You Can Depend on WYATT'S HYBRIDS

As this catalog is being prepared, we are well along with processing our 1949 crops of Wyatt's Corn Hybrids. Preliminary tests indicate the quality of the hybrids our customers will plant for their 1950 crops will be the finest ever.

Wyatt's hybrids are produced each year from new seed stocks direct from North Carolina Foundation Seed Producers. Each crop is grown under the supervision of the North Carolina Crop Improvement Association in well isolated fields. Detasselling of every Wyatt hybrid is systematic and complete.

To preserve this fine quality after the crop is made, all male rows are removed before the double-cross bearing female rows are harvested.

During each step of harvesting and processing each crop is carefully selected. Only well developed, sound seed ears go through the drier. After drying the reselected ears are shelled.

Three separate cleaning operations follow to remove dust, chaff and damaged grains. During these processes the grains are separated according to size for precision planting. At this stage all Wyatt hybrids are sampled and laboratory tested for moisture, physical purity and germination.

After meeting the high quality standards set for them, each lot of Wyatt hybrid Corn is treated with Du Pont's Arasan to protect it in the soil against adverse weather and certain soil borne diseases.

Select your hybrid seed Corn from the three offered on the opposite page. No finer seeds are obtainable at any price.

WYATT'S DEPENDABLE CORN HYBRIDS

F-27 N. C. 27 (Yellow) The most widely planted yellow corn in North Carolina and widely adapted and popular in South Carolina, Georgia, Alabama and Tennessee. While it is not the highest yielding yellow corn in every test, other qualities have won for it by far the greatest planter acceptance. Grain quality, shuck coverage, insect resistance and general good appearance and performance are some of these qualities. N. C. 27 averaged 71.6 bushels per acre in 2 tests in the Piedmont and 92.3 in 4 tests in the Coastal Plain regions during 1949. All tests were official. Root and stalk strength are very good and the plants average 179 ears per 100 stalks. Medium maturity. N. C. 27 at its very best, treated, tested and graded is sealed in the Wyatt bags. Buy it with confidence at your regular seed suppliers store or order it direct from us. Prices: 8 lb. bag \$2.40 postpaid. Not prepaid, 8 lbs. \$2.00; 14 lbs. (peck) \$3.00; 28 lbs. (½ bu.), \$5.75; 56 lbs. (1 bu.), \$10.50.

F-26 Dixie 17 (White) Currently the most popular white hybrid corn for the South. Dixie 17 made the highest average yield (111.7 bu. per acre) and highest individual yield (120.4 bu. per acre) in all 1949 N. C. official trials in competition with 36 hybrids and open pollinated varieties in both the Piedmont and Coastal Plain areas. It is widely adapted, yielding 111.7 bushels per acre in Camden County; 120.4 in Halifax; 115.1 in Robeson; 99.6 in Lenoir; 93.8 in Catawba and 65.4 in Rockingham. As the picture on this page indicates, the plants average 202 ears per 100 stalks as compared with 115 ears per 100 stalks of Weekley's, one of the better open pollinated varieties. Grain quality is good, kernels large and of uniform hard texture. Insect resistance is good except where rice weevils are severe. Husk coverage is good. Plants may stalk-break after maturity in closely spaced plantings and where high yields are produced. Medium maturity. Prices: 8 lb. bag \$2.40 postpaid. Not prepaid 8 lbs. \$2.00; 14 lbs. (peck) \$3.00; 28 lbs. (½ bu.) \$5.75; 56 lbs. (1 bu.) \$10.50.

F-4 N. C. 1032 (Yellow) A widely adapted yellow hybrid recommended especially in the Piedmont and Northern Coastal Plain areas of North Carolina, Piedmont South Carolina and Central and Northern portions of Georgia and Alabama. Yield and grain quality are good, sucker habit light and stalk strength best of all hybrids tried in official North Carolina field tests. Plants average 150 ears per 100 stalks. Shucks coverage is good and weevil resistance fair. The golden yellow kernels are deep, wide and of good quality. Medium maturity. Prices: 8 lb. bag \$2.40 postpaid. Not prepaid, 8 lbs. \$2.00; 14 lbs. (peck) \$3.00; 28 lbs. (½ bu.) \$5.75; 56 lbs. (1 bu.) \$10.50.

F-3 Tennessee 10 (White) A consistently good white hybrid for Coastal Plain, Piedmont and Mountain regions in North Carolina and extensively used in South Carolina, Georgia, Alabama and Tennessee. In the 1949 official tests Tennessee 10 averaged 90.5 bushels per acre in 4 tests in the Coastal Plain and 69 in 2 tests in the Piedmont. Its 6 year average 1944-49 in the Mountains is 85.8 bushels per acre. Medium maturity. Prices: 8 lb. bag \$2.40 postpaid. Not prepaid, 8 lbs. \$2.00; 14 lbs. (peck) \$3.00; 28 lbs. (½ bu.) \$5.75; 56 lbs. (1 bu.) \$10.50.

