FRUIT SITUATION

TFS-111

With the pack of frozen strawberries large in May, June, and July, net movement into cold storage also is large during these months, and stocks usually reach a seasonal high point on August 1. In 1953, the high point was on September 1, mainly because of continuing heavy output in California, where production of strawberries has increased sharply in

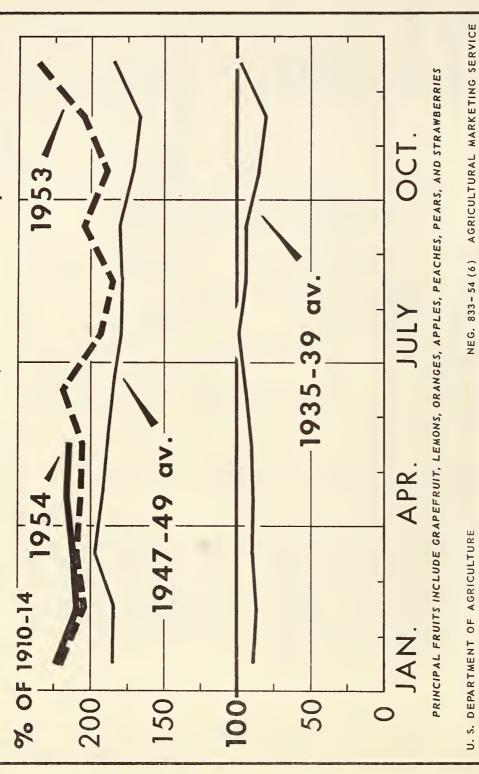

recent years. The pack of frozen strawberries in the United States in 1953 was about 226 million pounds, 13 percent larger than in 1952 and a new record. But utilization also has increased, and stocks in cold storage May 1, 1954, the end of the season, were also 13 percent larger than a year earlier.

UNITED STATES DEPARTMENT OF AGRICULTURE

AGRICULTURAL MARKETING SERVICE

Prices Received by Farmers, 1954 with Comparisons

heavy harvest time marketings of deciduous fruits in summer near that of 1953. first 5 months of 1954 was slightly higher than in the same The index of prices received by growers for fruit during the months of 1953 and somewhat above the 1947-49 average. With and early fall, the index usually declines. But prospective

higher prices for oranges this summer than in the summer of 1953, because of the much smaller California Valencia crop, probably will result in the level of prices continuing above or near that of 1953.

SUMMARY

June 1 prespects for the 1954 defiduous fruit crop were generally good. But on that date, the crop was not far enough advanced to indicate the final outturn. Demand for fruit is expected to be about as good this summer as a year earlier and the level of prices for the total deciduous crop may not be greatly different from that of 1953. Carryover stocks of canned deciduous fruits from the 1953-54 pack may not be much larger than a year earlier. Among the citrus fruits, supplies of fresh lemons may be about the same this summer as last. Supplies of oranges will be much smaller, but those of canned and frozen citrus juices will be larger. Prices for oranges are expected to average higher than last summer.

Prospective production of peaches and dried prunes is larger than in 1953. Prospects for apples on June 1 were for a crop above last year but below average. Although a pear crop about as large as in 1953 is forecast, production of Bartlett pears is expected to be larger, and that of other varieties smaller, than last year. Smaller crops in 1954 are estimated for strawberries, sweet cherries, and apricots. In California, a large production of Santa Rosa plums is indicated for all areas, but late varieties are showing light prospects.

Because of smaller crops, supplies of sweet cherries and apricots are expected to be smaller in late June and July than in this time of 1953. Marly-season supplies of peaches from the South-Gentral States will be much smaller than a year ago, those from the Southeastern States probably will be about the same, and those from California will be larger as a result of more freestone peaches. In July and August, more Bartlett pears from California will be available than in 1953. Supplies of most deciduous finits in late summer probably will be larger than a year earlier.

Fresh citrus fruit during summer comes mostly from California, although in recent years marketing of Florida oranges and grapefruit has extended into August. With production of California Valencia oranges about one-third smaller than in 1953, remaining supplies for this summer and early fall are down about the same amount. As a mosult, prices are expected to continue higher than last summer. Supplies of grapefruit and lemons probably will be about the same as a year ago. But there probably will be considerably more limes. Increased supplies of canned and frozen citrus juices will be available this summer.

In Florida in mid-June, the 1953-54 season for oranges and grapefruit was nearing the end. For the first time since frozen concentrated orange juice has been made, more than half of the Florida oranges including most of the increase in production, has been used for this type of juice. By June 5, over 64 million gallons of frozen concentrate had been made — about 46 percent more than a year earlier. The pack of canned single-strength citrus juices was about 14 percent larger. Although stocks of frozen citrus juices are much larger than a year ago, consumption in recent months also has been larger. On June 1, 1954, total stocks of frozen deciduous fruits and berries (excluding juices) were about 52 percent larger than on that date in 1953.

