## SECTION I.--INTRODUCTION

### Current Annual Report

This report presents statistics on patients in public hospitals for the mentally ill. Included are the following types of hospitals: the long-term State and county hospitals herein designated as public prolonged-care hospitals and the short-term State psychopathic hospitals.

No data are included for the Federal hospitals (including the Veterans Administration) or the territorial hospitals in this report.

The data are based on schedules received for the 30th Annual Census of Patients in Mental Institutions, the ninth such census to be conducted by the National Institute of Mental Health.

The tabulations made are comparable to those in earlier publications. They consist of a bookkeeping account of the flow of patients in and out of public hospitals, statistics on certain characteristics of first admissions, resident patients, discharges and on personnel and expenditures.

The generous cooperation of the various State governments and superintendents and staffs of the individual public hospitals is gratefully acknowledged. Without their assistance this report could not be made.

### Previous Reports

A detailed historical account of the development of the Annual Census of Mental Patients can be found in "Patients in Mental Institutions: 1947" pp. 1--4 U. S. Government Printing Office, Washington 25, D. C.

The first census in essentially its present form was conducted in 1923 and covered all types of hospitals. The next succeeding census was in 1926. Between 1926 and 1930 the inquiry was confined to State mental hospitals. From 1931 to date the enumeration has covered the State, county and psychopathic hospitals.

Part I of Public Health Service Publication No. 574, dealing with public institutions for mental defectives and epileptics has been published. This is Part II. Three more parts, Part III dealing with private hospitals for mental disease and general hospitals accepting mentally ill patients; Part IV concerned with private institutions for mental defectives and epileptics; and Part V presenting trend tables for the period 1944 through 1955 and special tables based on 1955 data for all mental hospitals and institutions for mental defectives and epileptics will also be published.

## SECTION II.--SCOPE OF THE DATA

### Purpose

The survey is designed to provide information as to the extent of use of public hospital facilities for the mentally ill in each State; to furnish basic data on a national level for the characteristics of first admissions to, resident patients in, and discharges from, public mental hospitals. Administrative information on movement of patient population, expenditures, and personnel employed, are also presented.

### Coverage

The period covered in this report is for the calendar year 1955 or fiscal year ending in 1955. Most of the data are reported for the year ending June 30th. However, certain hospitals report for the year ending March 31st, August 31st, October 31st or December 31st.

Reporting of movement of population data for the 217 State hospitals and the 48 county hospitals was not complete since one State and one county hospital did not report. Reporting of

movement for the 10 psychopathic hospitals was complete. (See Table A) Coverage was somewhat less for the remaining six schedules. The specific schedules requested were as follows;

#### Movement of Population

First admissions during the year by mental disorder, age and sex (two schedules--male and female)

Resident patients at end of year by mental disorder, age and sex (two schedules--male and female)

#### Personnel

#### Financial

A special coverage problem existed for the reports of the 22 State hospitals in New York. The State was able to report only limited data of the above described type. Data were completely reported for movement, personnel and finances. However, schedules pertaining to first admissions and resident patients were not available by mental disorder. However, the distribution of first admissions and resident patients by age and sex were supplied and will be shown as footnotes to the appropriate tables.

## Mental Health Statistics--Current Reports

A special report dealing with provisional data from this survey and presenting rates for all admissions, first admissions, discharges, deaths, and average daily resident patient populations by State has been published. It is

entitled "Patients in Public Hospitals for the Prolonged Care of the Mentally Ill, 1953", Series MHB-H-2 and was published in December 1956. Copies of this report may be obtained by writing to the National Institute of Mental Health, National Institutes of Health, Bethesda 14, Maryland.

<sup>1</sup> Public Prolonged-Care hospitals includes county as well as State operated hospitals.

<sup>2</sup> One of the State and one of the county hospitals did not report data for 1955. Therefore the percent return for the United States is 99.2, for Maryland 83.3, and for Tennessee 80.0. All other States had 100 percent returns.

The above data were based on the submission of a usable movement of patient population report. Receipt of other schedules had varying coverage.