Chemical Weed Control

Planters of large corn acreages should contact us for information on Chemical weed control. No obligation. A large Eastern grower wrote us May 26, 1949, "I treated around 80 acres of corn with the best results. Not hardly a weed left and did not hurt any corn in any way."

N. C. Agricultural Extension Service Recommendations for Increasing Corn Yields

1. Have the soil tested and apply lime as recommended.
2. Prepare a good seedbed and plant level with the ground except where drainage is poor.
3. Use 300-500 lbs. of 6-8-6 or 4-8-8 at planting. Use the higher rates following crops receiving low amount of fertilizer and the 4-8-8 on potash deficient soils or following legumes for hay.
4. Avoid late, deep cultivation but control weeds early. Use a weeder where available until corn is six inches high. Cultivate shallow until the corn is 2½ feet high, and then stop cultivation. Do not use turning plow or bull tongue. Do not injure corn roots.
5. Place rows about 3½ feet apart.
6. Space plants about 16-20 inches apart within the row, using wider spacing for less fertile soils.
7. Sidedress with adequate nitrogen (potash where needed) when corn is 6-8 weeks old or about 2½ feet high. Yield increases of 25-45 bushels per acre may be expected by use of 500 lbs. of Nitrate of Soda, or 400 lbs. of Calnitro or ANL, or from 250 lbs. per acre of Ammonium Nitrate. One-fourth of this rate of application should give yield increases of 10-12 bushels per acre above similar corn receiving no sidedressing.

WYATT'S *Western* Grown Muskmelons

CULTURE: The Melon delights in warm rich soil with good drainage. Good Melons, however, can be grown on almost any land if the trouble is taken to dig holes 2 feet square, filling them with a rich compost of woodsmold and cow-pen manure. Plant three-fourths to one inch deep April or May in rows 6 feet apart, leaving not less than 4 feet between the hills, putting about 10 seeds to the hill. As insects are often very destructive, it is best not to thin at all until the plants are well started. When they are large enough to be safe, thin to two in a hill, and keep the ground mellow and free from weeds. Those who make a speciality of Muskmelons will find it advantageous to start the seed under protection of glass, so as to have the plants ready by the time seeds could be usually planted in the open ground.

PEPPERS

One Ounce of Seed Produces About 1,000 Plants

CULTURE: Sow the seed in hotbed or box at a temperature of about 70 degrees on or about February 15 or outdoors in April. Transplant to the open ground when all danger of frost is over, in rows 3 to 5 feet apart and plants set 15 to 20 inches apart in the row—about 9,000 plants are required to set an acre. Cultivate frequently and keep free from weeds. A mixture of sheep manure and chicken manure is most desirable for distributing in the rows a week or ten days before the plants are set out. When the plants are well set and started at about 7 inches high, guano or any well-rotted manure hoed into the surface soil will also increase plant growth and fruiting qualities.

PELLETED SEEDS

The Why and Whereof of Pelleted Seeds:

In the pelleting process, each kind of seed is treated with individual formulas designed for its maximum protection and productivity. The seed is first coated with layers of fungicides to control seed and soil born diseases. Next, a layer of chemical fertilizers is added to supply sufficient food to the plant during the critical stages of sprouting. Finally, a coating of vitamins and hormones in an inert material base assures early and rugged growth. Soil deficiencies are often counter-acted by the use of minor elements such as boron or manganese in the pellet.

The increased size of pelleted seeds permits accurate spacing of even the tiniest seeds.

Another feature of pelleted seeds is that transplanting is eliminated. This process allows direct garden seeding of usually transplanted tomatoes, cabbage, cauliflower, etc. The time and labor saved here is obvious, and pelleted seeds can be planted up to two weeks earlier in the season as the seedlings will withstand much lower temperatures than transplants.

VEGETABLE PLANTING CALENDAR

Many otherwise successful gardeners lose months of valuable production because of a failure to realize the cold hardness of a number of the most popular and productive vegetables.

By successive plantings beet, broccoli, cabbage, carrot, chard, kale, mustard, onion, parsley, radish, spinach and turnip (salad or root) can be kept in production, out-of-doors and without protection winter or summer, every day in the year in this isothermal zone.

The planting information shown in the chart on this page is the result of careful preparation and years of actual gardening experience. Planting dates shown for tender varieties are

based on the average U. S. Weather Bureau records of the last killing frost in the spring and the first killing frost in the fall in this zone, for the past 50 years.

