THE CALIFORNIA FARMER

And Journal of Useful Sciences.

VOL. 1. SAN FRANCISCO, THURSDAY, JANUARY 5, 1854. NO. 1.

Memorial to Congress.

To the Honorable the Senate and House of Representatives, in Congress assembled:

The undersigned would most respectfully ask the attention of the Honorable Senate and House of Representatives to a few brief thoughts touching a subject which the undersigned believe to be of the highest importance to one of the States of the confederacy, and also of deep moment to the whole Union.

California the last State admitted into our glorious Union, has made such rapid advances as a State, has established so many and so flourishing cities, notwithstanding the dire and oft repeated calamities that have swept them again and again from existence almost by devouring flames; and again and again had many of her cities submerged by floods, unparalled in the history of older nations. California, with all these heavy calamities sufficient to have crushed wealthier States and older cities, now stands before the nations of the world a phenomenon of endurance, enterprise and success.

California, by her discoveries in mineral wealth, has created an enterprise and exerted influence upon the nations of earth unequalled in the history of the world.

Her cities, that a few years since were unknown, now contain warehouses of equal magnitude and beauty to those of any city of the older States, and for merchandise, the city of San Francisco, the Queen City of the Pacific, contains wares and merchandise of the richest kinds from every nation of the earth.

The bays of every nation wave in our harbor; a harbor that stands superior in the world, either for the extent, or for the security, tonnage, or speed of its shipping.

But there are greater interests than all these, and interests of greater moment, and more enduring in their influence, upon this State and Nation, and the nations of the earth.

Our cities may be destroyed by fire and by flood, and then can be replaced by the gold that is found in our mountains and rivers; but this gold may not be forever; this mineral wealth may be exhausted;—and if forever, we believe California possesses within her borders a mine of wealth richer by far than all other sources of wealth combined.

The Agriculture of California is now attracting a portion of that attention and interest which, when duly understood, appreciated and improved, will place the State before the world as possessing advantages of soil and climate in all their variety, to a degree never vouchsafed to any people.

With a temperature varying from 120° of heat in her cities and vallies, to the mountains where the snows and ice of ten, twenty and thirty feet eternally lie,—with soil so dry, that the earth, during a portion of the season, opens in fissures sufficiently wide to catch animals that fall into them, and yet these fissures most wisely ordained as the receptacles of the seed that shall, with the rainy season, restore again to the earth its verdure and beauty,—we have, too, soils in our valleys of vast extent, where the cultivation and the crops are ceaseless, and where many of the fruits yield continually.

There are valleys where, during the long dry season upon the surrounding hills, perpetual moisture is given to the crops in those valleys, by dews of unusual density and of an extraordinary character, thus giving the highest fertility to the soil, and producing crops of extraordinary amount.

There is something so unusual in these peculiarities of soil and climate, they are so deeply interesting in variety, both in the qualities of the soil, the different degrees of temperature in the same locality by day and by night, and the difference of one valley from another, distant but a few miles, these too differing in the character of the soil, and in their atmospheric character, that this State possesses within the vast extent of her territory, in her mountains, hills and valleys, a wealth in her Agriculture hitherto unknown, or granted to any people in the civilized world.

Deeply impressed as we are with these views, and having witnessed the wonderful developments already made in this "land of promise," by a constant study of these capabilities and an intercourse with the cultivators of the soil since 1849: we desire to lay before your honorable body a suggestion which has presented itself to our minds most forcibly, by these most wonderful developments, and the events so new, so wonderful, and which are to have an important bearing upon our action in its future history, and which events, if seized at the propitious moment, will place our nation before the world as the benefactors of the world, for we have an opportunity to accomplish a great work, and an opportunity which no other nation ever possessed.

California, by the discovery of gold within her borders, has become the residence and home of people "from out of all nations on the earth," induced hither by a desire for gold, inclined to remain by the success which crowns the enterprising and industrious everywhere, and in every branch of trade. We see people who have long dwelt under monarchical and despotic sway, now thanking and acting under the blessings which they feel result from our free institutions, and we cannot but see that these influences will work a great revolution in the nations of the earth; and if the golden moment is secured, if at the appropriate moment of time, the word is fitly spoken; if our nation seizes the opportunity now offered to it—eternity alone can reveal the blessings which this nation has it in its power to bestow upon those who come to this portion of our rich heritage from every nation on earth, upon whom we desire to exert this great influence for good.

We desire most respectfully, but most earnestly, to lay before your honorable body the suggestions to which we have alluded.

The Agriculture of California, this vast field of wealth to this State and Nation, needs that fostering care at the hands of the general government which a promising child should receive at the hands of an affectionate and devoted parent.

We see in this State a promise of future greatness in this ennobling science, we see that this State is destined to be the great granary of our nation. It may be destined of God, if rightly understood and appreciated, to be the source of supply when other portions of our beloved country may be in want.

We see, too, an opportunity of new sources of wealth and knowledge to be secured by encouraging people of all nations to become citizens, giving their allegiance to our laws and institutions, and rendering the knowledge they too possess, in advancing this great science in their adopted State and country.

We believe there never has been a period in the history of any nation, when so glorious an opportunity has been given to bestow so great a boon, and to throw so humanizing and christianizing an influence over so many people, and of so many different nations as is now offered to the people of these United States, and by the means which we would most respectfully suggest to your honorable bodies.

We therefore lay before you the proposed plan in brief as follows:

The endowment of an AGRICULTURAL COLLEGE, upon a permanent basis, with ample means for sustaining the necessary Professors of the several branches of the science, connecting with it all that appertains to natural history, of which a vast and rich field is yet unexplored in this country.

We [illegible] arguments needed to support a call and claim upon Congress for an appropriation of land for this State, now, and in preference to any and every State in the Union, we answer:

No [illegible] State in the Union has ever had drawn to it in so short a [illegible] such vast numbers of all nations, and never [illegible] been placed in a situation to exert so wide an influence.

[illegible] ground, whereon to [illegible] better effected than by a College liberally endowed—where the youth of all nations shall find the doors open wide to receive them, and where they could be instructed in the natural sciences, and particularly the many youth who must eventually become cultivators of the soil.

The present position of California, her relation to and with the Chinese, and the future and almost certain connection with the Japanese and the Asiatics—present a view to the reflecting mind of the most intense interest.

This view alone opens to us a world where our influence tells upon countless millions!

Shall this influence be exerted, and for good?

Shall it be exerted now?

Shall California be the mission field, and shall our nation be the first to occupy it?

God grant that it may be so.

Already this field is "ready for the harvest;" for there are now within the borders of this State the people of that nation that counts by thousands and tens of thousands, and they are but the heralds of the countless numbers that soon must follow, and in this great science of agriculture, while we extend to them protection and education, we shall be receiving in return, those revealments of that knowledge which that nation has possessed, as we may say, centuries in advance of us, and which will greatly add to our knowledge, wealth and greatness.

California, by her climate, soil and temperature, bears close resemblance to China. The products of China, with but few exceptions, are the same as California, and it is not too much to aver that ere long, with their knowledge and aid, tea, rice, sugar, and many other products, will be found in this State.

Already California has commenced the cultivation of cotton and tobacco—the great staples of our Southern States, and sugar, tea and coffee will soon be added, and, before many years, the silks and satins, and rich shawls, like those of India, will be the proud products of our own beloved country, if we are but true to ourselves, and to other nations, whom a wise providence is sending to us as helpers in all these great works of art and science.

Should Congress in the spirit of lofty patriotism and humanity, incited by a noble desire to accept and improve the opportunity now presented to this nation, to be the first to offer a free and liberal education in the highest sciences to the youth of all nations that come to us, and are desirous to receive such a boon, then shall we indeed be entitled to the name of "a great country"—and our institutions noble ones—for this will be the proof that our love of country, and confidence in her institutions and laws, are dearer to us than any personal or sectarian feeling or pride.

At this moment there is many a broad and fertile valley, that in coming years shall gladden us by fields of waving grain, and orchards of luscious fruit—many a bright hill side that soon shall be covered by the vine and fig tree—many a towering mountain, upon whose lofty summit now stand, in all their pride and glory, those giants of the forests, that like that wonder of the age, "the Mammoth Tree," the woodman will no longer spare, these too must give place to that onward march of the Anglo-Saxon race, over mountain, hill and valley, and marking its progress onward along the Pacific, by civilization, cultivation and christianization, even till it reaches and penetrates China, Japan, and the entire Asiatic region, and wending its way back again through the mother country, to our father land "New England." This is its great destiny—and thus shall the prophecy be fulfilled.

"The hill and mountain shall be laid low, and the valleys be filled."

"The desert shall blossom as the rose."

"Instead of the thorn shall come up the fir tree, and instead of the briar shall come up the myrtle tree, and the waste places of the earth shall become the highway of our God."

Shall we then, the great American nation, in the name of freedom and enlightened philanthropy, seize the auspicious moment to performing this great work of training the youth of many nations to a love of that study, and to engage in that ennobling science to which the Deity directed the mind of him whom he created after his own likeness, and then placed in the brightest spot of earth, and made him "Lord of the Creation."

In all our remarks applying to the great interests of the Pacific, as connected with California, we desire to be understood, as embracing with equal interest and care the vast and fruitful Territory of Oregon.

With an earnest prayer that the theme of these varied remarks may be received in the spirit that dictated them, and that the subject may receive that attention which its important bearing demands at the hands of our Government, and which thousands here on this Pacific coast, expect it to receive at an early day—we the undersigned, for ourselves and for the many with whom and for whom, as connected with this interest, we deeply feel, will, as in duty bound, ever pray.

San Francisco, Oct. 31, 1853. WARREN & SON.

Report of the Committee on Plows.

MESSRS. E. L. Beard, Wm. Neely Thompson, and J. Bryant Hill, the Committee appointed to award a silver plate to the manufacturer of the best California-made plow on exhibition at the Agricultural Fair of Warren & Son, have awarded the plate to Messrs. L. E. Morgan & Co. The plate is valued at $100. The following is the report:

The undersigned, having been appointed a Committee to examine the several plows presented for exhibition and premiums at the State Fair, having attended to that duty, submit the following report:

The several plows offered for exhibition and premiums were as follows:

L. E. Morgan & Co.—Steel Peoria Plows, viz.:

Clipper No. 6, a highly finished plow, with wheels and coulter, cutting 14 inch furrow;

Clipper No. 16, wheel and coulter, 16 inch furrow;

Clipper No. 18, wheel and coulter, 18 inch furrow;

Clipper No. 20, wheel and coulter, 20 inch furrow.

Peoria Plain or Prairie-land Plows:

No. 5, fine steel and finished, cutting 10 inch furrow; No. 5 1-2, same style and quality, cutting 12 inch furrow; No. 6, same character cutting 14 inch furrow; No. 7, same, 16 inch furrow.

L. E. Morgan & Co. exhibited in the Hall a most superb and highly finished clipper or prairie plow cutting a 14 inch furrow, reflecting great credit upon the workmen in the employment of their manufactory, in the construction of these plows, also a [illegible] plow, which was [illegible] in the Hall and attracted much attention.

There were also cast plows from the establishments of Ruggles, Nourse & Mason, of Worcester, Mass.; John Mayher & Co., of New York, and others, consisting of [illegible] hill, sub-soil, centre-draft, etc., etc., but as these were not put in competition, the Committee can only say that for cast-iron plows they hold their usual high rank.

The plows manufactured in this State being the only ones entitled to premiums, and this being the principal duty of the Committee, they proceeded to the examination.

A wrought steel plow from Stockton had been exhibited, but was withdrawn from competition.

The various plows from Messrs. Morgan & Co., were such as to give pleasure in their examination, and the Committee find them manufactured in a most satisfactory manner, and most creditable to the proprietor. From the abundant testimony before the Committee they are satisfied of their being the very best plows, and most thoroughly made, and plows that give greater satisfaction than any other steel plow in the country.

The Committee, in view of the facts before them of the high merit and most excellent reputation of their real worth, award to L. E. Morgan & Co., the premium prize, a silver plate, valued at $100.

The Committee hope that with another year many new varieties of plows, adapted to all forms of culture, the side-hill, the subsoil and the deep-tiller, will be manufactured by our citizens, and thus retain at home the wealth of our State for the real benefit of our own people.

E. L. BEARD,
WM. NEELY THOMPSON, } Committee.
J. BRYANT HILL.

Report of the Committee on Fruit.

THE undersigned were appointed a Committee to report upon the Fruits in the Agricultural Exhibition, and to make such awards as in their judgment the several specimens merited. Having attended to that duty, they take pleasure in making the following report and awards.

On entering upon this duty, the Committee found some difficulty in arriving at an immediate decision as to the names and character of the Fruit, from the fact, that, in the introduction of varieties into a new country, many Trees will be imported under different names, though in reality the same variety, and bearing different names in different States; and many known varieties receiving new and local names from various persons, who, having lost the original, give them names to suit their own fancy. The misplacing of labels, and other causes also produced confusion. Again, the wonderful fertility of our soil, and the rapid growth of the trees, have produced and will produce a change in the appearance, size, flavor, and general character of the fruits.

The Committee, in proceeding to their pleasant duty, would remark that the large number of specimens from various sources, and the remarkable size and beauty of the collection, was a matter of the most sincere pleasure to witness in this early stage of Horticulture in our State. The facts before the Committee of what they had to do in 1853, as Committee on Fruits, was pretty good evidence that the office of Fruit Committee in this State in 1855 will be no sinecure.

In proceeding to examine the Fruit, the Committee commenced with the collection of Gen. M. G. Vallejo, Sonoma Valley. There were exhibited by him, six dishes Grapes, of very fine size; five dishes Apples, of similar varieties, all good, for this early stage of Horticulture.

From Pierre Beccouarn, San Francisco—Two baskets fine monthly Strawberries; this fruit was high-flavored, and very fine.

From J. Truebody, Napa—Five Newtown Pippins, good size.

From H. B. Crist—Sacramento—Specimens of California Walnuts.

From David Spence, Monterey—California Almonds, of large size. These the Committee notice with pleasure, as indications of success for this fruit.

From L. B. Benchly, San Francisco—Three fine specimens of Louise Beurre de Jersey. Pears grown in Newport, R. I., in the garden of Mr. Benchly, and brought to this city by steamer. The Pears were fine and large though the stem was gone. They were a pleasing reminiscence of New England Pomology.

The following magnificent Fruits were also [illegible] presented or [illegible] in the Hall, to the Exhibition—not being the growth of this State:

From Capt. Folger—A basket of very fine Apples, grown from a seedling in Oregon. All these specimens, and many recommendations for the [illegible] were kindly [illegible] by Capt. Folger to the Committee.

By Gen. Adams, Sherwood, Oregon—Two fine Newtown Pippins, the product of a [illegible] tree.

By Capt. [illegible] Oregon—[illegible] nificent Oregon Pippin, of a bright golden hue, weighing one and a half pounds and measuring one foot and two inches in circumference.

By George Sanderson, San Francisco—From the nurseries of J. B. Stevens, Oregon—A collection of fine Apples, five or six kinds, and all fine and valuable varieties—Spitzenburgs, Greenings, Newark Pippins, etc.

By J. Pritchard, from Oregon—One Golden Pippin, from Milwaukie; a very perfect and beautiful specimen, weighing one pound five ounces.

By Messrs. Truett & Truett, San Francisco—One Golden Pippin, from Oregon. This wonderful specimen was the admiration of all; it was beautiful as it was large—weighing one pound nine ounces.

By Patch & Clayton—Five large baskets of superior Russet Pears, fine sugary flavor, juicy, and a first rate table fruit; (from Redman Park, Santa Clara.) Many of them weighed three-quarters of a pound each. Two dishes large purple Figs fully ripe, the second crop of the season.

Patch and Clayton also exhibited the following fruits, imported by them: two baskets Oranges, from Bora Bora; two Cocoa Nuts (growing), do; two baskets Oranges, from Lahaina; one basket Limes, from do; one basket Citrons, from do—all high flavored and fragrant, and added much to the exhibition.

From Julius K. Rose, Sonoma—Two dishes fine large Apples; four dishes purple Grapes; one dish white Chasselas Grapes; two dishes purple Figs. The Grapes of Mr. Rose were large and fine berries, and of delicious flavor, one bunch weighing five pounds. The white Grapes were the first shown in this country of the variety, and though small berries, were rich in flavor and esteemed highly. The Figs were large, fully ripe and luscious.

From Gen. M. M. McCarver, Oregon City—Six red striped seedling Apples, very large and beautiful, proved to be the Gravenstein; three Folpahockings, winter greenings; four pound Pears proved the true Angora—this collection of fruits was very superb, and as fine specimens as could be desired.

From J. Lewelling, Mission San Jose—One box six varieties of Apples—the Queen Pippin, California Pippin, Milwaukie, &c.—one box Grapes, very fine. Mr. Lewelling's Apples were remarkable, being the product of buds and grafts of the last year. The Grapes were large sized bunches, and weighing five pounds.

From E. L. Beard, San Jose—Six dishes large and superb specimens of the Sugar or Rousselt Pears, one branch of the tree containing twenty-three pears, full size; one branch of thirteen, large; one cluster on one stem containing four Pears weighing four pounds; seven dishes Grapes very large bunches, one weighing six pounds; three dishes porter Apples, extra; eight fine porter apples were exhibited, the product of one graft inserted the last year; one dish Olives.

From Capt. Isaac A. Morgan, Bolinas Bay—Three baskets Apples containing Baldwin's Spitzenburgs, Greenings, Pearmain, &c. The trees were planted in 1852, and are only seven-eighths an inch in diameter. Sixteen Apples were gathered from one small tree; a portion of the trees were in blossom in June. Mr. Morgan exhibited two fine Beurre Diel Pears, full size and beautiful.

The Committee were very desirous, in the [illegible] first exhibition in this city to [illegible] a precedent that may be valuable hereafter—that of correcting as far as possible the errors in naming the various fruits. The Committee having given several months to the subject have made the following awards:

For the best display of Grapes—To Julius K. Rose of Sonoma—a silver cup, value $25.

For the best specimens of Pears—To J. K. Rose of Sonoma—first class silver medal, $15.

For the best Pears—To E. L. Beard, of San Jose—first class silver medal, $15.

For the best Apples—To Capt. J. Lewelling of San Jose—first class silver medal, $15.

There were several [illegible] of very fine fruit [illegible] the growth of the [illegible] and [illegible] the Committee [illegible] and [illegible] Committee [illegible] and [illegible] Mr. [illegible] of [illegible] and [illegible] Mr. [illegible] of [illegible] and [illegible] Mr. [illegible] of

To Gen. M. M. M. Carver, Oregon City—for superb Pears and Apples, specimens reflecting great credit upon him and his nursery—a first class silver medal, $10.

To Gen. M. G. Vallejo, Sonoma—for collection of Apples and Grapes—first class silver medal, $10.

To E. L. Beard, San Jose—for Porter Apples and extra Grapes—first class silver medal, $10.

The Committee congratulate our citizens in the pleasing assurance they have of an abundance of luscious fruits of the very highest character and in a brief time, and we would assure all, that from the specimens exhibited at this Fair, no one need longer doubt of success. The Committee have been highly gratified to know by actual taste that many of the fruits were most excellent and high flavored, although they had been long gathered and had remained at the room many weeks.

The Committee hope that all who feel an interest in Fruit growing will hereafter give that care in the selection of only the best varieties, and strive for correctness in name and variety which is of so much importance and will save so much disappointment.

The Committee notice that at this date many of the best specimens are in perfect keeping, and now at the Hall, having remained eight weeks on exhibition.

F. W. Macondray,
Julius K. Rose,
Wm. Neely Thompson,
Davin Chambers,
G. P. Throckmorton.

Report on California Flour.

The following is the report of the Committee on California Flour, exhibited at the late Agricultural Fair:

The undersigned, Committee on Flour, assembled at the store of Coit & Beals, to investigate the eight samples of California made Flour exhibited at your Agricultural Fair, in competition for the award of a fifty dollar cup. The committee of three were all old New York flour merchants, and have given each of the samples submitted to us their full share of attention.

We would premise, that three of the samples were inferior in quality, two defective in color, and, for the credit of the mills, should never have been sent to the Fair, evidently being made of unsound and inferior wheat. One sample badly bolted; five samples were all of choice quality, and deserving of special commendation, and each worthy of the brand of Extra Family Flour. The Committee reduced, by careful comparison and tests, the five samples, marked A. C. E. F. G., down to three, C. E. F., and after comparing them for a half hour, finally decided to mix up the three samples into dough, which test reduced us to two samples, E. and F.; and, though unanimous in our judgment that E. was, in all respects the best flour, and accordingly decided that that was the premium sample, and entitled fully to the award of a silver cup, we feel convinced that tho three are worthy of special merit.

After declaring the award, we proceeded to open the key to the initials, and find that "Horner's Mills," of San Jose, was represented by "E.;" that the "Benicia Mills." J. F. Houghton, agent, was "F;" and that "C." represented the "Washington Mills," W. Van Court, of San Francisco; "G." represented the "Happy Valley Mills," Fitch & Co.; and last, though not least, "A" represented the "San Joaquin Steam Mills," Calvin, Paige & Co. proprietors.

Since making our award, we have called in a fourth New York flour dealer, and to whom the eight samples were submitted; and we are happy to say, that the gentleman without hesitation threw out the three inferior samples as unworthy a place in the Exhibition, and of the remaining five samples, his opinion, in all respects, corresponded with our own, which, to himself was a surprise, though to the Committee, a very satisfactory test that we had decided righteously. All of which is respectfully submitted.

H. Channino Beals,
E. T. Pease,
Wm. S. Alton.

P. S.—Since making our report we have been authorized to say that Messrs. Warren & Son have placed at the disposal of the Committee, in addition to the Premium Prize offered by them, the following Special Prizes:

A silver cup for the second best, and three first class silver medals to the proprietors of the four choice samples of Extra Family Flour, presented to us for competition, and which have a special notice in our report.

The Committee beg to remark, in conclusion, that the five samples of Flour were all of a high grade and the specimens do infinite credit to our State, and we are free to say, cannot be excelled in any respect, by any mills in the United States.

On behalf of the Committee,
H. Channino Beals, Chairman.

Anatomical Curiosities.

As the subject of Petrified Bones has been given a general attention, from the recent exhibition of them at the late Agricultural Fair, the following speculations of Dr. Coit in regard to them cannot be uninteresting.

Messrs. Warren & Son—Gents: In compliance with your request, I write you the conclusions at which I have arrived, touching the interesting collection of bones now in your Exhibition. With the exception of some fragments evidently canine—they are human bones, and in very nearly the same state of preservation—differing in that particular according to the difference in the ages of the individuals of whom they are parts, or the accidental circumstances in which they have lain, and which were more or less favorable to their preservation.

The crania, though differing from each other in shape, all present the distinctive characteristic of the North American Indians, namely, the high, broad cheek bones. They are generally in a good state of preservation, as also the long bones of the fore arm, still presenting a polished surface; and the fragment of the head of the *tibia* or leg bone, quite undecayed, showing the cells of the cancellated portion unbroken and perfect.

The teeth comprise both human and canine. Of the human, some are large and strong, a few being likewise much worn; these are doubtless of men of different ages; others are more delicate yet evidently adult, and are those of women; and others still are small, and in some instances wanting the bony fang—it having completely wasted away, leaving only the crown of the tooth covered with enamel. These are the teeth of children.

There are quite a number of canine teeth, both large and small, and in a perfect state of preservation; also a portion of the upper jaw of the dog, with the alviolar processes slightly crumbled.

These bones are all more or less incrusted with carbonate of lime, similar to the calcarous deposits common in limestone caverns. In some cases, it is arranged in layers or successive deposits, while in others it is arranged in large clusters of crystals, and in some instances both occur.

The similarity in the stage of decay presented by those bones, indicate that the persons to whom they belonged in life perished at about the same time. From their position and arrangement when discovered, they appear to occupy the places where the victims met death. The confused state in which a large number were found, as if the remains of many persons who crowded upon each other when dying; and in other instances the bones of an individual were found apart by themselves—all conveying the impression that they were found precisely where the individuals of whom they were parts met their death.

With regard to the length of time that these bones have occupied the places where they were discovered, we can only judge from the state of decay that they exhibit—I think it was less than a century. It is impossible to arrive at any just estimate, from the calcareous deposit that encrusted them, nor from the crystals of limestone that were upon them, as these deposits were the result of chemical action, requiring many or few years, according to circumstances. How they came to be in the cave is of course conjectural. It was evidently a small tribe or family, probably of the races of Indians still inhabiting California, who, with their dogs, took refuge there, perhaps to escape from a hostile band, and were there incarcerated till starvation destroyed the whole. Nothing appears to have been found indicating that it was a place of sepulchre

Yours, Benj. B. Coit.

Consolidation of Sandy Soil.

The importance of consolidating the land in the vicinity of our city, has of late been fully appreciated. To my knowledge, no propositions on this subject have as yet been made, and I take this opportunity to submit my views on a matter of such general interest.

The simplest way to make compact a moveable sandy surface, is the establishment of a suitable vegetation, which, once created, connects the loose masses by its interlaced roots, and at the same time, by its formation above the ground, breaks the power of the wind and lessens its destructive influence.

By examining the original vegetation of our "downs" in those places where they are now covered with verdure, we find a flora, which is particularly distinguished from that of the fertile soil by its ramifications. Small and scantily developed Rhizomata sustain a multitude of shoots which extend in all directions and rather resemble groups of vegetation than individual plants. Examples are, Chorizanthe, Polygonum, Nepeta, and several Oenothera and Sihærostigma.

These ramifications are not always above the ground, but often deeply below it; and the tourist will sometimes find, with astonishment, that in endeavoring to extract a plant from the ground, several other plants in different directions will be moved, and provided the connection is strong enough, will follow the one pulled out, although they had the appearance of being separate and disconnected. Examples of this case are furnished by the genera Polygonum, Eriogonum, Abronia, etc. etc.

Another peculiarity of the "down" vegetation is the preponderance of succulents over the ligneous property of plants, and which with apparently scanty resources, acquire and support a vast amount of organic moisture. I refer to the Cactus Family of plants. It will strike every spectator, how diminutive the roots are, which sustain such an enormous mass of vegetable life. In our "down" flora we have but a few and less remarkable forms, developed in such proportions above the ground. I recollect only one "Mesembrianthemum," and one "Ehevria," which might be placed in this category. Formations below the surface are furnished by "Sicyos" and "Abronia," whose colossal roots have frequently astonished the newly arrived farmer, when breaking up the ground.

Concerning shrubs and trees as well as annual plants, there is little difference between the vegetation of our "downs" and that of the fertile soil.

A remarkable feature of this scanty and unseemly flora is its great vital power, which in most instances produces a permanency of organs usually perishable in their nature. Long after the flora of the fertile soil is burned to dust by the rays of the sun, and its remnant carried away by the winds, the vegetation of our sand downs has lost none of its freshness of appearance and grows with equal life and strength, as it did in the favorable season. The perennial plants push their stems and blossoms in the fall as well as in the spring, the foliage of the shrubs remains unchanged, and some genera, for instance "Eriogonum" Graphalium, retain even the colored parts of the inflorescence long after the seed protected by the same has been matured. Nor is this difficult to account for. Organic life in its contact with inorganic matter always uses the most suitable weapon, and whilst, individually, death and destruction appear to predominate, yet collectively, life and developement obtain the victory.

It is true the process is a slow one, and as regards the "downs," ages upon ages might elapse without our co-operation, before the organic kingdom could celebrate its triumph over the crystalline frigidity of the quartz sand. Californians will hardly take much pleasure in observing a development whose single phases are centuries. Let us hasten, therefore, the course of nature, and arrest the course of the sand. The advancing, ever watchful enemy, has conquered already many a beautiful tract of land.

In selecting the proper remedy, let us adopt the way pointed out by nature; let us enter into an alliance with a vegetable kingdom.

A first bulwark and protection for our proposed greensward, would be found in the *genus cactus*, several species of which thrive well in this climate. This plant is satisfied with the poorest soil, and rows of it planted to windward would protect the growth of lower herbs, which, in return by their shoots, would hold together the loose sand near the cactus hedge. Well qualified for such a purpose are the grapes, "Polynogan and Elymus," also of their families "Abronia and Trameria." To render the hedge more dense, you may plant Artemisia, Lupinus, and other shrubs, and wherever the soil is moist enough, willows and poplars.

Some circumstances contribute much to facilitate the growth of such parallel hedges, and to improve the intervening soil. The most favorable one is the proximity of our large growing town. The influence of animal exhalation upon plants is usually much underated. Professor Liebig draws our attention to the importance of the ammonium contained in atmospheric fluids, for the growth of plants, and everybody, who like myself, for several years has attentively observed the condition of our Downs, will have noticed a marked difference in their vegetation, as it was and as it is.

I have thus briefly sketched the fundamental features of a plan which, when suited to each locality must be attended with favorable results. I shall feel proud to behold with the bodily eye the realization of ideas, which long filled my mental vision, and to rejoice in the sight of happy dwellings and verdure on those barren places, that now offer their sandy surfaces to the fury of the wind.

Citizens of a great country, which has been more powerful in creating than all the nations of antiquity in destroying, here is a worthy field for California energy. Make a paradise out of this desert, and you will build for yourself a nobler monument than ever was sculptured in marble or reared by servile hands; for he is the true benefactor of mankind who makes two blades of grass to grow, where formerly grew but one.

Dr. Herman Behr.

We republish the following most excellent article from the Evening Journal, on account of very just tribute it pays to the influence of agriculture upon all other interests in a community:

Agriculture—*The Future.*—It is a well-known fact that agriculture is the main feature in the success of every civilized country. Upon it must the superstructure of an extended commerce, flourishing trade, and all the varied successes of a community or people be built. It is a foundation stone proven by the experience of past ages to be firm as the eternal hills—not to be shaken by any adversity. No country has ever failed of success that has paid proper attention to this the greatest of all resources, for the reason that upon it depends every other branch of employment. The merchant, mechanic, miner and professional man are all mainly dependant upon the agricultural resources of the country in which they reside, for whatever of enduring success they may enjoy. In proportion with the extent of soil cultivated and the number of inhabitants engaging in the peaceful and honorable pursuit of agriculture, will be the rise and progress—the prosperity of a country. To the cultivation of her soil then, must California, the richest mineral country in the world, look in the future for her success, and not to the yields from her mines. The population of an agricultural country is stable; its members are fixtures, whose whole influence is brought to bear in sustaining and furthering the best interests of the community of which they form so honorable a body. The soil of California is one upon which nature has showered plenteous gifts: it is rich in native products and susceptible of higher cultivation than any other in the wide world. Within her southern portion rich tropical fruits and the staples of the southern Atlantic States can be raised in abundance. In her northern and middle districts the adaptation of the soil to the raising in tremendous quantities the cereal grains, the tobacco plant, and the finest vegetable growths in the world, has been demonstrated beyond the possibility of the slightest doubt. Evidence of the fact can be witnessed in quantity in this city at the exhibition room of Messrs. Warren & Son.

There must be some arrest to the mineral resources of this as well as any other country, but to the agricultural there can be no bounds. Chemistry has come to the aid of agriculture of late years, and now not only tells what the soil of any particular district is best adapted to the growth of, but by analysis demonstrates truthfully—unerringly, the subsistance to be mixed with it to increase its nutrition or power of producing; hence millions upon millions of years can roll by and yet no limit to the richness of California soil, or to the yield of its harvestings be found. When the people of this State think less of the sudden accumulation of fortunes, and in connection with it, their own personal pleasures, turning their attention to the encouragement of agricultural pursuits, and the sustenance of agricultural interests, then, and not till then, will California exhibit to all nations a success hitherto unapproached and thereafter unapproachable. To a knowledge of this fact some of her inhabitants seem to be awakening. Merchants in our city are seeing the necessity of establishing some sure foundation for their future success in trade. Those who feel an abiding interest in this State, who care for her future success, and look upon her as henceforth their only home, are endeavoring to advance the cause of agriculture in every way.

Whatever has a tendency to increase the number of the agriculturists, and whatever tends to throw light upon the yet hidden resources of our extensive valleys and plains, is worthy of the deepest aid and attention from all class in the State.

California State Agricultural Society.

In pursuance of a call issued in a circular by Warren & Son, and signed by many of the prominent cultivators of our State, a Convention of the Farmers and others interested in Agriculture was held in Musical Hall, for the purpose of forming a State Society. The Convention met December 6, at 3 P. M., when Julius K. Rose, Esq., was called to the Chair, and Wm. Neeley Thompson, Esq., appointed Secretary.

The Chairman said: The object of this Convention—of this meeting, which should have been a Convention—is to organize an Agricultural Society on a permanent basis, for the purpose of creating an interest among the people in all parts of the State in the Science of Agriculture. There are only a few of us here to-day, but I know that the greatest results flow from small beginnings such as this. I would recommend to this meeting to proceed to nominate a Committee for the purpose of drawing up a constitution and by-laws, and recommending permanent officers for the Society. I know that if this course be pursued, the Society will shortly have a decided increase, and will receive accessions from all parts of the State. We can have a Society here as respectable as any Agricultural Society in the Union. The subject is one of great importance, particularly to this State, and is one on which its ultimate prosperity will depend. The Agricultural interests of this state are fully equal to those of any State in the Union. I hope the gentlemen present will proceed to take proper action in the premises.

Mr. C. V. Gillespie said he fully concurred in the remarks of the Chairman, and moved to appoint a Committee to draw up a constitution and by-laws.

On motion, it was resolved that the above Committee consist of five.

The Chairman appointed the following named gentlemen such Committee: C. V. Gillespie, San Francisco; J. Bryant Hill, Santa Cruz; Wm. Neely Thompson, San Francisco; J. J Ames, San Diego; E. L. Beard, Alameda.

Mr. Gillespie moved that the name of the Chairman be added to that Committee. The motion prevailed.

On motion, the Convention then adjourned.

Agreeable to adjournment, the Convention met in the evening at 7 1-2 o'clock.

The Committee which had been appointed reported a constitution, which after some debate was unanimously adopted.

The Society then went into an election of officers, which resulted as follows:

President—F. W. McConoray.

Vice Presidents—One from each county: J. M. Horner, Alameda; Maj. John Bidwell, Butte; Mr. Chipman, Contra Costa; Abel Stearns, Los Angeles: Jerome D. Ford, Mendocino; Gen. C. J. Hutchinson, Sacramento; C. M. Weber, San Joaquin; Dr. J. B. Clements, San Luis Obispo; Wm. F. White, Santa Cruz; Maj. P. R. Reading, Shasta; Gen. G. M. Vallejo, Sonoma; Mr. Ryan, Trinity; Gen. John A. Sutter, Yuba; James K. DeLong, El Dorado; Capt. J. A. Morgan, Marin; J. Bryant Hill, Monterey; J. W. Osborne, Napa; Judge J. Judson Ames, San Diego; S. R. Throckmorton, San Francisco; J. F. Kennedy, Santa Clara; Pablo de la Guerre, Santa Barbara; Jefferson Hunt, San Bernardino; Simpson Thompson, Solano; E. Linoberg, Tuolome. Vacancies in other counties will be filled by the Executive Committee as provided by the Constitution.

Recording Secretary—C. V. Gillespie, Esq.

Treasurer—Judge David Chambers.

Corresponding Secretary—Col. J. L. F. Warren.

Executive Committee—E. L. Beard, Alameda county; Julius K. Rose, San Francisco county; D. W. C. Thompson, Sonoma county; H. C. Malone, Santa Clara county; Wm. Neely Thomson, San Francisco county.

After some remarks by Col. Warren, Mr. Thompson, and Mr. Rose, Judge Ames moved a vote of thanks to Col. Warren for his liberality in furnishing the Society with a place of meeting &c., which was passed unanimously.

The Society being fully organized, and there appearing no further business, the Convention adjourned *sine die*.

PROSPECTUS

OF THE

CALIFORNIA FARMER

And Journal of Useful Sciences.

We commence the issue of this JOURNAL OF AGRICULTURE and kindred Sciences, with the beginning of the New Year.

The Editorial Department is under the charge of Dr. J. F. MORSE, of Sacramento, (formerly editor of the Union,)—assisted by Col. WARREN, of the firm of Warren & Son, who will aid in the Agricultural and Market Reports, and Foreign and domestic data.

It will be the aim of the publishers to furnish to their readers, 1st. The most useful data for the practical Agriculturist, and to present to them all the most important practical results, obtained from authentic sources, in our own State.

2. To present the latest and most important facts from our sister States and Europe, touching Agriculture, in all its branches.

3. To furnish familiar illustrations of valuable Agricultural Implements, together with remarks explanatory of their character and success.

4. To furnish complete Grain Tables and Market Reports, and other data connected therewith.

5. General and Critical Notices of the various Agricultural and Horticultural Societies of our country and of Europe, sufficient to guide our own Cultivators, and keep them advised of the progress of the Science.

6. A portion of the JOURNAL will devoted to Select Literature—the aim of which will he to exhibit the purifying influences which flow from the pursuits of Agriculture, Horticulture and rural life. That kind of Literature which tends to a morbid excitability of the mind—which superinduces a species of sickly sentimentality, and degrades instead of elevates the character of man—as well as politics and sectarianism, will be rigidly excluded from its pages: our aim being to cultivate a love for and an interest in those useful Sciences which must ever add to the happiness of mankind.

Cultivators of the Soil, and all who feel an interest in these all-important and fundamental sources of our prosperity and happiness, are cordially invited to communicate with us freely. Their valuable aid is what we earnestly desire.

Advertisements in this JOURNAL (of which a limited number will be inserted) will reach a circulation hitherto unattained, extending to the remotest Agricultural Districts particularly—thus making it of the highest interest for all matters pertaining to Agriculture.

All communications for the Editorial columns should be forwarded to Dr. J. F. MORSE, Sacramento, or may be left at the office, on Bush street, two doors below Montgomery, San Francisco.

Communications on Business, Reports on Agriculture, and advertisements, should be addressed to J. F. MORSE & Co., or WARREN & SON, San Francisco.

Terms of the Paper—$8 per annum, in advance.

Persons wishing to act as Agents, will please forward their names to

J. F. MORSE & CO.,
(Publishers California Farmer,)
Bush street, below Montgomery,
SAN FRANCISCO, Cal.

Washington's Interest in Agriculture.

The Washington Intelligencer, speaking of the interest evinced by Washington to improve the stock of the country, alludes to the work published some time since, entitled "Washington's Letter on Agriculture;" from that valuable work the following record is made:

GEN. WASHINGTON'S MULES.—Upon Washington's first retirement in 1873, he became convinced of the defective nature of the working animals used in the agriculture of the Southern States, and set about remedying the evil by the introduction of mules instead of horses—the mule being found to live longer, be less liable to disease, require less food, and in every respect to be more valuable and economical than a horse, in the agricultural labor of the South.

Up to 1783, scarcely any mules were to be found in the American Confederation; a few had been imported from the West Indies, but they were of diminutive size and of little value. So soon as the views of the illustrious farmer of Mount Vernon were known on this subject, he received a present from the King of Spain of a jack and two jennies, selected from the royal stud at Madrid. The jack, called the Royal Gift was sixteen hands high, of a gray color, heavily made, and of sluggish disposition. At the same time the Marquis de la Fayette sent out a jack and jennies from the Island of Malta; this jack, called the Knight of Malta, was a superb animal, black color, with the form of a stag and the ferocity of a tiger. Washington availed himself of the best qualities of the two jacks by crossing the breeds, and hence obtained a favorite jack called Compound, which animal united the size and strength of the Gift with the high courage and activity of the Knight. The jacks arrived at Mt. Vernon in 1788. The General bred some very superior mules from his coach mares, sending them from Philadelphia for the purpose. In a few years the estate of Mt. Vernon became stocked with mules of a superior order rising to the height of sixteen hands, and of great power and usefulness—one was sold from a team of four mules at the sale of the General's effects for $800. In no portion of Washington's variety labors and improvements in agriculture was he so particularly entitled to be hailed as a public benefactor in the introduction of mules in lieu of horses.

Eastern News.

By the arrival of the Nicaragua Line's steamship Sierra Nevada, C. M. Baldwin, Esq., Commander, which entered this port on Saturday evening last, we have dates from New York to December 5th, and from New Orleans to the 7th. Among the passengers are Madame Anne Thillon, and Messrs. Leach and Hudson.

We give below a summary of news, from the N. Y. Herald.

WASHINGTON, Dec. 5.—Both Houses of Congress met to-day at noon—237 were present in the House of Representatives, of which number 143 voted for Lynn Boyd, who was declared duly elected Speaker. J. W. Forney was then elected clerk.

The Senate was called to order by Mr. Atchison, president *pro tem.*

Messrs. Johnson of Arkansas, Bell, of Tennessee, and Allen of Rhode Island, presented their credentials. Mr. Benjamin, of Louisiana, announced the election of John Slidell, as Senator from Louisiana, in place of Mr. Soule. Mr. Slidell and the other new members were then sworn in and took their seats. Committees were appointed to wait upon the President of the United States, to inform him of the organization, and that the two houses were ready to receive a message from him.

The Presidents's Message had not been delivered up to the 7th, but a correspondent of the New Orleans Picayune is reported to have obtained a copy, and telegraphed it to New Orleans

PRESIDENT'S MESSAGE.—We copy the following outline of President Pierce's forthcoming Message, from the Washington correspondent of the New York Times:

WASHINGTON, Sunday Night, December 4th.

The Message of President Pierce may be communicated to Congress to-morrow, though probably not before Tuesday. It will not be as long as those which have lately preceded it. Its statement of our existing relations with Foreign Powers will be marked by that terseness and explicit brevity which characterizes all of the President's speeches and writings.

The Message will briefly recapitulate the facts in the Koszta case, announce the principles laid down by our Government in connection with it, and proclaim that the President is determined to stand by them

It will lay before Coogress the present *status* of our relations with Mexico, and the favorable aspect of existing diplomatic negotiations with that nation.

It will give an official statement of the recent difficulty at the Chincha Islands, and probably an announcement of its satisfactory adjustment between our Government and that of Peru.

Nothing seems to be known as to what will be said about opening the Amazon, but the President will probably press the immense commercial advantages which will accrue to our country if Brazil can, by some means, be induced to throw that truthful and wonderful river open to the free competition of the commerce of the world.

The Message will give a statement of the present aspect of the Fishery Question, and show that no treaty has been matured in regard to it. It will call the particular attention of Congress to the importance, at the present juncture, of defining, with more accuracy, the boundary line between the United States and the British Possessions on the North.

It will suggest the justice of the Spanish claims for indemnity in the case of the schooner Amistad—animadvert with severity upon the conduct of the Spanish authorities in Cuba towards American citizens in that Island; and will intimate her Catholic Majesty that such proceedings must be stopped without delay.

A large increase of the Navy, and a modification of the Army, according to the suggestions of the Secretary of War, will be recommended.

An extension of the land system, with some modifications, over the territores—Utah and New Mexico; and in regard to the general system of the Public Lands, alterations in favor of actual settlers and extension of the pre-emption principle.

Important improvements in the Patent Laws, designed to encourage and protect American inventors, will be proposed.

A change in the present Judicial system of the United States will be recommended, on the ground that the present organization of courts is inadequate.

In regard to internal improvements the President will not submit any estimates for appropriations, and will base his reasons for withholding them upon the injustice and irregularity and inefficiency of the present system, and its inadequacy to meet the demands of commerce, and afford necessary security and protection to human life and to property.

In regard to the subject of Slavery, the President will reaffirm the Compromise and Union doctrines of his admirable inaugural, with an explicit and emphatic directness that will leave no room for doubt, as to his position. He will show that he stands where he always stood, the champion and defender of the Constitutional rights of each and every one of the States of the Confederacy, no matter whether their position be South or South of Mason and Dixon's Line, and show that the rights of Georgia are as dear to him as the rights of New Hampshire.

Among the special measures he will urge upon Congress will be, I am satisfied, a reduction of duties on certain articles, and the addition of others to free-list articles, which will be selected from among those entering into manufactures and not come into competition with American products, which articles enter into general consumption and pay low duties. The question will be argued at length, and a recommendation presented to Congress to adopt some new system—probably a general law, empowering the State to levy tonnage duties for the purpose of raising a fund for necessary works within their borders for the benefit of commerce.

The forthcoming Message will not countenance any appropriation of money by the general Government for building the Pacific Railroad; neither will it intimate that the Executive will approve of any bill, no matter how formed, by which the Federal Government is made the primary and principal agent in the construction of such a road. It will not even, I apprehend, specially favor the granting of alternate sections of land for any such objects, unless under circumstances which would induce a prudent and judicious individual proprietor to make a similar disposition of land.

FATAL RAILROAD ACCIDENT.—About 9 o'clock on the morning of the 2d ult., as the Elizabethport train of cars was passing the station at Elizabethtown, N. J., a young and [illegible] respectable man named Henry S. Fisler, while talking with Mr. Woodruff, the Superintendent of the New Jersey Railroad, suddenly turned and attempted to cross the track in advance of the train approaching from, when the cow-catcher caught his right foot, and whirled him with [illegible] under the platform of the Central Railroad Station. The driving wheels then passed over his foot and leg, crushing them in an awful manner. He was immediately picked up and carried into the Essex Hotel, where every possible attention was paid to him, but he died at 3 o'clock, after suffering the most [illegible] agony. He leaves a wife and child.

ANOTHER.—A freight train of twenty-three cars ran over a cow as the train was nearing Whitehall, N. Y., on the night of Dec 3d, throwing the engine and several of the cars from the track. The engineer, Mr M Mullen, was killed.

William Tinney has been convicted in the United States Circuit Court of North Carolina of embezzling [illegible] from the Post Office.

HORRIBLE AFFAIR.—On Saturday, Dec. 3d, at Troy, N. Y., an Irishman, employed at Reed's brewery, fell into a vat containing two hundred barrels of boiling wort, and was not discovered until three hours after. All the wort was turned into the sewer in presence of a Coroner's jury.

Rumors are current in Boston of the failure of two or three persons engaged in the California trade in that city, but no names are mentioned.

TRAGICAL AFFAIR.—William Patton, [illegible] a Mr Turner, a Tobacco Inspector, dead in the street, in New Orleans on the 3d of December, the cause being unknown.

FIRE.—Four factory buildings [illegible] and occupied by W B. Dodge & Co., Manufacturers of Cotton, for the manufacture of [illegible] were consumed by fire on Sunday, the 4th ult.

VERMONT LEGISLATURE.—The Vermont Legislature, in Joint Assembly, have elected [illegible] United States Senators for six years from March 4th next, Mr. Stephen [illegible] Democrat, in place of Mr. Phelps, Democrat, whose term expires. Mr. Collamer is a Whig and Mr. Phelps a Free Soiler. Judge Bell and Mr. L. [illegible] Democrats, were elected Judges of the Supreme Court. Judge Bell is a Democrat, and Judge [illegible] Whig. Judge [illegible] Democrat, was elected Treasurer. The Democrats have a majority in both branches.

H. C. G. [illegible] of Boston, has been appointed Consul to Liverpool, vice [illegible] and his family will soon leave for their future home.

Miss [illegible] E. Packard [illegible] Seminary, [illegible] Conn., [illegible] Professorship of Mathematics in that Institution, [illegible] a salary of $1,000 per annum.

The Turkish War.

By the arrival of the Cunard steamer Europa, at Halifax, we have European intelligence to the 19th November. The war between Russia and Turkey, occupies the public attention, to the exclusion of almost every other topic. We extract the following details of the battle of Oltenitza.

On the 2d and 3d instants the Russian General Poniloff endeavored to prevent the Turks from establishing themselves in advance of Oltenitza, on the Wallachian side of the Danube. The Ottomans maintained their positions, and caused the Russians the loss of six hundred men, among whom are eighteen officers. The position of Oltenitza, situated about thirty-eight miles from Bucharest, which is the basis of their operations in Wallachia, appeared so important to the Russian generals, that they resolved to make a fresh effort to drive the Turks from it. The attack was recommenced on the 4th, and continued through part of the 5th. The Russians had twelve hundred killed or wounded, and it is stated as certain that the Ottoman chasseurs, armed with the Vincennes carbines, made terrible havoc in the ranks of the officers. Almost all the commanders of corps have fallen. We will admit that we have no details of the consequences of the second engagement, but from the summons made to Prince Gortschakoff by Omer Pacha, to deliver up all the fortified places into the hands of the Turks, and to evacuate the Principalities as promptly as possible, there is reason to infer that the troops of the Sultan have assumed a real attitude of superiority.

That there should be some discrepancy in the accounts is natural enough; but they all agree that a battle has been fought, and that the Turks have had the best of it. Prince Gortschakoff, the commander-in-chief of the Russian forces, has left Bucharest, and advanced his head-quarters nearer the Danube; the next feat of arms will probably be the battle, or siege, or storming of Bucharest.

The Russian Government has officially announced that after the 23d of November, all Turkish vessels in Russian harbors will be seized as lawful prizes. At Odessa the greatest activity prevails in the corn trade. Four hundred vessels entered that port on the 10th of October, and double that number was expected. The corn deposits can fill them all and more.

As yet there are no symptoms of the commencement of a rising in the Italian provinces of Austria. The third *corps d'armee* in Poland was ordered to march to join Gortschakoff; but on the representation of Prince Paskiewiewitch, the Russian commander, that such a step would be dangerous, the order was countermanded. The Czar will, it is said, proceed in person to the theatre of war. The eventual position that Austria will assume is anxiously discussed. As yet she as well as Prussia remain neutral, or at least profess neutrality. But can they resist the force of circumstances? The Porte had promised not to employ Austrian subjects (refugees) in Europe in her armies. The last telegraphic despatch from Vienna states that Gen Klapa, the gallant defender of Comorn, has received a command.

From Sonora.

The following interesting news from Sonora was brought by Mr. Goodman, who came passenger in the Visurgis, which arrived at this port on the 1st inst, in 34 days from Mazatlan:

Mr. Goodman left here as passenger on the bark Caroline, being ignorant at the time of the business she was engaged in. He owned a considerable part of her cargo, which was destined for Guaymas, all of which he lost. He was on board the Caroline at the time of the engagement at La Paz, and witnessed the affair from the deck, which he represents as a sharp fight; the "Fillibusters" lost four men and the Mexicans seven, and quite a number wounded.

Mr. Goodman subsequently left for Mazatlan. The British ship of war was at Mazatlan when he arrived, but when her commander heard of what was going on in Lower California, he got under way at once, to protect the interests of British subjects in that territory and Guaymas. Many people took refuge in the Virago as soon as she arrived at La Paz, among whom was Mr. Robinson, acting consul for Great Britain and the United States at that place. The people were desperately enraged, and were about to murder Mr. Robinson, under the impression that he was more or less concerned with the Fillibusters. The Virago then sailed for Mazatlan, having a large number of foreigners on board, from Guaymas. Her commander called on the authorities and warned them not to interfere with the rights of any foreigners who may remain in Baja California or Sonora, unless they actually took up arms against the Mexican Government.

In Mazatlan, a fleet of four vessels, two brigs and two schooners, were fitting out with all dispatch, to carry reinforcements and attack Walker's force by sea and land. It is thought some time will elapse before the fleet will sail, owing to the want of hands. Captain Hayden, of the Visurgis, had great difficulty in obtaining his clearance, and was detained three days in consequence.

California Cotton.

WE have been shown a sample of cotton raised near Sacramento, by Thomas Selby, Esq. Although the staple is short, yet it is very fine and silky, and exceedingly strong, and would probably improve in the length of its staple, after a year or so of proper and careful cultivation. It may be classed as "middling fair" according to the classification of the article in New Orleans, and can be raised in the greatest abundance, and with less trouble and expense in this State than in Louisiana. The climate and soil of California are admirably adapted to the culture of this article, and even if no better quality could be produced than the sample before us, it would doubtless be more profitable to the grower than the raising of wheat or other grains.

The rapid growth and increase of California require that we should make every effort to supply our wants from our own resources, as far as practicable, and relieve ourselves from the power of foreign speculators on our own necessities. There is no doubt, that not only cotton, but coffee, tobacco, and many other articles of great and constant consumption, can be produced in as great quantities as the acre here and of as fine qualities as elsewhere. We therefore earnestly recommend this subject to the attention of the husbandman.—*Sun.*

WE take the following from the able annual review of the California market, prepared for and published in the Times and Transcript, of December 31:

LIVE STOCK.—Never to [illegible] the large number of cattle, sheep and horses brought over the plains the past season, every description of live stock has continued to command high prices and particularly so for beef cattle has the demand been active. At the close, American heifers, of fine quality, realized from $110 to $125 per head and dressed, from 15 to 22½ per lb. Californian heifers from $40 to $60 per head and dressed, from 12 to 15c per lb. Stock cattle, of all descriptions, have ruled high, viz: working oxen at $150 per yoke, cows and calves from $80 to $100 per head, and for a choice [illegible] as high as $125. Sheep from $5 to $6 per head, and [illegible] per lb. Horses from $50 to $75 per head for American, and from $100 to $150 for Spanish. Mules have been in good demand, and sold from $150 to $200 per head.

California Enterprise.

It is frequently remarked, and it is as readily admitted, that in no place on earth has there been such instances of individual enterprise, wonderful energy and almost superhuman exertions made, as in California. Twenty years since, had such enterprise been prophesied, they would have promptly been pronounced as fabulous—impossibilities; and yet, if we look around and note the changes that take place suddenly, we see daily evidence, that in California there has been given to the MIND a will to plan and execute, almost beyond human belief. We are led to these remarks by facts that came under our own observation very recently. The splendid buildings recently erected by Messrs. Maynard, Peachy, Halleck & Billings, on Montgomery street, the stores of the Hon. S. Brannan, and of Lieut. Maynard, on Sansome street—these with many others that are an honor to the proprietors and to the city, are surely indubitable proofs of California enterprise, worthy of note. We note also with pleasure that indefatigable Mr. Winn, with whom to plan is but to finish, announced that he would be happy to see his friends in his *new saloon*, on Friday evening last. Passing that way in the morning, about 9 A. M., and supposing our friend was nearly ready, we were surprised to find that the masons were but just commencing to break away the heavy arches of masonry that opened into the new saloon. Supposing the opening as announced, to be almost beyond possibility, we passed on. At 2 P. M. carpenters, painters and masons were making a scene of noise and dust, hardly compatible with the usual style of Mr. W.'s saloon. Passing that way again at 9 P. M., a gay and numerous company of ladies and gentlemen were thronging a spacious saloon, amid columned arches, richly curtained—seated at the tables beneath superb mirrors—and enjoying "ice creams," "cakes," and confections; and this too, in a saloon now superbly furnished, where even six hours previous the walls were unfinished.

It is gratifying to notice such instances of that enterprise in our citizens; it is such energy and tact that has made California what it is, and with the same dispositions among our wealthy citizens, to erect such specimens of architectural beauty, and those who occupy them to display equal skill in gratifying public taste, California will ever maintain her ascendency among the wealthy and influential States of the Union.

SACRAMENTO CITY.—Never was there exhibited a more magnificent enterprise by any community of individuals, than has been manifesting itself in this city during the past twelve months. We question whether it will ever be surpassed, and we know that it has never as yet been equalled. Our entire city has been regenerated and improved in a manner that is not more astounding in contemplation than enduring in all the features of permanency and grandeur. In the first place, the elevation of the grade of our streets has added a life-giving and life-enduring impulse to the city, that nothing else could have imparted. Now our principle thoroughfares are not only raised to a level with a high-water mark, but there seems now to be a general ambition excited to fill in and raise intervening lots and property, and it is therefore not too much to conjecture, that in two or five years at farthest, the whole city will be so elevated as to make a levee for defence totally unnecessary. And then for a city to rear so many beautiful and really fire-proof houses, upon the ashes of those formerly occupied in a few months time, is a source of wonder and amazement. Now, J and K, Second and Third streets are presenting a beauty and permanency of appearance that fills the mind of a true Sacramentonian with unutterable pride.

At some future time we will take occasion to speak more in detail of the work of our Valley Home.

Imports of Lumber.

Some idea of the importance of this branch of trade may be formed from the fact that from Dec. 12 to Dec. 20, 1853, there arrived from Oregon and Puget Sound twenty-one vessels, bringing in all [illegible] feet of lumber, principally [illegible] and [illegible] Humboldt and Trinidad [illegible] of the same time there arrived [illegible] vessels bringing [illegible] feet of lumber, making an aggregate of [illegible] feet, [illegible] an aggregate of [illegible] feet [illegible] during the same time.

[illegible] a Company [illegible] to [illegible] purposes.

The [illegible] Pioneer [illegible] and [illegible] the [illegible] in this [illegible].

THE CALIFORNIA FARMER.

SAN FRANCISCO:
Thursday, January 5, 1855.

In the beginning of an enterprise of so much importance as our title page expresses, we desire to make a clear and candid statement of the principles by which we shall be governed. We are confident that the very nature of the work proposed will excite a sufficient interest to secure to us an extensive circulation—a circulation, too, amongst a class of readers whose habits are much more favorable to a close and scrutinizing system of reading than is generally found amidst the hurried and excited denizenship of cities. To meet the wants of such a circulation must be the most pleasant employment in which the mind can be enlisted. It is of all intellectual functions the most exalted, from the very fact that it is complete in proportion as it is imbued with truth and utility. No man can write to suit the views and expectations of a mind devoted to any of the departments of Agriculture, unless he confines himself, in a great degree, to that which is pro-eminently useful. Such a declaration, however, does not prohibit his indulgence in everything that is truly beautiful: for a farmer cannot conceive of anything that is truly beautiful unless it be beautifully true. The mind that is developed under the auspices of Agriculture, becomes too strongly wedded to the realities of life, and to the consecrated truthfulness of nature, to turn with a vigorous relish to the fictions and follies of an artificial, and not unfrequently fantastic state of society.

That which contributes most directly to the substantial happiness of mankind, that which really advances and elevates the science of Husbandry, of all pursuits the most productive; that which holds in constant revelation the purest comminglings of life and nature; that which is the most honest and unaffected in its teachings, is the kind of information—the kind of literature or science which is received and cherished by a competent farmer. And this is the kind of information which we desire to communicate. To collect and present in agreeable portraiture the ever varying suggestions of science—to record the progressive developments of Agriculture, and submit them to the consideration of our California Farmers is, or should be, the peculiar object of our work. This is at any rate the course we shall adopt. Eschewing all partyisms in politics, all the affectations of society, and all the *cant* of religion, we shall devote ourselves to the improvement of Agriculture, to the embellishment of Homes, and to the elevation of Human Character.

The science of Farming has been lamentably neglected in California:—and yet enough has been done to demonstrate the agricultural resources of our country as equal to any section of the world. The soil is found to be of the most fertile and exhaustless character, varying in its adaptations according to topography, the seasons beautifully divided and appropriated, and the climate so combined as to afford all the advantages of a temperate or tropical zone without the respective evils that attend their separate application.

With such advantages in our favor, there is nothing too useful, too extensive or varied for California Agriculture to achieve. But to make success certain, men and mind must be zealously engaged in the developement of this immense department of wealth. The grand and extensive area of tilable land within the borders of our State should be improved, and when improved, should be known. It is true that within the last two years considerable attention has been paid to farming. But it has only been in the improvement and cultivation of the choice garden spots of the country—land which nature has so enriched and prepared for Agriculture that outlay and trouble hardly attend the cultivation of it. But now the public mind is becoming impressed with the great importance of Agriculture as a chief reliance in the more substantial and permanent growth of the Commonwealth. Husbandmen are beginning to appreciate the advantages of securing and improving farms; but the difference in seasons, in climate and the peculiarity of soil, are matters about which men of intelligence are seeking information. They would like to have the advantage of consulting the experiences of those who have already engaged in Horticulture and Pomology; they would like to know what encouragement can be offered for the raising of stock—to what extent men may engage in the Dairy business with a fair prospect of success—whether it would not be profitable to convert our vast lands into Rice fields,—whether many of the productions of China from which immense revenues are realized cannot be transferred to California and cultivated with profit; these and a thousand kindred subjects upon which reliable information is desired, offer a sufficient inducement for the establishment of an Agricultural Journal. These are the reasons that have urged us into the enterprise in which we have now fairly embarked. To the consideration of such subjects we now dedicate a journal that shall be second to no other vehicle of useful information in the State.

But to redeem such a pledge, we must receive the liberal support of those who feel an interest in any of the departments of the science of Agriculture. In no country are there more intelligent farmers than in California, and it is from these that we expect a most essential support; not from subscriptions and advertisement alone, but from the innumerable and thrilling sources of information which are opened to individuals, and which, when recorded and published, become of invaluable benefit to the masses.

We earnestly solicit farmers to communicate with us in respect to the number of acres they cultivate; the quantity of grains and vegetables raised; the kind, number and quality of stock; the quality of soil improved, how ploughed, planted and irrigated; the fencing best adapted to the country; the topography of farms; the best kind of dwellings, barns and farming utensils; and an infinite variety of useful matter, with which we can make interesting our journal. By responding to such a wish, we will be placed in a position in which we can infinitely benefit Agriculture, and through Agriculture advance all the departments of usefulness and improvements in our State.

If the votaries of farming will take a little trouble upon themselves in affording this kind of support, we will engage to furnish a weekly journal that will be a credit to the cause, and an interesting visitant to every household in the commonwealth.

As long as we control its columns, so long shall it be devoted to the useful and sublime office of elevating the husbandry of the Eureka State, of improvement in morals, and to the rational and sound entertainments of pure and living literature. As soon as we feel that our effort is substantially seconded by the public, we will make arrangements for presenting original matter that will be fully worthy of the science and interests to which we devote the FARMER.

With such aims we open our record, and most earnestly invite a liberal co-operation. From the press around us we know we shall receive an encouragement fully equal to our claims, and this is all we expect or demand.

California State Agricultural Society.

We shall ever be happy in giving an impetus to the advancement of the cause of Agriculture and its kindred associations, by presenting the interests of the "State Agricultural Society" to the citizens of California and our whole country. Now that a "State Society" has been organized, we feel it to be our duty as well as our pleasure to keep its interests and claims before the community.

We are happy to announce that three gentlemen have come forward voluntarily and signified their desire to donate *one hundred dollars, each*, —to form a fund for the Society—provided twenty names could be offered. We feel confident that it only requires these facts to be made known to secure not only *twenty*, but *fifty*, or *one hundred* names. By the constitution recently adopted at the organization of the society, one hundred dollars constitutes a person a Life Member, with all the privileges of the Society, and without further assessments.

We sincerely trust those who feel an interest in so valuable an institution, and reflect upon the good it can accomplish so soon as it has the means to operate with will not hesitate to step nobly forward and commence the work.

By the reported list of officers it will be observed that David Chambers, of Page, Bacon & Co., is the Treasurer of the Society, where the money can be deposited.

We would call attention to the communication of Dr. Herman Behr, which appears in another column. It is upon a subject of essential importance to the inhabitants of San Francisco, and the Doctor has exhibited a commendable interest, in the suggestions he has thrown out for consideration.

A new fashioned brick machine, at the Maryland Agricultural Fair, with the aid of one horse, "turned out" 16,000 bricks per day.

A Splendid Yield of Wheat.

We are informed yesterday, by a Mr. Petit, whose farm is located upon the American River, just above Brighton, that he sowed 160 lbs. of wheat last year, and that it yielded 170 bushels. This fact, under any circumstances, would be most interesting to the mind of a farmer, but it is especially interesting to men who arrived in this part of the country in '49, and passed by this same land. It is situated upon the western border of an immense prairie, fronting upon the American River, and so elevated in its topography as never to be subject to inundation. This soil is dry and sandy, and for a number of months in the year presents so barren an appearance as to challenge confidence in its capacity to sustain vegetation. The trouble of tilling is almost nominal, and yet when plowed and seeded, it will produce a crop of wheat or barley equal to any soil that can be found upon the face of the earth. As the farm recedes from the river, it is marked by slight undulations, until it loses itself in an expansive plain which extends to a distance of twelve and twenty miles. To what extent this land depends upon the river referred to for its nourishment and fertility, has not yet been given an adequate test, nor will it until the demand for an agricultural era becomes much greater than it now is. But so far as previous indications are concerned, there is ample reason to believe that in many seasons that which is most remotely situated from the banks of the stream, could be made to yield an excellent revenue to industry. The indigenous growths, whether upon the river or in the centre of the prairie, present the most thrifty and luxuriant array of foliage and flowers every spring; and the probability is that nothing would be required to substitute grains for the wild flowers, except an adaptation of seeding to the season of rain, the grain being deposited in the ground early or late, as the studied indications of a wet or dry season suggested. But as this opens the questions of seasons and signs, we must postpone further thoughts, until we can obtain an accumulation of data.

The Grape.

There is probably no country where the Grape produces so abundantly from slight culture as in California, and this profuse return is working in a measure to the injury of the cultivators, by retarding that attention to a right cultivation which would produce astonishing results. Some of the most singular and foolish systems are adopted in the planting of the Grape that the mind can conceive of. We have seen what men called vineyards, where a long cutting had been put into the ground by means of a crow-bar—for we could not call it planting; the persons supposing all that was necessary was to make a hole, and insert the cane about two feet, and they would shortly have a vineyard.

Again, we have seen those who suppose it sufficient to plough the ground, and then plant the vines the proper distances apart, and leave them to grow, occasionally mowing down the weeds and high grass which would grow between them.

To all who desire to raise grapes *fit to eat*, we say most emphatically: "Nothing great is ever accomplished without great labor." And most emphatically would we urge this upon the grape growers and fruit orchardists of California. By this we do not mean to be understood as advising expensive or extravagant labor. We mean judicious and well-directed effort.

Every variety of fruit needs appropriate soil and culture. The Grape needs peculiar soil and skill in its cultivation. If we would have large crops and fine fruit, the cultivator should understand the *wants of the vine*. If he would become a successful grower of it, he should know not only how to plant the vine, but how to grow it; how ripen the wood, how to prune it; the quantity of Grapes each vine should bear without injury, and when the fruit sets, how to color them; how and when to thin the bunches; all these duties should be well understood by the cultivator. Men may grow what are called Grapes by an easier process, but they will be such grapes that "if the fathers eat them, the children's teeth will be set on edge."

We trust these remarks will not prevent a single person from planting this valuable fruit, but rather induce them to desire that knowledge by which they can be numbered among the successful. To all such we commend "Hoare's Treatise on the Vine." This work has met the approval of the most scientific cultivators of the old country and the United States.

In future numbers we shall, as far as possible, give practical results of the cultivation of the vine in California, and we ask of all who are interested to favor us with their experience.

The Peach.

The cultivation of the Peach will form a new era in the history of this most delicious fruit. Its rapid growth, its early fruiting, the immense crops it will produce—if we should judge from its early and hasty advent—give us the assurance that ere long the markets of Francisco will be as noted for the Peaches of celebrated orchards in Nappa, Sonoma, Suscol, Santa Clara and Los Angeles, as are the markets of New York for the famous orchards of the Jerseys, &c.

What think you kind reader of, beholding, as you visit the markets of Francisco, in 1855, each morning, long rows of baskets of the luscious "red cheeked Melacaton," "Crawford's early and late Rareripes, "Royal George," "Old Mixon," and many other celebrated Peaches, upon which you have luxuriated in years gone by. Does not your mouth water, gentle reader? If you will but help us with your pen and your influence, we will not keep you waiting till 1855; give us your looks and words of cheer, and we will reward you with a portion of the crop of 1854.

The Peach can be easily grown from the pit, and in some cases will produce fruit the second year from the stone; in California, easily, the third year. By careful attention and study of the nature and characteristics of this fruit, and by securing choice seedlings, a person can secure an orchard of the very finest fruits, without the trouble of budding; many of the most delicious kinds being original seedling, although it does not always follow that "like produces like."

The Peach, as well as all other stone fruit, sport greatly, particularly when grown amidst their species of different varieties. Fruits change in their varieties from many causes; they change by the process of hybridization, by the seasons, by the character of the soil, and when grafted or budded by the nature of the tree to which they are transferred. For instance, the graft of a sweet apple, united upon the stock of sour variety, or *vice versa*, will more or less change the character of the fruit; so the luscious melting pear, when placed upon harder, breaking or baking species, changes the flavor to some extent, and this change goes on in a more or less susceptible degree, through all the ramifications of pomology.

Here, with a genial clime and a luxuriant soil, that secures a rapid and at the same time a healthy growth of all seedling fruits, we look forward most hopefully for the benefits arising to pomology, by a list of valuable seedling fruits, the productions of the earnest and skilful cultivators of the Eureka State.

Is California a fit Place for a Home?

There is a strange conception upon the minds of the mass of people in the older States particularly the Middle and Western, as to the character and condition of this State, and as to its ever being a permanent place of business or a fit place for a "Home."

Many who now visit this city for the first time are struck with wonder and astonishment at the extent of her populous streets, the magnitude, finish and durability of her warehouses and the splendor of her general appearance. A large portion of the east have but a feeble idea of the advance she has made in the arts, or the wealth she exhibits in her agricultural resources. Strangers who visit us now have so little idea of her advantages, that when the evidences rise before them, they are lost in wonder. There has probably been no one thing more beneficial and conclusive, or that has had an influence so great in inducing people to become permanent citizens and purchase land and settle thereon, than the display of the agricultural products recently exhibited in this city. This exhibition was the more wonderful from the fact that but few persons have ever engaged in the cultivation of the soil as permanent citizens—the greater portion doing it to realize profit for the time—a mere matter of speculation—and not as a science or a permanent business.

It is a matter of great satisfaction to know that the Agricultural Exhibition of the present year has been the means of inducing many who were yet unfixed in their purposes to become satisfied with California and to make up their minds to remain with us and become members of this growing commonwealth. It is also very pleasing to know the fact, and it can be attested to by hundreds, that the products of this season that have been seen by new comers, have been so convincing, that many of them have sent back at once and ordered their families to join them, feeling safe in their choice, and convinced that a country that could in this brief space of time reveal such productions, was a place to be called Home.

Rural Cemeteries.

Of all the subjects that wake up the sentient elements of the soul, this is the most touching in its sacred, its pathetic appeals. In the reservations of ample and beautiful grounds for the resting places of the dead, and in their legal consecrations to the offices of burial and undisturbed repose, there is something not only sublimely good and beautiful, but it constitutes the only true criterion by which to judge individual, family or nation. In proportion, as we honor and protect the graves of the loved ones departed, just in such a degree will we cherish the sentiments of affection and esteem for the living. No man with honorable feelings; no man that ever nourished and sustained an ennobling thought; no man that has a recollection extending from one day to the other, can witness the desecration of a grave, or a violation of the rights of the dead, without a sensation of honor like that which the coils of a snake would impart to a naked body. Everything in the human soul revolts at a barbarity so gross, a beastliness so depraved.

There was a time, we can remember it well, when a grave yard was a source of fear to our mind. But we had only then contemplated such places through the medium of a vision that was filled with gloomy burial scenes, that affected other and strange households. We did not then associate the mournful and plaintive interest which bereavement induces, and which hallows the sacred resting place of a departed friend. We had not then been told that memory and the grave were the only remaining relics that bound us to a fondly treasured companionship. The earth had not yet closed over the form of a father or mother, brother or sister, wife or child. And yet we could not then have marshalled up a sufficient stock of courage or thoughtlessness to rudely step upon what we knew to be a grave. We had at that time an undefinable, a gloomy veneration for all places of interment, and since death with its inexorable decrees has made us painfully familiar with their uses and value, we cannot too earnestly invoke their beautification and consecration to all the sublime and hallowed purposes for which they are designed.

This indeed seems to be a feeling so generally prevalent in our country, that nothing short of a consecrated and beautiful rural cemetery will answer the demand of public opinion. In proof of this, we refer with unutterable pride, and with feelings of the most profound satisfaction to the present efforts to open and set apart a proper cemetery in the environs of San Francisco. Such a movement is worthy of that great metropolis. It is worthy of the American people, worthy of California. We hope and trust that all the powers of art and nature will be brought into operation to adorn and perfect it. There is no reason why it should not be one of the most beautiful places in the world for interment. An enclosure, substantially protected, ornamented by avennes and lawns, beautifully margined with plants and flowers, tombs and monuments embowered in the perennial foliage of the symbolic Cypress, or shaded by the drooping boughs of the Salyx Babylonica, will become a feature of interest upon the Pacific, that, more than aught else, will demonstrate the ennobling progress of the American people. In such sacred precincts the soul can indulge its melancholy reflections, and cherish its memory of the dead, without a fear that the avarice or shameful indifference of man will ever disturb the remains of those for whom it mourns. Nothing but a beautiful cemetery,—a place that is embellished with sun-welcoming monuments, with sculptured figures, with grass-covered mounds and the varied little head-stones that hold up the record, "sacred to the memory of"—can respond to the wants of surviving affection.

We only hope that what San Francisco has so nobly began may be liberally imitated in the inland cities—that Sacramento may not only have a fence round its burying-ground, but that it may take some pains to have an entrance that can and will be opened and closed. A city of so much importance should pay more attention to protecting the graves of her citizens.

Reports on Agriculture.

We commence with the first number of the Farmer, to publish the Reports of the several Committees connected with the late Agricultural Exhibition, believing the facts they exhibit will give a more satisfactory evidence of the success of Agriculture, than the isolated facts when presented singly. Coming as they do, under the authority of gentlemen well known in our community, they will be received in full faith, and be data that can be relied upon.

Agriculture at the Sandwich Islands.

By the reports received from the Sandwich Islands, we learn that an increasing interest is felt in all branches of this science. From the transactions of the Royal Hawaiian Agricultural Society, kindly furnished us by the President, we note the prosperous condition of that society.

By the annual report of their treasurer, we learn that they have one hundred and twenty-four paying members, yielding $620 annually. In 1851 $500 was raised by voluntary subscriptions, and instantly the Government of the Island, by an act, voted the same amount—$500.

The society have now $1,500 funded property drawing interest. Their income from annual members and receipts at their exhibitions enable them to award this year $900 in prizes and books. A very able address was delivered by their corresponding secretary, John Montgomery, Esq., in June last, at their annual meeting. We note important features in the address, wherein the speaker urges with earnestness those who desire the prosperity of the Islands to these facts, and the same features exist in California, and can be urged with the same earnestness. The address calls upon the Islanders to look to the following productions that could be easily cultivated, and yet specie leaves the Islands to pay for what could be raised upon their own soil.

The article of Rice,—indispensable to the numerous Chinese, who form an important item in their population, and soon to be increased,—and yet $12,000 is annually paid out at Honolulu for for Rice.

Barley, Wheat and Flour, which could be easily raised and manufactured, have been sadly delayed and neglected, while $75,000 is annually paid for them.

Corn—$3,000 worth could be also successfully grown.

Tobacco will grow most luxuriantly, and for this $30,000 is annually paid; making a total of $120,000 for articles easily produced upon the Islands.

If the Island of Honolulu take so deep an interest in agriculture, and receive the aid of Government, shall not California awake to her duty, and enlist the interest of the government to her aid in agriculture? If the influx of the Chinese to the Islands induce the cultivation of Rice at the Islands, why should not the same results be produced here? If it is wrong in political economy to import what could be raised at Honolulu, is it not wrong to do the same thing in California? If it impoverishes Honolulu to pay $75,000 annually for Barley, Wheat and Flour that could be a home product, does it not impoverish California to import millions? If Honolulu imports $30,000 worth of Tobacco; what does California import? These are subjects for all to consider, and we commend them to all.

The entire address of Mr. Montgomery is of high interest, and reflects honor upon the author. The officers of the society are—Hon. W. L. Lee, President; six Vice-Presidents; five Executive Committees; J. Montgomery, Corresponding Secretary; E. O. Hall, Recording Secretary; Geo Williams, Treasurer.

To Correspondents.

We cannot permit our first number to go to press without soliciting communications from the votaries of Science, Art and Literature. Any Botanical, Mineralogical or Chemical Analysis that may be forwarded us; any description of machinery, or suggestions upon interesting subjects connected with husbandry, health or happiness, will not only receive our prompt attention, but will entail upon us a debt of gratitude which we shall endeavor to repay. It is time that the talent of our country began to turn over the subject of State resources in detail, to examine the component parts of the great mass of interests with which we are surrounded. California is already clothed herself in such an apparel of permanency as to require more consideration than she has heretofore received; more work in the way of arranging her claims and equalizing varied sources of wealth. And this can only be done in the beginning, by the voluntary efforts of men who delight in the revelations of truth. A few hours spent in analysis or description would not determine the mental resources of an individual, which would add to and vastly benefit the general mind of information in the State. We therefore hope that we may be favored in this particular respect.

P. H. T.—We have received the letter of this gentleman and fully concur with the sentiments of his first communication, having [illegible] to receive it again.

The Agricultural College.

We give elsewhere the "Memorial to Congress" upon the subject of a College for California, with the earnest hope that our readers will give the subject that thought and interest that a matter of such moment deserves.

We trust also that the citizens of the several counties will take up the subject, and conferring with their senators and representatives, will bring the matter before our State Legislature and have their voice go forward in support of the wants and interests of California.

With an Institution of this kind liberally endowed in a climate like ours—with a soil so fertile—with the material at ready command and boundless as it is wondrous and beautiful, for science in all her departments to revel in—these facts surely should induce every friend of California to urge this important subject home upon Congress until a portion of the vast wealth now idle almost, should be dispensed—whereby incalculable good could be made to flow back again upon all and every State of our glorious Confederacy. We do not desire an institution of this kind to be confined in its benefits to our own State—but to be "A Great National Institution," where by the aid of Science theoretically and practically applied, the vast and wonderful products of this entire country might be perfected in their culture and thus distributed by seed, scion, plant or tree, to every State and portion of our country and the world, and thus by a magnanimous example let our Nation commence a system of generous distribution or exchanges with other Nations upon the plan of that noble and enlightened philanthropist, Vattemaire, who has done so much to benefit mankind.

With these remarks, introductory, we leave this great subject in the hands of those who ought to see it accomplished—the People of California.

The Plough.

We commend the attention of the farmers of California to the "Report on Ploughs," in another column. This is the "great implement" of the cultivator of the soil. Land well and thoroughly ploughed is like a victory more than half won. A poor plough is the worst kind of waste; a waste of money, a waste of time in the use of it, and a waste of strength for man and beast. A good plough in the hands of a skilful ploughman is the wisest and best economy upon the farm; with such an implement work will be well and quickly done. That the Peoria Steel Premium Plough, of Morgan & Co., is that implement, the names of the able committee is the best guarantee. Mr. Beard, of San Jose, is one of the largest cultivators, and his experience has been obtained by the use of these ploughs, having used them by scores upon his extensive grounds. Mr. Hall, of the Pajaro Valley, is also one extensive cultivator, and has also used them in large numbers. Mr. Thompson, of Suscol Valley, also uses the same in preference—and thus not only from sight, but from actual experience the committee have decided upon the merits of the plough.

The report of the committee is of moment to all farmers.

Weather in the Sacramento Valley.

The oldest Forty-niner cannot remember as much cold weather in one winter as we have had already during the present season. Such severe frosts and heavy and humid fogs as mark our forenoons, we have never experienced in California. The quantity of rain, however, has been below the average of previous winters during the same months. The effect of this cold and foggy weather upon health has been very manifest in an increase of fevers, rheumatisms, and general inflammatory affections. But in the foregoing valley there is no malignant disease, resulting from the peculiar atmospheric condition referred to.

Steamboat Comforts.

We, certainly, travellers on the Sacramento river, have as many comforts and luxuries even as travellers upon any river; and there is no class of boats that can surpass them for [illegible] attention; and yet, while we speak of their [illegible] qualities, and the pleasure to many in the trips up and down the river we cannot help suggesting that some of our great lines would, we think, if many would patronize them in the Saloon, and thereby save Commodore Jones, the [illegible] of his [illegible] to the [illegible] of a table [illegible] to the [illegible] of a [illegible] a most [illegible] [illegible]

J. E. Teschemacher, Esq.

We deeply regret to notice the sudden death of this distinguished friend of horticultural science. Mr. Teschemacher died in the cars while on his way from the city of Boston to his residence in Medford, Mass. In the death of this gentleman, science has lost one of its truest votaries and ablest expounders—and it can truly be said of him, he loved the science, not for the fame or wealth or influence it would impart to him alone, but for the good it would diffuse and the happiness it would confer upon his fellow men.

Mr. Teschemacher was one of the early, most earnest and devoted friends of the Massachusetts Horticultural Society, and his able letters and addresses to and before that Society have done much to advance the interests of that influential institution. We remember well his noble enthusiasm in the cause of Horticulture and Floriculture, and remember too, listening with the deepest interest to his recital of the "History of the Fuchsa," at the "Annual Festival" of Flora in Faneuil Hall, Boston. As an amateur florist his collections were always rare; a connoiseur of the highest order, he only cultivated the best—"a few and rare," was his word. He loved to gather together a few of a particular kind at a time, and study them—the Fuchsa, the Cactus, the Tulip—and we remember the interest he felt in watching their development, and his modes of treatment,—his great object in view being to find the treatment best adapted to their natures.

In the year 1842, Mr. Teschemacher was elected to deliver the annual address before the Massachusetts Horticultural Society. It was delivered before the Society on the 16th September, to a large audience, and won for him deserved honor. From the printed copy published in the Society's Transactions of that year, which we preserved, the following extract will best evince his earnest love of Horticulture and his desire for its universal advancement:

"How happy for millions had Horticulture with its refinements, been in former times more universally disseminated amongst mankind. What would have been the pages of the history of South America, from its discovery to this day, had Pizarro and the ministers of religion who accompanied him, associated the cross which they bore in one hand, with the spade, the rake and the pruning knife, instead of the lance, the sword and the gun, in the other? How different would have been the existance and fate of whole generations of natives who passed lives of misery and were finally exterminated. How different would be at this day the face of immeasurable plains, the far stretched forests in such a heavenly climate! Her history would have been one of peace and prosperity, instead of one of blood and desolation; her plains would have been covered and adorned with swarms of happy and industrious races, by whom the names and the memory of these discoverers and civilizers would have been venerated and held sacred, like that of Mango Capac, who in ancient times introduced the simplest arts of peace among them, instead of being held in utter execration, which has at length resulted in their total expulsion with shame from the country."

Speaking of the societies and other aids towards the advancement of the pursuits of Agriculture and Horticulture, the orator remarks:

"But if Horticultural Societies have done much to advance this pursuit, Horticultural publications have done more. I was an original subscriber to London's Gardener's Magazine, (published in London),—the first of these publications, and I have watched with much interest the progress and effects of that and the other publications which have sprung from its example. I do not hesitate to state my conviction that, without such publications, many of these societies would not now be in existance, and that thousands of individuals who have found innocent and delightful resources and excitement in Horticulture, would have been ruined at the tavern or the gambling house—finally, that it is impossible to calculate the advantages bestowed on mankind by the vast diffusion of a taste for Horticulture, which these publications have mainly contributed to produce."

Such were the sentiments of this noble and earnest friend of Horticulture, and he but gave utterance to sentiments as noble as his heart was truthful and pure in its love of this science. Mr. Teschemacher was long the corresponding secretary of the Massachusetts Horticultural Society, and his devotion to its best interest gave an impetus at home and abroad that even now, after the lapse of a generation, goes before the world. Mr. Teschemacher's death was caused by disease of the heart. In this city [illegible] [illegible] [illegible]

A Happy New Year.

No period of time more opportune to commence a new enterprise, and no theme more appropriate than the one we have taken, and with which we desire to greet our readers as we meet them for the first time, with, each and all, "A Happy New Year," and could our wishes accomplish our desires for those whom we now address, it would be that they should be blessed in basket and in store; that a smiling Providence should shield them from sickness, sorrow and affliction; that "troops of friends" should gather thickly around them, and their pathway be one of peace, prosperity and happiness.

The year 1854 has indeed opened upon us most cheeringly; a cloudless sky, a bright sun, a mild and balmy atmosphere, ushered in a season that is marked in the calender of California hospitalities and friendships, as a "red letter day." This is a day of cordial greetings, of social reunions, of new pledges of friendships, and of kindly remembrances of those dear to us, and such as the one just enjoyed, give us the pleasing and most gratifying assurance that here in California the love of gold cannot obliterate the love of that social enjoyment, without which, even wealth is valueless.

We will venture the assertion, that in no part of the United States could the day have been more honored or more appropriately or delightfully observed than it was in Francisco and Sacramento, and we presume other cities also—we speak only of what we know. In Francisco and Sacramento the banking houses and principal mercantile houses were closed and business generally was suspended, to give place to a custom that is most truly commendable. On this day the "lords of the creation" pay due homage to the "fairest of creation," and it is a homage justly their due. We devoutly hope this custom will ever continue.

In a country like this, where business requires such constant application, it is absolutely necessary that seasons of respite from care and labor should occur frequently, else the physical man would be utterly prostrated and his social nature be disqualified from appreciating his higher duties. We have been informed that there has never been a more delightful season of New Year's enjoyments than the present in Francisco. The most extensive preparations had been made throughout the city, and the anticipations of the thousands upon the last day of 1853 were more than realized on the first day of 1854. Nature smiled propitiously and generous hearts were made glad. It would be invidious to particularize the many instances of boundless and magnificent hospitalities that have been made known to us, where all have done so nobly we are happy to praise all; suffice it to say, the "fair" knew they had the day, and the victory was justly theirs.

It was our fortune to be personally present in the "city of the plains," and we know it will excite no jealous thought if we speak earnestly and proudly of what it was our pleasure to note in this truly famed city. When we recall New Year's Day of 1853 in Sacramento, and remember a city that but a few weeks previous had been "blotted out in a night," and yet assumed her place among the cities of the land again. When we remember her too, so bravely bearing up under her trials; the opening year finding her a "buried city," submerged by the melting mountains, and the overcharged clouds of heaven, and still rising superior to all these ills; then too when we remember her, Venice like, pouring out her citizens in gay Gondolas, upon their accustomed joyous New Year's greeting, we do not wonder at her present proud and prosperous condition. New Year's day in Sacramento will long be remembered, on account of the associations connected with the seasons of fires and floods. Sacramento will also long remember New Year's Day of 1854, and we can most truly say that no city ever presented scenes of social life and enjoyment in a higher degree than has just been witnessed in that city.

It would be impossible for a stranger to conceive that Sacramento had been ever afflicted, The bankers and business men generally yielded the day to social enjoyment, and a generous strife to see who could make the greatest number of their friends happy. There was a general or round of visiting, from morn till midnight. Every countenance was cheerful; every heart spoke of happiness; and the ladies of Sacramento have surely won laurels for the general joy they diffused throughout the community, by the brilliant taste they displayed within their homes, and the very happy reception they gave their friends—we cannot, dare not, individualize. We remember them all and wish them all in return a full reward for the great happiness they have conferred.

To the readers of the Farmer we would tender our best wishes, our kindest hopes for their complete success in the noble science of agriculture, and we trust they will find pleasure and profit in perusing the columns of our weekly visitor, and that we shall receive from them that cordial support and generous encouragement which we earnestly desire, and so much need, to make our enterprise so successful that we shall, at the close of our first year's labors, say it has also been to us as well as our readers, a "Happy New Year."

Fruit Trees.

There is now no theme so interesting, certainly none more important in agriculture, that the subject of planting Fruit Trees.

There is a very great want of practical knowledge upon this subject. It is of the highest importance that a surgeon should understand the use of his instruments, lest he wound himself and bleed to death. Now, a person planting trees may fear no danger of wounds in the planting of trees, and yet, unless he does understand what he is about, he surely will be wounded and he will bleed freely—in his pocket.

It is of the highest importance to any person who wishes good fruit, to make himself acquainted with the nature of the tree he is planting—the kind of soil it requires for its nourishment—the time of planting, pruning &c. The growth of the wood of the tree is very rapid in this country, and if the proper nourishment is given to it, so as to cause it to develope fruit spurs instead of too much wood, then we have fruit. If the cultivators understands these wants of the tree, and can supply them, he will be completely successful.

The months of December and January are the best time for planting fruit trees. The manner of planting is a science of itself. The time and manner of planting, and the wants of the tree are so little understood, that here men bleed more freely—in their pockets—than the unskilful surgeon would if he cut himself ever so badly; he can bind up his wounds and cure them, but the man who has destroyed valuable trees by a want of knowledge in their care, cannot bring them back to life, nor bestow the luscious fruit they would have yielded. These are lost forever, and that is not all—his ignorance and want of skill produces the belief that fruit trees will not thrive in this country—and thus a check is given to the planting and growth of trees. Here is a more serious injury done than is first anticipated—he not only has wounded himself, but a whole community, by retarding their enjoyment of luscious fruits.

There need be no longer a single doubt of success in the growing of Fruit in California. We have all kinds of soil, all varieties of temperature and all positions and exposures in our climate. In our beautiful valleys, we have the deep, rich soil for the pear, plum, and fig; on our slopes we can plant our grape, peach, apricot and nectarine, or we can bud the three last upon the plum, and plant them all in our rich bottom lands. Upon our mountain sides and slopes the apple will luxuriate as well as in our valleys; the orange, lemon, lime, date, prune, and olive, all love and will luxuriate in our deep, alluvial soil with proper drainage and nutriment.

What is now needed, imperatively needed, is a proper study of the various fruits, in soil, nourishment, and proper training, and success is sure to follow such well-directed effort. We hope our citizens will give more care to this subject, and not despair of success because every tree they plant does not live and thrive. Look to it carefully—the fault is not with the tree; it was, more likely, the planting, soil, or care. Try again—or, if you have never tried, try now. A law should be enacted that every young man arriving at the age of 21 should plant a tree annually, under the directions of the authorities of the town or city where he resides—thus our cities and towns would soon become beautifully ornamented malls, parks, and walks, reflecting alike beauty and comfort upon the citizens and those in power. We trust California will not be behind other places in beautifying her great marts of trade and commerce—but rather in advance in all that appertains to usefulness and beauty.

The California Farmer will always be found at Sullivan's Newspaper Stand, Kearny street, and at other prominent places in every city, of which due notice will be given of places and agents, in the next number.

Our Prospectus will be found on the third page.

Magnificent Plants.

The Floral world, *i. e.* the American part of it, has, within a short time past, been most deeply interested and gratified by the introduction and successful cultivation and flowering of two or more of the most wonderful plants known.

To Caleb Cope, Esq., of Philadelphia, belongs the honor of successfully introducing into our country these valuable acquisitions, and much credit is certainly due to his gardener, Mr. Thos. Meacham, for the care and skill displayed in flowering the beautiful plants.

The Victoria Regia has excited the wonder and and admiration of many thousands of visitors at the Museum Hall, Philadelphia, where this gorgeous plant opened its first bloom, and the munificence of Mr. Cope, in introducing this plant was enhanced by contributing the income arising from its advent blooming to the noble cause of charity. It was exhibited at the Museum Hall in 1851, and was visited by nearly ten thousand persons, and the handsome sum of about $6000 was placed as a fund for charitable purposes. All honor to such munificent liberality.

The Nelumbium Speciosum has just been as successfully introduced and bloomed in the gardens of C. Cope, Esq., at Springbrook, Philadelphia. The plants that bloomed were raised from seeds brought from Calcutta by Mr. Ezra Bowen in 1852.

The Espiruto Sancto (an orchidens plant,) a rare and beautiful one, though previously bloomed in the States, was brought from Panama. (A plant was exhibited in San Francisco recently, in bloom, at the residence of the late lamented Capt. E. Knight.) This also opened its beautiful flowers the same evening with the Nelumbium Speciosum.

In noticing these rare and beautiful plants, and in perusing the many interesting descriptions of them, and the interest felt by so many thousands—we are induced to remind our California readers that it is far easier for us here in California to enjoy these glorious exhibitions of nature's handiwork than it is for the citizens of the Eastern States; and if we will but improve the opportunity so near at hand, and spend a small portion of the Gold we are so anxious to amass, we could soon witness in greater beauty and perfectness the queenly Victoria, the gorgeous Nelumbium, the magnificent Espirtuo Saneto and a host of other rare and wonderful plants, (and we could add fruits also) that the Celestial Empire will soon unfold to us. From that vast territory, and from the numerous isles of the sea, California will have opened to her a field as glorious for science as it is illimitable in resources and extent of territory, and we trust we may here find many of our wealthy merchants who will take a pleasure and secure happiness by advancing the sciences which beautify and adorn, as well as those which are more strictly needful or useful. We shall make it a point to keep our readers constantly advised of the most important discoveries in each branch of our labor, and shall look for encouragement in seeing the sciences advanced.

A more particular and detailed description of the blooming of the two first named rare plants will be given in the next number of the Farmer; the blooming of the Victoria Regia and the results are given from memory only—any error will be readily corrected.

We must accord to Mr. Wm. H. Burgess, (formerly of the "London News" *corps*,) the credit of furnishing us with a beautiful and appropriate vignette. The idea of making "Ceres" and "Agricola" the outside sentinels and supporters of a central exhibition of Commerce, Navigation, and Mining, is, to our mind, particularly happy. This is precisely the relation in which these two splendid and lovely characters should be contemplated by the internal interests referred to. And the artist has done well to present them in so favorable and legitimate positions. It is right, and an absolute necessity, that Agriculture, in its comprehensive claims, should be regarded as the boundary and abutment of commerce in its general relations. This is essentially its destiny, and will inevitably be the result of its development. We are therefore delighted to have the title-page of our journal ornamented in the manner in which Mr. Burgess,—in conjunction with the well-known and talented engraver, Mr. Anthony,—has presented it, and we take great pleasure in recommending these artists as men of good taste, and a facility in the execution of work which must secure them an ample degree of patronage.

Our printing materials are from the establishment of our prompt and enterprising friend Mr. E. Pelouze, on Washington street, who is the only man in California that *can* lit out an office.

Meeting of the Fifth Legislature.

Both branches of the Legislature were organized at 12 o'clock, on the 2d of January. In the Senate, Mr. Lyons of Nevada, was appointed Chairman. After a prayer by the Rev. Mr Woodbridge, the roll of the last Senate was called, and six gentlemen answered to their names.

The roll of the present Senate was then called and it was found that twenty-three members were present, to whom Judge Winston administered the oath of office.

The rules of the previous session were adopted until otherwise ordered, and a committee appointed to digest a code of laws for the government of the Senate.

The Senate next proceeded to the election of a President *pro tem*, in consequence of the illness of Lieut. Governor Purdy. Dr. B. F. Keene was unanimously elected and accepted the office with appropriate remarks.

The Senate then adjourned until the next day at 11 o'clock.

The House having been called to order Hon. J. M. Mandeville, of Tuolomne was chosen chairman *pro tem*, and, on calling the roll, forty-six gentlemen answered to their names, and were sworn in by Judge McKinistry, after which the Assembly adjourned until the next day at 12 o'clock.

Our Legislature is now fairly organized, and although we may expect a certain amount of log rolling and wire pulling, such as usually accompanies the session of a Legislative body, and which has in former years especially characterized that of our own State, yet we hope for brighter times, and trust that the members of the present Legislature will be true to the interests of the State, and serve their constituents, honestly and to the best of their ability.

We shall present our readers from time to time with the most important results of the deliberations of our Legislative bodies; but, as we shall observe a strict neutrality on political subjects, shall abstain from commenting upon party questions which may arise during the session.

We understand that an early removal of the seat of government from Benicia to Sacramento will take place, and, as we are always in favor of the good treatment of our public men, we congratulate them on the prospect thus presented of an agreeable winter residence.

Land Titles.—There is at the present moment no one subject that has so important a bearing upon the real and permanent welfare of California, as the speedy settlement of the Land Titles. The long delay in the adjustment of titles to large portions of territory, has prevented many occupants from making the improvements they would have done, had the titles been adjusted, so that all would know how to act. We presume the Commissioners are doing all that can be done at the present moment. There are, however, some highly important cases before the Board, which, if they could be decided, would accomplish a great deal of good. Among them, we may allude to the "Sutter Title," at Sacramento city. It has been delayed so long that men are becoming discouraged. They have had their property taken away by squatters, and the true owners wait patiently as they can, in the confident hope that ere long the matter will be finally judged rightly. Large amounts of money have recently been paid as taxes, to hold the titles, as it is confidently believed that justice will ere long be done to the citizens and the "noble old Pioneer," and his last days be made happy.

Public Health---Damaged Flour and Grains.

We are pleased to notice the condemnation manifested by the press generally upon the frauds perpetrated upon our citizens by the vile admixtures of quantities of damaged Flour, with smaller portions of good grain, and thus palming it off after grinding, as a new or superfine article. This practice has continued full long enough. The public have submitted to it more from the difficulty in detecting the sources from which it came than from any acquiescence in such abominable impositions. That which could not be effected by public censure will be reached by other means—interest. The present depression in breadstuffs and grains generally has reduced the prices of the best brands so low as to leave no profit to the manufacture of spurious flour, and soon, present prices ruling, the cry will be "Othello's occupations gone." We must rejoice at the result, although the grain grower and the manufacturer of pure breadstuffs may suffer for awhile by the present depressions of the market.

FIRE IN SACRAMENTO.—An alarm of fire on Tuesday evening, says the State Journal, proceeded from the burning of a camphene factory, near the levee, in the rear of some Chinese houses on I street. The fire department were promptly on hand and succeeded in arresting the progress of the flames by pulling down a number of adjacent shanties, as well as the one that was on fire. For a few minutes the danger of an extensive conflagration was very imminent. The surrounding houses were of wood, and very inflammable. Fortunately there was no wind stirring. The building and works were owned and occupied by a Mr. Moore, but there was only a small quantity of camphene on hand; loss about three hundred dollars. Such a manufactory should never be near dwelling houses or stables, as was this, as the manufacture of such an article is attended with considerable danger.

MARRIED.

In this city, Jan. 2d, by Rev. Mr. Rollinson, Mr. C. L. Hill to Miss Jane A., second daughter of Mr. Samuel Brocklurst, both of the Presidio.

In Stockton, Dec. 31st, Mr. Silas Burt to Miss Elizabeth Kerr, both of Stockton.

In Cincinnati, Nov. 16th, by Rev. Willis Lord, D. D., E. R. Hawley, of San Francisco, to Miss Mary J. Bigham, daughter of the late David Bingham, of Hamilton, Ohio.

In Sacramento, on the 20th ult., Mr. John Gale and Miss H. R. Booth.

In Sacramento, on the 28th ult., Mr. W. W. Burns, of San Francisco, and Mrs. M. A. Randolph.

In Sacramento, on the 29th ult., Mr. Thomas Carr and Miss Ellen McGregor.

In this city, January 1st, by Rev. C. B. Wyatt, Mr. Albert G. Randall to Miss Anne Auguste F., eldest daughter of Wm. Soule.

At Calapooya, Linn Co., O. T., Nov. 19th, Mr. Z. T. Moody and Miss Mary J. Stephenson.

At the residence of E. Wild, Esq., Oak Point, O. T., Nov. 17th, Mr. Charles Macguire and Miss Minerva Killum.

DIED.

In this city, on the morning of the 28th ult., HON. N. C. Read, formerly Supreme Justice of the State of Ohio.

In this city, on the 28th ult., Jane, daughter of John and Rosina Kyle, aged 4 years and 6 months. New Orleans papers please copy.

On the 15th ult., in Portland, O. T., Mrs. Elizabeth, consort of C. B. Cox.

In Nevada, on the 27th ult., Mr. Bryan W. Halsey, aged 27 years.

Drowned from the schr Gen. Lane, on the Sacramento river, on the 19th ult., Captain Gilman, of said schooner.

In Sacramento, on the 28th ult., Mrs. Marietta Woolley, wife of Dr. G. W. Woolley.

In this city Dec. 27th, at her residence, Mary Louisa, wife of Henry Channing Beals, and daughter of the late Wm. Johnson, of Lebanon, New Jersey, aged 32 years.

In this city, Dec. 27th, Florida Wood, infant daughter of Laura J. and Capt. H. D. Waller, U. S. Army.

OBITUARY.

"DEATH LOVES A SHINING MARK."

How truly has death been called the "King of Terrors." Come when or whence he may, his presence is ever unwelcome. No age, sex or condition, bol insurance against this ruthless destroyer of human hopes. The most lovely infant, bearing the impress of heaven's own purity—Woman in the sweet relations of social life, daughter, sister, wife, mother, marking her pathway as an angel visitant—Boyhood, bright and hopeful—Youth stepping forward with lifehest and holiest aspirations—Manhood, with all the dearest associations of life commingling—the more dear, the more hopeful, the more lovely these—oft seem to be the chosen times and places where the Destroyer strikes his fearful blow.

The city of San Francisco, within the last few months, has borne witness of these truths, in all these relations. There has been felt the death-deadening blow, and loving hearts are now mourning those dear ones that are "passing away, passing away." Among the many names enrolled on the pages of deaths' calendar, none occupied a purer or more exalted place in the hearts of kindred and friends than the late universally lamented MRS. HENRY CHANNING BEALS. In all the relations of life she was truthful, faithful, devoted—over them all her presence threw a new and brighter charm; but as the star of hope was at its meridian, and loving hearts gathered thickly around, the death blow was dealt, and this same bright star was stricken from the firmament of pleasure and beauty which an entire community contemplates with pride.

"I go, dear friend, to a brighter sky,"
(She said with fainting breath,)
"Transplanted to my home on high,"
Transplanted, is not death!

By this bereavement, society has lost one of its most useful members, one of its brightest ornaments, and a void has been made in the hearts of surviving kindred, that never can be filled. To the bereaved ones, sympathizing hearts may tender consolations and comfort, but only those who have alike suffered, can ever know with what terrific and desolating power the blow falls. We must have been where the "shot strikes" to know and appreciate the agony it induces.

Appropriately teaching, we add the following extract:

"In comparison with the loss of a wife all other bereavements are trifles. The wife, she who fills so large a space in the domestic heaven, she who is so busied, so unwearied—bitter, bitter is the tear that falls on her clay. You stand beside her grave and think of the past; it seems an amber-colored pathway, where the sun shone upon beautiful flowers, or the stars hung glittering overhead. Fain would the soul linger there. No thorns are remembered above that sweet clay, save those your own hand may have unwillingly planted. Her noble, tender heart lies open to your inmost sight. You think of her as all gentleness, all beauty and purity. But alas! she is dead! The dear head that so often laid upon your bosom, now rests upon a pillow of clay. The hands that so fondly administered so lovingly, are still and cold, beneath the folded garments. The heart whose every beat was for you, is cold as clay at your feet. And it is no use to urge arm over your beloved one; no sparkling face to look upon into eye of love; no trembling lips to murmur—"Oh, it is so sad." There is a stillness in every room! No—it is not silent, it is loud—loud the clock ticks, and ticks, and ticks! How sweet were the lovely parting, if we could hear it! Now it seems kind of fearful, that hush when you watched her slumber, as if fearful to disturb her sweet sleep. But many a heart is broken every year, and many a heart is bearing it as you are doing. You fain would give comfort to her. You cannot, she is in a happier world, but feel that she is [illegible] Christ [illegible] her. In her holy presence be a [illegible] In all [illegible] Meet [illegible] what [illegible] you. Be [illegible] of her memory.

MARKET REPORT.

SAN FRANCISCO, JANUARY 5, 1854.

[illegible]

A glance at the above prices will convince any one that the Farmers are not receiving large prices. Potatoes range lower than ever noted before in this country; sales have been effected to ship to Honolulu, front wharves we received them in 1850 and 1851.

H. W. BRADLEY'S
National Daguerrean Gallery,
CORNER OF CLAY AND KEARNY STREETS,
San Francisco, Cal.
Importers and Dealers in the best qualities of
Every Article required in the Business.
Portraits, large or small, equal to any in the world, taken at short notice. Also, the most improved STEREOSCOPIC PICTURES, a new and beautiful improvement [illegible]

NOT THE ONLY ONE!
ANOTHER MAN IS IN THE FIELD
Prepared to cut Quartz Rock into any form desired.
I will say to my friends and the public generally that I am prepared to work into any form they may desire, Quartz Rock, WITH A POLISH EQUAL TO THAT OF A MIRROR.
N. B.—Quartz Rock purchased at the highest prices.
J. W. TUCKER,
125 Montgomery street.

There are Three Things I Do Not Do!
1st. I do not get a gentleman to leave his Watch, and when he calls for it, charge him TWENTY-NIVE DOLLARS for cleaning it, and have it stop two hours after.
2d. I do not ask FIFTY DOLLARS for a chain, and sell it for THIRTY-SIX DOLLARS, and warrant it Fine Gold, when it is filled with brass solder, and have to take it back and pay FIFTY DOLLARS in money, and give another chain.
3. I do not tell a Captain he can leave his Chronometer gratis, and when he calls for it at the end of eight months, refuse to deliver him up his property, without he pays me SIXTY-FIVE DOLLARS, and TEN DOLLARS more for rating it.
There are many other things I do not do, which I may name at some other time. 1 4t J. W. TUCKER.

SUPERIOR FURNITURE.
THE largest and best stock in Sacramento may at all times be found at the Old Stand of R. P. & D. MOORE, No. 77 Third street, where they still persist in selling as much below their competitors as their superior facilities will afford. From Harper's Magazine.

THE HERO OF LAKE ERIE.

BY HENRY T. TUCKERMAN.

On a green knoll, in yonder field of graves,
Where the rank grass o'er mound and tablet waves,
A granite shaft allures the vagrant eye
To where the ashes of a hero lie.
This briny air, in its perennial sweep,
Nerved his young frame to conquer on the deep;
Around these shores, a boy, with sportive ease,
He trimmed his shallop to the wayward breeze;
A fearless athlete, in his summer play,
He clove the surf of this unrivalled bay;
Trod the lone cliff, where storm-lashed billows roll,
To see the rocks their baffled rage control,
Or watch their serried ranks majestic pour
A ceaseless tribute on his native shore;
The snowy fringes on each leaping surge,
Like victors' wreaths, heroic purpose urge;
In their wild roar the deadly charge he hears,
Feels in their spray a grateful nation's tears;
The mellow sunset, whose emblazoned crest,
With purple radiance flushes all the west,
Like glory's banner, to his vision spread,
To guide the living, consecrate the dead!

His boyhood thus by winds and waves beguiled,
Here Nature cradled her intrepid child;
Won his clear gaze to scan the horizon wall,
His heart with ocean's heart to rise and fall,
His ear to drink the music of the gale,
His pulse to leap with the careering sail,
His brow the landscape's open look to wear,
His eye to freshen in this crystal air;
Braced by her rigors, melted by her smile,
She reared the hero of her peerless isle.

Then went he forth—not like a knight of old,
Armed at all points, with veterans enrolled,
But in the strength of a devoted will,
A martyr's patience and a patriot's skill:
No fleet was his whose guns and pennons bore
The tested might of conquests won of yore;
The trees whose shadow played o'er Erie's wave
Were felled and launched—a rampart for the brave;
The oak that stretched its leafy branches there,
And dallied lightly with the autumn air,
One morn, a sturdy bulwark of the free,
Floated the empress of this inland sea!
No gray survivors of the battle's wreck
Manned the rude ports of her unpolished deck;
Destined to grapple with a practised foe,
The will to fight is all her champions know.

Sublime the pause when down the gleaming tide,
The virgin galleys to the conflict glide;
The very wind, as if in awe or grief,
Scarce wakes a ripple, or disturbs a leaf,
The lighted brand, the piles of iron hail,
The boatswain's whistle and the fluttering sail,
The thick-strewn sand beneath their noiseless tread,
To drink the gallant blood as yet unshed,
The long-drawn breath, the glance of mutual cheer,
Eager with hope, oblivious of fear,
Valor's stern mood, affection's pensive sigh,
Alone declare relentless havoc nigh.
Behold her chieftain's glad, prophetic smile.
As a new banner he unrolls the while.
Hear the gay shout of his elated crew
When the dear watchword hovers to their view,
And Lawrence, silent in the arms of death,
Bequeaths defiance with his latest breath.*

Why to one point turns every graceful prow?
What scares the eagle frow his lonely bough?
A bugle note far through the welkin rings,
From ship to ship its airy challenge flings;
Then round each bull the murky war-clouds loom,
Her lightnings glare, her sullen thunders boom;
Peal follows peal, and with each lurid flash,
The tall masts quiver, and the bulwarks crash;
The shrouds hang loose, the decks are wet with gore,
And dying shrieks resound along the shore.
As fall the bleeding victims, one by one,
Their messmates rally to the smoking gun,
As the maimed forms are sadly borne away,
From the fierce carnage of that murderous fray,
A fitful joy lights up each drooping eye
To see the starry banner floating high,
Or mark their unbarmed leader's dauntless air,
(His life enfolded in his loved one's prayer.)†
Pity and high resolve his bosom rend,
'Not o'er my head shall that bright flag descend!'
With brief monition from the hulk he springs,
To a fresh deck his rapid transit wings,
Back to the strife exultant shapes his way,
Again to test the fortunes of the day.

As bears the noble consort slowly down,
Portentous now her teeming cannon frown;
List to the volleys that incessant break
The ancient silence of that border lake!
As lifts the smoke, what tongue can fitly tell
The transports which those manly bosoms swell,
When Britain's ensign down the reeling mast
Sinks to proclaim the desperate struggle past?
Electric cheers along the shattered fleet,
With rapturous hail, her youthful hero greet;
Meek in his triumph as in danger calm,
With reverent hand he takes the victor's palm
His wreath of conquest on Faith's altar lays,‡
To his brave comrades yields the meed of praise;
With mercy's balm allays the captive's woe,
And wrings oblation from his vanquished foe?

While Erie's currents lave her winding shore
Or down the crags a rushing torrent pour,
While floats Columbia's standard to the breeze,
No blight shall with laurels such as these!

* Just before the action, a flag, with the motto—"Don't give up the ship!" was hoisted.

† Perry said, after his miraculous escape, that he owed his life to his wife's prayers.

‡ "It has pleased the Almighty to grant to the arms of the United States a signal victory," &c.—PERRY'S DISPATCH.

THE mind of the greatest man in the world is not so independent but that he may be subject to being troubled by the least jumble which is made around him—it need not be the noise of a cannon to disturb his thoughts; it need only be the noise of a weather-cock or pulley.—*Pascal.*

Trash.

WE commend the following article, which we have cut from an old paper, to those who never see any good in their fellow men:

The selfish and artful man will make use of this term, *trash*, to prejudice and undervalue the property and doings of another, who stands in his way, that he may thereby enhance his own. It matters not with him whom he injures, or to what extent, by his detractive insinuations. It is his purpose and his business to build himself up by pulling another down. Such an one, contrary to all fairness, contrary to reason and to law, will divert the stream from its natural course, and carry it away from his neighbor's lands, in order that he may, by the means, irrigate his own enclosures. Should he take a dislike to his neighbor's mastiff, he will cry "mad dog!" and raise a mob for the poor animal's destruction. These people sometimes also adopt the little word *fudge*, to effect their plans of deterioration; but not with the same application as when used by Mr. Burchill in the Vicar of Wakefield. Thus those that cry *trash* are, very often, a better exemplification of the term themselves, than whatever matter or thing they would decry by this special use of it. Such is that sort of trash which bears the human form, and "by their fruits ye shall know them." Junius says, in one of his letters, that whenever a Scotchman *smiles*, he "feels an involuntary emotion to guard himself against mischief." So, when any one, wishing to characterize the works of another, with affected wisdom, a shake of the head, and a distinctive emphasis, cries "TRASH!" does not suspicion reply, "take heed! there is something selfish in all this."

A certain widowed lady, wishing to purchase some hard wood, went to the market herself for that purpose, for she was not ashamed to do her own trading. As she stood examining a load of small-sized walnut, a woodmonger came up and inquired very significantly, "are you going to buy that are *trash?*" She replied that she was "thinking of it." "Well," said he, "before you trade, you'd better look at mine." So she went with him and viewed his load, composed of very handsome hornbeam. "There, woman," said he, "if you want a right down clever load of wood, there's the article; and I'll sell cheaper than any one on the stand; but if you want *trash*, then go and buy the other." Being a farmer's daughter, and acquainted with a wood-pile, she smoked the trick in a moment. "I will take the wood at your price, sir," said she, "but according to my custom, you must procure it to be sawed and split up fine, and I will pay when the work is done." Those who are acquainted with this kind of firewood, need not be told, that here was an end to the bargain.

Night-watch with a Dead Infant.

MOONEST thou thy bark, still voyager? Through those infant eyes, with a prophet's vision, sawest thou life's great battle-field, swarming with combatants? Fell upon thy ear the far-off din of its angry strife? Dropp'd thy head wearily on the bosom of the Sinless, fearful of earth's taint? Fluttered thy wing impotently 'gainst the bars of thy prison house, sweet bird of paradise?

God speed thy flight! No unerring sportsman shall ruffle thy spread pinions, or maim thy soaring wing. No sheltering nest had earth for thee, when the chill wind of sorrow might blow—no Garden of Eden, where the serpent lay coiled beneath the flowers—no Tree of Life, whose branches might have sheltered thee for aye!

Warm falls the sunshine on thy grassy pillow, sweet human blossom! Softly fall the night dews on the blue-eyed violet above thee! Side by side with thee are hearts that have long since ceased hoping or aching. There lies the betrothed maiden, in her unappropriated loveliness; the bride, with her head pillow'd on golden tresses, whose rare beauty even the great spoiler, seemed loth to touch; childhood, hut yesterday warm and rosy on its mother's breast; the gray haired pastor, gone to his reward; the youth of crisp'd locks and brow unfurrowed by care; the heart broken widow, the tearful orphan—all await with folded hands and closed eyes, alike with thee, the "Resurrection Morn." FANNY FERN.

A Future Great Man.

THE Wheeling Times mentions the arrival in that city of John Jacques, an orphan boy, aged 15 years, from the State of New York, on his way to California, overland. He states that he reached Philadelphia, by stowing himself in a car on a freight train; and remained there two weeks, sleeping in the market houses and subsisting on offal given him by servants at the hotels. Finally a railroad conductor allowed him to ride on the platform of a car to Baltimore, where he staid for more than a month, serving as an errand boy and newspaper carrier, after which he proceeded on foot to Frederick, begging enough to eat from the farm houses on the road; here he engaged as ostler at a tavern, hut left in a week on the top of a buggy wagon for Harper's Ferry, where he accidentally picked up a five dollar bill, and took the cars for Cumberland; a gentleman there paid his way to Wheeling; at the latter place he is endeavoring to engage as a cabin boy on hoard of a steamboat for St. Louis, where he hopes to engage as herdsman or cattle driver to California. Persevering boy, that, and we predict that if years are spared to him he will make his mark upon the age.

NATURE, which has given us one organ for speaking, has given us two for hearing, that we may learn that it is better to hear than speak.

PEORIA PREMIUM STEEL PLOWS.

THE FORMER CELEBRITY OF THE PEORIA PREMIUM STEEL PLOWS, and the unequalled success of their introduction in this State, would seem to preclude the necessity of any further effort on our part to draw attention thereto: but in view of the transitory nature of business in general in California, and the probability that some may have looked upon our establishment of an extensive and permanent manufacture of Plows here, in the face of such enormous importations and extravagant prices of material, as an impossibility—we believe it expedient to adopt this method of bringing it within the special notice of all concerned, that we are now manufacturing, and will have ready for this season's demand, three thousand of the most superior Plows ever made or used within this State.

We feel warranted in making this assertion, from the fact that all who used our Plows last season testify that they were superior: and we have studied so closely the immediate wants of our patrons from every section of the State, that we can now furnish Plows suitable to any particular kind of soil known in the State.

Our material has all been selected in the East by one of our firm, and imported by us directly from the manufacturers, which places it in our power to say confidently that nothing is lacking in quality, while we are enabled to make the plows at a cost greatly below that of last season, and are determined to sell at prices within the reach of every farmer who may wish to use the Peoria Premium Steel Plow.

It should be remembered that these plows will do double the work with half the team required in using the ordinary cast Plow; and that the work, when done, will be well done.

For particulars of prices, and descriptions of plows, we refer you to the subjoined card. The prices thereto detailed are those established at our factory, and the only alterations from them that we authorize our agents to make, is the addition of the cost of transportation to their places of business—thus placing the plows at every accessible point of the State for the exact price charged at the Factory, with the necessary expenses only added.

Farmers ordering our plows through mercantile houses here, would do well to write to us at the same time, if they would make sure of getting the right plow, for some are interested in representing that we are not making plows at all, while others will not sell our plows when they can get off a cast plow. We therefore recommend that orders should be sent to us directly, accompanied by an order upon your merchant for the amount, which you can always know by a reference to the card accompanying this circular.

On the 24th of June the interest of T. ADAMS in our business ceased, by the sale of his entire interest thereto to L. E. MORGAN. Aside from this, there has not, nor will there be, any alteration, as we have the same efficient and thoroughly practised hands in every department of our business.

E. L. MORGAN & CO., Successors to
T. ADAMS & CO.,
Corner of Broadway and Battery streets.

☞ The following are the established prices for the **Peoria Premium Steel Plows**, at our Factory, and the only addition our Agents are authorized to make thereto, is the cost of transportation to their points of business:

SIZE.	DESCRIPTION.	FURROW.	PRICE.
No. 5	plain	10 in	$ 30
5½	"	12 in	$ 35
6	"	14 in	$ 40
7	"	16 in	$ 50
6	clipper or prairie	14 in	$ 60
16	" "	16 in	$ 70
18	" "	18 in	$ 85
20	" "	20 in	$100
22	" "	22 in	$110
24	" "	24 in	$125
26	" "	26 in	$150
30	" "	30 in	$175
40	" "	40 in	$225
Subsoil Plows			$40
Cultivators			$25

[For the addition of wheel and axle to any of the above clipper Plows, an additional charge of $30.]

L. E. MORGAN & CO., Successors to
1 T. ADAMS & CO.

GEMS FOR THE PARLOR AND GEMS FOR THE GARDEN.

THE choicest Hyacinths, Tulips, Jonquils, etc., for the parlor and garden.
Also—New and rare Flower Seeds and Plants;
Small ornamental Plants for borders.
Osage Orange Plants, for GARDEN HEDGES, one of the safest and most ornamental hedges known.
Just received at WARREN & SON'S
1 Exhibition Hall.

WASHINGTON STEAM MILLS.

WASHINGTON FLOUR MILLS.

THE undersigned proprietor of the Washington Flouring Mills take pleasure in offering to families and the trade, Superior Family Flour. To our Mills, we are happy to say to our friends, was awarded the Silver Medal; and we shall be always striving to maintain for it a high reputation, so that our customers can send to us in confidence, believing they will receive the highest character of Flour the market affords.

In the same establishment we have extensive STEAM SAW MILLS, capable of performing every kind of work that may be desired, and to this branch of our business we invite the attention of the public. We have also STEAM PLANING MILLS, that will finish all kinds of work in the most workmanlike manner, and equal to anything performed in the country, and in the most prompt manner to order.

We invite all who are contracting work, to call on us and examine our Mills, and we can satisfy them of our ability to supply every order in each branch of our extensive establishment.

D. W. VANCOURT, Proprietor.
1 Near the Oriental.

POLLEY & CO.,

OF THE BAY STATE MILLS, would announce that for the better accommodation of their numerous customers and trade in general, that they have opened a branch of their business at the **Fire Proof Store, No. 49 K street**, between Second and Third, where they will always keep on hand a large stock of California FLOUR; also, Haxall and Gallego.

Public attention is particularly directed to the "BAY STATE LOWER MILLS' BRAND," an article we have every confidence in warranting, being made under our own inspection, from new Wheat, without any adulteration.

Ground feed of all kinds always on hand.

Every exertion will be used to merit a continuance of the favor heretofore so liberally extended to us. 1-3t

CRESCENT CITY HOTEL,

And General Stage Office for all parts,

J street, between Third and Fourth,

The proprietress feels grateful for the increased patronage extended to THIS LONG ESTABLISHED HOUSE.

The Location is well known as the most central in the city.

The Table, which is under the management of one of the best caterers in the country, is served in a manner unsurpassed.

The Sleeping Apartments are well ventilated, and supplied with clean beds and linen.

STAGES for all the interior towns leave every morning.
1-4t MRS. JANE COFFIN.

SACRAMENTO CITY BANK.

JOHN M. RHOADES, Banker.

Fire-proof Building, corner of K and Second streets,
SACRAMENTO CITY.

Will sell BILLS OF EXCHANGE on NEW YORK, on the STATE BANK OF OHIO, and on other points in the Atlantic States; will receive money and other valuables on general or special deposit, make collections, buy and sell specie, bullion, public stocks, &c. &c.

GOLD DUST purchased at the highest rates.
DRAFTS at par on San Francisco.
COLLECTIONS made on reasonable terms.
Gold Dust shipped to New York or the Mint at Philadelphia for coinage.
DEPOSITS received, either special or otherwise; and all business connected with banking promptly attended to. 1-tf

10,000 FRUIT TREES,

Grape Vines, Fig Trees, Raspberry and Current.

WE invite all who intend planting Trees and Vines to call on us before they make their purchases, as we can offer them many advantages that cannot be found elsewhere. Our collections, we know, are the most extensive, and the quality the best that can be had. We therefore invite all to call on us: we can show them, in our Exhibition Rooms, the samples of the actual fruit they produce. WARREN & SON,

Nurserymen and Seedsmen,
Musical Hall Buildings, San Francisco,
and 15 J street, Sacramento.

THEODORE PAYNE & CO.,

REAL ESTATE AND STOCK AUCTIONEERS.

THEODORE PAYNE. SQUIRE P. DEWEY.

OFFICE AND SALES-ROOM CORNER CALIFORNIA AND MONTGOMERY STREETS.

THEODORE PAYNE ..... AUCTIONEER.

☞ Messrs. PAYNE & CO. respectfully inform the public that they have established themselves as above, for the purpose of transacting the

Real Estate business, in all its branches,

For the conducting of which they esteem themselves peculiarly qualified, by having given it their special attention for over two years past, and made themselves familiar with all questions affecting titles, &c. &c.

They will give their especial attention to the public sales of estate, by Administrators, Assignees, Receivers, Mortgagees, &c., carefully complying with the forms of law.

A Register for Property, at either public or private sale, always open at their office.

WARREN & SON'S HORTICULTURAL MUSEUM AND HALL OF SCIENCE.

THE subscribers take pleasure in announcing to their friends and patrons that they open their Hall as a Museum of Horticulture and Natural Sciences. Having now completed our arrangements in Europe and in this country, we are enabled to offer to the patrons of this establishment (the first of the kind in California) everything desirable connected with the science of **Agriculture, Horticulture, and Floriculture.**

Connected with this establishment will be Nurseries, Gardens, Fruit Orchards, Graperies, and Greenhouses of the Proprietors; and therefore the patrons can be assured that it is much better for them to send their orders to first hands than to those who collect here and there, at auction and elsewhere, where there can be no certainty of the genuineness of what they buy.

The Nurseries will be extensive, containing several hundred thousand trees grown under the eye of the proprietors. The Fruit Garden will contain the choicest Fruits known in Europe and America.

The Museum will contain specimens of Fruit in Wax, rare and curious specimens of everything else in nature, both in wax and in a dried state; Oil Paintings, Drawings and Paintings of Fruits, Flowers, &c., together with specimens in Natural History, Books on Agriculture, Horticulture and Botany; Garden implements of all descriptions and of the most approved patterns.

SEEDS.—A large and superior assortment of Garden and Flower Seeds, comprising all the new and rare varieties. Field and Grass Seeds of warranted quality, wholesale and retail. The Seeds sold at this establishment will be warranted pure and genuine, true to their name and preserved in a proper manner. Dealers will receive a liberal discount.

Boxes of Seeds for exportation at $5 and upwards, so packed that they may be safely transported to any part of the world.

Packages of Flower Seeds, containing twenty varieties of Annuals, Biennials and Perennials, neatly packed in boxes, from $3 to $20.

☞ Separate Catalogues of Fruit and Forest Trees; Vines, Shrubs, Evergreens, Bulbs, Roses and Greenhouse Plants; Garden and Agricultural Seeds, may be had on application.

WARREN & SON,
NURSERYMEN, SEEDSMEN AND FLORISTS,
1-tf Musical Hall Building, Bush st, San Francisco.

SPECIMENS OF AGRICULTURE.

WE desire to call the attention of the Cultivators of the Soil, to the importance of Exhibiting such specimens as they may grow of every variety of GRAIN, GRASS, FRUIT and VEGETABLE—we mean all fine or extra specimens.

They will observe that "Our Hall" is now opened Free—and we shall make it a point to call public attention to every specimen and give all publicity to them that they merit.

In the Hall farmers will find all the most valuable Agricultural and Scientific Papers and Periodicals, and they are ever ready for their use and open to those who feel an interest in them and especially to the *Press* and to scientific men and Societies. It will be our aim to furnish a place where all could spend a leisure hour profitably, and they can do so *Free*.

1 WARREN & SON.

PROCLAMATION EXTRAORDINARY.

Woman's Rights VINDICATED AND MAINTAINED.

WHEREAS, from the creation of the world, it was designed by the "Great First Cause" that

Womans's Rights and Privileges

should be co-equal to Man's; and whereas, she has been treated by many men in all ages, up to the present time, as an inferior being to themselves: Now, therefore, be it known that I, M. L. WINN, of

Winn's Fountain Head and Branch,

having expended large sums of money at the FOUNTAIN HEAD for the gratification of the appetites of Gentlemen, do recommend that Woman be hereafter allowed and provided with the facilities to enjoy all the privileges for which she was by Providence designed; and for this purpose I do hereby proclaim, that my

BRANCH,

Corner Montgomery and Washington streets,

shall be conducted with a view exclusively to the **Enjoyment and Comfort of Ladies**, and such Gentlemen as know and appreciate their worth.

At the earnest solicitation of many Ladies and Gentlemen, and agreeable to my promise some months since to enlarge the BRANCH, so as to accommodate the fast increasing patronage, I shall, in a few days, add Two Spacious Stores on Montgomery street, to the Original Branch, making the

MOST EXTENSIVE ICE CREAM

And Refreshment Establishments in California.

The day of opening will be duly announced through the medium of the Daily Press, so that all may witness what has been accomplished for the accommodation and comfort of "God's best gift to man." In the meantime, lots of Fun and Jollification may be enjoyed in reading the mottoes and feasting upon the luxuries to be enjoyed at

WINN'S FOUNTAIN HEAD,

78 and 80 Long Wharf, and Branch, corner Washington and Montgomery streets;

where Every Thing for the Holidays may be found, from Sugar Whistle to a Bride's Cake of half a ton.

1 M. L. WINN, Proprietor.

The Young Baron of Lieberach.

A great many years ago—some hundreds, for aught I know—there lived a proud and puissant baron, named Rudolph von Lieberach, in whom a great many of the virtues, and all the vices, of his race seemed combined. His life was passed in his castle, in a sort of semi-barbarous retirement, except when foreign wars called him abroad; and the sudden change from the bustle of the field then made him sombre and gloomy for many weeks at a time. In his youth he had spent much time abroad, and had for two years served in the armies of the Greek emperor, at Constantinople, in whose service he had won much honor, but little reward. While in the capital of the Eastern empire he had seen and loved the fair daughter of a certain Greek noble attached to the court, and when he proffered her his hand, her father and the emperor compelled her to accept it, because they feared to offend the rude Frank warrior, though she loved him not. But, alas, what a change for her!

About a mile from the city, a luxurious villa stood on the rising ground overlooking the Bosphorus. Spacious gardens stretched from the house to the shore, perfumed by the surrounding orange groves, and shaded by the citron and olive trees which overhang the calm water, as if longing to kiss it. A fountain played in the centre, and arbors, at every corner invited to ease and retirement, while the nightingale sang all day long in the branches overhead. The rarest plants and flowers of Europe and of Asia grew side by side, and in every sight and sound there were music and beauty. The interior of the house was in keeping with the garden. Gorgeous tapestry—couches radiant with gilding, and covered with the richest silks which Venetian enterprise brought from the mysterious East—busts of the ancient philosophers of Greece, and of the early martyrs of Christianity—piles of manuscripts richly illuminated, and written by cunning hands—small marble fountains to cool the hot winds from the desert—verandahs in which the inmates might sit at eventide to inhale the refreshing breezes from the water, and hear the barking of the dogs, the laughter of children, and the song of lovers from the farther shore,—met the eye on every side. Here the youth of Agatha Kale was passed. She was the only child of her father, and he was a widower. She had been carefully educated by an old priest, who had retained a large leaven of the ancient philosophy mingled with the doctrines of the Christian religion. Plato and Pythagoras had shared his attention with Paul and the early fathers. He had not fallen into any of the extravagancies or corruptions which time and foreign influence had mixed up in the bosom of the church. He had too much of the fine sentiment of the beautiful to let one gross thought pass between him and the objects of his love and adoration; but he had in him too much of the pride of philosophy to become a missionary or a martyr. He was a priest because it gave him opportunities of indulging his love of literary research, without coming in contact with any of the common cares and passions of life; but he had little of the ardor of devotion which reigned amongst the common people. He was in fact born out of his time, and spent many an hour in bitter regrets that it had not fallen to his lot to mingle in the solemn groups who a thousand years ago had sauntered in abstraction amidst the groves of the Academy. He undertook the task of Agatha's education with joy; it gave him an opportunity of moulding a human being after his own mental image—to reproduce his own thoughts and aspirations, and regrets in a mind to which everything was new. Teaching was not to him the wearisome drudgery which so many now regard it, but an art which Socrates had ennobled. Under his tuition Agatha grew up all he could wish her refined, speculative mind of reading, and prone to doubt, but holding to that she embraced with tenacity, and defending it with subtlety. She grew up a model of Greek beauty—that beauty which had lent inspiration to the chisel of Praxiteles and the pencil of Apelles, a thousand years before which Greece in its prime, and which then and ever since has been eventually reproduced as if it came to the soil, when "Young Greece" is there. The high arched head, the lofty forehead, the straight nose, the thin delicate lips, the energy in the lines of the mouth, the smouldering fire in the soft light of the dark eye, bridged over by brows black as ebony, the swan-like throat intersected by veins "like streams through fields of snow," the graceful, wavy outline of the figure, which had never known an hour of constraint, and the soft, white roundness of the arms, were all Greek. The priest Demetrius took care the intellect should be Greek too. Every evening, from the time when she reached her fifteenth year until her marriage, the old man tottered into the garden two or three hours before sunset; and, sitting in the arbour, with a volume of the Republic, or the Phædo open before them, they talked over the anticipated Christianity of Socrates, sweet-souled piety of Cimon, the patriotism of Epaminondas, and examined the fabrics of speculation which had in later years been built upon the Gospel, until the sun sank into the blue waves of the Ægean, and with his last rays turned the waters of the Hellespont into gold. During the last year they were together, their conversations assumed unconsciously a tone of sadness. Dire calamities were hanging over them. The Turks had come down from the mountains, fiery and fanatical, and threatened to beleaguer the imparial city, and extirpate the Christian faith. Strange rumors were abroad. The emperor held councils by night, and from these Agatha's father returned anxious and thoughtful. What if their dreams and happiness should end under the scimitar of the barbarian their faith in their own doctrines be rudely tested by torture and violence, and their names added to the long list of martyrs and confessors! From this time their conversations, as well as their thoughts, turned more upon themselves—upon the discipline of their own hearts—more upon their feelings and less upon opinions and doctrines. They were often sad and tearful, but oftener far, hopeful and courageous. The old priest had not lived so long a life, with great examples constantly before him, without being able to rise to the level of the heaviest misfortune or calamity; and the precepts availed so well, that at length, amidst the wars, rumors of wars, fears, and misgivings which agitated all hearts in the great city, the only spot where calmness reigned was the summer-house of the senator's garden.

Thus matters stood, when the sorrowful morning arrived on which she was arrayed in bridal dress, and stood before the altar to be united for life to the Latin knight. Demetrius married them. His snowy beard seemed to quiver on his chest and his voice faltered as he pronounced the church's blessing on their heads. His farewell was calm and solemn.

On that evening the bride and bridegroom were rowed on board the galley in the harbor, and Agatha, standing on the deck, saw the palaces and spires of Constantinople, and the vine-clad hills above it, slowly fade from her view for ever.

When the honeymoon was over, her life in her husband's castle became weary enough. He was not a man after her heart; their tastes were not congenial. The summer brought pleasant walks in the woods, and rambles along the banks of the neighboring stream, but neither summer nor winter brought back the sunny skies and loved friends amongst whom her youth had been passed. They had one son, born the second year after their marriage; and when he was but three years old his father died suddenly.

Time wore on. Agatha was becoming an old woman, and Hugo, her son, a young man. He had reached his nineteenth year; was skilled in the martial exercises of the Germans, and well taught in all the lore of the Greeks, generous to a fault, ardent in his love as in his hate fiery and proud. She died before he had attained his majority. When she was on her death-bed she called him to her side, and gave him a box, containing a small phial, informing him that it was the gift of a certain Jewish rabbi, whom she had once succored when pursued by a mob, and who on giving it, had told her that if the liquor contained were drunk by her or those nearest and dearest to her, when in their greatest earthly need or peril, a way of deliverance would be speedily pointed out to them. With a romantic trust in the marvelous which was quite in unison with the enthusiasm of her character, she had preserved it carefully, and never having been placed in such a position herself as in her opinion to call for its use she bequeathed it as a legacy to him she most loved, and to whose path most snares and dangers were likely to be. In some petty wars which followed he was driven from his ancestral homes and placed under the ban of the empire for making predatory incursions on the burghers of an adjacent town. For several days he found shelter in the cottage of a vassal, but at last finding it [illegible] and sallied forth to seek aid and refuge where he could the wise counsel even

After undergoing various toils and anxieties, and passing through sundry "hair-breadth escapes," he arrived in Paris, and for awhile, with characteristic thoughtlessness, abandoned himself to all the dissipations of that metropolis, which was then, as now, the gayest and most frivolous on earth. But his funds were soon exhausted. Those who at first smiled upon him, in deference to his birth and his romantic career, began to look on him coldly, or avoid him, and he was at last driven to cast about for some course of life that would afford him the means of subsistence. He was one evening musing mournfully in his lodgings upon his position and prospects, when he bethought himself of the phial, and coming to the conclusion that he could never be in greater straits than he was then, he drank of its contents. He instantly fell into a deep sleep—a sleep as deep as death—and saw a vision. He was walking, or dreamed he was walking, along a broad avenue bounded on each side by lawns of surpassing verdure. The gnarled oaks, green with the moss of a century, threw their broad branches across the path, and streaked it with shadow. A refreshing breeze sighed gently through the leaves, and played amongst his hair, and at a little distance a brook ran parallel with his course, and, though hidden from his view, murmured gently and musically in his ear. In the trees overhead birds of the rarest plumage sang in strains of more than earthly melody, without a single pause, and it seemed to his enraptured senses as if there was hope and courage in every note. A grateful perfume seemed to pervade the atmosphere. And far away in the long vista a bright lake appeared dancing in the sunshine, with waterfowl of snowy whiteness gliding gently and gracefully over its surface. He was enchanted. His blood coursed thickly through his veins; his heart throbbed with rapturous excitement. It seemed as if he could never grow tired of wandering here.

He walked on thus the greater part of the day, but to his astonishment he at last began to perceive that he was making no progress. The lake seemed still as far away as ever, the same trees grew by his side, the same brook murmured in his ear, and the same birds sang overhead. Little by little he found all those features of the scenery which had at first given him so much pleasure begin to pall upon his senses. The perfume seemed to sicken and enervate him; the voice of the birds sounded heavy and dull. He longed wearily for a mountain side with a clear prospect, a refreshing breeze, and where at least he would find the fruits of his labor in making some progress on his way, and meeting some change of scene. Pondering over the time he had lost, and the strange position in which he found himself he sat down upon a mossy stone by the wayside. Absorbed in reverie, a voice whispered in his ear clear as a trumpet, but he knew not from whence it came. The tone seemed to be his own but he had not opened his lips. In energetic accents but reproachfully, reprovingly, and persuadingly, it seemed to say:

"Thou art treading in a perilous path. Delights are on either side of thee, but danger and destruction are ever in front. Turn boldly to the right pass through the wood follow the road that leads up yon hill, and at the top thou shalt find rest and peace."

Rising in obedience to a sudden impulse, he pushed boldly forward in the direction which had been indicated to him. He soon found himself in the highway. Great numbers of men were travelling along the same road. Some were strong, vigorous and hardy—a flush of hope courage and ardor in their cheeks and their eyes ever looking upwards. Others seemed faint and weary, as if they were unused to the work, and to [illegible] feebly seemed ever prone to [illegible] and rest, and think no more of ascending. And [illegible] at every step were the prostrate forms of those who had fainted and perished with the sight of expectation of their hope and ready vigor to every man. Some appeared to have sunk [illegible] after a long struggle and had left only [illegible] in the dust; and [illegible] the owl of the [illegible] and [illegible] and [illegible] of [illegible]. Agricultural Lectures.

We know our readers will be gratified and interested in the publication of the several lectures which have been delivered in Musical Hall, under the auspices of the Agricultural Exhibition, to aid in the developement of the resources of our country. The lectures were kindly and generously volunteered by the gentlemen, the hall was open free to all, and the attendance was most gratifying on each occasion. We know great good has resulted from them, and a wider and deeper interest has been infused throughout the community by them.

These able lectures will be presented in the ourse in which they were delivered, and under the corrections of those who delivered them. They should be read by every cultivator of the State, and every friend of its best interests.

FIRST PUBLIC LECTURE,

BY DR. HENRY GIBBONS,

Delivered at Musical Hall, Oct. 13, 1853.

It is a blessed age in which we live. The chief labor of man is not, as of old, to sunder and destroy; but rather to build, and unite and bind together. Nation to nation is linked by golden ties, stronger to their shame, be it said, than the ties of Christianity: but let us hope not to remain so forever. State to State, city to city, are chained by bands of iron on the earth, and magic wires above. That oceans separate continents—as the school book used to teach—is no longer true. The interests of the human family are becoming one and universal—union is the watchword! Some who have learned but the first lesson, restrict their views to party or section; others can embrace half a continent in their prayers and labors; while others, treading in the footsteps of the glorious missionary of Bethlehem, and limiting *their* vision by no horizon, acknowledge the universal brotherhood, and aim to gather into their union the entire heritage of God.

Science and art have joined hands and become helpmates. Not a department of human pursuit, intellectual or mechanical, but receives rich benefits from other departments: all are linked together in a system of harmonious co-operation and mutual dependance. The hand helps the head and the head the hand. That any one branch of art or knowledge should stand or progress alone, is impossible. It must give aid to others and receive aid from them in return. It is the tendeucy of the age to establish a union of arts and sciences, as well as a union of nations.

It is late in the day to ask the question, "what have the population of a city to do with agriculture? What has the merchant to do with the construction of a plough? What the physician with the culture of wheat? the lawyer with potatoes? the reverend divine with oxen?" It is late in the day for the farmer to enquire what his occupation has to do with books; what relation the tillage of the earth has to chemistry, or to mineralogy, or to geology. It is late in the day to attempt to cover up ignorance of everything outside of the counting house, the shop or the stable, by the stale cant of minding one's own business. The fact is, people who mind their own business are the most useless animals in the world, ignorant, selfish, heartless, soulless. If all men and women could be compelled to mind their own business, or in other words to keep within their own "appropriate sphere," there would be an end of progress; the world would come to a stand still, and the glories of our progressive age would be tarnished and effaced. When, in the history of the world, was there ever a race so determined to attend to other peoples' business, as well as their own; so obstinately resolved to be cramped up in no particular sphere, as the race that inhabits the land of Washington and of Franklin? What barriers do they acknowledge in morals or in geography? what scheme of reform is beyond their efforts? what portion of the earth's surface beyond their ambition? To use a term as expressive as it is inelegant, they are a generation of *squatters;* some under the banner of moral reform, squatting on every moral field, and contending for what they deem right, and truth, and justice, regardless of consequences. Others, under the stars and stripes, and with "manifest destiny" for their watchword squatting on every spot of soil, the occupants of which are too feeble or too lazy to defend it.

Declaim as we please against extravagance, and ultraism, and fanaticism, the truth is ultraists and fanatics are the very salt of the earth. They stir up the moral and political elements and purify the atmosphere. An old farmer once said to me at the close of a lecture on a moral theme, that he at first thought the lecturer went too far; but on second thought had changed his mind. "Because," he added, "in driving my team up a hill, it is necessary to drive the lead horses beyond the top, or the wagon don't reach it. So, if some of your lead horses, don't go beyond the right point, or the passengers who wait to be carried will never get there." The simile is a sound one. It is true in morals and politics. We give ourselves needless alarm at what we deem bold and extravagant doctrines. Even these have their use, and those who preach them may not break their necks. The matron of the poultry yard, who has hatched a brood of ducklings, supposing them to be her own legitimate offspring, is terribly frightened to see them rush into the water pond. She is a true conservative, a genuine old fogy, in agonies at the daring of radicalism.

The attempt to circumscribe the range of human thought and action by appropriate spheres will ever prove futile. Many of those who would thus impose restrictions, themselves desire a wider range in another direction; while those again who make the most noise on the subject neither attend properly to their own nor to any other sphere. It is common to advise women who are found abroad talking about their rights, to go home and darn their husband's stockings. I am not certain but that the stockings of such husbands are mostly better darned than those of their censorious advisers.

An eminent physician once made the remark to me, that he expected a change of weather when the moon should change. On asking his reason for the opinion, he had no argument to give, but simply took it for granted because such was the general impression—adding that he left all such questions to astronomers and others, and never bothered his head about subjects foreign to his profession. Now it happened that this gentleman did bother his head about sundry things foreign to his profession. He was a good "whip," and drove a pair of splendid horses. Half the time he had devoted to his stable would have revealed to him all the known secrets of meteorology. He also bothered his head very materially with wine and could expatiate eloquently on the flavor of Santerne and Heidsick. Half the time spent over the wine cup would have given him an insight into the sublime mysteries of astronomy, with much less "botheration" to his head.

Such remarks however, though intended to impress the hearer with the exclusive devotion of the individual to his calling are in reality but ingenious apologies for ignorance on subjects really connected with his profession. The influence of the Moon on disease, is truly an interesting theme, and cannot be investigated without reference to its reputed influence on the weather.

I knew a young lady who exhibited in her person the very perfection of the system of minding one's own business. She had spent all her life at school; could talk French and Spanish, and almost Latin; could pass her fingers over the keys of the piano with invisible celerity; could waltz irresistibly—in short, could do everything required by a fashionable education and nothing more. Having observed the frequent and by no means disagreeable association of lamb and peas on the dinner table, this most accomplished young lady inquired with infinite simplicity, what part of the lamb peas were taken from? Poor girl! she had wandered for once beyond her appropriate sphere.

In all departments of human pursuit, people who coop themselves up in the limited sphere of their calling, are fools out of that sphere and never folly wise in it. How is it possible that men should dwell on this noble planet of ours surrounded with all its beauties and glories and mysteries—and fill up the measure of life on such a stage with eyes turned away from surrounding objects and thoughts cramped into one narrow channel—how is it possible that they should do this without stunting their growth and falling short of the stature of manhood? Did God make man in his own image that he should shut out the effulgent light of heaven from his soul, till his eyes, like those of the moping owl, fit him only to prowl about the hen-roosts of traffic for a livelihood? "*Auri sacra fames!*"—inordinate and accursed thirst for gold! How has it debased the human character, thwarted human destiny, dragged down man from heaven, enslaved and brutalized the immortal mind!

Exhibitions like that now on the carpet are admirably adapted to impress a people with the identity of their varied interests, and to turn the tide of gifts aside from narrow and selfish channels. Especially is this the bearing of the series of lectures devised by the enterprising and enthusiastic proprietor. There is great need in California of all such appliances. Whatever diverts attention from the sensuous to the intellectual—whatever exhumes the mind for an hour from the mountain heap of day books, ledgers, and invoices, beneath which it is entombed—is a great public good, and its author is most undoubtedly a public benefactor.

The modesty of the American people has never deterred them from enjoying and expressing a high opinion of themselves and their country. In leaving their former homes, the immigrants to California brought with them an ample supply of the spirit of boasting. If I should say that the most adventurous, enterprising, and intelligent race of men under heaven, have commissioned the most adventurous, enterprising and intelligent of their number to colonize this western empire, and develope its unbounded resources, my audience will perceive nothing new or incredible in the declaration. There is, in the recent settlers of this land, a degree of intellectual and moral power not to be found in the same amount of population elsewhere on God's footstool.

But to what uses has this young Hercules applied his strength? What have the people of California done with the ten talents committed to their care? Alas! have they not buried them in the earth! Are not the mass at this moment grovelling spiritually as they are physically in the soil? How many lift their thoughts above the dust? How many wash their hands of toil to turn the pages of the Book of Knowledge? The theme is not likely to be popular. Men are not fond of being told their faults. Gratuitous counsel particularly is unpalatable. But the physician who would cure disease must first detect and expose it. As a member of this community, my destiny and that of those dearest to me on earth, interwoven with its interests, I offer no apology for plainness of speech on this subject. On the contrary, silence and concealment would require an apology.

Who, in California, reads a useful book? What proportion of our population rise above the desultory columns of the daily press, or the trashy works of fiction which infest the land, creeping like the lice of Egypt, even into the dough troughs; or at best the "Monthlies," which contain as much substantial nutriment for the mind as whipt syllabub for the body.

In the infant state of society, a few years ago, there was some excuse for such habits. The opportunities of improvement were wanting. The ameliorating influences of female society were wanting. The blessed atmosphere of home, the sterling enjoyments of domestic life were wanting. There was no place of rest for the weary spirit—no house of refuge for the troubled soul. No wonder then that men looked downward rather than upward. No wonder then that the few moments spared from the greedy pursuit of gain were spent in amusement and dissipation. No wonder that men of intellect and vigor should acquire habits of mental inertia, and bury their souls in a living tomb.

But that day has gone by. Our wives and our children are here, and we have the luxtures of home around us. Is it not time for us to change our habits—time that our substantial and influential men, parents especially, should find some other employment for their hours of leisure than the theatre and the billiard-room—not to mention worse places?—time that they should add to their stores of knowledge and to their vigor of intellect, instead of forgetting what they once learned, and suffering their energies to perish by neglect?—time that they should present a different example to their offspring, and surround the rising generation with better influences?

Early in the present year, a number of citizens, impressed with the necessity of making some provision for the intellectual and moral improvement of our young men, established the Mercantile Library Association. It was ushered into active existence under flattering auspices, and has been sustained thus far with much diffiienty, owing to the utter indifference of the great mass of our population. Even the small pittance required to keep open a commodious reading room with an excellent and rapidly increasing library, is paid grudgingly by many. The rooms of this institution form a comfortable and quiet home, well supplied with books and newspapers—the only establishment of the kind in California. Here you will find, in the evenings a few individuals availing themselves of its benefits—sometimes as many as half a score, out of a population of 49,000 souls. Where are the merchants, the tradesmen, the professional and business men of San Francisco to be found? They are in the play-house, in the billiard and bowling saloons, in the groggeries. Alas, for the tastes of our people! "Where the carrion is, there will the eagles be gathered together.

We have another institution, recently formed, and now struggling for existence—the California Academy of Natural Sciences, of which our enterprising and industrious citizens know less than they do of the literary institutions of Japan. I regard the Societies that I have named as of higher importance to the vital interests of this community than the great Pacific Railroad, or any other scheme of a mercantile and financial character. They are schools for the young—to feed the mind and strengthen the intellect—to make of our children men and women, who will do honor to the name of California; to divert from base and sensual pursuits to the exalted and ennobling culture of the rational faculties. It is the duty of every lover of his country, every friend of man, to give not only his good wishes but a hearty and practical aid and comfort to all such associations.

The reputation of our city and the State, the moral welfare of the population, the interests of the rising generation demand that such institutions should receive the good wishes and the practical aid of every citizen. The great object now is to divert men from sordid and sensual pursuits, and to induce them to look around with observing eyes, and to think. A habit of observation and reflection leads to perpetual enjoyment and to elevation of character. Exhibitions of the products of the farm, the garden, and the orchard, such as will be found in the adjoining Hall, tend to these results; especially the plan of public lectures associated with the Exhibition by the proprietors. But I will turn abruptly from this sermonizing, which, unfortunately, is not heard by those who most need it, and take up the remainder of my time with reference to some of the prominent features of the exhibition.

On entering the Hall you are struck with the tasteful decorations and paintings on the walls, and the profuse display of flowering plants, many of which are rare and beautiful. Prominent on the tables are enormous squashes, the largest weighing 121 pounds; onions that might bring tears of delight to the eye of a native of Wethersfield, weighing four pounds, and measuring from 20 to 23 inches in circumference; beets, 36, 40, and even 51 pounds—several of the long variety, some of which measure two feet eight inches, to which another foot may be added for the missing extremity, which appears to have been pulled through by the antipodes; sweet potatoes from San Jose, a foot and upwards in length; carrots, 5, 8, and 10 pounds in weight, and turnips and cabbages raised to order, of any size called for. The most striking feature of the Vegetable Department is the potato, specimens of which, weighing four pounds and measuring a foot or more in length, have been sent from all directions—San Jose, Santa Cruz, Alameda, Oakland, etc. Three years ago, when I landed here, it was a question whether California would ever produce a good crop of potatoes; now the soil is full of them, and thousands of bushels will rot in the earth, not worth the digging; even in Contra Costa almost at the door of this great market, the farmer will give half his crop to the laborer who gathers it. The productiveness is almost incredible. Twelve bushels are exhibited, weight 700 pounds; the product of three potatoes, grown at San Jose. It is a remarkable fact, that these large potatoes are always perfectly sound, and of excellent quality. I have heard of only two or three hollow potatoes in California. It is also remarkable that this vegetable requires no cultivation. Only plant the seed, without manure, and the work is done. Not a hoe or a plough enters the field till the crop is gathered. Weeds do not interfere, because the dry weather, which is really a blessing in this respect, prevents the germination of the seeds on the surface. There have been instances of the native farmers ploughing up their entire crop and replanting, because of rains falling after the first planting, and starting the weeds. It was cheaper to replant than to till.

In the vicinity of Santa Cruz and elsewhere, the potato has been attacked by a coleopterous insect, which burrows in the eyes and perforates the tuber in all directions. The Academy of Natural Science of this city have anticipated the exigencies of the farmer in regard to the ominous pest, by making it the subject of investigation, with a view to a remedy. The ends of the potato which project from the ground are first affected; and it is quite probable that if the plants were hilled, in the Atlantic fashion, the roots would be protected from the evil. I am not aware that the potato rot has made its appearance on this coast.

Ten or twelve varieties of wheat are exhibited, the growth of California and Oregon, some of which have produced sixty to seventy bushels an acre; weight 62 to 65 lbs. per bushel. The productiveness of barley is extraordinary. A specimen is exhibited from a crop of one hundred and forty-nine bushels to the acre—the evidence being above dispute. Stalks of Indian corn fourteen feet high, ten feet to the ears, from San Jose; ears from a crop of one hundred bushels to the acre; luxuriant specimens also from Alameda, directly across the Bay. Whether this crop can be made a profitable crop in California, remains to be proved. The cool nights which characterize the climate of the entire country, are unfavorable to its maturation.

Oats are exhibited 9 feet 4 inches high, and one specimen 10 feet 7 inches. Stalks of this grain were shown by the ardent and ill-fated Shelton, at his exhibition two years ago, 13 feet in height.

The specimens of flour are very interesting, both for quality and the beauty of the packages, showing perfection in this important branch of manufacture, which sprang up but yesterday. Specimens are shown manufactured in various quarters of the State, equal in whiteness and quality to the celebrated brands of Gallego and Haxall, as I know from actual trial.

Among the fruits are an abundance of grapes in superb clusters, a common weight of which is 5 to 6 pounds; delicious pears, many of which exceed one pound, a cluster of four on a stem weighing 7 pounds from that garden spot, San Jose; Pound or Bell pears, the largest weighing two pounds; Washington pears from Los Angeles, of uncommon size and beauty; apples from Oregon and California, one of which is 12 inches in circumference; three apples from a single graft a year old, from San Jose; Pearmains and Seek-no-further, from Capt. Morgan's, the trees planted last year, and growing directly on the coast, a few miles north of the Heads, in a sunny nook, backed by high hills to the leeward. This locality produces a spontaneous growth of the superb "Humboldt Raspberry," the fruit of which is three inches in circumference. It is highly worthy of cultivation, though in its native localities it is not a full bearer, and the berry is rather acid and destitute of the rich flavor of the Antwerp and other cultivated species. The plant grows abundantly in rich and moist situations on the coast to the northware.

There are exhibited some luxuriant specimens of a noxious weed called Tobacco, raised in Sacramento Valley, by a gentleman who is about to engage in its cultivation. The only decent use of this plant is to kill vermin, though men with perverted appetites often cram it into their mouth and nose. You will observe also a quantity of mustard seed, weighing five and a half ounces, the product of two plants, each plant producing, by careful computation, an increase of one hundred and five thousand. With the exception of tobacco, the mustard causes more annoyance than any other weed in California. It grows in complete forests, so high as to overtop one's head when riding on a horse. It frequently takes possession of a field and ruins the crop, the stem growing six inches in circumference and effectually defying the scythe or sickle. The seeds remain in the soil and continue to germinate for many years.

Of embroidery and needle-work, there are specimens not to be surpassed in richness and elegance. The wax fruit and shell work also possess extraordinary merit. But I cannot pretend to enumerate even the most prominent articles of the Exhibition. To appreciate them you must use your own eyes. I must not, however, conclude without calling your attention to the collections of Algæ, or sea-weeds, prepared by Mrs. Williams and Mrs. Boston, of Monterey. It is only within a few years that productions of this class have been closely studied by naturalists. The specimens are arranged with exceeding taste, and you will be surprised to observe from thtse collections what an elegant and diversified flora "the dark, unfathomed caves of ocean bear." They are to be found on the sea shores at low tide, and

they possess a beauty and variety of color, and a delicacy of structure which might well compensate a collector, even without regard to their scientific relations. We need a sprinkling through the State of such ladies as Mrs. Boston and Mrs. Williams, to revolutionize society and to give an intellectual and scientific complexion to our population. What a blessing it would be to California if but *a few* of our young ladies would read the Book of Nature instead of the Book of Fashion—would substitute botany for bracelets and jewelry—would cultivate their brains as much as their curls!

For the California Farmer.

"How is business?" This is the question asked and answered a thousand times every day, among our merchants and business men, and the invariable reply is—"dull! dull! dull!" and so we suppose it is; but what is to be done to bring about a different state of things? Shall we give up in despair, place our hands in our pockets and do nothing; or shall we rather meet the cresis manfully, hoping that as the approach of day is immediately preceded by the most intense darkness of the night, so the glimmerings of the dawn upon our mercantile horizon may soon be expected to appear.

We will briefly enquire into the causes which have brought about this unpleasant position of affairs, and if we can discover that cause, our next inquiry should be for the means of accomplishing the desired relief, and if it is found that errors in judgment or in action have not been the great mainspring of all the stringency which has been felt during the present season, then we may look to Providence for the cause, and trust alone to a kind all-seeing and omnipotent power to avert the ruin with which we are threatened.

Let us look back for a moment at the earlier stages of California trade. There was a time, and that not many years since, when the possession of property of any description, in ever so small a quantity, placed the owner in a position of indisputable independence, when the wish to sell was father to the act of selling, and the dust, the shining glittering dust came down in clouds to fill the hands of him who had, while at the same time he who had not, was never refused a liberal discount at the "bank of earth." Those were the golden days of business; every man was ready to buy, and the only impediment in the way was the lack of goods to be sold.

Gradually this state of things has passed away, the balances of trade have approached an equilibrium, till at the present time we have as much difficulty in selling as we formerly had in buying, with this difference, that whereas before, we were unable to find the merchandise, now the markets are glutted with every kind, and the difficulty is to find the buyer, and soon we shall be on an equality in this respect with the cities of the Eastern States.

One great instrument in bringing about the super-abundance of merchandise in this market has been the introduction of the vast numbers of large clipper ships, which have been built for this trade alone. These floating storehouses carrying from sixteen to twenty-six, and even thirty-six hundred tons of freight, have for the last two years been pouring upon us their enormous cargoes, at a rate entirely disproportionate to the wants or demands of our community, affording as they do, a ready means for the speculators and adventurers, who, each one hoping to outstrip the other and bring his goods first to market, have shipped, without reflection or judgment, to the great manifest injury of the legitimate merchant.

Another and most important cause of "hard times," has been found in "the iniquitous practices of parties at home, who have been in the habit of duplicating *on their own account*, in quick ships, the orders of the California correspondents, to whom they ship the same in much slower vessels, thus enabling themselves to profit by the demand for the articles shipped, and supplying that demand previous to the arrival of the original invoice, which on arrival finds a market fully stocked, and is sold at ruinous rates, or stored at great expense by the merchant, who should have enjoyed the advantage of his shrewdness and foresight in ordering the article at the proper time.

The dryness of our winter is preventing the miners from sending us the gold from the mines, and large exportations of coin have been made, thus reducing the circulating medium in the State. These, with other causes of a local or accidental nature, have for some time past been operating to produce a tightness in the money market and consequent dullness of trade. But let us not despair; we have seen more calamitous times than the present, and have out-lived them, and can do so again, and California will yet shine forth in glory an example to the world of human energy and indomitable endurance.

"Do nothing desperate, the darkest day—
Live till to-morrow—will have passed away."

* * *

The Grass Valley Telegraph says: "There will be seen within a radius of ten miles of Grass Valley, several thousand acres of cereal grains this fall and winter, a large proportion of which will be wheat—the first effort of the cultivation of that grain in this portion of the mountains, so far as we know."

The case of Silvester vs. Patterson, which attracted so much attention, some months ago, was finally submitted to H. Clay Monk, Esq., as arbitrator, who awarded the plaintiff damages to the amount of $1,000, and saved the defendant Capt. Patterson, with the costs, amounting to near $2,000.

California Legislature.

We publish the Legislative Committees in order to furnish data to those who may desire to know the several Committees should questions of interest arise requiring that knowledge; also the other proceedings of importance.

On Tuesday, Jan. 3, the Senate was duly organized by the choice of the following officers:

Secretary—John V. Lind, of Calaveras.
Ass't Sec'y—John H. Stewart, of El Dorado.
Sergeant-at-Arms—W. H. Harney, of Tulare.
Doorkeeper—E. C. Dowdigan, of Tuolumne.
Engrossing Clerk—J. C. Tucker, of Sacramento.
Enrolling Clark—Henry St. Clair, of Placer.

On motion, the Rev. Mr. Woodbridge was requested to officiate as Chaplain during the session.

On Wednesday, Jan. 4, in the Senate, a communication was received from the Lieut. Governor, appointing the following Porters and Pages, which were confirmed:

Pages—Jacob Henline, and Owen Mitchell.
Porters—Robt. Mastre, Christopher Hanleman, and Havid Hoge.

The Annual Message of the Governor was received, and 4000 copies ordered printed in English, and 500 in the Spanish language.

On Thursday, Jan. 5, the following standing committees were appointed:

Claims.—Walkup, Catlin, Lent.
Finance.—Sprague, Keene, Hager, Crenshaw.
Judiciary.—Hager, Sprague, Hall, Crabb, Smith, Coffroth, Bryan and Whiting.
Elections.—Stebbins, Mahony, Crabb.
Public Lands.—Keene, Hager, Coffroth, McGarry, Kurtz.
Commerce and Navigation.—Lent, Stebbins, Catlin, Moore and McFarland.
Public Expenditures.—Lyons, Hook, Sawyer, Mahoney and McGarry.
Federal Relations.—Coffroth, Tuttle and Bryan.
State Hospitals.—Kendall, Keene, Mahony, Hudspeth and Peck.
Mines and Mining Interests.—Gardiner, Walkup, Lyons, Coffroth, Hook, Peck and Livermore.
Indian Affairs.—Bryan, De la Guerre, McGarry, Wade and Hall.
State Prison and Public Buildings.—Whiting, Kendall, Walkup, Crabb and Moore.
Education.—McFarland, De la Guerre and Bryan.
State Library.—May, Lent and Sawyer.
Counties and County Boundaries.—Leake, Livermore and Gardner.
Corporations.—Crenshaw, Hager, May, Wade and Bryan.
Agriculture, Missions and Mission Lands.—De la Guerre, Grewell, Kurtz, Whiting and Kendall.
Public Printing.—Moore, Crenshaw and Walkup.
Roads and Highways.—Colby, Smith and Stebbins.
Contingent Expenses.—Hudspeth, Colby and Tuttle.
Military Affairs.—Hall, Whiting, Wade and Mahony.
Engrossed Bills.—Tuttle, Lyons, Sawyer, Lent, Kendall and Leake.
Enrolled Bills.—Smith, Sprague, Crenshaw, Moore, May and Peck.
Vice and Immorality.—Hook, Colby, Grewell, Kurtz and Lyons.
Mileage.—Livermore Wade and Sawyer.

A message was received from the Governor on Friday, nominating Chas. H. Hempstead as his private Secretary, and J. W. Denver, Secretary of State; both nominations were confirmed without opposition.

The Assembly, on Wednesday, Jan. 4, elected Chas. S. Fairfax as Speaker, and also the following officers: B. McAlpin, Chief Clerk; J. W. Scoby, Ass't Clerk; John Kimball, Engrossing Clerk; E. A. Kelly, Enrolling Clerk; Geo. Blake, Sergeant-at-Arms; John Warrington, Doorkeeper. Nothing of particular importance was done, for the remainder of the week.

California Pioneers.

This Society held their regular semi-annual meeting in the Superior Court room, on Saturday evening last. The meeting was very fully attended. After the reading of the minutes of the last meeting, the President, S. Brannan, Esq. addressed the Society as follows:

Gentlemen—Upon this, the fifth semi-annual meeting of our Association, I deem it not inappropriate to submit a few remarks upon its present condition and future prospects.

It will be remembered that we were organized in August, 1850, three years and a half since, our numbers then being only 165, but increasing gradually until it has reached 962 members.

The receipts into our treasury during the past semi-annual year amount to $2,[illegible] of which has been disbursed for various purposes, leaving with the Society on hand $211; thus leaving a balance of $1,[illegible] in the hands of the Treasurer unappropriated.

It will be seen from this statement that the financial condition of the Society is unembarrassed, and will be the earnest efforts of those having charge of its finances to [illegible] it: for it is a well ascertained fact that neither States, Associations nor individuals can flourish and progress unless untrammelled in their finances.

The objects of our Association are of such a character as to commend it especially to those who emigrated to this Territory and became identified with its progress and advancement, at a period when the brilliant career of California as a State, now only opening, but still astounding, scarcely found a lodgment in the fancy-weaving brain of the wildest dreamer.

They are to perpetuate its early history, to collect and preserve as matters of enduring record the stirring and startling incidents of its youth, when its mountains were mere frowning fastnesses the haunt of the wild untutored savage; its valleys waste and uncultivated; its rivers but the gushing openings of looming mountains into the broad ocean; its harbors unruffled by the keel of commerce, and uncheered by a glancing flag of enterprise and energy. More than this—we would collect and preserve facts for the historian, facts for the geologist, facts for the antiquarian, facts for the philosopher, to whatever department of science his investigations may be directed.

Yet more: we would preserve and embalm the memory of those who preceded and were the heralds of the glorious consummation: the Pioneers, who, inspired by the genius of progress, which recognizes no limits to its civilizing sphere, and acknowledges no insurmountable obstacles in its pathway, dared the dangers of traceless oceans and deserts, scaled mountain and miasma-breathing latitudes, to make a home and build an empire here, which not only kindles renewed hope in the bosom of the philanthropist, and cheers the drooping heart of the patriot, but bids fair to civilize the world.

An association composed of such materials, with such objects in view, and with such antecedents, must flourish.

We are a band of brothers; we are associated for purposes the most commendable, and the ends we seek to attain are at once dignified and exalted.

Let us, then, renew our efforts to advance the association. Let every annual and semi-annual meeting exhibit a state of things which shall strengthen the assurance of durability and permanency. Let us cherish and nourish the objects contemplated in our organization, and we will here form a society, not only interesting to ourselves as a social compact, but useful to the world as a fountain where philosophy, history, poetry, and painting may quaff their purest inspirations in after years.

Nineteen new members were elected, and the Society adjourned.

Farmers' Items.

We are glad to notice the interest manifested by the Press generally, in the cause of Agriculture; and we are particularly glad to notice valuable memoranda, gathered from various sources. We shall always take such items from the journals of the day, and shall endeavor to give the just credit in all cases.

We are grateful indeed for the words of encouragement from the Press, that greet us from every quarter, and shall strive to merit them by that devotion to the interests of Agriculture that its importance demands.