PEACHES

Larger Peach Crop In Prospect For 1954

Total production of peaches in the United States in 1954 was estimated as of June 1 at 67.3 million bushels, 4 percent larger than the 1953 crop and 1 percent larger than the 1943-52 average. Increases in California and Colorado more than offset heavy decreases in Texas, Arkansas, Michigan, and Washington. In other important peach States, prospective production is not greatly different from that in 1953.

The crop for the 10 Southern early peach States is expected to be 10.8 million bushels, 19 percent below the 1953 crop and 18 percent under average. Most of the reduction in these States from 1953 occurs in Texas, Arkansas, Mississippi, Oklahoma, and Louisiana. The crops in Alabama, Georgia, South Carolina, and North Carolina are much the same as in 1953. Peaches from these 10 States plus freestone peaches from California provide most of the fresh market peaches during June, July, and early August. The California freestone crop of 12,459,000 bushels is 17 percent larger than the 1953 crop. As a result, supplies of fresh market peaches in July may not be much smaller than in July 1953. In 1951 and 1952, about half of the California freestone peaches were sold for fresh use and nearly all of the rest were canned, dried, or frozen. Practically all of the California clingstone peaches were canned. The 1954 crop of clingstones in this State on June 1 was estimated at 25,669,000 bushels, 13 percent larger than in 1953. However, marketing of these peaches will again be under a State Marketing Order and some adjustment in supplies harvested may occur.

Heavier Parly Season Shipments Then In 1953

Carlot rail shipments of Georgia peaches started in late May, about the same time as in 1953. Light movement by rail from South Carolina and by truck from California started the lastfew days of May. Shipments increased rapidly in early June and exceeded the mates of a year earlier. With these larger shipments, prices for early varieties of Georgia peaches on the New York City wholesale market averaged somewhat lower the last week of May and the first week of June than prices for the same weeks of 1953. In July marketing from the 10 Southern States probably will be smaller, and prices may be higher, than in this month of 1953.

Total Stocks Of Janned Peaches about 8 Percent Larger On April 1, 1954, Than A Year Earlier

Stocks of canned peaches held by packers on April 1, 1954 were about 24 percent larger than a year earlier. In contrast, wholesalers' stocks were 17 percent smaller. Stocks in these two positions combined were about 3 percent larger. Packers' stocks of fruit cocktail and salad, which also contain a large percentage of peaches in the mixtures, were about the same on April 1, 1954 as on that date in 1953. But wholesalers' stocks of this item were 10 percent larger. The pack of canned peaches in 1953 was about 21.1 million cases (24-2½'s) and that of fruit cocktail and salad was about 9.2 million cases.

APRICOTS

Smaller Tonnage In 1954

115 C1

The 1954 crop of apricots in California, Washington, and Utah was estimated as of June 1 at 170,100 tons, 30 percent smaller than the 1953 crop and 23 percent below the 1943-52 average. In California, the largest producer, the crop of 156,000 tons is 32 percent smaller than the 1953 crop and 21 percent below average. Cold weather in Washington reduced the prospective crop, and on June 1 the outlook was for 8,900 tons in this State, 27 percent smaller than in 1953 and 51 percent under average. But the Utah crop of 5,200 tons is much larger than the 1953 crop of only 800 tons, which was reduced by freezes, and 9 percent below average.

Marketing Of California Apricots Started In Early June

The carlot rail movement of California apricots began with the shipment of 37 cars the week ending June 5, 1954. In 1953, movement started about a week earlier. Sales of 1954-crop Hoyal apricots on the New York auction the week ended June 5 averaged \$7.84 per lug (Brentwood, 24-25 pounds). This was lower than the 1953 opening price of \$8.65 per lug for the week ended May 29, 1953, but higher than the price of \$7.15 for the week ended June 5, 1953. Prices are expected to decline as usual with increased volume marketed. But with the crop considerably smaller this year and probable strong demand for canning, grower prices for the entire 1954 crop may average higher than for the 1953 crop.

Smaller Packs Of Canned and Dried Apricots In 1954

Nearly all the apricots that are canned and all those that are dried are grown in California. With the sharp reduction in the California crop and with packers' stocks of canned apricots on april 1, 1954 about 51 percent larger than a year earlier, the pack of canned apricots in 1954 is expected to be somewhat smaller than the relatively large 1953 pack of 4,759,000 cases (24-2½'s). Output of dried apricots also probably will be smaller than in 1953.

