H_2(NO_2)_3OH$. [173°]. Red needles.

(β)-Dinaphthylene oxide $C_{20}H_{12}O$. [155°] (K. a. U.); [157°] (W.); [161°] (M. a. W.). V.D. 9·05 (obs.). Formed by distilling (β)-naphthol (1 pt.) with PbO (3 pts.) (K. a. U.). Formed also by passing a current of air into boiling (β)-naphthol (Merz a. Weith, *B.* 14, 200) and by heating di-oxy-(β)-dinaphthyl (1 pt.) with $ZnCl_2$ (4 pts.) for 6 hours at 270° (Walder, *B.* 15, 2171). Silvery plates, insol. water, sl. sol. alcohol, v. sol. ether.

Picric acid compound $C_{20}H_{12}O\ 2C_6H_2(NO_2)_3OH$. Red needles, v. sol. hot benzene.

References.—DI-BROMO- and DI-CHLORO- DI-NAPHTHYLENE OXIDE.

(α)-DINAPHTHYLENE-OXIDE SULPHONIC ACID $C_{20}H_8(SO_3H)_4O$. Prepared by sulphonating (α)-dinaphthylene-oxide.—$A^{iv}Ba_2$ 2aq: needles, sparingly soluble in water with a beautiful blue fluorescence (Knecht a. Unzeitig, *B.* 13, 1725).

(β)-DINAPHTHYLENE-OXIDE-TETRA-SULPHONIC ACID $C_{20}H_8(SO_3H)_4O$. Prepared by sulphonating (β)-dinaphthylene-oxide.—$A^{iv}Ba_2$ 2aq: tables (K. a. U.).

DINAPHTHYLENE-PHENYL-AMINE *v.* Phenyl-dinaphthylene-amine.

NAPHTHYLENE DISULPHOCYANIDE $C_{10}H_6(SCN)_2$. [78°]. Formed from $C_{10}H_6S_2Pb$, alcohol, and cyanogen chloride (Ebert a. Kleiner, *B.* 24, 146). Needles.

(αβ)-NAPHTHYLENE-TOLAZINE $C_{17}H_{12}N_2$ *i.e.*  $C_6H_3(CH_3)<\genfrac{}{}{0pt}{}{N}{N}>C_{10}H_6$. [141°]. Formed by mixing acetic acid solutions, cooled to 0°, of (β)-naphthoquinone and tolylene-*o*-diamine (Hinsberg, *B.* 18, 1229). Distils without decomposition at a high temperature. Yellowish crystals. V. sol. alcohol, acetic acid, and benzene, insol. water. Dissolves in strong HCl with a brownish-red colour.

DI-NAPHTHYLENE-DI-THIO-DI-UREA

Octohydride  $CS<\genfrac{}{}{0pt}{}{NH.C_{10}H_{10}.NH}{NH.C_{10}H_{10}.NH}>CS$. [175°]. Formed by boiling the tetrahydride of (1, 4')-naphthylene-diamine with CS_2 and alcohol (Bamberger a. Bammann, *B.* 22, 951). Crystalline powder, v. sol. alcohol.

NAPHTHYLENE-UREA $C_{11}H_8N_2O$ *i.e.*  $C_{10}H_6<\genfrac{}{}{0pt}{}{NH}{NH}>CO$. [c. 380°]. Formed from naphthylene-diamine and $COCl_2$ in toluene at 100° (Hartmann, *B.* 23, 1048).

(αα)-DI-NAPHTHYL-ETHANE $C_{22}H_{18}$ *i.e.* $(C_{10}H_7)_2C_2H_4$. [160°]. Formed, together with (α)-naphthyl-carbinylamine, by reducing the amide of thio-(α)-naphthoic acid in alcoholic solution with zinc-dust and HClAq (Bamberger, *B.* 21, 54). Hexagonal plates, v. sol. chloroform and benzene, m. sol. ether, sl. sol. alcohol. The alcoholic solution exhibits greenish-blue fluorescence.

(ββ)-Di-naphthyl-ethane $C_{10}H_7.CH_2.CH_2.C_{10}H_7$ [253°]. Formed, in like manner, from thio-(β)-naphthoic amide (*B.*). Plates, v. sol. hot chloroform and benzene, sl. sol. ether and alcohol. Its solutions fluoresce bluish-violet.

References.—Tri-chloro- and Tri-chloro-tetra-nitro-di-naphthyl-ethane.

NAPHTHYL ETHER *v.* Di-naphthyl oxide.

(α)-NAPHTHYL-ETHYL-AMINE $C_{12}H_{13}N$ *i.e.* $C_{10}H_7.NHEt$. *Ethyl-naphthylamine.* (303° i.V.) at 723 mm. (Bamberger a. Helwig, *B.* 22, 1312). Formed by cohobating naphthylamine with EtBr (Limpricht, *A.* 99, 117; Schiff, *A.* 101, 90). Obtained also by reducing $C_{10}H_7.NH.CS.CH_3$ with zinc-dust and HClAq (Bernthsen a. Trompetter, *B.* 11, 1756). Colourless crystals, becoming dichroic (steel-blue and brown-red) in light. Forms a nitrosamine, which, in contact with alcoholic HCl, changes to the isomeric nitroso-derivative  $C_{10}H_6<\genfrac{}{}{0pt}{}{NEt}{N}>O$ [133°] (Kock, *A.* 243, 310).—B'HCl. [193°].—$B'_2H_2PtCl_6$: yellow prisms.—B'HBr.—B'HI: four-sided prisms.

(β)-Naphthyl-ethyl-amine $C_{10}H_7.NHEt$. (305°) at 716 mm. Oil (Henriques, *B.* 17, 2663; Bamberger a. Müller, *B.* 22, 1297). Yields a red dye with diazotised sulphanilic acid. $FeCl_3$ gives no colour in the cold, a greenish-brown colour in warm solutions. $K_2Cr_2O_7$ and H_2SO_4 give a brown colour and pp.—B'HCl. [235°]. Plates, sl. sol. cold water.

Nitrosamine $C_{10}H_7.NEt(NO)$. [49°]. Crystals. Converted by alcoholic hydrogen chloride at 5° into nitroso-naphthyl-ethyl-amine  $C_6H_4<\genfrac{}{}{0pt}{}{C(NO):CNHEt}{CH{=\!=}CH}$.—B'HCl. [108°]. Green prisms (from benzene) (Fischer a. Hepp, *B.* 20, 1248, 2471).

(α)-Naphthyl-di-ethyl-amine $C_{10}H_7NEt_2$. (291°). S.G. 1·005. Formed by heating (α)-naphthylamine (10 g.) with EtBr (15 g.) and alcohol or NaOHAq at 120° (B. E. Smith, *C. J.* 41, 180; Friedländer, *B.* 21, 3129). Formed also by heating (α)-naphthylamine hydrochloride with alcohol. Oil, v. sol. alcohol and ether. Forms a nitroso- derivative $C_{10}H_6(NO)NEt_2$ [165°].—B'HCl: silky plates, v. sol. hot water.—$B'_2H_2PtCl_6$: golden-yellow plates.—Sulphate: thick prisms.

Ethylo-iodide $C_{10}H_7NEt_3I$. [100°]. Cubes.

Ethylo-bromide $C_{10}H_7.NEt_3Br$. Tables (from water).

(β)-Naphthyl-di-ethyl-amine $C_{10}H_7.NEt_2$. (316° i.V.) at 717 mm. Oil (Bamberger a. Williamson, *B.* 22, 1760). Yields (β)-naphthylamine on heating with lime.—B'HCl. [175°]. Tables or needles, v. e. sol. water.—$B'_2H_2PtCl_6$. [95°].

Di-(β)-naphthyl-ethyl-amine $(C_{10}H_7)_2NEt$] [231°]. From di-(β)-naphthylamine and EtI at 150° (Ris, *B.* 20, 2619). Needles, m. sol. cold alcohol, insol. petroleum-ether.

(α)-NAPHTHYL-ETHYL-AMINE TETRAHYDRIDE $C_{12}H_{17}N$ *i.e.*  $\genfrac{}{}{0pt}{}{CH_2.CH_2.C.C(NHEt):CH}{CH_2.CH_2.C\text{-}CH{=\!=\!=}CH}$ (287° i.V.) at 717 mm. Formed by adding sodium to a solution of naphthyl-ethyl-amine in isoamyl alcohol (Bamberger a. Helwig, *B.* 22, 1312). Colourless liquid, sl. sol. water, v. sl. sol. NaOHAq, v. sol. alcohol. Reduces warm alcoholic $AgNO_3$. Diazobenzene sulphonic acid yields an orange dye. $FeCl_3$ added to a solution of its hydrochloride gives a claret colour, changing to greenish-yellow. $K_2Cr_2O_7$ and H_2SO_4 give a dirty yellow pp. in the cold, but in warm solutions a red colour, becoming greenish-brown; further addition of $K_2Cr_2O_7$ ppts. blue-black flakes. $KMnO_4$ oxidises it to adipic and oxalic acids.—B'HCl. [118°]. Prisms or needles, v. sol. water. —$B'_2H_2PtCl_6$. Plates, sl. sol. cold water.

Nitrosamine $C_{10}H_{11}(NEt.NO)$. Formed by adding $NaNO_2$ to a solution of the base in HClAq. Yellow oil, exhibiting Liebermann's reaction. Tin and HClAq reconvert it into $C_{10}H_{11}(NEtH)$. When dissolved in alcoholic HCl it slowly changes to the isomeric  $C_6H_8<\genfrac{}{}{0pt}{}{C(NEtH):CH}{C(NO) = CH}$ crystallising in golden needles [119°].

ar-**(β)-Naphthyl-ethyl-amine tetrahydride**  $\genfrac{}{}{0pt}{}{CH_2.CH_2.C.CH:C(NHEt)}{CH_2.CH_2.C.CH:CH}$. (291·5°) at 724 mm. Formed, together with the alicyclic isomeride, by reducing (β)-naphthyl-ethyl-amine (15 g.) in isoamyl alcohol with sodium (24 g.) (Bamberger a. Müller, *B.* 22, 1304). Colourless oil, volatile with steam, v. sol. alcohol, v. sl. sol. water, insol. NaOHAq. Smells like piperidine. $FeCl_3$ colours a warm solution of its hydrochloride reddish-brown. $KMnO_4$ oxidises it to adipic acid.—B'HCl. [173·5°]. Needles, v. sol. water, ppd. as plates by addition of HCl.—$B'_2H_2PtCl_6$. Needles.

ac-**(β)-Naphthyl-ethyl-amine tetrahydride**  $C_6H_4<\genfrac{}{}{0pt}{}{CH_2.CH.NHEt}{CH_2.CH_2}$. (267°) at 724 mm. S.G.

$_{15}$ ·998. Formed as above (B. a. M.). Colourless oil, sl. sol. water, very volatile with steam. $FeCl_3$ colours a warm solution of its hydrochloride reddish-brown. Reacts with diazobenzene nitrate, forming $C_{10}H_{11}.NEt.N_2C_6H_5$ [58°]. — B'HCl. [223·5°]. Prisms (from water) or needles (from $CHCl_3$). Ppd. in plates by adding HCl to its aqueous solution.—$B'HNO_3$. [184°]. Needles or plates, v. sol. hot water.—$B'HNO_2$. [180°]. Needles.—$B'_2H_2PtCl_6$. [204°]. Orange-yellow stellate crystals.—$B'C_6H_2(NO_2)_3OH$. [183·5°]. Needles, v. sol. water and alcohol.

Acetyl derivative $C_{12}H_{11}.NEtAc$. (328° uncor.) at 718 mm. Oil.

Nitrosamine $C_{10}H_{11}.NEt(NO)$. Yellow oil, v. sl. sol. cold water.

Ar-(β)-**Naphthyl-di-ethyl-amine tetrahydride**  $\begin{array}{l}CH_2.CH_2.C.CH:CNEt_2\\CH_2.CH_2.C.CH:CH\end{array}$. (298°) at 709 mm. The chief product of the reduction of $C_{10}H_7NEt_2$ by sodium (Bamberger a. Williamson, *B.* 22, 1763). Liquid, sl. sol. water. Yields a red dye with *p*-diazobenzene sulphonic acid. $KMnO_4$ oxidises it to adipic acid.—B'HCl: granules, v. e. sol. water.

Ac-(β)-**Naphthyl-di-ethyl-amine tetrahydride**  $C_6H_4{<}\begin{array}{l}CH_2.CH.NEt_2\\CH_2.CH_2\end{array}$. Liquid, sl. sol. water, insol. NaOHAq.—$B'H_2CO_3$: white needles.—B'HCl: prisms, v. sol. water.

(α)-**NAPHTHYL ETHYL CARBONATE** $C_{13}H_{12}O_3$ *i.e.* $C_{10}H_7.OCO.OEt$. [31°]. Obtained from (α)-naphthol and chloroformic ether (Bender, *B.* 13, 702; 19, 2266). Tables, sol. alcohol. By heating to boiling for some time it splits up into (α)-naphthol, a body $C_{21}H_{12}O_2$ [240°], which is probably a dinaphthylene-ketone-oxide  $C_{10}H_6{<}\begin{array}{c}O\\CO\end{array}{>}C_{10}H_6$, alcohol, and CO_2.

Di-(β)-Naphthyl-di-ethyl-orthocarbonate $(C_{10}H_7O)_2:C:(OC_2H_5)_2$. (298°–300°). Obtained by the action of chloroformic ether upon (β)-naphthol (Bender). White amorphous mass, melting with the heat of the hand. HCl at 250° decomposes it into (β)-naphthol, EtCl, and CO_2. By long boiling it is decomposed into (β)-naphthol, a body $C_{21}H_{12}O_2$, which is probably a dinaphthylene-ketone-oxide, alcohol, and CO_2.

(α)-**NAPHTHYL-ETHYLENE** $C_{12}H_{10}$ *i.e.* $C_{10}H_7.CH:CH_2$. Formed by the action of Na_2CO_3 on β-bromo-α-naphthyl-propionic acid (Brandis, *B.* 22, 2158). Oil, smelling like styrene. Bromine in chloroform forms $C_{10}H_7.CHBr.CH_2Br$ [168°].

References. — Di-chloro- and Di-chloro-tetra-nitro-di-naphthyl-ethylene.

DI-(α)-NAPHTHYL-ETHYLENE-DIAMINE $C_{22}H_{20}N_2$ *i.e.* $C_2H_4(NHC_{10}H_7)_2$. [127°]. Formed from naphthylamine and $C_2H_4Br_2$ (Reuter, *B.* 8, 23).—$B''H_2SO_4$.

Di-(β)-Naphthyl-ethylene-diamine $C_2H_4(NHC_{10}H_7)_2$. [153°] (M.); [150°] (B.). Formed, together with di-(β)-naphthyl-pyrazine tetrahydride  $C_2H_4{<}\begin{array}{l}N(C_{10}H_7)\\N(C_{10}H_7)\end{array}{>}C_2H_4$ [228°] by the action of ethylene bromide on (β)-naphthylamine in presence of sodium carbonate (Maschke, *C. C.* 1886, 824; Bischoff, *B.* 23, 1985). Plates and needles; sl. sol. ether, m. sol. absolute alcohol.

DI-(α)-NAPHTHYL-ETHYLENE-DI-CARBAMIC ETHER $C_{26}H_{28}N_2O_4$ *i.e.* $C_2H_4(N(C_{10}H_7).CO_2Et)_2$. [156°]. Formed from $C_2H_4(NHC_{10}H_7)_2$ and $ClCO_2Et$ (Reuter, *B.* 8, 25). V. sol. alcohol.

DI-(α)-NAPHTHYL-ETHYLENE DIOXIDE $C_{22}H_{18}O_2$ *i.e.* $C_2H_4(OC_{10}H_7)_2$. [126°]. Formed from (α)-naphthol, KOH, and $C_2H_4Br_2$ (Koelle, *B.* 13, 1956). Plates.

Di-(β)-Naphthyl-ethylene dioxide $C_2H_4(OC_{10}H_7)_2$. [217°]. Formed in like manner (K.). Plates; sl. sol. benzene and HOAc, insol. water, alcohol, and ether.

(β)-**NAPHTHYL-ETHYL-HYDRAZINE** $C_{12}H_{14}N_2$ *i.e.* $C_{10}H_7NEt.NH_2$. Formed from (β)-naphthyl-hydrazine and EtI in EtOH (Hauff, *A.* 253, 33). Yellow oil; v. sol. alcohol. Reduces Fehling's solution and HgO without forming a tetrazone.—B'HCl: plates.

NAPHTHYL ETHYL OXIDE *v. Ethyl ether* of Naphthol.

NAPHTHYL-ETHYL-NITROSAMINE *v. Nitrosamine* of Naphthyl-ethyl-amine.

NAPHTHYL-DI-ETHYL-PHOSPHINE $C_{14}H_{17}P$ *i.e.* $C_{10}H_7PEt_2$. (above 360°). Formed from $C_{10}H_7PCl_2$ and $ZnEt_2$ (Kelbe, *B.* 11, 1501). Yellow oil.

Ethylo-iodide $C_{10}H_7PEt_3I$. [209°]. Colourless leaflets.

NAPHTHYL-GLYCOCOLL *v.* Naphthyl-amido-acetic acid.

DI-NAPHTHYL-GLYCOL *v.* Di-naphthylene-glycol.

NAPHTHYL-GLYCOLLIC ACID *v.* Oxy-naphthyl-acetic acid.

(α)-**NAPHTHYL-GLYOXYLIC ACID** $C_{12}H_8O_3$ *i.e.* $C_{10}H_7.CO.CO_2H$. *Naphthoyl-formic acid.* [114°]. Obtained by saponification of its nitrile (Boessneck, *B.* 15, 3066; 16, 640), and by oxidation of (α)-naphthyl methyl ketone by $KMnO_4$ (Claus a. Feist, *B.* 19, 3181). Needles or plates; m. sol. water, v. sol. alcohol and ether. Gives a red colour on shaking with H_2SO_4 and benzene containing thiophene. Yields (α)-naphthoic acid [160°] on oxidation.—$CaA'_2 4\frac{1}{2}aq$: v. sol. water.—AgA': white pp., v. sl. sol. water.

Amide $C_{10}H_7.CO.CONH_2$. [151°]. Long white needles (from alcohol).

Nitrile $C_{10}H_7.CO.CN$. *Naphthoyl cyanide.* [101°]. Formed by heating (α)-naphthoyl chloride with $HgCl_2$ at 100°. Needles.

(β)-Naphthyl-glyoxylic acid $C_{10}H_7.CO.CO_2H$. [c. 75°]. Formed by gentle oxidation of (β)-naphthyl methyl ketone by dilute $KMnO_4$ (Claus a. Tersteegen, *J. pr.* [2] 42, 518). Reduced by sodium-amalgam to α-oxy-naphthyl-acetic acid $C_{10}H_7.CH(OH).CO_2H$.

NAPHTHYL-GUANIDINE $C_{11}H_{11}N_3$ *i.e.* $NH:C(NH_2).NHC_{10}H_7$. — $B'_2H_2CO_3$. Trimetric crystals; $a:b:c = {\cdot}666:1:1{\cdot}270$. — B'HCl. Trimetric crystals (Haushofer, *J.* 1882, 365).

Di-(α)-naphthyl-guanidine $C_{21}H_{17}N_3$ *i.e.* $NH:C(NHC_{10}H_7)_2$. *Menaphthylamine.* [c. 200°]. Formed by the action of gaseous cyanogen chloride on (α)-naphthylamine (Perkin, *C. J.* 9, 8; *A.* 98, 238). Small white needles with bitter taste; nearly insol. water, sl. sol. alcohol and ether. Cyanogen passed into its ethereal solution forms $C_{23}H_{17}N_5$, a pale-yellow crystalline mass; insol. water, m. sol. alcohol and ether; decomposed by cold HClAq in $C_{23}H_{15}N_3O_2$, crystallising in yellow scales [245°], and decomposed by acids into oxalic acid and di-naphthyl-guanidine.—B'HCl: amorphous; v. sol. alcohol and ether, sl. sol. water.—$B'_2H_2PtCl_6$.

Tri-(α)-naphthyl-guanidine $C_{31}H_{23}N_3$ *i.e.* $C_{10}H_7N:C(NHC_{10}H_7)_2$. [178°]. Formed from (α)-naphthylamine and $MeS.C(NC_{10}H_7)(NHC_{10}H_7)$ [174°] (Evers, *B.* 21, 962). Flat needles; insol. water, v. sol. alcohol.

(β)-NAPHTHYL-GUANIDO-BENZOIC ACID $C_{18}H_{15}N_3O_2$ *i.e.* $C_{10}H_7.NH.C(NH).NH.C_6H_4CO_2H$. Formed by heating cyancarbimidamido-benzoic acid with excess of (β)-naphthylamine (Griess, *B.* 16, 338). Small crystalline spherules; insol. ether, v. sl. sol. hot water and hot alcohol.—HA'HCl: sparingly soluble six-sided plates.

(α)-NAPHTHYL-HYDRAZINE $C_{10}H_{10}N_2$ *i.e.* $C_{10}H_7.NH.NH_2$. [116°]. (203° at 20 mm.). Formed by making a paste of (α)-naphthylamine and HClAq, adding $NaNO_2$ in the cold, filtering, and reducing with $SnCl_2$, the yield being 66 p.c. (Fischer, *A.* 232, 236). Plates; sl. sol. water, v. sol. other solvents.—B'HCl: plates.—$B'_2H_2SO_4$: plates.

Reactions.—1. *Acetone* forms $C_{10}H_7N_2H:CMe_2$ [74°].—2. *Pyruvic acid* produces the acid $C_{10}H_7N_2H:CMe.CO_2H$ [159°], which forms the ether EtA' [100°] (Schlieper, *A.* 239, 231).—3. *Di-bromo-pyruvic acid* forms the acid $C_{10}H_7N_2H:CH.C(N_2HC_{10}H_7)CO_2H$ [196°] (Nastvogel, *A.* 248, 89).—4. *Aceto-acetic ether* forms oxy-naphthyl-methyl-pyrazole $C_{14}H_{12}N_2O$ [c. 190°] (Knorr, *B.* 17, 551).

Tetrahydride 
$C_6H_8\left\langle\begin{matrix}CH:CH\\C(N_2H_3)\end{matrix}\right\rangle CH$. Obtained by treating a solution of the tetrahydride of (α)-naphthylamine hydrochloride (18 g.) with an equivalent quantity of $NaNO_2$ and dropping the mixture into a solution of $SnCl_2$ (45 g.) dissolved in HClAq at 0° (Bamberger a. Bordt, *B.* 22, 630). Prisms (from boiling ligroïn); sl. sol. water. Reduces Fehling's solution at 30°–40°. $K_2Cr_2O_7$ sets free nitrogen in the cold.—*B'HCl: silvery plates; v. sol. water.

(β)-Naphthyl-hydrazine $C_{10}H_{10}N_2$ *i.e.* $C_{10}H_7NH.NH_2$. [124°]. Formed in the same way as its (α)-isomeride (Fischer, *A.* 232, 242). Plates, m. sol. water, v. sol. hot alcohol. Turns red in air. Its solution in conc. HOAc is ppd. by water.

Reactions.—1. *Acetone* forms $C_{10}H_7N_2H:CMe_2$ [65°] (Schlieper, *A.* 236, 174).—2. *Aldehyde* yields $C_{10}H_7N_2H:CH.CH_3$ [128°].—3. *Phenyl-acetic aldehyde* forms a crystalline hydrazide decomposing at 100° (Ince, *A.* 253, 40).—4. *Acetophenone* forms a hydrazide crystallising in needles [c. 150°].—5. *Acetyl-propionic ether* forms $C_{17}H_{20}N_2O_2$ [130°], the acid corresponding to which at 175° forms the anhydride 
$C_{10}H_7N\left\langle\begin{matrix}N:CMe\\CO.CH_2\end{matrix}\right\rangle CH_2$ [119°] (Steche, *A.* 242, 368).—6. *Pyruvic acid* in alcoholic solution yields $C_{10}H_7N_2H:CMe.CO_2H$ [166°], which yields the ether EtA' [131°] (Schlieper, *A.* 236, 176).—7. *Di-bromo-pyruvic acid* yields yellow needles of $C_{10}H_7N_2H:CH.CO.C(OH).N_2HC_{10}H_7$? insoluble in alkalis (Nastvogel, *A.* 248, 85).—8. *Aceto-acetic ether* forms $C_{14}H_{12}N_2O$ [190°].

Salts.—*B'HCl: needles or plates.—*$B'_2H_2SO_4$: plates, sl. sol. hot water.—Nitrate: very soluble needles.

(β)-*Naphthyl-thiocarbazate* $C_{10}H_7N_2H_3HS.CS.N_2H_2C_{10}H_7$. [145°]. Plates.

Acetyl derivative $C_{10}H_7NH.NHAc$. [165°] (Hauff, *A.* 253, 25); [167°] (Hillringhaus, *B.* 22, 2657). Formed from (β)-naphthyl-hydrazine and HOAc or Ac_2O. Needles (from alcohol), m. sol. hot water. Reduces Fehling's solution.

Benzoyl derivative $C_{10}H_7NH.NHBz$. [155°]. Needles, insol. water, v. sol. hot alcohol.

Di-benzoyl derivative $C_{10}H_7N_2HBz_2$. [163°].

Di-(α)-naphthyl-hydrazine $C_{10}H_7.N_2H_2.C_{10}H_7$. *Hydrazo-naphthalene.* [275°].

Preparation.—1 pt. of azonaphthalene is finely suspended in a solution of 1½ pts. of NaOH in 160–170 pts. of alcohol, and the boiling mixture is treated with zinc-dust till decolourised; it is then poured into water containing NH_4HS and the pp. is dried and extracted with benzene, from which it crystallises on cooling.

Properties.—Colourless plates. Sublimable. V. sol. alcohol, ether, and benzene, insol. water. By warming with HCl it is converted into a mixture of two isomeric di-amido-dinaphthyls (Nietzki a. Goll, *B.* 18, 3253).

(1, 4)-NAPHTHYL-HYDRAZINE SULPHONIC ACID [1:4] $C_{10}H_6(N_2H_3).SO_3H$. Formed by reducing the diazo-compound of naphthionic acid with stannous chloride (Erdmann, *A.* 247, 333). Tufts of white needles, sl. sol. hot water, m. sol. hot HClAq.—A'Na 4aq: plates, sl. sol. cold water.

(1,4')-Naphthyl-hydrazine sulphonic acid [1:4'] $C_{10}H_6(N_2H_3)SO_3H$. Formed by reducing the diazo-compound of the (1,4')-naphthylamine sulphonic acid with $SnCl_2$. Plates, m. sol. water, v. sol. HCl.—A'Na 3½aq: needles, sl. sol. water.

Peri-Naphthyl-hydrazine sulphonic acid [1:1'] $C_{10}H_6(N_2H_3).SO_3H$. Formed, in like manner, from (1,1')-naphthylamine sulphonic acid. Small plates, sl. sol. hot water.—A'K: needles, v. sol. hot water.—A'Na: plates, v. sl. sol. water.

(α)-NAPHTHYL-IMIDO-DIACETIC ACID $C_{10}H_7N(CH_2.CO_2H)_2$. [133°]. Formed by the action of chloro-acetic acid and Na_2CO_3 on (α)-naphthyl-amido-acetic acid (Bischoff, *B.* 23, 2004). Colourless crystals, v. sol. alcohol.

(α)-*Naphthylamide* $C_{10}H_7N(CH_2.CO_2H)(CH_2.CONHC_{10}H_7)$. [199°]. Crystals (from benzene-alcohol).

Di-(α)-*naphthylamide* $C_{10}H_7N(CH_2.CONHC_{10}H_7)_2$. [202°]. Crystals, sl. sol. ligroïn.

(β)-Naphthyl-imido-diacetic acid $C_{14}H_{13}NO_4$. [182°]. Formed by heating chloro-acetic acid with (β)-naphthyl-amido-acetic acid and Na_2CO_3Aq at 160° (B.). Crystals, sol. alcohol, sl. sol. ether, insol. benzene. The solutions have a bluish-violet fluorescence.

(α)-NAPHTHYL-β-IMIDO-BENZYL-MALONIC ETHER $C_{24}H_{23}NO_4$ *i.e.* $C_6H_5.C(NC_{10}H_7).CH(CO_2Et)_2$. [145°]. Formed by the action of ω-chloro-benzylidene-(α)-naphthylamine upon sodio-malonic ether. Crystalline solid. Sl. sol. ether. By dilute HCl at 120° it is split up into acetophenone and (α)-naphthylamine (Just, *B.* 19, 987).

(β)-Naphthyl-β-imido-benzyl-malonic ether $C_{24}H_{23}NO_4$ *i.e.* $C_6H_5.C(NC_{10}H_7).CH(CO_2Et)_2$.

[140°]. Formed by the action of ω-chloro-benzylidene-(β)-naphthylamine $C_{10}H_7.N:CCl.C_6H_5$ upon sodio-malonic ether. Crystalline solid. Sl. sol. ether. By dilute HCl at 120° it is split up into acetophenone and (β)-naphthylamine (Just).

(β)-NAPHTHYL-β-IMIDO-BUTYRIC ACID $CH_3.C(NC_{10}H_7).CH_2.CO_2H$. [92°]. Needles, sol. water. Formed, together with its naphthalide, by heating a mixture of acetoacetic ether and (β)-naphthylamine at 150°–180°. By boiling with HCl it is converted into (*Py.* 1:3)-oxy-methyl-(β)-naphthoquinoline.

Naphthalide $C_{24}H_{20}NO$. [200°]. Needles, nearly insoluble in most solvents (Knorr, *B.* 17, 543).

DI-NAPHTHYL-IMIDO-THIOCARBAMIC ETHERS $C_{10}H_7NH.C(NC_{10}H_7).SR$. *Di-naphthyl-alkyl-ψ-thioureas.* Formed by heating di-naphthyl-thio-ureas with alkyl iodides (Evers, *B.* 21, 964).

Di-(α)-naphthyl-imido-thiocarbamic acid. *Methyl ether* $C_{10}H_7NH.C(NC_{10}H_7).SMe$. [136°]. Plates, sol. hot, v. sl. sol. cold, alcohol. Gives off HSMe on heating, leaving di-(α)-naphthyl-cyanamide, which on boiling with dilute HClAq yields di-(α)-naphthyl-urea. Boiling alcoholic potash also converts it into di-(α)-naphthyl-urea and HSMe. Dilute H_2SO_4 at 160° forms (α)-naphthylamine and $C_{10}H_7NH.CO.SMe$.—B'HI. [174°].—$B'_2H_2PtCl_6$. [202°]. Yellow powder.

Ethyl ether EtA'. [98°]. Prisms, sl. sol. hot alcohol.—B'HI. [157°].—$B'_2H_2PtCl_6$.

Propyl ether PrA'. [95°]. Plates.—B'HI. [97°].—$B'_2H_2PtCl_6$.

Ethylene derivative $C_{23}H_{18}N_2S$ *i.e.*  $C_{10}H_7N{:}C{<}\begin{matrix}N(C_{10}H_7)\\S.CH_2.CH_2\end{matrix}{>}$. [139°]. Formed by boiling di-(α)-naphthyl-thio-urea with ethylene bromide. Needles, v. sol. alcohol.—$B'_2H_2PtCl_6$.

Di-(β)-naphthyl-imido-thiocarbamic acid.

Methyl ether $C_{10}H_7NH.C(NC_{10}H_7).SMe$. [110°]. Needles, v. e. sol. warm alcohol and ether.—$B'_2H_2PtCl_6$.

Ethyl ether EtA'. [106°].—$B'_2H_2PtCl_6$. [155°].

Propyl ether PrA'. [66°].—$B'_2H_2PtCl_6$. [120°].

Ethylene derivative  $C_{10}H_7N{:}C{<}\begin{matrix}N(C_{10}H_7)\\S.CH_2.CH_2\end{matrix}{>}$. [172°]. Plates (from alcohol).—$B'_2H_2PtCl_6$. [146°].

DINAPHTHYLINE *v.* DI-AMIDO-DINAPHTHYL.

(αβ)-DI-NAPHTHYL-KETONE $C_{21}H_{14}O$ *i.e.* $(C_{10}H_7)_2CO$. Mol. w. 268. [135°]. S. (alcohol) 1·3 at 14°. Formed by heating (α)-naphthoic acid with naphthalene and P_2O_5 at 210° (Kollarits a. Merz, *B.* 6, 544); by the action of a strip of zinc on a mixture of (α)-naphthoyl chloride and naphthalene (Grucarevic a. Merz, *B.* 6, 1241), and by heating (β)-naphthoyl chloride with mercuric dinaphthyl at 175° (G. a. M.). Pointed needles (from boiling alcohol). On distillation with soda lime it yields naphthalene and a mixture of (α) and (β)-naphthoic acids.

(ββ)-Di-naphthyl ketone $(C_{10}H_7)_2CO$. Obtained in two isomeric forms [125·5°] and [164°] by heating (β)-naphthoic acid with naphthalene and P_2O_5 (K. a. M.), or (β)-naphthoyl chloride with naphthalene and zinc (G. a. M.). The two varieties may be separated by crystallisation from ether-chloroform. Both varieties yield naphthalene and (β)-naphthoic acid on distillation with soda-lime. The solubility of the variety melting at 164° in alcohol at 19° is less (·08) than that of the variety melting at 125·5° (·38). The latter variety may also be prepared by distilling calcium (β)-naphthoate (Hausamann, *B.* 9, 1515).

Di-naphthyl ketone $(C_{10}H_7)_2CO$. [140°]. Formed by distilling potassium naphthalene (β)-sulphonate with KHC_2O_4 (Giuseppe, *B.* 6, 546).

NAPHTHYL-MELAMINE *v.* CYANIC ACIDS.

(α)-NAPHTHYL MERCAPTAN $C_{10}H_8S$ *i.e.* $C_{10}H_7.SH$. *Thionaphthol.* Mol. w. 160. (285°). S.G. $\frac{0}{4}$ 1·1729; $\frac{23}{4}$ 1·1549. Formed by reducing naphthalene (α)-sulphonic chloride with zinc-dust and dilute H_2SO_4 (Schertel, *A.* 132, 91; Krafft a. Schönherr, *B.* 22, 822). Formed also by saponifying its ethyl ether which may be formed by the action of potassium xanthate on (α)-diazonaphthalene chloride (Leuckart, *J. pr.* [2] 41, 216). Colourless oil, with unpleasant smell, sl. sol. aqueous alkalis, v. sol. alcohol and ether. Oxidised in alcoholic solution by the air to di-(α)-naphthyl disulphide [91°]. Yields di-naphthyl sulphide [107°] on heating.—$Hg(SC_{10}H_7)_2$.—$Pb(SC_{10}H_7)_2$: yellow pp.

Ethyl ether $C_{10}H_7SEt$. (167·5°) at 15 mm. S.G. $\frac{0}{}$ 1·1198; $\frac{50}{}$ 1·0797. Formed from $C_{10}H_7SH$ by heating with EtI, alcohol, and KOH at 120°–150°.

Acetyl derivative $C_{10}H_7SAc$. (188° at 15 mm.). S.G. $\frac{20}{}$ 1·1519.

Benzoyl derivative $C_{10}H_7SBz$. [117°]. (262° at 15 mm.).

(β)-Naphthyl mercaptan $C_{10}H_7SH$. [75°]. (Billeter, *B.* 8, 463; L.); [81°] (K. a. S.). (286°). Formed by reducing naphthalene (β)-sulphonic chloride, and also by heating (β)-diazo-naphthalene chloride with a solution of EtO.CS.SK, saponifying the oily product, and boiling with zinc-dust and HClAq (Maikopar, *Z.* 1869, 711; Leuckart, *J. pr.* [2] 41, 220). Small plates (from ether), sl. sol. water. Not volatile with steam. Yields the corresponding disulphide on oxidation.—$Pb(SC_{10}H_7)_2$: orange powder.

Ethyl ether $C_{10}H_7SEt$. [16°]. (170·5° at 15 mm.).

Acetyl derivative $C_{10}H_7SAc$. [53·5°]. (191° at 15 mm.). Formed by heating the mercaptan with AcCl at 75°.

Benzoyl derivative $C_{10}H_7SBz$. [108°]. (267° at 15 mm.).

DI-(α)-NAPHTHYL-METHANE $C_{21}H_{16}$ *i.e.* $(C_{10}H_7)_2CH_2$. [109°] (above 360°). S. (alcohol) ·8 in the cold; 6·6 at 78°. Formed by the action of H_2SO_4 on a cooled mixture of naphthalene (5 pts.), methylal (1 pt.) and chloroform (20 pts.) (Grabowski, *B.* 7, 1605). Short prisms (from alcohol), v. sol. ether and chloroform. Not affected by chromic acid mixture. *Picric acid compound* $C_{21}H_{16}2C_6H_2(NO_2)_3OH$. [143°]. Reddish-yellow prisms (from chloroform).

Di-(β)-naphthyl-methane [92°]. Prepared by reducing di-(β)-naphthyl-ketone with P and HIAq (Richter, *B.* 13, 1728). Slender white needles, v. sol. alcohol and benzene. Yields $C_{21}H_{14}Br_2$ [164°] and $C_{21}H_{14}Br_4$ [150°–160°].

NAPHTHYL-METHYL-ALCOHOL *v.* NAPHTHYL-CARBINOL.

(α)-NAPHTHYL-METHYL-AMINE $C_{10}H_7NHMe$. *Methyl-(α)-naphthylamine.* (293° uncor.). Formed, together with dinaphthylamine, by passing MeCl into melted (α)-naphthylamine (Landshoff, *B.* 11, 638). Dark-red oil. Its alcoholic solution gives a violet pp. with $FeCl_3$.—$B'_2H_2PtCl_6$ 2aq.

Acetyl derivative $C_{10}H_7NMeAc$. [91°] (L.); [95°] (Norton a. Livermore, *B.* 20, 2272). Small white prisms, sl. sol. water, v. sol. alcohol and ether. Dilute nitric acid (10 p.c.) forms $C_{10}H_6(NO_2).NMeNO_2$ [157·5°].

Benzoyl derivative $C_{10}H_7.NMeBz$. [121°]. Formed by heating (α)-naphthyl-di-methylamine with BzCl at 180° (Hess, *B.* 18, 687). Crystals.

(α)-Naphthyl-di-methyl-amine $C_{12}H_{13}N$ *i.e.* $C_{10}H_7NMe_2$. (267°) (L.); (274·5° i. V. at 711 mm.) (Bamberger a. Helwig, *B.* 22, 1315). S.G. $\underline{20}$ 1·0423. Formed by heating (α)-naphthylamine (1 mol.) with MeI (2 mols.) and MeOH (Landshoff, *B.* 11, 643; *J. pr.* [2] 17, 286; Monnet, Reverdin, a. Nölting, *B.* 12, 2305). Prepared by heating (α)-naphthylamine hydrochloride with MeOH for 8 hours at 170° (Hantzsch, *B.* 13, 1348; Friedländer, *B.* 21, 3124). Oil.

Reactions.—1. Forms a nitroso-compound which decomposes in an acid aqueous solution into (1, 4)-nitroso-naphthol and dimethylamine. 2. *Nitric acid* forms two nitro-derivatives [88°] and [128°]. — 3. By condensation with *benzoic aldehyde* in presence of $ZnCl_2$ at 110° it yields $C_6H_5.CH(C_{10}H_6NMe_2)_2$ [188°].—4. $C_6H_4NMe_2.CHO[1:4]$ yields, in like manner, $NMe_2.C_6H_4.CH(C_{10}H_6NMe_2)_2$ [179°].—5. $COCl_2$, followed by Aq, yields $NMe_2.C_{10}H_6.CO_2H$ [164°].

Platinochloride $B'_2H_2PtCl_6$: yellow needles.

Methylo-iodide B'MeI. Yellowish-green flat needles, decomposed at 164° uncor. Not affected by NaOH, but Ag_2O yields a strongly alkaline hydroxide.—$(B'MeCl)_2PtCl_4$.

ar-Tetrahydride  $C_6H_6\left<\begin{matrix}NMe_2{:}CH\\CH\ {:}CH\end{matrix}\right>$. (262°) at 721 mm. Formed by reducing the base, dissolved in isoamyl alcohol, with sodium (B. a. H.). Colourless oil. Yields a colouring matter with *p*-diazobenzene sulphonic acid. Reduces $AgNO_3$. Oxidised to adipic acid by $KMnO_4$. Yields $B'_2H_2PtCl_6$ and B'MeI [164·5°].

(β)-Naphthyl-methyl-amine.

Benzoyl derivative $C_{10}H_7.NMeBz$: [169°]; glistening plates. Formed by heating di-methyl-(β)-naphthylamine with benzoyl chloride at 180° (Hess, *B.* 18, 688).

(β)-Naphthyl-di-methyl-amine $C_{10}H_7NMe_2$ [46°]. (305° cor.). Formed by heating commercial trimethylamine with (β)-naphthol at 200° (Hantzsch, *B.* 13, 2055), and by heating (β)-naphthylamine with MeI and NaOHAq at 120° (Bamberger a. Müller, *B.* 22, 1306). Forms very soluble salts.—$B'_2H_2PtCl_6$.

Methylo-iodide $C_{10}H_7.NMe_3I$. Tables, sl. sol. cold water. With Ag_2O it yields a strongly alkaline hydroxide.

ar-Tetrahydride  $C_6H_8\left<\begin{matrix}CH{:}CNMe_2\\CH{:}CH\end{matrix}\right.$. (287°) at 715 mm. Formed by reducing $C_{10}H_7NMe_3I$ dissolved in isoamyl alcohol with sodium (Bamberger a. Müller, *B.* 22, 1306). Colourless oil. Reduces auric chloride and $AgNO_3$. $FeCl_3$ gives a turbidity and a yellow colour. $K_2Cr_2O_7$ and H_2SO_4 give a yellow pp. and, on heating, a dirty-green colour. $KMnO_4$ oxidises it to adipic acid.—B'HCl.—$B'_2H_2PtCl_6$.—$B'HClHgCl_2$. [127·5°]. Needles, v. sl. sol. cold, v. sol. hot water. *Picrate*: needles.

ac-Tetrahydride  $C_6H_4\left<\begin{matrix}CH_2.CHNMe_2\\CH_2.CH_2\end{matrix}\right.$. (166·5° at 22 mm.). Formed at the same time as the aromatic isomeride.—B'HCl: needles, v. sol. water.—$B'_2H_2PtCl_6$: orange needles, v. sol. water.

Di-(β)-naphthyl-methyl-amine $(C_{10}H_7)_2NMe$. [140°]. Formed from $(C_{10}H_7)_2NH$ and MeI at 100° (Ris, *B.* 20, 2619). Needles, m. sol. cold alcohol, insol. ligroïn.

Isomeride of naphthyl-methyl-amine *v.* NAPHTHYL-CARBINYL-AMINE.

(α)-NAPHTHYL METHYL KETONE $C_{12}H_{10}O$ *i.e.* $C_{10}H_7.CO.CH_3$. [34°]. (297°). Formed by the action of AcCl in presence of $AlCl_3$ on naphthalene dissolved in ligroïn (Pampel a. Schmidt, *B.* 19, 2898; Claus a. Feist, *B.* 19, 3180; *J. pr.* [2] 42, 517). Crystals, insol. water, v. sol. alcohol and ether. Oxidised by $KMnO_4$ to (α)-naphthyl-glyoxylic acid. Yellow ammonium sulphide at 220° forms  $C_{10}H_7CMe\left<\begin{matrix}O\\NH\end{matrix}\right.$ [154°] (Willgerodt, *B.* 20, 2468).

Oxim $C_{10}H_7.CMe(NOH)$. [101°] (P. a. S.); [145°] (C. a. F.).

Phenyl-hydrazide $C_{10}H_7.CMe(N_2HPh)$. [146°] (P. a. S.); [173°] (C. a. F.). Needles.

Anilide $C_{10}H_7.CMe(NPh)$. [130°]. It will be seen that the melting-points of the oxim and phenyl-hydrazide of the ketone prepared by Claus are the same as those of the like derivatives of the (β)-ketone.

(β)-Naphthyl methyl ketone $C_{10}H_7.CO.CH_3$. [52°]. (301°). Formed, together with the (α)-isomeride by the action of Ac_2O on naphthalene in presence of $AlCl_3$ (Roux, *A. Ch.* [6] 12, 289; Müller a. Von Pechmann, *B.* 22, 2561). Leaflets, nearly insol. cold water. Oxidised by dilute $KMnO_4$ to (β)-naphthyl-glyoxylic acid [c. 75°], further oxidation forms (β)-naphthoic acid. Sodium-amalgam reduces it to $C_{10}H_7.CH(OH).CO_2H$ [176°].

Oxim $C_{10}H_7.C(NOH).CH_3$ [145°].

Acetyl derivative of the oxim [134°].

Phenyl-hydrazide [171°].

NAPHTHYL METHYL OXIDE *v. Methyl ether* of NAPHTHOL.

(α)-NAPHTHYL-DI-METHYL-PYRROLE $C_{16}H_{15}N$ *i.e.*  $C_{10}H_7N\left<\begin{matrix}CMe{:}CH\\CMe{:}CH\end{matrix}\right.$. [123°]. (312°). Formed by heating its dicarboxylic acid at 250° (Knorr, *A.* 236, 309). Insol. water, v. sol. alcohol, ether, and chloroform.

(β)-Naphthyl-di-methyl-pyrrole $C_{16}H_{15}N$. [71°]. (341°). Formed in like manner.

(α)-NAPHTHYL-DI-METHYL-PYRROLE DICARBOXYLIC ACID $C_{16}H_{15}NO_4$ *i.e.*  $C_{10}H_7N\left<\begin{matrix}CMe{:}C.CO_2H\\CMe{:}C.CO_2H\end{matrix}\right.$. [244°]. Formed by saponifying its ether, which is obtained by the action of (α)-naphthylamine on diacetyl-succinic ether (Knorr, *A.* 236, 308). Needles.—K_2A''.—BaA''.—$AgHA''$.

Ethyl ether Et_2A''. [91°].

(β)-Naphthyl-di-methyl-pyrrole-di-carboxylic acid $C_{10}H_7N$$C_{10}H_7N\left\langle\begin{matrix}CMe:C.CO_2H\\ |\\ CMe:C.CO_2H\end{matrix}\right.$. Its di-ethyl ether is obtained by mixing acetic acid solutions of di-aceto-succinic ether and (β)-naphthylamine (Knorr, *B.* 18, 304). Sparingly soluble in most solvents. Begins to decompose at 260° with evolution of CO_2.—BaA''.—$BaH_2A''_2$.

Di-ethyl ether $A''Et_2$: [124°]; needles.

DI-NAPHTHYL-METHYL-ψ-THIOUREA *v. Methyl ether* of DI-NAPHTHYL-IMIDO-THIOCARBAMIC ACID.

DI-(α)-NAPHTHYL OXIDE $(C_{10}H_7)_2O$. *Naphthyl ether.* [110°]. Formed by heating (α)-naphthol with $ZnCl_2$ or HCl (Merz a. Weith, *B.* 14, 195). Plates or tables, sol. hot alcohol and ether. May be distilled unchanged.—Picrate $C_{20}H_{14}O2C_6H_2(NO_2)_3(OH)$. [115°]. Red crystals.

Di-(β)-naphthyl oxide $(C_{10}H_7)_2O$. [105°]. Obtained by boiling (β)-naphthol with dilute (50 p.c.) H_2SO_4 (Graebe, *B.* 13, 1849), or by heating it with $ZnCl_2$ (2 pts.) at 190°, or with gaseous HCl (M. a. W.) Formed also by distilling aluminium (β)-naphthol (Gladstone a. Tribe, *C. J.* 41, 15). Pearly plates (from alcohol), sol. ether. Gives an orange colour with conc. H_2SO_4.

Picrate $C_{20}H_{14}O2C_6H_2(NO_2)_3OH$. [122°]. Small orange prisms.

DI-(α)-NAPHTHYL-PARABANIC ACID $C_{23}H_{14}N_2O_3$ *i.e.* $CO\left\langle\begin{matrix}N(C_{10}H_7).CO\\ N(C_{10}H_7).CO\end{matrix}\right\rangle$. [246°]. Formed by passing cyanogen gas into an alcoholic solution of methyl-di-(α)-naphthyl-imido-thio-carbamate and heating the crystals that separate with alcoholic HCl (Evers, *B.* 21, 973). Needles, v. sol. hot alcohol, sl. sol. ether, insol. water and dilute acids. Decomposed by boiling alcoholic potash into CO_2, oxalic acid, and (α)-naphthylamine.

(α)-NAPHTHYL PHENYL-AMIDO-METHYL KETONE $C_{18}H_{15}NO$ *i.e.* $C_{10}H_7.CO.CH_2.NHC_6H_5$. [130°]. Formed by the action of aniline on $C_{10}H_7.CO.CH_2Br$ in alcoholic solution (Pampel a. Schmidt, *B.* 19, 2899). Red crystals.

NAPHTHYL-PHENYL- compounds *v.* PHENYL-NAPHTHYL COMPOUNDS.

(α)-NAPHTHYL-DI-PHENYL METHYLENE-AMINE $C_{23}H_{17}N$ *i.e.* $C_{10}H_7.N:CPh_2$. Formed from (α)-naphthylamine and benzophenone-chloride Ph_2CCl_2 (Pauly, *A.* 187, 215). Golden plates (from ether), split up by acids into benzophenone and (α)-naphthylamine.

TRI-(α)-NAPHTHYL-PHOSPHATE $(C_{10}H_7O)_3PO$. [145°]. Prepared by heating (α)-naphthol with $POCl_3$; the yield being 65 p.c. of the theoretical (Schäffer, *A.* 152, 289; Heim, *B.* 16, 1769). Small glistening needles.

Tri-(β)-naphthyl-phosphate $(C_{10}H_7O)_3PO$. [111°]. Prepared by heating a mixture of (β)-naphthol and phosphorus-oxy-chloride; the yield being 65 p.c. of the theoretical (Heim, *B.* 16, 1768; *cf.* Schäffer). Fine white needles. Insol. water, sl. sol. cold alcohol.

NAPHTHYL-PHOSPHOROUS ACID *v.* NAPHTHALENE PHOSPHINIC ACID.

β-(α)-NAPHTHYL-PROPIONIC ACID $C_{13}H_{12}O_2$ *i.e.* $C_{10}H_7.CH_2.CH_2.CO_2H$. [148°]. Formed by reducing naphthyl-acrylic acid with sodium-amalgam (Brandis, *B.* 22, 2156). Needles (from alcohol), sol. boiling water.

(α)-NAPHTHYL-PROPYLENE-ψ-THIO-UREA $\left.\begin{matrix}CH_3.CH.S\\ CH_2.N\end{matrix}\right\rangle C.NH.C_{10}H_7$. [134°]. Formed by heating s-naphthyl-allyl-thio-urea [145°] with HClAq at 100° (Prager, *B.* 22, 3001). Tables, v. sol. chloroform, m. sol. ether, insol. water.—$B'_2H_2PtCl_6$. [206°].—$B'C_6H_2(NO_2)_3OH$. [192°].

NAPHTHYL-PURPURIC ACID $C_{11}H_7N_3O_4$. The K salt is formed by the action of aqueous KCy on di-nitro-naphthol (Sommaruga, *B.* 4, 94; *A.* 157, 328). The free acid is unstable. The K salt is golden-brown with metallic lustre. Potash-fusion yields benzoic, phthalic, and hemi-mellitic acids. The following salts were dried at 100°: NH_4A'.—KA'.—CaA'_2.—BaA'_2.

DI-(α)-NAPHTHYL-PYRAZINE TETRAHYDRIDE $C_{10}H_7N\left\langle\begin{matrix}CH_2.CH_2\\ CH_2.CH_2\end{matrix}\right\rangle NC_{10}H_7$. *Di-naphthyl-di-ethylene-diamine.* [265°]. Formed from ethylene bromide, (α)-naphthylamine, and NaOAc (Bischoff, *B.* 22, 1782). Prisms, v. sl. sol. alcohol.

Di-(β)-naphthyl-pyrazine tetrahydride. [228°]. Formed by the action of $C_2H_4Br_2$ on (β)-naphthylamine in presence of Na_2CO_3 (Bischoff, *B.* 23, 1984). Colourless crystals, insol. water, alcohol, ether, and HClAq, sol. hot HOAc.

(α)-NAPHTHYL-PYRIDINE HEXAHYDRIDE $C_{10}H_7NC_5H_{10}$. (185°–190° at 5–10 mm.). Formed by heating piperidine (2 mols.) with (α)-bromo-naphthalene (3 mols.) for 10 hours at 255° (Lellmann a. Büttner, *B.* 23, 1383). Thick yellow oil, with faint fæcal odour, rapidly becoming brown. V. sol. alcohol and ether. A solution of its hydrochloride is ppd. by $HgCl_2$, by $ZnCl_2$, and by chloride of gold.—B'HCl: groups of needles, v. sol. water.—$B'_2H_2PtCl_6$ 2aq.

(β)-Naphthyl-pyridine hexahydride. [58°]. Resembles the preceding in mode of preparation and properties. Colourless prisms, becoming grey on keeping.—B'HCl.—$B'_2H_2PtCl_6$ 6aq.

DINAPHTHYL-DIQUINONE, so-called, $C_{20}H_{10}O_4$ *i.e.* $C_6H_4\left\langle\begin{matrix}CO.CO.CH & CH.CO.CO\\ \ddot{O} & \ddot{O}\end{matrix}\right\rangle C_6H_4$. Obtained by oxidation of dinaphthyl-diquinhydrone $C_{20}H_{12}O_4$, a black powder formed by the action of dilute H_2SO_4 on (β)-naphthoquinone (Stenhouse a. Groves, *C. J.* 33, 415). Formed also by the oxidation of (β)-amido-(α)-naphthol by $FeCl_3$ or CrO_3 (Zincke a. Rathgen, *B.* 19, 2483). Small orange prisms, insol. water, v. sl. sol. other solvents. Not affected by boiling HNO_3 or by H_2SO_4.

Reactions.—1. Yields on reduction 'dinaphthyl-dihydroquinone.'—2. Distillation with *zinc-dust* converts it into dinaphthyl.—3. *Alkalis* form a green solution which, on exposure to air, changes to red from formation of $C_{20}H_{10}(OH)_2O_4$ [245°–250°] (Korn, *B.* 17, 3020).—4. $KMnO_4$ oxidises it to diphthalylic acid $C_{18}H_{10}O_6$.—5. *Aniline* forms $C_{44}H_{30}N_4O_2$ crystallising in red plates [250°] and forming a hydrochloride $C_{44}H_{30}N_4O_2H_2Cl_2$ crystallising in needles.

Iso-dinaphthyl-diquinone $C_{20}H_{10}O_4$. [250°–260°]. Formed by oxidising di-(β)-naphthyl with CrO_3 in HOAc (Staub a. Watson Smith, *C. J.* 47, 104). Amorphous yellow powder, sol. HOAc, sl. sol. most liquids. Turns brown at 215°.

NAPHTHYL - ROSINDULINE $C_{22}H_{21}N_4$ *i.e.*

$C_6H_4<\begin{array}{l}\overline{\quad\quad\quad\quad\quad}C{:}N\\ C(NC_{10}H_7).CH{:}C.NPh\end{array}>C_6H_4$. [247°]. Formed by heating benzene-azo-di-(*α*)-naphthylamine with aniline and alcohol at 165° (Fischer a. Hepp, *A.* 256, 246). Black needles, forming a blue solution in conc. H_2SO_4. Conc. HClAq at 210° splits it up into (*α*)-naphthylamine and rosindone $C_{22}H_{14}N_2O$.

(*α*)-**NAPHTHYL SILICATE** $C_{40}H_{28}SiO_4$ *i.e.* $(C_{10}H_7)_4SiO_4$. (425°–430° at 130 mm.). Needles (Hertkorn, *B.* 18, 1696).

(*β*)-**Naphthyl silicate.** (430° at 133 mm.). Crystalline (H.).

NAPHTHYL-SULPHAMIC ACID *v.* NAPHTHYLAMINE *ν*-SULPHONIC ACID.

NAPHTHYL SULPHATE.

Naphthyl-sulphuric acid $C_{10}H_8SO_4$ *i.e.* $C_{10}H_7O.SO_2.OH$. Formed by the action of $Cl.SO_2.OH$ on a cold solution of (*β*)-naphthol in CS_2 (Armstrong, *B.* 15, 204). It is also formed by dissolving (*β*)-naphthol (1 pt.) in cold H_2SO_4 (2 pts.) (Nietzki, *B.* 15, 305).—*NaA′. Slender leaflets, v. e. sol. water. Ppd. from aqueous solution by NaCl. Split up by boiling HClAq into (*β*)-naphthol and $NaHSO_4$. Does not react with diazo- salts.—*KA′: scales (from hot water). With PCl_5 it yields chloro-naphthalene. Bromine forms bromo-naphthol [84°].

DI-(*α*)-NAPHTHYL SULPHIDE $C_{20}H_{14}S$ *i.e.* $(C_{10}H_7)_2S$. [110°]. (290° at 15 mm.).

Formation.—1. By distilling a dry mixture of potassium naphthalene (*α*)-sulphonate and potassium sulphocyanide (Armstrong, *B.* 7, 407). 2. By distilling the lead salt of (*α*)-naphthyl mercaptan under diminished pressure (Krafft a. Schönherr, *B.* 22, 823).—3. By heating (*α*)-naphthyl mercaptan as long as H_2S is evolved (Leuckart, *J. pr.* [2] 41, 217).—4. By heating $(C_{10}H_7S)_2Pb$ with (*α*)-bromo-naphthalene at 235° for 4 hours (Krafft a. Bougois, *B.* 23, 3045).

Properties.—Needles, v. sol. benzene and HOAc, sl. sol. alcohol. Chromic acid in HOAc oxidises it to the sulphoxide [165°], and finally to the sulphone [187°] (Krafft, *B.* 23, 2368).

(*αβ*)-**Di-naphthyl sulphide** $(C_{10}H_7)_2S$. [61°]. (290° at 15 mm.). Formed by heating the lead salt of (*β*)-naphthyl mercaptan with (*α*)-bromo-naphthalene at 230° (Krafft, *B.* 23, 2368). Lustrous leaflets (from alcohol). Oxidised by CrO_3 in HOAc to $(C_{10}H_7)_2SO_2$ [123°].

Di-(*β*)-naphthyl sulphide $(C_{10}H_7)_2S$. [151°]. (296° at 15 mm.). Formed by distilling the lead salt of (*β*)-naphthyl mercaptan under 10 mm. pressure (K. a. S.). Plates, v. sl. sol. hot alcohol, v. sol. CS_2. Oxidised by CrO_3 in HOAc to $(C_{10}H_7)_2SO_2$ [177°] (Krafft, *B.* 23, 2366).

(*αα*)-**Di-naphthyl disulphide** $(C_{10}H_7)_2S_2$. [91°]. Formed by oxidising (*α*)-naphthyl mercaptan by exposing its alkaline solution to the air (Schertel, *A.* 132, 91; Leuckart, *J. pr.* [2] 41, 217). Monoclinic crystals, sl. sol. alcohol.

Di-(*β*)-naphthyl disulphide $(C_{10}H_7)_2S_2$. [137°] (L.); [139°] (C.). The chief product obtained by saponification of the oil which is formed by the action of potassium xanthate on (*β*)-diazo-naphthalene chloride (Leuckart, *J. pr.* [2] 41, 221). Formed also by reducing naphthalene (*β*)-sulphonic chloride with HIAq (Cleve, *B.* 21, 1100). Colourless plates, insol. water, v. sol. alcohol and ether. Reduced by zinc and H_2SO_4 to (*β*)-naphthyl mercaptan.

(*β*)-**NAPHTHYL SULPHOCYANIDE** $C_{11}H_7NS$ *i.e.* $C_{10}H_7SCN$. [35°]. Formed by the action of cyanogen chloride on $Pb(SC_{10}H_7)_2$ (Billeter, *B.* 8, 463). Decomposes on distillation. KHS forms KSCN and $HSC_{10}H_7$. Conc. HClAq forms $C_{10}H_7SH$, NH_3, and CO_2. Sodium-amalgam reduces it to sodium cyanide and $(C_{10}H_7)_2S_2$.

(*αα*)-**DI-NAPHTHYL SULPHONE** $(C_{10}H_7)_2SO_2$. [187°]. Formed by oxidising (*αα*)-di-naphthyl sulphide by CrO_3 in HOAc (Krafft, *B.* 23, 2368; *cf.* Leuckart, *J. pr.* [2] 41, 218).

(*αβ*)-**Di-naphthyl sulphone** $(C_{10}H_7)_2SO_2$. [123°]. Formed, together with the (*ββ*)-isomeride by heating naphthalene (8 pts.) with H_2SO_4 (3 pts.) at 180° (Stenhouse a. Groves, *B.* 9, 682; Cleve, *B.* 10, 1723; *Bl.* [2] 25, 256; *cf.* Berzelius, *A. Ch.* [2] 65, 290). Formed also by oxidising the corresponding di-naphthyl sulphide (Krafft, *B.* 23, 2369). Prisms (from CS_2), m. sol. boiling alcohol and ether.

(*ββ*)-**Di-naphthyl-sulphone** $(C_{10}H_7)_2SO_2$. [177°]. Formed as above, and also by dissolving (*ββ*)-di-naphthyl sulphide (1 pt.) in HOAc (200 pts.), warming, slowly adding a mixture of $K_2Cr_2O_7$ (3 pts.) dilute (1:3) H_2SO_4 (20 pts.) and HOAc (50 pts.), filtering, evaporating, and crystallising from alcohol (Krafft, *B.* 23, 2366). Long white needles. When heated with PCl_5 it yields (*β*)-chloro-naphthalene and naphthalene (*β*)-sulphonic chloride (Cleve, *Bl.* [2] 25, 25).

DINAPHTHYL SULPHONIC ACID *v.* DI-NAPHTHYL.

(*αα*)-**DI-NAPHTHYL SULPHOXIDE** $(C_{10}H_7)_2SO$. [164·5°]. Formed by oxidation of (*αα*)-di-naphthyl sulphide with chromic acid mixture and HOAc (Krafft, *B.* 23, 2367). Formed also by oxidation of naphthylene di-naphthyl sulphoxide $C_{30}H_{20}SO$ [111°] (Ekstrand, *B.* 17, 2603). White crystals (from alcohol).

NAPHTHYL-SULPHURIC ACID *v.* NAPHTHYL SULPHATE.

NAPHTHYL SULPHYDRATE *v.* NAPHTHYL MERCAPTAN.

(*α*)-**NAPHTHYL-THIOCARBAMIC ACID** $C_{10}H_7NH.CO.SH$. *Methyl ether* MeA′. [122°]. Formed by the action of dilute H_2SO_4 on methyl di-naphthyl-imido-thiocarbamate [136°] (Evers, *B.* 21, 970). Needles, v. sol. dilute alcohol, insol. water, alkalis, and dilute acids. Alcoholic ammonia forms, on heating, (*α*)-naphthyl-urea.

Ethylene derivative

$CO<\begin{array}{l}N(C_{10}H_7)\\ S.CH_2.CH_2\end{array}>$. [102°]. Formed by the action of dilute HClAq at 200° upon the substance

$C_{10}H_7N{:}C<\begin{array}{l}N(C_{10}H_7)\\ S.CH_2.CH_2\end{array}>$ (Evers, *B.* 21, 970). Needles.

(*β*)-**Naphthyl-thiocarbamic acid.** *Ethyl ether* $C_{10}H_7NH.CS.OEt$. [97°]. Formed by heating (*β*)-naphthyl thiocarbimide with alcohol at 130° (Cosiner, *B.* 14, 58). Needles or plates, v. e. sol. chloroform, m. sol. alcohol and ether.—$C_{10}H_7NAg.CS.OEt$. Ppd. by adding ammoniacal $AgNO_3$ to the alcoholic solution.

(*α*)-**Naphthyl-dithiocarbamic acid**

Methyl ether $C_{10}H_7NH.CS.SMe$. [185°]. Formed by heating $C_{10}H_7NH.CO.SMe$ with CS_2 (E.). Small needles; m. sol. hot dilute alcohol.

Ethylene derivative $CS\Big<\begin{matrix}N(C_{10}H_7)\\ S.CH_2.CH_2\end{matrix}\Big>$ [199°]. Formed by the action of CS_2 on $CO\Big<\begin{matrix}N(C_{10}H_7)\\ S.CH_2.CH_2\end{matrix}\Big>$ at 160° (Evers, *B.* 21, 972). Pearly plates (from hot alcohol).

(β)-Naphthyl-dithiocarbamic acid. *Tetrahydride.* Tetrahydronaphthylamine salt $C_{10}H_{11}NH_3S.CS.NHC_{10}H_{11}$. [142°]. Formed from the tetrahydride of (β)-naphthylamine and an ethereal solution of CS_2 (Bamberger a. Müller, *B.* 21, 857). Needles.

(β)-NAPHTHYL-THIO-SEMI-CARBAZIDE $C_{10}H_7NH.NH.CS.NH_2$. [204°]. Formed by heating (β)-naphthyl-hydrazine hydrochloride with ammonium sulphocyanide in alcoholic solution (Hauff, *A.* 253, 30; Hillringhaus, *B.* 22, 2657). Crystals; insol. water, sl. sol. cold alcohol.

(α)-NAPHTHYL-THIOCARBIMIDE $C_{10}H_7N:CS$. *Naphthyl mustard oil.* [58°]. Formed from di-naphthyl-thio-urea by distilling with P_2O_5 (Hall, *P. M.* [4] 17, 304) or by heating it with HClAq (34 p.c.) at 150° (Mainger, *B.* 15, 1414). Formed also by heating di-naphthyl-cyanamide with CS_2 at 200° (Huhn, *B.* 19, 2406). Long white needles; sol. alcohol, ether, and benzene. With naphthylamine in alcoholic solution it combines, forming di-naphthyl-thio-urea. Aniline forms phenyl-naphthyl-thio-urea.

(β)-Naphthyl thiocarbimide $C_{10}H_7NCS$. [62°]. Obtained in the same manner as its (α)-isomeride (Cosiner, *B.* 14, 61; Huhn, *B.* 19, 2407). Needles.

(β)-NAPHTHYL-THIOCARBIZINE $C_{11}H_8NS$ *i.e.* $C_{10}H_7.N\Big<\begin{matrix}NH\\ CS\end{matrix}$. [254°]. Formed by heating (β)-naphthyl-thio-semi-carbazide with dilute (20 p.c.) H_2SO_4 at 135° (Hauff, *A.* 253, 31). Pearly plates; insol. water, sl. sol. ether, v. sol. warm alcohol. May be sublimed.—B′HCl: needles; v. sol. hot water.—$B'H_2PtCl_6$.—$B'HNO_3$.

DI-(α)-NAPHTHYL-THIOHYDANTOÏN $C_{23}H_{16}N_2SO$ *i.e.* $C_{10}H_7N:C\Big<\begin{matrix}N(C_{10}H_7)\\ S.CH_2\end{matrix}\Big>CO$. [176°]. Formed by the action of chloro-acetic acid on di-(α)-naphthyl-thio-urea (Evers, *B.* 21, 974). Plates; insol. water, v. sol. alcohol.

Di-(β)-naphthyl-thiohydantoïn. [174°]. Resembles the (α)-isomeride in mode of preparation and properties.

NAPHTHYL-THIOSINAMINE is NAPHTHYL-ALLYL-THIO-UREA (*q. v.*).

(α)-NAPHTHYL-THIO-UREA $C_{11}H_{10}N_2S$ *i.e.* $C_{10}H_7NH.CS.NH_2$. [198°]. Formed by heating naphthylamine hydrochloride with ammonium sulphocyanide (De Clermont a. Wehrlin, *C. R.* 82, 512). Small trimetric prisms (from alcohol); sl. sol. water, ether, and cold alcohol.

Acetyl derivative $C_{10}H_7NH.CS.NHAc$. [198°]. S. (alcohol) 2·5 at 78°. Formed from (α)-naphthylamine and acetyl sulphocyanide (Miqnel, *Bl.* [2] 28, 103). Slender needles.

Benzoyl derivative $C_{10}H_7NH.CS.NHBz$. [173°]. S. (alcohol) 2 at 78°. Formed from (α)-naphthylamine and benzoyl sulphocyanide (Miquel, *A. Ch.* [5] 11, 326). Lustrous yellow prisms (from alcohol); insol. ether.

(β)-Naphthyl-thio-urea $C_{10}H_7NH.CS.NH_2$. [180°]. Formed by heating (β)-naphthylamine hydrochloride with potassium sulphocyanide (Cosiner, *B.* 14, 61). White trimetric plates.

Di-(α)-naphthyl-thio-urea $C_{21}H_{16}N_2S$ *i.e.* $CS(NHC_{10}H_7)_2$. [207° cor.] (E.); [197°] Brieger, *B.* 12, 1860; Huhn, *B.* 19, 2405). Formed by heating (α)-naphthylamine (100 g.) with CS_2 (50 g.) and alcohol (500 g.) for 14 hours at 75° (Delbos, *A.* 64, 371; Evers, *B.* 21, 963). Formed also by passing H_2S into a boiling solution of di-naphthyl-cyanamide $(C_{10}H_7N)_2C$ in dry benzene. Needles; almost insol. alcohol, ether, and benzene, sol. nitrobenzene. By adding HgO to its boiling solution in dry benzene it is re-converted into $C(NC_{10}H_7)_2$. MeI at 100° forms methyl di-naphthyl-imido-thio-carbamate $C_{10}H_7N:C(NHC_{10}H_7)SMe$ [136°] (*v.* DI-NAPHTHYL-IMIDO-THIO-CARBAMIC ETHERS.

Octohydride $CS(NHC_{10}H_{11})_2$. [170°]. Formed by heating (α)-naphthylamine tetrahydride with CS_2 and alcohol as long as H_2S is given off (Bamberger, *B.* 21, 1795). Needles, v. sol. alcohol, m. sol. ether.

Di-(β)-naphthyl-thio-urea $CS(NHC_{10}H_7)_2$. [193°] (C.; H.); [203° cor.] (E.). Prepared by heating (β)-naphthylamine in alcoholic solution with CS_2 for 14 hours at 75° (Cosiner, *B.* 14, 61; Evers, *B.* 21, 963). Formed also by passing H_2S into a boiling solution of *s*-di-(β)-naphthyl-cyanamide (carbo-di-(β)-naphthyl-imide) in dry cumene (Huhn, *B.* 19, 2407). White plates (from hot nitrobenzene), v. sl. sol. alcohol and ether. With MeI it forms the compound $C_{10}H_7NH.C(NC_{10}H_7).CSMe$ [110°], *v.* DI-NAPHTHYL-IMIDO-THIO-CARBAMIC ACID. By adding HgO to its boiling solution in benzene it is converted into $C(NC_{10}H_7)_2$. When heated with alcoholic NH_3 at 100° it yields (β)-naphthylamine and (β)-naphthyl-thio-urea (Gebhardt, *B.* 17, 3045). With mercuric cyanide and ammonia it yields $CN.C(NC_{10}H_7).NHC_{10}H_7$ [166°], which forms an acetyl derivative [141°] and a benzoyl derivative [188°] (Hefelmann, *C. C.* 1885, 884).

Octohydride $CS(NHC_{10}H_{11})_2$. [166°]. Formed by boiling with alcohol the product obtained by the action of CS_2 on the tetrahydride of (β)-naphthylamine (Bamberger a. Müller, *B.* 21, 858). White needles, v. sol. alcohol, v. e. sol. ether and benzene.

NAPHTHYL-TOLYL-AMINE *v.* TOLYL-NAPHTHYL-AMINE.

(α)-NAPHTHYL-UREA $C_{11}H_{10}N_2O$ *i.e.* $C_{10}H_7NH.CO.NH_2$. Obtained by saturating a solution of (α)-naphthylamine in dry ether with cyanic acid gas, and crystallising from hot alcohol (Schiff, *A.* 101, 90). Formed also, together with di-naphthyl-urea, by heating naphthylamine hydrochloride (3 pts.) with urea (1 pt.) at 150°–170° (Pagliani, *G.* 9, 30). Flat needles, nearly insol. water, m. sol. alcohol, v. sol. ether. Decomposes at 250° without previous fusion.

(β)-Naphthyl-urea $C_{10}H_7NH.CO.NH_2$. [c. 287°]. Prepared by heating urea with (β)-naphthylamine hydrochloride (Cosiner, *B.* 14, 62). White needles, sol. hot alcohol and hot water.

Di-(α)-naphthyl-urea $CO(NHC_{10}H_7)_2$. [270°].

Formation.—1. By heating the acid oxalate of (α)-naphthylamine (Delbos, *A. Ch.* [4] 21, 68), di-naphthyl-oxamide being first formed (Zinin, *A.* 108, 228).—2. By gradually heating (α)-naphthylamine (2 pts.) with urea (1 pt.) to 120° (Pagliani, *G.* 9, 28).—3. By boiling di-(α)-naphthyl-cyanamide with dilute alcohol (Huhn, *B.* 19, 2405).—4. By heating (α)-naphthylamine with carbamic ether at 185° (Smolka, *M.* 11, 200).

Properties.—Plates or needles, insol. water, sl. sol. boiling alcohol. Yields naphthylamine and no NH_3 on decomposition by KOH.

s-**Di-(β)-naphthyl-urea** $CO(NHC_{10}H_7)_2$. [293°] (H.); [286°] (E.).

Formation.—1. By the action of HgO on di-(β)-naphthyl-thio-urea suspended in spirit (Huhn, *B.* 19, 2406).—2. By boiling di-(β)-naphthyl-cyanamide $C(NC_{10}H_7)_2$ with dilute alcohol (H.).—3. By boiling potassium di-(β)-naphthoyl-hydroxylamine with water (Ekstrand, *B.* 20, 1360).

Properties.—Slender needles, sl. sol. alcohol, ether, benzene, and nitrobenzene.

u-**Di-(β)-naphthyl-urea** $C_{10}H_7)_2N.CO.NH_2$. [193°]. Formed by heating the chloro-formyl derivative of di-(β)-naphthylamine with ammonia for an hour at 140° (Kym, *B.* 23, 428). Groups of long needles (from alcohol), sl. sol. cold alcohol).

Tetra-(β)-naphthyl-urea $(N(C_{10}H_7)_2)_2CO$. [288°] (K. a. L.); [295°] (K.). Formed by heating di-(β)-naphthylamine with $(C_{10}H_7)_2N.COCl$ at 200°–260° (Kühn a. Landau, *B.* 23, 811, 2161; Kym, *B.* 23, 1542). Prismatic needles, sl. sol. alcohol and ether, v. sol. hot benzene.

NAPHTHYL-URETHANE *v.* NAPHTHYL-CARBAMIC ETHER.

NARCEÏNE $C_{23}H_{29}NO_9$. [134°] (Blyth); [145° cor.] (Hesse, *A.* 129, 251); [162°] (Claus a. Meixner, *J. pr.* [2] 37, 1; *cf.* Dott, *Ph.* [3] 20, 335). S. ·08 at 13°. S. (80 p.c. alcohol) ·1. Occurs in opium (Pelletier, *A. Ch.* [2] 50, 262; Couerbe, *A. Ch.* [2] 59, 151).

Preparation.—1. The aqueous extract of opium, from which morphine has been separated by Gregory's process, is mixed with ammonia, filtered, and ppd. by lead acetate. The filtrate is freed from lead by H_2SO_4, neutralised by ammonia, and evaporated. The narceïne is recrystallised from water (Anderson, *Tr. E.* 20, iii. 347).—2. A solution of the opium bases in HClAq is mixed with excess of NaOAc and allowed to stand for 24 hours. The filtrate evaporated to a small bulk on the water-bath deposits, after 24 hours, pure narceïne (Plugge, *Ar. Ph.* [3] 25, 343).

Properties.—Silky needles (containing 2aq), v. sol. hot water and alcohol, sl. sold cold water and chloroform, insol. ether. Cannot be sublimed. It loses its water of crystallisation at 100°, and at 140° gives off another H_2O (Hesse, *B.* 7, 105). It is insol. conc. KOHAq, sl. sol. dilute caustic potash and ammonia. Ppd. by $NaHCO_3$ from solutions of its salts. Inactive to light (Hesse, *A.* 176, 198). Can be extracted both from acid and alkaline solutions by shaking with benzene or chloroform (Plugge, *Ph.* [3] 20, 401). Narceïne is a somniferous poison; ·5 g. being probably a fatal dose.

Reactions.—1. *Zinc* and HClAq form a small quantity of an amorphous base $C_{23}H_{29}NO_6$ or $C_{23}H_{27}NO_8$ (Beckett a. Wright, *C. J.* 28, 701).—2. *Water* at 150° carbonises it.—3. *Chromic acid mixture* yields hemipic acid (10 p.c.) and methylamine (Beckett a. Wright, *C. J.* 29, 467).—4. *Ferric chloride* forms hemipic, but no opianic acid. Hemipic acid is also formed, though in smaller quantity, by oxidation by $KMnO_4$ or by MnO_2 and H_2SO_4. Alkaline $KMnO_4$ forms narceïc acid (*v. infra*).—5. Conc. HNO_3 yields oxalic acid.—6. Boiling *caustic potash* gives off ammonia and NMe_2, and forms a sparingly soluble acid $C_{23}H_{23}NO_8$ [210°].—7. *Potash-fusion* yields protocatechuic acid.

Tests.—1. Weak *iodine* solution colours solid narceïne dark blue, the colour not being removed by ammonia. The blue colour is destroyed by boiling water.—2. Conc. H_2SO_4 turns it brown, and then dissolves it, forming a yellow solution. Narceïne is not coloured by diluted sulphuric acid, but on heating over a water-bath a violet-red colour appears, which ultimately becomes cherry-red. If the red liquid be cooled and a trace of HNO_3 or KNO_2 be added, bluish-violet stripes appear (Plugge, *Ar. Ph.* [3] 25, 425).—3. *Erdmann's solution* gives a brown colour, turning reddish-brown on heating.—4. *Chloride of iodine* forms a greenish-yellow pp., which dissolves on heating (Dittmar, *B.* 18, 1612).—5. *Potassium chromate* gives no pp. in cold saturated solutions of salts of narceïne, but in hot solutions there is formed a pp. of narceïne chromate and free narceïne (Plugge, *Ar. Ph.* [3] 25, 793).—6. Narceïne is a feeble base, so that its salts may be titrated by standard alkali as if they contained no base (Plugge, *Ar. Ph.* [3] 25, 45).—7. When strongly heated it gives off vapours smelling like herring brine (Hesse).—8. *Chlorine-water* followed by ammonia gives a red colour.

Salts.—B′HCl (dried at 100°): concentric needles, sol. water and alcohol. S. ·36.—B′HCl 2½aq (Petit, *Bl.* [2] 18, 534). S. ·7.—B′HCl 3aq (Wright, *C. J.* 27, 109).—B'_5HCl (Petit).—$B'_{10}HCl$ (P.).—$B'_2H_2PtCl_6$ (dried at 100°): crystalline powder. [195°]. Golden needles (Claus).—$B'_2H_2PtCl_6$ 2aq: amorphous pp., changing to prisms (Hesse, *A.* 129, 250).—$B'_7(H_2SO_4)_4$ 10aq: crystals (Beckett a. Wright, *C. J.* 27, 69).—$B'_3H_2SO_4$.—$B'_4H_2SO_4$.—$B'_5H_2SO_4$.—Mercurico-chloride; oily at first, ultimately crystallising in concentric prisms (Hesse). [118°–122°] (Roser, *A.* 247, 175).—$B'_2H_2I_8$: slender needles (Jörgensen, *B.* 2, 460).—$B'HI_3$: needles (from alcohol).

Methylo-iodide B′MeI: [173° uncor.]; colourless needles (Claus a. Ritzefeld, *B.* 18, 1569).

Methylo-chloride B′MeCl: [210° uncor.]; easily soluble small white needles.—$(B'MeCl)_2PtCl_4$: nearly insoluble yellow powder.

Methylo-nitrate $B'MeNO_3$: [186° uncor.]; small white soluble needles (C. a. R.).

Ethylo-iodide B′EtI: granular crystals (Beckett a. Wright, *C. J.* 28, 703).—B′EtI 2aq. Yields alkaline B′EtOH which is readily split up into narceïne and alcohol.

Ethylo-bromide B′EtBr: [165° uncor.]; fine white soluble needles.—$(B'EtBr)CdBr_2$: small colourless needles (C. a. R.).

Ethylo-chloride B′EtCl: [170° uncor.]; small colourless needles.—$(B'EtCl)_2PtCl_4$: glistening yellow crystals [170° uncor.] (C. a. R.).—$(B'EtCl)HgCl_2$aq: [127°]; white crystalline pp.

Ethylo-nitrate $B'EtNO_3$: [155° uncor.]; long colourless silky needles, sol. water (C. a. R.).

Ethylo-oxalate $B'_2Et_2C_2O_4$: [c. 174° uncor.]; glistening needles (containing 6aq).

Benzylo-chloride $B'C_7H_7Cl$: [162° uncor.]; fine white needles, v. sol. hot water and alcohol, insol. ether.—$(B'C_7H_7Cl)_2PtCl_4$: [165° uncor.]; yellow crystalline powder.

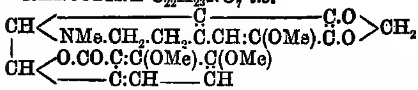
Methyl-narceïne $C_{23}H_{28}(CH_3)O_9N$. [175° uncor.]. Formed by adding KOH (2 pts.) to a boiling solution of narceïne-methylo-iodide (1 pt.) in 10 pts. of water (Claus a. Ritzefeld, *B.* 18, 1573). Fine colourless needles. V. sol. alcohol, sl. sol. water, nearly insol. ether.

Benzyl-narceïne $C_{23}H_{28}(C_7H_7)O_9N$. [169° uncor.]. Formed by the action of aqueous KOH upon narceïne-benzylo-chloride (Claus a. Ritzefeld, *B.* 18, 1574). Long white needles. V. sol. alcohol, nearly insol. water and ether. Alkaline reaction.—$(B'HCl)_2PtCl_4$ 2aq: [128° uncor.]; dark-yellow crystalline pp.

Narceïc acid $C_{15}H_{15}NO_6$. [184°]. Formed by oxidising narceïne with $KMnO_4$ (Claus a. Meixner, *J. pr.* [2] 37, 3). Prisms (containing 3aq), v. sol. alcohol, ether, chloroform, and hot water. Decomposes at 180°–200° into CO_2, dimethylamine, and di-oxy-naphthalene dicarboxylic acid $C_{12}H_8O_6$. Not acted upon by $FeCl_3$. —Na_3A'''.—Na_2HA''' 5aq [85°].—NaH_2A''' 4½aq.—$Ba_3A'''_2$ 5aq.—Ag_3A'''.

ψ-Narceïne *v.* NARCOTINE.

NARCOTINE $C_{22}H_{23}NO_7$ *i.e.*



$$\begin{array}{l}\mathrm{CH}<\begin{array}{l}\text{————————C————————C.O}\\ \mathrm{NMe.CH_2.CH_2.C.CH{:}C(OMe).C.O}\end{array}>\mathrm{CH_2}\\ \;| \\ \mathrm{CH}<\begin{array}{l}\mathrm{O.CO.C{:}C(OMe).C(OMe)}\\ \text{———C:CH———CH}\end{array}\end{array}$$

(Roser, *A.* 254, 357). Mol. w. 413. [155°] (Wynter Blyth, *C. J.* 33, 317); [176°] (Hesse). S. ·014 at 100°. S. (85 p.c. alcohol) 1 in the cold; 5 at 78° (Duflos, *B. J.* 12, 214). S. (ether) ·77 in the cold; 2·1 on boiling (Duflos); ·6 at 16° (Hesse). S. (isoamyl alcohol) ·325 in the cold. S. (benzene) 4·61 in the cold (Kubly, *J.* 1866, 823). S. (chloroform) 38 (Pettenkofer). S. (EtOAc) 1·7 (Henry). $[\alpha] = -130°$ in ethereal solution (Bouchardat, *A. Ch.* [3] 9, 213); −185° in alcoholic solution; −207° in chloroform at 22·5° (Hesse, *A.* 176, 192). Contained in opium to the amount of 5 to 8 p.c., and was the first alkaloid extracted therefrom (Derosne, *A. Ch.* 45, 257; Robiquet, *A. Ch.* [2] 5, 275; Dumas a. Pelletier, *A. Ch.* [2] 24, 188; 50, 269; Liebig, *A.* 6, 35; Brandes, *A.* 2, 274; Couerbe, *A. Ch.* [2] 59, 159; *A.* 17, 174; Regnault, *A. Ch.* [2] 68, 137; Wöhler, *A.* 50, 1; Blyth, *A.* 50, 29; Wertheim, *A.* 70, 71; 73, 208; Flückiger, *J.* 1869, 797).

Preparation.—1. The mother-liquor obtained in the preparation of morphine (*q. v.*) by Gregory's process is ppd. by ammonia, and the pp. recrystallised from boiling spirit (Anderson, *A.* 86, 179).—2. Opium is extracted with dilute HCl and the bases ppd. by KOH. The bases are treated with oxalic acid to ppt. papaverine, and the filtrate from acid papaverine oxalate ppd. by ammonia. The pp. is recrystallised from alcohol (Hesse, *A. Suppl.* 8, 284).—3. Conc. aqueous NaOAc added to a solution of the hydrochlorides of the opium bases throws down narcotine and papaverine. The pp. is redissolved in dilute HClAq and mixed with K_3FeCy_6 which ppts. papaverine ferricyanide. From the filtrate the narcotine is ppd. by ammonia (Plugge, *Ar. Ph.* [3] 25, 343).

Properties.—Trimetric prisms, or groups of needles. Cannot be sublimed. If cooled slowly after melting it forms slender radiating needles. Insol. cold water, m. sol. alcohol and ether. Lævogyrate in neutral solutions, dextrogyrate in acid solutions. Insoluble in aqueous potash, nearly insol. NH_3Aq. Dissolves in boiling baryta-water, but ppd. therefrom by NH_3Aq. Its solutions do not give a blue colour with $FeCl_3$. Narcotic poison, 3 g. killing a cat. Not acted upon by Ac_2O.

Reactions.—1. Distillation with conc. HIAq yields MeI (3 mols.) (Matthiessen a. Foster, *Tr.* 1863, 345; *C. J.* 16, 342; *A. Suppl.* 6, 60).—2. Conc. HClAq at 110° yields MeCl and, successively, di-methyl-nornarcotine, methyl-nornarcotine, and nornarcotine (Matthiessen a. Foster, *C. J.* 21, 257; Matthiessen, *Pr.* 17, 337; Matthiessen a. Wright, *Pr.* 17, 340). Distillation with equal volumes of H_2SO_4 and water gives $MeHSO_4$ and the three bodies last mentioned (Armstrong, *C. J.* 24, 56).—3. Boiling dilute KOHAq has no action, but potash-fusion at 200°–220° yields trimethylamine and other volatile amines (Hofmann, *A.* 75, 367).—4. Dilute *nitric acid* at 50° forms meconin, opianic acid, hemipic acid and cotarnine.—5. Distillation with HCl and platinic chloride also yields opianic acid and cotarnine. The same products are formed by oxidation with H_2SO_4 and MnO_2 (Wöhler).—6. *Water* at 140° splits it up into meconin and hydrocotarnine (Beckett a. Wright, *C. J.* 28, 583). *Sodium-amalgam* gives the same products.—7. *Iodine* acting on an alcoholic solution of narcotine forms tarconine methylo-periodide and iodo-tarconine methylo-periodide (Jörgensen, *J. pr.* [2] 2, 446; Roser, *A.* 245, 317).

Tests.—1. Conc. H_2SO_4 forms a yellow liquid which, when heated becomes orange-red and finally violet-red (Husemann, *A.* 128, 305).—2. H_2SO_4 containing a little HNO_3 gives a reddish-yellow colour.—3. Does not liberate iodine from iodic acid.—4. Does not reduce alkaline K_3FeCy_6 (Kieffer, *A.* 103, 277).—5. *Bromine* gradually added to a boiling solution of narcotine in dilute HClAq forms a rose-coloured liquid, the colour being destroyed by excess of bromine.—6. *Potassio-mercuric iodide* forms a yellowish-white pp. (Groves, *C. J.* 11, 97). Phosphomolybdic acid, picric acid, potassium sulphocyanide, and auric chloride also give pps. in solutions of salts of narcotine.—7. A solution of *potassium chromate* added to one of a salt of narcotine, ppts. free narcotine (Plugge, *Ar. Ph.* [3] 25, 793). $K_2Cr_2O_7$ ppts. narcotine bichromate.—8. Salts of narcotine require, on titration, the same amount of alkali for neutralisation as if the base were absent (Plugge, *Ar. Ph.* [3] 25, 45).—9. *Chloride of iodine* gives a curdy yellowish pp. (Dittmar, *B.* 18, 1612).

Salts.—B'HCl. Needles, v. sol. water. $[\alpha]_D = -47°$ to $-50°$ in a 2 p.c. solution containing excess of HCl. $[\alpha]_D = -104·5°$ in a 2 p.c. solution in 80 p.c. alcohol containing excess (1 mol.) of HCl (Hesse, *A.* 176, 192).—B'HCl aq (Dott, *J.* 1884, 1389).—B'_5HCl (Beckett a. Wright, *C. J.* 29, 164).—B'_7HCl.—B'_8HCl (B. a. W.).—**Mercurico-chloride**: white pp. (Hinterberger, *A.* 82, 311).—$B'_2H_2PtCl_6$ yellow crystalline pp. (Blyth). Decomposed by boiling water (De Coninck, *Bl.* [2] 45, 131).—$B'_2H_2PtCl_6$ 2aq (Hesse).—$B'_2H_2SO_4$ 4aq (Dott).—$B'_2H_2Cr_2O_7$.—$B'HI_3$: shining laminæ, converted by boiling alcohol into tarconine periodide $C_{12}H_{11}NO_3HI$, Jörgensen, *B.* 2, 460).—B'_2HOAc aq: needles (Dott).—**Binoxalate**: v. e. sol. water.—**Cyanurate** $B'H_3O_3C_3N_3$ $1\frac{1}{2}$aq; needles [c. 175°], v. sl. sol. water (Claus, *J. pr.* [2] 38, 229).

Methylo-chloride B′MeCl. Formed by heating narcotine with MeI and decomposing the viscid B′MeI with AgCl (Roser, *A.* 247, 168). Groups of needles, v. sol. water and alcohol. Yields ψ-narceïne (*v. infra*) on distillation with aqueous NaOH.—$B'_2Me_2PtCl_6$.

Ethylo-iodide B′EtI (How, *A.* 92, 327). Oil.

Ethylo-chloride *B′EtCl. Yields ψ-methyl-narceïne [173°] on treatment with NaOHAq.—$B'_2Et_2PtCl_6$.

Nornarcotine $C_{18}H_{17}NO_7$. Obtained by heating narcotine with fuming HIAq (Matthiessen a. Wright, *Pr.* 17, 340). White amorphous mass, turning brown in air. Almost insol. water, insol. alcohol and ether. A concentrated solution of its hydrochloride is ppd. by HCl and also by water. The hydrochloride is tasteless, and its solution gives with KOH, Na_2CO_3, and NH_3 pps. soluble in excess, and with platinic chloride a yellow pp., quickly turning brown.

Methyl derivative $C_{20}H_{19}NO_7$. Formed by heating narcotine with HClAq for some days. White amorphous mass, almost insol. water, insol. alcohol and ether. Its solution in conc. HClAq is ppd. by water. Astringent taste. The platinochloride is a yellow pp., slowly turning brown. The ppd. base is soluble in excess of NH_3Aq and Na_2CO_3Aq but sl. sol. KOHAq.

Di-methyl-derivative $C_{21}H_{21}NO_7$. Formed by heating narcotine with HClAq for 2 hours or with diluted H_2SO_4 at 100°. White amorphous mass, almost insol. water, v. sol. alcohol, sl. sol. ether. Its solution in HClAq is ppd. by water. Its hydrochloride tastes bitter. The platinochloride is a yellow pp. The ppd. base is insol. Na_2CO_3Aq, sl. sol. NH_3Aq, sol. KOHAq.

ψ-Narceïne $C_{23}H_{27}NO_8$. [c. 175°]. Formed by boiling narcotine with MeI, decomposing the resulting methylo-iodide by AgCl, adding an equivalent amount of NaOH, and distilling with steam (Roser, *A.* 247, 169). Slender white needles (containing 3aq), v. sol. alcohol and hot water, sl. sol. cold water, insol. ether. Dissolves in aqueous KOH and NH_3, but is reppd. by CO_2. Inactive to light. Coloured blue by iodine. Conc. H_2SO_4 forms a brownish-yellow solution, turned dirty-violet on heating. Chlorine-water followed by ammonia gives a red colour. According to Roser, this body is probably identical with narceïne.—$B'_2H_2SO_4$ 2aq: tufts of needles.—B′HCl 3aq.—$B'_2H_2PtCl_6$. [198°]. Thin needles, insol. water.—**Aurochloride**: [130°]; yellowish-red needles.—**Mercury double salt** [123°].

ψ-Methyl-narceïne $C_{24}H_{29}NO_8$. *ψ-Homo-narceïne.* [173°]. Formed by passing steam through a mixture of narcotine ethylo-chloride and aqueous NaOH (Roser, *A.* 247, 173). White needles (containing 3aq), v. sol. water and alcohol, insol. ether. Gives a blue colour with iodine. The **hydrochloride** and **sulphate** are v. sol. water.—$B'_2H_2PtCl_6$ 2aq: small yellow needles.

Teropiammon $C_{33}H_{29}NO_{13}$. A crystalline compound, insol. water, found among the products of the action of dilute HNO_3 on narcotine (Anderson). It forms a crimson solution in H_2SO_4 and yields NH_3 and opianic acid on boiling with potash.

Cotarnine $C_{12}H_{15}NO_4$ *i.e.*

$$\left[{}^{2}_{3}:1:4:5\right]CH_2{<}\substack{O\\O}{>}C_6H(OMe)(CHO).CH_2.CH_2.NHMe$$

(Roser, *A.* 254, 354). [133°].

Formation.—1. By the oxidation of narcotine by MnO_2 and H_2SO_4 (Wöhler, *A.* 50, 19; Matthiessen a. Foster, *Pr.* 11, 55; Beckett a. Wright, *C. J.* 28, 575); by platinic chloride (Blyth, *Mem. C. J.* 2, 168), by dilute nitric acid (Anderson, *C. J.* 5, 266; *A.* 86, 196) or by $K_2Cr_2O_7$ (M. a. F.).—2. By the oxidation of hydrocotarnine (Beckett a. Wright, *C. J.* 28, 580).

Properties.—Colourless needles, sl. sol. water, v. sol. alcohol and ether. Decomposed on fusion. A solution of its hydrochloride is neither ppd. by HCl nor by water. Its salts taste bitter. The freshly ppd. base dissolves in excess of aqueous NH_3 and Na_2CO_3, but is v. sl. sol. KOHAq. Decomposes on fusion. Cotarnine is not poisonous.

Reactions.—1. *Nitric acid* forms a red solution and, on heating, oxidises it to apophyllenic and oxalic acids.—2. Aqueous HCl, HI, or H_2SO_4 at 140° yields MeCl, MeI, or $MeHSO_4$ and cotarnamic acid.—3. *Zinc* and dilute HClAq yield hydrocotarnine.—4. *Bromine-water* forms $C_{12}H_{12}Br_3NO_3$ (Wright, *C. J.* 32, 533). Bromine water added to a solution of cotarnine hydrochloride forms $C_{12}H_{12}Br_3NO_3HBr$, a crystalline pp. [190°-200°] (Von Gerichten, *B.* 14, 311).

Salts.—B′HCl $2\frac{1}{2}$aq: long silky crystals (Blyth).—$B'_2H_2PtCl_6$: lemon-yellow crystalline pp., or dark-red six-sided prisms.—$B'HClHgCl_2$: pale-yellow pp.—B′HBr 2aq.—B′HI: yellow needles, sl. sol. cold water and alcohol (Roser, *A.* 249, 156).—$B'HI_3$. [142°] (Jörgensen, *J. pr.* [2] 2, 455).

Benzoyl derivative $C_{12}H_{14}BzNO_4$ $\frac{1}{2}$aq. [123°]. Formed by shaking cotarnine with BzCl and dilute NaOHAq (Roser, *A.* 254, 335). Long needles, insol. water, v. e. sol. hot alcohol.

Oxim $C_{12}H_5NO_3(NOH)$. [168°]. Prisms, insol. water, m. sol. alcohol, sol. alkalis.—B′HCl: small yellow needles, v. sol. water, m. sol. alcohol.—$B'_2H_2PtCl_6$: yellow crystalline pp. decomposed by boiling water.

Oxim of the benzoyl derivative $C_8H_8O_3(CH{:}NOH).C_2H_4.NMeBz$. [166°]. Formed by warming benzoyl-cotarnine with alcoholic hydroxylamine hydrochloride. Small pointed crystals, insol. water and ether, v. sol. alcohol, sol. NaOHAq.

Methyl-cotarnine

Methylo-iodide $C_{11}H_{11}O_4NMe_3I$. Formed by warming cotarnine with MeI (Roser). Yellow needles, sl. sol. cold water and alcohol. Decomposed by boiling NaOHAq into cotarnone and NMe_3.

Methylo-chloride $C_{11}H_{11}O_4NMe_3Cl$ 3aq. Formed from the iodide and AgCl. Crystals (from water). On warming with alcoholic hydroxylamine hydrochloride at 100° it yields $C_{14}H_{18}ClN_2O_3$ 2aq or $C_8H_8O_3(CN).C_2H_4NMe_3Cl$ a crystalline body, v. sol. water, converted by hot NaOHAq into NMe_3 and $C_8H_6O_3(CN).CH{:}CH_2$

[16 The last body forms a dibromide [140°]. $(C_{1}.H_{11}O_4NMe_2Cl)_2PtCl_4$.

Bromo-cotarnine $C_{12}H_{14}BrNO_4$. [100°]. Formed by treating hydrocotarnine hydrobromide with bromine-water (Wright, *C. J.* 32, 525). Crystals (from ether); decomposing at 100°. Reduced by zinc and HClAq to bromo-hydrocotarnine [78°]. — B'HBr. — Crystals, v. sol. water. Above 200° it melts, gives off gases, and forms a small quantity of tarconine hydrobromide, together with a blue substance $C_{20}H_{14}N_2O_6HBr$ insoluble in alcohol.

Cotarnone $C_{11}H_{10}O_4$ *i.e.* $CHO.C_8H_8O_3.CH{:}CH_2$. [78°]. Formed by warming methyl-cotarnine methylo-chloride with aqueous NaOH (Roser, *A.* 249, 163). Plates (from alcohol), slightly volatile with steam. Insol. cold water, m. sol. alcohol, ether, and HOAc.

Oxim $C_8H_6O_3(CH{:}NOH).CH{:}CH_2$. [132°]. Slender needles (from dilute alcohol).

Cotarn-lactone $C_{11}H_{10}O_6$ *i.e.*

$$CH_2<\genfrac{}{}{0pt}{}{O}{O}>C_6H(OMe)<\genfrac{}{}{0pt}{}{CO.O\text{———}}{CH(CH_2OH)}>$$

. [154°]. Formed by oxidising cotarnone with $KMnO_4$ (Roser, *A.* 254, 341). Prisms, sl. sol. cold alcohol or water. Forms with baryta the salt $Ba(C_{11}H_{11}O_7)_2$ 5aq.

Acetyl derivative $C_{11}H_8AcO_6$. [174°].

Benzoyl derivative $C_{11}H_9BzO_6$. [184°].

Cotarnic acid $C_{10}H_8O_7$ *i.e.*

$$CH_2<\genfrac{}{}{0pt}{}{O}{O}>C_6H(OMe)(CO_2H)_2\left[\genfrac{}{}{0pt}{}{1}{2}{:}3{:}5{:}6\right]$$

. [178°]. Formed by oxidising cotarnone or cotarn-lactone with aqueous $KMnO_4$ (Roser, *A.* 249, 165; 254, 345). Plates. Forms, on melting, the anhydride $C_{10}H_8O_6$ [162°]. On heating with P and HIAq it yields gallic acid. HClAq at 100° forms

$$CH_2<\genfrac{}{}{0pt}{}{O}{O}>C_6H_2(OMe)CO_2H$$

[210°]. Bromine in HOAc produces the compound

$$CH_2<\genfrac{}{}{0pt}{}{O}{O}>C_6Br_3(OMe)$$

[160°].

Salts.—KHA″$2\frac{1}{2}$aq: needles, v. sol. water. —BaA″: plates.—Ag_2A″.

Hydrocotarnine $C_{12}H_{15}NO_3$ *i.e.*

$$CH_2<\genfrac{}{}{0pt}{}{O}{O}>C_6H(OMe)<\genfrac{}{}{0pt}{}{CH_2.NMe}{CH_2.CH_2}$$

. [50°] (H.); [55°] (B. a. W.). Occurs in opium (Hesse, *A. Suppl.* 8, 326). Formed by reducing cotarnine with zinc and HClAq, and, together with meconin, by the action of zinc and HClAq on narcotine (Beckett a. Wright, *C. J.* 28, 577). It is also formed in small quantity (2 to 5 p.c.) in the preparation of opianic acid by the oxidation of narcotine. Monoclinic prisms (from ether), v. sol. alcohol and benzene. The crystals contain water of crystallisation ($\frac{1}{2}$aq). Conc. H_2SO_4 forms a yellow solution, changing on heating to crimson and, finally, to a dirty violet colour. Easily oxidised to cotarnine. Not attacked by Ac_2O. Bromine added to a solution of its hydrobromide forms $C_{12}H_{14}BrNO_3$ [78° cor.], which yields the crystalline salts $C_{12}H_{14}BrNO_3HBr$ and $(C_{12}H_{14}BrNO_3)_2H_2PtCl_6$.

Salts.—B'HCl aq.—$B'_2H_2PtCl_6$.—B'HI. S. 2 at 18°.—B'HBr $1\frac{1}{2}$aq.

Ethylo-iodide B'EtI. White micaceous plates, sl. sol. water. Yields $(B'Et)_2CO_3$ 4aq, B'EtCl [100°], both crystalline, and $(B'EtCl)_2PtCl_6$.

Acetyl-hydrocotarnine-acetic acid $C_{16}H_{19}NO_6$ [201°]. Formed by boiling cotarnine (1 pt.) with acetic anhydride (10 pts.) for $1\frac{1}{2}$ hours. Small needles. Sol. alcohol and benzene, sl. sol. boiling water, insol. cold water, and ether.—A'Ag: white pp.—A'_2Ca: very soluble small needles.

Ethyl ether A'Et: [113°]; white feathery needles (Bowman, *B.* 20, 2431).

Oxy-hydrocotarnine methylo-iodide

$$CH_2<\genfrac{}{}{0pt}{}{O}{O}>C_6H(OMe)<\genfrac{}{}{0pt}{}{CH(OH).NMe_2I}{CH_2\text{——}CH_2}$$

.

Methyl derivative $C_8H_6O_2{:}C_2H_5(OMe)NMe_2I$. [173°]. Formed by the action of MeI in the cold on a solution of cotarnine in MeOH (Roser, *A.* 254, 360). Yellow needles, v. sol. hot water and alcohol. Ppd. unchanged by adding NaOH to its warm aqueous solution. Boiling with water and Ag_2O expels $NHMe_2$.—$(C_{14}H_{20}NO_4Cl)_2PtCl_4$: orange pp.

Ethyl derivative $C_{11}H_{11}O_3(OEt)NMe_2I$. [168°]. Formed by the action of MeI on a cold solution of cotarnine in EtOH. Plates, v. e. sol. water and alcohol.

Isobutyl derivative $C_{13}H_{17}O_4N(OEt)I$. [120°]. Formed from cotarnine, MeI, and isobutyl alcohol. Plates (from water).

Cotarnamic acid $C_{11}H_{11}NO_3$. Formed by heating cotarnine with aqueous HCl at 140° (Matthiessen a. Foster, *A. Suppl.* 2, 379; Gerichten, *B.* 14, 310). Yields apophyllenic acid on oxidation by dilute HNO_3.—$C_{11}H_{11}NO_3HCl$ aq. White needles, sl. sol. cold water. On treatment with nitrous acid or on exposure to air its solution becomes green, with red fluorescence, and exhibits a spectrum resembling that of chlorophyll.

Tarconine $C_{11}H_9NO_3$. Formed by heating bromo-cotarnine hydrobromide at 200° (Wright, *C. J.* 32, 535) or tarconine methylo-chloride with conc. HClAq for 4 hours at 150° (Roser, *A.* 245, 321). Ppd. from solutions of its salts by KOH, but not by Na_2CO_3. Its hydrochloride heated at 200° forms a blue base $C_{20}H_{14}N_2O_4$, forming the blue salts $B'_4H_3Br_3$ and $B'_2H_2SO_4$.—Salts: B'HCl $1\frac{1}{2}$aq: needles, v. e. sol. water and alcohol.—$B'_2H_2PtCl_6$: insol. alcohol.

Methylo-iodide B'MeI. Formed by the action of H_2S on the periodide which is formed by boiling narcotine in alcoholic solution with iodine and some HCl. Tufts of yellow needles (from water or alcohol).—$B'MeI_3$. [160°]. Reddish-brown needles (from alcohol or HOAc).—$B'MeI_7$ (Jörgensen).—$B'MeBiI_4$.

Methylo-chloride B'MeCl: yellow needles.—$(B'MeCl)_2PtCl_4$: yellow crystalline pp., sl. sol. water.—$B'HAuCl_4$.

Bromo-tarconine $C_{11}H_8BrNO_3$ *i.e.*

$$C_4H_3BrO.C_6H_2N<\genfrac{}{}{0pt}{}{CO}{CH_2}>O$$

. [235°–238°]. Formed by heating the hydrobromide of the compound $C_{12}H_{12}Br_3NO_3$ (*v. Cotarnine*, Reaction 4) with water at 180° (Wright; Gerichten, *A.* 210, 84). Orange-red needles (containing 2aq), becoming crimson and anhydrous at 100°. Sl. sol. cold water, insol. ether. Water at 160° splits it up into cupronine and tarnine. Conc. HClAq at 120° forms nartic acid, tarnine, CO_2, and CO. Chromic acid mixture yields bromoform and apophyllenic acid. Bromine-water added to a solution of its hydrochloride yields cuprine, bromo-apophyllenic acid, and dibromo-apophyllin. Distillation over soda-lime yields pyridine. —B'HCl 2aq: crystals, sl. sol. cold water.—$B'HBr\,2aq$.—$B'_2H_2PtCl_8$: needles (from hot conc. HClAq).

Methylo-chloride $C_{11}H_8BrNO_6MeCl$: slender needles, v. e. sol. water, m. sol. alcohol.—$(B'MeCl)_2PtCl_4$.—$B'MeAuCl_4$.

Methylo-bromide $C_{11}H_8BrNO_3MeBr$. Formed by the action of bromine-water on an aqueous solution of tarconine methylo-chloride, the perbromide first formed being decomposed by H_2S (Roser, *A.* 245, 324). Long needles (containing aq), changing on standing to flat prisms. —$B'MeBr_3$. [165°]. Yellow rectangular plates (from alcohol or HOAc).

Methylo-iodide $C_{11}H_6BrNO_3MeI$. [204°]. Formed from bromo-tarconine and MeI (Gerichten, *A.* 210, 170). Yellow needles, sol. water, insol. ether. Turns brown at 170°. Boiling baryta-water converts it into formic aldehyde and methyl-bromo-tarconic acid. Moist Ag_2O forms the hydroxide crystallising in small red needles.

Ethylo-iodide $C_{10}H_8BrNO_3EtI$. [206°]. Formed from ethyl iodide and bromo-tarconine. Yellow needles. Yields $(B'EtCl)_2PtCl_4$.

Iodo-tarconine $C_{11}H_8INO_3$. Formed by heating its methylo-chloride at 180° (Roser, *A.* 245, 319). Crystallises from water in yellowish-red needles (containing aq), becoming dark red on drying.—B'HCl 2aq: silky yellow needles, v. sol. water, sl. sol. HClAq.

Methylo-chloride $C_{11}H_8INO_3MeCl$ aq. Formed from the methylo-iodide and AgCl. Yellowish-white needles (from alcohol), m. sol. water.—$(B'MeCl)_2PtCl_4$: needles, sl. sol. hot water.—$B'MeAuCl_4$: needles (from hot water).

Methylo-iodide $C_{11}H_8INO_3MeI$. Formed by the action of iodine on narcotine in alcoholic solution, the resulting periodides being decomposed by H_2S (Roser, *A.* 245, 317). Yellow needles, changing on standing to prisms; almost insol. cold water, sl. sol. hot alcohol.—$B'MeI_3$. [171°]. Needles, sl. sol. alcohol.

Methyl-tarconic acid .$C_{11}H_{11}NO_3$. [244°]. Formed from the aqueous solution obtained by the action of Ag_2O and water on tarconine methylo-chloride by boiling alone or with baryta (Roser, *A.* 245, 322; 254, 366). Not a true homologue of tarconic acid. Thin yellow needles (containing 2aq), v. sol. hot water, alcohol, mineral acids, and KOHAq, insol. ammonia.—$C_{11}H_{11}NO_6HCl$aq: white prisms or needles; turns yellow on drying at 100°.—$C_{11}H_{11}NO_3H_2SO_4$ 3aq: white prisms.—$(C_{11}H_{11}NO_3)_2H_2SO_4$ 6aq: yellowish crystals.

Bromo-methyltarconic acid $C_{11}H_{10}BrNO_3$. [233°]. Formed by boiling bromo-tarconine methylo-hydroxide with baryta-water (Gerichten, *A.* 210, 79; Roser, *A.* 245, 326). The ppd. Ba salt is decomposed by H_2SO_4 or HOAc. Yellow prisms (containing 2aq), insol. cold water and ether, sl. sol. hot alcohol. Darkens at 215°. Heated with conc. HClAq it yields MeCl, HBr, and tarconic acid.—CuA'_2.—BaA'_2: yellow pp.—$(HA'HCl)_2PtCl_4$: needles, m. sol. dilute HCl.

Ethyl-bromo-tarconic acid $C_{12}H_{12}BrNO_3$. [225°]. Formed by the action of baryta on bromo-tarconine ethylo-iodide (or ethylo-hydroxide) (Gerichten, *A.* 212, 182). Yellow needles (containing 2 aq), v. sl. sol. cold water, v. sol. alcohol, insol. ether. Its aqueous solution is neutral. Conc. H_2SO_4 forms a yellow solution. Conc. HClAq converts it, on heating, into EtCl, HBr, and tarconic acid.—HA'HCl: yellow needles.—$(HA'HCl)_2PtCl_4$.—$Cu'A_2$.

Tarconic acid $C_{10}H_7NO_3$. Formed by heating bromo-methyl-tarconic acid with conc. HClAq at 155° (Gerichten, *A.* 212, 184). Slender yellow needles, turning brown in air. Its alkaline solution is brown, becoming greenish-blue on standing. It reduces $AgNO_3$ in the cold.—HA'HCl: prisms, m. sol. hot water, insol. cold alcohol. $FeCl_3$ colours its solution red.

Nartic acid $C_{20}H_{18}N_2O_6$. *Nartine.* Formed by heating bromo-tarconine or tarnine with conc. HClAq at 130° (Gerichten, *A.* 212, 194; 212, 170). Yellow needles, decomposing at 200° without melting. Turns brown in air. NaOH does not ppt. it from acid solutions. Its solution in NaOHAq turns greenish-blue when exposed to air. Reduces $AgNO_6$. $KMnO_4$ oxidises it to a pyridine carboxylic acid. On distillation with soda-lime it yields pyridine.—$H_2A''H_2Cl_2$. [above 275°]. Yellow needles, m. sol. water.—$H_2A''HCl$: yellow needles, sl. sol. water.

Tarnine $C_{11}H_8NO_4$. [above 290°]. Formed by heating bromo-tarconine with water at 130° (Gerichten). Orange needles (containing 1½aq) m. sol. hot water and dilute alcohol, insol. ether—×B'HCl: yellow needles, sol. water.—$B'_2H_2PtCl_6$. Decomposed by boiling water.

Cupronine $C_{20}H_{18}N_2O_6$. Formed, together with tarnine, by heating bromo-tarconine with water at 140° (Gerichten, *B.* 14, 315; *A.* 210, 190°). Black powder, insol. hot water, alcohol, and ether. Forms a brown solution in aqueous NaOH or Na_2CO_3. Conc. H_2SO_4 forms a magenta-red solution, changing to violet on dilution. Conc. HClAq does the same.—B'HCl: coppery needles.—B'HBr: bluish-green needles with coppery lustre, sl. sol. water, forming a blue solution.

Cuprine $C_{11}H_7NO_3$. Formed by the action of bromine on a solution of bromo-tarconine hydrobromide (Gerichten, *A.* 210, 89). Minute blue needles with coppery lustre, sol. water and alcohol, insol. ether. Weak base, the hydrochloride crystallising in concentric groups of needles, the platinochloride being a deep-blue flocculent pp.

Apophyllenic acid is the mono-methyl ether of PYRIDINE DICARBOXYLIC ACID.

Di-bromo-apophyllin *v.* vol. i. p. 553.

Oxy-narcotine $C_{22}H_{23}NO_8$. Crystals which remain undissolved in the process of purifying narceïne (Beckett a. Wright, *C. J.* 29, 461). Small crystals (from alcohol), v. sl. sol. water and alcohol, insol. ether, nearly insol. benzene and chloroform. Ppd. from solutions of its salts by NaOH and Na_2CO_3, but redissolved in excess. Oxidised by $FeCl_3$ to hemipic acid and cotarnine.—B'HCl 2aq: crystals.—$B'_2H_2PtCl_6$.

NARINGIN $C_{21}H_{26}O_{11}$. *Aurantiin. Hesperidine.* [171°]. S. ·33 in the cold. $[\alpha]_D = -84{\cdot}5$ in aqueous solution; $-87{\cdot}6$ in alcoholic solution (W.); $[\alpha]_j = -64{\cdot}6$ (H.). Occurs in the flowers and other parts of *Citrus decumana.* The dry orange-blossoms contain about 2 p.c. It crystallises on cooling from the liquor left in the still after distilling over the oils with steam (Hoffmann, *Ar. Ph.* [3] 14, 139; Will, *B.* 18, 1311;

20, 295). White crystals (containing 4aq), nearly insol. cold water, sol. alcohol, insol. ether. Has a very bitter taste. Split up by dilute H_2SO_4 (3 p.c.) at 95° quantitatively into naringenin and isodulcite. It dissolves in alkalis with a yellowish-red colouration. Ferric salts produce a brownish-red colouration with dilute aqueous solutions. By sodium-amalgam it is converted into a colouring matter which dissolves in alcohol with a red colour and bluish fluorescence.

Naringenin $C_{15}H_{12}O_5$ probably [4:1] $C_6H_4(OH).CH:CH.CO.O.C_6H_3(OH)_2$ [1:3:5]. [248°]. Formed, together with isodulcite, by heating naringin with dilute (2–3 p.c.) H_2SO_4 on the water-bath. Glistening colourless, tasteless, and odourless crystals. V. sol. alcohol, ether, and benzene. Dissolves in alkaline hydrates forming yellow solutions, and is reprecipitated by CO_2. Ferric salts give a brown-red colouration. By sodium-amalgam it is converted into a colouring matter which dissolves in alcohol with a red colour and bluish fluorescence. By boiling with concentrated aqueous NaOH it is decomposed into phloroglucin and *p*-coumaric acid (Will, *B.* 18, 1322; 20, 297).

Naringenic acid is *p*-Coumaric acid.

NARTIC ACID *v.* Narcotine.

NATALOÏN *v.* Aloïn.

NEODYMIUM. The name given by Auer von Welsbach to that constituent of didymium which yields rose-coloured salts (*v.* Didymium, vol. ii. p. 383; *cf.* Metals, rare, this vol. p. 240).

NEOSSIDINE *v.* Proteïds, *Appendix C.*

NEOSSINE *v.* Proteïds, *Appendix C.*

NERIODOREÏN. A bitter yellow powder, extracted by alcohol from the bark and wood of *Nerium odorum*, an Indian plant prescribed for leprosy (Greenish, *Ph.* [3] 11, 873). It is sol. water, insol. chloroform. Its solution is ppd. by tannin and by ammoniacal lead acetate, and reduces Fehling's solution.

Neriodorin. A bitter resin, accompanying the preceding body, sl. sol. water and alcohol, v. sol. $CHCl_3$.

NEURIDINE $C_5H_{14}N_2$. A product of the putrefaction of flesh, appearing on the second day and disappearing about the fourth day (Brieger, *B.* 16, 1187, 1405; Bocklisch, *B.* 18, 86; Gautier, *Bl.* [2] 48, 12). It also occurs in fresh human brain (Brieger, *J. Th.* 1884, 92). Gelatinous mass with disgusting smell, v. e. sol. water, insol. alcohol and ether. Very poisonous (G.). Its solution is ppd. by $HgCl_2$ and by lead acetate. Yields di- and tri- methylamine on boiling with NaOHAq.—$B''H_2Cl_2$: needles, v. sol. water, insol. alcohol and ether.—$B''H_2PtCl_6$.

NEURINE $C_5H_{15}NO_2$ *i.e.* $CH_2(OH).CH_2.NMe_3OH$. *Choline. Di-methyl-oxy-ethyl-amine methylo-hydroxide. Tri-methyl-oxethyl-ammonium hydroxide. Sincaline.*

Occurrence.—In cotton seeds (Böhm, *J. pr.* [2] 30, 37); in putrefying flesh (Gautier, *Bl.* [2] 48, 13); in germinating pumpkin sprouts (E. Schulze, *H.* 11, 365); in the seeds of *Trigonella Fœnum-græcum* (Jahns, *B.* 18, 2518); in the seeds of vetch, *Vicia sativa* (Schulze, *B.* 22, 1827); in hops and beer (Griess a. Harrow, *C. J.* 47, 298; *B.* 18, 717); in areca nuts (Jahns, *B.* 23, 2972); in the fly agaric (Harnack, *J.* 1876, 803); in herring brine (Bocklisch, *B.* 18, 1923); in ergot of rye (Brieger, *H.* 11, 184); and in beet-root juice (Lippmann, *B.* 20, 3201).

Formation.—1. By boiling the bile of pigs or oxen with baryta (Strecker, *C. R.* 52, 1270; *A.* 123, 353; Dybkowsky, *J. pr.* 100, 163; Hüfner, *J. pr.* [2] 19, 302).—2. By boiling ox-brain with baryta (Liebreich, *A.* 134, 29; Baeyer, *A.* 140, 306).—3. By extracting yolk of egg with ether and alcohol, evaporating the extract, and boiling the residue with baryta (Diaconoff, *J.* 1867, 776; 1868, 730). In this preparation two similar bases occur, containing 34 and 32 p.c. Pt in their platinochlorides (Hundeshagen, *J. pr.* [2] 28, 247).—4. Together with glycero-phosphoric acid, oleïc, and palmitic acids by the action of alkalis on lecithin (Liebreich; Gobley, *C. R.* 70, 1297; Bokay, *H.* 1, 157; 12, 148).—5. Together with sinapic acid and barium sulphocyanide, by heating sinapine sulphocyanide with baryta-water (Claus a. Keesé, *Z.* [2] 4, 46).

Syntheses.—1. By heating trimethylamine (5 g.) with glycolic chlorhydrin (10 g.) at 100°; the resulting chloride $HO.CH_2.CH_2.NMe_3Cl$ being decomposed by moist Ag_2O (Wurtz, *C. R.* 65, 1015; 68, 1434; *A. Suppl.* 6, 116).—2. By the union of ethylene oxide with trimethylamine (Wurtz, *A. Suppl.* 6, 201).

Properties.—Strongly alkaline syrup, decomposed on boiling in concentrated aqueous solution into glycol and trimethylamine. Conc. HIAq and P at 140° forms $C_2H_4I.NMe_3I$. Weaker HIAq yields $C_2H_4I.NMe_3Cl$. Yields muscarine and betaïne on oxidation. Not poisonous.

Salts.—$C_2H_4(OH)NMe_3Cl$. Dimorphous: usually as long needles, sometimes in thin trimetric plates.—$(C_2H_4(OH)NMe_3Cl)_2PtCl_4$. Trimorphous: orange prisms (from warm saturated solution), reddish-brown trimetric tablets from a cold saturated solution, or regular octahedra from a solution containing 15 p.c. of alcohol. The first and third forms left in contact with their mother liquid change into the second form (Hundeshagen, *J. pr.* [2] 28, 245).—$(C_2H_4(OH)NMe_3Cl)AuCl_3$: yellow needles, sl. sol. cold water.—$C_2H_4(OH)NMe_3I$. Formed from $C_2H_4(OH)NMe_2$ and MeI (Knorr, *B.* 22, 1116).

Acetyl derivative of the chloride $C_2H_4(OAc).NMe_3Cl$.—$C_7H_{16}NO_2ClAuCl_3$: nodules.

NEURO-KERATIN *v.* Proteïds, *Appendix C.*

NICKEL. At. w. 58·6. Mol. w. unknown, as element has not been gasified. [c. 1400°–1420°] (Schertel, *N.* 22, 543); [c. 1450°] (Pictet, *C. R.* 88, 1317). S.G. 8·97 to 9·26 (Rammelsberg, *J.* 2, 282; for other values *v.* Clarke's *Table of Specific Gravities* [new ed.], 12). S.H. 14° to 97° ·10916 (Regnault, *A. Ch.* [3] 63, 1). $V_t = V_0 (1 + 3 \times {·}00001279t)$ $t = 40°$ (Fizeau, *C. R.* 68, 1125). E.C. at 0° (Hg at 0° = 1) 7·374 (Matthiessen a. Vogt, *P. M.* [4] 26, 242). S.V.S. c. 6·5. H.C. $[Ni^2, O^3, 3H^2O] = 120,380$ (*Th.* 3, 307). For spectrum of Ni (ultra-violet) *v.* Liveing a. Dewar, *Pr.* 43, 430.

Occurrence.—In some meteorites, from 3 to 8 p.c. associated with ·2 to 1 p.c. of Co. In the sun's atmosphere (Cornu, *C. R.* 86, 983). Ni has been found, to the extent of ·75 p.c., in a Pt ore from the Ural (Terreil, *C. R.* 82, 1116). Chiefly as *copper-nickel* Ni_2As_2, *white-nickel* $NiAs_2$, and Mg-Ni silicate, *garnierite.* Ni antimonide, arsenate, oxide, sulphide, carbonate, &c., also occur, chiefly in combination with compounds of Co, Fe, Sb, and Bi. Ni compounds are always present in Co ores, and Co is almost invariably a constituent of Ni ores. Ni compounds have been known to the Chinese for centuries; Ni forms a constituent of Chinese armour. Copper-nickel was known to the German miners in the Middle Ages; having in vain attempted to extract Cu from this mineral, they gave it the name of *kupfer-nickel*, or false copper. In 1751 Cronstedt showed the mineral to contain a special metal, to which he gave the name of nickel. The metal was obtained in impure condition by Cronstedt, and examined by Bergmann, Richter, and others. Fleitmann prepared larger quantities of Ni, and applied it to coat iron and steel. Böttger, c. 1840, introduced the practice of electro-nickel-plating; this application of Ni has become an important trade since c. 1869.

Formation.—*Copper nickel*, or *speiss* (a by-product in the production of smalt), is powdered and roasted (to remove As and oxidise Ni), again roasted with charcoal, dissolved in HNO_3Aq, saturated with H_2S, and the filtrate is ppd. by Na_2CO_3; the Ni is separated from the Fe and Co in the pp. by different processes (*v. Preparation*); the Ni is ppd. by alkali as $NiO.xH_2O$, the pp. is dehydrated by heat, and reduced by C or in H. An ammoniacal solution of Ni-NH_4 sulphate is sometimes decomposed by electrolysis.

Preparation.—A salt of Ni, tolerably free from Co, is obtained by such a method as the following from arsenical Ni sulphide, or *speiss*; speiss is a deposit formed in the pots in which roasted Co arsenide, mixed with *copper-nickel*, is fused with K_2CO_3 and quartz, in the preparation of smalt. The roasted ore, or *speiss*, is fused with chalk and fluorspar; the slag being poured off, the metal is powdered and roasted for a long time in a reverberatory furnace till fumes of As_2O_3 cease to come off; the product is dissolved in HClAq, the solution is diluted, bleaching powder is added to oxidise the Fe salts, and milk of lime to ppt. Fe_2O_3 with As oxide; the filtrate is acidified and ppd. by H_2S, the filtrate from this pp. is heated with bleaching powder to ppt. Co oxide, and the Ni remaining in solution is ppd. as oxide by milk of lime (Louyet, *J. Ph.* [3] 15, 204; for other methods *v.* Wagner, *Berg und Hüttenm. Zeit.* 1870. 134; Gilchrist, *B.* 16, 264; Donath, *D. P. J.* 236, 327; Wöhler, *P.* 6, 227; Cloez, *J.* 1857. 619; *v.* also DICTIONARY OF APPLIED CHEMISTRY).

Impure Ni may be purified by dissolving in HClAq with addition of HNO_3, evaporating to dryness, dissolving in water, acidulating with HClAq, boiling with excess of $NaHSO_3$ (to reduce As_2O_5 to As_2O_3), saturating the warm liquid with H_2S (after SO_2 is all removed), filtering after 12 hours or so, evaporating the filtrate to dryness, dissolving the residue in water, filtering, treating the filtrate with Cl and then ppg. Fe and Co by $BaCO_3$, removing excess of Ba by dilute H_2SO_4Aq, filtering, and ppg. Ni as carbonate by Na_2CO_3 (Cloez, *J.* 1857. 619). After ppg. As, Cu, Sb, Pb, and Bi by H_2S, the filtrate may be much concentrated and Ni ppd. as oxalate, by addition of oxalic acid (Deville, *A. Ch.* [3] 46, 82). Winkler (*Fr.* 6, 18) boils a solution of commercial $NiCO_3$ with NaClO till all Co is ppd., this occurs only when a large quantity of Ni is also thrown down; he filters, ppts. by H_2S, boils the filtrate, and ppts. $NiCO_3$ by addition of Na_2CO_3. Co is the most difficult impurity to separate from Ni salts; the most effectual method is to dissolve in HNO_3Aq, concentrate, neutralise by KOHAq, mix with KNO_2Aq, strongly acidify with acetic acid, and allow to stand for a few days, when the Co is completely ppd. as Co-K nitrite, and the filtrate contains the Ni (*cf.* Zimmermann, *A.* 232, 324).

Ni is obtained from $NiCO_3$ (or $NiO.H_2O$ ppd. from solutions by KOHAq) by washing thoroughly, spreading out to dry, heating till CO_2 is all removed, and then reducing by H, at c. 270 (Müller, *P.* 136, 51), or by heating with C; the latter method is conducted by making the NiO into a paste with oil, placing this in a crucible lined with charcoal, and heating in a powerful air- or blast-furnace.

$NiCO_3$ may be dissolved in HClAq, the solution evaporated to dryness, the residue of $NiCl_2$ thoroughly dehydrated, then sublimed in a porcelain tube in a stream of Cl, and finally reduced by heating in H (Winkler, *Fr.* 6, 18).

NiC_2O_4 yields Ni when heated out of contact with air; this may be done by heating under a layer of pounded glass which does not contain any heavy metal.

Ni is also obtained by electrolysing solutions of its salts, using a weak current; the best solution to use seems to be an ammoniacal one of Ni-NH_4 sulphate (*v.* Becquerel, *C. R.* **55**, 18; *cf.* Zimmermann, *A.* 232, 324).

Properties.—A very lustrous metal; white, with a slight greyish-yellow tinge. Hard; easily polished; ductile, malleable, and very tenacious. By heating in a porcelain oven, crystals of Ni, apparently regular, have been obtained. Slightly magnetic, but less so than Fe or Co. Ni obtained by reduction of NiO by charcoal usually contains a little C; such C-containing Ni is softer and less malleable than the purer metal (Boussingault, *Chem. Ind.* 1878. 130). As obtained by reducing NiO by H, or by heating NiC_2O_4, Ni forms a greyish-black, somewhat porous, pyrophoric powder. As obtained by reducing $NiCl_2$ in H, the metal forms a compact sponge, and also lustrous leaflets (Winkler, *Fr.* 6, 18; Gard, *J.* 1877. 266). By electrolysis of Ni solutions by a very weak current, Ni is obtained as coherent, lustrous, white plates (Becquerel, *C. R.* 55, 18). After fusion of large quantities of Ni, the metal becomes porous and crystalline, and loses its ductility; this is probably due to absorption of gases, and may be prevented by adding ⅛ p.c. of Mg (Fleitmann, *B.* 12, 454).

Ni shows *passivity*, *i.e.* under certain conditions it is unacted on by HNO_3Aq. According to Saint-Edme (*C. R.* 106, 1079), commercial sheet Ni is passive in ordinary HNO_3Aq, and passive Ni remains passive when heated to bright redness in H, whereas Fe loses its passivity (*cf.* *Passivity of iron*, under IRON, this vol. p. 52).

Ni is a metallic element. The oxides are basic, or react as peroxides; NiO forms a series of corresponding salts; Ni_2O_3 probably forms salts by reacting with acids, but these salts are reduced very easily to salts of NiO. Ni is closely related in its chemical properties to Co; it is classed with Co and Fe, and also shows analogies with Mn; *v.* IRON GROUP OF ELEMENTS, this vol. p. 65. No Ni salts are known corresponding with the cobalto- and cobalti-cyanides, M_4CoCy_6 and M_3CoCy_6; nor are nickel-ammonio-bases known analogous with the cobaltamines, although some Ni compounds, *e.g.* the haloid compounds, combine with NH_3. The ultra-violet spectra of Ni and Co do not exhibit much analogy (*v.* Liveing a. Dewar, *Pr.* 43, 430).

The at. w. of Ni has been determined (1) by reducing NiO in H (Erdmann a. Marchand, *A.* 82, 76; Russell, *C. J.* [2] 1, 51); (2) by analysing Ni oxalate (Schneider, *P.* 101, 387; 107, 605; 130, 303); by determining Cl in $NiCl_2$ (Dumas, *A. Ch.* [3] 55, 149); (3) by ppg. $NiSO_4Aq$ by $BaCl_2Aq$ (Sommaruga, *W. A. B.* 54 [2] 57); (4) by the reaction of $AuCl_3Aq$ on Ni, and determining the Au ppd. (Winkler, *Fr.* 6, 22; *cf.* Krüss a. Schmidt, *B.* 22, 11; but *v.* also Winkler, *B.* 22, 890); (5) by decomposing by heat strychnine-Ni cyanide and brucine-Ni cyanide (Lee, *C. N.* 24, 237); (6) by dissolving Ni in HClAq, and measuring H evolved (Russell, *C. J.* [2] 7, 294); (7) by determining S.H. of Ni, the result obtained shows that 58·6, and not a multiple of this number, is the at. w.; this result has been confirmed recently; (8) by determining V.D. of gaseous $Ni(CO)_4$ (Mond, Langer, a. Quincke, *C. J.* 57, 749).

Alleged decomposition of nickel.—Krüss a. Schmidt (*B.* 22, 11) found that by repeatedly treating NiS, prepared from the ordinary sulphate, with NH_4 sulphide, until the latter was no longer coloured brown, a bright-yellow residue was obtained; from this residue they prepared various salts, which they regarded as compounds of a new metal, and finally they obtained the supposed new metal by electrolysing an aqueous solution of the chloride, and also by reducing the dichloride in H. Krüss a. Schmidt (*B.* 22, 2026) prepared what they considered to be pure Ni, and by fractionally ppg. this as basic Ni-NH_4 arsenite they obtained two different substances, one having an at. w. 56–58, and the other an at. w. 61-100; hence they concluded that their former results were confirmed, that is, that Ni is really a compound or a mixture of two elements. Considerable doubt was thrown on these results by the work of Winkler on the reaction between pure $AuCl_3$ and Ni (*B.* 22, 890); and Fleitmann's experiments on large quantities of Ni also tend to show that Ni has not been separated into unlike parts (*Chem. Zeitung,* 13, 757).

Reactions and Combinations.—1. Pieces of Ni do not oxidise in *ordinary air*; *heated in air* Ni is superficially oxidised to NiO; Ni obtained by reduction of NiO at low temperatures is pyrophoric.—2. Ni burns to NiO when heated in *oxygen.*—3. By heating in *chlorine, bromine,* or *iodine,* $NiCl_2$, $NiBr_2$, or NiI_2 is produced.—4. Heated with *sulphur,* NiS is formed.—5. Ni combines with *phosphorus* when the elements are heated together.—6. Combines with *arsenic* in several proportions (*v. Nickel, arsenides of,* p. 501).—7. Absorbs, and probably also combines with, *carbon* (*v. Nickel, carbides of,* p. 501).—8. Combines with *carbon monoxide* (*v. Nickel carbon-oxide,* p. 501).—9. By reducing NiO in presence of SiO_2, Ni is obtained, containing *silicon* (*v. Nickel, silicides of,* p. 503).—10. *Steam* is slowly decomposed by Ni at red heat, NiO being formed (Regnault, *A. Ch.* [3] 62, 352).—11. *Nitric acid* forms $Ni(NO_3)_2$, but Ni is passive in conc. HNO_3Aq.—12. *Sulphuric and hydrochloric acids* react very slowly with Ni (*v.* Tissier, *C. R.* 50, 106).—13. Aqueous *sulphurous acid* is decomposed by Ni at c. 200°, with production of Ni_3S_4 (Geitner, *A.* 139, 354).—14. *Carbon dioxide* is reduced to CO by heating with Ni to redness (Bell, *C. N.* 23, 358).—15. Heated in *carbon monoxide* to 350°–450°, C is deposited and CO_2 produced (*v. supra,* No. 8; also *Nickel carbon-oxide,* p. 501).—16. Forms *alloys* with several metals (*v. Nickel, alloys of, infra*).—17. Occludes about 165 times its volume of *hydrogen* (Raoult, *C. R.* 69, 826).

Detection and Estimation.—Ni compounds give a bead with *borax* which is violet when hot and reddish-brown when cold in the oxidising flame, and in the reducing flame becomes opaque and grey from reduced Ni. Brown-black NiS is ppd. by alkali sulphides, insol. dilute cold HClAq, somewhat sol. yellow NH_4 sulphide; H_2S produces no pp. in acid solutions; moist NiS ppd. from cold solutions, oxidises rather easily in the air. Very small traces of Ni may be detected, in the absence of most other metals, by the rose-red colour produced by adding K_2CS_3Aq (Braun, *J.* 1868. 376). To detect small quantities of Ni in presence of Co, Papasogli places a piece of Zn in a solution of the double cyanides of the two metals: if Ni is present a red colour is produced (*J.* 1879. 1055); Donath a. Mayrhofer (*Fr.* 20, 379) add excess of NaOHAq, then I, boil, treat the pp. with NH_3Aq and NH_4ClAq, and test the solution by NH_4HS (*v.* also Jorisson, *Fr.* 21, 208).

Ni may be estimated as NiO after ppn. as $NiO.xH_2O$ by addition of KOHAq to a hot solution. For separation of Ni from Co *v.* COBALT, vol. ii. p. 218. Classen recommends the ppn. of Ni as oxalate, which on heating out of contact with air gives NiO (*Fr.* 16, 471; 18, 189, 386). Ni may also be estimated by electrolysing a solution of Ni-NH_4 oxalate in presence of excess of NH_4 oxalate (*v.* Classen; for description of apparatus *v.* Dittmar's *Exercises in Quantitative Chemical Analysis* [Glasgow, 1887]; *cf.* Merrick, *C. N.* 24, 100).

Technical Applications.—Alloys of Ni with Cu, and with Cu and Zn, are used for coinage in some countries, and for other purposes. These alloys are nearly white and hard. Many articles of iron and steel are now covered with a deposit of Ni. This covering is only very slightly acted on by ordinary air. *Nickel-plating* is usually accomplished by electrolysing an ammoniacal solution of Ni-NH_4 sulphate, using Ni as one of the electrodes, and the substance to be plated as the other (*v. D. P. J.* 201, 145; 206, 288; 211, 74; 212, 160; 219, 469; *v.* also Adams, *C. R.* 70, 123, 137; Becquerel, *ibid.* 70, 124, 137, 181; *v.* also DICTIONARY OF APPLIED CHEMISTRY).

Nickel, alloys of. An alloy of Ni with *aluminium,* approximately Al_6Ni, is obtained by melting together 8 parts Al with 3 parts dry $NiCl_2$ and 20 parts mixed KCl and NaCl, and treating with dilute HClAq (Michel, *A.* 115, 102). Alloys of Ni with *copper,* and with *copper and zinc,* are used for coinage and other purposes under the names of *German silver, packfong,* &c. Ramsay (*C. J.* 55, 532) found that an amalgam of Ni with *mercury* could be obtained in small quantities by electrolysing dilute solutions of Ni salts in contact with Hg.

Nickel, ammonio-compounds of. Some Ni compounds, *e.g.* $NiCl_2$ and $NiBr_2$, combine with NH_3; *v. Nickel bromide, Nickel chloride,* &c.

Nickel, antimonates of, $Ni(SbO_3)_2.6H_2O$ and $Ni(SbO_3)_2.12H_2O$; *v.* Heffter, *P.* 86, 446.

Nickel, antimonide of. NiSb occurs native as *breithauptite*.

Nickel, arsenates of, *v.* vol. i. p. 309. $Ni_3(AsO_4)_2.8H_2O$ occurs native as *nickel-bloom*.

Nickel, arsenides of. A brittle compound, Ni_2As, is formed by heating Ni with excess of As; also by very strongly heating Ni arsenates in a charcoal-lined crucible. (For other arsenides *v.* Descamps, *C. R.* 86, 1065.) Various Ni ores are essentially compounds of Ni and As; Ni_3As_2 = *speiss*; NiAs = *copper-nickel*; $NiAs_2$ = *white-nickel*.

Nickel, arsenite of, *v.* vol. i. p. 306.

Nickel, borate of, *v.* vol. i. p. 530.

Nickel, bromide of, $NiBr_2$. This, the only compound of Ni with Br, is obtained by passing Br vapour over finely-divided Ni heated to low redness. $NiBr_2$ forms a brownish-yellow solid; it sublimes in yellow, glittering scales (Berthemot, *A. Ch.* [3] 44, 389; Rammelsberg, *P.* 55, 243). Heated in air, or in steam, $NiBr_2$ forms NiO; it is completely decomposed by HNO_3Aq. Soluble alcohol and ether; deliquescent; soluble water to a green liquid.

The *hydrate* $NiBr_2.3H_2O$ is obtained, in green needles, by digesting Ni with BrAq; also by dissolving NiO or $NiCO_3$ in HBrAq, and evaporating (Rammelsberg, *P.* 55, 243). This hydrate is dehydrated at c. 200°. H.F. $[Ni, Br^2, Aq]$ = 71,820 (*Th.* 3, 307).

A compound of nickel-bromide with ammonia, $NiBr_2.6NH_3$, is obtained as a violet powder, by passing NH_3 over powdered $NiBr_2$; also, as a blue powder, by warming conc. $NiBr_2Aq$ with excess of NH_3Aq, and cooling. NH_3 is given off when the compound is heated: $NiBr_2.6NH_3$ is soluble in a little water without decomposition; much water causes ppn. of $NiO.H_2O$ (Rammelsberg, *l.c.*).

Nickel, carbides of. Commercial Ni always contains a little C. For experiments on carbonisation of Ni *v.* Gard, *Am. S.* [3] 14, 274; Boussingault, *C. R.* 86, 509; Pebal, *A.* 233, 160; Gautier a. Hallopeau, *C. R.* 108, 1111; Mond, Langer, a. Quincke, *C. J.* 57, 749.