Throughout our catalog we have endeavored to give the approximate number of days to maturity for all varieties. This information should be helpful, especially in determining the latest safe date to plant tender varieties in the summer or fall, in order to make a crop before frost.

Soil conditions permitting, we recommend planting on or immediately after the average date of the last frost in the spring, otherwise spring rains may delay planting days or weeks.

"TESTED SEEDS"

The term "tested seeds" as used in this catalog, and in all of our advertising means that every bag or package of seeds purchased at Wyatt's is supplied from a lot that has been carefully tested by the North Carolina Seed Testing Laboratory and the seeds are known to grow. Every lot of seeds reaching our warehouse is sampled and tested before the seeds are moved into our store for packaging or for sale in bulk. This accounts for the fact that "Wyatt's Tested Seeds" are more and more in demand in North Carolina and in the South.

Plant Wyatt's Tested Seeds and be sure of success.

FERTILIZERS AND SOIL CONDITIONERS

New Life
FOR YOUR SOIL

PREMIER Certified PEAT MOSS

To have a healthy garden you must first have *healthy soil*. Don't waste time, seed and fertilizer on poor soil. Premier Peat Moss, 97% organic, gives your soil loam-like texture, making it more productive. It absorbs 20 times its own weight in moisture . . . loosens and aerates heavy soil . . . adds body to light soil . . . prevents leaching. Water and fertilizer penetrate deeply, feeding the roots as needed.

Remember, your garden can be no better than your soil. Get Premier Peat Moss, with the certified seal.

For new lawns 1 bale should be thoroughly pulverized and mixed in each 100 to 200 sq. ft. of lawn area. Nothing is so beneficial to establish lawns as a bale of peat mixed with 100 pounds of Sheep Manure applied to each 2,000 sq. ft. 3 or 4 times each summer. Peat should also be used liberally in gardens, flower beds and borders, and as a mulch for shrubbery, because of its capacity to hold moisture. Prices: Large Bale 18" x 20" x 39" \$5.50; Handy Bale 18" x 14" x 30" \$4.25.

Ten Steps in Lawn Building

- 1—Break or plow deep, with subsoil or similar plow to prevent burying top soil—then level or grade as needed.
- 2—Apply the equivalent of 3 heavy, green cover crops or 3 inches weed free manure or both if available.
- 3—Apply lime as needed up to 50 lbs. per 1,000 sq. ft. and fertilizer 40 lbs. per 1,000 sq. ft.
- 4—Pulverize and smooth surface.
- 5—Seed 6 lbs. Carolina, Sunny South or Shady Nook, or 3 lbs. Colonial, mixture per 1,000 sq. ft., between September 1 and March 1.
- 6—Soak thoroughly but slowly to avoid moving seeds. Keep moist until grass is up. Soak occasionally during dry periods.
- 7—Mow Bermuda and rye grasses close and often; Blue grasses and fescues no closer than 2 inches nor more often than necessary, particularly during hot, dry seasons.
- 8—Compost clippings with liberal amount of sand and return to lawn in light applications as mulching during summer.
- 9—Feed at 6 to 8 week intervals from February through November with 20 to 40 lbs. per 1,000 sq. ft., high grade fertilizer or 50 to 100 lbs. per 1,000 sq. ft. sheep manure, or both. Always sprinkle after feeding.
- 10—Apply additional seeds as needed with regular feedings.

MORNING GLORIES

IPOMEAS. In growing Ipomeas (Morning Glories and Moonflowers), never plant until the soil is thoroughly warm. To aid germination of particularly hard-seeded varieties, filing a small notch at the top of the seed will help considerably.

Always select the driest, sandiest part of the garden and sow where the plants are to flower as the Ipomeas resent transplanting. Plants should be kept on the dry side in order to induce early and abundant flowering with a rather sparse growth of foliage. Heavy watering will stimulate foliage growth at the expense of flowers. A poor soil is preferable to a rich one and fertilizer should not be used as this will promote heavy foliage which will hide the flowers.

1804 Blue Star This new glory won the ALL AMERICA SELECTION 1949. The flowers are light blue with dark blue ribs to form a star. Very early. Pkt. 10c; 3 pkts. 25c; ¼ oz. 50c.

While the flowers are not quite so large as the Heavenly Blue Morning Glories they are of good size, 3 to 4 inches in diameter freely produced on fast growing vines that bloom 65 to 70 days after seeds are sown. The dark green foliage does not make a heavy growth, leaving the plants graceful in appearance. Easiest culture. Pkt. 10c; ¼ oz. 40c.