CHERRIES

Smaller Crop Of Sweet Cherries

The 1954 crop of sweet cherries was estimated as of June 1 at 77,680 tons, 16 percent smaller than the near-average 1953 crop. The decline resulted from heavy reductions in the four largest producing States: Oregon, 43 percent; California, 22 percent; Washington, 10 percent; and Michigan, 21 percent. Because of the smaller tonnage in these States, which provide, most of the sweet cherries that are canned and brined, the 1954 pack of these items probably will be smaller than the 1953 packs. Among the smaller producing States, production is up sharply in all except Ohio.

The carlot rail movement of sweet cherries from California started the week ending June 15, about a week later than in 1953. With the crop smaller than in 1953, weekly shipments have been running lighter than a year ago. Nevertheless, prices of most varieties on the New York auction during late May and early June averaged considerably under corresponding prices in 1953. This may have been partly the result of the lack of desired size of the cherries. Later in the season, prices may average higher than in 1953.

Packers' stocks of canned sweet cherries on April 1, 1954 were about 16 percent smaller than a year earlier. The 1953 pack of canned sweet cherries was approximately 1,059,000 cases (24-22's), and that of frozen sweet cherries was 1,739,055 pounds.

Sour Cherries

Production of sour cherries in the 6 Western States (Oregon, Washington Utah, Colorado, Idaho, and Montana) was estimated as cf June 1 at 8,890 tons, 11 percent larger than the 1953 tonnage but 27 percent below average. Large reductions in Oregon and Washington are more than offset by increases in other States. In Utah the new crop is more than twice the small 1953 tonnage.

The first estimate of the 1954 crop in the 5 Great Lakes States (New York, Pennsylvania, Ohio, Michigan, and Wisconsin) will be made as of June 15 and released June 21. In 1953, these 5 States produced approximately 126,000 tons, or 94 percent of the crop,

1 10

Stocks of canned our cherries held by packers april 1, 1954 were about 43 percent larger than the relatively small stocks of a year earlier. Stocks held by wholesale distributors were about the same as on April 1, 1953. Cold storage holdings of frozen cherries, mostly sour, on June 1, 1954 were over 2-1/2 times the unusually small stocks of a year earlier. The 1953 pack of canned sour cherries was about 2,829,000 cases (basis $24-2\frac{1}{2}$'s), slightly smaller than the 1952 pack. But the 1953 pack of about 115 million pounds of frozen sour cherries was 86 percent larger than the 1952 pack, which was cut short by storm damage to the crop at harvest time.

PEARS

As Production In 1953

Production of pears in 1954 was estimated as of June 1 at 29.2 million bushels, less than 1 percent above the 1953 crop but 4 percent below the 1943-52 average. About 25.2 million bushels, or 86 percent of the crop, is in California, Oregon, and Washington. This total is 3 percent larger than in 1953 but slightly below average. In these 3 States, the Bartlett crop of 20 million bushels is 16 percent larger than the 1953 crop, with a large: increacein California considerably more than offsetting a heavy reduction in Oregon and a smaller decrease in Washington.

Increased supplies of pears will be available this summer for fresh marketing and canning. Considerably smaller stocks of canned pears were held by packers on April 1 than a year earlier. The 1953 pack of 5.8 million cases $(24-2\frac{1}{2}!s)$ was 11 percent smaller than the 1952 pack and the smallest since 1948.

Prospective production of other pears, mostly winter varieties, in the 3 Pacific Coast States is about 5.2 million bushels, 28 percent smaller than in 1953. As with the Bartletts, the reduction of other varieties is in Oregon and Washington, where low temperatures in the spring damaged the pear crops as well as other fruits. Prospective production of pears in other than the 3 Pacific Coast States is about 14 percent smaller than in 1953.

1953-crop Pears Nearly All Marketed

Although cold-storage holdings of pears on January 1, 1954 were about one-third larger than a year earlier, stocks by May 1 had been reduced to the same volume as on that date in 1953. On June 1, 1954, stocks were down to only 29,000 bushels, about twice those of a year previously but less than average for June 1. Practically all of the remaining stocks of 1953-crop pears will be moved by July 1.

Imports of pears are seasonally the heaviest during barch, worff; and May, when they supplement domestic supplies. During these monthshoff 1954, they were much lighter than a year earlier. However, during July 1953—March 1954, imports were about 76,000 bushels, 5 percent larger thanking this period of 1952-53. In 1952-53 total imports were approximately 254,000 bushels. Exports of pears during 1953-54 have been assisted by a Government export-payment program.