Fruitfulness of California.—Messrs. Streeter & Co. have raised this season upon their ranch, situated about ten miles from Sonora, a cabbage fourteen inches in diameter, when stripped of its loose leaves; a parsnip nearly three feet long; and a bag of potatoes varying from the size of a pint cup to that of a quart cup. They have also raised from a single seed a pumpkin vine which has yielded forty pumpkins, weighing an aggregate weight of seven hundred and fifty-five pounds. They have also raised sixty-seven pounds of potatoes in a single hill, from one potato, planted without cutting; in another hill fifty-three pounds, and in another ninety-six. The world may be challenged to produce a soil of such remarkable fruitfulness as that of California.—*Herald.*

Messrs. Editors: Noticing in your paper an account of a "splendid yield of wheat," credited to the California Farmer, in which it is stated that one hundred and seventy bushels were raised from one hundred and seventy pounds sown (quantity of land not given,) permit me to say, that from eight acres of land near the San Leandro Creek in Alameda county, upon which were sown three hundred and sixty pounds, William C. Blackwell harvested the past season twelve hundred and sixty-eight bushels, being one hundred bushels to the acre. The grain was not weighed, the stubble having been burned by a accidental fire. The plaintiffs would have made at least four bushels more to the acre making [illegible] pounds for one pound sown or one hundred fold!

A. M. C.
—*Chronicle.*

The Oratorio.

Hayden's grand Oratorio of the Seasons was the occasion of a rich and luxurious feast of music at the Musical Hall on Tuesday evening. What a joyous relief to the [illegible] came in a city like ours, where the [illegible] to excitements and riches, which [illegible] wearied attention from more [illegible] all its sensitiveness to [illegible] and finish, all its sensitiveness to [illegible] to present to you the thoughts and feelings [illegible] such deathless men as Hayden, Handel, [illegible] and others.

It is indeed well for this community that [illegible] have such sources of relief—else the minds [illegible] men, constantly confined within the circle of duties that wear upon them, would be disqualified from performance. The mind must have a respite from care, to enable it to perform its obligations well and no relief, no enjoyment, so refreshing as the one to which we allude.

It is most gratifying to notice the deep interest which is now given to the science of music; it speaks well for our community. The Musical Hall was well filled on this occasion, and by the most intelligent and discriminating audience. The performance was of a high order—the conductor, Mr. Herold, deserves great credit for the skill he has displayed in presenting this noble Oratorio so correctly the first time. Those accomplished artists, Mrs. Jones and Messrs. Bent and Smith, received well merited tokens from the audience, during the performance, that they were duly appreciated. Too much praise could hardly be bestowed upon the orchestra for their very able achievements. The choruses were splendidly performed, and we feel proud in the thought that in a brief time, all the grand and most difficult Oratorios, as well as all the most select music that shall be offered, will be presented to our community, in a style and manner equal to any part of the Union, by the accomplished performers of the Pacific Musical Troupe.

While we record the pleasures experienced by our citizens at these musical feasts, and bestow well-merited encomiums upon the several performers; while we tell of the beauty of the place, and rejoice at these sources of our enjoyments, let us not forget that there are those who, though they may not come before us with the gush of song and strain of the Æolian, yet to them should be accorded that just meed of praise which belongs to them; and to the originator of the Musical Hall, to him who has designed, erected and finished this splendid structure, for such delightful entertainments to our minds, our thoughts should occasionally turn. To Henry Meiggs, Esq., more than any other citizen, San Francisco owes a debt of gratitude for the organization of the Musical Troupe, and for the intellectual refreshment frequently offered to this community; and his earnest and constant endeavors to advance the highest interests of our city, his liberality in such efforts, should ever be the theme of grateful minds. We see this liberality evinced by the announcement that this grand Oratorio will be repeated on Friday evening, 14th inst., for the benefit of the Orphan Asylum of this city. Such a noble charity needs only to be presented to secure a response commensurate with the liberality intended, and so worthy the cause. Such opportunities of a double good should never be lost. In this case, the receiver will be blessed in receiving and the giver in giving.

Real Estate.

Real Estate in San Francisco, at the present moment presents a feature so new, under the stringency of our money market, that we may safely say with propriety that the real estate of [illegible] is an enigma difficult to solve.

It is usually the case in cities of older [illegible] that when money advances to a very high rate of interest, the value of real estate is affected in such a manner as to depreciate it in value materially, while here in San Francisco the [illegible] seems to be the case; but as San Francisco and all California has ever been noted for [illegible] upon all subjects, and a new method of [illegible] all difficulties we suppose they have [illegible] covered some new theory by which while the money market is the tightest real estate commands the highest price. It is a fact that [illegible] of real estate [illegible] at a much [illegible] than one half [illegible] and [illegible] [illegible] [illegible]

THE CALIFORNIA FARMER.

JOHN F. MORSE, Editor.
J. L. L. F. WARREN, Assistant Editor.

SAN FRANCISCO:
Thursday, January 12, 1858.

Progress.

We know of no word in the English language upon which a volume could be more easily written, than upon this simple, yet magic dissyllable. As a popular and powerful element in the varying appeals of a partizan leader; as a compensating ing assurance to the moralist, and as a congenial and quickening visitant to the visionary, it is pre-eminently cherished, quoted and misinterpreted. But it is not our object to write a volume upon the word, nor to tire our kind readers with a prosaic and tedious lecture upon its comparative force. We only wish a reference to it that we may better present a few agreeable contrasts in which a real and interesting progress is manifested. By such a contemplation we are well assured that the mind may be entertained, at the same time that it will receive fresh inducement to esteem the principle which the word itself is designed to express.

In no single department of usefulness is the force of progress more thrillingly portrayed than in the publication of newspapers and periodicals. To an American, whose mind has been constantly subjected to the vitalizing influence of information thus disseminated, who can appreciate the scope and power of a free and well sustained press, it must appear as an incredible fact that two hundred and sixty-seven years ago there was not such a thing known as a newspaper, in any sense of the word. He could not believe, without irresistable evidence, that two hundred and twenty-two years ago a French physician, by the name of Theophrastus Renaudot, of Paris, asked and obtained the exclusive privilege of publishing the first weekly Gazette that the world ever saw.

In 1632 the first newspaper that was ever published made its appearance in England, under the patronage of Queen Elizabeth, and bore the following heading: "The English Mercurie, published by authoritie, for the prevention of false reports." These are facts which history demonstrates, and no mind can fail to be surprised and interested by the contrast which they exhibit with the present. Now England and France are living in the very radiance of a newspaper and periodical reign. If an individual turn from the contemplation of such a contrast, to a consideration of the comparative degree of civilization and enlightenment which existed before and after this system of diffusing knowledge, he can then appreciate a principle of progress which is not more unequivocal in fact, than grand and beautiful in effect. He can then understand our motive for selecting this simple word of eight letters as a theme for editorial reflections.

It was with a view of engaging the attention of Californians to a field of progress too inviting to be neglected, and too important and unlimited in its consequences to be sluggishly responded to. There is one grand fact derivable from history in the effects of a newspaper and periodical exposition—namely, that in proportion as a FREE PRESS is sustained, just to such a degree have the principles of truth and justice, liberty and equality. been made powerful and commanding; and hence, in our own favored, land, we have the highest perfection of political liberty, the most substantial social equality, and the most bold and insurmountable enterprise that the world can exhibit at the present day. These are the concessions which history is awarding us. And, with such assurances for encouragement, we cannot say that we in California lack inducement for action. We are just bringing into development the first federal State of the Union upon the Pacific. And the manner in which this is being done can be very well estimated by the population of the State, and the flood of newspapers which is in constant circulation of information throughout every town and county in the commonwealth. No fact is discovered, no principle demonstrated, no valuable observation is made, no danger discerned, no advantage foreseen, that is not made the subject of instant record and circulation for the general benefit of society.

How different the immense territories that lie west of us. It was but a few years ago that the following information was communicated at a public meeting, held at the American Tract House, by the Rev. Mr. Calhoun, from Mt. Lebanon. He said "that in all Syria, with a population of a million and a half, not a *single newspaper* was published. And that in the entire region in which the Arabic language is spoken, comprising Syria, Arabia, Egypt, and the Barbary States, including a population of FORTY MILLIONS, there is believed to be only one, if indeed one newspaper in that language, and only three or four in English and French. That there was but one in the Turkish language in all the Turkish dominions (including a population of sixty millions,) and that conducted by an Englishman." "The first newspaper," he says, "in the Turkish dominions, as well as several of those in the heathen countries, was started by American missionaries." "But," he says, "they are multiplying, and it is an interesting fact, that Armenian, Greek, and Judea journals, as also those of China, Africa, and the Sandwich Islands, are now copying Religious as well as Political articles, from American daily papers."

Such are contrasts that should awaken the minds of Americans to a sense of the most important duties and lead every man to the conclusion that the greatest field of progress ever opened to American enterprise and power, is the one which beckons us on to the Western regions of superstition and paganism. No department of human industry should be neglected in California, where impressions are being received that will exert a deathless effect upon that kind of progress which it is so honorable and delightful to contemplate.

Especially will the spirit of advancement and improvement be aided by a well developed system of California Husbandry. From no other source do foreigners derive so pleasant and abiding impressions as from the manner in which this essential and predominating pursuit is supported. When we can exhibit to the vast world of minds that people the East, a picture of Husbandry as beautiful in all its features and efficiency, as our system of communicating intelligence, then we will give such an impulse to the true progress of life as will afford us an enduring satisfaction. The influence of an enlightened and perfect system of tilling the soil and developing the present enjoyments of rural existence, will be less boisterous in its effects upon the extension of political freedom and moral elevation, but it will not be the less powerful nor less enduring in its effects. It will exert that kind of silent and invisible influence, which nature manifests in her greatest achievements. Like the silent yet mighty powers that develope towering trees from little acorns, that spreads the beauty of a rain-bow upon a blossoming rose, or that noiselessly conveys water from the beds of rivers and lakes to the heavens for distribution, so does the Farmer, by his industry, his enterprise and his intelligence stamp the impress of dignity and grandeur upon the nation which he feeds—so does he imbue the history of his country with a silent charm, more powerful in its ulterior and final effects than all the radiance of military glory or the splendors of diplomatic intercourse and parade.

The Agriculture of California can do much to civilize, enlighten and christianize the five hundred millions of immortal minds with which it is brought in most familiar contact. Progress in Agriculture is as beautiful as progress in the onward march of Human Freedom.

Cultivate Timber Trees.

The rapid growth of many varieties of our ornamental trees should excite more attention among our large landholders. The time is not distant when the demand for various kinds of Timber will awaken in the minds of many the thought of the opportunities they have had of laying a foundation for forest trees that would reflect credit upon the originators.

We trust our Legislature will take early care to awaken the proper interest by offering a liberal "bounty" for the best nurseries of Timber Trees, of all the valuable kinds desired for use in this country. The oak, pine, locust, ash, maple, beech, and redwood can all be made profitable to the grower as well as highly beneficial to the State and honorable to those who establish them.

We have seen the locust, of fine, handsome growth, six and eight feet high the first year from the seed. The ash, maple, beech and many other fine trees could be successfully grown and most rapidly too, and we trust attention will be awakened to this subject and the right interest given to it.

FLOWERS.—"Unhappy the man who has never had his eye filled with tears at the remembrance of a particular flower. Such a one can have neither a child or youth: he can have had neither mother, sister or affectionate bride; he never loved."

Right Choice of an Employment.

When we reflect upon the change which has been made in the habits and the employments of men by their visit to this land of gold, we no longer wonder at the success of some men and the want of success in others.

By their emigration to California, old habits are broken up and new ones formed, and in many instances for the better. We could recal many cases where men had pursued one kind of business for years, yet never successfully; continuing in it, on account of having been educated to that employment, and no other, although it was not congenial. On arriving in California they were compelled to enter a new field of labor, and often the very one that in early years they would have preferred! Now, mark the success which attends their every effort. Here is a case, where the person was in early life compelled to adopt a profession not at all congenial, or adapted to his mind, his taste, or his physical or mental abilities; and this one case is but the type of thousands. Men in this country adopt new professions, new occupations, because more congenial to their abilities and tastes, and hence the success we note.

We have ever believed that all men are adapted to some particular business, and that they are not only bound to succeed in that, but to excel in it. The great difficulty in not finding out in time the right occupation, arises from not studying the *character*, as it gives the early indications.

Some are peculiarly adapted for the pulpit, some for the practice of the healing art, some for the law, some for mercantile, and some for commercial pursuits; many as the raisers of stock, and more as the cultivators of the soil in its various ramifications.

The great want of success lies in the false position in which persons are placed. To be completely successful, a person must LOVE the business they pursue. then it becomes a pleasure, and all works harmoniously.

We find, in looking over an old pamphlet, published long since,—title-page, name and date gone—so excellent an article upon this subject, that we make the following extracts, and commend them heartily to our readers. Hereafter, we shall speak again upon this subject, for it is not only of vital moment to every community, but of the deepest interest to our new country.

"Every thing in life depends upon the right direction which shall be given in the choice of a calling. Nearly all the evils which have resulted from perverted or wasted talent, or from slumbering energies, might have been avoided, by a proper direction in the commencement; and all might have been avoided by a settled purpose to make the most of life. "You are a great fool," said a fellow student to Paley when he was wasting his early years in a course of dissipation. "You have talents which might raise you to the highest distinction. I have none, and it matters not how my life is spent." Paley took the hint so roughly given, and his subsequent course is well known. There is no name in the English church, perhaps, that should stand higher than his; there are few in the vast circles of English literature whose just fame shall be more extensively or permanently recorded. And so in all cases of perverted and ruinous talent. The author of Childe Harold might have sung in strains as pure, as full of sweet benevolence, and as much fitted to benefit men as the author of the Task; and the author of Waverly, that mighty man whose productions are so far diffused and which exert now such an influence, an influence which MUST wane when the world shall come to love truth more than fiction—might have employed his talents in productions that should have gone down to remotest times with the Novum Organum, the Treatise on the Understanding, or the Paradise Lost.

"The first principle, therefore, which should guide in the choice of a profession is that the most should be made of life; that talent should not be suffered to exhaust itself for nought; and should not be expended in wild and ruinous enterprises. The second which I suggest is, that where there is a fitness for either of two or more courses of life, a young man should choose that in which he can do most to benefit his fellow men. Society is organized on the principle that any lawful employment will not only not injure, but will advance the happiness of the whole community, as the movement of each part of a well-constructed machine will not only not embarrass, but will advance the harmonious and regular operation of every other part. A man commonly chooses a calling with a primary reference to his own interest, with a view to a livelihood, or to a well-earned reputation. And the Great Author of human happiness has so arranged the various relations and dependencies of society, that while this is the main object, yet in any lawful employment the welfare of the whole shall be promoted. The farmer, the lawyer, the merchant, the physician, the clergyman, at the same time that he may be in the main pursuing his own interest, is the source of benefit to all the other departments of society. For illustration, it is undoubtedly true, that every man might be his own physician and in some way prescribe for his own maladies and those of his family. But it is a saving in time, expense, and happiness, that there should be men regularly trained to the healing art and who should devote their time to it. Although the principle which prompted the man to embrace the medical profession may have been, in the main, the promotion of the welfare of society at large. So it is with all other lawful professions. Nor are there any callings which are an exception to this, except those which involve a violation of the laws of God. And perhaps there is no more direct way of deciding on the propriety of any calling in life than by determining the question whether it will or will not advance the happiness of others. Any man in a lawful occupation will be at every step of his life contributing to the welfare of all the other departments of society.

"It is undoubtedly true also, that the God of nature has fitted man to some particular calling in life; and that it is in virtue of this original adaptation, in connection with Providential arrangements, that the several professions are filled, and that the wheels of society are made to move on in harmony. Many a man, for instance, is by nature unfitted to be a preacher of the gospel. There is an utter and insuperable want of adaptedness in his mental powers, in his temperament, and in his propensities, for such a work. And in like manner there are men who are unfitted to be merchants. There is something about their original structure of mind, or their temperament, that utterly forbids success. So many a man has no mechanical genius; many a man has no qualification for public and official life. With this fact we are all familiar, alike in relation to the most elevated and to the humblest employments; and the divine agency in appointing and in perpetuating and superintending this diversity of gifts, is one of the most striking proofs of a controlling Providence. It is like the economy which has placed pearls in one part of the earth, and diamonds, and gold, and the ruby, and the topaz in others; or which has made one soil and climate adapted to the production of aromatics; another to the production of rich and healthful fruits; another eminently to plants of medicinal virtue that thus the world may be united in one great brotherhood, mutually dependent and harmonious."

Can we raise Sweet Potatoes?

The question is frequently asked—can we raise Sweet Potatoes? This question we are happy to answer by presenting the following facts. Messrs. Souther & Covey, on the Tuolomne River six miles below Dickenson's Ferry, exhibited samples of sweet potatoes at the Agricultural Exhibition, weighing seven pounds each. These gentlemen have been successful in raising the present year seven tons.

We have also the satisfaction of recording the fact that Mr. James Gillis, residing upon the Sacramento, cultivated the present year two acres, and harvested six tons to the acre! We have also information of other successful growers—among them Mr. Lloyd, of San Jose, who exhibited some of the finest sweet potatoes we have ever seen.

REMARKABLE YIELD OF POTATOES.—W. O. Connell, of San Lorenzo, Alameda county, exhibited at the State Fair of Warren & Son, the following: the produce of a single eye, 16 1-2 lbs. twelve potatoes, measuring 1 bushel; two potatoes, weighing 12 lbs. From four sacks of seed planted, there was harvested five hundred and twenty-nine sacks, on one and three quarters of an acre. The ground was twice plowed and subsoiled. Cultivators will see by this mode of cultivation, the reward of doing things well.

ANOTHER.—Dr. Samuel Murdoch, of San Jose Mission lands, exhibited at the State Fair, twelve bushels very fine potatoes; all the product of three seed potatoes. The weight of the product was about 750 lbs. This wonderful product is undoubtedly the largest on record in the annals of agriculture, and give assurance of what may be anticipated in the future.

Never tell a man he is a fool; for, in the first place, he won't believe you; in the next, you make him your enemy.

The Potato.

This great staple of the country demands the most earnest attention of the Farmers of California. No one product of this country demands more serious attention. When the Potato was first introduced here, the astonishing crops produced by the simplest labor, induced the belief that there were some features in the climate or soil, or both, that were peculiarly appropriate to the nature of this universal vegetable. Each succeeding year gave new and more astounding results; from the ordinary size they continued to increase, until it was common to find them weighing from 1 1-2 lb. to 3 lb. in quantities, and often 4, 5, and 6 lb.; and potatoes were exhibited, of 7, 8, and 10 lb. One singular and gratifying feature was also observed. This increased size did not detract from their goodness. They were not "hollow hearted," as was customary with large potatoes in the old States, but of a superior character and flavor.

The high price received in 1850 was such as to call the attention of the cultivators to this one article, and large and extensive plantations were planted each succeeding year. The price received in 1850 and 1851, gave to those engaged in growing them extensively, ample fortunes in one year. Messrs. Horner & Beard, of San Jose, were the largest cultivators and the most successful, and the returns to them were a rich reward for their generous outlay.

So great has been the success in this vegetable, and so confident have been the growers, that no one dreamed of any check to success, or any danger in planting it as extensively as they might. No one for a moment thought of an overstock, or of any injury that would result to the country or to the vegetable itself, by successively planting the same seed upon the same soil, for continuous years. No reflection was given to those all-important considerations, until the *effect* was seen and felt.

When the "potato rot" made its appearance, reflection came, and when acres and entire plantations of hundreds of acres were swept away—then the blow began to be felt seriously—then and not till then, those who were feeling the effects of this calamity were made to see the cause of it.

There can be no greater calamity befal California than to know that this disease was to continue here. Should no steps be taken to arrest this evil, and it fix itself upon us, the loss would be counted by millions.

We believe it the duty of the cultivator to take immediate measures for their own relief, and for security in the future. Every feature of this terrible disease should be made public, and every successful effort, every experiment that indicates success, should also be known. We earnestly invoke all interested to this subject, and we ask of them to communicate with us freely. We would recommend to them an entire change of seed they plant, and also of the ground they plant upon. We know it to be almost impossible to plant the same seed upon the same ground, without deteriorating the quantity and quality of the article grown. We do not say this is always so, but as a general rule, planting in and in, is as injurious in the vegetable kingdom as in the animal. A change of seed from one country to another, is recommended and practiced by the best cultivators everywhere. A change of soils—rotation of crops, is one of the great elements of success.

Would the farmers of California desire complete success? Let them observe carefully those *laws of nature* that cannot be broken with impunity, and they will remove one of the greatest obstacles in their progress. Let them also closely observe those deeply interesting "indices" that lay in their pathway, and they will soon understand much better than they do now the "seasons as they roll," and the various causes of the many sad disappointments which have been theirs to endure.

We shall continue this subject in another number.

Great Turnip.—We have received from the editors of the "Pioneer," Washington Territory, a splendid Turnip. It is one of the finest specimens yet exhibited, and we think one of the largest ever grown. We are very grateful for this kindness on the part of our friends of the Pioneer office and shall be always prompt in acknowledging and reciprocating all favors in this way, for this is the way to make known the astonishing fertility of our soil, and the success which attends the cultivation of it. Thanks Messrs. Editors of the Pioneer—thanks.

Sacramento City.

Public attention is now called to this city, from the fact that it is named as the future "Capital" of California. On Saturday evening last a committee of the legislature left Benicia, to visit Sacramento to examine the character of her "public buildings" together with the conveniences and facilities that could be offered over and above the present location at Benicia. What will be the report of that committee, we know not at present—the future will decide. This we believe however: that they will be gratified with the reception they meet at the hands of the citizens, pleased with the appearance of the city and with the facilities for intercourse with their constituents in every portion of the State, and most interested and gratified at the opportunities that can here be found for the enjoyment of intellectual and social life.

Setting aside all partiality, all personal considerations, we consider it for the interest of the people of this State that our legislature should be provided with a locality, and with comforts and conveniences sufficient to make duty a pleasure. It cannot be expected that men will toil and labor for the dear public to the best advantage, when they are deprvied of the ordinary comforts of life. We therefore believe, that in the present condition of Sacramento and Benicia, the former is decidedly the best and most appropriate and it will be in our humble opinion for the interest of our State and for the legislature, to make Sacramento the seat of government. She really deserves the especial favor of the State, if it can be conferred without wrong to others.

Sacramento stands out before the world a phenomenon of endurance, of enterprise and success. She is as "a city set on a hill, whose light cannot be hid." As a city, she has now no equal in this country for broad, clean, dry and finished streets. Her thoroughfares for miles are proof against all weather, and the magnitude and beauty of her fire-proof buildings are an evidence of her coming prosperity—nay more, her *present* prosperity. That heavy, sorrowful, distrustful look has passed, a cheerful, happy and encouraging look and word greet you, at every turn Their watchword is "onward and upward," and they will not stop until they make Sacramento the "Queen City" of the "Great Valley."

It should be gratifying to all who love energy and enterprize well directed, to hear of the reward the citizens of that city are receiving; Francisco should rejoice at it; the State should rejoice at it—for the prosperity of "Sacramento" tells well upon the mercantile interests of Francisco and of the State; the prosperity of one is the prosperity of all.

Planting Grain.

The great difference in the crops of Grain, both in quantity and quality, is not so much owing to the variety of seed planted, as to the season of planting. It is true that the variety has some influence, and the manner of preparing the land has its influence, but with the same seed and soil and same kind of preparation, the difference of time has a very material effect upon the quantity and quality produced. More than twenty-five per cent. difference is frequently noted by two weeks variation of time in planting.

It is of the utmost importance that we should watch the operation of nature, and the nearer we conform to this the nearer we approximate to the successful point. If any one will observe the time the wild grain begins to vegetate and spring forth, they will have the proper time of planting of the *cereals*. The sooner the seed is in the ground after it can be properly prepared, the better, and it will always be found that such planting will yield the finest grain and the largest quantities to the acre, and the grain will be clear, bright and plump. Whereas, that which is planted at different points later in the season, will be more or less imperfect in size, form, color and quality, as well as deficient in quantity.

We would most earnestly urge upon the cultivators to note these facts and give us the result of their experiments. We shall be very happy to make the Farmer the medium of any inquiries that may be desirable on this and kindred subjects, and we will do our best to satisfy all enquiries made.

A Wheat-growing Country.—We have been shown, by Wm. Neely Thompson, Esq. a sample of Australia White Wheat, raised by him in Sonoma Valley, which is the largest, most perfect and beautiful in appearance of any we have ever seen. It speaks well for the fertility and productiveness of California soil.

Sacramento River Steamers.

In all the history of river navigation in our country, where delightful scenery and splendid steamers make the trip from city to city speedy and pleasant, the Hudson has always borne away the palm; a tear rises in sweet remembrance as we recall the many hours we have enjoyed upon that famed river. The "Palisades" rise up again before us—the magnificent mansions, villas, and gardens that greet the eye at every bend in that delightful river—West Point—"Break neck Hill," with many other interesting scenes gleam up in memory as we recall pas years. But, beautiful as is that wide-renowned river, and splendid as are her steamers, have we not in California a Hudson too? We have a far-famed Sacramento! 'Tis true, we have not yet spread out upon her hills and banks many cities or villas, yet the day is not distant when, from this grand city of San Francisco to the head waters of the far distaut upper Sacramento, upon the prominent hill-sides and the chosen spots of this mighty river, whose waters shine with the "golden sands," there shall be cities and villas whose wealth, influence and beauty shall tell upon the history of the future. Already we see the promise looming up before us. Benicia, Sacramento and other places, speak great things for the future, and the splendid steamers that give assurance of speed, elegance and comfort, upon that river will compare with any lines of steamers in the United States. That proud pioneer of steamers, the noble Senator, moves upon the waters with a majesty that makes one feel proud of her. The splendid "New World" moves on her course like a floating palace. The beautiful "Antelope" leaps over the waters, her engines glancing as she flies, like the shining antlers of her beautifur namesake. The "Confidence," glides on smoothly in her stateliness, like the brave warrior who bears in his countenance the courage he possesses, like as this splendid boat bears upon her sides, in her name, the feelings she inspires. The Wilson G. Hunt, last named, though not least in the regular lines to this city—she, in her quiet beauty, moves on the waters like a thing of life, fleet as the wind.

In all these magnificent boats, we challenge the world to produce better or more complete and perfect arrangements. The commanders and officers on each and all, are distinguished for every qualification necessary for their positions—skilful, courteous and attentive, they aim to make the trip a most happy one. For style of accommodation, luxurious living, and prompt attention on board, these boats cannot be surpassed.

We have also upon the Sacramento and Marysville lines, those most excellent and well-adapted steamers, for river navigation—after the style of the Mississippi boats, with light draft of water—the "Bragdon," the "Camanche," and "Urilda," each and all most ably commanded and officered by experienced and gentlemanly men, whose courtesy and attention have won for them universal confidence and esteem. These boats, as they sweep up the river, look like floating palaces, and those who travel will ever find a goodly portion of these comforts, when they may take a passage.

We shall take pleasure in noting all and every addition to the comforts and facilities afforded in these means of communication, as they are of vital moment to the community.

Buckwheat.

The specimens of Buckwheat raised this season are a sufficient guarantee of the future success of this favorite grain, so needed in the list of household luxuries.

Until the present time it has been found very difficult to procure the flour of buckwheat in any degree satisfactory to the demands of a good housewife—and it is surely a most gratifying fact to know that hereafter in California there is a prospect of an ample supply of California grown Buckwheat and Fresh Buckwheat Flour.

Specimens of very superior grains of this wheat were exhibited at the Fair, from Mr. James Denmaan, from Petaluma, who gave us the following statistics:

Mr. Denman prepared one acre of land by light plowing and but once; the soil rather sandy and rather moist. The grain was sowed on the 15th of May. Twenty pounds of seed was put upon this acre, upon the rough soil; a slight harrowing and the work was done. The crop was harvested and the yield was 2 [illegible] pounds, or more than [illegible] pounds return from one.

[illegible]

PROSPECTUS

OF

THE CALIFORNIA FARMER

And Journal of Useful Sciences.

We commence the issue of this Journal of Agriculture and kindred Sciences, with the beginning of the New Year.

The Editorial Department is under the charge of Dr. J. F. Monse, of Sacramento, (formerly editor of the Union.)—assisted by Col. Warren, of the firm of Warren & Son, who will aid in the Agricultural and Market Reports, and Foreign and domestic data.

It will be the aim af the publishers to furnish to their readers, 1st. The most useful data for the practical Agriculturist, and to present to them all the most important practical results, obtained from authentic sources, in our own State.

2. To present the latest and most important facts from our sister States and Europe, touching Agriculture, in all its branches.

3. To furnish familiar illustrations of valuable Agricultural Implements, together with remarks explanatory of their character and success.

4. To furnish complete Grain Tables and Market Reports, and other data connected therewith.

5. General and Critical Notices of the various Agricultural and Horticultural Societies of our country and of Europe, sufficient to guide our own Cultivators, and keep them advised of the progress of the Science.

6. A portion of the Journal will devoted to Select Literature—the aim of which will be to exhibit the purifying influences which flow from the pursuits of Agriculture, Horticulture and rural life. That kind of Literature which tends to a morbid excitability of the mind—which superinduces a species of sickly sentimentality, and degrades instead of elevates the character of man—as well as politics and sectarianism, will be rigidly excluded from its pages: our aim being to cultivate a love for and an interest in those useful Sciences which must ever add to the happiness of mankind.

Cultivators of the Soil, and all who feel an interest in these all-important and fundamental sources of our prosperity and happiness, are cordially invited to communicate with us freely. Their valuable aid is what we earnestly desire.

All communications for the Editorial columns should be forwarded to Dr. J. F. Monse, Sacramento, or may be left at the office, on Bush street, two doors below Montgomery, San Francisco.

Communications on Business, Reports on Agriculture, and Advertisements, should be addressed to J. F. Morse & Co., or Warren & Son, San Francisco.

Terms of the Paper—$8 per annum, in advauce.

J. F. MORSE & CO.,
(Publishers California Farmer,)
Bush street, below Montgomery,
San Francisco, Cal.

The Egg Plant.

The most wonderful specimens of this very valuable fruit, that we have ever seen, was exhibited the present autumn at the annual fair. The plants were grown at San Jose, upon the grounds of E. L. Beard, Esq., by Mr. Henry Rae. One plant in bearing with seven fruit, weighing 25 lb. Also, six superb fruit, averaging 5 lb. each, and one weighing 7 1-2 lb. These were undoubtedly the finest specimens ever exhibited in the United States.

This most delicious fruit, usually classed among the vegetables, should be better known, and its qualities better appreciated. There are two varieties of this fruit, the purple and the white. Tho white is grown but little, being of little or no value for culinary purposes, yet very beautiful as a border ornament in the garden. The purple egg is one of the very finest edibles that can be produced. Various fancy dishes are prepared by the artists like "Raphael." This fruit is stuffed, cooked whole, or sliced and fried in batter; and when well prepared, it is indeed an epicurean dish.

We trust our cultivators will give this plant more attention, for when well grown it will yield an ample reward.

Astonishing Yield of Barley.

The most astonishing yield of barley, since "Ceres' first waved his golden tresses upon our fair earth, will be accorded to J. Bryant Hill, Esq., on the Salinas Plains near Monterey. Mr. Hill exhibited one sack of barley as the sample of the crop of 95 acres. Several distinguished persons visited this field of barley, on account of its remarkable beauty and productiveness. They went on purpose to [illegible] acre measured, reaped, thrashed, cleaned and sacked. They [illegible] acre of equal character to the whole [illegible] until this acre was sacked and weighed. And the following we lay before our readers and [illegible] the world to produce an equal. One acre produced one hundred, [illegible] weighing 52 [illegible] the hundred. They [illegible] Francisco, and [illegible] Monterey, who witnessed the [illegible] above, and know well [illegible]

To Our Patrons.

To Advertisers.—We would call the attention of those who desire to have their advertisements produce quick returns, to the pages of the California Farmer.

The Farmer will reach sources of trade entirely new and unattainable by any other means, and thus secure a large and immediate profit to those who desire to make known their business. By a glance at our advertising columns, it will be perceived that we present the best known and most extensive houses, and as we have space for but one or two of each branch, these will be the most prominent houses, and thus give more influence to them.

To Our Subscribers on the Pacific Coast.—We lay the two first numbers of the California Farmer before you, for your examination, and, we trust, your approval, hoping it will be our good fortune to be received in that kindly spirit which shall secure your interest, so that we shall have the pleasure of enrolling your names upon a list already most honorable and gratifying in this new enterprise.

We feel proud to notice upon our list of subscribers, thus early, many of the names of our most extensive and influential cultivators and citizens, for several copies each. It is such evidences of true interest that will urge us on to great exertions, that we may testify our appreciation of their regard.

We tender our sincere thanks to our friends for the prompt manner with which they respond to our prospectus, and for the generous list of subscribers already sent in. Let them continue to come in, kind friends: such tokens from you will be like "good seed sown in good ground;" it shall spring up and bear good thoughts from nature's purest streams, and you shall feel its refreshing wave roll back upon you, bearing precious fruit and fragrant flowers, delighting the taste and sweetening the senses.

To Subscribes in other States.—We send the first and second numbers of the paper to many of our friends in the old States, and those who have long distinguished themselves as the firm friends of Agriculture and kindred sciences. We do this, feeling confident they will hail with pleasure the establishment of an Agricultural journal in California, not only as a means of diffusing information in California, but also as a medium through which they can communicate with us, and receive valuable and reliable data upon this all-important source of wealth. We believe also that a large number of the Agriculturists abroad, who have become interested in the wonderful products of California, would desire to receive the California Farmer regularly as subscribers.

We would say to all who desire so sustain us in this enterprize, that we shall endeavor to present, from time to time, the most important features of the Agriculture of California, and shall prepare particular reports that will be interesting to our friends in the older States.

It will be gratifying to have the columns of the Farmer made the medium of communication between our distant co-workers and ourselves. Our best energies will ever be given to satisfy every enquiry from those who address us—particularly the practical farmer.

In order to make it perfectly convenient to remit to us the amount of subscription to our paper, we will receive bills on any of the State Banks that are usually current in New York—these can be remitted by mail to us at our publishing office, and the receipt will be acknowledged and the paper regularly mailed

We can assure the friends of Agriculture, abroad, as well as at home, that every token of their approbation, every evidence of their generous support, shall be met with a corresponding evidence on our part that we will merit their kindness.

Carriage Hire.

We have noticed frequently the gross and daring impositions upon strangers when arriving at our wharves upon the steamers down the river from Sacramento, and suppose the same evil exists elsewhere. Not only do they impose upon strangers, but the manner in which they rush into the cabins of the steamers, and their rudeness, is frequently beyond endurance; added to this, their coarse and rude language to one another, and to the stewards and others on board the steamers, demands immediate redress.

We have frequently wondered at the forbearance of the officers of the steamers. On the arrival of the boats, such is the rush over and upon the steamers, decks, that one unacquainted with this rude fashion would apprehend that some accident had happened. Beyond this intrusion and rudeness the heavy tax of the ride a short distance, and the very exorbitant price exacted when no agreement is made, now requires interferenee by the authorities of our city. It frequently happens that a person takes a carriage for himself and friends or family, and agrees to pay the price for it, alone for his own use. Even after this, the driver will say he has a friend who wishes to ride a few rods, and thrusts in others, and thus exacts a double fee, receiving pay twice over.

We have some cases on hand, and we shall not fail to note them until this evil is remedied, and strangers and all can pass in safety. In this effort we know we shall be sustained; having suffered, we know the evil.

We commend the lectures of Rev. Mr. Spear, now in course of delivery in this city, as most worthy the attention of our citizens at this particular juncture. No one in California is so well qualified for such a course of lectures, and none surely that would interest an audience more.

Report on Vegetables.—Owing to the crowded state of our columns, the Report of the Committee on Vegetables is unavoidably deferred till our next number.

The California Farmer will always be found at Sullivan's Newspaper Stand, Kearny street; at the Bookstore of Mr. Murray, Montgomery street, and at other prominent places in every city.

News from Lower California.

By the arrival of the steamer Southerner from San Diego, we have the San Diego Herald of the 15th inst., containing some very interesting intelligence of the Filibuster movements in Lower California:

We take the following interesting news from the Herald:

"As we were going to press we received further intelligence from Ensenada. The bark Anita had arrived with two hundred and thirty men as an additional force to the command of Colonel Walker, on the 20th inst., and immediately landed her troops. At this time the natives had fled, and nothing more had been seen of them after the new forces had arrived. The day after the arrival of the Anita sixty-five men were ordered to march on the town of Santa Tomas, under the command of Captain George A. Davidson, who effected the taking of the place without a fight. Mellendrez and Negrete had fled, but the property belonging to them at La Grulla was taken and appropriated for the use of the expedition. This was principally horses and cattle, and are all secured in the valley of Ensenada. The property of Mellendrez had been declared confiscated by the Mexican Government, he being outlawed by a decree of the military commandant. A new government has therefore taken possession of it, in right of the old. He has endeavored to regain the property which was declared confiscated by order of Santa Anna, by trying to drive the expedition from the country; and in order to do so, he has forced the natives to fight against it. The inhabitants of this part of the country refused to aid him, but have been obliged to do so in order to save the life of Negrete, commandant of Santa Tomas, and also of the Judge of the First Instance, whom Mellendrez had taken as prisoners, and threatened to put to death if the inhabitants did not enroll themselves under his command. They reluctantly did so, under the promise to release his prisoners. They beseiged them several days, keeping up a constant and ineffectual fire upon us on the first day of the seige. The gallant McKibbin met his death while taking deliberate aim at the person of the outlaw, Mellendrez. The heroic Capt. Gilman was also severely wounded. With these exceptions the men are without scathe or injury, and in excellent condition and spirits. On the 5th day our boys made an attack upon their camp, routing them completely, killing eight, and wounding several more. We also took possession of their field piece, ammunition, stock, camp equipage, &c., since which time Mellendrez has not been able to make a stand. The flag of "Two Stars" now waves triumphantly over Lower California, and the wealthy Rancheros are in exstacies, and do not fear to express their joy at our advent.

There have been but two deaths in the expedition, Lieut. McKibbin and private Bernard McCormack, the former of whom was killed at Ensenada, and the latter at La Grulla, being alone when surprised and surrounded by the enemy—he was shot in four places, being offered quarter but refused it, and fought to the last. It was afterwards ascertained at Santa Tomas that he killed three and wounded several others before he was overcome.

A decree has been issued by the President condemning to death all persons guilty of plundering the property of the friendly inhabitants.

The party embraces men of every profession, among them some surveyors, who are engaged in surveying the town of Ensenada, with its harbor and approaches, laying out the ground in streets and blocks, and superintending the repairs, fortifications and buildings erecting by the new Government.

The following are the names of the persons at present holding office in the Republic of Lower California:—

Hon. W. Walker, President.
Gen. H. P. Watkins, Vice-President.
Major Fred. Emory, Secretary of State.
Capt. J. W. Jarigan, Secretary of War.
" H. H. Snow, Collector of Customs.
" Wm. Mann, Capt. of Navy.
Major Oliver T. Beard, Q. M. General.
S. S. Richardson, M. D.
Lieut. Samuel Rutland, Adjt. Acting.
—— Lawrence, Commissary.
Capt. Chas, H. Gilman, Co, A.
" Wm. E. Cuttrell, " B.
" Geo. Davidson, " C.
" D. W. Chauney, " D.
" Norman Douglass " E.

Negrete and Mellendrez have both fled, the former to San Diego, where he has taken up his abode, and the latter to the lower country, without arms or followers, and in a destitute condition.

A call has been made upon the inhabitants to unite in a convention, for the purpose of adopting a constitution suited to the requirements of the people, and to establish such a code of laws as may be found adequate to preserve peace and order in the community.

The President is indefatigable in his devotion to the welfare of the people and his army, and his time is employed constantly in the labors of his office.

The defences at the port of Ensenada are now so far advanced that it is deemed impregnable to any force Santa Anna or anybody else can send against it. The supplies for the troops are abundant, and are well protected, so that even a siege could be resisted with success. The men are in the highest spirits at their recent achievements, and are ready for any emergency that may occur, and more than anxious for another opportunity to measuro thoir prowess with that of the enemy.

Irrigation.

To the first immigrants to California the question of irrigation came up as a *sine qua non*, not only in respect to the high lands that presented a dry and barren appearance, but in respect to the low intervals that margined our rivers. They were viewed under a disadvantage, and they excited an idea, than which none could be more erroneous. The first experiments in tilling the lands have completely exploded the conclusion referred to. Indeed, the tests to which they have been subjected have established a principle that was comparatively unknown in the practical departments of farming. The experiments already made show the farmer that nature has other methods of supplying soil with necessary moisture than obtaining it from rain clouds or dews—that there is a force beneath the earth's surface, that in this country can be relied upon in almost all cases for an adequate quantity of water. We mean the capillary power by which a circulation is maintained independently of the ordinary hydraulic forces with which all are familiar—a circulation arising from the loose and permeable condition of the soil itself Although this force may not be scientifically understood by all who have discovered the fact, yet it has not failed to suggest the value of the principle and to direct farmers generally into a fair appreciation of the advantage it affords. Hence, there is now a general impression amongst husbandmen that deep subsoil ploughing is essentially necessary in California, and that in proportion as they succeed in rendering light and loose the soil in which the seed is deposited, just in such a proportion will they succeed in securing the supply of moisture needed. In the first place, the seed sower has the rainy season to prepare and mellow the ground and also to germinate the seed and sustain the plant until the descending roots have made it less necessary for the soil upon the immediate surface to be kept moist—the roots themselves becoming a more perfect link in the capillary circulation than that which is created by the loose and spongy texture or condition of the soil.

But this is a matter as yet very imperfectly understood in its application to farming purposes. It has been sufficiently recognized to convince cultivators of the soil that the first impression in respect to irrigation was erroneous, and to no small extent mischievous, in its influence.

Shooting Affair.—Mr. Baugh, of the firm of Sweeny & Baugh, was shot on Tuesday, at Point Lobos, by a German named Fred ———, and but very little hopes are entertained of his recovery. Messrs. Sweeney & Baugh own a tract of land near Point Lobos, which they purchased some time ago, and where they have erected their telegraph light-house. A short time since they sold a small portion of the land to a gentleman named Chambers for $500, and took his note for that amount. When the note was matured, Chambers, it is said, refused to pay, and they sued him, and then the debt was liquidated.

Within the last few days certain gentlemen ordered Sweeny & Baugh to have their property re-surveyed, which they did, and after getting lines from the surveyor, employed laborers to make a fence around the ground, and men were at work there since Monday. Chambers came yesterday afternoon about 4 o'clock, with two others and a German named Fred ——, and as Mr. Baugh was looking down the hole where the post was to go, Chambers ordered his man to "shoot the d—d money-making son of a b—h;" he fired, the ball taking effect in the left cheek, and carrying away a part of the jaw-bone. The ball has not yet been discovered. Dr. Todd was sent for, and was unable to find the ball. At 9 P. M. he was insensible. After being shot Mr. Baugh was enabled to walk several yards towards the light-house. After shooting Mr. Baugh the German followed the other man for about a hundred yards, saying "he wanted to shoot that fellow in the red shirt."—*Herald.*

Chambers and Mayo were arrested yesterday morning. Chambers asserts that he did not give the order to fire. The parties arrested have been held to bail in the sum of 2,000 each. Mayo, the German, is in prison—not being able to find bail, Mr. B.'s wound will not probably prove fatal.

Land Claims.

These all-important questions are exciting a deep interest in our community at the present moment, and it will be well for our community to have them settled; and although some must suffer, settled as they may be, we desire for the good of the country to see them speedily adjusted, and we have faith to believe it will be on a fair, just and equitable principles.

The Fremont claim, confirmed by the Commissioners and appealed from, has been rejected by the higher courts.

The Peralta claim, which now involves large and important interests, is upon the point of settlement, and much feeling exists. We sincerely hope that when these claims are announced, all will yield ready acquiescence to the decision.

The Sutter claims are now the next most important, and we look with the deepest interest to the decision, as it will affect more in number than any other claim yet presented.

We are under weighty obligations to the gentlemanly messengers of Messrs. Adams & Co., for the prompt delivery of packages, letters, etc.

MARKET REPORTS.

San Francisco, Jan. 11, 1854.

We have no new feature in the market to observe; a continued apathy pervading the whole routine of trade and commerce. Yet we are glad to notice a cheerful spirit, and a readiness to bear patiently that which is beyond the control of man—for no one can doubt but that a portion at least of the inactivity of trade results from the want of rains.

RETAIL VEGETABLE MARKET.

In presenting the Retail Market of Vegetables, we do this to show the weekly value and list of family comforts and luxuries (for good vegetables are indeed luxuries) that are offered to us in our markets. Very few markets in the United States can present such luxuries every week, and have them fresh from the garden every day.

It will be seen that cauliflowers, celery, horseradish, tomatoes, and green peas command good prices, and we may say all garden products pay well—for the quantity raised upon a small portion of land is almost beyond belief.

Cabbages, ₱ head	$ 30	Mild Sweet Potatoes ₱ lb.	12

Radishes, ₱ doz	1 00		

Last night was one of those gems of night that would almost win a smile from melancholy itself. The streets were thronged with promenaders, who seemed thoroughly imbued with the sentiment unfailingly induced by a balmy atmosphere and soft moonlight.—*Ere. Picayune.*

A Prolific Sow.—Mr. Wm. Ward has a sow, says the Stockton Republican, which gave not less than twenty-three pigs at one litter, making the second litter within twelve months. There is not another as prolific sow in the world.

A Literary Society called the Sacramento Lyceum was organized at Sacramento on the 7th.

Messrs. Adams & Co., are authorized to receive money for us, and receipt for the same, at any of their offices throughout the State.

MARRIED.

In this city, on the 5th inst., at the Unitarian Church, by Rev. F. T. Gray, J. R. Robinson, Esq., of the Banking House of Robinson & Co., and Miss Kate Anderson.

On the 5th inst., in Stockton, by Rev. H. Kroh, Mr. Samuel Steinberger and Miss Anna Barbarin, Lewisville.

On 8 unday, 7th inst., at St. Francis Chapel, Vallejo street, by the Rev. Mr. Eaglesby, Mr. John Moore and Miss Ellen Casey, both of this city.

On the 7th inst., by the Rev. C. B. Hyatt, Hall McAllister and Louise, second daughter of Samuel Hermann, Jr.

In this city, Jan. 8, at the residence of C. T. Hopkins, Esq., by Rev. F. T. Gray, Charles H. McLellan, of Bath, Me., and Miss Louise Kendrick, of New York city.

At San Jose, on the 8th inst., by Rev. Eli Corwin, Mr. A. D. Briggs and Miss Caroline E. Hicks.

DIED.

In Sacramento, Jan. 8th, Geo. Byron McDaniel, of Orono, Maine, aged about 22.

Was killed by the late explosion of the steamer Ranger, at Alameda, on Sunday, 8th inst., Mr. Alex. Rose, aged 29 years.

In Placerville, Jan. 5th, Andrew Ale, aged 17 years, of Stephenson county, Mo.

NOT THE ONLY ONE!
ANOTHER MAN IS IN THE FIELD
Prepared to cut Quartz Rock into any form desired.
I will say to my friends and the public generally that I am prepared to work into any form they may desire, Quartz Rock, WITH A POLISH EQUAL TO THAT OF A MIRROR.
N. B.—Quartz Rock purchased at the lowest prices.
J. W. TUCKER.
125 Montgomery street.

There are Three Things I Do Not Do!
1st. I do not get a gentleman to leave his Watch and when he calls for it, charge him TWENTY-NINE DOLLARS for cleaning it, and have it ready in 24 hours after.
2d. I do not ask FIFTY DOLLARS for a chain, and sell it for THIRTY-SIX DOLLARS, and warrant it Fine Gold when it is not worth a cent, and refuse to take it back, and pay FORTY DOLLARS in money, as I have stated above.
3 I do not take a Gentleman to the Jewelry Store and when he comes out tell him that I have sold him a Watch, when in fact I have not, but have sent it to the Pawnbroker's, and got SIXTY DOLLARS, and TEN for the case for it.
There are many other things I do not do, which I have stated above. 1 4t J. W. TUCKER.

Gentlemen's Clothing and Furnishing Goods.
George F. Walter, No. 113 Montgomery street, opposite Burry & Patten's, has on hand and is constantly receiving a splendid assortment of goods for Gentlemen's wear, comprising, in part, fancy Cassimeres, Vestings and French Cloths, of various colors and finest texture. He is constantly receiving by the steamers, direct from his Agents in New York—Messrs. Crawly & Lent, 737 Broadway—invoices of Paris PANTS, Benjamin's make, of Cassimere, velvet face, the best ever imported. A discriminating public is invited to call and examine this stock.
MILITARY CLOTHING.
G. F. W. gives this department his especial attention. All styles of military suits made to order, from the best material, and guaranteed to give perfect satisfaction.
Gentlemen's Fashionable Clothing cut and made equal to any house in the Atlantic States—the workmanship by the best Tailors. The principle laid down is that no garment is delivered which is not a perfect fit; as every article is fitted on before being finished, thereby avoiding the unpleasant necessity of altering after leaving the store. Any garment that is made and does not fit perfectly, is not expected to be taken, as he is desirous of establishing a business that will give satisfaction to all who may favor him with their patronage.
N. B.—I still continue to take measures to be made up in New York by Messrs. Crowley & Lent. All orders sent will be received by return steamer.
GEORGE F. WALTER, 112 Montgomery street,
1 1m Opposite Burry & Patten.

VOLUNTEERS WANTED!
TO THE GREAT SALE OF
JEWELRY AT JOHN W. TUCKER'S.
I shall now commence selling off my entire stock, consisting of DIAMOND WORK, WATCHES, JEWELRY, SILVER WARE, etc., etc.
Amounting to more than $300,000!
I have got to sell all the above goods before the first of June, as I have to rebuild my store according to the new grade. Any person who wants a good article can procure one from me.
Cheaper than in any other City in the World!
But I don't wish it to be understood that I pretend to compete with those who sell trash;—persons who would not hesitate to guarantee a brass ring or a watch for pure gold;—these persons can sell lower than I can. If I sell an article of any kind, and it does not turn out as I represent it, I will return the money. No person shall leave my establishment dissatisfied. Call and see me before you purchase elsewhere.

A DREAM.

BY J. GIBSON.

I had a dream, a strangely chequered dream,
At first it thrilled my bosom to its core.
'Twas calm as twilight hour, when the wild roar
Of storms is hush'd, and from the east doth stream
The full orb'd moon's pale, mild and shadowy beam.
It was a mother in her humble home—
A widowed mother, all whose earthly joy
Was centred in a blooming, cherub boy.
Her spirit seem'd 'mong bygone scenes to roam,—
Anon she spoke, the boy kneeled by her side;
She placed one hand upon his head, then raised
Her eyes to Heaven; and, forth rushed the full tide
Of all a mother's love in silent prayer.
My soul was smit with awe, as on I gazed,—
I bowed my head, and worshipped with her there.

I raised mine eyes, the scene had changed,—the child
Now merged in manhood,—still the grief beguiled
Of that fond mother, waxing grey with years,
Their very souls comingled;—and, the tears
They shed were not the tears of witheriug grief;
But, like the dew-drop to the drooping flower;
Aud to their hearts surcharg'd brought sweet relief.
He bravely toil'd through many a weary hour,
To shield his aged mother from the hand
Of ruthless want—and, Fortune, smiling bland,
Danc'd in the path of noble upright toil;—
Of Poesy he drank the crystal streams,
And science round him shower'd her kindly beams.

Again the scene is changed,—ah! sadly changed!
What sight is this—all haggard and deranged
In beastly drunkenness! can this be he,
Who lately kneel'd upon the glassy lea,
Now wrapping in Death's sleep a mother's form?
That noble brow!—that eye!—ah! yes, tis he!
But oh, how fallen! how wretched, pale and worn!
That eye is rayless, which once beam'd like morn.
Hark! from those lips unholy torrents flow,
From which the soul, with loathing, shrinks aghast!
He reels—he staggers!—see! he smites his brow,
Tortured with agony, which none can know,
Save he whose soul dreams of the happy past—
His mind all scathed by passion's scorching blast.

All disappeared;—and darkness veil'd my sight,
Till on my ear rush'd a discordant sound,
As if n thousand Demons yelled around;
Then straight before me gleamed a baleful light;—
I gazed with horror on the frightful scene;—
It was a hell in miniature, where woe
Sat brooding darkly o'er the drunkard's mien,
And tortures stung his brain with maddening throe.
Ah! such was *He* amid that wretched throng,—
The poison'd chalice sparkling in his hand,
While forms of men in rags around him stand:
He trembles still to hear their ribald song:—
While thoughts of the sweet past flash through his soul,
Frenzied, he rushes to the drunkard's goal!

"Apples of Gold in Pictures of Silver."

We present our readers to-day a gem worth preserving. We have read and re-read it, and each time with new pleasure—each time discovering new beauties. One may read it, and be sure of pleasant dreams. It will hang around the memory like the echoes of sweetest music. We feel confident that all who love the delightful associations which gather around the new year, will thank us for republishing this editorial of the San Francisco Chronicle:

New Year's Day.—God made last Monday. There can be no dispute upon that head. You might submit it to the Legislature at Benicia, and they would answer aye. You might ask all San Francisco, and no chairman would be needed to put it to vote, no clerk to record the ballot. Nothing short of Divinity could have done it. The air came with the blandness of heaven's own atmosphere. It was as bracing as the cold northwest breeze of Maine, as mild as the Indian summer of Louisiana. Italy might have breathed it with a deep and delightful respiration, and believed it that which visits the Rialto or the Tiber. Switzerland might have felt stronger in its inspiration, and thought it a zephyr coming down from the glaciers, warmed into tepidity by the genial plains, basking in the smiles and warmth of spring.

There was nothing blue that day, save the skies, and everything put on a robe of golden beauty, colored in the sunlight, and bordered on the edges of the day with trimmings of stars. Nature's great broad face wore a smile as irresistable as that of the girl you love most dearly. One could not but feel its influence, for it seemed spread out everywhere. The lowlands were alive with glory. Over the hill tops, the light came and went in flashes and streams of wondrous brilliance. The lazy breezes stooped down to the laughing waters, as they passed, and the amorous waves pouted up their lips to the kisses of the wooer. On went the day in its joyousness, full of a gush of sentiment, as if the elements themselves sympathized with human hearts, and were determined to have a lark on New Year's Day. The sun smiled unusually cosy from every pore of his jolly face. The dull earth lighted up for once, like Eve from her first sleep, and blushed like her to find herself beautiful. The Bay lay around the men of our city like a sleeping spaniel at the foot of his master, and the ships, resting like swans on a sea of silver, swung leisurely with the tide, and like the ladies, awaited calls.

All male-dom emptied into the streets—all ladydom staid at home. It was a gala day, a holiday, a day for polishing anew the chain of friendship and interlocking the links of love. It was practical New Year's Day, one set apart to repair any omission or error of the old year. It was like the merry march with which the returning funeral band spirits off the sad thoughts which the recent burial had excited. The old year had been laid with his white beard in the tomb, and everybody came out to enjoy the smiles of the new comer.

Oh, it was a lovely babe; one upon which its parent might look with pride, satisfaction and hope. It seemed a spark struck off from the great wheel of ages by the hand of Time, one of the sands in his glass changed to gold. The streets were full of joy in the person of splendidly dressed handsome men, on their tour of friendship, acquaintance or love, and seemed almost to forget the out-door glories in their anticipations of those who presided over the domestic hospitalities. Bright and cheering as the sunlight were the smiles within doors, soft as the balmy air the words breathed by the festive board.

There was pleasure without—there was happiness within the dwelling. Hearts swelled more joyously—blood flowed through vein and artery with a wilder delight. Friendship went on foot. Love on wings, Aristocracy on wheels. Friendship smiled. Love sighed. Snob swelled. 'T was a grand time, a good time, a happy time. Old friendships grew nearer, Love grew stronger, Snob became a little less stately—all harmonizing and humanizing. There's nothing like Association. 'T is the sand-paper which rubs down nature's asperities, the burnisher which polishes the surface of society, the brush which applies the last varnish.

Therefore, long live the poetic and delightful custom of New Years calls. There is not a spot on earth where it could be of greater service. Business eats up intercourse like a cancer, and rust eats into the character like salt water into an iron hoop cast upon the sea shore. A custom which causes pleasant associations and sympathies is like oil on the surface of the waters, keeping them calm—oil on the surface of steel, keeping it bright. 'Tis the stamp on the genius of society, giving new beauty to its gold. Let New Year's Day, then, be our mint to coin anew pleasant feelings and turn into double eagles the rough bullion of life.

Heroism.

The following glowing description of noble and brave efforts to save life, we copy from The Sun of the 6th inst.—and we feel it the duty of the press to make known as widely as possible such heroic achievements and keep the actors in honorable remembrance:

One of those magnificent instances of glorious and intrepid conduct, which breaks like a gleam of vivid sunshine on the heart, and ennobles and dignifies human nature, occurred yesterday, off North Point. A small boat, in which were two men, was endeavoring to make its way to land, amidst the rolling billows that raged around it, when, within full view of the shipping, a monster wave o'ertopped the slender shell and swamped it. The drowning men clung with death hold to the capsized boat, and mutely implored the aid of those who witnessed the accident. Boat after boat of bold, determined sailors shoved off in the hopes of rescuing these unfortunates, and with rapid strokes made their perilous way over the foaming waves; but the contest was too unequal, and to save their own lives, they were obliged to return, one after the other. In this extremity Captain Clauster, of the Hamburg brig Geo. Henrich, manned his boat with three trusty seamen, and went to their rescue. By this time the anxiety of the hundreds collected on the wharf had raised almost to an agony of excitement, and every rod made by the boat and her gallant crew, was watched with intense feeling. At one time, she would appear to be entirely swallowed up in the waste of angry waters, at another, she would dance gaily on the crest of some foaming wave, as it rolled in its wrath towards the resounding shore. But yet, in spite of all danger, all obstacles, the gallant Clauster at the helm and the noble tars at the laboring oars, held on their errand of mercy, and finally succeeded in reaching the boat and saving the drowning men. It is needless to say that shouts and hurrahs rent the air at this splendid and most praiseworthy act, which it delights us to record. All honor to Captain Clauster and his gallant crew.

A Happy World.

This is a happy world—who says to the contrary is a fool or something else. There is everything to make us happy. The land, and sea contribute to our enjoyment. The man who has a good heart, sees pleasure where a bad person beholds nothing but gloom. The secret then of being happy and enjoying this world is, to possess a cheerful and virtuous heart. Who is the most cheerful and contented man in your neighborhood? The man who has the most honor, and possesses the greatest riches? No. It is he who has nothing but a kind heart. For nothing ruffles his temper, or disturbs his repose. The morning sky—the evening cloud—the rolling waters—the teeming forests and the fields of snow, give him a pleasure that others never dream of. It is he whose mind is led from nature up to nature's God, and every day that he lives he is as contented and happy as it is possible for a man to be. Depend upon it, the world is a beautiful one and contains a thousand sources, of enjoyment, which they only can see and feel whose hearts are pure, and whose lives correspond with the words of eternal truth.

Some lone bachelor editor, away out in Missouri, is guilty of the following:—Why is the heart of a lover like the sea serpent? Because it is a secreter (sea creeter) of great sighs (size). Dreadful, wasn't it?

PEORIA PREMIUM STEEL PLOWS.

THE FORMER CELEBRITY OF THE PEORIA PREMIUM STEEL PLOWS, and the unequalled success of their introduction in this State, would seem to preclude the necessity of any further effort on our part to draw attention thereto; but in view of the transitory nature of business in general in California, and the probability that some may have looked upon our establishment of an extensive and permanent manufacture of Plows here, in the face of such enormous importations and extravagant prices of material, as an impossibility—we believe it expedient to adopt this method of bringing it within the special notice of all concerned, that we are now manufacturing, and will have ready for this season's demand, three thousand of the most superior Plows ever made or used within this State.

We feel warranted in making this assertion, from the fact that all who used our Plows last season testify that they were superior: and we have studied so closely the immediate wants of our patrons from every section of the State, that we can now furnish Plows suitable to any particular kind of soil known in the State.

Our material has all been selected in the East by one of our firm, and imported by us directly from the manufacturers, which places it in our power to say confidently that nothing is lacking in quality, while we are enabled to make the plows at a cost greatly below that of last season, and are determined to sell at prices within the reach of every farmer who may wish to use the Peoria Premium Steel Plow.

It should be remembered that these plows will do double the work with half the team required in using the ordinary cast Plow; and that the work, when done, will be well done.

For particulars of prices, and descriptions of plows, we refer you to the subjoined card. The prices therein detailed are those established at our factory, and the only alterations from them that we authorize our agents to make, is the addition of the cost of transportation to their places of business—thus placing the plows at every accessible point of the State for the exact price charged at the Factory, with the necessary expenses only added.

Farmers ordering our plows through mercantile houses here, would do well to write to us at the same time, if they would make sure of getting the right plow, for some are interested in representing that we are not making plows at all, while others will not sell our plows when they can get off a cast plow. We therefore recommend that orders should be sent to us directly, accompanied by an order upon your merchant for the amount, which you can always know by a reference to the card accompanying this circular.

On the 24th of June the interest of T. Adams in our business ceased, by the sale of his entire interest therein to L. E. Morgan. Aside from this, there has not, nor will there be, any alteration, as we have the same efficient and thoroughly practised hands in every department of our business.

E. L. MORGAN & CO., Successors to
T. ADAMS & CO.,
Corner of Broadway and Battery streets.

☞ The following are the established prices for the Peoria Premium Steel Plows, at our Factory, and the only addition our Agents are authorized to make thereto, is the cost of transportation to their points of business:

SIZE.	DESCRIPTION.	FURROW.	PRICE.
No. 5	plain	10 in	$ 30
5½	"	12 in	$ 35
6	"	14 in	$ 40
7	"	16 in	$ 50
6	clipper or prairie	14 in	$ 60
16	" "	16 in	$ 70
18	" "	18 in	$ 85
20	" "	20 in	$100
22	" "	22 in	$110

WARREN & SON'S
HORTICULTURAL MUSEUM
AND
HALL OF SCIENCE.

THE subscribers take pleasure in announcing to their friends and patrons that they open their Hall as a Museum of Horticulture and Natural Sciences. Having now completed our arrangements in Europe and in this country, we are enabled to offer to the patrons of this establishment the first of the kind in California) everything desirable connected with the science of Agriculture, Horticulture, and Floriculture.

Connected with this establishment will be Nurseries, Gardens, Fruit Orchards, Graperies, and Greenhouses of the proprietors; and therefore the patrons can be assured that it is much better for them to send their orders to first hands than to those who collect here and there, at auction and elsewhere, where there can be no certainty of the genuineness of what they buy.

The Nurseries will be extensive, containing several hundred thousand trees grown under the eye of the proprietors. The Fruit Garden will contain the choicest Fruits known in Europe and America.

The Museum will contain specimens of Fruit in Wax, rare and curious specimens of everything else in nature, both in wax and in a dried state; Oil Paintings, Drawings and Paintings of Fruits, Flowers, &c., together with specimens in Natural History, Books on Agriculture, Horticulture and Botany; Garden implements of all descriptions and of the most approved patterns.

SEEDS.—A large and superior assortment of Garden and Flower Seeds, comprising all the new and rare varieties. Field and Grass Seeds of warranted quality, wholesale and retail. The Seeds sold at this establishment will be warranted pure and genuine, true to their name and preserved in a proper manner. Dealers will receive a liberal discount.

Boxes of Seeds for exportation at $5 and upwards, so packed that they may be safely transported to any part of the world.

Packages of Flower Seeds, containing twenty varieties of Annuals, Biennials and Perennials, neatly packed in boxes, from $3 to $20.

☞ Separate Catalogues of Fruit and Forest Trees; Vines, Shrubs, Evergreens, Dahlias, Roses and Greenhouse Plants; Garden and Agricultural Seeds, may be had on application.

WASHINGTON STEAM MILLS.

WASHINGTON FLOUR MILLS.

THE undersigned proprietor of the Washington Flouring Mills take pleasure in offering to families and the trade, Superior Family Flour. To our Mills, we are happy to say to our friends, was awarded the Silver Medal; and we shall be always striving to maintain for it a high reputation, so that our customers can send to us in confidence, believing they will receive the highest character of Flour the market affords.

In the same establishment we have extensive STEAM SAW MILLS, capable of performing every kind of work that may be desired, and to this branch of our business we invite the attention of the public. We have also STEAM PLANING MILLS, that will finish all kinds of work in the most workman-like manner, and equal to anything performed in the country, and in the most prompt manner to order.

We invite all who are contracting work, to call on us and examine our Mills, and we can satisfy them of our ability to supply every order in each branch of our extensive establishment.

D. W. VANCOURT, Proprietor.
1 Near the Oriental.

POLLEY & CO.,

OF THE BAY STATE MILLS, would announce that for the better accommodation of their numerous customers and trade in general, that they have opened a branch of their business at the Fire Proof Store, No. 49 K street, between Second and Third, where they will always keep on hand a large stock of California FLOUR; also, Hecall and Gallego.

Public attention is particularly directed to the "Bay State Lower Mills' Brand," an article we have every confidence in warranting, being made under our own inspection, from new Wheat, without any adulteration.

Ground feed of all kinds always on hand.

Every exertion will be used to merit a continuance of the favor heretofore so liberally extended to us. 1-3t

PREMIUM PLOUGHS.

WE invite the attention of farmers to the assortment of "Premium Steel Ploughs," now at our store at Exhibition Hall. These are the celebrated "Morgan & Co's Peoria Ploughs," pronounced by the committee the very best Plough in the United States. WARREN & SON'S
1 Agricultural Store.

THEODORE PAYNE. SQUIRE P. DEWEY.

THEODORE PAYNE & CO.,
REAL ESTATE AND STOCK AUCTIONEERS.

A register open to public inspection of property for sale.

The Spanish and French languages spoken.

Improved and unimproved Ranches and lands for sale in various parts of the State—Spanish titles. 1 4t

SUPERIOR FURNITURE.

THE largest and best stock in Sacramento may at all times be found at the Old Stand of E. P. & D. MOORE, No. 77 Third street, where they still persist in selling as much below their competitors as their superior facilities will admit of. Having on hand the most splendid and substantial assortment of all kinds of Furniture ever offered in Sacramento, we feel confident, with prices to suit, that none can go away empty that may favor us with a call.

Our stock consists of Bureaus, Secretaries, Wardrobes, Stands, Tables, Rockstands, Lounges, Sofas, Painted Mahogany, Black Walnut, Satin and Rosewood Sets—some of the finest and cheapest ever offered in this market.

Also, Mattresses, of Curled Hair, Patent Felt, Moss, Wool, Straw, and Straw with Cotton Tops. Also, Feather Pillows, and Feathers for Beds, with a large stock of Quilts, Comforts, Sheets, Blankets, &c., &c. Also, a very large stock of Chairs, Wood, and Cane Seats of all descriptions: also, of Hair, Cloth, Spring, Plush, Velvet and Carpet Bottoms, with Rockers of all kinds; all of which will be sold at reduced rates.

1 4t Also at 130 Jackson street, San Francisco.

A CARD.

FREE EXHIBITION HALL.—We desire to announce, and we do so most respectfully, that hereafter, during our Exhibition, our Hall, containing all the magnificent specimens of the Agricultural Exhibition, together with the choice Paintings and Embroideries, and many rare and beautiful specimens and curiosities from the "Islands of the Sea," will be open to the visits of all who wish to examine them. FREE OF CHARGE.

We would also announce to Artists that our Hall is offered to them, FREE, to exhibit their work for exhibition or sale, and we further announce to all persons who have Paintings, Statuary Works of Art, Curiosities, or extra specimens of anything of domestic manufacture, that here is a place the most appropriate for its exhibition or sale, and where the most extended notice can be given to it. All who have works of art, or any of the curiosities of the country, or wonderful specimen of the Agriculture of California or the Pacific coast, will find this Hall the most appropriate place for the exhibition of the same.

We desire also to state that all the Agricultural papers and periodicals of the United States and the principal publications of Europe upon the subjects of Agriculture, Horticulture, and Floriculture, and other scientific subjects, and to our patrons, and to the cause of Science, they are ever open, and we tender our best aid to developing to the utmost of our power the good resulting from them.

1 WARREN & SON.

FAMILY FLOUR.
HORNER'S PREMIUM FLOUR.
UNION CITY MILLS.

WE INVITE the particular attention of Families and the Trade, to the quality of the Flour manufactured by us. Our great aim has been, in the establishment of our Mills to procure the most perfect machinery, to employ the ablest millers, and to select the purest and finest wheat in the country. That we have been able to accomplish all this, the Product of our Mills now before the community is the best evidence.

The FLOUR we manufacture has been submitted to the ablest judges at our State, and after the most rigid and thorough test, they have awarded to us the "Premium Prize," and we shall have offer the same as "Horner's Premium Flour;" it shall be our constant effort to maintain for it the reputation of being the

The Best Flour in the Land.

Orders left with HORNER & CO. at our Storeship, Broadway wharf, will receive prompt attention.

ADVERTISEMENTS.—A limited number of Advertisements will be inserted at the following rates: For one square of eight lines, per month, $6. For business notices of five lines or less, per month, $4. A slight reduction will be made to regular advertisers.

Patriotism and Devotion.

We reprint the following, believing it good to keep alive the feelings that actuated the Heroes of the Revolution. The lofty patriotism that actuated the "Father of his country" to deeds of imperishable fame, and his devotion to that country, in all her interests, together with the love and affection that his example inspired in all who were around him—to these we attribute, as one of the great causes that led to and kept alive that willingness of spirit to become martyrs, in all the officers and soldiers in the revolution, under his command or influence.

We would ever hold up these examples to all—to officers and soldiers, whether military, civil, or judiciary. When such patriotism in defending and such devotedness in sustaining our institutions pervades the minds and hearts of our people, our country will be safe.

The revolution was over. Eight years' conflict had ceased, and the warriors were now to separate forever, turning their weapons into ploughshares, and their camps into workshops. The spectacle, though a sublime and gorgeous one, was yet attended with sorrowful feelings; for, alas! in the remains of that gallant army of patriotic soldiers now about to disband without pay, without suppers, stalked poverty and disease. The country had not the means to be grateful.

The details of the condition of many of the officers and soldiers of that period, according to history and oral tradition, were melancholy in the extreme. Possessing no means of patrimonial inheritance to fall back upon—thrown out of even the perilous support of the soldier, at the commencement of winter, and hardly fit for any other duty than that of the camp—their situation can be better imagined than described.

A single instance, as a sample of the situation of some of the officers, as related of the conduct of Baron Steuben, may not be amiss. When the main body of the army was disbanded at Newburg, and the veteran soldiers were bidding a parting farewell to each other, Lt. Col., Cochran, an aged soldier of the New Hampshire line, remarked with tears in his eyes, as he shook hands with the Baron:

"For myself, I could stand it; but my wife and daughters are in the garret of that wretched tavern, and I have no means of removing them."

"Come, come," said the Baron, "don't give way thus. I will pay my respects to Mrs. Cochran and her daughters."

When the good old soldier left them, their countenances were warm with gratitude—for he left there all he had.

In one of the Rhode Island regiments were several companies of black troops, who had served through the war, and their bravery and discipline were unsurpassed. The Baron observed one of these poor negroes on the wharf at Newburg, apparently in great distress.

"What is the matter, brother soldier?"

"Why, master Baron, I want a dollar to get home with, now the Congress has no further use for me."

The baron was absent for a few moments, and then returned with a silver dollar, which he had borrowed.

"There, it's all I could get. Take it."

The negro received it with a cry, hailed a sloop which was passing down the river to New York and as he reached the deck, took off his hat and said—

"God bless you, Master Baron!"

These are only single instances of the army at the close of the war. Indeed, Washington in this view at the close of his address to the army at Rocky Hill in November, 1783:

"And being now about to [illegible] his last public orders, to take his [illegible] leave of a long [illegible] in the military character, and to bid a final adieu to all the [illegible] he has had the honor to command, he can only [illegible] his prayer to the God of armies.

"May ample justice be done them here, and may the choicest of heaven's favors, both here and hereafter, attend those who, under divine auspices, have secured innumerable blessings for others.

"With these wishes and this benediction, the Commander-in-Chief is about to retire from service. The curtain of separation will soon be drawn, and the military scenes to him will be closed forever.

The closing of the "military scenes" I am about to relate:

New York had been occupied by Washington on the 25th of November. A few days afterwards, he notified the President of Congress, which body was then in session at Annapolis, in Maryland—that as the war was now closed, he should consider it his duty to proceed thence and surrender to that body the commission which he had received from them seven years before.

The morning of the 5th of December, 1783, was a sad and heavy one to the remnant of the American army in the city of New York. The noon of that day was to witness the farewell of Washington—he was to bid adieu to his military comrades forever. The officers who had been with him in solemn council, the privates who had fought and bled in the "heavy fight," under his orders, were to hear his commands no longer. The manly form and dignified countenance of the "great captain" was henceforth to live in their memories.

As the hour of noon approached, the whole garrison, at the request of Washington himself was put in motion, and marched down Broad street to Francis's tavern, his head-quarters. He wished to take leave of private soldiers alike with officers, and bid them all adieu. His favorite light infantry were drawn up in line, facing inwards, through Pearl street, at the foot of Whitehall, where a barge was in readiness to convey, him to Powell's Hook.

Within the dining-room of the tavern were gathered the generals and the field officers to take their farewell. Assembled there were Knox, Green, Clinton, Steuben, Gates and others, who had served with him faithfully and truly in the tented field; but alas! where were others that had entered the war with him, seven years before? Their bones crumbled in the soil, from Canada to Georgia. Montgomery had yielded up his life at Quebec, Wooster fell at Danbury, Woodhull was barbarously murdered while a prisoner at the battle of Long Island, and Mercer fell mortally wounded at Princeton; the brave and chivalric Laurens, after displaying the most heroic courage in the trenches at Yorktown, died in a trifling skirmish in South Carolina; the brave but eccentric Lee was no longer living, and Putnam, like a helpless child, was stretched upon the bed of sickness. Indeed, the battle-field and time had thinned the ranks which entered with him on the conflict of Independence.

Washington entered the room—the hour of separation had come. As he raised his eye and glanced on the faces of those assembled, a tear coursed down his cheek, and his voice was tremulous as he saluted them. Nor was he alone. Men, "albeit unused to the melting mood," stood around him, whose hands, uplifted to cover their brows, told that the tears which they in vain attempted to conceal, bespoke the anguish they could not hide.

After a moment's conversation, Washington called for a glass of wine. It was brought to him. Turning to the officers, he thus addressed them:

"With a heart full of love and gratitude, I now take my final leave of you, and I most devoutly wish your latter days may be as happy and prosperous as your former ones have been glorious and honorable." He then raised the glass to his lips, and added: "I cannot come to each of you and take my leave, but shall be glad if each of you will take me by the hand."

General Knox, who stood [illegible] burst into tears, and advanced, incapable of utterance. Washington grasped him by the hand and embraced him. The officers came up successively, and took an affectionate leave. No words were spoken, but all was the "silent eloquence of tears." What were mere words at such a scene? Nothing. It was the feeling of the heart—the [illegible] spoken.

When the last officer had embraced him, Washington left the room, followed by the generals and passed through the lines of light infantry; his step was slow and measured, his head uncovered, and tears flowing thick and fast as he bowed to the veterans he was to see no more forever. Shortly as [illegible] entered into the [illegible] at the rear. A [illegible] was [illegible] by [illegible] as [illegible] from the ranks and [illegible] hand.

"Farewell, my beloved General!"

Washington grasped the [illegible] commander's back of him. All [illegible] and [illegible] and the [illegible] followed. The [illegible] as they [illegible] to Whitehall.

soldiers told how deeply engraved upon their affections was the love of their commander.

At last, Washington reached the barge at Whitehall, and entered it. At the first stroke of the oar, he rose, and, turning to the companions of his glory, by waving his hat, bade them a silent adieu. Their answer was only in tears; and the officers and men, with glistening eyes, watched the receding boat till the form of their noble commander was lost sight of in the distance.—*N. Y. Jour. of Com.*

A Sketch.

The day had been mild and beautiful, the sun had just passed behind the mauntain tops, still casting its brightness upon the distant peaks in the far east ere it should pass entirely away. The mellow tints of twilight were now gathering around and over me, each tree and shrub seemed to be clad with new beauty; the very air came loaded with fragrance, for the vale lilly, and honeysuckle, and the myriads of nature's early spring flowers were just opening their honied petals; the lark and the sparrow were singing their evening song; the little lambs were frisking gaily as they neared their nightly shelter; the husbandman was returning to his home with a countenance already expressive of the welcome greeting that awaited him from his lovely wife and little one; the hum of the busy looms had ceased; the waters of the river and streamlet seemed to glide on more quiet and still—all, all above, below and around me joined in the joyous feeling such scenes awakens; my heart was touched, my eye filled, and the tear that trembled unconsciously upon the cheek spoke of harmony that exists between the created and the creator when the soul awakes, and in sweet and joyous contemplation, is drawn from "nature, up to nature's God."

From this reverie I was aroused by the kindly greeting of warm hearted friends bidding me join them in a ride up the mountain side. A moment more, and we were seated and ready; a crack of the whip, and we went forward and upward, speedily, merrily, and happily; now gliding onward over a smooth and pleasant plain; now plunging down into a dell, the light shut out by the arching trees, again bursting forth upon the plain; now down, now up; one moment shrouded in darkness the next silvered over by twilight rays. Now the eye feasted upon the gorgeous scenery that lay in beauty around and above us as we gazed in silent awe. Anon the heart was lifted up and spoke its joy in some rich and thrilling song, and "Away o'er the mountain's brow" was sung and felt to be in reality.

A few miles ride and we came to the end of our carriage road, our horses unharnessed and made fast, and taking our materials for a moonlight repast we ascended the remainder of our journey on foot. One hour more and we had reached the goal,—we stood upon the lofty summit!

"Many hands make light work," and quickly the stray fallen limbs and branches were gathered together, and the brilliant light that illumined the tree tops and the clouds, told that a fire was burning upon the mountain top. 'Tis indeed a happy thought in a world like ours that we can find kindred spirits congenially to whom we can reveal the heart thoughts with whom we can meet and be our very selves, throwing off the cloak custom would almost force us to wear, lest some form of etiquette should be infringed, or the sensibility of some "Mrs. Grundy" should be shocked at our daring independence of thought and speech—not I, I guess.

The [illegible] were [illegible] to our use the fine flavor of the China herb *alias* "ningyong extra" and the gay smile of our fair friends, that "tea was cozy," soon found us seated upon a broad and spacious rock (made for purpose for a tea party), as happy a group as ever drank tea by moonlight, six hundred feet in the air.

The table ground beneath the weight of good things. True friends thus met with heart and happy hearts, again [illegible] the tales of the [illegible]. Our hearts [illegible] and sang—[illegible] prepared to say the words, a [illegible] or a [illegible] upon the wild and beautiful, [illegible] for [illegible] and enough to spare.

[illegible]

there, and though loth to leave, the hour had c[illegible] that we must look our last look at the jo[illegible] scenes around us, and "gang awa."

Our descent from the mountain was more r[illegible] that graceful, more speedy than safe; yet st[illegible] nerve, youthful vigor, soon brought us to [illegible] "bonnie steeds," and soon we were speeding [illegible] way homeward to the "earth below."

Scenes like these from an epoch in one's li[illegible] they are to life what fragrance is to the flo[illegible] adding a double value to its former merit—[illegible] how many such scenes might come up in [illegible] day life, were we more reflective. We rush [illegible] thoughtlessly that we loose golden opportun[illegible] for heart happiness.

Never, never shall the reflection of that ha[illegible] evening pass from my memory. 'Tis like a [illegible] ture, on my brain daugerreotyped. I have l[illegible] it o'er again in my dreams, and it was w[illegible] dreaming on that I found a fac similie of [illegible] hurried sketch—it was indeed so! and it [illegible] legibly marked around in red ink, significant [illegible] most happy event, and it bore this date—"Mo[illegible] Tom."—*Vermont Mercury.*

Omnium Gatherum.

Want of Perfection.—A person, ha[illegible] upon on one occasion gotten Sir Philip Fra[illegible] into a corner, and innocently mistaking his a[illegible] tions and gestures for extreme interest in the [illegible] rative which he was administering to his pat[illegible] was somewhat confounded when the latter, sei[illegible] him by the collar, exclaimed with an oath, [illegible] "human nature could endure no more." I[illegible] impossible for men to always put an exact in[illegible] pretation upon the real feelings of those wh[illegible] they address; but not unfrequently by the i[illegible] propriativeness of things, thousands of individ[illegible] are placed in as uncomfortable a position as t[illegible] of Sir Philip in the corner.

Supercilious Requiter.—Rodger S[illegible] man was representative in Congress from C[illegible] necticut, and distinguished for his devoted patr[illegible] ism and his great natural talents; but unfortuna[illegible] he had been a shoemaker. At one time he [illegible] cited the ire of John Randolph, who, rising w[illegible] his usual squeaking sounds, said: "I sho[illegible] like to know what the gentleman did with [illegible] leather apron before he set out for Washingto[illegible] Mr. Sherman replied, imitating the same squ[illegible] ing: "I cut it up, sir, to make moccasins fo[illegible] descendents of Pocahontas?"—It is seldom t[illegible] quiet minds stoop to such meanness as reflect[illegible] upon one's origin or previous occupation, [illegible] when they do so, it is agreeable to see the re[illegible] made a torture.

Curious Extract—(From a Scotch pape[illegible] 1797).—Copy of a printer's bill presented to [illegible] Vestry, for work done in our chamber:

To filling up a chink in the Red Sea and [illegible] pairing the damages of Pharaoh's host.
To a new pair of hands for David and [illegible] den and a new set of teeth for the lion.
To repairing Nebuchednezzar's head.
To cleaning the whale's belly varnishing Jon[illegible] face and mending his left arm.
To a new skirt for Joseph's garment.
To a sheet-anchor, a jury-mast, and a long b[illegible] for Noah's ark.
To giving a blush to the cheek of Eve on [illegible] senting the apple to Adam.
To painting a new city in the land of Nod.
To cleaning the garden of Eden after Ada[illegible] expedition.
To making a bride for the Saviour's ba[illegible] and mending one of his eyes.
To putting a new handle to Moses' basket, [illegible] fitting bulrushes.
To setting [illegible] fuel to the fire of Nebu[illegible] nezzar's furnace.
[illegible] payment. D[illegible]

Relief.—Who that has ever seen the [illegible] and has felt anything of a [illegible] heart, [illegible] because [illegible] could the [illegible] Roderick [illegible] when he [illegible] of his [illegible] [illegible]

Ingenious.—Young man [illegible] [illegible] [illegible]

THE CALIFORNIA FARMER.

To the Friends of Agriculture.

We ask of all to whom we send this number, who are not already subscribers, to examine the FARMER, and to give it their influence. We trust to hear from them and to know that they will not only become subscribers to our Journal, but favor us with their communications. We desire to call their attention to our terms of subscription for clubs.

A Premium---Farmers' Clubs.

With the hope of inducing such of our friends, and theos who have a little leisure, to ride among their neighbors and introduce an AGRICULTURAL PAPER, we take pleasure in offering the CALIFORNIA FARMER: and, to make it an inducement, we say to such friends—if you will get us FIVE subscribers, and remit the amount, we will send you SIX PAPERS, or for TEN subscribers, TWELVE PAPERS. We trust there are many friends who will cheerfully take a little pains to aid us, and thus extend the circulation of the FARMER, and make a useful vehicle for the Agriculture of California.

To Our Patrons.

TO ADVERTISERS.—We would call the attention of those who desire to have their advertisments produce quick returns, to the pages of the CALIFORNIA FARMER.

The FARMER will reach sources of trade entirely new and unattainable by any other means, and thus secure a large and immediate profit to those who desire to make known their business. By a glance at our advertising columns, it will be perceived that we present the best known and most extensive houses, and as we have space for but one or two of each branch, these will be the most prominent houses, and thus give more influence to them.

Real Estate---Shipment of Specie.

By referring to the shipment of specie, it will be perceived that the amount is much lessened by the last boats. The causes for this cannot at this moment be truly known. It will be admitted readily that the depressed state of trade throughout the State, the want of rains to assist in mining operations, from whence come the supply of the precious "dust"—and the overstocked market in all kinds of merchandise, all operate to check the export of gold. We should also notice that extensive sales of real estate have been made during the last month, both in city property and estates in the country. This has required a large amount of capital, which might have been used in merchandizing, had the state of trade warranted it. By inquiry, it will be found that had business been brisk, the usual quantity, in all probability two-and-a-half millions, would have left the country.

The question arises—which will result in the greatest good to the country—the most permanent good—large shipments, easy money market, and high prices of merchandise, or the investment of the same capital here in real estate, the improvement and cultivation of the country, the producing our own supplies, and the manufacturing for all our own wants. The present high price of real estate is certainly an index of the confidence felt in that property over all others, and the large amount of foreign capital now investing in that property, and the increased attention given by the cultivators of the vast plains and valleys, will soon give a new tone to all kinds of trade. Rapidly we are becoming a manufacturing people, and, with the skill and talent now in the country, and that which the present prospects of California will soon draw to us, the time is not far distant when, instead of millions being sent abroad by every steamer, we shall, by becoming a home producing State, retain the wealth here accumulated, for the use and benefit of our own people.

Correspondence of "The Farmer."

We have on file many valuable and interesting letters from cultivators, from various sections of the State, from which we shall take the liberty of making extracts; that our friends may know we have received their valuable communications, we mention some of their names, and thank them for their interest: H. Marshall, Bodega; J. W. Russell, Pajaro Valley; T. P. Rohh, Sacramento River; J. Bryant Hill, Martinez; R. S. Kilburn, Nappa; Maurice Williams, C. P. Hester, F. F. Letcher, and C. Jones, San Jose; G. D. Dickenson, Tuolumne Co.; A. G. Register, Georgetown; R. H. Sawin, Santa Cruz; C. M. Hudspeth, Bodega; B. Polley, Downieville; Joseph Woodham, C. B. Smith, Martinez; Columbus Cooper, Sierra Co., and many others. We shall be glad to hear from our friends at all times, and to make known the practical results of their labors.

FAT OX.—A very fine fat ox has been exhibited on Bush street, at the Eureka Market House. The Ox would weigh from 1,500 to 1,600 lbs, and is a truly noble animal. It gives one a good appetite to call at this market and look at the fine sirloins, rib pieces and choice cuts.

EXTRAORDINARY BEAVER.—We saw, passing along K street, Sacramento, on Saturday last, an uncommonly large Beaver. It was a load for the man, who seemed to bear a heavy burden; it was caught on Dry Creek.

We had the happiness last evening of attending the readings of Mr. J. E. Murdoch, at Musical Hall. From an intimate acquaintance with that gentleman's wonderful accomplishments in elocution, we were prepared for a refreshing and most delightful entertainment; but, as of other days, when we have seen him hold in entrancement the cultivated minds of thousands of individuals, so did we hear last night what we cannot describe, what in justice we must leave to the appreciative feelings of the audience to conceive. His readings of the speeches of Brutus and Mark Antony; the conflict between Roderic Dhu and Fitz James, the Thanatopsis of Bryant, the Avalanche in Switzerland, were all so exquisitely rendered, as to leave nothing to wish for in the writer or reader. But in nothing was he so much at home, as in reproducing and giving effect to some of the facetious and irresistible scenes in Nicholas Nickleby. In the readings of Mr. Murdoch from Dickens, the power of the artiste was so strongly developed as to enable one to fully understand why he has secured such an exalted rank in genteel and elegant comedy. The power of the man over his own rich and incomparable voice, his accurate conception of the meaning of writers, and his exact conception of the relation of words to sound and sense, gained him such marks of applause as a man could not fail to treasure when it came to him from an audience of refined intellect and good taste. We do wish this gentleman could be sustained in a full and varied course of such readings as he gave last night. It appears to us that nothing could exert a more elevating effect upon society than such entertainments.

FOR the first time, we believe in the history of San Francisco, there was a "run" last evening and this morning, upon one of the leading banking houses of this city—Messrs. Adams & Co.—a house as solid, financially, as the rock of Gibraltar is, physically. The run was occasioned by a panic created by the circumstance of the name of the firm failing to appear among the shippers by the steamers of the 16th. Casual depositors, and parties making irregular remittances, became alarmed, supposing that Adams & Co. had sent nothing by the steamers; while in fact, they had shipped per John L. Stephens, $255,902; per Sierra Nevada, $122,000; total shipment on the 16th, $377,902. The house has of course met, and will continue to meet, all demands that have been or may be made upon it.—*Eve. Picayune.*

We are most happy to note the tone of confidence pervading the community respecting this responsible and influential Banking house. The readiness with which capital has been tendered them can be inferred from the MILLIONS placed at their disposal.

This is a question which involves the best interests of a wide spread community, and there is no one house whose influence is more widely felt. Not only is the effect felt at San Francisco, but at all their numerous offices, scattered at every point; and, in addition to this the immense amount of treasure confided to their care from every mining region and every mercantile community over the State. The evil suffered, and the damage done by any interruption to such an influence cannot be counted, and it behoves all to condemn in the strongest terms any act that shall tend to injure the credit or shake the public confidence in any institution, and more particularly in a House to whom the citizens of California are so largely indebted for facilities of communication and business as the house of Adams & Co.

Many interesting as well as amusing incidents might be mentioned of the events of the day—such as a deposit being withdrawn by one party of $7, while another would make a deposit of thousands. The House rendered every facility, and most readily and cheerfully, and gave notice that they would keep open till *midnight* to accommodate all who desired their money. Such was the general feeling throughout the best informed part of the citizens that, there being a plenty of "oro" on hand, those who unnecessarily became alarmed would soon find they had "their trouble for their pains."

For if all be true we hear people say,
More gold came in than was carried away.

THE brig J. B. Brown, hence for Oregon, returned to this port on Tuesday, having been struck by lightning at 8 P. M. on Sunday, about four miles from Point Reyes, which carried away main and fore topmasts, yards, sails, and all attached, together with the jib-boom. Being close on a lee shore at the time, was unable to save any of the gear. The man at the wheel was struck by the main boom, and had his hand injured.

ENORMOUS ROOT.—The San Jose Telegraph makes mention of a beet 3 ft. 3 in. long and weighing 42 lbs. It was grown in the garden of Mrs. Crandall.

Envy.

"ENVY'S A COAL, HISSING HOT FROM HELL."—*Festus.*

THERE is no one ingredient that is found in society that is so great an element of discord and unhappiness as the theme of our present remarks. It is indeed all that Festus so *warmly* describes; it is the gangrene that is found in the social circle; like the deadly Upas, it casts forth a miasma that is death to all the generous impulses of our better natures; like as the leaven hid in the measure of meal leavens the whole lump, so envy affects all within its reach—it taints all it touches.

Envy is the prolific mother of other evils that clearly follow in her train, and society has long suffered their blighting effects. Envy opens her lips, and the base inuendo is hurled against some spirit who dares essay a higher region, or nobler flight; the pointed arrow may perform its hateful mission, and pierce the ascending one, checking for a time the lofty flight, but the poison upon the shaft will soon be spent—for the pure blood will soon overcome the evil, and the flight will be the loftier when the contest is ended.

The spirit of detraction, which is so fondly nursed by this mother of evil, scatters broadcast its foul seed, and thorns and thistles obstruct the pathway of life, which otherwise would be strewn with flowers.

Envy is an assassin—a cowardly poltroon, that unsheaths the dagger in the dark, and stabs in the back; it does not strike openly, or in the light of day; "it hates the light, because its deeds are evil." One needs almost a coat of mail to be preserved from its venomed blow. None are safe from this walking pestilence, unless they lie face downwards to the earth, until this simoon, that would make a desert of all God's fair earth, has passed. Envy was originally doomed to crawl upon the earth, and the slimy monster would fain doom mankind to crawl also—all that dare walk erect—all that dare breathe the pure atmosphere of something above earth, are objects of its inveterate hate, and it would fain throw its slimy coils around them, to drag them down to its own level. But there has been found an antidote to heal this monster's sting—an antidote better than a coat of mail—a protection better than rings of steel or plate of gold—it is a brave spirit. A heart thus shielded wears a talisman that is proof against envy; every shaft will fall harmless, or be returned into the bosom of those who sent it. A truly brave spirit feels this, and looks calmly on, knowing the final result will be victory.

Life can never be free from evils. Flies may buzz about us—may annoy us, until we lose command of our temper; yet we should remember that flies are a necessary evil—they consume the impure air, and our health is better for their annoyance. The bee may sting us, and the smart may draw from us complaint; yet we should remember that the purer our own blood, the less inflammation arises from the sting, and consequently the less pain. Let us, then, keep our minds calm under these evils, and envy, malice, hatred, and uncharitableness, and all the train from pandemonium, can do but little harm, if we have the panoply of a brave spirit!

Rains.

How many hearts have been desponding of late—the miner the merchant, the banker and the agriculturalist; all were looking to the heavens for relief. Rain! rain! give us rain! The prayer of anxious hearts has been heard, and the clouds have given of this abundance. The pattering rain has caused many a smile, it has been to the countenances of men what the dew is to the plant, refreshing. How many pleasant dreams have been occasioned by these blessed rains; how sweetly sounds the falling drops upon the roof. The softest notes of the harp hold no comparison to it, for fortune and life,—life, business life—hangs upon these gentle streams. Could its value be told in dollars and cents, it would be millions; but there is a value above all this—it is the happiness it has diffused, and that is above all price.

THE new hotel in Sacramento built by Henry E. Robinson, Esq., was opened on Tuesday. It is fitted up in elegant style, and is to be under the charge of Mr. Jones, formerly of the Tehama House. We regret we were not able to respond to their polite invitations to attend the opening dinner. Our mouth waters at the thought of the good things that would have been tempting us.

THE following paragraphs, from the President's Message will be read with pride by every true American. These are sentiments worthy the Chief Magistrate of a great nation.

Recognizing the wisdom of the broad principle of absolute religious toleration proclaimed in our fundamental law, and rejoicing in the benign influence which it has exerted upon our social and political condition, I should shrink from a clear duty, did I fail to express my deepest conviction that we can place no secure reliance upon any apparent progress, if it be not sustained by national integrity, resting upon the great truths affirmed and illustrated by divine revelation. In the midst of our sorrow for the afflicted and suffering, it has been consoling to see how promptly disaster made true neighbors of districts and cities separated widely from each other, and cheering to watch the strength of that common bond of brotherhood, which unites all hearts, in all parts of this Union, when danger threatens from abroad, or calamity impends over us at home. * * * *

Martin Koszta, a Hungarian by birth, came to this country in 1850, and declared his intention, in due form of law, to become a citizen of the United States. After remaining here nearly two years, he visited Turkey. While at Smyrna, he was forcibly seized, taken on board an Austrian brig of war, then lying in the harbor of that place, and there confined in irons, with the avowed design to take him into the dominions of Austria. Our consul at Smyrna and legation at Constantinople interposed for his release, but their efforts were ineffectual. While thus imprisoned, Commander Ingraham, with the United States ship of war St. Louis, arrived at Smyrna, and, after inquiring into the circumstances of the case, came to the conclusion that Koszta was entitled to the protection of this government, and took energetic and prompt measures for his release. Under an arrangement between the agents of the United States and of Austria, he was transferred to the custody of the French consul-general, at Smyrna, there to remain until he should be disposed of by the mutual agreement of the consuls of the respective governments at that place. Pursuant to that agreement he has been released, and is now in the United States. The Emperor of Austria has made the conduct of our officers who took part in this transaction a subject of grave complaint. Regarding Koszta as still his subject, and claiming a right to seize him within the limits of the Turkish Empire, he has demanded of this government its consent to the surrender of the prisoner, a disavowal of the acts of its agents, and satisfaction for the alleged outrage. After a careful consideration of the case, I came to the conclusion that Koszta was seized without legal authority at Smyrna; that he was wrongfully detained on board of the Austrian brig of war; that, at the time of his seizure, he was clothed with the nationality of the United States; and that the acts of our officers, under the circumstances of the case, were justifiable, and their conduct has been fully approved by me and a compliance with the several demands of the Emperor of Austria has been declined. * *

I commend to your favorable consideration the men of genius of our country, who by their inventions and discoveries in science and art, have contributed largely to the improvements of the age without, in many instances, securing to themselves anything like an adequate reward. For many interesting details upon this subject, I refer you to the appropriate reports, and especially urge upon your attention the apparently slight, but really important modifications of existing laws therein suggested.

The erection of an asylum for the insane of the District of Columbia, and the army and navy and the United States has been somewhat retarded by the great demand for materials and labor during the past summer; but full preparation for the reception of patients before the return of another winter, is anticipated, and there is the best reason to believe, from the plan and contemplated arrangements which have been devised, with the large experience furnished within the last few years in relation to the nature and treatment of the disease, that it will prove an asylum indeed to this most helpless and afflicted class of sufferers, and stand as a noble monument of wisdom and mercy.

The growth of our population has now brought us, in the destined career of our national history, to a point at which it well behoves us to expand our vision over the vast prospective.

The successive decenuial returns of the census since the adoption of the constitution have revealed a law of steady progressive development, which may be stated, in general terms, as a duplication every quarter-century. Carried forward, from the point already reached, for only a short period of time as applicable to the existence of a nation, this law of progress, if unchecked, will lead us to almost incredible results. A large allowance for a diminished proportional effect of emigration would not very materially reduce the estimate, while the increased average duration of human life, known to have resulted from the the scientific and hygienic improvements of the past fifty years, will tend to keep up through the next fifty, or perhaps hundred, the same proportion of growth, which has been thus revealed in our last progress; and to the influence of these causes may be added the influx of laboring masses from eastern Asia to the Pacific side of our possessions, together with the probable accession of the populations already existing in other parts of our hemisphere, which, within the period in question will feel, with yearly increasing force, the natural attractions of so vast, powerful and prosperous a confederation of self-governing republics, and will seek the privilege of being admitted within its safe and happy bosom transferring with themselves, by a peaceful and healthy process of incorporation, spacious regions of virgin and exuberant soil, which are destined to swarm with the fast-growing and fast-spreading millions of our race.

Later from the East.

The Nicaragua steamship Cortes, Capt. Cropper arrived early on Sunday morning, bringing New York and Washington dates to Dec. 20, and Paris and Vienna to Dec. 1—being one week later than those previously received via the Ramsay route.

Among the passengers is Thomas F. Meagher, the eloquent and accomplished Irish orator.

The U. S. Revenue Cutter Hamilton left the dry dock at Charleston on the 9th of December, and was wrecked during the same night off Folly Breakers, Charleston Bay. The officers and crew took to two life boats, one of which has not been heard of; the other, containing Capt. Rudulph, the quarter-master, and four men, was lost, and all on board drowned, with the exception of one seaman. A despatch, dated Charleston, Dec. 19, states that the body of Capt. Rudulph had been picked up that morning and brought up to the city for burial. The following is a list of those on board when the disaster happened—Thomas C. Rudulph, Captain; Camillus Saunders, 1st Lieut. Curtiss Hine, 2d Lieut.; John Mahoney, boatswain; George Carter, gunner; William Rowan, seaman; John Sullivan, do.; Geo. Thompson, alias James Menan; Thomas Seone, quarter-master; Michael Cowley, seaman; Joseph Bowser do.; James Lucas, do.; Henry Olwell, uncertain; Timothy Hurley, seaman; John Johnson, do.; James Egan, saved; Charles Brown, cook.

The great fire which destroyed the establishment of the Harpers, was the most destructive which has visited New York since 1845. The papers state that the fire was witnessed by fifty thousand people. The fire was caused by camphene, as stated by one of the proprietors. The Messrs. Harper estimate their loss at $1,200,000, and they are insured to the amount of $250,000.

The Mitchel banquet took place at the Broadway theatre, Dec. 19th. Some six hundred people sat down to dinner, and the boxes were filled with as many ladies. Charles O'Conor, Esq., presided, and speeches were made by Messrs. Mitchel, Meagher, O'Gorman, Smyth, and others. Mr. Robert Emmet made an explanation relative to the funds of the Irish Directory.

The New York Herald of Dec. 20th says—Flour again advanced yesterday from 6 1-4 cents to 12 1-2 cents per barrel, while grain was about the same. Freights were firmer, and engagements were made to Liverpool at enhanced rates.

The libel suit against the New York Herald, growing out of its attacks upon the Opera Management of 1848, has been closed by a verdict of $10,000 damages and costs against the proprietor of the Herald, and in favor of Mr. Fry.

The Howard House in Broadway, New York, caught fire on the night of December 18th, and came very near being destroyed. The roof was in flames, but by the extraordinary exertions of the firemen the fire was extinguished.

From Chicago we have a brief account of a terrible riot among the workmen on the Illinois Central Railroad, near Lasalle. It appears that an altercation occurred about wages between a contractor named Story and a party of Irishmen, which resulted in the shooting of one of the disaffected. Mr. Story was afterwards captured and brutally murdered, and his wife was fired at, but escaped. It is reported that the foreman of the deceased has since shot nine of the laborers, and the Sheriff has killed two more and captured thirty. The ringleader of the rioters escaped.

The clipper ship White Squall reached New York Dec. 20th, after a short passage of 92 days.

The Newark N. J. Advertiser states that some persons who were engaged in grading the streets of that city, came upon a large hole, about twenty feet deep, two feet wide at the mouth, and seven at the bottom. The discovery has excited considerable curiosity in the vicinity.

On Sunday, Dec. 11, a crowd, estimated at 10,000, assembled around a man preaching against Catholicism in the east part of the city. He was subjected to a great annoyance from a number of foreigners of a different persuasion, but was protected by a large body of Americans, who contended for the freedom of speech. A riot appeared imminent, when the preacher was arrested by order of the Mayor.

A great procession was then formed, and marched to the residence of the Mayor, threatening to burn down his house, unless the man was released. In the meantime the case had undergone investigation, and the man was set at liberty, when the crowd dispersed.

On the succeeding Wednesday evening an immense meeting of American citizens was held in the Park, to express their sentiments upon the arrest of Rev. Dr. Parsons, while preaching in the open air, against Popery. Some 3,000 or 4,000 persons were present, and the proceedings were marked with much enthusiasm. The meeting was addressed by some half dozen speakers, who denounced Popery, and styled the arrest of Rev. Mr. Parsons as an attempt to put down freedom of speech.

Mr. Parsons delivered another sermon in the streets on the following Sunday, Dec. 18, and was surrounded by about 20,000 persons. No disturbance occurred, and no attempt to arrest was made. Three regiments were under arms all day.

The loss by the destruction of the Marine Hotel, at Fairfield, Conn., is said to be $75,000, on which there is insurance for only $25,000.

The engine for the Fricsson is completed. By means of a caoric engine the vessel will attain the speed of nine miles an hour. The Fricsson will be placed on the route between New York and Havre.

Ocean Mail Contracts.—In accordance with an act of Congress, the Postmaster General, sometime since advertised for bids for carrying the U. S. Mails for six years from the first of October, 1854, on certain foreign routes designated. This advertisement elicited proposals from various responsible parties, which have been submitted to Congress. There was only one bid for the mails now conveyed by the Collins line. William M. Biblo, President of the New York and Galway Steamship Company, offers to perform the service, twenty-six trips a-year, to such ports in Great Britain as may be directed by Congress, but states no specific sum therefore. This is the line that expects to cross the Atlantic in six days. The Collins line now receives $858,000 per annum, and will probably retain the contract. The lowest bid for the Bremen service is $184,500, which is $15,500 less than the sum at present paid. E. Mills puts in the bid, and will probably secure the contract. For the California service the present contractors receive $733,585. They sent in no bids. The Nicaragua Transit Company offer to perform this service (with the exception of that portion of the route between San Francisco and Oregon,) for $300,000. This is the lowest offer, and will probably secure the contract. In case the new bids are accepted, government may have to pay, in some instances, a heavy sum to present contractors by purchasing steamers which will be of no particular use.—*Boston Journal.*

Snow was on the ground in New York city, December 20th. Snow storms prevailed generally the same day throughout the northwest.

Three of Joseph Hall's children, of Roshville, Iowa, were accidentally poisoned recently, and all were lying corpses in the house at the same time.

Hector Jennings, of Sandusky, Ohio, has been notified by his attorney in London, that he is undisputed heir to one-half the Jennings estate in England—$60,000,000.

On Wednesday evening, the "Aurora Club," of Lowell, announced an amateur theatrical entertainment in a large room at the corner of Prescott and Merrimack streets, Lowell, and a large audience assembled, the room being filled. Just as the curtain was rising, "down came the house" in a most unexpected manner, injuring several persons badly, amongst whom was a lady, who had her ankle broken.

Gen. Wool to be sent to San Francisco. —Another Washington writer under same date says:—We understand that Major General Wool has been ordered to the command of the military division having its head-quarters at San Francisco. Colonel Hitchcock is at present there, but will of course be superceded in command upon General Wool's arrival. It is believed the President has been induced to send Gen. Wool to California in view of the importance of the position and the necessity which recent events have demonstrated of having a military officer stationed there of the highest rank, and clothed with the fullest powers to suppress any infringement upon our neutrality laws, and at the same time to protect our citizens on the Pacific. Gen. Wool, it is understood, will leave for the scene of his duties as soon as he can make the necessary arrangements for the voyage.

Fatal Railway Accident—*Shameful Conduct of a Conductor.*—James Dickerman, an employee on the Troy and Boston Railway, was killed at Troy on Saturday evening. He was a driver of one of the teams which are used to draw the cars from the city to the depot outside of the corporation, but on Saturday evening employed another to perform his duty, and took his place in the cars as a passenger for East Bennington, Vt., where his mother resides, whom he had not seen for three years. The conductor, whose name is White, seeing him in the cars was displeased at his substituting another man for driver, and ordered him off to his place. Dickerman replied that he was going home, and offered the conductor money for his fare. The conductor refused to take it, and pushed Dickerman off the cars, when the latter fell under the wheels, and was immediately crushed to death. The conductor, we understand, proceeded on up the road with the train. The deceased was a single man, about 35 years of age.—*Albany Register, Dec. 12.*

Letter from Martin Koszta.—We find the following letter in the last N. Y. Times:

Wrested a second time from the tiger grasp of the Austrian tyrant, I am owing my liberation mostly to the generous will of the people of this Union, which, awakening to the consciousness of their providential mission and destiny, seems determined to protect those bound to their fate by the voluntary oath of allegiance, and to have honored the name of this country to the cabinets of Europe, by this generous will which inspired the acts of those entrusted with the Executive power, and which found its real, manly expression in the heroic soul of Captain Ingraham.

Touching again the shores of America, I fell it my first duty to give a feeble expression of that gratitude which I foster in the innermost of my heart toward all those who took an active or even sympathizing part in that extraordinary case, on which the American Eagle, for the first time, let lighten its thunderbolts for the protection of the weak, for human and international right. Being only an accidental cause of this interesting event which saved me, my gratitude even to the most ardent, can be only of little value to the American people; but the hope, admiration and sympathy of nations longing for liberty, and on the other hand, the confusion and fear of prescription and traitor despots, is a reward noble in its sources, lasting in its efficacy, and worthy of a "People of Sovereigns." Most respectfully,

Martin Koszta.

New York, Wednesday Dec. 14, 1853.

From Europe.

By the arrival of the Cortes at this port, we have the details of the European news brought by the steamship Asia, which arrived at New York December 11, and the steamship Asia, which arrived Dec. 15. The latest dates from London are to December 3, and from the seat of war to November 26.

The news is important. It indicates the determination of Russia and Turkey to prosecute the war with vigor, and spring will open with immense armies in the field. There is every prospect of a general European war in 1854. Divisions of the English and French fleets have entered the Black Sea; Turkey has a large squadron there, and operations on the water as well as on the land, promise to be on the most extensive scale.

Rain and snow had been heavy in parts of Wallachia, so that operations were to a great extent impracticable. The aim of the commanders was therefore to get their men under cover. Omer Pacha, after leaving the garrison in the different fortresses on the right bank of the river, has marched the bulk of his troops back to the quarters which they occupied before the passage of the Danube was effected from Widdin Calefat. Gorschekoff has imitated his example.

A Marseilles paper has the following from Constantinople: "Admiral Slade, with the ship of the line Medjidik, five frigates and a steamer, has gone to cruise in the Black Sea. His object is to force the Russian cruisers from before Anapa, which is the only port of the Caucasus in a coast of eighty miles. He is accompanied by Seffir Bey, the Circassian Chief, who was so long detained at Adrianople, and he is to supply ammunition and arms to the Lesghians, the Laghes, and the Teherkesses tribes. This expedition is of the highest importance. If the Turks succeed in taking the fortresses that defend the entrance into the Caucasus, they will put an end to all communication by land between Russia and the Trans-Caucasian provinces acquired by the treaty of Gulistan. Numerous Polish and Russian deserters have reached the Turkish advanced posts in Asia. Two thousand Russian deserters are said to have reached the Turkish camp—a large number, yet perhaps correctly stated, as the Russian army in the Caucasus was the receptacle of all punished and degraded soldiers and officers, and consequently contained a great many malcontents. Hungarian officers, who served with Bem and Dembinski, have undertaken to organize these deserters into a serviceable corps."

It is confirmed that a Russian ship of war ran ashore and went to pieces. Of crew and troops it had 1,600 men on board, of whom 1,400 perished, and the remaining 200 were rescued by the Turks, and sent as prisoners to Constantinople.

The name of the Russian steam frigate sunk by the Turkish forts of Batoum, was the Foudroyant; the same which brought Prince Menchikoff to Constantinople, and remained there at his disposal during his stay.

On the 26th of November the Turks constructed a bridge between Rustuck and the Island of Moknan. This island remains in the possession of the Turks, notwithstanding the statement that they had been dislodged by the Russian artillery under Gen. Formosoff. They had also resisted all the attempts of the Russians to drive them from their positions below Hirsova, at the confluence of the Talonitza and the Danube.

Advices from Galatz state that the fourth and fifth Russian reserve corps are in movement, and are about to enter Wallachia. The whole of the army now in Poland is to be sent to the Principalities; and drafts from the Russian garrisons, together with a portion of the Imperial Grand, will garrison Poland.

On the 24th ult. Schamyl and Ishmael Pacha were to make a simultaneous attack on the Russian lines. The result has not reached us.

Treaty between France and England.—It is positively reported that France and England have entered into a treaty, by which they agree to sustain the Turks.

Official.—An official dispatch has been received from by the Seraskier, from Omer Pacha, commander of the army of the Danube, narrating the events of the 2d, 3d, and 4th of November, at Oltenitza. It says the engagement lasted four hours, and during this time the Russian wagons never ceased to carry off their dead, nevertheless they left 800 bodies on the field. The loss of the Turks amounted to 100 men.

Sweden.—The concentration of troops in Russian Finland, and the naval squadron stationed at Helsingfors, have excited the anxiety and apprehension of the Swede, and he has recommended to the Diet a complete system of defence, in order to place the country in a position to preserve its independence.

Austria continues active in concentrating an army on the Transylvania frontier.

Mr. Chickering's Estate.—We learn that Mr. Chickering's affairs are left in such a state, that it will require very little time to close them up, and that it is the intention of the family to continue the business as heretofore. Mr. Thomas F. Chickering is himself a most accomplished and experienced mechanic, and is in every way qualified to assume a position which the loss of his father imposes upon him. He will be assisted by his brothers, Messrs. Frances & George Chickering, and with the aid of Mr. George Chase, for many years the foreman and of Mr. C. H. Chase, the book, we anticipate for them many years of prosperity.—*Boston Gazette.*

The Horse.

The frequent exhibitions of cruelty practiced upon this noble animal, which we witness in our streets, and which demand the rebuke of every friend of humanity, induces us to lay before our readers such information, from time to time, as shall awaken the proper interest in the training and care of the horse, until his abilities and powers are better understood and appreciated.

There is probably no city in the Union of the size of San Francisco, where so many splendid horses can be found; and our express offices, job wagons and draymen are in possession of some of the handsomest and most powerful in the United States.

The following most excellent article from the "Farmer's Companion and Journal of the West," published at Detroit, Michigan, we recommend most highly:

Hints on Breaking Horses.—I. There is nothing more important about a horse than that he should be well trained. His usefulness as to ability, and the comfort, and even safety of the person using him, depend on judicious management for a year or so of the animal's life.

II. "Persuasion is better than force;" almost anything may be done with a horse by steady kindness. By nature it is timid; but when once gains confidence with its master, it becomes almost a rational being, and may be treated as such. On the contrary, severity, harshness, passion, and blows, rarely fail to spoil a young horse's temper, and render him either faulty or vicious. Better spend an hour in *persuading* him to do a thing, than two minutes in whipping him to it. He never forgets the first; while the second ceases to be an object of terror to him. A horse wants to *understand* what he is to do; and, when his judgment is once convinced that all is right, the difficulty is over. A horse is very apt to have the same temper that his trainer or master has.

III. A young horse, like a child, is a creature of imitation. It is much easier to teach it by the side of an old horse than by itself. It fully appreciates rewards; and the best horse-breakers give a young animal a handful of oats, or a piece of bread when it does well; clapping and playing with it. It certainly understands it, and in view of the reward takes pains. So, many give a few oats on returning it, after exercise, to the stable.

IV. It is believed by many, that a young colt can be trained and become attached to its master if he will cover its eyes with his hands, and breathe for a few minutes into its nose. Doing this frequently, for a few days, certainly seems to produce an effect; and we have known a colt to follow us about like a dog, after doing it, and another put up its nose to our face whenever we visited the stable. It is not infallible, but it is worth trying, and persevering in, for a few days or weeks. Wonderful stories of the effect of familiarity are told in the books; and it is simple that every one can make the experiment.

V. The breaking should begin after the second winter, on the principle that a young animal is more easily trained than an old one. At first, let it be bitted with a bit smaller than usual, and carefully selected so as not to hurt its mouth; with this, the lines being loosely fastened to a roller round its body, it may be suffered to run itself for a few successive days, for an hour or two at a time, and occasionally led about by a halter.

VI. The *halter-breaking* being perfect, and the animal following easily, and becoming tractable, portions of the harness may be put upon him, and last of all the blinders (if used); and a few days after, he may go into the team with a steady old horse. Let the wagon be light and empty. Let nothing be done except to speak kindly to him. The other horse will keep him moving, and he will soon learn to pull. If he is in any way frightened, sooth him, play with him, and show him that nothing will hurt him. When this is accomplished, gradually increase the load.

VII. The most difficult thing to teach is backing; and this, perhaps, is best taught by teaching him to back *out of* the wagon; then with a light wagon, and afterwards with a heavy one; see that he is perfect in each step, before progressing, and that his mouth is not hurt. It may be useful, at first, to have a second person to press him back steadily by the nose, till he begins to understand what is wanted. Patience and kindness are peculiarly necessary here, as all a horse's instincts are opposed to this movement.

VIII. Use the voice more than the whip, rather never use the whip except in case of vicious and bad temper. Let the words be distinct, always accompanied by an action the horse will learn what they mean. Remember that is like teaching you the language of Timbuctoo. The Arabians never use a whip. Foot voice and rein are quite sufficient. The slightest approach to a whip is a tap of the heels, or click on the roof of a cheek. With kindness and perseverance will be anything with a young horse.

THE CALIFORNIA FARMER.

JOHN F. MORSE, Editor.

SAN FRANCISCO:
Thursday, January 19, 1853.

Dwelling Houses in California.

We know of no subject more worthy of consideration than the above. Health and comfort in all countries are so much affected by the adaptation of dwelling houses to climate, that too much attention cannot be awarded to a local architecture. Houses that would be comfortable in the bleak and frosty regions of the north-eastern States, are by no means calculated to suit the requirements of such a climate as that in which we live. In the former States the situation of the dwellings and the size of the rooms are so arranged as to make it less difficult to keep them warm in winter. This is a leading feature in the construction, both internal and external, of houses that are erected in a cold climate, and it is a principle which cannot be carried out without defeating, to a great extent, one of the most important points in any residence—namely, that of free ventilation. But in California there is nothing in the climate requiring such an architectural feature. On the contrary, one of the first, if not the most important requirement of architecture in this country is to have the position of the house and capacity of rooms so developed as to prevent the inconvenience of the long and oppressive season of an exalted temperature. Houses in California, instead of being so built as to interrupt currents of air, should be so located and constructed as to promote them. In no country is there a greater necessity for high ceilings, for long and capacious halls, and for a general communication of rooms, or for projecting roofs and broad and long portices. A house so constructed as to present these features cannot be an uncomfortable house in winter or summer, and it will certainly be kept in better ventilation, and in consequence more healthy, than by any other system of architecture that can be adapted in California.

The location of a dwelling in this State most favorable for securing a free circulation in the hot summer months, is nearly north and south. At least our observation has induced the conclusion that houses so situated are much cooler and of course more comfortable. But in no section of the world can the beauty and healthfulness of high ceilings be more consistently secured than in this, and where there is no good reason for compelling a person to live in the constant inhalation of a rarified and deteriorated atmosphere, there is the strongest motive which health and common sense can urge, in favor of breathing the pure and invigorating air of heaven.

No conviction ever fastened itself upon our mind with more force, than the belief that half the diseases of mankind are superinduced by the exhausted and not unfrequently nephetic air which is being forever breathed in contracted parlors and drawing-rooms, and miserable pent-up sleeping apartments. But not only is it a good thing in California to consult an architecture adapted to the climate, and a location of house favorable to comfort; but it is especially a proper object in this country to pay attention to the cultivation of shade trees. We never yet got our mind so tinctured with notions of malaria from the decomposition of vegetable matter, as to fear the autumn leaves of a forest. On the contrary, such is the reciprocal necessities existing between the vegetable and animal kingdoms that the health of each can be best preserved by an intimate connexion. But we cannot now define the mutual dependencies that exist in this respect. The fact is too generally known to be denied in the reference, and the suggestion can be best responded to by embowering the dwellings of our country in the foliage of cultivated shade trees.

And then again, there is another matter of no small interest, in the kind of material best adapted to the building of houses in California. We believe it is the existing impression that brick can lay claim to being the best material of which houses have as yet been built; whether this be so or not, one thing is certain, that it is next to wood the most convenient material to secure. We do not believe however that sufficient attention has been paid to this part of our subject to warrant a full and final conclusion. But we hope that what we have already said upon the subject of houses will cause architects to give the public the benefit of their views, and that a subject of so much importance may not be postponed or kept in abeyance until our State is studded with buildings unfitted to climate, beauty, health or comfort.

Osage Orange.

We have been frequently desired to furnish directions for the *planting* the seed and preparing the ground for the plant, the transplanting, and the system best adapted to make a permanent hedge.

This is a subject of very great importance in this country; the cost of fencing is one of the heaviest bills the cultivator has to bear, and it is, or should be, his first care that what he does, should be done well.

We know that many suppose that it would require a great length of time to secure a Hedge from the Seed; yet it is not so. If the proper care is given in planting, cultivating, transplanting and heading in and forming the hedge, *three years* from the seed will give a very good barrier against intrusion; the fourth year a strong protection, and the fifth year an impregnable fence, a protection against man and beast, and even the smaller animals.

We recommend the following rules to be adopted to secure the most desirable fence needed in California: First secure good seed; a large portion of the seed offered having been boiled out, the life has been destroyed and the seed is worthless. No seed is good and reliable except that which has been carefully selected and washed out, after what is called the rotting process; in this way the seed is reliable. We recommend the seed to be soaked over night when the season of planting is a dry one—in moist weather it is not needed. The ground should be ploughed very deep; subsoiling will add to the growth of the seedling. Plant in broad drills quite thin, after the ground has been well and thoroughly pulverized; cover the seed two to three inches in wet weather, three to four in dry weather. When the seedlings have grown half the season, head them down one half—this will cause them to grow strong and be better furnished with roots. It will add to the strength and health of the plants to plough and cultivate between the rows of the seedling plants. When proper attention has been given to seedlings, they will make three to four and a half feet growth and strong plants the first year, and thus be ready for transplanting in the month of December or January, according as the earth may be suitable.

When a permanent hedge is to be made, the lines should be drawn and the ground plowed and subsoiled three feet wide; the soil should be moved if possible two feet deep. Great success lies in this deep culture. When plowed, a covering of four inches of good manure will add much to the health, growth and beauty of the plants.

When the ground is thus prepared, the plants should be selected from the nursery rows of equal size and strength, and these should be planted with a line, in double rows, the rows one foot apart and the plants one foot apart in the rows—setting them triangular, so as to break joints, thus filling the rows and making an uniformity in both sides of the hedge. The plants should be set a little deeper than they originally grew.

We recommend another feature in preparing a hedge for extensive grounds. Select a stronger plant than the average, and plant one every twenty-five feet. These are to be permitted "to rise with unclipped wings" and form a tree. It requires but little imagination to conceive of the beauty of a long and continuous hedge of living green for miles, ornamented with golden yellow fruit; and then towering up along this line, magnificent trees, twenty, thirty, forty, and fifty feet high, bearing the same golden fruit. All this can easily be accomplished by commencing right and doing it well.

After the transplanting is finished, and after the plants are first set and the ground levelled around them by treading lightly and raking clean and smooth, the plants should be cut down to within two inches of the ground; this will cause them to branch freely and grow thick. When they have reached two feet high, cut them back one-half; this causes them to grow slowly and branch again, and if the season is favorable they can be shortened a second time, and the work is done of pruning the first year. Let it be remembered that the ground around this hedge should be cultivated often and kept free of weeds and grass. Remember, too, in pruning, never to prune the strong plant you intend for the tree; this must grow unmolested, save pruning *up* the branches after the height of the head is reached.

The second year, in the spring, when the sap moves, head in again half or the whole of the last growth of the former year; do this according to the strength of the plant, and also commence forming the sides by strengthening them.

The form of the hedge must be according to the taste of the proprietor—square side and top, or conical, or round. Great care must be used in turning the top, lest by forgetfulness you clip the standard tree; a bit of red cloth to denote them will secure them from danger.

The third year the same course, only more pruning at the sides to make the hedge compact. With a little care and taste, a hedge can thus be made, and almost be impervious to the smaller animals.

With the hope that these hints may be of some service to our friends, we take leave, promising to give some hints by-and-by in regard to preparing *buildings* of the same materials.

The Cultivation of the Rose.

The luxuriant growth of this Queen of Flowers, in California, has astonished many who supposed they were familiar with the nature and habits of this loveliest gem of Flora. Besides this, its increased blooming powers, and its adaptation to our gardens, will soon enable us, in this country to present many new and valuable varieties by seed and by hybridation.

Many of the very choicest kinds, those of slow and delicate growth in other countries, become strong and vigorous; those that were shy bloomers increase their size and number of blooms, and and those which hardly produced perfect blooms, become here some of the finest blooms we have ever seen.

We were preparing brief directions for the cultivation of the rose from slips, that our fair amateurs might have an opportunity to experiment and show their skill—when, upon opening a familiar work received by last mail we found the directions so admirably given by a practical florist, in the form of a story, that we preferred to give it to our readers entire; and we believe they will read it with interest, and obtain some practical lessons to guide them. Here it is:

AUTOBIOGRAPHY OF A POT-ROSE.

A writer of no mean authority has said, that whenever an individual speaks of himself, we should listen with attention, as we may almost invariably gather from his remarks an insight into his character and nature. It is because I believe in this opinion that I am about to relate my own history; and if by withdrawing the veil, the public, by knowing more of my nature, should think less favorably of me, I shall at least have the satisfaction of having dissipated the false reverence upheld only by seclusion, and my associates may be gainers by the light thus thrown around my path.

Much that occurred in the first few weeks of my existence is of my existence is of course not very vividly before me; and lest I should mislead the public, it is perhaps better that such should be passed in silence. I, however, distinctly remember existing as a short branch, terminated by a flower-bud, in company with other branches, on what is termed the parent tree; and although deriving sustenance from the same root, and through the same stem, I had a certain sense of my own independence—of my capability of becoming a separate individual, and being in after times the main stem whence should arise Branches like myself. As I heard one and another bestow a passing word of praise on the freshness, beauty, and fragrance of my flower, but reserve the *comble de gloire* for the plant on which I grew, I longed for the time when my master, who was a nurseryman, should see fit to detach me from my parent and place me in a state of cutting, to begin life entirely on my own account.

Accordingly, one morning, just as my flower had dropped, I heard with joy, as he gently pressed me between his finger and thumb, that I was "ripe enough," to use his own words, and that on the morrow I was to become a cutting As the preparations for the coming event were made beneath my own eyes, I shall relate as briefly as possible the bare facts, not troubling the reader with my hopes, fears, and aspirations, as they may be more easily imagined than described. First of all was brought into the house about a peck of pure yellow loam, chopped fine, but not sifted; it appeared to have been the top-spit of an old pasture cut, and laid up to dry and air some months previously; the next material was about half a pock of decaped leaves, technically called leaf-mould, and next about a quarter of a peck of white sand. These materials were laid on a flat board and thoroughly mixed together by turning them frequently with a small spade, and then pronounced ready for use. I now saw a quantity of pots brought in, of the size called large sixties, and a boy followed with some broken pots under his arm, some brickbats, and a hammer. He began breaking the pots into pieces nearly the size of the bottom of the pot, and put one piece the concave side downwards over the hole in each pot; he then broke the bricks into pieces about the size of a nut, put a handful over each piece of crock, and filled the pots with the soil previously prepared, pressing it down rather firmly, and striking it off level with the top of the pot with his hand. I now made a pretty shrewd guess that into one of these pots I was to go; and with an exulting heart I saw my master approach with a little white-handled knife in his hand, and before I scarcely knew it, I was severed from the parent stem. After the *debris* of my flower was cut off, there remained two leaves; the upper one was left intact, and the lower removed; the stem was then cut straight, just below where the bottom leaf joined it, and I was cutting "made."

I was now inserted in company with three others, in one of the pots previously described. A hole was made at the side of the pot with a dibble, about the size of an ordinary cedar pencil, and the lower two-thirds of my height were placed firmly under the soil. The pot was then removed to a frame, with a gentle bottom-heat, and plunged to the rim in saw-dust. For the first few days I suffered greatly, owing to my old sources of nourishment being cut off, and having as yet no power of appropriating the new ones at my disposal. I am sure if my master had not exercised the greatest care and watchfulness over me, I must have died; and I resolved, if I recovered, to show my gratitude, by throwing blossoms and odors around his dwelling all my life. He kept a tank of warm water flowing beneath me night and day, by which means not only was the soil in which I was placed made warm and comfortable, but a moisture arose and adhered to the under sides of my leaf, which proved peculiarly refreshing. Whenever the sun burst upon me, threatening in my then state to exhaust me of my juices, he ran with a mat to afford me shade; and he further refreshed me morning and evening with a dew-like shower, thrown through a fine-rosed syringe. In about eight days the juices exuding from the top and bottom of my stem had formed a callons; and a few days later white porous roots began to form, with sponge-like points, that sucked up the moisture from the soil, and felt my almost exhausted strength rapidly recruiting. My master now allowed a little sun to fall on my leaf in the morning, and admitted a little air into the frame in which I had been closely shut for a fortnight By this treatment my strength became so great, and my roots spread so rapidly, that the eye in the axil of my leaf began to grow, and I was shaken out of the cutting-pot and placed in a pot of the same size by myself, in a soil something similar, but with decayed manure instead of leaf-mould, and about one-fourth the quantity of sand. I was here separated from my companions, one of whom had died a cutting, not having been sufficiently ripe when taken; one had not yet rooted, having been too ripe; and the fourth was placed in a separate pot like myself. I was now carried back to a frame with bottom-heat, syringed with water morning and evening, and shaded from the sun as before. For the first two or three days but very little air was admitted, but after that time more and more was given every day, the shade was made lighter by degrees, till at last the frame was entirely removed, and I was exposed to the sun and air night and day. It was now July, and the growing season was before me; my first anxiety was to show my gratitude to my master, and being of the kind called "autumnal," by the third week of September, I produced three, not over-large, but finely-shaped and highly-colored flowers.

As the nursery in which I grew was much frequented by lovers of flowers, I heard many high encomiums passed on me; and one evening I was purchased by a quaker, a piece of white paper was tied round my pot, and I was placed inside his carriage; and I, who before had only lived, now lived and moved I knew not whither. It was gratifying to me to see how my new master gazed upon me, handled me, and inhaled my attar breath, regarding me, as I thought, with more than usual interest, because he considered my destiny altogether changed in his hands. For my part, I resolved to do my best to please him, as I had done my former master. Soon the carriage stopped; I was handed out, passed through the the hall and drawing-room, admired by the servants and ladies, and placed by my master in the conservatory. I had not been long here before I saw a red-faced happy-looking man, without a coat, and with a blue apron, coming toward me with a watering-pot; this, as I afterwards learned, was John the gardener. My master met him close by me, and a conversation immediately ensued, ending by John expressing himself highly pleased, but wishing I had been a *wee bit bigger*. When I had shed my flowers, I was taken out of doors, and a frosty night having denuded my branches of their leaves, I was removed to a cold pit for winter quarters.—*Turner's Florist.*

Corn Cribs may be rendered *rat-proof*, by placing a large milk pan, bottom up, on the top of each post on which the crib stands, and having a moveable ladder by which to enter the door. The rats climb up the posts, but can get no further. Mice will also be excluded, unless carried in with the corn.

Varnish for Iron Work.—Dissolve in two pounds of tar oil, something more than half a pound of asphaltum, and a like quantity of pounded resin; the mixing is performed hot in an iron kettle, taking care it does not catch fire; when cold, the varnish is poured into a vessel and kept for use. It should be applied to hinges, gate-fastenings, and all iron exposed to the weather.

Sugar.—It is said there is a capital of $80,000,000 invested in the culture of cane in the States of Florida, Louisiana and Texas. These States produce annually about 300,000,000 pounds of sugar, besides which foreign importations are made to the extent of about 350,000,000 pounds. Even a short crop of sugar at the South, which reduces the usual production only 100 or 150,000,000 pounds, invariably advances the rate of sugar from one to one and a half cents per pound; which, on the entire consumption of 650,000,000 pounds, is equal, at one per cent, to $6,500,000, and at one and a half cents to about $10,000,000.

Report on Vegetables.

The following is the report of the Committee on Vegetables, at the Agricultural Exhibition in this city:

Messrs. Warren & Son: The undersigned, a Committee appointed to examine the Vegetables in your Hall for exhibition and premium, having attended to that duty, beg leave to submit the following report:

The vast number of specimens, their immense size and weight, and the volume of data offered at this Exhibition, would preclude the possibility of this Committee making that full and detailed report which they would desire; to do all this would require more space and time than could be conveniently published.

Your Committee therefore offer the following condensed report, and trust it will be considered, under the circumstances, satisfactory. The specimens are named in the order in which they were received:

From T. P. Robb's Ranch, Sacramento river—Three mammoth squashes, weighing 121, 95, and 87 pounds, largest 6 feet 3 inches in circumference—2d size, 5 feet 9 inches; three strings superior onions, of fifty each, averaging 2 pounds each; three sacks do. of 100 lbs. averaging two pounds each; two baskets very extra, 100 lbs. averaging 3 pounds each; one basket crookneck squashes, five varieties; one do. summer squashes, four varieties; one do. cucumbers, fancy; three heads celery, fine; one blood turnip beet, forming many heads; one cluster squash, numbering fifteen united on one stem, compact together.

From J. M. Horner, San Jose—Four fine squashes, 87, 70, 61, 35 pounds; one drumhead cabbage, 25 pounds; five cabbages, of five varieties; two specimens potatoes, 31-2 pounds each; one sack 19 onions, over 2 pounds each; one sack potatoes, over 2 pounds each; one extra cabbage, 35 pounds; one potato, 5 1-2 pounds.

From W. Pomeroy, Alviso—Four mammoth squashes, weighing 104, 85, 77, and 75 pounds, the largest one measuring 5 feet, 3 inches in circumference; one acorn squash, very handsome, weighing 34 pounds, 4 feet 5 inches in circumference; seven crookneck squashes, superior, one weighing 26 pounds, others 20, 18, 16, 14; four marrow squashes, 27 pounds each; four fine blood beets, weighing 25, 24, 20, and 17; one measuring three feet three inches in length.

From W. Neeley Thompson, Suscol Valley—Two baskets onions, 2 to 3 pounds each; four marrow squashes, 50 to 42 pounds each; two do. do. superb, 61 pounds each, pure in species and very extra, and of extraordinary size and quality; one basket Chili peppers, very handsome; one plant of same, in bearing; one basket tomatoes, fine.

From Henry Roe, Mission San Jose—one sack large egg plants, averaging 5 pounds each; one do., medium size, do. 3 pounds each; one plant in bearing, with seven fine fruit, weighing about 25 pounds; one specimen egg fruit, weighing 7 1-2 pounds.

From E. L. Beard, San Jose—Thirteen fine cabbages, averaging 25 pounds each; one sack fine blood beets; one do. do. carrots; one do. do. parsnips; one do. large potatoes, averaging 2 pounds each; four mammoth squashes, of superior kinds, weighing 73, 57, 56, 56 pounds each. This collection was very fine.

From Levi Hamilton, San Jose—Four large sugar beets, weighing 41, 41, 25, 17 pounds each, and very fine; two extra Valparaiso squashes, 56 and 52 pounds, and of fine form and appearance, nearly three feet long.

From Snide & Donahue, San Lorenzo—One sack extra potatoes, weighing 26 pounds.

From Pierre Beccouarn, Visitation Ranch, near Mission Dolores—Twelve large turnips, from 6 to 12 pounds each; thirty-six large carrots, from 4 to 6 pounds each; twelve artichokes; three clusters parsley; three black radishes; two baskets fine peas; one Brussell's cabbage; three rutabagas, weighing 20 pounds; three large and singular formed carrots.

From Doctor Sam'l Murdock, San Jose, Mission land—Seven sacks potatoes, 12 bushels, the product of three potatoes. We are satisfied that this statement is true; they were fine and large and the best in the market; and we believe this to be the largest crop ever raised from that amount of seed.

Ray & Jackson, San Francisco—One large and splendid beet, 36 1-2 pounds.

From Calvin Rogers, Contra Costa—One potato, 4 pounds.

From Rev. Lorenzo Waugh—one fine snowball turnip.

From Lawrence Leihu—collections—Five varieties squashes and pumpkins; four roots celery; three varities rhubarb; two do asparagus; collection cucumbers; one box mushrooms spawn. The above were exhibited more from curiosity than size or quality.

From A. Lloyd, San Jose Mission—Specimens beets, very fine; four sweet potatoes, weighing 20 pounds; 4 do. do., large, 26 pounds. The sweet potatoes of Mr. Lloyd were very interesting and were much praised, as proving the success that will attend their cultivation.

From E. Linoberg, Sonora—Four specimens Chili pepper.

From Chipman & Anguinbaugh, Alameda county—One blood turnip beet, 13 pounds; four onions weighing 8 pounds; specimens sweet and Irish potatoes; all good specimens.

From John Sayler, American River, Sacramento county—Sugar beet, 19, 16, 14 pounds; [illegible]; two [illegible] turnips. The [illegible] were [illegible] 10 lbs. 2 1.

From A. T. McClure, San Francisco—One potato, 4 pounds.

From G. T. Pierce, San Francisco—One potato, raised Pajaro Valley, weighing 5 1-2 pouns.

From J. Bryant Hill, Pajaro Valley—Three onions, weighing 9 pounds, one measuring two feet in circumference; four potntoes, weighing 10 pounds; one sack white onions, superior in size and quality, many weighing 3 pounds and upwards, some few 4 pounds each.

From E. T. Crane & Bro.—Ten fine extra potatoes, weighing 30 pounds.

From Asa Boyne, Martinez, Contra Costa; one sweet potato, weighing 6 pounds.

From Augustus Bonnet, San Francisco—Several samples, yellow and white sugar beet; rutabaga; white carrot, fine; white parsnip; red pepper; white solid celery, clean and well grown; salsify or vegetable oyster; large white leek, extra; large butter beans; dwarf do. shellbeans; one sugar beet, 52 pounds; two do. do. 37 and 27 pounds. This entire collection was very fine, displaying great care in cultivation.

From Southers and Covey, Tuolumne River—Specimens Mexican Yam, weighing 7 pounds. S. & C. raise this year seven tons.

From Merrill & Warren—Two samples potatoes from the ranch of Mr. Blaisdell, in Pajaro Valley, very large, 4 1-2 pounds each. Mr. B. cultivated 100 acres.

From James Gillis—Sweet potatoes weighing 7 1-2 pounds. Mr. Gillis cultivates two acres, and the crop this year will be six tons per acre.

From J. C. Debris, Fries Valley, Mission Dolores—One specimen beet; specimens peas, of the Queen Dwarf.

Col. J. T. Hall, Sacramento—One blood beet, of surpassing size, weighing when lifted from the ground 65 pounds, and when cleared of leaves and on exhibition 52 pounds, after it had been out of ground some time.

From Warren's Gardens, Sacramento—Four tomatoes, four varieties; one acorn squash, curious; two gourds, (Hercules club); one plant Hawaiian tobacco; specimens cucumbers, Walker's Rambler.

From Smith, Barber & Co, Sacramento—Five citron melons, fine.

From W. H. and Moses Nichols, Sulphur Spring Valley, near Benicia—Curious specimen of hybrid cabbage, in seed, a union of the cauliflower and cabbage, being an evidence of the difficulty of raising fine cabbages from any seed that has been grown contiguous to any other variety, same species.

From I. C. Woods—Fine samples potatoes, 2d crop, raised in Suisun Valley, July 19.

From Dr. Harris—Specimen of sea kelp, found on the shore. This specimen was of much interest; it was of remarkable beauty, being a large and smooth ball at one end, and tapering off like a rubber lash to a point, measuring 25 feet long, perfectly smooth and high polished.

From James Denman, Petaluma—Three white globe turuips, superior, weighing 23, 21, and 20 pounds.

From N. Knapp, San Jose—One sugar beet, 25 pounds; two turnip beets, 9 and 6 pounds.

Hamilton & Co. from Ritchie's Ranch, two miles above Crescent City, on the coast—One white flat turnip, weighing 33 pounds, a fine and beautiful specimen.

From Weaver & Blaisdell, San Francisco—One specimen potato, 5 1-2 pounds.

Mr. O'Connell, San Lorenzo, Alameda county—The produce of one hill of potatoes, 16 1-2 pounds, raised from one eye; two clusters potatoes, weighing 12 pounds, and twelve potatoes measuring one bushel. From four sacks seed planted, there was raised five hundred and twenty-nine sacks, on one and three quarters acres of land.

The committee have examined with much pleasure the extensive collection of the vegetables exhibited, and believe that there never has been exhibited within the United States a collection that would equal them for size, weight, beauty or excellence.

It would be difficult to make persons in the old States realize what was actually exhibited in the Hall. They must have been seen to have been believed. The committees would have made earlier repots, but for the great difficulty in obtaining statistics of the growers, in order to ascertain who were entitled to the premiums. Many exhibitors, after repeated enquiries, and with all the facts before them, of the great importance of rendering in a statement of the quantity grown, &c., failing to do so after great delay, the committee proceeded to make the awards to the best of their ability, feeling confident they have acted with strict justice to those who have at all made known by letter or otherwise, any statement of their crops to enable the committees to act thereon.

The committee have made the following

AWARDS;

To E. L. Beard, of San Jose, for the largest crop of Potatoes—630 acres—and averaging over 300 bushels per acre. A silver cup, valued at $25.

To J. P. Robb, for the best collections of Onions, exhibited both in quantity and quality, having grown 1,000 sacks. A first class medal, valued at $10; no person competing for the prize of 100 acres.

The best collection of Squashes and Pumpkins, to J. P. Robb, of Sacramento, for twelve varieties. Silver medal, valued at $10.

To E. L. Beard, of San Jose, for the best display of Cabbages. Silver medal, valued at $10.

To Geo. A. Lloyd, of San Jose, for the finest specimens of Sweet Potatoes. Silver medal, valued at $10.

To Augustus Bonnet, for the largest and finest collections of vegetables, consisting of twelve varieties, all very fine; the premium [illegible] Silver cup, valued at $25.

To Col. J. F. Hall, Sacramento, for the [illegible] beet [illegible] vegetables. Medal, valued at $5.

To [illegible] Hill, Pajaro Valley, for finest specimens Onions, weighing 5 lbs., one measuring 2 feet in circumference. Medal, $5.

To James Denman, Petaluma, for finest Turnips, weighing 26, 23 and 21 lbs. Medal, $5.

To Wm. Neely Thompson, Suscol Valley, for superb specimens Tomatoes. Medal, $5.

To J. M. Horner, San Jose, for largest and finest specimens Tomatoes, weighing 5 1-1 and 5 1-2 lbs. Medal, $5.

To J. M. Horner, San Jose, largest and best Cabbage, weighing 35 lbs. Medal, valued at $5.

The committee having full power to make awards to all exhibitors who were deserving special notice, award the following

SPECIAL PRIZES.

To W. Pomeroy, of Alviso, for superior mammoth Cocoanut and crookneck Squashes. A first class silver medal, $10.

To Henry Roe, San Jose, for very superb specimens Egg Plant, weighing from 5 to 7 1-2 lbs. each. A first class silver medal, $10.

To Wm. Neely Thompson, Suscol Valley, for his collection of Boston marrow Squashes; they were the largest, purest and handsomest probably ever exhibited at any show in the United States, weighing 61 lbs. each—bright golden yellow. A first class silver medal, $10.

To Dr. Sam. Murdoch, for his interesting collection of Potatoes; 7 bags, from 3 seed potatoes. A silver medal, $10.

To W. O. Comeli, San Lorenzo, for his collection Potatoes. Medal, $5.

To Pierre Beccouarn, for a fine collection of Carrots, Parsnips, Turnips and other vegetables. $10.

To Lawrence Leihu, San Francisco, for several specimens of Vegetables. Medal, $5.

To Wm. Neely Thompson, Suscol Valley, for two bushels extra red and yellow Onions, very finely grown. First class medal, $10.

The committee notice that several fine specimens were also shown by the friends of agriculture for exhibition, only collected in various places, and not of the growths of exhibitors, many of them very fine, and adding interest to the exhibition. Such evidences of interest we trust will result in their hereafter becoming identified more closely and exhibiting more largely, as the product of their own skill.

Your committee were much gratified to notice the increasing attention paid to the cultivation of the vegetable kingdom, and trust that all will find ample reward in their labors. No country in the world has ever presented such splendid specimens of agriculture, and we feel assured that coming years, under the auspices of an enlarged interest among all the cultivators, and a union of efforts among others, all under the auspices of the society now commencing, and with the aid of the press, California will present to the world the most interesting and delightful, as well as the most astonishing results, such results as the mind could hardly conceive at the present moment. That these results will be manifest, your committee have no doubt, and the wisest and most attentive care and skill will always reward the best. Such exertions your committee recommend to the cultivators.

All of which is respectfully submitted.

Davin Chambers,
F. W. Macondray,
L. E. Morgan. } Committee.

National Agriculture.

The total value of the annual products of the soil of the United States is now about one thousand millions of dollars; and no one who knows what Science *has done* for agriculture will doubt that the same amount of labor which is now employed in producing this aggregate might be so applied as to secure a total product thirty per cent. greater, or one thousand three hundred millions. But scientific, skilful, thorough Agriculture always employs more than the shiftless, slouching sort too generally prevalent; and it is certainly within bounds to estimate that our Agriculture might be so improved as, by the help of additional labor now unemployed and unproductive, to give an additional product of fifty per cent. or five hundred millions per annum—an achievement which would double the wealth of the country every eight or ten years. Whosoever will carefully review the Agriculture of a single State, or even an average county, in any part of the Union, and estimate how much its product might be enhanced by irrigation, manuring, deep plowing, &c., will perceive that our calculation is far within the truth.

But suppose that only half of it, or an addition of two hundred and fifty millions per annum to our annual Agricultural product is attainable, what an immense addition to our national wealth would thereby be insured? Four-fifths of this would probably be permanently added to the wealth of the country—that is, the farmer whose annual product should be swelled from $1,000 to $1,250, or from $2,000 to $2,500, would not eat or drink up the surplus, but would invest the greater part of it in new buildings, fences, barns, implements, furniture, &c. &c., giving profitable employment to mechanics and laborers and largely increasing the business of merchants and the incomes of professional men. Such an addition to the annual product of our Agriculture would increase the consumption of Manufactures, domestic and imported, in far greater ratio [illegible] from the annual product of every farm the food of those making a living on it must be first taken for home use, affording no business or profit to [illegible] people of towns; and [illegible] that [illegible] general trade of the country.—N. Y. Tribune.

PROSPECTUS

OF

THE CALIFORNIA FARMER

And Journal of Useful Sciences.

We commence the issue of this Journal of Agriculture and kindred Sciences, with the beginning of the New Year.

The Editorial Department is under the charge of Dr. J. F. Morse, of Sacramento, (formerly editor of the Union,)—assisted by Col. Warren, of the firm of Warren & Son, who will aid in the Agricultural and Market Reports, and Foreign and domestic data.

It will be the aim of the publishers to furnish to their readers, 1st. The most useful data for the practical Agriculturist, and to present to them all the most important practical results, obtained from authentic sources, in our own State.

2. To present the latest and most important facts from our sister States and Europe, touching Agriculture, in all its branches.

3. To furnish familiar illustrations of valuable Agricultural Implements, together with remarks explanatory of their character and success.

4. To furnish complete Grain Tables and Market Reports, and other data connected therewith.

5. General and Critical Notices of the various Agricultural and Horticultural Societies of our country and of Europe, sufficient to guide our own Cultivators, and keep them advised of the progress of the Science.

6. A portion of the Journal will devoted to Select Literature—the aim of which will be to exhibit the purifying influences which flow from the pursuits of Agriculture, Horticulture and rural life. That kind of Literature which tends to a morbid excitability of the mind—which superinduces a species of sickly sentimentality, and degrades instead of elevates the character of man—as well as politics and sectarianism, will be rigidly excluded from its pages: our aim being to cultivate a love for and an interest in those useful Sciences which must ever add to the happiness of mankind.

Cultivators of the Soil, and all who feel an interest in these all-important and fundamental sources of our prosperity and happiness, are cordially invited to communicate with us freely. Their valuable aid is what we earnestly desire.

All communications for the Editorial columns should be forwarded to Dr. J. F. Morse, Sacramento, or may be left at the office, on Bush street, two doors below Montgomery, San Francisco.

Communications on Business, Reports on Agriculture, and Advertisements, should be addressed to J. F. Morse & Co., San Francisco.

Terms of the Paper—$8 per annum, in advance.

J. F. MORSE & CO.,
(Publishers California Farmer,)
Bush street, below Montgomery,
San Francisco, Cal.

Advertisements in this Journal (of which a limited number will be inserted) will reach a circulation hitherto unattained, extending to the remotest Agricultural Districts particularly—thus making it of the highest interest for all matters pertaining to Agriculture.

Corn Harvester.

The New York Herald, in enumerating various articles on exhibition in the Crystal Palace, has the following:

Reams' patent corn harvester is another implement of agricultural life which will be interesting to farmers. The machine is very simple in its construction, and purports to cut, with the labor of one horse and a boy, from sixteen to twenty acres of corn per day, and lay it in bundles of from two to ten hills, as desired. An ingenious part of this machine, is an appliance called a dropper, by which the boy riding on the back of the horse can drop the bundles of corn at suitable distances in the furrow, all ready for shooking. The cost of this machine is reasonable, ranging from fifteen or twenty dollars. The speed of this machine is very desirable, as farmers consider it the best time to cut corn when the dew is on the stalks, or immediately after a rain. In dry times, the corn is brittle and difficult to cut. If this is able to accomplish that for which it is recommended, it must be a great advantage to every farmer to possess it.

Agricultural Fairs.

State Fairs seem to be growing into The Great Annual Festival, in many of the States, eclipsing all other gatherings by their comprehensive character, bringing into contact and communion, men of all occupations and tastes, from the most remote portion of the State, and by the great aggregation of stock, vegetables, fruits and implements for exhibition, illustrating the perfection to which, by skill, care and observance of physiological and mechanical laws, animals, vegetables and fruits, and the rude implements of the farmer can be brought. They cleave scales from the eyes of ignorance. They sweep away the films of prejudice, like cobwebs. They infuse into the mind of the young farmer an ambition to excel in his profession. They teach the money-losing waste of the profession, what fearful wastes, what extravagance of [illegible] what deterioration of [illegible] stock, have been the consequences of [illegible] a dogged, and selfish, and [illegible] course [illegible] fathers did before him. They [illegible] in [illegible] ways, the [illegible] [illegible] [illegible]

The Pioneer Ball.—This splendid anniversary celebration came off on Wednesday evening, 11th inst, at the Musical Hall, on Bush street. We are a dancer, and of course attended; and although the recollection of Balls, which we danced at in other days, is vivid, and the remembrance of fair faces which then shone upon us, no less so, still we are forced to admit in spite of early predilections, that the Pioneers have eclipsed the Fary-land frolics of our youth. That evening was no ordinary occasion. Music, with its "voluptuous swell;" "cheeks that blushed at their own loveliness;" "haughty forms and flashing eyes,"

"And thin robes
Floating like light clouds twixt our gaze and Heaven."

these were all there, and were to be expected. But more than all these we beheld the Pioneer Band of California; the men who preceded us, in piercing the wilderness, tamed the inclemencies of the elements and prepared this beautiful land for the home of civilization.

Many a rugged cheek met our gaze, parched by exposures, and wrinkled by premature age, but upon them all sat the smile of peace and happiness. It was plain to see that the Pioneers deemed the present a full compensation for the past, and a glorious promise of the future. Many of them promenaded the brilliant Hall the whole evening, with fairy-little arms hanging upon their own, refusing to dance, and pouring into willing ears the story of the early times in California. But there was a banner displayed upon the walls which told the same story, and in tones no less emphatic and eloquent. Within a gilded frame hung the banner of the celebrated Fremont Battalian. Of course it was the cynosure of every eye. The veteran gazed upon its folds and recalled the dread hour when it floated stiffened by frosts, in the bleak north winds of the Sierra Nevada; the maiden saw it, and shuddered at the fate of those whose last gaze had been fixed upon its triumphant stars, and the young aspirant felt his hot blood mount in exultation and pride, as he dreamily read the story of its victories, told by its gilded lips and in its stars of glory.

The Hall was literally crowded—the number present was variously estimated at from ten to twelve hundred persons. The supper, too, was magnificently prepared, and whole affair went off with perfect propriety and unrivalled eclat.—*Eve. News.*

Industrial Institute.

We were pleased to receive by last mail the doings of the Legislature of Illinois, and it reflects the highest honor upon that assemblage, to notice that the resolutions were passed by both branches unanimously. We give the resolutions below.

Important Resolution.—In the Illinois House of Representatives, Mr. Denio offered the following joint resolution, which was unanimous adopted:

Whereas, The spirit and progress of this age and country demaud the culture of the highest order of intellectual attainment, in theoretic and industrial science; and, whereas, it is impossible that our commerce and prosperity will continue to increase, without calling into requisition all the elements of internal thrift arising from the labors of the farmer, the mechanic, and the manufacturer, by every fostering effort within the reach of government; and whereas, a system of Industrial Universities, liberally endowed in each State of the Union, co-operative with each other and with the Smithsonian Institution at Washington, would develop a more liberal and practical education among the people tend the more to intellectualize the rising generation, and eminently conduce to the virtue, intelligence and true glory of our common country; therefore, be it

Resolved, by the House of Representatives, the Senate concurring therein, That our Senators in Congress be instructed, and our Representatives be requested, to use their best exertions to procure the passage of a law of Congress donating to each State of the Union an amount of public lands not less in value than five hundred thousand dollars, for the liberal endowment of a system of Industrial Universities, one in each State in the Union, to co-operate with each other and with the Smithsonian Institution at Washington, for the more liberal and practical education of our industrial classes and their teachers; a liberal and varied education, adapted to the manifold wants of a practical and enterprising people, and a provision for such educational facilities, being in manifest concurrence with the intimations of the popular will, it urgently demands the united effort of our national strength.

Resolved, That the Governor is hereby authorized to forward a copy of the foregoing resolutions to our Senators and Representatives in Congress, and to the Executive and Legislature of each of our sister States, inviting them to co-operate with us in this meritorious enterprise.

Large Cargoes.—Among other articles engaged by the ship Great Republic, loading at New York for Liverpool, are the following, viz: About 9,000 barrels flour, 60,000 to 70,000 bushels of corn and wheat, 1,000 bales of cotton, 8,009 barrels of resin, 1,000 tierces of beef, &c. &c. She was to sail when she had taken as much freight as she could cross the bar at Sandy Hook with.

The new ship Break O' Day, lately launched at Calais, Maine, loaded opposite at St. Stephen, for Liverpool, with the following cargo, viz; 1,604,000 feet of deals and boards, 133,000 laths, 16,000 pickets, and 16 cords of lath wood. She is a well built ship, of beautiful model, and reflects much honor on her builders.

The news relative to Land Titles is of much interest, and will be hailed with joy by the cultivators of the soil, as all that tends to a speedy adjustment affect them deeply. We give below the correspondence, which will explain the action taken by our Senators and Represeutatives at Washington.

Washington City, Dec. 1.

Sir: It is of the greatest importance to the people of California to have an early decision of the Supreme Court of the United States upon Spanish and Mexican grants for lands in that State. We are informed by the last mail that important decisions on this question have been made by the U. S. District Court for the Northern District, and we respectfully but earnestly invite your attention to the necessity of a speedy review of these decisions by the Supreme Court; and ask whether action can be had during the approaching session of the Court.

The importance of the subject to our constituents must be our apology for the enquiry, and the request of an answer at your earliest convenience.

With great respect, your obedient servants,

Wm. M. Gwin,
M. S. Latham.

Hon. C. Cushing, Attorney General.

Washington. Dec. 2.

Gentlemen: I have the honor to acknowledge the reception of your letter representing to me the magnitude of the interest involved in the cases before the Commissioners for adjudicating private land claims in California, and the importance of proceeding with all possible despatch in the appeals to the Supreme Court; and I can assure you that I shall spare no exertion to accomplish this object—in which view I propose at an early day to bring the subject to the attention of the Court.

I am, very respectfully, your obedient servant.

C. Cushing.

Messrs. W. M. Gwin, M. S. Latham.

United States Land Commissioners.

This Court have rendered the following decisions this week to the 17th. The great "Peralta Case" which involves so large an amount, and interests large numbers of persons, has not yet been decided, thus causing great disappointment:

No. 448. Francisco Sales, one lot, Mission San Gabriel, confirmed.

No. 489. Arno Maube, one lot, Mission San Gabriel, rejected.

No. 363. J. J. Sparks, "Huana," confirmed.

No. 140. Joaquin Estrade, "Sauta Rosa," confirmed.

No. 324. Jose Antonio de la Guerre, "Los Alamos," confirmed.

No. 283. Pedro San Saevers, "La Rincon del Rincon," confirmed.

No. 98. Ellen White, "Cholume," rejected.

No. 562. James Watson, "San Benito," confirmed.

No. 134. M. G. Vallejo, lot in Sonoma, confirmed.

No. 113. Rafael Garcia, "Mendocino," rejected.

No. 319. John Bidwell, "Ulpinas," confirmed.

No. 383. Maria de Jesus Garcia, "Los Noyales," confirmed.

No. 107. Robert H. Thomas, "Los Sancos," confirmed.

No. 106. Albert G. Toames, "Rio de los Molinos," confirmed.

No. 116. Jose Antouio Agguero, rejected.

No. 343. Henry Dalton, "Santa Anita," confirmed.

No. 162. Francisco Branch, "Arroya Grande," confirmed.

Great Crops.

The Annual Meeting of the Rockingham, N. H., Fair, was holden at Exeter, on the 9th inst. We find in the News Letter the report of the committee on crops, awarding the following premiums:

The committee on crops awarded the following premiums:

To Joseph Winslow, of Epping, for 111 bushels and 14 quarts, of Indian corn on one acre of ground, $5.

To Joseph Cilley, of Nottingham, for 121 bushels and 14 quarts of Indian corn on one acre and 23 rods of ground, $3.

To Stephen Dow, of Brentwood, for 175 1-2 bushels of Rye on 4 acres, 41 rods of ground, $4.

To Daniel C. Long, of Kingston, for 30 1-2 bushels of wheat on one acre and 24 rods of grounds, $4.

To A. C. Taylor, of Hampton, for 50 1-2 bushels of Barley on one acre and 10 rods of ground, $4.

To James H. Dow, of Rye, for 68 bushels Oats on one and a half acres of ground, $4.

To Rufus C. Sanborn, of Hamptonfalls, for 151 1-2 bushels of carrots on one quarter of an acre of ground, $4.

The Committee on Bog Meadows awarded to G. C. Brown, of Stratham, a premium of $5.

The above are certainly large corn crops. What would California Farmers say to 30 bushels wheat to the acre? and what would New Hampshire farmers say to our crops of 150 bushels barley to the acre?

We are under weighty obligations to the gentlemanly messengers of Messrs. Adams & Co., for the prompt delivery of packages, letters, etc.

A three year old heifer was killed at Santa Clara last week, which weighed 964 lbs.

A lady in Vermont, who signs herself E. E., has sent us the following contribution to our Fireside corner:

"Look on the Bright Side."—There is in earth enough of beauty to warm, to cheer and enliven the heart, were it but looked upon with an eye to see, a mind to feel it.

Look on the bright side, keep looking on the bright side. Surround yourself with forms and hues of beauty—"a thing of beauty is a joy for ever." Thus if you would be joyous, and who would not, cultivate a taste for the beautiful; and what so beautiful—ever renewing their youth and beauty—as the things with which God has surrounded us?

Then let that majestic elm still wave its brauches in lofty feeedom. Suppose it would make *so* many feet of boards, let it stand, as you would be happy in a shady, beautiful home. Leave that little patch for wife and children to scatter flower seeds in the spring time. Suppose you could raise *so* many potatoes upon it; leave it if you would meet joyous, smiling faces.

Indeed, surround, in country and city, your homes with the beautiful, that your eye, resting upon it, may be insensibly but surely attracted to that perfect beauty of soul which, if you make it yours, shall one day bear you where none will need say, "look on the bright side," since every shade will be bright; bright with purity; bright with love, for "God is love."—*Country Gentleman.*

Every six years, by law, there is a re-valuation of the real estate of Ohio for taxation. The last valuation was in 1847, when the entire taxable property of the State amounted to abont $475,000,000. The returns for the new valuation are nearly complete, and the Auditor estimates that they will vary but little from $800,000,000.

The California Farmer will always be found at Sullivan's Newspaper Stand, Kearny street, at the Bookstore of Mr. Murray, Montgomery street, and at other prominent places in every city.

Messrs. Adams & Co., are authorized to receive money for us, and receipt for the same, at any of their offices throughout the State.

The Golden Gate.—Considerable anxiety exits relative to the non-arrival of the Golden Gate. She was due here on Saturday. The Uncle Sam reported she was seen on the 11th inst., in latitude 25 30. She must have either sustained some injury in her machinery or run short of coal. It was reported the Columbia was to go in quest of her and render aid if needed

The Sandwich Islands—twelve in number—embrace a superficial area of abont six thousand and one hundred square miles. Four of the islands are rocky and uninhabitable.

State Agricultural College.

We rejoice to learn that the W. S. Letcher, Esq., of Santa Clara, of the Committee on Agriculture, has given notice that he should bring in a bill for the establishment of an Agricultural College for the State. We trust that every well-wisher of the State will bid this noble enterprise God speed.

It is announced by that committee that another bill to establish a State Society will be introduced. We are happy to say a State Society is already organized, and that gentlemen deeply interested in agriculture are connected with it, and will give their influence to it We trust the State will lend their aid and influence to carry it forward prosperously.

The late rains, which were very heavy in the upper counties, have given great encouragement to the Farmers, and the result will be a renewed attention to ploughing and planting, and much more ground will be improved by reason of the rains. More wheat will in consequence be planted.

The rise of the American River, near Patterson's Ferry, was 12 feet; it fell however, rapidly. At Marysville it rose to the Plaza. High up the river, by the appearance of the water and the masses of logs floating down, the rains must have swelled the rivers to an unexpected height suddenly. It will renew trade and put a cheerful aspect upon all business.

Shipments of Treasure,....Jan. 16, 1854.

PER STEAMER JOHN L. STEPHENS.

Adams & Co	$255,902	Spatz & Newhouse	$10,750

		Total	$760,403

MARKET REPORTS.

San Francisco, Jan. 18, 1854.

The principal feature to be observed in our markets the present week is a more cheerful spirit induced by the hope that the recent refreshing rains will bring a more promising state of things. A better feeling has indeed been manifest, although we could hardly say there were any very encouraging prospects.

The Agricultural interest has been cheered, and were it not for the continual arrivals of clippers with large freights, there would be a better feeling. While goods continue to arrive in such quantities, the entire trade must feel the bad effects of them. It will be noticed that the shipments of specie denote a large falling off, yet there can be no doubt even this contracted amount is much more than ought to go. We hope to see it continually decrease, until it shall be merely nominal, and made to by our becoming our own producers and manufacturers.

RETAIL VEGETABLE MARKET.

In presenting the Retail Market of Vegetables, we do this to show the weekly value and list of family comforts and luxuries (for good vegetables are indeed luxuries) that are offered to us in our markets. Very few markets in the United States can present such luxuries every week, and have them fresh from the garden every day.

It will be seen that cauliflowers, celery, horseradish, tomatoes, and green peas command good prices, and we may say all garden products pay well—for the quantity raised upon a small portion of land is almost beyond belief.

Cabbages, ₱ head	$ 37	Potatoes	2

Cauliflowers, ₱ head	50	Parsley	75
Radishes, ₱ doz	75	Parsnips	75
Sweet Potatoes, ₱ lb	12		

California Statistics.

The Rev. Mr. Phillips, in a sermon delivered lately in Stockton, gives the following interesting statistics in relation to the population, &c., of California. They are copied from the Journal:

The population of California four years ago, was 35,000, of which number 17,000, or one-half, were females. At the present time, there are 300,000, making an annual increase of 75,000. The sexes, which were about equally divided four years ago, now stand in great disproportion, as out of a population of 300,000, there are only 40,000 females, an increase of 23,000, averaging 5,750 every year, or 479 per month. Of this whole population, 26,000 are children, under fourteen years of age. Deduct from the number of females one-half the number of children, and we 27,500 white females in the State. The figures sum up as follows: Females, 27,500; Children, 25,000; Males, 247,500—making a total of 300,000. Of this number it is estimated that 100,000 reside on the coast, and 200,000 in the valleys and in the mountains. These estimates are reliable, and are only selected from among the mass of statistics presented on the occasion, as the most worthy of publication.

In connection with the above, we do not deem it amiss to publish some statistics connected with the churches, that may prove of interest. The Methodist Episcopal denomination has 43 churches and 41 ministers, in California, with a membership of 2,500. The same denomination, of the southern branch, have 21 churches, and membership of 536. The O. S. Presbyterian have 4 churches, and 5 ministers; and the N. S. Presbyterians have 7 churches and 11 ministers. The Congregationalist churches have an aggregate of 600 members. The Baptists have 6 churches, 10 ministers and 400 members. The Unitarians have one church and one minister. From the above it would appear that the Methodists in California, as in all new States, outnumber any other denomination by great odds. We are gratified at the religious prospect of our new country.

STEAMBOAT EXPLOSIONS. — These repeated calamities are but the more positive assurance that there is the most grievous neglect on the part of the owners and managers of these boats. This evil has been increasing for one year within a moderate distance of San Francisco. The loss of life has been terrible, and unless this evil is remedied, we shall have repeated and more severe yet to record. We would call the attention of the Legislature to the subject, and see if all this danger cannot be removed.

SHIPPING INTELLIGENCE.

PORT OF SAN FRANCISCO.

I shall now commence selling off my entire stock, consisting of DIAMOND WORK, WATCHES, JEWELRY, SILVER WARE, etc., etc.
Amounting to more than $300,000!
I have got to sell all the above goods before the first of June, as I have to remodel my store according to the new grade. Any person who wants a good article can procure one from me
Cheaper than in any other City in the World!
But I don't wish it to be understood that I pretend to compete with those who sell trash;—persons who would not hesitate to guarantee a brass ring or a watch for pure gold;—these persons can sell lower than I can. If I sell an article of any kind, and it does not turn out as I represent it, I will return the money. No person shall leave my establishment dissatisfied. Call and see me before you purchase elsewhere.