## SECTION III. --DEFINITIONS

### Type of Hospital Included

Included in this survey are the State and county hospitals for mental disease which are essentially long term hospitals and the State psychopathic hospitals which are, in general, intensive treatment, teaching and research hospitals and where the patient is generally held for a short term only.

In making a comparison between States it is important that the psychopathic facilities of the States concerned be taken into account with the prolonged care hospitals so that adequate judgment as to size, provision of facilities, and rates of admission, release, death and retention can be made.

### Data on Movement of Patient Population

Statistics on the movement of population present a formal accounting of the flow of patients into and out of mental hospitals during the year. The classification employed covers patients on the books at the beginning of the year, admissions, separations, and patients on the books at the end of the year. The reader should be aware that these data count transactions and not patients so that duplication of patients can exist. Each of the categories used, together with its subclasses, is listed and defined below.

1. Patients on the Books at the Beginning and End of the Year. All patients on the books of the hospital at the time stated, classified by actual location as follows:

(a) In hospital. Patients physically present or accounted present under the rules governing such matters in hospitals (that is, "resident patients").

(b) In extramural care. Patients on the books of the hospital but not in actual residence. (That is, subject to hospital control but residing in a location other than the hospital proper).

(i) In family care. Patients who have been placed in the community in private families other than their own, under State supervision.

The expense of maintenance may be borne by the State, the patient's estate, relatives, Old Age Assistance or some other person or agency.

(ii) In other extramural care. A majority of these patients are to be found on trial visit, usually to their homes, a type of care in which the ability of the patient to adjust to normal community life is tested. Since the patient is retained on the books of the hospital, he may be returned to the hospital for his own protection or for that of the community. The provisions under which patients are put on trial visit vary widely from State to State. Moreover, factors such as the degree of crowding of facilities, the development or extension of

methods of therapy and the number of social workers available for follow-up will affect the number on trial visit at any time. In addition to patients on trial visit, this category includes escaped patients and patients absent from the hospital for reasons not classified elsewhere.

2. Admissions other than Transfers. All patients who enter a mental hospital during the course of a year are designated as admissions. Admissions, other than transfers, are further classified as first admissions and readmissions.

(a) First admissions. Includes all patients admitted to a prolonged care mental hospital without a record of previous care (that is, a record of an admission and a formal discharge) in such a public or private hospital anywhere. The term is usually applied exclusively within a given type of hospital, that is, a patient going from a hospital for mental disease to an institution for mental defectives and epileptics, or vice versa, is considered a discharge from the first institution and a first admission to the second, not a transfer or a readmission. The psychopathic hospitals would also observe the above definition, except that patients who show a prior admission to the psychopathic hospital to which they are being admitted would be counted as readmissions.

(b) Readmissions. This category comprises patients admitted with record of previous treatment as indicated above.

3. Separations other than Transfers. All patients who are removed from the custody of the hospital are designated as separations. Separations, other than transfers, are the result of discharge or death. The nature of the classification of deaths and discharges is indicated below.

(a) Discharges. These represent patients who are formally removed from the custody of the hospital. Such patients may be discharged directly from the hospital or from extramural care. However, since practices with respect to placing patients on or removing them from extramural care vary so widely from hospital to hospital so as to introduce a serious lack of comparability within each of these classes, tables on the characteristics of discharged patients are presented for all discharges.

(b) Deaths. These represent patients who die while in the hospital or while in extramural care. No data are reported with respect to the age and diagnostic characteristics of patients who die in a given year.

4. Transfers. Those admissions and separations representing patients shifted within the same State from the supervision of one prolonged-care mental hospital to another, without a formal discharge, are designated as transfers. Since transfers do not represent additions

to the total patient population of hospitals within a given State and presumably have already appeared at some time in statistics on admissions, they are not given detailed consideration in this report. Psychopathic hospitals are instructed to consider such transfers as admissions and separations unless they are made to another psychopathic hospital within the State.