F 18

3200

Under this program, more than 298,000 boxes of winter pears had been exported or declared for export by June 1, 1954, the termination date of the program. Most of the pears covered by this program were handled by January 1, 1954. Total exports of pears during July 1953-March 1954, which include pears moved under the export program, were 711,000 bushels, 7 percent larger than a year earlier. For the entire 1952-53 season, total exports of pears were 679,000 bushels, over 2 percent of the 1952 crop.

Although terminal auction prices for D'Anjou pears, the principal winter variety, advanced this spring, they did not reach the high levels of the spring of 1953.

APPLES

Apple Crop Prospects For 1954

The first official forecast of the 1954 coop will be issued on July 9. Such indications as were available on June 1 for commercial apple production pointed to a crop larger than that in 1953 but smaller than the 1943-52 average.

1953-crop Apples

Stocks of apples in cold storage June 1, 1954 were down to about 1.3 million bushels, slightly smaller than a year earlier. Heaviest shipments in May consisted of Delicious and Vinesaps from Washington State. With supplies of these apples heavier this spring than last, prices at both shipping points and at domainal auntions have averaged lower than last spring. However, on a national average basis, grower prices for apples during the winter and spring of 1954 have been at the level of this period of 1953. Most of the relatively small remaining stocks of 1953-crop apples will be marketed in June.

Larger Exports, Smaller Imports In 1953-54 Than In 1952-53

Exports of apples during July 1953-March 1954 were a little over 1 million bushels, 10 percent larger than in the corresponding period of 1952-53. Total exports in 1952-53 were approximately 1,238,000 bushels, slightly more than 1 percent of the 1952 crop. Imports of apples during July 1953-March 1954 were somewhat larger than exports even though the total of about 1,345,000 bushels was 20 percent smaller than in the same months of 1952-53. In 1952-53 total imports were about 1,827,000 bushels.

PLUMS AND PRUNES

California Plum Crop Below Average

The 1954 crop of fresh plums in California was estimated as of June 1 at 74,000 tons, 14 percent smaller than the 1953 crop and 7 percent under the 1943-52 average. A large production of Santa Rosa plums is indicated for all areas, but late warieties are showing light prospects. This State in 1953 produced about 93 percent of the commercial plums. Most of the remainder came from Michigan. On June 1 the condition of the Michigan crop was much poorer than a year earlier and slightly under average. In 1953, 6,400 tone were grown in this State.

The dried prure crcp in California is estimated at 175,000 tons (dry basis), 20 percent larger than the 1953 crop but 2 percent below average.

The prune crop in the Pacific Northwest has been injured by spring frosts and the outlook on June 1 was less favorable than a year earlier, when 86,900 tons (fresh weight) were produced. Prunes from this area are used in a variety of ways, Utilization of the 1953 crop was approximately as follows: Fresh, 55 percent; canned, 24 percent; dried, 10 percent; frozen, 2 percent; and not used, 9 percent.

<u>Marly-Season Movement And Prices</u> <u>About The Same As In 1953</u>

The shipping season for fresh plums from California started with 47 cars the last week of May, about the same time as for the 1953 crop. Prices for California Beauty plums the first week of June averaged a little lower at snipping points, but slightly higher on the New York auction, than corresponding prices a year earlier. Although shippents of the early plums are about as large as last year, those of the later varieties are expected to be smaller, resulting in higher prices for these varieties than in 1953.

STRAWAURRIES

Smaller 1954 Crop

The 1954 commercial crop of strawberries was estimated as of J_{ψ} ne l at 11.7 million crates (24 quarts each), 6 percent smaller than the 1953 crop but 9 percent above the 1949-52 average. Most of the reduction in 1954 is in the late spring States. Dry weather in the summer and fall of 1953 in many of the Eastern States reduced stands and retarded development of remaining plants, which tended to reduce production in 1954. Moreover, frosts in some of the North Central States and the Pacific Northwest in the spring of 1954 reduced yields. Nevertheless, the 1954 crop is expected to be the third largest since 1942. The 108,300 acres for harvest in 1954 is about 3 percent under the 1953 acreage.

Lighter Pack Of Frozen Strawberries Seems Likely In 1954

In California, which leads in production, the 1954 crop of 4.1 million crates is about 4 percent larger than the 1953 crop. The Oregon crop of 1.6 million crates is 12 percent smaller, and the Washington crop of 1.3 million crates is 2 percent smaller. These three States provide most of the Strawberries that are frozen commercially. Partly because of the smaller crops in Oregon and Washington, the 1954 pack of commercially-frozen strawberries probably will be somewhat lighter than the record 1953 pack of 226 million pounds. In 1953, slightly more than half of the strawberry crop was processed, mostly by freezing. With freezing of the 1954 crop becoming heavy in California in May, stocks of frozen strawberries in cold storage increased 7 million pounds during that month, bringing total stocks on June 1 up to 58 million pounds, 32 percent larger than a year earlier.