10,000 FRUIT TREES,
Grape Vines, Fig Trees, Raspberry and Current.
WE invite all who intend planting Trees and Vines to call on us before they make their purchases, as we can offer them many advantages that cannot be found elsewhere. Our collections, we know, are the most extensive, and the quality the best that can be had. We therefore invite all to call on us: we can show them, in our Exhibition Rooms, the samples of the actual fruit they produce. WARREN & SON,
Nurserymen and Seedsmen,
Musical Hall Buildings, San Francisco,

Prepared to cut Quartz Rock into any form desired.
I will say to my friends and the public generally that I am prepared to work into any form they may desire, Quartz Rock, WITH A POLISH EQUAL TO THAT OF A MIRROR.
N. B.—Quartz Rock purchased at the highest prices.
J. W. TUCKER,
125 Montgomery street.

There are Three Things I Do Not Do!
1st. I do not get a gentleman to leave his Watch, and when he calls for it, charge him TWENTY-NINE DOLLARS for cleaning it, and have it stop two hours after.
2d. I do not ask FIFTY DOLLARS for a chain, and sell it for THIRTY SIX DOLLARS, and warrant it Fine Gold, when it is filled with brass solder, and have to take it back and pay FIFTY DOLLARS in money, and give another chain.
3. I do not tell a Captain he can leave his Chronometer gratis, and when he calls for it at the end of eight months, refuse to deliver him up his property, without he pays me SIXTY-FIVE DOLLARS, and TEN DOLLARS more for rating it.
There are many other things I do not do, which I may name at some other time. 1 4t J. W. TUCKER.

A CARD.
Prize Medals Awarded at the Agricultural Fair.
BY the steamers a little time since we received the Medals awarded to the success ful competitors at our Exhibition. Many of them are already engraved, and others are now engraving—these are and will be on exhibition at our Hall.
As soon as the large Prize and Diploma are received from the engravers, they will be publicly exhibited at the Hall together and the successful ones will take place.
Due notice will be given.
Our Hall is open every day and we are always happy to see our friends. WARREN & SON

THE ANGEL-WATCH;

OR, THE SISTERS.

A daughter watched at midnight
Her dying mother's bed;
For five long nights she had not slept,
And many tears were shed:
A vision like an angel came,
Which none but her might see;
"Sleep, dutcous child," the angel said
"And I will watch for thee!"

Sweet slumber like a blessing fell
Upon the daughter's face;
The angel smiled, but touched her not,
But gently took her place;
And oh, so full of *human* love
Those pitying eyes did shine,
The angel-guest half mortal seemed—
The slumberer half divine.

Like rays of light the sleeper's locks
In warm loose curls were thrown;
Like rays of light the angel's hair
Seemed like the sleeper's own,
A rose-like shadow on the cheek,
Dissolving into pearl;
A something in that angel's face
Seemed *sister* to the girl!

The mortal and immortal each
Reflecting each were seen;
The earthly and the spiritual,
With death's pale face between.
O human love, what strength like thine?
From thee those prayer's arise
Which, entering into Paradise,
Draw angels from the skies.

The dawn looked through the casement cold—
A wintry dawn of gloom,
A sudder showed the curtained bed,—
The still and sickly room:
"My daughter?—art thou there, my child!
Oh, haste thee, love, come nigh,
That I may see once more thy face,
And bless thee, ere I die!"

"If ever I were harsh to thee,
Forgive me now," she cried;
"God knows my heart, I loved thee most
When most I seemed to chide;
Now bend and kiss thy mother's lips,
And for her spirit pray!"
The Angel kissed her; and her soul
Passed blissfully away!

A sudden start!—what dream, what sound,
The slumbering girl alarms?
She wakes! she sees her mother dead
Within the angel's arms!
She wakes—she springs with wild embrace—
But nothing there appears
Except her mother's sweet dead face—
Her own convulsive tears.

GOD MADE THE MIND TO BE FREE.

Free is the Eagle's wing
As it cleaves the sun's warm ray:
Free is the Mountain spring
As it rushes forth to-day;
But freer far the Mind—
Priceless is liberty;
No hand must dare to bind!
God made it to be free.

You may fetter the Eagle's wing,
No more through clouds to soar;
You may seal the mountain spring,
That it leap to light no more;
But the Mind let none dare ebain;
Better it cease to be;
Born, not to serve, but reign!
God made it to be free.

Free is the summer's breeze
Floating from airy height;
Free are the flowing seas;
And free heaven's golden light;
But freer than light or air,
Or the ever rolling sea,
Is the mind, beyond compare!
God made it to be free.

Guard well the gift divine,
Than gems and gold more rare;
Keep watch o'er the sacred shrine,
No foe must enter there.
Oh, let not error bind,
Keep the freedom of the mind!
God made it to be free.

Musketos Under Glass.

A FRIEND of ours who has a taste for natural history is at present engaged cultivating musketos, and hopes to have them in full season during the winter. He keeps the larvæ in glass jars filled with water, and covered at the top with coarse muslin; and as the musketos emerge from their tadpole condition, they occupy the upper part of the cylinders, where they deport themselves for four days in a lively manner, and on the fifth lay their eggs and die. In this way he keeps up a "succession of crops," and by regulating the temperature of the breeding room, will be able to continue the musketo business until the natural season commences. The development of the musketo is a curious process. In the first place the egg becomes what is called the "water tiger"—a brisk little clock-faced devil, that devours all the smaller aniuaiculæ with insatiable appetite. In a spectrum of a drop of water projected from a hydroxygen microscope, we have seen the shadows of one of these water fiends swallow the shadows of a dozen smaller imps—the larvæ of midges and such "small deer"—in less than three minutes. In due time a change comes over the monster. Natnre envelopes it in a pellicle or semi-transparent shroud, from which the attenue of the musketo stick out at one end and the tail at the other. Finally the creature rises to the surface, the caul bursts, and out flies the insect, like an infernal illustration of the fable of Psheye.

SELIM & EDWARD FRANKLIN,

REAL ESTATE AGENTS AND AUCTIONEERS,

Office and Salesroom, 102 Merchant st., between Montgomery street and the Plaza.

Real estate of all descriptions sold at public and private sale. Particular attention given to sales for Administrators, Assignees, Receivers, Mortgagees, and others, according to law.

They will give their especial attention to the public sales of estate, by Administrators, Assignees, Receivers, Mortgagees, &c., carefully complying with the forms of law.

A Register for Property, at either public or private sale always open at their office

FAMILY FLOUR.

HORNER'S PREMIUM FLOUR.

UNION OITY MILLS.

WE INVITE the particular attention of Families and the Trade, to the quality of the Flour manufactured by us.

Our great aim has been, in the establishment of our Mills to procure the most perfect machinery, to employ the ablest millers, and to select the purest and finest wheat in the country.

That we have been able to accomplish all this, the Product of our Mills now before the community is the best evidence.

The FLOUR we manufacture has been submitted to the ablest judges of our State, and after the most rigid and thorough test, they have awarded to us the "PREMIUM PRIZE," and we shall have offer the same as "Horner's Premium Flour;" it shall be our constant effort to maintain for it the reputation of being the

The Best Flour in the Land.

Orders left with HORNER & CO. at our Storeship, Broadway wharf, will receive prompt attention.

1 4t HORNER.

SUPERIOR FURNITURE.

THE largest and best stock in Sacramento may at all times be found at the Old Stand of B. P. & D. MOORE, No. 77 Third street, where they still persist in selling as much below their competitors as their superior facilities will admit of. Having on hand the most splendid and substantial assortment of all kinds of Furniture ever offered in Sacramento, we feel confident, with prices to suit, that none can go away empty that may favor us with a call.

Our stock consists of Bureaus, Secretaries, Wardrobes, Stands, Tables, Bedsteads, Lounges, Sofas, Painted Mahogany, Black Walnut, Satin and Rosewood Sets—some of the finest and cheapest ever offered in this market.

Also, Mattresses, of Curled Hair, Patent Felt, Moss, Wool, Straw, and Straw with Cotton Tops, Also, Feather Pillows, and Feathers for Beds, with a large stock of Quilts, Comforts, Sheets, Blankets, &c., &c. Also, a very large stock of Chairs, Wood, and Cane Seats of all descriptions: also, of Hair, Cloth, Spring, Plush, Velvet and Carpet Bottoms, with Rockers of all kinds; all of which will be sold at reduced rates.

1 4t Also at 130 Jackson street, San Francisco.

A OARD.

FREE EXHIBITION HALL.—We desire to announce, and we do so most respectfully, that hereafter, during our Exhibition, our Hall, containing all the magnificent specimens of the Agricultural Exhibition, together with the choice Paintings and Embroideries, and many rare and beautiful specimens and curiosities from the "Islands of the Sea," will be open to the visits of all who wish to examine them, FREE OF CHARGE.

We would also announce to Artists that our Hall is offered to them, FREE, to exhibit their work for exhibition or sale, and we further announce to all persons who have Paintings, Statuary Works of Art, Curiosities, or extra specimens of anything of domestic manufacture, that here is a place the most appropriate for its exhibition or sale, and where the most extended notice can be given to it. All who have works of art, or any of the curiosities of the country, or wonderful specimen of the Agriculture of California or the Pacific coast, will find this Hall the most appropriate place for the exhibition of the same.

We desire also to state that all the Agricultural papers and periodicals of the United States and the principal publications of Europe upon the subjects of Agriculture, Horticulture, and Floriculture, and other scientific subjects, and to our patrons, and to the cause of Science, they are ever open, and we tender our best aid to developing to the utmost of our power the good resulting from them.

1 WARREN & SON.

WASHINGTON STEAM MILLS.

WASHINGTON FLOUR MILLS.

THE undersigned proprietor of the Washington Flouring Mills take pleasure in offering to families and the trade, Superior Family Flour. Tucan Mills, we are happy to say to our friends, was awarded the Silver Medal; and we shall be always striving to maintain for it a high reputation, so that our customers can rest secure in confidence, believing they will receive the highest character of Flour the market affords.

In the same establishment we have extensive STEAM SAW MILLS, capable of performing every kind of work that may be desired, and to this branch of our business we invite the attention of the public. We have also STEAM PLANING MILLS, that will finish all kinds of work in the most workmanlike manner, and equal to anything performed in the country, and in the most prompt manner to order.

We invite all who are contracting work, to call on us and examine our Mills, and we can satisfy them of our ability to supply every order in each branch of our extensive establishment.

D. W. VANCOURT, Proprietor.

1 Near the Oriental.

POLLEY & CO.,

OF THE BAY STATE MILLS, would announce that for the better accommodation of their numerous customers and trade in general, that they have opened a branch of their business at the Fire Proof Store, No. 49 K street, between Second and Third, where they will always keep on hand a large stock of California FLOUR; also, Hunall and Gallego.

Public attention is particularly directed to the "BAY STATE LOWER MILLS' BRAND," an article we have every confidence in warranting, being made under our own inspection, from new Wheat, without any adulteration.

Ground feed of all kinds always on hand.

Every exertion will be used to merit a continuance of the favor heretofore so liberally extended to us. 1-3t

PEORIA PREMIUM STEEL PLOWS.

THE FORMER CELEBRITY OF THE PEORIA PREMIUM STEEL PLOWS, and the unequalled success of their introduction in this State, would seem to preclude the necessity of any further effort on our part to draw attention thereto; but in view of the transitory nature of business in general in California, and the probability that some may have looked upon our establishment of an extensive and permanent manufacture of Plows here, in the face of such enormous importations and extravagant prices of material, as an impossibility—we believe it expedient to adopt this method of bringing it within the special notice of all concerned, that we are now manufacturing, and will have ready for this season's demand, three thousand of the most superior Plows ever made or used within this State.

We feel warranted in making this assertion, from the fact that all who used our Plows last season testify that they were superior; and we have studied so closely the immediate wants of our patrons from every section of the State, that we can now furnish Plows suitable to any particular kind of soil known in the State.

Our material has all been selected in the East by one of our firm, and imported by us directly from the manufacturers, which places it in our power to say confidently that nothing is lacking in quality, while we are enabled to make the plows at a cost greatly below that of last season, and are determined to sell at prices within the reach of every farmer who may wish to use the Peoria Premium Steel Plow.

It should be remembered that these plows will do double the work with half the team required in using the ordinary cast Plow; and that the work, when done, will be well done.

For particulars of prices, and descriptions of plows, we refer you to the subjoined card. The prices therein detailed are those established at our factory, and the only alterations from them that we authorize our agents to make, is the addition of the cost of transportation to their places of business—thus placing the plows at every accessible point of the State for the exact price charged at the Factory, with the necessary expenses only added.

Farmers ordering our plows through mercantile houses here, would do well to write to us at the same time, if they would make sure of getting the right plow, for some are interested in representing that we are not making plows at all, while others will not sell our plows when they can get off a cast plow. We therefore recommend that orders should be sent to us directly, accompanied by an order upon your merchant for the amount, which you can always know by a reference to the card accompanying this circular.

On the 24th of June the interest of T. ADAMS in our business ceased, by the sale of his entire interest therein to L. E. MORGAN. Aside from this, there has not, nor will there be, any alteration, as we have the same efficient and thoroughly practised hands in every department of our business.

E. L. MORGAN & CO., Successors to

T. ADAMS & CO.,

Corner of Broadway and Battery streets.

☞ The following are the established prices for the **Peoria Premium Steel Plows**, at our Factory, and the only addition our Agents are authorized to make thereto, is the cost of transportation to their points of business:

SIZE.	DESCRIPTION.	FURROW.	PRICE.
No. 5	plain	10 in	$ 30
5½	"	12 in	$ 35
6	"	14 in	$ 40
7	"	16 in	$ 50
6	clipper or prairie	14 in	$ 60
16	" "	16 in	$ 70
18	" "	18 in	$ 85
20	" "	20 in	$100
22	" "	22 in	$110
24	" "	24 in	$125
26	" "	26 in	$150
30	" "	30 in	$175
40	" "	40 in	$225
Subsoil Plows			$40
Cultivators			$25

[For the addition of wheel and axle to any of the above clipper Plows, an additional charge of $30.[

L. E. MORGAN & CO., Successors to

1 T. ADAMS & CO.

PREMIUM PLOUGHS.

WE Invite the attention of farmers to the assortment of "Premium Steel Ploughs," now at our store at Exhibition Hall. These are the celebrated "Morgan & Co.'s Peoria Ploughs," pronounced by the committee the very best Plough in the United States.

WARREN & SON'S

1 Agricultural Store.

WARREN & SON'S HORTICULTURAL MUSEUM AND HALL OF SCIENOE.

THE subscribers take pleasure in announcing to their friends and patrons that they open their Hall as a Museum of Horticulture and Natural Sciences. Having now completed our arrangements in Europe and in this country, we are enabled to offer to the patrons of this establishment (the first of the kind in California) everything desirable connected with the science of Agriculture, Horticulture, and Floriculture.

Connected with this establishment will be Nurseries, Gardens, Fruit Orchards, Graperies, and Greenhouses of the proprietors; and therefore the patrons can be assured that it is much better for them to send their orders to first hands than to those who collect here and there, at auction and elsewhere, where there can be no certainty of the genuineness of what they buy.

The Nurseries will be extensive, containing several hundred thousand trees grown under the eye of the proprietors. The Fruit Garden will contain the choicest Fruits known in Europe and America.

The Museum will contain specimens of Fruit in Wax, rare and curious specimens of everything else in nature, both in wax and in a dried state; Oil Paintings, Drawings and Paintings of Fruits, Flowers, &c., together with specimens in Natural History, Books on Agriculture, Horticulture and Botany; Garden implements of all descriptions and of the most approved patterns.

SEEDS.—A large and superior assortment of Garden and Flower Seeds, comprising all the new and rare varieties. Field and Grass Seeds of warranted quality, wholesale and retail. The Seeds sold at this establishment will be warranted pure and genuine, true to their name and preserved in a proper manner. Dealers will receive a liberal discount.

Boxes of Seeds for exportation at $5 and upwards, so packed that they may be safely transported to any part of the world.

Packages of Flower Seeds, containing twenty varieties of Annuals, Biennials and Perennials, neatly packed in boxes, from $3 to $20.

☞ Separate Catalogues of Fruit and Forest Trees; Vines, Shrubs, Evergreens, Dahlias, Roses and Greenhouse Plants; Garden and Agricultural Seeds, may be had on application.

WARREN & SON,

NURSERYMEN, SEEDSMEN AND FLORISTS,

1-tf Musical Hall Building, Bush st, San Francisco.

DONAHUE'S UNION IRON WORKS,

[THE FIRST ESTABLISHED IN THE STATE.]

Cor. of First and Mission streets, Happy Valley, San Francisco.

THE undersigned calls the attention of the citizens of California and Oregon to his unequalled facilities for doing work with rapidity and cheapness. He has under and will continue to make, such additions to his plant and labor-saving machinery, as the increasing avants of the State require, and hence solicits public patronage.

Saw and Grist Mill Irons,

Quartz Crushing and Amalgamating Machinery,

and Castings of either Iron or Brass of every description (having a most extensive assortment of ready made patterns) made promptly to order.

STEAM ENGINES from the manufactories of William Burdon, Brooklyn, New York, and other celebrated makers, constantly on hand and for sale.

BOILERS of every description furnished at lower rates than can be afforded elsewhere, the iron for the same being imported direct, and the machinery for shearing, punching and riveting being driven by steam power. Patent Steam and Water Gauges, Steam Whistles, Cocks, India Rubber Steam Packing. Ready made Bolts and Nuts, Belting Lace and other Engineer's Findings for sale.

2 3m JAMES DONAHUE.

Italian Marble, Granite and Free Stone Warehouse,

PROCLAMATION EXTRAORDINARY.

Woman's Rights

VINDICATED AND MAINTAINED.

WHEREAS, from the creation of the world, it was designed by the "Great First Cause" that

Womans's Rights and Privileges

should be co-equal to Man's; and whereas, she has been treated by many men in all ages, up to the present time, as an inferior being to themselves: Now, therefore, be it known that I, M. L. WINN, of

Winn's Fountain Head and Branch,

having expended large sums of money at the FOUNTAIN HEAD for the gratification of the appetites of Gentlemen, do recommend that Woman be hereafter allowed and provided with the facilities to enjoy all the privileges for which she was by Providence designed; and for this purpose I do hereby proclaim, that my

BRANOH,

Corner Montgomery and Washington streets,

shall be conducted with a view exclusively to the **Enjoyment and Comfort of Ladies,** and such Gentlemen as know and appreciate their worth.

At the earnest solicitation of many Ladies and Gentlemen, and agreeable to my promise some months since to enlarge the BRANCH, so as to accommodate the fast increasing patronage, I shall, in a few days, add Two Spacious Stores on Montgomery street, to the Original Branch, making the

MOST EXTENSIVE ICE CREAM

And Refreshment Establishments in California.

The day of opening will be duly announced through the medium of the Daily Press, so that all may witness what has been accomplished for the accommodation and comfort of "God's last best gift to man." In the meantime, lots of Fun and Jollification may be enjoyed in reading the mottoes and feasting upon the luxuries to be enjoyed at

WINN'S FOUNTAIN HEAD,

78 and 80 Long Wharf, and Branch, corner Washington and Montgomery streets;

where Every Thing for the Holidays may be found, from a Sugar Whistle to a Bride's Cake of half a ton.

1 M. L. WINN, Proprietor.

Gentlemen's Clothing and Furnishing Goods.

GEORGE F. WALTER, No. 113 Montgomery street, opposite Barry & Patten's, has on hand and is constantly receiving a splendid assortment of goods for Gentlemen's wear, comprising, in part, fancy Cassimeres, Vestings and French Cloths, of various colors and finest texture. He is constantly receiving by the steamers, direct from his Agents in New York—Messrs. Crawly & Lent, 737 Broadway—invoices of Paris PANTS, Benjeau's make, of Cassimere, velvet face, the best ever imported. A discriminating public is invited to call and examine this stock.

MILITARY CLOTHING.

G. F. W. gives this department his especial attention. All styles of military suits made to order, from the best material, and guaranteed to give perfect satisfaction.

Gentlemen's Fashionable Clothing cut and made equal to any house in the Atlantic States—the workmanship by the best Tailors. The principle laid down is that no garment is delivered which is not a perfect fit; as every article is fitted on before being finished, thereby avoiding the unpleasant necessity of altering after leaving the store. Any garment that is made and does not fit perfectly, is not expected to be taken, as he is desirous of establishing a business that will give satisfaction to all who may favor him with their patronage.

N. B.—I still continue to take measures to be made up in New York by Messrs. Crawcy & Lent. All orders sent will be received by return steamer.

GEORGE F. WALTER, 113 Montgomery street,

1 1m Opposite Barry & Pattens.

PIANO FORTES FOR HIRE.

WOODWORTH & CO., Importers of Piano Fortes, 130 Clay street, are now receiving a further supply of Piano Fortes, from the celebrated "Stodard" manufactory, expressly for hire. Also, now landing from the clippers, a large assortment of instruments suitable for HOLIDAY PRESENTS, consisting of 6, 6½ and 7 octaves, plain and carved, with pearl and ivory keys, likewise

Prince's Melodeons, 4 to 5 octaves;
India Rubber Piano Covers;
French Piano Covers;
Rosewood Music Stools, &c., &c. 1 4t

And Journal of Useful Sciences.

VOL. 1. SAN FRANCISCO, THURSDAY, JANUARY 26, 1854. NO.

THE CALIFORNIA FARMER,
AND JOURNAL OF USEFUL SCIENCES,
IS ISSUED AT THE OFFICE, ON BUSH STREET,
EVERY THURSDAY MORNING,
At Eight Dollars Per Annum, in Advance,
BY JAMES K. PHILLIPS & CO., Publishers.

JOHN F. MORSE, Editor.

ADVERTISEMENTS.—A limited number of Advertisements will be inserted at the following rates: For one square of eight lines, per month, $6. For business notices of five lines or less, per month, $4. A slight reduction will be made to regular advertisers.

Beautiful Trait of an Actor.

A most popular actor (his name will be known by-and-by), who had just played a series of characters with great effect, had remarked every evening in front of the curtain a young person of extreme beauty, who had watched his playing with an attention to which it was difficult to believe the motive a single one. Our actor knew well that he had inspired a profound passion, and he did not hesitate to respond to it with a full heart, although completely ignorant who the young and charming lady was that night after night cast on him her burning looks.

In the meantime, a wealthy personage wished our actor to put himself to the trouble of calling at his residence.

"Monsieur," said the banker, "I have an immense service to ask of you. It is to name the sum that will induce you to leave the city for a few years."

To this strange proposition the artist replied with a loud laugh—

"What do you think, Monsieur?" I am now at the climax of my reputation and my glory, which are my fortune. I would not leave for a million!"

"Well, I offer it to you! Leave, and I will instantly count you out a million; that will materialize the fumes of glory."

"But, Monsieur, can I know the powerful motives that induce you to make me such an offer?"

"Yes, I will tell you. My daughter, my only daughter, I wish to marry to her cousin, a young man destined for the highest office in the kingdom. My daughter is foolishly enamored of you. I cannot give her to you. It is necessary, therefore, that you leave."

"Monsieur!" replied the actor, after he had surmounted the first promptings of his pride, "if that be all, make your mind easy. I will not leave—you will not spend a million; and your daughter shall marry her cousin."

"What do you mean?"

"Detain me for dinner to-day, and place me near her."

At first the banker dared not to trust him; but the actor insisted and the other yielded. There were many of the wealthy to partake of the dinner—among others several bankers and their wives. The guests had already arrived, and the young lady of the house appeared at the same time.

But what was the surprise, the chagrin, and regret of the actor, in recognizing in this young lady the very one of whom he had been so passionately enamored in front of the scenery of his theatre!

She, stupefied at seeing him at her father's, stammered out a few words, and accepted his arm to go to the table, for the actor was determined, let the consequences be what they might, to keep the promise which he had made to the father of his love.

And he did keep it, in truth; and so well, that the young lady, on seeing what kind of a coarse, abject person of a clown she had given her heart to, felt as if it would break. In fact, the actor had caused a thousand inconveniences, and concluded by insulting the guests so grossly that most of them were anxious to leave. In a word, the scene became so stirring that as soon as dinner was over, the young lady herself, insulted and outraged, called the servants, and had the actor pushed outside the door.

But her cousin—her affianced—arrived in the evening. He recognized the celebrated actor. The latter related to him how he had just broken his own ties, annihilated himself by an odious role, in an incredible comedy of the *bon ton*—he told him the whole affair! The young lady discovered that she had been duped by an admirable ruse; that the man she had loved, and who loved her, had been immolated to her father's will. She saw her cousin no more with pleasure. She detested him from that time forth, and when pressed to determine on being married to him, she would give way to her feelings in reproaches and despair.

The whole of the next day was passed in despair by the banker, and in anxiousness and jealousy by the cousin. They finally concluded that the young lady had gone to join her lover, and they hastened to take her from him. A fact soon proved to them that their suspicions were well-founded, and the justices were applied to, in order to have the ravisher arrested.

But the artist had not accepted the sacrifice of the young lady. He avowed his courageous subterfuge of the previous evening, and that he loved his admirer to distraction; but he did not wish that she should be lost—dishonored. He catechised her, persuaded her, and brought her back to her father at the very moment the latter was in search of him. The father understood the legal better than the passionate expression of this denouement, and gradually touched, moved, conquered, it struck him he could do nothing better than to give the actor his daughter—he being the most honorable and honest man he had ever met.

This happened to be actor Garrick, who was so much esteemed that, at his death, his funeral pall was borne by the Duke of Devonshire, Lord Camden, Earl Speucer, and Viscount Palmerston, followed by fifty mourning carriages, containing the most of the English nobility.

A Magical Duet.

Bonnet, in his *Histoire de la Musique*, gives the following extraordinary account of a mathematician, mechanician, and musician, named Alix, who lived at Aix, in Provence, about the middle of the 17th century. Alix, after many years' study and labor, succeeded in constructing an automaton figure, having the shape of a human figure, which, by means of a concealed mechanism, played, or had the appearance of playing, on the guitar. The artist, after having tuned in perfect unison two guitars, placed one of them in the hands of the skeleton, in the position proper for playing, and on a calm summer evening, having thrown open the window of his apartment, he fixed the skeleton with the guitar in its hands in a position where it could be seen from the street. He then, taking the other instrument, seated himself in an obscure corner of the room, and commenced playing a piece of music, the passages of which were faithfully repeated or echoed by the guitar held by the skeleton, at the same time that the movement of its wooden fingers, as if really executing the music, completed the illusion. This strange musical feat drew crowds around the house of Alix, and excited the greatest astonishment; but, alas for the ill-fated artist, this sentiment was soon changed in the minds of the multitude into the most superstitious dread. A rumor arose that Alix was a sorcerer, and in league with the devil. He was arrested by order of the Parliament of Provence, and sent to be tried on the capital charge of magic or witchcraft. In vain the ingenious but unfortunate artist sought to convince the judges that the only means used to give apparent vitality to the fingers of the skeleton were wheels, springs, pulleys, and other equally unmagical contrivances, and that the marvellous result produced was nothing more criminal than the solution of a problem in mechanics. His explanations and demonstrations were either not understood or failed of convincing his stupid and bigoted judges, and he was condemned as a sorcerer and a magician. This iniquitous judgment was confirmed by the Parliament of Provence, which sentenced him to be burned alive in the principal square of the city, together with the equally innocent automaton figure, the supposed accomplice in his magical practices. This infamous sentence was carried into execution in the year 1564, to the great satisfaction and edification of all the faithful and devout inhabitants of Aix.

A Tiger's Jaws.

Grice and I obtained two-and-a-half months' leave on purpose to kill tigers, panthers, and bears. Having made our preparations for the jungle, we started on the nineteenth of March, with a fine band, consisting of one big drum, one big bell, four small drums, and a pair of pistols always loaded with coarse powder, and being continually let off. The noise of this concert was sufficient to frighten any animals out of the jungle; and, when it was not, we had also some twenty or thirty men to set up a supplementary yell. I should like you to have heard our band turning a corner among the hills! Our battery consisted of ten double guns—some rifles, the others smooth-bored—and two brace of pistols. We did not commence shooting until the twentieth, when we began about nine in the morning; our plan being to go some half a mile beyond the beaters: and, having placed ourselves in some likely spot, to sit quietly, and (if possible) [illegible] until they had beaten up to us. Owing to rain we saw nothing until the twenty-second; when, having walked some five miles, we posted ourselves, guns and all, on a small tree, and put the beaters in. We had been in the tree about twenty minutes, when Grice whispered to me, "Tiger!" I saw her almost at the same moment as Grice [illegible] four barrels, all of which took effect. She charged with frightful speed right under the tree in which we were sitting, and was into the jungle in a moment. Immediately after this, a peacock began calling, a sure sign of a tiger being near; and, sure enough, in another minute out came a small cub about the size of a dog: this, Grice shot. We then began the ticklish work of "following up," generally done on elephants; but, not being rich enough to sport them, we were forced to go on foot. We traced our prey about half a mile into the jungle, which was so thick that one could not see more than ten yards ahead. I separated some six or seven yards from Grice, and was in the act of looking down close to the ground, when I heard a frightful roar; and, before I had time literally to cock one barrel (I had imprudently gone into the jungle with my piece on half-cock), I felt myself jammed in the brute's jaws. She carried me about ten yards. My face, I believe, was touching her cheek, when Grice, with the most wonderful presence of mind, put two bullets into her ear. She dropped, but still held me. Grice ran up, and before she was actually dead, pulled me out of her mouth.

I am told that there was not two inches of space between my head and the spot where the bullets hit. Had Grice's hand shaken, I should have been shot through the head, as he had a very small mark to fire at. I was perfectly conscious when pulled out of the brute's mouth.

The skin, of course, I keep as a trophy—it is nearly twelve feet long. The accident occurred fifty miles from camp; and if it had not been for Grice, God knows how I should ever have been taken back; but he is well known by the natives—in fact they are afraid of him (his nickname is "Tiger Grice")—and he told them they would be well paid if they carried me to the next town, Jaat, about twelve miles off. After some little arrangement, they carried me to Jaat, where Grice is almost worshipped, on account of having last year killed a tigress which had at different times killed twenty-four of the villagers, and at the time Grice shot her, she was in the act of eating an unfortunate woman. Twenty-four men were sent out from camp with a palanquin to meet me. Grice rode all night by my side, and accompanied me till within two miles of camp, when he went back again to go on with his sport. It is more than a month since he has been heard of, but I hope he is all right. I suffered great agony, from the moment I was bitten. My mother was always anxious about all her children's constitutions; well, a very clever doctor told me that if I had not had an iron constitution it would have gone very hard with me. I am perfectly convalescent, walk about, and go out every evening; the wounds are healing, but it is irritable to have one's arm constantly slung up. I should like very much to send the skin to England, but it is very large, and difficult to pack up; otherwise, it would make a nice rug.

A Yankee at the Crystal Palace.

As we were sitting in the picture gallery of the Crystal Palace, taking a memoranda of its contents, a tall, ill-dressed Vermonter, attracted probably by the benignity of our visage, addressed us.

"Stranger, what mought they charge to let a feller in this 'ere show."

"Why do you ask; you paid at the entrance, did you not?"

"Y-a-a-s! I *didn't* pay nothin'; ef yew see anythin' green 'bout me, jest yew write, will ye?"

"How did you gain admittance, then?"

"Wa-a-ll, yew see I traded with a boy out there for a Herald, and gin him an extra cent to holler fire, and when the man with the brass thing on his coat looked aroond, I kinder edged in behind him.

Of course we expressed our indignation, and were about to leave him, when he seized our button-hole, saying quickly:

"Say, mister, don't be riled; guess they'll never miss it. Yew talk so all-fired honest, guess yew must be a newspaper-feller; been takin' notes, haint you? I've hearn about the short-hand."

We assented, and he resumed:

"Mought your name be Greeley, mister? because I seed a nigger wench looked just like a feller name; and ef she isn't, it's a lucky chance for you to spend—won't cost nothin', neither."

We denied *that* impeachment, and he continued:

"I always like newspaper critters, 'cause they're so clever. Been to the Emperor myself; talked about tree with [illegible] and handed round."

We next suggested to him the [illegible] performers among whom were [illegible] sang: "Hail! Columbia," [illegible]

"Yaas, they are good 'uns."

[illegible] we could proceed [illegible]

Northwest Passage.

The problem of centuries is solved. Commodore McClure has discovered the Northwest Passage. The sources of the Nile still remain [illegible] the ambition of travelers. The mountains of the Moon are still a myth. The Happy Islands and El Dorado are not yet inscribed upon maps. But the great polar problem is settled; there is a Northwest Passage.

Of what use it will be, unless it should be found to conduct to Symmes's Hole, it would be hard to say. The fact, being ascertained, must be [illegible] improved. Science will be served by it; human knowledge of the actual state of the ball upon which we are plunging through space will be increased. But no ship will ever thread its way through that dismal channel; and McClure, himself, the hero who has just secured a niche in history, has left final surmises as to his probable fate should he never return. No Chinese commerce will be drawn along that perilous way. No such short cut to the Pacific will ever be [illegible] proved, lest it should prove a shorter cut to deeper ocean. "The realms of the boreal pole still remain shrouded in glacial gloom. That summer sea, within the polar circle, of which [illegible] phrenzy of theorizers dreams, as the thirst-stricken traveller fancies flowing waters, will still be as fair, smoothly outspread in imagination. As they who list, and they to whom the intrepid navigator was dear, may still dream of Sir John Franklin's fleet riding at ease upon that tranquil sea; and still believe in that impossible fine summer which shall melt the icy gate that bars that sea, and lead him into warmer latitudes, and to a country that would celebrate his return as pagans the avatar of a Deity.

But, although no use may accrue from the great discovery, how justly is the fame of the long and terrible search for the Northwest passage associated with much that is most admirable in human heroism. The history of the enterprise is one long paean of the invincibility and majesty of the human will. Boreal armadas, Alps of ice swaying, enclosing and crushing, could not annihilate the genius and resolve of man. He is upon the planet to subdue it, and each triumph, like that of this discovery, only fulfils his destiny. Nor is it possible to observe the conduct of McClure without a thrill of genuine admiration. He achieves the great result; he knows that the fame is his, that he has done what so many men have longed to do; yet, without turning back to enjoy the applause that awaits him, he plunges deeper and farther into the chance of destruction, and himself leaves the clue to his probable fate should he never return. Were it only to develope such genuine heroism, were it only to inspire in mankind higher reverence for human power; the time and expense for the search of the Northwest Passage have not been lost.—*Harper's Magazine.*

Breeding Horses.—It is for the interest of the farmer, if he breed horses, to breed those only that will readily sell at prices that will fully remunerate him for the breeding. It is no more to raise a horse that will sell for two hundred dollars, than one that is hard to get rid of at forty. Experience and observation convinced us that this can be done by the [illegible] only *thorough-bred stallions* [illegible] country mares. The [illegible] owned of [illegible] [illegible] [illegible]

THE CALIFORNIA FARMER.

JOHN F MORSE, Editor.
J. L. L. F. WARREN, Assistant Editor.

To the Friends of Agriculture.

We ask of all to whom we send this number, who are not already subscribers, to examine the Farmer, and to give it their influence. We trust to hear from them and to know that they will not only become subscribers to our Journal, but favor us with their communications. We desire to call their attention to our terms of subscription for clubs.

Special Premiums for Subscriptions.

In addition to the standing inducement for the getting of subscribers for the "Farmer," we will make a present of HARPER'S ILLUSTRATED FAMILY BIBLE to the person who procures the most Subscribers in the first six months of our publication. This we regard as one of the most beautiful books ever issued. Who will have the prize?

A Premium---Farmers' Clubs.

With the hope of inducing such of our friends, and those who have a little leisure, to ride among their neighbors and introduce an Agricultural Paper, we take pleasure in offering the CALIFORNIA FARMER: and, to make it an inducement, we say to such friends—if you will get us five subscribers, and remit the amount, we will send you six papers, or for ten subscribers, twelve papers. We trust there are many friends who will cheerfully take a little pains to aid us, and thus extend the circulation of the Farmer, and make a useful vehicle for the Agriculture of California.

Subscribers will please be particular to name the Post Office to which papers are to be sent; or, if forwarded by express, which line they prefer.

To Our Patrons.

To Advertisers.—We would call the attention of those who desire to have their advertisements produce quick returns, to the pages of the California Farmer.

The Farmer will reach sources of trade entirely new and unattainable by any other means, and thus secure a large and immediate profit to those who desire to make known their business. By a glance at our advertising columns, it will be perceived that we present the best known and most extensive houses, and as we have space for but one or two of each branch, these will be the most prominent houses, and thus give more influence to them.

Effects of the Frost.

The oldest inhabitants of the country seem to agree that we have had an uncommonly severe winter, more cold weather and severer freezes than have been recognized for the last ten years. As might be expected where such frosts are unusual, a great deal of damage has resulted. Hundreds of thousands of bushels of potatoes and other vegetables were lying out in the open air, exposed to the action of the frosts, and as a matter of necessity, seriously injured. We saw some explorations made in large piles of bagged potatoes, and the frost had affected, and indeed ruined nearly all in the external layer of bags, and we were told that in the unbagged piles they were frozen in for a foot from the surface.

Such a general destruction of this vegetable might occasion an afflicting scarcity if there were not a preponderant quantity of them in market. But fortunately for consumers, the quantity raised last year was in all probability a great excess on the public demand—and the destruction incurred by the frost will not be so serious in its bearings as it otherwise would.

Prior to this frosty visitation, potatoes had become reduced in price to one, and one and a quarter cents per pound. The only effect, probably, from the foregoing loss, will be to increase the price and secure a more encouraging requitement to the farmers who had engaged in raising them.

Grapes.

Near the Mission of San Jose, we perceive there is an important consideration given to the cultivation of this invaluable fruit. Mr. Beard has a couple of the most extensive vineyards that it has been our pleasure to see. The vineyards are situated upon the western slope of a hill, which is very gradual in its ascent from the low table grounds of that valley. Their situation in respect to dry and wet soil is about midway. They are regarded in their products as being less valuable than any other fruit which he raises.

One particular thing to which we would refer was a difference of opinion in respect to the kind of soil best adapted to the cultivation of the grape.

The general impression we knew to be that grapes would be most productive when cultivated upon a comparatively dry soil, and when pruned very closely; but we were informed that a gentleman in that valley had tried the experiment of rooting vines in a low, wet soil, and during one season had not pruned the vines. The result in this instance was abundantly successful. His grapes were larger, more of them, and marked by a richer flavor, than those he raised upon higher and drier ground, and from close pruning. This might have been a mere contingency, or singular and capricious exception from a general rule; or it may be a source of most useful information, which could be most profitably taken under advisement. The cultivators of this fruit can best appreciate the experiment, and they alone can demonstrate the fallacy or correctness of the conclusions.

Sweet Potatoes.

During a recent visit to the valley of San Jose, near the old Mission, we took considerable pains to enquire in reference to this useful vegetable. From Mr. Horner we learned that he had experimented in the growth of sweet potatoes, but that he had not succeeded to his satisfaction. He thought the soil of his land was not adapted to their cultivation. His manner of planting was to cut the seed potatoes and deposit them in hills, as in planting the ordinary kind of potatoes, using manure in the hills.

Mr. Beard informed us that he had succeeded in raising very good sweet potatoes, but not in large quantities. He also thought that the soil was not well adapted to the culture of this vegetable. His plan of cultivating them was to first sprout the potatoes in warm beds, and transplanting them in finely pulverized soil, after all danger of frost had subsided.

These gentlemen were both of the opinion that the sandy soil on the banks of the American River, near Sacramento City, was peculiarly adapted to the cultivation of sweet potatoes. We trust that the farmers in and about the above-named city will pay especial attention to this subject and fully test the conjectures in respect to their soil.

Bulbous Roots.

We have now the pleasure of seeing in many of our dwellings several varieties of the choicest "Bulbs of Holland" and Japan and also the new varieties raised by hybridization in England and France. We have noticed in several of the dwellings of our citizens, the fragrant Hyacinth, Narcissus, and Jonquil. Some of the finest blooms of Japan Lillies ever raised, the delicate Crocus, the pure Snow Drop, and the gorgeous Tulip, now frequently meet our gaze and tell us that here in California, we shall yet enjoy all that is beautiful in Flora.

That our fair friends may be succesful in the cultivation of the genus, we append the following brief directions for cultivating them: They should be kept dark till the roots get advanced—if in pots, by covering two-thirds of the bulb in good rich mould, leaving the crown and eye above the earth; if in glasses, by keeping them in a dark room, the water in the glasses only touching the lower surface of the bulb.

Tomato Catsup.

That our lady friends may have a fine quality of this most desirable luxury, we append a recipe from the "Country Gentleman," a work published at Albany, and devoted to the science of Gardening. Take six pounds Tomatoes, and sprinkle with salt; let them remain a day or two, then boil, and pour through a coarse sieve or cullender. Put into the liquor half a pint of vinegar, clover, pepper, ginger and cinnamon—boil them one-third away; bottle tight. It should be shook before using.

Unequalled Potato Crop.

In what part of the world can a farmer be found, who in one season raises four hundred thousand bushels of potatoes? It remains for California to exhibit such a husbandman.

This was the crop of potatoes harvested by John M. Horner, Esq., of San Jose Valley, during the last season; and his neighbor and previous partner Mr. E. L. Beard, raised, in addition to other immense crops, two hundred and fifty thousand bushels of the same eseulent vegetable?

Can history furnish such evidence of enterprise, of energy and boldness in any two individuals since the world began? Can we not, in California, afford to be proud of two such farmers? Men, who unaided, save by their own herculean energy and masterly judgments have achieved positious of immortality as cultivators of the soil. If there were any previous doubt as to the ability of attaining fame through the chaunels of Husbandry, it must be dissipated by the celebrity which these two gentlemen have acquired within the last few years in this State.

California Legislature.—In the Senate, on the 18th inst., the bill providing for the permanent location of the Seat of Government at Sacramento, was defeated by a vote of nineteen to thirteen. Mr. Hall then gave notice that at an early day he would introduce a joint resolution to remove the seat of government *temporarily* to Sacramento. So the "removal question" is still unsettled. On Friday last, the Senate passed, by a vote of twenty-five to one, a bill to repeal the "flour inspection law," and it will undoubtedly pass the Assembly. We hope this will give a check to the sale of damaged flour.

[For the California Farmer.

"Hope springs eternal in the human breast—
Man never *is*, but always *to be* blest."

Especially has this sentiment been illustrated in the case of California immigrants. Led to embark in an adventurous enterprise, for the sake of accumulating rapidly an independent support, they have been allured by the sweet voice of the syren Hope, to pass through trials and to dare the most desperate risks.

The present is an age of speculation, and all who have come to this side of the great continent within the last five years are engaged, to a greater or less degree, in some kind of speculation—"making haste to be rich" is the order of the day, and none are content with the old manner of plodding on in regular business, making slow but sure progress towards amassing wealth; but, what was formerly in the older States accumulated by the labor of a life-time, must now be piled up in the short space of as many months as formerly occupied years to accomplish. This state of things has a great influence upon society—upon the minds and manners of men—enlarging their views and effecting a complete change in all their ideas, and causing their former homes, if perchance they ever visit them, to seem tame and "slow," for California is emphatically and truly a fast country—its inhabitants are fast, its horses are fast, and unfortunate indeed is the steamboat which is not fast; men eat fast, drink fast, talk fast, and the Telegraph has never done its duty quite fast enough to meet the views of some of our business men.

The sentiment which has most tended to produce this result has been Hope. This it has been, which has led men on through privations and miseries which are almost incredible. Hope held out to them the idea of riches and independence, showed them, through the dim vista of the future, their wives and children gathered around them, enjoying the comfort which was to be the reward of years of toil and perseverance in a foreign clime. Hope has sustained them, when, worn down by days and weeks of fruitless toil, they have been tempted to give up in despair, and has whispered to them the simple words "try again;" and, thus stimulated, they have tried again, and met at last with the success they so well deserved.

The human mind is so constituted that, while it looks back with ever so much dismay upon the past, the anticipatious of the future ever cheer and support in the trying hour of sickness, and aids, more than all else, the skill of the physician, in those dark hours. At the close of day, when night spreads her sable mantle over the world, we think with pleasure of to-morrow's dawn—to-morrow, which recedes as we approach, and, always coming, never comes.

Where would be the enthusiast, were he not led on by Hope? His bright dream of greatness and happiness—never, perhaps, destined to be realized—is the load-stone which points onward, without varying, to the point, which, ever receding as he advances, still appears a bright polar star to his imagination.

The boy at school looks forward with beaming countenance to some hoped for reward; and, as he advances along the pathway of life, finds that his principal enjoyment consists in the anticipations of the future, rather than in the realization of his highest day-dreams. Honor and domestic happiness may be his, yet he still looks forward, ever hopeful, towards a goal which promises some new pleasure.

The name of Hope is enrolled upon the bright list of angels, and she lends a charm which disrobes life of much of its dreariness. Many call her a castle-builder, and some have pronounced her a deceiver, because her visionary schemes are are not all true; yet, it is not the fault of Hope that her purposes are not fulfilled, or her promises realized; this is rather to be charged to the account of Time, that cruel spoiler, whose wings carry along with them the work of destruction, and bring about the various changes of human life. Time disappoints the fondest anticipations of Hope, blasts her noblest designs, and renders futile her most desirable projects; yet, though some of the most joyous prospects of Hope are sometimes defeated, she does not yield to despair. She ever has a bright side on which to look and form anew her plans.

The California Farmer will always be found at Sullivan's Newspaper Stand, Kearny street, at the Bookstore of Mr. Murray, Montgomery street.

Messrs. Adams & Co., are authorized to receive money for us, and receipt for the same, at any of their offices throughout the State.

Important Changes taking place among Farmers.—A very important change is taking place among the most extensive cultivators of the soil in California. Those who have heretofore cultivated garden vegetables in large quantities, are now making arrangements to enter much more extensively into the cultivation of wheat, barley, oats and corn. This will exert a happy effect in the way of equalizing crops, and preventing such an excess as has resulted from the too general growth of potatoes the last season; or, in other words, it will induce men to take up single departments of Agricultuae, and thereby contribute much more judiciously to the general demand. And, in addition to this, it will develope a much more perfect system of farming than can be achieved in any other way. It is the first step in a series of changes which will result in making the best grain growers, the best cultivators of vegetables, of fruits or flowers that can be made by any system of education or practice.

Shooting Affair.—A characteristic affray came off on Friday last, near Jackson street wharf. Some boatmen, wishing to move the storeship Java, belonging to Messrs. Silas E. Burrows & Son, to accommodate a pile driver, went on board for that purpose, when one of them named Palmer, was shot by Mr. O. H. Burrows, with a Colt's revolver. He fired twice, both balls taking effect—the first in the region of the spine, and the other in the left breast. Mr. Burrows gave himself up, and has been released on $10,000 bail—the wounded man being expected to recover.

Since writing the above, Mr. Burrows has been acquitted, on the grounds that he had a right to defend his property, and to meet force with force, Palmer having endeavored to forcibly move a vessel with a valuable cargo in it, which was in Burrows' charge.

Steamboat Explosion.—On Friday last, as the fine new steamer Helen Hensley was about leaving the foot of Jackson street wharf, bound to to Benicia, one of the flues of her centre boiler collapsed, blowing out both heads of the boiler, tearing down the bulkheads fore and aft, and destroying a portion of the forward part of the boiler deck. A great number of passengers were on board at the time, of whom two were instantly killed, and quite a number badly scalded. The cause of the explosion seems to be attributable to the inferior quality of the iron of which the boiler was composed, and to the fact that no means exist on this coast for testing boilers before they are put into use.

Constantinople.—This city occupies a triangular promontory of land between the Bosphorus and its inlet, the Golden Horn. It is about three miles and a half in length, and from one to four miles in breadth, and is enclosed in a triple range of walls twelve or thirteen miles in circumference, and entered by twenty-eight gates. It is built on an undulating declivity rising towards the land side. Externally it has an imposing appearance, with its mosques, cupolas, minarets and cypresses, and its piers crowded with shipping; but internally it mostly consists of a labyrinth of ill-paved, crooked, dirty lanes, and low-built small houses of wood, or rough hewn stone. There are a number of public fountains, which amply supply the city with water. Its population is estimated at about 400,000, including Galata and Pera, and it is composed of about 150,000 Greeks and Armenians, 20,000 Europeans, 60,000 Jews, and the remainder Turks and Armenians. There are between 300 and 400 mosques in the city and suburbs, 40 Mahommedan colleges, 87 hospitals, 29 Christian churches, 180 public baths, and 180 khans or inns, besides numerous bazaars, coffee houses and caravanseries. The seraglio is to the east of the city, and comprises an area of about three miles, separately enclosed by walls, and extending down to the sea of Marmora. The Golden Horn is a fine harbor, deep enough to float ships of the largest size; it can receive 1200 sail of the line, and is always full of mercantile and other vessels. On the north shore of the Golden Horn are the imperial dockyards. There is always a strong garrison of troops in this city, and many new barracks have been built by the late and present Sultan. The commerce of the port is extensive, but not so great as might at first sight be anticipated. The city is the see of the Greek, Armenian and Catholico-Armenian patriarchs.

Meagher's Lecture.—The lecture of Mr. T. F. Meagher, on Tuesday evening, was fully attended, and the orator gave universal satisfaction. We understand he is to deliver another lecture this evening, on Mr. Henry Grattan, the celebrated Irish patriot.

The clipper ship Onward arrived at this port yesterday, 150 days from New York.

Messrs. Stiles & Dounis, Benicia, are our authorized agents for Benicia, Martinez, and vicinity.

Wreck of the Golden Gate.

By the arrival of the "Goliah" from San Diego on Monday evening, we learn that on the afternoon of the 18th, the "Golden Gate," in attempting to come out of the harbor of San Diego, run aground on the bar, about two miles from land, and now lies on the bar, probably a wreck and total loss.

We learn that the Golden Gate broke her starboard shaft on the 10th of January, on the second day out from Acapulco, and when about five hundred miles below San Diego.

The Golden Gate left Panama on Sunday night Jan. 1st, and was making an excellent run when she broke her shaft.

The next morning after the shaft was broken, and while the Golden Gate was lying to, the Uncle Sam spoke her and passed on, the commander of the Golden Gate not wanting any assistance. The next morning after this, Capt. Isham put his passengers on allowance.

The Goliah brings two hundred of the Golden Gate's passengers.

Capt. Isham reports 750 passengers as having been on board, and no deaths or sickness occurred.

On the 14th, the Golden Gate made steam and got under headway, with one engine and one wheel, and arrived in the harbor of San Diego on the morning of the 18th, between 12 and 1 o'clock. The next day, on going out, she run her keel on the bar, and the Goliah, in trying to assist her in getting off, broke two cables, when the attempt was relinquished, and her bows swung round on the bar.

A short time after running aground, a heavy gale set in from the southeast, and carried away all her larboard guards and bulwarks, at which time she sprang aleak. At this time the fore-staysail and fore-topsail were set, in the hope of working her off; but the staysail was blown through the boltropes, and the topsail was carried away.

At this time the sea was so heavy that the Goliah could not approach the Golden Gate, and the passengers were obliged to remain on deck all night, with the sea breaking over it continually. The rain, the sea, and the cold searching wind, all combined to make the conditiou of the passengers anything but comfortable.

The next day the crew pumped all day; the firemen worked their bilge pumps, and about one hundred passengers volunteered with buckets. They gained a little on the water when the tide was on the ebb, but so soou as it flowed again she filled with more water than had been in her previously.

The Golden Gate now lies buried in seven feet of sand. So a passenger informs us, to whom we are indebted for the foregoing information; and he says there is no doubt in his own miud that the ship will prove a total loss.

The Golden Gate is a very strong, well-built vessel, and had she been less substantial she must have gone to pieces during the gale, and every person on board have perished.

Pat Hunt, who was on board with some fine blooded horses, got them safely on shore.—*Chronicle.*

Below we give Capt. Isham's letter to the agent in this city, giving an account of the sad disaster.

STEAMSHIP GOLDEN GATE,
On shore—San Diego Jan. 21, 1851.

E. FLINT, ESQ.—Dear Sir—I am obliged to report to you that on the 10th we broke our centre shaft, and drifted about under sail until the 14th, by which time we were able to steam with one engine and one wheel. I have 750 passengers on board. I came into San Diego on the night of the 18th, between 12 and 1 o'clock, for fresh provisions, all hands having been on allowance for six days. (I was 500 miles from San Diego when I broke down.) In leaving San Diego, I had got outside of Ballast and near to Point Loma, coming down broadside to; I gave the engine a back turn to get room to swing round; when I rang the bell to go ahead, it being so badly balanced, it could not be got over the centre, and the result was that the current sheered the ship on to the edge of the bank, which I did not consider of any consequence, notwithstanding I had been one engine, and it worked heavy. The ship then swung round and I brought up alongside the bank fore and aft.

The steamer Goliah was at the time leaving port; I made signals to her, and she came alongside and took my hawsers. By the time she got hold of me, the tide had fallen eight inches; she parted both hawsers, and I then saw no chance of getting off until the next high tide. I ran in my hawsers again, and the Goliah came to anchor, to be ready when the tide made. By this time it was 5 P. M., and perfectly smooth; the tide commenced to flow at 6 o'clock, at which time a gale from the south east burst upon us. At 9 o'clock the Goliah let go my hawsers, and made a shelter inside the harbor the gale continuing furiously; at 11 o'clock P. M., having sail on the ship and the engine at work, the ship swung round and brought up on the same shoal, not being able to get way on her on account of the violence of the storm and the breaking of the sea. After bringing up, the sea broke heavily over us until 4 o'clock in the morning when it moderated; but the sea continued to break heavily all around us; during the night the ship pounded very heavily, and almost any other ship would have gone to pieces; when the tide [illegible]

[illegible] was too rough to attempt to do anything with her. The ship leaks considerably, went through the night.

[illegible] water of the ocean over the [illegible] was [illegible] o'clock with her [illegible] pumps. At 7 P. M. had the [illegible] was received—

Later from Lower California.

By the arrival of the Goliah we received the San Diego Herald of Jan. 14, which contains the following letter brought to San Diego by Capt. Cutrell, who was accompanied by an escort of twenty men. Capt. Cutrell arrived on the Tuesday previous, Jan. 10th.

The letter contains no important news, being merely laudatory of Gov. Walker and his followers:

HEAD QUARTERS WALKER'S BATTALION,
Fort McKibben, L. C., Jan. 7, 1851.

Editor San Diego Herald:—Our expressman (Allen) was obliged to stop at San Miguel, by a report which he heard that a party of about twenty of the enemy were prepared to intercept him; but, by "hook or crook," he managed to send us several copies of your paper, and others, so that at this writing we are in the midst of about such an excitement as is kicked up at San Francisco after an important steamer arrival.

Among other thiugs I perceive that doubts are felt and expressed by some of the papers at our success, and that they have only one reasonable ground for them—that is—that our accounts do not *tally* as to *dates*. Now the fact is, that men iu camp, as we have been, do not keep the day of either week or the month, and when we have opportunities of writing letters, are not in the habit of waiting to inquire the date, but go ahead, and if necessary, estimate all such matters.

Your San Francisco cotemporaries who attempt to throw their doubts on us, do not, in this instance, show for the first time their fondness for the pettifogging, Recorder's Court style of argument. They are of that class of "old fogies" who disbelieve in anything not comprehensible to their limited faculties, and hold that a thing cannot be done because it never has heretofore been accomplished. Enough of these: we are of the practical sort; the real simon pure "Young America." My dates to you were only wrong it one respect, (as to the time of landing) which should have been stated as the 29th of November, instead of the 2d December, as I had it.

We are occupied (the Battalion I mean) in garrison, at this post and La Grulla (Fort Davidson) drilling our men, reconnoitering roads and making surveys; and President Walker, after sending out one surveying party under Maj. Emory, (Topographical Engineers) has just gone with a party as escort, towards San Rafael, on an excursion the nature of which none of us know. In fact, the Colonel does not talk much to any of us, but with all his quietness, has more go-ahead-itiveness in him than any man of his age. Where is the other man who would have attempted what he has? And where, above all, is the other man who would have succeeded as he has done? The only fault about him is, that the men of the Battalion have too much confidence in him; it is not possible to make them believe that any sized party can whip us if we have him with us; and perhaps it is so, for we have tried our leader, and think we know him.

Since last advices, we have recovered two of our men, Perry and Lockhart, who had been taken, while straggling for the command, and kept as prisoners by Mellendrez. The latter named illustrious individual had intended to inflict a few of his tender mercies upon these prisoners, had not one represented to him the fact, that we had two of their Governers as our prisoners.

Among other matters of garrison news, (for we are in the drill, real position of actual conquerors) we have only a few promotions to enliven the monotony of camp drill and discipline.

Many misrepresentations will reach you and every time that any miscreant who has heard of our movement does anything to any of the defenseless inhabitants betwe n here and San Diego, our enemies will not be slow to represent it as an act of aggression on the part of President Walker's forces. There are worthless vagabond Americans in every country, who are sharp enough to avail themselves of the present condition of the country to obtain travelling facilities, in the shape of forced loans of stock from the ranchers living on the road; but in Lower California the evils will be done away with when they get matters a little more settled.

President Walker has made promotions and alterations in our forces, which place Col. H. P. Watkins at the head of the regiment Lieut. Col. Charles H. Gilman (at present wounded) next in command, and Lieut. T. Crocker promoted to the rank of Major. Major Crocker is now in command of the first, and we are waiting the arrival of reinforcements, which are expected daily, to take up our line of march towards conquest. Our men are in fine health and all goes well. S. B.

ASPARAGUS AS APPLIED TO HYDROPHOBIA.—Dr. Charetes, physician at Athens, has published that asparagus is efficacious in the treatment of the above dreadful disease. In a late article published in the London Lancet, he wrote up by citing three cases as follows: "The patients were [illegible] run; all had been bitten by [illegible] mad. The two first known cases; they were completely cured under the use of asparagus; but in both cases the symptoms of hydrophobia were [illegible] In the larger experience [illegible] asparagus [illegible] and [illegible] the [illegible] [illegible] America. The [illegible] from [illegible] [illegible] [illegible]

THE CALIFORNIA FARMER.

JOHN F. MORSE, EDITOR.

SAN FRANCISCO:
Thursday, January 26, 1853.

Information most Needed.

At the present time nothing is more essential to the advancement of Agriculture in California, than a free interchange of views in respect to the best method of cultivating the soil. This information must come from the experimenters. The husbandmen alone can say which is the season for breaking ground, for depositing seed and for harvesting the products of his labor. Theories constructed upon the experiments of farmers in Atlantic States, can form but a very imperfect and unreliable guide. No man could either sow or plant by the lessons of husbandry received in any other portion of the world. We heard an extensive farmer remark, the other day, that in 1850 he ploughed his ground and planted a number of acres with potatoes in April. They came up and grew with a thriftiness and vigor which led him to believe that he would realize an immense yield. But to his astonishment, when the tops began to give evidence of maturity and he dug into the hills to find his anticipated luxuries, he was surprised to perceive no evidence of the bulbous vegetable. He suspected that the cause existed in planting so late, and the next year he broke up, prepared and planted his ground in January. The result was not only favorable, but so unusual as to excite his mind with wonder in respect to the power and fertility of the soil. From that time to the present he has been a constant experimenter, and now finds himself so advised as to seldom fail in his ideas of the adaptation of seed, soil and season.

And yet with him there are many things that he desires to learn. He has never lived in a country in which sweet potatoes are grown, and knows not how to prepare for the cultivation of this luxurious vegetable. He says, from all he can learn, that his soil and the geographical position of his farm are exactly what they should be to insure success in their culture. This is the case with hundreds of farmers in California, and it indicates the kind of information which is not only needed, but which is absolutely essential. And we ask the farmers of our State if they will not assist in our effort at collecting such information, and thereby enable us to put in a diffusable and useful form a kind of knowledge indispensable to the progress and improvement of our Agriculture? There is nothing too simple in its relations to sowing, planting, harvesting, or stock-raising for publication and study. Indeed, if the utmost attention be at once paid to communicating this kind of intelligence, it cannot meet the present and growing wants of California husbandry; and we would again urge the farmers of our State to send us every species of information which their experience has recommended to them as valuable. It will not make the knowledge less useful to them and it will subserve the highest possible purpose in elevating and perfecting this source of revenue and respect.

Deep Ploughing---Subsoiling.

We would most emphatically urge the attention of the cultivators to this all-important subject. The large sums annually expended for windmills, water tanks, troughs, hose, &c., can be mostly saved by a proper system of deep plowing and subsoiling. The greatest features of advancement in agriculture in California, is deep plowing. In a climate like ours, with months of dry and burning weather, it is of vital moment that cultivators should give their immediate attention to this subject, if they desire to be successful in their labors in the greatest degree.

The system of plowing some six to ten inches, be it ever so well done, will not long furnish food for the vegetation upon it; and however much irrigation may be done, the more water applied the harder the earth will bake, unless it be kept cultivated. Even then it becomes baked solid around the roots, rendering it impossible for the roots to descend into the deeper and richer earth below. By deep plowing, by the use of the subsoil plow, opportunity is given for the roots to descend for moisture and nourishment, be the weather ever so hot and dry; the longer the dry weather lasts, the deeper the roots penetrate. No one can estimate the value of deep plowing until they have tried it. An extended interest is being felt throughout the country on this subject.

We notice a very able address by the Hon. Horace Greeley, before the State Society of Indiana, upon the subject of deep plowing, subsoiling, irrigation, draining. Some most convincing arguments are produced, and the statement is made that the loss of crops by drought in the Western States, exceeds the whole cost of the federal government, an amount of over fifty millions. If this is the result of dry weather in the fertile West, and this could be saved by deep plowing, how much could be saved in California, Oregon, and the shores of the Pacific, where our dry seasons are in dry, burning weather, as five to one.

We do not hesitate to say, that the cost of waterworks of all kinds for the purposes of irrigation that could be saved by deep plowing, even the present year, would be more than the cost of supporting the government. Will our Farmers see to this, and give it that interest it so much demands?

Butter Making.

FROM AN ENGLISH PRIZE ESSAY.

A cow that has been exposed in the field all day, requires a greater quantity of unazotized food to support the heat of her body, than would have been necessary had she been protected from the cold; but in the evening, if she is removed into a warm, well-littered stall, where the warmth thus communicated is equivalent to a certain amount of food, we find the milk of the next morning considerably richer in butter. Besides the warmth of the shed, less butter is consumed by the oxygen of the air. In the stall, the respirations of an animal are much less frequent than in the field, and consequently less oxygen enters its system. Hence, it is a practice to milk those cows in the field that are distant from home, and to drive home to be milked only such cows as are close to the shed. The exercise required in walking home causes an increased play of the respiratory system, and therefore increases the amount of oxygen inhaled. The oxygen unites with part of the butter and consumes it. All good dairymen allow the cows to walk home at their own pace, and never accelerate it. When a cow is harrassed, and runs to escape the annoyance, her milk becomes heated, diminishes in volume and richness, and speedily becomes sour. This is a well known fact to all dairymen.

The quantity of *casein* (cheese) in the milk appears to be intimately connected with the nature of the food, being more abundant when the cow is fed with beans or oats; and would justify the conclusion that within certain limits the quality of milk may be made to vary in its composition, by regulating the food of the animal.

The milk obtained from various breeds varies greatly with respect to the butter which it contains; and still more with respect to the milk drawn from the cow at the commencement and near the conclusion of the milking. Dr. Anderson found the cream in the last cup of milk drawn from the udder, compared with that of the first cup in the proportion of 16 to 1. It is consequently of the greatest importance that the cow should be milked perfectly dry at each meal.

In milking, the cow should be milked "*clean*" *at once;* some are in the habit of doing this twice or three. The cow is a sensitive and capricious creature, easily offended; and if the dairy-maid rise from her before the milk is all withdrawn, the chances are that she will not stand quietly, with the further probability that she will hold back her milk a second time. During the flush of grass, when the cows are loaded with milk, it may be well always to round a second time, after having milked clean, by which means frequently some considerable quantity can be obtained. Milking should be done *fast*, to draw off the milk as quickly as possible. Some cows yield their milk with a copious flow on the gentlest handling; others require great exertions. The udder of the former will have a *soft skin* with *short teats;* that of the latter will possess a *thick skin*, with *long* and *tough teats.*

Every utensil connected with the dairy ought to be kept perfectly clean and sweet; scalded, and washed with cold water. Lime water, or weak saleratus water, is useful for occasional use. The milk should be put into a vessel to cool, but it ought *not* to stand so long as to allow the cream to partially separate. Being cooled, it should be strained into dishes, from two inches to four inches deep. In a dairy maintained at a proper temperature, the cream should be gathered every 24 hours; but in hot weather every 18 hours at the utmost.

The result of a number of careful experiments in churning was as follows:—1. The addition of some cold water, during churning, facilitates the process of the separation of the butter, especially when the cream is thick, and the weather hot.

2. Cream alone is more easily churned than a mixture of cream and milk.

3. Butter produced from sweet cream has the finest flavor when fresh, and appears to remain the longest period without becoming rancid.

4. Scalded cream, or the Devonshire method, yields the largest quantity of butter; but if intended to be salted, is most liable to acquire a rancid flavor by keeping.

5. Churning the milk and cream together, after they have become *slightly* acid, is the most economical process for districts where buttermilk can be sold, while at the same time it yields a large amount of excellent butter.

6. The greatest quantity of butter from a given quantity of cream is obtained at 60 deg. Fahr.; and the best kind at 55 in the churn just before the butter comes. When the heat exceeded 65 deg., no washing could detach the milk from the butter without the acid of salt; but when a quantity of salt was wrought well into it, and the mass allowed to stand for 24 hours, subsequently being well washed with cold spring water, the serous portion of the milk was extracted.

In Lancashire and Cheshire the practice is to divide the milk into two portions: the greater part of the *first* milk is set in the ordinary way to stand for cream, the cream being usually taken off quite sweet; and the *latter* part of the milking, which is rich in cream, is at once placed in a vessel containing the cream of prior milkings. The two (i. e. the cream of the first, and the milk and cream of the latter) are mixed before churning, when slightly sour. The churn should be set at 58 or 60 deg., and if smartly churned, the butter will "come" sometimes within an hour; and rarely, if set at the above temperatures, will it exceed one and a half hours. Forty plunges a minute of the churn is found the most judicious rate. Churning should be regulated by a thermometer, cold water being applied in summer, and warm water in winter to obtain the proper temperature. When the butter is made from cream alone, very early in the morning is the best period of the day for the purpose. After the butter is taken from the churn, it must first be well squeezed or "worked" by the hand, and all the water that can possibly be, must be pressed out, it being for this purpose kneaded, washed, and rolled out several times with clean cold water, and the last time a little pure salt should be kneaded into the mess, which will have the effect of causing the greater part of the remaining cheesy matter to exude when subsequently washed in cold water, salt appearing to have the property of dissolving casein. The whole secret of Dutch butter making consists in this fact. If properly made and washed, half an ounce of salt to one pound of butter is sufficient for winter butter; and one-fourth ounce of salt to the pound if for immediate use. In Germany and Ireland it is invariably found that the best made butter is produced in dairies where the milk is customarily placed on the floor. It is universally agreed among good butter makers that the cream should only be *slightly* sour when it is skimmed, and not much more so when churned. Cream allowed to remain very long on the milk and become very sour, will rarely or never make good flavored or keeping butter. A chemical change appears to take place, whereby the cheesy matter becomes united with the butter, without the possibility of again separating it. We suspect that this is the chief cause of a great deal of inferior butter. Try the experiment and test it. Pure butter, properly salted, cannot spoil; it is the butter-milk and cheese incorporated in it, that spoils it; and the smallest quantity, if corrupt, will give a bad flavor to the whole. If you buy your butter, and cannot get it good, can you do better than put this paper into the hands of your dairyman?

Samuelson's Digging Machine.

We give the brief remarks of the editor of Mark Lane Express, on the working of this instrument, as suggested at the recent trials at York and Gloucester:

The machine itself is quite the reverse of the plow. The latter is a *pressing*—the former a *lifting* operation; the one consolidates the subsoil—the other fractures it; the one plasters like a mason's trowel—the other lightens like a fork. The one is the operations of a *wedge*—the other of a *lever.* Hence the result is not only different, but, we may say, opposite on the soil.

The Gloucester trial was made in a soil perhaps too wet from the weather to give it a fair chance. To be fair and equal, especially in a new implement, where it may be supposed all the guards against contingencies are not fully provided, it is clearly important to have the medium on which it is supposed to operate in a state fit for its beneficial operation. In other words, the land must be in that state that the agriculturist would wish it to be in if he were about to sow it with the crop for which it was intended. The perpendicular motion, too, is one where the wet soil would be found to operate decidedly in an adverse manner; and hence the natural difficulties of the Gloucester trial were decidedly against the implement. And then it took seven horses, and for them it was hard work; and possibly it would, if worked for a whole day, have required relays, and might, according to appearance, have clogged before night. These are the unfavorable aspects under which it was presented. But when it is remembered that it loosens thoroughly a width of three feet; that it then took a space before it of nearly four plows, which would have required eight horses instead of seven; that the land had not been loosened in a similar manner before; the difficulty almost disappears, and it seems vastly more on a par with the plow than we could at first have imagined.

The York trial was in fine weather, but it had been preceded by almost unremitting rainy days for some period previously. The land was one of those strong untractable clays for which the valleys of Yorkshire are many of them so celebrated. The horses were certainly below par; but so thoroughly did the machine loosen the soil, pulverize the clods, and leave the surface, that three eminent practical judges awarded it a prize of five guineas.

Let it not, however, be thought we say that this machine has exactly answered all its professions. We say not whether this individual implement is calculated for general use or not; but we do say, most unhesitatingly, that the *principle of a digging or forking machine—which this is more particularly—is fully established.* We leave it for others to work out that principle, and to adapt details to the circumstances of each case of soil and crop; but it appears to us that the circular motion is calculated to break up, to pulverize, and especially to leave the root weeds near the surface in a satisfactory manner. And what of the draught, after all? Diminish the surface covered, and fewer horses will answer; only it must be borne in mind that the wider they are the greater the probability there is of all being covered, and if seven or eight horses will take a three feet wide implement, a pair will be master of one with a cover of one foot.

We have seen five letters from as many practical men in different parts of the country, all written about the same time, which quite agree in speaking favorably of its operation from day to day on their farms. We, however, do not wish this to be taken for more than it is worth, namely, that there are other trials, which, to say the least, proffer to act well, and to confirm the two more public experiments at Gloucester and at York.

We hope the *idea* will be carried out, and great practical results will follow. The plow has been in operation for at least four times ten centuries, and with very little real alteration, so far, at least, as regards its plastering and consolidating of the subsoil; but let other powers of stirring, mixing, and pulverizing, be brought into operation, and a more open subsoil, a deeper soil, and, as a consequence, more yielding and productive crops will be the result.

History and Culture of Mignonette.

It is now an age since this fragrant weed of Egypt first perfumed the European gardens, and it is so far climated as to spring from seed of its own sowing. The Reseda odorato first found its way to the south of France, where it was welcomed by the name of Mignonette (Little Darling) which was found too appropriate for this sweet little flower to be ever afterwards exchanged for any other. By a manuscript note in the library of the late Sir Joseph Banks, it appears that the seed of the Mignonette was sent in 1743, by Lord Bateman, from the Royal Gardens at Paris, to Mr. Richard Bateman at Old Windsor; but we should presume that this seed was not dispersed; and perhaps not cultivated beyond Mr. Bateman's garden, as we find that Mr. Miller received the seed from Dr. Adrian Van Royen, of Leyden, and cultivated it in the Botanic Garden at Chelsea in the year 1752. From Chelsea it soon got into the gardens of the London florists, so as to enable them to supply the metropolis with plants to furnish out the balconies—a fact noticed by Cowper, who attained the age of twenty-one in the year that this flower first perfumed the British atmosphere by its fragrance. The odor which this little flower exhales is thought by some to be too powerful for the house; but even those persons, we presume, would be delighted with the fragrance which it throws from the balconies into the streets, giving something like a breath of garden-air to the "close-pent man" whose avocations will not permit a ramble beyond the squares of the fashionable part of the town. To such persons it must be a luxurious treat to catch a few ambrosial gales on a summer evening, from a heated pavement, where offensive odors are but too commonly met with. We have frequently found the perfume of the Mignonette so powerful in some of the better streets, that we have considered it efficient to protect the inhabitants from those effluvia that bring disorder with them in the air. This genus of plants, of which there are a good many species, was named Reseda by the ancients, from *resedare*, to assuage, because some of the species were esteemed good for mitigating pain.

The Mignonette is transformed into a perennial shrub, which dispenses its odors at all seasons of the year, by the following simple treatment: A young plant should be placed in a garden pot, with a stick of about eighteen inches in height inserted by its side, to tie up its branches to; as it advances in height, the leaves and young branches being kept stript off from the lower part, so as to form a stem to the height required, this stem will become sufficiently hard and woody to endure the winter, by being placed in a greenhouse or the window of a sitting-room, and may be preserved for several years, if air is given to it whenever the weather will allow, so that the young branches do not become too delicate. As soon as the seed-vessels begin to form, they should be cut off, which will cause the plant to throw out a fresh supply of blossoms; but these plants should never be suffered to perfect their seed, as it would greatly weaken them, and would generally cause their entire decay; for the sweet Reseda is an annual in its proper climate, and therefore naturally decays when it ripens its seed. It is frequently observed that the seeds of the Mignonette which scattered themselves in the autumn produce finer plants than those that are sown in the spring, which should teach us to sow a part of our seed at that season of the year in pots or boxes, kept in frames through the winter, or in a greenhouse.—*Turner's Florist.*

Preserving Peaches.—To 12 lbs. of peaches take six lbs. of clear brown sugar, and one pint of the best cider vinegar. Simmer the sugar and vinegar together, which will make a clear syrup. Pour boiling water upon the peaches, and remove them in two minutes from the water and wipe them dry without breaking the skin. Put them into the syrup, and boil gently until the fruit is cooked to the stone. Keep the preserves in jars, which must be kept closely covered and in a cool place. They should be inspected occasionally, and if a white mould appears upon the surface of the syrup, it must be carefully skimmed off, and the syrup scalded and returned to the peaches. This is the most economical, and, to our taste, the very best preserve we know of.—*Providence Journal.*

Lecture upon Chinese Agriculture.

BY THE REV. WILLIAM SPEER.

Delivered at the Musical Hall, on Thursday Evening, Oct. 20, 1853.

Mr. Speer commenced his discourse by some remarks upon particular words in our language, whose origin may be traced to remote ages and to nations inhabiting the farthest ends of the earth. He compared the language itself to the fruit of a gigantic tree, bearing upon its enormous trunk the traces of an existence extending through countless ages, while the freshness of its verdure indicates an unabated vigor. There are, in it limpid and liquid sounds from the nations of the Mediterranean Coast, like the more sweet and mellowed products of a southern exposure; and on other boughs, more twisted and mossy with the Boreal winds, are the harsh and acrid offspring of soil in the far-distant North. But some of the roots of this tree penetrate to the primary rocks—far below the *detritus* which constitutes this visible landscape. Many of the words in common use have been handed down from periods of high antiquity, through the Greek, the Persian, the Ethiopic, and the Sanscrit, like cords to link remote races and ages, to contain and conduct human and inspired sentiments. Some of our substantives may be traced through many climes to the farthest East. Of these, he mentioned several instances; amongst others, that of the word "sugar." This is to be found alike in all the languages of modern Europe—in the Welsh, the tongue of the ancient Britons, and in the Greek, where it is mentioned as one of the products of India, and described as "honey from the cane called *saccharon*." In the language of the Eastern nations, the same sound is retained, and the Chinese *che* or *chay* may have been derived from, or be the monosyllabic origin of the same primitive designation. The word "cassia" was also instanced by Mr. S. in this connection, as another of the words which connect us with the old Oriental world. This delightful spice, he said, was introduced from the East, either India or Chiua, into Western Asia, at a period far beyond the era of history, and is mentioned more than once in the Scriptures, and not unfrequently in Classical History. It is heard in the Hebrew *kiddah*, in the Malay *kayu*, and probably in its primitive form in the Chinese *kwei*. We have also in the English language several words taken entirely from the Chinese—such as *gin-seng*, or "the man-plant" so called from the resemblrance of its roots to a humau hand; *tea*, pronounced in the Court dialect *cha*, in the Fuh-kien *tay*; *nankeen*, from Nanking, the ancient capital of China, which is destined to be the seat of the new dynasty; and *china*, the name which has been appropriated to the porcelain manufactures of the Empire, specimens of which have been found in the pyramids of Egypt, and have been recently exhumed from the ruins of Nineveh. But perhaps the most interesting word is *silk*—a sound now knowu in nearly every European, Asiatic, and American tongue—the culture of which was introduced into China twenty-five centuries before the Christian era. Mr. S. quoted several passages from the Bible making mention of this material. It is noticed as part of the clothing of the excellent woman by King Lemuel, in Prov. 31: 22. But the word *shesh* used in Hebrew is almost everywhere else translated "linen." It was more likely the ancient *byssus*. In Ezekiel 16th, the word *m'shi*—used there alone—is much more likely to be our modern silk. Such is the rendering of the Hebrew interpreters. At that period, 600 B. C., and probably much earlier, it was carried to Western Asia by the Phœnician and other traders, both by sea and laud. A third recurrence of this word is in Rev. 18: 12, where it is included in the merchandise of the mystical Babylon, under the name *sericon*, or the "serie" web. This is derived from *ser*, a silkworm, and was the first designation of the Chinese in the European world. He also spoke of its use among other ancient nations, particularly the Romans, with whom it was sold at its weight in gold—quoting the following beautiful description of it from Dionysius:

> "Nor flocks nor herds the distant Seres tend;
> But from the flowers that in the desert bloom,
> Tinctured with ever varying hue, they cull
> The glossy down, and card it for the loom.
> Hence, is their many-colored texture wrought,
> Precious and bright in radiance, that transcends
> The mingled beauties of the enamelled mead;
> A web so perfect, delicate and fine,
> Arachne and Arachne's progeny
> Might emulate in vain."

These words, Mr. S. said, showed, by the remarkable extent of their diffusion and the uniformity of sound which they retained in all climes and ages, how great and widely known the productious of Chinese Agriculture had been in past ages; but great as they had been, they were insignificant compared with that now opening upon us in the future, or even that which exists at present. In the account he should proceed to give of the latter, he said he wished it understood that he spoke only of the Southern parts of the Empire. In the northern portion of the Empire he had never been, and therefore would not assume to speak except upon information derived from others. The best way in which one could form a just conception of the Agriculture of China would be, said Mr. S., to imagine one's self placed upon a lofty eminence overlooking a rich valley, well watered, occupied by numerous rice-fields, and dotted over with cities and villages. The mountains are bold and picturesque, like those of California, but utterly bare, with the exception of a thin grass upon them. No extensive forests are to be seen, but only here and there a solitary shrub. No fences are visible, the only means of partition being dykes of earth thrown up across the plains of the fields, and along the banks of the streams, and provided with flood-gates by which the water is let in upon the rice fields. No solitary dwellings are to be seen, as in Christian countries; but the inhabitants collect in villages for the sake of mutual protection against robbers and thieves. Nor is the country intersected by roads; the dykes, some of which are well paved, constitute the only means of communication. Instead of vehicles, the produce of the country is carried in boats upon the rivers and canals, and in baskets swung upon poles borne upon the shoulders of coolies. The rich, when they go abroad, are carried in sedan chairs upon the top of the dykes, or else conveyed in boats from place to place.

Rice, said Mr. S., is, as is well known, the principal grain. It is not only the chief article of the food of the Chinese, but that of which they are fondest. Two and sometimes three crops are extracted from the soil. The mode of cultivation consists in a rude kiud of plowing, performed by means of the buffalo of the east, an animal resembling our ox—the only animal employed by them iu agricultural purposes—and then sowing the seed broadcast over the fields covered with several inches of water. When the blades spriug up, they are transplanted and sown in drills. Arrived at maturity, the crop is reaped by means of an instrument resembling a sickle. It is then carried to the village granaries and threshed or trampled out. Some credit is reflected upou the Chinese, said Mr. S., by the fact that the invention of the fanning machine, of such vast utility to us, has been knowu in China for centuries. They were first carried from China to Hollaud, by the Dutch; thence to Scotland, and thence to America. Machines are often to be seen on the threshing floors of the villages, similar to those in use in the Eastern States. After these operations are performed, continued Mr S., the grain is laid up for safe keeping—deducting the tithes paid as taxes for the support of the Government, or else commuted at a fixed rate. Of the numerous methods of preparation, the most usual is by boiliug. They display much skill in this matter, and prepare it in various ways, some of which are acceptable even to foreigners, particularly that called *Pilao*. Ardent spirits are distilled from the grain, and frequently used, particularly at meals. Mr. S. gave several details on this subject, and mentioned several varieties—from that of a quality approaching our South Carolina rice, to a coarse red rice, similar in appearance to wheat. The latter is exceedingly cheap, and large quantities are consumed by the poorer classes.

Of wheat, Mr. S. said, large quantities are raised in the North of China, of which a portiou is brought South and sold to the foreigners resident at Canton and elsewhere.

Cotton is also an important article of cultivation, but full accounts of it could be found in numerous books, and he therefore considered it unnecessary to give a detailed statement in relation to it.

Hemp is also extensively cultivated. There are numerous varieties of it, some of a white fibre, from which an article of grass cloth is manufactured. The French have lately introduced the cultivation of this article into our own country.

Sugar cane is another great production of Chinese agriculture. Much, it is well known, is exported to this port and elsewhere. The method of crystalization is different from that generally used. The syrup is poured into shallow pans, and a bamboo cane placed in it, around which the sugar chrystallizes in a manner similar to that in which rock candy is made. It is afterwards pulverized, and employed in sweet meats, or laid up for use or exportation.

The great variety of uses to which the bamboo is applied was adverted to. It is scarcely too much to say that a city might be built, and its inhabitants provided with necessary furniture and utensils, entirely of bamboo. Nearly every portion of a boat and its furniture, among the people on the water, may be formed of it. Then they eat its tender sprouts for food, distil its sap into spirits for a drink, and finally carve its dry roots into deities, which they worship.

Mr. S. then mentioned various minor productions, such as the water-chestnut, or *matai*; squashes, long beans, yams, taro, and ginger, which might profitably be introduced into our own gardens and fields. He exhibited specimens of some of them—of which a portion were dried in the sun, or otherwise prepared for preservation and exportation abroad. Rice and beans are made into maccaroni, and cakes. Some of the sweetmeats are pleasant, such as the preserved *kumkwat*, a tiny orange; or the *agaragar*, a sweet jelly obtained from a seaweed, and used in large quantities not only for food but in the arts. This should be boiled to be most palateable.

A variety of Chinese fruits were described; plantains, pine-apples, pomegranates, guava, mangoes, cocoa-nuts, water-melons, musk-melons, plums, grapes, more than twelve different kinds of orange (citrus), from the tiny *kumkwat*, not larger than a lady's thimble, to the gigantic pumelo, as large as a cocoa-nut, which is a favorite offering to the gods. Several fruits peculiar to China were adverted to: such as the *lichi*, which is above the size of a walnut, having a thin crisp shell and a large acorn-like seed, between which in fleshy leaves lies a delicious aromatic and juicy pulp; the *longan*, a fruit resembling the lchi but much smaller, and the *hang-tsu*, or date, all of which are dried and have already been imported here.

The *whangpee*, or "yellow skin," a tart grape-like fruit growing in clusters, is manufactured into a nice jam. The papaya, as it is called by the Portuguese at Macao, or by the Malays "Mati-kara or the wood melon," (the carica papaya of naturalists) grows upon a tall palm-like tree, and resembles in both external and internal appearance, a musk-melon. It is, however, insipid, and best when boiled and eaten like squashes. Apples and pears come from Shantung province, but are large, white skinned, hard as stone, and perfectly insipid—they are good when cooked. There are two delicious varieties of the peach; the *pin-to*, or flat peach, shaped like a common tomato, and the *hwang-to*, or yellow peach, which runs to the opposite extreme of length. Our own peach probably came from China, by way of Persia and Italy, more than two thousand years ago.

But the two products of China from which we may hope to obtain more benefit, are her silk and tea. Silk will at some future period be manufactured extensively by the Chinese population that will emigrate to various portions of the United States.

Of the cultivation of tea, he gave many details, and referring to the successful experiments of Dr. Junins Smith, of South Caroliua, expressed the opinion that it might perhaps be introduced into this couutry. The soil of China best adapted to it is found in elevated localities, aud composed chiefly of disintegrated sand stone or quartz. The plant passes through three or four pickings, and frequently each particular leaf is rolled by females or children. Considerable quantities are prepared in the form of cakes—thence called *brick* tea—for exportation to Russia. The plant itself is difficult of transportation by sea, and Mr. S. said every attempt to carry it to England has failed, until the recent invention of "Ward's Air-Tight Cases," by means of which this object had been attained by an Englishman named Fortune. The cultivation of tea prevails in most parts of the Empire, and a coarse, hardy kind is raised in Canton Province; but the best quality of black is produced in a region known as the Mohi, or Bohea Hills, four or five hundred miles to the north-east of Canton; while the best green comes from the neighborhood of the Yang-tsze-kiang River. It is the opiuion of Mr. Fortune, an intelligent botanist, that the two kinds are produced by one tree, and their peculiarities only the result of picking at a different season, a different mode of drying the leaf, or the addition of coloriug substances.

Mr. S. then proceeded to speak of the gardening of the Chinese, an art in which they greatly excel, which seems peculiarly adapted to the national taste. In the humblest and meanest tanka-boat on the river, you will see a neat little pot, or a row of them, with some pretty flower, which is tended with affectionate assiduity. These are often made to grow in glass jars of water only, or upon a handful of white pebbles. The grounds of the rich are beautifully laid out upon the principles of landscape gardening in vogue in Europe, and in accordance with which the Leasowes had been created by Shenstone. They are penetrated in all directions by skillfully contrived walks leading to the best points of view, ornamented with pavillions, gayly bedecked with bells, painted glass ornaments, suspended by silk threads, so as to tinkle in the wind, and poetical incriptions down their pillars; with grottoes constructed of stones washed into fantastic shapes by the waves of the sea-shore; with fanciful bridges; with edifices of various styles of architecture, some devoted to the family, some to literature or business, some to pleasure or to religion; with pools filled with gold and silver fish, or covered with the scarlet bowls of sacred lotus, a gigantic water-lily. The Chinese peculiarities in gardening were applied in England with great success by the celebrated architect Chambers, a century since. He wrote a very pleasing work on this subject, which was published in London in 1757. The Jesuit Attiret, wrote an account of the Emperor's gardens and pleasure houses, in 1743, in which, in the height of his admiration, he says: "in those everything is grand and truly fine, as well with regard to the design as execution; and I am so much the more struck with these, as nothing like any part of them hath ever before offered itself to my eyes." Mr. S. enumerated some of the different flowers cultivated by them—many of them having a large numbers of varieties—particularly the Lotus, Fleur de Lis, Honeysuckle, Chrysanthemum, Cactus, Geranium, &c., &c. Of the Camelia Japonica, he said, they possessed many beautiful varieties; and it was from China that this plant was first carried to England in 1739, and thence distributed to Italy, France and Germany. He spoke also of the curious skill of the Chinese in dwarfing plants, in training and cutting them to represent animals, boats and other objects; and in distorting fruit, such as the citron, into extravagant shapes—of their wonderful economy as agriculturists; of the admirable construction of their irrigating machines; and the general skill and invention of this singular people.

The Chinese have many superstitions in regard to agriculture. Thus, one will see rice planted in long rows running north and south. They have lucky days for planting, transplanting, reaping, gathering and threshing. If one sails up a Chinese river, he sees many pagodas on the summits of the hills. In the department of Canton there are at least fifteen. These, three stories high are usually consecrated to the god of literature. (Others are five, seven, nine and sometimes eleven stories high.) Even from the tops of the hills 200 feet high the air and landscape greatly to the picturesque. Within they are hollow from top to bottom, forming a telescope. Sometimes they contain [illegible] rarely. It is supposed that they were erected as expiatory rites or atonements for the [illegible] by [illegible], and that they are emblematical pencils. The Chinese suppose that these [illegible]

peror introduced agriculture and they worship him as a divine being. In many Chinese cities, it is customary at certain periods of the year for the mandarins to cause a huge ox to be made in the body of which are placed many others made of earth. After certain ceremonies, the ox is broken, and the citizens endeavor to procure a small portion, which they carry home to exercise a beneficial influence over their agricultural operations of the year.

In conclusion, Mr. S. said, the question is, why are these people brought here? For our benefit and theirs—that we may employ their industry and ingenuity; and that they may have the benefit of our science, our machinery, and above all of our morality. It is, said he, the ingenious theory of Goethe adopted by the botanists of the present day, that the flowers and fruits of plants are but modifications of the leaf; that the petal, the stamen, the ovule, the fruit, are but improvements upon that primitive type; on the other hand, that this symbol of human worthlessness and transitoriness, this rubbish which nature sweeps from the completed architecture of the year, contain all the elements of the painted and odorous blossoms. With this developement cultivation has much to do. Now, China, with its vast population, is like a forest. Upon its hills and plains, its myriad inhabitants have fluttered their season, and then faded and fallen like leaves. Transplanted into this new country, we must, like husbandmen, prune and water and cultivate them by every agency God has put in our power. Thus these wild plants shall be made to produce sweet flowers and pleasant fruit, give additioual beauty to the garden of the Lord, and help to enrich the garner above.

Apples.—The original Ribston Pippin Tree, the favorite apple of the English, was flourishing fifty years ago, and perhaps is now. Sir Henry Goodricke, being at Rouen, in Normandy, preserved the pips of some fine flavored apples, and sent them to Ribston, where they were sown. Out of seven trees, thus produced, five proved decided crabs. The other two proved good apples. They were never grafted; and one of them is the celebrated Ribston Pippin. Suckers from this tree produced fruit in the Horticultural Gardens at Chiswick in 1831. The old Golden Pippin, generally supposed to be worn out, still bears excellent fruit if grafted on the Paradise, or Doncin stock. The Coruish Gilliflower, one of the best English apples in the present day, was well known in the time of Charles I., and, as yet, shows no symptoms of decay. It requires to be grafted on a strong stock. Of the Ribston Pippin, Downing says: "It stands as high in Great Britain as the Bank of England, and to say that an apple has a Ribston flavor, is, there, the highest praise that can be bestowed. But it is scarcely so much esteemed in the United States. In Maine and parts of Canada it is very fine and productive."

The name *Rare-ripe*, applied to apples and peaches, is derived from an old Saxon word, *ræthe*, signifying early. The word *rathe*, meaning early, is still in use in the weald of Sussex, England, and the Rare-ripe apple is there called *Rathe ripe*. So that, instead of understanding that the rare-ripe Peach rarely ripens, we mean that it is, or ought to be, an early Peach.

Philosophy is reason with the eyes of the soul; poetry is philosophy with the wings of the spirit.

PROSPECTUS
OF
THE CALIFORNIA FARMER
And Journal of Useful Sciences.

We commence the issue of this Journal of Agriculture and kindred Sciences, with the beginning of the New Year.

The Editorial Department is under the charge of Dr. J. F. Morse, of Sacramento, (formerly editor of the Union).

It will be the aim of the publishers to furnish to their readers, 1st. The most useful data for the practical Agriculturist, and to present to them all the most important practical results, obtained from authentic sources, in our own State.

2. To present the latest and most important facts from our sister States and Europe touching Agriculture, in all its branches.

3. To furnish familiar illustrations of valuable Agricultural Implements, together with remarks explanatory of their character and [illegible]

4. To furnish complete Grain Tables and Market Reports, and other data connected therewith.

5. General and Critical Notices of the various Agricultural and Horticultural Societies of our country and of Europe, sufficient to guide our own Cultivators, and keep them advised of the progress of the Science.

Cultivators of the Soil, and all who feel an interest in this all-important and fundamental source of our prosperity and happiness, are cordially invited to communicate with us freely. Their valuable aid is what we earnestly desire.

Advertisements in this Journal, to a limited number will be inserted [illegible] read a [illegible] hitherto [illegible], exclusive of the [illegible] Agricultural Districts [illegible] making of the largest [illegible] for [illegible] purposes in [illegible]

[illegible]

Leaves from my Chinese Note Book.

UNDER this title I propose to send you, from time to time, descriptions of Chinese gardens, plants, and other objects of natural history which I consider of sufficient interest to occupy a place in your columns. As many of your readers have, no doubt, heard of "Howqua's Mixture" I shall begin by attempting to describe Howqua's garden.

This garden is situated near the well known Fa-tee nurseries, a few miles above the city of Canton, and is a place of favorite resort both for Chinese and foreigners who reside in the neighborhood, or who visit this part of the Celestial Empire. Having occasion to be in Canton a few weeks ago, I determined on paying it a visit in company with Mr. McDonald, who is well known in this part of the world as an excellent Chinese scholar, and to whom I am indebted for some translations of Chinese notices, which appeared very amusing to us at the time, and which, I dare say, will amuse your readers.

Having reached the door of the garden we presented the card with which we were provided, and were immediately admitted. The view from the entrance is rather pleasing, and particularly striking to a stranger who sees it for the first time. Looking "right ahead," as sailors say, there is a long and narrow paved walk lined on each side with plants in pots. This view is broken, and apparently lengthened by means of an octagon arch which is thrown across, and beyond that a kind of alcove covers the pathway. Running parallel with the walk, and on each side behind the plants, are low walls of ornamental brickwork, latticed so that the ponds or small lakes, which are on each side, can be seen. Altogether, the octagon arch, the alcove, the pretty ornamental flower pots, and the water on each side, has a striking effect, and is thoroughly Chinese.

The plants consist of good specimens of Southern Chinese things, all well known in England, such, for example, as Cymbidium sinense, Olea fragrans, Oranges, Roses, Camellias, Magnolias, &c., and, of course, a multitude of dwarf trees, without which no Chinese garden would be considered complete. In the alcove alluded to there are some nice stone seats, which look cool in a climate like that of Southern China. The floor of this building is raised a few feet above the ground-level, so that the visitor gets a good view of the water and other objects of interest in the garden. That this is a favorite lounge and smoking place with the Chinese, the following Chinese notice, which we found on one of the pillars, will testify: "*A careful and earnest notice:* This garden earnestly requests that visitors will spit Betle—(the natives in the south of China, like the Malays, are very fond of chewing the fruit of the Areca, commonly called Betle-nut)—outside the railing, and knock the ashes of pipes also outside." Several fine fruit trees and others are growing near the walks, and afford shade from the rays of the sun. On one of these we read the following: "Ramblers here *will be excused* plucking the fruit on this tree."

Near the centre of the garden stands a substantial summer-house, or hall, named "the Hall of Fragrant Plants." The same notice to smokers and chewers of Betle-nut is also put up here; and there is another and longer one which I must not forget to quote. It is this: "In this garden the plants are intended to delight the eyes of all visitors; a great deal has been expended in planting and in keeping in order, and the garden is now beginning to yield some return. Those who come here to saunter about are earnestly prayed not to pluck the fruit or flowers, in order that the beauty of the place may be preserved." And then follows a piece of true Chinese politeness: "We beg persons who understand this notice to excuse it!" Passing through the Hall of Fragrant Plants we approached, between two rows of Olea fragrans, a fine ornamental suite of rooms tastefully furnished and decorated, in which visitors are received and entertained. An inscription informs us that this is called "the Fragrant Hall of the Woo-che tree." Leaving this place by a narrow door we observed the following notice: "Saunterers here will be excused entering." This apparently leads to the private apartments of the family. In this side of the garden there is some fine artificial rockwork, which the Chinese know well how to construct, and various summer-houses tastefully decorated, one of which is called the "Library of Verdant Purity." Between this part of the garden and the straight walk already noticed, there is a small pond or lake for fish and Water Lilies. This is crossed by a zigzag wooden bridge of many arches, which looked rather dilapidated. A very necessary notice was put up here, informing "saunterers to stop their steps in case of accident."

On the outskirts of the garden we observed the potting sheds, a nursery for rearing young plants and seeds, and the kitchen garden. Here a natural curiosity was pointed out by one of the Chinese, which, at first sight, appeared singularly curious. Three trees were growing in a row, and at about twenty or thirty feet from the ground the two outer ones had sent out shoots, and fairly united themselves with the centre one. When I mention that the outer trees are the Chinese Banyan (*Ficus nitida*), it will readily be seen how the appearance they presented was produced. The long roots sent down by this species had lovingly embraced the centre tree, and appeared at first sight to have really grafted themselves upon it.

I am afraid I have given a very imperfect description of this curious garden. Those who know what a Chinese garden is will understand me well enough, but it is really difficult to give a stranger an idea of the Chinese style which I have been endeavoring to describe. In order to understand the Chinese style of gardening, it is necessary to dispel from the mind all ideas of fine lawns, broad walks and extensive views; and to picture in their stead everything on a small scale—that is, narrow paved walks, dwarf walls in all directions, with latticework or ornamental openings in them, in order to give views of the scenery beyond, halls, summer-houses and alcoves, ponds or small lakes with zigzag walks over them—in short, an endeavor to make small things appear large, and large things small, and everything Chinese. There are some of these ornaments, however, which I think might be imitated with advantage in our own gardens. Some of the doorways and openings in walls seemed extremely pretty. In particular I may notice a wall about ten feet high, having a number of open compartments filled with porcelain rods made to imitate the stems of the Bamboo. I shall now close this notice with the modest lines of the Chinese poet, which we found written in the "Library of Verdant Purity," and which seemed to be an effort to describe the nature of the garden:

> "Some few stems of Bamboo plants,
> A cottage growing round;
> A few flowers here—some old trees there,
> And a mow of garden ground."

—*R. R., in London Gardeners' Chronicle.*

Remarkable Supposed Case of Petrifaction.

THE Wheeling (Va.) Intelligencer, says:—"There arrived, within a few days, at the depot of the Baltimore and Ohio Railroad, in this city, an oblong box represented to contain a corpse, and it struck us as somewhat singular, it weighed 560 lbs., according to the freight charges upon it. Curious to know somthing more about this box than the external marks indicated, we instituted some inquiries, and derived the following information, which, as we got it from pretty good authority, we are inclined to consider correct until we receive a better explanation:—The wife of a gentleman living in Nelson county, in this State, died some four years ago, and was interred in the usual manner. Being a native of Woodford county, Ky., she had requested, before death, to be buried beside her kindred and in the hour of her childhood. From accident or delay, her request was not complied with until quite recently her relations caused her remains to be disinterred, when they were found to be of the extraordinary weight mentioned above—over 500 lbs.! At the time of her death her weight was about 110 lbs. Only the foot of the coffin, which was still in a good state of preservation, was broken open, when her feet were found to be in a perfect state of petrifaction, the stone partaking of the character of the hardest limestone formations in the locality of the grave. The inference is that the whole body is petrified. The gentleman in charge of the remains is having them conveyed to Woodford county, Ky., according to the request of the deceased. We omit the names of the deceased and her relations as immaterial to a matter which appears, as near as we can judge, to be correctly stated as above. Human petrifications are rare, among multifarious wonders of nature, but as they have been found, as the records of science attest, we have no reason to reject this instance as one among the rarest results of a peculiar combination of the physical elements."

Agricultural Operations at the Tejon.

MR. EDWARDS arrived from the Tejon this week, on his way to San Francisco. From him we gather the following interesting intelligence:

On the 10th inst., superintendent Beale gave a grand Fiesta to the Indians, at which several thousands were present, from all portions of the Southern country: from as far north as the Chowchilla river; from the western slope of the Sierra Nevada; from the great desert on the eastern side of that range; from the Tulare Lake, and from the Coast Range. With them Lieut. Beale had a long talk; explained the system he had adopted for their support, and desired their assistance in carrying out the proposed plan. They appeared much delighted with the prospect of having farms for themselves, and were eager to furnish hands to assist in carrying out the work now going on. Useful presents were distributed among them, after which the dancing commenced, and continued until sunrise next morning, when they all departed for their respective rancherias, much pleased at what had taken place, and expressing great satisfaction at the prospect of raising, by their own toil, enough for their support.

Lieut. Beale has now thirty plows running, (all worked by Indian boys) and expected, in the course of this week, to start as many more. The land selected for cultivation is very fertile, and the prospect of a large crop next summer, induces all to work hard and willingly.

For the last two months, Lieut. Beale has been upon the spot himself, conducting, with energy, all the work going on; and should the results be at all commensnrate with the care and attention he has bestowed, the Indians will long remember him as a benefactor.—*Los Angeles Star.*

A SINGULAR MARRIAGE CEREMONIAL.—In South Carolina there is no law prescribing a marriage ceremonial. Hence the mode of the ceremony and the character of the officiating functionary are left to the choice of the parties. Judge Frost, of the Court of Sessions, in a recent charge to a jury, remarked that if a man and woman jump over a broom, the former saying: "I take this woman to be my wedded wife," and the latter: "I take this man to be my wedded husband," and go to housekeeping, they are legally married—having entered into a bond of union which cannot be annulled so long as they live.

Life in Australia.

A BOOK has been lately published in England, entitled "A Lady's Visit to the Gold Diggings of Australia, in 1852-'53," which contains many interesting statements, and among them the following: "You may see, and hear too, some thoroughly colonial scenes in the streets. Once, in the middle of the day, when passing up Elizabeth street, I heard the unmistakeable sound of a mob behind, and as it was gaining upon me, I turned into the enclosed ground in front of the Roman Catholic cathedral, to keep out of the way of the crowd. A man had been taken up for horse-stealing, and a rare, ruffianly set of both sexes were following the prisoner and the two policemen who had him in charge. 'If but six of ye were my mind,' shouted he, 'it's this moment ye'd release him.' The crowd took the hint, and to it they set with right good will, yelling, swearing, and pushing with awful violence. The owner of the horse got up a counter demonstration, and every few yards the procession was delayed by a trial of strength between the two parties. Ultimately the police conquered; but this is not always the case, and often lives are lost and limbs broken in the struggle, so weak is the force maintained by the Colonial Government for the preservation of order. Another day, when passing the post-office, a regular tropical shower of rain came on rather suddenly, and I hastened up to the platform for shelter. As I stood there, looking out into Great Bourke street, a man, and, I suppose, his wife, passed by. He had a letter in his hand for the post; but as the pathway to the receiving box looked very muddy, he made his companion take it to the box, whilst he himself, from beneath his umbrella, complacently watched her getting wet through. 'Colonial politeness,' thought I, as the happy couple walked on. Sometimes a jovial wedding-party come dashing through the streets, there they go, the bridegroom with one arm around the lady's waist, the other raising a champagne bottle to his lips; the gay vehicles that follow contain company even more unrestrained, and from them noisier demonstrations of merriment may be heard. These digger's weddings are all the rage; and bridal veils, white kid gloves, and above all, orange blossoms, are generally most difficult to procure at any price. At times you may see men, half-mad, throwing sovereigns, like half-pence, out of their pockets into the streets; and I once saw a digger who was looking over a large quantity of bank notes, deliberately tear to pieces and trample in the mud every soiled or ragged one he came to; swearing all the time at the gold brokers for 'giving him dirty paper money for pure Alexander gold; he wouldn't carry dirt in his pocket—not he—thank God, he'd plenty to tear up, and spend too.'"

LAUNCH.—A beautiful yacht schooner called the "Matilda Heron," was launched at Rincon Point on Friday last. The Sun "does up" the event in the following unapproachable style:

"Well does this elegant creation of the genius and skill of our California mechanics merit the proud and distinguishing appellation bestowed on her. The day was lovely in the extreme, although severely cold; the bright sunbeams danced in gladness on the waters, that seemed tremblingly anxious to embrace the new love; and as the graceful fabric glided like a swan on that element, it parted with a silvery ripple, like the fond smile of affection with which a joyous bridegroom first greets his blushing bride.

"The feathery spray leaped freshly to the welcome of the graceful stranger, and the breeze sang Æolian melodies through the elegant tracery of her cordage, while the gay colors at her mast-heads fluttered in merry response to the music. The beautiful vessel seemed instinct with life, and cognizant of the fact that the lovely and accomplished lady whose name she bore, was looking on with throbbing pulse and grateful heart, at this renewed token of the high estimation in which she is held by all true Californians.

"Not a soul attended the launch who did not feel that the compliment paid to the genius and worth of the fair God-mother of this christening was but a realization of their own sentiments, and a tangible expression of their own admiration. May the Matilda Heron 'walk the waters like a thing of life,' successfully accomplishing the views of her enterprising builders, and do credit to the name of the lady California 'delights to honor.'"

MARRIED.

In Sacramento, 14th inst., by Rev. Mr. Wheeler, Mr. John M. Algie and Miss Amy Vestel, of Bear River.

In this city, 19th inst., at the Clinton House, by Rev. M. Noble, Mr. A. D. Shaw, of Consumnes River, and Miss Anna Werner, of this city.

In this city, by Rev. Mr. Gray, James A. McCrea, Esq., and Miss Georgiana Potter, daughter of Capt. Geo. S. Potter.

In this city, Jan. 17, by Rev. Wm. Spear, Mr. Edward Edwards and Miss Margaret Matilda Jones, both of this city.

In San Jose, on the 19th inst., S. A. Clark and Miss Abigail K. McKee, of Cornwall, Conn.

In Stockton, 19th inst., by B. G. Weir, Mr. Caleb Ward and Miss Agnes Scott.

At Bald Rock Ranch, Tuolumne county, 16th inst., at the residence of Mr. Turner, Mr. D. Washington Herron and Miss Missouri K. Turner.

At Vreka, 8th inst., by Elder Sutton, Mr. Foote and Miss Vidilia Roberts.

In Philadelphia, Dec. 15th, by Rev. J. C. Clay, Mr. P. Eldredge Garvin, of San Francisco, and Miss Mary, daughter of Benj. Moze, Esq., of the former place.

DIED.

On the 19th inst., from the effects of the explosion on board the Helen Hensley, Mr. Thomas Noyce, a native of Louisville, Ky.

In this city, 19th inst., at 5 o'clock, Mr. Thomas Noyce, of injuries received on board steamer Helen Hensley.

In this city, 23d inst., Mr. Lloyd Foreman, formerly of Hartford, Conn., aged 47.

In Curtsville, 16th inst., of pulmonary consumption, Captain John Jack, formerly of Pittsburg, Pa., but for the last five years a resident of Tuolumne county.

MARKET REPORTS.

San Francisco, Jan. 25, 1854.

The past and present week has been remarked as one of extreme dullness in commercial affairs, and merchants generally are dispirited. The Domestic Produce market has not escaped the prevailing dullness, and transactions in all descriptions have been limited. The recent rains will probably restore business to a more promising state, and lead merchants to anticipate more favorable advices from the interior.

The demand for Wheat has greatly fallen off, and no sales of importance have taken place, to our knowledge.

During the past few days somewhat better feeling has been manifested in Barley. The sales, however, have been of no importance.

In Corn, but little is doing.

Potatoes are at so low a figure as to have become a complete drug in the market.

RETAIL VEGETABLE MARKET.

In presenting the Retail Market of Vegetables, we do this to show the weekly value and list of family comforts and luxuries (for good vegetables are indeed luxuries) that are offered to us in our markets. Very few markets in the United States can present such luxuries every week, and have them fresh from the garden every day.

It will be seen that cauliflowers, celery, horseradish, tomatoes and green peas command good prices, and we may say all garden products pay well—for the quantity raised upon a small portion of land is almost beyond belief.

Cabbages, ₱ head	$ 37	Potatoes	3
do ₱ doz	3 00	Onions, prime	4

VOLUNTEERS WANTED!
TO THE GREAT SALE OF
JEWELRY AT JOHN W. TUCKER'S.

I shall now commence selling off my entire stock, consisting of DIAMOND WORK, WATCHES, JEWELRY, SILVER WARE, etc., etc.
Amounting to more than $300,000!
I have got to sell all the above goods before the first of June, as I have to rebuild my store according to the new grade. Any person who wants a good article can procure one from me
Cheaper than in any other City in the World!
But I don't wish it to be understood that I pretend to compete with those who sell trash;—persons who would not hesitate to guarantee a brass ring or a watch for pure gold;—these persons can sell lower than I can. If I sell an article of any kind, and it does not turn out as I represent it, I will return the money. No person shall leave my establishment dissatisfied. Call and see me before you purchase elsewhere.
JOHN W. TUCKER,

N. B.—Quartz Rock purchased at the highest prices.
J. W. TUCKER,
125 Montgomery street.

There are Three Things I Do Not Do!

1st. I do not get a gentleman to leave his Watch, and when he calls for it, charge him TWENTY-NINE DOLLARS for cleaning it, and have it stop two hours after.
2d. I do not ask FIFTY DOLLARS for a chain, and sell it for THIRTY SIX DOLLARS, and warrant it Fine Gold, when it is filled with brass solder, and have to take it back and pay FIFTY DOLLARS in money, and give another chain.
3. I do not tell a Captain he can have a Chronometer gratis, and when he calls for it at the end of eight months, refuse to deliver it up unless he pays me SIXTY-FIVE DOLLARS, and TEN DOLLARS more for taking it.
There are many other things I do not do which I may name at some other time. 1 4t J. W. TUCKER.

Musical Hall Building, San Francisco.
And J street, Sacramento.

Gentlemen's Clothing and Furnishing Goods.

GEORGE F. WALTER, No. 113 Mongomery street, opposite Barry & Patten's, has on hand and is constantly receiving a splendid assortment of goods for Gentlemen's wear, comprising, in part, fancy Cassimeres, Vestings and French Cloths, of various colors and finest texture. He is constantly receiving by the steamers, direct from his Agents in New York—Messrs. Crawly & Lent, 737 Broadway—invoices of Paris PANTS, Benjeau's make, of Cassimere, velvet face, the best ever imported. A discriminating public is invited to call and examine this stock.
MILITARY CLOTHING.
G. F. W. gives this department his especial attention. All styles of military suits made to order, from the best material, and guaranteed to give perfect satisfaction.
Gentlemen's Fashionable Clothing cut and made equal to any house in the Atlantic States—the workmanship by the best Tailors. The principle laid down is that no garment is delivered which is not a perfect fit; as every article is fitted on before being finished, thereby avoiding the unpleasant necessity of altering after leaving the store. Any garment that is made and does not fit perfectly, is not expected to be taken, as he is desirous of establishing a business that will give satisfaction to all who may favor him with their patronage.
N. B.—I still continue to take measures to be made up in New York by Messrs. Crouey & Leni. All orders sent will be received by return steamer.
GEORGE F. WALTER, 112 Montgomery street,
1 1m Opposite Barry & Patten.

DONAHUE'S UNION IRON WORKS,
[THE FIRST ESTABLISHED IN THE STATE.]
Cor. of First and Mission streets, Happy Valley, San Francisco

THE undersigned calls the attention of the citizens of California and Oregon to his unequalled facilities for doing work with rapidity and cheapness. He has made, and will continue to make, such additions to his tools and labor-saving machinery, as the increasing wants of the State require, and hence solicits a public patronage.
Saw and Grist Mill Irons,
Quartz Crushing and Amalgamating Machinery,
and Castings of either Iron or Brass of every description (having a most extensive assortment of ready made patterns) made promptly to order.
STEAM ENGINES from the manufactories of William Burdin, Brooklyn, New York, and other celebrated makers, constantly on hand and for sale.
BOILERS of every description furnished at lower rates than can be afforded elsewhere, the iron for the same being imported direct, and the machinery for shearing, punching and rivetting being driven by steam power. Patent Steam and Water Gauges, Steam Whistles, Cocks, India Rubber Steam Packing. Ready made Bolts and Nuts, Belting Lace and other Engineer's Findings for sale.

"GO FORTH INTO THE COUNTRY."

BY MRS. JAMES GRAY.

Go forth into the country,
From a world of care and guile.
Go forth to the untainted air,
And the sunshine's open smile,
It shall clear thy clouded brow—
It shall loose the worldly coil
That binds thy heart too closely up,
Thou man of care and toil!

Go forth into the country,
Where gladsome sights and sounds
Make the heart's pulses thrill and leap
With fresher, quicker bounds.
They shall wake fresh life within
The mind's enchanted bower;
Go, student of the midnight lamp,
And try their magic power.

Go forth into the country,
With its songs of happy birds,
Its fertile vales, its grassy hills,
Alive with flocks and herds.
Against the power of sadness
Is its magic all arrayed—
Go forth and dream no idle dreams,
Oh, visionary maid!

Go forth into the country,
Where the nut's rich clusters grow;
Where the strawberry nestles 'mid the furze
And the holly-berries glow.
Each season hath its treasures,
Like thee all free and wild—
Who would keep thee from the country,
Thou happy, artless child?

Go forth into the country,
It hath many a solemn grove,
And many an altar on its hills,
Sacred to peace and love.
And whilst with grateful fervor
Thine eyes its glories scan,
Worship God who made it all,
Oh! holy Christian man.

THE FORGET-ME-NOT.

FROM THE GERMAN OF MUCHLER.

By yon brook an softly streaming,
Springs a flow'ret, friendly, fair;
Gentle as the moonlight's beaming,
Pure it not unheeded there.

Bright as heaven's unclouded azure,
Symbol flower of mem'ry's truth,
To the pensive heart a treasure,
Whispering words that cheer and soothe.

Mild as starry hours, whose splendor
Tells of faith that knows no spot;
From afar, its warning tender,
Doth it speak, "forget me not!"

When thy farewell tears are flowing,
When to part must be thy lot,
By thy path its blossom blowing,
Meekly pleads "forget me not!"

Dear one! to this flow'ret listen!
Words of love each leaf have got!
See! its tears are dews that glisten,
And it sighs, "forget-me-not!"

SEVENTEEN.

Just seventeen! the sweetest age
That's entered on false beauty's page;
Lips like the rose-bud cleft in twain,
Eyes like twin stars beneath some cloud,
That comes their sparkling light to shroud;
Rich tresses of the Auburn glow,
Free waving o'er a brow of snow;
And the bosom heaving, swelling,
Where trickling Cupid holds his dwelling:
Of woman's life, no year, I ween,
Like soft, sweet, pouting seventeen.

COMMERCIAL VALUE OF HONESTY.—An old trader among the Northern Indians, who had some years ago established himself on the Wisseva, tells a good story, with a moral worth recollecting, about his first trials of trading with his red customers. The Indians, who evidently wanted goods, but for some time bought nothing. Finally, their chief, with a large body of his followers, visited him, and accosting him, "How do, Thomas, show me goods; I take four yard of calico, three coon-skins for yard, pay you by'm-by—to-morrow;" received his goods, and left. Next day, he returned with his whole band, his blankets stuffed with coon-skins. "American man, I pay now," with this, he began counting out the skins, until he had handed him over twelve. Then after a moment's pause, he handed the trader one more, remarking "that's it." I handed it back, said the trader, telling him he owed me but twelve, and I would not cheat him. We continued to pass it back and forth, each one asserting that it belonged to the other. At last he appeared to be satisfied, gave me a scrutinizing look, placed the skin in the folds of his blanket, stepped to the door and gave a yell, and cried in a loud voice, "Come, come, and trade with the pale face, he no cheat Indian; his heart big." He then turned to me, and said: "You take that skin. I tell Indian no trade with you—drive you off like a dog—but now you Indian's friend, and we yours." Before sundown, I was waist deep in furs, and loaded down with cash. So I lost nothing by my honesty.

ARTILLERY.—Archidames, king of Sparta, and son of Agesilaus, when he saw a machine invented for the casting of stones and darts, exclaimed that it was the "grave of valor." The same lament was made, according to Froissart, by some knights, on the first application of gunpowder to warlike purposes.

THERE are certain epoques when, in art, simplicity is an audacious originality.—*Pourcelet.*

WHEN the "Siamese Twins" were on view at Barnum's Museum, we saw a lank, cadaverous-looking clergyman, with a white cravat adjusted to his neck at the precise point of strangulation, go up to them and say in very measured and sepulchral tones:

"Young men, may I ask how long you have been in this condition?"

They both replied, at the same time, and in the same words:

"Twenty-one years, the fifteenth day of last September."

"Umph!" resumed their inquisitor, "that is a long time—quite a long time; you must be very much *attached* to each other!"

A fact so incontrovertible amused us a good deal at the time we remember; and we have been newly reminded of it by the following dialogue, which took place between Chang and Eng on their recent visit to the East, and an inquisitive Yankee of "that ilk."

After "dickering" some time with the door-keeper, he disbursed "the swindle," as he called it—a quarter of a dollar—and entered to see the "cur'osity." He surveyed the unique pair for the space of five minutes without saying a word At length he broke out:

"How long you fellers been in this kind of a hitch?"

"Forty-two years," replied Eng.

"Do tell! Gettin' kind o' used to it, then, I 'xpect."

"We ought to be, by this time," said the twins both together.

"Yes—'zactly; should say so, tew, myself. B'long to the same church, shouldn't wonder?"

"Yes," said Chang, "we do."

"Want to know!" continued the Yankee.—"Well," he added, examining the ligature, "ef one of you dies, t'other 'll be in a bad fix, won't he?"

"It would be bad," said Eng, with something of sadness in his face at the thought.

"Don't drink nothin,' 'xpect?" pursued their interrogator. "Ever go in to swim?"

"Sometimes," they answered.

After gazing at and scrutinizing them for a few moments longer, the indefatigable questioner again burst out with:

"Look o' here! s'posin' one o' yeou fellers gets into a scrape, and was about to be put into jail. How do you calc'late you'd get along?"

"Oh!" said Eng, laughing at the idea, "I'd go Chang's bail!"

"Sartain—ye-e-s; you *could* do that—couldn't ye?"

And here closed the instructive colloquy, and the inquisitor, whistling Yankee Doodle, retired and gave room for a fresh lot of examiners.

COULDN'T BUT LAUGH.—We were something amused yesterday, (says the Cincinnatti Daily Columbian) on the shore, observing some newly arrived Germans, who, in their rural, Dutchest kind of clothes, caps and pipes, were looking around them to see how things were working. One of the young Duichmen was really the most perfect carricature upon a live white man, we have met for a long time. He was a Peter Spyke in tone and fiuish, that would have convulsed any theater audience. His breeches ran up to his very armpits; immense pockets, in which he stowed wardrobe or edibles, until the pockets bulged out like plethoric saddle-bags. His vest was about six inches long, with bright metal buttons big as half dollars, plentifully scattered up in front. His coat was of the square-toed humpbacked order, and worth a heap of money to any comedian in the country. Peter had a cap, and such a cap! His head was of the Westerian size, and yet he endeavored to cover it with a geranium pot cap, of the most grotesque style, and scarcely big enough for a baby. Armed with a furious, double barrelled *merschaum*. Peter was smoking away at his leisure, and looking about as docile as a pet lamb in a clover patch. In the simplicity of his rural innocence, a young Hoosier comes up to Peter, and says:—

"Look a here, where's Columby street, mister?"

Peter looked at his interrogator with a blank stare, and giviug his pipe a fresh draught, he replied—"Wa's?"

"Where is Columby street?"

"Ein der brecht takel's, condeitch spraken."

"Look a here," says the Hoosier, breaking into Peter's speech, "what kind of stuff's that; I ax you where's Columby street, and you rip out with a blasted Choctaw sputter, the —— could'nt get the hang of; now, I ask you again where's Columby street?"

"Yaw," says Peter.

"You be ——," says the Hoosier, leaving.

"Yaw," says Peter, straight along.

A DELICIOUS DOMESTIC STORY.—Inquiring Young Lady.—"O, dear, do tell how Charles declared his love."

Expectant Wife.—"Well, Lucy, we were in the parlor, you know, and all at once he turned up his eyes so, I thought he was ill. Then he turned them down, and squeezed my wrist, and asked me if I'd have him—and—and"——

Inquiring Young Lady.—"Well, dear, what did he do next?"

Expectant Wife.—"Nothing, dear; but I said "Yes," and gracious! how he kissed me! Then, dear, I laid my head on his shoulder, and then we talked, dear. O, how I trembled. I thought I never could go through it"!

A YOUNG lady in Clinton, Mass., who married a rich man under pretence of being beautiful, is discovered to have painted, wore bustles and otherwise disguised her natural imperfections. Her husband sues her for obtaining money under false pretence.

WASHINGTON STEAM MILLS.

WASHINGTON FLOUR MILLS.

THE undersigned proprietor of the Washington Flouring Mills take pleasure in offering to families and the trade, Superior Family Flour. To our Mills, we are happy to say to our friends, was awarded the Silver Medal; and we shall be always striving to maintain for it a high reputation, so that our customers can send to us in confidence, believing they will receive the highest character of Flour the market affords.

In the same establishment we have extensive STEAM SAW MILLS, capable of performing every kind of work that may be desired, and to this branch of our business we invite the attention of the public. We have also STEAM PLANING MILLS, that will finish all kinds of work in the most workmanlike manner, and equal to anything performed in the country, and in the most prompt manner to order.

We invite all who are contracting work, to call on us and examine our Mills, and we can satisfy them of our ability to supply every order in each branch of our extensive establishment.

D. W. VANCOURT, Proprietor.
1 Near the Oriental.

POLLEY & CO.,

OF THE BAY STATE MILLS, would announce that for the better accommodation of their numerous customers and trade in general, that they have opened a branch of their business at the **Fire Proof Store, No. 49 K street**, between Second and Third, where they will always keep on hand a large stock of California FLOUR; also, Haxall and Gallego.

Public attention is particularly directed to the "BAY STATE LOWER MILLS' BRAND," an article we have every confidence in warranting, being made under our own inspection, from new Wheat, without any adulteration.

Ground feed of all kinds always on hand.

Every exertion will be used to merit a continuance of the favor heretofore so liberally extended to us. 1-3t

PEORIA PREMIUM STEEL PLOWS.

THE FORMER CELEBRITY OF THE PEORIA PREMIUM STEEL PLOWS, and the unequalled success of their introduction in this State, would seem to preclude the necessity of any further effort on our part to draw attention thereto: but in view of the transitory nature of business in general in California, and the probability that some may have looked upon our establishment of an extensive and permanent manufacture of **Plows** here, in the face of such enormous importations and extravagant prices of material, as an impossibility—we believe it expedient to adopt this method of bringing it within the special notice of all concerned, that we are now manufacturing, and will have ready for this season's demand, three thousand of the most superior Plows ever made or used within this State.

We feel warranted in making this assertion, from the fact that all who used our Plows last season testify that they were superior: and we have studied so closely the immediate wants of our patrons from every section of the State, that we can now furnish Plows suitable to any particular kind of soil known in the State.

Our material has all been selected in the East by one of our firm, and imported by us directly from the manufacturers, which places it in our power to say confidently that nothing is lacking in quality, while we are enabled to make the plows at a cost greatly below that of last season, and are determined to sell at prices within the reach of every farmer who may wish to use the Peoria Premium Steel Plow.

It should be remembered that these plows will do double the work with half the team required in using the ordinary cast Plow; and that the work, when done, will be well done.

For particulars of prices, and descriptions of plows, we refer you to the subjoined card. The prices therein detailed are those established at our factory, and the only alterations from them that we authorize our agents to make, is the addition of the cost of transportation to their places of business—thus placing the plows at every accessible point of the State for the exact price charged at the Factory, with the necessary expenses only added.

Farmers ordering our plows through mercantile houses here, would do well to write to us at the same time, if they would make sure of getting the right plow, for some are interested in representing that we are not making plows at all, while others will not sell our plows when they can get off a cast plow. We therefore recommend that orders should be sent to us directly, accompanied by an order upon your merchant for the amount, which you can always know by a reference to the card accompanying this circular.

On the 24th of June the interest of T. ADAMS in our business ceased, by the sale of his entire interest therein to L. E. MORGAN. Aside from this, there has not, nor will there be, any alteration, as we have the same efficient and thoroughly practised hands in every department of our business.

E. L. MORGAN & CO., Successors to
T. ADAMS & CO.,
Corner of Broadway and Battery streets.

☞ The following are the established prices for the **Peoria Premium Steel Plows**, at our Factory, and the only addition our Agents are authorised to make thereto, is the cost of transportation to their points of business:

SIZE.	DESCRIPTION.	FURROW.	PRICE.
No. 5	plain	10 in	$ 30
5½	"	12 in	$ 35
6	"	14 in	$ 40
7	"	16 in	$ 50
6	clipper or prairie	14 in	$ 60
16	" "	16 in	$ 70
18	" "	18 in	$ 85
20	" "	20 in	$100
22	" "	22 in	$110
24	" "	24 in	$125
26	" "	26 in	$150
30	" "	30 in	$175
40	" "	40 in	$225
Subsoil Plows			$40
Cultivators			$25

[For the addition of wheel and axle to any of the above clipper Plows, an additional charge of $30.]

L. E. MORGAN & CO., Successors to
1 T. ADAMS & CO.

PREMIUM PLOUGHS.

WE invite the attention of farmers to the assortment of "Premium Steel Ploughs," now at our store at Exhibition Hall. These are the celebrated "Morgan & Co.'s Peoria Ploughs," pronounced by the committee the very best Plough in the United States.

WARREN & SON'S
1 Agricultural Store.

WARREN & SON'S HORTICULTURAL MUSEUM AND HALL OF SCIENCE.

THE subscribers take pleasure in announcing to their friends and patrons that they open their Hall as a Museum of Horticulture and Natural Sciences. Having now completed our arrangements in Europe and in this country, we are enabled to offer to the patrons of this establishment (the first of the kind in California) everything desirable connected with the science of **Agriculture, Horticulture, and Floriculture.**

Connected with this establishment will be Nurseries, Gardens, Fruit Orchards, Graperies, and Greenhouses of the proprietors; and therefore the patrons can be assured that it is much better for them to send their orders to first hands than to those who collect here and there, at auction and elsewhere, where there can be no certainty of the genuineness of what they buy.

The Nurseries will be extensive, containing several hundred thousand trees grown under the eye of the proprietors. The Fruit Garden will contain the choicest Fruits known in Europe and America.

The Museum will contain specimens of Fruit in Wax, rare and curious specimens of everything else in nature, both in wax and in a dried state; Oil Paintings, Drawings and Paintings of Fruits, Flowers, &c., together with specimens in Natural History, Books on Agriculture, Horticulture and Botany; Garden implements of all descriptions and of the most approved patterns.

SEEDS.—A large and superior assortment of Garden and Flower Seeds, comprising all the new and rare varieties. Field and Grass Seeds of warranted quality, wholesale and retail. The Seeds sold at this establishment will be warranted pure and genuine, true to their name and preserved in a proper manner. Dealers will receive a liberal discount.

Boxes of Seeds for exportation at $5 and upwards, so packed that they may be safely transported to any part of the world.

Packages of Flower Seeds, containing twenty varieties of Annuals, Biennials and Perennials, neatly packed in boxes, from $3 to $20.

☞ Separate Catalogues of Fruit and Forest Trees; Vines, Shrubs, Evergreens, Dahlias, Roses and Greenhouse Plants; Garden and Agricultural Seeds, may be had on application.

WARREN & SON,
NURSERYMEN, SEEDSMEN AND FLORISTS,
1-tf Musical Hall Building, Bush st, San Francisco.

THEODORE PAYNE ..... AUCTIONEER.

☞ Messrs. PAYNE & CO. respectfully inform the public that they have established themselves as above, for the purpose of transacting the

Real Estate business, in all its branches,

For the conducting of which they esteem themselves peculiarly qualified, by having given it their special attention for over two years past, and made themselves familiar with all questions affecting titles, &c. &c.

They will give their especial attention to the public sales of estate, by Administrators, Assignees, Receivers, Mortgagees, &c., carefully complying with the forms of law.

A Register for Property, at either public or private sale always open at their office

FAMILY FLOUR.

HORNER'S PREMIUM FLOUR.

UNION CITY MILLS.

WE INVITE the particular attention of Families and the Trade, to the quality of the Flour manufactured by us.

Our great aim has been, in the establishment of our Mills to procure the most perfect machinery, to employ the ablest millers, and to select the purest and finest wheat in the country.

That we have been able to accomplish all this, the Product of our Mills now before the community is the best evidence.

The FLOUR we manufacture has been submitted to the ablest judges of our State, and after the most rigid and thorough test, they have awarded to us the "PREMIUM PRIZE," and we shall have offer the same as "Horner's Premium Flour;" it shall be our constant effort to maintain for it the reputation of being the

The Best Flour in the Land.

Orders left with HORNER & CO. at our Storeship, Broadway wharf, will receive prompt attention.

1 4t HORNER.

SUPERIOR FURNITURE.

THE largest and best stock in Sacramento may at all times be found at the Old Stand of B. P. & D. MOORE, No. 77 Third street, where they still persist in selling as much below their competitors as their superior facilities will admit of. Having on hand the most splendid and substantial assortment of all kinds of Furniture ever offered in Sacramento, we feel confident, with prices to suit, that none can go away empty that may favor us with a call.

Our stock consists of Bureaus, Secreturies, Wardrobes, Stands, Tables, Bedsteads, Lounges, Sofas, Painted Mahogany, Black Walnut, Satin and Rosewood Setts—some of the finest and cheapest ever offered in this market.

Also, Mattrasses, of Curled Hair, Patent Felt, Moss, Wool, Straw, and Straw with Cotton Tops. Also, Feather Pillows and Feathers for Beds, with a large stock of Quilts, Comforts, Sheets, Blankets, &c., &c. Also, a very large stock of Chairs, Wood, and Cane Seats of all descriptions: also, of Hair, Cloth, Spring, Plush, Velvet and Carpet Bottoms, with Rockers of all kinds; all of which he sold at reduced rates.

1 4t Also at 130 Jackson street, San Francisco.

A CARD.

FREE EXHIBITION HALL.—We desire to announce, and we do so most respectfully, that hereafter, during our Exhibition, our Hall, containing all the magnificent specimens of the Agricultural Exhibition, together with the choice Paintings and Embroideries, and many rare and beautiful specimens and curiosities from the "Islands of the Sea," will be open to the visits of all who wish to examine them, FREE OF CHARGE.

We would also announce to Artists that our Hall is offered to them FREE, to exhibit their work for exhibition or sale, and we further announce to all persons who have Paintings, Statuary, Works of Art, Curiosities, or extra specimens of anything of domestic manufacture, that here is a place the most appropriate for its exhibition or sale, and where the most extended notice can be given to it. All who have works of art, or any of the curiosities of the country, or wonderful specimen of the Agriculture of California or the Pacific coast, will find this Hall the most appropriate place for the exhibition of the same.

We desire also to state that all the Agricultural papers and periodicals of the United States and the principal publications of Europe upon the subjects of Agriculture, Horticulture, and Floriculture and other scientific subjects, and to our patronage and to the cause of Science, they are ever open, and we trust our best aid to developing to the utmost of our power the good resulting from them.

A Deer-Hunt in a "Dug-Out."

Some years ago I was on my way across the Rocky Mountains to Fort Vancouver, when circumstances rendered it necessary that I should stop some days at a small trading post on one of the branches of the Columbia River. I was in fact detained waiting for a party of fur traders with whom I was to travel; and as the post was a small one, with miserable accommodations, and scarcely room enough in its two or three wretched log-cabins to lodge half the company that happened at the time to claim its hospitality, I was of course *ennuyee* almost to death. The surrounding country, however, was beautiful, and the favorite haunt of the fallow deer, and its near congener, the long-tail. It was not long, therefore, after my arrival, before I put myself in train for a hunt.

After talking the matter over with my servant Dick, a half-breed, who happened to be a good guide and a first-rate hunter, we at length decided to commence sport with a fire-hunt—not, however as is usually practised among backwoodsmen, by carrying a torch through the woods, but by carrying our torch in a canoe, and, floating down the stream, shooting the deer that happened to be upon the banks drinking or cooling their hoofs in the water.

The next day, Dick and I proceeded in our preparations. In the first place, for the consideration of a few charges of powder, we borrowed an old canoe that belonged to one of the Flathead Indians—a sort of hanger-on at the post. This craft was simply a log of cotton-wood, rudely hollowed out by means of an axe, and slightly rounded at the ends to produce the canoe-shape. It was that species of water-craft popularly known throughout the west as a "dug-out," a phrase which explains itself. It was both old and rickety, but after a short inspection, Blue Dick declared it would be "first-rate."

Our next move was to prepare our torch. For this we had to make an excursion to the neighboring hills, where we found the very material we wanted—the dry knots of the pitch-pine tree. A large segment of birch bark was then sought for and obtained, and our implements were complete. At twilight all was ready, and stepping into our dug-out, we paddled silently down stream. As soon as we had got out of the neighborhood of the post we lighted our torch. This was placed in a large frying pan, out upon the bow. It blazed up brightly, throwing a glare over the surface of the stream, and reflecting in red light every object upon both banks. We, on the other hand, were completely hidden from view by means of the birch-bark screen, which stood up between us and the torch.

As soon as we were fairly under way, I yielded up the paddle to Dick, who now assigned to himself the double office of guiding the dug-out and keeping the torch trimmed. I was to look to the shooting; so, placing my trusty rifle across my thighs I sat alternately scanning both banks as we glided along. I shall never forget the romantic effect which was produced upon my mind during that wild excursion. The scenery of the river upon which we had launched our craft was at all times of a picturesque character. Under the blaze of the pine-wood—its trees and rocks tinged with a vermilion hue, while the rippling flow of the water ran like molten gold—the effect heightened to a degree of sublimity which could not have failed to impress the dullest imagination. It was the autumn season, too, and the foliage, which had not yet commenced falling had assumed those rich varied tints so characteristic of the American sylva. Various hues of green and golden, and yellow and deep red were exhibited upon the luxuriant frondage that lined the banks of the stream; here and there drooped like emerald-colored curtains down to the waters' edge. It was a scene of that wild beauty, that picturesque sublimity which carries one to the contemplation of his Creator.

"Voule!" muttered a voice that roused me from my reverie. It was Dick who spoke in the half-whisper of the hunter's-hand. I looked up from my musing, and perceived to the right bank. Means favored the direction indicated, and upon two green eyes—from the darker background of the foliage appeared bright and luminous. These objects were round, and close to each other; and at a glance I knew them to be the eyes of some animal, reflecting the light of our torch. My companion whispered me that they were the eyes of a deer. I took sight with my rifle, aiming as nearly as possible midway between the luminous spots. I pulled trigger, and my true piece cracked like a whip. The report was not loud enough to drown the noises that came back from the shore. There was a rustling of leaves, followed by a plunge, as of some body falling into the water. Dick turned the head of the dug-out, and paddled her up to the bank. The torch, blazing brightly, lit up the scene ahead of us, and our eyes were gratified by the sight of a fine buck, that had fallen dead into the river. He was about being drawn into the eddy of the current, but Dick prevented his, and, seizing him by the antlers, soon deposited him safely in the bottom of the boat.

Our craft was once more headed down stream, and we scrutinized every winding of the bank in search of another pair of gleaming eyes. In less than half an hour these appeared, and we succeeded in killing a second long-tail—a doe—and dragged her also into the boat. Shortly after, a third was knocked over, which we found standing out in the river, on a small point of sand. This proved to be a young spike-buck, his horns not having as yet branched off into antlers. About a quarter of a mile further down, a fourth deer was shot at, and missed, the dug-out having grazed suddenly against a rock just as I was pulling trigger, thus rendering my aim unsteady.

I need hardly say that this sport was extremely exciting; and we had got many miles from the post, without thinking either of the distance or of the fact that we should be under the disagreeable necessity of paddling the old Flathead's dug-out every inch of the way back again. Down stream it was plain sailing; and Dick's duty was light enough, as it consisted merely in keeping the canoe head-foremost in the middle of the stream. The current ran at the rate of three miles an hour, and therefore drifted us along with sufficient rapidity.

The first thing that suggested a return to either of us, was the fact that our pine knots had run out; Dick had just piled the last of them in the frying-pan. At this moment a noise sounded in our ears that caused us some feeling of alarm; it was the noise of falling water. It was not new to us, for, since leaving the post, we had passed the mouths of several small streams, that debouched into the one upon which we were in most cases over a jumble of rocks, thus forming a series of noisy rapids. But that which we now heard was directly ahead of us, and must, we thought be a rapid or fall of the stream itself: moreover, it appeared louder than any we had hitherto passed.

We lost but little time in conjecture. The first impulse of my companion, upon catching the sound, was to stop the progress of the dug-out which in a few seconds he succeeded in doing; but by this time our torch had shown us that there was a sharp turning in the river with a long reach of smooth water below. The cascade therefore could not be in our stream, but in some tributary that fell into it near the head. On seeing this, Dick turned his paddle, and permitted the dug-out once more to float with the current. The next moment we passed the mouth of a good-sized creek, whose waters, having just leaped a fall of several feet, fell into the river, covered with white froth and bubbles. We could see the fall at a little distance, through the branches of the trees and as we swept onward, its foaming sheet reflected the light of our torch like shining metal.

We had scarcely passed this point when my attention was attracted by a pair of fiery orbs that glistened out of some low bushes upon the left bank of the river. I saw that they were the eyes of some animal but what kind of animal I could not guess. I knew they were not the eyes of a deer. Their position, their relation their lesser size the wide space between them—all convinced me they were not a deer's eyes. Moreover they moved at times as if the head of the animal was carried about in irregular circles. This is never the case with the eyes of the deer, which either pass horribly from point to point or remain with a fixed and steady gaze. I knew therefore that it was no deer; but no matter what—it was some wild creature and I determined to [illegible] of the prize-hunter. I took aim and pulled trigger. [illegible] I heard the voice of my companion warning me as I thought not to shoot. I wondered at his [illegible] but it was then too late to heed [illegible] shot.

I first heard at the [illegible] of my shot. To my great surprise the eyes were still there, apparently as bright as ever! How I account for this I will [illegible] me; but I still believed that my bullet must have sped truly, as it had been delivered with a certain aim. As I turned to Dick for an explanation, a new sound not unlike that sometimes uttered by terrified swine, but still louder and more threatening, met my ear. I knew it well—I knew it was the snort of the grizzly bear.

Of all American animals, the grizzly bear is the most to be dreaded. Armed or unarmed, man is no match for him, and even the courageous hunter of these parts shuns the encounter. This was why my companion had admonished me not to fire. I thought I had missed; it was not so. My bullet had hit and stung the fierce brute to madness; and a quick cracking among the bushes was immediately followed by a heavy plunge; the bear was in the water.

"Good heavens, he's after us!" cried Dick, in accents of alarm, at the same time propelling the the dug-out with all his might. It proved true enough that the bear was after us, and the very first plunge had brought his nose up to the side of the canoe. However, a few well-directed strokes of the paddle set us in quick motion, and we were soon gliding rapidly down stream, followed by the enraged animal, that every now and then uttered one of his fierce snorts.

What rendered our situation a terrible one was, that we could not now see the bear, nor tell how far he might be from us. All to the rear of the canoe was a pitchy darkness, in consequence of the screen of birch bark. No object could be distinguished in that direction, and it was only by hearing him that we could tell he was still some yards off. The snorts, however, were more or less distinct, as heard amid the varying roar of the waterfall; and sometimes they seemed as if the snout from which they proceeded was close up to our stern. We knew that if he once laid his paw upon the canoe, we should either be sunk or compelled to leap out and swim for it. We knew, moreover, that such an event would be certain death to one of us, at least. I need hardly affirm that my companion used his paddle with all the energy of despair. I assisted him as was in my power with the butt-end of my gun, which was empty; on account of the hurry and darkness, I had not attempted to reload it.

We had shot down stream for a hundred yards or so, and were about congratulating ourselves on the prospect of an escape from the bear, when a new object of dread presented itself to our terrified imaginations. This object was the sound of falling water; but not as before, coming from tributary streams. No. It was a fall of the river upon which we were floating, and evidently only a very short distance below us! We were, in fact, within less than 100 yards of it. Our excitement in consequence of being pursued by the bear, as well as the fact that sounds of the cascade above still filled our ears, had prevented us from perceiving this new danger until we had approached it.

A shout of terror and warning from my companion seemed the echo of one I had myself uttered. Both of us understood the peril of our situation, and both, without speaking another word, set about attempting to stop the boat. We paddled with all our strength—he with the oar while I used the butt-end of my rifle. We had succeeded in bringing her to a sort of equilibrium, and were in hopes of being able to force her towards the bank, when all at once we heard a heavy object strike against the stern. At the same moment, the bow rose up into the air, and a number of the burning pine-knots fell back into the bottom of the canoe. They still continued to blaze; and their light now falling towards the stern showed us a fearful object. The bear had seized hold of the dug-out, and his fierce head and long curling claws were visible over the edge. Although the little craft danced about upon the water, and was likely to be turned keel upwards the animal showed no intention of relaxing its hold; but, on the contrary, seemed every moment mounting higher into the canoe.

Our peril was now extreme. We knew it, and the knowledge half paralyzed us. Both of us had started up, and for a few moments half-sat, half-crouched uncertain how to act. Should we use the paddles and get the canoe ashore, it would be only to throw ourselves into the jaws of the bear. On the other hand we could not [illegible] as was for in a few seconds we should be drifted over the falls, and how high those waters are, [illegible] We had never heard them, they might be [illegible] — [illegible] a hundred. [illegible] [illegible] [illegible]

THE CALIFORNIA FARMER.

J. L. L F. WARREN, Assistant Editor.

AGENTS FOR CALIFORNIA FARMER.

Messrs Adams & Co., at all their offices throughout the United States or Europe.

Messrs. Wells, Fargo & Co., at their offices throughout the Country.

San Francisco—Messrs. Murray & Co., booksellers, Montgomery street; Sullivan's newspaper stand, near the Post Office; Kimball's, Noisy Carriers Hall, Long wharf.

Oakland—Mr. Isaac Willard.

Benicia, Martinez, &c.—Messrs. Stiles & Dodds.

Union City and Mission San Jose—Messrs. Howard & Chamberlain.

San Luis Obispo—Dr. Thomas L. Harvey, P. M.

Sacramento—Mr. Oscar D. Avaline; Messrs. Currie Brothers.

Union, Humboldt Bay—A. H. Murdoch, P. M.

N. B.—We want Agents in all the principal localities, and persons disposed to act can have the opportunity, if satisfactory to all parties.

To the Friends of Agriculture.

We ask of all to whom we send this number, who are not already subscribers, to examine the Farmer, and to give it their influence. We trust to hear from them and to know that they will not only become subscribers to our Journal, but favor us with their communications. We desire to call their attention to our terms of subscription for clubs.

Special Premiums for Subscriptions.

In addition to the standing inducement for the getting of subscribers for the "Farmer," we will make a present of HARPER'S ILLUSTRATED FAMILY BIBLE to the person who procures the most Subscribers in the first six months of our publication. This we regard as one of the most beautiful books ever issued. Who will have the prize?

A Premium---Farmers' Clubs.

With the hope of inducing such of our friends, and those who have a little leisure, to ride among their neighbors and introduce an Agricultural Paper, we take pleasure in offering the CALIFORNIA FARMER: and, to make it an inducement, we say to such friends—if you will get us five subscribers, and remit the amount, we will send you six papers, or for ten subscribers, twelve papers. We trust there are many friends who will cheerfully take a little pains to aid us, and thus extend the circulation of the Farmer, and make a useful vehicle for the Agriculture of California.

Subscribers will please be particular to name the Post Office to which papers are to be sent; or, if forwarded by express, which line they prefer.

To Our Patrons.

To Advertisers.—We would call the attention of those who desire to have their advertisements produce quick returns, to the pages of the California Farmer.

The Farmer will reach sources of trade entirely new and unattainable by any other means, and thus secure a large and immediate profit to those who desire to make known their business. By a glance at our advertising columns, it will be perceived that we present the best known and most extensive houses, and as we have space for but one or two of each branch, these will be the most prominent houses, and thus give more influence to them.

To Agents.

☞ We desire Agents to report as early as possible, that we may be prepared in our issues for a sufficient number to supply the demand. Be sure and report promptly.

Large Farms.

In years gone by, when an Eastern man—a New England man—went West, he would, upon his return, tell of the immense fields of corn and grain which he had seen—sometimes one, two, or three hundred acres in one farm. This, East, was esteemed almost incredible. What would our friends say, could they take a ride, as we have done, from Union city to San Jose? Two proprietors there who are known now world-wide, Messrs. Horner and Beard, have in connection around their farms more than eighty miles of wire fence, and of the very best character;—some parts of this fence being extra, with iron posts, would make the value of fencing alone over one hundred thousand dollars. But the value is not in the fencing. Within these enclosures we find the following crops of the present year, as given to us by the proprietors themselves: Mr. Horner—Fifteen hundred acres of wheat, one hunderd and fifty acres oats, two hundred acres barley, six hundred acres Potatoes, besides acres upon acres of cabbage and other vegetable root crops for stock. Here we find about twenty-five hundred acres under cultivation. In addition to this, Mr. Horner will plant the present year two thousand five hundred Fruit Trees, and two thousand forest and ornamental trees.

Mr. Beard's plantations the present year will consist of eleven hundred acres of wheat, six hundred acres of oats, three hundred acres barley and six hundred acres potatoes, besides acres of cabbages, root crops for stock, &c. Mr. Beard will plant this season ten thousand Fruit Trees and many thousand Vines.

What glorious prospects ahead for this magnificent valley, and how nobly do the gentlemen expend their wealth, giving employment to the hundreds of laborers, increasing the luxuries of earth, and adding to its beauties.

It would be interesting for our friends in the Eastern States to make estimates of the value of the crops of such farmers as we have named; it would give them a better idea of California than they have yet received.

We have filed for insertion in our next number the Reports of two of the Committees who made awards at the Horticultural Fair, as also the able Lecture of Dr. H. M. Gray.

Railroad to the Grave.

How fearful the thought! We start at the remembrance of the many speedy messengers that this fell destroyer has sent upon earth, sundering the dearest ties of kindred and friendship; yet when the blow has fallen, and we stand beside the cold and lifeless clay, all thought of haste, of earthly excitement, of wealth, of fame, or of the many charms of ths outer world, are gone, yet our mind is with the quiet dead, and we would be alone.

Thus has it been. But the scene is changed. The age of improvement, of progress, gives a new type of humanity in all its phases. "Men make haste to be rich." Days are too short to accomplish all the desires of the human heart—to reach all the mind would grasp; walking is too slow; riding is not speed enough; the ears will not do for great exigencies, and the lightnings flash forth to convey plans, make contracts, and carry forward the designs of man: and in the midst of all this, Death lays his cold hand upon the projectors of these great enterprises, and the work ceases—not ceases all—the one mind may be silent—but the world around has caught the enthusiasm, and the Dead—the Dead—there must be no time lost now. The world's great maelstrom is moving on and time is precious, and where once the slow moving funereal train was in strict keeping with the scene and events around—now the age demands a speed corresponding to it.

That which induced these remarks, was the announcement in a late New York paper, that, so great was the number of burials at Greenwood Cemetery, that it would be found necessary to employ railroad cars for the purpose of the burial of the dead. No more comment is needed than the simple announcement of this startling fact. We are indeed a fast people—for we live and are buried with railroad speed.

Great Yield of Oats.

We give below the data of a great yield of oats in San Jose valley, as related to us from one of the firm of Hawley & Cornell, upon whose farm the product was harvested.

The crop was harvested from seven acres amounting to two hundred and thirty sacks—weighing twenty-three thousand nine hundred and twenty pounds. The oats were very heavy—unusually so—forty-seven lbs. per bushel—thus averaging seventy-four bushels per acre of this extraordinary heavy grain.

The usual weight of oats in the Eastern States is thirty-six pounds, and this crop would be in weight equal to ninety-five bushels per acre! What will our Eastern friends say to this?

The Pioneer.

We received a copy of the "California Pioneer," with the compliments of the publishers. We note its appearance with much pleasure. Give us books—give us food for the mind. California is prolific in everything—newspapers, books, periodicals, and well is it that the Press is so well represented. The citizens had better spend their money for such things than for that which might do harm. If people do not read, they will rove away—perchance do something that will not produce such satisfactory results as the reading a good paper or magazine.

The California Pioneer is very creditable indeed, although the publishers promise great improvement in future numbers.

The principal articles in No. I are—The Limantour Claim—Reminiscences of San Francisco—Poetry of California, principally a very severe criticism upon Quillem, the author of recent poems—Filibusterism—Pearl Diving—California in 1851, &c., &c. We sincerely wish the projectors success in their undertaking—they deserve it.

A New Plant.

Some months since a notice appeared in a journal of Washington Territory, the Pioneer we think, of a new and interesting plant, just discovered by Gen. Brooks, of Columbia. The plant was described in such glowing terms, that we were induced to address a letter to the gentleman, making inquiries respecting it. We received in reply the following letter, together with a branch of the shrub and a parcel of the seed, and we take pleasure in gratefully acknowledging the same, and shall endeavor to rear from the seed thus sent, the plant, under our own eye, that we may be enabled to study its character and know its value. We have the branches at the Hall, and they are still fresh as when sent—the wood is of a fine lively brown tint, the leaves a rich glossy green, covered over with a gum of considerable substance.

The shrubs will prove a handsome evergreen, and very ornamental. The only drawback we fear from its introduction would be the coating of gum upon the leaves, which in our dusty latitude would soon collect the dust and sand upon it and thus rob the plant of one of its principal beauties—its evergreen appearance.

Olympia, Washington Territory, November 20, 1853.

Dear Sirs: Your letter of the 7th inst. is received, and I hasten to comply with your request. As the express from this point to the Columbia river is carried on horse-back, I shall be able to send you but a small specimen of the tree. I enclose you also a few of the seeds. I hope the specimen I send, though a mere twig, may be sufficient to enable you to form a correct idea of the tree. It may be considerably injured on the passage and lose much of its fragrance. In your examination, I desire you to take a leaf between your thumb and fore-finger, and rub pretty vigorously with the thumb on the upper side, and you will readily perceive the gum which coates the same. When the leaves have become dry, if they are placed on a hot stove, the gum will ooze out like grease.

Hoping that the specimen and seeds may reach you in safety, and that the tree may meet your expectations, I remain,

Respectfully yours,
Q. A. Brooks.

The Golden Gate.—Hark! hear the shouting! This noble steamer is safe! What a generous, joyous, and sincere huzzah rung out from the noble-hearted seamen and brave officers of this beautiful ocean palace as she left the sandy bed, and swayed again into her native element. It was a proud moment, that—and hundreds, thousands, who have walked her decks, will feel that to them it is like the restoration of a dearly loved friend, whom they believed lost forever. These joyous shouts—we hear them still; and, ere we go to press, we hope to hear the booming guns announce her safe entrance through her self-named portals into our harbor.

Favors Received.—We are under many obligations to Messrs. Adams & Co., for acts of kindness in the delivery of parcels, papers, letters, &c., for the Farmer. We are most grateful, and pray that they may be blessed in "basket and store."

To Messrs. Wells, Fargo & Co., we are under many and repeated obligations for similar favors. They are now indeed,—in their splendid new establishment,—one of the corner stones of the Express and Forwarding Business of Uncle Sam's dominions.

A Trip to Sunny Side.

THE OLIVE, VINE AND FIG.

Who would not be glad to find the "Sunny Side" such a winter as this. The very name infuses a pleasing glow upon the feelings, and we hope it will impart interest enough to take the reader along with us a brief time only to "Sunny Side."

Beneath a chain of lofty mountains, now covered with the robes of white, from whence comes chilling blasts sweeping over a beautiful valley extending as far each way as the eye can reach, lay a group of ancient buildings, built of the "adobe," and covered with tile. The principal one, a dilapidated old mission church, reminds one of the legends of olden times, for by its appearance,—the old tower with its bells, the long range of buildings attached to the church,—there is evidence that the "glory of those days" have departed, for in and around we find congregated in various places the former worshippers, and you can read distinctly in the eyes of all that such are their convictions, that a new order of things has been established.

There is a mournful feeling that rises in the minds of all the generous hearted as they note such decay, however little they might sympathize with those who established these early Missions

After a thorough view of all these marks of olden time, we turned our eye to objects more inviting, as we look to the mountains above us, they infuse a chill as cold and gloomy as the thoughts of the grave. We turn therefore to a brighter scene—the vineyards and fruit orchards that have been planted to take the place of the old stock, which are rapidly "passing away;" along this chain of most splendid mountains, extending some miles, we note the "cattle upon a thousand hills," and while the lofty heights gleam up with their snow-capped summits, the lowing herds are cropping the tender grass that is springing up upon the gentle slopes that form the base of this long range of mountains.

Broad fields of early grain are just coming forth to tell us spring is nigh, and the early violet and crocus are peeping out from their wintry hiding places in the warm ravines that here and there divide the mountain. For several days the biting blast of a wintry wind of unusual severity has prevented nearly all kinds of labor out of doors. Planting has ceased, the plow stands in the furrow and the ox remains in the stall. Grim visaged Winter has laid his frosty palm upon all, and the embargo must be borne as bravely as we can, and if storms must come, we know

"Behind the clouds, the sun's still shining,"

and so it was at Sunny Side. The ice and snow and storm clouds were above us on the mountain-top—and we in the sweet valley below. Dense as were the clouds above us and cold as was the blast, the rays of the bright sun could break through the clouds and gladden us by its rays, and cheer us by its warmth—added to all this, we were within the "social circle," where the warmest and most genuine hospitality ever reigns.

The "Old Mission Church," with its numerous ranges of smaller tenements, is not all we would note. There are many very interesting mansions of the old Spanish gentry, who even now greet you with pleasure and pay you that courteous attention for which they are so noted, and there is many a neat and pretty cottage that tells of peace and plenty within. But there was one so sweetly located, that you could not but choose it first and love it best, as you would a beautiful rose-bud, from out a group of common flowers. Follow me, gentle reader, and I will lead you to it. Go with me now, past the decaying old cathedral or mission church, and winding round a portion of it, you enter the yard, find your way over the ruins of many a cell or cloister, and various workshops and stables, you find yourself entering a large, open yard; before you a neat latticed fence to shield the "pet flower" garden that adorns the spacious dwelling now before you. This dwelling you are about to enter has been constructed for the comfort and pleasure of the dwellers within—a long, villa-like dwelling, spacious and capacious within and the whole extent of the building protected from the summer's sun by the broad veranda that guards the entire front, giving beauty and grace to all. But why talk of the building now? Have you not heard the music within, and see you not the wreathing smoke that tells of the blazing fire; enter and hear the melody of the one and feel the warmth of the other. These are the luxuries that upon a freezing day like this, will make you prize both. Well, dear reader, what of the music? are you warmed? I know you enjoyed them both, but was there not richer music in the tones of the voice that gave you the generous welcome? Did not that welcome warm your *heart* more than all the caloric that burning fuel could furnish. Oh, is there not a charm most potent in truthful and courteous hospitality, that is beyond the thought or language to express.

Go with me now, kind reader, and as we stroll around this beautiful "Home," look up to see those towering hills above you, and look along these endless, undulating slopes; see the green grass, the growing grain, the early violet and the spring daisy, and then you may look far up at the chilling peaks above. Yet now you are looking at brighter prospects—here before you the long rows of the vine, that shall soon be fragant with blossoms, and the tempting fruit—these stately trees, the beautiful emblem of Peace, upon whose wavy branches now hang the purple fruit; and that graceful tree, though now leafless, it will soon be reclothed, and although the "fig tree shall not blossom," yet ere long its beautiful foliage shall come forth and the luscious fruit shall bend its branches with its weight. These long rows of stately trees, planted by hands long since silent in the tomb—they give you the delicious pear, the melting peach, the juicy plum and the plump cherry, and as you gaze upon all these glorious luxuries of earth—and as you look upon this fair scene, and feel the warmth of the bright sun now gladdening with its balmy breath, where, gentle reader, do you think I have carried you in my ramblings?

I will tell you if you will obey me, and if you would enjoy what I have so much enjoyed. Take a fresh pony and an easy saddle, and hie away to the Oakland ferry; cross quickly, mount and ride; sweep through that mighty valley beyond, north and east, take the whole length and breadth of it, for it is all beautiful and well worth visiting, and stop not long until you have found the place I have so briefly pictured, and then you will know that the "half was not told you," for you will recognize "Sunny Side," and while your lot is cast here you will feel how appropriate is the name to such a spot, for here you will enjoy so much of the bright side of life that you will feel however your own lot may be chequered or changed, you have indeed found, for the time you have thus lived, the "Sunny Side of Life.

January 22. Elliot.

To Legislators.

We know of no body of men whose favor and and support we would more gladly conciliate than the peoples' representatives now convened at the capital. These gentlemen can do so much to promote a grand development of agriculture in the State; they can impart such a healthful impulse to the science of farming in all its detail, that we must make an earnest appeal to them in behalf of the cause. They are convened together from every county in the State, and must know the varied wants of farmers all over the commonwealth. Such a complete representation could not be brought together by any other system of advertising or invitation; especially as respects authority, for in their legislative capacity they can give an impulse to the science of farming which cannot be secured in any other way. California is sufficiently old, and the agricultural interest sufficiently important to justify some specific assistance at the hands of the Legislature. There is no reason why the Legislature of our State should not lend its countenance and a small degree of patronage to the support of an Agricultural Association and an Annual Agricultural State Fair. We say that there is no reason why they should not; but there is a strong reason why they should. Legislators know very well that when any bill is presented deferring the revenue for current expenses, that its leading reliance, its great resource is through the medium of taxes assessed upon farmers, upon the tillers of the soil. Without this means of support the finances of the commonwealth would be in as bad a condition as even without food. The real estate owners, those who are doing more in one year to develope a permanent State interest than all the votaries of transient employments will do in five, are the ones who are absolutely realizing less assistance from Legislative patronage than any other class of laborers. This we believe to be wrong, and we cannot see any good ground of objection to direct and specific aid being awarded through the Legislature for the advancement, improvement and perfection of Agriculture in the State.

Cannot the Legislature appoint a committee to examine into the present Agricultural organization, and if found to afford sufficient inducement make it the agent of the State in maturing plans for an effective fair next fall, and for those experiments in husbandry which, when properly conducted and published, would exalt and establish the farming interests in the country? By thus favoring the individual efforts which have been made, and by a small appropriation in support of the cause, an immense amount of good can be accomplished.

It seems to us that it is too much a matter of propriety to require any accumulated arguments in favor of such Legislative assistance being rendered during this session to so noble a source of wealth. We therefore trust that our Legislators, who know and appreciate the importance of Agriculture, will give us some able and cheerful support in the way of appropriations for the present year. Will not some of the members of the Legislature take the matter into consideration and present the subject in the most favorable light to the Senate and Assembly? Anything we can do to aid them in so laudable an undertaking will be most cordially attended to.

Palmetto Ranch, Dec. 12th, 1853.

Dear Sir: I received your card a few days since. I should have been happy to have been present at the convention of cultivators of the soil but my affairs at home have prevented me. Taking a deep interest in what concerns the advancement of agricultural pursuits in this country, more especially in the mountains, you may depend upon my cordial support, as far as my means and experience will enable me, in that greatest of all works, the establishment of an agricultural journal. If you succeed in starting one, let it be second to none in the world; anything short of this I am convinced would not meet with that success such a work should merit.

In answer to your several enquiries, I will answer, as you have laid them before me, having you bear in mind that I am in the mountains, and only one year and one month since I commenced.

In answer to your fourth inquiry, I would say that our land is composed of hills and flats; the flats are from two to twenty acres. We have about 100 acres of land that may be called level, and still more land on hill side that in many of the Eastern States would not be called bad to work. The corner is composed of rich black loam and some parts also a mixture of adobe. We have [illegible] the wild pea is luxuriant in its growth, growing to a length of 12 and 14 feet. We are introducing the growth of alfalfa and white clover, but are not prepared to say what success will attend it. We have a small nursery of apple trees (say fifty) of one season's growth, from 8 in. to 2 ft. high. The different kinds of vegetables and quantity grown by us this year, are—potatoes, 10,000 lbs.; cabbage, 1,500 head; beets, 1,000 lbs.; vegetable oyster, 500 lbs.; turnips, 800 lbs.; with other smaller articles. We raised a small piece of corn which grew well, the most of it from 12 to 17 ft. high, ears filling well and getting ripe.

Our season for planting is about the first of April, although this season we did not commence until the middle of May. Some of our potatoes were not planted until the first week in June, a sample of which I forward you.

Yours truly, J. B. Polley.

N. B.—I would not have you think that this is a fair statement of what can be done up here in the mountains.

The Seed Trade.

The following from an English paper, though written for the latitude of London, will answer for any latitude where gardening operations are carried on, and we commend them to our readers:

"That there is a good deal of humbug in the London seed trade cannot be denied; but it is as notorious that the public have, in a great measure been the cause of it, and their indiscriminate love of quantity for money has brought it all upon themselves. A thirst for low prices has caused a most unwholesome competition. A scamp sets up for cheap selling, advertises retail seeds at less than he must pay wholesale to procure them himself. Common sense tells us that there are only two ways to do this; one by adulteration, the other by cheating his creditors. He must cheat somebody, either those he buys of, or those he sells to must be taken in. Yet such is the rage for cheap things that thousands encourage the cheap seller. The fair tradesmen see the ground slipping away from under their feet; they must either meet the public or lose their business. If none but sensible persons purchased seeds it would be no trouble to show them that they were duped by the cheap sellers; but it is not so: a vast majority do not know a good seed from a bad one, and nobody but the wiser can know the sort, that is, the particular variety, nor whether it be true or otherwise. The most respectable houses, where every precaution is used, are occasionally deceived. They may know the sample is good and in good condition, but although every seed may grow they may be far from true to the sort they buy it for; in which case it is worthless, and every ounce they sell injures their trade. The best seedsmen send their own seeds to be grown by regular seed growers, and pay them so much per quarter, or bushel, or ton, as the case may be, for all they can produce from that seed. They are seed growers who, judging what will pay them best, will grow on their own account; but having established a reputation and a connection, they have no difficulty in finding a market among those who know them. But of what use is seed that can only be bought at a full price to compete with the cheap shops? It is to be regretted that in an article which tells no tales as to its quality for months, the public should be so careless. Every man who has a shilling to spend should have the moral courage to deal with first-rate houses and pay a first-rate price for a first-rate article, because he is completely at the mercy of the seller, who has many ways of cheating him if disposed to do so. One mode of imposing on the public is to adulterate the article by means of dead seeds, and this has often been done to the extent of 75 per cent. Another mode is to serve them with an article of which the growth is unknown, and which, for want of a character, will bring no price in the market among creditable buyers. It is, therefore, bought to kill and mix with good seed, or to be retailed at a cheap rate. There is nothing more absurd than buying cheap things for a garden. Thousands of bulbs are sold at the marts under the hammer of rigging auctioneers, and yet failure in the bloom, year after year, will not cure silly people from buying. In seeds a man is not only robbed of the cost, but he loses his ground his crops, and his season. People can be found who will sell a hundred packets of flower-seeds for a crown; but would a man who has a character to lose or a connexion to preserve, or whose time is worth anything do so? No; and yet there are persons weak enough to buy the rubbish, because it is cheap. We know we are handling a ticklish subject, and that in this, as in many cases we may offend persons who might do us good. Our hope is, that truth, however ugly, will ultimately prevail; and that if we offend merely telling unpalatable facts, we may greatly ten by opening their eyes to the tricks which are played, and save them from being duped. Good seeds are of such importance and the cost so small, that we cannot and never will account for the prevailing disposition to look at the price. Let us suppose, for a moment, that a family wish to prove a crop of cabbages the difference between the very highest and the very lowest [illegible] the crop cannot be worth the price paid for the seed, and [illegible] "Penny wise and pound foolish" was never applied to [illegible] more appropriately than in the case of [illegible] seeds. We have [illegible] matter. If a man buys what he can get [illegible] alty for running after bargains; but in seeds a man is buying a future crop of something that may be good or good-for-nothing; and if the latter, he will have lost all his time and room as well as his money. We, therefore, strongly advise the public to avoid cheap things in all garden matters. Avoid all auctions but those on a man's premises, where there is a tangible reason for selling, and a chance of fair buying. We do not mean a sale where a man once a year pretends his ground is wanted for building, and has a sale with reserve upon every lot worth having. How often have we seen sales on the same premises, and the ground, after it was over, about one-third cleared. The best thing the public can do, if plants are wanted, is to go to a respectable nursery, buy only what it wanted, and of the size it is wanted. Avoid auctions altogether; leave them to the trade, who if they can buy worth their while, purchase, and if not, let things alone. A gentleman may be sure that if he does get a bargain, to all appearance, there is something which the trade discover and which he does not, and that nine times in ten such bargains are dear."—(*Flor. Cab.*, 1853, p. 112.)