1809 HEAVENLY BLUE. A graceful vine of extremely quick growth producing a great number of exquisitely formed deep clear blue petunia-like flowers. Ideal for covering stumps or other unsightly objects. Pkt. 10c; ¼ oz. 35c; oz. \$1.00.

Seed of the double and fringed sorts should be pressed into a shallow pot of sifted soil and covered with only a sprinkling of sand. The pot should be watered from below by placing it in water. Never allow to become too dry nor too moist.

Wyatt's Zinnias

We are happy to offer this year, seeds from the very finest Zinnias cultivated. Flowers from the fields where Wyatt's seeds are selected have been awarded gold medals for distinction in size and color since 1926. Wyatt's pure strain of Zinnias come direct from the originator who has exhibited all over the world. Each year Wyatt's Zinnias produce prize winning flowers for flower growers all over the South. Get your seeds from this pure strain and raise the prize winning Zinnias in your community.

CULTURE. Sow seeds indoors in March or April or out of doors after ground is warm. Thin out or transplant to 1 to 2 feet apart when plants are 3 to 4 inches high. Fertilize heavily, and pinch out first bud when it first forms in the top of the plants. Wyatt's Zinnias grow 3 to 5 feet high.

FANTASY ZINNIAS

Medium size flowers, informal in appearance, shaggy, ray-like petals massed to make a rounded, double flower.

2245 WILDFIRE. The plants are neat in habit, strong growing and very free blooming. 2½ to 3 ft. in height and come into flower 45 to 50 days after the seeds are sown. In growing this or any other zinnia we strongly recommend sowing the seeds where the plants are to bloom if it is at all possible. WILDFIRE is a rich dazzling scarlet. CLOVER SEEDS

F97 Alfalfa

F97 Alfalfa (Oklahoma Approved) While Alfalfa is a relatively expensive crop, the first cutting usually returns about double the cost of seeds, lime, fertilizer and planting. A good method is to lime the land and plant an annual legume crop that can be thoroughly disked, not turned, in preparing the alfalfa seed bed. Use 20 to 35 pounds (not more) borax per acre and drill August 20 to October 1, or February 15 to March 25, 25 to 40 pounds of thoroughly inoculated seeds per acre. Roll or cultipack after seeding. At seeding time use 1,200 pounds 2-12-12 and 8-10 tons barnyard manure if available and not weed infested. Apply 400 pounds 0-12-12 annually thereafter. Cut before $\frac{1}{4}$ flowers open. Always leave the alfalfa stand 6 inches tall or more for winter since any closer cutting invariably results in severe damage. If your stand of alfalfa becomes thin or weak sow 3 to 5 lbs. Orchard grass per acre to help control weeds and increase production. We handle only premium quality seeds. Supplies of good seeds will be limited. Prices: 1 to 4 lbs. 85c lb.; 5 to 10 lbs. 80c lb., postpaid. Not prepaid 10 lbs. \$7.00; 25 lbs. \$16.75; 100 lbs. or more at 65c lb.

BORAX. Prices: 25 lb. bag \$2.00; 100 lb. bag \$6.00. f.o.b. Raleigh, N. C.

F87 White Blossom Sweet Clover Adapted to a wide variety of soils; is used for pasture, for forage, for ensilage, for bees, for soil improvement. Especially good as a manure crop and to inoculate the soil in preparation for a crop of alfalfa. The roots break up, aerate and drain stiff subsoils and add humus. Spring sowings will yield a crop the following fall and two crops the following year. The first season it grows $1\frac{1}{2}$ to $2\frac{1}{2}$ feet high, but if cut when 6 inches high it stools out and makes a more tender growth for grazing. Sow 15 pounds per acre July to October or February, March. Prices: lb. 60c; 2 lbs. \$1.00; 5 lbs. \$2.00; 10 lbs. \$3.85, postpaid. Not prepaid 10 lbs. \$3.40; 25 lbs. \$8.25; 100 lbs. or more at 32c lb.

F86 Aliske Clover We offer only premium quality northern grown seeds of hardy strains. Used mostly in mixtures but when properly handled produces heavy tonnage of highly nutritious hay or grazing. Sow 2 to 5 pounds per acre in mixtures or 12 to 15 pounds alone, early spring or fall. Prices: 1 to 4 lbs. 80c lb.; 5 to 10 lbs. 70c lb., postpaid. Not prepaid 10 lbs. \$5.50; 25 lbs. \$26.50; 100 lbs. or more at 50c lb.