Strawberries About The Same
In 1954 As In 1953

Prices received by growers for strawberries in April and early May averaged about the same as in this period of 1953. Prices for the first half of May 1954 averaged \$8.40 per 24-quort crate, the same as a year earlier. In early June, prices received by rowers for fresh market strawberries at shipping points in central California averaged slightly higher than a year earlier. With production smaller in the late spring States and demand holding up well, prices for strawberries from these States may average a little higher than a year ago. Prices received by growers for 1953 crop strawberries sold for fresh use averaged \$8.41 per crate, for processing \$5.56, and for all uses \$6.97.

ORANGES

<u>Nuch Smaller Supplies Of</u>
<u>Summer Oranges Than In 1953</u>

darvest of Florida oranges was nearly completed in early June, while that of California Valencias was getting well under way. The latter will comprise the main source of fresh oranges during summer and early fall. On June 1 about 16 million boxes of California Valencias remained to be marketed, compared with about 25 million a year earlier. Production of Valencia oranges in California in 1953-54 was estimated as of June 1, 1954 at 19.2 million boxes, 35 percent smaller than in 1952-53 and about the same percentage under the 1942-51 average.

Total production of oranges and tangerines in the United States in 1953-54 is approximately 132 million boxes, 5 percent larger than in 1952-53 and 19 percent above average. The sharp decrease in California in 1953-54 was more than offset by the record crop in Florida. (See tables in appendix for detailed statistics on production)

Prices For Smaller Supplies
To Continue Higher Than Last Summer

Stimulated by strong demand for Florida Valencia oranges for processing, grower prices for these oranges advanced sharply in April and May. Meanwhile grower and terminal auction prices for the much smaller crop of California oranges continued considerably above a year earlier. As a result, grower prices for oranges, on a national average basis, were considerably higher in April and May than in these months of 1953.

although marketing of Florida oranges was about over in early June, sales of California Valencias continued in large volume. Terminal auction prices for the latter in early June averaged much higher than a year earlier. With remaining supplies of California Valencias about a third less than a year ago, prices this summer can be expected to average considerably above prices last summer.

Prices for California Valencias on the New York auction in May of this season averaged \$6.47 per box, 28 percent higher than a year earlier. Prices for Florida oranges on the 10 principal auctions from September 1953 through June 5, 1954 averaged \$4.30 per box, 3 percent higher than in the same part of 1952-53.

More Than Half Of The Florida Orange Crop Made Into Frozen Concentrate

Total utilization of 1953-54 crop Florida oranges by June 5, 1954 was more than 88 million boxes, over 19 million larger than by that date in 1953. Processors utilized over 61 million boxes, nearly 18 million more than in 1952-53, while fresh use of 27 million boxes was about 2 million larger.

Most of the increase in volume processed in 1953-54 was made into frozen concentrate, and output of this product is nearly half-again as large as in 1952-53. By June 5, 1954, about 47 million boxes, over half of the Florida crop, were used for frozen orange concentrate out of the total of over 61 million boxes processed by that date.

Larger Exports Of Oranges

Approximately 3.4 million boxes of fresh oranges were exported during November 1953-March 1954, 15 percent more than in the same months of 1952-53. Exports of canned and frozen orange juices and the percentage increases over the same months of 1952-53 were as follows: Canned single-strength orange juice, about 3.3 million gallons, 13 percent; canned concentrated orange juice, about 500,000 gallons, 163 percent; and frozen concentrated orange juice nearly 700,000 gallons, 45 percent.

In the entire 1952-53 season, total exports of fresh and processed oranges on a fresh equivalent basis amounted to nearly 13 million boxes or about 10 percent of the crop. These figures included exports under the Government export-payment programs.

Exports under the export-payment program for the 1953-54 crop continued heavy during April and May, with those from Florida decreasing as the end of the season neared and those from California increasing as the Valencia crop reached maturity. Through June 12, 1954 of the 1953-54 season, approximately 2.8 million boxes of fresh oranges had been declared for export under the program, 23 percent more than a year earlier. Declarations for export of processed oranges included 363,000 cases (24-2's) of canned single-strength orange juice, up 14 percent; about 558,000 gallons of canned concentrated orange juice, up 59 percent; and 56,000 gallons of frozen concentrated orange juice, up 59 percent. All exports under this program went to Suropean countries.

12

100

41.

Prospective Summer Supplies Of Grapefruit About The Same as In 1953

Supplies of fresh market grapefruit this summer will come mostly from California, where the summer crop of 1,310,000 boxes is 20 percent smaller than the 1953 crop. however, the small reduction in the supply from California may be offset by more from Florida, where there has been a tendency in recent years to extend marketings further into the summer. The Florida grapefruit crop of 42 million boxes, now nearly all harvested, is 29 percent larger than the 1952-53 crop and a new record. As usual, supplies this summer will be seasonally small.