Onions in California.

We have often received communications relative to that important subject—rotation of crops; and we are enquired of more particularly in regard to the staple product named above, how far the onion could be exempt from the general rule. We have made diligent enquiry, and we find in California many instances where cultivators of the onion have raised fine crops for many succeeding years upon the same soil. We beg our readers to favor us with all the facts in their possession bearing upon this point. As a general rule a change of soil and change of seed is of the highest moment to secure great crops—a change of seed always, and a change of soil generally.

We give below an extract from a letter from one of the largest growers in Danvers, Mass., who writes to the "Country Gentleman," under date of December 5. We leave the subject for investigation, and more practical results.

Messrs Editors—In reply to the inquires made by C. N. B., of Orient, L. I., in your paper of Dec. 1st, I beg leave to say that I have given much attention to the culture of the onion for a dozen years past, and can say with confidence that there does not exist the same necessity for a rotation of crops in the growing of onions as there does in the growing of most other crops. I am aware that I express an opinion directly at variance with that expressed by your correspondent. Nevertheless, the large quantity grown in this vicinity (not less than 100,000 barrels annually) and my frequent intercourse with those who have managed their cultivation, makes me quite as confident in this matter as any other of vegetable culture. I do know fields on which onions have grown for twenty years or more successively, without any apparent diminution of crop by reason of the continued culture. So general is the impression that onions vary from other crops in this particular, that it has become almost a proverb, that "onions will do well without a change of crops."

That benefit will accrue from varying the manures applied, there can be no doubt; and that liberal dressings of manure are necessary is also perfectly clear. Perhaps such application of manure remedies the objection naturally arising from the exhaustion of the ingredients necessary to support a crop.

Your correspondent asks—what is muscle bed? I understand it to be mud at the bottom of salt water rivers and creeks, filled with muscles or the shells of muscles. Thousands of loads of this valuable material are annually collected in this vicinity, and applied to the lands. It is considered a valuable dressing for onion lands, once in half a dozen years; and some apply it oftener. It is certainly a valuable dressing to apple orchards, as I have myself witnessed.

Your correspondent speaks of his onions rotting. No such action troubles our crop, excepting a rot occasioned by the imbedding of a small maggot in the bulb of the young plant.

The red, the white and the silver skin onions are the varieties usually grown by the cultivators in this neighborhood. There are others various from these, but I am not familiar with their culture.

The Breach of Promise Case.

The case has excited much interest of late that the [illegible] of a public journal that something should be said respecting it and that the decision, &c., should be published. We record the verdict in the Jury, which has awarded Mrs. Mary Gates the plaintiff, $450 and costs. The bill of costs amounts to $[illegible] as entered upon the part of Mrs. Gates and the [illegible] of the witnesses and [illegible] ment with [illegible] fees to the [illegible] Court. [illegible] of the [illegible] of the plaintiff and the [illegible] for the [illegible] [illegible] [illegible]

THE CALIFORNIA FARMER.

JOHN F. MORSE, Editor.

SAN FRANCISCO:
Thursday, February 2, 1854.

Horner's Ranch, Jan. 22, 1854.

Well, here I am beneath the "vine and fig-tree," or rather by a warm fire in the parlor of Mr. John M. Horner, whose fame as a glorious Agriculturist has been so frequently heralded to the wide-world. I had the pleasure of his company from San Francisco, and by his invitation am now enjoying the warm hospitality of himself and his excellent lady. To say that I have been interested under such circumstances would be a very mild expression of a most agreeable fact. For a long time could I sit and listen to this gentleman's remarks upon farming, and be sure of realizing both interest and profit from his ich experience.

The very idea of talking with a man who regards it as a rather inconsiderable thing to raise 400,000 bushels of potatoes in one season, is quite as thrilling in its reference to the grandeur of farming as it is agreeable in novelty. It is sufficient in itself to enlist one's feelings in a visit and acquaintancesbip with such an individual. But in a visit to such farmers as Messrs. Horner and Beard, we had greater sources of interest to promote than a mere acquaintancesbip, personally, with such men. We wished to see the immense farms that had been brought into an early cultivation through the unequalled industry and foresight of these devoted friends of Husbandry; we wished to know from actual observation the relations of the foregoing farms to the beautiful valley in which they were located, and especially to see how far advanced these men were in the science of domestic life as tillers of the soil. These were our motives for visiting, and how far the objects have been realized can be seen by the record.

After leaving Union City, which is situated upon the "Alameda Creek," at the head of steamboat navigation, we took a stage and travelled up the valley nine miles, at which point Mr. H. lives. The whole distance from the city is marked by the most beautiful agricultural scenery that can he imagined. The road the greater part of the distance was located about midway of one broad and gorgeous area of rich and tillable land,—an unbroken, level plain of meadows of some five or six miles in width and so fenced off and improved as to he doubly improved in beauty and utility.

One of the first matters of interest arising from artificial sources was the kind of fences which Messrs. Horner and Beard have made use of to enclose and protect their cultivated lands. The most of the fencing is composed of tightly stretched wire (some galvanized). which is supported by cedar posts firmly set in the ground and at various distances from four to sixteen feet apart. In some of these fences there are six, some five, and others but four wires. The wire fence thus constructed cost about $800 per mile. Mr. H. showed us a long line of fence, probably a mile and a half in length, which was made of round iron rods and heavy barred iron uprights. The uprights were about three feet apart and every third or fourth one double. This made an exceedingly firm and substantial fence, but cost about $3000, per mile. It was imported from England, where it was made to order.

Mr. H.'s farm includes a large tract of the alluvial plain referred to, and the foot hills that line the valley on the east. His house is situated near the base ridge and by the side of a little rivulet that steals musically down a sort of mountain ravine. The house in which he resides is a frame building, two stories high, and surrounded by a yard and garden which is being ornamented by fruits and flowering plants. Very near this building and to the east, stands a large adobe building which seems to be inhabited by his hands. The situations of the buildings are very pleasant, but we very much doubt whether frame houses can he made as comfortable in the varied seasons of California, as buildings composed of different materials. Yet the subject is one worthy of careful reflection. We have previously requested farmers and architects to give us their views in this particular. We believe that high and projecting roofs and capacious porticos will secure the greatest measure of comfort.

Mr. Horner, in his own house reveals a character for kindness, for placid and agreeable temperament which must elevate him in the general scale of honorable manhood. He makes himself the head and subject of affectionate intercourse, and seems while at home as if absorbed by the general magnetism of love and kindness that distinguish a household of happiness. As far as gastric matters are concerned, no man could make more sumptuous provision. His table, we think, would be a difficult thing to be converted into a spiritual medium, especially about 3 o'clock in the afternoon. If under experiment, it gave expression to any distinguishing voices, the phenomenon could be probably explained very readily by measuring the superincumbent pressure of roast beef, roast duck, roast goose, apple fritters, fricasseed chickens, ham and eggs, etc., etc., plum puddings, various pies, and preserved fruits in superabundance. In short, Mr. Horner is a man who understands the physiological propriety of cultivating an agreeable relationship with the inner man. More anon. J. F. M.

California Wheat.

This great staple of California should now be the theme of especial and united attention of every permanent citizen of California. Every effort should be made immediately to ascertain throughout every county the quantity of wheat planted the present year, in order to ascertain how near we approximate to the amount needed for home consumption.

Could the facts be gathered, we have no doubt but that this State will grow nearly sufficient for home use the coming year; but we have no certain data. Will not some of our prominent men who are interested in this all important question. Some one, two or three in each county, take a little pains to ascertain, or near as possible, and send us the result. Would it not be information that all would desire to possess, for their own guidance; and would it not be invaluable as a public document.

Let the cultivators of wheat look at this question rightly, and they will see it is for their interest to know these things. What a fact to send abroad, could such a fact be ascertained reliably! What a fact to send abroad—California raises wheat enough for home consumption! What an influence these data would have to check those who ship wheat to San Francisco, from Chili and elsewhere!

Is it not for the interest of the cultivator to check this importation? If it is, then let the farmer of every county take the matter in hand, and seeing how deeply they are interested in this question, let them aid us in gathering the complete statistics of the crop planted for 1854, and we will send forth a knowledge of the same to every continent, and if, as we verily believe, we shall grow enough the present year for home consumption, then we have the means within our hand to stop the importation of wheat from other places, and this we should do.

Come, farmers! one and all, see that every county prepare tables of the number of acres planted, and the average crop of the last year upon the same soil. These facts will enable us to make out data hat will interest all, and he of great benefit to the whole State.

Chinese New Years.

A singular manifestation of pleasure in the celebration of a public day by these natives was the continued explosion of "Chinese crackers." Standing on their balconies, they would light bunch after bunch, and throw them into the street sometimes as many as twenty packs exploding at a time, and making a continual rattling, like the discharge of distant musketry, this afforded much amusement to the Chinese, and collected great crowds in the vicinity of their dwellings.

Horse Exhibition at Springfield.

We lay before our readers extracts from the publications issued as connected with this celebrated exhibition. This was the first of the kind in the country, and the projectors of it have won to themselves great honor. It was completely successful, and will result in great good.

We trust the day is not far distant when California will show what she can do in the way of Horses, and we think we can with reason he proud of our noble animals—and not only the Horse, but all kinds of stock. What say you, Farmers? Will the year 1854 make the beginning?

Big Beet.—Some considerable interest is now felt in the production of mammoth vegetables, and the "Big Beet" of 42 lbs. is esteemed wonderful—it is indeed a fine one, and we should he much gratified if it reaches New York safely—it certainly will surprise them. Yet Col. A. T. Hall, of Sacramento, has *beat* that *Beet* by 25 lbs.—his Beet, now on exhibit'on at the Hall, weighed 67 when dug.

The Potato Crop.

THE EFFECT OF THE FROST UPON THE POTATO CROP.

We desire to hear from the cultivators from all parts of the parts of the State relative to the effects of the late severe weather, the temperature, the average loss of the crop, and the value of the potato in each locality.

We have examined the subject briefly in the valley of San Jose, and have derived authentic information from the most extensive growers in that valley, Messrs. Horner and Beard, and we should judge the loss to be one-fifth the entire crop now on hand. From information derived from many quarters directly around us, among the growers, and from the knowledge that large amounts were upon the wharves and other exposed situations in every city, town, and mining locality, we believe we can safely estimate the loss throughout the state, at one-fifth the entire quantity on band.

When the fact of this loss is announced, it would strike the eye of the casual reader, as a matter of but little moment, but we ask the reader to look at the figures, derived from undoubted sources, while we record only the loss that has fallen upon two cultivators in San Jose valley alone. The crop of Potatoes produced by J. M. Horner, Esq., the present year, is estimated in round numbers at twenty million pounds—it exceeds that hy one or two millions.

The crop of E. L. Beard, Esq., of the same valley, is estimated at ten millions—in round numbers, it would exceed that.

We have carefully estimated and ascertained from both those gentlemen that about one half of the crop has been sold, thus leaving fifteen million pounds to be affected by the frost.

The actual loss in these two cases alone is 3,000,000 pounds, and, at 1 1-2c. prr pound, would be the pretty little sum of forty-five thousand dollars.

But here is hut two instances of loss. Take the many cultivators in the other vallies—Santa Cruz, Pajaro, Bodega, and over our entire State, and one may estimate the loss at millions, of dollars in Potatoes alone; and yet, while we chronicle this apparent misfortune, connected with it there is a bright side, which we always love to find under the dispensations of Providence, that never "permits a sparrow to fall" without notice.

This wide spread loss will only be severely felt where the entire crop of the individual is lost, for all must admit that this calamity to this "great staple" must necessarily affect the market price of this article materially, and cause a rise in the price and an increased demand.

The immense crop of the present year rather overstocked the market for a time, as all were desirous of realizing the proceeds of the crop, to enable them to prepare for the duties of the ensuing year; and the quantity thrown upon the market has reduced the price to a mere nominal one.

The effect now of this loss will be removed in a measure by the increased value of the quantity now on hand. In fact, this apparent calamity will prove, we trust, only "a blessing in disguise." For example, there will be more dollars coming to the cultivators for each one hundred bags of potatoes at market at 3c. than for two hundred at 1 1-2c.—a saving of freight, of sacks, of drayage, and of labor, will put the gain where it truly belongs—in the producer's pocket, and give him a new word of encouragement, under the many trials and discouragements which have been theirs the past year.

We do not hesitate to assert, from all we can gather of the loss of the potato, that those who have now saved their crop, or portions of it, will realize a fair remunerative price for the balance on hand, as potatoes must necessarily rise considerably in value in our market.

The Disease and Preservation of the Potato.

Among the many theories of the cause of the potato disease which has been so prevalent for more than ten years, and which has baffled all the skill of vegetable physiologists and practical experiment, the following conclusions of T. J. Herapath, an English chemist of celebrity, originally communicated to the London Chemical Gazette, have considerable plausibility, and are worthy of attention.

1. That the potato blight is neither directly nor indirectly caused hy the ravages of any parasitical insect.

2. That it is a species of putrefactive fermentation, or incipient decomposition of the nitrogenous or albumenoid constituents of the sap or cell contents.

3. That this decomposition is either directly produced by a peculiar fungus, the "Botrytis infestans"—to which public attention has been already directed by other writers—or, what is in my opinion a still more probable supposition, the fungus referred to only makes its appearance after the fermentative processes have been in action for some time, and consequently is an effect, and not the cause of the disease.

4. That the blight has been in some measure produced by a long-continued and indiscriminate use of animal and nitrogenous manure, which has over stimulated the potato plant, and thus rendered it more susceptible of disease, and has, in fact, produced the same effect upon it that alcolic drinks, when taken in excess, do on the human system; that is to say, it has injured the stamina of the plant, and rendered the organism more readily affected by atmospheric and other influences.

5. That animal or highly nitrogenous organic manures should be used with great caution in the cultivation of the potato, and indeed in that of all root crops; the best manure for the potato plant being the inorganic compounds, such for instance as those which are, or were at one time, used in some parts of the continent.

6. That the disease, having once established itself, has become epidemic.

7. That it is contagious, if not infectious.

8. That the only mode of eradicating it is to restore the original constitution of the plant.

9. That this desirable result can only be brought about by introducing a complete alteration in the mode of cultivation that is adopted.

10. That the changes in question should consist, 1st. in thoroughly drying the seed potatoes by the process now known in several parts of Germany; 2ndly, in steeping them for a short time in the dilute solution of the sulphate of copper (blue vitriol or blue stone) of about the same strength as that used for pickling wheat; 3rdly, in planting them in poor, well-drained land; 4thly, and lastly, in substituting for the farm-yard manure, &c., now employed, some inorganic compost similar to those before alluded to.

In conclusion, I would suggest that the following simple experiment should be tried in storing the potato crop during the next season:—Let the tubers be stored in the usual way, but in the centre of each heap or sackful let there be placed a quantity of unslacked lime, not in actual contact with the roots, but enclosed in some porous vessel—an old wicker basket, for instance—and covered over with, and surrounded hy a thick layer of straw or hay. By this means the tubers will be kept dry; and as the presence of humidity in the air is a great incentive to putrefactive decomposition, one of the main causes of decay will be removed. The lime, so soon as it has become slacked, may be taken away and employed as manure; and, if practicable, should be replaced with fresh lime. The experiment I have described, it must be remembered, can be easily tried, and would cost but little even if carried out on a large scale; it cannot be productive of any injurious consequences, and will be doubtless attended with beneficial results.

Treatment of Milch Cows.

If in treating of cattle I have not already consumed too much time, I should like to say a word as to the bad treatment Milk cows are but too frequently subjected to in almost every place; a treatment as unwise as it is cruel. If it were confined to cities, where the poor animals are drugged with still slops and other unnatural food, by milkmen, so called, to excite the cows to yield undue quantities of what they call milk, I would not think it necessary to refer to it here; but the cruel and improper treatment of cows is not confined to cities alone—go where you will you are sure to be shocked at the scenes of suffering and neglect these patient animals are made to endure, whether on commons, farms, stables or yards. If driven out after milking, or brought home to be milked, they never fail of being run, whipped or cudgelled by some unfeeling boy, who seems to think it part of his duty to deal them as many blows as he can while within his reach. Then often follow the blows of the milker, should the poor animals wince under the pressure on teats, lacerated perhaps hy thorns or made sore from other causes. No wonder that this treatment, with scantiness of food and sometimes of water, reduces the cows to the wrethed condition in which they are hut too often found in every quarter. Set a farm hand to clean the cow stable daily, to curry and brush the cows, and he will be apt to think you a fool, or that you mean to degrade him—if he comply, it will be with reluctance, and it is quite likely that he will take more out of their hides, or put more into them, than you bargained for. Ask the same worthy to groom your horse, and he will not fail to do it cheerfully. Why this prejudice, this folly? Does not the cow stand in a more interesting relation to us than the horse? He works for us and carries us, to be sure, hut then do we partake of his flesh and blood while living, in the shape of milk, butter and cheese? and do we slaughter him for beef when we suppose him failing in strength? No. Well, then, why is not the same attention paid to the cleanliness and health of the cow as is bestowed upon the horse? The same care that produces so fine a condition in one, could not fail of having the same effect upon the other—and I say that it is the height of folly, and positive injustice to ourselves, to withhold those attentions from the cow. She is a second wet nurse to us and our children, and if this nurse he in ill health, will not her milk, cream and butter be imbued with her condition? Would we be willing to eat of the flesh of some of those wretchedly poor animals if they were slaughtered? And why should we not feel the same repugnance to use their milk? Let us be more careful in feeding those useful animals properly, and keeping them comfortable and clean and in good, healthy condition. —*Mr. Gowen's Address at Mercer.*

National Horse Exhibtion.

SPRINGFELD, Oct. 19.—The first national exhibition of horses ever held in any country, commenced in this city this morning. The first day's exercises are concluded, and it must be admitted that they have been such as to gratify the projectors as well as those who have been engaged in them. The day has been most beautiful, and the marshals and other officers have been polite and attentive, and the horses with their gilded trappings have appeared to the very best advantage. The number of horses in town is as large, perhaps, as could reasonably have been expected, considering that this is an experimental exhibition. Some of the best animals of their respective breeds and classes are present, and tho show, there can be no doubt, will be productive of much good.

The exhibition is held on a large plain adjoining the Armory, and occupies a space of 23 acres —nearly half as long as Boston Common. It is admirably adapted to the purpose for which it was selected, except that it is too far from the centre of business—being nearly a mile. The general features of the ground have already been published.

The ground at ten o'clock this morning made a magnificent appearance. The ring upon which the horses are exhibited is just half a mile in length, and it was entirely filled, and some portion of the way two deep, with the best turnouts the country can produce. The number of horses driven rouud the ring on the grand entree was about 340, single, double, and fours-in-hand. It was a magnificent scene, there iu that warm autumnal sun, to see those mettlesome chargers, with arched neck, eye of fire, and thundering hoof, all dressed in holiday attire, waiting for the word to start.

> "The steeds are all saddled and snort to the rein,
> Curved is each neck, and flowing each mane—
> White is the foam of their champ on the bit."

When all was ready, Hon. Geo. Dwight, President of the local Association, under the auspices of which the exhibition is held, and who is also Chief Marshal of the day, came before the judge's stand, and addressing Hon. M. P. Wilder, President of the National Agricultural Society, informed him that the exhibition was ready to open. Mr. Wilder replied in a few remarks, congratulating all concerued upon the happy auguries under which the exhibition opened, aud predicting that much good would be the result. With the flourish of trumpets, the grand cortege then moved on, and finally dispersed over the field. When the teams had scattered over the ground, the sight was if anything more beautiful.

The exhibition being thus opened, at twelve o'clock came the trial of farm or draught horses. This part of the exhibition was, in plain terms, a failure, as far as to-day is concerned. There were but four pairs of horses, and one single team upon the ground. The weight of the load for double teams was 5200 lbs.

The animals drew very well indeed, but there were none that showed tho capacity for drawing heavy loads that we see every day in the streets of Boston.

The exhibition of breeding mares with foals by their side, took place at two o'clock. There were but nine entries. Some of the colts were good animals, and will probably turn out well.

At 3 o'clock the exhibition of mares took place. There were 48 animals present, and among them some noble and beautiful specimens of the race. The show of mares was decidedly good. After this came exhibitions of the speed of horses, and there was some "fast driving." There was much excitement attending the display of speed by the various animals, and although there was no betting, so far as I learned, there was all the interest of a regular race. One of the most conspicuous objects in tho array was the turn-out of Mr. F. Corliss, of Longmeadow, a team of four horses attached to a gig. They were well managed, and made a good show.

Tho first day of the exhibition may be considered as successful. It is estimated that 4000 people have been on the ground during the day. This number will be much increased to-morrow and next day. The receipts at the door were $1850. This includes the season tickets, but does not include the entrance fee of the horses. There are now upwards of 400 horses entered upon the books of the Society, and it is confidently expected this number will be increased another hundred. A large number of distinguished visitors are expected on Friday, when the Agricultural Banquet will be held. Letters have been received from Edward Everett, Abbott Lawrence, Gov. Clifford, Rufus Choate, the Governors Seymour of Connecticut and New York, Gov. Fairbanks of Vermont, Hon. T. H. Benton, and other distinguished men, who all express a deep sympathy with the objects of the exhibition, and promise attendance if possible.

The exercises to-morrow (Thursday) will be nearly the same as to-day. The managers have announced that the grand *entree* of all the horses will be repeated both on Thursday and Friday mornings. It is worth a visit from Boston just to see this portion of the exhibition.

SECOND DAY.—The scene to-day has been most enlivening. The seats for spectators, which will accommodate about 4000, have been filled, a large proportion being ladies. The enthusiasm which is quickly created for a particular horse, is one of the most curious features. A favorite horse is greeted with the most uproarous shouts, while the "slow coach" is hooted and hissed, and driven from the track.

I have been much interested in witnessing the operations of the groomsmen. The care they show upon these dumb creatures is truly wonderful. It is a consolation to know that even if the horses are hard pressed in the ring, they are cared for with far more assiduity than the drivers, some of whom, it is not too much to say, labor as hard as the horse. The operations of the grooms brought to mind the lines of Byron:

> "The Cossack Prince rubbed down his horse,
> And made for him a leaty bed,
> And smooth'd his fetlocks and his mane,
> And slack'd his girth, and stripp'd his rein,
> And joyed to see how well he fed.
> * * * * *
> That steed from sunset until dawn
> His chief would follow like a lawn."

It is astonishing, particularly to the uniniated, how many good points every horse possesses in the view of the owner. Every owner of a horse claims that his horse is as fast as any other horse, that he has as much action, and as good bottom. For the time being, every spectator is a connoisseur in horse flesh, and the claims of the different animals are canvassed with as much acumen as though they were "thorough bred" horse jockies. Every horse has its friends, aud it will not be their fault if the value of their proteges is not doubled before they leave the city.

The Springfield Republican has some items which will interest those who atteuded the exhibition:

"The gross receipts of the exhibition were nearly $10,000, aud the sum received will be just about enough to pay expenses. The leading items of these expenses are, the premiums, amounting to about $3000, to which will probably be added many gratuities, over and above this sum, bestowed upon fine horses present from a distance, the erection of the high board fence around the ot and the building of the stalls and seats, which cost $1200 to $1500; printing and advertising; the banquet and the entertainment of invited guests. A large amount of minor expenses, many of which could not have been foreseen, and even now must be indefinitely estimated, were incurred. The managers were liberal in their arrangements, in proportion as the certainty of success enabled them to be. The receipts for entrance fees for horses amouuted to from $1600 to $1700, and between $1000 and $1200 were taken for tickets to the banquet. Tho balance of receipts is from entrance fees from spectators.

It may interest some to know the exact number of entries as they appear on the Secretary's books, and we give them: thorough breds 7; stallions 7 years and over 56; stallions ol 4 years and under 7, 34; geldings 136; breeding mares 53; breeding mares with foal at side 9; matched horses 33; fancy ditto 16; stallions and fillies of 3 years 16; of 2 years 10; of 1 year 7; farm and draft horses 6; ponies 21. The total number of entries was 407, covering, as we reckon it, 472 animals."

Grape Culture at the West.

WE have deferred, for some time, an article upon the grape interests of our State and West generally. We wish we could do the subject greater justiee than the limits of an editorial column give us opportunity; for the grape culture, the grape and wine interests of our community, are fraught with very considerable importanco now, and must, eventually, become a great and absorbing feature of the State's property. Fields of waving corn, or golden tasseled wheat, are fair to the view, but picture to yourself the vast vineyards that shall anon deck the hill and dale, with gorgeous and tempting, voluptuously rich, red, ripe, Isabellas, or Catawabas.

The third year after planting the slips, the production of wine may be commenced from the fruit. There is more expense and labor in commencing the cultivation of the vines, than is probably attendant upon the planting of the usual crops, but less afterwards. From one acre, well planted with healthy vines, probably from six hundred to one thousand dollars' worth of wine may be produced in good seasons. The wine has generally brought one dollar per gallon here, but this year will probably bring twenty-five cents more.

Notwithstanding the immense annual increase of the quantity of wine manufactured in the West, the price continues to improve, and it must do so as the wine becomes more generally known. This year, notwithstanding the increase of the wine made in this neighborhaod, the price has raised nearly twenty-five per cent.; and the demand for wine is much greater than last year. So must this demand continuo increasiug.

The crop this season has been very fruitful, surpassing, in fact, any former yield known in the West; the wiue will be very pure and demand great.

In Ohio there are about 1,500 acres of land exclusively devoted to grape-growing, between 300 aud 400 of which are near Cincinnati. Within twenty uniles of this city, including a part of Kentucky, on the opposite side of the river, there are 1,300 acres, and double the quantity of vines. More have been planted this year than there were last. In Missouri, near Hermann, there are 500 acres; in Indiana, 200 or 300; in Illinois about 100, and Kentucky the same—making about 2,500 acres in all. It is estimated that Indiana, Ohio and Kentucky will this year produce at least half a million gallons of wine. The yield on some of the vineyards will be equal to 7,000 or 8,000 gallons—allowing 2,400 vines to the acre, planted about three feet apart, in rows separated by a distance of three feet. Mr. Robert Buchanan, who is among the most successful cultivators of the vine, this year obtains about 800 gallons of wine from each acre of his vineyard, which will net him about $700 per acre. Some other vineyards will do equally well. Persons, however, are not advised to embark in grape-growing, with the expectation of profit, if it shall be necessary to hire labor. The German vine-dressers muster all capable members of their family into the service—the wife often being the most efficient. In this manner they realize an adequate income. It has been customary to give a piece of land, say fifteen or twenty acres, with a house on it, to these Germans, on the condition that the tenant shall plant a certain quantity of grapes each year, in a proper manner, and pay the proprietor one half the proceeds of the vineyard. The fruit is purchased from the vineyard men for from $5 to $6 per 100 pounds, (or two bushels)—a bushel yielding from 3 1-3 to 4 gallons of wine. It is then mashed by the manufacturers in the city, and pressed. The juice is then fermented in the cellars and the sparkling Catawba is in prime order for market at the end of fifteen or twenty months.

A few days ago we visited the wine-vaults of Mr. Longworth, and the following facts were derived: There are three vaults, one of which will turn out 50,000 bottles every year and another 100,000 bottles yearly of dry wiue. Some portion of the cellars is occupied by immense butts, or cylindrical tanks, one of which holds 5,000 gallons, or $5,000 worth of wine, if bottled. The staves are about three inches in thickness, and the heads curve inward, so as to introduce the arch, to resist the internal pressure. Other objects, quite as uoticeable, are the long rows of black bottles placed in a horizontal position, and stacked up, like cord wood, in solid piles as high as one's neck. In the cellars of the extensive native wine establishment of Longworth and Zimmerman are twenty-four casks holding about 2,500 gallons each, or 60,000 gallons altogether of the vintage of 1850, '51, '52; and it is expected to store 25,000 gallon's of this year's wine.

Mr. Longworth will this year have on hand and for sale, about 200,000 bottles sparkling Catawba; Messrs. Longworth & Zimmermau, some 60,000 bottles dry Catawba, exclusive of a quantity of wine sufficient for 190,000 bottles; Messrs. Bogen, Corneu & Son, Work, and others, from 90,000 to 100,000 bottles sparkling Catawba. Mr. Zimmerman tendered us various samples of the present and past year's wines, aud as far as our judgmeut in the matter stands, the purity and flavor of the vintage of '53 will prove the finest specimen of Catawba yet bottled in the country. —*Cincinnati Columbian.*

Merino Sheep for Mutton.

IN the Wool Grower for May is the following statement or advice:—"If you grow sheep for mutton, grow the large, coarse kind." Believing that the sentence contains a sentiment calculated to mislead men, and defeat their object, viz., the greatest income of cash from a given number of acres stocked with sheep. We deem it a duty to examine, and expose its incorrectness. It is generally a conceded point, that animals of the same kind, or breed, being of the same age, flesh and temperament, will consume food in proportion to their live weight—i. e., an ox which weighs 2,000 lbs. will consume 25 per cent., or one quarter more food, than any ox of the same breed, age, flesh and temperament, that weighs only 1,600 lbs. A sheep that weighs 200 lbs. will consume just double of one that weighs only 100 lbs.—the age, the breed, the flesh, &c., being aliko in both. Sufficient experiments, both in England and America, have established this axiom beyond all reasonable doubt. No scholar will deny it. Hence it follows that the true estimate of profits should be reckoned by the acre, and not by the head. Here is the tripstone of multitudes—this is a common blunder. If an acre turn off annually more profit when stocked with South-downs, than ten acres will, stocked with Spanish Merinos, yield the best returns in dollars and cents, then the palm of honor must de awarded to them.

In this comparison, we do not propose to estimate the Merinos at their value for stock purposes, but simply as the coarse sheep are reckoned—for their fleece and meat. This will be considered fair by the friends of coarse sheep. And first, we assert that we can raise as many lbs. of Merino mutton from an acre, or a given number of acres stocked with the Merino wethers, as we can stocked with coarse sheep; and secondly we affirm that it is equally good, and will fetch as much by the lb.; and our third statement is that the acre will yield one-third more wool, and every pound is worth one-third more than coarse—so that the fleeces are worth more than double those from the acre stocked with coarse sheep. I am aware that it is said by tradition, or self-interest, that the mutton of the Merino is comparatively valueless. We have, on hearing these objections, been reminded of the South Sea cannibal's repast on the flesh of his dead enemy, or of the chap that managed to shed tears to sell at so much a pint. The truth is the objection is without foundation—it is false and disreputable. Take a leg of Merino, and one of the fat South-Down, mutton, and have them equally well cooked, and not all the old epicures in America can tell which is which, if they be blind-folded before setting at the table.

We will here introduce testimony from several highly intelligent gentlemen from different States corroborative of our position. Says Mr. Theodore N. Davidson, of Virginia:—"I can raise as many pounds of Merino mutton to the acre, as any other breed, and I am sure, of decidedly better quality." Says H. W. Chaplin, of Virginia,—"The Merino highly recommends itself to all farmers." After enumerating several questions in their favor over the [illegible] sheep, he adds:—"The mutton, when fat, is excellent, being [illegible], and of fine flavor when well cooked." Says Mr Badleman, of N. Y.—"I know by experience that the Merino [illegible] English sheep." Says Nathan Dunlap, of Gallia Ohio.—"A grade of sheep between coarse and fine, are better for mutton than the coarse grained English sheep." Says John Young, of Belleville Ohio, speaking of Merino sheep,—"It is allowed to be a good business to rear them for mutton." Says James DeMott, of Seneca county, N. Y.,—"medium size—from 60 to 70 lbs., and at least one-half Merino—that they are the most profitable for mutton—they show more fat when opened, and the flesh is better generally than the common large sheep, or English breeds." Says Humphrey Howland, Esq., of Cuyuga Co., N. Y.,—"The Merino, wether is fully equal to South-Downs for mutton." Says Mr. Samuel Good, of Scottsville, Monroe Co., N. Y.,—"The Merino sheep are the most profitable, both for mutton and wool." (See Patent Office Reports for 1850–51.) This array of evidence might be extended, almost ad-infinitum. Thousands in the vicinity of Brighton market will give in similar testimony.

Aside from all this, the following are a few among many other reasons which the Merino claims as characteristic of the race:

1. They are hardy, and endure the severities of the climate much better than the English or native breeds of sheep, for the best of reasons, viz., they are much better protected, having about 400,000 wool hairs to the square inch, which common American sheep have 62,000 only.

2d. Their lougevity is great. They propagate, doing well, until 12 and 15 years old.

3d. They never shed their wool when kept in uniform condition.

4th. They are very quiet, and seldom jump a fence 4 feet in height, and hence take on flesh much easier than coarse sheep.

5th. They will bear crowding in large flocks and do well, while coarse sheep invariably decline when heavily stocked.

6th. They will do well on pasture so short and indifferent that on it a flock of coarse sheep would most certainly decline.

7th. They yield about one-third more wool, which is worth one-third more per lb., so their fleeces bring double those of common sheep.

8th. The wool hairs have 2,400 serrations, or saw-teeth to the inch, being much more than that of common wool, and consequently its felting properties are unsurpassed.

9th. The luxurious yolk of the fleece furnish these sheep with an impervious coat of mail, which resists rain and snow, and impurities that would injure the wool, and give to the manufactured fabric a softness and finish that adds 20 per cent. to its price when thrown upon the market.

In short, we believe they combine more excellences than any other breed of sheep on the globe, and when their merits are fully and everywhere known, will take the place of all others.—*Corres. of Wool Grower.*

Death of John Delafield.

WE find in the last number of the Rural New Yorker, an announcement of the death of this excellent and distinguished man. Though entirely unknown to us, except by his good works in the improvement of agriculture, and consequently of the human race, yet we feel with those who loved him the most, that we have lost a man whose like we may not soon look upon again. His survey of Seneca County, N. Y., alone, gives him an enviable fame. The Rural New Yorker says:

"Another ardent, zealous and most untiring and influential laborer in the cause of Agricultural improvement is no more! Hon. John Delafield, President of the N. Y. State Agricultural College, departed this life, at his late residence—Rose Hill, Seneca County—on Saturday, Dec. 6th. This melancholy event was as startling and unexpected to the family of the deceased, as it will be to distant friends—for he expired very suddenly, after only a few minutes illness, of disease of the heart. Mr. D. was about sixty years of age. Few particulars have reached us, as the painful intelligence was received by telegraph. A private letter which we received from Mr. Delafield only two days before his death, indicated vigorous health and enthusiastic zeal in the cause he had so zealously espoused and ably promoted. Truly, "in the midst of life, we are in death!"

In the death of Mr. Delafield, the agricultural interests of Western New York, the State, and indeed the whole country, sustain an irreparable loss—while the event will be sincerely deplored by thousands of warm and admiring friends and acquaintances. As we have before said in these pages—"Such men as Mr. Delafield are rare—would that each county in the State possessed one who could and would do as much as he has for Seneca—and where ever and whoever found, should receive the distinguished honor to which they are entitled.

INSECTS.—Horace Greeley, in his late Indiana Agricultural address, says:—"It has pleased the All-wise to subject Agriculture to the chances and perils of insect depredations, as well as to weeds, drought, frost, inundation, and other ills. The end of all these is beneficence—the [illegible] and discipline of man's capacities, though the necessary [illegible] and [illegible]. The [illegible] needs occasionally some [illegible], as the ravages of insects are [illegible] of pathos and [illegible], and, but for the [illegible] over every [illegible] extended [illegible] effort. But to those who [illegible] through. "[illegible] a [illegible] [illegible] themselves [illegible] [illegible] [illegible]

From the Sandwich Islands.

By the arrival of the schooner E. L. Frost, we have received files of the Polynesion to Jan. 7, from which we clip:

The brig Boston had arrived at Honolulu in thirteen days from San Francisco. She had made the passage from Honolulu to this port and back, including detentions, in thirty-eight days, being the quickest passage ever made, by three days.

Hon. Luther Severance, U. S. Commissioner to the Sandwich Islands, sailed for New York, with his family, in the clipper ship Young America, on the 30th of December. The Polynesian says:

Mr. Severance possesses in an eminent degree the qualities for the situation which he has occupied with so much credit to himself and usefulness to both governments. Experienced in public affairs in his own country, accomplished as a writer, mature in his judgment, and possessing a frank and honest mind, he has accomplished his mission with the honorable success which was anticipated by those who knew him best. In all his intercourse, under all circumstances, he has been regarded as a sincere friend, in whom entire confidence could be placed. His efforts have been for peace and usefulness, and not for personal distinction. And amid all the circumstances of irritation which have arisen here, his influence has been for law and order, for justice and equity. The Minister of Foreign Relations has given him a letter recrediting him to his own Government, as a representative whose course has been to the satisfaction of the King, and which is in the highest degree honorable to both gentlemen. We should deem it a subject of congratulation to any country that their foreign agents of every character should prove so successful in the discharge of their duties, and it gives us great pleasnre to believe that we can confideutly anticipate from Mr. Gregg a career of equal honor ahd usefulness.

Our society will regret the loss of Mr. S. and his family, who have contributed so much to its pleasure. They will be long remembered, and their influence long felt. And, in closing this brief expression of regard, we speak the sentiments of this whole community in wishing them a pleasant voyage to their native couutry, and a welcome by numerous friends and an approving Government.

His Royal Highness the Lieutenant General Prince Liholiho and the King's Ministers were much disappointed by the early departure of Mr. Severance on Friday morning. It had been arranged, unknown to Mr. Severance, that they should accompany him to the boat, that the Royal band should receive him while approaching the wharf with "God save the King," and on taking his seat in the boat under the flag of his own country, they should bid him farewell, the band playing "Hail Columbia."

As a private man and public officer Mr. Severance leaves on the Islands many friends and no enemies.

The following passage in the correspondenee of R. C. Willie, Minister of Foreign Affairs, to Mr. Severance, indicates a very friendly feeling toward the United States:

The King gives credit to the United States for having largely contributed to the civilzation of this kingdom, and believes that they will ever take, very naturally, a deep interest in what is mainly their own work. Consequently it is his Majesty's earnest desire that the relations between his kingdom and the United States should continue, as they have ever been, to be frank, just and friendly.

Now that your vast Republic has expanded itself to the borders of the Pacific, and that a new and rich commerce has been opened between America and Asia, his Majesty feels it to be of greater importance than ever that his Kingdom aud your Republic should pursue towards each other a kind and liberal policy."

Large Mail.—The mail for the United States by the brig Zoe, Capt. Paty, which sailed on Thursday, was the largest ever sent from this port, numbering 2,260 letters, and filling four large mail bags. The postage collected for the U. S. Government at the post office in Honolulu on the above, amounted to $126.

A new street, 20 feet wide, is to be opened from Merchant to King street, running between the Seamen's Chapel and the old Police Station House. Private parties give about one half of the land for this purpose, and the balauce belongs to the government, which has devoted it to that subject.

The Steamer Akamai.—This fine little steamer has again had her capabilities tested as a seaboat, and comes out of the trial with an increase of confidence in her capabilities.

She sailed from Hanalei ou Saturday last, bound for Honolulu, with considerable freight and a number of passengers. As she opened out into the channel, she experienced heavy weather from the south, which increased as she proceeded, until it became a gale of great severity. Still she held on her way, doing admirably, and making headway until she got half way across to Oahu, when her rudder chains parted. The tiller was immediately shipped, but the strain was so great that the rudder head split, which, for the time being, rendered it useless. It was soon, however, repaired. In the mean time a brave fellow had gone overboard to mend the chaiu, which he succeeded in doing, although it was as dark as midnight and a cloudy sky could make it. At the risk of his life he performed the important task, which had no sooner been accomplished than the tiller broke, and the situation of the boat became precarious. At this juncture it was deemed prudent to put back for Hanalei to repair damages, and the dangerous operation of wearing ship in a heavy sea was safely performed without shipping a sea or sustaining any damage. Her return to Hanalei was accomplished in a few hours, where the damage was repaired, wood taken in, and she again sailed on Sunday evening for this port, where she arrived on Monday, at 1 o'clock P. M. The wind had hauled to the westward on Sunday evening, which facilitated her return to port.

From China.

By the bark George E. Webster, Captain Folger, which arrived at this port on Tuesday last, from Hong Kong Dec. 13, we have dates from Shanghai to Nov. 29.

The following communication to the China Mail gives the position of the insurgents at Shanghai:

Shanghai, Nov. 29.—This city still stands in the hands of the insurrectionists; the relative position and strength of the belligerants continne without any material changes, either for the better or for the worse; and it is as difficult now as ever before to conjecture what is to be the issue of these strifes. On the river, above and below the city, the Imperialists exercise control, while the insurrectionists, with batteries along the shore off the eastern suburbs, keep that part of the river open to all who please to go and come as their friends; and during the last ten days, now and then a foreigner has been allowed to enter the city.

Upon the whole, the sympathies of the foreigners are less with the Imperialists than with the Rebels—or rather, it may perhaps more correctly be said, that the imperialists are more disliked than the rebels, and their conduct being more observed, is more detested. But such warfare is every way and on all accounts to be deprecated, and partizanship with it is most blameworthy. Nevertheless there are not a few among the foreigners take sides (with the insurrectionists;) and seamen, it is said, are receiving from the imperialists very high pay, greatly to the inconvenience and annoyance of the foreign shipmasters.

But all these things, notwithstanding the business of loading and dispatching of ships continues to go on, and teas seem to be coming into market as freely as if no troubles existed. The Chinese, as you know, take things of this sort very quietly, and well it is that they do so—well for themselves, and well for the foreigners. Troubles are coming heavy and more heavy upon them from month to month, and it is impossible to foresee whe onr how these calamities will terminate.

The real state of things, at Nanking and at other places farther northward, no one in Shanghai can certainly tell. Some confidently affirm that the insurgents have pushed their way up to within a hundred miles of the Dragon Throne, and were, by latest dates, ready to advance on the northern capital, in the same manner as they did ou Nanking last winter; others declare that they have all been exterminated, and that clouds of cavalry are tempest-like pouring down upon the plains of Central China.

Robberies are spoken of as being more than usually prevalent.

The interest in the rebellion is concentrated on the army advaneing towards Peking, and of this nothing is knowu with certainty, except that it is somewhere in Chihli, the province in which Peking is situated. All else at present is mere conjecture or fable.—*Hongkong Register, Dec.* 13.

As an evidence of the increased speed in which communications are now made from between nations, it may not be uninteresting to State that the China Mail of Dec. 8, now before us, contains extracts from the London Morning Herald of Oct. 8th.

Latest Mining Items.

In Sacramento, on Saturday evening last, a Miss Hayden, formerly from New Orleans, was shot by a man supposed to be Alexander H. Fash. The wound proved mortal. Miss Hayden died at 6 o'clock on Sunday morning. Fash, it is supposed, shot Miss Hayden, supposing it to be his wife, at whose house Miss Hayden boarded. Fash has not yet been arrested. We were informed that it is supposed that Mr. Fash designs giving himself up to the law, as overtures were made to some of the officers to know if the offence was bailable: if so, it was probable that he would surrender himself.

The river rose about two feet yesterday, caused by the melting of the snow on the mountains.

Real sleighing was indulged in last week near Diamond Springs.

The Placerville Republican says:—From every part we hear cheering reports from the miners. Water is plenty, and no time is lost by our population, but every moment is employed in searching for the glittering ore.

At Smith's Ranch the miners are very busy, now that they have plenty of water, and many of them are doing well.

In Placerville, Jan. 29th, the weather was very warm and clear. Business was very brisk all day. Gold dust was coming in quite plenty. An Indian was killed while in a drunken row, about ten miles below the town. The jury in the case of Hughes, for killing Mahoney, returned a verdict of "guilty of uanslaughter."

Dr. L. Bradley, the surviving partner of the firm of Bradley & Co., proprietors of a water canal, which it was their intention to lead into Placerville, for the use of the miners, has made an assignment of the property. Liabilities, $111,000; assets, 736 shares of the stock of the coporations of Bradley, Berdan & Co., the par or cost value of which, at the date of the assignment, was $146 per share, amounting to $107,456; $37,350 of which are due from the corporation of Bradley, Berdan & Co.

Charles Brown, a miner, formerly of New York city, was drowned at Oregon Bar, on the North Fork of the American River, on the 24th inst.

Nevada, Jan. 29, 9 P. M.—A messenger has just arrived in town from Eureka, Sierra county, who brings the painful intelligence of an encounter at that place, which occurred yesterday, between a party of Irishmen and Americans in regard to some claims and other difficulties that have been of a long standing. In the affray five of the Irishmen were shot; none, however, are supposed to be dangerously wounded. Great excitement exists in that region.

The Marysville Herald says that the names of of the three men who were drowned at Bidwell's, on Monday last, by the upsetting of a skiff, were John McMillan, from Jefferson Co., Wis., and Thomas and William Benn, brothers, from Wilber, Massachusetts.

Downieville, Jan. 28.—The recent stormy weather has suspended miuing operations for a time at Downieville. Last week $4000 was taken from the Wayne Tunnel, at Minesota, and we are told the claims average $3000 weekly.

Fire at Placerville.—We learn by telegraph to the Sacramento Union, that a fire occurred at Placerville early on Monday morning, destroying the theatre, owned by J. H. Treadmore & Co., loss $6000, and fifteen or sixteen other buildings, making a loss of $6000 or $8000 more.

Marysville.—The Herald says: Our city is still increasing. At no time this season has there been a period, when there could be seen less than twelve or fourteen buildings in active process of erection. Other improvements are constantly going on and the pleasant weather is actively improved by our citizens in every quarter.

This is the last day of January, and the weather is so deliciously warm, it reminds one of the northern dog-days. At 2 P. M., yesterday, the mercury in our thermometer ranged at 70. We have seen many a colder June day in Kentucky, and felt satisfied with it. The skies are cloudless, and the air is balmy and blissful. Old Sol looks down upon us with a bright, bland smile upon his benevolent face, as though he enjoyed the fun making us happy.

School Warrants.—As all that relates to "land titles" are subjects of greatest interest to the Cultivators, we shall at all times lay before them all that affects them. We annex the following letter from Col. Gift, Register of the Land Office, upon the subject, he having been inquired of respecting the claims of settlers:

Register's Office, Benicia, Jan. 25, '54.

Thos. Sherin: Sir—I am in receipt of your letter of Jan. 21st, in regard to the warrants. The laws have all been published, in relation to claims of men holding lands by virtue of school warrants; and it is plain that no man can hold land and deprive men from pre-empting government lands. Special instructions have been received at this office, saying that the warrant cannot be located until the lands have been surveyed, and such surveys returned to this office. If they do eject a pre-empter by law, it will only be a temporary thing, for I will get copies of the proceedings and send them to Washington immediately. In a few days the opinion of the Attorney General will be published, in relation to the location of these warrants, which will satisfy all men holding under the school land law in relation to their claims. Pre-emptors will save and hold their claims if they comply with the law in regard to pre-emption. Yours,

W. Gift, Register Land Office.

A Happy Man.—The original of the following picture of a happy man, drawn recently by Theodore Parker in one of his sermons, is said to be a highly esteemed resident of Newton, Mass. There ought to be a great many more just such happy men in our conntry, but we are afraid they are not:

"The happiest man I have ever known is one far enough from being rich, in money, and one who will never be very much nearer to it. His calling lits him, and he likes it, rejoices in its process as much as in its result. He has an active mind, well filled. He reads and he thinks. He tends his garden before sunrise, every morning—then rides suudry miles by the rail—does his ten hours' work in the town—whence he returns happy and cheerful. With his own smile he catches the earliest smile of the morning, plucks the first rose of his garden, and goes to his work with the little flower in his hand and a great one blossoming out of his heart. He runs over with charity as a cloud with rain; and it is with him as with the cloud—what coming from the cloud is rain to the meadows, is a rainbow of glories to the cloud that pours it. The happiness of the affections fills up the good man, and he runs over with friendship and love—connubial, parental, filial, friendly, too, and philanthropic besides. His life is a perpetual "trap to catch a sunbeam"—and it always "springs" and takes it in. I know no man who gets more out of life; and the secret of it is, that he does his duty to himself, to his brother, and to his God. I know rich men and learned men—men of great social position; and if there is genius in America, I know that—but a happier man I have never known."

We hail with pleasure the appearance of two more journals in our State. We need them all, and we trust that every county will bring them into being, for, as the light of day, makes known to us things beautiful and unknown, so a valuable newspaper will awaken the world to action, and the production of great good. Better have newspapers, periodicals and literature than gaming houses, and other means of consuming the time and means of those who have a leisure hour. Therefore we say earnestly, let us have light, and we are glad to welcome the Mariposa Chronicle as another gleam of it, and also the Jackson Centinel, the former edited by A. S. Gould, and the latter by C. Boynton, Esq.—both journals of interest and value, and they should receive a generous support. We shall say more anon.

Shipments of Specie.—The following is the shipment of treasure by the steamers, yesterday. The total amount, as will be seen, is $1,755,488.

PER COLUMBIA.

Page, Bacon & Co	$391,000

Hon. J. Neely Johnson.—This gentleman, who is wide and favorably known as an eminent lawyer and leading Whig politician, left yesterday with his lady, in one of the steamers, for a short visit to the Atlantic States. Mr. J. has held a distinguished position in the ranks of the Whig party, and he has acquired a prominence as well as wealth from his practice at the bar. May they have a pleasant trip, find friends well and enjoy their visit, and soon return to be again welcomed to the Pacific shores.

MARKET REPORTS.

San Francisco, Feb. 1. 1854.

The past and present week has been unmarked by any change for the better; a continued apathy has seized upon all the ramifications of trade—a doubt of the future, a want of confidence—affects injuriously all mercantile and commercial affairs. The vast amount of merchandise on hand, its constant increase by new arrivals, and no prospect of diminution by sales, gives that discouraging feeling that pervades all departments of trade. The late rains have, however, given an impetus to mining, and larger receipts are noticed as coming in. The produce market feels this pressure, and all the leading staples, Grain, Potatoes, &c., are finding very dull markets.

Barley, during the past week, was apparently advancing, owing mostly to speculations, but new arrivals checked it.

Wheat is very dull; no sales of importance.

Corn—Very little demand.

The large amount of Potatoes lost by the frost must affect the market before long, for it will be found that more has been injured than is at first perceptible. A few weeks, and we shall note a considerable change.

We trust, after this week, to note a better state of things. Let all wear a cheerful spirit, and bear as patiently as possible evils they cannot cure; cultivate generous and mutual forbearance, and brighter prospects will soon cheer them.

We should add that the prices of many articles enumerated are merely nominal.

JOBBING PRICES.

RETAIL VEGETABLE MARKET.

In presenting the Retail Market of Vegetables, we do this to show the weekly value and list of family comforts and luxuries (for good vegetables are indeed luxuries) that are offered to us in our markets. Very few markets in the United States can present such luxuries every week, and have them fresh from the garden every day.

It will be seen that cauliflowers, celery, horseradish, tomatoes, and green peas command good prices, and we may say all garden products pay well—for the quantity raised upon a small portion of land is almost beyond belief.

It will be perceived there is a large advance in the value of marketing this week.

Cabbages, ℔ head	$ 37	Potatoes	4

W. C. WALKER,

Florist, New Mission Road, near Toll House.

CAMELIAS, ROSES, CERANIUMS.—The finest collection, all in fine order for removal.

Plants sent to the city to order.

Boquets, cut Flowers, &c., at Gardens, or at office in Washington street, next the San Francisco Theatre. 5

Catalogue of Fruit and Fruit Trees.

WE call the attention of Nurserymen and Orchardists to a new catalogue just issued by us, prepared with great labor and cost, giving the lists of the best fruits cultivated in Europe or America, with their synonyms. This catalogue embraces also lists of best Vegetables, Ornamental Trees, Flowering Plants, Seeds, &c.—being a perfect illustration of the best varieties of everything belonging to Agriculture, Horticulture, and Floriculture, with brief directions for the cultivators in each department, and as *adapted to California.*

This work will be found a very great help to all engaged in cultivation.

Price $1 per copy. WARREN & SON,
Nurserymen, Seedsmen, and Florists,
5 Musical Hall Buildings.

FLOWERS! BRIGHT FLOWERS!

A GIFT FOR HOME.

"THROW PHYSIC TO THE DOGS."

WE convert the pill box into a Floral vase, and instead of the "nauseate drug," we offer the perfume of Flowers. Our beautiful collection of *California Flower Seeds* we now offer.

These are put up in handsome morocco cases, or homœopathic cases of glass bottles, with printed lists and directions, and with pressed flowers of the different varieties of each. These are of the most beautiful style that can be prepared, and are most appropriate gifts for home at this season.

We invite attention to them at our rooms, at Musical Hall Buildings. WARREN & SON,
5 Seed-men and Florists.

JEWELRY AT JOHN W. TUCKER'S.

I shall now commence selling off my entire stock, consisting of DIAMOND WORK, WATCHES, JEWELRY, SILVER WARE, etc., etc.

Amounting to more than $300,000!

I have got to sell all the above goods before the first of June, as I have to rebuild my store according to the new grade. Any person who wants a good article can procure one from me

Cheaper than in any other City in the World!

But I don't wish it to be understood that I pretend to compete with those who sell trash;—persons who would not hesitate to guarantee a brass ring or a watch for pure gold;—these persons can sell lower than I can. If I sell an article of any kind, and it does not turn out as I represent it, I will return the money. No person shall leave my establishment dissatisfied. Call and see me before you purchase elsewhere.
JOHN W. TUCKER.

125 Montgomery st.

There are Three Things I Do Not Do!

1st. I do not get a gentleman to leave his Watch, and when he calls for it, charge him TWENTY NIVE DOLLARS for cleaning it, and have it stop two hours after.

2d. I do not ask FIFTY DOLLARS for a chain, and sell it to THIRTY-SIX DOLLARS, and warrant it Fine Gold, when it is filled with brass solder, and have to take it back and pay FIFTY DOLLARS in money, and give another chain.

3. I do not tell a Captain he can leave his Chronometer ashore, and when he calls for it at the end of eight months, refuse to deliver him up his property, without he pays me SIXTY FIVE DOLLARS, and TEN DOLLARS more for resting it.

There are many other things I do not do, which I may refuse at some other time. 1 4t J. W. TUCKER.

TRUE FREEDOM---HOW TO GAIN IT.

BY CHARLES MACKAY.

We want no flag, no haunting rag,
For liberty to fight,
We want no blaze of murderous guns,
To struggle for the right.
Our spears and swords are printed words,
The mind our battle plain;
We've won such victories before,
And hope we shall again.

We love no triumphs sprung of force,
They strain her brightest cause;
'Tis not in blood that Liberty
Inscribes her civil laws.
She writes them on the people's hearts
In language clear and plain,
True hearts that moved the world before,
And so they shall again.

We yield to none in earnest love
Of Freedom's cause sublime;
We join the cry, "Fraternity!"
We keep the march of time,
And yet we grasp no spike or spear,
Our victories to obtain;
We've won without their aid before,
And so we shall again.

We want no aid of barricade,
To show a front to wrong;
We want a citadel in truth;
More durable and strong.
Calm words, great thoughts, unflinching faith,
They've won our battles many a time,
And so they shall again.

Peace, progress, knowledge, brotherhood—
The ignorant may sneer,
The bad deny; but we rely
To see their triumph near.
No widow's groans shall load our cause,
No blood of brethren slain;
We've won without such aid before,
And so we shall again.

THE LOVE OF CHILDREN.—The following beautiful sentence is from the pen of Coleridge. Nothing can be more eloquent, nothing more true:

"Call not that man wretched who, whatever else he suffers, as to pain inflicted or pleasure denied, has a child for whom he hopes and on whom he dotes. Poverty may grind him to the dust, obscurity may cast its dark mantle over him, his voice may be unheeded by those among whom he dwells, and his face may be unknown by his neighbors—even pain may rack his joints, and sleep flee from his pillow, but he has a gem with which he would not part for wealth defying computation, for fame filling a world's ear, for the brightest power, for the sweetest sleep that ever fell on mortal's eye."

THE AMERICAN "STUMP."—What is the first product of American civilization? It is not a church, for that takes time. It is not a schoolhouse, for that requires children. It is not jackknife, for that being a matter of first necessity, Jonathan always has one in his pocket wherever he goes. It is not even an axe, for although he would sit down and whittle out a handle, if that was all, yet he will not be quite ready to put a steel head to it of his own manufacture. The first product of American civilization is a stump. What is the first intellectual product of American civilization? A man to get upon it and make a speech; it may be about shooting the Indians, or building the church, or schoolhouse, or choosing a representative, but a speech, on something or other. The stump speaker is the father of American civilization.

WE like to see a man, no matter what business he may be engaged in, have a respect for it. It elevates labor, and ennobles trade. The other day, in the neighborhood of the Park, we encountered a tall, dignified looking man, in a long, seedy frock-coat, buttoned to the chin, with a very glossy old silk hat, presiding at an apple-stand. Some how or other, his manner, his "style," struck us. "What is the price of those apples?" we asked, pointing to a small pile of tempting red ones.

"We shall have to charge you two cents for those," said he; "they are a very superior article; but *there* is an apple," he added, "and of a good quality, that we can put to you at a cent!"

Shade of Commerce! He couldn't have said more, nor in a more portentous manner, if he had been offering goods in Stewart's marble-palace. He was very far from being what Mrs. Partington terms "*non pompous mentis!*"—*Knickerbocker.*

A CHANGE ANTICIPATED.—A young lady in a class studying physiology, in the high school at Sandusky, made answer to a question put, that in six years a human body became entirely changed, so that no particle which was in at the commencement of the period would remain at the close of it.

"Then, Miss L.," said the young gentleman tutor, "in six years you will cease to be Miss L."

"Why, yes, sir, I suppose so," she said, very modestly looking at the floor.

QUEER REASON FOR KISSING.—A gentleman, on parting with a lady, gave and received—as he supposed—a kiss of friendship. After the door closed, he overheard the following:

"Why, Lucy, a'n't you ashamed to kiss a man, all alone with him?"

"No, ma, I am not," answered Lucy, "for I only kissed him to smell his breath, to see if he had been drinking.

A YOUNG poet out West, in describing heaven, says "its a world of bliss, fenced in with galls." Where's the man who won't repent now?

Gentlemen's Clothing and Furnishing Goods.

GEORGE F. WALTER, No. 113 Montgomery street, opposite Barry & Patten's, has on hand and is constantly receiving a splendid assortment of goods for Gentlemen's wear, comprising, in part, fancy Cassimeres, Vestings and French Cloths, of various colors and finest texture. He is constantly receiving by the steamers, direct from his Agents in New York—Messrs. Crawly & Lent, 737 Broadway—invoices of Paris PANTS, Benjean's make, of Cassimere, velvet face, the best ever imported. A discriminating public is invited to call and examine this stock.

MILITARY CLOTHING.

G. F. W. gives this department his especial attention. All styles of military suits made to order, from the best material, and guaranteed to give perfect satisfaction.

Gentlemen's Fashionable Clothing cut and made equal to any house in the Atlantic States—the workmanship by the best Tailors. The principle laid down is that no garment is delivered which is not a perfect fit; as every article is fitted on before being finished, thereby avoiding the unpleasant necessity of altering after leaving the store. Any garment that is made and does not fit perfectly, is not expected to be taken, as he is desirous of establishing a business that will give satisfaction to all who may favor him with their patronage.

N. B.—I still continue to take measures to be made up in New York by Messrs. Croney & Lent. All orders sent will be received by return steamer.

GEORGE F. WALTER, 112 Montgomery street,
5 1m Opposite Barry & Pattens.

DONAHUE'S UNION IRON WORKS,

[THE FIRST ESTABLISHED IN THE STATE.]

Cor. of First and Mission streets, Happy Valley, San Francisco

THE undersigned calls the attention of the citizens of California and Oregon to his unequalled facilities for doing work with rapidity and cheapness. He has made, and will continue to make, such additions to his time and labor-saving machinery, as the increasing wants of the State require, and hence solicits public patronage.

Saw and Grist Mill Irons,
Quartz Crushing and Amalgamating Machinery,

and Castings of either Iron or Brass of every description (having a most extensive assortment of ready made patterns) made promptly to order.

STEAM ENGINES from the manufactories of William Burdon, Brooklyn, New York, and other celebrated makers, constantly on hand and for sale.

BOILERS of every description furnished at lower rates than can be afforded elsewhere, the iron for the same being imported direct, and the machinery for shearing, punching and riveting being driven by steam power. Patent Steam and Water Gauges, Steam Whistles, Cocks, India Rubber Steam Packing, Ready made Bolts and Nuts, Belting Lace and other Engineer's Findings for sale.

2 3m JAMES DONAHUE.

Italian Marble, Granite and Free Stone Warehouse,

No. 99 Battery Street

OBELISKS, Monuments, Head Stones, Imposing Stones, Table Tops, Centre Tables—the largest and best assortment in the city.

Italian Marble Mantels, of various patterns, richly carved Stationery Mantels.

All kinds of lettering done to order.

Quincy Granite, Connecticut Free Stone. Some choice patterns of moulded architectural Lintels; Red and Free Stone, &c.

We are constantly in receipt of fresh supplies of Mantels and Grates, together with building fronts, &c., by clippers from New York, and we are at all times prepared to execute Job Work on the most reasonable terms. For sale, to arrive, 100 mantels of new and superior styles, to which we invite the attention of the trade. We are determined to sell cheap.

COIT & BEALS,

PROCLAMATION EXTRAORDINARY.

Woman's Rights
VINDICATED AND MAINTAINED.

WHEREAS, from the creation of the world, it was designed by the "Great First Cause" that

Womans's Rights and Privileges

should be co-equal to Man's; and whereas, she has been treated by many men in all ages, up to the present time, as an inferior being to themselves: Now, therefore, be it known that I, M. L. WINN, of

Winn's Fountain Head and Branch

having expended large sums of money at the FOUNTAIN HEAD for the gratification of the appetites of Gentlemen, do recommend that Woman be hereafter allowed and provided with the facilities to enjoy all the privileges for which she was by Providence designed; and for this purpose I do hereby proclaim, that my

BRANCH,

Corner Montgomery and Washington streets,

shall be conducted with a view exclusively to the **Edjoyment and Gomfort of Ladies**, and such Gentlemen as know and appreciate their worth.

At the earnest solicitation of many Ladies and Gentlemen and agreeable to my promise some months since to enlarge the BRANCH, so as to accommodate the fast increasing patronage I shall, in a few days, add Two Spacious Stores on Montgomery street, to the Original Branch, making the

MOST EXTENSIVE ICE CREAM

And Refreshment Establishments in California.

The day of opening will be duly announced through the medium of the Daily Press, so that all may witness what has been accomplished for the accommodation and comfort of "God's best gift to man." In the meantime, bits of Fun and Jollification may be enjoyed in reading the mottoes and feasting upon the luxuries to be enjoyed at

WINN'S FOUNTAIN HEAD,
78 and 80 Long Wharf, and Branch, corner Washington and Montgomery streets;

where Every Thing for the Holidays may be found, from a Sugar Whistle to a Bride's Cake of half a ton.

1 M. L. WINN, Proprietor.

and 15 J street, Sacramento.

GRASS SEED

10,000 LBS. NEW GRASS SEEDS—Timothy or Herds' Grass, Red Clover, White Clover, Red Top, Kentucky Blue Grass.

Persons wanting the very best seed are requested to give attention to the above. WARREN & SON'S
Seed Warehouse,
Musical Hall Building, San Francisco.
And J street, Sacramento.

WASHINGTON STEAM MILLS.

WASHINGTON FLOUR MILLS.

THE undersigned proprietor of the Washington Flouring Mills take pleasure in offering to families and the trade, Superior Family Flour. To our Mills, we are happy to say to our friends, was awarded the Silver Medal; and we shall be always striving to maintain for it a high reputation, so that our customers can send to us in confidence, believing they will receive the highest character of Flour the market affords.

In the same establishment we have extensive STEAM SAW MILLS, capable of performing every kind of work that may be desired, and to this branch of our business we invite the attention of the public. We have also STEAM PLANING MILLS, that will finish all kinds of work in the most workman-like manner, and equal to anything performed in the country, and in the most prompt manner to order.

We invite all who are contracting work, to call on us and examine our Mills, and we can satisfy them of our ability to supply every order in each branch of our extensive establishment.

D. W. VANCOURT, Proprietor.
1 Near the Oriental.

POLLEY & CO.,

OF THE BAY STATE MILLS, would announce that for the better accommodation of their numerous customers and trade in general, that they have opened a branch of their business at the **Fire Proof Store, No. 49 K street**, between Second and Third, where they will always keep on hand a large stock of California FLOUR; also, Haxall and Gallego.

Public attention is particularly directed to the "BAY STATE LOWER MILLS' BRAND," an article we have every confidence in warranting, being made under our own inspection, from new Wheat, without any adulteration.

Ground feed of all kinds always on hand.

Every exertion will be used to merit a continuance of the favor heretofore so liberally extended to us. 1-3t

PEORIA PREMIUM STEEL PLOWS.

THE FORMER CELEBRITY OF THE PEORIA PREMIUM STEEL PLOWS, and the unequalled success of their introduction in this State, would seem to preclude the necessity of any further effort on our part to draw attention thereto: but in view of the transitory nature of business in general in California, and the probability that some may have looked upon our establishment of an extensive and permanent manufacture of Plows here, in the face of such enormous importations and extravagant prices of material, as an impossibility—we believe it expedient to adopt this method of bringing it within the special notice of all concerned, that we are now manufacturing, and will have ready for this season's demand, three thousand of the most superior Plows ever made or used within this State.

We feel warranted in making this assertion, from the fact that all who used our Plows last season testify that they were superior: and we have studied so closely the immediate wants of our patrons from every section of the State, that we can now furnish Plows suitable to any particular kind of soil known in the State.

Our material has all been selected in the East by one of our firm, and imported by us directly from the manufacturers, which places it in our power to say confidently that nothing is lacking in quality, while we are enabled to make the plows at a cost greatly below that of last season, and are determined to sell at prices within the reach of every farmer who may wish to use the Peoria Premium Steel Plow.

It should be remembered that these plows will do double the work with half the team required in using the ordinary cast Plow; and that the work, when done, will be well done.

For particulars of prices, and descriptions of plows, we refer you to the subjoined card. The prices therein detailed are there established at our factory, and the only alterations from them that we authorize our agents to make, is the addition of the cost of transportation to their places of business—thus placing the plows at every accessible point of the State for the exact price charged at the Factory, with the necessary expenses only added.

Farmers ordering our plows through mercantile houses here, would do well to write to us at the same time, if they would make sure of getting the right plow, for some are interested in representing that we are not making plows at all, while others will not sell our plows when they can get off a cast plow. We therefore recommend that orders should be sent to us directly, accompanied by an order upon your merchant for the amount, which you can always know by a reference to the card accompanying this circular.

On the 24th of June the interest of T. ADAMS in our business ceased, by the sale of his entire interest therein to L. E. MORGAN. Aside from this, there has not, nor will there be, any alteration, as we have the same efficient and thoroughly practised hands in every department of our business.

E. L. MORGAN & CO., Successors to
T. ADAMS & CO.,
Corner of Broadway and Battery streets.

☞ The following are the established prices for the **Peoria Premium Steel Plows**, at our Factory, and the only addition our Agents are authorized to make thereto, is the cost of transportation to their points of business:

SIZE.	DESCRIPTION.	FURROW.	PRICE.
No. 5	plain	10 in.	$ 30
5½	"	12 in.	$ 35
6	"	14 in.	$ 40
7	"	16 in.	$ 50
6	clipper or prairie	14 in.	$ 60
16	" "	16 in.	$ 70
18	" "	18 in.	$ 85
20	" "	20 in.	$100
22	" "	22 in.	$110

30	" "	30 in.	$175
40	" "	40 in.	$225
Subsoil Plows			$40
Cultivators			$25

[For the addition of wheel and axle to any of the above clipper Plows, an additional charge of $30.]

L. E. MORGAN & CO., Successors to
1 T. ADAMS & CO.

PREMIUM PLOUGHS.

WE invite the attention of farmers to the assortment of "Premium Steel Ploughs," now at our store at Exhibition Hall. These are the celebrated "Morgan & Co.'s Peoria Ploughs," pronounced by the committee the very best Plough in the United States. WARREN & SON'S
1 Agricultural Store.

WARREN & SON'S HORTICULTURAL MUSEUM AND HALL OF SCIENCE.

THE subscribers take pleasure in announcing to their friends and patrons that they open their Hall as a Museum of Horticulture and Natural Sciences. Having now completed our arrangements in Europe and in this country, we are enabled to offer to the patrons of this establishment the first of the kind in California) everything desirable connected with the science of **Agriculture, Horticulture, and Floriculture.**

Connected with this establishment will be Nurseries, Gardens, Fruit Orchards, Graperies, and Greenhouses of the proprietors: and therefore the patrons can be assured that it is much better for them to send their orders to first hands than to those who collect here and there, at auction and elsewhere, where there can be no certainty of the genuineness of what they buy.

The Nurseries will be extensive, containing several hundred thousand trees grown under the eye of the proprietors. The Fruit Garden will contain the choicest Fruits known in Europe and America.

The Museum will contain specimens of Fruit in Wax, rare and curious specimens of everything else in nature, both in wax and in a dried state; Oil Paintings, Drawings and Paintings of Fruits, Flowers, &c., together with specimens in Natural History, Books on Agriculture, Horticulture and Botany; Garden implements of all descriptions and of the most approved patterns.

SEEDS.—A large and superior assortment of Garden and Flower Seeds, comprising all the new and rare varieties. Field and Grass Seeds of warranted quality, wholesale and retail. The Seeds sold at this establishment will be warranted pure and genuine, true to their name and preserved in a proper manner. Dealers will receive a liberal discount.

Boxes of Seeds for exportation at $5 and upwards, so packed that they may be safely transported to any part of the world.

Packages of Flower Seeds, containing twenty varieties of Annuals, Biennials and Perennials, neatly packed in boxes, from $3 to $20.

☞ Separate Catalogues of Fruit and Forest Trees; Vines, Shrubs, Evergreens, Dahlias, Roses and Greenhouse Plants; Garden and Agricultural Seeds, may be had on application.

WARREN & SON,
NURSERYMEN, SEEDSMEN AND FLORISTS,
1-tf Musical Hall Building, Bush st, San Francisco.

A. A. SELOVER, R. H. SINTON.
A. A. SELOVER, Auctioneer.

SELOVER & SINTON,

REAL ESTATE AUCTIONEERS AND AGENTS.

Office and Salesroom, 136 Montgomery street, between Clay and Commercial.

MESSRS. SELOVER & SINTON respectfully inform the public that they have associated themselves together for the purpose of conducting the REAL ESTATE Business in all its branches for the prosecution of which they deem themselves particularly well qualified, having been intimate with the business in this city since July, 1849.

Particular attention given to all questions affecting titles, &c.

Great care will be taken in complying with the law, in sales of Assignees, Administrators, and other legal sales.

A Register for property, at public or private sale, always open at their office.

TERMS OF SALE.—Titles satisfactory, or no sale. Acts of sale at purchaser's expense. Ten per cent. of the purchase money will be required at time of sale from all parties not known to the Auctioneers.

The services of a gentleman of long experience have been secured for the full and complete search and examination of titles. 5 4t

SELIM & EDWARD FRANKLIN,

REAL ESTATE AGENTS AND AUCTIONEERS,

Office and Salesroom, 102 Merchant st., between Montgomery street and the Plaza.

Real estate of all descriptions sold at public and private sale. Particular attention given to sales for Administrators, Assignees, Receivers, Mortgagees, and others, according to law.

Monies invested and rents collected for parties at a distance. Loans effected on Bonds and Mortgages. Titles examined and surveys made by competent parties in the office, and the Notarial business exected by WILLIAM A. CORNWELL, Notary Public.

A register open to public inspection of property for sale.

The Spanish and French languages spoken.

Improved and unimproved Ranches and lands for sale in various parts of the State—Spanish titles. 5 4t

JAMES E. WAINWRIGHT. ALBERT G. RANDALL
JAMES E. WAINWRIGHT, Auctioneer.

WAINWRIGHT, RANDALL & CO.,

REAL ESTATE AND STOCK AUCTIONEERS,

Office and Salesroom, 100 Merchant Street, between Montgomery and Kearny.

MESSRS. WAINWRIGHT, RANDALL & CO. respectfully announce to their friends and the public generally that they have made this business connection, and re-established themselves, for the purpose of transacting the Real Estate business in all its branches, for the successful management of which they deem themselves well qualified, having had upwards of four years experience in this city.

They will give especial attention to making public sales of all kinds of property for Administrators, Assignees, Receivers, Mortgagees, and others, according to law.

Particular attention paid to preparing "Rancho" property for sale, and every facility will be afforded to the holders of such property for the transaction of their business. Mr. Randall, being conversant with the Spanish language (having resided several years in South America,) will give his personal attention to the translation of title papers, when required.

A practical Surveyor and Draughtsman will be in constant attendance at the office.

A large amount of property at private sale.

Conveyancing, under the supervision of A. G. RANDALL, Notary Public, under the law of 1853—and Commissioner for the State of New Hampshire. 5 4t

THEODORE PAYNE. SQUIRE P. DEWEY.

THEODORE PAYNE & CO.,

REAL ESTATE AND STOCK AUCTIONEERS.

OFFICE AND SALES-ROOM CORNER CALIFORNIA AND MONTGOMERY STREETS.

THEODORE PAYNE ..... AUCTIONEER.

☞ Messrs. PAYNE & CO. respectfully inform the public that they have established themselves as above, for the purpose of transacting the

Real Estate business, in all its branches,

For the conducting of which they esteem themselves peculiarly qualified, by having given it their special attention for over two years past, and made themselves familiar with all questions affecting titles, &c. &c.

They will give their especial attention to the public sales of estate, by Administrators, Assignees, Receivers, Mortgagees, &c., carefully complying with the forms of law.

A Register for Property, at either public or private sale, always open at their office 5

FAMILY FLOUR.

HORNER'S PREMIUM FLOUR.

UNION CITY MILLS.

WE INVITE the particular attention of Families and the Trade, to the quality of the Flour manufactured by us.

Our great aim has been, in the establishment of our Mills to procure the most perfect machinery, to employ the ablest millers, and to select the purest and finest wheat in the country.

That we have been able to accomplish all this, the Product of our Mills now before the community is the best evidence.

The FLOUR we manufacture has been put in test to the oldest judges of our State, and after the most rigid and thorough test, they have awarded to us the "PREMIUM PRIZE," and we shall have offer the same as "Horner's Premium Flour;" it shall be our constant effort to maintain for it the reputation of being the

The Best Flour in the Land.

Orders left with HORNER & CO. at our Store-ship, Broadway wharf, will receive prompt attention.

5 4t HORNER.

SUPERIOR FURNITURE.

THE largest and best stock in Sacramento may at all times be found at the Old Stand of B. P. & D. MOORE, No. 77 Third street, where they still persist in selling as much below their competitors as their superior facilities will admit of. Having on hand the most splendid and substantial assortment of all kinds of Furniture ever offered in Sacramento, we feel confident, with prices to suit, that none can go away empty that may favor us with a call.

Our stock consists of Bureaus, Secretaries, Wardrobes, Stands, Tables, Bedsteads, Lounges, Sofas, Painted Mahogany, Black Walnut, Satin and Rosewood Sofas—some of the finest and cheapest ever offered in this market.

Also, Mattresses, of Curled Hair, Patent Felt, Moss, Wool, Straw, and Straw with Cotton Tops. Also, Feather Pillows, and Feathers for Beds, with a large stock of Quilts, Comforts, Sheets, Blankets, &c., &c. Also, a very large stock of Chairs, Wood, and Cane Seats of all descriptions: also, of Hair, Cloth, Spring, Plush, Velvet and Carpet Bottoms, with Rockers of all kinds; all of which will be sold at reduced rates.

5 4t Also at 130 Jackson street, SAN FRANCISCO.

A CARD.

FREE EXHIBITION HALL.—We desire to announce, and we do so most respectfully, that hereafter, during our Exhibition, our Hall, containing all the magnificent specimens of the Agricultural Exhibition, together with the choice Paintings and Embroideries, and many rare and beautiful specimens and curiosities from the "Islands of the Sea," will be open to the visits of all who wish to examine them, FREE OF CHARGE.

We would also announce to Artists that our Hall is offered to them FREE, to exhibit their work for exhibition or sale, and we further announce to all persons who have Paintings, Statuary Works of Art, Curiosities, or extra specimens of anything of domestic manufacture, that here is a place the most appropriate for its exhibition or sale, and where the most extended notice can be given to it. All who have works of art, or any of the curiosities of the country, or wonderful specimen of the Agriculture of California or the Pacific coast, will find this Hall the most appropriate place for the exhibition of the same.

We desire also to state that all the Agricultural papers and periodicals of the United States and the principal publications of Europe upon the subjects of Agriculture, Horticulture, and Floriculture and other scientific subjects, and to our patrons, and to the cause of Science, they are ever open, and we tender our best aid to developing to the utmost of our power the good resulting from them.

The Wedding.

What can be more beautiful than a scene like this? Thus did my spirit whisper as I stood upon the steamer's deck, gazing upon the shores and Islands that eateh the eye as you enter the waters of the winding Kennebec.

The moon shone lustrously; the stars like myriads of diamonds filled the blue vault above, and the boat, as she rushed through the waters, cast from her breast a rohe of white foam, like a mantle laced with gems.

I had heen gazing for hours, when, leaving the place where I stood, I mingled with the crowd that were seated upon the deck. Among the passengers, my eye met one face that rose up in memory as a onee familiar friend. I had seen that faee hefore. I had not looked long ere our eyes met; a word, and the rushing thought filled each heart with ready greetings. We had not long been known to each other, ere our destiuies called us to widely different spheres.

The earth had made her annual circuit since last we met; but the memory of that last meeting rose quickly, for it had heen one of happiest joy. Here we were surrounded by kindred spirits, those we loved, and hy scenes and associations that always must make us hetter and happier. That meeting had made us friends, and now meeting again, recalled sweet recollections of those friends with whom we last met.

From whence comest thou, and whither art thou bound? were the first questions I propounded to my friend, after our mutual recognition. "Oh, I am on a hasty run to surprise them at home. I left 'old Kentucky,' as it were but yesterday, and to-morrow I hope to be there, on those mountains the farthest the eye can see in the distance. Sister Mary is to he married on Monday eve, and I have come home for tho wedding: and tell me, my friend, can you not come?" How easy and how sweetly will sincerity find the way to the heart, so earnest, so sincere were tho words of my friend, that I felt I could he doubly happy, for I knew there were others that would he most happy too—and quickly resolving it should be done, it was done in my heart!

The night passed peacefully and brightly away, and the rising sun of the Sabbath morn brought us safe to the end of our journey by steam. My friend passed on to his home among the mountains, and I joined my friends near hy, to pass in peace the blessed Sabbath day.

The morrow was the "wedding day," and much was to be done to accomplish what my heart had resolved. Monday arrived—but the clouds obscured the sky, the rain was falling, and the fog cast on all that sad chill which rain and fog will ever do, especially when they happen on a wedding day. The oh's and the ah's must be said some time, and these disappointments must come, else we were made too happy while here below. But why borrow trouble?—the wedding is not till evening, and forty miles must be passed ere that time will come—the storm may pass on and leave us a beauteous sky, or we may pass on and leave the storm behind us. We do know

"Behind the clouds, the sun is shining."

Oh that we could be wise, and murmur not at the dispensations of a kind Providence: all things are ordered rightly, and we should be far happier if we could but earnestly believe it. A fine pair of horses and an easy carriage conveyed us surely, though slowly, over hill and up mountain, and brought us safely to our destination, just as the sun passed below the horizon, giving promise hy its brightness, that the storm had passed away, and that the eve would be ushered in with a clear beautiful sky.

The kind reception by our friends was ample reward for a long journey in a stormy day. Never could such cheering and welcome words come from hearts insincere, and it is such a welcome from the heart, that bids the spirit leap forth in kindly greeting and resolve to be happy.

Ere the wedding hour arrived, the darkness and storm of the day had entirely passed away, the sun had gone from our view to gladden others by its dawning and the brightness seemed to fill all with light. It seemed as though there were brightness and love everywhere on earth and in heaven, and their happy smiles with such a soft and holy light, that it were impossible not to take this as an omen of good, a promise of happiness to the bridal pair. The marriage hour arrived, there was a heavenly stillness thrown around that dwelling, broken only by the gentle moving of the trees without, as the hreath of heaven touched them, and seemingly bent them down to open windows that they might be nearer the blissful scene that was passing within.

Never! never! shall I forget the emotion that filled my soul as I gazed upon that happy pair, their hands elasped, ready to receive the seal and take the vow that was to hind them for life. Clear and distinet, yet tender were the words uttered hy the minister of God as he united them. There was that earnest truthfulness stamped upon the hrow of hride and bridegroom, that told they had pondered well the vow they were about to take upon themselves—most earnest and touching was the prayer that went up to heaven that God would would hless those that had heen thus united "Twain in one."

"Would that this covenant might heneeforth he entrusted only to those who understand its momentous import."

"Who feel that ever on this earth
Where two are thus made one,
'Tis but a type of heavenly birth
Divinity begun:
A new a brighter life is given,
A bliss for earth, a hope for heaven."

Tho pleasing associations of that never to he forgotten marriage scene, I have laid away in memory's storehouse, to be called forth at my bidding. It was all hrightness and I lived it over again in my dream of the night.

The earth was never more heautiful, tho air never more halmy, and never were hearts more happy than these friends that met for a mountain ride at the early dawn, the morning after the marriage. The earth had been refreshed with copious showers, the sky that had been hidden from us the past day by storm clouds, was now all brightness, one vast expanse of blue was over us, and one sea of living green, as a carpet at our feet. The fragrance of the summer flowers filled the air with its perfume, and the joys of the heart bid the lips give forth that joy that echoed long and sweetly over the mountains that we were ascending.

The brightness and joy that was so lavishly scattered around us in nature, was reflected upon the features of the happy married couple that rode hy our side; and again upon us all, as if heaven was now propitiously marking by the opening day of this their first going out into the world, a promise of a blissful life. God grant that it may be so: none more worthy than these sweet friends

Ye who dwell in cities, whose lives are lost in the pursuit of gold only, how little can you know of lifo? The sun in its shining beams has no beauty for you, save the hope of gain by another day's winnings. That golden sunset comes not to your vision, your golden light is reflected only from your hoarded treasures. The mountains, though piled heaven high, arrest not one look: your sight can only be arrested by mountains of wealth. Hill, valley, streamlet, river, or sea has no claim for your attention, unless you can give forth instead of beauty, gold! gold!! gold!!!

This is the age of gold, the people are gold mad—every age, sex and condition, every profession is more or less tainted with this mania for gold. When, oh when will we begin to realize that "all is not gold that glitters," and that in "seeking for the shadow, we lose the substance" That while we spend our lives in search of gold to make us happy, we are losing opportunities of happiness far greater and more enduring than gold can ever give; we are daily neglecting to improve and enjoy the means that God has placed within our reach to be had, "without money and without price." His word, His works, His previdences, means of doing good, and conferring happiness upon those around us, thus bringing home to our own bosoms a joy and a delight which the "gold of Ophir" cannot purchase.

Let us then seize every event of life that marks our pathway as a "God send," a means of happiness for our friends and for ourselves, and improve them to the utmost, and we can all find enough to make us as happy as were those who enjoyed the "wedding scene among the mountains."

July 11, 1849. ELLIOT.

"What is a Letter?"—This question is answered by a poet thus happily:

What is a letter? Let a [illegible]—
A [illegible] that [illegible]
A [illegible]
What [illegible]
A [illegible]
A [illegible]
Fortune to [illegible]
[illegible]
Are [illegible]
The [illegible]

A Page from a Woman's Heart;

OR, FEMALE HEROISM.

"How did you come in possession of this?" said a young man, directing the pawnbroker's attention to a small, ruby pin in the show-case.

"That? O, that was brought here last night, hy a prettyish young woman, who seemed to he in a great fluster about the money; and so I hought it of her."

"How did she look? Had she blue eyes? Was she tall and slender?"

"Lord hless your soul!" said the pawnbroker, "I has hundreds of 'em in here every day; I never looks twiee at 'em. She was a hroken-down lady, I reekon. Somehody said she lived up that eourt yonder. Like to redeem the hrooch, sir?"

"Yes, certainly," said Ernest; and paying the extortioner five times what he had given for it, he deposited it in his vest pocket.

"Good God! that Agnes Kearn should come to this!" was his first exclamation on reaching the street. "That hrooch, that I have seen sparkle on her snowy neck thousands of times, when I could have kissed the very ground her little foot trod upon! Agnes in a pawnbroker's shop!" And he reeled and leaned for support against a jutting wall of the old building. Just then, a little girl tripped past, and, striking her foot against the curh-stone, fell heavily against him. Ernest raised her in a moment, and kissing her little, innocent face, was about releasing her, when the thought struck him that she might assist him in his search for Agnes.

"Where do you live, pretty one?" said he, looking into her hright blue eyes.

"I can't tell," said the child, hlushing; "my mamma hids me not talk to strangers. Won't you please put me down, sir?"

"Yes, certainly," said Ernest, as he saw her little lip begin to quiver; "only tell me your name first.

"I can't tell," said she again, with a womanly decision that would have amused him at any other time. So, putting her gently down upon the pavement, he prepared to follow her at a distance. There was something in the expression of her face that interested him,—that reminded him of one he had loved, O, how deeply! And then he counted the weary years that had intervened since her marriage. Yes; it might be her child.

On she went, little Minnie, turning corner after corner, with the speed of an antelope, then disappeared up the small, dingy court, into the doorway of a small, black house, never once turning her graceful little head.

Ernest followed, she opened a small door, and, forgetting in her haste to close it after her, he heard her say,—almost breathless from speed and agitation,—"I did'nt tell mamma; I didn't tell. The gentleman asked me my name and where I lived; but,—kiss me, mamma, I certainly didn't tell him."

"Dear child," said the mother, as she gave her a kiss.

That voice! there was but one in the wide world that could so thrill him.

"O, mamma, here is!" said Minnie, as she tried to close the door. "I certainly didn't tell him," and she began to sob piteously.

"Agnes! Ernest!" They were simple words to convey so much meaning! "Your husband, Agnes, is he dead? Why do I find you here?" She shook her head, and turned deadly pale.

"What then?" said Ernest, drawing himself up, as if he were already called upon to protect her.

"Dead to me," said Agnes, in a low voice.

Ernest took from his pocket the small brooch. "You must have suffered much, ere you part with this, Agnes. It has told me a silent tale of misery that I will not pain your heart to echo. I ask you not of him. It is enough for me that he is living while you are suffering here. I will not curse him in your presence; but, Agnes, you must give me the right of an old friend to take care of you; you must leave this wretched place;" and he looked first at her, then at the miserable surroundings.

"Your father Agnes! does he know of this? Is money still his god?"

Agnes replied only by her tears.

"Tell me—how have you lived?" [illegible]

She pointed to a small [illegible] in the corner of the room.

"Slow starvation!" said he [illegible]

This is folly, Agnes. Just [illegible] your heart, [illegible] you [illegible] the door of [illegible] weeping young [illegible] self for [illegible] derstand your [illegible] a brother's [illegible]

Agnes Kearn, [illegible] "Let [illegible] Ernest, [illegible] you kenow what I am now. By God's [illegible] denee, you see. That I have suffered more keenly than you, who read my heart so well can dream, I acknowledge. Nothing meets my eye here that is not coarse and repulsive. I have deprived myself of food, that my child might not hunger. I have no earthly father, save in name; but, through all this, Ernest, I have preserved my self-respect, and I would rather die than take one dollar, even as a loan, from you. Nay, hear me out," said she, laying her hand upon his arm, as he strode impatiently across the room. "This poor, weary heart is tried and tasked to the utmost. Like Noah's dove, it finds no resting-place. Nay, spare your reproaches, and be generous. Think you it costs that heart nothing to turn coldly away, and say nay?" and her voice tremhled, and her eyes filled with tears. "Ernest, my heart may not echo hack your words of kindness; the love that is born of sorrow is strong, and wild, and deep. Leave me, Ernest. Do not deceive yourself; it is not a hrother's heart you offer me. I must toil on, unaided hy you. The night has heen long, tedious and starless; the morning must dawn ere long. I will wait and trust. If I forsako not myself, God will not forsake me."

"Once more—shall I leave you, Agnes?" said the young man, as he took her hand.

"God wills it," was her low reply.

The door closed upon Ernest's retreating figure; then her woman's heart gave way. Covering her face with her hands, she wept long and bitterly; then came a holy calm—a peace which only those may know who are self-conquerers.

And where was that "earthly father" He ate and drank and slept, careless who befriended his child; careless of the more than mortal strength she needed to keep that warm and tried heart from yielding to the pressure of poverty, temptation and despair. "Like as a father pitieth his children" were unmeaning words to poor Agnes.

"This is a very correct translation," said the pedantic Professor Boggs; "very well done, madam; couldn't have done better myself; and that's the highest praise I can bestow upon it. I suppose you expect to be well paid for it, like all the rest of our applicants for this sort o' thing.

"I need all you can give me, said Agnes," dejectedly; "it has cost me a week of unremitting labor."

"V-e-r-y p-o-s-s-i-b-l-e," said the professor, looking at her through his glasses; "I'm told you are the daughter of old Mr. Kearn; he is a man who is well off; how came you to be reduced to this extremity?" (Cruel, avaricious father! the dagger again driven home to that suffering heart by your neglectful hand!)

Agnes replied, "You will excuse me, sir, from entering into the details of my private history. If the translation pleases you, I shall be happy to dispose of it; if not, I must look elsewhere."

Mr. Boggs returned it, with a stately bow Agnes found her way into the open air. The excitement of her interview with Earnest, fasting and fatigue, "told" at last. Her steps became unsteady, her sight failed her; and she reeled and fell upon the pavement.

"Drunk!" said one of tho bystanders, with a sneer.

"A fallen angel!" said another.

"Take her to the watch-house," said a third.

"Here, little girl," said a rowdy lad, seizing a child, who seemed quite bewildered by the crowd, "don't you want to get a sight of the drunken woman?"

"No, no," said the child, struggling to free herself as he lifted her above their heads; then with a piercing shriek, as her eye fell on the prostrate form, "O, it is my mamma! my own dear mamma! she's dead! my mamma is dead!" and making her way to her side, she kissed her pale lips and [illegible] and clung to her neck, till there was not a dry eye in the crowd.

"Mr Kearn," said a little dapper man, as he touched that [illegible] head, "do you [illegible] that crowd yonder?"

"Yes—yes—what of it? A crowd [illegible] What of it?"

"Nothing is [illegible] looking at your daughter Agnes who [illegible] as if her [illegible] her! I [illegible] Agnes Kearn, [illegible]

THE CALIFORNIA FARMER

J. L. L F. WARREN, Assistant Editor.

AGENTS FOR CALIFORNIA FARMER.

Messrs Adams & Co., at all their offices throughout the United States or Europe.

Messrs. Wells, Fargo & Co., at their offices throughout the Country.

San Francisco—Messrs. Murray & Co., booksellers, Montgomery street; Sullivan's newspaper stand, near the Post Office; Kimball's, Noisy Carriers Hall, Long wharf.

Oakland—Mr. Isaac Willard.

Benicia, Martinez, &c.—Messrs. Stiles & Dodds.

Union City and Mission San Jose—Messrs. Howard & Chamberlain.

San Luis Obispo—Dr. Thomas L. Harvey, P. M.

Sacramento—Mr. Oscar D. Avaline; Messrs. Carle Brothers.

Union, Humboldt Bay—A. H. Murdoch, P. M.

Mount Farm, O. T.—Gen. M. M. McCarver.

Marysville.—Geo. S. Becker.

Stockton—Rosenbaum & Joackimsen.

New York City, N. Y.—J. M. Thorburn & Co.

N. B.—We want Agents in all the principal localities, and persons disposed to act can have the opportunity, if satisfactory to all parties.

To the Friends of Agriculture.

We ask of all to whom we send this number, who are not already subscribers, to examine the Farmer, and to give it their influence. We trust to hear from them and to know that they will not only become subscribers to our Journal, but favor us with their communications. We desire to call their attention to our terms of subscription for clubs.

Special Premiums for Subscriptions.

In addition to the standing inducement for the getting of subscribers for the "Farmer," we will make a present of HARPER'S ILLUSTRATED FAMILY BIBLE to the person who procures the most Subscribers in the first six months of our publication. This we regard as one of the most beautiful books ever issued. Who will have the prize?

A Premium---Farmers' Clubs.

With the hope of inducing such of our friends, and those who have a little leisure, to ride among their neighbors and introduce an Agricultural Paper, we take pleasure in offering the CALIFORNIA FARMER: and, to make it an inducement, we say to such friends—if you will get us five subscribers, and remit the amount, we will send you six papers, or for ten subscribers, twelve papers. We trust there are many friends who will cheerfully take a little pains to aid us, and thus extend the circulation of the Farmer, and make a useful vehicle for the Agriculture of California.

Subscribers will please be particular to name the Post Office to which papers are to be sent; or, if forwarded by express, which line they prefer.

To Our Patrons.

To Advertisers.—We would call the attention of those who desire to have their advertisements produce quick returns, to the pages of the California Farmer.

The Farmer will reach sources of trade entirely new and unattainable by any other means, and thus secure a large and immediate profit to those who desire to make known their business. By a glance at our advertising columns, it will be perceived that we present the best known and most extensive houses, and as we have space for but one or two of each branch, these will be the most prominent houses, and thus give more influence to them.

To Agents.

☞ We desire Agents to report as early as possible, that we may be prepared in our issues for a sufficient number to supply the demand. Be sure and report promptly.

Correspondence of the Farmer.

We make extracts from an interesting letter received from Mr. Cooper, high up in the mountains, and also one from Mr. Brown, in Napa Valley. These data are what we desire, for they give the practical operations of the greatest interest of California. We shall be happy at all times to hear from those interested, from every part of the State.

Oak Ranch, Sierra County,
Near Downieville, Jan. 9, 1854.

Messrs. Editors,—Your Circular I received about the last of December.

I have resided in this State three and a half years. I emigrated from the State of Maine. I occupy 640 acres of land, about 200 acres of which is woodland. The forest trees are Oak, Hard Pine, Sugar Pine, Fir, Hemlock, Pitch Pine, Cedar and Ash. My land is all pasturage, except about ten acres, which I have under cultivation, which will make about 630 acres, my woodland being also pasturage. I planted 1,500 lbs. of potatoes and dug 17 tons. Fresh vegetables bring a high price here in the mountains. My cultivated land has netted more than $400 per acre the past season, but the quantity of land fit for cultivation is small, in comparison with the agregate. My place is in about 41 N. lat.; I do not know the altitude, but it is at least 1500 feet above the river at Downieville, and is five miles west of that place. The ground that I cultivate is a table land that makes out from a mountain which shelters it north and east, their tops being about 800 feet above it. There are also mountains north-west and west, but it is quite open towards the south and south-west. It was covered with a fine growth of thrifty oaks, from one foot to 20 inches in diameter at the butt, and from 75 to 100 feet high. This oak is different from any I have noticed in the valley. It splits well and makes good pick helves and the best of firewood. My best soil is a black loam, eighteen inches deep, probably formed by a deposit of oak leaves. The season for planting is from the 15th of April to the 20th of May: harvest October and November; irrigate from June to September this is indispenssble. I do this by bringing water about half a mile, from a neighboring ravine, in small troughs. I bring the water to the highest point on the cultivated ground, and let it on between the rows. I plant 500 lbs. potatoes to the acre. I use the best potatoes I can get, and cut them into pieces about an inch square, so as to get one eye ou each piece, plant in drills, about 12 inches apart, and run two furrows before dropping, as it is desirable to plant deep. I planted about three acres the first year. I sell them for 16 cents per pound. Deep plowing is much the best. Manure of any kind and ashes improve the ground and crop. I shall close by saying that I have been farming only two years. I should like to see an agricultural Journal of an high order established in this State.

Columbus Cooper.

From Mr. Brown's letter we quote the following, and hope the example in regard to an Agricultural Society, will be followed by every county in the State:

Speaking of preparing his grounds, he alludes to the fine native trees and shrubs which are found in that vicinity, enumerating the Mancinito, Fir, Redwood, White Pine, Black Walnut, Filbert, English Walnut, and lastly the Nutmeg, which was recently found ou the hills near the upper end of the valley. All these trees grow wild in our valley and the hills adjacent. In reference to the science of agriculture, he says—"I am now striving to organize an agricultural society in this county, and am confident of ultimate success. I have also a small but growing list of subscribers to the California Farmer. We are waking up here, in regard to the interest of agriculture, and soon will set to work in earnest. Nature has done all we could possibly desire for Napa Valley, and we hope to lend our efforts towards advancing the science of farming."

Rural Cemeteries.

This subject is awakening a due degree of interest in many of the States of our Union, and recently assumes a form that we are glad to note. That there has been in many Rural Cemeteries, that were commenced within the last ten years, more of a desire to display wealth, to excite admiration and win fame, than a regard for true taste, or appropriate design, no one can doubt. The huge obelisk, the capacious monumental tombs bearing upon their fronts histories and titles, none of which could live in memory, though recorded there. The fancy railings, glittering with gold, with their fancy archways only speaking display: these surely are not in keeping with the "place of them that sleep."

If the object of a Rural Cemetery be to make an exhibition of works of art, we might approve such display; but a Rural Cemetery is a place for the burial of the dead, and while we would desire to take from it all that superstitions, fear and dread connected with the grave, we would throw around it everything of a softening and hallowing influence, and would desire that every work of art placed on or around a grave, every tomb, obelisk, cenotaph, or any other token whatever, that it should be chaste, beautiful and strictly in keeping with the place and the object. There should be a perfect harmony in taste and design; nature should be copied, and everything in a Rural Cemetery should, in the strictest sense, be harmonious.

We are led to these remarks from noticing the efforts making to establish a Rural Cemetery near San Francisco. We trust when this plan is commenced it will not be done hastily. Everything depends upon a right beginning. The place should be appropriate, both in location and character in the designing of the grounds; the proper grouping of the trees, for light and shade; the character of the soil. These and many other considerations render it highly important that a work of this kind should not be commenced too hastily. An error in the commencement in the original designing may forever destroy the finest locality and the best natural scenery.

There is an appropriateness in design for the "home of the dead," that when duly regarded will strike every beholder with a feeling of reverence, and chastened sadness, and which will do more to disarm death of his terror, and prepare men to live better, than all the costly mausoleums and stately monuments that wealth can raise.

We trust ere long to see the commencement of a Rural Cemetery at some proper place near San Francisco, and then we do hope that in this great age of progress, we shall have an evidence that California has not been slow in performing a portion of her duty.

The Board of Land Commissioners have decided the Peralta Case in favor of claimants.

Mokelumne Valley.—We were favored with a call from Mr. E. H. Lock a few days since, and was gratified with an account of the improving interest in farming which is manifesting itself in that part of the State. Mr. L. cultivates about 200 acres of land, which he says is very fertile, and upon which he had raised large crops of potatoes. He had housed between five and six hundred bushels of potatoes to the acre. He informed us that he planted corn in the latter part of July last, and that it produced an excellent crop. Grains were being raised in great abundance, and a fine flouring mill was in process of erection near his ranch. The proportion of tillable land was comparatively small, but from the general attention paid to farming, it would yield large supplies. An excellent market was found for all kinds of vegetables, affording a much larger profit on products than could be realized in the more extensive valleys. We would be very much pleased to hear from Mr. Lock any future communications of general interest to farming.

The Tule Lands.

We publish to day the annexed communication from an active friend of Agriculture and Horticulture, a member of the Assembly, and we are truly gratified to know that a subject of such vast moment is awakening the attention of our legislators.

We invite all to give us the experiments that have been made, and the detail of them. We are among those who believe that our "Tule Lands" are among our most valuable lands, and would most respectfully suggest to the honorable Senate and Assembly the offering a generous bounty to those who should reclaim a certain quantity and bring it into cultivation. We would suggest also that the State cause surveys of these lands, and that they be set apart in large tracts, with proper appropriations and bounties to such as are disposed to take charge of them, under special acts for their recovery. We are confident that the day is not far distant when some of the finest plantations of the world will have been made from the soil redeemed from our now waste Tule Lands.

We shall continue the subject, and ask the co-operation of all interested. We are ready to aid to the utmost of our humble abilities in this great work.

Assembly Chamber, Benicia,
February 7th, 1854.

Messrs. Editors.—The subject of the Tule or overflowed lands in this State, and the imperative necessity of devising some wise and general system for the reclamation of the same, has for a long time attracted the attention of all those citizens of our State, who look forward with hopeful eye to the time when California will be as celebrated for its agricultural beauty and wealth as it now is for the immensity of its mineral resources.

I have long been desirous that the present Legislature should take the initiatory in this important work, but am barred at the outset by an uncertainty as to the most advisable course to adopt.

It is a matter which, in connection with all the agricultural interests of this State, has commanded your almost entire consideration, and upon which you must have collected a mass of information which will doubtless be of great value to the entire State, if properly brought before the Legislature. I therefore write to you, desiring your assistance, both from your own personal information, and through the columns of the Farmer towards enlightening all upon this subject. Knowing your earnest desire to advance the permanent prosperity of this State, by placing it upon the sure foundation of agricultural wealth, I make this request without hesitation.

I am happy to inform you that the Assembly have evinced their interest in the advancement of this great branch of industry, by directing the sergeant-at-arms to furnish each member with your invaluable agricultural paper. I hope to see the Senate "go and do likewise," then we may anticipate the commencement of enlightened legislation for the advancement of our farming interests.

I am, with great respect, yours,
Humphrey Griffith.

Report of Ladies' Committee.—The report of the Ladies' Committee will be read with interest. The various specimens of their skill and taste, as exhibited at the late Fair, have won the admiration of thousands, and we have now the pleasure of reading their report, and we learn that the prizes are in the process of engraving and will be awarded shortly, with all due honor to the fair winners. The time will be duly announced.

Better Times Coming.—To an old traveller it was quite gratifying to see the goodly number of passengers that were on there upward trip to Sacamento on Saturday last. It looked like the good old times, when crowded boats and heavy freights were the order of the day. There was also a very handsome freight—about eighty tons. By the way, "that stove in the Ladies' Cabin" makes a fine appearance, besides, adding so much to the comfort of passengers. The steamer Confidence can now boast of having one of the most *recherche* Ladies' Cabins on the route. This steamer, with her splendid accommodations, her gentlemanly officers, and the attention given to make all happy offers extra inducement to travel.

Big Potatoes.—We clip the following from an Eastern exchange—they are boasting of potatoes weighing 2 lbs.; what would they say to look at some of our *small taters*, only weighing 4, 5, 6 and 8 lbs. each:

The editor of the Syracuse Union has seen a potato which measures 12 inchss in length, and weighs 2 lbs. When dug up it weighed more, but has decreased by drying. Thirty such potatoes would make a bushel, and a thousand would make a tolerable load for a pair of horses.

Public Documents.—We are under obligations to Hon. Senator Gwinn, and Hon. M. S. Latham, for valuable Congressional Papers, of great interest.

Also, to Hon. H. Griffith, of our State Legislature, for interesting matters from our own State, and particularly for his bringing the subject of our "Tule Lands" before us. For his deep interest in the cause of Agriculture, and for the opportunity now offered of laying the most important data weekly before our Legislative bodies, we are pleased and grateful, and shall endeavor to bring the most urgent duties relative to Agriculture immediately forward, feeling assured our Senators and Representatives are ever desirous of watching with solicitude this great source of wealth.

We have received from a lady, over the signature of "F." an interesting communication relative to the "Homes," "Flora," etc., of California, and shall give it a place in our next number. We shall ever be glad to hear from our fair friends, and will give them the best attention.

Salting Plum Trees.—For many years I have salted my plum trees and had large crops of fruit, but last winter I omitted to salt the trees, excepting three, and the consequence was that I had no plums excepting on the trees that I salted, which confirms me that the only sure way to get a crop of plums is to put salt around the trees in the winter. About four quarts is sufficient for a tree; put it around in a circle about a foot from the tree. Any time in January or February will do, without regard to snow being on the ground.

Report of the Committee

ON EMBROIDERY, PAINTINGS, AND WORKS OF ART, EXHIBITED IN WARREN & SON'S ANNUAL FAIR, MUSICAL HALL BUILDING.

Gentlemen: The undersigned, in behalf of the Committee of Ladies appointed to examine the Embroideries, Paintings, Works of Art, etc. which were exhibited in the Hall, having attended to that duty, beg leave to make the following report:

The Committee, desirous to recognize all the various articles exhibited in the Hall, would hereby briefly name them in the order in which they were received, and in the examinations endeavor to give to all of merit, such notice as the occasion will permit in the time the Committee can devote to each.

The Committee congratulate the lovers of science, art, and taste, on the evidence before them in the magnificent specimens of the handiwork of those of our own sex, feeling assured that we have in California all the material, in mind, will, disposition, to advance and elevate the condition of society, by such evidences, and exhibitions of them. There were received—

From Mrs. J. Shannon, San Francisco—one Boquet of worsted wrought flowers, excellently well executed, and in fine taste.

From Miss Bourne, a young girl, San Francisco—one Embroidered Lamp Stand, very neat.

From Mrs. Wm. King, Marysville—the Backs and Arms for two arm chairs; the Seat for one chair; one Smoking Cap, embroidered velvet; one Infant's Embroidered Shawl.

From Mrs. S. H. Meeker, San Francisco—one piece Embroidery, in worsted—design, Moses with the decalogue.

From Mrs. S. S. Simonds, San Francisco—one embroidered Cricket; two do. Ottomans; one and do. cricket, cherries and grapes wrought expressly for the exhibition of 1853.

From Mrs. Waldo, San Francisco—one Embroidered Couch; one Embroidered Easy Chair; one Embroidered Rug.

From Mrs. Dr. Ober, San Francisco, one Lamp-mat.

From Mrs. Emerson, San Francisco, one pair Embroidered Suspenders.

From Mrs. L. M. Plummer—a Monochromatic Drawing.

From Mrs. Croghan—one piece, Embroidery upon white Naples silk; one piece, Flowers embroidered on white satin.

From Miss Mary R. Patch, San Francisco—two specimens, in frames, of Chencil Embroidery.

From Mrs. D. Norcross, San Francisco—one case Rich Regalia, with white ground; six pieces costly colored Regalia of the higher orders of Masons.

From Miss Elizabeth C. Hunt, San Francisco—one Wrought Lamp Mat.

From Mrs. Christian Scriber, San Francisco—one Boquet Artificial Flowers—excellent; one Jerusalem Cherry Tree—very perfect; one Wreath in silver tissue.

From Miss Lucy Tiennes, San Francisco—one Pencil Sketch, winter scene—a delicate and admirable design, and indicates skill and taste.

From Mrs. J. R. Rollinson, San Francisco—one Large Picture in Worsted Embroidery, a scene from the opera of the "Bohemian Girl." This work was commenced in New York in 1852, and completed in this city in 1853.

From Mrs. Harvey S. Brown, San Francisco—one Embroidered Chair Back.

From Mrs. F. P. Medina, Sacramento—one piece of superb Shell Work, representing a vase of flowers.

From Mr. Boston, of Monterey—cards of Sea Mosses, from the shore of California, arranged with great taste; Shells, and one Whale's Tooth.

From Mr. James E. Wolf, San Francisco—one basket Flowers, made of a piece of colored cambric, upon white ground.

From Mrs. Helen W. Williams, Santa Cruz—Sea Mosses, collected and arranged at Monterey, formed into baskets of flowers.

From Mrs. A. A. Selover, San Francisco—one bracket embroidered in Worsted; a rich group of Flowers, in fine keeping.

Miss Rude, Sacramento—embroidered Watch Case.

From Miss E. Barney, Sacramento—box of Wax Flowers, admirably executed.

From Mrs. Mary A. Phillips, Boston, Mass.—a silk patch Bed Quilt, containing 9,500 pieces.

From Mrs. Geo. Mellus, San Francisco—a Hair Wreath, composed of hair from the members of their family, from infancy to age.

From Mrs. G. W. Ruggles, San Francisco—one wrought Cambric Collar.

From Miss E. V. Furst, San Francisco—two pieces Embroidery on perforated cards.

From Miss Agnes Wilson, San Francisco—small Embroidery in frames.

From Mrs. A. N. Comstock, San Francisco—one large splendid piece of Embroidery, measuring 2 feet 5 inches, 3 feet 2 inches wide—an Euglish Hunting Scene; one Boquet Flowers on white satin.

From Miss Ann Wormer, San Francisco—one basket Artificial Fruit, Cherries and Blackberries. The form and grouping of the fruits were excellent, but the coloring altogether too black, taking away the natural look of the fruit.

From Miss Anna Thellar, San Francisco—one box Wax Flowers; lilly, rose, dahlias, &c., very beautiful.

From Mrs. J. P. Meakings, San Francisco—two pieces Embroidery; a pair Chair Seats, very rich.

From Mrs. Harvey S. Brown, San Francisco—two Paintings in Oil, a woodland scene and a moonlight scene—good designs.

From Miss M. E. Beatty, Sacramento—a Piano Cover, richly embroidered on drab broadcloth.

From Mrs. Danberg, San Francisco—one Beadwork Cricket; one Beadwork Cushion; one Clock or Statuary Stand—beautiful.

From Miss Anna Maria Kortkampf, Mokelumne Hill—one piece Hair Work, in the form of a basket of flowers—a work of great taste.

From Mrs. M. P. Benton—two Oil Paintings, the Child and Lamb and a Landscape, both copies and of very high order.

From Mrs. McCann, San Francisco—two Paintings, one of fruits and the other of flowers—correct and highly finished.

From Mrs. T. A. Hughs, San Francisco—one Water Color Drawing, executed in England in 1847.

From Mrs. J. P. Havens, San Francisco—a Bonnett, made from the leaves of the southern pine, from the Old Palmetto State.

From Mrs. Bates, San Francisco—a very neatly embroidered Boy's Jacket; four Embroidered Toothpicks.

From Mrs Bennett—two pieces Embroidery on broadcloth—well executed.

The Committee having enumerated all the specimens exhibited, would proceed to the

AWARDS:

The Committee after a careful examination of all the material points to be decided, have awarded

To Mrs. Croghan, of San Francisco—the Grand Premier Prize, a silver cup, gold mounted, valued at $50. The specimen exhibited by Mrs. Croghan was a piece of beautiful Embroidery upon white satin—a cluster of grapes, surrounded by a semi-circle of flowers, copied from nature. The work displays most excellent taste and fine execution.

The splendid piece of Embroidery upon white satin executed by Mrs. Comstock, of San Francisco, represented a collection or Boquet of the richest flowers. The great truthfulness of the work, in the design, form, and general execution, particularly the coloring, places it high in the estimation of the committee and they award to Mrs. Comstock the Second Prize of a silver cup, value $25.

The next piece, which the Committee had examined with very great care, was a work executed by Miss M. E. Beatty, of Sacramento, of great beauty and attractions. It is a work labor, and reflects high credit on the artist; yet the Committee deemed the coloring of the fruits to be so far from nature as to deprive them of the opportunity of awarding to it the prize which at first glance it seemed entitled. The Committee deem it worthy a special prize, and award to it a first class silver medal.

A beautiful piece of embroidery by Mrs. S. H. Meeker, of San Francisco, represents the leader of the Israelites with the "Decalogue" in his hands and the broken tablets of stone at his feet. The position of his people around the great lawgiver, and the indignation expressed in the features of Moses, towards his idolatrous followers, is most striking, and the grouping and coloring of the whole picture is so life-like that the Committee award to it a special prize of a first class silver medal.

The Committee notice also with pride the admirable piece of embroidery by Mrs. J. R. Rollinson, of San Francisco—a sketch from the "Bohemian Girl—the exquisite taste and colors, and the excellence of finish, deserve the high consideration of Committee, and a medal.

The "English Hunting Scene," a large and magnificent piece of embroidery, by Mrs Comstock, was the admiration of the Committee for the beauty of design and the elegance of the finish and was an equal match to the "Bohemian Girl," in merit, and in the minds of the Committee worthy of especial notice, and a medal.

An embroidered Cricket, Stool and Bracket, of bead work, in blue and white, by Mrs. Dauburg, of San Francisco, evinced labor and taste, and particularly deserved notice.

Mrs. King, of Marysville, exhibited three pieces of embroidery—two arm chair backs and one seat, and a hunting cap, all most beautifully wrought, and deserving especial notice, and the Committee award a special prize of a first class Silver Medal.

A perfect and beautiful collection of Wax Fruits, true to nature; the work of Miss Abbie A. Warren, deserve very great credit, and a medal,

A case of Shell Work, by Mrs. Medina, won the admiration of all the Committee.

Beautiful Sea Mosses, in cases and on card, reflect credit for their wonderful perfection, and Mrs. Boston and Mrs Williams, who are the manufacturers of these gems, deserve commendations especial for the introduction of these pleasing productions. To each lady a prize medal is awarded.

The sisters of "Rose Cottage" exhibited a beautiful and unique design of a cottage and grounds within a glass case. The cottage was excellent in design and admirable in taste, and suitable for our own Eureka State. The grounds, walks and lakes, as laid down in the design, are beautiful, and the Committee look forward to the day when our own State will be dotted over in all her shining vallies with "homes" made beautiful without and happy within, by the appliances of arts and science in aid of nature. A special award to the sisters of Rose Cottage of a first class silver medal.

A handsome water colored drawing, of fruit grouped in vase, from Mrs. T. A. Hughes, was esteemed by the Committee worthy a prize medal.

Madam Waldo exhibited, Embroidered Couch, Easy Chair and Rug—most superbly executed, coloring rich, design perfect. The Committee award a special prize.

Mrs. Havens exhibited a Bonnet made from the Southern pine leaf—a very handsome specimen of handiwork. To this the Committee award a medal.

A Boy's Jacket, by Mrs. Bates, was very much admired for its admirable taste.

A most perfectly beautiful specimen of art and taste was exhibited by Mrs. Geo. Mellus,—a Hair Boquet, composed of the hair of all the members of the family, from the silken hair of the little infant to the silvery locks of age. To this most touching memorial of affection. The Committee award a special prize, a medal.

The Committee, in examining the various evidences of taste and skill, find it very difficult to decide the relative merits of many pieces, as the great majority of specimens exhibited were not within the rule entitling them to prizes, not having been prepared for the Exhibition; yet the Committee have been liberally aided by Messrs. Warren & Son, who have placed special prizes at the disposal of the Committee for occasions of real desert.

The "White Lilly," by Mrs. Beatty, a water-colored drawing, was exquisitely done, and won the admiration of the Committee, and to this the Committee award a special prize of first class medal.

A very beautiful Pencil Sketch, by Mrs. Plummer, "A Gothic Church;" a special prize, first class medal.

Mrs. Norcross exhibited a case of Richly Embroidered Regalia, of surpassing elegance, and the Committee deem it worthy a medal.

To Mrs. Maria Louisa Mellus, for a finely executed Crayon Drawing, the admiration of the Committee, and a special prize medal.

The Committee having completed the examinations and awards of all the contributions of Ladies, would defer to another Report those works including the Daguerreotypes, Paintings, and Drawings of other artists, together with many valuable curiosities, which will be embraced in the concluding Report of the Committees.

The Committee were highly gratified to witness the deep interest which has been manifested the past year, and they look forward to the coming year, when they trust a wider and more extended influence will be exerted, that we may exhibit to the world evidences that California possesses in her people as much genius, taste, enterprise and taste as any other portion of the globe.

All of which is submitted.

Mrs A. Gibson, Mrs. Gillespie.
Mrs. Haight, Miss Harris
Mrs. Lellingwell, Miss Gibson.
Misses Macondray.

Hon. M. S. Latham.

We take pleasure in laying before our readers the eloquent words of the gentleman named, at his *debut* before the House, at Washington, D. C. The opportunity was a most fitting one, and nobly has he acquitted himself. The citizens of Sacramento county may well be proud of their Representative:

Mr. Latham said—Mr. Speaker: Gratitude for the kindness of a *friend*, as well as reverence for the greatness of a *man*, prompt me to unite my stranger voice with yours in this mournful requiem for the departed. And if an apology be needed, that thus early I claim your attention, let it be enough to say that, from the lips now cold and fixed, and the voice now hushed in death, came first the encouraging words of counsel and incentive, the gentle tones of sympathy and feeling that have placed me to-day, among you. I could leave to the gentlemen who have preceded me, and to the quiet meditation of my own heart, the retrospect of his irreproachable life, and the rehearsal of the noble principles that he so long and firmly advocated, were it not that over every mountain and valley, every plain and ravine of California, are scattered thick the adopted homes of Alabamians, who while the memories of their childhood are fresh, or the graves of their fathers green, can never fail, with you, to remember the *life* of the *statesman* with exultation, or forget to mourn the *death* of the *good man* with sympathetic expression. How natural, then, that I should turn your attention to a few pages in the history of a man, who has filled every place, but one, to which the ambition of an American citizen may aspire, and has filled all with distinguished credit to himself and honor to the country.

William Rufus King was a noble specimen of an American statesman and gentleman. The intimate friend of John C. Calhoun, and the cotemporary of Webster, Clay, Cass, and Benton, he maintained a proud position in the Senate of the United States, by his strong, practical good sense, his experience and wisdom as a legislator, the acknowledged rectitude of his intentions, and that uniform urbanity of manner which marked, not so much the man of conventional breeding, as the true gentleman at heart. He was no sophist to himself, and hence it was that he was truthful and sincere to all the world. His course in the Senate was considerate and dignified. He never to the impulso of the moment; but made his tongue wait upon his judgment. He never knew what it was to speak, act, or legislate by indirection. He was frank and loyal to his colleagues, as he was devoted to his own State, and sincerely attached to the Union. Is it a wonder then that the Senate listened to every word that fell from his lips; that his voice was potential whenever it pleaded the cause of his country?

It is said that during a primary meeting held by one of the factions into which the first French National Convention was divided, one of the men who afterwards played a most conspicuous part in history, spoke but a few words, and these without emphasis. Yet such was the conviction he produced, that his views were instantly adopted. He possessed the genius of *character*; he believed what he said, and produced conviction in others. It is this peculiar "genius of character" which gave force and direction to Mr. King's speeches in the United States Senate, and produced that deference to his avowed opinions and principles which none of his colleagues shared in a more eminent degree. In all that belonged to him individually, Mr. King was the very type of an American gentleman. Free from artifice and disguise, his every thought and instinct was chivalric. Not to adventitious circumstance, not to the chances of birth or fortune, not to the society into which he was thrown, was he indebted either for the distinction to which he rose in public life or to the grace which adorned his private character. He never borrowed the lights or sentiments from others. His mind and heart were of American growth, while his eminent virtues seemed to illustrate our national character. As Americans, we recognize no standard of greatness which is not based on moral excellence, such as pre-eminently distinguished the early founders of our institutions and laws; and in this respect few of the great men whose names have passed into our history, can boast of a nearer approach to those great exemplars, than he whose irreparable loss we now mourn in common with the whole country. During his long and eventful life, of which a very large portion was spent in the public service, there is not an act which can be referred to but to his honor—not a suspicion that could mar the purity and lustre of his escutcheon. Mr. King became a member of the Senate in 1819, when the State of Alabama was admitted into the Union and enjoyed the honor of representing her, without one intermission, ever since. He was a member of that body when he was nominated for the Vice Presidency, and its presiding officer. The respect of his colleagues had already [illegible] the place to which he was [illegible] the almost unanimous vote of the people was from principle and [illegible] ness; but he did not [illegible] he loved Alabama most. While he was [illegible] State [illegible] [illegible] [illegible]

THE CALIFORNIA FARMER.

JOHN F. MORSE, EDITOR.

SAN FRANCISCO:
Thursday, February 9, 1854.

BEARD'S RANCH, Jan. 23, '54.

No inclemency of weather could unfit a man for appreciating the beauties that surround this and the farm we have just left. Nature has done so much to adorn, to embellish and beautify, that there seems very little necessity for invoking the powers of art. And yet art has not been idle about the old Mission of San Jose. Under the supervision of Mr. Beard, who is alike distinguished with his friend and partner Mr. Horner, the old Mission has been rescued from a process of decay, and converted into an elysium of husbandry. The old adobe walls, instead of reflecting a dingy and douhtful hospitality, have been transformed by art into the representatives of an improved masonry, and the echoing mediums of a happy and refined society. Indeed, there is something so irresistably comfortable in the modernized old adobe mansions of California, that we almost incline to the opinion that they are peculiarly if not almost essentially adapted to our seasons and climate. In the sultry and oppressive days of summer, they are ever cool, and in the humid, cold intervals of winter, they are as cosy and comfortable as the spirit of ease and indulgence could desire.

Such were our reflections upon entering and enjoying for a brief season the home of Mr Beard. He lives in a part of the adobe building, erected by the founders of the Mission, and has done and is doing so much in the way of modernizing the premises, that one could scarcely recognize the sombre walls of 1797. But it was not alone the physical transformations of the place that gave interest to our visit and imprinted a most agreeable reflection upon our minds.

It was to feel that one was sharing the hospitality of another hero in farming, one who could talk as quietly over a crop of 250,000 bushels of potatoes as if he had been but pruning a few grape vines before breakfast, or peradventure but just concluding a few carelessly delivered orders to an awkward plough-boy for the day. We could not avoid, perhaps, an almost imprudent observation of men who in so short a time had reared such magnificent superstructures of fame and independence as Messrs. Horner and Beard have already achieved; men of such peculiar combinations of character as to go to every extreme of enterprise without committing a mistake in judgment; men who could so rapidly enlarge the sphere and detail of their operations without appearing to increase the aggregate of labor that devolved upon themselves. But we think we saw in both of these gentlemen an explanation of their success which they could not, if they wished, conceal. They are men of steady habits, stern and inflexible purposes, clear and quick business perceptions, infinite and exact method, honorable and equitable in feelings. This we believe to be a true condensation of those traits of character which have placed them amongst the grandest members of the noble science of farming.

Mr. Beard, too, is not only at home in the cultivation of thousands of acres of land every season, but he is peculiarly at home as a husband, father and neighbor. He seems to be quite as successful in his cultivation of the moral graces of a refined and lovely household, as in the raising of grains and vegetables, or the cultivation of fruits and flowers that adorn his farm and gardens. But no man could work with greater facilities in constructing a warm and comfortable fireside, than E. L. Beard, Esq., of the old San Jose Mission. As we did not sit down, however, to write a treatise upon farmers' wives and daughters, we must be satisfied with the general declaration that Mrs. B. and her accomplished daughter could conveniently make a much less comfortable refuge a most felicitous home.

Mr. B. informed us that he contemplated cultivating about 2,500 acres the coming season, and, like most of those who are engaged in extensive farming, he will devote the principal part of his attention and labor to the raising of grains. He is also paying particular attention to the cultivation of fruit trees, and, if we mistake not, will be one of the foremost men in producing rich and luscious fruits, in a few years from this time. Certainly no two men can be found who deserve more consideration and renown than Messrs. Horner and Beard.

J. F. M.

THE Lecture on Agriculture, delivered by Dr. H. M. Gray, published in to-day's FARMER, will richly repay an attentive perusal.

Idlers vs. Loafers.

THE frequent notices made of idlers, loafers, &c., is a subject that should be regarded with more than a mere word, a note, or a subject for an item. It is true there are a vast number of persons that have no employment, that in the strict sense of that word are not "idlers." They are unemployed, not from choice, but from circumstances beyond their control.

There are also a large number of idlers to which the name of "loafers" is a very appropriate name. They are idle, because they prefer to be so; they are *drones in the hive*, and they loaf from place to place, living upon those who are too good natured to drive them away, or not independent or fearless enough to advise, counsel or rebuke the sluggards as they need.

The first class deserve the kind aid and sympathy of every generous heart—"every heart knows its own bitterness," and it would be a most difficult matter, and oft a painful one to dive down into the causes which may have operated to change the condition of a man from the once active and profitable engagements of business, to the now listless and painful duty of peramhulating our streets from morn till night, seeking some honorable way to sustain himself. Let us keep in mind that in California all our principal cities have been devastated by fire, and many swept by floods. Many a business man has seen the hope of years perish in a night. Upon all our rivers the cultivators have been heavy losers, oft and again. The miner has seen his brightest prospects swept from his sight by the raging torrent pouring down from the mountains, and the adversity that followed upon all classes has often broken the courage, destroyed the energy, and almost filled the bravest heart with despair; and those who have seen brighter days, have been numbered among those whom a cold world call "Idlers." This is not just, for the calamities that meet us in California are not those ordinarily sent unto men; and it is not just to wound the sensitive one by the epithet of the idle, because he cannot bear a load of crushing weight.

Some men may endure heroically all that adverse fate may heap upon them; others sink under them dispirited, and to such a generous sympathy or helping hand should be extended, for this may again revive the latent spark, and kindle into life that energy which coldness and neglect would destroy forever.

The second class to which we allude, we have but little sympathy for, and they deserve but little. Like the "drone in the hive," they would live by others' labor, and in California there are always opportunities for such, and we regret to say they seem to fatten. Like the vampyre, however, they draw the stream of life away steadily, and death is sure to follow, either to the individual or community to which they fasten.

There are many kinds of loafers. The genteel loafer, who enters your house, throws down his hat and cane, seats himself by your fireside, dines with you, sups with you, lodges with you, and all too, unbidden. Not content with this, he takes your horse from the stable, or your carriage, rides at his pleasure, and perchance may think he is honoring you by his company.

Then there is the "hanger-on loafer," one who has fallen a peg from his genteel scale. His brass having become a little tarnished, he descends a little from his bright career, and hangs around your dwelling or place of business to catch an opportunity to make himself at "home for dinner," or for a lunch. He reads your papers, smokes your cigars, listens to your business matters, looks over your shoulder while writing, and makes familiar tattle with your intimate friends; and that too after has he received hints enough his place is better than his company.

The last we shall name is the "dangerous loafer." He once occupied the loafer's highest seat; but he has fallen, step by step, until he is now nearly shut out of every decent business place. His rank laziness has grown upon him, until he is willing to sleep upon the floor, and this he does that he may gather the crumbs that lay about, either to eat, to drink or wear; and at last he passes the rubicon, and is too unsafe to be permitted entrance where property is exposed.

This kind of loafers are now becoming too numerous in our community, and from even this low condition, they unite and form a power that works in the dark; they are everwhere around in the bye places to watch the strangers and the unwary, that they may fleece them; and this kind of loafers are those who now are day by day added to the cells of our prisons. They once occupied higher ground, and it is for the purpose of making the proper distinction between the "unfortunate, unemployed man," and the "vagabond loafer," that we have thus been led on in these remarks. The one needs and demands the sympathies of every generous heart; the other, the scorn and contempt of the industrious and enterprising, everywhere.

We trust we shall ever see the proper terms applied in each instance, until the first are again prospered and happy, and the latter reformed or punished. Then, and not till then, will our community be rid of idlers and loafers of every kind.

PEREGRINE.

Agricultural College for California.

IT will be recollected that in our first number we published the "Memorial to Congress," asking for an appropriation to endow the same upon a liberal scale. Such a one as would be worthy a great nation. We are most happy to announce to the readers of the FARMER, and to all who feel an interest in a subject of such importance, that our Senators are acting with that promptness that characterises them as firm friends to the interests of our State.

We give the following as the action of the Senate of the United States, at its sitting Dec. 13th: The early and prompt action, and the unanimous reception by the Senate of the memorial gives an assurance that we may hope for some action by Congress during this session.

U. S. SENATE, Dec. 13, 1853.

Senator Weller—I beg leave to present the memorial of Warren & Son, and other intelligent and enterprising citizens of California, praying for the endowment, by general Goverument, of an Agricultural College in the State of California, upon a permanent basis, with ample means to sustain the necessary professors of the several branches of the science.

I move the memorial be referred to the Committee on Agriculture. Referred unanimously.

"THE ANGEL AMONG THE FLOWERS."—We commend the beautiful poem on the last page of today's paper. It was originally prepared for the Annual Festival and Horticultural display in the "old cradle of Liberty," in Boston, and was recited in 1845.

HOW TO RAISE SQUASHES.—Mr. A. Holman gives the followiug directions in the N. E. Farmer, for raising the marrow squash:—

When I have planted my squash seeds after the following rule, I have never failed of having been well paid for my labor, viz:—Dig the holes sixteen or eighteen inches deep, three feet broad and seven feet apart; throw the top soil on one side, and the bottom soil on the other side of the holes. After digging as many holes as I wish to plant hills, I return the top soil to the bottom of the holes, and then take one bushel or more of well pulverized manure, one peck leached ashes, for each hill, and with a spade or shovel mix well together from top to bottom. Then plant the seeds, leaving the top of the hills level with the surface of the ground, and keep so during the season. When they are up, and the bugs have done troubling them, thin out, leaving two or three stocks in each hill, which will cover the grouud before the summer is ended.

Wheat in England.

THERE is no labor in respect to which an English farmer is more careful than in the preparation of Wheat for sowing. It is a prevailing opinion that without the usual method there adopted, smut is generated; and from observations I have made, I am diaposed to think there is some foundation for that idea. Salt, lime, or ashes, with strong ley, are articles generally used. These are mixed with the grain the evening before, that the wheat may be well saturated with them by the next day, when taken into the field.

In selecting grain for sowing, great attention is paid to the cleanliness and quality of it, and it is not often that a farmer will sow the same stock above two or three years. White wheat is considerably grown, which is a beautiful thin-skinned delicate berry, and much prized by millers, but it is a most difficult thing to keep it from becoming mixed with other grain. It is generally grown on poor soils, or upon lands that have lain fallow during the summer season, and always brings a lower price in market. The flour is of a darker color, and the berry larger than that of other wheat. There is a species of black oat grown there, and to preserve free from a mixture of white, great pains are taken. We have known a farmer have his seed picked over by hand, that he might have it pure.—*Plow, Loom and Anvil.*

GOOD AND BAD WORK.—A farmer, says Cole, dismissed a hand because, in his abscuee, he set only nine trees in a day. The farmer set out the remaining 91 of the hundred himself the next day. The result was, that the nine bore more fruit the first year of bearing than all the others.

YELLOW BUTTER IN WINTER.—We observe different expedients for this purpose, and among the rest, putting in the yolks of eggs just before the coagulation of the butter in churning. This may be good; but the best way we have found is, to put a peck of carrots—not into the churn, but—into the cow's stomach every morning and evening.

Lecture on Agriculture.

BY DR. H. M. GRAY.

Delivered in the Musical Hall, Nov. 5, 1853.

OUR lots have been cast in a land, upon which is indelibly impressed the seal of greatness. Nature here and now assumes her grandest attributes, and conducts her manifold processes upon a scale of magnificence to which the history of the world affords no parallel. Out of her large heart and from her bounteous hand, she affords, with more than tropical luxuriance, sustenance and plenty for all the children of her care.

Glance over the wide extent of territory embraced within the boundaries of our State,—survey the broad and fertile valleys, inexhaustible in the richness of their soil, and fed by streams whose waters shall, at no distant day, like the Egyptian Nile, plant myriad germs of growth and beauty, and impart increased capacities for development from the mountains to the sea; study the gigantic forms of vegetable growth—those old patrician trees, chronicling those centuries of old, upon which rests the seal of eternal silence; observe, too, the adamantine walls and ledges of rocks, those great stone-books of nature, from whose disintegration this soil, so truly marvellous in its capacities, was formed; take in also, with a large vision the broad features of our landscapes, our mountains mantled with eternal snow, their summits battling ever with the angry clouds, the home of the storm winds and the eyrie of the condor and the eagle, whose screams accord most nobly with the deep monotone of the tempest stricken pines; look at the broad valleys sleeping at their bases in the warm sunlight, gladdened with the rejoicing gush of springs, and smiling in perennial verdure; our bays, stretching away from the sea, into the rich core of the State's heart; the greensward, brilliant with flowers, whose glorious hues outrival the looms of Tyre, whereon angels might tread with joy, forgetful erewhile of the "rivers of living waters" and "the golden streets," and the pure chrystalline air, resting upon the bosom of the land like a veil of gossamer, and where even the

> "Great Heavens
> Seem to stoop down upon the scene in love,
> A nearer vault, and of a tenderer blue
> Than that which bends above the Eastern hills."

Look upon all this, I say—aye, and look nearer home, look in yonder exhibition room and see what in a single year natnre has offered to labor as a reward, see what a glorious promise she extends to enterprise and skill, and can the mind fail to be impressed with the strong conviction that in all the essential elements of greatness, in all the capabilities for infinite expansion, this State of our adoption is the very garden spot of the earth.

When I observe the grand scale on which all the processes of nature are here conducted, the enormous size of her vegetable productions, and their rapid development, I am almost tempted to believe that so generous and prolific a mother had intended to nurture a race of giants rather than the pigmies of our race and age. But the great law of compensation is ever at work; if nature is over bountiful, human need stands ready to divide these blessings with the less favored, and even though the age of the physical Titan has passed, our State gives good omen that the Titan mind is neither dwarfed nor crippled in its noblest attributes.

No, friends: the MIND is the only true Titan. It constructs, it arranges, it perfects, it reduces chaos to order, deformity to beauty, and out of the irresponsible and blindly working elements, it draws the materials for self-growth, for physical improvement, and for the general advancement in power, strength, wisdom, and the moral and intellectual culture of the race.

It is the strong Saxon hand, and the inventive and matchless brain of free acting and free thinking Saxon men, that shall yet, upon these shores, pile Pelion upon Ossa, until they reach the stars.

It will not be expected that I shall speak to you to-night upon either practical or scientific agriculture; neither my pursuits or education fit me for this task.

It is unfortunate for the interests of Agriculture in this State, that no men whose familiarity with this and kindred interests eminently fit them for the work, have as yet come forward to impart instruction and to awaken both scientific and practical interest upon this important subject. Agriculture needs its apostles and exponents, to sow the seeds of knowledge and improvement as well in the fertile brains as in the fertile fields of our State, before the full harvest of ripened experience can be enjoyed—and not among the least of the benefits which may be expected to accrue from this great movement is the awakening of a deep and general interest in the development of the agricultural resources of California, and the best mode by which that development may be secured.

In the remarks I shall have the honor of offering for your consideration to-night, it is my intention to throw out a few general hints upon the tendency of agricultural pursuits, their influences upon society, socially and morally, together with an attempted estimate of the capacities which our State possesses for a very high degree of perfection in Agriculture and its kindred occupations.

The position of California with respect to its Agricultute is remarkable. The State is an epitome of the world. Every variety of soil is here, and here also is every variety of climate. Its proximity to the ocean, the inequality of its surface, and the electric and meteorological conditions of its atmosphere, modify its soil and climate in a most wonderful degree. Besides, it stretches through many parallels of latitude, having a

a widely diversified temperatura, and presenting appropriate locotions for the growth and culture of every form of vegetable life.

To-day you may surround yourself with the warm breath and abounding verdure of the tropics —tomorrow breathe the invigorating and renovating atmosphere of the temperate zone, and still upon the morrow shiver in the northern blast, and stiffen with the aretic cold.

A country thus variously endowed, and fitted for the highest culture is an anomaly in the history of the world. It presents to science, to art, and to intelligent labor a field almost limitless in extent, and exhaustless in resources.

Every species of plant and grain, fruits and flowers in all their diversified characteristics, trees and shrubs, and all the delicate exotics of foreign climes; in short, every form of vegetable life, may here find an appropriate location, and rapidly attain the highest degree of perfection.

Indigenous to its soil, in native luxuriance, and almost without cultivation, its manifold productions year after year have sprang from the teeming earth, unappreciated and unemployed, only yielding by their decay increased richness and reproductive energy to the fruitful matrix from whence they were derived.

But a year has passed since the hand of skilful cultivation was stretched out to reclaim, from waste and exuberance, these productions of the earth, and lo! they have yielded harvests an hundred fold. What, then, may be expected, when science and art, when industry, energy and skill shall have combined to develope all the hidden wealth of a soil, the poorest of products is the very Gold which called it into notice—aye, almost into existence.

When, as in a vast garden, the abundant fruits of the earth, are cultivated by scientific husbandry, and when the exotics and the productions of other climes and other soils shall have been indigenized, amid our fertile valleys, then will California present a spectacle of which the world may well be proud.

We read of a garden once, that was planted eastward in Eden, beautiful with abounding verdure, through which murmured the pellucid waters of life-giving streams, now, alas! fabulous and lost. It needs no prophet's ken, to see in the future that fable realized upon our shores, and though the the golden age has passed, there shall yet remain upon the earth an age of gold, of happier omen and more glorious fulfilment than that of old.

Not only is our State remarkable for its adaptation to the highest forms of vegetable culture, but it is in a still more wonderful degree conspicuous by the character of its population, and the ability they possess of availing themselves at once of all the advantages which the soil presents. We have not alone the bountiful earth and the genial climate, but we have the men here on the ground, fitted by birth, by education, and by experience, to operate without delay and to the best advantage.

Did it ever occur to you—the romance of this country's settlement? It is almost a miracle, but a miracle that is ever enacting when a great idea takes possession of a world, and the great universal heart springs to the consummation of a glorious destiny.

Through the ages, deep buried in the very centre of the world, midway between its continents, midway between its poles, this slope of the Pacific lay dormant and unknown. It looked over the waters dreamily to the orient, and the wind that fanned its hills and valleys was the breath of Asia, slumbering at noontide among her palms; a high wall shut it out from the eastern slope of the continent, and from the noise of civilization and the excitement of national greatness, yet it had in it the germ of boundless wealth. At length Gold, that Archimedean lever, by which the world is moved, was discovered, and then commenced the most wonderful crusade that ever swept across a continent. Representatives from every nation in the world, from every class of society, disciples of every art and science full of youth and courage, full of energy and strength, took possession of the soil, and brought to bear, in the upbuilding of our State, all the varied accomplishments and talents which gives us, at the present moment a population possessing more elements of power, wisdom, and energy than any other land that was ever colonized by human beings.

California sprang into existence, full grown, in a day, and the emblematic figure of Minerva upon our State seal, is most aptly chosen. Full armed for war, the goddess leaped from the brain of Jove —in like manner, with the fullest maturity of strength, we emerged from chaos into a condition of physical, commercial, and political development that enabled us to take our place at once in the great brotherhood of States—the youngest and the strongest—the last to be adopted, and yet from the exhaustless rivers of her wealth enriching all the others.

There was no slow and gradual accession of numbers, no gradual evolution of power by the slow processes of time and accretion—no clinging to strong neighbors for support—no suppliant hand outstretched for aid, for counsel, for support —but peopled in an hour by an overwhelming tide of emigration, that rushed westward like a cataract, swarming in armies across the continent, marching undaunted through a foreign and inimical State, braving the perils of the Cape of Storms —onward, still onward, struggled this crusading army toward the West.

Youth, broad-breasted and strong, for the first time forsook the hearthstone for the light of life: bold sent its strong arm, religion its peaceful heralds, science its ardent votary, art its cunning hand, and labor its stern muscle, as soldiers in the great army of civilization.

They came from the hills of New England, from the hot breath of crowded cities, from the gorgeous savannahs of the South, from old homes in merry England, from the vineyards of France, from old Germany, from the alpine fastnesses of the land of Tell, moved by an impulse they could not control, they sat down together on these shores, under the peaceful shadows of these shores under the peaceful shadows of our hills, to aid in working out the great problem of human liberty, and to take one step further in the subjugation of the earth, to the dominions of Anglo Saxon civilization.

But to return from our digression.

Consider this population, so full of strength and varied attainments, bending their energies to the cultivation of the soil. Let our hundred thousand cultivators, from every corner of the earth, locate themselves in those spots where the soil and climate are appropriate to the cultivation of certain classes of vegetable products, with which each may be intimately acquainted, and how long will it be before the State of California would become not only the richest in her mineral resources, but also in the extent and perfection of her vegetable products?

Let these farmers bring to bear upon the development of our Agricultural wealth the knowledge that each one possesses upon a given subject. Let the New England farmer learn of the sugar planter; let the rice grower step into the adjoining valley, and, taking the Chinese cultivator by the hand, confer with him upon the culture of the tea; let the viutager of France and Spain trade books with the orchardist of New York and New Jersey; let the English farmer give to his Yankee brother some lessons (how greatly needed) in rural embellishment—show him that the cottage embowered in trees, trellised with vines, and redolent with the sweet breath of flowers, is a better and a happier home than the naked, rude, unsightly structure, destitute of shade, and totally devoid of grace and beauty.

And, beyond all, let science and enlightened art contribute by inventions and machinery to the lightening of human labor. Fortunately for the future, the idea has become obsolete that art and science can have no bearing upon practical agriculture. The two are inseparably connected, and reciprocally dependant upon each other.

That cultivator who refuses to be guided by the lights of science, who refuses to avail himself of the aids which geology and chemistry bring to his assistance, scarcely deserves more than the miserable pittance which by hard toil he drags from the reluctant earth.

The benefits which geology confers on Agriculture are neither few or trifling. Our limits will not permit us to point out in detail how the nature of the soil depends on that of the rocks from the disintegration of which it was derived, nor to show how particular plants affect particular soils, in which in a state of nature they exclusively flourish, and in which they flourish most in a state of cultivation, so that by consulting a good geological map of a given district, we may predict before we enter it, the species of crops that will be found most extensively cultivated, and which experience has proved to be the best adapted to it.

Not less valuable to the agriculturist, and especially in a country where the successful pursuit must depend so largely upon irrigation, is an acquaintance with geology, by which he is taught where to sink his shafts for the vivifying element, how to conduct his drainage, and where to adapt his crops to the peculiar character of soil best suited to the growth of definite forms of vegetable life.

With Chemistry, likewise, the farmer must become by necessity acquainted. The use of mineral manures, their chemical composition, their mode of application to change and modify certain conditions of soil, their influence upon the generation and fructification of seeds and plants—all demand his most serious consideration. And the advance of the age in all that pertains to Agriculture and horticulture, renders this knowledge imperative to be possessed by him who would successfully cultivate the earth.

A consideration of the above facts points clearly to the necessity that now exists for the establishment, under government patronage and support, of universities for the study of the natural sciences, and especially in their relations to Agriculture. Endow liberally in this State a great normal school, for the education and training of accomplished men, practically and scientifically for the cultivation and improvement of the soil; call together the ablest teachers in every department of natural science, show to capital and industry where their investments can be made to the best advantage, upon this garden spot of earth; show to the world what inexhaustible wealth science and toil may derive from the prolific and girgin soil; illustrate that the slavish lust for vold, and its enormous accumulation, does not constitute either the surest wealth, the highest happiness, or tho firmest basis of national prosperity; teach the world that the soil is the natural source of wealth, that Agriculture is a calling that underlies all others, and to which all others are dependant, and that he who, by the skilful combination of the scientific with the practical, makes to grow two blades of grass where one grew before, causes foliage and verdure to cover the barren rock, and corn and wine to grow in the waste places, is more of a philanthropist and worthy of more eminent honor, than he who builds palaces or swells his coffers with useless gold.

Need I speak in this connexion of the antiquity or dignity of agriculture, and of the necessity for its encouragement as a means of national prosperity and independence. It is the original source of all wealth and prosperity. It [illegible] and raiment; it gives us life, health, and strength; its productions furnish the materials for the labors of the manufacturer, and in its turn it swells the white sails of commerce; it is the basis of all other arts—the great substratum upon which rests every other interest, individual and national; it is the most ancient of all occupations; it was the first labor commanded by Heaven, and consequently the most honorable, dignified and important; its seniority and divine origin entitle it not only to our respect, but to the highest consideration among the arts of which it is the common parent.

The importance of Agriculture and the necessity for its encouragment as a means of national prosperity, must be obvious to all. The culture of the soil lies at the bottom of all culture, mental, moral, and physical. In every country it has been coeval and inseparably connected with civilization. The dawn of the one is the birth of the other. It is an axiom of history too plain to admit question, that until the savage abandons his roaming, hunting and fishing, and, laying aside his vagrant habits, confines himself to some fixed abode, and improves the soil, he can never become a civilized being. I repeat again, it is agriculture that civilizes a nation—it is agriculture that feeds a nation —it is agriculture that clothes a nation, and it cannot be denied, that that, which civilizes, feeds, and clothes us, must be regarded as the chief pillar of our national prosperity.

Remember, too, that from the tillers of the soil all greatness has sprung—from farmers' sons, "who themselves held the plow." Old Rome had her Cincinnatus and her Virgil; Mount Vernon had its immortal farmer, Washington; Ashland, Lindenwald, Northbend—names sacred in American story, were the honored abodes of husbandmen; and around that silent tomb by the sea, where lies buried the majesty of America, are collected the enduring evidences of the attachment and love of the greatest of America's statesmen for the noblest of human employments!

Not alone as a source of national prosperity and greatness, is our subject worthy of consideration. The tendencies of Agricultural pursuits upon the individual man, in the development of his better nature, upon society, in the refinement of taste, in the conservation of health, and in the preservatiou of morals, are all eminently worthy of notice.

Among the peaceful fields, in the midst of bounteous harvests, by the margins of clear streams, in the depths of mysterious and solemn woods, where the grand old trees are evermore repeating

"Their old poetic legends to the winds,"

the heart grows better, and the expanding spirit holds purer and sweeter converse with the great intelligences of the universe.

The vast city, with its everlasting roar of feverish and teeming life, rests like a great incubus upon the soul. The air is stifling; upon the excited brain, as upon the unnaturally attuned ear of fever, the sounds fall discordantly, on every side we feel the pressure of heaving—aye, of bursting hearts. But go into the quiet country, and let the sweet voices of the great mother—Nature—fall upon the ear, soothingly as the tones of a benediction; look up into the blue firmament, with its foreshadowing of eternal peace; inhale the breath of flowers, and the sweet odors that come up from the fragrant earth, and let the calm come on, in these bright intervals of "life's fitful fever."

Calm and quiet, serenity and repose, hope and love, softness and tears—these are the fair children born in the sunshine and sporting in the shade, with whom it is good and pleasant to walk in the free and open air.

In the crowded city, we feel the throbbing heart of man, but in the quiet country we see and feel and hear the beating of the great loving heart of Nature.

The peaceful pursuits of Agriculture, while they develop and strengthen the noblest virtues of character, afford examples of social order and domestic tranquillity, witnessed in no other sphere or walk in life. Crime, among farmers, is almost unknown; sedition, riot, social vice, businessdishonesty, spring not from the well ordered lives of those who till the earth.

They fill no Hospitals, crowd no jails, commit no midnight depredations, betray no State, and breed no paupers.

The school house, and the village church, stand in the way to mould and guide the intellect and the spirit; while the plow, and the spade, and the anvil afford the weapons wherewith these hardy children of toil go forth over the earth to hold and possess it.

Patriotism is indigenous to soil. The love of the homestead and the paternal acres finds a wider expression in the love of country. All the associations of childhood, the clustering memories of manhood, all the neighborly attachments, the friendly gatherings, and the mutual aids furnished one to the other in the hour of need or pressure, but serve to bind more closely the ties of social intercourse, and strengthen the bonds of love for the land of birth or adoption.

When the first signal of resistance was raised in the war of our independence, it was the farmers of Concord and Lexington by whom the first blow was struck. The yeomanry of Bunker Hill, made their bloody repulse, not less with the legitimate weapons of war, than with the scythe and pruning hook, turned into the spear and sword, and at last, the [illegible] was triumphantly consummated, by the [illegible] and undying patriotism of the Farmer General, Washington.

The Agricultural Exhibition in the adjoining room is the first [illegible] made in behalf of Agriculture in California.

It is [illegible] seed that [illegible] and the ripened harvest. The Fair, O [illegible] be unveiled, what a glorious prospect would greet our enraptured visit.

I see the noble parks where the deer and the antelope bound and play. I see the rivers turned aside from their accustomed channels, irrigating the broad valleys and conveying fertility, beauty and wealth wherever their currents stray. I see the vineyards, purple with the blood of grapes, and happy vintagers, revelling in the sparkling flood, like Bacchanals at a wine feast. I see the great tropical productions, sugar, rice, tea, coffee, waving in native luxuriance. I see departing ships go hence, freighted with the products of the soil, a richer prize to us and to the world than the yellow dust, so laboriously torn from its native matrix. I hear the sound of hammers in the great shops and foundries, and the swift whir of of wheels in immense manufactories.

I see on every hill-side and on every plain, the neat cottage, the school house, the church, the work shop, the lyceum—contiguous to the great cities, the marble walls of colleges and universities, gleam in the pure air, the proudest monuments of national prosperity, and social peace—and I also see the elegant abodes of luxury and refinement, looking out from shadowing groves, adorned with all that is beautiful and exquisite in architecture, the home of generous plenty, and the seats of elegant enjoyment.

All this to the eye that looks intently forward, comes out clear and defined from the misty horizon of the future, its the voyager, eager and intent, beholds looming out from the distant bank of clouds, the outlines of the mountains and the shore, so hope and reason, with prophetic vision, may behold even afar off, the "good time coming."

Honor to the enthusiasm, the energy, and the self-sacrifice that prompted the noble design of this California Agricultural Exhibition, and that carried it into successful execution!

Its influences will be lasting, and long after the remembrances of yonder beautiful display shall have faded from our minds, we shall acknowledge the benefits derived therefrom in an enlarged acquaintance with the capabilities of our noble State—in joining together in the ties of fraternal union, the followers of a common pursuit—in kindling emulation and friendly rivalry, and in producing unity of action in the practical development of all those resources, agricultural, mineral and commercial, upon which the future glory and dignity of our State must depend, and which, if energetically expanded and fostered by a protecting government, will ultimately lead us to the highest pinnacle of glory and renown.

Adaptation of Crops to Market.

The farmer who is wide awake to his business should watch, as well as follow the markets. He should know what crops will sell well. So far as he can form a probable or approximate opinion on this point, he should conform his cultivation to it. In some places he can produce milk to advantage; in others butter or cheese. Again, he may be so situated that neither of these articles will pay him so good a profit as some others. Here his main crop will be hay, there fruit; here potatoes, there squashes and other vegetables.

A farmer in Beverly, last year, raised on two and a half acres of land 18,000 cabbages per acre the net receipt of which averaged him $150. Another farmer, in Danvers, cultivated an acre of land with sage, and realized the handsome profit of $400. The cultivation of the onion in this latter town gives employment to many hands, and and is the source of large profits.

Other examples might be cited to illustrate the importance of adapting crops to the markets, such as the production of the smaller fruits in the neighborhood of cities. It is not the crop on which the farmer himself sets the highest value that should be raised by him, but the crops he can produce at the least expense and sell to the greatest profit.

Some farmers are fearful of loss, if they diverge from the beaten track. They go on, therefore cultivating the same products, and often on the same fields, as did their fathers. Other farmers seem to entertain the opinion that unless they raise the heavier products—corn, and potatoes and grain, and hay, they are no longer farmers but a sort of market gardeners.

But away with such idle fears and foolish notions! Let our farmers study their true interest! Let them not stand still while others are going ahead. Let them be up and doing something to supply the wants of the towns and cities in their vicinity; and not the necessities only, but the tastes also. Let them raise flowers, even, if it will pay a profit! Why not? The taste for flowers is an innocent and rational one; why should not it be gratified?

There are so many articles not yet cultivated to any extent among us, that [illegible] be raised to advantage. For example, [illegible] ble product, such as the castor oil bean, might be introduced and raised, to afford an oil for domestic light, or for mechanical purposes. Some substitute, drawn from mother earth, will doubtless be soon introduced. Sunflower seed might, perhaps, be found to answer. But we must leave the subject for the present, hoping [illegible] it.—*Plough, Loom and Anvil.*

Mixing Grass Seed.—Experience [illegible] an advantage [illegible] grass seed [illegible] for sowing, [illegible] or two [illegible] different [illegible] and yield more [illegible] than [illegible] of one alone. [illegible] red clover, timothy and [illegible]

The Strawberry.

We present our readers to-day with an article upon the nature of this delicious fruit. As many cultivators of the Strawberry may not be aware of such a theory, we publish the article to call their attention to it, and awaken the right feeling to so important a truth. The great cause of the failure of many persons in growing this fruit arises from a want of knowledge of the character and habits of this vine. A little attention to this subject will ensure success. We take the article from the Plow, the Loom, and the Anvil, and shall continue the subject hereafter.

SEXUAL CHARACTER OF THE STRAWBERRY.

The people in Burlington county, New-Jersey, must be behind the age in the cultivatiou of the strawberry. You say, "Jason Heritage sold 500 quarts, which formed one picking, and were sold at $250—fifty cents per quart." The same thing was done in these backwoods twenty-five years ago. One individual now brings 4,000 quarts a day, and is satisfied if he gets seven or eight cents per quart; often far less. Twenty-five years ago we were learned botanists, and held all strawberry plants that bore blossoms perfect in both male and female organs, and raised *a quarter of a crop*. We now hold a different doctrine, and plant one Hermaphrodite to twenty Pistillate plants. We have new seedling, suspassing all plants that I have ever seen, and one I never expected to see—a plant perfect in both male and female organs, that has for five years produced a full crop of large, perfect, well-flavored fruit. I have never seen one of the celebrated English ones that would average one third of a crop of perfect fruit. I was recently at Newark, New Jersey, and was at gardeus where the strawberry was cultivated extensively for market. They were not informed of the sexual character of plants. I saw several beds of Burn's new Pistillate Pine, with not one perfect berry to fifty blossoms, and the gardener deemed it an imposition. He had no other variety within forty feet In his principal beds he fortunately, among Hovey and other Pistillates, had a new seedling Hermaphrodite, raised by my sister in Newark, of which more that one half of the blossoms bore perfect fruit, and the blossoms were so abundant that the quantity of fruit was as large as the roots could render perfect. Strange as it may appear, even in England the true sexual character of the plant was unknown. Mr. Keen, the originator of the celebrated Hermaphrodite that bears his name, discovered that one of his seedlings perfected no fruit. Seeing no stamens in the blossoms, he set one with stamens near it, and the vine bore a full crop. He reported the case to the Horticultural Society, but no further notice was taken of it. In raising from seed, one-half are generally wholly defective in female organs, and not one blossom in one thousand will bear a perfect fruit. All require artificial impregnation. It is done hy insects. Put one hundred plants in a forcing department of plants, perfect in hoth male and female organs, and if there be no insects, not one blossom in fifty will bear fruit. In such cases, the impregnation may be made hy a brush. Where the air is stirring, it may impregnate a few. Thirty years since, adjacent to our city, an ignorant German made a fortune by raising strawberries for market. They were the largest and finest in market, and brought from twenty-five to fifty cents per quart. The same quantity of ground produced five times as much fruit as was raised by his neighbors. I had one-eighth of an acre in vines, and went to the German to buy fruit. His neighbors picked up the plants he threw on the road, when thinning out his plants, and they proved barreu. A chance observation of the German's son led me to suspect the cause. I discovered the sexual influence; made it known. Strawberries went as low as five and six cents per quart, and the German ceased to cultivate them, and raised vegetables; abusing his son and heaping "*donner und blitzen*" on my head. Hailing from what was once the land of rye flour, I am anxious to see the price of strawherries reduced in this State. U. Longworth.

Sacramento Pioneen Association.—The following gentlemen were last evening elected officers of the Sacramento Pioneer Association to serve until the seventh day of September next—Joseph W. Winaus, President; William M. Carpenter, Joseph H. Nevett. J. B. Starr, J. B. Mitchell, D. J. Lisle and Richard Rust, Vice Presidents; Samuel Colville, Recording Secretary; N. A. H. Ball, Corresponding Secretary, B. F. Hastiugs, Treasurer; H. E. Robinson, R.P. Johnson, Volney Spalding, George Rowland, C. C. Sackett, W. C. Waters and James Haworth, Directors. The meeting was a large and enthusiastic one.

Fluctuations in Flour.—The Baltimore American contains an interesting table on the fluctuations in the wholesale price of flour in the three first months of the year from 1706 to the present time. In March, 1706, the price was $15 per barrel; in Jan., 1800, $11 per barrel; in March, 1805, $13; during the war 1812-15 the highest price paid was $11; in 1817, $14.25 was paid; in March, 1821 it was as low as $3.75; from that time to 1828 it did not go above $7; in 1829 it was as high as $8.50; the next year as low as $4.50; in 1837, $11, (the time of the flour riots in New York); in 1838-9, $8; in 1841 it was down to $4.50; in 1843 to $3,87; in 1844, $4.25; in 1845, $4; and from that time to the present did not go above $6 in the months named. In the crrly part of 1853, flour was as low as $5.25 per barrel; now it is much higher.

Mining Interests.

From all parts of the mining districts we hear encouraging news—in some places very large yields. From our exchanges we gather the following:

Nevada, Feb. 3.—The whole face of the country is changed by the late storm. In every direction the miners are at work, and industry and hopefulness have taken the place of tedious waiting and discouragement. Without any more rain for a month the diggings will be well enough supplied with water, while the great majority of the miners will be able to work till July on the past favors of the clerk of the weather.

From Camptonville, situated between Oregon Creek and the North Yuba, a gentleman reports that the place has grown up from nothing at the latter part of June, to its present popualtion of one thousand. They have two good saw mills, one steam, the other water, and the people live in good houses built of sawn lumber. The diggiugs are a gravel range much like the Wauloupa diggings—with a slate formation, the granite pitching into the hill. They are worked by beiug sluiced from the top down. The diggings pay very well. and are very permanent. The miners work altogether with hose, on what is known as the "hydraulic" principle. The "Gold Ditch Co." taking its water from Oregon Creek, sells weekly of water from $700 to $1200. Camptonville is a new, hustling little town, directly on the new road to Downieville about seven miles above Foster's bar.—*Nevada Journal.*

Important Gold Discoveries.—South Calaveras, Jan. 31.—Some valuable discoveries have recently been made here. that bid fair to outrival places more celebrated for their auiferous wealth; one in particular made about three days ago, by Mr. Joseph Bigarial, recently from West Fowler, St. Lawrence county, New York. He succeeded in realizing the handsome sum of eighteen ounces from ten pans of dirt. The stuff containing the gold, is a light colored, slightly adhesive sand, mixed with a smooth and apparently well worn gravel somewhat of the consistency of pulverized freestone, and coarse river gravel. The hill has been named "Bigarial's Hill."

The Aunona Silver Mine.—The Sonora Herald says: "Mr. Theophilus Dodge, of this city, has just returned from the Coast Range, and has given some interesting particulars in reference to to the newly discovered Aurora mine. He locates it about fifty miles south of Pacheco's Pass, and twenty south of Panoche Pass, in the Coast Rauge. The vein is from five to six feet thick, and is supposed to be one of the most extensive in the known world. So far as analyzed, the gold takeu from the top of the mine yields $60 to the 100 pounds. It is slightly tinctured with copper. Senors Ripa and Volado have formed a company, consisting of Americans and Californians, under the name of the "Aurora Silver Mining Company," for the purpose of working the vein ou a large scale. Mr. Dodge has explored all that region of country, and speaks of it in glowing terms. Between the mine and San Luis Ranch are extensive and fertile valleys of public land, well watered. good for graziug or agricultural purposes. which invite the emigrant.."

Great excitement has been recently awakened by capitalists in the shipment of quartz rock to Europe, and the experiments made have been quite successful. We should not be at all surprised to see large shipments made regularly from this country to England, and profitable ones too. We give the following results as quoted by authority:

Berdan's Gold Machine in England.—In the London Mining Journal, and the Times, we noticed very favorable reports of the operations of this machine, which appear to confirm more than was said of it in our last volume. Prof. Ansted, an eminent mineralogist, has been making experiments with it on California quartz, and has reported on the subject. In the report it is stated that gold was obtained at the rate of 4 oz. 4 dwts., and 21 grs. per ton, and valued at £17 18s. 3d., from some Californian quartz in which there was barely a trace of the metal visible when first examined, while some gossan from the copper lodes at Poltimore, North Devon, also yielded at the rate of 1 oz., 12 1-2 dwts. It is also stated by the Professor that ores containing no more than half an ounce to the ton, could be profitably worked by this machine in England.

Mr. Calvert, a well known mineralogist, has also been operating upon some English gold quartz, and he states that he obtained 2 oz. 4 dwts. 10 grs., per ton; its qualities an amalgamator are very highly extolled.

A Distrust of One's own Abilities.—There are more failures in life to be attributed to a person's distrust of his own abitities, that can be laid to the door of one's vanity inducing him to attempt what he is incapable of performing. Hundreds of young men never rise, from fear of falling; while others who have every opportunity, look with so much doubt upon their own talents, that they refuse golden opportunities. Modesty is certainly commendable, and undue allowance of assurance repulsive, but few men are so constituted, that they cannot by application accomplish tasks, which at the glance would seen insurmountable. It is our belief that many men walk in a small circle, who might, had they the boldness, enlarge their sphere of usefulness. In these days of progress, a man must look out for himself, and depend upon his own resources, or he will find when too late the folly of a distrust in his own abilities.

Eastern News.

By the Nicaragua Co.'s steamship Brother Jonathan, which arrived at this port on Thursday, 2d inst., we have dates from New York to the 15th of January. Among the passengers were Madame Anna Bishop and Mr. Bochsa, "the Father of the Harp."

The most important news is that respecting the purchase of Sonora, which seems to be confirmed. The New York Herald says they are enabled to state, upon the best authority, that a treaty to that effect has been negotiated by Mr. Gadsden, approved by the President, and will soon be submitted to the Senate. The boundary will include the route known as "Lieut. Cooke's Wagon Route," extending to the thirty-first parallel, and going due west, taking in the whole of the peninsula of Lower California, including Sonora—upon the payment by the United States to Mexico of fifty millions of dollars.

On the morning of the 26th December, a fire broke out at No. 224 Front street, New York, destroying Mr. McKay's magnificent new ship, the Great Republic, together with the clipper White Squall, and packet ship Joseph Walker, besides several sloops, schooners, etc. The Great Republic was insured for $260,000. The total loss is estimated at over one million dollars.

The fine packet ship Staffordshire, of Train & Co.'s Liverpool Line, while on her passage from Liverpool to Boston, struck on Blond Rock, off Cape Sable, on the Nova Scotia coast, on the morning of Dec. 30th, and immediately sunk, drowning about one hundred and sixty persons, including Capt. Richardson. The three mates, seventeen seamen, and twelve passengers reached Cape Sable. The ship was built by Mr. Donald McKay, and was fully insured in New York.

The papers are filled with accounts of most disgraceful riots at Erie, N. Y., in consequence of the Erie and New York R. R. Company changing the terminus of their road from Erie to Dunkirk. Several lives had been lost; but at our latest dates, Jan. 4, all was quiet.

The steamship San Francisco left New York, Dec. 21st, for San Francisco, having on board the 3d Regiment U. S. Artillery, under the command of Gen. Wool. She has since been spoken at sea, disabled.

Mr. Seward's Pacific Railroad bill contemplates a route north of the fortieth parallel, beginning at the western boundary of Mississippi and terminating at the eastern boundary of California. It is to be built by any company chartered by any one of the States, and to be used by the U. S. as a military and post road. It is to be completed in five years—at least one fifth every year.

A terrible riot occurred in Cincinnati on Christmas day, caused by a demonstraton of an organized body of Germans against Bishop Bedini, the Pop's Nuncio. After a severe conflict, in which fire-arms were freely used, the police captured about sixty rioters, of whom fourteen were wounded and one died.

Colonnade Row, the largest block in Brooklyn, N. Y., has been burnt—loss $150,000. There have been an unusual number of large fires, including the Albion College, at Albion, Mich., and eight thousand bales of cotton, at Shreveport, La.

The steamer Marlborough exploded at Charleston, on the 22d Nov., killing the captain, first and second mates, engineer and twelve out of fifteen hands on board.

Mrs. Helen C. Lake, wife of Hon. D. Lake, Judge of the District Court of California, died ou the 23d of December, in New York. Mrs. Lake arrived from California in perfect health but a few days previously, and the steamer had already taken out advices to her husband of her safe arrival.

Our advices from Europe are to the 14th December. According to one account, the Turkish fleet had been almost annihilated by a Russian Squadron; while another account gives the loss of the Turks at seven frigates and two corvettes, and that of the Russians at two ships of the line, three frigates and two steamboats. That there has been some hard fighting is pretty evident; but, until more reliance can be placed on European telegraphs, we are unable to form any opinion as to the result. It is said, however, that the Anglo-French fleet had been ordered to enter the Black Sea, and this, if correct, would seem to indicate that the Turks had been beaten. According to telegraphic despatches, received by the London Chronicle, the Turks had been completely successful in their land operations in Asia, having taken several fortresses, and surrounded Prince Woronzoff in the vicinity of Tiflis.