F80 White Dutch Clover Because of its spreading habit and persistent year 'round growth White Dutch is invaluable for lawn and pasture use. It grows in all soils and will grow both in the shade and open areas responding to lime and fertilizers recommended for other clovers. Like other clovers White Dutch enriches the soil while furnishing nutritious grazing. Sow 6 to 8 pounds per acre alone or 2 to 3 pounds with other clovers or grasses. Prices: lb. \$1.40; 5 lbs. \$6.40; 10 lbs. \$11.95, postpaid. Not prepaid 10 lbs. \$11.50; 25 lbs. \$28.00; 100 lbs. or more at \$1.10 lb.

F82 Red Clover (N. C. Grown) One of the most productive of the clovers. Well adapted to our piedmont soils. Especially valuable in pasture mixtures. Sow early spring or fall 20 pounds per acre. Lime and fertilizer as for other clovers. Prices: 1 to 4 lbs. 85c lb. 5 to 10 lbs. 80c lb., postpaid. Not prepaid 10 lbs. \$7.00; 25 lbs. \$16.75; 100 lbs. or more at 65c lb.

F83 Crimson Clover Should be sown from August to October. When sown by itself, 25 to 30 pounds are required to the acre; sown with grain or vetches, 15 pounds would be sufficient. Write for prices.

F89 Ladino Clover—More Popular Every Year A perennial clover of exceptional merit for pastures, especially on moist, fertile land. Recovers rapidly from grazing or clipping and is leafy and succulent. A complete recovery after grazing often takes place in two weeks. Its growing season is as long as that of any other legume. Like all clovers, Ladino succeeds best on well limed, fertile and somewhat moist land. Sow 5 to 6 pounds per acre alone or 1 to 3 pounds in mixtures. Prices: lb. \$2.85; 2 lbs. \$5.40; 5 lbs. \$13.25; 10 lbs. \$26.00, postpaid. Not prepaid 10 lbs. \$25.50; 25 lbs. \$63.50; 100 lbs. or more at \$2.50 lb.

F95 Sericea Lespedeza Scarified and re-cleaned. This is the perennial lespedeza being grown so largely over the south. Its greatest asset is that it grows on the poorest soils without fertilizer or lime and while it steadily improves the land, it produces an abundance of nutritious hay if cut when tender. Prices lb. 55c; 2 lbs. \$1.00; 5 lbs. \$1.95; 10 lbs. \$3.65, postpaid. Not prepaid 10 lbs. \$3.20; 25 lbs. \$7.75; 100 lbs. or more at 30c lb.

F89 Ladino Clover and Orchard Grass

F93 Kobe Lespedeza A variety particularly adapted to lowlands and lighter soils. The leaves and stems are slightly coarser making a heavier hay crop. This variety is recommended by the N. C. Experiment Stations for all but the mountainous regions of North Carolina, South Carolina and Virginia. Sow 30 to 40 lbs. per acre. Responds to liming and fertilizing. Prices: 100 lb. bags \$15.00. Write for quantity prices.

F92 Korean Lespedeza Korean Lespedeza will grow on any soil, wet or dry, rich or poor, sour or sweet. Unexcelled for hay crop since it will produce from 2 to 4 tons of good hay per acre on a good thick even stand. It is almost equal to alfalfa in feeding value, and compares favorable in fineness, palatability and protein content. A good stand will make one ton of hay per acre for each 4 to 5 inches above cutter bar. Korean Lespedeza is earlier than other lespedezas, this insures harvest before fall rains and early frost and gives time for seed bed preparation for small grain that fall. Sow 30 pounds of seed per acre February to April. Prices: 100 lb. bag \$9.00. Write for quantity prices.

Alta and F53 Kentucky 31 Fescues. Soil Conservation Service Photo.

F57 Alta Fescue A tall or giant Fescue adapted to a wide variety of soils and uses. Like most long lived grasses, growth is slow after germination and should not be grazed until 6 inches high. Once established Alta Fescue promises to be the most versatile and valuable grass in a generation. It is the highest yielding grass in virtually every experiment station where it has been tried; is palatable and grows over a longer period each year than other grasses. Alta has a remarkable resistance to drought and its dense, deep roots make it ideal for erosion control, soil building, weed control, roadside planting, athletic fields, parks, airports, etc. In combination with suitable legumes it produces an excellent almost year 'round pasture. Because it has no underground root stocks it cannot become a pest and is readily killed by plowing. Continued high yields will require feeding, especially nitrogen which may be supplied partly by seeding with clover. Seed in a prepared, firm seed bed fall or early spring 20 to 25 lbs. per acre alone; 10 to 15 lbs. with 3 lbs. Ladino, White or Sub Clover, or 15 lbs. Lespedeza. Prices: lb. \$1.20; 5 lbs. \$5.25, postpaid. Not prepaid 10 lbs. \$9.40; 25 lbs. \$23.00; 100 lbs. or more at 90c lb.