Total production of grapefruit in the United States in 1953-54 is 48.2 million boxes, 26 percent larger than the 1952-53 crop but 6 percent smaller than the 1942-51 average.

Prices Continue Lower Than A Year Ago

With the crop larger, grower prices for grapefruit each month of the current season have averaged somewhat under the comparable prices in 1952-53. Prices for Florida grapefruit on the principal auction markets through June 5, 1954 of this season averaged \$3.89 per box, 6 percent lower than for the same part of 1952-53.

Prices for fresh grapefruit during the summer months depend mainly on the volume and quality available for this time of year, supplies of canned sitrus juices, and supplies of other competing fruits. Prices this summer may not be greatly different from those of a year earlier.

Volume Of Florida Grapefruit Processed Up 31 Percent, Fresh Use Up 16 Percent

Of the 39.3 million boxes of 1953-54 crop Florida grapefruit utilized by June 5, 1954, nearly 20 million boxes, or slightly over half, were used fresh. This was an increase of 16 percent over fresh use to the same date in 1953. About 19.4 million boxes of the 1953-54 crop were processed by June 5, 1954, 31 percent more than a year earlier. Nost of the increase was made into canned juice, resulting in increases of 34 percent in the pack of single-strength grapefruit juice and 11 percent in blended grapefruit and orange juice. The pack of canned grapefruit sections is up 14 percent. Moreover, there are substantial increases in the packs of frozen concentrated grapefruit juice and blended juice.

Increased Exports In 1953-54

Exports of fresh grapefruit, like those of oranges, are running larger than during the 1952-53 season. During Wovember 1953-March 1954, exports of fresh grapefruit totaled about 968,000 boxes, 22 percent larger than in the same period of 1952-53. Exports of canned single-strength grapefruit juice were about 1,861,000 gallons, up 5 percent; but those of blended grapefruit and orange juice, 1,396,000 gallons, were down 8 percent. During the entire 1952-53 soason, exports of fresh and processed grapefruit on a fresh equivalent basis amounted to approximately 3 million boxes, 8 percent of the crop. The above figures include exports made with Government export payments.

Declarations for export through June 12, 1954 under the current export-payment program included 227,000 boxes of fresh grapefruit, more than twice those a year earlier, and 314,000 cases (24-2's) of canned single-strength grapefruit juice, 34 percant larger.

LERONS AND LIMES

More Lemons Processed, Remaining Supplies About The Same As A Year Ago

about 6.5 million boxes 1953-54 crop lemons remained to be marketed after June 1, about the same as a year earlier. So far this season, about as many were used fresh as a year earlier, but considerably more were processed. Total output of frozen concentrate for lemonade is expected to increase some this season over 1952-53. About one-third of the 1.952-53 crop was processed, mostly into juice.

Production of lemons in California in 1953-54 was estimated as of June 1, 1954 at 14.4 million boxes, 14 percent larger than the near-average 1952-53 crop.

Prices This Summer Expected To Be Wear Year Earlier

Prices received by growers for bemons have tended to decline since the start of the season late last fall, and in most months they averaged under the relatively high prices of the same months of 1952-53. But with continued strong demand for lemons for juice and concentrates and the usual summer-time demand for fresh lemons, prices may advance somewhat. While no lemons were reported used for citric acid in 1952-53, some are being used for that purpose in 1953-54. For the summer, market prices for fresh lemons are likely to average near those of this period of 1953. On the 10 auctions for the week ended June 5, 1954, prices averaged 46.87 per box, 12 percent lower than a year earlier.

Slightly Parser Exports

March 1954 totaled 179,000 boxes, about 4 percent more than in the same part of 1952-53. In the entire 1952-53 season, about 609,000 boxes were exported. Imports of lemons have been negligible since August 1952.

Larger Crop Of Florida Limes In 1954-55

The 1954 crop of Florida limes was estimated as of June 1 at 420,000 boxes, about 14 percent larger than the 1953 crop and nearly twice the 1942-51 average. harvesting of the new crop usually starts in April. Marketing is seasonally heavy during June-October and concludes the following winter. In May 1954, prices received by growers for limes, basis the packing house door, averaged \$6.88 per box, 24 percent lower than in May 1954.

TREE NUTS

Production of walnuts in California in 1954 was estimated as of June 1 at 68,000 tons, 28 percent larger than in 1953 and 4 percent above the 1943-52 average. The first forecast of the crop in Oregon will be issued July 9. In 1953 production in Oregon was 4,600 tons and that of both States combined was 57,600 tons.