Nickel carbon-oxide $Ni(CO)_4$. Mond, Langer, a. Quincke (*C. J.* 57, 749) found that Ni decomposes CO at 350°–450°, with separation of C and formation of CO_2. When the product was allowed to cool in CO they noticed that the escaping gas caused a Bunsen flame to become very luminous, and when heated deposited Ni. Following up this observation they found that when finely-divided Ni, produced by reducing the oxide in H, is allowed to cool in a slow current of CO the gas is readily absorbed by the Ni when the temperature has fallen to c. 100°, and that by replacing the CO by CO_2, N, H, or air, a mixture of gases is obtained which deposits Ni when heated above 150°. By analysing the mixture of gases thus obtained, and determining the Ni by passing the gases through a capillary tube at 180°, M., L., a. Q. found that one volume of the Ni compound present in the gases gave four volumes of CO. The analyses led to the formula NiC_4O_4. By passing the mixed gases through a tube surrounded with salt and ice a colourless mobile liquid was obtained, which was proved, by estimations of Ni and C, to be NiC_4O_4. The V.D. determined at 50° was found to be 86·9; NiC_4O_4 requires 80·4. The new compound is called nickel-carbon-oxide by its discoverers; it boils at 43° at 751 mm., solidifies at −25° to needle-shaped crystals, and has S.G. 1·3185 at 17°. The vapour is very poisonous. The compound is sol. alcohol, benzene, and chloroform; it is not acted on by dilute acids or alkalis, nor by conc. HClAq; conc. HNO_3Aq and *aqua regia* dissolve it readily. The vapour ppts. Ag from AgCl in NH_3Aq; it is decomposed by Cl, giving $NiCl_2$ and $COCl_2$; Br acts similarly; electric sparks produce Ni and CO.

Nickel, chloride of, $NiCl_2$. H.F. $[Ni,Cl^2]$ = 74,530 (*Th.* 3, 307); $[NiCl^2,Aq]$ = 19,170. S.G. 2·56 (Schiff, *A.* 108, 21). Prepared by gently heating powdered Ni in a stream of dry Cl, and subliming in the Cl (H. Rose, *P.* 20, 156). Also by dissolving NiO or $NiCO_3$ in HClAq, or Ni in *aqua regia*, and evaporating to dryness. Golden yellow scales. Sublimes readily without melting. Prepared in the wet way, $NiCl_2$ is deliquescent and easily soluble in water; sublimed $NiCl_2$ dissolves slowly in boiling water. Heated in air Cl is evolved and NiO formed. Heated in a stream of O, is entirely changed to Ni_3O_4 (Schulze, *J. pr.* [2] 21, 407). KOHAq decomposes sublimed $NiCl_2$ only after prolonged boiling. PH_3 forms Ni_3P_2, and HCl; molten P forms Ni_3P_2 and PCl_3 (H. Rose, *P.* 27, 117). For S.G. of conc. $NiCl_2Aq$ *v.* Franz, *J. pr.* [2] 5, 274.

The *hexa-hydrate* $NiCl_2.6H_2O$ (Laurent, *A. Ch.* [3] 60, 354) is obtained by cooling conc. $NiCl_2Aq$. Soluble in 1½–2 parts water; sol. in alcohol. Sabatier (*Bl.* [3] 1, 88) describes a *dihydrate* $NiCl_2.2H_2O$, obtained by placing the hexahydrate over H_2SO_4 *in vacuo* at 20° for three months. Thomsen gives $[Ni, Cl^2, 6H^2O]$ = 94,860 (*Th.* 3, 307).

The *oxychloride* $NiCl_2.8NiO.13H_2O$ is obtained by adding a little NH_3Aq to $NiCl_2Aq$ (Raoult, *C. R.* 69, 826).

Compounds with ammonia. (1) $NiCl_2.6NH_3$ is obtained by passing NH_3 over dry $NiCl_2$ (H. Rose, *P.* 20, 155); also by adding alcohol to $NiCl_2$ in NH_3Aq (Erdmann, *Gm.-K.* (6th edit.) 3, 553; F. Rose, *Gm.-K.* (6th edit.) 3, 561). Soluble without change in cold water; decomposed slowly by much cold water, quickly by hot water. Slightly sol. conc. NH_3Aq; insol. alcohol. (2) $NiCl_2.2NH_3$; obtained by heating $NiCl_2.6NH_3$ to 120°. Gives $NiCl_2$ when heated in *vacuo*, and a little Ni when very strongly heated.

Compounds with ammonium chloride. (1) $NiCl_2.NH_4Cl.6H_2O$; green deliquescent crystals, obtained by evaporating a solution of the constituents in the ratio $NiCl_2:NH_4Cl$ (Hantz, *A.* 66, 283). Jörgensen (*Gm.-K.* (6th edit.) 3, 561) obtained crystals containing c. ·5 p.c. $NiCl_2$ by evaporating $NiCl_2Aq$ with a large excess of NH_4Cl. (2) $NiCl_2.4NH_4Cl.7H_2O$; yellow, star-shaped, crystals, obtained by decomposing Ni-NH_4 sulphate solution by an equivalent of $BaCl_2$, filtering and evaporating over H_2SO_4 (Adams a. Meyrick, *J.* 1871. 308; *cf.* Tupputi, *A. Ch.* [3] 78, 169).

$NiCl_2$ form *double salts* with CaCl, $CdCl_2$, and

$AuCl_3$ (*v.* Goddefroy, *B.* 8, 9; von Hauer, *W. A. B.* 20, 40; *ibid. W. A. B.* 17, 348).

Nickel, chromates of, *v.* vol. ii. p. 156.

Nickel, cyanide and double cyanides of, *v.* vol. ii. p. 343.

Nickel, ferricyanide of, *v.* vol. ii. p. 339.

Nickel, ferrocyanides of, *v.* vol. ii. p. 336.

Nickel, fluoride of, NiF_2. S.G. 2·855 at 14° (Clarke, *Am. S.* [3] 13, 291). The hydrate $NiF_2.3H_2O$ is obtained by dissolving $NiO.H_2O$ or $NiCO_3$ in HFAq, and evaporating (Berzelius; Clarke, *Am. S.* [3] 13, 291). Decomposed by much hot water to *oxyfluoride* $Ni_2OF_2.H_2O$ (Berzelius). Combines with AlF_3, fluorides of the alkali metals (Wagner, *B.* 19, 896), and with SiF_4 (*v. Nickel, silicofluoride of,* p. 503), TiF_4 (*v.* Titanium fluoride), and ZrF_4 (*v.* Zirconium fluoride). With $Mo_2O_2F_2$ forms the compound $NiF_2.MoO_2F_2.6H_2O$ (Delafontaine, *J.* 1867. 236).

Nickel, hydroxides or hydrated oxides of, *v. Nickel, oxides and hydrated oxides of, infra.*

Nickel, iodide of, NiI_2. $[Ni, I^2, Aq] = 41,400$ (*Th.* 3, 307). Prepared by heating Ni, reduced from NiO by H, with I, and subliming the NiI_2 from the residue of Ni and NiO (Erdmann, *J. pr.* 7, 249). Also by heating $NiI_2.6H_2O$, which is obtained by dissolving $NiO.H_2O$ in HIAq, or by treating finely divided Ni with excess of I and water. Iron-black, lustrous, metal-like, scales. Deliquescent; soluble in water, forming a brown liquid, which becomes green on dilution. Partly decomposed when strongly heated in air. By digesting NiI_2Aq with $NiO.H_2O$, or by evaporating NiI_2Aq, Erdmann (*l.c.*) obtained the *oxyiodide* $NiI_2.9NiO.15H_2O$.

Compounds with ammonia. (1) $NiI_2.4NH_3$; a yellow-white mass; by passing NH_3 over NiI_2 (Rammelsberg, *P.* 48, 119). (2) $NiI_2.6NH_3$; by adding excess of NH_3Aq to conc. NiI_2Aq, warming, and cooling or adding alcohol (Erdmann, *l.c.*; Rammelsberg, *l.c.*).

Nickel, nitride of. A compound of Ni with N is said to be formed by heating NiO to c. 200° in NH_3; it is decomposed at a higher temperature (Warren, *C. N.* 55, 155).

Nickel, oxides and hydrated oxides of. Nickel forms three oxides; NiO, Ni_3O_4, and Ni_2O_3; a fourth oxide, Ni_2O, probably exists; there are indications of the existence of oxides intermediate between Ni_3O_4 and Ni_2O_3, and also of an oxide containing more O than Ni_2O_3. Hydrates of NiO and Ni_2O_3, and perhaps of Ni_3O_4, have been isolated. The oxides of Ni are basic, but the only Ni salts which have been prepared with certainty correspond with NiO. NiO is oxidised by heating to c. 400°, but the product is reduced to NiO at c. 600°.

Nickel monoxide NiO (*Nickelous oxide. Protoxide of nickel*). Occurs native as *bunsenite*. Obtained by heating Ni or $NiCl_2$ in steam (Regnault, *A. Ch.* [3] 62, 352); by heating the hydrate or $NiCO_3$ in absence of air; by strongly heating $Ni(NO_3)_2$ (Russell, *C. J.* [2] 1, 58), $NiSO_4$ (Baubigny, *C. R.* 97, 951), or a mixture of $NiSO_4$ and K_2SO_4 (Debray, *C. R.* 52, 985); by reducing Ni_2O_3 by H at 190°–230° (Moissan, *A. Ch.* [5] 21, 238; *cf.* Wright a. Luff, *C. J.* 33, 1; also Müller, *P.* 136, 59), or by NH_3 at c. 180° (Vorster, *Dissertation*, Göttingen, 1861), at a moderate temperature. NiO is obtained in green regular octahedra by heating Ni borate with CaO in a porcelain oven, and treating the product with HClAq (Ebelmen, *C. R.* 33, 526).

NiO is a green powder, becoming deep-yellow when heated (Moissan, *A. Ch.* [5] 21, 238; Zimmermann, *A.* 232, 324). S.G. 5·6 (Playfair a. Joule, *C. S. Mem.* 3, 81); 6·66 (Rammelsberg, *J.* 2, 282); 6·8 crystallised (Ebelmen, *C. R.* 33, 526). Heated to 350°–440°, NiO is oxidised to Ni_2O_3, which is again deoxidised to NiO at c. 600° (Moissan, *A. Ch.* [5] 21, 199). NiO is readily reduced to Ni; reduction by CO begins at c. 120°, by H at c. 220°, by C at c. 450° (Wright a. Luff, *C. J.* 33, 1); reduction by NH_3 begins at c. 200° (Vorster, *Dissertation*, Göttingen, 1861). NiO is oxidised to Ni_2O_3 by ozonised O (Schönbein, *J. pr.* 93, 35). NiO, if not strongly heated, dissolves in NH_3Aq; it decomposes NH_4 salts with evolution of NH_3. NiO dissolves in acids forming salts NiX_2, $X = NO_3$, ClO_3, $\frac{1}{2}SO_4$, $\frac{1}{3}PO_4$, &c.

Hydrate of nickel monoxide $4NiO.5H_2O = 4Ni(OH)_2.H_2O$ (*Nickelous hydrate; nickelous hydroxide*). This hydrate is obtained as a pale greenish pp., by adding alkali solution to solution of a Ni salt. According to Teichmann (*A.* 156, 17) the hydrate can be obtained free from acid only from $Ni(NO_3)_2Aq$; T. recommends to add NaOHAq, free from carbonate, to cold $Ni(NO_3)_2Aq$, to wash the excess of pp. with cold water till the alkaline reaction disappears, then to wash with water containing a little NH_3, and finally with boiling water, and to dry at 100°. $4NiO.5H_2O$ is also obtained, as a green crystalline powder, by heating NiO or $NiCO_3$ in NH_3Aq (*Gm.-K.* (6th edit.) 3, 536).

Nickelous hydrate is a pale-green powder; slightly soluble in water (Fresenius). If not washed free from alkali it oxidises in presence of air and SO_2Aq, but the product is reduced to NiO by excess of SO_2Aq (Wicke, *Z.* 1865. 86). When strongly heated, H_2O is evolved and NiO remains. H_2O_2Aq forms a hydrate of Ni_2O_3 (Schönbein, *J. pr.* 93, 35); but, according to Bayley, H_2O_2Aq is without action (*P. M.* [5] 7, 126). Oxidised by Cl and hypochlorites to $Ni_2O_3.xH_2O$. Soluble in NH_3Aq and solutions of NH_4 salts. $4NiO.5H_2O$ reacts with acids as a strong base, forming salts NiX_2, $X = NO_3$, $\frac{1}{2}SO_4$, $\frac{1}{3}PO_4$, &c. Thomsen gives $[NiO^2H^2, H^2SO^4Aq] = 26,110$; and $[NiO^2H^2, 2HClAq] = 22,580$ (*Th.* 3, 307).

Nickel sesquioxide Ni_2O_3 (*Nickelic oxide.* Sometimes called *nickel peroxide*). A black powder; S.G. 4·84 at 16° (Herapath, *P. M.* 64, 321). Obtained by decomposing by heat at the lowest possible temperature $Ni(NO_3)_2$ (Berzelius; Vorster, *Dissertation*, Göttingen, 1861), or $Ni(ClO_3)_2$ (Wächter, *J. pr.* 30, 327); also by melting $NiCl_2$ with $KClO_3$ (Schulze, *J. pr.* [2] 21, 407); also by treating Ni salts in solution with KClOAq or KBrOAq (Schröder, *C. C.* 1890. 931). Heated in air to c. 600° Ni_2O_3 is reduced to NiO (Moissan, *A. Ch.* [5] 21, 199); reduction in H begins at c. 190° (M., *l.c.*). Dissolves in H_2SO_4Aq or HNO_3Aq with evolution of O, in HClAq with evolution of Cl; in each case salts of NiO are produced. Soluble in NH_3Aq with evolution of N (Müller, *P.* 136, 59).

Hydrates of nickel sesquioxide.

(1) $Ni_2O_3.2H_2O$; brownish crust, S.G. 2·744, obtained by electrolysing an alkaline solution of

Ni·K tartrate (Wächter, *J. pr.* 30, 327). (2) $Ni_2O_3.3H_2O$; by oxidising NiO or $4NiO.5H_2O$, suspended in water, by Cl or BrAq ; also by adding alkali and NaClO to solution of a Ni salt (Wächter, *l.c.*). A black solid, which reacts with acids and NH_3Aq as Ni_2O_3 does; reduced to $4NiO.5H_2O$ by SO_2Aq (Wicke, *Z.* 1865. 86), also by Na_2SO_3Aq (Schulze, *J.* 1864. 270). H.F. $[Ni^2,O^3,3H^2O] = 120,380$ (*Th.* 3, 307). Carnelley a. Walker (*C. J.* 53, 91) think that no definite stable hydrate of Ni_2O_3 exists.

NICKELO-NICKELIC OXIDE Ni_3O_4. A grey, metal-like, non-magnetic solid, obtained by passing O over $NiCl_2$ at 350°–440° (Baubigny, *C. R.* 87, 1082).

NICKELO-NICKELIC HYDRATE. A black powder, having the composition $Ni_8O_9.H_2O$ ($= Ni_2O_3.6NiO.H_2O$), is said to be formed by heating $NiCO_3$ to 300° (H. Rose, *P.* 84, 571).

NICKEL SUBOXIDE. An oxide, Ni_2O, is said to be produced by reducing NiO in H at 210°–214° (Müller, *P.* 136, 59); also by reducing NiO in CO at a low temperature (Bell, *C. N.* 23, 258, 267).

NICKEL PEROXIDE. By the reaction of hypochlorites on $Ni_2O_3.3H_2O$ one or more oxides are produced containing more O than Ni_2O_3. Wicke gives the composition Ni_4O_7 (*Z.* 1865. 303); Bayley (*C. N.* 39, 81) gives the formula Ni_3O_5. Carnot (*C. R.* 108, 610) says that Ni salt solutions give Ni_2O_3 when treated with hypochlorites or with Br and KOHAq.

Nickel, oxychloride of, *v. Nickel chloride*, p. 501.

Nickel, oxyfluoride of, *v. Nickel fluoride*, p. 502.

Nickel, oxyiodide of, *v. Nickel iodide*, p. 502.

Nickel, phosphides of. Ni and P combine when heated together. Various compounds have been described: (1) Ni_5P_2; by heating Ni, bone ash, quartz-sand, and C (*Gm.-K.* (6th ed.) 3, 542). (2) Ni_2P; by reducing $5NiO.P_2O_5$ in H (Struve, *J.* 1860. 76). (3) Ni_3P_2; by reducing $3NiO.P_2O_5$ in H (H. Rose, *P.* 24, 332), also by heating $NiCl_2$ or NiS in PH_3, or by passing PH_3 over heated Ni (Davy; Schrötter, *W. A. B.* 2, 304).

Nickel, salts of. *Compounds obtained by replacing H of acids by Ni.* The Ni salts which have been studied all correspond with the oxide NiO, and belong to the form NiX_2 where $X = ClO_3$, NO_3, $\frac{1}{2}SO_4$, $\frac{1}{2}CO_3$, $\frac{1}{3}PO_4$, &c. The oxide Ni_2O_3 probably forms salts, but they are very easily reduced to salts of NiO. The Ni salts are obtained by dissolving Ni, NiO, or $NiCO_3$ in acids. The salts of Ni are generally yellowish when dehydrated, and green when combined with water. Some of the compounds of Ni combine with NH_3. The haloid compounds, the sulphate and nitrate of Ni, and some of the other salts, are soluble in water; the oxides, sulphides, phosphate, carbonate, and a few other salts, are insoluble in water. Solutions of Ni salts in water are green; they redden litmus slightly. Most Ni salts are decomposed by heating in air; $NiCl_2$, $NiBr_2$, and NiI_2 can be sublimed unchanged. The chief Ni salts of oxyacids are the *antimonate*, *arsenates* and *-ite*, *borate*, *bromate*, *carbonate*, *chlorate*, *chromate*, *iodate* and *periodate*, *molybdates*, *nitrates* and *-ite*, *phosphates* and *-ite* and *hypophosphite*, *selenate*, *silicates*, *sulphates* and *-ite*, *thiosulphate* (*v.* CARBONATES, NITRATES, &c.).

Nickel, selenide of, NiSe. A silver-white, brittle, crystalline, solid; S.G. 8·46; obtained by action of Se vapour on finely powdered Ni. Melts at red heat, with loss of Se. Insoluble in HClAq; slowly dissolved by HNO_3Aq, quickly by *aqua regia* (Little, *A.* 112, 211).

Nickel, silicides of. Commercial Ni generally contains more or less Si. For experiments on the quantity of Si taken up by Ni *v.* Gard, *Am. S.* [3] 14, 274.

Nickel, silicofluoride of, $NiSiF_6.6H_2O$. Hexagonal rhombohedral, green crystals; S.G. 2·109; by dissolving $NiCO_3$ in H_2SiF_6Aq. Decomposed at red heat, giving NiF_2 and SiF_4 (Berzelius; Marignac, *Ann. M.* [5] 15, 262).

Nickel, sulphides of. Four sulphides of Ni are known: Ni_2S, NiS, Ni_3S_4, and NiS_2. NiS is somewhat soluble in NH_4 sulphide; it also forms a compound with K_2S. The only sulphide produced by the direct union of Ni and S is NiS.

NICKEL MONOSULPHIDE NiS. Occurs native as *capillary pyrites* or *millerite*. Formed by heating Ni with S; by heating NiO with S, or in a stream of H_2S (Tupputi, *A. Ch.* [3] 78, 133; 79, 153); also by heating $NiCl_2$ with K_2SAq in a sealed tube to c. 160° (Sénarmont, *A. Ch.* [3] 30, 142). As prepared by these methods, NiS is a yellow, brittle, solid; decomposed very slowly by steam at red heat (Regnault, *A. Ch.* [3] 62, 280); not decomposed by H; slowly acted on by Cl when hot (*v. P.* 42, 540); oxidised by heating in air; acted on by PH_3, when hot, with formation of Ni_3P_2 (Schrötter, *W. A. B.* 2, 304); insol. HClAq, sol. HNO_3Aq and *aqua regia*.

NiS, in combination with water, is ppd. from neutral Ni solutions by H_2S, or by NH_4HSAq; also by heating Ni salts with $Na_2S_2O_3Aq$ preferably in sealed tubes at c. 120° (Gibbs, *Am. S.* [2] 37, 346). Thomsen gives $[Ni,S,nH^2O] = 19,400$ (*Th.* 3, 307). The pp. thus obtained is brown-black; if ppd. from boiling solutions it may be washed and dried without change, but if ppd. from cold solutions it oxidises in the air (Clermont a. Guiot, *C. R.* 84, 714; 85, 73). Decomposed by boiling with water (Geitner, *A.* 139, 354). Somewhat soluble in NH_3Aq and alkali sulphide solutions; the brown solutions thus obtained deposit NiS by standing in air or on addition of a weak acid. According to Baubigny (*C. R.* 94, 1417) the pp. produced by H_2S in neutral solutions of Ni salts is a hydrosulphide which is decomposed to NiS and H_2S by filtration. A very dilute aqueous solution of a *colloidal form* of NiS was obtained by Winssinger (*Bl.* [2] 49, 452) by ppg. from a very dilute solution and dialysing.

Compound with potassium sulphide, $3NiS.K_2S$. A yellow, lustrous, crystalline solid; obtained by fusing $NiSO_4$ with K_2CO_3.

NICKEL DISULPHIDE NiS_2. A dark iron-grey powder; obtained by strongly heating $NiCO_3$ with K_2CO_3 and S, and treating with water (Fellenberg, *P.* 50, 75).

NICKELO-NICKELIC SULPHIDE Ni_3S_4. An amorphous greyish-black solid of this composition is obtained by heating $NiCl_2Aq$ with polysulphides of K to 160° (Sénarmont, *A. Ch.* [3] 30, 142); by heating Ni with SO_2Aq or Na_2SO_3Aq to 200°, Ni_3S_4 is obtained in rhombohedral crystals (Geitner, *A.* 139, 354).

Nickel subsulphide Ni_2S. A yellow, metal-like solid; obtained by heating $NiSO_4$ to redness, also by heating $NiSO_4$ or ppd. NiS with S in H (H. Rose, *P.* 110, 31). Ni_2S was obtained in small crystals by heating Ni in CS_2 vapour to bright redness (Gautier a. Hallopeau, *C. R.* 108, 1111). Prolonged heating in CS_2 produces NiS.

Nickel, sulphocyanide of, *v.* vol. ii. p. 350.

M. M. P. M.

NICOTIANIC ACID *v.* **Pyridine carboxylic acid.**

NICOTINE $C_{10}H_{14}N_2$ *i.e.*

$$CH\left\langle\begin{matrix}N—CH_2\\CH{:}CH\end{matrix}\right\rangle CH.CH\left\langle\begin{matrix}CH_2.CH\\CH_2.CH_2\end{matrix}\right\rangle N$$

(?) or

$$\begin{matrix}CH{:}CH.C.CHEt.CH_2\\CH{:}\ N\ .C.\ NH\ .CH_2\end{matrix}$$

(Pinner, *B.* 24, 61). *Dipyridyl hexahydride* (Liebrecht, *B.* 19, 2587). Mol. w. 162. (247° cor.) at 745 mm. S.G. $\frac{10}{4}$ 1·0183; $\frac{20}{4}$ 1·0110 (Landolt, *A.* 189, 318). V.D. 5·61 (calc. 5·58 (Barral, *J.* 1847, 614). S.H. ·420 (Colson, *Bl.* [3] 3, 8). *Heat of solution and of neutralisation* (Colson, *A. Ch.* [6] 19, 407). $[\alpha]_D = -161{\cdot}6°$ (L.).

Occurrence.—In leaves of tobacco (*Nicotiana Tabacum*) (Vauquelin; Posselt a. Reimann, *B. J.* 10, 193), and in the leaves of *Macrophylla rustica* and *M. glutinosa*. Occurs also in Pituri (Gerard, *J.* 1878, 915; Petit, *J.* 1879, 791). According to Zeise and to Vohl and Eulenberg (*Ar. Ph.* [2] 147, 130) it is not present in tobacco smoke, but Heubel obtained evidence of its presence therein (*D. P. J.* 207, 343).

Preparation.—Tobacco leaves (10 pts.) are soaked in water for 24 hours, and the mixture heated to 100° by steam. The aqueous extract is mixed with lime (1 pt.) and distilled. The distillate is neutralised by oxalic acid and evaporated to a thin syrup. Addition of conc. KOHAq now separates the base, which is rectified in a current of H (Laiblin, *A.* 196, 130).

Properties.—Colourless liquid, not frozen at −10°. Smells like tobacco, unless it is quite pure. It is very hygroscopic. Mixes with water, developing heat. Lævorotatory. The optical activity of its aqueous solution varies greatly with concentration: in a 4 p.c. solution $[\alpha]_D = -77°$ at 20°; in a ·88 p.c. solution $[\alpha]_D = -79°$ (Pribram, *B.* 20, 1840). Solutions of salts of nicotine are dextrorotatory. Nicotine has a burning taste and is very poisonous. Nicotine turns brown on exposure to air and light. Its solutions are strongly alkaline. It is very soluble in water, alcohol, ether, terpenes, and fatty oils. At 100° it dissolves 10 p.c. of sulphur. Ether extracts it from the aqueous solution. KOH separates it from aqueous solution.

Estimation.—1. By distilling with potash, extracting the distillation with ether, evaporating the ether, converting the residue into sulphate and repeating the process.—2. Tobacco is mixed with aqueous NaOH and some alcohol and extracted with ether. The extract is evaporated and the nicotine distilled over with steam and estimated by titration with standard acid, or by the polarimeter (Kissling, *Fr.* 21, 75; 22, 199; *Chem. Zeit.* 13, 1030; Popovici, *H.* 13, 445; Biel, *Ar. Ph.* [3] 26, 322).

Reactions.—1. *Oxidised* by nitric acid, chromic acid mixture, or $KMnO_4$ to pyridine carboxylic (nicotinic) acid (Huber, *A.* 141, 271; Laiblin, *B.* 10, 2136).—2. Alkaline K_3FeCy_6 oxidises it to isodipyridyl (C. a. E.).—3. Nicotine (5 pts.) heated with sulphur (1 pt.) at 140° gives H_2S and 'thiotetrapyridine' $C_{20}H_{18}N_4S$, which separates from boiling alcohol in sulphur-yellow crystals [155°], and forms the salts $B''H_2Cl_2$, $B''H_2PtCl_6$, and $B''HHgCl_3$. On distillation with finely-divided copper, thiotetrapyridine is converted into isodipyridyl (Cahours a. Etard, *C. R.* 88, 999; 90, 275).—4. Vapour of nicotine passed through a red-hot tube is partly decomposed, yielding paraffins, olefines, pyridine, methylpyridine, and collidine (C. a. E.).—5. Nicotine (5 pts.) heated with selenium (1 pt.) at 240° forms isodipyridyl and collidine dihydride $C_8H_{13}N$ (203°) (Cahours a. Etard, *C. R.* 92, 1079).—6. *Bromine* added to a dilute aqueous solution of nicotine forms a yellow flocculent pp. If this be dissolved by heating to 70° red crystals of the tetrabromide $C_{10}H_{14}N_2Br_4$ separate on cooling. With conc. HBrAq they form the salt $C_{10}H_{14}N_2Br_4HBr$ (Cahours a. Etard, *C. R.* 90, 1315).—7. By distilling the double chloride of zinc and nicotine with lime there is formed pyrrole, methylamine, NH_3, and a liquid base $C_{10}H_{11}N$ (250°–270°) with disgusting odour. A solution of the hydrochloride of this base is coloured dark red on boiling with $PtCl_4$ (Laiblin, *A.* 196, 172).—8. *Sodium* reduces nicotine in alcoholic solution to dipiperidyl.—9. HI and P at 260° gives nicotine dihydride.—10. H_2O_2 in presence of platinum black forms orange granular crystals of oxy-nicotine $C_{10}H_{14}N_2O$, which is oxidised by $KMnO_4$ to nicotinic acid, and forms a picrate [154°–158°] (Pinner a. Wolffenstein, *B.* 24, 65).—11. HgO at 240° yields oxytrinicotine $C_{30}H_{54}N_{12}O_4$ (?) which separates in brown flakes on addition of KOH to its acid solution. Its platinochloride $C_{60}H_{54}N_{12}O_44H_2PtCl_6$ 12aq is brownish-yellow (Etard, *C. R.* 97, 1218).

Salts.—$B''H_2Cl_2$: long fibrous deliquescent crystals (Barral, *A.* 44, 281). $[\alpha]_D = +102°$.—$B''H_2PtCl_6$: yellow crystalline pp. or ruby-red prisms, very soluble in excess of nicotine, insol. alcohol and ether. Not decomposed by boiling water (O. De Coninck, *Bl.* [2] 45, 131).—$B''H_4PtCl_6$: orange prisms (from HClAq). Obtained by adding nicotine to a solution of platinous chloride in HClAq (Raewsky, *J.* 1847, 615). The mother-liquor from which this salt has separated deposits red crystals of $B''H_2PtCl_4$.—$B''_2H_2SO_4$: crystals, v. sol. water and alcohol.—$B''HgCl_2$: white pp., formed by adding mercuric chloride to a solution of nicotine. Insol. water and ether, almost insol. alcohol (Ortigosa, *A.* 41, 118).—$B''3HgCl_2$. Long crystals, deposited on standing by a dilute solution of nicotine hydrochloride to which $HgCl_2$ has been added until a permanent pp. begins to form (Boedeker, *A.* 73, 372).—$B''HCl4HgCl_2$: crystalline pp. obtained by adding a cold neutral solution of nicotine hydrochloride to a large excess of mercuric chloride.—$B''H_2ZnCl_4$ 4aq: crystals (from 80 p.c. alcohol) (Vohl, *J. pr.* [2] 2, 331).—$B''H_2Cl_2Sn_2Cl_4$ aq. [162°]. Crystals, got by adding tin to the hydrochloride (Colson, *Bl.* [3] 3, 11).—$B''H_2CdCl_4$ 2aq (V.).—$B''H_2I_2$: needles (Wertheim, *J.* 1863, 441).—$B''HgI_2$: colourless crystals (from hot water).—$B''H_2HgI_4$: yellow prisms, sol. cold water and alcohol.—$B''ZnI_2$.—$B''HI_2$.—$B''HCl,HI_3$.—$B''AgNO_3$. Prisms.—**Tartrate** $B''(C_4H_6O_6)_2$ 2aq: white crystalline tufts, v. sol. water (Dreser, *Ar. Ph.* [3] 27, 266).—Nitroprusside: sol. water (Davy, *Ph.* [3] 11, 756).—Chloro-iodide, dark-yellow pp. (Dittmar, *B.* 18, 1612).—Picrate $B''2C_6H_2(NO_2)_3OH$. [218°]. Yellow needles (P. a. W.).

Methylo-iodide $B''Me_2I_2$ (Stahlschmidt, *A.* 90, 222). With moist Ag_2O it yields a caustic base. It yields the salts $B''Me_2PtCl_6$, $B''2MeAuCl_4$, and $B''Me_2Cl_24HgCl_2$. When the methylo-iodide is treated with alcoholic KOH at 45° it gives a ruby-red colouration; on addition of acids the colour remains red, and, on pouring into a large quantity of water, shows a green fluorescence (O. De Coninck, *C. R.* 104, 1374).

Ethylo-iodide $B''Et_2I_2$: prisms, v. sol. water, sl. sol. alcohol and ether (Von Planta a. Kekulé, *A.* 87, 2). Yields with Ag_2O a caustic base. It forms the crystalline salts $B''Et_2PtCl_6$ and $B''2EtAuCl_4$, and amorphous $B''Et_2Cl_23HgCl_2$. An alcoholic solution of the ethylo-iodide is coloured garnet-red, and finally crimson, by heating with addition of potash for 10 hours on a water-bath. After acidifying and pouring into water the colour is still red (De Coninck, *C. R.* 104, 513).

Isoamylo-iodide $B''2C_5H_{11}I$. Yields $B''(C_5H_{11})_2PtCl_6$ (Stahlschmidt).

Nicotine dihydride $C_{10}H_{16}N_2$. *Hydronicotine.* (264°). S.G. ^{17} ·993. $[\alpha]_D = -15°\,40'$ in a 13·7 p.c. solution. Formed by heating nicotine with fuming HIAq and red phosphorus at 265° for 10 hours (Etard, *C. R.* 97, 1218). Liquid, with faint odour, miscible with water, alcohol, and ether. Lævorotatory. Its hydrochloride is not ppd. by $HgCl_2$.—$B''H_2PtCl_6aq$: pale-yellow crystals, v. sl. sol. water.

Isonicotine *v.* Dipyridyl tetrahydride.

NICOTINIC ACID *v.* Pyridine carboxylic acid.

Homo-nicotinic acid *v.* Di-methyl-pyridine carboxylic acid.'

NIGRANILINE *v.* Aniline black.

NIGROSINE. A name used by Wolff (*Chem. Ind.* 2, 290, 319) to denote a blue-black substance $C_{36}H_{27}N_3$, found among the products of the action of arsenic acid on aniline hydrochloride at 230°. Its hydrochloride $C_{36}H_{27}N_3HCl$ exhibits in solution blood-red fluorescence, and is decolourised by reducing agents. The name 'nigrosine' has also been applied to indulines, more especially when obtained by the action of nitro-benzene on a mixture of pure aniline and aniline hydrochloride.

NIOBATES *v.* p. 506.

NIOBIUM. Nb (*Columbium*). At. w. 94. Mol. w. unknown. S.G. 7·06 at 15·5° (Roscoe, *C. N.* 37, 26).

Occurrence.—Niobates occur in a few rare minerals, *e.g.* in *columbite, tantalite, samarskite, yttro-ilmenite, euxenite,* and some varieties of *pitch-blende.* Niobates are generally accompanied by tantalates, tungstates, titanates, zirconates, and compounds of Th, Ce, and Yt.

History.—In 1801, Hatchett found a new oxide in a mineral called *columbite* from Massachusetts; to the metal of the new oxide he gave the name columbium (*Crell's Ann.* 1, 197, 257, 352). In the following year, Ekeberg (*Scher. J.* 9, 597) examined two minerals—one from Finland, the other from Sweden—and announced the discovery of a new oxide; as the oxide was soluble only in caustic alkalis and was ppd. by acids, Ekeberg gave to the metal of this oxide the name tantalum. In 1809, Wollaston (*S.* 1, 520) pronounced the oxides discovered by Hatchett and Ekeberg, respectively, to be identical. Berzelius confirmed the decision of Wollaston (*P.* 4, 6); he proposed to apply the name tantalum to the characteristic metal of *columbite* and the minerals examined by Ekeberg. Oxide of tantalum was recognised as present in several rare minerals (*v.* Hermann, *J. pr.* 38, 91; H. Rose, *P.* 63, 321). In 1844, H. Rose began a series of researches on the minerals containing tantalum compounds (*P.* vols. 63, 69, 73, 74, 90, 99, 100, 101, 102). Rose concluded that oxides of three distinct metals exist in these minerals: oxide of tantalum in *tantalite* from Finland and Sweden; and oxides of two new metals, which he called niobium and pelopium, in *tantalite* from Massachusetts (formerly called *columbite*) and in a *tantalite* from Bavaria. In 1853, Rose came to the conclusion that the compounds described by him as oxides of niobium and pelopium were really two different oxides of the same metal which was different from tantalum; this metal Rose called niobium (from Niobe, the daughter of Tantalus) (Rose, *P.* 63, 317). As different specimens of niobium oxide showed considerable differences of S.G., Marignac re-examined the ground, and showed that some of Rose's oxides of niobium contained tantalum (*C. R.* 60, 234, 1355). Marignac also showed that the most probable formulæ for the oxide and chloride of Nb are Nb_2O_5 and $NbCl_5$, respectively. Blomstrand (*J. pr.* 97, 57) confirmed Marignac's results. Determinations of S.G. of gaseous Nb chloride and oxychloride by Deville a. Troost (*C. R.* 56, 891) have shown the formulæ $NbCl_5$ and $NbOCl_3$ to be molecular. H. Rose supposed he had obtained Nb by reducing a compound of Nb, K, and F by Na; Delafontaine showed that Rose's supposed Nb was really NbO, and that the compound from which it was obtained contained O (*Ar. Sc.* 27, 167). Blomstrand obtained Nb, containing some H, in 1864 by reducing the chloride in H; in 1878 Roscoe prepared approximately pure Nb by the same method (*C. N.* 37, 25).

The existence of three other metals in niobium-containing minerals has been asserted by von Kobell (*J. pr.* 79, 291; 83, 193, 449), and Hermann (*J. pr.* 38, 91, 119; *J. pr.* [2] 3, 373; 4, 178; 15, 105); but the researches of Blomstrand and Marignac (*l.c.*) make the existence of these metals—*diomium, ilmenium,* and *neptunium*—very doubtful.

Preparation.—Very finely-powdered *columbite* is fused with 3 times its weight of $KHSO_4$, in an iron or Pt crucible, until completely dissolved; after cooling, the residue is powdered and treated with boiling water, whereby sulphates of K, Fe, and Mn are removed; the insoluble portion is washed, and digested with yellow NH_4 sulphide, sulphides of Sn and W thus go into solution and FeS remains mixed with Nb_2O_5 and Ta_2O_5; the residue is washed and digested with HClAq, to remove FeS; the insoluble in acid is thoroughly washed with boiling water until white. To separate Nb from this mixture of Nb_2O_5 and Ta_2O_5, the whole is dissolved in HFAq, the solution is heated to boiling, and

¼ part KHF_2 is added for each part of mixed Nb_2O_5 and Ta_2O_5 used; the liquid is evaporated until 1 g. of the mixed oxides is present in about 7 c.c., and allowed to cool; crystals of K_2TaF_7 separate, these are washed with cold water till the washings give no red, but a pure yellow, pp. with tincture of galls; the filtrate is concentrated with addition of KHF_2, and the second crop of K_2TaF_7 crystals is removed and washed. After one or two repetitions of this process, fine tablets of $NbOF_3.2KF$ separate on evaporating the filtrate from the K_2TaF_7 crystals; the tablets are collected, pressed, and heated in a Pt dish with H_2SO_4 until HF is completely removed; the residue is boiled with a large quantity of water for some time, when a white pp. of $Nb_2O_5.xH_2O$ separates out (Berzelius; *v.* also Marignac, *Ar. Sc.* 23, 167, 249; 25, 5). The pp. of $Nb_2O_5.xH_2O$ is washed, dried, and heated to redness; it is then mixed with a large excess of charcoal, the mixture is heated, then placed in a large hard glass tube (a small quantity being used, as $NbCl_5$ is very voluminous), heated in dry CO_2 until perfectly dry, and allowed to cool in dry CO_2; the CO_2 is then completely expelled by dry Cl, and the tube is then heated to redness while dry Cl passes through it; $NbCl_5$ collects in the tube, and is distilled in a stream of dry Cl. The $NbCl_5$ is then vapourised in a current of perfectly dry H, with precautions to prevent the entrance of air and moisture, and the mixed vapour is passed through a red-hot tube of hard glass. The grey, lustrous crust of Nb which forms in the tube is finally strongly heated in a stream of perfectly dry H (Roscoe, *C. N.* 37, 25). Nb thus prepared contains about ·27 p.c. H.

Properties and Reactions.—A steel-grey lustrous metal. S.G. 7·06 at 15·5° (Roscoe, *l.c.*). Insol. HClAq, HNO_3Aq, or *aqua regia*; sol. conc. H_2SO_4. Heated in air, burns to Nb_2O_5. Heated in Cl forms $NbCl_5$.

The at. w. of Nb has been determined (1) by determinations of V.D. of $NbCl_5$ and $NbOCl_3$ (Deville a. Troost, *C. R.* 56, 891; 60, 1221); and by analyses of $NbCl_5$ (H. Rose, *P.* 104, 432; Blomstrand, *Acta Univ. Lund.* 1864; Marignac, *Bibl. Univ. Genève*, 1865 and 1866); (2) by analyses of $NbOF_3.2KF$. aq (Marignac, *l.c.*).

Nb is metallic in its physical properties. NbO and Nb_2O_5 dissolve in conc. H_2SO_4, but no definite sulphates or other salts of the oxides have been isolated. $Nb_2O_5.xH_2O$ forms several niobates, in which Nb forms part of the negative radicle. Nb forms the third member of the even-series family of Group V.; it is closely related to Ta, and less closely to N, P, V, As, Sb, Di, Er, and Bi (*v.* NITROGEN GROUP OF ELEMENTS, this vol. p. 571).

Detection and Estimation.—Niobates dissolve in hot HClAq; on adding water and boiling, $Nb_2O_5.xH_2O$ ppts. Solutions in HClAq are coloured blue, then dark brown, by Zn. K_4FeCy_6Aq gives a red pp., and K_3FeCy_6Aq a bright-yellow pp., with aqueous solutions of alkali niobates; gall tincture gives an orange-red pp. Nb is estimated as Nb_2O_5; the process is sufficiently described under *Preparation* (*cf.* Rammelsberg, *P.* 136, 177, 362; 144, 56, 191).

Niobium, acids of, and their salts. Niobic oxide, Nb_2O_5, reacts with alkali oxides to form salts; these niobates may be regarded as derived from various hydrates of Nb_2O_5. Hydrated niobic oxide, $Nb_2O_5.xH_2O$, is obtained by fusing Nb_2O_5 with $KHSO_4$, washing with water, dissolving in HClAq, and ppg. by NH_3Aq; the pp. thus obtained by Santesson (*Bl.* [2] 24, 52) contained c. 8·4 p.c. water, which corresponds with the composition $3Nb_2O_5.4H_2O$ ($=Nb_6O_{11}(OH)_8$). The hydrate $Nb_2O_5.7H_2O$ is obtained, according to Santesson (*l.c.*), by reacting on $NaNbO_3$ with H_2SO_4Aq and drying at 100° (*v. Hydrates of niobic oxide*, p. 509). Niobates have not been obtained by neutralising hydrates of Nb_2O_5, but either by fusing Nb_2O_5 with basic oxides or carbonates, or by double decomposition from solutions of alkali niobates.

NIOBATES. The niobates belong to the form $xNb_2O_5.yMO$, where $M = K_2$, Ca, Mg, Mn, &c. Niobates are known corresponding with the meta- and pyrophosphates; and, besides these, salts have been isolated in which the ratio of the basic to acidic oxide varies from 1:2 to 4:1. The niobates are prepared by fusing Nb_2O_5 with basic oxides, carbonates, and a few other salts; some niobates are obtained by ppg. solutions of alkali niobates by solutions of metallic salts. The alkali niobates are soluble in water; the others are insoluble. Solutions of the alkali niobates are decomposed by H_2SO_4Aq with ppn. of $Nb_2O_5.xH_2O$; CO_2 ppts. acid salts. Solutions of niobates in HClAq are reduced by Zn to Nb_3O_5 (blue), and then to Nb_2O_4 (brown-black) (*v. Niobium oxides*, p. 508). *Fluoniobates* and *fluoxyniobates* are also known (*v.* next page).

Potassium niobates. (1) *Metaniobate*, $KNbO_3$. Small rectangular tablets; sol. water; obtained by dissolving Nb_2O_5 in molten CaF_2, fusing the product with K_2CO_3, in ratio $K_2CO_3:Nb_2O_5$, and repeatedly treating the mass (after cooling) with boiling dilute H_2SO_4Aq (Joly, *Fremy's Encyclop. Chimique*). (2) *Pyroniobate*, $K_4Nb_2O_7.11H_2O$. Insol. water; obtained by melting Nb_2O_5 with a large excess of K_2CO_3, and washing with water (Santesson, *Bl.* [2] 24, 52). (3) $3Nb_2O_5.4K_2O.16H_2O$, and (4) $7Nb_2O_5.8K_2O.32H_2O$. The former salt is obtained by fusing Nb_2O_5 with 2 to 3 times its weight of K_2CO_3, dissolving in water, and evaporating *in vacuo*; large monoclinic crystals, efflorescent in air, loses $12H_2O$ at 100°, and is dehydrated at red heat. The second salt is obtained in quadratic octahedra by slowly evaporating a solution of the first salt (Marignac, *A. Ch.* [4] 8, 5; 13, 5). (5) $2Nb_2O_5.3K_2O.13H_2O$; rhombic pyramids, by adding KOHAq to solution of salt (3) or (4), and evaporating slowly (Marignac, *l.c.*). (6) $2Nb_2O_5.2K_2O.11H_2O$; the crystalline residue obtained by fusing Nb_2O_5 and K_2CO_3, in the ratio $Nb_2O_5:K_2CO_3$, and treating with water, has this composition (Santesson, *Bl.* [2] 24, 52). (7) $4Nb_2O_5.3K_2O$; obtained by strongly heating Nb_2O_5 with twice its weight of $KHSO_4$ for some hours, and washing with water (Joly, *Fremy's Encyclop. Chimique*). (8) $3Nb_2O_5.K_2O.5H_2O$; prepared by boiling $KNbOF_3.2KFAq$ with $KHCO_3$, washing the powder which separates, and drying at 100° (Marignac, *l.c.*).

Sodium niobates. (1) *Metaniobate*, $2NaNbO_3.5H_2O$. Rhombic prisms; obtained by fusing Nb_2O_5 with 3 pts. Na_2CO_3, allowing to stand in contact with cold water (which dissolves Na_2CO_3), dissolving in hot water, and crystallising

(Joly, *Fremy's Encyclop. Chimique*). Santesson (*Bl.* [2] 24, 52) obtained this salt by boiling $Nb_2O_5.xH_2O$ with NaOHAq; the salt remained insoluble in NaOHAq, slightly soluble in cold water. (2) $4Nb_2O_5.Na_2O.H_2O$; a salt, probably with this composition, was obtained by Santesson (*l.c.*) as a gelatinous pp. by passing CO_2 into solution of $NaNbO_3$. (3) $3Nb_2O_5.2Na_2O.9H_2O$. An insoluble amorphous salt, obtained by fusing Nb_2O_5 with NaOH and treating with water (Santesson, *l.c.*).

Niobates of Ca, Mg, and Mn—viz. $Ca_2Nb_2O_7$, $Ca(NbO_3)_2$; $Mg_2Nb_2O_7.2MgO$, $Mg_2Nb_2O_7.MgO$, $Mg_2Nb_2O_7$; $Mn(NbO_3)_2$—have been obtained by Joly (*l.c.*) by fusing $CaCl_2$, $MgCl_2$, and $MnCl_2$, with Nb_2O_5. Joly also obtained a niobate of Fe, and a niobate of Fe and Mn. H. Rose (*P.* 90, 456) obtained niobates of Cu, Hg, and Ag by adding salts of these metals to solutions of $NaNbO_3$.

FLUONIOBATES. These salts, which may also be regarded as compounds of NbF_5 with metallic fluorides, and sometimes also with HF, are obtained by dissolving $Nb_2O_5.xH_2O$ in large excess of HFAq, adding metallic carbonates, and evaporating; the fluoniobates are also formed by dissolving fluoxyniobates (*v. infra*) in HFAq and evaporating (Marignac, *A. Ch.* [4] 13, 5; Santesson, *Bl.* [2] 24, 52). The following are the principal fluoniobates:—

$(NH_4)_2NbF_7.2NbOF_3.NH_4F$;
$Co_5Nb_3F_{25}.5HF.28H_2O$
$(=3NbF_5.5CoF_2.5HF.28H_2O)$;
$Cu_4Nb_2F_{18}.HF.18H_2O$
$(=2NbF_5.4CuF_2.HF.18H_2O)$;
$Fe_3Nb_2F_{16}.19H_2O$ $(=2NbF_5.3FeF_2.19H_2O)$;
$Mn_5Nb_3F_{25}.5HF.13H_2O$
$(=3NbF_5.5MnF_2.5HF.13H_2O)$;
$Ni_5Nb_2F_{25}.5HF.28H_2O$
$(=3NbF_5.5NiF_2.5HF.28H_2O)$;
$K_2NbF_7(NbF_5.2KF)$.

FLUOXYNIOBATES. These salts are obtained by dissolving Nb_2O_5 with alkali fluorides in HFAq, and evaporating. They may be regarded as derived from the hypothetical acids H_2NbOF_5, H_3NbOF_6, and H_4NbOF_7; they may also be looked on as compounds of $NbOF_3$ with alkali fluorides. The fluoxyniobiates have been examined chiefly by Marignac (*A. Ch.* [4] 8, 5; 13, 5).

Ammonium fluoxyniobates. 1. $(NH_4)_2NbOF_5$ $(=NbOF_3.2NH_4F)$. Obtained by dissolving Nb_2O_5 and NH_4F in HFAq, and evaporating; easily soluble rhombic prisms, isomorphous with $WO_2F_2.2NH_4F$.—2. $(NH_4)_3NbOF_6$ $(=NbOF_3.3NH_4F)$. Obtained similarly to the foregoing salt; forms octahedral crystals, isomorphous with $ZrF_4.3NH_4F$ (Baker, *C. J.* 35, 762).—3. $(NH_4)_4NbOF_7$ $(=NbOF_3.4NH_4F)$. Obtained by dissolving $Nb_2O_5.xH_2O$ in conc. NH_4FAq; cubic and octahedral crystals of the regular system (Joly, *P.* 108, 467). — 4. $(NH_4)_5Nb_3O_3F_{14}.H_2O$ $(=3NbOF_3.5NH_4F.H_2O)$. Obtained by adding less than an equivalent of NH_4F to Nb_2O_5 in HFAq, and evaporating.

Potassium fluoxyniobates. — 1. $K_2NbOF_5.H_2O$ $(=NbOF_3.2KF.H_2O)$. Obtained by evaporating a solution of Nb_2O_5 in HFAq after addition of KF. By crystallising from water, the salt separates in such fine tablets that the liquid appears to gelatinise; monoclinic tables are obtained by crystallising from water containing a little HF. Loses H_2O at 100°; melts at red heat; sol. in 12-13 pts. water at 17°-21°; easily soluble in hot water.—2. K_3NbOF_6 $(=NbOF_3.3KF)$. Obtained by adding excess of KF to solution of the foregoing salt. Cubical crystals belonging to the regular system (Baker, *C. J.* 35, 761).—3. $K_5Nb_3O_3F_{14}.H_2O$ $(=3NbOF_3.5KF.H_2O)$. Obtained by adding less than an equivalent of KF to Nb_2O_5 in HFAq, evaporating a little, separating from $K_2NbOF_5.H_2O$ which separates, and evaporating the mother-liquor.—4. $K_3NbOF_6.HF$ $(=NbOF_3.3KF.HF)$. Obtained by dissolving Nb_2O_5 in considerable excess of HFAq, and adding excess of KF; isomorphous with $SnF_4.3KF.HF$.

Fluoxyniobates of Cu and Zn have also been obtained; $CuNbOF_5.4H_2O$, and $ZnNbOF_5.6H_2O$.

Niobium, alloys of. An alloy of Nb with Al, approximately of the composition Nb_2Al_3, was obtained by Marignac (*Ar. Sc.* 31, 89) by heating $NbF_5.2KF$ with Al in a carbon crucible, and treating with cold HClAq. A grey, crystalline, metal-like powder; S.G. 4·45 to 4·52. Soluble in hot HClAq with evolution of H. Insoluble in HNO_3Aq or dilute H_2SO_4Aq; boiling conc. H_2SO_4 forms SO_2 and S; soluble in HFAq.

Niobium, bromide of. $NiBr_5$. Formula probably molecular, because of similarity with $NbCl_5$, which has been gasified. A purple-red solid, obtained by passing CO_2 laden with Br vapour over a heated mixture of Nb_2O_5 and C (H. Rose, *P.* 104, 442).

Niobium, carbide of. By heating to c. 1500° a mixture of 4 pts. Nb_2O_5, 1 pt. sugar carbon, and 1 pt. Na_2CO_3, Joly obtained large violet needles of the composition NbC (*Bl.* [2] 25, 206).

Niobium, carbonitride of. By heating Nb_2O_5 with a mixture of Na_2CO_3 and C to c. 1200°, Deville (*C. R.* 66, 180) obtained a crystalline mass, which evolved NH_3 when heated with molten KOH; according to Joly (*Bl.* [2] 25, 206), this substance is either a carbonitride of Nb, or a mixture of carbide, NbC, with nitride NbN.

Niobium, chlorides of. Two chlorides of Nb are known, $NbCl_5$ and $NbCl_3$.

NIOBIUM PENTACHLORIDE $NbCl_5$. Mol. w. 270·85. V.D. 138·9 (Deville a. Troost, *C. R.* 60, 1221). Melts at 194° and boils at 240° (D. a. T., *l.c.*).

Preparation.—Perfectly dry Nb_2O_5 is mixed with a large excess of dry sugar or starch, the mixture is completely charred by heating in a closed crucible, and a small quantity is then placed in a rather wide tube of hard glass, narrowed here and there, connected with a CO_2 and a Cl apparatus; the tube is gently heated for some time while a stream of perfectly dry CO_2 is passed through it, and is then allowed to cool in the CO_2; when cold, perfectly dry Cl is passed through the tube; when every trace of CO_2 is expelled, the tube is gradually heated to bright redness in the stream of Cl; $NbCl_5$, mixed with a little $NbOCl_3$, collects in the wider parts of the tube. The $NbCl_5$ is separated from the less volatile $NbOCl_3$ by distillation in dry Cl.

As $NbCl_5$ is very voluminous the operation must be conducted in wide tubes and with small quantities of the mixed Nb_2O_5 and C (H. Rose).

Properties and Reactions.—Yellow needles; melts at 194°, beginning to sublime at 125°, boils at 240° (Deville a. Troost, *C. R.* 60, 1221). Vapour is yellow. Soluble in alcohol. Fumes in air, giving off HCl. Decomposed by water to HCl and $Nb_2O_5.xH_2O$. Soluble in cold conc. HClAq; Zn produces a blue colour in this solution; on dilution and heating, $Nb_2O_5.xH_2O$ separates. Soluble in conc. H_2SO_4 with evolution of HCl. Vapour of $NbCl_5$ is reduced to Nb by heating with H (Blomstrand; Roscoe, *C. N.* 37, 25). $NbOCl_3$ is produced by heating with Nb_2O_5. $Nb_2O_2S_3$ is formed by heating in CS_2 vapour (Delafontaine, *Ar. Sc.* 27, 167).

NIOBIUM TRICHLORIDE $NbCl_3$. When vapour of $NbCl_5$ is slowly passed through a red-hot tube, a dark-grey metal-like crust forms on the sides of the tube; this crust is $NbCl_3$ (Roscoe, *C. N.* 37, 25). Not volatile; non-deliquescent; unchanged by H_2O or NH_3Aq; by HNO_3Aq gives HCl and $Nb_2O_5.xH_2O$. Heated in air, gives off white fumes. When heated in CO_2, produces CO and $NbOCl_3$.

Niobium, fluorids of. No fluoride of Nb has been isolated with certainty. $Nb_2O_5.xH_2O$ dissolves easily in HFAq; on evaporation a non-crystallisable mass is obtained, which evolves white fumes when heated and leaves Nb_2O_5. Solution of $Nb_2O_5.xH_2O$ in HFAq yields *fluoniobates* when mixed with metallic carbonates and evaporated; these fluoniobates may be regarded as compounds of NbF_5 with metallic fluorides (*v. Fluoniobates*, p. 507).

Niobium, haloid compounds of. The only haloid compound of Nb which has been gasified is $NbCl_5$; the trichloride is also known, and the formula $NbCl_3$ is probably molecular. No fluoride or iodide has been isolated, but several compounds are known, which may be regarded as formed by the union of NbF_5 with more positive fluorides (*v. Fluoniobates*, p. 507). $NbCl_3$ reduces CO_2 to CO at a high temperature. Oxyhaloid compounds are known, of the form $NbOX_3$, where X = Br, Cl, or F.

Niobium, hydride of, ?NbH. Marignac (*Ar. Sc.* 1868) obtained a heavy grey powder, having approximately the composition NbH, mixed with a little Nb_2O_5, by heating K_2NbF_7, mixed with a little KHF_2, and covered with NaCl, with excess of Na in an iron crucible. The reaction was energetic; the fused mass was broken up, treated with water, then with water containing a little HF, then washed with water, and finally filtered and dried. The powder obtained by Marignac had S.G. 6 to 6·6; it dissolved in conc. HFAq with rapid evolution of H; it was insoluble in HClAq, HNO_3Aq, and dilute H_2SO_4Aq, sol. warm conc. H_2SO_4, also in molten $KHSO_4$; heated in air or O to above 100° it burned to Nb_2O_5 and H_2O; it was unchanged when heated in H. Krüss a. Nilson (*B.* 20, 1691) repeated Marignac's experiments, using a quantity of Na equivalent to the K_2NbF_7; they obtained a mixture of c. 77 p.c. NbH, c. 21·5 p.c. Nb_2O_5, and c. 1 p.c. Fe_2O_3. K. a. N. give S.H. of NbH as ·097 at 0° to 100°, ·092 at 0° to 210·5°, ·087 at 0° to 301·5°, and ·083 at 0° to 449°.

Niobium, nitride of, ?NbN. $NbCl_5$ absorbs NH_3; on heating, NH_4Cl is evolved, and a black mass remains which contains N. Heated with KOHAq, NH_3 is evolved; it is not attacked by HNO_3Aq; soluble in HFAq; heated in air, it oxidises with incandescence. The composition of this body is approximately NbN (H. Rose; Deville, *C. R.* 66, 180; Joly, *Bl.* [2] 25, 206). By reducing Nb_2O_5 with a mixture of soda and C, Deville obtained a crystalline mass, probably a mixture of nitride and carbide of Nb.

Niobium, nitro-carbide of, *v. Niobium, carbonitride of*, p. 507.

Niobium, oxides of. Three oxides of Nb have been isolated, NbO, NbO_2, and Nb_2O_5; a fourth, Nb_2O_5, probably exists. Nb_2O_5 is formed by heating Nb in air or O, also by decomposing $NbOCl_3$ by water, and in other ways; NbO_2 is produced by the partial reduction of Nb_2O_5 in H; NbO is obtained by the incomplete reduction of $NbOF_3$ or $NbOCl_3$ by Na or Mg; when Nb_2O_5 in HClAq is reduced by Zn the solution becomes brown, and a solid separates, which is probably Nb_3O_5. Moist Nb_2O_5 reacts as an acid-forming oxide; niobates are formed by fusing Nb_2O_5 with basic acids or carbonates (*v. Niobates*, p. 506). The mol. w. of none of the oxides of Nb is known with certainty.

NIOBIC OXIDE Nb_2O_5 (*Niobic anhydride. Niobium pentoxide*).

Occurrence.—Niobates occur in a few rare minerals, *e.g. columbite, tantalite*, and *samarskite.*

Preparation.—1. $NbOCl_3$ is agitated with water, the insoluble $Nb_2O_5.xH_2O$ is washed till free from HCl, dried at 100°, and heated to incipient redness. The solution after treating $NbOCl_3$ with water contains much Nb_2O_5; the oxide is obtained by adding slight excess of NH_3Aq, warming till every trace of NH_3 is removed, collecting the pp., washing till free from HCl, and drying.—2. Dilute H_2SO_4Aq is added to a boiling solution of $NaNbO_3$, the ppd. $Nb_2O_5.xH_2O$ is thoroughly washed and heated.—3. Impure Nb_2O_5 is fused with $KHSO_4$, the fused mass is treated with water, and the pp. is washed and heated.—4. Nb_2O_5 is obtained in crystals by dissolving in molten borax, heating in a porcelain oven, washing, and drying (Nordenskjöld, *P.* 114, 612; Ebelmen, *A. Ch.* [3] 33, 34; Knop, *Z. K.* 12, 610; also by strongly heating Nb_2O_5 (from $NbOCl_3$) in a slow current of HCl (Deville, *C. R.* 66, 180). For preparation of Nb_2O_5 from *columbite v.* NIOBIUM, *Preparation*, p. 505.

Properties.—A white powder; becomes yellow when heated, and goes white on cooling. Insoluble in water. S.G. 4·4 to 4·53 (Marignac, *A. Ch.* [4] 8, 5). The crystals of Nb_2O_5 are flat, right-angled tablets; they are optically active (Nordenskjöld, *P.* 114, 612; *cf.* Ebelmen, *A. Ch.* [3] 33, 34; Knop, *A.* 159, 56). S.H. ·118 at 0° to 210·5°, ·124 at 0° to 301·5°, ·134 at 0° to 449°. (Krüss a. Nilson, *B.* 20, 1691).

Reactions.—1. Dissolves in hot conc. *sulphuric acid*; the solution may be diluted without ppn., but on heating all the Nb_2O_5 is ppd.; the pp. contains H_2SO_4.—2. Boiling *hydrochloric acid* dissolves only traces of Nb_2O_5; the residue is easily soluble in water, and this solution is ppd. on boiling with H_2SO_4Aq (Wöhler, *P.* 48, 93; Marignac, *A. Ch.* [4] 8, 15; 13, 20; H. Rose, *P.* 112, 484).—3. Easily dissolved by cold *hydrofluoric acid.*—4. Soluble in *caustic potash* solution.—5. *Caustic soda* does not dissolve Nb_2O_5 but the product is soluble in water. Nb_2O_5 which has been strongly heated is insoluble in H_2SO_4, HClAq, or HFAq; it is dissolved by molten alkalis.—6. Reduced by *hydrogen* to

NbO_2 at full red heat.—7. Moist Nb_2O_5 dissolved in HClAq is reduced by *zinc* with formation of a blue liquid which then becomes brown and deposits brown flocks, probably of Nb_2O_5 (Marignac, *A. Ch.* [4] 13, 5).—8. Strongly heated with *hydrogen sulphide*, or *carbon disulphide*, an oxysulphide is formed, probably Nb_2OS_2 (Delafontaine, *Ar. Sc.* 27, 167).—9. Heated with *ammonia*, Nb nitride (*q.v.*) is formed.—10. Mixed with *carbon* and heated in *chlorine* or *bromine*, $NbCl_5$ (or $NbBr_5$) is formed along with some $NbOCl_3$ (or $NbOBr_3$).—11. Fused with *basic oxides* or *carbonates*, niobates (*q. v.*) are produced.

Combinations.—1. With *water* to form various hydrates (*v. infra*).—2. Nb_2O_5 appears to combine with some acids, but no definite compounds have yet been isolated; *e.g.* the pp. obtained by decomposing $NbOCl_3$ by water in presence of Na_2HPO_4 contains H_3PO_4, and the pp. obtained by adding water to Nb_2O_5 in H_2SO_4 and boiling contains H_2SO_4 (*v.* Blomstrand, *Acta Univ. Lund.* 1864).

Hydrates of niobic oxide. Various hydrates of Nb_2O_5 are known. By fusing Nb_2O_5 with $KHSO_4$, boiling with water, dissolving the pp. in HClAq, and ppg. by NH_3Aq, Santesson (*Bl.* [2] 24, 52) obtained a flocculent pp. containing 8·04 to 8·41 p.c. H_2O, agreeing with the formula $3Nb_2O_5.4H_2O$. The solid obtained by ppg. $NaNbO_3Aq$ by H_2SO_4Aq and drying at 100° has the composition $Nb_2O_5.7H_2O$, according to Santesson (*l.c.*). The hydrate obtained by decomposing $NbOCl_3$ by water is amorphous; that formed by the action of moist air on $NbOCl_3$ is said to be crystalline (H. Rose, *P.* 112, 557). The hydrates of Nb_2O_5 react as weak acids (*v. Niobates*, p. 506).

Niobous oxide NbO (*Niobium monoxide*). By reducing $NbOF_3.2KF$ with Na, H. Rose obtained a black powder which he thought to be Nb (*P.* 104, 312). This substance was recognised as an oxide by Delafontaine (*Ar. Sc.* 27, 167). Prepared by strongly heating $NbOF_3.2KF$ with Na, under KCl, and washing with cold water. S.G. 6·3 to 6·67. Obtained in crystals by passing vapour of $NbOCl_3$ over heated Mg wire (Deville a. Troost, *C. R.* 60, 1221; *v.* also Deville, *C. R.* 66, 183). Black, lustrous, regular crystals. Moist NbO is soluble in boiling dilute HClAq, or in HFAq; H is said to be evolved. KOHAq dissolves NbO, forming K niobate. Molten $KHSO_4$ forms Nb_2O_5; heated in Cl $NbOCl_3$ is produced.

Niobium dioxide NbO_2 (*Niobium tetroxide* [Nb_2O_4]). A black powder with blue reflection; insol. water and acids. Formed by heating Nb_2O_5 in a stream of H to full white heat (Delafontaine, *Ar. Sc.* 27, 167).

Wöhler (*P.* 48, 93) noticed that Zn reduces a solution of Nb_2O_5 in HClAq, with production of blue and then brown coloured substances. Marignac (*A. Ch.* [4] 13, 5) obtained a blue-brown pp. by boiling $Nb_2O_5.xH_2O$ with HClAq, dissolving the residue in water, and reducing by Zn.

Niobium, oxybromide of, $NbOBr_3$. A voluminous, crystalline, yellowish solid, obtained by passing Br vapour over a heated mixture of Nb_2O_5, with a little charcoal (H. Rose, *P.* 104, 442). Sublimes without melting. Heated in CO_2 gives Nb_2O_5 and $NbBr_5$. Decomposed by water, giving $Nb_2O_5.xH_2O$ and HBrAq.

Niobium, oxychloride of, $NbOCl_3$. Mol. w. 216·1. Obtained, along with $NbCl_5$, by heating Nb_2O_5 mixed with charcoal in a stream of Cl; also by heating Nb_2O_5 in a stream of CO_2 charged with vapour of $NbCl_5$ (Deville a. Troost, *C. R.* 60, 1221). A white, lustrous mass; sublimes at c. 400° without melting. V.D. at 440° to 810° $=114$ (D. a. T., *l.c.*). Heated strongly in CO_2, $NbCl_5$ and Nb_2O_5 are formed; the same products are formed by heating in H (Blomstrand, *Acta Univ. Lund.*, 1864). Sol. alcohol; decomposed by water to $Nb_2O_5.xH_2O$ and HClAq.

Niobium, oxyfluoride of, $NbOF_3$. Small crystals, optically active; resemble ZrF_4; obtained by strongly heating Nb_2O_5, mixed with a large excess of CaF_2 in HCl (Joly, *C. R.* 81, 1266). $NbOF_3$ forms various compounds with metallic fluorides (*v. Fluoxyniobates*, p. 507).

Niobium, oxysulphide of, Nb_2OS_3. A black powder; obtained by passing H_2S or CS_2 vapour over strongly heated Nb_2O_5. The product of these reactions was supposed by H. Rose to be a sulphide of Nb (*P.* 111, 193; *v.* also Rose a. Hermann, *J. pr.* 111, 393). Delafontaine (*Ar. Sc.* 27, 167) showed the substance to be an oxysulphide; Rammelsberg (*J. pr.* 108, 95) thought the composition was NbOS or $Nb_7O_7S_8$.

Niobium, salts of. No compounds obtained by replacing the H of acids by Nb have yet been isolated. There are indications that Nb_2O_5 combines with some acids (*v. Niobic oxide, Combinations*, No. 2, *supra*). M. M. P. M.

NITRANILIC ACID *v.* Di-nitro-di-oxy-quinone.

NITRANILINE *v.* Nitroaniline.

NITRATES. *Salts of nitric acid*, HNO_3. The greater number of the nitrates are normal salts; many basic nitrates also exist. The general formula for normal nitrates may be written $M^n.nNO_3$, where M^n denotes a metal of *n* valency. The normal nitrates may also be regarded as composed of a basic and an acidic radicle; on this view, they are classed under the general formulæ $M_2O.N_2O_5$, $MO.N_2O_5$, $M_2O_3.3N_2O_5$, $MO_2.2N_2O_5$. The simplest way of looking at the composition of the basic nitrates is to regard them as compounds of the acidic radicle N_2O_5 with more than the normal quantity of base; thus normal lead nitrate is $PbO.N_2O_5$, and basic lead nitrate is $3PbO.N_2O_5$. Several basic nitrates may be formulated as salts of the hypothetical orthonitric acid H_3NO_4, which bears the same relation to ordinary, or meta, nitric acid that orthophosphoric bears to metaphosphoric acid; thus basic lead nitrate $3PbO.N_2O_5$ may be written $Pb_3(NO_4)_2$.

Some nitrates occur native; *e.g.* $Ca(NO_3)_2$, $Mg(NO_3)_2$, KNO_3, $NaNO_3$. Alkali nitrates are found in river, spring, and drainage waters, and in the juices of some plants. With regard to the formation of nitrates in the soil *v.* Nitrification, this vol. Nitrates are prepared by dissolving metals, metallic oxides or carbonates, in nitric acid; also, in some cases, by double decomposition from the alkali nitrates.

Most nitrates are crystalline salts. As no nitrate has been gasified, the formulæ of these salts are not necessarily molecular. The normal nitrates are soluble in water; a few, *e.g.* $Bi(NO_3)_3$, are decomposed by water with production of insoluble basic nitrates. Nitrates are decomposed by heat; a few give off HNO_3, but in almost all cases O is evolved, along with oxides of N and H_2O; the final residue is generally a metallic oxide corresponding with the nitrate used; $AgNO_3$ leaves a residue of Ag. Heated with combustible bodies, nitrates cause deflagration or explosion; if the combustible body be an acid-forming element, or a compound capable of forming an acid by oxidation, a salt is formed composed of the metal of the nitrate and the acid produced from the combustible body. Thus K_2SeO_4 is formed by deflagrating KNO_3 with Se, and K_2MnO_4 by deflagrating KNO_3 with an oxide or salt of Mn. Alkali nitrates are reduced to NH_3 by the action of potash and zinc, or by a pair of metals one of which is distinctly more electro-positive than the other, *e.g.* by Cu and Zn, Fe and Zn, Pt and Zn, &c. Alkali nitrates are also reduced to NH_3 by the action of common putrefactive organisms in presence of peptones and air; also by Pt black charged with O, in the presence of dextrose (*v.* Loew, *B.* 23, 675). Nitrates are reduced to nitrites, N_2O, NO, and N, by organisms present in the soil (*v.* Warrington, *C. J.* 45, 669; 53, 742 [references are given here to other memoirs]; 59, 484; Munro, *C. J.* 49, 667).

The greater number of the nitrates are insoluble in conc. nitric acid. A few dissolve in a large quantity of the acid; according to Ditte (*A. Ch.* [5] 18, 320) these nitrates combine with HNO_3 to form acid salts, *e.g.* $KNO_3.2HNO_3$, $NH_4NO_3.HNO_3$, $KNO_3.3HNO_3$, $RbNO_3.5HNO_3$. Some other hydrated nitrates dissolve in warm HNO_3Aq when dehydrated; on cooling, hydrates are deposited containing less water than those which crystallise from water; to this class of nitrates belong $Mg(NO_3)_2$, $Mn(NO_3)_2$, $Zn(NO_3)_2$, $Al(NO_3)_3$, $Cu(NO_3)_2$ (Ditte, *l.c.*).

The methods of detecting and estimating nitrates are numerous; reference must be made to *Manuals of analysis*.

Aluminium nitrates. The *normal* salt, $Al(NO_3)_3.9H_2O$, obtained by dissolving AlO_3H_3 in HNO_3Aq, and evaporating, crystallises in oblique rhombic prisms. Melts at 73°; deliquescent; e. sol. H_2O and HNO_3Aq (Ordway, *A.* 76, 247; Salm-Horstmar, *J.* 1850. 301; Thorey, *Russ. Zeitschr. Pharm.* 10, 321). The salt does not react with HCl gas (Thomas, *C. J.* 33, 367). *Basic* Al nitrates are obtained by digesting $Al(NO_3)_3$ with AlO_3H_3 (Ordway, *l.c.*).

Ammonium nitrate NH_4NO_3. According to Tissandier (*C. R.* 82, 388) this salt is frequently present in rain-water. It is obtained by adding a slight excess of NH_3Aq to HNO_3Aq and evaporating; also by passing the electric discharge through a mixture of H, N, and O; by passing H_2S into dilute HNO_3Aq; by the interaction of certain metals, *e.g.* Sn, with HNO_3Aq. NH_4NO_3 crystallises in various forms according to the temperature; the crystals formed at 36° are trimetric, those formed at 87° are rhombohedral, and monometric crystals are produced at 120° (Lehmann). The specific heats, volume-changes, and heats of transformation, of the various modifications have been determined by Bellati a. Romanese (*Nuovo Cimento*, [3] 21, 5; abstract in *C. J.* 54, 106). S.G. 1·707 (Kopp, *A.* 36, 1); 1·709 (Schiff, *A.* 112, 88); for other results *v.* Clarke's *Specific Gravity Table*, new ed. 110. NH_4NO_3 dissolves in H_2O with a large disappearance of heat. S. at 18° c. 200; saturated solution contains 47·8 p.c. NH_4NO_3, and boils at 164°. E. sol. alcohol. Deliquesces in air, losing NH_3 and acquiring an acid reaction. Melts at c. 152°; decomposition begins at c. 210° and becomes explosive at c. 300°; products are H_2O and N_2O, but part of salt volatilises (Berthelot, *C. R.* 82, 932); heated very rapidly, NH_3, NO, and NH_4NO_2 are also formed (B.). According to B. (*l.c.*) NH_4NO_3 may be sublimed unchanged, by placing the fused salt in a basin covered with filter paper, over which is a paper cylinder filled with coarse fragments of glass, and heating gently not above 190°–200°. NH_4NO_3 condenses considerable quantities of NH_3, forming a liquid varying in composition according to temperature and pressure (*v.* Divers, *Pr.* 21, 107; Raoult, *C. R.* 77, 788). At −10°, and 760 mm., the liquid $NH_4NO_3.2NH_3$ is formed; heated to 28·5° a solid remains, $NH_4NO_3.NH_3$ (R., *l.c.*); *cf.* Mendelejeff (*B.* 23, 3464), who regards $NH_4NO_3.NH_3$ and $NH_4NO_3.2NH_3$, as amides obtained from $NO.OH.ONH_4.ONH_4$ and $NO(OHN_4)_3$, which are the NH_4 salts of hypothetical orthonitric acid $NO(OH)_3$. The liquid compounds of NH_4NO_3 and NH_3 react with many salts, the reactions generally resembling those of NH_4NO_3 and dry NH_3 combined (for details *v.* Divers, *l.c.*). NH_4NO_3 absorbs dry HCl, forming NH_4Cl; after a time a little Cl and NO are evolved (Thomas, *C. J.* 33, 367). The Cu-Zn couple reduces NH_4NO_3Aq to NH_3 and NH_4NO_2; at B.P. NO is evolved (Gladstone a. Tribe, *C. J.* 33, 150).

Antimony nitrate. The compound $Sb_4O_8.N_2O_5$ is said to be formed by dissolving Sb_4O_6 in cold fuming HNO_3 (Péligot, *C. R.* 23, 709).

Barium nitrate $Ba(NO_3)_2$. Crystallises in tetartohedral forms belonging to the regular system (Scacchi, *J.* 1860. 13; Baumhauer, *Z. K.* 1, 51; Lewis, *P. M.* [5] 3, 453). S.G. 3·22 to 3·24 (Kremers, *J.* 5, 15; for other determinations *v.* Clarke's *Specific Gravity Table* (new ed.), 111). H.F. [Ba, O, N^2O^5 Aq] = 187,020 (?) (*Th.* 3, 518). Melts at c. 593° (Carnelley, *C. J.* 33, 278). S. 5 at 0°, 7 at 10°, 9·2 at 20°, 11·6 at 30°, 14·2 at 40°, 17·1 at 50°, 20·3 at 60°, 23·6 at 70°, 27 at 80°, 30·6 at 90°, 32·2 at 100°; saturated solution boils at 101·9°; S.G. and pctge. composition of $Ba(NO_3)_2Aq$ are as follows (Mulder):—

S.G.	P.c. $Ba(NO_3)_2$	S.G.	P.c. $Ba(NO_3)_2$
1·009	1	1·05	6
1·017	2	1·06	7
1·025	3	1·069	8
1·034	4	1·078	9
1·042	5	1·087	10

$Ba(NO_3)_2$ is only slightly soluble in water containing HCl or HNO_3; insol. alcohol.

$Ba(NO_3)_2$ is prepared by adding to $BaCO_3$, or crude BaS, enough HNO_3Aq to decompose almost the whole of the salt, filtering, and crystallising; also by mixing equivalent weights of $BaCl_2$ and $NaNO_3$ in solution, and recrystallising the $Ba(NO_3)_2$ which separates (Bolley, *C. C.* 1860. 330; Kuhlmann, *D. P. J.* 150, 57, 108, 415). $Ba(NO_3)_2$ melts at a moderate temperature; at red heat it evolves O, N, and NO_2, and leaves BaO; according to Rammelsberg (*B.* 2, 147; 7, 542) the residue contains more O than BaO, and has the composition Ba_3O_4. $Ba(NO_3)_2$ is not acted on by HCl gas (Thomas, *C. J.* 33, 367).

Beryllium nitrates. The composition of these salts is doubtful. They are very soluble in water and difficult to crystallise. By double decomposition from $BeSO_4Aq$, and evaporating, Ordway (*J. pr.* 76, 22) obtained deliquescent crystals approximating to the composition $Be(NO_3)_2.3H_2O$. By heating at 100° the crystals lost half of their nitric acid, and a basic salt remained, soluble in water. Other soluble basic salts seem to be formed by adding a little NH_3Aq to a solution of the normal salt, and by digesting the normal salt with $BeO.xH_2O$.

Bismuth nitrates. The *normal* salt has the composition $Bi(NO_3)_3.10H_2O$ according to Gladstone (*J. pr.* 44, 179) and Heintz (*J. pr.* 45, 102); according to the more recent work of Yvon (*C. R.* 84, 1164) the crystallised salt has the composition $2Bi(NO_3)_3.11H_2O$. The normal salt is formed by dissolving Bi, Bi_2O_3, or $Bi_2(CO_3)_3$ in HNO_3Aq, filtering through asbestos or powdered glass, and evaporating to the crystallisation-point. Forms large deliquescent crystals; S.G. 2·823 at 13° (Clarke's *Table of Specific Gravities* (new ed.), 112). Crystals are very caustic; they melt easily in the water of crystallisation; decomposition begins at c. 75°–80° with production of basic salts (*v. infra*). Decomposed by HCl gas, giving $BiCl_3$ and also much Cl, along with NO, H_2O, and possibly other oxides of N and Cl (Thomas, *C. J.* 33, 367). Various *basic* salts have been described. According to Graham (*A.* 29, 16) $2(BiO.NO_3).H_2O$ is formed by heating the normal salt to 80°, and is not decomposed below 260° (*cf.* Ruge, *J.* 1862. 163). Yvon (*C. R.* 84, 1164) assigns the composition $4(BiO.NO_3).3H_2O$ to the salt obtained by heating the normal salt to 120°, and also to the product of the action of water on the normal salt. Many basic salts, $xBi_2O_3.yN_2O_5.zH_2O$, seem to be produced by decomposing $Bi.3NO_3$, or a solution of Bi in HNO_3Aq, by water; the composition of the most stable of these *subnitrates* is $BiO.NO_3.H_2O$; in other cases x, y, and z have such values as 5, 4, and 9, or 5, 3, and 8, or 6, 5, and 9. The composition of these basic salts varies with the temperature of the water used, the amount of washing given to the pp., and the length of time the pp. is allowed to remain in contact with the acid liquid above it. The compositions of these salts, and the preparation of a salt of constant composition for medicinal use, have been examined chiefly by Phillips (*J. Ph.* 18, 688), Duflos (*Ar. Ph.* [2] 23, 307), Herberger (*R. P.* 55, 289, 306), Ullgren (*B. J.* 17, 169), Dulk (*R. P.* 33, 1), Becker (*Ar. Ph.* 55, 31, 129), Janssen (*Ar. Ph.* 68, 1, 129), Ruge (*J.* 1862. 163), and Yvon (*C. R.* 84, 1164).

Cadmium nitrate $Cd(NO_3)_2.4H_2O$. White, prismatic, deliquescent, needles; by dissolving Cd, CdO, or $CdCO_3$ in HNO_3Aq and evaporating. S.G. 2·45 at 14°, 2·46 at 20° (Laws, *Am. S.* [3] 14, 281). H.F. $[Cd,O^2,N^2O^4,4H^2O] = 125,170$; $[Cd, O, N^2O^5Aq] = 86,000$ (*Th.* 3, 518). Melts at 59·5°, and boils at c. 132° (Ordway, *Am. S.* [2] 27, 14). Reacts with HCl gas to produce $CdCl_2$, evolving Cl and NO (Thomas, *C. J.* 33, 367). Wells (*Am.* 9, 304) describes a *basic* salt; to this salt he has assigned the composition $2CdO.N_2O_5.3H_2O$; obtained by digesting hot $Cd(NO_3)_2Aq$ with CdO, and allowing to cool.

Cæsium nitrate $CsNO_3$. Obtained by dissolving Cs_2CO_3 in HNO_3Aq, and evaporating; the *habitus* of the crystals depends on the rate of evaporation. Melts below red heat; when strongly heated evolves O, and forms $CsNO_2$. S. 10·58 at 3·2°; very slightly sol. in alcohol (Bunsen, *P.* 119, 1).

Calcium nitrate $Ca(NO_3)_2.4H_2O$. Occurs in soils when conditions are favourable to production of HNO_3, and Ca salts are also present. This salt is prepared in some countries by the slow decomposition of animal and vegetable matter. S.G. 1·79 when liquid, and 1·9 when solid, at 15·5° (Ordway, *J.* 12, 115). S.G. of $Ca(NO_3)_2 = 2·5$ at 17·9° (Favre a. Valson, *C. R.* 77, 579). H.F. $[Ca,O^2,N^2O^4,4H^2O] = 218,440$; $[Ca,O,N^2O^5Aq] = 177,160$. Prepared by dissolving CaO or $CaCO_3$ in HNO_3Aq, and evaporating; if the evaporation is continued to dryness the anhydrous salt is obtained. The hydrated salt crystallises with difficulty in deliquescent, six-sided prisms; melts at 44°; boils at 132°, remaining clear till c. one-third of the water has gone, when the anhydrous salt is deposited (Ordway, *Am. S.* [2] 27, 14). The dry salt $Ca(NO_3)_2$ melts at 561° (Carnelley, *C. J.* 33, 278). Decomposed at high temperature, giving off O and NO; the partially decomposed salt is phosphorescent (*Baldwin's phosphorus*); not acted on by HCl gas (Thomas, *C. J.* 33, 367).

Cerium nitrates. *Cerous nitrate*, $Ce(NO_3)_3.6H_2O$, is obtained as a pale rose-coloured, deliquescent, crystalline mass, by dissolving Ce_2O_3, or CeO_2 in presence of reducing substances, in HNO_3Aq, evaporating, and drying over H_2SO_4 (Lange, *J. pr.* 82, 129). Gives off $3H_2O$ at 150°, and decomposes at 200°. Forms several double salts with nitrates MNO_3 and $M(NO_3)_2$, *e.g.* $Ce(NO_3)_3.2KNO_3.2H_2O$, $2Ce(NO_3)_3.3Mg(NO_3)_2.24H_2O$. These double nitrates have been examined by Lange (*l.c.*) and Holzmann (*J. pr.* 84, 76), and more recently by Zschiesche (*J. pr.* 107, 65). They are obtained by crystallising a mixed solution of $Ce(NO_3)_3$ and the other nitrate; and also by dissolving CeO_2 in HNO_3, adding the other nitrate and a little alcohol, and evaporating. Should the metal of the nitrate which is added be capable of forming a higher oxide than that corresponding to the nitrate used, a little of this oxide is sometimes formed at the expense of the O of the CeO_2, and the reduction from $Ce(NO_3)_4$ to $Ce(NO_3)_3$ proceeds without addition of alcohol; thus, addition of $Mn(NO_3)_2$ to CeO_2 dissolved in HNO_3Aq produces $2Ce(NO_3)_3.3Mn(NO_3)_2.24H_2O$, with simultaneous formation of a little MnO_2. The double cerous nitrates are also formed by dissolving the various metals in an acid solution of CeO_2 in HNO_3Aq; reduction is effected to $Ce(NO_3)_3$. *Ceric nitrate*, $Ce(NO_3)_4$. Said to be obtained as a reddish-yellow mass by evaporating CeO_2 in HNO_3Aq; decomposed by hot water forming a basic salt. Combines with KNO_3 and NH_4NO_3 to form $2Ce(NO_3)_4.4MNO_3.3H_2O$ (Berzelius, *P.* 1, 29.)

Chromium nitrates. The *normal* salt, $Cr(NO_3)_3.9H_2O$, is obtained by dissolving CrO_3H_3 in HNO_3Aq, evaporating, and crystallising from warm water; the crystals, which form with difficulty, are purple oblique prisms, melting at

37° to a green liquid which boils at 125·5° (Ordway, *Am. S.* [2] 9, 30; 27, 14). Various *basic* salts are described by Loewel (*Ph. C.* 1845. 580), Ordway (*Am. S.* [2] 26, 197), and Siewert (*A.* 126, 86); they are formed by heating the normal salt, by dissolving CrO_3H_3 in solution of the normal salt, and by boiling HNO_3Aq with excess of CrO_3H_3.

Cobalt nitrates. The *normal* salt, $Co(NO_3)_2.6H_2O$, forms red, prismatic, deliquescent crystals; S.G. 1·83 at 14° (Boedeker); melts below 100°; at higher temperatures gives off H_2O and oxides of N, and leaves black Co_3O_4. Produced by dissolving Co, or $CoCO_3$ in HNO_3Aq, and evaporating. Easily sol. water. Franz (*J. pr.* [2] 5, 274) gives the following table showing p.c. $Co(NO_3)_2$ in aqueous solutions at 17·5°:—

P.c. $Co(NO_3)_2$	S.G.
5	1·0462
10	1·0906
15	1·1378
20	1·1936
25	1·2538
30	1·319
35	1·3896
40	1·4662
Saturated at 17·5°	1·5382

Thomsen gives H.F. $[Co, O^2, N^2O^4, 6H^2O]$ 123,330; $[Co, O, N^2O^5Aq] = 84,540$. When HCl gas is passed over $Co(NO_3)_2$, $CoCl_2$, oxides of N, and Cl are formed (Thomas, *C. J.* 33, 367). Combines with cerous nitrate to form $Co(NO_3)_2.Ce(NO_3)_2.8H_2O$ (Lange, *J. pr.* 82, 129).

Basic salts are obtained by adding NH_3Aq to $Co(NO_3)_2Aq$ under different conditions (*v.* Winkelblech, *A.* 13, 148, 253; Habermann, *M.* 5, 442).

Copper nitrates. The *normal* nitrate, $Cu(NO_3)_2.3H_2O$, is obtained by dissolving Cu or CuO in HNO_3Aq, and evaporating. The solution is at first green owing to production of $Cu(NO_2)_2$. Blue prismatic crystals; S.G. 2·174 (Hassenfratz, *A.* 28, 3). The salt $Cu(NO_3)_2.6H_2O$ is deposited below 20°. H.F. $[Cu, O^2, N^2O^4, 6H^2O] = 96,950$ (*Th.* 3, 518). The hexahydrated salt effloresces in air, losing $3H_2O$; it melts at 38°, and decomposes at 65°, forming a basic salt. The trihydrated salt melts at 114·5°, and decomposes at 170°. At red-heat, $Cu(NO_3)_2$ evolves N oxides and leaves CuO; it is deliquescent, easily sol. water, but ppd. again by conc. HNO_3Aq. Franz gives following table (*J. pr.* [2] 5, 274):—

S.G. of $Cu(NO_3)_2Aq$	P.c. $Cu(NO_3)_2$
1·0942	10
1·2037	20
1·3299	30
1·4724	40
1·5404	44

$Cu(NO_3)_2$ is rapidly decomposed by HCl, with formation of $CuCl_2$, Cl, NO, and probably N (Thomas, *C. J.* 33, 367).

Basic nitrates of Cu are produced by boiling $Cu(NO_3)_2Aq$ with KNO_3Aq, or by passing N_2O_3 into H_2O holding CuO_2H_2 in suspension; the product is said to be $4CuO.N_2O_5.3H_2O$ (Vogel a. Reinhauer, *J.* 1859. 216). For other basic salts *v.* Graham, *T.* 1837. 47; Casselmann, *Fr.* 4, 24; Tutschew, *Z.* 6, 109.

Didymium nitrate $Di(NO_3)_3.6H_2O$. Rose red crystals; by dissolving Di_2O_3 in HNO_3Aq and crystallising; S.G. 2·249; loses $6H_2O$ at 200°. Easily sol. water and alcohol; forms double salts with $Co(NO_3)_2$, $Ni(NO_3)_2$, and $Zn(NO_3)_2$ (*v.* Marignac, *A. Ch.* [3] 38, 148; Hermann, *Rep. Chim. pur.* 1861. 53; Frerichs a. Smith, *A.* 191, 346; Cleve, *Bl.* [2] 43, 361).

Erbium nitrate $Er(NO_3)_3.6H_2O$. Large crystals; sol. water and alcohol. Decomposed by heat forming a basic salt $2Er_2O_3.3N_2O_5.9H_2O$ (Höglund, *Bl.* [2] 18, 193, 279; Cleve, *C. R.* 91, 381).

Gallium nitrate $Ga(NO_3)_3$. Obtained by dissolving Ga in HNO_3Aq, evaporating at 100°, drying in an exsiccator, and heating in a dry air-stream to 40°. Decomposes at 110°, and at 200° leaves Ga_2O_3 (de Boisbaudran).

Gold nitrates. By dissolving $Au_2O_3.xH_2O$ in HNO_3Aq, a very unstable salt is obtained; Schottländer gives the formula $5(AuO.NO_3).H_2O$ as approximately correct (*A.* 217, 312). The compound $Au(NO_3)_3.HNO_3.3H_2O$, which may be called *auronitric acid*, is obtained in large crystals by dissolving $Au_2O_3.xH_2O$ in HNO_3Aq, with special precautions. This compound forms shining, yellow, triclinic octahedra; S.G. 2·84; it is readily decomposed by heat to $2Au_2O_3.N_2O_5.2H_2O$ (Schottländer, *A.* 217, 312). Several salts are known derived from auronitric acid; they are obtained by dissolving $HNO_3.Au(NO_3)_3$ along with various nitrates in HNO_3Aq, and evaporating. The K salts are $KAu(NO_3)_4$ and $HK_2Au(NO_3)_6$ (Schottländer, *l.c.*).

Indium nitrate $2In(NO_3)_3.9H_2O$. Large needle-shaped crystals; by dissolving excess of In in HNO_3Aq, and evaporating in an exsiccator. Loses $6H_2O$ at 100°: at red heat forms a basic salt, then In_2O_3 (Winkler, *J. pr.* 94, 1; 102, 273).

Iron nitrates. According to Scheurer-Kestner (*C. R.* 47, 927), Fe reacts with HNO_3Aq S.G. 1·034 to form $Fe(NO_3)_2$ and NH_4NO_3, with acid S.G. 1·073 $Fe(NO_3)_3$ is also formed, with acid S.G. 1·115 only $Fe(NO_3)_3$ is produced, and with more conc. acid basic salts begin to be formed.

Ferrous nitrate $Fe(NO_3)_2.6H_2O$ is best prepared by dissolving FeS in cooled HNO_3Aq S.G. less than 1·12; the liquid is made as nearly neutral as possible by addition of FeS, decanted, evaporated slowly, and strongly cooled. The crystals may be kept unchanged at low temperatures in the mother-liquor. S. 200 at 0°, 300 at 25° (Ordway, *Am. S.* [2] 40, 325).

Ferric nitrate $Fe(NO_3)_3.9H_2O$ (Ordway, *Am. S.* [2] 26, 197; 27, 14). Prepared by dissolving Fe in HNO_3Aq S.G. 1·29 till about 10 p.c. Fe is taken up by the acid, then adding an equal volume of HNO_3Aq S.G. 1·43; oblique rhombic prisms are deposited on cooling. S.G. 1·6835 at 20°; nearly colourless; slightly deliquescent; very soluble in water; very slightly soluble in cold HNO_3Aq; melts 47·2°; acid begins to be given off at 100°; boils 125°; completely decomposed at red heat (Ordway, *l.c.*). Hausmann obtained $Fe(NO_3)_3.6H_2O$ (*A.* 89, 109; *v.* also Widenstein, *J. pr.* 84, 243). Scheurer-Kestner obtained a dihydrated salt (*J.* 1862, 193).

Numerous *basic ferric nitrates* were obtained by Ordway (*l.c.*) by dissolving FeO_2H_2 in $Fe(NO_3)_3Aq$, and evaporating (*v.* also Hausmann, *A.* 89, 109; and Scheurer-Kestner, *J.* 1862. 193). Basic salts are also produced by heating $Fe(NO_3)_3Aq$. Basic ferric nitrates are slowly resolved by boiling water to normal salt and Fe_2O_3; the change proceeds most rapidly by heating in a sealed tube.

Several *ferric aceto-nitrates, e.g.* $Fe(NO_3)(C_2H_3O_2)_2.3H_2O$, $Fe(NO_3)_2(C_2H_3O).8H_2O$ have been prepared and described by Scheurer-Kestner (*A. Ch.* [3] 63, 422).

Lanthanum nitrate $La(NO_3)_3.6H_2O$. Large prismatic, deliquescent, crystals; easily sol. water and alcohol. May be fused without decomposition at c. 40°, but at rather higher temperature HNO_3 is removed and a basic salt formed: completely decomposed at red heat (Ordway). Two *double salts*, $2La(NO_3)_3.3Ni(NO_3)_2.36H_2O$, and $2La(NO_3)_3.3Zn(NO_3)_2.69H_2O$, are described by Frerichs a. Smith (*A.* 191, 359).

Lead nitrates. The *normal* salt, $Pb(NO_3)_2$, crystallises in octahedra from a solution of PbO or $PbCO_3$ in boiling very dilute HNO_3Aq. S.G. 4·472 at 4° (Playfair a. Joule, *C. J.* 1, 137); 4·41 at 15·5° (Holker, *P. M.* [3] 27, 214; *v.* also Schröder, *P.* 106, 226; Ditte, *B.* 15, 1438). H.F. $[Pb, N^2, O^6] = 105{,}500$; $[Pb, O^2, N^2O^4] = 109{,}470$; $[Pb, O, N^2O^5Aq] = 68{,}070$ (*Th.* 3, 518). S. 39 at 0°, 48·3 at 10°, 60·6 at 25°, 80 at 45°, 101 at 65°, 120·5 at 85°, 138·9 at 100° (Kremers, *P.* 92, 497). S. in alcohol, S.G. ·9282, 4·96 at 4°, 5·82 at 8°, 8·77 at 22°, 12·8 at 40°, 11·49 at 50° (Gerardin, *A. Ch.* [4] 5, 129). Insol. conc. HNO_3Aq. $Pb(NO_3)_2$ is decomposed at low red heat giving PbO, O, and NO_2. In HCl gas, $PbCl_2$ is formed with evolution of NO and Cl (Thomas, *C. J.* 33, 367). Forms a compound with lead phosphate, viz. $Pb(NO_3)_2.Pb_3(PO_4)_2.2H_2O$ (Gerhardt, *A.* 68, 286).

Many *basic lead nitrates* have been described. The salt $2PbO.N_2O_5.H_2O$, which formula may be written $Pb.OH.NO_3$, is obtained by boiling $Pb(NO_3)_2Aq$ with PbO, filtering hot, and allowing to cool (Berzelius, *P.* 19, 312; Pelouze, *J. pr.* 25, 486; Persoz, *A. Ch.* [3] 58, 191). S.G. 5·93 (Ditte, *C. R.* 94, 1180). Several other basic salts are known; according to Wakeman a. Wells (*Am.* 9, 299) the only recrystallisable basic salt, besides $Pb.OH.NO_3$, is $10PbO.3N_2O_5.5H_2O$.

Lithium nitrate $LiNO_3$. By neutralising HNO_3Aq with LiOH or Li_2CO_3, and evaporating. Rhombic prisms; S.G. 2·334 (Kremers, *P.* 92, 520). H.F. $[Li,N,O^3] = 111{,}615$; $[Li,O,NO^2] = 113{,}620$; $\frac{[Li^2,O,N^2O^5Aq]}{2} = 97{,}005$ (*Th.* 3, 518). Melts at 264° (Carnelley, *C. J.* 33, 275). Easily sol. water and alcohol. Kremers (*P.* 114, 41) gives following table:—

S.G. $LiNO_3Aq$ at 19·5°	P.c. $LiNO_3$
1·0769	14·2
1·1346	26·7
1·193	40·6
1·255	57·5
1·3154	77·4

$LiNO_3$ slowly reacts with dry HCl, a small quantity of Cl and NO being evolved (Thomas, *C. J.* 33, 370).

The *hydrated salt* $LiNO_3.5H_2O$ is said to be obtained by crystallising below 10° (Troost, *A. Ch.* [3] 51, 134).

Magnesium nitrate $MgNO_3.6H_2O$. Occurs in mother-liquor from saltpetre plantations; also in some well-waters of Stockholm, according to Berzelius. Prepared by neutralising HNO_3Aq by *magnesia alba*, and evaporating. Very deliquescent monoclinic crystals (Marignac, *J.* 1856. 336). S.G. 1·464 (Playfair a. Joule, *C. S. Mem.* 2, 401). H.F. $[Mg,O^2,N^2O^4,6H^2O] = 214{,}530$. $[Mg,O,N^2O^5Aq] = 176{,}480$ (*Th.* 3, 518). Very soluble water and alcohol. Oudemans (*Fr.* 7, 419) gives the table:—

P.c. $Mg(NO_3)_2 6H_2O$	S.G. $Mg(NO_3)_2Aq$
1	1·0034
5	1·0202
10	1·0418
15	1·0639
20	1·0869
25	1·1103
30	1·1347
35	1·1649
40	1·1909
45	1·2176
49	1·2397

According to Graham (*T.* 1837. 47), $5H_2O$ are removed from $Mg(NO_3)_2.6H_2O$ at c. 330° (M.P. of lead), and the monohydrated salt can be fused without change, but is decomposed at red heat, leaving MgO. Einbrodt (*A.* 65, 115) found that acid began to be evolved before five-sixths of the water was removed, hence he regarded the existence of $Mg(NO_3)_2.H_2O$ as very doubtful. By heating $Mg(NO_3)_2.6H_2O$ until water ceases to come off, a *basic* salt $3MgO.N_2O_5$ is obtained, according to Chodnew (*A.* 71, 241). Reacts with HCl gas to form $MgCl_2$, Cl and O and H_2O being evolved (Thomas, *C. J.* 33, 370).

Manganese nitrate $Mn(NO_3)_2.6H_2O$. Small monoclinic crystals (Hannay, *C. J.* 33, 269). Obtained by dissolving $MnCO_3$ in HNO_3Aq, also by dissolving MnO_2 in HNO_3Aq in sunlight or presence of deoxidisers, and evaporating. S.G. 1·8199 when solid at 21°; 1·8104 when liquid at 21° (Ordway, *J.* 12, 113). H.F. $[Mn,O^2,N^2O^4,6H^2O] = 157{,}700$; $[Mn,O,N^2O^5Aq] = 117{,}720$ (*Th.* 3, 518). Decomposed by heat, giving MnO_2, Mn_2O_3, or Mn_3O_4, according to the temperature. Reacts with HCl gas to form $MnCl_2$, with evolution of Cl and NO (Thomas, *C. J.* 33, 370). According to Schultz-Sellac (*Z.* 1870. 646) the salt $Mn(NO_3)_2.3H_2O$ crystallises from solution in conc. HNO_3Aq.

Mercury nitrates. *Mercuric nitrate*, $2Hg(NO_3)_2.H_2O$, is obtained by dissolving HgO in excess of slightly warmed HNO_3Aq, and evaporating over H_2SO_4; after some minutes the liquid above the crystals has the composition $Hg(NO_3)_2.2H_2O$ (Millon, *A. Ch.* [3] 18, 361). Ditte (*J.* 1854. 366) obtained $Hg(NO_3)_2.8H_2O$ by cooling to −15° a nearly neutral conc. solution of HgO in HNO_3Aq.

Basic mercuric nitrates are readily formed by heating the normal salt; the chief are $2HgO.N_2O_5.3H_2O$ (Ditte, *l.c.*); $2HgO.N_2O_5.2H_2O$ (Marignac, *J.* 1855. 415); $3HgO.N_2O_5.H_2O$, obtained by the prolonged action of water on any of the other basic salts.

Mercuric nitrate forms several *double salts.*

With HgI_2, the compounds $Hg(NO_3)_2.HgI_2$, $Hg(NO_3)_2.2HgI_2$, and $2Hg(NO_3)_2.3HgI_2$ are formed (Preuss, *A.* 29, 326; Liebig, *A.* 72, 79). These iodo-nitrates are decomposed by water, with separation of HgI_2 and solution of $Hg(NO_3)_2$. With HgS, the compound $Hg(NO_3)_2.2HgS$ is formed; by digesting freshly ppd. HgS with $Hg(NO_3)_2Aq$, also by passing into $Hg(NO_3)_2Aq$ less H_2S than suffices to decompose it wholly.

Mercurous nitrate. The nitrates derived from Hg_2O have been examined chiefly by Mitscherlich (*P.* 9, 387), Lefort (*A.* 56, 247), Marignac (*A. Ch.* [3] 27, 332), and Gerhardt (*A.* 72, 74). $HgNO_3$ is formed by the reaction of excess of Hg with HNO_3Aq, but if the action is continued basic salts are produced. Basic salts are also obtained by decomposing $HgNO_3$ by water.

The *normal salt*, $HgNO_3.2H_2O$, is obtained in colourless monoclinic crystals by reacting on excess of Hg with cold HNO_3Aq S.G. c. 1·2. To prevent admixture of basic salts it is advisable to allow the acid and Hg to remain in contact until crystals cease to be formed, then to warm gently, filter, and allow to crystallise. S.G. 4·78 (Playfair a. Joule, *C. S. Mem.* 2, 401). The crystals effloresce somewhat in air; they are dissolved without change in a little water, but dilution produces basic salts. By heating $HgNO_3$ with water HgO and NO_2 are formed. HgCl is formed when HCl is passed over $HgNO_3$, and Cl and NO are evolved (Thomas, *C. J.* 33, 370).

Basic mercurous nitrates are formed by warming with Hg the mother-liquor from the preparation of the normal salt, and by treating the normal salt with water. To the salt obtained by the first of these methods Gerhardt gave the formula $3Hg_2O.2N_2O_5.H_2O$; Marignac gave the formula $4Hg_2O.3N_2O_5.H_2O$. The other basic salts are: (1) $2Hg_2O.N_2O_5.H_2O$ (Gerhardt), obtained by the action of a little boiling water on $HgNO_3$; Marignac formulates this salt as $5Hg_2O.3N_2O_5.2H_2O$. (2) $2Hg_2O.N_2O_5.H_2O$ (Gerhardt, Marignac), obtained by adding much water to $HgNO_3Aq$.

Mercurous nitrate forms *double salts* with NH_4NO_3, $Pb(NO_3)_2$, $Ba(NO_3)_2$, and $Sr(NO_3)_2$. The compositions of these salts are expressed by the formulæ $2HgNO_3.4NH_4NO_3.5H_2O$ (Rammelsberg, *P.* 109, 397); $2M(NO_3)_2.2Hg_2O.N_2O_5$, where M = Pb, Ba, or Sr (Städeler, *A.* 87, 129).

Mercuroso-mercuric nitrate, $Hg_2O.2HgO.N_2O_5$. This salt is formed by the gradual oxidation of $HgNO_3$ in air. It is best obtained by boiling 1½ parts HNO_3Aq, S.G. 1·2, with 1 part Hg till all Hg is dissolved, and maintaining the solution near its B.P. The salt separates as a yellow powder; after a time a white basic mercurous nitrate begins to form (Wittstock; Gerhardt, *A.* 72, 74; Brooks, *P.* 66, 63). Rubbed with NaCl, HgCl and oxychloride are formed, and on addition of water $HgCl_2$ goes into solution. Treated with HCl gas both HgCl and $HgCl_2$ are formed with evolution of Cl and NO (Thomas, *C. J.* 33, 370). The salt may be regarded as derived from orthonitric acid—$NO(OH)_3$—by replacing H by Hg^I and H_2 by Hg^{II}

$$\left[NO(OHg)(O_2Hg) = \frac{Hg_2O.2HgO.N_2O_5}{2}\right].$$

Nickel nitrates. The *normal salt*, $Ni(NO_3)_2.6H_2O$, is obtained, in emerald-green, deliquescent, monoclinic crystals, by dissolving Ni, NiO, or $NiCO_3$, in HNO_3Aq, and evaporating. Melts at 56·7°, and boils at 136·7°, remaining clear till $3H_2O$ is gone off (Ordway, *Am. S.* [2] 26, 197; 27, 14). S.G. 2·065 at 14°, 2·037 at 22° (Clarke's *Specific Gravity Table* [new ed.], 112). H.F. $[Ni, O^2, N^2O^4, 6H^2O] = 124,720$; $[Ni, O, N^2O^5Aq] = 83,420$ (*Th.* 3, 518). Several *double salts* of $Ni(NO_3)_2$ are known:– with $Ce(NO_3)_2$, $Di(NO_3)_3$, and $La(NO_3)_3$ (*v.* CERIUM NITRATES, DIDYMIUM NITRATE, LANTHANUM NITRATE). With *ammonia* forms

$$Ni(NO_3)_2.4NH_3.2H_2O$$

(Laurent, *A. Ch.* [3] 36, 354); and

$$Ni(NO_3)_2.6NH_3.1\tfrac{1}{2}H_2O$$

(F. Rose, *Ammon. Kobaltverbind.* [Heidelberg, 1871], 27). Also combines with *nickel chloride* and *ammonia* to form

$$6(Ni(NO_3)_2.4NH_3.H_2O).(NiCl_2.6NH_3).10H_2O$$

(Schwarz, *W. A. B.* 1850. 272).

The *basic salt* $8NiO.N_2O_5.5H_2O$ is ppd. as a white powder by adding boiling NH_3Aq to a solution of the normal salt (Habermann, *M.* 5, 440).

Palladium nitrates. The *normal salt* $Pd(NO_3)_2.xH_2O$ forms brown-yellow rhombic prisms; very deliquescent; obtained by dissolving Pd in cold HNO_3Aq, evaporating to a syrup at the ordinary temperature, and allowing to stand in a warm place (Fischer, *P.* 10, 607). By dissolving the normal salt in water, and diluting, the Pd is gradually ppd. as a *basic salt.* Basic salts are also obtained by evaporating Pd in HNO_3Aq at c. 100° to 120°, and treating the residue with water (Fischer, *l.c.*; Kane, *B. J.* 24, 236).

Platinum nitrates. A brown salt, probably $Pt(NO_3)_4$, is obtained by dissolving $PtO_2.xH_2O$ in HNO_3Aq, or by decomposing $Pt(SO_4)_2Aq$ with $Ba(NO_3)_2Aq$, and evaporating (Berzelius).

Potassium nitrate KNO_3. (*Nitre. Saltpetre.*) Melts at 339° (Carnelley, *C. J.* 33, 277). S.G. 2·0958 to 2·1078 at 4° (Playfair a. Joule, *C. J.* 1, 137); 2·059 at 0° (Quincke, *P.* 135, 642); 1·072 at M.P. (Braun, *P.* 154, 190). H.F.

$$[K, O, NO^2] = 121,485;\ \left[\frac{K^2, O, N^2O^5Aq}{2}\right] = 96,050$$

(*Th.* 3, 518). Heat of solution = −7967 at 15° −7814 at 34°, −7541 at 53° (Tilden, *Pr.* 38, 401). S.H. 13° to 98° = ·23875 (Regnault, *A. Ch.* [3] 1, 129). S. 13·3 at 0°, 21 at 10°, 31·2 at 20°, 44·5 at 30°, 63·9 at 40°, 85·9 at 50°, 110·9 at 60°, 139 at 70°, 172 at 80°, 206 at 90°, 247 at 100° (Mulder, *J.* 1866. 65; *v.* also Tilden a. Shenstone, *T.* 175, 23). Schiff gives the following tables (*A.* 107, 87, 293; for more extended tables *v.* Gerlach, *Fr.* 8, 286):—

Weight of alcohol in 100 parts	Weight of KNO_3 in 100 parts solution saturated at 15°
0	20·5
10	13·2
20	8·5
30	5·6
40	4·3
50	2·8
60	1·7
80	0·4

S.G. of KNO_3Aq at 21°	Weight of KNO_3 in 100 parts solution
1·1683	24·93
1·1073	16·62
1·0695	11·08
1·051	8·31
1·0337	5·54
1·017	2·77

S. in glycerin S.G. 1·225 = 10 (Vogel, *N.R.P.* 16,557). KNO_3 is dimorphous; it usually crystallises in trimetric prisms, *a*:*b*:*c* = ·589:1: ·701; if a drop of KNO_3Aq is allowed to crystallise slowly under the microscope, rhombohedral crystals are formed (Frankenheim, *P.* 92, 354). If the rhombohedral crystals are touched by a prismatic crystal while the crystallisation is proceeding, they are changed to prismatic; the prismatic may be changed to rhombohedral by heating nearly to the melting-point.

Occurrence.—In small quantities in all vegetable soils; also in most spring and river waters (Boussingault, *C. R.* 44, 108). Nitre is found in the soil of caves, in different parts of the world, wherein animal or vegetable matter undergoes putrefaction, and where alkalis or alkaline earths are present to combine with the nitric acid produced (*v.* Nitrification, p. 521). Nitre is also found as an efflorescence on the surface of the soil in parts of India, Arabia, South America, and other warm countries; the percentage of KNO_3 in a Bengalese soil was found by Davy to be 8·3. KNO_3 occurs in the juices of certain plants; notably in the leaves of the castor-oil plant.

Formation.—1. By the oxidation of nitrogenous matter in presence of air, moisture, and potash (*cf.* Nitrification, p. 521).—2. By the action of K_2CO_3 or KOH on $Ca(NO_3)_2$, or $NaNO_3$. 3. By the oxidation of NH_3 in presence of moisture, air, and ferric oxide, and combination of the HNO_3 formed with KOH (Pesci, *G.* 1875. 307).

In the artificial preparation of nitre by oxidation of nitrogenous matter in soils, the first step is to prepare a soil rich in N-containing materials; this is done by mixing porous soil, preferably that left from the lixiviation of a former nitre-bed, with farm-yard manure, animal and vegetable refuse, and wood ashes or calcareous matter, and watering this with urine. This soil is then formed into a mound under a shed, and the process of nitrification is allowed to proceed for perhaps a couple of years; air must be freely admitted, and great care must be taken to keep the soil neither too wet nor too dry. About 5lbs. crude nitre are obtained, on an average, from 1,000lbs. of such soil (for more details *v.* Dictionary of Applied Chemistry).

Preparation.—1. By purifying crude nitre prepared from the washings of *saltpetre earth.* The liquor from the saltpetre earth contains $Ca(NO_3)_2$, $Mg(NO_3)_2$, with smaller quantities of KNO_3 and $NaNO_3$, and also alkaline chlorides; K_2CO_3 (wood-ashes) is added, the liquid is filtered and evaporated; the crude KNO_3 is then treated with enough boiling water to dissolve all KNO_3 but not all the NaCl present—S. of KNO_3 at 100° = 247, S. of NaCl at 100° = 39—the liquid is boiled for a considerable time, when NaCl separates with $CaCO_3$ and $MgCO_3$; the liquid is then run off, and while crystallising it is constantly stirred to insure formation of small crystals containing little mother-liquor; the crystals are recrystallised, washed with saturated KNO_3Aq (to dissolve the last traces of alkaline chlorides), and again crystallised.—2. From *Chili-saltpetre* ($NaNO_3$), by adding this salt to hot conc. K_2CO_3Aq, when Na_2CO_3 separates and KNO_3 remains in solution. The mother-liquor is evaporated as long as Na_2CO_3 continues to separate, then run off and allowed to crystallise, with constant stirring.—3. By neutralising pure HNO_3Aq with pure KOHAq or K_2CO_3Aq, evaporating, and crystallising.

Properties.—A white, crystalline salt; dimorphous; S.G. c. 2·1; easily sol. water, solution tastes cool and bitter; melts below red heat to a colourless liquid which solidifies on cooling to a white fibrous mass, known as *mineral crystal* or *salprunellæ.* At red heat evolves O, and N as temperature increases. Deflagrates when heated with combustible bodies (for physical properties *v.* beginning of article).

Reactions.—1. Decomposed by *heat*; at c. 300°-400° O is evolved, and KNO_2 formed; as temperature increases N is evolved, and finally a mixture of K_2O and K_2O_4 remains.—2. Evolves O when *heated in presence of combustible substances* such as P, S, Zn, C, &c. Hence the use of KNO_3 in gunpowder; and as an oxidiser when molten.—3. Heated with *copper foil*, nearly pure K_2O is formed; a similar change occurs when KNO_3 is heated with *iron.*—4. Most *elements* are oxidised by heating with KNO_3; if the oxide produced is acidic, a K salt of the corresponding acid is produced.—5. *Organic compounds* are generally burnt (to CO_2 and H_2O) by heating with KNO_3.—6. Reduced by the *copper-zinc* couple, in presence of water, at first to KNO_2 and then to NH_3; a similar reduction takes place by *hydrogen occluded* by Pd, Pt, or Cu (Gladstone a. Tribe, *C. J.* 33, 139, 306).—7. Reacts with *hydrogen chloride gas* to form KCl, evolving Cl and N oxides (Thomas, *C. J.* 33, 367). For methods by which nitre may be valued approximately, or completely analysed, reference must be made to *Manuals of Analysis*; for an account of the technical applications of nitre reference should be made to Dictionary of Applied Chemistry.

Rhodium nitrate $Rh(NO_3)_3.2H_2O$ (?). A gum-like, very deliquescent, mass, obtained by dissolving $Rh_2O_3.3H_2O$ in HNO_3Aq, and evaporating at 100° till HNO_3 ceases to be evolved (Claus, *J. pr.* 34, 428; Berzelius).

Rubidium nitrate $RbNO_3$. Obtained in long needles, or six-sided prisms (according to rate of evaporation) by neutralising HNO_3Aq by Rb_2CO_3 and evaporating. S. 20·1 at 0°, 43·5 at 10°. When heated evolves O (Kirchhoff a. Bunsen, *P. M.* [4] 22, 55). According to Ditte (*C. R.* 89, 641) an *acid salt,* $2RbNO_3.5HNO_3$, is obtained by dissolving $RbNO_3$ in $HNO_3.H_2O$; this salt is decomposed by water or heat.

Samarium nitrate $Sm(NO_3)_3.6H_2O$. Pale yellow prisms; e. sol. water; S.G. 2·375 (Cleve, *C. N.* 48, 74; 51, 145).

Scandium nitrate $Sc(NO_3)_3$(?) Small plates; by evaporating at 100° a solution of Sc_2O_3 in HNO_3Aq. Decomposed by heat, giving a basic salt soluble in water (Nilson, *B.* 13, 1444).

Silver nitrate $AgNO_3$. (*Lunar caustic.*) S.G. 4·238 to 4·328 (Schröder, *P.* 107, 113). S. 121·9 at 0°, 227·3 at 19·5°, 500 at 54°, 714 at 85°, 1111 at 110° (Kremers, *P.* 92, 497); S. 1622·5 at 125°, 1941·4 at 133° (Tilden a. Shenstone, *T.* 175, 23). Saturated solution boils at 125°. S. in boiling alcohol = 25. Melts at 218° (Carnelley, *C. J.* 33, 276). H.F. $[Ag, O, NO^2] = 30{,}745$; $[Ag, N, O^3] = 28{,}740$ (*Th.* 3, 517). Crystallises in trimetric system; $a:b:c = \cdot9433:1:1\cdot37$. S.H. 16° to 99° = ·14352 (Regnault, *A. Ch.* [3] 1, 129).

Preparation. — Pure Ag is dissolved in HNO_3Aq, the solution is evaporated to dryness, the residue is heated gently till all HNO_3 is removed, when it is dissolved in water and crystallised. If solution of Ag in HNO_3Aq proceeds in the cold the liquid becomes blue from solution of N_2O_3, but no gas is evolved; on warming, NO escapes rapidly. $AgNO_3$ may be prepared from Ag which contains Cu by saturating warm fairly conc. HNO_3Aq with the metal, adding enough KOHAq to a part of the solution to ppt. Ag_2O along with CuO, digesting the pp. with the rest of the solution, whereby the remaining CuO is ppd., filtering, and evaporating the filtrate.

Properties.—White trimetric crystals; solution in water is perfectly neutral to litmus paper, has a metallic taste, and is poisonous; melts below red heat; is a powerful caustic, at once destroying flesh when applied to it. $AgNO_3$ is readily reduced by organic matter in light.

Reactions.—1. Decomposed by *heat*, leaving Ag.—2. With *hydrogen chloride* gas forms AgCl and HNO_3, with evolution of a very little Cl and NO (Thomas, *C. J.* 33, 371).—3. With *organic matter*, *e.g.* paper, dust, &c., forms Ag in presence of sunlight.—4. $AgNO_3Aq$ is slowly and very partially decomposed by *hydrogen* with ppn. of Ag (Russell, *C. J.* [2] 12, 3).—5. *Uranous oxide*, UO_2, ppts. Ag, with production of $UO_2(NO_3)_2$ (Isambert, *C.R.* 80, 1087).

Combinations.—1. With *ammonia*, to form $AgNO_3.2NH_3$; by supersaturating conc. $AgNO_3Aq$ with NH_3; decomposes above 100°, giving off NH_3 and N (Marignac, *P.* 9, 413; Mitscherlich, *A. Ch.* [2] 72, 288; Kane, *P.* 20, 153). Dry $AgNO_3$ absorbs NH_3 to form $AgNO_3.3NH_3$ (H. Rose, *J.* 1857. 256).—2. With *silver bromide*, to form $AgNO_3.AgBr$; by dissolving freshly ppd. AgBr in very conc. hot $AgNO_3Aq$ (Risse, *A.* 111, 42). AgCl seems to form a similar compound.—3. With *silver iodide*, to form several compounds. $2AgNO_3.AgI$ is obtained by boiling very conc. $AgNO_3Aq$ with AgI, pouring off, and allowing to cool (Risse, *A.* 171, 23; Riche, *A.* 111, 39; *cf.* Weltzien, *A.* 101, 127; Kremers, *J. pr.* 71, 54; Preuss, *A.* 29, 329; Schnauss, *Ar. Ph.* [2] 82, 260; Hofmann, *A.* 171, 23; Stürenberg, *Ar. Ph.* [2] 143, 12).—4. With *ammonium* and *potassium nitrates* to form $AgNO_3.MNO_3(M = NH_4 \text{ or } K)$ (Ditte, *C. R.* 101, 878).

Sodium nitrate $NaNO_3$. (*Cubic saltpetre, Chili saltpetre*). S.G. 2·2606 at 4° (Playfair a. Joule, *C. S. Mem.* 2, 401); 2·246 at 15·5° (Holker, *P. M.* [3] 27, 213); 1·878 at melting-point (Braun, *P.* 154, 190). Melts at c. 316° (Carnelley, *C. J.* 33, 276). H.F. $[Na, N, O^3] = 111{,}250$; $[Na, O, NO^2] = 113{,}255$; $\left[\frac{Na^2,O,N^2O^5Aq}{2}\right] = 91{,}310$ (*Th.* 3, 518). Heat of solution −4786 at 16°, −4255 at 54° (Tilden, *Pr.* 38, 401). S. 72·9 at 0°, 80·8 at 10°, 87·5 at 20°, 94·9 at 30°, 102 at 40°, 112 at 50°, 122 at 60°, 134 at 70°, 148 at 80°, 162 at 90°, 180 at 100°, 200 at 110°; saturated solution freezes at −17·5° (Rüdorff, *B.* 2, 68), contains 216·4 parts $NaNO_3$ in 100 water, and boils at 119·7° (Mulder, *J.* 1866. 65; *cf.* Ditte, *C. R.* 80, 1164; Maumené, *C. R.* 58, 81; 81, 107). Schiff (*A.* 110, 75) gives a table showing S.G. and p.c. composition of $NaNO_3Aq$. S. in alcohol (61·4 p.c.) at 26° = 21·2 (Pohl, *W. A. B.* 6, 600; *v.* also Wittstein, *Viertelj. Zeit. Pharm.* 12, 109). 75 parts $NaNO_3$ added to 100 parts water at 13·2° lower the temperature through 18·5°. 50 parts $NaNO_3$ mixed with 100 parts snow lower the temperature to −17·5°.

Occurrence.—In large quantities in Chili, Peru, and some other parts of South America.

Preparation.—1. The crude salt is purified by repeated solution and crystallisation; or it is recrystallised once or twice, the first portions of each crop of crystals being rejected, then heated with HNO_3Aq, whereby chlorides are transformed into nitrates and again crystallised. 2. By neutralising HNO_3Aq with NaOHAq or Na_2CO_3Aq, and evaporating.

Properties.—White obtuse rhombohedrons, having much the aspect of cubes; hence the name *cubic saltpetre.* Absorbs water from moist air. Melts c. 316°, and solidifies to white mass on cooling; decomposes at higher temperature similarly to, but more readily than, KNO_3; deflagrates with charcoal, &c., but less quickly than KNO_3.

Reactions.—Decomposed by *heat* at c. 350°–380°, evolving O, and at higher temperature N also.—2. *Heated in presence of oxidisable bodies*, produces oxides, which, if acidic, form Na salts of corresponding acids.—3. With *hydrogen chloride* forms NaCl, and evolves NO and Cl (Thomas, *C. J.* 33, 367).

Strontium nitrate $Sr(NO_3)_2$. Prepared by adding to $SrCO_3$ enough HNO_3Aq to dissolve nearly all the salt, filtering, and crystallising. Separates without water of crystallisation from hot conc. solutions; from cold and more dilute solutions crystals of $Sr(NO_3)_2 4H_2O$ are obtained (Souchay a. Lenssen, *A.* 99, 45). The anhydrous salt crystallises in octahedrons, S.G. 2·98 at 16·8° (Favre a. Valson, *C. R.* 77, 579). The hydrate forms triclinic crystals, $a:b:c = \cdot5895:1:\cdot808$, S.G. 2·249 at 15·5° (F. a. V., *l.c.*) H.F. $[Sr,N,O^3] = 109{,}910$ (*Th.* 3, 517). S. anhydrous salt 20 in cold water, 200 in boiling water. Melts at red heat with decomposition, leaving SrO. Does not react with HCl gas (Thomas, *C. J.* 33, 371). A compound with Sr acetate, viz. $Sr(NO_3)_2.Sr(C_2H_3O)_2.3H_2O$, is obtained by allowing a mixed solution of the salts to evaporate (von Hauer, *J. pr.* 74, 432).

Tellurium nitrate. The compound $8TeO_2.2N_2O_5.3H_2O$ is obtained by dissolving Te in excess of hot HNO_3Aq S.G. greater than 1·15; the salt crystallises in forms which are probably orthorhombic; soluble in HNO_3Aq; easily decomposed by water with separation of TeO_2 (Klein, *A. Ch.* [6] 5, 59).

Thallium nitrates. *Thallous nitrate*, $TlNO_3$, is obtained by dissolving Tl in not very conc. HNO_3Aq, keeping as small an excess of acid as possible, and evaporating. Rhombic prisms, S.G. 5·5 (Lamy a. Des Cloizeaux, *N.* 1, 116). S. 10·6 at 15°, 43·5 at 58°, 588 at 107° (Crookes, *C. J.* **17**, **141**; Lamy, *C. R.* 54, 1255). Insol. alcohol. Melts at 205° without decomposition and solidifies to a glass S.G. 5·8 (Lamy, *l.c.*) H.F. $[Tl,N,O^3]$ = 58,150 (*Th.* 3, 517). Strongly heated in a crucible leaves $TlNO_2$ and Tl_2O_3 (Carstanjen, *J. pr.* 102, 65, 129).

Thallic nitrate $Tl(NO_3)_3$. Separates in large deliquescent crystals from solution of TlO.OH in HNO_3Aq S.G. 1·4; according to Strecker (*A.* 135, 207) the crystals contain $6H_2O$, and according to Willm (*A. Ch.* [4] 5, 5) $8H_2O$. Decomposed at c. 100°.

Thorium nitrate $Th(NO_3)_4.12H_2O$. Large, translucent tables; very hygroscopic; lose $8H_2O$ over H_2SO_4. Forms a very soluble double salt with KNO_3.

Tin nitrates. No definite salt has been isolated. Stannous oxide dissolves in very dilute cold HNO_3Aq, but the solution decomposes on heating with separation of SnO_2 (*cf.* Ditte, *A. Ch.* [5] 27, 145). Sn dissolves in cold very dilute HNO_3Aq, with production of $NH_4.NO_3$ and probably $Sn(NO_2)_2$. Freshly ppd. SnO_2 dissolves in HNO_3Aq: on heating SnO_2 is ppd.

Titanium nitrate. By evaporating a solution of TiO_2 in HNO_3Aq over lime, Merz obtained lustrous plates $5TiO_2.N_2O_5.6H_2O$; soluble in cold water (*J. pr.* 99, 157).

Uranium nitrate. By dissolving U or an oxide of U in HNO_3Aq, and evaporating, large, yellow, rhombic crystals are deposited having the composition $UO_2(NO_3)_2.6H_2O$ = *uranyl nitrate.* S.G. 2·807 (Boedeker). Effloresces somewhat in dry air; melts at 59·5°, and boils at 118° (Ordway, *J.* 1859. 114). A trihydrated salt, $UO_2(NO_3)_2.3H_2O$, was obtained by Schultz-Sellack (*Z.* [2] 6, 646) by evaporating a strongly acid solution of the ordinary salt over H_2SO_4 and KOH. Reacts with HCl to form U oxychloride with evolution of Cl and NO (Thomas, *C. J.* 33, 371).

Vanadium nitrates. No definite salt has been isolated. By dissolving VO or VO_2 in HNO_3Aq, a blue solution is obtained which cannot be evaporated without decomposition (Berzelius). By dissolving V_2O_5 in HNO_3Aq, and allowing to evaporate, a reddish residue is obtained (Berzelius).

Yttrium nitrate $Y(NO_3)_3.6H_2O$. Large translucent crystals; by evaporating over H_2SO_4, a solution of Y_2O_3 in HNO_3Aq (Cleve, *Bl.* [2] 21, 344). Heated till NO_2 is evolved, the *basic* salt $2Y_2O_3.3N_2O_5.9H_2O$ is obtained (*v.* Bahr a. Bunsen, *A.* 137, 1).

Zinc nitrate $Zn(NO_3)_2.6H_2O$. Zn dissolves in HNO_3Aq with formation of NH_4NO_3 and $Zn(NO_3)_2$; from very dilute HNO_3Aq, N_2O is evolved. The salt is prepared by evaporating a solution of Zn, ZnO, or $ZnCO_3$, in HNO_3Aq. Large 4-sided prisms; deliquescent; very soluble water and alcohol; melt at 36·4° and boil at 131° (Ordway, *Am. S.* [2] 27, 14); lose $2H_2O$ *in vacuo* over H_2SO_4 (Vogel a. Reischauer, *N. J. P.* 11, 137); lose all H_2O by heating to 105° in stream of dry air (Pierre, *A. Ch.* [3] 16, 247). S.G. 2·063 at 18° (Clarke's *Table of Specific Gravities* (new ed.) 110). H.F. $[Zn,O^2,N^2O^4,6H^2O]$ = 142,180; $[Zn,O,N^2O^5Aq]$ = 102,510 (*Th.* 3, 518). The S.G. of $Zn(NO_3)_2Aq$ and p.c. of $Zn)NO_3)_2$ are given by Franz (*J. pr.* [2] 5, 274):—

S.G.	P.c.	S.G.	P.c.
1·0496	5	1·3268	30
1·0968	10	1·3906	35
1·1476	15	1·4572	40
1·2024	20	1·5258	45
1·264	25	1·5984	50

$Zn(NO_3)_2$ with HCl gas gives $ZnCl_2$, evolving Cl and NO (Thomas, *C. J.* 33, 371). Many *basic nitrates of zinc* are known; they are obtained by heating the normal salt, by treating HNO_3Aq with a large excess of Zn, and by digesting hot $Zn(NO_3)_2$ with ZnO (*v.* Schindler, *N. J. P.* 11, 137; Vogel a. Reischauer, *ibid.*; Ordway, *Am. S.* [2] 27, 14; Grouvelle, *A. Ch.* [3] 19, 137; Wells, *Am.* 9, 304).

Zirconium nitrates. The *normal salt* $Zr(NO_3)_4$ is said to be obtained by evaporating a solution of $ZrO_2.xH_2O$ in excess of HNO_3Aq; by heating to 100°, the *pyro-salt* ZrN_2O_7 is formed; and by boiling a dilute aqueous solution of this, the *basic salt* $3ZrO_2.2N_2O_5$ is produced.

M. M. P. M.

NITRATION *v.* NITRO- COMPOUNDS.

NITRIC ACID. HNO_3. (*Spirit of nitre. When dilute, aquafortis.*) Mol. w. 62·89 (*v. infra*). [c. −47°] (Berthelot, *Bl.* [2] 29, 3). (86°) (Mitscherlich, *P.* 18, 152; Millon, *J. pr.* 29, 337). S.G. 1·552 at 12·5° (Mitscherlich, *l.c.*); 1·552 at 15° (Millon, *l.c.*). V.D. (mixed with dry air) at 40·5° = 34·3 (Playfair a. Wanklyn, *C. J* 15, 142; *v. infra*). S.H. of $HNO_3.10H_3O$ = ·768, $HNO_3.20H_2O$ = ·849, $HNO_3.50H_2O$ = ·93, $HNO_3.100H_2O$ = ·963, $HNO_3.200H_2O$ = ·982 (Thomsen, *P.* 142, 337). H.F. $[H,N,O^3]$ = 41,510; $[H,O,NO^2]$ = 43,515; $[H,O^2,NO]$ = 63,085;

$$\left[\frac{N^2,O^5,H^2O}{2}\right] = 7{,}330;$$

$$\left[\frac{N^2O,O^4,H^2O}{2}\right] = 16{,}200;$$

$$\left[\frac{2NO,O^3,H^2O}{2}\right] = 28{,}905;$$

$$\left[\frac{2NO^2,O,H^2O}{2}\right] = 9{,}335;$$

$[N^2,O^5,Aq]$ = 29,820; $[N^2O^3Aq,O^2]$ = 36,640; $[2NO^2,O,Aq]$ = 33,830; $[N^2O,O^4,Aq]$ = 47,560; $[2NO,O^3,Aq]$ = 72,970; $[H,N,O^3,Aq]$ = 49,090; $[HNO^2Aq,O]$ = 18,320 (*Th.* 2, 199). H.V. 7250 (Berthelot, *C. R.* 90, 1510). For E.C. of HNO_3Aq at different dilutions *v.* Ostwald (*J. pr.* [2] 32, 300). Affinity of HNO_3Aq approximately the same as HClAq. M.M. 1·18 (Perkin, *C. J.* 55, 680).

Occurrence.—In small quantities in rain-water, varying from c. ·1 to c. 16 pts. per million pts. of rain; for measurements *v.* Goppelsröder, (*Fr.* 10, 259; 11, 16); Warington (*C. J.* 55, 537; references are given to various other results). Ekin (*C. J.* [2] 9, 64) found HNO_3 in the spring-water of an uncultivated hill near Bath, not exposed to contact with organic matter. Salts of HNO_3 occur in almost all soils, although not generally in large quantities; and also in the juices of many plants.

Nitric acid has been known from early times. Geber mentions it (8th cent.); Glauber (17th cent.) gave directions for its preparation from nitre by the use of H_2SO_4. Lavoisier showed that this acid contained O; Cavendish proved the presence of N in it, and obtained it by passing electric sparks through moist O and N.

Formation.—1. By burning H in O in presence of air (Lavoisier; Kolbe, *A.* 119, 176; Hofmann, *B.* 3, 658). The experiments of L. T. Wright (*C. J.* 35, 42) tend to show, although they do not absolutely prove, that the HNO_3 is formed by oxidation of NH_3, not of N.—2. By passing electric sparks for some time through a mixture of moist N and O (Böttger, *J. pr.* 73, 494; Perrot, *C. R.* 49, 204; Buff a. Hofmann, *A.* 113, 140).—3. By exploding air with electrolytic gas (H_2+O) (Bunsen). Hempel's experiments (*B.* 23, 1455) show that HNO_3 is formed when air is burnt with O and electrolytic gas under pressure of several atmos. Hempel also proves that considerable quantities of HNO_3 are formed when C is burnt in compressed air in presence of strongly compressed O.—4. By burning air in coal-gas (Ilosva, *Bl.* [3] 2, 734); or coal-gas in air (Wright, *C. J.* 35, 42).—5. According to Berthelot (*C. R.* 108, 543), a very little HNO_3 is formed when ether and P are slowly oxidised by air in presence of water.—6. Nitrates are formed by the oxidation of nitrogenous animal or vegetable matter in the soil (*v.* NITRIFICATION). 7. Ozone produces NH_4NO_2 from NH_3, and NH_4NO_2 easily oxidises to NH_4NO_3 (Carius, *A.* 174, 31; Schönbein, *J. pr.* 75, 99; Weith a. Weber, *B.* 7, 1745; Wöhler, *A.* 136, 256).—8. By oxidising NH_3 in presence of moisture; *e.g.* by passing NH_3 and air over Pt black heated to c. 300°; by distilling $(NH_4)_2SO_4$ and conc. H_2SO_4 with $K_2Cr_2O_7$; or distilling $(NH_4)_2SO_4$ with $KMnO_4$ and dilute H_2SO_4Aq (Tessié du Mothay, *W. J.* 1871. 260).—9. HNO_3 is a product of the reaction of NO_2 with H_2SO_4; and $NaNO_3$ is formed by acting on NaOHAq with N_2O_3 (Lunge, *B.* 12, 1058).—10. By heating $MnCl_2$ or $MnSO_4$ with $NaNO_3$ (Kuhlmann, *W. J.* 1862. 239).—11. By decomposing $Ba(NO_3)_2Aq$ or $Pb(NO_3)_2Aq$ by H_2SO_4Aq, filtering, and concentrating by evaporation.—12. By heating $NaNO_3$ with AlO_3H_3 or SiO_2 (Wagner, *D. P. J.* 183, 76).

Preparation.—1. A mixture of 101 pts. thoroughly purified and dry KNO_3, in coarse powder, and 98 pts. pure H_2SO_4 is heated in a capacious glass retort, the neck of which passes some way into a glass receiver which is kept cold. The distillate is again distilled till one-third has passed over, when a quantity of conc. H_2SO_4 equal to the contents of the retort is added (when the retort is cold), the receiver is changed, and distillation is continued; the distillate is again distilled at as low a temperature as possible, to get rid of H_2SO_4; the distillate thus obtained is gently warmed, and a current of perfectly dry CO_2 is passed through it until it is quite colourless; oxides of N are thus removed. HNO_2 may be removed by distilling with a little urea, which decomposes HNO_2, giving CO_2, H_2O, and N.—2. Commercial acid is distilled, after addition of a little KNO_3 to decompose H_2SO_4, until a few drops give no pp., when diluted, with $AgNO_3$; the receiver is then changed and distillation continued.

Preparation of fuming nitric acid.—The red fuming acid consists of a solution of NO_2 in HNO_3; it is a more powerful oxidiser than the ordinary acid. It is prepared by heating a 202 pts. KNO_3 with 98 pts. H_2SO_4 and continuing the distillation as long as liquid comes over; the second stage of the process, which is represented by the equation $KHSO_4+KNO_3=K_2SO_4+HNO_3$, occurs only at a temperature so high that part of the HNO_3 is decomposed with formation of NO_2. A better method is to arrange the materials so that a portion of the HNO_3 is reduced to NO_2 as soon as it is formed; this may be done by mixing 100 pts. KNO_3 with $3\frac{1}{2}$ pts. starch, placing the mixture in a large retort the beak of which passes inside a glass tube 3 to 4 feet long which tube dips into a glass receiver kept very cold, and adding 100 pts. H_2SO_4 S.G. 1·85. The process goes on almost without the application of heat. About 60 pts. red fuming acid are obtained from 100 pts. KNO_3 (Brunner, *Rép. Chim. app.* 3, 188).

Properties.—Perfectly pure HNO_3 has not been isolated; Roscoe obtained an acid with from 99·5 to 99·8 p.c. HNO_3 (*A.* 116, 211). Nitric acid is a colourless, highly corrosive liquid; according to Berthelot it solidifies at c. −47°; the B.P. is 86°, but decomposition begins below this temperature; at c. 256° the change $2HNO_3=2NO_2+H_2O+O$ is complete. The following table shows the process of decomposition by heat (Carius, *B.* 4, 828):—

t	S.G. of vapour		P.c. decomposition	c.c. of O from 1 g. HNO_3
	Air=1	H=1		
86°	2·05	29·6	9·53	8·43
100	2·02	29·1	11·77	10·41
130	1·92	27·6	18·78	16·62
160	1·79	25·8	28·96	26·22
190	1·59	23·0	49·34	43·69
220	1·42	20·4	72·07	63·79
250	1·29	18·6	93·03	82·30
256	1·25	18·0	100·0	88·47
265	1·24	17·9		
312	1·23	17·8		

By mixing the vapour from HNO_3 with dry air, Playfair a. Wanklyn (*C. J.* 15, 142) found the V.D. at 40·5° = 34·3, that calculated from HNO_3 being 31·5. HNO_3 is slowly and partially decomposed by sunlight, giving NO_2, O, and H_2O; so that when exposed to sunlight the acid becomes yellow and contains NO_2. Solution of HNO_3 in water, and dilution of the liquid, are accompanied by production of heat; Thomsen (*Th.* 3, 66) gives the following table:—

x	$[HNO^3,xH^2O]$	$[HNO^3.xH^2O,xH^2O]$
·5	2005	1280
1	3285	
1·5	4160	1550
2·5	5276	1389
3	5710	
5	6665	653
10	7318	140
20	7458	−22
40	7436	−15
80	7421	29
100	7439	
160	7450	45
320	7493	

If these results are plotted, and a curve drawn, with the horizontal lines showing molecules of H_2O and the vertical lines showing quantities of heat, the curve shows no signs of irregularity; hence, Thomsen concludes that the heat of solution and dilution of HNO_3 does not indicate the formation of any definite hydrates of HNO_3. Considering the results which have followed a very close and extended examination of the heat of dilution of H_2SO_4 (*v.* especially Pickering, *C. J.* 57, 64), it seems inadvisable to draw conclusions in favour of, or against, the formation of hydrates of HNO_3, from the limited number of thermal observations made by Thomsen. Berthelot (*Bl.* [2] 22, 530) has also measured the heat produced on adding water to HNO_3 already diluted with known quantities of water, and concludes that a hydrate $HNO_3.2H_2O$ exists in aqueous solutions of HNO_3. Perkin has determined the magnetic rotatory power of HNO_3 and $HNO_3.xH_2O$ (*C. J.* 55, 680); his results are:—M.M. $HNO_3 = 1·18$; M.M. $HNO_3 + 2·67H_2O = 3·656$. Now by deducting 2·67 (M.M. of $2·67H_2O$) from 3·656, we get ·986 as the M.M. of HNO_3 in presence of $2·67H_2O$; but pure HNO_3 gave M.M. 1·18; hence the water has reduced the M.M. of HNO_3 by ·194. From these results, Perkin concludes that HNO_3 and H_2O combine to form H_3NO_4.