F53 Kentucky 31 Fescue A tall Fescue very similar to Alta. This strain was developed in Kentucky from whence its fame as a pasture grass has spread over the South. Because of its close kinship to Alta we recommend the same practices listed above for Alta. Prices: lb. \$1.20; 5 lbs. \$5.25, postpaid. Not prepaid 10 lbs. \$9.40; 25 lbs. \$23.00; 100 lbs. or more at 90c lb.

F48 Bermuda Grass Makes a vigorous and persistent growth in every part of the South; lasts for years; stands heat without injury; grows well in any soil that is not too wet. Sow at the rate of 10 to 20 lbs. to the acre for pasture; 60 to 80 lbs. for lawns and golf courses. Plant from March until June. HEGARI

F197 Hegari Recognized as the most valuable and widely adapted member of the sorghum family, and well suited to conditions in the Southern states. Hegari has great forage value for two reasons. First because its high sugar content makes stalks and leaves highly palatable to livestock, and second,

it yields heavily with its many broad leaves and substantial stalks. As an ensilage crop many acres are planted to Hegari every year in the South. As a pasture crop, in thickly seeded plantings it pastures well and also makes good hay. Its largest use is in bundle feeding and it can be left shocked in the field until fed, or as is coming into more general practice, it is ground head, stalks and leaves through a hammer mill. Hegari makes a good substitute crop for corn, which it out yields on light soils, and it can be planted much later. Prices: lb. 30c; 5 lbs. 85c; 10 lbs. \$1.55, postpaid. Not prepaid 10 lbs. \$1.10; 25 lbs. \$2.25; 100 lbs. or more at 8½c lb.

It does well even on poor land, and surprisingly well in dry seasons. Plant April to August, 6 to 8 lbs. to the acre in rows 3 feet apart. Prices: lb. 35c; 5 lbs. \$1.20; 10 lbs. \$2.35, postpaid. F296 Combine Milo

F146 Soy Bean, Ogden

SOY BEANS

CULTURE: Soy beans may be planted either broadcast or in drills. They grow equally well on light and heavy soils, but on heavy soils they should not be planted more than 1 to 1½ inches deep except in dry seasons. On light sandy soils plant deeper, but not more than 3 inches. Plant in April, May or June. Such large seeded varieties as Mammoth Yellow require 1 bushel or more per acre, whereas Laredo small seeded kind only require 1 peck to the acre.

F146 Ogden Ogden is considerably earlier than most beans and is consequently better adapted to rotations with small grains. Seedings as late as June in the Wake County trials made a substantial production of hay. Average bean yield for 6 tests at scattered points in the state during 1943 was 27.8 bushels per acre. Plants are nicely branched and for that reason are more desirable for hay than the coarser growing types. Prices: 2 bu. bags \$3.75 per bu.

F150 Volstate A yellow seeded variety producing high yields of good oil beans. Plants are somewhat taller than Ogden and slightly less branched. For a hay crop or a crop that might be optional we would recommend Ogdens, but for a crop planted on light land and for combining we would recommend the Volstate owing to the height of the plant and the fact that the beans are somewhat bunched on the plant. Prices: 2 bu. bags \$3.75 bu.

F304 Crotalaria, Giant Striata

F151 Virginia It is about twenty days earlier than Mammoth Yellow. The vines make a fine growth, are filled with pods, stand about three feet high, are easy to cut and easy to cure. Prices: 2 bu. bags \$3.50 per bu.

F140 Wood's Yellow A strong upright growing plant producing a heavy crop of beans. This variety is suitable for sowing thick for hay, or planting alone or with corn for grazing. One of the best varieties for bean production and the beans are readily accepted at the crushing mills. Late maturing. Packed 2 bushels. Write for prices.

F147 Tokio A heavy producer of extra-large pods and beans. Packed 2 bushels. Write for prices.

F142 Otootan Its late maturity is more than overcome by the abundant growth—five feet and more in long seasons—its fine stems and abundant foliage, and the fine texture of its hay. 1 peck to acre. Write for prices.

HOW TO USE DILUTION TABLE

This Dilution Table indicates the quantities of any given spray material to add to a given quantity of water to give the desired dosage (strength) of spray.

All liquid or semi-liquid materials are proportioned directly on a liquid basis, i. e., 1 to 100 dilution indicates that one gallon of spray material should be diluted with water to make 100 gallons of diluted spray (or three tablespoonfuls to make one gallon of diluted spray).

Dry materials such as Lead Arsenate or "BORDO" are proportioned by mixing a given number of pounds of spray material with water to make each 100 gallons of diluted spray. To aid in mixing, the table shows the smaller quantities of dry materials in convenient household measuring units.