The June 1 condition of the California almond crop was moderately better this year than in 1953 but only slightly better than average. The 1953 crop was 36,100 tons.

Prospects on June 1 for filberts in Oregon, the main producing State, were not quite as good as a year earlier and somewhat below average. The outlook in Washington was not nearly as favorable as a year ago but almost as good as average. Production in 1953 was 4,300 tons in Oregon and 740 tons in Washington.

DRIED FRUIT

Production of dried prunes in California in 1954 was estimated as of June 1 at 175,000 tons dry basis. This is 20 percent above the small 1953 crop and 2 percent smaller than the 1943-52 average of about 178,900 tons. California accounts for all of the dried prunes except for small quantities produced in Oregon and in some years in Mashington. Prospects are still uncertain for other dried fruits in 1954.

The 1953-54 commercial pack of dried fruits was approximately 425,000 tons, processed weight, about 10 percent under the 1952-53 pack. The decline was the result mainly of reduced output of raisins. The above figures exclude relatively small quantities of sub-standard prunes and figs. Per capita consumption of all dried fruits in 1953-54 probably will be about 4.4 pounds, much the same as in recent years.

Even though the 1953-54 pack of 212,000 tons of raisins was about 11 percent smaller than the 1952-53 pack, it was considerably larger than usual domestic utilization. To help move the surplus raisins into export markets, an export-payment program has been in operation by the Department since September 1, 1953. Under this program over 48,000 tons had been declared for export through June 12, 1954. The rate of payment to exporters is 2 cents per pound. A similar export-payment program for dried apricots was announced April 28, 1954. By June 12, about 1,818 tons had been declared for export. The rate of payment for apricots is 7.5 cents per pound. The 1953-54 pack of dried apricots was about 17,000 tons, nearly twice the 1952-53 pack. Total exports of dried fruits during September-March, 1953-54 were about 65,000 tons, 41 percent under exports for the same months of 1952-53. Total exports in 1952-53 were about 137,000 tons.

CANNED FRUITS AND FRUIT JUICES

Stocks of Canned Fruits Not Greatly Different From A Year Ago

Stocks of 10 items of canned fruits combined (apples, applesauce, apricots, sweet cherries, sour cherries, fruit cocktail and salad, peaches, pears, plums and prunes, and citrus segments) held by packers on April 1, 1954, the most recent date for which data are available, were about 6 percent larger than a year earlier. Stocks of canned peaches, apricots, applesauce, and sour cherries were up considerably, stocks of canned fruit cocktail and salad were about the same, while those of the other products were down substantially. In contrast, holdings by wholesalers of 7 items of canned fruits combined (applesauce, apricots, sour cherries, fruit cocktail and salad, peaches, pears, and pineapple) on April 1, 1954 were about 5 percent smaller than on that date in 1953. Total stocks of canned fruits held by wholesalers usually do not change greatly from month to month, while those of packers generally decline during winter and spring and reach a sassonal low level in early summer.

The 1953-54 pack of commercially-canned fruits in contenental United States was about 2.9 billion pounds, the equivalent of 67 million cases of 24 No. $2-\frac{1}{2}$ cans. This was about 4 percent larger than the 1952-53 pack. Per capita consumption of canned fruits in 1953 was about 21 pounds.

In Florida where the 1953-54 season for canning citrus segments is nearing the end, about 3.6 million cases (24-2½'s) had been packed by June 5, 1954. This is 16 percent larger than the output for the corresponding period of 1952-53. Movement into the distributive trade also has been larger than a year ago. Stocks held by packers on June 5, 1954 were about 16 percent larger than on that date in 1953.

There is no Government set-aside order for 1954-pack canned fruits such as were in effect for the 1951, 1952, and 1953 packs to facilitate procurement by the quartermaster General of the army for use by the armed forces. Military procurement from the 1954 packs is expected to be accomplished without difficulty. The 1953 set aside covered nearly 3.5 million cases $(24-2\frac{1}{2})$'s) of 13 fruits and amounted to about 5 percent of the 1953 packs of these fruits.

Larger Florida Pack Of Canned Citrus Juices In 1953-54

Production of canned citrus juices in Florida through June 5 of the 1953-54 season was about 39 million cases (24-2's), 14 percent larger than in the same part of 1952-53. Most of the increase consisted of grapefruit juice and blended grapefruit and orange juice. The pack of canned orange juice was only 3 percent larger. Most of the increase in volume of Florida oranges processed in 1953-54 was made into frozen orange concentrate. Movement of canned citrus juices also was larger than in 1952-53. Total packers' stocks on June 5, 1954 were 24 percent larger than a year earlier, and stocks of orange juice were practically unchanged.