The electrical conductivity of HNO_3Aq for increasing dilution has been measured by Kohlrausch a. Grotrian (*P. M.* [4] 49, 417) and by Ostwald (*Z. P. C.* 1, 74). Conductivity increases slightly with dilution, but soon reaches a maximum. The behaviour of HNO_3Aq in this respect is characteristic of that of the strong monobasic acids (*cf.* also Bouty, *C. R.* 106, 654). Roscoe (*C. J.* 13, 150) has shown that distilling HNO_3Aq at 760 mm. results in production of an acid containing 68 p.c. HNO_3; the formula $2HNO_3.3H_2O$ requires 70 p.c., and $HNO_3.2H_2O$ requires 63·6 p.c., HNO_3; the liquid of constant B.P. is therefore not a definite hydrate. This liquid boils at 120·5° under 735 mm. pressure. By distilling at 150 mm. pressure, Roscoe obtained an acid containing 67·6 p.c. HNO_3; at 70 mm. (B.P. 65°–70°) the acid contained 66·7 p.c. HNO_3; at pressure greater than 760 mm. rather more than 68 p.c. HNO_3 was present in the acid of constant B.P. The percentage of HNO_3 in the liquid obtained by passing dry air into HNO_3Aq containing from 64 to 68 p.c. HNO_3, varies with temperature; the higher the temperature the greater the percentage of HNO_3. For every mixture of HNO_3 and H_2O there is a fixed temperature, whereat HNO_3 and H_2O evaporate in the same proportion as they are present in the residual acid; for 66·2 p.c. HNO_3 this temperature is 100°, for 64·5 p.c. it is 60° (Roscoe, *l.c.*; for older observations *v.* Millon, *J. pr.* 29, 349; Smith, *Ph. C.* 1848. 203). When HNO_3 and H_2O are mixed, the maximum contraction takes place for the ratio $2HNO_3:3H_2O$ (Kolb, *A. Ch.* [4] 10, 140).

Kolb (*A. Ch.* [4] 10, 136) gives the following table, showing weight of HNO_3 is 100 pts. of HNO_3Aq (*p*) at 0° and 15°. The numbers marked with an asterisk were directly determined by adding a weighed excess of $CaCO_3$, and weighing the residue :—

On adding water to the fuming red nitric acid, the liquid becomes green, then blue, and finally colourless when dilute; red vapour of NO_2 is evolved, the more rapidly the higher is the temperature. The NO_2 present in the fuming acid is slowly decomposed by the added water, giving HNO_2, which colours the liquid blue (the green colour being the result of the yellow caused by NO_2 and the blue caused by HNO_2); on further dilution NO is evolved, and only HNO_3 remains:

(1) $2NO_2 + H_2O = HNO_3 + HNO_2$;
(2) $3HNO_2 = HNO_3 + 2NO + H_2O$.

Reactions.—1. *Heat* decomposes HNO_3 to NO_2, H_2O, and O; the decomposition is complete at c. 256° (Carius, *B.* 4, 828).—2. *Light* slowly decomposes HNO_3 in the same way as heat; hence very conc. HNO_3Aq kept in an open place always contains some NO_2.—3. The products of *electrolysis* of HNO_3Aq vary with the dilution of the acid; with acid $2HNO_3{:}3H_2O$ no H is evolved at first; after a little NO comes off, and then H begins, while the NO slowly ceases; as dilution increases H is evolved and products of reduction —N_2O_3, NO, N, and NH_3—are produced, the more rapid the electrolysis the greater is the quantity of H evolved; very dilute acid evolves H only without the formation of reduced products (Bourgoin, *J. Ph.* [4] 13, 266 [abstract in *C. J.* [2] 9, 885]; Gladstone a. Tribe, *C. J.* 35, 172).—4. Conc. HNO_3Aq is rapidly reduced by *hydrogen occluded* by Pt or Pd, with oxidation of the H (G. a. T., *l.c.*).—5. HNO_3Aq is also reduced by many *metals*; the products vary with temperature, concentration of the acid, and the nature of the metal. Mg with 68 p.c. acid *plus* an equal quantity, or twice the quantity, of water, produces H along with gaseous reduction-products (G. a. T., *C. J.* 35, 178). The gaseous reduction-products are generally N_2O, NO, and N; these gases are formed by the reaction with HNO_3Aq of *e.g.* Al, Cd, Co, Cu, In, Fe, Pb, Mg, Ni, Ag, Tl, Sn, Zn (Acworth, *C. J.* 28, 828; Acworth a. Armstrong, *C. J.* 32, 54). It appears to be the case that the greater the heat of formation of a metallic oxide the more completely is HNO_3Aq reduced by the metal (*cf.* Thomsen, *Th.* 3, 547). Al, Cd, Fe, Mg, Pb, Sn, Zn, and the alkali metals produce NH_4NO_3 and NH_2OH, but no nitrous acid or nitrites; Bi, Cu, Hg, and Ag produce nitrites, but no NH_4NO_3 or NH_2OH (Divers, *C. J.* 43, 443; for the combined action of HNO_3Aq and H_2SO_4Aq on Zn *v.* Divers a. Shimidzu, *C. J.* 47, 597). In most cases nitrates of the metals are formed, but sometimes these are decomposed with the final formation of oxides, *e.g.* Sb, Sn, and W (*v.* also Veley, *Pr.* 48, 458). Ta, Ti, Au, and most of the Pt metals do not react with HNO_3Aq.—6. All the solid *non-metals* are oxidised by nitric acid.—7. *Oxidisable compounds* are oxidised by HNO_3Aq; *e.g.* ferrous compounds are changed to ferric, stannous to stannic, arsenious to arsenic; sulphides generally yield sulphates and nitrates.—8. *Hydriodic acid* and *iodides* yield H_2O, NO, and I.—9. *Hydrochloric acid* gives H_2O, NOCl, and Cl (*v. aqua regia* under CHLORHYDRIC ACID, vol. ii. p. 8; *Reactions* No. 17).—10. *Organic compounds* are oxidised by HNO_3Aq; straw, hay, cotton, &c., are inflamed by the conc. acid (Kraut, *B.* 14, 301). Many organic compounds, especially those of the benzenoid class, form nitro- derivatives, H being replaced by NO_2.—11. With *starch*, N_2O_3 or a mixture of this with NO_2 is produced; HNO_3Aq S.G. 1·3 to 1·35 gives almost pure N_2O_3; if the S.G. is greater than 1·35 NO_2 is also produced; if S.G. is less than 1·3 the chief gaseous product is NO (Lunge, *B.* 11, 1229, 1641).

Combinations.—1. With *water*; it is still undecided whether a hydrate or hydrates of HNO_3 are produced when HNO_3 is dissolved in water; *v. Properties*, p. 519.—2. With *ammonia* to form NH_4NO_3.—3. With dry *sulphur dioxide* to form $SO_2.NO_2.OH$ (*v.* NITROGEN DERIVATIVES OF SULPHUR ACIDS in vol. iv.).—4. With some *nitrates* to form acid salts; according to Ditte (*A. Ch.* [5] 18, 320), the nitrates which combine with HNO_3 when dissolved in excess of the acid are those of NH_4, K, Rb, and Tl.—5. With *nitric anhydride* to form $(HNO_3)_2N_2O_5$ ($= H_2N_4O_{11}$; *v. Dinitric acid, infra*).

Detection and Estimation v. Manuals of Analysis.

DINITRIC ACID $H_2N_4O_{11}$($=(HNO_3)_2.N_2O_5$). Weber (*J. pr.* [2] 6, 342) obtained this compound by adding very conc. colourless HNO_3 to melted N_2O_5, and cooling to c. 8° (for details of preparation *v.* Weber, *l.c.*). A bluish yellow liquid, solidifying at c. 5°; S.G. 1·642 at 18°. Fumes in air; dissolves in water with production of much heat; when gently warmed N_2O_5 is evolved. It is very dangerous to keep the compound in sealed tubes as explosions generally occur. Acts as a powerful oxidiser; forms NO_2 derivatives with many carbon compounds. The relation of this acid to nitric acid is probably similar to that of disulphonic to sulphonic acid: $H_2SO_4 + SO_3 = H_2S_2O_7$; $2HNO_3 + N_2O_5 = H_2N_4O_{11}$. M. M. P. M.

NITRIDES. *Compounds of N with one other more positive element.* The term is generally applied to the binary compounds of N with B, P, Si, and the metals. The metallic nitrides have for the most part the composition denoted by the formulæ RN, R_2N, or R_3N; R = monovalent metal. They are mostly obtained by the action of ammonia on metallic oxides or chlorides; frequently also by the direct action of atmospheric nitrogen on metals at the moment of separation from their oxides by charcoal. Some metallic nitrides are also obtained by the reaction of metals or oxides of metals with hydrazoïc acid, HN_3 (*q.v.* p. 559). Most of them have a metallic aspect, are easily decomposed by heat, sometimes with explosion; some of them, however, withstand a very high temperature without decomposition. Many of them are reduced to metals by strongly heating in hydrogen or ammonia-gas; heated with water or hydrate of potassium they often yield metallic oxides and ammonia; they burn when heated in the air. They unite with other metallic compounds, especially with metalamides. The chief metallic nitrides are those of Al, Cu, Cr, Fe, Mg, Hg, Mo, Ni, Nb, Pt, K, Na, Ta, Th, ?Sn, Ti, W, U, Y, Zn, and Zr. For descriptions of the nitrides *v.* the several metals enumerated above. M. M. P. M.

NITRIFICATION. Nitre occurs in many parts of the earth. In some places it is found as an efflorescence on the surface of the soil; it is formed on the sides of caves (generally those frequented by animals), on the walls of old stables, and in the soil surrounding some of the villages in North India (*v.* Palmer, *C. J.* [2] 6, 318). Nitre also occurs in Algeria, Spain, &c.; and very large deposits of $NaNO_3$ are found in Peru. Nitrates are found in all, or almost all, soils, especially in those which are fertile and well manured. Nitrates are obtained by the artificial oxidation of nitrogenous matters in soils, by arranging the conditions so that there is first an accumulation of nitrogenous compounds, and then a slow oxidation in presence of moisture and some base which combines with the HNO_3 as it is produced (*v. Potassium nitrate, Formation*, p. 515).

That HNO_3 is formed by the oxidation of nitrogen compounds has been abundantly proved (*e.g.* by Boussingault, *C. R.* 82, 477). There is no convincing experimental proof that the N of the air is oxidised to HNO_3, under normal naturally occurring conditions. L. T. Wright (*C. J.* 35, 42) found that HNO_3 is formed by burning H in air, but that if special precautions are taken to remove all NH_3 from the air, HNO_3 is not formed. Boussingault (*C. R.* 76, 22) found that there was no increase in the total N in a quantity of soil rich in N compounds, after keeping in a closed vessel full of air for 11 years, although there was a marked increase in the nitrates in the soil. Various experimenters have proved that NH_3 can be oxidised to HNO_3, *e.g.* by ozone, by $KMnO_4$ and H_2SO_4, &c. (*v.* NITRIC ACID, *Formation*, p. 518). Experiments conducted at Rothamsted have proved conclusively that nitrates are formed in a fertile soil from NH_4 salts applied to the soil. The following table, taken from the article NITRIFICATION in the first edition of this Dictionary (Supp. iii. p. 1399), exhibits very clearly the oxidation of NH_4 salts to nitrates in the soil:—

Nitrogen existing as nitrates in one million parts of drainage water.

	Plots which received no NH_4 salts				Plots which received 400lbs. NH_4 salts per acre, between March 10 and 13

In 1862, Pasteur suggested that the oxidation of nitrogen compounds in the soil to nitrates is accomplished by a living organism. In 1877 Schloesing a. Muntz (*C. R.* 84, 301; 85, 1018) showed that nitrification did not take place in sewage slowly filtered through a column of pure sand and limestone until after 20 days, that nitrification then proceeded rapidly, but was completely stopped by allowing vapour of chloroform free access to the surface of the sand and limestone; 7 weeks after the application of $CHCl_3$, a little vegetable earth, which was known to nitrify easily, was placed on the surface of the sand, and then nitrification began again. S. a. M. also showed that heating soil to 100° destroyed the power of that soil to produce nitrates from nitrogenous matter.

Warington has conducted, at Rothamsted, an extensive, laborious, and accurate, series of experiments on nitrification in soils; his memoirs are to be found in *C. J.* 33, 44; 35, 429; 45, 637 [numerous references here to other workers]; 47, 758; 51, 118; 53, 751; *cf.* also Munro, *C. J.* 49, 632. The results fully confirm the view that the production of nitrates in soils from nitrogenous compounds is due to the activity of a living organism. Summarising the results, Warington says (*C. J.* 45, 461): 'Nitrification in soils and waters is found to be strictly limited to the range of temperature to which the vital activity of low organisms is confined. Nitrification is also dependent on the presence of plant-food suitable to organisms of low character. Further proof is afforded by the fact that antiseptics are fatal to nitrification. The action of heat is equally confirmatory. By raising sewage or soil to the temperature of boiling water, its nitrifying power is entirely destroyed. Finally, nitrification can be started in boiled sewage, or in other sterilised liquids of suitable composition, by the addition of a few particles of surface soil, or a few drops of a solution which has lately nitrified; while, if no such addition is made, these liquids may be freely exposed to filtered air without nitrification taking place. . . . Schloesing has apparently given a final blow to the theory that air exists in a condensed state in the pores of a soil, and may on that account exert special oxidising powers, by his recent experiments (*Ann. de la Science agronomique*, 1884. 1), showing that the gases in a vegetable soil simply occupy the normal volume due to temperature and atmospheric pressure.'

The result of Warington's examination of the classes of bodies that undergo nitrification in soils is, that all nitrogenous substances which yield ammonia by the action of organisms existing in fertile soils are nitrifiable (*C. J.* 45, 653).

The conditions under which nitrification proceeds in soils, sewage, &c., are as follows (W. *C. J.* 45, 654 *et seq.*):—(1) A sufficient quantity of some base must be present to combine with the nitric acid. When the whole of the bases present are neutralised the nitrification stops, although nitrifiable compounds may still be present. There is a limit to the quantity of alkaline carbonate which can be present in a liquid undergoing nitrification. This fact renders impossible the nitrification of urine, except when diluted with water, because the first product of the action on urine of organisms in the soil is NH_4 carbonate, and unless this be present in very moderate quantity nitrification cannot proceed. Warington's experiments showed that 14 parts urine in 100 water did not nitrify when kept in contact with soil containing nitrifying organisms for 172 days. Addition of gypsum allows nitrification to proceed in cases where it would either not occur or be stopped by the presence of NH_4 carbonate (W., *C. J.* 47, 758; Pickard, *Ann. de Science agronomique*, 1884. 302; Joulie, *ibid.* 1884. 289). Thus, whereas a 14 p.c. urine solution did not nitrify after 172 days, a 30 p.c. solution, to which gypsum was added, nitrified after 78 days, and a 50 p.c. solution containing gypsum nitrified after 151 days. (2) In order that a nitrogenous liquid shall nitrify, the concentration of the liquid must not exceed a certain degree (for experiments *v. C. J.* 45, 662). (3) A sufficient quantity of the nitrifying organism must be present. The vigour of the organisms obtained in different cultivations differs considerably. A liquid which refuses to nitrify when seeded, because its concentration is excessive, may be caused to undergo nitrification by seeding it with a very vigorous organism, *i.e.* one which has been obtained by cultivation in a fairly conc. solution well supplied with nutriment. 'The plan that has proved most effective in producing rapid nitrification is to make use of the sediment lying at the bottom of the vessel in which the nitrification of a fairly strong solution has been conducted' (W., *l.c.* p. 665). (4) Stagnant liquids of considerable depth nitrify much less quickly than a shallow liquid of similar composition, or than a liquid which is poured over a porous solid and so brought into contact with fresh supplies of oxygen. (5) Some quantity of carbon in combination—'organic carbon'—is needed for the nourishment of the nitrifying organism, but no advantage accrues from the presence of more C than is required for this purpose (*cf.* Munro, *C. J.* 49, 651 *et seq.*). (6) Nitrification proceeds within certain limits of temperature; the organism seems to be destroyed at, or somewhat below, 100°; at 3°–5° nitrification proceeds much more slowly than at somewhat higher temperatures. (7) Light tends to decrease, or even stop, the process of nitrification (*v.* W., *C. J.* 33, 44). The product of nitrification is sometimes a nitrite, sometimes a nitrate, and sometimes both. The exact conditions under which nitrite and nitrate are formed have not yet been determined satisfactorily. In a later communication (*C. J.* 59, 484) Warington describes the isolation of two organisms: one of these oxidises ammonia to nitrous acid and has no effect on nitrites; the other produces neither nitrites nor nitrates in ammoniacal solutions, but in absence of ammonia rapidly converts nitrites into nitrates. P. F. Frankland and G. C. Frankland (*Pr.* 47, 296) seem to have isolated a bacillus, which grows slowly in broth, and which converts ammoniacal salts into nitrates.

With regard to the distribution of the nitrifying organisms in the soil, Warington's experiments show that the organisms are not evenly distributed below a depth of about 9 inches in clay-soils (*C. J.* 45, 649), and that nitrification occurs chiefly, if not altogether, in the surface-soil, and rarely in a clay-subsoil 2 or 3 feet from the surface (*C. J.* 51, 118). M. M. P. M.

NITRILES. Compounds of the form $R.C{:}N$ where R is an organic radicle.

Formation.—1. By distilling potassium alkyl sulphates ($KRSO_4$) with potassium cyanide (Dumas, *C. R.* 25, 474).—2. From alkyl iodides and potassium cyanide in presence of dilute alcohol (Schlagdenhauffen, *C. R.* 48, 228; Henry, *C. R.* 104, 1181).—3. By dehydrating amides by distillation with P_2O_5 or P_2S_5 (Dumas, Malaguti, a. Leblanc, *A.* 64, 333).—4. By distilling organic acids with potassium or lead sulphocyanide. This reaction is most successful with aromatic acids (Krüss, *B.* 17, 1766).—5. By boiling the formyl derivatives of aromatic amines (*e.g.* (formanilide) with zinc-dust (Gasiorowski, *B.* 17, 73).—6. By the action of bromine and NaOH on the amide of the acid containing one C atom more: $X.CH_2.CONH_2 + 3Br_2 + 8NaOH = X.CN + 6NaBr + Na_2CO_3 + 6H_2O$. This reaction, which gives a means of descending the series, is particularly applicable to the higher homologues (yield from monoamide = 30 p.c.), but the lower the homologue the smaller is the yield, till in the case of valeramide hardly any nitrile at all is formed, the chief product of the reaction being butylamine (Hofmann, *B.* 17, 1406).—7. By distilling the formyl derivatives of aromatic monamines with zinc-dust, the yield being 10 p.c.–20 p.c. (Gasiorowski a. Merz, *B.* 18, 1008).—8. By warming the oxim of the corresponding aldehyde with Ac_2O.—9. Aromatic nitriles may be formed from diazo- compounds by Sandmeyer's reaction, using cuprous cyanide (Sandmeyer, *B.* 17, 2653).

Reactions.—1. Readily converted into NH_3 and the corresponding acid by heating with *acids* or *alkalis*. Cold conc. HClAq forms the intermediate amides.—2. *Alcohol* (1 mol.) and gaseous HCl form the salt of an imido-ether, *e.g.* $CH_3.CH(OEt){:}NH_2Cl$.—3. *Zinc* and dilute acids yield the corresponding amine (Mendius, *A.* 121, 129).—4. H_2S unites, forming a thioamide, *e.g.* $CH_3.CS.NH_2$.—5. *Sodium* polymerises many fatty nitriles. Sodium acting on an alcoholic solution of aromatic nitriles often reduces them to the aromatic hydrocarbons or their hydrides (Bamberger a. Lodter, *B.* 20, 1702).—6. HBr combines with nitriles. The product is decomposed by water, fatty nitriles yielding the acid, while benzonitrile yields benzamide.—

I. *Hydroxylamine* unites, forming amidoxims $R.C(NH_2):NOH$.

NITRILO - DIACETONAMINE *v.* Acetonamine.

NITRILO - PROPIONITRILE. A name for hydrocyanaldine *v.* vol. i. p. 104.

NITRITES. *Salts of nitrous acid*, HNO_2, *v.* *Nitrous acid* and *Nitrites*, under Nitrogen, p. 567.

NITRO- . *Use of this prefix applied to inorganic compounds*: for *nitro- compounds* and *nitro- salts v.* the element the nitro- compound of which is sought for, or the salts to the names of which *nitro-* is prefixed. Thus, *nitroferrocyanides* are described under *ferrocyanides*, a section of the group Cyanides; *nitrochromate of potassium* is described under Chromates.

NITRO-ACENAPHTHENE $C_{12}H_9NO_2$. [155°] (J.); [102°] (A.). Formed by nitrating acenaphthene dissolved in HOAc (Jandrier, *C. R.* 104, 1858; Quincke, *B.* 20, 609; 21, 1454). Pale-yellow needles (by sublimation). Easily reduced by zinc and HCl to an amido- derivative, which yields a bluish-violet product on oxidation.

Dinitro-acenaphthene $C_{12}H_8(NO_2)_2$. [206°]. Yellow needles, formed at the same time as the preceding (Q.; *cf.* Berthelot, *Bl.* 8, 250).

NITRO-ACETIC ACID $CH_2(NO_2)CO_2H$ or $CH_2(ONO)CO_2H$.

Ethyl ether EtA'. (c. 155°). S.G. $\frac{0}{}$ 1·133. Formed from bromo- or iodo-acetic ether and silver nitrite at 130°. Extracted with ether Fororand, *Bl.* [2] 31, 536; Steiner, *B.* 15, 1605; Lewkowitsch, *J. pr.* [2] 20, 163). Oil, smelling like nitrous ether. Yields amido-acetic ether on reduction. Splits up when boiled for a long time, yielding CO_2, oxalic ether, and NO.

NITROACETAMIDO - DI - METHYL - HYDROQUINONE *v.* *Acetyl-di-methyl derivative* of Nitro-amido-hydroquinone.

NITRO-ACET-ANILINE *v.* *Acetyl derivative* of Nitro-aniline.

NITRO-ACET-NAPHTHALIDE *v.* *Acetyl derivative* of Nitro-naphthylamine.

NITRO-ACETONITRILE. A name formerly given to fulminic acid (*v.* vol. ii. p. 317).

NITRO-ACETONYL-UREA
$CMe_2<\begin{matrix}CO.NH\\N(NO_2).CO\end{matrix}>$(?). [141°]. Obtained by nitrating acetonyl-urea (Franchimont a. Klobbie, *R. T. C.* 7, 241). Slender needles, sl. sol. water and benzene, sol. alcohol and ether. Decomposed by boiling water, forming α-oxy-isobutyric acid.

o-NITRO-ACETOPHENONE $C_8H_7NO_3$ *i.e.* $CH_3.CO.C_6H_4NO_2$ [1:2]. *Nitro-phenyl methyl ketone.* Formed, together with the *m-* isomeride, by nitration of acetophenone, especially at 40° (Engler, *B.* 18, 2238). Prepared by boiling o-nitro-benzoyl-acetoacetic ether with dilute H_2SO_4 for 8 hours, and extracting with ether (Guthzeit, *A.* 221, 325). Oil, v. sol. alcohol. With PCl_5 it yields chloro-*o*-nitro-styrene. Boiling alcoholic ammonium sulphide converts it into indigo. $KMnO_4$ yields o-nitro-benzoic acid. Tin and HCl yield o-amido-acetophenone (242°–252°).

m-Nitro-aceto-phenone
$CH_3.CO.C_6H_4NO_2$ [1:3]. [81°] (Buchka, *B.* 10, 1714). Formed by the action of *m*-nitro-benzoyl chloride on sodio-acetacetic ether and digesting the product with water (Gevekoht, *B.* 15, 2084). Obtained also by nitrating acetophenone in the cold. Needles, volatile with steam. Yields *m*-nitro-benzoic acid on oxidation.

Oxim [132°]. Forms a methyl-ether [64°] (Gabriel, *B.* 15, 3063).

p-Nitro-acetophenone $CH_3.CO.C_6H_4NO_2$ [1:4]. [81°]. Formed by the action of *p*-nitro-benzoyl chloride on sodio-acetacetic ether, and digesting the product with water (Gevekoht, *B.* 15, 2084). Formed also by warming *p*-nitro-phenyl-propiolic acid with dilute H_2SO_4, or by allowing its ether to stand with conc. H_2SO_4 at 40°, pouring the *p*-nitro-benzoyl-acetic acid which is formed into water, and expelling CO_2 by boiling (Drewson, *A.* 212, 160; Engler a. Zulke, *B.* 22, 203). Yellow prisms. Yields chloro-*p*-nitro-styrene with PCl_5. Yields *p*-amido-acetophenone [106°] on reduction by tin and HCl.

Phenyl-hydrazide
$CH_3.C(N_2HPh).C_6H_4NO_2$. [132°].

NITRO-ACET-TOLUIDE *v.* *Acetyl derivative* of Nitro-toluidine.

NITRO-ACET-XYLIDE *v.* *Acetyl derivative* of Nitro-xylidine.

DI-NITRO-ACETYLENE-DI-UREA $C_4N_6H_4O_4$ *i.e.* $CO<\begin{matrix}NH.C(NO_2).NH\\NH.C(NO_2).NH\end{matrix}>CO$. *Di-nitroglycoluril*e. Formed by nitrating acetylene-di-urea (Franchimont a. Klobbie, *R. T. C.* 7, 18). Chars at 180°. On boiling with water it is decomposed into CO_2, water, and an isomeride of hydantoïc acid.

NITRO- ACIDS *v.* Nitro- compounds.

(α)-NITRO-ACRIDINE $C_{13}H_8N_2O_2$ *i.e.* $C_{13}H_8(NO_2)N$. [214°]. Formed, together with the two following bodies, by nitrating acridine (Graebe a. Caro, *A.* 158, 275). Golden-yellow plates (by sublimation), insol. water, sl. sol. alcohol and ether. Its solution in dilute acids shows blue fluorescence. The hydrochloride crystallises in yellow prisms.

(β)-Nitro-acridine [154°]. Plates, v. sol. hot alcohol. Forms salts with acids.

Di-nitro-acridine $C_{13}H_7(NO_2)_2N$. Reddish-yellow tables, sl. sol. alcohol and ether. Does not dissolve in dilute acids.

TRI-NITRO-ACRIDINE CARBOXYLIC ACID $C_{13}H_5(NO_2)_3NCO_2H$. Formed by boiling methyl-acridine with HNO_3 (S.G. 1·33) (Bernthsen, *A.* 224, 40). Yellow prisms.

NITRO-ALDEHYDO-BENZOIC ACID
$C_6H_3(CHO)(NO_2).CO_2H$ [1:2:4]. [160°].

Formed, together with a small quantity of $C_6H_3(CHO)(NO_2).CO_2H$ [1:3:4] [184°] by nitrating *p*-aldehydo-benzoic acid (Löw, *A.* 231, 368). Four-sided prisms (from water), v. sol. alcohol and ether. With acetone and NaOH it forms indigo-carboxylic acid.—AgA': sl. sol. water.

Ethyl ether EtA'.

NITRO-ALDEHYDO-CINNAMIC ACID
$C_{10}H_7NO_5$ *i.e.* $C_6H_3(CH:CH.CO_2H)(NO_2)(CHO)$ [1:2:4]. [194°]. Formed by nitration of aldehydo-cinnamic acid (Löw, *A.* 231, 376). Prisms. V. sol. glacial acetic acid, acetone, and hot water, hardly sol. ether or chloroform. Does not give the indigo reaction with acetone and NaOH, so that NO_2 is probably not *ortho* to CHO.—AgA' aq.

Ethyl ether EtA'. [80°]. Prisms.

NITRO-ALIZARIN *v.* Nitro-di-oxy-anthraquinone.

DI-NITRO-ALLYL-ANILINE $C_9H_9N_3O_4$ *i.e.* $C_3H_5NHC_6H_3(NO_2)_2$. [76°]. Formed from bromo-

m-di-nitro-benzene, allylamine, and alcohol (Romburgh, *R. T. C.* 4, 192). Yellow needles.

Tri-nitro-allyl-aniline $C_9H_8N_4O_6$ *i.e.* $C_3H_5NHC_6H_2(NO_2)_2$. [80°]. Formed by the action of allylamine on chloro-tri-nitro-benzene (picryl chloride) (R.).

p-**NITRO-ALLYL-BENZOYL-ACETIC ETHER** $C_6H_4(NO_2).CO.CH(C_3H_5).CO_2Et$. [46°]. Formed (from sodium *p*-nitro-benzoyl-acetic ether and allyl iodide (Perkin a. Bellenot, *C. J.* 49, 452).

NITRO-AMIDO-ACETAMIDE $C_2H_5N_3O_3$ *i.e.* $CH_2(NH.NO_2).CONH_2$. Formed by decomposing nitro-hydantoïn by boiling water (Franchimont a. Klobbie, *R. T. C.* 7, 239). Long prisms, decomposing at 130°.

NITRO - DI - AMIDO - BENZENE *v.* NITRO-PHENYLENE-DIAMINE.

NITRO - AMIDO - BENZENE SULPHONIC ACID $C_6H_6N_2SO_5$ *i.e.* $C_6H_3(NO_2)(NH_2)(SO_3H)$ [2:1:4]. o-*Nitraniline sulphonic acid.* Formed by heating (1, 2, 4)-bromo-nitro-benzene sulphonic acid with alcoholic NH_3 at 180° (Goslich, *A.* 180, 103) and by nitrating acetyl-*p*-amido-benzene sulphonic acid (Nietzki, *B.* 18, 294; 21, 3220). The same acid appears to be formed by sulphonating o-nitro-aniline (Post a. Hardtung, *B.* 13, 38). Yellow needles, extremely sol. water, m. sol. alcohol and HClAq. Boiling aqueous KOH converts it into $C_6H_3(NO_2)(OK)(SO_3K)$. HClAq at 180° yields o-nitro-aniline.

Salts.—KA'aq. S. 5 at 6°.—NH_4A'. S. 13 at 6°.—BaA'_2 2½aq. S. ·5 at 9°.—CaA'_2 2½aq (P. a. H.).—PbA'_2 2aq. S. 2 at 6°.

Chloride $C_6H_2(NO_2)(NH_2).SO_2Cl$. [60°].

Amide [156°]. Yellow needles.

Nitro-amido-benzene sulphonic acid $C_6H_3(NO_2)(NH_2)(SO_3H)$[1:2:4]. Formed by the action of HNO_3 (1 mol.) on acetyl-amido-benzene *m*-sulphonic acid (1 mol.) dissolved in conc. H_2SO_4 (Eger, *B.* 21, 2579; 22, 847). Yellow needles (from water), sl. sol. alcohol, almost insol. ether.—KA': golden-yellow plates (from water).—NaA': yellow needles, v. sol. water.

Nitro-amido-benzene sulphonic acid $C_6H_3(NO_2)(NH_2)(SO_3H)$ [3:1:6]. Formed by heating *m*-nitroaniline sulphate at 120°-170° with $ClSO_3H$ (Limpricht, *B.* 18, 2186). Long colourless prisms or glistening plates. Easily soluble in hot water, more sparingly in cold.

Salts.—A'K aq: long thin glistening red prisms or yellowish-red plates.—A'Na 2aq: small yellow plates.—A'_2Ca 4aq: easily soluble large orange tables or thick red prisms.—A'_2Ba aq: red tablets or prisms, sparingly soluble in cold water.

Nitro-amido-benzene sulphonic acid $C_6H_3(NO_2)(NH_2)(SO_3H)$[3:1:4]? Formed by heating *m*-nitro-aniline with fuming H_2SO_4 at 160° (Post a. Hardtung, *A.* 205, 102; *B.* 13, 40). Yellowish-brown prisms.—BaA' 2aq: long spikes. S. 14 at 100°.—CaA'_2 4aq: small needles, v. sol. water. This acid is perhaps identical with the preceding.

Nitro-amido-benzene sulphonic acid $C_6H_3(NO_2)(NH_2)(SO_3H)$[4:1:3]. Formed in small quantity by heating $C_6H_3Br(NO_2)(SO_3H)$ [1:4:3] with alcoholic ammonia at 160° (Thomas, *A.* 186, 132). Needles, v. sol. water.—BaA'_2 1½aq. S. ·15 at 15°.

Nitro-amido-benzene disulphonic acid $C_6H_2(NO_2)(NH_2)(SO_3H)_2$. Formed by the action of ammonium sulphide on di-nitro-benzene disulphonic acid obtained from nitro-benzene *m*-sulphonic acid (Limpricht, *B.* 8, 289). Very deliquescent mass.—BaA'' 2aq.

(α)-**NITRO-AMIDO-BENZOIC ACID** $C_7H_6N_2O_4$ *i.e.* $C_6H_3(NO_2)(NH_2).CO_2H$[2:5:1]. Mol. w. 182. Formed by boiling (α)-di-nitro-*m*-uramido-benzoic acid with water (Griess, *B.* 5, 198; 11, 1734). Yellow needles or prisms, m. sol. hot water, v. sol. hot alcohol. Yields nitro-oxy-benzoic acid [169°]. Yields on reduction a diamido-benzoic acid which forms *p*-phenylene-diamine on distillation.—BaA'_2 3aq.

(β)-Nitro-amido-benzoic acid $C_6H_3(NO_2)(NH_2).CO_2H$[4:3:1]. [298°]. Formed by boiling (β)-di-nitro-*m*-uramido-benzoic acid with water (Griess). Formed also by saponifying its acetyl derivative (Kaiser, *B.* 18, 2946). Red plates or needles. Yields on reduction a diamido-benzoic acid which forms o-phenylene-diamine on distillation.—CaA'_2 aq: red crystals, sl. sol. water.—BaA'_2 2aq.

Ethyl ether EtA'. [139°]. Red needles.

Formyl derivative [221°]. (Zehra, *B.* 23, 3634).

Acetyl derivative $C_6H_3(NO_2)(NHAc)CO_2H$. [206°]. Formed, together with the (2, 3, 1)-isomeride, by nitrating *m*-acetamido-benzoic acid below 0° (K.). Yellow tables.—CaA'_2 7½aq.—BaA'_2 7aq.

γ-Nitro-amido-benzoic acid $C_6H_3(NO_2)(NH_2)(CO_2H)$[2:3:1]. [157°]. Formed by boiling (γ)-di-nitro-*m*-uramido-benzoic acid with water (Griess, *B.* 2, 435; 5, 199). Formed also by saponifying its acetyl derivative which is prepared as above (K.). Long yellow needles, v. sol. hot water. Yields o-nitro-benzöic acid on elimination of NH_2 (Griess, *B.* 11, 1734). Yields on reduction a di-amido-benzoic acid which forms o-phenylene-diamine on distillation.—KA' 2aq.—BaA'_2 7aq.—HA'HCl, white crystals, decomposed by water.

Acetyl derivative $C_6H_3(NO_2)(NHAc).CO_2H$. [241°]. Colourless crystals.—CaA'_2 6aq.—BaA'_2 aq.

(δ)-Nitro-amido-benzoic acid $C_6H_3(NO_2)(NH_2).CO_2H$ [3:4:1]. [284°]. Formed by heating di-nitro-*p*-uramido-benzoic acid with water (Griess, *B.* 5, 855). Formed also by heating $C_6H_3(NO_2)(OMe).CO_2H$ [3:4:1] with aqueous ammonia at 140°–170° (H. Salkowski, *A.* 173, 52). Reddish-yellow needles (from alcohol), sl. sol. hot water. Yields, on reduction, di-amido-benzoic acid [210°]. Converted into *m*-nitro-benzoic acid by the diazo- reaction.—KA' aq: orange prisms.—BaA'_2 5aq.

Ethyl ether EtA'. [145°]. Formed by heating $C_6H_3Br(NO_2).CO_2Et$ [4:3:1] with alcoholic NH_2 for 3 hours at 150° (Grohmann, *B.* 23, 3449). Yellow crystals.

Amide $C_6H_3(NO_2)(NH_2).CONH_2$. [227°]. Formed by heating $C_6H_3Br(NO_2).CONH_2$ [4:3:1] with alcoholic NH_3 at 180° (G.). Lemon-yellow crystals, insol. water, sl. sol. alcohol.

Acetyl derivative $C_6H_3(NO_2)(NHAc).CO_2H$. [221°]. Formed by nitration of acetyl-*p*-amido-benzoic acid below 10° (Kaiser, *B.* 18, 2943). Thick yellow tables, v. sl. sol. cold water.—CaA'_2 2aq.—BaA'_2 6½aq.

(ε)-Nitro-amido-benzoic acid $C_6H_3(NO_2)(NH_2)(CO_2H)$ [5:2:1]. [268°].

Formation. — 1. By boiling di-nitro-*o*-uramido-benzoic acid with water (Griess, *B.* 11, 1730).—2. By heating $C_6H_3(NO_2)(OEt).CO_2Et$ with alcoholic NH_3 at 140° and boiling the resulting amide with baryta-water (Hübner, *A.* 195, 21).—3. By heating $C_6H_3Br(NO_3).CO_2H$ [2:5:1] with conc. NH_3Aq at 145° (Rahlis, *A.* 198, 112).—4. From its amide which is formed when nitro-isatoic acid is warmed with aqueous ammonia (Kolbe, *J. pr.* [2] 30, 477).

Properties.—Slender yellow needles, v. sol. boiling water. On elimination of NH_2 it yields *m*-nitro-benzoic acid.

Salts.—KA'2aq. — $CaA'_2$3aq. — $BaA'_2$3aq: v. sol. cold water, sl. sol. hot water.—$PbA'_2$2aq.—HA'HCl: needles, decomposed by water.

Amide $C_6H_3(NO_2)(NH_2).CONH_2$. [200°–210°]. Yellow needles (from acetone).

(ζ)-**Nitro-amido-benzoic acid** $C_6H_3(NO_2)(NH_2)(CO_2H)$ [3:2:1]. [204°]. Formed by heating $C_6H_3(NO_2)(OEt)(CO_2Et)$ [3:2:1] with alcoholic NH_3 at 130°–160° and saponifying the resulting amide (Hübner, *A.* 195, 37). Yellow needles (from water). On elimination of NH_2 it yields *m*-nitro-benzoic acid.—KA'.—$CaA'_3$2aq. —$SrA'_2$2aq.—$BaA'_2$2aq: purple needles, sl. sol. cold water. — Pb(OH)A'. — CuA'_2. — AgA'. — HA'HCl: needles.

Ethyl ether EtA'. [204°]. Plates.

Amide $C_6H_2(NO_2)(NH_2)(CONH_2)$. [109°]. Yellow plates, almost insol. water and alcohol.

(η)-**Nitro-amido-benzoic acid** $C_6H_3(NO_2)(NH_2).CO_2H$ [5;3:1]. [208°]. Formed by reducing *s*-di-nitro-benzoic acid with NH_3 and H_2S (Hübner, *A.* 222, 81). Small golden prisms (from water). On elimination of NH_2 it yields *m*-nitro-benzoic acid. Reduces to di-amido-benzoic acid which, when distilled with steam, forms phenylene *m*-diamine.—NaA'aq: red needles.—NH_4A' 3aq: bright-yellow needles. — $BaA'_2$4aq. — $CaA'_2$5½aq. — $PbA'_2$3½aq. — AgA'aq.

Ethyl ether EtA'. [155°]. Yellow needles.

Di-nitro-*o*-amido-benzoic acid $C_7H_5N_3O_6$ *i.e.* $C_6H_2(NO_2)_2(NH_2).CO_2H$. Mol. w. 227. [256°]. Formed, together with its methyl ether, by heating $C_6H_2(NO_2)_2(OEt).CO_2Me$ with aqueous ammonia (H. Salkowski, *B.* 4, 870; *A.* 173, 40). Golden-yellow scales (from alcohol).—NH_4A'aq.

Methyl ether MeA'. [165°]. Needles.

Ethyl ether EtA'. [135°]. Laminæ.

Di-nitro-*p*-amido-benzoic acid $C_6H_2(NO_2)_2(NH_2)(CO_2H)$ [5:3:4:1]. *Chrysanisic acid.* [260°]. Formed by the action of aqueous ammonia upon $C_6H_2(NO_2)_2(OMe)CO_2H$, which is a product of the action of warm fuming HNO_3 on anisic acid (Cahours, *A. Ch.* [3] 27, 454; Beilstein a. Kellner, *A.* 128, 104). Formed also by oxidation of di-nitro-*p*-toluidine by chromic acid mixture (Friederici, *B.* 11, 1975). Plates (from alcohol), sl. sol. cold Aq.—NH_4A'.—AgA'.

Methyl ether MeA'. [144°]. Plates.

Ethyl ether EtA'. [114°]. Plates.

Acetyl derivative $C_6H_2(NO_2)_2(NHAc).CO_2H$. [270°]. Silky needles.

Nitro-di-amido-benzoic acid $C_7H_7N_3O_4$ *i.e.* $C_6H_2(NO_2)(NH_2)_2CO_2H$ [5:4:3:1]. Formed by reducing chrysanisic acid with H_2S and alcoholic NH_3 (B. a. K.). Minute red crystals, v. sol. alcohol, sl. sol. hot water.—NH_4A'aq. Monoclinic prisms; $a:b:c = 1{\cdot}073:1:1{\cdot}809$; $\beta = 77° 32'$.

DI-NITRO-AMIDO-BENZYL-METHYL KETONE $C_9H_9N_3O_5$. [214°] Formed by reducing tri-nitro-benzyl methyl ketone in alcoholic solution with the theoretical quantity of $SnCl_2$ and HCl (Dittrich, *B.* 23, 2724). Groups of golden-yellow needles (from alcohol).

NITRO-AMIDO-ISOBUTYL-BENZENE $C_4H_9.C_6H_3(NO_2)(NH_2)$ [1:2:3]. *Nitro-isobutyl-aniline.* [124°]. Formed by saponifying its acetyl derivative (Gelzer, *B.* 21, 2941). Yellow crystals, v. sol. boiling water.

Acetyl derivative $C_4H_9.C_6H_3(NO_2)(NHAc)$. [106°]. Obtained by nitrating $C_4H_9.C_6H_4.NHAc$. Yellow needles, v. sl. sol. boiling water.

Nitro-amido-isobutyl-benzene $C_4H_9.C_6H_3(NO_2)(NH_2)$ [1:3:4]. [106·5°]. Formed from its acetyl derivative and alcoholic potash (Gelzer, *B.* 20, 3254). Orange crystals, sl. sol. hot water.

Acetyl derivative $C_4H_9.C_6H_3(NO_2)(NHAc)$. [105°]. (252°). Yellow needles. Obtained from $C_4H_9.C_6H_4.NHAc$ [1:4] and fuming HNO_3 at 0°.

Di-nitro-amido-isobutyl benzene $C_6H_2(C_4H_9)(NO_3)_2(NH_2)$. [127°]. Got by heating di-nitro-isobutyl-phenol [93°] with NH_3Aq at 175° (Barr, *B.* 21, 1544). Yellow needles.

p-**NITRO-DI-AMIDO-DI-ISOBUTYL-TRI-PHENYL-METHANE** $C_6H_4(NO_2).CH(C_6H_3(NH_2).C_4H_9)_2$. [126°]. Formed from *p*-nitro-benzoic aldehyde, *p*-amido-isobutyl-benzene, and conc. H_2SO_4 (Bischler, *B* 21, 3207). Yellow needles. Its hydrochloride and platinochloride are both crystalline. Its di-acetyl derivative melts at 114°, and its di-benzoyl derivative at 126°.

m-**Nitro-di-*p*-amido-di-isobutyl-tri-phenyl-methane** $C_{27}H_{33}N_3O_2$. [65°]. Formed from *m*-nitro-benzoic aldehyde, *p*-amido-isobutyl-benzene, and conc. H_2SO_4.

Di-benzoyl derivative [114°]. Plates.

(α)-**NITRO-*o*-AMIDO-CINNAMIC ACID** $C_9H_8N_2O_4$ *i.e.* $C_6H_3(NH_2)(NO_2).CH:CH.CO_2H$? [240°]. Formed from *o*-amido-cinnamic acid (1 pt.), conc. H_2SO_4 (15 pts.), and KNO_3 (3 pts.) at 0°. On dilution with water (β)-nitro-*o*-amido-cinnamic acid separates as brownish needles, while the (α)-compound may be ppd. by nearly neutralising the mother-liquor with NaOH (Friedländer a. Lazarus, *A.* 229, 241). Brown needles. Insol. benzene, ether, or petroleum, sl. sol. water, v. sol. alcohol and acetone. Dissolved by mineral acids, but ppd. by sodic acetate. With HCl at 150° it gives (α)-nitro-carbostyril (nitro-oxy-quinoline), which forms slender white needles; v. sl. sol. alcohol, glacial acetic acid, or acetone, and does not melt below 320°.

Ethyl ether EtA'. [160°]. Formed, along with (β)-nitro-carbostyril, by nitrating *o*-amido-cinnamic ether. Compact brown needles.

(β)-**Nitro-*o*-amido-cinnamic acid** $C_6H_3(NH_2)(NO_2).CH:CH.CO_2H$. [254°]. Prepared as above. Brownish-yellow needles. Insol. dilute mineral acids, and in water. Sol. alkalis. With HCl at 150° it gives (β)-nitro-carbostyril [260°], which crystallises from glacial acetic acid in compact yellow needles.

(3:4:1)-**Nitro-amido-cinnamic acid** $C_6H_3(NO_2)(NH_2).C_2H_2.CO_2H$. [225°]. Formed by saponifying its acetyl derivative, which is formed by nitration of acetyl-*p*-amido-cinnamic acid (Gabriel a. Herzberg, *B.* 16, 2021). Red needles. Sol. hot alcohol and acetic acid, less sol. water, nearly insol. benzene and ligroïn.

Acetyl derivative [261°–266°].

NITRO-AMIDO-*o*-CRESOL
$C_6H_2Me(NO_2)(NH_2)(OH)$ [1:3:5:2]. [118°]. Obtained by nitrating $C_6H_2Me(CO_2H)(NHAc)(OH)$ [1:3:5:2] and saponifying the resulting acetyl derivative (Nietzki a. Ruppert, *B.* 23, 3478). Brownish-red needles (from alcohol).

Di-acetyl derivative
$C_6H_2Me(NO_2)(NHAc)(OAc)$. [146°].

Nitro-amido-cresol. *Methyl ether.*
$C_6H_2Me(NO_2)(NH_2)(OMe)$ [1:2:4:5]. [132°]. Formed from its acetyl derivative. Needles. On elimination of NH_2 and reduction it yields $C_6H_3Me(NH_2)(OMe)$ [111°]. Reduction yields $C_6H_2Me(NH_2)_2OMe$ [166°].

Acetyl derivative
$C_6H_2Me(NO_2)(NHAc)(OMe)$. [156°]. Formed from $C_6H_2Me(NHAc)(OMe)$ in HOAc by treatment with HNO_3 (S.G. 1·48) (Limpach, *B.* 22, 789). Needles.

Nitro-ω-amido-cresol *Methyl ether of the acetyl derivative*
$C_6H_3(CH_2.NHAc)(NO_2)(OMe)$ [1:3:4]. *Methyl derivative of acetyl-nitro-oxy-benzylamine.* [137°]. Formed by nitrating $C_6H_4(CH_2.NHAc)(OMe)$ in the cold (Goldschmidt a. Polonowska, *B.* 20, 2410). Prisms, v. sl. sol. hot water. Yields nitro-anisic acid on oxidation.

Di-nitro-amido-*m*-cresol
$C_6HMe(NO_2)_2(NH_2)OH$. [151°] (L. a. D.); [156°] (E. a. O.). Formed by reducing tri-nitro-cresol $C_6HMe(NO_2)_3OH$ [1:2:4:6:3] with H_2S and alcoholic NH_3 (Kellner a. Beilstein, *A.* 128, 166; Liebermann a. Dorp, *A.* 163, 104; Emmerling a. Oppenheim, *B.* 9, 1094). Thin yellow needles (from hot water).

Di-nitro-amido-*m*-cresol
$C_6HMe(NO_2)_2(NH_2)(OH)$ [1:2 or 5:4:6:3]. [160°]. Formed by nitrating $C_6H_2Me(CO_2H)(NHAc)(OH)$ (Nietzki a. Ruppert, *B.* 23, 3479). Large red needles. Perhaps identical with the preceding.

Mono-acetyl derivative. [225°].

Di-acetyl derivative. [175°].

NITRO-AMIDO-ISO-CYMENE
$C_6H_2(NO_2)(NH_2)PrMe$ [*x*:5or6:3:1]. Formed from its phthalyl derivative by heating with conc. HCl for 24 hours at 180° (Kelbe a. Warth, *A.* 221, 176). Oil. Volatile with steam.

Benzoyl derivative
$C_6H_2(NO_2)(NHBz)PrMe$. [177°]. Formed by nitration of the benzoyl derivative of amido-iso-cymene.

Phthalyl derivative
$(C_6H_2(NO_2)PrMe)_2C_2O_2C_6H_4$. [167°]. Formed by nitration of the phthalyl derivative of amido-iso-cymene.

Di-nitro-amido-cymene $C_6HMePr(NO_2)_2(NH_2)$ [1:4:2:6:3]. [113°–115°]. From the ethyl ether of di-nitro-thymol and alcoholic NH_3 at 180° (Mazzara, *G.* 19, 160). Yellow tables (from dilute alcohol), sl. sol. hot water.

NITRO-*p*-AMIDO-ETHYL-BENZENE
$C_6H_3(C_2H_5)(NO_2)(NH_2)$ [1:3:4]. [47°]. Yellowish-red prisms. Sol. alcohol, ether, benzene, chloroform, and CS_2, more sparingly in ligroïn. The acetyl compound is obtained by careful nitration of acetyl-*p*-amido-ethyl-benzene.

Acetyl derivative
$C_6H_3(C_2H_5)(NO_2)(NHAc)$: [47°]; long yellow silky needles, extremely soluble in alcohol, ether, &c., less easily in ligroïn (Paucksch, *B.* 17, 769).

Di-nitro-*p*-amido-ethyl-benzene
$C_6H_2(C_2H_5)(NO_2)_2NH_2$ [1:3:5:4]. [135°]. Orange-yellow prisms. Sol. benzene and chloroform, less easily in alcohol and ether. The acetyl derivative is obtained by nitration of acetyl-*p*-amido-ethyl-benzene.

Acetyl derivative
$C_6H_2(C_2H_5)(NO_2)_2NHAc$: [182°]; needles.

NITRO-AMIDO-HYDROQUINONE.

Acetyl-di-methyl derivative
$C_6H_2(NO_2)(NHAc)(OMe)_2$: [164°]; yellow needles. Formed by nitration of acetyl-amido-di-methyl-hydroquinone (Baessler, *B.* 17, 2121).

NITRO-AMIDO-HYDROTOLUQUINONE
$C_6HMe(NO_2)(NH_2)(OH)_2$. Formed by reducing di-nitro-hydrotoluquinone with $SnCl_2$ (Kehrmann a. Brasch, *J. pr.* [2] 39, 389). Its hydrochloride crystallises in long yellow needles changing to small plates.

NITRO-AMIDO-MESITYLENE
$C_6HMe_3(NO_2)(NH_2)$. [73°]. *Nitro-mesidine.* Formed by reducing di-nitro-mesitylene with alcoholic ammonium sulphide (Maule, *C. J.* 2, 116; *A.* 71, 137; Knecht, *A.* 215, 98; Klobbie, *R. T. C.* 6, 31).—B'HCl.—$B'_2H_2PtCl_6$.—$B'_3H_3PO_4$.

Acetyl derivative $C_6HMe_3(NO_2)(NHAc)$. [191°]. Formed by nitrating acetyl-mesidine (Biedermann a. Ledoux, *B.* 8, 58; Ladenburg, *B.* 7, 1133; *A.* 179, 163). Silky needles, m. sol. alcohol. Feeble base.

Benzoyl derivative $C_6HMe_3(NO_2)(NHBz)$. [168·5°]. Formed by nitrating benzoyl-mesidine (Schack, *B.* 10, 1711).

Nitro-di-amido-mesitylene $C_6Me_3(NO_2)(NH_2)_2$. [184°]. Formed, together with di-nitro-amido-mesitylene by reduction of tri-nitro-mesitylene by alcoholic ammonium sulphide (Fittig, *A.* 141, 139). Orange laminæ (from water) or monoclinic crystals (from alcohol); $a:b:c = 1·625:1:·417$; $\beta = 60°\ 4'$ (Lang, *A.* 141, 140; Hintze, *A.* 235, 183), v. sl. sol. cold water.—$B''H_2Cl_2$: tables.

Di-nitro-amido-mesitylene $C_6Me_3(NO_2)_2(NH_2)$. *Di-nitro-mesidine.* [194°]. Formed as above. Sulphur-yellow crystals (from alcohol), insol. water. Very feeble base, its hydrochloride being decomposed by water.

Acetyl derivative $C_6Me_3(NO_2)_2(NHAc)$. [275°]. S. (alcohol) 5 at 78°. Formed by nitrating the acetyl derivative of nitro-amido-mesitylene. Needles.

NITRO-AMIDO-DI-METHYL-ANILINE *v.* NITRO-PHENYLENE-DI-METHYL-DIAMINE.

TETRA-NITRO-DI-METHYL-DI-AMIDO-DI-PHENYL-METHANE. *Di-nitro-derivative* $CH_2(C_6H_2(NO_2)_2.NMe.NO_2)_2$. Formed by the action of HNO_3 (S.G. 1·48) on $CH_2(C_6H_4NMe_2)_2$ dissolved in HOAc (Romburgh, *R. T. C.* 7, 226). Decomposes at 218°. On boiling with aqueous KOH it gives off methylamine. CrO_3 in HOAc forms $CO(C_6H_2(NO_2)_2NMeH)_2$.

NITRO-AMIDO-METHYL-QUINOLINE

$C_6H_4\Big\langle\begin{matrix}C(NH_2):C(NO_2)\\ N\text{=====}CMe\end{matrix}$. [201°]. Formed by heating chloro-nitro-(*Py.* 3)-methyl-quinoline with alcoholic NH_3 at 190° (Conrad a. Limpach, *B.* 21, 1965). Yellow needles (from alcohol).

NITRO-AMIDO-(α)-NAPHTHOIC ACID $C_{11}H_8N_2O_4$ *i.e.* $C_{10}H_5(NO_2)(NH_2).CO_2H$. [c. 110°]. Formed by reducing di-nitro-naphthoic acid [215°] with H_2S and NH_3 (Ekstrand, *J. pr.* [2] 38, 271; *B.* 19, 1985). Needles (from water).

Nitro-amido-(β)-naphthoic acid $C_{10}H_5(NO_2)(NH_2).CO_2H$. [235°]. Formed by reducing di-nitro-(β)-naphthoic acid [226°] (Ekstrand, *J. pr.* [2] 42, 301). Stellate groups of small needles.—HA′HCl: needles.

Nitro-amido-(α)-naphthoic acid. *Acetyl derivative* $C_{10}H_5(NO_2)(NHAc)CO_2H$. [259°]. Formed by nitrating the acetyl derivative of (4′?, 1)-amido-naphthoic acid (Ekstrand, *J. pr.* [2] 38, 247). Yellow needles, v. sol. alcohol.

Nitro-amido-naphthoic acid $C_{10}H_5(NO_2)(NH_2)CO_2H$ [4′:1′:1]. *Anhydride*  $C_{10}H_5(NO_2)\left\langle{}^{NH}_{CO}\right\rangle$ *Nitro-naphthostyril.* [300°]. Formed by nitrating naphthostyril (Ekstrand, *J. pr.* [2] 38, 180). Orange needles (from HOAc).

Di-nitro-amido-naphthoic acid. *Anhydride*  $C_{10}H_4(NO_2)_2\left\langle{}^{NH}_{CO}\right\rangle$. [above 290°]. Formed by nitrating the preceding anhydride (E.). Plates, v. sl. sol. HOAc and alcohol.

NITRO-AMIDO-(α)-NAPHTHOL $C_{10}H_8N_2O_3$ *i.e.* $C_{10}H_5(NH_2)(NO_2)OH$. [130°]. Formed by reducing di-nitro-(α)-naphthol with ammonium sulphide (Ebell, *B.* 8, 564). Small yellowish needles, insol. water, sol. alcohol.

Benzoyl derivative $C_{10}H_7BzN_2O_3$. [158°]. Small red needles (from alcohol) (Hübner, *A.* 208, 332).

Nitro-di-amido-(α)-naphthol. *Tri-acetyl derivative* $C_{10}H_4(NO_2)(NHAc)_2OAc$. [235°]. Formed by nitrating $C_{10}H_5(NHAc)_2OAc$ [280°] (Meerson, *B.* 21, 1195). Yellow powder, yielding phthalic acid on oxidation by potassium permanganate. Fuming HClAq converts it into  $C_{10}H_4(NO_2)(NH_2)\left\langle{}^{O}_{N}\right\rangle CMe$, whence boiling dilute potash forms  $C_{13}H_4(NO_2)(OH)\left\langle{}^{O}_{N}\right\rangle CMe$ crystallising in brown needles [163°].

NITRO-AMIDO-NAPHTHOL SULPHONIC ACID $C_{10}H_8N_2SO_6$ *i.e.* $C_{10}H_4(NO_2)(NH_2)(OH)SO_3H$. Formed by reducing di-nitro-naphthol sulphonic acid with $SnCl_2$ (Lauterbach, *B.* 14, 2029). Golden-yellow plates, m. sol. hot water. Its alkaline solution is blood-red.

NITRO-AMIDO-TETRA-OXY-BENZENE $C_6(NO_2)(NH_2)(OH)_4$. Formed by partial reduction of di-nitro-di-oxy-quinone (nitranilic acid) with $SnCl_2$. Small violet needles, nearly insol. alcohol, ether, and benzene (Nietzki a. Benckiser, *B.* 16, 2094; 18, 500). Its alkaline solution is readily oxidised by the air to nitro-amido-di-oxy-quinone $C_6(NO_2)(NH_2)(OH)_2O_2$. Nitrous acid converts it into nitro-diazo-di-oxy-quinone $C_6(NO_2)(N_2OH)(OH)_2O_2$.

NITRO-*o*-AMIDO-PHENOL $C_6H_6N_2O_3$ *i.e.* $C_6H_3(NO_2)(NH_2).OH$ [6:2:1]. [111°]. Formed by reducing the corresponding di-nitro-phenol with ammonium sulphide (Post a. Stuckenberg, *A.* 205, 85). Red needles, sl. sol. water, v. sol. alcohol and ether. Gives a dirty-green colour with $FeCl_3$.—$B'_2H_2SO_4$: colourless pyramids.

Nitro-*o*-amido-phenol. *Methyl ether* $C_6H_3(NO_2)(NH_2)(OMe)$ [3:2:1]. [76°]. Formed from $C_6H_3(NO_2)_2(OMe)$ [118°] by heating with alcoholic ammonia at 190° (Bantlin, *B.* 11, 2106). Long yellow needles.

Nitro-*o*-amido-phenol $C_6H_3(NO_2)(NH_2).OH$ [4:2:1]. [142°]. Obtained by reducing the corresponding di-nitro-phenol with ammonium sulphide (Laurent a. Gerhardt, *Compt. Chim.* 1849, 468; *A.* 75, 68; Post a. Stuckenberg, *A.* 205, 71). Orange prisms (containing aq) melting at 80° to 90° or anhydrous crystalline crusts, melting at 142°; v. sol. hot water, alcohol, and ether.—$C_6H_5KN_2O_3C_6H_6N_2O_3$: dark-red nodules. —AgHA″: brownish-yellow pp. (L. a. G.).

Benzoyl derivative $C_6H_5BzN_2O_3$. [above 200°]. Yellow needles, sl. sol. alcohol.

Nitro-benzoyl derivative [218°].

Methyl ether $C_6H_3(NO_2)(NH_2)(OMe)$. *Nitro-anisidine.* Formed by reducing $C_6H_3(NO_2)_2(OMe)$ by alcoholic ammonium sulphide (Cahours, *A.* 74, 301). Long garnet-red needles, insol. cold, sol. boiling, water.—B′HCl. —$B'_2H_2PtCl_6$.—B′HBr.—$B'HNO_3$.—$B'_2H_2SO_4$.

Benzoyl derivative of the methyl ether $C_6H_3(NO_2)(NHBz)(OMe)$. Needles (from alcohol); m. sol. boiling alcohol.

Ethyl ether $C_6H_3(NO_2)(NH_2)(OEt)$. [97°]. Formed by heating the di-ethyl ether of di-nitro-di-oxy-*s*-di-phenyl-hydrazine (hydrazo-nitro-phenetole) with conc. HClAq (Andreae, *J. pr.* [2] 21, 318). Yellow needles, m. sol. water. Yields *p*-nitro-phenetole on elimination of amidogen.—B′HCl.

Nitro-*o*-amido-phenol $C_6H_3(NO_2)(NH_2)(OH)$[5:2:1]. *Carbonyl derivative*  $C_6H_3(NO_2)\left\langle{}^{NH}_{O}\right\rangle CO$. [241°]. Obtained by nitrating carbonyl-*o*-amido-phenol (Chelmicki, *J. pr.* [2] 42, 441). Long yellow needles (from water). Converted by boiling KOHAq into nitro-pyrocatechin [170°].

Nitro-*o*-amido-phenol. *Acetyl derivative of the methyl ether* $C_6H_3(NO_2)(NHAc)(OMe)$. [143°]. Formed by nitrating $C_6H_4(NHAc)(OMe)$[1:2] (Mühlhäuser, *A.* 207, 242). Yellow needles (from alcohol).

Nitro-amido-phenol [134°]. Formed by boiling nitrated *m*-phenylene-diamine with aqueous KOH (Barbaglia, *B.* 7, 1259). Orange plates.

Nitro-*m*-amido-phenol. *Methyl ether* $C_6H_3(NO_2)(NH_2)(OMe)$[4:3:1]. [129°]. Formed by heating (4, 3, 1)-di-nitro-anisole with alcoholic NH_3 at 190° (Bantlin, *B.* 11, 2106). Yellow leaflets (by sublimation).

Nitro-*p*-amido-phenol $C_6H_3(NO_2)(NH_2)(OH)$ [3:4:1]. [148°]. Got by saponifying its acetyl derivative (Hähle, *J. pr.* [2] 43, 63). Dark-red prisms, forming a violet solution in alkalis.—KA′. HA′HCl: plates or prisms.

Di-acetyl derivative. [147°]. Formed from di-acetyl-*p*-amido-phenol and fuming HNO_3. Pale-yellow prisms (from dilute alcohol).

Methyl ether $C_6H_3(OMe)(NO_2)(NH_2)$. [123°]. Formed in small quantity by distilling $C_6H_3(OMe)(NO_2)NMe_3OH$, a crystalline compound got by mixing nitro-*p*-amido-phenol with NMe_4OH. Crystals. Yields $C_6H_3(OMe)(NO_2)(NHAc)$ and $C_6H_3(OMe)(NO_2)(NH_3Cl)$.

Nitro-*p*-amido-phenol $C_6H_3(NO_2)(NH_2)OH$. [206°]. Formed by boiling its *m*-nitro-benzoyl derivative with alkalis (Hübner, *A.* 210, 382). Colourless needles (containing aq) melting at

183° or anhydrous golden needles, melting at 206°.—KA′ 1½aq: red silky needles.—NaA′ 2aq.—BaA′$_2$ 4aq.

Nitro-benzoyl derivative $C_6H_3(NO_2)(NH_2)O.CO.C_6H_4NO_2$. [225°]. Formed by nitrating benzoyl-*p*-amido-phenol [228°]. Yellow needles (from HOAc).

Nitro-di-amido-phenol $C_6H_7N_3O_3$ *i.e.* $C_6H_2(NO_2)(NH_2)_2OH$[4:6:2:1]. Formed by reducing picric acid with aqueous ammonium sulphide (Griess, *A.* 154, 202). Long dark-yellow needles (containing aq) or narrow plates, sl. sol. water and alcohol, v. sl. sol. ether.—$(HA')_2H_2SO_4$ 5aq: yellowish needles.—BaA′$_2$ 2aq: ruby-red needles.

Nitro-di-amido-phenol. *Dibenzoyl derivative* $C_6H_2(NO_2)(NHBz)_2OH$. [167°–170°]. Formed by nitrating di-benzoyl-(*a*)-diamido-phenol.

Nitro-di-amido-phenol. *Dibenzoyl derivative* $C_6H_2(NO_2)(NHBz)_2OH$. [201°]. Formed by nitrating (6, 2, 1)-di-amido-phenol (Post a. Stuckenberg, *A.* 205, 79). Long brown needles, sl. sol. alcohol.

Di-nitro-*o*-amido-phenol $C_6H_5N_3O_5$ *i.e.* $C_6H_2(NO_2)_2(NH_2)(OH)$[6:4:2:1]. *Picramic acid.* [170°]. S. ·14 at 22° (Darney, *Am.* 5, 36).

Formation.—1. By reduction of picric acid (Wöhler, *P.* 13, 488; Girard, *A.* 88, 281; *J.* 1855, 535; Pugh, *A.* 96, 83; Lea, *J.* 1861, 637. 2. By nitration of nitro-*o*-amido-phenol (Stuckenberg, *A.* 205, 75), or of benzoyl-*o*-amido-phenol (Hübner, *A.* 210, 392).

Properties.—Red needles. Converted by the diazo- reaction into $C_6H_3Cl(NO_2)_2$ [110°]. The salts do not explode when struck. Cyanogen passed into its alcoholic solution forms 'ethoxy-carbimidamido - dinitrophenol' $C_9H_{10}N_4O_6$ (Griess, *B.* 15, 448), a crystalline body converted by boiling HClAq into uramidodinitrophenol.

Salts.—NaA′aq. S. 2·06 at 15·5°. Dark-red crystalline crusts (Smolka, *M.* 8, 391).—NH$_4$A′: orange-red tables.—KA′.—BaA′$_2$.—CuA′$_2$.—MgA′$_2$ 3aq. S. 5·58 at 17°.—ZnA′$_2$ aq. S. ·017 at 23°.—CdA′$_2$ aq. S. ·08 at 23°; ·314 at 100°.—Hg$_2$A′$_2$: red powder.—HgA′$_2$ aq: yellow needles. S. ·032 at 18°; ·08 at 100°.—PbA′$_2$: red needles. S. ·038 at 20°; ·067 at 100°.—MnA′$_2$ 2aq. S. 1·026 at 19°.—CoA′$_2$. S. ·031 at 100°.—NiA′$_2$. S. ·0286 at 100°.—AgA′.—HA′HCl: reddish-brown needles (Petersen, *Z.* 1868, 378).—(HA′HCl)$_2$PtCl$_4$.

Acetyl derivative $C_6H_2(NH_2)(NO_2)_2(OAc)$. [193°] (Schiff, *B.* 19, 849).

Methyl ether $C_6H_2(NH_2)(NO_2)_2(OMe)$. Dark-violet needles (from alcohol), insol. cold Aq.

Di-nitro-*m*-amido-phenol $C_6H_2(NO_2)_2(NH_2)(OH)$ [6:4:3:1]. [225°]. Formed by warming di-nitro-aniline with alcoholic KCy (Lippmann a. Fleissner, *M.* 7, 96). Brownish-red crystals, v. sl. sol. water. Yields di-nitro-resorcin on warming with aqueous alkalis. Its salts explode on heating.—KA′.—BaA′$_2$.—HgA′$_2$ aq.

Di-nitro-amido-phenol $C_6H_2(NO_2)_2(NH_2)(OH)$. [202°]. Formed by the action of aqueous NH$_3$ on (δ)-tri-nitro-phenol (Henriques, *A.* 215, 334).—KA′ aq.

Di-nitro-amido-phenol $C_6H_2(NO_2)_2(NH_2)(OH)$ [6:2:4:1]. *Isopicramic acid.* [170°]. S. ·032 at 22°; ·31 at 100°. Formed by heating its benzoyl derivative with HClAq (Dabney, *Am.* 5, 33). Yellowish-brown needles (from water).—KA′: bluish-black crystals (from alcohol). Explodes when heated.

Benzoyl derivative $C_6H_2(NO_2)_2(NHBz)(OH)$. [250°]. Formed by heating $C_6H_2(CO_2H)(NHBz)(OH)$ [1:5:2] dissolved in HOAc with HNO$_3$ at 80° (D.). Yellow plates (from alcohol).—KA′aq.—BaA′$_2$ 3aq.—CaA′$_2$ 4½aq.—PbA′$_2$.

Di-nitro-*o*-amido-phenol. *Benzoyl derivative* $C_6H_2(NO_2)_2(NHBz).OH$ [4:3?:2:1]. [220°]. Formed by nitrating benzoyl-*o*-amidophenol in HOAc at −4° (Hübner, *A.* 210, 387). Greenish-yellow needles, insol. water. On treatment with POCl$_2$ it yields $C_6H_2(NO_2)_2\!\left\langle\begin{matrix}O\\N\end{matrix}\right\rangle\!C.C_6H_5$. [219°].—KA′ 2aq.—NH$_4$A′ aq.—BaA′$_2$ 5aq.—ZnA′$_2$ 3aq.—AgA′: red needles.

Di-nitro-*o*-amido-phenol. *Acetyl derivative of the methyl-ether* $C_6H_2(NO_2)_2(NHAc)(OMe)$. [157°]. Formed by nitration of *o*-acetanisidine (Mühlhäuser, *B.* 13, 921; *A.* 207, 234). Prisms.

Tri-nitro-amido-phenol. *Ethyl ether* $C_6H(NO_2)_3(NH_2)(OEt)$. Formed by heating $C_6H(NO_2)_3(OEt).NHCO_2Et$ with dilute H$_2$SO$_4$ Köhler, *J. pr.* [2] 29, 283). Small yellow needles (from alcohol).

***o*-NITRO-*p*-AMIDO-DIPHENYL** $C_{12}H_{10}N_2O_2$ *i.e.* $C_6H_4(NO_2).C_6H_4NH_2$. [98°]. Formed by reducing *op*-di-nitro-diphenyl with ammonium sulphide (Schultz, *A.* 174, 225; 207, 350). Reddish-brown monoclinic crystals; $a:b:c = 1{\cdot}52:1:2{\cdot}19$; $\beta = 69°\,31'$.—B′HCl: needles.

***p*-Nitro-*p*-amido-diphenyl** $C_6H_4(NO_2).C_6H_4.NH_2$. [198°]. Formed by reducing *pp*-di-nitro-diphenyl with alcoholic ammonium sulphide in the cold (Fittig, *A.* 124, 278; Schultz, *A.* 174, 222). Small red needles (from alcohol). Gives *p*-nitro-benzoic acid on oxidation.—B′$_2$H$_2$PtCl$_6$.

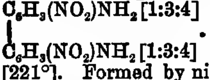
Nitro-*p*-amido-diphenyl. *Benzoyl derivative* $C_6H_5.C_6H_3(NO_2)(NHBz)$ [1:3:4]. [143°]. Formed by nitrating benzoyl-*p*-amido-diphenyl (Hübner, *A.* 209, 339). Needles (from HOAc). Reduced by tin and HOAc to

$C_6H_5.C_6H_3\!\left\langle\begin{matrix}N\\NH\end{matrix}\right\rangle\!C.C_6H_5$. [198°].

Di-nitro-*p*-amido-diphenyl. *Benzoyl derivative* $C_{12}H_7(NO_2)_2NHBz$. [206°]. Formed by nitrating benzoyl-*p*-amido-diphenyl (Hübner). Dark-yellow needles (from HOAc).

Nitro-di-amido-diphenyl [4:1] $C_6H_4(NH_2).C_6H_3(NO_2)(NH_2)$ [1:2:4]. [143°]. Formed by mixing benzidine sulphate (28 g.) in H$_2$SO$_4$ (300 g.) with KNO$_3$ (10 g.) (Täuber, *B.* 23, 796). Long red needles.—B″H$_2$SO$_4$ ½aq.

Di-nitro-di-*p*-amido-diphenyl $C_{12}H_{10}N_4O_4$ *i.e.*



$\begin{array}{l}C_6H_3(NO_2)NH_2\,[1:3:4]\\ |\\ C_6H_3(NO_2)NH_2\,[1:3:4]\end{array}$ *Di-nitro-benzidine.*

[221°]. Formed by nitration of di-acetyl-benzidine and saponification of the product with KOH (Brunner a. Witt, *B.* 20, 1024; *cf.* Strakosch, *B.* 5, 237). Obtained also by hydrolysis of di-nitro-di-phthalyl-benzidine (Bandrowski, *M.* 8, 471). Red needles. Sol. phenol, v. sl. sol. alcohol, insol. water. Its tetrazo-compound combines with *a*-naphthylamine-*p*-sulphonic acid to form a dye-stuff, which dyes unmordanted cotton the shade of alizarine-violet. By $SnCl_2$ and HCl it is reduced to tetra-amido-diphenyl.

Di-acetyl derivative [above 300°].

Di-nitro-di-*p*-amido-diphenyl [197°]. Obtained, together with the preceding, by hydrolysis of di-nitro-di-phthalyl-benzidine (Bandrowski). Yellow needles (from alcohol).

Di-nitro-di-amido-diphenyl [4:3:1]$C_6H_3(NH_2)(NO_2).C_6H_3(NO_2)(NH_2)$[1:2or3:4] *Di-nitro-benzidine.* [214°]. Formed by stirring KNO_3 (20·2 g.) into benzidine sulphate (28·2 g.) dissolved in H_2SO_4 (300 g.) (Täuber, *B.* 23, 795). Yellow plates (from alcohol). Its azo-compounds do not dye cotton.

NITRO-AMIDO-PHENYL-ACETIC ACID $C_8H_8N_2O_4$ *i.e.* $C_6H_3(NO_2)(NH_2).CH_2CO_2H$ [2:4:1]. [186°]. Formed by reducing (4,2,1)-di-nitro-phenyl-acetic acid with aqueous ammonium sulphide (Gabriel a. Meyer, *B.* 14, 824). Reddish-yellow needles, v. sol. hot water and alcohol, sl. sol. ether. Forms salts with acids and bases. —HA′HCl: colourless needles.

Methyl ether MeA′. [94°].

Ethyl ether EtA′. [100°]. Yellow needles.

Nitro-amido-phenyl-acetic acid $C_6H_3(NO_2)(NH_2)CH_2.CO_2H$ [3:4:1]. [144°]. Prepared by saponification of its nitrile (nitro-amido-benzyl cyanide) by boiling with HCl (Gabriel, *B.* 15, 836). Orange-yellow plates or needles. Sol. alcohol and ether, insol. CS_2. By the action of amyl nitrite and HCl it gives (3,4,1)-nitro-diazo-ω-nitroso-toluene $C_6H_2(N_2Cl)(NO_2)(CH_2.NO)$.

Nitrile $C_6H_3(NO_2)(NH_2).CH_2CN$. [118°]. Formed by saponifying its acetyl derivative with potash. Orange plates, sol. water and alcohol.

Acetyl derivative of the nitrile $C_6H_3(NO_2)(NHAc).CH_3CN$. [113°]. Formed by nitrating $C_6H_4(NHAc).CH_2CN$ (Gabriel). Flat yellow needles or plates, sol. alcohol and hot water.

***m*-Nitro-α-amido-phenyl-acetic acid** $C_6H_4(NO_2).CH(NH_2).CO_2H$. [172°]. Formed by adding HNO_3 (1 mol.) to a cold solution of α-amido-phenyl-acetic acid in H_2SO_4 (Plöchl a. Loë, *B.* 18, 1179). Silky needles, v. sol. hot water, insol. alcohol.—CuA'_2: pale-blue needles.

DI-NITRO-AMIDO-DIPHENYLAMINE $C_{12}H_{10}N_4O_4$ *i.e.* [4:1] $C_6H_4(NH_2).NH.C_6H_3(NO_2)_2$ [1:2:4]. [177°]. Formed by the action of chloro-di-nitro-benzene on *p*-phenylene-diamine in alcoholic solution in presence of NaOAc (Nietzki, *B.* 23, 1852). Brownish-red plates, sl. sol. alcohol.—$B'C_6H_2(NO_2)_3OH$: brown needles.

Acetyl derivative $C_{12}H_9AcN_4O_4$. [238°]. Red needles.

Di-nitro-amido-diphenylamine [172°]. Formed from *m*-phenylene-diamine and $C_6H_3Cl(NO_2)_2$ (Leymann, *B.* 15, 1237).

NITRO - AMIDO - PHENYL - ISOBUTYRIC ACID $C_{10}H_{12}N_2O_4$ *i.e.* $C_6H_3(NO_2)(NH_2).CH_2.CHMe.CO_2H$. [138°]. Formed by reducing di-nitro-isobutyric acid with ammonium sulphide (Edeleanu, *C. J.* 53, 559). Bright-red plates. Reduced by long boiling with ammonium sulphide to the compound

$$\left[1\begin{smallmatrix}4\\3\end{smallmatrix}\right] C_6H_3(NH_2){<}\begin{matrix}CH_2.CHMe\\NH.CO\end{matrix} \quad [216°].$$

***p*-NITRO-*o*-AMIDO-PHENYL-CARBAMIC ETHER** $C_6H_3(NO_2)(NH_2).NH.CO_2Et$ [4:2:1]. [162°]. Formed by reduction of di-nitro-phenyl-urethane with hot aqueous NH_4HS (Hager, *B.* 17, 2630). Orange-red needles or prisms. V. sol. alcohol, v. sl. sol. water. On heating above its melting-point it loses EtOH, and is converted into nitro-phenylene-urea with the formula

$$C_6H_3(NO_2){<}\begin{matrix}NH\\NH\end{matrix}{>}CO.$$

NITRO-AMIDO-PHENYL-ETHANE *v.* NITRO-AMIDO-ETHYL-BENZENE.

NITRO-AMIDO-DI-PHENYL-ETHYLENE $C_{14}H_{12}N_2O_2$ *i.e.* $C_6H_4(NO_2).CH:CH.C_6H_4NH_2$. [230°]. Formed by reducing di-nitro-di-phenyl-ethylene with alcoholic ammonium sulphide (Strakosch, *B.* 6, 329). Purple plates (from nitrobenzene).—B′HCl: silky needles, decomposed by water.

Nitro-amido-di-phenyl-ethylene [2:1] $C_6H_4(NO_2).CH:CH.C_6H_4(NH_2)$ [1:2]. Formed by reducing di-o-nitro-stilbene, formed by the action of alcoholic potash on o-nitro-benzyl chloride (Bischoff, *B.* 21, 2077). Amorphous mass, sol. ether and alcohol.

Di-nitro-amido-phenyl-ethylene *v.* DI-NITRO-AMIDO-STYRENE.

***p*-NITRO-DI-*p*-AMIDO-TRI-PHENYL-METHANE** $C_6H_4(NO_2).CH(C_6H_4.NH_2)_2$. Prepared by heating aniline sulphate (28 pts.) with *p*-nitro-benzoic aldehyde (15 pts.) and $ZnCl_2$ (20 pts.) at 100° (Fischer, *B.* 15, 677). Large garnet-red crystals (containing C_7H_8). Yields paraleucaniline on reduction with zinc and HCl. —$B''H_2Cl_2$: needles.

***m*-Nitro-di-*p*-amido-tri-phenyl-methane** [3:1] $C_6H_4(NO_2).CH(C_6H_4.NH_2$ [1:4]$)_2$. [136°]. Prepared by heating *m*-nitro-benzoic aldehyde with aniline hydrochloride and $ZnCl_2$ (Fischer a. Ziegler, *B.* 13, 671). Light-yellow crystals, sol. ether. Crystallises with C_6H_6 in yellow concentric crystals [81°].

NITRO-AMIDO-PHENYL-(α)-NAPHTHYL-AMINE $C_{16}H_{13}N_3O_2$ *i.e.* $C_{10}H_7.NH.C_6H_3(NO_2).NH_2$ [1:4:2]. [147°]. Formed by reducing di-nitro-phenyl-(α)-naphthylamine with alcoholic ammonium sulphide (Heim, *B.* 21, 2302). Dark-yellow needles (from dilute alcohol). Gives a dark-green solution in H_2SO_4.

Nitro-amido-phenyl-(β)-naphthylamine $C_{10}H_7.NH.C_6H_3(NO_2).NH_2$ [1:4:2]. [195°]. Formed by reducing di-nitro-phenyl-(β)-naphthylamine (Heim, *B.* 21, 590). Needles or prisms, m. sol. alcohol. Dyes silk golden-yellow. Conc. H_2SO_4 forms a yellow solution turned green by heating.

Acetyl derivative $C_{16}H_{12}AcN_3O_2$. [200°]. Orange-red needles (from alcohol).

***p*-NITRO-α-AMIDO-PHENYL-PROPIONIC ACID** $C_9H_{10}N_2O_4$ *i.e.* $C_6H_4(NO_2)CH_2.CH(NH_2).CO_2H$. Formed from α-amido-phenyl-propionic acid, H_2SO_4, and HNO_6 (Erlenmeyer a. Lipp, *A.* 219, 213). Fluffy white mass (from alcohol), or prisms in stars (containing 1½aq) (from water). Sl. sol. alcohol, m. sol. water, insol. ether, v. sol. ammonia. Neutral to litmus. Bitter-sweet taste. Turns brown at 220°, decomposes at 240°–245°. Gives, on oxidation by chromic mixture, *p*-nitro-benzoic acid. Boiled with KOH it gives off NH_3.—HA′HCl. Needles in rosettes.—CuA'_2 2aq.

Nitro-amido-β-phenyl-propionic acid [3:4:1] $C_6H_3(NO_2)(NH_2)C_2H_4.CO_2H$. *Nitro-amido-*

hydrocinnamic acid. [145°]. Red crystals. Sol. water, alcohol, ether, and benzene. The acetyl derivative is formed by nitration of *p*-amido-*β*-phenyl-propionic acid.

Acetyl derivative [174°]. Long yellow needles. Sol. alcohol and benzene, sl. sol. cold water and ether (Gabriel, *B.* 15, 844).

Nitro-amido-phenyl-propionic acid [2:4:1] $C_6H_3(NO_2)(NH_2).CH_2.CH_2.CO_2H$. [139°]. Prepared by reduction of di-nitro-phenyl propionic acid with aqueous ammonium sulphide (Gabriel a. Zimmermann, *B.* 12, 601). Plates or flat needles. Sol. alcohol, ether, and acetic acid, insol. CS_2.

Di-nitro-amido-β-phenyl-propionic acid [5:3:4:1] $C_6H_2(NO_2)_2(NH_2)CH_2.CH_2.CO_2H$. [194°]. Formed by heating $C_6H_2(NO_2)_2(OMe).C_2H_4.CO_2H$ with ammonia in sealed tubes at 100° (Stöhr, *A.* 225, 87). Yellow needles, v. sl. sol. water. Does not form salts with acids.—NH_4A'.—$BaA'_2 1\frac{1}{2}aq$.

Methyl ether MeA'. [102°].

Ethyl ether EtA'. [95°].

DI-NITRO-AMIDO-PHENYL-TOLYL-AMINE $C_7H_6(NH_2).NH.C_6H_3(NO_2)_2$. [184°]. Formed from tolylene-diamine [99°] and $C_6H_3Cl(NO_2)_2$ (Leymann, *B.* 15, 1237). Red tables.

Formyl derivative [157°].

Acetyl derivative [164°].

***p*-NITRO-DI-o-AMIDO-PHENYL-DI-TOLYL-METHANE** $C_6H_4(NO_2).CH(C_7H_6.NH_2)_2$.

(*α*)-Isomeride. [172°]. Formed from *p*-nitro-benzoic aldehyde, *p*-toluidine, HClAq and alcohol (Bischler, *B.* 20, 3302). Crystallises from benzene in needles (containing C_6H_6), v. sl. sol. cold alcohol.—$B''H_2PtCl_6$.

(*β*)-Isomeride. [127°]. Formed from *p*-nitro-benzoic aldehyde, *p*-toluidine, and conc. H_2SO_4 (Bischler, *B.* 20, 3304). Yellow plates, v. sol. benzene and warm alcohol, sl. sol. ligroïn.—$B''H_2Cl_2$.—$B''H_2PtCl_6$.

Di-acetyl derivative [136°].

Di-benzoyl derivative [152°].

***m*-Nitro-di-o-amido-phenyl-di-tolyl-methane** [3:1]$C_6H_4(NO_2).CH(C_7H_6.NH_2)_2$.

(*α*)-Isomeride. [128°]. Formed by the action of HCl on a mixture of *m*-nitro-benzoic aldehyde and *p*-toluidine.

(*β*)-Isomeride. [86°]. Formed from *m*-nitro-benzoic aldehyde, *p*-toluidine and H_2SO_4 (Bischler, *B.* 21, 3207). Yellowish needles, v. sol. hot alcohol.—$B''H_2PtCl_6$.

Di-acetyl derivative. [104°].

Di-benzoyl derivative. [148°].

***p*-Nitro-di-*m*-amido-phenyl-di-tolyl-methane** [4:1]$C_6H_4(NO_2).CH(C_7H_6.NH_2)_2$. Prepared by heating o-toluidine sulphate with *p*-nitro-benzoic aldehyde and $ZnCl_2$ at 100° (Fischer, *B.* 15, 679). Small yellow crystals (containing C_6H_6).

***m*-NITRO-DI-AMIDO-PHENYL-DI-XYLYL-METHANE** $C_6H_4(NO_2).CH(C_6H_3Me_2.NH_2)_2$. [92°]. Formed by condensing *m*-nitro-benzoic aldehyde with *m*-xylidine (Bischler, *B.* 21, 3216). Plates.—$B''H_2Cl_2$: yellow plates.—$B''H_2PtCl_6$.

Acetyl derivative. [132°]. Needles.

Benzoyl derivative. [186°].

***p*-Nitro-di-o-amido-phenyl-di-xylyl-methane** $C_6H_4(NO_2).CH(C_6H_3Me_2.NH_2)_2$. [90°]. Formed by condensing *p*-nitro-benzoic aldehyde with *m*-xylidine by H_2SO_4 (B.). Yellow needles.—$B''H_2Cl_2$.—$B''H_2PtCl_6$.

Di-acetyl derivative. [88°].

Di-benzoyl derivative. [192°]. Needles.

DI-NITRO-DI-AMIDO-DIPHENYL SULPHONIC ACID $C_6H_3(NO_2)(NH_2).C_6H_2(NO_2)(NH_2).SO_3H$ [1:3:4:5]. Obtained from di-acetyl-di-amido-diphenyl sulphonic acid by nitration and saponification (Zehra, *B.* 23, 3460).—KA' aq.

Di-acetyl derivative. Yellow needles.

***s*-DI-NITRO-DI-AMIDO-QUINONE** $C_6(NO_2)_2(NH_2)_2O_2$ [1:4:2:5:3:6]. Prepared by dissolving *s*-di-amido-di-imido-benzene nitrate $C_6H_2(NH_2)_2(NH)_2(HNO_3)_2$ (1 pt.) in conc. H_2SO_4 (15 to 20 pts.) at about 10°. On adding lumps of ice to the mixture, the compound crystallises out in dark-yellow needles. It is practically insoluble in all indifferent solvents. Very weak base, whose salts are readily decomposed by water. By warming with dilute KOH, ammonia is evolved, and the K salt of nitranilic acid $C_6(NO_2)_2(OK)_2O_2$ separates out. By stannous chloride it is reduced to tetra-amido-hydroquinone $C_6(NH_2)_4(OH)_2$ [1:2:4:5:3:6] (Nietzki, *B.* 20, 2115).

NITRO-AMIDO-RESORCIN $C_6H_6N_2O_4$ *i.e.* $C_6H_2(NO_2)(NH_2)(OH)_2$. [170°]. Formed by reduction of di-nitro-resorcin with ammonium sulphide (Benedikt a. Hübl, *M.* 2, 325). Dark-brown crystals, sl. sol. water, v. sol. alcohol.—$B'_2H_2SO_4$: needles.

Di-nitro-amido-resorcin $C_6H(NO_2)_2(NH_2)(OH)_2$. [190°]. Obtained by reducing tri-nitro-resorcin (styphnic acid) with alcoholic ammonium sulphide (B. a. H.). Coppery leaflets, insol. water, sl. sol. alcohol.

DI-NITRO-*p*-AMIDO-STYRENE $C_6H_3(NO_2)(NH_2).CH:CH(NO_2)$. Formed by nitrating *p*-amido-cinnamic acid, CO_2 being split off (Friedländer a. Lazarus, *A.* 229, 247). Slender reddish-brown needles (from alcohol). Conc. H_2SO_4 gives off CO_2 forming a nitro-amido-benzoic aldehyde.

Acetyl derivative. [252°].

Di-nitro-amido-styrene $C_6H_2(NO_2)_2(NH_2).C_2H_3$. *Acetyl derivative.* [212°]; needles, sol. alcohol and acetic acid, sl. sol. hot water, nearly insol. ether; formed by nitration of acetyl-*p*-amido-cinnamic acid (Gabriel a. Herzberg, *B.* 16, 2041).

NITRO-AMIDO-TOLUENE *v.* NITRO-TOLUIDINE.

NITRO-AMIDO-TOLUENE *exo*-SULPHONIC ACID $C_6H_3(NO_2)(NH_2).CH_2SO_3H$. Formed by reducing $C_6H_3(NO_2)_2.CH_2SO_3H$ by NH_3 and H_2S (Mohr, *A.* 221, 226). Needles, sol. water.—KA'.—BaA'_2 2aq.

Nitro-amido-toluene sulphonic acid $C_6H_2Me(NO_2)(NH_2).SO_3H$ [1:2:4:5]. S. ·17 at 11°. Obtained by sulphonating (2,1,4)-nitro-toluidine (Foth, *A.* 230, 300). Yellow needles (from water).—KA'aq.—BaA'_2 4aq.

Nitro-amido-toluene sulphonic acid $C_6H_2Me(NO_2)(NH_2).SO_3H$ [1:3:2:5]. Formed from acetyl-o-toluidine by successive sulphonation and nitration (Nietzki a. Pollini, *B.* 23, 138).

NITRO-AMIDO-*p*-TOLUIC ACID $C_6H_2Me(NO_2)(NH_2)CO_2H$ [1:2?:3:4]. [245°]. Formed by saponifying its acetyl derivative (Niementowski, *J. pr.* [2] 40, 27). Yellow needles, sol. hot water.—KA' 2aq: reddish-yellow needles.

Acetyl derivative [210°]. Formed from

acetyl-amido-toluic acid and HNO_3 in the cold. Yellow needles, insol. water.

Nitro-amido-toluic acid $C_6H_2Me(NO_2)(NH_2)CO_2H$ [1:2:4:5]. [236°]. Formed by heating bromo-nitro-toluic acid with alcoholic NH_3 at 180° (Fileti a. Crosa, *G.* 18, 298). Silky yellow needles (containing aq).

DI-NITRO-DI-AMIDO-DITOLYL [3:5:4:1] $C_6H_2Me(NO_2)(NH_2).C_6H_2Me(NO_2)(NH_2)$ [1:3:5:4]. [267°]. Formed by saponifying its acetyl derivative (Gerber, *B.* 21, 746). Garnet-red needles.

Di-acetyl derivative. Obtained from di-amido-ditolyl. Crystals, decomposing at 320°.

NITRO-AMIDO-XYLENE *v.* Nitro-xylidine.

NITRO-AMIDO-XYLENE SULPHONIC ACID $C_8H_{10}N_2SO_5$ *i.e.* $C_6HMe_2(NO_2)(NH_2)SO_3H$ [1:3:2or5:4:6]. Formed by nitration of *m*-xylidine sulphonic acid (Sartig, *A.* 230, 338). Slender needles (from water), sl. sol. cold water, insol. alcohol.—KA' 1½aq.—BaA'_2 1½aq.—PbA'_2 aq.

NITRO-AMYLENE $C_5H_9NO_2$ *i.e.* $CH_2.CH(NO_2).C_3H_5$. Formed from allyl iodide and potassium nitro-ethane (Gal, *J.* 1873, 333). Oil. May be reduced to $C_5H_9NH_2$ (85°).

Nitro-amylene $CH_3.C(NO_2):CMe_2$. [166°–170°]. Formed from di-methyl-ethyl-carbinol and conc. HNO_3 (Haitinger, *M.* 2, 289). Oil, sol. alcohol and ether. Dissolves in alkalis and gives a blue colour with KNO_2 and H_2SO_4. On heating with HClAq it gives NH_3, hydroxylamine, and acetic acid. On heating with water it yields nitro-ethane and a ketone. NaOEt gives a yellow pp.

NITRO-ANILIC ACID *v.* Di-nitro-di-oxy-quinone.

o-**NITRO-ANILINE** $C_6H_6N_2O_2$ *i.e.* $C_6H_4(NO_2).NH_2$ [2:1]. *o-Nitraniline.* Mol. w. 138. [71·5°].

Formation.—1. By heating o-bromo-nitro-benzene with alcoholic NH_3 (Walker a. Zincke, *B.* 5, 114).—2. Together with *p*-nitro-aniline by nitration of acetanilide and saponification of the product (Körner).—3. By heating o-nitro-anisole $C_6H_4(NO_2)(OMe)$ with ammonia at 200° (Salkowski, *A.* 174, 278).—4. By reduction of o-di-nitro-benzene (Rinne a. Zincke, *B.* 7, 1374).—5. By nitration of benzanilide and saponification of the product (Lellmann, *A.* 221, 6).

Preparation.—1. By splitting off the HSO_3 group from *o*-nitro-aniline-*p*-sulphonic acid by heating it with HCl under pressure. The sulphonic acid can be very readily prepared by sulphonation and nitration of acetanilide (Nietzki a. Benckiser, *B.* 18, 294).—2. Twelve pts. of *o*-nitro-phenol are heated with 20 pts. of aqueous NH_3 (35 p.c.) at 160°–170° for 16 hours; the product is crystallised from water; the yield being about 60 p.c. of the *o*-nitro-phenol employed (Merz a. Riz, *B.* 19, 1749).

Properties.—Orange needles, m. sol. hot water, v. sol. alcohol, v. e. sol. ether. Volatile with steam. Does not combine with chlorinated quinones (Niemeyer, *A.* 228, 322).

Salts.—$B'HCl$: plates. Decomposed by water into HCl and o-nitro-aniline.

Formyl derivative $C_6H_4(NO_2)(NHCHO)$. [122°]. Needles (Hübner a. Herff, *A.* 209, 367).

Acetyl derivative $C_6H_4(NO_2)(NHAc)$. [93°]. Yellow plates, m. sol. cold water.

Propionyl derivative [63°] (Smith, *Am.* 6, 172).

Benzoyl derivative. [94°]. Needles.

Oxalyl derivative *v.* Oxalic acid.

m-Nitro-aniline $C_6H_4(NO_2).NH_2$ [3:1]. [114°]. (285°). S. ·114 at 20°; S. (alcohol) 7·05 at 20° (Carnelley a. Thomson, *C. J.* 53, 786).

Formation.—1. By reducing *m*-di-nitro-benzene with H_2S and alcoholic ammonia (Hofmann a. Muspratt, *A.* 57, 204; Beilstein a. Kurbatoff, *A.* 176, 44).—2. Together with *p*-nitro-aniline by adding HNO_3 to a solution of aniline in H_2SO_4 (Hübner, *A.* 208, 299).

Preparation.—A solution of $SnCl_2$ (3 mols.) in alcohol saturated with HCl is slowly allowed to drop into a well-cooled alcoholic solution of *m*-di-nitro-benzene (1 mol.) with continual agitation (Anschütz a. Heusler, *B.* 19, 2161).

Properties.—Long yellow needles. Colours pine-wood yellow. Gives no colour with bleaching powder.

Reactions.—1. *Cyanogen* passed into its alcoholic solution forms a compound with formula $C_6H_4(NO_2).NH.C(NH).C(NH).C_6H_4.NO_2$ (Senf, *J. pr.* [2] 35, 530).—2. *Cyanogen iodide* forms a green pp. of $(C_6H_4(NO_2)NH)_4C$ [236°] (Hübner, *B.* 10, 1719).—3. *Silver nitrate* forms a compound $(C_6H_4(NO_2)(NH_2))_4AgNO_3$ [125°] when added to its alcoholic solution (Mixter, *Am.* 1, 239).—4. *Chlorinated quinones* dissolved in benzene form dark-green crystalline additive compounds (Niemeyer, *A.* 228, 322).

Salts.—$B'HCl$. Pearly crystals, v. e. sol. water.—$B'_2H_2PtCl_6$. Yellow powder, v. e. sol water and alcohol.—$B'HBr$: plates (Staedel a. Bauer, *B.* 19, 1940).—$B'_2H_2C_2O_4$: crystals.

Acetyl derivative $C_6H_4(NO_2)(NHAc)$. [150°]. (Meldola a. Salmon, *C. J.* 53, 778; [143°] (Meyer a. Stüber, *A.* 165, 183). Prisms.

Benzoyl derivative. [156°]. Plates.

p-Nitro-aniline $C_6H_4(NO_2)(NH_2)$ [4:1]. [147°]. S. ·077 at 20°; S. (alcohol) 5·84 at 20° (Carnelley a. Thomson, *C. J.* 53, 786).

Formation.—1. By nitration of the anilides of tartaric, succinic, or acetic acid, the product being saponified (Arppe, *A.* 90, 147; 93, 157; Hofmann, *Pr.* 10, 589; 12, 639), the o-nitro-aniline, which is formed at the same time, may be removed by steam-distillation (Körner).—2. By heating [4:1]$C_6H_4(NO_2)(OMe)$ with ammonia at 200° (Salkowski, *A.* 174, 281).—3. By reduction of *p*-di-nitro-benzene (Zincke a. Rinne, *B.* 7, 871).—4. By heating *p*-chloro-nitro-benzene with ammonia (Engelhardt a. Latschinoff, *Z.* 1870, 232).—5. By heating *p*-nitrophenol (6 pts.) with aqueous NH_3 (20 pts.) at 190°–200° for several hours; the yield being 58 p.c. (Merz a. Riz, *B.* 19, 1753).

Preparation.—1. Equal volumes of HNO_3 (S.G. 1·42) and H_2SO_4 are mixed and cooled. Acetanilide is gradually added as long as it will dissolve. The cold solution is set aside for half an hour, then poured into water, and the nitro-compound crystallised from boiling water. The nitro-acetanilide is saponified by boiling NaOH, and the nitraniline crystallised from water (Meldola, *C. J.* 43, 427).—2. 1 kilo. of acetanilide is slowly dissolved in 4 kilos. of H_2SO_4, kept cool by standing the vessel in a stream of cold water. 590 grms. of HNO_3 of S.G. 1·478 (=85 p.c.), or the corresponding quantity of ordinary HNO_3 (1·42) diluted with 1200 grms. of H_2SO_4 is then very gradually run in, taking care that the temperature does not rise above 20°. After standing, the product is poured into cold water, and the yellow pp. of nitracetanilide which separates is filtered off and saponified by boiling with strong HCl. The yield is very satisfactory (Nölting a. Collin, *B.* 17, 262; R. J. Friswell, *priv. com.*).

Properties.—Long monoclinic needles (from water). May be readily sublimed. Not volatile with steam. Weak base, its salt being decomposed by water. Does not combine with chlorinated quinones. Cyanogen iodide at 120° forms $(C_6H_4(NO_2).NH)_4C$ [above 300°] (Hübner).

Salts.—$B'HCl$.—$B'_2H_2PtCl_4$.

Formyl derivative $C_6H_4(NO_2)(NHCHO)$. [194°]. Formed from formanilide and fuming HNO_3 at −17° (Osborn a. Mixter, *Am.* 8, 346).

Acetyl derivative $C_6H_4(NO_2)(NHAc)$. [207°]. Formed by nitrating acetanilide. Prisms. Gives *p*-nitro-phenol when boiled with conc. KOHAq (Wagner, *B.* 7, 76).

Benzoyl derivative [199°]. Needles.

Di-nitro-aniline $C_6H_5N_3O_4$ *i.e.* $C_6H_3(NO_2)_2(NH_2)$ [6:2:1]. Mol. w. 183. [138°]. S. (95 p.c. alcohol). ·52 at 12°. Obtained by heating the methyl or ethyl ether of *c*-di-nitro-phenol with aqueous ammonia (Salkowski a. Rehs, *B.* 7, 370; *A.* 174, 273). Yellow needles. Yields *m*-di-nitro-benzene on elimination of NH_2.

Acetyl derivative $C_6H_3(NO_2)_2(NHAc)$. [197°].

Di-nitro-aniline $C_6H_3(NO_2)_2(NH_2)$ [4:2:1]. [176°] (Barr); [188°] (Hentschel, *J. pr.* [2] 34, 427). S. (95 p.c. alcohol) ·76 at 21° (S.); (88 p.c. alcohol) 5·8 (Rudneff, *Z.* 1871, 202).

Formation.—1. By the action of alkalis on di-nitro-phenyl-citraconimide (Gottlieb, *A.* 85, 17). — 2. By heating (1,2,4)-chloro-di-nitro-benzene with alcoholic ammonia (Clemm, *J. pr.* [2] 1, 145).—3. By heating [4:2:1] $C_6H_3(NO_2)_2(OMe)$ with NH_3Aq at 100° (Salkowski, *B.* 5, 872; 6, 139).—4. By heating (4,2,1)-di-nitro-phenol (3 g.) with ammonia (10 c.c. of 27 p.c.) for 16 hours at 175° (Barr, *B.* 21, 1542).

Properties.—Light-yellow prisms; v. sl. sol. boiling water. Does not form salts.

Reactions.—1. Elimination of NH_2 yields *m*-di-nitro-benzene.—2. Conc. KOHAq forms di-nitro-phenol [114°] (Willgerodt, *B.* 9, 979).—3. Alcoholic KCy added slowly forms di-nitro-amido-phenol [225°] (Lippmann a. Fleissner, *M.* 7, 95).

Acetyl derivative $C_6H_3(NO_2)_2(NHAc)$. [120°]. Formed by nitration of acetanilide (Rudneff, *Z.* 1871, 202; Ladenburg, *B.* 17, 148).

Tri-nitro-aniline $C_6H_4N_4O_6$ *i.e.* $C_6H_2(NO_2)_3(NH_2)$ [6:4:2:1]. *Picramide.* Mol. w. 228. [188°]. Formed by the action of ammonia on (1,2,4,6)-chloro-tri-nitro-benzene (Pisani, *A.* 92, 326) or on picric ethers (Liebermann a. Palm, *B.* 8, 278). Formed also by dissolving *p*-bromo-aniline in cooled HNO_3 (S.G. 1·5) (Hager, *B.* 18, 2578). Yellow plates with blue shimmer (from alcohol) or monoclinic tables (from HOAc). Tin and HCl reduce it to tri-amido-phenol (Hepp, *A.* 215, 350). Nitrous ether does not attack it. Boiling potash yields picric acid.

Combinations. — $(C_6H_4N_4O_6)C_6H_6$. Yellow prisms, which separate from its solution in benzene (Mertens, *B.* 11, 843).—$B'C_7H_8$.—$B'C_{14}H_{10}$.—$B'C_6H_5NH_2$. [124°] (Hepp, *Bl.* [2] 30, 4 *A.* 215, 359).

References. — Bromo, Chloro, and Iodo nitro-aniline.

NITRO-ANILINE-SULPHONIC ACID *v.* Nitro-amido-benzene-sulphonic acid.

NITRO-ANISIC ACID *v. Methyl derivative* of Nitro-oxy-benzoic acid.

NITRO-ANISOLE *v. Methyl ether* of Nitro-phenol.

NITRO-ANTHRAQUINONE $C_{14}H_7NO_4$ *i.e.* $C_6H_4\left<\begin{matrix}CO\\CO\end{matrix}\right>C_6H_3(NO_2)\left[\begin{smallmatrix}1\\2\end{smallmatrix}\;3\right]$. Mol. w. 253. [220°]. Prepared by nitrating anthraquinone dissolved in H_2SO_4 by HNO_3 in the cold (Roemer, *B.* 15, 1786; Liebermann, *B.* 16, 54). Yellow plates (by sublimation) or prismatic needles (from HOAc); sol. benzene, aniline, and chloroform, sl. sol. alcohol and ether. On reduction and treatment with nitrous acid it yields erytho-oxy-anthraquinone.

Nitro-anthraquinone $C_6H_4\left<\begin{matrix}CO\\CO\end{matrix}\right>C_6H_3NO_2\left[\begin{smallmatrix}1\\2\end{smallmatrix}\;4\right]$. [230°]. Formed by boiling anthraquinone for half an hour with HNO_3 (S.G. 1·5) (Böttger a. Petersen, *J. pr.* [2] 6, 367; *B.* 6, 20; *A.* 166, 147). Formed also by nitration of di-bromo-anthracene (Claus a. Hertel, *B.* 14, 978). Yellow needles (by sublimation), insol. water, v. sl. sol. ether and alcohol, m. sol. benzene and HOAc. Yields alizarin on fusion with potash. Conc. H_2SO_4 (12 pts.) at 200° forms 'imido-oxy-anthraquinone' $C_{28}H_{16}N_2O_6$, which sublimes in rose-coloured needles.

Di-nitro-anthraquinone $C_{14}H_6N_2O_6$ *i.e.* $\left[3\;\begin{smallmatrix}1\\2\end{smallmatrix}\right]C_6H_3(NO_2)\left<\begin{matrix}CO\\CO\end{matrix}\right>C_6H_3(NO_2)\left[\begin{smallmatrix}1\\2\end{smallmatrix}\;6\right]$. Mol. w. 298. [above 300°]. Prepared by allowing anthraquinone (10 g.) dissolved in H_2SO_4 mixed with HNO_3 (10 g. of S.G. 1·48) to stand for several days. It is also formed by nitrating *o*-nitro-anthraquinone (Roemer, *B.* 16, 363). Yellow crystals (by sublimation), sol. nitro-benzene, sl. sol. xylene and HOAc, nearly insol. alcohol and ether. On reduction and treatment with nitrous acid it yields di-oxy-anthraquinone (anthrarufin). On heating with H_2SO_4 at 200° it yields four colouring matters, $C_{28}H_{17}N_3O_8$, $C_{28}H_{17}N_3O_{12}$, $C_{28}H_{16}N_4O_7$, and $C_{28}H_{17}N_3O_9$.

Di-nitro-anthraquinone $C_{14}H_6N_2O_6$. [256°–260°]. Formed by boiling anthraquinone with a mixture of equal volumes of H_2SO_4 and HNO_3 (S.G. 1·5), or by boiling anthracene with fuming nitric acid (Böttger a. Petersen, *A.* 160, 147; 166, 154). Minute monoclinic, almost colourless, crystals, insol. water, sl. sol. alcohol, v. sl. sol. ether. H_2SO_4 converts it at 200° into violet 'di-imido-di-oxy-anthraquinone' $C_{14}H_8N_2O_4$.

Di-nitro-anthraquinone $C_{14}H_6N_2O_6$. *Fritzsche's Reagent.* [280°]. Formed, together with anthraquinone, by heating anthracene with dilute nitric acid at 90°. On crystallisation from alcohol it separates first (Fritzsche, *N. Petersb. Acad. Bull.* 22, 43; *Z.* 1869, 114; *cf.* Anderson, *A.* 122, 302). Prepared by adding HNO_3 (30 g.) to a solution of chrysene (50 g.) containing anthracene in alcohol (5,000 c.c.), and heating on a water-bath. The crystals of the chrysene compound (*v. infra*) which then separate are oxidised by CrO_3 in HOAc, which attacks the chrysene and leaves the di-nitro-anthraquinone (Schmidt, *J. pr.* [2] 9, 263).

Properties.—Yellow needles (from boiling HOAc), v. sl. sol. alcohol and ether. Sublimes in colourless serrated plates. Forms very characteristic compounds with aromatic hydrocarbons. H_2SO_4 at 200° forms $C_{14}H_8N_2O_4$, a black powder.

Combinations. — $C_{14}H_6N_2O_6(PhCH:CHPh)$: orange-red plates.—$C_{14}H_6N_2O_6(C_{14}H_{10})$: violet monoclinic laminæ, obtained by dissolving di-nitro-anthraquinone (9 pts.) and anthracene (10 pts.) in crude xylene (100 pts.).—With chrysene: $C_{14}H_6N_2O_6(C_{18}H_{12})$. Slender red needles [294°], sl. sol. boiling HOAc.

NITRO-ANTHRAQUINONE-CARBOXYLIC ACID $C_{14}H_6O_2(NO_2).CO_2H$. [above 300°]. Formed by nitration of anthraquinone-carboxylic acid (Liebermann a. Glock, *B.* 17, 891). Small needles. Dissolves in H_2SO_4 with a violet colour.

(α)-NITRO-ANTHRAQUINONE-SULPHONIC ACID $C_{14}H_7NSO_7$ *i.e.*

$C_6H_4{<}{\begin{smallmatrix}CO\\CO\end{smallmatrix}}{>}C_6H_2(NO_2)(SO_3H)$ $\left[\begin{smallmatrix}1\\6\end{smallmatrix}\ 2{:}3\right]$. [255° uncor.]. Prepared by nitration of anthraquinone-sulphonic acid with a mixture of HNO_3 (1·5) and H_2SO_4, the (β)-isomeric acid which is formed simultaneously remains dissolved whilst the α acid separates out (Claus, *B.* 15, 1514; 17, 1276; Lifschütz, *B.* 17, 899; *cf.* Liebermann, *B.* 16, 55). Small white plates (from dilute HNO_3) or very fine silky needles (from hot water). Strong acid. On fusion with KOH it gives alizarin.

Salts.—A'Na aq: long needles, sol. hot water, nearly insol. cold water and alcohol.—A'K: small needles.—$A'NH_4$ ½aq: felted needles.—A'_2Ca: microscopic needles, sl. sol. water.—A'_2Ba: needles.

Chloride: [194° uncor.]. Yellow concentric needles. Nearly insol. alcohol and ether.

(β)-Nitro-anthraquinone-sulphonic acid $C_{14}H_6O_2(NO_2)(SO_3H)$. [250° uncor.]. Crystalline powder. V. sol. water and alcohol. Strong acid. Formed as above. Fusion with KOH gives no alizarin.

Salts.—K, Na, and NH_4 salts are extremely soluble. — A'_2Ba 3½aq: needles.—A'_2Pb 2aq: white needles (Claus, *B.* 15, 1516).

Nitro-anthraquinone-(α)-di-sulphonic acid [182°]. Formed by nitration of the lead salt of anthraquinone-(α)-di-sulphonic acid with HNO_3 and H_2SO_4 (Claus a. Schneider, *B.* 16, 907). Yellow prisms. Sol. water, alcohol, and acetic acid; insol. ether, chloroform, and ligroin.

DI-NITRO-ANTHRONE $C_{14}H_8N_2O_5$. [116°]. Formed as a by-product in the preparation of hydroanthracene-nitrite by the action of HNO_3 on an acetic-acid solution of anthracene-dihydride (Liebermann a. Landshoff, *B.* 14, 472). Insol. alkalis, sol. benzene.

DI-NITRO-DIANTHRYL $C_{28}H_{16}N_2O_4$ *i.e.*

[337°].

Formed by nitration of dianthryl in acetic acid solution (Gimbel, *B.* 20, 2433). Yellow stellate needles. V. sol. benzene and chloroform, sl. sol. alcohol and acetic acid. On reduction it gives di-amido-dianthryl [309°]. By CrO_3 and acetic acid it is oxidised readily to anthraquinone. Bromine forms $C_{28}H_{14}Br_2$ [above 300°] (Sachse, *B.* 21, 2512).

NITRO-ARACHIC ACID $C_{20}H_{39}(NO_2)O_2$. [70°]. Formed by mixing arachic acid with HNO_3 and H_2SO_4 (Tassinari, *B.* 11, 2031). Sl. sol. cold alcohol, v. sol. ether.

NITRO-ARBUTIN *v.* ARBUTIN.

TETRA-NITRO-AURINE $C_{19}H_{10}(NO_2)_4O_3$. [c. 140°]. Formed by nitration of aurine (Ackermann, *B.* 17, 1625). Brownish-yellow microscopic needles. V. sol. alcohol, nearly insol. water, benzene, chloroform, and ether. Dissolves in alkalis with a dark-red colour.

Salts.—$A''Ag_2$: brown pp.—$A''Ba$: black powder.

Ethyl ether $A''Et_2$: [c. 105°]; yellow crystals, v. sol. alcohol and benzene, insol. water and carbonated alkalis.

NITRO-AZO- compounds *v.* AZO- COMPOUNDS.

Nitro-diazo- compounds *v.* DI-AZO- COMPOUNDS.

NITRO-AZOXY- compounds *v.* AZOXY- COMPOUNDS.

NITRO-BARBITURIC ACID $C_4H_3N_3O_5$ *i.e.*

$CO{<}{\begin{smallmatrix}NH.CO\\NH.CO\end{smallmatrix}}{>}CH.NO_2$. *Dilituric acid.* Formed by the action of nitric acid on hydurilic acid and on barbituric acid (Schlieper, *A.* 56, 23; Baeyer, *A.* 127, 211; 130, 140). Colourless dimetric efflorescent prisms (containing 3aq), v. sol. hot water forming an intense yellow solution, m. sol. alcohol, insol. ether. Bromine and water at 100° decompose it into di-bromo-barbituric acid and HNO_3. HIAq reduces it to amido-barbituric acid. Its solution gives a white pp. with ammonium salts.

Salts.—The salts are very stable, the acid not being separated by mineral acids.—NH_4H_2A''': crystalline pp., v. sl. sol. cold water.—NaH_2A'''2aq: silky needles.—KH_2A'''. Ppd. by adding HCl to a solution of the acid in potash.—K_2HA''': yellow needles, insol. alcohol and conc. KOHAq. Explodes when heated.—$BaH_2A'''Cl$ aq.—$Ca(H_2A''')_2$4aq.—$Cu(H_2A''')_2$6aq.—$Fe(H_2A''')_2$8aq.—$Fe(H_2A''')_3$9aq.—AgH_2A'''aq.—Ag_3A'''.

NITRO-BENZALDOXIM *v.* *Oxim* of NITRO-BENZOIC ALDEHYDE.

NITRO-BENZAMIDE *v.* *Amide* of NITRO-BENZOIC ACID.

m-**NITRO-BENZAMIDINE** $C_6H_4(NO_2).C(NH).NH_2$. Formed from nitro-benzoic imido-ethyl ether (Tafel a. Enoch, *B.* 23, 1552). Colourless mass (from ether), v. sol. water.—B'HCl. [240°]. Tables, v. sol. water.

m-**NITROBENZAMIDOXIM** $C_7H_7N_3O_3$ *i.e.* $C_6H_4(NO_2).C(NOH).NH_2$. [174°]. Formed from *m*-nitro-benzonitrile and hydroxylamine (Schöpff, *B.* 18, 1063). Orange needles, v. sol. warm water. $ClCO_2Et$ forms $C_6H_4(NO_2).C(NH_2).NO.CO_2Et$ [153°]. Acetic anhydride produces the azoxim

$C_6H_4(NO_2).C{<}{\begin{smallmatrix}N.O\\N\end{smallmatrix}}{>}CMe$ [109°]. — B'HCl. — $B'_2H_2PtCl_6$.

Ethyl ether $C_7H_6EtN_3O_3$. Prisms.—B'HCl.

Benzyl ether $C_7H_6(CH_2Ph)N_3O_3$. [58°].

p-**Nitro-benzamidoxim** $C_6H_4(NO_2).C(NH_2).NOH$. [169°]. Formed from *p*-nitro-benzonitrile and hydroxylamine (Weise, *B.* 22, 2418). Yellow needles, sol. acids and alkalis. Reduces Fehling's solution and ammoniacal $AgNO_3$. M. sol. hot water and alcohol. Can be distilled. With Ac_2O it yields $C_6H_4(NO_2).C{<}\substack{N.O\\N}{>}CMe$ [144°], while aldehyde forms $C_6H_4(NO_2).C{<}\substack{N.O\\NH}{>}CH.CH_3$ [153°]. $ClCO_2Et$ produces $C_6H_4(NO_2).C(NH_2).NO.CO_2Et$ [169°], which on heating yields the compound $C_6H_4(NO_2).C{<}\substack{N.O\\NH}{>}CO$ [286°]. Sodium diazobenzene sulphonate produces the compound $C_6H_4(NO_2).C{<}\substack{N.O\\NH}{>}C(NH_2).C_6H_4NO_2$ [151°] (Stieglitz, *B.* 22, 3157). $COCl_2$ reacts in benzene solution, forming $(C_6H_4(NO_2).C(NH_2).NO)_2CO$ [232°].—B′HCl. [185°].

Ethyl ether $C_6H_4(NO_2).C(NH_2).NOEt$, [60°]. Formed from the Na salt and EtI. With nitrous acid it yields $C_6H_4(NO_2).C(O.NO).NOEt$. [55°].—B′HCl.

NITRO-BENZENE $C_6H_5NO_2$. Mol. w. 123. [3°]. (209°) at 745 mm. (Brühl, *A.* 200, 188). S.G. $\frac{20}{4}$ 1·2039 (B.). S.V. 121·9 (Lossen, *A.* 254, 73); 121·5 (Ramsay). $\mu_\beta = 1{\cdot}5712$. $R_\infty = 52{\cdot}64$. *Dispersive power*: Barbier a. Roux, *C. R.* 108, 1249). Formed by nitration of benzene (Mitscherlich, *P.* 31, 625). The rate of nitration has been studied by Lothar Meyer (*B.* 22, 18). In small quantity by the action of ozonised air on a mixture of sulphuric acid and benzene (L. Maquenne, *Bl.* [2] 37, 298). Formed also by the action of ppd. Cu_2O (1 mol.) in the cold upon an aqueous solution of diazo-benzene nitrite (1 mol.), obtained by slowly adding a solution of 15 g. $NaNO_2$ in 50 c.c. of water to a mixture of 9 g. of aniline, 20 g. HNO_3 (1·4), and 50 c.c. of water. When the evolution of nitrogen has ceased the nitro-benzene is distilled off with steam; the yield is 42 p.c. of the theoretical (Sandmeyer, *B.* 20, 1494).

Preparation.—A mixture of nitric acid (100 pts.) and H_2SO_4 (115 pts.) is run into benzene. The product is washed with alkali and distilled.

Properties.—Oil, v. sol. alcohol and ether. Not attacked by chlorine or bromine in the cold.

Reactions.—1. For *bromination* the presence of carriers ($FeBr_3$ or $FeCl_3$) are necessary. Thus nitrobenzene (10 g.) heated with $FeBr_3$ (3 g.) and bromine (4·3 c.c.) in sealed tubes for 10 hours at 105° gives 65 p.c. of the theoretical amount of *m*-bromo-nitro-benzene. When the same mixture is heated for 30 hours at 120° the product is tetra-bromo-nitro-benzene (Scheufelen, *A.* 231, 158). Bromine at 250° forms $C_6H_2Br_4$ and a little C_6HBr_5 (Kekulé, *A.* 137, 169).—2. *Chlorine* in presence of $FeCl_3$ forms *m*-chloro-nitro-benzene and (5,2,1)-di-chloro-nitro-benzene.—3. Not attacked by boiling dilute potash or ammonia. Boiling alcoholic potash forms azoxybenzene.—4. Readily reduced to aniline.—5. *Chromic oxychloride* forms a powder $C_6H_5(NO_2)(CrO_2Cl)_2$, decomposed by water with reproduction of nitro-benzene (Henderson a. Campbell, *C. J.* 57, 253; *cf.* Étard, *A. Ch.* [5] 23, 272).—6. Exposed to *sunlight* in alcoholic solution it is reduced to aniline, aldehyde being formed (Ciamician a. Silber, *B.* 19, 2899; *G.* 16, 536).—7. Conc. HClAq at 245° forms di-chloro-aniline (Baumhauer, *A. Suppl.* 7, 204).—8. Reduced in alcoholic solution by *sodium-amalgam* to azo-benzene (Werigo, *A.* 135, 176; Alexijeff, *Bl.* [2] 1, 324).

o-**Di-nitro-benzene** $C_6H_4(NO_2)_2$ [1:2]. Mol. w. 168. [118°]. S. (alcohol) 3·8 at 24·8°; 33 at 78°. Formed in small quantity in the preparation of the *m*-isomeride, and purified by successive crystallisations from alcohol and HOAc (Rinne a. Zincke, *B.* 7, 869; Körner, *G.* 4, 354; Lobry, *R. T. C.* 2, 239). Long colourless needles (from hot water) or monoclinic tables (from alcohol) (Bodewig, *J.* 1884, 464). May be sublimed. Yields on reduction *o*-nitro-aniline [71°] and *o*-phenylene-diamine [99°].

m-**Di-nitro-benzene** $C_6H_4(NO_2)_2$[1:3]. [90°] (Reissert, *B.* 23, 2243). (297° cor.) (Meyer a. Stadler, *B.* 17, 2649 note). S. (alcohol) 5·9 at 24·8°. The chief product of the action of boiling fuming HNO_3 on benzene or nitrobenzene (Deville, *A. Ch.* [3] 3, 187; Muspratt a. Hofmann, *A.* 57, 214). Formed also from (4,2,1)-di-nitro-aniline by elimination of NH_2 (Rudneff, *Z.* 1871, 203). Prepared by adding benzene to a mixture of equal volumes of H_2SO_4 and fuming HNO_3, and heating until a sample of the oily layer solidifies on cooling. The product is poured into water, and the solid crystallised from alcohol (Körner; Beilstein a. Kurbatoff, *A.* 176, 43).

Properties.—Colourless flexible needles, v. e. sol. boiling alcohol. Detonates when projected into a red-hot tube filled with nitrogen (Berthelot, *A. Ch.* [6] 16, 24). A mixture with $KClO_3$ is a powerful explosive (*rackarock*).

Reactions.—1. On *reduction* it yields *m*-nitro-aniline [114°] and *m*-phenylene-diamine (Hofmann, *Pr.* 11, 518).—2. Alcoholic KCy forms $C_6H_3(NO_2)(OEt).CN$ (Lobry de Bruyn, *R. T. C.* 2, 205).—3. Alkaline K_3FeCy_6 forms (4,2,1)- and (6,2,1)-di-nitro-phenols (Hepp, *B.* 13, 2347; *A.* 215, 355).

p-**Di-nitro-benzene** $C_6H_4(NO_2)_2$[1:4]. [172°]. Deposited from the alcoholic mother-liquor from which the *m*-isomeride has crystallised (Körner). Flat monoclinic needles, sl. sol. cold alcohol. May be sublimed. Yields *p*-nitro-aniline [146°] and *p*-phenylene-diamine [140°] on reduction. Forms a sparingly soluble compound with naphthalene.

i-**Tri-nitro-benzene** $C_6H_3(NO_2)_3$[1:2:4]. [57·5°]. S.G. $\frac{15{\cdot}5}{}$ 1·73. S. (alcohol) 5·4 at 15·5°; S. (benzene) 141 at 15·5°. Formed by heating *p*-di-nitro-benzene with a mixture of HNO_3 and H_2SO_4 (Hepp, *A.* 215, 362; Lobry de Bruyn, *R. T. C.* 9, 190). Yellow crystals. Forms with aniline a compound $C_6H_3(NO_2)_3C_6H_5NH_2$. [84°].

Reactions. — 1. NaOMe in HOMe forms $C_6H_3(NO_2)_2(OMe)$ [4:2:1] [88°].—2. NaOEt forms $C_6H_3(NO_2)_2(OEt)$ [4:2:1] [86°].—3. Boiling aqueous Na_2CO_3 forms (4,2,1)-di-nitro-phenol [112°]. 4. Alcoholic NH_3 forms di-nitro-aniline [175°].

s-**Tri-nitro-benzene** $C_6H_3(NO_2)_3$ [1:3:5]. [122°]. Prepared by heating *m*-di-nitro-benzene (40 g.) with HNO_3 (120 g.) and fuming H_2SO_4 (300 g.) for one day at 80° and then for two days at 120°, the yield being 50 p.c. (Hepp, *A.* 215, 347; Claus, *B.* 16, 1597). Trimetric plates; *a*:*b*:*c* = ·954:1: ·733, sl. sol. cold alcohol, v. e. sol. benzene (forming a compound with C_6H_6). Not volatile with steam. With aniline it forms $C_6H_3(NO_2)_3NH_2Ph$ crystallising from benzene in red plates [124°]. With naphthalene it forms

$C_6H_3(NO_2)_3C_{10}H_8$ [153°], and with di-methyl-aniline $C_6H_3(NO_2)_2NMe_2Ph$ [108°].

Reactions.—1. Alkaline K_3FeCy_6 oxidises it to picric acid.—2. NaOMe dissolved in HOMe forms, in the cold, $C_6H_2(NO_2)_2(OMe)$ [105°] (De Bruyn, *R. T. C.* 9, 208).—3. Reduced by tin and HClAq to tri-amido-benzene.

References.—Bromo-, Chloro-, Chloroiodo- and Iodo-nitro-benzene.

NITRO-BENZENE PHOSPHONIC ACID $C_6H_4(NO_2)PO(OH)_2$. *Nitrophosphenylic acid.* [132°]. S. 98 at 22°; 92 at 98°. Obtained by nitrating benzene phosphonic acid (Michaelis a. Benziger, *B.* 8, 1310; *A.* 188, 275). Deliquescent crystals exploding above 200°.—BaA'' 2aq.—$Ba(HA'')_2$ 2aq.—CaA'' ½aq.—PbA''.—Ag_2A''.

***m*-NITRO-BENZENE-SULPHINIC ACID** $C_6H_4(NO_2)SO_2H$ [1:3]. [95°]. Formed, together with nitrobenzene and N_2, by boiling the compound $C_6H_4(NO_2).NH.NH.SO_2.C_6H_4(NO_2)$ with baryta-water. Long silky needles. V. e. sol. ether, sl. sol. alcohol.

Salts.—KA': small e. sol. prisms.—AgA': long silky needles, sl. sol. water.—BaA'_2 1½aq: yellowish prisms (Limpricht, *B.* 20, 1240).

***p*-Nitro-benzene-sulphinic acid** $C_6H_4(NO_2).SO_2H$ [1:4]. [120°]. Formed in the same way as the preceding acid from the corresponding *p*- compound. Plates. Less soluble in ether than the *m*-isomeride.—BaA'_2aq: yellowish prisms (Limpricht, *B.* 20, 1241).

***o*-NITRO-BENZENE SULPHONIC ACID** $C_6H_4(NO_2)SO_3H$ [1:2]. Formed in small quantity in the nitration of benzene sulphonic acid (Limpricht, *A.* 177, 60).—NH_4A': long needles.—KA': sl. sol. water.—BaA'_2 aq: v. e. sol. water.—PbA'_2 3aq.

Chloride $C_6H_4(NO_2)SOCl$. [67°].

Amide $C_6H_4(NO_2)SO_2NH_2$. [186°]. Reduced by HI in HOAc it yields  $C_6H_4\left\langle\begin{matrix}NH\\SO_2\end{matrix}\right\rangle$ [193°] (Cleve, *B.* 20, 1534).

***m*-Nitro-benzene sulphonic acid** $C_6H_4(NO_2)(SO_3H)$ [1:3]. Formed by sulphonating nitro-benzene, or by nitrating benzene sulphonic acid (Schmidt, *A.* 120, 163; Meyer a. Stüber, *A.* 165, 164; Rose, *Z.* 1871, 224; Limpricht, *A.* 177, 60). Formed also by the action of $ClSO_3H$ on nitro-benzene in CS_2 (Armstrong, *Z.* 1871, 321; Limpricht, *B.* 18, 2175). Deliquescent laminæ.—NH_4A'. Prisms.—KA'. S. 1·7 to 1·9 at 7°.—NaA'.—BaA'_2 aq. S. (of BaA'_2) 4 at 21° (Goslich, *A.* 180, 104); 2 at 7° (L.).—CaA'_2 2aq. S. (of CaA'_2) 6 at 6°.—MgA'_2 4aq.—ZnA'_2 3aq.—PbA'_2 2aq. S. (of PbA'_2) 4 at 10°.

Chloride $C_6H_4(NO_2).SO_2Cl$. [61°].

Amide $C_6H_4(NO_2).SO_2NH_2$. [161°]. Reduced by HI and HOAc to  $C_6H_4\left\langle\begin{matrix}NH\\SO_2\end{matrix}\right\rangle$ [83°].

***p*-NITRO-BENZENE SULPHONIC ACID** $C_6H_4(NO_2)SO_3H$ [1:4]. Formed in small quantity in the nitration of benzoic acid (Limpricht).—NH_4A'. Plates. S. 8·5 at 7°.—KA'. Prisms. S. 3·7 at 7°.—$BaA'_2$3aq. S. (of BaA'_2) 4·6 at 6°.—CaA'_2 2aq.—PbA'_2 2aq. S. (of PbA'_2) 11·8 at 5·5°. [The solubilities of salts here given are the weights dissolved in 100 c.c. of the solution.]

Chloride $C_6H_4(NO_3).SO_2Cl$. Oil.

Amide $C_6H_4(NO_2).SO_2NH_2$. [131°].

(α)-Nitro-benzene *m*-disulphonic acid $C_6H_3(NO_2)(SO_3H)_2$. Formed, together with the (β)-isomeride, by nitration of benzene *m*-disulphonic acid (Heinzelmann, *A.* 188, 160; 190, 222). Slender deliquescent needles (containing *x*aq).—$(NH_4)_2A''$: flat prisms.—K_2A''.—BaA''4aq.—BaA'' 5aq.—BaA'' 6aq.—$Ba_2A''(OH)_2$ 15aq.—PbA'' 4aq.—$Pb_2A''O$ 2½aq.—Ag_2A''.

Chloride $C_6H_3(NO_2)(SO_2Cl)_2$. [96°].

Amide $C_6H_3(NO_2)(SO_2NH_2)_2$. [242°].

(β)-Nitro-benzene *m*-disulphonic acid $C_6H_3(NO_2)(SO_3H)_2$ [4:1:3]. Formed as above. Very hygroscopic crystals. Its salts are more soluble than those of the (α)-isomeride.—$(NH_4)_2A''$.—K_2A'' ½aq (?).—BaA'' 5aq.—PbA''4aq.

Chloride $C_6H_3(NO_2)(SO_2Cl)_2$. Oil.

Nitro-benzene disulphonic acid $C_6H_3(NO_2)(SO_3H)_2$. Formed from nitro-amido-benzene disulphonic acid by the diazo- reaction (Limpricht, *B.* 8, 289).—PbA'' aq: needles.

Di-nitro-benzene sulphonic acid $C_6H_3(SO_3H)(NO_2)_2$[1:2:4]. [108°]. Formed from $(C_6H_3(NO_2)_2)_2S_2$, and fuming HNO_3 (Willgerodt a. P. Mohr, *J. pr.* [2] 34, 117). Very hygroscopic yellow prisms (containing 3aq), v. sol. water, sl. sol. ether, insol. benzene. Not attacked by fuming HNO_3 at 200°.

Reactions.—1. *Aniline* forms, on boiling, $C_6H_3(NO_2)_2(NPhH)$ [156°].—2. Boiling alcoholic *ammonia* forms $C_6H_3(NO_2)_2(NH_2)$ [178°].—3. KHS forms, in the cold, $C_6H_3(NO_2)_2SH$.—4. Rapidly decomposed by cold *potash*, becoming di-nitro-phenol [114°].

Salts. — KA'. — NaA'aq. — BaA'_2 aq. — CaA'_2 2aq.—ZnA'_2 6aq.—PbA'_2 3aq.

Chloride $C_6H_3(SO_2Cl)(NO_2)_2$. [102°].

Amide $C_6H_3(SO_2NH_2)(NO_2)_2$. [154°].

Di-nitro-benzene sulphonic acid $C_6H_3(NO_2)_2SO_3H$ [3:2:1]. Formed by warming nitro-benzene *m*-sulphonic acid with H_2SO_4 (1 vol.) and HNO_3 (3 vols.) (Limpricht, *B.* 9, 554; Sachse, *A.* 188, 143). Deliquescent crystals. NH_4A'.—KA'1½aq.—BaA'_2 3aq.—$PbA'_2$3aq.

Chloride $C_6H_3(NO_2)_2SO_2Cl$. [89°].

Amide $C_6H_3(NO_2)_2SO_2NH_2$. [238°].

Di-nitro-benzene disulphonic acid $C_6H_2(NO_2)_2(SO_3H)_2$. Formed by boiling nitro-benzene *m*-sulphonic acid with H_2SO_4 (1 vol.) and fuming HNO_3 (6 vols.) (Limpricht, *B.* 8, 289). Crystalline mass. Its chloride and amide are crystalline and decompose without melting.—K_2A'' aq.—Na_2A'' 3aq.—BaA'' 2aq.—CaA'' aq.—PbA'' 3aq.—CuA'' 3aq.

Tri-nitro-benzene sulphonic acid $C_6H_2(NO_2)_3SO_3H$. [185°]. Prepared by boiling chloro-tri-nitro-phenol (picryl chloride) with alcohol and dry $NaHSO_3$ (Willgerodt, *J. pr.* [2] 32, 117). Large crystals (containing 2aq), melting at 100° when hydrated. Decomposed by alkalis in the cold into SO_2 and picric acid.—NaA' 2aq.

NITRO-BENZENYL-AMIDO-OXIM *v.* Nitro-benzamidoxim.

NITRO-BENZIDINE *v.* NITRO-DI-*p*-AMIDO-DIPHENYL.

NITRO-BENZIL $C_{14}H_9(NO_2)O_2$. [142°]. Formed by nitration of benzoïn or benzil (Zinin, *A. Suppl.* 3, 153; Hausmann, *B.* 23, 531) Yellow crystals, sl. sol. alcohol.

(α)-*Dioxim* $C_{14}H_{11}N_3O_4$ [225°]. Formed by heating nitrobenzil with hydroxylamine hydrochloride at 100°. Crystalline body, v. sl. sol. alcohol.

(β)-*Dioxim.* [185°]. Formed by heating the (α)-isomeride with alcohol at 165° for several hours. White needles, v. sol. alcohol. Like the (α)-isomeride it is split up by conc. HClAq at 100° into hydroxylamine and nitro-benzil.

Di-nitro-benzil $C_{14}H_8(NO_2)_2O_2$. [131°]. S. (alcohol) ·73 in the cold; 2·4 at 78°. Formed, together with the following isomeride by boiling benzil with fuming HNO_3 (Zagumenny, *J. R.* 4, 278). Octahedra or moss-like forms.

Di-nitro-benzil [147°]. S. (alcohol) ·34 in the cold; 1·9 at 78°. Formed as above. Plates.

Iso-di-nitro-benzil $C_{14}H_8(NO_2)_2O_2$. [205°]. S. (95 p.c. alcohol) ·042 in the cold; ·9 on boiling. Formed by oxidation of (α)- or (γ)-di-nitro-deoxybenzoïn by CrO_3 in HOAc (Golubeff, *J. R.* 13, 29; *B.* 17, 581). Yellow needles.

o-NITRO-BENZOIC ACID $C_6H_4(NO_2).CO_2H$ [1:2]. Mol. w. 167. [147·7°] (Reissert, *B.* 23, 2244). S. ·61 at 16·5°. Formed in small quantity in the preparation of the *m*- isomeride by nitration of benzoic acid (Griess, *B.* 8, 526; *A.* 166, 129; L. Liebermann, *B.* 10, 862; Widnmann, *A.* 193, 204). Obtained also by saponifying its nitrile. Prepared by oxidising o-nitro-cinnamic acid with chromic acid mixture (Beilstein a. Kuhlberg, *A.* 163, 134; Widnmann, *B.* 8, 393) or, better, by oxidising o-nitro-toluene (Weith, *B.* 7, 1058; Widnmann, *A.* 193, 225; Noyes, *B.* 16, 53; Monnet, Reverdin, a. Nölting, *B.* 12, 443) or o-nitro-benzyl chloride (Nölting, *B.* 17, 385).

Properties.—Small triclinic needles (from water), v. sol. alcohol and ether, v. sl. sol. water. Has a sweet taste. Very slightly volatile with steam.

Salts.—$BaA'_2$3aq. Triclinic crystals, v. sol. water.—$CaA'_2$2aq: needles.—PbA'_2aq.—AgA'. Crystals, v. sol. hot water.

Ethyl ether EtA'. [30°]. Triclinic crystals.

Chloride $C_6H_4(NO_2).COCl$. Oil.

Cyanide $C_6H_4(NO_2).CO.CN$. [54°]. Formed from the chloride and AgCy at 100° (Claisen a. Shadwell, *B.* 12, 351). White prisms.

Anhydride $(C_6H_4(NO_2).CO)_2O$. [135°]. Needles (Bischoff a. Rach, *B.* 17, 2789).

Amide $C_6H_4(NO_2).CONH_2$. [176°] (Bischoff, *A.* 239, 109). With KOH and bromine it yields $C_6H_4(NO_2)(CONHBr)$ converted by boiling potash into *o*-nitro-aniline (Hoogewerff a. Van Dorp, *R. T. C.* 8, 173).

Di-nitro-anilide $C_6H_4(NO_2).CO.NHC_6H_3(NO_2)_2$. [178°]. Formed by nitrating benzoyl-*m*-nitro-aniline (Schwartz, *B.* 10, 1708).

Nitrile $C_6H_4(NO_2).CN$. *o-Nitro-benzonitrile.* Mol. w. 148. [110°]. Obtained by heating the amide with P_2O_5 at 100° (Hübner a. Bärtlein, *B.* 10, 1713). Formed also by the action of hot cuprous potassium cyanide on *o*-nitro-diazo-benzene chloride (Sandmeyer, *B.* 18, 1494) and by treating the oxim of o-nitro-benzoic aldehyde with Ac_2O (Gabriel a. Meyer, *B.* 14, 2338). Needles, v. sol. water and alcohol.

m-**Nitro-benzoic acid** $C_6H_4(NO_2).CO_2H$ [1:3]. [141°]. S. ·25 at 10°; 10 at 100° (Mulder); ·235 at 16·5° (Beilstein). Formed by nitration of benzoic acid (Mulder, *A.* 34, 297; Gerland, *A.* 91, 185; Hübner, *A.* 222, 72). Formed also by boiling nitro-hippuric acid with HClAq (Bertagnini, *A.* 78, 104; 79, 259) and by the oxidation of *m*-nitro-toluene (Beilstein, *A.* 132, 137; 155, 25; 163, 136). Obtained also by the action of hot cuprous potassium cyanide solution upon *m*-nitro-diazo-benzene chloride, and saponification of the crude nitrile; the yield being 72 p.c. (Sandmeyer, *B.* 18, 1494).

Properties.—Colourless laminæ (from water), v. e. sol. alcohol and ether. May be sublimed. Crystallises in three monoclinic modifications (Bodewig, *J.* 1879, 677). Yields amido-benzoic acid on reduction and azoxybenzoic acid on heating with alcoholic potash (Griess, *A.* 131, 92).

Salts.—$NH_4HA'_2$.—NaA' 3aq: colourless tables.—KA'aq. Needles. S. 14 in the cold; 200 at 100° (Sokoloff, *J.* 1864, 343).—$MgA'_2$7aq.—$CaA'_2$2aq. S. 3·3 in the cold; 5·5 at 100°.—Ca(OBz)A' 3aq (Salkowsky, *B.* 10, 1258).—$SrA'_2$2⅓aq.—$SrA'_2$4aq.—$BaA'_2$4aq. Needles. S. ·38 in the cold, 5·3 at 100° (Sokoloff). S. (of BaA'_2) ·22 at 9° (Mills, *C. J.* 19, 363).—$ZnA'_2$5aq.—$ZnA'_2$4aq. S. 1·6 in the cold 7·7 at 100°.—$CdA'_2$4aq (Schiff, *A.* 104, 326).—PbA'_2.—$MnA'_2$4aq.—FeA'_3.—CuA'_2aq.—AgA'.

Methyl ether MeA'. [70°]. (279°). Prisms (Chancel, *Compt. Chim.* 1849, 179; *A.* 72, 275).