From South America and Australia.

By the arrival of the steamer Oregon at this port on Sunday last, from Panama, we are put in possession of dates from Valparaiso to Dec. 31, and from Australia to the 15th November.

Valparaiso papers represent the country to be in a highly prosperous condition—labor being in brisk demand, and buildings going up in all directions.

In Lima there seems to be a growing discontent against the government. General Torrico, with the government troops, encountered Domingo Elias, the leader of the rebels, on the 7th ult., and defeated him, entirely routing the militia men and slaves he had rallied around him. He and his son had left the country.

Two severe shocks of an earthquake had been felt in Lima.

British ship Cambrodia, Burns, 1,140 tons burden, sank at sea, 600 miles from Callao. The captain and crew reached Callao in boats four days afterwards.

Australian papers mention much discontent among the mining population, owing to the unequal state of taxation in the mines. The Argus warns the inhabitants of Melbourne to beware of pestilence arising from the filthy state of the city, and instances the fate of New Orleans and Rio Janeiro. The same paper advocates the Maine Liquor Law for that "drink-degraded land."

Provisions are said to be plenty in the interior, except flour which sells at £12 ($60) per bag. Gold sells at £3 15s. 3d. per ounce in the mines, and at Melbourne at £3 16s. 6d., with an upward tendency. The exports to San Francisco from Melbourne, for the quarter euding October 10th, were valued at £1,410 ($7,050).

Agriculture in Virginia.—The following facts relative to the state of agriculture in Virginia will tell equally well when applied to any other State:

The Southern Planter, Richmond, Va., states that owing to the various instrumentalities put in operation, the Committee appointed by the State Society can report that since the annual meeting in December last, the number of members has been increased from 439 to at least 4,000! and the funds in the hands of the Treasurer from $268 to about $8,000.

In preparing for their State Show the Society expended $10,000, and with the prospect that such a large sum would prove an economical expenditure. It affords us great pleasure to notice these energetic movements in the Old Dominion.

Marine Disaster.—Intelligence was received in this city yesterday, of the loss of the clipper ship San Francisco, 108 days from New York, as she was beating into this harbor. When opposite Fort Point, on the north shore, she missed stays and struck a rock, carrying away her bowsprit, and some of her rigging, and causing her to leak so much that they were compelled to run her ashore. She lies about a quarter of a mile outside the point where the British ship Jenny Lind was wrecked about two months since. She now has 14 feet water in her hold, and will prove a total loss, with her cargo valued at $150,000. Her passengers have all been brought to the city.

MARKET REPORTS.

San Francisco, Feb. 8, 1854.

We are cheered by hope of better things ahead—the rains have given encouragement to the Cultivators, and thus induced a little stir in trade—and were it not for the continued influx of merchandise by new arrivals, we should assert a certainty of permanent improvement.

All kinds of Grain are dull. Potatoes hang heavy, owing to the immense quantities stored and coming in by contract. We however have faith to believe the farmers will receive a remunerating price yet.

We repeat our remarks of last week relative to prices. They are merely at nominal rates. Sales are made to meet an emergency and without regard to market rates or value of the goods.

Perseverance, energy, and will to conquer and overcome all difficultics that depress trade will soon put things better.

JOBBING PRICES.

J. W TUCKER,
125 Montgomery street.

There are Three Things I Do Not Do!

1st. I do not get a gentleman to leave his Watch, and when he calls for it, charge him TWENTY NINE DOLLARS for cleaning it, and have it stop two hours after.

2d. I do not ask FIFTY DOLLARS for a chain, and sell it for THIRTY SIX DOLLARS, and warrant it Fine Gold when it is found with brass mixed, and have to take it back and give FIFTY DOLLARS in exchange, and have another chain.

3. I do not sell a Gentleman he can leave his Chronometer, Watch, Gold Guard Chain and Locket, all of right quantities, worth in the aggregate, when he pays me SIXTY FIVE DOLLARS, and TEN DOLLARS more for raising it.

There are many things I do not do while I am doing business here.

1 4t J. W. TUCKER.

VOLUNTEERS WANTED!
TO THE GREAT SALE OF
JEWELRY AT JOHN W. TUCKER'S.

I shall now commence selling off my entire stock, consisting of DIAMOND WORK, WATCHES, JEWELRY, SILVER WARE, etc., etc.
Amounting to more than $300,000!
I have got to sell all the above goods before the first of June, as I have to rebuild my store according to the new grade. Any person who wants a good article can procure one from me
Cheaper than in any other City in the World!
But I don't wish it to be understood that I pretend to compete with those who sell trash;—persons who would not hesitate to guarantee a brass ring or a watch for pure gold;—there persons can sell lower than I can. If I sell an article of any kind, and it does not turn out as I represent it, I will return the money. No person will leave my establishment dissatisfied. Call and see me before you purchase elsewhere.
JOHN W. TUCKER,
1 1m 125 Montgomery street, near Sacramento.

Catalogue of Fruit and Fruit Trees.

WE call the attention of Nurserymen and Orchardists to a new catalogue just issued by us, prepared with great labor and cost, giving the lists of the best fruits cultivated in Europe or America, with their synonyms. This catalogue embraces also lists of best Vegetables, Ornamental Trees, Flowering Plants, Seeds, &c.—being a perfect illustration of the best varieties of everything belonging to AGRICULTURE, HORTICULTURE, and FLORICULTURE, with brief directions for the cultivators in each department, and *as adapted to California.*
This work will be found a very great help to all engaged in cultivation.
Price $1 per copy. WARREN & SON

SONG OF THE ANGEL OF THE FLOWERS.

BY J. WARLAND, ESQ.

I rose mid Eden's virgin bowers,
And caught upon my wings
Your rosy tints, celestial flowers!
That bloomed beside her springs.
The etherial sun his golden light
Shed through the perfumed air;
No foot but mine, at morn or night,
Could crush the flower-cups there.
The morning dew-drops as the fell,
And sparkled in her bowers,
Paint, in each bright and tiny cell,
The Angel of the Flowers.

And thou, sweet bird of Paradise!
Dancing from spray to spray,
Who, in the soft and silver light,
Singest the livelong day—
Thou wooest me with thy strain of love
From flowery lawn to hill,
And to my song—as wreaths I wove—
Gay danced each laughing rill.
Thy music, on the freighted breeze,
That kissed the Elysian bowers,
Entranced, amid young Eden's trees,
The Angel of the Flowers.

And when, in that enchanting hour,
I saw thee soar away,
I rose with thee from Eden's bower,
Into celestial day;
I flew o'er earth, her flowers to cull,
And sighed for Eden's bliss,
Among the bright and beautiful
Whose cheeks the soft winds kiss;
Sailing on the delicious breeze,
I heard them in their bowers.
Each daughter hailed, beneath the trees,
The Angel of the Flowers.

And as we sang a sad adieu
To our sweet Eden clime—
I heard angelic voices chant
A farewell song sublime.
I saw them wave their hands, and lean
Upon their harps the while;
I wept—as closed the golden gates
Upon their heavenly smile.
I turned away, and on my wings
Caught the light of Eden's bowers,
And far I heard their farewell chant
To the Angel of the Flowers.

Downward to earth I winged my way,
And wooed the laughing girls,—
I wove my roses in their cheeks,
Their lips and sunny curls;
The lily's white, the rose's blush—
I wove them into one;
I braided in their hair the flush
Of the golden, setting sun.
Me pressing, till our hearts were one,
We sang, those blissful hours;
They pledged their love forevermore
To the Angel of the Flowers.

I saw one take her bridal vow,
A rose upon her breast—
She blushed, as to her bosom's shrine
Her lover's hand she prest.
I marked the graceful creature's tear,
As she gave her heart away,
And crushed, in that embrace, the rose
Upon her breast that lay.
Its fragrance breathed from her sweet lips,
As she kissed him in her bowers,
And welcomed to their green retreat
The Angel of the Flowers.

Another, in her radiant bloom,
I watched upon the green,—
She bent above the churchyard tomb,
And wept for one within.
She plucked the moss-rose from her breast
And placed it on his bier—
And, as her low-voiced prayer she breathed,
I caught that mother's tear.
But, as she turned in grief away,
And sought her cypress bowers,
She touched her lute, in plaintive strain,
To the Angel of the Flowers.

I saw a bright-eyed child at play,
His laughing dimples hid
Beneath his silken curls,—his eyes,
Like jewels of Ginmschid.
He chased the gorgeous butterfly
From fragant shrub to tree—
He plucked the wild rose from its stalk
And laughed with boyish glee.
The rose no thorn shall bear for him,
In youth's unclouded hours—
She fanned the cherub with her wing,—
Sweet Angel of the Flowers.

And oh! amid that lovely throng,
Two sisters, in sweet glee,
Were singing, as they tripped along,
O'er blooming lawn and lea.
They plucked the daisy in their path,
The violet from its bed,
And strewed them where a brother lay,
To rest his aching head.
He kissed them for the grateful boon—
So sweet in his sick hours,
And bade them cling, with sister's love,
To the Angel of the Flowers.

I gazed at Beauty, as she sighed,
Upon her jewelled throne,
And scattered wealth around, like pearls
That clasp her virgin zone.
Queen-like, she trod—her fairy feet
Tripping to songs of mirth—
The south wind dallied with her cheeks.
Bright creature of the earth!
I pressed her lily hand in *mine*—
As we sought the rosy bowers,
I breathed my perfumes to her lips,
And WOMAN since, herself hath been
THE ANGEL OF THE FLOWERS.

THE hand that can make pie is a continual feast to the husband that marries it.

OLN JESTS.—Persons who gloat over dust and black-letter need scarcely be told that the best of of "modern" jests are almost literally from the antique: in short, that what we employ to "set the table in a roar" were employed by the wise men of old to enliven *their* cups, deep and strong; that to jest was a part of the Platonic philosophy; and that the excellent fancies, the flashes of merriment, of our forefathers, are nightly, nay, hourly re-echoed for our amusement. Yet such is the whole art of pleasing: what has pleased will, with certain modifications, continue to please again and again, until the end of time.

A speculative gentleman, wishing to teach his horse to do without food, starved him to death. "I had a great loss," said he; "for, just as he learned to live without eating, he died."

A curious inquirer, desirous to know how he looked when asleep, sat with closed eyes before a mirror

A young man told his friend that he dreamed that he had struck his foot against a sharp nail. "Why then do you sleep without your shoes?" was the reply.

A robustious countryman meeting a physician, ran to hide behind a wall; being asked the cause, he replied, "It is so long since I have been sick, that I am ashamed to look a physician in the face."

A gentleman had a cask of American wine, from which his servant stole a large quantity. When the master perceived the deficiency, he diligently inspected the top of the cask, but could find no traces of an opening. "Look if there be not a hole in the bottom," said a bystander. "Blockhead!" he replied, "do you not see that the deficiency is at the top, and not at the bottom?"

A young man, meeting an acquaintance, said, "I heard that you were dead." "But," says the other, "you see me alive. "I do not know how that may be," replied he: "you are a notorious liar; but my informant was a person of credit."

A man hearing that a raven would live two hundred years, bought one to try.

A man wrote to his friend in Greece, begging him to purchase books. From negligence or avarice, he neglected to execute the commission; but fearing that his correspondent might be offended, he exclaimed, when next they met, "My dear friend, I never got the letter you wrote to me about the books."

A wittol, a barber, and a bald-headed man travelled together. Losing their way, they were forced to sleep in the open air; and, to avert danger, it was agreed to keep watch by turns. The lot first fell on the barber, who for amusement, shaved the fool's head while he slept; he then woke him, and the fool, raising his hand to scratch his head, exclaimed, "Here's a pretty mistake; rascal! you have waked the bald-headed man instead of me."

A man that had nearly been drowned while bathing, declared that he would not again go into the water until he had learned to swim.

A fellow had to cross a river, and entered a boat on horseback; being asked the cause, he replied, "I must ride, because I am in a hurry.

A student in want of money sold his books, and wrote home, "Father, rejoice, for I now derive my support from literature."—*Mrs. Partington's Carpet Bag.*

BECOMING A MEDIUM.—The fascinating spiritual rapping is without a doubt gaining strength among us, and some very ludicrous incidents often grow out of it at times, as well as more serious and deplorable ones.

A few nights since, within this week, a young male friend of ours, who from a sneering skeptic had become a devout believer, retired to rest, after having his nervous system partially destroyed by the information, through the spirit of his grandfather, that he would very soon become a powerful medium. He was in his first comfortable snooze, when a clicking noise in the direction of the door awoke him. He listened intently; tho noise was still going on—very like the raps of the spirits on the table, indeed!

"Who is there?"

There was no answer, and the queer noise stopped.

"Anybody there?"

No answer.

"It must have been a spirit," he said to himself. "I must be a medium. I'll try. (Aloud.) If there is a spirit in the room it will signify the same by saying 'aye'—no, that's not what I mean. If there is a spirit in the room, will it please rap three times?"

There very distinct raps were given in the direction of the bureau.

"Is it the spirit of my sister?"

No answer.

"Is it the spirit of my mother?"

Three taps.

"Are you happy?"

Nine taps.

"Shall I hear from you to-morrow?"

Raps very loud again; this time in the direction of the door.

"Shall I ever see you?"

The raps then came from the outside of the door. He waited long for an answer to his last question, but none came. The spirit had gone; and after thinking on the extraordinary visit, he turned over and fell asleep.

On getting up in the morning, he found that the spirit of his mother had carried off his watch and purse, his pants down stairs into the hall, and his great coat altogether.—*Mrs. Partington's Carpet Bag.*

FISH for no compliments, as they are generally caught in shallow water.

PEORIA PREMIUM STEEL PLOWS.

THE FORMER CELEBRITY OF THE PEORIA PREMIUM STEEL PLOWS, and the unequalled success of their introduction in this State, would seem to preclude the necessity of any further effort on our part to draw attention thereto: but in view of the transitory nature of business in general in California, and the probability that some may have looked upon our establishment of an extensive and permanent manufacture of Plows here, in the face of such enormous importations and extravagant prices of material, as an impossibility—we believe it expedient to adopt this method of bringing it within the special notice of all concerned, that we are now manufacturing, and will have ready for this season's demand, three thousand of the most superior Plows ever made or used within this State.

We feel warranted in making this assertion, from the fact that all who used our Plows last season testify that they were superior: and we have studied so closely the immediate wants of our patrons from every section of the State, that we can now furnish Plows suitable to any particular kind of soil known in the State.

Our material has all been selected in the East by one of our firm, and imported by us directly from the manufacturers, which places it in our power to say confidently that nothing is lacking in quality, while we are enabled to make the plows at a cost greatly below that of last season, and are determined to sell at prices within the reach of every farmer who may wish to use the Peoria Premium Steel Plow.

It should be remembered that these plows will do double the work with half the team required in using the ordinary cast Plow; and that the work, when done, will be well done.

For particulars of prices, and descriptions of plows, we refer you to the subjoined card. The prices therein detailed are those established at our factory, and the only alterations from them that we authorize our agents to make, is the addition of the cost of transportation to their places of business—thus placing the plows at every accessible point of the State for the exact price charged at the Factory, with the necessary expenses only added.

Farmers ordering our plows through mercantile houses here, would do well to write to us at the same time, if they would make sure of getting the right plow, for some are interested in representing that we are not making plows at all, while other will not sell our plows when they can get off a cast plow. We therefore recommend that orders should be sent to us directly, accompanied by an order upon your merchant for the amount, which you can always know by a reference to the card accompanying this circular.

On the 24th of June the interest of T. ADAMS in our business ceased, by the sale of his entire interest therein to L. E. MORGAN. Aside from this, there has not, nor will there be, any alteration, as we have the same efficient and thoroughly practised hands in every department of our business.

E. L. MORGAN & CO., Successors to
T. ADAMS & CO.,
Corner of Broadway and Battery streets.

☞ The following are the established prices for the **Peoria Premium Steel Plows**, at our Factory, and the only addition our Agents are authorised to make thereto, is the cost of transportation to their points of business:

SIZE.	DESCRIPTION.	FURROW.	PRICE.
No. 5	plain	10 in	$ 30
5½	"	12 in	$ 35
6	"	14 in	$ 40
7	"	16 in	$ 50
6	clipper or prairie	14 in	$ 60
16	" "	16 in	$ 70
18	" "	18 in	$ 85
20	" "	20 in	$100

PROCLAMATION EXTRAORDINARY.

Woman's Rights
VINDICATED AND MAINTAINED.

WHEREAS, from the creation of the world, it was designed by the "Great First Cause" that

Womans's Rights and Privileges

should be co-equal to Man's; and whereas, she has been treated by many men in all ages, up to the present time, as an inferior being to themselves: Now, therefore, be it known that I, M. L. WINN, of

Winn's Fountain Head and Branch

having expended large sums of money at the FOUNTAIN HEAD for the gratification of the appetites of Gentlemen, do recommend that Woman be hereafter allowed and provided with the facilities to enjoy all the privileges for which she was by Providence designed; and for this purpose I do hereby proclaim, that my

BRANCH,

Corner Montgomery and Washington streets,

shall be conducted with a view exclusively to the **Enjoyment and Comfort of Ladies**, and such Gentlemen as know and appreciate their worth.

At the earnest solicitation of many Ladies and Gentlemen and agreeable to my promise some months since to enlarge the BRANCH, so as to accommodate the fast increasing patronage I shall, in a few days, add Two Spacious Stores on Montgomery street, to the Original Branch, making the

MOST EXTENSIVE ICE CREAM

And Refreshment Establishments in California.

The day of opening will be duly announced through the medium of the Daily Press, so that all may witness what has been accomplished for the accommodation and comfort of "God's last best gift to man." In the meantime, lots of Fun and Jollification may be enjoyed in reading the mottoes and feasting upon the luxuries to be enjoyed at

WINN'S FOUNTAIN HEAD,

78 and 80 Long Wharf, and Branch, corner Washington and Montgomery streets;

where Every Thing for the Holidays may be found, from a Sugar Whistle to a Bride's Cake of half a ton.

1 M. L. WINN, Proprietor.

5 4t Also at 130 Jackson street, San Francisco.

A OARD.

FREE EXHIBITION HALL.—We desire to announce, and we do so most respectfully, that hereafter, during our Exhibition, our Hall, containing all the magnificent specimens of the Agricultural Exhibition, together with the choice Paintings and Embroideries, and many rare and beautiful specimens and curiosities from the "Islands of the Sea," will be open to the visits of all who wish to examine them, FREE OF CHARGE.

We would also announce to Artists that our Hall is offered to them FREE, to exhibit their work for exhibition or sale, and we further announce to all persons who have Paintings, Statuary Works of Art, Curiosities, or extra specimens of anything of domestic manufacture, that here is a place the most appropriate for its exhibition or sale, and where the most extended notice can be given to it. All who have works of art, or any of the curiosities of the country, or wonderful specimen of the Agriculture of California or the Pacific coast, will find this Hall the most appropriate place for the exhibition of the same.

We desire also to state that all the Agricultural papers and periodicals of the United States and the principal publications of Europe upon the subjects of Agriculture, Horticulture, and Floriculture and other scientific subjects, and to our patrons, and to the cause of Science, they are ever open, and we tender our best aid to developing to the utmost of our power the good resulting from them.

'V A' & SON

THE CALIFORNIA FARMER

And Journal of Useful Sciences.

VOL. 1. SAN FRANCISCO, THURSDAY, FEBRUARY 16, 1854. NO. 7.

THE CALIFORNIA FARMER,
AND JOURNAL OF USEFUL SCIENCES,
IS ISSUED AT THE OFFICE, ON BUSH STREET,
EVERY THURSDAY MORNING,
At Eight Dollars Per Annum, in Advance,
BY JAMES K. PHILLIPS & CO., Publishers.

JOHN F. MORSE, Editor.

ADVERTISEMENTS.—A limited number of Advertisements will be inserted at the following rates: For one square of eight lines, per month, $6. For business notices of five lines or less per month, $4. A slight reduction will be made to regular advertisers.

The Ruined Valley.

It was in the early part of June. The weather had been unusually warm, the air sultry and close. Weary, I had sought my pillow for rest. Sleep did indeed come, but it was neither a continued or a refreshing sleep, and, after restless hours I arose before the dawn and sought the open air upon the neighboring hills.

I had selected a lofty point, commanding an extensive prospect upon all sides and there I awaited the opening day and the rising sun.

A strong wind had sprung up in the night, from the west, and the sultry atmosphere of past days had left, and a clear and sweet air gave new life to both body and mind. Nothing could be more beautiful, nothing more calculated to elevate and purify thoughts than to witness a scene like the one just unfolding before me. At first, a pale yellow tinge faintly gleamed upon the eastern horizon, but quickly this expanded and deepened in color from faint tints to those of bright and burnished gold, each moment producing new beauty and power; from their low and distant bed these harbinger clouds rose upwards and onwards, mounting hill after hill, and then leaping upward to the very heavens with a bound. At this moment my attention was directed to the grove near me, from which issued a chorus of the sweetest melody that ever struck my ear. It seemed an anthem of praise—and so it was, for as I turned my head eastward, the glorious sun was lifting himself upward to gladden the earth. It was this beautiful advent that had called forth the sweet anthems from the feathered songsters a moment before, and now there were added a thousand notes in joyous chorus, for from every tree, bush and plant, every living thing gave a recognition of coming day—unitedly they gave forth their morning song of praise to God.

Tears unrestrained flowed freely from own eyes as I beheld this universal evidence that God was thus acknowledged by created beings even in this lower order of his works; and my heart bowed in adoration as it joined to swell the morning hymn of praise that was now going up to him who said "Let there be light."

Refreshed and strengthened by this spiritual communion, and being in a proper state of mind to look forth upon Nature and her fair and glorious work, I gazed forth upon the scenery which now met my sight, as the early morning light rested upon it. It was indeed beautiful. Hills, valleys, streamlets and rivers, orchards, gardens, woods, groves and lawns were scattered in rich and varied profusion for miles around me, and my eyes feasted upon this vision of nature's own handiwork for many hours.

As I viewed and reviewed every scene that came within the reach of vision my eye would constantly turn to one spot more lovely than all the rest There I loved to gaze, for it seemed a hallowed spot. There was a quiet and a charm resting upon this place, that, turn and gaze as I would, my eyes would be drawn back to it, for there they loved to rest. So often had I viewed it, that it seemed a familiar spot. The mansion was large and handsome; over the arched gateways the rose and honeysuckle shed forth their beauty and fragrance. Broad and smoothly pebbled walks around the borders of these grounds gave a taste and a charm to all the other arrangements that marked this "vale of sweets," for the spot which I shall now more fully describe lay in a beautiful valley. High and strong walls and fences enclosed the best portions of these rich and fertile lands. Here a pretty stream ran through the centre of the grounds, giving freshness as well as beauty to the spot. It was the season of roses, and it required but little imagination to conceive that the fresh breeze which now reached me from that direction bore to me some of the fragrance that exhaled from the large parterres of roses that I could see were then opening their fragrant petals to the morning light. Trees loaded with early summer fruit, arbors covered with the grape, and fruits of every season were there. There, too, beneath the glass of many houses could be seen plants and flowers from every clime; the orange and the fig were there, and the lemon and the pomegranate; clusters of ripening grapes of every kind, from the pale yellow to the deepening purple, luscious and tempting; beautiful walks, shady arbors, and summer-houses, and cool retreats were there in abundance. Near the centre of these grounds, just over a neat little bridge, I saw a miniature pond, the surface of whose waters was covered with the fragrant water lily. The more I gazed, the more I felt convinced that this was no ordinary spot; it seemed to me the home of flowers; for, gaze where I would, new beauties constantly developed themselves. My eye caught sweet little alcoves, tastefully arranged, where the busy bees were at work, culling from the flowers around their own home, their stores of transparent nectar and bearing it away to their own perfect cells.

My eye now rested upon a beautiful temple near the grounds, surrounded by a chaste portico, with its columns; beneath which seats were arranged, giving a quiet retreat at all times from the sun and heat of the day. I had scarcely comprehended all that was to be seen in this sweet spot, ere my attention was attracted by noticing some one leave the mansion and walk towards this retreat. I now saw the person distinctly, and quickly gathered from his appearance that it was he who claimed this spot as his home. In one hand he he held a scroll, and in the other a flute. His walk was slow and sad, and there seemed in his gait a measured sadness. I had brought my glass with me, and now a deep interest in this person caused me to raise it to my eye, to ascertain if I could read a deeper, truer lesson than mere imagination would teach. I was not disappointed—my conjectures were true; distinctly I could see by movement and gesture that sad thoughts were tenants of his mind. He had now reached the temple and seated himself; after a minute, he raised his flute to his lips, and the sweet but melancholy strain that reached my ear fully confirmed all I had supposed. It was an air that had long been familiar to me; I listened with deep emotion. Suddenly he ceased playing, and, laying aside the instrument, wiped from his eyes the tears that had freely gushed from them. Such was the effect upon me that I could not turn away my gaze, and in a few moments he rose, and, drawing his hand across his brow, he raised his eyes upward, seemingly to catch inspiration from above, and broke forth, in tones soft and distinct, to the same strain he had been playing. Clear and free his song floated away upon the wings of the early morn, and, distant as I was, I could catch a portion of the song that came from his lips, for it was familiar. These were his words:

"'Tis sad, 'tis sad, to think upon
The joyous days of old;
When every year that wearies on
Is numbered by some friendship gone,
Some kindly heart grown cold.
Could those days but come again
With their thorns and flowers,
I would give the hopes of years
For those bygone hours."

He seemed much affected, for he turned away and rested against one of the pillars of the verandah, for a moment; but again he sang—

"'Tis sad, 'tis sad to number o'er
The faces glad and gay,
Which we have loved—some smile no more
Around us as they did of yore;
And some have turned away.
Could those days but come again
With their thorns and flowers,
I would give the hopes of years
For those bygone hours."

His voice trembled ere he had finished, and quickly bowing himself upon the seat, he gave way to his sorrow. I wept also—there was an interest in my soul, awakened for him, beyond my own control. My attention was again awakened by the appearance of another person from the mansion. This person differed altogether from the former—he of whom I have spoken seemed to move, as if conscious of bearing high and noble purposes. The one now approaching moved quickly, and gazed around, as if in search of some one, or fearful of meeting some one. There was that in his movement that told of one not satisfied with himself. The dress as well as the movements of these two individuals was widely different; the former wore the dress of an American, the latter, of a foreigner: the cap bearing upon its front the thistle, and the plaid upon his shoulder told that he was a Highlander: and as soon as his eye rested upon the former, who was now seated in the verandah, he hastened to his side. They seemed to meet as friends; yet there was in the deportment of the stranger enough to convince me that there was danger in trusting the "dangerous thistle." A cold shudder crept over me, as if danger was imminent to the friend who had so deeply won my sympathies. I turned away sick with the very thought, and feeling wearied even by the intensity with which I had interested myself, I laid my head upon my cloak for rest and meditation, when quickly I was lost in sleep.

So deep had been the impression made upon my mind, that the scene before me was continued in my sleep; but such a dream—fearful even to the dreamer; should it be even a faint shadow of a reality, how fearful. God save my friend from the fate which my dream fastened upon him by his treacherous friend.

How long I slept and dreamed I know not, but here is the fearful picture, and it can never leave my mind:

Methought I was still looking at this friend and the stranger, who were now engaged in earnest conversation, every moment growing more and more excited as I judged by their gestures. Presently they both arose. My friend raised his head slowly and pointed upward toward Heaven; he then waved his hand to the stranger as if bidding him depart, and turned from him and seated himself again, overpowered by strong emotions.

At that moment darkness seemed to gather suddenly, the heavens were overcast, dark and fearful clouds arose rapidly, the lightning flashed, the pealing thunder shook the very earth; a hurricane came on. I looked for my friend; there he sat, calm and immovable. His companion at that moment sprang to him, to arouse him, but quickly turning from him, left the verandah and walked away a few rods, when, returning upon the opposite side he sprang forward and hastily climbing one of the columns of the portico, and placing himself upon the verandah, moved around to where my friend had sat, who had at this moment risen and was leaning against a column of the portico. Over this very column now stood the foreigner. Again a cold shudder chilled the blood in my veins, for it seemed as if some fearful treachery was preparing for my friend.

The gathering storm was approaching, and most fearfully was it thundering. The darkness had nearly shut out my vision. As I looked again, the bright glare of the lightning revealed to me my friend still leaning against the column. But the stranger was suddenly transformed into a hideous serpent, so awfully hideous and monstrous that, though dreaming, I remember I closed my eyes to shut out the awful sight. When I looked again, the serpent was slowly and stealthily moving forward and bending down upon the very column against which my friend rested. I saw and felt the danger. I essayed to scream, but my tongue clave to my mouth with fear. I saw the slimy reptile move on in his deadly purpose; nearer he approached his victim. Coldness crept over me; I grew faint. I saw the serpent approach and make ready for his spring, his head compressed, his eyes glaring, his forked tongue hissing. All was now ready, victor and victim. I would have sprung forward, but I could not move—horror held me fast. A moment only of dreadful suspense, ere the serpent loosed his hold above and sprang upon the heart of my friend. A wild and fearful shriek of agony reached my ear. This was followed by a flood of lightning that seemed to burn into my very eye-balls.

Crash upon crash then came the bursting thunderbolt, and then all was still. I dared not look forth again for many moments, but when I gazed again, agony filled my soul. The storm had spent its fury on the brightest spot I loved. My chosen spot, with every thing lovely, had been laid waste; destruction had seized upon everything beautiful and borne it down in its fury. The spoilers hand had marked everything lovely. The roses lay broken from their stems and were trampled down. Everything in and around had been the sport of fury, and desolation reigned triumphant. The running stream was choked by the mass of ruins that had been swept into it. Flowers were no longer there; the home of the busy insect was borne off—the home of the rare and beautiful plants had been swept away and nothing could be seen but nakedness and ruin.

With agony of feeling I looked for my friend. Amid the ruins of the beautiful temple lay that friend, cold and dead. In his agony he had torn open his dress, and upon his breast I distinctly saw the wound of the serpent's fang. My friend had fallen! a victim of treachery; and the spot which I had selected as the most beautiful, a few hours before, I now gazed upon in sadness, then turned away to look no more upon—The Ruined Valley.

A man praising porter, said it was so excellent a beverage that taken in great quantities it always made him fat.

"I have seen the time," said another, "when it made you lean."

"When?" asked the engineer.

"Last night—against a wall."

Mr. Schoolmaster, do you know Algebra?

"Algebra? No; but I know his father Colonel Bray, and that's near enough.

This is a reason to the man who didn't know mathematics, we know Jem Mason like a book.

Doctor—(feeling her pulse (affectionately)—"My son, why do you look that filthy thing—"

Precocious youth (coolly)—"To get the juice out of it, old sawbones!"

All's Well.

"Twelve o'clock at night, and all's well!"

False prophet! Still and statute-like, at yonder window stands the wife. The clock has told the small hours; yet her face is pressed closely against the window-pane, striving in vain, with straining eye, to pierce the darkness. She sees nothing; she hears nothing, but the beating of her own heart Now she takes her seat; opens a small Bible, and seeks from it what comfort she may, while tears blister the pages. Then she clasps her hands, and her lips are tremulous with mute supplication. Hist! There is an unsteady step in the hall; she knows it! Many a time and oft it has trod on her heart-strings. She glides down gently to meet the wanderer. He falls heavily against her; and, in maudlin tones, pronounces a name he had long since forgotten "to honor." O, all-enduring of woman's love! No reproach, no upbraiding—the slight arm passed around that reeling figure, once erect in "God's own image." With tender words of entreaty, which he is powerless to resist, if he would, she leads him in. It is but a repetition of a thousand such vigils! It is the performance of a vow, with a heroism and patient endurance too common and every-day to be chronicled on earth; too holy and heavenly to pass unnoticed by the "registering angel" above!

"All 's well!"

False prophet! In yonder luxurious room sits one whose curse it was to be fair as a dream of Eden. Time was when those clear eyes looked lovingly into a mother's face—when a gray-haired father laid his trembling hand, with a blessing, on that sunny head—when brothers' and sisters' voices blended with her own, in heart-music, around that happy hearth. O! where are they now? Are there none to say to the repenting Magdalen, "Neither do I condemn thee,—go, and sin no more?" Must the gilded fetter continue to bind the soul that loathes it, because man is less merciful than God?

"All 's well!"

False prophet! There lies the dead orphan. In all the length and breadth of the green earth there was found no sheltering nest where that lonely dove could fold its wings, when the parent birds had flown. The brooding wing was gone, that covered it from the cold winds of neglect and unkindness. Love was its life; and so it drooped!

"All 's well!"

False prophet! Sin walks the earth in purple and fine linen; honest poverty, with tear-bedewed face, hungers and shivers and thirsts, "while the publican stands afar off!" The widow pleads in vain to the ermined judge for "justice;" and, unpunished of Heaven, the human tiger crouches in his lair, and springs upon his helpless prey!

"All 's well!"

Ah, yes, all is well!—for "He who seeth the end from the beginning" holds evenly the scales of justice. "Dives" shall yet beg of "Lazarus." Every human tear is counted. They shall yet sparkle as gems in the crown of the patient and enduring disciple! When the clear, broad light of eternity shines upon life's crooked paths, we shall see the snares and pitfalls from which our hedge of thorns has fenced us in; and, in the maturity of our full-grown faith, we shall exultingly say,—"Father! not as I will, but as Thou wilt!"

—*Fern Leaves.*

"Nil Desperandum."

No, never! Every cloud has a silver lining; and He who wove it knows when to turn it out. So, after every night, however long or dark there shall yet come a golden morning. Your noblest powers are never developed in prosperity. Any bark may glide in smooth water, with a favoring gale; but that is a brave, skilful oarsman who rows up stream, against the current, with adverse winds, and no cheering voice to wish him "God speed. Keep your head above the wave; let neither sullen despair nor weak vacillation drag you under. Heed not the poisoned arrow of sneaking treachery that whizzes past you from the shore. Judas sold him. If when he sold his Master; and for him there dawned no resurrection morning!" 'Tis glorious to battle on with a brave heart while wearing pusillanimity [illegible] bring back. Dream not of the word "surrender." When some frail human reed from [illegible] bends beneath you lean on the "Rock of Ages." The Great Architect passes you through the furnace not to purify [illegible] but it shall never consume you. He will [illegible] thorns to your smile [illegible] head" [illegible] grass [illegible] [illegible] [illegible]

THE CALIFORNIA FARMER.

J. L. L. F. WARREN, Assistant Editor.

AGENTS FOR CALIFORNIA FARMER.

Messrs. Adams & Co., at all their offices throughout the United States or Europe.

Messrs. Wells, Fargo & Co., at their offices throughout the Country.

San Francisco—Messrs. Murray & Co., booksellers, Montgomery street; Sol. Livan's newspaper stand, near the Post Office; Kimball's, Noisy Carriers Hall, Long wharf.

Oakland—Mr. Isaac Willard.

Benicia, Martinez, &c.—Messrs. Stiles & Dodde.

Union City and Mission San Jose—Messrs. Howard & Chamberlain.

San Luis Obispo—Dr. Thomas L. Harvey, P. M.

Sacramento—Mr. Oscar D. Aveline; Messrs. Carle Brothers.

Union, Humboldt Bay—A. H. Murdock, P. M.

Mount Farm, O. T.—Gen. M. M. McCarver.

Mowerville—Geo. S. Becker.

Stockton—Rosenbaum & Jonckimsen.

New York City, N. Y.—J. M. Thorburn & Co.

N. B.—We want Agents in all the principal localities, and persons disposed to act can have the opportunity, if satisfactory to all parties.

To the Friends of Agriculture.

We ask of all to whom we send this number, who are not already subscribers, to examine the Farmer, and to give it their influence. We trust to hear from them and to know that they will not only become subscribers to our Journal, but favor us with their communications. We desire to call their attention to our terms of subscription for clubs.

Special Premiums for Subscriptions.

In addition to the standing inducement for the getting of subscribers for the "Farmer," we will make a present of HARPER'S ILLUSTRATED FAMILY BIBLE to the person who procures the most Subscribers in the first six months of our publication. This we regard as one of the most beautiful books ever issued. Who will have the prize?

A Premium---Farmers' Clubs.

With the hope of inducing such of our friends, and those who have a little leisure, to ride among their neighbors and introduce an Agricultural Paper, we take pleasure in offering the CALIFORNIA FARMER: and, to make it an inducement, we say to such friends—if you will get us five subscribers, and remit the amount, we will send you six papers, or for ten subscribers, twelve papers. We trust there are many friends who will cheerfully take a little pains to aid us, and thus extend the circulation of the Farmer, and make a useful vehicle for the Agriculture of California.

Subscribers will please be particular to name the Post Office to which papers are to be sent; or, if forwarded by express, which line they prefer.

To Our Patrons.

To Advertisers.—We would call the attention of those who desire to have their advertisements produce quick returns, to the pages of the California Farmer.

The Farmer will reach sources of trade entirely new and unattainable by any other means, and thus secure a large and immediate profit to those who desire to make known their business. By a glance at our advertising columns, it will be perceived that we present the best known and most extensive houses, and as we have space for but one or two of each branch, these will be the most prominent houses, and thus give more influence to them.

To Agents.

☞ We desire Agents to report as early as possible, that we may be prepared in our issues for a sufficient number to supply the demand. Be sure and report promptly.

Legislative Influence.

We feel proud of California and the influence she is exerting, and can exert, by recognizing with pride and satisfaction the resources of her own mighty valleys and plains. We feel assured that the happiness of the people, the permanency of the State, the blessings and influence she has it in her power to exert over other portions of our country and the world, depends, in a great measure, upon the action of our Legislators.

The Legislature of California stand at the present moment in the same position as that of a parent, who, holding the hand of a promising child, points him to the world into which he is about to enter and act for himself.

Shall the young man leave the shelter of the parental roof and go forth alone, uncounselled and unaided, to rise or fall, however many difficulties and dangers may meet and crush his earliest hopes; or shall he, while relying strongly upon his own energy and determined perseverance, feel that in the day of dark adversity, there is a helping hand that is ever ready to stretch forth, that will not permit him to sink and faint.

Thus it is at this present moment with the agriculture and agriculturalists of California. A great science is presented to a people who are embarking their all, ready to give all their energy, all that personal care, all that devotion which its greatness demands, according to their several abilities. A vast and almost illimitable field lies before them, ready to receive the impress that science shall give, and feeling the greatness of the enterprise in which they are engaged, the agriculturalists look to the Legislature for that shield, that protection, that aid, which the youth would feel he needs from the hand of his parent.

A wise, a generous, a magnanimous Legislation upon agriculture, at the present moment, would secure a greater amount of good and make more permanent "Happy Homes," than would all the wealth of the mines, could they be accumulated in one measureless body, and that wealth diffused in luxurious living, for the first would strengthen the arm of labor and encourage home industry, the latter only leads to indulgence, idleness and waste of the agricultural wealth which may yet be revealed under the fostering care of a wise Legislation. No people can long be prosperous and happy who rely solely upon their mineral resources. Vast as is the mineral wealth of California, it is but a drop to the ocean in comparison with the value of agriculture, and all history tells the tale of those countries, where the people are consumers and not producers of those articles that constitute the necessaries of life.

California stands before the world pre-eminently great in all those resources that make her a truly independent State, and if the present Legislators of California will but give their attention to this most important subject, there shall be such a beginning, the very dawning of which shall fill the hearts of the people with wonder, and a few short years only will pass ere the wildest enthusiast will see his dreamings more than realized. We have faith to believe that we have in our present Legislature members from all sections of our State, who feel right on this subject, who are actuated by high and statesman-like views, and who feel a pride in all that tends to elevate our State and stand ready to encourage "Home Industry."

We are satisfied that California will take the lead in this matter, and that our public men, our senators and representatives are desirous to prove to the people at large, in spite of all the charges of extravagance and political corruption that they are the friends of the laboring classes—the "bone and sinew of the commonwealth"—and everything that will tend to elevate them, everything that shall encourage home industry shall have their earnest and prompt attention and care. We have confidence, therefore, that the "Eureka State" shall be the "Pioneer State" in the establishment of agricultural schools, colleges and institutions under the patronage of the State.

Sonoma County in the Field.

We were gratified exceedingly to notice a few days since that the agriculturalists of Sonoma county were about forming a County Society, and that the cultivators of that section were invited to meet at Petaluma on the 22d February. This is a most suitable way to honor that day. The birth day of the "Father of our Country" can be honored in no more appropriate and feeling a manner, than to cherish his practical virtues and recall the noble efforts he made to diffuse the blessing of cultivated and happy homes. Washington was an agriculturalist in the most exalted sense of that word. He was a practical farmer, and amid all his labors as a statesman, he had time to correspond with the scientific and practical minds of our own country and Europe, and he expended liberally of his wealth to improve the breeds of stock, and also many other branches of agriculture, the most important to our country. His "Letters on Agriculture" to Sir John Sinclair, in England, were of that lofty and patriotic strain that spoke of his love of country and his desire to advance this greatest interest. These are Washington's words: "I know of nothing that will add so much to the greatness of a country, as the improvement of its agriculture." This was his belief, and his life was an exemplification of his belief.

We therefore rejoice that his memory is thus to be hallowed, and let the friends of agriculture devote that day in recalling the active virtues of Washington and strive to imitate his noble example; let them gather together their families around an altar, erected on that day, and inscribe upon it—"Washington! the Father of his Country—the devoted friend of Agriculture."

We were also pleased to receive a call from one of our friends of that county, C. P. Yorse, Esq., of Petaluma, in reference to this subject, and we feel assured that Sonoma county will act with energy, and that the day named will be appropriately observed.

We shall hope to be able to accept their kind invitation to be among them, feeling it will be good to be there.

State Agricultural Society.—We have been exceedingly gratified to have the opportunity to peruse the plan of a bill which the Hon. W. S. Letcher kindly forwarded us for our examination, upon this subject. The bill has been admirably drawn, and bears upon its front that generous care and regard for the great interests involved, becoming statesmen. Well may we be proud of our legislators when we have such evidence that they are indeed the people's representatives. We look with the deepest interest to further action upon this good work.

We are sorry to learn that Judge Ames, of the San Diego Herald, lost a press, type, etc., in the ship San Francisco.

President Pierce and Agriculture.

It must be a matter of great surprise to all, that the President of the United States, in his message, should have so entirely overlooked the great interests of Agriculture. It cannot be supposed for a moment that this arose from any other cause than unintentional omission for the magnitude of the interests involved would preclude the possibility of its being considered in any other light than the basis of our wealth.

This omission we at first supposed arose from an intention on the part of the President to make the Agriculture of the United States the subject of a "special message" and the establishment of a National Bureau the foundation of the message. We believed the time had come for such action, and, as so many of the States of our Union were moving in this matter, we had the hope that this was the cause of the President's thus passing over this source of wealth.

We need only refer to the last census report to show one feature of the interests involved. The value of the "Live Stock" of the United States, taking the census report as a basis of calculation, would now be estimated at six hundred millions of dollars! Here is an interest and a value exceeding that of all the manufacturing establishments in the country, and also exceeding the capital employed in commerce, both inland and foreign. And what must we think when so great an interest shall be overlooked by those who have the guardianship of these interests? We look with anxiety for an explanation of the reason why this subject is thus overlooked—and we look with hope.

River Steamers—Rise of the Waters, etc.—We never were more convinced of the value of our river steamers, than on a trip up and down, a few days ago; one feels so secure on board of them. It was our good fortune to enjoy a trip down river last Monday, on the pioneer steamer Senator. There is a luxury now in travelling, for in addition to the safety, there are so many comforts that one can but enjoy it.

The late rains have increased the waters above and the river at Sacramento is now higher than at any other time this season, being above the old banks opposite the city. The city is safe, however; her present substantial levee is proof against any floods or storms Sacramento will ever see again. The city presents a handsome appearance, in her long streets so perfectly dry and passable at all times—strangely in contrast with the great city of San Francisco.

Along the banks of the river the plows are busy and the grounds present a garden-like appearance. Clearings, upon an extended scale, are going on. We hope for a generous return to the cultivators, which will no doubt be realized, unless the rise of the waters should prevent. We wish, however, we could see a little more care to obviate these dangers by a system of dyking and embankments. We believe the danger could be removed if this was done. The best portions of the grounds could thus be protected and much loss prevented.

In coming down river, we had an opportunity to witness what may truly be called great piloting. The Senator entered the slough with a full head of steam, at a rapid rate, the current running very strong, and portions of the river like a boiling cauldron. With the speed of a race horse she kept on her way, steadily and bravely; it would have made an old-fashioned pilot shake in his shoes to have seen her turn the short bends in this crooked passage; but fearless she swept through. She reached San Francisco at 8 P. M., only six and a half hours from city to city, being one of the very best passages made.

Ball of the Marion Rifles.—Do you dance? If you do, kind reader, we hope you were present at the festival ball of this gallant corps. We shall not be charged by any one with misrepresentation when we say that the Ball of the Marions was the most recherche of the season. There may have been greater numbers, and more wealth, and brighter diamonds, at previous assemblies; but, for social enjoyment, for real pleasure in dancing, agreeable partners, elegant dancers, excellent music, and a tip-top supper, give us the Marion's Ball. It was a patriotic affair, and the Marions deserve the thanks of the community for their efforts to make the heart merry in times like the present, when the "blues" are so prevalent, and surely it is better to dance off trouble than to lay it to heart. Thanks, again, to the gallant Marions.

The law suit relative to the Tuolumne Canal has compromised, and the property is said to have been acquired by James King of William.

Correspondence.

The following letter of Mr. Woodham, of Santa Clara, contains many facts which will be of interest; and we desire cultivators to exchange thoughts through the columns of the Farmer, and thus a mutual benefit will be the result.

The difficulties the farmers meet with from the "pests of the farm" squirrels, gophers, &c., can in a great degree be remedied, by constant interchange of efforts made by each one. The cause of rust and blight in wheat and other calamities will thus be discovered, and we therefore ask for the California Farmer an interest among our friends for its circulation, that we can thus spread all the light we can for their benefit

Santa Clara, Dec. 6, 1853.

Messrs. Warren & Son:—In answer to your circular of Nov. 15th, I assure you I shall heartily unite with you in an endeavor to promote the interest of agriculture in California. In answer to your specific questions I may say: I have resided here three years. I came from New York to Chili in 1842; from thence to California in 1849. I occupy 160 acres—all prairie—about 80 acres cultivated in grain, vegetables, &c. Should have planted more, but the land this year was too wet to plant. I have no waste land. I have four species clover; red top, and a very fine grass. I cultivate about 200 peach trees. A small garden spot and 50 or 60 plants. About 8 acres of potatoes were worthy and not worth digging.

My land has a descent of about 20 feet; the upper part dry and somewhat sandy on the top in places, and crops liable to destruction by squirrels. The lower part of the land wet six weeks later in the spring and six weeks earlier this fall than the two preceding seasons.

I will here state the results of my experiments in farming. I have been on this spot during my residence in California. The first year no crop of any amount, except potatoes—in low land sowed wheat; in dry land, in the latter part of December, it was overrun by mustard and squirrels, our great obstacles to cultivation. Next year I had good crops of wheat and barley sowed early—from Aug. to Feb.—ploughed in some immediately after harvest, to save the seed remaining after harvesting. This come good as any. The wheat was much down and difficult to harvest. I had to reap, mow, cradle, and about 12 acres. I got it cut by a machine at double price. This is a difficulty from early sowing. I should like to know the result of mowing down close, about April, as well to check growth of straw, as to deep down mustard. I estimated my red wheat at 33 bushels, and white wheat at 50 per acre; sowed a bushel to the acre. This year I sowed late, in hopes to avoid mustard; the same quantity as before to the acre; but the mustard was quite as bad, and not over half a crop of wheat in many places, and where very thick, so rusted as to be scarcely worth harvesting. My experience is in favor of early sowing, and such land as mine, stiff and heavy, shallow ploughing for grain, and deep for potatoes.

Wishing you success in your undertaking,
I remain your obedient servant,
Joseph Woodham.

[For the California Farmer.

Gentlemen: Are not we Californians too heedless of the many little things that make so much of the elegance of home? Are we not too proud of the teeming brain that conceives, and the strong arm and firm will that execute our projects? Too exultant in youth, forgetting that youth and manhood must terminate in age, when rest must be our portion, and comfort our desire? Of all the trivial matters of every day life, nothing renders a homestead more cosy than the cultivation of flowers around it. Who has not passed an ordinary-looking house, embowered in climbing plants, with the exclamation of—"that is a comfortable looking place!"

We who originated from New England, where, those who wish to slander our "home," show their ignorance of the laws of astronomy and physiology by asserting that the sun has become so disgusted at shining upon so barren a country, that it takes the "smartest men in Yankee land" to pry him out of bed morning after morning, with crowbars; and that the pasture grounds are so bestrewn with stones that they are obliged to sharpen the noses of the sheep that they may get them into the interstices between the stones by way of enabling them to get the scanty herbage; we acknowledge that *several* months in the year are *rather* cool and frosty, and that the uncultivated portions of the country are not especially fertile; still we recollect the breath of the sweet-brier and piuk, and the low, black roofed houses overgrown and rendered so charming, during the summer months, by the woodbine. Those of us who were born farther south and west, under a more genial sun and on a more fruitful soil, all recollect that plants were growing by nearly every door-step. And this country which has received us from every place, assimilating our sectional prejudices and peculiarities, the lovely "land of our adoption," will receive kindly almost every variety of plant and flower.

Much has been said of the moral effect of the association with flowers. One word on the subject: Have you noble, active boys, frolicking and and boisterous, never quiet unless sleeping, and when even then their "feet seem dreaming" (not "a' dance," like the poet's French girls,) a double shuffle; whose heels are continually intruding upon the furniture and corn-stricken toes; and whose unfortunate elbows are always disarranging table covers, overturning ink-stands,

flower-pots, etc? If so, give them a little garden plot, to cultivate. They will be delighted, and by finding that delicate plants cannot be roughly handled or trodden upon with impunity, they will learn to step gently, and to be more careful of all things. Then how many paroxysms of romance and sentimentality, your daughter, expends in the exchange of rose-buds with a neighboring beau, which but for this substitute, she would vent in billet-doux which might in mature years be made a source of uneasiness or mortification.

Let us then, (even if we have but twenty feet front,) cultivate a few flowering shrubs and graceful vines; thus beautifying the town or hamlet of which we are residents, as well as adding to the comforts of home one of those things which constitute the "poetry of life."

Sacramento Valley. F.

Every one to his Trade.

The following interesting facts were made known to us the last week, on a trip up river:

Some time in '50 a worthy man met our friend who is well and agreeably known on board the Senator as Dr. ——, and upon being asked by the Doctor what he was doing, he rather mournfully said, he was doing *nothing*. He was in fact "dead broke." But what *can* you do, said the Doctor, whose generous feelings were prompting him to aid his fellow man. Well, said he, I can "make sausages;" but I have no money! But, said the Doctor, I will let you have money, if you wish to try. The man replied that he would try, most cheerfully, and was very grateful.

This industrious and worthy man, by the kind aid thus tendered him, set to work, and being well skilled in *this particular* trade, he was successful; his customers increased, until he had as much business as he could attend to. His fame as sausage maker was widely known, and such was his success that in a year or more he accumulated about $8000 and left for the States.

As we have had so many instances of the change which comes over a man upon his return East, so our worthy friend must needs try his luck, and engage in some speculation and prepare to come back again. But in this he was unlucky, and in a little time found himself poor again.

Again he met his friend the Doctor, and again was he cheered and aided, and went to work at his old trade of sausage making.

And now he is doing "first rate," as the word goes; and so great has been his success, we are informed, that he "monopolizes" all the trade of the "up river boats," i. e., he makes sausages for them all; and reader, if you are a lover of a "real good sausage," just take a trip up river, and when you dine, don't forget to call for a "sausage." We understand that such is the increased demand now for this favorite dish, that the steward is obliged to lay in an extra supply. Let us not forget while we enjoy this dish, that we owe it to our friend the Doctor, whose generosity and aid gave encouragement to a worthy man, and thus a double good has been done. W.

Agricultural Machinery.

Nothing is more worthy the attention of agriculturists than the improvement of the implements and machinery of the farm. A tool that is often used should be of the very best construction, even at an additional cost. It is quite a consideration to a laborer who does fifty days' work at hoeing in a season, if, by the use of a perfect tool, costing fifty cents more, he can do this work as easily in forty days, and save ten days of labor. The farmer who throws aside his four-dollar plow, and, by purchasing one at eight dollars, is enabled to save for his team in five years one-fourth of a hundred days' plowing each, or one hundred and twenty-five days in all, makes an investment with his extra four dollars far exceeding that in any bank, railway, or gold-digging company.

If the thing were possible, a most interesting and novel exhibition might be made at a State Fair,—more convincing than any thing else could be of the great progress of modern agriculture,—by presenting a collection of all the implements, such as were used in this State in the year 1800, alongside the numerous and finished machines of 1853. All the premium cast plows, with their gracefully curved and polished moldboards—the subsoilers, the deep-tillers, and cast-steel plated implements, would be represented by the old square-faced "bull plow;" the threshing machines, in all their modifications, by the swing-flail; the most improved fanning mills and separators, by the wheat-riddle; wheat drills, gang plows, and wheel cultivators, by a shouldered bag of grain and a forked harrow; revolving horse rakes, mowing and reaping machines, by the hand rake, scythe and sickle, &c. The implements of 1800 would not load a horse-cart; those of 1853, with their various forms, would freight a steamboat or long trail of rail-cars. The State Agricultural Museum should, if possible, preserve specimens of these relics of fifty years ago.

And yet, in many particulars, the improvement of farm implements is yet in its infancy. The most finished cast-steel plow of the present day, perfect as it may seem, consumes five-sixths of the moving force to overcome friction and cohesion. For, in ordinary work, a horse will do the same as lift a 700 lbs. seven inches high per second; while a good two-horse plow, in turning the soil, lifts only about 200 lbs. of the earth seven inches high in a average per second. There is an opportunity for mechanics to exercise their ingenuity in overcoming the 80 per cent. of friction and resistance.

The English agriculturists have been lately much occupied in endeavoring to devise some other way of loosening and pulverizing the soil, besides plowing. They have not yet been very successful, although some of their newly introduced machines, in connection with the plow, have accomplished wonders. The two most efficient of these are perhaps Croskill's Clod-crusher and the Norwegian Harrow, both of which we described some months ago, and which might be introduced into our clayey districts with great probable advantage. A recent number of the English Agricultural Gazette described a new digging machine, which has lately been tried with some success. It is rather a forking than a digging machine, acting by prongs, not by cutting flat surfaces and edges. Drawn by six horses, it pulverized the soil of a field, consisting of a friable loam plowed the previous autumn, so that in walking over it the feet sank three inches, and a stick could be thrust down eight or nine inches. Every circle of its twelve teeth revolved on a separate rowel, of which there were seven, six inches apart, strung upon one axle. The rowels consisted of heavy cylindric blocks of iron, one foot in diameter, and four or five inches wide, from whose surfaces project teeth ten or twelve inches long, curved in such a manner as to enter the earth perpendicularly as the machine revolves. Between the blocks are heavy washers, which keep them asunder, and facilitate the motion and cleansing of the whole. Such a machine as this may in some cases pulverize the earth more perfectly than the plow and harrow, but otherwise appears to possess no advantage on the score of economy or expedition; for the six horses required to draw it, pulverize a strip only three and a half feet wide, and get over only about four acres a day; an amount easily plowed and harrowed by the teams separately. Still, however, it is not altogether impossible that such a machine may be the germ of something fitted to a single two-horse team, and working the earth more economically or more efficiently than the common law. In this respect an important step may have been taken.

More recently, we observe a notice of a new subsoil plow, lately invented in the north of England, which certainly proposes to accomplish wonders. In the first place, it "skims the surface;" secondly, trenches the land; thirdly, subsoils the ground to any required depth; fourthly, it will perform either of these operations combined or separately; fifthly, it requires no skill in holding, and no "balks" can ever be made; sixthly, it buries all vegetable matter and weeds; seventhly, it may be used on land wet or dry; and eighthly, it trenches land at one quarter of the ordinary expense by hand. This plow appears not to have been tried as yet, although commended by an English agricultural journal of high character; but we confess, so many wonderful qualities partake largely of the marvellous, and remind us of the extraordinary quack medicine, which not only cured the different diseases, but possessed many other very useful properties, such as restoring a rent boot, doubling the milk of the cows, causing hens to lay with great rapidity, preventing decay in fence posts, preventing horses from balking, rendering railroads proof against collisions, making steamboat boilers safe from explosion, besides increasing the speed of the boat, &c.

Another attempt, not so successful as this claims to be, was made some years ago, at the Bristol exhibition of the English Agricultural Society, of a digging machine, constructed simply of a wooden roller, set spirally with spoon-shaped spikes, so as to dig up the land when drawn over it. Unfortunately, the first trial was made on the fair ground, and instead of digging, it gathered soil among the teeth as it proceeded, till the whole became an immense cylindrical mass of earth, in which the teeth were buried and hidden. That, of course, ended the history of this d[illegible].

Thousands of very ingenious men have labored for years in improving the old-fashioned soil-inverter, the plow; and possibly nothing better than this implement will ever be contrived; but ingenuity in other directions is certainly worthy of encouragement. At the present time, a trenching machine is greatly needed, that shall not require six or eight horses, as the largest subsoil and trench plows now do, but where one or two horses may be set to work and turn up the subsoil and throw under the surface, with all the perfection of finish accomplished by hard labor, and with one quarter of the expense.—*Albany Cultivator.*

Lime and its Compounds.

Lime, in some of its combinations, is found in all our crops. Those named below contain it in the following proportions: 25 lbs. of wheat contain 8 1-2 lbs.; 38 bushels of barley, 15 lbs.; 50 bushels of oats, 8 lbs.; 2 tons of clover, 125 lbs; 9 tons of potatoes, 246 lbs.

The presence of lime in the soil may be recognized by bringing it in contact with an acid; an effervescence will be produced.

Some reliance may also be placed upon the nature of the weeds or the spontaneous growth of a soil. Lime will be found wanting in those which produce red sheep-sorrel, the chestnut, and resinous trees. The application of lime is one of the surest modes of eradicating these plants. It neutralizes the acids, which abound in them.

It should not be understood, however, that a successful experiment of this sort (the destruction of such growths) is all that is required; the farmer has then but just rid himself of some of the hindrances in the way of successful cultivation. He must now provide, [illegible] crops which will secure him a rich harvest.

To some extent lime acts as a fertilizer and perhaps its use is owing to its absorption of carbon from the atmosphere; for it is well known that the effect of a bushel of lime and of pure lime is essentially the same. Pure lime becomes a carbonate whenever it is exposed to the air; but pure lime has a superiority over the carbonate in its ability to decompose vegetable or any other organic matter. Hence it is always useful when green crops are ploughed in, or new grounds are broken up. Most fruit trees also consume large quantities of lime.

Quicklime has the power of setting free the ammonia from guano and from fermenting manures. Hence its use in connection with such fertilizers, that is, when they are first applied, should generally be avoided.

Recent analyses of soils in Ohio, Iowa, and Wisconsin, by Dr. Wells and Dr. Owen, lead to the conclusion that those soils are not derived from the disintegration of underlying rocks, but from materials brought from a distance. For notwithstanding those rocks are chiefly carbonate of lime, not the slightest trace of carbonic acid was found in the soils. Hence the presence of limestone in the rocks of a given territory must not be held as conclusive evidence that these elements exist in the soil. Actual analysis alone can demonstrate the fact.

Lime is useful in clay soils, by diminishing its adhesiveness, and setting free its alkalies. Slacked lime acts most speedily, but the effects of the carbonate are more permaneut,

Sulphate of lime, or gypsum, is serviceable in various ways. It retains useful elements that would otherwise be lost, as ammouia; it acts as a stimulant upon loams and peaty soils; it is also a fertilizer, furnishing the necessary food for the growth of the crop. But if bumic acid is abundant, it will decompose the gypsum, and the sulphuric acid being set free, will prove injurious to the roots of the growth. On soils very rich with humus, gypsum should therefore be used very sparingly.

Gypsum may be used either in a powder, in the raw state, or roasted—that is, calcined. It is especially beneficial when applied to the growth of clover, beans, peas, and sundry grasses; but less serviceable to grains, turnips, and other green crops. It may be applied to the surface, scattering it broadcast, or placed in the hills, at the time of planting, or applied at later periods. It may also be used on the compost heap. On grass land it should be sown in the spring; but, if sown in the fall, it will be chiefly beneficial to the next year's crop. When applied to grain, 200 or 300 pounds per acre is generally used, and on grass lands five or six bushels per acre.

The phosphate of lime is one of the most essential kinds of manure, which must be applied, in some form, on all lands from which crops are taken. One of its elements, at least, the phosphorus, is often exhausted sooner than any other of the constituents of the growth. But so much has been said of it elsewhere, that we need not enlarge upon it here, in these elementary suggestions.

Taking Up and Storing Dahlias.

In a treatise on this flower, recently published by Groombridge, the cutting down is recommended "not to be performed until the first frosts have completely checked vegetation. For choice good varieties, it is an excellent plan to place a small hillock of dry ashes round the stem of each plant. This protects the embryo buds both from any sudden frosts, and also carries off to a distance the heavy autumnal rains. In wet grounds, especially, this is a good and useful application, though in high land it may not be absolutely necessary. Choose some dry morning when there is a probability of a dry following day, and cut down the plants within one foot of the ground. The day following, take up all the roots so cut down, and turn them upward to allow the watery sap to drain from the stems. Bring them in under cover, and see that the numbers or names are all securely tied to the stems with copper wire. Mat or twine is not good for this purpose, because it will soon rot, and the name may be easily displaced or lost—a matter of consequence to those who wish to keep their plants true to name. The roots should all be taken up on the same or the following day, in order to become all dry together so that they may be put away for the winter at once. Let all the soil be carefully picked out from among the tubers without wounding them. As soon as they are quite dry, and before they begin to shrivel, fix upon a place to store them away. A dry cellar is best, because there is, in such a place, just sufficient moisture to keep the tubers fresh without shrivelling, and the buds alive. Pack them with their stems downward, and cover them up with dry clean straw, several inches thick, a layer of roots and a layer of straw between and under each layer of roots. In the winter quarters they may remain till the season for starting them into growth returns. They should be looked over about once a month, and all decaying roots and rotting stems removed, and fresh dry straw laid upon them to absorb any moisture; this is the best method of keeping Dahlia grand-roots. Pot-roots, [illegible] their tops cut off and the pots [illegible] in a place where the frost cannot [illegible]. If the amateur has a green house, pots may be conveniently stored away under the stage inside; no water to be given to them. Plants kept better than [illegible], and therefore it is best to have a [illegible] for this purpose. If the amateur has no room for his grand-roots, put a good [illegible] pot-roots by themselves the [illegible] away to some [illegible] provided [illegible] the frost can be kept from them. [illegible] covering over with dry straw or [illegible] In such places they will require [illegible] during the winter, to examine all decaying roots and remove

From the Sandwich Islands.

The brig Prince de Joinville arrived [illegible] this port on Sunday, twenty days from Honolulu. Advices are to the 21st January.

The Polynesian discusses the subject of hard times which prevail there, and points out the necessity of an increased developement of their agricultural resources. It says that coffee, sugar, syrup, molasses, indigo, arrow-root, cotton and wool, may be produced to a large extent, though they are not, and that the soil and climate are much better for their production than those of Louisiana.

In relation to the weather, the Polynesian says: "We have had several days of winter weather during the past week, and the thermometer has actually been down to 60—a degree of cold which attracted the attention of everybody, and has elicited as much remark as ten degrees below zero would have called forth in cold climates. This temperature has been highly enjoyed by most people, and no cases of freezing to death have yet come to our knowledge. We should "like a few more of the same sort."

A correspondent of the Polynesian on East Maui writes—"I am happy to report the state of things on this part of the Island as prosperous. There have been from six to ten cases of small pox in Hamakua, and three deaths. No new case during the past six weeks. We can now report freedom from the small pox, if no new case should be introduced from abroad. There has been no case in Koolau, none in Kula, none in in Honuala, and but one or two in Wailuku. We hear that there are but few cases remaining in the districts of Hana, Kipahulu and Kaupo.

"A word in respect to agricultural prospects at Makawao and vicinity. The weather has been quite favorable all along for plowing, and much of it has been done. Cattle and horses are still busily employed, and as three months remain in which wheat can be sown, there remains a strong probability that much will be put in; especially as there is no lack of seed."

The Dromedary.

We would call the attention of our citizens, particularly those whose business is to travel long distances and to pack goods across the broad valleys and over mountains, to the introduction of the enduring dromedary. We believe they could be introduced with success, and be of invaluable service to our country. Who will have the patriotism to make the first trial?

The subject has elicited the previous attention of some of our statesmen, and it will be seen by the article quoted below, that it is esteemed of sufficient importance to attract the notice of our Government officials:

The Secretary of War recommends trying the experiment of employing camels and dromedaries in the transportation of military supplies among the regions of the West. Mr. Davis says the modes of transportation now used—wagons drawn by horses, mules or oxen—besides being very expensive are necessarily very circuitous on the routes travelled, slow and generally unsatisfactory. Their progress upon an average is seldom more than twelve miles per day. And they are frequently needed to go over routes where grass and water cannot be found except at long intervals. Other difficulties attending the present modes of transportation, are alluded to, and then the report proceeds as follows:

"On the older continents, in regions reaching from the torrid to the frigid zones, embracing arid plains and precipitous mountains covered with snow, camels are used with the best results. They are the means of transportation and communication in the immense commercial intercourse with Central Asia. From the mountains of Circassia to the plains of India, they have been used for various military purposes, to transmit despatches, to transport supplies, to draw ordnance, and as a substitute for dragoon horses.

Napoleon, when in Egypt, used with marked success the dromedary, a fleet variety of the same animal, in subduing the Arabs, who [illegible] and country were very similar to those of the mounted Indians of the Western plains. I learn from what is believed to be reliable authority, that France is about again to adopt the dromedary in Algiers, for a similar purpose to that in which they were so successfully used in Egypt.

For like military purposes, for expresses and for reconnoissance, it is believed the dromedary would supply a want now severely felt in our service; and for transportation with more rapidity across the country, than [illegible] it is believed would result in a [illegible] great saving to diminish the expense and [illegible] of our troops on the Western frontier.

For this [illegible] it is [illegible] that the necessary provision be made for the introduction of a [illegible] such service. If the animal is found to be [illegible] to our country and service."

[illegible]

[illegible]

THE CALIFORNIA FARMER.

JOHN F. MORSE, Editor.

SAN FRANCISCO:
Thursday, February 16, 1854.

System.

In no pursuit in the world is system more essential than in farming. This is perhaps of all other vocations the one in which method is most positively a source of unvarying success, and without which the most certain discomforts and beggary result. In childhood this broad fact was peculiarly illustrated to our mind by our spelling-book representations of "Thrifty" and "Unthrifty." Two farm scenes were pourtrayed by the artist. One exhibited a farm surrounded with neat, substantial and secure fences, with bars and gates in a perfect condition of usefulness and convenience; a dwelling of symmetrical architecture, and beautifully painted, embellished in front by a soft and luxuriant lawn, and on each side by spacious gardens filled with flowers, fruits, and vegetables, near to which were barns, corn-cribs, carriage house, sheds and poultry yards, neither of which had been neglected by the carpenter, nor basely abandoned by the painter, or by the more common beautifier of farms—the whitewasher. In this picture could be seen fat and spirited horses, peering from the stable windows; cozy looking cows, ruminating with contentment beneath the sheds expressly prepared and kept clean for their comfort; unsqualing hogs, revelling in obesity; well trained sheep, with their white faces--the living symbols of purity and ease; together with geese and turkies, ducks and hens, so tutored and managed as to yield all the evidences of their beauty and utility without any of those repulsive annoyances which result from giving them universal license and promiscuous lodging-places. The ploughs were carefully stored; the ox-carts and wagons well painted and in exact repair; the yokes in a particular spot, the harnesses, unbroken and complete, hanging where method had provided them a secure place; and indeed everything in and about the farm in exact and beautiful keeping with the wishes of a farmer who had "a place for everything, and everything in its place."

But while such was the view held up to an admiring and forming mind, there was an opposite picture so dissimilar and so wretched, as to leave no one indifferent in respect to a choice between them.

The farm of Unthrifty, or the man without system, had as much land, but unfortunately it was mortgaged, overgrown with rank weeds, with almost unapproachable roads, dilapidated fences, no gardens or lawns, no finished houses, barns, sheds, gates or bars, no carts or wagons that were not so much the victims of breakings and repairs as to make them unfit for use, no harnesses that had not been grievously patched with twine, ropes and chains, and in short not an animal or an ordinary improvement could be seen that did not appear in open and malignant rebellion against the presiding husbandry of the place. These were extremes, but true pictures of farming, with and without system. And the same delineations then made, the same good and evils then resulting from the different policy and habits of farmers, do still exist, in representation of the beauty of method and the utter tendency to destruction which an absence of system induces.

We advert to this subject because California is just being settled and developed in its agricultural resources, and because it is difficult to elevate a husbandry that has been generally depraved in the beginning of its career. Should the first efforts at cultivating California soil be of the impoverished, filthy, unsystematized kind that indicates an unthrifty husbandman, then will it be a difficult thing to secure to this pursuit among the rich lands of the State, such a reputation as can be achieved by system and by a generous attention to the beauties and luxuries as well as the indispensables of a farmer's life.

Lecture of J. B. Crockett, Esq.—We publish to-day a portion of this able Lecture. It will be found to embrace most important interests, and in order to give the entire Lecture, we are obliged to publish it in two numbers. We feel assured our readers will find it a document worth preserving.

Soft-Soaping Rabbits.—We are informed that the application of soft soap to the trunks of fruit trees, late in autumn, will effectually protect them from the attacks of rabbits. It is applied with a swab.

Planting Fruit Trees and Raising Fruit.

This is one of the most important questions at this moment among the Cultivators of California. It is not the mere question, can we grow Apples, and Pears, or Peaches and Plums? for these can be grown almost any where, and it has already been proved that we *can* grow them in California; the specimens already exhibited in our markets and at the late Exhibition, are the best evidences that it can be done.

And now the question arises, shall the Cultivators of Fruits be crowned with success? We answer in the affirmative, believing as we do that California will, within a few years, exhibit the finest Fruit in the world.

We aver the fact from careful examination, that we have soil and climate, season and temperature so well adapted to Fruit-growing that California can successfully grow almost every fruit known. We shall in successive numbers endeavor to give the best modes of cultivation and the soil and experience suitable for each.

We make these remarks to call the attention of our readers to a very interesting "dialogue" upon the subject of "Planting Fruit Trees," which we copy from the "Magazine of Horticulture" of Messrs. Hovey & Co. of Boston, a work most ably conducted, now in its nineteenth volume.

We have examined carefully the article, and cheerfully commend it to our readers—premising, however, that *our autumn* is *January and February*, instead of October and November. In California, it is necessary to wait for the first rains to soften the earth well—then we recommend the planting to commence—and the season is governed by early and late rains. We advise a careful perusal of the article in all its detail. Capt. Lovett, to whom reference is made in one of the paragraphs, is a gentleman distinguished for his success in Fruit-growing, and his testimony can be relied on as resulting from *practical* experience.

We shall be glad to hear from all who feel interested in the subject, at all times.

The best season for transplanting trees.

Subscriber. Which season do you prefer, Spring or Autumn, for transplanting trees? You have had some experience in this matter, and as I find my neighbors differ much in their opinions, I am anxious to have your advice.

Editor. It is true there are various opinions upon this matter. Many men, indeed a greater portion of those who give such advice, sometimes rather dogmatically, never planted more than a dozen trees, and those not more than once or twice in their lives,—when, perhaps, making their garden around their dwelling,—and as they, of course, chose the season they thought the best, whether fall or spring, they advise all to do as they did. Their evidence is *ex parte;* for they never took hold of the thing experimentally,—planting fall and spring for a series of successive years,—the only way to test such a question.

Sub. So I should think: but I find, too, people not only differ as regards the general season of planting, but as regards the kinds of trees suited to the season.

Ed. Yes. I am aware of that: one cultivator states that he prefers the spring for all kinds of trees; another, that he prefers the fall; a third, prefers the fall for everything, except peaches; and others, would set out everything in the autumn except *stone* fruit.

Sub. True, and it is for this very reason that there are so many opinions that I wish to know which season you prefer, and, if not too much trouble, to give the reasons that have guided you in your choice.

Ed. Willingly. It is a rule we have always adopted in our horticultural operations, never to do anything unless it can be justified upon some principle. This hap-hazard kind of gardening,—doing what others have done before us,—or following the advice of every writer who gives his year's experience to the public, is what we never practice, unless accounted for on good and sound reasons.

Sub. I have not read your Magazine without learning that long ago; and therefore ask the question in regard to transplanting trees; for, beyond the mere *ipse dixit* of the many that the fall or the spring is best because *it is*. I have been unable to learn why one season is better than the other, or why both are not good alike.

Ed. It is natural enough that there should be this variety of opinions; especially among the mass of the people, who, of course, cannot have the experience of professional men; and as our general information upon gardening has been derived from English works, where the fall may be said to have no end, or the spring no beginning, so far as moving the earth is concerned, we have adopted the views of those writers who generally recommend planting in winter. Loudon says, when treating of the apple, pear, &c., they may be planted "in any open weather from November to February."

Sub. A very different climate, certainly, from ours.

En. So different that scarcely any rules laid down by English writers will apply in many things to our own practice. Winter, with us, sets in so soon after the fall of the leaf, and the ground continues frozen so late in spring, that there is scarcely more than ten or twelve weeks, counting both fall and spring, to perform the operation of transplanting: of course, I mean in the northern portion of the United States.

Sub. I was hardly aware that the time was so short as you state, though I know it is brief enough to one who has much planting to do.

En. Why, let us see. The leaves rarely fall before the 20th of October, and it will not generally be safe to delay planting beyond the first of December, though we often have favorable weather later—this is six weeks. Then the ground rarely opens till the first of April, and trees are frequently in bloom the first of May—making four weeks more, ten weeks in all.

Sub. According to your reckoning, we have more time in the autumn than spring, which we fail to avail ourselves of on account of the prevalent idea that spring is the best season.

Ed. Just so. But this is not all. You will bear in mind that winter often leaves the ground in such a wet and sodden state that transplanting cannot be well done for some days, and frequently a fortnight is as good as lost. While in the autumn the ground is dry, loose and friable, and the operation of transplanting can be done in half the time,—and infinitely better too,—than it can in the spring.

Sub. True enough. This condition of the soil in autumn never occurred to me; its wet state has always kept back my work in spring. Why, last year I had a quantity of trees to set out, and it was nearly the first of May before I could finish the work. It rained from the first to the fifteenth of April almost every day, and the ground was so completely saturated that the holes would fill with water almost as quick as they were opened.

Ed. I recollect the time well. On the sixth of April we had one foot of snow, and up to the 21st, nearly a foot of rain. On the 8th of May the cherries were in bloom!

Sub. This was even less time than your calculation allowed for spring work—short enough certainly.

Ed. So short that we may as well give up doing much planting in one year, unless we take advantage of autumn too.

Sub. Then I understand you to say you would plant both fall and spring.

En. Yes, both.

Sub. But you do not mean to say you have no preference of one over the other?

Ed. Certainly not. You have not heard me through. My object is to show that if fall planting is no better than spring, or even not as good, it is necessary that a good deal of it must be done then when large quantities are to be set out. I decidedly prefer the autumn for transplanting all hardy deciduous trees of any size.

Sub. Go on.

En. Autumn planting is better than spring for the following reasons:

1st. The time is longer than in spring.

2d. The ground is in better condition.

3d. The trees are then in the most dormant state.

4th. The roots, where cut, heal better, and are prepared to send out fresh ones even before the frost is out of the ground.

5th. The winter and spring rains settle the earth around the roots.

6th. The trees are well established before warm weather overtakes them.

Sub. These appear satisfactory reasons and based on sound principles; but I should be glad to have you state whether you would transplant in the autumn without reference to soil or locality.

Ed. Not by any means. There are soils and situations where autumn planting might be injurious; but then these are not likely to occur; for that soil which will not admit of transplanting in the autumn is entirely unfit to grow a tree, at least with the expectation of producing fine fruit; and therefore there is little necessity of making any such exception in our rules. We are presuming that the object of every planter of fruit trees is to get good fruit. It cannot be done in a soil or situation too wet and cold to set the trees out safely in the fall. It is somewhat different with forest trees; as it is often an object to plant up some low, cold piece of ground, needed for shade or shelter. In that case, the spring would be the preferable season.

Sub. I appreciate the truth of your remarks, and agree with you that no tree ought to be planted in a soil which cannot carry it safely through the winter. But is there no danger of winter killing the shoots or trunk, even in favorable soils? such is the general complaint of spring planters.

En. Not the least: that is, no more than if the tree had not been removed. If the tree is in good health when set out, it will receive no more injury than it would have done standing in the nursery row. We have known severe winters to kill several kinds of young pear trees to the ground: if set out previously to such a hard winter, they might be injured; but we do not think their liability to the danger increased by removal.

Sub. That is just what I wish to learn: your experience extends over many years, and through a series of variable winters, which should enable you to judge correctly of their effects upon transplanted trees, and with this experience you are confident there is no more danger of winter killing than if set out the previous spring?

En. Not any; except as I before stated, when planted in cold, wet and unfavorable soils.

Sub. This point settled, which has been the greatest bugbear in the way of autumn transplanting, leaves little doubt of its being the best season. Your fourth, fifth and sixth propositions appear to decide the question. There can be no doubt of the better ability of the trees to send out roots early in the spring, which will enable them to resist our June and July droughts, so trying to all transplanted trees.

Ed. Have you ever carefully noted down the changes in the growth of newly planted trees? If not, do so another year. You will find that a tree set out in April will break freely, and start into growth vigorously; but by the time our early rains are over and dry weather sets in, then they often come to a dead stand—scarcely another shoot will they make all summer. Just at the time the greatest supply of sap is required, the tree is unable to give it, as it has not yet established itself sufficiently to furnish that supply; consequently the growth stops, and in many instances death ensues.

Sub. Without noting particularly the condition of trees which I have transplanted in the early part of the season, I have lost too many not to be aware that, in June or July, they generally have completed about all the growth they make the first year.

En. Now give the same attention to those you set out in the fall. You will find they will rarely start so early, and generally not so vigorously, as the spring-planted ones. They come along slow, but sure—no faster than the roots are made which have got the start of the shoots—and in July and August will make almost as much wood as an old established tree. If, again, you look into the subject thoroughly you will find the roots are at work long before the surface of the soil is loosened from its frosty hold. Just as we see an old tree, after one or two hot days in April or May, break into leaf. If, however, the frost was not out, the tree would remain stationary: this shows that there is root action long before we see it indicated by the breaking of the buds.

Sub. Very reasonable and true. It must weaken the energies of any tree making much wood to attempt to supply the food which a week of June or July weather would extract.

Ed. Precisely so, and a little observation will convince any one of this.

Sub. Something has been said in favor of the autumn, that trees make root after they are set out that season. Is this so?

Ed. This question is not one of doubt, but of fact. Capt. Lovett, in an article in our Magazine some years ago, has shown that trees transplanted early in the autumn always put out new roots before winter, and when protected by a covering of manure or leaves, to keep out the frost, the root making process goes on until mid-winter, and we are inclined to believe *all* winter. This we know, that roses, currants, or any similar shrubs which root easily, if put into a frame in November, and protected so as to keep out all frost, may be taken up with good roots in April: showing that the formation of roots goes on when the plant is in what we generally term a dormant state.

Sub. My observation, though somewhat limited, has, however, convinced me that the reasons you give in favor of autumn transplanting are founded on sound principles, and when understood cannot fail to be generally followed. At another time I have some further questions to ask about pruning and summer treatment.

Fourth Agricultural Lecture.

BY J. B. CROCKET, ESQ.

Delivered at the Musical Hall, January –, 1854.

Ladies and Gentlemen:—Appearing before you as I do this evening, at the request of the proprietors of the magnificent exhibition, in the adjoining apartment—gentlemen who have distinguished themselves by a most laudable and earnest effort to advance the agricultural interests of California—it may be anticipated, perhaps, that the remarks which I shall address to you, will properly pertain to the science of agriculture and to its practical uses. But though the field is inviting, I am incompetent to explore it. Neither by education or practice am I qualified to enter upon a critical analysis of the nature of soils, the organic laws of vegetable life, and the beautiful, but mysterious processes through which the bounties of nature are dispensed to man. My pursuits in life (unfortunately perhaps for myself) have led me to other fields of thought and action. Instead of the simple, innocent, invigorating pursuits of rural life, my time and thoughts have been occupied with violated contracts and broken laws; sometimes seeking redress for the one, and occasionally, it may be, endeavoring to palliate or execute the other. In choosing this mode of life, I was not sufficiently mindful perhaps of the sentiment so beautifully expressed by the poet, Young—

> "Who lives to nature, rarely can be poor;
> Who lives to fancy, never can be rich."

But however that may be, the fact is indisputable, that I can neither enlighten you with new theories, or entertain you with old ones, pertaining to the science of agriculture—a deficiency which, on the present occasion, will doubtless be the more readily excused, from the fact that my audience is chiefly composed, not of practical farmers, eagerly seeking for information in relation to subsoils, patent ploughs, the best manures, the most important breeds of stock, and other kindred subjects; but of ladies and gentlemen, who, for the most part, are at best but amateur horticulturists, and can be presumed to feel only that general interest in the subject of agriculture which all must feel who properly appreciate its magnitude and importance. Without therefore attempting to enter much into detail, I propose to submit to you some suggestions of a general nature, as to the value and dignity of agricultural pursuits, and the peculiar interest with which they are, or should be, regarded in California.

In the primitive ages, agriculture was almost the sole employment of man, and has ever continued to be, in a true sense, the most honorable, dignified and innocent of human pursuits. Thomson, the great poet of nature, has commemorated this fact in the following beautiful lines—

"In ancient times, the sacred plough employed
The kings, and awful fathers of mankind;
And some, with whom compared, your insect tribes
Are but the beings of a summer's day,
Have held the scale of empire, ruled the storm
Of mighty war, then, with unwearied hand,
Disdaining little delicacies, seized
The plough, and greatly independent lived."

But in those primitive ages the public taste had not become corrupted with vicious indulgences, nor the public morals enervated with an excess of luxuries. What is termed the "march of civilization" had not then taught men that labor was undignified, or that a pampered indolence (which in modern parlance is termed an elegant leizure) was more honorable than a life of useful, frugal industry. In those days there were no steamboats and railroads to stimulate commercial enterprise, and thus direct human energy into an easier channel for acquiring wealth, that by slow and patient toil. There were no magnetic telegraphs, by which information is conveyed with the rapidity of thought, and by which shrewd speculators are enabled to purchase the products of the farm, at less than their fair market value. There were no yellow-backed novels, with their over-wrought stories of love, crime and enterprise, to excite and debauch the fancies of young men and women, and to teach them that they were, or ought to have been, heroes and heroines, rather than plain, honest farmers and spinsters. There were no magnificent gambling saloons, with their gaudy trappings, to teach verdant young men, and not a few deluded old ones, a near road to fortune. There were no splendid dram-shops, sparkling with cut glass and silver; adorned with painting and statuary, tempting the heedless to despise honest labor, whilst they dreamed of opulence and splendor, under the excitement of iced sherbets and daintily flavored beverages. There were no polkas and mazurkas, and German waltzes, to teach fashionable young ladies "the poetry of motion;" in learning which there was a bare possibility they might forget how to blush, or which, at all events, would not have been likely to increase their taste for the plain, homely details of domestic life. Above all, in those days there was no California, with its mountains and rivers of gold, with its "rockers" and "toms," its "sluices" and "dams," its "quartz mills" and "crushers," its feverish hopes, its excited passions, its charming visions of speedy opulence and princely wealth. Dr Johnson, in his poem entitled the "Vanity of Human Wisdom," has portrayed with so graphic a pen, the all-powerful and demoralizing effect of gold, that without any great sketch of the imagination, we might conclude it was designed as a prophetic picture of events since realized.

"But scarce observed, the knowing and the bold,
Fall in the general massacre of gold;
Wide-wasting pest! that rages unconfined,
And crowds, with crimes, the records of mankind.
For gold, his sword the hireling ruffian draws;
For gold, the hireling judge distorts the laws—
Wealth, heaped on wealth, nor truth, nor safety buys;
The dangers gather as the treasures rise."

But, as I have said, there *was* a time when neither railroads, nor steamboats, telegraphs nor trashy novels, gambling saloons nor dram-shops, polkas nor California gold, had stimulated the passions, whetted the grosser appetites, nor corrupted the plain, simple, manly taste of our nature. It was in that Arcadian age that agriculture was most esteemed and most generally practiced; and whilst I am not of that school of dyspeptic philosophers, who complain of all modern improvements, as mere useless encroachments upon the simple habits and innocent tastes of the past, yet it is not to be denied, that with the advance of what is termed civilization and the progress of science and art, we have lost much of that stern simplicity, that true dignity, that unsophisticated manly virtue, which characterized the pastoral ages. This is but the natural result of causes easily comprehended. So long as the tilling of the earth was the chief, and indeed almost the only employment of man, there were but few causes to engender strifes, stimulate bad passions, impair the honest impulses, or weaken the naturally generous emotions of the heart. But as human pursuits multiplied, as wealth and luxury increased, as commerce spread her sails and courted every gale, as science explored the mysteries of nature, and art sought to rival her perfections; when genius ventured into new and untried paths for its development, and enterprise found new avenues to fortune—then the minds of men were brought into conflict, and their fiercest passions quickened. The ambition, which before had been content to rule a hamlet, now sought to sway an empire; the avarice which once had coveted only petty gains, now gloated over great heaps of gold; the pride which had formerly tread its dainty path in rustic finery, now flaunts abroad in rustling silks and gay attire. And thus it has been with all the weaknesses and frailties, as well as the active vices of our nature. They have grown upon us, just in proportion to the increased opportunities for their indulgence, and have become intensified in proportion to the stimulants applied to them. But it may be asked, if I maintain the opinion, that the world is constantly growing worse instead of better, as civilization advances, as science achieves its triumphs, as literature sheds abroad its mild, refulgent light, and religion dispenses its genial rays throughout the earth. I really, that whilst it is undeniably true that vice and crime have fearfully multiplied and are constantly assuming new phases, yet, with increased knowledge, and with improved systems of government and laws, and especially by means of more enlightened systems of religion and morality we are enabled to hold in check the turbulent passions and rampant vices which are constantly at war with social order and would otherwise quickly exterminate it. So that whilst there is more vice to regulate and restrain, there are more efficient methods to control it. But without stopping to discuss a question not particularly pertinent to the subject in hand, I think I may at all events reiterate the assertion that agricultural pursuits are peculiarly favorable to the development of a high system of morality and virtue, which is the proposition with which I set out, and the truth of which has been attested by the experience of all the past.

Go ask the intelligent statemen, in whom he reposes his firmest trust for the safety of the commonwealth? He will answer: "In the inhabitants of the rural districts." Ask the experienced military chieftain, in whose fidelity and loyalty he would most confide in the hour of peril; or the judge, as he administers the laws, who are the most incorruptible arbiters between man and man. They will answer: "The honest yeomanry of the country." Ask the minister of religion, where it is that piety is most fervent, that honesty and truth are most revered, that vice is most abhored, and that man, in his fallen estate, approaches nearest to the image of his creator. He will answer: "In the peaceful shades of rural life—amidst forests and flowers—along green lanes and beside rippling streams, where the heart is constantly filled with the beauties of nature—or, as Whittier expresses it, where

"The green earth sends its incense up,
From every mountain shrine—
From every flower and dewy cup
That greeteth the sunshine."

(Where)

"The mists are lifted from the rills,
Like the white wings of prayer;
They lean above the ancient hills,
As doing homage there."

But it is quite obvious why the healthful, innocent pursuits of rural life are, of all others, the most favorable to purity of morals, the development of gentle emotions and fixed principles of virtue. One whose lifetime is passed in the broad fields, or amidst the solitude of forests, and is constantly communing with nature, can scarcely become wholly vicious and corrupt. Every wild flower that blooms around him is a mute appeal to his conscience, and every murmuring brook whispers in his ear a tale of innocence and love. No human being, however grovelling his appetites, or limited his moral perceptions, can be wholly insensible to the gentle, purifying influences of the beauties of nature. The note of a bird, the hue of a flower, the sighing of a breeze; nay, the very rustling of a leaf, will now and then awaken an echo in his heart, to remind him of the innocence of his childhood, or recall some long forgotten memory of the past. Even the untutored savage bows to the majesty of nature, and does reverence at her altar. And whilst upon this branch of my subject, I might, if it were necessary, institute a comparison in these respects, between city and country life. I might point to the fact, that large cities are the very nurseries of crime—hot-beds wherein the most prurient vices do rankly vegetate—painted sepulchres, adorned with tiusel, only to hide the rottenness within. How much, think you, of all the crime the world has ever multiplied, of all the vice that makes up the great record of human frailties and folly, have occurred in cities? Take any one great city—London for example—and compare its criminal calender for a series of years, with that of all the rural districts of England combined; go through its dark lanes and alleys, peep into its damp cellers and secluded dens; enter its gin-palaces, its gambling hells; visit its prisons and poor houses, its hospitals and reform schools, and then imagine, in addition to all this, how long must be the catalogue of crime in such a city, which is practised in secret, and never meets the public eye. Do this, and then answer whether I have truly characterized great cities, as painted sepulchres and hot-beds of vice.

Or, let us take an example nearer home—the city of Boston, for example—a city in the midst of a population distinguished for its intelligence, morality and piety—the abode of classic learning, of princely wealth, of generous hospitality. It would seem that in this city all has been done that Christian piety, a shrewd sagacity, or an enlarged benevolence could do, to repress vice, and maintain a high standard of social order; and yet I will venture the assertion, that in this model city there is more of flagrant crime, of secret vice, and in all respects a greater laxity of morals, than in all the agricultural districts of Massachusetts combined. Or, to come still nearer home—let us walk through the crowded thoroughfares of San Francisco; let us take an evening stroll through Commercial street, when its Peter Funk auctioneers are making the air vocal with their eloquence—when its gambling saloons and dram shops are refulgent with garish lights, and charm the senses with sweet music and delicious wines; or along the classic purlieus of Dupont street, where a modest cheek dare not venture without a blush; or among the dance-houses and doggeries of Pacific street, where vice wallows in its filth, and delights in its own grossness; and then on the next morning at 11 o'clock, let us peep into the Recorder's Court, and we will probably behold such an array of blackened eyes, battered faces, thievish looks, and hardened crime, as should cause humanity to weep for its degradation. But why need I debate a proposition, the truth of which has been established by the experience of all past ages? From the time when our Saviour was crucified at Jerusalem, down to the present hour, cities have given birth to the most accursed crimes that history records; and in this respect, be, in despite of all that Christianity, with its European States, in this respect, and I have laws, and the most sagacious philanthropy can do to the contrary. Human nature is so constituted that it cannot bear too close a contact with itself. Like some beautiful flower, it sickens, pines, and becomes but a noxious weed, in the close and foetid air of the hot-house—but puts forth all the glory of its hues, when exposed to the balmy breezes and gentle showers of Heaven. If, therefore, we wish to cultivate the highest standard of moral excellence, and to lay the foundation of a future renown which shall distinguish us through all time, let us in all practicable modes persuade our people to till the earth, rather than crowd together in the polluted atmosphere of populous cities.

But this is a more imperative duty with the American people than with any other nation under Heaven. With us, the people are recognized as the only legitimate sovereigns, from whose will spring all government and law. Corrupt and poison the popular mind, degrade the morals of the people, and you render them wholly unfit for rational self-government, and they quickly become the fit tools for tyrants, and slaves to their ambition. But preserve the public morals unsullied, let our sons and daughters inhale the pure and invigorating atmosphere of country life, and we need not fear for the safety of the Republic. It was the hardy, patriotic, high-souled farmers who achieved our liberties, and it is they who must perpetuate them. In the dark days of the Revolution, at their country's call, they rushed from the mountains of Vermont, from the hills and plains of Massachusetts, from the valleys of Virginia and the savannas of the South, to rally round the standard of the immortal Washington—himself a farmer. And if, in the course of future events, our national safety should again be threatened, by a collision with foreign powers, it is the farmers who must bear the stars and stripes aloft over every victorious field. Or if, perchance, we shall be threatened with intestine commotions—if our public agents shall become corrupt, or some ambitious leader arise, who shall seek to overthrow our liberties, it is the plain, sturdy, honest farmers, from valley and plain, from mountain-side and hill-side, who must come to the rescue. No nation can well become thoroughly enslaved, whose people drink in freedom from the simple majesty of nature. But all history proves, that it is in over-crowded cities, with their dark dens and reeking stews, that tyrants and demagogues find the fittest tools for their work. If, therefore, we would preserve the glory of the past, and insure safety and renown in the future, we have but one path to tread—encourage and render honorable the farmer.

I have thus far spoken of agriculture chiefly in its moral aspects; but there are others, which are even more important. It has been ordained by Providence, that man shall look to the earth not only for the means of sustenance, but also for nearly every thing that supplies his luxuries or gratifies his tastes. The meanest peasant in his thatched hut, and the proudest monarch in his imperial palace, are alike dependant upon the earth—the one for his brown crust and frugal meal, the other for his dainty viands and purple robe. The haughty beauty, bent upon conquest, arrayed in rustling silks and costly laces, forgets, perhaps, that she is indebted to the bounteous earth for the rose that blushes upon her cheek, the ruby that glows in her lip, and the beautiful garments which adorn her person. The artist, as he looks proudly on the beautiful creations of his pencil, should remember that the earth and nature are the fountains from whence he draws the inspirations of his genius. Thus, in all the walks of life—in every department of business or of pleasure—the highest and lowest are alike dependant upon the generous earth for existence itself and all that makes it endurable. Agriculture, itself lies at the foundation of all human employment, and furnishes the broad base, on which the others rest. Without it, commerce would fold its wings, and our merchant ships would rot at their moorings, our mechanics and artizans would close their doors because there would be nothing to manufacture; our merchants would abandon their callings, for there would be nothing to sell or to buy; even the lawyers would be bereft of their vocation, for there would be nothing left worth quarrelling about. But doctors and ministers must have ample employment—the one in healing the manifold diseases of the body, the other of the mind consequent upon such a deplorable state of affairs. Such being the important relation which Agriculture sustains towards all other employments, it has always been the policy of wise governments to foster and encourage it beyond any other pursuit, and those are the wisest which have done the most in this respect. And here I cannot forbear to say that it is absolutely surprising that in the United States so little has been done either by the Federal or State authorities, having for its object the direct encouragement of Agriculture, in a practical form. In this respect, we are immeasurably behind most of the European States. With us, all that has been done has been accomplished by individual enterprise or by voluntary associations; whilst in Europe the most enlightened states have made and are now making systematic and well-directed efforts to introduce improved methods of culture, new kinds of stock, better implements of husbandry, and by the establishment of agricultural colleges and model farms, under the fostering care of government, to inculcate a taste for such pursuits and to train up a large body of scientific young men, who shall be thus qualified to [illegible] only practically but theoretically, and who shall the advancement which [illegible] All my [illegible]

fore extracted from a very eloquent address, recently delivered by Uriel Wright, Esq., before the State Agricultural Society of Missouri, the following interesting account of what has been accomplished by some of the leading governments of Europe, in behalf of Agriculture. Before proceeding to his statistics he says:

"The vast area of this country compared with its population, and the richness of its virgin soil, conspired to bring about a careless culture—ending in the present state of Agriculture in America. Man has relied more upon the bounty of Providence than upon his own skill. West of every worn-out field lay acres untouched by the hand of toil. West of every State exhausted by injudicious husbandry, lay territory in its virgin state, too tempting to the emigratory principle in man. It has been deemed less difficult to open a new farm than to improve an old one. Our population, by a law seemingly as irresistible as that which carries the waves of ocean to the shore, have from the Atlantic board passed the Alleghanies, climbed the Rocky Mountains, and descended to the Pacific. Nothing in the world's history is like it. In 1620, the men of Plymouth Rock saw the first light of morning gild the waves of the Atlantic, and now their descendants see twilight deepen on the smooth waters of the Pacific.

"A continent has within the period of a little more than two centuries been subdued into civilization by our people, and much the greater portion of it has been compassed since the Declaration of Independence. In this eventful period, government, laws and institutions have arisen—the creations of American mind—which extort the admiration of the world—but the genius of our people has not, heretofore, been led by inventive necessity to study the mysteries of the production of the earth. No famine has ever swept over this, our own beautiful portion of the globe. With small toil its population has been fed, and a surplus produce has gone to supply the wants of older and more crowded nations. America has had more land than laborers, and accordingly we see the inventive mind of our country creating laborers out of wood and metal, and sending them to the field to do the work of men. In this department of enterprise, with the untaught study of only twenty-five years, we lead and teach the nations of the earth. And in any field of human enterprise, set but an object and a motive before the mind of America, and she will win trophies against the competition of a world.

"Bounded now by two oceans, the period has arrived in the history of our country, when the public mind is directed to the improvement of our present possessions, and the agricultural mind of the country to the improvement of the soil within its present boundaries. The indications are unmistakable as they are wide spread. North and South, East and West, the cry is up, "why shall not Agriculture be an educated Art?" Why shall not educated mind go from the halls of learning to the farm, as it goes everywhere else? How the young mind shall be educated to fit it for the field, has not been decided. It is a great question, requiring thought and mature deliberation. It is a subject worthy of the best energies of the best minds of America. Whatever suggestions I offer, is with diffidence, but by whatever steps of progress led, it seems to me the end must be the school, the experimental farm, and the college. I know no other mode by which Science—Agricultural Science—can be so taught as to blend theory and practice—the highest consummation of art. In other countries important attainments have been already reached by these instrumentalities. Europe, engaged for centuries in the cultivation of the arts of war, has, since the fall of Napoleon, turned its attention to the arts of peace. In the short period of its repose, three hundred and fifty schools, exclusively devoted to agricultural education, have arisen, surrounded by experimental farms, upon which the sciences taught have been practically applied.

(Concluded in our next.)

A Venerable Farmer.—Dea. Josiah Howe, of Phillipston, who was seventy years of age last March, has raised from his farm the past season, 100 bushels corn, 100 bushels oats, 15 bushels barley, 75 bushels potatoes, (his potatoes were a very poor yield, as he had ground enough for 200 bushels, with a common yield,) and has cut 18 tons of hay, picked 12 barrels of apples from the trees by hand, besides various other work common to good farmers; and *performed all the work himself*, with the assistance of a boy 12 years old a little more than one half of the time, and 1 1-2 days by a man. He did not in one instance fail to milk the cows himself night and morning since last winter.—*N. E. Farmer.*

Trimming Trees.—Fall is the best time to trim trees. It removes the [illegible] would not otherwise would take the sap and heal over much quicker than at any other time. If large limbs are cut off, put on paint to keep out the wet and prevent rotting. I think the best time for trimming all kinds of trees is when the fruit is gathered. I have tried all seasons, and have come to the above conclusion.—*Ohr. N. E. Farmer.*

As a farmer may write by the yard and thresh by the bushel; or he may write by the bushel and thresh by the yard. Covering a large piece of land with a small portion of [illegible] a small piece with a large portion, has already [illegible] as a writer and farmer [illegible] to notice. We [illegible] single sentence [illegible] and there is a literary [illegible] a work and a [illegible]

The [illegible] and some [illegible] shades.

Cultivation of the Rose.

Our readers will remember that in a previous number we presented them with part of the "Autobiography of a Pot Rose," and we now publish a continuation of the same. If they have filed the Farmer, they will have full directions for the growth, care and blooming of the Rose, and in so pleasing and instructive a form as to induce them to cultivate this queen of flowers now, if they have never done so before. Our fair friends will find in this detailed mode of cultivation, the cause of their failure in "blooming the Rose," and the frequent loss of those and other valuable plants. This arises from *over watering plants* during the period they need rest. We trust the story of the Rose will prove interesting and useful.

THE AUTOBIOGRAPHY OF A POT ROSE.

Throughout the winter months, I gave very little trouble, although I received every attention that was necessary. The soil about my roots was kept rather dry; sometimes I did not receive any water for a fortnight together, for John the gardener knew well that, as my roots were in an inactive state, such a stimulant would prove injurious rather than beneficial. When the weather was fine, the frame was opened, and I was exposed to the sun and air; and if wet, it was so tilted that a circulation of air was admitted though the rain was excluded. When the weather was frosty the frame was kept closely shut, and sometimes a straw mat was drawn over the glass. Thus I passed my first winter, in company with other plants; and when the spring arrived, my powers were so invigorated by the rest I had received, that I felt prepared to grow and blossom with unusual vigor. Early in March I was pruned. I had seven shoots, four strong ones placed at about equal distances, and three weaker ones rising between the former. The latter were cut off close to the main stem, and the remaining four were shortened to two eyes each, so that I might produce eight blooms in June, which was considered enough for my strength. After this I was placed in a larger pot, of the size called 48, in the same soil as last used, and plunged on the top of a dung-bed, without any frame. The warmth thus generated about my roots stimulated them to feed and grow, and the increase in the size of my branches was proportionately great. Eight flowers was the number actually produced; and I need not say that I received a liberal supply of weak liquid manure from the commencement of growth to their development.

When the flowers were over, the supply of water was again diminished, which was quite in accordance with my feelings; for after so much exertion I required temporary rest. I remained inactive for about three weeks, when I was again potted into a larger pot, this time No. 24; again freely supplied with water and stimulated by a bottom heat to a new growth, and I produced in September no less than twenty flowers, which, if of smaller dimensions than those of summer growth, were pronounced superior in shape and color. I now discovered that my master began to be proud of me; he brought all his friends to see me, and when he found them interested in my appearance, he gave them my history in brief or detail, according to the humor of the moment. Some I saw smile at the earnestness with which he spoke of various matters; and one young gentleman, a philosopher I think they called him, said gravely, shaking his head, that it was monstrous for a reasonable man to occupy himself so earnestly with such trifles, that "the proper study of mankind was man." My master, who was a man of most amiable and even temper, smiled, and calmly replied, that it had never been the business of his life, but only his recreation, and as such it had yielded him an amount of health and calm enjoyment which he would not have exchanged for the purple of an emperor or the riches of the Sacramento. As my master's garden was celebrated for many rare and fine things, it was often the resort of certain *savans* of horticulture. The gardener John was not himself of that class. He was a plain, practical man, honest and skilful, not dogged and averse to new things because they were new, but averse to replace old by new, before testing the latter by experiment. I often heard some well-fought battles between John and the savans; and while the savans seemed to know most of logic, it seemed to me that John knew most of gardening. Of this I felt sure, after hearing John argue one night with one of these *celebres*, a miller, to whom my master seemed to pay great deference on the subject of Rose-culture. A new stock from Italy was the subject of discussion, I think they called it Manetti. John was told this stock was to surpass all other stocks. When budded on it, Roses were to grow double as fast as any other, and never to spawn or sucker; the most shy and delicate were to become free and robust even on the poorest soils; and, in fact, the sooner every other stock and stool was rooted out of the garden and replaced by these the better. As the miller spoke of his own experience, and was wholly disinterested in the matter, my master became a convert. I trembled, when John quietly said, "Let us try this stock first, and if it prove equally good on our soil, we can then replace our other Roses with it." My master seemed to think this course reasonable, and adopted it; and that he was well pleased with his decision, the sequel will sufficiently show.

This has led me to a rather long digression. To return. My September flowers had fallen, and I learnt that it was the intention to "force me"—that is, to change my seasons, so as to develope my first blossoms in March, instead of June. To this end the pot in which I grew was laid on its side, so that I might get no water naturally or artificially, but sink rapidly into a state of rest. This I did, and was pruned and conveyed to a cold pit, there to wait till the first of January, which was the commencement of the forcing season. The operation of pruning seemed much more difficult this year than before; I had a great number of branches, some weak and some strong, some well and some ill placed. It was evidently a puzzle even to John what to do for the best; and he walked round me and looked at me some time before he could make up his mind to begin. At last he seemed to have decided which shoots should remain, and he began removing the others carefully till only twelve were left—one tall shoot in the centre, and the others dispersed around it at about equal distances. The shoots were then shortened; on the strong ones were left about five eyes, and on the weak ones one, two or three, and I was pronounced pruned ready for forcing.—*Turner's Florist.*

From the Interior.

We copy the following items from the Mariposa Chronicle:

Since our last issue the miners in this section of the country have been favored with the most encouraging season that has probably been vouchsafed to them during the present winter. From all quarters, we hear the most gratifying results, cheering alike to all classes of the community.

At Messrs. Jenkins & Evans' celebrated quartz vein on Missouri Gulch, the yield is decidedly on the "big lift" order. Since the rains set in, work on the vein has been suspended, and Mr. Jenkins has been engaged in sluicing the surface dirt adjacent. On Monday he found a detached quartz boulder, (evidently at one time a part of the vein) a cubic foot in dimensions, literally glossed with gold. From this rock, in a crude extempore manner, was obtained a little over $1,600.

On Sherlock's Creek, miners have been making good wages. One company last week cleared $1400. The same company have been averaging $200 a week clear for some months.

The diggings in Carson's Creek continue good. A Mexican a few days since found one lump of pure gold weighing 14 ounces, and two other pieces of nearly 6 ounces each. The average yield is between $4 and $5 per day to the man.

At Bear Valley every gulch and creek resounds with the gladsome sound of cradling and tom washing. It is said by the Forty-Niners of Bear Valley that the old mine has proved and is yet the richest spot in California. Bear Valley Camp, otherwise known as Simpsonville, is prettily situated, and contains about fifty houses.

Prospecting just now produces indisputable evidence that Mariposa is second to none in the vast extent and value of her mineral resources. Every hill, gulch, flat and creek is auriferous in the extreme, and could our people but obtain a continuous and uniform supply of water, they would develope wealth, in all probability, fully equal to the most celebrated productions of Eldorado, Nevada, and other northern counties. We trust that at an early day some positive steps will be taken toward introducing the Merced or the San Joaquin river.

Portions of the skeleton of a young man named Robert Coleman, who left French Camp about six weeks since on a hunting expedition, was discovered by the Indians on Tuesday last, in the lair of some grizzlies. Mr. Coleman came to this country from Alabama about two years ago, and was a person generally liked and esteemed by all who knew him.

Two men at Agua Frio are making from twenty to seventy-five dollars per day; and there is plenty more just such ground in this county, which cannot, however, be made available without the introduction of water from the Merced or San Joaquin.

A difficulty occurred last Friday morning, at upper Agua Frio, between two miners named Knight and Hancock, which resulted in the former sending a pistol ball through his adversary's right arm, inflicting a serious wound.

The mines at Park's Bar are doubtless among the richest in the State. The Marysville Herald learns that the miners at that place are making extensive preparations to work the rich placers in those diggings. Two ditches will, in a few days be completed, which will furnish all the water desired. Both of their ditches furnish all the sluice heads necessary for use.

Mr. Daniel Manning, from Dayton, Ohio, aged 44 years, was killed on the 7th inst., by the caving in of the bank while sluicing near Georgetown. He leaves a wife and two children in Dayton, Ohio.

The Marysville Herald has reliable information that new mines have been discovered near the Prairie House, about ten miles from Maryville. Our informant represents these new diggings to be extensive, capable of giving employment to several thousand men, and thinks the earth will pay ten dollars to the man, per day. Two hundred men are already at work.

The Herald is also informed, from another source, that extensive mines have recently been discovered, and are being worked, in the vicinity of the Indian Ranch, twenty-seven miles from this city.

Brilliant accounts reach us constantly of successful mining operations in Calaveras county. A friend of ours has just received a letter from Angel's Camp, dated January 29, which complains of the coldness of the weather and scarcity of the water, but represents the mining prospects as very rich. Two Frenchmen, at Cherokee Flat, after going down fourteen feet through what they supposed to be the bed rock, found dirt that averaged $500 to the pan. The gold lies in what appears to be a decomposed quartz vein.

At a meeting of the miners of Canal Gulch, Siskiyou county, Feb. 1, the following preamble and resolutions were adopted.

Whereas, The miners of Canal Gulch are deprived of the water that flows down the original channel, in consequence of a ditch constructed in said gulch, for the purpose of conveying the water to other portions of the mines:

Resolved, That we do not recognize any ditch company's right to the water, for the purpose of conveying the same to other portions of the mines, whereby the miners of said gulch are prevented from working their claims in consequence of said ditch.

Resolved, That should there be a surplus of water, we are willing they should have the same for whatever purposes they may desire.

Resolved, That the miners of said gulch will use the water running down said gulch, to enable us to work our claims to better advantage, and defend the same.

The Limantour Claim.—The Times and Transcript publishes several documents relative to the arrest and imprisonment at Sixtla, in the State of Guerrero, Mexico, of Mr. A. Jouan, who claims to be an American citizen, at the suit of Mr. Jose Y. Limentour. These documents include a letter from Charles L. Denman, U. S. Consul at Acapulco, to the Governor of the Department, demanding the release of Mr. Jouan, and several letters from this gentleman in relation to his arrest and imprisonment. Mr. Jouan in his letters states that his testimony relative to the Limantour claim, is of the utmost importance to the United States, and intimates very clearly that the claim of Limantour is a fraud throughout.

It is said that fifty persons left for Sonora, on Monday, in the bark Anita.

Guaymas Times.—Mr. H. Davidson has made arrangements to start a weekly paper in Guaymas, Mexico. Mr. L. P. Fisher, at the Merchants' Exchange, is agent for the new paper.

Two men named Guild and Ingalls, together with twelve Chinamen, were recently murdered by the Indians in Shasta County, near the town of Pittsburgh.

Mr. E. R. Budd has succeeded Mr. A. A. Sargent as editor of the Nevada Journal. Mr. Sargent has engaged in the study of the legal profession, in which we wish him abundant success.

U. S. Land Commission, Feb. 14, 1854.

By Commissioner Campbell—

No. 369—Claim of Augustin Machado, to Ballona, 1 square league, in Los Angelos co.; confirmed.

No. 327—Claim of Anastasio Carillo, to Punta de la Conception, in Santa Barbara county; rejected. (Dissenting opinion by Com. Thompson, confirming the claim.)

No. 382—Claim of Bernardo Yorba to La Sienna, 4 square leagues in Los Angelos county; (Dissenting opinion by Com. Thompson, confirming the claim.)

By Commissioner Thompson—

No. 223—Claim of Juan Martin to Rancho de la Corte de Madera de Norato, 2 square leagues in Marin co.; confirmed.

No. 78—Claim of Fulgencio Higuera to Agua Caliente, 2 square leagues in Santa Clara co.; confirmed.

No. 272—Claim of Maria Merced Lugo, Foster et al to San Pascual, 3 square leagues in Los Angeles co.; rejected.

By Commissioner Felch—

No. 346—Claim of Abel Stearns to La Laguna, 3 square leagues in San Diego co.; confirmed.

No. 258—Claim of Thomas Pacheco and Augustiu Alviso to Potrero de los Serritos, 3 square leagues in Santa Clara co.; confirmed 2 square leagues.

No. 293—Claim of Hiram Grimes, et al. to El Pescadero, 8 square leagues in San Joaquin co.; rejected.

No. 161—Claim of Vincent Sanchez et al. heirs, Jose Sanchez, to Las Aminas, formerly called Sitio de la Brea, in Santa Clara county; confirmed.

Board adjourned until next Tuesday.

Marble Work.—There can be no better evidence of the steady onward course of California to become an "Independent State"—relying upon her own resources—than to examine the products of her skill and industry among her citizens. In every city of note and in various parts of the State, there is continually opening to our view, manufactories of the various useful and ornamental articles required among us. We could note many of recent origin, but our space prevents us to name but the one to which we allude, *i. e.*, the beautiful marble work now on exhibition at the warehouse of Coit & Beals, on Battery street. For beauty of design and for finish in the workmanship, we are confident it cannot be excelled in any State in the Union.

We surely can say our citizens should be proud of this branch of art established among us, for these are luxuries which wealth shall demand, and as we are so rapidly increasing in superb dwellings, marble fire-pieces will be a necessary requirement. We commend all who are building, to call at Messrs. Coit & Beals' and examine these splendid works of art.

A Luxury.—Messrs. White & Balch, 17 and 19 New World Market, have sent us a sample of "Horse Radish," finely prepared in glass bottles. Here we have a "home production" of a luxury, and save the cost and trouble of importation, besides keeping the *oro* this side. We commend such efforts and this fine condiment too.

MARKET REPORTS.

San Francisco, Feb. 8, 1854.

We are cheered by hope of better things ahead—the rains have given encouragement to the Cultivators, and thus induced a little stir in trade—and were it not for the continual influx of merchandise by new arrivals, we should assert a certainty of permanent improvement.

All kinds of Grain are dull. Potatoes hang heavy, owing to the immense quantities stored and coming in by contract. We however have faith to believe the farmers will receive a remunerating price yet. Onions have advanced.

We repeat our remarks of last week relative to prices. They are merely at nominal rates. Sales are made to meet an emergency and without regard to market rates or value of the goods.

Perseverance, energy, and will to conquer and overcome all difficulties that depress trade will soon put things better.

JOBBING PRICES.

Mr. Frederick Smith recently from Buffalo N. Y., is sick, at Hilman's Temperance House, on Davis street, No. 84, and wishes to find his brother, Col. John Smith, somewhere in this State. Information on this subject will greatly oblige the afflicted, destitute man, who has buried his wife and child within a few days past. They came up on the last trip of the Brother Jonathan. *

An original tale, "The Ruined Valley," will be found on our first page.

MARRIED.

In this city, 7th inst., by Rev. J. A. Benton, Capt. David Marvin, formerly of New Jersey, , and Mrs. Rosanna Jayne, formerly of New York.

In this city, Feb. 5, at Trinity Church, by the Rev. Mr. Wyatt, Mr. J. Weston, Jr., of Hopkinson, Mass., and Miss S. F. Richardson, of Boston, Mass.

At Georgetown, Feb. 2, by E. C. Southworth, Esq., Mr. Michael Crowley and Miss Maria Clark, both of Georgetown.

In Placerville, Feb. 7, by Rev. Mr. Turner, Mr. Fred. Wadsworth, Jr., of Diamond Springs, and Miss Mary Jane Kelly, of Placerville.

At Mud Springs, on the 5th inst., by G. W. Stafford, Esq., Mr. J. B. Tincbo and Miss Mary A. McKinsley.

At the same time and place, by the same, Mr. George H. Sprague and Miss M. McKinsley.

DIED.

In this city, on Monday, the 13th inst., Frederick Eugene, only son of Alonzo C. and Virginia A. Wakeman, aged 13 months and 13 days.

In Oregon, Feb. 1st, at his farm, about seven miles from Portland, John Elliott, Esq., M. W. G. M. of the Grand Lodge of Masons for the Territories of Oregon and Washington. Mr Elliott was accidentally killed by the falling of a tree.

At Sacramento, Feb. 11th, Louis Walter, infant son of Jas. C. and Mary M. Zabrishie, aged 20 months.

At Pajaro Valley, Jan. 23, of inflammation of the bowels, Geo. W. Lynch, of Salina, N. Y., aged 25 years.

In Oakland, 9th inst., Alfred Stephens, formerly of Michigan, aged 26 years.

At sea, on board schr. Tennessee, 8th inst., Capt. J. S. Inglee, aged 53 years, of New York.

At Whipple's Mills, Redwoods, Feb. 5th, of dysentery, after a typhoid fever, Robert S. Ewing, aged 28, formerly of Indiana, Penn.

In Camptonville, Feb. 5, after a long and painful illness, Mrs. Nancy A., wife of G. P. Sanders, aged 39 years.

At Honolulu, Jan. 5, Hugh McD. Dickson, Esq., of the firm of H. & W. Dickson.

At Los Angeles, Jan. 25, Mr. Steven Jarvis, late of Sydney, N. S. W., aged 32 years.

SHIPPING INTELLIGENCE.

PORT OF SAN FRANCISCO.

Prepared to cut Quartz Rock into any form desired.
I will say to my friends and the public generally that I am prepared to work into any form they may desire, Quartz Rock, WITH A POLISH EQUAL TO THAT OF A MIRROR.
N. B.—Quartz Rock purchased at the highest prices.
J. W. TUCKER.
125 Montgomery street.

There are Three Things I Do Not Do!
1st. I do not get a gentleman to leave his Watch, and when he calls for it, charge him TWENTY-NIVE DOLLARS for cleaning it, and have it stop two hours after.
2d. I do not ask FIFTY DOLLARS for a chain, and sell it for THIRTY SIX DOLLARS, and warrant it Fine Gold, when it is filled with brass solder, and have to take it back and pay FIFTY DOLLARS in money, and give another chain.
3. I do not tell a Captain he can have his Chronometer gratis, and when he calls for it at the end of eight months, refuse to deliver him up his property, without he pays me SIXTY-FIVE DOLLARS, and TEN DOLLARS more for rating it.
There are many other things I do not do, which I may name at some other time. 1 4t J. W. TUCKER.

GEMS FOR THE PARLOR AND GEMS FOR THE GARDEN.

Rosewood Music Stools, &c., &c. 1 4t

VOLUNTEERS WANTED!
TO THE GREAT SALE OF
JEWELRY AT JOHN W. TUCKER'S.
I shall now commence selling off my entire stock, consisting of DIAMOND WORK, WATCHES, JEWELRY, SILVER WARE, etc., etc.
Amounting to more than $300,000!
I have got to sell all the above goods before the first of June, as I have to rebuild my store according to the new grade. Any person who wants a good article can procure one from me
Cheaper than in any other City in the World!
But I don't wish it to be understood that I pretend to compete with those who sell trash;—persons who would not hesitate to guarantee a brass ring or a watch for pure gold;—these persons can sell lower than I can. If I sell no article of any kind, and it does not turn out as I represent it, I will return the money. No person shall leave my establishment dissatisfied. Call and see me before you purchase elsewhere.
JOHN W. TUCKER.

THE FOREST TREES.

BY ELIZA COOK.

Up with your heads, ye sylvan lords,
Wave proudly in the breeze,
For our cradle bands and coffin boards,
Must come from the forest trees.

We bless ye for your summer shade,
When our weak limbs toil and tire;
Our thanks are due for your winter aid,
When we pile the bright log fire.

O, where would be our rule on the sea,
And the fame of the sailor band,
Were it not for the oak and cloud-crowned pine
That sprung on the quiet land?

When the ribs and the masts of the good ship live,
And weather the gale with ease,
Take his glass from the tar who will not give
A health to the forest trees.

Ye lend to life its earliest joy,
And wait on its latest page:
In the circling hoop for the rosy boy,
And the easy chair for age.

The old man totters on his way,
With footsteps short and slow;
But without the stick for his help and stay,
Not a yard's length could he go.

The hazel twig in the stripling's hand
Hath magic power to please;
And the trusty staff and slender wand
Are plucked from the forest trees.

KEEP COOL.

BY G. W. LIGHT.

Are your matters all awry?
Keep cool;
But consider well the reason:
If you are but right yourself,
Things will come right in their season.
Keep cool.

Though your case be desperate,
Keep cool:
Desperate evils may be cured—
They cannot withstand a MAN!
What have true men not endured?
Keep cool.

Has a villain cheated you?
Keep cool:
He's the loser—don't despair:
Now your eye-teeth have been cut,
Keep your temper; grin and bear.
Keep cool.

Has a maiden proved unkind?
Keep cool;
If you'd have your heart's desire,
Teach young Cupid's golden bow
You can stand its keenest fire.
Keep cool.

Can you not reform the world?
Keep cool;
Only one thing you can do—
Give a brave heart to the work;
Heaven wants no more of you.
Keep cool.

Does the prince of serpents hiss
Keep cool.
Show your stiffest under lip:
When he sees that you are firm,
You will find that off he'll slip.
Keep cool.

Let your ills be what they may,
Keep cool;
Seize this truth with heart and hand—
He that ruleth well himself
Can the universe withstand.
Keep cool.

TO THE FIRST SNOW.

BY ELLIOT.

Gently and still the snow flakes fall,
Covering the earth with a pure white pall—
They seem like tears to a cold world given,
For they freeze as they leave their home in heaven.
They come to cover the earth's cold breast,
And shield the flower-buds in their rest.
That when Spring comes again they'll bloom,
And scatter wide their sweet perfume.
And earth with her virgin robe shall say,
Bring forth my bridal robe, sweet May!
Then the snow shall melt, for April showers
Are the angels' tears to opening flowers;
And the birds shall come with songs anew
To wed the beautiful, good and true.

OBEYING ORDERS.—A certain general of the United States Army, supposing his favorite horse dead, ordered an Irishman to go and skin him.

"What! is Silvertail dead?" asked Pat.

"What's that to you?" replied the officer, "do as I bid you, and ask no questions."

Pat went about his business, and in an hour or two he returned.

"Well Pat, where have you been all this time?" asked the general.

"Skinning your horse, your honor."

"Does it take nearly two hours to perform such an operation?"

"No, your honor, but then you see it took about half an hour to catch him."

"Catch him! fire and furies! was he alive?"

"Yis, yer honor, and I could not skin him alive, you know."

"Skin him alive! did you kill him?"

"To be sure I did, yer honor! and sure you know I must obey orders without asking any questions."

You should forgive many things in others, but nothing in yourself.

Pop Goes the---Bottle.

UNNER the title of "Thrilling Adventure of a Young Lady," we find in an exchange a very comical story.

"In one of the most sober towns of Hampshire county, where the Maine Law is strictly observed, the keeper of one of the hotels has for several months past kept a bottle or two of wine in the bed where he slept, taking care to remove them every night when he went to bed, and replace them when he got up in the morning. A few days since, after replenishing his bottles, and not having a good opportunity to carry them to their old quarters, he slipped them under the bolsters of one of the beds reserved for travellers, and being called out of town to spend the following day, forgot to remove them. It unfortunately happened that a young lady traveller, stopping at the hotel for the night, was unsuspectingly conducted to the room where the liquors were deposited. As the evening grew late, the young lady went to bed, and was soon fast asleep, little dreaming of the mischievous *spirits* in such immediate proximity. About midnight, when all had become still, the secreted liquor—owing to the heat of the atmosphere or that imparted to it by the sleeper—expanded to such a degree as to defy longer confinement. Pop! pop! went the corks of both bottles, almost as loud as the report of as many pistols, and awaking the fair sleeper, who sprang from the bed, uttering such wild and terrific screams, that every person in the house was immediately aroused. The moon shone bright enough for the lady to see the liquor on her night dress, and with the conviction that she had been shot, she fainted and fell to the floor. A dozen servants immediately burst into the lady's room, and were horrified to find her lying on the floor, covered with blood! All believed that some horrible tragedy had been enacted—that she had either committed suicide or had been cruelly murdered. A light soon convinced them that she still breathed. No time was lost in sending for a surgeon, whilst the half dressed inmates of the house commenced a search for the assassin or the instrument which had been used to perpetrate the horrid deed. On examining the bed, it was found to be drenched with what looked to be the blood of the young lady; but the strong smell of wine caused one to investigate further, and of course the bottles were discovered! How the doctor came, and the lady recovered, and the landlord tried to hush up the affair the next day, can be better imagined than described.

HOW TO CHOOSE A DOMESTIC.—Housekeeping is not so full of sunshine and rose-colored bliss as many imagine. It is hardly possible to get along without cooks, scullions, and chambermaids: and what with their waste, wittles and impudence, says Aunt Sally, they are plaguy drawbacks on domestic peace and comforts. Old Peppergrass was the "enstomer" for discriminating between the useful and the careless. Peppergrass sent word to the Register office that he wanted a good girl for general housework. About the time he expected an applicant he laid a broom down in the yard, near the gate. Presently a girl comes up to the gate, opens it, and strolls up to the house; the broom being immediately in the path, Miss Betsy strides over it. The old man was on the watch, and the first salute the girl got, was, "I don't want *you*." The girl sloped, and suddenly bullet-headed Nancy appears. Seeing the broom in her way, she gives it a kick, and waddles up to the house. "You won't suit me, that's certain, Miss Mopsy!" bawls Peppergrass. She disappeared in a hurry; and finally a third appears, opening the gate, and coming into the yard, she carefully closes the gate behind her, and walks up—the broom is still in the path; this she picks up and carries along to the house, where she deposites it along side the woodshed. Before the girl could explain her business there, Peppergrass bawls out. "Yes, yes, come in, *you'll* suit me." And she did; for that girl lived with Peppergrass seven years, and only quitted it to go to housekeeping on her own hook; and a capital wife she made. Peppergrass was right.

THE most elegant "turn-out" in Washington, is said to be that of General Cass. The color of the carriage is "a dark violet, the panels being so smoothly finished and highly polished, as to present almost the surface of a mirror. The linings are of rich blue and gold silk reps, with silk lacings to correspond. The carriage is hung very low, and possess all the requsites of an elegant vehicle for luxurious ease, without any attempt at gaudy display. On the centre of the panel of each door is inscribed the letter C., enclosed in a very small and neat wreath. Speaking tubes, card-racks, etc., form part of the appendage of the coach."

ADVERTISING nowadays has become reduced to a science. Somebody *alliterizes* in this manner, in an advertisement of a superior article of marking-ink: to wit, that it is remarkable for "requiring no preparation, pre-eminently pre-engages peculiar public predilection; produces palpable, plainly perceptible, perpetual perspicuities; penetrates powerfully, precluding previous pre-requisite preparations; possesses particular prerogative; protects private property; prevents presumptuous, pilfering persons practising promiscuous proprietorship; pleasantly performing plain practical penmanship; perfectly precludes puerile panegyries, preferring proper public patronage."

FLIRTING—(*By an old hand at it.*)—Flirting is a most amusing game. It is true there is nothing gained by it, but then there is nothing staked. In fact you may call it, "playing at cards for love."

PEORIA PREMIUM STEEL PLOWS.

THE FORMER CELEBRITY OF THE PEORIA PREMIUM STEEL PLOWS, and the unequalled success of their introduction in this State, would seem to preclude the necessity of any further effort on our part to draw attention thereto; but in view of the transitory nature of business in general in California, and the probability that some may have looked upon our establishment of an extensive and permanent manufacture of Plows here, in the face of such enormous importations and extravagant prices of material, as an impossibility—we believe it expedient to adopt this method of bringing it within the special notice of all concerned, that we are now manufacturing, and will have ready for this season's demand, three thousand of the most superior Plows ever made or used within this State.

We feel warranted in making this assertion, from the fact that all who used our Plows last season testify that they were superior: and we have studied so closely the immediate wants of our patrons from every section of the State, that we can now furnish Plows suitable to any particular kind of soil known in the State.

Our material has all been selected in the East by one of our firm, and imported by us directly from the manufacturers, which places it in our power to say confidently that nothing is lacking in quality, while we are enabled to make the plows at a cost greatly below that of last season, and are determined to sell at prices within the reach of every farmer who may wish to use the Peoria Premium Steel Plow.

It should be remembered that these plows will do double the work with half the team required in using the ordinary cast Plow; and that the work, when done, will be well done.

For particulars of prices, and descriptions of plows, we refer you to the subjoined card. The prices therein detailed are those established at our factory, and the only alterations from them that we authorize our agents to make, is the addition of the cost of transportation to their places of business—thus placing the plows at every accessible point of the State for the exact price charged at the Factory, with the necessary expenses only added.

Farmers ordering our plows through mercantile houses here, would do well to write to us at the same time, if they would make sure of getting the right plow, for some are interested in representing that we are not making plows at all, while other will not sell our plows when they can get off a cast plow. We therefore recommend that orders should be sent to us directly, accompanied by an order upon your merchant for the amount, which you can always know by a reference to the card accompanying this circular.

On the 24th of June the interest of T. ADAMS in our business ceased, by the sale of his entire interest therein to L. E. MORGAN. Aside from this, there has not, nor will there be, any alteration, as we have the same efficient and thoroughly practised hands in every department of our business.

E. L. MORGAN & CO., Successors to
T. ADAMS & CO.,
Corner of Broadway and Battery streets.

☞ The following are the established prices for the **Peoria Premium Steel Plows**, at our Factory, and the only addition our Agents are authorized to make thereto, is the cost of transportation to their points of business:

SIZE.	DESCRIPTION.	FURROW.	PRICE.

PROCLAMATION EXTRAORDINARY.

Woman's Rights
VINDICATED AND MAINTAINED.

WHEREAS, from the creation of the world, it was designed by the "Great First Cause" that

Woman's Rights and Privileges

should be co-equal to Man's; and whereas, she has been treated by many men in all ages, up to the present time, as an interior being to themselves: Now, therefore, be it known that I, M. L. WINN, of

Winn's Fountain Head and Branch

having expended large sums of money at the FOUNTAIN HEAD for the gratification of the appetites of Gentlemen, do recommend that Woman be hereafter allowed and provided with the facilities to enjoy all the privileges for which she was by Providence designed; and for this purpose I do hereby proclaim, that my

BRANCH,

Corner Montgomery and Washington streets,

shall be conducted with a view exclusively to the **Enjoyment and Comfort of Ladies**, and such Gentlemen as know and appreciate their worth.

At the earnest solicitation of many Ladies and Gentlemen and agreeable to my promise some months since to enlarge the BRANCH, so as to accommodate the last increasing patronage I shall, in a few days, add Two Spacious Stores on Montgomery street, to the Original Branch, making the

MOST EXTENSIVE ICE CREAM

And Refreshment Establishments in California.

The day of opening will be duly announced through the medium of the Daily Press, so that all may witness what has been accomplished for the accommodation and comfort of "God's last best gift to man." In the meantime, lots of Fun and Jollification may be enjoyed in reading the mottoes and feasting upon the luxuries to be enjoyed at

WINN'S FOUNTAIN HEAD,

78 and 80 Long Wharf, and Branch, corner Washington and Montgomery streets;

where Every Thing for the Holidays may be found, from a SugarWhistle to a Bride's Cake of half a ton.

M. L. WINN, Proprietor.

SELIM & EDWARD FRANKLIN,
REAL ESTATE AGENTS AND AUCTIONEERS,

Real Estate business, in all its branches,

For the conducting of which they esteem themselves peculiarly qualified, by having given it their special attention for over two years past, and made themselves familiar with all questions relecting titles, &c. &c.

They will give their especial attention to the public sales of estate, by Administrators, Assignees, Receivers, Mortgagees, &c., carefully complying with the forms of law.

A Register for Property, at either public or private sale, always open at their office 5

DONAHUE'S UNION IRON WORKS,
[THE FIRST ESTABLISHED IN THE STATE.]

Cor. of First and Mission streets, Happy Valley, San Francisco

THE undersigned calls the attention of the citizens of California and Oregon to his unequalled facilities for doing work with rapidity and cheapness. He has made, and will continue to make, such additions to his time and labor-saving machinery, as the increasing wants of the State require, and hence solicits public patronage.

Saw and Grist Mill Irons,
Quartz Crushing and Amalgamating Machinery,

and Castings of either Iron or Brass of every description (having a most extensive assortment of ready made patterns) made promptly to order.

STEAM ENGINES from the manufactories of William Burdon, Brooklyn, New York, and other celebrated makers, constantly on hand and for sale.

BOILERS of every description furnished at lower rates than can be afforded elsewhere, the iron for the same being imported direct, and the machinery for shearing, punching and riveting being driven by steam power. Patent Steam and Water Gauges, Steam Whistles, Cocks, India Rubber Steam Packing. Ready made Bolts and Nuts, Belting Lace and other Engineer's Findings for sale.

2 3m JAMES DONAHUE.

FAMILY FLOUR.
HORNER'S PREMIUM FLOUR.
UNION CITY MILLS.

WE INVITE the particular attention of Families and the Trade, to the quality of the Flour manufactured by us.

Our great aim has been, in the establishment of our Mills to procure the most perfect machinery, to employ the ablest millers, and to select the purest and finest wheat in the country.

That we have been able to accomplish all this, the Product of our Mills now before the community is the best evidence.

The FLOUR we manufacture has been submitted to the ablest judges of our State, and after the most rigid and thorough test, they have awarded to us the "PREMIUM PRIZE," and we shall have offer the same as "Horner's Premium Flour;" it shall be our constant effort to maintain for it the reputation of being the

The Best Flour in the Land.

Orders left with HORNER & CO. at our Storeship, Broadway wharf, will receive prompt attention.

5 4t HORNER.

SUPERIOR FURNITURE.

THE largest and best stock in Sacramento may at all times be found at the Old Stand of B. P. & D. MOORE, No. 77 Third street, where they still persist in selling as much below their competitors as their superior facilities will admit of. Having on hand the most splendid and substantial assortment of all kinds of Furniture ever offered in Sacramento, we feel confident, with prices to suit, that none can go away empty that may favor us with a call.

Our stock consists of Bureaus, Secretaries, Wardrobes, Stands, Tables, Bedsteads, Lounges, Sofas, Painted Mahogany, Black Walnut, Satin and Rosewood Setts—some of the finest and cheapest ever offered in this market.

Also, Mattresses, of Curled Hair, Patent Felt, Moss, Wool, Straw, and Straw with Cotton Tops. Also, Feather Pillows, and Feathers for Beds, with a large stock of Quilts, Comforts, Sheets, Blankets, &c., &c. EVERY THURSDAY MORNING,
At Eight Dollars Per Annum, in Advance,
BY JAMES K. PHILLIPS & CO., Publishers.

JOHN F. MORSE, Editor.

Advertisements.—A limited number of Advertisements will be inserted at the following rates: For one square of eight lines, per month, $6. For business notices of five lines or less per month, $4. A slight reduction will be made to regular advertisers.

"Our Hatty."

She might have had twenty other names, but that was the only appellation I ever heard. It was, "Get out of the way, Hatty!"—"I dare say, Hatty broke that vase, or lost that book!"—"Don't come here; what a fright you are, Hatty!" till the poor, sensitive child almost felt as if she had the mark of Cain upon her forehead. She had brothers and sisters, but they were bright, and saucy, and bold, and cunning; and, when they wished to carry out a favorite scheme, could throw their arms about the parental neck, flatter some weak side, carry the day, and then laugh at their juvenile foresight; so their coffers were always filled, while poor Hatty's was empty;—and she laid all these things up in her little grieved heart, and, as she saw the duplicity better rewarded than sincerity, began to have little infidel doubts whether the Bible, that her father read so much out of, was really true; while Joseph's "coat of many colors" flaunted ever before her tearful eyes! All her sweet, childish impulses were checked and crushed; and, where the sweet bowers of love and confidence should have sprung up, the weeds of distrust and suspicion took bitter root!

She took no part in the conversation of the domestic circle. "She was stupid," so they told her; and she had heard it till she believed it true. Sometimes, as was often the case, some talented person made part of the family circle; on such occasions, Hatty would listen in her corner till her great, wild eyes glowed and burned like living coals of fire. But there was one spot where none disputed Hatty's right to reign,—a little lonely room at the top of the house, which she had fitted up in her own wild way, and where she was free from reproof or intrusion.

You should have seen her there,—with her yearning heart half broken with neglect,—doubtful of her own powers, and weeping such passionate tears, that she was "so stupid, and ugly, and disagreeable," that nobody could ever love her! And so she made friends with the holy stars, the fleecy clouds, and the brilliant rainbow, the silver moonbeam, and the swift lightning; and an artistic eye, seeing her soul-lit face at that small window, might have fancied her some Italian improvisatrice! There, the fetters fell off, the soul was free, and the countenance mirrored it forth. Back in the family circle she was again "Our Hatty!"

"That young daughter of yours differs very much from the rest of the family, Mr. Lee," said a maiden lady, who was visiting there.

"Yes, yes!" said the old man, with a shrug. "She don't look much like a Lee; in fact, she's very plain. She's a strange, unaccountable child.—likes her own company better than anybody's else, and don't care a rush-light for all the nick-nacks other girls are teasing fur. Sometimes I think she belongs to another brood.—got changed in the cradle, or something."

"How does she spend her time?" said Miss Tabetha.

"I'm sure I don't know. Wife says she has a little den at the top of the house, where she sits star-gazing. Queer child, that Hatty!—plain as a pike-staff;" and Mr. Lee took up his newspaper, and put his feet on the mantel.

Miss Tabetha was confounded! She had an uncommonly warm heart, for an old maid. She had never been a parent;—she wished she had, just to show some people what a nice one she'd have made! She inwardly resolved to know more of "Our Hatty."

Rap, tap, on the door of Hatty's little den,—what on earth did it mean? She hoped they were not going to take that away from her; and, with a guilty, frightened look, she opened the door.

Miss Tabetha entered.

"Are you vexed with me for coming here, child? You don't look glad to see me."

"No, no!" said Hatty, pushing back a tangled mass of dark hair; "but its so odd you should want to come. Nobody ever wanted to see me before."

"And why not, Hatty?"

"Well, I don't know," said she, with touching weakness and simplicity, "unless it's because I'm stupid, and ugly, and disagreeable.'"

"Who told you that, Hatty?"

"All of them down stairs," said she; "and I don't care about it, only—only,"—and the tears rolled down her cheeks,—"it is so dreadful to feel that nobody can ever love me!"

Miss Tabetha said, "Humph!"

"Hatty," said she, "come here. Do you ever look in the glass?"

"Not since a long while," said the young girl, shrinking back.

"Come here, and look in this little mirror. Do you see those large, dark, bright eyes of yours? Do you see the wealth of raven hair, which a skilful hand might render a beauty, instead of that tangled deformity? Do you see those lithe, supple limbs, which a little care and training might render graceful as the swaying willow? There is intellect on your brow; soul in your eyes; your voice has a thrilling heart-tone. Hatty, you are a gem in the rough!—you cannot be 'ugly;' but, listen to me. It is every woman's duty to be lovely and attractive. You have underrated and neglected yourself, my poor child. Nature has been no niggard to you. I do not say this to make you vain, but to inspire you with a proper confidence in yourself. But—what have we here?" as a large portfolio fell at her feet.

"O, Miss Tabetha, please don't! It's only a little scribbling, just when I felt wretched! please don't!"

"Yes, but I shall, though. It's just what I want to see most;" and she went on reading paper after paper, while Hatty stood like a culprit before her. When she had finished, she said, very slowly and deliberately:

"Hatty, come here! Did you know that you were a genius?"

"A what, Miss Tabetha?"

"A genius, you delicious little bit of simplicity,—a genius! You'll know fast enough what it means; and to think I should have been the first to find it out!" and she caught the astonished child in her arms, and kissed her, till Hatty thought a genius must be the most delightful thing in the world, to bring so much love with it.

"Look here, Hatty,—does anybody know this?" holding up the manuscripts.

Hatty shook her head.

"So much the better. 'Stupid, ugly and disagreeable!' humph! Do you know I'm going to run off with you?" said the old maid. "We shall see what we shall see, Miss Hatty!"

Five years had rolled away. A new life had been opened to Hatty. She had grown into a tall, graceful woman. Her step was light as a fawn's. Her face,—not beautiful, certainly, if tried by the rules of art,—and yet, who that watched its ever-varying expression, would stop to criticize? No one cared to analyze the charm. She produced the effect of beauty; she was magnetic; she was fascinating. Miss Tabetha was satisfied;—"she knew it would be just so."

They had almost forgotten her at Lee house. Once in a while they wondered "if Miss Tabetha wasn't tired of her." Miss Tabetha thought she would let them know!" Unbounded with their amazement, when Miss Tabetha ushered "Our Hatty" in. It was unmaccountable! She was really "almost pretty!" Still there was the same want of heart in their manner to her; and the little old maid could not have kept within bounds, had she not had powerful reasons of her own for keeping quiet awhile.

"By the way, Miss Tabetha," said Mr. Lee, "as you are a blue-stocking, can you enlighten me as to the author of that charming little volume of poems, which has set all the literary world astir? It isn't often I get upon the stilts, but I'd give something to see the woman who wrote it."

Miss Tabetha's time had come. Her eyes twinkled with malicious delight. She handed him a volume, saying, "Well, here is a book I was commissioned to give you by the authoress herself."

Mr. Lee rubbed his glasses, set them astride his nose, and read the following on the fly-leaf:

"To my dear father, James Lee; from his affectionate daughter, The Author.

Mr. Lee sprang from his chair, and, seizing his child by both hands, ejaculated, "Hatty Lee! I'm proud of you!"

Tears gather slowly in her large eyes, as she said, "O, not that! Dear father, lead me close to your heart, and say, 'Hatty, I love you!'"

Her head sank upon his shoulder. The old man read his child's heart at last: he saw it all,—all her childish unhappiness,—and, as he kissed her brow, and cheek, and lips, said, in a choking voice, "Forgive your old father, Hatty!"

Her hand was laid upon his lips, while smiles and tears chased over her face, like sunshine and shadow over an April sky.

O, what is Fame to a woman? Like the "apples of the Dead Sea," fair to the sight, ashes to the touch! From the depths of her overflowing heart, came th ever a voice that was so hushed!—Take it all back, only give me love!

Incident of a Battle.

Some English guardsmen who were in the Battle of Waterloo, related to Hayden, the painter, the following anecdotes of the thickest of the fight. They present war in all its horrors:

The description of the men was simple, characteristic and poetical. They said that when the life guards and cuirassiers met, it was like the ringing of ten thousand blacksmiths' anvils. One of them knew my models, Shaw and Dakin. He saw Dakin, while fighting on foot with two cuirassiers, also on foot, divide both their heads with cuts five and six. He said Dakin rode out, foaming at the mouth, and cheered on his troops. In the evening he saw Dakin lying dead, cut in pieces. Dakin sat to me for the sleeping groom on his knees in Macbeth.

Another saw Shaw fighting with two cuirassiers at a time. Shaw, he said, always cleared his passage. He saw him take an eagle, but lost it afterwards; as when any man got an eagle, all the troops near him on both sides, left off fighting, and set on him who had the eagle. He went on himself very well, but riding too far, was speared by a lancer, and fainted away. Recovering, he sat upright, when three or four lancers saw him, rode at him, and speared at him till they thought him dead. He remembered nothing till he revived by the shaking as they carried him to the yard of La Haye Sainte. There he heard some one groaning, and turning round, saw Shaw, who said: "I am dying; my side is torn off by a shell." His comrades told us how he had swooned away, and being revived by their taking him up to be carried to Brussels at daybreak, he saw poor Shaw dead, with his cheek in his hand.

Corporal Webster, of the second life guards, saw Shaw give his first cut. As he was getting down the rising ground in the hollow road, a cuirassieur waited and gave point at his belly; Shaw parried the thrust, and before the Frenchman recovered, cut him right through "his brass helmet to the chin, and his face fell off him like a bit of apple."

Another, Hodgson, (a model, and the finest of all, standing six feet four inches, a perfect Achilles,) charged up to the French baggage. He saw artillery driver boys of sixteen crying on their horses. In coming back, a whole French regiment opened and let him pass at full gallop, and then closed and gave him a volley, and never hit him or horse.

The first man who stopped him was an Irishman in the French service. He dashed at him and said, "D—n you, I'll stop your cruwing." Hodgson said he was frightened, as he had never fought anybody with swords. Watching the cuirassieur, however, he found he could not move his horse so quickly as he could; so letting go the reins, and guiding his horse with his knees, as the cuirassieur gave point at his throat, Hodgson cut his sword hand off, and dashed his sabre through his throat, cutting it round and round. The first cut he gave him was on the cuirass, which he thought was silver lace. The shock nearly broke his arm. "D—n me, sir," he added, "now I had found out the way, I soon gave it them." As Hodgson rode back, after being fired at, an officer encountered him. Hodgson cut his horse at the naps, and, as it dropped dead, the officer's helmet rolled off, and Hodgson saw a bald head and white hairs. The officer begged for mercy, but at that instant a troop of lancers was approaching at the gallop, so Hodgson cleaved his head in two at a blow and escaped. The recollection of the white hairs, he told us, pained him often. Before he got back to the British lines a lancer officer charged him, and missing his thrust, came right on Hodgson and his horse. Hodgson got clear, and cut his head off at the neck, at one blow, and the head dropped on his haversack, where he kept the blood stain.

"Pen-u" says, in his Pocket-Book for 1854 that there are several things which "you never can by any account get a lady—be she young or old—to confess to." Here are some of them:—"That she laces tight.—That her shoes are too small for her.—That she is ever tired at a ball.—That she paints.—That she is as old as she looks. That she has been more than fifty minutes dressing.—That she has kept you waiting.—That she blushed when a certain person's name was mentioned.—That she ever says a thing she doesn't mean.—That she is fond of scandal.—That she can't keep a secret.—That she—is afraid of any person in the world—is in love.—That she doesn't want a new bonnet.—That she can do with one single thing less when she is about to travel.—That she hasn't the proportion of an angel, or the temper of a saint—how she would go through fire—if it were proper.—That she doesn't know better than every one else what is best for her—that she is not a fool or a coquette.—That she is ever to the contrary."

Trout Fishing.—We have a friend who is a somewhat practical joker, residing in a pleasant country residence near the ocean. Some time since he had a visit from Professor ———, of poetic memory. The Professor is a keen trout fisherman, and seeing a pond at some distance from R's residence, he inquired—

"Can you fish for trout in that pond?"

"O, yes," said R., "as well as not."

"Possible!—where's your rod?"

"I have none. I'm no fisherman. But if you want to try, we'll go over to S———, and get tackle, and you may try your hand at it to-morrow."

"It was thereupon agreed to do so, and the day was passed by the worthy Professor in preparations for angling.

The next morning early, R. drove him over to the pond, and he whipped it all around to windward and leeward, and finally waded in up to his waist, and threw his flies most skillfully, but never raised a fin. At length, as the sun grew tolerably hot, he turned to R. who lay under a tree solacing himself with a book and a cigar, and exclaimed:

"I don't believe there is a trout in your pond."

"I don't know that there is," replied R. imperturbably.

"Why, you told me there was."

"O, no," said R. leisurely turning and lighting another cigar, "you asked me if you could fish for trout here, and I said you could as well as not. I've seen folks do it often, but I never knew of one being caught here."

Fit for a Lawyer.—An old lady walked into a lawyer's office lately, when the following conversation took place:

Lady—Squire, I called to see if you would like to take this boy and make a lawyer of him.

Lawyer.—The boy appears rather young, madam—how old is he?

Lady.—Seven years, sir.

Lawyer.—He is too young, decidedly too young. Have you no boys older?

Lady.—O yes, sir. I have several; but we have concluded to make farmers of the others. I told my old man I thought this little feller would make a first rate lawyer, and so I called to see if you would take him.

Lawyer.—No, madam; he is too young yet, to commence the study of the profession. But why do you think this boy any better calculated for a lawyer than your other sons?

Lady.—Why, you see, sir, he's just seven years old to-day. When he was only five, he'd lie like all natur; when he got to be six, he was as sassy and impudent as any critter could be; and how he'll steal every thing he can lay his hands on!

Crow Eating.—A worthy old farmer residing in the vicinity of Lake Mahopack, was worried to death last summer by boarders. They found fault with his table, and said he had nothing fit to eat.

"Darn it," said old Isaac, one day, "what a fuss you're making. I can eat anything."

"Can you eat a crow?" said one of the boarders.

"Yes I ken eat a crow!"

"Bet you a hat" said the guest.

The bet was made, the crow caught and nicely roasted, but, before serving up, they contrived to season it with a good dose of Scotch snuff. Isaac sat down to the crow. He took a good bite and began to chew away.

"Yes, I kin eat crow! (another bite and an awful face.) *I kin eat crow; but I'll be darned if I hanker arter it.*"

Mrs. Partington, on reading an account of a schooner having her jib-boom carried away in Long Island Sound, wondered "why people would go such things out o' doors nights, to be stolen, when they was so many loafers about, ready to steal anything they could lay they hands to."

Pill or Poetry.—During a recent performance of Shakespeare's Romeo and Juliet, the fair Juliet's question, in the balcony scene, "Art thou gone so?" was answered by Romeo as he was descending the ladder, "Love, I am only going to the next door but one." "What!" exclaimed Juliet, "are you going to pill me?" "Yes, love," replied Romeo, "I am going to pill you." "Then take a dose of poetry," rejoined Juliet, "and don't come upon the stage any more," which he never did more than described.

Epitaph.—A [illegible] Lodi, has had the remains of the penny [illegible] a tombstone in the cemetery near Centerville, a wonder of being placed among the dead. Here lies ——, who died [illegible] for any person of the name.

What is Kiss[illegible]

Is Mr. [illegible] and Mrs. [illegible] and Mrs. [illegible] and Mrs

THE FOREST TREES.

BY ELIZA COOK.

Up with your heads, ye sylvan lords,
Wave proudly in the breeze,
For our cradle bands and coffin boards,
Must come from the forest trees.

We bless ye for your summer shade,
When our weak limbs toil and tire;
Our thanks are due for your winter aid,
When we pile the bright log fire.

O, where would be our rule on the sea,
And the fame of the sailor band,
Were it not for the oak and cloud-crowned pine
That sprung on the quiet land?

When the ribs and the masts of the good ship live,
And weather the gale with ease,
Take his glass from the tar who will not give
A health to the forest trees.

Ye lend to life its earliest joy,
And wait on its latest page:
In the circling hoop for the rosy boy,
And the easy chair for age.

The old man totters on his way,
With footsteps short and slow;
But without the stick for his help and stay,
Not a yard's length could he go.

The hazel twig in the stripling's hand
Hath magic power to please;
And the trusty staff and slender wand
Are plucked from the forest trees.

KEEP COOL.

BY G. W. LIGHT.

Are your matters all awry?
Keep cool;
But consider well the reason:
If you are hut right yourself,
Things will come rigbt in their season.
Keep cool.

Though your case he desperate,
Keep cool:
Desperate evils may be cured—
They cannot withstband a MAN!
What have true men not endured?
Keep cool.

Has a villain cheated you?
Keep cool:
He's the loser—don't despair:
Now your eye-teeth have been cut,
Keep your temper; grin and bear.
Keep cool.

Has a maiden proved unkind?
Keep cool;
If you'd have your heart's desire,
Teach young Cupid's golden how
You can stand its keenest fire.
Keep cool.

Can you not reform the world?
Keep cool:
Only one thing you can do—
Give a brave heart to the work;
Heaven wants no more of you.
Keep cool.

Does the prince of serpents hiss
Keep cool.
Show your stiffest under lip:
When he sees that you are firm,
You will find that off he'll slip.
Keep cool.

Let your ills be what they may,
Keep cool;
Seize this truth with heart and hand—
He that ruleth well himself
Can the universe withstand.
Keep cool.

TO THE FIRST SNOW.

BY ELLIOT.

Gently and still the snow flakes fall,
Covering the earth with a pure white pall—
They seem like tears to a cold world given,
For they freeze as they leave their home in heaven.
They come to cover the earth's cold breast,
And shield the flower-buds in their rest,
That when Spring comes again they'll bloom,
And scatter wide their sweet perfume.
And earth with her virgin robe shall say,
Bring forth my bridal robe, sweet May!
Then the snow shall melt, for April showers
Are the angels' tears to opening flowers;
And the birds shall come with songs anew
To wed the beautiful, good and true.

OBEYING ORDERS.—A certain general of the United States Army, supposing his favorite horse dead, ordered an Irishman to go and skin him.

"What! is Silvertail dead?" asked Pat.

"What's that to you?" replied the officer, "do as I bid you, and ask no questions."

Pat went about his business, and in an hour or two he returned.

"Well Pat, where have you been all this time?" asked the general.

"Skinning your horse, your honor."

"Does it take nearly two bours to perform such an operation?"

"No, your honor, but then you see it took about half an hour to catch him,"

"Catch him! fire and furies! was he alive?"

"Yis, yer honor, and I could not skin him alive, you know."

"Skin him alive! did you kill him?"

"To be sure I did, yer bonor! and sure you know I must obey orders without asking any questions."

You should forgive many things in others, but nothing in yourself.

Pop Goes the---Bottle.

UNDER the title of "Thrilling Adventure of a Young Lady," we find in an exchange a very comical story.

"In one of the most sober towns of Hampshire county, where the Maine Law is strictly observed, the keeper of one of the hotels bas for several months past kept a bottle or two of wine in the bed where he slept, taking care to remove them every night when he went to bed, and replace them when he got up in tbe morning. A few days since, after replenishing bis bottles, and not having a good opportunity to carry them to their old quarters, he slipped them under the bolsters of one of the beds reserved for travellers, and being called out of town to spend the following day, forgot to remove them. It unfortunately happened that a young lady traveller, stopping at the hotel for the night, was unsuspectingly conducted to the room where the liquors were deposited. As the evening grew late, the young lady went to bed, and was soon fast asleep, little dreaming of the mischievous *spirits* in such immediate proximity. About midnight, when all had become still, the secreted liquor—owing to the heat of the atmosphere or that imparted to it by tbe sleeper—expanded to such a degree as to defy longer confinement. Pop! pop! went the corks of both bottles, almost as loud as the report of as many pistols, and awaking the fair sleeper, who sprang from the bed, uttering such wild and terrific screams, that every person in tbe house was immediately aroused. The moon shone bright enough for the lady to see the liquor on her night dress, and with the conviction that she had been shot, she fainted and fell to the floor. A dozen servants immediately burst into the lady's room, and were horrified to find her lying on the floor, covered with blood! All believed that some horrible tragedy had been enacted—that she had either committed suicide or had been cruelly murdered. A light soon convinced them that she still breathed. No time was lost in sending for a surgeon, whilst the half dressed inmates of the house commenced a search for the assassin or the instrument which bad been used to perpetrate the horrid deed. On examining the bed, it was found to be drenched with wbat looked to be the blood of the young lady; but the strong smell of wine caused one to investigate further, and of course the bottles were discovered! How the doctor came, and the lady recovered, and the landlord tried to husb up the affair tbe next day, can be better imagined than described.

HOW TO CHOOSE A DOMESTIC.—Housekeeping is not so full of sunshine and rose-colored bliss as many imagine. It is hardly possible to get along without cooks, scullions, and chambermaids: and what with their waste, wittles and impudence, says Aunt Sally, they are plaguy drawbacks on domestic peace and comforts. Old Peppergrass was the "customer" for discriminating between the useful and the careless. Peppergrass sent word to the Register office that he wanted a good girl for general housework. About the time he expected an applicant he laid a broom down in the yard, near the gate. Presently a girl comes up to the gate, opens it, and strolls up to the house; the broom being immediately in the path, Miss Betsy strides over it. The old man was on the watch, and the first salute the girl got, was, "I don't want *you*." The girl sloped, and suddenly bullet-headed Nancy appears. Seeing the broom in her way, she gives it a kick, and waddles up to the house. "You won't suit me, that's certain, Miss Mopsy!" bawls Peppergrass. She disappeared in a hurry; and finally a third appears, opening the gate, and coming into the yard, she carefully closes the gate behind her, and walks up—the broom is still in the path; this she picks up and carries along to the house, where she deposites it along side the woodshed. Before the girl could explain her business there, Peppergrass bawls out. "Yes, yes, come in, *you'll* suit me." And she did; for that girl lived with Peppergrass seven years, and only quitted it to go to housekeeping on her own hook; and a capital wife she made. Peppergrass was right.

THE most elegant "turn-out" in Washington, is said to be that of General Cass. The color of the carriage is "a dark violet, the panels being so smoothly finished and highly polished, as to present almost the surface of a mirror. The linings are of rich blue aud gold silk reps, with silk lacings to correspond. Tbe carriage is hung very low, and possess all tbe requsites of an elegant vehicle for luxurious ease, without any attempt at gaudy display. On the centre of the panel of each door is inscribed the letter C., enclosed in a very small and neat wreath. Speaking tubes, card-racks, etc., form part of the appendage of the coach."

ANVERTISING nowadays has beeome reduced to a science. Somebody *alliterizes* in this manner, in an advertisement of a superior article of marking-ink: to wit, that it is remarkable for "requiring no preparation, pre-eminently pre-engages peculiar public predilection; produces palpable, plainly perceptible, perpetual perspicuities; penetrates powerfully, precluding previous pre-requisite preparations; possesses particular prerogative; protects private property; prevents presumptuous, pilfering persons practising promiscuous proprietorship; pleasantly performing plain practical penmanship; perfectly precludes puerile panegyrics, preferring proper public patronage."

FLIRTING—(*By an old hand at it.*)—Flirting is a most amusing game. It is true there is nothing gained by it, but then there is nothing staked. In fact you may call it, "playing at cards for love."

PEORIA PREMIUM STEEL PLOWS.

THE FORMER CELEBRITY OF THE PEORIA PREMIUM STEEL PLOWS, and the unequalled success of their introduction in this State, would seem to preclude the necessity of any further effort on our part to draw attention thereto; but in view of the transitory nature of business in general in California, and the probability that some may have looked upon our establishment of an extensive and permanent manufacture of Plows here, in the face of such enormous importations and extravagant prices of material, as an impossibility—we believe it expedient to adopt this method of bringing it within the special notice of all concerned, that we are now manufacturing, and will have ready for this season's demand, three thousand of the most superior Plows ever made or used within this State.

We feel warranted in making this assertion, from the fact that all who used our Plows last season testify that they were superior: and we have studied so closely the immediate wants of our patrons from every section of the State, that we can now furnish Plows suitable to any particular kind of soil known in the State.

Our material has all been selected in the East by one of our firm, and imported by us directly from the manufacturers, which places it in our power to say confidently that nothing is lacking in quality, while we are enabled to make the plows at a cost greatly below that of last season, and are determined to sell at prices within the reach of every farmer who may wish to use the Peoria Premium Steel Plow.

It should be remembered that these plows will do double the work with half the team required in using the ordinary cast Plow; and that the work, when done, will be well done.

For particulars of prices, and descriptions of plows, we refer you to the subjoined card. The prices therein detailed are those established at our factory, and the only alterations from them that we authorize our agents to make, is the addition of the cost of transportation to their places of business—thus placing the plows at every accessible point of the State for the exact price charged at the Factory, with the necessary expenses only added.

Farmers ordering our plows through mercantile houses here, would do well to write to us at the same time, if they would make sure of getting the right plow, for some are interested in representing that we are not making plows at all, while other will not sell our plows when they can get off a cast plow. We therefore recommend that orders should be sent to us directly, accompanied by an order upon your merchant for the amount, which you can always know by a reference to the card accompanying this circular.

On the 24th of June the interest of T. ADAMS in our business ceased, by the sale of his entire interest therein to L. E. MORGAN. Aside from this, there has not, nor will there be, any alteration, as we have the same efficient and thoroughly practised hands in every department of our business.

E. L. MORGAN & CO., Successors to
T. ADAMS & CO.,
Corner of Broadway and Battery streets.

☞ The following are the established prices for the **Peoria Premium Steel Plows**, at our Factory, and the only addition our Agents are authorized to make thereto, is the cost of transportation to their points of business:

PROCLAMATION EXTRAORDINARY.

Woman's Rights
VINDICATED AND MAINTAINED.

WHEREAS, from the creation of the world, it was designed by the "Great First Cause" that

Woman's Rights and Privileges

should be co-equal to Man's; and whereas, she has been treated by many men in all ages, up to the present time, as an inferior being to themselves: Now, therefore, be it known that I, M. L. WINN, of

Winn's Fountain Head and Branch

having expended large sums of money at the FOUNTAIN HEAD for the gratification of the appetites of Gentlemen, do recommend that Woman be hereafter allowed and provided with the facilities to enjoy all the privileges for which she was by Providence designed; and for this purpose I do hereby proclaim, that my

BRANCH,

Corner Montgomery and Washington streets,

shall be conducted with a view exclusively to the **Enjoyment and Comfort of Ladies**, and such Gentlemen as know and appreciate their worth.

At the earnest solicitation of many Ladies and Gentlemen and agreeable to my promise some months since to enlarge the BRANCH, so as to accommodate the fast increasing patronage I shall, in a few days, add Two Spacious Stores on Montgomery street, to the Original Branch, making the

MOST EXTENSIVE ICE CREAM

And Refreshment Establishments in California.

The day of opening will be duly announced through the medium of the Daily Press, so that all may witness what has been accomplished for the accommodation and comfort of "God's last best gift to man." In the meantime, bits of Fun and Jollification may be enjoyed in reading the mottoes and feasting upon the luxuries to be enjoyed at

WINN'S FOUNTAIN HEAD,
78 and 80 Long Wharf, and Branch, corner Washington and Montgomery streets;

where Every Thing for the Holidays may be found, from a SugarWhistle to a Bride's Cake of half a ton.

M. L. WINN, Proprietor.

Advertisements.—A limited number of Advertisements will be inserted at the following rates: For one square of eight lines, per month, $6. For business notices of five lines or less per month, $4. A slight reduction will be made to regular advertisers.

"Our Hatty."

She might have had twenty other names, but that was the only appellation I ever heard. It was, "Get out of the way, Hatty!"—"I dare say, Hatty broke that vase, or lost that book!"—"Don't come here; what a fright you are, Hatty!" till the poor, sensitive child almost felt as if she had the mark of Cain upon her forehead. She had brothers and sisters, but they were bright, and saucy, and bold, and cunning; and, when they wished to carry out a favorite scheme, could throw their arms about the parental neck, flatter some weak side, carry the day, and then laugh at their juvenile foresight; so their coffers were always filled, while poor Hatty's was empty;—and she laid all these things up in her little grieved heart, and, as she saw the duplicity better rewarded than sincerity, began to have little infidel doubts whether the Bible, that her father read so much out of, was really true; while Joseph's "coat of many colors" flaunted ever before her tearful eyes! All her sweet, childish impulses were checked and crushed; and, where the sweet bowers of love and confidence should have sprung up, the weeds of distrust and suspicion took bitter root!

She took no part in the conversation of the domestic circle. "She was stupid," so they told her; and she had heard it till she believed it true. Sometimes, as was often the case, some talented person made part of the family circle; on such occasions, Hatty would listen in her corner till her great, wild eyes glowed and burned like living coals of fire. But there was one spot where none disputed Hatty's right to reign,—a little lonely room at the top of the house, which she had fitted up in her own wild way, and where she was free from reproof or intrusion.

You should have seen her there,—with her yearning heart half broken with neglect,—doubtful of her own powers, and weeping such passionate tears, that she was "so stupid, and ugly, and disagreeable," that nobody could ever love her! And so she made friends with the holy stars, the fleecy clouds, and the brilliant rainbow, the silver moonbeam, and the swift lightning; and 'an artistic eye, seeing her soul-lit face at that small window, might have fancied her some Italian improvisatrice! There, the fetters fell off, the soul was free, and the countenance mirrored it forth. Back in the family circle she was again "Our Hatty!"

"That young daughter of yours differs very much from the rest of the family, Mr. Lee," said a maiden lady, who was visiting there.

"Yes, yes!" said the old man, with a shrug. "She don't look much like a Lee; in fact, she's very plain. She's a strange, unaccountable child,—likes her own company better than anybody's else, and don't care a rush-light for all the nicknacks other girls are teasing for. Sometimes I think she belongs to another brood,—got changed in the cradle, or something."

"How does she spend her time?" said Miss Tabetha.

"I'm sure I don't know. Wife says she has a little den at the top of the house, where she sits star-gazing. Queer child, that Hatty!—plain as a pike-staff;" and Mr. Lee took up his newspaper, and put his feet on the mantel.

Miss Tabetha was confounded! She had an uncommonly warm heart, for an old maid. She had never been a parent;—she wished she had, just to show some people what a nice one she'd have made! She inwardly resolved to know more of "Our Hatty."

Rap, tap, on the door of Hatty's little den,—what on earth did it mean? She hoped they were not going to take that away from her; and, with a guilty, frightened look, she opened the door.

Miss Tabetha entered.

"Are you vexed with me for coming here, child? You don't look glad to see me."

"No, no!" said Hatty, pushing back a tangled mass of dark hair; "but its so odd you should want to come. Nobody ever wanted to see me before."

"And why not, Hatty?"

"Well, I don't know," said she, with touching weakness and simplicity; "unless it's because I'm queer, and ugly, and disagreeable."

"Who told you that, Hatty?

"All of them down stairs," said she; "and I don't care about it, only—only,"—and the tears rolled down her cheeks,—"it is so dreadful to feel that nobody can ever love me!"

Miss Tabetha said, "Humph!"

"Hatty," said she, "come here. Do you ever look in the glass?"

"Not since a long while," said the young girl, shrinking back.