NOTE: When two or more spray materials are combined in one spray mixture the same water is used to dilute all the materials.

Planet Jr. Tractors and Equipment

Planet Jr.

The Planet Jr. trade mark has been known in the Implement field since 1871 and Planet Jr. machines and equipment have been sold by our company since 1881. More than three-quarters of a century of experience in design and manufacture is your recommendation to buy a Planet Jr. Garden Tractor.

Ranking above any tractors in their class are the efficient, sturdy and versatile 1½ h.p. and 2½ h.p. tractors shown at left of this page. These sizes are ideal for small farms, nurseries and home gardens. They have a variety of uses with attachments shown at right of page.

At the left below is shown the 3 h.p. and 5 h.p. tractors, which are designed for the farmer who has given up his horse and plans to use power equipment, or the commercial vegetable grower who wants ample power for plowing, harrowing, seeding, cultivating and mowing.

The illustration shows the many features of advantage to you—adjustable handles shaped for easy handling; sturdy construction, actually the frame is welded instead of bolted together; the motor is set well ahead of the wheels, balancing the weight, making it easier to turn at the ends of rows, and providing maximum traction and power beyond the rated horsepower of the motor.

The patented Planet Jr. Jiffy Hitch provides for quick-change of attachments without the use of tools.

You can use it in very narrow rows—as close as 9 inches. You can use it in 42 to 48-inch rows by closing off the flow in three spouts and distributing through the other three—either on the right or left hand side.

The No. 220 spreads fertilizer from 4 to 30 inches on the ground. The hopper capacity is one bushel and the weight of the load is placed over the wheel, making it easy to push. The No. 220 will distribute 100 to 2,000 pounds of commercial fertilizer to the acre. Quantity per acre is regulated by a notched index on the right hand handle. The shut-off rod is operated from the same point.

NO. 9—PLANET JR. HORSE HOE AND CULTIVATOR

Weight 70 lbs.
Price: \$24.65

These Planet Jr. Horse Hoes and Cultivators are stronger, better made and finished than any other one-horse cultivators, and enable you to increase your yield, because they do a greater variety of work in corn, potatoes, cotton, beans, tobacco and other crops requiring similar cultivation, and do it more thoroughly. Cultivate deep or shallow, in different width rows, and the extra long frames make them steady running. All Planet Jr. cultivator steels are made of beveled steel thickest down the center, making them self-sharpening, and the points retain their shape and strength. No. 9 has lever expander, allowing quick adjustment for different width rows. Used with or without a wheel.

NO. 9-D. Without wheel. Price: \$21.95.

NO. 4-D—PLANET JR. PLAIN CULTIVATOR

Weight 49 lbs.
Price: \$15.25

This tool is strong and simple. It has patent handle braces; very firm, simple and convenient. With them the frame and handles seem almost like one solid piece. NO. 100-D—PLANET JR. PLAIN CULTIVATOR

We offer this Cultivator with the object of filling a definite need where lands are light or where farming is done on a modest scale. It weighs but 42 pounds. It will stand hard usage and do excellent work. A steady running tool and easy to handle and adjust.

Wyatt's Summer and Fall Flowering Bulbs

AMARYLLIS

(Hippeastrum)

Huge lily-like flowers in striking colors are produced on tall stalks as the leaves appear. Not hardy but sometimes grown outside in this vicinity. Best treated as house bulbs. Very easily grown.

Hybrids—an assortment of large flowers in mixture. 75c each; 3 for \$2.00.

BEGONIAS

Tuberous Rooted

Camellia-Flowered Double

Easily grown and most colorful as well as pleasing and exciting summer and fall flowering plants. Soil preference is a light loam to which has been added well rotted manure and leaf mold. Almost any good potting soil will do however. Shady locations are best. Use in the garden or in pots. Plant tubers with the indented side up. The flowering season extends to frost after which the tubers may be lifted and stored over winter. Scarlet, white, salmon, yellow, copper, mixed 30c each, 3 for 75c; 6 for 1.25.

CANNAS

Tropical summer-flowering plants of the banana family grown for both bold foliage and their huge brilliantly colored flowerheads. Very effective in large beds or as backgrounds for smaller plants. Plant in enriched soil and give abundant water for maximum growth. Unless otherwise stated, the foliage is green and height is approximately four feet.

Wintzer's Colossal—Large scarlet flowers Height five feet.

King Midas—Pure gold flowers.

King Humbert—Most popular of all. Foliage purple-madder brown over bronze. Immense flowerheads of velvety orange scarlet, rose tinted and margined at base.

The President—Large rich glowing scarlet flowers.

Richard Wallace—Canary yellow.

Hungaria—Rich soft pink.

Shenandoah—Red foliage. Salmon pink flowers.