Ethyl ether EtA'. [43°] (Tafel a. Enoch, *B.* 23, 1551). (296°). Monoclinic prisms. Decomposed by bromine at 170°–200° into nitro-benzoic acid and ethylene bromide (Naumann, *A.* 133, 202).

s-Tri-chloro-phenyl ether $C_6H_2Cl_3A'$. [132°]. Formed by nitrating the benzoyl derivative of (6,4,2,1)-tri-chloro-phenol (Daccomo, *B.* 18, 1165).

Di-bromo-phenyl ether $C_6H_3Br_2A'$ *v.* vol. i. p. 607.

Nitro-phenyl ethers v. Nitro-benzoyl derivatives of NITRO-PHENOLS.

Chloride $C_6H_4(NO_2).COCl$. [34°]. (184° at 50 mm.); (275°–278°). Prisms (Cahours, *A. Ch.* [3] 23, 339; Hugh, *B.* 7, 1267; Claisen a. Thompson, *B.* 12, 1942).

Cyanide $C_6H_4(NO_2).CO.CN$. (231° at 145 mm.). Formed from the chloride and AgCy (C. a. T.). Heavy oil.

Anhydride $(C_6H_4(NO_2).CO)_2O$. Solid (Gerhardt, *A.* 87, 158).

Acetic-m-nitro-benzoic anhydride $C_6H_4(NO_2).CO.OAc$. [45°]. Formed from the Ag salt and AcCl (L. Liebermann, *B.* 10, 863; Beilstein, *Bn.* 2, 786; Greene, *Am.* 11, 414).

Benzoic-m-nitro-benzoic anhydride $C_6H_4(NO_2).CO.OBz$. Crystalline (Gerhardt).

Amide $C_6H_4(NO_2).CONH_2$. [142°]. Needles (Field, *A.* 55, 45; Chancel, *Compt. Chim.* 1849, 180; Beilstein, *A.* 132, 137; Schiff, *A.* 218, 185). Its alcoholic solution mixed with $AgNO_3$ and NaOH gives a gelatinous pp. of $C_6H_4(NO_2).CO.NHAg$ (Tafel a. Enoch, *B.* 23, 1550). With bromine and potash it gives *m*-nitro-aniline (Hoogewerff a. Van Dorp, *R. T. C.*

8, 173). With *m*-nitro-benzoyl chloride it is converted into its *m*-nitro-benzoyl derivative [195°] (W. Schulze, *A.* 251, 158).

Anilide $C_6H_4(NO_2).CONHPh$. [144°]. Plates (Engler a. Volkshausen, *B.* 8, 34; Hübner, *B.* 9, 774).

m-Nitro-anilide $C_6H_4(NO_2).CO.NHC_6H_4NO_2$. [187°]. Needles (from amyl alcohol) (McHugh, *B.* 7, 1268).

Di-nitro-anilide $C_6H_4(NO_2)CO.NHC_6H_3(NO_2)_2$ [1:2:4]. [165°]. Formed by nitration of the benzoyl derivatives of o- and *p*-nitro-aniline (Schwartz, *B.* 10, 1708.

p-Toluide $C_6H_4(NO_2).CO.NHC_6H_4Me$. [162°]. Needles (from alcohol) (Hübner, *A.* 210, 335).

Nitro-p-toluide $C_6H_4(NO_2).CO.NH.C_6H_3Me.NO_2$ [1:4:2]. [188·5°]. Yellow silky needles (from alcohol). Formed by nitrating the *p*-toluide.

Mesidide $C_6H_4(NO_2).CO.NHC_6H_2Me_3$. [205°].

Nitro-mesidide $C_6H_4(NO_2).CO.NHC_6H(NO_2)Me_2$. [207°]. Formed, together with the following, by nitrating the mesidide (Schack, *B.* 10, 1711).

Di-nitro-mesidide $C_6H_4(NO_2).CO.NHC_6Me_3(NO_2)_2$. [307°]. Needles.

Nitrile $C_6H_4(NO_2).CN$. [117°]. Formed by nitrating benzonitrile, or by dehydrating *m*-nitro-benzoic amide (Beilstein a. Kuhlberg, *A.* 146, 336; Engler, *Z.* [2] 4, 613; *A.* 149, 297; Fricke, *B.* 7, 1321). Formed also by the action of hot cuprous potassium cyanide solution upon *m*-nitro-diazo-benzene chloride (Sandmeyer, *B.* 18, 1494). Prepared by adding benzonitrile (10 mols.) to KNO_3 (11 mols.) dissolved in H_2SO_4 below 25° (Schöpff, *B.* 18, 1063). Needles (from water), sl. sol. water, v. sol. alcohol and ether.

p-**Nitro-benzoic acid** $C_6H_4(NO_2).CO_2H$ [1:4]. [238°]. S. ·075 at 16°. Formed by the action of fuming HNO_3 on toluene (Glenard a. Boudault, *A.* 48, 344; G. Fischer, *A.* 127, 137; 130, 128; Beilstein a. Wilbrand, *A.* 126, 255; 128, 257), and by oxidising *p*-nitro-toluene with chromic acid (Beilstein a. Geitner, *A.* 139, 335; Körner, *Z.* [2] 5, 636; Rosenstiehl, *Z.* [2] 5, 701). Produced also by the oxidation of *p*-nitro-cinnamic acid, and, in small quantity, by the nitration of benzoic acid (Griess, *B.* 8, 528; Ladenburg, *B.* 8, 536). Obtained also by the action of a hot cuprous potassium cyanide solution upon *p*-nitro-diazo-benzene chloride, and saponification of the crude nitrile thus got (Sandmeyer, *B.* 18, 1492). Prepared by oxidising *p*-nitro-toluene (50 g.) with CrO_3 (250 g.) and H_2SO_4 (110 g.) diluted with water (450 g.) (Schlosser a. Skraup, *M.* 2, 519; *cf.* Michael a. Norton, *B.* 10, 580).

Properties.—Yellowish laminæ (from water) or needles (by sublimation), v. sol. alcohol and ether. Less soluble in water than the *m*- and *o*- isomerides. Reduced by tin and HCl to *p*-amido-benzoic acid, and by sodium-amalgam to *p*-azo-benzoic acid.

Salts.—NH_4A' 2aq: efflorescent laminæ.—NaA' 3aq: triclinic crystals (Bilfinger, *A.* 135, 154).—KA' 2aq. S. 33 in the cold; 200 at 100° (Sokoloff, *J.* 1864, 343).—BaA'_2 5aq: monoclinic crystals (Bücking a. Haushofer, *A.* 193, 212). S. ·4 in the cold; 12·5 at 100°.—BaA'(OBz) (Salkowsky, *B.* 9, 24).—CaA'_2 8aq: efflorescent tables. S. 3 in the cold; 8·3 at 100°.—CaA'_2 9aq.—CaA'(OBz) 3aq (Salkowski, *B.* 10, 1258).—SrA'(OBz) aq.—ZnA'_2 2aq. S. (of ZnA'_2) ·7 at 17° (Mills, *C. J.* 19, 363); 1·25 at 100°.—PbA'_2.

Methyl ether MeA'. [96°].

Ethyl ether EtA'. [57°].

Chloride $C_6H_4(NO_2).COCl$. [75°]. (c. 204° at 105 mm.). Slender needles (from ligroïn) (Gevekoht, *A.* 221, 335).

Amide $C_6H_4(NO_2).CONH_2$. [198°]. Needles. (Beilstein a. Reichenbach, *A.* 132, 143). Treatment with bromine and KOHAq converts it into *p*-nitro-aniline.

Anilide $C_6H_4(NO_2).CONHPh$. [204°] (Leo, *K.* 3, 552).

Nitrile $C_6H_4(NO_2).CN$. [147°]. Formed from the amide and P_2O_5 (Engler, *A.* 149, 298; Fricke, *B.* 7, 1321), or by the action of hot cuprous potassium cyanide solution on *p*-nitro-diazo-benzene chloride (Sandmeyer, *B.* 18, 1492). Laminæ (from alcohol), v. sol. hot alcohol.

Fourth and fifth nitro-benzoic acids have been described by Fittica (*B.* 8, 252, 710, 741; 9, 788; 10, 481; *J. pr.* [2] 17, 188), but their existence has been contested by other chemists (Leo Liebermann, *B.* 10, 1038; Widmann, *B.* 10, 1159; Claus, *B.* 13, 891).

(4,3,1)-**Di-nitro-benzoic acid** $C_7H_4N_2O_6$ *i.e.* $C_6H_3(NO_2)_2CO_2H$ [4:3:1]. [161°]. S. ·673 at 25°. Prepared by heating *p*-nitro-benzoic acid with nitric and sulphuric acids in sealed tubes, and separated from the (4,2,1) isomeride, simultaneously formed, by the greater solubility of the latter in water (Claus a. Halberstadt, *B.* 13, 815). Colourless crystals. Sol. alcohol, ether, and hot water, sl. sol. cold water. Very bitter taste. Sublimes undecomposed.

Salts.—A'_2Ba 4aq: white crystals.—A'_2Ca 3aq: plates. The potassium, sodium, and ammonium salts are easily soluble.

Di-nitro-benzoic acid $C_6H_3(NO_2)_2(CO_2H)$ [5:2:1]. [177°]. Formed, together with the (4,2,1)- and (6,2,1)-isomerides by boiling o-nitro-benzoic acid with a mixture of fuming HNO_3 (1 pt.) and H_2SO_4 (1 pt.) for 15 minutes (Griess, *B.* 7, 1223). Needles or prisms, sl. sol. cold water, m. sol. hot water. The di-amido-benzoic acid, obtained by reduction, yields *p*-phenylene-diamine on distillation.—BaA'_2 4aq: six-sided plates, sl. sol. hot water.

Di-nitro-benzoic acid $C_6H_3(NO_2)_2CO_2H$ [4:2:1]. [179°]. S. 1·849 at 25°. Formed in the prepation of each of the two preceding acids (Griess, *B.* 7, 1225; Claus a. Halberstadt, *B.* 13, 816; Hübner a. Stromeyer, *B.* 13, 461; *A.* 222, 79). Obtained also by heating di-nitro-toluene with fuming HNO_3 at 100° for a fortnight (Tiemann a. Judson, *B.* 3, 223). White needles or tables. May be sublimed. Tastes bitter. On reduction with tin and HClAq it at once yields *m*-phenylene-diamine.—BaA'_2 3aq: m. sol. cold water.—CaA'_2 2aq.—MgA'_2 9aq.

Di-nitro-benzoic acid $C_6H_3(NO_2)_2CO_2H$ [6:2:1]. [202°]. Formed, together with styphnic acid $C_6H(NO_2)_3(OH)_2$ and the (4,2,1)- and (5,2,1)-di-nitro-benzoic acids, by heating o-nitro-benzoic acid with HNO_3 and H_2SO_4 (Griess). Felted needles (from boiling water), v. sol. boiling water. Tastes intensely bitter. Split up on distillation into CO_2 and *m*-di-nitro-benzene. On treatment with tin and HClAq it yields *m*-phenylene-diamine.—BaA'_2 2aq: v. e. sol. cold water.

Di-nitro-benzoic acid $C_6H_3(NO_2)_2CO_2H$ [5:3:1]. [204°]. S 1·9 at 100°. Formed by nitration of benzoic acid or of *m*-nitro-benzoic acid with a mixture of HNO_3 and H_2SO_4 (Cahours, *A. Ch.* [3] 25, 30, Voit, *A.* 99, 100; Tiemann a. Judson, *B.* 3, 223; Muretoff, *Z.* [2] 6, 641; Michler, *A.* 175, 152). Obtained also by heating di-nitro-toluene [93°] with fuming HNO_3 at 150°, or by oxidising it with chromic acid mixture (Staedel, *B.* 14, 902; *A.* 217, 194; Hubner, *A.* 222, 73), and in small quantity by the oxidation of '*β*'-di-nitro-naphthalene with dilute HNO_3 (S.G. 1·15) at 150° (Beilstein a. Kurbatow, *B.* 13, 355).

Preparation.—1. By heating benzoic acid (20 g.) with H_2SO_4 (180 g.) and fuming HNO_3 (50 g.) for 4 hours nearly to boiling (Hübner).—2. By heating *m*-nitro-benzoic acid (100 g.) with fuming nitric acid (500 g.) and H_2SO_4 (600 g.) for 12 hours (H.).

Properties.—Thin tables (from dilute HNO_3) or monoclinic crystals (Henniges, *J.* 1882, 902), v. sl. sol. cold water, sl. sol. dilute HNO_3, v. sol. alcohol and HOAc. Reduced by tin and HCl to di-amido-benzoic acid, which yields *m*-phenylene-diamine on distillation with baryta.

Salts.—NaA'.—KA'.—BaA'_2 aq (Hübner): m. sol. hot water.—BaA'_2 5aq (Muretoff).—CaA'_2 aq.—MgA'_2 8aq.—MnA'_2 2aq.—PbA'_2 aq.—AgA': needles (from hot water).

Ethyl ether EtA'. [94°] (H.); [91°] (B. a. K.). S. (90 p.c. alcohol) ·562 at 13°.

Amide $C_6H_3(NO_2)_2CONH_2$. [183°] (Voit, *A.* 99, 105); [177°] (M.). Plates (from water).

Tri-nitro-benzoic acid $C_6H_2(NO_2)_3CO_2H$. [190°]. Obtained by heating tri-nitro-toluene with fuming HNO_3 for a fortnight at 100° (T. a. J.). Trimetric crystals; *a*:*b*:c = ·887:1:·572 (Friedländer, *Z. K.* 1, 623). May be sublimed.—AgA': plates, sl. sol. water.

References.—Bromo-, Chloro-, and Iodo-, Nitrobenzoic acids.

***o*-NITRO-BENZOIC ALDEHYDE**

$C_6H_4(NO_2).CHO$. Mol. w. 151. [44°] (G. a. M.); [46°] (F. a. H.).

Formation.—1. In small quantity, together with the *m*-isomeride, by adding benzoic aldehyde to a mixture of HNO_3 and H_2SO_4 (Rudolph, *B.* 13, 310; *cf.* Fittica, *B.* 10, 1630).—2. By treatment of its oxim with chromic acid mixture (Gabriel a. Meyer, *B.* 14, 829).—3. By oxidising *o*-nitro-cinnamic acid with dilute $KMnO_4$ (Friedländer a. Henriques, *B.* 14, 2801).—4. By adding $NaNO_2$ to a cold solution of *o*-nitro-cinnamic ether in fuming nitric acid (F. a. H.).—5. In small quantity by the action of water on the compound of *o*-nitro-toluene with CrO_2Cl_2 (Richter, *B.* 19, 1062).

Preparation.—50 grms. of crude *o*-nitro-cinnamic acid are suspended in 2½ litres of water, neutralised with Na_2CO_3 and filtered. The clear solution is put into a large stoppered bottle, 1 litre of benzene added, and kept cold during the reaction by the addition of ice. 1225 c.c. of a 6 p.c. solution of $KMnO_4$ is added by degrees, shaking continuously, in order that the nitro-benzaldehyde, as it is formed, may be removed by the benzene from the action of the oxidising agent. The emulsion which is produced is now treated with a warm solution of 150 grms. of sodium sulphite and HCl added, which dissolves the MnO_2. The benzene layer, which contains the whole of the nitrobenzaldehyde is removed, and the latter obtained by distilling off the benzene. The yield is 50 p.c. to 60 p.c. of the theoretical (Einhorn, *B.* 17, 119).

Properties.—Long yellow needles (from water), sl. sol. water, v. sol. alcohol and ether. May be distilled. Volatile with steam. With $NaHSO_3$ it forms a compound crystallising in plates.

Reactions.—1. On *reduction* with tin and HOAc it yields anthranil $C_6H_4{<}\begin{smallmatrix}CO\\NH\end{smallmatrix}{>}$, the lactam of *o*-amido-benzoic acid (Friedländer a. Henriques, *B.* 15, 2105; *cf.* Rudolph, *B.* 13, 310). Reduced by $FeSO_4$ and NH_3 to amido-benzoic aldehyde (Friedländer, *B.* 15, 2572; 17, 456).—2. Yields *o*-nitro-benzoic acid on *oxidation* with dilute aqueous $KMnO_4$. It also undergoes this oxidation when administered to dogs (Sieber a. Smirnoff, *M.* 8, 88).—3. Conc. NaOHAq converts it into *o*-nitro-benzoic acid and *o*-nitro-benzyl alcohol.—4. NaOAc and Ac_2O yield *o*-nitro-cinnamic acid by Perkin's reaction.—5. On warming with a dilute alcoholic solution of *urea* a compound $C_6H_4(NO_2).CH(NH.CO.NH_2)_2$ [200°] is formed (Lüdy, *M.* 10, 295). When a few drops of H_2SO_4 are added to an alcoholic solution of *o*-nitro-benzoic aldehyde and urea there is formed a different compound $C_{19}N_4H_{22}O_7$ [170°].—6. With *di-methyl-aniline* it forms nitro-tetra-methyl-di-amido-tri-phenyl-methane $C_6H_4(NO_2).CH(C_6H_4NMe_2)_2$.—7. *Aceto-acetic ether* (2 mols.) and NH_3 form *o*-nitro-phenyl-di-methyl-pyridine dihydride dicarboxylic ether [120°] and a compound $C_{19}H_{20}N_4O_3$ [189°], forming a salt B'HCl, converted by nitrous acid into an indifferent isomeride [192°] (Lepetit, *B.* 20, 1338).—8. Boiling conc. aqueous KCy forms *o*-azoxy-benzoic acid.—9. *Aldehyde* and a little baryta-water forms $C_9H_9NO_4$ [120°], converted by further treatment with baryta-water into $C_6H_4(NO_2).CH(OH).CH_2.CH_2OH$ [109°], and by NaOHAq into indigo (Baeyer a. Drewson, *B.* 15, 2861).—10. *Acetone* and NaOH forms *o*-nitro-styryl methyl ketone, which on warming with more alkali yields indigo.

Oxim $C_6H_4(NO_2).CH:NOH$. *o-Nitro-ω-nitroso-toluene.* [96°]. Formed by the action of hydroxylamine on the aldehyde in alcoholic solution, or by treating (2,4,1)-nitro-amido-phenyl-acetic acid with nitrous acid (Gabriel a. Meyer, *B.* 14, 826; 15, 3057; 16, 520). Slender needles (from hot water), v. sol. alcohol and ether. Tastes sweet. Dissolves in alkalis. Conc. HClAq at 160° decomposes it into *o*-nitro-benzoic acid and NH_3. Boiling with Ac_2O and NaOAc forms the nitrile of *o*-nitro-benzoic acid.

Methyl derivative of the oxim $C_6H_4(NO_2).CH:NOMe$. [58°].

Phenyl hydrazide $C_6H_4(NO_2)CH:N_2HPh$. [153°] (P.); [148°] (L.). Formed by adding phenyl-hydrazine to an alcoholic solution of the base (Pickel, *A.* 232, 232; Lüdy, *M.* 10, 314). Scarlet needles, sl. sol. hot water, forming a dark-blue solution in conc. H_2SO_4.

***m*-Nitro-benzoic aldehyde** $C_6H_4(NO_2).CHO$. [3:1]. [58°]. Obtained by dissolving benzoic aldehyde (1 vol.) in a mixture of fuming HNO_3 (1 vol.) and H_2SO_4 (10 vols.) in the cold (Bertagnini, *A.* 79, 259; 86, 190; Lippmann a. Hawliczek, *B.* 9, 146; Friedländer a. Henriques, *B.* 14, 2802; Ehrlich, *B.* 15, 2010). Needles (from water), m. sol. hot water, v. sol. alcohol.

Reactions.—1. *Chromic acid* oxidises it to *m*-nitro-benzoic acid.—2. *Tin* and HOAc reduce it to *m*-amido-benzoic aldehyde.—3. *Ammonia* forms $(C_6H_4(NO_2)CH)_3N_2$, which on heating with aqueous KOH forms tri-nitro-amarin $C_{21}H_{16}N_6O_6$. 4. *Ammonia* and *acetoacetic ether* form $C_6H_4(NO_2).C_5NH_2Me_2(CO_2Et)_2$ [65°] (Lepetit, *B.* 20, 1338, 2397).—5. *Sodium succinate* and acetic anhydride form nitro-phenyl-paraconic acid  $C_6H_4(NO_2).\underline{CH.CH(CO_2H).CH_2.CO.O}$ (Salomonson, *R. T. C.* 6, 1).—6. When its benzene solution is shaken with H_2SO_4 there is formed $C_6H_4(NO_2).CHPh_2$ [90°]; while toluene, by similar condensation, yields $C_6H_4(NO_2).CH(C_7H_7)_2$ [85°] (Tschacher, *B.* 21, 188).—7. *Phenyl-acetonitrile* and alcoholic NaOEt yields the nitrile of nitro-α-phenyl-cinnamic acid (Frost, *A.* 250, 156).—8. After administration to a dog it is excreted as *m*-nitro-hippuric acid (Sieber, *M.* 8, 88).

Combinations. — $(C_7H_5NO_3)NH_4SO_3H$ ½aq: colourless prisms. — $(C_7H_5NO_3)NaSO_3H$ 5aq: yellowish crystalline scales (from hot water).—$(C_7H_5NO_3)NPhH_2SO_3H_2$: needles (Schiff, *A.* 195, 301).—$(C_7H_5NO_3)_4PH_3$: powder, insol. alcohol. Formed from the aldehyde, PH_3, and HCl (Messinger a. Engels, *B.* 21, 333).

Oxim $C_6H_4(NO_2).CH:NOH$. [119°]. Needles (from water) (Gabriel, *B.* 15, 3060). PCl_5 yields *m*-nitro-benzonitrile (Gabriel, *B.* 16, 520).

Iso-oxim. [118°]. Formed by passing HCl into an ethereal solution of the oxim, and decomposing the hydrochloride by Na_2CO_3. Needles (from ether). Combines with phenyl cyanate in ethereal solution with formation of $C_6H_4(NO_2).CH.NO.CONPhH$ [75°], which readily changes into an isomeride [105°]. By treatment with NaOMe and MeI it is converted into a mixture of two isomeric methyl derivatives $C_6H_4(NO_2).CH:NOMe$, melting at 69° and at 117° (Goldschmidt a. Ernst, *B.* 23, 2170). MeI acting on its silver salt gives the methyl ether, melting at 69°. NaOEt and benzyl chloride yield a benzyl ether [148°]. Phenyl cyanate in ethereal solution yields $C_6H_4(NO_2).CH:NO.CO.NHPh$ [105°], crystallising in yellow needles.

Phenyl-hydrazide $C_6H_4(NO_2).CH:N_2HPh$. [121°] (Pickel, *A.* 232, 232; Lüdy, *M.* 10, 315). Orange tables. Yields an acetyl derivative $C_{13}H_{10}(NO_2)N_2Ac$ [170°] (Schroeder, *B.* 17, 2097). Nitrous acid converts it into $(C_6H_4(NO_2).CH:N.NPh)_2NOH$, which crystallises in needles, forming a deep-blue pp. in H_2SO_4.

p-Nitro-benzoic aldehyde $C_6H_4(NO_2).CHO$ [4:1]. [106°].

Formation.—1. By boiling *p*-nitro-benzyl chloride (10 pts.) with $Pb(NO_3)_2$ (14 pts.), water (60 pts.), and HNO_3 (S.G. 1·3) (Fischer a. Greiff, *B.* 13, 670).—2. By oxidising *p*-nitro-cinnamic ether (Friedländer a. Henriques, *B.* 14, 2803) or *αp*-di-nitro-cinnamic ether (Friedländer a. Maly, *A.* 229, 212; *cf.* Baeyer, *B.* 14, 2317).

Preparation.—1. By adding KNO_3 to a cooled solution of *p*-nitro-cinnamic acid, or its methyl or ethyl ether, in strong H_2SO_4; the yield is 60 p.c. to 95 p.c. (Basler, *B.* 16, 2714).—2. 45 pts. of chromyl chloride (CrO_2Cl_2) are slowly added to 20 pts. *p*-nitro-toluene, dissolved in 80 to 100 pts. of CS_2. After standing for two days, the pp. $(C_6H_4(NO_2)CH_3,Cr_2O_4Cl_4)$ is separated, washed with CS_2, and treated with water. The CS_2 is driven off with steam, and the product recrystallised from water; yield, 60 p.c. to 70 p.c. of the nitro-toluene (Richter, *B.* 19, 1060).

Properties.—Long colourless prisms (from hot water), sl. sol. water and ether, m. sol. alcohol. May be sublimed. Volatile with steam. Forms with $NaHSO_3$ a compound crystallising in plates.

Reactions.—1. *Chromic acid mixture* oxidises it to *p*-nitro-benzoic acid.—2. *Aniline* forms $C_6H_4(NO_2).CH:NPh$ [93°].—3. *Dimethylaniline* condenses with it to *p*-nitro-tetra-methyl-di-*p*-amido-tri-phenyl-methane. — 4. When administered to dogs it is excreted as *p*-nitro-hippuric acid.—5. With *p-toluidine* and conc. HClAq it forms $C_6H_4(NO_2).CH(C_6H_3Me.NH_2)_2$ [172°] (Bischler, *B.* 20, 3302).—6. *Ammonia* and *acetoacetic ether* form the compound $C_6H_4(NO_2).C_5NH_2Me_2(CO_2Et)_2$ [118°–122°]. — 7. *Indoxyl* with HClAq and HOAc forms the indogenide  $C_6H_4\langle{}^{CO}_{NH}\rangle C:CH.C_6H_4NO_2$, crystallising in red needles [273°].

Oxim $C_6H_4(NO_2)CH:NOH$. [129°]. Reddish-yellow scales (Gabriel a. Herzberg, *B.* 16, 2000).

Iso-oxim [175°] (Behrend, *A.* 263, 349).

Benzyl ether of the iso-oxim  $C_6H_4(NO_2).CH\langle{}^{N(C_2H_7)}_{O}$. [118°]. Formed by oxidising (β)-benzyl-*p*-nitro-benzyl-hydroxylamine with K_3FeCy_6 (Behrend a. König, *B.* 23, 2750). Needles (from alcohol), split up by hot HClAq into *p*-nitro-benzoic aldehyde and (β)-benzyl-hydroxylamine.

Phenyl-hydrazide $C_6H_4(NO_2)CH:N_2HPh$. [125°]. Red needles (Pickel, *A.* 232, 232). Forms a red solution in conc. H_2SO_4 (Lüdy, *M.* 10, 315).

NITROBENZOIC ANHYDRIDE *v. Anhydride* of Nitrobenzoic acid.

***m*-NITRO-BENZOIC IMIDO-ETHYL ETHER** $C_9H_{10}N_2O_3$ *i.e.* $C_6H_4(NO_2).C(NH).OEt$. Formed by treatment of $C_6H_4(NO_2).CONHAg$ with EtI, followed by ethereal HCl (Tafel a. Enoch, *B.* 23, 1550). Yellow oil.—B′HCl. White mass, v. sol. water and alcohol; converted by hot water into *m*-nitro-benzoic ether.—$B'H_2C_2O_4$. [132°].

NITRO-BENZONITRILE *v. Nitrile* of Nitrobenzoic acid.

***o*-NITRO-BENZOPHENONE** $C_{13}H_9NO_3$ *i.e.* $C_6H_5.CO.C_6H_4(NO_2)$. *o-Nitro-di-phenyl-ketone* [105°]. Formed by oxidation of *o*-nitro-di-phenyl-methane with CrO_3 in acetic acid (Geigy a. Koenigs, *B.* 18, 2403). Colourless crystals.

m-Nitro-benzophenone $C_6H_5.CO.C_6H_4.NO_2$ [95°]. Formed by the action of *m*-nitro-benzoyl chloride upon benzene in presence of Al_2Cl_6 (Geigy a. Koenigs, *B.* 18, 2401; *cf.* Becker, *B.* 15, 2090). Yellowish needles.

p-Nitro-benzophenone $C_6H_4(NO_2).CO.C_6H_5$ [138°]. Formed by oxidation of *p*-nitro-di-phenyl-methane with CrO_3 in acetic acid (Basler, *B.* 16, 2717). Small white plates or needles. Sol. benzene, hot alcohol, and hot water, sl. sol. cold water, cold alcohol, ligroïn, and CS_2.

(α)-Di-nitro-benzophenone $(C_6H_4(NO_2))_2CO$. [190°]. Formed, together with a larger quantity of the (β)-isomeride, by heating benzophenone with fuming HNO_3 at 60° (Prätorius, *B.* 10, 1855; 11, 744; Staedel, *A.* 194, 349; 218, 344). Formed also by oxidation of the corresponding di-nitro-di-phenyl-methane [183°] by CrO_3 in HOAc (Staedel a. Sauer, *B.* 11, 1747). Long needles (from HOAc). Yields on reduction di-amido-benzophenone [172°].

(β)-Di-nitro-benzophenone $C_{13}H_8N_2O_5$. [149°]. Formed as above. Laminæ (from benzene or HOAc). Yields on reduction di-amido-benzophenone [165°].

Oxim $(C_6H_4.NO_2)_2C:NOH$: [207°]; small yellow needles (from hot alcohol).

Phenyl hydrazide $(C_6H_4.NO_2)_2C:N_2HC_6H_5$; [220°]; red powder; sol. acetic acid, sl. sol. alcohol, insol. water (Münchmeyer, *B.* 20, 510).

(γ)-Di-nitro-benzophenone $C_{13}H_8N_2O_5$. [190°]. Formed by oxidation of the di-nitro-di-phenyl-methane [118°]. Crystals. Yields on reduction di-amido-benzophenone [131°].

Tetra-nitro-benzophenone $C_{13}H_6(NO_2)_4O$. [225°]. Formed by oxidising tetra-nitro-di-phenyl-methane (Staedel, *A.* 218, 341). Needles (from HOAc).

***p*-NITRO-BENZOYL-ACETIC ACID** $C_9H_7NO_5$ *i.e.* $C_6H_4(NO_2).CO.CH_2.CO_2H$. *Nitro-phenyl methyl ketone carboxylic acid.* [135°]. Formed by digesting *p*-nitro-phenyl-propiolic ether with H_2SO_4 (85 p.c.) at 35° till it is completely soluble in aqueous NaOH (Perkin a. Bellenot, *B.* 17, 326; 18, 952; *C. J.* 49, 444). Needles, v. sol. alcohol and ether, sol. water. $FeCl_6$ colours its alcoholic or hot aqueous solution reddish-brown. On heating by itself or with dilute acids or alkalis it splits up into CO_2 and *p*-nitro-acetophenone.

Methyl ether MeA′. [107°]. Monoclinic crystals; v. sol. hot alcohol. NaOMe forms yellow crystals of $C_6H_4(NO_2).CO.CHNa.CO_2Me$, a body from which benzyl chloride produces $C_6H_4(NO_2).CO.CH(C_7H_7).CO_2Me$ [57°].

Ethyl ether EtA′. [76°]. Monoclinic crystals; $a:b:c = {\cdot}358:1:1{\cdot}238$; $\beta = 72°\ 22'$. Its alcoholic solution is coloured brownish-violet by $FeCl_3$. Nitrous acid acting on its ethereal solution forms $C_6H_4(NO_2).CO.C(NOH).CO_2Et$ [220°]. Yields $C_6H_4(NO_2).CO.CHNa.CO_2Et$, crystallising in orange needles, whence aqueous $AgNO_3$ forms an explosive amorphous Ag salt. The sodium salt is converted by ethyl iodide into the ether $C_6H_4(NO_2).CO.CHEt.CO_2Et$ [40°].

NITRO-BENZOYL-ACETOACETIC ETHER *v.* ACETOACETIC ETHER.

o-NITRO-BENZOYL-ACETONE $C_{10}H_9NO_4$ *i.e.* $NO_2.C_6H_4.CO.CH_2.CO.CH_3$ [55°]. Got by boiling *o*-nitro-benzoyl-aceto-acetic ether with H_2SO_4 (1 pt.) and water (2 pts.) for 4 hours (Gevekoht, *A.* 221, 332). Crystallised from benzoline. Insol. water, v. sol. alcohol and ether. Gives with phenyl-hydrazine a compound melting at 120°, crystallising from alcohol in slender needles, possibly nitro-di-phenyl-methyl-pyrazole (Fischer a. Bülow, *B.* 18, 2136).

***p*-NITRO-BENZOYL-ANGELIC ETHER** $C_6H_4(NO_2).CO.CH(C_3H_5).CO_2Et$. [46°]. Formed by the action of allyl iodide upon the sodio-derivative of *p*-nitro-benzoyl-acetic ether (Perkin a. Bellinot, *B.* 18, 957). Colourless plates.

(α)-DI-NITRO-BENZOYL-BENZOIC ACID $C_{14}H_8(NO_2)_2O_3$. [240°]. Formed from benzoyl-benzoic acid, HNO_3, and H_2SO_4 (Plaskuda, *B.* 7, 988). Plates.—BaA'_2 aq.—CaA'_2 2aq.

(β)-Di-nitro-benzoyl-benzoic acid $C_6H_4(NO_2).CO.C_6H_3(NO_2).CO_2H$. [212°]. Formed by boiling di-nitro-phenyl-*p*-tolyl ketone with CrO_3 and HOAc (Plaskuda a. Zincke, *B.* 7, 984). Plates (from hot water).

o-NITRO-BENZOYL-BENZYL-MALONIC ETHER $C_6H_4(NO_2).O.C(CH_2Ph)(CO_2Et)_2$. [94°]. Formed from sodium benzyl-malonic ether and o-nitro-benzoyl chloride, or from benzyl chloride and sodium o-nitro-benzoyl-malonic ether (Bischoff a. Siebert, *A.* 239, 103). Prisms (from dilute alcohol). V. sol. ether and hot alcohol, sl. sol. ligroïn. Gives no colour with $FeCl_3$. Alcoholic KOH produces benzyl-malonic acid and o-nitro-benzoic acid. Ammonia forms o-nitro-benzamide and benzyl-malonic ether.

NITRO-BENZOYL CHLORIDE *v. Chloride* of NITRO-BENZOIC ACID.

NITRO-BENZOYL CYANIDE *v. Cyanide* of NITRO-BENZOIC ACID.

NITRO-BENZOYL-FORMIC ACID *v.* NITRO-PHENYL-GLYOXYLIC ACID.

o-NITRO-BENZOYL-MALONIC ETHER $C_6H_4(NO_2).CO.CH(CO_2Et)_2$. [54°]. The sodium-derivative $C_6H_4(NO_2).CO.CNa(CO_2Et)_2$ is formed by the action of NaOEt on di-nitro-di-benzoyl-malonic ether, or of o-nitro-benzoyl chloride (1 mol.) on di-sodio-malonic ether (1 mol.) (Bischoff, *B.* 16, 1044; 17, 2791; 22, 387). Needles or prisms (from alcohol). $FeCl_3$ colours its alcoholic solution dark-red. Bromine acting on its sodium derivative forms the bromo-derivative $C_6H_4(NO_2).CO.CBr(CO_2Et)_2$ [72°]. On reduction by zinc-dust and HCl it yields (*Py.* 1,3)-di-oxy-quinoline (*Py.* 2)-carboxylic acid, and other bodies.

o-Di-nitro-di-benzoyl-malonic ether $(C_6H_4(NO_2).CO)_2C(CO_2Et)_2$. [93°]. Colourless tables or prisms. Obtained by the action of o-nitro-benzoyl chloride (2 mols.) on di-sodio-malonic ether (1 mol.) in alcoholic solution. By treatment with sodium ethylate one of the nitro-benzoyl groups is removed with formation of sodio-nitro-benzoyl-malonic ether and nitro-benzoic ether. By alcoholic NH_3 both benzoyl groups are removed with production of malonic ether and nitro-benzamide (2 mols.) (Bischoff a. Rach, *B.* 17, 2789).

***m*-NITRO-BENZOYL PEROXIDE** $(C_6H_4(NO_2).CO)_2O_2$. Oil, ppd. by adding water to a solution of benzoyl peroxide in fuming HNO_3 (Brodie, *Pr.* 12, 655).

DI-*p*-NITRO-DI-BENZOYL-SUCCINIC ETHER $C_6H_4(NO_2).CO.CH(CO_2Et).CH(CO_2Et).CO.C_6H_4(NO_2)$. [180°]. Formed by the action of iodine on an ethereal solution of the sodium derivative of *p*-nitro-benzoyl-acetic ether (Perkin a. Bellenot, *C. J.* 49, 452; *B.* 18, 953). Needles. Forms an amorphous di-sodium derivative.

o-NITRO-BENZYL ALCOHOL $C_7H_7NO_3$ *i.e.* $C_6H_4(NO_2).CH_2OH$. [74°]. Prepared by the action of aqueous NaOH on o-nitrobenzoic aldehyde (Friedländer a. Henriques, *B.* 14, 2804; Gabriel a. Borgmann, *B.* 16, 2065; Geigy a. Koenigs, *B.* 18, 2403). Yellow needles, sl. sol. water. Yields on reduction by zinc and HCl *o*-amido-benzyl alcohol [82°]. Chromic acid oxidises it to *o*-nitro-benzoic acid.

m-**Nitro-benzyl alcohol** $C_6H_4(NO_2).CH_2OH$. (175°–180° at 3 mm.). Formed by heating *m*-nitro-benzoic aldehyde with alcoholic potash, and ppg. by water (Grimaux, *Bl.* [2] 8, 433).

Preparation.—2 pts. of *m*-nitro-benzaldehyde are mixed with a cooled solution of 1 pt. of KOH in 6 pts. of water. After standing overnight the product is extracted with ether; the yield is nearly the theoretical (Becker, *B.* 15, 2091).

Oil, decomposed by distillation under atmospheric pressure.

p-**Nitro-benzyl alcohol** $C_6H_4(NO_2).CH_2OH$. [92°]. Formed by heating its acetyl derivative with aqueous NH_3 at 100° (Beilstein a. Kuhlberg, *Z.* [2] 3, 467; *A.* 147, 343). Formed also, together with di-nitro-*p*-toluidine, by warming the *p*-nitro-benzyl ether of di-nitro-*o*-cresol with alcoholic NH_3 (Staedel, *A.* 217, 183).

Preparation.—1. Finely powdered *p*-nitrobenzaldehyde (1 pt.) is added to 5 or 6 pts. of 15 p.c. aqueous NaOH, and allowed to stand for 12 hours; it is then diluted with a little water and extracted with ether; the yield is 80 p.c. to 90 p.c. of the theoretical.—2. 20 pts. of *p*-nitro-benzyl-acetate (obtained by nitration of benzyl acetate) in 40 pts. of boiling alcohol is treated with 35 pts. of 15 p.c. aqueous NaOH, quickly cooled and poured into 200 pts. of iced water, and the pp. collected; the yield is about 75 p.c. (Basler, *B.* 16, 2715).

Properties.—Yellowish needles. Yields *p*-nitro-benzoic acid on oxidation. Concentrated nitric acid converts it into the nitrate $C_6H_4(NO_2).CH_2.O.NO_2$ [71°] (Staedel, *B.* 14, 90).

Acetyl derivative $C_6H_4(NO_2).CH_2OAc$. [78°]. Formed by dropping benzyl acetate into fuming HNO_3. Pale-yellow needles.

o-**NITRO-BENZYLAMINE** $C_7H_8N_2O_2$ *i.e.* $C_6H_4(NO_2).CH_2NH_2$. Formed by heating o-nitro-benzyl-phthalimide with HClAq at 200° (Gabriel, *B.* 20, 2228). Liquid, v. sol. water.—B'HCl. Needles, v. sol. water.—$B'_2H_2PtCl_6$ 2aq.

Formyl derivative $C_7H_7AcN_2O_2$. [90°]. Formed by heating the hydrochloride with dry sodium formate and formic acid (Gabriel a. Jansen, *B.* 23, 2813). Crystals. Yields quinazoline dihydride on reduction by zinc and HCl.

Acetyl derivative. [99°]. Needles. Yields on reduction $C_6H_4(NH_2).CH_2NHAc$ [113·5°].

Benzoyl derivative [112°]. Needles (from hot alcohol). Yields on reduction $C_6H_4(NH_2).CH_2NHBz$ [109°].

m-**Nitro-benzyl-amine** $C_6H_4(NO_2).CH_2NH_2$. Formed by heating *m*-nitro-benzyl-phthalimide with HClAq (Gabriel a. Hendess, *B.* 20, 2869). Formed also from *m*-nitro-benzyl chloride and alcoholic NH_3 (Borgmann, *C. C.* 1885, 456). Needles.—$B'_2H_2PtCl_6$: plates.

Acetyl derivative $C_6H_4(NO_2).CH_2NHAc$. [91°]. Needles, sol. hot water.

p-**Nitro-benzyl-amine** $C_6H_4(NO_2).CH_2NH_2$. Prepared from *p*-nitro-benzyl chloride by treatment with potassium phthalimide and decomposition of the *p*-nitro-benzyl-phthalimide (Hafner, *B.* 23, 337). Strongly alkaline oil, absorbing CO_2 from the air. Converted by nitrous acid into *p*-nitro-benzyl alcohol. CS_2 forms $C_6H_4(NO_2).CH_2NH.CS.NH.CH_2.C_6H_4NO_2$ [193°].—B'HCl: plates, m. sol. water.—$B_2'H_2PtCl_6$.—B HNO_2: needles, sl. sol. water.

Acetyl derivative $C_6H_4(NO_2).CH_2NHAc$. [133°]. Needles, sol. water. Formed by heating the base with Ac_2O and NaOAc, or by nitration of the acetyl derivative of benzylamine (Amsel a. Hofmann, *B.* 19, 1286).

Benzoyl derivative [156°]. Needles.

Di-*p*-nitro-di-benzyl-amine $C_{14}H_{13}N_3O_4$ *i.e.* $(C_6H_4(NO_2).CH_2)_2NH$. [93°]. Obtained, together with the following isomeride and tri-nitro-tribenzylamine, by heating nitro-benzyl chloride with aqueous NH_3 at 100° (Strakosch, *B.* 6, 1056). Yellow plates (from alcohol).—B'HCl. [212°].—$B'_2H_2PtCl_6$.

Di-nitro-di-benzyl-amine. [above 100°]. Formed as above.—B'HCl. [173°].

Tri-o-nitro-tri-benzyl-amine $(C_6H_4(NO_2).CH_2)_3N$. [157°]. Formed almost exclusively by heating o-nitro-benzyl chloride with aqueous NH_3. Long yellowish needles. Sol. benzene, sl. sol. alcohol. Its salts are decomposed by water (Lellmann a. Stickel, *B.* 19, 1605).

Tri-*p*-nitro-tri-benzyl-amine $(C_6H_4(NO_2).CH_2)_3N$. [163°]. Formed by heating *p*-nitro-benzyl chloride with aqueous NH_3 (Strakosch). Needles (from HOAc).

Tri-nitro-benzyl-amine $N(CH_2.C_6H_4.NO_2)_3$. [159°]. Formed by nitration of tri-benzyl-amine with a mixture of conc. HNO_3 and conc. H_2SO_4. Colourless crystals. Sol. hot acetic acid, insol. alcohol and ether (Marquardt, *B.* 19, 1030).

o-**NITRO-BENZYL-ANILINE** $C_6H_4(NO_2).CH_2.NHC_6H_5$. Prepared by heating 2 mols. of aniline with 1 mol. of o-nitro-benzyl chloride in alcoholic solution for 2 hours on the water-bath. It crystallises in two allotropic forms, of which the unstable form changes into the stable by fusion or by long keeping. The unstable form crystallises in reddish-yellow monoclinic needles, $a:b:c$ = ·8585:1:1·1587, $\beta = 87°\ 42'\ 52''$; and melts at [44°]. The stable form crystallises in glistening brown triclinic prisms, $a:b:c = 1{\cdot}6764:1:?$, $\alpha = 117°$, $\beta = 137°\ 40'\ 6''$, $\gamma = 69°\ 38'\ 44''$; it melts at [57°]. V. sol. alcohol, ether, and benzene, sparingly in petroleum-ether. Reduced by tin and HCl to $C_{13}H_{10}N_2$ [83°].—B'HCl 3aq: white needles, basified by much water.

Acetyl derivative $C_6H_4(NO_2).CH_2.NPhAc$. [75°] (Paal a. Krecke, *B.* 23, 2637).

Benzoyl derivative $C_6H_4(NO_2)CH_2.NPhBz$. [101°]. Well-formed crystals; sol. alcohol, ether, and acetic acid, v. sol. chloroform, sl. sol. petroleum-ether. By reduction with tin and HCl it is converted into $C_6H_4(NH_2).CH_2NPhBz$ [115°] (Lellmann a. Stickel, *B.* 19, 1605; 24, 718; Söderbaum a. Widman, *B.* 23, 2193).

Formyl derivative $C_6H_4(NO_2).CH_2.NC_7H_7.CHO$. [77°]. Yellow monoclinic plates; $a:b:c$ = ·548:1:1·085; $\beta = 69°\ 7'$. Yields phenyl-quinazoline dihydride on reduction (Paal a. Busch, *B.* 22, 2683).

m-**Nitro-benzyl-aniline** $C_6H_4(NO_2)CH_2.NHC_6H_6$. [86°]. From *m*-nitro-benzyl chloride and aniline (Borgmann, *C. C.* 1885, 456). Orange-red needles.—B'HCl: plates.

p-**Nitro-benzyl-aniline** $C_6H_4(NO_2)CH_2.NHC_6H_5$. [68°]. Formed from *p*-nitro-benzyl chloride and aniline (Strakosch, *B.* 6, 1062). Golden-yellow needles, sol. hot alcohol.—B'HCl. Plates.

Di-nitro-di-benzyl-aniline $(C_6H_4(NO_2).CH_2)_2NC_6H_5$. [206°]. Formed in small quantity as a by-product of the action of *o*-nitro-benzyl chloride upon aniline. Greenish-yellow needles. Sparingly soluble in acetic acid (Lellmann a. Stickel, *B.* 19, 1608).

m-**Nitro-benzyl-aniline** $C_6H_4(NO_2).NH.C_7H_7$. [107°]. From *m*-diazo-nitro-benzene *m*-nitro-benzyl-anilide by heating with conc. HCl at 100° (Meldola a. Streatfeild, *C. J.* 51, 114).

The *Nitrosamine* is an oil.

p-**Nitro-benzyl-aniline** $C_6H_4(NO_2).NH.C_7H_7$, [143°]. From *p*-diazo-nitro-benzene *p*-nitro-benzyl-anilide by heating with conc. HCl at 100° (Meldola a. Streatfeild, *C. J.* 51, 113; Meldola a. Salmon, *C. J.* 53, 779). Golden scales.

Nitrosamine $C_6H_4(NO_2).N(NO).C_7H_7$. [108°].

Acetyl derivative [109°].

Benzoyl derivative $C_6H_4(NO_2).NBz.CH_2Ph$. [194°]. Needles.

p-**Nitro-di-benzyl-aniline** $C_6H_4(NO_2).N(CH_2.C_6H_5)_2$. [130°]. Formed by nitration of di-benzyl-aniline dissolved in acetic acid. Yellow needles. Sol. hot alcohol and acetic acid, sl. sol. cold alcohol, v. sol. ether and benzene (Matzudaira, *B.* 20, 1613).

NITRO-BENZYL-BENZENE *v.* NITRO-DI-PHENYL-METHANE.

Di-*m*-nitro-di-benzyl-benzene $C_{20}H_{16}N_2O_4$ *i.e.* $C_6H_4(CH_2.C_6H_4NO_2)_2$. [165°]. Formed by the action of H_2SO_4 on a mixture of *m*-nitro-di-phenyl-methane and *m*-nitro-benzyl alcohol (Becker, *B.* 15, 2091).

Di-*p*-nitro-di-benzyl-benzene $C_6H_4(NO_2).CH_2.C_6H_4.CH_2.C_6H_4(NO_2)$. [c. 146°]. Formed as a by-product in the preparation of *p*-nitro-di-phenyl-methane by the action of H_2SO_4 on a mixture of *p*-nitro-benzyl alcohol and benzene (Basler, *B.* 16, 2716). Small white concentric needles. Sol. benzene and hot acetic acid, v. sl. sol. other solvents.

m-**NITRO-BENZYL BROMIDE** $C_7H_6Br.NO_2$ *i.e.* $C_6H_4(NO_2).CH_2Br$. [58°]. Formed by heating *m*-nitro-toluene with bromine at 130° (Wachendorff, *A.* 185, 266).

p-**Nitro-benzyl bromide** [100°]. Formed from *p*-nitro-toluene and Br (W.). Needles.

p-**NITRO-BENZYL-CARBAMIC ETHER** $C_6H_4(NO_2).CH_2.NH.CO_2Et$. [117°]. Formed from *p*-nitro-benzylamine and $ClCO_2Et$ (Hafner, *B.* 23, 340). Silky needles, v. sol. ether.

o-NITRO-BENZYL CHLORIDE $C_7H_6ClNO_2$ *i.e.* $C_6H_4(NO_2).CH_2Cl$. [49°]. Formed, together with the *p*-isomeride, by nitration of benzyl chloride in the cold (Beilstein a. Geitner, *A.* 139, 337; Abelli, *G.* 13, 97; Nölting, *B.* 17, 385; Kumpf (*A.* 224, 100). Formed also by treating o-nitro-benzyl alcohol with PCl_5 in the cold (Gabriel a. Borgmann, *B.* 16, 2066; Geigy a. Königs, *B.* 18, 2401). Thick crystals. Reduced by $SnCl_2$ to o-'benzylene-imide' C_7H_7N, an amorphous base (Lellmann a. Stickel, *B.* 19, 1611). Aniline yields oily $C_6H_4(NO_2).CH_2NHPh$ reduced by zinc-dust in HOAc to the amido-compound $C_6H_4(NH_2).CH_2.NHPh$ [82°] (Söderbaum a. Widman, *B.* 23, 2193).

m-**Nitro-benzyl-chloride** $C_6H_4(NO_2).CH_2Cl$. [47°]. (c. 178° at 35 mm.). Long yellow needles, V. sol. alcohol, ether, and benzene. Formed by the action of PCl_5 on the alcohol (Gabriel a. Borgmann, *B.* 16, 2064).

p-**Nitro-benzyl chloride** [4:1] $C_6H_4(NO_2).CH_2Cl$. [71°]. Formed by treating benzyl chloride with HNO_3 (S.G. 1·48) at −10° (Elbs a. Bauer, *J. pr.* [2] 34, 343; *cf.* Beilstein a. Geitner, *A.* 139, 337; Strakosch, *B.* 6, 1056; Grimaux, *Bl.* [2] 8, 433). Formed also by passing chlorine into *p*-nitro-toluene at 190° (Wachendorff, *B.* 8, 1101; *A.* 185, 271). Crystals.

Reactions.—1. *Ammonium sulphide* gives *p*-nitro-benzyl mercaptan (Strakosch, *B.* 5, 697). 2. *Alcoholic potash* gives an azo- derivative of di-nitro-stilbene.—3. An alkaline solution of SnO forms *p*-dinitro-dibenzyl (W. Roser, *A.* 238, 363).—4. *Chromic acid mixture* oxidises it to *p*-nitro-benzoic acid.—5. A solution of $SnCl_2$ in HClAq reduces it to *p*-'benzylene-imide' C_7H_7N, an amorphous base (L. a. S.).

NITRO-BENZYL CYANIDE *v.* *Nitrile* of NITRO-PHENYL-ACETIC ACID.

o-NITRO-BENZYL-ETHYL-MALONIC ETHER $C_{16}H_{21}NO_6$ *i.e.* $C_6H_4(NO_2).CH_2.CEt(CO_2Et)_2$. Formed from ethyl-malonic ether, NaOEt, and o-nitro-benzyl chloride (Lellmann a. Schleich, *B.* 20, 440). Reduced by zinc and HOAc to $C_{14}H_{17}NO_3$ [114°].

p-**Nitro-benzyl-ethyl-malonic ether** [52°]. Formed in like manner. Needles.

o-NITRO-BENZYL ETHYL OXIDE $C_6H_4(NO_2).O.C_2H_5$. Formed by heating *o*-nitro-benzyl chloride with alcohol in a boiling brine-bath (Errera, *G.* 18, 232). Oil.

m-**Nitro-benzyl ethyl oxide.** Prepared by heating *m*-nitro-benzyl chloride with alcoholic potash (E.). Oil, solidifying in a freezing mixture.

p-**Nitro-benzyl ethyl oxide** [24°]. Prepared by heating *p*-nitro-benzyl chloride with alcohol (E.). Trimetric crystals.

NITRO-BENZYLIDENE-ACETONE *v.* NITRO-STYRYL METHYL KETONE.

NITRO-BENZYLIDENE-ACETONAMINE *v.* ACETONAMINE.

m-**DI-NITRO-DI-BENZYLIDENE-DI-AMIDO-DIPHENYL** $C_6H_4(NO_2).CH:N.C_6H_4.C_6H_4.N:CH.C_6H_4(NO_2)$. Formed by heating *op*-di-amido-diphenyl with *m*-nitro-benzoic aldehyde and alcohol at 100° (Reuland, *B.* 22, 3011). Yellow crystalline powder, m. sol. alcohol. The isomeric compound from *p*-nitro-benzoic aldehyde and *op*-di-amido-diphenyl melts at 208°, while that from di-*p*-amido-diphenyl and *m*-nitro-benzoic aldehyde melts at 234° (Schiff a. Vanni, *A.* 258, 375).

m-**NITRO-BENZYLIDENE-ANILINE** $C_{13}H_{16}N_2O_2$ *i.e.* [3:1]$C_6H_4(NO_2).CH:NPh$. [61°]. Formed from *m*-nitro-benzoic aldehyde and aniline (Lazorenko, *J.* 1870, 760). Needles.

p-**Nitro-benzylidene-aniline** [4:1]$C_6H_4(NO_2).CH:NPh$. [93°]. Formed by heating aniline with *p*-nitro-benzoic aldehyde at 100° (Fischer, *B.* 14, 2524).

Di-*m*-nitro-benzylidene-aniline [3:1]$C_6H_4(NO_2).CH:N.C_6H_4(NO_2)$ [1:3]. [153°]. Formed by warming the alcoholic solution of *m*-nitro-benzoic aldehyde with *m*-nitro-aniline (Hantzsch, *B.* 23, 2775).

m-**NITRO-BENZYLIDENE BROMIDE** $C_6H_4(NO_2).CHBr_2$[1:3]. [102°]. Formed by heating *m*-nitro-toluene (1 mol.) with bromine (2 mols.) at 140° (Wachendorff, *A.* 185, 278). Minute needles (from alcohol).

p-**Nitro-benzylidene bromide** $C_6H_4(NO_2).CHBr_2[1:4]$. [82°]. Formed by heating *p*-nitro-toluene (1 mol.) with bromine (2 mols.) at 140° (W.). Needles or rectangular plates (from alcohol). By heating with aniline it yields *p*-rosaniline (Zimmermann a. Müller, *B.* 17, 2936).

m-**NITRO-BENZYLIDENE CHLORIDE** $C_6H_4(NO_2).CHCl_2$. [65°]. Formed from *m*-nitro-benzoic aldehyde and PCl_5 (Widmann, *B.* 13, 676; Erlich, *B.* 15, 2010). Thin monoclinic plates or needles (from alcohol); v. sol. ether.

p-**Nitro-benzylidene chloride** $C_6H_4(NO_2).CHCl_2$. [46°]. Formed from *p*-nitro-benzoic aldehyde and PCl_5 (Zimmermann a. Müller, *B.* 17, 2937; 18, 997), and by nitration of benzylidene chloride (Hübner a. Beute, *B.* 6, 803). Prisms (from alcohol). Yields *p*-rosaniline on heating with aniline.

o-**NITRO-BENZYLIDENE-HYDRAZINE** $(C_6H_4(NO_2).CH)_2N_2$. [181°]. Formed from *o*-nitrobenzoic aldehyde and hydrazine salts (Curtius a. Jay, *J. pr.* [2] 39, 43). Yellow needles.

p-**NITRO-BENZYLIDENE-INDOXYL** *v. Indogenide* of *p*-NITRO-BENZOIC ALDEHYDE.

o-**NITRO-BENZYLIDENE MALONIC ACID** $C_{10}H_7NO_6$ *i.e.* $[2:1]C_6H_4(NO_2).CH:C(CO_2H)_2$. [161°]. Formed by heating *o*-nitro-benzoic aldehyde with malonic acid and HOAc at 60° (Stuart, *C. J.* 47, 158; 49, 365). Needles (from water), v. sol. ether, v. e. sol. ether, sl. sol. $CHCl_3$. With HBr it yields a yellow compound melting at 227°. Boiling water decomposes it slowly, forming *o*-nitro-benzoic aldehyde, malonic acid, and a little *o*-nitro-cinnamic acid. — $BaA''\,2\frac{1}{2}aq$: feathery tufts, converted by warm water into insoluble $BaA''aq$.—Ag_2A''.

Ethyl ether Et_2A''. [53°].

m-**Nitro-benzylidene-malonic acid** $[3:1]C_6H_4(NO_2).CH:C(CO_2H)_2$. [205°]. Formed from *m*-nitro-benzoic aldehyde, malonic acid, and HOAc (Stuart, *C. J.* 47, 155; 49, 361). Crystals, sl. sol. cold water and ether. Partially decomposed by hot water into *m*-nitro-benzoic aldehyde and malonic acid. Split up on fusion into CO_2 and *m*-nitro-cinnamic acid [196°]. HBr forms $C_6H_4(NO_2).CHBr.CH(CO_2H)_2$. Bromine combines with it, yielding the dibromide $C_6H_4(NO_2).CHBr.CBr(CO_2H)_2$.

Ethyl ether Et_2A''. [73°].

p-**Nitro-benzylidene-malonic acid** $C_6H_4(NO_2).CH:C(CO_2H)_2$. [227°]. Formed from *p*-nitro-benzoic aldehyde, malonic acid, and HOAc at 60° (Stuart, *C. J.* 43, 408). Formed also, together with a small quantity of the *ortho*-acid from benzylidene-malonic ether by nitration and saponification (Stuart, *C. J.* 47, 155). Crystals, split up on fusion into CO_2 and *p*-nitro-cinnamic acid. Decomposed by hot water into *p*-nitro-benzoic aldehyde and malonic acid. Bromine forms $C_6H_4(NO_2).CHBr.CBr(CO_2H)_2$ which gives off HBr at 100°, leaving a residue [188°], and is decomposed by water yielding $C_6H_4(NO_2)CH:CBr.CO_2H$ [208°].

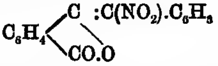
Ethyl ether Et_2A''. [93°]. Prisms. Converted by HBr into $C_6H_4(NO_2)CHBr.CH(CO_2H)_2$ [89°] (Stuart, *C. J.* 49, 362).

m-**NITRO-BENZYLIDENE DI-METHYL DISULPHONE** $C_9H_{11}NS_2O_6$ *i.e.* $[1:3]C_6H_4(NO_2).CH(SO_2CH_3)_2$. [179°]. Formed by oxidising *m*-nitro-benzylidene-di-thio-di-glycollic acid (Bongartz, *B.* 21, 487). Slender needles (from dilute HOAc).

p-**Nitro-benzylidene di-methyl disulphone** $[1:4]C_6H_4(NO_2).CH(SO_2CH_3)_2$. [248°]. Formed by oxidising *p*-nitro-benzylidene-di-thio-di-glycollic acid with $KMnO_4$ (B.). Yellowish needles (from hot water).

NITRO-BENZYLIDENE-PHTHALIDE

$C_{15}H_9NO_4$ *i.e.*



Preparation.—10 pts. of crude di-nitro-benzyl-phthalide are dissolved in 20 pts. of hot alcohol, diluted with 10 pts. of hot water, and heated for half an hour on the water-bath; the yield is 46 p.c. of theoretical, but when pure di-nitro- compound is used, nearly 100 p.c. (Gabriel, *B.* 18, 1251, 3471).

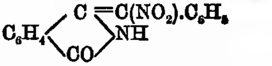
Properties.—Glistening crystals. Split up on dry distillation into phenyl cyanate and phthalic anhydride. Alcoholic NaOH converts it into the salt $C_{15}H_9NO_5Na_2\,2\frac{1}{2}aq$ which crystallises in colourless prisms and is decomposed by acids into ω-nitro-toluene $C_6H_5.CH_2(NO_2)$ and phthalic anhydride. Reduced by HI and P to isobenzylidene-phthalide

$$C_6H_4\left\langle\begin{matrix}CH:CPh\\CO.O\end{matrix}\right.$$

[91°] and a compound $C_{15}H_{11}NO_2$ [257°] whence KOH and MeI yield two isomeric bodies $C_{16}H_{13}NO_2$ melting at 237° and 121° (Gabriel, *B.* 20, 2863).

NITRO-BENZYLIDENE-PHTHALIMIDINE

$C_{15}H_{10}N_2O_3$ *i.e.*



Phthalimidyl-nitro-benzyl. Formed together with oxy-nitro-benzyl-phthalimidine by leading N_2O_3 or N_2O_4 into a benzene solution of benzal-phthalimidine or of deoxybenzoïn-*o*-carboxylamide $C_6H_4(CO.NH_2).CO.CH_2.C_6H_5$ (Gabriel, *B.* 18, 2439).

Nitro-benzylidene-phthalimidic acid $C_{15}H_{12}N_2O_4$ *i.e.* $C_6H_4(CO_2H).C(NH_2):C(NO_2).C_6H_5$ [145°-150°]. Formed by dissolving nitro-benzylidene-phthalimidine in hot dilute NaOH and precipitating with an acid (Gabriel, *B.* 18, 2440). Acetyl chloride reconverts it into the anhydride. Nitrous acid passed into the solution in benzene converts it into nitro-benzylidene-phthalide.

Salts.—A'Ag: microcrystalline powder.—$A'_2Ba\,7aq$: long yellow needles or short prisms.

Ethyl ether A'Et: [155°]; yellow crystals.

Nitro-iso-benzylidene-phthalimidine *v.* (*Py.* 1:4:2)-NITRO-OXY-PHENYL-ISOQUINOLINE.

NITRO-BENZYLIDENE-DI-THIO-DI-GLYCOLLIC ACID $C_{11}H_{11}NS_2O_6$ *i.e.* $C_6H_4(NO_2).CH(S.CH_2.CO_2H)_2$. The *o*-, *m*-, and *p*- varieties of this acid are formed by the action of thioglycollic acid on the three nitro-benzoic aldehydes (Bongartz, *B.* 21, 479).

o-**Acid** [123°]. Needles (from HOAc).

m-**Acid** [130°]. Needles (from dil. HOAc).

p-**Acid** [162°]. Needles (from dil. HOAc).

o-**NITRO-BENZYLIDENE-DI-UREA** $C_8H_{11}N_5O_4$ *i.e.* $C_6H_4(NO_2).CH(NH.CO.NH_2)_2$. [200°]. Formed by warming an alcoholic solution of urea with *o*-nitro-benzoic aldehyde (Schiff, *A.* 251, 186; Lüdy, *M.* 10, 304). Needles (containing aq), sl. sol. water and alcohol.

o-**NITRO-BENZYL IODIDE** $C_6H_4(NO_2).CH_2I$ [75°]. Formed from *o*-nitro-benzyl chloride, KI, and alcohol (Kumpf, *A.* 224, 103). Plates.

p-Nitro-benzyl iodide $C_6H_4(NO_2).CH_2I$. [127°]. Formed in like manner. Needles.

p-**NITRO-BENZYL-MALONIC ACID** $C_6H_4(NO_2).CH_2.CH(CO_2H)_2$. Formed by saponification of the ether which is obtained in small quantity, together with di-nitro-di-benzyl-malonic ether, by the action of *p*-nitro-benzyl chloride upon sodio-malonic ether (Lellmann a. Schleich, *B.* 20, 434). Yellow powder. Carbonises at 240° without melting. CaA″ and BaA″: yellow pps.

Ethyl ether Et_2A'': [63°]; yellowish prisms; sol. ordinary solvents.

Di-*o*-nitro-di-benzyl-malonic ether $(C_6H_4(NO_2).CH_2)_2:C(CO_2Et)_2$. [97°]. Obtained by the action of *o*-nitro-benzyl chloride upon sodio-malonic ether. Yellow crystals. Sol. alcohol and ether (Lellmann a. Schleich, *B.* 20, 438).

Di-*p*-nitro-di-benzyl-malonic ether $(C_6H_4(NO_2).CH_2)_2:C(CO_2Et)_2$. [170°]. Formed by the action of *p*-nitro-benzyl chloride upon sodio-malonic ether. Colourless silky needles. Sol. acetic acid, sl. sol. alcohol, and chloroform.

p-**NITRO-BENZYL MERCAPTAN** $C_7H_7NSO_2$ *i.e.* $C_6H_4(NO_2).CH_2SH$. [140°]. Formed from *p*-nitro-benzyl chloride and alcoholic ammonium sulphide (Strakosch, *B.* 5, 698). Laminæ.

TRI-NITRO-BENZYL-MESITYLENE $C_{16}H_{15}(NO_2)_3$. [185°]. Formed by nitration of benzyl-mesitylene at 0° (Louise, *A. Ch.* [6] 6, 182). Prisms (from alcohol-chloroform).

TRI-NITRO-BENZYL METHYL KETONE $C_6H_2(NO_2)_3CH_2.CO.CH_3$. [89°]. Obtained by boiling tri-nitro-phenyl-acetoacetic ether (10 g.) dissolved in HOAc (100 g.) with H_2SO_4 (20 g.) and water (30 g.) for 8 hours (Dittrich, *B.* 23, 2723). Long yellowish-white needles, sol. alkalis.

Phenyl-hydrazide $C_{15}H_{13}N_5O_6$. [125°].

NITRO-*p*-BENZYL-PHENOL $C_{13}H_{11}NO_3$ *i.e.* $Ph.CH_2.C_6H_3(NO_2)OH$ [1:3:4]. [75°]. From benzyl-phenol and HNO_3 (S.G. 1·4). Prisms. Volatile with steam.—KA′: brick-red needles (Rennie, *C. J.* 41, 221).

Di-nitro-*p*-benzyl-phenol $Ph.CH_2.C_6H_2(NO_2)_2OH$ [1:3:5?:4]. [88°]. From the above, HOAc, and HNO_3. Formed also by the action of HNO_3 on *p*-benzyl-phenol sulphonic acid (Rennie, *C. J.* 49, 408). Oxidised by CrO_3 it gives benzoic acid.—KA′; orange needles.—BaA'_2.

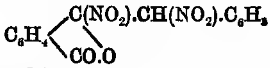
Di-nitro-*o*-benzyl-phenol [82°]. Obtained by warming *o*-benzyl-phenol sulphonic acid with dilute HNO_2 (Rennie).—KA′aq.—BaA'_2.

Tri-nitro-benzyl-phenol $C_{13}H_8(NO_3)_3OH$. [148°]. Got by dissolving potassic benzyl-phenol sulphonic acid in HNO_2 (S.G. 1·4) and evaporating (Rennie, *C. J.* 41, 36, 223). Silky pale-yellow needles. Yields *p*-nitro-benzoic acid on oxidation with chromic acid mixture.—$C_{13}H_8(NO_2)_3OK$.

NITRO-*p*-BENZYL-PHENOL SULPHONIC ACID ×$C_7H_7.C_6H_2(OH)(NO_2)SO_3H$.—KA′. Formed by action of HNO_3 (S.G. 1·2) and potassic benzyl-phenol sulphonate (Rennie, *C. J.* 41, 35).

Nitro-*o*-benzyl-phenol sulphonic acid. Formed in like manner.—KA: yellow scales.

DI-NITRO BENZYL-PHTHALIDE $C_{15}H_{10}N_2O_6$ *i.e.*



$C_6H_4\begin{cases}C(NO_2).CH(NO_2).C_6H_5 \\ CO.O\end{cases}$ (?). [113°].

Formed by passing nitrous acid gas into a solution of benzylidene-phthalide in benzene (Gabriel, *B.* 18, 1251). Colourless crystals. Readily converted into nitro-benzylidene-phthalide (*q. v.*).

o-**NITRO-BENZYL-PHTHALIMIDE**

$C_6H_4\begin{matrix}CO \\ CO\end{matrix}N.CH_2.C_6H_4(NO_2)$ [1:2]. [219°].

Formed from potassium phthalimide and *o*-nitro-benzyl chloride at 100°–130° (Gabriel, *B.* 20, 2227). Prisms.

m-Nitro-benzyl-phthalimide. [155°]. Formed in like manner. Needles.

p-Nitro-benzyl-phthalimide. [175°] (S.); [172°] (Hafner, *C. C.* 1889, 671). Prisms (from HOAc) (Salkowski, *B.* 22, 2142).

p-**NITRO-BENZYL-PIPERIDEÏN** $C_6H_4(NO_2).CH_2.NC_5H_8$. [35°–40°]. Formed by dissolving its polymeride in HClAq and ppg. by ammonia (Lellmann a. Schwaderer, *B.* 22, 1333). Readily polymerises to $(C_6H_4(NO_2).CH_2.NC_5H_8)_2$ [120·5°], which is also obtained by treating di-piperideïn with *p*-nitro-benzyl chloride and NaOHAq.

NITRO-BENZYL-PIPERIDINE $C_6H_4(NO_2).CH_2NC_5H_{10}$. The o-, *m*-, and *p*-isomerides are formed by the action of *o*-, *m*-, and *p*- nitro-benzyl chloride on piperidine in hot alcoholic solution (Lellmann a. Pekrun, *A.* 259, 40).

o-Isomeride. Oil. Reduced by $SnCl_2$ to *o*-amido-benzyl-piperidine [82·5°]. — B′HCl. — $B'_2H_2PtCl_6$.

m-Isomeride. Oil. Reduced by $SnCl_2$ to *m*-amido-benzyl-piperidine [112°].—B′HCl.

p-Isomeride. [34°]. B′HCl.—$B'_2H_2PtCl_6$.

NITRO-BENZYL-QUINOLINE TETRA-HYDRIDE $C_6H_4(NO_2).CH_2NC_9H_{10}$. The three isomerides are formed by heating *o*-, *m*-, and *p*-nitro-benzyl chloride (1 mol.) with quinoline tetrahydride (2 mols.) in hot alcoholic solution (Lellmann a. Pekrun, *A.* 259, 50).

o-Isomeride. [111°]. Brownish-red tables.—$B'_2H_2PtCl_6$: yellow amorphous pp.

m-Isomeride. [99°]. Red prisms; reduced by $SnCl_2$ to *m*-amido-benzyl-quinoline tetrahydride [82°].

p-Isomeride. [102°]. Red prisms. — $B'_2H_2PtCl_6$.

NITRO-BENZYL SELENOCYANIDE $C_8H_6N_2SeO_2$ *i.e.* $C_6H_4(NO_2).CH_2SeCN$. [122·5°]. Formed by nitration of benzyl selenocyanide at −4° (C. L. Jackson, *B.* 8, 321; *A.* 179, 16). Needles (from alcohol).

o-**NITRO-BENZYL SULPHIDE** $(C_6H_4(NO_2).CH_2)_2S$. [124°]. Formed, together with a little of the disulphide, by passing NH_3 and H_2S into an alcoholic solution of *o*-nitro-benzyl chloride (Jahoda, *M.* 10, 880). White plates. Yields on oxidation by HNO_3 the sulphoxide $(C_6H_4(NO_2).CH_2)_2SO$ [163°] and the sulphone $(C_6H_4(NO_2).CH_2)_2SO_2$ [200°].

o-Nitro-benzyl disulphide $(C_6H_4(NO_2).CH_2)_2S_2$. [47°]. Formed as above (J.).

p-Nitro-benzyl disulphide [89°]. Yellow crystals (Strakosch, *B.* 5, 698).

p-**NITRO-BENZYL SULPHOCYANIDE** $C_6H_4(NO_2).CH_2.SCN$. Formed from *p*-nitro-benzyl chloride and alcoholic potassium sulphocyanide (Henry, *B.* 2, 638). Small needles.

p-**NITRO-BENZYL-DI-THIO-CARBAMIC ACID** $NO_2.C_6H_4.CH_2.NH.CS.SH$. The *p*-nitro-benzyl ammonium salt [193°] of this acid is formed by treating *p*-nitro-benzylamine with CS_2 in ether (Hafner, *B.* 23, 339).

DI-*p*-NITRO-DI-BENZYL-THIO-UREA $CS(NH.CH_2.C_6H_4.NO_2)_2$. [202°]. Formed by boiling *p*-nitro-benzyl-ammonium *p*-nitro-benzyl-di-thio-carbamate with HgO and alcohol (Hafner, *B.* 23, 340). Needles, sl. sol. alcohol.

o-NITRO-BENZYL-*p*-TOLUIDINE $C_6H_4(NO_2).CH_2.NH.C_6H_4Me$. [72°]. Obtained by heating 4 pts. of *p*-toluidine with 1 pt. of o-nitro-benzyl chloride for ½ hr. on the water-bath. Yellow crystals. V. sol. most ordinary solvents.

Salts. — B'HCl: colourless needles. — $B'_2H_2PtCl_6$* : sparingly soluble pp.—$B'_2H_2SO_4$* : thin glistening plates.

Acetyl derivative $C_6H_4(NO_2).CH_2.NAcC_6H_4Me$: [65°]; stout crystals; on reduction with tin and HCl it is converted into o-amido-benzyl-toluidine. [79°]. (Lellmann a. Stickel, *B.* 19, 1609; 24, 718).

Formyl derivative [79°]. Formed by heating a solution of formyl-*p*-toluidine in benzene with sodium till dissolved, and then adding *p*-nitro-benzyl chloride (Paal a. Busch, *B.* 22, 2695). Needles.

o-Nitro-benzyl-*o*-toluidine. *Formyl derivative* $C_6H_4(NO_3).CH_2.N(C_7H_7).CHO$. [76°]. Formed from *o*-nitro-benzyl chloride and sodium formyl-*o*-toluidine (Paal a. Busch, *B.* 22, 2701). Yellow needles grouped in spherules.

p-**NITRO-BENZYL-UREA** $C_8H_9N_3O_3$ *i.e.* $NH_2.CO.NH.CH_2.C_6H_4NO_2$. [197°]. Formed by heating *p*-nitro-benzylamine hydrochloride with silver cyanate at 100° (Hafner, *B.* 23, 339). Pale-yellow needles, v. sol. HOAc and alcohol.

DI-*p*-NITRO-DI-BENZYL-UREA $CO(NH.CH_2.C_6H_4NO_2)_2$. [234°]. Formed by boiling the corresponding thio-urea with HgO; or by adding a solution of $COCl_2$ in benzene to one of *p*-nitro-benzylamine in ether (Hafner, *B.* 23, 340). Silvery needles (from HOAc).

NITRO-BROMO- compounds *v.* Bromo-nitro-compounds.

NITRO-BRUCINE *v.* Brucine.

ω-NITRO-*n*-BUTANE $C_4H_9NO_2$ *i.e.* $CH_3.CH_2.CH_2.CH_2.NO_3$. (152° cor.). S.G. $\frac{0}{}$ ·9945. Formed from *n*-butyl iodide and $AgNO_2$ (Züblin, *B.* 10, 2083; Pribram a. Handl, *M.* 2, 656). Reduced by tin and HCl to butylamine. HClAq at 140° forms hydroxylamine and *n*-butyric acid.

β-Nitro-butane $CH_3.CH_2.CH(NO_2).CH_3$. (138°). Formed from *sec*-butyl iodide (120 pts.) and silver nitrite (150 pts.) (V. Meyer a. Locher, *B.* 7, 1506; *A.* 180, 134). Formed also from $CH_3.CHBrNO_2$ and $ZnEt_2$ (Bevad, *J. R.* 20, 125).

ω-Nitro-isobutane $(CH_3)_2CH.CH_2NO_2$. (137°–144°). S.G. $\frac{0}{}$ 1·0083. Formed from *sec*-isobutyl iodide and $AgNO_2$ (Demole, *B.* 7, 709, 790; *A.* 175, 142; P. a. H.). Unlike ω-nitro-*n*-butane, it does not give a crystalline pp. with NaOEt, although it dissolves in alkalis.

Nitro-*tert*-butane $(CH_3)_3CNO_2$. (110°–130°). Formed, in small quantity, together with *tert*-butyl nitrite, by the action of $AgNO_2$ on *tert*-butyl iodide (Tscherniak, *A.* 180, 155). Oil, smelling like peppermint. Does not dissolve in alkalis. May be reduced to *tert*-butylamine (*cf.* V. Meyer, *A.* 244, 222).

Di-nitro-butane $C_4H_8N_2O_4$. Formed from bromo-ω-nitro-*n*-butane, aqueous KNO_2 and dilute H_2SO_4 (Züblin, *B.* 10, 2085). Oil, decomposed at 190° by distillation.—$KC_4H_7N_2O_4$: golden scales, sol. water and alcohol. — $AgC_4H_7N_2O_4$: yellow scales with blue reflex.

Di-nitro-butane $C_4H_8(NO_2)_2$. (197°). S.G. $\frac{18}{0}$ 1·205. Formed by the action of HNO_3 on di-isoamyl ketone or on propyl-acetoacetic ether (Chancel, *C. R.* 94, 399; 96, 1466). Heavy oil, forming crystalline K and Ag salts. Decomposed on distillation.

Di-(β)-nitro-butane $CH_3.CH_2.C(NO_2)_2.CH_3$. (199° cor.). Formed by oxidising butyl-ψ-nitrole with nitric acid (V. Meyer, *B.* 9, 701), or by boiling isovaleric acid with HNO_3 (Bredt, *B.* 15, 2324). Oil, not soluble in alkalis. Tin and HCl convert it into hydroxylamine and methyl ethyl ketone.

Di-nitro-isobutane $(CH_3)_2CH.CH(NO_2)_2$. Formed from bromo-nitro-isobutane, KNO_2, and dilute H_2SO_4 (Z.). Oil. — $KC_4H_7(NO_2)_2$. — $AgC_4H_7(NO_2)_2\frac{1}{2}$aq.

DI-NITRO-ISOBUTYL-ANILINE $C_{10}H_{16}N_3O_4$ *i.e.* $C_4H_9NH.C_6H_3(NO_2)_2$. [80°]. Formed from bromo-*m*-di-nitro-benzene and isobutylamine (Romburgh, *R. T. C.* 4, 192). Yellow needles.

Tri-nitro-isobutyl-aniline $C_6H_2(NO_2)_3NHC_4H_9$. [95°]. Formed from chloro-tri-nitro-benzene (picryl chloride) and isobutylamine (R.). Converted by fuming HNO_3 into the nitramine $C_6H_2(NO_2)_3N(NO_2)C_4H_9$ [110°].

m-**NITRO-ISOBUTYL-BENZENE** $C_{10}H_{13}NO_2$ *i.e.* $C_6H_4(NO_2).C_4H_9$. (251°) at 740 mm. Formed from nitro-amido-isobutyl-benzene by elimination of NH_2 (Gelzer, *B.* 21, 2941). Oil. Yields *m*-nitro-benzoic acid on oxidation.

o-Nitro-*tert*-butyl-benzene $C_6H_4(NO_2).CMe_3$ [1:2]. (249°). S.G. $\frac{18}{}$ 1·074. Formed from *tert*-butyl-benzene and fuming HNO_3 (Senkowsky, *B.* 23, 2416). Yellow oil, Smelling like cymene. Reduced by tin and HCl to $C_6H_4(NH_2).CMe_3$, (c. 235°), S.G. $\frac{18}{}$ ·977, which yields an acetyl derivative [159°].

p-Nitro-*tert*-butyl-benzene $C_6H_4(NO_3).CMe_3$ [1:4]. [30°]. (276°). Formed at the same time as the preceding (S.). Yellow needles (from alcohol). Yields, on reduction, $C_6H_4(NH_2).CMe_3$ S.G. $\frac{15}{}$ ·953.

NITRO-*m*-ISOBUTYL-BENZOIC ACID $C_6H_3(C_4H_9)(NO_2)CO_2H$. [140°]. Formed by nitration of *m*-isobutyl-benzoic acid (Kelbe a. Pfeiffer, *B.* 19, 1727). Small needles (from petroleum-ether).—AgA': somewhat soluble pp.—MeA': liquid.

Nitro-*p*-isobutyl-benzoic acid $C_6H_3(C_4H_9)(NO_2)CO_2H$. [161°]. Long fine needles (from water). Formed by nitration of *p*-isobutyl-benzoic acid.—AgA': white pp.

Methyl ether MeA': fluid (Kelbe a. Pfeiffer, *B.* 19, 1726).

NITRO-BUTYLENE $C_4H_7NO_2$. (154°–158°). Formed by allowing HNO_3 (S.G. 1·52) to drop into *tert*-butyl alcohol (Haitinger, *Sitz. W.* 77 [2] 428; *A.* 193, 366; *M.* 2, 286). Formed also in small quantity by saturating HNO_3 with isobutylene (H.). Pale-yellow oil, heavier than water. Dissolves in alkalis, and is reppd. by acids. Excess of water at 100° splits it up into acetone and nitro-methane. Br unites, forming oily $C_4H_7Br_2NO_2$.—$NaC_4H_6NO_2$: powder, v. sol. water.

NITRO-ISOBUTYL-PHENOL $C_4H_9.C_6H_3(NO_2)(OH)$ [1:3:4]. [95°]. (290°) at 711 mm. Formed by boiling nitro-amido-isobutyl-benzene with dilute potash (Gelzer, *B.* 21, 2947). Red needles (from alcohol), v. sol. hot water.

Di-nitro-isobutyl-phenol $C_4H_9.C_6H_2(NO_2)_2OH$. [93°]. Formed from isobutyl-phenol [99°], HOAc, and HNO_3 (Studer, *A.* 211, 244; *B.* 14, 1474; Liebmann, *B.* 14, 1842). Sulphur-yellow needles (from alcohol). Yields di-nitro-amido-isobutyl-benzene on heating with NH_3Aq.

TRI-NITRO-ISOBUTYL-TOLUENE $C_6HMe(C_4H_9)(NO_2)_3$. *Artificial musk.* [97°]. Formed by heating isobutyl-toluene with HNO_3 and H_2SO_4 for 24 hours on a water-bath (Baur, *C. R.* 111, 238). White needles, sol. alcohol and ether. Its solutions smell like musk. Forms a crystalline compound with naphthalene [90°].

TRI-NITRO-ISOBUTYL-XYLENE $C_6Me_2(C_4H_9)(NO_2)_3$. [110°]. Formed by nitration of isobutyl-xylene (Baur, *C. R.* 111, 238). White needles. Its alcoholic solution smells like musk.

NITRO-CAMPHOLENIC ACID *v.* CAMPHOLENIC ACID.

NITRO-CAMPHOR *v.* CAMPHOR.

TETRA-NITRO-CARBAZOLE $C_{12}H_5(NO_2)_4NH$. Formed by nitrating carbazole (Graebe, *A.* 202, 26). Lemon-yellow crystals (from HOAc), insoluble in alcohol and ether.—$C_{12}H_5(NO_2)_4NK$: insol. water.

Four tetra-nitro-carbazoles have been described by Ciamician and Silber (*G.* 12, 277) as formed by the nitration of carbazole. The melting-points of three of them are 308°, above 320°, and about 285°, while the fourth decomposes before melting.

NITRO-CARBOXY-CINNAMIC ACID $C_6H_3(CH{:}CH.CO_2H)(NO_2)(CO_2H)$[1:2:4]. [287°] (Löw, *A.* 231, 371). Formed by nitrating carboxy-cinnamic acid. Hemispherical aggregates or regular tablets (from water). That the NO_2 is in the o- position is shown by the fact that, by Baeyer's synthesis, it gives rise to indigo dicarboxylic acid. Heated with conc. H_2SO_4 it does not turn blue. It yields a dibromide, which is converted by aqueous NaOH into nitro-carboxy-phenyl-propiolic acid.

NITRO-CARBOXY-PHENYL-PROPIONIC ACID $C_6H_3(NO_2)(CO_2H)CH{:}CH.CO_2H$ [3:1:4]? [192°]. Got by nitration (Widman, *B.* 22, 2273).

NITRO-CARVACROL $C_{10}H_{13}NO_3$ *i.e.* $C_6H_2(C_3H_7)Me(NO_2)(OH)$. [78°]. Formed from nitroso-carvacrol, KOH, and K_3FeCy_6 (Paterno a. Canzoneri, *G.* 10, 233). Needles, almost insol. water.

NITRO-CHLORO-derivatives *v.* CHLORO-NITRO-derivatives.

NITRO-CHLOROFORM *v.* TRI-CHLORO-NITRO-METHANE.

DI-NITRO-CHOLESTERIN $C_{26}H_{42}(NO_2)_2O$. [121°]. Obtained by nitration of cholesterin (Preis a. Raymann, *B.* 12, 224). Colourless needles, sl. sol. cold alcohol. By boiling a hot saturated solution of cholesterin in HOAc with HNO_3 (S.G. 1·54), Reinitzer (*M.* 9, 440) obtained a nitro- compound melting at 94°. By adding cholesterin (1 pt.) to a mixture of HOAc (10 pts.) and fuming HNO_3 (3 pts.), Latschinoff (*J. R.* 10, 360) obtained a compound crystallising in plates, decomposing at 180° without melting.

NITRO-CHOLESTERYL-CHLORIDE $C_{26}H_{42}(NO_2)Cl$. [148°–149°]. Colourless needles. Prepared by nitration of cholesteryl chloride (Preis a. Raymann, *B.* 12, 225).

NITRO-CHRYSENE *v.* CHRYSENE.

NITRO-CHRYSOQUINONE *v.* CHRYSOQUINONE.

NITRO-CINCHONAMINE *v.* CINCHONA BASES.

o-NITRO-CINNAMIC ACID $C_9H_7NO_4$ *i.e.* [2:1]$C_6H_4(NO_2).CH{:}CH.CO_2H$. Mol. w. 193. [232°] (M.); [237°] (T. a. O.); [240°] (Baeyer, *B.* 13, 2257). Formed, together with the *p*-isomeride, by nitrating cinnamic acid (Beilstein a. Kuhlberg, *A.* 163, 126; Müller, *A.* 212, 124). Formed also from o-nitro-benzoic aldehyde, Ac_2O, and NaOAc (Gabriel a. Meyer, *B.* 14, 830).

Preparation.—1. Cinnamic acid (1 pt.) is dissolved in nitric acid (5 pts.); the mixture is poured upon snow, and the ppd. acids separated by means of alcohol (B. a. K.).—2. Cinnamic ether (10 g.) is dropped into fuming HNO_3 at 0°. The solution is poured at once into water at 0°. The *solid* pp. is washed with water, and treated with alcohol, which dissolves the o-, leaving the *p*- compound (Stuart, *C. J.* 43, 408). Fair yield (4 g.).—3. The product of nitration of cinnamic acid is etherified, and the o-nitro-cinnamic ether is separated from the *p*-isomeride by means of its greater solubility in ether (Tiemann a. Opermann, *B.* 13, 2060). The acid may then be obtained from its ether by hydrolysis with H_2SO_4 (Fischer a. Kuzel, *A.* 221, 265).

Properties.—Needles, insol. water, sl. sol. cold alcohol. Yields o-nitro-benzoic acid on oxidation by chromic acid mixture. Its solution in H_2SO_4 becomes blue on warming or on standing.

Salts. — CaA'_2 2aq: yellow needles. — BaA'_2 4aq: minute yellow needles.

Methyl ether MeA'. [73°].

Ethyl ether EtA'. [42°] (M.); [44°] (B.). Trimetric crystals, $a{:}b{:}c = {·}927{:}1{:}\ {·}517$. Readily combines with bromine. Reduced by aqueous ammonium sulphide to carbostyril. In hot alcoholic solution tin and HCl reduce it to o-amido-cinnamic ether.

Chloride $C_6H_4(NO_2).CH{:}CH.COCl$. [65°]. Crystalline solid (Fischer a. Kuzel, *B.* 16, 34).

m-**Nitro-cinnamic acid** [3:1]$C_6H_4(NO_2).CH{:}CH.CO_2H$. [197°]. Prepared by heating *m*-nitro-benzoic aldehyde with Ac_2O and NaOAc (Schiff, *B.* 11, 1783; Tiemann a. Opermann, *B.* 13, 2060). Yellow needles. Yields *m*-nitro-benzoic acid on oxidation. A mixture of HNO_3 (2 pts. of S.G. 1·5) and conc. H_2SO_4 (5 pts.) converts it at 0° into *ωm*-di-nitro-styrene (Friedländer a. Lazarus, *A.* 229, 233). Reduced by tin and HCl to *m*-amido-cinnamic acid.—AgA': insoluble pp.

Ethyl ether EtA'. [79°].

p-**Nitro-cinnamic acid** [4:1] $C_6H_4(NO_2).CH{:}CH.CO_2H$. [286°] (T. a. O.); [288°] (D.). Formed by nitration of cinnamic acid (Mitscherlich, *A. Ch.* [3] 4, 73; E. Kopp, *C. R.* 53, 634; Tiemann a. Opermann, *B.* 13, 2059).

Preparation.—From cinnamic acid (1 pt.) and cold HNO_3 (5 pts.). The acids produced are etherified, the *p*-ether, [139°], crystallising from alcohol. It is saponified by H_2SO_4 (1 pt.), HOAc (1 pt.), and water (1 pt.) (Drewson, *A.* 212, 150).

Properties.—Prisms, v. sl. sol. boiling alcohol. Yields *p*-oxy-benzoic acid on oxidation.

Salts.—KA′: very soluble crystals.—CaA'_2 3aq.—CaA'_2 2aq.—SrA'_2 5aq.—BaA'_2 3aq: minute needles.—MgA'_2 6aq: nodules.—HgA'_2.—$Hg_3A'_4Cl_2$ 3aq.—AgA′: insoluble pp.

Methyl ether MeA′. [161°]. (286°).

Ethyl ether EtA′. [139°] (B. a. K.); [137°] (Müller, *A.* 212, 125). Combines with bromine forming a dibromide whence alcoholic potash produces two bromo-nitro-cinnamic ethers, melting at 63° and 93°. Reduced by tin and HCl to *p*-amido-cinnamic acid and *p*-amido-styrene (Bender, *B.* 14, 2359).

Anhydride $(C_6H_4(NO_2).CH:CH.CO)_2O$. Formed from the K salt and $POCl_3$ (Chiozza, *A. Ch.* [2] 39, 231). Melts under boiling water.

Amide $C_6H_4(NO_2).CH:CH.CONH_2$. [155°–160°] (Cahours, *A. Ch.* [3] 27, 452).

α-*m*-Di-nitro-cinnamic ether $C_6H_4(NO_2).CH:C(NO_2).CO_2Et$. Formed from *m*-nitro-cinnamic ether, HNO_3 (1 pt.) and H_2SO_4 (2 pts.) below 20° (Friedländer a. Lazarus, *A.* 229, 235). Thick plates (from ether). Insol. water and light petroleum.

Reactions.—1. With alcohol, on warming, it forms $C_6H_4(NO_2).CH(OEt).CH(NO_2).CO_2Et$, a colourless oil. When this is dissolved in ether and ammonia is passed in, a pp. of $C_6H_4(NO_2).CH(OEt).C(NH_4)(NO_2).CO_2Et$ is formed. This is soluble in water and gives pps. with many metallic salts. The compound $C_6H_4(NO_2).CH(OEt).CH(NO_2).CO_2Et$ is converted by the simultaneous action of bromine and NaOH into the ethyl derivative of di-bromo-di-nitro-α-phenyl-methyl-carbinol.—2. Boiled with water it forms alcohol, nitro-methane, CO_2, and *m*-nitro-benzoic aldehyde.

ap-Di-nitro-cinnamic acid [4:1] $C_6H_4(NO_2).CH:C(NO_2).CO_2H$. Formed from *p*-nitro-cinnamic acid, HNO_3, and H_2SO_4 at −10° to −20°. White plates. At 0° it decomposes into CO_2 and *ap*-di-nitro-styrene.

Methyl ether MeA′. [127°].

Ethyl ether EtA′. [110°]. Formed from *p*-nitro-cinnamic ether (1 pt.), HNO_6 (2 pts. of S.G. 1·5), and H_2SO_4 (4 pts.) (Friedländer a. Mähly, *A.* 229, 210). Thin plates (from benzene-ligroïn), v. sol. benzene, nearly insol. ligroïn.

Reactions.—1. CrO_3 in HOAc oxidises it to *p*-nitro-benzoic acid.—2. $K_2Cr_2O_7$ and HOAc forms *p*-nitro-benzoic aldehyde.—3. Boiling water decomposes it into alcohol, CO_2, *p*-nitro-benzoic aldehyde, and nitro-methane. Boiling dilute acids behave in the same way, only the nitro-methane appears as hydroxylamine.—4. A solution in conc. H_2SO_4 at 100° poured into water gives a pp. of *p*-nitro-benzaldoxim.—5. Boiling dilute (5 p.c.) Na_2CO_3 forms bright-yellow plates of $C_{14}H_{10}N_2O_3$ [188°], insol. water, dilute acids, and alkalis.—6. *Alcohol* unites forming $C_6H_4(NO_2).CH(OEt).CH(NO_2)CO_2Et$ [52°], whence the alcohol cannot be removed by heating at 110°, or even with dilute HCl at 90°. Methyl alcohol forms the corresponding $C_6H_4(NO_2).CH(OMe).CH(NO_2).CO_2Et$ [77°].—7. Tin and HCl reduce it to *ap*-diamido-phenyl-propionic ether and *p*-amido-phenyl-acetonitrile.

o-NITRO-CINNAMIC ALDEHYDE $C_9H_7NO_3$ *i.e.* [2:1] $C_6H_4(NO_2).CH:CH.CHO$. [127°]. Formed by boiling o-nitro-oxy-phenyl-propionic aldehyde with Ac_2O (Baeyer a. Drewson, *B.* 16, 2207). Formed also by condensation of o-nitro-benzoic aldehyde with aldehyde by means of dilute NaOH, the yield being 40 p.c. of the theoretical (Diehl a. Einhorn, *B.* 20, 2335).

Preparation.—25 g. of cinnamic aldehyde are slowly added to 500 g. of conc. H_2SO_4 containing 20 g. of KNO_3. The solution is precipitated in water, and the mixture of o- and *p*-nitro-cinnamic aldehydes is crystallised from alcohol with animal-charcoal. The product is dissolved in absolute alcohol and the boiling solution mixed with an equal volume of sodium bisulphite solution; the solution is quickly cooled and separates the greater part of the bisulphite compound of the *p*-isomeride, the remaining portion being salted out by the addition of NaCl; the filtrate contains the bisulphite of the o-isomeride. The two isomerides are obtained from their bisulphites by decomposing the latter in aqueous solution with H_2SO_4 (Diehl a. Einhorn).

Properties.—Colourless needles, v. sol. boiling water and $CHCl_3$, sl. sol. alcohol and ether. Combines with bisulphites. Yields quinoline on reduction. On heating with malonic acid in HOAc it yields $C_6H_4(NO_2).CH:CH.CH(OH).CH(CO_2H)_2$ [269°] and o-nitro-phenyl-butinene dicarboxylic acid $C_{12}H_9NO_6$ [213°] (Einhorn a. Gehrenbeck, *A.* 253, 374).

Phenyl-hydrazide $C_6H_4(NO_2).CH:CH.CH.N_2HPh$. [158°]. Needles.

Di-phenyl-hydrazide $C_6H_4(NO_2).CH:CH.CH.N_2Ph_2$. [69°]. Yellow crystals (Cornelius a. Homolka, *B.* 19, 2240).

m-Nitro-cinnamic aldehyde $C_6H_4(NO_2).CH:CH.COH$. [116°]. Formed by eliminating H_2O from *m*-nitro-β-oxy-β-phenyl-propionic aldehyde (Göhring, *B.* 18, 720). Prepared by dissolving 100 pts. of *m*-nitro-benzaldehyde in 2,000 pts. of alcohol, diluting with 4,000 pts. of water, and adding at once to the milky liquid 35 pts. of coml. acetic aldehyde and 70 pts. of 10 p.c. aqueous NaOH. After 12 hours' standing the pp. is separated, pressed, washed, and crystallised; the yield is 50 p.c. of the theoretical (Kinkelin, *B.* 18, 483). Long thin prisms, v. sol. benzene and acetic acid, sl. sol. cold alcohol, ether, and hot water. Unites with Br forming $C_6H_4(NO_2).CHBr.CHBr.CHO$ [c. 90°].

Phenyl-hydrazide $C_6H_4(NO_2).C_2H_2.CH.N_2HPh$: [160°]; red tables.

p-Nitro-cinnamic aldehyde [4:1]$C_6H_4(NO_2).CH:CH.CHO$. [142°]. Formed from *p*-nitro-benzoic aldehyde, aldehyde, and dilute NaOH, the resulting *p*-nitro-β-oxy-β-phenyl-propionic acid being boiled with HOAc (Göhring, *B.* 18, 372; Einhorn, *A.* 253, 348). Formed also, together with the o-isomeride, by nitration of cinnamic aldehyde (*v. supra*). Colourless needles. Combines with bisulphites. Condenses with acetone in presence of NaOH to $(C_6H_4(NO_2).CH:CH.CH:CH)_2CO$ [218°] and $C_6H_4(NO_2).CH:CH.CH:CH.CO.CH_3$ [132°], the last compound forming a phenyl-hydrazide melting at 210°.

Oxim $C_6H_4(NO_2).CH:CH.CH(NOH)$. [179°].

Phenyl-hydrazide $C_6H_4(NO_2).C_2H_2.CH:N_2HPh$. [181°]. Orange red crystals, forming a red solution in conc. H_2SO_4.

Anilide $C_6H_4(NO_2).C_3H_3{:}NPh$. [133°].

o-**NITRO-CINNAMOYL-ACETO-ACETIC ETHER** $C_{15}H_{13}NO_6$ *i.e.* $C_6H_4(NO_2).CH{:}CH.CO.CHAc.CO_2Et$. [120°]. Prepared by the action of o-nitro-cinnamoyl chloride on sodio-acetacetic ether (Fischer a. Kuzel, *B.* 16, 34). Yellow prisms. Sol. chloroform, sl. sol. alcohol and ether. It forms stable salts with alkalis, soluble in water with a reddish-yellow colour. Gives a dark-red colouration in alcoholic solution with Fe_2Cl_6. Boiled with 30 p.c. dilute H_2SO_4 it gives nitro-cinnamoyl-acetone.

o-**NITRO-CINNAMOYL-ACETONE** $C_6H_4(NO_2).CH{:}CH.CO.CH_2.CO.CH_3$. [113°]. Prepared by boiling o-nitro-cinnamoyl-aceto-acetic ether with dilute H_2SO_4(30 p.c.). By longer boiling with dilute H_2SO_4 it is converted into *o*-nitro-styryl-methyl-ketone (o-nitro-benzylidene-acetone) (Fischer a. Kuzel, *B.* 16, 35). Fine yellow prisms. Sol. hot alcohol, sl. sol. cold alcohol, ether and CS_2. Gives a red colouration with Fe_2Cl_6. Dissolves in alkalis with a yellow colour.

NITRO-COCCUSIC ACID *v.* Tri-nitro-oxy-*m*-toluic acid.

NITRO-CODEÏNE *v.* Codeïne.

NITRO-COMENIC ACID *v.* Comenic acid.

NITRO-COMPOUNDS. Compounds containing the group nitroxyl (NO_2) directly united, by means of its nitrogen, to carbon. Their most general characteristic is that they yield amido-compounds on reduction (*v.* Amines and Amido-acids).

Formation.—1. Fatty nitro- compounds are formed by the action of silver nitrite on alkyl iodides. The isomeric nitrites are also formed in this reaction.—2. Aromatic nitro- compounds are formed by the direct action of nitric acid. The nitric acid must usually be concentrated, and its action is intensified by mixture with H_2SO_4. Phenols and oxy-acids may be nitrated by dilute nitric acid. Various anilides, boiled with dilute nitric acid (S.G. 1·029), are converted into di-nitro- derivatives of the base. Thus acetyl-methyl-aniline becomes di-nitro-methyl-aniline (Norton a. Allen, *B.* 18, 1995).—3. Aromatic amido- compounds may be converted into the corresponding nitro- compounds by the cuprous reaction (Sandmeyer, *B.* 20, 1495). For this purpose cupric sulphate (50 g.) is dissolved, together with glucose (15 g.), in boiling water (100 c.c.), and at once treated with soda (20 g.) dissolved in water (60 c.c.). After cooling, the mixture is neutralised with acetic acid. To this mixture the nitrate of the diazotised base (prepared from the base, HNO_3, and $NaNO_2$) is added in the cold.—4. Fatty compounds of the form $X.CHBr.NO_2$ are converted by KNO_2 in alkaline solution into salts of di-nitro- compounds of the form $X.CK(NO_2)_2$.

Reactions.—1. Acid reducing agents yield amido-compounds directly, but alkaline reducing agents (*e.g.* sodium-amalgam; zinc-dust and NaOH) acting upon aromatic nitro- compounds yield in the first place intermediate bodies, *v.* Azo- and Azoxy- compounds. In some cases where reduction is effected by tin and HClAq chlorination may take place; thus *m*-nitro-toluene gives a chloro-toluidine. The best general reducing agent is a solution of $SnCl_2$ in HClAq.—2. In the groups $CH_2.NO_2$ and $CH.NO_2$ hydrogen is displaceable by metals, and hence bodies containing these groups dissolve in alkalis. Such solutions yield, on addition of bromine, compounds containing the groups $CHBr.NO_2$ and $CBrNO_2$. The compounds $X.CHBrNO_2$ can further give rise to $X.CNaBrNO_2$ and $X.CBr_2NO_2$.—3. Primary fatty nitro- compounds yield hydroxylamine on heating with HClAq at 140°, *e.g.* $CH_3.CH_2NO_2+H_2O = CH_3.CO.OH+H_2NOH$ (V. Meyer a. Locker, *A.* 180, 163).—4. *Nitrous acid* converts primary fatty nitro- compounds into nitrolic acids, containing the group $CH(NO)(NO_2)$ or $C(NOH).NO_2$, which form red solutions with alkalis. Nitrous acid converts secondary fatty nitro- compounds into nitroles, containing the group $C(NO)(NO_2)$, which are blue when in the liquid state or in solution.—5. Aromatic nitro- compounds may be reduced by heating with halogen acids. Thus nitro-benzene is reduced to aniline by heating with HIAq at 104°, by HBrAq at 185°, and by HClAq at 245° (Baumhauer, *A. Suppl.* 7, 212).—6. Boiling aqueous alkalis can in some cases displace NO_2 by hydroxyl. In this way *o*-di-nitro-benzene is converted into *o*-nitro-phenol.—7. When aromatic compounds containing two or more nitroxyls in one benzene nucleus are treated with alcoholic NH_3 and H_2S it is usual for one nitroxyl only to be reduced to amidogen.—8. Aromatic di- and tri- nitro- compounds frequently form molecular compounds with one another and with aromatic hydrocarbons.—9. The acetyl derivatives of nitrated aromatic amines, in which the NO_2 group is in the *o*- or *p*- position to the NHAc group (*e.g.* acetyl-*o*- and *p*- nitro-aniline, di-acetyl-nitro-*p*-phenylene diamine, diacetyl-nitro-*p*-naphthylene diamine, acetyl-o-nitro-β-naphthylamine, &c.), are readily soluble in cold aqueous KOH(1:2) with a deep-yellow colour. On standing saponification takes place, and the nitro- compound crystallises out. When the NO_2 group is in the *m*-position to the NHAc group, *e.g.* acetyl-*m*-nitraniline, acetyl-*m*-nitro-*p*-toluidine, &c., the substance is not soluble in aqueous KOH (Kleemann, *B.* 19, 336).

NITRO-*o*-COUMARIC ACID. *Methyl derivative* $C_{10}H_9NO_5$ *i.e.* [5:2:1] $C_6H_3(NO_2)(OMe).CH{:}CH.CO_2H$. [238°]. Formed by heating $C_6H_3(NO_2)(OMe).CHO$ with NaOAc and Ac_2O (Schnell, *B.* 17, 1383). White needles, sl. sol. cold water, v. sol. alcohol and ether.—CaA'_2.—BaA'_2.—AgA'.

Anhydride 
$$C_6H_3(NO_2)\left\langle\begin{matrix}CH{:}CH\\ O\;\;.CO\end{matrix}\right.$$

Nitro-coumarin. [183°]. Formed by dissolving coumarin in cold fuming HNO_3 (Delalande, *A. Ch.* [3] 6, 343; Bleibtreu, *A.* 59, 191). Formed also by heating nitro-salicylic aldehyde [125°] with Ac_2O and NaOAc (Taege, *B.* 20, 2110). Needles. Oxidised by $KMnO_4$ to nitro-*o*-oxy-benzoic acid [228°]. Reduced by $FeSO_4$ and NH_3 to amido-coumarin [161°]. Bromine vapour gives a di-bromide [271°].

Nitro-*o*-coumaric acid $C_9H_7NO_5$ ***i.e.*** [3:2:1] $C_6H_3(NO_2)(OH).CH{:}CH.CO_2H$. [242°]. Formed by heating its methyl derivative with NaOHAq. Yellow crystals (from alcohol). Not converted into nitro-coumarin by boiling water or by HBrAq.

Methyl derivative $C_6H_3(NO_2)(OMe).CH:CH.CO_2H$. [193°]. Formed from the methyl derivative of (3,2,1)-nitro-salicylic aldehyde by Perkin's reaction (Miller a. Kinkelin, *B.* 22, 1709). Prisms (from alcohol). With methyl iodide it gives the ether $C_6H_3(NO_2)(OMe).CH:CH.CO_2Me$ [89°].

Nitro-*o*-coumarinic acid [3:2:1] $C_6H_3(NO_2)(OH).CH:CH.CO_2H$. [150°]. Formed by dissolving nitro-coumarin in boiling aqueous alkalis, and ppg. the cold solution by HCl (Miller a. Kinkelin, *B.* 22, 1706). Yellow prisms (from warm alcohol). On warming with water or alcohol it changes to its anhydride, nitro-coumarin. Its salts are explosive.—$Na_2C_9H_5NO_6$.—$BaC_9H_5NO_6$ 3½aq.—$Ag_2C_9H_5NO_5$.

Methyl derivative $C_6H_4(NO_2)(OMe).CH:CH.CO_2H$. [136°]. Tables.

Methyl derivative of the methyl ether $Me_2C_9H_5NO_5$. [69°]. Formed from the Ag salt and MeI. Prisms. Readily reconverted into the acid, even by aqueous Na_2CO_3.

Anhydride $C_6H_3(NO_2)\langle\begin{matrix}CH:CH\\O.CO\end{matrix}$. *Nitro-coumarin.* [191°]. Formed from (3,2,1)-nitro-salicylic aldehyde (60 g.), NaOAc (90 g.), and Ac_2O (130 g.). Prisms (from benzene), or needles (from alcohol).

Nitro-*m*-coumaric acid [2:3:1] $C_6H_3(NO_2)(OH).CH:CH.CO_2H$. [218°]. Formed from *m*-amido-cinnamic acid by nitration and displacement of NH_2 by OH through the diazo-reaction (Luff, *B.* 22, 293). Needles (from water or alcohol).

Nitro-*m*-coumaric acid [4:3:1] $C_6H_3(NO_2)(OH).CH:CH.CO_2H$. [248°]. Formed by nitrating *m*-coumaric acid (Luff, *B.* 22, 296). Golden-yellow needles (from alcohol).

Methyl derivative $C_6H_3(NO_2)(OMe).CH:CH.CO_2H$. [218°]. Formed from [4,3,1] $C_6H_3(NO_2)(OMe).CHO$ by Perkin's reaction (Landsberg, *D. P. J.* 262, 139).

Methyl ether of the methyl derivative $C_6H_3(NO_2)(OMe).CH:CH.CO_2Me$. [143°]. Plates (Rieche, *B.* 22, 2359). Formed by nitration of $C_6H_4(OMe).CH:CH.CO_2Me$.

Ethyl ether of the methyl derivative $C_6H_3(NO_2)(OMe).CH:CH.CO_2Et$. [163°]. Needles (from alcohol) (Ulrich, *B.* 18, 2572).

ε-Nitro-*m*-coumaric acid [5:3:1] $C_6H_3(NO_2)(OH).CH:CH.CO_2H$. Accompanies the (2,3,1)-acid (*v. supra*). Crystals.

Nitro-*m*-coumaric acid [6:3:1] $C_6H_3(NO_2)(OH).CH:CH.CO_2H$. [216°]. Formed from acetyl-*m*-amido-cinnamic acid by nitration and displacement of NHAc by hydroxyl (Luff, *B.* 22, 292). Yellow powder.

Nitro-*p*-coumaric acid [3:4:1] $C_6H_3(NO_2)(OH).CH:CH.CO_2H$. [198°]. Formed from its methyl derivative by heating with HOAc saturated with HBr (Einhorn a. Grabfield, *A.* 243, 374). Yellow needles (from alcohol). Forms a dibromide [72°].

Ethyl ether EtA′. [109°].

Methyl derivative $C_6H_3(NO_2)(OMe).CH:CH.CO_2H$. [140°]. Formed from [3:4:1] $C_6H_3(NO_2)(OMe).CHO$, NaOAc, and Ac_2O. White needles. Yields a dibromide [178°], from which alkalis form the acid $C_6H_3(NO_2)(OMe).C_2HBr.CO_2H$ [205°].

Methyl ether of the methyl derivative $C_6H_3(NO_2)(OMe).CH:CH.CO_2Me$. [125°].

Ethyl ether of the methyl derivative $C_6H_3(NO_2)(OMe).CH:CH.CO_2Et$. [100°].

Di-nitro-*o*-coumaric acid. *Methyl derivative* $C_6H_2(NO_2)_2(OMe).CH:CH.CO_2H$. [193°]. Formed by nitrating the methyl derivative of *o*-coumaric acid (Perkin, *C. J.* 39, 416). Orange-brown needles (from alcohol).

Di-nitro-*m*-coumaric acid. *Methyl derivative of the methyl ether* $C_6H_2(NO_2)_2(OMe).CH:CH.CO_2Me$. [178°]. Formed by nitration (Rieche, *B.* 22, 2358). Yellowish needles (from alcohol). Yields on saponification $C_6H_2(NO_2)_2(OMe).CH:CH.CO_2H$, which decomposes at 215°.

NITRO-*o*-COUMARIC ALDEHYDE $C_6H_3(NO_2)(OH).CH:CH.CHO$. [200°]. Formed from $C_6H_3(NO_2)(OH).CHO$ [126°], aldehyde, and aqueous NaOH (Von Miller a. Kinkelin, *B.* 20, 1931; 22, 1716). Yellow needles. Forms a sodium derivative, crystallising in red tables, and a phenyl-hydrazide [235°].

Nitro-*o*-coumaric aldehyde [3:2:1] $C_6H_3(NO_2)(OH).CH:CH.CHO$. [133°]. Formed in the same way from the aldehyde $C_6H_3(NO_2)(OH).CHO$ [109°] (M. a. K.). Golden needles, v. sol. alcohol. Forms a sodium derivative, crystallising in red needles, a phenyl-hydrazide [157°], and a methyl derivative [115°].

NITRO-COUMARIN *v. Anhydride* of NITRO-COUMARIC ACID.

NITRO-*o*-CRESOL $C_7H_7NO_3$ *i.e.* $C_6H_3Me(OH)(NO_2)$ [1:2:3]. [70°]. Obtained, together with the (1,2,5)-isomeride, by nitrating *o*-cresol (Hofmann a. Miller, *B.* 14, 567; Staedel, *A.* 217, 50, 203; Rapp, *A.* 224, 175; Hirsch, *B.* 18, 1512). Formed also by boiling a dilute acid solution of *o*-diazotoluene sulphate (1 mol.) with HNO_3 (1 mol.) (Nölting a. Wild, *B.* 18, 1339; Deninger, *J. pr.* [2] 40, 299). Yellow prisms (from dilute alcohol), insol. water, v. sol. alcohol and ether; volatile with steam.—$KC_7H_6NO_3$: garnet-red trimetric tables.—AgA′: red needles.

Methyl ether MeA′. Oil.

Ethyl ether EtA′. Oil.

Nitro-*o*-cresol $C_6H_3Me(OH)(NO_2)$ [1:2:4]. [108°]. Formed by boiling diazotised nitro-*o*-toluidine [107°] with water (Nölting a. Collin, *B.* 17, 269). Yellow needles (from ligroïn). Its K, Ag, and NH_4 salts form yellow crystals.

Methyl ether. [74°] (Witt, *B.* 23, 3638).

Nitro-*o*-cresol $C_6H_3Me(OH)(NO_2)$ [1:2:5]. [95°] (N. a. W.); [80°–85°] (H.). Formed from nitro-*o*-toluidine [128°] by the diazo- reaction, or by merely boiling with conc. NaOHAq (Nevile a. Winther, *C. J.* 41, 423). Formed also by nitrating *o*-cresol (Hirsch, *B.* 18, 1512). Needles (from water), not volatile with steam. When crystallised from water it melts at 30°–34°, but it melts at 95° after crystallisation from ether.

Ethyl ether EtA′. [71°]. Formed by nitrating the ethyl derivative of *o*-cresol (Staedel, *A.* 217, 155, 203; Kayser, *B.* 15, 1133). Needles.

Nitro-*o*-cresol $C_6H_3Me(OH)(NO_2)$ [1:2:6]. [143°]. Formed from nitro-*o*-toluidine [92°] by the diazo- reaction (Ullmann, *B.* 17, 1961). Yellow needles (from water). Has an intensely sweet taste.

c-Nitro-*m*-cresol $C_6H_3Me(OH)(NO_2)$ [1:3:4]. [56°]. Formed, together with the (1,3,6)-isomeride from *m*-cresol, HOAc, and HNO_3 (Staedel, *A.* 217, 51; *A.* 259, 223; Claus, *J. pr.* [2] 39, 63). Yellow monoclinic plates (from benzene), volatile with steam. Gives di-bromo-nitro-cresol [93°]. Its K salt forms red plates.

Ethyl ether EtA′. [51°]. White needles (from dilute alcohol).

s-Nitro-*m*-cresol $C_6H_3Me(OH)(NO_2)$ [1:3:5]. [91°]. Formed from nitro-*m*-toluidine by the diazo- reaction (Nevile a. Winther, *C. J.* 41, 417). Yellow crystals, not volatile with steam. Crystallises from water in a hydrated condition, and then melts at 62°.

Nitro-*m*-cresol $C_6H_3Me(OH)(NO_2)$ [1:3:6]. [129°]. Formed, together with the (1,3,4)-isomeride from *m*-cresol, HNO_3, and HOAc below 0° (Staedel, *A.* 259, 210; Claus, *J. pr.* [2] 39, 63). Formed also by oxidising nitroso-*m*-cresol with alkaline K_3FeCy_6 (Bertoni, *G.* 12, 304). Colourless crystals, not volatile with steam. Gives di-bromo-nitro-cresol [143°]. Reduces to amido-cresol [174°].—KA′ 2aq: yellow plates.—NaA′ 2aq.

Ethyl ether EtA′. [54°].

Nitro-*p*-cresol $C_6H_3Me(OH)(NO_2)$ [1:4:3]. [34°]. Formed from acetyl-*p*-toluidine by nitrating and boiling the product with conc. NaOHAq (Wagner, *B.* 7, 537; Nevile a. Winther, *C. J.* 41, 426), by the action of nascent nitrous acid on *p*-toluidine (Deninger, *J. pr.* [2] 40, 299), or by boiling *p*-diazotoluene sulphate (1 mol.) with HNO_3 (1 mol.) (Nölting a. Wild, *B.* 18, 1339). Formed also by nitrating *p*-cresol (Armstrong a. Thorpe, *B. A.* 1875, 112; Hofmann a. Miller, *B.* 14, 572; Staedel, *A.* 217, 54). Yellow crystals (from benzene), volatile with steam.—NaA′.—AgA′.

Methyl ether MeA′. (274°).

Ethyl ether EtA′. (275°–285°).

Benzyl ether C_7H_7A'. [54°]. Formed from benzyl chloride and the Ag salt (Frische, *A.* 224, 142).

o-Nitro-benzyl ether [163°].

Nitro-*p*-cresol $C_6H_3Me(OH)(NO_2)$ [1:4:2]. [77°]. Formed from the corresponding nitro-*p*-toluidine by the diazo- reaction (Nevile a. Winther, *C. J.* 41, 422; Knecht, *A.* 215, 87). Yellow needles (from ligroïn).

Methyl ether MeA′. (267°). Oil.

Di-nitro-o-cresol $C_6H_2Me(OH)(NO_2)_2$[1:2:3:5]. [86°]. S. (alcohol). 7·8 at 15°. Formed by heating (1,2,5)-*o*-cresol sulphonic acid with dilute HNO_3 (Nevile a. Winther, *C. J.* 37, 631; 41, 422). Formed also by boiling o-diazo-toluene disulphonic acid with dilute HNO_3 (N. a. W.), or from *o*-diazo-toluene nitrate and HNO_3 (Nölting a. De Salis, *B.* 14, 987; *A. Ch.* [6] 4, 105). Obtained also from the corresponding di-nitro-toluidine (N. a. S.), and by nitrating o-cresol and the (3,1,2)- and (5,1,2)-nitro-*o*-cresols (Hirsch, *B.* 18, 1512; Barr, *B.* 21, 1543). Formed also from $C_6H_2Me(OH)Br_2$ and fuming HNO_3 (Claus, *J. pr.* [2] 38, 327). Yellow needles, slightly volatile with steam. Yellow dye.—KA′*x*aq: yellow crystals.

Salts.—BaA'_2.—$BaA'_2 3\frac{1}{2}$aq.—AgA′.

Ethyl ether EtA′. [51°]. Obtained by nitrating $C_6H_4Me(OEt)$[1:2] (Staedel, *B.* 14, 899; *A.* 217, 153; 259, 219), or from the Ag salt and EtBr (N. a. S.). Yields di-nitro-*o*-toluidine [210°] on heating with alcoholic NH_3 at 130° (Van Romburgh, *R. T. C.* 3, 397).

p-Nitro-benzyl ether $C_6H_4(NO_2).CH_2A'$. [145°]. Obtained by nitrating the benzyl ether of o-cresol (Staedel). Needles.

Di-nitro-*m*-cresol
$C_6H_2Me(OH)(NO_2)_2$[1:3:4:5or2]. [99°]. Formed from di-nitro-amido-cresol by elimination of NH_2 (Nietzki a. Ruppert, *B.* 23, 3479). Needles.

Ethyl ether EtA′. [22°].

Di-nitro-*m*-cresol
$C_6H_2Me(OH)(NO_2)_2$[1:3:4:6].

Ethyl ether EtA′. [97°]. Formed by nitrating ethyl-nitro-cresol [51°] (Staedel, *A.* 259, 226).

Di-nitro-*p*-cresol $C_6H_2Me(OH)(NO_2)_2$[1:4:3:5]. [85°]. A product of the action of nitrous acid on *p*-toluidine nitrate, on amido-toluic acid [167°], and on *p*-toluidine disulphonic acid (Beilstein a. Kreusler, *A.* 144, 183; Martius a. Wichelhaus, *Z.* [2] 5, 440; *B.* 2, 207; Richter, *A.* 230, 323). Formed also by boiling di-nitro-*p*-toluidine with aqueous NaOH (Wagner, *B.* 7, 536); by nitrating *p*-cresol and (3,1,4)-nitro-*p*-cresol (Armstrong a. Field, *B.* 6, 974; Frische, *A.* 224, 139); or boiling diazo-*p*-toluene sulphonate with dilute HNO_3 (Nevile a. Winther, C. *J.* 37, 631). Yellow needles (from dilute alcohol).—NaA′: red needles. S. 2·3 at 17°.—KA′. S. 1·5 at 16° (M. a. W.); ·99 at 17° (Staedel). Used as a dye (gold-yellow). A sample of ‘Victoria yellow’ was found by Martius and Wichelhaus to consist of a salt of a dinitrocresol [110°]. Victoria-yellow is poisonous (Weyl, *B.* 20, 2835).—BaA'_2.—AgA′. S. ·29 at 17°.

Methyl ether MeA′. [122°].

Ethyl ether EtA′. [73°]. Formed by nitrating ethyl-*p*-cresol (Staedel, *A.* 217, 161). When heated with alcoholic NH_3 it yields di-nitro-*p*-toluidine [168°] (Romburgh, *R. T. C.* 3, 405).

Benzoyl ether C_7H_7A'. [109°].

p-Nitro-benzyl ether [186°].

Di-nitro-*p*-cresol $C_6H_2Me(OH)(NO_2)_2$. Obtained by the action of excess of nitrous acid on $C_6H_3Me(OH)(NO_2)$[1:4:2] (Knecht, *A.* 215, 90). Yellow needles (from water). Does not melt when heated but forms a violet sublimate

Tri-nitro-*o*-cresol $C_6HMe(OH)(NO_2)_3$. [102°] Formed by heating nitro-*o*-diazo-toluene nitrate with nitric acid (S.G. 1·33) (Nölting a. Collin, *B.* 17, 270). Orange prisms (from acetone). Yields $NaNO_2$ when heated with NaOHAq. With naphthalene it forms $(C_7H_5N_3O_7)C_{10}H_8$ [106°].

Tri-nitro-*m*-cresol
$C_6HMe(OH)(NO_2)_3$[1:3:2:4:6]. [106°]. S. 2·2 at 20°; ·8 at 100° (Duclos). Formed by nitration of *m*-cresol or its sulphonic acid (Duclos, *A.* 109, 141; Nölting a. De Salis, *B.* 14, 987; 15, 1861; *A. Ch.* [6] 4, 118; Beilstein a. Kellner, *A.* 128, 165). Formed also by the action of HNO_3 on nitroso-*m*-cresol (Wurster a. Riedel, *B.* 12, 1799); by heating nitro-coccusic acid with water at 180° (Liebermann a. Dorp, *A.* 163, 101; Kostanecki a. Niementowski, *B.* 18, 251); and by the action of cold conc. HNO_3 on (2,6,3,4,1)-di-iodo-toluquinone (Kehrmann, *J. pr.* [2] 39, 392). Yellow needles (from water). Forms with naphthalene a compound $(C_7H_5N_3O_7)C_{10}H_8$ [127°].—NH_4A'. Converted by warm aqueous KCy into

purple crystals of potassium 'cresyl-purpurate' $KC_6H_6N_5O_8$ (Sommaruga, *Z.* 1870, 657).—KA′: yellow needles.—Pb(OH)A′.—AgA′: prisms.

Ethyl ether EtA′. [72°] (N. a. S.); [75°] (Staedel, *A.* 259, 221, 227). Converted by cold alcoholic NH_3 into tri-nitro-toluidine [126°].

NITRO-o-CRESOL SULPHONIC ACID $C_7H_7NSO_6$ *i.e.* $C_6H_2Me(OH)(NO_2)SO_3H$. Formed from (1,2,5)-o-toluidine sulphonic acid by dissolving in fuming HNO_3 and boiling the resulting nitro-diazo-toluene sulphonic anhydride with water (Hayduck, *A.* 172, 218). Deliquescent. —$BaC_7H_5NSO_6$ $3\frac{1}{2}$aq.—$Ba(C_7H_6NSO_6)_2$ 5aq.

Nitro-*p*-cresol sulphonic acid. *Ethyl derivative* $C_6H_2Me(OH)(NO_2).SO_3H$[1:4:2:5]. Formed by heating nitro-diazo-toluene sulphonic acid with NaOEt (Foth, *A.* 230, 306). Needles. —BaA'_2 4aq: yellow plates.

NITRO-CRYPTOPINE *v.* CRYPTOPINE.

NITRO-CUMENE $C_9H_{11}NO_2$ *i.e.* $C_6H_4Pr(NO_2)$. [−35°]. Formed from cumene and fuming HNO_3 at 0° (Pospekhoff, *J. R.* 18, 52; *Bl.* [2] 45, 178; *cf.* Cahours, *C. R.* 25, 552; 26, 315; Nicholson, *C. J.* 1, 2; Ritthausen, *J. pr.* 61, 79). Oil, volatile with steam.

Nitro-ψ-cumene $C_6H_2Me_3(NO_2)$[1:3:4:5]. [20°]. Formed by eliminating NH_2 from nitro-ψ-cumidine (Edler, *B.* 18, 629). Large thick prisms, volatile with steam.

Nitro-ψ-cumene $C_6H_2Me_2(NO_2)$. [71°]. (265°). Formed from ψ-cumene and cold fuming HNO_3 (Schaper, *Z.* [2] 3, 12; Fittig a. Laubinger, *Z.* [2] 4, 577). Colourless needles (from alcohol), volatile with steam. Yields on oxidation $C_6H_2Me_2(NO_2)CO_2H$ [195°].

Tri-nitro-cumene $C_9H_9N_3O_6$ *i.e.* $C_6H_2Pr(NO_2)_3$ [1:2:4:6]. [109°]. Formed from cumene, HNO_3, and H_2SO_4 (Fittig, *A.* 149, 328). Needles, sl. sol. cold alcohol.

Tri-nitro-ψ-cumene $C_6Me_3(NO_2)_3$. [185°]. Formed by nitrating ψ-cumene (Fittig a. Laubinger, *A.* 151, 261). Prisms (from benzene), almost insol. boiling alcohol. By passing hydrogen sulphide into its boiling ammoniacal alcoholic solution, nitro-ψ-cumidine-sulphonic acid $C_6Me_3(NO_2)(NH_2)SO_3H$ [1:3:4:2:6:5] is formed (Mayer, *B.* 19, 2312; 20, 966).

NITRO-ψ-CUMENOL $C_6HMe_3(OH)(NO_2)$ [1:3:4:6:2]. [48°]. Obtained by evaporating an alcoholic solution of the nitrate to dryness, and distilling the residue with steam (Auwers, *B.* 17, 2979; 18, 2658). Long reddish-yellow crystals (from alcohol), m. sol. hot water. Reconverted into the nitrate by warming with dilute HNO_3.

Nitrate $C_6HMe_3(NO_2).O.NO_2$. [84°]. Formed from ψ-cumenol and cold fuming HNO_3. Trimetric tables or prisms, insol. water, sl. sol. cold alcohol.

Methyl ether $C_6HMe_3(NO_2)OMe$. [42°].

Nitro-cumenol $C_6H_3Pr(NO_2)(OH)$. Oil, formed, together with an isomeride [86°], by nitrating $C_6H_4Pr(OH)$[1:2] (Fileti, *G.* 16, 120).

Di-nitro-ψ-cumenol $C_6Me_3(OH)(NO_2)_2$ [1:3:4:6:2:5]. [112°]. Formed by passing NH_3 into an alcoholic solution of the nitrate of nitro-ψ-cumenol [84°]. Yellow crystals, insol. water. Forms a red solution in alkalis.

NITRO-CUMIDINE $C_9H_{12}N_2O_2$ *i.e.* $C_6H_3(C_3H_7)(NO_2)(NH_2)$. [below 100°]. Formed by reducing di-nitro-cumene with alcoholic ammonium sulphide (Cahours, *C. R.* 24, 557; 26, 315). Yellow scales. Forms a crystalline benzoyl derivative.—B′HCl aq.—$B'_2H_2SO_4$aq: needles.

Nitro-ψ-cumidine $C_6HMe_3(NO_2)(NH_2)$ [1:3:4:5:6]. [47°]. Formed from acetyl-ψ-cumidine by nitration and saponification (Edler, *B.* 18, 629). Red needles (from dilute alcohol).

Acetyl derivative [194°] (E.); [204°] (Auwers, *B.* 18, 2661). Prisms (from alcohol).

Nitro-ψ-cumidine $C_6HMe_3(NO_3)(NH_2)$. [137°]. Formed by treating tri-nitro-ψ-cumene with alcoholic ammonium sulphide (Fittig a. Laubinger, *A.* 151, 262). Yellow needles.—B′HCl.—$B'_2H_2SO_4$ aq.

Nitro-ψ-cumidine *Acetyl derivative* $C_6HMe_3(NO_2)NHAc$. [131°]. Formed by nitration of acetyl-ψ-cumidine [112°] (Engel, *B.* 18, 2231). Yellow needles.

Di-nitro-ψ-cumidine $C_6Me_3(NO_2)_2(NH_2)$. [78°]. Formed from acetyl-ψ-cumidine [112°] by nitration and saponification (Engel, *B.* 18, 2232). Yellow needles.

Acetyl derivative. [204°]. Needles.

Di-nitro-ψ-cumidine $C_6Me_3(NO_2)_2(NH_2)$ [1:3:4:2:5:6]. [183°]. Obtained from acetyl-ψ-cumidine [164°] by nitration and saponification (Auwers, *B.* 18, 2661). Orange needles (from alcohol).

Acetyl derivative. [280°]. Sl. sol. alcohol.

NITRO-ψ-CUMIDINE SULPHONIC ACID $C_9H_{12}N_2SO_5$ *i.e.* $C_6Me_3(NO_2)(NH_2)(SO_3H)$ [1:3:4:2:6:5]. Formed by passing H_2S into a boiling solution of tri-nitro-ψ-cumene in alcoholic NH_3, and also by heating nitro-ψ-cumidine with $ClSO_3H$ at 165° (Mayer, *B.* 19, 2312; 20, 966). Colourless plates. Melts, with decomposition at 240°–260°. Forms an amorphous acetyl derivative $C_9H_{11}AcN_2SO_5$ [c. 230°].

NITRO-CUMINIC ACID $C_{10}H_{11}NO_4$ *i.e.* $C_6H_3Pr(NO_2).CO_2H$ [4:2:1]. [99°]. Formed by boiling nitro-isopropyl-cinnamic acid with CrO_3 in HOAc (Widman, *B.* 19, 269). Tables or monoclinic prisms.

Nitro-cuminic acid $C_6H_3Pr(NO_2).CO_2H$ [4:3:1]. [159°]. Obtained by nitration of cuminic acid (Gerhardt a. Cahours, *A. Ch.* [3] 1, 73; 25, 36; Fileti, *G.* 11, 15; Alexejeff, *J. R.* 17, 112; *Bl.* [3] 2, 727). Formed also by oxidation of its aldehyde (nitro-cuminol) [54°] (Lippmann a. Strecker, *B.* 12, 77; Widman, *B.* 15, 2547) and of nitro-cumyl methyl ketone (Widman, *B.* 21, 2232). Yellowish scales (from alcohol), turned red by sunlight, especially when dissolved in benzene (Alexejeff, *Bl.* [2] 45, 178).—CaA'_2.—PbA'_2.—AgA′.

Ethyl ether EtA′. (290°). Oil.

Nitrile $C_6H_3Pr(NO_2).CN$. [71°]. Formed by nitrating cumonitrile (Czumpelik, *B.* 2, 183).

Nitro-*n*-cuminic acid $C_6H_3Pr(NO_2).CO_2H$ [4:3:1]. [113°]. Formed by oxidation of nitro-*n*-cumyl methyl ketone by $KMnO_4$ (Widman, *B.* 21, 2231). Formed also by nitration of *n*-cuminic acid (Körner, *A.* 216, 230). Colourless needles (from hot water), turned brown by light.—BaA'_2 4aq.—SrA'_2 5aq.

Methyl ether MeA′. [64°]. Crystals from alcohol) (Abenius, *J. pr.* [2] 40, 438).

Nitro-*n*-cuminic acid $C_6H_3Pr(NO_2).CO_2H$ [4:2:1]. [157°]. Formed by oxidation of nitro-propyl-cinnamic acid (Widman, *B.* 19, 276). Tables (from dilute alcohol), sl. sol. water.

Di-nitro-cuminic acid $C_6H_2Pr(NO_2)_2.CO_2H$. [221°]. Formed by nitration of cuminic acid (Cahours, *A.* 69, 243; Lippmann a. Strecker, *B.* 12, 78). Reddish crystals.—BaA′$_2$.—CaA′$_2$.—AgA′ aq (Kraut, *C. C.* 1859, 85).

Ethyl ether EtA′. [77·5°].

Amide $C_9H_9(NO_2)_2.CONH_2$. Crystals.

Di-nitro-ψ-cuminic acid $C_6Me_3(NO_2)_2.CO_2H$ [1:3:4:2:5:6]. [205°]. *Di-nitro-durylic acid.* Formed by nitrating ψ-cuminic acid (Gissmann, *A.* 216, 207; Nef, *A.* 237, 8). Prisms (from dilute alcohol).—CaA′$_2$ 3aq.—BaA′$_2$ 3aq.

NITRO-CUMINIC ALDEHYDE $C_{10}H_{11}NO_3$ *i.e.* $C_6H_3Pr(NO_2).CHO$ [4:2:1]. *Nitro-cuminol.* Formed by oxidising nitro-isopropyl-cinnamic acid with $KMnO_4$ (Einhorn a. Hess, *B.* 17, 2019). Oil, volatile with steam. With acetone and NaOHAq it produces di-isopropyl-indigo.

Nitro-cuminic aldehyde $C_6H_3Pr(NO_2)CHO$ [4:3:1]. [54°]. Formed by nitration of cuminic aldehyde (Lippmann a. Strecker, *B.* 12, 76; Widman, *B.* 15, 166). Triclinic prisms. Combines with bisulphites.

NITRO-ψ-CUMOQUINONE $C_9H_9NO_4$ *i.e.* $C_6Me_3O_2(NO_2)$ [1:3:4:2:5:6]. [113°]. Formed by heating ψ-cumoquinone carboxylic acid with HNO_3 (S.G. 1·4) at 100° for half an hour (Nef, *C. J.* 53, 428; *A.* 237, 17). Yellow plates, which may be sublimed. Heated with alcoholic SO_2 in sealed tubes it yields $C_6Me_3(OH)_2(NO_2)$ [106°].

NITRO-CUMYL-ACRYLIC ACID *v.* NITRO-PROPYL-CINNAMIC ACID.

NITRO-CUMYL METHYL KETONE $C_{11}H_{13}NO_2$ *i.e.* [1:2:4] $C_6H_3Pr(NO_2).CO.CH_3$. *Nitro-aceto-cumene.* [49°]. Formed by nitrating cumyl methyl ketone in the cold (Widman, *B.* 21, 2227). Prisms, v. sol. benzene, sl. sol. ligroïn.

Oxim $C_6H_3Pr(NO_2).C(NOH).CH_3$. [117°].

Phenyl-hydrazide [138°].

Nitro-*n*-cumyl methyl ketone [1:2:4] $C_6H_3Pr(NO_2).CO.CH_3$. Formed by nitrating *n*-cumyl methyl ketone (W.). Oil.

Oxim $C_9H_{10}(NO_2).C(NOH).CH_3$. [86°].

Phenyl hydrazide [139°].

NITRO-*n*-CUMYL-PROPIONIC ACID $C_6H_3Pr(NO_2).CH_2.CH_2.CO_2H$[4:3:1]. [99°]. Formed by nitration (Widman, *B.* 19, 2776). Crystals (from dilute HOAc).

NITRO-CYMENE $C_{10}H_{13}NO_2$ *i.e.* $C_6H_3MePr(NO_2)$ [1:4:2]. S.G. $\frac{15}{}$ 1·085. Formed by nitrating cymene (Barlow, *A.* 98, 245; Landolph, *B.* 6, 937; Fittica, *A.* 172, 314; Widman, *B.* 19, 584; Söderbaum a. Widman, *B.* 21, 2126). Yellow oil. Oxidised by $KMnO_4$ to nitro-oxy-isopropyl-benzoic acid and terephthalic acid.

Nitro-isocymene $C_6H_3MePr(NO_2)$ [1:3:x]. Formed from *m*-isocymene and fuming HNO_3 (Kelbe a. Warth, *A.* 221, 161). Oil, volatile with steam, but decomposed on distillation. Yields nitro-toluic acid [214°] on oxidation.

Di-nitro-cymene $C_6H_2MePr(NO_2)_2$. [54°]. Formed by nitrating cymene (Kraut, *A.* 92, 70). Got also from di-nitro-amido-cymene (Mazzara, *G.* 19, 160). Iridescent tablets (from alcohol).

Di-nitro-cymene [78°]. Formed from di-nitroso-cymene [72°] and HNO_3 (S.G. 1·35) (Kehrmann a. Messinger, *B.* 23, 3562). Crystals, v. sol. alcohol.

Di-nitro-cymene $C_{10}H_{12}(NO_2)_2$. S.G. $\frac{12}{}$ 1·206. Formed by nitrating cymene from ptychotis oil (Landolph). Oil, volatile with steam.

Di-nitro-cymene $C_{10}H_{12}(NO_2)_2$. [250°]. Got from a coal-tar cymene (Rommier, *Bl.* [2] 19, 434).

Tri-nitro-cymene $C_6HMePr(NO_2)_3$. [119°]. Formed by nitrating cymene (from camphor) (Fittig, *A.* 145, 142). Thin plates.

Tri-nitro-isocymene $C_6HMePr(NO_2)_3$. [73°]. Formed by nitration of *m*-isocymene (Kelbe, *A.* 210, 54). Yellow leaflets, smelling like musk.

NITRO-CYMENE SULPHONIC ACID $C_6H_2MePr(NO_2)SO_3H$[1:4:6:2]. Formed from cymene by sulphonation and nitration (Errera, *G.* 19, 533).—BaA′$_2$ aq.—MgA′$_2$ 5aq.

Amide [139°]. Scales.

Nitro-cymene disulphonic acid $C_{10}H_{13}NS_2O_8$ *i.e.* $C_6HMePr(NO_2)(SO_3H)_2$. Formed from nitro-cymene and $ClSO_3H$ (Leone, *G.* 11, 512). Not obtained pure.—BaA″ 3½aq.—PbA″ 4½aq: needles.

NITRO-ISOCYMIDINE $C_{10}H_{14}N_2O_2$ *i.e.* $C_6H_2Me(C_3H_7)(NO_2)(NH_2)$. Formed by heating its phthalyl derivative with conc. HClAq at 180° (Kelbe a. Warth, *A.* 221, 176). Oil, volatile with steam.

Benzoyl derivative [177°]. Formed by nitrating benzoyl-isocymidine (K. a. W.). Needles (from alcohol).

Phthalyl derivative $C_{10}H_{12}(NO_2).N:C_2O_2:C_6H_4$. [167°]. Formed by nitrating phthalyl-isocymidine. Needles.

NITRODECOIC ACID $C_9H_{18}(NO_2).CO_2H$. A product of the action of boiling HNO_3 on the acids of cocoanut oil (Wirz, *A.* 104, 291).

NITRO-DRACYLIC ACID is *p*-NITRO-BENZOIC ACID.

NITRO-DULCITE *v.* DULCITE.

NITRO-c-DURENE $C_{10}H_{13}NO_2$ *i.e.* $C_6HMe_4(NO_2)$ [1:2:3:4:5]. *Nitro-prehnitene.* [61°]. (295° i.V.). Formed by the action of HNO_3 on c-durene (Töhl, *B.* 21, 905). Needles. Yields on reduction c-duridine [70°].

Di-nitro-c-durene $C_6Me_4(NO_2)_2$ [1:2:3:4:5:6]. [178°]. Formed from c-durene, HNO_3, and H_2SO_4 in the cold (Jacobsen, *B.* 19, 1214) and also from penta-methyl-benzene and fuming HNO_3 (Gottschalk, *B.* 20, 3287). Yellowish needles or prisms (from alcohol).

Di-nitro-durene $C_6Me_4(NO_2)_2$ [1:2:4:5:3:6]. [205°]. Formed from durene and conc. HNO_3 at 0° (Fittig a. Jannasch, *Z.* 1870, 162; Nef, *A.* 237, 3; *C. J.* 53, 428). Colourless prisms, sl. sol. alcohol.

Di-nitro-isodurene $C_6Me_4(NO_2)_2$ [1:2:3:5:4:6]. [156°]. Prepared from isodurene, HNO_3, and H_2SO_4 (Jacobsen, *B.* 15, 1853). Prisms, sl. sol. cold alcohol.