"Come here, and look in this little mirror. Do you see those large, dark, bright eyes of yours? Do you see the wealth of raven hair, which a skilful hand might render a beauty, instead of that tangled deformity? Do you see those lithe, supple limbs, which a little care and training might render graceful as the swaying willow? There is intellect on your brow; soul in your eyes; your voice has a thrilling heart-tone. Hatty, you are a gem in the rough!—you cannot be 'ugly;' but, listen to me. It is every woman's duty to be lovely and attractive. You have underrated and neglected yourself, my poor child. Nature has been no niggard to you. I do not say this to make you vain, but to inspire you with a proper confidence in yourself. But—what have we here?" as a large portfolio fell at her feet.

"O, Miss Tabetha, please don't! It's only a little scribbling, just when I felt wretched! please don't!"

"Yes, but I shall, though. It's just what I want to see most;" and she went on reading paper after paper, while Hatty stood like a culprit before her. When she had finished, she said, very slowly and deliberately:

"Hatty, come here! Did you know that you were a genius?"

"A what, Miss Tabetha?"

"A genius, you delicious little bit of simplicity,—a genius! You'll know fast enough what it means; and to think I should have been the first to find it out!" and she caught the astonished child in her arms, and kissed her, till Hatty thought a genius must be the most delightful thing in the world, to bring so much love with it.

"Look here, Hatty,—does anybody know this?" holding up the manuscripts.

Hatty shook her head.

"So much the better. 'Stupid, ugly and disagreeable!' humph! Do you know I'm going to run off with you?" said the old maid. "We shall see what we shall see, Miss Hatty!"

Five years had rolled away. A new life had been opened to Hatty. She had grown into a tall, graceful woman. Her step was light as a fawn's. Her face,—not beautiful, certainly, if tried by the rules of art,—and yet, who that watched its ever-varying expression, would stop to criticize? No one cared to analyze the charm. She produced the effect of beauty; she was magnetic; she was fascinating. Miss Tabetha was satisfied;—"she knew it would be just so."

They had almost forgotten her at Lee house. Once in a while they wondered "if Miss Tabetha wasn't tired of her." Miss Tabetha thought she would let them know!" Unbounded with their amazement, when Miss Tabetha ushered "Our Hatty" in. It was unaccountable! She was really "almost pretty!" Still there was the same want of heart in their manner to her; and the little old maid could not have kept within bounds, had she not had powerful reasons of her own for keeping quiet awhile.

"By the way, Miss Tabetha," said Mr. Lee, "as you are a blue-stocking, can you enlighten me as to the author of that charming little volume of poems, which has set all the literary world astir? It isn't often I get upon the stilts, but I'd give something to see the woman who wrote it."

Miss Tabetha's time had come. Her eyes twinkled with malicious delight. She handed him a volume, saying, "Well, here is a book I was commissioned to give you by the authoress herself."

Mr. Lee rubbed his glasses, set them astride his nose, and read the following on the fly-leaf:

"To my dear father, James Lee; from his affectionate daughter, The Author.

Mr. Lee sprang from his chair, and, seizing his child by both hands, ejaculated, "Hatty Lee! I'm proud of you!"

Tears gather slowly in her large eyes as she said, "O, not that! Dear father, look in your heart, and say, 'Hatty, I love you!'"

Her head sank upon his shoulder. The old man read his child's heart at last: he saw it all,—all her childish unhappiness,—and, as he kissed her brow, and cheek, and lips, said, in a choking voice "Forgive your old father, Hatty!"

Her hand was laid upon his lips, while smiles and tears chased over her face, like sunshine and glow over an April sky.

O what is Fame to a woman? Like the "apples of the Dead Sea," fair to the sight, [illegible] to the touch! From [illegible] to find it out, [illegible] ever a voice [illegible] —Take it all back, only give me [illegible]

Incident of a Battle.

Some English guardsmen who were in the Battle of Waterloo, related to Hayden, the painter, the following anecdotes of the thickest of the fight. They present war in all its horrors:

The description of the men was simple, characteristic and poetical. They said that when the life guards and cuirassiers met, it was like the ringing of ten thousand blacksmiths' anvils. One of them knew my models, Shaw and Dakin. He saw Dakin, while fighting on foot with two cuirassiers, also on foot, divide both their heads with cuts five and six. He said Dakin rode out, foaming at the mouth, and cheered on his troops. In the evening he saw Dakin lying dead, cut in pieces. Dakin sat to me for the sleeping groom on his knees in Macbeth.

Another saw Shaw fighting with two cuirassiers at a time. Shaw, he said, always cleared his passage. He saw him take an eagle, but lost it afterwards; as when any man got an eagle, all the troops near him on both sides, left off fighting, and set on him who had the eagle. He went on himself very well, but riding too far, was speared by a lancer, and fainted away. Recovering, he sat upright, when three or four lancers saw him, rode at him, and speared at him till they thought him dead. He remembered nothing till he revived by the shaking as they carried him to the yard of La Haye Sainte. There he heard some one groaning, and turning round, saw Shaw, who said: "I am dying; my side is torn off by a shell." His comrades told us how he had swooned away, and being revived by their taking him up to be carried to Brussels at daybreak, he saw poor Shaw dead, with his cheek in his hand.

Corporal Webster, of the second life guards, saw Shaw give his first cut. As he was getting down the rising ground in the hollow road, a cuirassieur waited and gave point at his belly; Shaw parried the thrust, and before the Frenchman recovered, cut him right through "his brass helmet to the chin, and his face fell off him like a bit of apple."

Another, Hodgson, (a model, and the finest of all, standing six feet four inches, a perfect Achilles,) charged up to the French baggage. He saw artillery driver boys of sixteen crying on their horses. In coming back, a whole French regiment opened and let him pass at full gallop, and then closed and gave him a volley, and never hit him or horse.

The first man who stopped him was an Irishman in the French service. He dashed at him and said, "D—n you, I'll stop your crowing." Hodgson said he was frightened, as he had never fought anybody with swords. Watching the cuirassieur, however, he found he could not move his horse so quickly as he could; so letting go the reins, and guiding his horse with his knees, as the cuirassieur gave point at his throat, Hodgson cut his sword hand off, and dashed his sabre through his throat, cutting it round and round. The first cut he gave him was on the cuirass, which he thought was silver lace. The shock nearly broke his arm. "D—n me, sir," he added, "now I had found out the way, I soon gave it them." As Hodgson rode back, after being fired at, an officer encountered him. Hodgson cut his horse at the naps, and, as it dropped dead, the officer's helmet rolled off, and Hodgson saw a bald head and white hairs. The officer begged for mercy, but at that instant a troop of lancers was approaching at the gallop, so Hodgson cleaved his head in two at a blow and escaped. The recollection of the white hairs, he told us, pained him often. Before he got back to the British lines a lancer officer charged him, and missing his thrust, came right on Hodgson and his horse. Hodgson got clear, and cut his head off at the neck, at one blow, and the head dropped on his haversack, where he kept the blood stain.

"Pen-u" says, in his Pocket-Book for 1854 that there are several things which "you never can by any account get a lady—be she young or old—to confess to." Here are some of them:—"That she laces tight.—That her shoes are too small for her.—That she is ever tired at a ball.—That she paints.—That she is as old as she looks. That she has been more than [illegible] minutes dressing.—That she has kept you waiting.—That she blushed when a certain person was mentioned.—That she ever says a thing she doesn't mean.—That she is afraid of ghosts.—That she can't keep a secret.—That she—one of all persons in the world—is in love.—That she doesn't want a new bonnet.—That she can do more than one thing [illegible] when she is about to travel.—That she hasn't the forgiveness of an angel, or the temper of a saint.—That she would always through misfortune (if what misfortune?—They she doesn't know better than every one else what is best for her.—That she is a fool in a thousand.—That she is ever to the wrong."

Trout Fishing.—We have a friend who is a somewhat practical joker, residing in a pleasant country residence near the ocean. Some time since he had a visit from Professor ———, of poetic memory. The Professor is a keen trout fisherman, and seeing a pond at some distance from R's residence, he inquired—

"Can you fish for trout in that pond?"

"O, yes," said R., "as well as not."

"Possible!—where's your rod?"

"I have none. I'm no fisherman. But if you want to try, we'll go over to S———, and get tackle, and you may try your hand at it to-morrow."

"It was thereupon agreed to do so, and the day was passed by the worthy Professor in preparations for angling.

The next morning early, R. drove him over to the pond, and he whipped it all around to windward and leeward, and finally waded in up to his waist, and threw his flies most skillfully, but never raised a fin. At length, as the sun grew tolerably hot, he turned to R. who lay under a tree solacing himself with a book and a cigar, and exclaimed:

"I don't believe there is a trout in your pond."

"I don't know that there is," replied R. imperturbably.

"Why, you told me there was."

"O, no," said R. leisurely turning and lighting another cigar, "you asked me if you could fish for trout here, and I said you could as well as not. I've seen folks do it often, but I never knew of one being caught here."

Fit for a Lawyer.—An old lady walked into a lawyer's office lately, when the following conversation took place:

Lady—Squire, I called to see if you would like to take this boy and make a lawyer of him.

Lawyer.—The boy appears rather young, madam—how old is he?

Lady.—Seven years, sir.

Lawyer.—He is too young, decidedly too young. Have you no boys older?

Lady.—O yes, sir, I have several; but we have concluded to make farmers of the others. I told my old man I thought this little feller would make a first rate lawyer, and so I called to see if you would take him.

Lawyer.—No, madam; he is too young yet, to commence the study of the profession. But why do you think this boy any better calculated for a lawyer than your other sons?

Lady.—Why, you see, sir, he's just seven years old to-day. When he was only five, he'd lie like all natur; when he got to be six, he was as sassy and impudent as any critter could be; and how he'll steal every thing he can lay his hands on!

Crow Eating.—A worthy old farmer residing in the vicinity of Lake Mahopack, was worried to death last summer by boarders. They found fault with his table, and said he had nothing fit to eat.

"Darn it," said old Isaac, one day, "what a fuss you're making. I can eat anything."

"Can you eat a crow?" said one of the boarders.

"Yes I ken eat a crow!"

"Bet you a hat," said the guest.

The bet was made, the crow caught and nicely roasted, but, before serving up, they contrived to season it with a good dose of Scotch snuff. Isaac sat down to the crow. He took a good bit and began to chew away.

"Yes, I kin eat crow! (another bite and an awful face.) *I kin eat crow; but I'll be darned if I honker arter it.*"

Mrs. Partington, on reading an account of a schooner having her jib-boom carried away in Long Island Sound, wondered "why people would have such things out o' doors nights, to beat their shins, they was so many buggers about, always getting something they could lay their hands to."

THE CALIFORNIA FARMER.

THURSDAY, FEBRUARY 23, 1854.

TO CORRESPONDENTS.

Poetry—"The Exile,"—Received, approved; will appear in our next.

An Obituary of the late W. E. P. Hartwell of Montery, was received too late for insertion this week, and will appear in our next.

Fred G——.—Your most acceptible contribution will be found in this issue, and we shall be happy to hear from you at all times.

Advance of Horticulture.

California has before her, in this great science of Horticulture, a bright destiny. We have claimed for her the title—"Garden of the world."

A few years of the same attention among our wealthy citizens, and the beautifying and improving the rich vallies, and we are satisfied we sball not be called "False Prophet."

We have noticed the orchards and gardens established by Messrs. Horner and Beard, of San Jose, containing many thousand trees and vines. We have now, in Napa Valley, several wealthy citizens of San Francisco, who areinterested in some of the finest grounds of the State. We have gathered data of the improvements now going on at the beautiful residence lately occupied hy Don Salvador Vallejo, now owned by David Page, Esq., of this city.

Tbis is one of the most fertile portions of the valley, and presents scenery picturesque and beautiful, as the soil is rich and fertile. Mr. Page will iucrease the value and productiveness of this cultivated spot by planting the present year nearly 40,000 California grape vines, 6,000 Foreign grapes, choice kinds, and about 6,000 fruit trees of all kinds, besides several hundred ornamental trees and vines, and 10,000 strawberry plants.

Iu addition to this, Mr. Page has 300 acres in wheat, planted with extra care, and one hundred and twenty-five of barley. Upon the estate are now 150 swine, and a large stock of domestic fowls.

It is well for California when our enterprising merchants bestow a portion of their wealth in permanent improvements, such as sball actually benefit the country, by promoting home industry, and retaining our gold within the State. This is patriotism, aud we shall notice all such improvements, wherever found.

Correspondence.

We call attention to the valuable and practical letters of Mr. J. B. Hill, of Salinas plains, and Mr. J. P. Hester, of San Jose. We have marked some passages in italics, and we direct attention to them. It will he observed that the crops decrease in quantity and quality when they are planted twice on the same soil. Let it be ever borne in mind by every cultivator that a *rotation of crops* is always the best. A change of soil and a change of seed will always increase the crop in quantity and quality.

San Francisco, Dec. 3, 1853.

Messrs. Warren & Son—Gentlemen—In compliance with your request, I herehy furnish you with a statement of my farming operations for the present year.

The manner of cultivation bas been on *shares*—that is to say, for a portion of the crop, other parties have performed the labor, being furnished with the land, or the land, seed, implements, teams, &c. The system of furnishing lands, &c., to persons unable to do it for themselves, is of very general use in California. Whatever may be its advantages, it certainly is not the most satisfactory as regards the style of cultivation. I hope, for the good of the farming interest, that it will not continue very long in California.

I allude to this matter to show that under a different metbod of culture the results might be greatly improved.

The amount of land wbich I had in cultivation in the Pajaro Valley was 950 acres, a little more or less, of which over 600 were in potatoes, 200 in barley, and 120 in wheat. Of the potatoes, 150 acres were indifferently cultivated and consequeutly gave a poor crop, yielding from 125 to to 200 bushels to the acre. The best portion of my crop gave as high as 500 bushels per acre. About one half of it produced 300. The average was about 250 bushels per acre.

Of the whole, I think from 10 to 20 per cent. were destroyed by worms, some parcels not being worth the digging, others scarcely injured at all. *The ground which had been planted two years in succession was the first in which the worm appeared, and the potatoes suffered much more than in land not previously tilled. The crop of barley was not as good as last year on the same ground*—yield 60 bushels per acre. Seed sown per acre, 100 lbs. Wheat—80 acres averaged about 50 bushels; the other 40 not more than 20. The last named grew on dry land, and s ood very thin. Seed sown, per acre 100 lbs. In addition to the above, I had in cultivation on the Salinas Plains 100 acres of barley and 50 acres of potatoes. Whole amount of barley harvested estimated at 12,000 bushels. It was not weighed, except the product of two acres, but the amouut arrived at by taking the solid conteuts of the storchouse in which it was placed—it being in bulk. It is believed that from 1000 to 2000 bushels were destroyed by stock and vermin before threshing. Two separate acres were measured and the product weighed, which gave 149 and 129 bushels respectively. Time of sowing, from 20th March to 20th April. The largest yield latest sown. Amount of seed, 100 to 125 lbs—the last named giving the best yield.

My potatoes at Salinas are not yet dug. I have been two years engaged in farming in California, and am fully convinced that, with improved culture the average yield, large as it is, can be increased fully 25 per cent. over the present year or past.

Duly appreciating your efforts for elevating the character of the agricultural interest in California, I remain, truly yours.

J. Bryant Hill.

San Jose, Dec. 4, 1853.

Messrs. Warren & Son — Gents — I emigrated to this State in 1849, from Indiana. I occupy one claim of 160 acres, and 31 acres, where my homestead is, on the Stockton Rancho, without woodland. On my homestead are 7 acres of mowing land, and 4 of pasturage. On my claim two-thirds uncultivated. All my grasses grow spontaneously; the principal is clover, of which there are several varieties. I have four acres in orchard, consisting of apples, peaches, pears, cherries, plums, figs, &c., and one acre of grapes. I have 14 acres of potatoes; I planted 6 bushels to the acre. I failed in cutting the potatoes. *There should be but one eye to a piece—one stock or shoot is enough in a hill.* Of wheat I sowed 125 lbs. to the acre, the object of which was to prevent the growth of mustard and to prevent the wheat from falling, as the multiplication of shoots weakens the straw, but for the avoidance of which I think one busbel per acre is best. My grain land is loose and somewhat mixed with sand. My homestead land is low and wet. The past season was different from auy previous one—rains later in the spring, which produced the rust, much less fogs thau usual without which vegetables do not succeed well in general. Oregon and Australia wheat withstood the rust, *but the California was its victim.*

I have resorted to ditching to reclaim my wet land, and have succeeded. That and the removal of stock tberefrom have changed the soil from a a hard cracked condition to a mellow one.

In haste I have sketched the above liues.

Yours respectfully.

C. P. Hester.

Massachusetts Horticultural Society.

We publish to-day the Report of the 25th Annual Exhibition of this influential Society. We do this that the friends of Horticulture in this State may note the influence given to this science by those high in authority, and .he liberal expenditures made for its advancement, by reference to the cost of the exhibition ($2,560 72), and the income arising from it ($2,524 50). It must be remembered that all expenses would be more than quadrupled here, and therefore needs a greater influence to sustain it—and the cost of admission there being merely nominal, the number of admissions must have been over *ten thousand.*

We trust the day is not far distant when the public will take a deep interest, and our annual shows become *the* Festival of the Seasons—for surely, if there is a country in the world where May Day Festivals and Annual Fairs should be days of Public Rejoicing, California is that place:

REPORT OF THE COMMITTEE OF ARRANGEMENTS.

The Committee of Arrangements beg leave to made the following report:

The exhibition of the Society on the Common, under Mr. Wright's large pavilion, terminated successfully, not only in the rich display of fruits, flowers, and vegetables, which were without parallel in previous exhibitions, but also resulting in a pecuniary gain to the Society of four hundred dollars. The public, as well as the members of the Society, appear to have been well satisfied with the arrangement and comfort of the pavilion, and with its endless variety of horticultural productions.

Notwithstanding the fears entertained by some persons, that the Common would be injured by the erection of the tent, it was conceded by those opposed, that no essential harm was done to the ground. In a few weeks no traces of the injury could be observed. The Committee are much indebted to his Honor the Mayor and other officers of the city government, for the anxiety they manifested to promote the welfare of the Society, and to overcome the objections raised to prevent the use of the Common for this exhibition.

The most important item in preparing for this exhibition, was laying the floor, the erection of tables, stands, &c., requiring for the construction of the whole, about 50,000 feet of boards and joist. The Mayor and Aldermen would not give permission to use the Common for the occasion, without the agreement on the part of the Committee to lay a floor over the whole area of the pavilion, to preserve the grass from injury. The expense of lumber and labor, in laying the floor, amounted to $877. The lumber sold at auction for $440, making the cost $437.

The Committee are of opinion that, should it be found expedient hereafter to have a similar exhibition, a considerable saving might be made by advertising for proposals to execute the work and furnish the lumber.

At the commencement of the exhibition we were visited by a severe rain storm, which falling very suddenly, penetrated the canvass and gave the fruit and flowers a thorough drenching. It resulted, however, in no great damage to the products on exhibition, except to the grapes and cut flowers, and rendering the place uncomfortably wet for a few hours, and in greatly diminishing the receipts at the door for that day. The weather for the remainder of the time was remarkably pleasant, and crowds of people thronged the pavilion, particularly in the evening, when the place, lighted with gas and enlivened with the band of music, seemed like a piece of enchantment.

The committee regretted the necessary termination of the exhibition nearly as soon as it was under good head-way, as the public had but just learned of the glory of the place when it was closed. Should there be another exhibition of the kind, we are of opinion that it could be opened on Thursday and kept open for a week or ten days, by allowing the contributors to renew the perishable flowers on Monday, a large sum of money would be secured to the Society. The risk of holding an exhibition under a tent would be greatly lessened, could there be more time between the opening and close; contributors of the perishable fruits and flowers could be remunerated by additional premiums for their products.

The whole amount taken at the door, was	$2,124 50
Sale of lumber	440 94
	$2,565 45
Sundry expenses of Exhibition	$2,157 72
Cash paid Capt. Austin, Treasurer	400 00
" for trunk for linen	3 00
In the hands of the Chairman	4 73
	$2,565 45

Cosmography,

Or, Philosophic Views of the Universe, by Chas. F. Winslow, M.D., of this city.

We have received a copy of this work from the author—a neat volume of 175 pages—a work that one may read with increasing interest—beautiful thoughts, coming from a mind highly imbued with the philosophy and science of which the work treats and a high reverence for the Author of all things created. This work should be read. We bespeak for it a wide circulation.

We make extracts of the three closing paragraphs of the volume—the author having been speaking of the advanced knowledge in science, the tendency of which knowledge is, the beautiful and harmonious action of all, revealing the wisdom and goodness of God in his plans for the happiness of man:

"The pursuit of this inquiry has led to the development of a sublime and beautiful truth, uniting inseparably the two great departments of astronomical and geological science. Heretofore they have been as widely separated as the heavens and the earth. Astronomers, so charmed with the glories of the celestial universe, have hardly devoted an hour to contemplations of the physical structure of our own planet. Geologists, so amazed at the countless vestiges of human life which crowd the strata of the earth's crust, barely glance at the heavenly bodies, and theorize only on the results of Plutonic agencies, or aqueous and atmospheric degradations, and on the destruction of antediluvian races. Science and philosophy must awaken to still more sublime contemplations. The earth is only one marvellous link in an endless chain of cosmical creations. It is composed of atoms, each one of which is bound by mysterious and harmonious relations to all the rest in the physical universe. The revolutions of the earth around the sun not only expose its surface to cheering and fertilizing beams of light, but its universal mass throbs through every molecule, as it hastens along its circuit in obedience to the great celestial laws. It is moved from centre to circumference with intense activity. Quiet and gigantic internal changes beget quiet and gigantic external results. Slow igneous ulcerations of the inner surface of the crust at last induce sudden subterranean convulsions, or volcanic inundations. Universal or local revolutions of surface ensue. As continents rise and oceans retire, isothermal variations as gradually succeed each other; and, in corresponding succession, various organic creations spring up, or pass away, both on the earth and in the sea, according to laws regulating their physical inception and development, ordained by the Almighty.

"Thus is evanescent, ever-changing life upon the earth connected with the ceaseless rolling of the spheres. While the varying seasons and day and night, are necessary for the resuscitation of natural forces, and the different wants of organic being, the revolutions of the earth's surface are necessary for unfolding the endless resources of the Creator's plan, and to prepare it for the abode of the crowning work of his will. Epochs, whose duration exceeds all human calculation, have succeeded each other in unknown numbers, with all their multifarious forms of existence progressively in the scale of development in the lapse of time. Strata on strata of organic remains have thus been heaped on each other and upon the land; and were the deposites of each geological age piled one upon the other they would rise many miles in height. Had complete repose brooded for ever over the globe, coal-beds, slates, marbles, coal-beds, and metalliferous mines would all lie deep in the bowels of the earth, or beneath the ocean, and beyond the reach of man. But the ever-changing year, which brings seed-time and harvest, and summer and winter, for the growth and sustenance of swarming myriads of organized forms, brings at the same time changes in the physical constitution of the planets, slow and imperceptible, or active and determinate, which exhibit with overwhelming eloquence the benificence and universal providence of the Creator. How necessary all these changes for the highest physical happiness and the intellectual and moral perfection of man! Had our race been created first instead of last, the bare granitic surface of the globe would have been an inhospitable abode indeed; or, midway in the course of ages, we should have inbabited a surface filled with a rank and noisome vegetation, exhaling only pestilence, and unfit for the fulfilment of the sublime plan of our creation; if still later, our companions would have been hideous and terrible monsters, whose existence would seem fabulous, did not their remains demonstrate to us their magnitude and rapacity. But the lot of man was designed for the highly elaborated surface of the earth, where the companions of his creation could administer to his wants, and aid his occupations; and where all the abounding wealth of metals and of decomposed animal and vegetable remains has been overturned and exposed by physical changes, to invite and reward his mechanical and agricultural toil.

"Thus all created things seem linked together. We can trace the special creations of God from step to step on this globe, all the way from man back to the first plants and animals which he made in the primordal seas. Special and definite interpositions of divine thought and energy are manifest from age to age in organic creations, and they are all linked to the successive revolutions of the surface of the earth. Through countless ages we can trace these changes, and these exhibitions of Infinite Wisdom, till we arrive back, and stand upon the bare crystalline surface of the uninhabitable globe. The contemplation of these changes and these creations almost brings us face to face with the great Jehovah. How wonderful and manifold his works! How marvellous the faculties of thought which translate us towards Infinity! But the cause of these remarkable changes in the planet, to which vegetable and animal life are subordinate, lie without and beyond it. The influence which steals through its constituent molecules is more subtile and potent than the light and heat of the solar rays which warm and fertilize its surface. In these solar powers dwell the levers of the Almighty, by which he has raised from the bosom of the deep the lofty mountain and sloping vale, and prepared them for the abode of successive races of plants and animals.

"Thus, by the exertion of the intellectual and meditative faculties with which man is endowed, he can ascend step by step through the infinite series of created things; behold his own existence linked through the atoms of the earth to the heart of the sun,—and that depending for its energies and stability upon the stellar multitudes of the milky way; and the whole universe chained together in one vast empire, embracing alike molecule and globe, sun and systems of suns, stretching beyond the reach of mortal sight, and all bound with enduring power to the omnipotent arm of their Creator."

Real Estate.

There is probably no other city in the United States, unless we except Boston, Mass., where so much cash is at all times ready to be invested in real estate as in San Francisco. The mercantile interest usually controls the capital of great cities but San Francisco and Boston are exceptions to the general rule, and here we have the reason why, amid the prevailing paralysis upon trade, when every species of merchandize is almost valueless, real estate continues to command very high prices, and, at any moment, when no price could be obtained or an offer made for merchandize, cash stands ready to purchase real estate by the tens or hundreds of thousands of dollars.

Birth Day of Washington.—This day, hallowed by the dearest association in the history of our country, and interwoven with all that is patriotic and holy in thought and feeling—this day has been ushered in by the ringing of bells and the roaring of cannon. Every institution, every association bearing that glorious name has felt a thrill through all its pulsations, and the heart is made to beat quicker and stronger at the name of Washington. This day will be forever observed. So long as the name of liberty and truth exist, so long will the birth day of "the Father of his Country" be kept in holy remembrance. California, even amid her eager pursuits for gold, turns for a while to that which is more enduring, the "Memory of Washington;" and in all her cities and villages gather the patriotic and the true to keep alive among the people those shining virtues, that exalted patriotism and love of country that has made the name of Washington immortal.

Crops of Wheat for 1854.—We desire to draw the attention of the cultivators to this important subject, and as it is so necessary for them to know the probable crop of 1854, we would ask of some one or more persons in each county to collect the statistics of their several counties, as far as practicable, and forward it to us, and we will prepare tables of the same, and publish them in the Farmer for the benefit of all.

Pruning.

Pruning, properly considered, is one of the most important operations connected with the growth and management of trees and plants. That many do not so regard it, we have the most abundant evidence. Orchard pruning, which may be considered the simplest and plainest of all pruning—almost mechanical—is either so unskilfully done in general, or so neglected, that we feel safe in saying that the orchards of this country are diminished in value at least one-half. There are many erroneous notions in regard to this as well as other branches of culture, that must be abandoned before we can attain to anything like a complete, perfect, or profitable system. Some regard pruning as merely a mechanical operation, that any man may perform, and that in rare cases only is necessary. Their practice is in perfect keeping with this belief. Others, and among them some who occupy the position of teachers and expounders of the principles and practice of horticulture, speak of it as being merely a superfluous and costly refinement in cultivation, that people of leisure may indulge in for their amusement, but as being quite inconsistent with an economical and profitable course of culture. It is not a paying operation, they say, and therefore it will pay best to let it alone.

How common it is to bear this argument of "it won't pay," raised against all improvement. It won't pay to drain, nor to fence, nor to plow deep, nor manure well; it won't pay to buy good stock at a good price, nor to provide them with good food, and shelter and care; and so this excuse is offered for everything that is miserable in farming. It won't pay, say our city authorities, to make sewers and clean the streets and purify the atmosphere, and so disease is invited to waste the lives and interrupt the business of the people. Occasionally, however, an agriculturist, more enlightened, more enterprising and daring than his neighbors, lays aside the popular notion, and drains, and trenches and fences; buys the best breed of animals, erects them good houses, and he grows rich; and if not rich, famous—his name is passed around as a master spirit—a model farmer. So another city, under a more enlightened and liberal administration, adopts a thorough system of sewerage, and removes every source of impurity, regardless of the expense or of a clamorous opposition, and when epidemics prevail, it rejoices in health and uninterrupted prosperity, while death is causing dismay and desolation in others. Then it finds out that it pays to be cleanly. The notion that "it won't pay" to do everything well is a great error.

But pruning, some say, is an unnatural operation, practised and recommended only by certain enthusiastic persons, whose zeal has outrun their knowledge. That it is throwing difficulties and expenses in the way of cultivation that ought to be avoided, and that the less we practice it the better. Nature, they say, never prunes, and why should we? People who talk thus do not know what they say. To be consistent, they must not only discard pruning, but budding, grafting, spade and hoe culture, and in fact the entire routine of operations which constitute our present advanced and comparatively perfect system of cultivation. Nature neither buds nor grafts, nor hoes, nor spades nor drains nor manures. She does not make vine borders nor hot-beds, build vineries nor green-houses. These are unnatural operations, in the estimation of some people, inasmuch as they are not natural. It is right and proper that the cultivator should study nature well for her laws cannot be violated with impunity; but it is his business to aid her by all the means which art and science have furnished him. Nature unaided does not produce Black Hamburg grapes, Bartlett pears, Newtown Pippin apples, nor Early York peaches; but she has given us the raw material from which to produce all of them, and she has indicated certain conditions necessary to their growth and improvement.

Nothing can appear more unnatural to the man who is ignorant of the principles of cultivation, than the common treatment of foreign grapes. They are not only furnished with unnatural supplies of food, but their pruning consists in cutting away annually three-fourths of their young wood. Now our natural cultivator might say that nature never intended the grape to be subjected to such treatment. But what sort of grapes would we produce without it? Fine fruits and beautiful trees and plants are not the spontaneous production of unaided nature, but require the intervention of a multitude of nice and skilful operations, which constitute the art of gardening. Neither do men arrive at a knowledge of these operations instinctively; they are not so perfectly plain and simple as to require no study, no teaching, no experience.

Those who think and write otherwise, only deceive themselves and others. The most simple mechanical art requires two or three years of an apprenticeship. A nail, a pin, or a shoe peg, are very simple objects—no mystery whatever about them; and yet men cannot instinctively become peg-makers, pin-makers, or nailers. A tree is a far more complicated piece of mechanism than any of these. It has an organization and a life. It is composed of a multitude of parts, each of which has its functions to fulfil, and all these parts bear certain relations to each other and to the life and growth of the whole tree, just as each of the various parts of the apparently complicated steam engine has a certain part to play, and is essential to the completeness and efficiency of the whole. A machinist is expected to know the name and purpose of every beam and bolt and screw of the engine which he constructs, but he is not expected to acquire that knowledge instinctively. He must exercise both his mind and his hands, he must think and read and practise for years, before he will dare call himself a machinist or an engineer. Trees have roots and rootlets, stems, branches, leaves and buds; all these are designated by certain names, and have distinct offices to perform in the process of vegetation and fruit bearing. Then there are different genera and species and varieties of trees and plants, all differing in certain habits of growth, and bearing, and requiring different treatment as regards soil, culture, climate, &c. The intelligent cultivator must be familiar with the names and functions of all these parts, the peculiar structure, mode of growth and bearing of the different genera and species and varieties; but it will not come to him intuitively, any more than a knowledge of mechanics. Let those answer who have devoted a long life to the theory and practice of field and garden culture, and find that at last they are but learners; and that if they were to live three times the ordinary life of man, they would be learners still.

We are not disposed to magnify the difficulties of cultivation, or to convey the impression that every man may not be a successful culturist; but we feel it our duty to the young, at least, to expose the fallacy of the teaching that cultivation is so plain and simple that "he who runs may read," and that those who inculcate the necessity of study and research, and of minute and careful operations, are mere enthusiastic humbugs. Whoever gives ear to such absurdities, can never hope to attain eminence as a cultivator.

Pruning, as we said in the outset, is one of the most important operations connected with the culture and management of trees. It is an indispensable operation to a greater or less extent, from the moment when the seedling is taken from the seed-bed, through all the phases of its development, until its existence as a living organized body terminates. What nurseryman transplants a stock into his nursery rows without pruning? And does he not prune his young trees at one and two and three or four years' growth, until they are ready for their final destination? Were it not for this constant annual or periodical care, a nursery would become an impenetrable jungle, and men who wanted trees would avoid it as they would a pestilence. Then, who transplants trees into the garden or orchard without pruning? Roots and branches are necessarily submitted to this operation by every careful and skilful cultivator. Nor is it indispensable to trees alone, but to every shrub or plant that comes within the sphere of cultivation. What gardener can grow a respectable looking geranium, a rose, or fuchsia, without pruning? What is it but the effects of pruning that distinguish the magnificent specimens that figure at the exhibitions of Chiswick, from the tall, lean, misshapen deformities that have been left to nature, and that every man feels ashamed to own? There is no such thing in reality as growing well-shaped symmetrical trees and plants, and sustaining them in a vigorous and fruitful state without pruning. But we must say however, that necessary and useful though it be, we should greatly prefer to have it undone than done unskilfully. "The object of the pruner," says Lindley, "is to diminish the number of leaves and branches; whence it may be understood how delicate are the operations he has to practice, and how thorough a knowledge he ought to possess of all the organs which regulate the organs of vegetation. If well-directed, pruning is one of the most useful, and if ill-directed, it is among the most mischievous operations that can take place upon a plant."

Every man of experience will endorse this statement. The pruner should know well what he does, and the precise reasons why he does it. Pruning is not lopping off a branch at random, as a man who walks in the dark, not knowing whether he is advancing on safe footing, or about to step over a precipice. Every cut that a pruner makes upon a tree or plant, should be guided by a knowledge of the habits of growth, and blossoming and bearing of the subject, and have a well understood and determined object in view. A feeble tree and a vigorous tree must not be pruned alike, no more than an invalid should be served with the same food, and urged to the same labor as a man in full health. An apple and a pear tree that produce their fruit only (with rare exception) on wood of three years old and upwards, cannot be pruned in the same way as a peach or a nectarine that bears principally on wood of one season's growth. The grape, the currant, the raspberry, the quince, the filbert, and the fig, have each a peculiar mode of growth and of bearing, and the pruning applied to them must be based upon an accurate knowledge of this. Even in the same species, a prolific variety must not be pruned in the same way as a shy bearer. The cultivator of ornamental plants knows how necessary it is to understand the mode of flowering plants, in order to prune them well. In roses, for instance, all the perpetual bloomers produce their blossoms on young wood of the current season's growth, while the summer roses generally produce their blossoms or blossom shoots from wood of the preceding years.

Pruning becomes plain and simple when these principles are studied, and instead of being an expensive, superfluous, or unnatural operation, is one of the most useful, interesting, and beautiful, enabling us to exercise a perfect control over the forms and fruitfulness of our trees, and to adapt to every circumstance and condition that fancy or interest may dictate. There is certainly no branch of culture so inviting to gentlemen who love their gardens and trees and desire to participate in their management. It is a pleasant exercise for both body and mind, and its practice not only awakens increased interest in regard to the trees themselves, but throws a new interest on the whole subject of vegetation.

The Potato Disease in Great Britain.

The Farmer's Magazine (London) thus alludes to the Potato Disease of 1853:

When shall we have done with the alarms, the theories, the specifics, and with the reality of the potato disease? That it seems to be now, nearly beyond all precedent, serious; that it has assumed even new phases of virulence; and that it has utterly, hitherto, baffled all possible efforts of man—appears to be acknowledged. Science and skill, practice and experiment, seem all set at fatal defiance. The Potato Commission met, and investigated, and reported; and were as powerless before it as they were before war, famine and pestilence. Nor does the tendency to disease apparently wear out. If it lies a little more quiescent one year, it is only to break out with renewed vigor the next: if one species of potato is free one season, it is the more severely diseased in the following: nay, it seems as if some vast providential arrangement were at work, specially to baffle the wisdom of man, and to say to his science, his philosophy, and his skill, "Hitherto shalt thou come, and no further!"

The phase of the potato disease of 1853 is peculiar. There are two remarkable characteristics which never before attended it. In all former years, the potatoes raised under glass gave early indications of the disease: on this occasion, there were few, if any, complaints on the subject. The next peculiarity was that, as soon as the stalks become brown and spotted, the disease was ravaging the tubers. But, on this occasion, the stalks were brown, in many cases, for weeks before any manifestation of the disease took place; and it was hoped it had expended its virus in blackening the tops, when the tubers so long escaped. A third peculiarity was, that the crop this year was fully mature before the visitation took place; and hence there was a prospect of a most abundant yield; the disease set in after the heavy rains of September—a time when, otherwise, the plant was assumed to be safe. *But it was not the rain which caused it*, because in many instances, when the potatoes were taken up, and stored away carefully and dry, covered so as to have no evil atmospheric influence—still, on opening the pits or removing the cover, if housed, they were just as bad as if they had been fully exposed. All precedent, all experience, all accumulations of knowledge, all things set at naught, with one full swoop.

Nor is it peculiar. In the north and south of England, in the whole of Ireland, and in the generally more favored districts of Scotland, the disease seems to have spread, while in Canada it has appeared with great virulence. We have not heard how the small islands of Scilly and the Isle of Wight have this year been favored, as they have usually escaped in a considerable degree, when others have been sufferers.

In this country the disease has resolved itself into a simple question of the abstraction of so much food—fully thirty per cent. of a good crop are already gone; but in Ireland the investigation is more vital and stirring. We have before us a report of the meeting of the Chemico-Agricultural Society of Ulster, in which the plan of Dr. Bollman was canvassed, with other modes proposed to arrest, if not cure, the disease.

Dr. Bollman's principle seemed to us by far the most reasonable of all recommended, if the disease were at all inherent from the parent tuber. Dr. Hodges demonstrated the disease to be a fungus, breaking up the structure of the potato; and if there was seminal infection, like the smut in wheat, Dr. B.'s plan of high-drying the tubers was by far the most rational one we knew of, especially as extreme dryness is absolutely destructive to the sporules of almost every fungus, and the Botrytes, the peculiar fungus of the potato disease, was unlikely to find a nidus in so highly dried a set. But if it be first of all atmospheric, as is all but certain, and if the decomposing mischief is *from without*, we cannot see how Dr. Bollman's preparation could be at all effectual.

And so it appears it has failed in numberless instances; and so has peat charcoal, as well as pulling up the stalks, planting in spent tan, and a thousand more similar schemes of prevention.

The whole of the facts, however, lead to this conclusion—plant as early as possible, so as to get a large portion matured and sold before the disease sets in, as it usually does with great severity late in August, though this year it was about the middle of September before it became general.

California Peach Orchards.

As California is destined to become a great Peach Country, we desire the orchardists to try the experiment recorded below. We give it for their benefit.

Successful Method of Grafting the Peach.—To successfully graft the peach tree has been universally considered next to an impossibility; but in consequence of the ease and success of budding, this concession has seemed of but little practical importance. Yet every one, of the least experience in this matter, knows that many trees, where budding had been neglected or unsuccessfully performed, might be saved and rendered valuable if grafting could be performed with success.

I am aware that Dr. Page of Washington published and copyrighted about a year ago, a method of grafting the peach for which [illegible] claimed to that a [illegible] efficiency. His plan consisted in the [illegible] the growth of the tree [illegible] with grafting, by transplanting [illegible] and pruning.

[illegible] I should think [illegible]

It [illegible] as the other [illegible] fruits in the manner of the common cleft. The [illegible] side seams are to be waxed in the usual manner, the cleft *filled*, and the end of the stub covered with *warm* or melted composition. The whole is then to be wound with composition cloth, to prevent curling of the bark.

That this plan will succeed, is a demonstrated fact, but in how great a proportion of cases, experience is too limited to determine. Suffice it to say, that eight scions set in different branches of the same tree, all lived and grew with astonishing rapidity. Will others give this plan a trial and report the results.—*Country Gentleman.*

Fattening Swine.

The business of fattening swine is often rendered far more expensive than it need be. Many farmers feed only their best and most valuable grains and vegetables, and feed them raw. In this way a much larger quantity of food is required, than would be necessary, were the food prepared by boiling or steaming. Indian corn fed whole, is always an expensive article in fattening any animal, and those who rely upon it exclusively for making pork, must not be surprised if their meat costs more per pound, than the meat is worth in the market. Many farmers are aware that the corn consumed by an animal, will, if sold in the market, at the common price, purchase more pork than it will make. But by selecting poor corn, grinding it into meal, perhaps with the cobs, and cooking it either by boiling or steaming, and when convenient mixing it with boiled potatoes, turnips, beets, carrots or pumpkins, all of which are highly nutritious and salutary in their effects upon the general health, a very considerable and important saving may be made, and the pork, instead of being an expensive article of food, will be rendered an economical one.

In connection with every piggery there should be an apparatus for steaming or boiling where the several articles of food can be prepared and tempered with economy and ease. Apples are excellent for feeding swine, and if boiled or steamed and mixed with corn and cob meal, will be found to contribute essentially to the economy of fattening not only of swine, but of other animals. A person who was some years since engaged rather largely in fattening pork for the northern market, assured us that he preferred apples and meat to any other diet. He expressed his belief that pork could be fattened on this food, for four cents per pound—less even, we thought, than upon any kind of grain. In this economical manner the farmer may every year fatten pork not only sufficient for his own use, but frequently a surplus for the market, and it will be of the best quality. —*N. E. Farmer.*

Animal Tenacity of Life.

Among the lower animals tenacity of life is the most remarkable in the polypi; they may be pounded in a mortar, split up, turned inside out like a glove, and divided into parts, without injury to life; fire alone is fatal to them.' It is now about a hundred years since Trembley made us acquainted with these animals, and first discovered their indestructibility. It had subsequently been taken up by other natural historians, who have followed up these experiments, and have even gone so far as to produce monsters by grafting. If they be turned inside out, they attempt to replace themselves, and if unsuccessfully, the outer surface assumes the properties and power of the inner, and the reverse. If the effort be partially successful only, the part turned back disappears in twenty-four hours, and that part of the body embraces it in such a manner that the arms which projected behind are now fixed in the centre of the body; the original opening also disappears, and in the room of feelers a new mouth is formed, to which new feelers attach themselves, and this new mouth feels immediately. The healed extremity elongates itself into a tail, of which the animal has now two. If two polypi be passed into one another like tubes, and pierced through with a bristle, the inner one works its way through the other and comes forth again in a few days; in some instances, however, they grow together, and then a double row of feelers surround the mouth. If they be mutilated the divided parts grow together again, and even pieces of two separate individuals will unite into one.

Highland Habits.—An English paper remarks that one of the most singular peculiarities of the Highlanders or of certain clans of them, consists in their obstinate adherance to the old way of doing things; they are in short, a complete set of old fogies! Their mode of building, for example, is precisely the same as that practised in the days of Wallace. Her Majesty, the Queen, is building a splendid castle at Balmoral, and every piece of granite of which the walls are composed, is carried singly, on a Highlander's back up a narrow, zig-zag platform, to the top of the wall and is deposited by him in its appointed place. A single man will thus carry on his shoulders a block of granite two feet in [illegible] and of proportionate thickness. If a large block [illegible] to be transported, [illegible] are passed under it and four brawny Highlanders trot off to its destination! [illegible] are never used, and the workmen [illegible] and carrying anything in the shape of [illegible] poles or machines of any kind.

[illegible] TREE. [illegible] A [illegible] has been made by the [illegible] of [illegible] tree [illegible] trade from Liverpool and [illegible] The [illegible] [illegible] the [illegible] and [illegible] [illegible] [illegible]

THE CALIFORNIA FARMER.

J. L. L. F. WARREN, Assistant Editor.

SAN FRANCISCO:
Thursday, February 23, 1854.

The Fisheries of California.

In the State House in Boston, Massachusetts, the "cod fish" that hangs suspended in the representative chamber is the proud emblem of the valuable fisheries that form one of the chief sources of wealth to the State.

It will be remembered that the cod and mackerel fisheries employ a large number of vessels and give employment to thousands; and it would have seemed preposterous to have supposed, a few years since, that California would ever become a competitor in any department of the Fisheries, with New England—yet such is now the fact.

The Salmon Fisheries of California are assuming a character to cause them to be recognized as a valuable branch of our "home industry."

California and Oregon will soon become large exporters of salmon, and the wealth of other portions of our country and of the world must return to California, in gold or its equivalent, the value of this product.

By the clippers now leaving our ports, over *one thousand barrels of salmon* are shipped, and the value of some sixteen to twenty thousand dollars is saved to the State. These are important facts, and worthy of note.

Sending Flour back to New York.

Grain growers may take courage now, when they see the result of low prices of Wheat, Flour, and Grain. California has been the world's market for everything, no matter what; and shippers of goods in other States have acted with such madness in shipping, in the face of a falling market too, that we have very little sympathy for them in their losses. In their desire to "get rich," they disregarded all mercantile customs and forms, and continued shipping *duplicate* and triplicate invoices of goods on their own account, that they might compete with their correspondents or outstrip them. The consequence has been a ruinous and overstocked market in all the great staples, as well as in all kinds of merchandise, in every branch of trade.

The result of this duplicity is now seen in the depression of trade caused by this very excess of importation, and in no article more distinctly than in the great staple of flour.

Flour is now selling in this market at less than cost in Boston and New York, and the present week large shipments of flour are loading for New York, carrying with it accounts of losses, in no way pleasant to original shippers.

This, however, is not without a benefit—there is no loss without some gain," and it will result finally in good to the Farmers here—and they can take courage, for the next year will not find our market overstocked with foreign flour—for California is able to raise wheat enough for her own people, and she will do it.

What should the State do for Farmers.

We find the following opinion expressed in one of our exchanges, as to the wants of the Farmers, in our old Western States, and we think it sound, and could our State Government realize the impetus that could be given to this right arm of our industry and wealth by a prompt and generous recognition and aid to this interest, in such a way as they in their wisdom may devise, we feel confident that a rich return into the coffers of our State would be the result, by the general prosperity of the people and the increase of those resources which sustain and build up a State.

The data of the value of the crops of Michigan would be enhanced four-fold, and the value of our government land in an equal ratio, and the systems of drainage alluded to can be applied to our Tule lands, and the best systems for irrigation made also a theme of interest. We trust our government will not let this matter pass without their notice, even this session of the Legislature:

We are no believers in what is politically called *centralization*, nor in a government interfering one way or another, with private enterprise. The less governing a nation endures, the better it generally prospers. But a government is a human machine to manufacture more happiness for the majority than that majority could enjoy without it; and there are occasions when it becomes the duty of a government to step forward and assist individuals. This is peculiarly true in a republic, where the people themselves are the government, and where the officials are but the people's obedient servants. The strength of a government is its unity; the weakness of a people is their individuality. The government has power, and, above all, money at its control, and can act with decision where the majority could not act at all. Now in Michigan, the great majority are Farmers; the business of the State is agriculture; and all other business and professions depend on the Farmers for prosperity. What benefits the majority of Farmers, benefits all. If the farmers are intelligent and wealthy, the State is intelligent and wealthy. If the Farmers are ignorant and poor, the State is ignorant and poor. Still further, the money which the government spends is mostly paid by the Farmers. It is theirs. They contribute it in order that they may be better off than if they kept it all to themselves; but still, as they contribute it, they have a right to say how it shall be spent. Now in all communities there are wants—wants which all feel, and yet which no individual—which nothing less than a government, can supply. Education is one of these wants, and we all, compelled by government, pay our money to afford an education to our neighbors' children. But is Education the *only* want which such a Republic as ours suffers from, and which we must call on the government to attend to? Certainly not. If the government by establishing an agricultural school can make us better farmers, so that every acre of land yields annually ten dollars, where now it yields five, then we hold it to be the duty of the government to establish that school—with our own money, remember,—for all the government's money comes out of our own pockets, only it rarely ever returns to the same snug quarters. In 1850, we had two millions of acres under cultivation in this State. Who doubts that if the Farmers were as well instructed in their business as the engineer is in his, we could not just as easily make our farms yield at the least $2 an acre more, yearly? Here, then, in one item alone, we should have an income of four millions a year more than we have at present. We have 40,000 farmers in the State. *One dollar* a year from each would establish one of the most magnificent institutions of the sort the world ever saw; and is there a Michigan Farmer who cannot afford two red cents a week to put four millions a year into our conglomerated pocket? But the government alone, by the power of its unity, can accomplish such a purpose. Again, let us see what else the government can do for us. It has been thoroughly proved in Europe and well proved in America, that *thorough draining* on the average, adds *thirty per cent.* to the crops. This a low statement. In 1850, we raised five millions bushels of wheat; drained land would have given us seven and a half millions, equal to as many dollars. But as individuals we have not the capital to drain our lands; we want pipes, but the machines and necessary fixtures are too costly. If each town once had its own machine, and made its own pipes, most of us could afford to drain; and what is more, most of us would drain. Why should not the government supply the towns with machines, and pay half a dozen skilled Engineers to make levels, and lay out our systems of drains for us? With all the follies and miseries of the old-world governments, they beat us in wisdom in these respects. They feel that it is for their interest to help the people occasionally, for the people could not pay their taxes without it. We who have the power in our own hands, and are just as desirous to make money, will not unitedly move a finger nor wag a tongue to smother ourselves in temporal blessings. Since 1846, the English government has lent the landowners fifty millions of dollars, at a nominal interest, for the sole purpose of draining. The French government, overwhelmed with debt, annually distributes 16,000 francs to enable local agricultural societies *to buy drain-pipe machines*. The lamented Delafield, at his own expense, imported such a machine into western New York, and afforded the pipes at a low cost. Every good farmer went to draining, and the State Agricultural Society tells us, in 1852, of *one* Farmer, who has constructed sixteen miles of drains on his farm. "A nod is good as a wink"—you know the proverb—we shall say no more, but beseech you, Friends! to think of these things and lay them to heart. The day of action will soon come.

For the Dairymen.

MILK PRODUCING BREED OF CATTLE.

The "Dairy" of California is one of the prominent features of "home industry," and we shall always keep it before our readers, and shall be pleased to receive all the light we can from those who are engaged in it.

From an English work *Americanized*, we present the following extract, as an introduction to the subject, which we shall keep constantly in mind:

It is usual, in works on cattle, to classify them by the length or shortness of their horns; and, as a matter of natural history, it may be the most correct mode of dividing or classifying the different tribes of animals which prevail in one or other of the districts of Great Britain and Ireland. But for practical purposes, it is by no means either advantageous or convenient. There are certain breeds which have certain peculiar qualities, and as the size of horn has no connection whatever with those qualities, it is by far the most desirable course to classify them according to their properties, rather than by any arbitrary mark of distinction altogether unindicative of their peculiar capabilities. There is, in this country, a great variety of pasturage—from the very rich to the very poor, and from the extremely warm to the exposed and stormy, and in every gradation of this range is a class of cattle kept and propagated.

The great object for which cattle are kept by the farmer is either to grow beef for the market, or to produce milk, which shall be converted into butter or cheese, or sold as milk, to supply the great towns. Hence the former selects the fat-producing, and the latter the milk-producing class of animals. Nature, as a general thing, has provided that different races of animals, and different individuals of these races, are, more than others, adapted to the secretion of one or the other of these necessary products. The objects of the two secretions are essentially different, and the tendencies and qualities necessary for both are never active in the same animal at the same time. For while the former is a reservoir for the carbonaceous matter of the food, laid by for subsequent use in the respiratory system, the latter is the secretion of a substance necessary to support the young progeny until it is able to sustain itself, and to procure from the green pastures the food there provided for it. Hence to produce milk is, more or less, the natural quality of all kinds and races of cattle; but some will produce large quantities, but thin and poor in quality; some smaller quantities, and rich in oily matter; while others will afford a small quantity, but abundant in solid matter; and the first class would be selected by the milk-man near the populous city, the second by the dairy-man whose product was intended to be butter, and the third by the maker of cheese. There are some tribes of cattle that are both good fatteners and good milkers, but never at the same time.

The milk-producing breeds are more widely diffused than any other, because they are capable of being kept to advantage on qualities of herbage which are inadequate profitably to sustain the fat-secreting breeds. Grass-land on the clay soils on the sides of the uplands, and even on the poorer sands, is quite adequate to supply the means of making butter or cheese; but it will very ill repay the person who attempts to feed cattle on herbage so inferior; while the rich alluvial feeding-pastures which generally skirt the rivers are far more profitably employed in raising summer beef, than in the production of milk, of cheese, or of butter. Some races of long-horns, of short-horns, or middle-horns, or even of polled animals are to be placed amongst the one class we have alluded to, and some amongst the other, and we prefer arranging the breeds most celebrated for the quantity or quality of their milk under the first head, and reserve the second to the races with special aptitude for fattening.

The question arises very naturally how far it is possible, by external conformations of the individual animal, to detect its capabilities for the secretion of milk? There are instances in every breed where it is evident nature has been more bountiful, or more niggardly, in bestowing the qualities calculated to produce the secretion for which the race may be celebrated; and there are, doubtless, marks, well known to the dairy-man, which seldom fail to indicate the power of the animal in the range of qualities peculiar to his race. On the continent of Europe this has been professed to be carried to a very minute extent. Francois Guenon, a Frenchman, professed to have found, by close observation, a mode of deciding authoritatively, not only the quantity and quality of milk which would be given by any particular cow, but also the period for which she would retain her milk after calving; and this he proposed to do by external appearances alone, and these of a somewhat arbitrary kind.

It is not within the compass of this little work to give anything like a description of the mode he adopted, now made public, but the foundation is his classification of all kinds of cattle into eight classes or families; each family is divided into three sections, according to size only, and each section is again subdivided into eight orders.

[To be continued.]

"Is there anything for me to do?

The following most excellent article, we clip from the Country Gentleman, and feel it will answer for the latitude of California, or any part of the world, and we commend its careful perusal:

With what force should this question come home to every one. Without activity, life is but a dream—a surfeiting ennui. To do good in his day and generation should be the highest aim of man—it would be worthy of his being. We have often contrasted the glory of the ever active mind with the dark insipidity of the puerile and dreamy intellect, wishing in our heart that a sense of true human greatness could be aroused in every one, believing that the smallest of the race has a mighty work before him, if he could but realize it, which must tell both upon the present and the future.

Upon the present generation rests the responsibility of shaping the destiny of the next, by giving its youthful impulses a high and noble direction, and to do this, self-culture must be a universal, individual aim. The farmer and mechanic ought to feel the deepest interest in this matter. There is no good reason why they should not be equally as intelligent as they are useful, and if they will make the effort, manfully and perseveringly, they cannot fail of attaining to that high position whence they may minister to the mental as well as the physical wants of the world. Let them lay aside the *isms* and *csisms* which are only arousing men's *evil* passions, cultivate a more intimate acquaintance with science, art, history and literature, being careful to distinguish between the true and the false, and they will soon find that enviable attainment is far from being among the impossibilities.

We are anxious to see an advance step taken among the mass of our farmers; and as we contemplate the disordered political condition of our State, action among them seems to be imperative. In this country the farmer ought to have an immense influence in arresting moral corruption, (he is properly the rectifier of political errors,) hence he should be educated, intelligent and prompt. It will not do to argue a want of time; system will surmount all obstacles and enable almost every one to avail themselves of the very forcible suggestions we have frequently read with satisfaction in the Country Gentleman, to appropriate the long winter evenings for the development of the higher faculties. Forget party animosities, social jealousies, and all other hindrances to such plans as will give a free and healthy action to the mind, and suffer the social and the home circles to become radiant with the results of thought and research, that we may look over your broad plains and long to enjoy the rich mental feasts of the Farmers' Club Room, or sigh for the social luxuries of their firesides. A.

Governor Bowdoin and the School Boys.

"The severest punishment I ever received." This Mr. Editor, was the closing remark of a venerable and respected friend, when giving me an account, a few days ago, of one of his boyish pranks in old Boston. I wish I could tell the story as he tells it; but it is good, and, in my opinion, teaches so admirable a lesson to us all, that I venture to hope it may find a place in your pages, even in the shape in which I shall attempt it:

My old friend, *raised* in Boston, brought up and nurtured within the shadow of the Old South, was, in his younger days, like most other boys, considerably addicted to the consumption of ripe fruit, and not very keenly perceptive of the laws of meum and tuum in obtaining it. I will not stop to inquire whether this weakness be inherited direct from our first parents; it is sufficient that my friend was so completely under its influences, that even the fine fruit of Mr. Bowdoin's garden was no exception to those *agrairan* notions which the boys of the town applied to all the fruit on the peninsula.

Mr. Bowdoin's garden then occupied an area which is now covered with brick, mortar and paving stones. It was defended by a wall, the altitude of which was considered by the whole school as one of their prime grievances. A portion of this wall, however, had become somewhat ruinous, a breach was reported practicable, and half a dozen chosen boys were selected for the attack. My old friend was one of the number. The appointed time was between one and two P. M., when it was conjectured that Mr. B. and his family would be at dinner. The stormers assemble—the breach is carried in gallant style, and stomachs, pockets, trousers, and even shirt bosoms are quickly filled with the forbidden fruit. A triumphant retreat is already anticipated, but as the little band draws near to the breach—horror of horrors!—it is discovered to be in possession of a sturdy servant man of Mr. B., supported by a huge bamboo, and retreat by other pass is out of the question. Stomachs probably remained in statu quo, but all other engines of transport are quickly relieved of the burdens—the invaders draw near to the breach, intending to make a rush; but are informed by the sturdy guard, that "Mr. Bowdoin is in the parlor, and wishes to see the young gentlemen."

Flight is in vain, and, with palpitating hearts, our heroes march in single file towards the house, the servant man and the bamboo covering the rear. The posse was met at the hall door by the good Mr. Bowdoin, who made them a most courteous and friendly bow, welcomed them to his house, and invited them to walk in and sit down. They were ushered into the parlor, where two or three young ladies were employed at needlework, presented with much form, and treated with abundance of bewitching smiles. An inner door was now opened, and Mr. Bowdoin conducted them into the drawing-room, where two elderly ladies were sitting. Here a still more ceremonious introduction took place. The ladies were all kindness—the lads were requested to be seated—a bell was rung—a servant appeared—cake, wine, and fruit were ordered by Mr. B. On the return of the servant, Mr. B. rose, filled the wine glasses, and handed them round, most kindly pressing the youngsters, and insisting on their partaking of the good things—entertaining his reluctant guests all the while with declarations of the great happiness at the honor done him by their visit—inquiring their views as to the war then raging in Europe—what they thought of the growing power of Bonaparte—what part they supposed the Archduke Charles would take in the political ferment of the day, &c. &c.

This amusing scene lasted nearly an hour, the ladies and the good Mr. B. appearing to vie with each other in attentions to the now conscience-stricken marauders. At length Mr. B. pulled out his watch, and said: "My good young friends, I regret to say that I have an appointment. I should have been happy to prolong this visit. I hope to have the pleasure of seeing you again. Meantime, my boys, at any time you will favor me with a call, the garden and orchard are entirely at your service, and my man James has orders to help you to any fruit you may desire." With these words the boys are dismissed, with many bows and shakes of the hand. "Oh," said my good old friend, "'twas the severest punishment I ever got, and I never robbed an orchard since!"

This is a true story, Mr. Editor: I hope it is not the worse for not being a fable. How greatly in the spirit of Christianity and good sense was the good Mr. Bowdoin's rebuke. How well it told upon the boys—it reached their hearts—places inaccessible to whips and bamboos. How true it is that a soft answer turneth away wrath," and "a word in season, how good it is." When will it be that mankind shall have ascertained the power of kindness, forbearance, mercy, and brotherly love!—*Boston Transcript.*

Fourth Agricultural Lecture.

BY J. B. CROCKET, ESQ.

Delivered at the Musical Hall, January –, 1854.
(Concluded.)

"Necessity, that wonderful mother of invention, has forced Europe, with its crowded population, to seize upon the first years of peace, to learn how to make the earth more bountiful. Germany, France and England, within that period, have given birth to chemists of world-wide distinction, who have illustrated the power of science over the soil. Government has been wise enough to put by the side of all engaged in the culture of a plant, or the growth of an animal, the chemist who has studied the laws of vegetable and animal physiology. The man of science has been able to teach the sheep-grower how to improve his wool. The testimony is uniform to this great practical test of usefulness, that wherever these institutions flourish, Agriculture is most elevated as an art.

"Distinguished travellers, the reports made to our Patent Office, and the instructive evidence furnished by Professor Hitchcock in his celebrated report on the condition of agriculture in Europe, made upon personal inspection, established the truth of the proposition.

"The Royal Agricultural College, at Cirencester, has six professors, and seven hundred acres of land for agricultural purposes. The school at Grignon, near Paris, has also six professors—and in this school, where the education is thorough, the entire course is three years. The experimental farm attached to it contains seven hundred and fifty acres. France has at present seventy-five agricultural institutions. The present ruler of the French nation has shown—whatever else he has exhibited in his imperial sway—sagacity and wisdom in his department of agriculture. At Versailles there is a National Agronomic Institute, employing nine first class professors and three thousand six hundred and fifty acres of land. The course of instruction in France embraces a wide range of the sciences. Thus the Grignon school teaches algebra, geometry, mechanics, surveying, leveling, stereometry, (the measuring of solid bodies,) and lineal drawings in the mathematical sciences—in the physical science, mineral chemistry, mineralogy, geology and botany—organic chemistry or agricultural technology, agricultural arboriculture, sylviculture, veterinary art, agriculture zoology and equitation, in what are denominated technological sciences and rural architecture, forest economy, farm accounts, rural economy and rural law, in the noological sciences. This institution has already graduated six hundred students. Prussia alone has three superior schools, two intermediary schools, twelve inferior schools, thirteen special schools, and two connected with colleges and universities.

"They abound in the various principalities of Germany, in Italy, and the Autocrat of Russia, in his wide domains has found it necessary to establish sixty-eight agricultural institutions. The superior schools rank with our best colleges, in the extent and variety of the sciences studied, and the intermediate schools may compare favorably with most of our colleges. The institute established as late as 1818, by the King of Wermburg, has a royal domain of eight hundred and twenty-five acres, one director, six professors, besides six other functionaries charged with various labors. The instruction given is embraced in three departments. First, Agricultural matters; second, Forest matters; third, Auxiliary. Omitting all that relates to the forest, let us glance at what is included in the agricultural course and the sciences in aid of agriculture.

"First, Climate; second. Soil; third, Manures; fourth, tools and implements of tillage; fifth, of clearing up of ground; sixth, of meadows and pasture; seventh, of agriculture in general. This is divided into ploughing and other tillage, seed plots, (of grain and root culture,) threshing and preservation of grain. Eight, of special agriculture. All cultivated plants are treated of particularly. One course of studies is viticulture, embracing the culture of the vine and wine-making. Another, the culture of fruit trees. Another, the rearing of cattle—the various races, their crossing, and the treatment of their young. Also of the horse; his natural history, the different methods of raising, the choice of animals for reproduction. The treatment of mares and colts, another rural industry in *winter*,—the manufacture of beet sugar, of liquid manures, &c., in *summer*, the manufacture of vinegar, cider, lime and draining tiles, and the last course of agriculture embraces the whole field of rural economy; as valuation of real estate, general circumstances of the country, of farms in general, and the different parts of the same farm, of the home means of maintaining its fertility, of systems of culture, of labor and the internal organization of a farm, of the relation between the number of beasts and the land worked, of the capital of the farmer, of the different modes of working a farm, and the last, but not least, agricultural book-keeping.

"I glance only at the sciences auxilliary to agriculture—higher arithmetic; algebra, trigonometry.

"The science of measuring solids, applied geometry, mathematics applied to the culture of trees and the entire forest, and their valuation: physics, mechanics, chemistry, vegetable botany and physiology, special and rural botany, zoology, veterinary medicine; the natural history of domestic animals, their anatomy, animal physiology; the care to be taken of animals the treatment and medicine for slight diseases, the description of diseases, pathology and therapuetics; veterinary surgery, the internal diseases of animals and murrains, rural constructions, preparing plans and drawings for masonry.

To illustrate these courses of instruction, the means are ample. Among them, the separations on a large farm, annexed to the institute, a forest of five thousand acres, a botanic garden, a library, a geological and mineralogical collection, a collection of woods, seeds and resins from the forest, a collection in comparative anatomy, and a collection of specimens of wool; specimens of agricultural products; model of instruments of tillage, models for physical science, and collections for chemistry and the laboratory.

"I should weary you by any further detail of the system of instruction established at the most celebrated of the Agricultural colleges of Europe. They form an interesting study for the statesman and the man of science, when he comes to the model which shall be adopted in our own country."

And now whilst all this has been accomplished in Europe, and much of it by despotic governments, having no sympathy with the masses, what, let me enquire, has been done, by democratic America, to elevate agriculture to the dignity of an art? I answer, nothing—literally nothing. We have colleges to educate clergymen, and doctors, and lawyers, and to fit them for their several pursuits. We have a national academy, to teach young men the art of war, and a naval school, to fit them to command our fleets; but none to instruct them in the peaceful and most useful art of agriculture. The most important of all human pursuits, and the first in dignity, has been left to take care of itself, and that too, when no other people under the sun have such inducements as we, to foster and develope this particular branch of industry. We are, or ought to be, essentially an agricultural people. Such pursuits would best comport with the simplicity of our republican institutions, and will forever prove their surest bulwark in time of peril. As a nation of farmers, we would be wholly invincible, and would go down to posterity, the richest, happiest and most powerful people, upon whom God has ever showered his blessings. Then, too, we have a broad domain, extending from ocean to ocean, embracing 26 deg. of latitude, with a temperate climate and a soil of marvellous fertility, fitted to produce almost everything that grows between the torrid and frigid zones. Washed by by two oceans—intersected in all directions by navigable rivers—and bounded on the north by a chain of inland seas. The United States, if she is true to her own interests, must of necessity become the granery of the whole world. Hers is emphatically a mission of peace, separated as she is by a broad ocean, from the rotten and tottering dynasties of Europe, taking no part in their perpetual struggles for dominion, be it hers to teach them, not only the blessings of a well-ordered republican government, but also to divine arts of peace and the highest civilization. But how can she accomplish this noble destiny? Only by training up her own people in the arts she would teach others. As agriculture is the very corner stone on which the fabric of her present greatness and future glory must forever rest, let her cherish it as the apple of her eye; let her lavish her best gifts upon the honest, sturdy farmer; let her "magnify him and make him honorable in the eyes of men;" let her educate him thoroughly for his calling, so that he may till the earth with all the lights which science, combined with his own practical experience, affords. Let agricultural schools and colleges, and model farms be established and liberally endowed in every State and, if possible, in every country; and in a few years, with such advantages as this country affords for the prosecution of such pursuits, we should have a large body of intelligent, practical educated farmers, whose influence would be seen and felt in every corner of the Union. We have now in the national treasury a surplus of twenty five millions, which our rulers are amazingly puzzled to know what to do with. If they would accept advice from so humble a source, I would respectfully suggest that it cannot be better employed than in building up and endowing several hundred agricultural schools in the various States.

But what interest does California feel, and what part is she to enact, in the effort to advance and elevate Agriculture? Are her people so delirious with the gold fever—are they so absorbed with speculation and trade—are they all so eager to become millionaires in a day, that they cannot wait for the slow process of "seed time and harvest?" These are important questions, and without attempting to answer them, I shall proceed to show what the answer ought to be. I shall take it for granted, for the sake of the argument at least, that those whom I have the honor to address, propose to make California their future home, and therefore are directly interested in her future welfare and growth. The question is, how are these to be best promoted?

It has always been doubted by wise statesmen and others well versed in political economy whether a country well adapted to Agriculture and commerce, is not invariably injured by the discovery that it contains rich mines of the precious metals. Gold and silver add nothing to the productive wealth of a country. They have but a nominal and fictitious value, and except as articles of ornament or luxury are useful only as mediums of exchange, by which property is bought and sold. With the consent of the whole civilized world, they have been fixed upon as the standard of value, by means of which commodities are exchanged; and except for this, they would not be half so valuable as iron or copper because not half so useful. A country, therefore which produces nothing but gold, and is compelled to purchase from other countries everything consumed, it is evident can never grow rich, unless the quantity of gold produced exceeds considerably what is required to purchase the necessary supplies. California affords the most striking illustration of this truth that the world has ever witnessed. If she had raised her own supplies during the last five years, instead of sending abroad for them, then the money which has gone to pay for them would either have remained here, or have been exchanged for other commodities, not articles of prime necessity. But of the many ship-loads of gold that California has produced, by far the largest portion has been sent abroad to pay for the flour and pork, the sugar and coffee, the clothing and other necessaries which our people were compelled to have, and this depleting process still continues, and so long as it does continue, it is impossible, in the nature of things, that California can become a great, rich and prosperous State. Like a prodigal spendthrift, she is wasting her substance in buying from others what she could as well produce herself. She is paying daily, for example, enormous sums for Haxall and Gallego flour, when her teeming soil yields to the husbandman a superior quality of wheat, with a generous profusion that almost defies belief; and I trust the time is near at hand when the sending of flour to California will be like "sending coals to Newcastle." The result of this state of affairs is, that though our mines have proved to be rich beyond all example, and have yielded an amount of treasure, which, a few years ago, would have appeared absolutely fabulous, yet nearly the whole of it has gone to enrich the wheat growers of Virginia or New York, the farmers of Illinois or Iowa, or the merchants and speculators of New York and Boston. Even now, by every steamer, we are pouring millions into their coffers, and are but "hewers of wood and drawers of water," or perhaps it would be more correct to say, "diggers of gold and consumers of flour and pork" for the especial benefit of farmers, speculators, and shipbuilders on the other side of the mountains. But in the name of all that is sensible, why should this state of things continue longer? Why not produce these articles at home, and keep our money at home, to build houses and ships, to establish colleges and schools—to adorn and beautify our houses—and if we should have more than we know what to do with, we can either purchase Japan for a sugar plantation or the Sandwich Islands for a flower garden. But whatever other folly we may commit, let us at all events cease to import from abroad what we can better produce at home.

But what *can* we produce at home? The adjoining apartment will furnish the answer; and, after inspecting this goodly array of California products, you will ask in return—what can we *not* produce at home? The truth is, no one can visit this extraordinary exhibition without a feeling of surprise at the wondrous fertility of the soil, and its peculiar adaptation to the arts of the husbandman. In 1845—only eight years ago—California was a sort of terra incognita, known only to a few adventurous navigators, as a place where beads and calico could be exchanged for hides and tallow. In 1846, when the American forces took possession of it, and indeed up to the time of the gold discoveries in 1848, it was regarded as a sterile, mountainous, sandy region, parched up with drought during one half the year, and drenched with constant floods the other half. All the reports sent back from here during that period concurred in representing the country as wholly unfit for agricultural purposes; and it was very generally believed that it would produce nothing but small grain, and that in very limited quantities, owing to the long-continued droughts. The discovery of gold in 1848, brought with it the necessary results of so exciting an event. Men, women and children were seized with a sudden frenzy. They abandoned their homes, shouldered their picks and tin pans, and rushed pell-mell to the mines. Their gardens and patches were given up to the birds and coyotes, and towns even were nearly abandoned. Even San Francisco, which had then begun to assume some importance, was left almost without inhabitants—town lots were of no value, and houses could be had almost for the asking. When the news reached the Atlantic States, multitudes rushed from all quarters towards the modern Ophir—their hopes excited to the highest pitch, with the prospect of speedy wealth, and their passions inflamed to frenzy by the eagerness of the pursuit. Since the days of the Crusaders, when belted knights and plumed warriors marshalled their invading hosts for the redemption of the Holy Land, no movement of the popular mind has equalled in intensity that which has sent such crowds of votaries to the shrine of mammon in this land of gold. In the midst of such exciting scenes as these, it is not surprising that the gentle peaceful art of Agriculture should have been wholly overlooked for a time. No one had time to experiment in turnips and cabbages, and no one thought he could afford to raise potatoes and onions at even a dollar per pound. It would take them too long to grow, and he wished to make his pile in a day. After a time, however, a few sagacious, right-minded men concluded that it might be worth while to try whether growing potatoes and onions at a dollar a pound would prove a losing business, even in California. They made the experiment, and were themselves astounded at the results. In despite of droughts and floods and winds and fogs the virgin soil yielded such bounteous returns as had hitherto been wholly unknown in any part of the world, and were in fact so incredible as to [illegible] belief in their reality. I distinctly remember to have read in a newspaper, some two years and a half ago, before I had ever seen California, an account of one season's produce on the farm of Mr. Horner, near the Mission of San Jose, and I remember also with what incredulity I laid down the paper, and concluded the whole affair must of necessity be a mere California exaggeration. But if I had continued to be incredulous, my doubts would be instantly dispelled by a glance at the exhibition in the adjoining room. I shall not therefore waste time in dilating upon the capabilities of the soil of California, and the wondrous adaptation of its mild and genial climate to Agricultural pursuits. Messrs. Warren & Son have furnished you with a more convincing argument in this respect than any I could adduce.

And now, since we have made some little progress in Agriculture, I repeat the question—What interest does California feel in the subject, and what does she propose to accomplish in relation to it? Be assured the question is a grave one, and the answer should be well considered. But, whatever the answer may be, one thing is evident—to wit, that no people under Heaven ever had such inducements as we of California to embrace and cherish agriculture as an art—to lavish our best gifts upon the farmer—to elevate and dignify his vocation. We are prompted to this course by an all-powerful principle of self-interest, appealing directly to our pockets. Instead of paying our money to the farmers and speculators of New York and Virginia, let us pay it to our own, who will furnish us a better and a cheaper article. But there are yet higher and nobler motives to impel us to this course. We are but the pioneers of a high state of civilization on the shores of the Pacific. We are laying the foundations of a great empire, under circumstances peculiarly auspicious; and every principle of patriotism or of pride appeals to us—the great cause of human freedom and progress beseeches us—Christianity implores, and the voice of more than twenty millions of our countrymen demands that the work be not imperfectly done. Favored as we are by Providence, with a soil of boundless fertility, with a territory on this coast of immense extent—with a climate genial, healthful and temperate—with mines of almost fabulous wealth—with a population intelligent, sagacious and enterprising, and with republican institutions, wisely modelled to confer the the greatest good upon the greatest number—if we fail in our mission, we shall incur the just reproaches of the whole civilized world. But if we would achieve a solid and permanent success, we must not rely alone upon our mines, however rich. We must build school houses and churches, and thereby educate and elevate the masses. We must build clipper ships and ocean steamers, so that the wings of our commerce will whiten the bosom of the broad Pacific, and cluster around its beautiful isles; and above all, we must cherish as a priceless gem, the divine art of agriculture; we must cause our beautiful valleys and plains, to blossom as the rose, and our sturdy farmers to feel, that we esteem them as salt of the earth. If in these respects, we perform our duty faithfully, the gold mines of California will soon cease to be its chief attraction. Merchants will gather here from all quarters of the world, to share the opulence of our commerce, and farmers, with their honest, jocund faces, will come in crowds, to subdue our virgin soil. The man of fortune and of leisure will come, attracted by our genial, healthful climate; and with all these will come the minister, the schoolmaster, the artisan, the man of letters, and all others who, by their genius and acquirements, contribute to a state of the highest civilization. Great cities will spring up at our chief commercial points; our ports will be crowded with the shipping of all nations; and our valleys and plains will be dotted with orchards and country mansions, and smiling gardens. When all this is done, we shall have performed our duty, and California will have accomplished her destiny. Those of us who shall live to see it accomplished, will then exclaim in the very apposite language of Cowper, as we point to Telegraph Hill—

> How oft upon yon eminence, our pace
> Has slackened to a pause, and we have borne
> The rustling wind, scarce conscious that it blew,
> While admiration, feeding at the eye,
> And still unsated, dwelt upon the scene.

How I Saved my Currants.—Returning home after an absence of a couple of years, some four years since, I found my currant bushes, which were in rows on the outside of my garden, overgrown with witch grass, and was informed by my better-half that she could not welcome my return with a glass of currant-juice, as her bushes had yielded but a very few currants the season past. I could not thjnk of losing them, as I was too fond of their fruit and besides, they had cost me much labor. Digging them up and rooting out all the grass was too great a task, therefore I thought I would try and smother it out. I covered the earth aronnd them to the depth of two or three inches with tan bark, putting some half dozen shovelsful in to the centre of each bush. It operated to a charm; the grass was exterminated, and the next season I spaded in the tan bark and since then my bushes have yielded bountifully. I am satisfied that vegetable dressing is equally as good, if not better, for trees and shrubbery than barn-yard manure which I save for field dressing.—*Maine Farmer.*

Benefit of Railroads to Farmers.—At the average price of the last twenty years, a quantity of corn is estimated to be worth [illegible] bushels of wheat, while 17[illegible] miles from market, where the same distance [illegible] of corn would be worth $22 50. A ton of [illegible] would be worth [illegible] by railroad it would be worth $[illegible].

"Wise[illegible]

AGENTS FOR CALIFORNIA FARMER.

Messrs Adams & Co., at all their offices throughout the United States or Europe.

Messrs. Wells, Fargo & Co., at their offices throughout the Country.

San Francisco—Messrs. Murray & Co., booksellers, Montgomery street; Sullivan's newspaper stand, near the Post Office; Kimball's, Noisy Carriers Hall, Long wharf; J. H. Still, bookseller, Montgomery street.

Oakland—Mr. Isaac Willard.

Benicia, Martinez, &c.—Messrs. Stiles & Dodds.

Union City and Mission San Jose—Messrs. Howard & Chamberlain.

San Luis Obispo—Dr. Thomas L. Harvey, P. M.

Sacramento—Mr. Oscar D. Aveline; Messrs. Carle Brothers.

Union, Humboldt Bay—A. H. Murdoch, P. M.

Mount Farm, O. T.—Gen. M. M. McCarver.

Marysville—Geo. S. Booker.

Stockton—Rosenbaum & Joackimsen.

New York City, N. Y.—J. M. Thorburn & Co.

N. B.—We want Agents in all the principal localities, and persons disposed to act can have the opportunity, if satisfactory to all parties.

To the Friends of Agriculture.

We ask of all to whom we send this number, who are not already subscribers, to examine the Farmer, and to give it their influence. We trust to hear from them and to know that they will not only become subscribers to our Journal, but favor us with their communications. We desire to call their attention to our terms of subscription for clubs.

Special Premiums for Subscriptions.

In addition to the standing inducement for the getting of subscribers for the "Farmer," we will make a present of HARPER'S ILLUSTRATED FAMILY BIBLE to the person who procures the most Subscribers in the first six months of our publication. This we regard as one of the most beautiful books ever issued. Who will have the prize?

A Premium---Farmers' Clubs.

With the hope of inducing such of our friends, and those who have a little leisure, to ride among their neighbors and introduce an Agricultural Paper, we take pleasure in offering the CALIFORNIA FARMER: and, to make it an inducement, we say to such friends—if you will get us five subscribers, and remit the amount, we will send you Six papers, or for ten subscribers, twelve papers. We trust there are many friends who will cheerfully take a little pains to aid us, and thus extend the circulation of the Farmer, and make a useful vehicle for the Agriculture of California.

Subscribers will please be particular to name the Post Office to which papers are to be sent; or, if forwarded by express, which line they prefer.

To Our Patrons.

To Advertisers.—We would call the attention of those who desire to have their advertisements produce quick returns, to the pages of the California Farmer.

The Farmer will reach sources of trade entirely new and unattainable by any other means, and thus secure a large and immediate profit to those who desire to make known their business. By a glance at our advertising columns, it will be perceived that we present the best known and most extensive houses, and as we have space for but one or two of each branch, these will be the most prominent houses, and thus give more influence to them.

Agents Wanted.

We want good active agents to visit every county in the State for the Farmer. Young men can find a steady and profitable employment. Apply at this office.

☞ We desire Agents to report as early as possible, that we may be prepared in our issues for a sufficient number to supply the demand. Be sure and report promptly.

Sacramento the Capital of California. This question, so long under debate, may now be considered as settled. By a vote of the Senate, 13 to 11, it was resolved to that effect, and we doubt not the Assembly will cheerfully concur.

We rejoice at this: we believe great good will be accomplished by it. A greater degree of convenience and comfort to Legislators will ensure more speedy legislation, and thus shorten sessions, —less expense to the State, less taxes upon the people, and more satisfaction generally.

There can be no question that Sacramento is by far the best located, and possessing more facilities for intercommunication with all parts of the State readily, by telegraph, steam and stage, than any other. The general quiet comfort, and the increased benefits of an enlarged society will have their influence to remind every member of the Legislature and every officer of the Government, that they are the people's representatives, and that the people will hold them to a strict account for the manner in which they make and execute the laws.

Sugar Cane.—We were pleased the other day to see on the deck of the steamer Union, some very fine samples of Sugar Cane, marked, for San Jose, to an active agriculturalist. We are confident of success to this important staple, and if more attention is given to it, we shall soon save the amount of gold that is sent to the Islands and China for sugar and syrups, and our own State will receive the benefit of home productions.

Col. Crockett's Lecture.—We would especially commend the most able address of Col. J. B. Crockett, which is concluded in this number of the Farmer. This lecture should be read and preserved, and we hope the friends of Agriculture will preserve not only this lecture but the entire course of four, which have been published in the Farmer.

Fire at Sacramento.—A fire broke out, on Saturday last, in a frame building on K street, between 7th and 8th, occupied and used by Miller & Dixon as a camphene manufactory, and as a mill for grinding feed. In a very few minutes the entire establishment was consumed. The loss amounted to about $3,000, nearly all of which falls upon Messrs. Miller & Dixon.

Mining Intelligence.

By reference to the correspondence from Cherokee Flat, says the State Journal, it will be seen that the new discovery of a rich quartz lead at that place is confirmed in all its extravagance. We have conversed with several gentlemen from Cherokee, and they all agree in the statement that this new discovery is the richest ever made in the State; and when the company now engaged in working it have succeeded in procuring machinery such as will relieve the shaft they have sunk from the abundance of water, we are confident that the yield will astonish gold hunters in all sections of the State. The water, as stated by our correspondent, rushes in with such force that no means now in possession of the claimants will be sufficient to keep it out, and the claim has consequently locked up. From an assay of the quartz rock sent to San Francisco, and subjected to the test of an amalgamation by Messrs. Kellogg & Richter, we learn the yield was much greater even than was expected. "The quantity," says the assayer, "was very good; gold was visible to the naked eye." Attempts have been made to purchase this claim, but so far without success. We shall take occasion probably to visit the scene of this new discovery, to inspect its untold wealth. Other discoveries have been made in the same neighborhood, and create some excitement.

The following is a portion of the correspondence referred to above. It is dated Angel's Camp, February 17, 1854:

"The Cherokee Quartz claim is proving even richer than was expected. The original shaft caved in, and another shaft was sunk some 25 feet distant, and carefully curbed as they went down. The vein was again struck upon, about 2 1-2 feet below the surface, and with much difficulty the shaft was sunk 28 feet; at this depth a cross vein was found, cutting the original vein at an angle of about 15 degrees. This new vein is much the largest, and is rich beyond description. Three thousand dollars was taken out in one afternoon, but it is almost impossible to work it any further, until steam pumps are used to free it from water."

News from the South.—By the arrival of the Southerner, Hilliard commander, we have later intelligence from Lower California, and the Southern portions of this State.

The Southerner left the Columbus at San Diego, where she had arrived from Ensenada, with the sick and wounded of the Fillibustering army. Walker had gone South with 150 men. Prior to his departure, however, he spiked all the guns that he was unable to transport, and drove off all his sheep and cattle.

Mellendrez, the California outlaw Chieftain, had raised a force of 350 men, about 90 miles South of Ensenada, and it is said, stands ready to attack Walker upon the first favorable opportunity.

Lieut. Ball, of the Portsmouth, has the flag of the Fillibusters in his possession.

Col. Gilman, who was so seriously wounded in the seige of Ensenada, came up on the Southerner, also Lieut. Ruddach, who was wounded in a duel with Major Cracker.

Lieut. Beal, U. S. Indian Agent for California, also arrived on the Southerner.

We take the following in relation to the Gold Fields, from the Los Angeles Star.

There are three companies, embracing twenty-seven persons, who are now engaged in turning the water upon the placers. They are in treaty with Senor Duarte for the purchase of the land for the location of a town. These companies are composed of old miners, and they are sanguine as to the golden prospect. Aside from these companies, there are some forty persons prospecting in different places. It is proper to state that persons have returned to town who report that there is no gold there worth digging; and that there is nothing in the confirmation of the land which indicates the abundance of it. A few weeks will settle the question. The excitement in town is very much allayed.

The Great Printing Invention.—The correspondence of the Times thus describes a new printing machine in the Great Exhibition at New York. The machine "is a new printing press, which prints from uncut paper, rolling from a cylinder, and cuts and folds with a perfect regularity 30,000 copies per hour. There is no counteraction in the process, and consequently no time lost in returning motion. Both sides are printed at the same time, and 30,000 per hour is a low estimate, since by increasing the speed they can be printed as fast as paper or cloth can be unrolled from a cylinder. The inventor declares that he can print one mile of a newspaper as fast as a locomotive can run on a railway. With perfect machinery and arrangements he may do it. His present experiments demonstrate a practical principle, and the invention is looked upon with wonder and delight. I shall describe this invention hereafter in detail."

Natural Laws.—The late census developed many curious facts. In regard to the numerical laws which govern the sexes, it showed that there are more males than females born, by about four per cent.; at twenty years of age there are more females than males; at forty years, the balance is again in favor of the males; and at the age of three-score years and ten, the numbers of the two sexes are about even. Beyond this age, the probabilities of longevity are much greater in favor of women than of men. At the time of the taking of the census, there were 430 American women above 100 years of age.

Loss of Steamship San Francisco.—No week passes without being called upon to record the loss of some noble steamer or clipper. There seems to be a current of fatality attending our coast and vessels connected with us within the last few months. Calamities appear to run in veins or currents, the same as diseases, and of late they have been as fatal as the cholera. The San Francisco left New York on the 23d December, with 700 to 800 passengers. After a few days at sea and of continued gales, this steamer became a wreck and was abandoned in a sinking condition.

The loss of this steamer is a terrible calamity; not only the loss of a costly and beautiful vessel but nearly two hundred persons were swept from her deck or perished by exposure. Most fortunately several vessels were spoken, which came to their aid and rescue, and to whom too much credit cannot be awarded for their humanity.

The following data gives the number saved by each vessel: Saved by bark Kilby, 100; by the Three Bells, 230; by the Antarctic, 200. Total saved 530. Number lost 170. There is every reason to fear the number was greater. The steamer was insured for $300,000 in New York, which covers her value. But who can estimate the amount of sorrow and grief this calamity has entailed upon those thus bereft.

Congressional—California Land Claims. Mr. Latham, of this State, from the committee on public lands, reported a bill extending until March, 1855, the act to ascertain and settle private land claims in California. He said the commission was appointed in the spring of 1851, but was not organized till January, 1852. Between 800 and 900 claims have been filed, embracing a million acres of land in California. The commission have disposed of about 300 cases, and about 200 cases have been argued and submitted to the Board, but remain undecided. It was desirable the bill should be passed at once, to prevent loss to the government and to claimants. The bill was passed.

Magnificent Steamboat.—The Louisville Journal says that the materials, timbers, engines, and joining work and everything complete of the most magnificent and costly steamboat ever built in the west, was recently shipped from New Albany to New Orleans. She is designed for a packet on the Sacramento river. The Journal says she will surpass in magnificence and speed the now celebrated Mississippi river steamboat "Eclipse." We understand she is to be the property of the proprietors of the fine steamer J. Bragdon, now commanded by T. J. Lyles, Esq., one of the most popular captains in the trade between this port and Sacramento. This great steamer was shipped from New Orleans for this port on the 9th of January,

Riches of the Amazon Valley.—The New York Chronica, a Spanish paper, contains an interesting letter from a correspondent in Chaycapoyas, South America, descriptive of the mineral wealth in the valley of the Amazon, founded upon the personal observation of the author. We have had reports that expeditions were organizing in California to seek for gold in this valley. The writer says that after passing the village of Balzns, the first in the Amazon valley, he came to the settlement of Gallon. Here he found more than sixty gold mines, none of which are worked at the present day, and having made several diggings, he obtained n "castellmno" of gold to the "carga." In the village of St. Thomas, twelve leagues to the eastward of Chaychapoyas, he found an immunerable number of veins of gold, only a few of which are worked by the lazy, shiftless Indians of the country. The hill of Sucahala, six leagues to the south of Chaychapoyas, is traversed by a very rich veins of silver. One of these veins, about four inches in width and more than two leagues in length, was estimated to be twice as rich as those of Cerro de Pasco and Potosi. The opening of this hill would doubtless lead to the attainment of immense riches; a thousand miners could work here upon their respective properties without molesting each other. Rich quicksilver mines also abounded in the immediate vicinity.

The writer tells some remarkable stories about the gold washings of Borja, a place about one hundred miles from Chaychapoyas. He says that on the insurrection of the Borja Indians, about fourteen years ago, Col. D. D. Najar started with a small force to chastise the rebels. He was unsuccessful, however, in his endeavors to find them, and being tired of his fruitless labors, was about returning, when he bethought him of the fame of these gold deposits, and ordered one of his soldiers to gather a small quantity of sand, and what what was his surprise to discover that more than one-half of it was pure gold! When the Indians of Borja were in a semi-civilized state, they paid their taxes in gold, having a measure for that purpose, and the surplus they threw into the river. From the river Chinchilpe to Barranca, about one hundred leagues, gold is found all along the shores in various quantities, but more particularly in the stagnant pools and on the small islands, when a knife was given in exchange for a handful of gold dust.

At the present time the great washings are occupied by the Huambisas tribes, a warlike race, who have descended from the higher valleys of the Amazon. They are extremely agile, tall and well formed, and support themselves by fishing, hunting, and the cultivation of the soil. They possess one hill, says the writer, which contains more than one hundred rich veins of gold.

The Habeas Corpus Act.—The recent riot at the Mercantile Hotel on Pacific wharf, the arrest of the rioters by our active police, and their illegal discharge under a miscalled "habeas corpus act," has excited this community to a state of feeling bordering upon civil war.

We are glad to see the unanimity with which this stretch of power has been condemned by the Press and by every good citizen. If allowed to pass unrebuked, our Government is at an end and we must expect to see the re-organization of the Vigilance Committee and their immediate action, in order that life and property may be protected.

We publish the following card from the Police officers; it speaks for itself:

To His Honor Mayor Garrison:

The Police Officers of this city deem this a fitting opportunity to express, in plain terms, their feelings in regard to the late disgraceful riot. Ever since the organization of a Police force in his city, most of the actors in the late disturbance, and men of their calibre, have been a greater source of annoyance to that corps and the public, than all the other law-breaking populace put together. True, they have often been made to pay small fines, and as often bled their peculiar friends; but when a heavy fine has been imposed, the cases have been appealed, and the courts and attornies in the upper spheres seem to have been mesmerized into quiet slumbers by the same peculiar friends of the mulcted.

The public and their officers have been set at defiance. Is it to be wondered at, then, if the Police, after having been beaten, abused, and struggling with drunken ruffians, should feel incensed at the conduct of Judge Wells in unlocking their prison doors at midnight, to turn them out upon an unguarded community? Whilst Policemen must stand by with folded arms, and meekly receive the scoff, the jeers and threats of deadly vengeance of midnight brawlers?

If they afterwards see that midnight *habeas corpus* Judge imbibing in a dram-shop, festooned with the released rioters and grog-shop politicians, and listen to his Honor assert with an oath, "That he would not allow four or five rascally, thieving Policemen, to arrest men, and keep them confined all night; that he had the power, and by G—d he meant to use it;" is it strange if they afterwards did not wish to appear before his Honor to give evidence, and probably be made puppets in a "solemn farce."

The Police appeal to your Honor, the Public and the Press. They are, and ever have been, willing to do their duty. They ask your Honor and the people to stand by them. They have sworn to support and try and execute the laws, and if sustained they will yet triumph, despite the jackalls of party, the self-styled "election makers."

Very respectfully, your obedient servants,

Capt. Hampton North,	Corns. H. Murphy,
Asst. Capt. B. B. Monks,	Michael Dolen,
Andrew Mackenzie,	G. W. Johnson,
Michael Kenny,	Sam'l Black,

B. SEGUINE, City Marshal.

San Francisco, February 20, 1854.

Destructive Fire.—After an interim of several weeks, during which our ever active and vigilant Fire Department have had little else to do besides burnishing up their pet machines and taking an occasional rush at a false alarm, they were in reality called out, and to some purpose, on Monday morning at two o'clock, at an alarm proceeding from Kearny street, and which soon proved to be a fire making a formidable, alarming appearance, and which at first threatened to carry destruction to a large amount of property. The fire occurred in a small one story building on the east side of Kearny street, between Pine and California, and no sooner had the flames enveloped the building than there was a general moving of furniture in the neighborhood, under the supposition that so inflammable a section of the city must certainly be consumed. The promptitude manifested by the Department in getting to the spot was most surprising, and though two of the adjoining buildings were somewhat injured, the flames were not allowed to spread beyond these. The house was occupied by Mr. Miller as a feed and grain store, and the basement was used as a mattress-making establishment. What remained of the building after the fire was extinguished, was torn down. A saddler's shop and that of a tinman adjoining, with the stock, was considerably injured. The Cafe de Bruxelles was also somewhat injured.—Com. Adv.

Honors to Maj. Gen. Wool.—The following resolution was received from the Board of Assistant Aldermen and passed unanimously by the Board of Aldermen:

Whereas, We have learned with much pleasure of the arrival in this city of our distinguished fellow-citizen, Major General John E. Wool, of the U. S. Army, therefore,

Resolved, (the Board of Aldermen concurring,) That in consideration of the eminent services rendered his country by Major General Wool, and of his private worth, that the freedom of the city of San Francisco be tendered to him, and that he be invited to use the Council Chamber on Wednesday afternoon, the 22d inst, in which to receive the visits of his fellow-citizens; and that a committee of two from each Board, together with his Honor the Mayor, be appointed to convey Gen. Wool the wishes of the Council.

Board of U. S. Land Commissioners.

Tuesday, Feb. 21, 1854.

The Board of U. S. Land Commissioners met this morning, and transacted the following business: Opinions were read in eight cases. Four claims were confirmed and four rejected. The following were confirmed, viz.:

By Commissioner T. Campbell—

No. 152—Claim of Juan Malarin, to rancho called "Guadalupe," and "Llaitos de los Correos" in Monterey county, two square leagues.

No. 154—Same to rancho "Chualar" in Monterey county, two square leagues.

No. 151—Same to rancho "Zanjones" in Monterey county, one and a half square leagues.

No. 510—Claim of Jose Dolores Ortega, to "Canada de Corral," in Santa Barbara county, two square leagues.

Opinions rejecting the following claims were read

By Commissioner A. Felch—

No. 89—Claim of James Morehead, administrator, &c., of Wm. Knight, to "Carmel" on the borders of the river Sacramento, ten square leagues.

No. 169—Claim of Silvestre de la Portilla to "Valle de San Jose," San Diego county, four square leagues more or less.

By Commissioner Campbell—

No. 452—Claim of Francisco Ma Alvarado, to "Dos Pennasquitos, in San Diego county, two square leagues more or less.

No. 169—Claim of Samuel Stokes to Rancho "de los Veigelos," formerly called "de Enmedio" and "Canada de Cecada" in Monterey county, to two square leagues.

Commissioner Thompson was absent from the session. The Board adjourned till Tuesday next 28th inst.

AMERICAN CITIZENSHIP.—A bill has been reported in the U. S. House of Representatives, from the committee on the judiciary, to secure the rights of citizenship to the children of citizens born out of the limits of the United States. The bill provides that children whose fathers were citizens at the time of their birth, shall be regarded citizens; and further, that when a woman not a citizen, is married to a citizen, she shall be deemed to be a citizen. The bill was passed by the House without opposition.

MARKET REPORTS.

San Francisco, Feb. 22, 1854.

We are cheered by hope of better things ahead—the rains have given encouragement to the Cultivators, and thus induced a little stir in trade—and were it not for the continued influx of merchandise by new arrivals, we should assert a certainty of permanent improvement.

All kinds of Grain are dull. Potatoes hang heavy, owing to the immense quantities stored and coming in by contract. We however have faith to believe the farmers will receive a remunerating price yet. Onions have advanced.

We repeat our remarks of last week relative to prices. They are merely at nominal rates. Sales are made to meet an emergency and without regard to market rates or value of the goods.

Perseverance, energy, and will to conquer and overcome all difficulties that depress trade will soon put things better.

MARRIED.

In this city, on the 16th inst., by the Rev. T Dwight Hunt, Mr. Stephen Jamison, of Ohio, Placer county, and Miss Anna Smith, both formerly of Philadelphia.

In Sacramento, Feb. 14th, by the Rev. J. A. Benton, Mr. Alonzo McCloud and Miss Mary A. Sullivan, both of Stockton.

At Prairie City, Feb. 14th, by Squire McDaniel, Mr. H. F. Kellum and Miss Sarah J. French.

In Polk county, O. T., Jan. 15th, Mr. John T. Doyle and Miss Lavinia C. Ford.

At Olympia, O. T., Feb. 3d, Mr. John P. Lecky and Mrs. Julia Tynon.

At Olympia, O. T., Feb. 6th, Mr. A. J. Chambers and Miss Margaret White.

DIED.

In this city, Feb. 17th, Thomas Van Dyk, aged 20 years, son of Francis Van Dyk, of Brooklyn, King's co., N. Y.

In this city, 19th inst., of dropsy, Patrick Garner, a native of Ireland, aged 36 years.

On board British ship Dalirada, Dec. 11th, on her voyage from Liverpool, Mrs. Susan Scott, wife of the captain, a native of Liverpool, aged 28 years.

At his residence, on Mason street, of apoplexy, John S. Shuler, M. D., aged 60 years.

In this city, on the 20th inst., B. Wookey Rodgers, Jr., late of New York city, aged 30 years.

On the Santiam, Marion county, O. T. January 27th, Henry Evans, aged 23 years.

OBITUARY.

On Friday, Feb. 10, after an illness of only three days, Louis, son of Col. J. E. Zabrisbie, of Sacramento City, aged 1 year.

Death is always unwelcome, even to those in years; for the human heart is rarely so tried and afflicted as not to have something to live for, even in its latest years. But when death comes suddenly, and strikes the lovely child just in its early morn, where it lays upon its mother's breast, like a beautiful bud nestling in rosy health upon its parent stem—when death comes thus, it may well be called the "King of Terrors." A beautiful little child of about a year old, whom we saw but a week since, joyous in its happy life of innocence, we met again; but where, and how? There it lay upon its mother's bed, pale, cold and lifeless: the destroyer had touched it, and the vital spark had fled. It was beautiful even in death—too beautiful to lay in the cold ground. Its clustering ringlets; its full and transparent face; its rosy lips, had not the impress of death, and yet the heart had ceased to beat, the angel of death had done its work, and its bright spirit had been caught up to a brighter world. There it lay, all that was left of it. In its little hand was a tender rose bud, an emblem of its own earthly condition, the "bud broken from its parent branch." We saw it leave its brief home, and we heard the sands fall upon its coffin—"earth to earth, and dust to dust"—we saw sweet flowers planted upon its grave; and we believe, dark as is the bereavement to its fond parents and kindred, the grave where their beautiful child has been laid is but the portals for its entrance to a better world. Our heart's deepest sympathies are all we can tender to the bereaved. We feel, for we have been alike bereaved by the same cruel blow.

SHIPPING INTELLIGENCE.

PORT OF SAN FRANCISCO

ARRIVALS.

Wanted.

A [illegible]

NOT THE ONLY ONE!

ANOTHER MAN IS IN THE FIELD

Prepared to cut Quartz Rock into any form desired.

I will say to my friends and the public generally that I am prepared to work into any form they may desire, Quartz Rock, WITH A POLISH EQUAL TO THAT OF A MIRROR.

N. B.—Quartz Rock purchased at the highest prices.

J. W. TUCKER,
125 Montgomery street.

There are Three Things I Do Not Do!

1st. I do not get a gentleman to leave his Watch, and when he calls for it, charge him TWENTY-NINE DOLLARS for cleaning it, and have it stop two hours after.

2d. I do not ask FIFTY DOLLARS for a chain, and sell it for THIRTY SIX DOLLARS, and warrant it Fine Gold, when it is filled with brass solder, and have to take it back and pay FIFTY DOLLARS in money, and give another chain.

3. I do not tell a Captain he can leave his Chronometer gratis, and when he calls for it at the end of eight months, refuse to deliver him up his property, without he pays me SIXTY-FIVE DOLLARS, and TEN DOLLARS more for rating it.

There are many other things I do not do, which I may name at some other time. 1 4t J. W. TUCKER.

GEMS FOR THE PARLOR AND GEMS FOR THE GARDEN.

THE choicest Hyacinths, Tulips, Jonquils, etc., for the parlo and garden.

Also—New and rare Flower Seeds and Plants;
Small ornamental Plants for borders.
Osage Orange Plants, for GARDEN HEDGES, one of the safest and most ornamental hedges known.

Just received at WARREN & SON'S
1 Exhibition Hall

WANTED—At the general Agency and Intelligence office, No. 87 Long wharf, 3d door below Sansome street, up stairs.

Houses, Farms, Lots for sale or to Rent.

Merchants, Farmers, Mechanics, Hotel Keepers, and Private Families supplied with help at the shortest notice.

Merchants' clerks, laborers and servants can find immediate employment by applying as above.

Money loaned on securities, personal and real estate.

T. H. PERKINS,

P. S. Particular attention paid to furnishing Farmers with help immediately upon receiving their orders. And in writing to us they will please specify the exact kind of help required, and the wages. Address T. H. PERKINS & Co.

Intelligence Office,
2 4t 87 Long wharf.

WASHINGTON STEAM MILLS.

WASHINGTON FLOUR MILLS.

THE undersigned proprietor of the Washington Flouring Mills take pleasure in offering to families and the trade, Superior Family Flour. To our Mills, we are happy to say to our friends, was awarded the Silver Medal; and we shall be always striving to maintain for it a high reputation, so that our customers can send to us in confidence, believing they will receive the highest character of Flour the market affords.

In the same establishment we have extensive STEAM SAW MILLS, capable of performing every kind of work that may be desired, and to this branch of our business we invite the attention of the public. We have also STEAM PLANING MILLS, that will finish all kinds of work in the most workmanlike manner, and equal to anything performed in the country, and in the most prompt manner to order.

We invite all who are contracting work, to call on us and examine our Mills, and we can satisfy them of our ability to supply every order in each branch of our extensive establishment.

D. W. VANCOURT, Proprietor.
1 Near the Oriental.

Catalogue of Fruit and Fruit Trees.

WE call the attention of Nurserymen and Orchardists to a new catalogue just issued by us, prepared with great labor and cost, giving the lists of the best fruits cultivated in Europe or America, with their synonyms. This catalogue embraces also lists of best Vegetables, Ornamental Trees, Flowering Plants, Seeds, &c.—being a perfect illustration of the best varieties of everything belonging to AGRICULTURE, HORTICULTURE, and FLORICULTURE, with brief directions for the cultivators in each department, and as *adapted to California*.

This work will be found a very great help to all engaged in cultivation.

Price $1 per copy. WARREN & SON,
Nurserymen, Seedsmen, and Florists.
5 Musical Hall Buildings.

POLLEY & CO.,

OF THE BAY STATE MILLS, would announce that for the better accommodation of their numerous customers and trade in general, that they have opened a branch of their business at the Fire Proof Store No. 49 K street, between Second and Third, where they will always keep on hand a large stock of California FLOUR; also, Hecall and Gallego.

Particular attention is particularly directed to the "BAY STATE LOWER MILLS' BRAND," an article we have every confidence in warranting, being made under our own inspection, from new Wheat, without any adulteration.

Ground feed of all kinds always on hand.

Every exertion will be used to merit a continuance of the favor hereto[illegible] so liberally extended to us. 1 3t

VOLUNTEERS WANTED!

TO THE GREAT SALE OF

JEWELRY AT JOHN W. TUCKER'S.

I shall now commence selling off my entire stock, consisting of DIAMOND WORK, WATCHES, JEWELRY, SILVER WARE, etc., etc.

Amounting to more than $300,000!

I have got to sell the above goods before the first of June, as I have to rebuild my store according to the new grade. Any person who wants a good article can procure the same

Cheaper than in any other City in the World!

But I don't wish it to be understood that I pretend to compete with those worthless trash,—persons who would not hesitate to guarantee a brass ring or a watch to be pure gold—these persons can find lower rates than I can. If I sell an article of any kind, and it does not turn out as I represented it, I will return the money. So [illegible] my store, and see me before you purchase elsewhere.

JOHN W. TUCKER,
1 1m 125 Montgomery street, near Sacramento.

For the California Farmer.

"WEEP NOT FOR THE DEAD."

Oh, weep not for the dead—for them no tears be given—
The paths of peace they tread—their footsteps wend to Heaven;
Their earthly journey o'er, their weary task is done—
For them no trouble more, or pain, or toil, shall come.

Then weep not for the dead—or, if to weep ye must,
Then be it for the head, by guilt, bowed down to dust;
For those by death passed by, who vainly seek for rest—
Who cannot, dare not die, by weight of crime opprest;

For those of hope bereft—by those they love forsaken—
Who, by God's spirit left, no warning may awaken—
Who blindly yield to sin,—from Heaven's portal driven—
Nor feel remorse within;—*for these* let tears be given.

For those who linger here, earth's pain and sorrow knowing,
Earth's yearnings and its fears, their feeble purpose showing—
Who still their frail barks steer, o'er life's tempestuous sea;—
If thou *must* drop a tear, for *such* then let it be.

But oh! for one so fair, so early from us taken,
Before corroding care had her young spirit shaken,—
Whose guileless, loving soul hath winged its way to Heaven—
Let no bell's mournful toll, no selfish sigh, be given.

Her pilgrimage is o'er, life's weary pathway trod,—
For her, oh weep no more—she rests in peace with God;
Rather rejoice, that she is ta'en,—with Him to dwell—
To join the jubilee, that angel voices swell.

To light our dreary way, our souls from sin to wean—
Point out that star whose ray safe guides us down life's stream,
Our heavy hearts to cheer,—she unto us was given—
For this He sent her here, from His bright home in heaven.

Her loving mission o'er,—His purposes effected,—
Towards that better shore our storm-beat bark's directed;
Earth's guise no longer worn—put off, her mould of clay—
By sister angels borne, to Him she speeds her way.

Then dry your weeping eyes, no mournful sable wear—
That form which in earth lies, but hid a jewel rare;
And till that hour shall come, when we may with her dwell,
His will, not ours, be done, who "doeth all things well."

San Francisco, Cal. FRED G——.

A Boy.—A boy is the spirit of mischief embodied—a perfect tectotum—spinning round like a jenny, or tumbling heels over head. He must invariably go through the process of leaping over every chair which is within his reach, makes drum-heads of the doors, turns the tin pans into cymbals, takes the best knives out to dig worms for bait, and loses them; hunts up the molasses cask and leaves the molasses running; is boon companion to the sugar barrel, searches up all the pie and preserves left after supper, and eats them, goes to the apples, hides his old cap in order to wear his best one, cuts his boots accidentally if he wants a new pair, tears his clothes for fun, jumps into the puddles for fun, and for ditto cuts your furniture and tracks your carpets. He is romping, shouting, blustering, shouting, and in all but his best estate a terrible torment, especially to his sisters. He don't pretend to much until he is twelve; then the rage for frock coats and high dickies commences. At fourteen he is too big to split wood or go after water, and at the time these interesting offices ought to be performed, contrives to be invisible; whether concealed in the garret with some old worm-eaten novel for a companion, ensconced in the woodshed trying to learn legerdemain tricks, or bound off on an expedition that turns out in most cases to be more deplorable than explorable—to coin a word. At fifteen, he has a tolerable experience of the world—*but*, from fifteen to twenty, may we be clear from the track when he is in sight; he knows more than Washington and Benjamin Franklin together; in other words, he knows more then than he will ever know again.

The Bavarian Schottische.—The style o the Schottische is full of graceful positions, and has the combined beauties of the St. Vitus and Indian war dances, with a strong insinuation of an afflicted cat upon hot building materials. The most popular, elegant and, in fact, the only acknowledged fashion of executing the Scottische is this: As the music leads off, plunge suddenly forward, with four abrupt jerks of the hand to keep time, then as suddenly dart back again with the same jumps and jerks. Then stand on one leg, as much like a lame duck as you can, change quickly to the other, and hop round four times. In this you must take great care to lift up your legs, as if for instance something heavy had fallen on your soft corn at one time, or boiling cobbler's wax had been inserted in your boots. The effort is very pleasant to look at. Continue in this way anywhere in the room, but be certain to whirl your partner until you can see nothing distinctly, for you can never arrive at the full enjoyment of the Scottische until you reach this crisis. You then run a muck among the other Schottische until you experience a shock, which will be caused by a pair of teetotums; but never heed that. If you should by chance see another couple near you, which, however, will rarely happen, never stop to try to get out of the way, as that is directly contrary to the science and etiquette of the Scottische, but go on, and if a lady is floored (elegant and expressive) it is none of your business; if you are a large man, the amusement is much greater, as then, instead of your being knocked down every time by the concussions, it is greatly in your favor that the other party may be knocked down instead.

A negro had a severe attack of rheumatism, which finally settled in his foot. He bathed it, and rubbed it, and swathed it, but all to no purpose. Finally, tearing away the bandages, he stuck it out, and with a shake of his fist over it, exclaimed:

"Ache away, den, ole feller; ache away. I shan't do nuffin more for yer; dis chile ken stand it as long as you ken; so ache away!"

Nurserymen and Seedsmen,
Musical Hall Buildings, San Francisco, and 15 J street, Sacramento.

PEORIA PREMIUM STEEL PLOWS.
THE FORMER CELEBRITY OF THE PEORIA PREMIUM STEEL PLOWS, and the unequalled success of their introduction in this State, would seem to preclude the necessity of any further effort on our part to draw attention thereto: but in view of the transitory nature of business in general in California, and the probability that some may have looked upon our establishment of an extensive and permanent manufacture of Plows here, in the face of such enormous importations and extravagant prices of material, as an impossibility—we believe it expedient to adopt this method of bringing it within the special notice of all concerned, that we are now manufacturing, and will have ready for this season's demand, three thousand of the most superior Plows ever made or used within this State.
We feel warranted in making this assertion, from the fact that all who used our Plows last season testify that they were superior: and we have studied so closely the immediate wants of our patrons from every section of the State, that we can now furnish Plows suitable to any particular kind of soil known in the State.
Our material has all been selected in the East by one of our firm, and imported by us directly from the manufacturers, which places it in our power to say confidently that nothing is lacking in quality, while we are enabled to make the plows at a cost greatly below that of last season, and are determined to sell at prices within the reach of every farmer who may wish to use the Peoria Premium Steel Plow.
It should be remembered that these plows will do double the work with half the team required in using the ordinary cast Plow; and that the work, when done, will be well done.
For particulars of prices, and descriptions of plows, we refer you to the subjoined card. The prices therein detailed are those established at our factory, and the only alterations from them that we authorize our agents to make, is the addition of the cost of transportation to their places of business—thus placing the plows at every accessible point of the State for the exact price charged at the Factory, with the necessary expenses only added.
Farmers ordering our plows through mercantile houses here, would do well to write to us at the same time, if they would make sure of getting the right plow, for some are interested in representing that we are not making plows at all, while other will not sell our plows when they can get off a cast plow. We therefore recommend that orders should be sent to us directly, accompanied by an order upon your merchant for the amount, which you can always know by a reference to the card accompanying this circular.
On the 24th of June the interest of T. Adams in our business ceased, by the sale of his entire interest therein to L. E. Morgan. Aside from this, there has not, nor will there be, any alteration, as we have the same efficient and thoroughly practised hands in every department of our business.
E. L. MORGAN & CO., Successors to
T. ADAMS & CO.,
Corner of Broadway and Battery streets.

☞ The following are the establi-hed prices for the Peoria Premium Steel Plows, at our Factory, and the only addition our Agents are authorized to make thereto, is the cost of transportation to their points of business:

SIZE.	DESCRIPTION.	FURROW.	PRICE.
No. 5	plain	10 in	$ 30
5½	"	12 in	$ 35
6	"	14 in	$ 40

PROCLAMATION EXTRAORDINARY.
Woman's Rights
VINDICATED AND MAINTAINED.
WHEREAS, from the creation of the world, it was designed by the "Great First Cause" that
Womans's Rights and Privileges
should be co-equal to Man's; and whereas, she has been treated by many men in all ages, up to the present time, as an inferior being to themselves: Now, therefore, be it known that I, M. L. WINN, of
Winn's Fountain Head and Branch
having expended large sums of money at the FOUNTAIN HEAD for the gratification of the appetites of Gentlemen, do recommend that Woman hereafter allowed and provided with the facilities to enjoy all the privileges for which she was by Providence designed; and for this purpose I do hereby proclaim, that my
BRANCH,
Corner Montgomery and Washington streets,
shall be conducted with a view exclusively to the Enjoyment and Comfort of Ladies, and such Gentlemen as know and appreciate their worth.
At the earnest solicitation of many Ladies and Gentlemen and agreeable to my promise some months since to enlarge the BRANCH, so as to accommodate the fast increasing patronage I shall, in a few days, add Two Spacious Stores on Montgomery street, to the Original Branch, making the
MOST EXTENSIVE ICE CREAM
And Refreshment Establishments in California.
The day of opening will be duly announced through the medium of the Daily Press, so that all may witness what has been accomplished for the accommodation and comfort of "God's last best gift to man." In the meantime, lots of Fun and Jollification may be enjoyed in reading the mottoes and feasting upon the luxuries to be enjoyed at
WINN'S FOUNTAIN HEAD,
78 and 80 Long Wharf, and Branch, corner Washington and Montgomery streets;
where Every Thing for the Holidays may be found, from a Sugar Whistle to a Bride's Cake of half a ton.
M. L. WINN, Proprietor.

FAMILY FLOUR.
HORNER'S PREMIUM FLOUR.
UNION CITY MILLS.
WE INVITE the particular attention of Families and the Trade, to the quality of the Flour manufactured by us.
Our great aim has been, in the establishment of our Mills to procure the most perfect machinery, to employ the ablest millers, and to select the purest and finest wheat in the country.
That we have been able to accomplish all this, the Product of our Mills now before the community is the best evidence.
The FLOUR we manufacture has been submitted to the able judges of our State, and after the most rigid and thorough test, they have awarded to us the "Premium Prize," and we shall have offer the same as "Horner's Premium Flour;" it shall be our constant effort to maintain for it the reputation of being the
The Best Flour in the Land.
Orders left with HORNER & CO. at our Storeship, Broadway wharf, will receive prompt attention.
5 4t HORNER.

SUPERIOR FURNITURE.
THE largest and best stock in Sacramento may at all times be found at the Old Stand of B. P. & D. MOORE, No. 77 Third street, where they still persist in selling as much below their competitors as their superior facilities will admit of. Having on hand the most splendid and substantial assortment of all kinds of Furniture ever offered in Sacramento, we feel confident, with prices to suit, that none can go away empty that may favor us with a call.
Our stock consists of Bureaus, Secretaries, Wardrobes, Stands, Tables, Bedsteads, Lounges, Sofas, Painted Mahogany, Black Walnut, Satin and Rosewood Sets—some of the finest and cheapest ever offered in this market.
Also, Mattresses, of Curled Hair, Patent Felt, Moss, Wool, Straw, and Straw with Cotton Tops. Also, Feather Pillows, and Feathers for Beds, with a large stock of Quilts, Comforts, Sheets, Blankets, &c., &c. Also, a very large stock of Chairs, Wood, and Cane Seats of all descriptions: also, of Hair, Cloth, Spring, Plush, Velvet and Carpet Bottoms, with Rockers of all kinds; all of which will be sold at reduced rates.
5 4t Also at 130 Jackson street, San Francisco.

A CARD.
FREE EXHIBITION HALL.—We desire to announce, and we do so most respectfully, that hereafter, during our Exhibition, our Hall, containing all the magnificent specimens of the Agricultural Exhibition, together with the choice Paintings and Embroideries, and many rare and beautiful specimens and curiosities from the "Islands of the Sea," will be open to the visits of all who wish to examine them, FREE OF CHARGE.
We would also announce to Artists that our Hall is offered to them FREE, to exhibit their work for exhibition or sale, and we further announce to all persons who have Paintings, Statuary Works of Art, Curiosities, or extra specimens of anything of domestic manufacture, that here is a place the most appropriate for its exhibition or sale, and where the most extended notice can be given to it. All who have works of art, or any of the curiosities of the country, or wonderful specimen of the Agriculture of California or the Pacific coast, will find this Hall the most appropriate place for the exhibition of the same.
We desire also to state that all the Agricultural papers and periodicals of the United States and the principal publications of Europe upon the subjects of Agriculture, Horticulture, and Floriculture and other scientific subjects, and to our patrons, and to the cause of Science, they are ever open, and we tender our best aid to developing to the utmost of our power the good resulting from them.

THE CALIFORNIA FARMER

Any Journal of Useful Sciences.

VOL. 1. SAN FRANCISCO, THURSDAY, MARCH 2, 1854. NO. 9.

THE CALIFORNIA FARMER,
AND JOURNAL OF USEFUL SCIENCES,
PUBLISHED EVERY THURSDAY MORNING.
BY WARREN & SON.
Office in Musical Hall Building, Bush street.

TERMS.—Eight dollars per annum, in advance; four dollars for six months; or delivered by carrier at one dollar per month.

ADVERTISEMENTS.—A limited number of Advertisements will be inserted at the following rates: For one square of eight lines, per month, $6. For business notices of five lines or less, per month, $4. A slight reduction will be made to regular advertisers.

Trouble-the-House:

A LEGEND OF LIVONIA.

ONCE on a time there lived, in the province of Livonia, a certain peasant named Peter Letski. Peter had no relation that he knew of in this world except his mother. She and her husband had come from Courland long ago, when they were married; but the man died five-and-twenty years before the date of our story, and old Roskin and her son lived on in the cabin of pine logs he had built on the lands of the Boyar Nicklewitz. The Boyar took rank with the high and ancient nobility of Russia. His ancestors had fought against the Mongols and held office under Ivan the Terrible. They were said to have been rich; but little of their wealth had descended, for there was not a poorer estate, nor a more prudently supplied *hof*, in the province. Theodore Nicklewitz sowed his own hemp and rye, mowed his own meadows, and set a good example to the reapers in harvest time; while his wife and two daughters brewed quass, baked ryo loaves, preserved everything, from cranberries to caviare, against the winter, and spun with their maids great packs of yarn, for sale to the eastern merchants.

In short, there was work for man and maid at the hof; but the quass was always strong, the holidays were well kept there, and most of the peasants thought a seat in its great hall worth having when the snow lay deep in Livonia.—Somehow, Peter and his mother preferred the old cottage. It was built, as we have said, of pine logs, out of which were cut the door and window, the latter glazed, so to speak, with a sheet of thin mica; the roof was of wattles, overlaid a yard deep with turf and clay, and as green as a meadow in summer. Their property, besides a cow and a patch of ground, consisted of a loom, a stove, a spinning-wheel, and a chest, wherein were laid up the Sunday clothes which Peter's father had left him, and those which old Roskin inherited from her mother. They were free peasants of the old Germanic race, long settled in Courland. No boyar owned or maintained them, but Roskin was a noble spinner, and Peter had few equals at the spade, axe, or flail. Of schools Peter Letski was ignorant; books he had never seen, excepting in church; and the only education his mother gave him was: "My son, be honest, and trust in God."

Under that brief, but often repeated lesson, Peter grew up one of the best sons in the province. It was his fixed opinion that no woman on earth could equal his mother in knowledge, prudence, and housekeeping; besides, she had been friends, relations and all to him. Though poor, they had been happy together in the log cabin, whose rent, as well as that of the rye field, was paid in hard labor to the thrifty boyar. In summer and harvest time, Peter was bound to devote certain days to his fields; Roskin spun at the hof, in winter evenings; while her son made baskets, nets and shining tackle always getting as near as he could to the wheel turned by the pretty Niga, whose soft blue eyes and light golden hair had turned the heads of half the neighborhood. Like Peter, Niga was an only child, but death had taken her mother. Her father, honest Ivan, as the peasants called him, was a stout old boor, who hewed wood in summer in the forest, and in winter at the hof; he and his axe belonged to the boyar. Niga, of course, was a born serf, but old Roskin said she would make a good wife. Peter thought so too, and the hymeneal crowns of gilt paper kept in the neighboring church would have been required, but for a scheme of their common master. His old nurse had died some years before, leaving an unmarried daughter, for whom the boyar had promised to provide; and, to do him justice, he tried to find her a husband, but Ratinka had become so notable for tongue and temper throughout the parish, that neither serf nor freeman could be induced to take her for better or for worse, even with a promised portion of twenty silver roubles.

All his own serfs were unfortunately married; Theodore Nicklewitz had therefore fixed his eyes on Peter, as the only chance for Ratinka; and as neither he nor his mother liked to leave their old cottage, and they could not buy Niga's freedom, the young man was obliged to present himself one day before his lord in as respectful a manner as possible. While things remained in this state, a courier from St. Petersburgh arrived one day at the hof, bringing great intelligence. A younger brother of the boyar's father, who, having no estate, not liking the church, and still less the army, had degraded himself in the eyes of his relations so far as to become a corn merchant. Of course he was regarded as a blot in the escutcheon; no one spoke of him, even at Christmas; but the man lived long, gathered money, retired from business, and died in his country-house, near Riga, very old, rich, and intestate.

Theodore Nicklewitz was his nearest heir, and an honest lawyer (we are writing of old times) sent him word to come and take possession. It was an event in the boyar's life, for he had never been so far from home; but he sent for the priest, made his will, and took five stout men to guard him. Peter's master obtained his inheritance; but so much time was spent in proving himself the heir according to law, and in hunting up the old merchant's money where it lay in banks and bonds, that the corn was reaped and housed, the snow had fallen, the frost set in, and there was safe travelling over lake and river, before Theodore Nicklewitz, with the goods and chattels of that discarded relative, gathered together to the last rag, and packed on sundry sledges, drove home to his careful family.

Half his servants had been sent for to help him in this home-bringing, and among the rest Peter Letski. The sledge he drove was a borrowed one, and somewhat crazy, on which account it was placed under his care, for Peter had the reputation of being a prudent driver. For the same reason, the goods packed in it were the very gleanings of the merchant's country house—old coats, shattered crockery, and odds and ends of all sorts, which the boyar thought might be useful some day. Peter's horse was borrowed also, and lazy with long service. Vigilance and exertion on the driver's part were required to keep up to the rest of the company. Night had fallen on them while far from the end of their journey, but master and man went merrily on through the keen frost and clear starlight. They were bringing goods and money to the hof; the boyar would be a rich man now; the serfs looked for more liberal housekeeping: and Peter began to speculate on the probabilities of Ratinka's getting married. The old horse was going steadily; he pulled his wolf-skin cloak closer about him, and one dream maybe followed another through his brain till a suitor was found, Ratinka disposed of, and Niga and himself dancing at her wedding.

Here a sound, as of somebody stepping into his sledge among the rags and crockery, made Peter start up and open his eyes. No one was there—but he had been asleep and dreaming. The horse, left to its own discretion, had been distanced by the whole company. Peter couldn't hear a sound of the sledge-bells, but he knew they were not three versts from home, for on his right hand lay a ruined castle, where it was said, a covetous bishop had lived long ago, and oppressed the country by exacting tithes and dues, till the northern heathens took the castle and hanged him. Its roofless walls stood gray and lonely on the frozen plain. Peter urged his horse on, till they were fairly left behind; but, just as he pulled up his cloak once more, and settled himself to go home comfortably, a sharp, shrill voice at his very side said:

"That's a fine night, Peter Letski!"

"It is," said Peter, his hair beginning to rise, for he could see nobody. "Who are you?"

"They call me Trouble-the-house," replied the voice.

"It is an odd name, friend. Where did you come from?"

"Never mind where I came from," said the voice, in a still sharper tone. "I'm going home to the hof with you and the rest of this fine legacy."

Peter was frightened into silence by this statement; he would have jumped out, but the old horse suddenly quickened its pace to a full gallop, and the sledge flew over the snow so fast that the lights of the hof were in sight, and in a minute more, Peter was through the timber-gate and in the yard, where the rest of the company were rapidly unloading.

Every man, from the boyar downward, inquired what had frightened his horse, for the creature stood trembling. Peter didn't care to tell them; but there was no sledge in the yard more quickly emptied than his own. Nothing but the rags and the crockery could Peter see, though he thought there was a kind of rustle in the hay-straw as the last old pot came out, and a queer sound of stamping steps going in before them all to the great kitchen, where a supper, which surpassed even the serfs' expectations, awaited them.

There was no want of brown, and cabbage, and [illegible] at which poor old Ratinka's fashion matter and servants sat according to rank; but the supper did not go off so joyously as might have been anticipated. The youngest daughter broke a china bowl which had been in the family for fifty years—that upset the boyardeen; the boyar became so critical before the bottle of corn-brandy on his right was quite empty, that he found fault with everything said or done: and all agreed that Peter Letski did no justice to himself or the supper.

Peter lost no time in relating the cause of that unwonted neglect to his mother when safe in their own cottage; and after minute inquiries touching what he had to drink on the road, old Roskin said she had never heard of any such traveller in all the tales of Courland—one didn't know what might come home with an old corn-merchant's legacy. But her advice was, to keep the story between themselves till father Michael their priest should return from visiting his brother in Upper Lithuania, which would certainly take place before Christmas. His mother's advice was Peter's law. He went on thrashing, basket making, and sleeping, as in other winters; old Roskin, too, spun as usual at the hof, but the hof was not the place it had been. The industrious quiet had been broken to bring home that legacy, and could not be restored. The servants grumbled for stronger quass; the daughters repined for new dresses; the boyardeen grew closer than ever; and the boyar thought that every man was stealing. Then there were grand visitors, counts and barons, who came from leagues away, and had to be entertained in the great parlor, never before opened excepting for marriage-feasts. Among them came a certain Count Ratschoff, who would have married Theodore's eldest daughter, but that the boyar and he could never come to an understanding on the subject of her dowry. However the count had been in St. Petersburg seven years looking after a legacy which he did not get, and having some knowledge of the great world there, he undertook to instruct the whole house of Nicklewitz touching their dignity and interest.

Under his direction, the peasants were not permitted to speak in the old familiar forms to their betters; the kitchen was obliged to wait until the parlor had finished, and got only broken victuals; the rye bread was weighed, the quass was measured; and the boyar resolved to have Ratinka married without delay. His determination was signified the week before Christmas, when one evening after supper, Peter was summoned to the parlor door, to see his master seated in great state with his pipe, his tobacco box, and a quart cup in the shape of an eagle, filled to the brim with corn brandy, before him. Peter had never before beheld the splendors of that apartment. Its silver candlesticks, its walls covered with crimson leather, and its gilt ceiling, which shone on the wedding festivities of Theodore's great-grandfather, overwhelmed the Courland peasant, but his mind was relieved from the weight of its magnificence by his master demanding, "Peter Letski, when do you mean to marry Ratinka, my nurse's daughter? I will give her a portion of twenty silver roubles. Father Michael will be here in three days, and my will is, that you make ready for the wedding."

"Master," said Peter quietly, "it is my fear that Ratinka might not agree well with my mother."

"Your mother!" cried the boyar fiercely, for he had tried the brandy; "I'll have no such excuses. You either marry Ratinka or leave my land."

Peter had never seen the boyar so angry, and he stammered out in his confusion, "I knew how it would be when Trouble-the-house came after the legacy."

It so happened that Count Ratschoff, who sat drinking with the boyar, imagined and not without private reasons, that Peter was speaking of him, so with wrath in his eyes, and brandy in his brain, he made but one bound from the table to poor Peter, seized him by the collar of his sheep-skin, and kicked him out of the hof.

Though a free man, Peter was brought up in Livonia, and ran as fast as possible from the Count's boots.

The night was pitch dark, for moon and stars were hidden by a heavy mist, and when Peter thought of slackening his pace, neither the horse nor its dependencies could be seen. There was a red gleam on the plain before him, however—that he took to be the great [illegible] thought his mother's window. Old Roskin sat at her wheel that day, nursing the new-born, which had fallen sick and Peter had said [illegible] for her. He felt certain it would [illegible] to see the old cottage and she didn't [illegible] than herself; but she [illegible] to go home and [illegible] anyway.

The light guided him [illegible] the road but Peter never thought the way so long. He knocked [illegible]; the light [illegible] and [illegible] he [illegible] ment, rose from the bishop's ruined castle, at the entrance of which he found himself, while a dead horse and an upturned sledge lay close by on the snow.

Peter had a good conscience, but he was frightened to the heart when the same sharp shrill voice once more saluted him with—

"Peter Letski, that's a fine night!"

"Middling," said Peter. "Who are you?" as, looking in its direction, he saw a dwarfish old man—clothed in rags that had once been rich fur and velvet, and so thin that his bones seemed fleshless—straining and striving to raise the upturned sledge.

"I'm a brother of the traveller you took home with the corn-merchant's legacy," said the little old man.

"Are there many of you?" inquired Peter.

"A great family, and like to be greater," replied the dwarf. "Come and help me to raise this sledge."

"Is it yours?" said Peter, who would have helped anything; and between them the sledge was lifted, and he saw it was richly lined, and gaily painted.

"Everything is ours," cried the dwarf, thrusting his hand under the crimson cushion and drawing out a leathern money-bag. "Take this," he continued, clinking it at Peter's ear, "and I'll go home with you. What are you thinking of?"—as Peter held back both his hands. "This would buy the land your cottage stands on, and the boyar will be glad enough to sell it before my brother's done with him."

"I'm thinking how my mother would like it," says Peter.

"Your mother!" cries the dwarf, "what can she do for you and Niga?"

"She taught me to be honest and trust in God," said Peter.

At the last word, he felt the heavy bag of roubles thrown on his feet. The red fire-light sank, and with it the old dwarf vanished, and a long moan sounded through the ruins. Peter knelt in the darkness and said his prayers; before he finished, the rising moon was scattering the mist, and by its light he saw what the fire had not shown him—a traveller lying at no great distance, as if he had fallen from the sledge. Peter ran to him; he was sound asleep, and he covered him up with a good fur mantle. So, carefully replacing the money-bag under the cushion, he ran for help to the nearest cottage. Five strong peasants assisted Peter to carry him home; his sledge, with all it contained, also found room in the log-cabin, for the poor horse had broken his neck by falling on the slippery snow. Old Roskin said she never heard such snoring as the stranger practised that night; but next morning he awoke well, and much astonished. Peter explained how their acquaintance had commenced, presented him with all his travelling chattels safe and entire, even to the empty flask, which had contained three pints of Livonian brandy. The traveller's own story set forth that he was a Lithuanian merchant on his journey to collect debts and purchase linen yarn in the province; that the mist or the brandy had bewildered him; and that of the ragged dwarf he knew nothing. No hospitable invitations of its lord, however, could induce him to take rest and refreshments at the hof, but he presented forty roubles to Peter, half that sum to the parish church, purchased a peasant's horse, and took his departure. It must have been through that Lithuanian merchant that the tale of Peter's adventure oozed out, even before the arrival of Father Michael; but, far from being warned, the boyar swore Peter had plundered his noble house, refused all offers for his cottage-ground, and swore to take a great revenge by marrying him to Ratinka the day after Christmas. Old Roskin had made up her mind to retire unmolested with their forty roubles, for Father Michael's pleadings on her behalf had failed; but on Christmas-eve [illegible] the hof was set on fire, and [illegible] burned to the ground. Very little of [illegible] legacy was saved; but [illegible] to go in before the family to the [illegible] on the verge of the forest, where they [illegible] Theodore Nicklewitz and the [illegible] cottage-ground, for he was in [illegible] and a pedlar [illegible] who came to sell [illegible] was a stranger, having [illegible] by the [illegible] Peter and Niga and [illegible] the wedding [illegible] a [illegible] the consent of the [illegible] Peter's wedding was [illegible] Count Ratschoff's [illegible] the boyar paid Theodore's portion, as he [illegible] Peter's cottage was [illegible] was never after [illegible]

THE CALIFORNIA FARMER.

SAN FRANCISCO, THURSDAY, MARCH 2, 1854.

A CARD.
To the Public.

We take this opportunity to lay before you a copy of the "California Farmer and Journal of useful sciences," for your perusal, and we trust your approval.

The "California Farmer" has but recently presented itself, and already has received most kind and flattering notices from its friends; a goodly list of subscribers, constantly and steadily increasing, gives the publishers encouragement to put forth still greater efforts to make it a valuable scientific journal, an acceptable family paper and an agreeable weekly visiter among the practical cultivators of the soil.

It will be the aim of the publishers to furnish to their readers the most useful and reliable data for the practical agriculturalist, and to present the most interesting features and topics in every branch of this science.

To furnish general and critical notices of the most important Agricultural and Horticultural Societies and Exhibitions in our country and Europe.

A portion of the paper will be devoted to *select literature*, the aim of which will be to exhibit the purifying influences which flow from the pursuits of Agriculture, Horticulture, and Rural life—our aim being to cultivate a love for and an interest in those useful sciences which must ever add to the happiness of mankind.

Cultivators of the Soil, and all friends of Science, are invited to communicate with us freely; their valuable aid is what we desire.

The Journal will be distributed through the city by carriers, and left at the residences of those who may favor us with their support.

This number will be distributed to many who may not be subscribers, with the hope that the perusal of its pages may secure their influence and favor.

Special Premiums for Subscriptions.

In addition to the standing inducement for the getting of subscribers for the "Farmer," we will make a present of HARPER'S ILLUSTRATED FAMILY BIBLE to the person who procures the most Subscribers in the first six months of our publication. This we regard as one of the most beautiful books ever issued. Who will have the prize?

A Premium---Farmers' Clubs.

With the hope of inducing such of our friends, and those who have a little leisure, to ride among their neighbors and introduce an Agricultural Paper, we take pleasure in offering the CALIFORNIA FARMER: and, to make it an inducement, we say to such friends—if you will get us five subscribers, and remit the amount, we will send you six papers, or for ten subscribers, twelve papers. We trust there are many friends who will cheerfully take a little pains to aid us, and thus extend the circulation of the Farmer, and make a useful vehicle for the Agriculture of California.

Subscribers will please be particular to name the Post Office to which papers are to be sent; or, if forwarded by express, which line they prefer.

To Our Patrons.

To Advertisers.—We would call the attention of those who desire to have their advertisements produce quick returns, to the pages of the California Farmer.

The Farmer will reach sources of trade entirely new and unattainable by any other means, and thus secure a large and immediate profit to those who desire to make known their business. By a glance at our advertising columns, it will be perceived that we present the best known and most extensive houses, and as we have space for but one or two of each branch, these will be the most prominent houses, and thus give more influence to them.

Agents Wanted.

We want good active agents to visit every county in the State for the Farmer. Young men can find a steady and profitable employment. Apply at this office.

☞ We desire Agents to report as early as possible, that we may be prepared in our issues for a sufficient number to supply the demand. Be sure and report promptly.

Sweet Potatoes.

The fact has been clearly demonstrated that Sweet Potatoes can be successfully grown in this State, and of the finest quality. Three important things are to be observed to secure that success: The season of planting—the kind of soil—and the manner of planting—the last particularly important. We recommend the following:

The season will be governed in a manner by the temperature—as early as they can be planted to avoid the frost. In order to expedite the season, the tubers may be planted in a frame or hot-bed of gentle heat. This will give some two weeks or more advance, so as to be ready to transplant when danger of the frost is past, after the eyes are well started. The ground should be well plowed, selecting a rich sandy loam; a good dressing of manure should be plowed in; plow deep; plow and cross plow, then back-furrow into rows so as to form moderate ridges. The ground prepared, the hot-bed can be opened, and the eyes that have started can be taken off the tuber with a knife—slicing off a small piece of the potato with the eye, and planting each eye in the ridges thus prepared, about one foot apart, and covering them about three inches. The tubers with eyes not started can be placed again in the hot-bed for future use. After planting, the ground should be kept clear of weeds and cultivated with a hoe. Plowing between the rows two or three times, and cultivating well will reward the cultivator by creating a moisture and increasing the crops. We anticipate large and successful crops from such a method, and shall take pleasure in recording the various modes of cultivators, and the crops of our Farmers.

Disease of the Grape vine.

We would call the attention of the cultivators of the vine to the very important subject now agitating the old world in relation to the disease of the grape vine.

The most extensive vine growers of France and England, more particularly in the wine districts, have become alarmed at a disease that threatens the entire destruction of the vine. The disease has proved as fatal to the vine in the island of Madeira as the rot to the potato in Ireland, and the result has been ruin and death, by reason of want and famine, by the loss of their crops. Along the Rhine, and the best districts of Burgundy, the disease has left its mark, and threatens the entire destruction of the vine. The most learned and skilful minds are at work to discover the nature of the disease and apply a remedy. Thus far it has baffled them.

We have not the time nor space in this number to go into the subject as fully as we desire—our object being to awake an interest in the fact of the existence of that disease, and call attention to it.

We ask our readers not to lose sight of this important fact—ere long we shall see a great change in the cultivation of the grape; districts that have grown it perhaps for hundreds of years will grow it no more, and others will adopt it.

California is destined to become a mighty vineyard—her wine presses running over with wine. Those beautiful hillsides and undulating slopes along our broad and endless valleys, will, in a few years, become the vineyards of California.

Attention should be given to this subject immediately. The old varieties and stock of many kinds of fruits in the old countries are "passing away"—their day is past; new ones must take their place.

We believe the cause of this disease and decay to arise from the constantly planting the same variety upon the same soil and in the same climate. The stock should be changed; it should be renewed—regenerated by seed. Planting in and in, must by the laws of nature, be detrimental to health and life in the vegetable as well as the animal kingdom, and we believe that it is of the utmost moment that attention should be given to raising new fruits of all kinds from the seed.

We believe California admirably adapted to the growth of fruits, and particularly the grape, and desire to see our Horticulturalists give their attention to the raising new varieties from the seed. This must be successful.

France and Belgium have become noted for their new varieties of Pears, England for Apples, and the old States for Peaches; let California come in for the honors of the Grapes. We trust attention will be given to it, and that "Our Legislature" will see the importance of this subject and give their thoughts to it. We shall give a more extended article, with statistics and complete data, ere long, and shall glad to hear from our friends upon the subject.

California Flour.

HOME INDUSTRY—HOME PROSPERITY.

We had the pleasure within a few days, to pass an hour in the examination of the extensive Flouring Mills of J. M. Horner, Esq., of "Union City, San Jose.

We confess being surprised, although aware of the great energy of the proprietor, to see the admirable system in the mills and in all that appertains to their management. The miller Mr. Runnells, very politely waited upon us through the mills, to make us familiar with every department.

Here is Home Industry.

Here is the evidence of the permanency of our State, as well as its prosperity.

The mill is two stories high, large and spacious, containing *eight run of stones* capable of turning out *two hundred and fifty barrels per day*. There are but four run at work now, yielding half this number of barrels—this we believe is as large a quantity, or larger, than any other mill now running. The miller informed us that the "*French's* Burr Mill Stone" is decidedly the finest stone, and the 3-ft. the best size.

We examined the wheat, a very superior quality of "Volunteer Australia," some ten thousand bushels remain, of the proprietor's own raising, for the use of the mills.

"Horner's Flour," it will be remembered, took the first premium at the late Exhibition, and it maintains a deservedly high repute, selling at the mills at retail at $14—almost double the price of Gallego; the wholesale rates are about $12.

It is a great satisfaction to visit an establishment of this kind, for you have the evidence before you, that the *flour* is pure and truly a "home product," while a vast amount of the *flour* offered in our market is but the vile mixture of sour flour reground—injurious to health and a deception to the purchaser.

Everything connected with the mill is turned to advantage; the "bran," an excellent food for stock, is made more so, by the addition of a portion of middlings, increasing the value of the food and giving it a readier sale.

A large amount of stock upon Mr. Horner's Ranch, is fed by the waste of the mill—yielding another source of profit.

The flour "looked good enough to eat" as it came warm and pure from the mill. We rejoice at the prosperity of these mills, for we know by the history of them and the other extensive operations of the same gentleman, the vast sums of money annually expended in *labor* in that valley. Mr. Horner is a public benefactor. Such examples should be duly appreciated in every community.

The cultivation of the soil, the establishing of manufactories, the employing laborers—efforts of this kind give stability and prosperity to a State, and should be duly regarded.

We shall take early opportunity to visit all manufactories of "home products," and make them known as widely as possible—giving credit where credit is due.

Mission Peak.

The Sabbath day! A day of rest! a day for communion with God and nature, and the enjoyments of Home. We have often found how blessed it is to have a day of rest, and to have enjoyed the refined happiness which flows from the comforts and blessings of home.

All may not have a home literally of their own, and yet they may have a home everywhere. Some are so constituted by nature, by temperament and disposition, as to make all around them happy. Such will find homes everywhere—for home is where the heart is, and next to the sacred and holy duties of home, are those of the Sabbath day, or we should say, they are blended harmoniously in one. Home is the place of rest, and Sabbath hours at home are the holy time of the heart.

The Sabbath day! We have enjoyed it. We stood upon the loftiest point of Mission Peak, San Jose, and felt we could worship God there. The blue vault of heaven was over us, and the bright green valley far away below; lifting our eyes upward, light and glory beamed upon us from His throne; gazing below, verdure and beauty filled our vision, far as the eye could reach. It was a fitting time—the Sabbath day, for worship—a fitting place, this temple on the mountain; and our lips could not refrain uttering, "Be thou O God exalted high." Far better than a "pilgrimage to Mecca," is a trip to Mission Peak; the heart is made better in less time, and the good accomplished more lasting; the inspirations gathered are more pure; the intercourse with the Deity more direct, Nature with a thousand voices is the teacher. "The voice of nature is the voice of God."

The valley of San Jose should be better known among those citizens who desire a beautiful home. A few years and the railroad will give a speedy intercourse with this rich valley, and there is no richer spot of earth than the valley of San Jose, around the Mission. The magnificent sunny slopes at the base of that long range of mountains, will be like the "vine clad hills of sunny France," in coming years. The far famed Windsor Park holds no comparison, in point of beauty and extent,—viewing it from the castle—to the Mission Valley, as you look upon it from the lofty hills above.

Let our wealthy citizens give but a portion of their means to make beautiful homes, and we may vie with the world, for nature has been lavish in her gifts. We learn with pleasure that the owner of these broad lands will be glad to dispose of some of the fine locations, provided a just appreciation of them will be given by purchasers in laying them out. There are many objects of attraction within the circle of a few miles around the Mission of San Jose. Warm springs of valuable medicinal powers; mountain scenery, the mountains being accessible on horseback to their highest point. These mountains are covered with the richest verdure, and some of the finest ornamental trees known—the evergreen oak, bay tree, manzineto, tallow tree, &c. Living springs are found high up, affording abundance of water, and sufficient for all purposes. The soil is very deep and extremely rich. Artesian wells could be introduced along the slopes, with perfect success, and the waters used for fountains to beautify as well as useful for irrigation. There seems to be nothing wanting in the natural preparation for "Homes," and Providence seems indicating, that in a few years this mighty valley, along the entire base of these rich slopes, we shall have the "happy homes" of many thousands of our prosperous and enterprising citizens.

A visit to the Valley would amply reward any one, and a glimpse at it would induce them to make it their choice.

Correspondence.

To the Editor of the California Farmer:

In the early part of September, 1850, while on my way from Stockton to Mariposa, I stopped one night at a public house near the Merced river—the only stopping place on the road for a number of miles. The "public house" was made of canvass, and the floor was of firm and substantial earth. The lodging apartment was out of doors, and travellers had unbounded liberty in choosing the spot where to stretch their weary limbs, enveloped in their own blankets. Such were the accommodations which the country afforded at that date. In the course of the evening, the following conversation, in substance, transpired between the landlord and a traveller:

Landlord. This country is not going to last long. The gold will soon be dug out, and you can't raise anything on the land, everything is burnt up so in the summer.

Traveller. I am not so sure of all that. Where did that hay come from, that you are feeding to our horses at twenty cents a pound?

Landlord. All round here, everywhere. It is the Wild Oats, and grows abundantly all over this part of the country.

Traveller. What did it cost you, and how much do you get from an acre?

Landlord. It cost me nothing except the labor of gathering. I suppose I got about three tons to the acre.

Traveller. Three tons! What would that amount to at twenty cents a pound?

Landlord. About four hundred dollars, I 'spose, if you count 2,000 pounds to the ton, California fashion.

Traveller. Well, if you can get four hundred dollars from one acre, without cultivation, how much *less* would you be able to get *with* cultivation? And where's the use of talking about the land being burnt up and good for nothing?

Landlord. But you don't suppose this state of things is to last! When the gold runs out and the miners stop their supplies, what is to become of the soil? It can never support an agricultural population, like the Atlantic States or the Valley of the Mississippi.

Traveller. Tell me, if you please, what would be considered a reasonable profit per acre, from the land in New England, where you came from?

Landlord. I came from Western New York, sir. I had fifty acres of pretty good land, and thought I was doing remarkably well if I got an average of twenty dollars an acre for my crops.

Traveller. And out of that you had to pay for labor and so forth, more than one-half?

Landlord. Yes, two-thirds.

Traveller. Then you cleared from fifty acres, in a good agricultural district, about as much as from one acre in this wilderness which you say cannot support a permanent population?

Landlord. See here, mister, aint you a bit of a lawyer?

Traveller. No sir. I am seeking for information; I do not dispute anything you say, but I want to get hold of the facts and evidence on which your opinions rest. It is not likely the present state of things will continue, but it seems to me, nevertheless, making all allowance for the changes likely to occur, that if you can manage to get four hundred dollars an acre off this soil at present, there must be in it a degree of productiveness equal to the support of a population as dense as that of Western New York. If nature raises three tons of hay on an acre of wild land, I should think man might live there.

Landlord. But just think of it. Everything is burnt up by the beginning of June, and from that time till November or December you can do nothing for want of rain. At the present time, when the Atlantic farmers are busy gathering their crop, one must be idle here—losing the best season of the year.

Traveller. Well, don't you lose a part of the year in New York? From November to May, one-half the year, you are locked up with frost and your land is idle, while you and your stock are eating up the fruits of the other half. Here the rains in November set you at work and give a start to vegetation, and your season of planting and cultivation continues till May. You are absolutely certain of one crop, at all events. From May to November is the agricultural winter in California, with this difference—the sun warms you more cheaply than fuel, and your stock require no costly houses for shelter, and instead of eating their heads off in the stall, they feed on the grass and wild oats which are dried and preserved by nature or the soil.

Landlord. But what is to be done for water? You will find no water for miles on these plains.

Traveller. Can't you find it by digging?

Landlord. I reckon you can, by digging 10 or 20 feet, anywhere about here. Towards Stockton I am told that an abundant supply of water is found in the driest season, by digging only five or six feet. But who has time to dig wells?

Traveller. The time will come when the wells are needed. You know there are extensive districts in the Atlantic States quite as destitute of natural water courses as the plains of California, and where you must dig, not only 10 or 20, but 50 and 60 feet for water, and yet the wants and the industry of man have converted these regions

into fruitful gardens, supporting a dense population.

Landlord. Well, well, I reckon you have me there. But there is another difficulty I want you to solve. Where are we to get our fuel and our timber for fences and so forth?

Traveller. That is a small matter. In many places stone can be had for fencing. Fences can be easily and cheaply constructed of iron wire; or ditches and embankments of earth may be resorted to. As to fuel, when I passed through Stockton, a few days ago, I saw them cooking with anthracite coal, dug from the Schuylkill region in Pennsylvania. If, when things are yet in the bud, fuel can find its way to California, and up the bay and the river to Stockton, coming all the distance from Pennsylvania, and even from England, we need not make ourselves uneasy about fuel for the future, especially when the climate is so mild that it is needed only for cooking.

Landlord. Well, stranger, I knock under. I guess it's nigh bed time.

The Coal Trade.—To such an extent has our coal industry been developed, that at the present time not less than 37,000,000 of tons are annually raised, the value of which at the pit's mouth is little less than £10,000,000; at the places of consumption, including expense of transport and other charges, probably not less than £20,000,000. The capital employed in the trade exceeds £10,000,000. About 400 iron furnaces of Great Britain consume annually 10,000,000 tons of coal and 7,000,000 tons of ironstone, in order to produce 2,500,000 tons of pig-iron, of the value of upwards of £8,000,000. For the supply of the metropolis alone 3,600,000 tons of coal are required for manufacturing and domestic purposes; our coasting vessels conveyed in 1850 upwards of 9,360,000 tons to various ports in the United Kingdom, and 3,350,000 tons were exported to foreign countries and the British possessions. Add to this that about 120,000 persons are constantly employed in extracting the coal from the mines, and that in some of the northern counties there are more persons at work under the ground than upon its surface, and some approximate idea will be formed of the importance of this branch of our industry. The extent of the coal areas in the British Islands is 12,000 square miles, and the annual produce 37,000,000 tons; of Belgium, 240 miles, annual produce, 5,000,000 tons; of France, 2,000 miles. annual produce, 4,150,000 tons; of the United States, 113,000 miles, annual produce, 4,000,000 tons; of Prussia, 2,200 miles, annual produce, 3,500,000 tons; of Spain, 4,000 miles, annual produce, 550,000 tons; of British North America, 180,000 miles, annual produce not known. Taking the British Islands alone, and dividing them into districts, we find the supposed workable area as follows, in acres: Northumberland and Durham, 500,000; Cumberland, Westmoreland and West Riding, 99,500; Lancashire, Flintshire and North Staffordshire, 550,000; Shropshire and Worcestershire, 79,950; South Staffordshire, 65,000; Warwickshire and Leicestershire, 80,000; Somersetshire and Gloucestershire, 167,500; South Wales, 600,000; Scottish coal fields, 1,045,000. Irish coal fields—Ulster. 500,000; Connaught, 200,000; Leinster, 150,000; Munster, 1,000,000. Our exports. which in 1840 amounted to 1,606,000 tons, valued at £576,000, had increased in 1850 to 3,531,000 tons, of the value of £1,284,000. In 1841 our exports to France were 451,800 tons; to Holland, 173,378 tons; to Prussia, 116,296 tons; and to Russia, 77,152 tons. In 1850 they were to France, 612,545 tons; to Holland, 159,953 tons; to Prussia, 186,528 tons; and to Russia, 235,188 tons.—*Durham Chronicle.*

Metallic Caskmaking.—The new and ingenious principle of making casks from metal, patented by Mr. Clare of this town, is now in operation, at his works in Nash Grove. The casks are made by machinery, expressly adapted to this new branch of manufacture by skilful engineers, whose services were secured for the purpose. The staves, specimens of which have already been exhibited in public, are of peculiar construction. and the great difficulty to be overcome was to produce each stave complete by one operation. This is effected by means of a screw press, to which a large mechanical power is applied. The iron cut is into the required lengths. and after being subjected to a powerful heat in a furnace is transferred to the press, where it receives its exact form and mould. The machine throws out the staves at the rate of one per minute. It is necessary to cut the iron in opposition to the grain, in order that when the flange is formed it may be made without cracking.

The staves, on being completed, are grouped, and formed into casks when required for use. Each stave is calculated to bear a pressure of 100 lbs. in the square inch. The heads of the casks are formed by a machine adapted to cut circles of very large diameter with the utmost precision. By a very simple plan the heads of the metallic casks can be removed without disturbing the hoops which bind them together—a matter of the utmost importance where it is necessary to transfer liquids from one cask to another. It is thought that the metallic casks will ere long come into general use, and almost, if not entirely, supercede the common wooden casks now employed for all purposes.—*English paper.*

Important Decision.—The Court of Appeals of New York, has decided that the trustees of any Catholic church may assign all their property, in perpetuity, to the control of Bishop Hughes and his successors in office, unless there is a special law against it.

Rotation of Crops---Its Uses and Effects.

The practice of rotation in crops is an agricultural improvement of very modern date. It is first mentioned in Dickson's Treatise on Agriculture, published in Edinburgh, in 1777. For more than a century it has been partially practiced in Flanders, and perhaps in some other adjoining and highly cultivated countries. It was afterwards introduced, and imperfectly carried out on a limited scale in the Norfolk district in Great Britain; but its general introduction did not take place till the beginning of the present century. The system of rotation is one of the first and most important principles of general husbandry, and it cannot be omitted without manifest disadvantage and loss. Its place was formerly supplied by *naked fallows.* This practice consists, as I have before shown, in giving the soil an occasional or periodical *rest*, in which no crop is taken off, and the soil is allowed to produce just what it pleases or nothing at all, for one or more years, when it is refreshed and invigorated for the production of its accustomed useful crops. This system, it will be perceived, implies the loss of the income from the soil for a certain portion of the time, and it can be tolerated only where there is more land than can be cultivated.

Modern agricultural science has detected, in part at least, the true theory of the necessity for rotation. It has been discovered, that every crop robs the soil of a part of its elements, (fifteen or sixteen elementary substances combined in various forms and proportions), and that no two dissimilar crops abstract these elements or their compounds from the soil, in the same proportions. Thus, if we consider the amount of the salts taken out of the soil by a crop of turnpis, amounting to five tons of roots per acre; of barley, 38 bushels; one ton each of dry clover or rye grass; and of wheat, 25 bushels, we shall find the great disproportions of the various elements, which the different vegetables have appropriated. As given by Johnston there will be in pounds as follows:

	Turnip Roots.	BARLEY. Grain.	BARLEY. Straw.	Red Clover.	Rye Grass.	WHEAT. Grain.	WHEAT. Straw.	Total.
Potash	145.5	5.6	4.5	45.0	98.5	33	06	253.0
Soda	64.3	3.8	1.1	12.0	16.3	3.5	09	106.9
Lime	45.8	3.1	12.9	61.0	69.0	11.5	72	149.0
Magnesia	15.5	3.6	1.8	6.5	6.0	04	11.0	32.9
Alumina		0.5	9.0	8.0	6.0	0.8	2.7	26.2
Silica	22.2	23.6	90.9	8.33	6.0	0.8	8.60	159.4
Sulphuric Acid	43.0	1.3	3.4	15.0	6.0	0.9	1.10	70.7
Phosphoric do.	32.4	4.2	3.7	15.0	6.0	0.9	2.50	64.7
Chlorine	143	0.4	1.5	8.0	0.1	0.2	0.9	153.1
							Total.	970.9*

Besides the elements above noted, all crops absorb oxide of iron, and nearly all oxide of magnanese and iodine; and of the organic elements associated in various combinations, they appropriate about 97 per cent. of their entire dried weight. Now, it is not only necessary that all the above materials exist in the soil, *but that they are also to be found in a form precisely adapted to the wants of a growing plant.* That they exist in every soil, in some condition, to an amount large enough to afford the quantity required by the crop, can hardly be doubted; but that they are all in a form to supply the full demands of a luxuriant crop, is probably true of such only as are found, under favorable circumstance of season and climate, to have produced the largest burthens.

If a succession of any given crops are gathered and carried off the land, without the occasional addition of manures, they will be found gradually to diminish in quantity, till they reach a point when they will scarcely pay the expenses of cultivation. I mean to be understood as affirming this of all crops and all soils, however naturally fertile the latter may be; unless they are such as receive an annual or occasional dressing from the overflow of enriching floods, or are artificially irrigated with such water as holds the necessary fertilizing matters in solution; and such are not exceptions, but receive their manure in another form, unaided by the hand of the husbandman. Neither are *old meadows* (mowing lands filled with the natural or uncultivated grasses, or whatever useful forage they choose to bear), exceptions to this rule; although they may part with a portion of their annual crop in the hay, which is removed, and which is not returned as manure, and by a partial rest or pasturage, appear to sustain their original fertility. But if the true character of the various plants which they produce, were accurately observed and all of which are indiscriminately embraced under the general head of grass or hay, it would be found that the plants gradually change from year to year; and while some predominate in one season, others take their place the year succeeding, and these again are supplanted by others in an unceasing round of natural rotation.

* This is exclusive of the [illegible] TO BE CONTINUED.

Whosoever is vexed at a reproach, would be proud if he were commended.

Depth for Burying Manure.

Men are divided as to the proper depth of burying manure. Some hold that it sinks in the soil, is washed downward by the leaching rains, and therefore should be applied near the surface. Others assert that its volative and most valuable parts rise by fermentation, and that consequently it should be buried deep. Now, it usually happens, when doctors disagree, that both are partly right and partly wrong; but in the present instance, they are both a little in the right, and a great deal in the wrong.

Manure usually stays very nearly where it is put. If buried near the surface, it remains near the surface; if buried deep, there it remains; if plowed under in large lumps, it has but little power to rise, sink, or in any other way to intermix itself, and hence the reason that thorough pulverization or harrowing before manure is turned under gives a large result in large crops.

The power clay possesses of absorbing the fertilizing portions of manure, is very great. Soils which possess a medium amount of clay or loam, with a medium degree of tenacity, will absorb all that is valuable in ordinary yard manure, equal to nearly their own bulk. Forty loads of manure to the acre, form a heavy coating; yet this is only one load to four square rods, constituting a depth, when spread, of only one-third of an inch or so, before they are all absorbed by the soil. Hence the error of supposing that they can possibly, in ordinary soils, rise or sink to any practicable depth. And hence also, the great importance of mixing manures very intimately through all parts of the soil, if plants are to get their full benefit, and not be over-fed at one part of their roots and starved at another.

They are many proofs of the correctness of the position here taken. We have made large piles of compost, consisting of one-third rich stable manure, and two-thirds of loam and turf, yet all the odor was completely retained, and not the slightest portion passing off could be perceived by the smell. We have buried large dead animals with a coating of only six inches of loam; not the faintest indication of the decomposition below ever reached the surface. On the other hand, the soil that forms the bottom of manure yards, is not found even within a few inches of the surface to be at all enriched by the piles of fertility which rest upon it.

The true rule for burying manure, is to place it just at such depth in the soil as the roots of the crop usually extend, which varies with different plants. Some of the grasses, for instance, form a turf very near the surface, and hence an autumn top-dressing will soak in enough to benefit them essentially. Clover roots run deeper, and this crop is consequently but little benefitted by top-dressings when of much size, except so far as they operate in keeping the surface moist. The roots of fruit trees are still deeper. and they derive but little advantage except from manures well spaded or worked in. They, however possess an important advantage over annuals and perennial rooted plants; by continuing in growth for successive years, those roots which happen to run into the region of fertility, soon throw out numerous fibres, and secure an amount of nourishment, of which annual plants, in consequence of their more limited powers of extension, are not able to avail themselves.

There are, however, not many crops which do not need the full depth afforded by ordinary plowing; and hence the best practice for nearly all kinds of culture, is to spread the manure well, harrow it most thoroughly, in order to break it as fluely as possible, and at the same time to mix it intimately with the surface; then turn it under by ordinary plowing, and the lower half of the inverted earth will furnish a thoroughly enriched bed for the roots to penetrate. If a greater depth of fertility is needed than ordinary plowing affords, the coat of harrowed manure may be thrown under ten or twelve inches by means of a double mouldboard or Michigan plow; and then another coat of manure spread, harrowed, and plowed under by a light or gang-plow. The young plants of the crop are thrown rapidly forward by the upper stratum of manure, and at a later stage of growth, are equally stimulated by the lower stratum.—*Country Gentleman.*

Statistics of the Shoe Manufacture.—This has become a great business—and though everybody is aware of this, very few are aware of the actual extent to which it is carried on.

In the State of Massachusetts it is the second in importance, agriculture being the first. It has not only a greater number of persons engaged in it than any other handicraft, but probably pays better. The Andover Advertiser has an article giving the statistics of this business, from which it appears that the aggregate value of boots and shoes manufactured in the State is estimated at $37,000,000, which equals the manufacture in all of the other States combined, and exceeds that of any other manufacture in this Commonwealth, the item of cotton goods of all kinds amounting to but $12,103,449. Of the above value $12,000,000 worth are annually shipped to New York, where there are but 250 boot and shoe warehouses, many of which sell from $100,000 to $1,000,000 a year, and three of them exceed the highest sum named. The remainder, that are not used at home, are sent to the South and West, to California, the West Indies, South America, Australia, the Sandwich Islands, to England, and the continent of Europe.

The sale of "[illegible]" which does not include leather [illegible] a year. Most of the [illegible] are made in New Hampshire, and one firm, it is said, manufacture fifty bushels daily. The pegs are cut by machinery. A machine has been invented recently to drive them in an incredibly short space of time, and another machine for sewing and stitching has come into use.

Lynn is engaged in this business more extensively than any other town. With a population of 14,257, the number of manufactures is 144, and of operatives 3,787 males, and 6,422 females; and the number of pairs made annually, 4,633,900; from 1840 to 1850 there were 707 dwelling houses built, and the number of rateable polls doubled. Danvers—population, 8,109; manufacturers, 35; operatives, 1,184 males, 693 females; pairs made, 1,123,000; dwelling houses increased from 479 to 1,020 from 1840 to 1850, and the number of rateable polls in a similar proportion. Stoneham—population, 2 885: manufacturers, 24; operatives, 415 males, 376 females; 850,000 pairs of children's shoes made annually. There is more than one male shoemaker to each family. In Grafton, one manfacturer uses 100 bushels of shoe pegs per year.

The whole number of persons engaged in the business within the State, by the census of 1850, is 39,944.

The Hand that Saves Us.—Two painters were employed to fresco the walls of a magnificent cathedral; both stood on a rude scaffolding constructed for the purpose some forty feet from the floor. One of them was so intent upon his work that he became wholly absorbed, and in admiration stood from the picture, gazing at it with intense delight. Forgetting where he was, he moved back slowly, surveying critically the work of his pencil, till he had neared the edge of the plank upon which he stood. At this critical moment his companion turned quickly, and almost frozen with horror, beheld his imminent peril; another instant and the enthusiast would be precipitated upon the pavement. If he spoke to him it was certain death; if he held his peace death was equally sure. Suddenly he regained his presence of mind, and seizing a wet brush, flung it against the wall, spattering the beautiful picture with unsightly blotches of coloring. The painter flew forward, and turned upon his friend with fierce upbraidings; but, startled at his ghastly face, he listened to his recital of danger, looked shuddering at the dread space below, and with tears of gratitude blessed the hand that saved him. Just so, we sometimes get absorbed upon the pictures of the world, and, in contemplating them, step backward, unconscious of our peril, when the Almighty, in mercy, dashes out the beautiful image, and draws us, at the time we are complaining of his dealing, into his outstretched arms of compassion and love.

A Kentucky Corn Crop.—Kentucky has long been famous for extraordinary crops of Indian corn. If we remember rightly, a crop was reported there, some years ago, as producing 94 bushels to the acre—some 20 bushels more than we have seen reported from any other State. Mr. S. F. Tebbs, of Cynthian, informs us that he cultivated forty acres of corn on his farm near that place the past season, and sold the whole crop to a miller, who weighed it at his mill, and that the whole yielded ninety bushels (56 lb. to the bushel) per acre. The work expended upon it was as follows:—"Plowed deep (8 or 9 inches) early in the spring—planted 1st to 10th May, 3 feet by 3.—gave it two furrows each way, and hoed part, where the grass (foxtail) interfered. All done and laid before jointing."—*Exchange.*

"Robb's."—This is the designation of one of the most elegant and comfortable restaurants in this city. It is located in Clay street, in the new block lately erected by Dr. Elliot,—which, by the way, is a fine specimen of architecture, and adds, in no small degree, to the ornamenting of the city. The restaurant is fitted up in the most costly and beautiful style, and speaks well for the taste and liberality of the proprietors—Messrs. Robb, Doty and Gould. The room occupied for the saloon is one hundred and twenty feet in length by about twenty-five in width, and extends through from Clay to Merchant streets—having an entrance from the latter. About forty feet of the saloon is set apart for the accommodation of ladies, and is very tastefully decorated, and furnished in a most superb manner. The tables, thirty-five in number, are of white marble supported upon bronzed iron pedestals, and capable of accommodating four persons each. The culinary department is under the superintendance of "Raphael," long and favorably known in this city. Under the management of the gentlemanly proprietors, we have no doubt the public will be well provided for, and "Robbs" will be a favorite place of resort. [illegible] attend the enterprise.