-11 -11 IrS-111 - 16 -

The 1952-53 pack of all canned fruit juices was about 1.95 billion bounds, the equivalent of 66 million cases of 24 No. 2 cans. This included about 1.05 billion pounds of citrus juices canned in Florida. For capita consumption of all canned fruit juices in 1953 was nearly 14 pounds, single-strength basis.

FROZEN FRUITS AND FRUIT JUICES

Larger Pack Expected

Total commercial production of frozen fruits, berries, and fruit juices in the United States in 1954 is expected to be somewhat larger than the record 1953 pack of 1.3 billion pounds. A further substantial increase in output of citrus juices is indicated in 1953-54, but a relatively small reduction in this year pack of deciduous fruit and berries seems probable.

With a considerable decrease in production of strawberries in Oregon and Vashington more than offsetting a small increase in California, the 1954 pack of frezen strawberries may fall below the record in 1953. Most of the strewberries that are frezen are grown in these three States. The 1953 pack of 226 million pounds of frezen strawberries was 13 percent larger than the 1952 pack. Total production of frezen deciduous fruits and berries in 1953 was about 542 million pounds, up 27 percent from 1952.

In Florida, the season for making frozen citrus juices from 1953-54 crop fruit was nearing the end in mid-June. Through June 5, output of frozen concentrated orange juice totaled over 64 million gallons (634 million pounds, product weight), 46 percent larger than production in the same part of the 1952-53 season. Output of frozen concentrated grapefruit juice totaled 1.6 million gallons by June 5, 1954, an increase of 30 percent, and output of frozen concentrated blended orange and grapefruit juice was 881,000 gallons, up 96 percent. But the pack of about 443,000 gallons of frozen concentrated tangerine juice was 19 percent smaller.

Because of the much smaller California Valencia orange crop in 1953-54, output of frozen orange concentrate from these oranges probably will be somewhat under the 1953 pack of 4.7 million gallons. But there is likely to be some further increase in pack of frozen concentrate for lemonade made from the larger 1953-54 lemon crop. The 1952-53 pack was over 9 million gallons. Total production of all frozen citrus juices in 1952-53 was about 640 million pounds, 14 percent larger than in 1951-52.

Stocks In Cold Storage June 1, 1954 Much Parger Than A Year Marlier

Cold-storage holdings of frozen deciduous fruits and berries (excluding juices) on June 1, 1954 were over 198 million pounds, compared with 131 million a year earlier and about 198 million 2 years earlier. On June 1, 1954, stocks of all items, except apricots and grapes, were larger than a year previously. All items, except strawberries, decreased during "ay 1954.

With output of frozen orange concentrate seasonally heavy during May, stocks of orange juice increased 84 million pounds (8.5 million gallons) that month. Total stocks of orange juice on June 1, 1954 were about 364 million pounds (36.8 million gallons), 52 percent larger than a year earlier! With the pack of frozen orange juice in Florida about completed and only a light p ck expected in California this summer, stocks will decline until the new season starts late next fall.

According to the Department's May report on Consumer Purchases of Fruits and Juices, household consumers purchased considerably more frezen concentrated orange juice during January-April 1954 than in this period of 1953. In April 1954, purchases were about 5.2 million gallons, 31 percent larger than a year earlier. Except in January, retail prices averaged lower than in these months of 1953. But because of the higher prices that Florida processors paid for Valencia oranges this spring, some advance can be expected in retail prices this summer. Purchases of frozen lemonade by household consumers in the first four months of 1954 also have been much heavier, at slightly higher prices, than a year earlier.

Per capita consumption of frozen citrus juices in 1953 was about 4 pounds, basis weight of the frozen products, compared with about 3.5 pounds in 1952. Per capita consumption of frozen deciduous fruits and berries was about 3 pounds each year.

1/ Related to crop from bloom of year shown. In Cal. the picking season usually extends from about Oct. 1 to Dec. 31 of the following year. In other States the season begins about Oct. 1, and ends in early summer, except for Fla. Limes, hervest of which usually starts about Apr. 1 of year shown. For some States in certain years, production includes some quantities donated to charity, unharvested, and/or not utilized on account of economic conditions. 2/ Includes small quantities of tangerines. 3/ Short-time average. 4/ Net content of box varies. In Cal. and Ariz. the approximate average for oranges is 77 lbs. and grapefruit 65 lbs. in the Desert Valleys: 68 lbs. for Cal. grapefruit in other areas; in Fla. and other States, oranges, incl. tangerines, 90 lbs. and grapefruit 80 lbs.; Cal. lemons, 79 lbs.; Fla. limes, 80 lbs. 5/ In Cal. and Ariz., navels and misc.