#### Nomenclature

In 1952 the American Psychiatric Association adopted and the American Medical Association approved a revision of the nomenclature for mental disorder. This report presents data in terms of the revised nomenclature as it appears in the Section on Diseases of the Psychobiologic Unit of the "Standard Nomenclature of Diseases and Operations", American Medical Association 1952. The nomenclature also appears in the "Diagnostic and Statistical Manual--Mental Disorders" American Psychiatric Association, 1952.

#### Characteristics of First Admissions and Resident Patients

Tables are presented for both of these patient categories for the United States and each State by mental disorder, age and sex. For first admissions age is computed as of the last birthday prior to admission. In the case of resident patients it is computed for

the last birthday as of the end of the reporting year.

#### Characteristics of Discharged Patients

Beginning with this report tables on discharge by condition on discharge and sex are neither presented in the annual report nor are they collected in the annual census for two main reasons:

1. Discharge from the books of a mental hospital is used by different hospitals in different ways. Some hospitals discharge a large proportion of patients directly while others use a period of trial visit, parole, convalescent leave, etc., prior to discharge in most cases. In most States this period is arbitrarily set by law and varies in length from 90 days up to three years. In many States discharge from trial visit, etc., is administrative and does not require a return to the hospital. Therefore, the adequacy of the determination of condition on discharge varies according to the length of time between last hospital examination and time of discharge from the hospital books.

2. The standards for determination of condition on discharge are not well defined and have been applied under varying administrative conditions, thus rendering comparisons between hospitals or State hospital systems difficult to interpret.

### SECTION IV. --LIMITATIONS OF THE DATA

#### Utility of Hospital Rates as a Measure of Prevalence and Incidence

Variations in resident patient and first admission rates to the public mental hospitals provide, in theory, a basis for inference as to the variations in the prevalence and incidence of serious mental disease among the several States.

However, there are a number of reasons why such inferences cannot and should not be made for this purpose in our present state of knowledge. Some of these reasons are as follows:

1. The relationship between the number of mentally ill who are hospitalized and the number of persons with mental illness in the population who are not hospitalized is not known.
2. Not all persons who are seriously mentally ill are hospitalized. The inability to gain admittance may be related to the degree of overcrowding of existing facilities which, in turn, varies with the adequacy of facilities for the care of mental patients. Those States with more extensive facilities of various types or with regulations requiring admission of all patients without regard to available space

are more apt to show greater numbers of hospitalized patients.

In addition many persons with mental illness which is not too severe, may not seek help or be identified so as to obtain assistance. Also there have been developing a large number of alternative facilities to help such persons outside of the hospital, such as psychiatric clinics, specialized social agencies and other groups.

3. In a given State, either the expansion of facilities or a sudden increase in discharges will provide empty beds and thus permit an upswing in admission for patients, who, because of insufficient hospital space, were unable to gain admittance in previous years. This means that the increased admission rate does not reflect increased numbers of new mentally ill but rather an accumulation of patients who would have been included in the admission figures of previous years. Similar considerations also apply to the concept of resident patients as an indication of prevalence.

States also vary in their definitions of the terms used to measure hospital-based incidence and prevalence. The definitions of first

admission and resident patient are not standard and may vary so widely as to cause serious differences.

#### Special Problems Relating to Hospitals Included in the Survey

No comparable data are available on three groups of public mental hospitals: The Veterans Administration, the military, and the Public Health Service. The report is limited to the continental United States at this time, therefore, data are not presented on the territorial hospitals. Rates using civilian population as a base, computed for the continental United States for these data are understated to the extent that statistics on patients in the Veterans Administration or Public Health Service Hospitals are not available. However, with the use of civilian population the possibility of understating or overstating rates due to rapid shifts in the population between civilian and military status is created.

Another point to be considered is that most of these hospitals regardless of control or type are closely associated, in their functions as hospitals, either by operating as screening facilities or as treatment service for acute cases only with chronic cases going to other hospitals or serving as alternative facilities for all types of patients and must be considered as a group in any analysis of the data.