Royal Agricultural Society in England.—The Annual Show of this Society was held at Gloucester, and was a very successful exhibition. Owing to a new regulation of the Society, excluding animals over [illegible] cattle were not quite as large as at [illegible] shows. The number of implements shown was 2, the largest number ever exhibited. [illegible] of January, 1851. [illegible] were entered for Prizes, [illegible] were awarded for a total [illegible] Hussey and Bell's Reaping Machine.

THE CALIFORNIA FARMER.

SAN FRANCISCO, THURSDAY, MARCH 2, 1854.

Drilling Grain.

In a country so admirably adapted as is California to the culture of wheat, the method of cultivation has heretofore seemed almost a matter of indifference; the extreme fertility of the soil has secured a profitable return for even the most careless husbandry. But the time is rapidly approaching, here as elsewhere, when competition will compel farmers to seek out and practice the most improved method of production. Amongst these methods of increased production, drilling small grain doubtless holds a prominent place. Every well informed farmer knows, from reading if not from practice, the advantages which the drilling of grain possesses over broadcast sowing; but as there are in this State many persons who have turned their attention to farming, without much previous knowledge or experience of the subject, it may not be amiss briefly to recapitulate the advantages of drill planting.

With a properly constructed machine, every grain is planted at a proper and uniform depth and well covered, and precisely the right amount, neither more nor less, is sown upon, or rather in, the ground. All these points are essential to the production of a maximum crop; and in broadcast sowing there is danger of failure in every one of them. The most careful and expert seedsman cannot sow wheat or other small grain with the exactness of a well constructed drill, and of course where the harrow is drawn over land left in ridges by the plow, some of the seed will be covered deep, some shallow, and some not at all; of which latter fact clouds of crows and blackbirds are aware, if the farmer is not. These are the main points to be considered, and in Great Britain, where scientific and practical agriculture is carried to a greater degree of perfection than elsewhere, they are so well understood, that broad-cast sowing has almost, if not entirely, ceased to be practiced.

In selecting a drill, the chief things to be looked to are, efficiency, economy and simplicity. Some drills are liable to choke, and feed irregularly; others cost more than small farmers can afford to expend; and some again are so complicated that they are continually liable to get out of order, and require the services of a skilful mechanic to adjust them. These objections, one or the other of which can be urged against most of the drills now employed, have so far served very much to restrict their use, and to induce farmers to follow on in the beaten and thriftless track of broad-cast sowing. Without resorting to distinctious or invidious comparisons, we will merely state that the grain drill patented by Mr. Richard J. Gatling, and now on sale by Samuel Henderson, Esq., of Santa Clara, possesses, in a high degree, the above requisites of efficiency, economy and simplicity. In the absence of drawings, we will endeavor to give such a description of it as may enable our readers to judge for themselves of its merits.

The machine consists of a platform about five feet square. This platform rests on two wheels with a revolving iron axle, or, more properly speaking, each wheel has its own axle; the axle being divided in the middle, in order to give each wheel an independent motion in turning. Attached to the bottom of this platform are five hollow teeth of cast iron, for conveying the grain into the ground. These teeth are arranged, in two rows, one behind the other. The teeth in each row are twenty inches apart, and so arrangod that those in the hindmost row follow in the middlo of the spaces between those in the foremost row; thus making the drills ten inches apart, which experience has demonstrated to be the proper distance. This arrangement of the teeth is much preferable to having them in one row, as it renders the machine much less liable to be clogged by stubble or other trash. Over these teeth are placed the boxes containing the grain. Over the mouth of each tooth—and consequently in the bottom of each box—lies a common auger (minus the point), which revolves horizontally. On the head of each auger is a a small pinion, which runs in a corresponding cog-wheel on the iron axle. Over the point where the auger terminates, in the mouth of the hollow tooth, is a sliding gauge for regulating the quantity of grain to be sown. The horses are attached to the front, either by a pole or iron bracket. When the wheels are set in motion, the axles revolve, driving the augers, which, as it were, *bore* out the grain into the hollow teeth, down which it descends into the soil.

It will be at once seen that this machine must sow with unfailing regularity; as it is impossible the augurs should be clogged by the grain, or any impurities it may contain. So long as the wheels turn, the augers *must* revolve; and so long as they revolve, whatever is in the boxes over them must be emptied down the hollow teeth. And it matters nothing whether the team be a yoke of sluggish oxen, or a pair of spirited horses, the quantity of grain sown on an acre must of course be the same; for the amount of grain sown depends entirely on the *number of revolutions* of the axle, and *not* on the velocity of its motion. The above described machine is of a proper size for two horses, and will sow six acres a day. On large farms it might be desirable to have one with nine teeth; five in the foremost row and four in the hindmost; and requiring four horses to draw it. In a machine of this size, the platform would of course be proportionally lengthened laterally; the length fore and aft remaining the same.

Such is "Gatling's Grain Drill," a wonder at once for its ingenuity and simplicity. Much less complex in its structure than a common wagon, it may almost be said to be impossible that it should ever get out of order; and when it *does* need repair, the most ordinary workman can do what is needful; and being simple, it is of course cheap. This drill has been used by some of the most skilful husbandmen in the neighborhood of Santa Clara; and the best testimony in its favor is, that where it has been used *once*, it is always used *again;* because a largely increased crop has never failed to be the result. One may be seen at work on the San Lorenzo, in Alameda county, on the farm of Mr. Winton; also on the farms of Messrs. Robinson, Burnett, and John Wiseman, of Santa Clara, who will doubtless take pleasure in showing it to any of our readers in those places.

We again call the attention of farmers to the importance of looking into this matter of drilling grain; for they will find their advantage in it. As for Gatling's drill, if it is the best one, they will of course employ it, if not, procure the best, and set about using it at once. A sample will shortly be seen at Warren & Son's exhibition hall, Bush street, San Francisco.

Sonoma County Ahead.

In a previous number of the Farmer we announced that Sonoma County was in the field. She has spoken, and we hail the intelligence with pleasure. We give place to the Report of the Officers of the Society, which we trust will arouse every county in the State to follow their noble example. From their energetic Secretary we have received valuable data, from which correspondence we have ventured to clip the following paragraph—"I herewith furnish you with an account of our first Agricultural meeting, not only the first in the County, but I believe the first *County meeting* in the State. About thirty persons were present. Among the number were some of our most intelligent and extensive farmers—all of whom evinced much interest in the undertaking. It is their determination to hold the first Annual Fair this fall, of which due notice will be given you. I send list of subscribers to your valuable journal, and trust that the distribution of your paper will beget a desire to subscribe with others. A spirit of emulation has already sprung up, which must result in good crops, good horses and cattle, and I might add, comfortable and happy homes."

This is the right tone; we like it; there is soul in it; when the heart is in the work, the work will be done. Sonoma will be the banner County yet. Hear the report of the officers:

Agreeable to notice, there was a meeting of the citizens of Napa Valley held at the Court House in Napa City, on Saturday, the 11th ult., having for its object the organization of a County Agricultural Society. On motion, John M. Hamilton, Esq., was called to the Chair, and J. Evans Brown appointed Secretary. On motion, a Committee of Six was appointed for the purpose of drafting the Constitution and By-Laws, and to report the same at the next regular meeting, on the third Saturday of the ensuing month.

The Chair appointed Messrs. J. Griggsby, Judge Starks, Wells Kilburn, Angus L. Boggs, Bartlett Vines, and J. Evans Brown, members of that Committee.

It was ordered that the Secretary forward a statement of the proceedings of the meeting to the Editors of the California Farmer, with a request to publish.

J. M. Hamilton, Pres't.

J. E. Browne, Sec'y.

Farming in the Mountains.—The Sonora Herald says: "Wheat and barley will grow on these hills, and will mature without irrigation. The Messrs. Heslep have tried it at the Bald Mountain ranch, and with complete success. Let us raise our own grain without depending on the valleys and paying extravagant freights."

"Knowledge is Power."

The "Ocean Steamers," with all their powerful machinery and pouderous boilers, might lie listlessly upon the water, powerless, were the engineer wanting in the "knowledge" of that machinery and its uses, and the strength and capacity of those boilers.

The "beautiful Clipper" that sits upon the wave so lightly, moving almost without power, would soon be a scattered wreck upon the shore, were there no "pilot" whose "knowledge" of the *helm* enables him to guide her safe through dangerous shoals and keep her from the ragged reef.

The "Telegraph" might essay in vain to carry thought along its extended line, were the "knowledge" wanting by which the battery is brought in contact and the communications formed.

It is the "knowledge" possessed of these several *elements of power* that gives the possessor the means to use them for his own good as well as for the advance of science. The builder of the ocean steamer does not remain ignorant of the strength needed to sustain the powerful machinery, nor the engineer enter upon his duties without the requisite "knowledge" to move that machinery, and thus convey the mighty mass in safety to her destination.

Donald McKay, the builder of the most beautiful "clippers" ever known, would not have reached the proud eminence he has attained without that "knowledge" which has given him the "power" to place upon the ocean the fleetest and most perfect modeled ships that ever floated.

That beneficial and powerful influence which has been diffused throughout the world by those lightning messengers, would have been lost had Morse been wanting in the "knowledge" of the "power" he could control.

If in these pursuits it requires *study* to fit a man for a "knowledge" of the weapons he is wielding, that he may enjoy and use the "power" they give, ought not the cultivator of the soil also to acquire a "knowledge" of those *elements of power* within his charge?

Is not the *cultivator* embarked with a valuable cargo on an important voyage, and shall *he* not know whether his *ship* is safe, his *pilot* skilful and his freight destined to a prosperous market?

The "Homestead," is the Farmer's ship, and he should know every rope in it—he should know the nature of the soil he cultivates, and its capacities for each and every product; he should study to attain a "knowledge" of its wants and necessities appropriate to every season and climate. As the pilot by *his* "knowledge" understands every sail and uses them to carry him successfully and safely across the ocean, so the farmer should control every element of the soil and bend them to his purposes, that they may waft him to a profitable harvest.

"Knowledge is power," and in every department of science it is felt to be so. We fear, however, among agriculturalists, they do not feel its full force. Among all other classes of men, they feel it to be of the highest moment to be thoroughly acquainted with the details of their own occupation; but the agriculturists do not fully appreciate the magnitude of the enterprise in which they are engaged; they are too apt to believe that the least labor and cost will suffice. As for improvement, what was done last year may as well be done this year; they rarely dream of applying Scientific knowledge to agriculture. Books are seldom read—lectures are of little value—newspapers are a bore—and if they have leisure they wish to rest and enjoy it. This will not apply to all, but it is too true in its application to the mass.

We trust there is a spirit abroad that will correct these fatal errors, and that the old excuse, "there is no scientific knowledge needed," is exploded.

We find a most excellent article upon the subject of improvement by means of "a Newspaper in a Family," so appropos that we append it to this article, and we trust the farmers of California will read, approve, and never again say—

"I CAN'T AFFORD IT."

At this season of the year, when people are called upon to subscribe to papers, the excuse "I can't afford it," is very frequently made, which, being interpreted, means "I regard other things of more consequence to myself and family than a newspaper." Rightly considered, there are very few influences which tell more immediately and effectually upon the improvement of the family circle than a well conducted and high-toned paper. Judge Thomas, of Worcester, Mass., in a recent lecture before the Young Men's Association in this city, said, "The Newspaper Press is destined to be the chief instrument of popular culture. It is, intellectually, the daily bread of the people. The power of the press, great as it is, is continually increasing, and will draw to itself, and demand for its service more and more of the learning and talents of the country. The eloquence of the bar, of the assembly and of the stump, create a stronger immediate impression, but there sphere is too limited to compete with the wide spread influence of the eloquence of the pen. As an instrument for swaying the popular mind, they all yield to it. The pen is the true lever of Archimedes, and in the newspaper press has been found the place for a fulcrum."

The man of business "can't afford" to do without his paper. He must know the condition of the markets, the financial prospects, and the passing events of the day. It teaches him when to buy and when to sell, and he often finds a single paragraph worth its thousands of dollars to him. The mechanic "can't afford" to dispense with his paper. There are suggestions in it which his brother mechanics have made, by which he can profit; or it contains some new labor-saving invention which enables him to make the same article in less time. The farmer "can't afford" to carry on his farm without his paper. There is that in it which, if properly studied and practiced, increases the income of his farm twenty thirty, or even one hundred per cent. He learns from it what are the best varieties of grain, what fruits are the best suited to her soil and climate, what crops have been made the most profitable, what implements are the best, and last, not least, he may learn the value of careful observation and accurate knowledge. No one can afford to be without all the means of information which are within his reach. No one can afford to live in darkness when the world is full of light, to plod on in ignorance when it is the mission of truth to instruct and elevate the mind.

Least of all can any man afford to deprive his family of the advantages which a journal of the right stamp affords. What are a few dollars and cents in comparison with right views, sound principles and generous feelings! A word in season, fitly spoken, may change the whole tone of life, and like the seed sown in good ground bring forth an-hundred fold in noble living and energetic acting. It is a short-sighted policy that consults only immediate effects, while it overlooks the far-reaching results which the most trivial causes often develope in character. If persons would only take a second thought, we are sure they would never say "I can't afford" to subscribe for a paper which contains practical suggestions with regard to the best methods of making this life, with all its varied interests, what it should be. But in papers as everything else, it should be an invariable rule to provide the best. It is better to be ignorant than to be lead astray—better to read nothing than what is pernicious in its tendency.

One thing is certain, we "can't afford" to live without the effort to become wiser and better as we grow older—we "can't afford" to act as though there were no future, no life beyond this life, no eternity beyond time; for our attainments in knowledge and excellence in this world will be the measure of our happiness in the next.

California Grain--Threshers and Separators.

California is destined to attract the attention of the world in all that appertains to the planting of *Wheat and other Grains*, and she is now attracting attention at home and abroad by the immense product of Grain she has harvested the past year and the extensive fields that have been planted the present year.

The present condition of the *Flour market* is but the result of the immense crops of California and Oregon wheat that have been brought upon the market, and the half has not been told.

Not only in all the Eastern and Western States of our own country but even in Europe, merchants interested in the grain crop of the United States will turn their inquiries to California, that they may base their calculation upon the amount raised the present year.

We rejoice at this, and say emphatically, California will provide for herself. California is able to raise wheat enough for her own consumption, and she will do it. Therefore we say again to shippers of Wheat and Flour, you have been duly notified, and if there is a profit to be made in raising Wheat and manufacturing Flour, our own citizens deserve it, and they should receive the reward they deserve.

There is another feature to which we call attention: Manufacturers of the most valuable implements and all improvements in everything that relates to grain sowing and harvesting, turn their attention to California, as the great field for them to operate. We are reminded of this by the recent introduction of the new grain drills to which we allude this day, and to the valuable and much improved implements advertised by Messrs. Coit & Beals, and we trust our cultivators will ever bear in mind that the best tools and seeds are always cheapest.

Ornamental and Shade Trees.—Nothing adds more to the beauty and value of a residence than a few shade and ornamental trees. The present is a good time for the planting, and owners of real estate can make no better investment than in planting them around their buildings and even around their vacant lots. A house will bring a better rent and let more readily, and lots will sell better thus improved.

Sheep Breeding.

We take pleasure in laying before our readers the annexed communication from a gentleman who has done a great service to our State, by introducing valuable stock and also many new trees and shrubs from China. Such uses of wealth not only give satisfaction and benefit to the individual, but the results are widely beneficial.

We believe that California possesses the advantages of raising sheep, equal, if not superior to many of the sheep-raising States of the North and East. We have abundance of food for them, at little or no cost; we can shelter them at less expense than any other State; the climate suits them; the flocks increase far beyond those of other States, and disease and death are not so prevalent. We believe that we can become a wool growing State, and that the time is not far distant when we can use the wool in our own manufacturing establishments. We are tending to this, and shall we not rejoice to know it? We feel therefore that those who take an interest in "home productions," by importing stock or introducing any article into our State, deserve well o the State, and we are glad to record the instance alluded to in the communication appended to this.

This is but the beginning—the same gentleman is doing much to improve valuable lands and to beautify as well as benefit the community by means of his wealth.

It is to be hoped that attention to this subject will attract others to "go and do likewise," and thus hasten the day when California shall in every sense be an independent State.

"In July, 1851, I imported from Shangbai, in China, seven broad tailed sheep; on the 1st February, inst., they had increased naturally to fifty-three, besides some ten or twelve lost from casualties.

"These sheep are very prolific, more so than any I know of. Two of my ewes have had *five* lambs each, and several four at a birth. I think they have two or more, oftener than a less number. Many of the ewes, I notice, have four teats. Some of the young ewes lambed here have had twin lambs before nine months old, and the average births of all are twice in eleven months.

"For mutton, these sheep are extra superfine, and weigh 150 pounds. For wool they are of little value; their fleeces weigh not over two to three pounds each, and coarse.

"I am not familiar with the natural history of the broad-tailed Asiatic sheep, and just now, am not prepared to write any thing interesting in regard to them, but I may do so after a time."

We take the following article from the Farmers's Companion:

Breeders of sheep—no matter of what variety—should be very cautious in selecting their bucks, and look not only at the good qualities of the individual, but also at his adaptation to the ewes; choosing an animal that will amend any imperfections in wool or carcase which may be observable in the females. The requirements of their flock of ewes should be particularly noticed, and a careful separation of them made, so as to ascertain more accurately their precise defects, and to point out with greater certainty the peculiar kind of buck necessary to rectify these defects. This should be done before procuring the buck—not to buy first, and then try and suit the ewes to him afterwards. *Never purchase a buck from an unknown flock.* An inferior buck from a flock of well-known repute will produce better stock than an accidental good one from an inferior flock. By all means keep to a "good strain;" adhere to flocks of well-known and deserved celebrity; you are far more certain as to the result. It is always better for a breeder to hire a buck than to buy one. Bucks "now-a days" are so highly kept, so pampered, that vast numbers of them are defective stock-getters. A yearling buck is generally supposed to be fully equal to serve 75 to 80 ewes; but a two year old buck should not have more than 70 to 75; In making choice of a buck to suit the ewe flock, regard should be had to every requirement. Neither *wool nor mutton* ought to take precedence, both must be of equal value. If any quality is to be discontinued, or of necessity given up for the time, let it be beauty, or symmetry, or some minor point. These are truly good in their place, but for these never give up the main qualifications—a good fleece, a fat back, and a full symmetrical proportion of great substance. As far as possible, put a short-legged buck to a long-legged ewe; a full chested buck to a narrow-chested ewe; a heavy-wooled buck to a light-wooled ewe; and so on, as judgment dictates, endeavoring to obtain from the male what is wanting in the female. In breeding what are termed "half breeds" or "grades," great care should be taken to obtain bucks from good flocks, or the end will be defeated. The very best of bucks should be used, possessing every good qualification of wool, mutton, and symmetry. It is quite a mistake to suppose that any bucks will do for half breeds. No such thing. If half-bred sheep are to retain favor with the grazier, they must be bred with every care and attention to the main qualities. Many farmers use bucks half-bred for this purpose; this is a mistake, and one that will in a few years cause them to be disappointed. In all cases use the best buck, or the best kind of a buck you can obtain, *and be not too nice about the price.* I have known many flocks to make from seventy-five cents to a dollar and a half per head more than others of the like size, solely from better and more correct breeding; and the difference is far greater as they grow up and are fattened.

Trees on Farms.

Another point of some importance, as connected with farming, is that of scattering trees in the hedges and open fields. On lands devoted exclusively to pasturing, such as are needed for their shade; and, scattered generally over a country, they add much to its beauty and picturesqueness. Especially is this the case in this country, where, owing to a damp atmosphere, the falling leaves soon decay and mingle with the soil, instead of becoming dry and littering the land and highways, as with us. Englishmen are justly proud of their old, spreading trees. Landlords often enter it in their leases that no tree shall be cut down. Still, in those parts of the empire, where the farming is best, the trees are going. You now see but few trees in the wheat-fields of the lowlands of Scotland, for instance; and very few in the fields of such farmers as Mr. Pusey and Mr. Mechi. These men do not sacrifice their love for the beautiful in nature. They cultivate trees in their proper places. They are the last men, I suppose, who would leave a country naked and bald; but trees have no longer a place among their wheat and barley.

In our land of scorching summers, let there be trees. It would be barbarous to root them out from our cultivated fields, where they are injurious, without, at the same time, securing their growth in other places, where they are not only harmless but pleasing to the eye, conducive to health, and often more profitable than anything else the soil will grow. Let them stud our pasture lands, as gems of beauty and of comfort. Our cattle need the means of coolness in summer, and warmth in winter. Only by attending to this in matter shall we ever approach that excellence this department, which our British brethern have attained. More depends upon cherishing the breeds we have, than upon new. Let trees line our highways. Their roots and tops will be a little injurious to the bordering lands, but not much; the weary traveller and his beast may rest under their shade; our children shall delight the palate from their produce; and our grand-children build their houses with the timber they grow. If our road-sides were adorned by a tree once in five rods, the rows alternating with each other, as far as convenient, the roads, with the exception of here and there a wet place, which might be intermitted if thought desirable, would not be a whit the worse, and in many soils be far better. If one-fourth of these are rock maples, they might furnish sugar for the population, whenever it should be cheaper to manufacture than to buy; and no one can tell what future times may be. Rural dwellings should be adorned by shade trees. An *American* farm-house, under a sun shining intensely at least two hundred and fifty days in a year, is a very different thing from an English country residence, where the sun scarcely shines as many hours, and that mainly morning and evening. Yet the Englishman takes care to provide his residence with trees; the breezes that enter his windows come purified by a previous passage through dense foliage; but too often the American neglects to surround himself with these *conservators* of health and comfort; so that he and his family breathe air, not only scorching hot, but often surcharged with carbon and ammonia. An American farm-house, without trees at a little distance, (not so near as to produce injurious dampness,) is out of all taste, is unfavorable to health and comfort, and in utter disregard of the great law of adaptation to circumstances of situation and climate.—*Albany Cultivator.*

Roofing for Buildings.

I notice some remarks in your paper of the 28th inst. in reference to cheap roofs, and the cost of some, as reported in the Prairie Farmer, as being from five to six dollars per 100 feet. Now, speaking from experience, I think I can tell of a covering for roofs cheaper than any of that kind, and at the same time not liable to any of the objections allowed to exist in those of which you speak, while it is of a material certainly less destructible from exposures incident to all roofs, than that spoken of there.

The roofing planks or boards should be of hemlock, laid close together, and at least three nails driven in the width of the planks or boards wherever nailed, to prevent warping from the heat of the sun. Over these may be applied a coat of coal tar for the purpose of furnishing throughout the whole a fastening to the covering to be spoken of, as the sun as it beats on the roof while the tar is not yet thoroughly dried in, renders it sufficiently liquid to cause an adhesion to be effected between it and the covering.

The best material to cover with is twilled cotton cloth, costing here generally not to exceed eight cents per yard, and possessed of sufficient body to retain, without allowing to pass through it, coal tar mixed with cement (Roman dale) or fine brick dust, laid on with a white-wash brush. Over the whole while yet new, sand can be sifted; this serves to keep the covering in place and to prevent the wind from crevices [illegible] the roof, from raising the roof covering, and when thoroughly dry, cracking the coating on it.

This kind of roof, as I have referred to the beginning of this communication, will be good and perpetual where there are timbers and rafters enough to support roofs, and [illegible] of these. The cloth may be laid crosswise with the length of the boards or not as the maker wishes—should be laid on the surface of the roof boards, without any raise, and lapped at least one and a half or two inches, using tacks of the size of those used commonly in fastening down carpets, driven pretty close together; the hemlock being possessed of great retentive power, no fear of their drawing out need be entertained, and as for rusting, the tar renders it impossible. I covered a roof of upwards of 400 square feet in this way at a cost of about $7 50, which has now been in use three years and upwards, showing slight defects occasionally, but which are wholly attributable to my want of experience in laying it down—I never having heard of any thing before like it, and being, as I believe, the first of the kind in this region of country.

Hoping that the information communicated may be of use to many on whom, like myself, Mammon has not smiled benignly, I will farther say, that in answer to any inquiries through your paper, I will communicate, if agreeable to you, any information which my experience, since acquired, will allow.—*Corres. Country Gentleman.*

Jenny Lind and her Baby.

The following article, from the Albany State Register, is one of those delicious little bits of newspaper writing, which, for genuine eloquence and feeling, are not surpassed by the happiest efforts of our best orators:—

Jenny Lind, the peerless—the Nightingale of the North—has a baby.—*Exchange paper.*

Well, what of it? Hasn't Jenny Lind, the peerless—the Nightingale of the North—a right to have a baby, we should like to know? Would you always have her singing to the cold world, warm as it may be in admiration of her songs, charming it by her sweet notes? Must she always be warbling to gaping crowds who gaze upon her only as a public performer? Look into the nursery where Jenny's baby sleeps in its little cradle, and hear the low lullaby of her sweet voice. See how fondly she gazes upon the helpless thing; and when it opens its little eyes, and looks trustingly up to the face of its mother, hear how she warbles the bird song to charm it back to sleep. Listen to the angel sounds! There is no effort, no art in that seraphic music It comes gushing forth from a heart full of a mother's affection, overflowing with a mother's yearning. How soft and low it is, and yet how full of the intensest love. Be still! Appland not. It is nature, all nature, supremely sweet though it be. Disturb not the enchanting harmony by the voice of praise. See! those litle eyes have closed again. Jenny's baby sleeps, and the song has died away—vanished slowly like a dream, or a receding shadow, into silence.

"Rock the cradle," Jenny.

But why, we ask again, should not Jenny, the world renowned Jenny, have a baby to love, to hold in her arms, to kiss and hug, to toss into the air, and trot upon her knee, and chirrup too, and tumble about with all a mother's doating playfulness? She has conquered fame—shall she linger in a solitary age, and die alone at last? Shall the hearts affections be wasted in the pursuit of ambition; and shall no loving and trusting faces cheer her through life, and stand around her death bed like bright visions looking towards the sky? Shall she walk the world's high places companionless, and without a staff for her age to lean upon? No! Ten thousand times dearer to her mother's heart is the crowing, even the cries of that little one, than the loudest applause that ever went up from the crowded audience, on the day of her proudest triumph. Ten thousand times sweeter is the smile, than the fragrance of the flowers that were showered upon her, as a tribute of admiration to her transcendant sweetness of song. Yes yes, ambition is nothing—triumphs are nothing—admiration of the world, fame and wealth are nothing. The mother looks upon her little child, and her heart clings to its feebleness, and all other world-visions vanish away.

"Rock the cradle," Jenny.

Go out to sing before the great world never again—pass forever from the gaze, to sit calmly by the domestic hearth, gathering your little ones around you, teaching them the value of "the divinity that stirs within them," the duties of life and hope of eternity. Tell them the littleness of fame, and folly of ambition, the beauty of holiness, and the home with the just at last. And when the angels shall gather around the Great White Throne, among the voices that shall mingle in the song of the Redeemer, yours and theirs shall be heard in the full volume of their sweetness, chanting the praise of Him that liveth for ever.

Buffaloes.—A member of Gov. Stevens' northern route exploring party, in a long communication to the St. Louis Republican, written from the head of Yellow Stone relates the following among many other [illegible] of the party:

On Sunday, after a march of [illegible] the buffaloes were reached. They were [illegible] and on each side of the train. For [illegible] ahead it seemed one vast drove yard. They were [illegible] seated by some as high as [illegible] ones [illegible] a very [illegible] [illegible] train at our usual [illegible] about half a [illegible] mile. The [illegible] sex in number, were [illegible] selected ones from the herd, soon dispatched them. In less than an hour the wagons were sent but a small distance from the route to receive the choicest pieces of the buffalo.

In the next two days' march the hunters were kept some distance ahead, to keep off the buffaloes; it was the only way the safe passage of the train could be insured through this sea of flesh. The pack mules and spare animals following on in the train, too numerous to be separately led, were hard to control; and despite every precaution and care, one horse and four mules were lost, they getting mingled with a herd of buffaloes. Every effort was made to reclaim them—hours spent in their attempted recovery. The efforts were entirely useless.

The Finest Ox in the World.—An ox, acknowledged by all who have seen him to be the most extraordinary one they have ever heard of, is about to be forwarded to the Smith-field Cattle Show, from Sir H. Verney's, of Claydon House. He was bred and fed by the Hon. Baronet, and is a pure short-horn. He is rather over five years old, and is supposed to be much heavier than the famous Durham ox, about which so much noise was made at the beginning of the present century, or than the American ox, which some few years since attracted so much notice. He stands nearly eighteen hands high, and measures 6 feet 6 inches from hip to shoulder, three feet across the hips, 9 feet 11 inches in girth behind the shoulder, and 12 feet in length from the tip of the nose to the rump, while his depth from chin to brisket exceeds 4 feet 6 inches. He is exceedingly well made up, particularly along the whole length of his back; and notwithstanding his great size, presents none of those monstrous fatty excrescences which so generally disfigured the highly-fed beasts, and were so generally condemned a few years since. He has been fed upon grass, cake and corn; and is supposed by various judges, who have courteously been permitted by Mr. Fraser, Sir H. Verney's steward, to visit him to weigh upwards of 300 stone. Notwithstanding his great weight, he is exceedingly active, is very tractable, and is a capital feeder; indeed, Mr. Fraser does not hesitate to express his belief that the animal could stand feeding for another year. In color he is a light roan, with white predominating, and is altogether a very handsome, quiet beast, with a kind head and docile eye.—*Bucks (Eng.) Chron.*

Meaning of Homeric Names.—The following is from a recent lecture on "The Women of Homer," by Prof. E. North, of Hamilton College:

"Homer's idea of what contributes to a woman's praise, is hinted at in the names by which his heroines are designated. These names are not given to keep alive a grandmother's memory; nor because novelists have clothed them with a fictitious charm; but for the sake of their significance. Andromache, when interpreted, means the hero's battle-prize; Theano, the heavenly-minded; Arete, the sought-for; Calianissa, ruling by beauty; Hecamede, the far-thoughted; Euryelea, the widely-praised; Iphimidea, the strong-thinker; Polyxene, the very hospitable; Nausicaa, the ship-gaited, (in allusion to her easy and graceful movements;) Penelope, the web-unraveller; and thereby hangs a proverb. 'The weaving of Penelope's web,' is, at this day, a proverbial phrase for the doing of a deed that is never finished. Penelope was pressed to select a second husband from among the many princely suitors for her hand. She promised to think of the matter, after she had woven a shroud for the aged hero, Laertes. Her trick to prolong the weaving of the web is thus described by herself: 'During the day, I wove the large web, but by night, when the torches were lit, I unravelled it. Thus, for three years, I kept clear of the suitors; but when the fourth year came, they found me out, through the connivance of my waiting maids—careless creatures—and they gave me a scolding. Then I finished the shroud, though against my will, and by compulsion."

Thoughts for the Thoughtful.—Of all happy households, that is the happiest where falsehood is never thought of. All peace is broken up when once it appears that there is a liar in a house. All comfort has gone when suspicion has once entered; when there must be reserve in talk and reservation in belief. Anxious parents, who are aware of the pains of suspicion, will place general confidence in their children, and receive what they say freely, unless there is strong reason to distrust the truth of any one. If such an occasion should unhappily arise they must keep the suspicion from spreading as long as possible, and avoid disgracing their poor child while there is a chance of its cure by their confidential assistance. He should have their pity and [illegible] help, as if he were suffering under [illegible] disorder. If he can be cured he will become daily grateful for the [illegible]. If he endeavor fail, means must [illegible] taken to prevent his example from [illegible] and [illegible] the family contagion. I fear that [illegible] or a [illegible] [illegible] [illegible]

THE CALIFORNIA FARMER.

SAN FRANCISCO, THURSDAY, MARCH 2, 1854.

Drilling Grain.

In a country so admirably adapted as is California to the culture of wheat, the method of cultivation has heretofore seemed almost a matter of indifference; the extreme fertility of the soil has secured a profitable return for even the most careless husbandry. But the time is rapidly approaching, here as elsewhere, when competition will compel farmers to seek out and practice the most improved method of production. Amongst these methods of increased production, drilling small grain doubtless holds a prominent place. Every well informed farmer knows, from reading if not from practice, the advantages which the drilling of grain possesses over broadcast sowing; but as there are in this State many persons who have turned their attention to farming, without much previous knowledge or experience of the subject, it may not be amiss briefly to recapitulate the advantages of drill planting.

With a properly constructed machine, every grain is planted at a proper and uniform depth and well covered, and precisely the right amount, neither more nor less, is sown upon, or rather in, the ground. All these points are essential to the production of a maximum crop; and in broadcast sowing there is danger of failure in every one of them. The most careful and expert seedsman cannot sow wheat or other small grain with the exactness of a well constructed drill, and of course where the harrow is drawn over land left in ridges by the plow, some of the seed will be covered deep, some shallow, and some not at all; of which latter fact clouds of crows and blackbirds are aware, if the farmer is not. These are the main points to be considered, and in Great Britain, where scientific and practical agriculture is carried to a greater degree of perfection than elsewhere, they are so well understood, that broad-cast sowing has almost, if not entirely, ceased to be practiced.

In selecting a drill, the chief things to be looked to are, efficiency, economy and simplicity. Some drills are liable to choke, and feed irregularly; others cost more than small farmers can afford to expend; and some again are so complicated that they are continually liable to get out of order, and require the services of a skilful mechanic to adjust them. These objections, one or the other of which can be urged against most of the drills now employed, have so far served very much to restrict their use, and to induce farmers to follow on in the beaten and thriftless track of broad-cast sowing. Without resorting to distinctions or invidious comparisons, we will merely state that the grain drill patented by Mr. Richard J. Gatling, and now on sale by Samuel Henderson, Esq., of Santa Clara, possesses, in a high degree, the above requisites of efficiency, economy and simplicity. In the absence of drawings, we will endeavor to give such a description of it as may enable our readers to judge for themselves of its merits.

The machine consists of a platform about five feet square. This platform rests on two wheels with a revolving iron axle, or, more properly speaking, each wheel has its own axle; the axle being divided in the middle, in order to give each wheel an independent motion in turning. Attached to the bottom of this platform are five hollow teeth of cast iron, for conveying the grain into the ground. These teeth are arranged, in two rows, one behind the other. The teeth in each row are twenty inches apart, and so arranged that those in the hindmost row follow in the middle of the spaces between those in the foremost row; thus making the drills ten inches apart, which experience has demonstrated to be the proper distance. This arrangement of the teeth is much preferable to having them in one row, as it renders the machine much less liable to be clogged by stubble or other trash. Over these teeth are placed the boxes containing the grain. Over the mouth of each tooth—and consequently in the bottom of each box—lies a common auger (minus the point), which revolves horizontally. On the head of each auger is a a small pinion, which runs in a corresponding cog-wheel on the iron axle. Over the point where the auger terminates, in the mouth of the hollow tooth, is a sliding gauge for regulating the quantity of grain to be sown. The horses are attached to the front, either by a pole or iron bracket. When the wheels are set in motion, the axles revolve, driving the augers, which, as it were, *bore* out the grain into the hollow teeth, down which it descends into the soil.

It will be at once seen that this machine must sow with unfailing regularity; as it is impossible the augers should be clogged by the grain, or any impurities it may contain. So long as the wheels turn, the augers *must* revolve; and so long as they revolve, whatever is in the boxes over them must be emptied down the hollow teeth. And it matters nothing whether the team be a yoke of sluggish oxen, or a pair of spirited horses, the quantity of grain sown on an acre must of course be the same; for the amount of grain sown depends entirely on the *number of revolutions* of the axle, and *not* on the velocity of its motion. The above described machine is of a proper size for two horses, and will sow six acres a day. On large farms it might be desirable to have one with nine teeth; five in the foremost row and four in the hindmost; and requiring four horses to draw it. In a machine of this size, the platform would of course be proportionally lengthened laterally; the length fore and aft remaining the same.

Such is "Gatling's Grain Drill," a wonder at once for its ingenuity and simplicity. Much less complex in its structure than a common wagon, it may almost be said to be impossible that it should ever get out of order; and when it *does* need repair, the most ordinary workman can do what is needful; and being simple, it is of course cheap. This drill has been used by some of the most skilful husbandmen in the neighborhood of Santa Clara; and the best testimony in its favor is, that where it has been used *once*, it is always used *again*; because a largely increased crop has never failed to be the result. One may be seen at work on the San Lorenzo, in Alameda county, on the farm of Mr. Winton; also on the farms of Messrs. Robinson, Burnett, and John Wiseman, of Santa Clara, who will doubtless take pleasure in showing it to any of our readers in those places.

We again call the attention of farmers to the importance of looking into this matter of drilling grain; for they will find their advantage in it. As for Gatling's drill, if it is the best one, they will of course employ it, if not, procure the best, and set about using it at once. A sample will shortly be seen at Warren & Son's exhibition hall, Bush street, San Francisco.

Sonoma County Ahead.

In a previous number of the Farmer we announced that Sonoma County was in the field. She has spoken, and we hail the intelligence with pleasure. We give place to the Report of the Officers of the Society, which we trust will arouse every county in the State to follow their noble example. From their energetic Secretary we have received valuable data, from which correspondence we have ventured to clip the following paragraph—"I herewith furnish you with an account of our first Agricultural meeting, not only the first in the County, but I believe the first *County meeting* in the State. About thirty persons were present. Among the number were some of our most intelligent and extensive farmers—all of whom evinced much interest in the undertaking. It is their determination to hold the first Annual Fair this fall, of which due notice will be given you. I send list of subscribers to your valuable journal, and trust that the distribution of your paper will beget a desire to subscribe with others. A spirit of emulation has already sprung up, which must result in good crops, good horses and cattle, and I might add, comfortable and happy homes."

This is the right tone; we like it; there is soul in it; when the heart is in the work, the work will be done. Sonoma will be the banner County yet. Hear the report of the officers:

Agreeable to notice, there was a meeting of the citizens of Napa Valley held at the Court House in Napa City, on Saturday, the 11th ult., having for its object the organization of a County Agricultural Society. On motion, John M. Hamilton, Esq., was called to the Chair, and J. Evans Brown appointed Secretary. On motion, a Committee of Six was appointed for the purpose of drafting the Constitution and By-Laws, and to report the same at the next regular meeting, on the third Saturday of the ensuing month.

The Chair appointed Messrs. J. Griggsby, Judge Starks, Wells Kilburn, Angus L. Boggs, Bartlett Vines, and J. Evans Brown, members of that Committee.

It was ordered that the Secretary forward a statement of the proceedings of the meeting to the Editors of the California Farmer, with a request to publish.

J. M. Hamilton, Pres't.
J. E. Browne, Sec'y.

Farming in the Mountains.—The Sonora Herald says: "Wheat and barley will grow on these hills, and will mature without irrigation. The Messrs. Heslep have tried it at the Bald Mountain ranch, and with complete success. Let us raise our own grain without depending on the valleys and paying extravagant freights."

"Knowledge is Power."

The "Ocean Steamers," with all their powerful machinery and ponderous boilers, might lie listlessly upon the water, powerless, were the engineer wanting in the "knowledge" of that machinery and its uses, and the strength and capacity of those boilers.

The "beautiful Clipper" that sits upon the wave so lightly, moving almost without power, would soon be a scattered wreck upon the shore, were there no "pilot" whose "knowledge" of the *helm* enables him to guide her safe through dangerous shoals and keep her from the ragged reef.

The "Telegraph" might essay in vain to carry thought along its extended line, were the "knowledge" wanting by which the battery is brought in contact and the communications formed.

It is the "knowledge" possessed of these several *elements of power* that gives the possessor the means to use them for his own good as well as for the advance of science. The builder of the ocean steamer does not remain ignorant of the strength needed to sustain the powerful machinery, nor the engineer enter upon his duties without the requisite "knowledge" to move that machinery, and thus convey the mighty mass in safety to her destination.

Donald McKay, the builder of the most beautiful "clippers" ever known, would not have reached the proud eminence he has attained without that "knowledge" which has given him the "power" to place upon the ocean the fleetest and most perfect modeled ships that ever floated.

That beneficial and powerful influence which has been diffused throughout the world by those lightning messengers, would have been lost had Morse been wanting in the "knowledge" of the "power" he could control.

If in these pursuits it requires *study* to fit a man for a "knowledge" of the weapons he is wielding, that he may enjoy and use the "power" they give, ought not the cultivator of the soil also to acquire a "knowledge" of those *elements of power* within his charge?

Is not the *cultivator* embarked with a valuable cargo on an important voyage, and shall *he* not know whether his *ship* is safe, his *pilot* skilful and his freight destined to a prosperous market?

The "Homestead," is the Farmer's ship, and he should know every rope in it—he should know the nature of the soil he cultivates, and its capacities for each and every product; he should study to attain a "knowledge" of its wants and necessities appropriate to every season and climate. As the pilot by *his* "knowledge" understands every sail and uses them to carry him successfully and safely across the ocean, so the farmer should control every element of the soil and bend them to his purposes, that they may waft him to a profitable harvest.

"Knowledge is power," and in every department of science it is felt to be so. We fear, however, among agriculturalists, they do not feel its full force. Among all other classes of men, they feel it to be of the highest moment to be thoroughly acquainted with the details of their own occupation; but the agriculturists do not fully appreciate the magnitude of the enterprise in which they are engaged; they are too apt to believe that the least labor and cost will suffice. As for improvement, what was done last year may as well be done this year; they rarely dream of applying Scientific knowledge to agriculture. Books are seldom read—lectures are of little value—newspapers are a bore—and if they have leisure they wish to rest and enjoy it. This will not apply to all, but it is too true in its application to the mass.

We trust there is a spirit abroad that will correct these fatal errors, and that the old excuse, "there is no scientific knowledge needed," is exploded.

We find a most excellent article upon the subject of improvement by means of "a Newspaper in a Family," so appropos that we append it to this article, and we trust the farmers of California will read, approve, and never again say—

"I CAN'T AFFORD IT."

At this season of the year, when people are called upon to subscribe to papers, the excuse "I can't afford it," is very frequently made, which, being interpreted, means "I regard other things of more consequence to myself and family than a newspaper." Rightly considered, there are very few influences which tell more immediately and effectually upon the improvement of the family circle than a well conducted and high-toned paper. Judge Thomas, of Worcester, Mass., in a recent lecture before the Young Men's Association in this city, said, "The Newspaper Press is destined to be the chief instrument of popular culture. It is, intellectually, the daily bread of the people. The power of the press, great as it is, is continually increasing, and will draw to itself, and demand for its service more and more of the learning and talents of the country. The eloquence of the bar, of the assembly and of the stump, create a stronger immediate impression, but there sphere is too limited to compete with the wide spread influence of the eloquence of the pen. As an instrument for swaying the popular mind, they all yield to it. The pen is the true lever of Archimedes, and in the newspaper press has been found the place for a fulcrum."

The man of business "can't afford" to do without his paper. He must know the condition of the markets, the financial prospects, and the passing events of the day. It teaches him when to buy and when to sell, and he often finds a single paragraph worth its thousands of dollars to him. The mechanic "can't afford" to dispense with his paper. There are suggestions in it which his brother mechanics have made, by which he can profit; or it contains some new labor-saving invention which enables him to make the same article in less time. The farmer "can't afford" to carry on his farm without his paper. There is that in it which, if properly studied and practiced, increases the income of his farm, twenty thirty, or even one hundred per cent. He learns from it what are the best varieties of grain, what fruits are the best suited to her soil and climate, what crops have been made the most profitable, what implements are the best, and last, not least, he may learn the value of careful observation and accurate knowledge. No one can afford to be without all the means of information which are within his reach. No one can afford to live in darkness when the world is full of light, to plod on in ignorance when it is the mission of truth to instruct and elevate the mind.

Least of all can any man afford to deprive his family of the advantages which a journal of the right stamp affords. What are a few dollars and cents in comparison with right views sound principles and generous feelings! A word in season, fitly spoken, may change the whole tone of life, and like the seed sown in good ground bring forth an-hundred fold in noble living and energetic acting. It is a short-sighted policy that consults only immediate effects, while it overlooks the far-reaching results which the most trivial causes often develope in character. If persons would only take a second thought, we are sure they would never say "I can't afford" to subscribe for a paper which contains practical suggestions with regard to the best methods of making this life, with all its varied interests, what it should be. But in papers as everything else, it should be an invariable rule to provide the best. It is better to be ignorant than to be led astray—better to read nothing than what is pernicious in its tendency.

One thing is certain, we "can't afford" to live without the effort to become wiser and better as we grow older—we 'can't afford" to act as though there were no future, no life beyond this life, no eternity beyond time; for our attainments in knowledge and excellence in this world will be the measure of our happiness in the next.

California Grain--Threshers and Separators.

California is destined to attract the attention of the world in all that appertains to the planting of *Wheat and other Grains*, and she is now attracting attention at home and abroad by the immense product of Grain she has harvested the past year and the extensive fields that have been planted the present year.

The present condition of the *Flour market* is but the result of the immense crops of California and Oregon wheat that have been brought upon the market, and the half has not been told.

Not only in all the Eastern and Western States of our own country but even in Europe, merchants interested in the grain crop of the United States will turn their inquiries to California, that they may base their calculation upon the amount raised the present year.

We rejoice at this, and say emphatically, California will provide for herself. California is able to raise wheat enough for her own consumption, and she will no it. Therefore we say again to shippers of Wheat and Flour, you have been duly notified, and if there is a profit to be made in raising Wheat and manufacturing Flour, our own citizens deserve it, and they should receive the reward they deserve.

There is another feature to which we call attention: Manufacturers of the most valuable implements and all improvements in everything that relates to grain sowing and harvesting, turn their attention to California, as the great field for them to operate. We are reminded of this by the recent introduction of the new grain drills to which we allude this day, and to the valuable and much improved implements advertised by Messrs. Coit & Beals, and we trust our cultivators will ever bear in mind that the best tools and seeds are always cheapest.

Ornamental and Shade Trees.—Nothing adds more to the beauty and value of a residence than a few shade and ornamental trees. The present is a good time for the planting, and owners of real estate can make no better investment than in planting them around their buildings and even around their vacant lots. A house will bring a better rent and let more readily, and lots will sell better thus improved.

Sheep Breeding.

We take pleasure in laying before our readers the annexed communication from a gentleman who has done a great service to our State, by introducing valuable stock and also many new trees and shrubs from China. Such uses of wealth not only give satisfaction and benefit to the individual, but the results are widely beneficial.

We believe that California possesses the advantages of raising sheep, equal, if not superior to many of the sheep-raising States of the North and East. We have abundance of food for them, at little or no cost; we can shelter them at less expense than any other State; the climate suits them; the flocks increase far beyond those of other States, and disease and death are not so prevalent. We believe that we can become a wool growing State, and that the time is not far distant when we can use the wool in our own manufacturing establishments. We are tending to this, and shall we not rejoice to know it? We feel therefore that those who take an interest in "home productions," by importing stock or introducing any article into our State, deserve well o the State, and we are glad to record the instance alluded to in the communication appended to this.

This is but the beginning—the same gentleman is doing much to improve valuable lands and to beautify as well as benefit the community by means of his wealth.

It is to be hoped that attention to this subject will attract others to "go and do likewise," and thus hasten the day when California shall in every sense be an independent State.

"In July, 1851, I imported from Shanghai, in China, seven broad tailed sheep; on the 1st February, inst., they had increased naturally to fifty-three, besides some ten or twelve lost from casualties.

"These sheep are very prolific, more so than any I know of. Two of my ewes have had *five* lambs each, and several four at a birth. I think they have two or more, oftener than a less number. Many of the ewes, I notice, have four teats. Some of the young ewes lambed here have had twin lambs before nine months old, and the average births of all are twice in eleven months.

"For mutton, these sheep are extra superfine, and weigh 150 pounds. For wool they are of little value; their fleeces weigh not over two to three pounds each, and coarse.

"I am not familiar with the natural history of the broad-tailed Asiatic sheep, and just now, am not prepared to write any thing interesting in regard to them, but I may do so after a time."

We take the following article from the Farmers's Companion:

Breeders of sheep—no matter of what variety—should be very cautious in selecting their bucks, and look not only at the good qualities of the individual, but also at his adaptation to the ewes; choosing an animal that will amend any imperfections in wool or carcase which may be observable in the females. The requirements of their flock of ewes should be particularly noticed, and a careful separation of them made, so as to ascertain more accurately their precise defects, and to point out with greater certainty the peculiar kind of buck necessary to rectify these defects. This should be done before procuring the buck—not to buy first, and then try and suit the ewes to him afterwards. *Never purchase a buck from an unknown flock.* An inferior buck from a flock of well-known repute will produce better stock than an accidental good one from an inferior flock. By all means keep to a "good strain;" adhere to flocks of well-known and deserved celebrity; you are far more certain as to the result. It is always better for a breeder to hire a buck than to buy one. Bucks "now-a days" are so highly kept, so pampered, that vast numbers of them are defective stock-getters. A yearling buck is generally supposed to be fully equal to serve 75 to 80 ewes; but a two year old buck should not have more than 70 to 75; In making choice of a buck to suit the ewe flock, regard should be had to every requirement. Neither *wool nor mutton* ought to take precedence, both must be of equal value. If any quality is to be discontinued, or of necessity given up for the time, let it be beauty, or symmetry, or some minor point. These are truly good in their place, but for these never give up the main qualifications—a good fleece, a fat back, and a full symmetrical proportion of great substance. As far as possible, put a short-legged buck to a long-legged ewe; a full chested buck to a narrow-chested ewe; a heavy-wooled buck to a light-wooled ewe; and so on, as judgment dictates, endeavoring to obtain from the male what is wanting in the female. In breeding what are termed "half breeds" or "grades," great care should be taken to obtain bucks from good flocks, or the end will be defeated. The very best of bucks should be used, possessing every good qualification of wool, mutton and symmetry. It is quite a mistake to suppose that any bucks will do for half breeds. No such thing. If [illegible] are to return over with the greatest, they must be bred with every care [illegible] In all cases use the best buck, or the best kind of a buck you can obtain, *and be not too nice about the price.* I have known many flocks to make from seventy-five cents to a dollar and a half per head more than others of the like size, solely from better and more correct breeding; and the difference is far greater as they grow up and are fattened.

Trees on Farms.

Another point of some importance, as connected with farming, is that of scattering trees in the hedges and open fields. On lands devoted exclusively to pasturing, such as are needed for their shade; and, scattered generally over a country, they add much to its beauty and picturesqueness. Especially is this the case in this country, where, owing to a damp atmosphere, the falling leaves soon decay and mingle with the soil, instead of becoming dry and littering the land and highways, as with us. Englishmen are justly proud of their old, spreading trees. Landlords often enter it in their leases that no tree shall be cut down. Still, in those parts of the empire, where the farming is best, the trees are going. You now see but few trees in the wheat-fields of the lowlands of Scotland, for instance; and very few in the fields of such farmers as Mr. Pusey and Mr. Meehi. These men do not sacrifice their love for the beautiful in nature. They cultivate trees in their proper places. They are the last men, I suppose, who would leave a country naked and bald; but trees have no longer a place among their wheat and barley.

In our land of scorching summers, let there be trees. It would be barbarous to root them out from our cultivated fields, where they are injurious, without, at the same time, securing their growth in other places, where they are not only harmless but pleasing to the eye, conducive to health, and often more profitable than anything else the soil will grow. Let them stud our pasture lands, as gems of beauty and of comfort. Our cattle need the means of coolness in summer, and warmth in winter. Only by attending to this in matter shall we ever approach that excellence this department, which our British brethern have attained. More depends upon cherishing the breeds we have, than upon new. Let trees line our highways. Their roots and tops will be a little injurious to the bordering lands, but not much; the weary traveller and his beast may rest under their shade; our children shall delight the palate from their produce; and our grand-children build their houses with the timber they grow. If our road-sides were adorned by a tree once in five rods, the rows alternating with each other, as far as convenient, the roads, with the exception of here and there a wet place, which might be intermitted if thought desirable, would not be a whit the worse, and in many soils be far better. If one-fourth of these are rock maples, they might furnish sugar for the population, whenever it should be cheaper to manufacture than to buy; and no one can tell what future times may be. Rural dwellings should be adorned by shade trees. An *American* farm-house, under a sun shining intensely at least two hundred and fifty days in a year, is a very different thing from an English country residence, where the sun scarcely shines as many hours, and that mainly morning and evening. Yet the Englishman takes care to provide his residence with trees; the breezes that enter his windows come purified by a previous passage through dense foliage; but too often the American neglects to surround himself with these *conservators* of health and comfort; so that he and his family breathe air, not only scorching hot, but often surcharged with carbon and ammonia. An American farm-house, without trees at a little distance, (not so near as to produce injurious dampness,) is out of all taste, is unfavorable to health and comfort, and in utter disregard of the great law of adaptation to circumstances of situation and climate.—*Albany Cultivator.*

Roofing for Buildings.

I notice some remarks in your paper of the 28th inst. in reference to cheap roofs, and the cost of some, as reported in the Prairie Farmer, as being from five to six dollars per 100 feet. Now, speaking from experience, I think I can tell of a covering for roofs cheaper than any of that kind, and at the same time not liable to any of the objections allowed to exist in those of which you speak, while it is of a material certainly less destructible from exposures incident to all roofs, than that spoken of there.

The roofing planks or boards should be of hemlock, laid close together, and at least three nails driven in the width of the planks or boards wherever laid, to prevent warping from the heat of the sun. Over these may be applied a coat of coal tar for the purpose of furnishing throughout the whole a fastening to the covering to be spoken of, as the sun as it heats on the roof while the tar is not yet thoroughly dried in, renders it sufficiently liquid to cause an adhesion to be effected between it and the covering.

The best material to cover with is twilled cotton cloth, costing here generally not to exceed eight cents per yard, and possessed of sufficient body to retain, without allowing to pass through it, coal tar mixed with cement (Rosendale) or fine brick dust, laid on with a white-wash brush. Over the white while yet new, sand can be sifted; this serves to keep the covering in its place and to prevent the wind from creviss[illegible] roof, from raising the roof covering, and more especially, cracking the coating on it.

This kind of roof[illegible] [illegible] this [illegible] and [illegible] whose [illegible] roofs and [illegible] of these. The cloth may be laid crosswise to the length of the boards or not as the maker wishes—should be laid on the surface of the roof boards, without any raise, and lapped at least one and a half or two inches, using tacks of the size of those used commonly in fastening down carpets, driven pretty close together; the hemlock being possessed of great retentive power, no fear of their drawing out need be entertained, and as for rusting, the tar renders it impossible. I covered a roof of upwards of 400 square feet in this way at a cost of about $7 50, which has now been in use three years and upwards, showing slight defects occasionally, but which are wholly attributable to my want of experience in laying it down—I never having heard of any thing before like it, and being, as I believe, the first of the kind in this region of country.

Hoping that the information communicated may be of use to many on whom, like myself, Mammon has not smiled benignly, I will farther say, that in answer to any inquiries through your paper, I will communicate, if agreeable to you, any information which my experience, since acquired, will allow.—*Corres. Country Gentleman.*

Jenny Lind and her Baby.

The following article, from the Albany State Register, is one of those delicious little bits of newspaper writing, which, for genuine eloquence and feeling, are not surpassed by the happiest efforts of our best orators:—

Jenny Lind, the peerless—the Nightingale of the North—has a baby.—*Exchange paper.*

Well, what of it? Hasn't Jenny Lind, the peerless—the Nightingale of the North—a right to have a hahy, we should like to know? Would you always have her singing to the cold world, warm as it may be in admiration of her songs, charming it by her sweet notes? Must she always he warbling to gaping crowds who gaze upon her only as a public performer? Look into the nursery where Jenny's baby sleeps in its little cradle, and hear the low lullaby of her sweet voice. See how fondly she gazes upon the helpless thing; and when it opens its little eyes, and looks trustingly up to the face of its mother, hear how she warbles the bird song to charm it back to sleep. Listen to the angel sounds! There is no effort, no art in that seraphic music It comes gushing forth from a heart full of a mother's affection, overflowing with a mother's yearning. How soft and low it is, and yet how full of the intensest love. Be still! Applaud not. It is nature, all nature, supremely sweet though it be. Disturb not the enchanting harmony by the voice of praise. See! those litle eyes have closed again. Jenny's baby sleeps, and the song has died away—vanished slowly like a dream, or a receding shadow, into silence.

"Rock the cradle," Jenny.

But why, we ask again, should not Jenny, the world renowned Jenny, have a baby to love, to hold in her arms, to kiss and hug, to toss into the air, and trot upon her knee, and chirrup too, and tumble about with all a mother's doating playfulness? She has conquered fame—shall she linger in a solitary age, and die alone at last? Shall the hearts affections be wasted in the pursuit of ambition; and shall no loving and trusting faces cheer her through life, and stand around her death bed like bright visions looking towards the sky? Shall she walk the world's high places companionless, and without a staff for her age to lean upon? No! Ten thousand times dearer to her mother's heart is the crowing, even the cries of that little one, than the loudest applause that ever went up from the crowded audience, on the day of her proudest triumph. Ten thousand times sweeter is the smile, than the fragrance of the flowers that were showered upon her, as a tribute of admiration to her transcendant sweetness of song. Yes yes, ambit on is nothing—triumphs are nothing—admiration of the world, fame and wealth are nothing. The mother looks upon her little child, and her heart clings to its feebleness, and all other world-visions vanish away.

"Rock the cradle," Jenny.

Go out to sing before the great world never again—pass forever from the gaze, to sit calmly by the domestic hearth, gathering your little ones around you, teaching them the value of "the divinity that stirs within them," the duties of life and hope of eternity. Tell them the littleness of fame, and folly of ambition, the beauty of holiness, and the home with the just at last. And when the angels shall gather around the Great White Throne, among the voices that shall mingle in the song of the Redeemer, yours and theirs shall be heard in the full volume of their sweetness, chanting the praise of Him that liveth for ever.

Buffaloes.—A member of Gov. Stevens' northern route exploring party, in a long communication to the St. Louis Republican, written from the head of Yellow Stone river, relates the following among many other "hair breadth escapes" of the party:

On Sunday, after a [illegible] the buffaloes were [illegible] and on both sides of the road. [illegible] it seemed as [illegible] [illegible] immediately [illegible] considered a very [illegible] trust at [illegible] almost [illegible] number [illegible] [illegible] [illegible]

AGENTS FOR CALIFORNIA FARMER.

Messrs Adams & Co. at all their offices throughout the United States or Europe.
Messrs. Wells, Fargo & Co., at their offices throughout the Country.
Messrs. Langton & Co. *for Downieville, Foster's Bar, Goodyear's Bar, Minesota.*
Messrs. Leland & McCoombe—*Crescent City, Port Orford, Uniontown, Eureka, and Buckspor't.*
San Francisco—Messrs. Murray & Co., booksellers, Montgomery street; Sullivan's newspaper stand, near the Post Office; Kimball's, Noisy Carriers Hall, Long wharf; J. H. Still, bookseller, Montgomery street.
Oakland—Mr. Isaac Willard.
Benicia, Martinez, &c.—Messrs. Stiles & Dodds.
Union City and Mission San Jose—Messrs. Howard & Chamberlain.
San Luis Obispo—Dr. Thomas L. Harvey, P. M.
Sacramento—Mr. Oscar D. Avaline; Messrs. Curle Brothers.
Union, Humboldt Bay—A. H. Murdoch, P. M.
Mount Farm, O. T.—Gen. M. M. McCarver.
Marysville—Geo. S. Becker.
Stockton.—Rosenbaum & Jonckimsen.
New York City, N. Y.—J. M. Thorburn & Co.
Bidwell's, Butte Co—P. Freer.
Watsonville, Trinity Co.—H. B. Davidson & Co.
Yreka—Crane, Rogers & Co.

N. B.—We want Agents in all the principal localities, and persons disposed to act can have the opportunity, if satisfactory to all parties.

The Firemen's Annual Parade.

This magnificent demonstration came off on Monday, according to announcement, though the day was the most unpropitious that could possibly have been selected. It opened dull and dismal, and never, since the Deluge, did the rain come down faster or more persceringly. At daylight, the ringing of the bells called the Firemen to prepare for the festivities of the day, and at 10 o'clock the companies were mustered at their respective Engine houses. The streets were decorated at many points with flags, and at the Volunteer and Pennsylvania Engine houses a string of flags and signals extended across the street.

Shortly before 12 o'clock, strains of martial music gave notice that the Companies were approaching the place of rendezvous on Stockton street, and in a few minutes the line was formed. We are unable to devote much space to the details of the procession, and will content ourselves with stating that it consisted of twelve splendid-looking Engine Companies, with their Engines, three Hook and Ladder Companies, with their trucks, and the National Lancers, together with the city officers and a large number of invited guests. The Department numbered nearly 1000 men.

The procession, after forming in admirable order, marched through the streets which had been designated, to the Metropolitan Theatre, where the oration was to be delivered. The department filled the boxes, parquette, and lower gallery, while the stage was occupied by the guests and the officers of the day. Mr. Van Bokkelen having called the meeting to order, the Rev. Bishop Kipp delivered an appropriate prayer. Mr. H. Haight, the Treasurer of the Firemen's Charitable Fund, read the Annual Report, which showed that the balance now on hand amounted to $20,-641, which is securely invested at 2 to 3 per cent per month. The Report was received with loud applause. James W. Stillman, Esq., then delivered a fine ode, written for the occasion by Mr. J. D. Brower, of Columbian Engine, No. 11. The orator of the day, Hon. Edward Stanley, then took the stand, and delivered a masterly oration, which we regret our inability to publish, owing to its great length. This was succeeded by characteristic speeches by Gen. Wool, Ex-Gov. Foote, Mayor Garrison, Dr. Gray, Geo. H. Hossefross, C. P. Duane, and Mrs. Sinclair, who acknowledged in her own graceful way, the hearty welcome with which she was received.

On leaving the theatre, the Companies took up their line of march through the appointed streets, to the City Hall, and were dismissed.

We will just add that there is not a city in the world that has so great reason to be proud of its Fire Department as San Francisco. We will match them against the world.

The Chronicle says, in its own peculiar way: "If our Firemen had waited five years, they could not have found a more propitious day for their celebration—could not have found one which would so have tried their mettle. If any doubts of their pluck existed before, none can live after the battle of yesterday. Ten legions of water spouts could not make them "back der machine," though they all "took water." The clerk of the weather got his back up, and seemed determined to strike a balance sheet, if it took all the rain to make the books straight. So mother Nature's watering pot was capsized, and the earth became a lake of water. Rivers of liquid mud poured through our streets.

"Each hair became a water-spout, the brim of each hat a miniature Niagara. Oh, how some of the boys longed for a fire to break out. But there was no chance for that. Conflagration was fairly ashamed of itself, and hid its red face in the furnaces of foundries and close stoves. All the salamanders died, and aspiring sturgeons anticipated holding a revel in the halls of San Francisco. Everything was wet—everything was muddy. Drum-heads stretched, and became flabby and soundless. But not a Fireman flagged. They were out for duty as well as amusement, and they had both. Just about the time that the last man of the last company got under cover, the Clerk got over his pet, the rain ceased and the weather cleared off.

"Washington made a mistake;" he should have been born in the dry season, or the anniversary of his birth should be adjourned some three or six months. And we move that the subject be referred to the Committee on Fire and Water in the Council."

Australian News.

By the arrival of the American bark "Gay Head" at this port, on the 26th inst., from Sydney, we are in possession of files of Sydney papers to the 8th of December. The dates from Launceston are to the 20th November, and from Hobart Town to the 26th of the same month.

The Northern diggings, in the vicinity of Tamworth, were about being abandoned, on account of the smallness of the yield.

The gold received at Sydney, from the Western diggings, for the week ending Dec. 1, exhibits an increase of 350 ounces over the previous week The greatest contentment prevails amoug the miners in that region, and a still further improvement is anticipated, as operations progress, and the auriferous localities become better known.

The following are the prices of provisions at Burradong:—Flour, £2 10s. per cwt.; Tea, 2s. 6d. per lb.; Sugar, 6d.; Beef, 3d.; sheep, 11s. each.

The Southern mines, from the latest receipts, indicate a steady improvement in the yield. At the Braidwood mines, miners are said to be realizing from two to three ounces per day.

At Melbourne, the receipts of dust were on the increase. The whole quantity received during the week ending Nov. 24, was 41,744 ounces. The want of water is proving a serious drawback at the Goulburn miners. The Ovens were paying well. The price of gold continues at £3 16s 9d., with a good demand and fair supply.

The American clipper "Sovereign of the Seas," arrived at Port Phillip on the 25th November, having made the passage from England in 70 days, according to one account, while another states the time at 78 days. This must be considered a first-rate passage, if we allow for the fact that she drew 22 feet 6 inches of water. The passengers speak in the highest terms of the treatment they received from Capt. Warner.

The Sydney Empire, of December 2d, furnishes a report of the current wages in the colonies, as follows: Painters, 15s. to 20s. per day; Carpenters and Joiners, 13 to 15s.; Plasterers, 22 to 55s.; Bricklayers, 22 to 25s.; Masons, 20 to 30s.; Laborers, 8 to 10s.; Quarrymen, 20 to 21s.; Blacksmiths, 10 to 15s.; Carters, 7 to 10s.; Shipwrights, 16 to 20s.; Boatbuilders, 12 to 15s.; able seamen, 15 to 18s.; Female House Servants, 8 to 12s.; Male House Servants, 12 to 20s.

Mining Items.

From the Sacramento Union we take the following:

Special Election.—The election on Saturday resulted in favor of issuing the $35,000 bonds for the Fire Department, and the $80,000 for paying contractors and warrants, by a large majority. The result is as anticipated, and we are glad on account of the contractors and warrant holders, that the result has proved so favorable. It will relieve them, provided the bonds can be sold in a reasonable time. We fear, however, they will go off slow at any price over sixty cents on the dollar.

At Diamond Springs it was raining for the most part of last week, and still continues. Business good. Miners are doing well; as evidence of the fact, the banking and express offices are purchasing more dust than was ever known before.

In Placerville, on Sunday, it rained heavily all day, and still continues There are a great many people in town, and business generally is assuming a more active appearance. Miners are doing well, merchants busy, and all classes prosperous. It is estimated that one thousand ounces of gold were exchanged for coin by miners to-day.

We copy from the Grass Valley Telegraph the following interesting mining intelligence:—

As the result of a short ramble among the miners in our immediate vicinity, we give the following reports: On McClintock's ranch, the old Virginia company are averaging 13 ounces per day. A portion of this company are engaged in washing over tailings, and from these they save from 8 to 10 dollars per day to the hand.

On the upper portion of Pike Flat, Bryden & Co. are working to good advantage; their savings amount to ten dollars per day to the hand.

The Buenta Vista Co.'a diggings have been and are still very extensive. The average yield is certain at $16 per day to the share.

MARRIED.

In Sonora, Feb. 19th, Mr. Hiram A. Knight, of Hero, Grand Isle county, Vt., and Miss Henrietta Sweetser, of Libertyville, Illinois.

At Indian Flat, El Dorado county, Feb. 12th, Mr. Robert Blocksom and Miss Emelie M. White.

In Sonoma, Feb. 23d, Mr. John Dixon and Miss Mary E McCracken, all of Sonoma.

In this city, Feb. 19th, Thomas Spencer and Miss Rachel Whittle, both of this city.

At the Mission of San Diego, Jan. 29th, William French and Miss Virginia Ann Cosgin.

In this city, on the 25th inst., at Trinity (Episcopal) Church, by the Rev. Mr. Wyatt, Henry Quintock and Lydia Milton.

DIED.

On Monday morning, 27th inst., Ella Denison, infant daughter of James W. and Charlotte Scott, aged 14 days.

In Sacramento, on Feb. 25th, Isabella, infant daughter of Capt. M. and Mary E. Littleton, aged 5 months and 16 days.

In this city, Feb. 21st, the wife of Mr. John W. Wesscnger.

In Benicia, Feb. 20th, of croup, Thomas Arnold, son of Rev. C. M. Blake, aged 5½ years.

In Stockton, on Monday, Feb. 20th, Mrs. Ellen Biven, late consort of John Biven, deceased, aged 64 years.

[In her death, the editors of this paper have lost a mother. A mother! What a volume is condensed in that word!—*Stockton Post.*]

At the U. S. Hospital, Honolulu, Jan. 18th, Mr. H. Turdell, belonging to Brooklyn, N. Y. He left the United States on board the "Mary Frazier." He was a cooper by trade.

At the Prairie House, 22 miles from Sacramento city, on the 16th inst., Franklin C. Hatch, aged 45 years. Mr. Hatch was from Buffalo, N. Y., and was respected by all who knew him. He leaves a wife and children to mourn his loss.

In San Diego, Feb. 11, Mr. Jacob Manase.

DEATH OF MR. W. E. P. HARTNELL, STATE TRANSLATOR.

We are grieved to announce the death of this old Californian at Monterey on the morning of the 24 ult., after a lingering disease, in the fifty-sixth year of his age. Mr. Hartnell was a native of Backbarrow, Lancashire, England, and came to this country in 1822, to establish the first foreign commercial house in California, in connection with Messrs. John Begg & Co., of Lima, under the style of Hartnell, McCulloh & Co. The only one now in California, who was in connection with this firm, is David Spence, Esq., who arrived in 1824, and has never since been out of the country. This house was the first which opened the trade in hides and tallow in our State.

Mr. Hartnell married Donna Theresa Noriega de la Guerra, daughter of Don Jose Noriega, of Santa Barbara, by whom he had twenty-one children, twelve of whom are now living.

Under the administration of Gov. Alvarado, he was Administrator of the custom house at Monterey, and was afterwards appointed Inspector General of the Missions of California, on the secularization of those establishments by the Mexican governments, at a salary of $3,000 a year.

About 1834, on the arrival of the exiled Padre Patrick Short, from the Sandwich Islands, in connection with that old priest, he established at the Alizal in Monterey County, the college of Patrocino, for the education of the young men of California, but which was discontinued after a short struggle. On the taking of Monterey by Commodore Jones, in 1842, he acted as mediator between the Americans and Mexicans. He was appointed by Gen. Kearny, Translator and keeper of the Spanish Archives, in 1847, under Capt. H. W. Halleck, which office he continued to hold until the Government papers were removed to Benicia, and placed under the care of the military authorities.

Mr. Hartnell, since his arrival in California, has always resided in Monterey.

He was probably the first among the most accomplished linguists on the Pacific Coast of the American Continent; being a thorough proficient in the English, French, German, Spanish, Italian and Portuguese languages. He was a good reader in Greek and Latin, and could converse in several of the dialects of the Pacific Islands and the Indian tongues in California. A few years ago he informed the writer of this, that he acquired for conversation the dialects of some twelve different Indian tribes from the neophytes of the old Mission of Carmelo, and had undertaken the study of Chinese. He had a most extraordinary faculty for acquiring languages, and was blessed with a highly retentive memory.

Mr. Hartnell was a firm believer in the doctrines of the Catholic Church, and was received into that ancient religious community shortly after his arrival in this country. He assumed in all religious disputes with his friends the position of an ardent proselyter, and has stood compadre and padrino to more people than any one else in California.

It is no flattery to say that he had a heart as open as the day, and on all occasions evinced a most generous, forbearing, and charitable disposition. He was indeed without falsehood or hypocracy, the friend of the poor, the needy and the shiftless. His hospitality knew no other bounds than lack of funds, and he was a man of the strictest veracity and integrity, whom no silver or gold could buy. Had he been greedy or careful of money, his wealth could now be told by millions, for his opportunities of acquisition were constant and uncompetited.

He was appointed by the second California Legislature, State Spanish Translator, which office he held till the day of his death. His second son, we are happy to say, is gifted with his father's talent.

During the progress of Mr. Hartnell's illness, the greatest interest was manifested in his welfare by his fellow townsmen and the people of the country. He was attended by his brother-in-law, Don Pablo de la Guerra, and the rare consolation was accorded to him in his last moments to have his eyes closed by his wife and children, and receive from a priest of his church the consolations of a religious faith which had his warmest affections.

And when we call to mind, in view of this old man's death, the mixed, shifting, unsettled population of California, and that every one of us of 350,000 souls are but wanderers from the homes of our fathers, and lately but strangers in this Pacific Palestine, which in the memory of children has risen from silent solitude, (like some tall palm, the noiseless fabric sprung,) and that the bones of thousands lie unblessed in solitary deserts, or packed under the hard clay of snow-covered sierras—no father, mother, sister, brother to close their eyes—how forcible is the recollection of the solemn and softening lines of Gray, conned in schoolboy memory wherever the English language is spoken:

"On some fond breast the parting soul relies,
Some pious drops the closing eye requires:
Ev'n from the tomb the voice of Nature cries,
Ev'n in our ashes live their wonted fires.
For who to dumb forgetfulness a prey,
This pleasing, anxious being e'er resigned,
Left the warm precincts of the cheerful day,
Nor cast one longing, lingering look behind."

The day before his death, Mr. Hartnell called his family around his bedside, and to each one separately gave his counsel of advice for the guidance of their lives; after which he solemnly bestowed his blessing on them, one by one, and bade them his farewell of this world. He continued perfectly calm and sensible till within one or two hours of his death, and died at three in the morning. "For we must all die, and are like water spilt on the ground, which cannot be gathered up again."

His funeral was attended by a large concourse of friends, and the flag was at half-mast from the Fort and Custom House, in respect to his memory. His body was laid next to that of his niece, Mrs. Sully, in the rural cemetery of the town of Monterey, under the old oak trees which have never been disturbed since they sprouted from the earth. And may the rude axe of no civilized barbarian, ever be permitted to destroy these venerable relicts of nature's youth, which the forefathers of California spared to cover the last remains of this mortality.

A. S. T. or N.

MARKET REPORTS.

San Francisco, March 1, 1854.

We are cheered by hope of better things ahead—the rains have given encouragement to the Cultivators, and thus induced a little stir in trade—and were it not for the continued influx of merchandise by new arrivals, we should assert a certainty of permanent improvement.

All kinds of Grain are dull. Potatoes hang heavy, owing to the immense quantities stored and coming in by contract. We however have faith to believe the farmers will receive a remunerating price yet. Onions have advanced.

We repeat our remarks of last week relative to prices. They are merely at nominal rates. Sales are made to meet an emergency and without regard to market rates or value of the goods.

Perseverance, energy, and will to conquer and overcome all difficulties that depress trade, will soon put things better.

This has been our report for weeks.

JOBBING PRICES.

N. B.—Quartz Rock purchased at the highest prices.
J. W. TUCKER,
125 Montgomery street.

There are Three Things I Do Not Do!

1st. I do not get a gentleman to leave his Watch, and when he calls for it, charge him TWENTY-NIVE DOLLARS for cleaning it, and have it stop two hours after.
2d. I do not ask FIFTY DOLLARS for a chain, and sell it for THIRTY SIX DOLLARS, and warrant it FINE GOLD, when it is filled with brass solder, and have to take it back and pay FIFTY DOLLARS in money, and give another chain.
3. I do not tell a Captain he can leave his Chronometer gratis, and when he calls for it at the end of eight months, refuse to deliver him up his property, without he pays me SIXTY FIVE DOLLARS, and TEN DOLLARS more for fixing it.
There are many other things I do not do, which I may name at some other time. 1 4t J W TUCKER.

VOLUNTEERS WANTED!
TO THE GREAT SALE OF
JEWELRY AT JOHN W. TUCKER'S.

I shall now commence selling off my entire stock, consisting of DIAMOND WORK, WATCHES, JEWELRY, SILVER WARE, etc., etc.
Amounting to more than $300,000!
I have got to sell all the above goods before the first of June, as I have to rebuild my store according to the new grade. Any person who wants a good article can procure one from me
Cheaper than in any other City in the World!
But I don't wish it to be understood that I pretend to compete with those who sell trash;—persons who would not hesitate to guarantee a brass ring or a watch for pure gold;—these persons can sell lower than I can. If I sell an article of any kind, and it does not turn out as I represent it, I will return the money. No person shall leave my establishment dissatisfied. Call and see me before you purchase elsewhere.
JOHN W. TUCKER,
1 1m 125 Montgomery street, near Sacramento.

WASHINGTON STEAM MILLS.
WASHINGTON FLOUR MILLS.

THE undersigned proprietor of the Washington Flouring Mills take pleasure in offering to families and the trade, Superior Family Flour. To our Mills, we are happy to say to our friends, was awarded the Silver Medal; and we shall be always striving to maintain for it a high reputation, so that our customers can send to us in confidence, believing they will receive the highest character of Flour the market affords.
In the same establishment we have extensive STEAM SAW MILLS, capable of performing every kind of work that may be desired, and to this branch of our business we invite the attention of the public. We have also STEAM PLANING MILLS, that will finish all kinds of work in the most workman-like manner, and equal to anything performed in the country, and in the most prompt manner to order.
We invite all who are contracting work, to call on us and examine our Mills, and we can satisfy them of our ability to supply every order in each branch of our extensive establishment.
D. W. VANCOURT, Proprietor.
1 Near the Oriental.

Catalogue of Fruit and Fruit Trees.

WE call the attention of Nurserymen and Orchardists to a new catalogue just issued by us, prepared with great labor and cost, giving the lists of the best fruits cultivated in Europe or America, with their synonyms. This catalogue embraces also lists of best Vegetables, Ornamental Trees, Flowering Plants, Seeds, &c.—being a perfect illustration of the best varieties of everything belonging to AGRICULTURE, HORTICULTURE, and FLORICULTURE, with brief directions for the cultivators in each department, and as *adapted to California.*
This work will be found a very great help to all engaged in cultivation.
Price $1 per copy. WARREN & SON,
5 Nurserymen, Seedsmen, and Florists, Musical Hall Building.

POLLEY & CO.,

OF THE BAY STATE MILLS, would announce that for the better accommodation of their numerous customers and trade in general, that they have opened a branch of their business at the Fire Proof Store, No. 49 K street, between Second and Third, where they will always keep on hand a large stock of California FLOUR; also, Hazall and Gallego.
Public attention is particularly directed to the "BAY STATE LOWER MILLS' BRAND," an article we have every confidence in warranting, being made under our own inspection, from new Wheat, without any adulteration.
Ground feed of all kinds always on hand.
Every exertion will be used to merit a continuance of the favor heretofore so liberally extended to us. 1-3t

THE EXILE.

Go, talk of spring to the trampled flow'r,
Of light to the fallen star,
Of glory to those who in danger's hour
Lie cold on the field of war;
But ye mock the exile's heart when ye tell
Of aught but the home where it pines to dwell.

Go, tell of love to the broken hearted,
Of friends to the misanthrope,
Of tears where tears have never started,
Of vows where vows are broke;
But ye mock the exile's heart when ye speak
Of any of these, so fruitless, so weak.

Go, talk of heaven to the deep in sin,
Of paradise in hell,
Of pardon for the wretch to win
When the fatal drop has fell;
But ye only mock the exile's breast,
And weary the heart that seeks for rest.

Go, tell of the tomb—that silent cell
Where all our sorrows cease!
Go, bid the exile therein dwell,
In everlasting peace!
And ye mock not his heart, for ye surely tell
Of the only blest home where it pines to dwell.

C.

THE BLASTED TREE.

BY L. VIRGINIA SMITH.

'Twas the Autumn sere, and at evening's fall
I passed by a lonely and desolate hall,
Where haunting shadows of by-gone hours,
Look coldly out from the faded bowers.
Pale silence sits in her chambers lone,
And dust lies deep on the threshold stone:
Over the portal and casement twines
The long, bare sprays of neglected vines;
And the last, faint day-beam seems to brood,
Like a pallid ghost o'er the Solitude.
By broken portal, and crumbling stone
A giant sentinel stands alone,
Blackened and weather-stained, gaunt and bare,
His huge arms battle with shapes of air,
Hoarse and sullen the night-winds sigh
Through the knotted branches mournfully,
Till a voice creeps up like an augury,
And this is the song of the Blasted Tree:

Ha! Ha!—this is life—with the tempest at war—
And the storm-god has left me with many a scar.
He marshalled his squadrons, they come in their power,
On the wings of the whirlwind to blast and devour,—
Yet I stand like a king on his blood-girdled throne,
I have braved their wild fury unaided,—alone.

I laugh at the whirlwind as cloud after cloud,
It dashes to mist o'er the battlements proud,
When the hills' rocky ramparts have rattled and rang,
To the hurricane's raging and thundering clang;
Unquailing, unflinching, my desolate head,
I lift up to Heaven 'mid darkness and dread.

Swift wind of the wilderness, mighty and free,
What terrors hast thou for the blast-smitten tree?
Thou piercest my bosom with arrowy stings,
Thou strikest my branches with strong, beating wings;
Bring arrow, and pinion, in anger combined,
They shall not avail thee, oh! pitiless wind.

Thou Frost-king, with kisses so mystic and vague,
Like the still, falling curse of the merciless plague,
Come, lay thy chill fingers all night on my brow,
Their touch cannot injure the hare, blackened bough,—
Come, drop thy cold pestilence deep in my heart,
No torturing pang can its poison impart.

And thou, the Sun despot,—a fierce lammer-geyer
Swift-winged with lightning, red-crested with fire,—
With eye-balls far-blazing he springs from his lair,
With the speed of an arrow he plunges in air;
The green forest droops in his withering path,
But the old tree undaunted has breasted his wrath.

Yet one is mine enemy, fearful and strong,
He has followed me far,—he has haunted me long,
He looked on Creation, his perilous eye
Shall see all mortality blossom and die,—
He soon shall o'ertake me,—I bear the deep chime
That heralds the march of my conqueror—TIME!

THOUGHTS SUGGESTED BY THE NEW YEAR.

BY THOMAS CAMPBELL.

The more we live, more brief appear
Our life's succeeding stages;
A day to childhood seems a year,
And years like passing ages.

The gladsome current of our youth,
Ere passion yet disorders,
Steals, lingering, like a river smooth,
Along its grassy borders.

But as the core-worn cheek grows won,
And sorrow's shafts fly thicker,
Ye stars that measure life to man!
Why seem your courses quicker?

When joys have lost their bloom and breath,
And life itself is vapid;
Why, as we reach the Falls of Death,
Feel we its tide more rapid?

It may be strange—yet who would change
Time's course to slower speeding?
When one by one our friends are gone,
And left our bosoms bleeding.

Heaven gives our years of fading strength
Indemnifying fleetness;
And those of youth, a *seeming length*,
Proportioned to their sweetness.

The meanest thing to which we bid adieu,
Loses its meanness in the parting hour.
When long neglected worth seems born anew;
The heart that scorns earth's pageantry and power,
May melt in tears, or break, to quit a flower

A Fishing Adventure.

A SEA captain "down East" a regular old salt, relates the subjoined as one of his fishing experiences:

Once with a friend he went out to catch halibut. His comrade prided himself on his skill in the business, and a rivalry arose between the two friends as to which should capture the first fish. Having dropped anchor and lines, they waited with fishermen's patience for a bite; but for a long time none came. At length the countenance of the captain's companion began to lighten up; and presently he called out—

"I've got one!" He commenced hauling in with great vigor. "It must be a large one," said he, "a hundred pound fellow, at least. He pulls stoutly, I tell you!"

It was indeed evident that a big fellow was at the other end of the line, and it was soon discovered that it was to be no easy matter to capture him.

"I must let him run," said he, "and tire him out!"

Accordingly, he gave him line, which was carried off rapidly. Soon the excited fisherman began to haul in again, making sure of his victim this time.

"Stand by, Captain!" said he, "with the boat hook, and hook him in the gills when he comes up. Get well braced, for he's a rouser!"

The captain accordingly braced himself for a tug, boat hook in hand, and waited impatiently for the moment of capture. His excited comrade was yet pulling carefully and slowly at the line, lest it should be broken, and eagerly watching for the first appearance of the prize, when, suddenly, a "sea change" came over his features, and dropping the line, he exclaimed:

"*Je-rew-salem! Captain, it is the anchor!*"

The captain went down in a shower of laughter, and it was a long day before the fisherman heard the last of catching an anchor, "paying it out" and "letting it run till it got tired."

THERE is not a more common offence against the laws of common courtesy (we might say, oftentimes, of common decency) than is practiced by a certain class of lawyers nowadays in the examination of witnesses upon the stand. Now and then, however, an impertinent lawyer "gets it back" in such a way that he is fain to "call the *next* witness." Of such was the following, not as yet "put down in the *books*," but well worthy of being transferred from "the *papers*:"

"At a late term in the Court of Sessions a man was brought up by a farmer, accused of stealing some ducks.

"'How do you know they are your ducks?' asked the defendant's counsel.

"'Oh, I should know them *any* where,' replied the farmer; and he went on to describe their different peculiarities.

"'Why,' said the prisoner's counsel, 'those ducks can't be such a rare breed; I have some very like them in my own yard.'

"'That's not unlikely, sir,' replied the farmer; 'they are not the *only* ducks I have had stolen lately!'

"'Call the *next* witness!'"

WASHINGTON'S WIFE.—A guest at Mount Vernon happened to sleep in a room next to that occupied by the President and his lady. Late in the evening, when the people had retired to their various chambers he heard the lady delivering a very animated lecture to her lord and master upon something which he had done, that she thought ought to have been done differently. To all this he listened in the profoundest silence; and when she too was silent, he opened his lips and spoke, "Now, good sleep to you, my dear." Portraits, and descriptions of her, show her to have been a pretty, agreeable, kind, little woman, from whom it really could not have been so disagreeable to have a curtain lecture.—*Eclectic Review.*

A LECTURER, who was contending, at a tiresome length and great tautological perplexity, that "*Art* could not improve *Nature*," was startled "half out of his boots" by the question, in a deep, sonorous voice, by one of his audience:

"How do you think you would look *without your wig?*"

The question was a "poser"—the argument a "*non sequitur*!"

AN UNPROMISING OLD LADY.—The Sunderland Herald states, that the whole of the ladies of the village, who were voters, with one exception, voted against Mr. Elliot in the Houghton contest. One of them entering the polling place with Mr. Hopper, was about to record her vote, when Rev. Alfred Lee exclaimed, "That old lady, Mrs. Shield, promised me to vote for the amendment." Bridling up, she responded, with a look of scorn, "I never gave a promise to any man in all my life."—(Roars of laughter.)

THE saying that "there is more pleasure in giving than receiving," is snpposed chiefly to relate to medicine, kicks, and advice.

PIANO FORTES FOR HIRE.

WOODWORTH & CO., importers of Piano Fortes, 130 Clay street, are now receiving a further supply of Piano Fortes, from the celebrated "Stodard" manufactory, expressly for hire. FAMILY FLOUR.
HORNER'S PREMIUM FLOUR.
UNION CITY MILLS.

WE INVITE the particular attention of Families and the Trade, to the quality of the Flour manufactured by us.

Our great aim has been, in the establishment of our Mills to procure the most perfect machinery, to employ the ablest millers, and to select the purest and finest wheat in the country.

That we have been able to accomplish all this, the Product of our Mills now before the community is the best evidence.

The FLOUR we manufacture has been submitted to the ables judges of our State, and after the most rigid and thorough test, they have awarded to us the "PREMIUM PRIZE," and we shall have offer the same as "Horner's Premium Flour;" it shall be our constant effort to maintain for it the reputation of being the

The Best Flour in the Land.

Orders left with HORNER & CO. at our Storeship, Broadway wharf, will receive prompt attention.

5 4t HORNER.

FLOWERS! BRIGHT FLOWERS!
A GIFT FOR HOME.
"THROW PHYSIC TO THE DOGS."

WE convert the pill box into a Floral vase, and instead of the "nauseate drug," we offer the perfume of Flowers.

Our beautiful collection of *California Flower Seeds* we now offer.

These are put up in handsome morocco cases, or homœopathic cases of glass bottles, with printed lists and directions, and with pressed flowers of the different varieties of each. These are of the most beautiful style that can be prepared, and are most appropriate gifts for home at this season.

We invite attention to them at our rooms, at Musical Hall Buildings. WARREN & SON,
5 Seedsmen and Florists.

3,000 lbs. New Garden Seeds.

RECEIVED by Brother Jonathan and John L. Stephens—20 cases Fresh Garden Seeds, of the very best varieties, which we sell all offer at wholesale or retail at low prices.

Purchasers who buy of us may always depend upon the Seed being true and fresh. We never offer seed from auction houses and re use bbls. WARREN & SON,
8-tf Musical Hall.

SIGN OF THE GOLDEN MORTAR.

JUSTIN GATES, wholesale and retail Druggist, 76 K street, Sacramento, offers for sale at greatly reduced prices, a large and well selected assortment of

6 1m 94 Battery street, corner of Clay.

PROCLAMATION EXTRAORDINARY.
Woman's Rights
VINDICATED AND MAINTAINED.

WHEREAS, from the creation of the world, it was designed by the "Great First Cause" that

Womans's Rights and Privilegcs

should be co-equal to Man's; and whereas, she has been treated by many men in all ages, up to the present time, as an interior being to themselves: Now, therefore, be it known that I, M. L. WINN, of

Winn's Fountain Head and Branch

having expended large sums of money at the FOUNTAIN HEAD for the gratificatin of the appetites of Gentlemen, do recommend that Woman be hereafter allowed and provided with the facilities to enjoy all the privileges for which she was by Providence designed; and for this purpose I do hereby proclaim, that my

BRANCH,

Corner Montgomery and Washington streets,

shall be conducted with a view exclusively to the **Enjoyment and Comfort of Ladies,** and such Gentlemen as know and appreciate their worth.

At the earnest solicitation of many Ladies and Gentlemen and agreeable to my promise some months since to enlarge the BRANCH, so as to accommodate the fast increasing patronage I shall, in a few days, add Two Spacious Stores on Montgomery street, to the Original Branch, making the

MOST EXTENSIVE ICE CREAM
And Refreshment Establishments in California.

The day of opening will be duly announced through the medium of the Daily Press, so that all may witness what has been accomplished for the accommodation and comfort of "God's last best gift to man." In the meantime, lots of Fun and Jollification may be enjoyed in reading the mottoes and feasting upon the luxuries to be enjoyed at

WINN'S FOUNTAIN HEAD,
78 and 80 Long Wharf, and Branch, corner Washington and Montgomery streets;

where Every Thing for the Holidays may be found, from a Sugar Whistle to a Bride's Cake of half a ton.

1 M. L. WINN, Proprietor.

PEORIA PREMIUM STEEL PLOWS.

THE FORMER CELEBRITY OF THE PEORIA PREMIUM STEEL PLOWS, and the unequalled success of their introduction in this State, would seem to preclude the necessity of any further effort on our part to draw attention thereto: but in view of the transitory nature of business in general in California, and the probability that some may have looked upon our establishment of an extensive and permanent manufactory of Plows here, in the face of such enormous importations and extravagant prices of material, as an impossibility—we believe it expedient to adopt this method of bringing it within the special notice of all concerned, that we are now manufacturing, and will have ready for this season's demand, three thousand of the most superior Plows ever made or used within this State.

We feel warranted in making this assertion, from the fact that all who used our Plows last season testify that they were superior: and we have studied so closely the immediate wants of our patrons from every section of the State, that we can now furnish Plows suitable to any particular kind of soil known in the State.

Our material has all been selected in the East by one of our firm, and imported by us directly from the manufacturers, which places it in our power to say confidently that nothing is lacking in quality, while we are enabled to make the plows at a cost greatly below that of last season, and are determined to sell at prices within the reach of every farmer who may wish to use the Peoria Premium Steel Plow.

It should be remembered that these plows will do double the work with half the team required in using the ordinary cast Plow; and that the work, when done, will be well done.

For particulars of prices, and descriptions of plows, we refer you to the subjoined card. The prices therein detailed are those established at our factory, and the only alterations from them that we authorize our agents to make, is the addition of the cost of transportation to their places of business—thus placing the plows at every accessible point of the State for the exact price charged at the Factory, with the necessary expenses only added.

Farmers ordering our plows through mercantile houses here, would do well to write to us at the same time, if they would make sure of getting the right plow, for some are interested in representing that we are not making plows at all, while other will not sell our plows when they can get off a cast plow. We therefore recommend that orders should be sent to us directly, accompanied by an order upon your merchant for the amount, which you can always know by reference to the card accompanying this circular.

On the 24th of June the interest of T. ADAMS in our business ceased, by the sale of his entire interest therein to L. E. MORGAN. Aside from this, there has not, nor will there be, any alteration, as we have the same efficient and thoroughly practised hands in every department of our business.

E. L. MORGAN & CO., Successors to
T. ADAMS & CO.,
Corner of Broadway and Battery streets.

☞ The following are the established prices for the **Peoria Premium Steel Plows,** at our Factory, and the only addition our Agents are authorized to make thereto, is the cost of transportation to their points of business:

Office in Musical Hall Building, Bush street.

TERMS.—Eight dollars per annum, in advance; four dollars for six months; or delivered by carrier at one dollar per month.

ADVERTISEMENTS.—A limited number of Advertisements will be inserted at the following rates: For one square of eight lines, per month, $6. For business notices of five lines or less, per month, $4. A slight reduction will be made to regular advertisers.

The Godson.

ONE evening, in the year 1849. M. Roullard, a jeweller in Paris, and one of the heads of the trade, was seated at the back of his shop reading, with seemingly great attention, a paper magnificently embossed and ornamented. At a short distance from him sat Jane, his niece, a pretty dark-haired girl of eighteen, whose eyes continually wandered from the knitting in her fingers to the glass-doors of the shop. At last Mr. Roullard carefully folded his paper, and a beaming smile of satisfaction illuminated his visage.

"It is perfect," said he to his niece in an undertone. "My lord cardinal must grant my request."

"How anxious you seem, uncle, to be called court jeweller," replied Jane, her thoughts evidently elsewhere; her eyes, at all events, were directed to the street.

"Anxious to be called court-jeweller?" cried Roullard; "of course I am. Why, if I can only manage it, my fortune is made!"

"I always thought you very rich, uncle."

"Well, if I am, one can never be rich enough," said Roullard in a solemn voice. Besides, you don't cousider the honor of belonging to the court."

"That is the great objection," murmured the young girl hesitatingly. "I fear you may find the title embarrassing."

"But why?"

"Because you have hitherto had all the custom of the prince's party."

"Well?"

"And you have been in the habit of listening to so much against the cardinal; and, indeed, have not hesitated yourself"——

"Hush!" interrupted the jeweller, imposing silence with both his hands. "You must never speak of that again. I certainly have been guilty of a few jokes about his eminence: I was very wrong; but, as I confess my sins, I hope to be forgiven."

"That's true, to be sure; but, then, your workmen and assistants have acquired the same habit."

"Well, then, they must change," replied he, with great decision. "I don't in the least intend to be compromised by my workmen. When I spoke ill of the cardinal, I really did not understand him; besides, Monsieur Vantar was living then, and there was no chance of getting his place; but now all that is changed. I heard of his death only yesterday, as I was returning from taking Julien to the St. Germain diligence. By the way, has he returned yet?"

"No, uncle," said Jane, who again looked towards the quay. "I can't think what keeps him. I feel quite uncomfortable."

Roullard fixed his eyes steadily on his niece, then speaking in a discontented voice: "You easily feel uncomfortable about anything concerning Julien Noiraud. I suppose you are still thinking of marrying him?"

"It was my mother's last wish," replied Jane in tones of trembling emotion."

"Ah, that's all very well; but I have quite different views on the subject. As I can give you a good fortune, you must be the wife of a rich man; and your Monsieur Noiraud is not worth a hundred crowns."

"He may, perhaps, be able to make his way, and become wealthy."

"Yes; but only by some especial miracle," continued her uncle, ironically. "No doubt, he expects that Italian adventurer to turn up and do wonders for him, because he lodged with his mother and stood god-father to him at his baptism. Was not Tuliano his name?"

"Now, really, uncle, you know Julien only talks of that as a joke."

"Precisely; and, therefore, as his hopes of advancement are in no way brilliant, I positively refuse my consent to his becoming my nephew; and I beg that for the future you will be less attentive to him. I don't wish to tell him at once but you must help me to make him understand his position by degrees; besides, if I am made court-jeweller, such a marriage, you must yourself see, would be out of the question. In point of fact, you must then marry some great lord"——

M. Roullard was interrupted by the arrival of [illegible] There were other than the usual customers from Duke, M. Colbert, and Mr. [illegible] to three persons of rank, and [illegible] to visit M. Roullard. They had, however, heard of some curious workmanship in gold at his shop, and had called to look at it. The fat jeweller overwhelmed them with attention, upset his shop from one end to the other to find things worthy of their notice, and carefully mixed up in his conversation protestations of reverence and attachment the cardinal and his friends. M. Roullard had no fixed opinions; his conscience was of the weathercock species, and always changed with the wind of public opinion; it was only really steady when occupied with anything likely to prove of advantage to himself. This having been the case all his life, and possessing some talent in his profession, he had at last attained a certain standing in it. He had just put on one side several articles of jewelry for Mr. Colbert, at considerably reduced prices, in consideration of that gentleman's devotion to the cardinal, and had just commenced a fresh panegyric on the virtues of his eminence, when the door opened, and a young man about five-and-twenty, marked with small-pox, but still good-tempered and bright-looking, entered the shop. The new-comer jerked a parcel on to the counter with anything but gentleness. "Good-morning, governor," said he, after having bowed to the three gentlemen; "I hope my absence did not perplex you. I could not return last night: Monsieur de Nogent kept me to repair something for him"——

"Oh, oh, you come from the count," interrupted Colbert. "How did you leave him?"

"Marvellously well, sir."

"Then," said the former, "he must have been engrossed in composing some wickedness against the cardinal."

"Of course he has," cried Julien, laughing; "he sang me twenty verses of a lampoon he had just written"——

"How durst he?" interrupted Roullard, looking horribly scandalised.

"Why not?" answered Julien: "he was even good enough to teach me some of them. Let me think—what was the air? wait a little."

M. Roullard coughed, rolled his eyes, made all sorts of signs to Julien, but they were totally incomprehensible to the young man. He had been in the habit of hearing all sorts of fun and wickedness talked of the cardinal, and could not in the least conceive so sudden a change; so, after thinking a moment, he began to sing.

"Julien," shouted Roullard, trembling with fear.

"Let him go on," interrupted the commander, who, though a partisan of the cardinal's, thoroughly enjoyed the joke. "I delight in doggerel verses, and have a whole collection of Mazarenades at home."

"Why, that's like the governor," said Noirand. "Monsieur de Longueville's valet sends him all he can get hold of."

The jeweller stammered a reply, but shouts of laughter completely drowned what he said. When it somewhat moderated, he impatiently asked Julien what he did standing there, and if he expected his day's work was over.

The foreman, perfectly ignorant of the change that had taken place, replied without hesitation: "I only wished to give you pleasure."

"Why, then, did you not leave that parcel, as I directed, with the Marquis d'Arveau?"

"I did," said Julien.

"Then what does that parcel contain?" continued the jeweller, pointing to the one on the counter.

Julien could not help smiling. "That, governor, contains a collection of lampoons that were given me by Monsieur de Nogent."

"Lampoons against the cardinal, I'll lay a wager," said the commander.

"Exactly, all just arrived from Holland."

"And were they to add to Monsieur Roullard's collection?"

"Why, you see, I thought the governor would feel pleased."

"Once more the three gentlemen made the shop ring with laughter; and this time the anger of Roullard knew no bounds. "It is a falsehood!" shouted he.

"A falsehood!" repeated Julien, trembling with indignation. "Only ask the workmen."

"Will you hold your tongue?" vociferated Roullard.

"I don't want to talk; but I won't be called a liar."

"But you are a liar; and to prove it, I order you to quit my house this instant."

"Me?"

"Leave the shop at once, I insist. No one shall work here who speaks disrespectfully of the cardinal. I am his most faithful subject. I would lay down my fortune—my life for him. Long live Cardinal Mazarin!" Roullard had completely lost all mastery over himself; he [illegible] door, and [illegible] The poor young man was [illegible] but in vain. At last he, too, lost patience. "I'm off, then, for I see you are quite mad."

"Here is what I owe you," said Roullard, taking money from a drawer.

"I'll make you a present of it," said Julien, as he put on his hat.

"Take it, I tell you, and never return."

"Return!" cried the young man, "after having been called a liar, and ordered off the premises? No no; one must have but a poor heart to do that. You shall never complain of seeing me again."

"That's just what I wish."

"And your wish will be gratified. I am not one day devoted to the prince, and the next to the cardinal."

"Have you finished?"

"Yes, quite; but as you don't wish to continue your collection, I'll take possession of my lampoons." Roullard shook his fist in the young man's face; but Julien disdainfully shrugged his shoulders, took up his parcel, and strode into the street.

At first he walked on in rage, scarcely knowing where—thinking of nothing but the injustice and folly of his master; but, insensibly, rage gave way to sadness. He did not care for losing his place—there were plenty of other jewellers in Paris, who would gladly employ him; but, then, Roullard was Jane's uncle, and there was now no hope of his consenting to their marriage. What was to be done? His heart died within him, for the trial was indeed a sore one. Occupied with these thoughts, he had walked through the Tuileries, and gained the then solitary banks of the Seine. Here he sat down; and his eyes falling on the parcel, he was inclined to throw it from him in disgust. "Cursed cardinal," thought he, "you are the cause of all. Had it not been for you, I should not have left Monsieur Roullard; I should have established myself in his confidence, become his head-man, and no doubt shortly have gained his consent to marry Mademoiselle Jane." During these thoughts, he mechanically opened the packet, and was looking over the contents, one pamphlet, called *Satirical Biography of Cardinal Mazarin*, met his eye, and on the first page he found the following paragraph: "Before taking holy orders, his lordship the cardinal wore a sword. He commanded a company in 1825, and was intrusted by the Pope's generals, Conti and Bagni, with a private mission to the Marquis de Coeuvres. His eminence found him at Grenoble, and remained there two months, under the name of Captain Juliano." Julien read this passage once over again, his heart beating more madly each time. The names, the date, the place, made mistake impossible. The captain thus spoken of must be the same who had held him at his baptism, and to his astonishment, he discovered he was godson to his eminence. His first feeling was surprise; his second, intense joy. He bounded from his seat, repeating: "God-son to the cardinal—godson to the cardinal!" Leaving all the papers strewn on the ground, for any one who liked to take possession, he first ran towards Roullard's in order to tell him and his niece the good news; but suddenly he changed his mind: perhaps the jeweller might refuse to believe him, and think it only an excuse to be again taken into favor. Under these circumstances, he might again order him away, and that was an insult impossible to be borne by a cardinal's godson. So, changing his course, he directed his steps to his own little room by the Palais de Justice; and having possessed himself his baptismal register, which confirmed his claims, he made the best of his way to the cardinal's residence.

Arrived there, he asked for an old friend of his called Pierre Chottart, who occupied the important office of head-cook, in the establishment. They had seen little of each other for several years, on account of their different opinions on politics, so that Chottart scarcely recollected him. When they had conversed for a few minutes, Julien informed his friend he had come to see the cardinal. The cook thought him mad, when Julien insisted upon seeing him at any risk, but without explaining why.

"I suppose you think you have only to send in your name to be received at once?" said Chottart in an [illegible]

"Not exactly," said Julien; "but I trust you will put me in the way of seeing his eminence."

"Oh, the way is perfectly simple; [illegible] audience."

"Now, really, Pierre [illegible] and I ask your help as a friend and you only make [illegible]"

"[illegible] dine [illegible] table d'hôte."

"No; but is it really impossible to speak to the cardinal?"

"Quite impossible. How am I, an [illegible] positively belonging to his [illegible] and [illegible]

"Is this true?"

"Perfectly true; and even now I am occupied in preparing his chocolate."

"Oh, that chocolate, then, is for the prime minister?" said Julien, looking into the silver pot which stood on the stove.

"By and by I shall pour it into this cup; a servant will come for it, and take it into the vestibule up that staircase; he will then call the cardinal's valet, who will take the waiter from him and present it to the cardinal."

"So that the valet is the only person who approaches his eminence?"

"Precisely. But there is the signal."

Just then a bell rang, and the cup was immediately filled and placed on the silver waiter by Pierre Chottart; he then went into the next apartment to fetch an embroidered napkin, worked in gold, with the cardinal's arms. Julien's mind was made up in an instant: he rushed to the door through which the cook had disappeared, and locked it, caught up the waiter, and flew up the staircase pointed out to him, ran along seven passages, and, on his arrival in the grand vestibule, opened the first door that presented itself, and, it happening to be the right one, found himself face to face with the cardinal.

The latter was busily engaged in writing, but the unaccustomed noise caused him to look up, and great astonishment was depicted on his face as his eyes rested on the wild-looking unliveried being before him.

"Who are you? Where did you come from? What do you want?" asked the cardinal in a hurried voice, and with that strong Italian accent he had never been able to lose.

"Is it *really* his eminence," said Julien, as he almost dropped the waiter on the table: "then I am saved! Good-evening godfather!"

The cardinal rose with a frightened air and walked towards the bell.

"Oh, you don't remember me," said Julien, laughing. "I don't know how you should: you have never seen me since 1625."

"How, since 1625?" repeated Mazarin, who began to think he had a madman to deal with.

"What do you mean?"

"Well, I wonder you can't guess," said the young man, clapping his hands with delight. I am the son of old Mother Noiraud." The cardinal seemed to reflect. "Oh, don't you remember Mother Noiraud of Grenoble? You lodged with her when you were a captain, and gave your name to her son."

"I think I begin to recollect. But this son"—

"That's I," interrupted Julien with a gay laugh. "Julien Noiraud, of Grenoble. The moment I found out that you were the Captain Juliano of my baptism, I ran at once to tell you. I hope I have found you well, godfather?"

There was something in the complete ease and gaiety of the young man that amused and pleased the cardinal. He asked him his reasons for thinking himself his god-son, and then desired to look at the proofs. Julien presented his register and the pamphlet. The cardinal read the letter from beginning to end without a single change of expression. When he had finished, he looked up at Julien and said: "So you are pleased at having discovered your godfather?"

"Oh, am I not? If you only knew how badly I am in want of help!"

"The deuce you are!" said the cardinal. "Then you are not well off?"

"Couldn't be worse," said Julien.

"And I suppose you have sought me in the hope that I shall assist you?"

"I was sure that you who have so often saved France would find no difficulty in helping a poor fellow like me."

The cardinal smiled at the flattery contained in this speech, and the [illegible] Julien continue to proceed; he told all about his [illegible] Roullard, and his wish to marry Mademoiselle Jane, the [illegible] only consent [illegible] of his [illegible]

"Well, well," said the cardinal, placing his hand on the [illegible] shoulder, "don't fear, [illegible]; I'll [illegible] you."

"Ah, godfather," murmured Julien [illegible] joy.

"Fool that you [illegible]

"No, I won't [illegible]

I shall expect you to [illegible]

"I'll take [illegible]

"[illegible]

"No, [illegible]

"You [illegible]

"I will [illegible]

"You [illegible]

"[illegible]

"And [illegible]

[illegible]

Julien looked at the cardinal with the utmost surprise; but Mazarin repeated the permission, adding, he trusted to find him worthy of the favor. He then told him to retire, after having ordered him to appear in his new costume at his levee next day.

One may easily imagine the excessive disappointment of our hero. What had he gained? thought he. Lodging, dress, and food, were to be found out of his own small savings, and yet all his time was to be at the disposal of the cardinal, and in return he had only obtained the empty honor of calling him godfather. He heartily wished he had never discovered the identity of Captain Juliano and his eminence: it would have been far better to have regained the favor of M. Roullard, or have sought employment elsewhere, thought he. But now that is forbidden: and I have heard that people are often sent to the Bastile, and left to die and rot there, for no less things than disobeying the orders of the prime miuister; so I must resign myself to my fate. Heavily oppressed by these feelings, he regained his garret, and with a sad heart awaited the morrow.

Julien procured a court-suit next morning from a gentleman who had come from the country for an audience, and was obliged to sell part of his wardrobe to defray the expense of returniug to his province. This made a great hole in our hero's small purse, and he thought himself hnt ill repaid by the false air of a gentleman, which he felt sat badly on him. As he entered the audience chamber, all eyes were turned on him, and every one seemed to inquire of his neighbor who he could be. Commander de Souvre and M. Dubois were talking in the embrasure of one of the wiudows; on his approach they ceased their conversatiou, and each appeared to reflect where he had seen him before. All at once he heaed a voice exclaim in a tone of surprise: "I declare it is Noiraud!" Julien jumped round, and found himself face to face with Roullard.

"How in the name of fortune, dare you come here, and in court-dress too?" cried the stupified jeweller.

"I am like you, waiting for his eminence," said Julien in an off-hand toue.

"Ah, I remember now," said the Commander de Soure drawing near; "this is the young mau you dismissed yesterday."

"A jeweller's assistant here!" exclaimed Dubois. "It is positively scandalous! What on earth cau he want with tho cardinal?"

"We shall soon learn," said De Souvre, "for here he eomes."

At that moment the door was thrown open, and Mazarin entered. He advanced up the room bowing, and stopping now and then to listen to petitions, &c. He soon arrived opposite Julien, and smiled very graciously on seeing him. "Oh, you are here," said he, touching him playfully on the cheek with his glove. "How are you to-day, poverino?"

"Very well, thank you, godfather."

The word was magic. Julien had scarcely pronounced it, when a visible movement was perceptible among the courtiers. All eyes were fixed on him, and every mouth seemed to repeat: "Godson to the cardinal—godson to the cardinal!" Envy and jealousy were at once painted on each face; and Mazarin, who from the corners of his sharp eyes saw the effect produced, immediately leaned ou the young man's shoulder, and continued his progress round the room, talking to him in the most fauiliar tone, and constantly asking him what reply he should give to the different petitions presented to him. Julien, not kuowing whether he was in jest or in earuest, contented himself with replying: "Yes, godfather;" "No, godfather; As you like, godfather"—as the question required. And the courtiers all admired his reserve, which they attributed to knowledge and caution. As Mazarin retired, he told Julien to join him in his study as soon as he received a summons to that effect.

He had scarcely disappeared, when the jeweller's assistaut was overwhelmed with congratulations. Noiraud scarcely knew how to stammer out sufficient complimeuts. The commander allowed the crowd to disperse; and takiug Julien aside: "I am delighted, dear sir—yes, perfectly delighted at your good fortune." Julien thanked him. "His eminence appears to have a great affection for you, and I am sure he would refuse you nothing."

"Do you really think so?" said Noiraud, aud immediately began to make up his mind to solicit the cardinal's permission to return to business.

"I am quite sure of it," returned the commander; "and to prove it, I beg of you to speak a good word for me. My nephew is waiting for the command of a regiment; will you get it for hiu?"

"Me?"

"You can obtain it for him if you choose."

"I should really only he too happy."

"Then you promise?"

"I wish I could; but"——

"Oh, don't say another word. If you only fulfil our wishes, you will not, believe me, find us ungrateful." As he said this, the commander pressed our hero's hand, and walked away.

A miuute later he met M. Dubois, who seized him by the arm. "A word with you," said he. "I have just asked for a monopoly of the commerce in Les Iles du Vent: if you procure it for me, you shall at once receive six thousand francs."

"Six thousand francs!" repeated Julien, perfectly astounded.

"Oh, I perceive, I have not offered a sufficient sum. Say ten—twelve thousand then?"

"I assure you," cried Julien, "you are altogether mistaken. I have no influence whatever with his eminence; and your request heing either granted or refused, does not in the least depend upon me."

Dubois looked at him for a momeut, and let go his arm. "Ah, I see how it is," muttered he—"my opponents have already spoken to you?"

"I don't know what you mean."

"No douht they have offered you a larger sum."

"I swear to you"——

"Never mind—never mind. I'll apply to some one else. You must not thiuk that because you are godson to his eminence you are to have your own way in everything. At all events, we'll fight for it, sir, we'll fight for it." And Jean Dubois disappeared in a pet, without waiting for a reply.

Julien had not recovered from his surprise when he was sent for by the cardinal, who at once saw something unpleasant had occurred, and inquired as to what it was. Julien gladly repeated every word.

"Bravo! bravo!" laughed his eminence. "As they beg for your protection and good-will, *caro*, you must really give it them."

"What you mean, godfather! Do you wish me to ask favors for them?"

"No, no. Ask nothing. Tell me all, and let them imagine that you influence me. Ah, poverino, influence is well paid!"

"And so, godfather, you wish me to receive"—

"Receive all, Juliano: never refuse a good aud willing offer; and if you can't always procure for the givers anything they wish, you can at least be grateful, you know."

When Noiraud left the cardinal he was more than ever surprised; but nothing can describe his astonishment when, two days afterwards, he received three thousand francs, accompanied by a most grateful note, from M. de Souvre, thanking him for the colonelship he had so kindly procured for his nephew. As he finished reading, in rushed M. Dubois: "You have gained the day, Monsieur Noiraud," said he in a good-humored tone, but with great respect. "My opponents have conquered. I was very wrong to fight with you, and I've been punished. However, here are the ten thousand francs we spoke of; aud you must put in a good word for me the next time I have a favor to ask." He placed a pocket-book, containing the money in notes, on the table. Julien wished to refuse, saying he had had nothing whatever to do with the decision; but Dubois would not listen to a word.

"It's all right," said he, as he left the room. "You are very eautious; but of course it would not do for you to compromise his eminence. I will believe everything you choose to tell me, and won't ask any questions: only, for mercy's sake, never place your influence agaiust my interests again."

"I have no difficulty in swearing that," replied Julien; "but"——

"I am quite satisfied then," said Dubois, "for you look like a man of your word; and, in return, if ever you want a few thousand francs, come to me. I shall only be too glad to assist the cardinal's godson." He left the room with a profound bow.

Julien repeated all to the cardinal, who, rubbing his hands with glee, told him to take good care of his money. Our hero became richer every day. It was of no use his protesting he was without influence, no one believed him; in fact, it was all put down to proper and praiseworthy reserve; it rather increased than diminished his reputation; and he was day after day forced to accept money for snpposed services. In a few months he was a rich man.

During all this time M. Roullard had been sliding in a contrary direction—as Julien had grown great in the world, he had grown small. His petition to become court-jeweller had been met with a decided refusal, and the prince's friends deserted hiu in consequence of the application, so that the proverb of "between two stools one falls to the ground," was completely verified. As he attributed his ill success entirely to Julien's influence, he was for some time madly angry; but being one of those easy-going natures who always find it most convenient to look with a favorable eye on the powers that be, he one day sought his former pupil, and assured him he could no longer hear to live on bad terms with any one he had felt such an interest in, and had therefore come to ask pardon for the past and friendship for the future.

Julien was only too happy to be reconciled; his affection for Jane had rather increased than dimiuished, and his first request was that Roullard would consent to their marriage. The latter jumped at the proposal, and all being settled, they were married shortly after, Roullard having resigned his business entirely to his new nephew.

When Julien, radiant with happiness, presented his young wife to his godfather, the cardinal laughingly pinched his ear, saying: "You little thought what would follow when I permitted you to address me as godfather."

"That is indeed true," replied the godson; "I could never have imagined I should owe so very much to the title."

"That is because you knew nothing of human nature, and had not studied men, *picciolo*," said the cardinal. "At court it is not what one *is*, but what one *seems* to be, that insures success."

Agriculture.—The appearance of the fields gives intimation that extensive agricultural operations have been engaged in of late. In Ione Valley there are over 2,500 acres under cultivation this year. In the barley crop, a serious failure is anticipated, in consequence of mustard seed being largely mixed with the grain. We have heard several gentlemen say they intended to plough up and substitute other crops. Wheat is coming into favor, and in future will be largely planted. It is spoken of as a much more profitable crop than barley.—*Calaveras Chronicle.*

THE CALIFORNIA FARMER.

SAN FRANCISCO, THURSDAY, MARCH 9, 1854.

Special Premiums for Subscriptions.

In addition to the standing ioducement for the getting of subscribers for the "Farmer," we will make a present of HARPER'S ILLUSTRATED FAMILY BIBLE to the person who procures THE MOST SUBSCRIBERS in the first six months of our publication. This we regard as one of the most beautiful books ever issued. Who will have the prize?

A Premium---Farmers' Clubs.

With the hope of inducing such of our friends, and those who have a little leisure, to ride among their neigbbors and introduce an AGRICULTURAL PAPER, we take pleasure in offering the CALIFORNIA FARMER: and, to make it an inducement, we say to such friends—if you will get us FIVE subscribers, and remit the amount, we will send you SIX PAPERS, or for TEN subscribers, TWELVE PAPERS. We trust there are many friends who will cheerfully take a little pains to aid us, and thus extend the circulation of the Farmer, and make a useful vehicle for the Agriculture of California.

Subscribers will please be particular to name the Post Office to which papers are to be sent; or, if forwarded by express, which line they prefer.

To Our Patrons.

To Advertisers.—We would call the attention of those who desire to have their advertisements produce quick returns, to the pages of the California Farmer.

The Farmer will reach sources of trade entirely new and unattainable by any other means, and thus secure a large and immediate profit to those who desire to make known their business. By a glance at our advertising columns, it will be perceived that we present the best known and most extensive houses, and as we have space for but one or two of each branch, these will be the most prominent houses, and thus give more influence to them.

Agents Wanted.

We want good active agents to visit every county in the State for the Farmer. Young men can find a steady and profitable employment. Apply at this office.

☞ We desire Agents to report as early as possible, that we may be prepared in our issues for a sufficient number to supply the demand. Be sure and report promptly.

Senatorial Election.

Sacramento has had quite a busy and a merry time of it for the past week. The removal of the capital and fixtures, and the great Senatorial question, caused a large increase to the inhabitants of the "levee city," and since Saturday the city has been literally "crammed."

Saturday and Sunday were busy times for politicians and on Monday, the great question was brought before the House,

It will be seen that the bill before the Assembly—to come to an election this season—passed by a majority of 5—the Senate bill by a vote of 17 to 17, and by the casting vote of the President was made the question of the 17th. This great quostion is now the all-absorbing theme, in all circles. Everything must yield to it; it engages all interests and all parties, and draws all to it. Business relations are laid aside or made secondary to it.

We are no politicians, nor can we ever be drawn into polities, but we learn there are other interests at stake besides political advancement and party pap.

The great interest to be regarded is the landed property of California, and the uninitiated in polities are not aware that the titles to real estate in California now depend upon this Senatorial question. If these facts can be made known and established, it will be seen that the farmers of California are more interested than any other party in the State. We are casually informed that the most important land titles—their prompt and permanent decisiou—is in a very important degree connected with this election. That these two candidates, Messrs. Gwinn and Broderick, are the antipodes upon these questions. We believe no subject of equal importance has ever been brought before this State, as the settlement of the land titles. Thousands of industrious and hardy laborers are now waiting with great anxiety the decision of land titles, and the man who will stand up in the U. S. Senate aud labor for the speedy settlement of the land titles, will be the man of their choice, irrespective of party. It is life or death with them—all now depends upon an immediate action. We MUST have the land titles settled. The good of the people demands it—the best interests of the State demands it—and we shall do all in our power to throw all the light can, relative to this interest, before our readers; and the man who will be the friend of Agriculture, the friend of a speedy, just and equitable settlement of these important questions, will be the choice of the farmers of California.

We repeat, the prompt settlement of these titles will do more to people California with permanent citizens, of the right character, than all the gold of the mines.

There has been already too much delay; oven the settlement before the Land Commissioners is not final. An appeal can be taken. This ought not so to be. What! an appeal from the United States to the United States. If the Commissioners are the special authority of the United States, why appeal from their decision? Why should it not be final? We wish some action that shall be speedy, definite, certain, final.

Sacramento Steamens.—The consolidation of the interests of the several lines of steamers upon the Sacramento river, has produced a change in the management of some of the boats that cannot fail to be noticed by old travellers on these lines.

When we take a trip up or down river—as we step upon either boat—we immediately associate the names of captain and clerk with the boat in which we are passengers. With each of these officers, passengers are more or less familiar and are ever receiving attentions and courtesies from them; and absence from their command a single trip could not fail to be noticed.

We were reminded of this in our trip from Sacramento this week, on the Antelope. The absence of Capt. Bushnell from the command he has so long and so very favorably sustained, could not but awaken regret in the hearts of his friends; to know that his cheerful greeting will no more meet them on board the Antelope, will always cause a sad thought—for no commander could have enjoyed more deserved confidence and esteem than has Capt. Bushnell while in command of this fleet and beautiful steamer.

We most cheerfully accord to the present commander and officers, all that is required of ability to command and urbanity to please; yet we can not lose an old friend without sincere regret.

Capt. Bushnell will ever be kindly remembered hy his friends, so long as the "Antelope" shall play upon the waters or along the banks of the Sacramento.

We cannot but pay a just tribute of respect to another gentleman whom this change has removed from us—Capt. Waters, so long known to Sacramentans and all others as the agent of the "old line" of steamers, the Senator and New World. For many years has Capt. Waters been prompt at his post, and most favorably known as the oldest steamboat agent on the Sacramento, and justly regarded as the pioneer and umpire in all steamboat matters up river. His many friends will regret that any necessity compels his removal from the position which he has so long occupied

---

Raspberry.—This delicious fruit promises to become one of the most prolific fruits known. We have known many instances of their producing the first year of their planting here. The "Humboldt," a very superior large purple fruit, has been grown here very successfully. The Oregon raspberry is near akin to it. The Franconia, the Red and White Antwerp, and the Falstaff, have all been grown—and they each and all increase in size of the berry and in their productiveness, in California. No person should be without them, if they have a small spot of ground, for they are easily cultivated. The ground should be dug deep (16 to 18 inches) and fine, and made rich with old, well-rotted manure. The plants should be grown in clusters of three in a hill; a strong stake placed firmly in the ground and four to five feet high, the plants in a triangle around the stake; the hills 3 1-2 feet apart, and the rows 3 1-2 feet apart. The plants should be kept tied up to the stakes, as grapes—for when in good health and bearing, the weight of the fruit will *break down the branches*. The fruit always is produced from the growth of the present year. The plants should be cut down every year after the crop is off and the canes dried.

Agricultural Meetings in Napa County. We cheerfully correct an error which occurred in our last week's issue. We gave credit to "Sonoma county" for the public meeting and the action for a County Agricultural Society.

It should have been "Napa county;" to them belongs the credit. And we give notice to the friends of Agriculture, in the surrounding districts, that there will be a meeting of the friends of Agriculture and those interested in that Society, in Napa City, on Saturday, March 18, in the early part of the day—and all who feel interested are invited to be present.

We hope there will be a full attendance, and we trust to receive a cheering account of the interest felt.

Post Masters.—We shall be very much gratified if the postmaster of each town and city in the State will feel an interest in the California Farner, and give it their influence, and favor and aid us by a kind word in the ear of some one who will become a subscriber. The terms we believe liberal; and we shall be glad to see the clubs increasing in numbers and size.

Later from the Eastern States and Europe.

By the arrival of the Nicaragua Co.'s steamer Cortes at this port, on Saturday last, we are placed in possession of New York papers of Feb. 4, and New Orleans to the 7th. The Cortes brought nearly 1100 passengers.

The papers are filled with accounts of and speculations upon the doings of the General Government, to the exclusion of almost every other topic.

John Mitchel is carrying on a bitter newspaper war against Henry Ward Beecher, in which Mitchel seems to have decidedly the best of it.

Mr. Donald McKay, the builder and owner of the ship Great Republic, has received the nice little "pile" of $235,000—that being the amount of insurance on the ship and cargo. The underwriters and other friends gave him a public dinner in New York, at which the most generous and kindly feelings were expressed, and every encouragement offered him to restore the Great Republic to her original strength and beauty.

The weather in the North on the 28th and 29th Jan., was the coldest on record, and at Concord, Montpelier, and many other places, the mercury in the thermometer had fallen nearly 30° below zero.

We have the usual long list of large fires from the Atlantic cities. On the morning of Feb. 4, a fire occurred in New Orleans, destroying six steamboats, which, with their cargoes, were valued at $600,000. Forty lives were lost. The steamer Georgia was also burnt at the same place on the 28th of January, on which occasion thirty lives were lost—mostly slaves.

We find the following "Young American" paragraph in the N. Y. Tribune: "The steamer William Norris, which is to cross the Atlantic three waves at a time, in six days, is almost ready for launching. She is building at Green Point, and will be ready before the 1st of March.

The Tribune publishes a despatch dated Montreal, February 1, which states that "the Parliament House and adjoining buildings at Quebec were entirely destroyed by fire about 2 o'clock this morning. The flames were not discovered until they had too much headway to be got under, notwithstanding that a sentinel was on duty near the spot. The fire originated in the south portion of the building, from the furnace. It is believed that part of the valuable library was saved, but the Historical Society's Library and apparatus were almost entirely consumed. The buildings were insured for £30,000. and the Provincial Library for £6,000."

We are indebted to the New Orleans papers of the 6th and 7th February for a week's later news from Europe, by the Cunard steamship Arabia, which arrived at Halifax on the 4th February. It was passed over the wire to New Orleans.

We have further accounts of the battle of Citale, confirming the Turkish successes. It appears that the Russians were concentrating at Citale, in order to attack Kalefat on the 13th; but on the 6th, fifteen thousand Turks marched out of Kalefat, attacked and stormed Citale—had a murderous conflict with the the Russians in the field on the 7th, and renewed the battle on the 8th—ending in the evening with the total discomfiture of the Russians, who confess to 4000 killed, and their Generals Aurep and Tuinnut wounded.

On the 9th, the Turks having remained overnight on the field beyond Citale—attacked the reserve of the Russians, and drove them back upon Krajova, with the loss of cannon and immense slaughter on both sides. On the 10th, the Turks, having razed the Russian fortifications, returned to Kalefat. The Turks were commanded in this action by Zednsky, Selim Pacha, and Mehemed Pacha—one of whom, probably Mehemed, is reported killed.

The above victories were officially announced to the French and English embassies.

The news from Asia is unimportant.

Letters from Trebizonde of the 6th December, say that M. Schaumyl had organized a Polish regiment of twelve hundred strong. He has plenty of provisions and ammunition, and is organizing at Dagheston. The Abyssinians are in alliance with him.

The Hungarians and Poles who had been waiting at Constantinople for employment, were shipped on the 2d of January for the army in Asia. Klapka declined an Asian command, but offers to serve in Europe.

On the 5th of January, the whole of the allied fleets were in the Black Sea.

Two ships had been sent with the following to the Russian Government at Sebastopol, conformably with the orders of the Russian and French Governments:

"The British Squadron, in consort with that of France, is on the point of appearing in the Black Sea. The object of this movement is to protect the Ottoman Territory from aggression or hostile acts. We apprize you thereof, with a view to prevent all collision, tending to disturb the amicable relations existing between our governments, which we are desirous of preserving, and which we have no doubt you are equally anxious to maintain. To this end we should feel happy to learn that you, animated by these intentions, had deemed it expedient to give the requisite instructions to the Admiral commanding the Russian forces in the Black Sea, so as to obviate any occurrence calculated to endanger peace.

(Signed) REDCLIFFE,
BARAGUAY D'HILLIERS.

It was at first intended to send a portion of the fleet only into the Black Sea, but a rumor was current that the whole of the Russian fleet had sailed from Sebastopol, and consequently the whole of the allied fleets entered. It was further rumored that Russian ships of war were off Erzeroum, probably expecting to intercept the Turkish convoy, (which was under the protection of the Allies,) carrying 15,000 men for Asia. Merchantmen at Constantinople on the 9th, report not having seen the fleets, and they are consequently supposed to have sailed towards Baytown, where it is surmised the Russians have also gone.

Around Sebastopol and the coast of the Crimea, the Russians are erecting batteries, and have extinguished all the light houses.

ENGLAND.—Prince Albert's unpopularity is increasing. He is accused of interfering in the government, of letting out state secrets to his relatives German princes, of intriguing against France and in favor of Russia, and of not attending to his own business generally.

There is a growing movement to sever the church from the state, many of the parishes refusing to levy church taxes.

SPAIN.—The newborn Princess of Spain died on the 8th of January, at Madrid, after one day's illness. The circumstance, taken in connection with the antecedent scandals, excites comment, as the child was spoken of as being of a particularly healthy constitution. The child was born on the 5th.

ITALY.—A great scarcity of food prevails throughout the Roman States.

PERSIA.—Important intelligence has arrived from Persia by private letters via Trebizonde. It appears that a [illegible] arose in Teheran in consequence of the dismissal of two [illegible] by order of the Czar. The [illegible] in command of the [illegible] declared [illegible] be held no answer for the public [illegible], the [illegible] being so much exasperated at being [illegible] Russians. It was [illegible] of the state of things that the Shah was moved to prepare [illegible] with the British [illegible] and is [illegible] not without a suspicion [illegible] his ministers.

News from China.

THE Hamburg bark, Alster, Piening, arrived at this port on the 31st inst., in 68 days from Hong Kong, with dates to the 18th December. The dates are no later than those brought by the George E. Webster; but we gather much fuller details.

We have been disappointed in the non-receipt of full particulars of the loss, about the 25th October, of Lieut. John Mathews and thirteen men of the U. S. S. Plymouth during the late visit of that vessel to the Baum Islands. Mr. Mathews, we are told, had gone off on a shooting excursion to an island about five miles distant from the anchorage, but observing the Kohi-i-noor coming in, he made for her. As the weather had a very threatening appearance, he was advised to return to the Plymouth, but declined doing so; and a heavy gale, or rather hurricane, having raged towards evening, it is believed the boat capsized and all hands were drowned. A thorough but unsuccessful search was made by their shipmates of every spot on which there was the slightest probability of their taking refuge.—*China Mail.*

CAPTURE OF PIRATICAL JUNKS.—Mr. F. Williams, of H. M. steamer Hermes, arrived in the harbor this forenoon, in a pirate junk which he had taken, having been blown out to sea fourteen days ago; and during the interim he and his boat's crew of fourteen men have had little else to eat but calavances. He reports the capture or destruction of forty pirate junks, believed to be the "patriot" fleet lately escaped from Amoy; and we are told that in pursuing the pirates, two of the Hermes' boats capsized in the surf, and as the crews landed, they were stripped of everything and carried into the interior, whence they were only liberated on payment of a heavy ransom. Lorcha No. 70 was in the hands of the pirates, but was rescued by the Hermes, and had arrived at Amoy. The master had received some ill treatment, but none of the crew were hurt. Another large pirate fleet had escaped to sea.—*China Mail.*

We have been favored with the following extract of a report of Lieutenant Commander Junius Boyle, commanding the U. S. storeship Southampton, to Commodore Perry:—

"On the 29th October, near the Island of Formosa, I discovered a volcano, distant from the land about 10 miles, in a violent state of eruption, throwing vast columns of vapor to a great height, resembling in appearance a similar phenomenon which I witnessed some years ago on the coast of Sicily. This, however, I believe to be of greater magnitude and force, although no lava was visible through the dense bank of vapor or steam which hung about it; and the depth of water is here much greater than on the Sicilian coast; hence the above conclusion. When last seen, at 3 P. M., it was in a lively state of activity, and bore N.N.W., distant about 10 miles, in latitude about 24 N., longitude 121.50 E. There was no sail in sight, and I named it after John P. Kennedy, Esq., late Secretary of the Navy.

Quiet prevails at both Cantou and Amoy, and the restoration of the constituted authorities at the latter place has been a matter of gratulation to the residents.

THE REBELLION.—There has been no very reliable intelligence about the progress of the Rebels, since last dispatch of the mail. A report, however, was brought from Shanghae by the Lady Mary Wood, that, after being defeated by the Imperialists, at "Sinchow in Peebeelee;" the insurgent army continued to advance, and had at the end of October reached "Jinkew, about 60 miles from Peking."

Peking is presumed to be well garrisoned, and we learn from the son of a Chinese gentleman, recently arrived from the capital, that its stores of rice are sufficient for three years' consumption, the present price being high, but not exorbitant. We have already drawn attention to similar information as shewing that the prognostications of newspaper writers about the insurgents having cut off supplies, were mere assumptions, like a good deal more that is written about the Rebellion.

Of other provinces, we learn that Kiangsi and Nganhwui are now quiet, matters proceeding in their usual course as if they had never been infested by rebels, who (that is, bands claiming to belong to the Nanking body) are now committing ravages in Hunan, their object, according to accounts we have received, being mainly plunder. They came near without entering the capital of the province, but set fire to a city to the west of it.

The interest in this is concentrated on the army advancing towards Pekin, and of this nothing is known with certainty, except that it is somewhere in Chihli, the province in which Pekin is situated. All else, at present, is mere conjecture.—*Hong Kong Register.*

Since writing the above, the Chinese ship Hamilton arrived, bringing dates to the 20th, but no additional news of any importance. We take the following description of the pirate junks captured by H. M. S. Hermes, from the Friend of China of the 17th:

These vessels were admirably fitted. One had twenty-four pieces, quite new—one long 18-pounder, and 12-pounders, all new English guns and carriages, with the new improvements: elevating screws, compressors, and disparts, English flannel cartridges, case, grape and round shot, &c.

Between the 25th of November and the 4th of December the Hermes took forty junks manned by 1170 men, carrying an armament of four twenty-four pounders, seven eighteen pounders, forty-eight twelve pounders, sixty-six six pounders, and thirty gingalls—in all 155 guns. It is believed that ninety men were killed, forty-one were taken prisoners, also ten women and four children.

Home Industry.

WE copy with pleasure the evidence of the increasing attention that is being given to supply the wants of California with home manufactures. This is right and what California needs: it is what is demanded to make the State permanent and prosperous. This will keep our gold at home for the upbuilding of the interests of California. We say success to the enterprising proprietors of the establishment; and say to our citizens to patronize "Home Industry."

"Not long ago we saw in one of the San Francisco papers an account of a Tannery in Los Angeles county, which was established under very favorable auspices. We are always glad to hear of such improvements in any part of the State, for they add greatly to the well-being of the people, as well as to the substantial wealth of the State. In our neighboring town of Santa Clara, our industrious citizens, Andrew Jacobson and Louis Wampah, have had in operation a Tanning and Saddlery Establishment for four years, which is doing a very large and daily increasing business. So large an amount of work is done is these factories, and so enterprising are the proprietors, that they would be able to supply the demand of the whole country with leather and skins, saddles and harness manufactured in the best style from the products of our own State, and superior in quality to the same articles imported from the Atlantic States. The proprietors feel a laudable desire not only to emulate but to excel, the imported articles, and spare no pains or expense in doing so. They have in their employ the best workmen, of nearly all nations.

Messrs. Jacobson & Wampach take pleasure in showing their establishment and manufactures to all who call on them, as specimens of California industry and skill. And to those requiring articles in their line, we say call and examine their stock, and we doubt not, that both in the quality and price of the articles you will be suited, and have the satisfaction of adding in the building up of home manufactories."—*San Jose Telegraph.*

READ the interesting story commenced on the first page of to-day's paper.

From Oregon Territory.

By the arrival of the steamer Peytona, four days from Portland, O. T., we have Oregon journals to the 1st March, from which we glean the following items:

LYNCHING.—Thirty-nine lashes on his bare back, a shaved head, and a coat of tar and feathers were administered a few days since, at Lynn City to Valentine Neal, for which misdeed does not appear.

WEATHER.—The weather is reported to be severely cold at Oregon City—old settlers say the coldest that has ever been known there. Wednesday night the mercury sank two degrees below zero, and on Thursday stood at zero. As little preparation is ever made here for foddering stock, it must have suffered much throughout the valley.

The Columbia river is frozen over for thirty miles below the mouth of the Willamette.

STEAMER FIRE-FLY SUNK.—The steam-tug Fire-Fly, owned and commanded by Capt. Thos. Hawks, was sunk on Wednesday night, Feb. 26, below Astoria, by which melancholy accident Capt. Hawks, Van Dyke Wiesenthal, the Purser, Z. H. Swasey, engineer, and an Indian boy, were drowned. Capt. Hawks was well known as an old and skilful pilot on the river, and was respected by all as a peaceable, industrious, and honest man. He leaves a wife to mourn his loss. Mr. Wiesenthal was formerly from Boston; the son of Dr. T. V. Wiesentbal of the U. S. Navy, and a brother of A. Wiesenthal of this city; and was engaged on the steamer for the purpose of becoming acquainted with the river and bar. Mr. Swasey was a young man, much respected by all who knew him—a practical engineer, whose future prospects were second to none other. He was from Bath, Maine, where we learn his friends now reside.

STATE ORGANIZATION.—By a law passed at the late session of the Legislative Assembly, the people, at the next June election, will be called upon to express their wishes as to the formation of a State Government. If a majority decide in favor of calling a Convention to form a State Constitution, then, under the law, an election is to be held in September, to send delegates to the Constitutional Convention, to frame a State Constitution, which is to be submitted to the people at the June election in 1855. If approved by the people at that time, it is to be submitted to Congress, and admission asked as a State.

The Oregonian learns that Gov. Stevens, of Washington Territory, has disbanded his entire corps, who were engaged in the exploration of a northern route for the Pacific Railroad. Considerable dissatisfaction has for some time existed between the Governor and the officers under his command.

ERUPTION OF ST. HELENS.—The crater of Mt. St. Helens has been unusually active for several days past. Those who have been in a position to obtain a view of the mountain, represent clouds of smoke and ashes as continually rising from it. The smoke appears to come up in puffs, which was the case at the time we visited it in August last. There is now more smoke issuing from it than there was then, which indicates that the volcanic fires are rapidly increasing within the bowels of this majestic mountain.

The Oregonian says—It is reported that new and rich gold mines have just been discovered on this side of the Calapooya mountains, about forty miles south of what used to be called Marysville, now Corvallis. We give the story for what it is worth.

The anniversary of the birth of the greatest of American warriors and statesmen, who alone it is universally acknowledged was "first in war, first in peace, and first in the hearts of his countrymen," was commemorated at Oregon by a grand soiree on Wednesday evening last. Washington Hall, recently erected by S. M. Moss, was gorgeously fitted up for the assembly, which was large and highly respectable.

CATTLE—*High Prices.*—The Scott County, Ky., Importing Company, lately held a sale at Georgetown. We give a portion of the prices which cattle sell for out West. Improved Yorkshire hogs, one sow, $150; one do., $160; one do., $100; one do., $160; one boar, $60. Durham bulls brought the following prices: one, called Baron Feversham, $1,525; Pathfinder, $860; Capt. Lanson, $400; Cunninghan, $865. Cows and heifers ranged from $405 to $710. Twenty-five Cotswold Sheep sold at the following prices: $200, $475, $275, $170, $250, $160, $103, $90, $155, $123, $125, $170, $105, $100, $150, $151, $80, $157, $165, $160, $172 50, $162 50, $192, $160, $177. Ten South Down Sheep brought the following prices: $80, $75, $80, $85, $81, $75, $85, $21, $80, $80. Three Leicestershire Sheep, sold for $47, $50, $50. We notice among the purchasers the names of some of the best graziers of that State.

A GREAT APPLE TREE.—There is an apple tree in Litchfield, Conn., owned by Solomon Marsh, which measures fourteen feet around the trunk is 130 years old, and produced last season twenty bushels of apples of a delicious quality. Previous to 1845 it had yielded some 100 bushels per annum for years. The tree was brought from Hartford by some of the early settlers of Litchfield.

The whigs carried the day at the late election in Marysville by a fair majority. They elected their Mayor, Marshal and five of the eight Aldermen.

Interior Items.

QUARTZ SPECULATIONS.—A short time since, Messrs Turner & Co. sold the loose quartz on the surface, from their claim at Guadalupe, for $100, and the parties purchasing have taken out of the same $3,090, according to their own statement; but by many it is supposed they have made much more.

The mining news from Agua Frio is of the old sort, since the rain. Messrs. Roland, Lamaston & Co., having but little to do one day last week, started out prospecting in the street, and are now working a claim in Main street, that is paying them $20 to $28 per day to the man. Accounts from Upper Agua Frio are quite encouraging. Miners are making on an average, about $10 per day to the man.

The first shipment of gold dust to England, by the Agua Frio Quartz Company, was made last Saturday.

On Wednesday last, as some miners were at work in a place known as Jackass Gulch, near Mokelumne river, at a considerable depth, one of the party discovered the skull of a human being, and near it a jaw bone. They presented a singular formation. The skull was small and without any forehead, the eyes being placed immediately under the top of the skull. The jaw bone was large and the teeth perfect.

The rains falling copiously have enabled the miners to keep at work in those ravines and gulches not favored by the supply of water from any of the canals. In consequence, a large amount of gold has been dug out, which is ascertained by the great increase of deposits and sales at our express offices.

A miner, working on Hughes' ravine, took out one day last week, a lump of gold weighing 190 ozs.

The following are from the Empire County Argus:

YANKEE SLIDE—SUSPENSION DITCH.—The Yankee Slide, on the Middle Fork of the American river, is known to be one of the richest slides in California. Heretofore it has been impossible to work it to advantage, on account of the difficulty of getting the dirt to the water. This is about being remedied. A company of miners have already constructed a ditch down Missouri Canon, on the opposite side of the river, and are making active preparations to carry the water across the river. The wire is purchased, and will be put up in a short time, to make a suspension ditch across the river. It is to be one hundred and fifty feet above the bed of the stream, and is the only work of the kind in California.

The Mountain Ditch Mining Co., took out, in one day last week, over $1,300, including one lump weighing 2 3-4 pounds.

The Missouri Tunnel, at Mount Gregory, on the Middle Fork of the American, has penetrated 440 feet, at a cost of $8,000. It has reached the auriferous gravel, and large returns are expected. Two other tunnels run into the hill, costing thus far $15,000 each.

A Mr. McKenny has struck a rich lead near the Knickerbocker Ranch. The first three loads of dirt yielded $50, in pieces of 50 cents to $8.

The miners in Volcano Canon are doing remarkably well. One company on Saturday last took out $1,000; one nugget weighing twenty-two ounces, solid gold. Other companies are taking out fine specimens. A few days ago, a company took out a piece weighing $700, and another company one worth $494.

We learn from the Placer Herald that the Bear River and Auburn Canal Co., intend extending their Ditch to Dotan's Bar, by which a large extent of flats will be made available, and give profitable employment to one or two thousand men.

The Sonora Herald says: "We congratulate our citizens upon the prospect of a revival of quartz mining, upon improved plans, that will benefit the parties, and benefit the city, and benefit all who are doing business in this place."

At Chip's Flat they are doing a remarkably good business in mining. Of those companies who have got their tunnels into the lead, none are making less than $200 per week to the hand above all expenses. This is what we call a good business, particularly when it is a general thing among the miners.

At Forest city, they have quit mining by the dollar or ounce; but count their earnings by the pound. A few days since, one company of six persons took out seven pounds, at one day's work.

At Millerton, Mariposa County, on the 22d ult. a man named Andrew McFarlane went to an Indian camp near the town and endeavored to force a squaw to become his companion for the night. One of the Indians interfering to protect her the fellow not only stabbed him, but another who stood by. The one first stabbed has died and the other is not expected to live. The Indians all represent as being a quiet [illegible] people, and McFarlane as a [illegible] from whom [illegible] fled.

THE CALIFORNIA FARMER.

SAN FRANCISCO, THURSDAY, MARCH 9, 1854.

Dignity of Agriculture.

In a new country like California,—for it is yet new in many respects,—it is all important that first principles should be recognized in all grand enterprises; and in the science of agriculture we are confident that these are not understood by those who are engaged in that great enterprize in any degree commensurate with its importance.

This belief will induce us from time to time to lay before our readers some of the most important truths appertaining to Agriculture, and in the plainest and most comprehensible forms, with the hope of leading the great mass of cultivators of California to a desire to become interested in the great truths which science reveals.

It is a want of this knowledge that has foiled so many industrious men in their labors—a want of knowledge of the soil they cultivated, and its capabilities has resulted in the partial or entire, loss of crops, and their consequent abandonment of their efforts. A want of knowledge of the structure of plants, and their necessary food, has tended to the same results.

Such ought not to be the case, where knowledge is so easily attained. In all mechanical employments, those engaged feel the necessity of becoming thoroughly acquainted with the implements of trade, and the trade itself, and in all artistical pursuits such is ever the case with those who desire success to follow their vocations. And shall the cultivators of the soil be deficient in the necessary knowledge of their vocation?

The science of Agriculture has been kept in the background too long. Men engaged in it have thought too little of their employment—its nobility has not inspired them sufficiently to induce them to engage in it with that earnestness and zeal it deserves and demands. They have only worked with their hands, and have been willing to be called the "rough-fisted farmer," blushing to own the name, and have felt, when men in other employments have sneeringly called them only "plow-joggers," that indeed they were less than men, and have submitted to insult and degradation? Why was this? Was it because the employment was degrading? No. Was it because there was no pleasure in it? No. Was it because there was no profit in it? Was it because there was no happiness in it? No. Was it because there was no honor in it? No. Was it because there was no public good in it? No. Then, why has there always hung around this noble science that feeling of distrust and that willingness on the part of those engaged in it to permit it to be considered in the light in which it has been viewed?

Why has there been wanting that enthusiasm and interest, on the part of the public, in this science, that its greatness demands? We answer, because those engaged in it have not had their hearts in the work. Viewing things through a wrong medium, they saw the world looked upon the rough garb of the farmer—his dress of homespun, his coarse shoes, rough hands, and sun burnt countenance, with less complacency than upon the genteel dress of the merchant, manufacturer, or banker, whose polished appearance and easy manner gave him a better passport to society, and a "higher place in the synagogue." They yielded to that influence, and permitted the "dress to make the man."

Thank God, that day has past.

Light is breaking! The cultivator of the soil begins to feel the value of his employment, and the benefit it diffuses. He begins to feel that its labors and duties are not degrading, but ennobling. He feels that it is full of pleasure and profit when rightly conducted. He feels that there is honor in it, and that, so far as the public good is concerned, it is the basis of all wealth and prosperity.

More than this, he finds that the farmer can, if he pleases, be as intelligent and polished as the merchant, manufacturer or banker. That they have not been willing or desirous to make themselves so, in times past, all must admit. They did not seem to feel that the farmer required to be a student, or his brain should dream of science. The farmer's son that gave promise of talent was sent to college, and prepared for the ministry, studied medicine, law, or some profession, and the thick-headed boy, that knew nothing, or could learn nothing—*he would do for the farm.* And thus was laid the foundation of that great wrong which has been done to the noble science of agriculture. But, "there's better times coming" Reflection, study, and those truths that nature has made us feel, has awakened an interest and a feeling that will, ere long, manifest itself in new beauty, glory, and usefulness upon all the institutions of our country.

Our present object is to introduce the subject, and to commend the following truths, which we have extracted from Professor Johnson's work, to the attention of our readers.

"In investigating the structure of plants, that of the leaves becomes essential, to know how plants should be fed; that is, to those who are desirous of understanding the principal branches of knowledge, on which all sound agriculture must be based. Among the circumstances connected with the structure of plants, the organization of the leaf is of the greatest importance. The upper side differs generally from the under; when subjected to the magnifying power of the microscope, this difference is very striking. The under part of the leaf is found to be studded with little holes or pores, or mouths, which sustain important functions or relations to the life of plants. They are very numerous. To give some idea of their number, I may mention that on a square inch of a single leaf, twenty thousand of these little pores have been seen and counted. The number of these pores indicates to those who have studied this subject, the circumstances of climate and atmosphere to which this plant is adapted.

By means of these pores, they suck in aerial food from the atmosphere—the mode in which they drink it in, the quantity and circumstances under which they absorb it must favorably; that is, the circumstances of temperature and moisture, are related to the form and number of these pores, as they occur in particular kinds of leaves.

The structure of the stems of plants is also one much connected with their growth. Those who have the curiosity to examine the structure of the stems of plants, have only to turn to Professor Emmons' volume on the Agriculture of New York, where sections of plants and trees are given with great accuracy and beauty. These, as Professor E. well says, exhibit in a strong light, the important relations which science bears to the practical cultivation of these plants.

The structure of the roots of plants, is another important point, requiring a minute study into the manner in which the stem tapers down into the extreme fibres of the root of the spongy form of the extremity of the roots, which enables it to draw to it all of sustenance that it gets from the soil. Thus the habits of these roots are important. Some plants spread their roots over the surface, as the turnip, which spreads its roots to the distance of four or five feet. You may readily trace them to the distance of three or four, and even five feet, showing from how great a distance these plants draw their sustenance. Some plants descend to a great depth. This is another important point, for if the habit of a plant is thus to go down to a great depth, and if the deeper it goes, the more food it extracts from the soil, then it is quite clear that the more shallow the soil is kept, the less the farmer has studied the soil.

Now, among the plants of this habit, wheat is one that will send its roots three or four feet into the soil, in search of food; and the more mellow the soil, the more easy it is to get the food, which enables it to grow to a great height, and to reach its maturity. Hence a knowledge of this fact, in regard to wheat and flax, suggests the necessity that the soil should be deeply cultivated—that the farmer should plow deep, in order to avail himself of this store house of natural food, which is essential to supply the wants of the plant, and enable it, through the medium of its roots to bring this food to the surface, and make it useful. Thus, some plants have roots so formed that they will grow only in light soils—others in stiff soils only. Wheat requires a strong and stiff soil—the barley and the turnip a light soil, and this fact indicates that where a farmer has only a strong soil, he must lighten it in order to grow barley or the turnip; and that some soils must be drained in order to cultivate these two things.

Certain plants indicate certain soils, as the thistle indicates a rich and productive soil. Brambles indicate a loamy soil; the wild radish a poor soil; the rush, a good soil, but one that is useless for want of drainage; the common rag wort, (rag weed,) which occurs in arable lands indicates that the land is badly cultivated.

Trees indicate different varieties of soil. The beech, a light soil; maple, also a light soil of a very superior quality. The habits of plants, particularly of those which infest the soil, is important, as teaching us how to exterminate them; that is, it is important to know whether they are annual, biennial, or perennial. Those that are perennial, like the Canada thistle, indicate from that fact how they are to be exterminated; if annual, they must be kept down every year; if biennial, they must, to be attended to once in two years. Perennial plants require to be more effectually exterminated, according to the character of their seeds—as, for instance, whether they are strong, and will remain long in the ground without rotting. The seed of the pigeon weed, for instance, is of this character, and may be carried to great distances without being destroyed. This vitality of seeds, therefore, is of great consequence to the practical man.

I need not go further into details, to convince you how far an ignorance of botany stands in the way of progress in agricultural pursuits. But there are many different kinds, of plants, which botanists study, which are of particular interest to the practical farmer, or which, at least, possess as high an interest to them, as any other.

I may mention mildew, smuts, and rust. This is a subject of the highest interest. By examining them closely through the microscope, botanists have discovered how they grow—what they are—how they propagate—how they get into the plant and seed—and how they may be exterminated. It is obvious that to exterminate smut, you must either destroy the seeds, (sporules) when they have come to maturity, or destroy the plants before they have attained that state. But of all the smuts, or fungi, as they are called, that injuriously affect plants, the potato disease is one of the most remarkable; and when we consider how important a root the potato is, and what great distress has followed the effects of this disease, you cannot fail to see that this branch of knowledge, the province of which is to investigate the causes of a disease like this, is deserving of all possible encouragement. And though no study arrives at maturity at once, still, because we cannot discover everything in a moment, or by so short a process as we could wish, we are not, on that account, to discourage these investigations."

Belgium Pomological Convention.

This important movement in Belgium will be of immense value to fruit growers in this country; by their decisions many varieties will be discarded to make room for the new varieties that will be introduced and for those of recent origin that have been before the convention. We have no doubt but the action of the Pomological Conventions of our National Society gave the stimulus as alluded to in the article that we publish below, and we trust it will awaken a due interest in the minds of those who are planting orchards in this country.

It is of the highest moment that California Fruit Growers should take an interest in Pomology—that they should be familiar with the BEST VARIETIES of all kinds of fruits, and familiar with the *synonyms of Fruits*, otherwise they will make a vast amount of difficulty for themselves, and disappointment to all who grow fruit. There is an urgent demand that this subject should receive the attention that it merits—there are large orchards being established—but we fear there is too little attention given to the varieties planted; there has been more inclination to plant a great number of trees at a small cost, than to plant the best kind—more attention to quantity than quality, this will bring a sad disappointment. A large amount of seedling trees of the most common kind have been planted, and people seem willing to take their chance as to quality—forgetting that it costs no more to plant and cultivate a good tree than a poor one—and they will find that the quality of the fruit grown will be something like the Indian's preaching: his preaching *cost but little*, and the people got "*mighty poor preach.*" So with the ordeal of trees, that cost but little; producing but poor fruit, they will soon be neglected, and finally abandoned. Now is the time to remedy these errors in California.

We trust our distinguished Cultivators in the several valleys will take measures to call a Convention of Fruit Growers during the present session of our legislature, at the capital. We believe our law-makers will be pleased to aid in so laudable a work.

We trust also that the legislature will awaken to its true interest on the subject, and give generous bounties to the Cultivators of the Soil in all the important products of the country. We look with deep interest to their action, believing they will see the importance of such measures.

"From the London Gardener's Chronicle and other European papers we have intelligence of a movement in Belgium of the utmost importance to American pomologists. The Belgian Government has issued a Royal Commission for the purpose of collecting and publishing all existing information concerning the qualities of fruits and their cultivation. The old kinds still deserving preservation are to be described, as well as the numerous varieties of modern origin; the names by which they are known to be reconciled and reduced to a common standard; and the best sorts are to be illustrated by figures. This measure, which the Agricultural Congress of Belgium has for four years recommended, is confided to eight gentlemen of the country, and to certain corresponding members, among whom Mr. Rivers, of Sawbridgeworth, and Mr. Robert Thompson, of Chiswick, represent Great Britain.

The work will appear in parts, each containing four colored plates, and the necessary letter-press. Ordinary sets are to be charged twenty-four francs, and fine paper copies thirty-six francs a year; the first part is advertised for the beginning of the year.

The Commission announces that no statement whatever will be made, the truth of which is not ascertained, and which shall not have been justified by experience. The errors which ignorance, *charlatanerie*, or private interests have rendered current will be rigidly exposed. Every writer is to sign his own article; but no article is to be admitted which shall not have been specially discussed by the Commission. The points to be elucidated with each variety will be the best mode of culture, whether as standard, pyramid, or against walls; the bearing vigor, good quality and keeping; the soil best suited to each, and the settlement of the synonyms. None but the finest kinds will be figured, that the Commission guarantees.

Our National Pomological Society has no doubt to some extent been the means of calling out this Commission. It is much needed, and if the work is prosecuted in the thorough manner indicated will do much good."

Laying Down to Grass.

We give the following extract from "The Elements of Agricultural Chemistry," by Professor Johnston, and published by Saxton, of New York:

On this subject, two facts seem to be pretty generally acknowledged.

First, That land laid down to artificial grasses for one, two, three, or more years, is in some degree rested or recruited, and is fitted for the better production of crops of corn. Letting it lie a year or two longer in grass, therefore, is one of the received modes of bringing back to a sound condition a soil that has been exhausted by injudicious cropping.

Second, That land thus laid down with artificial grasses diminishes in value again after two, three, or five years—more or less—and only by slow degrees acquires a thick sward of rich, nourishing natural herbage. Hence the opinion that grass land improves in quality the longer it is permitted to lie—the unwillingness to plow up old pasture—and the comparatively high rents which, in some parts of the country, old grass land is known to yield.

Granting that grass land does thus *generally* increase in value, three important facts must be borne in mind before we attempt to assign the cause of this improvement, or the circumstances under which it is likely to take place for the longest time and to the greatest extent.

1. The value of the grass in any given spot may increase for an indefinite period, but it will never improve beyond a certain extent—it will necessarily be limited, as all other crops are, by the quality of the land. Hence the mere laying down to grass will not make *all* and *good*, however long it may lie. The extensive commons, heaths, and wastes, which have been in grass from the most remote times, are evidence of this. They have, in most cases, yielded so poor a natural herbage as to have been considered unworthy of being enclosed as permanent pasture.

2. Some grass-lands will retain the good condition they thus slowly acquire for a very long period, and *without manuring*—in the same way, and upon nearly the same principle, that some rich corn-lands have yielded successive crops for 100 years without manure. The rich grass-lands of England, and especially of Ireland, many of which have been in pasture from time immemorial, without receiving any known return for all they have yielded, are illustrations of this fact.

3. But others, if grazed, cropped with sheep, or cut for hay, will gradually deteriorate, unless some proper supply of manure be given to them—which required supply must vary with the nature of the soil, with the kind of stock fed upon it, and with the kind of treatment to which it has been subjected.

Strawberries.—The following excellent article on the planting of that delicious fruit we commend to our cultivators, premising, however, that the August and September of the East will apply to November and December of California, and prove better; for the roots will become established and grow all winter, and the labor of watering and care be in a manner saved:

The practice of planting strawberries in August is a very good one *well* done, but very hazardous when performed with as little care as one would take in April. Every season we have to listen to hundreds of complaints concerning the loss of summer and autumn plantations of strawberries. The plants, in most cases, are feeble, the dry weather not allowing them to become well rooted. The ground is dry, and although the plants may have been set after a shower, the heat, sun, and dry air, soon leaves the ground as dry as ever, and what can the plants do but die? We must suggest to those who desire to make a strawberry bed in August or September, to see in the first place that the ground is thoroughly wet. If a rain does not happen to come at the right time, and in sufficient quantity, then apply the watering pot or engine, and drench it completely, until the water has gone down even to the subsoil. The plants may then be set. But when they are in the ground, even thus prepared for them, all is not over. If a brilliant sun shines out upon them in its full force the day after they are planted, the chances are ten to one against their living. In such a case, slight shade should be afforded for a few days. Evergreen boughs, or boards set on their edge and meeting at the top, forming a roof over the rows of plants, are easily applied.

If such a course as this is followed, strawberry plants may be set in any month of summer, and in any sort of weather. Nothing can be a greater waste of time than the very common method of planting in a soil as dry as ashes, and then dribbling a little water on every day. People say, "I cannot see why it is my plants die; I water them every day." They do not understand that this every-day sprinkling amounts to nothing more than to hasten the death of the plants. *One* good thorough soaking of the ground *before* the plants are set, will generally sustain them till rerooted, and is worth a thousand sprinklings afterwards.—*Gen. Farmer.*

Rotation of Crops---Its Uses and Effects.

[CONCLUDED.]

ANOTHER illustration of rotation may be observed in the succession of forest trees that shoot up on the same soil, to supply the places of such of their predecessors as have decayed or been cut down. Thus, the pine and other of the coniferæ, are frequently found to usurp the place of the oak, chestnut, and other deciduous trees. This sometimes occurs only partially, but in repeated instances which have come within my notice, forests have been observed to pass entirely from one order of the vegetable creation to its remote opposite, the seeds or germs of which (the product of an ancient rotation), had been lying dormant for centuries, perhaps, waiting a favorable condition of circumstances and soil to spring into life.

Many choice secondary bottom lands, and others munificently supplied by nature with all the materials of fertility, have, by a long succession of crops, been reduced to a condition of comparative sterility. Yet it will have been found in the progress of this exhaustion, that after the soil ceased to give an adequate return of one crop, as of wheat, corn, or tobacco, it would still yield largely of some other genus which was adapted to it. These lands, when thus reduced, and turned out to commons for a few years, will again give crops much larger than those which closed their former bearing career, proving that nature has been silently at work in renovating the land for further use. The whole course of her operations is not yet known; but it is satisfactorily ascertained, that she is incessantly engaged in producing those changes in the soil, which enable it to contribute to vegetable sustenance. Enough of lime, or potash, or silica may have been disengaged to yield all that may be required for one crop, which by that crop is principally taken up, and if another of the same kind follows in quick succession, there will be a deficiency; yet if a different crop succeed, there may be found enough of all the materials for nutrition, in forms and proportions unlike either which has preceded it, and by the time a recurrence to the first is necessary, the soil may he in a condition again to yield a remunerating return. These remarks apply equally to such soils as have, and such as have not received manures; unless, as is seldom the case, an accurate science should add them in quantity and character (*specific manures*), fully to supply the exhaustion. The additiou or withholdiug of manures, only accelerates or retards this effect.

Another prominent advantage of rotation, is in its onabling such crops to have the benefit of manure, as cannot receive it without hazard or injury if applied directly upon them. Thus wheat and the other white grains, are liable to overgrowth of straw, rust, and mildow, if manured with recent dung; yet is this applied at no risk to corn, roots and most of the hoed crops; and when tempered hy one season's exhaustion, and the various changes and combinations which are effected in the soil, it safely ministrs in profusion to all the wants of the smaller cereal grains. An additional benefit of rotation is, by bringing the land into hoed crops at proper intervals, it is cleared of auy troublesome weeds which may infest it. And a still further advantage may be found, in cutting off the appropriate food of insects and worms, which, in the course of time, by having a full supply of their necessary aliment, and especially if undisturbed in their haunts, will oftimes become so numerous as seriously to interfere with the labors of the farmer. A variation of the crop, exposure of the insects to the frosts, and the change of cultivation which a rotation insures, will make serious inroads upon their numbers, if it does uot effectually destroy them.

The noxious excretions of plants, a fanciful theory first broached and ingeniously defended by the powerful name of Decandolle, and which the closest scrutiny of scientific observers since, has pronounced unworthy of credit, does not form another reason for rotation. It is because principles essential to successful vegetation have been abstracted, not that others hurtful to it have been added to the soil by preceding crops, which renders rotation necessary.

From all that has hitherto been learned on the subject of rotation, either from science or practice, two general principles may be assumed as proper to guide every farmer in his course of cropping. First, to cultivate as great a variety of plants as his soil, circumstances and market will justify; and second, to have the same or any similar species follow each other at intervals as remote as may be consistent with his interests. From the foregoing observations on the subject, it is evident that the proper system of rotation for any farmer to adopt, must depend on all the conditions by which he is surrounded, and that it should vary according to these varying circumstances.

It is a practice with some to alternate wheat and clover, giving only one year to the former and one or two years to the latter. This will answer for a long time on soils adapted to each crop, provided there be added to the clover, such manures as contribute to its own growth, and such also, as are exhausted by wheat. The saline manures, ashes, lime, &c., may be added directly to the wheat without injury; but gypsum should be sown upon the clover, as its benefits are scarcely perceptible on wheat, while upon clover, they are of the greatest utility. But there are objections to this limited variety, as it does not allow an economical or advantageous use of barn-yard manures, which, from their combining all the elements of fertility, are the most certain in their general effect. In different countries of Europe, fields which have been used for an old-fashioned clover crop have become clover-sick, as it is familiarly termed. The plant will not grow luxuriantly, sometimes refusing to vegetate, or if it starts upon its vegetable existence, it does so apparently with the greatest reluctance and suffering, and ekes out a puny, thriftless career, unattended with a single advantage to its owner. This is simply the result of the exhaustion of one or more of the indispensable elements of the plant. If it be desirable to pursue this two-course system for any length of time, *nothing short of the application of all such inorganic matters as are taken up by the crops, will sustain the land in a fertile condition.* I subjoin, simply for the purpose of illustration, and the guidance of such persons as may have little experience in rotation, some systems which have been pursued with advantage in this country.

On a grass sod broken up, with a heavy dressing of barn-yard manure, or muck, ashes, and lime if necessary. First year, corn with gypsum scattered over the plants after the first hoeing, which should be done immediately upon its making its appearance; second year, roots with manure; third year, wheat if adapted to the soil, with guano; if not then barley, rye or oats, with grass or clover seed or both; fourth year, meadow, which may be continued at pleasure, or till the grass or clover gives way. The meadows may be followed by pasturing if desired. Clover should not remain over two years as meadow, but for pasture it may be continued longer.

First year, corn or roots on a grass or clover ley with manure; second, oats and clover, with a top dressing of 10 to 12 bushels of crushed bones per acre; third, clover pastured to last of June, then grown until fully matured in August, when it is turned over, and a light dressing of compost and 40 to 80 bushels of leached ashes spread over it, and wheat and Timothy seed sown about 15th September. If desired, clover is sown the following spring. This gives for the fourth year, wheat; fifth and sixth, and if the grass continues good, the seventh year also, meadow.

First, corn on a grass sod heavily manured, and a half gill of ashes and gypsum mixed at the rate of two of the former to one of the latter, and put in the hill, and a less quantity of pure gypsum added after the corn is first hoed; second, oats or barley, with lime at the rate of 20 or 30 bushels per acre, sown broadcast after the oats and harrowed in; third, peas or beans, removed early, and afterwards sown with wheat; fourth, wheat with a light top-dressing of compost, guano and saline manures in the spring, and clover, or grass and clover seed; fifth, two or three years in meadow and pasture.

First, wheat on a grass sod; second, clover; third, Indian corn, heavily manured; fourth, barley or oats, with grass or clover seed; fifth, and following, grass or clover, with guano.