NITRO-DURENOL $C_6Me_4(NO_2)OH$. [130°]. Formed by nitration of durenol with ordinary HNO_3 at 0°. Yellow crystals. V. e. sol. alcohol, nearly insol. water. Dissolves in alkalis with a dark-yellow colour (Jacobsen a. Schnapauff, *B.* 18, 2844).

NITRO-*c*-DURIDINE $C_6Me_4(NO_2)(NH_2)$ [1:2:3:4:5:6]. [131°]. Formed by reducing di-nitro-*c*-durene with alcoholic ammonium sulphide (Töhl, *B.* 21, 904). Red needles, sol. alcohol. Yields, on reduction, $C_6Me_4(NH_2)_2$ [140°].

NITRO-ERYTHRITE *v.* ERYTHRITE TETRANITRATE.

NITRO-ETHANE $C_2H_5NO_2$ *i.e.* $CH_3.CH_2.NO_2$. Mol. w. 75. (114°). S.G. $\frac{15}{15}$ 1·0561; $\frac{25}{25}$ 1·0461 (Perkin, *C. J.* 55, 689). M.M. 2·837. S.V. 80·3 (Schiff; Lossen, *A.* 254, 73). H.F.p. 26,880. H.F.v. 25,140 (Thomsen, *Th.*). Formed by adding EtI to cold silver nitrite and subsequently distilling from a water-bath (V. Meyer, *B.* 5, 399; *A.* 171, 1; 175, 88; Götting, *A.* 243, 115; Kissel, *J. R.* 1882, 226). Formed also by distilling $KEtSO_4$ with $NaNO_2$, the yield being 6 p.c. of the theoretical (Lauterbach, *B.* 11, 1225), and by the action of $AgNO_2$ on potassium chloro-propionate (Kolotoff, *Bl.* [2] 47, 169). Oil, with pleasant odour. With alcoholic soda it gives an amorphous pp. of C_2H_5ONa, a salt which is very soluble in water, forming a solution in which $HgCl_2$ ppts. crystalline $C_2H_4(NO_2)HgCl$. The solution of sodium nitro-ethane gives with $FeCl_3$ a blood-red colour, with $CuSO_4$ a green solution, and with $AgNO_3$ a white pp. rapidly turning black.

Reactions.—1. *Iron* and *acetic acid* reduce it to ethylamine.—2. When mixed with potash and KNO_2, and H_2SO_4 is slowly added, there is formed ethyl-nitrolic acid $CH_3.C(NOH).NO_2$, [81°], the alkaline salts of which form deep-red solutions (V. Meyer, *B.* 7, 425).—3. Fuming H_2SO_4 yields ethane *s*-di-sulphonic acid.—4. HClAq (S.G. 1·14) at 140° splits it up into hydroxylamine and HOAc (Meyer a. Locher, *A.* 180, 163).—5. NaOEt and EtI form oily C_5H_7NO (168°) (Götting). NaOMe and MeI form C_4H_5NO (c. 155°). According to Socoloff (*J. R.* 20, 579) alcoholic soda forms C_6H_9NO (175°) and the presence of alkyl iodides does not affect the product.—6. $ZnEt_2$ followed by water forms di-ethyl-hydroxylamine and other products (Kissel, *J. R.* 1887, 109).—7. *Benzoyl chloride* forms di-benzoyl-hydroxylamine and di-acetyl-hydroxylamine (Kissel, *J. R.* 1882, 40).

Constitution.—The constitution of nitro-ethane has been discussed by Victor Meyer (*B.* 5, 404; 8, 30; *A.* 244, 222); Geuther (*B.* 7, 1620); Alexejeff (*Bl.* [2] 46, 266); Socoloff (*Bl.* [2] 47, 166); Bevad (*J. R.* 20, 125), and others.

Di-nitro-methane $CH_3.CH(NO_2)_2$. (186° cor.). S.G. $\frac{23\cdot5}{}$ 1·3503. Formed by the action of KNO_2 and alcoholic potash on bromo-nitro-ethane (Ter Meer, *A.* 181, 1). Formed also by the action of conc. HNO_3 on di-ethyl ketone and on methyl-acetoacetic ether (Chancel, *Bl.* [2] 31, 504; *C. R.* 96, 1466). Oil, with sweet taste. Reduced by tin and HClAq to hydroxylamine, NH_3, and HOAc. Reduced by sodium-amalgam to ethyl-azaurolic acid.—$CH_3.CK(NO_2)_2$: yellow monoclinic crystals, m. sol. cold water, insol. alcohol. Explodes when struck. Its aqueous solution gives a reddish-brown pp. with $FeCl_3$, a pale-blue pp. with $CuSO_4$, and a light-brown pp. with $HgCl_2$.—AgA′: lustrous yellow plates.

Tri - nitro - ethane (?) $CH_3.C(NO_2)_3$. [55°]. Formed from methyl-malonic acid and HNO_3 (Franchimont, *R. T. C.* 5, 281). Crystals.

Tetra-nitro-ethane (?). *Potassium derivative* $C_2K_2(NO_2)_4$. Formed from di-bromo-tetra-nitro-ethane, potash, and ammonium sulphide (Villiers, *C. R.* 97, 258; 98, 431). Crystals, which decrepitate below 100° and detonate at 200°, or even when treated with dilute acids.

NITRO-ETHENYL-TRI-AMIDO-BENZENE $C_8H_8N_2O_4$ *i.e.*

[1:2:3:4] $C_6H_2(NO_2)(NH_2)<\!\begin{smallmatrix}NH\\N\end{smallmatrix}\!>C.CH_3$. [295°–300°]. Formed by heating di-acetyl-di-nitro-*p*-phenylene-diamine with alcoholic NH_3 at 150° (Nietzki a. Hagenbach, *B.* 20, 331; *cf.* Biedermann a. Ledoux, *B.* 7, 1532). Red needles.

Nitro - di - ethenyl - tetra - amido - benzene $C_{10}H_9O_2N_5$ *i.e.*

[5:1:2:3:4] $C_6H(NO_2)\left(<\!\begin{smallmatrix}NH\\N\end{smallmatrix}\!>CMe\right)_2$. [276°]. Formed by nitration of di-ethenyl-tetra-amido-benzene (Nietzki a. Hagenbach, *B.* 20, 331). Orange-red needles (containing aq). By reduction it is reconverted into di-ethenyl-tetra-amido-benzene.—$B''H_2Cl_2PtCl_4\,\frac{1}{2}aq$: long golden-yellow needles.

DI-NITRO-DI-ETHENYL-TETRA-AMIDO-DITOLYL

$CMe<\!\begin{smallmatrix}NH\\N\end{smallmatrix}\!>C_6HMe(NO_2).C_6HMe(NO_2)<\!\begin{smallmatrix}NH\\N\end{smallmatrix}\!>CMe\left[1:3:\begin{smallmatrix}4\\5\end{smallmatrix}\right]$. [242°]. Formed from acetyl-di-nitro-toluidine by reduction with ammonium sulphide, and treatment of the resulting hydrazo- compound with boiling dilute HClAq (Bankievitch, *B.* 21, 2407). Prisms, v. e. sol. alcohol.—$B''H_2Cl_2$.—$B''2HNO_3$. [214°]. Yellow needles.

NITRO-ETHENYL-PHENYLENE-DIAMINE $C_8H_7N_3O_2$ *i.e.*

[1:3:4] $C_6H_3(NO_2)<\!\begin{smallmatrix}NH\\N\end{smallmatrix}\!>CMe$. [216°]. Formed by heating nitro-o-phenylene-diamine with Ac_2O at 190°, cooling, and boiling with dilute H_2SO_4 (Heim, *B.* 21, 2307). Yellowish-brown needles (from water), v. sol. hot alcohol.

NITRO-ETHENYL-TOLYLENE-DIAMINE

$C_6H_2Me(NO_2)<\!\begin{smallmatrix}N\\NH\end{smallmatrix}\!>CMe\left[1:3:\begin{smallmatrix}5\\4\end{smallmatrix}\right]$. [246°]. Formed from acetyl-*p*-toluidine by nitration and reduction (Bankievitch, *B.* 21, 2402). Needles. Yields on reduction ethenyl-tetra-amido-toluene [100°].—$B''H_2Cl_2$.—$B''HNO_3$. [207°]. Yellowish plates.

NITRO-ETHENYL-TOLYLENE-DIAMINE. [185°] (L.); [202°] (N.). Formed by nitrating ethenyl-tolylene-o-diamine (Ladenburg, *B.* 8, 677; Niementowski, *B.* 19, 723). Needles.

NITRO-ETHYL-ALCOHOL $C_2H_5NO_3$ *i.e.* $CH_2(NO_2).CH_2OH$. S.G. $\frac{19\cdot4}{19\cdot4}$ 1·1691. Formed from glycol iodhydrin and $AgNO_2$ (Demuth a. V. Meyer, *B.* 21, 3529; *A.* 256, 29). Yellowish liquid, sol. water, decomposed on distillation. Reacts with diazo- salts yielding azo- dyes (*e.g.* $C_6H_5.N_2.CH(NO_2).CH_2OH$). Nitrous acid converts it into methyl-nitrolic and glycollic acids.—$CH_2(NO_2).CH_2ONa$: white granular powder.

NITRO-ETHYL-AMIDO-BENZOIC ACID $C_9H_{10}N_2O_4$ *i.e.* [1:3:5] $C_6H_3(NO_2)(NHEt).CO_2H$. [208°]. Formed from nitro-amido-benzoic acid and EtBr (Rollwage, *B.* 10, 1704). Yellow needles (from water).—BaA'_2 4aq: red needles.

Nitro-di-ethyl-*m*-amido-benzoic acid $C_6H_3(NO_2)(NEt_2).CO_2H$. Monoclinic crystals; $a:b:c = \cdot893:1:1\cdot095$. $\beta = 74°\ 57'$ (Heintze, *J.* 1885, 1454; *cf.* Lehmann, *Dissert.*, Göttingen, 1884).

NITRO-ETHYL-AMIDO-PHENOL. *Nitrosamine of the ethyl ether* $C_{10}H_{13}N_3O_4$ *i.e.*

$C_6H_3(NO_2)(OEt).NEt(NO)$. Formed from $C_6H_4(OEt).NHEt$ and nitrous acid (Förster, *B.* 21, 354). Yellowish prisms. Does not form salts.

o-**NITRO-TETRA-ETHYL-DI-*p*-AMIDO-TRI-PHENYL-METHANE** $C_{27}H_{33}N_3O_2$ *i.e.* $C_6H_4(NO_2).CH(C_6H_4NEt_2)_2$. [110°]. Formed by heating *o*-nitro-benzoic aldehyde with di-ethyl-aniline and dehydrated oxalic acid (Fischer a. Schmidt, *B.* 17, 1898). Orange triclinic prisms.

p-**Nitro-tetra-ethyl-di-*p*-amido-tri-phenyl-methane.** [113°]. Obtained from *p*-nitro-benzoic aldehyde and di-ethyl-aniline (Kaeswurm, *B.* 19, 744). Thick needles or monoclinic plates.

NITRO-ETHYLAMINE $C_2H_5NH.NO_2$. *Ethyl-nitramine.* [3°]. Formed from ethylamine by treatment with $ClCO_2Me$ and decomposition of the resulting $C_2H_5NH.CO_2Me$ by ammonia (Franchimont a. Klobbie, *R. T. C.* 7, 356).

o-**NITRO-ETHYL-ANILINE** $C_6H_{10}N_2O_2$ *i.e.* $C_6H_4(NO_2).NHEt$ [1:2]. Formed by heating *o*-nitro-phenol with alcoholic ethylamine for 12 hours at 175°. Formed also by heating the ethylene ether of *o*-nitro-phenol with alcoholic ethylamine at 140° (Hempel, *J. pr.* [2] 39, 199; 41, 162). Red oil, sol. acids, but reppd. by water. Yields on reduction *o*-phenylene-ethyl-diamine (249°). Nitrous acid converts it, in ethereal solution, into di-nitro-ethyl-aniline [114°].

Nitrosamine $C_6H_4(NO_2).NEt(NO)$. [30°]. Formed from the hydrochloride of the base and $NaNO_2$ in aqueous solution. Yellow needles (from dilute alcohol or HOAc).

m-**Nitro-ethyl-aniline** $C_6H_4(NO_2)NHEt$ [1:3]. [60°]. Formed by heating *m*-nitro-aniline (16 g.) with EtBr (14 g.) and aqueous NaOH (6 g.). Formed also by adding HNO_3 (41·5 g. of S.G. 1·39) to a cooled solution of ethyl-aniline (50 g.) in H_2SO_4 (1,000 g.) (Nölting a. Stricker, *B.* 19, 546). Reddish-yellow needles, volatile with steam. With diazotised *p*-bromo-aniline it yields $C_6H_4Br.N_2.NEt.C_6H_4NO_2$ [136°] (Meldola a. Streatfeild, *C. J.* 55, 429).

Nitrosamine $C_6H_4(NO_2).NEt(NO)$. [47°].

Acetyl derivative $C_6H_4(NO_2).NEtAc$. [89°].

p-**Nitro-ethyl-aniline** $C_6H_4(NO_2)(NHEt)$ [1:4]. [95°]. Obtained by nitration of acetyl-ethyl-aniline dissolved in H_2SO_4 (5 pts.), the product being saponified (Weller, *B.* 16, 31; Nölting a. Collin, *B.* 17, 267). Formed also by heating *p*-nitro-aniline with EtBr and alcoholic potash at 110° (Schweitzer, *B.* 19, 142). Yellow prisms with violet reflex (from alcohol). Somewhat volatile with steam. With diazotised *p*-bromo-aniline it yields $C_6H_4Br.N_2.NEt.C_6H_4NO_2$ [125°].

Nitrosamine $C_6H_4(NO_2).NEt(NO)$. [120°]. Yellow needles (from alcohol) (Meldola a. Streatfeild, *C. J.* 49, 61).

Acetyl derivative $C_6H_4(NO_2).NEtAc$. [118°].

Benzoyl derivative $C_6H_4(NO_2).NEtBz$. [98°]. Needles, v. sl. sol. hot water (Meldola a. Salmon, *C. J.* 53, 774).

m-**Nitro-di-ethyl-aniline** $C_6H_4(NO_2).NEt_2$ [1:3]. (289°). Formed, together with a small quantity of the *p*- isomeride, by nitration of di-ethyl-aniline dissolved in H_2SO_4 (20 pts.) (Groll, *B.* 19, 199). Obtained also by heating *m*-nitro-aniline (20 g.) with EtI (46 g.) and NaOH (12 g.) in alcoholic solution for 8 hours at 100° (Nölting a. Stricker, *B.* 19, 550). Dark-yellow oil.

p-**Nitro-di-ethyl-aniline** $C_6H_4(NO_2).NEt_2$ [1:4]. [78°]. Formed by oxidation of nitroso-di-ethyl-aniline with $KMnO_4$ and H_2SO_4; and also by the action of nitrous acid on di-ethyl-amido-benzene-azo-di-ethyl-aniline (Lippmann a. Fleissner, *B.* 16, 1422; Groll). Yellow monoclinic needles with blue reflex.—$B'_2H_2PtCl_6$: thin prisms.

Di-nitro-ethyl-aniline $C_6H_3(NO_2)_2.NHEt$ [4:2:1]. [114°]. Formed from bromo-di-nitro-benzene and alcoholic ethylamine (Van Romburgh, *R. T. C.* 2, 104). Formed also by boiling $C_6H_5.NEtAc$ with dilute HNO_3 (S.G. 1·029) (Norton a. Allen, *B.* 18, 1997); and by the action of nitrous acid on an ethereal solution of *o*-nitro-ethyl-aniline (Hempel, *J. pr.* [2] 39, 199; 41, 168). Yellow needles (from alcohol). Decomposed by boiling conc. KOHAq into ethylamine and di-nitro-phenol.

Di-nitro-di-ethyl-aniline $C_6H_3(NO_2)_2NEt_2$ [4:2:1]. [80°]. Prepared by nitrating di-ethyl-aniline, and also by treating bromo-di-nitro-benzene with diethylamine (Van Romburgh, *R. T. C.* 2, 35; 8, 251). Yellow needles. Decomposed by boiling aqueous KOH into di-ethylamine and di-nitro-phenol. When gently oxidised by CrO_3 it yields di-nitro-aniline [175°].

Tri-nitro-ethyl-aniline $C_6H_2(NO_2)_3NHEt$. *Ethylpicramide.* [84°]. Formed from chloro-tri-nitro-benzene (picryl chloride) and NH_2Et in alcohol (Van Romburgh, *R. T. C.* 2, 107). Crystals (from alcohol) which turn brown in air.

Tri-nitro-di-ethyl-aniline $C_6H_2(NO_2)_3.NEt_2$. [164°]. Prepared by adding a hot alcoholic solution of $NHEt_2$ to (1,2,4,6)-chloro-tri-nitro-benzene. Orange crystals (from benzene). Decomposed by potash into picric acid and di-ethylamine.

Tetra-nitro-ethyl-aniline $C_6H_2(NO_2)_3.NEt(NO_2)$. *Nitramine* of *tri-nitro-ethyl-aniline.* [96°]. Obtained by the action of HNO_3 and H_2SO_4 on ethyl-aniline and on di-ethyl-aniline (Van Romburgh, *R. T. C.* 2, 31, 114). Yellow plates (from alcohol). Decomposed by 10 p.c. aqueous Na_2CO_3 into picric acid and ethylamine. Reduced by tin and HClAq to tri-amido-phenol.

NITRO-ETHYL-ANTHRONE $C_{16}H_{12}NO_3$ *i.e.*

$C_6H_4\left<\begin{matrix}CO\text{ ——— }\\CEt(NO_2)\end{matrix}\right>C_6H_4$. [102°]. Formed, as a by-product, in the preparation of ethyl-anthracene hydride-nitrite by the action of HNO_3 on ethyl-anthracene hydride dissolved in HOAc (Liebermann a. Landshoff, *B.* 14, 474).

o-**NITRO-ETHYL BENZENE** $C_6H_4(NO_2).C_2H_5$. [228°]. S.G. $\frac{24.5}{}$ 1·126. Formed, together with the *p*- isomeride, by dissolving ethyl-benzene in HNO_3 (Beilstein a. Kuhlberg, *A.* 156, 206; *Z.* [2] 5, 524). Oil.

p-**Nitro-ethyl-benzene** $C_6H_4(NO_2).C_2H_5$. (246°). S.G. $\frac{25}{}$ 1·124. Oil.

Nitro-di-ethyl-benzene $C_6H_3Et_2(NO_2)$ (155° at 23 mm.). Formed from di-ethyl-benzene and fuming HNO_3 at 0° (Voswinkel, *B.* 22, 316). Oil; boils with partial decomposition at 280°–285°.

Di-nitro-tetra-ethyl-benzene $C_6Et_4(NO_2)_2$. [115°]. Pale-yellow prisms (Galle, *B.* 16, 1745).

Tri-nitro-di-ethyl-benzene $C_6H(NO_2)_3Et_2$. [62°]. Yellow prisms (Voswinkel, *B.* 21, 2830).

o-NITRO-ETHYL-BENZENE SULPHONIC ACID $C_8H_9NSO_5$ *i.e.* $C_6H_3(NO_2)Et.SO_3H$. Formed by sulphonation (Beilstein a. Kuhlberg, *A.* 156, 207).—BaA'_2. S. ·54 at 17·5°.

p-**Nitro-ethyl-benzene sulphonic acid**—$BaA'_2 5aq$. S. 2·61 at 17·5°. Needles.

NITRO-*p*-ETHYL-BENZOIC ACID $C_6H_3Et(NO_2).CO_2H$. [156°]. Formed from *p*-ethyl-benzoic acid and cold-fuming HNO_3 (Aschenbrandt, *B.* 12, 1304; *A.* 216, 220). Needles (from water).—$NaA' 2aq$.—$CaA'_2 2aq$.—$SrA'_2 4aq$.—$BaA'_2 4aq$: leaflets, sl. sol. water.

***p*-NITRO-α-ETHYL-BENZOYL-ACETIC ETHER** $C_6H_4(NO_2).CO.CHEt.CO_2Et$. [40°]. Formed from $C_6H_4(NO_2).CO.CHNa.CO_2Et$ and EtI (Perkin a. Bellenot, *C. J.* 49, 451). Plates.

DI-NITRO-ETHYLENE-UREA

$CO\langle{}^{N(NO_2).CH_2}_{N(NO_2).CH_2}\rangle$. [210°]. Obtained from ethylene-urea and HNO_3 (Franchimont a. Klobbie, *R. T. C.* 7, 17). Prisms. On boiling with water it loses CO_2 and forms ethylene-di-nitramine $C_2H_4(NH.NO_2)_2$ [174°].

DI-NITRO-ETHYLIC ACID $C_2H_6N_2O_2$. *Ethyl-nitramine?* Formed from $ZnEt_2$ and NO. Prepared by passing nitric oxide into a benzene solution of $ZnEt_2NaEt$, obtained by adding sodium (12·7 g.) to cold zinc ethyl (100 g.). The product is successively treated with ether, alcohol, and water; zinc is ppd. by CO_2; the filtrate evaporated, and the sodium salt extracted by alcohol (Frankland a. Graham, *C. J.* 37, 570; *cf.* Frankland, *C. J.* 9, 89; Zuckschwerdt, *B.* 7, 291; *A.* 174, 302). The free acid is unstable. Its salts yield ethylamine on reduction by sodium-amalgam. Alcoholic potash forms ethylamine and nitric acid (Zorn, *B.* 15, 1008).—$NaC_2H_5N_2O_2$.—$CaA'_2 3aq$.—BaA'_2.—MgA'_2.—ZnA'_2.—$ZnA'_2 aq$.—$CuA'_2 \frac{1}{2}aq$: flat dark-blue needles (from alcohol).—AgA'.—$AgA'AgNO_3$.

NITRO-o-ETHYL-PHENOL $C_6H_3Et(NO_2).OH$. (212°–215°). Formed in small quantity by the action of nitrous acid on $C_6H_4Et.NH_2$ (Suida a. Plohn, *Sitz. W.* [2] 81, 245).—$BaA'_2 aq$: orange plates.

Di-nitro-*o*-ethyl-phenol $C_6H_2Et(NO_2)_2OH$. Formed from o-ethyl-phenol and cold HNO_3 (S. a. P.). Heavy oil.—BaA'_2 (at 100°). Yellow plates (from alcohol).

NITRO-*p*-ETHYL-ISOPROPYL-BENZENE $C_6H_3EtPr.NO_2$. (265°). Obtained from [4:1] C_6H_4EtPr and HNO_3 (Von der Becke, *B.* 23, 3194).

DI-NITRO-(β)-ETHYL-THIOPHENE $C_4H(C_2H_5)(NO_2)_2S$. Formed by nitration of (β)-ethyl-thiophene by passing air charged with its vapour into fuming HNO_3 (Bonz, *B.* 18, 552). Crystalline solid. With alcoholic KOH it yields a blue colouration, becoming red on longer exposure to the air, or by addition of more KOH.

NITRO-*o*-ETHYL-TOLUENE $C_6H_3MeEt(NO_2)$. Oil (Claus a. Pieszcek, *B.* 19, 3087).

Di-nitro-*o*-ethyl-toluene $C_6H_2MeEt(NO_2)_2$. Oil, not solid at 0°.

Di-nitro-*p*-ethyl-toluene. [52°]. Obtained, with an oily isomeride, by nitrating *p*-ethyl-toluene (Jannasch a. Dieckmann, *B.* 7, 1513).

Tri-nitro-*p*-ethyl-toluene $C_6HMeEt(NO_2)_3$. [92°]. Obtained by nitration (Glinzer a. Fittig, *A.* 136, 303). Prisms (from alcohol).

Nitro-ethyl-*p*-toluidine $C_6H_3Me(NO_2).NHEt$ [4:3:1]. [48°]. Formed from ethyl-*p*-toluidine (1 pt.), H_2SO_4 (20 pts.), and HNO_3 (Nölting a. Stricker, *B.* 19, 549). Flat red prisms, v. sol. alcohol.

Nitro-ethyl-*p*-toluidine $C_6H_3Me(NO_2).NHEt$ [4:2:1]. [59°]. Formed by heating nitro-*p*-toluidine with EtI (Gattermann, *B.* 18, 1483; Niementowski, *B.* 20, 1883). Red crystals (from alcohol), v. sol. ether.

Acetyl derivative (245°–250° at 150mm.).

Di-nitro-ethyl-o-toluidine. *Nitramine.* [1:3:5:6] $C_6H_2Me(NO_2)_2.NEt(NO_2)$. [72°]. Formed, in small quantity, by the action of HNO_3 on di-ethyl-o-toluidine (Van Romburgh, *R. T. C.* 3, 402). Yellow crystals (from alcohol).

Di nitro-ethyl-*p*-toluidine $C_6H_2Me(NO_2)_2NHEt$ [1:3:5:4]. [126°]. Formed by nitration of nitro-ethyl-*p*-toluidine (Gattermann, *B.* 18, 1485). Orange crystals.

Nitrosamine $C_7H_5(NO_2)_2.NEt(NO)$. [78°].

Nitramine $C_6H_2Me(NO_2)_2.NEt(NO_2)$. [116°] (R.; G.); [106°] (N. a. L.). Formed from di-ethyl-*p*-toluidine and fuming HNO_3 (Van Romburgh, *R. T. C.* 3, 408). Formed also from $C_6H_4Me(NEtAc)$ and dilute (10 p.c.) HNO_3 (Norton a. Livermore, *B.* 20, 2271). Converted by boiling NaOHAq into di-nitro-*p*-cresol [83°].

TRI-NITRO-ETHYL-o-XYLENE $C_6Me_2Et(NO_2)_3$. [121°]. Needles (from alcohol) (Fittig a. Ernst, *A.* 139, 193; Stahl, *B.* 23, 992).

Tri-nitro-ethyl-*m*-xylene. [127°]. Formed from ethyl-*m*-xylene, HNO_3, and H_2SO_4 (Stahl). White needles, m. sol. alcohol.

Tri-nitro-*s*-ethyl-*m*-xylene. [138°]. Needles, v. sl. sol. alcohol (Jacobsen, *B.* 7, 1434).

Tri-nitro-ethyl-*p*-xylene. [129°]. Prisms (from hot alcohol) (Jacobsen, *B.* 19, 2516).

NITRO-EUGENOL $C_{10}H_{11}NO_4$ *i.e.* $C_6H_2(C_3H_5)(NO_2)(OMe)(OH)$ [1:5:3:4]. [44°]. Formed by nitration of eugenol (Weselsky a. Benedikt, *M.* 3, 387). Triclinic crystals, sl. sol. water. Volatile with steam.

Acetyl derivative [61°]. Tables.

NITRO-EUXANTHIC ACID *v.* EUXANTHIC ACID.

NITRO-PSEUDO-FLAVENOL *v.* FLAVENOL.

NITRO-FLUORANTHENE *v.* FLUORANTHENE

***p*-NITRO-FLUORENE** $C_{13}H_9NO_2$ *i.e.*

$CH_2\langle{}^{C_6H_3(NO_2)}_{C_6H_4-\!\!-\!\!-}\rangle$. [151°] (H.); [154°] (S.). Formed from fluorene, HOAc, and HNO_3 (Hodgkinson, *C. J. Proc.* 1, 37; Strasburger, *B.* 17, 107). Prisms, v. sl. sol. alcohol.

Di-nitro-fluorene  $CH_2\langle{}^{C_6H_3(NO_2)}_{C_6H_3(NO_2)}\rangle$. [201°]. Formed by nitrating fluorene (Fittig a. Schmitz, *A.* 193, 134). Needles (from HOAc).

DI-NITRO-FLUORESCEÏN $C_{20}H_{10}(NO_2)_2O_5$. Formed from fluoresceïn (1 pt.), H_2SO_4 (20 pts.), and HNO_3 (2 pts.) at 0° (Baeyer, *A.* 183, 1). Amorphous yellow powder.

Di-acetyl derivative. Pale-yellow needles (from alcohol). On boiling for some minutes with dilute (15 p.c.) KOH it forms a blue solution.

Tetra-nitro-fluoresceïn $C_{20}H_8(NO_2)_4O_5$. Formed from fluoresceïn (1 pt.) and fuming HNO_3 (5 pts.) Colourless crystals (from HOAc). Its alcoholic solution is yellowish-red, and, on adding an acid, becomes first reddish-violet and then colourless.

NITROFORM *v.* TRI-NITRO-METHANE.

NITRO-FURFURYL-ETHYLENE $C_4H_3O.CH:CH(NO_2)$. [184°]. From furfuraldehyde and an alkaline solution of nitro-ethane (P.). Yellow prisms.

Nitro-furfuryl-nitro-ethylene $C_4H_2(NO_2)O.CH:CH(NO_2)$. [144°]. Yellow felted needles. Formed by nitration of furfuryl-nitro-ethylene. It is oxidised by CrO_3 to nitro-pyromucic acid.

Dibromide: [111°]; yellow prisms (Priebs, *B.* 18, 1362).

NITROGEN. N. (*Azote.*) At. w. 14·01. Mol. w. 28·02. Boils at −194·4° (Olszewski, *W.* 31, 58). According to Sarrau (*C. R.* 94, 639, 718, 845) the critical temperature of N is −123·8°, and the critical pressure is 42·1 atmos. S.G. (gas) ·97247 (air = 1). S.G. (liquid) ·885 (water = 1) at b.p. (O., *l.c.*; *cf.* Wroblewski, *C. R.* 102, 1011). S.G. (gas) at 3000 atmos. (water = 1) ·823 (Amagat, *C. R.* 107, 522). V.D. 14 (von Jolly, *W.* 6, 536). S.H.p. (equal wt. of water = 1) ·2368; (equal volume of air = 1) ·2377 (Regnault, *Acad.* 26, 302). C.E. ·0036677 (von Jolly, *P. Jubelbd.* 82). S. ·01843 at 4°, ·01751 at 6·2°. ·0152 at 12·6°, ·01436 at 17·7°, ·01392 at 23·7°; the absorption-coefficient $= {\cdot}020346 - {\cdot}00053887t + {\cdot}000011156t^2$ (Bunsen, *Gasom. Methoden* [2nd ed.] 209). S. (alcohol) ·12561 at 1·9°, ·12384 at 6·3°, ·12241 at 11·2°, ·12148 at 14·6°, ·12053 at 19°, ·11973 at 23·8°; absorption-coefficient $= {\cdot}126338 - {\cdot}000418t + {\cdot}000006t^2$ (Carius, *A.* 94, 136; Bunsen, *Gasom. Methoden* [2nd ed.] 209).

$$\text{Refraction-equivalent}\left(\frac{\mu-1}{d}\,.\,\text{At. w.}\right) = 4{\cdot}1 \text{ to } 5{\cdot}3$$

(Gladstone, *Pr.* 18, 49). Mean value of μ for white light = 1·0003019; dispersion-power = ·2086 (Croullebois, *A. Ch.* [4] 26, 236; *v.* also Mascart, *P.* 153, 149). M.M. N^{v} c. ·114; N^{III} c. ·611 (Perkin, *C. J.* 55, 736). T.C. (air = 1) ·98 (Narr, *P.* 142, 123); ·993 (Plank, *Carl Rep.* 13, 164). H.C. $[N^2,O] = -17{,}740$; $[N,O] = -21{,}575$; $[N,O^2] = -2{,}005$; $[N^2,O^3,Aq] = -6{,}820$; $[N^2,O^5,Aq] = 29{,}820$ (*Th.* 2, 198); $[N^2,O^3] = -22{,}200$; $[N^2,O^5] = -1{,}200$; $[N^2,O^3,Aq] = -8{,}400$; $[N^2,O^5,Aq] = 28{,}600$ (Berthelot, *A. Ch.* [5] 20, 255). Coefficient of compressibility 750–1,000 atmos. ·000407, 1000–1500 atmos. ·000265, 1500–2000 atmos. ·00017, 2000–2500 atmos. ·000122, 2500–3000 atmos. ·000091 (Amagat, *C. R.* 107, 522). Transpiration-coefficient (O = 1) ·873 (Meyer a. Springmühl, *P.* 148, 526); ·885 (von Obermayer, *W. A. B.* 73 [2nd part], 433). Friction-coefficient at 0° = ·000184 (M. a. S., *l.c.*); ·0001659 (von O., *l.c.*). The spectrum of N varies much; there are two distinct spectra, known as the elementary line spectrum and the band-spectrum (for measurements of lines, *v. B. A.* 1884. 429; also Ames, *P. M.* [5] 30, 48).

Occurrence.—In the atmosphere, forming c. ⅘ths by volume. In the fluid-cavities of some specimens of rock-crystals (Davy, *T.* 1822. 367). In the air-bladders of fishes, and in other cavities of the bodies of animals and vegetables. In the gases from some fumaroles. In certain wells (*v.* L. Smith, *Am. S.* [2] 12, 366). Probably in the sun (Young, *Am. S.* [3] 4, 356; Draper, *ibid.* [3] 14, 89). Compounds of N occur in very large quantities throughout the animal, vegetable, and mineral, kingdom.

In 1772 Rutherford (*De aere mephitico*; Edinburgh, 1772) showed that the expired breath of animals contained a gas which extinguished flame, but which was not carbonic acid, as it was not absorbed by potash. A little later Lavoisier proved that this gas was present in air. As this gas did not support animal life, Lavoisier called it *azote* (ἀ and ζωή). Chaptal afterwards gave it the name *nitrogen*, because it was present in nitre.

Formation.—1. From air; by removing CO_2 by KOHAq, moisture and NH_3 by conc. H_2SO_4, and O by passing over red-hot Cu (*v. Preparation*, No. 1).—2. By passing air through a mixture of sawdust and Fe sulphide (obtained by saturating ppd. Fe_2O_3 with H_2S), and then through alkaline pyrogallate solution, and finally through conc. H_2SO_4. When the process is completed, passage of H_2S re-forms Fe sulphide, which may be used again.—3. By burning P in an inclosed quantity of air, over water, and allowing the P_2O_5 formed to dissolve in the water.—4. By passing air through conc. NH_3Aq, and then sending the mixture of air and NH_3 over Cu heated to redness; the CuO formed is reduced by the NH_3 (Lupton, *C. N.* 33, 90).—5. Berthelot (*Bl.* [2] 13, 314) partly covers with NH_3Aq c. 200 grams pure Cu turnings in a 10–14 litre flask, closes the flask by a cork carrying a safety funnel-tube, and a delivery tube which is stopped by a caoutchouc cap, and shakes from time to time. The O is thus completely removed from the air in the flask; the N may be obtained by pouring into the flask water previously freed from O by shaking with NH_3Aq and Cu; the gas should be passed through KOHAq, conc. H_2SO_4, and then through $CrCl_2Aq$ (B., *Bl.* [3] 2, 643).—6. By shaking FeO_2H_2, or MnO_2H_2, with air; the hydroxides are obtained by adding NaOHAq to conc. $FeSO_4Aq$ or $MnSO_4Aq$, and at once stopping the ingress of air.—7. By placing pyrogallic acid in a flask, adding NaOHAq, corking, and shaking for some time (*v.* Liebig, *A.* 77, 107).—8. By passing over Pt black a mixture of 100 vols. air (from which CO_2 has been removed) with 42 vols. H (Dumoulin, *L'Institut*, 1851. 11).—9. By passing Cl into rather dilute NH_3Aq, keeping the NH_3 always in large excess; $8NH_3 + 3Cl_2 = 6NH_4Cl + N_2$ (the experiment is dangerous, as NCl_3 may be formed and explode).—10. By warming conc. NH_4NO_2Aq; or more easily conc. KNO_2Aq mixed with 3 vols. conc. NH_4ClAq, whereby KCl and NH_4NO_2 are formed and the NH_4NO_2 is decomposed ($NH_4NO_2 = 2H_2O + N_2$; Corenwinder, *A.* 72, 225). Addition of conc. $K_2Cr_2O_7Aq$ oxidises N oxides (which are generally produced) to HNO_2 (*v. Preparation*, No. 2). Loew (*B.* 23, 3018) has found that a 4–5 p.c. solution of NH_4NO_2 is decomposed at the ordinary temperature by Pt black, with evolution of N.—11. By heating in a retort an intimate mixture of equal parts dry NH_4Cl and $K_2Cr_2O_7$, and passing the gas through $FeSO_4Aq$ to absorb NO which is generally formed. The chief change is represented approximately thus: $2NH_4Cl + K_2Cr_2O_7 = 2KCl + 4H_2O + Cr_2O_3 + N_2$.—12. By heating powdered $(NH_4)_2Cr_2O_7$, which decomposes to Cr_2O_3, H_2O, and N.—13. By adding conc. NH_4ClAq to a strongly alkaline conc. solution of NaBrO (prepared by adding Br to cold NaOHAq); N is evolved rapidly (? $3NaBrO + 2NH_4Cl = 3NaBr + 3H_2O + 2HCl + N_2$). Solution of bleaching-powder may be used, but there is danger of formation and explosion of NCl_3.—14. By heating a mixture of NH_4NO_3 and MnO_2 to c. 200° (not over 215°) ($4NH_4NO_3 + MnO_2 = Mn(NO_3)_2 + 8H_2O + 3N_2$; Gatehouse, *B.* 10, 1007).—15. N is evolved in the reactions of several metals with HNO_3; the gas evolved by the action of Zn on HNO_3Aq in presence of much NH_4NO_3 consists of c. 90 p.c. N, with N_2O and NO (Acworth, *C. J.* 28, 839).

Preparation.—1. A very slow stream of air is passed from a gasholder through U tubes containing slightly moistened KOH, to absorb CO_2, then through U tubes containing $CaCl_2$, to absorb H_2O, and then through a long hard glass tube, containing Cu turnings, or better Cu obtained by reducing CuO in H (Carius, *A.* 94, 126), and heated to bright redness in a furnace; the gas which issues is allowed to bubble through a solution of $CrCl_2$, to remove any traces of O which may remain, and is then dried by passing through $CaCl_2$ in several U tubes, and then over P_2O_5. Before the air-stream is started, the tube containing the Cu should be heated and a stream of H passed through it, to remove traces of CuO (this is not necessary, of course, if the Cu has been prepared by reducing CuO by H); after cooling, one end of the tube should be sealed and the other connected with a Sprengel-pump, and the Cu should be heated in a vacuum for some time. If this precaution is not taken, the N will contain H (von Jolly, *W.* 6, 536). The solution of $CrCl_2$ is prepared before use by digesting $CrCl_3Aq$ with scrap Zn and HClAq until a clear blue liquid is obtained, which is poured into Na acetate solution, in an atmosphere of CO_2; the red pp. of chromium acetate is washed with H_2O containing CO_2, and is then placed in a flask closed by a cork with entrance tube (to be attached to the N apparatus), exit tube, and a funnel though which HClAq is dropped on to the acetate, which is thereby changed to $CrCl_2$; the whole of the acetate is not dissolved, to avoid free HCl; the N apparatus is at once attached to the flask (O. von der Pfordten, *A.* 228, 112).—2. Solid NH_4Cl is added to an almost saturated cold solution of $NaNO_2$, when no more NH_4Cl dissolves the liquid is poured into a capacious flask, cold conc. $K_2Cr_2O_7Aq$ is added, about 1 pt. $K_2Cr_2O_7$ for each 1 pt. $NaNO_2$ used, and the mixture is gently warmed. The $K_2Cr_2O_7$ oxidises any oxides of N to HNO_3 (*v.* Gibbs, *B.* 10, 1387). It is advisable to pass the N through KOHAq to absorb any traces of Cl compounds coming from impurities in the salts used (Gibbs, *l.c.*).—3. A solution of 1 pt. $K_2Cr_2O_7$, 1 pt. NH_4NO_2, and 1 pt. $NaNO_2$, in 3 pts. water is warmed in a fair-sized flask (Böttger, *Jahr. des phys. Vereins zu Frankfort*, 1876–77. 24).

Properties.—A tasteless, colourless, odourless gas, which does not burn, nor support combustion, nor form a pp. with CaOAq. Liquid N is obtained by cooling the gas to −136° under a pressure of some hundred atmos., and then reducing pressure, not too suddenly, to not less than 50 atmos.; the N does not remain liquid for more than a few seconds. Liquid N is colourless, transparent, and shows a very sharp meniscus (Wroblewski a. Olszewski, *A. Ch.* [6] 1, 112). According to Cailletet (*A. Ch.* [5] 5, 132), N is liquefied, for a second or two, by subjecting the gas to 200 atmos. pressure at 13°, and then suddenly reducing the pressure. It has not been solidified. N is slightly lighter than air; 1 litre at the sea-level, lat. 45°, weighs 1·2574614 grams (von Jolly, *W.* 6, 536). N is very slightly sol. water (for S. *v.* beginning of this art.). Small quantities of N are absorbed by molten pig-iron, cast-iron, and steel (Parry, *Am. Ch.* 6, 107; Troost a. Hautefeuille, *C. R.* 76, 482, 562; 80, 909; Ledebur, *C. C.* 1873. 810). Wood charcoal also absorbs N; according to R. A. Smith, charcoal which has absorbed N and O, when exposed to the air for a time gives off O only (*Pr.* 12, 424; *cf.* Montmagon a. de Laire, *Bl.* [2] 11, 261). N is chemically inert; it combines slowly with O when electric sparks are sent through a mixture of the gases for some time; HNO_3 is formed when electrolytic gas ($H_2 + O$) is strongly compressed and then exploded in compressed air in presence of a little KOHAq, and also when C is burnt in a mixture of strongly compressed air and O (in presence of a little KOHAq) (Hempel, *B.* 23, 1455). N and H combine under the influence of the electric discharge. At or towards white heat N combines with B, Cr, Mg, Si, and V; probably also with Al, Fe, and Zn. The compounds of N are extremely numerous and exhibit great differences of properties. N is related chemically to P, V, As, Nb, Sb, Di, Er, Ta, and Bi; these elements form Group VI. Most of the oxides of N are acidic, none is basic; NH_3, however, is markedly basic and alkaline (*v.* NITROGEN GROUP OF ELEMENTS, p. 571).

The influence exerted on the molecular volumes of N compounds by the N atoms has not yet been measured satisfactorily (for a synopsis of data *v.* Kopp, *A.* 250, 1). The molecular rotatory power of N compounds varies according as the N atom is in direct union with 3 or 5 other atoms; but the exact numerical value to be assigned to N^{III} and N^{V} has not yet been finally determined (*v.* Perkin, *C. J.* 55, 680). Neither have final values been yet determined for the atomic refractions of N^{III} and N^{V}.

The atomic wt. of N has been determined (1) by finding the ratio of Ag to $AgNO_3$, the at. wts. of Ag and O being known (Marignac, *A.* 59, 289; Stas, *Rech.* 50; *Nouv. R.* 281); (2) by finding the ratio of NH_4Cl to Ag needed to ppt. the Cl (M., *l.c.*; Stas, *Rech.* 87; *Nouv. R.* 57).

Supposed allotropic form of nitrogen.—By passing a succession of powerful electric sparks through N at not more than 20 mm. pressure, Thomson a. Threlfall (*Pr.* 40, 329) observed a diminution in the volume of the N; at 8 mm. the diminution amounted to 8 to 10 p.c. of the original volume; after long warming to 100° the gas attained its original volume. T. a. T. supposed that an allotropic form of N is produced under these conditions. According to Johnson *C. J.* 39, 130), when N, obtained from KNO_2Aq and NH_4ClAq, is mixed with H, and the gases are passed over spongy Pt, NH_3 is formed; but NH_3 is not produced if the gases are passed through a hot tube before coming in contact with the spongy Pt. Johnson concluded that N can exist in two forms: one active and the other inactive, the latter being formed by the action of heat on the former (*v.* also Johnson's pamphlet, *Elementary Nitrogen, and on the Synthesis of Ammonia* [Churchill, 1885]).

Fixation of nitrogen by growing plants.—Experiments conducted in recent years tend to show that certain plants, notably *Leguminosæ*, are able to absorb N from the air and build up nitrogenous material therewith. The absorption of N seems to occur in nodules which grow on the roots of the plants. For an account of the more important experiments up to the early part of 1890 *v.* Lawes a. Gilbert, *Pr.* 46, 85; abstract in *N.* 42, 41: *v.* also Atwater a. Woods, *Am.* 12, 526; also Schloesing a. Laurent, *C. R.* 111, 750; abstracts in *C. J.* 60, 353.

Reactions and Combinations.—1. Combines with *oxygen* to form NO_2 when electric sparks are sent through the gases for some time. When air is strongly compressed and mixed with compressed O and some electrolytic gas ($H_2 + O$), an open tube containing KOHAq is placed in the vessel, and a spark is passed, a considerable quantity of KNO_3 is found in the KOHAq (Hempel, *B.* 23, 1455). HNO_3 is also formed by exploding $H_2 + O$ in air at the ordinary pressure standing over Hg (Bunsen, *Gasom. Methoden* [2nd ed.], 71). Nitrites, or HNO_2, are formed in very small quantities in certain cases of combustion in air, *e.g.* when P, H, or ether is slowly burnt (Schönbein, *J. pr.* 84, 193; 86, 129; Berthelot, *A. Ch.* [5] 12, 440; *C. R.* 108, 543; Kolbe, *A.* 119, 176; Zöller a. Grete, *B.* 10, 2145; Ilosva, *Bl.* [3] 2, 734). It is doubtful whether the nitrites are produced by the oxidation of N or of NH_3 in the air; the experiments of L. T. Wright (*C. J.* 35, 42) tended to show that nitrites are not formed by burning H in air from which NH_3 has been carefully removed. According to Ilosva (*Bl.* [3] 2, 734), nitrites are formed by passing air over Pt black heated to c. 250°. Loew (*B.* 23, 1443) showed that small quantities of nitrites are produced when pure Pt black is treated with pure NaOHAq in the air. Neither of these sets of experiments proves conclusively that the N, and not the NH_3, of the air was the source of the N of the nitrites produced. Schönbein's statement that N combines with *ozone* has been disproved by Carius (*A.* 174, 31).—2. N combines with *hydrogen* to form NH_3 under the influence of the electric discharge (Chabrier, *C. R.* 75, 484; Donkin, *Pr.* 21, 281; Morren, *C. R.* 48, 432; Perrot, *C. R.* 49, 204; *cf.* Johnson, *C. J.* 39, 130; and Wright, *C. J.* 39, 359). Ramsay a. Young assert that a trace of NH_3 is formed when a mixture of moist N and H is passed through a red-hot tube containing iron filings (*C. J.* 45, 93).—3. At a very high temperature N combines with *boron, chromium, magnesium,* and *silicon*, and probably also with *aluminium, iron,* and *zinc*, to form nitrides (*v.* these elements).—4. N combines with *carbon* to form C_2N_2, when induction-sparks are passed between C poles in an atmosphere of N (Morren, *C. R.* 48, 342). Cyanides are formed when a mixture of C with oxide of an alkali, or alkaline earth, metal is heated in N; Hempel (*B.* 23, 3390) has shown that considerable quantities of cyanides are thus formed if the reaction occurs at pressures from 10 to 60 atmospheres.

Detection of nitric nitrogen, i.e. N in combination as nitrite or nitrate. One part of N existing as a nitrite or nitrate in 20,000,000 parts of water suffices to give a violet-blue colour with a drop of diphenylamine sulphate in H_2SO_4 followed by 2 c.c. conc. H_2SO_4 and stirring (*v.* Warington, *C. J.* 45, 644).

Nitrogen, acids of. The compound N_3H, known as *hydrazoïc acid*, is described under *Nitrogen, hydrides of*, p. 559; for the *Oxyacids of nitrogen v.* p. 567.

Nitrogen, boride of, *v.* Boron nitride, vol. i. p. 527.

Nitrogen, bromide of. ?NBr_3. According to Millon (*A. Ch.* [2] 69, 75) the red, very explosive, oily, liquid formed by adding KBrAq to N chloride covered with a little water is a bromide of N.

Nitrogen, chloride of. NCl_3. This compound is frightfully explosive. Experiments must be conducted with small quantities and with the greatest care. V. Meyer (*B.* 21, 26) describes a glass case in which experiments with NCl_3 may be conducted.

Preparation.—1. A stick of NH_4Cl is suspended in as conc. HClOAq as can be obtained; an oily liquid slowly collects in a small leaden basin placed at the bottom of the vessel in which the reaction proceeds (*cf.* Troost a. Hautefeuille, *C. R.* 69, 152).—2. NH_4ClAq saturated at 35° is poured into a glass basin, and a glass cylinder, closed at one end by parchment, and partly filled with the same NH_4ClAq, is placed upright in the liquid in the basin; a Pt plate, forming the positive pole of a battery of at least 6 to 8 Grove or Bunsen cells, is immersed in the NH_4ClAq in the cylinder, and the negative pole—also a Pt plate—is placed obliquely under the parchment which closes the lower end of the cylinder. A very thin layer of turpentine is spread on the surface of the NH_4ClAq in the cylinder. When the current is sent through the liquid very small oily drops form at the positive pole and float to the surface, where they explode on coming into contact with the turpentine (Böttger a. Kolbe, *A.* 64, 236; Böttger, *J. pr.* 68, 374).—3. About 30 grams pure NH_4Cl are dissolved in hot water, the solution is filtered if necessary, diluted to 1½ litres, and placed in a perfectly clean leaden basin; a small leaden basin with a handle is placed in the centre of the larger basin; a fair-sized, very clean flask is filled with Cl, and this flask is immersed in the NH_4ClAq, so that the mouth of the flask covers the small leaden dish. The apparatus is placed out of direct sunlight, in a glass case with double walls, having an open door at one end (*v.* V. Meyer, *B.* 21, 26). The Cl is slowly absorbed by the NH_4ClAq which rises in the jar; when about ½ of the Cl has disappeared, oily drops begin to be formed in the liquid; these drops increase in quantity and size, and at last sink into the small leaden dish. The leaden dish is very carefully removed, and its contents are poured into a small separating funnel made of very thin glass; the NH_4ClAq is removed by a pipette, the greatest care being taken that the liquid does not come into contact with any kind of organic matter; the oil in the funnel is repeatedly washed in the cold water till the washings are free from Cl, and a gentle stream of air is sent through the oil to remove the last traces of Cl. The oil is now allowed to drop from the funnel into a very small glass vessel, where it is dried by contact with a little bit of dry $CaCl_2$; the oil is then poured into a little weighed tube holding about 1 c.c., and closed by a loosely-fitting stopper. The very greatest care is required in conducting these operations, especially the removal of the oil from the separating funnel, as the rubbing of the glass tap against the funnel is very apt to cause explosion; when a little of the oil has been dropped into the vessel in which it is to be dried, another clean glass dish must at once be placed beneath the funnel, as explosion would occur if a trace of the oil should drop on to the table. (For more details *v.* Gattermann, *B.* 21, 751.) The oil thus obtained is a mixture of chlorinated ammonias $NH_{3-x}Cl_x$ (G., *l.c.*); the composition of portions of the oil varies. To prepare pure NCl_3, after washing the oil in a separating funnel till free from Cl, and separating the water as completely as possible, Gattermann passes a fairly rapid stream of pure Cl over the oil, which is in the narrow part of the funnel, for about ½ an hour; he then washes and dries the oil in the way described. The analysis was made by decomposing the oil by NH_3Aq, when N and HCl are formed (the HCl combining with excess of NH_3 to form NH_4Cl), and estimating Cl. The process is carried out by Gattermann (*l.c.*) by dropping the little weighing tube and the stopper (which is removed from the tube) into water in a flask, closed by a cork carrying a small dropping funnel and a tube passing downwards into a beaker of water, allowing about 20 c.c. conc. NH_3Aq to flow *very slowly* into the flask, when the decomposition is complete (about 4 hours are required) adding the water in the beaker to the contents of the flask, and boiling for a short time, adding HNO_3Aq and $AgNO_3Aq$, and weighing the AgCl formed.

Properties and Reactions.—A dark-yellow oil; S.G. c. 1·6 (determined by finding that the oil very slowly sank in $Fe_2(SO_4)_3Aq$, S.G. 1·578, Porret, Wilson, a. Kirk, *G. A.* 47, 56). Explodes when exposed to direct sunlight or the light of burning Mg. Explodes at c. 90°–95° when heated in a perfectly clean tube (*v.* G., *l.c.*); explodes on contact with wood, grease, oil, or almost any kind of organic matter. The explosion of NCl_3 is frightfully violent. The older observers said that explosions occurred under most curious and apparently contradictory conditions; *e.g.* contact with P, As, or Se caused explosion, but no explosion occurred by contact with C, S, gum, starch, or wax. Gattermann (*l.c.*) thinks that light was the cause of many of these explosions. The vapour of NCl_3 acts on the eyes and mucous membrane of the nostrils. NCl_3 is decomposed by conc. HClAq, giving NH_4Cl and Cl; NH_3Aq produces NH_4Cl and N; Hg forms $HgCl_2$ and N; SO_2Aq produces NH_3, H_2SO_4, and HCl; As_2O_3Aq and SH_2Aq also set free N.

The formation of NCl_3 from N and Cl would be accompanied by the disappearance of much heat. Deville a. Hautefeuille give $[N, Cl^3] = -38,000$ (*C. R.* 69, 152; *cf.* Ogier, *A. Ch.* [5] 20, 5).

Ch.* [8] 15, 82; Gladstone, *C. J.* 7, 51; Deville a. Hautefeuille, *C. R.* 69, 152; Böttger a. Kolbe, *A.* 64, 236; Böttger, *J. pr.* 68, 374; Gattermann, *B.* 21, 751.

Nitrogen, chlorophosphide, *v. Nitrogen, phosphochloride of*, p. 570.

Nitrogen, chlorosulphide of, *v. Nitrogen, sulphochloride of*, p. 571.

Nitrogen, fluoride of. Warren (*C. N.* 55, 289) says that a yellow oil, probably a fluoride of N, is obtained by electrolysing NH_4FAq; the oil explodes by contact with a gold wire.

Nitrogen, hydrides of.

Three compounds of N and H have been isolated, viz. *ammonia*, NH_3; *hydrazine*, N_2H_4; and *hydrazoïc acid* N_3H. Ammonia is described in vol. i. p. 196, and hydrazine in vol. ii. p. 706. As hydrazoïc acid has been isolated since the publication of vol. ii. this compound is described here:—

Hydrazoïc acid N_3H.  . (*Azoimide. Hydrogen nitride.*) This acid was discovered by Curtius in 1890 (*B.* 23, 3023).

Formation.—Ethyl benzoylglycollate reacts with N_2H_4 to form benzoyl-hydrazine and the ethyl salt of hydrazine acetic acid; thus,

$$C_6H_5CO.O.CH_2COOEt + 2N_2H_4$$
$$= C_6H_5CO.NH.NH_2 + NH_2.NH.CH_2.CO_2Et + H_2O.$$

By the reaction of benzoyl-hydrazine with $NaNO_2$ and acetic acid, benzoyl-azoimide is formed; thus, $C_6H_5CO.NH.NH_2 + NOOH = C_6H_5CO.N\!<\!\begin{smallmatrix}N\\ \vdots\\ N\end{smallmatrix} + 2H_2O$. By boiling this imide with NaOH the Na salts of benzoic and hydrazoic acids are produced; thus,

$$C_6H_5CO.N\!<\!\begin{smallmatrix}N\\ \vdots\\ N\end{smallmatrix} + 2NaOH$$
$$= C_6H_5COONa + NaN\!<\!\begin{smallmatrix}N\\ \vdots\\ N\end{smallmatrix} + H_2O.$$

By adding dilute H_2SO_4Aq and warming, hydrazoïc acid gas is evolved.

Preparation.—Ethyl hippurate is dissolved in as small a quantity as possible of boiling alcohol, $N_2H_4.H_2O$ is added in the ratio $C_6H_5CO.NH.CH_2.COOEt : N_2H_4.H_2O$; hippuryl hydrazine, $C_6H_5CO.NH.CH_2.CO.NH.NH_2$, separates on cooling. The crystals are recrystallised from alcohol, and dissolved in much warm water, with addition of rather more than a molecular proportion of $NaNO_2$; the solution is cooled to 0°, and mixed with excess of acetic acid, when lustrous tablets of a nitroso-compound (probably $C_6H_5CO.NH.CH_2.CO.N\!<\!\begin{smallmatrix}NO\\ NH_2\end{smallmatrix}$) separate; the crystals are collected by help of a filter-pump, washed with cold water, and dissolved in very dilute NaOHAq. This solution is gently warmed for a short time on the water-bath, and is then placed in a flask connected with a condenser and furnished with a dropping funnel. A flask containing $AgNO_3Aq$ is used as a receiver; dilute H_2SO_4Aq is allowed to drop very slowly into the boiling liquid in the flask; N_3H distils over with steam, and, reacting with the $AgNO_3$ in the receiver, produces AgN_3; the operation is continued so long as a pp. is produced in the receiver. The AgN_3 is collected by the help of the pump, and well washed with cold water; it must not be heated above 60°, else there is danger of a severe explosion. The AgN_3 is decomposed by boiling with dilute HClAq, the distillate is fractionated, and the portion which distils over in the early stages is collected separately from the rest. In this way a solution of N_3H containing 27 p.c. N_3H is obtained. By repeatedly fractionating with great care, N_3HAq containing over 90 p.c. N_3H is obtained; and all water can be removed from this solution by fused $CaCl_2$ (Curtius a. Radenhausen, *J. pr.* [2] 43, 207). The process of fractionation is often attended with explosions.

Properties and Reactions.—A 27 p.c. solution of N_3H is a thickish liquid, which sinks in water; it possesses an extremely offensive odour; with NH_3 it gives white clouds. Pure N_3H is a clear, colourless, very foully smelling, liquid. It boils at 37°. It is very explosive. When touched with a hot substance it explodes with violence; it also explodes when placed in a barometric vacuum. The solution of N_3H corrodes the skin and causes headache and giddiness. N_3HAq is a strong monobasic acid; it dissolves Fe, Zn, Cu, Al, and Mg with rapid evolution of H; it appears to dissolve slightly Au and Ag. With $AgNO_3Aq$ and $HgNO_3Aq$ white pps. of AgN_3 and HgN_3 are obtained. The affinity of N_3HAq is a little greater than that of acetic acid. The salts of N_3H are also very explosive, with the exception of those of the alkali and alkaline earth metals.

The following salts are described by Curtius (*B.* 23, 3032): $N(NH_{43})$, $(N_3)_2Ba$, N_3Hg, N_3Ag; salts of Cu, Fe, and Na were also prepared.

In connexion with N_3H *v.* Mendelejeff, *B.* 23, 3464.

Nitrogen, iodides of. (*Iodamines.*) Very explosive compounds containing N and I are obtained by rubbing I with conc. NH_3Aq, by pouring an alcoholic solution of I into NH_3Aq or alcoholic NH_3, by pouring NH_3 into alcoholic I, by pouring a solution of I in *aqua regia* into NH_3Aq or NH_4ClAq, by adding bleaching-powder solution (neutralised by acetic acid) to NH_4IAq; by adding NH_3Aq to a mixed solution of HCl and HIO_3, by the action of N chloride on KIAq, and by adding I and alcohol to 'white precipitate.' The products of these reactions are very dark-coloured powders, which explode, more or less readily and violently, by rubbing or striking. Analyses of these substances seemed to show that at least three different explosive compounds existed, viz. NI_3, NH_2I, and $N_2H_3I_3 (=NH_3.NI_3)$. For details and analyses *v.* Serullas, *P.* 17, 304; Millon, *A. Ch.* [2] 69, 78; Marchand, *J. pr.* 19, 1; Bineau, *A. Ch.* [3] 15, 71; Gladstone, *C. J.* 4, 34; 7, 51; Bunsen, *A.* 84, 1; Stahlschmidt, *P.* 119, 421; Champion a. Pellet, *Bl.* [2] 24, 447; Mallet, *Am.* 1, 4; Guyard, *A. Ch.* [6] 1, 358. Guthrie (*C. J.* [2] 1, 239), by adding I to conc. NH_4NO_3Aq or $(NH_4)_2CO_3Aq$ containing KOH, obtained a brown-black liquid, which, he said, had the composition $NH_3I.I$ (*v. post*).

Raschig (*A.* 230, 212) has re-examined the various methods of preparing and analysing N iodides. According to R., three compounds exist, NI_3, NH_2I, and NHI_2; but only NI_3 and NH_2I have been isolated by R.

Tri-iodamine NI_3. NH_4Cl and I in the ratio $NH_4Cl{:}6I(1{:}14{\cdot}24)$ were dissolved in KIAq, and NaOHAq was added in the ratio $NH_4Cl{:}4NaOH$, *i.e.* 2·99 parts NaOH for each part NH_4Cl used; the black pp. which forms was collected immediately (with the help of a filter-pump) and washed 6–8 times with cold water, as rapidly as possible, then dissolved in HClAq and analysed. Raschig (*l.c.*) expresses the reaction thus, $NH_4ClAq + 6IAq + 4NaOHAq$
$= NI_3 + NaClAq + 3NaIAq + 4H_2O$. NI_3 is rapidly decomposed by water to NHI_2. Mallet (*Am.* 1, 4) obtained NI_3 by triturating I with a large excess of the most conc. NH_3Aq, keeping temperature at or below 0°, pouring off the liquid and triturating with more NH_3Aq, repeating this several times, then agitating 2 or 3 times in a cooled flask with absolute alcohol, then with dry ether, and allowing the ether to evaporate. NI_3 is a heavy, nearly black, powder. According to Raschig (*l.c.*), the NI_3 prepared by the action of NH_3Aq on I is much more explosive than the iodide formed by the action of NH_4ClAq and NaOHAq on I. NI_3 dissolves in KCyAq, forming ICy, KOHAq, and NH_3Aq (Millon, *A. Ch.* [2] 69, 78; Raschig, *A.* 230, 212); KSCyAq reacts similarly, producing ICy, HI, KOH, NH_3, and H_2SO_4 (R., *l.c.*).

Di-iodamine NHI_2. Prepared similarly to NI_3, using the materials in the ratio
$NH_4Cl{:}4I{:}3NaOH$ (Raschig, *l.c.*). Mallet (*Am.* 1, 4) obtained this compound by triturating I with not very conc. NH_3Aq at the ordinary temperature, washing with water till NH_3 could not be detected in the washings, keeping under water for three days, washing with alcohol and ether, and allowing to dry. Gladstone obtained NHI_2 by acting on an alcoholic solution of I with NH_3 (*C. J.* 4, 34; 7, 51); with H_2S it gave HI and NH_3, with SO_2Aq the products were NH_3, HI, and H_2SO_4. Stahlschmidt obtained NHI_2 by adding alcoholic NH_3 to an alcoholic solution of I (*P.* 119, 421).

Mono-iodamine NH_2I. Raschig (*A.* 230, 212) expected to obtain this compound by the reaction of NH_4Cl and NaOH with I, using these materials in the ratio $NH_4Cl{:}2I{:}2NaOH$; but the pp. was very quickly decomposed by water to $NH_3.NI_3$. Millon (*A. Ch.* [2] 69, 78) gave the formula NH_2I to the iodide prepared by him, and Marchand (*J. pr.* 19, 1) confirmed this composition. Guyard (*A. Ch.* [6] 1, 358) describes a light-brown explosive compound, decomposed by light, exploding in contact with water, prepared by NH_3Aq reacting with I in an iodide solution; to this compound he gives the formula NH_2I; with an ammoniacal solution of a Cu salt it forms $Cu_2I_2.2NH_2I$.

Tri-iod-diamine $N_2H_3I_3 (=NH_3.NI_3)$. Obtained by mixing cold nearly saturated alcoholic solution of I and NH_3; decomposed by HClAq giving NH_3 and ICl in the ratio $2NH_3{:}3ICl$. This compound seems to have been obtained by Raschig (*A.* 230, 212) by mixing NH_4ClAq, I, and NaOHAq in the ratio $NH_4Cl{:}2I{:}2NaOH$, and washing the pp. with water.

Other compounds of nitrogen, iodine, and hydrogen. (1) *Iodammonium iodide*, $NH_3I.I$; a mobile brownish-red liquid, formed by adding finely powdered I to saturated NH_4NO_3Aq or $(NH_4)_2CO_3Aq$ mixed with about $\frac{1}{3}$ of an equivalent of KOH (Guthrie, *C. J.* [2] 1, 239). Soluble alcohol, ether, $CHCl_3$, CS_2, and KIAq; decomposes by heat, giving I and probably NH_3I; decomposes in the air to NH_3 and I; water forms NH_4I, HI, and NHI_2 which explodes producing N, I, and H_2O. According to Seamon (*C. N.* 44, 188), this compound is formed by acting on dry I with dry NH_3, and absorbing the excess of NH_3 by standing near H_2SO_4. S. describes the compound as a nearly black liquid, S.G. 2·46 at 15°, solidifying at −2°, decomposing slowly at 15°, quickly at 70°.

(2) *Compounds of ammonia with iodine.* α. $NH_3.I$, obtained by the action of NH_3 on I at 10° (Millon, *A. Ch.* [2] 69, 78); formed at 80° according to Raschig (*A.* 241, 253). β. $(NH_3)_3I$ formed at 20° (Bineau, *A. Ch.* [3] 15, 71; Raschig, *l.c.*). γ. $(NH_3)_2I$, formed at 0°. δ. $(NH_3)_5I_2$ formed at −10° (R., *l.c.*). It is doubtful whether these bodies are true compounds or not.

Nitrogen, oxides of. N forms five oxides: N_2O, NO, N_2O_3, NO_2, N_2O_5. N_2O_3 and N_2O_5 are the anhydrides of HNO_2 and HNO_3 respectively; NO_2 reacts with water to produce both HNO_2 and HNO_3; N_2O is obtained by the decomposition of HNOAq, but the acid has not been obtained from the oxide; NO is a neutral oxide. Whether N_2O_3 exists in the gaseous state is not yet finally settled; the other oxides, with the exception of N_2O_5, are gases under ordinary conditions. NO_2 exhibits polymerism; at low temperature the molecular weight corresponds with the formula N_2O_4, and at higher temperatures with the formula NO_2. Besides these five oxides, there is said to exist a pernitric oxide NO_3 or N_2O_6.

NITROUS OXIDE N_2O. (*Nitrogen monoxide. Laughing gas.*) Mol. w. 43·98. Melts at −99°, and boils at −92° (Wills, *C. J.* [2] 12, 21). S.G. 1·527. S.G. liquid N_2O ·9756 at −5°, ·937 at 0°, ·8964 at 10°, ·8365 at 20° (Andréeff, *A. Ch.* [3] 56, 317; *cf.* Wills, *C. N.* 28, 170; Wroblewski, *C. R.* 97, 166; Cailletet a. Mathias, *C. R.* 102, 1202). V.D. 22·1. S.H.p. (equal wt. of $H_2O = 1$) 16° to 207° = ·22616 (Regnault, *Acad.* 26, 1), 26° to 103° = ·2126, 27° to 206° = ·2241 (Wiedemann, *P. M.* [5] 2, 81). $\frac{\text{S.H.p.}}{\text{S.H.v.}}$ 1·3106 at 0°, 1·27238 at 100° (Clausius, *Mechan. Wärmetheorie*, i. 62). C.E. (22° to 98°) ·0037067 (von Jolly, *P. Jubelbd.* 82). S. 1·305 at 0°, 1·095 at 5°, ·92 at 10°, ·778 at 15°, ·67 at 20°; absorption-coefficient $= 1·30521 - ·045362t + ·0006843t^2$ (Carius, *A.* 94, 139). Absorption-coefficient in alcohol $= 4·17805 - ·069816t + ·000609t^2$ (Carius, *l.c.*). H.F. $[N^2, O] = -17,740$; $[NO, N] = 3835$ (*Th.* 2, 198). For vapour-pressures from −25° to 40° *v.* Regnault, *J.* 1863. 66.

Nitrous oxide was discovered by Priestley in 1776, and carefully studied by Davy.

Formation.—1. By dissolving Zn in HNO_3Aq (S.G. 1·2 diluted with an equal vol. of water).—2. By decomposition of NH_2OHAq by $AgNO_3$, $K_2C_2O_4$, &c., *v.* HYDROXYLAMINE, *Reactions*, No. 1 (vol. ii. p. 735).—3. By the gradual decomposition of $H_2N_2O_2Aq$ (*v. Hyponitrous acid*, p. 569).—4. By the action of $SnCl_2$ in HCl on HNO_3Aq or a nitrate.—5. By passing NO through SO_2Aq or an acid sulphite.—6. By the action of HNO_3Aq on Cu in presence of much $Cu2NO_3$; if NH_4NO_3 is present, much N_2O and N, with little NO, are produced (Acworth, *C. J.* 28, 828).

Preparation.—1. Pure NH_4NO_3 is slowly heated in a retort to a temperature at which gas begins to be given off. The gas flame is then lowered, and the decomposition allowed to proceed: $NH_4NO_3 = N_2O + 2H_2O$. It is best to make the NH_4NO_3 by neutralising pure dilute HNO_3Aq with pure NH_3Aq or $(NH_4)_2CO_3Aq$, evaporating till the B.P. gets to c. 120° and a drop solidifies on a cold plate, allowing to cool, and breaking up into small pieces. If the temperature rises above 250°, decomposition to N, O, and H_2O may occur with explosive violence; in the change $NH_4NO_3 = N_2O + 2H_2O$ c. 31,100 cals. are produced, whereas the change $NH_4NO_3 = N_2 + O + 2H_2O$ is accompanied by the production of c. 48,700 cals. (*Th.* 2, 205). To obviate explosions, Caseneuve (*D. P. J.* 257, 435) recommends to dry NH_4NO_3 carefully over a low flame, to bring the salt while warm into a retort or flask, to heat with a very small flame which is gradually increased till decomposition begins, and then to withdraw the flame. The gas is collected over hot water, brine, or Hg. If the gas is to be used as an anæsthetic, the greatest care should be taken that the NH_4NO_3 used is pure, and especially that it is quite free from NH_4Cl, else the N_2O may contain Cl; the gas should be passed through KOHAq and $FeSO_4Aq$, to absorb traces of Cl, NO_2, and NO.—2. A mixture of 5 parts $SnCl_2$, 10 parts HClAq S.G. 1·21, and ·9 parts HNO_3Aq S.G. 1·38, is heated to boiling, when pure N_2O is evolved in a regular stream; any alteration in the proportions may cause explosions (Campari, *C. C.* 1888. 1569).

Properties.—A colourless gas, with a slightly sweetish smell and taste. Supports combustion almost as well as O. When breathed, N_2O produces insensibility, which lasts for a short time only. It is often used as an anæsthetic in dental operations; for this purpose it is usually much compressed in iron bottles. N_2O is decomposed by heat, the decomposition being complete at c. 900°. H and N_2O forms an explosive mixture; most inflammable gases burn in N_2O. N_2O is liquefied at 0° by a pressure of c. 30° atmos.; the liquid occupies c. $\frac{1}{30}$ of the volume of the gas (Faraday, *A.* 56, 157). Liquid N_2O is colourless and very mobile; a drop burns when let fall on the skin; on evaporation much cold is produced; liquid N_2O boils in liquid CO_2. Metals dropped into liquid N_2O generally hiss as hot iron does in water. Glowing C swims on the liquid and burns briskly. Hg sinks and freezes; S, I, P do not react. Water freezes when added to liquid N_2O, but so sudden an evolution of vapour occurs that an explosion generally takes place (Faraday, *A.* 56, 157); nitric and sulphuric acids are frozen by liquid N_2O; alcohol, ether, and CS_2 mix, without freezing. By evaporating liquid N_2O in an air-stream, Wills (*C. J.* [2] 12, 21) obtained solid N_2O in some quantity; the solid is a snow-like substance, more compact than solid CO_2; when slightly warmed it melts, at c. −99°, and then boils, at c. −92°.

Reactions.—1. Decomposed by heat to N and O; change is complete at c. 900° (Langer a. V. Meyer, *Pyrochemische Untersuchungen* [Brunswick, 1885], 65; *cf.* Berthelot, *C. R.* 77, 1448).—2. Decomposed to N and O, by *electric sparks*. 3. Passed over red-hot *iron*, Fe_2O_3 and N are formed.—4. Potassium or sodium burns in N_2O setting free N.—5. Mixed with *hydrogen*, or other *combustible gas* such as CO, PH_3, H_2S, or a hydrocarbon, and brought to a flame, combustion ensues at the expense of the O of the N_2O (explosions occur with H).—6. *Easily burnt sub-*

stances, when inflamed and plunged into N_2O, burn almost as rapidly as in O; *e.g.* C, P, S, Na, &c.—7. Mixed with *oxygen*, and subjected to the electric discharge, NO_2 is formed.—8. A solution of N_2O in *water* is neutral to litmus; N_2O is, however, related to the acid $H_2N_2O_2$, as it is obtained by the decomposition of this acid in aqueous solution (*v. Hyponitrous acid*, p. 569). The hyponitrites may be regarded as compounds of the negative radicle N_2O with more positive oxides, *e.g.* $Ag_2O.N_2O$.

References to older memoirs.—Gay-Lussac, *G. A.* 58, 29; W. Henry, *Annals of Phil.* 24, 299, 344; Pleischl, *S.* 38, 461; Davy, *G. A.* 6, 105; Natterer, *P.* 62,133; Dumas, *C. R.* 27, 463.

Nitric oxide NO. (*Nitrogen dioxide. Deutoxide of nitrogen. Nitrous gas or air.*) Mol. w. 29·97. V.D. 15; not changed from −100° to 1200° (Daccomo a. V. Meyer, *B.* 20, 1832; Langer a. Meyer, *Pyrometrische Untersuchungen* [1885] 66). S.H.p. (equal wt. of H_2O = 1) 13° to 172° = ·23173 (Regnault, *Acad.* 26, 1); S.H.v. (equal wt. of H_2O = 1) ·1652 (Clausius, *Mechan. Wärmetheorie*, 1, 62). S. c. ·05 at ordinary temp. S. (in alcohol) ·309 at 2°, ·282 at 11·8°, ·266 at 20° (Bunsen, *Gasom. Methoden*, [2nd ed.] 227). S. (in H_2SO_4 S.G. 1·84) at 13° = 3·5; S. (in H_2SO_4Aq S.G. 1·5) at 18° = 1·7 (Lunge, *B.* 18, 1391). H.F. [N, O] = −21,575; $[N^2O,O]$ = −25,410.

NO is liquefied at the following temperatures and pressures (Olszewski, *C. R.* 100, 940):—

Pressure in atmos.	71·2	57·8	49·9	41
Temperature . .	−93·5°	−97·5°	−100·9°	−105°
Pressure in atmos.	31·6	20	10·6	5·4
Temperature . .	−110·9°	−119°	−129°	−138°
Pressure	1 atmo.	138 mm.	18 mm.	
Temperature . .	−153·6°	−167°	−176·5°.	

The critical temp. is c. −93·5° according to Olszewski; but according to Cailletet (*C. R.* 85, 1016) NO is liquefied at −11° under a pressure of 104 atmos., but not at 8° even under 270 atmos. pressure. NO solidifies at −167° (Olszewski, *l.c.*).

NO was discovered by Priestley and called by him *saltpetre-gas.*

Formation.—1. NO is probably formed in the first stages of those combustions in air whereby nitrites and nitrates are produced, *e.g.* in burning air with compressed O, in slowly burning P, ether, &c., in air (*v.* Nitrogen, *Reactions*, No. 1; p. 558). NO is also probably formed when electric sparks are passed through a mixture of N and O.—2. By reducing HNO_3Aq or HNO_2Aq; *e.g.* by reaction with Cu, by passing in SO_2, by electrolysis, &c. (*v.* Nitric acid, *Reactions*, Nos. 3, 4, 5; p. 520).—3. By reacting on KNO_3 with $FeCl_2Aq$ and HClAq, or with $FeSO_4Aq$ and H_2SO_4Aq.

Preparation.—1. A quantity of HClAq is divided into 2 equal parts; one portion is converted into $FeCl_2Aq$ by dissolving iron wire in it until it is saturated; the two portions are then mixed and placed in a retort or flask, KNO_3 is added in quantity nearly equal to that of the Fe used, and the whole is warmed ($6FeCl_2Aq + 8HClAq + 2KNO_3 = 6FeCl_3Aq + 2KClAq + 4H_2O + 2NO$). $FeSO_4Aq$ and H_2SO_4Aq may be substituted for $FeCl_2Aq$ and HClAq.—2. Cu cuttings are added to HNO_3Aq, S.G. 1·2, in a flask arranged so that it can be surrounded by cold water when desired; action begins after a little and red fumes of NO_2 are evolved; when the gas in the flask is quite colourless it is collected over cold water, or if required dry it is passed over solid dry KOH and then through conc. H_2SO_4. About 130 c.c. acid are used for 15 grams Cu. The HNO_3Aq used should not be more conc. than S.G. 1·2, and temperature must be kept as low as possible, else N_2O and N_2O_3 may be formed. If the action proceeds for some time the gas contains considerable quantities of N_2O, as the reaction of Cu with much $Cu(NO_3)_2Aq$ in presence of HNO_3 produces this gas (Acworth, *C. J.* 28, 828). But with all precautions, NO prepared by this method is always liable to contain N_2O and N (*v.* Acworth, *l.c.*). Carius (*A.* 94, 138) says NO can be obtained pure by passing the products of the reaction of Cu with HNO_3Aq into $FeSO_4Aq$, which absorbs NO but not N_2O or N, and then gently warming the solution thus obtained.—3. Kämmerer (*B.* 18, 3064) recommends to fill a Wolff's bottle with Cu turnings, add enough cold saturated $NaNO_2Aq$ to fill the bottle $\frac{1}{3}$, and then allow conc. H_2SO_4 to drop in little by little.—4. Thiele (*A.* 253, 246) prepares NO by adding conc. $NaNO_2Aq$ (free from carbonate) to $FeCl_2$ or $FeSO_4$ in HClAq.—5. SO_2 is prepared by heating Cu with conc. H_2SO_4, and passed into slightly warmed HNO_3Aq S.G. 1·15; the issuing gas is passed through wash-bottles wherein excess of SO_2 is absorbed ($3SO_2 + 2HNO_3Aq + 2H_2O = 3H_2SO_4Aq + 2NO$).

Properties.—A colourless gas; at great pressure and very low temperature, a colourless liquid; becomes solid at −167°. As NO combines with O immediately on coming into contact with air, it cannot be determined whether pure NO is or is not tasteless and odourless. Sl. sol. water, v. sl. sol. H_2SO_4, less sol. H_2SO_4Aq. NO does not change the colour of litmus. Substances which produce much heat when burning, *e.g.* P and C, continue to burn in NO if plunged into the gas when burning vigorously; burning S or H, or a burning taper, ceases to burn in NO. A mixture of NO and H is not explosive. NO is reduced to N_2O by Zn, Fe, SO_2, &c. At a very high temperature, c. 1700°, NO is decomposed to N and O.

The S.G. of NO has been determined from −100° to 1200° (*v.* beginning of this article), for this temperature-interval the molecular formula is NO.

NO is a neutral oxide. In the compound NOCl, formed by the union of NO and Cl, NO acts as the more positive radicle; it also perhaps takes the part of the positive radicle in nitrosulphuric acid, which may be regarded as $SO_2.OH.ONO$.

Reactions.—1. Decomposed into N and O by *heat*, but only at a very high temperature; c. 1700°, according to Langer and V. Meyer (*Pyrochemische Untersuchungen*, 66).—2. *Electric sparks* produce N_2O (which then goes to N and O) and O (Berthelot, *Bl.* [2] 26, 101).—3. Reduced to N_2O by many *easily oxidised* substances, *e.g.* moist *zinc* or *iron* filings (NH_3 also is produced), *sulphur dioxide and water* (reductions occurs even in presence of O if H_2SO_4 is also present, *v.* Lunge, *C. J.* 47, 465), *hot copper*, &c.—4. Heated with *potassium* or *sodium*, K_2O or Na_2O and N are formed.—5. Passed over red-hot *carbon* N and CO_2 are obtained.—6. Mixed with *hydrogen* and inflamed, H_2O and N are formed; NH_3 is formed by passing a mixture of NO and H over spongy Pt (L. Wright, *C. J.* 39, 357).—7. The *copper-zinc couple* acting on NO in presence of water produces NH_3 (Gladstone a. Tribe, *C. J.* 43, 341).—8. *Stannous chloride*, in presence of HClAq, produces $NH_2OH.HCl$, N, and $SnCl_4$; the action ceases at 100° (Divers a. Haga, *C. J.* 47, 623).—9. When a flame is brought to a mixture of NO and *carbon disulphide*, CO_2, SO_2, and N are produced very rapidly, and with a brilliant white flash.—10. In contact with *water* in the dark slowly produces HNO_2Aq, N, and a little N_2O (Cooke, *C. N.* 58, 115; *cf.* Russell a. Lapraik, *C. J.* 32, 37).—11. Contact with conc. *potash solution* causes a slow formation of KNO_2Aq, N_2O, and N (Gay-Lussac, *Gm.* 2, 378; Russell a. Lapraik, *C. J.* 32, 35).—12. With *alkaline solution of pyrogallol* N_2O and N are formed (R. a. L., *l. c.*).—13. Reduced to NH_3, with separation of I, by conc. *hydriodic acid* solution (Chapman, *C. J.* [2] 5, 166).—14. An *alkaline solution of stannous hydroxide* ($=K_2SnO_2$) produces $K_2N_2O_2$ and K_2SnO_3 (Divers a. Haga, *C. J.* 47, 361).—15. *Ferrous hydroxide*, in presence of much conc. KOHAq, reduces N_2O to NH_3 (D. a. H., *l. c.*).—16. Oxidised to HNO_3Aq by an alkaline solution of *potassium permanganate*, with separation of $MnO_2.xH_2O$ (Wanklyn a. Cooper, *P. M.* [5] 6, 288).—17. Oxidised to NO_2 and N_2O_3 by *nitric acid* of S.G. $>1{\cdot}15$.—18. With *nitric acid in sulphuric acid*, $SO_2.OH.ONO$ is produced.—19. With *oxygen and water* NO is wholly oxidised to HNO_3Aq (Lunge, *C. J.* 47, 465).—20. With *oxygen and conc. sulphuric acid* forms $SO_2OH.ONO$ (L., *l.c.*).

Combinations.—1. With *oxygen* to form NO_2. According to Lunge (*C. J.* 47, 465), NO_2 is the chief or only product when excess of O is used, but with excess of NO both NO_2 and N_2O_3 are formed.—2. With *ferrous salts* in solution, to form deep-brown coloured liquids. Gay (*A. Ch.* [6], 5, 145) finds that the quantity of NO absorbed is independent of the kind of ferrous salt used and of dilution. It is proportional to the quantity of Fe in solution, and varies with temperature and pressure. The relation between quantity of NO absorbed and pressure is a special one; it resembles that which holds good in the solution of NH_3 by water. The solutions lose all NO *in vacuo*, or by passing a stream of H into them. The quantity of NO absorbed at 8° and 760 mm. nearly agrees with the formula $2NO.3FeSO_4$; between 8° and nearly 25° the formula $NO.2FeSO_4$ approximately expresses the quantity of NO absorbed; and at c. 25° the NO agrees with that required by $NO.5FeSO_4$. NO is also absorbed by *chromous*, *stannous*, and *mercurous salt solutions*.—3. With *antimony chloride*, to form $NO.2SbCl_3$; also with *aluminium*, *bismuth*, and *ferric chloride* (Beeson, *C. R.* 108, 1012).—4. NO combines with liquid N_2O_4 to form N_2O_3 (*q. v.*).

References to older memoirs.—Gay-Lussac, *A. Ch.* [3] 28, 229; Millon, *C. R.* 14, 908; Carius, *A.* 94, 138.

NITROGEN TRIOXIDE N_2O_3. (*Nitrous anhydride. Nitrogen sesquioxide.*) Mol. w. 75·9 (*v. infra*).

Formation.—1. By passing NO into liquid N_2O_4 at c. 20°, more or less pure liquid N_2O_3 is formed (Dulong, *A. Ch.* 2, 317; Péligot, *A.* 39, 327; Ramsay, *C. J.* 57, 590). According to Hasenbach (*J. pr.* [2] 4, 1), N_2O_3 is produced by passing a mixture of NO and NO_2 through a hot tube, and then into a vessel surrounded by a freezing mixture. Ramsay a. Cundall (*C. J.* 47, 672) showed that no contraction occurs when NO_2 and NO are mixed at the ordinary temperature.—2. By reacting on starch or As_2O_3 with HNO_3Aq S.G. 1·3 to 1·35 (Lunge, *B.* 11, 1641; Stenhouse a. Groves, *C. J.* 31, 545).—3. Fritzsche (*J. pr.* 22, 14) gently warmed red fuming HNO_3, condensed the vapour, again very gently warmed this liquid, and passed the vapour into a strongly cooled receiver; to 92 parts of the liquid thus obtained (chiefly N_2O_4) he added 45 parts of cold water very slowly, the liquid being kept very cold. Two layers of liquid were thus obtained; the under was very deep blue, and was regarded by Fritzsche as fairly pure N_2O_3; the upper layer, which was grass-green, was a solution of N_2O_3 and NO_2 in HNO_3Aq. By placing both liquids in a retort kept at 0°, the lower layer boiled, and a pure indigo-blue liquid condensed in the very strongly cooled receiver; this liquid consists chiefly of N_2O_3 according to Fritzsche. F. (*l.c.*) obtained a deep-blue liquid, containing, according to him, at least 93·4 p.c. N_2O_3, by distilling a large quantity of nitric acid which had been used in a battery, condensing the distillate in a vessel surrounded by snow and $CaCl_2$, and redistilling several times at the lowest possible temperature.—4. By the reaction of O on excess of NO, considerable quantities of N_2O_3 are produced (Lunge, *C. J.* 47, 466).—5. By dropping water on to 'chamber-crystals' (nitrosyl sulphate, $SO_2.OH.ONO$) (Streiff, *B.* 5, 285).

Preparation.—Pure N_2O_3 has not been obtained. 1. The gas obtained by reacting on starch or powdered As_2O_3 with HNO_3Aq S.G. 1·35 is nearly pure N_2O_3, according to Lunge (*B.* 11, 1229, 1641); the starch is made into a paste with water, and the acid is added from a dropping funnel; the flask is gently warmed, and then plunged into cold water. Stenhouse a. Groves (*C. J.* 31, 545) also recommend HNO_3Aq S.G.; the reaction proceeds at 70° with production of nearly pure N_2O_3.—2. Pure NO is passed into cold liquid N_2O_4. The product is not pure N_2O_3 (Ramsay, *C. J.* 57, 591). But *v.* Lunge, *Z. anorg. Chem.* 7, 209 [1894].

Properties. — The liquid obtained by condensing the gaseous product of the reaction between As_2O_3 and HNO_3Aq, S.G. 1·3, at 70°, passing the vapour of this liquid over P_2O_5, and condensing again, is deep blue; it does not solidify at $-90°$; it is miscible with liquid N_2O; O passed into liquid N_2O_3, mixed with N_2O_4, very slowly, if at all, combines with the N_3O_3; liquid N_2O_3 appears to dissociate slightly to NO and N_2O_4 at $-90°$ (Ramsay, *C. J.* 57, 597). Gaines (*C. N.* 48, 97) says that N_2O_3 liquefies at $-14{\cdot}4°$. According to Geuther, liquid N_2O_3 boils at 3·5°, and has the following S.G. 1·464 at $-8°$, 1·4555 at $-4°$, 1·451 at $-1°$, 1·449 at 0°, 1·4485 at 1°, 1·447 at 2°. Birhaus

(*C. R.* 109, 63) says that N_2O_3 solidifies at $-82°$; Ramsay found the blue liquid to remain liquid at $-90°$. (Birhaus's liquid probably contained N_2O_4, as it was formed by the action of O on excess of NO_2.)

Molecular weight of nitrogen trioxide.—Ramsay determined the lowering of the freezing-point of N_2O_4, after passing in NO and calculating the quantity of N_2O_3 produced by the increase in weight; his results, on the whole, are in favour of the formula N_2O_3 for the liquid compound. There has been much discussion as to the existence of this oxide in the state of gas. Some chemists deny the existence of a compound nN_2O_3, and say that the reactions of this supposed compound are those of a mixture of NO and NO_2 (containing variable quantities of N_2O_4 according to the temperature). As NO rapidly combines with O, a mixture of NO and NO_2 would also surely combine with O; but Ramsay a. Cundall have shown (*C. J.* 47, 187) that O acts very slowly on the blue liquid which, on the hypothesis of the non-existence of N_2O_3, is a mixture of NO and N_2O_4; this result is confirmed by Ramsay's later observations (*C. J.* 57, 597), and also by observations made by Richardson (*C. J.* 51, 397). Lunge has shown (*D. P. J.* 233, 63) that the gas from the blue liquid which has the empirical composition N_2O_3 is not wholly transformed into NO_2 even in presence of 10 times as much O as is required on the assumption that the gas in question is a mixture of NO and N_2O_4. Moreover, Ramsay a. Cundall (*C. J.* 47, 672) showed that although no change in appearance or volume occurs when NO_2 gas is mixed with NO, yet on lowering the temperature of the mixed gases, by HClAq and ice, a dark-blue liquid was formed (liquid NO is colourless, and liquid N_2O_4 is yellow-red). Again, Ramsay (*C. J.* 57, 597) found that the blue liquid does not freeze at $-90°$, but part of a mixture of NO and N_2O_4 would freeze at $-10°$, as this is about the freezing-point of N_2O_4. Some of the reactions of N_2O_3 with alkalis, H_2SO_4, &c., are scarcely those of a mixture of two substances (*v. Reactions*, 1, 2, and 5). According to Gay-Lussac (*G. A.* 58, 29) a mixture of excess of NO with O allowed to stand for a long time over KOHAq forms KNO_2Aq, and the gases disappear in the ratio required to form N_2O_3.

As regards the existence of N_2O_3 as a gas, Lunge's experiments show that the oxidation of the gas obtained by heating starch with HNO_3Aq S.G. 1·35 to NO_2 is not completed by a very large excess of O (*D. P. J.* 233, 63; *B.* 12, 357). Now, as Lunge has also shown (*C. J.* 47, 465), that NO_2 is the sole product, or almost the sole product, of the action of excess of O on NO, and therefore as soon as O is added to NO there must be present a mixture of NO, NO_2, and O, it is difficult to escape the conclusion that the action of a large excess of O on a mixture of NO and NO_2 must result in the formation of much NO_2; and that, therefore, the gas obtained by HNO_3Aq acting on starch, contains N_2O_3, which is not oxidised by O to N_2O_4. Ramsay a. Cundall (*C. J.* 47, 672) found that no contraction occurred on mixing NO_2 with NO; if any N_2O_3 were formed contraction must have occurred. R. a. C. prepared a blue liquid having the composition N_2O_3 (by action of HNO_3Aq on As_2O_3), and determined the V.D. of the gas obtained by gently warming the liquid. The V.D. was 22·35 at 18·2°; V.D. corresponding to $N_2O_3 = 38$. If the gas was supposed to be a mixture of NO, NO_2, and N_2O_3 (without any N_2O_4), there must have been present 17·63 p.c. N_2O_3 to raise the S.G. of $NO + NO_2$ to 22·35; hence the maximum percentage of N_2O_3 gas which could be present was 17·63; but as the gas certainly contained some N_2O_4, the percentage of N_2O_3 gas must have been less than 17·63. R. a. C. show that a mixture of NO, NO_2, and N_2O_4, having the same percentage of N and O as N_2O_3, would have the V.D. 23·42 under the conditions of their experiment, assuming a formula given by Willard Gibbs to be correct; hence they conclude that the gas examined by them was more probably a mixture of NO, NO_2, and N_2O_4, than a mixture of these gases with N_2O_3. R. a. C. also draw attention to the remarkable result of Lunge's experiments, which he has himself stated, that the dissociation of N_2O_3 (supposing it to exist as a gas) is almost independent of temperature. According to Luck (*Fr.* 8, 402) and Moser (*W.* 2, 139), the absorption-spectrum of the gas supposed to be N_2O_2 is identical with that of NO_2 (containing N_2O_4). On the question of the existence or non-existence of gaseous N_2O_3, besides the memoirs referred to, *v.* Lunge, *B.* 11, 1232, 1641; 12, 357; 15, 495; Witt, *B.* 12, 2188; Geuther, *A.* 245, 96.

Reactions.—1. Dissolves in *water* at 0°, forming a blue liquid; on warming, NO is evolved and HNO_3Aq remains; if the solution is neutralised by alkali, a mixture of a nitrite (MNO_2) and nitrate (MNO_3) is obtained. According to Fremy (*C. R.* 79, 61) addition of a little water causes evolution of pure NO, and HNO_3 is formed, but addition of much cold water produces a fairly stable solution, which may be kept unchanged for some days, and which slowly evolves NO and N_2O_3 on warming. Addition of sand, powdered $CaSO_4$, or other indifferent substance, causes rapid decomposition to HNO_3Aq and NO. The solution is a strong reducer; cold SO_2Aq forms various nitro-derivatives of S oxy-acids, warm SO_2Aq forms NO, N, NH_3, and H_2SO_4 (F., *l.c.*; *cf.* Reinsch, *J. pr.* 28, 399).—2. Passed into *alkali solution*, nitrite and nitrate are formed (*cf. Nitrous acid* and *Nitrites*, p. 567). Gay-Lussac (*G. A.* 58, 29) says that KNO_2 is formed by allowing O, mixed with a large excess of NO, to stand over KOHAq, and that the gases disappear in the ratio required to form N_2O_3.—3. Decomposes *urea* evolving N.—4. With *benzenoid primary amido- compounds*, forms diazo- compounds (*q. v.* vol. i. p. 397). With *paraffinoid amido-compounds*, the general result is to substitute OH for NH_2 and evolve N.—5. With conc. *sulphuric acid*, nitrosyl sulphate ($SO_2.OH.ONO$) is formed. As NO_2 reacts with conc. H_2SO_4 to form $SO_2.OH.ONO$ and HNO_3, and as NO passed into H_2SO_4 containing HNO_3 forms $SO_2.OH.ONO$ and H_2O, it is sometimes argued that the reaction of N_2O_3 with H_2SO_4 is easily explained by the view that regards N_2O_3 as a mixture of NO and NO_3; if this view is held, then the two reactions

(1) $2NO_2 + H_2SO_4 = SO_2.OH.ONO + HNO_3$;
(2) $HNO_3 + 2NO + 3H_2SO_4$

$= 3SO_2.OH.ONO + 2H_2O$ must proceed simultaneously and at equal rates, and the supposed mixture must never contain more NO than is shown by the ratio $NO:NO_2$, otherwise some NO would pass on unabsorbed. According to Lunge (*l.c.*) (confirmed by Groves, *C. S. Proc.* 1, 24), NO only slowly converts H_2SO_4 containing HNO_2 into $SO_2.OH.ONO$.

Combinations.—According to Weber (*P.* 118, 471) N_2O_3 combines with $SnCl_4$ and $TiCl_4$, *e.g.* to form $SnCl_4.N_2O_3$.

Nitrogen dioxide NO_2; and **Tetroxide** N_2O_4 (*Nitrogen peroxide. Nitroso-nitric anhydride*). The mol. w. of the compound N_nO_{2n} varies with temperature; at low temperatures and small pressure (c. −12° at 115 mm.) the mol. w. is $91·86 = N_2O_4$, and at moderately high temperatures (c. 150°) the mol. w. is $45·93 = NO_2$ (*v. infra*). N_2O_4 melts at −10° (Deville a. Troost, *C. R.* 64, 257; Ramsay, *C. J.* 57, 590). Boils at 21·64° (760 mm.; Thorpe, *C. J.* 37, 224). S.G. (liquid) $\frac{0^\circ}{4^\circ} = 1·4903$ (Thorpe, *l.c.*). V.D. at −12° and 115·4 mm. = 42·54 (Natanson, *W.* 27, 606); at 130° a. 718 mm. = 23·26 (Richardson, *C. J.* 51, 397); at 183° a. 760 mm. = 22·7 (Deville a. Troost, *C. R.* 64, 237); at 27° a. 16 to 35 mm. = 23·1 (Troost, *C. R.* 86, 1395). S.H. (liquid) ·46 (Ramsay, *C. J.* 57, 590); for S.H. at different temperatures *v.* Berthelot a. Ogier (*A. Ch.* [5] 30, 382). For heat of fusion *v.* Ramsay (*l.c.*). H.F. $[N,O^2] = -2,005$; $[NO,O] = 19,570$; $[N,O^2,Aq] = 5,750$ (*Th.* 2, 199). For electrical resistance of liquid N_2O_4 *v.* Boguski (*Z. P. C.* 5, 69). For absorption-spectrum *v.* Kundt (*P.* 141, 157), Gernez (*C. R.* 74, 465), Luck (*Z.* [2] 6, 287). For thermal expansion *v.* Thorpe (*C. J.* 37, 224).

Molecular weights of nitrogen peroxide.—The V.D. at low temperatures near the liquefying point corresponds with the formula N_2O_4, and the same formula expresses the molecular composition at c. 27° under a pressure of 16 to 35 mm.; when heated to c. 150° the V.D. shows that the molecular formula is NO_2. Measurements of V.D. are given by Deville a. Troost (*C. R.* 64, 257); Troost (*C. R.* 86, 1395); Playfair a. Wanklyn (*C. J.* 15, 156); E. a. L. Natanson (*W.* 27, 606); Richardson (*C. J.* 51, 397). That the change in V.D. measures a process of dissociation from N_2O_4 to NO_2 has been shown by Natanson (*l.c.*); Naumann (*A. Suppl.* 6, 205; *B.* 11, 2045); Salet (*C. R.* 67, 488). The amount of dissociation is increased by raising temperature or lowering pressure (*v.* especially Natanson, *l.c.*). Ramsay determined the lowering of the freezing point of acetic acid by dissolving N peroxide in it (*C. J.* 53, 621), and also the lowering of f. p. of C_6H_5Cl and $CHCl_3$ by the peroxide (*C. J.* 57, 590); both results tend to show that the mol. w. of the liquid compound is N_2O_4.

Formation.—1. By passing electric sparks through a mixture of O and N.—2. By bringing NO into contact with excess of air or O.—3. By heating $Pb(NO_3)_2$. — 4. By the action of $AgNO_2 + NO_2Cl$ (Exner, *C. C.* 1872. 273); but the existence of NO_2Cl is denied by Williams (*C. J.* 49, 226).—5. According to Hasenbach (*J. pr.* [2] 4, 1), by passing O into the liquid obtained by heating starch with HNO_3Aq and condensing; but the observations of Ramsay a. Cundall (*C. J.* 47, 187) show that O very slowly, if at all, combines with N_2O_3.—6. By the reaction between NOCl and KNO_3 (Girard a. Pabst, *Bl.* [2] 30, 351).

Preparation.—1. A mixture of dry NO and about an equal volume of dry O is passed over dry KOH, and then into a vessel cooled to −20°; solid N_2O_4 is thus obtained (Péligot, *A.* 9, 259; 39, 327; *cf.* Dulong, *G. A.* 58, 53; a. Lunge, *C. J.* 47, 465).—2. Dry powdered $Pb(NO_3)_2$ is heated in a tube of hard glass, and the gas is passed into a U tube cooled to c. −8°; a stream of dry O is passed through the liquid in the U tube for some time (Péligot, *l.c.*; Thorpe, *C. J.* 37, 224).—3. By very gently heating As_2O_3 with HNO_3Aq S.G. 1·5 and a little conc. H_2SO_4, and passing O into the liquid thus obtained (*cf.* Ramsay a. Cundall, *C. J.* 47, 187, with Lunge, *B.* 11, 1641).—4. By distilling fuming HNO_3 at a low temperature, and fractionating the distillate in a stream of dry O (Fritzsche, *J. pr.* 22, 21). Setlick (*C. C.* 1888. 461) has determined the yields of NO_2 obtained by the various processes.

Properties.—At temperatures below −10° a white, crystalline (? prismatic), deliquescent solid; between −10° and 21·6° a liquid, which is nearly colourless at −9°, yellow at 0°, and orange at 21°; at temperatures above 21·6°, a gas, the colour of which deepens from orange-yellow to nearly black as temperature rises. At c. 180°–200° decomposition to NO + O begins and is complete at c. 620° (Richardson, *C. J.* 51, 397; *cf. Reactions*, No. 1). The colourless liquid is N_2O_4; as this dissociates into NO_2 the colour becomes deeper and deeper red (*v.* Salet, *C. R.* 67, 488; also *v. supra*). The gaseous compound at ordinary temperatures is a mixture of NO_2 and N_2O_4; this gas is reddish-brown, has a pungent odour, is irrespirable, and stains the skin yellow. NO_2 dissolves in cold water, forming HNO_2Aq and HNO_3Aq; it is dissolved, apparently without change, by $CHCl_3$, C_6H_5Cl, CS_2 (Friedburg, *C. N.* 47, 52), and $C_6H_5NO_2$. As solution of NO_2 in HNO_3 does not show the absorption-lines of gaseous and liquid N_nO_{2n} it is probable that the solution in HNO_3 contains a compound or compounds of the two substances (Gernez, *C. R.* 74, 465). NO_2 probably combines with NO at low temperatures to form N_2O_3 (*cf. Combinations*, No. 1).

NO_2 is an acidic oxide, inasmuch as it reacts with H_2O to form HNO_2Aq and HNO_3Aq; because of this reaction it may be looked on as nitroso-nitric anhydride, or perhaps better (as there i no nitroso-nitric acid) as a mixed anhydride There are no salts corresponding with NO Numerous nitro- compounds are known, obtained by substituting the monovalent radicle NO_2 for H.

Reactions.—1. *Heat* dissociates N_2O_4 to $2NO_2$ (*v.* beginning of this article). At c. 180° a. 755 mm. decomposition to NO + O begins; at c. 400° about 33 p.c. of the NO_2 is decomposed, at c. 500° 60 p.c. is decomposed, and at c. 620° the change is complete; on cooling, the NO + O recombine to form NO_2 (Richardson, *C. J.* 51, 397).—2. *Electric sparks* are said to decompose NO_2 to N and O; according to Richardson (*C. J.* 51, 402) a very small quantity of a white solid is produced.—3. NO_2 dissolves in *water*; added to a little ice-cold H_2O a green solution is obtained, which becomes blue on dilution, and then colourless; the solution gives the reactions of HNO_2 and HNO_3. On warming NO_2Aq, or on adding NO_2 to hot water, NO is evolved and HNO_3Aq remains ($3NO_2 + H_2O + Aq = 2HNO_3Aq + NO$). The cold colourless solution of NO_2 in water may be raised to the boiling-point without a complete decomposition of the HNO_2Aq to HNO_3Aq and NO; addition of Pt wire or powdered glass, &c., causes decomposition of NO_2Aq with evolution of NO. NO_2Aq decomposes HIAq and iodides in solution with separation of I; it also deoxidises $KMnO_4Aq$.—4. With *aqueous solution of an alkali* NO_2 produces a nitrite and a nitrate.—5. *Sulphydric acid in solution* absorbs NO_2, evolving NH_3 and depositing S. — 6. NO_2 passed into *conc. sulphuric acid* forms HNO_3 and nitrosyl sulphate (lead-chamber crystals, $SO_2.OH.ONO$) (*v.* Lunge, *D. P. J.* 233, 65).—7. NO_2 dissolves in very *conc. nitric acid*, forming a yellow liquid, which is probably not merely a solution of NO_2 in HNO_3, inasmuch as it does not show the absorption-lines of gaseous or liquid N_2O_4, whereas a solution in CS_2 does show these lines (*v.* Gernez, *C. R.* 74, 465).—8. NO_2 reacts with many *carbon compounds* replacing H by NO_2; with *alcoholic iodides* it usually produces nitrates of the alcoholic radicle, *e.g.* $C_2H_5I + N_2O_4 = C_2H_5NO_3 + NO + I$.—9. With cold *boron chloride*, crystals $BCl_3.NOCl$ are formed (Geuther, *J. pr.* [2] 8, 854).—10. *Carbon monoxide* is said to be partly oxidised to CO_2, while part of the CO combines with NO_2.—11. When NO_2 is mixed with *hydrogen*, and the mixed gases are passed over spongy Pt, H_2O and NH_3 are formed.—12. Ordinary *combustibles* are extinguished in NO_2; but strongly burning *phosphorus* and *carbon* continue to burn.—13. Many *metals* decompose NO_2, forming oxides and N; Fe, Cu, &c., at a red heat, K and Na at the ordinary temperature.—14. Liquid N_2O_4 reacts with *mercury* to form $HgNO_3$ and NO without any nitrite; the equation $2N_2O_4 + 2Hg = 2HgNO_3 + 2NO$ is almost realised quantitatively (Divers a. Shimidzu, *C. J.* 47, 630). With *silver*, liquid N_2O_4 forms $AgNO_3$; *copper* probably forms $Cu_2(NO_3)_2$ (D. a. S., *l.c.*).—15. Liquid N_2O_4 reacts with *liquid sulphur dioxide* to form $(NO_2)_2.S_2O_5$ (De la Provostaye, *A. Ch.* [3] 73, 362).—16. With *sulphuric anhydride*, NO_2 gas forms $NO_2.S_2O_5.O.NO_2$ (Weber, *P.* 123, 337).

Combinations.—1. With *nitric oxide*, at low temperatures, to form a blue liquid which is chiefly N_2O_3 (Dulong, *A. Ch.* 2, 317; Peligot, *A.* 39, 327; Ramsay, *C. J.* 57, 590; Richardson, *C. J.* 51, 397). Ramsay a. Cundall (*C. J.* 47, 672) found that no contraction occurs when dry NO_2 and NO are mixed at the ordinary temperature. According to Hasenbach (*J. pr.* [2] 4, 1), N_2O_3 is formed by passing NO and NO_2 through a hot tube, and then into a well-cooled receiver.—2. With *chlorine*, and *bromine*, to form NO_2Cl, and NO_2Br, respectively (Gay-Lussac, *A. Ch.* [3] 23, 203; Landolt, *A.* 116, 177; but denied by Williams, *C. J.* 49, 226).—3. With *antimonic chloride*, to form $3SbCl_5.N_2O_4$; obtained by heating in a sealed tube at 100° (Besson, *C. R.* 108, 1012).—4. NO_2 also combines with the *chlorides of aluminium*, *antimony* ($SbCl_3$), *bismuth*, and *iron*; the compounds are decomposed by water, and also by a gentle heat (B., *l.c.*).—5. With *phosphorus pentafluoride*, to form crystals of $NO_2.PF_5$; very easily decomposed (Tassel, *C. R.* 110, 1264).—6. With *magnesium hydrogen phosphate*, to form $2MgHPO_4.NO_2$ (Luck, *Fr.* 1874. 255).—7. With *amylene* (and some other hydrocarbons) to form $C_5H_{10}(NO_2)_2$.

Constitution of N_2O_4.—From the reactions of liquid N_2O_4 with Hg and Ag, whereby $HgNO_3$, or $AgNO_3$, and NO are produced, Divers a. Shimidzu conclude that N_2O_4 is best represented as $NO.NO_3$ (*C. J.* 47, 630). This formula is in keeping with the reaction $AgO.NO + NO_2Cl = AgCl + NO.ONO_2$ (Exner, *C. C.* 1872, 273); this argument, however, assumes $AgNO_2$ to have the structure AgO.NO (*v. Nitrites*, p. 567); it also assumes the existence of NO_2Cl. The formation of nitrosyl sulphate by the reaction of N_2O_4 with H_2SO_4 is also in keeping with the formula $NO.NO_3$; $NO.NO_3 + H_2SO_4 = NO.HSO_4 + HNO_3$. Also, if nitrous acid is assumed to be HO.NO, then the formation of this acid and HNO_3 by the reaction of N_2O_4 with water points to the formula $NO.ONO_2$ ($NO.ONO_2 + H_2O = NO.OH + HO.NO_2$). The formation of diazo-benzene nitrate by the reaction of N_2O_4 with amido-benzene is in keeping with the formula $NO.ONO_2$; thus $C_6H_5.NH_2 + NO.ONO_2 = NO_2.O.N{:}N.C_6H_5 + H_2O$. The formation of $C_2H_5.ONO_2$ by the reaction of N_2O_4 with C_2H_5I is best expressed by writing N_2O_4 as $NO.ONO_2$ ($C_2H_5I + NO.ONO_2 = C_2H_5.ONO_2 + I + NO$). The fact that $C_5H_{10}(NO_2)_2$ when reduced by Sn and HClAq yields NH_4Cl and not an NH_2 compound, induced V. Meyer (*A.* 171, 5) to assign to N_2O_4 the formula $NO.O_2.NO$, and to write $C_5H_{10}(NO_2)_2$ as $C_5H_{10}(ONO)_2$; because had the C been in direct union with N, an NH_2 compound would have been formed on reduction. N_2O_4 is dissociated by heat to $2NO_2$; this reaction seems to point to the constitution $O_2N.NO_2$, or perhaps to $NO.O_2.NO$. Whichever formula is adopted, the reactions of N_2O_4 make it evident that some substances separate the group NO_2, and others the group ONO, and that the way in which the molecule N_2O_4 splits up depends largely on the conditions of the reaction.

NITROGEN PENTOXIDE N_2O_5 (*Nitric anhydride*). Mol. w. uncertain, as compound has not been gasified.

Formation.—1. By passing Cl over $AgNO_3$ ($2AgNO_3 + Cl_2 = 2AgCl + N_2O_5 + O$).—2. By dehydrating conc. HNO_3 by P_2O_5 ($2HNO_3 + P_2O_5 = 2HPO_3 + N_2O_5$).—3. By the reaction of NO_2Cl on $AgNO_3$ at 60°–70° ($AgNO_3 + NO_2Cl = AgCl + N_2O_5$; Odet a. Vignon, *C. R.* 69, 1142; 70, 96; but the existence of NO_2Cl is very doubtful, *v.* Williams, *C. J.* 49, 226).

Preparation.—1. Perfectly dry $AgNO_3$ is placed in a dry U tube, which is connected by a glass tube, without corks or caoutchouc, with another dry U tube having a small reservoir at the bottom; the U tube containing $AgNO_3$ is immersed in a water-bath, and the other U tube is surrounded by ice and salt; a very slow stream of dry CO_2 is passed through the apparatus, the $AgNO_3$ being kept at c. 180° (to expel every trace of moisture); a very slow stream of dry Cl is then passed from a gasholder (the Cl being stored over conc. H_2SO_4, and driven out by the inlet of H_2SO_4), the $AgNO_2$ being heated to 95°, and the temperature then lowered to 58°–68°. After a time crystals of N_2O_5 appear in the cooled U tube, while a little liquid (N_2O_4 or N_2O_3) collects in the small reservoir. Not more than 3 to 4 litres Cl should pass in 24 hours. To transfer the N_2O_5 to another vessel, the Cl is replaced by a current of dry CO_2, the U tube is connected by a glass tube with the vessel, which is immersed in a freezing mixture, the U tube is removed from its freezing mixture, and the N_2O_5 is poured into the vessel (Deville, *A. Ch.* [3] 28, 241).—2. Very conc. HNO_3 is surrounded by ice and salt, rather more P_2O_5 than the wt. of HNO_3 is added little by little, so that the temperature does not rise above 0°, the thick mass is brought into a wide retort and distilled at as low a temperature and as slowly as possible, the retort being cooled if the liquid froths; pure N_2O_5 condenses in the cooled receiver, but towards the end of the reaction liquid $2N_2O_5.H_2O$ is formed (Berthelot, *Bl.* [2] 21, 53; a modification of the process given by Weber, *J. pr.* [2] 6, 342). About 80 grams N_2O_5 are obtained from 150 gr. HNO_3.

Properties and Reactions.—Very lustrous, translucent, rhombic prisms; melts c. 30°, with partial decomposition to N_2O_4 and O, and boils between 45° and 50°. N_2O_5 should be kept in stoppered bottles over H_2SO_4. At c. 15° the crystals become yellowish, but are colourless when kept in a freezing mixture (Weber, *l.c.*). S.G. c. 1·64. H.F. $[N^2,O^5] = -31,600$ (Berthelot, *A. Ch.* [5] 6, 145); $[N^2,O^5,Aq] = 29,820$ (*Th.* 2, 199), N_2O_5 decomposes slowly when kept, rapidly in sunlight, giving N_2O_4 and O (Berthelot, *Bl.* [2] 21, 53). Burning P burns brightly in slightly-warmed N_2O_6; C burns in the vapour of N_2O_5, but not in the solid or liquid compound; K burns brightly, but most of the metals are without action on N_2O_5; with S there is formed $(NO_2)_2S_2O_5$ (Weber, *l.c.*). N_2O_5 reacts with water to form HNO_3. With conc. HNO_3, it produces $H_2N_4O_{11}$ ($=2N_2O_5.H_2O$, or $N_2O_5.2HNO_3$; *v. Dinitric acid*, under NITRIC ACID, p. 520). The reactions of N_2O_5 point to the constitution $NO_2.O.NO_2$.

PERNITRIC OXIDE NO_3 or N_2O_6. According to Hautefeuille a. Chappuis (*C. R.* 92, 80, 134; 94, 1111, 1306), a very unstable compound of this composition is obtained by the action of the silent electric discharge on a mixture of N and O at a low temperature. When a certain quantity is formed, the substance begins to decompose to NO_2 and O. Berthelot (*Bl.* [2] 35, 227) says that the compound is obtained by the action of the induction discharge on a mixture of O and NO_2. The compound is described as a liquid which does not solidify in a freezing mixture of ice and salt, and is extremely unstable, decomposing to NO_2 and O.

Nitrogen, oxyacids of. The only oxyacids of N which have been isolated are nitric (HNO_3) and dinitric ($H_2N_4O_{11}$); nitrous acid (HNO_2) and hyponitrous acid ($H_2N_2O_2$) are known in aqueous solution. Nitric and dinitric acids are described under the heading NITRIC ACID (p. 517). The present article contains descriptions of nitrous and hyponitrous acids and their salts.

NITROUS ACID and NITRITES; HNO_2Aq and M^INO_2. Nitrites are usually, if not always, accompanied by nitrates in nature. Nitrites are present int he atmosphere; Warington (*C. J.* 39, 229) has shown that when distilled water is exposed to the air it soon gives the reactions of nitrites. Small quantities of nitrites are present in many river and well waters (*v.* Warington, *C. J.* 55, 537; Munro, *C. J.* 49, 632). The juices of many plants contain nitrites (Genadius, *Am. Ch.* 5, 7). Nitrites are sometimes, but not generally, found in saliva (Wurster, *B.* 22, 1901). Nitrites are formed in the soil by oxidation of various nitrogenous compounds (*v.* NITRIFICATION, p. 521). $NaNO_2$ is formed by exposing Pt black to air and NaOHAq (Loew, *B.* 23, 1443). NH_4NO_2 is produced by passing O and air over Pt black at 180°–300° (Ilosva, *Bl.* [3] 2, 734). NH_4NO_2 is also produced by burning H in air (Struve, *J.* 1870. 199, 209; Schönbein, *J.* 1862. 94; Zöller a. Grete, *B.* 10, 2145); and also during the slow combustion in air of P or ether (Berthelot, *A. Ch.* [5] 12, 440; *C. R.* 108, 543; Kolbe, *A.* 119, 176; Ilosva, *Bl.* [3] 2, 734). It was formerly stated that NH_4NO_2 is formed by the direct union of N and H_2O (by evaporating H_2O in air), but this has been disproved (Carius, *A.* 174, 31; Weith a. Weber, *B.* 7, 1745); Berthelot, however, asserts that NH_4NO_2 is produced by subjecting H_2O and pure N to the action of a very powerful induction-coil (*Bl.* [2] 27, 338). NH_4NO_2 is also formed by the oxidation of NH_3 by ozone (Carius, *l.c.*; Goppelsröder, *J. pr.* [2] 4, 139, 383). Fe nitrite is said to be formed by passing air over reduced Fe at 190°–250° (Ilosva, *Bl.* [3] 2, 734). Alkali nitrites are formed, along with nitrates, by the reaction of N_2O_3 on alkali solutions (*v. Nitrogen trioxide*; *Reactions*, No. 2, p. 564). Nitrous acid, along with HNO_3, is produced by the action of cold water on N_2O_3 (*v. Nitrogen trioxide*; *Reactions*, No. 1, p. 564). Nitrites are also formed by the reduction of nitrates; *e.g.* by heating KNO_3, O is evolved and KNO_2 remains; or by the action of amalgamated Zn on KNO_3Aq, KNO_2Aq is produced.

The normal nitrites have the composition M^INO_2 and $M^{II}(NO_2)_2$; several basic nitrites are known. Most of the normal nitrites are soluble in water and alcohol; $AgNO_2$ is one of the least soluble nitrites, from it most of the other nitrites may be obtained. Nitrites are decomposed by heat, evolving NO or NO_2, and leaving metallic oxide or metal; solutions of nitrites are decomposed by boiling, generally with evolution of NO and formation of nitrates. Nitrites in solution are decomposed by dilute H_2SO_4Aq, giving HNO_2Aq, which soon decomposes to HNO_3Aq and NO. Acidulated solutions of nitrites reduce $KMnO_4Aq$, $K_2Cr_2O_7Aq$, H_2SAq, &c.; they ppt. Au from $AuCl_3Aq$, and Hg from mercurous solutions. These solutions decompose KIAq with separation of I, and give a brown colour with $FeSO_4Aq$; these reactions serve to distinguish nitrites from nitrates. (For details regarding the detection and estimation of nitrites, a *manual of analysis* must be consulted.) Nitrites may be regarded either as MO.NO or as $M.NO_2$; Divers (*C. J.* 47, 226) endeavours to show that the second view is preferable.

Nitrous acid HNO_2Aq. This acid is known only in aqueous solution; and it is doubtful whether HNO_2Aq has been obtained free from HNO_3Aq. Fremy (*C. R.* 79, 61) says that a solution of N_2O_3 in a considerable quantity of cold water may be kept for some days without change, and that on boiling NO and N_2O_3 are evolved. The solution very probably contains HNO_2, but whether it is free from HNO_3 or not is undecided. This solution acts as a strong reducer. Thomson gives the thermal data $[N^2,O^3,Aq] = -6,820$; $[H,N,O^2,Aq] = 30,770$; $[2NO,O,Aq] = 36,330$; $[H,NO,O,Aq] = 52,345$ (*Th.* 2, 199).

Nitrites $M^{I}NO_3$ and $M^{II}(NO_2)_2$; also basic salts, $xMO.yN_2O_3$, and $xM_2O_3.yN_2O_3$. The nitrites have been examined chiefly by Fischer (*P.* 74, 115), Lenz (*P.* 118, 282), Hampe (*A.* 125, 295), Stromeyer (*A.* 96, 230), Lang (*J. pr.* 86, 299).

Ammonium nitrite NH_4NO_3. A crystalline mass, decomposed by heat to N and H_2O (*v.* NITROGEN, *Preparation*, No. 2, p. 557). Obtained by decomposing NH_4ClAq by $AgNO_2Aq$. Berthelot (*Bl.* [2] 21, 55) says this salt is formed, along with N, by the action of dry NH_3 on NO and O. It was formerly stated that NH_4NO_2 is produced by evaporating water in air free from NH_3, but this was disproved by Carius (*A.* 174, 31) and by Weith a. Weber (*B.* 7, 1745). According to Berthelot (*Bl.* [2] 27, 238) NH_4NO_2 is produced by the action of a powerful induction-coil on a mixture of H_2O and pure N. NH_4NO_2 is also formed by oxidising NH_3Aq by ozone (Carius, *l.c.*; Goppebröder, *J. pr.* [2] 4, 139, 383); and also, along with ozone and H_2O_2, by burning H in air (Struve, *J.* 1870. 199, 209; Zöller a. Grete, *B.* 10, 2145).

Barium nitrite $Ba(NO_2)_2.H_2O$ (Fischer).

Cadmium nitrite $Cd(NO_2)_2.H_2O$ (Hampe; Lang).

Calcium nitrite $Ca(NO_2)_2.H_2O$ (Fischer; Hampe; Lang).

Cobalt nitrite. This salt is not known, but several double salts of $Co(NO_2)_3$ have been isolated.

Cobalt-potassium nitrite $2Co(NO_2)_3.6KNO_2.xH_2O$ (x varies from 0 to 1, 3, and 4). Prepared by mixing KNO_2Aq and $Co(NO_3)_2Aq$, or $CoCl_2Aq$, adding excess of acetic acid, washing the pp. with K acetate solution, and then with 80 p.c. alcohol, and drying below 100°. A bright-yellow powder, consisting of small 4-sided prisms; very slightly sol. water, insol. alcohol or ether. At 200° gives NO_2, Co_2O_3, and KNO_2 (Fischer, *P.* 67, 245; Saint-Evre, *J. pr.* 54, 85; 58, 185; Braun, *Fr.* 6, 42; 7, 313; Stromeyer, *A.* 96, 220; Erdmann, *J. pr.* 97, 385; Sadtler, *Am. S.* [2] 49, 189). Various other Co-K nitrites are formed under different conditions of concentration and acidification (*v.* especially Sadtler, *l.c.*). If Ca salts are present a triple nitrite of Co, Ca, and K is ppd. (Erdmann, *l.c.*). A triple nitrite of Co, Pb, and K is described by Stromeyer (*l.c.*). Erdmann (*l.c.*) also describes a compound of $Co(NO_2)_3$, KNO_2, and NH_3.

Cobalt-cæsium nitrite $Co(NO_2)_3.3CsNO_2.H_2O$ (Rosenbladt, *B.* 19, 2531).

Cobalt-sodium nitrites
$2Co(NO_2)_3.4NaNO_2.H_2O$ and
$2Co(NO_2)_3.6NaNO_2.H_2O$ (Sadtler, *l.c.*).

Copper nitrites, basic salts (Hampe; van der Meulen, *B.* 12, 758).

Lead nitrites. These salts were examined by Proust, Chevreul (*G. A.* 46, 176), and Berzelius (*G. A.* 40, 194; 46, 156). Péligot (*A.* 39, 338) revised and classified the work; Bromeis (*A.* 72, 38), von Lorenz (*W. A. B.* [2nd part] 84 1133), and Meissner (*J. Z.* [2] 3, 26), more recently have examined these salts. The lead nitrites are all basic salts; many seem best looked on as compounds of basic nitrites with basic nitrates. They are obtained by digesting $Pb(NO_3)_2Aq$ with Pb; von Lorenz says that 14 different salts are thus obtained.

Magnesium nitrite $Mg(NO_2)_2.3H_2O$ (Lang); $Mg(NO_2)_2.2H_2O$ (Hampe).

Mercuric nitrite $Hg(NO_2)_2.2HgO.H_2O$ (Lang).

Nickel nitrite $Ni(NO_2)_2$ (Lang). The *double salts*, $Ni(NO_2)_2.4KNO_2$; $Ni(NO_2)_2.2KNO_2.Ba(NO_2)_2$; $Ni(NO_2)_2.2Ba(NO_2)_2$; $Ni(NO_2)_2.Ca(NO_2)_2.2KNO_2$ have been isolated (Erdmann, *J. pr.* 97, 385).

Platino-nitrites v. PLATINUM, vol. iv.

Potassium nitrite KNO_2. Colourless, microscopic, prismatic crystals (according to Lang, *J. pr.* 86, 295, the crystals are $2KNO_2.H_2O$); very sol. water, insol. absolute alcohol. KNO_2Aq with H_2SO_4 evolves NO, and forms KNO_3Aq. KNO_2 is prepared by passing into cold KOHAq the gas obtained by heating starch with HNO_3Aq S.G. 1·35, evaporating till crystallisation begins, pouring off from the crystals of KNO_3, adding dilute acetic acid and 2 vols. alcohol, separating the lower layer which forms and evaporating it (Fischer). Stahlschmidt (*P.* 128, 466) reduces KNO_3Aq by Zn in presence of NH_3Aq. Erdmann (*J.* 1866. 154) reduces KNO_3 by fusion with Fe, and crystallises from water.

Double salts of KNO_2 with the nitrites Ba, Cd, Ca, Co, Cu, Pb, Mg, Hg, Ni, Pd, Ag, Sr, and Zn are described by Hampe, Lang, and Fischer.

Silver nitrite $AgNO_2$. Obtained by adding $AgNO_3Aq$ to the solution produced by passing into KOHAq the gas formed by heating starch with HNO_3Aq S.G. 1·35, after neutralising this solution by acetic acid. Small white crystals. Dissolves in 300 pts. water at ordinary temperatures, easily in boiling water. The decomposition of $AgNO_2$ by heat has been examined by Divers a. Shimidzu (*C. J.* 47, 630). Treated with H_2S, $AgNO_2$ yields Ag_2S, S, NO, NH_3, and NH_2OH (Divers a. Haga, *C. J.* 51, 48).

Sodium nitrite $NaNO_2$. A crystalline salt, prepared similarly to KNO_3. Étard (*Bl.* [2] 27, 434) recommends to fuse $NaNO_3$ with an equivalent quantity of K_2SO_4, and to extract with alcohol.

Strontium nitrite $Sr(NO_2)_2$ (Hampe).

Zinc nitrite $Zn(NO_2)_2.3H_2O$ (Lang; Hampe).

HYPONITROUS ACID and HYPONITRITES; $H_2N_2O_2Aq$ and $M_2N_2O_2$. Hyponitrites were first obtained by Divers in 1871, by reducing nitrates by Na-amalgam (*Pr.* 19, 425). The salts were examined by Zorn (*B.* 10, 1306; 11, 1630, 2217; 12, 1509; 15, 1007, 1258); van der Plaats (*B.* 10, 1507); Menke, (*C. J.* 33, 401); Berthelot a. Ogier (*C. R.* 96, 30, 84). In 1884 Divers and Haga (*C. J.* 45, 78) showed that the silver salt is $nAgNO$. The investigation has been continued by Divers and Haga (*C. J.* 47, 364; 55, 760), Dunstan and Dymond (*C. J.* 51, 646), and Berthelot and Maquenne (*C. R.* 108, 1286, 1303).

Zorn prepared ethyl hyponitrite and determined its molecular formula (from V.D.) to be $(C_2H_5)_2N_2O_2$; hence the formula for the salts is better written $M_2N_2O_2$ than MNO.

Hyponitrites are produced (1) by reducing nitrates or nitrites in solution by Na-amalgam (Divers); (2) by electrolysing nitrite solution, using Hg as negative electrode (Zorn; Divers a. Haga); (3) by the reaction of $Fe(OH)_2$ on alkaline nitrite solution, or on NO in presence of alkali (Zorn; Dunstan a. Dymond); (4) by decomposing oxyamidosulphonates [salts of $NH(SO_3H).OH$] by alkali (Divers).

Silver hyponitrite $Ag_2N_2O_2$ (*Nitrosyl silver*).

Preparation.—1. Na-amalgam is added to KNO_3Aq in the ratio KNO_3:4Na, the liquid being kept cold. When evolution of gas ceases the solution is neutralised by acetic acid, and $AgNO_3$ is added; the pp. is washed in the dark with cold water, dissolved in cold dilute HNO_3Aq, and reppd. by Na_2CO_3Aq; the pp. is thoroughly washed in the dark and dried *in vacuo* over H_2SO_4 (Divers, *Pr.* 19, 425; D. a. Haga, *C. J.* 45, 78).—2. Zorn (*B.* 12, 1509) reduces $Ba(NO_2)_2$ by Na-amalgam, and ppts. by $AgNO_3Aq$; the pp. of $Ag_2N_2O_2$ thus obtained is pure. The $Ba(NO_2)_2$ is obtained by boiling $Ba(NO_3)_2Aq$ with Pb, prepared by ppg. dilute Pb acetate solution by Zn; the boiling is continued till all the Pb is changed to PbO; the PbO in solution is removed by CO_2, and the last traces by H_2S; the filtrate is evaporated to a thick oil, which cools to a mass of $Ba(NO_2)_2$; the salt is obtained pure by crystallising from 80 p.c. alcohol. For preparing large quantities of $Ag_2N_2O_2$, Zorn (*l.c.*) places the Na-amalgam, in large pieces, in the middle bulb of a Kipp's apparatus, the $Ba(NO_2)_2Aq$ being in the lower bulb, and the upper he half-fills with distilled water. By regulating the stopcocks so that a slow stream of gas escapes, the reduction proceeds satisfactorily.—3. Pure $FeSO_4Aq$ is mixed with enough milk of lime to ppt. the Fe as $Fe(OH)_2$; $NaNO_2Aq$ is added (1 part $NaNO_2$ to 10 parts $FeSO_4$), and the apparatus is kept cold. When the reaction is finished the solution is ppd. by $AgNO_3Aq$ (Zorn, *B.* 15, 1258; *cf.* Dunstan a. Dymond, *C. J.* 51, 646).

Properties and Reactions.—$Ag_2N_2O_2$ is a yellowish amorphous salt. By standing in NH_3Aq over H_2SO_4, it is obtained in small crystals (Zorn). The salt is not hygroscopic; insol. water; may be kept in boiling water without decomposition; is decomposed at c. 100°, probably giving $AgNO_3$; when quickly heated to c. 150°, $Ag_2N_2O_2$ explodes, evolving brown vapours. $Ag_2N_2O_2$ dissolves in HNO_3Aq and H_2SO_4Aq, it is reppd. by NH_3Aq or Na_2CO_3Aq. Unacted on by CO_2. Decomposed by NaOHAq at c. 70°. Decomposed by H_3PO_4Aq, H_2S, or boiling $H.C_2H_3O_2Aq$, with production of $H_2N_2O_2Aq$. $Ag_2N_2O_2$ reacts with C_2H_5I to form $(C_2H_5)_2N_2O_2$ (Zorn, *B.* 11, 1630), the formula of which compound is molecular, as its V.D. has been determined.

Barium hyponitrite BaN_2O_2 is described by Zorn (*B.* 15, 1007).

Calcium and *Strontium hyponitrites* $CaN_2O_2.4H_2O$ and $SrN_2O_2.5H_2O$ are described by Maquenne (*C. R.* 108, 1303).

Hyponitrous acid $H_2N_2O_2Aq$. Known only in solution. Moist $Ag_2N_2O_2$ is suspended in water, such a quantity of dilute HClAq is added that a little $Ag_2N_2O_2$ remains unchanged, and the liquid is filtered from AgCl (van der Plaats, *B.* 10, 1507). $H_2N_2O_2Aq$ is an acid liquid, fairly stable; may be boiled with HNO_3Aq or $H.C_2H_3O_2Aq$ without decomposition; reduces $KMnO_4Aq$, and separates I from KIAq. The solution slowly decomposes, and after a few weeks not a trace of $H_2N_2O_2$ remains. The liquid thus obtained is neutral; probably N_2O and H_2O are formed. It was proved by van der Plaats (*l.c.*) that conc. H_2SO_4 evolves N_2O from $H_2N_2O_2Aq$.

Constitution of hyponitrites.—The compound $(C_2H_5)_2N_2O_2$ reacts not as an ethereal salt but as a diazo- compound; with reducers it evolves N and forms C_2H_5OH; water produces C_2H_5OH, $CH_3.CHO$, and N. The constitution of this compound is $C_2H_5.O.N{:}N.O.C_2H_5$, and hence the constitution of the acid is probably $HO.N{:}N.OH$ (Zorn, *B.* 11, 1630). This formula is confirmed by the production of hyponitrites, along with sulphites, by the action of KOHAq on $NH(SO_3K).OH$. This reaction shows that the O in hyponitrites is in direct union both with N and H (Divers a. Haga, *C. J.* 55, 760).

Nitrogen, oxybromide of, NOBr (*Nitrosyl bromide*). Mol. w. not determined directly; probably = 109·72, from analogy with NOCl. A very dark-brown liquid. Obtained by passing NO into Br at −7° to −15° (Landolt, *A.* 116, 177); also by distilling nitrosyl sulphate ($NO.H.SO_4$) with KBr (Girard a. Pabst, *Bl.* [2] 30, 531). Landolt gives b.p. as −2°; Girard a. Pabst as 19°. Easily decomposed to NO and Br by heat. With cold water forms HBrAq and HNO_2Aq; with KOHAq forms KBrAq and KNO_2Aq.

Nitryl tribromide. Landolt (*A.* 116, 117) supposed that a compound $NOBr_3$ is obtained (along with NOBr) by passing Br into well-cooled Br. That the amount of NO absorbed by Br, at c. 15°, is nearly independent of pressure, and corresponds approximately with the quantity required to form $NOBr_3$, was shown by Pattison Muir (*C. J.* 28, 844). The experiments of Fröhlich (*A.* 224, 270), and of Roozeboom (*R. T. C.* 4, 381) have shown that the so-called nitryl tribromide is probably only a mixture of NOBr and Br.

Nitrogen, oxychlorides of. The compound NOCl has been isolated; the existence of NO_2Cl is very doubtful; according to Hautefeuille a. Chappuis (*A. Ch.* [6] 2, 282), a compound $N_2Cl_2O_{13}$ is formed by passing N with O and Cl through an induction-apparatus. The non-existence of $NOCl_2$, said by Gay-Lussac to be produced by the reaction of conc. HClAq with HNO_3 (*A. Ch.* [3] 23, 203), has been proved by Tilden (*C. J.* 27, 633), and this has been confirmed by Goldschmidt (*A.* 205, 372).

NITROSYL CHLORIDE NOCl (*Chloronitrous gas*). Mol. w. 65·34. V.D. 33 at c. 15° to 700° (Sudborough a. Millar, *C. J.* 59, 73). S.G. at −18° 1·433, at −12° 1·4165 (Geuther, *A.* 245, 97; Tilden, *C. J.* 27, 630). Boils at c. −8° (Tilden). An orange-red gas; liquefied by passing through a U tube cooled by ice and salt; the liquid is reddish yellow. Dissociation into NO and Cl begins at c. 780°, at 985° about 42 p.c. is dissociated (S. a. M., *l.c.*). For absorption-spectrum *v.* Magnanini (*Z. P. C.* 4, 427). Formed by combination of NO with Cl (Gay-Lussac, *A. Ch.* [3] 23, 203); by the reaction of PCl_5, PCl_3, or $AsCl_3$ with NO_2 or N_2O_3; and by the reaction of $POCl_3$ with KNO_2 (Naquet, *J.* 1860. 102); by passing

HCl into N_2O_4 at a low temperature, by heating conc. HClAq and HNO_3, and by heating NO.H.SO_4 with NaCl.

NOCl is more readily prepared by warming HNO_3Aq S.G. 1·42 with c. 4 vols. HClAq S.G. 1·16, passing the gases over $CaCl_2$ and then into conc. H_2SO_4 until the acid is saturated, then adding perfectly dry NaCl, and heating gently (Tilden, *C. J.* 27, 630; *cf.* Girard a. Pabst, *Bl.* [2] 30, 531).

NOCl reacts with H_2O to form HClAq and HNO_2Aq; with KOHAq it produces KClAq and KNO_2Aq; Hg decomposes it, forming NO and HgCl; it dissolves Au and Pt more slowly (Tilden, *l.c.*). With conc. H_2SO_4, nitrosyl sulphate (NO.H.SO_4) is formed (Tilden). NOCl reacts energetically with SO_3 to produce $NO_2.SO_2.Cl$ (Weber, *P.* 123, 333). Forms double compounds with many metallic chlorides, *e.g.* $AlCl_3$, $SbCl_3$ (*v.* Sudborough, *C. J.* 59, 655).

Nitryl chloride NO_2Cl. A compound with this composition was supposed to be formed by the reaction of $POCl_3$ with $AgNO_3$ or $Pb(NO_3)_2$, also by passing a very slow stream of Cl over $AgNO_3$ at c. 95° (Odet a. Vignon, *C. R.* 69, 1142; 70, 96); Hasenbach obtained a liquid which he took to be NO_2Cl by passing Cl and NO_2 through a hot tube and cooling the issuing gases (*J. pr.* [2] 4, 1); Williamson (*Pr.* 7, 15) poured $SO_2.OH.Cl$ on to KNO_3, and obtained a gas which formed HNO_3Aq and HClAq with cold water, and was supposed by W. to be NO_2Cl; Müller (*A.* 122, 1) supposed that NO_2Cl was formed by the reaction of NO_2 with PCl_5; and Schiff thought he had obtained the compound as a product of the reaction of HNO_3 with PCl_5. Meissner (*J. Z.* 10, 27) failed to obtain any NO_2Cl by the processes used by Odet a. Vignon, Schiff, Müller, and Williamson. Geuther (*A.* 245, 96) could not form NO_2Cl by the reaction of PCl_5 with HNO_3, NO_2, or a nitrate. Williams (*C. J.* 49, 222) showed that NO_2Cl is not produced by the reaction (1) of $POCl_3$ with $Pb(NO_3)_2$, (2) of $POCl_3$ with HNO_3, (3) of $SO_2.OH.Cl$ with KNO_3, (4) of SO_2Cl_2 with KNO_3; he also established a very large probability in favour of the conclusion that the products of the reaction of NO_2 with Cl, at different temperatures, are NOCl, and N_2O_4 holding more or less Cl in solution.

Nitrogen, phosphide of, *v.* Phosphorus nitride.

Nitrogen, phosphochlorides of, $N_3P_3Cl_6$ (*Phosphorus chloronitride. Nitrogen chlorophosphide. Phosphorus nitrogen chloride*). Mol. w. 347·13. V.D. 176·7 (Gladstone a. Holmes, *C. J.* 17, 225; Wichelhaus, *B.* 3, 163). S.G. 1·98 (G. a. H.). Melts at c. 110° (G. a. H.); at 114° (W.); boils at 240° (G. a. H.); at 250°–260° (W.). Crystallises in trimetric forms; $a:b:c = \cdot 4417:1:1\cdot 8165$ (Groth, *B.* 3, 166), $\frac{\mu-1}{d}M = 109\cdot 9$ (G. a. H.).

Formation.—By heating PCl_5 with NH_4Cl, NH_3, or NH_2HgCl.

Preparation.—1. PCl_5 is saturated with dry NH_3, the product is distilled with water, and the crystals which form on the sides of the receiver are washed, dried, and recrystallised from hot ether (Wöhler a. Liebig, *A.* 11, 146).—2. A mixture of 1 pt. PCl_5 and 2 pts. NH_4Cl is heated in a flask connected with a reversed condenser; the mass gets red, then brown, and the $N_3P_3Cl_6$ sublimes; the compound is dissolved out in ether and crystallised, or is blown over in steam (Gladstone, *C. J.* 3, 135; modified by Couldridge, *C. J.* 53, 398). The yield is not more than 10 p.c. of the PCl_5 used.—3. An intimate mixture of white pp. (NH_2HgCl) and PCl_5 is gently heated in a flask; the product is treated with water, which dissolves out $HgCl_2$ and NH_4Cl; the residue is dried and the $N_3P_3Cl_6$ is dissolved out (from $PCl_3N_2H_4$) by ether (Gladstone a. Holmes, *C. J.* 17, 225).

Properties.—Hard, lustrous, trimetric, crystals; sol. alcohol, ether, or $CHCl_3$; insoluble in water, but slowly decomposed (G. a. H.; W.). Gives off white fumes when heated in air; may be sublimed in H or H_2S. Solution in alcohol slowly decomposes, also that in ether if a trace of water is present (even in absence of water, according to Wichelhaus). Is not acted on by I (G.); nor by hot H_2SO_4Aq, HClAq, or HNO_3Aq (Wöhler a. Liebig); decomposed by hot fuming HNO_3 (G.).

Reactions.—1. *Water* forms pyrophosphodiamic acid ($P_2N_2H_8O_5$) and HCl, according to G. a. H.; but W. says the products are many and complicated.—2. *Ammonia* or *potash* decomposes $N_3P_3Cl_6$ in alcoholic solution, the reaction being similar to that of water (G. a. H.).—3. *Ammonia gas* passed over melted $N_3P_3Cl_6$ forms phospham nPN(NH), and HCl (Couldridge, *C. J.* 53, 398).—4. Heated with *aniline*, $P_3N_3(NHC_6H_5)_6$ is formed (Hofmann, *B.* 17, 1909; Couldridge, *l.c.*); *orthotoluidine*, and *phenylhydrazine* produce similar reactions (C., *l.c.*).—5. *Nascent hydrogen* forms PH_3 (W., *l.c.*).—6. Heated with *copper oxide*, NO_2 and N are evolved.—7. Passed over red-hot *iron*, N is evolved and $FeCl_3$ and Fe phosphide remain (W. a. L.).