All Cannas: 3 for 30c; 6 for 50c; 12 for 90c; 25 for \$1.65; 100 for \$5.25.

CALADIUMS

ELEPHANT EARS—(C. ESCULENTUM)

Huge tropical-like leaves reaching three feet or more in length under good culture. Plant in rich soil and give plenty of water.

Large bulbs: 50c each; 3 for \$1.20; 6 for \$2.15; 12 for \$3.95; 25 for \$7.15. Mammoth Bulbs: 70c each; 3 for \$1.75; 6 for \$3.00; 12 for \$5.50.

FANCY LEAF

Very colorful and ornamental foliage plants. Adapted to pot culture, boxes, and garden use. Plant about twelve inches apart and two inches deep in a mixture of leaf mold, well rotted manure, and loam if available, if not, they will thrive in heavier soils. Plantings may be made in sunny locations or in shade. Water sparingly until growth starts then abundantly. A warm temperature is required and light intensifies the color of the foliage. Mixed. 30c each; 3 for 75c; 12 for \$2.40.

TUBEROSES

Tuberose are grown chiefly for their fragrance which is quite intense. A single stalk, generally two to three feet in height, rises above a rosette of leaves and produces a short raceme of waxy-white funnel-shaped flowers. Plant after danger of frost six to eight inches apart and two or three inches deep.

Double Dwarf Excelsior Pearl.

Mexican Single.

3 for 40c; 6 for 70c; 12 for \$1.25; 25 for \$2.30; 100 for \$8.25.

DAHLIAS

For variation of form, color and size no other fall flowering plants can equal or so much as approach dahlias. Over 12,000 varieties have been described since the introduction of dahlias to North American gardeners. Flowering occurs profusely from late July until frost.

CULTURE: Plant from early May to the middle of July. Dahlias are not very exacting in their requirements. Plant in any fertile garden soil having good drainage. Sunshine is essential for best development of both flowers and plants. Dig holes six inches deep and three feet apart for the decorative and cactus types. Smaller growing varieties may be planted somewhat closer. Drive a five or six ft. stake at least a foot into the ground near each hole for support during storms. Place the root flat with the old stem end near the stake. Cover with two inches of soil. As the plant grows gradually fill to ground level, never higher. Cultivate after rains and as often as is necessary to keep free from weeds and grasses. Any good potato fertilizer may be applied two or three times during the growing season. Excellent results are obtained with VIGORO. Avoid excess use of nitrogen. Allow only one bud to remain per stem and only one stalk per plant. Sub-lateral branches should be kept pinched out to provide good stems for cutting.

After frost cut stalks about two inches above the ground. Dig carefully so as not to break the root "necks," dry off excess moisture, remove soil and pack in boxes or baskets covering clumps with VERMICULITE, PEAT, sawdust or newspapers. Store away from heat and frost.

In dividing, part of the old stalk must be left with each root, otherwise new sprouts will not appear. Divide preferably after sprouting.

The varieties offered are of the following classes:

F.D.—Formal decorative—Petals broad and flat and in orderly arrangement. Flowers double.

I.D.—Informal decorative—Double flowers with petals curled, twisted or otherwise irregular.

S.C.—Semi Cactus—Double flowers with petal margins rolled outward or backward for less than half their length.

POMPON—Ball-shaped or somewhat flattened, fully double flowers measuring less than two inches in diameter.

MINIATURE—Excepting pompons various types not exceeding three and one-half inches in diameter.

Dahlias are quoted at postpaid prices. Please name substitutes, otherwise we shall use our judgment in case of shortages.

AGLOW—(I.D.)—Soft apricot heavily suffused scarlet on centers of the petals, enhanced by an overall golden sheen. Flowers are sometimes 10 inches in diameter. \$1.50 each.

ARELDA LLOYD—(I.D.)—Clear lemon yellow faintly suffused rose. Almost identical to Jane Cowl except in color. 50c each.

JANE COWL—(I.D.)—Huge flowers of buff, old gold, apricot and rose. One of the most perfect of all dahlias. A universal cutting and exhibition variety. 50c each.

GLADIOLUS

Ever increasing interest in Gladiolus is naturally to be expected—sheer beauty, unlimited color and variety plus ease of culture are irresistible appeals to all gardeners.

After danger of frost, plant in enriched garden soil about 6 inches apart and 3 or 4 inches deep, cultivate sufficiently to keep soil loosened and to prevent growth of weeds and grasses. Generous watering during the growing season will greatly increase size of corms and flowers. Plantings should be made at two-week intervals until mid-July for continuous succession of flowers.

Corms offered are number 1—the ideal size for best flowers. Postage prepaid as quoted.