A good rotation for light, sandy lands, is first, corn well manured and cut off early and removed from the ground, which is immediately sown with rye, or the rye hood in between the hills; second, rye with clover sown in the spring, and gypsum added when fairly up; third, clover out for hay, or pastured, the latter being much more advantageous for the land.—*American Farm Book.*

TO BOIL HAM.—Wash the ham in cold water two or three times, and put in a kettle of hot (not boiling) water to cover it; let it boil gently, according to its weight, (fifteen minutes to each pound); it must be kept slowly boiling all the time; keep the pot covered except to take off the scum as it rises; if it is like to boil over, take the lid partly off.

Putting meat down to boil in cold water draws out its juices. Hard or fast boiling makes it tough or hard.

When it is done, take off the skin, trim off the under side neatly, and put spots of pepper and stick cloves at regular intervals over the whole upper surface. Or dredge it well with wheat flour or rolled crackers, and brown it in a hot oven or before a hot fire. Serve hot with the gravy from it, and boiled vegetables; or it may be served cold. Trim the bone with parsley or the delicate leaves of celery, and put sprigs of the same around it on the dish; lemon sliced and dipped in flour, or batter and fried, may be laid over the ham and on the dish. Mashed potatoes, stewed apple or cranberry, dressed celery or boiled spinach, or caulilower and mashed turnips, are served hot with ham.

With cold ham, serve pickles or dressed celery, or both, and bread and butter sandwich.—*Southern Agriculturist.*

GRIST MILL NEAR SONORA.—Mr. Wm. G. Heslep, says the Herald, is fitting up a grist mill on Wood's creek, about two miles below Sonora. He will be ready to grind barley for feed in a short time. The stones and bolting apparatus for making flour have not yet arrived from the Atlantic States. Mr. Heslep has determined to have his apparatus as good as the best. Let our farmers, therefore go to work and sow wheat, buckwheat and barley, and let them plant corn. Fresh corn-meal, and fresh buck-wheat—who does not look forward with pleasure to the chance of a supply?

INDIAN MEAL DOUGH NUTS.—A tea cup and a half of boiling milk, poured on two tea cups of sifted Indian meal. When it is cold add two tea cups of wheat flour, one tea cup of butter, one and a half of sugar, one of yeast, and two eggs, with a table-spoonful of cinnamon or a grated nutmeg. If not sufficiently stiff add equal portions of wheat and Indian meal. Let it rise till very light. Roll it about half an inch thick, and cut into oval diamond shaped cakes, and boil them in lard.

Cheviot Sheep.

WHILE attention is being directed to various breeds of mutton sheep, the Cheviot ought not to be overlooked. It has existed from time immemorial on the Cheviot range of hills, on the border of England and Scotland. It is more hardy than any of the lowland breeds, and is better adapted to rough and exposed situations. The Cheviots are not much known in the United States. We know of only two importations of them—one by the late Hon. Daniel Webster, and the other by Col. Carmichael, of Wisconsin. Mr. Webster's were only a few. They were kept at his farm in Marshfield, but we do not know what success attended his attempt to propagate them. In reply to an enquiry, Mr. Webster gave the writer the following description in 1850.

"They are very handsome, coming fully up to the cuts of them which you find in English publications. I do not think mine are very large, as my pastures are not rich, and I have taken no particular pains with them. I have had no great experience of them as to their mutton, as yet; but some wethers have proved very good. I think the breed fattens readily."

Martin's description of the breed is as follows: "They are full behind the shoulder, and the fore-quarters are justly proportioned to the hind; they are straight in the back, round in the rib, clean and small houed in the limbs; the wool, which is of a quality superior for many combing purposes, comes forward behind the ears, but leaves the face uncovered. The Cheviot sheep is capablo of enduring much cold aud privation; it possesses considerable fattening properties, the wethers being ripe for the butcher at two years of age; and averaging from 15 to 18 lbs. the quarter. The mutton is excellent. This description applies to the Cheviots with a cross of the Leicester. In all that regards size, form and contour, they are superior to the old breed; but the wool has become coarser and longer."

Count de Gourcy, a French gentleman who made a tour through England and Scotland in 1850, thus speaks of the Cheviot sheep which he saw on the mountains of Sutherland:

"I was surprised in going over those horrible mountains and miserable pastures, to see them stocked with such fine animals, yielding, on an average, five pounds of long and beautiful wool, washed upon the back; wethers three and a half years old, without having eaten any other thing than what is to be found in these wilds, weighing, alive, 200 English pounds, together with ewes that at five years old, and with the same feed, are fat, and weigh from 60 to 70, and even 90 pounds. What I have seen in this journey makes me more convinced than ever, that the Cheviot breed is one of the highest merit, since they live and prosper on such land, under such a severe climate, and that, too, without other food than what these wilds furnish."—*Cultivator.*

Manures.

ALL substances, both liquid and solid, of vegetable or animal origin, that by their decomposition fertilize the earth by serving as food for plants, are called manures. Thus, a crop of clover turned in by the plough, as it decomposes, furnishes a supply of manure of vegetable origin. The remains of dead animals, on the other hand, furnish manure of animal origin.

Manures may be divided into several classes: 1. Ordinary manure, a mixture of animal and vegetable substances. 2. Animal manure, strictly of animal origin. 3. Vegetable manures, as green crops turned under, straw, etc.

The value of manures depends upon their nature. Those of animal origin are usually exceedingly active, and of little duration. Among vegetable substances, those most valuable as food are also most valuable as manure.

The continual application of vegetable manures will not bring land up to the highest degree of fertility. They must be aided by animal manures which, by means of the salts which they contain, exercise upon the soil a peculiar influence.

Though in general the development of plants is greatly favored by the application of manures, yet there are cases in which they will do more harm than good, if great attention is not paid to their condition and mode of application. Thus, the liquid manure from the stable may burn the plants to which it is applied, if it has not been fermented and mixed with a due proportion of water.

Other manures again, though beneficial to the growth of plants, are often injurious by introducing and encouraging the growth of weeds that are afterwards found difficult to extirpate. This is more commonly the case with unfermented manures.

The vast importance of manure to the farmers is too generally acknowledged to make it necessary here to argue the question. The profits of the farmer depend upon the quantity of manure that he applies to his crops. It is very evident that the amount of labor required to produce a crop is the same for poor as for rich land, and yet what a difference in the yield.

DEPTH OF ROOTS—In a [illegible]—Henry Coon of Michigan [illegible] Mining Newspaper, as the result of all his experience that he has invariably found the roots of grass, vegetables, fruit and flower trees, wherever they may be, no matter what soil or depth. He says he never plants where the roots penetrate a hard clay more than eight feet, and has practically proved that by the thickness of a board three times over, just beneath the surface. He says he never digs deeper than one foot to plant and cultivate the soil, and finds the better

The Capital.

THE first of March will be an epoch in the history of the "city of fire and floods." That moving energy, that heroic perseverance, that undismayed will to conquer and to triumph over a combination of calamities, such as the citizens of no other city in the world has ever experienced has been proudly rewarded.

We do not look upon this event as a political movement at all. We see in it proof that cities, like men—who are true to themselves—will always rise. Circumstances may for a time overwhelm them with difficulties; but if the right spirit is there they will surely conquer. Their day of triumph will surely come! Thus has it been with Sacramento, and it is no mere compliment to praise her; she merits more than can be said of her. The difficulties the mass of her citizens have surmounted have been such that, could they be written, they would put to shame the ordinary tales of romance or heroic adventures. Sacramento has never received any portion of the credit and sympathy she has deserved. A little more generosity, a little more magnanimity on the part of some whose iron hand has been felt, would have been wiser, better and more humane, and the result of such actions would have better for all.

We believe the storm has passed; the dark clouds are hanging away into the distant horizon; brighter rays are gleaming over the "queen city of the prairies;" the heavy heart has found relief in hope and better prospects; the gloom is passing from the brow, cheerfulness and smiles betoken confidence again.

Hark! there is joy in that city, the bells are ringing merrily, and the booming cannon tells of victory. Not a victory bought with blood and conquest; not a victory achieved by partisan strife; but a perfect triumph of those great principles that always give honor with the victory. A triumph of human energy, overcoming luckless misfortune and despair.

Sacramento, the city of ashes — Sacramento, buried in the floods—citizens of Sacramento left houseless, homeless, we may say penniless, inspired by that energy that knows no defect, have now the proud satisfaction of knowing that all was not lost—

> All was not lost! those mighty words—I will!
> Woke in the heart with an electric thrill:
> Those slumbering energies, only dormant then,
> Which sprung to life and banish'd dark despair—
> Then with a shout, the noble work began:
> That work is finished by a victory won.

Sacramento city may now be considered the permanent seat of government of California, and we may consider it settled by the will of the people, spoken through their representatives.

When we consider the location of Sacramento, her facilities for communication with the interior and with San Francisco; when we consider the conveniences and comforts that can be afforded to the Legislators; when we consider the numerous little comforts which always facilitate legislation; These all present conclusive evidence that the legislation will be shortened, the expense to the State lessened, the acts passed, and all legislation accomplished will be more complete and satisfactory to government and people. Such being our views, we most heartily rejoice at the present results.

Let Sacramento now but look well to her own acts, to the conduct of her officials; see that wise men, good men, and true, only are elected, and this beautiful city will go on prospering and to prosper, until her name and fame shall be as bright as the golden sands which are gathered from the mountains that environ us.

Again we rejoice at the prospect that is dawning upon our favorite city, "Sacramento, Capital of California."

DISEASE IN CHICKENS.—We have frequent inquiries relative to the prevailing mortality among [illegible] fowls, and as the disease is in various parts of the country. The following, from an exchange paper, and we extract it by a letter from a friend, who thinks [illegible] all the information they can get for their trouble [illegible]

"My chickens have a disease that has proved fatal to [illegible] and I have lost about three hundred. They appeared to be sick and stagger, and soon are unable to follow the hens about the yard. They are subject to [illegible] and [illegible] and [illegible] and

New Port on the Pacific.

The greatest objection urged against the Tehuantepec route has been the want of a harbor sufficient for the shipping that will in coming years be engaged in the commerce of the Pacific and centering at that point.

The Company that were organized under the Hargus grant believe the lagoon of Bocco Baro could be made a good port by turning certain rivers. A generous reward having been offered for a suitable port, P. E. Trastow, Esq., an engineer of known talents, whose valuable services on the Tehuantepec road had made him distinguished, commenced a series of explorations.

A series of perilous adventures in the wilderness on the Isthmus coast was completely successful, as will be found by the announcement of the discovery of the "Bay of Ventosa" as recorded. A harbor of magnitude, and one eminently adapted to the prospective wants that it may well be called a great discovery.

The perseverance and skill displayed by Mr. Trastour, amid the dangers and trials with which he was surrounded, the immense benefit this discovery will be to science, and to our mercantile and commercial interest and to those of the world, enlitle him to the honor and gratitude of the nation. We publish from the journals of the day the followiug extracts of his adventures, which will be read with much interest.

We found in the basin of Ventosa Bay, by sounding: At 150 feet from the shore, 16 to 19 feet deep; at 400 feet from the shore, 17 to 22 feet deep; at 500 feet from the shore, 18 to 24 feet deep; at 1000 feet from the shore, 29 to 36 feet deep.

The harbor was discovered. We continued our soundings during eighteen consecutive days, being at sea, with a strong wind, from seven to eight hours a day. We ran over Ventosa Bay in every direction, and even ventured to sail out, with our small boat, more than ten miles into the open sea.

The immense basin of La Ventosa presents a safe and commodious harbor to vessels of all sizes. Closed at the west by the heights of the Morro, it is open at the south and east. This configura- of the Bay allows vessels to have ingress and egress, irrespective of the quarter from which the wind blows. Throughout its great extent, and on entering it from the sea, no shoals are to be met with; everywhere a good anchorage is to be found. The bottom is of compact sand, and a great proportion of it is mixed with clay. La Ventosa is decidedly the best port of the Isthmus, on the Pacific coast, and its depth is regularly graduated.

Speaking of the trials which he underwent in the execution of his project, Mr. T. says:

I had dispersed my people on three boats, so as to have an eye upon the Indians. The order was given to follow in quick succession, and to make calls every half hour. At night we moved our boats near each other, making them fast to the strongest tree above water. But, heavens, what nights! what sufferings! how long they appeared to us! We could hardly stretch our limbs in a canoe loaded with barrels, boxes, trunks, tools and mathematical instruments; our wearing apparel, and even our spare clothes and linen in our trunks were soaked and drenched with water. An incessant shower kept us constantly wet, and we had to remain so a number of days; add to this, that innumerable multitudes of musquitoes were always and at all times upon us. Whenever the current brought along an old stump of a tree to strike against our canoes, the three boats were forthwith filled with thousands of ferocious large ants, against which we had to struggle in the darkness of a rainy night. Some of these insects were more than half an inch long, English measure, and their bite was dreadful.

During daytime, musquetoes continued to plague us, but as our limbs were kept in motion, we felt them less. In proportion as we advanced, we had to cut our way with the axe or hatchet, through large branches of trees, and to destroy the climbing plants that opposed solid fences to our passage. At every stroke, clouds of musquetoes, ants and wasps fell upon us; we were also assailed by dangerous snakes coming from the trees. We had to kill them at once, and it was not an easy matter amidst the confusion of our baggage. And yet we had still other perils to encounter; for, whilst some of us were cutting down trees and bushes, others were holding fast to the boat for fear of being carried away by the waves lashing against our canoes. We encouraged each other in struggling against the waves; but what a storming confusion of currents and counter-currents, now bounding over submerged trees, now bouncing and foaming against natural obstacles, everywhere urging their way with a kind of desperate fury. What emotions did we not feel, when one of our canoes, suddenly heaved up and carried away by the billows, precipitated, headlong in the waves, the Indian, who to keep back the boat, would hang on branches of trees. Oh, what trouble we had to save the drowning man; and yet, at this distance of time, how pleasant to my mind is the recollection that no one of my fellow-laborers perished.

We were sometimes compelled to navigate at the foot of the hills, making a salient angle, the basis whereof was corroded by the strength of currents; from their summits, large blocks, composed of stones and agglutinated sand, fell off at irregular intervals. One day, the direction of our way made us pass below one of these promontories. A single mass of earth, nearly one hundred feet long by twenty or thirty feet thick, detached itself all at once from the mountain, at the height of sixty feet above our heads, and uprooting a large number of trees, fell straightforward into the water below. The last canoe had just passed over, the instant before. Clouds of dust and sand prevented us from seeing it. Astounded, we stood silent as death. The shock was so violent that it left no room for grief, and we stood looking on the scene with painful anxiety, when, the mist disappearing, our friends were seen coming towards us, safe from their terrible danger.

In such a long journey, we could hardly protect our provisions against the rain. Some of our victuals were destroyed, and the balance was damaged. For more than a month, we had no other food, half-cooked with floated wood, minus salt, and anything but healthy. Our strength failed us; our bodies were covered with festering sores; we were deprived of sleep; and the Indians becoming sullen, could no longer be managed. In fact, ready for revolt, the Indians assumed long faces and air of discontent. I condoled and sympathized with them, and tried to inspire them with some courage. My condescension emboldened their audacity, but they did not venture yet to begin the quarrel.

Steamboat Combination.

The great association of steamboat owners—of their capital and steamers, will prove a favorable event for the public. We know we shall differ from the majority, but this will be the result.

A moderate and fair rate of passage and freight will be established—an effort to improve in speed and regularity—a wise and strict economy of time and expense, and an increase of attention and comfort, will as surely be the result as that the combination has been formed.

Those who are at the head of this gigantic enterprise are known as gentlemen of wealth and influence; the capital employed is very large, and consequently there must be wisdom in their management or the concern will not pay. Travellers generally will choose the best boats, and as the present depression of trade has caused several boats to be laid up, it cannot be expected to be a profitable thing now. Again, all the smaller boats on upper routes are drawing a pro rata interest, even without earning anything or paying expenses; and they draw from the resources of the large boats—they being the only ones that can be supported until business improves.

There is too much capital employed, to remain idle, and if the price is above the value, by means of the monopoly, the people will not travel. Necessity will compel even this mammoth enterprise to yield to the wants of the people, to keep their capital paying. This will be the result. We do not fear any evil, but rather good from it.

The present lines are well known—they possess the means requisite for every comfort and pleasure for their passengers, and are so well known that praise is not needed.

The community have a guarantee, in the character of those who compose this company, that the same or better accommodations will be offered, and we have no doubt that if the thing is possible the fare and freight will be reduced to the satisfaction of the public.

We have never seen any good resulting from petty opposition—no good ever came of it—nothing but confusion, discomfort and dissatisfaction. We like comfort and safety and feel that the risk of the amount of capital engaged—the attention it demands to manage and control machinery so vast—demand and should receive a liberal return.

We believe merchants, freighters, passengers, owners and all will be better satisfied, and all will have more money in their tills at the end of the year, by a fair liberal price than by all the opposition, reduction of prices below the real value, &c.

Let us have regularity, such as we can depend on, and with the present line of steamers—their able and courteous commanders and officers, and the splendid accommodations all must enjoy, we shall be satisfied. It will be better for all concerned, up or down river.

The Pioneer.—We find upon our table the second number of this California monthly magazine. The contents are highly interesting and valuable. The "Editor's Table" is amusing, particularly the "chit chat" of the celebrated Pipes. The Pioneer should receive a generous support.

Thanks.—We are under many obligations to Messrs. Adams & Co.'s express, for the prompt delivery of packages, letters, etc.

Our thanks are also due to Messrs. Wells, Fargo & Co.'s express messengers, for attentions to this office.

Lake Erie Grapes.

Charles Carpenter, of Kelley's Island in Lake Erie, off Sandusky Bay, gives an account of some very successful experiments in grape culture on that island. He says:

The soil of Kelley's Island consists of a few inches of vegetable mould, resting on a subsoil of hard clay, in which is mixed some pebbles and sand, mostly of lime stone, and occasionally crystals of sulphuret of iron are found.

When the whole are mixed by plowing, they make a pretty stiff soil, well supplied with lime, sulphur and iron, and yield heavy crops of wheat or corn. Most of the Island is nearly level, or having a gentle slope, just sufficient to carry off the surface water.

Where grape vines are planted, the ground is subsoiled eighteen inches deep, and underdrained. The first planting of grapes was in 1842 or '43, when a few Isabellas were planted in gardens. The Catawba was introduced two or three years later. The unusual growth of the vine, and superior quality of fruit, attracted the attention of persons acquainted with their culture, and generally elicited expressions of surprise; and induced several persons to engage in the culture for the sale of fruit and wine-making.

In the spring of 1851, the writer set part of a field where corn or wheat had been raised for five successive years. The ground subsoiled and underdrained. Layers and cuttings each one year old were used. In February, 1852, the growth was cut down to two and four inches from the ground.

From one to four shoots were allowed to grow, according to the strength of the plant. The side shoots were picked off twice in the early part of the season, in all from three to five feet from the root, after which all were permitted to grow. In November some of the Isabellas had two shoots each eighteen feet long, others four shoots each fourteen feet long.

Some of the Catawba have two, others four shoots ten feet long each, of wood well ripened nearly to the ends. No manure of any kind has ever been put on this field, except some leached ashes on one corner, and that does not appear to have increased the growth at all.

The yield of fruit has been uniformly heavy until the vines were injured by the severe winter of 1851—'52, and again by long continued and heavy rains while in blossom.

Mildew is sometimes seen on the Isabella, but never on the Catawba. The rot I have never seen but once.

The training here is entirely on trellis, some made of wood and some of wire. That of wire is made thus: Set posts twenty-five feet apart, bore half inch holes at suitable distances; if for three wires, say twenty, forty, and sixty inches from the ground; or if for four wires, at eighteen, thirty-two, forty-six and sixty do. Then draw in annealed wire, number nine, the entire length of the row of posts, letting the end come through the last post about four inches, drive in a half-inch pin of hard wood from the outside, and give the end of the wire one turn around the pin close to the post. Then from the other end draw the wire tight and fasten as before. The end posts should be set firm, with a brace from the inside.

Number nine annealed wire is four and a half cents per pound, and weighs just one pound per lineal rod. Wire trellis is put up very rapidly, and costs less than half that of wood.

It is better, also, for the clusters can hang singly, and have full benefit of the air.

A little wine has been made for the last three years—has been pronounced by good judges to be of the first quality.

Grapes will keep until May or June without decaying. I once put a bushel in a basket, covered with a sheet of paper, and set the basket in the cellar, on a barrel of apples. In March they were sound and fresh, and in better condition than the russet apples.

The influence of the lake has a marked effect on our vegetation, retarding it in the spring and preventing late frosts. In sixty years that peaches have been grown here, they have never been injured by a spring frost.

In the fall the water retains the warmth acquired during the summer, sufficient to extend our season considerably beyond that of the main land at a distance from the lake. We never have a frost before the 20th of October, and often not until much later. The first this season to do injury, was November 13th, when the thermometer fell to twenty-eight degrees, until which time peppers, tomatoes, and the like, were untouched. A trifle of white frost had been observed before in some localities, but not sufficient to do injury.

The severe droughts of summer are considerably mitigated by the moisture arising from the lake, while at the same time, fogs, so destructive to the grape leaves, are of rare occurrence in summer or autumn.

The clipper bark Rebekah, Townsend, arrived at this port on Tuesday, after a short passage of 42 days from Hong Kong. She brings later dates than those received by the Hamilton, but no news of general interest. The news per Hamilton and Alster will be found in another column.

Robbery.—During the trip of the Camanche from Marysville yesterday morning, the Clerk's room was entered, and Adams & Co.'s Express bag robbed of four hundred ounces of gold dust. After a search among the passengers, one of them was arrested and taken to the Police Office, and the whole amount found in his trunk.

AGENTS FOR CALIFORNIA FARMER.

Messrs Adams & Co. at all their offices throughout the United States or Europe.
Messrs. Wells, Fargo & Co., at their offices throughout the Country.
Messrs. Langton & Co. *for Downieville, Foster's Bar, Goodyear's Bar, Minesota.*
Messrs. Leland & McCoombe—*Crescent City, Port Orford, Uniontown, Eureka, and Buckeport.*
San Francisco—Messrs. Murray & Co., booksellers, Montgomery street; Sullivan's newspaper stand, near the Post Office; Kimball's, Noisy Carriers Hall, Long wharf; J. H. Still, bookseller, Montgomery street.
Oakland—Mr. Isaac Wilbur.
Benicia, Martinez, &c.—Messrs. Stiles & Dodds.
Union City and Mission San Jose—Messrs. Howard & Chamberlain.
San Luis Obispo—Dr. Thomas L. Harvey, P. M.
Sacramento—Mr. Oscar D. Avaline; Messrs. Curle Brothers.
Union, Humboldt Bay—A. H. Murdoch, P. M.
Mount Farm, O. T.—Gen. M. M. McCarver.
Marysville—Geo. S. Becker.
Stockton—Rosenbaum & Jonckimsen.
New York City, N. Y.—J. M. Thorburn & Co.
Bidwell's, Butte Co.—P. Freer.
Weaverville, Trinity Co.—H. B. Davidson & Co.
Yreka—Crane, Rogers & Co.

N. B.—We want Agents in all the principal localities, and persons disposed to act can have the opportunity, if satisfactory to all parties.

MARKET REPORTS.

San Francisco, March 8, 1854.

M. ABBATE,

SON of one of the largest vine cultivators of Italy, and lately from the Atlantic States, where several vineyards have been planted under his direction, to the full satisfaction of the owners, offers his services to the Farmers of this State, who wish to add to their plantations that of the VINE.

Address P. B. ABBATE, at this office. Refer to Messrs. Warren & Son. 10 1m*

PROSPECTUS.

THE SACRAMENTO DEMOCRAT will be published every morning, (Sundays excepted) on and after Saturday, 11th inst., by the undersigned, in the city of Sacramento.

Arrangements have been entered into, by which we will be able to furnish the latest and most interesting News from all parts of the State, with as much promptness and facility as any other paper in the State; and we assure all who may favor us with their patronage, that no labor or expense will be spared to make our paper interesting, not only as a political paper, but as a family paper, and highly valuable to the Commercial community.

The DEMOCRAT, in its politics, will be Democratic, and will observe the old Land Marks of Jeffersonian Democracy. Its policy will be to support and maintain the present Administration of the Federal Government; and, while nothing sectional shall enter into the columns of our paper, we shall stand by the usages of the Party, and combat every innovation upon the principles which so long have governed and held together the NATIONAL UNION DEMOCRACY.

The DEMOCRAT will be furnished to Subscribers at the usual rates.

THE DREAM.

DEDICATED TO MISS EMMA I. PENSAM.

You ask me why I sit so sad and still—
Why o'er my face glad smiles refuse to play;
Can Love be conquered meekly by the will,
Or reason, the unquiet torment lay,
That haunts the mind of one, by joy forsak'n?
Unmoved, can we forever bid hope fly,
And in our hearts feel no despair awak'n—
Betray no pain, or hush th' unconscious sigh?

Bid me not smile—I cannot, dare not try—
My soul *will* thro' its living windows speak;
Its language would my mockery belie,
And dark contortions prove deception weak.
I had a dream;—Methought that I did love,
And bright Hope whispered that 'twas not in vain;
My soul's ark gladly welcomed back the dove,
That spoke of life, truth, happiness, again.

Methought I wandered on a foreign shore,
Where summer's glad'ning verdure ever stayed;
Where flowers bloomed, and balmy zephyrs bore
Sweet fragrance to me. Not alone I strayed,
For by my side was one, whose beaming face
Bespoke a heart alive to love's true flame;
Her form was perfect—all her movements, grace,
And 'wildering charms did in her presence reign.

Methought she whispered me sweet words of hope—
Her arms in love's embrace around me twine;
Bright visions, stores of happiness do ope
To my fond fancy, painting bliss as mine.
Her tones from hidden lute did seem to come—
Heav'n's untold bliss from out her eyes did gleam:
My life-sought goal, methought at length I'd won—
Alas! I woke, to find it was a dream.

O'er hopes that brightened young Life's opening morn,
Sad feeling ponders; so the mind doth cling
To dreams like this; and though the heart be torn,
Sweet recollection, soothing balm doth bring.
Then chide me not, for oh! I cannot smile—
Nor deem me weak because so sad I seem;
I'll yet be gay, but for a little while
Let mem'ry linger on that happy dream.

FRED. G——

COME AWAY.

BY MRS. SHIRLEY.

Leave, leave the land of gold!
Though mines of wealth untold,
Deep buried in the dark ravines,
'Neath beds of rock or whispering pines;
Gold is there in the Ocean's shore,
And rivers wash the sparkling ore.
Flowers bloom in the lonely vale,
Their fragrance breathes on ev'ry gale;
The cactus and the pale May rose,
Their petals to the sun unclose;
The tiger lilly's drooping cup,
Hearts-ease and violet springing up—
Or cluster blossoms star-lit eyes,
Drink dewy fragrance from the skies.

More brilliant dyes that these, I ween,
May deck the vale and dark ravine—
Or clearer waters silvery gleam
Where wild clover fringe the woodland stream;
The bright rills gush, the torrents roar
Along the mossy rock-bound shore;
Huge mountains, height on height arise,
Their summits pierce the cloud-wreathed skies—
The teeming earth, the boundless sea,
Are there in wild sublimity.

Leave, leave the land of gold!
The heart will sure grow cold
Absorbed in every selfish care,
A sordid god is worshipped there.
This fev'rish thirst for earthly gain
Will sap the life-blood, turn the brain,
Fell disappointment too, may come,
Then, longings for the distant home;
Perchance the wine-cup's fatal draught
By erring ones too oft is quaffed;
Fair talents thus so madly sown,
Hurls reason from her trembling throne;
Or pale disease with hollow stare,
Her victims hurries to despair!

How many, homeless, wander now
O'er the wild plains with care-worn brow;
And eagerly the promised boon
Is sought—in vain—alas! too soon—
A mound of earth—the coyote's prey!
Death ends it all—oh! come away!

Sometimes I tremble with a fear
Lest thou should'st never come. Oh! ne'er
God spare me from that bitter hour,
May desolation's fearful power
Sweep every high and glorious thought,
Which Love, impassioned Love, has brought!
This world would be so dark and lone,
Without thy smile, thy cheering tone.
Now every happy face I see,
Brings back a dream of memory—
Of joys divine, too pure to last—
I wake again, they're gone—they're past!

Seek not the dazzling wealth of earth,
Its fleeting joys, or careless mirth;
But win for thee that priceless gem,
Immortal life—a diadem
That fadeth not, and pure will be,
And last through all eternity.

"JULIAS, 'spose dere are six chickons in the coop and de man sell tree, how many is dere lefl?"

"What time of de day was it?"

"What time ob day was it? What the debil has dat to do wid it?"

"A good deal, honey; if it was arter dark dere wouldn't be none lefl, dat is, if you happened to come along dat way."

"Look here, nigger, just stop dem personalities. If you don't, I'll 'splode your head wid a pump-handle—I will, sartin's Moses."

IT is better to be the credit of a mean post than the disgrace of a high one.

One of the Justices.

THE following case, which will make some of our metropolitan lawyers 'rise in their boots,' was actually adjudicated in the year 1802, in the town of ——, in the State of Rhode Island.

Shark vs. Ogles. Corram Ball, Justice.—Count, Trespass done by Michael, the hired man of Ogle, for fishing in the river illegally. Damages laid at fifty dollars.

Upjohn for defendant and plaintiff, *per se.*

Justice.—You for Ogle?

Upjohn.—Yes.

Justice.—The deuce you are! The case is disposed of, and I am now making up the judgment. I will admit no testimony, but if you have anything to say. I will hear you.

Upjohn.—I will proceed as soon as your honor is at liberty.

Justice.—I was only making up the judgment, sir. I will hear you; go on.

Upjohn.—I object to the decision of the case before the time assigned in the writ, and before I am heard.

Justice.—Go on, sir, I'll hear you. I can hear just as well while I'm writing. It will make no difference.

Upjohn.—This is brought by plaintiff versus defendant for damages done by Michael. It should have been brought vs. Michael the trespasser.

Justice.—Sue a beggar and ——. I'll hear all you have to say.

Upjohn.—The defendant cannot be connected with the transaction, nor is he sought to be. Besides, the statute, (page 105) requires a notice of six days to defendant in all actions, and here is only one day's notice.

Justice.—Notice seems to have been sufficient to bring you here! But go on, I'll hear you. You don't disturb me.

Upjohn.—The statute also requires, (page 175) the writ to be under seal. This writ has no seal.

Justice.—Mr. Shark, just run your eye over the bill, and see if the costs are high enough. Go on, I hear every word you say.

Upjohn.—This writ is directed to a sheriff, and is served by a town sergeant. Your honor cannot proceed.

Justice.—Then this is not a court! Ha! ha! Go on. We *do* proceed, you see.

Upjohn.—It is no trespass to fish in the river.

Justice.—Ah, ha! No trespass to trample down clover, eh?

Upjohn.—But the action is not for trespassing in the clover.

Justice.—That bill of costs right, Mr. Shark?

Upjohn.—The damage is laid in the writ at fifty dollars. Now your honor has exceeded your jurisdiction. A Justice cannot give judgment for over twenty dollars, nor have jurisdiction where more is claimed.

Justice.—Why, Squire, you 'talk as one of the foolish women talk,' as Solomon said on a similar occasion. *Cannot* give judgment for more than twenty dollars—umph! I have given judgment for more than double that amount, and costs to match. Don't trouble the court with such futile objections. The court is adjourned, and no appeal allowed;

Rothschild "Short."

THERE is a good story told recently of Baron Rothschild, of Paris, the richest man of his class in the world, which shows that it is not only "money which makes the mare go," but "*ready* money," "unlimited credit" to the contrary notwithstanding.

On a very wet and disagreeable day, the Baron took a Parisian omnibus, on his way to Bourse, or Exchange; near which the Nabob of Finance alighted, and was going away without paying. The driver stopped him, and demanded his fare. Rothschild felt in his pocket, but he had not a cent of change. The driver was very wroth.

"Well, what did you get in for, if you could not pay? You must have known that you had no money."

"I am Baron Rothschild!" exclaimed the great capitalist, "and there is my card."

The driver threw the card into the gutter.

"Never heard of you before," said the driver, "and don't want to hear of you again. But I want my fare, and I must have it!"

The great banker was in haste.

"I have only an order for a million," he said. "Give me change."

And he proffered a coupon for fifty thousand francs.

The conductor stared, and the passengers set up a horse-laugh. Just then an "Agent de Change" came by, and Baron Rothschild borrowed of him the six sous.

The driver was now seized with a kind of remorseful respect, and, turning to the Money King he said,

"If you want ten francs, sir, I don't mind lending them to you on my own account."

VAT you call zem tings vit long hills zat fly and make a noise, h-z-z? said a Frenchman the other day.

"Woodcock," was the reply.

"Eh, bien? I kill zis morning before I eat breakfast twenty-five woodcock."

"The deuce you did! Where did you come across them?"

"In mine chamber-bed."

"Twenty-five woodcock in your chamber! You mean musquitos."

"Eh bien, zen. I kill twenty-five musquitos."

INTEGRITY and uprightness will preserve us, and will clear themselves.

FAMILY FLOUR.

HORNER'S PREMIUM FLOUR.

UNION CITY MILLS.

WE INVITE the particular attention of Families and the Trade, to the quality of the Flour manufactured by us. Our great aim has been, in the establishment of our Mills to procure the most perfect machinery, to employ the ablest millers, and to select the purest and finest wheat in the country. That we have been able to accomplish all this, the Product of our Mills now before the community is the best evidence. The FLOUR we manufacture has been submitted to the ablest judges of our State, and after the most rigid and thorough test, they have awarded to us the "PREMIUM PRIZE," and we shall have offer the same as "Horner's Premium Flour;" it shall be our constant effort to maintain for it the reputation of being the

The Best Flour in the Land.

Orders left with HORNER & CO. at our Storeship, Broadway wharf, will receive prompt attention.

5 4t HORNER.

PROCLAMATION EXTRAORDINARY.

Woman's Rights

VINDICATED AND MAINTAINED.

WHEREAS, from the creation of the world, it was designed by the "Great First Cause" that

Woman's Rights and Privileges

should be co-equal to Man's; and whereas, she has been treated by many men in all ages, up to the present time, as an inferior being to themselves: Now, therefore, be it known that I, M. L. WINN, of

Winn's Fountain Head and Branch

having expended large sums of money at the FOUNTAIN HEAD for the gratification of the appetites of Gentlemen, do recommend that Woman be hereafter allowed and provided with the facilities to enjoy all the privileges for which she was by Providence designed; and for this purpose I do hereby proclaim, that my

BRANCH,

Corner Montgomery and Washington streets,

shall be conducted with a view exclusively to the Enjoyment and Comfort of Ladies, and such Gentlemen as know and appreciate their worth.

At the earnest solicitation of many Ladies and Gentlemen and agreeable to my promise some months since to enlarge the BRANCH, so as to accommodate the fast increasing patronage I shall, in a few days, add Two Spacious Stores on Montgomery street, to the Original Branch, making the

MOST EXTENSIVE ICE CREAM

And Refreshment Establishments in California.

The day of opening will be duly announced through the medium of the Daily Press, so that all may witness what has been accomplished for the accommodation and comfort of "God's best gift to man." In the meantime, lots of Fun and Jollification may be enjoyed in reading the notices and feasting upon the luxuries to be enjoyed at

WINN'S FOUNTAIN HEAD,

78 and 80 Long Wharf, and Branch, corner Washington and Montgomery streets;

where Every Thing for the Holidays may be found, from a Sugar Whistle to a Bride's Cake of half a ton.

1 M. L. WINN, Proprietor.

PEORIA PREMIUM STEEL PLOWS.

THE FORMER CELEBRITY OF THE PEORIA PREMIUM STEEL PLOWS, and the unequalled success of their introduction in this State, would seem to preclude the necessity of any further effort on our part to draw attention thereto; but in view of the transitory nature of business in general in California, and the probability that some may have looked upon our establishment of an extensive and permanent manufacture of Plows here, in the face of such enormous importations and extravagant prices of material, as an impossibility—we believe it expedient to adopt this method of bringing it within the special notice of all concerned, that we are now manufacturing, and will have ready for this season's demand, three thousand of the most superior Plows ever made or used within this State.

We feel warranted in making this assertion, from the fact that all who used our Plows last season testify that they were superior: and we have studied so closely the immediate wants of our patrons from every section of the State, that we can now furnish Plows suitable to any particular kind of soil known in the State.

Our material has all been selected in the East by one of our firm, and imported by us directly from the manufacturers, which places it in our power to say confidently that nothing is lacking in quality, while we are enabled to make the plows at a cost greatly below that of last season, and are determined to sell at prices within the reach of every farmer who may wish to use the Peoria Premium Steel Plow.

It should be remembered that these plows will do double the work with half the team required in using the ordinary cast Plow; and that the work, when done, will be well done.

For particulars of prices, and descriptions of plows, we refer you to the subjoined card. The prices therein detailed are those established at our factory, and the only alterations from them that we authorize our agents to make, is the addition of the cost of transportation to their places of business—thus placing the plows at every accessible point of the State for the exact price charged at the Factory, with the necessary expenses only added.

Farmers ordering our plows through mercantile houses here, would do well to write to us at the same time, if they would make sure of getting the right plow, for some are interested in representing that we are not making plows at all, while other will not sell our plows when they can get off a cast plow. We therefore recommend that orders should be sent to us directly accompanied by an order upon your merchant for the amount, which you can always know by a reference to the card accompanying this circular.

On the 24th of June the interest of T. ADAMS in our business ceased, by the sale of his entire interest therein to L. E. MORGAN. Aside from this, there has not, nor will there be, any alteration, as we have the same efficient and thoroughly practised hands in every department of our business.

E. L. MORGAN & CO., Successors to
T. ADAMS & CO.,
Corner of Broadway and Battery streets.

☞ The following are the established prices for the Peoria Premium Steel Plows, at our Factory, and the only addition our Agents are authorized to make thereto, is the cost of transportation to their points of business:

SIZE.	DESCRIPTION.	FURROW.	PRICE.
No. 5	plain	10 in	$ 30
5½	"	12 in	$ 35
6	"	14 in	$ 40
7	"	16 in	$ 50
6	clipper or prairie	14 in	$ 60
16	" "	16 in	$ 70
18	" "	18 in	$ 85
20	" "	20 in	$100
22	" "	22 in	$110
24	" "	24 in	$125
26	" "	26 in	$150
30	" "	30 in	$175
40	" "	40 in	$225
Subsoil Plows			$10
Cultivators			$25

[For the addition of wheel and axle to any of the above clipper Plows, an additional charge of $30.]

L. E. MORGAN & CO., Successors to
1 T. ADAMS & CO

JAMES E. WAINWRIGHT. ALBERT G. RANDALL
JAMES E. WAINWRIGHT, Auctioneer.

WAINWRIGHT, RANDALL & CO.,

REAL ESTATE AND STOCK AUCTIONEERS,

Office and Salesroom, 100 Merchant Street, between Montgomery and Kearny.

Messrs. WAINWRIGHT, RANDALL & CO. respectfully announce to their friends and the public generally that they have made this business connection, and re-established themselves, for the purpose of transacting the Real Estate business in all its branches, for the successful management of which they deem themselves well qualified, having had upwards of four years experience in this city.

They will give especial attention to making public sales of all kinds of property for Administrators, Assignees, Receivers, Mortgagees, and others, according to law.

Particular attention paid to preparing "Rancho" property for sale, and every facility will be afforded to the holders of such property for the transaction of their business. Mr. Randall, being conversant with the Spanish language (having resided several years in South America,) will give his personal attention to the translation of title papers, when required.

A practical Surveyor and Draughtsman will be in constant attendance at the office.

A large amount of property at private sale.

Conveyancing, under the supervision of A. G. RANDALL, Notary Public, under the law of 1853—and Commissioner for the State of New Hampshire. 5 4t

THEODORE PAYNE. SQUIRE P. DEWEY.

Hames:	Saddlery Hardware;

Skirting, Bridles and Harness Leather; Patent and enamelled Leather, Calf Skins, &c. 8 4t

FLOWERS! BRIGHT FLOWERS!

A GIFT FOR HOME.

"THROW PHYSIC TO THE DOGS."

WE convert the pill box into a Floral vase, and instead of the "nauseate drug," we offer the perfume of Flowers. Our beautiful collection of *California Flower Seeds* we now offer.

These are put up in handsome morocco cases, or homœopathic cases of glass bottles, with printed lists and directions, and with pressed flowers of the different varieties of each. These are of the most beautiful style that can be prepared, and are most appropriate gifts for home at this season.

We invite attention to them at our rooms, at Musical Hall Buildings. WARREN & SON,

5 Seedsmen and Florists.

3,000 lbs. New Garden Seeds.

RECEIVED by Brother Jonathan and John L. Stephens—20 cases Fresh Garden Seeds, of the very best varieties, which we shall offer at wholesale or retail, at low prices.

Purchasers who buy of us may always depend upon the Seed being true and fresh. We never offer seed from auction houses and refuse lots. WARREN & SON,

8-tf Musical Hall.

THE CALIFORNIA FARMER

The Journal of Useful Sciences.

VOL. 1. SAN FRANCISCO, THURSDAY, MARCH 16, 1854. NO. 11.

TERMS.—Eight dollars per annum, in advance; four dollars for six months; or delivered by carrier at one dollar per month.

ADVERTISEMENTS.—A limited number of Advertisements will be inserted at the following rates: For one square of eight lines, per month, $6. For business notices of five lines or less, per month, $4. A slight reduction will be made to regular advertisers.

Industry and Idleness.

"COME, William, a single day, out of the three hundred in a year, is not too much."

"True, Henry Thorne. Nor is the single drop of water that first finds its way through the dyke much; but yet the first drop but makes room for a small stream to follow, and then comes a flood. No, no, Henry, I cannot go with you to-day; and if you will be governed by a friend's advice, you will not neglect your work for the fancied pleasures of a sporting party."

"All work and no play, makes Jack a dull boy. We were not made to be delving for ever with tools in close rooms. The fresh free air is good for us. Come, William, you will feel better for a little recreation. You look pale from confinement. Come; I cannot go without you."

"Henry Thorne," said his friend William Moreland, with an air more serious than that at first assumed, "let me in turn urge you to stay."

"It is in vain, William," his friend said, interrupting him.

"I trust not, Henry. Surely, my early friend and companion is not deaf to reason."

"No, not to right reason."

"Well, listen to me. As I said at first, it is not the loss of a single day, though even that lost, is a serious waste of time, that I now take into consideration. It is the danger of forming a habit of idleness. It is a mistake, that a day of idle pleasure recreates the mind and body, and makes us return to our regular and necessary employments with renewed delight. My own experience is, that a day thus spent, causes us to resume our labors with reluctance, and makes irksome what before was pleasant. Is it not your own?"

"Well, I don't know; I can't altogether say that it is; indeed, I never thought about it."

"Henry, the worst of all kinds of deception is self deception. Don't, let me beg of you, attempt to deceive yourself in a matter so important. I am sure you have experienced this reluctance to resuming work after a day of pleasure. It is an universal experience. And now that we are on this subject, I will add, that I have observed in you an increasing desire to get away from work. You make many excuses, and they seem to you to be good ones. Can you tell me how many days you have been out of the shop in the last three months?"

"No, I cannot" was the reply, made in a tone indicating a slight degree of irritation.

"Well, I can, Henry"

"How many is it, then?"

"Ten days."

"Never."

"It is true, for I kept the count."

"Indeed, then, you are mistaken. I was only out a gunning three times, and a fishing twice."

"And that makes five times. But don't you remember the day you were made sick by fatigue?"

"Yes, true, but that is only six."

"And the day you went up the mountain with the party?"

"Yes."

"And the twice you staid away because it stormed?"

"But, William, that has nothing to do with the matter. If it stormed so violently that I couldn't come to the shop, that surely is not to be set down to the account of pleasure taking."

"And yet, Henry, I was here, and so were all the workmen but yourself. If there has not been in your mind a reluctance to coming to the shop, I am sure the storm would not have kept you. I am plain with you, because I am your friend, and you know it. Now, it is this increasing reluctance on your part, that alarms me. Do not, then, add fuel to a flame that, if thus nourished, will consume you."

"But, William, ——"

"Don't make excuses, Henry. Think of the aggregate of ten lost days. You can earn a dollar and a half a day easily, and do earn it whenever you work steadily. Ten days in three months is fifteen dollars. All last winter you know, Ellen went without a cloak, because you could not afford to buy one for her; now the money that you could have earned in the time wasted in the last three months, would have bought her a very comfortable one—and you know that it is cloudy now, and will soon be again upon us. Sixty dollars a year buys a great many comforts for a family."

Henry Thorne remained silent for some moments. He felt the force of William Moreland's reasoning; but his own inclinations were stronger than his friend's arguments. He wanted to go with two or three companions a gunning, and even the vision of his young wife shrinking in the keen winter wind, was not sufficient to conquer this desire.

"I will go this once, William," he said at length, with a long inspiration; "and then I will quit it. I see and acknowledge the force of what you say; I never viewed the matter so seriously before."

"This once may confirm a habit now too strongly fixed," urged his companion. "Stop now, while your mind is rationally convinced that it is wrong to waste your time, when it is so much needed for the sake of making comfortable and happy one who loves you, and has cast her lot in life with yours. Think of Ellen, and then be a man."

"Come, Harry!" said a loud, cheerful voice at the shop door; "we are waiting for you!"

"Ay, ay," responded Henry Thorne. "Good morning, William, I am pledged for to-day. But after this, I will swear off!" And so saying, he hurried away.

Henry Thorne and William Moreland were workmen in a large manufacturing establishment in one of our thriving inland towns. They had married sisters, and thus friendship that had long existed, was confirmed by closer ties of interest.

They had been married about one year, at the time of their introduction to the reader, and, already, Moreland could perceive that his earnings bought many more comforts for his little family than did Henry's. The difference was not to be accounted for in the days the other spent in pleasure taking, although their aggregate loss was no mean item to be taken from a poor man's purse. It was to be found, mainly, in a disposition to spend, rather than to save; to pay away for trifles that were not really needed, very small sums, whose united amount in a few weeks would rise to many dollars. But, when there was added to this constant check upon his prosperity, the frequent recurrence of a lost day, no wonder that Ellen had less of good and comfortable clothing than her sister Jane, and that her house was far less neatly furnished.

All this had been observed, with pain, by William Moreland and his wife, but, until the conversation recorded in the opening of this story, no word of remonstrance or warning had been ventured upon by the former. The spirit in which his words were received, encouraged him to hope that he might exercise a salutary control over Henry, if he persevered, and he resolved that he would extend thus far towards him the offices of a true friend.

After dinner of the day during which her husband was absent, Ellen called in to see Jane, and sit the afternoon with her. They were only sisters, and had always loved each other much. During their conversation, Jane said, in allusion to the season.

"It begins to feel a little chilly to-day, as if winter were coming. And, by the way, you are going to get a cloak this fall, Ellen, are you not?"

"Indeed, I can hardly tell, Jane," Ellen replied, in a serious tone; "Henry's earnings, somehow or other, don't seem to go far with us; and yet I try to be as prudent as I can. We have but a few dollars laid by, and both of us want warm under-clothing, and Henry must have a coat and pair of pantaloons to look decent this winter. I must try and do without the cloak, I think."

"I am sorry for that. But keep up a good heart about it, sister. Next fall you will surely be able to get a comfortable one; and you shall have mine as often as you want it, this winter. I can't go out much, you know; our dear little Ellen, your namesake, is too young to leave often."

"You are very kind, Jane," Ellen said, and her voice slightly trembled.

A silence of some moments ensued, and then the subject of conversation was changed to one more cheerful.

That evening just about nightfall, Henry Thorne came home, much fatigued, bringing with him half a dozen squirrels, and a single wild pigeon.

"There, Ellen, is something to make a nice pie for us to-morrow," he said, tossing his game bag upon the table.

"You look very tired, Henry," his wife said tenderly; "I wouldn't go out any more this fall if I were you."

"I don't intend going out any more, Ellen," he replied, "I'm sick of it."

"You don't know how glad I am to hear you say so!" his wife said, and she seemed almost ready to cry. "Sometimes, I am afraid you are sorry when you are not shooting or fishing as if you were not doing right."

"You shall not fear any more, Ellen," he replied; "I've been thinking all the afternoon about your cloak. Could we afford it now, and we have a dear one by the autumn? How I am to get the cloak, I do not see, and yet I cannot bear the thought of your going all this winter again, without one."

"O never mind that dear." Ellen said with a cheerful tone, her face brightening up. "We can't afford it this fall and so that's settled. But I can have Jane's whenever I want it, she says; and you know she is so kind and willing to lend me anything that she has. I don't like to wear out her things, but then I shall not want the cloak often."

Henry Thorne sighed, at the thoughts his wife's words stirred in his mind.

"I don't know how it is," he at length said, despondingly; "William can't work any faster than I can, nor earn more a week, and yet he and Jane have everything comfortable, and are saving money into the bargain, while we want many things that they have, and are not a dollar ahead."

One of the reasons for this, to her husband, unaccountable difference, trembled on Ellen's tongue. But she could not make up her mind to reprove him; and she bore in silence, and with some pain, what she felt as a reflection upon her want of frugality in managing household affairs.

Let us advance the characters we have introduced, a year in their life's pilgrimage, and see if there are any fruits of these good resolutions.

"Where is Thorne, this morning?" asked the owner of the shop, of Moreland, one morning, an hour after all the workmen had come in.

"I do not know, really," Moreland replied. "I saw him yesterday, when he was well."

"He's off gunning, I suppose, again. If so, it is the tenth day he has lost in idleness during the last two months. I am afraid I shall have to get a hand in his place, upon whom I can place more dependence. I shall be sorry to do this, for your sake, and for the sake of his wife. But I do not like such an example to the workmen and apprentices, and besides, being away from the shop, often disappoints a job."

"I could not blame you, sir," Moreland said; "and yet, I do hope you will bear with him for the sake of Ellen. I think if you would talk to him, it would do him good."

"But why don't you talk to him, William?"

"I have talked to him frequently, but he has got so that he won't bear it any longer from me."

"Nor would he bear it from me, either, I fear, William."

Just at that moment, the object of the conversation came in.

"You are late this morning, Henry," said the owner of the shop to him, in the presence of the other workmen.

"It's only a few minutes past the hour," he replied, moodily.

"It's more than an hour past."

"Well, it is, I can make it up."

"That is not the right way, Henry. Lost time is never made up."

Thorne did not understand the general truth intended to be expressed, but supposed at once that the master of the shop meant to intimate that he would work him out of the lost hour notwithstanding he had promised to make it up. He therefore turned an angry look upon him, and said—

"Do you mean to say that I would cheat you, sir?"

The employer was a hasty man and tenacious of his dignity as a master. He invariably discharged a journeyman who was in the least disagreeable in his language or manner towards himself before the other workmen. Acting under the impulse that at once prompted him, he said:

"You are discharged;" and instantly turned away.

As quickly did Henry Thorne turn and leave the shop. He took his way homeward but he became comfortable things, and I thought of how I had neglected them, and of how little we had to live for. Just at that thought [illegible] through his sister's mind, and it [illegible] passed, that she had [illegible] by [illegible] escape [illegible] Ellen not [illegible] sought [illegible] her own [illegible] and [illegible] to look at them as her heart [illegible] [illegible] [illegible]

tained in Charleston. S. Carolina, sold off a portion of his scanty furniture, and his cow, by which he received money enough to remove there with his wife and child. Thus were the sisters separated; and in that separation, gradually estranged from the tender and lively affection that presence and constant intercourse had kept burning with undiminished brightness. Each became more and more absorbed, every day, in increasing cares and duties; yet to one those cares and duties were painful, and to the other full of delight.

Ten years from the day on which they parted in tears, Ellen sat, near the close of the day, in a meanly furnished room, in one of the southern cities, watching, with a troubled conscience, the restless slumbers of her husband. Her face was very thin and pale, and it had a fixed and strongly marked expression of suffering. Two children, a boy and a girl, the one about six, and the other a little over ten years of age, were seated listlessly on the floor, which was uncarpeted. They seemed to have no heart to play. Even the elasticity of childhood had departed from them. From the appearance of Thorne, it was plain that he was very sick; and from all the indications the room in which he lay afforded, it was plain that want and suffering were its inmates. The habits of idleness he had suffered to creep at a slow but steady pace upon him, and idleness brought intemperance, and intemperance reacting upon idleness completed his ruin, and reduced his family to poverty in its most appalling form. Now he was sick with a southern fever, and his miserable dwelling afforded him no cordial, nor his wife and children the healthy food that nature required.

"Mother!" said the little boy, getting up from the floor, where he had been sitting for half an hour, as still as if he were sleeping, and coming to Ellen's side, he looked up earnestly and imploringly in her face.

"What, my child?" the mother said, stooping down and kissing his forehead, while she parted with her fingers the golden hair that fell in tangled masses over it.

"Can't I have a piece of bread, mother?"

Ellen did not reply, but rose slowly and went to the closet, from which she took part of a loaf, and cutting a slice from it, handed it to her hungry boy. It was her last loaf, and all their money was gone. The little fellow took it, and breaking a piece off for his sister, gave it to her; the two children then sat down side by side, and eat in silence the morsal so sweet to them.

With an instinctive feeling, that from nowhere but above could she look for aid and comfort, did Ellen lift her heart, and pray that she might not be forsaken in her extremity. And then she thought of her sister Jane, from whom she had not heard for a long, long time, and her heart turned towards her with an eager and yearning desire to see her face once more,

And now let us look in upon Jane and her family. Her husband, by saving where Thorne spent in fooling trifles, and working when Thorne was idle, gradually laid by enough to purchase a little farm, upon which he had removed, and there, industry and frugality brought its sure rewards. They had three children: little Ellen had grown to a lively, rosy-cheeked, merry-faced girl of eleven years; and George, who had followed Ellen, was in his eleventh year, and after him came the baby, now just completing his twelfth month of its innocent happy life. It was in the season that the farmer's toil is rewarded, and William Moreland was among those whose labor had met an ample return.

How different was the scene, in his well established cottage, full to the brim of plenty and comfort, to that which was passing at the same hour of the day, a short time before, in the sad abode of Ellen, herself its saddest inmate.

The table was spread for the evening meal, always eaten before the sun hid his bright face, and George and Ellen, although the supper was not yet brought in, had taken their places; and Moreland, too, had drawn up with the baby on his knee, which he was amusing with an apple from a well filled basket, the product of his own orchard.

A hesitating rap drew the attention of the tidy maiden who assisted Mrs. Moreland in her duties.

"It is the poor old blind man," she said, in a tone of compassion, as she opened the door.

"Here is a shilling for him, Sally," said Moreland, handing her a piece of money. "The Lord has blessed us with plenty, and something to spare for his needy children."

"Ain't I glad that I've got eyes, and plenty to eat," George said, glancing at the blind man, and then looking up into his mother's face, with boyish delight, as she brought in a savoury dish for their supper.

"O, but that looks good!" ejaculated Ellen, peeping into the dish—as her mother paused, to smile upon her boy,—and enjoying the coming feast in imagination.

The liberal meal upon the table, the mother sat down with the rest, and, as she looked around upon each happy face, her heart blessed the hour that she had given her hand to William Moreland. Just as the meal was finished, a neighbor stopped at the door and said:

"Here's a letter for Mrs. Moreland; I saw it in the post-office, and brought it over for her, as I was coming this way."

"Come in, come in," Moreland said, with a hearty welcome in his voice.

"No. I thank you, I can't stop now. Good evening," replied the neighbor.

"Good evening," responded Moreland, turning from the door, and handing the letter to Jane.

"It must be from Ellen," Mrs. Moreland remarked, as she broke the seal. "It is a long time since we heard from them; I wonder how they are doing?"

She soon knew, for on opening the letter she read this:—

"*Savanah, September*, 18—

"*My Dear Sister Jane*:—James has just died, and I am left here without a dollar, and know not where to get bread for myself and two children. I dare not tell you all I have suffered since I parted from you. I ——

"My heart is too full, I cannot write. Heaven only knows what I shall do! Forgive me, sister, for troubling you; I have not done so before, because I did not wish to give you pain, and I only do so now, for an impulse that I cannot resist.

"Ellen."

Jane handed the letter to her husband, and sat down in a chair, her senses bewildered, and her heart sick.

"We have enough for Ellen, and her children, too, Jane," Moreland said, folding the letter after he had read it. "We must send for them at once. Poor Ellen! I fear she has suffered much."

"You are good and kind, and noble-hearted, William!" Jane said, bursting into tears.

"I don't know that I am any better than any body else, Jane. But I can't bear to see others suffering, and never will, if I can afford relief. And surely, if industry brought no other reward, the power it gives us to benefit and relieve others, is enough to make us ever active"

* * * * *

In one month from the time Ellen's letter was received, she with her children, were inmates of Moreland's cottage. Gradually, the light returned to her eye, and something of the former glow of health and contentment to her cheek. Her children in a few weeks were as gay and happy as any. The delight that glowed in the heart of William Moreland, as he saw this pleasing change, was a double reward for the little he had sacrificed in making them happy. Nor did Ellen feel, with her children, an entire burden upon her sister and her husband;—her activity and willingness found enough to do that needed doing, and Jane often used to say to her husband,

"I don't know which is the gainer over the other, me or Ellen; for I am sure, I can't see how we could do without her."—*Godey's Lady's Book.*

THE CALIFORNIA FARMER.

SAN FRANCISCO, THURSDAY, MARCH 16, 1854

Special Premiums for Subscriptions.

In addition to the standing inducement for the getting of subscribers for the "Farmer," we will make a present of HARPER'S ILLUSTRATED FAMILY BIBLE to the person who procures THE MOST SUBSCRIBERS in the first six months of our publication. This we regard as one of the most beautiful books ever issued. Who will have the prize?

A Premium---Farmers' Clubs.

With the hope of inducing such of our friends, and those who have a little leisure, to ride among their neighbors and introduce an AGRICULTURAL PAPER, we take pleasure in offering the CALIFORNIA FARMER: and, to make it an inducement, we say to such friends—if you will get us FIVE subscribers, and remit the amount, we will send you SIX PAPERS, or for TEN subscribers, TWELVE PAPERS. We trust there are many friends who will cheerfully take a little pains to aid us, and thus extend the circulation of the FARMER, and make a useful vehicle for the Agriculture of California.

Subscribers will please be particular to name the Post Office to which papers are to be sent; or, if forwarded by express, which line they prefer.

To Our Patrons.

To ADVERTISERS.—We would call the attention of those who desire to have their advertisements produce quick returns, to the pages of the CALIFORNIA FARMER.

The FARMER will reach sources of trade entirely new and unattainable by any other means, and thus secure a large and immediate profit to those who desire to make known their business. By a glance at our advertising columns, it will be perceived that we present the best known and most extensive houses, and as we have space for but one or two of each branch, these will be the most prominent houses, and thus give more influence to them.

Agents Wanted.

We want good active agents to visit every county in the State for the FARMER. Young men can find a steady and profitable employment. Apply at this office.

☞ We desire Agents to report as early as possible, that we may be prepared in our issues for a sufficient number to supply the demand. Be sure and report promptly.

Description of the Samaoan, or Navigator Islands:

THEIR ADVANTAGES AS A STOPPING PLACE FOR VESSELS.

This group of Islands will undoubtedly be brought more into notice and become quite a business port for vessels sailing in their vicinity and being in want of provisions, fruits, water, &c., and a place where exchanges of merchandise can be very profitably effected.

We have received from the Commercial Agent of the United States, A. Van Camp, Esq., many curious specimens of the manufactures of the Islands, curious shells, insects, &c., which we shall be happy to show to all who are interested in natural history, and we are promised additional specimens.

We feel assured from our acquaintance with the gentleman, that he will do much to call attention to these Islands, and bring them into notice, so that our citizens may be fully apprised of any advantages that may result to them, either in our mercantile, commercial, or agricultural interests.

We copy from the communication of Mr. Van Camp in the Herald of this city, the following:

The large Islands, six in number, extend about three hundred miles from east to west, and contain a great many good harbors that have been well surveyed by the U. S. Exploring Expedition. Vessels going for cargoes of hogs, etc., should always call at "Tau," sometimes called "Manua," the most easterly of the group. There is good anchorage on the N. W. side, lat. 14 14, lon. 160 27, where a supply of hogs, fowls, cocoa nuts, etc. can be obtained in exchange for blue and white cotton cloth, blue and orange calico fancy prints, axes, hatchets, umbrellas, etc., much better than for money. Some twenty miles farther west are two Islands, "Ofu" and "Oloosina;" they are very fertile and beautiful, producing hogs, etc., the natives friendly and anxious to trade. Continuing west some eighty miles you arrive at "Tutuilla," the third largest Island of the group. This is also very fertile and populous, containing several good harbors, "Pago Pago" on the south side, lat. 14 19, lon. 170 38, and "Fagasa" on the north side, lat. 14 18, lon. 170 42, where supplies can always be had in exchange for goods. On these Islands the natives are very much under the influence of the missionaries, consequently have had no war for a number of years. They are exceedingly hospitable and friendly to foreigners.

Sixty miles farther west you make the Island of "Upolu," the largest, most populous and fertile of the group. There are also several good harbors on the north side of this island. The principal one is "Apia," latitude 13 50, longitude 171 41. The scenery as you sail along this island from east to west, is most picturesque and beautiful. There are numerous high mountains and delightful valleys with streams of water, and high waterfalls—one back of the town of "Apia," seven hundred and eighty feet perpendicular. Apia harbor is the residence of the Agents of the American and British Governments, and here whalers come to refit and get their supplies. It is safe at all times for the largest vessels, and is the best place to wood and water in the South Pacific. The expenses are small; there is no duty on any articles; no harbor dues except five dollars to the Chief and ten for pilotage! wood is two dollars per cord delivered on board; fowls, fruits and vegetables are in abundance; hogs can always be had of the speculators for six cents per pound, and they will take goods in exchange, allowing from one to two hundred per cent. profit on cost. At this place, they want in addition to cloth, etc., powder, shot, lead and guns. Groceries of all kinds are also in demand. We have white population of about three hundred to consume them.

"Savaii" is situated some sixty miles farther west, and is the last large island of the group. It has one good harbor on the north side, "Matoute," lat. 13 28, lon. 172 18. The natives of a part of this island, with one or two districts of "Upolu," are at war at this time. Their usual weapons are clubs and spears, not very formidable or destructive. Their wars are not general, merely one town or district with another. They never molest or interfere with foreigners. Vessels are perfectly safe in going into any of the harbors.

I visited the entire group in 1851, and obtained a cargo of hogs, fowls and fruits, and brought them to California. I returned to Upola in July, 1852, and resided there with my family until April, 1853. I consider it a most delightful and healthy climate, the thermometer ranging from sixty-nine to eighty-one, with fine sea breezes all the time, and showers of rain every few days. We can have all the tropical fruits every day in the year—bananas, oranges, pine apples, bread fruit, etc. Sugar cane, cotton, indigo, and nutmegs, grow spontaneously on all the islands. I have given the proper names of separate islands; the native name for the group is "Samoa," usually called Navigator's. I can safely guarantee that all vessels coming to Apia shall get all the supplies they require. Yours, etc. A. VAN CAMP,
U. S. Commercial Agent for the Samaoan and Friendly Islands.

THE INDIAN RESERVE.—Capt. P. E. Conner, Deputy Collector of Customs, stationed at the Tejon Pass, writes that there are about 2,500 on the Indian Reserve in that vicinity, all of whom are industriously engaged plowing, sowing, and performing other labor required about a large farm. He says there are no less than 2,500 acres of excellent land sowed with wheat, well ditched, with a stream of water running through the ditch for the distance of six miles, and from which the whole field can be irrigated. Connected with the farm is one of the most excellent gardens in California, in which is planted a large quantity of grape vines, together with the trees of the various tropical fruits adapted to this climate, such as the orange, peach, apricot, pear, pomegranate, &c. There are also about 2,000 head of cattle on the Reserve, together with a large number of sheep and goats.

The Indians appear to be very happy and contented. Whilst the men perform the labor of the farm, the old people do the household work, and the girls and young women are employed in making garments for themselves and the men.

It is the opinion of Capt. Conner that after the first year or two the Indians on this Reserve will be able to raise everything for their own maintenance, and thereby save the government a large amount yearly, which otherwise would have to be paid for Indian wars, Indian depredations, &c.

The success that has so far attended the Reserve is certainly remarkable, and leads us to anticipate important results.

Later from the East.

THE mail steamers Columbia and Republic arrived at this port on Monday evening last, bringing the Great Eastern Mail of the 5th ult. They bring no later papers from New York, but we have New Orleans papers to the 14th, *via* Vera Cruz and Acapulco, from which we make up the following summary.

The Administration of the Crystal Palace have published the premiums bestowed for superior excellence to the different countries. Americans take the first prizes; the French obtained eleven silver premiums and one hundred and fifty-three of bronze, for various articles; after these England, Belgium, Italy, Austria and Prussia follow in regular succession. Spain obtained but one bronze medal for a specimen of raw silk. Cuba received a medal for cigars, and honorable mention for some medicinal products. Of the South American countries, only one obtained a medal, which was given to Columbia for some elegantly embroidered handkerchiefs from the town of Maracaibo. Hayti obtained a bronze medal for some mahogany furniture and other products.

M. Carballo, the Chilian minister at Washington, has returned to Chili to assume the part of Minister of the Interior in his own country.

Father Gavazzi has left for England.

From France we have continued accounts of active preparations for war. Gen. Bosquet has been commissioned to select the best troops from the corps of Tonaves and Spahis, in Algiers, to recruit the Turkish army. It is rumored that the Emperor will despatch 50,000 men to Candia, which are to act in concert with 20,000 British troops, and are to take part in the contest. The Artillery corps has been largely increased, and three distinct encampments have been ordered—one at the Var, one on the Rhine, and the third in the north of the Empire. The second half of the conscripiton of 1852 has been called into active service.

It is said that on the reception of the news of the battle of Sinope, Louis Napoleon sent a letter to the Sultan in his own handwriting, assuring him of the efficient aid of France.

The King of Belgium is desirous of uniting his daughter to the heir-apparent of Portugal.

The Governments of Sweden and Denmark have declared a determined neutrality in regard to the Eastern question. Austria and Holland are about making the same declaration.

DETENTION OF THE STEAMER.—The Columbia was detained at Panama until the 24th inst., in waiting for the passengers by the steamer Georgia, which vessel sailed from New York for Aspinwall on the 6th of February. The Georgia encountered a very heavy gale, which caused her to put into Norfolk in distress. Her mails were carried to Aspinwall by the Empire City. The Georgia did not sustain any loss. The Columbia and the Republic brought the whole of the Great Eastern Mail of the 6th ult.

The Railroad is in fine running order as far as Obispo, leaving but 16 miles travel.

The health of the Isthmus was excellent—not a case of sickness having occurred among the Columbia's passengers.

The Columbia brings 330 bags, being the largest amount of mail matter ever brought to this port.

AGRICULTURAL CONVENTION AT NAPA CITY.—The friends of Agriculture will convene at Napa City, next Saturday morning, March 18th, for the purpose of forming a County Society, perfecting its organization, and taking suitable measures for a County Agricultural Show, this coming autumn. This is the right spirit, and we earnestly urge all who can possibly attend to do so. Every cultivator in the county should be there to give his influence and show his interest. There is no way in which he can promote his own interest better than by such an effort. The meeting of agriculturalists, the exchange of practical information, and the sympathy felt and expressed in common, will awaken a feeling that will do much for the county. We anticipate great good from this meeting, and hope to hear of a very full attendance.

THE new and beautiful evergreen plant which we have alluded to, as being found by General Brooks, of Olympia, Washington Territory, we believe to be the *Cionanthus Fragrans*. This is one of the finest and sweetest shrubs known; a lively, beautiful evergreen, susceptible of being cultivated into a variety of forms, and adding much to our collection of evergreens. By referring to the advertisement in our columns, a description will be found, with the place of sale.

The Vineyards of Northern California.

Mr. Editor—The agricultural resources of this State, although little known, and comparatively undeveloped, are of the very first class. Its valleys are very extensive and fertile, possessing a capacity for production unequalled by any portion of the Union. I have lately visited portions of the northern part of the State with reference to its capacity as a fruit growing country. As to the Peach, Pear, Apple, Grape, &c., I think it has no equal. There are several vineyards now in full bearing in different parts of Northern California, fully sustaining this character of its soil and climate. In the valley of Santa Rosa there is a vineyard of two thousand vines. One hundred of these are fifteen years old. These latter vines are trained to the height of six feet, and then allowed to spread at random upon a frame work, having a free circulation of air. They are trimmed every winter to a mere head, leaving only from three to five buds for wood and fruit. The remainder of the vines in this vineyard are two years old. They are trimmed low to a standard within six inches of the ground, and it is intended to grow the fruit thus near the earth. The theory is, that the fruit being thus near the ground, will be shaded and protected from the extreme heat of the sun. How the experiment will succeed, I am unable to determine. The soil is a clayey loam on a level surface.

Sonoma valley contains the finest vineyards in Northern California. It contains about five thousand vines, planted about six feet apart. The soil is a grayish loam, breaking into lumps the size of a large potato in working, and easy of cultivation. The vineyard is situated on a gentle declivity of the foot hills of the Contra Costa Range of mountains. There are several unfailing springs of water running from the hill-sides above, which furnish an abundance of water for irrigation. These springs are highly impregnated. A portion of this vineyard is fifteen years old, and is bearing abundantly. The vines are trimmed to a standard of about two feet, and every winter all the wood of the previous year is trimmed off, and only from three to five buds are left for wood and fruit the ensuing year. This trimming is done from November till March. The older vines are supported by braces where necessary. The growing wood of the old vines is interwoven in the form of a large hoop, and the vine is then made to sustain the whole weight of the branches and fruit of the year. The grapes hang in large beautiful clusters near the head of the standard vine, and are mostly protected from the rays of the sun in this manner. The whole vineyard is occasionally irrigated. The income of this vineyard is estimated at $20,000. The climate of this valley is dry and of a moderate temperature. There are also two vineyards at the old Mission of San Jose. One of these contains about 4000 vines, in a tolerable condition. They are trimmed to a standard about two feet high, and from three to five buds are saved for wood and fruit. The vines are allowed to spread at random over the ground during the summer. This vineyard is irrigated. The other vineyard is small, and the vines. Some of them are said to be sixty years old. The mode of trimming is the same as the last vineyard. A portion of the ground is in grass, and only a small space around each vine is cultivated. This vineyard is not irrigated. These are planted about six feet apart. They are situated high on the declivity of the foot hills of the Contra Costa Range of mountains, and are watered from a mountain stream. The soil is a dark loam, breaking into small lumps, and easy of cultivation, with a dry limestone subsoil. This soil is well adapted to the vine.

There are two vineyards in Napa valley—one of them, belonging to a Mr. Yount, I have not seen. A part of it has been planted fifteen years, and produces abundantly. The other is owned by Mr. Kellogg, formerly of Illinois. It was planted in 1849. It is situated on a level piece of ground, under the brow of a high hill, with an eastern exposure. The surface is level, and the soil a gravel full of large and small stones, and very different from any other I have examined. There are about fifteen hundred vines, and each one is trained to a standard of two feet. They are trained after the manner of the other vineyards I have described. In the spring, before the vines commence growing, this vineyard presents the appearance of so many small stumps of trees. This vineyard is irrigated three times every season—once when the fruit is setting, again when it is half-grown, and lastly when the fruit is ripening. The vines spread at random over the ground. This vineyard is productive, and pays well. There is also a small vineyard at Livermore's Ranch, on the Cuntra Costa range, about twenty miles east of the Mission of San Jose. It has been planted about fifteen years, and is trimmed to a standard of about six feet, and allowed to spread at random upon frame work. It is trimmed after the manner of the other vineyards I have mentioned. This vineyard is an alluvial soil, on the banks of a mountain stream. The soil is a black clay, mixed with very rich black vegetable mould, very soft and adhesive, and even miry in the winter. In summer, it becomes very dry and hard, and cracks to the depth of several inches, and is full of large crevices. The fruit is said to be very sweet.

The climate of all the vallies of Northern California is dry in summer, and well adapted to the culture of the grape. There is no such thing as the rot, to any knowledge. A large portion of the country is covered with limestone rock, and has a soil well adapted to the vine.

There are a number of old vineyards in Lower California, which are very productive. The grapes are shipped to San Francisco, and sold at high prices. Of these vineyards, however, I know nothing personally. Only one kind of grape has been cultivated on this coast. It is believed to be the Malaga grape of old Spain, introduced here about one hundred and fifty years since by the Roman Catholic Missionaries who visited this country. It is a grape of a fine quality, and well acclimated.

Yours,
E. Townsend.

The following communication we publish, knowing the writer to be a scientific and practical Florist, and from whom we hope to receive occasional descriptions of the "beautiful" among the mountains. We copy it from the Calaveras Chronicle.

South Calaveras, Feb. 20, 1854

Mr. Editor:—In a recent communication we spoke of a valuable discovery of gold having been made in close proximity to Forman's Ranch, which at that time appeared to have no connection with what is generally understood by a regular "lead," and although nothing has transpired since the first discovery of this curious deposit really proving that it is part of the country, yet other observations aid us in forming the opinion that such is the case.

It is certainly correct that a streak or vein of quartz runs almost immediately from Carson's hill, through Albany Flat, Angel's, and Cherokee Flat, where one of the richest claims ever discovered in California is at present being worked with astonishing success, and continues through the whole distance, passing the Hawk-Eye Ranch, Pilkington's, Forman's, &c.; continuing on some distance west of San Andreas. It is quite perceptible to any one travelling the road, enough of the quartz appearing to warrant the supposition that it is one continual vein for a distance of 16 miles.

Upon this general line of quartz has been found diggings of richness, in every one of the above named camps, and in our opinion, if it is pronounced unworthy of a fair and complete test in this vicinity, it must be for easy reasons. On the range spoken of, near the Hawk Eye, quite a number are doing well, realizing more, on an average, than Congress pay, and so long as water lasts, there is no doubt but labor will be amply remunerated in that part, and not that part alone but in many others equally available for mining purposes; in fact, take the whole range from Carson's to San Andreas, and it is very questionable indeed if it can be outdone by any equal extent of territory in the southern mines.

The weather, though lowering and rainy-like, is neither unfavorable nor unpleasant, the humidity of the atmosphere giving fresh lustre to vegetable life. When spring begins its fine career in the mountains of this country it probably cannot be matched in point of beauty by any portion of the globe.

If it were not for a disposition on our part not to encroach too much upon your space, we might extend more at length upon objects of interest in the vegetable kingdom as they appear to us. We may say with freedom that the floral beauty of California is not to be excelled—which season has already begun. That little emblem of purity, the California primrose (*Dodecatheon Media*) has already shown itself in sunny localities, and others of equal beauty are preparing for bloom.

Although in this country we do not hear the whistle of the "merrie ploughboy," nor the songs of the larks of our native sky, yet innumerable objects of beauty and interest are here to eclipse even these.

J. G.

Apparatus for Condensing Smoke.—Mr. J. Bloom, a German, now resident in New York city, has taken a patent for a new invention for preventing the nuisance of the great volumes of smoke which arises from all chimneys of great manufacturing establishments, especially in cities.

The plan adopted by the inventor is to carry the chimney flue in a circle from a moderate height above the fire, to the bottom or near the bottom of a cistern of water. Of course there can be no natural draft, and an artificial one is created by exhausting the air from the space over the water in the cistern by a double acting air pump. The smoke is thus completely decomposed leaving a residium of lamp black in the bottom of the cistern, while the gasseous portion rises to to the surface of the water, and escapes into the air free from dust or color. The coarse part of the cinders are arrested in the upper part of the flue by a sieve, and fall back into the fire, and another portion fall in the horizontal part and the residue being deposited in the water, it follows that a small pipe would answer all the purposes of a large chimney stack.

In the experiment a very rough model was used in a small room, and the fire made in the furnace with pitch-pine wood, and by turning a small crank operating the air pump, every particle of smoke was decomposed, while the fire burned freely as with a good draft-chimney.

The inventor calculates that one-eighth of the power of a steam-engine would be required to work the air pumps, so as to get rid of all the nuisance usually arising from the consumption of a large quantity of coal.

Big Strikes.—The Columbia Argus reports a number of big strikes: one of Mr J D Searle's vat, of pure gold, weighing sixty-seven ounces. At Volcano Canon one company on Saturday last took out $1,000; one pound weighing twenty-two ounces solid gold. A few days ago a company took out a piece weighing 8½ and another company one worth $1,184. Another piece taken out in one day was over $1,000.

The Lumber Product of Grass Valley.

The lumber product of Grass Valley, is estimated by the Telegraph at 150,000 feet per week. The capacity of the mills now running, and being erected, is equal to 1,500,000 per month, full time: to which those of Nevada township are able to add a like quantity. With the access to the San Francisco market, which the Sacramento Railroad, and Marysville Plank Road will give us, our mountain mills can compete with those upon the coast, upon their own ground, with the up-country demand for lee-way, without foreign competitors.

The Winchester mill, situated on Wolf Creek a little south of the village, is the most extensive and complete of the various establishments of Nevada county, engaged in the manufacture of lumber. Its engine is sixty horse power—and gives motion to an upright saw on the mulay principle, and a large circular. In addition is a Woodworth Planing machine, capable of turning out five to eight thousand feet of tongued and grooved flooring, of excellent quality, a Shingle Machine, and a powerful Lathe for every description of iron turning, screw turning, &c., &c. The works of the company will be completed the present season, by this addition of the quartz machinery, and will be among the most noticeable attractions for citizens and strangers.

Another Woodworth machine, the first in this country, is attached to the Mount George mill, a mile and a half, north-easterly from Grass Valley; and still another is being erected, at the new Saw Mill of Col. Dibble, on Mud Flat, midway between Grass Valley and Nevada; Messrs. Tibbals and Wheeler, successors in the management of the of the new Collins mill, (Manhattan Company) are putting up a fine Saw Mill, which will be ready to start in a few weeks.

The prices of lumber at this place, says the Grass Valley Telegraph, rule at $30 per M at the mills for common descriptions, and $60 per M for No. 1, flooring. At Nevada, we understand the rates have gone up to $35 and $40, under a large local demand for building and mining purposes. The Marysville Plank Road project, now regarded as sure, will undoubtedly carry up the price to $40 at the mills. Extensive preparations are making for brick and other buildings in this place, to keep pace with the ready upward progress of Grass Valley; and as we said, the lumber trade is becoming more and more an important element in the business operations of this county, second only to the mines, which are here as extensive and as productive as in any other portion of the State, while the cost of living and the *home comforts*, are quite satisfactory too, and within the control of all classes.

Diamond Springs.—We find in a late number of the Miner's Advocate, the following graphic description of the rise and progress of Diamond Springs, showing how a California village springs into existence and becomes a town, as if by magic art:

In the spring of '50 the first house—i. e. a canvas tent—was raised near the upper end of the present site of Diamond Springs, since which time the town has attained its present prosperous and flourishing condition. The town is situated on the direct road from Carson Valley to Sacramento City, and about fifty miles from the latter. The location is fine, and from the hills which surround the town, where there are many beautiful sites for the rural cottage, you command a view of an immense expanse of country, which, for beauty and grandeur of mountain scenery, is unsurpassed on the continent. Far away to the East, the snow-capped Sierra Nevada, with their forests of tall and majestic pines, towering towards the sky, forming a seemingly impassable barrier to the further progress of man; while to the west the mountains gradually fall, one below the other to the valley of the Sacramento. As far as the eye can reach, the ravine the gulch, and the stream, all are worked by the hardy pioneer of the pick and shovel.

During the last summer the town has increased materially, both in population and size. It now contains nine hotels, nine dry good's stores, eleven groceries, one drug and one book store; one gambling and three billiard saloons, four bakeries, two livery stables and four blacksmith shops—besides which there are over two hundred and fifty private dwellings. Late last fall a large brick building was erected on Main street; also, Union Hall, erected on Court Square, by the united efforts of the Free Masons, Odd Fellows, and Sons of Temperance, all of which Orders are well represented in the place. Messrs. Hunter & Co. and Adams & Co. have each a banking house in town, where the principal part of the oro is purchased. There are, however, some twenty other houses where gold dust is taken in the way of trade. The total average amount purchased per week, as near as can be ascertained, is two thousand six hundred ounces, which, at $17 40 per oz., brings the immense sum of $45,240.

Within the township of Diamond Springs there are seven saw mills which turn out at the low average of 3000 feet each per day, 126,000 per week, worth, at the mill from $35 to $40 per M. Placing the average at $37, we have the sum of $4,662 as the value of the lumber manufactured every week within six miles of Diamond Springs and all within the township.

Grass Valley.—There were [illegible] in Grass Valley on the first of January, 1854. Number of Brick Stores 4. Number of Brick Dwellings [illegible] Number of Frame houses [illegible] and two churches, built during the past two years.

Interior Items.

Revival of Business.—The Stockton Journal says:—We learn from a reliable source that Thursday last was the biggest business day we have had for a long time. Our informant, in coming to town from his rancho (20 miles out on the Mokelumne Hill road,) met over thirty loaded teams, all bound for the mines. There is equally as brisk trade on the Sonora and Mariposa roads. Boats for French Camp are plying regularly; freight, $5 per ton.

Funeral of Dr. Dickson.—The Sacramento Union of March 11th says that the remains of Dr. J. P. Dickson, who fell in the recent duel near that place, were buried on the preceding afternoon between three and four o'clock, from Jones' Hotel. The funeral was conducted under the direction of the Masonic Fraternity, a large delegation of whom attended the corpse to its final resting place, as did also nearly all the members of the Legislature, and many of our citizens. The Masonic delegation proceeded to the ground on foot; the others filled a long train of carriages and other vehicles.

Woman Shot in Sacramento.—A man named Ayres, says the Journal, who keeps a coffee stand on the corner of K and Sixth streets, got into a quarrel Friday afternoon, with a negro woman that kept house for him, and shot her in the knee. The wound is not dangerous. Ayres was arrested and examined before Recorder Curtis, who bound him over in the sum of $2000.

A Large Lump.—A lump of gold was found a few days since, near Middletown, that weighed upwards of 100 ounces. It was mixed with quartz rock, but was supposed to be worth at least $1000.

Columbia.—The miners at Columbia and Ballard's Ranch, are doing well since the late rains. Water is abundant. They are averaging $6 and $8 per day to the hand.—*Empire Co. Argus.*

From San Diego and Lower California.—The U. S. steamer Columbia, Lieut. Ball commander, arrived at this port on Tuesday, from San Diego, which port she left on the 11th, bringing late and important news from Lower California. From the San Diego Herald we learn that Walker has taken up his quarters at St. Vincente, and a communication from one of the Filibusters says that the inhabitants of the country have voluntarily given in their allegiance to the "New Republic"; other accounts say that only a few inhabitants took the oath, being forced to do so, or be robbed and murdered. Two of Walker's men had been tried by a court martial and shot. The Hon. Frederick Emory, Secretary of State of the New Republic, and Senor Cordova, were arrested at San Diego, and brought to this city on the Columbus. Mexican forces are on the way to meet Walker and drive him from the country.

The Herald says there is trouble among the Dieguinos Indians in that county, in consequence of the reappointment by Lieut. Beale, of old Tomas, as Captain General over that tribe; they threaten rebellion.

Rain.—For two days the rain has been falling—falling, we might say pouring, for we have had some of the '49 rains. We rejoice at this profusion of rain; the earth needs it; the hills and the mountains need it to clothe them again with verdure and beauty. We know muddy streets are not comfortable, and the streets of San Francisco, portions of them, are utterly impassable; and in the condition of our *unfinished* city, rain is anything but acceptable—the good it will produce elsewhere is forgotten in the inconvenience we suffer here. Let us look on the bright side of things. The rains are the blessings to the miner and the agriculturalist, and they are both feeling the good effects of it; the miner is reaping the golden harvest, and the agriculturalist witnesses the crops coming forth with bright promise. Let us therefore bear any personal inconveniences, remembering that to everything there is a season, and the promise is, "There shall be the early and the latter rain." Let us bless God for it, "He doeth all things well."

Congressional Favors.—We acknowledge the reception of valuable documents and packages of seeds from Hon. J. A. McDougal. Among the documents: "The Survey Climate of [illegible]" in its relation to agricultural productions; [illegible] a report of the Secretary of the [illegible] Institute—containing valuable [illegible] for which we return many thanks.

Every flower [illegible] is an emblem of a promise and [illegible] a token of a blessing. When the [illegible] of beauty and [illegible] smile in luxury upon the [illegible] (the [illegible] and small fruits are [illegible] of ripening) and small fruits are [illegible] of ripening upon the [illegible] of the [illegible] When [illegible] and [illegible] are [illegible] and [illegible] [illegible] [illegible]

THE CALIFORNIA FARMER.

SAN FRANCISCO, THURSDAY, MARCH 16, 1854.

Dignity of Agriculture.

In our last issue we spoke of the science of Agriculture as demanding from its followers a higher appreciation of its value than it has ever yet received. We reiterate the language we have before used, that "Agriculture has been kept in the background too long;" its votaries, the masses that have been, as it were, engaged in it for life, have not sufficiently esteemed their calling. They have felt and have acted as if they did not claim to be equal to other men.

In public life, the farmers have stood back, feeling disqualified to cope with the professional man or the educated merchant or manufacturer—never thinking he should be as well or better educated than either, and fit to instruct in all those matters that appertain to the general good—fit to explain and teach in all that is connected with the great science of Agriculture.

The cultivator should be familiar with Geology, Chemistry and Botany, and this knowledge must awaken in his mind a thirst for still higher attainments.

We would not by any means be understood as implying that there are no educated men among the cultivators of the soil; far from it. We only speak of the masses, that live on, unable or unwilling to spring into a new life—a life where science is constantly revealing new truths and adorning with new beauties. Agriculture can boast, among the names enrolled on her brightest pages, the first, best, greatest, that ever adorned any science. The names of Washington, Adams, Webster, Calhoun, Clay, Jackson, Cass, and a host of other men, that stand before the world, monuments of exalted greatness, were among those whose noblest efforts have been given to this science, and it is their glorious example, that we desire to present to those who come after them, as examples worthy of imitation. When we reflect upon the characters of such men, and upon their memories, we feel that a portion of their greatness was derived from the pursuits they followed, and their engagement in agriculture left an impress upon their characters not to be mistaken.

The pursuits of Agriculture call into action the noblest faculties of the mind, and the more engaged the mind becomes in these pursuits the more enlarged the faculties become.

There is something enticing in the pursuit of Agriculture, but its allurements are not to wrong; there is a thirst created, as the mind becomes engaged, that is never satisfied, for the more interest that is felt and the more beauties discovered and enjoyed, the more are discerned in the perspective, and thus the mind is led to new discoveries.

We need men of mind to become engaged in this science, that it may receive a new impulse. We need more of wealth, that greater practical experiments may be perfected. We need men of refined taste, that new adornments may be given. Thus by study, practical experiment and taste, the science shall be advanced to a degree commensurate with its importance and with the progress of the age.

We are most happy to see the indices of a brighter day for Agriculture. Intelligent minds are combining for its advancement in connexion with kindred sciences. The public mind is turned to the immense wealth it creates and bestows, and to the permanency it gives to the character of the commonwealth; for none can deny at this day, that Agriculture is the basis of the wealth of California and of the world. The contrast of the present time and the past, in the attention paid to Agriculture, is incredible, and we look with hope to see at no distant day institutions liberally endowed by the General and State Governments, where the youth of our country can be educated and prepared to take the place assigned them by the Creator.

"God made man in his own image," and placed him in the most beautiful spot of earth, "The Garden of Eden;" made him "Lord of the Creation," and commanded him to "till the earth," to "subdue it"—make it bring forth fruit plenteously. Thus created, thus empowered, shall man fail in his high vocation?

We trust the future will give evidence that among all the various sciences, none will make greater advances, or none command more attention and dignity, than Agriculture.

The Gas Company of New Orleans purchase their coal at thirty-eight cents a barrel, and, after making gas which they sell at four dollars a hundred feet, resell the residue, in the shape of coke, for seventy-five cents a barrel.

On Style and Expression in certain Trees and Shrubs--Their Adaptabilities, &c.

[Communicated to the Journal of the London Horticultural Society, by Robert Errington, C. M. H. S.]

Landscape gardening in its strict sense has scarcely kept pace with what has been termed the Gardenesque of late years; and why? Simply, I suppose, from the fact that where there is one person who can appreciate the beauties of lines and forms, independent of color, there is a score who can not; but who nevertheless are, it may be adepts at what is termed "clumping" flowers, and all the paraphernalia of the flower garden.

While, however, England sustains her position in the van of civilization, so long must true landscape gardening be fostered; and it must be confessed that we owe its preservation and encouragement mainly to our aristocracy, who are ever in a better position to appreciate its value than any other class of society.

My purpose is to draw attention to the beauties of form in certain trees and shrubs, old-fashioned kinds or not, and to point to their eligibilities, whether in the park, the ordinary pleasure grounds, or the flower garden. As country seats differ—and indeed should do so—as to their general tone or expression, sometimes through position and adventitious circumstances, and sometimes as a matter of design, it follows that a judicious adaptation of trees and shrubs becomes necessary, whether as accompaniments or as constituting a portion of the chief features of the grounds. In most of the pleasure grounds connected with the seats of our nobility and gentry, certain by-scenes, retreats, nooks, or decorative adjuncts occur, which either possess a kind of individuality, or require it to be created by the skill of the artist. Hence the necessity for a nice perception of the character and ultimate expression of trees and shrubs. The grave and the gay would be terms far too sweeping in their signification to embrace all the objects required in extensive gardens. From the mausoleum to the parterre may exist several intermediate characters, each requiring a separate impress, yet merging into each other. For instance, there may be the rosary, the American ground, the decorated promenade, the terrace, rock-work, etc.; and as matters further from home, walks and adjuncts connected with the margins of the park, the lake, the woodlands, the grove. It need scarcely be urged that each of these requires peculiarity of style in the trees and shrubs which are used as accompaniments. There exists, moreover, in addition, a demand for trees and shrubs adapted to the various styles of architecture; and to the vestibule, the corridor, balustrades, arcades, the conservatory, &c.

Thus far I have pointed to a few of the chief objects, in order to show the demand for a variety and choice of materials, and to mark the existence of such, and to claim in some degree for the landscape gardener an immunity from the ordinary bondage imposed by the great goddess Fashion; the genuine landscape gardener caring more for lines and forms than gaudy colors.

Mere novelty and color, then, being set aside for a moment, I would beg to advert to what we may term style and expression in trees and shrubs, and with much deference submit the following, which is capable of amplification:

Forms—Round or Flat-headed, generally massive; Pointed or Spiay; Columnar; Fastigiate; Horizontal; Weeping.

To these common terms, as descriptive of general forms, may be added certain other characters or habits; such as the tinted, or those which impart a solemn grandeur or richness, at the season of fading, in our early autumn or winter months; feathery and light branched trees or shrubs, adapted in a special way to the vista or glade; rock-shrubs and trees, those adapted to the banks of water; climbers, creepers, twiners, berry bearers, and variegations; with the coarser and more rustic-looking things, as leading to or connected with the woodlands, the fields, or the moor.

I will now point to a few trees and shrubs in each of the classes, begging it to be understood that they may be either old or new, their suitability alone being the assumed ground of merit.

Round or Flat-headed Section.—Foremost, "the gnarled and unwedgeable Oak"—everybody's favorite. Here we have one of the finest contributaries to a bold sky outline—in age exhibiting broad and heavy masses of foliage, disposed in well-defined, abrupt, and even angular breaks; added to which a tortuous and rugged bark—a bold relief among trees and shrubs of a tamer character. The Beech, too, a tree for the park, the grove, the glade, or the vista. The Sycamore, which, although when young is of no significance, attains a character in age frequently of much consequence to the scenery where it is situate; the foliage in this case running into heavy masses, with deeply indented breaks in the outline. The Scotch Fir in age frequently attains a most picturesque appearance. In this section we have such trees as the Elm, the Lime, and various others.

Pointed or Spiry.—Such as the Lombardy Poplar, the Taxodium sempervirens, Douglas Pine, Larch, Silver Fir, and several other conifers, with the beautiful Cryptomeria, and many ornamental shrubs. Trees and shrubs of this habit are finely adapted for relieving the monotony of a heavy sky outline. What a charming effect is produced by even a group or two of the Hollyhock, peeping forth from among a heavy mass of flat-headed shrubs! The Lombardy Poplar, too: who has not seen and admired this tree, rising in the distance in conjunction with the steeple of some time-hallowed church? This is indeed a most important section. If I remember right, Mr. Repton affirms that spiry trees are well adapted to the Grecian style of architecture.

Columnar.—Here are many admirable things, particularly suited as accompaniments to buildings. For the margin of promenades, terraces, or indeed any long, straight, and formal walks or lines—the corridor, balustrade, &c.—they are considered well adapted. I need only point to the Irish Yew, Arbor Vitæ, Red Redar, with some of the members of the Juniperus and Cupressus families, as peculiarly of this class.

Fastigiate.—There are some singular-looking things in this section; as for instance the upright or Cornish Elm—indeed, some of the conifers may be placed here. There has been some difference of opinion as to the use of the Lombardy Poplar, which is perhaps more of the columnar character; but I think any one going from London to Richmond by water, must be struck with the extraordinary effect produced at some villas on the banks, in grounds of which the Lombardy Poplar, the Cedar of Lebanon, and the Weeping Willow, may be seen in close combination with buildings of modern style; the whole producing a most striking picture—such forms powerfully contrasting with the beautiful river to complete the scene.

Horizontal.—The ancient Cedar of Lebanon may here be placed foremost: too well known to require description. The Cedrus Africanus will probably stand in this class; and that ponderous and dignified-looking tree, the Araucaria imbricata; the Silver Fir, and indeed several conifers belong here, which altogether is a most important class, especially with reference to architectural lines and forms.

Weeping Kinds.—First, the old Salix Babylonica, or Weeping Willow, which may stand as the type of this class of trees; albeit we have such graceful things as the Cupressus funebris, the Deodar, the Hemlock Spruce, &c.; even the Birch, in some of its best humors, swells the list, which, if space would permit, might be enlarged with many a goodly candidate.

Who would refuse the Deodar and the Weeping Willow a place contiguous to water scenery? The latter is so much at home in such a situation, that an ornamental piece of water in a pleasure ground is scarcely considered complete without it. Here previous associations and individual aptitude combine to press this time-honored tree on the notice of all lovers of the graceful.

Having thus given a hasty sketch of character in trees—a subject which, if done justice to, would fill a book—I may now be permitted to point out a few trees or shrubs, which, although possessing much character, may not fall in strictly with any of the classes here assumed.

Conifers in general: it is almost superfluous to remark that they possess capabilities of giving quite a new tone to British scenery; not that they will by any means cause us to part with our majestic Oaks, our Beeches, &c. On the contrary, they will add power to existing groups of deciduous timber trees, by depth of contrast; and combine, as it were, the freshness of spring with the gloom of winter.

Among these the Deodar seems, by general consent, to occupy the very first place, based upon a double consideration: its exceeding great beauty as a tree, and the well-known durable character of its timber. Another capital feature belongs to it: the power of its leader to resist frost or cutting winds. No person, on first observing its graceful and delicate-looking leader, growing so late in the autumn, could suppose that it could remain unscathed through a severe winter. It is, moreover, the most manageable Fir I have seen, as to habit; it would be easy to keep it in a dwarf state for many years. It is thus adapted to rock-work, or other rustic affairs, where pendent forms are employed. Next, the regal-looking Araucaria—a tree for palaces. Cryptomeria, too, and the Douglas Pine; and then the genera Cephalotaxus, Libocedrus, Juniperus, Taxodium, Cupressus, &c. What a rich group! Any painter who, by anticipation could produce a landscape on canvas, such as will be obtained in Britain in some twenty or thirty years hence by these fine things, would perhaps give a greater impulse to planting than all the advertising of the tradesmen.

The selection of trees and shrubs possessing autumnal tints is by no means an unimportant part of the planter's business. When the gloom of winter threatens—when the aspect of our gardens becomes totally changed by the general decadence of the floral tribes—then the bounteous hand of Providence, by a gracious compensation, "lights up" the woodland, the grove, and the shrubbery, by those delightfully various and ever-changing tints which all who can appreciate the beauties of the landscape so much admire.

This is a numerous section, and any one who would watch and carefully classify them would do planters a real service. I may just observe, that the most glorious tints I am acquainted with are those of the Liquidamber, the old yellow Azalea, and I am tempted to add, although somewhat out of place, the true West's St. Peter's vine. The Oak family are not poor in these things; the old Merry tree is sometimes beautifully tinted; so is the Corylus atropurpureus, the Hippocastanum, and a host of others, including pure yellows, as the Tulip tree, &c. To these may be added, for their rich tints, our colored stemmed shrubs, as some of the Dogwoods. The berried race may also be glanced at. Foremost, the old Holly, associated in the mind with the Christmas festivities of centuries, and outdoors second to none in the richness of its embellishments, or as shelter, whether in the shrubbery, the field, the park, or the forest. Next, the sombre Yew, with its funeral associations, combining massiveness, durability, and hardihood; the Arbutus, Juniper, Leycesteria, Snowberry, Ivy, Mahouia, the Garrya, Euonymus, &c.

The variegated section is by no means meagre or inapt for decorative purposes. Materials also for rock-work, or for imparting a wilderness character, undergrowths and climbers; and lastly, as a consideration worthy the close attention of every one engaged in ornamental gardening, our very early spring flowering shrubs or trees, and our very late ones.

Among the former, I would point to the old snowy Mespilus, the Almond, Ribes, the Corchorus, Chimonanthus, Cydonia japonica, Mezereon, Cornelian Cherry, Weigelia, Forsythia, &c. Among the latter, the old Althæa frutex, Erica herbacea, Cletbra, Arbutus, Escallonias, Laurustine; and lastly, the old Glastonbury Thorn, of legendary fame—and difficult it is to know whether to class this with the old year or the new.

Sketchy as the present remarks necessarily are, as applied to a subject having such wide bearings, it may be seen by those unacquainted with our trees and shrubs, how rich England is in materials for decoration, at whatever period of the year, or whatever the style; and I may be allowed to express a hope, that all intent on beautifying their gardens, parks, &c., will take into consideration the propriety of paying a due regard to the habitudes and adaptibilities of trees and shrubs.

Roses for Winter Blooming.

A selection for this purpose should be made from the Tea and Bourbon families, on their own roots or budded very low. Presuming the plants brought from the nursery are in the small pots they are generally grown in for sale, they should at once be placed into those a size larger, carefully and freely watered, during this and the next month, cutting off all the flower-buds they may show before September. About the middle of the latter month, shorten the strongest shoots, and thin out the slender ones, depriving them of some of the soil, and repot in those a good size larger, using a compost of turfy loam, sand and manure in about equal proportions; they also like a little leaf mould; put several pieces of broken crock in the bottom of the pot, then a portion of the soil; place the plant so that its surface roots shall just be covered, and then fill in with the soil; place them in a situation partially shaded—water sparingly, till they begin to grow—then expose them fully to the sun, and water freely every day. There they may remain till the middle or end of October, when they should be removed to a pit to prepare them for flowering. Previous to their removal, the pots should be washed, and the plants neatly tied up. Where charcoal can be had, it will be found of great utility in the pot-culture of Roses, broken to the size of nuts, and about one-fifth mixed with the soil; the roots delight to ramble through it, and the foliage becomes of a richer and darker green; the surface of the soil must have frequent stirrings. The plants must be carefully examined, and whenever infested by the green-fly, the latter should be destroyed by tobacco smoke. Roses in pots are wonderfully benefitted by a watering of manure-water now and then. This water is very easily prepared. Let droppings from the stable or cow house be put into a large tub or barrel, with water kept over them for a week or two, occasionally stirring it up; the water may then be poured or drawn off for use. Guano water also makes a good manure. A quarter of a pound of guano in three gallons of water, frequently stirred before using, will be found very nourishing: indeed, one pound to sixteen gallons will be strong enough to use by the inexperienced, for if used much stronger than I have stated it would injure plants in pots. In the open ground any of these manures may be used stronger, and rather more frequently.—*London Gardeners' Chronicle, July 16.*

Standard Rose Trees.—I offer to the lovers of standard Roses a little plan of my own; it has succeeded admirably. An artificial prop to standard Roses is unsightly, and is both exposed to decay in the run of time, and to disasters from the raging in the wintry blast. In order to do without this prop, plant three standard Roses, (the longer the stem, the better,) in an equilateral triangle. If on a slope, one leg must be longer than the other two. They may be from eight to fourteen inches apart. Bring the stems together at the top, and bore a hole through each of them, a little below where they have been budded; then through these holes thread a copper wire, such as is used for soda-water bottles, and bring the heads of the three plants quite close together, making the ends of the wire fast. This is all. You have here a group so firm and strong, that it can never break down, or ever require an artificial support. I made four groups last autumn. They are now in fine blow, and are much admired.—*Charles Waterton, in London Gardeners' Chron*

Blanching Rhubarb.—The advantages of blanching the stalks of Rhubarb, for culinary purposes, are two-fold, namely, the desirable qualities of improved appearance and flavor, and a saving in the quantity of sugar necessary to render it agreeable to the palate, since the leaf-stalks, when blanched, are infinitely less harsh than those grown under the full influence of light, in an open situation. It may either be blanched by earthing up the roots early in spring, or earthen pots may be used, as in blanching sea-kale.

Taking the Stalks.—Remove a little earth, and, bending down the leaf you would remove, slip it off from the crown without breaking, or using the knife. The stalks are fit to use when the leaf is half expanded; but a larger produce is obtained by letting them remain till in full expansion, as is practised by the market-gardeners. The stalks are tied in bundles of a dozen and upwards, and thus exposed for sale.

Raising Fruits from Seed.

We know of no subject on which we can more profitably offer a few observations at this time of the year than that of raising fruit from seed. We are every year ransacking foreign countries for new varieties; we are not satisfied with what we have, and we never shall be. It is in the nature of man to seek for novelties; and it is well, on the whole, that it is so. We shall not say a word against this, but desire to commend to people's attention the abundant means nature has placed in our reach to produce new varieties here, at home, on our own soil.

Shall these be neglected? We hope not. There seems, fortunately, at the present time, a disposition in the public mind favorable to the improvement of home resources in a gardening sense, and the raising of seedling fruit is certainly one of the most important. Just enough has been done to show the facility, and afford us encouragement to proceed. Dr. Kirtland's cherries, Dr. Brinckle's raspberries, and many varieties of strawberries, all of much merit, are recent additions to our lists of fruits, raised from seed in the simplest manner, without any regard to the niceties of hybridization; so we can count up fifteen or twenty first rate American seedling apples, some of which and indeed many, have a national reputation, all raised from chance seedlings.

Now, in fruit-raising, it is of the highest importance that every man cultivate such varieties as are best adapted to his soil and climate. One of the great problems which pomologists are at present endeavoring to solve, relates to this very point. As botanists have divided the surface of the earth into zones of vegetation, each of which is characterized by a peculiar flora, by the prevalence of certain trees, and shrubs, and plants that flourish there, and there only; so in fruit-culture it is believed necessary to map off this great country of ours, embracing such a variety of climate, into pomological zones, in each of which certain fruits succeed better than in others. On this pomological chart, that our American Pomological Society, if it live and thrive, intend one day to appoint a commission to make out, shall be clearly defined the exact limits of successful cultivation of our *Bartletts*, *Seckels*, and *Virgalieus*; our *Newtown Pippins*, *Baldwins*, and *Spys*; and this will certainly be a most interesting and valuable map. But it may bo a long time yet before it is completed, or before we shall have collected the great mass of facts and statistics which the execution of the project will demand.

Meantime, it must be urged upon fruit-growers, both professional and amateur, every man or woman, boy or girl, who can obtain seeds of fine fruits, to plant them and rear them into bearing trees. It scarcely admits of a doubt but that this is the true, and almost the *only* way to obtain varieties completely adapted to all local circumstances; this can be read plainly in the history of nearly all our native fruits. As a general thing, their culture is most successful in the region of their origin. Some, liko certaiu genera of plants, are confined to narrow limits, beyond which they do not appear to prosper; others admit of a greater diffusion, and adapt themselves to a greater variety of circumstances.

The most forcible illustration of this is found in the case of northern and southern fruits. The *Fameuse*, *Pomme*, *Grise*, and some other apples of the north, are best in the coldest latitudes, and fail as they go south, until they become utterly valueless before they reach the Mississippi. So in the case of southern fruits, like the *Rawles' Janet*, *Tewkesbury Winter Blush*, &c., that succeed only where the seasons are very long, and are entirely valueless in the north, as spring opens about the first of May, and autumnal frosts come as early as the first of October. The *Porter* and *Baldwin* are in no place so good as in Massachusetts; the *Newtown Pippin* is best on Long Island and the Hudson, the *Spitzenburgh* in New York, &c.

Aside from the unquestionable facts of the case, it is clearly natural that this should be so. A variety springing up from seed in any given locality, is, in the course of its production, endowed with a constitution and habits adapted to that locality in a particular manner—just as men are more at home in the climate and mode of life of their native country than in any other, and are, in a measure, proof against local diseases, that strangers would immediately fall victims to. This is all in strict conformity to the harmonious laws, that regulate and govern all nature, animate and inanimate.

Now, we are an impatient people—a "fast" people, to use a current term—and we are quite loth to embark in anything that does not promise immediate results. Our young men greatly prefer hazarding their lives for the chance of securing a lump of California gold to working a fortune patiently but surely out of their paternal acres. To such people, raising new and fine fruits from seed, where perhaps not more than one in ten thousand may be a prize, is a slow business, and anything probably cannot convince them that it is more rapid than they imagine. But we shall try, nevertheless.

Suppose, for instance, we wish to produce some seedling strawberries; we take the finest berries of the best kinds to be had; they must be perfectly ripe; either wash the seeds out of the pulp or crush the berries, and spread out pulp, seeds, and all to dry. We then sow either the clean seeds, or dried pulp and seeds, in light earth, and by autumn we have nice plants. These must protect from the winter by a covering of straw, and the next spring they are put out into rows. The fruit they bear and the [illegible] we have gained a prize or not. Raspberries, Currants, and Gooseberries, are managed exactly in the same manner, and bring forth fruit in the same time. This is not a tedious process. Three years, or four, enable us to arrive at some result with these small fruits, and very important fruits they are. It would take as long as this to raise a colt fit for market, and a first rate Strawberry, Currant, or Raspberry is as valuable as two or three good colts, at least, or it he might be half a dozen.

Peaches are easily raised from seed, and come quickly into bearing. Every one knows the method of raising Peaches from seed. The fresh pits may be transferred at once from the pulp to the ground, and in three or four years it will yield fruit. Pears and Apples are more tedious; but there is a way to manage these to obtain an early result. Suppose, now, in 1853, we collect seeds of the finest Apples and Pears; as they are taken from the fruits they are placed in sand or earth till all are collected; they are then planted in fine prepared earth. Next spring they will start, and in the autumn of 1854 they will be yearling plants. While yet in leaf select the most promising subjects—such as show in their features the greatest degree of refinement; then, instead of waiting ten years for these to bear, we bud or graft them into bearing trees,—dwarfs, if possible—and in two years they will be fruited. Plums and Cherries are managed in the same manner.

We think that no reasonable person who has patience enough to wait for the ordinary seed time and harvest, could call this a very tedious process. Aside from the advantages which it offers, the raising of seedling fruits is full of instruction and interesting, as every one can testify who has given it a trial.—*Genesee Farmer.*

Stir the Soil.

Some entertain an idea that it is injurious to stir the soil when it is dry and the plants are suffering for want of rain. The error of this supposition is well exposed in an article written by the Hon. J. Lowell, headed "Stirring the Earth a Relief against Drought," published in the Massachusetts Agricultural Repository. The following is an extract:

In this extraordinary (very dry) season, I had a small patch of early potatoes, planted in a warm and sandy soil, purposely to procure an early crop; the soil was at least three-quarters pure sand, but mixed with some food for plants among the sand. The severe drought threatened a total loss of the crop. The potato stalks were feeble, drawn up, scarcely larger than goose quills, and I expected every day to see them wither; all hopes of a crop were abandoned. I thought they were fair subjects of a desperate experiment. On one of the hottest and driest days I gave them a thorough ploughing, passing the plow four times through each row; first plowing two furrows from the hills, as near the roots as possible without throwing out the seed potatoes, and then returning the loam or earth instantly back by two other furrows. No rain intervened for ten days. In three days after, the potatoes changed their color, they started afresh as if they had received the benefit of ample showers, while not a drop of rain had fallen.

The dews, which were abundant, settled upon the new-turned earth, while before the plowing no moisture had been apparent.

The last fact, though it cannot have escaped the notice of the most careless cultivator, has not been as yet explained. We can easily see, that a soil rendered porous would more readily and easily convey its moisture to the roots. It becomes like a sponge, and is readily permeable, or rather permits the moisture to pass between the particles. But it is not yet understood why it attracts the moisture. Perhaps, however, it may be owing to its presenting a much greater surface to the moist air of the night. The fact, however, which is what most concerns us, is settled. Perhaps some of the experiments of our distinguished countryman Dr. Wells, a physician of London, who rendered himself distinguished by his remarks on dew, may tend to explain this fact, though it is not my purpose to examine the theory.

Every man who feels an interest in the question can satisfy himself by stirring a small piece of earth in a time of severe drought, and if he does not find it in the morning more full of moisture than the undisturbed ground in its vicinity, let him continue an unbeliever.

But there is another mode, and it is one which I have never heard suggested, by which I apprehend the stirring of the surface, and making it light and porous, is beneficial in great droughts. It is this: light porous bodies are bad conductors of heat; perhaps they have more air between their interstices. The facts are familiar to us.—Metallic bodies acquire an intense heat under the rays of the sun; so do stones in proportion to their density. The earth, when very compact, will become exceedingly hot, but garden loam, which is very porous, remains cool at noonday two inches below the surface. I believe, therefore, that moving the surface, and keeping it in a light and porous state, enables it to resist the heat of the sun's rays; that the air between the particles of earth communicates the heat more slowly than the particles themselves do when in close contact.

Such is my theory, but I am an enemy to theories. I always distrust them; I look only to facts; and having observed that a slight covering of half an inch of seaweed would preserve my strawberries from drought, which can only arise from its lying loose on the surface, I have been led to infer that the undisturbed loose soil in a state of powder [illegible] stated results brought on owing to the same cause, to wit, the shadowing off but of the solar rays is communicated to the roots. But, be the theory sound or unsound, I am persuaded that every farmer will find that the free use of his plough and hoe, in times of severe drought, will be of more value to him than as much manure as that labor would purchase. I have always been convinced, from my experience as a horticulturist, that the great secret in cultivation consists in making the soil porous. In raising exotic plants, we know it to be true, and our flower-pots are always supplied with soil the most porous which we can obtain. The farmer may borrow light from an occupation which he looks upon with disdain, but which serves to elucidate and explain the secrets of vegetation.

Green Fodder.

Corn is sometimes profitably planted or sown for fodder. In an Address to the Essex Agricultural Society, by the late Col. Pickering, we find the following remarks:

Every farmer knows how eagerly cattle devour the entire plant of the Indian corn in its green state; and land in good condition will produce heavy crops of it. Some years ago, just when the ears were in the milk, I cut close to the ground the plants growing on a measured space, equal as I judged to the average product of the whole piece; and found that, at the same rate, an acre would yield twelve tons of green fodder; probably a richer and more nourishing food than any other known to the husbandman. And this quantity was the growth of less than 4 months.

It has appeared to me that the sort called sweet corn yields stalks of richer juice than the common yellow corn. It is also more disposed to multiply suckers—an additional recommendation to it when planted to be cut in a green state for horses and cattle, and especially for milk cows; and the time of planting may be so regulated as to furnish supplies of food just when the pastures usually fail. I am inclined to doubt whether any other green food will afford butter of equal quality.

A correspondent of the Mariposa Chronicle, writing under date of Merced River, March 1, has the following:

From Phillips' Ferry, on the Merced River, to its mouth, is about thirty-five miles. Along this river, between these points, there is probably more than 15,000 acres of good arable land. Of this there are probably more than 1600 acres under some sort of system of cultivation. Of this, about 500 acres are or will be sown in barley, and about 500 acres or more in wheat; and the remaining 800 acres, in potatoes, &c., will be under the process of cultivation the ensuing season. A very fair estimate of the products of these 1600 acres will be, for the barley, 30 bushels to the acre, making 24,000 bushels, or 1,500,000 pounds, which at 3 cents per pound, will amount to $36,000; of wheat, at 30 bushels to the acre, there will be produced 15,000 bushels, or 600,000 lbs., which at 6 cents per pound, will amount to $56,000; averaging the remaining 300 acres at $100 each, they will amount to $30,000—making a sum total of $122,000. The above estimate will fall below the mark in every material point. If we had any good manufacturing mills, with proper fixtures for cleaning grain of smut and dirt, we would ask no favors of New York and Chili. We have as good water power and as plenty of it as could be desired, and all that is wanting is the enterprise and capital to improve it.

California Wine.—We have received, by the polite attentions of George Yount, Esq., of Napa City, two bottles wine made from his vineyard, from the Los Angeles Grape. The wine has a good flavor, like the "Bordeaux claret;" has a fine body and free from the objectionable taste usually found in domestic wines. Mr. Yount manufactures about one thousand gallons.

Currant Wine.—A bottle of currant wine was sent us from Gen. M. M. McCarver, of Oregon, made from currants grown in his grounds. The rapid growth of the currant, and the abundant crop it yields, gives promise that this pleasant beverage will become common with us.

Beautiful New Evergreen Plant.—We announce with pleasure that we have received a few of the rare and beautiful Fragrant Evergreen Shrub, recently discovered in Washington Territory. This is one of the finest and will prove one of the best ornamental shrubs known.

Milk and Butter.—The Editor of the Massachusetts Ploughman says he has Devon cows and heifers that "will yield one pound of good butter, from four quarts of milk." He states that this result has been obtained "after repeated trials by himself and others, and that there can be no mistake or accidental luck in the matter."

Great Yield.—A correspondent at Roxbury Litchfield county, informs us that Dr. New Haven Palladium, that Dr. A. W. Fenn of that town, has raised this season from one kernel of corn, sixteen ears, the product of which was 4,200 kernels.

The Eloquence of the Human Hand.

We take the following from the Albany Country Gentleman:

Mr. B. F. Taylor, of New York, delivered a lecture before the Young Men's Association, taking for his subject the "Eloquence of the Human Hand." It was written in a sprightly, dashing style, and was rich in pretty fancies and illustrations of poetic beauty. We have only space to say a word about it. The leading thought was that it is not by tongue and pen alone that eloquence is uttered and written—that there are thoughts too vast for either, which find their expression in the works of the hand. He who gives actual practical life to thought is as much superior to him who merely records it, as he who wins a battle is superior to him who sings it. There are some who talk with the pen, and some who talk with the hammer. Is he who writes down thought on paper, or he who expresses it in wood, stone and iron, the greater author? The telegraph wire—that living nerve unwound from the human heart and throbbing with its beatings—speaking by a flash of fire of home and all it contains, is a noble line of a noble epic, uttered by the eloquence of the human hand. The eloquence of the human hand has created the Lightning Rod. Was it not a grander thought than is written in poems, when Franklin fixed bayonets against the clouds of Heaven, and held them there at bay?

Man resolves to wed the waters of Lake Erie to the Atlantic. There was no page broad enough to write that poetic thought upon, save the broad bosom of the Empire State; and he writes it there with a spade. Two iron chains are flung across it, binding them forever together, by the eloquence of the human hand.

Were the globe to be depopulated to-night, and were some angel to visit it in search of traces of man, he would look for them, and would find them in the conquered powers of nature—in the river obedient to the wheel and grinding at the mill—in the meadow standing patiently with her rich load of fruits—in the lightning darting from city to city, and prairie to prairie, carrying messages and news—in the marble quarry yielding up its hidden forms of beauty, needing but the breath of omnipotence to live and speak—life, only without its motion, and death without its decay.

What dignity is there not in the mechanic arts, viewed in this light? The tendency of such a view is to reduce all factitious distinctions. The man that carries out his thought is equal and superior to the man who only tells of his. The artisan who has emblazoned his deeds in the solid iron of ever multiplying engines, leaves behind him a coat of arms that is proof against forgetfulness. Yet young men neglect the opportunity it offers. They waste years in seeking fame in the battle, in the study, and in the forum, when it lies just before them, on waiting for them to make it their own, by the eloquence of their hands.

Mechanics neglect it when they content themselves with daily imitating the thoughts of other men, instead of boldly working out their own.

The lecturer spoke in glowing metaphors of the eloquence of the human hand, expressed in the picture of the artist which conquers time and places the object of our love beyond the touch of change—in the daguerreotype which intercepts a ray of sunlight and bids it fix forever the look of a countenance—in the lighthouse, that star below the clouds which keeps the mariner safe—in the telescope, that eye which is tearless and sleepless and looks through where the door of God's workchamber stands ajar and sees the process of making new worlds out of vapory nebulæ and clustering stars—in the steam engine, that thought which has done more than all books in the world, save one, to place man upon his proper intellectual pedestal—in the caloric engine, which is still more human as it breathes the air of human lungs—in the crystal palace, which is but the retina of a huge eye which surveys at a glance the industry of the world—in philosophy, which now works with trowel and apron—in geology, which is busy writing the autobiography of the earth.

Learning like this was not handed down from ancient temples. Eloquence like this was not uttered in Greece and Rome. Such eloquence is the birthright of a sturdier race! The Saxon is the race that speaks with the hand. It was a Saxon heart that stood on the shore where the pillars had been inscribed with *Ne plus ultra*, and that raised its hand and struck off the *Ne*. There was more beyond, and Saxon hearts set forth to try what it was made of. It was a Saxon that first leaped over the flinty threshold of Plymouth Rock. It was Saxon strokes that brought down the forest and chained the streams and furrowed the hillsides. On and on, restless went the Saxon till he made the wilderness vocal with Saxon [illegible] and Saxon [illegible]

The present naval force of [illegible] consists of 645 ships of war [illegible] Denmark, [illegible] comprising [illegible] 120 guns each. Also [illegible] Austria and Sardinia [illegible] of the smaller [illegible] Of this number 150 [illegible] Government [illegible] Government [illegible]

The Rose.

We would call particular attention to the article annexed, which we copy from "Parson's Work on the Rose." It is worthy a careful perusal, as the Rose will be found to thrive in California so luxuriantly that the blooms will seem almost too beautiful to be real:

ROSES THAT BLOOM DURING THE WHOLE SEASON.
REMONTANT ROSES.

The term remontant—signifying, literally, *to grow again*—we have chosen to designate this class of roses, there being no word in our own language equally expressive. They were formerly called Damask and Hybrid Perpetuals, but are distinguished from the true Perpetual or Everblooming Roses by their peculiarity of distinct and separate periods of bloom. They bloom with the other roses in early summer, then cease for a while, then make a fresh season of bloom, and thus through the summer and autumn, differing entirely from the Bourbon and Bengal Roses, which grow and bloom continually through the summer. In order, therefore, to avoid confusion, we have deemed it best to adopt the French term, Remontant.

These roses have generally been obtained by hybridization between the Hybrid China and Damask and the Bourbon and China Roses, uniting the luxuriant growth and hardy character of the two former with the everblooming qualities of the latter. They are generally large, double, very fragant, and bloom, many of them, freely throughout the season. They are also perfectly hardy, and grow well in any climate without protection. These qualities render them very desirable, and they are fast driving out of cultivation the Garden Roses, which bloom but once, and during the rest of the season cumber the ground. There are, it is true, among the latter some varieties like Madame Plantier, Chenedole, Persian Yellow, and others, that are not equaled by any varieties existing among the Remontants. Such, however, is the skill now exerted by rose growers, that this will not long be the case, and we may hope soon to have among the Remontants, roses of every shade of color, with the snow-like whiteness of Mad. Plantier, the golden richness of Persian Yellow, or the peculiar brilliancy of Chenedole.

These roses are difficult of propagation in any other way than budding, and two or three varieties only will readily take from the cuttings. When budded on strong stocks, however, they will nearly all make luxuriant shoots and show an abundant bloom. The following varieties are among the most esteemed for various excellent qualities.

Baronne Prevost is one of the very best of this class, blooming freely in autumn, and producing very fragant flowers, of a bright rose color. It is also of luxuriant growth, and large, rich foliage.

Comte de Paris is one of the best, growing and blooming freely throughout the summer. It is double and globular, and possesses a very agreeable tea scent. Its color is light crimson, with a shade of lilac.

La Reine is the largest Remontant rose known. It is beautifully cupped, almost globular, very double, and very fragant. Its color is a brilliant rose, slightly tinged with lilac, and as bloomed in our grounds, is not at all inferior to the frontispiece. Its foliage and habit are very good, and it may fairly rank as one of the most magnificent roses. It owes its origin to Laffay, and made its appearance in 1843.

Madame Laffay is unsurpassed in beauty of form and brilliancy of color. Its beautifully cupped form is almost perfect, although of medium size. Its fine, large foliage, and its very fragrant flowers of a glowing, rosy crimson, place it at the very head of this class. It blooms freely throughout the summer and autumn, and its form and color render it, like Chenedole, striking among a thousand flowers.

William Jessie is one of the very largest roses in this class, scarcely second in size to La Reine. Its flowers open freely, but require good culture to be produced abundantly in the autumn. Its form is cupped, and its color crimson, with a tinge of lilac.

The directions for the culture of Remontant roses are very much the same as for roses in general. In order to insure a perfect autumnal bloom, it is well to shorten a large number of the flower-bearing shoots, as soon as the flower buds appear early in summer; for there is then a great abundance of summer roses, and these are not needed. The plant will then furnish a fine bloom the latter part of summer, and through the autumn. The faded blooms should also be removed from the plant, as, if left to form seed-vessels, much of the sap is diverted from the support of the young shoots. For forcing, the Remontant Roses are very beauiful. From their luxuriant growth they form very fine tree roses.

The remontant is a valuable class of roses, and will doubtless soon furnish so great a variation in form and color as to drive out of cultivation the old summer varieties.

New Paper—Sacramento Democrat.—This paper came to us last evening. It is a very neat paper, and its selections are interesting and various. The character of the paper is political, of course.

Express Favors.—We are under continued favors from Messrs. Adams & Co., and Messrs. Wells, Fargo & Co., for delivery of packages, letters, &c.; and for valuable files of up river papers. Such favors we trust we shall always appreciate.

The Horse.

We have heretofore introduced this subject, and we feel it of importance that our extensive horse owners, who are largely interested in stock of all kinds, should give particular attention to the breed of horses they are now introducing. We fear there is not that attention given that its importance demands. We know there are immense numbers of this noble animal upon our broad prairies, running wild, possessing valuable points. These should be noted and improved upon by crossing with improved breeds.

Our stock raisers should aim to advance in all classes of animals, and none more deserving of their highest consideration than the noble animal to which we call attention.

California now possesses some of the finest specimens we have ever seen both for beauty, size, strength, and fleetness, and we hope attention will soon be awakened sufficiently to this subject to call together those interested in the raising of stock, so that we may announce for the coming year an exhibition of the stock of California that shall command the attention of the whole State.

The horse was not known on any part of the American Continent until introduced by Europeans.

The principal breeds and varieties which now prevail in the United States are the common horse, descended from the horses originally introduced by the English colonists, and mixed, more or less, with varieties of later introduction: the thorough-bred or Race-horse; the Arabian; the Canadian; the Norman; the Morgan; the Cleveland Bay; the Dray; and the American Trotting horse.

Speaking of the race-horse, Mr. Youatt says: There is much dispute with regard to the origin of the thorough-bred horse. By some he is traced through sire and dam to Eastern parentage; others believe him to be the native horse, improved and perfected by judicious crossing with the Barb, the Turk, or the Arabian. The Stud Book, which is an authority acknowledged by every English breeder, traces all the old racers to some Eastern origin; or it traces them until the pedigree is lost in the uncertainty of an early period of breeding. If the pedigree of a racer of the present day be required, it is traced back to a certain extent, and ends with a well known racer; or, if an earlier derivation be required, that ends with an Eastern horse, or in obscurity.

It must, on the whole, be allowed, that the present English thorough-bred horse is of foreign extraction, improved and perfected by the influence of the climate, and by diligent cultivation. Of course, there are some exceptions, as in the case of Sampson and Bay-Malton, in each of whom, although the best horses of their day, there was a cross of vulgar blood; but they are only exceptions to the general rule. In our best racing stables, and particularly in the studs of the Earls of Grosvenor and Egremont, this is an acknowledged principle; and it is not, when properly considered a principle at all derogatory to the credit of the country. The British skill, made the thorough-bred horse what he is.

The beautiful tales of Eastern countries, and somewhat remoter days, may lead us to imagine that the Arabian horse possesses marvellous powers; but it cannot admit of a doubt, that the English trained horse is more beautiful, and far swifter and stouter than the justly-famed coursers of the desert. In the burning plains of the East, and the frozen climate of Russia, he has invariably beaten every antagonist on his native ground. A few years ago Recruit, an English horse of moderate reputation, easily beat Pyramus, the best Arabian, on the Bengal side of India.

It must not be objected, that the number of Eastern horses imported is far too small to produce so numerous a progeny. It will be recollected that the thousands of wild horses on the plains of South America descended from only two stallions and four mares which the early Spanish adventurers left there.

Whatever may be the truth as to the origin of the race-horse, the strictest attention has for the last three years been paid to pedigree. In the descent of almost every modern racer, not the slightest flaw can be discovered; or when, with the splendid exceptions of Sampson and Bay-Malton, one drop of common blood has mingled with the pure stream, it has been immediately detected in the inferiority of form, and deficiency of bottom, and it has required two or three generations to wipe away the stain, and get rid of its consequences.

The racer is generally distinguished by his beautiful Arabian head, his fine and finely-set-on neck, his oblique, lengthened shoulders, well-bent hinder legs; his ample, muscular quarters; his flat legs, rather short from the knee downward, although although not always so deep as they should be; and his long and elastic pastern. Those are separately considered where the structure of the horse is treated of.

The racer, however, with the most beautiful form, is occasionally a sorry animal. There is sometimes a want of energy in an apparently faultless shape, for which there is no accounting. But there are two points among those just enumerated, which will rarely or never deceive—a well-placed shoulder and a well-bent hinder leg.

Sub Soil.

The elements of the subsoil are sometimes of the same nature as those that compose the surface; but they have not the same properties, for they are deprived of contact with the air, and are rarely found mixed with mould. In other cases, the mineralogical elements of the subsoil are of a nature entirely different from those on the surface.

We may in general distinguish three species of subsoil: the clayey, the sandy or gravelly, and the calcareous. Depending upon the nature of the soil, each of these subsoils, as we shall see, endows it with properties more or less favorable.

A clayey subsoil, beneath a clay soil, is injurious, as it retains too much moisture in wet weather, and becomes too hard in seasons of drought. This evil is somewhat corrected by deep plowing, which loosens the soil, rendering it more permeable, and capable of retaining a greater quantity of water, without being injurious to vegetation.

If a sandy soil covers a clay subsoil, it is much less exposed to the evil effects of drought, on account of the moisture retained beneath it; and by deep plowing the clay may be mixed with and thus improve it.

These mixtures of the subsoil and soil are not the only means that the farmer possesses of preserving in the land the moisture necessary to the vegetation of plants. Frequent stirring gives also to land the property of retaining moisture, and this is the case in stiff, and in sandy soil. The cause of this has not yet been well explained, but it is so: and it is in contradiction to an opinion entertained by many, that frequent working in times of drought is injurious to the crop.

As a clay subsoil is suitable to sandy land, just so is a sandy subsoil favorable to a surface containing much clay. It permits the infiltratiyn of the superabundant moisture, and may ameliorate the soil if mixed with it.

But a sandy soil, based upon a subsoil of the same nature, being entirely too permeable to moisture, must suffer much from drought, and yield but indifferent crops. There is, too, great waste of manures, as their liquid parts sink too deep.

When the soil is devoid of carbonate of lime, and the subsoil is calcareous, a mixture of the two by deep plowing is evidently beneficial. Stiff soils particularly profit by this mixture; for at the same time they will lose a portion of their tenacity, become more favorable to vegetation, and rendered easier to work. But the carbonate of lime in the subsoil must be in an earthy state, and not in the form of stones, a few only of which, the schistous, can, as we have seen, become friable on the surface.

From what precedes, we perceive that there are many cases in which deep plowing can improve the soil, and increase its products. It is true that, in certain cases, these workings appear in the first years to injure rather than benefit the soil. This is the case when the subsoil contains principles, such as the oxyde of iron, that may be fatal to vegetation. But generally in a few years these injurious properties disappear, after the elements brought to the surface have been acted upon by atmospheric influences and mixed with humus.

The farmer sometimes contents himself (and perhaps it is the best plan) with merely stirring the subsoil, without bringing it to the surface. It is then acted upon by the atmosphere, and gradually mixed with fertilizing influences. This operation is performed by a plow made for the purpose, called a subsoil plow, which follows the furrow immediately behind the ordinary plow.

Fragrant flowers are like open Bibles, scattering thousands of texts along our pathway.

Commercial and Financial.

What shall we say of business, what can we say? The stagnation of trade has been severely felt, and has caused severe disappointment and heavy losses, and yet business men bear it with good grace and true courage; and acting as they now do with caution, decreasing instead of increasing their liabilities, and using the strictest economy, we may hope to pass the dark trial ere long and emerge into a brighter state of things—for a better time will surely come.

Let business men, while using caution and care in their business operations, use also that generous forbearance that is so much needed in times that try every man.

The trade up river is very moderate indeed, not full freight for one boat on the Sacramento river.

If business men would forbear croaking and resolve that good times were coming, good times *would* come. The papers all *guess* at the cause of the present embarassments in trade, but very rarely has the true cause been pointed at or thought of. If we may venture *our* humble opinion, we would gently say, there are *too few producers*—the wealth of the country is swept away by too heavy imports, vastly beyond the wants of the population yet in California.

The mercantile interest preponderate, and the largest portion of any profit made in this branch, is speedily consumed in the "enormous rents" and other expenses that are enough to crush business men.

Business men, servants of all kinds, are working for their landlords and their labor goes to them instead of their own families. The enormous incomes received by real estate owners, swell their coffers and tempt them to build still more, and thus the capital which should be given to other operations, to manufactures, to agriculture, and to the means of producing what is good for the country, is absorbed in cities, and the wealth that should be distributed becomes concentrated—the rich become richer, the poor become poorer, and the mass suffer—business becomes deranged—men become discouraged, and the country retrogades.

This will ever be the case when a country pays out its wealth for that which she should and could produce, as well as California could and should have done.

Let the citizens of California look well to these facts and remedy the evil before it is too late.

Catalogue of Fruit and Fruit Trees.

WE call the attention of Nurserymen and Orchardists to a new catalogue just issued by us, prepared with great labor and cost, giving the lists of the best fruits cultivated in Europe or America, with their synonyms. This catalogue embraces also lists of best Vegetables, Ornamental Trees, Flowering Plants, Seeds, &c.—being a perfect illustration of the best varieties of everything belonging to AGRICULTURE, HORTICULTURE, and FLORICULTURE, with brief directions for the cultivators in each department, and as *adapted to California.*

This work will be found a very great help to all engaged in cultivation.

Price $1 per copy. WARREN & SON,

THE VINE AND THE OAK.

Around an oak, a brave old tree,
A graceful vine had twined;
Its foliage sang sweet melody,
And rustled in the wind;
The oak had loved the tender vine—
Had watched it as it grew—
Had raised it in the bright sunshine
His sturdy branches through.

And now, when angry thunders broke
In madness o'er the wood,
And rudely struck the brave old oak,
It showed its gratitude:
His shattered boughs it kindly bound—
Upheld them tenderly:
Around its riven trunk it wound,
Preserving the old tree.

Thus woman, when the angry wind
Of rude misfortune blows,
Is ever gentle, good and kind—
A soother of our woes—
Dispels our sorrows, soothes our pain,
And bids our griefs depart—
Calls back light, life, and joy again
Into the broken heart.

THE DEPARTED.

There is a time—a dreary time—
When life's illusions fade away,
Like music's faint receding chime,
Or like the sun's last parting ray.

Ah, then how shrinks the lonely heart!
When all its cherished flowers have died;
And Hope, the latest to depart,
Has e'en her farewell requiem sighed.

What now remains our path to cheer,
That path which leads but to the tomb?
'Tis the blest thought it brings us near
The loved, the blest—to share their doom.

A LEAF.

As through a little glass we see a wide expanse of air,
And earth and sky, and field and tree, spread out in beauty there,
So, in the smallest thing of earth, a leaf, a bud, a flower,
We may perceive the wondrous truth of an Almighty Power.

A wondrous field is shown us there, whose end we cannot see
So far above all thoughts of men is its infinity;
A field where nothing rank can grow—a field forever green;
We scarce can catch a glimpse below—above 'twill all be seen.

In Nature there are no degrees of beauty—all are one;
Each leaf is formed as wondrously as any star or sun;
Then scorn not e'en a little leaf, on this sepulchral sod—
Read, mark, and learn, and court belief—'twill lead thy thoughts to God.

"I Can't."

Apollo! what a face! Doleful as a hearse; folded hands; hollow chest; whining voice; the very picture of cowardly irresolution. Spring to your feet, hold up your head, draw that fine form of yours up to the height that God made it; draw a long breath, and look about you. What do you see? Why, all creation taking care of number one; pushing ahead like the car of Juggernaut, over live victims. There it is, and you can't help it. Are you going to lie down and be crushed?

By all that is manly, no!—dash ahead! You have as good a right to mount the triumphal car as your neighbor. Snap your fingers at croakers. If you can't get round a stump, leap over it, high and dry. Have nerves of steel, a will of iron. Never mind sideaches, or heartaches, or headaches—dig away without stopping to breathe, or notice envy or malice. Set your target in the clouds, and aim at it. If your arrow falls short of the mark, what of that? Pick it up and go at it again. If you should never reach it, you will shoot higher than if you only aimed at a bush. Don't whine, if your friends fall off. At the first stroke of good luck, by Mammon, they will come round you like a hive of bees, till you are disgusted with human nature.

"I can't!" Oh, pshaw! I throw my glove in your face, if I am a woman! You are a disgrace to cord uroys. What! a man lack courage? A man want independence? A man be discouraged at obstacles? A man afraid to face anything on earth, save his Maker? Why, I have the most unmitigated contempt for you, you little pusillanimous pussy-cat. There is nothing manly about you, except your whiskers.—*Fanny Fern.*

The Emperor Alexander.

In the recent historical and political work of Monsieur Leowzon le Due, late Charge de Mission to Russia, he relates the following anecdote:

"During the reign of tha Emperor Alexander, the daughter of a noble family in a remote province fell in love with one of her father's male domesties, and had the misfortune to become a mother. Fearing that her shame might be disclosed, she consented that the partner of her guilt should destroy the child; and both her parents dying a few months afterwards, she was left an orphan. Then her former paramour began to persecute her unceasingly, and extorted large sums of money from her by threatening to reveal her crime. The girl yielded to his menaces for a considerable period, but, becoming weary of bis pertinacity, she contrived to set fire to some premises where the man was sleeping, and, all means of egress having been previously removed, he perished miserably in the flames. But, notwithstanding her freedom from any damning evidence her bosom was now so torn by agonizing remorse for the double crime she had committed, that one day, unable to bear her mental torments any longer, she hastened to the village church and confessed her sins to the priest, who of course communicated the astounding tale to bis wife, under the promise of inviolable secrecy. Not long afterwards, the young lady was present at a ball given by a personage of the very highest distinction, where she eclipsed all her rivals by her beauty and the splendor of her attire, when, whilst she was the cynosure of all others' eyes, the observed of all observers, the priest's wife approached her unsuspecting victim, and openly recounted the horrifying story the yonug lady had repeated to the priest. The ball-room was in an uproar, the young lady was arrested immediately, and ultimately tried and condemned; but, being of noble birth, the judges thought it necessary to refer the sentence to the Emperor for his approbation previous to its being carried into execution. The result of the appeal was totally unlooked for; the Emperor was so indignant at the priest's treachery, that he degraded him from his ministerial office, and sent him to the army to serve as a common soldier for life; and he was so touched with the girl's sincere repentance, .hat he merely sentenced her to do penance in a convent for two months."

An Interesting Husband.

If you could see my husband, Solomon Stillweather! It is my firm conviction he will be the death of me! I am naturally a happy, bright, energetic, warm-hearted, chain-lightning, impulsive woman—born after stages were exploded, and in the days of railroads and steam engines. I have the most capacious heart that ever thumped against a silken boddice: can hate like Lucifer, and love in proportion, and be eternally grateful to one who is kind to me. Now, S-o-l-o-m-o-n is a perpetual calm. Nothing ruffles him; nothing disturbs bim. Mount Vesuvius couldn't make him hurry. He does everything—mercantile and matrimonial—by rule, square and compass. As the proper time arrives, it 'comes off,' and not a fraction of a second sooner. Were the house on fire, he would stop to take the lint off his coat, and brush his teeth, before starting. If I ask him a question at breakfast, I never get an answer before tea. He walks around the house with a noiseless, velvety tread, like a superannuated pussy-cat. Should the children in their play knock over the tea-table and its contents, he looks quietly up from his book and drawls out,—'A-i-n-'t y-o-u r-a-t-h-e-r r-u-d-e, c-h-i-l-d-r-e-n?'

One summer evening, in the country, as he sat on the grass smoking a cigar, it occurred to me whether anything short of an earthquake would start him up; so I placed a string of crackers directly behind him, and touched 'em off, and, as sure as I'm a living woman, he never so much as winked.

You should see him getting ready for church on Sunday, as he pares and polishes his finger-nails—lays every hair on his head over its appropriate bump, sprinkles a drop of cologne on the northwest corner of his pocket-handkerchief, and ties the bow of that cravat for the fortieth time. I never saw Solomon excited. I never heard him laugh, and he don't know the luxury of tears. Now, if I could only get up a domestic squabble—thunder-clouds clear the atmosphere, you know—but it's no use. I've tried to stir him up on politics; but he's on the fence—had as lief jump one way as another, too. I've put on the sulks, and been distant and dignified; I tell you he likes it—besides, you couldn't freeze him colder than he is. I've been loving, and petted him—it's a waste of ammunition—he can't be thawed out!

It's my solemn belief he was originally intended for an old maid, but, by some horrid mistake—he's my husband. I can double Cape Horn while he is saying, 'My dear.' O—O! when the coroner's jury sits on me, won't the verdict be, 'Died of excess of Stillweather?'

Evil Company.—Sophronius, a wise teacher, would not suffer even his grown up sons and daughters to associate with those whose conduct was not pure and upright.

"Dear father," said the gentle Eulalia to him one day, when he forbade her, in company with her brother, to visit the volatile Lucinda, "dear father, you must think us very childish if you imagine we should be exposed to danger by it."

The father took in silence a dead coal from the hearth, and reached it to his daughter. "It will not burn you, my child, take it."

Eulalia did so, and behold, her delicate white hand was soiled and blackened, and, as it chanced, her white dress also.

"We cannot be too careful in handling coals," said Eulalia in vexation.

"Yes, truly," said her father; you see, my child, that coals, even if they do not burn, will blacken. So it is with the company of the vicious."

Woman hen Master.—A large number of husbands are proverbially improvident—they waste enormous sums on their personal indulgences and unnecessary expenditures; they also neglect to supervise the economy of their establishment, and thus get involved in embarrassments which invariably lead them to the Insolvent Court. Some husbands drink to excess, others are idle and indifferent, and some unmitigated vagabonds. All of them embitter the existence of their families and ruin the tempers of their wives; but when the latter practice the same or equivalent vices, the havoc is hideous. An extravagant wife is worse than a pestilence. She eats a man right up with as little remorse as she would devour an omelet. She is one of the domestic plagues sent to punish the whole fraternity of husbands. But as she also punishes herself and ruins her family, she must be treated just as the medical profession say tho cholera must be met; strong sanatory measures must be brought into requisition to neutralize her recklessness; her lavishness must be refused by the strong arm of conjugal authority.

JAMES E. WAINWRIGHT. ALBERT G. RANDALL
JAMES E. WAINWRIGHT, Auctioneer.

WAINWRIGHT, RANDALL & CO.,
REAL ESTATE AND STOCK AUCTIONEERS,
Office and Salesroom, 100 Merchant Street, between Montgomery and Kearny.

Messrs. Wainwright, Randall & Co. respectfully announce to their friends and the public generally that they have made this business connection, and re-e-tablished themselves, for the purpose of transacting the Real Estate business in all its branches, for the successful management of which they deem themselves well qualified, having had upwards of four years experience in this city.

They will give especial attention to making public sales of all kinds of property for Administrators, Assignees, Receivers, Mortgagees, and others, according to law.

Particular attention paid to preparing "Rancho" property for sale, and every facility will be afforded to the holders of such property for the transaction of their business. Mr. Randal, being conversant with the Spanish language (having resided several years in South America,) will give his personal attention to the translation of title papers, when required.

A practical Surveyor and Draughtsman will be in constant attendance at the office.

A large amount of property at private sale.

Conveyancing, under the supervision of A. G. RANDALL, Notary Public, under, the law of 1853—and Commissioner for the State of New Hampshire. 5 4t

THEODORE PAYNE. SQUIRE P. DEWEY.

PROCLAMATION EXTRAORDINARY.

Woman's Rights
VINDICATED AND MAINTAINED.

WHEREAS, from the creation of the world, it was designed by the "Great First Cause" that
Woman's Rights and Privileges
should be co-equal to Man's; and whereas, she has been treated by many men in all ages, up to the present time, as an inferior being to themselves: Now, therefore, be it known that I, M. L. WINN, of
Winn's Fountain Head and Branch
having expended large sums of money at the FOUNTAIN HEAD for the gratification of the appetites of Gentlemen, do recommend that Woman be hereafter allowed and provided with the facilities to enjoy all the privileges for which she was by Providence designed; and for this purpose I do hereby proclaim, that my
BRANCH,
Corner Montgomery and Washington streets,
shall be conducted with a view exclusively to the Enjoyment and Comfort of Ladies, and such Gentlemen as know and appreciate their worth.

At the earnest solicitation of many Ladies and Gentlemen and agreeable to my promise some months since to enlarge the BRANCH, so as to accommodate the fast increasing patronage I shall, in a few days, add Two Spacious Stores on Montgomery street, to the Original Branch, making the
MOST EXTENSIVE ICE CREAM
And Refreshment Establishments in California.

The day of opening will be duly announced through the medium of the Daily Press, so that all may witness what has been accomplished for the accommodation and comfort of "God's last best gift to man." In the meantime, lots of Fun and Publication may be enjoyed in reading the mottoes and feasting upon the luxuries to be enjoyed at
WINN'S FOUNTAIN HEAD,
78 and 80 Long Wharf, and Branch, corner Washington and Montgomery streets;
where Every Thing for the Holidays may be found, from a Sugar Whistle to a Bride's Cake of full size.
1 M. L. WINN, Proprietor

PEORIA PREMIUM STEEL PLOWS.

THE FORMER CELEBRITY OF THE PEORIA PREMIUM STEEL PLOWS, and the unequalled success of their introduction in this State, would seem to preclude the necessity of any further effort on our part to draw attention thereto; but in view of the transitory nature of business in general in California, and the probability that some may have looked upon our establishment of an extensive and permanent manufacture of Plows here, in the face of such enormous importations and extravagant prices of material, as an impossibility—we believe it expedient to adopt this method of bringing it within the special notice of all concerned, that we are now manufacturing, and will have ready for this season's demand, three thousand of the most superior Plows ever made or used within this State.

We feel warranted in making this assertion, from the fact that all who used our Plows last season readily cast they were superior; and we have studied to change the form of the wants of our patrons from every section of the State, that we can now furnish Plows suitable to any particular soil of soil known in the State.

Our material has all been selected in the East by one of our firm, and imported by us directly from the manufacturers, which place it in our power to say confidently that nothing is lacking in quality, while we are enabled to make the plows at a cost greatly below that of last season, and are determined to sell at prices within the reach of every farmer who may wish to use the Peoria Premium Steel Plow.

It should be remembered that these plows will do double the work with half the team required in using the ordinary cast Plow; and that the work, when done, will be well done.

For particulars of prices, and descriptions of plows, we refer you to the subjoined card. The prices therein detailed are those established at our factory, and the only alterations from them that we authorize our agents to make, is the addition of the cost of transportation to their places of business—thus placing the plows at every accessible point of the State for the exact price charged at the Factory, with the necessary expenses only added.

Farmers ordering our plows through mercantile houses here, would do well to write to us at the same time, if they would make sure of getting the right plow, for some are interested in representing that we are not making plows at all, while others will not sell our plows when they can get off a cast plow. We therefore recommend that orders should be sent to us directly, accompanied by an order upon your merchant for the amount, which you can always know by a reference to the card accompanying this circular.

On the 24th of June the interest of T. Adams in our business ceased, by the sale of his entire interest therein to L. E. Morgan. Aside from this, there has not, nor will there be, any alteration, as we have the same efficient and thoroughly practised hands in every department of our business.

E. L. MORGAN & CO., Successors to
T. ADAMS & CO.,
Corner of Broadway and Battery streets.

☞ The following are the established prices for the **Peoria Premium Steel Plows**, at our Factory, and the only addition our Agents are authorized to make thereto, is the cost of transportation to their points of business:

SIZE.	DESCRIPTION.	FURROW.	PRICE.

Eugene and Leonce.

TRANSLATED FROM THE FRENCH.

Madame de Palmene, left a widow while still young devoted herself to the education of her only daughter, the object of all her tenderness and all her care. At her husband's death his estate was found to be burdened with heavy debts; and in order to liquidate them, Madame de Palmene determined to give up her residence in Paris and to retire to her chateau in Touraine, a few miles from the town of Loches. The castle was old, and of great extent. The drawbridge, the moat, and the towers recalled the memorable days of chivalry—days whose departure we would doubtless regret, if the valor and loyalty of the gallant chevaliers could only have supplied the place of laws and the police. The interior of the building corresponded with the outside. On every side were traces of the noble simplicity of earlier times; there was neither gilding nor marble, nor the ridiculous profusion of porcelain vases and little toys which crowd our modern houses; but the walls were covered with beautiful tapestry, representing interesting passages in history. There were long galleries ornamented with fine paintings, and from the windows of the grand saloon, on one side, could be seen a superb forest, and on the other, the smiling banks of the Livre, a branch of the Loire.

It was in this lovely spot that Eugenie, the daughter of Madam de Palmene, passed the opening years of her youth.—it was here that she acquired a taste for rural pleasures and a peaceful retired life. During the beautiful spring and summer days, she took long walks with her mother, and when wearied with the heat of the day would seek in the forest a refreshing shade. Eugenie would gather, in every direction, the wild flowers which grew in profusion around them, and her mother, while she rested, would explain to her their names and properties. Often into this pleasant retreat she would bring her lessons, or would listen while her mother read some interesting book; and, as the day declined, they would leave the shade of the forest to wander along the banks of the river. As Eugenie grew older her occupations became more sedentary and necessarily detained her more within doors; but she rose with the day, often breakfasted in the park, and still found an opportunity in the evening to walk one or two miles with her mother. She had for a companion a young girl named Louise, the daughter of her governess. Louise was industrious, warm hearted and intelligent; only a year or two older than Eugenie, she was always present when she received her lessons, and profited so much by them, that her young mistress justly regarded her rather as a friend than as dependant.

By the time that Eugenie reached her seventeenth year her character was as formed as her mind was strong. She united to the grace and gentleness of her race, a cultivated mind, an ardent heart, and an unalterable sweetness of temper. Her tenderness and gratitude to her mother [illegible] Every moment of her life was [illegible] with her mother, and seeking upon every occasion to render her [illegible] there was no employment [illegible] time. Does her heart [illegible] Madame will hear no reproof [illegible] pleasure, and be cured by [illegible] mercy.' Did she study [illegible] What will be Madame's astonishment [illegible] the most perfect [illegible] ! In writing [illegible] ; every [illegible]

Madame de Palmene renewed an acquaintance with many persons whom she had been familiar with in former times. Among these, she distinguished with pleasure an old and valued friend of her husband, a Count d'Amilly, a gentleman deserving of her regard by his virtues and abilities. His wife had died some years before, and he had a son of about nineteen years of age, then absent in Italy.

Count d'Amilly came every evening to sup at the house of Madame de Palmene. Punctually at ten o'clock Eugenie retired to rest, and as soon as she had left the room the Count broke forth into a eulogium upon her attractions. He admired her talents, her beauty, and the air of mingled frankness and grace that imparted an inexpressible charm to every action. At other times he spoke of his son, and praised his mind, his character, and his generous disposition. Madame de Palmene would listen delightedly to the encomiums upon her daughter, and heard with an emotion of interest the frequent mention of Leonce, the Count de Amilly's son, and in these conversations time slipped by unheeded, until they would exclaim in astonishment, "Can it be three o'clock?" The Count continued for several months his assiduities, and one day he said to Madame:

"My son will inherit from me a considerable fortune, but before giving it to him, I wish to ensure his enjoying it properly. When he returns I must endeavor to find for him a wife, whose grace, goodness and beautiful example will induce him to cherish virtue, and whose companionship may make all his duties agreeable."

Madame de Palmene recognised in this description the portrait of her daughter, but after reflecting upon the extreme disproportion between her fortune and that of the Count, she could scarcely persuade herself that he really entertained such intentions in favor of Eugenie.

Two years had elapsed since Madame de Palmene's residence in Paris, and Eugenie had reached her eighteenth year, when one evening the Count entering their house, asked permission to present to them his son, who had just arrived. At the same moment appeared an interesting looking young man, who advanced toward Madame with an air at once eager and timid, adding a grace to his natural attractions. The Count and his son remained to supper. Leonce spoke little, but every thing he said evinced a desire to please, and Madame de Palmene observed that his eye constantly rested on Eugenie. The next day the Count returned with his son.

"My dear friend," said Madame de Palmene, "I must remind you that I have made an irrevocable decree against admitting young men of the age of your son."

"But, Madame," replied the Count it is in the highest degree important that you should find out whether he is agreeable to you."

"Why so?"

"Ah, Madame do you not see that his happiness and mine depend upon your approbation? Only give yourself an opportunity of knowing him and if he has the good fortune to please you all my desires will be fulfilled."

This was indeed speaking intelligibly; Madame de Palmene expressed to the Count her grateful sense of the compliment to her daughter, but she would not make hurry any person. She would let Count Eugene's feelings and make some inquiries about the character of Leonce.

The result of her inquiries was entirely to confirm her in the favor with she already regarded the young man for her daughter, and [illegible] person, [illegible] and [illegible] Already nearly two months had elapsed, since Madame de Palmene's departure, and during this time Eugenie had not once visited Paris. She had nothing to desire but the return of her mother; she was all in all to her husband, and each day he became more dear to her. Often, as they walked together in the woods and fields, Eugenie would question Leonce about his travels, and would receive both pleasure and instruction from his replies. At other times, seated together upon the banks of some woodland stream, Eugenie would sing some simple ballad, accompanying her voice with a guitar. Her sweet melodious voice drew around her shepherds and reapers, from the plains and harvest fields around, who forgot their labors and their fatigue in listening to her singing.

One evening Eugenie remarked, among her auditors an old man of apparently more than seventy years, whom she had never before seen; attracted by his venerable aspect and flowing silvery hair, she inquired his name. He was an old peasant, she was told, named Jerome, remarkable in the village for his devotion to a poor paralytic sister, who was dependent upon him, and to five little orphan grandchildren, whom he maintained by the labor of his own hands.

Eugenie had little command of money. Her father-in-law was wealthy and liberal, but, wishing to give to his children habits of order and economy, he had the wisdom and courage to forbear from yet sharing his fortune with them. "When you have proved to me," said he to his son, "that you know how to make a good use of money, we will have a common purse. In five years, for instance if I am satisfied with your conduct, I will joyfully deprive myself in favor of a son, reasonable and economical; but I can never give a dissipated and extravagant spendthrift a fortune made by my prudence, and of which I have a right to dispose at my pleasure."

"Ah, my father, in giving me Eugenie, have you not already given me everything?"

[TO BE CONCLUDED.]

The Mountain Express.

Who is that man descending the hill towards the bar, on that jaded mule? He does not look exactly like a miner, yet his soiled clothes, broad brimmed hat, and a beard of two years' growth, make him look as if he was neither a greenhorn nor a trader. Look at him. His blankets are spread across his saddle and under them are a large pair of saddle-bags, which are puffed out too much to contain bags of gold, while the self-possession with which he urges his weary mule over the broken rocks across the precipitous hill-side proves him to be familiar with the dangers of mountain paths. Why that is the Expressman on his return from San Francisco, Sonora and Marysville with letters and newspapers for the miners. At nearly every house where there is a miner a letter awaits him, sent by some expressman, whom the miners who have to wade their letters from the post office in the valley, encounter them on their several journeys, generally once a month. The expenses of carrying the Express, with many private individuals to get from the miners all letters and papers directed to their addresses and bring them to the miners at their diggings. For this he receives a compensation of from one to two dollars on all letters brought to any post office, and generally a dollar for each newspaper.

There is scarcely a spot in the mines but what is visited by the Express, with letters from home, and the sight of the Express mule, after days of loneliness and despair, has caused the strongest man to burst into tears. Many a poor miner, after months of labor and economy, has had his hopes of a return to his home and friends blasted by the non-arrival of the Express, and has been compelled to remain another year, or perhaps for ever, from a family anxiously awaiting his return. Many a wife, watching, perhaps, with a sick child, has been disappointed, and has had to bear her sorrows alone, because the Express has not arrived.

[illegible]

[illegible] for you," and with a "—— the [illegible] heavy heart, they go sullenly back to work, [illegible] disappointment for social intercourse [illegible] the rest of the day.

Say; just look at that rough looking [illegible] out one side, leaning against a tree, with [illegible] towards us. Let us get around where we can [illegible] his face. Why! he has got a letter, and the tears are streaming down his rough cheek, till they wet his long beard. Are they tears of joy or sorrow? See how his bosom heaves as he presses the back of his hard hand hastily across his eyes. Is it from painful emotions? "Ah, Jem, you've got a letter—have you good news? Are all well?" "Yes, yes, good news—all well, thank God;" and he is too full to say more. Let us respect his feelings, and leave him to read alone, and give his long pent up emotions full scope. Home and friends are before him; all the rest of the world is a blank.

Home and friends! Have you ever been for months isolated from the world in the wild solitudes of the mountains? And have you left behind a wife and children, dearer to you than life itself; a father and mother, brother and sister; or is there a bright-eyed darling, whose affections are all your own, and who offers daily and nightly prayers for your success, your welfare, and your speedy return? Oh, how your heart yearns towards them, how your very soul strives to burst its fetters to embrace them, how the tears start in your eye, as they do in mine at this very moment, as they are thus presented to your mind, with the sad thought that months of toil of doubtful success, of danger, perhaps, and dreary isolation, must pass, even if life is spared before you can clasp them to your bosom. And when you have opened the floodgate of [illegible] and poured out the full tide of love in glowing words upon a letter-sheet, with a heart lit and [illegible] peated "God bless you," depicting your [illegible] fortune, your hopes and prospects, [illegible] look upon the [illegible] nience, but as a benefactor? Ah, you do next to your own [illegible] you [illegible] have been there—I know it well [illegible] the missile of love, and look upon the well-known hand and read and [illegible] again, oh, I have felt—(hold up [illegible] you've got me to crying, and I haven't [illegible] ghost of a pocket-handkerchief.)

But the Express does not always carry grateful tidings. As in the case of [illegible] which proved the truth of that [illegible] Shakspeare, or Milton or [illegible] you put your finger on a [illegible] long since to Californ[illegible] don very [illegible] peated "God bless you," depicting [illegible] and [illegible]

THE CALIFORNIA FARMER.

SAN FRANCISCO, THURSDAY, MARCH 23, 1854

Agricultural Meetings.

We find in our eastern exchanges, the reports of the Agricultural meetings held in the State House, Boston, Mass., and the great interest manifested in them by the members of the Legislature during the present session. The third meeting of this seasou was held Jan. 31, Gov. Washburn presiding. We copy a portion of his address of that evening, upon taking the Chair.

"Gov. Washburn urged upon his hearers as a means of elevating the farmer, that they should act together and come together as a class—a scientific class, and as pursuing the most important calling of Society. Let there be an *esprit du corps*, and let it be known as a high and respectable profession, and farmers cannot help taking their true position in society.

Another manner of improvement will be in sustaining the County and State Societies, attending their meetings, and discussing there the matters of general interest to the profession. This will cause the farmer to feel his own powers, and increase his consideration in the community."

Gov. W. alluded to the cause for congratulations which the farmers of Massachusetts have when he compares his condition with that of the farmers of other sections of the country, where perhaps the soil may be richer, but where the blessings of churches, schools, and other beneficent institutions, do not cluster in such rich profusion as in Massachusetts.

It will be remembered that from the first number of the "Farmer" and particularly the series of articles upon the "Dignity of Agriculture," and the importance of agricultural meetings, we have but uttered the same tone that is now borne to us by this last mail, as the action of the farmers of Massachusetts, led on by the able and talented Governor of that good old Commonwealth.

We trust ere long to see our own Eureka State engaged in like manner, and her Senators and Representatives, and Governor, too, taking active part in this great fundamental interest of the Commonwealth.

Strawberries.

This most delicious, most healthy, and luxurious fruit is destined to become abundant in a very short time in California.

We are glad to notice the increased attention that is given to their cultivation and the very great success that has already been the result.

This fruit will be with us almost a perpetual fruit. There are many varieties that will bear a continuous crop if they are properly cared for. Among these the Alpine varieties, red and white, the Boston Pine, Hovey's, Keenes Seedling, and we presume many other varieties not yet fully tested by us.

We have grown some of these varieties, and have eaten the fruit from the same vines from June to November, and have seen abundant crops during several months in the year.

When heavy crops and continuous ones are wanted, the runners should be kept off, and the original plants should be nourished with liquid manure, and shielded in the dry season with fine old decomposed manure upon the entire surface of the ground around the plants. With this protection to the soil, the plants will not burn, but will increase in health and vigor, and the crop be abundant.

Congressional Favors.—We are under many obligations to Hon. Messrs. Gwinn and Latham, the able and watchful representatives of California interests, for valuable documents. Their prompt action in every matter touching the welfare of our State, gives us assurance that our interests are in safe hands.

Messrs. Langton & Co. have placed us under many obligations for up river papers. We have received from them Reports of the Survey of the "Sierra Mountain Water Company," and the Sierra Citizen. The Reports contain a mass of valuable data and very interesting information. The Citizen is a neatly published paper, with a goodly share of news and much that is quite interesting and valuable from the mountains.

Many Thanks—To Messrs. Wells, Fargo & Co. and Adams & Co., for up river papers constantly and for valuable exchanges from the States; also for parcels, letters, &c., prompt as the sun.

Errata.—In our notice of the work of Dr. A. S. Taylor, of Monterey, the name *Nardrette*, should read Navarette.

The Real Wealth of California.

But a brief period of time has transpired since the announcement of the wonderful discoveries of gold in California struck a chord in the hearts of our people, that vibrated as music's sweetest tones to the soul of those that live in melody. The nation became gold mad. Every age, sex and condition was more or less tainted with this love of gold—the commerce of our country quickly felt its influence and the ocean was soon whitened by the sails of hundreds of vessels, that would otherwise have become fire wood and traffic for the junk dealer. Next, the mercantile interest caught the infection, and the shelves of a thousand merchants were emptied of contents that had become household gods, almost from their long residence in the same place. Brushed and packed they soon were on the broad way to the land of gold. Brief was the time ere a change was seen in every city, village and hamlet in our wide spread nation. The far sighted, thinking, quick witted had already embarked their all and were gone. Next, the unreflecting, unsettled and wavering, catching the infection, were borne on, and hundreds of ships bore the thousands and tens of thousands—a mixed multitude—of all ages, tastes, feeling and means, and they hurried on. Then came those that for years had been battling against the current of adversity, and had been struggling on, "hoping against hope," they sprang to this golden era, as the field where energies and hopes

That had for years been crush'd,
Could spring to life anew.

and they, cutting asunder the tenderest ties of life, became exiles from home for those they loved dearer than their own life; and now, behold the living masses that crowd the decks of steamers and every ship and craft that dared the ocean's wave. 'Twas like the moving days of old when the children of Israel took up their line of march—cities and towns were almost depopulated, and still they come, and as they come the thirst is still for gold

Thus for three or more years the thousands that have rushed to this El Dorado, have believed they came of their own free will and accord; they little dreamed that in all this great and wonderful emigration from the populous cities and towns where ease and luxury were a common boon, that as they came, willing to forego all these sources of happiness, and endure all, and much more than the heart could conceive—that they were but the agents of an all-wise and ever-ruling Providence that was thus bringing them hither for a higher purpose and a more durable good to the nation than the mere acquisition that gold could bestow. God in his providences had touched the only spring in man's nature that could be touched to make him the instrument to prepare the way for peopling the land and cultivating it until it should bring forth "an hundred fold."

Agriculture at Washington.

We publish the notice of the U. S. Agricultural Society (already past,) for the purpose of showing the plans adopted and in progress, to advance its various departments. We like the plan proposed of holding national exhibitions in the different parts of our country, and hope the day is not far distant when California shall have her national exhibitions. We feel confident she will not disappoint delegates from any section of our country in their anticipations of her resources, let it be when it may.

The second annual meeting of the United States' Agricultural Society, will be held at Washington, D. C., on Wednesday, February 22d, 1854.

Among the objects of the Association are the following:

The acquisition and dissemination of the best experience in the Science of Agriculture;—

The union of the men who desire to advance to its legitimate rank, this most important of all human pursuits;—and

The increase and extension throughout our country of a more cordial spirit of intercourse between the friends of Agriculture, by whose countenance and co-operation this Society shall be elevated to a position of honor and usefulness worthy of its national character.

Business of importance will come before the meeting. A new election of officers is to be made, and in which every State and Territory is to be represented.

Applications will be laid before the Society for the holding of National Exhibitions in different parts of the Union.

Delegations are respectfully solicited from all the Agricultural Societies in the country, and the attendance of all Agriculturists, who may find it convenient to honor the occasion with their presence. Marshall P. Wilder, Pres't.

The State Board of Agriculture, in session at Indianapolis, have passed a resolution to hold the next State Fair, where the largest bonus is offered.

What a Garden should Be.

Few words awaken a greater variety of pleasing remembrances and ideas than *Garden*; and its utterance strikes a chord, that, swelling and vibrating, carries us back to the birth-place of man, and thence, lingering in the valleys of India, climbing the mountains of Europe, nestling among the glades and parks of England comes to us fraught with mysterious meaning, and manifests even here, in bare, bleak, rocky New England, how endeared are its associations and memories to the refined mind.

Is it wonderful that every mind should feel it a part of its own nature to love the garden, the birthplace of man, and his resort ever, for repose, pleasure and instruction? Would any philosophy be far wrong that, starting with the assumption that God manifestly interferes in the special actions of his children, should assert the first employment of man, and his natural and congenial one, was the gardener? Were it desirable to prove that division of labor constitutes the welfare of communities, that of Adam, which drove him from the Garden of Eden, would seem an intentional interference of God, to prevent all the dwellers on the earth being tillers of the soil. When driven thence, and forced to seek their support, some of his descendants, too lazy to cultivate the earth, would turn to less laborious occupations, and try to substitute the work of the wits for that of the hands.

It is worthy of notice, that amongst the more simple of the civilized nations, all refinement sought its expression in something connected with the garden. If we instance the Greeks, we cannot fail to remember that Plato and Aristotle taught in gardens, and that Pliny and Horace were devotees to its culture and beauty. Our Saviour passed his most trying hours on earth in a garden, and through all later time, men of leisure and refinement devote their first wealth and opportunity to developing some of nature's beauties. This peculiar tendency of man for such a resort and pleasure could not escape the poets; and therefore it is, that we find all the amative and lyric poets, with some of the epic, basing much of their claim to attention on the praises of garden walks and pleasures. There the tales of love are told, parties of pleasure planned and executed, and grave council held; and when the place is not specially referred to, some of its gifts or associations, are the absolute or symbolized medium of courtesy and intercourse.

Were the critic to carefully unthread from the acknowledged language of love, letters, and society all the images and epithets owing their origin to some connection with gardens and flowers, he would deprive it of half its ornament.