Nitrogen, selenide of (?NSe). Espenschied (*A.* 113, 101) passed NH_3, diluted with H, over well-cooled $SeCl_4$, shook the product with water, and washed the ppd. mixture of Se and N selenide with CS_2 (to extract Se); he thus obtained an orange-yellow powder, which was extremely explosive and very dangerous to handle. Analyses pointed to the formula NSe, but E. supposed that the substance probably contained H besides N and Se. For details of preparation and properties *v.* Espenschied (*l.c.*).

Nitrogen, silicide of, *v.* Silicon nitride, in vol. iv.

Nitrogen, sulphide of, nNS. Mol. w. unknown. S.G. 2·1166 at 15° (Michaelis, *Z.* [2] 6, 460); 2·22 at 15° (Berthelot, *A. Ch.* [5] 27, 202). Sublimes at 135°; melts at 158°, and decomposes with slight explosions at 160° (M., *l.c.*; at 207° according to B., *l.c.*). Berthelot (*l.c.*) gives [N,S] = −31,900. N sulphide was prepared, but not pure, by Soubeiran (*A. Ch.* [2] 67, 71); Fordos and Gélis obtained it approximately pure (*A. Ch.* [3] 32, 385); it has been examined further by Michaelis (*Z.* [2] 6, 460), and Demarçay (*C. R.* 91, 854, 1066; 92, 726). N sulphide easily explodes when rubbed or struck with a hammer.

Preparation.—1. SCl_2 or S_2Cl_2 is dissolved in 8–10 vols. CS_2, and dry NH_3 is passed in; the liquid darkens in colour, and a cochineal-red pp. is produced, which dissolves after a time and a brown powder is ppd.; passage of NH_3 is continued until the brown pp. dissolves, and the liquid becomes orange-yellow with a few nearly colourless flocks of NH_4Cl floating in it (addition of more NH_3 decomposes the NS in solution); the liquid is filtered and allowed to evaporate, when orange-red NS separates; the NS is collected and washed with CS_2, to remove traces of S. Omitting intermediate products, the reaction may be represented approximately as $8NH_3 + 3SCl_2 = 2NS + S + 6NH_4Cl$ (F. a. G.).—2. $SOCl_2$ is surrounded by cold water, and NH_3 is passed into it; after a time the cold water is removed, the solid mass is mixed by a glass rod, and NH_3 is passed over it as long as absorption continues; the nearly white mass thus obtained is treated with CS_2, and the solution on evaporation deposits NS; the insol. in CS_2 consists of NH_4Cl, $(NH_4)_2SO_3$, and polythionates of NH_4 (Michaelis).

Properties.—Orange-red, rhombic (or ? triclinic) crystals, with a faint odour, which becomes more marked at c. 120°; the vapour rapidly attacks the mucous membrane of the nose and eyes; detonates at c. 160°; explodes violently when rubbed or struck by a hammer; adheres strongly to glass or paper when rubbed thereon; is electric. Insol. in, but slowly decomposed by, water; slightly sol. alcohol, ether, turpentine; CS_2 is the best solvent, this solution slowly decomposes.

Reactions.—1. *Water* slowly decomposes NS, forming NH_3Aq, $(NH_4)_2S_2O_3Aq$, and $(NH_4)_2S_3O_6Aq$. 2. *Potash* forms NH_3, $K_2S_2O_3Aq$, and K_2SO_3Aq.—3. *Hydrogen chloride* produces NH_4Cl, chlorides of S, and probably a compound of NS with SCl_2.—4. *Chlorine* reacts on NS in $CHCl_3$ with formation of a compound of S chloride and NS; Demarçay (*C. R.* 91, 854) gives the formula SNCl to the product, and says that addition of NS to this produces $(SN)_3Cl$.—5. A large excess of *sulphur chloride* reacting on NS in $CHCl_3$ produces a compound of S, N, and Cl, to which Demarçay (*C. R.* 91, 1066) assigns the formula S_4N_3Cl.—6. *Nitric acid* forms $S_4N_3NO_3$; and *sulphuric acid* produces HCl and $S_4N_3HSO_4$ (D., *l.c.*; also *C. R.* 92, 726).

Combinations.—With *sulphur dichloride* to form several compounds, especially $2NS.SCl_2$, $4NS.SCl_2$, and $6NS.SCl_2$ (Michaelis).

Nitrogen, sulphochloride of. $NS_2Cl(=N_2S_3.SCl_2)$. According to Soubeiran (*A. Ch.* 67, 87, 101), this substance is formed by heating, in a sealed tube at 100°, the compound $2NH_3.SCl_2$, which is obtained by passing a slow stream of NH_3 into SCl_2. NS_2Cl is a citron-yellow solid; decomposed by heat to N, S, and S_2Cl_2; decomposed by water to NH_4Cl and $H_2S_2O_3$. NS_2Cl is also said to be formed by passing CO_2 into a hot solution of NS in S_2Cl_2 (S., *l.c.*). M. M. P. M.

NITROGEN GROUP OF ELEMENTS. *Nitrogen, phosphorus, vanadium, arsenic, niobium, antimony, didymium, erbium, tantalum, bismuth.* Of these ten elements, N, As, Sb, and Bi are found uncombined; the others occur only in combination. N is found in vast quantities in the air; compounds of N and also of P occur in large quantities in rocks and in animal and vegetable matter. Compounds of As, Sb, and Bi are widely distributed in minerals, but no very large quantities are found. Compounds of V are found widely spread about, but they occur only in comparatively small quantities. The compounds of Nb, Di, Er, and Ta have been found in but a few minerals; these four bodies are classed among the rare elements. Sb has been known as a metal from about the end of the fifteenth century, and Bi from the sixteenth century; P was prepared in 1669, As in 1694, and N in 1772; V was obtained by Roscoe in 1867, investigations on this element having been carried on from the beginning of this century; Di was isolated in 1842; Nb and Ta were obtained nearly pure in 1864, after a long series of investigations conducted by different chemists from 1801 onwards; researches on Er have been carried on since 1788 to the present day, but the element has not yet been isolated. Within recent years great doubt has been cast on the elementary character of Di, and although the investigation of Er is yet far from complete it is very probable that the substance known by this name is not a simple body. Of the names given to the ten elements, As is derived from the name by which the chief ore of this metal was known in ancient times; N, P, and Di express characteristic properties of the elements; Er is derived from the locality where the minerals were found from which the compounds of this element have been prepared; V, Nb, and Ta are taken from mythological personages; and the origins of the names Bi and Sb are not known with certainty.

N is obtained from air by removing the O by hot Cu, or other deoxidiser; P is prepared by heating Ca phosphate with SiO_2 to combine with the Ca, and C to remove the O; As, Sb, and Bi are prepared by removing O from the oxides by C; V and Nb by reducing the chlorides at a high temperature by H, and Di by reducing the chloride by Na or K; to obtain Ta, the compound Na_2TaF_7 is reduced by Na; Er has not yet been isolated. N is a gas at ordinary temperatures, but has been liquefied at a very low temperature under great pressure; P is a soft solid with a low melting-point and not high S.G.; the other elements are hard, lustrous, and metal-like; none has a very high S.G., Ta = 11 (?) is the heaviest; and all melt at or below a full red heat (M.P. of V, Nb, and Ta, not determined; Er not isolated). The following table presents some of the chief properties of the ten elements:—

	NITROGEN	VANADIUM	NIOBIUM	DIDYMIUM	TANTALUM
Atomic weights	14·01	51·2	94	144	182
	One or more compound of each element, except Di, has been gasified; specific heat of Di only has been determined directly. Mol. w. of N = At. w. × 2; mol. w. of none of the others known.				
Melting-points	—	—	—	600°–700°	—

	NITROGEN	VANADIUM	NIOBIUM	DIDYMIUM	TANTALUM
Specific gravities (approx.)	(liquid) ·885	5·5	7	6·5	11 (?)
Specific heats	—	—	—	·04563	—
$\frac{\textit{Atomic weight}}{\textit{Spec. grav.}}$ (approx.)	15·8	9·1	13·4	22·1	16·6 (?)
Occurrence and preparation	In large quantity in air. Many compounds, especially nitrates and NH_3 compounds, are widely distributed in large quantities. Prepared by removing O from air.	Vanadates of Pb, Ca, Bi, &c. occur as comparatively rare minerals. Small quantities of V compounds are very widely distributed. Prepared by long-continued heating VCl_2 in H.	Niobates occur in a few rare minerals. Prepared by repeatedly heating $NbCl_5$ in H.	Silicate of Di is found in several rare minerals. Prepared by heating $DiCl_3$ with K; or by electrolysing molten $DiCl_3$.	Tantalates occur with niobates in a few rare minerals. Prepared by heating K_2TaF_7 with K, or Na_2TaF_7 with Na.
Physical properties	Colourless, tasteless, odourless gas; liquefied at very low temp. and great pressure, liquid boils at c. −195°	Grey, lustrous crystalline powder.	Steel grey, lustrous solid.	White solid, with slightly yellow tinge; hard, ductile.	Grey, lustrous, solid; not obtained free from impurities.
Chemical properties	Combines slowly with O under influence of electric discharge; also to a small extent with H. At high temp. combines with B, Cr, Mg, Si, and V; and perhaps also with Al, Fe, and Zn. Compounds exhibit most diverse chem. properties; oxides are generally acidic; one hydride is strongly alkaline, another is acidic. Never replaces H of acids to form salts. Forms the oxychloride NOCl. An allotropic form perhaps exists, proof is not satisfactory. Atom is trivalent in NH_3.	Burns in air to V_2O, then to V_2O_3, and finally to V_2O_5. Burns in Cl to VCl_4. Combines with N to form VN. Dissolved by conc. H_2SO_4 and HNO_3; forms vanadates with molten alkalis. Some oxides are basic, *e.g.* V_2O_3; others are basic and acidic, *e.g.* V_2O_4 which forms salts with acids and also with alkalis. Reacts both as a metal and a non-metal. Forms oxychlorides $VOCl_3$, $VOCl_2$, and VOCl. Does not form a hydride. Atom is tetravalent in VCl_4, perhaps trivalent in $VOCl_3$.	Burns in air to Nb_2O_5. Combines with Cl to $NbCl_5$. Sol. in conc. H_2SO_4, not in HNO_3 or HClAq. Nb_2O_5 forms niobates with basic oxides; also dissolves in H_2SO_4, but no definite salts isolated. No hydride known with certainty, but there are indications of existence of hydride. Forms a nitride. Oxychloride is $NbOCl_3$. Compounds formed by replacing H of acids by Nb not yet isolated, but probably exist. NbF_5 and $NbOF_3$ form many double salts. Atom pentavalent in $NbCl_5$.	Burns in air to Di_2O_3. Di_2O_5 exists and acts as a peroxide. Di_2O_3 is basic, easily sol. dilute acids. Decomposes cold water slowly, and hot water rapidly. Di is almost certainly a mixture or compound of two or more elements. DiOCl is isolated. No hydride. No compounds gasified.	Burns in air to Ta_2O_5. Combines with Cl to form $TaCl_5$. Ta_2O_5 forms tantalates with alkalis; seems to have no basic properties. Sol. only in HFAq, and H_2SO_4 + HFAq. Forms a nitride. No hydride known. No oxychlorides isolated. Atom pentavalent in $TaCl_5$.

	PHOSPHORUS	ARSENIC	ANTIMONY	ERBIUM	BISMUTH
Atomic weights	30·96	74·9	120	166	208
Molecular weights	61·92 and 123·84	149·6 and 299·6	(?) 120 (?) 240	—	(?) 208 or (?) 416
	Compounds of all these elements, except Er, have been gasified; and S.H. of each, except Er, has been determined directly.				
Melting-points (approx.)	45°	500° (under pressure)	425°	—	270°
Specific gravities (approx.)	1·9	5·7	6·7	—	9·9
Specific heats	·202	·083	·053	—	·0308
$\frac{\textit{Atomic weight}}{\textit{Spec. grav.}}$	16·3	13·2	18	—	20·5
Occurrence and preparation	Many phosphates occur in large quantities and widely distributed in rocks and waters, also in bones and plants. Compounds of P with C, N, and O, are found in nerve and brain matter. Prepared by heating $Ca_3(PO_4)_2$ with SiO_2 and C.	Is found native in small quantity; compounds with S and other elements are widely distributed, but are not found in very large quantities. Prepared by reducing As_2O_3 by C.	Sb found native in small quantity; Sb_2S_3 occurs in comparatively small quantities, fairly widely distributed; other compounds also occur sparingly. Prepared by reducing Sb_2O_3 by C.	As silicate in a few rare minerals. Er has not yet been isolated.	Bi found native; chief compounds are Bi_2S_3 and Bi_2O_3, not found in any large quantities, but fairly widely distributed. Prepared by reducing Bi_2O_3 by C.
Physical properties	Soft, wax-like, crystalline solid; also a red amorphous solid. Non-conductor of electricity.	Grey, hard, brittle, crystalline, solid; also as a black amorphous powder. Fair conductor of electricity.	White, lustrous, brittle, very crystalline, solid. Fair conductor of electricity.	Not isolated.	White, with slightly reddish tinge; brittle, crystalline, not good conductor of electricity.
Chemical properties	Burns in air to P_2O_3 and P_2O_5. Combines directly with Cl, Br, and I, to form PX_3 and PX_5. Oxidised by HNO_3 to H_3PO_4. Oxides are anhydrides; several oxyacids known. Does not form salts by replacing H of acids. Hydride PH_3 resembles NH_3, but is less alkaline. Exists in two allotropic forms. Atom trivalent and pentavalent in gaseous molecules.	Burns in air to As_2O_3; As_2O_5 also known. Combines directly with Cl, Br, and I, to form AsX_3. Oxidised by HNO_3 to H_3AsO_4. Oxides are acidic, and As_2O_3 is also feebly basic. Does not form salts by replacing H of acids. Hydride AsH_3 is scarcely if at all alkaline. Exists in two allotropic forms. Atom trivalent in gaseous molecules.	Burns in air to Sb_2O_3; Sb_2O_5 also known. Combines directly with Cl, Br, and I, to form SbX_3 and SbX_5. Oxidised by HNO_3 to Sb_2O_4 and $Sb_2O_5.xH_2O$. Oxides are acidic and basic. Forms a few salts by replacing H of acids. Decomposes steam, evolving H. Hydride SbH_3 is not alkaline. Atom trivalent in gaseous molecules.	Reactions of Er not known, as the metal has not yet been isolated. Very probably Er is a mixture or compound of two or more elements. Er_2O_3 is basic, no acidic oxide known. No hydride known. No compound yet gasified.	Burns in air to form Bi_2O_3; Bi_2O_5 also known. Combines directly with Cl, Br, and I, to form BiX_3. Oxidised by HNO_3 to $Bi3NO_3$. Oxides are basic; Bi_2O_5 acts as a basic peroxide with perhaps very feeble acidic properties. Many salts formed by replacing H of acids by Bi. Decomposes steam, evolving H. No hydride isolated. Atom trivalent in gaseous molecules.

General formulæ and characters of chief compounds. MH_3; M = N, P, As, Sb. M_2O_3; M = any element of the group except Nb and Ta. M_2O_4; M = N, P, V, Nb, Sb, Ta, Bi. M_2O_5; M = any of the elements except Er. M_2S_3; M = P, V, As, Sb, Di, Bi. M_2S_5; M = P, V, As, Sb; some other sulphides known, *e.g.* NS, VS, TaS_2; no sulphide of Nb or Er isolated. MCl_3; M = any of the elements except Er and Ta. MCl_5; M = P, Nb, Sb, Ta; some other haloid compounds exist, *e.g.* P_2I_4, VCl_4; no haloid compounds of Er isolated with certainty. HMO_3, H_3MO_3, H_3MO_4, $H_4M_2O_7$; most of these acids exist for M = N, P, V, As, Sb; acids containing Nb and Ta also known; no acids of Di, Er, or Bi isolated. M_23SO_4, &c.; M = Di, Er, Bi. $VO(SO_4)$, $(VO_2)_2(SO_4)_3$, &c. $As_2O_3.xSO_3$; $Sb_2O_3.xSO_3$, &c.

The *hydrides* NH_3, PH_3, AsH_3, and SbH_3 show a gradation of properties, from the strongly alkaline NH_3 to the neutral AsH_3 and SbH_3; NH_3 combines readily with acids, PH_3 only with such strong acids as HI or HCl; AsH_3 and SbH_3 do not combine with acids. AsH_3 and SbH_3 are easily decomposed by heat, while NH_3 and PH_3 are stable in this respect. The hydrides are all oxidised by mixing with O and heating, NH_3 being the most difficult to change in this way. A hydride of Nb (? NbH) probably exists. N forms also the hydrides N_3H and N_2H_4; the former is a fairly strong acid, the latter is basic. Besides PH_3, two hydrides of P, viz. P_2H_4 and P_4H_2, exist.

Regarded broadly, the *oxides* may be divided into three classes: (1) *acidic oxides*, those of N and P; (2) *basic*, those of Di, Er, and Bi; (3) *acidic and basic*, those of V, As, and Sb—acidic and ? basic, oxides of Nb and Ta. The distinctly acidic oxides of N are N_2O_3, NO_2, and N_2O_5; with water N_2O_3 forms HNO_2Aq, and N_2O_5 forms HNO_3Aq, but NO_2 produces both HNO_2 and HNO_2; N_2O may be called the anhydride of $H_2N_2O_3$, inasmuch as it is formed by heating $H_2N_2O_3Aq$, but the acid has not been obtained from N_2O. NO can hardly be classed as acidic or basic; there are compounds in which NO may be regarded as playing the part of the more positive radicle, *e.g.* NOCl and $NO.H.SO_4$, and there are others in which NO seems to form the negative radicle, *e.g.* $(NO)_2H_2$, and perhaps NO.OH. P_2O_3 and P_2O_5 react with water to form H_3PO_3Aq and H_3PO_4Aq respectively; P_2O_4 forms both of these acids. The oxides M_2O_3, where M = Di, Er, or Bi, react with acids to form salts $M_2.3X$ (X = SO_4, $2NO_3$, &c.); Bi_2O_5 forms salts $Bi_2.3X$ and evolves O, this oxide probably forms bismuthates—$Bi_2O_5.xM_2O$—when fused with large excess of alkalis, but these bimuthates cannot be isolated. V_2O_3 probably forms salts with acids; the compound $V_2O_3(SO_3)_4.xH_2O$ has been isolated. V_2O_4 with strong acids forms salts $xV_2O_4.yA$ (A = acidic oxide, SO_3, &c.), and with alkalis it produces salts of the type $xV_2O_4.yM_2O$. V_2O_5 reacts with alkalis to produce vanadates $xV_2O_5.yM_2O$; it also combines with several anhydrides to form salts $xV_2O_5.yA$ (A = acidic oxide, P_2O_5, SO_3, &c.); the acids HVO_3 and $H_4V_2O_7$ have been isolated. As_2O_3 does not form an acid with water, but with KOHAq it produces $KAsO_2$; As_2O_5 with water forms H_3AsO_4. As_2O_3 combines with a few anhydrides of strong acids to form such compounds as $xAs_2O_3.ySO_3$. Neither Sb_2O_3 nor Sb_2O_5 forms an acid with water; a few unstable salts $Sb_2O_3.M_2O$ have been isolated; three weakly acidic hydrates of Sb_2O_5 are known, from each of which salts are derived. With acidic oxides Sb_2O_3 combines to form $xSb_2O_3.yA$ (A = acidic oxide, SO_3, &c.), some of these compounds are fairly well-defined salts, *e.g.* $Sb_2O_3.3SO_3$. The oxides Nb_2O_5 and Ta_2O_5 form salts when fused with alkalis, $xM_2O_5.yM_2O$; these oxides dissolve in some strong acids, probably with formation of salts, although none has yet been isolated.

The *oxyacids* of the nitrogen elements are numerous; oxyacids of all except Di, Er, and Bi are known. The table on p. 575 presents the composition of the most marked of the acids, and the relations between them, their corresponding oxides, and their salts; the symbol Aq added to the formula of an acid means that that acid is known only in aqueous solution; M here stands for a monovalent metal; RO = basic oxide generally, including M_2O, MO, M_2O_3.

The acids of N and P possess the characteristics of acids much more fully than any of the other oxyacids of the N elements. HNO_2, HNO_3; HPO_3, H_3PO_4, $H_4P_2O_7$, H_3PO_3; H_3AsO_4; these acids are produced by the reaction of their corresponding oxides with water—the other acids of the N elements are not obtained directly from their oxides, although in many cases the oxides are formed by heating the acids. HNO_3Aq is a very strong acid, about equal to HClAq; putting the strength or affinity of HNO_3Aq as 100, that of H_3PO_4Aq is approximately about 6, and that of H_3AsO_4Aq about 4. One can scarcely give the name *acid* to the hydrated oxides of Nb and Ta, and it is very doubtful whether $Sb_2O_3.3H_2O$ (= H_3SbO_3) can be called an acid. It should be remembered that the oxides of Nb and Ta have not been very fully examined.

The chief *haloid compounds* of the nitrogen elements are MX_3 and MX_5; no haloid compound of Er has been isolated with certainty; TaX_3 is not known, and pentahaloid compounds of N, V, As, Di, and Bi have not yet been prepared. V forms VCl_4, which has been gasified unchanged. Most of the haloid compounds are formed by the direct union of their elements; they are decomposed by water, forming HXAq, and oxyacids or hydrated oxides in the cases of N, P, V, As, Nb, and Ta, and oxyhaloid compounds in the cases of Di (? Er) and Bi; $SbCl_3$ gives SbOCl if little water is used, but Sb_2O_3Aq if much warm water is employed.

The *sulphides*, M_2S_3, of P, V, As, and Sb react with alkali sulphides to form alkali thiosalts; Di_2S_3 and Bi_2S_3 show no acidic properties; Er and Nb sulphides have not been isolated, and the sulphides of Ta have been studied but slightly; NS is an explosive compound, which forms NH_4 salts of thionic acids when treated with water or potash.

The nitrogen elements form Group V. of the elements in the classification based on the periodic law. This group is composed as follows:—

	2	3	4	5	6	7	8	9	10	11
Even series	N = 14		V = 51		Nb = 94		Di = 144		Ta = 182	
Odd series		P = 31		As = 75		Sb = 120		Er = 166		Bi = 208

Acid	Salts	Corresponding oxide	Remarks
Nitrogen: $H_2N_2O_2Aq$	$M_2N_2O_2$	N_2O	Acid not formed from N_2O, but N_2O obtained by heating $H_2N_2O_2Aq$, and by action of H_2SO_4 on $M_2N_2O_2Aq$.
HNO_2Aq	MNO_2	N_2O_3	Acid obtained by dissolving N_2O_3 in fair quantity of cold water; solution slowly decomposes to HNO_3Aq and NO. Doubtful whether HNO_2Aq has been obtained quite free from HNO_3.
HNO_3	MNO_3; also M_3NO_4; and many basic nitrates $xN_2O_5.yRO$; also probably a few acid salts $M^INO_3.xN_2O_5$	N_2O_5	N_2O_5 reacts with water to form HNO_3Aq; N_2O_5 obtained by removing H_2O from HNO_3 by P_2O_5.
$H_2N_4O_{11}$	None	N_2O_5	Acid formed by adding very conc. HNO_3 to melted N_2O_5, and cooling.
Phosphorus: $H.H_2PO_2$	$M.H_2PO_2$	None	Acid obtained by action of equivalent quantity of H_2SO_4Aq on $Ba(H_2PO_2)_2$, which is produced by P reacting with BaOAq. H_3PO_2 decomposes by heat to H_3PO_4 and PH_3.
H_2PO_3	$M.HPO_3$ and M_2PO_3	None	H_2PO_3 obtained by H_2S on $PbPO_3$ in water and evaporation *in vacuo*. H_2PO_3Aq fairly stable; boiled with H_2SO_4Aq forms H_3PO_2Aq and H_3PO_4Aq.
$[H_2.H_2P_2O_5]$	$M_2.H_2P_2O_5$	P_2O_4 (?)	Acid unknown. Na salt got by heating $NaH_2PO_3.5H_2O$ to 160°; Pb salt got by heating $PbH_2(HPO_3)_2$ to 140° *in vacuo.*
$H_2.HPO_3$	$M_2.HPO_3$ and $M.H_2PO_3$	P_2O_3	Acid obtained by slow action of cold water on P_2O_3; decomposed by heat to H_3PO_4 and PH_3.
HPO_3; H_3PO_4; $H_4P_2O_7$	$M.PO_3$; M_3PO_4, M_2HPO_4, MH_2PO_4; $M_4P_2O_7$, $M_2H_2P_2O_7$	P_2O_5	Acids obtained by action of water on P_2O_5. A little cold water gives HPO_3; cold water and P_5O_5 in ratio P_2O_5:$2H_2O$ give $H_4P_2O_7$; much water gives H_3PO_4. H_3PO_4 heated gives $H_4P_2O_7$, and this at higher temperature gives HPO_3. P_2O_5 is not obtained by heating the acids.
Vanadium: HVO_3; $H_4V_2O_7$	MVO_3; $M_4V_2O_7$; also salts of types M_3VO_4, $M_2V_4O_9$, $M_2V_4O_{11}$, &c.	V_2O_5	Acids not obtained directly from the oxide; but V_2O_5 obtained by heating the acids.
Arsenic: —	$MAsO_2$; M_3AsO_2	As_2O_3	As_2O_3 in water does not form an acid, but reacts with alkalis &c. to form salts.
$HAsO_3$; H_3AsO_4; $H_4As_2O_7$	$MAsO_3$; MH_2AsO_4, M_2HAsO_4, M_3AsO_4; $M_4As_2O_7$	As_2O_5	H_3AsO_4 obtained by action of H_2O on As_2O_5; H_3AsO_4 gives $H_4As_2O_7$, and at higher temperature $HAsO_3$ is formed; on heating $HAsO_3$, As_2O_5 and H_2O are produced.

Acid	Salts	Corresponding oxide	Remarks
Niobium:			
$xNb_2O_5.yH_2O$ (? acids)	$xNb_2O_5.yRO$; some belong to types $MNbO_3$ and $M_4Nb_2O_7$, others are more complex	Nb_2O_5	Hydrates of Nb_2O_5 are known; but salts are not obtained by reaction of these with alkalis, but by fusing Nb_2O_5 with alkalis and alkaline carbonates.
Antimony:			
H_3SbO_3 (? acid)	$MSbO_2$	Sb_2O_3	H_3SbO_3 is not obtained directly from Sb_2O_3, but Sb_2O_3 is formed by heating H_3SbO_3. H_3SbO_3 scarcely exhibits acidic properties. $MSbO_2$ are few; produced by dissolving Sb_2O_3 in alkalis.
—	$M_2Sb_2O_5$ (? $MSbO_3.MSbO_2$)	? Sb_2O_4	Said to be formed by fusing Sb_2O_4 with alkalis and alkaline carbonates.
$HSbO_3$; H_3SbO_4; $H_4Sb_2O_7$	$MSbO_3$; $M_4Sb_2O_7$, $M_2H_2Sb_2O_7$	Sb_2O_5	Acids are not obtained directly from Sb_2O_5, but oxide is formed by heating the acids. H_3SbO_4 gives $HSbO_3$ at 175°; $H_4Sb_2O_7$ is obtained from its salts; it is easily decomposed to $HSbO_3$. $HSbO_3$ dissolves in KOHAq, but does not form salts thus; $MSbO_3$, obtained by fusing Sb_2O_5 or $HSbO_3$ with alkalis or alkaline carbonates. $M_4Sb_2O_7$ are formed by action of RO on $MSbO_2$.
Tantalum:			
$Ta_2O_5.2H_2O$ (? acid)	$MTaO_3$; also complex salts of general form $xTa_2O_5.yRO$.	Ta_2O_5	Acid not formed directly from oxide, but oxide obtained by heating the acid. Salts formed by fusing Ta_2O_5 or $H_4Ta_2O_7$ with basic oxides.

The division into two families is not marked; the properties of the members of the group vary gradually from N, which is a typical non-metal, to Bi, which is distinctly metallic. The properties of these elements and their compounds show that on the whole V, Nb, and Ta form a family; As, Sb, and Bi another family; and N and P a third family. Di and Er have not been much examined, and it is very probable that neither is an elementary substance. For detailed descriptions of the elements and their chief compounds, *v.* NITROGEN, PHOSPHORUS, &c.

M. M. P. M.

NITROGLYCERIN *v.* GLYCERIN.

NITRO-HARMALINE *v.* HARMALINE.

NITRO-HEMIPIC ACID *v.* HEMIPIC ACID.

NITRO-HEPTANE (?) $C_7H_{15}NO_2$. (193°–197°). S.G. ^{19} ·937. Occurs among the products of the action of HNO_3 (S.G. 1·38) on light petroleum oils (95°–100°) (Beilstein a. Kurbatoff, *B.* 13, 2029). Oil, sol. warm KOHAq.

NITRO-HEPTYL-BENZENE $C_7H_{15}.C_6H_4NO_2$. (178° at 10 mm.). Formed by nitration (Auger, *Bl.* [2] 47, 50). Heavy straw-coloured oil.

DI-NITRO-HEPTYLENE $C_7H_{12}(NO_2)_2$. [182°]. From heptinene and HNO_3 (S.G. 1·3) (Morris, *C. J.* 41, 175). Tables (from alcohol). Sol. alcohol, ether, and benzene, volatile with steam.

NITRO-HEXADECYL-BENZENE $C_6H_4(C_{16}H_{33})NO_2$. *Nitro-cetyl-benzene.* [c. 36°]. Formed by nitration of cetyl-benzene (Krafft, *B.* 19, 2984).

NITRO-*p*-HEXADECYL-TOLUENE $C_6H_3(NO_2)Me.C_{16}H_{33}$. [40°]. Obtained by nitration of hexadecyl-toluene (Krafft a. Göttig, *B.* 21, 3182).

DI-NITRO-HEXANE $C_5H_{11}.CH(NO_2)_2$. Obtained from hexyl methyl ketone and HNO_3 (Chancel, *C. R.* 94, 399). Heavy oil. Yields *n*-hexoic acid on reduction.—$KC_6H_{11}N_2O_4$: yellow plates (from hot water).—AgA′.

Tetra-nitro-hexane $C_6H_{10}(NO_2)_4$. Crystals, obtained by passing NO_2 into an ethereal solution of diallyl at 0° (Henry, *B.* 2, 279).

NITRO-HEXOIC ACID $C_6H_{11}NO_4$. [112°]. Formed by reducing di-nitro-hexoic acid in alcoholic solution by sodium-amalgam (Kullhem, *A.* 167, 45; Kachler, *A.* 191, 159). Four-sided prisms, v. sol. water and alcohol. With tin and HClAq it yields methyl isopropyl ketone, hydroxylamine, and CO_2. On adding H_2SO_4 to a solution of the K salt mixed with KNO_2, there is produced a blue colour, which can be taken up by ether.—NaA′ 3aq.—BaA′$_2$ 3aq.—$BaC_6H_9NO_4$.—AgA′.

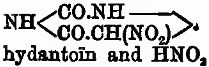
Di-nitro-hexoic acid $C_6H_{10}N_2O_6$. [215°]. Formed by boiling camphor with HNO_3 (Kullhem, *A.* 163, 231; Kachler, *A.* 191, 144). Plates (from water).—NH_4A'.—$NaA'4aq$.—$CaA'_2 3aq$: slender needles.—$BaA'_2 5aq$.—$BaA'_2 3aq$.—AgA'. Formerly supposed to be $C_7H_{12}N_2O_6$, *v. Di-nitro-heptoic acid*, under Camphor, vol. i. p. 672.

NITROHEXYLENE $C_6H_{11}NO_2$ (?). (210°–215°). A product of the action of HNO_3 (S.G. 1·34) on the fraction 95°–100° of the petroleum of Baku (Beilstein a. Kurbatoff, *B.* 13, 1820).

***m*-NITRO-HIPPURIC ACID** $C_9H_8N_2O_5$ *i.e.* $C_6H_4(NO_2).CO.NH.CH_2.CO_2H$. [162°]. S. ·36 at 23°. Formed by the action of HNO_3 and H_2SO_4 on hippuric acid; and occurs in dogs' urine after administration of *m*-nitro-benzoic acid (Bertagnini, *A.* 78, 100; Schwanert, *A.* 112, 69; Conrad, *J. pr.* [2] 15, 254). Needles. Split up by HClAq into glycocoll and *m*-nitro-benzoic acid. $CaA'_2 3aq$. — BaA'_2.—$CuA'_2 5aq$. — $ZnA'_2 6aq$. — $PbA'_2 5aq$.—AgA'.

p-**Nitro-hippuric acid** $C_9H_8N_2O_5$. [129°]. Occurs in urine after a dose of *p*-nitro-toluene (Jaffé, *B.* 7, 1673). Orange prisms (from alcohol).—$BaA'_2 4aq$.—AgA': long needles.—Urea salt $HA'CON_2H_4$. [180°]. Occurs in dogs' urine after a dose of *p*-nitro-benzoic aldehyde (Sieber a. Smirnoff, *M.* 8, 90). Pearly plates.

NITRO-HYDANTOÏN $C_3H_3N_2O_4$ *i.e.*



$NH\left\langle\begin{matrix}CO.NH\text{——}\\CO.CH(NO_2)\end{matrix}\right\rangle$. [170°]. Formed from hydantoïn and HNO_3 (Franchimont a. Klobbie, *R. T. C.* 7, 12).

DI-*p*-NITRO-HYDROBENZOÏN.

Acetyl derivative $C_6H_4(NO_2).CH(OAc).CH(OAc).C_6H_4NO_2$. [340°]. From the dibromide of di-*p*-nitro-di-phenyl-ethylene and alcoholic KOAc (Elbs a. Bauer, *J. pr.* [2] 34, 346). Small yellow crystals, m. sol. alcohol, ether, and glacial HOAc.

NITROHYDROCHLORIC ACID *v.* Chlorhydric acid, *Reactions*, No. 17, vol. ii. p. 8.

NITRO-HYDROCINNAMIC ACID *v.* Nitro-β-phenyl-propionic acid.

DI-NITRO-HYDRO-*p*-COUMARIC ACID *v.* Di-nitro-*p*-oxy-β-phenyl-propionic acid.

NITRO-HYDRO-ψ-CUMOQUINONE $C_9H_{11}NO_4$ *i.e.* $C_6Me_3(NO_2)(OH)_2$. [106°]. Formed from nitro-ψ-cumoquinone and SO_2 (Nef, *A.* 237, 18). Yellow needles (from ether).

NITRO-HYDRO-(β)-NAPHTHOQUINONE $C_{10}H_7NO_4$ *i.e.* $C_{10}H_5(NO_2)(OH)_2$. [159·5°]. Formed from nitro-(β)-naphthoquinone and SO_2 (Zaertling, *B.* 23, 177; *cf.* Groves, *C. J.* 45, 299). Red needles, sol. boiling water.

NITRO-HYDROQUINONE. *Mono-methyl ether* $C_6H_3(NO_2)(OMe)(OH)$. [83°]. Formed from HNO_3 and $C_6H_4(OMe)(OH)$ in ether (Weselsky a. Benedikt, *M.* 2, 369). Orange needles.

Di-methyl ether $C_6H_3(NO_2)(OMe)_2$. [71°]. Formed from $C_6H_4(OMe)_2$ and cold dilute (1:10) HNO_3 (Habermann, *B.* 11, 1034; Mühlhäuser, *A.* 207, 253). Felted needles.

Mono-ethyl ether $C_6H_3(NO_2)(OEt)(OH)$. [83°]. Yellow needles (W. a. B.).

Di-ethyl ether $C_6H_3(NO_2)(OEt)_2$. [49°]. Formed by nitration (Nietzki, *A.* 215, 148).

Mono-benzyl derivative $C_6H_3(NO_2)(OC_7H_7)(OH)$. [158°]. Formed by boiling the benzyl derivative of nitro-arbutin with dilute H_2SO_4 (Schiff a. Pellizzari, *A.* 221, 371; *G.* 14, 501). Yellow needles (from water).

Di-benzyl derivative $C_6H_3(NO_2)(OC_7H_7)_2$. [83°]. Obtained by nitration of $C_6H_4(OC_7H_7)_2$. Yellow needles (from alcohol).

Di-propionyl derivative $C_6H_3(NO_2)(O.COEt)_2$. [86°]. Obtained by nitration (Hesse, *A.* 200, 247).

Di-nitro-hydroquinone $C_6H_4N_2O_6$ *i.e.* $C_6H_2(NO_2)_2(OH)_2$ [5:2:4:1]. [136°]. Obtained by saponification of its di-acetyl derivative (Nietzki, *B.* 11, 469; *A.* 215, 145) and also by boiling di-nitro-arbutin with dilute H_2SO_4 (Strecker, *A.* 118, 293). Flat golden needles (from water). Its alkaline solutions are violet.—BaA'': violet-black needles with bronze lustre.

Di-acetyl derivative. [96°]. Obtained by nitrating the di-acetyl derivative of hydroquinone. Yellow needles.

Mono-methyl ether [102°]. Needles.

Di-methyl ether. The two crystalline isomerides $C_6H_2(NO_2)_2(OMe)_2$[3:2:1:4] [177°] and $C_6H_2(NO_2)_2(OMe)_2$[5:2:1:4] [202°] are formed by nitrating $C_6H_4(OMe)_2$ (Nietzki a. Rechberg, *B.* 23, 1216).

Mono-ethyl ether [71°]. Yellow needles.

Di-ethyl ether. The two crystalline isomerides $C_6H_2(NO_2)_2(OEt)_2$[3:2:1:4] [130°] and $C_6H_2(NO_2)_2(OEt)_2$[5:2:1:4] [176°] are formed by nitration of the di-ethyl derivative of hydroquinone (Nietzki, *A.* 215, 150; N. a. R.).

Methyl ethyl ether $C_6H_2(NO_2)_2(OMe)(OEt)$. [144°]. Formed from $C_6H_2(NO_2)_2(OMe)(OEt)$ (Fiala, *M.* 6, 914).

Benzyl ether $C_6H_2(NO_2)_2(OC_7H_7)(OH)$. [137°]. Formed by nitration (S. a. P.). Golden needles.—$KA'aq$: explosive scarlet needles.—$C_{13}H_{16}N_2O_6 2NH_3$. Loses NH_3 in air, forming NH_4A', which is stable.

Tri-nitro-hydroquinone. *Di-methyl ether* $C_6H(NO_2)_3(OMe)_2$. [101°]. Formed by adding a solution of $C_6H_4(OMe)_2$ in HOAc to a cold mixture of H_2SO_4 and fuming HNO_3 (H.). Yellow needles (from alcohol).

Di-ethyl ether $C_6H(NO_2)_3(OEt)_2$. [130°]. Formed from either $C_6H_2(NO_2)_2(OEt)_2$ by further nitration (Nietzki). Yellow needles. Aniline forms red crystals of $C_6H(NO_2)_2(NHPh)(OEt)_2$ [133°] whence alcoholic potash yields yellow crystals of $C_6H(NO_2)_2(OH)(OEt)_2$ [152°].

Tetra-nitro-hydroquinone. *Di-isobutyl ether* $C_6(NO_2)_4(OC_4H_9)_2$. Formed by nitrating $C_6H_4(OC_4H_9)_2$ (Schubert, *M.* 3, 686). Needles (from alcohol), v. sol. hot HOAc.

DI-NITRO-HYDROTOLUQUINONE $C_6HMe(NO_2)_2(OH)_2$. [149°–153°]. Obtained by saponifying its mono-acetyl derivative, which is got by nitrating the di-acetyl derivative of hydrotoluquinone (Kehrmann a. Brasch, *J. pr.* [2] 39, 377). Yellowish-red crystals (containing aq).

Acetyl derivative $C_6HMe(NO_2)_2(OAc)(OH)$. [146°]. Yellow crystals.

Di-acetyl derivative $C_6HMe(NO_2)_2(OAc)_2$. [154°–157°]. Colourless silky needles.

NITRO-DI-IMIDO-HYDROQUINONE $C_6H(NO_2)(NH)_2(OH)_2$[3:5:2:4:1]. Formed from di-amido-hydroquinone sulphate, HOAc, and HNO_3 (S.G. 1·4) (Nietzki a. Schmidt, *B.* 22, 1658). Needles or prisms. Reduced by $SnCl_2$ to tri-amido-hydroquinone.

NITRO-IMIDO-DI-PHENYL-SULPHOXIDE $NH<\begin{matrix}C_6H_4\text{———}\\C_6H_3(NO_2)\end{matrix}>SO$. Formed by nitration of imido-di-phenyl-sulphoxide (Bernthsen, *B.* 17, 2858).

(*a*)-**Di-nitro-imido-di-phenyl-sulphoxide** $NH<\begin{matrix}C_6H_3(NO_2)\\C_6H_3(NO_2)\end{matrix}>SO$. Formed, together with the (*β*)-isomeride by nitration of imido-di-phenyl-sulphide (Bernthsen, *A.* 230, 115). Orange needles. Reduced by $SnCl_2$ and HCl to (*a*)-di-amido-imido-di-phenyl sulphide.

Acetyl derivative $C_{12}H_5Ac_2N_3SO_5$.

(*β*)-**Di-nitro-imido-di-phenyl-sulphoxide.** Lemon-yellow powder. Reduced by $SnCl_2$ and HCl to (*β*)-di-amido-imido-di-phenyl sulphide.

NITRO-DI-IMIDO-RESORCIN $C_6H(NH)_2(NO_2)(OH)_2$[6:4:2:3:1]. Formed from di-amido-resorcin sulphate, HOAc, and HNO_3 (Nietzki a. Schmidt, *B.* 22, 1659). Needles.—K_2A'': orange needles.

NITRO-INDAZINE $C_7H_5(NO_2)N_2$. [181°]. Formed, together with nitro-cresol, by heating diazotised (4, 1, 2)-nitro-o-toluidine sulphate with water (Witt, Nölting, a. Grandmougin, *B.* 23, 3636). Needles. Yields a methyl derivative $C_7H_4Me(NO_2)N_2$ [159°], an acetyl derivative [140°], and a bromo- derivative $C_7H_4Br(NO_2)N_2$ [229°].

DI-NITRO-INDIN *v.* INDIN.

DI-NITRO-INDIGO *v.* INDIGO.

NITRO-INOSITE *v.* INOSITE.

NITRO-IODO- compounds *v.* **IODO-NITRO-** compounds.

NITRO-ISATIN *v.* ISATIN.

NITRO-ISATOIC ACID *v.* ISATOIC ACID.

NITRO-LACTIC ACID *v.* NITRO-OXY-PROPIONIC ACID.

TRI-NITRO-LAURENE $C_{11}H_{13}(NO_2)_3$(?). [84°]. From laurene, HNO_3, and H_2SO_4 (Fittig, *A.* 145, 150).

NITROLIC ACIDS. Compounds of the form $R.CH(NO)(NO_2)$ or $R.C(NO_2):NOH$. They are formed by the action of nitrous acid (*i.e.* KNO_2 and H_2SO_4) on the sodium derivatives of primary nitro-paraffins, and by the action of hydroxylamine on the compounds $R.C(NO_2)Br_2$. Their alkaline solutions are red (V. Meyer, *B.* 7, 1510; *cf.* vol. i. p. 101). The compounds of the form $RR'C(NO)(NO_2)$ formed by the action of nitrous acid on secondary nitro-paraffins are called pseudonitroles. The pseudonitroles are also formed by the action of NO_2 upon ketones; thus acetone yields $(CH_3)_2C(NO)(NO_2)$ (Scholl, *B.* 21, 506). The pseudonitroles may perhaps be formulated $RR'C:N.O.NO_2$ (V. Meyer, *B.* 21, 1291). The pseudonitroles do not form salts; their solutions are blue.

NITRO-MALONIC ETHER $CH(NO_2)(CO_2Et)_2$. Formed from malonic ether (1 pt.) and HNO_3 (5 pts. of S.G. 1·5), the product being extracted with ether (Franchimont a. Klobbie, *R. T. C.* 8, 283). Heavy oil, decomposing carbonates and forming a white crystalline compound with NH_3, decomposing at 150°.

Methyl nitro-malonate forms the analogous $CH(NO_2)(CO_2Me)_2NH_3$ [c. 166°].

o-NITRO-MANDELIC ACID $C_8H_7NO_5$ *i.e* $C_6H_4(NO_2).CH(OH).CO_2H$. [140°]. Formed from di-*ω*-bromo-o-nitro-acetophenone and very dilute KOH (Engler a. Wöhrle, *B.* 20, 2201). Formed also from o-nitro-benzoic aldehyde, KCy, MeOH, and HCl (Engler a. Zielke, *B.* 22, 207). Small crystals, v. sol. water.

Methyl ether MeA'. [74·5°]. Sol. alcohol.

m-**Nitro-mandelic acid.** [120°]. Formed from *m*-nitro-*a*-amido-phenyl-acetic acid and HNO_2 (Plöchl a. Loë, *B.* 18, 1181) and also from di-*ω*-bromo-*m*-nitro-acetophenone and dilute KOH (E. a. W.). Yellowish rhombohedra with bitter taste.—NH_4A'.—AgA'.

Ethyl ether EtA'. [63°].

m-**Nitro-mandelic imido-ether** $C_6H_4(NO_2).CH(OH).C(NH)OEt$. [84°]. Formed from *m*-nitro-benzoic aldehyde, KCy, alcohol, and HCl (Beyer, *J. pr.* [2] 31, 393). Dendritic needles (from ligroïn).—B'HCl. [129°]. Needles. Cold dilute HClAq converts it quickly into *m*-nitro-mandelic ether [63°].

p-**Nitro-mandelic acid** [126°]. Formed in like manner (E. a. Z.). Yields *p*-oxy-phenyl-glyoxylic acid on boiling with aqueous Na_2CO_3.

Methyl ether MeA'. [87°]. Prisms.

Ethyl ether EtA'. [76°]. Needles.

NITRO-MESIDINE *v.* NITRO-AMIDO-MESITYLENE.

NITRO-MESITOL $C_6HMe_3(NO_2)(OH)$. [64°]. From nitro-amido-mesitylene and HNO_2 (Knecht, *B.* 15, 1376; *A.* 215, 98). Yellow plates (from water), volatile with steam.

NITRO-MESITYLENE $C_6H_2Me_3(NO_2)$. [42°]. (255°). Formed, together with much di-nitro-mesitylene, from mesitylene and HNO_3 (S.G. 1·38) (Fittig, *A.* 141, 132; 147, 2). Formed also from nitro-amido-mesitylene and HNO_2 (Ladenburg, *A.* 179, 170; Klobbie, *R. T. C.* 6, 31). Triclinic prisms (from alcohol). CrO_3 in HOAc oxidises it to $C_6H_2Me_2(NO_2).CO_2H$[6:2:1:4] [200°-225°] (Emerson, *Am.* 8, 268).

Di-nitro-mesitylene $C_6HMe_3(NO_2)_2$. [86°]. Obtained by dropping mesitylene into cooled fuming HNO_3. Trimetric prisms, m. sol. hot alcohol.

Tri-nitro-mesitylene $C_6Me_3(NO_2)_3$. [232°]. Formed from mesitylene, HNO_3, and H_2SO_4. Colourless needles (from hot alcohol) or triclinic prisms (from acetone). Yields NH_3 and di-amido-mesitylene on reduction by tin and HClAq.

NITRO-MESITYLENE SULPHONIC ACID $C_9H_{11}NSO_5$ *i.e.* $C_6HMe_3(NO_2)(SO_3H)$. [131°]. S. 100 in the cold. Formed from mesitylene sulphonic acid and HNO_3 (Roze, *Z.* [2] 6, 74; *A.* 164, 65). Prisms (containing 1½ aq).—KA' aq.—BaA'_2.—CuA'_2 3aq.—PbA'_2 aq.

(*a*)-**NITRO-MESITYLENIC ACID** $C_9H_9NO_4$ *i.e.* $C_6H_2Me_2(NO_2)(CO_2H)$ [5:3:2:1]. [212°]. Formed by nitrating mesitylenic acid (Schmitz, *A.* 193, 162). Colourless crystals (from alcohol).—BaA'_2 4aq: needles, v. e. sol. water.

Ethyl ether EtA'. [64°]. Tables.

(*β*)-**Nitro-mesitylenic acid** $C_6H_2Me_2(NO_2)(CO_2H)$ [5:3:4:1]. [223°]. Found, in small quantity, in preparing the preceding acid (Fittig, *A.* 141, 149; 147, 48; Schmitz). Formed also by oxidising nitro-mesitylene (*q.v.*) monoclinic crystals (from alcohol). Melts at 179° when crystallised from water.—BaA'_2 4aq. — BaA'_2 2aq. — BaA'_2 6aq. — CaA'_2 6aq. — MgA'_2 11aq.—AgA'.

Ethyl ether EtA' [72°]. Needles.

NITRO-MESITYL-PHTHALIMIDE

$C_6H_4<\begin{matrix}CO\\CO\end{matrix}>N.C_6HMe_3(NO_2)$. [210°]. Formed by nitration of mesityl-phthalimide (Eisenberg, *B.* 15, 1018). Prisms, sol. alcohol.

Di-nitro-mesityl-phthalimide

$C_6H_4<\begin{matrix}CO\\CO\end{matrix}>N.C_6Me_3(NO_2)_2$. [242°]. Formed from mesityl-phthalimide, HNO_3, and H_2SO_4(E.). Needles, sol. alcohol.

NITRO-METHANE $CH_3.NO_2$. Mol. w. 61. (101°). S.G. $\frac{15}{15}$ 1·1441; $\frac{25}{25}$ 1·1330. M.M. 1·858 (Perkin, *C. J.* 55, 687). S.V. 59·5 (Schiff; Lossen, *A.* 254, 73). H.F.p. 18,600. H.F.v. 17,440 (Thomsen, *Th.*). Formed, unaccompanied by methyl nitrite, from MeI and $AgNO_3$ (V. Meyer, *A.* 171, 32). Formed also by heating potassium chloro-acetate with potassium nitrite (Kolbe, *J. pr.* [2] 5, 427; Preibisch, *J. pr.* [2] 7, 480; 8, 316). Heavy oil. With alcoholic potash it gives a pp. of $CH_2K.NO_2(EtOH)$, the aqueous solution of which is ppd. by $HgCl_2$, the pp. being explosive. Iron and acetic acid reduce it to methylamine. Fuming H_2SO_4 forms hydroxylamine and CO. HClAq (S.G. 1·14) at 150° forms formic acid and hydroxylamine. Benzoic aldehyde yields $C_6H_5.CH:CH.NO_2$ (characteristic) (Priebs, *A.* 225, 319). Nitro-methane converts dichlorhydrin $CH_2Cl.CH(OH).CH_2Cl$ into di-chloro-formin $CH_2Cl.CH(OCHO).CH_2Cl$ (Pfungst, *J. pr.* [2] 32, 237). $ZnEt_2$, followed by water, yields methyl-di-ethyl-hydroxylamine (Bevad, *J. R.* 20, 125).

Di-nitro-methane. Potassium salt $CHK(NO_2)_2$. Formed by passing H_2S into a solution of $CBrK(NO_2)_2$ mixed with ammonia (Villiers, *Bl.* [2] 41, 282). Yellow explosive crystals.

Tri-nitro-methane $CH(NO_2)_3$. *Nitroform.* [15°]. Formed by boiling with water tri-nitro-acetonitrile, a product of the action of HNO_3 and H_2SO_4 on fulminuric acid (Schischkoff, *A.* 103, 364). White crystals, m. sol. water. Explodes when quickly heated. Reduced by tin and HCl to hydroxylamine, NH_3, and HCy (V. Meyer a. Locher, *A.* 180, 172).

Tetra-nitro-methane $C(NO_2)_4$. Mol. w. 196. [13°]. (126°). Formed from tri-nitro-methane, conc. H_2SO_4, and fuming HNO_3 (Schischkoff, *A.* 119, 248). White crystals, which will not burn.

NITRO-METHANE TRICARBOXYLIC ETHER $C(NO_2)(CO_2Et)_3$. Formed from $CH(CO_2Et)_3$ and HNO_3 (S.G. 1·52) (Franchimont a. Klobbie, *R. T. C.* 9, 220). Oil.

NITRO-METHANE DISULPHONIC ACID $CH(NO_2)(SO_3H)_2$. The salt K_2A'', formed by the action of conc. H_2SO_3Aq on chloropicrin crystallises in minute plates, v. sl. sol. cold water (Rathke, *A.* 161, 153; 167, 220).

NITRO-METHOXY- compounds *v. Methyl derivatives* of Nitro-oxy- compounds.

NITRO-DI-METHYL-AMIDO-BENZENE SULPHONIC ACID $C_8H_{10}N_2SO_5$ *i.e.* $C_6H_3(NMe_2)(NO_2).SO_3H$. Formed together with $C_6H_4(NO_2)NMe_2$, from $C_6H_4(NMe_2).SO_3H$ and aqueous $NaNO_2$ (Michler a. Walder, *B.* 14, 2176). Yellow crystals (from water).—BaA'_2.—CaA'_2.

NITRO-TETRA-METHYL-DI-AMIDO-BENZOPHENONE $C_{17}H_{19}N_3O_3$ *i.e.* $NMe_2.C_6H_3(NO_2).CO.C_6H_4.NMe_2$. [144°]. Formed from $CO(C_6H_4.NMe_2)_2$ by nitration (Nathansohn a. Müller, *B.* 22, 1883). Needles (from warm alcohol), sl. sol. ether.

Di-nitro-di-methyl-amido-benzophenone $C_{12}H_7(NO_2)_2(NMe_2)CO$. [142°]. Obtained from $C_6H_5.CO.C_6H_4NMe_2$ and fuming HNO_3 (Fischer *A.* 206, 88). Nodules (from dilute HOAc).

Tetra-nitro-di-methyl-di-amido-benzophenone $CO(C_6H_2(NO_2)_2.NMeH)_2$. [225°]. Formed by boiling its di-nitro- derivative with phenol (Van Romburgh, *R. T. C.* 6, 252, 365). Plates, v. sl. sol. alcohol.

Di-nitro-derivative $CO(C_6H_2(NO_2)_2.NMeNO_2)_2$. Formed by the action of conc. HNO_3 on $CO(C_6H_4NMe_2)_2$ or $CS(C_6H_4NMe_2)_2$ (R.; Baither, *B.* 20, 3296). Yellow crystals, decomposing at about 210°.

NITRO-DI-METHYL-AMIDO-PHENOL. *Anhydride of the methylo-hydroxide*

$C_8H_{12}N_2O_2$ *i.e.* $C_6H_3(NO_2)<\begin{matrix}O\\NMe_3\end{matrix}>$. Formed from nitro-amido-phenol, MeI and KOH (Griess, *B.* 13, 647). Yellow crystals.—B'HCl aq.—B'HI 2aq.—$B'_2H_2PtCl_6$ 6aq: yellow crystals.

Di-nitro-di-methyl-amido-phenol $C_8H_9N_3O_5$ *i.e.* $C_6H_2(NO_2)_2NMe_2(OH)$. [195°]. Formed from KCy and alcoholic $C_6H_3(NO_2)_2NMe_2$ at 50° (Lippmann a. Fleissner, *M.* 6, 808). Triclinic yellow crystals. Converted by boiling KOHAq into dimethylamine and di-nitro-resorcin [145°].—NH_4A'. [195°].—KA'.—BaA'_2 1½aq.—AgA': red crystalline pp.

Tri-nitro-methyl-amido-phenol. *Nitro-derivative* $C_6H(NO_2)_3(OH).NMe(NO_2)$. [188°]. Formed by boiling $C_6H(NO_2)_4.NMe(NO_2)$ with water (Van Romburgh, *R. T. C.* 8, 275). Yellow crystals (from water). Its methyl ether $C_6H(NO_2)_2(OMe).NMe(NO_2)$ [99°] is formed by dissolving $C_6H(NO_2)_4NMe(NO_2)$ in MeOH. The ethyl ether $C_6H(NO_2)_3(OEt).NMe(NO_2)$ [98°] is formed in like manner.

DI-NITRO-TETRA-METHYL-DI-*p*-AMIDO-DIPHENYL $C_6H_3(NO_2)(NMe_2).C_6H_3(NO_2)(NMe_2)$. [188°]. Obtained by nitration (Michler, *B.* 14, 2164; 17, 118). Red needles.

DI-NITRO-DI-METHYL-*p*-AMIDO-DIPHENYLAMINE [4:2:1] $C_6H_3(NO_2)_2.NH.C_6H_4NMe_2$. [168°]. Formed from $C_6H_3Cl(NO_2)_2$ and $C_6H_4(NH_2)(NMe_2)$ (Lellmann a. Mack, *B.* 23, 2739).—Orange plates.

***p*-NITRO-DI-METHYL-AMIDO-DI-PHENYL-CARBINOL** $C_6H_4(NO_2).CH(OH).C_6H_4NMe_2$. [96°]. Formed by boiling *p*-nitro-benzoic aldehyde with di-methyl-aniline and HClAq (Albrecht, *B.* 21, 3294). Thin yellow needles.

Reactions.—1. *Dimethylaniline* and $ZnCl_2$ yield $C_6H_4(NO_2).CH(C_6H_4NMe_2)_2$ [177°].—2. Boiling *alcoholic potash* and *zinc-dust* form an azo- compound [199°].—3. *Zinc-dust* and HCl reduce it to di-methyl-di-amido-di-phenyl-carbinol [165°] and di-methyl-di-amido-di-phenyl-methane [93°].

Methylo-iodide B'MeI. [c. 175°].

o-Nitro-tetra-methyl-di-*p*-amido-tri-phenyl carbinol $C_{23}H_{25}N_3O_3$ *i.e.* $C_6H_4(NO_2).C(OH)(C_6H_4NMe_2)_2$. *o-Nitro-malachite green.* [163°]. Formed by heating di-methyl-aniline (3½ pts.) with *o*-nitro-benzoic aldehyde (1 pt.) and $ZnCl_2$ (1 pt.) on the water-bath, and oxidising the resulting leuco-base with PbO_2 and dilute H_2SO_4 (O. Fischer a. Schmidt, *B.* 17, 1890). Small yellow crystals, sol. alcohol.

***m*-Nitro-tetra-methyl-di-*p*-amido-tri-phenyl-carbinol** [3:1] $C_6H_4(NO_2).C(OH)(C_6H_4NMe_2)_2$. Formed by oxidation of *m*-nitro-tetra-methyl-di-amido-tri-phenyl-methane (E. a. O. Fischer, *B.* 12, 802).—Picrate: small green needles.

***p*-Nitro-tetra-methyl-di-amido-tri-phenyl-carbinol.** Formed like the two preceding isomerides, and also by heating dimethylaniline with BzCl and ZnCl (E. a. O. Fischer, *B.* 12, 800; 14, 2528). Small golden prisms. Dyes a splendid green.—Picrate: minute needles.

NITRO-DI-METHYL-AMIDO-PHENYL-HEXYL KETONE $C_{15}H_{22}N_2O_3$ *i.e.* $C_6H_3(NO_2)(NMe_2).CO.C_6H_{13}$. [65°]. Obtained by nitrating $C_6H_4(NMe_2).CO.C_6H_{13}$ (Auger, *Bl.* [2] 47, 42). Yellow needles (from alcohol).

***o*-NITRO-TETRA-METHYL-DI-*p*-AMIDO-TRI-PHENYL-METHANE** $C_6H_4(NO_2).CH(C_6H_4NMe_2)_2$. o-*Nitro-leuco-malachite-green.* [160°]. Prepared by heating o-nitro-benzoic aldehyde with dimethylaniline and $ZnCl_2$ (Fischer, *B.* 15, 682; 17, 1889. Yellow monoclinic prisms, sl. sol. alcohol.

***m*-Nitro-tetra-methyl-di-amido-tri-phenyl-methane** $C_6H_4(NO_2).CH(C_6H_4NMe_2)_2$. [152°]. Obtained in the same way from *m*-nitro-benzoic aldehyde (E. a. O. Fischer, *B.* 12, 802). Yellow crystals, sl. sol. alcohol.

***p*-Nitro-tetra-methyl-di-amido-tri-phenyl-methane.** [177°]. Obtained from *p*-nitro-benzoic aldehyde, dimethylaniline, and $ZnCl_2$ at 100° (Fischer, *B.* 14, 2526). Golden plates.

Methylo-iodide $B''Me_2I_2$ aq. [220°].

Tetra-nitro-di-methyl-di-amido-di-phenyl-methane $CH_2(C_6H_2(NO_2)_2.NMeH)_2$. [250°]. Formed by boiling its di-nitro-derivative with phenol (Van Romburgh, *R. T. C.* 7, 233). Orange crystals, sl. sol. hot alcohol.

Di-nitro-derivative $CH_2(C_6H_2(NO_2)_2.NMe.NO_2)_2$. Formed from $CH_2(C_6H_4.NMe_2)_2$, acetic acid, and HNO_3. Yellow crystalline substance, decomposing at 217°-220°.

Hexa-nitro-tetra-methyl-di-amido-tri-phenyl-methane. [200°]. Formed by nitrating $CH(C_6H_5)(C_6H_4NMe_2)_2$ (O. Fischer, *A.* 206, 122). Golden needles, sol. alcohol.

NITRO-DI-METHYL-*p*-AMIDO-PHENYL-OXAMIC ETHER $C_{12}H_{15}N_3O_5$ *i.e.* [1:3:4] $C_6H_3(NMe_2)(NO_2).NH.CO.CO_2Et$. [152°]. Formed from di-methyl-amido-phenyl-oxamic ether and nitrous acid (Wurster a. Sendtner, *B.* 12, 1804). Red needles. Gives $C_6H_3(NMe_2)(NH_2)_2$ on reduction by tin and HClAq.

NITRO-TETRA-METHYL-DI-AMIDO-PHENYL-DI-TOLYL-METHANE $C_6H_4(NO_2).CH(C_6H_3Me.NMe_2)_2$. [224°]. Formed from di-methyl-*m*-toluidine and *p*-nitro-benzoic aldehyde (Kock, *B.* 20, 1562). Yields a picrate [199°].

NITRO-METHYL-AMINE *v.* METHYL-NITRO-AMINE, p. 279.

Nitro-di-methyl-amine *v.* DI-METHYL-NITRO-AMINE, p. 280.

o-NITRO-METHYL-ANILINE $C_7H_8N_2O_2$ *i.e.* [1:2] $C_6H_4(NO_2).NHMe$. [28°]. Formed by heating o-nitro-phenol with alcoholic methylamine at 180° (Hempel, *J. pr.* [2] 41, 164).

Nitrosamine $C_6H_4(NO_2).N(NO)Me$. [36°].

***m*-Nitro-methyl-aniline** [1:3]$C_6H_4(NO_2).NHMe$. [66°]. Formed by methylation of *m*-nitro-aniline (Nölting a. Stricker, *B.* 19, 548). Reddish-yellow needles, sol. hot Aq.

Acetyl derivative $C_6H_4(NO_2).NAcMe$. [95°]. Needles, sol. water (Meldola, *C. J.* 53, 777).

Benzoyl derivative $C_7H_7BzN_2O_2$. [105°].

Nitrosamine $C_6H_4(NO_2).N(NO)Me$. [70°].

***p*-Nitro-methyl-aniline** [1:4]$C_6H_4(NO_2).NHMe$. [152°]. Formed by heating [1:4]$C_6H_4(NO_2).N_2.NMe.C_6H_4(NO_2)$[4:1] with HClAq (Meldola a. Salmon, *C. J.* 53, 774). Short thick yellowish-brown prisms or tablets (from alcohol), sl. sol. hot water, v. sol. alcohol.

Acetyl derivative $C_6H_4(NO_2).NAcMe$. [153°].

Benzoyl derivative. [112°]. Prisms.

Nitrosamine $C_6H_4(NO_2).N(NO)Me$. [100°].

***m*-Nitro-di-methyl-aniline** $C_6H_4(NO_2).NMe_2$[1:3]. [61°]. (280°-285°). Large red prisms. Obtained by heating *m*-nitro-aniline hydrobromide (1 mol.) with MeOH (2 mols.) at 100° (S. a. B.). Prepared by nitration of dimethylaniline in presence of a large excess of H_2SO_4, *p*-nitro-dimethylaniline being formed in smaller quantity. A mixture of 193 g. of HNO_3 (S.G. 1·35) and 600 g. of ordinary H_2SO_4 is allowed to slowly drop into a solution of 200 g. of dimethylaniline in 4,000 g. of ordinary H_2SO_4, keeping the mixture cooled below 5°. After standing for 4 or 5 hours it is poured into about 10 litres of iced water and filtered from the ppd. *p*-nitro- derivative, more of which separates on partial neutralisation with Na_2CO_3 (50 or 60 g. on the whole). The filtrate neutralised with Na_2CO_3 deposits the *m*-nitro-di-methyl-aniline; the yield is 160 to 170 g. (Groll, *B.* 19, 198).

Methylo-bromide $C_6H_4(NO_2).NMe_3Br$. Crystalline (Städel a. Bauer, *B.* 19, 1941). Yields crystalline B'MeCl, $B'_2Me_2PtCl_6$, and unstable B'MeOH which is converted by *m*-nitro-phenol into $C_6H_4(NO_2).NMe_3.O.C_6H_4(NO_2)$ [62°].

***p*-Nitro-di-methyl-aniline** $C_6H_4(NO_2).NMe_2$. [163°]. Formed by adding HNO_2 to a solution of dimethylaniline in HOAc (Weber, *B.* 10, 760). Formed also by oxidising *p*-nitroso-di-methyl-aniline with $KMnO_4$ (Wurster, *B.* 12, 528; *cf.* Schraube, *B.* 8, 616); by heating *p*-chloro-nitro-benzene with NMe_3 at 180° (Leymann, *B.* 15, 1234); and by the action of nitrous acid on $C_6H_4(NMe_2).SO_3H$ (Michler a. Walder, *B.* 14, 2176), on $C_6H_4(NMe_2).N_2.C_6H_4NMe_2$ (Lippmann a. Fleissner, *B.* 16, 1421); and on the base $C_6H_3(NO_2)(NH_2)NMe_2$ (Hewi, *B.* 21, 2309). Yellow needles. Does not form salts.

Di-nitro-methyl-aniline $C_7H_7N_3O_4$ *i.e.* $C_6H_3(NO_2)_2.NHMe$. [177°].

Formation.—1. From chloro-di-nitro-benzene and methylamine (Leymann, *B.* 15, 1234).—2. By heating $C_6H_3(NO_2)_2NMe_2$ [78°] in HOAc with bromine (L.), or CrO_3 (Van Romburgh, *R. T. C.* 8, 250).—3. By nitrating the formyl, acetyl, or oxalyl derivative of methyl-aniline (Norton a. Allen, *B.* 18, 1995; Norton a. Livermore, *B.* 20, 2273).

Properties.—Yellow crystals, v. sol. alcohol, sl. sol. hot water.

Di-nitro-di-methyl-aniline $C_6H_3(NO_2)_2.NMe_2$[4:2:1]. [87°]. Formed from $C_6H_3Cl(NO_2)_2$ and NMe_3 (Leymann, *B.* 15, 1283). Prepared by slowly adding 500 g. of dimethylaniline to a mixture of 6 litres of ordinary conc.

HNO_3 and 6 litres of water, cooled to 0°; the yield being 116° (Mertens, *B.* 19, 2123; *cf.* Weber, *B.* 10, 763). Large yellow pointed crystals or prisms. V. sol. alcohol, chloroform, benzene, acetic acid, and HClAq. Heated with 10 p.c. KOHaq it readily decomposes into di-nitro-phenol [114°] and dimethylamine. Boiled with fuming HNO_3 it is converted into tri-nitro-phenyl-methyl-nitramide $C_6H_2(NO_2)_3.NMe(NO_2)$.

Salts.—B'HCl: unstable.—$B'_2H_2Cl_2PtCl_4$: granular pp., or large brownish-red pyramids.

Di-nitro-di-methyl-aniline $C_6H_3(NO_2)_2.NMe_2$[5:3:1 ?]. Formed by nitration of dimethylaniline with dilute HNO_3 (equal vols. of HNO_3 (S.G. 1·4) and water) without cooling, the yield being 15 p.c. (Mertens, *B.* 19, 2125). Golden-brown plates. Decomposes at 250°–272°. Soluble in phenol. It is attacked only by very strong KOH. Boiled with fuming HNO_3 it is converted into di-nitro-phenyl-methyl-nitramine $C_6H_3(NO_2)_2.NMe(NO_2)$, a crystalline body which explodes above 220°.

Tri-nitro-methyl-aniline $C_7H_3N_4O_6$ *i.e.* $C_6H_2(NO_2)_3NHMe$. [111°]. Formed from $C_6H_2Cl(NO_3)_3$ (picryl chloride) and methylamine in hot alcoholic solution (Van Romburgh, *R. T. C.* 2, 31, 105, 305). Yellow needles (from alcohol). Gives off $NMeH_2$ when heated with KOHAq.

Nitro- derivative $C_6H_2(NO_2)_3NMe(NO_2)$. [127°]. Obtained from dimethylaniline (10 pts.), H_2SO_4 (100 pts.), and HNO_3 (200 pts. of S.G. 1·48). Obtained also from methyl-aniline and HNO_3 (Romburgh), and by nitration of di-methyl-amido-phenyl naphthyl sulphone (Michler a. Schacht, *B.* 12, 1790). Pale-yellow crystals (from alcohol). Yields picric acid on boiling with aqueous Na_2CO_3. Reduced by tin and HClAq to tri-amido-phenol.

Tri-nitro-di-methyl-aniline $C_6H_2(NO_2)_3NMe_2$. [138°]. Formed from picryl chloride and alcoholic dimethylamine (Van Romburgh, *R. T. C.* 2, 105; 8, 250). Yellow crystals (from benzene). Forms with picric acid the crystalline compound $C_8H_3N_4O_8C_6H_2(NO_2)_3OH$ [114°].

Tetra-nitro-methyl-aniline. *Nitro- derivative* $C_6H(NO_2)_4.NMe(NO_2)$. [146°]. Formed from the preceding tri-nitro-di-methyl-aniline and HNO_3 (S.G. 1·5) (Van Romburgh, *R. T. C.* 8, 274). Yellowish-white needles. On dissolving in MeOH it yields $C_6H(NO_2)_3(OMe).NMe(NO_2)$ [99°]; alcohol forms $C_6H(NO_2)_3(OEt).NMe(NO_2)$ [98°] in like manner. Aqueous methylamine produces $C_6H(NO_2)_3(NMeH).NMe(NO_2)$ [192°] and $C_6H(NO_2)_3(NMeH)_2$ [235°]. If a few drops of aniline be poured upon the nitro- derivative it catches fire.

NITRO-METHYL-ANTHRAQUINONE $C_{14}H_6O_2(CH_3)(NO_2)$. [270°]. Prepared by nitration of methyl-anthraquinone by adding KNO_3 to its solution in H_2SO_4 (Römer a. Link, *B.* 16, 696). Sublimes in small white needles. Sl. sol. alcohol and ether, v. sol. nitrobenzene.

TRI-NITRO-TRI-METHYL-BENZENE $C_6Me_3(NO_2)_3$ [1:2:3:4:5:6]. [209°]. Got by nitration (Jacobsen, *B.* 19, 2517).

NITRO-METHYL-BENZOIC ACID *v.* NITRO-TOLUIC ACID.

Nitro-di-methyl-benzoic acid $C_9H_9NO_4$ *i.e* $C_6H_2Me_2(NO_2).CO_2H$. [195°]. Formed by oxidising nitro-ψ-cumene (Schaper, *Z.* 1867, 13). Slender needles.—CaA'_2 6aq.—BaA'_2 9aq.—EtA'.

***p*-NITRO-METHYL-COUMARILIC ACID**

$C_6H_3(NO_2)\left<\begin{matrix}CMe:C.CO_2H\\ O\end{matrix}\right>$. [178°]. Obtained by saponification of its ethyl-ether, which is formed by heating dry *p*-nitro-phenol sodium with chloro-acetoacetic ether and dissolving the product (probably *p*-nitro-phenoxy-acetic ether) in conc. H_2SO_4 (Nuth, *B.* 20, 1332). Short yellow needles. M. sol. hot water, alcohol, and ether; nearly insol. cold water. Most of the salts are sparingly soluble.—$AgA'\frac{1}{2}$aq: small needles.

Ethyl ether EtA': [74°]. White needles.

NITRO-METHYL-ETHYL-BENZENE *v.* NITRO-ETHYL-TOLUENE.

NITRO-(*B.* 2-*Py.* 2)-DIMETHYL-(*Py.* 3)-ETHYL-QUINOLINE $C_{13}H_{14}N(NO_2)$. [109°]. Formed by nitration of di-methyl-ethyl-quinoline (Harz, *B.* 18, 3391). Triclinic crystals. Easily soluble in chloroform, m. sol. ether.

Salts.—B'HCl×: easily soluble yellow crystals.—$B'_2H_2PtCl_6$ 2aq: short thick orange crystals, sol. hot water.

Nitro-(*B.* 2, 4; *Py.* 2)-tri-methyl-(*Py.* 3)-ethyl-quinoline $C_{14}H_{16}(NO_2)N$. [90°]. Formed by nitration of the base (*cf.* p. 326). Needles (from alcohol). It is accompanied by the di-nitro- derivative $C_{14}H_{15}(NO_2)_2N$ [152·5°] Waldbott, *B.* 23, 2272).

DI-NITRO-METHYLIC ACID (so-called) $CH_4N_2O_2$ *i.e.* $CH_3.NH.NO_2$? By passing NO into $ZnMe_2$ there is formed $CH_3(ZnMe)N_2O_2$, which is decomposed by water yielding $CH_3(ZnOH)N_2O_2$, whence CO_2 yields crystalline $(CH_3.N_2O_2)_2Zn$aq, which is converted, by adding Na_2CO_3 to its aqueous solution, into very soluble $CH_3NaN_2O_2$aq (Frankland, *C. J.* 11, 88).

DI-NITRO-METHYL-MESIDINE *Nitramine* $C_6Me_3(NO_2)_2NMe(NO_2)$. [138°]. Formed from $C_6Me_3H_2.NMe_2$, H_2SO_4, and HNO_3 (Klobbie, *R. T. C.* 6, 31). Crystals, sl. sol. ether.

NITRO-METHYL-NAPHTHALENE $C_{11}H_9NO_2$. [81°]. Formed, together with the di-nitro- derivative [206°], by nitration of (β)-methyl-naphthalene (Schulze, *B.* 17, 844). Thin yellowish needles.

DI-NITRO-(*Py.* 3)-METHYL-(β)-NAPHTHOQUINOLINE $C_{14}H_9(NO_2)_2N$. Four bodies of this constitution, melting at 227°, 230°, 205°–212°, and 250°, may be obtained, as well as a tetra-nitro- derivative [277°], by nitrating the (*Py.* 3)-methyl-(β)-naphthoquinoline which is formed by condensation of (β)-naphthylamine with paraldehyde (Seitz, *B.* 22, 256).

NITRO-DI-METHYL-PHENYL-ACETIC ACID [3:5:2:1] $C_6H_2(CH_3)_2(NO_2).CH_2.CO_2H$. *Nitro-mesityl-acetic acid.* [139°]. Formed by heating (5:3:1)-di-methyl-phenyl-acetic acid with dilute nitric acid (Wispek, *B.* 16, 1579). Long fine needles. Sol. alcohol, ether, and hot water, insol. cold water. On reduction it gives carbomesyl $(C_6H_2(CH_3)_2\left<\begin{matrix}CH_2\\ NH\end{matrix}\right>CO)$.

Salts.—A'_2Ca 4aq: thick needles.—A'_2Ba $4\frac{1}{2}$aq: fine needles.—A'Ag.

Di-nitro-methyl-phenyl-acetic acid *v.* DI-NITRO-TOLYL-ACETIC ACID.

(*B.* 4)-NITRO-(*Py.* 3)-METHYL-QUINOLINE $C_{10}H_6N_2O_2$ *i.e.* $\begin{array}{l}\text{CH:CH.}\ \ \text{C.CH:CH}\\ \text{CH:CNO}_2\text{.C. N :CMe}\end{array}$. *o-Nitro-quinaldine.* [137°]. Formed, together with the isomeride [82°] by nitration of (*Py.* 3)-methyl-quinoline (Doebner a. Miller, *B.* 17, 1699; Gerdeissen, *B.* 22, 245). Formed also by the action of aldehyde on *m*-nitro-aniline. Long needles, sl. sol. cold water.—B'HCl: prisms.—$B'_2H_2PtCl_6$: small needles.

(*B.* 1 or 3)-Nitro-(*Py.* 3)-methyl-quinoline $C_9H_5Me(NO_2)N$. *m-Nitro-quinaldine.* Formed as above, and also by the action of aldehyde on *m*-nitro-aniline (D. a. M.). Slender needles, volatile with steam. — B'HCl : prisms. — $B'_2H_2PtCl_6$: needles.

(*B.* 1 or 3)-Nitro-(*B.* 2)-methyl-quinoline. [117°]. Formed by nitrating (*B.* 2)-methyl-quinoline (Noelting a. Trautmann, *B.* 23, 3655). Formed also from (2, 1, 4)-nitro-toluidine, glycerin, picric acid, and H_2SO_4. Needles. Yields a methylo-iodide. [190°].

(*B.* 4)-Nitro-(*B.* 2)-methyl-quinoline $\begin{array}{l}\text{CMe:CH——C.CH:CH}\\ \text{CH :C(NO}_2\text{).C.N : CH}\end{array}$. [122°]. Formed from nitro-*p*-toluidine (N. a. T.). Yellow needles.

(*B.* 1)-Nitro-(*B.* 4)-methyl-quinoline $\begin{array}{l}\text{CH:C(NO}_2\text{).C.CH:CH}\\ \text{CH:CMe}\ \ \ \text{.C.N}\ \ \text{:CH}\end{array}$. [93°]. Formed from (4, 2, 1)-nitro-*o*-toluidine and also by nitrating (*B.* 4)-methyl-quinoline.

Nitro-methyl-quinoline. [127°]. Got by nitrating lepidine (Busch a. Königs, *B.* 23, 2687).

Nitro-(*Py.* 3)-methyl-quinoline tetrahydride. *Nitroso-derivative* $C_{10}H_{11}(NO_2)N.NO$. [152°]. A product of the action of nitrous acid on (*Py.* 3)-methyl-quinoline tetrahydride (Möller, *A.* 242, 314). Golden plates (from alcohol-benzene).

Nitro-(*Py.* 4)-methyl-quinoline tetrahydride $C_6H_3(NO_2)\!<\!\begin{array}{l}\text{CH}_2\text{. CH}_2\\ \text{NMe.CH}_2\end{array}$. *Nitro-kairoline.* [94°]. Formed by careful nitration of kairoline (Feer a. Königs, *B.* 18, 2390). Long red needles.

(*B.* 1)-Nitro-(*B.* 2, 4)-di-methyl-quinoline $\begin{array}{l}\text{CMe:C(NO}_2\text{).C.CH:CH}\\ \text{CH :CMe}\ \ \ \text{.C.N}\ \ \text{:CH}\end{array}$. [108°]. Formed by nitrating di-methyl-quinoline, and also from nitro-*m*-xylidine [125°], glycerin, H_2SO_4, and picric acid (N. a. T.). Yellow needles.

Nitro-(*B.* 2, 4; *Py.* 3)-tri-methyl-quinoline $\begin{array}{l}\text{CMe:CH. C.CH:CH}\\ \text{CH :CMeC.N}\ \ \text{:CMe}\end{array}$. [92°]. Formed by nitrating tri-methyl-quinoline (Panajotoff, *B.* 20, 35). Needles.—$B'_2H_2PtCl_6$3aq: crystalline.

Di-nitro-(*Py.* 4)-methyl-quinoline tetrahydride $C_6H_2(NO_2)_2\!<\!\begin{array}{l}\text{CH}_2\text{. CH}_2\\ \text{NMe.CH}_2\end{array}$. *Di-nitro-kairoline.* [148°]. Formed from kairoline, HOAc, and HNO_3 (Feer a. Königs, *B.* 18, 2390). Golden-yellow plates, sol. alcohol.

DI-NITRO-DI-METHYL-SULPHAMIDE $C_2H_6N_4SO_6$ *i.e.* $SO_2(NMe.NO_2)_2$. [90°]. Formed from di-methyl-sulphamide and HNO_3 (Franchimont, *R. T. C.* 3, 419). Crystals (from benzene).

NITRO-METHYL-THIENYL METHYL KETONE $C_7H_7NSO_3$ *i.e.* $C_4MeH(NO_2)S.CO.CH_3$. [121°]. Obtained by nitrating $C_4MeH_2S.CO.CH_3$ (Demuth, *B.* 19, 1861). Needles (from ether).

NITRO-DI-METHYL-THIOPHENE $C_6H_7NSO_2$ *i.e.* $SC_4Me_2H(NO_2)$. *Nitro-thioxene.* Oil, formed from di-methyl-thiophene vapour, HOAc, and HNO_3 (Messinger, *B.* 18, 1638).

NITRO-METHYL-o-TOLUIDINE $C_8H_{10}N_2O_2$ *i.e.* $C_6H_3Me(NO_2)$.NHMe [2:4:1]. [134°]. Obtained by oxidation from nitroso-methyl-o-toluidine $C_6H_3Me(NO)$.NHMe (Kock, *A.* 243, 309). Greenish-yellow needles, sol. benzene.

Nitro-methyl-*p*-toluidine $C_6H_3Me(NO_2)$.NHMe [4:2:1]. [85°]. Formed from nitro-*p*-toluidine and MeI (Gattermann, *B.* 18, 1487; Niementowski, *B.* 20, 1874). Red needles (from alcohol) or tables (from benzene).

Acetyl derivative [64°]. (250–255° at 270 mm.). Plates.—$B'C_6H_2(NO_2)_3OH$. [212°].

Di-nitro-methyl-o-toluidine. *Nitro-derivative.* [2:4:6:1]$C_6H_2Me(NO_2)_2NMe.NO_2$. [120°]. Formed from di-methyl-o-toluidine and HNO_3 (Van Romburgh, *R. T. C.* 3, 395). Pale-yellow crystals. Potash converts it into methylamine and di-nitro-*o*-cresol.

Di-nitro-methyl-*p*-toluidine $C_6H_2Me(NO_2)_2NHMe$ [4:6:2:1]. [129°]. Obtained from $C_6H_4Me(NAcMe)$ and HNO_3 (A. L. Thomsen, *B.* 10, 1582; Gattermann, *B.* 18, 1487). Red needles (from dilute alcohol).

Nitrosamine $C_6H_2Me(NO_2)_2$.NMe.NO. [125°]. Yellow needles.

Nitro-derivative $C_6H_2Me(NO_2)_2.NMe.NO_2$. [139°]. Formed from di-methyl-*p*-toluidine (1 pt.), H_2SO_4 (2 pts.), and HNO_3 (10 pts.) (Van Romburgh, *R. T. C.* 3, 404). The same compound [130°] appears to be formed by the action of dilute HNO_3 on [1:4]$C_6H_4Me.NAcMe$ (Norton a. Livermore, *B.* 20, 2268). Nearly colourless crystals (from boiling alcohol). Yields di-nitro-*p*-cresol on boiling with potash.

Tri-nitro-methyl-*m*-toluidine. *Nitro-derivative* [3:6:4:2:1] $C_6HMe(NO_2)_3NMe.NO_2$. [102°]. Formed from di-methyl-*m*-toluidine and HNO_3 (S.G. 1·5) (Van Romburgh, *R. T. C.* 3, 413). Pale-yellow crystals.

Tri-nitro-methyl-*p*-toluidine $C_6HMe(NO_2)_3$.NHMe [4:6:3:2:1]. [138°]. Formed by further nitration of nitro-methyl-*p*-toluidine (G.). Yellowish crystals.

Nitro-di-methyl-*m*-toluidine $C_6H_3Me(NO_2).NMe_2$. [84°]. Obtained by oxidising nitroso-di-methyl-*m*-toluidine with $KMnO_4$ (Wurster a. Riedel, *B.* 12, 1800). Yellow needles.

Di-nitro-di-methyl-*m*-toluidine $C_6H_2Me(NO_2)_2.NMe_2$. [107°]. Prepared by nitration of di-methyl-*m*-toluidine dissolved in HOAc (W. a. R.). Yellow needles.

Di-nitro-di-methyl-*m*-toluidine $C_6H_2Me(NO_2)_2.NMe_2$. [168°]. Formed from di methyl-*m*-toluidine, HNO_3 and H_2SO_4 (W. a. R.). Less sol. alcohol than the isomeride [107°].

(*α*)-NITRO-NAPHTHALENE $C_{10}H_7NO_2$. Mol. w. 173. [56°] (Mills, *P. M.* [5] 14, 27); [61°] (D'Aguiar, *B.* 5, 370; Schiff). (304°) (De Coninck, *B.* 5, 12). S.V.S. 141 (Schiff, *A.* 223, 265). S.G. ≙ 1·331 (Schröder, *B.* 12, 1613). S. (88 p.c. alcohol) 2·8. Formed by nitration of naphthalene (Laurent, *A. Ch.* [2] 59, 378; Beilstein a. Kuhlberg, *A.* 169, 83; Guareschi, *B.* 10, 294). Formed also by elimination of NH_2 from (*α*)-nitro-(*α*)-naphthylamine (Liebermann, *A.* 183, 235).

Preparation.—By shaking naphthalene with nitric acid in the cold, and recrystallising from alcohol or ligroïn (B. a. K.; *cf.* Piria, *A.* 78, 32). Prepared also by stirring naphthalene (250 pts.)

with a mixture of HNO_3 (200 pts.) and H_2SO_4 (800 pts.) at 40°-50° (Witt, *Chem. Ind.* 10, 215).

Properties.—Pale-yellow prisms. A few milligrammes projected into a red-hot test-tube containing nitrogen detonates slightly with a white flame; a larger quantity gives a red flame; with a still larger quantity no flame is seen (Berthelot, *A. Ch.* [6] 16, 24).

Reactions.—1. Readily reduced to (α)-naphthylamine. Zinc-dust and HClAq yields chlorinated naphthylamines.—2. PCl_5 forms (α)-chloro-naphthalene.—3. *Chlorine* yields mono-, di-, tri-, and tetra-chloro-naphthalenes (Atterberg, *B.* 9, 316, 926).—4. *Bromine* forms bromo-nitro-naphthalene [122·5°], di-bromo-nitro-naphthalene [98°], and two tetrabromides.—5. HBrAq at 195° yields $C_{10}H_7Br$ and $C_{10}H_6Br_2$ (Baumhauer, *B.* 4, 926).—6. CrO_3 in HOAc forms c-nitro-phthalic acid (Beilstein a. Kurbatoff, *C. C.* 1881, 359).—7. Distillation over *zinc-dust* produces (αβ)-naphthazine (G. Schultz, *B.* 17, 478).

Tetrabromide $C_{10}H_7(NO_2)Br_4$. [131°]. S. (93·5 p.c. alcohol) ·26 at 15·2°. Formed from nitro-naphthalene and bromine (Guareschi, *A.* 222, 286). White needles. When kept at 137° in a current of air for some time it changes to an isomeride [143°] and $C_{10}H_6Br(NO_2)$ [122·5°]. When boiled with alcohol for a long time it changes to a second isomeride [173°], S. (93·5 p.c. alcohol) ·13 at 15·2°.

(β)-Nitro-naphthalene $C_{10}H_7NO_2$. [79°]. Formed by eliminating NH_2 from (2, 1)-nitro-(α)-naphthylamine (Lellmann, *B.* 19, 236; 20, 891). Formed also by the action of precipitated Cu_2O (2 mols.) upon a solution of (β)-diazo-naphthalene nitrite (1 mol.) obtained by adding a solution of 12 g. $NaNO_2$ in 40 g. water to a mixture of 7 g. of (β)-naphthylamine, 15 g. HNO_3, and 250 c.c. of water. The yield is small. (Sandmeyer, *B.* 20, 1496). Yellow needles, v. sol. alcohol. Volatile with steam. Reduced by zinc and HOAc to (β)-naphthylamine.

'α'-Di-nitro-naphthalene $C_{10}H_6(NO_2)_2$ [1:4′]. Mol. w. 218. [212°]. Formed, together with the (1,1′)-isomeride, by boiling naphthalene with fuming HNO_3 or by heating it with HNO_3 and H_2SO_4 at 100° (Darmstädter a. Wichelhaus, *B.* 5, 253; D'Aguiar, *B.* 5, 370; Beilstein a. Kurbatoff, *A.* 202, 219). Formed also by heating nitro-(α)-naphthoic acid [239°] with HNO_3 (S.G. 1·3) (Ekstrand, *B.* 18, 2881).

Properties.—Six-sided needles (from HOAc), v. sl. sol. HOAc. A few milligrammes thrown into a red-hot tube full of nitrogen detonate with reddish-white flame (Berthelot, *A. Ch.* [6] 16, 25).

Reactions.—1. *Oxidised* by HNO_3 (S.G. 1·15) at 150° to c-nitrophthalic, s-di-nitro-benzoic, and picric acids (Beilstein a. Kurbatoff, *Bl.* [2] 34, 327).—2. PCl_5 yields (γ)-di-chloro-naphthalene [107°].

'β'-Di-nitro-naphthalene $C_{10}H_6(NO_2)_2$ [1:1′]. [172°]. S. (88 p.c. alcohol) ·187 at 19°. S. (benzene) ·72 at 19°. S. (chloroform) 1·1 at 19°. Formed, at the same time as the preceding, by nitrating naphthalene (Darmstädter a. Wichelhaus, *A.* 152, 301; Beilstein a. Kuhlberg, *A.* 169, 86). Formed also by heating nitro-(α)-naphthoic acid [215°] with HNO_3 (S.G. 1·3) (Ekstrand, *B.* 18, 2881), and by eliminating NH_2 from di-nitro-(β)-naphthylamine (Gaess, *J. pr.* [2] 43, 37). Tables, more soluble in HOAc, chloroform, benzene, and acetone than the (1,4′)-isomeride.

Reactions.—1. Dilute HNO_3 at 150° yields di-nitro-phthalic acid [226°], s-di-nitro-benzoic acid, and picric acids.—2. PCl_5 forms ζ-di-chloro-naphthalene and δ-tri-chloro-naphthalene.

(γ)-Di-nitro-naphthalene $C_{10}H_6(NO_2)_2$[1:3]. [144°]. Obtained from di-nitro-(α)-naphthylamine [235°] by elimination of NH_2 (Liebermann a. Hammerschlag, *A.* 183, 272). Yellow needles.

(δ)-Di-nitro-naphthalene $C_{10}H_6(NO_2)_2$ [1:3′ ?]. [162°]. Formed by eliminating NH_2 from di-nitro-(β)-naphthylamine [238°] (Graebe a. Drews, *B.* 17, 1172). Yellow needles, v. sol. alcohol.

'α'-Tri-nitro-naphthalene $C_{10}H_5(NO_2)_3$. Mol. w. 263. [122°]. Formed by further nitration of 'α'-di-nitro-naphthalene (D'Aguiar, *B.* 5, 372, 897). Monoclinic crystals, v. sol. HOAc.

'β'-Tri-nitro-naphthalene $C_{10}H_5(NO_2)_3$. [213°]. S. (88 p.c. alcohol) ·06 at 23°. Obtained by further nitration of 'β'-di-nitro-naphthalene (Laurent, *A.* 41, 98; D'Aguiar; Beilstein a. Kuhlberg, *A.* 169, 96). Formed also by eliminating NH_2 from tri-nitro-(α)- or (β)-naphthylamine (Staedel, *B.* 14, 901; *A.* 217, 174), and by the action of fuming HNO_3 and conc. H_2SO_4 on nitro-(α)-naphthoic acid (Ekstrand, *B.* 19, 1131). Prisms (from HOAc), v. sl. sol. HOAc and ether.

(γ)-Tri-nitro-naphthalene $C_{10}H_5(NO_2)_3$. [147°] (B. a. K.); [154°] (A.). S. (90 p.c. alcohol) ·11 at 18·5°. S. (ether) ·38. S. (benzene) 1·05 at 18·5°. Obtained by boiling 'α'-di-nitro-naphthalene for a few minutes with H_2SO_4 and fuming HNO_3 (Beilstein a. Kuhlberg, *B.* 6, 647). Yellow plates.

'α'-Tetra-nitro-naphthalene $C_{10}H_4(NO_2)_4$ [259°]. Formed by boiling 'α'-di-nitro-naphthalene with HNO_3 and H_2SO_4 for some hours (A.; B. a. K.). Crystals (from chloroform), almost insol. alcohol.

'β'-Tetra-nitro-naphthalene $C_{10}H_4(NO_2)_4$. [200°]. Formed by heating 'β'-di-nitro-naphthalene with fuming HNO_3 for 4 days at 100° (Lautemann a. D'Aguiar, *Bl.* 3, 261). Asbestos-like needles (from alcohol). Explodes when heated.

References.—BROMO-, CHLORO-, and IODO-, NITRO-NAPHTHALENE.

NITRO-NAPHTHALENE DICARBOXYLIC ACID $C_{10}H_5(NO_2)(CO_2H)_2$. *Nitro-naphthalic acid.* Got by oxidising nitro-acenaphthene (Quincke, *B.* 21, 1454). Yellow needles. On heating it yields an anhydride [220°].—CaA″ aq.—$(NH_4)_2$A″ aq.

'α'-NITRO-NAPHTHALENE SULPHONIC ACID $C_{10}H_6(NO_2)(SO_3H)$ [1:4′]. Formed from (α)-nitro-naphthalene and fuming H_2SO_4 or $ClSO_3H$ (Laurent, *C. R.* 31, 537; Armstrong a. Williamson, *C. J. Proc.* 2, 233; Erdmann, *A.* 247, 311). Formed also by nitrating naphthalene (α)-sulphonic acid (Cleve, *Bl.* [2] 24, 506). Straw-yellow prisms (containing 4aq), v. sol. water, sl. sol. dilute H_2SO_4. Tastes bitter. Its K salt distilled with $K_2Cr_2O_7$ and HCl gives chloro-nitro-naphthalene [111°] and di-chloro-nitro-naphthalene [85°]. Sodium-amalgam reduces it to (α)-naphthylamine and H_2SO_4 (Claus a. Graeff, *B.* 10, 1303).

Salts.—KA′ ½aq. S. 2·1 at 15°.—NH_4A′ 1½aq.—NaA′ ½aq.—MgA'_2 3aq.—CaA'_2 2aq.—BaA'_2 3aq.

Chloride $C_{10}H_6(NO_2)(SO_2Cl)$. [113°].

Amide $C_{10}H_6(NO_2)(SO_2NH_2)$. [225°].

Nitro-naphthalene-'β'-sulphonic acid $C_{10}H_6(NO_2)(SO_3H)$[1:3′]. Formed, together with two or more isomerides, by nitration of naphthalene (β)-sulphonic acid (Cleve, *Bl.* [2] 26, 444), and, together with a larger quantity of the 'α'-acid and some of the θ-acid by heating nitro-naphthalene with H_2SO_4 containing excess of SO_3 at 100° (Palmaer, *B.* 21, 3260). Yields $C_{10}H_6Cl_2$ [48°].

Salts.—KA′.—NH_4A'.—NaA′3aq.—BaA'_2aq. S. ·115 at 22°.—$MgA'_2$7aq.—CaA'_2aq.—$ZnA'_2$6aq.—$PbA'_2$3aq.—MnA'_2 6aq.—$CuA'_2$6aq.—AgA′.

Ethyl ether EtA′. [115°].

Chloride $C_{10}H_6(NO_2).SO_2Cl$. [126°]. Monoclinic crystals; *a*:*b*:c = ·996:1: ·831; β = 81° 28′.

Amide. [184°]. Yellowish needles.

(γ)-Nitro-naphthalene sulphonic acid $C_{10}H_6(NO_2)(SO_3H)$[1:3]. Formed, together with the 'β' and (θ)-isomerides, by nitration of naphthalene (β)-sulphonic acid (Cleve, *B.* 19, 2170). Its chloride on heating with PCl_5 yields $C_{10}H_6Cl_2$ [61°].—KA′.—NaA′.—BaA'_2 3aq.—PbA'_2 3aq.

Ethyl ether EtA′. [115°].

Chloride $C_{10}H_6(NO_2).SO_2Cl$. [140°].

Amide [225°]. Long needles.

(θ)-Nitro-naphthalene sulphonic acid $C_{10}H_6(NO_2)(SO_3H)$ [1:2′]. The Ba salt is the most soluble of the Ba salts of the acids obtained by nitration of naphthalene (β)-sulphonic acid (Cleve, *Bl.* [2] 29, 415; *B.* 21, 3264). Occurs also among the products of sulphonation of (α)-nitro-naphthalene (Palmaer). Its chloride, heated with PCl_5, yields $C_{10}H_6Cl_2$ [62°].—KA′½aq.—NaA′½aq.—NH_4A'.—$BaA'_2$3aq. S. (of BaA'_3) 11 at 100°; ·2 at 17°.—$CaA'_2$2aq.—$MgA'_2$9aq.—$PbA'_2$3aq. — $MnA'_2$10aq. — $CuA'_2$8aq. — $ZnA'_2$10aq.—AgA′.

Ethyl ether EtA′. [107°]. Needles.

Chloride [167°]. Yellow needles.

Amide [223°]. Needles.

Nitro-naphthalene sulphonic acid $C_{10}H_6(NO_2)(SO_3H)$[1:4]. Formed, together with the (1:1′) and 1:4′) isomerides by nitration of naphthalene (α)-sulphonic acid; the acids being separated by crystallisation of their chlorides from benzene (Cleve, *B.* 23, 958). Yellowish crystalline mass.—KA′.—NaA′aq.—$CaA'_2$2aq. S. 2·7 at 17°; 7 at 100°.—BaA'_2aq. S. 1·5 in the cold; 3 at 100°.—PbA'_2 6aq.—AgA′: needles.

Methyl ether MeA′. [117°].

Ethyl ether EtA′. [93°].

Chloride $C_{10}H_6(NO_2)SO_2Cl$. [99°].

Amide [188°]. Octahedra.

Nitro-naphthalene sulphonic acid $C_{10}H_6(NO_2)(SO_3H)$ [1:1′]. A product of the nitration of naphthalene (α)-sulphonic acid (Cleve, *B.* 23, 962).

Chloride [101°].

'α'-Nitro-naphthalene disulphonic acid $C_{10}H_5(NO_2)(SO_3H)_2$[4:2:2′]. Obtained from its chloride, which is formed by nitrating naphthalene 'α'-disulphonic chloride $C_{10}H_6(SO_2Cl)_2$ (Alén, *Bl.* [2] 39, 63; *Bn.* 2, 156). Needles, v. e. sol. water.—Na_2A''6aq.—K_2A''3aq.—CaA″5aq.—BaA″5aq.—PbA″4aq.—Ag_2A''3aq.

Chloride $C_{10}H_5(NO_2)(SO_2Cl)_2$. [141°]. With PCl_5 it yields θ-tri-chloro-naphthalene.

Amide. [287°].

'β'-Nitro-naphthalene disulphonic acid $C_{10}H_5(NO_2)(SO_3H)_3$[1:3:2′]. Formed by nitrating naphthalene 'β'-disulphonic acid (Alén). Scales.—Na_2A''2aq.—K_2A''.—CaA″2aq.—BaA″2aq.—PbA″2aq.—Ag_2A''2aq.

Chloride $C_{10}H_5(NO_2)(SO_2Cl)_2$. [186°]. With PCl_5 it gives (γ)-tri-chloro-naphthalene.

Amide [above 300°]. Needles.

Di-nitro-naphthalene 'α'-disulphonic acid $C_{10}H_4(NO_2)_2(SO_3H)_2$. Obtained from its chloride which is formed by nitrating naphthalene 'α'-disulphonic acid (Alén).—K_2A''.—K_2A''4aq.—BaA″5aq.—Ag_2A''aq.

Chloride [219°]. Needles (from benzene).

Amide $C_{10}H_4(NO_2)_2(SO_2NH_2)_2$. [c. 306°].

***Peri*-NITRO-(α)-NAPHTHOIC ACID** $C_{10}H_6(NO_2)(CO_2H)$[1:1′]. [215°]. S. ·04 in the cold. S. (alcohol) 5. Formed, together with the (1,4′)-isomeride by nitrating (α)-napththoic acid (Küchenmeister, *B.* 3, 739; Ekstrand, *B.* 12, 1393; 18, 73, 2881; 19, 1138; *J. pr.* [2] 38, 156, 276). Prisms, v. sol. alcohol. Yields on nitration di-nitro-naphthalene [170°].

Salts.—NaA′.—$CaA'_2$3aq. S. 2 at 15°.—$BaA'_2$6aq.—PbA'_2aq: yellow prisms.

Ethyl ether EtA′. [69°]. Octahedra.

Amide $C_{10}H_6(NO_2)(CONH_2)$. [280°]. Needles, converted by conc. HClAq at 170 into

$C_{10}H_4Cl_2<\substack{NH\\CO}>$ [261°].

Nitro-(α)-naphthoic acid $C_{10}H_6(NO_2)(CO_2H)$[1:4′]. [239°]. S. ·02 at 15°. S. (alcohol) ·5 at 15°. Formed as above, and also by saponifying its nitrile which is obtained by nitrating the nitrile of (α)-naphthoic acid (Graeff, *B.* 14, 1063; 16, 2250; Ekstrand, *J. pr.* [2] 38, 241). Needles. HNO_3 (S.G. 1·3) converts it into di-nitro-naphthalene [212°].—NaA′5aq.—$CaA'_2$2aq. S. ·63 at 15°.—$BaA'_2$3½aq: yellow needles.—$PbA'_2$5½aq.

Methyl ether MeA′. [110°].

Ethyl ether EtA′. [93°].

Isopropyl ether PrA′. [101°].

Nitrile $C_{10}H_6(NO_2)CN$. [205°].

(γ)-Nitro-(α)-naphthoic acid [255°]. Formed by heating its nitrile with HClAq at 160° (Graeff, *B.* 16, 2252). Needles (by sublimation).

Nitrile [153°]. Formed, together with the isomeride [205°] by nitrating (α)-naphthonitrile.

'α'-Nitro-(β)-naphthoic acid [220°]. Formed, as well as the four following acids, by nitration of (β)-naphthoic acid (Ekstrand, *B.* 12, 1325). Needles.—CaA'_2. S. ·26 at 15°.

Ethyl ether EtA′. [82°]. Needles.

'β'-Nitro-(β)-naphthoic acid $C_{10}H_6(NO_2)(CO_2H)$[1′or4′:2]. [293°]. Formed as above (Ekstrand, *B.* 18, 1207; *J. pr.* [2] 42, 375). Obtained also by saponifying its nitrile (Graeff, *B.* 16, 2252). Needles, m. sol. hot alcohol.—KA′aq.—NaA′2aq.—CaA'_2 3aq. S. ·12 at 15°.—$BaA'_2$4aq.

Methyl ether MeA′. [112°]. Needles.

Ethyl ether EtA′. [109°]. Needles.

Isopropyl ether PrA′. [76°]. Needles.

Nitrile $C_{10}H_6(NO_2)CN$. [173°]. Formed by nitration of (β)-naphthoic nitrile. Needles.

(γ)-Nitro-(β)-naphthoic acid [269°]. Formed as above. Needles, v. sol. alcohol.

Ethyl ether EtA′. [93°].

(δ)-Nitro-(β)-naphthoic acid $C_{10}H_6(NO_2)(CO_2H)$ [4′or1′:2]. [288°]. S. (alcohol) ·25 in the cold. Formed as above (Ekstrand, *J. pr.* [2] 42, 292). Needles. Yields di-nitro-naphthoic acid [226°] with fuming HNO_3.—NH_4A'.—NaA′ 2aq.—BaA'_2 8aq.—CaA'_2 4½aq. S. ·15 in the cold.

Ethyl ether EtA′. [121°]. Plates.

(ε)-Nitro-(β)-naphthoic acid. [285°]. One of the products of the action of HNO_3 (S.G. 1·42) on (β)-naphthoic acid (Ekstrand, *J. pr.* [2] 42, 304). Stellate needles (from alcohol).

Ethyl ether EtA′. [75°]. Needles.

Di-nitro-(α)-naphthoic acid $C_{10}H_5(NO_2)_2CO_2H$ [4:4′:1]. [265°]. Obtained by nitration of (α)-naphthoic acid and of (1,4′)-nitro-naphthoic acid (Ekstrand, *B.* 17, 1600; 19, 1984; 20, 219, 1353; *J. pr.* [2], 38, 259). Prisms or needles (from alcohol). Reduced by tin and HClAq to naphthylene-diamine [65°]. H_2S in alkaline solution forms $C_{10}H_5N_2.CO_2H$ (?), a bluish-violet pp.—NaA′ 6aq.—BaA'_2 2½aq.—CaA'_2 3aq: needles. S. ·7 in the cold.

Ethyl ether EtA′. [143°]. Needles.

Di-nitro-(α)-naphthoic acid $C_{10}H_5(NO_2)_2CO_2H$. [215°]. Formed, together with the preceding acid, by nitrating (α)-naphthoic acid (Ekstrand, *B.* 19, 1984; *J. pr.* [2] 38, 270). Needles or plates (from alcohol). Yields nitro-amido-naphthoic acid [c. 110°] on reduction by H_2S and NH_3.—CaA'_2.

Ethyl ether EtA′. [137°]. Needles.

Di-nitro-(α)-naphthoic acid $C_{10}H_5(NO_2)_2CO_2H$ [4′:1′:1]. [218°]. Formed by nitrating nitro-(α)-naphthoic acid [239°], and occurs among the products of the action of fuming HNO_3 on (α)-naphthoic acid (Ekstrand, *B.* 20, 220; *J. pr.* [2] 38, 267). Trimetric crystals (from alcohol); $a:b:c = {·}973:1:1{·}442$. Yields a lactam of di-amido-naphthoic acid on reduction.—CaA'_2 7aq: yellow needles, v. e. sol. water.

Ethyl ether EtA′. [129°]. Needles.

Di-nitro-(β)-naphthoic acid $C_{10}H_5(NO_2)_2CO_2H$. [226°]. S. (alcohol) 1·7 in the cold. Formed, together with the isomeride [148°] by dissolving (β)-naphthoic acid in fuming HNO_3. Formed also, in like manner, from nitro-(β)-naphthoic acid [288°] (Ekstrand, *B.* 17, 1602; *J. pr.* [2] 42, 300). Needles (from alcohol). Yields by reduction nitro-amido-naphthoic acid [235°] and di-amido-naphthoic acid [c. 230°].—NH_4A' aq. S. ·35 in the cold.—BaA'_2 6aq.—CaA'_2 4aq. S. ·06 in the cold.

Ethyl ether EtA′. [141°]. Needles.

Di-nitro-(β)-naphthoic acid $C_{10}H_5(NO_2)_2CO_2H$ [1:1′:2] or [4:4′:2]. [248°]. S. (alcohol) 1·6 in the cold. Formed as above, and also by nitrating nitro-(β)-naphthoic acid [293°] (Ekstrand, *B.* 17, 1602; *J. pr.* [2] 42, 286). Rectangular prisms. Reduced by $FeSO_4$ and NH_3 to di-amido-naphthoic acid [202°].—NH_4A' aq.—NaA′ 4aq.—BaA'_2 8aq.—CaA'_2 5aq.

Ethyl ether EtA′. [165°].

Tri-nitro-(α)-naphthoic acid $C_{10}H_4(NO_2)_3CO_2H$. [283°]. Formed in small quantity by the action of H_2SO_4 and HNO_3 on nitro-(α)-naphthoic acid [215°] (Ekstrand, *B.* 19, 1131; *J. pr.* [2] 38, 372). Wedge-shaped needles (from alcohol). Tastes very bitter.—CaA'_2 5aq.

Ethyl ether EtA′. [131°]. Prisms.

Tri-nitro-(α)-naphthoic acid $C_{10}H_4(NO_2)_3CO_2H$. [236°]. Formed from di-nitro-(α)-naphthoic acid [265°], H_2SO_4, and fuming HNO_3 (Ekstrand, *B.* 19, 1987). Needles.

Ethyl ether EtA′. [191°]. Needles.

Tri-nitro-(α)-naphthoic acid $C_{10}H_4(NO_2)_3CO_2H$. [293°]. A product of nitration of di-nitro-(α)-naphthoic acid [265°] (E.). Cubes, sl. sol. alcohol.

Ethyl ether EtA′. [150°]. Needles.

NITRO-(α)-NAPHTHOL $C_{10}H_6(NO_2)(OH)$ [2:1]. [128°]. Formed, together with the isomeride [164°], from acetyl- or benzoyl-naphthylamine by nitrating and boiling the product with NaOHAq (Andreoni a. Biedermann, *B.* 6, 342; Liebermann a. Dittler, *A.* 183, 245; Worms, *B.* 15, 1815; Lellmann, *B.* 19, 802). Obtained also by oxidising (β)-naphthoquinone (β)-oxim (Fuchs, *B.* 8, 629); and by the action of nitrous acid on (α)-naphthylamine at 100° (Deninger, *J. pr.* [2] 40, 300). Yellow needles, sl. sol. water, m. sol. alcohol; volatile with steam.—KA′ aq.—BaA'_2 3aq: red needles.

Nitro-(α)-naphthol $C_{10}H_6(NO_2)(OH)$ [4:1]. [164°]. Formed as above, and also by the action of (nascent) nitrous acid on (α)-naphthylamine in the cold (Deninger, *J. pr.* [2] 40, 300). Golden needles (from water), not volatile with steam; v. e. sol. alcohol. Yields di-nitro-naphthol [138°] on nitration. By successive reduction and oxidation it may be converted into (α)-naphthoquinone.—KA′.—NaA'_2 2aq: crimson needles, bluish-red when anhydrous.—BaA'_2 aq.—BaA'_2 3aq (Hübner, *A.* 208, 325).—CaA'_2 3aq.—PbA'_2: scarlet powder.—AgA′.

Nitro-(β)-naphthol. *Ethyl ether* $C_{10}H_6(NO_2)(OEt)$ [1:2′]. [73°]. Formed, together with the ethyl ethers of the two following isomerides, by nitrating $C_{10}H_7(OEt)$ dissolved in HOAc (Gaess, *J. pr.* [2] 43, 25). Needles.

Nitro-(β)-naphthol. *Ethyl ether* $C_{10}H_6(NO_2)(OEt)$ [2:2′]. [114°]. Needles. Yields on oxidation nitrophthalic acid [114°].

Nitro-(β)-naphthol $C_{10}H_6(NO_2)(OH)$ [1:2]. [103°]. Formed by oxidising the (α)-oxim of (β)-naphthoquinone (Stenhouse a. Groves, *C. J.* 32, 51), or by boiling the acetyl derivative of nitro-(β)-naphthylamine with NaOHAq (Liebermann a. Jacobson, *A.* 211, 46). Formed also by the action of (nascent) nitrous acid on (β)-naphthylamine (D.). Needles. By reduction followed by oxidation it may be converted into (β)-naphthoquinone.

Acetyl derivative $C_{10}H_6(NO_2)(OAc)$. [61°]. Yields $C_{10}H_6(NHAc)(OH)$ on reduction by zinc-dust and HOAc (Böttcher, *B.* 16, 1933).

Benzoyl derivative $C_{10}H_6(NO_2)(OBz)$. [142°]. Yields $C_{10}H_6(NHBz)(OH)$ on reduction.

Ethyl ether EtA′. [104°]. Yellow needles (Wittkamp, *B.* 17, 393; Gaess, *J. pr.* [2] 43, 22).

Di-nitro-(α)-naphthol $C_{10}H_5(NO_2)_2(OH)$[4:2:1]. *Martius yellow.* [138°]. Formed by the action of HNO_3 on (α)-naphthol, (α)-naphthol sulphonic acid, and (2,1)- or (4,1)-nitro-naphthol (Martius, *Z.* [2] 4, 80; Darmstädter a. Wichelhaus, *A.* 152, 299; Liebermann, *A.* 183, 249). Formed also by boiling diazonaphthalene chloride or sulphonate with dilute nitric acid (Martius; Nevile a. Winther, *C. J.* 37, 632). Sulphur-yellow crystals, nearly insol. boiling water, sl. sol. alcohol. Not volatile with steam.

Yields phthalic acid on oxidation. Its salts dye wool yellow. Poisonous: ·4 g. killed a dog (Weyl, *B.* 21, 2191).—NH_4A' aq.—Na_2A'' aq.—CaA'_2 6aq.—SrA'_2 3aq.—BaA'_2 3aq.—AgA'.

Ethyl ether EtA'. [88°]. Needles.

Di-nitro-(β)-naphthol $C_{10}H_5(NO_2)_2(OH)$ [1:2':2]. [194°]. Formed by heating (β)-naphthol with alcohol and HNO_3 (Wallach a. Wichelhaus, *B.* 3, 846). Prepared by boiling a solution of (β)-diazonaphthalene chloride with HNO_3 (Graebe a. Drews, *B.* 17, 1170). Yellow needles. Dyes deep yellow. On oxidation it yields nitro-phthalic acid [160°].—KA'2aq: yellow needles.—$Ba'A_2$ aq (Löwe, *B.* 23, 2542).—AgA': scarlet pp.

Ethyl ether EtA'. [138°] (Graebe); [144°] (Gaess). Formed by nitrating the compounds $C_{10}H_6(NO_2)(OEt)$ [114°] and [104°]. Yellow needles. Converted by NH_3 into di-nitro-naphthylamine [238°].

Di-nitro-(β)-naphthol $C_{10}H_5(NO_2)_2(OH)$ [1:1':2']. [198°]. Formed from its ether by saponifying with alcoholic potash (Gaess). Plates. Yields nitrophthalic acid [212° or 218°] on oxidation.

Ethyl ether EtA'. [215°]. Obtained by nitrating $C_{10}H_6(NO_2)(OEt)$ [1:2] (Gaess), and also from the [1:2'] isomeride. Needles. Possibly identical with the following isomeride.

Di-nitro-(β)-naphthol $C_{10}H_5(NO_2)_2(OH)$[4':1':2].

Ethyl ether EtA'. [215°]. Formed by nitrating $S(C_{10}H_6.OEt)_2$ (Onufrovitch, *B.* 23, 3356). Orange needles. Yields (6, 3, 2, 1)-di-nitro-phthalic acid on oxidation.

Tri-nitro-(α)-naphthol $C_{10}H_4(NO_2)_3(OH)$. [176°]. S. ·28 at 15°. Formed from di-nitro-(α)-naphthol, H_2SO_4, and HNO_3 (Ekstrand, *B.* 11, 161; Diehl a. Merz, *B.* 11, 1662). Small crystals. Yields di-nitro-phthalic acid [213°] on oxidation.—KA' aq. S. ·25 in the cold.—NaA' aq. S. 3 in the cold.—NH_4A'. S. ·15 in the cold.—BaA'_2 2½aq. S. ·09.—CaA'_2 3½aq. S. ·4.—AgA'.

Methyl ether MeA'. [128°]. Got by nitrating $C_{10}H_7OMe$ (Staedel, *B.* 14, 899; *A.* 217, 172). Yellow plates.

Ethyl ether EtA'. [148°].

Tri-nitro-(β)-naphthol $C_{10}H_4(NO_2)_3OH$.

Methyl ether MeA'. [213°]. Got by nitrating $C_{10}H_7OMe$ (Staedel).

Ethyl ether EtA'. [186°].

Tetra-nitro-(α)-naphthol $C_{10}H_3(NO_2)_4OH$. [180°]. S. (benzene) ·45 at 18°. Formed by boiling $C_{10}H_3Br(NO_2)_4$ [170·5°] with Na_2CO_3Aq (Merz a. Weith, *B.* 15, 2714). Yields di-nitro-phthalic acid [227°] on oxidation.—NaA' 2aq. S. ·1 at 19°.—CaA'_2 2aq.—BaA'_2 3aq.—AgA' 3aq: red needles.

DI-NITRO-(α)-NAPHTHOL SULPHONIC ACID $C_{10}H_6N_2SO_8$ *i.e.*

$C_6H_3(SO_3H)\left<\begin{matrix}C(OH):C(NO_2)\\C(NO_2):CH\end{matrix}\right.$. *Naphthol yellow S.* Formed by warming (α)-naphthol trisulphonic acid with dilute nitric acid at 50° (Lauterbach, *B.* 14, 2028). Obtained also from mono- or di-sulphonic acids of (α)-naphthol in which one SO_3H is in a different ring to the hydroxyl. Long yellow needles. Very powerful dye, producing a very fast greenish-yellow shade.—K_2A'': v. sl. sol. cold water. Not poisonous (Weyl, *B.* 21, 2191).

Di-nitro-(α)-naphthol sulphonic acid $C_{10}H_4(NO_2)_2(OH)(SO_3H)$[4':x:2:4]. *Croceïn-yellow.* Formed by warming (β)-naphthol (α)-sulphonic acid with dilute HNO_3 (Nietzki a. Zübelen, *B.* 22, 454).—KA': golden scales.

NITRO-(β)-NAPHTHOQUINONE $C_{10}H_5(NO_2)O_2$. [158°]. Formed by nitrating (β)-naphthoquinone (Stenhouse a. Groves, *A.* 194, 203; *C. J.* 33, 416; 45, 299). Crimson plates (from HOAc), sl. sol. ether and water. With alcoholic aniline it forms the compound

$C_{10}H_4(NO_2)(OH)\left<\begin{matrix}O\\NPh\end{matrix}\right.$ [253°] (Korn, *B.* 17, 908). *p*-Bromo-aniline forms the corresponding body

$C_{10}H_4(NO_2)(OH)\left<\begin{matrix}O\\N.C_6H_4Br\end{matrix}\right.$ [245°] (Brauns, *B.* 17, 1133). The corresponding *o*-toluide melts at 240°, the *p*-toluide at 241°. Excess of aniline in benzene forms yellow needles of $C_{16}H_{14}N_2O_4$. [186°]. Hydroxylamine hydrochloride in presence of HOAc forms a salt $C_{10}H_5NO_4(NH_2OH)$ [141°], which on boiling with HOAc yields nitro-hydro-(β)-naphthoquinone (Zaertling, *B.* 23, 179).

Nitro-(γ)-naphthoquinone. [208°]. Formed by oxidising nitro-acenaphthene (Quincke, *B.* 21, 1460). Yellowish-red needles, yielding with aniline $C_{10}H_4O_2(NO_2)(NHPh)$ [138°]; and, with diphenylamine, $C_{10}H_4O_2(NO_2)(NPh_2)$.

NITRO-(αα)-DINAPHTHYL $C_{10}H_7.C_{10}H_6NO_2$. [188°]. Formed from dinaphthyl, HNO_3, and HOAc (Julius, *B.* 19, 2549). Orange plates.

Di-nitro-dinaphthyl $C_{10}H_6(NO_2).C_{10}H_6(NO_2)$. [280°]. Formed by nitrating dinaphthyl (J.). Yellow needles, insol. alcohol, v. sl. sol. C_6H_6.

Tetra-nitro-dinaphthyl $C_{20}H_{10}(NO_2)_4$. Formed from dinaphthyl and fuming HNO_3 (Lossen, *A.* 144, 77). Amorphous orange powder.

Tetra-nitro-(ββ)-dinaphthyl. [150°]. Formed from isodinaphthyl and HNO_3 (Staub a. Watson Smith, *C. J.* 47, 104). Amorphous yellow powder.

NITRO-(α)-NAPHTHYL-AMIDO-BENZOIC ACID $C_{10}H_7NH.C_6H_3(NO_2).CO_2H$[4:3:1]. Formed by heating (α)-naphthylamine with bromo-nitro-benzoic acid (Heidenleben, *B.* 23, 3458). Yields on reduction the amido- acid [90°].—NaA': reddish-brown powder.

Ethyl ether EtA'. [109°].

Nitro-(β)-naphthyl-amido-benzoic acid. Formed in like manner from (β)-naphthylamine (H.). Brick-red crystals, insol. water.—NaA'.

Ethyl ether EtA'. [127·5°].

NITRO-(α)-NAPHTHYLAMINE $C_{10}H_6(NO_2)(NH_2)$[2:1]. [144°]. Formed by saponifying its acetyl derivative, which is produced, together with that of the (4, 1)-isomeride [190°], by nitrating the acetyl derivative of (α)-naphthylamine (Lellmann a. Remy, *B.* 17, 109; 19, 236, 796). Red monoclinic prisms (from alcohol). Converted by boiling alcoholic potash into nitro-naphthol [128°].

Acetyl derivative $C_{10}H_6(NO_2)(NHAc)$. [199°]. With 1 mol. of the (4, 1)-isomeride it forms a compound [170°].

Di-acetyl derivative $C_{10}H_6(NO_2)(NAc_2)$. [115°]. Got by using Ac_2O at 140°.

Benzoyl derivative $C_{10}H_6(NO_2)(NHBz)$. [175°] (Worms, *B.* 15, 1814). Yields benzenyl-naphthylene-diamine [210°] on reduction with tin and HCl (Hübner, *A.* 208, 324).

Nitro-(α)-naphthylamine $C_{10}H_6(NO_2)(NH_2)$[4:1]. [190°]. Formed as above (Liebermann, *A.* 183, 232; L. a. R.). Orange needles (from alcohol). Yields naphthylene-diamine [186°] on reduction.

Acetyl derivative [190°].

Di-acetyl derivative [144°].

Benzoyl derivative [224°]. Yields nitro-naphthol [164°] on boiling with potash.

Nitro-(α)-naphthylamine $C_{10}H_6(NO_2)(NH_2)$ [4′:1]. [119°]. Formed by reduction of 'α'-di-nitro-naphthalene with alcoholic NH_3 and H_2S (Beilstein a. Kuhlberg, *A.* 169, 81). Small red needles (from water). On elimination of NH_2 it yields (α)-nitro-naphthalene.—$B'_2H_2SO_4$ 2aq: needles, sl. sol. cold water.

Sulphonic acid $C_{10}H_6(NO_2)(NH_2)(SO_3H)$ [4′:1:4]. Formed from (1, 4)-naphthylamine sulphonic acid by acetylation, nitration, and subsequent saponification (Nietzki a. Zübelen, *B.* 22, 451). Colourless needles. Potash yields nitro-naphthylamine.

Nitro-(β)-naphthylamine $C_{10}H_6(NO_2)(NH_2)$ [1:2]. [127°] (L. a. J.); [124°] (Meldola, *C. J.* 47, 520). Formed by saponifying its acetyl derivative, which is obtained by nitrating the acetyl derivative of (β)-naphthylamine (Liebermann a. Jacobson, *B.* 14, 806, 1792; *A.* 211, 42). Orange needles, sol. hot water.

Acetyl derivative $C_{10}H_6(NO_2)(NHAc)$. [124°]. Reduced by tin and HOAc to ethenyl-(αβ)-naphthylene-diamine (Fischer a. Hepp, *B.* 20, 2473).

Di-nitro-(α)-naphthylamine $C_{10}H_5(NO_2)_2(NH_2)$. [4:2:1] [239°] (Witt, *B.* 19, 2032). Obtained from its acetyl derivative, which is formed by nitrating $C_{10}H_7NHAc$. The saponification is effected by alcoholic NH_3 or by H_2SO_4 (Liebermann, *A.* 183, 274; Meldola, *B.* 19, 2683). Formed also by heating di-nitro-(α)-naphthol with alcoholic NH_3 (Witt). Lemon-yellow needles. Readily converted by potash into di-nitro-α-naphthol. On elimination of NH_2, it yields di-nitro-naphthalene [144°].

Acetyl derivative [250·5°] (Ebell, *A.* 208, 330); [247°] (L.). Needles.

Benzoyl derivative [252°]. Needles.

Di-nitro-(β)-naphthylamine $C_{10}H_5(NO_2)_2(NH_2)$. [242°]. Formed by heating $C_{10}H_5(NO_2)_2(OEt)$ [144°] with aqueous NH_3 at 140° (Graebe a. Drews, *B.* 17, 1172; Gaess, *J. pr.* [2] 43, 31). On elimination of NH_2 it yields di-nitro-naphthalene [161·5°] or [167°]. Two isomeric compounds $C_{10}H_5(NO_2)_2NHAc$ [185°] and [235°] are got by nitrating acetyl-(β)-naphthylamine (Maschke, *C. C.* 1886, 824).

Di-nitro-(β)-naphthylamine $C_{10}H_5(NO_2)_2(NH_2)$ [1:1′:2′]. [223°]. Formed from $C_{10}H_5(NO_2)_2(OEt)$ [215°] (Gaess). Yields di-nitro-naphthalene [172°].

Di-nitro-naphthylamine obtained from the $C_{10}H_5(NO_2)_2(OEt)$ [215°] of Onufrevitch (*B.* 23, 3362) carbonises at 235°–250°.

Tri-nitro-(α)-naphthylamine $C_{10}H_4(NO_2)_3(NH_2)$. [c. 264°]. Formed from $C_{10}H_4(NO_2)_3.OEt$ and alcoholic NH_3 at 50° (Staedel, *B.* 14, 901; *A.* 217, 173). Yellow prisms (from toluene). On elimination of NH_2 it yields tri-nitro-naphthalene [181°].

Tri-nitro-(β)-naphthylamine. Formed from $C_{10}H_4(NO_2)_3.OEt$ and NH_3 (S.). Yellow needles. Yields tri-nitro-naphthalene [181°] on elimination of NH_2.

Tetra-nitro-(α)-naphthylamine $C_{10}H_3(NO_2)_4NH_2$. [194°]. Formed from $C_{10}H_3Br(NO_2)_4$ and NH_3 (Merz a. Weith, *B.* 15, 2718). Yellow needles, sl. sol. alcohol.

Tetra-nitro-(β)-naphthylamine [202°]. Formed from (β)-bromo-tetra-nitro-naphthalene and NH_3 (M. a. W.). Yellow needles.

Nitro-di-(β)-naphthyl-amine. *Benzoyl derivative* $C_{10}H_7.NBz.C_{10}H_6NO_2$. [168°]. Got by nitrating $(C_{10}H_7)_2NBz$ (Ris, *B.* 20, 2625). Nodules (from alcohol) or prisms (containing C_6H_6) [95°] (from benzene). Yields, on reduction, benzenyl-naphthylene-naphthyl-diamine [163°].

Di-nitro-di-(β)-naphthyl-amine $C_{20}H_{12}(NO_2)_2NH$. [225°]. Formed from di-(β) naphthyl-amine, HOAc, and HNO_3 (Ris a. Weber, *B.* 17, 197).

Tetra-nitro-di-(β)-naphthyl-amine $C_{20}H_{10}(NO_2)_4NH$. [286°]. Formed by mixing di-(β)-naphthylamine, HOAc, and HNO_3 without cooling (R. a. W.). Granules. On further nitration it yields hexa-nitro-di-naphthyl-amine.

NITRO-NAPHTHYLENE-DIAMINE. *Di-acetyl derivative.* $C_{10}H_5(NO_2)(NHAc)_2$[2:4:1]. [c. 295°]. Formed by nitrating $C_{10}H_6(NHAc)_2$ (Kleemann, *B.* 19, 335). Yellow needles, yielding phthalic acid on oxidation.

DINITRO-(α)-DINAPHTHYLENE-OXIDE $C_{20}H_{10}(NO_2)_2O$. [270°]. Prepared by nitration of (α)-dinaphthylene-oxide (Knecht a. Unzeitig, *B.* 13, 1725). Yellow needles.

Dinitro-(β)-dinaphthylene-oxide $C_{20}H_{10}(NO_2)_2O$. [221°]. Prepared by nitration of (β)-dinaphthylene-oxide (K. a. U.). Orange-red needles.

TETRA-NITRO-DI-NAPHTHYL-METHANE $CH_2\{C_{10}H_5(NO_2)_2\}_2$. Formed from di-(α)-naphthyl-methane and HNO_3 (Grabowski, *B.* 7, 1605). Colourless crystals, decomposing at 260°–270°.

NITRO-(α)-NAPHTHYL-PIPERIDINE $C_{10}H_6(NO_2)NC_5H_{10}$. [77°]. Formed by heating (1, 4)-bromo-nitro-naphthalene with piperidine (Lellmann a. Büttner, *B.* 23, 1387). Yellow needles. Weak base.

DI-NITRO-DI-(α)-NAPHTHYL DISULPHIDE $S(C_{10}H_6.NO_2)_2$. [186°]. Formed from nitro-naphthalene sulphonic chloride and HI (Cleve, *B.* 23, 960). Greenish-yellow scales.

NITRO-NITROSO-ANTHRONE $C_{14}H_8N_2O_4$. [263°]. Formed by boiling hydroanthracene-nitrite (vol. i. p. 277) with alkalis (Liebermann a. Landshoff, *B.* 14, 470). Yellow needles, yielding anthraquinone on oxidation.

NITRO-OCTANE $C_8H_7NO_2$. (205°–212°). Formed by distilling octyl iodide with $AgNO_2$ (Eichler, *B.* 12, 1883).

NITRO-OCTOIC ACID $C_8H_{15}(NO_2)O_2$. S.G. $\underline{18}$ 1·093. Formed by boiling the non-volatile acids of cocoa-nut oil for a long time with HNO_3 (Wirz, *A.* 104, 289). Oil.—AgA′.—EtA′. S.G. $\underline{18}$ 1·031. Oil.

NITRO-OCTYL-BENZENE $C_6N_4(NO_2)C_8H_{17}$. The three isomerides may be got by nitrating octyl-benzene (Ahrens, *B.* 19, 2721). o-Nitro-octyl-benzene carbonises at 130°; the *m*-isomeride melts at 124°; the *p*- variety melts at

204°. They yield the corresponding nitro-benzoic acids on oxidation by $KMnO_4$.

Di-nitro-octyl-benzene $C_6H_3(NO_2)_2C_8H_{17}$. [226°]. Formed by nitration of octyl-benzene.

NITRO-OPIANIC ACID *v.* OPIANIC ACID.

NITRO-ORCIN $C_7H_7NO_4$ *i.e.* $C_6H_2Me(NO_2)(OH)_2$. Two nitro-orcins [120°] and [115°] are formed, together with an azo-compound, by the action of a cold mixture of nitrous and nitric acids on an ethereal solution of orcin (Weselsky, *B.* 7, 439). They may be separated by steam-distillation, the compound melting at 120° being volatile. The nitro-orcin [120°] forms $Ba(HA'')_2$; the isomeride [115°] yields $Ba(HA'')_2$ 8aq and BaA'' 3aq. By the action of HNO_2 and HNO_3 on the ethyl derivative of orcin there are formed two compounds $C_6H_2Me(NO_2)(OH)(OEt)$, melting at 54° and 103° respectively (Weselsky a. Benedikt, *M.* 2, 371).

Di-nitro-orcin $C_6HMe(NO_2)_2(OH)_2$. [164·5°]. S. (alcohol) 5·5 at 15°. Formed from di-nitroso-orcin and cold dilute HNO_3 (S.G. 1·3) (Stenhouse a. Groves, *A.* 188, 358). Yellow plates, m. sol. boiling water. May be sublimed.—$Ba(HA'')_2$ aq.

Di-nitro-orcin [110°]. Obtained by saturating toluene with NO_2 (Leeds, *A. C. J.* 2, 416; *B.* 14, 483). Golden needles (from alcohol). Dyes silk yellow.

Tri-nitro-orcin $C_6Me(NO_2)_3(OH)_2$. [163°]. Formed from orcin, H_2SO_4, and HNO_3 (Stenhouse, *Pr.* 19, 410; Merz a. Zetter, *B.* 12, 681). Yellow needles, v. sol. hot water. Explodes above 163°. Dyes the skin yellow.—K_2A'': orange needles.—BaA'' 3aq.—PbA''.—Ag_2A'': amorphous orange-red pp.

Methyl ether Me_2A''. [69·5°].

Ethyl ether Et_2A''. [61·5°].

NITRO-OXINDOL $C_8H_6ON(NO_2)$. Prepared by adding powdered KNO_3 to a solution of oxindol in H_2SO_4 (Baeyer, *B.* 12, 1313). Yellow needles, sol. alcohol. Begins to decompose at 175°.

p-**NITRO-ω-OXY-ACETOPHENONE** $C_6H_4(NO_2).CO.CH_2OH$. [121°]. Formed by boiling bromo-nitro-acetophenone with NaOAc and HOAc, diluting with water, and boiling again (Engler a. Zulke, *B.* 22, 204). Sol. hot alkalis.

Nitro-di-oxy-acetophenone $C_6H_2(NO_2)(OH)_2.CO.CH_3$. [142°]. Formed by nitration (Nencki a. Sieber, *J. pr.* [2] 23, 537).

TETRA-NITRO-OXY-AMIDO-ANTHRAQUINONE $C_{14}H_5N_5O_{11}$ *i.e.* $C_{14}H_2(NO_2)_4(NH_2)(OH)O_2$. *Chrysammidic acid.* Formed by boiling chrysammic acid $C_{14}H_2(NO_2)_4(OH)_2O_2$ with ammonia (Schunck, *A.* 65, 236; Graebe a. Liebermann, *A. Suppl.* 7, 310). Olive-green needles, forming a dark-purple aqueous solution. Its salts explode when heated.

NITRO-OXY-AMIDO-BENZOIC ACID $C_7H_6N_2O_5$ *i.e.* $C_6H_2(NO_2)(OH)(NH_2)CO_2H$ [5:2:3:1]. [220°]. Got by reducing di-nitro-*o*-oxy-benzoic acid (Hübner a. Babcock, *B.* 12, 1345). Crystals.

NITRO-OXY-AMIDO-DIPHENYL. *Acetyl derivative* $C_6H_4(NHAc).C_6H_3(NO_2)(OH)$. [264°] (Schmidt a. Schultz, *A.* 207, 347). Yellow needles.

NITRO-DI-OXY-DI AMIDO-TRI-PHENYL-METHANE *Di-methyl-ether* $C_6H_4(NO_2)CH(C_6H_3(OMe)NH_2)_2$. [108°]. Formed by heating *p*-nitro-benzoic aldehyde with anisidine sulphate and H_2SO_4 (Fischer, *B.* 15, 680). Golden needles (containing C_6H_6). *m*-Anisidine yields an isomeric body [189°] (Kock, *B.* 20, 1562).

NITRO-DI-OXY-AMIDO-QUINONE $C_6H_4N_2O_6$ *i.e.* $C_6(NO_2)(OH)_2(NH_2)O_2$. The salt $C_6H_2K_2N_2O_6$ is precipitated on exposing a solution of $C_6(NO_2)(NH_2)(OH)_4$ in aqueous K_2CO_3 to the air (Nietzki a. Benckiser, *B.* 18, 499). It forms coppery needles.

NITRO-OXY-ANTHRAQUINONE. *Ethyl ether*  $C_6H_4<\substack{CO\\CO}>C_6H_2(NO_2)(OEt)$ $\left[{}^{1}_{6}{:}2{:}3\right]$. [243°]. Formed by oxidation of the nitroso-anthrone of the ethyl ether of nitro-anthrol (Liebermann a. Hagen, *B.* 15, 1795). Colourless needles, sl. sol. alcohol.

Nitro-di-oxy-anthraquinone $C_{14}H_7(NO_2)O_4$. (α)-*Nitro-alizarin.* [196°]: Prepared by nitration of the di-acetyl derivative of alizarin (Schunck a. Römer, *B.* 12, 587). Less soluble in alcohol and HOAc than the (β)-isomeride. Oxidised by HNO_3 to phthalic acid. Yields purpurin on warming with H_2SO_4.

Nitro-di-oxy-anthraquinone. (β)-*Nitro-alizarin. Alizarin orange.* [244°]. Formed by nitration of alizarin dissolved in HOAc (S. a. R.; Rosenstiehl, *Bl.* [2] 26, 63). Formed also by boiling di-nitro-oxy-anthraquinone with dilute (20 p.c.) NaOH (Simon, *B.* 15, 692). Orange needles (from benzene), sl. sol. KOHAq. Dyes alumina mordants red and iron mordants reddish-violet.

Di-acetyl derivative [218°]. Needles.

Nitro-tri-oxy-anthraquinone $C_{14}H_7(NO_2)O_5$. Formed from alizarin and fuming HNO_3 (Strecker, *Z.* 1868, 264). Red crystalline powder.—K_2A''.

Di-nitro-oxy-anthraquinone $C_6H_4{:}C_2O_2{:}C_6H(NO_2)_2(OH)$[1:3:2]. [270°]. Formed from oxy-anthraquinone and fuming HNO_3 (Simon, *B.* 14, 464; 15, 694). Yellow needles. Dyes wool and silk orange.—KA'.—CuA'_2 2aq.—MgA'_2 5aq.—AgA'.

Ethyl ether EtA'. [158°].

Di-nitro-di-oxy-anthraquinone $C_{14}H_6(NO_2)_2O_4$. *Di-nitro-purpuroxanthin.* [250°]. Formed from purpuroxanthin and cold HNO_3 (S.G. 1·48) (Plath, *B.* 9, 1205). Red needles (from HOAc).—NH_4HA''.—BaA'': red needles.

Tetra-nitro-di-oxy-anthraquinone $C_{14}H_4(NO_2)_4O_4$. *Tetra-nitro-anthraflavic acid. Tetra-nitro-anthraflavone.* Formed by boiling anthraflavic acid with HNO_3 (S.G. 1·4) (Schardinger, *B.* 8, 1487). Yellow needles, melting with explosion at 307·6° cor.—Salts.—$(NH_4)_2A''$.—$(NH_4)_2A''NH_3$.—$(NH_4)_2A''2NH_3$.—Ag_2A'': brownish needles.

Tetra-nitro-di-oxy-anthraquinone $C_{14}H_4(NO_2)_4O_4$. *Tetra-nitro-isoanthraflavic acid.* Formed by nitrating isoanthraflavic acid (Roemer a. Schwarzer, *B.* 15, 1045). Yellow plates (from dilute HNO_3). Its alkaline solution is red. Dyes wool and silk orange-yellow, but does not combine with mordants.—K_2A'' 2aq: silky-red needles.

Tetra-nitro-di-oxy-anthraquinone $C_{14}H_4(NO_2)_4O_4$. *Tetra-nitro-anthrarufin.* Formed by nitration of anthrarufin (Liebermann, *B.* 12, 188). Small yellow plates (from fuming HNO_3).—Na_2A'' 4aq.—K_2A'' aq: bronze-coloured prisms. MgA'' 6aq.

Tetra-nitro-di-oxy-anthraquinone $C_{14}H_4(NO_2)_4O_4$. *Chrysammic acid.* Formed by heating aloes with HNO_3 (S.G. 1·37) (Schunck, *A.* 39, 1; 65, 235; Stenhouse a. Müller, *C. J.* 19, 319; Tilden, *Ph.* [3] 2, 845). Formed also by nitration of chrysazin (di-oxy-anthraquinone) (Liebermann a. Giesel, *B.* 8, 1643; 9, 329; *A.* 183, 193). Golden plates or monoclinic prisms. Explodes when quickly heated. Aqueous potassium cyanide at 60° forms chrysocyammic acid $C_{16}H_8N_6O_{12}$ 6aq, which forms the dark-red salts $(NH_4)_2A''$ 3aq, K_2A'' 3aq, and CaA'' 3aq.

Salts.—Na_2A'' 3aq (Mulder, *A.* 68, 339; 72, 285).—K_2A''. S. ·08 in the cold. Flat rhomboidal plates; polarises light, the two rays being differently coloured (Brewster, *P.* 69, 552; Hirschwald, *A.* 183, 198).—BaA'' 2aq.—BaA'' 4aq. — MgA'' 5aq. — PbA'' 5aq. — $Pb_2A''(OH)_2$. — PbA'' 4aq.—MnA'' 5aq.—CuA'' 4aq.