For example, the States of New Jersey and Wisconsin have large county hospital systems which care for patients who, in other States, are cared for in State hospitals. These county hospitals represent about one-third of the average daily resident patient population in New Jersey and about four-fifths in Wisconsin. Also in Ohio the receiving hospitals, here included with the psychopathic hospitals, serve as the receiving facilities of the State hospital system and should be included with them in analysis.

In order to avoid rigidity and to keep the number of categories of hospitals within reasonable limits, some hospitals have been classified in terms of parallel function rather than strictly by type of control. There are three such hospitals involved in this report.

#### 1. St. Elizabeth's Hospital, Washington, D. C.

This hospital is operated by the Federal Government but has been classified with State hospitals, since it performs for residents of the District of Columbia the same functions a State hospital performs for the resident of a State and is largely supported financially by reimbursements from the District of Columbia for the services it offers to District residents.

However, non-residents of the District of Columbia are also cared for at the hospital under various Federal laws.

#### 2. Wayne County General Hospital and Infirmary, Eloise, Michigan

This general hospital is operated by Wayne County. Its large psychiatric unit is classified by the State as a State mental hospital because it provides care for patients from Wayne County who normally would be cared for in the State mental hospitals of Michigan. Many of these patients, who are direct State responsibilities, are cared for under contract with the county.

#### 3. The DeJarnette State Sanitarium, Staunton, Virginia

This State operated hospital is not included in the report. The hospital's funds for operation do not come from tax sources and in all of its aspects is operated as a private mental hospital. Therefore, data for this hospital are included with data for private hospitals reported in Part III of Publication No. 523.

#### Other Limitations

Data on overcrowding are not presented in this report. Variations in standards in determining the base, rated capacity, from which overcrowding is computed, are such that comparison among States in percent overcrowding may be misleading.

Data on personnel vacancies are presented but such data are available only for those hospitals with established tables of organization. Undoubtedly additional vacancies would have been reported by hospitals which do not budget for specific positions but which had unexpended funds for salaries and wages.

<sup>1</sup> Data do not include 23,484 first admissions, since some hospitals were unable to report the above information for their first admissions. The amount of such underreporting by State and sex is as follows:

State	Total	Male	Female
Total	23,484	11,906	11,578
District of Columbia....	1,001	477	524
Maryland.....	568	339	229
Massachusetts.....	5,740	3,149	2,591
New York.....	15,955	7,741	8,214

The State of New York was able to provide the age distribution of its first admissions by sex although data on diagnosis was not available. In order to maintain agreement in totals between the tables by State and diagnosis and by State and age the age distribution of New York State patients was not included in the above table but is presented below.

MALE.....	7,941	146	967	1,273	956	860	1,016	1,203	1,051	424	45

<sup>1</sup> Data do not include 147,610 resident patients since some hospitals were unable to report the above information for their resident patients. The amount of such underreporting by State and sex is as follows:

State	Total	Male	Female
Total	147,610	68,934	78,676
Alabama.....	7,197	3,397	3,800
Georgia.....	11,701	5,351	6,350
Maryland.....	2,312	1,248	1,064
Massachusetts....	23,178	10,346	12,832
North Carolina...	1,759	758	1,001
Oregon.....	3,368	1,652	1,716
West Virginia....	1,431	577	854
New York.....	96,664	45,605	51,059

The State of New York was able to provide the age distribution of its resident patients by sex although data on diagnosis was not available. In order to maintain agreement in totals between the tables by State and diagnosis and by State and age the age distribution of New York State patients was not included in the above table but is presented below.

MALE.....	45,605	412	1,911	5,277	7,643	9,678	8,988	7,409	3,449	721	117

<sup>1</sup> Data do not include 189 resident patients since some hospitals were unable to report the above information for their resident patients. The amount of such underreporting by State and sex is as follows:

State	Total	Male	Female
Total	189	94	95
Massachusetts.....	124	62	62
New York.....	65	32	33

The State of New York was able to provide the age distribution of its resident patients by sex although data on diagnosis was not available.

In order to maintain agreement in totals between the tables by State and diagnosis and by State and age the age distribution of New York State patients was not included in the above table but is presented below.

MALE.....	32	1	4	7	6	6	5	2	-	1	-