Ethyl ether Et_2A''. Pale-red needles or yellow prisms (Stenhouse).

Benzoyl derivative $C_{14}H_2Bz_2N_4O_{12}$. Yellow, almost insoluble, prisms.

NITRO-OXY-BENZENE *v.* NITRO-PHENOL.

Nitro-tri-oxy-benzene. *Tri-methyl derivative* $C_6H_2(NO_2)(OMe)_3$ [*x*:1:2:3]. [100°]. Formed from $C_6H_3(OMe)_3$ and conc. HNO_3 (Will, *B.* 21, 612). Thick prisms. With HNO_3 it yields $C_6H(NO_2)_2(OMe)_3$ [126°], sl. sol. alcohol.

Di-nitro-tetra-oxy-benzene. *Methylene-di-methyl derivative. Di-nitro-apione.* $C_6(NO_2)_2(OMe)_2<^{O}_{O}>CH_2$. [118°]. Formed from apiolic acid (4 g.), HOAc (50 c.c.), and HNO_2 (100 c.c. of S.G. 1·4) (Ciamician a. Silber, *B.* 22, 2489; 23, 2290). Yellow needles, insol. water. Yields on reduction $C_9H_6O_4(NH_2)_2$ [119°]. With diacetyl it condenses to $C_{13}H_{14}N_2O_4$ [176°], and with benzil to $C_9H_8O_4<^{N.CPh}_{N.CPh}$ [222°], both crystallising in needles.

NITRO-*o*-OXY-BENZOIC ACID $C_6H_3(NO_2)(OH)(CO_2H)$ [5:2:1]. *Nitro-salicylic acid. Anilotic acid.* [228°]. Mol. w. 183. S. ·176 at 22° (Hübner); ·07 at 15·5° (Schiff). Formed, together with the isomeride [144°], by the action of nitric acid on salicylic acid and on indigo (Chevreul, *A. Ch.* [1] 72, 131; Buff, *A. Ch.* [2] 37, 160; Dumas, *A. Ch.* [2] 63, 205; [3] 2, 227; Gerhardt, *A. Ch.* [3] 7, 325; Marchand, *J. pr.* 26, 385; Piria, *A.* 56, 35; Stenhouse, *A.* 70, 253; Schiff, *A.* 154, 14; Schiff a. Masino, *G.* 9, 318; *A.* 198, 258; Hübner, *A.* 195, 6). Formed also by the action of aqueous $NaNO_2$ and H_2SO_4 on salicylic acid at 50° (Deninger, *J. pr.* [2] 42, 550); by boiling (ε)-nitro-amido-benzoic acid [263°] with potash (Griess, *B.* 11, 1730); and by heating *p*-nitro-phenol with CCl_4 and alcoholic potash at 100° (Hasse, *B.* 10, 2188). White needles, v. sol. alcohol. Its aqueous solution is coloured red by $FeCl_3$. Distillation with CaO yields *p*-nitro-phenol [114°].

Salts. — KA'. — NH_4A'. — BaA'_2 6aq. — $BaC_7H_3NO_5$ 2aq. — CaA'_2 6aq. — SrA'_2 5½aq. — MgA'_2 4aq.—ZnA'_2 5aq.—AgA'.

Methyl ether MeA'. [88°]. Formed from methyl salicylate and nitrous acid (Deninger, *J. pr.* [2] 40, 302).

Ethyl ether EtA'. [94°]. Needles.

Methyl derivative $C_6H_3(NO_2)(OMe)(CO_2H)$. [143°]. Formed from $C_6H_4(OMe)(CO_2H)$ and HNO_3 (Kraut, *A.* 150, 6; Salkowski, *A.* 173, 41). Needles. Gives no colour with $FeCl_3$.

Ethyl derivative $C_6H_3(NO_2)(OEt).CO_2H$. [163°] (P.); [161°] (K.). Formed from ethoxy-benzoic aldehyde $C_6H_4(OEt)CHO$ and conc. HNO_3 (Perkin, *A.* 145, 311). Formed also from $C_6H_2(NO_2)(OH).CO_2Me$, EtI, and KOH, the resulting $C_6H_5(NO_2)(OEt).CO_2Me$ being saponified (Kraut). Plates (from boiling water).—BaA'_2 2aq —EtA'. [98°] (Hübner).

Amide $C_6H_3(NO_2)(OH).CONH_2$. [225°]. Needles. Behaves as an acid, decomposing carbonates, and forming the salts $C_7H_5KN_2O_4$ aq. —CaA'_2 4aq.—BaA'_2 4aq.—PbA'_2 4aq.

Anilide $C_6H_3(NO_2)(OH).CO.NHPh$. [224°]. Formed by nitrating $C_6H_4(OH).CONHPh$ (Mensching, *A.* 210, 343). Needles.

Nitro-*o*-oxy-benzoic acid $C_6H_3(NO_2)(OH)CO_2H$ [3:2:1]. [144°]. S. ·13 at 15·5° (Schiff). Formed as above, and also by adding H_2SO_4 to a solution of salicylic acid and $NaNO_2$ at 100° (Deninger, *J. pr.* [2] 42, 551), and by the action of nitrous acid on oil of wintergreen (Smith a. Knerr, *Am.* 8, 100). Obtained also by heating o-nitro-phenol with CCl_4 and alcoholic potash at 100° (Hasse). Needles (containing aq). Melts at 125° when hydrated, 144° when anhydrous. $FeCl_3$ colours its solution red. Yields o-nitro-phenol on heating with dilute H_2SO_4 at 150°.

Salts.—NaA'.—KA'.—BaA'_2. Needles.—$BaC_7H_3NO_5$ 1½aq.—MgA' 2aq. — $PbC_7H_3NO_5$. — AgA'.

Ethyl ether EtA'. [118°].

Amide $C_6H_3(NO_2)(OH).CONH_2$. [146°]. Needles. Yields the salts $Ca(C_7H_5N_2O_4)_2$ 4aq.—BaA'_2 2aq.—$Pb(OH)A'$ 2aq.

Nitro-*o*-oxy-benzoic acid $C_7H_5NO_5$ *i.e.* $C_6H_3(NO_2)(OH)(CO_2H)$[6:2:1]. *Amide of the methyl derivative* $C_6H_3(NO_2)(OMe)CONH_2$. [195°]. Formed by boiling its nitrile with baryta-water (Lobry de Bruyn, *R. T. C.* 2, 217). Yellowish needles, m. sol. acetone.

Nitrile of the methyl derivative $C_6H_3(NO_2)(OMe)CN$. [171°]. Formed by boiling *m*-di-nitro-benzene with KCy and MeOH (Lobry de Bruyn, *R. T. C.* 2, 212). Needles (from alcohol). Boiling alcoholic potash converts it into $C_6H_3(OH)_2CO_2H$.

Amide of the ethyl derivative $C_6H_3(NO_2)(OEt).CONH_2$. [197°]. Needles.

Nitrile of the ethyl derivative $C_6H_3(NO_2)(OEt)CN$. [137°]. Formed from *m*-di-nitro-benzene and alcoholic KCy. Tables.

α-Nitro-*m*-oxy-benzoic acid $C_6H_3(NO_2)(OH)CO_2H$[6:3:1]. [169°]. Formed by boiling (α)-nitro-amido-benzoic acid with potash (Griess, *B.* 11, 1733). Light-yellow crystals containing aq), v. sol. water.—$BaC_7H_3NO_5$ 6aq: orange prisms.

Methyl derivative $C_6H_3(NO_2)(OMe)(CO_2H)$. [133°]. Formed by oxidising $C_6H_3(NO_2)(OMe)CHO$ with $KMnO_4$ (Rieche, *B.* 22, 2354).

β-Nitro-*m*-oxy-benzoic acid $C_6H_3(NO_2)(OH)CO_2H$[4:3:1]. [230°]. Formed by boiling the corresponding nitro-amido-benzoic acid with KOHAq and, together with the (2,3,1)- and (5,3,1)-isomerides, by nitration of a boiling aqueous solution of *m*-oxy-benzoic acid by HNO_3

(Griess, *B.* 5, 856; 20, 403). Yellow plates (from hot water).—$BaC_7H_3NO_5$ aq.

Nitrile $C_6H_3(NO_2)(OH).CN$. [183°]. From *m*-oxy-benzoic nitrile and HNO_3 (Smith, *J. pr.* [2] 16, 227). Coloured dark red by aqueous $FeCl_3$. Belongs perhaps to one of the isomeric nitro-*m*-oxy-benzoic acids.

(γ)-Nitro-*m*-oxy-benzoic acid $C_6H_3(NO_2)(OH)CO_2H$[2:3:1]. [178°]. Formed by boiling (2,3,1)-nitro-amido-benzoic acid with potash, and also by nitrating *m*-oxy-benzoic acid (Griess, *B.* 11, 1734; 20, 403). Yellow plates or prisms (containing aq). Tastes sweet. —BaA'_2 1½aq.

Methyl derivative $C_6H_3(NO_2)(OMe)CO_2H$. [251°]. Formed from its aldehyde and Ag_2O (Rieche, *B.* 22, 2352). White plates.—AgA′.

(ζ)-Nitro-*m*-oxy-benzoic acid $C_6H_3(NO_2)(OH)CO_2H$[5:3:1]. [167°]. Formed by nitrating *m*-oxy-benzoic acid (*v. supra*). Crystals (containing aq).—BaA'_2 6aq: prisms.

Methyl derivative $C_6H_3(NO_2)(OMe)CO_2H$. [233°]. Long white needles (Rieche, *B.* 22, 2356).

δ-Nitro-*p*-oxy-benzoic acid $C_6H_3(NO_2)(OH).CO_2H$[3:4:1]. [185°].

Formation.—1. By dissolving *p*-oxy-benzoic acid in dilute nitric acid (Barth, *Z.* 1866, 647; Griess, *B.* 20, 408).—2. By boiling (3,4,1)-nitro-amido-benzoic acid with potash (Griess, *B.* 5, 856).—3. By the action of aqueous $NaNO_2$ and H_2SO_4 on *p*-oxy-benzoic acid at 40° (Deninger, *J. pr.* [2] 42, 552).—4. In small quantity in the action of CCl_4 and alcoholic potash on *o*-nitro-phenol (H.)

Properties.—Needles, sl. sol. hot water. Gives no colour with $FeCl_3$.

Salt.—$BaC_7H_3NO_5$ aq: red nodules.

Methyl derivative $C_6H_3(NO_2)(OMe)CO_2H$. *Nitranisic acid.* [187°]. Formed by boiling anisic acid or oil of anise with nitric acid (Laurent, *B. J.* 23, 416; Cahours, *A.* 41, 71; Engelhardt, *A.* 108, 243; Salkowski, *A.* 163, 6; *B.* 10, 1254). Also from $C_6H_3(NO_2)(OMe).CH_2NHAc$ by oxidation with $K_2Cr_2O_7$ (Goldschmidt a. Polonowska, *B.* 20, 2410). Small needles (from water). Yields o-nitro-phenol on heating with water at 220°.—NaA′aq.—KA′aq.—CaA'_2 4aq.—SrA'_2 4aq. —BaA'_2: flocculent pp.—PbA'_2.—AgA′.

Methyl ether of the methyl derivative $C_6H_3(NO_2)(OMe)CO_2Me$. [108°]. Plates.

Ethyl ether of the methyl derivative $C_6H_3(NO_2)(OMe)CO_2Et$. [100°]. Tables.

Nitrile of the methyl derivative $C_6H_3(NO_2)(OMe).CN$. [150°]. Formed from $C_6H_4(OMe)CN$ and HNO_3 (Henry, *B.* 2, 668). Small needles (from alcohol).

Nitro-di-oxy-benzoic acid. *Di-methyl derivative* $C_6H_2(NO_2)(OMe)_2CO_2H$[4:5:3:1]. [225°]. Formed from $C_6H_3(OMe)_2CO_2H$ and dilute HNO_3 (H. Meyer, *M.* 8, 431). Needles (from water). Yields on reduction, $C_6H_2(NH_2)(OMe)_2CO_2H$ [182°].—CuA'_2 2½aq.—PbA'_2.—AgA′: needles.

Nitro-di-oxy-benzoic acid. *Methyl derivative* $C_6H_2(NO_2)(OH)(OMe)CO_2H$[*x*:4:3:1]. *Nitro-vanillic acid.* White needles (Matsmoto, *B.* 11, 122).

Acetyl derivative $C_6H_2(NO_2)(OAc)(OMe)CO_2H$. [182°]. Needles.

Di-methyl derivative $C_6H_2(NO_2)(OMe)_2CO_2H$. *Nitro-veratric acid.* Yellow needles (containing ½aq). Its methyl ether melts at 144° and its ethyl ether at 100°.

Di-nitro-oxy-benzoic acid $C_6H_2(NO_2)_2(OH)CO_2H$[5:3:2:1]. *Di-nitro-salicylic acid.* [173°]. Formed by nitration of salicylic acid (Cahours, *A. Ch.* [3] 25, 11; Stenhouse, *A.* 78, 1; Hübner, *A.* 195, 45). Tables or needles (containing aq). After fusion it melts at 158°. $FeCl_3$ colours its solution red.—NH_4A'.—KA′: sl. sol. water.—$K_2C_7H_2N_2O_7$ aq: m. sol. water.—NaA′.—BaA'_2.—$BaC_7H_2N_2O_7$ 3aq: needles.—CaA'_2 2aq.—$PbC_7H_2N_2O_7$ 3aq.—AgA′: sparingly soluble granules.

Methyl ether MeA′. [127°]. Yellowish scales. Yields $NH_4C_8H_5N_2O_7$ and $AgC_8H_5N_2O_7$.

Ethyl ether EtA′. [99°]. Yields the salts $NH_4C_9H_7N_2O_7$ and $AgC_9H_7N_2O_7$.

Methyl derivative of the methyl ether $C_6H_2(NO_2)_2(OMe).CO_2Me$. [69°]. Prisms. (Salkowski, *A.* 173, 43).

Methyl derivative of the ethyl ether $C_6H_2(NO_2)_2(OMe).CO_2Et$. [47°]. Tables.

Ethyl derivative of the methyl ether $C_6H_2(NO_2)_2(OEt)CO_2Me$. [80°]. Prisms.

Ethyl derivative of the ethyl ether $C_6H_2(NO_2)_2(OEt)CO_2Et$. [49°]. Prisms.

Di-nitro-*p*-oxy-benzoic acid $C_6H_2(NO_2)_2(OH)(CO_2H)$ [5:3:4:1]. [237°]. Formed by boiling di-nitro-*p*-amido-benzoic acid with potash (Salkowski, *A.* 173, 36). Thin tables.—KA′. S. ·7 at 16·5°.—$K_2C_7H_2N_2O_7$ 2aq. S. 32 at 16·5°.—$BaC_7H_2N_2O_7$ 5aq.—$BaC_7H_2N_2O_7$ 3½aq.—Ag′A.—$Ag_2C_7H_2N_2O_7$.

Ethyl ether EtA′. [87°]. Yields $KC_9H_7N_2O_7$, S. ·9, and $AgC_9H_7N_2O_7$.

Methyl derivative $C_6H_2(NO_2)_2(OMe)CO_2H$. *Dinitranisic acid.* [182°]. Formed by nitration of nitro-anisic acid (Salkowski a. Rudolph, *B.* 10, 1254; Stöhr, *A.* 225, 86).—KA′aq.—AgA′.

Ethyl ether EtA′. [79°].

Ethyl derivative of the ethyl ether $C_6H_2(NO_2)_2(OEt).CO_2Et$. [59°]. Needles.

Tri-nitro-*m*-oxy-benzoic acid $C_6H(NO_2)_3(OH).CO_2H$. Formed by warming *m*-diazoamide-benzoic acid with HNO_3 (Griess, *A.* 117, 28), and by the action of fuming HNO_3 on *m*-amido-benzoic acid (Beilstein a. Geitner, *A.* 139, 11). Large crystals (from conc. HNO_3). Explodes when heated.—$(NH_4)_2C_7HN_3O_9$ 2aq.—$BaC_7HN_3O_9$ 3aq.—$Ag_2C_7HN_3O_9$.

Tri-nitro-oxy-benzoic acid [105°]. Formed from *m*-oxybenzoic acid by successive treatment with dilute H_2SO_4 and HNO_3 (Schardinger, *B.* 8, 1490). Tables and prisms (containing aq).—$BaC_7HN_3O_9$ 2aq.—$CaC_7HN_3O_9$ 5aq: green needles, exploding at 237°.

NITRO-*o*-OXY-BENZOIC ALDEHYDE $C_6H_3(NO_2)(OH)CHO$. [3:2:1]. [109°]. Formed together with the (5,2,1)-isomeride, by nitrating salicylic aldehyde (Mazzara, *G.* 6, 460; Von Miller, *B.* 20, 1927; 22, 1709; Taege, *B.* 20, 2109). Its compound with $NaHSO_3$ does not crystallise. Sodium-amalgam forms brown amorphous $\{C_6H_3(OH)(CHO)\}_2N_2H_2$ (Brigel, *A.* 135, 169).—$NaC_7H_4NO_4$.—$Ba(C_7H_4NO_4)_2$2aq: orange crystals.

Acetyl derivative [110°].

Phenyl-hydrazide [165°].

Methyl derivative $C_8H_7NO_4$. [102°].

Nitro-*o*-oxy-benzoic aldehyde $C_6H_3(NO_2)(OH)CHO$ [5:2:1]. [125°]. Formed as above. Forms a solid compound with $NaHSO_3$.—$NaA'2aq$: needles.—BaA'_26aq.—BaA'_33aq.

Acetyl derivative [112°].

Phenyl-hydrazide [186°].

Methyl derivative $C_6H_3(NO_2)(OMe)CHO$. [90°]. Formed by nitrating $C_6H_4(OMe)CHO$ (Schnell, *B.* 17, 1382; *cf.* Voswinckel, *B.* 15, 2027). Needles (from water).

Nitro-*m*-oxy-benzoic aldehyde $C_6H_3(NO_2)(OH)(CHO)$ [2:3:1]. [128°]. Formed, together with the isomeride [166°], by nitration of *m*-oxy-benzoic aldehyde (Tiemann a. Ludwig, *B.* 15, 2052, 3052). Yellow plates, sol. benzene.

Methyl derivative $C_6H_3(NO_2)(OMe)CHO$. [107°] (T. a. L.); [102°] (R.). Formed from the aldehyde, KOH, and MeI (T. a. L.). Formed also, together with the (6, 3, 1)- and (5, 3, 1)-isomerides from $C_6H_4(OMe)CHO$ and HNO_3 at 0° (Rieche, *B.* 22, 2350). Forms a very soluble compound with $NaHSO_3$. With acetone and NaOH it condenses to di-methoxy-indigo. $C_6H_3(NO_2)(OMe)CH:NOH$, its oxim, melts at 170°; and its phenyl-hydrazide $C_6H_3(NO_2)(OMe)CH:N_2HPh$ at 134°.

Nitro-*m*-oxy-benzoic aldehyde $C_6H_3(NO_2)(OH)CHO$ [6:3:1]. [166°]. Formed by nitrating *m*-oxy-benzoic aldehyde (T. a. L.). Needles, v. sl. sol. benzene.

Methyl derivative [83°]. Plates, volatile with steam. Its compound with $NaHSO_3$ is m. sol. water. With acetone and KOH it yields a substance resembling indigo. Its oxim $C_6H_3(NO_2)(OH)CH:NOH$ melts at 152°, and the corresponding phenyl-hydrazide at 154°.

Nitro-*m*-oxy-benzoic aldehyde. *Methyl derivative* $C_6H_3(NO_2)(OMe)(CHO)$ [5:3:1]. [97°] (U.); [104°] (R.). A product of the nitration of [3:1] $C_6H_4(OMe)CHO$ (Ulrich, *B.* 18, 2572; Rieche, *B.* 22, 2354). Does not give the indigo reaction. Forms an oxim [148°], and a phenyl-hydrazide [126°].

Nitro-*p*-oxy-benzoic aldehyde $C_6H_3(NO_2)(OH)CHO$ [3:4:1]. [140°]. Formed by nitrating *p*-oxy-benzoic aldehyde (Mazzara, *G.* 7, 285; Herzfeld, *B.* 10, 1269). Needles, slightly volatile with steam.—$C_6H_3(NO_2)(OK)CHO\,aq$.—AgA': canary yellow pp.

Methyl derivative. Nitro-anisic aldehyde. [84°]. Formed from anisic aldehyde, HNO_3, and H_2SO_4 (Einhorn a. Grabfield, *A.* 243, 370). Yellow needles. Forms a phenyl hydrazide [131°].

Di-nitro-*m*-oxy-benzoic aldehyde. *Methyl-derivative* $C_6H_2(NO_2)_2(OMe)CHO$. [110°]. Formed, together with an isomeride [155°], by treating [3:1]$C_6H_4(OMe)CHO$ with H_2SO_4 and KNO_3 (Tiemann a. Ludwig, *B.* 15, 2055).

Nitro-di-oxy-benzoic aldehyde. *Ethyl derivative* $C_6H_2(NO_2)(OEt)(OH)CHO$ [*x*:5:2:1]. [130°]. Formed from $C_6H_3(OEt)(OH)CHO$ and dilute HNO_3 (Hantzsch, *J. pr.* [2] 22, 472). Scarcely volatile with steam.

TETRA-NITRO-*o*-OXY-BENZYL-ANILINE $C_{13}H_8(OH)(NO_2)_4N$. [66°]. Formed from *o*-oxy-benzyl-aniline, HNO_3, and H_2SO_4 (Emmerich, *A.* 241, 345). Yellow needles (from benzene).

DI-NITRO-DI-OXY-DI-BENZYL UREA. *Di-ethyl derivative* $CO(NH.CH(OEt).C_6H_4NO_2)_2$. [170°]. Formed from urea, nitro-benzoic aldehyde, alcohol, and H_2SO_4 (Lüdy, *M.* 10, 305).

NITRO-OXY-CINNAMIC ACID *v.* NITRO COUMARIC ACID.

NITRO-OXY-CUMINIC ACID. *Methyl derivative* $C_6H_2(C_3H_7)(NO_2)(OMe)CO_2H$. [146°]. Formed from the methyl derivative of cymophenol and dilute HNO_3 (Paterno a. Canzoneri, *G.* 10, 233). Yellowish crystals.—$BaA'_2 2\frac{1}{2}aq$.

Isomeride *v.* NITRO-OXY-ISOPROPYL BENZOIC ACID.

NITRO-DI-OXY-ETHYL-PYRIMIDINE $CO<\begin{smallmatrix}NEt.CH\\NH.CO\end{smallmatrix}>C(NO_2)\,aq$. *Nitro-ethyl-uracil* [194·5°]. Formed from potassium nitro-uracil and EtBr at 150° (Lehmann, *A.* 253, 84). White needles.—KA'.—AgA': needles, v. sl. sol. cold Aq.

DI-NITRO-OXY-ETHYL-QUINOLINE TETRAHYDRIDE. *Ethyl derivative* $C_{13}H_{17}N_3O_5$ *i.e.* $C_9H_7Et(OEt)(NO_2)_2N$. [77°]. Formed by nitrating $C_9H_9Et(OEt)N$ (Kohn, *C. J.* 49, 509; *B.* 19, 1048). Yellow prisms (from alcohol), with basic properties.

NITRO-OXY-MALEÏC IMIDE $C_4H_2N_2O_4$. The salt $NH<\begin{smallmatrix}CO.C.NO_2\\CO.C.OK\end{smallmatrix}$ separates as light-yellow crystals when a solution of di-chloro-maleïc imide is warmed with KNO_2 (Ciamician a. Silber, *Rend. Accad. Linc.* [4] 4, 447; *B.* 22, 33, 2490). It is almost insol. water.

TETRA-NITRO-DI-OXY-METHYL-ANTHRAQUINONE $C_{14}H_3Me(OH)_2(NO_2)_4O_2$. *Tetra-nitro-chrysophanic acid.* Formed by heating chrysophanic acid with fuming HNO_3 (Liebermann a. Giesel, *A.* 183, 175). Yellow plates or needles.

NITRO-DI-OXY-METHYL-ETHYL-PYRIMIDINE $CO<\begin{smallmatrix}NMe.CH\\NEt.CO\end{smallmatrix}>C(NO_2)$. [73°]. *Nitro-methyl-ethyl-uracil.* Formed from silver nitro-ethyl-uracil and MeI at 130° (Lehmann, *A.* 253, 86). Pearly rhombohedra (containing aq).

Nitro-di-oxy-methyl-ethyl-pyrimidine $CO<\begin{smallmatrix}NEt.CH\\NMe.CO\end{smallmatrix}>C(NO_2)$. [109°]. Formed from silver nitro-methyl-uracil and EtBr at 150° (L.). Needles (containing aq).

NITRO-OXY-TRI-METHYL-PYRIDINE $C_8H_{10}(NO_2)NO$. *Nitro-methyl-ψ-lutidostyril.* [161°]. Formed by nitrating oxy-tri-methyl-pyridine (Hantzsch, *B.* 17, 1032). Yellow needles or prisms, sol. hot alcohol.

NITRO-DI-OXY-METHYL-PYRIMIDINE $C_5H_5N_3O_4$ *i.e.* $CO<\begin{smallmatrix}NH\ .CH\\NMe.CO\end{smallmatrix}>C.NO_2$. *Nitro-methyl-uracil.* [255°]. S. ·714 at 20°. Formed from potassium nitro-uracil and MeI at 140° (Hoffmann, *A.* 253, 77). Needles (containing aq), v. sol. hot water. Baryta-water at 160° liberates methylamine and NH_3.—KA': needles.—BaA'_2.—AgA': minute white needles (from hot water).

Nitro-di-oxy-di-methyl-pyrimidine $CO<\begin{smallmatrix}NMe.CH\\NMe.CO\end{smallmatrix}>C(NO_2)$. [154·5°]. From the silver salt of nitro-di-oxy-methyl-pyrimidine and MeI at 120° (Lehmann, *A.* 253, 82). Needles (containing aq). Yields $NMeH_2$ when heated with baryta at 130°.

NITRO-OXY-METHYL-QUINAZOLINE $C_6H_3(NO_2)<\begin{smallmatrix}C(OH):N\\N{=\!=\!=}CMe\end{smallmatrix}$. Formed from oxy-methyl-quinazoline [233°] and conc. HNO_3 (De-hoff, *J. pr.* [2] 42, 348). Yellow crystalline powder, sol. alcohol. Does not melt below 280°.

Methyl derivative [165°]. Needles.

(*Py.*2)-**NITRO**-(*Py.*1)-**OXY**-(*Py.*3)-**METHYL-QUINOLINE** $C_6H_4\left\langle\begin{array}{l}C(OH):C(NO_2)\\ N{=\!=\!=}CMe\end{array}\right.$. Formed by nitrating oxy-(*Py.* 3)-methyl-quinoline (Conrad a. Limpach, *B.* 20, 950). Needles, v. sl. sol. boiling alcohol. Does not melt at 270°.

(*B.* 3)-**Nitro**-(*B.* 4)-**oxy**-(*B.* 1)-**methyl-quinoline** $\begin{array}{l}CH:CMe \text{ ——— } C.CH:CH\\ C(NO_2):C(OH).C.\ N\ :CH\end{array}$. [206°]. This body is formed by oxidising the corresponding nitroso-oxy-methyl-quinoline with alkaline K_3FeCy_6 (Noelting a. Trautmann, *B.* 23, 3667). In the same way may be formed (*B.* 4)-nitro-(*B.* 1)-oxy-(*B.* 2)-methyl-quinoline; (*B.* 1)-nitro-(*B.* 4)-oxy-(*B.* 3)-methyl-quinoline [193°]; and (*B.* 2)-nitro-(*B.* 1)-oxy-(*B.* 4)-methyl-quinoline [182°].

NITRO-OXY-TRI-METHYL-QUINOLINE CARBOXYLIC ACID $C_{13}H_{12}N_2O_5$ *i.e.* $C_9HMe_3(NO_2)(CO_2H)(OH)N$. Formed by warming (*Py.* 1)-oxy-(*B.* 1, 2, 4; *Py.* 3)-tetra-methyl-quinoline with HNO_3 (S.G. 1·4) (Conrad a. Limpach, *B.* 21, 529). White insoluble powder. —NaA′ aq: yellowish needles.

NITRO-DI-OXY-NAPHTHALENE *v.* NITRO-HYDRONAPHTHOQUINONE.

Di-nitro-di-oxy-naphthalene. *Di-ethyl-derivative* $C_{10}H_4(NO_2)_2(OEt)_2$. [229°]. Formed from (ε)-di-chloro-di-nitro-naphthalene and alcoholic potash (Alén, *Bl.* [2] 36, 435). Yellow needles.

NITRO-OXY-NAPHTHOIC ACID $C_{10}H_5(NO_2)(OH).CO_2H$. [242°]. Formed by dissolving its anhydride in alkalis (Ekstrand, *J. pr.* [2] 38, 282). Plates.—$CaC_{11}H_5NO_5$ 5½aq: yellowish-red needles.

Anhydride $C_{10}H_5(NO_2)\left\langle\begin{array}{l}O\\ CO\end{array}\right.$. [242°]. Formed by nitrating *peri*-oxy-naphthoic acid. Yellow needles (from HOAc).

Nitro-oxy-naphthoic acid [202°] (Schmidt a. Burkard, *B.* 20, 2700). Yields (β)-nitro-(α)-naphthol on distillation with lime.

NITRO-OXY-(α)-NAPHTHOQUINONE $C_{10}H_5NO_5$ *i.e.* $C_6H_4\left\langle\begin{array}{l}CO.C.NO_2\\ CO.C.OH\end{array}\right.$. *Nitronaphthalic acid.* [157°]. Formed from oxy-(α)-naphthoquinone, H_2SO_4, and HNO_3; the yield being 85 p.c. of the theoretical (Diehl a. Merz, *B.* 11, 1317). Formed also from di-chloro-(α)-naphthoquinone and alcoholic $NaNO_2$ at 100° (Kehrmann, *B.* 21, 1780; *J. pr.* [2] 40, 180). Yellow leaflets or tables.—NH_4A'.—NaA′aq.—KA′aq.—BaA'_2.—PbA'_2 aq.—PbA'_2 4½aq.—AgA′.

Sulphonic acid $C_{10}H_3(SO_3H)(NO_2)(OH)O_2$ [2′:3:2:4:1]. Formed from di-chloro-(α)-naphthoquinone sulphonic acid [229°] and $NaNO_2$ (K.).—$K_2C_{10}H_3NSO_8$ (dried at 100°): slender yellow needles.

DI-NITRO-DI-OXY-(ββ)-DINAPHTHYL DI-SULPHONIC ACID $C_{20}H_6(NO_2)_2(OH)_2(SO_3H)_2$. Got by nitrating $C_{20}H_8(OH)_2(SO_3)_2Ba$ (Julius, *Chem. Ind.* 10, 97). Yellow needles (containing 3aq).

o-**NITRO**-*p*-**OXY-DIPHENYL** [4:1] $C_6H_4(OH).C_6H_4.NO_2$ [1:2]. [138°]. Formed by the action of nitrous acid on the corresponding nitro-amido-diphenyl (Schultz a. Strasser, *B.* 14, 614; *A.* 207, 351). Yellow needles.

p-**Nitro**-*p*-**oxy-diphenyl** [4:1] $C_6H_4(OH).C_6H_4.NO_2$[1:4]. [170°]. Formed from *p*-nitro-*p*-amido-diphenyl (S. a. S.).

Nitro-oxy-diphenyl $C_{12}H_8(NO_2)(OH)$. [67°]. Formed by nitration of oxydiphenyl (Latschinoff, *J. R.* 5, 52). Lemon-yellow prisms (from ether).

Di-nitro-oxy-diphenyl $C_{12}H_7(NO_2)_2(OH)$. [154°]. Formed at the same time as the preceding (L.). Golden plates (from alcohol).—KA'_2 2aq: sparingly soluble plates.

Di-nitro-di-oxy-diphenyl [3:4:1] $C_6H_3(NO_2)(OH).C_6H_3(NO_2)(OH)$ [1:3:4]. [272°] (K.); [280°] (S.). Formed from *pp*-di-oxy-diphenyl and HNO_3 (S.G. 1·45) (Kunze, *B.* 21, 3331; Schütz, *B.* 21, 3531). Yellow needles, insol. alcohol.

Di-acetyl derivative [215°]. Needles.

Di-benzoyl derivative [206°]. Plates.

Ethyl ether [193°]. Formed by nitrating the ethyl ether of di-oxy-diphenyl (Hirsch, *B.* 22, 336).

Di-nitro-di-oxy-diphenyl $C_{12}H_8N_2O_6$. [184°]. Formed by oxidising o-nitro-phenol with aqueous $KMnO_4$ (Goldstein, *J. R.* 6, 193; 10, 318). Yellow needles (from benzene).

Di-benzoyl derivative. [191°]. Needles.

Tetra-nitro-di-oxy-diphenyl [4:3:5:1]$C_6H_2(OH)(NO_2)_2.C_6H_2(NO_2)_2(OH)$ [1:3:5:4]. [220°] (K.); [225°] (S.). From di-oxy-diphenyl, HOAc, and HNO_3 (Kunze, *B.* 21, 3333; Schütz, *B.* 21, 3532). Yellow needles.—Na_2A''.—NaHA″: brownish-red needles.

Di-acetyl derivative. [236°]. Needles.

Hexa-nitro-tetra-oxy-diphenyl $C_{12}H_4N_6O_{16}$. *Hexa-nitro-diresorcin.* Formed by warming tetra-acetyl-diresorcin with fuming HNO_3 (Benedikt a. Julius, *M.* 5, 178). Yellow crystals, exploding at 230°; v. e. sol. water.

m-**NITRO**-α-**OXY-PHENYL-ACETIC ACID** *v.* NITRO-MANDELIC ACID.

NITRO-OXY-PHENYL-AMIDO-BENZOIC ACID $C_6H_4(OH).NH.C_6H_3(NO_2).CO_2H$[4:3:1]. [261°]. Formed from bromo-nitro-benzoic acid, alcohol, and amido-phenol at 120° (Schöpff, *B.* 22, 3288). Small needles, m. sol. water.

DI-NITRO-o-OXY-DIPHENYLAMINE [2:1]$C_6H_4(OH).NH.C_6H_3(NO_2)_2$[1:2:4]. [199°]. Got from $C_6H_3Br(NO_2)_2$ and o-amido-phenol (Schöpff, *B.* 22, 900). Orange crystals (from alcohol).

Acetyl derivative [150°]. Needles.

Ethyl derivative [164°]. Red needles.

Methyl derivative [151°]. Needles.

Di-nitro-*p*-oxy-diphenylamine. *Di-benzoyl derivative* $C_{12}H_7(NO_2)_2(OBz)NBz$. [195°]. Got by nitrating $C_{12}H_8(OBz)NBz$ (Philip a. Calm, *B.* 17, 2437). Small crystals, sl. sol. alcohol.

Di-nitro-di-oxy-diphenylamine. *Diethyl derivative* $C_6H_5NHC_6H(NO_2)_2(OEt)_2$. [133°]. Formed by heating aniline with the diethyl derivative of di-nitro-hydroquinone (Nietzki, *A.* 215, 157). Red needles (from alcohol).

NITRO-OXY-PHENYL-ANGELIC-(β)-LACTONE $[4:1]C_6H_4(NO_2).CH:CH.CH\left\langle\begin{array}{c}CH_2\\ O\end{array}\right\rangle CO$. [111°]. Formed by adding soda to a cold solution of $C_6H_4(NO_2).C_2H_3Br.CH\left\langle\begin{array}{c}CH_2\\ O\end{array}\right\rangle CO$ (Einhorn a. Gehrenbeck, *B.* 22, 47; *A.* 253, 370).

o-**NITRO**-β-**OXY-PHENYL-BUTYLENE DI-CARBOXYLIC ACID** $[1:2]C_6H_4(NO_2).CH:CH.CH(OH).CH(CO_2H)_2$.

[269°]. Formed by heating malonic acid (10 g.) with o-nitro-cinnamic aldehyde (15 g.) at 125° (Einhorn, *A.* 253, 375). Stellate needles.

NITRO-OXY-PHENYL-CARBAMIC ETHER. *Ethyl derivative* $C_6H_3(NO_2)(OEt).NH.CO_2Et$. [71°]. Formed, as well as two di-nitro- derivatives [141°] and [121°] and a tri-nitro- derivative [212°] by the action of nitric acid on [4:1]$C_6H_4(OEt).NH.CO_2Et$ (Köhler, *J. pr.* [2] 29, 261). All four compounds crystallise from alcohol in needles.

NITRO-DI-OXY-PHENYL-CROTONIC ACID. *Anhydride*  $C_6H_2(NO_2)(OH)\langle{CMe:CH \atop O{-\!\!-}CO}$. *Nitro-(β)-methyl-umbelliferone.* Formed, as well as the di-nitro- derivative [220°] by nitration of (β)-methyl-umbelliferone dissolved in HOAc (Pechmann a. Cohen, *B.* 17, 2136). Both compounds crystallise in yellow needles, sol. alcohol.

NITRO - OXY - PHENYL - ETHYLENE *v.* NITRO-OXY-STYRENE.

o-NITRO-β-OXY-PHENYL-ETHYL METHYL KETONE $C_{10}H_{11}NO_4$ *i.e.* $C_6H_4(NO_2).CH(OH).CH_2.CO.CH_3$. [69°]. Formed from o-nitro-benzoic aldehyde, acetone, and dilute aqueous NaOH (Baeyer a. Drewsen, *B.* 15, 2857). Prisms.

***p*-Nitro-β-oxy-phenyl-ethyl methyl ketone** [58°]. Formed in like manner from *p*-nitro-benzoic aldehyde (Baeyer a. Becker, *B.* 16, 1969). Crystals. Yields nitro-styryl methyl ketone on boiling with Ac_2O. Boiling potash forms a compound $(C_{10}H_9NO_3)_n$ [254°].

***p*-NITRO-β-OXY-PHENYL-(*Py.* 3)-ETHYL-QUINOLINE** $C_6H_4(NO_2).CH(OH).CH_2(NC_9H_6)$. [160°]. Formed by heating (*Py.* 3)-methyl-quinoline with *p*-nitro-benzoic aldehyde at 120° (Bulach, *B.* 20, 2046). Silky needles (from alcohol).—$B'_2H_2PtCl_6$.—$B'HNO_3$: white needles.

DI - NITRO - DI -o- OXY - DI - PHENYL - HYDRAZINE. *Di-ethyl derivative* $\{C_6H_3(NO_2)(OEt)\}_2N_2H_2$. [202°]. Formed by reduction of the corresponding azo- compound [285°] by alcoholic ammonium sulphide (Andreæ, *J. pr.* [2] 21, 325). Yellow prisms, insol. cold alcohol. Hot HClAq converts it into nitro-amido-phenol and $\{C_6H_3(NO_2)(OEt)\}_2N_2$.

NITRO-OXY-PHENYL-METHYL-PYRAZOLE $C_{10}H_9N_3O_3$ *i.e.*  $C_6H_5.N\langle{CO.CH(NO_2) \atop N\ :CMe}$. [127°–130°]. Formed by the action of nitrous acid on oxy-phenyl-methyl-pyrazole, and of nitric acid on the oxim thereof (Knorr, *A.* 238, 187). Prisms (from alcohol), insol. acids.

NITRO-OXY-PHENYL-PROPIOLIC ACID. *Methyl derivative* $C_6H_3(NO_2)(OMe).C{:}C.CO_2H$. [135°]. Formed from $C_6H_3(NO_2)(OMe).CHBr.CHBr.CO_2H$ and alcoholic potash (Einhorn a. Grabfield, *A.* 243, 377). White needles, sol. water.

NITRO-OXY-PHENYL-PROPIONIC ACID [3:4:1]$C_6H_3(NO_2)(OH).CH_2.CH_2.CO_2H$. *Nitro-hydro-p-coumaric acid.* [91°]. Formed by nitrating *p*-oxy-phenyl-propionic acid (Stöhr, *A.* 225, 57). Orange needles (from water).

Methyl ether MeA′. [64°]. Needles.

Ethyl ether EtA′. [38°]. Needles.

Nitro-α-oxy-phenyl-propionic acid $C_6H_4(NO_2).CH_2.CH(OH).CO_2H$. A mixture of the o- and *p*- isomerides is formed by the action of fuming HNO_3 at −5° on α-oxy-phenyl-propionic acid (Erlenmeyer a. Lipp, *A.* 219, 228). The nitrate $C_6H_4(NO_2).CH_2.CH(ONO_2).CO_2H$ of the *p*- isomeride crystallises from hot water in needles, leaving that of the *o*- compound in solution.

o-Nitro-β-oxy-phenyl-propionic acid $C_9H_9NO_5$ *i.e.* [2:1] $C_6H_4(NO_2).CH(OH).CH_2.CO_2H$. [126°]. Formed by oxidation of the product of condensation of o-nitro-benzoic aldehyde with acetic aldehyde (Baeyer a. Drewson, *B.* 16, 2206). Formed also from β-bromo-o-nitro-phenyl-propionic acid and hot Na_2CO_3Aq (Einhorn, *B.* 16, 2214; 17, 1660, 2013). Monoclinic prisms (from water). Dilute H_2SO_4 at 190° converts it into *o*-nitro-cinnamic acid.—BaA'_2 2aq: needles.

Methyl ether MeA′. [51°].

β-Lactone  $C_6H_4(NO_2).CH\langle{CH_2 \atop O}\rangle CO$. [124°]. Formed from $C_6H_4(NO_2).CHBr.CH_2.CO_2H$ and cold aqueous Na_2CO_3. Yellow monoclinic crystals (from chloroform). Split up by boiling with water into *o*-nitro-styrene and CO_2. Boiling HOAc yields indigo.

Amide $C_9H_{10}N_2O_4$. [197°]. Formed from β-bromo-o-nitro-phenyl-propionic acid and ammonia. Formed also from the lactone and NH_3 (Einhorn, *B.* 16, 2646; Basler, *B.* 17, 1494). Needles, v. sol. water. Yields with Ac_2O an acetyl derivative $C_9H_9AcN_2O_4$ [142°], a compound $C_9H_8N_2O_3$ [c. 80°], and the acetyl derivative thereof $C_9H_7AcN_2O_3$ [172°].

***m*-Nitro-β-oxy-phenyl-propionic acid** [3:1] $C_6H_4(NO_2).CH(OH).CH_2.CO_2H$. [105°]. Formed by boiling β-bromo-*m*-nitro-phenyl-propionic acid with water (Prausnitz, *B.* 17, 596; 1660). Plates (from water).

Ethyl ether EtA′. [56°]. Crystals.

Lactone $C_9H_7NO_4$. [98°]. Deposited from a cold solution of the sodium salt. Yields *m*-nitro-styrene on boiling with water.

***p*-Nitro-β-oxy-phenyl-propionic acid** $C_9H_9NO_5$. [132°]. Formed by the action of alkalis on β-bromo-*p*-nitro-phenyl-propionic acid, its lactone being the intermediate product (Basler, *B.* 16, 3004; 17, 1494). Needles, m. sol. cold Aq.

Methyl ether MeA′. [74°]. Prisms.

Ethyl ether EtA′. [46°]. Crystalline.

Lactone $C_9H_7NO_4$. [92°]. Yields *p*-nitro-styrene when boiled with HOAc.

Amide $C_9H_{10}N_2O_4$. [166°]. Prisms (from alcohol). Forms with Ac_2O an acetyl derivative [146°-150°].

Anilide $C_{15}H_{14}N_2O_4$. [176°]. Plates.

***p*-Nitro-αβ-di-oxy-phenyl-propionic acid** $C_9H_9NO_6$ *i.e.* $C_6H_4(NO_2).CH(OH).CH(OH).CO_2H$. [168°]. Formed from *p*-nitro-phenyl-glycidic acid and diluted H_2SO_4 (Lipp, *B.* 19, 2645). Plates, sl. sol. cold water.

o-Nitro-*m*β-di-oxy-phenyl-propionic acid. *Methyl derivative* [2:5:1] $C_6H_3(NO_2)(OMe).CH(OH).CH_2.CO_2H$. [106°]. Got from $C_6H_3Cl(NO_2).CH(OH).CH_2.CO_2H$ and NaOMe (Eichengrün a. Einhorn, *B.* 23, 1491). Colourless plates (from water).

***αp*-Di-nitro-β-oxy-phenyl-propionic acid.** *Methyl derivative* $C_6H_4(NO_2).CH(OMe).CH(NO_2).CO_2H$. *Methyl ether* MeA′. [118°]. Formed from methyl *αp*-di-nitro-cinnamate by boiling with MeOH (Friedländer a. Mähly, *B.* 16, 851; *A.* 229, 210).

Ethyl ether EtA′. [77°]. Formed in like manner, using EtOH.

Ethyl derivative $C_6H_4(NO_2).CH(OEt).CH(NO_2).CO_2H$. Methyl ether MeA′. [110°]. Formed by boiling *ap*-di-nitro-cinnamic ether with alcohol. Monoclinic prisms *a*:*b*:c = ·849:1:·517; $\beta = 87° 25'$. Sol. potash. Yields the salts $Ba(C_{12}H_{13}N_2O_7)_2$ and $AgC_{12}H_{13}N_2O_7$. Ethyl ether EtA′. [52°]. Monoclinic crystals.

Di-nitro-oxy-phenyl-propionic acid $C_9H_8N_2O_7$ *i.e.* [5:3:4:1] $C_6H_2(NO_2)_2(OH).CH_2.CH_2.CO_2H$. *Di-nitro-hydro-p-coumaric acid.* [138°]. Formed by nitrating oxy-phenyl-propionic acid (Stöhr, *A.* 225, 68). Trimetric prisms (from HOAc).—NH_4HA''. [230°].—$(NH_4)_2A''$.—AgHA″.—Ag_2A'': dark-red needles.

Methyl ether MeA′. [87°]. Needles. Yields AgMeA″ on adding Ag_2CO_3 to its ethereal solution.

Ethyl ether EtA′. [175°]. Yields red needles of AgEtA″.

Methyl derivative $C_6H_2(NO_2)_2(OMe).CH_2.CH_2.CO_2H$. [124°]. Got by saponifying its methyl ether with H_2SO_4 and HOAc. Needles or plates (from dilute alcohol). Methyl ether $C_6H_2(NO_2)_2(OMe).C_2H_4.CO_2Me$. [53°]. From the basic silver salt and MeI. Ethyl ether EtA′. [71°]. Needles, v. sl. sol. Aq.

Ethyl derivative $C_6H_2(NO_2)_2(OEt).CH_2.CH_2.CO_2H$. [126°]. Needles. Methyl ether MeA′. [36°]. Ethyl ether EtA′. [50°]. Needles or plates.

Di-nitro-oxy-phenyl-propionic acid $C_9H_8N_2O_7$. *Dinitromelilotic acid.* [155°]. Formed by nitrating melilotic acid (Zwenger, *A. Suppl.* 5, 118). Prisms (from alcohol).—BaA″ aq.—Ag_2A''.

Two isomeric acids are obtained by nitration of phloretic acid (Hlasiwetz, *A.* 102, 155). Both form yellow crystals.

o-NITRO-β-OXY-PHENYL PROPIONIC ALDEHYDE $C_9H_9NO_4$ *i.e.* [1:2] $C_6H_4(NO_2).CH(OH).CH_2.CHO$. Formed from o-nitro-benzoic aldehyde, acetic aldehyde, and 2 p.c. aqueous NaOH (Baeyer a. Drewsen, *B.* 16, 2205). Crystalline. Forms a compound with aldehyde $C_9H_9NO_4(C_2H_4O)$ [125°], which yields indigo on treatment with alkalis. Similar compounds of the formula $C_9H_9NO_4(C_2H_4O)$ are formed by the action of *m*- and *p*-nitro-benzoic aldehydes on aldehyde and NaOHAq. The *m*-compound gives off aldehyde at 100°, the *p*-compound melts at about 115° (Göhring, *B.* 18, 372, 720).

***m*-NITRO-β-OXY-PHENYL-PYROTARTARIC ACID.** *Lactone* $C_{11}H_9NO_6$ *i.e.*

$C_6H_4(NO_2).CH{<}\begin{matrix}O\text{——}CO\\CH(CO_2H)\end{matrix}{>}CH_2$. *Nitro-phenyl-paraconic acid.* [171°]. Formed by heating *m*-nitro-benzoic aldehyde with sodium succinate and Ac_2O at 125° (Salomonson, *R. T. C.* 6, 1). Crystalline. Boiling with NH_3Aq and $BaCl_2$ ppts. $C_{11}H_9BaNO_7$. Phenylhydrazine at 130° forms $C_{11}H_8NO_5(N_2HPh)$ [132°]. — $Cu(C_{11}H_8NO_6)_2$. — PbA'_2: needles (from hot water).

Methyl ether $MeC_{11}H_8NO_6$. Oil.

***p*-Nitro-β-oxy-phenyl-pyrotartaric acid.** *Lactone* [163°] (S.); [155°] (Erdmann, *B.* 18, 2742). Formed in like manner from *p*-nitro-benzoic aldehyde. Boiling with NH_3Aq and $BaCl_2$ ppts. $BaC_{11}H_9NO_7$.—CuA'_2.—AgA′.

NITRO-*p*-OXY-PHENYL-QUINOLINE $C_{15}H_{10}N_2O_3$. [151°]. Formed in small quantities when *p*-amido-(*Py.* 3)-phenyl-quinoline is heated with KNO_2 (Weidel, *M.* 8, 138). Yellow plates, m. sol. alcohol.

***m*-Nitro-(*B.* 2)-oxy-(*Py.* 1)-phenyl-quinoline.** *Methyl derivative*

$\begin{matrix}MeO.\underset{\cdot}{C}\ :C.H\underset{\cdot}{C}.C.(C_6H_4NO_2):\underset{\cdot}{C}H\\ \dot{C}H:CH.\dot{C}.N\text{======}\dot{C}H\end{matrix}$. [130°]. Formed by heating *m*-nitro-cinnamic aldehyde with *p*-anisidine and HClAq (Miller a. Kinkelin, *B.* 20, 1919). Needles (from benzene), sl. sol. alcohol.

(*Py.* 1,4,2)-Nitro-oxy-phenyl-isoquinoline

$C_{15}H_{10}N_2O_3$ *i.e.* $C_6H_4{<}\begin{matrix}C(NO_2):CPh\\C(OH):N\end{matrix}{>}$. [c. 245°]. Formed by passing nitrous acid gas through a solution of oxy-phenyl-isoquinoline in HOAc (Gabriel, *B.* 19, 831). Small yellow crystals.

Methyl derivative $C_{15}H_9MeN_2O_3$. [169°].

DI-NITRO-DI-OXY-DI-PHENYL SULPHONE $C_{12}H_8N_2SO_8$ *i.e.* $SO_2\{C_6H_3(NO_2)(OH)\}_2$. Formed by nitrating di-oxy-di-phenyl sulphone (Glutz, *A.* 147, 59). Scales, insol. water, sol. alkalis. Yields $C_{12}H_6Na_2N_2SO_8$ and $C_{12}H_6Ag_2N_2SO_8$, a di-methyl derivative $C_{12}H_6Me_2N_2SO_8$ [215°], a di-ethyl derivative [192°], and a di-isoamyl derivative [151°]. With aniline it forms the compound $C_{12}H_6(NHPh)_2(NO_2)_2SO_2$, crystallising from aniline in red prisms.

Tetra-nitro-di-oxy-di-phenyl sulphone $SO_2\{C_6H_2(NO_2)_2(OH)\}_2$. [253°]. Formed by further nitration of the preceding body (Annaheim, *B.* 11, 1668). Long-yellow needles.—K_2A''.—Na_2A'': octahedra.

TETRA-NITRO-DI-OXY-DIPHENYL DISULPHONIC ACID $\{C_6H(NO_2)_2(OH).SO_3H\}_2$. Formed by nitration (Limpricht, *A.* 261, 336).—Na_2A'' aq. K_2A'': yellow crystals.

***m*-NITRO-*p*-OXY-DI-PHENYL-THIO-UREA** [3:1] $C_6H_4(NO_2).NH.CS.NH.C_6H_4(OH)$ [1:4]. [152°]. Formed from *m*-nitro-phenyl-thiocarbimide and *p*-amido-phenol (Steudemann, *B.* 16, 2335). Needles, sl. sol. ether.

DI-NITRO-OXY-PHENYL-UREA $C_7H_6N_4O_6$ *i.e.* $C_6H_2(NO_2)_2(OH).NH.CO.NH_2$. *Uramido-di-nitro-phenol.* Formed by heating urea with di-nitro-amido-phenol (picramic acid) (Griess, *J. pr.* [2] 5, 1). Plates (from water).—AgA′: pp.

NITRO-DI-OXY-PHTHALIC ACID. *Methyl derivative* $C_6H(OMe)(OH)(NO_2)(CO_2H)_2$ [4:3:6:2:1]. *Normethylnitrohemipic acid.* [220°]. Formed by boiling its imide with KOH (Elbel, *B.* 19, 2310). White needles, v. sol. water.

Imide

$C_6H(OMe)(OH)(NO_2){<}\begin{matrix}C(NH)\\CO\end{matrix}{>}O$. [252°]. Formed by boiling the oxim $C_6H(OMe)(OH)(NO_2)(CO_2H)CH:NOH$ with HOAc. Yellow needles, sol. hot water and alkalis.

Dimethyl derivative v. Nitro-HEMIPIC ACID.

Di-nitro-oxy-phthalic acid $C_6H(NO_2)_2(OH)(CO_2H)_2$. *Juglonic acid.* Formed by oxidation of juglone or its acetyl derivative by boiling with HNO_3.

Salts.—$A''(NH_4)_2$: reddish-yellow tables or thin needles, v. sol. water.—A″HK.—A′Ba×: yellow tables (Bernthsen a. Semper, *B.* 18, 210).

NITRO-OXY-ISOPROPYL-BENZOIC ACID $CMe_2(OH).C_6H_3(NO_2).CO_2H$ [4:3:1]. [191°]. Formed by oxidising nitro-cuminic acid or nitro-cuminol with $KMnO_4$ (Widman, *B.* 15, 2549; 16, 2567; 21, 2232). Long needles (from water).—NH_4A' 2aq. — CaA'_2.—BaA'_2 6aq.—PbA'_2 5aq.—CuA'_2 1½aq.—AgA' ½aq: crystals, m. sol. hot Aq.

Acetyl derivative [133°].

Ethyl ether EtA'. [96°].

Nitro-oxy-isopropyl-benzoic acid $CMe_2(OH).C_6H_3(NO_2)CO_2H$ [4:2:1]. [168°]. Formed by oxidising nitro-cymene or the acid $C_6H_3Pr(NO_2).C_2H_2.CO_2H$ with alkaline $KMnO_4$ (Widman, *B.* 19, 270; Söderbaum, *B.* 21, 2128). Tables (from ether), m. sol. hot water.

Isomeride *v.* NITRO-OXY-CUMINIC ACID.

Di-nitro-oxy-propyl-benzoic acid. *Lactone*

$$C_6H_4\left<\begin{matrix}C(NO_2)(CHMe.NO_2)\\ CO\text{ ——————— }O\end{matrix}\right>.$$

[90°]. Formed from ethylidene-phthalide and NO_2 (Gabriel, *B.* 19, 838). Colourless needles (from alcohol).

NITRO-β-OXY-*p*-ISOPROPYL-PHENYL-PROPIONIC ACID

[4:2:1] $C_6H_3Pr(NO_2).CH(OH).CH_2.CO_2H$. [120°]. Formed by boiling $C_6H_3Pr(NO_2).CHBr.CH_2.CO_2H$ with aqueous Na_2CO_3 (Einhorn a. Hess, *B.* 17, 2024). Silvery plates.

Amide $C_{12}H_{16}N_2O_4$. [150°].

Anhydride

$$C_6H_3Pr(NO_2).CH\left<\begin{matrix}CH_2\\ O\end{matrix}\right>CO.$$

[73°]. Formed by the action of cold aqueous Na_2CO_3 on bromo-nitro-cumyl-propionic acid. Crystals, v. sol. alcohol.

NITRO-DI-OXY-PYRIMIDINE $C_4H_3N_3O_4$ *i.e.*

$$CO\left<\begin{matrix}NH.CH\\ NH.CO\end{matrix}\right>C.NO_2.$$

Nitro-uracil. Formed by heating the K salt of its carboxylic acid at 130° (Behrend, *A.* 229, 35; 240, 8). Yellow needles, which explode on heating. Yields iso-barbituric acid on reduction. Urea forms crystalline $C_5H_7N_5O_5$. Guanidine gives a similar salt $C_5H_8N_6O_4$ aq.—KA'aq: prisms, sl. sol. water.—CaA'_2 6aq. — BaA'_2 5aq. — ZnA'_2 3½aq. — CuA'_2 7CuO.

Nitro-di-oxy-pyrimidine carboxylic acid $C_5H_3N_3O_6$ *i.e.*

$$CO\left<\begin{matrix}NH.C(CO_2H)\\ NH.CO\end{matrix}\right>C.NO_2.$$

Formed by warming di-oxy-methyl-pyrimidine (methyl-uracil) with H_2SO_4 and HNO_3 at 80° (Behrend, *A.* 229, 32; 240, 4; Köhler, *A.* 236, 32). Yellow crystals (containing 2aq).—KHA''aq: plates, sl. sol. water.—BaA'' ½aq.—Ag_2A'' aq.—PbA'' 1½aq.

Ethyl ether $EtHA''$. [250°]. Prisms.

(α)-NITRO-(*Py.* 3)-OXY-QUINOLINE $C_9H_6N_2O_3$. 'α'-*Nitro-carbostyril.* Formed by heating 'α'-nitro-*o*-amido-cinnamic acid with HClAq at 150° (Friedländer a. Lazarus, *A.* 229, 243). Needles (from alcohol). Does not melt below 220°.

(β)-Nitro-(*Py.* 3)-oxy-quinoline. [260°]. Formed in like manner from 'β'-nitro-amido-cinnamic acid (F. a. L.). Needles (from HOAc).

(γ)-Nitro-(*Py.* 3)-oxy-quinoline. [280°]. Formed by nitrating carbostyril (F. a. L.). Needles (from HOAc).

Methyl derivative [181°]. From the silver salt and MeI (Feer a. Königs, *B.* 18, 2396).

(*B.* 4)-Nitro-(*Py.* 3)-oxy-quinoline

$$\begin{matrix}CH{:}CH\text{——}C.CH{:}CH\\ CH{:}C(NO_2).C\text{—}N{:}C.OH\end{matrix}.$$

[168°]. Formed from di-methyl *o*-nitro-coumarinate and alcoholic NH_3, the resulting (3, 2, 1)-nitro-amido-cinnamic amide being heated with HClAq at 140° (Miller a. Kinkelin, *B.* 22, 1711). Prisms, v. sol. hot water.

(*B.* 4, 2)-Nitro-oxy-quinoline

$$\begin{matrix}C(OH){:}CH.C.CH{:}CH\\ CH{:}C(NO_2).C.\ N\ {:}CH\end{matrix}.$$

[136°]. Formed by nitrating (*B.* 2)-oxy-quinoline (Skraup, *M.* 3, 551) and by the action of nitric acid on (*B.* 2)-oxy-quinoline carboxylic acid (Schmidt a. Altschul, *B.* 20, 2697; 21, 2255) and on nitroso-oxy-quinoline (Mathëus, *B.* 21, 1642, 1886). Yellow needles.—$B'HNO_3$ aq: orange prisms, v. sol. hot alcohol.

Nitro-(*B.* 4)-oxy-quinoline. [173°]. Formed by heating its carboxylic acid with glycerin at 200° (Schmitt a. Engelmann, *B.* 20, 2693) and by the action of HNO_3 (S.G. 1·38) on nitroso-(*B.*4)-oxy-quinoline (Von Kostanecki, *B.* 24, 154). Needles, sl. sol. alcohol.

Nitro-(*B.* 3)-oxy-quinoline. [255°]. Formed by nitrating *m*-oxy-quinoline (Skraup, *M.* 3, 564). Yellow plates, decomposed by fusion.

Nitro-oxy-quinoline. Formed by the action of HNO_3 on a syrupy acid obtained by oxidation of cinchonine (Weidel a. Hazura, *M.* 3, 773). Crystalline powder, melting far above 300°.—$B'_2H_2PtCl_6$: monoclinic prisms.

(*B.* 1, 3)-Di-nitro-(*B.* 4)-oxy-quinoline

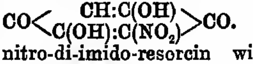
$$\begin{matrix}CH{:}C(NO_2)\text{ — }C.CH{:}CH\\ C(NO_2){:}C(OH).C.\ N\ {:}CH\end{matrix}.$$

[276°]. Formed by the action of HNO_3 on *o*-oxy-quinoline carboxylic acid, and on *ana*-nitroso-*o*-oxy-quinoline (Schmitt a. Engelmann, *B.* 20, 2692; Kostanecki, *B.* 24, 155; *cf.* Bedall a. Fischer, *B.* 14, 1368). Plates.

NITRO-(*B.* 4)-OXY-QUINOLINE CARBOXYLIC ACID $C_9H_4(NO_2)N(OH)(CO_2H)$. Formed by boiling the nitrate of *o*-oxy-quinoline carboxylic acid with HOAc (Schmitt a. Engelmann, *B.* 20, 2693). Needles, sl. sol. HOAc.

NITRO-OXY-QUINONE. *Carbonyl derivative* $(C_6H_2O_2(NO_2)O)_2CO$. [260°]. Formed by oxidation of nitro-amido-phenyl carbonate by chromic acid mixture (Löwenberg, *C. C.* 1886, 390). Pale-brown needles.

Nitro-di-oxy-quinone



$$CO\left<\begin{matrix}CH{:}C(OH)\\ C(OH){:}C(NO_2)\end{matrix}\right>CO.$$

Formed by warming nitro-di-imido-resorcin with dilute (10 p.c.) NaOHAq (Nietzki a. Schmidt, *B.* 22, 1659). Golden needles, m. sol. water.—K_2A'': orange needles.

Di-nitro-di-oxy-quinone

$$CO\left<\begin{matrix}C(NO_2){:}C(OH)\\ C(OH){:}C(NO_2)\end{matrix}\right>CO.$$

Nitranilic acid.

Formation.—1. By the action of nitrous acid on hydroquinone (Nietzki, *B.* 10, 2147).—2. By the action of a mixture of fuming HNO_3 and conc. H_2SO_4 on di-acetyl-hydroquinone below −5°; the yield in this case being 65 p.c. (Nietzki, *B.* 16, 2092; 18, 499).—3. By adding dinitrohydroquinone to a cooled mixture of HNO_3 (3 pts.) and HOAc (6 pts.) (Nietzki, *A.* 215, 142).—4. By boiling *s*-di-nitro-di-amido-quinone with dilute potash (Nietzki, *B.* 20, 2116).—5. By the action of fuming HNO_3 on

$$CO_2H.C\left<\begin{matrix}CO.C(OH)\\ C(OH).CO\end{matrix}\right>C.CO_2H$$

(Hantzsch, *B.* 19, 2398; *cf.* Loewy, *B.* 19, 2385).

Preparation.—By slowly adding a hot saturated alcoholic solution of chloranil (4 pts.) to a concentrated aqueous solution of sodium nitrite (10 pts.) heated to 80°–90°; a yellow crystalline pp. of the sodium nitranilate soon separates, and a small quantity which remains in solution is precipitated by NaOH; the whole is recrystallised from hot water (Nef, *B.* 20, 2027).

Properties.—Golden tables, v. sol. water and alcohol, insol. ether. When anhydrous it explodes at 170° without previous fusion. $FeCl_3$ gives a green crystalline pp. Chlorine forms oxalic acid and chloropicrin (Levy, *A.* 249, 66). On reduction it yields tetra-oxy-di-amido-benzene which gives *p*-phenylene-diamine on distillation with zinc-dust (Nietzki, *B.* 19, 2727). Hydroxylamine hydrochloride forms an explosive salt $C_6O_4(NO_2)_2(NH_4O)_2$ (Nef, *Am.* 11, 17).

Salts.—Na_2A'': dichroic monoclinic crystals; $a:b:c = ·946:1:·985$; $\beta = 87° 51'$.—K_2A'': yellow needles (from hot water).—$(NH_4)_2A''$.—BaA'': plates, insol. water.

Di-nitro-di-oxy-quinone. A product of the action of nitrous acid on protocatechuic acid dissolved in ether (Gruber, *B.* 12, 519). Greenish-yellow needles, v. sol. water.—Na_2A'' 2aq: explodes when heated.

NITRO-OXY-STYRENE. *Methyl derivative* [1:2:4] $C_6H_3(OMe)(NO_2).CH:CH_2$. [89°]. Formed, together with the di-nitro- derivative $C_6H_2(OMe)(NO_2)_2.C_2H_3$ [163°], by the action of conc. HNO_3 on [4:1] $C_6H_4(OMe).CH:CH.CO_2H$ (Einhorn a. Grabfield, *A.* 243, 366). Crystals, volatile with steam. Yields a dibromide [79°]. Forms, on oxidation, nitranisic acid [187°].

NITRO-OXY-STYRYL METHYL KETONE *Methyl derivative* $C_{11}H_{11}NO_4$ *i.e.* [4:3:1] $C_6H_3(OMe)(NO_2).CH:CH.CO.CH_3$. [159°]. Formed by nitration of the ketone, and also by condensation of $C_6H_3(OMe)(NO_2)CHO$ with acetone (Einhorn a. Grabfield, *A.* 243, 364). Yellow needles (from water), sol. ether.

NITRO-OXY-SULPHO-BENZOIC ACID $C_7H_5NSO_8$ *i.e.* $C_6H_2(NO_2)(OH)(SO_3H)(CO_2H)$. Formed from nitro-*o*-oxy-benzoic acid and fuming H_2SO_4 (Mandt, *B.* **10**, 1701).—$Ba_3A'''_2$ 12aq: hair-like needles.

NITRO-OXY-TOLUENE *v.* NITRO-CRESOL.

Nitro-di-oxy-toluene *v.* NITRO-ORCIN.

Nitro-tetra-oxy-toluene $C_6Me(NO_2)(OH)_4$. [157°]. Formed by the action of HCl and $SnCl_2$ on nitro-di-oxy-toluquinone (Kehrmann a. Brasch, *J. pr.* [2] 39, 382). Black needles, forming a violet powder. Its solution forms HCy, oxalic acid, and other products on boiling.

Di-nitro-di-oxy-toluene $C_6HMe(NO_2)_2(OH)_2$ [1:3:5:2:4]. *Di-nitro-cresorcin.* [90°]. Formed from cresorcin and HNO_3 (Von Kostanecki, *B.* 20, 3136). Needles, m. sol. cold water.

NITRO-OXY-*o*-TOLUIC ACID $C_8H_7NO_5$ *i.e.* $C_6H_2Me(OH)(NO_2)CO_2H$ [1:4:x:2]. [172°]. Formed by nitration of oxy-*o*-toluic acid (Kostanecki a. Niementowski, *B.* 18, 254). Needles, sol. hot Aq.

Nitro-oxy-*m*-toluic acid $C_6H_2Me(OH)(NO_2).CO_2H$ [3:4:5:1]? [87°]. Formed by heating (4,3,1)-oxy-toluic acid with conc. HNO_3 (Mahon, *Am.* 4, 186). Yellow needles, sl. sol. water. Its salts explode when heated.—CaA'_2 4aq.—BaA'_2 4aq: orange needles; crimson when anhydrous.

Nitro-oxy-*p*-toluic acid $C_6H_2Me(OH)(NO_2).CO_2H$ [4:3:x:1]. [188°]. Formed by the action of nitrous acid on (3,4,1)-amido-toluic acid (Ahrens, *Z.* 1869, 105). Golden needles.—BaA'_2 7aq: scarlet, sl. sol. alcohol.

Nitro-oxy-toluic acid. *Methyl derivative* $C_6H_2Me(OMe)(NO_2)CO_2H$. [175°]. Formed from the methyl ether of thymol and dilute HNO_3 (Paterno a. Canzoneri, *G.* 9, 445). Slender needles, v. sol. alcohol.—BaA'_2 2aq: straw-coloured crystals.

Ethyl derivative [162°]. Formed, in like manner, from the ethyl ether of thymol. Long slender needles.

Nitro-ω-oxy-*o*-toluic acid $C_6H_3(NO_2)(CH_2OH)CO_2H$ [4:2:1]. [129°]. Formed by dissolving nitro-phthalide in aqueous KOH (Hoenig, *B.* 18, 3451). Minute needles.—AgA′.

Tri-nitro-oxy-*m*-toluic acid $C_6HMe(OH)(NO_2)_3CO_2H$ [1:3:2:4:6:5]. *Nitrococcic acid.* [170°–180°]. Formed by the action of boiling nitric acid (S.G. 1·37) on cochineal (De la Rue, *A.* 64, 23; Liebermann a. Dorp, *A.* 163, 100) and on (5,3,1)-oxy-toluic acid (Kostanecki a. Niementowski, *B.* 18, 250). Colourless plates (containing aq). On boiling with moist Ag_2O it yields silver tri-nitro-cresol and CO_2.—$(NH_4)_2A''$ $\frac{1}{2}$aq.—BaA'_2 aq.—Ag_2A'': needles.

NITRO-OXY-*m*-TOLUIC ALDEHYDE $C_8H_7NO_4$ *i.e.* $C_6H_2Me(NO_2)(OH)CHO$ [5:3:2:1]. [141°]. Formed by warming oxy-toluic aldehyde with HNO_3 (Schotten, *B.* **11**, 788). Yellow needles, sl. sol. hot water.

Nitro-oxy-*m*-toluic aldehyde $C_6H_2Me(NO_2)(OH)CHO$ [5:3:4:1]. [152°]. Formed by nitrating (4,3,1)-oxy-toluic aldehyde (S.). Needles, sl. sol. hot water.

NITRO-DI-OXY-TOLUQUINONE $C_6Me(NO_2)(OH)_2O_2$ [2:5:3:6:4:1]. *Tolunitranilic acid.* [180°]. Formed by the action of a dilute alcoholic solution of KNO_2 on tri-chloro-toluquinone (Kehrmann, *B.* 21, 1779; *J. pr.* [2] 39, 377). Golden needles (containing $x$aq). Its aqueous solution decomposes on boiling forming HCy, oxalic acid, and CO_2.—K_2A'' 3aq: yellowish-red prisms.

DI-NITRO-DI-OXY-DITOLYL $C_{14}H_{12}N_2O_6$. [273°] (G.); [270°] (D.). Formed by boiling tetrazo-ditolyl sulphate with HNO_3 (Gerber, *B.* 21, 750); by the action of nascent nitrous acid on di-amido-ditolyl (the yield being quantitative); and by heating di-oxy-ditolyl di-carboxylic acid with HNO_3 (Deninger, *J. pr.* [2] 40, 300; *B.* 21, 1639). Yellow needles (from toluene or pyridine).

NITRO - OXY - TOLYLENE - ETHENYL - AMIDINE $C_9H_9N_3O_3$. [256°]. Formed by the action of alcoholic ammonium sulphide on the acetyl derivative of di-nitro-*p*-toluidine (Bankiewitch, *B.* 21, 2404). Lustrous green needles, not affected by HClAq at 200°.

NITRO-PENTANE $C_5H_{11}NO_2$ *i.e.* $Pr.CH_2.CH_2.NO_2$. (150°–160°). Formed from isoamyl iodide and $AgNO_2$ (V. Meyer, *B.* 5, 203; *A.* 171, 43; 175, 135).

Di-nitro-pentane $C_4H_9.CH(NO_2)_2$. Formed from di-amyl ketone and HNO_3 (Chancel, *C. R.* 94, 399). Heavy oil. Forms *n*-valeric acid on reduction.—$KC_5H_9N_2O_4$.—AgA′.

o-NITRO-PHENOL $C_6H_5NO_3$ *i.e.* $C_6H_4(NO_2).OH$ [1:2]. Mol. w. 139. [45°]. (214°). S.V.S. 107·64 (Schiff).

Formation.—1. Together with the *p*-isomeride by nitration of phenol (Hofmann, *A.* 103, 347; Fritzsche, *A.* 110, 150; *J. pr.* 73, 293; Gold stein, *B.* 11, 1943).—2. By heating *o*-bromo-nitro-benzene [38°] or *o*-chloro-nitro-benzene with aqueous potash in sealed tubes (Zincke a. Walker, *B.* 5, 117; Engelhardt a. Latschinoff, *B.* 3, 423).—3. By boiling *o*-di-nitro-benzene with NaOHAq (Laubenheimer, *B.* 9, 1828).—4. Together with *p*-nitro-phenol by boiling diazobenzene sulphate with nitric acid (Nölting a. Wild, *B.* 18, 1338).—5. Together with *p*-nitro-phenol by adding liquid N_2O_4 to cooled CS_2 containing C_6H_5ONa in suspension (Schall, *B.* 16, 1901).—6. By heating diazobenzene nitrate with dry toluene, nitrogen being given off (Remsen a. Orndorff, *Am.* 9, 390).—7. By the action of $NaNO_2$ and H_2SO_4 on aniline (Deninger, *J. pr.* [2] 40, 298).

Preparation.—Phenol (1 pt.) is slowly added to a mixture of HNO_3 (1 pt. of S.G. 1·38) and water (6 pts.), cooled to 0°; the product is neutralised with Na_2CO_3 and distilled with water (Neumann, *B.* 18, 3320).

Properties.—Light-yellow prisms or needles, v. sol. alcohol and ether, sl. sol. cold water.

Reactions.—1. Reduced by tin and HCl to *o*-amido-phenol.—2. Aqueous NH_3 (35 p.c.) at 160°-200° yields *o*-nitro-aniline (Merz a. Ris, *B.* 19, 1749).—3. *Phenyl-hydrazine* dissolved in xylene at 100° produces *o*-amido-phenol, benzene, NH_3, and nitrogen (Barr, *B.* 20, 1497).

Salts.—The colour of the salts has been examined by Carnelley a. Alexander (*C. J. Proc.* 4, 64).—NH_4A': scarlet plates.—$KA'\frac{1}{2}aq$: orange-red crystals (F.).—KA'aq (Post, *B.* 8, 1552). S. 16 at 6°; 21 at 15°.—NaA': scarlet plates, v. e. sol. water.—BaA'_2. S. 9 at 6°. $SrA'_2 3aq$.—$CaA'_2 4aq$: plates.—$CaA'_2 aq$: orange needles.—AgA': orange-red pp. S. ·14 at 15°.

Acetyl derivative $C_6H_4(NO_2)OAc$. [41°]. (253°). Long colourless needles or prisms, v. sol. alcohol (Böttcher, *B.* 16, 1933).

Benzoyl derivative $C_6H_4(NO_2)(OBz)$. [59°]. Formed from *o*-nitro-phenol and BzCl (Hübner, *A.* 210, 386; Schiaparelli, *G.* 11, 73; Neumann, *B.* 18, 3320; 19, 2018). Prisms or needles. Yields on nitration the compound $C_6H_4(NO_2).O.CO.C_6H_4(NO_2)$ [1:3] [126°], crystallising in needles.

Methyl ether $C_6H_4(NO_2)(OMe)$. *o-Nitro-anisole.* [9°]. (277°) at 735 mm. Formed, together with the *p*- isomeride, by nitration of anisole. Formed also by methylation of o-nitro-phenol (Brunck, *Z.* 1867, 204; Mühlhauser, *A.* 207, 237) and by boiling *o*-chloro-nitro-benzene with NaOMe in HOMe (De Bruyn, *R. T. C.* 9, 200). Oil. Converted into *o*-nitro-aniline by heating with ammonia (Salkowski, *A.* 174, 278).

Ethyl ether $C_6H_4(NO_2)(OEt)$. o-*Nitro-phenetol.* (267°). Formed by ethylation of *o*-nitro-phenol (Groll, *J. pr.* [2] 12, 207; Seidel, *J. pr.* [2] 42, 448) and by heating $C_6H_4Cl(NO_2)$ with NaOEt (De Bruyn). Oil. When distilled with alcoholic potash it yields $C_6H_4(NH_2)(OEt)$ and no azo- compound; but when reduced in alcoholic solution by sodium-amalgam it forms $N_2(C_6H_4OEt)_2$ and $N_2O(C_6H_4OEt)_2$ (Schmitt a. Möhlau, *J. pr.* [2] 18, 200).

Bromo-ethyl ether $C_6H_4(NO_2)O.C_2H_4Br$. [44°]. Formed from $C_6H_4(NO_2)(ONa)$ and ethylene bromide (Weddige, *J. pr.* [2] 24, 246). Yellow prisms (from alcohol).

Reactions.—1. With an alcoholic solution of NH_3 it yields $C_6H_4(NO_2)O.C_2H_4NH_2$ [73°] and $NH(C_2H_4O.C_6H_4NO_2)_2$ [192°].—2. Heated with potassium salicylic ether $C_6H_4(OK)CO_2Et$ in alcoholic solution it yields two products: (*a*) an ether $C_6H_4(NO_2).O.C_2H_4.O.C_6H_4.CO_2Et$ [c. 100°] saponified by HCl yielding the corresponding acid [145°], which may be reduced to an amido- acid [110°] whose hydrochloride melts at 177°; and (*b*) a compound of the formula $C_6H_4(NO_2).O.C_2H_4.O.CO_2.C_6H_4OH$ [106°] which gives an acetyl derivative [80°] (Wagner, *J. pr.* [2] 27, 212). — 3. Heated with [4:1] $C_6H_4(OK)CO_2Et$ in alcoholic solution it forms *o*-nitro-phenoxy-ethyl-*p*-oxy-benzoic ether [103°] which is saponified by HCl at 140°, forming an acid $C_6H_4(NO_2)O.C_2H_4.O.C_6H_4.CO_2H$ [c. 206°]. The corresponding amido- acid melts at 185° (Wagner).—4. Potassium benzoate at 140° yields $C_6H_4(NO_2).O.C_2H_4.OBz$ [77°].

Amido-ethyl ether $C_6H_4(NO_2).O.C_2H_4NH_2$. [73°]. Formed as above. Small plates (from water). Yields a benzoyl derivative [95°] and a dibenzoyl derivative $C_6H_4(NO_2).O.C_2H_4.NBz_2$ [122°]. The benzoyl derivative reduced by tin and hydrochloric acid yields $C_2H_4{<}\begin{matrix}NH.CPh\\O.C_6H_4\end{matrix}{>}N$. [151°] (Weddige, *J. pr.* [2] 24, 250).

Ethylene ether $C_2H_4(OC_6H_4.NO_2)_2$. [163°]. Formed from $C_6H_4(NO_2)ONa$ and $C_2H_4Br_2$.

Isobutyl ether (275°–280°). S.G. $\underline{20}$ 1·136 (Riess, *B.* 3, 780).

Benzyl ether $C_6H_5.CH_2.O.C_6H_4(NO_2)$. [29°]. From the K salt and C_7H_7Cl (Kumpf, *A.* 224, 121).

p-Nitro-benzyl ether $C_6H_4(NO_2).CH_2.O.C_6H_4.NO_2$. [129°]. Needles (K.).

Phenacyl ether $C_6H_4(NO_2).O.CH_2.CO.C_6H_5$. [118°]. (194°). Formed from the K salt and ω-bromo-aceto-phenone (Lellmann a. Donner, *B.* 23, 172). Needles, m. sol. alcohol. $ZnCl_2$ and HCl at 100° convert it into $C_6H_4{<}\begin{matrix}O.CH_2\\N:CPh\end{matrix}$ [103°] crystallising in needles, and forming the salts $B'H_2PtCl_6$ and $B'HAuCl_4$.

m-Nitro-phenol $C_6H_4(NO_2)OH$[1:3]. [96°]. (194° at 70 mm.). Obtained from *m*-nitro-aniline by the diazo- reaction (Fittig a. Bantlin, *B.* 7, 179; 11, 2099; Henriques, *A.* 215, 323; Wagner, *J. pr.* [2] 32, 70). Yellow crystals, sol. hot water; not volatile with steam.—KA' 2aq: orange needles. S. 12 at 6° (Post a. Mehrtens, *B.* 8, 1552).—$BaA'_2 2aq$. S. 1·7 at 6°.—PbA'(OH). S. ·013 at 15°.—AgA': brownish-red pp.

Benzoyl derivative $C_6H_4(NO_2).OBz$. [95°]. Pale-yellow crystals (Neumann, *B.* 19, 2979). Nitric acid (S.G. 1·48) converts it into the crystalline *m*-nitro-benzoyl derivative $C_6H_4(NO_2).O.CO.C_6H_4(NO_2)$ [129°].

Methyl ether MeA'. [38°]. (254°). Needles, volatile with steam (Bantlin).

Ethyl ether EtA'. [34°]. (264°) (Bantlin, Wagner, *J. pr.* [2] 32, 71).

Bromo-ethyl ether C_2H_4BrA'. [39°]. Formed, with the following, from the K salt and ethylene bromide (Weddige, *J. pr.* [2] 24, 255).

Ethylene ether $C_2H_4A'_2$. [139°].

p-Nitro-phenol $C_6H_4(NO_2).OH$. [114°]. S.V.S. 108·28 (Schiff).

Formation.—1. Together with the *o*-isomer.

ide, by the nitration of phenol, especially at low temperatures (Fritzsche, *J. pr.* 75, 257; Goldstein, *J. R.* 10, 353).—2. By heating *p*-chloro-nitro-benzene [85°] or bromo-nitro-benzene [125°] with aqueous potash at 130° (Engelhardt a. Latschinoff, *B.* 3, 423; Richter, *B.* 4, 460).—3. From acetanilide by nitrating, and heating the [4:1]$C_6H_4(NO_2)(NHAc)$ with conc. NaOHAq (Wagner, *B.* 7, 76).—4. From *p*-nitro-aniline by the diazo- reaction (Fittig, *B.* 7, 280).—5. By dry distillation of nitro-*o*-oxy-benzoic acid (Schmidt a. Cook, *K.* 3, 41).—6. By oxidation of nitroso-phenol (Baeyer, *B.* 7, 965).—7. Together with the o-isomeride, by adding liquid N_2O_4 to cooled CS_2 containing C_6H_5ONa in suspension (Schall, *B.* 16, 1901).—8. By the action of $NaNO_2$ (in excess) and H_2SO_4 on aniline, *o*-nitro-phenol being also formed (Deninger, *J. pr.* [2] 40, 298).

Preparation.—The mixture of o- and *p*-nitro-phenols is distilled with steam. The residue is dissolved in hot water and mixed with excess of Na_2CO_3 when $C_6H_4(NO_2)ONa$ crystallises out on cooling (Salkowski, *A.* 174, 280).

Properties.—Slender colourless needles (from water. Dimorphous (Lehmann, *Z. K.* 1, 45). V. sol. alcohol. Not volatile with steam. Sol. hot HClAq (Kollrepp, *A.* 234, 1).

Reactions.—1. Distillation with PCl_5 yields *p*-chloro-nitro-benzene [85°].—2. Aqueous *ammonia* at 160° to 200° forms *p*-nitro-aniline (Merz a. Ris, *B.* 19, 1749).—3. *Phenyl-hydrazine* at 100° produces *p*-amido-phenol, benzene, NH_3, and nitrogen (Barr, *B.* 20, 1499).

Salts.—The colour of the salts has been examined by Carnelley (*C. J. Proc.* 4, 64).—NaA′4aq: yellow tables.—NaA′2aq. *Heat of neutralisation* 12,840 (Alexejeff a. Werner, *Bl.* [3] 2, 718).—$NaHA'_2$2aq: orange-red prisms (from water).—KA′2aq. S. 4·5 at 6° (Post a. Mehrtens, *B.* 8, 1552).—$KHA'_2$2aq.—$BaA'_2$8aq: monoclinic prisms. S. 1 at 6°; 1·3 at 15°.—$BaH_2A'_4$4aq. — $SrA'_2$7aq: yellow needles. — $CaA'_2$4aq.—$CaH_2A'_4$8aq.—$MgA'_2$8aq.—$Pb_5O_2A'_6$. — $Pb_2HA'_5$. — AgA′aq: scarlet pp., changing to orange prisms.—AgA′2aq. S. ·3 at 15°.—$AgHA'_2$aq: yellowish green laminæ.—$Ag_5HA'_6$: purple needles.

Benzoyl derivative $C_6H_4(NO_2)$.OBz. [142·5°]. Colourless efflorescent needles (from alcohol) (Schiaparelli, *G.* 11, 73; Neumann, *B.* 19, 2020). On treatment with HNO_3 (S.G. 1·48) it forms [4:1]$C_6H_4(NO_2).O.CO.C_6H_4NO_2$[1:3] [135·5°].

Methyl ether MeA′. [51°]. (259°). Formed by methylation of *p*-nitro-phenol (Brunck, *Z.* [2] 3, 202; Willgerodt a. Ferko, *J. pr.* [2] 33, 152; Skraup, *M.* 6, 761). Formed also by heating *p*-chloro-nitro-benzene with KOH dissolved in MeOH (Willgerodt, *B.* 14, 2632; 15, 1004). Prisms.

Ethyl ether EtA′. [58°]. (283°) (Andreæ, *J. pr.* [2] 21, 331). Formed from the Ag salt and EtI (Fritzsche) and also from C_6H_5OEt and fuming HNO_3 (Hallock, *Am.* 1, 271). Obtained also by boiling *p*-chloro-nitro-benzene with KOH and dilute (60 p.c.) alcohol (Willgerodt, *B.* 15, 1002). Prepared by heating $C_6H_4(NO_2)(OK)$ with $KEtSO_4$ in alcoholic solution for 3 hours (Willgerodt a. Ferko, *J. pr.* [2] 33, 153). Prisms. Sodium-amalgam rapidly reduces it, in alcoholic solution, to $N_2(C_6H_4.OEt)_2$ (Schmitt a. Möhlau, *J. pr.* [2] 18, 199).

Ethylene ether $C_2H_4A'_2$. [143°]. Formed, at the same time as the bromo-ethyl ether, by heating the Na compound with ethylene bromide at 140° (Weddige, *J. pr.* [2] 21, 127; 24, 254).

Bromo-ethyl-ether $CH_2Br.CH_2A'$. [63°] Yellowish plates, insol. water, v. sol. alcohol.

Reactions.—1. Heated with potassium *p*-oxy-benzoic ether [4:1] $C_6H_4(OK).CO_2Et$ it forms $C_6H_4(NO_2).O.C_2H_4.O.C_6H_4.CO_2Et$ [131°], which when saponified by HClAq at 130° yields the corresponding acid [218°] (Wagner, *J. pr.* [2] 27, 224).—2. Alcoholic [2:1]$C_6H_4(OK).CO_2Et$ forms $C_6H_4(NO_2).O.C_2H_4.O.CO_2.C_6H_4OH$ [131°] and the ether $C_6H_4(NO_2).O.C_2H_4.O.C_6H_4.CO_2Et$ [c. 81°] whence HCl liberates the acid [132°].

Amido-ethyl ether $C_2H_4(NH_2)A'$. [109°]. Formed by heating the bromo-ethyl ether with alcoholic ammonia. Yellow scales (from water).

Isobutyl ether (285°–290°). S.G. $\underline{2^{\circ}}$ 1·105.

Benzyl ether $C_6H_5CH_2A'$. [106°]. Prisms. Yields on nitration a compound melting at 168° (Kumpf, *A.* 224, 123).

p-Nitro-benzyl-ether [183°]. Needles.

Fourth and fifth nitro-phenols have been described by Fittica (*J. pr.* [2] 24, 5; *B.* 13, 711) but their existence has not been confirmed by other chemists (Natanson, *B.* 13, 415).

(α)-Di-nitro-phenol $C_6H_3(NO_2)_2(OH)$ [4:2:1]. [114°]. S. 4·8 at 100°; ·5 at 18°; ·014 at 0° (Gruner, *J. pr.* 102, 222).

Formation.—1. By nitration of phenol, o-nitro-phenol, and *p*-nitro-phenol (Laurent, *A. Ch.* [3] 3, 212; Körner, *Z.* [2] 2, 662, 731).—2. From anisole by nitration and saponification (Cahours, *A. Ch.* [3] 25, 22).—3. From di-nitro-amido-phenol (picramic acid) by elimination of NH_2 (Griess, *A.* 113, 210).—4. From chloro-di-nitro-benzene [50°] and bromo-di-nitro-benzene [72°] by heating with potash (Clemm, *J. pr.* [2] 1, 145; Engelhardt a. Latschinoff, *B.* 3, 97).—5. By boiling *i*-tri-nitro-benzene with aqueous Na_2CO_3 or by heating it with water at 160° (De Bruyn, *R. T. C.* 9, 191).—6. By boiling *i*-di-nitro-aniline with KOHAq for a long time (Willgerodt, *B.* 9, 979).—7. From di-nitro-di-ethyl-aniline and dilute potash (Van Romburgh, *R. T. C.* 2, 35).

Properties.—Yellowish rectangular plates (from water), v. sl. sol. cold alcohol.

Reactions.—1. Yields only picric acid on further nitration (Hübner a. Schneider).—2. Aqueous KCy at 70° forms potassium metapurpurate $C_7H_4KN_3O_4$ which separates as brownish-red crystals with green lustre (Pfaundler a. Oppenheim, *Z.* 1865, 470; Sommaruga, *A.* 157, 335).

Salts.—KA′aq. S. 1·4 at 6° (Post a. Mehrtens, *B.* 8, 1554); 1·6 at 7° (Hübner a. Schneider, *A.* 167, 92).—KA′aq (Romburgh).—NaA′aq.—$BaA'_2$7aq: golden needles.—$BaA'_2$6aq: yellow needles.—$BaA'_2$5aq: orange prisms. S. ·3 at 7°.—$BaA_2$4aq: monoclinic crystals (P. a. M.).—$MgA'_2$9aq.—$MgA'_2$12aq.—Pb(OH)A′2aq. S. ·08 at 15°.—$MnA'_2$5aq.—$NiA'_2$8aq.—AgA′aq. S. ·4 at 15°.

Benzoyl derivative $C_6H_3(NO_2)_2OBz$. Plates (from alcohol) (Laurent a. Gerhardt, *A.* 75, 77).

m-Nitro-benzoyl derivative [161°]. Formed by nitration of [2:1] $C_6H_4(NO_2).OBz$ or of the *p*-isomeride (Neumann, *B.* 18, 3322; 19, 2021). Needles.

Methyl ether MeA'. [88°]. Formed by boiling anisole or anisic acid with fuming HNO_3 (Cahours, *A.* 69, 236) or by heating (4, 2, 1)-chloro-di-nitro-benzene or *i*-tri-nitro-benzene with KOH dissolved in MeOH (Willgerodt, *B.* 12, 762; De Bruyn, *R. T. C.* 9, 190). Needles.

Ethyl ether EtA'. [86°]. Formed by the action of HNO_3 on C_6H_5OEt (Cahours, *A.* 74, 315) and on $N_2(C_6H_4.OEt\,[1:4])_2$ (Andreæ, *J. pr.* [2] 21, 335); and also in the same way as the methyl ether (W.). Needles.

Allyl ether C_3H_5A'. [47°].

Di-oxy-propyl ether $C_3H_5(OH)_2A'$. [c. 83°]. Formed from [1:2:4] $C_6H_3Cl(NO_2)_2$, glycerin, and KOH (W.).

Phenyl ether C_6H_5A'. [71°] (W.).

Benzyl ether $C_6H_5CH_2A'$. [149°].

p-Nitro-benzyl ether [201°] (Kumpf).

(β)-Di-nitro-phenol $C_6H_3(NO_2)_2(OH)$ [4:3:1]. [64°]. Formed, together with the (α)-isomeride, by nitrating o-nitro-phenol (Hübner a. Schneider, *A.* 167, 89; Salkowski, *A.* 174, 270; Körner, *G.* 4, 325). Pale-yellow needles (from water), sl. sol. water, v. e. sol. hot alcohol. Somewhat volatile with steam.—NaA'3aq: red needles.—KA'. S. 1·3 at 6°.—BaA'_2aq: golden needles. S. ·18 at 7°.—$MgA'_2$6aq.—$Pb_2OA'_2$. S. ·037 at 15°.—AgA'. S ·3 at 6° (Post a. Mehrtens, *B.* 8, 1552).—AgA'aq: red needles.

m-Nitro-benzoyl derivative [149°]. Got from [3:1] $C_6H_4(NO_2)OBz$ and HNO_3 (Neumann, *B.* 19, 2980). Yellow needles, sl. sol. ether.

Methyl ether MeA'. [117°]. Converted by NH_3Aq at 130° into di-nitro-aniline [138°].

Ethyl ether EtA'. [58°]. Needles.

Benzyl ether $PhCH_2A'$. [76°]. Prisms. Yields [4:1] $C_6H_4(NO_2).CH_2.O.C_6H_3(NO_2)_2$ [1:2:6] [137°] on nitration (Kumpf, *A.* 224, 130).

(γ)-Di-nitro-phenol $C_6H_3(NO_2)_2(OH)$ [5:3:1]. [104°] (B.); [122°] (De B.). Formed, together with the (δ)- and (ε)- isomerides, by nitration of *m*-nitro-phenol (Bantlin, *B.* 11, 2103; *A.* 215, 324). Obtained also by heating its methyl ether with conc. HClAq at 180° (De Bruyn, *R. T. C.* 9, 208). Needles, volatile with steam.—KA'2aq.—$BaA'_2$3aq.—$BaA'_2$2aq: red feathery crystals.

Methyl ether MeA'. [96°] (B.); [105°] (De B.) (above 360°). Formed by heating *s*-tri-nitro-benzene with NaOMe in HOMe for 24 hours (De Bruyn). Needles.

(δ)-Di-nitro-phenol $C_6H_3(NO_2)_2(OH)$ [4:3:1]. [134°]. Prepared, together with the (ε)- and (γ)-isomerides, by nitration of *m*-nitro-phenol (Bantlin, *B.* 11, 2104). Colourless needles, not volatile with steam.—$BaA'_2$3aq: brown prisms.

Methyl ether MeA'. [70°]. Needles.

(ε)-Di-nitro-phenol $C_6H_4N_2O_5$ *i.e.* $C_6H_3(NO_2)_2(OH)$ [3:2:1]. [144°]. Prepared, together with the (γ) and (δ) isomerides, by nitration of *m*-nitro-phenol (Bantlin, *B.* 11, 2104). Yellow needles (from water).—KA'2aq: yellow needles.—BaA'_2: brown needles.

Methyl ether MeA'. [118°]. Tables.

Tri-nitro-phenol $C_6H_2(NO_2)_3OH$ [6:4:2:1]. *Picric acid.* Mol. w. 229. [122°]. S. ·626 at 5°; 1·225 at 20°; 3·89 at 77° (Marchand, *J. pr.* 64, 91). R_∞ 78·82 in a 1·74 p.c. benzene solution (Kanonnikoff, *J. pr.* [2] 31, 348).

Formation.—1. By the action of hot nitric acid on phenol, tri-bromo-phenol, o- and *p*- nitro-phenols, (α)- and (β)- di-nitro-phenols, saligenin, salicylic aldehyde, salicin, salicylic acid, phlorizin, indigo, coumarin, aloes, gum benzoïn, balsam of Peru, and from the resin of *Xanthorrhœa hastilis* (Hausmann, *Journ. de Phys. et de Chimie*, 1788; Welter, *A. Ch.* 29, 301; Liebig, *P.* 13, 191; 14, 466; *A.* 9, 80; 39, 350; Dumas, *A. Ch.* [2] 53, 178; [3] 2, 228; Laurent, *A. Ch.* [3] 3, 221; *A.* 43, 219; Perra, *D. P. J.* 165, 386; Piria, *A.* 56, 63; Stenhouse, *A.* 57, 88; 66, 243; Carey Lea, *Am. S.* [2] 26, 279; E. Kopp, *A. Ch.* [3] 13, 233; Delalande, *A.* 45, 337; Marchand, *A.* 48, 336; 52, 345; Schunck, *A.* 39, 6; 65, 234).—2. By boiling (1,2,4,6)-chloro-tri-nitro-benzene (picryl chloride) with aqueous Na_2CO_3 (Engelhardt a. Latschinoff, *B.* 3, 98; Clemm, *J. pr.* [2] 1, 145).—3. By oxidation of *s*-tri-nitro-benzene with K_3FeCy_6 in slightly alkaline solution (Hepp, *B.* 13, 2346).—4. By heating iodo-benzene with silver nitrite at 150° (Geuther, *A.* 245, 100).

Preparation.—Phenol (1 mol.) is dissolved in conc. H_2SO_4 and the resulting phenol sulphonic acid treated with HNO_3 (4½ mols. of S.G. 1·35) (Schmitt a. Glutz, *B.* 2, 52).

Properties. — Light-yellow laminæ (from water) or trimetric prisms (from ether). May be sublimed if slowly heated, but if a few milligrammes be dropped into a red-hot tube violent detonation occurs; with a larger quantity a less violent decomposition occurs (Berthelot, *A. Ch.* [6] 16, 21). Sl. sol. water, a ·01 p.c. solution being distinctly yellow. V. sol. alcohol and ether. Tastes bitter. Dyes silk and wool yellow. It is poisonous. Forms crystalline compounds with aromatic hydrocarbons (Fritzsche, *J. pr.* 73, 212; *A.* 109, 247).

Reactions.—1. *Bleaching-powder* yields, on boiling, chloropicrin CCl_3NO_2 and tetra-chloro-quinone. A mixture of $KClO_3$ and HCl acts in like manner.—2. Distillation with aqueous NaOBr forms bromopicrin (Stenhouse, *P. M.* [4] 8, 363). 3. *Ferrous sulphate* and *lime* reduce it to di-nitro-amido-phenol (picramic acid) (Girard, *C. R.* 36, 421).—4. *Tin* and HClAq reduce it to tri amido-phenol (picramine) (Roussin, *Bl.* 1861, 60; Beilstein, *A.* 130, 244). *Iodide of phosphorus* acts in like manner on its aqueous solution (Lautemann, *A.* 125, 1).—5. Hot conc. KCyAq forms a blood-red solution of potassium isopurpurate which crystallises in brownish-red scales with green lustre having either the formula $KC_8H_4N_5O_6$ (Hlasiwetz, *A.* 110, 289) or $KC_6H_2N_5O_5$ (Baeyer, *J.* 1859. 458). Ammonium chloride converts this salt into an ammonium salt $NH_4C_6H_4N_6O_6$ greatly resembling murexide.—6. PCl_5 yields $C_6H_2Cl(NO_2)_3$ (Pisani, *C. R.* 39, 852).

Salts. — Explode when struck or when strongly heated. — NH_4A': trimetric prisms (Laurent, *Rev. Scient.* 9, 26).—LiA'. S.G. $\frac{12}{}$ 1·716: slender yellow prisms (Beamer a. Clarke, *Am.* 1, 153).—$_x$NaA'. S. about 8 at 15°. S. (alcohol) 1·25 in the cold (Hager, *Pharm. Centr.* 22, 225).—KA'. Trimetric prisms; *a*:*b*:c = 1:2·70:1·88 (Laurent, *Rev. Scient.* 10, 26). S. ·4 at 15°; 7 at 100°. S. (alcohol) ·04 (Hager). Explodes when struck, giving off CO_2, CO, and nitrogen, with smaller quantities of hydrogen and CH_4, and leaving a residue of KCy, carbon, and K_2CO_3 (Sartan a. Vieille, *C. R.* 93, 61).—BaA'_2 5aq: monoclinic crystals.—BaA'_2 6aq. S. (of BaA'_2) 1·2 at 17° (Tscheltzoff, *A. Ch.* [6] 8, 233).—BaA'_2 4aq. S. ·6 at 6° (Post a. Mehrtens).—CaA'_2 5aq. S. (of CaA'_2) 50 at 20°.—SrA'_2 5aq: yellow crystals (Marchand). S. (of CaA'_2) 1·4 at 20°.—$MgA'_2$8aq. S. (of MgA'_2) 10 at 22°.—$MgA'_2 3NaA'$9aq (Müller, *Z.* 1865, 189).—CdA'_2 7aq.—$CdA'_2 3NH_3$ (Carey Lea, *Am. S.* [2] 31, 78).—$CdA'_2 6NaA'$ 12aq.—CuA'_2 5aq: green needles.—CuA'_2 8aq.—CuA'_2 10aq.—$CuA'_2 4NH_3$.—CoA'_2 5aq: brown needles.—$CoA'_2 4NH_3$.—$CoA'_2 6NaA'$ 12aq.—NiA'_2 8aq.—$NiA'_2 6NaA'$ 12aq.—FeA'_2 5aq: yellow crystals.—$FeA'_2 6NaA'$ 12aq.—$FeA'_2(OH)$ 8aq.—MnA'_2 5aq (Müller).—MnA'_2 8aq (Marchand).—PbA'_2 aq (E. Kopp, *A. Ch.* [3] 13, 233). S. ·9 at 15°.—PbA'_2 2aq.—$PbA'(OH)$.—$Pb_3A'_2O_2$ 3aq.—$Pb_5A'_2O_4$.—$Pb(OAc)A'$ 4aq.—$Hg_2A'_2$.—$AlA'_2(OH)$ 8aq.—ZnA'_2 8aq. S. (of ZnA'_2) 12·5 in the cold.—$ZnA'_2 3NH_3$.—$ZnA'_2 6NaA'$ 12aq.—AgA' aq. S. ·9 at 15°.—$AgA'_2 2NH_3$. Compounds of picric acid with organic bases and with aromatic hydrocarbons, are described under those bases and hydrocarbons.

Acetyl derivative $C_6H_2(NO_2)_3OAc$. [76°]. Yellow crystals (Tommasi a. David, *C. R.* 77, 207).

Benzoyl derivative $C_6H_2(NO_2)_3OBz$.

Methyl ether MeA'. *Trinitroanisole.* [60°]. (C.); [64°] (Post a. Mehrtens, *B.* 8, 1552). Formed by nitrating PhOMe (Cahours, *A.* 69, 238) and by methylation of picric acid. Monoclinic tables (Friedländer, *J.* 1879, 514).

Ethyl ether EtA'. [78°]. Long needles (Stenhouse a. Müller, *A.* 141, 80; Willgerodt, *B.* 12, 1277).

Iodoethyl ether C_2H_4IA'. [70°]. From the Ag salt and $C_2H_4I_2$ (Andrews, *B.* 13, 244).

Phenyl ether PhA'. Formed from KOPh and $C_6H_2Cl(NO_2)_3$. Needles (W.).

o-Nitro-phenyl ether $C_6H_4(NO_2)A'$. [173°].

p-Nitro-phenyl ether $C_6H_4(NO_2)A'$. [153°]. Plates (from alcohol) (Willgerodt, *B.* 17, 1766).

Benzyl ether $C_6H_5CH_2A'$. [147°]. Yellow prisms (Kumpf, *A.* 224, 131).

p-Nitro-benzyl ether $C_6H_4(NO_2).CH_2A'$. [108°]. Formed from silver picrate and *p*-nitro-benzyl iodide (K.).

(β)-Tri-nitro-phenol $C_6H_2(NO_2)_3OH$[6:4:3:1]. [96°]. Formed, together with the (γ)-isomeride and tri-nitro-resorcin (styphnic acid) by the action of conc. HNO_3 on (γ)-di-nitro-phenol (Henriques, *A.* 215, 325; *cf.* Bantlin, *B.* 8, 21). Needles, v. e. sol. alcohol and ether, m. sol. hot water. Forms with naphthalene a compound [72°].—KA': violet needles, insol. alcohol.—BaA'_2 4aq: red prisms.

(γ)-Tri-nitro-phenol $C_6H_2(NO_2)_3(OH)$[6:3:2:1]. [118°]. Formed by nitrating (ε)-dinitrophenol, and also, together with the (β)-isomeride, by nitrating (γ)- or (δ)-dinitrophenol (Henriques). White needles. Readily converted into styphnic acid by boiling with fuming HNO_3. Forms with naphthalene a compound crystallising in yellow needles [100°].—KHA': red needles, insol. alcohol.—BaA'_2: golden-yellow scales.

References.—Chloro-, Bromo, and Iodo-nitro-phenol.

o-NITRO-PHENOL SULPHONIC ACID $C_6H_3(OH)(NO_2)(SO_3H)$[1:2:4]. [122°]. Formed by sulphonating *o*-nitro-phenol (Kekulé, *Z.* 1867, 641; Armstrong, *Z.* 1871, 321; Armstrong a. Brown, *B.* 7, 923). Formed also by nitration of phenol *p*-sulphonic acid (Schmitt a. Glutz, *B.* 2, 51; Körner, *G.* 2, 444; Kolbe a. Gauho, *A.* 147, 71) and by boiling (1, 2, 4)-bromo-nitro-benzene sulphonic acid (Goslioh, *A.* 180, 105). Needles (containing 3aq). Melts at 52° when hydrated, 122° when anhydrous.—NH_4A'.—NaA' 3aq.—$Na_2C_6H_3NSO_6$ 3aq.—KA'.—K_2A'' aq.—K_2A'' 2aq.—BaA'_2 aq.—BaA'' 2aq: red crystals, sl. sol. water.

***p*-Nitro-phenol sulphonic acid** $C_6H_5NSO_6$ *i.e.* $C_6H_3(OH)(NO_2)(SO_3H)$[1:4:2]. Formed from *p*-nitro-phenol and fuming H_2SO_4 (Körner a. Post, *B.* 5, 852, 1055; 6, 395; 7, 163; *A.* 205, 38). Formed also by nitrating phenol *o*-sulphonic acid (Stückenberg, *A.* 205, 45). Crystals (containing 3aq), beginning to decompose when heated at 110°. Give a brown pp. with $FeCl_3$.—KA': monoclinic crystals, *a*:*b*:c = 1·704:1:1·524; β = 117° 59'.—K_2A'' aq.—NaA' 2aq.—Na_2A'' 2aq.—CaA'_2 3aq.—CaA'' 2½aq.—BaA'_2aq.—BaA'' aq.—PbA'_2 1½aq.—CuA''.

Nitro-phenol disulphonic acid $C_6H_5NS_2O_9$ *i.e.* $C_6H_2(OH)(NO_2)(SO_3H)_2$. Formed from di-nitro-benzene disulphonic acid by reduction to nitro-amido-benzene disulphonic acid and displacement of NH_2 by OH (Limpricht, *B.* 8, 289). Minute needles.—BaA'' 2aq: crystalline.

Di-nitro-phenol sulphonic acid $C_6H_4N_2SO_8$ *i.e.* $C_6H_2(OH)(NO_2)_2(SO_3H)$. Formed by the action of nitrous acid on *s*-di-phenyl-hydrazine disulphonic acid (Balentine, *A.* 202, 358). Prisms from alcohol), v. sol. water. Decomposes at 160°.—KA' ½aq.—K_2A'' 2aq.—BaA'' 3½aq (Bertram, *P. Beibl.* 6, 779).

Tri-nitro-phenol sulphonic acid $C_6H(NO_2)_3(OH)(SO_3H)$[6:4:2:1:3]. Formed from phenol *m*-sulphonic acid and HNO_3 (Berndsen, *A.* 177, 92).—KA' aq: prisms, exploding when heated.—BaA'_2 3aq: crystals, m. sol. water.

o-NITRO-DIPHENYL $C_{12}H_9NO_2$ *i.e.* $C_6H_5.C_6H_4NO_2$[1:2]. [37°]. (c. 320°). Formed, together with the *p*- isomeride, by nitration of diphenyl (Lüddens, *B.* 8, 870; Hübner, *A.* 209, 341; Schultz, *A.* 207, 352). Thick plates (from dilute alcohol).

***p*-Nitro-diphenyl.** [113°]. (340° i.V.). Formed as above (Schultz, *A.* 174, 210; Hübner; Zimmermann, *B.* 13, 1960). Long needles (from alcohol). Yields *p*-nitro-benzoic acid on oxidation.

oo-Di-nitro-diphenyl $C_{12}H_8N_2O_4$ *i.e.* [2:1]$C_6H_4(NO_2).C_6H_4NO_2$[1:2]. [124°]. Formed from di-nitro-di-*p*-amido-diphenyl by elimination of amidogen (Täuber, *B.* 24, 197). Straw-yellow needles, sl. sol. cold alcohol.

***op*-Di-nitro-diphenyl** $C_{12}H_8N_2O_4$ *i.e.* [2:1]$C_6H_4(NO_2).C_6H_4(NO_2)$[1:4]. [93·5°]. Formed, together with the *pp*-isomeride, by heating diphenyl with HNO_3 and H_2SO_4 (Fittig, *A.* 124, 275; Schultz, Schmidt, a. Strasser, *A.* 207, 349). Golden monoclinic needles; *a*:*b*:*c* = 1·08 : 1 : ·91; β = 87° 30'. More sol. alcohol than the *pp*- isomeride.

***mm*-Di-nitro-diphenyl** [3:1]$C_6H_4(NO_2).C_6H_4(NO_2)$[1:3]. [198°]. **Formed** from di-nitro-di-*p*-amido-diphenyl by elimination of the NH_2 groups (Brunner a. Witt, *B.* 20, 1028). Small yellow needles. Yields **di-*m*-amido-diphenyl** on reduction.

***pp*-Di-nitro-diphenyl** [4:1]$C_6H_4(NO_2).C_6H_4(NO_2)$[1:4]. [233°] (Schultz, *A.* 174, 221). Formed as above. Needles. Yields benzidine on reduction.

Tetra-nitro-diphenyl $C_{12}H_6(NO_2)_4$. [140°]. Formed from diphenyl, H_2SO_4, and HNO_3 (Losanitsch, *B.* 4, 404). Amorphous mass, sl. sol. alcohol.

***o*-NITRO-PHENYL-ACETIC ACID** $C_8H_7NO_4$ *i.e.* $C_6H_4(NO_2).CH_2.CO_2H$. [138°] (B.); [141°] (S.). Formed, in small quantity, in the preparation of the *p*- isomeride by nitration of phenyl-acetic acid (Radziszewski, *B.* 3, 648; Bedson, *C. J.* 37, 93). Obtained also by saponifying its nitrile (Gabriel a. Borgmann, *B.* 16, 2066). Needles (from water) or monoclinic plates (from alcohol). Yields *o*-nitro-benzoic acid on oxidation with $KMnO_4$. Gives oxindole on reduction. —BaA'_2 2aq.

Nitrile $C_6H_4(NO_2).CH_2.CN$. *o-Nitro-benzyl cyanide.* [83°] (B.); [84°] (S.). Formed in small quantity, together with the *m*- and *p*- isomerides, by nitration of benzyl cyanide (H. Salkowski, *B.* 17, 507). Formed also, together with a larger quantity of the compound $C_6H_4(NO_2).CHCy.CH_2.C_6H_4NO_2$ [111°] and small quantities of $C_{15}H_8N_8O_8$ [c. 238°] and $C_{22}H_{14}N_4O_8$ [191°], by boiling *o*-nitro-benzyl chloride with alcoholic KCy (Bamberger, *B.* 19, 2635). Trimetric prisms.

***m*-Nitro-phenyl-acetic acid** [3:1]$C_6H_4(NO_2).CH_2.CO_2H$. [117°] (G. a. B.); [120°] (S.). Formed from the nitrile which is obtained from *m*-nitro-benzyl chloride and KCy. Needles.—AgA′: silky needles.

Nitrile [61°]. Monoclinic crystals.

***p*-Nitro-phenyl-acetic acid** [4:1]$C_6H_4(NO_2).CH_2.CO_2H$. [152°]. Formed as above (Radziszewski, *B.* 2, 209; Maxwell, *B.* 12, 1765; Gabriel, *B.* 14, 2342; 15, 834; Bedson, *C. J.* 37, 92). Silky needles. With *o*-nitro-phenyl-acetic acid it forms a molecular compound [114°]. Yields *p*-oxy-benzoic acid on oxidation. Sodium-amalgam yields $N_2(C_6H_4.CH_2.CO_2H)_2$ [above 300°] (Wittenberg, *Bl.* [2] 43, 111).—NaA′ 2aq. — BaA'_2. — BaA'_2 7aq. — ZnA'_2 aq. — AgA′: needles.

Methyl ether MeA′. [55°]. Needles.

Ethyl ether EtA′. [65°]. Plates.

Amide [192°]. Long prisms.

Nitrile [116°]. Plates. Alcoholic KOH forms a crimson solution in which diazobenzene chloride ppts. $C_{14}H_{16}N_4O_2$ [202°] (Czumpelik, *B.* 3, 474; Perkin, *C. J.* 43, 111).

Di-nitro-phenyl-acetic acid $C_8H_6N_2O_6$ *i.e.* [4:2:1]$C_6H_3(NO_2)_2CH_2.CO_2H$. [160°]. Formed from phenyl-acetic acid, H_2SO_4, and fuming HNO_3 (R.; Gabriel a. Meyer, *B.* 14, 823). Formed also by boiling di-nitro-phenyl-acetoacetic ether with dilute H_2SO_4 (Heckmann, *A.* 220, 128). Pale-yellow needles, sol. hot water. Decomposed by heat into di-nitro-toluene [71°] and CO_2.

Methyl ether MeA′. Forms with diazobenzene chloride $C_6H_3(NO_2)_2.C(N.NHPh).CO_2Me$ [183°] (V. Meyer, *B.* 22, 319). Diazotoluene forms the homologous tolyl-hydrazide of methyl di-nitro-phenyl-glyoxylate [168°] crystallising in red needles (Hausknecht, *B.* 22, 325). The corresponding derivatives of diazoxylene and diazonaphthalene melt at 159° and 94° respectively.

Ethyl ether EtA′. [55°]. Needles. When heated with alcoholic potash it yields $C_{24}H_{18}N_8O_{15}$ [151°], which forms the salt $K_2C_{24}H_{16}N_8O_{16}$, crystallising in golden plates.

Tetra-nitro-di-phenyl-acetic ether $\{C_6H_3(NO_2)_2\}_2CH.CO_2Et$. [154°]. Formed from sodium di-nitro-phenyl-acetoacetic ether and bromo-di-nitro-benzene (Von Richter, *B.* 21, 2470). Crystalline.—$C_{16}H_{11}NaN_4O_{10}$ [80°]: very hygroscopic plates.

***p*-NITRO-PHENYL-ACETIC ALDEHYDE** $C_6H_4(NO_2).CH_2.CHO$. [86°]. Formed by boiling the barium salt of $C_6H_4(NO_2).CHCl.CH(OH).CO_2H$ with water (Lipp, *B.* 19, 2645; *cf.* Forrer, *B.* 17, 984). Needles, sl. sol. cold water.

DI-NITRO-PHENYL-ACETOACETIC ETHER [4:2:1] $C_6H_3(NO_2)_2.CHAc.CO_2Et$. [94°]. Formed from $C_6H_3Br(NO_2)_2$, acetoacetic ether, and NaOEt (Heckmann, *A.* 220, 128). Plates.

Tri-nitro-phenyl-acetoacetic ether $C_6H_2(NO_2)_3.CHAc.CO_2Et$. [98°]. Formed, together with $\{C_6H_2(NO_2)_3\}_2CAc.CO_2Et$ [205°], from picryl chloride $C_6H_2Cl(NO_2)_3$ and sodium acetoacetic ether (Dittrich, *B.* 23, 2720). Crystals, v. sol. hot alcohol.

***p*-NITRO-PHENYL-ACETURIC ACID** $C_6H_4(NO_2).CH_2.CO.NH.CH_2.CO_2H$. [173°]. Got by nitrating phenylaceturic acid (Hotter, *J. pr.* [2] 38, 110). Needles, decomposed by boiling HClAq into glycocoll and *p* nitro-phenyl-acetic acid.—ZnA'_2 2½aq.—AgA′: needles, v. sl. sol. cold water.

***o*-NITRO-PHENYL-ACETYLENE** $C_8H_5NO_2$ *i.e.* $C_6H_4(NO_2).C\vdots CH$. [82°]. Formed by boiling *o*-nitro-phenyl-propiolic acid with water (Baeyer, *B.* 13, 2259). Needles, sol. hot water. Gives pps. with ammoniacal $AgNO_3$ and Cu_2Cl_2.

***p*-Nitro-phenyl-acetylene** [149°] (M.); [152°] (D.). Formed by boiling *p*-nitro-phenyl-propiolic acid with water (Drewson, *A.* 212, 158). Formed also from $C_6H_4(NO_2).CHBr.CHBr.CO_2Et$ and alcoholic potash (C. L. Müller, *A.* 212, 133). Needles (from hot water). Gives a red pp. with ammoniacal Cu_2Cl_2 and a greenish-yellow pp. with ammoniacal $AgNO_3$.

Di-*p*-nitro-di-phenyl-acetylene $C_{14}H_8N_2O_4$ *i.e.* $C_6H_4(NO_2).C\vdots C.C_6H_4NO_2$. [288°]. Formed from $C_6H_4(NO_2).CHBr.CHBr.C_6H_4NO_2$ by heating with soda-lime at 180° (Elbs a. Bauer, *J. pr.* [2] 34, 346). Yellow needles (by sublimation).

o-Nitro-di-phenyl-di-acetylene $C_{16}H_9NO_2$ *i.e.* $C_6H_4(NO_2).C\vdots C.C\vdots CPh$. [155°]. Formed by the action of K_3FeCy_6 on a mixture of the cuprous salts of phenyl-acetylene and *o*-nitro-phenyl-acetylene (Baeyer a. Landsberg, *B.* 15, 57). Yellow plates, sol. alcohol.

Di-o-nitro-di-phenyl-diacetylene $C_6H_4(NO_2).C\vdots C.C\vdots C.C_6H_4(NO_2)$. [212°]. Formed by the action of an alkaline solution of K_3FeCy_6 on the cuprous salt of *o*-nitro-phenyl-acetylene (Baeyer, *B.* 15, 51). Golden needles, sol. chloroform. Fuming H_2SO_4 converts it into the isomeric diisatogen.

NITRO-PHENYL-ACRYLIC ACID *v.* NITRO-CINNAMIC ACID.

NITRO - DI - PHENYL - ACRYLIC ACID. *Nitrile.* The *o*-, *m*-, and *p*-, varieties, melting at 128°, 134°, and 118° respectively, are formed by the action of the corresponding nitro-benzoic aldehydes on phenyl-acetic nitrile (benzyl cyanide) in presence of alcoholic NaOEt (Frost, *A.* 250, 160).

o-**NITRO - PHENYL - ALLENYL - MALONIC ACID** $C_6H_4(NO_2).CH:CH.CH:C(CO_2H)_2$. [213°]. Formed by heating o-nitro-cinnamic aldehyde with malonic acid and HOAc at 100° (Einhorn, *A.* 253, 374). Needles.—CuA″.—Ag_2A'': yellowish plates.

p-Nitro-phenyl-allenyl-malonic acid [208°]. Formed from *p*-nitro-cinnamic aldehyde, malonic acid, and HOAc (Einhorn a. Gehrenbeck, *B.* 22, 45). Yellow needles (from HOAc). Br forms $C_6H_4(NO_2).CHBr.CHBr.CBr:C(CO_2H)_2$ [206°] crystallising in plates.—$(NH_4)_2A''$.—CuA″.—Ag_2A'': flocculent pp.

Ethyl ether Et_2A''. [105°]. Needles.

o-**NITRO-PHENYL-AMIDO-ACETIC ACID** $C_6H_4(NO_2).NH.CH_2.CO_2H$. [193°]. Formed from bromo-acetic acid and o-nitro-aniline at 125° (Plöchl, *B.* 19, 6). Dark-red prisms, sl. sol. ether. Yields oxy-quinoxaline dihydride on reduction.—NH_4A': flat orange prisms.

p - **NITRO - PHENYL - *ω* - AMIDO - ACETOPHENONE** $C_6H_5.CO.CH_2.NH.C_6H_4.NO_2$. [167°]. Formed by heating its nitrosamine with HCl Möhlau, *B.* 15, 2474). Golden needles (from HOAc). Yields acetophenone and *p*-phenylenediamine on reduction.

Nitrosamine $C_{14}H_{11}N_3O_4$ *i.e.* $C_6H_5.CO.CH_2.N(NO).C_6H_4.NO_2$. Formed from phenyl-amido-acetophenone, HOAc, and nitrous acid gas (M.). Plates, decomposing at 135°–145°.

Di - nitro - phenyl - *ω* - amido - acetophenone $C_6H_5.CO.CH_2.NH.C_6H_3(NO_2)_2$. [172°]. Formed by nitration of phenyl - amido - acetophenone (Möhlau, *B.* 15, 2479). Golden prisms (from HOAc). Yields *i*-tri-amido-benzene on reduction.

s - **TRI - NITRO - TRI - PHENYL-TRI-AMIDO-BENZENE** $C_6(NHPh)_3(NO_2)_3$. [238°]. Formed from $C_6Br_3(NO_2)_3$ and aniline (Jackson a. Wing, *Am.* 10, 283). Orange powder, insol. water.

m - **NITRO - PHENYL - *p* - AMIDO - BENZOIC ACID** $C_6H_3(NO_2)(NHPh).CO_2H[3:4:1]$. [254°]. Formed by heating (4,3,1)-bromo-nitro-benzoic acid with aniline (Schöpff, *B.* 22, 3281). Garnet-red needles. Yields an amido- acid [153°].—NaA′.—NaA′aq.—BaA'_2 3aq.—AgA′: orange plates.

Ethyl ether EtA′. [123°]. Hexagonal.

Anilide $C_6H_3(NO_2)(NHPh).CONHPh$. [216°]. Formed by heating aniline with bromo nitro-benzoyl chloride (Grohmann, *B.* 23, 3448). Blood-red leaflets from HOAc.

Nitrile $C_6H_3(NH_2)(NHPh).CN$. [126°]. Formed from bromo-nitro-benzonitrile and aniline (Schöpff, *B.* 23, 3444).

o-Nitro-phenyl-*m*-amido-benzoic acid $C_6H_3(NO_2)(NHPh).CO_2H[2:3:1]$. [248°]. Formed from (3,2,1)-bromo-nitro-benzoic acid and aniline (Schöpff, *B.* 23, 3440). Yellow needles.—NaA′ 2aq.—BaA'_2 5aq.

Ethyl ether EtA′. [112°]. Needles.

m-Nitro-phenyl-o-amido-benzoic acid. *Nitrile.* $C_6H_3(NO_2)(NHPh)CN[5:2:1]$. [170°]. Formed from (2,5,1)-bromo-nitro-benzonitrile and aniline (S.). Lemon-yellow needles.

Di-nitro-phenyl-*o*-amido-benzoic acid $C_{13}H_9N_3O_6$ *i.e.* $[4:2:1]C_6H_3(NO_2)_2.NH.C_6H_4.CO_2H$. [264°]. Formed by warming *o*-amido-benzoic acid with $C_6H_3Cl(NO_2)_2$ (Jourdan, *B.* 18, 1448). Orange needles, almost insol. water.—BaA'_2: dark-red crystalline powder.

NITRO-PHENYL-AMIDO-NAPHTHOQUINONE *v.* (*α*)-NAPTHOQUINONE, *Reactions* 16 and 17.

DI-NITRO-PHENYL-DI-AMIDO-DIPHENYL $C_{18}H_{14}N_4O_4$ *i.e.* $C_6H_4(NH_2).C_6H_4.NH.C_6H_3(NO_2)_2$. [245°]. Formed by boiling benzidine with alcohol and (1,2,4)-chloro-di-nitro-benzene (Willgerodt, *B.* 9, 981). Long needles (from HOAc).

Di-o-nitro-di-phenyl-diamido-diphenyl $C_6H_4(NO_2).NH.C_6H_4.C_6H_4.NH.C_6H_4(NO_2)$. [240°]. Formed by boiling benzidine with *o*-chloro-nitro-benzene and alcohol (Schöpff, *B.* 22, 904). Needles (from HOAc).

Tetra - nitro - di - phenyl - di - amido - diphenyl $C_6H_3(NO_2)_2.NH.C_6H_4.C_6H_4.NH.C_6H_3(NO_2)_2$. [above 330°]. Formed from $[1:2:4]C_6H_3Cl(NO_2)_2$, alcohol, and benzidine at 120° (W.). Yellow powder, sl. sol. alcohol.

DI-NITRO-PHENYL-AMIDO-TOLYL-AMINE $[4:2:1]C_6H_3(NO_2)_2.NH.C_6H_3Me.NH_2$. [147°]. Formed from tolylene-*o*-diamine and *i*-chloro-di-nitro-benzene (Ernst, *B.* 23, 3428). Brownish-yellow needles. Yields with HNO_2 the azimide

$$C_6H_3(NO_2)_2N{<}{\genfrac{}{}{0pt}{}{C_7H_6}{N}}{\gg}N. \quad [186°].$$

o-**NITRO-DI-PHENYL-AMINE** $C_{12}H_{12}N_2O_2$ *i.e.* $[2:1]C_6H_4(NO_2).NHC_6H_5$. [75°]. Formed from aniline and o-chloro-nitro-benzene or *o*-bromo-nitro-benzene at 100° (Schöpff, *B.* 22, 903; 23, 1839). Trimetric crystals (from alcohol); $a:b:c = \cdot468:1:\cdot671$. Yields on reduction the amido- compound [80°].

p-**Nitro-diphenylamine** $[4:1]C_6H_4(NO_2).NH.C_6H_5$. [133°]. Formed from benzoyl-diphenylamine by nitration and elimination of Bz (Hofmann, *A.* 132, 167; Lellmann, *B.* 15, 825). Formed also from its nitrosamine by treatment with aniline (Witt, *C. J.* 33, 205). Pale-yellow scales (from dilute alcohol). Colours alcoholic potash scarlet. Dyes silk yellow.

Benzoyl derivative [129°]. Prisms.

Nitrosamine $C_6H_4(NO_2).N(NO).C_6H_5$. [134°]. Formed by warming diphenylamine with HNO_3, isoamyl nitrite, and alcohol (W.). Crystals, sol. chloroform.

Di-o-nitro-diphenylamine $NH(C_6H_4NO_2)_2$. [220°] (L.); [212°] (W.). Obtained from its benzoyl derivative, and also, together with the *p*- isomeride, by the action of alcohol (50 c.c.), aniline (25 g.) and aniline hydrochloride (30 g.) at 100° on the mixed di-nitro-di-phenyl-nitrosamines prepared from diphenylamine (17 g.), amyl nitrite (48 g.), alcohol (50 c.c.), nitric acid (40 c.c. of S.G. 1·424), and HOAc (50 c.c.) (Witt, *C. J.* 33, 208). Red felted needles.

Benzoyl derivative $NBz(C_6H_4NO_2)_2$. Formed, together with that of the *p*- isomeride from benzoyl diphenylamine and fuming HNO_3 (Lellmann, *B.* 15, 827).

Di-*p*-nitro-diphenylamine $C_{12}H_9N_3O_4$ *i.e.* $NH(C_6H_4.NO_2[1:4])_2$. [216°] (L.); [214°] (W.). Got as above. Yellow needles with blue reflex.

Benzoyl derivative. [224°]. Monoclinic crystals, sl. sol. alcohol.

Di-nitro-diphenylamine $C_{12}H_9N_3O_4$ *i.e.* $C_6H_5.NH.C_6H_3(NO_2)_2$[1:2:4]. [157°]. Formed from $C_6H_3Br(NO_2)_2$ or $C_6H_3Cl(NO_2)_2$ and aniline or di-phenyl-thio-urea (Clemm, *B.* 3, 128; Willgerodt, *B.* 9, 977; 11, 601; *cf.* Hepp, *Bl.* [2] 30, 4).

Tri-nitro-diphenylamine $C_{12}H_8N_4O_6$ *i.e.* $C_6H_5.NH.C_6H_2(NO_2)_3$[1:2:4:6]. [175°]. Formed from $C_6H_2Cl(NO_2)_3$ (picryl chloride) and aniline (Clemm, *B.* 3, 126). Scarlet prisms.

Tri-nitro-diphenylamine [3:1]$C_6H_4(NO_2).NH.C_6H_3(NO_2)_2$[1:2:4]. [194°]. Formed from $C_6H_3Br(NO_2)_2$ or $C_6H_3Cl(NO_2)_2$ and *m*-nitro-aniline (Austen, *B.* 7, 1250; Willgerodt, *B.* 9, 1178). Short yellow needles (from HOAc).

Tri-nitro-diphenylamine [4:1]$C_6H_4(NO_2).NH.C_6H_3(NO_2)_2$. [181°]. Formed from *p*-nitro-aniline and bromo-di-nitro-benzene (A.). Yellow powder, v. e. sol. HOAc.

Tri-nitro-diphenylamine. [135°]. Formed by boiling the acetyl derivative of diphenylamine with dilute nitric acid (S.G. 1·029) (Norton a. Allen, *B.* 18, 1997). Yellow needles, v. sol. alcohol.

Tetra-nitro-diphenylamine $C_{12}H_7N_5O_8$ *i.e.* [3:1]$C_6H_4(NO_2).NH.C_6H_2(NO_2)_3$[1:2:4:6]. [205°]. Formed from *m*-nitro-aniline and picryl chloride (Austen, *B.* 7, 1248). Orange crystals (from HOAc).

Tetra-nitro-diphenylamine [4:1]$C_6H_4(NO_2).NH.C_6H_2(NO_2)_3$[1:2:4:6]. [216°]. Formed in like manner from *p*-nitro-aniline (A.).

Tetra-nitro-diphenylamine $NH\{C_6H_3(NO_2)_2\}_2$. [180°]. Got by heating $C_6H_3(NO_2)_2.NH.CO_2Et$ with alcoholic potash (Hager, *B.* 17, 2629). Reddish-brown plates (from alcohol).

Tetra-nitro-diphenylamine [192°]. Formed by nitration of diphenylamine, diphenyl-nitrosamine, and diphenyl methylamine $NMePh_2$ (Gnehm a. Wyss, *B.* 10, 1318). Yellow crystals (from alcohol). Forms a scarlet solution in NaOHAq.

Hexa-nitro-diphenylamine $\{C_6N_2(NO_2)_3\}_2NH$. *Dipicrylamine.* [238°] (A.); [234°] (M.). Formed by nitrating diphenylamine, diphenyl methylamine, or tetra-nitro-diphenylamine [216°] (Austen, *B.* 7, 1250; Gnehm, *B.* 7, 1399; 9, 1245, 1557; Mertens, *B.* 11, 845). Yellow prisms (from acetic acid). Its ammonium salt $NH_4C_{12}H_4N_7O_{12}$ is used as a yellow dye ('aurantia').—$Ba(C_{12}H_4N_7O_{12})_2$: red rhombohedra.

Hexa-nitro-diphenylamine [261°]. Formed by nitrating tetra-nitro-diphenylamine [205°] (A.). Small yellow crystals (from HOAc). Explodes when heated.

Nitro-tri-phenyl-amine $(C_6H_5)_2N.C_6H_4(NO_2)$. [140°]. Formed from triphenylamine, HOAc, and HNO_3 (Herz, *B.* 23, 2537). Golden plates.

Di-nitro-tri-phenyl-amine $C_6H_5N(C_6H_4NO_2)_2$. [207°]. Formed from triphenylamine (2 g.), HOAc (35 g.) and HNO_3 (2 g.) at 60° (Herz, *B.* 23, 2538). Yellow needles, v. sol. benzene.

Tri-nitro-tri-phenylamine $N(C_6H_4NO_2)_3$. [280°]. Formed from triphenylamine (2 g.), HOAc (35 g.), and HNO_3 (4 g.) at 100° (Heydrich, *B.* 18, 2156; Herz, *B.* 23, 2539). Bronze-yellow needles, v. sl. sol. HOAc.

m-**NITRO-PHENYL-ANGELIC ALDEHYDE** $C_6H_4(NO_2).CH:CEt.CHO$. [46°]. Formed from *m*-nitro-benzoic aldehyde, butyric acid, and dilute NaOHAq (Von Miller a. Rohde, *B.* 22, 1838). Plates; reduced by tin and HCl to amido-ethyl-indonaphthene [89°].

Phenyl-hydrazide [135°]. Red needles.

DI-NITRO-DI-*p*-PHENYL-BENZENE $C_{18}H_{12}(NO_2)_2$. [277°]. Formed by nitration of diphenylbenzene (Schmidt a. Schultz, *B.* 11, 1755; *A.* 203, 125). Yellow monoclinic needles (from nitro-benzene).

Tri-nitro-di-*p*-phenyl-benzene $C_{18}H_{11}(NO_2)_3$. [195°]. Formed from diphenylbenzene and fuming HNO_3 (S. a. S.). Needles. Yields on reduction a base [170°].

Tri-nitro-diphenylbenzene [200°]. Formed by nitration of isodiphenylbenzene (S. a. S.). Needles. Yields on reduction a base [288°].

Tetra-nitro-tri-phenyl-benzene $C_{24}H_{14}(NO_2)_4$. [above 370°]. Formed, together with an isomeride [108°], by nitrating triphenylbenzene (Mellin, *B.* 23, 2535). Both bodies crystallise in needles.

NITRO-PHENYL-BENZYLIDENE-AMINE $C_{13}H_{10}N_2O_2$ *i.e.* $C_6H_5.CH:N.C_6H_4NO_2$. [66°] (Lazorenko, *J.* 1870, 760); [73°] (Lachovitch, *M.* 9, 695). Formed from benzoic aldehyde (or hydrobenzamide) and *m*-nitro-aniline. Needles.

p-**Nitro-phenyl-benzylidene-amine** $C_7H_6:N.C_6H_4(NO_2)$ [1:4]. [115°]. Formed from hydrobenzamide by warming with *p*-nitro-aniline. Yellow needles (Lachovitch).

Isomerides *v.* NITRO-BENZYLIDENE-ANILINE.

NITRO-PHENYL BENZYL OXIDE $C_6H_4(NO_2).O.CH_2Ph$. Formed from potassium nitro-phenol, alcohol, and benzyl chloride (Kumpf, *A.* 224, 121). The *o*- compound melts at 29°, and the *p*- compound at 106°. Both are crystalline.

Di-nitro-phenyl benzyl oxide $C_{13}H_{10}N_2O_5$ *i.e.* $C_6H_3(NO_2)_2.O.CH_2Ph$. Formed from silver dinitrophenol and benzyl iodide (K.). The (4,2,1)-compound melts at 149°, and the (6,2,1)-compound at 76° (OH=1). Both crystallise from HOAc.

Tri-nitro-phenyl benzyl oxide $C_{13}H_9N_3O_7$ *i.e.* [6:4:2:1] $C_6H_2(NO_2)_3.O.CH_2Ph$. [147°]. Formed from silver picrate and benzyl iodide (K.). Yellowish prisms (from benzene).

TRI-NITRO-DI-PHENYL-BENZYL-PHOSPHINE OXIDE $PO(C_6H_4NO_2)_2(C_7H_6NO_2)$. [206°]. Formed from the oxide, fuming HNO_3, and conc. H_2SO_4 (Dörken, *B.* 21, 1505). Crystals, m. sol. HOAc.

DI-NITRO-PHENYL-BENZYL SULPHIDE $C_7H_7.S.C_6H_3(NO_2)_2$ [1:2:4]. [128°]. Formed from (1,2,4)-chloro-di-nitro-benzene, alcoholic K_2S, and benzyl chloride (Willgerodt, *B.* 18, 331). Yellowish plates.

NITRO-PHENYL-BROMO-PROPIONIC ACID *v.* BROMO-NITRO-PHENYL-PROPIONIC ACID.

o-NITRO-PHENYL-BUTINYL METHYL KETONE $C_6H_4(NO_2).C_4H_4.CO.CH_3$. [73·5°]. Formed, together with $(C_6H_4(NO_2).C_4H_4)_2CO$ [208·5°], from o-nitro-cinnamic aldehyde, acetone, alcohol, and dilute (2 p.c.) NaOHAq (Diehl a. Einhorn, *B.* 18, 2327). Broad needles (from alcohol).

o-NITRO-PHENYL-BUTINYL PHENYL-BUTINYL KETONE $C_{20}H_{17}NO_3$ *i.e.* $C_6H_4(NO_2).C_4H_4.CO.C_4H_4.C_6H_5$. [136·5°]. Formed from *o*-nitro-cinnamic aldehyde, phenyl-butinyl methyl ketone, alcohol, and dilute NaOHAq

(Diehl a. Einhorn, *B.* 18, 2329). Golden crystals (from acetone).

***p*-NITRO-PHENYL-ISOBUTYRIC ACID** $C_6H_4(NO_2).CH_2.CHMe.CO_2H$. [121°]. Formed from phenyl-isobutyric acid and conc. HNO_3 (Edeleanu, *C. J.* 53, 559). Small prisms, sol. alcohol.

NITRO-PHENYL-CARBAMIC ETHER $C_6H_4(NO_2).NHCO_2Et$. The *o*- compound [58°] and the *p*- compound [129°] are got from the corresponding nitro-aniline and $ClCO_2Et$ (Rudolph, *B.* 12, 1295; Hager, *B.* 17, 2625). The *p*- compound is also got by nitration of phenyl-carbamic ether (Behrend, *A.* 233, 9). Both are crystalline.

Di-nitro-phenyl-carbamic ether $C_9H_9N_3O_6$ *i.e.* [4:2:1] $C_6H_3(NO_2)_2NH.CO_2Et$. [111°]. Formed by nitration of either *o*- or *p*- nitro-phenyl-carbamic ether (Hager, *B.* 17, 2629). Needles (from alcohol). An isomeride [210°] is got by the action of HNO_3 on $C_6H_5NH.CS.OEt$ (Losanitsch, *B.* 10, 691).

Di-nitro-di-phenyl-carbamic ether $(C_6H_4.NO_2)_2N.CO_2Et$. The oily *o*- compound is formed together with the *p*- compound [134°] by nitration of di-phenyl-carbamic ether (Hager, *B.* 18, 2574). The *p*- compound is the less sol. alcohol.

***m*-NITRO-TRI-PHENYL-CARBINOL** $C_6H_4(NO_2).CPh_2.OH$. [75°]. Formed from $C_6H_4(NO_2).CHPh_2$ by bromination in sunlight, followed by successive treatment with KOAc and KOH (Tschacher, *B.* 21, 190). Colourless crystals, sol. ligroïn.

***p*-Nitro-tri-phenyl-carbinol.** [136°]. Formed by oxidising *p*-nitro-tri-phenyl-methane with CrO_3 in HOAc (Baeyer a. Löhr, *B.* 23, 1623). Crystals (from dilute HOAc).

Tri-*p*-nitro-tri-phenyl-carbinol $C_{19}H_{13}N_3O_7$ *i.e.* $(C_6H_4.NO_2)_3COH$. [172°]. Formed by oxidising tri-nitro-tri-phenyl-methane (E. a. O. Fischer, *B.* 11, 1079). Colourless crystals (from HOAc).

TETRA-NITRO-DI-PHENYL CARBONATE $(C_6H_3(NO_2)_2)_2CO$. [127°]. Formed from di-phenyl carbonate, HNO_3, and H_2SO_4 (Kempf, *J. pr.* [2] 1, 407; Löwenberg, *C. C.* 1886, 390). Nodules, v. sl. sol. ether.

NITRO-DIPHENYL CARBOXYLIC ACID $C_{12}H_9(NO_2)O_2$. [222°]. Formed by nitration of diphenyl *o*-carboxylic acid (Schmidt, *A.* 193, 115). Monoclinic crystals (from alcohol).—BaA'_2.—CaA'_2: nodules, v. sol. water.

Nitro-diphenyl carboxylic acid $C_{14}H_6NO_6$ *i.e.* [2:1] $C_6H_4(CO_2H).C_6H_3(NO_2).CO_2H$ [1:4:2]. [217°]. Formed by oxidation of nitro-phenanthraquinone [257°] (Strasburger, *B.* 16, 2347). Light-yellow needles (from water).

Di-nitro-diphenyl carboxylic acid [4:1] $C_6H_4(NO_2).C_6H_3(NO_2).CO_2H$ [1:2:4]. [252°]. Formed by nitrating diphenyl *p*-carboxylic acid (Strasser a. Schultz, *A.* 210, 192). Needles, m. sol. alcohol.

Methyl ether MeA′. [156°]. Needles.

(α)-Di-nitro-diphenyl dicarboxylic acid $C_{12}H_6(NO_2)_2(CO_2H)_2$. [249°] (H.); [253°] (Schultz, *A.* 196, 26). Formed by oxidation of di-nitro-phenanthraquinone (Struve, *B.* 10, 75), and, together with the following acid, by nitration of diphenyl di-o-carboxylic acid (Hummel, *A.* 193, 129). Pale-yellow needles (containing aq). —BaA'_2 6aq: long prisms.

Methyl ether Me_2A''. [178°]. Prisms.

(β)-Di-nitro-diphenyl dicarboxylic acid. [297°]. Formed as above (Schultz, *A.* 203, 105). Needles (from hot water).—BaA'_2 4aq: triclinic prisms.

Methyl ether Me_2A''. [132°]. Tables.

NITRO-PHENYL CHLORO-METHYL KETONE *v.* CHLORO-NITRO-ACETOPHENONE.

***o*-NITRO-PHENYL-CINNAMIC ACID** $C_{15}H_{11}NO_4$. [196°]. Formed from *o*-nitro-benzoic aldehyde, sodium phenyl acetate, and Ac_2O at 160° (Oglialoro a. Rosini, *G.* 20, 396). Needles. —BaA'' 5aq.—BaA'' 8aq.

NITRO-PHENYLENE-o-DIAMINE $C_6H_3(NO_2)(NH_2)_2$ [4:2:1]. [198°]. Formed by reducing (4,2,1)-di-nitro-aniline with alcoholic ammonium sulphide (Gottlieb, *A.* 85, 27; Heim, *B.* 21, 2305). Dark-red plates (from toluene). Ac_2O at 190° forms $C_6H_3(NO_2){:}N_2H{:}CMe$ [216°]. —$B'HCl$ aq.—$B'_2H_2PtCl_6$.—$B'HNO_3$.—$B'_2H_2SO_4$. —$B'_2H_2C_2O_4$.—$B'_2H_2PtCy_4$ 5aq.

Di-acetyl derivative [227°]. Needles.

Nitro-phenylene-*m*-diamine $C_6H_7N_3O_2$ *i.e.* $C_6H_2(NO_2)(NH_2)_2$. [161°]. Obtained from its diacetyl derivative, which is got by nitrating $C_6H_4(NHAc)_2$ (Barbaglia, *B.* 7, 1259). Yellowish-red prisms, sol. water.

Di-acetyl derivative $C_6H_3(NO_2)(NHAc)_2$. [246°]. Slender needles (from alcohol).

Di-benzoyl derivative $C_6H_3(NO_2)(NHBz)_2$. [222°]. Got by nitrating dibenzoyl phenylene-*m*-diamine (Ruhemann, *B.* 14, 2652). Needles (from HOAc).

Nitro-phenylene-*p*-diamine $C_6H_3(NO_2)(NH_2)_2$[2:4:1]. [137°]. Formed from its diacetyl or dibenzoyl derivatives, got by nitrating the corresponding derivatives of phenylene-*p*-diamine (Ladenburg, *B.* 17, 149; Hinsberg, *A.* 254, 255). Dark needles with green lustre.

Di-acetyl derivative $C_6H_3(NO_2)(NHAc)_2$. [186°]. On warming with NaOHAq it yields the mono-acetyl derivative crystallising in red needles [195°].

Di-nitro-phenylene-diamine $C_6H_6N_4O_4$ *i.e.* $C_6H_2(NO_2)_2(NH_2)_2$. [211°]. Formed by reducing picramide $C_6H_2(NO_2)_3NH_2$ [6:4:2:1] with ammonium sulphide (Norton a. Elliott, *B.* 11, 327). Red needles, almost insol. cold water.

Di-acetyl derivative $C_6H_2(NO_2)_2(NHAc)_2$. [246°]. Yellow needles.

Di-nitro-phenylene-*m*-diamine $C_6H_2(NO_2)_2(NH_2)_2$ [4:2:3:1]. [c. 250°]. Formed by heating di-nitro-resorcin with aqueous ammonia (Barr, *B.* 21, 1545). Brownish needles (from HOAc), sl. sol. alcohol.

Di-nitro-phenylene-*m*-diamine $C_6H_2(NO_2)_2(NH_2)_2$. [c. 300°]. Obtained by saponification of its di-acetyl derivative which is formed by nitration of di-acetyl-*m*-phenylene-diamine (Nietzki a. Hagenbach, *B.* 20, 333). Orange-yellow crystals.

Di-acetyl derivative. [228°]. Needles.

Di-nitro-phenylene-*p*-diamine. *Di-acetyl derivative.* [258°]. Formed by nitrating di-acetyl-phenylene-*p*-diamine (Nietzki a. Hagenbach, *B.* 20, 331). Yellow solid, sl. sol. alcohol.

Tri-nitro-phenylene-*m*-diamine $C_6H_5N_5O_6$ *i.e.* $C_6H(NO_2)_3(NH_2)_2$ [6:4:2:3:1]. [above 250°]. Formed by boiling the di-ethyl ether of tri-nitro-resorcin with alcoholic ammonia (Nölting a. Collin, *B.* 17, 260; Barr, *B.* 21, 1546).

Yellow granules. Reduced by $SnCl_2$ and HCl to unstable penta-amido-benzene.

NITRO-DIPHENYLENE-KETONE $C_{13}H_7NO_2$ *i.e.* $\left[3:\genfrac{}{}{0pt}{}{6}{1}\right]C_6H_3(NO_2)<\genfrac{}{}{0pt}{}{C_6H_4}{CO}>$. [220°]. Formed, as well as di-nitro-diphenylene ketone [290°], by nitration of o-diphenylene ketone (Schultz, *A.* 203, 103). The isomeric nitro- derivative of iso-diphenylene-ketone [83°] melts at 220°–230° (Carnelley a. Dunn, *B.* 21, 2005).

Nitro-diphenylene-ketone carboxylic acid $C_{14}H_7(NO_2)O_3$. [246°]. Got by warming diphenylene-ketone carboxylic acid with HNO_3 (Fittig a. Liepmann, *A.* 200, 6). Golden needles (from alcohol).—BaA'_2 4aq: yellow needles, sl. sol. water.

(α)-DI-NITRO-DIPHENYLENE-KETONE OXIDE $C_6H_3(NO_2)<\genfrac{}{}{0pt}{}{O}{CO}>C_6H_3(NO_2)$. [190°]. Formed, together with a (β)-isomeride [260°], by warming diphenylene-ketone oxide with HNO_3 (Wichelhaus a. Salzmann, *B.* 10, 1401; R. Richter, *J. pr.* [2] 28, 292; A. G. Perkin, *C. J.* 43, 189; Graebe, *A.* 254, 286). An isomeric body [224°] is formed, together with a di-nitro- derivative [235°], by nitration of iso-diphenylene-ketone oxide [91°] (R.).

NITRO-PHENYLENE-DI-METHYL-o-DI-AMINE $C_6H_3(NO_2)(NMe_2)(NH_2)$ [4:1:2]. [63°]. Formed by reducing di-nitro-dimethylaniline by ammonium sulphide (Heim, *B.* 21, 2308). Orange needles (from water).

Nitro-phenylene-tri-methyl-diamine $C_6H_3(NO_2)(NMe_2)(NHMe)$.

Acetyl derivative. [c. 210°].

Nitrosamine $C_6H_3(NO_2)(NMe_2)(NMeNO)$. [87°]. Formed from $C_6H_4(NMe_2)_2$ and HNO_2 in excess (Wurster a. Schobig, *B.* 12, 1811). Needles.

Tri-nitro-phenylene-di-methyl-diamine $C_8H_9N_5O_6$ *i.e.* $C_6H(NO_2)_3(NHMe)_2$. [235°]. Formed by heating its nitramine with phenol or aqueous methylamine (Romburgh, *R. T. C.* 7, 6; 8, 279). Golden crystals (from HOAc).

Di-nitramine $C_6H(NO_2)_3(NMe.NO_2)_2$. Formed by boiling $C_6H_4(NMe_2)_2$ with fuming HNO_3 (Romburgh, *R. T. C.* 6, 252). Pale-yellow crystals, decomposing at about 205°. A nitramine $C_6H(NO_2)_3(NHMe)(NMeNO_2)$ is got by the action of methylamine on $C_6H(NO_2)_4NMeNO_2$. It separates from HOAc in golden crystals [192°].

NITRO-PHENYLENE-(α)-NAPHTHYL-o-DIAMINE $C_6H_3(NO_2)(NH_2)(NHC_{10}H_7)$. [147°]. Formed from (4, 2, 1)-di-nitro-phenyl-(α)-naphthylamine and ammonium sulphide (Heim, *B.* 21, 2302). Needles (from HOAc), v. e. sol. alcohol. The isomeric compound from di-nitro-phenyl-(β)-naphthylamine melts at 195°, and yields an acetyl derivative [200°], which is converted by Ac_2O into nitro-phenylene-(β)-naphthyl-acetamidine [162°].

DI-NITRO-PHENYLENE-NAPHTHYLENE OXIDE $C_{16}H_8(NO_2)_2O$. [235°]. Formed by nitrating (α)-phenylene-(α)-naphthylene oxide (Arx, *A.* 209, 141). V. sol. ether and HOAc.

NITRO-PHENYLENE-NAPHTHYL-ACET-AMIDINE $C_6H_3(NO_2)<\genfrac{}{}{0pt}{}{N(C_{10}H_7)}{N:CMe}>$. [162°]. Formed from nitro-amido-phenyl-(β)-naphthylamine and Ac_2O (Heim, *B.* 21, 589). Needles.

DI-NITRO-DIPHENYLENE OXIDE $C_{12}H_6(NO_2)_2O$. [200°]. Formed from diphenylene oxide and fuming HNO_3 (Hoffmeister, *A.* 159, 211). Crystals (from alcohol).

NITRO-PHENYLENE-UREA $C_7H_5N_3O_3$ *i.e.* $C_6H_3(NO_2)<\genfrac{}{}{0pt}{}{NH}{NH}>CO$. Formed by heating nitro-amido-phenyl-carbamic ether (Hager, *B.* 17, 2630). Colourless needles, not melted at 300°.

NITRO-*u*-DI-PHENYL-ETHANE $C_6H_4(NO_2).CHPh.CH_3$. [80°]. Formed, together with $(C_6H_4.NO_2)_2CH.CH_3$ [149°], by nitration of *u*-di-phenyl-ethane (Anschütz a. Romig, *B.* 18, 664). Long yellow needles.

Di-*p*-nitro-*s*-di-phenyl-ethane [4:1] $C_6H_4(NO_2).CH_2.CH_2.C_6H_4(NO_2)$ [1:4]. [179°]. Formed, together with an isomeride [75°], from dibenzyl and fuming HNO_3 (Stelling a. Fittig, *A.* 137, 260; Leppert, *B.* 9, 15). Formed also from *p*-nitro-benzyl chloride, $SnCl_2$, and NaOHAq (W. Roser, *A.* 238, 364). Needles, sl. sol. alcohol.

DI-NITRO-DI-PHENYL-ETHANE DICARBOXYLIC ACID $C_{16}H_{12}(NO_2)_2O_4$. Formed by nitrating *s*-di-phenyl-ethane di-*o*-carboxylic acid (Dobreff, *A.* 239, 70). Minute crystals, melting above 300°.—CaA″.

Ethyl ether EtHA″. [60°].

Di-nitro-di-phenyl-ethane dicarboxylic acid [226°]. Formed by nitration of *s*-di-phenyl-ethane *αβ*-dicarboxylic acid (Reimer, *B.* 14, 1802). Amorphous (containing aq). An isomeric acid [242°] is got by nitrating *s*-di-phenyl-ethane *αα*-dicarboxylic acid. Both acids yield *p*-nitro-benzoic acid on oxidation.

***o*-NITRO-PHENYL-ETHYL CARBONATE** $C_6H_4(NO_2).OCO.OEt$. (275°–285°). Formed by the action of chloro-formic ether upon the potassium salt of o-nitro-phenol (Bender, *B.* 19, 2268). Heavy yellow oil.

NITRO-PHENYL-ETHYLENE *v.* NITRO-STYRENE.

Nitro-*s*-di-phenyl-ethylene $C_6H_4(NO_2).CPh:CH_2$. [86°]. Formed from $C_6H_4(NO_2).CPh(OH).CH_3$ and AcCl (Anschütz a. Romig, *B.* 18, 664). Yellow crystals (from ether).

Di-*o*-nitro-di-phenyl-ethylene $(C_6H_4(NO_2))_2C_2H_2$. Formed in two modifications '*cis*' [126°] and '*trans*' [196°], by the action of alcoholic potash upon o-nitro-benzyl chloride (Bischoff, *B.* 21, 2072; 23, 2072). Both crystallise in needles.

Di-*p*-nitro-di-phenyl-ethylene. Formed in two modifications, [c. 213°] and [c. 282°], by the action of alcoholic potash on *p*-nitro-benzyl chloride (Walden, *B.* 23, 1959; *cf.* Strakosch, *B.* 6, 328). Both are crystalline.

DI-*m*-NITRO-DI-PHENYL-ETHYLENE-DIAMINE $(C_6H_4(NO_2).NH)_2C_2H_4$. [206°]. Obtained by heating *m*-nitro-aniline with ethylene bromide at 130° (Gattermann a. Hager, *B.* 17, 778). Reddish-yellow crystals, insol. alcohol.

NITRO-*s*-DI-PHENYL-ETHYLENE CARBOXYLIC ACID. *Nitrile* $C_6H_4(NO_2).CCy:CHPh$. [176°]. Got from *p*-nitro-phenyl-acetonitrile, benzoic aldehyde, and alcoholic NaOEt at 50° (Remse, *B.* 23, 3134). Yellow needles. By using o- or *m*- nitro-benzoic aldehyde, the corresponding di-nitro- compounds [4:1] $C_6H_4(NO_2).CCy:CH.C_6H_4(NO_2)$ [2:1] [185°] and [4:1] $C_6H_4(NO_2).CCy:CH.C_6H_4(NO_2)$ [3:1] [195°] may be made. Both crystallise in needles.

***m*-NITRO-PHENYL-ETHYLENE-QUINOLINE** $C_9NH_6.CH:CH.C_6H_4NO_2$. [136°]. Obtained by heating methyl-quinoline (lepidine) with *m*-nitro-benzoic aldehyde and $KHSO_4$ at 160° (Heymann a. Königs, *B.* 21, 1424). Needles.

NITRO-PHENYL ETHYL KETONE $C_6H_4(NO_2).CO.C_2H_5$. [100°]. Formed, together with a syrupy isomeride, by nitration of phenyl-ethyl ketone (Barry, *B.* 6, 1007). Prisms.

NITRO-PHENYL-FURFURYL-ACRYLIC ACID. *Nitrile* $C_6H_4(NO_2).CCy{:}CH.C_4H_3O$. [173°]. Formed from furfuraldehyde, *p*-nitro-phenyl-acetonitrile, and alcoholic NaOEt (Freund a. Immerwahr, *B.* 23, 2852). Needles.

o-NITRO-PHENYL-GLYCIDIC ACID $C_9H_7NO_5$ aq *i.e.* $C_6H_4(NO_2).C_2H_2O.CO_2H$. *Nitro-phenyl oxyacrylic acid.* [108°]. Formed from $C_6H_4(NO_2).CH(OH).CHCl.CO_2H$ and alcoholic potash (Baeyer, *B.* 13, 2262; Morgan, *B.* 17, 219; Lipp, *B.* 19, 2649). Prisms (containing aq). Melts at 94° when hydrated; 108° when anhydrous. Yields indigo and CO_2 on heating.—NH_4A' aq.—AgA': white crystalline pp.

p-**Nitro-phenyl-glycidic acid.** [188°]. Formed in the same way as the o- isomeride (Lipp), and also by the action of HOCl on sodium *p*-nitro-cinnamate (Erlenmeyer, *B.* 14, 1868). Plates (from hot water). Yields $C_6H_4(NO_2).CH(OH).CH(OH).CO_2H$ on boiling with dilute H_2SO_4.

NITRO-PHENYL-GLYCOCOLL *v.* NITRO-PHENYL-AMIDO-ACETIC ACID.

NITRO-PHENYL-GLYCOLLIC ACID *v.* GLYCOLLIC ACID.

o-NITRO-PHENYL-GLYOXYLIC ACID $C_6H_4(NO_2).CO.CO_2H$. [49°]. Formed from its amide, which is got by the action of cold conc. HClAq on $C_6H_4(NO_2).CH_2Cy$ (Claisen a. Shadwell, *B.* 12, 352; Fehrlin, *B.* 23, 1577). Needles.

Amide [189°] (C. a. S.); [199°] (F.)

Nitrile [54°]. Prisms (from ligroïn).

Phenyl hydrazide [166°]. Changed by dissolving in alcoholic KOH and adding HCl into an isomeride [190°]. HNO_3 converts the first phenyl-hydrazide into a body melting at 77°–80°, and the second into one melting at 95°–100°. Both yield isatin phenyl-hydrazide on reduction. The ethyl ether of the phenyl-hydrazide $C_{16}H_{15}N_4O_5$ crystallises in yellow prisms [128°] (Krause, *B*, 23, 3617).

Phenyl-methyl-hydrazide. [142°].

Oxim of the ethyl ether $C_6H_4(NO_2).C(NOH).CO_2Et$. [163°]. Needles (from boiling water) (Gabriel, *B.* 16, 519).

m-**Nitro-phenyl-glyoxylic acid** [78°]. Formed by boiling its amide with alkalis (Claisen a. Thompson, *B.* 12, 1944; 14, 1187. Prisms.—KA': flat prisms.—BaA'_2 aq.—AgA': nodules.

Amide $C_6H_4(NO_2).CO.CONH_2$. [152°]. Formed from *m*-nitro-phenyl-acetonitrile, and also by nitration of phenyl-glyoxylic amide.

Nitrile (231° at 145 mm.). Oil.

Phenyl hydrazide [176°] (F.). Crystals. Successive treatment with KOH and HClAq yields a green compound [285°].

Di-nitro-phenyl-glyoxylic acid.

Phenyl-hydrazide of the methyl ether. $C_6H_3(NO_2)_2.C(N_2HPh).CO_2Me$. [183°]. Formed from methyl-di-nitro-phenyl-acetate and diazobenzene chloride (V. Meyer, *B.* 22, 319). Alcoholic potash forms a blue solution, changing to

yellow, and forming $C_6H_3(NO_2){<}\begin{smallmatrix}C(CO_2H)\\NPh.N\end{smallmatrix}{\gg}$ [272°], which yields a methyl ether [192°].

m-**NITRO-DIPHENYL-GUANIDINE** $NH{:}C(NHPh).NHC_6H_4NO_2$. [132°]. Formed from *m*-nitro-di-phenyl-thio-urea, PbO, and alcoholic NH_3 (Brückner, *B.* 7, 1236). Cyanogen, followed by dilute HClAq, changes it to the oxalyl derivative [168°], whence hot conc. HCl forms nitro-di-phenyl-parabanic acid (Hirsch, *C. C.* 1888, 624).

m-**Nitro-tri-phenyl-guanidine.** [159°]. Formed from *m*-nitro-di-phenyl-thio-urea, PbO, and aniline (B.; Losanitsch, *B.* 16, 50). Yellow plates.—$B'_2H_2PtCl_6$.

m-**Di-nitro-di-phenyl-guanidine** $NH{:}C(NH.C_6H_4NO_2)_2$. [190°]. Formed from *m*-nitro-aniline and cyanogen chloride (Hofmann, *A.* 67, 156), or from di-nitro-di-phenyl thio-urea, PbO, and alcoholic NH_3 (B.). Scales. $B'HCl$.—$B'_2H_2PtCl_6$.

Tri-*m*-nitro-tri-phenyl-guanidine $C_6H_4(NO_2).N{:}C(NH.C_6H_4.NO_2)_2$. [189°]. Formed from di-nitro-di-phenyl-thio-urea, iodine, and alcohol (L.). Yellow plates, sol. hot alcohol.

DI-NITRO-DI-PHENYL-HEPTANE $C_7H_{14}(C_6H_4NO_2)_2$. Oil (Auger, *Bl.* [2] 47, 42).

o-NITRO-PHENYL-HYDRAZINE $C_6H_4(NO_2)NH.NH_2$. [90°]. Formed from o-nitro-diazobenzene chloride, HCl, and $SnCl_2$ at 0° (Bischler, *B.* 22, 240, 2801). Brick-red needles from benzene), sl. sol. cold alcohol. With benzoic aldehyde it yields $C_6H_5.CH{:}N.NH.C_6H_4NO_2$ [187°].—$B'HSnCl_3$: prisms.—$B'HCl$: needles.—$B'_2H_2SO_4$: flesh-coloured needles.

Formyl derivative $C_6H_4(NO_2).NH.NHCHO$. [177°]. Formed from o-nitro-phenyl-hydrazine hydrochloride, formic acid, and some Na_2CO_3. Needles, v. e. sol. hot Aq.

Acetyl derivative [141°]. Needles.

Di-acetyl derivative [58°]. Prisms.

Benzoyl derivative [166°]. Needles.

Oxalyl derivative $C_2O_2(NH.NH.C_6H_4NO_2)_2$. Formed from the hydrazide and oxalic ether. Yellow needles, sol. hot nitrobenzene.

m-**Nitro-phenyl-hydrazine** $C_6H_4(NO_2)NH.NH_2$. [93°]. Prepared in the same way as the o- compound (Bischler a. Brodsky, *B.* 22, 2809). Canary-yellow needles. Reacts with ketonic compounds, yielding their *m*-nitro-phenyl-hydrazides, with the following melting-points: from aldehyde [98°]; from acetone [112°]; from benzoic aldehyde [118°]; from acetophenone [160°]; from benzil [158°]; and from aceto-acetic ether [117°].

Salts.—$B'HCl$.—$B'_2H_2SO_4$: yellow crystalline groups, v. sol. hot water.

Acetyl derivative [145°]. Plates.

Di-acetyl derivative [150°]. Tables.

(α)-Acetyl-(β)-benzoyl derivative $C_6H_4(NO_2)NBz.NHAc$. [137°]. Formed from the acetyl derivative and Bz_2O at 160°. Yellowish aggregates of crystals.

(α)-Benzoyl-(β)-acetyl derivative $C_6H_4(NO_2)NAc.NHBz$. [147°]. Formed from the benzoyl derivative, Ac_2O, and NaOAc. Needles (by sublimation).

Benzoyl derivative. [151°]. Needles.

Di-benzoyl derivative. [153°]. Plates.

Di-nitro-di-phenyl-hydrazine $C_6H_5.NH.NH.C_6H_3(NO_2)_2$ [1:2:4]. [120°]. Formed from $C_6H_3Cl(NO_2)_2$ and phenyl-hydrazine (Willgerodt, *J. pr.* [2] 37, 350; 40, 252; 42, 132). Red plates. Converted by shaking with HgO into $C_6H_5.N_2.C_6H_3(NO_2)_2$ [117°]. On boiling with alcohol it yields $C_6H_5.N_2.C_6H_3(NO)_2$ [178°]; boiling HOAc forms $C_6H_5.N_2.C_6H_3(NO)(NO_2)$ [175°].

Di-*m*-nitro-s-di-phenyl-hydrazine $(C_6H_4(NO_2))_2N_2H_2$. [220°]. Formed from di-nitro-azobenzene and cold alcoholic ammonium sulphide (Lermontoff, *B.* 5, 236). Yellow needles.

Tri-nitro-di-phenyl-hydrazine $C_6H_5NH.NHC_6H_2(NO_2)_3$ [1:2:4:6]. [185°]. Formed from $C_6H_2Cl(NO_2)_3$ and phenyl-hydrazine hydrochloride (Willgerodt, *J. pr.* [2] 37, 346; 40, 264; Fischer, *A.* 190, 132; 253, 1). Red crystals, melting at 175°–180° when slowly heated, but 183°–185° when quickly heated. By boiling with MeOH it is converted into the compound $C_6H_5.N_2:C_6H_2(NO_2)_2$ [218°]. On heating with HOAc it yields $C_6H_5N_2C_6H_2(NO_2)_2(NO)$ [248°] (Freund, *B.* 22, 1663), which yields a mono-sulphonic acid crystallising from water in yellow needles, not melted at 360°.

o-NITRO-PHENYL-HYDRAZINE SULPHONIC ACID $C_6H_3(NO_2)(SO_3H).NH.NH_2$. Formed from o-nitro-diazobenzene sulphonic acid and a well-cooled, strongly acid, solution of $SnCl_2$ (Nietzki a. Lerch, *B.* 21, 3220).—HA'HCl.

***m*-Nitro-phenyl-hydrazine sulphonic acid** [3:6:1] $C_6H_3(NO_2)(SO_3H).NH.NH_2$. Formed from nitro-diazobenzene sulphonic acid and cold $SnCl_2$ (Limpricht, *B.* 18, 2194). Yellow needles (containing aq).—KA' 1½aq.—BaA'₂ 1½aq.—PbA'₂ 4aq.

NITRO-PHENYL-HYDROXYLAMINE *v.* HYDROXYLAMINE DERIVATIVES.

DI-NITRO-DI-PHENYL-HYPOPHOSPHOROUS ACID $(C_6H_4NO_2)_2PO.OH$. [268°]. Formed from Ph_2PO_2H, nitric acid, and H_2SO_4 (Dörken, *B.* 21, 1513). Yellow pp., v. sol. water.—NH_4A'. [260°].—KA' 2aq.—BaA'₂ 6aq.—PbA'₂.—AgA'.

NITRO-PHENYL-ψ-INDAZINE CARBOXYLIC ACID

$$C_6H_3(NO_2)\left\langle\begin{matrix}N(C_6H_5)\\C(CO_2H)\end{matrix}\right\rangle N.$$

[272°]. Formed by the action of alcoholic potash on the red needles [183°] formed from di-nitro-phenyl-acetic ether and diazobenzene (V. Meyer, *B.* 22, 319; *A.* 264, 149). Sulphur-yellow needles, v. sl. sol. alcohol. Reduced by $SnCl_2$ to a dihydride [235°].

Methyl ether MeA'. [192°]. Needles. Converted by HNO_3 into $C_{15}H_{10}N_4O_6$ [281°]; and by H_2SO_4 into a sulphonic acid (Strassmann, *B.* 23, 714).

Ethyl ether EtA'. [158°]. Needles.

NITRO-DI-PHENYL-KETONE *v.* NITRO-BENZOPHENONE.

DI-NITRO-PHENYL-MALONIC ETHER $C_6H_3(NO_2)_2.CH(CO_2Et)_2$. [51°]. Formed from sodium malonic ether and $C_6H_3Br(NO_2)_2$ (Von Richter, *B.* 21, 2472). Pale-yellow prisms.

***m*-NITROPHENYL MERCAPTAN** $C_6H_4(NO_2).SH$. Formed by the action of alcoholic potash on the ether formed from potassium xanthate and *m*-diazobenzene (Leuckart, *J. pr.* [2] 41, 197). Yellow liquid with nasty smell.

***p*-Nitro-phenyl mercaptan** $C_6H_4(NO_2)SH$. [77°]. Formed from $C_6H_4Cl(NO_2)$ and alcoholic KSH (Willgerodt, *B.* 18, 331). Crystals.

Di-nitro-phenyl mercaptan $C_6H_3(NO_2)_2SH$ [4:2:1]. [131°]. Formed from $C_6H_3Cl(NO_2)_2$ and KHS (Willgerodt, *J.* 1884, 974). Needles.

Ethers (Willgerodt, *B.* 18, 330). MeA'. [126°].—EtA'. [113°].—PrA'. [94°].—$PrCH_2A'$. [72°].—$C_6H_5CH_2A'$. [128°].—BzA'. [113°].

Di-nitro-phenyl-mercaptan [195°]. Formed by heating $C_6H_3(NO_2)_2SCN$ with conc. H_2SO_4 (Austen a. Smith, *Am.* 8, 90). Yellow powder.

Tri-nitro-phenyl mercaptan $C_6H_2(NO_2)_3SH$ [6:4:2:1]. [114°]. Formed from $C_6H_2Cl(NO_2)_3$ and alcoholic KSH (W.). Small yellowish needles. Explodes at 115°.—KA': brown needles.

o-NITRO-PHENYL-METHACRYLIC ACID $C_6H_4(NO_2).CH:CMe.CO_2H$. [165°]. Formed by hydrolysis of its ether, which is prepared from methyl phenyl-methacrylate and HNO_3. Formed also from phenyl-isobutyric acid and HNO_3 (Edeleanu, *B.* 20, 621; *C. J.* 53, 559). Crystalline powder, yielding o-nitro-benzoic acid on oxidation.

***m*-Nitro-phenyl-methacrylic acid** [197°]. Formed from *m*-nitro-benzoic aldehyde by heating with sodium propionate and propionic anhydride (Von Miller, *B.* 23, 1900). White powder, v. sol. hot alcohol.

***p*-Nitro-phenyl-methacrylic acid** [208°]. Formed in the same way as the o- isomeride (E.). Crystals.—AgA': white needles.

Methyl ether MeA'. [115°]. Plates.

***m*-NITRO-PHENYL-METHACRYLIC ALDEHYDE** $C_6H_4(NO_2).CH:CMe.CHO$. [83°]. Formed from *m*-nitro-benzoic aldehyde, propionic aldehyde, and dilute (10 p.c.) aqueous NaOH (Miller a. Kinkelin, *B.* 19, 530). Thin prisms (from alcohol). Aniline yields oily $C_6H_3(NO_2).CH:NPh$ and crystalline $C_6H_3(NO_2).CH(NHPh)_2$ [170°]. Tin and HCl yield a base $C_{10}H_{11}N$ [98°], whence Ac_2O forms $C_{10}H_{10}AcN$ [148°], and benzoic aldehyde produces $C_{10}H_9N(CHPh)$ [73°].

Phenyl-hydrazide $C_{16}H_{15}N_3O_2$. [135°].

NITRO-DI-PHENYL-METHANE $C_{13}H_{11}NO_2$ *i.e.* $C_6H_5.CH_2.C_6H_4NO_2$.

o- compound. Formed from o-nitro-benzyl chloride, benzene, and $AlCl_3$ (Geigy a. Kœnigs, *B.* 18, 2402). Oil.

***m*- compound.** [141°]. Formed from *m*-nitro-benzyl alcohol and conc. H_2SO_4 (Becker, *B.* 15, 2091). Oil; sol. alcohol.

***p*- compound.** [31°]. Formed by either of the above methods (Basler, *B.* 16, 2716; Manns, *C. C.* 1888, 1363). Prisms, v. sol. alcohol.

***m*-Nitro-tri-phenyl-methane** $CHPh_2.C_6H_4NO_2$. [90°]. Formed from *m*-nitro-benzoic aldehyde, benzene, and H_2SO_4 (Tschacher, *B.* 19, 2463; 21, 188). Crystals (from ligroïn).

***p*-Nitro-tri-phenyl-methane.** [93°]. Formed in like manner (Baeyer a. Löhr, *B.* 23, 1622).

Di-nitro-di-phenyl-methane $C_{13}H_{10}(NO_2)_2$. By nitrating diphenyl-methane Doer (*B.* 5, 795) obtained two compounds of this formula, melting at 183° and 172°; while Staedel (*A.* 194, 363) obtained the (α)- compound [183°] and a (β)-isomeride [118°]. By nitrating *m*-nitro-di-phenyl-methane Becker (*B.* 15, 2092) obtained a fourth isomeride [94°], while Basler (*B.* 16, 2719) got a fifth isomeride [175°] by the nitration of *p*-nitro-di-phenyl-methane.

Tri-nitro-tri-phenyl-methane $CH(C_6H_4.NO_2)_3$. [207°]. Formed by nitrating tri-phenyl-methane

(E. a. O. Fischer, *A.* 194, 254; *cf.* Hemilian, *B.* 7, 1203). Scales (from benzene).

Tetra-nitro-di-phenyl-methane. [172°]. Formed from CH_2Ph_2 and fuming HNO_3 at 0° (Staedel, *A.* 218, 339). Long pointed needles.

DI-NITRO-DI-PHENYL-METHYL-AMINE $C_6H_4(NO_2)NMe.C_6H_5$. [167°]. Formed from $C_6H_3Cl(NO_2)_2$ and $C_6H_5NMe_2$ or C_6H_5NHMe (Leymann, *B.* 15, 1235). Reddish needles.

NITRO-DI-PHENYL-METHYL-CARBINOL $C_6H_4(NO_2).CPh(OH).CH_3$. [107°]. Formed from *u*-di-phenyl-ethane and HNO_3 (Anschütz a. Romig, *B.* 18, 664). White prisms, yielding an acetyl derivative [86°].

o-**NITRO-PHENYL-TRIMETHYLENE GLYCOL** $C_6H_4(NO_2).CH(OH).CH_2.CH_2(OH)$. [109°]. Formed from *o*-nitro-benzoic aldehyde, acetic aldehyde, and an alkali (Baeyer a. Drewson, *B.* 15, 2861). Colourless needles.

NITRO-PHENYL TRIMETHYLENYL KETONE CARBOXYLIC ACID

$C_6H_3(NO_2).CO.C(CO_2H)<{\begin{matrix}CH_2\\ \dot{C}H_2\end{matrix}}$. [176°]. Obtained from its ether, which is produced by the action of ethylene bromide on sodium *p*-nitro-benzoyl-acetic ether (Perkin a. Bellinot, *B.* 18, 958). Colourless needles.—AgA′: amorphous.

Ethyl ether EtA′. [84°]. Prisms.

NITRO-PHENYL-METHYL KETONE *v.* NITRO-ACETOPHENONE.

p-**NITRO-PHENYL-METHYL-OXAZOLE**

${\begin{matrix}CH:C(C_6H_4NO_2)\\ N{=\!=}C(CH_3){-}\end{matrix}}>O$. [157°]. Formed by the action of conc. HNO_3 on the base obtained from acetamide and bromo-acetophenone (Lewy, *B.* 21, 925). Yellow needles, v. sol. hot alcohol. Yields an amido- derivative [115°].

p-**NITRO-PHENYL-(β)-METHYL-PIPERIDINE** $C_6H_4(NO_2).NC_5H_9Me$. [61°]. Formed by heating (β)-methyl-piperidine with $C_6H_4Cl(NO_2)$ at 150° (Lellmann a. Büttner, *B.* 23, 1389). Golden plates (from alcohol).—$B'HAuCl_4$ 2aq.

Di-nitro-phenyl-(β)-methyl-piperidine [67°]. Formed in like manner, using the compound $C_6H_3Cl(NO_2)_2$ [1:2:4]. Yellow needles.

o-**NITRO-DI-PHENYL-METHYL-PYRAZOLE**

$C_{16}H_{13}N_3O_2$ *i.e.* $C_6H_4(NO_2).C<{\begin{matrix}N\ .\ NPh\\ CH:CMe\end{matrix}}$. [95°] or [105°]. (285° at 70 mm.). Formed by heating its carboxylic acid [218°] (Knorr a. Jödicke, *B.* 18, 2261). Iridescent plates [95°], slender needles, or thick prisms [105°].—$B'_2H_2PtCl_6$. [198°].

p-**Nitro-di-phenyl-methyl-pyrazole** $C_{16}H_{13}N_3O_2$. Formed by heating its carboxylic acid [202°]. Oil.—$B'_2H_2PtCl_6$: slender needles.

Tri-nitro-di-phenyl-methyl-pyrazole

$C_6H_4(NO_2).C<{\begin{matrix}N.N(C_6H_4NO_2)\\ C(NO_2){=}CMe\end{matrix}}>$. [178°]. Formed by nitrating di-phenyl-methyl-pyrazole (Knorr a. Laubmann, *B.* 22, 174). V. sl. sol. alcohol.

NITRO-DI-PHENYL-METHYL-PYRAZOLE CARBOXYLIC ACID

$C_6H_4(NO_2).C<{\begin{matrix}N.N(C_6H_5){-\!-\!-}\\ C(CO_2H):CMe\end{matrix}}>$. The ethers of the *o*- acid [218°] and of the *p*- acid [202°] are respectively formed by heating *o*- and *p*- nitro-benzoyl-acetoacetic ether with phenyl-hydrazine in HOAc (Knorr a. Jödicke, *B.* 18, 2257). The *o*- ether melts at 146° and the *p*- ether at 128°. Both crystallise well.

m-**NITRO-PHENYL-DI-METHYL-PYRIDINE DICARBOXYLIC ETHER** $C_{19}H_{20}N_2O_4$ *i.e.* $C_6H_4(NO_2).C_5NMe_2(CO_2Et)_2$. [65°]. Formed from its dihydride and fuming HNO_3 (Lepetit, *G.* 17, 461). Colourless crystals (from alcohol).—$B'_2H_2PtCl_6$. [202°]. Orange-yellow needles.—$B'HNO_3$. [130°]. Colourless needles.

NITRO-PHENYL-DI-METHYL-PYRIDINE DIHYDRIDE DICARBOXYLIC ETHER $C_6H_4(NO_2).C_5NH_2Me_2(CO_2Et)_2$. Formed from nitro-benzoic aldehyde, acetoacetic ether, alcohol, and NH_3 (Lepetit, *G.* 17, 460; *B.* 20, 1341).

o- isomeride. [120°]. Yellow tables.

m- isomeride. [161°]. Tables.

p- isomeride. [118°–122°].

m-**NITRO-PHENYL-METHYL-QUINOLINE**

$C_6H_4<{\begin{matrix}CH:CMe\\ N:C.C_6H_4NO_2\end{matrix}}$. [145°]. Formed by heating aniline with *m*-nitro-α-methyl-cinnamic aldehyde and conc. HClAq (Miller a. Kinkelin, *B.* 19, 531). Small plates, v. sol. hot alcohol.—$B'HCl$.—$B'_2H_2PtCl_6$: long needles.

DI-NITRO-PHENYL-(α)-NAPHTHYLAMINE $C_{16}H_{11}N_3O_4$ *i.e.* [4:2:1]$C_6H_3(NO_2)_2.NHC_{10}H_7$. [190·5°]. Formed from (α)-naphthylamine and $C_6H_3Br(NO_2)_2$ [72°] (Heim, *B.* 21, 2302). Orange-red needles (from alcohol). Conc. H_2SO_4 forms a dark-blue solution.

Isomeride. [77°]. Prepared by nitration of phenyl-(α)-naphthylamine (Streiff, *B.* 13, 1853).

Di-nitro-phenyl-(β)-naphthylamine [169°] (H.); [179°] (E.). Prepared by the action of $C_6H_3Br(NO_2)_2$ or $C_6H_3Cl(NO_2)_2$ on (β)-naphthylamine (Heim, *B.* 21, 589; Ernst, *B.* 23, 3429). Prisms. By nitration of phenyl-(β)-naphthylamine Streiff obtained $C_{16}H_{12}(NO_2)N$ [85°] and $C_{16}H_{11}(NO_2)_2N$ [192°–195°], both crystalline.

Tetra-nitro-phenyl-naphthylamine $C_{10}H_3(NO_2)_4NHC_6H_5$. The (α)- compound [162·5°] and the (β)- isomeride [253°] are formed from aniline and the corresponding bromo-tetra-nitro-naphthalenes (Merz a. Weith, *B.* 15, 2712). Both crystallise from benzene in orange-needles (containing benzene).

DI-NITRO-PHENYL-(α)-NAPHTHYL-HYDRAZINE $C_{16}H_{12}N_4O_4$. [181°]. Formed from (α)-chloro-di-nitro-benzene and (α)-naphthyl-hydrazine (Willgerodt, *J. pr.* [2] 43, 184). Red prisms. (β)-Naphthylamine yields an isomeride [188°].

Tri-nitro-phenyl-(α)-naphthyl-hydrazine $C_{16}H_{11}N_5O_6$. [176°]. Got from an alcoholic solution of picryl chloride and (α)-naphthyl-hydrazine (W.). Occurs in a red stable modification and an unstable yellow one. (β)-Naphthylamine forms an isomeride [175°] also occurring in two forms.

DI-NITRO-PHENYL-(β)-NAPHTHYL OXIDE $C_{10}H_7.O.C_6H_3(NO_2)_2$[1:2:4]. [95°]. Formed from $C_6H_3Cl(NO_2)_2$ and (β)-naphthol (Ernst, *B.* 23, 3430). Yellow needles (from alcohol).

NITRO-PHENYL NITRO-BENZYL OXIDE $C_6H_4(NO_2).O.CH_2.C_6H_4(NO_2)$. The compound formed from *p*-nitro-benzyl chloride, *o*-nitro-phenol, and alcoholic potash melts at 129°; the *pp*- isomeride at 183° (Kumpf, *B.* 17, 1077; *A.* 224, 107).

Di-nitro-phenyl nitro-benzyl oxide. [4:2:1]$C_6H_3(NO_2)_2.O.CH_2.C_6H_4NO_2$[1:4] [201°] and [6:2:1]$C_6H_3(NO_2)_2.O.CH_2.C_6H_4NO_2$[1:4] [137°] have been prepared (Staedel, *B.* 14, 899; Kumpf).

They yield di-nitro-aniline and *p*-nitro-benzyl alcohol [91°] on heating with alcoholic ammonia.

Tri-nitro-phenyl nitro-benzyl oxide [6:4:2:1]$C_6H_2(NO_2)_3.O.CH_2.C_6H_4NO_2$[1:4]. [108°]. Long thin needles (K.).

DI-NITRO-DI-PHENYL OXIDE $C_{12}H_8(NO_2)_2$. [135°]. Formed by nitrating di-phenyl oxide (Hoffmeister, *A.* 159, 191). Needles.

Di-nitro-di-phenyl oxide $C_6H_3(NO_2)_2.OC_6H_5$. [71°]. Formed from $C_6H_2Cl(NO_2)_2$ and PhOK (Willgerodt). Needles.

Tri-nitro-di-phenyl oxide [4:2:1]$C_6H_3(NO_2)_2.O.C_6H_4NO_2$[1:*x*]. Formed from $C_6H_3Cl(NO_2)_2$ and $C_6H_4(NO_2)(OK)$. The o- compound ($x=2$) melts at 119°, the *p*- isomeride ($x=4$) at 114° (Willgerodt a. Hüetlin, *B.* 17, 1764). Both are v. sol. benzene.

Tetra-nitro-di-phenyl oxide [6:4:2:1]$C_6H_2(NO_2)_3.O.C_6H_4(NO_2)$[1:*x*]. Formed from $C_6H_2Cl(NO_2)_3$ and $C_6H_4(NO_2)(OK)$. The *o*-compound ($x=2$) melts at 173° and the *p*-isomeride at 153° (W. a. H.). Both are crystalline.

Tetra-nitro-di-phenyl oxide $\{C_6H_3(NO_2)_2\}_2O$. [195°]. Formed by the action of $C_6H_3Cl(NO_2)_2$ on $C_6H_3(OK)(NO_2)_2$ (Willgerodt, *B.* 13, 887). Thick crystals, almost insol. alcohol.

NITRO-PHENYL-OXY-ACETIC ACID *v.* NITRO-MANDELIC ACID.

***p*-NITRO-PHENYL OXY-BUTYL KETONE ANHYDRIDE CARBOXYLIC ACID** $C_{12}H_{11}(NO_2)O_3$ *i.e.*  $O\Big<\begin{matrix}C(C_6H_4NO_2)\\CH_2.CH_2.CH_2\end{matrix}\Big>C.CO_2H$. Formed from trimethylene bromide and sodium *p*-nitro-benzoyl-acetic ether (Perkin, jun., *B.* 18, 954; *C. J.* 51, 735). Melts at 172° when crystallised from benzene; 183° when crystallised from water.—AgA′: light-yellow needles.

Ethyl ether EtA′. [63°]. Lustrous yellow monoclinic crystals; $a:b:c = 2{\cdot}353:1:1{\cdot}853$; $\beta = 80°\ 42'$.

***m*-NITRO-PHENYL-PARACONIC ACID** $C_{11}H_9NO_6$ *i.e.*  $C_6H_4(NO_2).CH\Big<\begin{matrix}CH(CO_2H)\\O.CO\end{matrix}\Big>CH_2$. [171°]. Formed by heating *m*-nitro-benzoic aldehyde with Ac_2O and NaOAc at 125° (Salomonson, *B.* 18, 2154; *R. T. C.* 6, 1). Crystals. Yields with baryta the salt $C_{11}H_8NO_7Ba$. The corresponding *p*- isomeride melts at 163° (S.; *cf.* Erdmann, *B.* 18, 2742).

***p*-NITRO-PHENYL-PENTINOIC ACID** $C_6H_4(NO_2).CH:CH.CH:CH.CO_2H$. [271°]. Formed from *p*-nitro-cinnamic aldehyde, Ac_2O, and NaOAc (Einhorn a. Gehrenbeck, *B.* 22, 45; *A.* 253, 357). Formed also by oxidising the ketone $C_6H_4(NO_2).CH:CH.CH:CH.COMe$ with NaOCl. Yellowish needles (from alcohol). Forms a tetrabromide [254°].—AgA′: flocculent pp.

Ethyl ether EtA′. [118°]. Plates.

o-Nitro-di-phenyl-pentinoic acid. *Nitrile* $C_6H_5.CH:CH.CH:C(C_6H_4NO_2).CN$. [206°]. Formed from *p*-nitro-benzyl cyanide, cinnamic aldehyde, and NaOEt (Remse, *B.* 23, 3135). Needles.

***p*-NITRO-PHENYL-PHENYL-(β)-AMIDO-PROPIONIC ACID** $C_6H_4(NO_2).CH(NHPh).CH_2.CO_2H$. [122°]. Formed from aniline and $C_6H_4(NO_2).CHBr.CH_2.CO_2H$ (Basler, *B.* 17, 1500). Yellow crystals.

Ethyl ether EtA′. [78°]. Crystals.

DI-NITRO-PHENYL-PHENYLENE DIAMINE $C_6H_3(NO_2)_2.NH.C_6H_4.NH_2$. [172°]. Formed from $C_6H_3Cl(NO_2)_2$[1:2:4] and phenylene-*m*-diamine (Leymann, *B.* 15, 1237).

NITRO-PHENYL PHOSPHATES. The following compounds have been prepared by Rapp (*A.* 224, 158), the NO_2 being in the *p*- position:

$C_6H_4(NO_2)O.PO(OH)_2$ [112°];

$(C_6H_4(NO_2)O)_2PO.OH$ [133°];

$(C_6H_4(NO_2).O)_2PO.OEt$ [135°]; and

$(C_6H_4(NO_2)O)_3PO$ [155°]. Tri-o-nitro-tri-phenyl phosphate melts at 126° (Engelhardt a. Latschinoff, *Z.* 1870, 230).

TRI-NITRO-TRI-PHENYL-PHOSPHINE OXIDE $OP(C_6H_4NO_2)_3$. [243°]. Got by nitrating tri-phenyl-phosphine hydrate (Michaelis a. Soden, *B.* 17, 921; *A.* 229, 324). It is accompanied by an isomeride [68°].

***m*-NITRO-PHENYL-PHTHALIMIDE**  $C_6H_4\Big<\begin{matrix}CO\text{———}O\\C(NC_6H_4NO_2)\end{matrix}\Big>$. [243°]. Prepared by heating phthalic anhydride with *m*-nitro-aniline (Gabriel, *B.* 11, 2261). Needles, v. sl. sol. EtOH.

NITRO-PHENYL-PIPERIDINE. The following compounds are formed by the action of piperidine upon the corresponding halogen derivatives of nitro- and di-nitro- benzene respectively (Lellmann, *B.* 20, 680; 21, 2281):

[1:4] $C_6H_4(NO_2).NC_5H_{10}$ [81°]: red prisms, yielding the salts B′HCl and $B'_2H_2PtCl_6$.

[1:2] $C_6H_4(NO_2).NC_5H_{10}$ [105·5°]: yellow plates, yielding the salts B′HCl and $B'_2H_2PtCl_6$.

[4:2:1] $C_6H_3(NO_2)_2.NC_5H_{10}$ [92°]: orange needles.

o-NITRO-PHENYL-PROPIOLIC ACID $C_9H_5NO_4$ *i.e.* $C_6H_4(NO_2).C{\vdots}C.CO_2H$. Formed from $C_6H_4(NO_2).CHBr.CHBr.CO_2H$ (or its ether) and aqueous NaOH (Baeyer, *B.* 13, 2258; Müller, *A.* 212, 127). Needles (from hot water), decomposing at 156°. On boiling with water it gives o-nitro-phenyl-acetylene. Boiling alkalis yield isatin. Reduction with glucose and alkalis produces indigo. $FeSO_4$ also reduces it, in alkaline solution, to indigo-white. Its Na salt boiled with aqueous KCN and glucose yields indigo, even in presence of much HCN (Michael, *J. pr.* [2] 35, 254).

Ethyl ether EtA′. [61°]. Tables. Converted by conc. H_2SO_4 into isatogenic ether (*q.v.*).

***p*-Nitro-phenyl-propiolic acid** [181°] (M.); [198°] (D.). From $C_6H_4(NO_2).CHBr.CHBr.CO_2Et$ and alcoholic potash (C. Müller, *A.* 212, 127; Drewson, *A.* 212, 154; Perkin, *C. J.* 49, 442). Yields *p*-nitro-phenyl-acetylene and CO_2 on distilling with steam.—AgA′: amorphous powder.

Ethyl ether EtA′. [126°]. Needles.

***o*-NITRO-β-PHENYL-PROPIONIC ACID** $C_6H_4(NO_2).CH_2.CH_2.CO_2H$. [112°]. Formed from (2, 4, 1)-nitro-amido-phenyl-propionic acid by elimination of NH_2 (Gabriel a. Zimmermann, *B.* 12, 600; 13, 1680). Yellow crystals.—AgA′.

***m*-Nitro-phenyl-propionic acid.** [118°]. Formed in like manner from the (3, 4, 1)-nitro-amido-phenyl-propionic acid (Gabriel, *B.* 15, 845). Yellow needles, sl. sol. water.

***p*-Nitro-β-phenyl-propionic acid.** [164°]. Formed together with the o- acid, by nitration of (β)-phenyl-propionic acid (Glaser a. Buchanan, *Z.* 1869, 193; Beilstein a. Kuhlberg, *A.* 163, 132).—$CaA'_2$2aq.—$BaA'_2$2aq: small needles.

Ethyl ether EtA′.

***o*-Nitro-α-phenyl-propionic acid** $C_6H_4(NO_2).CHMe.CO_2H$. [110°]. Formed, together with the *p*- isomeride [88°], by nitration of α-phenyl-propionic acid (Trinius, *A.* 227, 262). The o- acid forms the salt CaA'_2 2aq; the *p*- acid gives CaA'_2 2aq and BaA'_2 2aq.

Di-nitro-phenyl-propionic acid $C_6H_3(NO_2)_2.CH_2.CH_2.CO_2H$. [127°]. Formed by nitration of β-phenyl-propionic acid (G. a. Z.).

Ethyl ether EtA′. [32°]. Needles.

α-NITRO-PHENYL-PROPYLENE $C_6H_5.CH:C(NO_2).CH_3$. [64°]. Formed from benzoic aldehyde, nitro-ethane, and $ZnCl_2$ at 140° (Priebs, *A.* 225, 354); yellow needles.

Di-nitro-phenyl-propylene $C_6H_4(NO_2).CH:C(NO_2).CH_3$. The o- compound [77°] is formed, together with the *p*- isomeride [115°], by nitrating α-nitro-phenyl-propylene (T.).

Di-nitro-phenyl-propylene $C_6H_3(NO_2)_2CH:CHMe$. [118°]. Formed from $C_6H_5.CH:CMe.CO_2H$ and HNO_3 (Edeleanu, *B.* 20, 622). Yellowish needles.

***m*-NITRO-PHENYL-PYRIDYL-ETHYLENE** $C_6H_4(NO_2).CH:CH.C_5H_4N$. [120°]. Formed from *m*-nitro-benzoic aldehyde and methyl-pyridine (Schuftan, *B.* 23, 2716). Plates.—$B'_2H_2PtCl_6$. [240°].—*Mercury double salt* $B'HClHgCl_2$. [211°].—Picrate: yellow plates.

TETRA-NITRO-TETRA-PHENYL-PYRROLE $NH(C.C_6H_4NO_2)_4$. Formed from tetra-phenyl-pyrrole and HNO_3 (Fehrlin, *B.* 22, 554). Yellow needles (from HOAc), decomposing at 123°.

(α)-NITRO-(*Py.* 1)-PHENYL-QUINOLINE $C_{15}H_{10}N_2O_2$. [187°]. Formed together with a smaller quantity of a (β)-isomeride [118°] and a little of a (γ)-isomeride [135°] by nitration of (*Py.* 1)-phenyl-quinoline  $C_6H_4\left\langle\begin{matrix}CPh:CH\\N=CH\end{matrix}\right.$ (Königs a. Nef, *B.* 20, 624). They are all crystalline.

***m*-Nitro-(*Py.* 3)-phenyl-quinoline**  $C_6H_4\left\langle\begin{matrix}CH:CH\\N:C.C_6H_4.NO_2\end{matrix}\right.$. [124°]. Obtained by heating *m*-nitro-cinnamic aldehyde with aniline and HClAq at 140° (Miller a. Kinkelin, *B.* 18, 1900). White needles.—B′HCl.—$B'_2H_2PtCl_6$.

Tetrahydride  $C_6H_4\left\langle\begin{matrix}CH_2.CH_2\\NH.CH.C_6H_4NO_2\end{matrix}\right.$ [101°]. Tables. Yields a nitrosamine [71°].—B′HCl: silky needles.

Nitro-(*B.* 2)-phenyl-quinoline $C_{15}H_{10}N_2O_2$. [173°]. Formed, as well as a di-nitro- derivative [208°], by the nitration of (*B.* 2)-phenyl-quinoline  $\left.\begin{matrix}CPh:CH\\CH\ :CH\end{matrix}\right\rangle C_5H_3N$ (La Coste a. Sorger, *A.* 230, 28).—$B'_2H_2PtCl_6$: yellow needles.

DI-NITRO-DI-PHENYL-SUCCINIC ACID $C_{16}H_{14}O_4(NO_2)_2$. The (α)- compound [226°] and its (β)- isomeride are formed by nitrating (α)- and (β)-di-phenyl-succinic acid respectively (Reimer, *B.* 14, 1804). Both give *p*-nitro-benzoic acid on oxidation.

DI-NITRO-DI-PHENYL-SULPHAZIDES $C_{12}H_{10}(NO_2)_2N_2SO_2$ *i.e.* $C_6H_4(NO_2)NH.NH.SO_2C_6H_4NO_2$? Compounds formed by the action of SO_2, nitrous acid, and alcohol on the nitro-anilines (Limpricht, *B.* 20, 1241). The o-, *m*-, and *p*- compounds melt at 150°, 162°, and 160° respectively. They yield nitrogen, nitro-benzene, and nitro-benzene sulphinic acid on boiling with baryta.

DI-*p*-NITRO-DI-PHENYL DISULPHIDE $(C_6H_4.NO_2)_2S_2$. [181°] (W.); [170°] (L.). Formed by oxidation of *p*-nitro-phenyl mercaptan (Willgerodt, *B.* 18, 333), or by boiling with alcoholic potash the product of the combination of potassium xanthate with *p*-nitro-diazobenzene (Leuckart, *J. pr.* [2] 41, 199). Prisms (from HOAc).

Tetra-nitro-di-phenyl-sulphide $S(C_6H_3(NO_2)_2)_2$. [193°]. Obtained from [1:2:4] $C_6H_3Cl(NO_2)_2$ and alcoholic KSH (Beilstein a. Kurbatoff, *B.* 11, 2056; Willgerodt, *B.* 12, 768). Yellow needles. An isomeric body [245°] is formed by the action of H_2SO_4 and fuming HNO_3 on $C_6H_3(NO_2)_2SCN$ (Austen a. Smith, *Am.* 8, 91).

Tetra-nitro-di-phenyl disulphide $S_2(C_6H_3(NO_2)_2)_2$. Obtained by oxidising [4:2:1] $C_6H_3(NO_2)_2SH$ (Willgerodt, *Bn.* 2, 527). Yellow needles, exploding at about 280°.

Penta-nitro-di-phenyl-sulphide $C_6H_3(NO_2)_2.S.C_6H_2(NO_2)_3$. [217°]. Formed from $C_6H_3Cl(NO_2)_2$, K_2S, and $C_6H_2Cl(NO_2)_3$ (W.). Thick crystals (from HOAc).

Hexa-nitro-di-phenyl sulphide $S(C_6H_2(NO_2)_3)_2$. [226°]. Formed from picryl chloride and K_2S (W.). Golden plates (from HOAc).

DI-NITRO-PHENYL SULPHOCYANIDE $C_6H_3(NO_2)_2SCN$. [139°]. Formed by heating [1:2:4]$C_6H_3Br(NO_2)_2$ with potassium sulphocyanide in MeOH (Austen a. Smith, *Am.* 8, 89). Buff-yellow crystals (from chloroform).

NITRO-DI-PHENYL SULPHONE $C_6H_5.SO_2.C_6H_4NO_2$. [92°]. Formed by heating di-phenyl sulphone with fuming HNO_3 (Gericke, *A.* 100, 208). Minute crystals.

Di-nitro-di-phenyl sulphone $(C_6H_4(NO_2))_2SO_2$. [164°] (G.); [197°] (S. a. N.). Formed by nitrating di-phenyl sulphone (G.) and by the action of SO_3 on nitro-benzene (Schmid a. Nölting, *B.* 9, 79). Small tables.

Tetra-nitro-di-phenyl sulphone $(C_6H_3(NO_2)_2)_2SO_2$. [241°]. Prepared by oxidising the corresponding sulphide [193°] (Beilstein a. Kurbatoff, *A.* 197, 78). Yellowish prisms.

***p*-NITRO-DIPHENYL *p*-SULPHONIC ACID** $C_6H_4(NO_2).C_6H_4SO_3H$. Prepared by sulphonation of *p*-nitro-diphenyl or by nitration of diphenyl *p*-sulphonic chloride (Gabriel a. Damberger, *B.* 13, 1408).—NaA′.—CuA'_2 4aq.—BaA'_2 4aq: small needles.

Chloride $C_{12}H_8(NO_2).SO_2Cl$. [178°].

Amide $C_{12}H_8(NO_2).SO_2NH_2$. [228°].

Ethyl ether EtA′. [169°].

Nitro-diphenyl disulphonic acid. The chloride $C_{12}H_7(NO_2)(SO_2Cl)_2$ [130°] is formed, together with $C_{12}H_6(NO_2)_2(SO_2Cl)_2$ [166°], by nitration of diphenyl disulphonic chloride (G. a. D.).

DI-NITRO-DI-PHENYL SULPHOXIDE $(C_6H_4(NO_2))_2SO$. [116°]. Formed from di-phenyl sulphoxide, $NaNO_3$, and H_2SO_4 (Colby a. McLoughlin, *Am.* 9, 70; *B.* 20, 198). Minute yellow crystals, v. sol. alcohol.

NITRO-PHENYL-THIO-CARBAMIC ACID $C_6H_4(NO_2).CS.OH$.

Methyl ether MeA′. The *m*- compound [120°] is formed by boiling *m*-nitro-phenyl-thio-carbimide with MeOH (Steudemann, *B.* 16, 551). Colourless needles.

Ethyl ether EtA′. The *m*- compound [115°] and its *p*- isomeride [176°] are formed by boiling the corresponding nitro-anilines with CS_2, alcohol, and potash (Losanitsch, *B.* 15, 470; 16, 49). Both are crystalline.

***m*-NITRO-DI-PHENYL-THIO-SEMICARBAZIDE** $C_6H_4(NO_2).NH.NH.CS.NHPh$. [147°]. Formed from phenyl-thio-carbimide and *m*-

nitro-phenyl-hydrazine (Bischler a. Brodsky, *B.* 22, 2015). Dark-yellow globular aggregates.

m-**NITRO-PHENYL-THIO-CARBIMIDE** $C_6H_4(NO_2).N.CS$. [61°]. (c. 277°). Formed by heating *m*-nitro-phenyl-thio-urea with Ac_2O (Steudemann, *B.* 16, 549, 2331). White needles.

DI-NITRO-PHENYL-THIOPHENE $C_6H_4(NO_2).C_4SH_2(NO_2)$. [178°]. Formed from phenyl-thiophene and fuming HNO_3 (Renard, *C. R.* 109, 699). Amorphous yellow powder.

m-**NITRO-PHENYL-THIO-UREA** $C_7H_7N_3SO_2$ *i.e.* $C_6H_4(NO_2).NH.CS.NH_2$. [158°]. Formed from *m*-nitro-phenyl-thiocarbimide (Steudemann, *B.* 16, 550). Lemon-yellow crystals.

m-**Nitro-di-phenyl-thio-urea** $C_6H_4(NO_2).NH.CS.NHPh$. [155°]. Formed from *m*-nitro-aniline and phenyl thiocarbimide (Brückner, *B.* 7, 1235; Losanitsch, *B.* 14, 2365; Gebhardt, *B.* 17, 3045). Small needles, sl. sol. cold alcohol.

Di-*m*-nitro-phenyl-thio-urea $CS(NH.C_6H_4NO_2)_2$. [160°]. Formed from *m*-nitro-aniline and *m*-nitro-phenyl thiocarbimide (Brückner, *B.* 6, 1103; S.). Yellow crystals.

o-**NITRO-PHENYL-*p*-TOLUIDINE** $C_6H_4(NO_2).NH.C_7H_7$. [68°]. Formed from *p*-toluidine and *o*-bromo-nitro-benzene (Schöpff, *B.* 23, 1842). Orange plates.

Di-nitro-phenyl-toluidine [4:2:1] $C_6H_3(NO_2)_2.NHC_6H_4Me$ [1:*x*]. Formed from toluidine and $C_6H_3Cl(NO_2)_2$ (Willgerodt, *B.* 9, 980; Leymann, *B.* 15, 1236). The *o*- compound ($x=2$) melts at 102°, the *p*- compound ($x=4$) at 137°. The isomeric $PhNH.C_6H_2(NO_2)_2Me$ formed from tri-nitro-toluene and aniline, melts at 142° (Hepp, *A.* 215, 369).

DI-NITRO-PHENYL-TOLYLENE-DIAMINE $C_6H_3(NO_2)_2NH.C_6H_3Me.NH_2$. [184°]. Formed from tolylene *m*-diamine and [1:2:4] $C_6H_3Cl(NO_2)_2$ (Leymann, *B.* 15, 1237). Red tables.

Formyl derivative [157°].

Acetyl derivative [164°].

NITRO-PHENYL-TOLYL-KETONE $C_{14}H_{11}(NO_2)O$. [127°]. Formed by the action of HNO_3 on phenyl tolyl ketone and on phenyl-*p*-tolyl-methane (Plascuda a. Zincke, *B.* 7, 983; Milne, *B.* 5, 685). Flat plates (from alcohol).

Di-nitro-phenyl-*m*-tolyl-ketone $C_{14}H_{10}(NO_2)_2O$. [145°]. Formed from di-nitro-phenyl-*m*-tolyl-methane [141°], HOAc, and CrO_3 (Senff, *A.* 220, 236). Pointed needles (from alcohol) or short prisms (from HOAc).

Di-nitro-phenyl-*p*-tolyl-ketone $C_6H_4(NO_2).CO.C_7H_6(NO_2)$. [127°]. Formed, as well as the tri-nitro- derivative [165°], by nitration of phenyl-*p*-tolyl ketone (Z. a. P.). Needles.

m-**NITRO-PHENYL-DI-TOLYL-METHANE** $(C_7H_7)_2CH.C_6H_4NO_2$. [85°]. Formed from *m*-nitro-benzoic aldehyde, toluene, and H_2SO_4 (Tschacher, *B.* 19, 2464; 21, 188). Crystals.

Di-nitro-phenyl-tolyl-methane $C_{14}H_{12}(NO_2)_2$. The three compounds of this composition got by nitrating phenyl- o-, *m*-, and *p*- tolyl-methane melt at 100°, 141°, and 137° respectively (Zincke, *B.* 7, 986; Senff, *A.* 220, 235). Tetra-nitro-phenyl-*p*-tolyl-methane melts at 161°.

NITRO-PHENYL-*p*-TOLYL-THIO-UREA $C_{14}H_{13}N_3SO_2$ *i.e.* $C_6H_5.NH.CS.NH.C_7H_6NO_2$. [143°]. Formed from (2,4,1)-nitro-toluidine and phenyl-thiocarbimide (Steudemann, *B.* 16, 2336). Crystals. Melts, after one fusion, at 167°.

m-**Nitro-phenyl-*p*-tolyl-thio-urea** $C_6H_4(NO_2).NH.CS.NH.C_7H_7$. [173°]. Formed from *m*-nitro-phenyl thiocarbimide and *p*-toluidine (S.). Needles, sl. sol. ether.

Di-nitro-phenyl-*p*-tolyl-thio-urea $C_6H_4(NO_2).NH.CS.NH.C_7H_6NO_2$. [188°]. Formed from *m*-nitro-phenyl thiocarbimide and (2,4,1)-nitro-toluidine (S.). Crystals, sl. sol. alcohol.

m-**NITRO-PHENYL-UREA** $C_7H_7N_3O_3$ *i.e* $C_6H_4(NO_2).NH.CO.NH_2$. Formed from *m*-nitro-aniline and cyanogen chloride (Hofmann, *A.* 67, 156; 70, 137). Yellow needles (from water).

m-**Nitro-di-phenyl-urea** $C_6H_5NH.CO.NHC_6H_4NO_2$. [197°] (G.); [187°] (B.). Formed from *m*-nitro-di-phenyl-thio-urea and PbO (Brückner, *B.* 7, 1236). Formed also by boiling with benzene the compound $PhNH.CO.N(C_6H_4.NO_2).N:NPh$ [104°] obtained by the action of phenyl cyanate on $(C_6H_4NO_2).NH.N:NPh$ (Goldschmidt, *B.* 21, 2573). Yellow needles.

p-**Nitro-di-phenyl-urea** [202°]. Formed by the action of phenyl cyanate on a solution of *p*-nitro-diazoamidobenzene in benzene (G.). Yellow crystals (from alcohol).

m-**Nitro-tri-phenyl-urea** $NPh_2.CO.NHC_6H_4NO_2$. [155°]. Formed from *m*-nitro-aniline and $NPh_2.COCl$ (Lellmann a. Bonhöffer, *B.* 20, 2121). Yellow needles. The isomeride prepared from *p*-nitro-aniline melts at 176°, and crystallises in bluish-green tables.

Di-*m*-nitro-di-phenyl-urea $CO(NH.C_6H_4NO_2)_2$. [233°]. Formed from the thio-urea and PbO (B.). Yellow needles (Losanitsch, *B.* 16, 50).

Tetra-nitro-di-phenyl-urea $CO(NH.C_6H_3(NO_2)_2)_2$. Formed by nitration of di-phenyl-urea (Losanitsch, *B.* 10, 690; 11, 1539). Yellow needles, melting above 200° (L.) or at 189° (Hentschel, *J. pr.* [2] 34, 426). The green K salt $C_{13}H_6K_2N_8O_9$ explodes on heating.

p-**NITRO-PHENYL-VALERIC ACID** $C_6H_4(NO_2).CH_2.CHEt.CO_2H$. Formed by heating *p*-nitro-benzyl-ethyl-malonic ether with aqueous KOH (Lellmann a. Schleich, *B.* 20, 438). Sparingly soluble powder, carbonising above 300°.

p-**NITRO-PHENYL-VINYL-MALONIC ACID** $C_6H_4(NO_2).CH:CH.CH(CO_2H)_2$. [208°]. Formed from *p*-nitro-cinnamic aldehyde, malonic acid, and HOAc (Einhorn a. Gehrenbeck, *B.* 22, 45).

NITRO-PHLOROGLUCIN $C_6H_2(NO_2)(OH)_3$. Formed from phloroglucin and dilute HNO_3. (Hlasiwetz a. Pfaundler, *A.* 119, 199). Reddish-yellow scales, sl. sol. water.

Tri-nitro-phloroglucin $C_6(NO_2)_3(OH)_3$. [158°]. Formed from tri-nitroso-phloroglucin, HNO_3, and H_2SO_4 (Benedikt, *B.* 11, 1376). Hexagonal crystals (containing aq). Its salts are explosive and dye yellow. With KCy it gives the isopurpuric acid reaction.—KH_2A''' aq.—K_2HA'''.—K_3A'''.

NITRO-PHTHALIC ACID $C_6H_3(NO_2)(CO_2H)_2$ [3:2:1]. Mol. w. 211. [220°]. S. (HOAc) 7·5 at 26° (Aguiar, *B.* 5, 899).

Formation.—1. By boiling naphthalene with HNO_3 (Marignac, *A.* 38, 7; Laurent, *A.* 41, 110).—2. By nitration of phthalic acid (Hugo Müller, *Z.* 1863, 257; Faust, *A.* 160, 57; Miller, *A.* 208, 224).—3. By oxidation of nitro-naphthalene or of (*a*)-di-nitro-naphthalene (Beilstein a. Kurbatoff, *B.* 12, 688; *C. C.* 1881, 359; *A.* 202, 217; Guareschi, *B.* 10, 294).

Properties.—Yellow crystals, v. sol. hot water. Splits up below its melting-point into water and anhydride when slowly heated.

Salts.—K_2A''aq.—KHA''aq.—$(NH_4)_2A''$.—$(NH_4)HA''$2aq. — $BaA''x$aq. — $ZnA''1\frac{1}{2}$aq. — $PbA''1\frac{1}{2}$aq.—Ag_2A'': white powder.

Mono-ethyl ether $EtHA''$. [111°].

Di-ethyl ether Et_2A''. [45°].

Anhydride $C_8H_3NO_5$. [164°] (Graeff, *B.* 15, 1127).

Nitro-phthalic acid $C_6H_3(NO_2)(CO_2H)_2$ [4:2:1]. [161°].

Formation.—1. Together with the preceding isomeride, by nitration of phthalic acid (O. Miller, *A.* 208, 224).—2. By the oxidation of di-nitro-(β)-naphthol (Graebe a. Drews, *B.* 17, 1171).

Properties.—Small pale-yellow needles (containing aq). Resolved at 165° into water and its anhydride.

Salts.—K_2A''.—BaA''2aq.—$Ba_{12}H_2A''_{13}$.—$Zn_{12}H_2A''_{13}$2aq.—Ag_2A'': long colourless needles.

Mono-ethyl ether $EtHA''$. [128°].

Di-ethyl ether Et_2A''. [33°].

Anhydride $C_8H_3NO_5$. [114°].

Di-nitro-phthalic acid $C_6H_2(NO_2)_2(CO_2H)_2$ [5:3:2:1]. [226°]. Formed by the oxidation of 'β'-di-nitro-naphthalene or tetra-nitro-(α)-naphthol with dilute HNO_3 (Beilstein a. Kurbatoff, *B.* 13, 354; *A.* 202, 225; Merz a. Weith, *B.* 15, 2728). Prisms.—CaA''.—BaA''.

Mono-ethyl ether $EtHA''$. [187°].

Di-nitro-phthalic acid $C_6H_2(NO_2)_2(CO_2H)_2$ [6:3:2:1]. [200°]. Formed by heating 'β'-bromo-tetra-nitro-naphthalene with dilute HNO_3 (Merz a. Weith, *B.* 15, 2728). Needles.—BaA''.

Di-nitro-phthalic acid $C_6H_2(NO_2)_2(CO_2H)_2$. Formed from nitro-anisic acid, HNO_3, and H_2SO_4 (Engelhardt a. Latschinoff, *Z.* [2] 7, 262). Tables (from water).—BaA'': nearly insol. water.

Nitro-isophthalic acid $C_6H_3(NO_2)(CO_2H)_2$ [5:3:1]. [249°]. S. ·146 at 15°; ·171 at 16°; 81·1 at 99°. Prepared, together with an isomeride [260°] by heating isophthalic acid (100 g.) with fuming HNO_3 (1 kilo) for 24 hours (Beyer, *J. pr.* [2] 22, 35[illegible]; 25, 473; *cf.* Storrs a. Fittig, *A.* 153, 285). Plates (containing $1\frac{1}{2}$ aq).

Salts.—$K_2A''1\frac{1}{2}$aq. S. (80 p.c. alcohol) ·744 at 15°.—Na_2A''aq. S. (80 p.c. alcohol) ·32 at 15°. Explodes above 160°.—$(NH_4)HA''$.—MgA''5aq. S. 2·15 at 15°.—$CaA''3\frac{1}{2}$aq. S. ·72 at 15°. Turned violet by light.—$SrA''4\frac{1}{2}$aq. S. ·47 at 15°.—$BaA''2\frac{1}{2}$aq. S. ·85 at 15°.—ZnA''aq. S. ·55.—CdA''2aq. S. ·75 at 15°.—$Pb_5OA''_4$.—$Cu_3OA''_2$.—MnA''5aq. S. 2·44 at 15°.—$Fe_{14}O_9A''_{12}$.—$CoA''4\frac{1}{2}$aq. S. 2·16 at 15°.—$NiA''4\frac{1}{2}$aq. S. 2·74 at 15°.—Ag_2A''. Explodes above 100°.

Methyl ether Me_2A''. [122°].

Ethyl ether Et_2A''. [84°].

Nitro-isophthalic acid $C_6H_3(NO_2)(CO_2H)_2$ [4:3:1]. [246°] (C.); [259°]. Formed by oxidation of nitro-xylene (Claus, *J. pr.* [2] 38, 318; *cf.* Wroblewsky, *Bl.* [2] 34, 332; Noyes, *Am.* 10, 472). White needles (containing 3aq), m. sol. cold water.—BaA''4aq (C.).—$BaA''1\frac{1}{2}$aq (N.).—$CaA''\frac{1}{2}$aq. — MgA''6aq. — PbA''3aq (W.).—$Ag_2A''7\frac{1}{2}$aq: pearly plates.

Di-nitro-isophthalic acid $C_6H_2(NO_2)_2(CO_2H)_2$. [215°]. Formed from isophthalic acid and fuming HNO_3 at 180° (Claus). Needles (containing 5aq). — Na_2A''2aq. — K_2A''2aq. — BaA''7aq.—CaA''4aq.—MgA''4aq: needles, v. sol. water.

NITRO-PHTHALIDE
$\left[4:\frac{1}{2}\right]C_6H_3(NO_2){<}\begin{smallmatrix}CO\\CH_2\end{smallmatrix}{>}O$. [141°]. Formed by nitration of phthalide (Hoenig, *B.* 18, 3447). Long needles. Aqueous KOH yields $C_6H_3(NO_2)(CH_2OH)(CO_2K)$. CrO_3 in HOAc oxidises it to nitrophthalic acid [161°]. The acid of which it is the anhydride melts at 129°. An isomeric nitro-phthalide [136°] is formed by oxidising (α)-nitro-naphthalene.

NITRO-DIPHTHALYL $C_{16}H_7NO_6$ *i.e.* $C_6H_4{:}C_4O_4{:}C_6H_3NO_2$. [270°]. Formed by heating nitro-phthalide with phthalic anhydride and NaOAc (Graebe a. Guye, *A.* 233, 244). Yellow needles (from HOAc).

NITRO-PIPERIDINE $C_5H_{10}N(NO_2)$. (245°). Formed by treating piperyl-urea with HNO_3 (S.G. 1·5) at −10°, pouring upon sodium carbonate and extracting with ether (Franchimont a. Klobbie, *R. T. C.* 8, 302). Colourless liquid, solidifying below −10°. Volatile with steam.

NITROPODOCARPIC ACID *v.* PODOCARPIC ACID.

NITRO-PROPANE $C_3H_7NO_2$ *i.e.* $PrNO_2$. (127°) (M. a. R.); (131°) (P.). S.G. $\frac{15}{15}$ 1·0108; $\frac{25}{25}$ 1·0023. M.M. 3·819 (Perkin, *C. J.* 55, 689). Formed, together with propyl nitrite, by the action of silver nitrite on propyl iodide (V. Meyer a. Rilliet, *B.* 5, 1029; *A.* 171, 36; Pribram a. Handl, *M.* 2, 653; Cahours, *C. R.* 77, 749). Oil.—$NaC_3H_6NO_2$: white powder.

Iso-nitro-propane $PrNO_2$. (c. 117°). Formed, together with an isomeride (44°), by the action of silver nitrite on isopropyl iodide (V. Meyer a. Locher, *B.* 7, 670; *A.* 171, 39; Kiesel, *J. R.* 16, 135; *Bl.* [2] 40, 72; *Bn.* 1, 225). Oil, decomposed by HClAq at 100°.

Di-nitro-propane $CH_3.CH_2.CH(NO_2)_2$. (189° cor.). S.G. $\underline{22\cdot5}$ 1·258. Formed from bromo-nitro-propane and KNO_2 (Ter Meer, *A.* 181, 19), and by the oxidation of di-propyl ketone (Chancel, *C. R.* 96, 1466; Kurtz, *A.* 161, 208). Oil.—KA'.—AgA': explosive laminæ.

Iso-di-nitro-propane $(CH_3)_2C(NO_2)_2$. [53°]. (187° uncor.). Formed by oxidation of propyl-pseudonitrole $(CH_3)_2C(NO)(NO_2)$ (Meyer a. Locher, *B.* 7, 1613). Formed also by the action of nitric acid on isobutyric and isovaleric acids (Bredt, *B.* 15, 2322). White crystals, volatile with steam.

NITRO-PROPENYL-BENZOIC ACID
$C_6H_3(NO_2)(C_3H_5)CO_2H$ [3:4:1]. [155°]. Formed by boiling nitro-oxypropyl-benzoic acid with aqueous HCl (S.G. 1·10) for a long time (Widman, *B.* 15, 2551; 16, 2569). Short needles.—NH_4A'.—$CaA'_2$2aq. S. ·555 at 16°.—$BaA'_2 3\frac{1}{2}$aq. S. ·425 at 18°.—CuA'_2aq.—AgA': slender needles.

β-NITRO-PROPIONIC ACID $C_3H_5NO_4$ *i.e.* $CH_2(NO_2).CH_2.CO_2H$. [67°]. Formed from β-iodo-propionic acid and $AgNO_2$ (Lewkovitch, *J. pr.* [2] 20, 165). Scales (from chloroform).

Ethyl ether EtA'. (c. 163°). V.D. 4·85 (calc. 5·09).

DI-NITRO-PROPYL-ANILINE $C_9H_{11}N_3O_4$ *i.e.* $C_6H_3(NO_2)_2NHC_3H_7$ [4:2:1]. [95°]. Formed from propylamine and $C_6H_3Br(NO_2)_2$, or by oxidising the following body (Van Romburgh, *R. T. C.* 4, 191; 8, 252). Yellow needles.

Di-nitro-di-propyl-aniline
$C_6H_3(NO_2)_2N(C_2H_7)_2$ [4:2:1]. [40°] (Romburgh, *R. T. C.* 8, 252).

Tri-nitro-propyl-aniline $C_6H_2(NO_2)_3NH.C_3H_7$. [59°]. Formed from $NH_2C_3H_7$ and $C_6H_2Cl(NO_2)_3$. Yields, with HNO_3, the nitramine $C_6H_2(NO_2)_3N(NO_2)C_3H_7$ [97°].

NITRO-ISOPROPYL BENZENE *v.* NITRO-CUMENE.

Di-nitro-*p*-di-propyl-benzene $C_6H_2Pr_2(NO_2)_2$. [65°]. Formed from di-propyl-benzene and fuming HNO_3 (Körner, *B.* 11, 1865; *A.* 216, 226). Plates, volatile with steam.

Tri-nitro-*m*-di-isopropyl benzene $C_6HPr_2(NO_2)_3$. [111°]. Yellow needles (Uhlhorn, *B.* 23, 3142).

NITRO-PROPYL-BENZOIC ACID *v.* NITRO-*n*-CUMINIC ACID.

NITRO-ISOPROPYL-CINNAMIC ACID [4:2:1] $C_6H_3Pr(NO_2).CH:CH.CO_2H$. '*Nitro-cumenyl-acrylic' acid.* [157°]. Formed by nitration of propyl-cinnamic acid (Einhorn a. Hess, *B.* 17, 2016; Widman, *B.* 19, 258). Needles, v. sol. alcohol. Yields o-nitro-cuminic aldehyde on oxidation by $KMnO_4$.

Nitro-isopropyl-cinnamic acid [4:3:1] $C_6H_3Pr(NO_2)C_2H_2.CO_2H$. [141°]. Formed by heating *m*-nitro-cuminic aldehyde (4 pts.) with Ac_2O (5 pts.) and NaOAc (3 pts.) at 175° for 4 hours (Widman, *B.* 19, 413). Tables. Forms a dibromide [184°].—KA′ (dried at 100°).—NaA′ 3aq.—BaA′$_2$ 5½aq.—CaA′$_2$ 3aq.

Ethyl ether EtA′. [59°]. Tables.

Nitro-*n*-propyl-cinnamic acid [4:2:1] $C_6H_3Pr(NO_2)C_2H_2CO_2H$. [123°]. Formed, in small quantity, in the nitration of isopropyl-cinnamic acid (Widman, *B.* 19, 273). On oxidation by alkaline $KMnO_4$ it yields nitro-*n*-cuminic acid and nitro-cuminic acid. Bromine forms a di-bromide [171°].

DI-NITRO-PROPYL-THIOPHENE $C_4HPr(NO_2)_2S$. Formed by nitration (Ruffi, *B.* 20, 1742). Oil.

NITRO-PROTOCATECHUIC ACID $C_7H_5NO_6$.

Methyl derivative $C_6H_2(NO_2)(OMe)(OH)CO_2H$ [*x*:3:4:1]. Formed by boiling its acetyl derivative [182°] which is produced by the nitration of acetyl-vanillic acid $C_6H_3(OMe)(OAc)CO_2H$ (Tiemann a. Matsmoto, *B.* 9, 945; 11, 132). Needles (from alcohol).

The isomeric $C_6H_2(NO_2)(OMe)(OH).CO_2H$ [5:3:4:1] [202°] is formed by oxidation of acetyl-nitro-eugenol (Weselsky a. Benedikt, *M.* 3, 392), and crystallises in yellow needles.

Methyl derivative $C_6H_2(NO_2)(OMe)(OH)CO_2H$ [6:4:3:1]. [173°]. Formed from its acetyl derivative [169°], which is got by nitrating acetyl-isovanillic acid (T. a. M.). Needles.

Di-methyl derivative $C_9H_9NO_6$ *i.e.* $C_6H_2(NO_2)(OMe)_2CO_2H$. Formed by nitration of veratric acid $C_6H_3(OMe)_2CO_2H$ (T. a. M.; Merck, *A.* 108, 59). Yellow needles (containing ½aq). Yields the ethers MeA′ [144°] and EtA′ [100°].

Iso-nitro-protocatechuic acid. *Di-methyl ether* $C_6H_2(NO_2)(OMe)_2CO_2H$. [202°]. Formed by methylation of nitro-vanillic acid (T. a. M.). Needles. Yields MeA′ [128°] crystallising in needles.

Nitro-protocatechuic acid. *Methyl-propyl ether* $C_{11}H_{13}NO_6$ *i.e.* $C_6H_2(NO_2)(OMe)(OPr)CO_2H$. Formed by nitration (Cahours, *Bl.* [2] 29, 270).

Nitro-protocatechuic acid. *Methylene ether* $CH_2O_2:C_6H_2(NO_2)CO_2H$. [172°]. Formed from piperonylic acid $CH_2<\substack{O\\O}>C_6H_3.CO_2H$ by nitration (Jobst a. Hesse, *B.* 11, 1031; *A.* 199, 70). Needles.—KA′ ½aq.—PbA′$_2$ aq.—CuA′$_2$ 4aq.—AgA′: needles or plates.

NITROPRUSSIDES *v.* vol. ii. p. 340.

NITROPYROCATECHIN $C_6H_5NO_4$ *i.e.* $C_6H_3(NO_2)(OH)_2$[4:2:1]. [170°]. Formed by the action of nitrous acid on pyrocatechin (Benedikt, *B.* 11, 362; *J. pr.* [2] 18, 455). Formed also by boiling the carbonyl derivative of (5,2,1)-nitro-amido-phenol with potash (Von Chelmicki, *J. pr.* [2] 42, 442). Small yellow needles (from ether). Its aqueous solution is turned purple by alkalis. Dyes stuff mordanted with alumina orange (Kostanecki, *B.* 22, 1347).—BaA″ 3aq: dark-red plates, with metallic lustre.

An isomeric nitropyrocatechin [86°] is formed, together with the preceding, by nitration of pyrocatechin (Weselsky a. Benedikt, *M.* 3, 386). A *di-methyl derivative* of nitro-pyrocatechin $C_6H_3(NO_2)(OMe)_2$ [96°] is formed by nitrating veratrole (Merck, *A.* 108, 60; Tiemann a. Matsmoto, *B.* 9, 939; 11, 131).

The *methylene derivative* $C_6H_3(NO_2)<\substack{O\\O}>CH_2$ [148°] is a product of the action of nitric acid on piperonylic acid (Hesse, *A.* 199, 73, 341). It crystallises in needles.

Di-nitro-pyrocatechin $C_6H_2(NO_2)_2(OH)_2$. *Methyl derivative* $C_6H_2(NO_2)_2(OMe)(OH)$. *Di-nitro-guaiacol.* [123°]. Made by the action of nitrous acid gas upon an ethereal solution of guaiacol at 0° (Herzig, *M.* 3, 825). Plates. The *di-methyl derivative* $C_6H_2(NO_2)_2(OMe)_2$, formed by nitration of veratrol, melts above 100° (M.). The *methylene derivative* $C_6H_2(NO_2)_2O_2CH_2$ [101°] is formed in the nitration of piperonylic acid (H.).

Tri-nitro-pyrocatechin. *Di-methyl-derivative* $C_6H(NO_2)_3(OMe)_2$. [145°]. Got by nitrating $C_6H_3(NO_2)(OMe)_2$ (T. a. M.). Prisms.

DI-NITRO-PYROCOLL $C_{10}H_4(NO_2)_2N_2O_2$. Got by nitrating pyrocoll (Ciamician a. Danesi, *G.* 12, 39). Yellow crystals, decomposing before fusion.

NITRO-PYROGALLOL $C_6H_2(NO_2)(OH)_3$. [205°]. Got by passing nitrous fumes into an ethereal solution of pyrogallol (Barth, *M.* 1, 882). Triclinic olive-brown prisms (containing aq); $a:b:c = 2{\cdot}842:1:{\cdot}493$. $C_6H_2(NO_2)(OEt)_2(OH)$ [123°] and $C_6H_2(NO_2)(OEt)(OH)_2$ [139°] are formed in the same way (Weselsky a. Benedikt, *M.* 2, 214). The compounds $C_6H(NO_2)_2(OEt)_3$ [73°] and $C_6(NO_2)_3(OEt)_3$ [93°] are formed by nitration.

NITROPYROMECONIC ACID $C_5H_3(NO_2)O_3$. Formed by nitrating pyromeconic acid (Ost, *J. pr.* [2] 19, 192). Crystals (from alcohol).—NaA′.—AgA′.

DI-NITRO-PYROMELLITIC ACID $C_6(NO_2)_2(CO_2H)_4$[5:2:6:4:3:1]. Formed by oxidation of di-nitro-ψ-cuminic acid $C_6Me_3(NO_2)_2CO_2H$ [205°] (Nef, *C. J.* 53, 428; *A.* 258, 317). Long silky needles.—Ag$_2$A″: amorphous pp.

Methyl ether Me$_4$A$^{\text{iv}}$. [180·6°].

Ethyl ether Et$_4$A$^{\text{iv}}$. [130°].

NITRO-PYROMUCIC ACID $C_5H_3NO_5$ *i.e.* $C_4H_2(NO_2)O.CO_2H$. [184°]. Formed from dehydromucic acid (1 pt.), HNO_3 (10 pts.), and conc. H_2SO_4 (1 pt.) (Klinkhardt, *J. pr.* [2] 25, 51). Got also from $C_4H_2(NO_2)O.CH:CH(NO_2)$ by oxidation with CrO_3 (Priebs, *B.* 18, 1362). Yellow plates (from water). Yields succinic acid (and not an amido- acid) on reduction with tin and HClAq.—CaA'₂.—PbA'₂.—AgA'.

Ethyl ether EtA'. [101°].

DI-NITRO-PYRROLE $C_4H_2(NO_2)_2NH$. [152°]. Formed by the action of fuming HNO_3 on pyrryl methyl ketone. Formed also, together with an isomeride [173°], by the action of fuming HNO_3 on pyrrole carboxylic acid at 0° (Ciamician a. Silber, *B.* 18, 1462; 19, 1081; *G.* 16, 347). Colourless plates. BaA'₂: yellow needles.

NITRO-PYRROLE CARBOXYLIC ACID $C_4H_2(NO_2)NH(CO_2H)$. [217°]. Formed by saponifying its methyl ether, which is got by nitrating $C_4H_3NH(CO_2Me)$ (Anderlini, *B.* 22, 2505; *Rend. Accad. Linc.* [5] 1, 40). Yellow needles (containing aq), sl. sol. cold water.

Methyl ether MeA'. [197°].

An isomeric acid [161°] may be obtained from its methyl ether [179°] which accompanies the preceding ether. $C_4H(NO_2)_2NH(CO_2Me)$ [115°] is also formed in the nitration.

Nitro-pyrrole carboxylic acid. [146°]. Formed by boiling di-nitro-pyrocoll with potash solution (Ciamician a. Danesi, *G.* 12, 40). Minute needles (containing aq).—NH_4A': prisms or scales.

NITRO-PYRRYLENE-DI-METHYL DIKETONE $C_8H_8N_2O_4$ *i.e.* $C_4H_2(NO_2)N(CO.CH_3)_2$. [149°]. Formed by nitrating pyrrylene di-methyl diketone (Ciamician a. Silber, *G.* 16, 347; *B.* 18, 1467; 19, 1078). Needles (from water).

NITRO-PYRRYL METHYL KETONE. By nitrating  $NH\langle\begin{array}{l}CH:CH\\CAc:CH\end{array}$ two compounds are formed [197°] and [156°]. Both yield pps. of $C_6H_5N_2O_3Ag$ (Ciamician a. Silber, *B.* 18, 413, 1457). A compound $C_4H_2(NO_2)_2N.CO.CH_3$ [114°] crystallising in yellow needles (containing aq) may also be obtained.

(*B.* 1)-**NITRO-QUINOLINE** $C_9H_6N_2O_2$ *i.e.*  $\begin{array}{l}CH:C(NO_2).C.CH:CH\\CH:CH——C.N:CH\end{array}$ [72°]. Formed, together with the (*B.* 4)-isomeride, by the nitration of quinoline, especially in presence of fuming H_2SO_4 in the cold (Claus a. Kramer, *B.* 18, 1243; Noelting a. Trautmann, *B.* 23, 3654). Colourless needles (containing aq).

(*B.* 2)-**Nitro-quinoline**  $\begin{array}{r}NO_2C\ \ :CH.C.CH:CH\\CH:CH.C.\ N\ :CH\end{array}$ [150°] (La Coste, *B.* 16, 669); [164°] (C. a. K.). Formed by boiling *p*-nitro-aniline (25 pts.), glycerin (60 pts.), nitro-benzene (15 pts.), and H_2SO_4 (50 pts.) for 4 hours. Needles (containing aq).—$B'_2H_2PtCl_6$: small yellow needles.

Methylo-iodide B'MeI. Needles.

(*B.* 3)-**Nitro-quinoline**  $\begin{array}{r}CH:CH.C.CH:CH\\NO_2.C\ \ :CH.C.\ N\ :CH\end{array}$ [131·5°]. Formed from *m*-nitro-aniline, picric acid, glycerin, and H_2SO_4 (Claus a. Stiebel, *B.* 20, 3095). Needles.—B'HCl. [225°].—$B'HNO_3$.—$B'_2H_2PtCl_6$: prisms.

(*B.* 4)-**Nitro-quinoline**  $\begin{array}{l}CH:CH——C.CH:CH\\CH:C(NO_2).C.\ N\ :CH\end{array}$ [89°]. Formed by nitrating quinoline; and also by boiling o-nitro-aniline with glycerin, nitrobenzene, and H_2SO_4 (Königs, *B.* 12, 449; La Coste, *B.* 16, 673; Claus, *B.* 18, 1243; Noelting, *B.* 23, 3654). Formed also by heating quinoline (*B.* 4)-sulphonic acid with HNO_3 (Claus a. Küttner, *B.* 19, 2886), and by warming $C_6H_3(NO_2)(OMe).CH:CH.CHO$ with alcoholic ammonia (Miller a. Kinkelin, *B.* 22, 1716). Prisms.—$B'_2H_2PtCl_6$: orange needles.

(*B.* 2, 4)-**Di-nitro-quinoline**  $\begin{array}{l}C(NO_2):CH.C.CH:CH\\CH:C(NO_2).C.\ N\ :CH\end{array}$ [150°]. Formed by heating (4, 2, 1)-di-nitro-aniline with glycerin, nitro-benzene, and H_2SO_4 (La Coste, *B.* 15, 562). Long slender needles.

By the nitration of quinoline two isomeric di-nitro-quinolines [183°] and [134°] may be got (Claus a. Kramer, *B.* 18, 1243). Their platinochlorides $B'H_2H_2PtCl_6$ form yellow crystals.

NITRO-QUINOLINE-(*Py.* 3)-CARBOXYLIC ACID $C_9H_5(NO_2)(CO_2H)N$. [220°]. Formed by boiling (*Py.* 3)-methyl-quinoline (quinaldine) with nitric acid (S.G. 1·4) (Doebner a. Miller, *B.* 15, 3076). Crystals, sl. sol. cold water.—AgA'.

NITRO-RESORCIN $C_6H_3(NO_2)(OH)_2$[4:3:1]. [115°]. Formed together with a volatile (2, 3, 1)-isomeride [85°], in the preparation of diazoresorcin by the action of nitrous acid on an ethereal solution of resorcin (Weselsky, *A.* 164, 1; *M.* 1, 887). Lemon-yellow needles. When heated with concentrated sulphuric acid it yields $O(C_6H_3(NO_2)OH)_2$ (Hazura, *M.* 4, 610; 5, 188) which forms $Ba(C_{12}H_7N_2O_7)_2$ 2aq and $BaC_{12}H_6N_2O_7$ 5½aq. The isomeride [85°] is converted by the action of nitrous acid into $C_6H_2(OH)O(NOH)(NO_2)$[1:3:4:2] (De la Harpe a. Reverdin, *Bl.* [2] 49, 760).—$BaH_2A''_2$ 5aq.—$BaH_2A''_2$aq.—$BaH_4A''_3$ 2aq: golden needles.

Methyl ethers

$C_6H_3(NO_2)(OH)(OMe)$[4:3:1]. [95°]. Volatile with steam.—$C_6H_3(NO_2)(OMe)(OH)$[4:3:1]. [144°]. Not volatile with steam.

Ethyl ethers $C_6H_3(NO_2)(OEt)(OH)$. [79°]. Volatile with steam. [131°]. Non-volatile.

Di-acetyl derivative $C_6H_3(NO_2)(OAc)_2$. [91°]. Tables (from alcohol) (Errera, *G.* 15, 273).

Di-benzoyl derivative

$C_6H_3(NO_2)(OBz)_2$. [111°]. Got by nitration (Schiaparelli a. Abelli, *G.* 13, 257; Errera, *G.* 15, 271).

Di-m-nitro-di-benzoyl derivative [123°].

Di-nitro-resorcin $C_6H_2(NO_2)_2(OH)_2$[4:2:3:1]. [142°]. Formed by the action of nitrous fumes, or of cold HNO_3, upon di-nitroso-resorcin (Benedikt a. Hübl, *M.* 2, 323; Barr, *B.* 21, 1544; Von Kostanecki, *B.* 21, 3122). Formed also by boiling di-nitro-*m*-amido-phenol with dilute KOHAq (Lippmann a. Fleissner, *M.* 6, 814; 7, 98). Golden leaflets.—K_2A''½aq.—BaA''.—Ag_2A'': red pp.

Methyl ether $C_6H_2(NO_2)_2(OMe)(OH)$. [75°]. Needles (Aronheim, *B.* 12, 30).

Di-nitro-resorcin $C_6H_2(NO_2)_2(OH)_2$. [213°]. Formed by nitration of the di-acetyl derivative of resorcin (Typke, *B.* 16, 552). Yellow prisms or needles.—$(NH_4)_2A''$.—$BaH_2A''_2$.—BaA'': red scales with violet lustre, v. sl. sol. water.

Ethers $C_6H_2(NO_2)_2(OMe)_2$: [67°]; $C_6H_2(NO_2)_2(OEt)_2$. [75°]. Obtained by nitration of the ethers of resorcin (Hönig, *B.* 11, 1039; Aronheim, *B.* 12, 32).

Tri-nitro-resorcin

$C_6H(NO_2)_3(OH)_2$.[6:4:2:3:1]. *Styphnic acid. Oxypicric acid.* Mol. w. 245. [175°]. S. ·64 at 14° (Stenhouse, *Pr.* 19, 410).

Formation.—1. By the action of boiling nitric acid on extract of Brazil wood, or sapan wood, euxanthone, gum ammoniac, assafœtida, galbanum, peucedanin, ostruthin, saganenum, or the aqueous extract of fustic or sandal wood (Chevreul, *A. Ch.* 66, 116; 73, 43; Erdmann, *J. pr.* 37, 409; 38, 355; Böttger a. Will, *A.* 58, 273; Rothe, *J. pr.* 46, 376; Gorup-Besanez, *A.* 183, 336; Stenhouse, *C. J.* 19, 236). Graebe, *B.* 22, 1405).—2. By the action of nitric acid on *m*-nitro-phenol, on γ, δ, or ε- di-nitro-phenols, and on β or γ tri-nitrophenol (Bantlin, *B.* 10, 524; 11, 2101; Henriques, *A.* 215, 340).—3. By the nitration of resorcin or of either di-nitro-resorcin (Merz a. Zetter, *B.* 12, 681; Benedikt a. Hübl, *M.* 2, 326; Von Kostanecki, *B.* 21, 3122). 4. By boiling tri-nitro-phenylene-di-methyl diamine with potash (Romburgh, *R. T. C.* 7, 6).—5. Together with three di-nitro-benzoic acids, by adding o-nitro-benzoic acid to a mixture of fuming HNO_3 and H_2SO_4 (Griess, *B.* 7, 1224; Salkowski, *B.* 8, 637).

Properties.—Yellow laminæ. Ppd. from its aqueous solution by HCl. V. sol. alcohol and ether.

Salts.—$(NH_4)HA''$.—$(NH_4)_2A''$: monoclinic needles; $a:b:c = 1:1·66:2·09$; $\beta = 76° 52'$. — Na_2A'' 2½aq. — KHA''aq. —K_2A''.— BaA'' 3aq.— BaA''aq.—SrA'' 2aq.— CaA'' 3½aq.—$Pb_2(OH)_2A''$. —$MnH_2A''_2$ 12aq.—CoA'' 3½aq.—$CaK_2A''_2$ 4aq.— $NiK_2A''_2$ 3aq.— CuA'' 4aq. — $Cu(NH_4)_2A''_2$ 7aq.— $CuK_2A''_2$ 4aq.—Ag_2A''aq: slender needles.

Methyl ether Me_2A''. [124°]. Formed by nitrating $C_6H_4(OMe)_2$ (Hönig, *B.* 11, 1039).

Di-ethyl ether Et_2A''. [121°]. Yields tri-nitro-*m*-phenylene-diamine on heating with ammonia (Nölting a. Collin, *B.* 17, 259).

NITRO-RESORCIN SULPHONIC ACID $C_6H_2(NO_2)(OH)_2(SO_3H)$. [124°]. Formed by sulphonating nitro-resorcin [115°] (Hazura, *M.* 4, 610). Minute crystals (containing 1½aq).— BaA'''_2 4aq: yellow needles.—BaA''' 2aq: yellow scales.—Ba_3A_2''' 10aq: blood-red needles.

A nitro-resorcin disulphonic acid is formed by oxidising the corresponding nitroso-compound with H_2O_2 (Ulzer, *M.* 9, 1130).

NITRO-SALICYLIC ACID *v.* NITRO-OXY-BENZOIC ACID.

NITROSAMINES. Compounds containing nitrosyl (NO) united to nitrogen. They are described under the amines from which they are derived by displacement of hydrogen by nitrosyl. Nitrosamines are formed by the action of nitrous acid upon secondary bases. They are neutral substances and may be reconverted into the parent base by boiling with tin and HClAq, with zinc and H_2SO_4, with aniline, or with alcoholic potash (Geuther, *A.* 128, 151; Griess, *B.* 7, 218; Witt, *C. J.* 33, 203). Many aromatic nitrosamines are converted into *p*-nitroso- compounds by alcoholic HCl; the nitrosyl entering the benzene nucleus (Fischer a. Hepp, *B.* 20, 1247, 2471).

NITROSATES. This name is given by Wallach (*A.* 241, 288) to compounds formed by the union of nitrogen peroxide with unsaturated hydrocarbons. Thus Guthrie's 'amylene nitrite' (vol. i. p. 210) would be called amylene nitrosate and may be represented as nitroso-amyl nitrate of formula $C_5H_{10}(NO)(O.NO_2)$ or $C_5H_9(NOH)(ONO_2)$. This body reacts with aromatic bases forming $C_5H_9(NOH)NPhH$ [141°], $C_5H_9(NOH)NHC_6H_4Me[1:4]$ [112°], and the isomeric $C_5H_9(NOH)NHC_6H_4Me[1:2]$ [115°], which yield nitrosamines melting at 128°, 148°, and 150° respectively. Amylene 'nitrosate' reacts in like manner with o-anisidine, piperidine, and diethylamine, forming bases melting at 139°, 96°, and 72° respectively. These bases are termed 'nitrol-amines' by Wallach.

The term nitrosite is given by Wallach to compounds resulting from the union of N_2O_3 with unsaturated hydrocarbons. Thus terpinene nitrosite $C_{10}H_{16}N_2O_3$ may be viewed as a nitroso-nitrite with formula $C_{10}H_{16}(NO)(ONO)$ or $C_{10}H_{15}(NOH)(ONO)$. They readily exchange O.NO for NHR' or NR'R'' when acted upon by bases, forming nitrolamines. Thus terpinene nitrosite acted upon by ethylamine yields 'terpinene-nitrol-ethylamine' $C_{10}H_{15}(NOH).NHEt$ [131°].

NITROSO-ACETIC ETHER *v.* OXIMIDO-ACETIC ETHER.

NITROSO-ACETOACETIC ETHER $C_6H_9NO_4$ *i.e.* $CH_3.CO.C(NOH).CO_2Et$. [54°]. Formed by the action of nitrous acid on aceto-acetic ether, and on acetyl-malonic ether (V. Meyer a. Züblin, *B.* 11, 320; Wleügel, *B.* 15, 1050; Ceresole, *B.* 15, 1326; Lang, *B.* 20, 1327). Prisms, sl. sol. water, sol. alkalis. Forms $CH_3.C(NOH).C(NOH).CO_2Et$.

Anilide $C_{10}H_{10}N_2O_3$. [100°]. Formed by the action of nitrous acid on the anilide of acetoacetic acid (Knorr, *A.* 236, 80). Prisms.

NITROSO-TRIACETONAMINE *v.* ACETONAMINE.

NITROSO-ACETONE $C_3H_5NO_2$ *i.e.* $CH_3.CO.CH:NOH$ or $CH_3.CO.CH_2.NO$. *Oxim of pyruvic aldehyde. Oxim of methyl-glyoxal.* [65°]. Formed by the action of nitrous acid on acetoacetic ether (V. Meyer a. Züblin, *B.* 11, 695; Ceresole, *B.* 15, 1326), and by warming acetone with amyl nitrite and HCl (Claisen, *B.* 20, 252). Silvery leaflets or prisms, boiling with decomposition at about 200°. V. sol. water and alcohol, volatile with steam. May be sublimed.

Reactions.—1. Dilute HClAq at 140° forms acetic and formic acids and ammonia (Treadwell and Steiger, *B.* 15, 1059).—2. Tin and HCl give di-methyl-pyrazine.—3. *Hydroxylamine hydrochloride* forms methyl-glyoxim or acetoximic acid (vol. i. p. 38) and a compound, $C_6H_9N_3O_3$, which detonates at 238°–247°, and forms an explosive hydrochloride $C_6H_9N_3O_3HCl$ [113°] (Scholl, *B.* 23, 3578).—4. *Phenyl-hydrazine* yields $CH_3.C(N_2HPh).CH:NOH$ [134°] (Pechmann, *B.* 21, 2994).—5. *Phenyl-methyl-hydrazine* yields $CH_3.C(N_2MePh).CH:NOH$ [118°].

Methyl ether $C_3H_4O(NOMe)$. (115° uncor.). Formed by heating nitroso-acetone with NaOMe (Meyer a. Ceresole, *B.* 15, 3067; 16, 833). Colourless oil.

Ethyl ether $C_3H_4O(NOEt)$. (130°).

Benzyl ether $C_3H_4O(NOC_7H_7)$. [46°].

Di-nitroso-acetone $CH(NOH).CO.CH(NOH)$. [144°]. Formed by the action of nitrous acid on acetone dicarboxylic acid (Pechmann a. Wehsarg, *B.* 19, 2465; 21, 2992). Prisms, sl. sol. cold water, decomposed by boiling water into HCy, CO_2, and water. Explodes when heated.

Phenyl-hydrazide $N_2HPh:C(CH:NOH)_2$. [145°]. Needles. Yields a mono-acetyl derivative [133°].

Phenyl-methyl-hydraside [137°]. Crystals.

Oxim CH(NOH).C(NOH)CH(NOH). *Tri-nitroso-propane.* [171°]. Crystalline powder.

NITROSO-ACETOPHENONE $C_6H_7NO_2$ *i.e.* $C_6H_5.CO.CH{:}NOH$. *Oxim of phenyl-glyoxylic aldehyde.* [128°]. Prepared by the action of amyl-nitrite and NaOEt on acetophenone (Claisen a. Manasse, *B.* 20, 2194; Braun, *B.* 22, 556). Thin, monoclinic plates; $a{:}b{:}c = 2{\cdot}762{:}1{:}2{\cdot}146$; $\beta = 66°\ 54'$. Sl. sol. cold water, soluble in aqueous Na_2CO_3. On heating with Ac_2O it yields $C_6H_5.CO.CN$. $SnCl_2$, in HClAq, reduces it to ω-amido-acetophenone and di-phenyl-pyrazine. When its compound with $NaHSO_3$ is boiled with H_2SO_4 it yields $C_6H_5.CO.CHO$. Hydroxylamine hydrochloride yields $C_{16}H_{13}N_3O_2$ [207°–211°] (Scholl, *B.* 23, 3580).

Oxim v. Oxim of Phenyl-glyoxal.

p-**NITROSO-ANILINE** $C_6H_4(NO)(NH_2)[1{:}4]$. [174°]. Formed by heating nitroso-phenol with NH_4Cl, ammonium acetate, and ammonium carbonate (Fischer a. Hepp, *B.* 20, 2475; 21, 684). Steel-blue needles (from benzene). Decomposed by NaOHAq into NH_3 and nitroso-phenol. Tin and HCl reduce it to phenylene-*p*-diamine. Phenyl-hydrazine hydrochloride forms $C_{12}H_{12}N_4O$ [125°]. Phenyl-methyl-hydrazine yields $C_{13}H_{14}N_4O$ [151°].—$C_6H_5NaN_2O$ 2aq: yellow crystals.

NITROSO-ANTHRONE *v.* Anthracene.

NITROSO-BENZENE ×$C_6H_5.NO$. On distilling with steam, the product of the action of nitrosyl chloride on $HgPh_2$, there is obtained a pungent green liquid, which yields aniline on reduction (Baeyer, *B.* 7, 1638). By oxidising the di-oxim of quinone with alkaline K_3FeCy_6, there is obtained a golden-yellow pp., probably di-nitroso-benzene $C_6H_4(NO)_2[1{:}4]$. It yields *p*-phenylene-diamine on reduction, and *p*-di-nitro-benzene on warming with HNO_3. Hydroxylamine hydrochloride converts it into quinone dioxim.

NITROSO-BENZYL-ALLYL-THIO-UREA $PhC(NOH).NH.CS.NHC_3H_5$. Formed by melting together allyl thiocarbimide and benzamidoxim (Koch, *B.* 24, 399). Fine needles.

ISO-NITROSO-BENZYL-AMINE *v.* Benzenyl-amidoxim.

p-**NITROSO-DI-BENZYL-ANILINE** $C_6H_4(NO).N(CH_2.C_6H_5)_2$. [92°]. Formed by adding amyl nitrite to a solution of di-benzyl-aniline in alcoholic HCl. Thin steel-blue plates, or small green crystals. V. sol. ether and CS_2, m. sol. alcohol. On reduction it gives *u*-di-benzyl-*p*-phenylene diamine (Matzudaira, *B.* 20, 1616).

NITROSO-BENZYL-MALONIC ACID $C_7H_7.C(NO)(CO_2H)_2$. [120°]. Obtained from its ether, which is got from nitroso-malonic ether, NaOEt, and benzyl chloride (Conrad a. Bischoff, *A.* 204, 121; 209, 215). Plates. On fusion, or on boiling with water, it gives benzyl alcohol, CO_2, and HCy.—K_2A'' aq (dried at 100°).

NITROSO-BENZYL-TOLYL-THIO-UREA $PhC(NOH).NH.CS.NH.C_6H_4Me$. [67°]. Formed by melting *p*-tolyl-thio-carbimide with benzamidoxim (Koch, *B.* 24, 397).

NITROSO-BETORCIN $C_8H_9NO_3$ *i.e.* $C_6H(NO)Me_2(OH)_2[x{:}1{:}4{:}3{:}5]$. Obtained by the action of nitrosyl sulphate $SO_3H(NO)$ on a solution of betorcin (Stenhouse a. Groves, *C. J.* 37, 404; Von Kostanecki, *B.* 19, 2323). Red prisms (from HOAc).

p-**NITROSO-ISOBUTYL-ANILINE** $C_6H_4(NO).NHCH_2Pr$. [94°]. Formed from iso-butyl-aniline, $NaNO_2$, and HCl (Wacker, *A.* 243, 297). Steel-blue crystals, v. sol. alcohol. Yields $C_6H_4(NH_2).NHCH_2Pr$ on reduction. Boiling alkalis split it up into *p*-nitroso-phenol and iso-butylamine. Further treatment with $NaNO_2$ and HCl yields $C_6H_4(NO).N(NO)CH_2Pr$.

α-**NITROSO-*n*-BUTYRIC ACID** $C_4H_7NO_3$ *i.e.* $C_2H_5.C(NOH).CO_2H$. [151°]. Formed by the action of nitrous acid and NaOH upon ethyl-acetoacetic ether (Wleügel, *B.* 15, 1057). Flat prisms.—AgA′: insoluble powder.

β-Nitroso-butyric acid $CH_3.C(NOH).CH_2.CO_2H$. [140°]. Obtained from its ether, which is got by the action of hydroxylamine on acetoacetic ether (Westenberger, *B.* 16, 2996).—AgA′: white pp.

(αβ)-**Di-isonitroso-butyric acid** $C_4H_6N_2O_4$ *i.e.* $CH_6.C(NOH).C(NOH).CO_2H$. Obtained from its *ethyl ether* [140°] which is formed, together with the *anhydride* $C_8H_{10}N_4O_7$ [133°], by the action of hydroxylamine on nitroso-acetoacetic ether (Ceresole a. Köckert, *B.* 17, 821). The acid is crystalline and gives the salts $BaA'_2\ 2\frac{1}{2}aq$ and AgA′. The anhydride gives $BaA''\ \frac{1}{2}aq$ and Ag_2A''.

NITROSO-CARVACROL $C_6H_2(NO)(C_3H_7)(CH_3)(OH)$. [153°]. Yellow prisms (Paterno a. Canzoneri, *B.* 12, 383. Reduced by $SnCl_2$ to amido-carvacrol [304°].

NITROSO-CARVENE *v.* Carvoxim.

NITROSO- COMPOUNDS. Compounds containing nitrosyl NO. They are usually obtained by the action of nitrous acid. They may be divided into nitrosamines (*q. v.*) in which nitrosyl is attached to nitrogen, and nitroso- compounds proper in which nitrosyl is attached to carbon. Compounds in which nitrosyl is attached to oxygen are called nitrites. Compounds containing the divalent radicle oximidogen NOH are often called isonitroso- compounds, the group C:NOH being isomeric, and often interchangeable, with the group CH.NO. The isonitroso-compounds may be obtained by the action of hydroxylamine on aldehydes, ketones, and ketonic compounds, and may thus be termed oximides, oximes, or oxims of these ketonic bodies. Nitrous acid acting upon the group .CO.CH₂. frequently converts it into .CO.C(NOH).: the new body may be termed either a nitroso-derivative of the original ketone, or a mono-oxim of the diketone .CO.CO.; the latter terminology is that usually employed in this dictionary. Nitrous acid acting upon a secondary amine forms a nitrosamine; with tertiary aromatic amines and with phenols it yields nitroso-compounds, the nitrosyl taking up the *para*-position. When the *p*- position is occupied the nitrosyl can in some cases still enter the benzene nucleus in the o- position. The nitroso-phenols  $HO.C{<}\begin{matrix}CH{:}CH\\CH.CH\end{matrix}{>}C.NO$ and the oxims of the mono-quinones  $CO{<}\begin{matrix}CH{:}CH\\CH{:}CH\end{matrix}{>}C{:}NOH$ are identical, and will be described under the quinones. Some aromatic nitrosamines are converted into the isomeric *p*-nitroso- compounds by the action of alcoholic HCl.

NITROSO-CREATININE *v.* Creatinine.

NITROSO-CRESOL *v. Oxim* of Toluquinone.

DI-NITROSO-CRESORCIN $C_6HMe(NO)_2(OH)_2$ or $C_6HMe(NOH)_2O_2$[1:3:5:2:4]. Formed from cresorcin and HNO_2 (Von Kostanecki, *B.* 20, 3135). Pale-green plates (containing aq). Explodes above 160°. Sl. sol. water. With HNO_3 it yields di-nitro-cresorcin [90°].

DI-NITROSO-CYMENE $C_{10}H_{12}N_2O_2$. [72°]. Formed by oxidising the di-oxim of thymoquinone with alkaline K_3FeCy_6 (Kehrmann a Messinger, *B.* 23, 3560). Greenish-yellow pp., smelling like iodine. After one fusion it melts at 130°.

NITROSO-ETHYL-ACETONE is the (β)-oxim of Methyl ethyl diketone (*q. v.*).

NITROSO-ETHYL-ANILINE $C_8H_{16}N_2O$ *i.e.* [4:1]$C_6H_4(NO)(NHEt)$. [78°]. Obtained by adding alcoholic HCl to an ethereal solution of the nitrosamine of ethyl-aniline (Fischer a. Hepp, *B.* 19, 2993). Green plates, v. sol. alcohol. Yields $C_6H_4(NH_2)(NHEt)$ (270°) on reduction. On heating with aqueous NaOH it is split up into nitroso-phenol and ethylamine.—B′HCl: needles, v. sol. water.

Nitroso-di-ethyl-aniline [1:4]$C_6H_4(NO).NEt_2$. [84°]. Formed from di-ethyl-aniline and nitrous acid (Kopp, *B.* 8, 621). Green prisms (from ether). Decomposed by boiling dilute NaOH into nitroso-phenol and diethylamine. Salts.—$B'_2H_2PtCl_6$.—B'_2I_8. [118·5°] (Dafert, *M.* 4, 506).—B'_2I_3. [127°].—$B'_2H_2SO_4$.—$B'2C_6H_2(NO_2)_3(OH)$.—B'_2HCy. [171°] (Lippmann, *M.* 6, 544). Orange crystals (from alcohol).

NITROSO-DI-ETHYL KETONE *v.* (α)-*Oxim* of Methyl ethyl diketone.

α-NITROSO-ETHYL-PHENYL-AMINE $C_6H_4(NH_2).CH(NO).CH_3$. Formed by heating $C_6H_4(NH_2).CH_2NO$ with KOH, methyl alcohol, and MeI at 100° (Gabriel a. Meyer, *B.* 14, 2339). Yellowish oil.—B′HCl: prisms.

Acetyl derivative $C_6H_4(NHAc).CH(NO).CH_3$. [109°].

NITROSO-ETHYL-o-TOLUIDINE $C_9H_{12}N_2O$ *i.e.* $C_6H_3Me(NO).NHEt$. [140°]. Green plates (Fischer, *B.* 19, 2994).

NITROSO-ETHYL-o-XYLIDINE $C_{10}H_{14}N_2O$ *i.e.* $C_6H_2(NO)Me_2(NHEt)$ [1:2:3:4]. [124°]. Green crystals (Menton, *A.* 263, 327).—B′HCl: needles.

NITROSO-FORMANILIDE *v.* Formic acid.

α-NITROSO-GLUTARIC ACID $CO_2H.C(NOH).CH_2.CH_2.CO_2H$. [152°]. Produced by boiling furazyl-propionic acid

$O\!\left\langle\begin{matrix}N{:}CH\\ N{:}C.CH_2.CH_2.CO_2H\end{matrix}\right.$

[86°] with potash, the semi-nitrile $CN.C(NOH).CH_2.CH_2.CO_2H$ [87°] being formed at the same time (Wolff, *A.* 260, 112). Prisms. Yields amido-glutaric acid on reduction.—BaA″1½aq : needles, v. sl. sol. water.

Amidoxim $CO_2H.CH_2.CH_2.C(NOH).C(NOH).NH_2$. [158°]. Formed by the action of hydroxylamine on the semi-nitrile [87°]. Needles, sl. sol. water.

NITROSO-GUANIDINE *v.* Guanidine.

NITROSO-HEXOIC ETHER $CH_3.C(NOH).CHEt.CO_2Et$. Formed from ethyl-acetoacetic ether and hydroxylamine (Westenberger, *B.* 16. 2997). Oil.

Nitroso-hexoic acid $CH_3.C(NOH).CMe_2.CO_2H$. [97°]. By the action of amyl nitrite and nitric acid on tri-methyl-ethylene there is formed a compound $CMe_2(ONO_2).C(NOH).CH_3$ which when heated with alcoholic KCy yields the nitrile $CH_3.C(NOH).CMe_2.CN$ [100°] (230°) which forms on saponification the corresponding amide [164°] and acid [97°] (Wallach, *A.* 248, 166). The acid is split up by heat into CO_2 and the oxim of methyl isopropyl ketone.

NITROSO-INDOXYL *v.* ψ-Isatin oxim.

NITROSO-MALONIC ACID $CH(NO)(CO_2H)_2$ or $C(NOH)(CO_2H)_2$. *Oxim of mesoxalic acid.*

Formation.—1. By treating barbituric acid with nitrous acid and warming the resulting violuric acid with potash (Baeyer, *A.* 131, 292). 2. From its ether, which is got by passing nitrous fumes into sodium-malonic ether (Conrad a. Bischoff, *B.* 13, 599; *A.* 209, 211).—3. By the action of hydroxylamine on mesoxalic acid (Meyer a. Müller, *B.* 16, 608).

Properties.—Needles. Decomposes at 126° with violence. At 40° its aqueous solution gives off CO_3 and HCy. Sodium-amalgam reduces it to amido-malonic acid.

Salts.—K_2A''½aq.—PbA″ aq.—AgA′ ½aq.

Ethyl ether Et_2A''. S.G. $\frac{15}{15}$ 1·149. Oil.

NITROSO-MESITYL OXIDE $CMe_2{:}CH.CO.CH{:}NOH$. [102°]. Prisms (Claisen a. Manasse, *B.* 22, 526).

NITROSO-METHYL-ACETONE *v. Oxim* of Di-methyl-diketone.

NITROSO-DI-METHYL-*p*-AMIDO-BENZOIC ACID $C_6H_2(NOH)(NMe_2).CO_2H$. [224°]. Formed by the action of nitrous acid on $C_6H_4(NMe_2)CO_2H$ (Bischoff, *B.* 22, 342). Plates (from alcohol). Yields $C_6H_4(NMe_2)CO_2H$ on reduction with $SnCl_2$ and HCl. Salts.—$B'H_2C_2O_4$. [178°–181°].—$B'C_6H_2(NO_2)_3OH$. [168°]. — B′HCl: slender needles.

Methyl ether MeA′6½aq. [101°].—B′HCl.—$B'C_6H_2(NO_2)_3OH$. Golden-yellow needles.

NITROSO-DI-METHYL-AMIDO-BENZOPHENONE $C_6H_5.CO.C_6H_2(NOH).NMe_2$. Oil (Bischoff, *B.* 22, 340).

Nitroso-tetra-methyl-diamido-benzophenone *v.* p. 263.

***p*-NITROSO-METHYL-ANILINE** $C_7H_8N_2O$ *i.e.* $C_6H_4(NO).NMeH$. [118°]. Formed by adding alcoholic HCl to an ethereal solution of the nitrosamine $C_6H_5.NMe(NO)$ (Fischer a. Hepp, *B.* 19, 2991). Steel-blue prisms (from water). Decomposed by NaOHAq into *p*-nitroso-phenol and methylamine. Yields $C_6H_4(NH_2)(NMeH)$ on reduction. Nitrous acid forms the nitrosamine $C_6H_4(NO).NMe.NO$ [101°]. Nitric acid (S.G. 1·13) yields the nitro-compound $C_6H_4(NO_2).NMe.NO$ [104°].

Nitroso-di-methyl-aniline $C_6H_4(NO)NMe_2$ or

$C_6H_4\!\left\langle\begin{matrix}NMe_2\\ N\end{matrix}\right\rangle\!O$

Mol. w. 150. [85°]. Formed by the action of nitrous acid on di-methyl-aniline hydrochloride (Baeyer a. Caro, *B.* 7, 963; Schraube, *B.* 8, 616; Wurster, *B.* 12, 523, 1825; Meldola, *C. J.* 39, 37). Green plates (from ether).

Reactions.—1. Reduced by *tin* and HClAq to $C_6H_4(NH_2)(NMe_2)$.—2. Resolved by boiling *alkali* into nitroso-phenol and dimethylamine.—3. K_3FeCy_6 oxidises it to $C_6H_4(NO_2)(NMe_2)$.—4. *Alcoholic potash* forms $N_2O(C_6H_4NMe_2)_2$.—5. HClAq at 105° yields $C_6H_4(NH_2)(NMe_2)$,

$C_6H_2Cl_2(NH_2)(NMe_2)$ and $C_6H_2Cl_2(NH_2)_2$ (Möhlau, *B.* 19, 2010).—6. *Phenyl-hydrazine acetate* yields $C_{14}H_{16}N_4O$ [103°]. This base is also formed by the action of diazobenzene on nitroso-dimethylaniline (O. Fischer, *B.* 21, 2610; 22, 623). Phenyl-methyl-hydrazine yields the compound $C_{15}H_{16}N_4O$ [141°].

Salts.—$B'HCl$: yellow needles.—$B'H_2SO_4$.—$B'H_2C_2O_4$ 2aq.—$B'H_2C_2O_4$.—$B'_2H_4FeCy_6$ aq.—$B'_3H_3FeCy_6$ $2\frac{1}{2}$aq.—B'_2AgNO_3.—B'_2HCy. [222°]. (Lippmann a. Fleissner, *M.* 6, 537).

Combinations.—B'_2I_3. [116°] (Dafert, *M.* 4, 506).—B'_3I_2. [124°].—B'_2PhNH_2: steel-blue crystals.—$B'_2NH_2.C_6H_4Me$ [1:4].—B'_2PhOH.—$B'C_6H_6$: dark-green crystals.—$B'_2HCyC_6H_6$.—$B'_2HCyC_6H_5NO_2$.—$B'_2HCyC_7H_8$.—$(B'_2HCy)_3(PhN_2)_2$.

NITROSO-METHYL-OXINDOLE *v. Oxim of* Methyl-isatin.

NITROSO-METHYL-o-TOLUIDINE $C_6H_3Me(NO)(NHMe)$ [1:5:2]. [151°]. Formed by the action of HCl on the isomeric nitrosamine $C_6H_4Me(NMe.NO)$ (Kock, *A.* 243, 308). Green plates. Split up by boiling NaOHAq into nitroso-o-cresol and methylamine. $KMnO_4$ oxidises it to nitro-methyl-o-toluidine.—$B'H_2Cl_2$ aq. [110°]. Yellow cubes.

Nitroso-di-methyl-*m*-toluidine $C_6H_3Me(NO)NMe_2$ [1:2:5]. [92°]. Formed by the action of nitrous acid on di-methyl-*m*-toluidine (Wurster a. Riedel, *B.* 12, 1796; 13, 126). Light-green needles. Decomposed by boiling NaOHAq into NMe_2H and the oxim of *m*-toluquinone.—$B'HCl$.—$B'_2H_4FeCy_6$ aq.—$B'_2H_5FeCy_6$ 2aq: yellow needles.

NITROSO-METHYL-o-XYLIDINE $C_6H_2Me_2(NO)(NHMe)$ [1:2:6:3]. [161°]. Green needles, sl. sol. water (Menton, *A.* 263, 323).—$B'HCl$: crystalline meal.

NITROSO-NAPHTHALENE $C_{10}H_7(NO)$. [89°]. Formed from $Hg(C_{10}H_7)_2$ and NOBr in CS_2 (Baeyer, *B.* 7, 1639; 8, 615). Yellow crystals.

Di-nitroso-naphthalene $C_{10}H_6(NO)_2$ [1:4]. Formed by the action of alkaline K_3FeCy_6 on the dioxim of (α)-naphthoquinone (Nietzki a. Guitermann, *B.* 21, 433). Pale-yellow powder, exploding at 120°. Insol. water and alcohol.

Di-nitroso-naphthalene $C_{10}H_6(NO)_2$ [1:2]. [126°]. Formed from (β)-naphthoquinone dioxim and K_3FeCy_6 (Leuckart, *B.* 19, 174). Needles, m. sol. alcohol.

NITROSO-NAPHTHOL *v. Oxim* of Naphthoquinone.

NITROSO-(β)-NAPHTHOL SULPHONIC ACID $C_{10}H_5(NO)(OH)SO_3H$ or $C_{10}H_5(NOH)O(SO_3H)$ [1:2:3] or [1:3:2]. Formed from ammonium (β)-naphthol sulphonate, $NaNO_2$, and HCl (Meldola, *C. J.* 39, 41). Very soluble orange crystals. Its solution gives with phenol in HOAc a blue colour, becoming red on dilution, and with diphenylamine a blue colour, remaining blue on dilution. Tin and HCl reduce it to the amido- acid.—BaA'_2 aq: orange needles.—$BaC_{10}H_5NSO_5$ 2aq: green needles.—$Ag(NH_4)A''$.—$(NH_4)_2A''$ aq: green.—MgA''3aq: orange.—ZnA''3aq.—PbA''aq.

An isomeric acid, obtained by reducing benzene-azo-(β)-naphthol sulphonic acid with aqueous ammonium sulphide, crystallises in sparingly soluble grey needles (Griess, *B.* 14, 2042).

NITROSO-DI-(α)-NAPHTHYL-AMINE $C_{10}H_6(NO).NHC_{10}H_7$. [169°]. Formed from $(C_{10}H_7)_2N.NO$ and alcoholic HCl (Fischer a. Hepp, *B.* 20, 1248; Wacker, *A.* 243, 301). Dark-red needles. With boiling dilute H_2SO_4 it yields the mono-oxim of (α)-naphthoquinone and (α)-naphthylamine.—$B'HCl$: green needles.

Nitroso-(β)-naphthylamine $C_{10}H_6(NO)NH_2$ [1:2]. [152°]. Formed by heating the (α)-oxim of (β)-naphthoquinone with NH_4Cl and NH_4OAc (Ilinski, *B.* 17, 391; Harden, *A.* 255, 150). Dark-green needles (from dilute alcohol. Yields naphthylene o-diamine on reduction and the di-oxim of (β)-naphthoquinone on treatment with hydroxylamine.—$B'HCl$.—$B'_2H_2PtCl_6$.—$B'H_2SO_4$ aq.

(α) - NITROSO - (β) - NAPHTHYL-ETHYL-AMINE $C_{10}H_6(NO).NHEt$. [121°]. Formed by the action of alcoholic HCl at 6° on the nitrosamine $C_{10}H_7.NEt(NO)$, and also by the action of ethylamine on the (α)-oxim of (β)-naphthoquinone (Fischer a. Hepp, *B.* 20, 2471; 21, 686). Green crystals. Yields a crystalline nitrosamine $C_{12}H_{11}N_3O_2$, decomposing at 105°.

(α)-Nitroso-(α)-naphthyl-ethyl-amine $C_{12}H_{12}N_2O$ *i.e.* $C_{10}H_6(NO)NHEt$ [1:4]. [133°]. Formed in like manner (Kock, *A.* 243, 310). Brown pp. Reduced by stannous chloride to $C_{10}H_6(NH_2)(NHEt)$. Yields ethylamine and $C_{10}H_6(NOH)O$ when boiled with NaOHAq.—$B'HCl$.—Picrate $C_{18}H_{15}N_5O_8$. [174°].—$C_{12}H_{13}N_2O_2Na$: white spangles, v. sol. water.

Tetrahydride  $C_6H_8<\begin{array}{l}C(NHEt){:}CH\\C(NO)=CH\end{array}$ [119°]. Formed from the isomeric nitrosamine and alcoholic HCl (Bamberger a. Helwig, *B.* 22, 1314). Needles.—$B'HCl$: golden crystals. Nitroso-naphthyl-di-ethyl-amine $C_{10}H_6(NO).NEt_2$. [165°]. Formed by adding $NaNO_2$ to a well-cooled solution of the base (B. E. Smith, *C. J.* 41, 182). Reddish-golden scales. Gives a blue colour with H_2SO_4.

NITROSO-NITRATES *v.* Nitrosates.

NITROSO-NITRO-ANTHRONE $C_{14}H_8N_2O_4$. [263°]. Formed by the action of alkalis on 'hydro-anthracene nitrite' (Liebermann, *B.* 14, 467; *cf.* vol. i. p. 277).

NITROSO-NITRO-BUTANE $C_4H_8N_2O_3$ *i.e.* $CH_3.C(NO)(NO_2).C_2H_5$. *Pseudobutylnitrole.* [58°]. Formed by the action of KOH, KNO_2, and dilute H_2SO_4 on β-nitro-butane (Meyer a. Locher, *A.* 180, 136) and of NO_2 on $CH_3.C(NOH).C_2H_5$ (Scholl, *B.* 21, 508). White prisms (from chloroform), yields a blue liquid on fusion. Insol. water and alkalis.

The isomeric $Pr.CH(NO)(NO_2)$ and $PrCH(NO)(NO_2)$ are oils (Demole, *B.* 7, 790; Züblin, *B.* 10, 2084).

NITROSO-NITRO-PENTANE $Et_2C(NO)(NO_2)$. [63°]. Formed from $Et_2C{:}NOH$ and N_2O_4 (Scholl, *B.* 21, 509).

NITROSO-NITRO-PROPANE $C_3H_6N_2O_3$ *i.e.* $CH_3.C(NO)(NO_2).CH_3$. [76°]. Formed from acetoxim and N_2O_4 (Scholl, *B.* 21, 508). The isomeric compound $CH_3.CH_2.CH(NO)NO_2$ or $CH_3.CH_2.C(NOH).NO_2$ melts at 60° (Meyer, *A.* 175, 114).

NITROSO-NITRO-RESORCIN $C_6H_4N_2O_5$ *i.e.* $C_6H_2(OH)(NO_2)O(NOH)$ [1:2:3:4]. Formed from nitro-resorcin [85°] and nitrous acid (De la Harpe a. Reverdin, *B.* 21, 1405). Brown needles, not melted at 200°, explodes at a higher temperature.

NITROSO-ORCIN $C_6H_2Me(NO)(OH)_2$. Formed from orcin, NaOHAq, and amyl nitrite (Krämer, *B.* 17, 1883). Dark-red prisms. When heated with orcin and H_2SO_4 it gives the dyestuff $C_{14}H_{11}NO_3$.

Di-nitroso-orcin $C_6HMe(NO)_2(OH)_2$ [1:2:4:3:5]. Formed by adding H_2SO_4 containing N_2O_3 to a solution of orcin (Stenhouse a. Groves, *C. J.* 31, 544). Yellow prisms. Blackens about 140° without melting. Alcoholic hydroxylamine hydrochloride at 100° yields $C_6HMe(NOH)_4$, whence Ac_2O forms $C_6HMe(N_3O)_3$ [47°] (Goldschmidt, *B.* 20, 1607). The compound $C_6HMe(NOH)_4$ yields, on oxidation by potassium ferricyanide, the product $C_6HMe(NO)_4$ [103°], crystallising in pale-yellow needles.

NITROSO-OXANTHRANOL $C_{14}H_9NO_3$. Formed by boiling 'hydro-anthracene nitrite' with alkalis (Liebermann, *B.* 14, 471). Orange flakes, sol. alkalis.

NITROSO-OXINDOLE *v.* Isatin oxim.

NITROSO-OXY-METHYL-QUINOLINES $C_5H_3N{:}C_4HMe(NO)(OH)$. The following crystalline compounds have been obtained by the action of nitrous acid on the oxy-methyl-quinolines (Noelting a. Trautmann, *B.* 23, 3665):— (*B.*3)-nitroso-(*B.*4)-oxy-(*B.*1)-methyl-quinoline; (*B.*1)-nitroso-(*B.*4)-oxy-(*B.*2)-methyl-quinoline; (*B.*4)-nitroso-(*B.*1)-oxy-(*B.*2)-methyl-quinoline; (*B.*1)-nitroso-(*B.*4)-oxy-(*B.*3)-methyl-quinoline; and (*B.* 2)-nitroso-(*B.* 1)-oxy-(*B.* 4)-methyl-quinoline. Friedländer and Müller (*B.* 20, 2014) have obtained in like manner (*Py.* 1,3)-nitroso-oxy-(*Py.* 4)-methyl-quinoline crystallising in red needles.

NITROSO-OXY-DI-PHENYL-AMINE $C_6H_3(NO)(OH).NHPh$ [4:3:1]. Formed from $C_6H_4(OH).NPh(NO)$ and alcoholic HCl (Kohler, *B.* 21, 909). Red needles, m. sol. alcohol.

NITROSO-(*B.* 4)-OXY-QUINOLINE $C_9H_5(NO)(OH)N$. Formed from o-oxy-quinoline and nitrous acid (Lippmann a. Fleissner, *M.* 10, 794). Yellow needles. The isomeric nitroso-(*B.* 2)-oxy-quinoline crystallises from HOAc in golden needles (Mathëus, *B.* 21, 1886).

(*Py.* 2)-Nitroso-(*Py.* 1,3) di-oxy-quinoline $C_6H_4\left\langle\begin{matrix}CO.C(NOH)\\ N:C(OH)\end{matrix}\right.$. [208°]. Formed by the action of nitrous acid on (*Py.* 1,3)-di-oxy-quinoline (oxycarbostyril (Baeyer a. Homolka, *B.* 16, 2216). Orange prisms. Decomposed by conc. HClAq into isatin and hydroxylamine. $SnCl_2$ yields tri-oxy-quinoline.

NITROSO-PHENOL *v.* *Mono-oxim* of Quinone.

NITROSO-PHENYL-ACETIC ACID *v.* *Oxim* of Phenyl-glyoxylic acid.

***p*-NITROSO-DI-PHENYL-AMINE** $C_6H_4(NO).NPhH$. [143°]. Formed from di-phenyl-nitrosamine and alcoholic HCl (O. Fischer a. Hepp, *B.* 19, 2991; 21, 677, 2614). Green plates (from benzene). With phenyl-hydrazine hydrochloride it yields a compound $C_{18}H_{16}N_4O$ [112°]. Free phenyl-hydrazine in ether yields amido-diphenylamine [75°] and $C_{24}H_{20}N_4O$ [173°]. *p*-Bromo-aniline yields $C_{36}H_{25}Br_4N_5$ [243°]. Tin and HCl reduce it to $C_6H_4(NH_2)(NPhH)$ [65°] (Ikuta, *A.* 243, 274). Aqueous NaOH yields aniline and quinone-oxim.—B'HCl: bronze tables or needles.

Acetyl derivative [97°]. Red prisms.

Nitrosamine $C_6H_4(NO).NPh(NO)$. [98°].

NITROSO-PHENYL-BENZYL-THIO-UREA PhC(NOH).NH.CS.NHPh. [172°]. Crystals (from alcohol) (Koch, *B.* 24, 394).

NITROSO-PHENYL-(*a*)-NAPHTHYL-AMINE $C_{10}H_6(NO).NHPh$. [150°]. Formed from phenyl-naphthyl-nitrosamine and alcoholic HCl (Fischer a. Hepp, *B.* 20, 1247). Brownish-yellow crystals. Yields $C_{10}H_6(NH_2).NHPh$ on reduction. Boiling dilute H_2SO_4 splits it up into aniline and quinone oxim.—B'HCl: green plates.

TRI-NITROSO-PHLOROGLUCIN $C_6(NO)_3(OH)_3$. Prepared by the action of KNO_2 and HOAc on phloroglucin (Benedikt, *B.* 11, 1374). Needles, sol. water and alcohol.—K_3A''': needles, exploding above 130°.

TRI-NITROSO-PROPANE *v.* *Oxim* of Di-nitroso-acetone.

NITROSO-PROPIONIC ACID *v.* *Oxim* of Pyruvic acid.

NITROSO-PROPYL-ANILINE $C_9H_{12}N_2O$ *i.e.* $C_6H_4(NO).NPrH$. [59°]. Formed from the isomeric $C_6H_5.NPr(NO)$ and alcoholic HCl (Wacker, *A.* 243, 291). Steel-blue needles, v. sol. alcohol. Yields $C_6H_4(NH_2).NPrH$ on reduction, and quinone-oxim and $NPrH_2$ on boiling with alkalis. $NaNO_2$ and HCl yield $C_6H_4(NO).NPr(NO)$ [69°].

Nitroso-di-propyl-aniline $C_6H_4(NO).NPr_2$. [42°]. Formed from di-propyl-aniline (241°) and HNO_2 (Mandl, *M.* 7, 99). Green trimetric crystals, $a{:}b{:}c = {\cdot}576{:}1{:}{\cdot}277$. Yields quinone-oxim and dipropylamine on warming with potash. HCy forms $C_{25}H_{37}N_5O_2$. [140°].

NITROSO-PROPYL-CRESOL $C_{10}H_{13}NO_2$ *i.e.* $C_6H_2MePr(NO)(OH)$. *Cymoquinone oxim* [140°] is formed from propyl-cresol, KNO_2, and HOAc (Mazzara, *G.* 12, 167). The isomeric $C_6H_2MePr(NO)(OH)$ melts at 167°.

NITROSO-RESORCIN $C_6H_3(NO)(OH)_2$ [4:3:1]. *Oxy-quinone oxim.* Formed from $C_6H_4(OH)(ONa)$ and amyl nitrite (Fèvre, *Bl.* [2] 39, 585; *C. R.* 96, 790). Golden crystals (containing aq), turning brown at 112°. Its solution is turned deep green by a ferrous salt. $SnCl_2$ reduces it to amido-resorcin. H_2O_2 yields nitroresorcin (Ulzer, *M.* 9, 1128).—NH_4A' 2aq.—KA' aq.—NaA'.—AgA': brown needles.
